

# TMP139 0.5°C Accuracy, JEDEC DDR5 Grade B, Digital Temperature Sensor With I<sup>2</sup>C and I3C Interface

## 1 Features

- Supports JEDEC JESD302-1 DDR5 Grade B temperature sensor
- Exceeds JEDEC temperature accuracy specification:
  - $\pm 0.25^{\circ}\text{C}$  typical
  - $\pm 0.5^{\circ}\text{C}$  maximum ( $+75^{\circ}\text{C}$  to  $+95^{\circ}\text{C}$ )
  - $\pm 0.75^{\circ}\text{C}$  maximum ( $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ )
- Operating temperature range:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Low power consumption:
  - 8.3- $\mu\text{A}$  typical average quiescent current
  - 4.0- $\mu\text{A}$  typical standby current
- I/O power supply of 1 V
- Core power supply of 1.8 V
- Two wire serial bus interface (I<sup>2</sup>C and I3C basic operation modes)
- Up to 12.5-MHz data transfer rate in I3C basic mode
- In Band Interrupt (IBI) for alerting host
- Parity error check function for host writes
- Packet error check function for host read and writes
- 11-bit resolution:  $0.25^{\circ}\text{C}$  (1 LSB)
- Standard 6-ball DSBGA (WCSP) package with 0.5-mm pitch

## 2 Applications

- DDR5 DIMM modules
- Server
- Laptops
- Workstations
- SSDs

## 3 Description

The TMP139 is a high-accuracy temperature sensor with an I<sup>2</sup>C / I3C compliant digital interface supporting In Band Interrupts (IBI). Supporting the interface requirements of JEDEC JESD302-1 for Grade-B devices, the TMP139 exceeds the temperature accuracy requirements of the specification, enabling higher performance DDR5 memory modules. Available in a compact 6-ball DSBGA package, TMP139 is designed for high-speed, high-accuracy and low-power thermal monitoring applications.

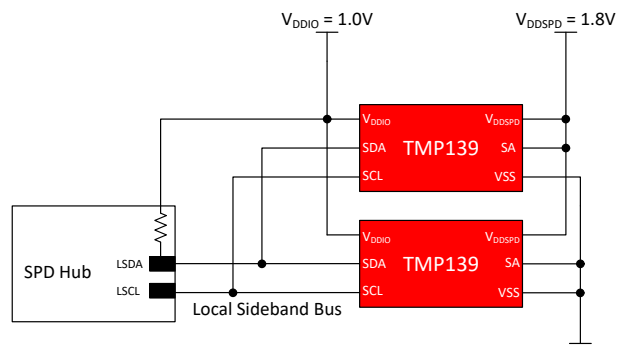

The TMP139 has a typical accuracy of  $\pm 0.25^{\circ}\text{C}$  over the entire temperature range from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  and offers an on-chip 11-bit analog-to-digital converter (ADC) providing a temperature resolution of  $0.25^{\circ}\text{C}$ .

The TMP139 is designed to operate from a core power supply of 1.8 V and I/O power supply of 1 V, with a low typical average quiescent current of 8.3  $\mu\text{A}$  when performing conversions every 125 ms.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	BODY SIZE (NOM)
TMP139	DSBGA (6)	1.328 mm × 0.828 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

### Changes from Revision B (November 2022) to Revision C (May 2023) Page

- Changed the reset value of MR2 register from 04h to 06h..... 35
- Changed the reset value for the MR2 DEV\_REV\_MINOR[2:0] bit from 010 to 011..... 35

### Changes from Revision A (February 2022) to Revision B (November 2022) Page

- Changed *Device Information* table to *Package Information* ..... 1
- Updated typical  $I_Q$  from 4.7  $\mu\text{A}$  to 8.3  $\mu\text{A}$ ..... 5
- Updated max  $I_Q$  from 10  $\mu\text{A}$  to 12.4  $\mu\text{A}$  ..... 5
- Updated test condition for  $I_{\text{DDR}}$  and typical current..... 5
- Updated test condition for  $I_{\text{DDW}}$  and typical current..... 5
- Updated typical active current from 92  $\mu\text{A}$  to 99  $\mu\text{A}$  ..... 5
- Updated typical standby current from 0.6  $\mu\text{A}$  to 4  $\mu\text{A}$ ..... 5
- Updated max standby current from 4  $\mu\text{A}$  to 6.5  $\mu\text{A}$  ..... 5
- Updated  $t_{\text{SUSTA}}$  in I3C mode from 19.2 ns to 12 ns to match JESD302-1..... 6
- Updated  $t_{\text{HDSTA}}$  in I3C mode from 38.4 ns to 30 ns to match JESD302-1..... 6
- Updated  $t_{\text{SUSTO}}$  in I3C mode from 19.2 ns to 12 ns to match JESD302-1..... 6
- Changed [Figure 6-8](#) through [Figure 6-12](#) ..... 8
- Moved the *Power Supply Recommendations* and *Layout* sections to the *Application and Implementation* section..... 48

### Changes from Revision \* (December 2020) to Revision A (February 2022) Page

- Changed the reset value of MR2 register from 02h to 04h..... 35
- Changed the DEF\_ADDR\_POINT\_EN bit description..... 35
- Changed the address in the MR7 register description..... 35

## 5 Pin Configuration and Functions

**Figure 5-1. YAH Package 6-Pin DSBGA Top View**

**Table 5-1. Pin Functions**

PIN		I/O	DESCRIPTION
NAME	BALL		
SA	B2	I	Address select. Connected to $V_{DDSPD}$ or GND
SCL	A1	I	Serial clock
SDA	B1	I/O	Serial data input and output. Pin may be open drain or push-pull in I <sup>2</sup> C mode and open drain in I <sup>2</sup> C mode
$V_{DDIO}$	A2	I	Supply voltage for sensor I/Os
$V_{DDSPD}$	C2	I	Supply voltage for sensor core
VSS	C1	—	Ground

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Power supply, $V_{DDIO}$	-0.5	2.1	V
Power supply, $V_{DDSPD}$	-0.5	2.1	V
Input voltage SA	-0.5	2.1	V
Input voltage SCL, SDA	-0.5	$V_{DDIO} + 0.3$	V
Output sink current SDA		±15	mA
Junction temperature, $T_J$	-55	150	°C
Storage temperature, $T_{stg}$	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage	$V_{DDIO}$	0.95	1.0	1.05	V
	$V_{DDSPD}$	1.7	1.8	1.98	V
I/O Voltage	SA	0	$V_{DDSPD} + 0.3$		V
	SCL, SDA	0	$V_{DDIO} + 0.3$		V
Operating free-air temperature, $T_A$		-40		125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TMP139	UNIT
		YAH (WCSP)	
		6 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	116.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	1.0	°C/W
$R_{\theta JC(bottom)}$	Junction-to-case (bottom) thermal resistance	NA	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	33.6	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	0.4	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	33.6	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

at  $T_A = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $V_{\text{DDIO}} = 0.95\text{ V}$  to  $1.05\text{ V}$  and  $V_{\text{DDSPD}} = 1.7\text{ V}$  to  $1.98\text{ V}$  (unless noted); typical specification are at  $T_A = 25^{\circ}\text{C}$ ,  $V_{\text{DDIO}} = 1\text{ V}$  and  $V_{\text{DDSPD}} = 1.8\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>TEMPERATURE INPUT</b>						
$T_{\text{ERR}}$	Temperature Accuracy	+75°C to +95°C		±0.25	±0.5	°C
		-40°C to +125°C		±0.25	±0.75	°C
$T_{\text{RES}}$	Resolution	1 LSB (11-bit)		0.25		°C
$T_{\text{REPEAT}}$	Repeatability <sup>(1)</sup>			1		LSB
$t_{\text{ACT}}$	Active conversion time			5.5		ms
$t_{\text{CONV}}$	Conversion interval			125		ms
$T_{\text{HYST}}$	Temperature Hysteresis		1			°C
<b>DIGITAL INPUT/OUTPUT</b>						
$C_{\text{IN}}$	Input capacitance <sup>(2)</sup>	Input capacitance (SCL and SDA)			4	pF
$R_{\text{ON}}$	Output pullup and pulldown driver impedance	SDA pin	20		100	Ω
$I_{\text{LI}}$	Leakage input current		-1	0	1	μA
$I_{\text{LO}}$	Leakage output current		-1	0	1	μA
$V_{\text{IL}}$	Low-level input logic		-0.3		0.3	V
$V_{\text{IH}}$	High-level input logic		0.7		1.35	V
$V_{\text{HYS}}$	Input voltage hysteresis	SCL and SDA pins	60	100		mV
$V_{\text{OL}}$	Low-level output logic	SDA pin, $I_{\text{OL}} = -3\text{ mA}$	0		0.3	V
$V_{\text{OH}}$	High-level output logic	SDA pin, $I_{\text{OH}} = 3\text{ mA}$	0.75			V
$\text{SLEW\_RATE}$	Output slew rate <sup>(2)</sup>	SDA pin	0.1		1.0	V/ns
<b>POWER SUPPLY</b>						
$I_{\text{Q}}$	Average current (serial bus inactive)	125-ms conversion interval		8.3	12.4	μA
$I_{\text{DDR}}$	Average current (read operation)	125-ms conversion interval, read temperature register, $f_{\text{SCL}} = 12.5\text{ MHz}$		8.3		μA
$I_{\text{DDW}}$	Average current (write operation)	125-ms conversion interval, write alert register, $f_{\text{SCL}} = 12.5\text{ MHz}$		8.3		μA
$I_{\text{ACT}}$	Active current	During 5.5-ms active conversion		99	140	μA
$I_{\text{DD1}}$	Standby current	Between active conversion during continuous conversion		4	6.5	μA
$V_{\text{PON}}$	Power-on reset threshold	Monotonic rise between $V_{\text{PON}}$ and $V_{\text{DDSPD(MIN)}}$	1.6			V
$V_{\text{POFF}}$	Power-off reset threshold for warm power on cycle	No ringback above $V_{\text{POFF}}$			0.3	V
$t_{\text{INIT}}$	Initialization time after Power-on reset <sup>(2)</sup>	<a href="#">Figure 7-2</a>			10.0	ms
$t_{\text{POFF}}$	Warm power cycle off time <sup>(2)</sup>	<a href="#">Figure 7-3</a>	1.0			ms
$t_{\text{SENSE\_SA}}$	Time from valid $V_{\text{DDSPD}}$ supply to sense SA pin for LID code assignment <sup>(2)</sup>	<a href="#">Figure 7-2</a>			5.0	ms
$t_{\text{RST}}$	Device reinitialization time <sup>(2) (3)</sup>				40	μs

- (1) Repeatability is the ability to reproduce a reading when the measured temperature is applied consecutively, under the same conditions.  
(2) Parameter is specified by design  
(3) Parameter is specified for RSTDAA Common Command Code

## 6.6 Timing Requirements

minimum and maximum specifications are over  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  and  $V_{\text{DDIO}} = 0.95\text{ V}$  to  $1.05\text{ V}$  (unless otherwise noted)<sup>(1)</sup>

		I <sup>2</sup> C MODE - OPEN DRAIN		I <sup>3</sup> C MODE - PUSH PULL <sup>(1)</sup>		UNIT
		MIN	MAX	MIN	MAX	
f <sub>SCL</sub>	SCL operating frequency	0.01	1	0.001	12.5	MHz
t <sub>HIGH</sub>	Clock pulse width high time (Figure 6-1)	260		35		ns
t <sub>LOW</sub>	Clock pulse width low time (Figure 6-1)	500		35		ns
t <sub>TIMEOUT</sub>	Detect clock low timeout (Figure 7-4)	10	50	10	50	ms

## 7 Detailed Description

### 7.1 Overview

The TMP139 is a high-accuracy temperature sensor that supports a power-up sequence, power-down and device reset, parity and packet error check functions, In Band Interrupts (IBI), and common command codes (CCC).

### 7.2 Functional Block Diagram

**Figure 7-1. TMP139 Functional Block Diagram**

### 7.3 Feature Description

#### 7.3.1 Power-Up Sequence

The TMP139 has two supply pins:  $V_{DDSPD}$  which is the core supply, and  $V_{DDIO}$  which is the IO supply. To ensure that the device starts up correctly, the application must power up  $V_{DDSPD}$  first followed by  $V_{DDIO}$ . Additionally, the power-on reset (POR) circuit is implemented to prevent improper operation in case of an incorrect power-up sequence.

As shown in [Figure 7-2](#), the  $V_{DDSPD}$  supply is applied first and must rise monotonically between  $V_{PON(min)}$  and  $V_{DDSPD(min)}$  without ring back. The  $V_{DDIO}$  supply must ramp up next and must reach the correct level before any operation can be performed.

**Figure 7-2. Power-Up Sequence**

When the  $V_{DDSPD}$  and  $V_{DDIO}$  supply have ramped up above the minimum threshold values, the TMP139 performs the following steps:

1. Within the time  $t_{SENSE\_SA}$ , the device samples the SA pin to configure the LID code which forms part of the device address.

2. Within time  $t_{NIT}$ , enables the interface to accept the command from the host.

The device always powers up in the I<sup>2</sup>C mode of operation.

### 7.3.2 Power-Down and Device Reset

When the  $V_{DDSPD}$  supply decreases, the device operation is not ensured below  $V_{DDSPD(min)}$  level. To ensure that the device operates correctly, the application must ensure that the  $V_{DDIO}$  and  $V_{DDSPD}$  must remain below  $V_{POFF}$  for  $T_{POFF}$  as shown in Figure 7-3. Once the condition is met, the device shall be reset properly and the power-up sequence will initialize the device correctly.

Figure 7-3. Power-Down and Reset Sequence

### 7.3.3 Temperature Result and Limits

All temperature result and limit registers are eleven bit values stored in two consecutive registers. The low byte register comes first followed by the high byte register as shown in Table 7-1 for the register map. The data is represented as a 11-bit signed number with the most significant bit for the temperature format being the signed bit. Each of the temperature value bits is assigned a weight which can be used to compute the temperature value. All unused bits read as 0 and any attempt to write a unused bit shall have no effect. The resolution of the temperature result and limit registers is always 0.25°C and the values can range from -255.75°C to +255.75°C, even though the recommended operating range is from -40°C to +125°C.

Table 7-1. Temperature Register Format

REGISTER BYTE	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Low Byte	8	4	2	1	0.5	0.25	RSVD = 0	RSVD = 0
High Byte	RSVD = 0	RSVD = 0	RSVD = 0	Sign	128	64	32	16

The Table 7-2 shows examples of the temperature register read and its corresponding conversion in°C.

Table 7-2. Temperature Register Examples

TEMPERATURE (°C)	HIGH BYTE	LOW BYTE
+255.75	0000 1111	1111 1100
+125	0000 0111	1101 0000
+95	0000 0101	1111 0000
+85	0000 0101	0101 0000
+75	0000 0100	1011 0000
+1	0000 0000	0001 0000
+0.25	0000 0000	0000 0100
0	0000 0000	0000 0000
-0.25	0001 1111	1111 1100
-1	0001 1111	1111 0000
-25	0001 1110	0111 0000
-40	0001 1101	1000 0000
-255.75	0001 0000	0000 0000

### 7.3.4 Bus Reset

The bus reset mechanism is supported by the TMP139, to prevent a device from locking up the serial bus. The devices on the bus do not drive the SCL, therefore the bus reset mechanism uses the timeout scheme on the SCL as shown in Figure 7-4. When the SCL is held low by the host controller for a time which is greater than  $T_{\text{TIMEOUT(max)}}$ , TMP139 shall be reset and take the following action:

- Interface is reset, and as the bus reset is considered a Stop condition, any pending internal transaction is also cleared.
- The TMP139 returns to I<sup>2</sup>C mode of operation, and resets the following registers:
  - MR7 register, DEV\_HID\_CODE[2:0] is set to 3'b111.
  - MR18 register, PEC\_EN, PAR\_DIS and INF\_SEL are set to 1'b0.
  - MR27 register, IBI\_ERROR\_EN is set to 1'b0.
  - MR52 register, PEC\_ERROR\_STATUS and PAR\_ERROR\_STATUS are set to 1'b0.
- TMP139 does not resample the SA pin.
- TMP139 floats the SDA pin so that the bus controller can pull up the line.

**Figure 7-4. I<sup>2</sup>C or I3C Basic Bus Reset**

### 7.3.5 Interrupt Generation

The TMP139 does not have a dedicated interrupt or alert pin, but instead supports interrupt generation using In Band Interrupts (IBI) on the SDA pin. Interrupt generation using IBI is only supported during I3C mode of operation. Hence the application must ensure that the device is first programmed to work in I3C mode before it enables the IBI. As there are multiple devices on the I3C basic bus—each capable of generating an IBI—an arbitration process is required.

The TMP139 generates an IBI only when it sees the bus in idle state for  $t_{\text{AVAL}}$ . Once this condition is met, the device pulls the SDA line low by  $t_{\text{IBI\_ISSUE}}$  to indicate to the host that it has an IBI. The host shall start by driving the SCL low, which creates the Start bus condition. At this point the device shall send its device address on the bus with the R/W bit set.

There can be a condition when the host starts a new bus transaction at the same time as the TMP139 is generating an IBI. In such a case, the TMP139 shall arbitrate along with the host in the device address byte.

### 7.3.6 Parity Error Check

The parity error check implemented by the TMP139 is odd parity. In I<sup>2</sup>C mode, parity error check is not supported except for supported common command codes (CCC). In I3C mode the parity error check is supported for both CCC and host to device data transfers. The parity bit is only sent during the host write and the TMP139 shall check the parity to ensure that the data or CCC it received is correct. The device implements odd parity. If an odd number of bits in the byte are set as 1, the parity bit is set as 0. If an even number of bits in the byte are set as 1, the parity bit is set as 1.

If there is a parity error during a data transfer or CCC, then the TMP139 shall drop the bytes after the parity error is detected and shall wait for a Stop condition on the bus.

When a parity error is detected, the device shall set the IBI\_STATUS bit in the MR48 register and PAR\_ERROR\_STATUS bit in the MR52 register.

### 7.3.7 Packet Error Check

The packet error check (PEC) is implemented with a CRC-8 using the polynomial given in [Table 7-3](#).

**Table 7-3. PEC Rule Table**

PEC Rule	Attributes
PEC width	8-bits
PEC polynomial	$x^8 + x^2 + x^1 + 1$ (07h)
Initial seed value	00h
Input data reflected	No
Output data reflected	No
XOR value	00h

The PEC is supported in I3C mode only and is computed on the device address, the R/W bit and the data packet. The seed value for the PEC function is reset to zero on either a Start or Repeated Start bus condition.

Any host transaction that results from a PEC enable or disable must be followed by a Stop condition on the bus immediately to allow an update on the PEC control bit in the [MR18](#) register.

## 7.4 Device Functional Modes

This section describes the serial address structure of the TMP139 and how the device operates in both I<sup>2</sup>C mode and I3C basic mode, including the switching between the modes. This section also describes the behavior of the TMP139 during IBI and the bus reset sequence.

### 7.4.1 Conversion Mode

The TMP139 powers up in continuous conversion mode. In this mode, the device shall perform temperature conversions every 125 ms as shown in [Figure 7-5](#).

**Figure 7-5. Continuous Conversion Timing Diagram**

The application software can stop the conversion by clearing bit 0 of the [MR26](#) register. When disabled, the device shall not update the result registers. When the temperature sensor is disabled, the host must wait for at least one active conversion cycle for the disable to take effect before any other writes are performed to the device. When the temperature sensor is re-enabled for continuous conversion mode, the host must wait for at least one conversion interval before reading the temperature results. During this time, read to other registers may be performed.

### 7.4.2 Serial Address

The TMP139 has a 7-bit serial address which is used by the host to communicate with the device in both I<sup>2</sup>C and I3C basic modes of operation. The [Table 7-4](#) shows the serial address format for the TMP139. As described in the [power-up sequence](#), the SA pin is sampled on power up. The sampled value of the SA pin is used to select one of the two possible local device type ID (LID) section of the serial address. The LID is concatenated with the host ID (HID) to form the 7-bit unique serial address.

**Table 7-4. Serial Address Format**

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
0	SA	1	0	1	1	1	R/W

**Table 7-4. Serial Address Format (continued)**

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Local Device Type ID (LID)				Host ID (HID)			Read/Write

If the SA pin is connected to GND, then the serial address for the TMP139 is encoded as 7'b0010111. If the SA pin is connected to V<sub>DDSPD</sub>, then the serial address is encoded as 7'b0110111.

### 7.4.3 I<sup>2</sup>C Mode Operation

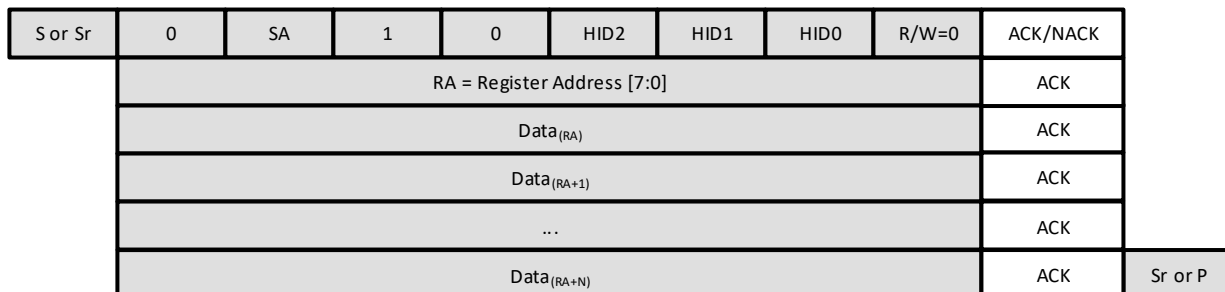

The I<sup>2</sup>C mode of operation is the primary mode of operation when the device is **powered up**, goes through a **bus reset**, or when a RSTDAACCC is issued if the device is in I3C mode of operation. The maximum bus speed supported in this mode is up to 1.0 MHz. In this mode of operation, the following are not supported:

1. IBI: If IBI is enabled during I3C basic mode, then switching to I<sup>2</sup>C mode shall disable the IBI enabling mechanism. If there are device events that cause the generation of IBI, then the status of the events shall be logged by the device in the respective register.
2. Packet Error Check: This feature is not supported. If the host attempts to write data with a PEC byte, then the PEC byte shall be treated as a data byte and written to the register address in an incremental format.
3. Parity Error Check: The parity error check is not supported except for the CCC that are listed in [Table 7-6](#).

In the I<sup>2</sup>C mode of operation, the TMP139 supports SETHID, DEVCTRL and SETAASACCC, and data transfer packets without PEC. Additionally, a Start or Repeated Start followed by 7'h7E with W = 0 is only allowed for the purpose of issuing the supported CCCs. Any other operation involving a Repeated Start shall be considered illegal.

#### 7.4.3.1 Host I<sup>2</sup>C Write Operation

For I<sup>2</sup>C write operation, the host controller sends the device address with R/W bit as 0, after a Start or Repeated Start as shown in [Figure 7-6](#). This is followed by the 8-bit register address and then the data. The TMP139 writes the data to the register address specified. The internal write register address pointer is incremented after every data byte written. If the write results in an address rollover, then the device shall reset the internal write register address pointer and continue the write operation if possible. The TMP139 does not NACK the data byte for reserved or read-only register, but shall discard the data byte and not update the register.

**Figure 7-6. I<sup>2</sup>C Write Operation**

#### 7.4.3.2 Host I<sup>2</sup>C Read Operation

For I<sup>2</sup>C read operation, the host controller sends the device address with R/W bit as 0, after a Start or repeated start. This is followed by the 8-bit register address. Once the register address is available to the TMP139, the host issues a Repeated Start and sends the device address with R/W bit as 1. At this point the device shall send the data from the register address incrementally, till the host sends a NACK. If the read operation results in the internal read register address pointer to rollover, then the TMP139 device behavior is not defined.

S or Sr	0	SA	1	0	HID2	HID1	HID0	R/W=0	ACK/NACK	
	RA = Register Address [7:0]								ACK	
Sr	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
	Data <sub>(RA)</sub>								ACK	
	Data <sub>(RA+1)</sub>								ACK	
	...								ACK	
	Data <sub>(RA+N)</sub>								NACK	Sr or P

**Figure 7-7. I<sup>2</sup>C Read Operation**

### 7.4.3.3 Host I<sup>2</sup>C Read Operation in Default Read Address Pointer Mode

The TMP139 provides a default read address pointer mode as shown in [Figure 7-8](#) to read a specific register on the I<sup>2</sup>C bus. Since the number of bytes to be sent by the host are two less than a standard I<sup>2</sup>C read operation, this mode provides for a more efficient polling mechanism. The [MR18](#) register, bit DEF\_RD\_ADDR\_POINT\_EN is used to enable the mode and bits DEF\_RD\_ADDR\_POINT\_Start are used to set the default read address pointer to a specific register in the register map. When enabled, the TMP139 shall set the internal read address pointer to the specific register when there is a Stop condition on the bus.

S or Sr	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
	Data <sub>(DEF_ADDR_POINTER)</sub>								ACK	
	Data <sub>(DEF_ADDR_POINTER+1)</sub>								ACK	
	...								ACK	
	Data <sub>(DEF_ADDR_POINTER+N)</sub>								NACK	Sr or P

**Figure 7-8. I<sup>2</sup>C Default Read Address Pointer Mode**

There can be two specific cases in this mode of operation. In the first case as shown in [Figure 7-9](#), there is a normal I<sup>2</sup>C read preceding the default read mode. If a Stop precedes the Start, then the internal read address pointer shall be set to the default address pointer and subsequent data reads shall result in the data bytes sent by the TMP139 corresponding to the default read address pointer. If a Repeated Start is issued instead of a Stop, then the TMP139 shall send data based on the default read address pointer.

S or Sr	0	SA	1	0	HID2	HID1	HID0	R/W=0	ACK/NACK	
RA = Register Address [7:0]									ACK	
Sr	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
Data <sub>(RA)</sub>									ACK	
Data <sub>(RA+1)</sub>									ACK	
...									ACK	
Data <sub>(RA+N)</sub>									NACK	P
S	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
Data <sub>(DEF_ADDR_POINTER)</sub>									ACK	
Data <sub>(DEF_ADDR_POINTER+1)</sub>									ACK	
...									ACK	
Data <sub>(DEF_ADDR_POINTER+N)</sub>									NACK	Sr or P

Figure 7-9. I<sup>2</sup>C normal read followed by a Default Read Address

In the second case as shown in Figure 7-10, there is a normal I<sup>2</sup>C write preceding the default read mode. If there is a Stop, followed by a write bus operation and then a Repeated Start for the read mode, then the TMP139 shall update its internal read address pointer to the default read address and transmit bytes to the host.

											P

Data <sub>(DEF_ADDR_POINTER+1)</sub>									ACK		
...									ACK		
Data <sub>(DEF_ADDR_POINTER+N)</sub>									NACK	Sr or P	

Figure 7-10. I<sup>2</sup>C normal write followed by a Default Read Address

#### 7.4.3.4 Switching from I<sup>2</sup>C Mode to I3C Basic Mode

As shown in Table 7-6, only DEVCTRL, SETHID and SETAASA CCCs are supported in I2C mode. The host may issue DEVCTRL and/or SETHID, before it can issue SETAASA for switching the device from I<sup>2</sup>C mode to I3C basic mode.

When the SETAASA is issued by the host, the device shall register the command by setting MR18 register INF\_SEL bit to 1'b1 once the Stop condition on the bus is detected. After this, the TMP139 shall be in the I3C basic mode of operation.

### 7.4.4 I3C Basic Mode Operation

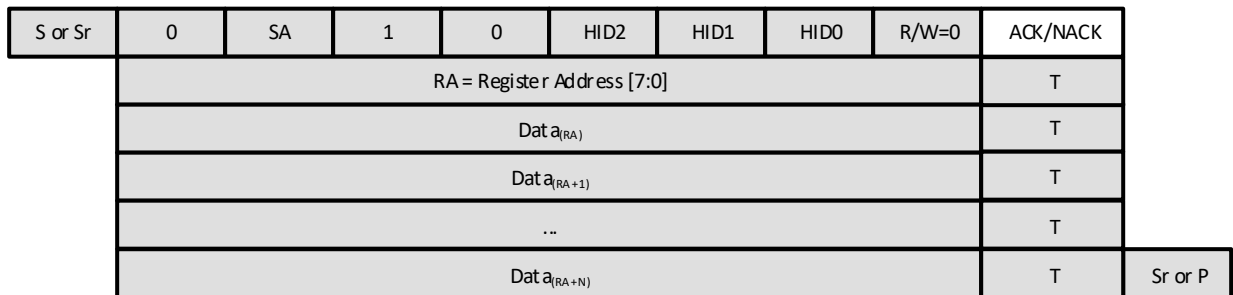

As described in the previous section, I3C basic mode of operation is always entered from the I<sup>2</sup>C mode of operation. When in the I3C basic mode, the device can support data transfer rates of up to 12.5 MHz with a push-pull SDA driver. Additionally, the following may be supported by default or when enabled:

1. IBI: Disabled by default, the IBI can now be enabled.
2. Packet error check: Disabled by default, but the TMP139 can support the PEC feature when enabled by the host.
3. Parity check: Is always enabled by default.

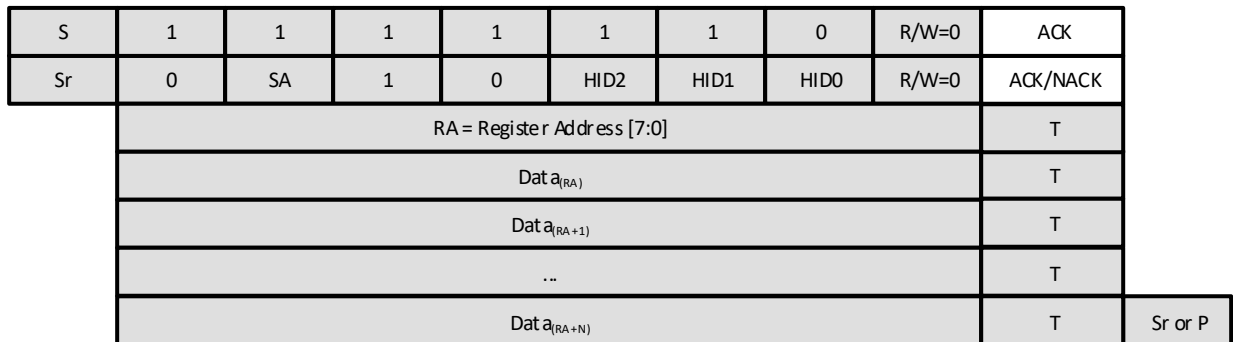

In I3C basic mode of operation, the read and write packets may have different structures. The structure of the data payload shall be dependent on the feature that has been enabled.

#### 7.4.4.1 Host I3C Write Operation without PEC

As shown in [Figure 7-11](#) and [Figure 7-12](#), an I3C basic write operation is the same as an I<sup>2</sup>C write operation. For all bytes after the device address field, the 9<sup>th</sup> bit is the parity bit sent by the host. When the IBI is enabled by the host, it must send the IBI header byte which consists of 7'h7E+R/W=0, before it sends the device address. This allows the participating devices on the bus to arbitrate between themselves if more than one device has an interrupt condition that needs to be communicated to the host.

**Figure 7-11. I3C Basic Mode Write**

**Figure 7-12. I3C Basic Mode Write with IBI Header**

If there is a parity error during the data transfer, the device shall discard all the bytes including the byte for which parity error was detected and set the parity error condition. If the host attempts to start a new transaction with a Repeated Start to the same device, then TMP139 shall NACK the device address to indicate an error condition to the host. The host must first clear the parity error condition before performing any new transfer to the TMP139. When IBI is enabled, the device can communicate to the host the error conditions seen, using IBI. However when IBI is not enabled, it is strongly recommended that the host check the error status register to ensure that no parity error was detected on the bus.

#### 7.4.4.2 Host I3C Write Operation with PEC

As shown in [Figure 7-13](#) and [Figure 7-14](#), when the PEC is enabled by the host, an additional byte is added by the host after sending the register address. The format for the additional byte is described in [Table 7-5](#).

**Table 7-5. Command Truth Table - PEC Enabled Mode**

CMD	RW	Command Name	Command Description
000	0	W1R	Write 1 Byte to Register address specified in data packet
	1	R1R	Read 1 Byte from Register address specified in data packet
001	0	W2R	Write 2 Bytes to Register address specified in data packet
	1	R2R	Read 2 Bytes from Register address specified in data packet
010 – 111	X	RSVD	Reserved

If the CMD value sent by the host is not valid for TMP139, the device shall not write any data to the register specified.

S or Sr	0	SA	1	0	HID2	HID1	HID0	R/W=0	ACK/NACK	
	RA = Register Address [7:0]								T	
	CMD		W=0	0	0	0	0	0	T	
	Data <sub>(RA)</sub>								T	
	...								T	
	Data <sub>(RA+N)</sub>								T	
	PEC								T	Sr or P

**Figure 7-13. I3C Basic Mode Write with PEC enabled**

S	1	1	1	1	1	1	0	R/W=0	ACK	
Sr	0	SA	1	0	HID2	HID1	HID0	R/W=0	ACK/NACK	
	RA = Register Address [7:0]								T	
	CMD		W=0	0	0	0	0	0	T	
	Data <sub>(RA)</sub>								T	
	...								T	
	Data <sub>(RA+N)</sub>								T	
	PEC								T	Sr or P

**Figure 7-14. I3C Basic Mode Write with IBI Header and PEC enabled**

If there is a parity error during the data transfer, the device shall discard all the bytes including the byte for which parity error was detected and set the parity error condition. If the host attempts to start a new transaction with a Repeated Start to the same device, then TMP139 shall NACK the device address to indicate an error condition to the host. The host must first clear the parity error condition before performing any new transfer to the TMP139.

If there is a PEC error, then the TMP139 shall discard the entire data packet and set the PEC error condition. If the host attempts to start a new transaction with a Repeated Start to the same device, then TMP139 shall NACK the device address to indicate an error condition to the host. The host must first clear the PEC error condition before performing any new transfer to the TMP139.

When IBI is enabled, the device can communicate to the host the error conditions seen, using IBI. However when IBI is not enabled, it is strongly recommended that the host check the error status register to ensure that no parity or PEC error was detected on the bus.

#### 7.4.4.3 Host I3C Read Operation without PEC

As shown in [Figure 7-15](#) and [Figure 7-16](#), an I3C basic mode read is same as I<sup>2</sup>C read operation. For all bytes sent by the device, the 9<sup>th</sup> bit is the T-bit, which is used by the device and host to negotiate continuation of the read transfer. During the read phase, the device drives the T-bit as 1, before the rising edge to tell the host that it can send more bytes or drives the T-bit as 0, to indicate to the host that the device wants to terminate the transfer and the host shall respond with either a Stop or Repeated Start on the bus. The host may also terminate the transfer by driving the T-bit as 0, only when device sends the T-bit as 1, which creates a repeated start condition on the bus. Additionally, the host may send a Stop on the bus. When the IBI is enabled by the host, it must send the IBI header byte which consists of 7'h7E+R/W = 0, before it sends the device address. This allows the participating devices on the bus, to arbitrate between themselves if more than one device has an interrupt condition that needs to be communicated to the host.

S or Sr	0	SA	1	0	HID2	HID1	HID0	R/W=0	ACK/NACK

Sr	0	SA	1	0	HID2	HID1	HID0	R/W=0	ACK/NACK	
RA = Register Address [7:0]									T	
Sr	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
Data <sub>(RA)</sub>									T=1	
Data <sub>(RA+1)</sub>									T=1	
...									T=1	
Data <sub>(RA+N)</sub>									T=1	Sr or P

**Figure 7-16. I3C Basic Mode Read with IBI Header**

The TMP139 shall NACK the read phase of the transaction if there was a parity error in the write phase before the repeated start. The device shall also send the T-bit as 0, if the host attempts to read data continuously such that the internal read address pointer reaches 255, which is the last register in the register map table. Additionally, if the host attempts to start a new transaction with a Repeated Start to the same device, when there was a parity error in the previous transaction, then TMP139 shall NACK the device address to indicate an error condition to the host. The host must first clear the parity error condition before performing any new transfer to the TMP139. When IBI is enabled, the device can communicate to the host the error conditions seen, using IBI. However when IBI is not enabled, it is strongly recommended that the host check the error status register to ensure that no parity error was detected on the bus.

### 7.4.4.4 Host I3C Read Operation with PEC

As shown in Figure 7-17 and Figure 7-18, when the PEC is enabled by the host, an additional byte is added by the host after sending the register address. The format for the additional byte is described in Table 7-5. Since only one and two byte reads are permitted by the CMD byte, the device shall terminate the read phase after sending one byte of data and PEC byte or two byte of data and PEC byte, followed by the T-bit as 0. In an unlikely case where the host sets the register address as 255, and attempts a read of two bytes, the device result is not guaranteed.

S or Sr	0	SA	1	0	HID2	HID1	HID0	R/W=0	ACK/NACK	
RA = Register Address [7:0]									T	
CMD				R=1	0	0	0	0	T

Data <sub>(RA)</sub>									T=1	
...									T=1	
Data <sub>(RA+N)</sub>									T=1	
PEC									T=0	Sr or P

Figure 7-18. I3C Basic Mode Read with PEC enabled and IBI Header

If the CMD value sent by the host is not valid for TMP139, the device shall NACK the read phase.

The TMP139 shall NACK the read phase of the transaction if there was a parity error in the write phase before the Repeated Start. If the host attempts to start a new transaction with a Repeated Start to the same device, then TMP139 shall NACK the device address to indicate an error condition to the host. The host must first clear the parity error condition before performing any new transfer to the TMP139.

If there is a PEC error, then the TMP139 shall NACK the read phase of the transaction. If the host attempts to start a new transaction with a Repeated Start to the same device, then TMP139 shall NACK the device address to indicate an existing error condition to the host. The host must first clear the PEC error condition before performing any new transfer to the TMP139.

When IBI is enabled, the device can communicate to the host the error conditions seen, using IBI. However when IBI is not enabled, it is strongly recommended that the host check the error status register to ensure that no parity or PEC error was detected on the bus.

#### 7.4.4.5 Host I3C Read Operation in Default Read Address Pointer Mode

The default read address pointer mode in I3C basic mode works the same way as I<sup>2</sup>C mode as shown in [Figure 7-19](#) to [Figure 7-22](#). The device shall also send the T-bit as 0, if the host attempts to read data continuously such that the internal read address pointer reaches 255, which is the last register in the register map table. The host may also terminate the transfer by driving the T-bit as 0 only when PEC is not enabled.

S or Sr	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
	Data <sub>(RA)</sub>								T=1	
	Data <sub>(RA+1)</sub>								T=1	
	...								T=1	
	Data <sub>(RA+N)</sub>								T=1	Sr or P

**Figure 7-19. I3C Basic Mode Default Read Address Enabled**

S	1	1	1	1	1	1	0	R/W=0	ACK	
Sr	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
	Data <sub>(RA)</sub>								T=1	
	Data <sub>(RA+1)</sub>								T=1	
	...								T=1	
	Data <sub>(RA+N)</sub>								T=1	Sr or P

**Figure 7-20. I3C Basic Mode Default Read Address Enabled with IBI Header**

When PEC is enabled, then the [MR18](#) register sets the default number of bytes that shall be sent, after which the device shall send the PEC byte with T-bit as 0.

S or Sr	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
	Data <sub>(RA)</sub>								T=1	
	...								T=1	
	Data <sub>(RA+N)</sub>								T=1	
	PEC								T=0	Sr or P

**Figure 7-21. I3C Basic Mode Default Read Address Enabled with PEC Enabled**

S	1	1	1	1	1	1	0	R/W=0	ACK	
Sr	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
	Data <sub>(RA)</sub>								T=1	
	...								T=1	
	Data <sub>(RA+N)</sub>								T=1	
	PEC								T=0	Sr or P

**Figure 7-22. I3C Basic Mode Default Read Address Enabled with PEC Enabled and IBI Header**

The TMP139 shall NACK the address phase, during a Repeated Start, if there was an error in the previous transaction.

### 7.4.5 In Band Interrupt

The In Band Interrupt (IBI) is an elegant method to inform the host of an event in the TMP139. There are two types of events that the TMP139 generates:

1. Error event: Events corresponding to parity or PEC error.
2. Temperature event: Events corresponding to the temperature exceeding the higher temperature limits or falling below the lower temperature limits.

By default, all interrupt sources are disabled when the device powers up. The interrupt source can only be enabled when the device is in I3C basic mode of operation, as enabling the interrupt source shall generate an IBI which is not allowed in I<sup>2</sup>C mode of operation. An IBI can only be requested by the TMP139 when the bus has been in an inactive state for the  $t_{\text{AVAL}}$  period. Once the condition for an inactive state on the bus is met, and there is no bus transaction, the TMP139 shall initiate an IBI by driving the SDA low to indicate to the host of a pending IBI.

#### 7.4.5.1 In Band Interrupt Arbitration Rules

Based on the state of the host controller readiness and due to the fact that there are multiple devices on the bus, the IBI generation and arbitration must follow some rules, as described below. All of these conditions assume that the bus has been inactive for  $t_{\text{AVAL}}$  period.

1. When the host controller starts a write or read with IBI header, TMP139 shall start driving its own address on the bus. The host on seeing a value other than the IBI header shall no longer drive the SDA, allowing the TMP139 to transmit its device header along with R/W bit set to 1.
2. If the host controller can accept the IBI from the device, it shall ACK the device address, release the bus on the falling edge of SCL and shall accept the bytes sent by the TMP139.
3. If the host controller cannot accept the IBI from the device, it shall NACK the device address and issue a Stop condition on the bus. The TMP139 shall retry another IBI only after  $t_{\text{AVAL}}$  period.
4. When the host controller starts a write or read without an IBI header to a device on the bus which has a lower device address than the TMP139, the device on detecting a mismatch, shall no longer participate on the bus and retry another IBI only after  $t_{\text{AVAL}}$  period.
5. When the host controller starts a write or read without an IBI header to a device on the bus which has a higher device address than the TMP139, the device wins the bus arbitration and the host shall no longer participate on the bus. The host may accept the IBI by sending an ACK or disregard the IBI by sending a NACK. In the latter case, TMP139 shall retry another IBI only after  $t_{\text{AVAL}}$  period.
6. When the host controller starts a write or read transaction without an IBI header to the TMP139 which is also requesting an IBI, either the host or TMP139 can win.
7. If the host controller starts a write transaction, then it shall win the bus arbitration and the TMP139 shall let go of the bus. The TMP139 shall retry another IBI only after  $t_{\text{AVAL}}$  period.
8. If the host controller starts a read transaction, then all the bits shall match. However at this point the host is expecting an ACK from the TMP139 for the read request, while the TMP139 is waiting for an ACK from the host for the IBI. As a result there shall be a NACK on the bus. In such a case, the TMP139 shall retry the IBI only after  $t_{\text{AVAL}}$  period. However if the host issues start (or Repeated Start) and attempts the read transaction before the  $t_{\text{AVAL}}$  period, it shall get an ACK from the TMP139 and the host read shall win the arbitration on the bus.
9. As described above, in the case when there are multiple devices initiating an IBI at the same time, the device which has the lowest device address shall win the bus arbitration and the TMP139 when it detects a loss on the bus arbitration, shall retry another IBI only after  $t_{\text{AVAL}}$  period

#### 7.4.5.2 In Band Interrupt Bus Transaction

As shown in [Figure 7-23](#) and [Figure 7-24](#), when the device has to send an IBI, wins arbitration on the bus and the IBI is ACK by the host, it shall always send the mandatory data byte (MDB) as 8'h00, followed by the [MR51](#) and [MR52](#) register values. After transmitting the last byte, it shall set the T-bit as 0, after which the host controller must send a Stop condition on the bus.

S	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
MDB = 0x0									T=1	
MR51[7:0]									T=1	
MR52[7:0]									T=0	P

**Figure 7-23. IBI Payload Packet with PEC Disabled**

If PEC is enabled, then after MR52 register value, the PEC byte is sent with the T-bit set as 0. Again, the host must send a Stop condition on the bus.

S	0	SA	1	0	HID2	HID1	HID0	R/W=1	ACK/NACK	
MDB = 0x0									T=1	
MR51[7:0]									T=1	
MR52[7:0]									T=1	
PEC									T=0	P

**Figure 7-24. IBI Payload Packet with PEC Enabled**

When an IBI is asserted by the device and it successfully transmits the IBI, including the MDB, MR51, MR52 and PEC (if PEC mode is enabled) bytes, the device shall automatically clear the IBI\_STATUS bit in [MR48](#) register.

#### 7.4.6 Common Command Codes Support

The TMP139 supports a subset of the CCC as listed in the I3C basic specification and shown in [Table 7-6](#). Only CCC specified in the JESD302-1 are supported and the TMP139 shall either NACK unsupported CCC (if possible) or ignore the actions when on a generic I3C bus. Similarly, for supported CCC—depending on whether the TMP139 is in I<sup>2</sup>C or I3C mode—if a non-applicable CCC is sent, the device shall ignore the actions.

The TMP139 requires a Stop condition on the bus after receiving any CCC before it can process a device specific read or write operation. Similarly, when processing a device specific read or write condition, a Stop on the bus should follow before any CCC can be issued.

The TMP139 can receive a direct CCC with a Repeated Start condition after another direct CCC. Similarly, it is valid to send a broadcast CCC following another broadcast CCC with a Repeated Start in between. In such a case, the action taken by the device will only be updated following a Stop condition on the bus. The behavior of TMP139 is not defined if a direct CCC is followed by a broadcast CCC or vice-versa with a Repeated Start. For example, it is a legal combination in I<sup>2</sup>C mode to send a SETHID CCC, followed by a Repeated Start, then a SETAASA CCC followed by a Stop condition. However, in I3C mode, sending a direct ENEC CCC followed by Repeated Start and then a broadcast DEVCTRL CCC is not a valid condition for the TMP139. The host must issue a Stop after ENEC CCC, before it sends a broadcast DEVCTRL CCC.

The CCC sent to the TMP139 may either be a broadcast code or a direct code. All CCC operations require the host to send 7'h7E with R/W = 0, followed by the CCC and payload bytes specific to the CCC. For a direct CCC, the host shall issue a Repeated Start on the bus after the CCC byte followed by the payload bytes.

**Table 7-6. Supported CCC**

CCC	Mode	Code	Description	Applicable in I <sup>2</sup> C Mode	Applicable in I3C Mode
ENEC	Broadcast	0x00	Enable Event Interrupts	No	Yes
	Direct	0x80			
DISEC	Broadcast	0x01	Disable Event Interrupts	No	Yes
	Direct	0x81			
RSTDA	Broadcast	0x06	Put the device in I <sup>2</sup> C mode	No	Yes

**Table 7-6. Supported CCC (continued)**

CCC	Mode	Code	Description	Applicable in I <sup>2</sup> C Mode	Applicable in I3C Mode
SETAASA	Broadcast	0x29	Put the device in I3C Basic Mode	Yes	No
GETSTATUS	Direct	0x90	Get Device Status	No	Yes
DEVCAP	Direct	0xE0	Get Device Capability	No	Yes
SETHID	Broadcast	0x61	TMP139 updates 3-bit HID field	Yes	No
DEVCTRL	Broadcast	0x62	Configure Device	Yes	Yes

**7.4.6.1 ENEC CCC**

The ENEC CCC is issued by the host controller to enable the event interrupt generation. The CCC takes effect after a Stop has been issued by the host controller. Once the ENEC is received, the TMP139 shall update the MR27 register bit IBI\_ERROR\_EN to 1'b1.

**Note**

It is illegal for the host controller to send the ENINT bit as 0.

The command may be issued either as a broadcast command or as a direct command to TMP139 as shown in Figure 7-25 and Figure 7-26.

**Figure 7-25. ENEC CCC Broadcast**

**Figure 7-26. ENEC CCC Direct**

The command may be issued either as a broadcast or as a direct command, as shown in Figure 7-27 and Figure 7-28, with PEC Enabled. In such a case the host controller shall append the PEC byte calculated on all bytes except the byte with 7'h7E and R/W=0 after the Start or Repeated Start.

**Figure 7-27. ENEC CCC Broadcast with PEC Enabled**

S or Sr	1	1	1	1	1	1	0	R/W=0	ACK/NACK	
	0x80								T	
	PEC								T	
Sr	0	SA	1	0	HID2	HID1	HID0	R/W=0	ACK/NACK	
	0x00							ENINT	T	
	PEC								T	Sr or P

**Figure 7-28. ENEC CCC Direct with PEC Enabled**

**Note**

TMP139 NACKs the ENEC CCC if the previous transaction has a parity or PEC error and the host starts the transaction with a Repeated Start.

**7.4.6.2 DISEC CCC**

The DISEC CCC is issued by the host controller to disable the event interrupt generation. The CCC takes effect after a Stop has been issued by the host controller. Once the DISEC is received, the TMP139 shall update [MR27](#) register bit IBI\_ERROR\_EN to 1'b0.

**Note**

It is illegal for the host controller to send the DISINT bit as 0.

The command may be issued either as a broadcast command or as a direct command to a specific device as shown in [Figure 7-29](#) and [Figure 7-30](#).

S or Sr	1	1	1	1	1	1	0	R/W=0	ACK/NACK

0x00								DISINT	T	
PEC									T	Sr or P

Figure 7-32. DISEC CCC Direct with PEC Enabled

**Note**

TMP139 NACKs the DISEC CCC if the previous transaction has a parity or PEC error and the host starts the transaction with a Repeated Start.

**7.4.6.3 RSTDAA CCC**

When the RSTDAA CCC is issued by the host controller to the TMP139, it shall switch from I3C basic mode to I<sup>2</sup>C mode. The CCC takes effect after a Stop has been issued by the host controller. Once the RSTDAA is received, the TMP139 shall perform the following actions:

- Update the MR18 register bit INF\_SEL as 1'b0 for I<sup>2</sup>C mode of operation.
- Update the MR18 register bit PEC\_EN as 1'b0 to disable PEC, if it was previously enabled.
- Update the MR18 register bit PAR\_DIS as 1'b0 to enable parity check, if it was previously disabled.
- Update the MR27 register bit IBI\_ERROR\_EN as 1'b0 to disable IBI, if it was previously enabled.

The command is always issues as a broadcast command as shown in Figure 7-33.

S or Sr	1	1	1	1	1	1	0	R/W=0	ACK/NACK	
0x06									T	Sr or P

Figure 7-33. RSTDAA CCC Broadcast

The command may also be issued with PEC enabled, as shown in Figure 7-34. In such a case, the host controller shall append the PEC byte calculated on all bytes except the byte with 7'h7E and R/W=0 after the Start or Repeated Start.

S or Sr	1	1	1	1	1	1	0	R/W=0	ACK/NACK	
0x06									T	
PEC									T	Sr or P

Figure 7-34. RSTDAA CCC Broadcast with PEC

**Note**

TMP139 NACKs the RSTDAA CCC if the previous transaction has a parity or PEC error and the host starts the transaction with a Repeated Start.

**7.4.6.4 SETAASA CCC**

When the SETAASA CCC is issued by the host controller to the TMP139, it shall switch from I<sup>2</sup>C mode to I<sup>3</sup>C basic mode. The CCC takes effect after a Stop has been issued by the host controller. Once the SETAASA is received, the TMP139 shall set the MR18 register bit INF\_SEL as 1'b1 for I<sup>3</sup>C basic mode of operation.

The CCC is always issues as a broadcast command, as shown in Figure 7-35, with no PEC bytes since it is applicable only during I<sup>2</sup>C mode.

S or Sr	1	1	1	1	1	1	0	R/W=0	ACK	
	0x29								T	Sr or P

**Figure 7-35. SETAASA CCC**

**Note**

TMP139 NACKs the SETAASA CCC if the previous CCC transaction has a parity error and the host starts the transaction with a Repeated Start.

**7.4.6.5 GETSTATUS CCC**

The GETSTATUS CCC is issued by the host controller to the TMP139 to get the status of any pending parity error, PEC error, or interrupt event. Once the GETSTATUS is received, the TMP139 shall not clear the status and host must issue additional transactions on the bus to clear the status flags individually or by writing 1'b1 to the MR27 register CLR\_GLOBAL bit.

The command is issued only in direct mode as shown in Figure 7-36, when PEC is disabled, and in Figure 7-37, when PEC is enabled. In the latter case, the host controller shall append the PEC byte calculated on all bytes except the byte with 7'h7E and R/W=0 after the Start or Repeated Start. The TMP139 calculates the PEC on the data bytes that are sent to the host.

	PEC								T=0	Sr or P

Figure 7-37. GETSTATUS CCC Direct with PEC Enabled

**Note**

TMP139 NACKs the GETSTATUS CCC if the previous transaction has a parity or PEC error and the host starts the transaction with a Repeated Start.

**7.4.6.6 DEVCAP CCC**

The DEVCAP CCC is issued by the host controller to the TMP139, to get the optional device capabilities that are supported as given in Table 7-7.

The command is issued only in direct mode as shown in Figure 7-38, when PEC is disabled, and in Figure 7-39, when PEC is enabled. In the latter case the host controller shall append the PEC byte calculated on all bytes except the byte with 7'h7E and R/W=0 after the Start or Repeated Start. The TMP139 calculates the PEC on the data bytes that are sent to the host.

Bit	Value	Comments
DEVCAP_MSB[2]	1	0 = No support for Timer Based Reset 1 = Timer Based Reset supported
DEVCAP_MSB[1:0]	00	Reserved
DEVCAP_LSB[7:0]	8'h00	Reserved

**Note**

TMP139 NACKs the DEVCAP CCC if the previous transaction has a parity or PEC error and the host starts the transaction with a Repeated Start.

**7.4.6.7 SETHID CCC**

The SETHID CCC is issued by the host controller to the TMP139 to update the HID code of the device serial address. The CCC takes effect after a Stop has been issued by the host controller. Once the SETHID is received, the TMP139 shall update the MR7 register bits DEV\_HID\_CODE[2:0] to the value HID[2:0] as sent in the CCC data payload when Stop bus condition is sent by the host.

**Figure 7-40. SETHID CCC Broadcast**

**Note**

TMP139 NACKs the SETHID CCC if the previous transaction has a parity error and the host starts the transaction with a Repeated Start.

**7.4.6.8 DEVCTRL CCC**

The DEVCTRL CCC is issued by the host controller for enable or disable operations that are common to devices on the bus and TMP139 shall recognize the DEVCTRL CCC.

The command is generally issued in broadcast mode, but may be issued as unicast or multicast mode as well. The host may issue the DEVCTRL CCC as a generic access with RegMod field set as 0 or for a specific register access with RegMod set as 1. When RegMod field is set to 0, Figure 7-41 shows the DEVCTRL CCC packet structure when PEC is disabled. Figure 7-42 shows the structure of the DEVCTRL CCC when RegMod field is set to 0 and PEC is enabled. In the latter case the host controller shall append the PEC byte calculated on all bytes except the byte with 7'h7E and R/W=0 after the Start or Repeated Start.

S or Sr	1	1	1	1	1	1	0	R/W=0	ACK

									Sr or P

Figure 7-42. DEVCTRL CCC With REGMOD = 0 and PEC Enabled

When RegMod field is set to 1, [Figure 7-43](#) shows the DEVCTRL CCC packet structure when PEC is disabled. [Figure 7-44](#) shows the structure of the DEVCTRL CCC when RegMod field is set to 1 and PEC is enabled. In the latter case the host controller shall append the PEC byte calculated on all bytes except the byte with 7'h7E and R/W = 0 after the Start or Repeated Start. If the CMD field indicates that there is only one byte to write, then the optional register data must not be sent by the host.

S or Sr	1	1	1	1	1	1	0	R/W=0	ACK

PEC									T	Sr or P

**Figure 7-44. DEVCTRL CCC With REGMOD = 1 and PEC Enabled**

**Note**

TMP139 NACKs the DEVCTRL CCC if the previous transaction has a parity or PEC error and the host starts the transaction with a Repeated Start.

The [Table 7-8](#) describes the definition of the command fields.

**Table 7-8. DEVCTRL CCC Command Definitions**

Field	Description	Values	Action
ADDRMASK[2:0]	Broadcast, multicast or unicast selection	000 = Unicast command	TMP139 matches the DEVADDR[6:0] field with its serial address .
		011 = Multicast command	TMP139 matches the DEVADDR[6:3] field with its LID code in the serial address.
		111 = Broadcast command	TMP139 ignores the DEVADDR[6:0] and performs the required action.
STOFFSET[1:0]	Start offset byte	00 = Byte 0	TMP139 identifies which byte is the first byte out of DEVCTRL DATA 0, DEVCTRL DATA 1, DEVCTRL DATA 2 and DEVCTRL DATA 3 and updates its register accordingly. This field is valid only when REGMOD = 0.
		01 = Byte 1	
		10 = Byte 2	
		11 = Byte 3	
PECBL[1:0]	Identifies the burst length for PEC byte position	00 = 1 Byte	TMP139 identifies the position of the PEC byte after the DEVCTRL DATA bytes are sent. This field is valid only when REGMOD = 0 and PEC is enabled.
		01 = 2 Byte	
		10 = 3 Byte	
		11 = 4 Byte	
REGMOD	Identifies if it is a generic or specific register access	0 = Generic Access	TMP139 understand the DEVCTRL DATA byte as generic data bytes described in <a href="#">Table 7-9</a>
		1 = Register Access	TMP139 understand the DEVCTRL DATA byte as specific register access bytes. If PEC is disabled, the format used for specific register access is as per <a href="#">Figure 7-11</a> . If PEC is enabled, the format used for specific register access is as per <a href="#">Figure 7-13</a>

**Table 7-9. Generic Data Byte Format**

DEVCTRL DATA Bit	Function	Values	Action
DEVCTRL DATA 0 [7]	PEC Enable	0 = Disable	<a href="#">MR18</a> register PEC_EN bit is updated
		1 = Enable	
DEVCTRL DATA 0 [6]	Parity Disable	0 = Enable	<a href="#">MR18</a> register PAR_DIS bit is updated
		1 = Disable	

**Table 7-9. Generic Data Byte Format (continued)**

DEVCTRL DATA Bit	Function	Values	Action
DEVCTRL DATA 0 [5:0]	Reserved	Reserved	
DEVCTRL DATA 1 [7:4]	Reserved	Reserved	
DEVCTRL DATA 1 [3]	Global IBI Clear	0 = No action	MR27 register CLR_GLOBAL bit is updated
		1 = Clear all events and pending IBI	
DEVCTRL DATA 1 [2:0]	Reserved	Reserved	
DEVCTRL DATA 2 [7:0]	Reserved	Reserved	
DEVCTRL DATA 3 [7:0]	Reserved	Reserved	

**Note**

TMP139 NACKs the DEVCTRL CCC if the previous transaction has a parity or PEC error and the host starts the transaction with a Repeated Start.

**7.4.7 I/O Operation**

The device comes up in the I<sup>2</sup>C mode of operation with an open-drain I/O for its interface. However, when the device is in I3C mode, the I/O may be either open drain or push pull. The dynamic switching between open-drain and push-pull mode is primarily meant to support In Band Interrupts (IBI). Table 7-10 describes the different modes of operation for the I/O for each cycle.

**Table 7-10. TMP139 Dynamic I/O Operation for I3C Mode**

OPERATION	OPEN-DRAIN MODE	PUSH-PULL MODE
Start + Device Address	Yes	No
Start + 7'h7E IBI Header Byte	Yes	No
REPEAT Start + Device Address	No	Yes
REPEAT Start + 7'h7E IBI Header Byte	No	Yes
CCC Bytes (after 7'h7E+R/W=0+ACK)	No	Yes
STOP	No	Yes
ACK/NACK Responses	Yes	No
Interrupt Request by TMP139 + Device Address	Yes	No
Command and address operations	No	Yes
IBI Payload	No	Yes
Write Data, T-bit sequence	No	Yes
Read Data, T-bit sequence	No	Yes
PEC, T-bit sequence	No	Yes

**7.4.8 Timing Diagrams**

The TMP139 is a I<sup>2</sup>C and I3C interface-compatible device. Figure 6-1 to Figure 6-3 describe the various bus conditions that are supported on the bus. The following lists the definitions for the bus conditions:

- Bus Idle:** Both SDA and SCL lines remain high after a Stop condition.
- Start (S) condition:** A change in the state of the SDA line from high to low, when the SCL is high defines a Start condition. The Start condition is preceded by a bus idle.
- Stop (P) condition:** A change in the state of the SDA line from low to high, when the SCL is high defines a Stop condition.
- Repeated Start (S<sub>R</sub>) condition:** A change in the state of the SDA line from high to low, when the SCL is high and is preceded by a data transfer defines a Repeated Start condition.
- Data Transfer:** The number of data bytes transferred between a Start and Stop condition and determined by the host or device.

- Acknowledge:** Each receiving device, when addressed, is obliged to generate an acknowledge (ACK) bit during device address and host to device write transfer. A device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable low during the high period of the acknowledge clock pulse. On a host receive, the termination of the data transfer can be signaled by the host generating a Not-Acknowledge (NAK) on the last byte that is transmitted by the target device. This behavior is as per I<sup>2</sup>C mode of operation.

During I3C mode of operation, each receiving device shall only acknowledge its device address. Additionally, the host shall acknowledge the device address during a successful IBI address arbitration.

- T-Bit:** The T-bit is only applicable in I3C mode of operation or when the host sends a common command code (CCC) during I<sup>2</sup>C mode of operation. The T-bit contains the parity information when the host writes to the targeted device(s). During a read, if the T-bit is sampled as 1 on the rising edge of the 9<sup>th</sup> clock, the bit indicates a continuation of a read by the device. If a host wants to terminate the read, then the host can activate the pullup while the device drives the line high as shown in Figure 6-2. When the device stops driving the line and tri-states its output, the pull up keeps the line high momentarily before the host claims control of the bus to generate a Repeated Start and Stop to end the read. If the host can accept more data from the device, the host must not drive the line. The device samples the SDA on the falling edge of the 9<sup>th</sup> clock, and if the T-bit is sampled as 1, the device resumes driving the SDA for the next byte. During a read, if the T-bit is sampled as 0 on the rising edge of the 9<sup>th</sup> clock, the bit is used to indicate a termination of the read by the device as shown in Figure 6-3. The host shall also drive the SDA low, such that when the device stops driving the line and tri-states its output, the host has control of the bus to generate a Stop to end the read.

## 7.5 Programming

This section describes the programming model for specific operations of the TMP139.

### 7.5.1 Enabling Interrupt Mechanism

IBI can only be enabled in I3C basic mode. Figure 7-45 shows the programming model the host controller must follow to correctly enable the IBI for the TMP139.

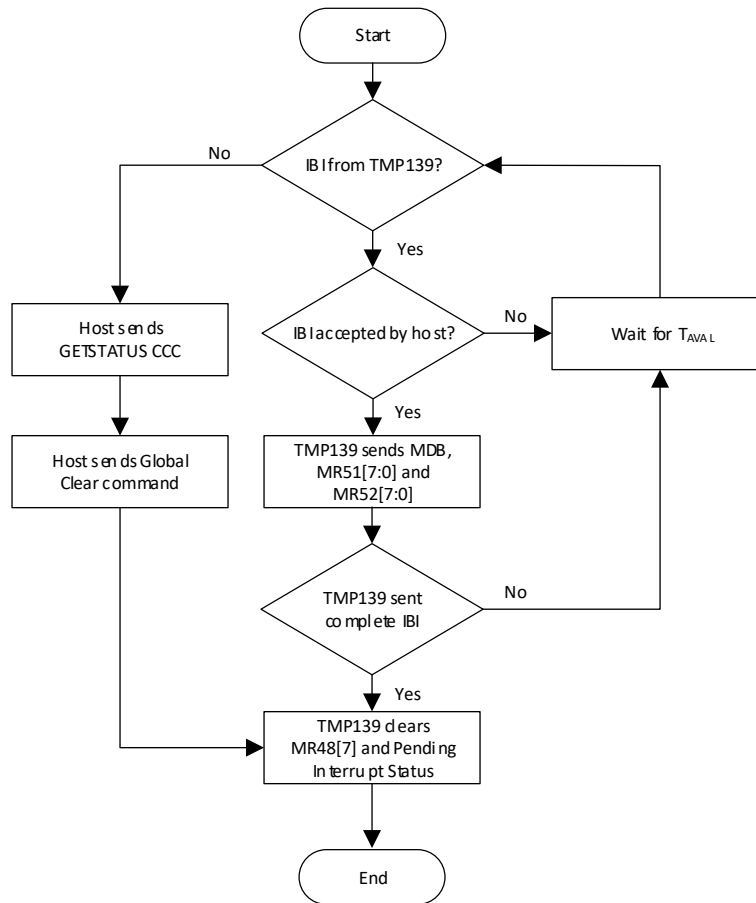

**Figure 7-45. Interrupt Enable Flowchart**

### 7.5.2 Clearing Interrupt

While IBI can be generated in I3C basic mode, the TMP139 shall update the status bit for different events (other than PEC error) even in I<sup>2</sup>C mode. Figure 7-46 shows the programming model for the host controller to clear an

IBI in I3C basic mode. In I<sup>2</sup>C mode, the host controller can poll the TMP139 using register data read as already described in Section 7.4.3.2.

**Figure 7-46. Interrupt Clear Flowchart**

R-97h							

**Table 7-17. MR4: Vendor ID Byte 1 Field Descriptions**

Bit	Field	Type	Reset	Description
7:6	VENDOR_ID_BYTE1[7:0]	R	97h	Indicates the upper byte of the Vendor ID.

### 7.6.6 MR7: Device Configuration - HID (address = 07h) [reset = 0Eh]

The MR7 register reads the HID configured by the host controller. This register can only be updated by the SETHID CCC when device is in I<sup>2</sup>C, by the RSTDA A when the device is in I3C mode, or by a bus reset.

Return to [Register Map](#).

**Figure 7-52. MR7: Device Configuration - HID Register**

7	6	5	4	3	2	1	0
Reserved				DEV_HID_CODE[2:0]		Reserved	
R-0h				RW-111		R-0	

**Table 7-18. MR7: Device Configuration - HID Field Descriptions**

Bit	Field	Type	Reset	Description
7:4	Reserved	R	0h	Reserved
3:1	DEV_HID_CODE[2:0]	RW	111	Device HID Code. The TMP139 device responds to unique 7-bit address as formed by a 4-bit LID code as <a href="#">Table 7-4</a> and 3-bit HID code as configured in this register. <sup>1</sup>
0	Reserved	R	0	Reserved

- This register is updated only when SETHID CCC is sent to the TMP139 or when the device goes through a bus reset sequence.

**Note**

Any host transaction which results in write or update to MR7 register must be immediately followed by a Stop condition. A Repeated Start may result in unpredictable behavior.

### 7.6.7 MR18: Device Configuration (address = 12h) [reset = 00h]

The MR18 register is used to configure the device features. In I3C mode, it allows the PEC to be enabled and Parity (T-bit) to be disabled. It also controls the default read address mode for both I<sup>2</sup>C and I3C bus operations. The burst length for the PEC byte is allowed only in I3C mode and the host controller must not update the bit in the I<sup>2</sup>C mode of operation.

Return to [Register Map](#).

**Figure 7-53. MR18: Device Configuration Register**

7	6	5	4	3	2	1	0
PEC_EN	PAR_DIS	INF_SEL	DEF_RD_ADDR_POINT_EN	DEF_RD_ADDR_POINT_Start[1:0]	DEF_RD_ADDR_POINT_BL	Reserved	
RW-0	RW-0	R-0	RW-0	RW-0	RW-0	RW-0	R-0

**Table 7-19. MR18: Device Configuration Field Descriptions**

Bit	Field	Type	Reset	Description
7	PEC_EN	RW	0	PEC enable <sup>1</sup> 0 = PEC is disabled 1 = PEC is enabled
6	PAR_DIS	RW	0	Parity (T-bit) disable <sup>1</sup> 0 = Parity or T-bit is enabled 1 = Parity or T-bit is disabled
5	INF_SEL	R	0	Interface selection 0 = I <sup>2</sup> C protocol (maximum speed of 1 MHz) 1 = I3C basic protocol
4	DEF_RD_ADDR_POINT_EN	RW	0	Default read address pointer enable 0 = Disable default read address pointer (address pointer is set by host) 1 = Enable default read address pointer (address selected by MR18 register, DEF_RD_ADDR_POINT_Start[1:0] bits)
3:2	DEF_RD_ADDR_POINT_Start[1:0]	RW	00	Default read address pointer starting address <sup>2</sup> 00 = MR49 register 01 = Reserved 10 = Reserved 11 = Reserved
1	DEF_RD_ADDR_POINT_BL	RW	0	Burst length for read pointer address for PEC calculation 0 = 2 bytes 1 = 4 bytes
0	Reserved	R	0	Reserved

1. PEC enable and parity disable are automatically updated when RSTDAA CCC is issued on the bus or a bus reset sequence is applied.
2. Setting any of the reserved values shall result in unpredictable behavior from TMP139.

#### Note

Any host transaction which results in write or update to MR18 register must be immediately followed by a Stop condition. A Repeated Start may result in unpredictable behavior.

### 7.6.8 MR19: Clear MR51 Temperature Status Command (address = 13h) [reset = 00h]

The MR19 register is written by the host to clear status for the temperature comparison after the most recent conversion.

Return to [Register Map](#).

0	PAR_ERROR_STATUS	R	0	Parity check error status 0 = No parity error. 1 = Parity error in one or more bytes.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

The TMP139 is used to measure the temperature of the memory components on a DIMM card. The TMP139 features an I<sup>2</sup>C and I<sup>3</sup>C bus, and there can be up to 2 devices on the bus as required by the DDR5 application. As the TMP139 operates on the I<sup>3</sup>C bus, the device does not require an external pull up resistor on the SDA or SCL pin.

### 8.2 Typical Application

**Figure 8-1. Typical Connections**

#### 8.2.1 Design Requirements

The I<sup>3</sup>C bus does not require an external pullup resistor on the SDA pin as the pullup is embedded in the host controller. The SCL pin is an input-only pin that is driven by the host controller in push-pull mode, and the pin must be connected directly. The SA pin can only be connected to the V<sub>DDSPD</sub> or GND.

#### 8.2.2 Detailed Design Procedure

Place the TMP139 devices in close proximity to the heat source that must be monitored with a proper layout for good thermal coupling. The placement ensures that the temperature changes are captured within the shortest possible time interval.

### 8.2.3 Application Curves

Table 8-1 shows the curves for this application example.

**Table 8-1. Table of Graphs**

NAME	GRAPH
Temperature Error vs Temperature	<a href="#">Figure 6-8</a>
Active Conversion Current vs Temperature	<a href="#">Figure 6-9</a>
Average Current vs Temperature	<a href="#">Figure 6-10</a>
Standby Current vs Temperature	<a href="#">Figure 6-11</a>
Shutdown Current vs Temperature	<a href="#">Figure 6-12</a>
Sampling Rate Change	<a href="#">Figure 6-13</a>

### 8.3 Power Supply Recommendations

The TMP139 operates with dual supply pins. The supply  $V_{DDIO}$  is used for the bus interface and operates in the range of 0.95 V to 1.05 V. The pin  $V_{DDSPD}$  is used as the supply for the core and operates in the range of 1.7 V to 1.98 V. A power-supply bypass capacitor is required for precision and stability. Place these power-supply capacitors as close to the supply and ground pins of the device as possible. A typical value of these supply bypass capacitor is 0.01  $\mu$ F. Applications with noisy or high-impedance power supplies can require a bigger bypass capacitor to reject power-supply noise.

### 8.4 Layout

#### 8.4.1 Layout Guidelines

Place the power-supply bypass capacitor as close as possible to the supply and ground pins as possible. The recommended value of this bypass capacitor is 0.01  $\mu$ F. The SCL does not require a pull up as it is driven in push-pull mode by the hub device. The SDA does not require an external pull up, as in I3C the pull up resistor is integrated in the hub device as well.

#### 8.4.2 Layout Example

**Figure 8-2. Layout Example**

## 9 Device and Documentation Support

### 9.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

### 9.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## EXAMPLE BOARD LAYOUT

**YAH0006-C01**

**DSBGA - 0.4 mm max height**

DIE SIZE BALL GRID ARRAY

NOTES: (continued)

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. See Texas Instruments Literature No. SNVA009 ([www.ti.com/lit/snva009](http://www.ti.com/lit/snva009)).

## EXAMPLE STENCIL DESIGN

**YAH0006-C01**

**DSBGA - 0.4 mm max height**

DIE SIZE BALL GRID ARRAY

NOTES: (continued)

- 4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMP139AIYHR	ACTIVE	DSBGA	YAH	6	12000	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 125	28VL	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TMP139AIYAHR	DSBGA	YAH	6	12000	180.0	8.4	0.93	1.43	0.47	2.0	8.0	Q1

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TMP139AIYHR	DSBGA	YAH	6	12000	182.0	182.0	20.0

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
