LOW-NOISE, HIGH-OUTPUT DRIVE, CURRENT-FEEDBACK OPERATIONAL AMPLIFIERS

Check for Samples: THS3120 THS3121

FEATURES

- **Low Noise:**
  - **1 pA/√Hz Noninverting Current Noise**
  - **10 pA/√Hz Inverting Current Noise**
  - **2.5 nV/√Hz Voltage Noise**
- **High Output Current Drive: 475 mA**
- **High Slew Rate:**
  - **1700 V/µs (R_L = 50 Ω, V_O = 8 V_{PP})**
- **Wide Bandwidth: 120 MHz (G = 2, R_L = 50 Ω)**
- **Wide Supply Range: ±5 V to ±15 V**
- **Power-Down Feature: (THS3120 Only)**

APPLICATIONS

- **Video Distribution**
- **Power FET Driver**
- **Pin Driver**
- **Capacitive Load Driver**

DESCRIPTION

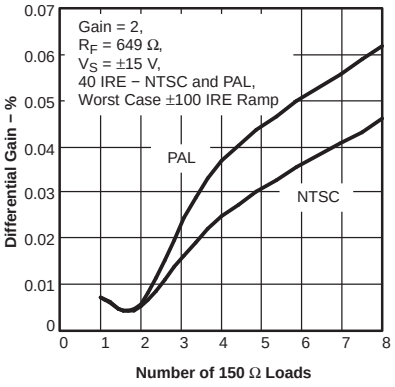
The THS3120 and THS3121 are low-noise, high-voltage, high output current drive, current-feedback amplifiers designed to operate over a wide supply range of ±5 V to ±15 V for today's high-performance applications.

The THS3120 offers a power saving mode by providing a power-down pin for reducing the 7-mA quiescent current of the device, when the device is not active.

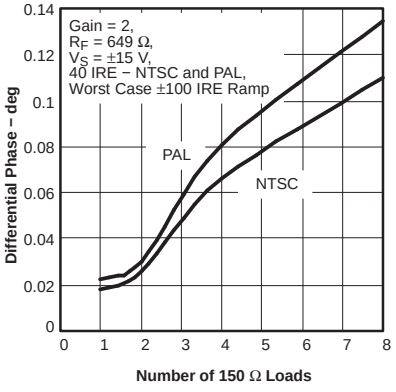
These amplifiers provide well-regulated ac performance characteristics. Most notably, the 0.1-dB flat bandwidth is exceedingly high, reaching beyond 90 MHz. The unity-gain bandwidth of 130 MHz allows for good distortion characteristics at 10 MHz. Coupled with high 1700-V/µs slew rate, the THS3120 and THS3121 amplifiers allow for high output voltage swings at high frequencies.

The THS3120 and THS3121 are offered in an SOIC-8 (D) package and an MSOP-8 (DGN) PowerPAD™ package.

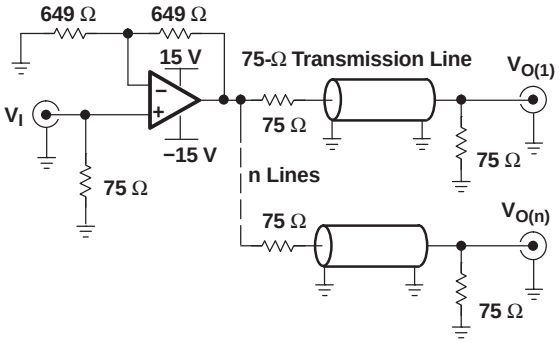
DIFFERENTIAL GAIN vs NUMBER OF LOADS



DIFFERENTIAL PHASE vs NUMBER OF LOADS

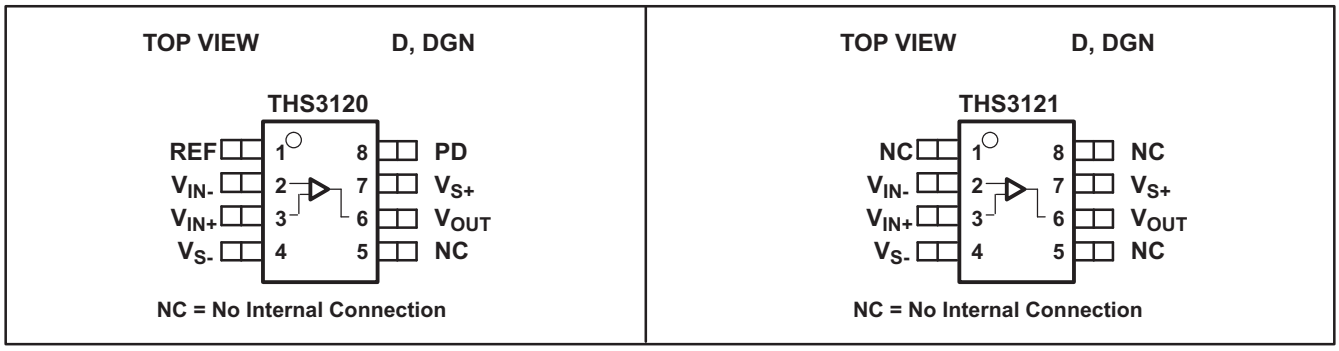


VIDEO DISTRIBUTION AMPLIFIER APPLICATION



This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.



NOTE: The device with the power down option defaults to the ON state if no signal is applied to the PD pin. Additionally, the REF pin functional range is from V_{S-} to (V_{S+} – 4 V).

AVAILABLE OPTIONS(1)

T_A	PACKAGED DEVICE		
	PLASTIC SMALL OUTLINE SOIC (D)	PLASTIC MSOP (DGN) (2) (3)	SYMBOL
0°C to +70°C	THS3120CD	THS3120CDGN	AQA
	THS3120CDR	THS3120CDGNR	
–40°C to +85°C	THS3120ID	THS3120IDGN	APN
	THS3120IDR	THS3120IDGNR	
0°C to +70°C	THS3121CD	THS3121CDGN	AQO
	THS3121CDR	THS3121CDGNR	
–40°C to +85°C	THS3121ID	THS3121IDGN	APO
	THS3121IDR	THS3121IDGNR	

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
(2) Available in tape and reel. The R suffix standard quantity is 2500 (for example, THS3120CDGNR).
(3) The PowerPAD is electrically isolated from all other pins.

DISSIPATION RATING TABLE

PACKAGE	θ_{JC} (°C/W)	θ_{JA} (°C/W)	POWER RATING T_J = +125°C	
			T_A = +25°C	T_A = +85°C
D-8(1)	38.3	95	1.05 W	421 mW
DGN-8(2)	4.7	58.4	1.71 W	685 W

(1) These data were taken using the JEDEC standard low-K test PCB. For the JEDEC proposed high-K test PCB, the θ_{JA} is +95°C/W with power rating at T_A = +25°C of 1.05 W.
(2) These data were taken using 2 oz. (56,7 grams) trace and copper pad that is soldered directly to a 3 inch x 3 inch (76,2 mm x 76,2 mm) PCB. For further information, see the *Application Information* section of this data sheet.

RECOMMENDED OPERATING CONDITIONS

PARAMETER		MIN	NOM	MAX	UNIT
Supply voltage	Dual supply	±5		±15	V
	Single supply	10		30	
Operating free-air temperature, T_A	Commercial	0		+70	°C
	Industrial	–40		+85	
Operating junction temperature, continuous operating, T_J		–40		+125	°C
Normal storage temperature, T_{STG}		–40		+85	°C

ABSOLUTE MAXIMUM RATINGS(1)

Over operating free-air temperature, unless otherwise noted.

PARAMETER			UNIT
Supply voltage, $V_{S–}$ to V_{S+}			33 V
Input voltage, V_I			$\pm V_S$
Differential input voltage, V_{ID}			±4 V
Output current, I_O (2)			550 mA
Continuous power dissipation			See Dissipation Ratings Table
Maximum junction temperature, T_J (3)			+150°C
Maximum junction temperature, continuous operation, long-term reliability, T_J (4)			+125°C
Operating free-air temperature, T_A		Commercial	0°C to +70°C
		Industrial	–40°C to +85°C
Storage temperature, T_{STG}			–65°C to +125°C
ESD ratings:	HBM		1000
	CDM		1500
	MM		200

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The THS3120 and THS3121 may incorporate a PowerPAD on the underside of the chip. This acts as a heatsink and must be connected to a thermally dissipating plane for proper power dissipation. Failure to do so may result in exceeding the maximum junction temperature which could permanently damage the device. See TI Technical Brief SLMA002 for more information about using the PowerPAD thermally-enhanced package.
(3) The absolute maximum temperature under any condition is limited by the constraints of the silicon process.
(4) The maximum junction temperature for continuous operation is limited by the package constraints. Operation above this temperature may result in reduced reliability and/or lifetime of the device.

ELECTRICAL CHARACTERISTICS

At V_S = ±15 V, R_F = 649 Ω, R_L = 50 Ω, and G = 2, unless otherwise noted.

APPLICATION INFORMATION

MAXIMUM SLEW RATE FOR REPETITIVE SIGNALS

The THS3120 and THS3121 are recommended for high slew rate pulsed applications where the internal nodes of the amplifier have time to stabilize between pulses. It is recommended to have at least 20-ns delay between pulses.

The THS3120 and THS3121 are not recommended for applications with repetitive signals (sine, square, sawtooth, or other) that exceed 900 V/µs. Using the part in these applications results in excessive current draw from the power supply and possible device damage.

For applications with high slew rate, repetitive signals, the THS3091 and THS3095 (single), or THS3092 and THS3096 (dual) are recommended.

WIDEBAND, NONINVERTING OPERATION

The THS3120 and THS3121 are unity-gain stable 130-MHz current-feedback operational amplifiers, designed to operate from a ±5-V to ±15-V power supply.

Figure 47 shows the THS3121 in a noninverting gain of 2-V/V configuration typically used to generate the Typical Characteristics. Most of the curves were characterized using signal sources with 50-Ω source impedance, and with measurement equipment presenting a 50-Ω load impedance.

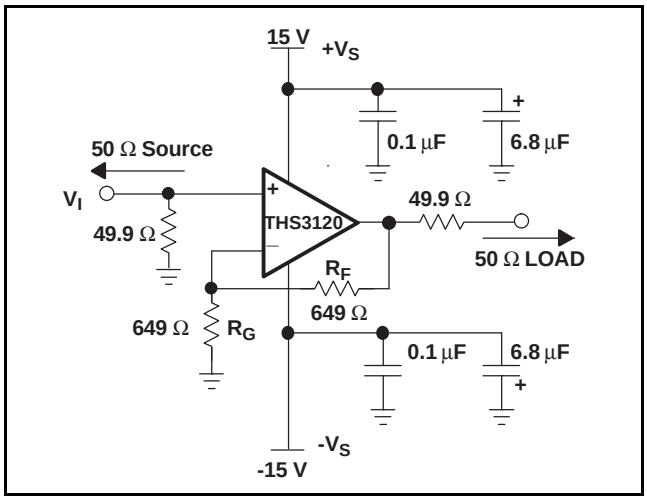

Figure 47. Wideband, Noninverting Gain Configuration

Current-feedback amplifiers are highly dependent on the feedback resistor R_F for maximum performance and stability. Table 1 shows the optimal gain setting resistors R_F and R_G at different gains to give maximum bandwidth with minimal peaking in the frequency response. Higher bandwidths can be achieved, at the expense of added peaking in the frequency response, by using even lower values for R_F. Conversely, increasing R_F decreases the bandwidth, but stability is improved.

Table 1. Recommended Resistor Values for Optimum Frequency Response

THS3120 AND THS3121 R_F AND R_G VALUES FOR MINIMAL PEAKING WITH R_L = 50 Ω			
GAIN (V/V)	SUPPLY VOLTAGE (V)	R_G (Ω)	R_F (Ω)
1	±15	—	806
	±5	—	909
2	±15	649	649
	±5	750	750
5	±15	124	499
	±5	124	499
10	±15	33.2	301
	±5	33.2	301
–1	±15	681	681
	±5	750	750
–2	±15 and ±5	340	681
–5	±15 and ±5	100	499
–10	±15 and ±5	36.5	365

WIDEBAND, INVERTING OPERATION

Figure 48 shows the THS3121 in a typical inverting gain configuration where the input and output impedances and signal gain from Figure 47 are retained in an inverting circuit configuration.

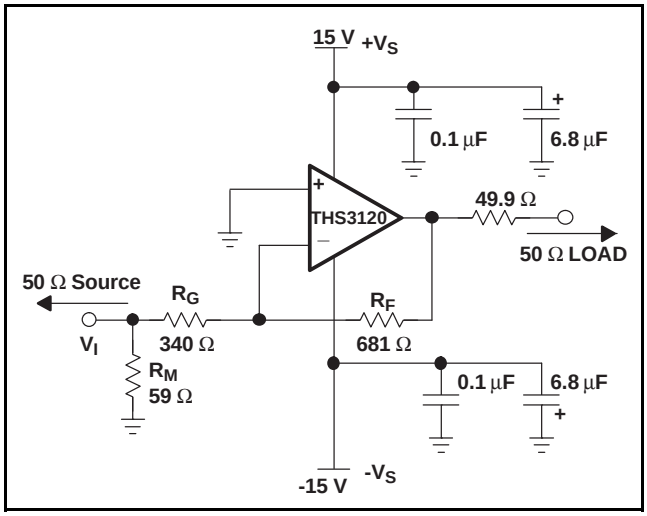

Figure 48. Wideband, Inverting Gain Configuration

SINGLE-SUPPLY OPERATION

The THS3120 and THS3121 have the capability to operate from a single supply voltage ranging from 10 V to 30 V. When operating from a single power supply, biasing the input and output at mid-supply allows for the maximum output voltage swing. The circuits of Figure 49 show inverting and noninverting amplifiers configured for single-supply operation.

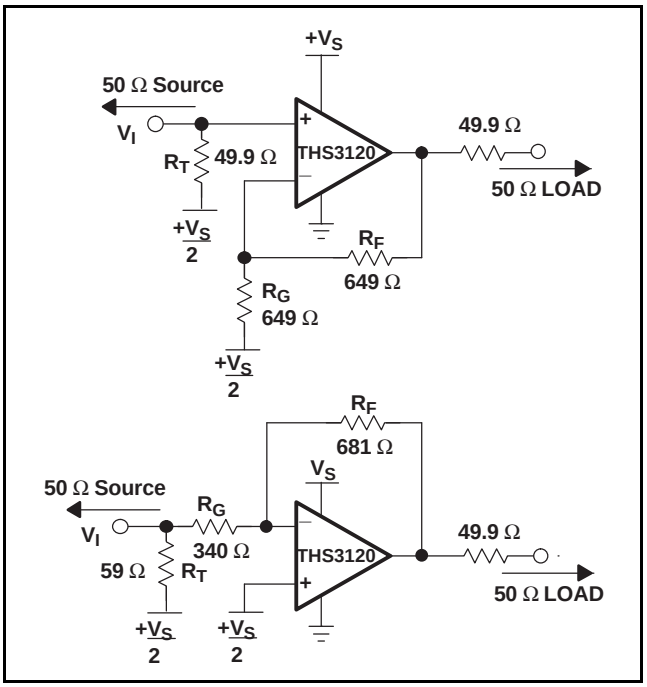

Figure 49. DC-Coupled, Single-Supply Operation

Video Distribution

The wide bandwidth, high slew rate, and high output drive current of the THS3120 and THS3121 matches the demands for video distribution for delivering video signals down multiple cables. To ensure high signal quality with minimal degradation of performance, a 0.1-dB gain flatness should be at least 7x the passband frequency to minimize group delay variations from the amplifier. A high slew rate minimizes distortion of the video signal, and supports component video and RGB video signals that require fast transition times and fast settling times for high signal quality.

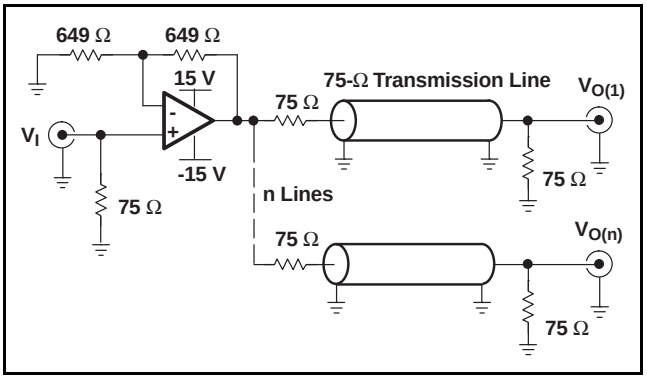

Figure 50. Video Distribution Amplifier Application

Driving Capacitive Loads

Applications such as FET drivers and line drivers can be highly capacitive and cause stability problems for high-speed amplifiers.

Figure 51 through Figure 57 show recommended methods for driving capacitive loads. The basic idea is to use a resistor or ferrite chip to isolate the phase shift at high frequency caused by the capacitive load from the amplifier feedback path. See Figure 51 for recommended resistor values versus capacitive load.

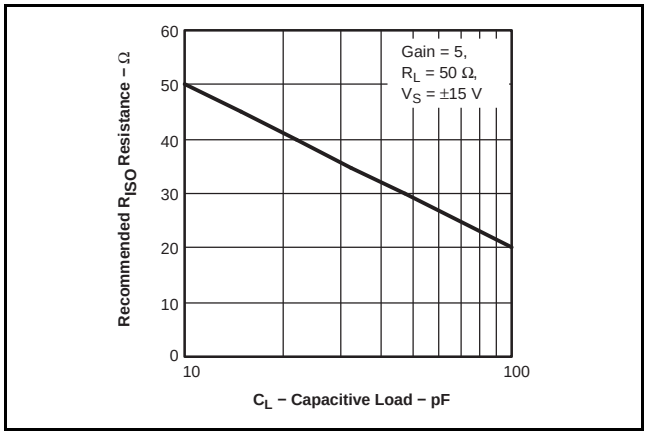

Figure 51. Recommended R_{ISO} vs Capacitive Load

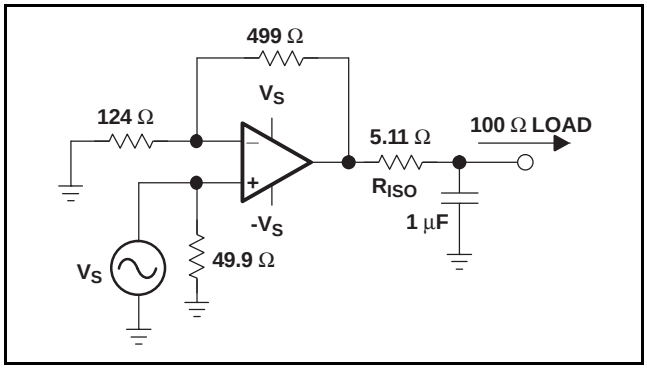

Figure 52. Resistor to Isolate Capacitive Load

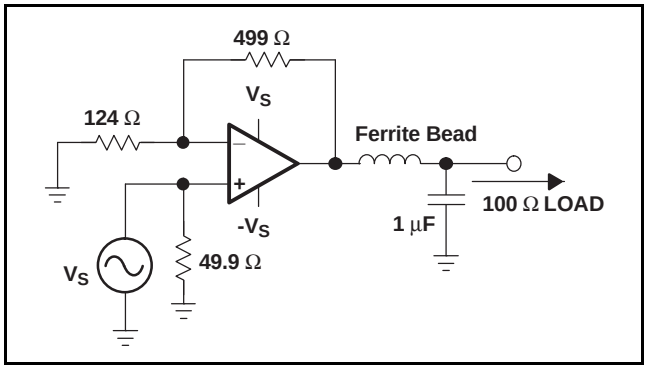

Figure 53. Ferrite Bead to Isolate Capacitive Load

Placing a small series resistor, R_{ISO}, between the amplifier output and the capacitive load, as shown in Figure 52, is an easy way of isolating the load capacitance.

Using a ferrite chip in place of R_{ISO}, as shown in Figure 53, is another approach of isolating the output of the amplifier. The ferrite impedance characteristic versus frequency is useful to maintain the low frequency load independence of the amplifier while isolating the phase shift caused by the capacitance at high frequency. Use a ferrite chip with similar impedance to R_{ISO}, 20 Ω to 50 Ω, at 100 MHz and low impedance at dc.

Figure 54 shows another method used to maintain the low frequency load independence of the amplifier while isolating the phase shift caused by the capacitance at high frequency. At low frequency, feedback is mainly from the load side of R_{ISO}. At high frequency, the feedback is mainly via the 27-pF capacitor. The resistor R_{IN} in series with the negative input is used to stabilize the amplifier and should be equal to the recommended value of R_F at unity gain. Replacing R_{IN} with a ferrite chip of similar impedance at about 100 MHz as illustrated in Figure 55 gives similar results with reduced dc offset and low frequency noise. (See the *Additional Reference Material* section for expanding the usability of current-feedback amplifiers.)

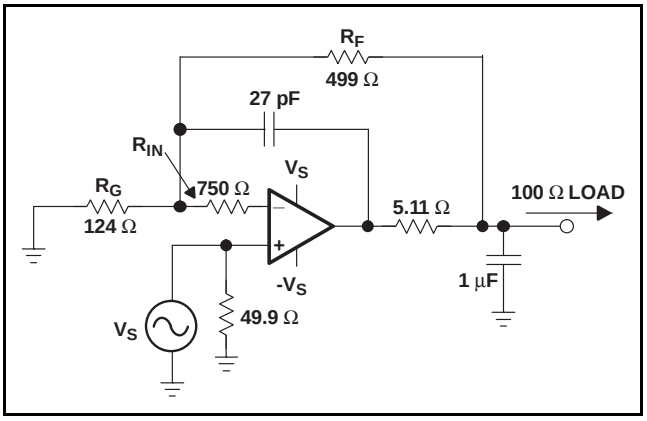

Figure 54. Feedback Technique with Input Resistor for Capacitive Load

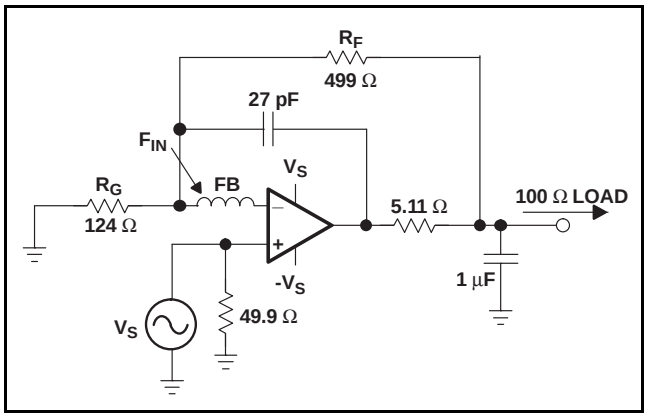

Figure 55. Feedback Technique with Input Ferrite Bead for Capacitive Load

Figure 56 is shown using two amplifiers in parallel to double the output drive current to larger capacitive loads. This technique is used when more output current is needed to charge and discharge the load faster as when driving large FET transistors.

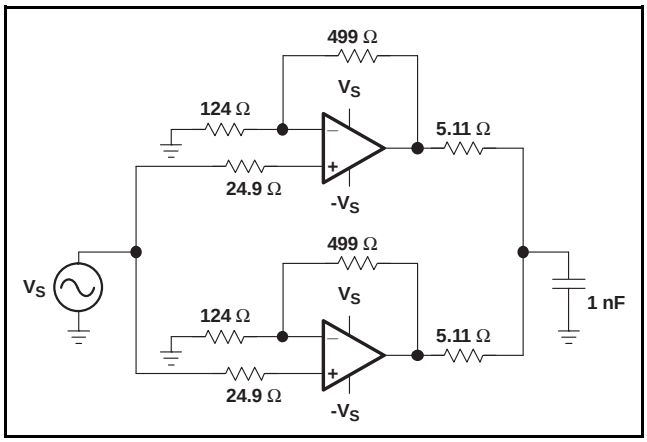

Figure 56. Parallel Amplifiers for Higher Output Drive

Figure 57 shows a push-pull FET driver circuit typical of ultrasound applications with isolation resistors to isolate the gate capacitance from the amplifier.

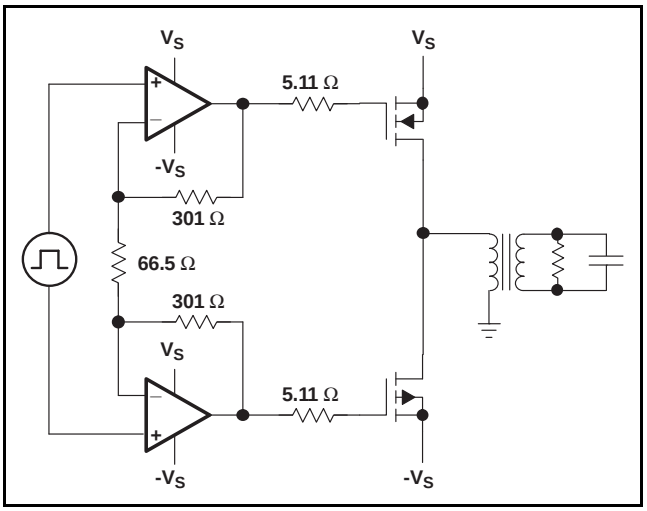

Figure 57. PowerFET Drive Circuit

SAVING POWER WITH POWER-DOWN FUNCTIONALITY AND SETTING THRESHOLD LEVELS WITH THE REFERENCE PIN

The THS3120 features a power-down pin (PD) which lowers the quiescent current from 7 mA down to 300 µA, ideal for reducing system power.

The power-down pin of the amplifier defaults to the REF pin voltage in the absence of an applied voltage, putting the amplifier in the normal *on* mode of operation. To turn off the amplifier in an effort to conserve power, the power-down pin can be driven towards the positive rail. The threshold voltages for power-on and power-down are relative to the supply rails and are given in the specification tables. Below the *Enable Threshold Voltage*, the device is on. Above the *Disable Threshold Voltage*, the device is off. Behavior in between these threshold voltages is not specified.

Note that this power-down functionality is just that; the amplifier consumes less power in power-down mode. The power-down mode is not intended to provide a high-impedance output. In other words, the power-down functionality is not intended to allow use as a 3-state bus driver. When in power-down mode, the impedance looking back into the output of the amplifier is dominated by the feedback and gain setting resistors, but the output impedance of the device itself varies depending on the voltage applied to the outputs.

Figure 58 shows the total system output impedance which includes the amplifier output impedance in parallel with the feedback plus gain resistors, which cumulate to 1298 Ω. Figure 47 shows this circuit configuration for reference.

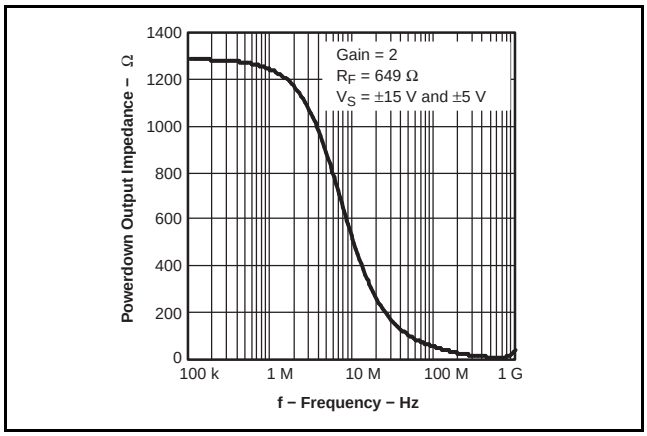

Figure 58. Power-down Output Impedance vs Frequency

As with most current-feedback amplifiers, the internal architecture places some limitations on the system when in power-down mode. Most notably is the fact that the amplifier actually turns *ON* if there is a ±0.7 V or greater difference between the two input nodes (V+ and V–) of the amplifier. If this difference exceeds ±0.7 V, the output of the amplifier creates an output voltage equal to approximately [(V+) – (V–) – 0.7 V] × Gain. Also, if a voltage is applied to the output while in power-down mode, the V– node voltage is equal to $V_{O(applied)} \times R_G/(R_F + R_G)$. For low gain configurations and a large applied voltage at the output, the amplifier may actually turn *ON* due to the aforementioned behavior.

The time delays associated with turning the device on and off are specified as the time it takes for the amplifier to reach either 10% or 90% of the final output voltage. The time delays are in the order of microseconds because the amplifier moves in and out of the linear mode of operation in these transitions.

POWER-DOWN REFERENCE PIN OPERATION

In addition to the power-down pin, the THS3120 features a reference pin (REF) which allows the user to control the enable or disable power-down voltage levels applied to the PD pin. In most split-supply applications, the reference pin is connected to ground. In either case, the user needs to be aware of voltage-level thresholds that apply to the power-down pin. Table 2 shows examples and illustrate the relationship between the reference voltage and the power-down thresholds. In the table, the threshold levels are derived by the following equations:

PD ≤ REF + 0.8 V for enable

PD ≥ REF + 2 V for disable

where the usable range at the REF pin is

$V_{S–} \le V_{REF} \le (V_{S+} – 4\ V)$.

The recommended mode of operation is to tie the REF pin to midrail, thus settings the enable/disable threshold to $V_{(midrail)}$ + 0.8 V and $V_{(midrail)}$ = 2 V respectively.

Table 2. Power-Down Threshold Voltage Levels

SUPPLY VOLTAGE (V)	REFERENCE PIN VOLTAGE (V)	ENABLE LEVEL (V)	DISABLE LEVEL (V)
±15, ±5	0	0.8	2
±15	2	2.8	4
±15	–2	–1.2	0
±5	1	1.8	3
±5	–1	–0.2	1
30	15	15.8	17
10	5	5.8	7

Note that if the REF pin is left unterminated, it floats to the positive rail and falls outside of the recommended operating range given above ($V_{S–} \le V_{REF} \le V_{S+} – 4$ V). As a result, it no longer serves as a reliable reference for the PD pin, and the enable/disable thresholds given above no longer apply. If the PD pin is also left unterminated, it floats to the positive rail and the device is disabled. If balanced, split supplies are used ($\pm V_S$) and the REF and PD pins are grounded, the device is enabled.

PRINTED-CIRCUIT BOARD LAYOUT TECHNIQUES FOR OPTIMAL PERFORMANCE

Achieving optimum performance with high frequency amplifiers, like the THS3120 and THS3121, requires careful attention to board layout parasitic and external component types. Recommendations that optimize performance include:

- Minimize parasitic capacitance to any ac ground for all of the signal I/O pins. Parasitic capacitance on the output and input pins can cause instability. To reduce unwanted capacitance, a window around the signal I/O pins should be opened in all of the ground and power planes around those pins. Otherwise, ground and power planes should be unbroken elsewhere on the board.
- Minimize the distance [< 0.25 inch, (6,4 mm)] from the power-supply pins to high frequency 0.1-µF and 100-pF decoupling capacitors. At the device pins, the ground and power-plane layout should not be in close proximity to the signal I/O pins. Avoid narrow power and ground traces to minimize inductance between the pins and the decoupling capacitors. The power-supply connections should always be decoupled with these capacitors. Larger (6.8 µF or more) tantalum decoupling capacitors, effective at lower frequency, should also be used on the main supply pins. These may be placed somewhat farther from the device and may be shared among several devices in the same area of the PC board.
- Careful selection and placement of external components preserve the high-frequency performance of the THS3120 and THS3121. Resistors should be a very low reactance type. Surface-mount resistors work best and allow a tighter overall layout. Again, keep the leads and printed circuit board (PCB) trace length as short as possible. Never use wirewound type resistors in a high-frequency application. Because the output pin and inverting input pins are the most sensitive to parasitic capacitance, always position the feedback and series output resistors, if any, as close as possible to the inverting input pins and output pins. Other network components, such as input termination resistors, should be placed close to the gain-setting resistors. Even with a low parasitic capacitance shunting the external resistors, excessively high resistor values can create significant time constants that can degrade performance. Good axial metal-film or surface-mount resistors have approximately 0.2 pF in shunt with the resistor. For resistor values greater than 2.0 kΩ, this parasitic capacitance can add a pole and/or a zero that can effect circuit operation. Keep resistor values as low as possible, consistent with load driving considerations.
- Connections to other wideband devices on the board may be made with short direct traces or through onboard transmission lines. For short connections, consider the trace and the input to the next device as a lumped capacitive load. Relatively wide traces [0.05 inch (1,3 mm) to 0.1 inch (2,54 mm)] should be used, preferably with ground and power planes opened up around them. Estimate the total capacitive load and determine if isolation resistors on the outputs are necessary. Low parasitic capacitive loads (less than 4 pF) may not need an R_S because the THS3120 and THS3121 are nominally compensated to operate with a 2-pF parasitic load. Higher parasitic capacitive loads without an R_S are allowed as the signal gain increases (increasing the unloaded phase margin). If a long trace is required, and the 6-dB signal loss intrinsic to a doubly-terminated transmission line is acceptable, implement a matched impedance transmission line using microstrip or stripline techniques (consult an ECL design handbook for microstrip and stripline layout techniques). A 50-Ω environment is not necessary onboard, and in fact, a higher impedance environment improves distortion as shown in the distortion versus load plots. With a characteristic board trace impedance based on board material and trace dimensions, a matching series resistor into the trace from the output of the THS3120/THS3121 is used as well as a terminating shunt resistor at the input of the destination device. Remember also that the terminating impedance is the parallel combination of the shunt resistor and the input impedance of the destination device: this total effective impedance should be set to match the trace impedance. If the 6-dB attenuation of a doubly-terminated transmission line is unacceptable, a long trace can be series-terminated at the source end only. Treat the trace as a capacitive load in this case. This does not preserve signal integrity as well as a doubly-terminated line. If the input impedance of the destination device is low, there is some signal attenuation due to the voltage divider formed by the series output into the terminating impedance.
- Socketing a high-speed part like the THS3120 and THS3121 is not recommended. The additional lead length and pin-to-pin capacitance introduced by the socket can create an extremely troublesome parasitic network which can make it almost impossible to achieve a smooth, stable frequency response. Best results are obtained by soldering the THS3120/THS3121 parts directly onto the board.

PowerPAD DESIGN CONSIDERATIONS

The THS3120 and THS3121 are available in a thermally-enhanced PowerPAD family of packages. These packages are constructed using a downset leadframe upon which the die is mounted (see Figure 59a and Figure 59b). This arrangement results in the lead frame being exposed as a thermal pad on the underside of the package (see Figure 59c). Because this thermal pad has direct thermal contact with the die, excellent thermal performance can be achieved by providing a good thermal path away from the thermal pad. Note that devices such as the THS312x have no electrical connection between the PowerPAD and the die.

The PowerPAD package allows for both assembly and thermal management in one manufacturing operation. During the surface-mount solder operation (when the leads are being soldered), the thermal pad can also be soldered to a copper area underneath the package. Through the use of thermal paths within this copper area, heat can be conducted away from the package into either a ground plane or other heat dissipating device.

The PowerPAD package represents a breakthrough in combining the small area and ease of assembly of surface mount with the, heretofore, awkward mechanical methods of heatsinking.

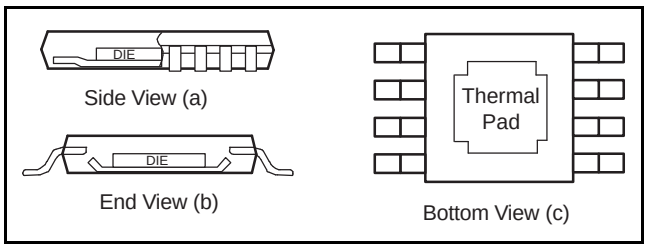

Figure 59. Views of Thermally-Enhanced Package

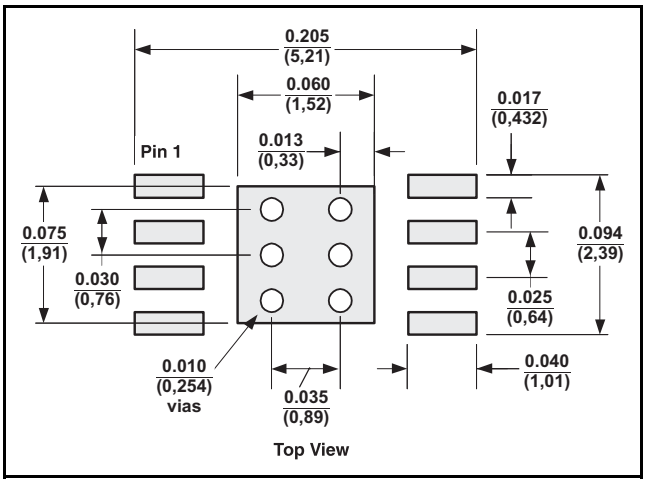
Although there are many ways to properly heatsink the PowerPAD package, the following steps illustrate the recommended approach.

PowerPAD LAYOUT CONSIDERATIONS

1. PCB with a top side etch pattern as shown in Figure 60. There should be etch for the leads as well as etch for the thermal pad.
2. Place five holes in the area of the thermal pad. These holes should be 0.01 inch (0,254 mm) in diameter. Keep them small so that solder wicking through the holes is not a problem during reflow.



Dimensions are in inches (millimeters).

Figure 60. DGN PowerPAD PCB Etch and Via Pattern

3. Additional vias may be placed anywhere along the thermal plane outside of the thermal pad area. This helps dissipate the heat generated by the THS3120/THS3121 IC. These additional vias may be larger than the 0.01-inch (0,254 mm) diameter vias directly under the thermal pad. They can be larger because they are not in the thermal pad area to be soldered so that wicking is not a problem.
4. Connect all holes to the internal ground plane. Note that the PowerPAD is electrically isolated from the silicon and all leads. Connecting the PowerPAD to any potential voltage such as V_{S-}, is acceptable as there is no electrical connection to the silicon.
5. When connecting these holes to the ground plane, do not use the typical web or spoke via connection methodology. Web connections have a high thermal resistance connection that is useful for slowing the heat transfer during soldering operations. This makes the soldering of vias that have plane connections easier. In this application, however, low thermal resistance is desired for the most efficient heat transfer. Therefore, the holes under the THS3120/THS3121 PowerPAD package should make their connection to the internal ground plane with a complete connection around the entire circumference of the plated-through hole.
6. The top-side solder mask should leave the terminals of the package and the thermal pad area with its five holes exposed. The bottom-side solder mask should cover the five holes of the thermal pad area. This prevents solder from being pulled away from the thermal pad area during the reflow process.

7. Apply solder paste to the exposed thermal pad area and all of the IC terminals.
8. With these preparatory steps in place, the IC is simply placed in position and run through the solder reflow operation as any standard surface-mount component. This results in a part that is properly installed.

POWER DISSIPATION AND THERMAL CONSIDERATIONS

The THS3120 and THS3121 incorporate automatic thermal shutoff protection. This protection circuitry shuts down the amplifier if the junction temperature exceeds approximately +160°C. When the junction temperature reduces to approximately +140°C, the amplifier turns on again. But, for maximum performance and reliability, the designer must take care to ensure that the design does not exceed a junction temperature of +125°C. Between +125°C and +150°C, damage does not occur, but the performance of the amplifier begins to degrade and long term reliability suffers. The thermal characteristics of the device are dictated by the package and the PC board. Maximum power dissipation for a given package can be calculated using the following formula.

$$P_{Dmax} = \frac{T_{max} - T_A}{\theta_{JA}}$$

where:

P_{Dmax} is the maximum power dissipation in the amplifier (W).

T_{max} is the absolute maximum junction temperature (°C).

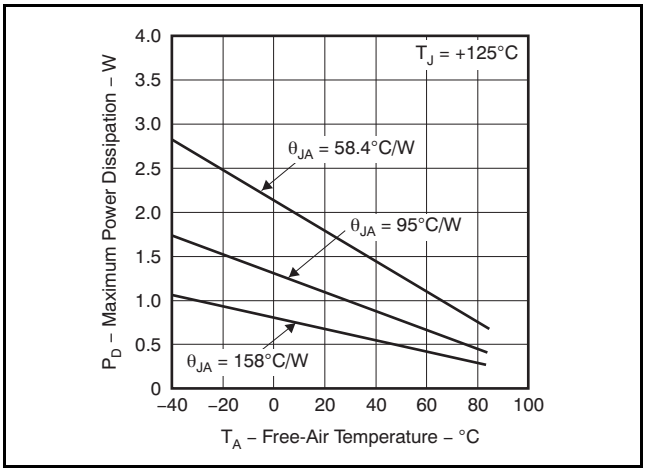
T_A is the ambient temperature (°C).

$\theta_{JA} = \theta_{JC} + \theta_{CA}$

θ_{JC} is the thermal coeffiecient from the silicon junctions to the case (°C/W).

θ_{CA} is the thermal coeffiecient from the case to ambient air (°C/W). (1)

For systems where heat dissipation is more critical, the THS3120 and THS3121 are offered in an MSOP-8 with PowerPAD package offering even better thermal performance. The thermal coefficient for the PowerPAD packages are substantially improved over the traditional SOIC. Maximum power dissipation levels are depicted in the graph for the available packages. The data for the PowerPAD packages assume a board layout that follows the PowerPAD layout guidelines referenced above and detailed in the PowerPAD application note (literature number SLMA002). also illustrates the effect of not soldering the PowerPAD to a PCB. The thermal impedance increases substantially which may cause serious heat and performance issues. Be sure to always solder the PowerPAD to the PCB for optimum performance.



Results are with no air flow and PCB size = 3 inches × 3 inches (76,2 mm × 76,2 mm); θ_{JA} = 58.4°C/W for MSOP-8 with PowerPAD (DGN); θ_{JA} = 95°C/W for SOIC-8 High-K test PCB (D); θ_{JA} = 158°C/W for MSOP-8 with PowerPAD without solder.

Figure 61. Maximum Power Distribution vs Ambient Temperature

When determining whether or not the device satisfies the maximum power dissipation requirement, it is important to not only consider quiescent power dissipation, but also dynamic power dissipation. Often times, this is difficult to quantify because the signal pattern is inconsistent, but an estimate of the RMS power dissipation can provide visibility into a possible problem.

DESIGN TOOLS

Evaluation Fixtures, Spice Models, and Application Support

Texas Instruments is committed to providing its customers with the highest quality of applications support. To support this goal an evaluation board has been developed for the THS3120 and THS3121 operational amplifier. The board is easy to use, allowing for straightforward evaluation of the device. The evaluation board can be ordered through the Texas Instruments web site, www.ti.com, or through your local Texas Instruments sales representative.

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. This is particularly true for video and RF-amplifier circuits where parasitic capacitance and inductance can have a major effect on circuit performance. A SPICE model for the THS3121 is available through the Texas Instruments web site (www.ti.com). The product information center (PIC) is also available for design assistance and detailed product information. These models do a good job of predicting small-signal ac and transient performance under a wide variety of operating conditions. They are not intended to model

the distortion characteristics of the amplifier, nor do they attempt to distinguish between the package types in the small-signal ac performance. Detailed information about what is and is not modeled is contained in the model file itself.

REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision D (January 2009) to Revision E **Page**

- Changed Power-Down Characteristics, *Power-down quiescent current* test conditions of ±15 V Electrical Characteristics 5
- Changed Power-Down Characteristics, *PD pin bias current* parameter of ±15 V Electrical Characteristics 5
- Changed Power-Down Characteristics, *Power-down quiescent current* test conditions of ±5 V Electrical Characteristics 7
- Changed Power-Down Characteristics, *PD pin bias current* parameter of ±5 V Electrical Characteristics 7
- Updated format of Application Information section 15
- Added caption title to Figure 52 17
- Added caption title to Figure 53 17
- Added caption title to Figure 54 17
- Added caption title to Figure 55 18
- Added caption title to Figure 56 18
- Changed first sentence of second paragraph of the *Saving Power with Power-Down Functionality* section 18
- Changed last sentence of *Power-Down Reference Pin Operation* section 19

Changes from Revision C (February 2007) to Revision D **Page**

- Changed input offset voltage values 4
- Changed input common-mode voltage range values 4
- Changed power-supply rejection ratio values 5
- Changed input offset voltage values 6
- Changed input common-mode voltage range values 6
- Changed power-supply rejection ratio values 7

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

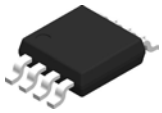
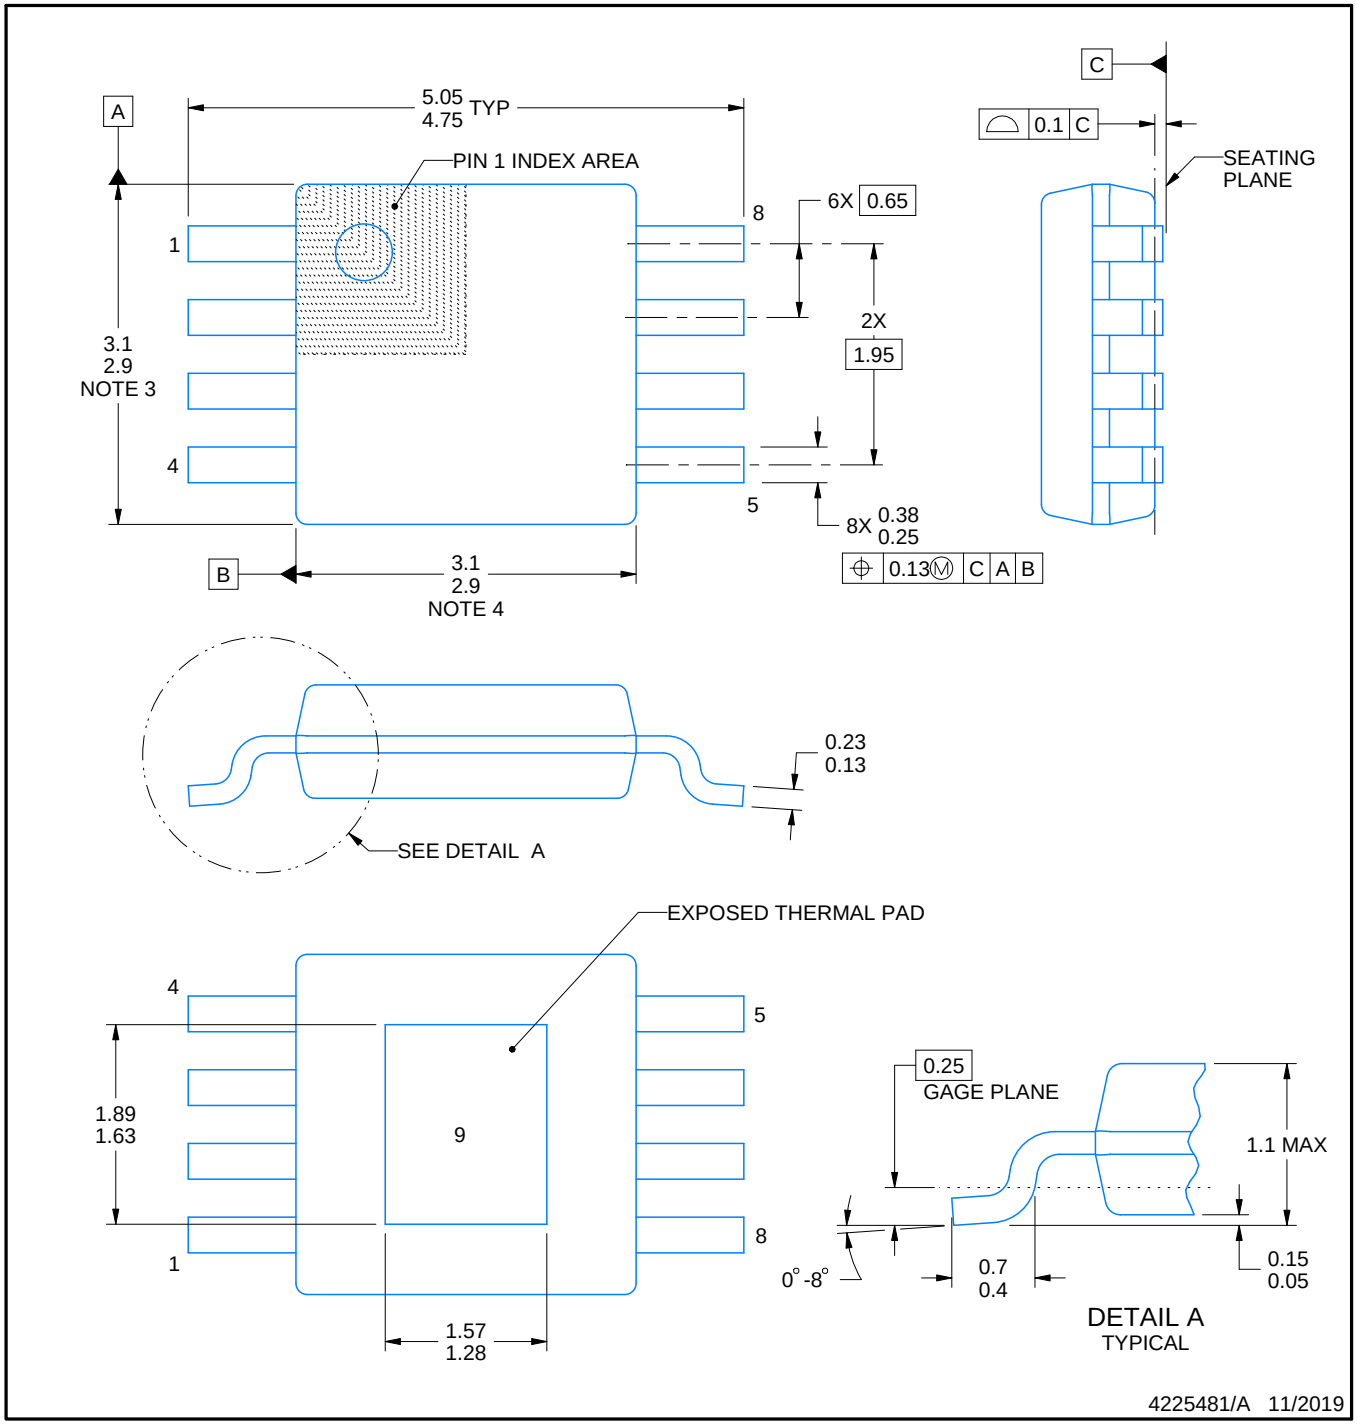
PACKAGE OUTLINE

DGN0008D



PowerPAD™ VSSOP - 1.1 mm max height

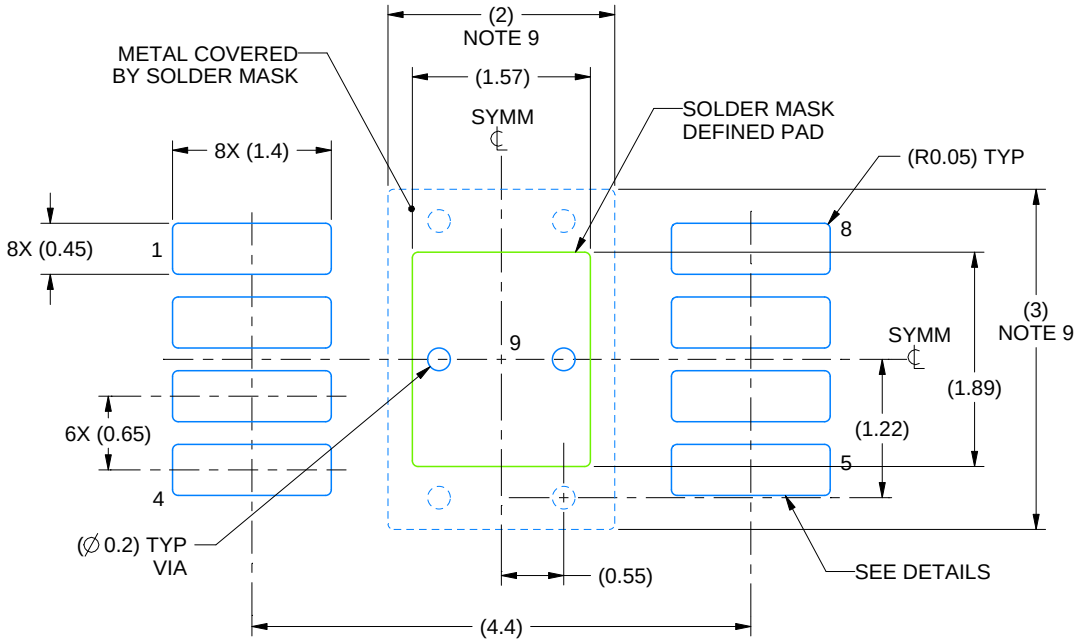
SMALL OUTLINE PACKAGE



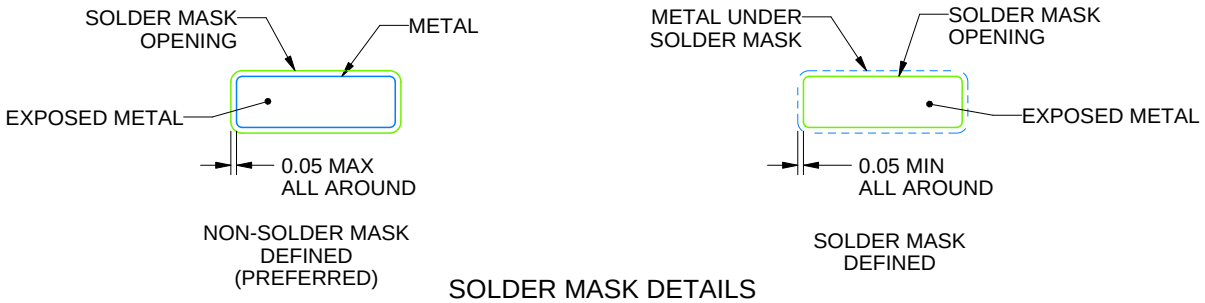
PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 15X

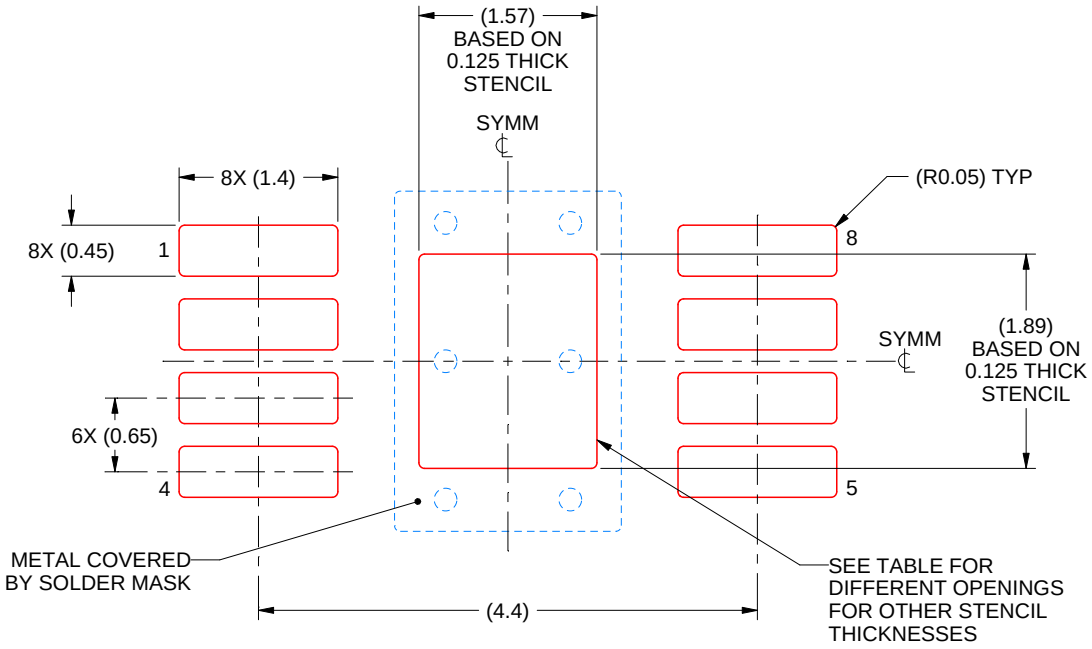


SOLDER MASK DETAILS

4225481/A 11/2019

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.



SOLDER PASTE EXAMPLE
EXPOSED PAD 9:
100% PRINTED SOLDER COVERAGE BY AREA
SCALE: 15X

STENCIL THICKNESS	SOLDER STENCIL OPENING
0.1	1.76 X 2.11
0.125	1.57 X 1.89 (SHOWN)
0.15	1.43 X 1.73
0.175	1.33 X 1.60

4225481/A 11/2019

NOTES: (continued)

10. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
11. Board assembly site may have different recommendations for stencil design.

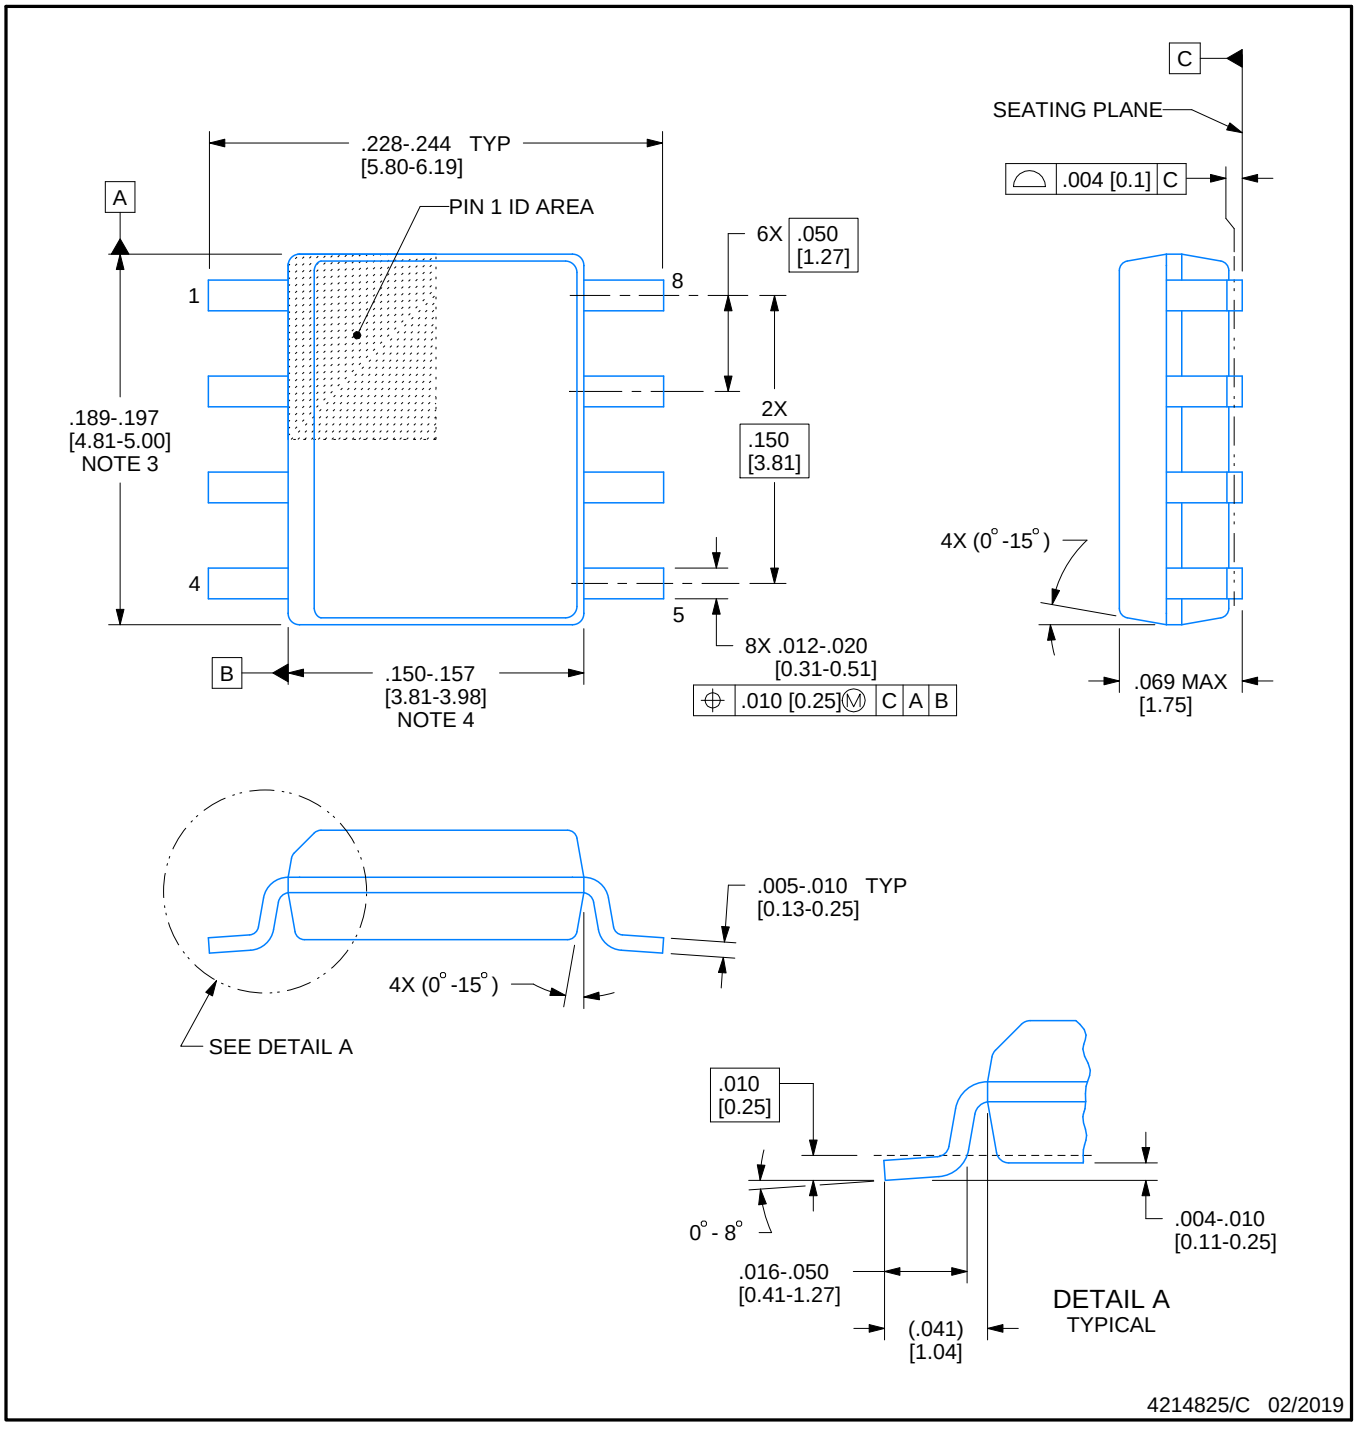
SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT



NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.
