

TL7700 Supply-Voltage Supervisor

1 Features

- Adjustable Sense Voltage With Two External Resistors
- 1.0% Sense Voltage Tolerance (25°C)
- Adjustable Hysteresis of Sense Voltage
- Wide Operating Supply-Voltage Range: 1.8 V to 40 V
- Wide Operating Temperature Range: –40°C to 85°C
- Low Power Consumption:
 $I_{CC} = 0.6 \text{ mA}$ Typical, $V_{CC} = 40 \text{ V}$

2 Applications

- Digital Signal Processors (DSPs)
- Microcontrollers (MCUs)
- FPGAs, ASICs
- Notebooks, Desktop Computers
- Set-Top Boxes
- Industrial Control Systems

3 Description

The TL7700 is a bipolar integrated circuit designed for use as a reset controller in microcomputer and microprocessor systems. The SENSE voltage can be set to any value greater than 0.5 V using two external resistors.

Circuit function is very stable, with supply voltage in the 1.8-V to 40-V range. Minimum supply current allows use with ac line operation, portable battery operation, and automotive applications. The TL7700 device is designed for operation from –40°C to 85°C.

5 Pin Configuration and Functions

NC – No internal connection

Pin Functions

NAME	PIN		I/O	DESCRIPTION
	PDIP, SO, TSSOP	VSSOP		
CT	1	3	I/O	Timing capacitor connection. This terminal sets the RESET output pulse duration (t_{po}). It is connected internally to a 15- μ A constant-current source. There is a limit on the switching speed of internal elements; even if CT is set to 0, response speeds remain at approximately 5 to 10 μ s. If CT is open, the device can be used as an adjustable-threshold noninverting comparator. If CT is low, the internal output-stage comparator is active, and the $\overline{\text{RESET}}$ output transistor is on. An external voltage must not be applied to this terminal due to the internal structure of the device. Therefore, drive the device using an open-collector transistor, FET, or 3-state buffer (in the low-level or high-impedance state).
GND	4	5	—	Ground Keep this terminal as low impedance as possible to reduce circuit noise.
NC	3, 6, 7	2, 6, 7	—	No internal connection
$\overline{\text{RESET}}$	8	1	O	Reset output This terminal can be connected directly to a system that resets in the active-low state. A pullup resistor usually is required because the output is an npn open-collector transistor. An additional transistor should be connected when the active-high reset or higher output current is required.
SENSE	2	4	I	Voltage sense This terminal has a threshold level of 500 mV. The sense voltage and hysteresis can be set at the same time when the two voltage-dividing resistors are connected. The reference voltage is temperature compensated to inhibit temperature drift in the threshold voltage within the operating temperature range.
V_{CC}	5	8	—	Power supply This terminal is used in an operating-voltage range of 1.8 V to 40 V.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{CC}	Supply voltage ⁽²⁾		41	V
V _s	Sense input voltage	-0.3	41	V
V _{OH}	Output voltage (off state)		41	V
I _{OL}	Output current (on state)		5	mA
T _J	Operating virtual-junction temperature		150	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the network ground terminal.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	500
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V _{CC}	Supply voltage	1.8	40	V
I _{OL}	Low-level output current		3	mA
T _A	Operating free-air temperature	-40	85	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾	TL7700				UNIT

8 Detailed Description

8.1 Overview

The TL7700 is a bipolar integrated circuit designed for use as a reset controller in microcomputer and microprocessor systems. The SENSE voltage can be set to any value greater than 0.5 V using two external resistors. The hysteresis value of the sense voltage also can be set by the same resistors. The device includes a precision voltage reference, fast comparator, timing generator, and output driver, so it can generate a power-on reset signal in a digital system.

The TL7700 has an internal 1.5-V temperature-compensated voltage reference from which all function blocks are supplied. Circuit function is very stable, with supply voltage in the 1.8-V to 40-V range. Minimum supply current allows use with ac line operation, portable battery operation, and automotive applications.

8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

A. $I_{CT} = 15 \mu\text{A}$ (Typ), $I_S = 2.5 \mu\text{A}$ (Typ)

8.3 Feature Description

8.3.1 Sense-Voltage Setting

The SENSE terminal input voltage, V_s , of the TL7700 typically is 500 mV. By using two external resistors, the circuit designer can obtain any sense voltage over 500 mV. In Figure 18, the sensing voltage, V_s' , is calculated as:

$$V_s' = V_s \times (R1 + R2)/R2$$

where

- $V_s = 500 \text{ mV typ at } T_A = 25^\circ\text{C}$ (1)

At room temperature, V_s has a variation of $500 \text{ mV} \pm 5 \text{ mV}$. In the basic circuit shown in Figure 18, variations of $[\pm 5 \pm (R1 + R2)/R2] \text{ mV}$ are superimposed on V_s .

Feature Description (continued)

Figure 18. Setting the Sense Voltage

8.3.2 Sense-Voltage Hysteresis Setting

If the sense voltage (V_s) does not have hysteresis in it, and the voltage on the sensing line contains ripples, the resetting of TL7700 is unstable. Hysteresis is added to the sense voltage to prevent such problems. As shown in Figure 19, the hysteresis (V_{hys}) is added, and the value is determined as:

$$V_{hys} = I_s \times R1$$

where

- $I_s = 2.5 \mu A$ typ at $T_A = 25^\circ C$ (2)

At room temperature, I_s has variations of $2.5 \mu A \pm 0.5 \mu A$. Therefore, in the circuit shown in Figure 18, V_{hys} has variations of $(\pm 0.5 \times R1) \mu V$. In circuit design, it is necessary to consider the voltage-dividing resistor tolerance and temperature coefficient in addition to variations in V_s and V_{hys} .

The sense voltage, $V_{s'}$, is different from the SENSE terminal input voltage, V_s . $V_{s'}$ normally is 500 mV for triggering.

Figure 19. V_{CC} -RESET Timing Chart

Feature Description (continued)

8.3.3 Output Pulse-Duration Setting

Constant-current charging starts on the timing capacitor when the sensing-line voltage reaches the TL7700 sense voltage. When the capacitor voltage exceeds the threshold level of the output drive comparator, $\overline{\text{RESET}}$ changes from a low to a high level. The output pulse duration is the time between the point when the sense-pin voltage exceeds the threshold level and the point when the $\overline{\text{RESET}}$ output changes from a low level to a high level. When the TL7700 is used for system power-on reset, the output pulse duration, t_{po} , must be set longer than the power rise time. The value of t_{po} is:

$$t_{po} = C_t \times 10^5 \text{ seconds}$$

where

- C_t is the timing capacitor in farads (3)

There is a limit on the device response speed. Even if $C_t = 0$, t_{po} is not 0, but approximately 5 μs to 10 μs . Therefore, when the TL7700 is used as a comparator with hysteresis without connecting C_t , switching speeds (t_r/t_f , t_{po}/t_{pd} , and so forth) must be considered.

8.4 Device Functional Modes

Figure 20 describes how the $\overline{\text{RESET}}$ output pin responds to a change in the voltage at the sense pin. When the sense pin drops below 500 mV, the $\overline{\text{RESET}}$ pin is pulled low.

The sense voltage, $V_{s'}$, is different from the SENSE terminal input voltage, V_s . $V_{s'}$ normally is 500 mV for triggering.

Figure 20. V_{CC} RESET Response and Timing

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TL7700 supply-voltage supervisor allows for any voltage greater than 500mV to be monitored. This flexibility allows it to be used in many applications from FPGAs and Microcontrollers to Industrial supply monitoring.

9.2 Typical Application

Figure 21 shows an application where the TL7700 device is being used to sense the voltage supply for a microcontroller that is supplied with 5 V. If the sense voltage drops below 4.5 V, the RESET pin is pulled LOW, signaling the microcontroller to reset.

Copyright © 2016, Texas Instruments Incorporated

Figure 21. 5-V Supply Voltage Supervision

9.2.1 Design Requirements

- When the TL7700 is used for system power-on reset, the output pulse duration, t_{po} , must be set longer than the power rise time. The value of t_{po} is: $t_{po} = C_t \times 10^5$ seconds
- The RESET output is an open-collector output, so a pullup resistor is required.

9.2.2 Detailed Design Procedure

The SENSE terminal input voltage, V_s , of the TL7700 typically is 500 mV. By using two external resistors, any sense voltage over 500 mV can be sensed.

Resistor R1 should be selected first to set the desired hysteresis. See [Sense-Voltage Hysteresis Setting](#) for detailed information on how to set the hysteresis.

Resistor R2 should then be selected based on the R1 value and the desired V_s voltage. In [Figure 18](#), the sensing voltage, $V_{s'}$, is calculated as: $V_{s'} = V_s \times (R1 + R2)/R2$

Typical Application (continued)

9.2.3 Application Curve

Figure 22. Sense Input Voltage vs Temperature

10 Power Supply Recommendations

The TL7700 device will operate within the supply range specified in *Recommended Operating Conditions*. The device risks permanent damage over the voltage specified in *Absolute Maximum Ratings*.

11 Layout

11.1 Layout Guidelines

Figure 23 shows an example layout for the TL7700 device. As the $\overline{\text{RESET}}$ pin is an open collector output, a pullup resistor is required to ensure the output is high when the output transistor is off.

11.2 Layout Example

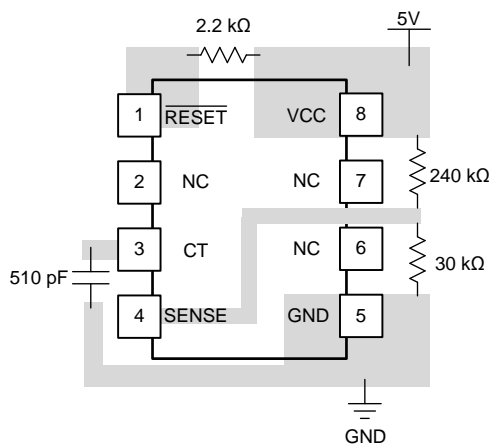

Figure 23. DGK Package Example Layout for 5 V Supply Supervision

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Community Resource

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.3 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. (1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

P (R-PDIP-T8)

PLASTIC DUAL-IN-LINE PACKAGE

4040082/E 04/2010

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. Falls within JEDEC MS-001 variation BA.

PW0008A

PACKAGE OUTLINE
TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153, variation AA.
