HD3SS213 5.4Gbps DisplayPort 1.2a 2:1/1:2 差動スイッチ

1 特長

- DisplayPort 1.2 電気規格に対応
- 最大 5.4Gbps のデータ・レートをサポートする 2:1 および 1:2 スイッチング
- HPD スイッチングをサポート
- AUX および DDC スイッチングをサポート
- 5.4GHz を超える広い -3dB 差動帯域幅
- 優れた動的特性 (2.7GHz 時):
  - クロストーク=-50dB
  - 絶縁=-25dB
  - 挿入損失=-1.5dB
  - 反射損失=-13dB
  - 最大ビット間スキュー=5ps
- V_{DD} 動作範囲:3.3V ± 10%
- パッケージ・オプション:
  - 5mm × 5mm、50 ピン nFBGA
- 出力イネーブル (OE) ピンは、消費電力を節約するためにスイッチをディセーブルします
- HD3SS213 < 10mW (スタンバイ<30µW OE = L の場合)

2 アプリケーション

- PC / ノート PC
- タブレット
- ネットワーク接続の周辺機器とプリンタ

3 概要

HD3SS213 デバイスは高速パッシブ・スイッチで、2 つのフル DisplayPort 4 レーン・ポートを、アプリケーション内で 2 つのソースのうちの 1 つから 1 つのターゲット位置に切り替えることができます。また、1 つのソースを 2 つのシンクのうちの 1 つに切り替えます。DisplayPort アプリケーションの場合、HD3SS213 は、ZEQ パッケージの補助 (AUX)、ディスプレイ・データ・チャネル (DDC)、ホット・プラグ検出 (HPD) 信号のスイッチングをサポートします。

代表的なアプリケーションの 1 つは、1 つの DisplayPort シンクを駆動する必要のある 2 つの GPU を搭載したマザーボードです。GPU は Dx_SEL ピンで選択します。もう 1 つのアプリケーションは、1 つのソースが 2 つのシンクのうちの 1 つを切り替える必要がある場合です。この例は、サイド・コネクタとドッキング・ステーション・コネクタです。スイッチングは、Dx_SEL ピンと AUX_SEL ピンを使用して制御されます。HD3SS213 は、-40℃～105℃の産業用温度範囲全体にわたって、3.3V の単一電源で動作します。

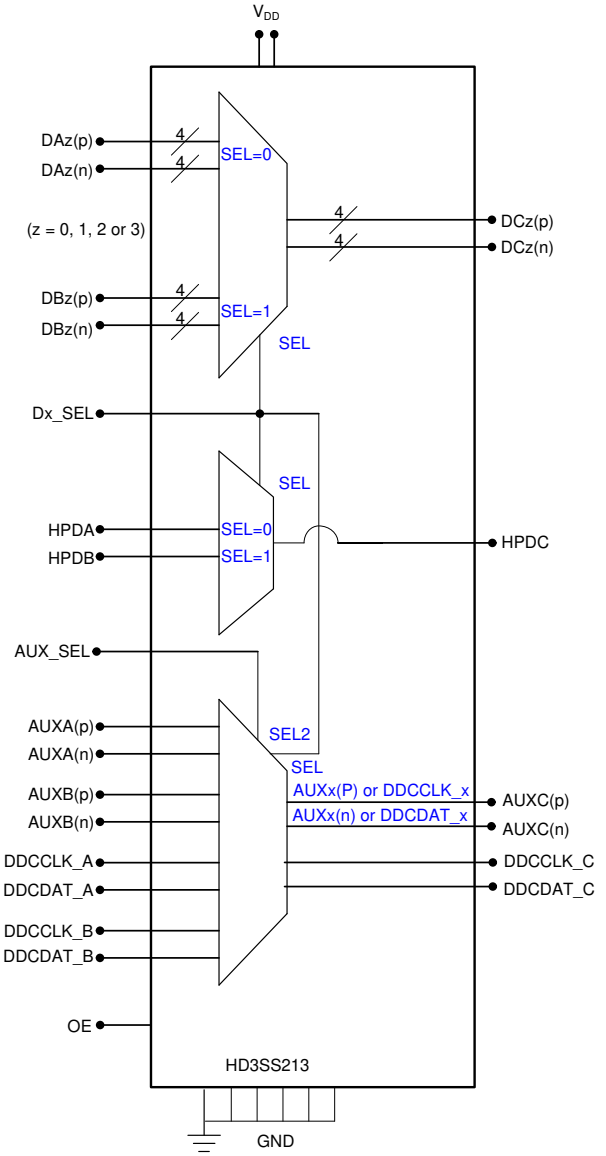
7 Detailed Description

7.1 Overview

The HD3SS213 device is a high-speed passive switch offered in an industry standard 50-pin nFBGA package. The device is specified to operate from a single supply voltage of 3.3 V over the industrial temperature range of –40°C to 105°C. The HD3SS213 is a generic 4-CH high-speed mux/demux type of switch that can be used for routing high-speed signals between two different locations on a circuit board. The HD3SS213 also supports several other high speed data protocols with a differential amplitude of < 1800 mV_{PP} and a common-mode voltage of < 2 V, as with USB 3.0 and DisplayPort 1.2. For display port applications, the HD3SS213 also supports switching of both the auxiliary and hot plug detect signals.

The high speed port selection control inputs of the device, Dx_SEL and AUX_SEL pins can easily be controlled by available GPIO pins within a system.

7.2 Functional Block Diagram



7.3 Feature Description

The HD3SS213 behaves as a two to one or one to two using high bandwidth pass gates (see *セクション 7.2*). The input ports are selected using the AUX_SEL and Dx_SEL pins which are shown in 表 7-1.

表 7-1. AUX/DDC Switch Control Logic

7.4 Device Functional Modes

The HD3SS213 can be operated in normal operation mode or in shut down mode. In normal operation, the inputs ports of the HD3SS213 are routed to the output ports according to 表 7-1. In standby mode, the HD3SS213 is disabled to enable power savings with a typical current consumption of 2.5 µA. The functional mode is selected through the OE input pin with HIGH for normal operation and LOW for standby.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

Many interfaces require AC coupling between the source and sink. The 0402 capacitors are the preferred option to provide AC coupling, and the 0603 size capacitors also work. The 0805 size capacitors and C-packs must be avoided. When placing AC coupling capacitors symmetric placement is best. A capacitor value of 0.1 µF is best and the value must be match for the ± signal pair. There are several placement options for the AC coupling capacitors. Because the switch requires a bias voltage, the capacitors must only be placed on one side of the switch. If they are placed on both sides of the switch, a biasing voltage must be provided. A few placement options are shown below.

In 図 8-1, the coupling capacitors are placed on the source pair. In this situation, the switch is biased by the sink.

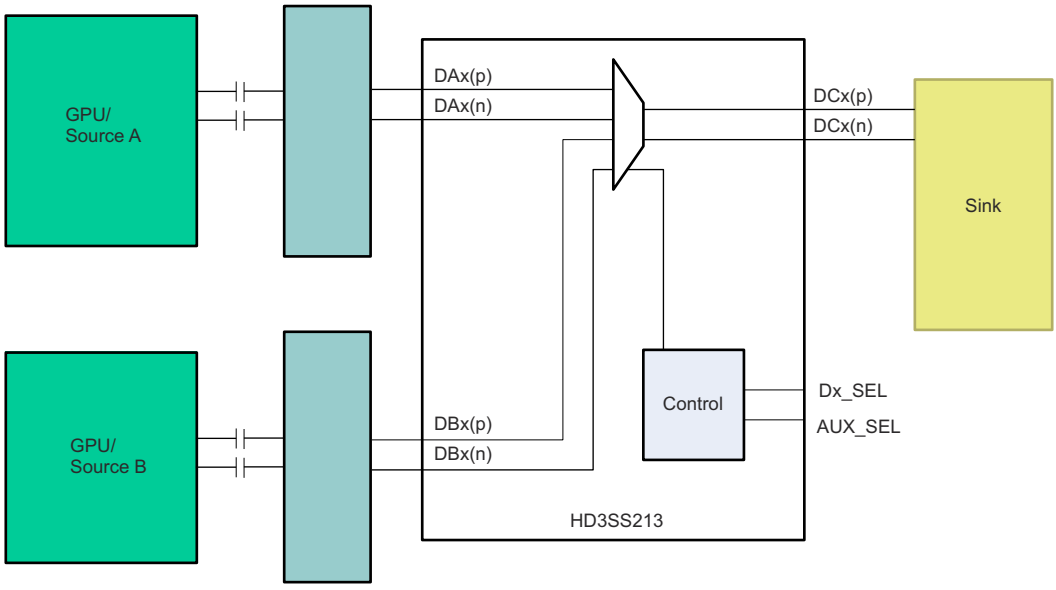

図 8-1. Source Biased by the Sink

In 図 8-2, the coupling capacitors are placed between the switch and Sink. In this situation, the switch is biased by the Source

8.2 Typical Applications

8.2.1 HD3SS213 AUX Channel in 2:1 Application

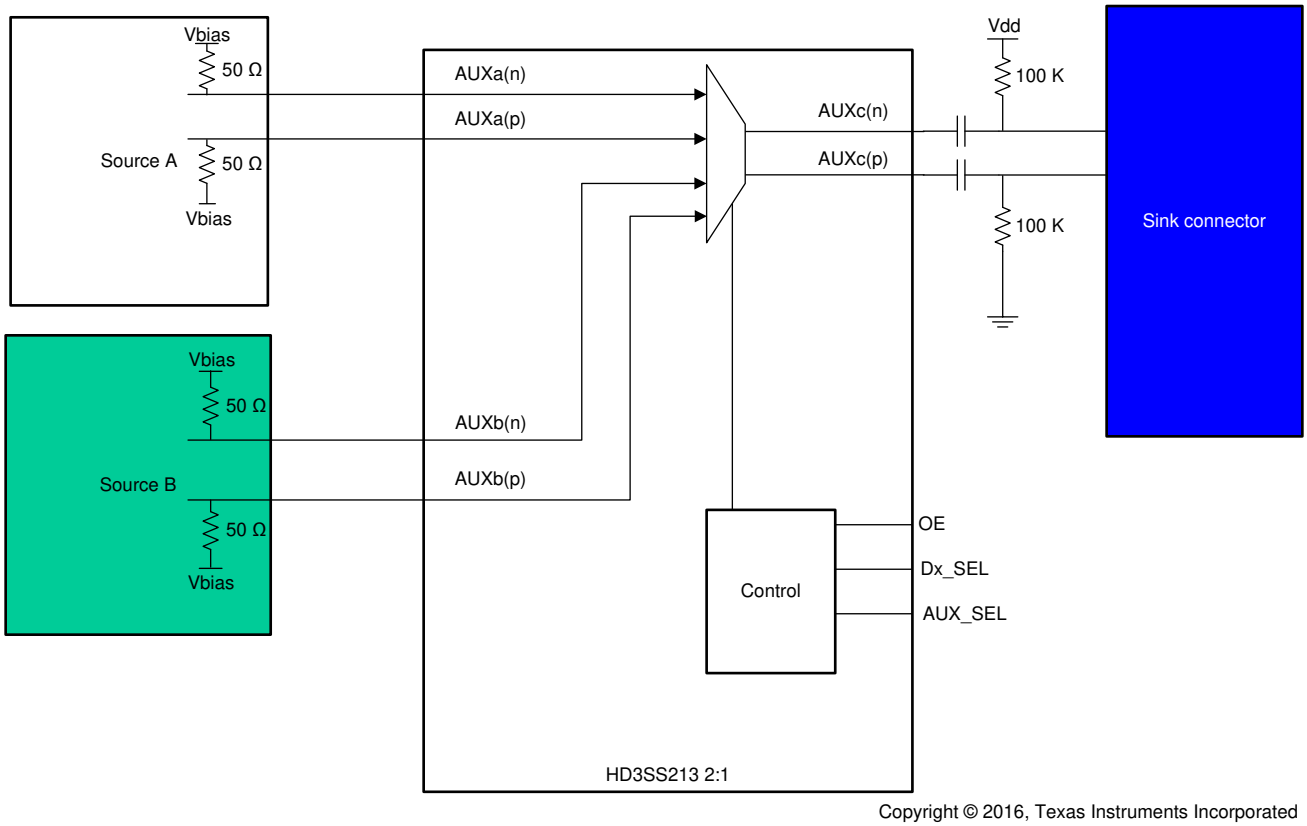

図 8-3. HD3SS213 AUX Channel in 2:1 Application Schematic

8.2.1.1 Design Requirements

表 8-1 lists the design parameters.

表 8-1. Design Parameters

PARAMETERS	VALUE
Input voltage	3.3 V
Decoupling capacitors	0.1 µF
AC capacitors(1)	75 nF to 200 nF AC capacitors

(1) DAx, AUXAx, AUXBx and DBx require AC capacitors. N lines require AC capacitors. Alternate mode signals may or may not require AC capacitors.

8.2.1.2 Detailed Design Procedure

- Connect VDD and GND pins to the power and ground planes of the printed-circuit board with 0.1-µF bypass capacitor
- Use VDD/2 logic level at AUX_SEL pin
- Use 3.3-V TTL/CMOS logic level at Dx_SEL to connect DAx to DCx
- Use GND logic level at Dx_SEL to connect DBx to DCx
- Use controlled-impedance transmission media for all the differential signals
- Ensure the received complimentary signals are with a differential amplitude of <1800 mV_{PP} and a common-mode voltage of <2 V

8.2.2 HD3SS213 AUX Channel in 1:2 Application

AUX channel is controlled by AUX_SEL. This pin configures the switch to route the incoming AUX signal to the outgoing AUX path, when AUX_SEL = 0 the AUXA channel is routed to AUXC, when AUX_SEL = 1 the AUXB channel is routed to AUXC.

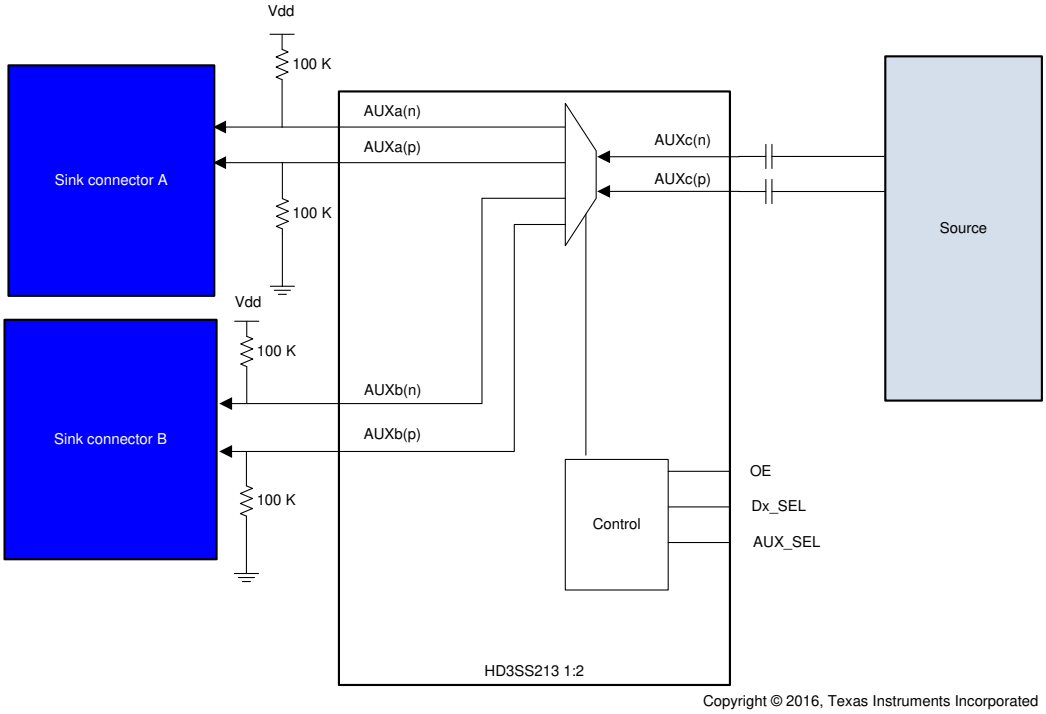

図 8-8. HD3SS213 AUX Channel in 1:2 Application Schematic

Power Supply Recommendations

The HD3SS213 requires 3.3 V power sources. 3.3-V supply (VDD) must have 0.1-µF bypass capacitors to VSS (ground) for proper operation. TI recommends one capacitor for each power terminal. Place the capacitor as close as possible to the terminal on the device and keep trace length to a minimum. Smaller value capacitors like 0.01 µF are also recommended on the supply terminals.

9 Layout

9.1 Layout Guidelines

- Routing the high-speed differential signal traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects from the DisplayPort connectors to the repeater inputs and from the repeater output to the subsequent receiver circuit.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Decoupling capacitors must be placed next to each power terminal on the HD3SS213. Take care to minimize the stub length of the race connecting the capacitor to the power pin.
- Avoid sharing vias between multiple decoupling capacitors.
- Place vias as close as possible to the decoupling capacitor solder pad.
- Widen VDD and/or GND planes to reduce effect if static and dynamic IR drop.

9.1.1 Differential Traces

Guidelines for routing PCB traces are necessary when trying to maintain signal integrity and lower EMI. Although there seems to be an endless number of precautions, this section provides only a few main recommendations as layout guidance.

1. Reduce intra-pair skew in a differential trace by introducing small meandering corrections at the point of mismatch.
2. Reduce inter-pair skew, caused by component placement and IC pinouts, by making larger meandering correction along the signal path. Use chamfered corners with a length-to-trace width ratio of between 3 and 5. The distance between bends must be 8 to 10 times the trace width
3. Use 45° bends instead of right-angle (90°) bends. Right-angle bends increase the effective trace width, which changes the differential trace impedance creating large discontinuities. A 45° bends is seen as a smaller discontinuity.
4. When routing around an object, route both trace of a pair in parallel. Splitting the traces changes the line-to-line spacing, thus causing the differential impedance to change and discontinuities to occur
5. Place passive components within the signal path, such as source-matching resistors or AC coupling capacitors, next to each other. Routing as in case a) creates wider trace spacing than in b). However, the resulting discontinuity is limited to a far narrower area.
6. When routing traces next to a via or between an array of vias, make sure that the via clearance section does not interrupt the path of the return current on the ground plane below
7. Avoid metal layers and traces underneath or between the pads off the DisplayPort connectors for better impedance matching. Otherwise, they cause the differential impedance to drop below 75 Ω and fail the board during TDR testing.
8. Use the smallest size possible for signal trace vias and DisplayPort connector pads as they have less impact on the 100 Ω differential impedance. Large vias and pads can cause the impedance to drop below 85 Ω.
9. Use solid power and ground planes for 100 Ω impedance control and minimum power noise.
10. For 100 Ω differential impedance use the smallest trace spacing possible, which is usually specified by the PCB vendor.
11. Keep the trace length between the DisplayPort connector and the DisplayPort device as short as possible to minimize attenuation.
12. Use good DisplayPort connectors whose impedances meet the specifications.
13. Place bulk capacitors (for example, 10 µF) close to power sources, such as voltage regulators or where the power is supplied to the PCB.
14. Place smaller 0.1-µF or 0.01-µF capacitors at the device.

10.4 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい ESD 対策をとらないと、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
HD3SS213ZXHR	ACTIVE	NFBGA	ZXH	50	2500	RoHS & Green	SNAGCU	Level-3-260C-168 HR	-40 to 105	HD3SS213	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

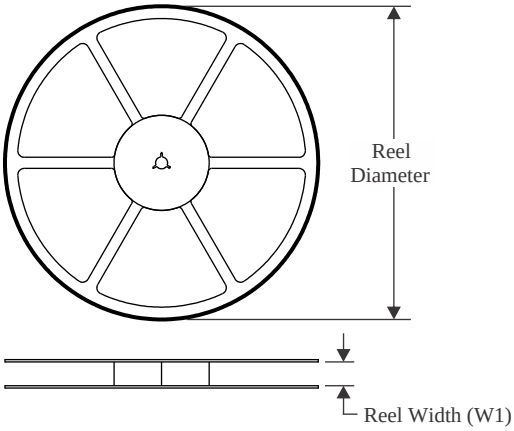
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

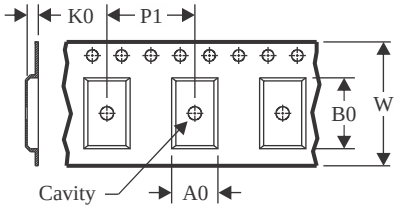
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

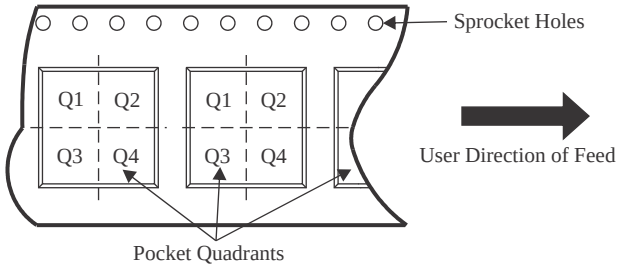


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal
