

# TMAG511x-Q1 2D, Dual-Channel, High-Sensitivity, Hall-Effect Latch

## 1 Features

- AEC-Q100 qualified with the following results:
  - Device temperature grade 1: –40°C to 125°C ambient operating temperature range
  - Device HBM ESD classification Level H3A
  - Device CDM ESD classification Level C6
- [Functional Safety-Capable](#)
  - [Documentation available to aid functional safety system design](#)
- 2D sensing with planar and vertical hall sensors
- Inherent quadrature independent of magnet alignment or magnet pole pitch
- Two functional options available:
  - TMAG5110-Q1: independent 2D outputs
  - TMAG5111-Q1: speed and direction outputs
- Ultra-high magnetic sensitivity:
  - TMAG511x2-Q1: ±1.4mT (typical)
  - TMAG511x4-Q1: ±3mT (typical)
- Fast 40kHz sensing bandwidth
- 2.5V to 38V operating  $V_{CC}$  range
- Open-drain output (10mA sink)
- Wide ambient operating temperature range:
  - –40°C to +125°C
- **Protection features**
  - Reverse supply protection (up to –20V)
  - Device survives up to 40V
  - Output short-circuit protection
  - Output current limitation

## 2 Applications

- Incremental rotary encoding
- Linear speed and direction control
  - [Roof](#) and [trunk](#) motor control
  - [Window](#) and [door](#) motor control
- Angular position detection
  - Knob control (radio and climate control)
  - [Electronic power steering](#)
  - Fluid measurement
- Angular speed and direction
  - [Electric pumps](#)
  - [Fans](#)
  - Wheel and motor speed

## 3 Description

The TMAG5110-Q1 and TMAG5111-Q1 are 2-dimensional, dual Hall-effect latches operating from a 2.5V to 38V power supply. Designed for high-speed and high-temperature motor applications, these devices are optimized for applications leveraging rotating magnets. Integrating two sensors and two separate signal chains the TMAG511x-Q1 offers two independent digital outputs giving speed and direction calculation (TMAG5111-Q1) or giving directly the digital output of each independent latches (TMAG5110-Q1). This high level of integration allows the use of a single TMAG511x-Q1 device instead of two separate latches.

The device is offered in a standard 3mT operating point, as well as a high-sensitivity 1.4mT operating point. The higher magnetic sensitivity provides flexibility in low-cost magnet selection and mechanical component placement. The TMAG511x-Q1 is also available in three 2-axis combination options (X-Y, Z-X, Z-Y) to allow flexible placement of the sensor relative to the magnet.

The device performs consistently across a wide ambient temperature range of –40°C to +125°C.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
TMAG5110-Q1	DBV (SOT-23, 5)	2.9mm × 2.8mm
TMAG5111-Q1		

- (1) For all available packages, see the package option addendum at the end of the data sheet.
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Power Supply Voltage	V <sub>CC</sub>	-20	40	V
	Voltage ramp rate (V <sub>CC</sub> < 5V)	Unlimited		V/μs
	Voltage ramp rate (V <sub>CC</sub> > 5V)	0	2	
Output Pin Voltage	V <sub>OUT1</sub> , V <sub>OUT2</sub>	GND – 0.5	40	V
Output pin reverse current during reverse supply condition		0	100	mA
Magnetic flux density, B <sub>MAX</sub>		Unlimited		T
Junction temperature, T <sub>J</sub>	Junction temperature, T <sub>J</sub>	-40	150	°C
Storage temperature, T <sub>stg</sub>		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup> HBM ESD Classification Level 2	±2000	V
		Charged device model (CDM), per AEC Q100-011 CDM ESD Classification Level C4A	± 500	V

- (1) AECQ 100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V <sub>CC</sub>	Power supply voltage	2.5	38	V
VO	Output pin voltage (OUT1, OUT2)	0	38	V
ISINK	Output pin current sink (OUT1, OUT2) <sup>(1)</sup>	0	10	mA
T <sub>A</sub>	Ambient temperature	-40	125	°C

- (1) Power dissipation and thermal limits must be observed

## 7 Detailed Description

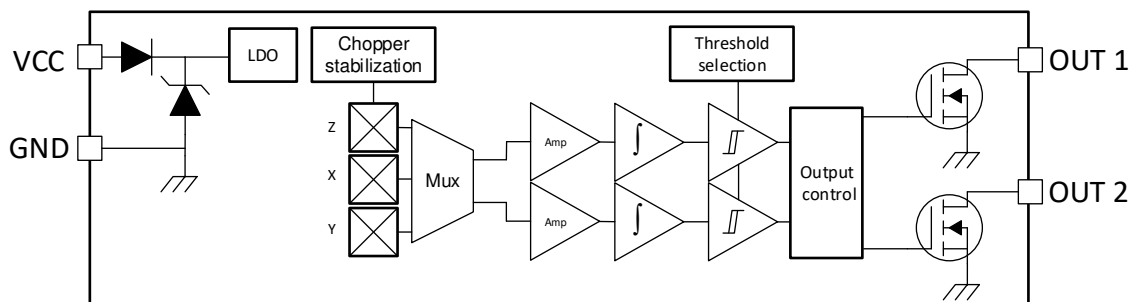

### 7.1 Overview

The TMAG5110-Q1 and TMAG5111-Q1 are dual chopper-stabilized Hall effect sensors with two digital latched outputs for rotational magnetic sensing applications. The TMAG511x-Q1 device can be powered with a supply voltage between 2.5 V and 38 V, and survives continuous  $-20$  V reverse-battery conditions. The TMAG511x-Q1 device only operates when a voltage of 2.5 V to 38 V applied to the  $V_{CC}$  pin (with respect to the GND pin). In addition, the device can withstand voltages up to 40 V for transient durations.

Alternating north and south magnetic poles are required to toggle the outputs of each Hall-effect latch.

The device is offered in a standard 3 mT typical operating point, as well as a high-sensitivity 1.4 mT typical operating point. The higher magnetic sensitivity provides flexibility in low-cost magnet selection and mechanical component placement. The TMAG511x-Q1 is also available in three 2-axis combination options (X-Y, Z-X, Z-Y) to support flexible multiple installation orientations relative to the magnet.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 2D Description

##### 7.3.1.1 2D General Description and Advantages

The best way to understand the advantage of a 2D dual latch hall sensor is to compare its behavior with others solutions used in the market. The two most common methods are: dual planar hall latch sensors or two single hall latch sensors. Those methods are used in applications such as rotary encoding or speed and direction sensing. The principle is to set two sensors apart at a certain angle such that they will sense the same magnetic field but with a fixed phase difference. The frequency of the signal will give the speed or incremental information while the phase will give the direction of rotation. For an easy read, the signals should be as close to a quadrature signal as possible, meaning there is a  $90^\circ$  phase shift between the two signals. To create those two signals in quadrature, the two latches must be placed at a distance of  $\frac{1}{2}$  pole + n pole from one another.

The TMAG511x-Q1 can be used instead of a dual planar hall latch or two single hall latch sensors. The TMAG511x-Q1 has two integrated hall latch sensors spaced at a  $90^\circ$  angle from each other, which allows each sensor to detect a quadrature component of the same magnetic field. For A, B, and C device variants, the magnetic direction detected will be XY, ZX, and ZY, respectively. Each of those components are placed at  $90^\circ$  from each other by design, therefore the output signals will also be separated with the same angle value. Wherever the sensor is placed to catch the right two components of the field, the output will be in quadrature from one another. [Figure 7-1](#) shows the result of two different type of sensors when the devices are placed close to a ring magnet.

Figure 7-1. Dual Planar Latch vs. 2D Dual Latch

### 7.3.1.2 2D Magnetic Sensor Response

The TMAG5110-Q1 has two integrated latches that update their results to the OUT1 and OUT2 pins. Each one of these outputs will then have a latch functionality. Figure 7-2 shows the response to different magnetic poles for each output.

The TMAG5111-Q1 outputs are not directly connected to the two integrated latches. Additional processing is available to generate the speed and direction outputs.

Figure 7-2. Latch Functionality

Figure 7-3 shows the magnetic response of both the TMAG5110-Q1 and TMAG5111-Q1 to a sinusoidal field. The sinusoidal curves represents the evaluation of the magnetic seen by both integrated hall sensors.

The TMAG5110-Q1 response shows both outputs reacting to this signal by going low once the field is higher than  $B_{OP}$  and going high when the field is lower than  $B_{RP}$ .

The TMAG5111-Q1 response shows how those two signals are processed to create a speed output and a direction output.

**Figure 7-3. TMAG511x-Q1 Output Behavior**

### 7.3.1.3 Axis Polarities

The Figure 7-4 shows the directions from where each axes are sensitive to a south pole. This also shows that the opposite directions are sensitive to the north pole.

Figure 7-4. Axis Polarities

### 7.3.2 Axis Options

#### 7.3.2.1 Device Placed In-Plane to Magnet

The outer edge of the magnet is the area where the magnetic field is the strongest. Placing the sensor on the outer edge of the magnet enables the sensor to get the best flexibility in terms of distance and sensitivity selection. The different figures below show how to use the different versions of the TMAG511x-Q1 in regards to the magnet and sensor placement.

The options shown in [Figure 7-5](#) and [Figure 7-6](#) composed of the X and Y axes enable the sensor to be placed in the same plane as the ring magnet. The sensor can be placed facing the magnet or on the side of the magnet. The part can also be turned at 180 degrees along the Z axis.

Figure 7-5. XY Outer Edge 1

Figure 7-6. XY Outer Edge 2

The options shown in [Figure 7-7](#) and [Figure 7-8](#) composed of Z and X axes enable the sensor to be placed below the magnet, or facing the magnet with the front side of the device. The part can also be turned at 180 degrees along the Z axis.

Figure 7-7. ZX Outer Edge 1

Figure 7-8. ZX Outer Edge 2

The options shown in [Figure 7-9](#) and [Figure 7-10](#) composed of Z and Y axes also enable the sensor to be placed below the magnet in a different position, as well as facing the ring magnet with the side of the device. The part can also be turned at 180 degrees along the Z axis.

Figure 7-9. ZY Outer Edge 1

Figure 7-10. ZY Outer Edge 1

### 7.3.2.2 Device Placed on the Side Edge of the Magnet

The side edge of the magnet still provides a magnetic field, but the field is much weaker than the field on the outer edge. Placing the sensor on the side edge minimizes the flexibility as of how far the device can be placed from the ring magnet. The 2 mT version enables high sensitivity, allowing the application to work as well as when the device is placed on the outer edge. Nevertheless this option can be helpful in application where the sensor has to fit within the magnet diameter.

The options shown in [Figure 7-11](#) and [Figure 7-12](#) composed of X and Y axes enable the sensor to be placed facing the side edge of the magnet. The side of the sensor can also be placed next to the side edge of the magnet. The part can also be turned at 180 degrees along the Z axis.

**Figure 7-11. XY Side Edge 1**

**Figure 7-12. XY Side Edge 2**

The options shown in [Figure 7-13](#) and [Figure 7-14](#) composed of Z and X axis enable another way to place the sensor facing the side edge of the magnet. The top of the sensor can also be placed facing the side edge of the magnet. The part can also be turned at 180 degrees along the Z axis.

**Figure 7-13. ZX Side Edge 1**

**Figure 7-14. ZX Side Edge 2**

The options shown in [Figure 7-15](#) and [Figure 7-16](#) composed of Z and Y axes enable the placement of the sensor on the side edge of a magnet with the pins facing the magnet, or with top of the sensor facing the side edge of the magnet. The part can also be turned at 180 degrees along the Z axis.

**Figure 7-15. ZY Side Edge 1**

**Figure 7-16. ZY Side Edge 1**

### 7.3.3 Power-On Time

Figure 7-17 shows the behavior of the device after the  $V_{CC}$  voltage is applied and when the field is below the  $B_{OP}$  threshold. When the minimum value for  $V_{CC}$  is reached, the TMAG5110-Q1 takes time  $t_{ON}$  to power up and then time  $t_{PD}$  to update the output to a level High.

Figure 7-18 shows the behavior of the device after the  $V_{CC}$  voltage is applied and when the field is above the  $B_{OP}$  threshold. When the minimum value for  $V_{CC}$  is reached, the TMAG5110-Q1 takes time  $t_{ON}$  to power up and then time  $t_{PD}$  to update the output to a level High.

For the TMAG5111-Q1, the power-on behavior is similar, but OUT1 updates to Low during the  $t_{PD}$  time. OUT2 updates to High during the  $t_{PD}$  time. The output value following the power-on sequence then depends on the magnet placement, the sense of rotation, and the device variant.

**Figure 7-17. Power-On Time When  $B < B_{OP}$**

**Figure 7-18. Power-On Time When  $B > B_{OP}$**

TMAG5110-Q1 devices with the R pinout version have a Low output state during the  $t_{PD}$  time. The output stays Low if the field sensed at power-on is between  $B_{OP}$  and  $B_{RP}$ , until  $B_{RP}$  is crossed. This behavior for the TMAG5110-Q1 R pinout versions can be seen in Figure 7-19 and Figure 7-20.

**Figure 7-19. Power-On Time When  $B < B_{OP}$  (R Pinout Version)**

**Figure 7-20. Power-On Time When  $B > B_{OP}$  (R Pinout Version)**

### 7.3.4 Propagation Delay

The TMAG511x-Q1 samples the Hall element at a nominal sampling interval of  $t_{PD}$  to detect the presence of a magnetic south pole. Between each sampling interval, the device calculates the average magnetic field applied to the device. As defined in Figure 7-22, if this average value crosses the  $B_{OP}$  or  $B_{RP}$  threshold, the device changes the corresponding level. Because the system, Hall sensor + magnet is by nature asynchronous, the propagation delay  $t_d$  will vary depending on when the magnetic field goes above the  $B_{OP}$  value. As shown in Figure 7-21 the output delay will then depend on when the magnetic field will get higher than the  $B_{OP}$  value. The first graph shows the typical case.

The magnetic field goes above the  $B_{OP}$  value at the moment where the output is updated. The part will then only need one cycle of  $t_{PD}$  to update the output. The second graph shows a magnetic field going above the  $B_{OP}$  value just right before half of the sampling period. This is the best case possible where the output will be updated in just half of the sampling period. Finally, the third graph shows the worst possible case where the magnetic field goes above the  $B_{OP}$  value just after half of the sampling period. At the next output update, the value will still see a value under the threshold and will need a whole new period to update the output

**Figure 7-21. Field Sampling Timing**

Figure 7-22 shows TMAG511x-Q1 propagation delay analysis when a magnetic south pole is applied. The Hall element of the TMAG511x-Q1 experiences an increasing magnetic field as a magnetic south pole approaches near the device as well as a decreasing magnetic field as a magnetic south pole leaves away. At time  $t_1$  the magnetic field goes above the  $B_{OP}$  threshold. The output will then start to move after the time  $t_{PD}$ . As shown in Figure 7-22, this time will vary depending on when the sampling period is. At  $t_2$  the output start pulling to the low voltage value. At  $t_3$  the output is completely pulled down to the lower voltage value. The same process happen on the other way when the magnetic value is going under the  $B_{OP}$  threshold.

**Figure 7-22. Propagation Delay**

### 7.3.5 Hall Element Location

The sensing element inside the device is in the center when viewed from the top. Figure 7-23 shows the exact position of the sensors in regard of the package.

Figure 7-23. Hall Element Location

### 7.3.6 Power Derating

The device is specified from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  for a voltage rating of 2.5 V to 38 V. Because the part is draining at its maximum a current of 17 mA the maximum voltage that can be applied will depend on what is the maximum ambient temperature acceptable for the application. The curve in Figure 7-24 shows the maximum acceptable power supply voltage versus the maximum acceptable ambient temperature.

The [Figure 7-24](#) can also be calculated using the following formulas:

$$T_J = T_A + \Delta T \tag{1}$$

where

- $T_J$  is the junction temperature
- $T_A$  is the ambient temperature
- $\Delta T$  is the difference between the junction temperature and the ambient temperature

$$\Delta T = P_D \times R_{\theta JA} \tag{2}$$

where

- $P_D$  is the power dissipated by the part
- $R_{\theta JA}$  is the junction to ambient thermal resistance

$$P_D = V_{CC} \times I_{CC} \tag{3}$$

where

- $V_{CC}$  is the voltage supply of the device
- $I_{CC}$  is the current consumption of the device

Combining the three equations above gives [Equation 4](#) below:

$$V_{CC \max} = \frac{T_{J \max} - T_A}{I_{CC \max} \times R_{\theta JA}} \tag{4}$$

This equation gives the maximum voltage the part can handle in regards of the ambient temperature.

For example, with an the application required to work within a ambient temperature of maximum 85°C, and  $T_{Jmax}$ ,  $R_{\theta JA}$  and  $I_{CCmax}$  are defined in the data sheet, the maximum voltage allowed for this application is determined in [Equation](#):

$$V_{CC \max} = \frac{170^\circ\text{C} - 140^\circ\text{C}}{6.5 \text{ mA} \times 166.5^\circ\text{C} / \text{W}} = 27.72 \text{ V}$$

**Figure 7-24. Power Derating Curve**

## 7.4 Device Functional Modes

The TMAG511x-Q1 device has one mode of operation that applies when the *Recommended Operating Conditions* are met.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

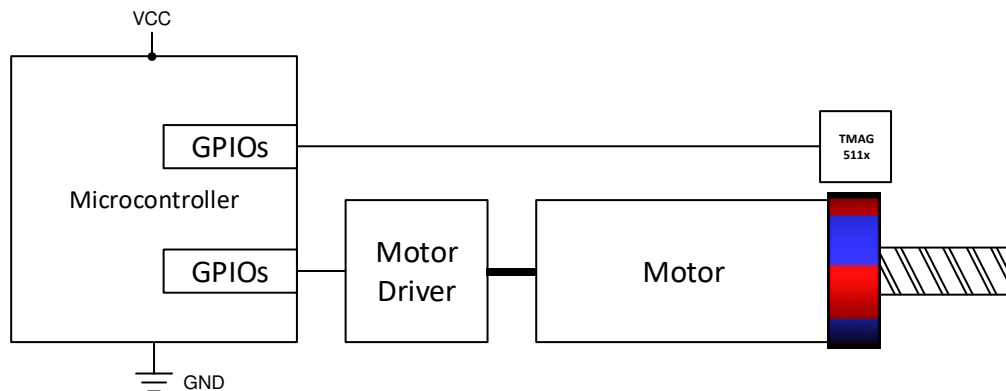

### 8.1 Application Information

The TMAG511x-Q1 is designed for rotary applications for DC motor sensors or incremental rotary encoding.

For reliable functionality, the magnet must apply a flux density at the sensor greater than the corresponding maximum  $B_{OP}$  or  $B_{RP}$  numbers specified in the [Magnetic Characteristics](#) table. Add additional margin to account for mechanical tolerance, temperature effects, and magnet variation. Magnets generally produce weaker fields as temperature increases.

### 8.2 Typical Applications

#### 8.2.1 Incremental Rotary Encoding Application

**Figure 8-1. Incremental Encoding**

#### 8.2.1.1 Design Requirements

[Table 8-1](#) lists the use the parameters for this design.

**Table 8-1. Design Parameters**

DESIGN PARAMETER	EXAMPLE VALUE
Motor speed	22.5 kRPM
Number of magnet poles	8
Dimensions	9.7 mm diameter × 2 mm thick
Magnetic material	Ceramic 8D
Air gap above the Hall sensors	2.5 mm
Radial magnetic flux density peak	±12.5 mT
Tangential magnetic flux density peak	±9.5 mT

### 8.2.1.2 Detailed Design Procedure

Incremental encoders are used on knobs, wheels, motors, and flow meters to measure relative rotary movement. By attaching a ring magnet to the rotating component and placing the TMAG511x-Q1 nearby, the sensor will generate voltage pulses as the magnet turns. The TMAG511x-Q1 integrates two sensors and two signal chains. This means each channel can go up to the maximum speed independently from each other.

When the magnet rotates, the TMAG5110-Q1 will generate alternate pulses on each output. One input will be the result of what is sensed from one specific axis, while the other output will sense from another specific axis. In [Table 8-1](#), this is also referred as Radial and Tangential magnetic flux. Those two signals are the result of two different components of the same magnetic field resulting in the two signals being 90° from one another. Also called quadrature output, this type of signal is ideal to measure a rotational count as well as a change in direction of the ring magnet.

The TMAG5111-Q1 directly generates the speed and direction outputs. This eliminates the need for external processing.

The maximum rotational speed that can be measured is limited by the sensor bandwidth and the magnetic strength of the magnet.

Generally, the bandwidth must be faster than two times the number of poles per second. In this design example, the maximum speed is 22500 RPM, which involves a rotation of 3000 poles per second when using an 8-pole magnet. The TMAG511x-Q1 sensing bandwidth is typically 40 kHz, which is more than thirteen times the pole frequency.

The strength of the magnet also has an impact on how fast the magnet can turn. A weaker magnet with a maximum strength very close to the threshold value will limit the maximum speed by limiting the amount of time where this field will be higher than the  $B_{OP}$ . The time spent above the  $B_{OP}$  value will be longer for a magnet with stronger field.

When the magnet strength is significantly higher than  $B_{OP}$ , [Equation 5](#) can be used to calculate the allowed speed.

$$\text{Speed (RPM)} \leq \frac{\text{Bandwidth (Hz)} \times 60}{\text{Number of poles}} \tag{5}$$

### 8.2.1.3 Application Curve

**Figure 8-2. TMAG5110-Q1 Output Response**

**Figure 8-3. TMAG5111-Q1 Output Response**

### 8.3 Power Supply Recommendations

The TMAG511x-Q1 is powered by 2.5-V to 38-V DC power supplies. A decoupling capacitor placed close to the device must be used to provide local energy with minimal inductance. TI recommends using a ceramic capacitor with a value of at least 0.01  $\mu\text{F}$ .

### 8.4 Layout

#### 8.4.1 Layout Guidelines

Magnetic fields pass through most non-ferromagnetic materials with no significant disturbance. Embedding Hall effect sensors within plastic or aluminum enclosures and sensing magnets on the outside is common practice. Magnetic fields also easily pass through most printed-circuit boards (PCBs), which makes placing the magnet on the opposite side of the PCB possible.

#### 8.4.2 Layout Example

Figure 8-5. Layout Example (Pinout Version: R)

## 9 Device and Documentation Support

### 9.1 Device Support

#### 9.1.1 Device Nomenclature

Figure 9-1 shows a legend for reading the complete orderable part numbers.

Figure 9-1. Device Nomenclature

### 9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
 All trademarks are the property of their respective owners.

### 9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision B (June 2022) to Revision C (December 2024)</b>	<b>Page</b>
• Added Functional Safety information to the data sheet.....	1
• Added preview SOT-23 Version R pinout to the data sheet.....	4
• Changed production data SOT-23 pinout name to SOT-23 Version A.....	4
• Added the <i>Device Nomenclature</i> section.....	36

<b>Changes from Revision A (September 2021) to Revision B (June 2022)</b>	<b>Page</b>
• Changed <i>Layout Example</i> .....	35

<b>Changes from Revision * (July 2021) to Revision A (September 2021)</b>	<b>Page</b>
• Removed the preview notes from the <i>Device Comparison</i> table.....	3
• Added operating supply current for the TMAG511xx4-Q1.....	6
• Added graphs to the <i>Typical Characteristics</i> section.....	7

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**DBV0005A-C01**

**PACKAGE OUTLINE**  
**SOT-23 - 1.25 mm max height**

SMALL OUTLINE TRANSISTOR

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.

**EXAMPLE BOARD LAYOUT**

**DBV0005A-C01**

**SOT-23 - 1.25 mm max height**

SMALL OUTLINE TRANSISTOR

NOTES: (continued)

- 5. Publication IPC-7351 may have alternate designs.
- 6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

## EXAMPLE STENCIL DESIGN

**DBV0005A-C01**

**SOT-23 - 1.25 mm max height**

SMALL OUTLINE TRANSISTOR

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- (3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties.
