## 1 Device Information

### 1.1 Product Description

The TPS7H1121-SP is a radiation-hardened low dropout linear regulator (LDO) which operates over a wide range of input voltages optimized for powering devices in a space environment. It is capable of sourcing up to 2A over a 2.25V to 14V input. The device offers excellent stability and features a programmable current limit with a wide adjustment range. To support the complex power requirements of FPGAs, DSPs, and microcontrollers, the TPS7H1121-SP provides enable on and off functionality, programmable soft start, and a power good open-drain output.

## 2 Total Dose Test Setup

### 2.1 Test Overview

The TPS7H1121-SP was tested according to MIL-STD-883, Test Method 1019.9. For this testing, Condition A was used. For Condition A, the product was irradiated up to target radiation level and then put through full electrical parametric testing on the production Automated Test Equipment (ATE). All devices were fully functional, and passed all electrical parametric tests with the readings within the data sheet electrical specification limits.

### 2.2 Test Description and Facilities

The TPS7H1121-SP HDR exposure was performed on biased and unbiased devices in a Co-60 gamma cell at the Dallas CLAB (DCLAB) at Texas Instruments in Dallas, Texas. The unattenuated dose rate of this cell is 182.92rads(Si)/s. After exposure, the devices were brought to Junkins Laboratory at Texas Instruments in Dallas for full post-radiation electrical evaluation using Texas Instruments ATE. ATE test limits are set per data sheet electrical limits based on preliminary qualification and characterization data.

### 2.3 Test Setup Details

The devices under HDR exposure were tested in both biased and unbiased conditions shown in [Test Configuration and Conditions](#).

#### 2.3.1 Unbiased

For the unbiased HDR conditions, the exposure was performed with all pins grounded.

#### 2.3.2 Biased

The TPS7H1121-SP biased exposure was performed with a 14V bias on the Vin pins and 2.58V bias on the ENABLE pin. [Figure 2-1](#) shows the biased diagram that was used for HDR exposure.

## 3 TID Characterization Test Results

### 3.1 TID Characterization Summary Results

The parametric data for the TPS7H1121-SP passes up to 100krad(Si) HDR TID irradiation. The drifts of the electrical parameters through HDR were within the data sheet limits.

Overall, the TPS7H1121-SP showed a strong degree of hardness to HDR TID irradiation up to 100 krad(Si) for both biased and unbiased exposure conditions. The measurements taken post-irradiation for each sample set showed a marginal shift for most parameters at each dose level for both biased and unbiased. The parameters that did show a greater degree of change between pre- and post-irradiation were still within the electrical performance characteristics specified in the data sheet electrical parameters. See [Section 3.2](#) for parameters and associated tests.

See [Appendix A](#) for HDR report up to 100krad(Si).
