8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relck process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	1h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

5.2.1.54 PLL_CORE_HSDIVIDER Register (Offset = 428h) [Reset = 0000XXXXh]

31-6	RESERVED	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins. For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

5.2.1.97 PLL_DSP_CLKCTRL Register (Offset = 804h) [Reset = 0991XXXXh]

PLL_DSP_CLKCTRL is shown in [Table 5-100](#).

Return to the [Summary Table](#).

Table 5-100. PLL_DSP_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLESCLIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading. SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	9h	Trim value for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N ² +1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	R	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	RESERVED	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0: Reserved 0x2: HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3: Reserved 0x4: HS1: DCOCLK range is from 1000 MHz to 2000 MHz 0x5: Reserved
9	RESERVED	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0: FREQLOCK asserted when DC frequency error less than 1% 0x1: FREQLOCK asserted when DC frequency error less than 2%

15-12	RESERVED	R	0h	
11-0	M	R/W	174h	Feedback Multiplier is REGM

5.2.1.102 PLL_DSP_FRACDIV Register (Offset = 818h) [Reset = 08XX0000h]

PLL_DSP_FRACDIV is shown in [Table 5-105](#).

Return to the [Summary Table](#).

Table 5-105. PLL_DSP_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING} ([DPLL_MULT / (DPLL_DIV + 1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz
23-18	RESERVED	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

5.2.1.103 PLL_DSP_BWCTRL Register (Offset = 81Ch) [Reset = 0000000h]

PLL_DSP_BWCTRL is shown in [Table 5-106](#).

Return to the [Summary Table](#).

Table 5-106. PLL_DSP_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

5.2.1.104 PLL_DSP_FRACCTRL Register (Offset = 820h) [Reset = 0000000h]

PLL_DSP_FRACCTRL is shown in [Table 5-107](#).

Return to the [Summary Table](#).

Table 5-107. PLL_DSP_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread read 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

5.2.1.105 PLL_DSP_STATUS Register (Offset = 824h) [Reset = EXXX161h]

PLL_DSP_STATUS is shown in [Table 5-108](#).

Return to the [Summary Table](#).

Table 5-108. PLL_DSP_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	Status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	Status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	1h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
26-12	RESERVED	R	0h	
11	CLKDCOLDOACK	R	0h	Status on PHASELOCK output pin
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	1h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

5.2.1.106 PLL_DSP_HSDIVIDER Register (Offset = 828h) [Reset = 0000XXXXh]

PLL_DSP_HSDIVIDER is shown in [Table 5-109](#).

Return to the [Summary Table](#).

Table 5-113. PLL_DSP_HSDIVIDER_CLKOUT3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	RESERVED	R	0h	
12	PWDN	R/W	0h	Power down for HSDIVIDER M7 divider and hence CLKOUT3 output 0h (R/W) = CLKOUT3 divider active 1h (R/W) = CLKOUT3 divider is powered down
11-10	RESERVED	R	0h	
9	STATUS	R	0h	HSDIVIDER CLKOUT3 status 0h (R) = The clock output is gated 1h (R) = The clock output is enabled
8	GATE_CTRL	R/W	0h	Control gating of HSDIVIDER CLKOUT3 0h (R/W) = Automatically gate this clock when there is no dependency for it 1h (R/W) = Force this clock to stay enabled even if there is no request
7-6	RESERVED	R	0h	
5	DIVCHACK	R	0h	Toggle on this status bit after changing HSDIVIDER_CLKOUT3_DIV indicates that the change in divider value has taken effect
4-0	DIV	R/W	4h	DPLL post-divider factor, M7, for internal clock generation. Divide values from 1 to 31. 0h (R/W) = Reserved

5.2.1.111 PLL_PER_PWRCTRL Register (Offset = 83Ch) [Reset = 0000030h]

PLL_PER_PWRCTRL is shown in [Table 5-114](#).

Return to the [Summary Table](#).

Table 5-114. PLL_PER_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins. For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

5.2.1.112 PLL_PER_CLKCTRL Register (Offset = 840h) [Reset = 0991XXXXh]

PLL_PER_CLKCTRL is shown in [Table 5-115](#).

Return to the [Summary Table](#).

Table 5-115. PLL_PER_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLESZIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading. SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	9h	Trim value for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 0 1 IDLE = 0 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 1 IDLE = 1 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N-2) 1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	R	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	RESERVED	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0: Reserved 0x2: HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3: Reserved 0x4: HS1: DCOCLK range is from 1000 MHz to 2000 MHz 0x5: Reserved
9	RESERVED	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0: FREQLOCK asserted when DC frequency error less than 1% 0x1: FREQLOCK asserted when DC frequency error less than 2%

Table 5-115. PLL_PER_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-2	RESERVED	R	0h	
1	SSCTYPE	R/W	0h	SSC Type
0	TINTZ	R/W	0h	PLL core soft reset

5.2.1.113 PLL_PER_TENABLE Register (Offset = 844h) [Reset = 0000000h]

PLL_PER_TENABLE is shown in [Table 5-116](#).

31-20	RESERVED	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	RESERVED	R	0h	
11-0	M	R/W	174h	Feedback Multiplier is REGM

5.2.1.117 PLL_PER_FRACDIV Register (Offset = 854h) [Reset = 08XX0000h]

PLL_PER_FRACDIV is shown in [Table 5-120](#).

Return to the [Summary Table](#).

Table 5-120. PLL_PER_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. DPLL_SD_DIV = CEILING ((DPLL_MULT/(DPLL_DIV+1)) * CLKINP/250), where CLKINP is the input clock of the DPLL in MHz
23-18	RESERVED	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

5.2.1.118 PLL_PER_BWCTRL Register (Offset = 858h) [Reset = 0000000h]

PLL_PER_BWCTRL is shown in [Table 5-121](#).

Return to the [Summary Table](#).

Table 5-121. PLL_PER_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

5.2.1.119 PLL_PER_FRACCTRL Register (Offset = 85Ch) [Reset = 0000000h]

PLL_PER_FRACCTRL is shown in [Table 5-122](#).

Return to the [Summary Table](#).

Table 5-122. PLL_PER_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread read 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

5.2.1.120 PLL_PER_STATUS Register (Offset = 860h) [Reset = EXXX161h]

PLL_PER_STATUS is shown in [Table 5-123](#).

Return to the [Summary Table](#).

Table 5-123. PLL_PER_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	Status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	Status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	1h	1 indicates ADPLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLJ requires recalibration
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLJ requires recalibration
26-12	RESERVED	R	0h	
11	CLKDCOLDOACK	R	0h	Status on PHASELOCK output pin
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLJ are gated and it is ready for retention.
6	LOSSREF	R	1h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

5.2.1.121 PLL_PER_HSDIVIDER Register (Offset = 864h) [Reset = 0000XXXXh]

PLL_PER_HSDIVIDER is shown in [Table 5-124](#).

Return to the [Summary Table](#).

Table 5-124. PLL_PER_HSDIVIDER Register Field Descriptions

Bit	Field	Type	Reset	Description

5.2.1.130 ANA_REG_CLK_CTRL_REG1_XO_SLICER Register (Offset = C00h) [Reset = 0000000h]

ANA_REG_CLK_CTRL_REG1_XO_SLICER is shown in [Table 5-133](#).

Return to the [Summary Table](#).

Table 5-133. ANA_REG_CLK_CTRL_REG1_XO_SLICER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R	0h	Reserved Reads return 0x0 and writes have no effect. 0x0 = Functional Reset
14	SLICER_APLL_BYPASS_DRV	R/W	0h	Slicer APLL Bypass Drive This bit controls the drive strength of the APLL Bypass Slicer 0 = Low-power drive 1 = High-power drive 0x0 = Functional Reset
13	SLICER_APLL_BYPASS	R/W	0h	Slicer APLL Bypass This bit enables a high-speed slicer connected to CLKM which can be used to drive a high-speed clock directly as the SYNTH reference clock. 0 = Normal operation (bypass slicer disabled) 1 = APLL Bypass Slicer Enabled 0x0 = Functional Reset
12	XTAL_DETECT_XO_SLICER	R/W	0h	XTAL Detect Enable This bit connects a pullup and sense circuitry to CLKM to detect the presence or absence of a crystal. This operation will conflict with oscillator functionality, so this bit must be asserted only when the oscillator is disabled (CTRL_CLKTOP_REG 1 bit 2 must be '0'). After asserted, the internal XTAL_SENSE signal will reflect a '1' if a crystal is present (CLKM sees a high impedance) or '0' if CLKM is tied to ground. After the sense operation is detected, this bit must be cleared before the oscillator will function properly if enabled. 0 = Normal operation (pullup and sense circuitry are disconnected from CLKM, XTAL_SENSE outputs '1') 1 = XTAL sense function enabled (pullup and sense circuitry connected to CLKM, output of XTAL_SENSE reads '1' if high impedance, '0' if CLKM is tied to ground) 0x0 = Functional Reset
11	SLICER_DCCPL_XO_SLICER	R/W	0h	Slicer DC-Coupled Mode 0 = Normal operation (AC-couple CLKP to internal slicer) 1 = DC-couple CLKP to internal slicer to CLKP 0x0 = Functional Reset
10	SLICER_HIPWR_XO_SLICER	R/W	0h	Slicer High-power Mode This bit bypasses the input clock slicer current-starving/filtering circuitry to increase gain and reduce device phase-noise at the expense of power and reduced supply noise rejection. This permits the use of a high-speed external test clock (660MHz max). 0 = Normal operation (current-limiting present) 1 = High-power/high-speed test mode 0x0 = Functional Reset
9	FASTCHARGEZ_BIAS_XO_SLICER	R/W	0h	Bias Fast-charge Enable (Active Low) This bit bypasses the RC filtering on the XOSC/SLICER Bias to permit more rapid power-up. 0 = Bias fast-charge 1 = Normal operation (filtering present) 0x1 = Functional Reset
8-4	XOSC_DRIVE_XO_SLICER	R/W	0h	Crystal Oscillator Output Drive Binary-weighted oscillator drive control 0x0 = Functional Reset

10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	15h	

5.2.2.2 MSS_RST_CAUSE_CLR Register (Offset = 4h) [Reset = 0000000h]

MSS_RST_CAUSE_CLR is shown in [Table 5-173](#).

Return to the [Summary Table](#).

Table 5-173. MSS_RST_CAUSE_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	clr	R/W	0h	Write pulse bit field: Clear bit for rst cause register (writing '111' will clear the rst cause register)

5.2.2.3 MSS_RST_STATUS Register (Offset = 8h) [Reset = 0000003h]

MSS_RST_STATUS is shown in [Table 5-174](#).

Return to the [Summary Table](#).

Table 5-174. MSS_RST_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	cause	R	3h	Has the status because of which reset has happened. Bit0: POR Reset Bit1: Warm Reset Bit2: STC Reset Bit3 Reset for CR5A and MSS_CR5A_VIM using MSS_RCM::MSS_CR5SSA_RST_CTRL Bit4: Reset for CR5B and MSS_CR5B_VIM using MSS_RCM::MSS_CR5SSB_RST_CTRL Bit5: Reset for CR5A only using MSS_RCM::MSS_CR5A_RST_CTRL Bit6: Reset for CR5B only using MSS_RCM::MSS_CR5B_RST_CTRL Bit7: Reset for CR5A and MSS_CR5A_VIM caused because of reset request by debugger in CR5A Bit8: Reset for CR5B and MSS_CR5B_VIM caused because of reset request by debugger in CR5B Bit9: Reset for CR5SS by the RESET FSM using MSS_CTRL::R5_CONTROL_RESET_FSM_TRIGGER

5.2.2.4 SYSRST_BY_DBG_RST Register (Offset = Ch) [Reset = 0000XXXh]

SYSRST_BY_DBG_RST is shown in [Table 5-175](#).

Return to the [Summary Table](#).

Table 5-175. SYSRST_BY_DBG_RST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	
18-16	r5b	R/W	0h	writing '111' will block debug reset request from CR5B toggling globally reset for CR5B
15-3	RESERVED	R	0h	
2-0	r5a	R/W	0h	writing '111' will block debug reset request from CR5A toggling globally reset for CR5A

5.2.2.5 RST_ASSERDLY Register (Offset = 10h) [Reset = 000000Fh]

RST_ASSERDLY is shown in [Table 5-176](#).

Return to the [Summary Table](#).

Table 5-176. RST_ASSERDLY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	common	R/W	Fh	Value decides number of cycles reset should be asserted for CR5SS related resets

5.2.2.6 RST2ASSERTDLY Register (Offset = 14h) [Reset = 0000000h]

RST2ASSERTDLY is shown in [Table 5-177](#).

Return to the [Summary Table](#).

Table 5-177. RST2ASSERTDLY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	r5b	R/W	0h	Value decides number of cycles should be held before asserting reset for r5ss local reset for CR5B
23-16	r5a	R/W	0h	Value decides number of cycles should be held before asserting reset for r5ss local reset for CR5A
15-8	r5ssb	R/W	0h	Value decides number of cycles should be held before asserting reset for r5ss global reset for CR5B
7-0	r5ssa	R/W	0h	Value decides number of cycles should be held before asserting reset for r5ss global reset for CR5A.

5.2.2.7 RST_WFICHECK Register (Offset = 18h) [Reset = 07XXXXXXh]

RST_WFICHECK is shown in [Table 5-178](#).

Return to the [Summary Table](#).

Table 5-178. RST_WFICHECK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	
26-24	r5b	R/W	7h	writing '000' will disable check for WFI before local reset assertion of CR5A
23-19	RESERVED	R	0h	
18-16	r5a	R/W	7h	writing '000' will disable check for WFI before local reset assertion of CR5A
15-11	RESERVED	R	0h

Table 5-313. HSM_DMTB_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	0h	Status shows the current divider value chosen for HSM_DMTB
7-0	clkinuse	R	1h	Status shows the source clock selected for HSM_DMTB

5.2.2.143 MSS_CSI2A_RST_CTRL Register (Offset = 450h) [Reset = 00000000h]

MSS_CSI2A_RST_CTRL is shown in [Table 5-314](#).

Return to the [Summary Table](#).

Table 5-314. MSS_CSI2A_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	assert	R/W	0h	This feature is for debug purpose only. Software needs to ensure the state of the Device/IP before configuring. Writing '111' will reset MSS CSI2A

5.2.2.144 MSS_CSI2A_CLK_GATE Register (Offset = 454h) [Reset = 0000000h]

MSS_CSI2A_CLK_GATE is shown in [Table 5-315](#).

Return to the [Summary Table](#).

Table 5-315. MSS_CSI2A_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	gated	R/W	0h	writing '111' will gate clock for MSS CSI2A

5.2.2.145 HW_SPARE_RW0 Register (Offset = FD0h) [Reset = 0000000h]

HW_SPARE_RW0 is shown in [Table 5-316](#).

Return to the [Summary Table](#).

Table 5-316. HW_SPARE_RW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw0	R/W	0h	Reserved for HW R&D

5.2.2.146 HW_SPARE_RW1 Register (Offset = FD4h) [Reset = 0000000h]

HW_SPARE_RW1 is shown in [Table 5-317](#).

Return to the [Summary Table](#).

Table 5-317. HW_SPARE_RW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw1	R/W	0h	Reserved for HW R&D

5.2.2.147 HW_SPARE_RW2 Register (Offset = FD8h) [Reset = 0000000h]

HW_SPARE_RW2 is shown in [Table 5-318](#).

Return to the [Summary Table](#).

Table 5-318. HW_SPARE_RW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw2	R/W	0h	Reserved for HW R&D

5.2.2.148 HW_SPARE_RW3 Register (Offset = FDCh) [Reset = 0000000h]

HW_SPARE_RW3 is shown in [Table 5-319](#).

Return to the [Summary Table](#).

Table 5-319. HW_SPARE_RW3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw3	R/W	0h	Reserved for HW R&D

5.2.2.149 HW_SPARE_RO0 Register (Offset = FE0h) [Reset = 0000000h]

HW_SPARE_RO0 is shown in [Table 5-320](#).

Return to the [Summary Table](#).

Table 5-320. HW_SPARE_RO0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro0	R	0h	Reserved for HW R&D

5.2.2.150 HW_SPARE_RO1 Register (Offset = FE4h) [Reset = 0000000h]

HW_SPARE_RO1 is shown in [Table 5-321](#).

Return to the [Summary Table](#).

Table 5-321. HW_SPARE_RO1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro1	R	0h	Reserved for HW R&D

5.2.2.151 HW_SPARE_RO2 Register (Offset = FE8h) [Reset = 0000000h]

HW_SPARE_RO2 is shown in [Table 5-322](#).

Return to the [Summary Table](#).

Table 5-322. HW_SPARE_RO2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro2	R	0h	Reserved for HW R&D

9	hw_spare_rec9	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
8	hw_spare_rec8	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D

Table 5-325. HW_SPARE_REC Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	hw_spare_rec7	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
6	hw_spare_rec6	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
5	hw_spare_rec5	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
4	hw_spare_rec4	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
3	hw_spare_rec3	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
2	hw_spare_rec2	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
1	hw_spare_rec1	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
0	hw_spare_rec0	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D

5.2.2.155 LOCK0_KICK0 Register (Offset = 1008h) [Reset = 00000000h]

LOCK0_KICK0 is shown in [Table 5-326](#).

Return to the [Summary Table](#).

- KICK0 component

Table 5-326. LOCK0_KICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick0	R/W	0h	- KICK0 component

5.2.2.156 LOCK0_KICK1 Register (Offset = 100Ch) [Reset = 00000000h]

LOCK0_KICK1 is shown in [Table 5-327](#).

Return to the [Summary Table](#).

- KICK1 component

Table 5-327. LOCK0_KICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick1	R/W	0h	- KICK1 component

5.2.2.157 intr_raw_status Register (Offset = 1010h) [Reset = 0000000h]

intr_raw_status is shown in [Table 5-328](#).

Return to the [Summary Table](#).

Interrupt Raw Status/Set Register

Table 5-328. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.2.2.158 intr_enabled_status_clear Register (Offset = 1014h) [Reset = 0000000h]

intr_enabled_status_clear is shown in [Table 5-329](#).

Return to the [Summary Table](#).

Interrupt Enabled Status/Clear register

Table 5-329. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.2.2.159 intr_enable Register (Offset = 1018h) [Reset = 0000000h]

intr_enable is shown in [Table 5-330](#).

Return to the [Summary Table](#).

Interrupt Enable register

Table 5-330. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.2.160 intr_enable_clear Register (Offset = 101Ch) [Reset = 0000000h]

intr_enable_clear is shown in [Table 5-331](#).

Return to the [Summary Table](#).

Interrupt Enable Clear register

Table 5-331. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.2.161 eoi Register (Offset = 1020h) [Reset = 0000000h]

eoi is shown in [Table 5-332](#).

Return to the [Summary Table](#).

EOI register

Table 5-332. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.2.162 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-333](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-333. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.2.163 fault_type_status Register (Offset = 1028h) [Reset = 0000000h]

fault_type_status is shown in [Table 5-334](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-334. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_ 0000 = Supervisor read fault - priv = 1 dir = 1 dtype != 1 01_ 0000 = Supervisor write fault - priv = 1 dir = 0 00_ 1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_ 0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_ 0010 = User write fault - priv = 0 dir = 0 00_ 0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_ 0000 = No fault

5.2.2.164 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-335](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-335. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.2.165 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-336](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-336. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.3 DSS_RCM Registers

Table 5-337 lists the memory-mapped registers for the DSS_RCM registers. All register offset addresses not listed in Table 5-337 should be considered as reserved locations and the register contents should not be modified.

Table 5-337. DSS_RCM Registers

Offset	Acronym	Register Name	Section
0h	PID	PID register	Go

Complex bit access types are encoded to fit into small table cells. [Table 5-338](#) shows the codes that are used for access types in this section.

Table 5-338. DSS_RCM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.3.1 PID Register (Offset = 0h) [Reset = 61800215h]

PID is shown in [Table 5-339](#).

Return to the [Summary Table](#).

PID register

Table 5-339. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h

10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	15h	

5.2.3.2 HW_REG0 Register (Offset = 4h) [Reset = 00000000h]

HW_REG0 is shown in [Table 5-340](#).

Return to the [Summary Table](#).

Table 5-340. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.3.3 HW_REG1 Register (Offset = 8h) [Reset = 00000000h]

HW_REG1 is shown in [Table 5-341](#).

Return to the [Summary Table](#).

Table 5-341. HW_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.3.4 PREVIOUS_NAME Register (Offset = Ch) [Reset = 00000000h]

PREVIOUS_NAME is shown in [Table 5-342](#).

Return to the [Summary Table](#).

Table 5-342. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.3.5 HW_REG3 Register (Offset = 10h) [Reset = 0000000h]

HW_REG3 is shown in [Table 5-343](#).

Return to the [Summary Table](#).

Table 5-343. HW_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.3.6 DSP_PD_CTRL Register (Offset = 14h) [Reset = 000001Xh]

DSP_PD_CTRL is shown in [Table 5-344](#).

Return to the [Summary Table](#).

Table 5-344. DSP_PD_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	
4	proc_halt	R/W	1h	Controls the unhalting on the processor during the power-up sequence Write 1 : The DSP is kept in halt state at the end of the power up sequence. The L2 memories can now be initialised and loaded before setting this bit to 0, unhalting the processor and begin execution Write 0 : The processor is unhalted at the end of the power up sequence. Here the assumption is the code is already downloaded in L2 and the processor can immediately begin execution on power up.
3-1	RESERVED	R	0h	
0	interrupt_mask	R/W	1h	Masks interrupts to the DSP. Write 1 : Mask interrupts to the DSP before powering off the DSP. When masked, any interrupts are now stored in the Missed event register. Write 0 : Send the interrupts to the DSP after power on.

5.2.3.7 DSP_PD_TRIGGER_WAKUP Register (Offset = 18h) [Reset = 0000000h]

DSP_PD_TRIGGER_WAKUP is shown in [Table 5-345](#).

Return to the [Summary Table](#).

Table 5-345. DSP_PD_TRIGGER_WAKUP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	wakeup_trigger	R/W	0h	Write pulse bit field: Trigger Power Up of the DSP. Write 1 : Triggers DSP power up sequence

5.2.3.8 DSP_PD_TRIGGER_SLEEP Register (Offset = 1Ch) [Reset = 0000000h]

DSP_PD_TRIGGER_SLEEP is shown in [Table 5-346](#).

Return to the [Summary Table](#).

Table 5-346. DSP_PD_TRIGGER_SLEEP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	sleep_trigger	R/W	0h	Write pulse bit field: Trigger Power Down of the DSP. Write 1 : Triggers DSP power down sequence

5.2.3.9 DSP_PD_STATUS Register (Offset = 20h) [Reset = 00000XXh]

DSP_PD_STATUS is shown in [Table 5-347](#).

Return to the [Summary Table](#).

Table 5-347. DSP_PD_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R	0h	
8	pwrsm_dbg_ovrd	R	0h	Status bit indicating if there is an override for the DSP from Debug SubSystem. 0 : No override from DebugSS 1 : Override from DebugSS
7-6	RESERVED	R	0h	
5-4	pd_status	R	0h	Power Mode status of DSP 00 : Powered OFF 01 : Transitioning from OFF to ON state 10 : Transitioning from ON to OFF state 11 : Powered ON
3-1	RESERVED	R	0h	
0	proc_halted	R	0h	Processor is halted

5.2.3.10 DSP_PD_CTRL_MISC0 Register (Offset = 24h) [Reset = 14514514h]

DSP_PD_CTRL_MISC0 is shown in [Table 5-348](#).

Return to the [Summary Table](#).

Table 5-348. DSP_PD_CTRL_MISC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	
29-24	pwrsm_grst_deassertcnt	R/W	14h	TI Internal Feature No of cycles to wait after de-assertion of GRSTN during DSP Power-up sequence. Max allowed value is 31.
23-18	pwrsm_porrst_deassertcnt	R/W	14h	TI Internal Feature No of cycles to wait after de-assertion of POR during DSP Power-up sequence. Max allowed value is 31.
17-12	pwrsm_lrst_assertcnt	R/W	14h	TI Internal Feature No of cycles to wait after assertion of LRSTN during DSP Power-up sequence. Max allowed value is 31.
11-6	pwrsm_grst_assertcnt	R/W	14h	TI Internal Feature No of cycles to wait after assertion of GRSTN during DSP Power-up sequence. Max allowed value is 31.
5-0	pwrsm_porrst_assertcnt	R/W	14h	TI Internal Feature No of cycles to wait after assertion of POR during DSP Power-up sequence. Max allowed value is 31.

5.2.3.11 DSP_PD_CTRL_MISC1 Register (Offset = 28h) [Reset = 00XX4514h]

DSP_PD_CTRL_MISC1 is shown in [Table 5-349](#).

Return to the [Summary Table](#).

Table 5-349. DSP_PD_CTRL_MISC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	
26-24	iso_sync_bypass	R/W	0h	HW RnD reserved. Do not Touch - Only for debug purpose
23	RESERVED	R	0h	
22-20	rst_sync_bypass	R/W	0h	HW RnD reserved. Do not Touch - Only for debug purpose
19	RESERVED	R	0h	
18	pwrsm_lresetout_mask	R/W	0h	TI Internal Feature 1:mask lresetout from DSPin FSM
17-12	pwrsm_isoen_assertcnt	R/W	14h	TI Internal Feature No of cycles to wait after assertion of ISO_ENABLE during GEM power-down sequence. Max allowed value is 31.
11-6	pwrsm_clkstop_deassertcnt	R/W	14h	TI Internal Feature No of cycles to wait after de-assertion of GEM_CLK_STOP_REQ during GEM Power-up sequence. Max allowed value is 31.
5-0	pwrsm_lrst_deassertcnt	R/W	14h	TI Internal Feature No of cycles to wait after de-assertion of LRSTN during DSP Power-up sequence. Max allowed value is 31.

5.2.3.12 DSP_PD_STATUS_MISC0 Register (Offset = 2Ch) [Reset = 0003A0XFh]

DSP_PD_STATUS_MISC0 is shown in [Table 5-350](#).

Return to the [Summary Table](#).

Table 5-350. DSP_PD_STATUS_MISC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R	0h	
17	pwrsm_lrstout	R	1h	TI Internal Feature Lreset output indication from GEM
16	pwrsm_c66_clkstop_ack	R	1h	TI Internal Feature Clock stop request ack from GEM
15	pwrsm_sdma_async2scr_clkstop_ack	R	1h	TI Internal Feature SDMA slave disable Done from clock stop ack from the master port of the async bridge present in the SDMA port.
14	pwrsm_sdma_async2rcm_clkstop_req	R	0h	TI Internal Feature SDMA Slave disable Ack from Interconnect. This is from the clock stop req signal coming from the slave port of the async bridge in SDMA.
13	pwrsm_sdma_scr2async_clkstop_req	R	1h	TI Internal Feature Clock Stop request from SCR to SDMA Async Bridge
12	pwrsm_mem_agoodout	R	0h	TI Internal Feature Memory AGOOD Output from GEM (synchronized to Bus clock)
11	pwrsm_mem_aonout	R	0h	TI Internal Feature Memory AON Output from GEM (synchronized to Bus clock)
10	pwrsm_mem_pgoodout	R	0h	TI Internal Feature Memory PGOOD Output from DSP (synchronized to Bus clock)
9	pwrsm_mem_ponout	R	0h	TI Internal Feature Memory PON Output from DSP (synchronized to Bus clock)
8	pwrsm_pgoodout	R	0h	TI Internal Feature Logic PGOOD Output from DSP (synchronized to Bus clock)
7	pwrsm_ponout	R	0h	TI Internal Feature Logic PON Output from DSP (synchronized to Bus clock)
6	RESERVED	R	0h	
5-0	state	R	1Fh	This is the internal state of the DSP power State machine. Currently value of 13 needs to be polled to confirm we can now download code to the L2 memory before unhalting the processor. Plan to change this in TPR and provide a single bit to poll on and move this to debug register since all the other states are irrelevant for SW

5.2.3.13 DSP_PD_WAKEUP_MASK0 Register (Offset = 30h) [Reset = FFFFFFFFh]

DSP_PD_WAKEUP_MASK0 is shown in [Table 5-351](#).

Return to the [Summary Table](#).

Table 5-351. DSP_PD_WAKEUP_MASK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	wakeup_mask0	R/W	FFFFFFFh	Bit level mask for each of the wakeup source bits [31:0] 1 : Masked 0 : Unmasked

5.2.3.14 DSP_PD_WAKEUP_MASK1 Register (Offset = 34h) [Reset = FFFFFFFFh]

DSP_PD_WAKEUP_MASK1 is shown in [Table 5-352](#).

Return to the [Summary Table](#).

Table 5-352. DSP_PD_WAKEUP_MASK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	wakeup_mask1	R/W	FFFFFFFh	Bit level mask for each of the wakeup source bits [63:32] 1 : Masked 0 : Unmasked.

5.2.3.15 DSP_PD_WAKEUP_MASK2 Register (Offset = 38h) [Reset = FFFFFFFFh]

DSP_PD_WAKEUP_MASK2 is shown in [Table 5-353](#).

Return to the [Summary Table](#).

Table 5-353. DSP_PD_WAKEUP_MASK2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	wakeup_mask2	R/W	FFFFFFFh	Bit level mask for each of the wakeup source bits [95:64] 1 : Masked 0 : Unmasked.

5.2.3.16 DSP_PD_WAKEUP_STATUS0 Register (Offset = 3Ch) [Reset = 0000000h]

DSP_PD_WAKEUP_STATUS0 is shown in [Table 5-354](#).

Return to the [Summary Table](#).

Table 5-354. DSP_PD_WAKEUP_STATUS0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	wakeup_status0	R	0h	Wakeup source status bits [31:0]

5.2.3.17 DSP_PD_WAKEUP_STATUS1 Register (Offset = 40h) [Reset = 0000000h]

DSP_PD_WAKEUP_STATUS1 is shown in [Table 5-355](#).

Return to the [Summary Table](#).

Table 5-355. DSP_PD_WAKEUP_STATUS1 Register Field Descriptions

Bit	Field	Type	Reset	Description

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.2.3.115 intr_enabled_status_clear Register (Offset = 1014h) [Reset = 0000000h]

intr_enabled_status_clear is shown in [Table 5-453](#).

Return to the [Summary Table](#).

Interrupt Enabled Status/Clear register

Table 5-453. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.2.3.116 intr_enable Register (Offset = 1018h) [Reset = 0000000h]

intr_enable is shown in [Table 5-454](#).

Return to the [Summary Table](#).

Interrupt Enable register

Table 5-454. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.3.117 intr_enable_clear Register (Offset = 101Ch) [Reset = 0000000h]

intr_enable_clear is shown in [Table 5-455](#).

Return to the [Summary Table](#).

Interrupt Enable Clear register

Table 5-455. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.3.118 eoi Register (Offset = 1020h) [Reset = 00000000h]

eoi is shown in [Table 5-456](#).

Return to the [Summary Table](#).

EOI register

Table 5-456. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.3.119 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-457](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-457. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.3.120 fault_type_status Register (Offset = 1028h) [Reset = 0000000h]

fault_type_status is shown in [Table 5-458](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-458. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_ 0000 = Supervisor read fault - priv = 1 dir = 1 dtype != 1 01_ 0000 = Supervisor write fault - priv = 1 dir = 0 00_ 1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_ 0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_ 0010 = User write fault - priv = 0 dir = 0 00_ 0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_ 0000 = No fault

5.2.3.121 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-459](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-459. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.3.122 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-460](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-460. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.4 RSS_RCM Registers

Table 5-461 lists the memory-mapped registers for the RSS_RCM registers. All register offset addresses not listed in Table 5-461 should be considered as reserved locations and the register contents should not be modified.

Table 5-461. RSS_RCM Registers

Offset	Acronym	Register Name	Section
0h	PID	PID register	Go
4h	HW_REG0		Go
8h	HW_REG1		Go
Ch	PREVIOUS_NAME		Go
10h	HW_REG3		Go
18h	RSS_BSS_SYS_CLK_GATE		Go
20h	RSS_EDMA_RST_CTRL		Go
24h	RSS_BSS_RST_CTRL		Go
28h	RSS_FRC_CLK_SRC_SEL		Go
2Ch	RSS_FRC_CLK_GATE		Go
30h	RSS_FRC_CLK_DIV_VAL		Go
34h	RSS_FRC_CLK_STATUS		Go
38h	RSS_FRC_RST_CTRL		Go
3Ch	RSS_IP_CLK_CFG		Go
40h	RSS_IP_ACCESS_DIS		Go
FD0h	HW_SPARE_RW0		Go
FD4h	HW_SPARE_RW1		Go
FD8h	HW_SPARE_RW2		Go
FDCh	HW_SPARE_RW3		Go
FE0h	HW_SPARE_RO0		Go
FE4h	HW_SPARE_RO1		Go
FE8h	HW_SPARE_RO2		Go
FECh	HW_SPARE_RO3		Go
FF0h	HW_SPARE_WPH		Go
FF4h	HW_SPARE_REC		Go
1008h	LOCK0_KICK0	- KICK0 component	Go
100Ch	LOCK0_KICK1	- KICK1 component	Go
1010h	intr_raw_status	Interrupt Raw Status/Set Register	Go
1014h	intr_enabled_status_clear	Interrupt Enabled Status/Clear register	Go
1018h	intr_enable	Interrupt Enable register	Go
101Ch	intr_enable_clear	Interrupt Enable Clear register	Go
1020h	eoi	EOI register	Go
1024h	fault_address	Fault Address register	Go
1028h	fault_type_status	Fault Type Status register	Go
102Ch	fault_attr_status	Fault Attribute Status register	Go
1030h	fault_clear	Fault Clear register	Go

Complex bit access types are encoded to fit into small table cells. Table 5-462 shows the codes that are used for access types in this section.

Table 5-462. RSS_RCM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.4.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in [Table 5-463](#).

Return to the [Summary Table](#).

PID register

Table 5-463. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.4.2 HW_REG0 Register (Offset = 4h) [Reset = 00000000h]

HW_REG0 is shown in [Table 5-464](#).

Return to the [Summary Table](#).

Table 5-464. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.4.3 HW_REG1 Register (Offset = 8h) [Reset = 0000000h]

HW_REG1 is shown in [Table 5-465](#).

Return to the [Summary Table](#).

Table 5-465. HW_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.4.4 PREVIOUS_NAME Register (Offset = Ch) [Reset = 0000000h]

PREVIOUS_NAME is shown in [Table 5-466](#).

Return to the [Summary Table](#).

Table 5-466. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.4.5 HW_REG3 Register (Offset = 10h) [Reset = 0000000h]

HW_REG3 is shown in [Table 5-467](#).

Return to the [Summary Table](#).

Table 5-467. HW_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.4.6 RSS_BSS_SYS_CLK_GATE Register (Offset = 18h) [Reset = 00000000h]

RSS_BSS_SYS_CLK_GATE is shown in [Table 5-468](#).

Return to the [Summary Table](#).

Table 5-468. RSS_BSS_SYS_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	gated	R/W	0h	Clock gating config for RSS BSS Data should be loaded as multibit. Write 3'b000 : Clock is ungated Write 3'b111 : Clock is gated

5.2.4.7 RSS_EDMA_RST_CTRL Register (Offset = 20h) [Reset = 00000XXh]

RSS_EDMA_RST_CTRL is shown in [Table 5-469](#).

Return to the [Summary Table](#).

Table 5-469. RSS_EDMA_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	0h	
10-8	tptca0_assert	R/W	0h	writing '111' will reset MSS_TPCCA
7	RESERVED	R	0h	
6-4	tpcca_assert	R/W	0h	This feature is for debug pupose only. software need to ensure the correct state of Device/IP before configuring this reset control for RSS EDMA Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW
3	RESERVED	R	0h	
2-0	assert	R/W	0h	This feature is for debug pupose only. software need to ensure the correct state of Device/IP before configuring this reset control for RSS EDMA Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW

5.2.4.8 RSS_BSS_RST_CTRL Register (Offset = 24h) [Reset = 0000000h]

RSS_BSS_RST_CTRL is shown in [Table 5-470](#).

Return to the [Summary Table](#).

Table 5-470. RSS_BSS_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	assert	R/W	0h	<p>This feature is for debug pupose only. software need to ensure the correct state of Device/IP before configuring this reset control for RSS BSS Data should be loaded as multibit.</p> <p>Write 3'b000: Reset is not asserted by SW.</p> <p>There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW</p>

5.2.4.9 RSS_FRC_CLK_SRC_SEL Register (Offset = 28h) [Reset = 0000000h]

RSS_FRC_CLK_SRC_SEL is shown in [Table 5-471](#).

Return to the [Summary Table](#).

Table 5-471. RSS_FRC_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for FRC. Data should be loaded as multibit. For example: if '0x5' should be selected then '0x555' should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.4.10 RSS_FRC_CLK_GATE Register (Offset = 2Ch) [Reset = 0000000h]

RSS_FRC_CLK_GATE is shown in [Table 5-472](#).

Return to the [Summary Table](#).

Table 5-472. RSS_FRC_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	gated	R/W	0h	writing 3'b111 will gate the clock for FRC

5.2.4.11 RSS_FRC_CLK_DIV_VAL Register (Offset = 30h) [Reset = 0000000h]

RSS_FRC_CLK_DIV_VAL is shown in [Table 5-473](#).

Return to the [Summary Table](#).

Table 5-473. RSS_FRC_CLK_DIV_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	
11-0	clkdivr	R/W	0h	Divider value for FRC selected clock. Data should be loaded as multibit. For example: if divider value of 8(1000) should be selected then '100010001000' should be configured to the register. Refer to TPR12 clock planner for clock reference

5.2.4.12 RSS_FRC_CLK_STATUS Register (Offset = 34h) [Reset = 0000001h]

RSS_FRC_CLK_STATUS is shown in [Table 5-474](#).

Return to the [Summary Table](#).

Table 5-474. RSS_FRC_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	0h	Status shows the current divider value chosen for FRC
7-0	clkinuse	R	1h	Status shows the source clock selected for FRC

5.2.4.13 RSS_FRC_RST_CTRL Register (Offset = 38h) [Reset = 0000000h]

RSS_FRC_RST_CTRL is shown in [Table 5-475](#).

Return to the [Summary Table](#).

Table 5-475. RSS_FRC_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	assert	R/W	0h	This feature is for debug pupose only. software need to ensure the correct state of Device/IP before configuring this reset control for RSS FRC Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW

5.2.4.14 RSS_IP_CLK_CFG Register (Offset = 3Ch) [Reset = 0000000h]

RSS_IP_CLK_CFG is shown in [Table 5-476](#).

Return to the [Summary Table](#).

Table 5-476. RSS_IP_CLK_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	gate	R/W	0h	IP clock gating configuration bits Writing 3'b111 will gate the IP

5.2.4.15 RSS_IP_ACCESS_DIS Register (Offset = 40h) [Reset = 0000000h]

RSS_IP_ACCESS_DIS is shown in [Table 5-477](#).

Return to the [Summary Table](#).

Table 5-477. RSS_IP_ACCESS_DIS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	disable	R/W	0h	IP access disable configuration bits Writing 3'b111 will disable the IP

5.2.4.16 HW_SPARE_RW0 Register (Offset = FD0h) [Reset = 0000000h]

HW_SPARE_RW0 is shown in [Table 5-478](#).

Return to the [Summary Table](#).

Table 5-478. HW_SPARE_RW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw0	R/W	0h	Reserved for HW R&D

5.2.4.17 HW_SPARE_RW1 Register (Offset = FD4h) [Reset = 0000000h]

HW_SPARE_RW1 is shown in [Table 5-479](#).

Return to the [Summary Table](#).

Table 5-479. HW_SPARE_RW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw1	R/W	0h	Reserved for HW R&D

5.2.4.18 HW_SPARE_RW2 Register (Offset = FD8h) [Reset = 0000000h]

HW_SPARE_RW2 is shown in [Table 5-480](#).

Return to the [Summary Table](#).

Table 5-480. HW_SPARE_RW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw2	R/W	0h	Reserved for HW R&D

5.2.4.19 HW_SPARE_RW3 Register (Offset = FDCh) [Reset = 0000000h]

HW_SPARE_RW3 is shown in [Table 5-481](#).

Return to the [Summary Table](#).

Table 5-481. HW_SPARE_RW3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw3	R/W	0h	Reserved for HW R&D

5.2.4.20 HW_SPARE_RO0 Register (Offset = FE0h) [Reset = 00000000h]

HW_SPARE_RO0 is shown in [Table 5-482](#).

Return to the [Summary Table](#).

Table 5-482. HW_SPARE_RO0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro0	R	0h	Reserved for HW R&D

5.2.4.21 HW_SPARE_RO1 Register (Offset = FE4h) [Reset = 00000000h]

HW_SPARE_RO1 is shown in [Table 5-483](#).

Return to the [Summary Table](#).

Table 5-483. HW_SPARE_RO1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro1	R	0h	Reserved for HW R&D

5.2.4.22 HW_SPARE_RO2 Register (Offset = FE8h) [Reset = 0000000h]

HW_SPARE_RO2 is shown in [Table 5-484](#).

Return to the [Summary Table](#).

Table 5-484. HW_SPARE_RO2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro2	R	0h	Reserved for HW R&D

5.2.4.23 HW_SPARE_RO3 Register (Offset = FECh) [Reset = 0000000h]

HW_SPARE_RO3 is shown in [Table 5-485](#).

Return to the [Summary Table](#).

Table 5-485. HW_SPARE_RO3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro3	R	0h	Reserved for HW R&D

5.2.4.24 HW_SPARE_WPH Register (Offset = FF0h) [Reset = 0000000h]

HW_SPARE_WPH is shown in [Table 5-486](#).

Return to the [Summary Table](#).

5.2.4.27 LOCK0_KICK1 Register (Offset = 100Ch) [Reset = 00000000h]

LOCK0_KICK1 is shown in [Table 5-489](#).

Return to the [Summary Table](#).

- KICK1 component

Table 5-489. LOCK0_KICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick1	R/W	0h	- KICK1 component

5.2.4.28 intr_raw_status Register (Offset = 1010h) [Reset = 0000000h]

intr_raw_status is shown in [Table 5-490](#).

Return to the [Summary Table](#).

Interrupt Raw Status/Set Register

Table 5-490. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.2.4.29 intr_enabled_status_clear Register (Offset = 1014h) [Reset = 0000000h]

intr_enabled_status_clear is shown in [Table 5-491](#).

Return to the [Summary Table](#).

Interrupt Enabled Status/Clear register

Table 5-491. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.2.4.30 intr_enable Register (Offset = 1018h) [Reset = 0000000h]

intr_enable is shown in [Table 5-492](#).

Return to the [Summary Table](#).

Interrupt Enable register

Table 5-492. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.4.31 intr_enable_clear Register (Offset = 101Ch) [Reset = 0000000h]

intr_enable_clear is shown in [Table 5-493](#).

Return to the [Summary Table](#).

Interrupt Enable Clear register

Table 5-493. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.4.32 eoi Register (Offset = 1020h) [Reset = 00000000h]

eoi is shown in [Table 5-494](#).

Return to the [Summary Table](#).

EOI register

Table 5-494. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.4.33 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-495](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-495. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.4.34 fault_type_status Register (Offset = 1028h) [Reset = 0000000h]

fault_type_status is shown in [Table 5-496](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-496. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_ 0000 = Supervisor read fault - priv = 1 dir = 1 dtype != 1 01_ 0000 = Supervisor write fault - priv = 1 dir = 0 00_ 1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_ 0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_ 0010 = User write fault - priv = 0 dir = 0 00_ 0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_ 0000 = No fault

5.2.4.35 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-497](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-497. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.4.36 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-498](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-498. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.5 DSS_CTRL Registers

Table 5-499 lists the memory-mapped registers for the DSS_CTRL registers. All register offset addresses not listed in Table 5-499 should be considered as reserved locations and the register contents should not be modified.

Table 5-499. DSS_CTRL Registers

Offset	Acronym	Register Name	Section

1	tpcc_b_meminit_done	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is complete. Write 0x1 to clear status. Refer TPCC Memory initialization sequence in EDMA section for more details
0	tpcc_a_meminit_done	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is complete. Write 0x1 to clear status. Refer TPCC Memory initialization sequence in EDMA section for more details

5.2.5.28 DSS_DSP_L2RAM_MEMINIT_START Register (Offset = 80h) [Reset = 0000000h]

DSS_DSP_L2RAM_MEMINIT_START is shown in [Table 5-528](#).

Return to the [Summary Table](#).

Table 5-528. DSS_DSP_L2RAM_MEMINIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7	vb31	R/W	0h	Write pulse bit field: Start Memory initialization of DSP L2 memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie DSS_DSP_L2RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear DSS_DSP_L2RAM_MEMINIT_DONE)
6	vb30	R/W	0h	Write pulse bit field: Start Memory initialization of DSP L2 memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie DSS_DSP_L2RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear DSS_DSP_L2RAM_MEMINIT_DONE)
5	vb21	R/W	0h	Write pulse bit field: Start Memory initialization of DSP L2 memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie DSS_DSP_L2RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear DSS_DSP_L2RAM_MEMINIT_DONE)
4	vb20	R/W	0h	Write pulse bit field: Start Memory initialization of DSP L2 memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie DSS_DSP_L2RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear DSS_DSP_L2RAM_MEMINIT_DONE)
3	vb11	R/W	0h	Write pulse bit field: Start Memory initialization of DSP L2 memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie DSS_DSP_L2RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear DSS_DSP_L2RAM_MEMINIT_DONE)
2	vb10	R/W	0h	Write pulse bit field: Start Memory initialization of DSP L2 memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie DSS_DSP_L2RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear DSS_DSP_L2RAM_MEMINIT_DONE)

Table 5-528. DSS_DSP_L2RAM_MEMINIT_START Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	vb01	R/W	0h	Write pulse bit field: Start Memory initialization of DSP L2 memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie DSS_DSP_L2RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear DSS_DSP_L2RAM_MEMINIT_DONE)
0	vb00	R/W	0h	Write pulse bit field: Start Memory initialization of DSP L2 memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie DSS_DSP_L2RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear DSS_DSP_L2RAM_MEMINIT_DONE)

5.2.5.29 DSS_DSP_L2RAM_MEMINIT_STATUS Register (Offset = 84h) [Reset = 0000000h]

DSS_DSP_L2RAM_MEMINIT_STATUS is shown in [Table 5-529](#).

Return to the [Summary Table](#).

Table 5-529. DSS_DSP_L2RAM_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7	vb31	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of DSP L2 memory is in progress.
6	vb30	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of DSP L2 memory is in progress.
5	vb21	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of DSP L2 memory is in progress.
4	vb20	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of DSP L2 memory is in progress.
3	vb11	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of DSP L2 memory is in progress.
2	vb10	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of DSP L2 memory is in progress.
1	vb01	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of DSP L2 memory is in progress.
0	vb00	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of DSP L2 memory is in progress.

5.2.5.30 DSS_DSP_L2RAM_MEMINIT_DONE Register (Offset = 88h) [Reset = 0000000h]

DSS_DSP_L2RAM_MEMINIT_DONE is shown in [Table 5-530](#).

Return to the [Summary Table](#).

1	hw_spare_rec1	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D
0	hw_spare_rec0	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D

5.2.5.190 LOCK0_KICK0 Register (Offset = 1008h) [Reset = 00000000h]

LOCK0_KICK0 is shown in [Table 5-690](#).

Return to the [Summary Table](#).

- KICK0 component

Table 5-690. LOCK0_KICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick0	R/W	0h	- KICK0 component

5.2.5.191 LOCK0_KICK1 Register (Offset = 100Ch) [Reset = 00000000h]

LOCK0_KICK1 is shown in [Table 5-691](#).

Return to the [Summary Table](#).

- KICK1 component

Table 5-691. LOCK0_KICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick1	R/W	0h	- KICK1 component

5.2.5.192 intr_raw_status Register (Offset = 1010h) [Reset = 0000000h]

intr_raw_status is shown in [Table 5-692](#).

Return to the [Summary Table](#).

Interrupt Raw Status/Set Register

Table 5-692. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.2.5.193 intr_enabled_status_clear Register (Offset = 1014h) [Reset = 0000000h]

intr_enabled_status_clear is shown in [Table 5-693](#).

Return to the [Summary Table](#).

Interrupt Enabled Status/Clear register

Table 5-693. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.2.5.194 intr_enable Register (Offset = 1018h) [Reset = 0000000h]

intr_enable is shown in [Table 5-694](#).

Return to the [Summary Table](#).

Interrupt Enable register

Table 5-694. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.5.195 intr_enable_clear Register (Offset = 101Ch) [Reset = 0000000h]

intr_enable_clear is shown in [Table 5-695](#).

Return to the [Summary Table](#).

Interrupt Enable Clear register

Table 5-695. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.5.196 eoi Register (Offset = 1020h) [Reset = 00000000h]

eoi is shown in [Table 5-696](#).

Return to the [Summary Table](#).

EOI register

Table 5-696. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.5.197 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-697](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-697. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.5.198 fault_type_status Register (Offset = 1028h) [Reset = 0000000h]

fault_type_status is shown in [Table 5-698](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-698. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_ 0000 = Supervisor read fault - priv = 1 dir = 1 dtype != 1 01_ 0000 = Supervisor write fault - priv = 1 dir = 0 00_ 1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_ 0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_ 0010 = User write fault - priv = 0 dir = 0 00_ 0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_ 0000 = No fault

5.2.5.199 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-699](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-699. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.5.200 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-700](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-700. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.6 HWA_CM4_CTRL/DSS_CM4_CTRL Registers

Table 5-701 lists the memory-mapped registers for the HWA_CM4_CTRL registers. All register offset addresses not listed in Table 5-701 should be considered as reserved locations and the register contents should not be modified.

Table 5-701. HWA_CM4_CTRL/DSS_CM4_CTRL Registers

Offset	Acronym	Register Name	Section
0h	PID	PID register	Go
4h	HW_REG0		Go
8h	HW_REG1		Go
Ch	PREVIOUS_NAME		Go
10h	HW_REG3		Go

102Ch	fault_attr_status	Fault Attribute Status register	Go
1030h	fault_clear	Fault Clear register	Go

Complex bit access types are encoded to fit into small table cells. [Table 5-702](#) shows the codes that are used for access types in this section.

Table 5-702. DSS_CM4_CTRL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.6.1 PID Register (Offset = 0h) [Reset = 61800215h]

PID is shown in [Table 5-703](#).

Return to the [Summary Table](#).

PID register

Table 5-703. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	15h	

5.2.6.2 HW_REG0 Register (Offset = 4h) [Reset = 00000000h]

HW_REG0 is shown in [Table 5-704](#).

Return to the [Summary Table](#).

Table 5-704. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg0	R/W	0h	Reserved for HW R&D

5.2.6.3 HW_REG1 Register (Offset = 8h) [Reset = 00000000h]

HW_REG1 is shown in [Table 5-705](#).

Return to the [Summary Table](#).

Table 5-705. HW_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg1	R/W	0h	Reserved for HW R&D

5.2.6.4 PREVIOUS_NAME Register (Offset = Ch) [Reset = 00000000h]

PREVIOUS_NAME is shown in [Table 5-706](#).

Return to the [Summary Table](#).

Table 5-706. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg2	R/W	0h	Reserved for HW R&D

5.2.6.5 HW_REG3 Register (Offset = 10h) [Reset = 0000000h]

HW_REG3 is shown in [Table 5-707](#).

Return to the [Summary Table](#).

Table 5-707. HW_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg3	R/W	0h	Reserved for HW R&D

5.2.6.6 HWA_CM4_B0_MEMINIT_START Register (Offset = 14h) [Reset = 0000000h]

HWA_CM4_B0_MEMINIT_START is shown in [Table 5-708](#).

Return to the [Summary Table](#).

Table 5-708. HWA_CM4_B0_MEMINIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b0_meminit_start	R/W	0h	Write pulse bit field: Start Memory initialization of Param memory. Write 0x1 to start memory initialization.

5.2.6.7 HWA_CM4_B0_MEMINIT_STATUS Register (Offset = 18h) [Reset = 0000000h]

HWA_CM4_B0_MEMINIT_STATUS is shown in [Table 5-709](#).

Return to the [Summary Table](#).

Table 5-709. HWA_CM4_B0_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b0_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of Param memory is in progress.

5.2.6.8 HWA_CM4_B0_MEMINIT_DONE Register (Offset = 1Ch) [Reset = 0000000h]

HWA_CM4_B0_MEMINIT_DONE is shown in [Table 5-710](#).

Return to the [Summary Table](#).

Table 5-710. HWA_CM4_B0_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b0_meminit_done	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Status field. Read value 0x1 indicates previously triggered Memory initialization of Param memory is complete. Write 0x1 to clear status. Refer Memory initialization sequence in EDMA section for more details

5.2.6.9 HWA_CM4_B1_MEMINIT_START Register (Offset = 20h) [Reset = 0000000h]

HWA_CM4_B1_MEMINIT_START is shown in [Table 5-711](#).

Return to the [Summary Table](#).

Table 5-711. HWA_CM4_B1_MEMINIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b1_meminit_start	R/W	0h	Write pulse bit field: Write pulse bit field:Start Memory initialization of Param memory. Write 0x1 to start memory initialization.

5.2.6.10 HWA_CM4_B1_MEMINIT_STATUS Register (Offset = 24h) [Reset = 0000000h]

HWA_CM4_B1_MEMINIT_STATUS is shown in [Table 5-712](#).

Return to the [Summary Table](#).

Table 5-712. HWA_CM4_B1_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b1_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of Param memory is in progress.

5.2.6.11 HWA_CM4_B1_MEMINIT_DONE Register (Offset = 28h) [Reset = 0000000h]

HWA_CM4_B1_MEMINIT_DONE is shown in [Table 5-713](#).

Return to the [Summary Table](#).

Table 5-713. HWA_CM4_B1_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b1_meminit_done	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Status field. Read value 0x1 indicates previously triggered Memory initialization of Param memory is complete. Write 0x1 to clear status. Refer Memory initialization sequence in EDMA section for more details

5.2.6.12 HWA_CM4_B2_MEMINIT_START Register (Offset = 2Ch) [Reset = 0000000h]

HWA_CM4_B2_MEMINIT_START is shown in [Table 5-714](#).

Return to the [Summary Table](#).

Table 5-714. HWA_CM4_B2_MEMINIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b2_meminit_start	R/W	0h	Write pulse bit field: Start Memory initialization of Param memory. Write 0x1 to start memory initialization.

5.2.6.13 HWA_CM4_B2_MEMINIT_STATUS Register (Offset = 30h) [Reset = 0000000h]

HWA_CM4_B2_MEMINIT_STATUS is shown in [Table 5-715](#).

Return to the [Summary Table](#).

Table 5-715. HWA_CM4_B2_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b2_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of Param memory is in progress.

5.2.6.14 HWA_CM4_B2_MEMINIT_DONE Register (Offset = 34h) [Reset = 0000000h]

HWA_CM4_B2_MEMINIT_DONE is shown in [Table 5-716](#).

Return to the [Summary Table](#).

Table 5-716. HWA_CM4_B2_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_b2_meminit_done	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Status field. Read value 0x1 indicates previously triggered Memory initialization of Param memory is complete. Write 0x1 to clear status. Refer Memory initialization sequence in EDMA section for more details

5.2.6.15 HWA_CM4_MBOX_MEMINIT_START Register (Offset = 38h) [Reset = 0000000h]

HWA_CM4_MBOX_MEMINIT_START is shown in [Table 5-717](#).

Return to the [Summary Table](#).

Table 5-717. HWA_CM4_MBOX_MEMINIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_mbox_meminit_start	R/W	0h	Write pulse bit field: Start Memory initialization of Param memory. Write 0x1 to start memory initialization.

5.2.6.16 HWA_CM4_MBOX_MEMINIT_STATUS Register (Offset = 3Ch) [Reset = 0000000h]

HWA_CM4_MBOX_MEMINIT_STATUS is shown in [Table 5-718](#).

Return to the [Summary Table](#).

Table 5-718. HWA_CM4_MBOX_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	hwa_cm4_mbox_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of Param memory is in progress.

5.2.6.17 HWA_CM4_MBOX_MEMINIT_DONE Register (Offset = 40h) [Reset = 0000000h]

HWA_CM4_MBOX_MEMINIT_DONE is shown in [Table 5-719](#).

Return to the [Summary Table](#).

Table 5-719. HWA_CM4_MBOX_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description

5.2.6.18 HWA_CM4_MBOX_WRITE_DONE Register (Offset = 44h) [Reset = 0XXXXXXXh]

HWA_CM4_MBOX_WRITE_DONE is shown in [Table 5-720](#).

Return to the [Summary Table](#).

Table 5-720. HWA_CM4_MBOX_WRITE_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R	0h	
28	proc_7	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 7
27-25	RESERVED	R	0h	
24	proc_6	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 6
23-21	RESERVED	R	0h	
20	proc_5	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 5
19-17	RESERVED	R	0h	
16	proc_4	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 4
15-13	RESERVED	R	0h	
12	proc_3	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 3
11-9	RESERVED	R	0h	
8	proc_2	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 2
7-5	RESERVED	R	0h	
4	proc_1	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 1
3-1	RESERVED	R	0h	
0	proc_0	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 0

5.2.6.19 HWA_CM4_MBOX_READ_REQ Register (Offset = 48h) [Reset = 0XXXXXXXh]

HWA_CM4_MBOX_READ_REQ is shown in [Table 5-721](#).

Return to the [Summary Table](#).

Table 5-721. HWA_CM4_MBOX_READ_REQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R	0h	
28	proc_7	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This is request from processor 7 to HSM. Requesting it to read from mailbox.
27-25	RESERVED	R	0h	
24	proc_6	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This is request from processor 6 to HSM. Requesting it to read from mailbox.
23-21	RESERVED	R	0h	
20	proc_5	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This is request from processor 5 to HSM. Requesting it to read from mailbox.
19-17	RESERVED	R	0h	
16	proc_4	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This is request from processor 4 to HSM. Requesting it to read from mailbox.
15-13	RESERVED	R	0h	
12	proc_3	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This is request from processor 3 to HSM. Requesting it to read from mailbox.
11-9	RESERVED	R	0h	
8	proc_2	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This is request from processor 2 to HSM. Requesting it to read from mailbox.
7-5	RESERVED	R	0h	
4	proc_1	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This is request from processor 1 to HSM. Requesting it to read from mailbox.
3-1	RESERVED	R	0h	
0	proc_0	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This is request from processor 0 to HSM. Requesting it to read from mailbox.

5.2.6.20 HWA_CM4_MBOX_READ_DONE Register (Offset = 4Ch) [Reset = 0XXXXXXh]

HWA_CM4_MBOX_READ_DONE is shown in [Table 5-722](#).

Return to the [Summary Table](#).

Table 5-722. HWA_CM4_MBOX_READ_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R	0h	
28	proc_7	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 7
27-25	RESERVED	R	0h	
24	proc_6	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 6
23-21	RESERVED	R	0h	
20	proc_5	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 5
19-17	RESERVED	R	0h	
16	proc_4	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 4
15-13	RESERVED	R	0h	
12	proc_3	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 3
11-9	RESERVED	R	0h	
8	proc_2	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 2
7-5	RESERVED	R	0h	
4	proc_1	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 1
3-1	RESERVED	R	0h	
0	proc_0	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 0

5.2.6.21 HWA_CM4_IRQ_REQ Register (Offset = 50h) [Reset = 00000000h]

HWA_CM4_IRQ_REQ is shown in [Table 5-723](#).

Return to the [Summary Table](#).

Table 5-723. HWA_CM4_IRQ_REQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	select	R/W	0h	Write pulse bit field: Software configuration for INT Request

5.2.6.22 HWA_CM4_POR_RST_CTRL Register (Offset = 54h) [Reset = 00000000h]

HWA_CM4_POR_RST_CTRL is shown in [Table 5-724](#).

Return to the [Summary Table](#).

Table 5-724. HWA_CM4_POR_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	assert	R/W	0h	Write pulse bit field: Por reset control for CM4

5.2.6.23 HWA_CM4_SYS_RST_CTRL Register (Offset = 58h) [Reset = 0000000h]

HWA_CM4_SYS_RST_CTRL is shown in [Table 5-725](#).

Return to the [Summary Table](#).

Table 5-725. HWA_CM4_SYS_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	assert	R/W	0h	Write pulse bit field: Reset control for CM4

5.2.6.24 HWA_CM4_CFG Register (Offset = 5Ch) [Reset = 00007XXXh]

HWA_CM4_CFG is shown in [Table 5-726](#).

Return to the [Summary Table](#).

Table 5-726. HWA_CM4_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R	0h	
14-12	cm4_sys_reset_hold	R/W	7h	In development mode by default cm4 will be held in reset. Writing 3'b000 will remove it from reset.
11-9	RESERVED	R	0h	
8	cm4_clk_gate	R/W	1h	CM4 Clock Gate. 0 : Un-gate the clock, 1 : Clock gated.
7-3	RESERVED	R	0h	
2	wicenreq	R/W	1h	WIC mode Request from PMU
1	sleep_hold_reqn	R/W	1h	Hold core in sleep mode. '0' : When in sleep mode, enable continue to hold the core in sleep '1' : This feature is disabled
0	force_hclk_active	R/W	1h	Force HCLK to run , overrides GATEHCLK

5.2.6.25 HWA_CM4_RST_CAUSE_CLR Register (Offset = 60h) [Reset = 0000000h]

HWA_CM4_RST_CAUSE_CLR is shown in [Table 5-727](#).

Return to the [Summary Table](#).

Table 5-727. HWA_CM4_RST_CAUSE_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	clear	R/W	0h	Write pulse bit field: Writing '111' will clear the HWA_CM4_RST_STATUS_REG

5.2.6.26 HWA_CM4_RST_CAUSE Register (Offset = 64h) [Reset = 0000000h]

HWA_CM4_RST_CAUSE is shown in [Table 5-728](#).

Return to the [Summary Table](#).

Table 5-728. HWA_CM4_RST_CAUSE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	status	R	0h	Reset Cause Register. Value of 1'b1 indicates reset from different sources. [0] : POR_RSTN, [1] : SYS_RSTN (Warm reset), [2] : STC Reset, [3] : Register HWA_CM4_POR_RST_CTRL, [4] : Register HWA_CM4_SYS_RST_CTRL, [5] : Reset trigger from GSM, [7:6] : Reserved

5.2.6.27 HWA_CM4_FSM_RST_CTRL Register (Offset = 68h) [Reset = 0X0F00XXh]

HWA_CM4_FSM_RST_CTRL is shown in [Table 5-729](#).

Return to the [Summary Table](#).

Table 5-729. HWA_CM4_FSM_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	
30-28	rst_fsm_trig	R/W	0h	Write pulse bit field: writing '111' will trigger the reset fsm for CM4
27	RESERVED	R	0h	
26-24	rst_wfcheck	R/W	0h	writing '111' will check for WFI before asserting reset to CM4
23-16	rst_assertdly_common	R/W	Fh	This field the decides number of cycles reset to CM4 should be asserted
15-8	rst2assertdly	R/W	0h	This field the decides number cycles for which the reset should be held before asserting reset for CM4. This register should be programmed only for debug, otherwise the value should be 8'h00.
7-0	RESERVED	R	0h	

5.2.6.28 HWA_CM4_WFI_OVERRIDE Register (Offset = 6Ch) [Reset = 0000000h]

HWA_CM4_WFI_OVERRIDE is shown in [Table 5-730](#).

Return to the [Summary Table](#).

Table 5-730. HWA_CM4_WFI_OVERRIDE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	wfi_override	R/W	0h	writing '111' will override the wfi signal from CM4

5.2.6.29 HWA_CM4_PERIPH_ERRAGG_MASK Register (Offset = 70h) [Reset = 0000000h]

HWA_CM4_PERIPH_ERRAGG_MASK is shown in [Table 5-731](#).

Return to the [Summary Table](#).

Table 5-731. HWA_CM4_PERIPH_ERRAGG_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	
11	rcss_ctrl_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
10	rcss_ctrl_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
9	rcss_rcm_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
8	rcss_rcm_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
7	dss_hwa_cfg_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
6	dss_hwa_cfg_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
5	dss_cm4_ctrl_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
4	dss_cm4_ctrl_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
3	dss_ctrl_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
2	dss_ctrl_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
1	dss_rcm_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
0	dss_rcm_rd	R/W	0h	Writing '1' will mask the respective peripheral error line

5.2.6.30 HWA_CM4_PERIPH_ERRAGG_STATUS Register (Offset = 74h) [Reset = 0000000h]

HWA_CM4_PERIPH_ERRAGG_STATUS is shown in [Table 5-732](#).

Return to the [Summary Table](#).

Table 5-732. HWA_CM4_PERIPH_ERRAGG_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	
11	rcss_ctrl_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
10	rcss_ctrl_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
9	rcss_rcm_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
8	rcss_rcm_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
7	dss_hwa_cfg_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
6	dss_hwa_cfg_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
5	dss_cm4_ctrl_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
4	dss_cm4_ctrl_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
3	dss_ctrl_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
2	dss_ctrl_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
1	dss_rcm_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
0	dss_rcm_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line

5.2.6.31 HWA_CM4_PERIPH_ERRAGG_STATUS_RAW Register (Offset = 78h) [Reset = 0000000h]

HWA_CM4_PERIPH_ERRAGG_STATUS_RAW is shown in [Table 5-733](#).

Return to the [Summary Table](#).

Table 5-733. HWA_CM4_PERIPH_ERRAGG_STATUS_RAW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	
11	rcss_ctrl_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
10	rcss_ctrl_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
9	rcss_rcm_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
8	rcss_rcm_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
7	dss_hwa_cfg_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
6	dss_hwa_cfg_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
5	dss_cm4_ctrl_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
4	dss_cm4_ctrl_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
3	dss_ctrl_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
2	dss_ctrl_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
1	dss_rcm_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line
0	dss_rcm_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the pre mask status of the respective peripheral error line

5.2.6.32 HWA_CM4_AHB_ERRAGG_MASK Register (Offset = 7Ch) [Reset = 0000000h]

HWA_CM4_AHB_ERRAGG_MASK is shown in [Table 5-734](#).

Return to the [Summary Table](#).

Table 5-734. HWA_CM4_AHB_ERRAGG_MASK Register Field Descriptions

0	hw_spare_rec0	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Reserved for HW R&D

5.2.6.48 LOCK0_KICK0 Register (Offset = 1008h) [Reset = 00000000h]

LOCK0_KICK0 is shown in [Table 5-750](#).

Return to the [Summary Table](#).

- KICK0 component

Table 5-750. LOCK0_KICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick0	R/W	0h	- KICK0 component

5.2.6.49 LOCK0_KICK1 Register (Offset = 100Ch) [Reset = 00000000h]

LOCK0_KICK1 is shown in [Table 5-751](#).

Return to the [Summary Table](#).

- KICK1 component

Table 5-751. LOCK0_KICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick1	R/W	0h	- KICK1 component

5.2.6.50 intr_raw_status Register (Offset = 1010h) [Reset = 0000000h]

intr_raw_status is shown in [Table 5-752](#).

Return to the [Summary Table](#).

Interrupt Raw Status/Set Register

Table 5-752. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.2.6.51 intr_enabled_status_clear Register (Offset = 1014h) [Reset = 0000000h]

intr_enabled_status_clear is shown in [Table 5-753](#).

Return to the [Summary Table](#).

Interrupt Enabled Status/Clear register

Table 5-753. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.2.6.52 intr_enable Register (Offset = 1018h) [Reset = 0000000h]

intr_enable is shown in [Table 5-754](#).

Return to the [Summary Table](#).

Interrupt Enable register

Table 5-754. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.6.53 intr_enable_clear Register (Offset = 101Ch) [Reset = 0000000h]

intr_enable_clear is shown in [Table 5-755](#).

Return to the [Summary Table](#).

Interrupt Enable Clear register

Table 5-755. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.6.54 eoi Register (Offset = 1020h) [Reset = 00000000h]

eoi is shown in [Table 5-756](#).

Return to the [Summary Table](#).

EOI register

Table 5-756. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.6.55 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-757](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-757. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.6.56 fault_type_status Register (Offset = 1028h) [Reset = 0000000h]

fault_type_status is shown in [Table 5-758](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-758. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_ 0000 = Supervisor read fault - priv = 1 dir = 1 dtype != 1 01_ 0000 = Supervisor write fault - priv = 1 dir = 0 00_ 1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_ 0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_ 0010 = User write fault - priv = 0 dir = 0 00_ 0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_ 0000 = No fault

5.2.6.57 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-759](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-759. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.6.58 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-760](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-760. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.7 MSS_CTRL Registers

Table 5-761 lists the memory-mapped registers for the MSS_CTRL registers. All register offset addresses not listed in Table 5-761 should be considered as reserved locations and the register contents should not be modified.

Table 5-761. MSS_CTRL Registers

Complex bit access types are encoded to fit into small table cells. [Table 5-762](#) shows the codes that are used for access types in this section.

Table 5-762. MSS_CTRL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.7.1 PID Register (Offset = 0h) [Reset = 61800215h]

PID is shown in [Table 5-763](#).

Return to the [Summary Table](#).

PID register

Table 5-763. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	15h	

5.2.7.2 MSS_SW_INT Register (Offset = 4h) [Reset = 00000000h]

MSS_SW_INT is shown in [Table 5-764](#).

Return to the [Summary Table](#).

Table 5-764. MSS_SW_INT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	
4-0	pulse	R/W	0h	write pulse bit field: Write_pulse bit field: writing 1'b1 to each bit will trigger MSS_SW_INT 0-4 respectively to CR5A/B.

5.2.7.3 MSS_CAPEVNT_SEL Register (Offset = 8h) [Reset = 0000000h]

MSS_CAPEVNT_SEL is shown in [Table 5-765](#).

Return to the [Summary Table](#).

Table 5-765. MSS_CAPEVNT_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	src1	R/W	0h	Writing a value 'N' will select Nth interrupt from CR5A/B interrupt mapping to trigger CAP-EVENT1 to all MSS_RTIs. Example: writing 8'h0A will select 10th interrupt to trigger CAP-EVENT1 to all MSS_RTIs. (which is MSS_RTIB_INT1)
7-0	src0	R/W	0h	Writing a value 'N' will select Nth interrupt from CR5A/B interrupt mapping to trigger CAP-EVENT0 to all MSS_RTIs. Example: writing 8'h0A will select 10th interrupt to trigger CAP-EVENT0 to all MSS_RTIs. (which is MSS_RTIB_INT1)

5.2.7.4 MSS_DMA_REQ_SEL Register (Offset = Ch) [Reset = 0000000h]

MSS_DMA_REQ_SEL is shown in [Table 5-766](#).

Return to the [Summary Table](#).

Table 5-766. MSS_DMA_REQ_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	select	R/W	0h	Reserved for R&D. Do not touch

5.2.7.5 MSS_DMA1_REQ_SEL Register (Offset = 10h) [Reset = 0000000h]

MSS_DMA1_REQ_SEL is shown in [Table 5-767](#).

Return to the [Summary Table](#).

Table 5-767. MSS_DMA1_REQ_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	select	R/W	0h	Reserved for R&D. Do not touch

5.2.7.6 MSS_IRQ_REQ_SEL Register (Offset = 14h) [Reset = 0000000h]

MSS_IRQ_REQ_SEL is shown in [Table 5-768](#).

Return to the [Summary Table](#).

Table 5-768. MSS_IRQ_REQ_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	select	R/W	0h	Reserved for R&D. Do not touch

5.2.7.7 MSS_SPI_TRIG_SRC Register (Offset = 18h) [Reset = 0000XXXXh]

MSS_SPI_TRIG_SRC is shown in [Table 5-769](#).

Return to the [Summary Table](#).

Table 5-769. MSS_SPI_TRIG_SRC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	
26-16	trig_spib	R/W	0h	Writing 1'b1 to each bit will trigger MSS_SPIB Trigger< 0-10> respectively
15-2	RESERVED	R	0h	
1-0	trig_spia	R/W	0h	Writing 1'b1 to each bit will trigger MSS_SPIA Trigger< 0-1> respectively

5.2.7.8 MSS_ATCM_MEM_INIT Register (Offset = 1Ch) [Reset = 0000000h]

MSS_ATCM_MEM_INIT is shown in [Table 5-770](#).

Return to the [Summary Table](#).

Table 5-770. MSS_ATCM_MEM_INIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem_init	R/W	0h	write pulse bit field:Write_pulse bit field: Writing 1'b1 will start initializing the ATCM banks of CR5A/B. Value in each row is initialized to 0x0C_0000_0000

5.2.7.9 MSS_ATCM_MEM_INIT_DONE Register (Offset = 20h) [Reset = 00000000h]

MSS_ATCM_MEM_INIT_DONE is shown in [Table 5-771](#).

Return to the [Summary Table](#).

Table 5-771. MSS_ATCM_MEM_INIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem_init_done	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This field will be high once initialization of ATCM banks is finished. Writing '1' would clear the bit.

5.2.7.10 MSS_ATCM_MEM_INIT_STATUS Register (Offset = 24h) [Reset = 0000000h]

MSS_ATCM_MEM_INIT_STATUS is shown in [Table 5-772](#).

Return to the [Summary Table](#).

Table 5-772. MSS_ATCM_MEM_INIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem_status	R	0h	1'b0: No initialization is happening for ATCM banks of CR5A/B 1'b1: Initialization is in progress for ATCM banks of CR5A/B

5.2.7.11 MSS_BTCM_MEM_INIT Register (Offset = 28h) [Reset = 0000000h]

MSS_BTCM_MEM_INIT is shown in [Table 5-773](#).

Return to the [Summary Table](#).

Table 5-773. MSS_BTCM_MEM_INIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem_init	R/W	0h	write pulse bit field:Write_pulse bit field: Writing 1'b1 will start initializing the B0/1TCM banks of CR5A/B

5.2.7.12 MSS_BTCM_MEM_INIT_DONE Register (Offset = 2Ch) [Reset = 0000000h]

MSS_BTCM_MEM_INIT_DONE is shown in [Table 5-774](#).

Return to the [Summary Table](#).

Table 5-774. MSS_BTCM_MEM_INIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem_init_done	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This field will be high once initialization of B0/1TCM banks is finished. Writing '1' would clear the bit.

5.2.7.13 MSS_BTCM_MEM_INIT_STATUS Register (Offset = 30h) [Reset = 0000000h]

MSS_BTCM_MEM_INIT_STATUS is shown in [Table 5-775](#).

Return to the [Summary Table](#).

Table 5-775. MSS_BTCM_MEM_INIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem_status	R	0h	1'b0: No initialization is happening for B0/1TCM banks of CR5A/B 1'b1: Initialization is in progress for B0/1TCM banks of CR5A/B

5.2.7.14 MSS_L2_MEM_INIT Register (Offset = 34h) [Reset = 0000000h]

MSS_L2_MEM_INIT is shown in [Table 5-776](#).

Return to the [Summary Table](#).

Table 5-776. MSS_L2_MEM_INIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1	partition1	R/W	0h	write pulse bit field:Write_pulse bit field: Writing 1'b1 will start initializing the L2 Bank1. Value in each row is initialized to 0x0
0	partition0	R/W	0h	write pulse bit field:Write_pulse bit field: Writing 1'b1 will start initializing the L2 Bank0. Value in each row is initialized to 0x0

5.2.7.15 MSS_L2_MEM_INIT_DONE Register (Offset = 38h) [Reset = 0000000h]

MSS_L2_MEM_INIT_DONE is shown in [Table 5-777](#).

Return to the [Summary Table](#).

Table 5-777. MSS_L2_MEM_INIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1	partition1	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This field will be high once initialization of L2 bank1 is finished. Writing '1' would clear the bit
0	partition0	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This field will be high once initialization of L2 bank0 is finished. Writing '1' would clear the bit

5.2.7.16 MSS_L2_MEM_INIT_STATUS Register (Offset = 3Ch) [Reset = 0000000h]

MSS_L2_MEM_INIT_STATUS is shown in [Table 5-778](#).

Return to the [Summary Table](#).

Table 5-778. MSS_L2_MEM_INIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1	partition1	R	0h	1'b0: No initialization is happening for L2 bank1 1'b1: Initialization is in progress for L2 bank1
0	partition0	R	0h	1'b0: No initialization is happening for L2 bank0 1'b1: Initialization is in progress for L2 bank0

5.2.7.17 MSS_MAILBOX_MEM_INIT Register (Offset = 40h) [Reset = 0000000h]

MSS_MAILBOX_MEM_INIT is shown in [Table 5-779](#).

Return to the [Summary Table](#).

Table 5-779. MSS_MAILBOX_MEM_INIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem0_init	R/W	0h	write pulse bit field:Write_pulse bit field: Writing 1'b1 will start initializing the MSS_MBOX. Value in each row is initialized to 0x0

5.2.7.18 MSS_MAIIBOX_MEM_INIT_DONE Register (Offset = 44h) [Reset = 0000000h]

MSS_MAIIBOX_MEM_INIT_DONE is shown in [Table 5-780](#).

Return to the [Summary Table](#).

Table 5-780. MSS_MAIIBOX_MEM_INIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem0_done	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This field will be high once initialization of MSS_MBOX is finished. Writing '1' would clear the bit

5.2.7.19 MSS_MAILBOX_MEM_INIT_STATUS Register (Offset = 48h) [Reset = 00000000h]

MSS_MAILBOX_MEM_INIT_STATUS is shown in [Table 5-781](#).

Return to the [Summary Table](#).

Table 5-781. MSS_MAILBOX_MEM_INIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem0_status	R	0h	1'b0: No initialization is happening for MSS_MBOX 1'b1: Initialization is in progress for MSS_MBOX

5.2.7.20 MSS_RETRAM_MEM_INIT Register (Offset = 4Ch) [Reset = 0000000h]

MSS_RETRAM_MEM_INIT is shown in [Table 5-782](#).

Return to the [Summary Table](#).

Table 5-782. MSS_RETRAM_MEM_INIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem0_init	R/W	0h	write pulse bit field:Write_pulse bit field: Writing 1'b1 will start initializing the MSS_RETRAM. Value in each row is initialized to 0x0

5.2.7.274 MSS_TPTC_BOUNDARY_CFG Register (Offset = 6E0h) [Reset = 0012X2X2h]

MSS_TPTC_BOUNDARY_CFG is shown in [Table 5-1036](#).

Return to the [Summary Table](#).

Table 5-1036. MSS_TPTC_BOUNDARY_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	RESERVED	R	0h	
21-16	tptc_b0_size	R/W	12h	6 bit signal used for deciding the boundary crossing size for CID-RID-SID reordering of MSS_TPTC_B0 Example: writing 6'd19 decides boundary to be 2^{19} i.e. 512 KB
15-14	RESERVED	R	0h	
13-8	tptc_a1_size	R/W	12h	6 bit signal used for deciding the boundary crossing size for CID-RID-SID reordering of MSS_TPTC_A1 Example: writing 6'd19 decides boundary to be 2^{19} i.e. 512 KB
7-6	RESERVED	R	0h	
5-0	tptc_a0_size	R/W	12h	6 bit signal used for deciding the boundary crossing size for CID-RID-SID reordering of MSS_TPTC_A0 Example: writing 6'd19 decides boundary to be 2^{19} i.e. 512 KB

5.2.7.275 MSS_TPTC_XID_REORDER_CFG Register (Offset = 6E4h) [Reset = 0000XXXXh]

MSS_TPTC_XID_REORDER_CFG is shown in [Table 5-1037](#).

Return to the [Summary Table](#).

Table 5-1037. MSS_TPTC_XID_REORDER_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RESERVED	R	0h	
16	tptc_b0_disable	R/W	0h	writing 1'b1 will disable the CID-RID-SID reordering feature for MSS_TPTC_B0
15-9	RESERVED	R	0h	
8	tptc_a1_disable	R/W	0h	writing 1'b1 will disable the CID-RID-SID reordering feature for MSS_TPTC_A1
7-1	RESERVED	R	0h	
0	tptc_a0_disable	R/W	0h	writing 1'b1 will disable the CID-RID-SID reordering feature for MSS_TPTC_A0

5.2.7.276 GPADC_CTRL Register (Offset = 6E8h) [Reset = 0000FXXh]

GPADC_CTRL is shown in [Table 5-1038](#).

Return to the [Summary Table](#).

Table 5-1038. GPADC_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	RESERVED	R	0h	
12-8	gpadc_trigin_sel	R/W	Fh	Writing below decimal values to this register will select corresponding interrupt as GPADC trigger source. 0: GPIO_0 1: GPIO_1 2: GPIO_2 3: GPIO_3 4: RSS_CSI2A_EOL_INT 5: RSS_CSI2A_SOF_INT0 6: RSS_CSI2A_SOF_INT1 7: RSS_CSI2A_SOF_INT 8: RSS_CSI2B_SOF_INT 9: HW_Sync_FE1 10: HW_Sync_FE2 11: DSS_RTIA_1 12: DSS_RTIB_1 13: MSS_RTIA_INT1 14: MSS_RTIB_INT1 15: MMR based SW trigger
7-1	RESERVED	R	0h	
0	gpadc_sw_trig	R/W	0h	Writing 1'b1 will give MMR based SW trigger to GPADC

5.2.7.277 HW_Sync_FE_CTRL Register (Offset = 6ECh) [Reset = 00000XXh]

HW_Sync_FE_CTRL is shown in [Table 5-1039](#).

Return to the [Summary Table](#).

Table 5-1039. HW_Sync_FE_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R	0h	
8	fe2_sel	R/W	0h	Writing 1'b0 : Selects MCANA filter event as HW_Sync_FE2 1'b1 : Selects MCANB filter event as HW_Sync_FE2
7-1	RESERVED	R	0h	
0	fe1_sel	R/W	0h	Writing 1'b0 : Selects MCANA filter event as HW_Sync_FE1 1'b1 : Selects MCANB filter event as HW_Sync_FE1

5.2.7.278 DEBUGSS_CSETB_FLUSH Register (Offset = 6F0h) [Reset = 00000XXh]

DEBUGSS_CSETB_FLUSH is shown in [Table 5-1040](#).

Return to the [Summary Table](#).

Table 5-1040. DEBUGSS_CSETB_FLUSH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	0h	
10	CSETB_FULL	R	0h	When HIGH indicates that the ETB RAM has overflowed or wrapped around to address zero
9	CSETB_ACQ_COMPLET E	R	0h	When HIGH, indicates that trace acquisition is complete by ETB, that is, the trigger counter is at zero
8	CSETB_FLUSHINACK	R	0h	Return acknowledgement to CSETBFLUSHIN
7-1	RESERVED	R	0h	
0	CSETB_FLUSHIN	R/W	0h	External control used to assert the ATB signal AFVALIDS and drain any historical FIFO information on the bus

5.2.7.279 ANALOG_WU_STATUS_REG_POLARITY_INV Register (Offset = 6F4h) [Reset = 00003D5Ch]

ANALOG_WU_STATUS_REG_POLARITY_INV is shown in [Table 5-1041](#).

Return to the [Summary Table](#).

Table 5-1041. ANALOG_WU_STATUS_REG_POLARITY_INV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	inv_ctrl	R/W	3D5Ch	This register decides the polarity of each status bit before providing to the MSS_ESM. Each bit controls the respective status bit.

5.2.7.280 ANALOG_CLK_STATUS_REG_POLARITY_INV Register (Offset = 6F8h) [Reset = 0000000h]

ANALOG_CLK_STATUS_REG_POLARITY_INV is shown in [Table 5-1042](#).

Return to the [Summary Table](#).

Table 5-1042. ANALOG_CLK_STATUS_REG_POLARITY_INV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	inv_ctrl	R/W	0h	This register decides the polarity of each status bit before providing to the MSS_ESM. Each bit controls the respective status bit.

5.2.7.281 ANALOG_WU_STATUS_REG_GRP1_MASK Register (Offset = 6FCh) [Reset = FFFFFFFFh]

ANALOG_WU_STATUS_REG_GRP1_MASK is shown in [Table 5-1043](#).

Return to the [Summary Table](#).

Table 5-1043. ANALOG_WU_STATUS_REG_GRP1_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description

5.2.7.306 R5_CONTROL Register (Offset = 800h) [Reset = 00XXXXXXh]

R5_CONTROL is shown in [Table 5-1068](#).

Return to the [Summary Table](#).

Table 5-1068. R5_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	
26-24	rom_wait_state	R/W	0h	writing '111' enables a single cycle wait state with respect to CR5A_clk for rom access. This needs to be set when R5 clock is at 400MHZ and Interconnect-clk is at 200MHZ. (because it is a timing issue in this scenario)
23-19	RESERVED	R	0h	
18-16	reset_fsm_trigger	R/W	0h	Write pulse bit field: writing 3'b111 will trigger the reset FSM. Reset FSM ensures reset to R5SS and inturn ensures the latching of lock_step and also mem_swap bit
15-11	RESERVED	R	0h	
10-8	lock_step_switch_wait	R/W	0h	writing 3'b111 ensures switch happens only after R5SS reset. Orelse it will be a immediate switch.
7-3	RESERVED	R	0h	
2-0	lock_step	R/W	7h	writing 3'b000 ensures R5 to be in Dual-Core mode. Note: The change happens after the R5SS reset assertion if R5_CONTROL_lock_step_switch_wait is set. Or else the switching to Dual-core happens on the fly.

5.2.7.307 R5_ROM_ECLIPSE Register (Offset = 804h) [Reset = 00000XXh]

R5_ROM_ECLIPSE is shown in [Table 5-1069](#).

Return to the [Summary Table](#).

Table 5-1069. R5_ROM_ECLIPSE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	0h	
10-8	memswap_wait	R/W	0h	writing 3'b111 ensures ROM-Eclipsing happens only after R5SS reset. Orelse it will be a immediate change.
7-3	RESERVED	R	0h	
2-0	memswap	R/W	0h	writing '111' ensures eclipsing of CR5A_ROM immediately if memswap_wait is not set. If memswap_wait is set then ROM is eclipsed after R5SS reset assertion.

5.2.7.308 R5_COREA_HALT Register (Offset = 808h) [Reset = 0000007h]

R5_COREA_HALT is shown in [Table 5-1070](#).

Return to the [Summary Table](#).

Table 5-1070. R5_COREA_HALT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	halt	R/W	7h	writing '000' will unhalt CR5A. This register should be written only once.

5.2.7.309 R5_COREB_HALT Register (Offset = 80Ch) [Reset = 0000007h]

R5_COREB_HALT is shown in [Table 5-1071](#).

Return to the [Summary Table](#).

Table 5-1071. R5_COREB_HALT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	halt	R/W	7h	writing '000' will unhalt for CR5B. This register should be written only once.

5.2.7.310 R5_STATUS_REG Register (Offset = 810h) [Reset = 000001XXh]

R5_STATUS_REG is shown in [Table 5-1072](#).

Return to the [Summary Table](#).

Table 5-1072. R5_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R	0h	
8	lock_step	R	1h	Reading 1: confirms R5SS is in lockstep mode. Reading 0: confirms R5SS is in Dual-core mode.
7-1	RESERVED	R	0h	
0	memswap	R	0h	reading 1: confirms ROM is Eclipsed from with RAM for R5.

0	tpcc_a_intg	R/W	0h	

5.2.8.8 RSS_TPCC_MEMINIT_START Register (Offset = 20h) [Reset = 0000000h]

RSS_TPCC_MEMINIT_START is shown in [Table 5-1118](#).

Return to the [Summary Table](#).

Table 5-1118. RSS_TPCC_MEMINIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	tpcc_a_meminit_start	R/W	0h	Start Memory initialization of memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed.

5.2.8.9 RSS_TPCC_MEMINIT_DONE Register (Offset = 24h) [Reset = 0000000h]

RSS_TPCC_MEMINIT_DONE is shown in [Table 5-1119](#).

Return to the [Summary Table](#).

Table 5-1119. RSS_TPCC_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	tpcc_a_meminit_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.

5.2.8.10 RSS_TPCC_MEMINIT_STATUS Register (Offset = 28h) [Reset = 0000000h]

RSS_TPCC_MEMINIT_STATUS is shown in [Table 5-1120](#).

Return to the [Summary Table](#).

Table 5-1120. RSS_TPCC_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	tpcc_a_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.

5.2.8.11 TPTC_DBS_CFG Register (Offset = 2Ch) [Reset = 0000000h]

TPTC_DBS_CFG is shown in [Table 5-1121](#).

Return to the [Summary Table](#).

Table 5-1121. TPTC_DBS_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3-2	tptc_a1	R/W	0h	Max Burst size tieoff value for TPTC A1
1-0	tptc_a0	R/W	0h	Max Burst size tieoff value for TPTC A0

5.2.8.12 RSS_TPCC_A_PARITY_CTRL Register (Offset = 30h) [Reset = 0000000h]

RSS_TPCC_A_PARITY_CTRL is shown in [Table 5-1122](#).

Return to the [Summary Table](#).

Table 5-1122. RSS_TPCC_A_PARITY_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2	parity_err_clr	R/W	0h	Write 0x1 to clear the Parit Error status for TPCC
1	parity_testen	R/W	0h	Enable Parity Test for TPCC. Write 0x1 : Parity Test is enabled on PARAM memory
0	parity_en	R/W	0h	Enable Parity for TPCC. Write 0x1 : Parity is enabled on PARAM memory

5.2.8.13 RSS_TPCC_A_PARITY_STATUS Register (Offset = 34h) [Reset = 00000XXh]

RSS_TPCC_A_PARITY_STATUS is shown in [Table 5-1123](#).

Return to the [Summary Table](#).

Table 5-1123. RSS_TPCC_A_PARITY_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	parity_addr	R	0h	TPCC Error Address at which Parity Error occurred
7-0	RESERVED	R	0h	

5.2.8.14 RSS_TPTC_BOUNDARY_CFG Register (Offset = 274h) [Reset = 0000012h]

RSS_TPTC_BOUNDARY_CFG is shown in [Table 5-1124](#).

Return to the [Summary Table](#).

Table 5-1124. RSS_TPTC_BOUNDARY_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	0h	
5-0	tptc_a0_size	R/W	12h	Writing 1'b1 will disable the CID-RID-SID reordering feature for the TPTC instance

5.2.8.15 RSS_TPTC_XID_REORDER_CFG Register (Offset = 278h) [Reset = 0000000h]

RSS_TPTC_XID_REORDER_CFG is shown in [Table 5-1125](#).

Return to the [Summary Table](#).

Table 5-1125. RSS_TPTC_XID_REORDER_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	tptc_a0_disable	R/W	0h	6 bit signal used for deciding the boundary crossing size for CID-RID-SID reordering of TPTC Example: writing 6'd19 decides boundary to be 2^{19} i.e. 512 KB

5.2.8.16 DBG_ACK_CPU_CTRL Register (Offset = 27Ch) [Reset = 0000000h]

DBG_ACK_CPU_CTRL is shown in [Table 5-1126](#).

Return to the [Summary Table](#).

Table 5-1126. DBG_ACK_CPU_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	sel	R/W	0h	Select the Processor Suspend that is used to Suspend the DSS Peripehrals 0:MSS CR5 1:DSP 2:DSS CM4 3-7:RSS CR4

5.2.8.17 RSS_ADCBUF_PING_MEMINIT Register (Offset = 280h) [Reset = 0000000h]

RSS_ADCBUF_PING_MEMINIT is shown in [Table 5-1127](#).

Return to the [Summary Table](#).

Table 5-1127. RSS_ADCBUF_PING_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	start	R/W	0h	Start Memory initialization of memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed.

5.2.8.18 RSS_ADCBUF_PING_MEMINIT_DONE Register (Offset = 284h) [Reset = 0000000h]

RSS_ADCBUF_PING_MEMINIT_DONE is shown in [Table 5-1128](#).

Return to the [Summary Table](#).

Table 5-1128. RSS_ADCBUF_PING_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.

5.2.8.19 RSS_ADCBUF_PING_MEMINIT_STATUS Register (Offset = 288h) [Reset = 00000000h]

RSS_ADCBUF_PING_MEMINIT_STATUS is shown in [Table 5-1129](#).

Return to the [Summary Table](#).

Table 5-1129. RSS_ADCBUF_PING_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.

5.2.8.20 RSS_ADCBUF_PONG_MEMINIT Register (Offset = 28Ch) [Reset = 0000000h]

RSS_ADCBUF_PONG_MEMINIT is shown in [Table 5-1130](#).

Return to the [Summary Table](#).

Table 5-1130. RSS_ADCBUF_PONG_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	start	R/W	0h	Start Memory initialization of memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed.

5.2.8.21 RSS_ADCBUF_PONG_MEMINIT_DONE Register (Offset = 290h) [Reset = 0000000h]

RSS_ADCBUF_PONG_MEMINIT_DONE is shown in [Table 5-1131](#).

Return to the [Summary Table](#).

Table 5-1131. RSS_ADCBUF_PONG_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.

5.2.8.22 RSS_ADCBUF_PONG_MEMINIT_STATUS Register (Offset = 294h) [Reset = 0000000h]

RSS_ADCBUF_PONG_MEMINIT_STATUS is shown in [Table 5-1132](#).

Return to the [Summary Table](#).

Table 5-1132. RSS_ADCBUF_PONG_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.

5.2.8.23 SOC_TO_BSS_SW_INT Register (Offset = 2C8h) [Reset = 0000000h]

SOC_TO_BSS_SW_INT is shown in [Table 5-1133](#).

Return to the [Summary Table](#).

Table 5-1133. SOC_TO_BSS_SW_INT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	trig	R/W	0h	Write Pulse Bit field writing to each bit field <0-7>: 1'b1:triggers BSS_SW_INT_RSS_CTRL<0-7> to BSS

5.2.8.24 RSS_DBG_ACK_CTL0 Register (Offset = 2CCh) [Reset = 0000000h]

RSS_DBG_ACK_CTL0 is shown in [Table 5-1134](#).

Return to the [Summary Table](#).

Table 5-1134. RSS_DBG_ACK_CTL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	frc	R/W	0h	emulation suspend signal control . Writing '111' would ungate the emulation suspend signal to the FRC

5.2.8.25 DMMSWINT1 Register (Offset = 2D0h) [Reset = 00XXXXXXh]

DMMSWINT1 is shown in [Table 5-1135](#).

Return to the [Summary Table](#).

Table 5-1135. DMMSWINT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	RESERVED	R	0h	
22	DMMCQWREN	R/W	0h	CQ Write Enable from DMM. 0 --> Write to CQ memory will happen from DFE and Ping-pong select will come from HW FSM (same as ADC Buffer ping-pong select). 1 --> Write to CQ memory will happen from CQ_W slave port in DSS interconnect using DMM as master and Ping-pong select will come from DMMCQPINPONSEL register.
21	DMMCQPINPONSEL	R/W	0h	CQ Ping Pong select for HIL Mode
20-19	RESERVED	R	0h	
18	DMMCPWREN	R/W	0h	Writing 1'b1: Enables DMM writes in to CP read registers 1'b0: Disables DMM writes to CP read registers
17	DMMADCBUFWREN	R/W	0h	ADC Buffer Write Enable from DMM. 0 --> Write to ADC BUF memory will happen from DFE and Ping-pong select will come from HW FSM (same as ADC Buffer ping-pong select). 1 --> Write to CQ memory will happen from ADCBUF_W slave port in DSS interconnect using DMM as master and Ping-pong select will come from DMMADCBUFPINPONSEL register.
16	DMMADCBUFPINPONSEL	R/W	0h	ADC Buffer Ping Pong select for HIL Mode
15-0	RESERVED	R	0h	

5.2.8.26 RSS_SHARED_MEM_MEMINIT Register (Offset = 2D4h) [Reset = 0000000h]

RSS_SHARED_MEM_MEMINIT is shown in [Table 5-1136](#).

Return to the [Summary Table](#).

Table 5-1136. RSS_SHARED_MEM_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	start	R/W	0h	Start Memory initialization of memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed.

5.2.8.27 RSS_SHARED_MEM_MEMINIT_DONE Register (Offset = 2D8h) [Reset = 0000000h]

RSS_SHARED_MEM_MEMINIT_DONE is shown in [Table 5-1137](#).

Return to the [Summary Table](#).

Table 5-1137. RSS_SHARED_MEM_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.

5.2.8.28 RSS_SHARED_MEM_MEMINIT_STATUS Register (Offset = 2DCh) [Reset = 0000000h]

RSS_SHARED_MEM_MEMINIT_STATUS is shown in [Table 5-1138](#).

Return to the [Summary Table](#).

Table 5-1138. RSS_SHARED_MEM_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.

5.2.8.29 BSS_CONTROL Register (Offset = 400h) [Reset = 0XXXX000h]

BSS_CONTROL is shown in [Table 5-1139](#).

Return to the [Summary Table](#).

Table 5-1139. BSS_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	
30-28	dss_l3_access	R/W	0h	writing 3'b111 allocates DSS_L3_BANKB1 256KB as TCM for RSS_CR4
27	RESERVED	R	0h	
26-24	halt	R/W	7h	writing 3'b000 unhalts BSS. This is expected to be written only once per processor reset cycle.
23-19	RESERVED	R	0h	
18-16	wfi_override	R/W	0h	writing 3'b111 overrides the WFI signal from CR4 and asserts it.
15-12	RESERVED	R	0h	
11-0	bootmode	R/W	0h	writing 12'h000 : selects the normal boot mode for CR4. 12'h111 : selects the FW dev mode for CR4 12'h222 : selects the orbit mode for CR4 12'h333 : selects the 14xx ROM swap mode

5.2.8.30 BSS_TCM_MEMINIT Register (Offset = 404h) [Reset = 00000000h]

BSS_TCM_MEMINIT is shown in [Table 5-1140](#).

Return to the [Summary Table](#).

15-0	TSTPATRX2IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 1.

5.2.8.46 TESTPATTERNRX3ICFG Register (Offset = 808h) [Reset = 00010000h]

TESTPATTERNRX3ICFG is shown in [Table 5-1156](#).

Return to the [Summary Table](#).

Table 5-1156. TESTPATTERNRX3ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX3IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 2
15-0	TSTPATRX3IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 2

5.2.8.47 TESTPATTERNRX4ICFG Register (Offset = 80Ch) [Reset = 00010000h]

TESTPATTERNRX4ICFG is shown in [Table 5-1157](#).

Return to the [Summary Table](#).

Table 5-1157. TESTPATTERNRX4ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX4IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 3
15-0	TSTPATRX4IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 3

5.2.8.48 TESTPATTERNRX1QCFG Register (Offset = 810h) [Reset = 00010000h]

TESTPATTERNRX1QCFG is shown in [Table 5-1158](#).

Return to the [Summary Table](#).

Table 5-1158. TESTPATTERNRX1QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX1QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.
15-0	TSTPATRX1QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.

5.2.8.49 TESTPATTERNRX2QCFG Register (Offset = 814h) [Reset = 00010000h]

TESTPATTERNRX2QCFG is shown in [Table 5-1159](#).

Return to the [Summary Table](#).

Table 5-1159. TESTPATTERNRX2QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX2QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 1.
15-0	TSTPATRX2QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 1.

5.2.8.50 TESTPATTERNRX3QCFG Register (Offset = 818h) [Reset = 00010000h]

TESTPATTERNRX3QCFG is shown in [Table 5-1160](#).

Return to the [Summary Table](#).

Table 5-1160. TESTPATTERNRX3QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX3QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 2
15-0	TSTPATRX3QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 2

5.2.8.51 TESTPATTERNRX4QCFG Register (Offset = 81Ch) [Reset = 00010000h]

TESTPATTERNRX4QCFG is shown in [Table 5-1161](#).

Return to the [Summary Table](#).

Table 5-1161. TESTPATTERNRX4QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX4QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 3
15-0	TSTPATRX4QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 3

5.2.8.52 TESTPATTERNVLDCFG Register (Offset = 820h) [Reset = 0000008h]

TESTPATTERNVLDCFG is shown in [Table 5-1162](#).

Return to the [Summary Table](#).

Table 5-1162. TESTPATTERNVLDCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	0h	
10-8	TSTPATGENEN	R/W	0h	Enable for test pattern generator. This is used to Mux with the functional data from BSS. 000 -->Disable, 111-->Enable, Others are reserved.
7-0	TSTPATVLCNT	R/W	8h	Number of DSS Interconnect clocks (200 MHz) between successive samples for the test pattern gen.

5.2.8.53 ADCBUF CFG1 Register (Offset = 824h) [Reset = 00010004h]

ADCBUF CFG1 is shown in [Table 5-1163](#).

Return to the [Summary Table](#).

Table 5-1163. ADCBUF CFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RESERVED	R	0h	
16	ADCBUFPIPOSEL	R	1h	TI Internal Feature Ping-pong select value from ADC Buffer Packing logic. Even in SW override mode, this register will indicate the ping-pong select signal generated from the ADC Buffer Packing logic and not the override value.
15	ADCBUFCONTSTOPPL	R/W	0h	Stop Pulse for Continuous mode. The data capture will stop once this register is set. Continuous mode is expected to be only used for CZ and ADC Buffer Testpattern mode : Its a wspecial access type, write to this field will generate a pulse
14	ADCBUFCONTSTRTPPL	R/W	0h	Start Pulse for Continuous mode. The data capture will start from Address 0 once this register is set. All the other configurations like Enable, Sample Count are expected to be programmed before this pulse. Continuous mode is expected to be only used for CZ and ADC Buffer Testpattern mode : Its a wspecial access type, write to this field will generate a pulse
13	ADCBUFCONTMODEEN	R/W	0h	Continuous mode enable for ADC Buffer. This is set when a fixed number of samples have to be stored in Ping/Pong and not depend on Chirp time-lines (Eg: Analog Lab characterization to stream out continuous data from DFE). Continuous mode is expected to be only used for CZ and ADC Buffer Testpattern mode
12	ADCBUFWRITEMODE	R/W	0h	This needs to be programmed to 0x1 in AR16xx 0 --> Interleaved, 1 --> Non-interleaved
11	ADCBUFPIPOOVRVAL	R/W	0h	TI Internal Feature SW override value for ADC Buffer Ping Pong select
10	ADCBUFPIPOOVRCNT	R/W	0h	TI Internal Feature Override control for ADC Buffer Ping Pong select
9	RX3EN	R/W	0h	Enable for Rx3 write
8	RX2EN	R/W	0h	Enable for Rx2 write
7	RX1EN	R/W	0h	Enable for Rx1 write
6	RX0EN	R/W	0h	Enable for Rx0 write
5	ADCBUFIQSWAP	R/W	0h	0 --> I is stored in LSB and Q is stored in MSB 1 --> Q is stored in LSB and I is stored in MSB
4	ADCBUFRL2CHINTRL	R/W	0h	TI reserved field. Do not touch
3	ADCBUFRLMODECHSEL	R/W	0h	TI Internal Feature 0 -->I channel, 1 --> Q channel
2	ADCBUFREALONLYMODE	R/W	1h	0-->Complex Data mode, 1-->Real data mode
1	ADCBUFPIPOSELINV	R/W	0h	TI Internal Feature Inversion control for ADC Buffer Ping-pong select. By default ADC Buffer write starts with Pong write. By setting this bit to 1, it will start from Ping write after reset.
0	ADCBUFWRSOURCE	R/W	0h	TI Internal Feature Write source for ADC Buffer. 0 --> DFE, 1 --> VIN

5.2.8.54 ADCBUF CFG1_EXTD Register (Offset = 828h) [Reset = 0000000h]

ADCBUF CFG1_EXTD is shown in [Table 5-1164](#).

Return to the [Summary Table](#).

Table 5-1164. ADCBUF CFG1_EXTD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADCBUFINTGENDLY	R/W	0h	TI Internal Feature. No of clocks to delay the ping-pong switch and interrupt generation w.r.t ADC Valid fall pulse. This will enable dithering the DSP activity for successive ping-pong switch cycles. This will not delay the ping pong toggle which will happen immediately after ADC Valid fall.

5.2.8.55 ADCBUF CFG2 Register (Offset = 82Ch) [Reset = 0100XX00h]

ADCBUF CFG2 is shown in [Table 5-1165](#).

Return to the [Summary Table](#).

Table 5-1165. ADCBUF CFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	
26-16	ADCBUF ADDR X1	R/W	100h	128 bit Address offset to be added to the internal address pointer for Rx1 writes in Non-interleaved mode.
15-11	RESERVED	R	0h	
10-0	ADCBUF ADDR X0	R/W	0h	128 bit Address offset to be added to the internal address pointer for Rx0 writes in Non-interleaved mode.

5.2.8.56 ADCBUFCFG3 Register (Offset = 830h) [Reset = 0300XX00h]

ADCBUFCFG3 is shown in [Table 5-1166](#).

Return to the [Summary Table](#).

Table 5-1166. ADCBUFCFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	
26-16	ADCBUFADDRX3	R/W	300h	128 bit Address offset to be added to the internal address pointer for Rx3 writes in Non-interleaved mode.
15-11	RESERVED	R	0h	
10-0	ADCBUFADDRX2	R/W	200h	128 bit Address offset to be added to the internal address pointer for Rx2 writes in Non-interleaved mode.

5.2.8.57 ADCBUF CFG4 Register (Offset = 834h) [Reset = XX000400h]

ADCBUF CFG4 is shown in [Table 5-1167](#).

Return to the [Summary Table](#).

Table 5-1167. ADCBUF CFG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	
30	ADCBUF PNGSEL TGLDIS	R/W	0h	TI Internal Feature 0 --> Delay Interrupt Gen and Ping/Pong toggle together based on <code>cfg_interrupt_gen_delay</code> , 1 --> Delay only Interrupt Gen based on <code>cfg_interrupt_gen_delay</code> . But toggle Ping/Pong select signal as soon as the write is complete.
29-26	RESERVED	R	0h	
25-21	ADCBUF NUMCHR P PONG	R/W	0h	Number of chirps to be stored in Pong buffer. This register should be programmed with one less than the actual number needed. This is used when data is written to Pong Memory. The value written to this field should be the same as that configured for Ping
20-16	ADCBUF NUMCHR P PING	R/W	0h	Number of chirps to be stored in Ping buffer. This register should be programmed with one less than the actual number needed. This is used when data is written to Pong Memory. The value written to this field should be the same as that configured for Pong
15-0	ADCBUF SAMPCNT	R/W	400h	No of samples to store in each Ping and Pong register in continuous mode of ADC Buffer. In real only mode this refers to the number of real samples and in complex mode, this refers to number of complex samples. This refers to the number of samples per channel. This counter increments once for every new sample from DFE (as long as 1 or more channels are enabled). The max allowed value varies depending on other configurations (No of channels enabled and real/complex data). Continuous mode is expected to be only used for CZ and ADC Buffer Testpattern mode

5.2.8.58 ADCBUFINTGENDITHERDLY Register (Offset = 838h) [Reset = 00000000h]

ADCBUFINTGENDITHERDLY is shown in [Table 5-1168](#).

Return to the [Summary Table](#).

Table 5-1168. ADCBUFINTGENDITHERDLY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADCBUFINTGENDITHERDLY	R/W	0h	TI Internal Feature. Additional dithering delay added on the Chirp Available interrupt

5.2.8.59 CBUFF_FRAME_START_SEL Register (Offset = 83Ch) [Reset = 0000000h]

CBUFF_FRAME_START_SEL is shown in [Table 5-1169](#).

Return to the [Summary Table](#).

Table 5-1169. CBUFF_FRAME_START_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	sel	R/W	0h	writing: 1'b0: selects frame_start from DFE 1'b1: Selects frame_start from chirp_avail (adc capture complete)

5.2.8.60 CQCFG1 Register (Offset = C00h) [Reset = 4010000Xh]

CQCFG1 is shown in [Table 5-1170](#).

Return to the [Summary Table](#).

Table 5-1170. CQCFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	
30-22	CQ2BASEADDR	R/W	100h	128-bit Address offset which indicates the start address for storing CQ0 (ADC/RxIF Saturation Detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
21-13	CQ1BASEADDR	R/W	80h	128-bit Address offset which indicates the start address for storing CQ0 (Signal Image Band Energy detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
12-4	CQ0BASEADDR	R/W	0h	128-bit Address offset which indicates the start address for storing CQ0 (Wide Band Energy detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
3	CQ96BITPACKEN	R/W	0h	This is used to pack the CQ data into only the LSB 96 bits of each row of the CQ memory. This can be used in 3 channel mode of LVDS where the ADC data and Chirp Params occupy only LSB 96 bits of each memory row.
2	RESERVED	R	0h	
1-0	CQDATAWIDTH	R/W	0h	This is used to appropriately pack the valid CQ data bits in appropriate bits in the CQ memory. 00, 01->Raw 16, 10-->Raw 12, 11-->Raw14

5.2.8.61 CQCFG2 Register (Offset = C04h) [Reset = 0000XXXh]

CQCFG2 is shown in [Table 5-1171](#).

Return to the [Summary Table](#).

Table 5-1171. CQCFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R	0h	
17	CQ_CLK_GATE	R/W	0h	writing: 1'b0: ungates the clk to CQ logic 1'b1: Gates the clk to CQ logic
16	CQPIPOSELVAL	R/W	0h	Ping pong select override value for CQ Memory. 1 --> Read access from Chirp Info Slave of DSS Interconnect will be routed to ping memory and write access from CQ_W/DFE write will be routed to pong memory. 0 --> Read access from Chirp Info Slave of DSS Interconnect will be routed to pong memory and write access from CQ_W/DFE write will be routed to ping memory.
15-13	RESERVED	R	0h	
12	CQPIPOSELCNT	R/W	0h	Ping pong select override control for CQ Memory. 0 --> Ping-pong select comes from HW FSM (same as the ping-pong select for ADC Buffer)/DMMCQPINPONSEL 1 --> Ping pong select for CQ memory is taken from SW register (CQPIPOSELVAL)
11-9	RESERVED	R	0h	
8	CQ2TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ2 (ADC/RxIF Saturation). Once enabled, each 8 bit data is same as Addr+1.
7-5	RESERVED	R	0h	
4	CQ1TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ1 (SI). Once enabled, each 16 bit data is same as [2*Addr+1 for the MSB 8 bits and Addr+1 for the LSB 8 bits.
3-1	RESERVED	R	0h	
0	CQ0TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ0 (WBE). Once enabled, each 16 bit data is same as [2*Addr+1 for the MSB 8 bits and Addr+1 for the LSB 8 bits.

5.2.8.62 CPREG0 Register (Offset = C08h) [Reset = 0000000h]

CPREG0 is shown in [Table 5-1172](#).

Return to the [Summary Table](#).

Table 5-1172. CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG0	R	0h	Chirp Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.63 CPREG1 Register (Offset = C0Ch) [Reset = 0000001h]

CPREG1 is shown in [Table 5-1173](#).

Return to the [Summary Table](#).

Table 5-1173. CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG1	R	1h	Chirp Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.64 CPREG2 Register (Offset = C10h) [Reset = 0000002h]

CPREG2 is shown in [Table 5-1174](#).

Return to the [Summary Table](#).

Table 5-1174. CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG2	R	2h	Chirp Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.65 CPREG3 Register (Offset = C14h) [Reset = 0000003h]

CPREG3 is shown in [Table 5-1175](#).

Return to the [Summary Table](#).

Table 5-1175. CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG3	R	3h	Chirp Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.66 CPREG4 Register (Offset = C18h) [Reset = 0000000h]

CPREG4 is shown in [Table 5-1176](#).

Return to the [Summary Table](#).

Table 5-1176. CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG4	R	0h	Chirp Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.67 CPREG5 Register (Offset = C1Ch) [Reset = 0000000h]

CPREG5 is shown in [Table 5-1177](#).

Return to the [Summary Table](#).

Table 5-1177. CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG5	R	0h	Chirp Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.68 CPREG6 Register (Offset = C20h) [Reset = 0000000h]

CPREG6 is shown in [Table 5-1178](#).

Return to the [Summary Table](#).

Table 5-1178. CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG6	R	0h	Chirp Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.69 CPREG7 Register (Offset = C24h) [Reset = 0000000h]

CPREG7 is shown in [Table 5-1179](#).

Return to the [Summary Table](#).

Table 5-1179. CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG7	R	0h	Chirp Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.70 CPREG8 Register (Offset = C28h) [Reset = 0000000h]

CPREG8 is shown in [Table 5-1180](#).

Return to the [Summary Table](#).

Table 5-1180. CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG8	R	0h	Chirp Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.71 CPREG9 Register (Offset = C2Ch) [Reset = 0000000h]

CPREG9 is shown in [Table 5-1181](#).

Return to the [Summary Table](#).

Table 5-1181. CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG9	R	0h	Chirp Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.72 CPREG10 Register (Offset = C30h) [Reset = 00000000h]

CPREG10 is shown in [Table 5-1182](#).

Return to the [Summary Table](#).

Table 5-1182. CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG10	R	0h	Chirp Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.73 CPREG11 Register (Offset = C34h) [Reset = 0000000h]

CPREG11 is shown in [Table 5-1183](#).

Return to the [Summary Table](#).

Table 5-1183. CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG11	R	0h	Chirp Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.74 CPREG12 Register (Offset = C38h) [Reset = 00000000h]

CPREG12 is shown in [Table 5-1184](#).

Return to the [Summary Table](#).

Table 5-1184. CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG12	R	0h	Chirp Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.75 CPREG13 Register (Offset = C3Ch) [Reset = 0000000h]

CPREG13 is shown in [Table 5-1185](#).

Return to the [Summary Table](#).

31-0	CH3CPREG15	R	0h	Multi Chirp 3 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.142 CH4CPREG0 Register (Offset = D48h) [Reset = 00000000h]

CH4CPREG0 is shown in [Table 5-1252](#).

Return to the [Summary Table](#).

Table 5-1252. CH4CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG0	R	0h	Multi Chirp 4 Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.143 CH4CPREG1 Register (Offset = D4Ch) [Reset = 0000001h]

CH4CPREG1 is shown in [Table 5-1253](#).

Return to the [Summary Table](#).

Table 5-1253. CH4CPREG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG1	R	1h	Multi Chirp 4 Parameters Register 1. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.144 CH4CPREG2 Register (Offset = D50h) [Reset = 0000002h]

CH4CPREG2 is shown in [Table 5-1254](#).

Return to the [Summary Table](#).

Table 5-1254. CH4CPREG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG2	R	2h	Multi Chirp 4 Parameters Register 2. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.145 CH4CPREG3 Register (Offset = D54h) [Reset = 0000003h]

CH4CPREG3 is shown in [Table 5-1255](#).

Return to the [Summary Table](#).

Table 5-1255. CH4CPREG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG3	R	3h	Multi Chirp 4 Parameters Register 3. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.146 CH4CPREG4 Register (Offset = D58h) [Reset = 00000000h]

CH4CPREG4 is shown in [Table 5-1256](#).

Return to the [Summary Table](#).

Table 5-1256. CH4CPREG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG4	R	0h	Multi Chirp 4 Parameters Register 4. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.147 CH4CPREG5 Register (Offset = D5Ch) [Reset = 00000000h]

CH4CPREG5 is shown in [Table 5-1257](#).

Return to the [Summary Table](#).

Table 5-1257. CH4CPREG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG5	R	0h	Multi Chirp 4 Parameters Register 5. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.148 CH4CPREG6 Register (Offset = D60h) [Reset = 00000000h]

CH4CPREG6 is shown in [Table 5-1258](#).

Return to the [Summary Table](#).

Table 5-1258. CH4CPREG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG6	R	0h	Multi Chirp 4 Parameters Register 6. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.149 CH4CPREG7 Register (Offset = D64h) [Reset = 0000000h]

CH4CPREG7 is shown in [Table 5-1259](#).

Return to the [Summary Table](#).

Table 5-1259. CH4CPREG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG7	R	0h	Multi Chirp 4 Parameters Register 7. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.150 CH4CPREG8 Register (Offset = D68h) [Reset = 00000000h]

CH4CPREG8 is shown in [Table 5-1260](#).

Return to the [Summary Table](#).

Table 5-1260. CH4CPREG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG8	R	0h	Multi Chirp 4 Parameters Register 8. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.151 CH4CPREG9 Register (Offset = D6Ch) [Reset = 00000000h]

CH4CPREG9 is shown in [Table 5-1261](#).

Return to the [Summary Table](#).

Table 5-1261. CH4CPREG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG9	R	0h	Multi Chirp 4 Parameters Register 9. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.152 CH4CPREG10 Register (Offset = D70h) [Reset = 00000000h]

CH4CPREG10 is shown in [Table 5-1262](#).

Return to the [Summary Table](#).

Table 5-1262. CH4CPREG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG10	R	0h	Multi Chirp 4 Parameters Register 10. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.153 CH4CPREG11 Register (Offset = D74h) [Reset = 0000000h]

CH4CPREG11 is shown in [Table 5-1263](#).

Return to the [Summary Table](#).

Table 5-1263. CH4CPREG11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG11	R	0h	Multi Chirp 4 Parameters Register 11. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.154 CH4CPREG12 Register (Offset = D78h) [Reset = 0000000h]

CH4CPREG12 is shown in [Table 5-1264](#).

Return to the [Summary Table](#).

Table 5-1264. CH4CPREG12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG12	R	0h	Multi Chirp 4 Parameters Register 12. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.155 CH4CPREG13 Register (Offset = D7Ch) [Reset = 0000000h]

CH4CPREG13 is shown in [Table 5-1265](#).

Return to the [Summary Table](#).

Table 5-1265. CH4CPREG13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG13	R	0h	Multi Chirp 4 Parameters Register 13. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.156 CH4CPREG14 Register (Offset = D80h) [Reset = 00000000h]

CH4CPREG14 is shown in [Table 5-1266](#).

Return to the [Summary Table](#).

Table 5-1266. CH4CPREG14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG14	R	0h	Multi Chirp 4 Parameters Register 14. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.157 CH4CPREG15 Register (Offset = D84h) [Reset = 0000000h]

CH4CPREG15 is shown in [Table 5-1267](#).

Return to the [Summary Table](#).

Table 5-1267. CH4CPREG15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CH4CPREG15	R	0h	Multi Chirp 4 Parameters Register 15. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.8.158 CH5CPREG0 Register (Offset = D88h) [Reset = 00000000h]

CH5CPREG0 is shown in [Table 5-1268](#).

Return to the [Summary Table](#).

Table 5-1347. DSP_ICFG Registers (continued)

Offset	Acronym	Register Name	Section
0003111Ch	L1DDEDADDR	The L1D Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in the STATUS registers. The addresses for both correctable and noncorrectable errors are held in this register. The value contained in the addresss field is the lower 16 bits of the word boundary of the memory access. If the access is to 0x00F00020, the address field will read 0x0020, if the access is to 0x00F07FE0, the address field will read 0x7FE0.	Go
00031120h	L1DTEDEADDR	The L1D Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in the STATUS registers. The address for both correctable and noncorrectable errors are held in this register. The value of the address is the index (or address on the RAM) of the RAM module.	Go
00031124h	L1DEDCNT	The L1D TAG Error Detection Error Count Register stores the error counts for correctable and noncorrectable errors which occur in the L1D Cache Memories, these counts are accumulated regardless of the exception mapping in the L1DEDCMD (0x0182_1108) interrupt enable bits. The counters capture the total number of correctable and non-correctable errors from both the DATA and TAG memories.	Go
00031128h	L2TEDCMD	This write only register provides control for enabling and disabling the ECC logic ofr the UMC. This register controls the parameters which are accumulated for the Data and Tag RAMs in the DMC. Enabling the ECC allows the counting of recoverable and non-recoverable errors as well as registering the requestor and the address and cache states for any ECC errors which are reported.	Go
0003112Ch	L2TCSTAT	This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.	Go
00031130h	L2TNCSTAT	This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.	Go
00031134h	L2TEDADDR	The L2Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in 1.3.1.12. With both exceptions activated, the TAG exception will take priority on simultaneous exceptions. The address in these fields is the displacement into the memory as presented to the address port of the SRAM.	Go
0003113Ch	L2MNCSTAT	This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.	Go

Table 5-1347. DSP_ICFG Registers (continued)

Offset	Acronym	Register Name	Section
00031140h	L2MEDADDR	The L2Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in 1.3.1.12. With both exceptions activated, the TAG exception will take priority on simultaneous exceptions.	Go
00031144h	L2SCSTAT	This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.	Go
00031148h	L2SNCSTAT	This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.	Go
0003114Ch	L2SEDADDR	The L2Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in 1.3.1.12. With both exceptions activated, the TAG exception will take priority on simultaneous exceptions.	Go
00031150h	L2LCSTAT	This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.	Go
00031154h	L2LNCSTAT		Go
00031158h	L2LEDADDR	The L2Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in 1.3.1.12. With both exceptions activated, the TAG exception will take priority on simultaneous exceptions.	Go
0003115Ch	L2TEDCNT	The L2 Error Detection Error Count Register stores the error counts for correctable and non-correctable errors which occur in the L1D Data Memory, these counts are accumulated regardless of the exception mapping in the L1DEDCMD (0x0182_1108) interrupt enable bits. The counts contained in these registers are the accumulation of all L2 errors. This value saturates at an unsigned 0xFFFF.	Go
00031160h	L1PTEDCMD	This write only register provides control for enabling and disabling the Parity logic of the PMC. This register controls the parameters which are accumulated for the Data and Tag RAMs in the PMC. Enabling the Parity allows the counting of recoverable and non-recoverable errors as well as registering the requestor and the address and cache states for any Parity errors which are reported.	Go
00031164h	L1PTEDSTAT	This read only register contains the current error. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.	Go

Table 5-1374. MEXPFLAG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MEXPFLAG	R	0h	Masked exception flags

5.2.9.27 MEXPFLAG2 Register (Offset = E8h) [Reset = 0000000h]

MEXPFLAG2 is shown in [Table 5-1375](#).

Return to the [Summary Table](#).

Masked exception flags

Table 5-1375. MEXPFLAG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MEXPFLAG	R	0h	Masked exception flags

5.2.9.28 MEXPFLAG3 Register (Offset = ECh) [Reset = 00000000h]

MEXPFLAG3 is shown in [Table 5-1376](#).

Return to the [Summary Table](#).

Masked exception flags

Table 5-1376. MEXPFLAG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MEXPFLAG	R	0h	Masked exception flags

5.2.9.29 INTMUX1 Register (Offset = 104h) [Reset = 07060504h]

INTMUX1 is shown in [Table 5-1377](#).

Return to the [Summary Table](#).

Interrupt Mux Register

Table 5-1377. INTMUX1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	_RESV3	0h	Always read as 0. Writes have no affect.	Interrupt selector 7
30-24	INTSEL7	R/W	7h	
23	_RESV2	0h	Always read as 0. Writes have no affect.	Interrupt selector 6
22-16	INTSEL6	R/W	6h	
15	_RESV1	0h	Always read as 0. Writes have no affect.	Interrupt selector 5
14-8	INTSEL5	R/W	5h	
7	_RESV0	0h	Always read as 0. Writes have no affect.	Interrupt selector 4
6-0	INTSEL4	R/W	4h	

5.2.9.30 INTMUX2 Register (Offset = 108h) [Reset = 0B0A0908h]

INTMUX2 is shown in [Table 5-1378](#).

Return to the [Summary Table](#).

Interrupt Mux Register

Table 5-1378. INTMUX2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	_RESV3	0h	Always read as 0. Writes have no affect.	
30-24	INTSEL11	R/W	Bh	Interrupt selector 11
23	_RESV2	0h	Always read as 0. Writes have no affect.	
22-16	INTSEL10	R/W	Ah	Interrupt selector 10
15	_RESV1	0h	Always read as 0. Writes have no affect.	
14-8	INTSEL9	R/W	9h	Interrupt selector 9
7	_RESV0	0h	Always read as 0. Writes have no affect.	
6-0	INTSEL8	R/W	8h	Interrupt selector 8

5.2.9.31 INTMUX3 Register (Offset = 10Ch) [Reset = 0F0E0D0Ch]

INTMUX3 is shown in [Table 5-1379](#).

Return to the [Summary Table](#).

Interrupt Mux Register

Table 5-1379. INTMUX3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	_RESV3	0h	Always read as 0. Writes have no affect.	
30-24	INTSEL15	R/W	Fh	Interrupt selector 15
23	_RESV2	0h	Always read as 0. Writes have no affect.	
22-16	INTSEL14	R/W	Eh	Interrupt selector 14
15	_RESV1	0h	Always read as 0. Writes have no affect.	
14-8	INTSEL13	R/W	Dh	Interrupt selector 13
7	_RESV0	0h	Always read as 0. Writes have no affect.	
6-0	INTSEL12	R/W	Ch	Interrupt selector 12

5.2.9.32 AEGMUX0 Register (Offset = 140h) [Reset = 03020100h]

AEGMUX0 is shown in [Table 5-1380](#).

Return to the [Summary Table](#).

AEG Event Mux Register

Table 5-1380. AEGMUX0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	
30-24	AEGSEL3	R/W	3h	AEG event selector 3
23	RESERVED	R	0h	
22-16	AEGSEL2	R/W	2h	AEG event selector 2
15	RESERVED	R	0h	
14-8	AEGSEL1	R/W	1h	AEG event selector 1
7	RESERVED	R	0h	
6-0	AEGSEL0	R/W	0h	AEG event selector 0

5.2.9.33 AEGMUX1 Register (Offset = 144h) [Reset = 07060504h]

AEGMUX1 is shown in [Table 5-1381](#).

Return to the [Summary Table](#).

AEG Event Mux Register

Table 5-1381. AEGMUX1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	
30-24	AEGSEL7	R/W	7h	AEG event selector 7
23	RESERVED	R	0h	
22-16	AEGSEL6	R/W	6h	AEG event selector 6
15	RESERVED	R	0h	
14-8	AEGSEL5	R/W	5h	AEG event selector 5
7	RESERVED	R	0h	
6-0	AEGSEL4	R/W	4h	AEG event selector 4

5.2.9.34 INTXSTAT Register (Offset = 180h) [Reset = 0000000h]

INTXSTAT is shown in [Table 5-1382](#).

Return to the [Summary Table](#).

Interrupt Exception Status Register

Table 5-1382. INTXSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SYSINT	R	0h	System event number
23-16	CPUINT	R	0h	CPU interrupt number
15-1	_RESV3	0h	Always read as 0. Writes have no affect.	
0	DROP	R	0h	Dropped event flag

5.2.9.35 INTXCLR Register (Offset = 184h) [Reset = 0000000h]

INTXCLR is shown in [Table 5-1383](#).

Return to the [Summary Table](#).

Interrupt Exception Clear Register

Table 5-1383. INTXCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	_RESV3	0h	Always read as 0. Writes have no affect.	
0	CLEAR	W	0h	Clear interrupt exception status

5.2.9.36 INTDMASK Register (Offset = 188h) [Reset = 00000000h]

INTDMASK is shown in [Table 5-1384](#).

Return to the [Summary Table](#).

Dropped Interrupt Mask Register

Table 5-1384. INTDMASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	_RESV1	0h	Always read as 0. Writes have no affect.	Interrupt drop mask
15-4	IDM	R/W	0h	
3-0	_RESV0	0h	Always read as 0. Writes have no affect.	

5.2.9.37 EVTASRT Register (Offset = 1C0h) [Reset = 03020100h]

EVTASRT is shown in [Table 5-1385](#).

Return to the [Summary Table](#).

Event Assert Register

Table 5-1385. EVTASRT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MRA	W	0h	Maximal Reset Request Assert
30	SRA	W	0h	System Reset Request Assert
29	CRA	W	0h	Chip Reset Request Assert
28	LRA	W	0h	Local Reset Request Assert
27-8	_RESV0	0h	Always read as 0. Writes have no affect.	
7-0	EA	W	0h	Event Assert

5.2.9.38 PDCCMD Register (Offset = 00010000h) [Reset = 00000000h]

PDCCMD is shown in [Table 5-1386](#).

Return to the [Summary Table](#).

Table 5-1386. PDCCMD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RESV_1	0h	Always read as 0. Writes have no affect.	
16	GEMPD	R/W	0h	Enable power-down during IDLE
15-14	RESV_2	0h	Always read as 0. Writes have no affect.	
13-12	EMCLOG	R/W	0h	EMC SRAM Sleep Mode
11-10	RESV_3	0h	Always read as 0. Writes have no affect.	
9-8	UMCLOG	R/W	0h	UMC SRAM Sleep Mode
7-6	DMCMEM	R/W	0h	DMC Logic Clock Gating
5-4	DMCLOG	R/W	0h	DMC SRAM Sleep Mode
3-2	PMCMEM	R/W	0h	PMC Logic Clock Gating
1-0	PMCLOG	R/W	0h	PMC SRAM Sleep Mode

5.2.9.39 MM_REVID Register (Offset = 00012000h) [Reset = 00000000h]

MM_REVID is shown in [Table 5-1387](#).

Return to the [Summary Table](#).

Table 5-1387. MM_REVID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MM_REVID	R/W	0h	

5.2.9.40 IDMA0_STAT Register (Offset = 00020000h) [Reset = 00000000h]

IDMA0_STAT is shown in [Table 5-1388](#).

Return to the [Summary Table](#).

IDMA Channel 0 Status

Table 5-1388. IDMA0_STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	_RESV1	0h	Always read as 0. Writes have no affect.	
1	PEND	R	0h	Command pending
0	ACTV	R	0h	Command active

5.2.9.41 IDMA0_MASK Register (Offset = 00020004h) [Reset = 00000000h]

IDMA0_MASK is shown in [Table 5-1389](#).

Return to the [Summary Table](#).

IDMA Channel 0 Register Mask

Table 5-1389. IDMA0_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	Register mask

5.2.9.42 IDMA0_SOURCE Register (Offset = 00020008h) [Reset = 0000000h]

IDMA0_SOURCE is shown in [Table 5-1390](#).

Return to the [Summary Table](#).

IDMA Channel 0 Source Address

Table 5-1390. IDMA0_SOURCE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	SOURCEADDR	R/W	0h	Source address
4-0	_RESV1	0h	Always read as 0. Writes have no affect.	

5.2.9.43 IDMA0_DEST Register (Offset = 0002000Ch) [Reset = 00000000h]

IDMA0_DEST is shown in [Table 5-1391](#).

Return to the [Summary Table](#).

IDMA Channel 0 Destination Address

Table 5-1391. IDMA0_DEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	DESTADDR	R/W	0h	Destination address
4-0	_RESV1	0h	Always read as 0. Writes have no affect.	

5.2.9.44 IDMA0_COUNT Register (Offset = 00020010h) [Reset = 00000000h]

IDMA0_COUNT is shown in [Table 5-1392](#).

Return to the [Summary Table](#).

IDMA Channel 0 Count

Table 5-1392. IDMA0_COUNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	_RESV1	0h	Always read as 0. Writes have no affect.	Interrupt enable
28	INT	R/W	0h	
27-4	_RESV2	0h	Always read as 0. Writes have no affect.	Transfer frame count
3-0	COUNT	R/W	0h	

5.2.9.45 IDMA1_STAT Register (Offset = 00020100h) [Reset = 00000000h]

IDMA1_STAT is shown in [Table 5-1393](#).

Return to the [Summary Table](#).

Table 5-1393. IDMA1_STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	_RESV1	0h	Always read as 0. Writes have no affect.	
1	PEND	R	0h	Command pending
0	ACTV	R	0h	Command active

5.2.9.46 IDMA1_SOURCE Register (Offset = 00020108h) [Reset = 00000000h]

IDMA1_SOURCE is shown in [Table 5-1394](#).

Return to the [Summary Table](#).

Table 5-1394. IDMA1_SOURCE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	SOURCEADDR	R/W	0h	Source address
1-0	_RESV1	0h	Always read as 0. Writes have no affect.	

5.2.9.47 IDMA1_DEST Register (Offset = 0002010Ch) [Reset = 00000000h]

IDMA1_DEST is shown in [Table 5-1395](#).

Return to the [Summary Table](#).

Table 5-1395. IDMA1_DEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	DESTADDR	R/W	0h	Destination address
1-0	_RESV1	0h	Always read as 0. Writes have no affect.	

5.2.9.48 IDMA1_COUNT Register (Offset = 00020110h) [Reset = 00000000h]

IDMA1_COUNT is shown in [Table 5-1396](#).

Return to the [Summary Table](#).

Table 5-1396. IDMA1_COUNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	PRI	R/W	0h	Priority
28	INT	R/W	0h	Interrupt enable
27-17	_RESV1	0h	Always read as 0. Writes have no affect.	
16	FILL	R/W	0h	Fill/Copy Mode Select
15-2	COUNT	R/W	0h	Transfer word count
1-0	_RESV2	0h	Always read as 0. Writes have no affect.	

5.2.9.49 CPUARBE Register (Offset = 00020200h) [Reset = 00010010h]

CPUARBE is shown in [Table 5-1397](#).

Return to the [Summary Table](#).

Table 5-1397. CPUARBE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESV_1	0h	Always read as 0. Writes have no affect.	Priority
18-16	PRI	R/W	1h	
15-6	RESV_2	0h	Always read as 0. Writes have no affect.	Max wait count
5-0	MAXWAIT	R/W	10h	

5.2.9.50 IDMAARBE Register (Offset = 00020204h) [Reset = 00000010h]

IDMAARBE is shown in [Table 5-1398](#).

Return to the [Summary Table](#).

Table 5-1398. IDMAARBE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESV_1	0h	Always read as 0. Writes have no affect.	
5-0	MAXWAIT	R/W	10h	Max wait count

5.2.9.51 SDMAARBE Register (Offset = 00020208h) [Reset = 0000001h]

SDMAARBE is shown in [Table 5-1399](#).

Return to the [Summary Table](#).

Table 5-1399. SDMAARBE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESV_1	0h	Always read as 0. Writes have no affect.	
5-0	MAXWAIT	R/W	1h	Max wait count

5.2.9.52 ECFGARBE Register (Offset = 00020210h) [Reset = 00070000h]

ECFGARBE is shown in [Table 5-1400](#).

Return to the [Summary Table](#).

Table 5-1400. ECFGARBE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESV_2	0h	Always read as 0. Writes have no affect.	
18-16	PRI	R/W	7h	Priority
15-0	RESV_1	0h	Always read as 0. Writes have no affect.	

5.2.9.53 ICFGMPFAR Register (Offset = 00020300h) [Reset = 00000000h]

ICFGMPFAR is shown in [Table 5-1401](#).

Return to the [Summary Table](#).

5.2.9.74 EDCINTMASK Register (Offset = 00031100h) [Reset = 0000007Fh]

EDCINTMASK is shown in [Table 5-1422](#).

Return to the [Summary Table](#).

This read write registers contains the masks for the exceptions generated by each of the EDC error detection units added in this change. Also contained in this register are the bit fields indicating which module has issued an exception.

Reads of this register do not affect the mask bits but do clear the exception bits.

Table 5-1422. EDCINTMASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	Reserved
6	L1PTAG	R/W	1h	L1PTAG Exception Enable: 1 enables the propagation of the exceptions generated from the error detector. Write 0 to disable exceptions.
5	L2LRU	R/W	1h	L2LRU Exception Enable: 1 enables the propagation of the exceptions generated from the error detector. Write 0 to disable exceptions.
4	L2SNOP	R/W	1h	L2SNOP Exception Enable: 1 enables the propagation of the exceptions generated from the error detector. Write 0 to disable exceptions.
3	L2TAG	R/W	1h	L2TAG Exception Enable: 1 enables the propagation of the exceptions generated from the error detector. Write 0 to disable exceptions.
2	L2MPPA	R/W	1h	L2DMPPA Exception Enable: 1 enables the propagation of the exceptions generated from the error detector. Write 0 to disable exceptions.
1	L1DTAG	R/W	1h	L1DTAG Exception Enable: 1 enables the propagation of the exceptions generated from the error detector. Write 0 to disable exceptions.
0	L1DDATA	R/W	1h	L1DDATA Exception Enable: 1 enables the propagation of the exceptions generated from the error detector. Write 0 to disable exceptions.

5.2.9.75 EDCINTFLG Register (Offset = 00031104h) [Reset = 00000000h]

EDCINTFLG is shown in [Table 5-1423](#).

Return to the [Summary Table](#).

This register loads the interrupt flags upon issue by the EDC detection module. These flags are loaded independently of any other flags. Upon a read operation all flags are cleared.

Table 5-1423. EDCINTFLG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	Reserved
6	L1PTAG	R/W	0h	L1P TAG Exception: 1 indicates that an exception has been issued from this error detector. Read of register clears bit.
5	L2LRU	R/W	0h	L2 LRU Exception: 1 indicates that an exception has been issued from this error detector. Read of register clears bit.
4	L2MPPA	R/W	0h	L2 MPPA Exception: 1 indicates that an exception has been issued from this error detector. Read of register clears bit.
3	L2SNOP	R/W	0h	L2 SNOP Exception: 1 indicates that an exception has been issued from this error detector. Read of register clears bit.
2	L2TAG	R/W	0h	L2TAG Exception: 1 indicates that an exception has been issued from this error detector. Read of register clears bit.
1	L1DTAG	R/W	0h	L1DTAG Exception: 1 indicates that an exception has been issued from this error detector. Read of register clears bit.
0	L1DDATA	R/W	0h	L1DDATA Exception: 1 indicates that an exception has been issued from this error detector. Read of register clears bit.

5.2.9.76 L1DEDCMD Register (Offset = 00031108h) [Reset = 00000003h]

L1DEDCMD is shown in [Table 5-1424](#).

Return to the [Summary Table](#).

This write only register provides control for enabling and disabling the ECC logic of the DMC. This register controls the parameters which are accumulated for the Data and Tag RAMs in the DMC. Enabling the ECC allows the counting of recoverable and non-recoverable errors as well as registering the requestor and the address and cache states for any ECC errors which are reported.

Table 5-1424. L1DEDCMD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R	0h	Reserved
25	CCLRTAG	R/W	0h	Correctable Error Clear: Writing 1 clears the correctable error count in the DMCEDPECNT register. This is a one-shot register, and is cleared immediately.
24	CCLRDATA	R/W	0h	Non-Correctable Error Clear: Writing 1 clears the noncorrectable error count in the DMCEDPECNT register. This is a one-shot register and is cleared immediately.
23-18	RESERVED	R	0h	Reserved
17	NCCLTAG	R/W	0h	Correctable Error Clear: Writing 1 clears the correctable error count in the DMCEDPECNT register. This is a one-shot register, and is cleared immediately.
16	NCCLRDATA	R/W	0h	Non-Correctable Error Clear: Writing 1 clears the noncorrectable error count in the DMCEDPECNT register. This is a one-shot register and is cleared immediately.
15-9	RESERVED	R	0h	Reserved
8	SUSPDATA	R/W	0h	Suspend TAG: Write 1 to prevent hamming codes from being written into memory but allows data to be written.
7-2	RESERVED	R	0h	Reserved
1	ENTAG	R/W	1h	Enable Data: Initialized to the active state (1), to disable EDC on Data write 0
0	ENDATA	R/W	1h	Enable TAG: Initialized to the active state (1), to disable EDC on TAG write 0.

5.2.9.77 L1DDCSTAT Register (Offset = 0003110Ch) [Reset = 0000001h]

L1DDCSTAT is shown in [Table 5-1425](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located. The error information is written upon the occurrence of the first ECC error encountered. CERR1 is set, and the values are retained. If any additional ECC errors occur, this is indicated by setting CERR2.

Table 5-1425. L1DDCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CERR1	R	0h	Correctable Error 1: Indicates that one correctable error has occurred and that they BANK, BYTE and BITPOS values are valid. Cleared upon writing a 1 to L1DEDCMD.CCLRDATA
30	CERR2	R	0h	Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK, BYTE and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L1DEDCMD.CCLRDATA
29-10	RESERVED	R	0h	Reserved
9-7	BANK	R	0h	BANK Number: This value indicates the bank number of the error indicated when CERR1 is 1. This value is the lowest numbered bank if multiple banks error simultaneously. This value is set upon the first error occurring and is cleared by writing a 1 to L1DEDCMD.CCLRDATA.
6-5	BYTE	R	0h	Byte Number: This value indicates the byte number of the error indicated when CERR1 is 1. This value is the lowest numbered byte if multiple bytes error simultaneously in the same bank.This value is set upon the first error occurring and is cleared by writing a 1 to L1DEDCMD.CCLRDATA.
4-2	BITPOS	R	0h	Bit Position: This value indicates the bit position of the error indicated when CERR1 is 1. This value is the specific single error bits from the byte indicated by BYTE and the bank indicated by BANK. This value is set upon the first error occurring and is cleared by writing a 1 to L1DEDCMD.CCLRDATA.
1	SUSP	R	0h	Suspend: EDC logic is in suspend mode, this value is representative of the state of the last write to L1DEDCMD.SUSPDATA.
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L1DEDCMD.ENDATA.

5.2.9.78 L1DDNCSTAT Register (Offset = 00031110h) [Reset = 0000001h]

L1DDNCSTAT is shown in [Table 5-1426](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located. This register is similar to Error! Not a valid bookmark self-reference. with the exception of the bit position register fields, with two bit errors it is not possible to provide the locations. . The error information is written upon the occurrence of the first ECC error encountered. CERR1 is set, and the values are retained. If any additional ECC errors occur, this is indicated by setting CERR2.

Note: Non-correctable errors do not mean two bits in the 256 bit data word, but two bits+ of error in a single byte. The EDC is capable of correcting up to 8 bits in a single word if there are only single bit errors in each byte.

Table 5-1426. L1DDNCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NCERR1	R	0h	Non-Correctable Error 1: Indicates that one correctable error has occurred and that they BANK, BYTE and BITPOS values are valid. Cleared upon writing a 1 to L1DEDCMD.NCCLRDATA
30	NCERR2	R	0h	Non-Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK, BYTE and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L1DEDCMD.NCCLRDATA
29-10	RESERVED	R	0h	Reserved
9-7	BANK	R	0h	BANK Number: This value indicates the bank number of the error indicated when NCERR1 is 1. This value is the lowest numbered bank if multiple banks error simultaneously. This value is set upon the first error occurring and is cleared by writing a 1 to L1DEDCMD.NCCLRDATA.
6-5	BYTE	R	0h	Byte Number: This value indicates the byte number of the error indicated when NCERR1 is 1. This value is the lowest numbered byte if multiple bytes error simultaneously in the same bank.This value is set upon the first error occurring and is cleared by writing a 1 to L1DEDCMD.NCCLRDATA.
4-2	RESERVED	R	0h	Reserved
1	SUSP	R	0h	Suspend: EDC logic is in suspend mode, this value is representative of the state of the last write to L1DEDCMD.SUSPDATA
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L1DEDCMD.ENDATA.

5.2.9.79 L1DTCSTAT Register (Offset = 00031114h) [Reset = 0000001h]

L1DTCSTAT is shown in [Table 5-1427](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located. The error information is written upon the occurrence of the first ECC error encountered. CERR1 is set, and the values are retained. If any additional ECC errors occur, this is indicated by setting CERR2.

Table 5-1427. L1DTCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CERR1	R	0h	Correctable Error 1: Indicates that one correctable error has occurred and that they BANK and BITPOS values are valid. Cleared upon writing a 1 to L1DEDCMD.CCLRDTAG
30	CERR2	R	0h	Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L1DEDCMD.CCLRRTAG
29-9	RESERVED	R	0h	Reserved
8	BANK	R	0h	Bank: Value indicates which bank the correctable error occurred in.
7	CHANNEL	R	0h	Channel: Access to the banks of the L1D TAG memory are split into channels: 1 = [53: 43],[31: 16] 2 = [42: 32],[15: 0] Bit Position is an index in the respective channels, this will yield the error bit position.
6-2	BITPOS	R	0h	Bit Position: This value indicates the bit position of the error indicated when CERR1 is 1. This value is the specific single error bits from the byte indicated by BYTE and the bank indicated by BANK. This value is set upon the first error occurring Cleared upon writing a 1 to L1DEDCMD.CCLRRTAG
1	SUSP	R	0h	Suspend: EDC logic is in suspend mode, this value is representative of the state of the last write to L1DEDCMD.SUSPDATA
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L1DEDCMD.ENDATA.

5.2.9.80 L1DTNCSTAT Register (Offset = 00031118h) [Reset = 0000001h]

L1DTNCSTAT is shown in [Table 5-1428](#).

Return to the [Summary Table](#).

L1D Error Detect TAG Non-Correctable Status Register

Table 5-1428. L1DTNCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NCERR1	R	0h	Non-Correctable Error 1: Indicates that one correctable error has occurred and that they BANK, BYTE and BITPOS values are valid. Cleared upon writing a 1 to L1DEDCMD.NCCLRTAG
30	NCERR2	R	0h	Non-Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK, BYTE and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L1DEDCMD.NCCLRTAG
29-8	RESERVED	R	0h	Reserved
7	BANK	R	0h	BANK Number: This value indicates the bank number of the error indicated when NCERR1 is 1. This value is the lowest numbered bank if multiple banks error simultaneously. This value is set upon the first error occurring and is cleared by writing a 1 to L1DEDCMD.NCCLRDATA.
6-2	RESERVED	R	0h	Reserved
1	SUSP	R	0h	Suspend: EDC logic is in suspend mode, this value is representative of the state of the last write to L1DEDCMD.SUSPDATA
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L1DEDCMD.ENDATA.

5.2.9.81 L1DDEDADDR Register (Offset = 0003111Ch) [Reset = 0000000h]

L1DDEDADDR is shown in [Table 5-1429](#).

Return to the [Summary Table](#).

The L1D Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in the STATUS registers. The addresses for both correctable and noncorrectable errors are held in this register. The value contained in the addresss field is the lower 16 bits of the word boundary of the memory access. If the access is to 0x00F00020, the address field will read 0x0020, if the access is to 0x00F07FE0, the address field will read 0x7FE0.

Table 5-1429. L1DDEDADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26-16	NCADDR	R	0h	Non-Correctable Address: The value in this field is qualified by L1DEDDNCSTATE.NCERR1, when that field is written to a 1, the address of the noncorrectable error is written to this register field. . Cleared upon writing a 1 to L1DEDCMD.NCCLRDATA
15-11	RESERVED	R	0h	Reserved
10-0	CADDR	R	0h	Correctable Address: The value in this field is qualified by L1DEDDNCSTATE.CERR1, when that field is written to a 1, the address of the non-correctable error is written to this register field. . Cleared upon writing a 1 to L1DEDCMD.NCCLRDATA

5.2.9.82 L1DTEADDR Register (Offset = 00031120h) [Reset = 00000000h]

L1DTEADDR is shown in [Table 5-1430](#).

Return to the [Summary Table](#).

The L1D Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in the STATUS registers. The address for both correctable and noncorrectable errors are held in this register. The value of the address is the index (or address on the RAM) of the RAM module.

Table 5-1430. L1DTEADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26-16	NCADDR	R	0h	Non-Correctable Address: The value in this field is qualified by L1DEDDNCSTATE.NCERR1, when that field is written to a 1, the address of the noncorrectable error is written to this register field. . Cleared upon writing a 1 to L1DEDCMD.NCCLRDATA
15-11	RESERVED	R	0h	Reserved
10-0	CADDR	R	0h	Correctable Address: The value in this field is qualified by L1DEDDNCSTATE.CERR1, when that field is written to a 1, the address of the non-correctable error is written to this register field. . Cleared upon writing a 1 to L1DEDCMD.NCCLRDATA

5.2.9.83 L1DEDCNT Register (Offset = 00031124h) [Reset = 00000000h]

L1DEDCNT is shown in [Table 5-1431](#).

Return to the [Summary Table](#).

The L1D TAG Error Detection Error Count Register stores the error counts for correctable and noncorrectable errors which occur in the L1D Cache Memories, these counts are accumulated regardless of the exception mapping in the L1DEDCMD (0x0182_1108) interrupt enable bits. The counters capture the total number of correctable and non-correctable errors from both the DATA and TAG memories.

Table 5-1431. L1DEDCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NCPECNT	R	0h	Non-correctable EDC error count. Shows the number of non-correctable errors which have occurred in the DMC memories since last reset. This counter is cleared by writing a zero value to the counter.
15-0	CPECNT	R	0h	Correctable EDC error count: Shows the number of correctable errors which have occurred in the DMC memories since last reset. This counter is cleared by writing a zero value to the counter.

5.2.9.84 L2TEDCMD Register (Offset = 00031128h) [Reset = 000000Fh]

L2TEDCMD is shown in [Table 5-1432](#).

Return to the [Summary Table](#).

This write only register provides control for enabling and disabling the ECC logic of the UMC. This register controls the parameters which are accumulated for the Data and Tag RAMs in the DMC. Enabling the ECC allows the counting of recoverable and non-recoverable errors as well as registering the requestor and the address and cache states for any ECC errors which are reported.

Table 5-1432. L2TEDCMD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R	0h	Reserved
19	CCLRSNOP	W	0h	Correctable Error Clear, SNOP: writing 1 to this register cause the corresponding counter to be cleared. The value written to this register is a one shot event.
18	CCLRLRU	W	0h	Correctable Error Clear, LRU: writing 1 to this register cause the corresponding counter to be cleared. The value written to this register is a one shot event.
17	CCLRMPPA	W	0h	Correctable Error Clear, MPPA: writing 1 to this register cause the corresponding counter to be cleared. The value written to this register is a one shot event.
16	CCLRTAG	W	0h	Correctable Error Clear, TAG: writing 1 to this register cause the corresponding counter to be cleared. The value written to this register is a one shot event.
15-12	RESERVED	R	0h	Reserved
11	NCCLRSNOP	W	0h	Non- Correctable Error Clear, SNOP: writing 1 to this register cause the corresponding counter to be cleared. The value written to this register is a one shot event.
10	NCCLRLRU	W	0h	Non- Correctable Error Clear, LRU: writing 1 to this register cause the corresponding counter to be cleared. The value written to this register is a one shot event.
9	NCCLRMPPA	W	0h	Non- Correctable Error Clear, MPPA: writing 1 to this register cause the corresponding counter to be cleared. The value written to this register is a one shot event.
8	NCCLRTAG	W	0h	Non- Correctable Error Clear, TAG: writing 1 to this register cause the corresponding counter to be cleared. The value written to this register is a one shot event.
7-4	RESERVED	R	0h	Reserved
3	SNPEDCEN	W	1h	Enable EDC: writing a 1 to this register enables EDC on the SNOOP Memory
2	LRUEDCEN	W	1h	Enable EDC: writing a 1 to this register enables EDC on the LRU Memory
1	MPPAEDCEN	W	1h	Enable EDC: writing a 1 to this register enables EDC on the MPPA Memory
0	TAGEDCEN	W	1h	Enable EDC: writing a 1 to this register enables the EDC modules for this memory. This bit is persistent and must be actively written to 0 to disable the EDC modules.

5.2.9.85 L2TCSTAT Register (Offset = 0003112Ch) [Reset = 0000001h]

L2TCSTAT is shown in [Table 5-1433](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.

Table 5-1433. L2TCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CERR1	R	0h	Correctable Error 1: Indicates that one correctable error has occurred and that they BANK and BITPOS values are valid. Cleared upon writing a 1 to L2EDCMD.CCLRDTAG
30	CERR2	R	0h	Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L2EDCMD.CCLRDTAG
29-9	RESERVED	R	0h	Reserved
8	BANK	R	0h	Bank: indicates which of the two banks (0 = BANK 0, 1 = BANK 1) contains the correctable error. Cleared upon writing a 1 to L2EDCMD.CCLRDTAG
7	CHANNEL	R	0h	Channel: Access to a bank are split, therefore an indication of channel 1 = [41: 21] 2 = [20: 0] Bit Position is qualified from these as displacements within the channel.
6-2	BITPOS	R	0h	Bit Position: This value indicates the bit position of the error indicated when CERR1 is 1. This value is the specific single error bits from the byte indicated by BYTE and the bank indicated by BANK. This value is set upon the first error occurring Cleared upon writing a 1 to L2EDCMD.CCLRDTAG
1	RESERVED	R	0h	Reserved
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L1DEDCMD.ENDATA.

5.2.9.86 L2TNCSTAT Register (Offset = 00031130h) [Reset = 0000001h]

L2TNCSTAT is shown in [Table 5-1434](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.

Table 5-1434. L2TNCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NCERR1	R	0h	Non-Correctable Error 1: Indicates that one correctable error has occurred and that they BANK, BYTE and BITPOS values are valid. Cleared upon writing a 1 to L1DEDCMD.NCCLRTAG
30	NCERR2	R	0h	Non-Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK, BYTE and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L1DEDCMD.NCCLRTAG
29-9	RESERVED	R	0h	Reserved
8	BANK	R	0h	Bank: indicates which of the two banks (0 = BANK 0, 1 = BANK 1) contains the correctable error. Cleared upon writing a 1 to L2EDCMD.CCLRRTAG
7-1	RESERVED	R	0h	Reserved
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L1DEDCMD.ENDATA.

5.2.9.87 L2TEDADDR Register (Offset = 00031134h) [Reset = 00000000h]

L2TEDADDR is shown in [Table 5-1435](#).

Return to the [Summary Table](#).

The L2Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in 1.3.1.12. With both exceptions activated, the TAG exception will take priority on simultaneous exceptions. The address in these fields is the displacement into the memory as presented to the address port of the SRAM.

Table 5-1435. L2TEDADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26-16	NCADDR	R	0h	Non-Correctable Address: The value in this field is qualified by L2EDDNCSTATE.NCERR1, when that field is written to a 1, the address of the noncorrectable error is written to this register field. . Cleared upon writing a 1 to L2EDCMD.NCCLRDATA
15-11	RESERVED	R	0h	Reserved
10-0	CADDR	R	0h	Correctable Address: The value in this field is qualified by L2EDDNCSTATE.CERR1, when that field is written to a 1, the address of the non-correctable error is written to this register field. . Cleared upon writing a 1 to L2EDCMD.NCCLRDATA

5.2.9.88 L2MNCSTAT Register (Offset = 0003113Ch) [Reset = 0000001h]

L2MNCSTAT is shown in [Table 5-1436](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.

Table 5-1436. L2MNCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NCERR1	R	0h	Non-Correctable Error 1: Indicates that one correctable error has occurred and that they BANK, BYTE and BITPOS values are valid. Cleared upon writing a 1 to L2EDCMD.NCCLRMPPA
30	NCERR2	R	0h	Non-Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK, BYTE and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L2EDCMD.NCCLRMPPA
29-1	RESERVED	R	0h	Reserved
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L1DEDCMD.ENEDC

5.2.9.89 L2MEDADDR Register (Offset = 00031140h) [Reset = 00000000h]

L2MEDADDR is shown in [Table 5-1437](#).

Return to the [Summary Table](#).

The L2Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in 1.3.1.12. With both exceptions activated, the TAG exception will take priority on simultaneous exceptions.

Table 5-1437. L2MEDADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26-16	NCADDR	R	0h	Non-Correctable Address: The value in this field is qualified by L2EDSNCSTATE.NCERR1, when that field is written to a 1, the address of the non-correctable error is written to this register field. Cleared upon writing a 1 to L2EDCMD.NCCLRMPPA
15-0	RESERVED	R	0h	Reserved

5.2.9.90 L2SCSTAT Register (Offset = 00031144h) [Reset = 0000001h]

L2SCSTAT is shown in [Table 5-1438](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.

Table 5-1438. L2SCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CERR1	R	0h	Correctable Error 1: Indicates that one correctable error has occurred and that they BANK and BITPOS values are valid. Cleared upon writing a 1 to L2EDCMD.CCLRDSNOP
30	CERR2	R	0h	Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L2EDCMD.CCLRSNOP
29-7	RESERVED	R	0h	Reserved
6-2	BITPOS	R	0h	Bit Position: This value indicates the bit position of the error indicated when CERR1 is 1. This value is the specific single error bits from the byte indicated by BYTE and the bank indicated by BANK. This value is set upon the first error occurring Cleared upon writing a 1 to L2EDCMD.CCLRSNOP
1	RESERVED	R	0h	Reserved
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L2EDCMD.ENEDC

5.2.9.91 L2SNCSTAT Register (Offset = 00031148h) [Reset = 00000001h]

L2SNCSTAT is shown in [Table 5-1439](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.

Table 5-1439. L2SNCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NCERR1	R	0h	Non-Correctable Error 1: Indicates that one correctable error has occurred and that they BANK, BYTE and BITPOS values are valid. Cleared upon writing a 1 to L2EDCMD.NCCLRSNOP
30	NCERR2	R	0h	Non-Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK, BYTE and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L2EDCMD.NCCLRSNOP
29-1	RESERVED	R	0h	Reserved
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L2EDCMD.ENEDC

5.2.9.92 L2SEDADDR Register (Offset = 0003114Ch) [Reset = 00000000h]

L2SEDADDR is shown in [Table 5-1440](#).

Return to the [Summary Table](#).

The L2Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in 1.3.1.12. With both exceptions activated, the TAG exception will take priority on simultaneous exceptions.

Table 5-1440. L2SEDADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	
30-26	RESERVED	R	0h	Reserved
25-16	NCADDR	R	0h	Non-Correctable Address: The value in this field is qualified by L2EDDNCSTATE.NCERR1, when that field is written to a 1, the address of the noncorrectable error is written to this register field. . Cleared upon writing a 1 to L2EDCMD.NCCLRSNOP
15-10	RESERVED	R	0h	Reserved
9-0	CADDR	R	0h	Correctable Address: The value in this field is qualified by L2EDDNCSTATE.CERR1, when that field is written to a 1, the address of the non-correctable error is written to this register field. . Cleared upon writing a 1 to L2EDCMD.NCCLRSNOP

5.2.9.93 L2LCSTAT Register (Offset = 00031150h) [Reset = 0000001h]

L2LCSTAT is shown in [Table 5-1441](#).

Return to the [Summary Table](#).

This read only register contains the current error data for Correctable ECC errors. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.

Table 5-1441. L2LCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CERR1	R	0h	Correctable Error 1: Indicates that one correctable error has occurred and that they BANK and BITPOS values are valid. Cleared upon writing a 1 to L2EDCMD.CCLRDLRU
30	CERR2	R	0h	Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L2EDCMD.CCLRDLRU
29-7	RESERVED	R	0h	Reserved
6-2	BITPOS	R	0h	Bit Position: This value indicates the bit position of the error indicated when CERR1 is 1. This value is the specific single error bits from the byte indicated by BYTE and the bank indicated by BANK. This value is set upon the first error occurring Cleared upon writing a 1 to L2EDCMD.CCLRDLRU
1	RESERVED	R	0h	Reserved

5.2.9.94 L2LNCSTAT Register (Offset = 00031154h) [Reset = 00000001h]

L2LNCSTAT is shown in [Table 5-1442](#).

Return to the [Summary Table](#).

Table 5-1442. L2LNCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NCERR1	R	0h	Non-Correctable Error 1: Indicates that one correctable error has occurred and that they BANK, BYTE and BITPOS values are valid. Cleared upon writing a 1 to L2EDCMD.NCCLR:LRU
30	NCERR2	R	0h	Non-Correctable Error 2: Indicates that a subsequent correctable error has occurred ,BANK, BYTE and BITPOS values are valid but apply to the error reported in CERR1. Cleared upon writing a 1 to L2EDCMD.NCCLR:LRU
29-1	RESERVED	R	0h	Reserved
0	EN	R	1h	EDC Enable: Indicates EDC logic is enabled, this value is representative of the state of the last write to L2EDCMD.ENEDC

5.2.9.95 L2LEDADDR Register (Offset = 00031158h) [Reset = 00000000h]

L2LEDADDR is shown in [Table 5-1443](#).

Return to the [Summary Table](#).

The L2Correctable Error Detection Address Register pair contain the additional information on correctable errors reported in 1.3.1.12. With both exceptions activated, the TAG exception will take priority on simultaneous exceptions.

Table 5-1443. L2LEDADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R	0h	
25-16	NCADDR	R	0h	Non-Correctable Address: The value in this field is qualified by L2EDDNCSTATE.NCERR1, when that field is written to a 1, the address of the noncorrectable error is written to this register field. . Cleared upon writing a 1 to L2EDCMD.NCCLRLRU
15-10	RESERVED	R	0h	
9-0	CADDR	R	0h	Correctable Address: The value in this field is qualified by L2EDDNCSTATE.CERR1, when that field is written to a 1, the address of the non-correctable error is written to this register field. . Cleared upon writing a 1 to L2EDCMD.NCCLRLRU

5.2.9.96 L2TEDCNT Register (Offset = 0003115Ch) [Reset = 00000000h]

L2TEDCNT is shown in [Table 5-1444](#).

Return to the [Summary Table](#).

The L2 Error Detection Error Count Register stores the error counts for correctable and non-correctable errors which occur in the L1D Data Memory, these counts are accumulated regardless of the exception mapping in the L1DEDCMD (0x0182_1108) interrupt enable bits. The counts contained in these registers are the accumulation of all L2 errors. This value saturates at an unsigned 0xFFFF.

Table 5-1444. L2TEDCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NCPECNT	R	0h	Non-correctable EDC error count. Shows the number of non-correctable errors which have occurred in the DMC memories since last reset. This counter is cleared by writing a zero value to the counter. CPECNT 15-0 0 Correctable EDC error count:
15-0	CPECNT	R	0h	Correctable EDC error count: Shows the number of correctable errors which have occurred in the DMC memories since last reset. This counter is cleared by writing a zero value to the counter.

5.2.9.97 L1PTEDCMD Register (Offset = 00031160h) [Reset = 0000001h]

L1PTEDCMD is shown in [Table 5-1445](#).

Return to the [Summary Table](#).

This write only register provides control for enabling and disabling the Parity logic of the PMC. This register controls the parameters which are accumulated for the Data and Tag RAMs in the PMC. Enabling the Parity allows the counting of recoverable and non-recoverable errors as well as registering the requestor and the address and cache states for any Parity errors which are reported.

Table 5-1445. L1PTEDCMD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	0h	Reserved
5	NCCLR	W	0h	Non-Correctable Error Clear: Clears the non-correctable error count in the DMCEDPECNT register
4-1	RESERVED	R	0h	Reserved
0	EN	W	1h	Enable Parity: Enables the Parity logic (parity_enable)

5.2.9.98 L1PTEDSTAT Register (Offset = 00031164h) [Reset = 0000001h]

L1PTEDSTAT is shown in [Table 5-1446](#).

Return to the [Summary Table](#).

This read only register contains the current error. The register provides information on whether the error was correctable or non-correctable, the requestor, and what position the error was located.

Table 5-1446. L1PTEDSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NCERR2	R	0h	Non-Correctable Error: Indicates that there was a second non-correctable error, Also indicates the logged error is valid.
30	NCERR1	R	0h	Non-Correctable Error: Indicates the first error was noncorrectable.
29-1	RESERVED	R	0h	Reserved
0	EN	R	1h	Enable: reflects the current state of the EN bit from L1PEDCMD

5.2.9.99 L1PTEDADDR Register (Offset = 00031168h) [Reset = 00000000h]

L1PTEDADDR is shown in [Table 5-1447](#).

Return to the [Summary Table](#).

The address error registers for correctable and non-correctable errors are identical in structure, the indication applies to the correctable and non-correctable errors, they are both covered in this section. The register provides a record of the address of the detected error and the access status or the cache.

Table 5-1447. L1PTEDADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26-16	NCADDR	R	0h	Non-Correctable Address: The value in this field is qualified by L1PEDDNCSTATE.NCERR, when that field is written to a 1, the address of the non-correctable error is written to this register field. . Cleared upon writing a 1 to L1PEDCMD.NCCLRLR
15-0	RESERVED	R	0h	Reserved

5.2.9.100 L1DTEDCNT Register (Offset = 0003116Ch) [Reset = 00000000h]

L1DTEDCNT is shown in [Table 5-1448](#).

Return to the [Summary Table](#).

This read only register contains the counts of correctable and non-correctable errors which have occurred. To reset these counts write to the DMCEDCMD register in the appropriate bit.

Table 5-1448. L1DTEDCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NCPECNT	R	0h	Non-correctable EDC error count. Shows the number of non-correctable errors which have occurred in the DMC memories since last reset. This counter is cleared by writing a zero value to the counter.
15-0	RESERVED	R	0h	Reserved

5.2.9.101 L2CFG Register (Offset = 00040000h) [Reset = 01000000h]

L2CFG is shown in [Table 5-1449](#).

Return to the [Summary Table](#).

Table 5-1449. L2CFG Register Field Descriptions

Bit	Field	Type	Reset	Description

Bit	Field	Type	Reset	Description
31-0	I	R/W	0h	

5.2.9.136 L2EDSTAT Register (Offset = 00046004h) [Reset = 0000001h]

L2EDSTAT is shown in [Table 5-1484](#).

Return to the [Summary Table](#).

L2 EDC Status register

Table 5-1484. L2EDSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESV1	0h	Always read as 0. Writes have no affect.	
23-16	BITPOS	R	0h	Bit position of Error
15-10	RESV2	0h	Always read as 0. Writes have no affect.	
9-8	NERR	R	0h	Non correctable Error
7	VERR	R	0h	Victim EDC Error
6	DMAERR	R	0h	DMA EDC Error
5	PERR	R	0h	PMC Data EDC Error
4	DERR	R	0h	DMC Data EDC Error
3	SUSP	R	0h	EDC Suspend
2	DIS	R	0h	EDC Disable
1	RESV3	0h	Always read as 0. Writes have no affect.	
0	EN	R	1h	EDC Enable

5.2.9.137 L2EDCMD Register (Offset = 00046008h) [Reset = 0000001h]

L2EDCMD is shown in [Table 5-1485](#).

Return to the [Summary Table](#).

L2 EDC Command register

Table 5-1485. L2EDCMD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESV1	0h	Always read as 0. Writes have no affect.	
7	VCLR	W	0h	Victim EDC Error
6	DMACLR	W	0h	DMA EDC Error
5	PCLR	W	0h	PMC Data EDC Error
4	DCLR	W	0h	DMC Data EDC Error
3	SUSP	W	0h	EDC Suspend
2	DIS	W	0h	EDC Disable
1	RESV3	0h	Always read as 0. Writes have no affect.	
0	EN	W	1h	EDC Enable

5.2.9.138 L2EDADDR Register (Offset = 0004600Ch) [Reset = 0000000h]

L2EDADDR is shown in [Table 5-1486](#).

Return to the [Summary Table](#).

L2 EDC error address

Table 5-1486. L2EDADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R	0h	L2 Error detection address
4-3	WAY	R	0h	Addr way
2-1	RESV1	0h	Always read as 0. Writes have no affect.	
0	RAM	R	0h	Addr is sram

5.2.9.139 L2EDCPEC Register (Offset = 00046018h) [Reset = 00000000h]

L2EDCPEC is shown in [Table 5-1487](#).

Return to the [Summary Table](#).

L2 EDC correctable error count

Table 5-1487. L2EDCPEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESV1	0h	Always read as 0. Writes have no affect.	count
7-0	CNT	R	0h	

5.2.9.140 L2EDCNEC Register (Offset = 0004601Ch) [Reset = 00000000h]

L2EDCNEC is shown in [Table 5-1488](#).

Return to the [Summary Table](#).

L2 EDC noncorrectable error count

Table 5-1488. L2EDCNEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESV1	0h	Always read as 0. Writes have no affect.	count
7-0	CNT	R	0h	

5.2.9.141 MDMAERR Register (Offset = 00046020h) [Reset = 00000000h]

MDMAERR is shown in [Table 5-1489](#).

Return to the [Summary Table](#).

Table 5-1489. MDMAERR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	ERR	R	0h	Error
28-12	RESV_2	0h	Always read as 0. Writes have no affect.	
11-8	XID	R	0h	XID
7-3	RESV_1	0h	Always read as 0. Writes have no affect.	
2-0	STAT	R	0h	Status

5.2.9.142 MDMAERRCLR Register (Offset = 00046024h) [Reset = 00000000h]

MDMAERRCLR is shown in [Table 5-1490](#).

Return to the [Summary Table](#).

Table 5-1490. MDMAERRCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESV_1	0h	Always read as 0. Writes have no affect.	
0	CLR	R	0h	Error clear

5.2.9.143 L2EDCEN Register (Offset = 00046030h) [Reset = 0000001Fh]

L2EDCEN is shown in [Table 5-1491](#).

Return to the [Summary Table](#).

L2 EDC enable register

Table 5-1491. L2EDCEN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESV1	0h	Always read as 0. Writes have no affect.	
4	SDMAEN	W	1h	Enable edc on sdma reads to l2 sram
3	PL2SEN	W	1h	Enable edc on pmc hits to l2 sram
2	DL2SEN	W	1h	Enable edc on dmc hits to l2 sram
1	PL2CEN	W	1h	Enable edc on pmc hits to l2 cache
0	DL2CEN	W	1h	Enable edc on dmc hits to l2 cache

5.2.9.144 L1PEDSTAT Register (Offset = 00046404h) [Reset = 00000000h]

L1PEDSTAT is shown in [Table 5-1492](#).

Return to the [Summary Table](#).

L1P EDC Status register

Table 5-1492. L1PEDSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESV1	0h	Always read as 0. Writes have no affect.	
6	DMAERR	R	0h	DMA Error
5	PERR	R	0h	Parity Error
4	RESV2	0h	Always read as 0. Writes have no affect.	
3	SUSP	R	0h	EDC Suspend
2	DIS	R	0h	EDC Disable
1	RESV3	0h	Always read as 0. Writes have no affect.	
0	EN	R	0h	EDC Enable

5.2.9.145 L1PEDCMD Register (Offset = 00046408h) [Reset = 00000000h]

L1PEDCMD is shown in [Table 5-1493](#).

Return to the [Summary Table](#).

L1P EDC Command register

Table 5-1493. L1PEDCMD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESV1	0h	Always read as 0. Writes have no affect.	
6	DMACLR	W	0h	Clear DMA Error
5	PCLR	W	0h	Clear Parity Error
4	RESV2	0h	Always read as 0. Writes have no affect.	
3	SUSP	W	0h	EDC Suspend
2	DIS	W	0h	EDC Disable
1	RESV3	0h	Always read as 0. Writes have no affect.	
0	EN	W	0h	EDC Enable

5.2.9.146 L1PEDADDR Register (Offset = 0004640Ch) [Reset = 00000000h]

L1PEDADDR is shown in [Table 5-1494](#).

Return to the [Summary Table](#).

L1P EDC error address

Table 5-1494. L1PEDADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R	0h	L1P Error detection address
4-1	RESV1	0h	Always read as 0. Writes have no affect.	
0	RAM	R	0h	Addr is sram

5.2.9.147 MAR Register (Offset = 00048000h) [Reset = 0000001h]

MAR is shown in [Table 5-1495](#).

Return to the [Summary Table](#).

MAR register

Table 5-1495. MAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESV_1	0h	Always read as 0. Writes have no affect.	
3	PFX	R	0h	Hard coded to 0
2	PCX	R	0h	Hard coded to 0
1	WTE	R	0h	Hard coded to 0
0	PC	R	1h	Hard coded to 1

5.2.9.148 L2MPFAR Register (Offset = 0004A000h) [Reset = 00000000h]

L2MPFAR is shown in [Table 5-1496](#).

Return to the [Summary Table](#).

Table 5-1496. L2MPFAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADDR	R	0h	

5.2.9.149 L2MPFSR Register (Offset = 0004A004h) [Reset = 0000000h]

L2MPFSR is shown in [Table 5-1497](#).

Return to the [Summary Table](#).

Table 5-1497. L2MPFSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESV_1	0h	Always read as 0. Writes have no affect.	
15-9	FID	R	0h	PrivID of faulting requestor
8	LOCAL	R	0h	Fault due to local CPU access
7	NS	R	0h	Fault due to non-secure code
6	RESV_2	0h	Always read as 0. Writes have no affect.	
5	SR	R	0h	Fault due to Supervisor Read
4	SW	R	0h	Fault due to Supervisor Write
3	SX	R	0h	Fault due to Supervisor Execute
2	UR	R	0h	Fault due to User Read
1	UW	R	0h	Fault due to User Write
0	UX	R	0h	Fault due to User Execute

5.2.9.150 L2MPFCR Register (Offset = 0004A008h) [Reset = 00000000h]

L2MPFCR is shown in [Table 5-1498](#).

Return to the [Summary Table](#).

Table 5-1498. L2MPFCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESV_1	0h	Always read as 0. Writes have no affect.	
0	MPFCLR	W	0h	

5.2.9.151 L2MPPA Register (Offset = 0004A200h) [Reset = 0000FFFFh]

L2MPPA is shown in [Table 5-1499](#).

Return to the [Summary Table](#).

L2 Memory Protection Page Attribute register

Table 5-1499. L2MPPA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESV_1	0h	Always read as 0. Writes have no affect.	
15	AID5	R/W	1h	Allow ID 5 to access page
14	AID4	R/W	1h	Allow ID 4 to access page
13	AID3	R/W	1h	Allow ID 3 to access page
12	AID2	R/W	1h	Allow ID 2 to access page
11	AID1	R/W	1h	Allow ID 1 to access page
10	AID0	R/W	1h	Allow ID 0 to access page

Access Type	Code	Description
Read Type		

**Table 5-1512. MSS_IOMUX Access Type Codes
(continued)**

Access Type	Code	Description
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

5.2.10.1 PADAA_cfg_reg Register (Offset = 0h) [Reset = 0000000h]

PADAA_cfg_reg is shown in [Table 5-1513](#).

Return to the [Summary Table](#).

Table 5-1513. PADAA_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.2 PADAB_cfg_reg Register (Offset = 4h) [Reset = 0000000h]

PADAB_cfg_reg is shown in [Table 5-1514](#).

Return to the [Summary Table](#).

Table 5-1514. PADAB_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.3 PADAC_cfg_reg Register (Offset = 8h) [Reset = 0000000h]

PADAC_cfg_reg is shown in [Table 5-1515](#).

Return to the [Summary Table](#).

Table 5-1515. PADAC_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.

8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.4 PADAD_cfg_reg Register (Offset = Ch) [Reset = 0000000h]

PADAD_cfg_reg is shown in [Table 5-1516](#).

Return to the [Summary Table](#).

Table 5-1516. PADAD_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	1h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.5 PDAE_cfg_reg Register (Offset = 10h) [Reset = 0000000h]

PDAE_cfg_reg is shown in [Table 5-1517](#).

Return to the [Summary Table](#).

Table 5-1517. PDAE_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	1h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.6 PDAF_cfg_reg Register (Offset = 14h) [Reset = 0000000h]

PDAF_cfg_reg is shown in [Table 5-1518](#).

Return to the [Summary Table](#).

Table 5-1518. PDAF_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	1h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.7 PADAG_cfg_reg Register (Offset = 18h) [Reset = 0000000h]

PADAG_cfg_reg is shown in [Table 5-1519](#).

Return to the [Summary Table](#).

Table 5-1519. PADAG_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	1h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.8 PDAH_cfg_reg Register (Offset = 1Ch) [Reset = 0000000h]

PDAH_cfg_reg is shown in [Table 5-1520](#).

Return to the [Summary Table](#).

Table 5-1520. PDAH_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	1h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.9 PADAI_cfg_reg Register (Offset = 20h) [Reset = 0000000h]

PADAI_cfg_reg is shown in [Table 5-1521](#).

Return to the [Summary Table](#).

Table 5-1521. PADAI_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	1h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable

Table 5-1620. PADED_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.109 PADEE_cfg_reg Register (Offset = 1B0h) [Reset = 0000000h]

PADEE_cfg_reg is shown in [Table 5-1621](#).

Return to the [Summary Table](#).

Table 5-1621. PADEE_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.110 PADEF_cfg_reg Register (Offset = 1B4h) [Reset = 0000000h]

PADEF_cfg_reg is shown in [Table 5-1622](#).

Return to the [Summary Table](#).

Table 5-1622. PADEF_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.111 PADEG_cfg_reg Register (Offset = 1B8h) [Reset = 0000000h]

PADEG_cfg_reg is shown in [Table 5-1623](#).

Return to the [Summary Table](#).

Table 5-1623. PADEG_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.112 PADEH_cfg_reg Register (Offset = 1BCh) [Reset = 0000000h]

PADEH_cfg_reg is shown in [Table 5-1624](#).

Return to the [Summary Table](#).

Table 5-1624. PADEH_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description

3-0	func_sel	R/W	1h	Function select

5.2.10.119 PADEO_cfg_reg Register (Offset = 1D8h) [Reset = 0000000h]

PADEO_cfg_reg is shown in [Table 5-1631](#).

Return to the [Summary Table](#).

Table 5-1631. PADEO_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.120 PADEP_cfg_reg Register (Offset = 1DCh) [Reset = 0000000h]

PADEP_cfg_reg is shown in [Table 5-1632](#).

Return to the [Summary Table](#).

Table 5-1632. PADEP_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	1h	Active Low Output Override
6	oe_override_ctrl	R/W	1h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	1h	Function select

5.2.10.121 USERMODEEN Register (Offset = 1F0h) [Reset = 0000000h]

USERMODEEN is shown in [Table 5-1633](#).

Return to the [Summary Table](#).

Table 5-1633. USERMODEEN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	USERMODEEN	R/W	0h	Write 0XADADADAD to enable user mode write access to IO CFG space

5.2.10.122 PADGLBLCFGREG Register (Offset = 1F4h) [Reset = 0000000h]

PADGLBLCFGREG is shown in [Table 5-1634](#).

Return to the [Summary Table](#).

Table 5-1634. PADGLBLCFGREG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	PADGLBLCFGREG	R/W	0h	2:0 : global_ie_n_ctl - Write 3'b111 to pass global_ie_n_val to IE_N/ RXACTIVE_N pin of all the IOs. 3 : global_ie_n_val - Active low 10:8 : global_oe_n_ctl - Write 3'b111 to pass global_oe_n_val to OE_N/GZ pin of all the IOs. 11 : global_oe_n_val - Active low 18:16 : global_pi_ctl - Write 3'b111 to pass global_pi_val and global_pu_val to all the IOs 19 : global_pi_val 20 : global_pu_val

5.2.10.123 IOCFGKICK0 Register (Offset = 1F8h) [Reset = 0000000h]

IOCFGKICK0 is shown in [Table 5-1635](#).

Return to the [Summary Table](#).

Table 5-1635. IOCFGKICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	IOCFGKICK0	R/W	0h	Kicker 0 Register. The value 83E7 0B13h must be written to KICK0 as part of the process to unlock the CPU write access to the above PIN MUX registers (including IOCFGKICK1)

5.2.10.124 IOCFGKICK1 Register (Offset = 1FCh) [Reset = 0000000h]

IOCFGKICK1 is shown in [Table 5-1636](#).

Return to the [Summary Table](#).

Table 5-1636. IOCFGKICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	IOCFGKICK1	R/W	0h	Kicker 1 Register. The value 95A4 F1E0h must be written to the KICK1 as part of the process to unlock the CPU write access to above PINMUX registers (excluding IOCFGKICK0). IOCFGKICK0 has to be written with 83E70B13h to enable access to IOCFGKICK1.

5.2.11 TOP_CTRL Registers

Table 5-1637 lists the memory-mapped registers for the TOP_CTRL registers. All register offset addresses not listed in Table 5-1637 should be considered as reserved locations and the register contents should not be modified.

Table 5-1637. TOP_CTRL Registers

Offset	Acronym	Register Name	Section
0h	PID	PID register	Go
4h	MDO_CTRL		Go
8h	PROBE_BUS_SELO		Go

Complex bit access types are encoded to fit into small table cells. [Table 5-1638](#) shows the codes that are used for access types in this section.

Table 5-1638. TOP_CTRL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write

**Table 5-1638. TOP_CTRL Access Type Codes
(continued)**

Access Type	Code	Description
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.11.1 PID Register (Offset = 0h) [Reset = 61800215h]

PID is shown in [Table 5-1639](#).

Return to the [Summary Table](#).

PID register

Table 5-1639. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	15h	

5.2.11.2 MDO_CTRL Register (Offset = 4h) [Reset = 000000Xh]

MDO_CTRL is shown in [Table 5-1640](#).

Return to the [Summary Table](#).

Table 5-1640. MDO_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	0h	
5-4	SRC_SELECT	R/W	0h	Select the source IP of LVDS Data 0: Aurora full data on LVDS 1: CBUFF on LVDS 2: Aurora bit-clk ,frame clk and 2 data support. 3: Aurora 1bit clk and 2 data support for LOP package
3-1	RESERVED	R	0h	
0	AURORATX_SRC_SELECT	R/W	0h	Select the TPIU source to TOP_AURORATX IP 0: Measurement Data 1: Trace Data

5.2.11.3 PROBE_BUS_SEL0 Register (Offset = 8h) [Reset = 00000000h]

PROBE_BUS_SEL0 is shown in [Table 5-1641](#).

Return to the [Summary Table](#).

Table 5-1641. PROBE_BUS_SEL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	sel	R/W	0h	Probe Bus 0 Mux Select

5.2.11.4 PROBE_BUS_SEL1 Register (Offset = Ch) [Reset = 0000000h]

PROBE_BUS_SEL1 is shown in [Table 5-1642](#).

Return to the [Summary Table](#).

Table 5-1642. PROBE_BUS_SEL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	sel	R/W	0h	Probe Bus 1 Mux Select

5.2.11.5 RS232_SLEEP_CLK_DIV Register (Offset = 10h) [Reset = 00000131h]

RS232_SLEEP_CLK_DIV is shown in [Table 5-1643](#).

Return to the [Summary Table](#).

Table 5-1643. RS232_SLEEP_CLK_DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	div_val	R/W	131h	The Divider value for RS232 sleep clock generation from RCclk

5.2.11.6 RS232_SLEEP_CLK_DIV_by2 Register (Offset = 14h) [Reset = 0000098h]

RS232_SLEEP_CLK_DIV_by2 is shown in [Table 5-1644](#).

Return to the [Summary Table](#).

Table 5-1644. RS232_SLEEP_CLK_DIV_by2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	div_val	R/W	98h	The Dividerby2 value for RS232 sleep clock generation from RCclk. This decides the duty cycle of sleep clock.

5.2.11.7 RS232_STATUS Register (Offset = 18h) [Reset = 02B6X000h]

RS232_STATUS is shown in [Table 5-1645](#).

Return to the [Summary Table](#).

Table 5-1645. RS232_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R	0h	
27-16	curr_bit_interval	R	2B6h	Current RS232 bit interval being used
15-12	RESERVED	R	0h	
11-0	clk_duration	R	0h	Number of vbusp clocks measured in one sleep clock frequency

5.2.11.8 EFUSE_DIEID0 Register (Offset = 200h) [Reset = 00000000h]

EFUSE_DIEID0 is shown in [Table 5-1646](#).

Return to the [Summary Table](#).

Table 5-1646. EFUSE_DIEID0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R	0h	EFUSE DieID[31:0]

5.2.11.9 EFUSE_DIEID1 Register (Offset = 204h) [Reset = 00000000h]

EFUSE_DIEID1 is shown in [Table 5-1647](#).

Return to the [Summary Table](#).

Table 5-1647. EFUSE_DIEID1 Register Field Descriptions

Bit	Field	Type	Reset	Description

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.3 Device Clock Architecture

5.3.1 Clock Overview

[Figure 5-2](#) shows a high-level overview of the device clock architecture. The figure captures the key clock sources and the configuration options available to select the appropriate clock source. The detailed structure is captured under each PLL clocking section.

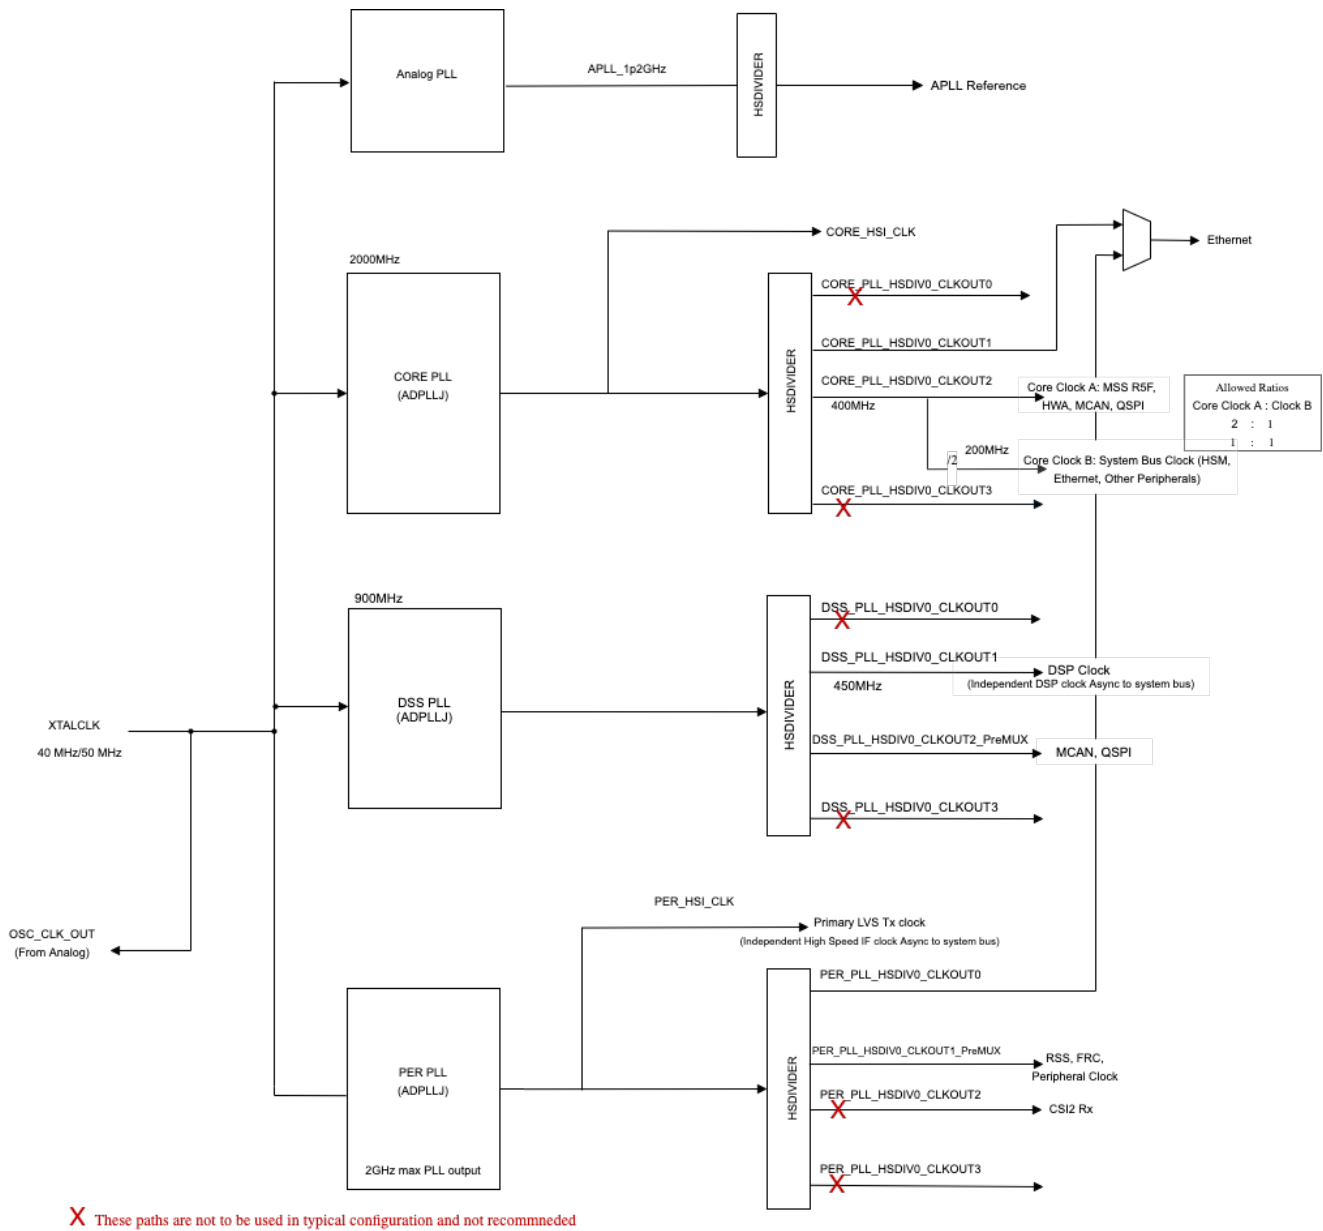

Figure 5-2. Clock Tree Configuration

There are 2 clock sources for AWR2x44P

1. Crystal
2. External Clock source

The 40 MHz and 50 MHz crystals are supported.

The external crystal is connected to an oscillator that generates 40MHz/50MHz clock. This clock is fed to PLLs.

- Analog PLL - APLL
- Digital PLL for Core of type ADPLLJ → Core PLL
- Digital PLL for peripherals of type ADPLLJ → Per PLL
- Digital PLL for Core of type ADPLLJ → DSS PLL

There is a RC Oscillator that powers the chip before the crystal oscillator come up during the boot. This RC Oscillator is also the backup Oscillator when the crystal oscillator fails.

The Clocks generated by the PLLs & Oscillators are routed to various entities of the SOC by the use of clock multiplexors. To provide operating frequency of the clocks to various entities of the chip the clocks are divided with the help of the clock dividers.

The clock configuration involves configuring the PLLs, the multiplexors and the dividers at the right time in the boot sequence of the chip. Typically, the clock configuration is handled in the SBL (Secondary Boot loader) and configurations are retained through the lifecycle of the application. Though re-configurations of the clocks can be done at run time keeping in mind of the limitations of each PLL, it's not recommended to re-configure the clocks at run time.

5.3.2 Root Clocks

These are the clocks used as inputs to various clock multiplexors and eventually routed to peripherals

Table 5-1748.

Clock Name	Max Frequency (MHz)	Note
DPLL_CORE_HSDIV0_CLKOUT0	0	
DPLL_CORE_HSDIV0_CLKOUT1	500	
DPLL_CORE_HSDIV0_CLKOUT2	400	
DPLL_CORE_HSDIV0_CLKOUT3	0	
DPLL_DSP_HSDIV0_CLKOUT0	0	
DPLL_DSP_HSDIV0_CLKOUT1	450	
DPLL_DSP_HSDIV0_CLKOUT2	240	
DPLL_DSP_HSDIV0_CLKOUT3	0	
DPLL_PER_HSDIV0_CLKOUT0	500	
DPLL_PER_HSDIV0_CLKOUT1	200	
DPLL_PER_HSDIV0_CLKOUT2	0	
DPLL_PER_HSDIV0_CLKOUT3	0	
RCCLK32K	0.032	Internal fixed clock
RCCLK10M	10	Internal fixed clock
XTALCLK	50	From Crystal
MSS_CR5F_CLK	400	Generated Clock
SYS_CLK	200	Generated Clock
DPLL_CORE_HSDIV0_CLKOUT1_MUXED	500	Generated Clock
DPLL_CORE_HSDIV0_CLKOUT2_MUXED	400	Generated Clock
DPLL_PER_HSDIV0_CLKOUT1_MUXED	200	Generated Clock
WUCPUCLK	50	From XTAL
PLL_CORE_CLK	1500	
PLL_PER_CLK	1600	

Muxed Primary Clocks

There are 4 primary clocks that are muxed with other clocks. The mux inputs and clock gates for these clocks are as shown in the figures below.

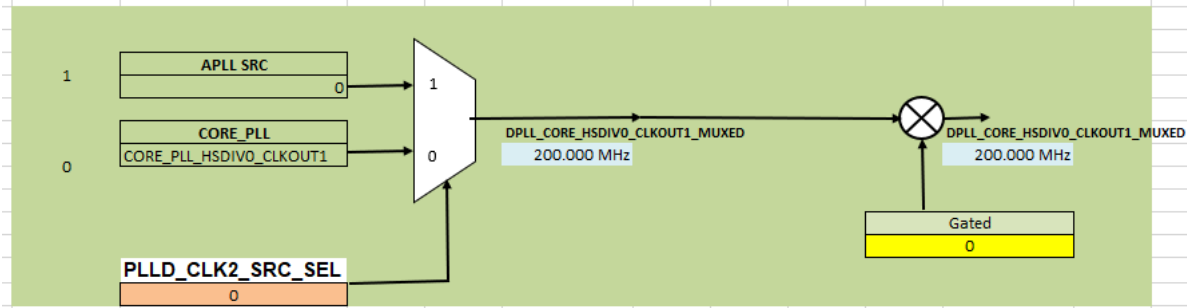

Figure 5-3. DPLL_CORE_HSDIV0_CLKOUT1_MUXED

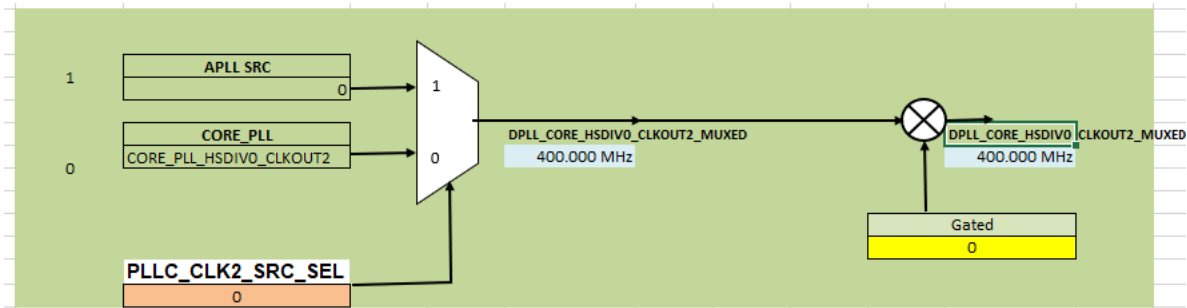

Figure 5-4. DPLL_CORE_HSDIV0_CLKOUT2_MUXED

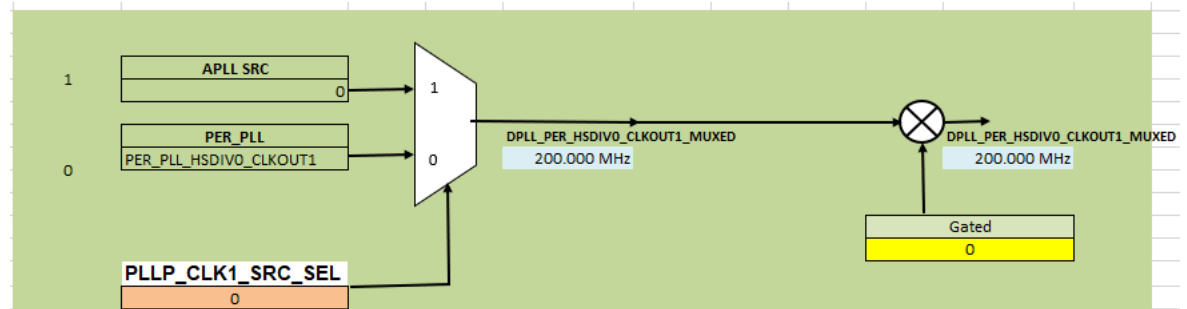

Figure 5-5. DPLL_PER_HSDIV0_CLKOUT1_MUXED

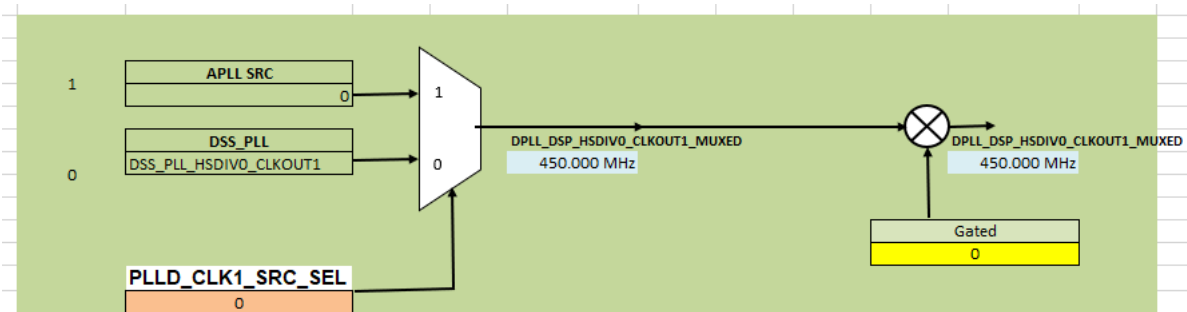

Figure 5-6. DPLL_DSP_HSDIV0_CLKOUT1_MUXED

The registers that control these muxes are as below

Table 5-1749.

Name	Address	Bit Position	Typical Value
PLLC_CLK2_SRC_SEL	0x02140464	11:0	0x0

Table 5-1749. (continued)

Name	Address	Bit Position	Typical Value
PLLD_CLK1_SRC_SEL	0x0214046C	11:0	0x0
PLLP_CLK1_SRC_SEL	0x02140470	11:0	0x0
PLLC_CLK2_GATE	0x0214047C	2:0	0x0
PLLD_CLK1_GATE	0x02140480	2:0	0x0

R5_COREA_GATE	0x0210 01B4	2:0	0bxxxx xxxx xxxx xxxx xxxx xxxx xxxx

5.3.3 External Clocks

The clocks in the AWR2944P device to the supported peripherals are as depicted in Figure 5-8.

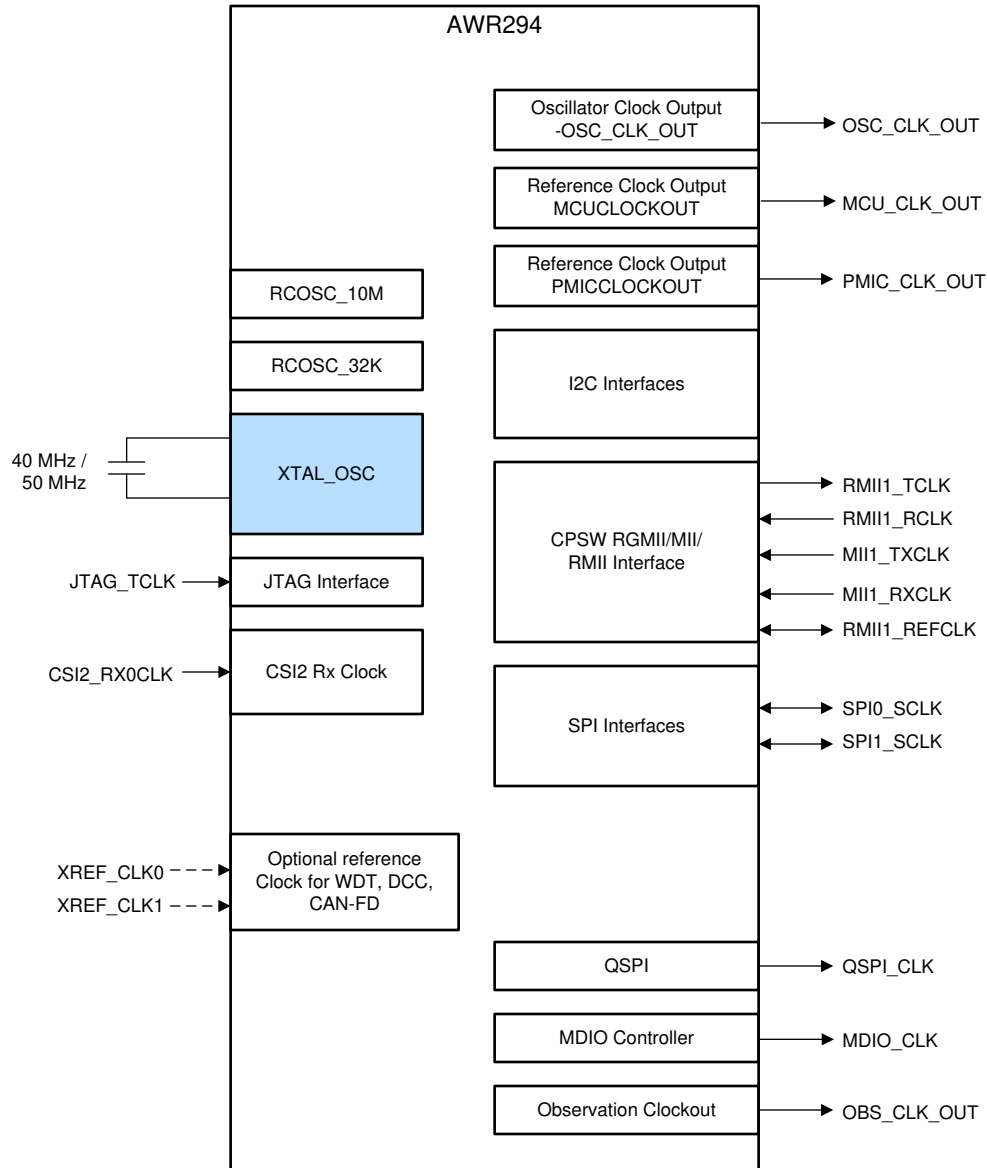

Figure 5-8. External Clocks

Note

RCOSC_10M , RCOSC_32K : these two clocks are internal and not available for application.

5.3.4 Clock Selection

lists the configuration options for the clock source, divider, and gating selections for different peripheral clocks.

Table 5-1751. Configuration Options

5.3.5 Analog Modules
5.3.5.1 ADPLL

General features of the ADPLL-J module are:

- Low Jitter Phase-Locked Loop

- RHEA, OCP, and Direct Access interface
- Programmable 8-bit input divider: N
- Programmable 12-bit integer, 18-bit fractional loop multiplier: M
- Programmable 7-bit post divider: M2
- Digital control and loop filter
- User-selectable multiple in-built oscillators for power-jitter optimization
- Primary output clock on digital core domain: $CLKOUT = (M / (N+1)) * CLKINP * (1/M2)$
- Additional output clock on internal LDO domain: $CLKOUTLDO = (M / (N+1)) * CLKINP * (1/M2)$
- Internal oscillator clock on internal LDO domain: $CLKDCOLDO = (M / (N+1)) * CLKINP$
- Output clock gating control: CLKOUTEN / CLKOUTLDOEN / CLKOUTDCOLDOEN
- Digital LOCK indicators for frequency and phase lock
- Fast re-lock
- Input to output bypass on CLKOUT
- Bypass programmable 4-bit divider: N2: $CLKOUT = CLKINP / (N2 + 1)$
- Optional low frequency bypass clock control: ULOWCLKEN CLKOUT = CLKINPULOW
- Power management modes:
 - Power down
 - Idle bypass
 - Stop Clock-input Bypass
 - Retention
- Output clock Spread spectrum clocking supported

The ADPLLLJ is a low jitter PLL with a 2-GHz maximum output. ADPLLLJ has a predivide feature which allows user to divide, for instance, a 24-MHz or 26-MHz reference clock to 1 MHz and then multiply up to 2 GHz maximum. All PLLs will come-up in bypass mode at reset. SW needs to program all the PLL settings appropriately and then wait for PLL to be locked.

Spread Spectrum Clocking

The module supports spread spectrum clocking (SSC) on its output clocks. SSC is used to spread the spectral peaking of the clock to reduce any electromagnetic interference (EMI) that may be caused due to the clock's fundamental or any of its harmonics. When SSC is enabled the clock's spectrum is spread by the amount of frequency spread, and the attenuation is given by the ratio of the frequency spread (Δf) and the modulation frequency (f_m), i.e., $10 * \log_{10}(\Delta f / f_m)$ dB.

Note

Please refer [MMWAVE-MCUPLUS-SDK](#) for reference implementation of this feature.

5.3.5.2 ADPLLJ Programming Model

5.3.5.2.1 ADPLLJ Programming Sequence

The following sequence is for PLL_PER. Similar registers exist for PLL_CORE and PLL_DSP.

1. Program the values M and N2 in TOP_RCM: PLL_PER_MN2DIV.
2. Program the values of N and M2 in TOP_RCM: PLL_PER_M2NDIV.
3. Program the Fractional M in TOP_RCM: PLL_PER_FRACDIV_FRACTIONALM.
4. Program the Sigma Delta Divider (SD) in TOP_RCM: PLL_PER_FRACDIV_REGSD.
5. Copy the NWEELL TRIM from EFUSE to TOP_RCM: PLL_PER_CLKCTRL_NWEELLTRIM.
6. Write 0x0 to TOP_RCM: PLL_PER_CLKCTRL_IDLE.
7. Write 0x1 to TOP_RCM: PLL_PER_TENABLE.
8. Write 0x1 to TOP_RCM: PLL_PER_CLKCTRL_TINTZ.
9. Write 0x0 to TOP_RCM: PLL_PER_TENABLE.
10. Write 0x1 to TOP_RCM: PLL_PER_TENABLEDIV.
11. Write 0x0 to TOP_RCM: PLL_PER_TENABLEDIV.
12. Poll Lock Status by reading TOP_RCM: PLL_PER_STATUS_PHASELOCK until it is 0x1.

5.4 HS Divider Programming Sequence

The following sequence is for PLL_PER. Similar registers exist for PLL_CORE and PLL_DSP.

1. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT0_DIV.
2. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT1_DIV.
3. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT2_DIV.
4. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT3_DIV.
5. Write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_TENABLEDIV.
6. Write 0x0 to TOP_RCM:PLL_PER_HSDIVIDER_TENABLEDIV.
7. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT0_GATE_CTRL.
8. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT1_GATE_CTRL.
9. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT2_GATE_CTRL.
10. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT3_GATE_CTRL.

5.5 M2 and N2 Change On-the-Fly

The dividers M2 and N2 are designed to change on the fly and provide a glitch-free frequency switch from the old to new frequencies. In other words, they can be changed while the PLL is in a locked condition, without having to switch to bypass mode. A status toggle bit will give an indication if the new divisor was accepted. These dividers can also be changed in bypass mode, and the new divisor value will be reflected on output after the PLL relocks. For more details, see the PLL configuration procedures for each PLL.

5.6 Clock Register Details

Table 5-1752. Registers for the COREPLL

Name	Address	Bit Position	Typical Value
PLL_CORE_M2NDIV.N	0x0214 0410	7:0	0

5.8 Memory Protection Unit (MPU) and Firewalls

5.8.1 Functional Operation

The MPU performs memory protection checking for a CBA bus. It inputs a VBUSM or VBUSP bus, then checks the address against the fixed and programmable regions to see if the access is allowed. If allowed, the transfer is passed unmodified to the output VBUSM or VBUSP bus. If the transfer is illegal (fails the protection check), then the MPU does not pass the transfer to the output bus but rather services the transfer internally back to the input bus (to prevent a hang) returning the fault status to the requestor as well as generating an interrupt about the fault.

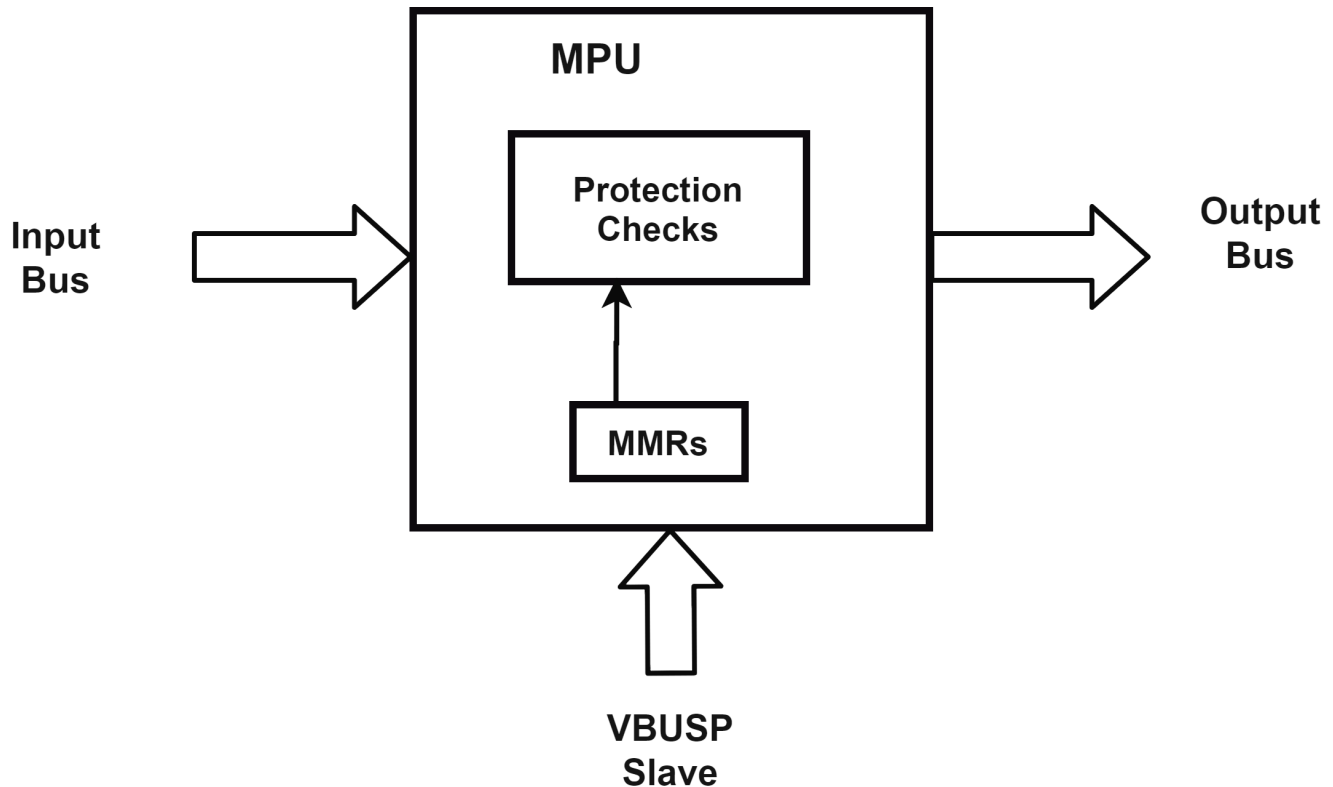

Figure 5-9. MPU Top Level Diagram

The first check is the transfer's privID against the AID settings. There is an AID register bit for each possible privID (0 to 15) and an AIDX that covers privIDs not configured. The privID is used to lookup the associated AID bit. If the AID bit is 0, then the range does not cover that privilege level and the range is not checked (although other ranges with different AID setting will) for this transfer. If the AID bit is 1, then the range does cover that privilege level and the permissions are checked. The transfer secure and debug parameters are checked against the MPPA values to detect an allowed access. The two bits (NS and EMU) provide 3 permission levels. If the NS is set, the range is non-secure and any security or debug level may access the range. If the NS is not set, the range is secure only and only secure level accesses are allowed. In secure mode, if the EMU is set, debug accesses are allowed. If the EMU is not set, debug accesses are not allowed. For non-debug accesses, the read, write, and execute permissions are also checked. There is a set of permissions for supervisor mode and another for user mode. The "priv" attribute of the transfer determines which is checked. If priv = 1, the supervisor rwx bits are checked against the "dir" and "dtype" attributes of the transfer (read is dir = 1 and dtype not instruction, write is dir = 0, execute is dir = 1 and dtype = instruction). If priv = 0, the user rwx bits are checked against the same attributes. If the associated rwx bit for the type of transfer is 1, the transfer is allowed, but if the rwx bit is 0, the transfer is not allowed.

The function outputs whether the transfer is allowed or not. If the transfer address range (start to end address, or those with AID bits = 0) does not match any range, the transfer is either allowed or disallowed based on the configuration mode of the MPU to "assumed allowed" or "assumed disallowed" mode. If any of the overlapped ranges does not allow the access, the access is not allowed. Only when all the overlapped ranges allow the access is the access allowed. The final permissions are the lowest of each type of permission from any hit range (so if a transfer hits 2 ranges, one that is rw and one that is rx, then the final permission is just r).

5.8.2 Firewalls

There are 2 types of firewalls in the system: access control firewalls and PrivID-based firewalls. The following sections clarify the usage of the firewalls.

Access control firewalls — These firewalls generally allow or disallow access to a particular entity. The different variations of these firewalls are:

- Configuration-based complete (read-write) access allow/disallow
- Configuration-based selected (read/write/read-write) access allow/disallow

The firewalls also support a “Lock” of the configuration, which is a sticky bit implementation that does not allow for any further updates to the configuration until the next power cycle.

PrivID based firewalls — The PrivID-based firewall is used to protect peripheral ports from unintentional access from controller ports. The transactions over the bus interconnect have an associated Privilege Identifier field with the read-write access used to determine the validity (allow-disallow) of the transaction. A high level view of the firewall is shown in [Figure 5-10](#).

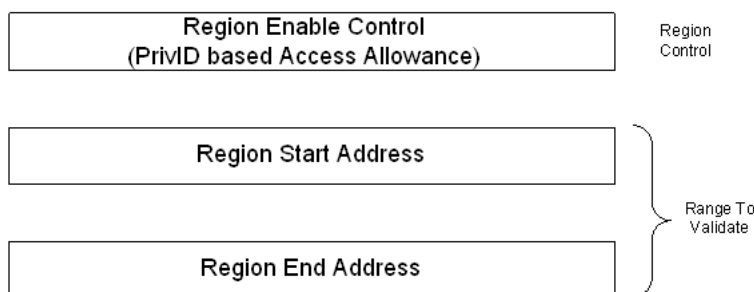

Figure 5-10. PrivID Firewall Overview

A region and the region controls are defined as to which controllers/PrivIDs would be allowed or disallowed access (based on modes). If the address range (start address to end address) of the input transfer overlaps with one of the regions, then the transfer parameters are checked against the address range permissions. These permissions are programmable and follow the MPPA (Memory Protection Permission Attribute) standard set by the Highlander Memory Management architecture. Additionally, the region controls also include read/write/execute permissions both in user/supervisor modes. Further, secure and debug modes can also be configured.

Thus, this section of the PCR controls the configurations of MPU regions in the device. The default_prog_mppa, default_prog_start_addr, default_prog_end_addr (for region 0 and 1) at the time of reset. It is controlled based on security manager’s signals soc_firewall_bypass and hsm_firewall_bypass.

ISC (Initiator-side Security Control) — The Initiator side Security Control (ISC) module is responsible for inserting the PrivID values to the transactions issued by the controller to allow or disallow the transaction by the firewalls in the system.

The ISC module is placed on the controllers that are potentially capable of interacting with the security sub-system and assigned a value from the ID Allocation register (details in [Section 5.8.3](#)).

Allocation of PrivIDs to all controllers must only based on the ID Allocation register under the control of the HSM. The ISC also has a bypass control that does not change or populate the PrivID.

The default Block and Bypass Tie-off values for each MPU is captured in the table below :

(Note: For GP device 'Bypass' is the default reset value and for HS-SE device 'Block' is the default reset value. For MPU_RSS_DSS2RSS and MPU_RSS_MSS2RSS the default reset value is 'Bypass' for all type of devices)

MPU_RSS_DSS2RSS and MPU_RSS_MSS2RSS registers does not fall under the HSM space unlike others and instead falls in the RSS space

For GP device 'Bypass' is the default reset value

		mppa0	start_addr0	end_addr0	mppa1	start_addr1	end_addr1
		[31:0]	[31:0]	[31:0]	[31:0]	[31:0]	[31:0]

Figure 5-11. Default MPU Reset Configurations

5.8.3 ID Allocation

The PrivID allocation is primarily a static allocation in the system, and defined by the values specified in [Table 5-1756](#)

Table 5-1756. PrivID Grouping and Allocation

Master Group	PrivID Allocation
HSM Masters	
HSM CortexM4	0x1
HSM Secure eDMA TPTCs (x2)	0x1
MSS Masters	
MSS Cortex R5FA,B AXI-M (x2)	0x2
MSS eDMA TPTCs	0x2
Ethernet DMA	0x2
Debug Masters	
DebugSS JTAG	0x4
RS232	0x4
DMM	0x4
DSS Masters	
DSS MDMA Port	0x5
DSS eDMA TPTC	0x5
DSS eDMA TPTC	0x5
RCSS Masters	
RCSS ICSS-M Ports (x2)	0x6
RCSS CSI2 A, B (x2)	0x6
RCSS eDMA TPTCs (x2)	0x6

5.8.4 Memory Map (MPU)

The default registers are listed in [Table 5-1757](#). There can also be configured MMRs.

Table 5-1757. Memory Map Registers

Address Offset	Register
0x000	Revision
0x004	Configuration
0x010	Interrupt Raw Status/Set
0x014	Interrupt Enabled Status/Clear

Table 5-1757. Memory Map Registers (continued)

Address Offset	Register
0x018	Interrupt Enable
0x01C	Interrupt Enable Clear
0x020 - 0x0FC	Reserved
0x100	Reserved
0x104	Reserved
0x108	Reserved
0x10C	Reserved
0x110 - 0x1FC	Reserved
0x200	Programmable 1 Start Address
0x204	Programmable 1 End Address
0x208	Programmable 1 MPPA
0x20C	Reserved
0x210 - 0x2FC	Additional Programmable Range MMRs
0x300	Fault 1 Address
0x304	Fault 1 Status
0x308	Fault 1 Clear

5.8.4.1 Revision Register (Base Address + 0x000)

The Revision Register contains the ID and revision information.

Table 5-1758. Revision Register

Bits	Field	Type	Reset	Description
31:30	scheme	r/o	1	Scheme.
29:28	reserved	r/o	0	Always read as 0. Writes have no affect.
27:16	modID	r/o	0xe81	Module ID field.
15:11	revrtl	r/o	Any	RTL revision. Will vary depending on release.
10:8	revmaj	r/o	1	Major revision.
7:6	revcustom	r/o	0	Custom revision.
5:0	revmin	r/o	2	Minor revision.

5.8.4.2 Configuration Register (Base Address + 0x004)

The readonly Configuration register contains the configured values of the module.

Table 5-1759. Configuration Register

Bits	Field	Type	Reset	Description
31:24	address_align	r/o	0	Address alignment for range checking. 0 = 1k 1 = 2k 2 = 4k ...
23:20	num_fixed	r/o	0	Number of fixed address ranges.
19:16	num_prog	r/o	8	Number of programmable address ranges.
15:12	num_fixed_aids	r/o	0	Number of supported fixed AIDs. 0 = no specific fixed AIDs supported (all treated equally) N = PrivIDs from 0 to N-1 supported, others use AIDX

Table 5-1759. Configuration Register (continued)

Bits	Field	Type	Reset	Description
11:1	reserved	r/o	0	Always read as 0.
0	assumed_allowed	r/o	0	Assumed allowed mode. 0 = assumed disallowed 1 = assumed allowed

5.8.4.3 Interrupt Raw Status/Set Register (Base Address + 0x010)

The Interrupt Raw Status/Set register shows the interrupt status (before enabling) and allows setting of the interrupt status.

Table 5-1760. Interrupt Raw Status/Set Register

Bits	Field	Type	Reset	Description
31:02:00	reserved	r/o	0	Always read as 0.
1	addr_err	w1ts	0	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	w1ts	0	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.8.4.4 Interrupt Enabled Status/Clear Register (Base Address + 0x014)

The Interrupt Enabled Status/Clear register shows the interrupt enabled status and allows clearing of the interrupt status.

Table 5-1761. Interrupt Enabled Status/Clear Register

Bits	Field	Type	Reset	Description
31:2	reserved	r/o	0	Always read as 0.
1	enabled_addr_err	w1tc	0	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	w1tc	0	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.8.4.5 Interrupt Enable Register (Base Address + 0x018)

The Interrupt Enable register shows the interrupt enable value and allows setting the enable.

Table 5-1762. Interrupt Enable Register

Bits	Field	Type	Reset	Description
31:02	reserved	r/o	0	Always read as 0.
1	addr_err_en	w1ts	0	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	w1ts	0	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.8.4.6 Interrupt Enable Clear Register (Base Address + 0x01C)

The Interrupt Enable Clear register shows the interrupt enable and allows clearing of the interrupt enable. Reads return the Interrupt Enable register value, but writes can clear the interrupt enables.

Table 5-1763. Interrupt Enable Clear Register

Bits	Field	Type	Reset	Description
31:02	reserved	r/o	0	Always read as 0.
1	addr_err_en_clr	w1tc	0	Addressing violation error enable. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	w1tc	0	Protection violation error enable. Write a 1 to clear the enable. Writing a 0 has no effect.

5.8.4.7 EOI Register (Base Address + 0x020)

The EOI register allows software to indicate when the end of interrupt service is complete. The eoi vector value is dependent on the interrupt handling.

Table 5-1764. EOI Register

Bits	Field	Type	Reset	Description
31:8	reserved	r/o	0	Always read as 0.
7:0	eoi_vector	r/w	0	EOI vector value. Write this with the interrupt distribution value in the chip. This drives the mpu_eoi_vector output signal.

5.8.4.8 Interrupt Vector Register (Base Address + 0x024)

The Interrupt Vector register displays the interrupt vector returned from interrupt distribution.

Table 5-1765. Interrupt Vector Register

Bits	Field	Type	Reset	Description
31:0	intr_vec	r/o	0	Interrupt vector. Reads mpu_intr_vector input signal.

5.8.4.9 Programmable Address Start Register N (Base Address + 0x200, 0x210, 0x220, ...)

The Programmable Address Start register holds the start address for the range. This register is writable by a supervisor entity (priv = 1) only. If the NS bit is in non-secure mode (= 0) in the associated MPPA register, the register is also only writable by a secure entity (secure = 1). The width of the field is determined by the comp_width parameter.

(Note: For GP device 'Bypass' is the default reset value and for HS-SE device 'Block' is the default reset value. For MPU_RSS_DSS2RSS and MPU_RSS_MSS2RSS the default reset value is 'Bypass' for all type of devices)

Refer to Default MPU Reset Configurations.

Table 5-1766. Programmable Address Start Register

Bits	Field	Type	Reset	Description
31:N	start_addrN	r/w	input	Start address for range N. Defaults to input signal value.
N-1:0	reserved	r/o	0	Always read as 0.

5.8.4.10 Programmable Address End Register N (Base Address + 0x204, 0x214, 0x224, ...)

The Programmable Address End register holds the end address for the range. This register is writable by a supervisor entity (priv = 1) only. If the NS bit is in non-secure mode (= 0) in the associated MPPA register, the register is also only writable by a secure entity (secure = 1). The field width is determined by the comp_width parameter.

(Note: For GP device 'Bypass' is the default reset value and for HS-SE device 'Block' is the default reset value. For MPU_RSS_DSS2RSS and MPU_RSS_MSS2RSS the default reset value is 'Bypass' for all type of devices)

Refer to Default MPU Reset Configurations.

Table 5-1767. Programmable Address End Register

Bits	Field	Type	Reset	Description
31:N	end_addrN	r/w	input	End address for range N. Defaults to input signal value.
N-1:0	reserved	r/o	1s	Always read as all bits 1.

5.8.4.11 Programmable MPPA Register N (Base Address + 0x208, 0x218, 0x228, ...)

The Programmable Address MPPA register holds the permissions for the region. This register is writeable by a non-debug supervisor entity ($priv = 1$) only. If the NS bit is in secure mode ($= 0$), the register is also only writeable by a non-debug secure entity ($secure = 1$). The NS bit is only writeable by a non-debug secure entity. For debug accesses, the register is writeable only when $NS = 1$ or $EMU = 1$.

(Note: For GP device 'Bypass' is the default reset value and for HS-SE device 'Block' is the default reset value. For MPU_RSS_DSS2RSS and MPU_RSS_MSS2RSS the default reset value is 'Bypass' for all type of devices)

Refer to Default MPU Reset Configurations.

Table 5-1768. Programmable MPPA Register

Bits	Field	Type	Reset	Description
31:26	reserved	r/o	0	Always read as 0.
25:10	AID15-0	r/w	input	AIDs checked for this region. Defaults to input value. 0 = AID is not checked for these permissions. 1 = AID is checked for these permissions.
9	AIDX	r/w	input	Additional AIDs checked. Defaults to input value.
8	reserved	r/o	0	Always read as 0.
7	ns	r/w	input	Non-secure permission. Defaults to input value.
6	emu	r/w	input	Debug permission. Defaults to input value.
5	sr	r/w	input	Supervisor read permission. Defaults to input value.
4	sw	r/w	input	Supervisor write permission. Defaults to input value.
3	sx	r/w	input	Supervisor executable permission. Defaults to input value.
2	ur	r/w	input	User read permission. Defaults to input value.
1	uw	r/w	input	User write permission. Defaults to input value.
0	ux	r/w	input	User executable permission. Defaults to input value.

5.8.4.12 Fault Address Register (Base Address + 0x300)

The Fault Address register holds the address of the first protection fault transfer.

Table 5-1769. Fault Address Register

Bits	Field	Type	Reset	Description
31:0	fault_addr	r/o	0	Fault address.

5.8.4.13 Fault Status Register (Base Address + 0x304)

The Fault Status register holds the status and attributes of the first protection fault transfer.

Table 5-1770. Fault Status Register

Bits	Field	Type	Reset	Description
31:24	id	r/o	0	Transfer ID.
23:16	mstid	r/o	0	controller ID.
15:13	reserved	r/o	0	Always read as 0.
12:09	privid	r/o	0	Privilege ID.
8	reserved	r/o	0	Always read as 0.
7	ns	r/o	0	Non-secure access.
6	reserved	r/o	0	Always read as 0.
5:00	fault_type	r/o	0	Fault type. 100000 = supervisor read fault 010000 = supervisor write fault 001000 = supervisor execute fault 000100 = user read fault 000010 = user write fault 000001 = user execute fault 111111 = relaxed cache linefill fault 010010 = relaxed cache writeback fault 000000 = no fault

5.8.4.14 Fault Clear Register (Base Address + 0x308)

The Fault Clear register allows the software to clear the current fault, so that another can be captured when this register is written.

Table 5-1771. Fault Clear Register

Bits	Field	Type	Reset	Description
31:1	reserved	r/o	0	Always read as 0.
0	fault_clr	w/o	0	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.9 Power Domains

The device has two power domains:

- Always-on power domain: This power domain supplies power to entire device except for the DSP core. This domain cannot be switched off dynamically within the device.
- DSP power domain: The DSP core inside the DSP subsystem is placed on switchable power domain. This feature can be used to reduce power consumption of the device when the DSP core is not in use. By default, the state of this power domain is OFF.

5.9.1 DSP Power Domain

The C66x DSP is off by default on bootup. The DSS_RCM controls the power cycling of the DSP. Software can trigger a power on/off sequence by writing to the DSP_PD registers in DSS_RCM space.

5.9.1.1 Software Sequence To Power On DSP

1. Unmask the wakeup trigger related to DSS_DSP_WAKEUP. This is DSP interrupt number 16. Thus, unmask the 16th bit in the register DSS_RCM.DSP_PD_WAKEUP_MASK0 by writing 0xFFFFFFF.
2. Trigger DSP wakeup by writing 0x1 to register DSS_RCM.DSP_PD_TRIGGER_WAKU.
3. Poll DSS_RCM.DSP_PD_STATUS.STATE for the value 13. This indicates that the L2 memory can now be written to or preloaded with code.

4. Download the DSP code into L2.
5. Write 0x0 to DSS_RCM.DSP_PD_CTRL.PROC_HALT to unhalt the processor and begin execution.

5.9.1.2 Software Sequence To Power OFF DSP

1. Ensure that all previous registered events during the previous power down are cleared.
2. Set up the DSP interrupt routine for DSS_DSP_PDC_INT (Gem event number : 118) as below:
 - a. Set the bit DSP_ICFG.PDCCMD.GEMPD.
 - b. Execute the idle instruction
3. If DSP powers up in autonomous mode without the program download, set the DSS_REG.GEMPWRSMCFG4.PWRSMLRSTHALT bit to 0x0.
4. Unmask the events to use as wakeup events in DSS_RCM:DSP_PD_WAKEUP_MASK[0-2].
5. Unmask the events to receive as hardware event pulses after the next power up in DSS_RCM:DSP_PD_MISSED_EVENT_MASK [0-2].
6. Mask all interrupts from DSP by setting the DSS_RCM:DSP_PD_CTRL:DSP_PD_CTRL_INTERRUPT_MASK field to 0x1.
7. Trigger a power down by setting the DSS_RCM:DSP_PD_TRIGGER_SLEEP field to 0x1, and wait in a while loop. This triggers the interrupt DSS_DSP_PDC_INT, followed by the power-down of the DSP core by the control module.
8. The state of the DSP power domain can be polled by other main subsystem R5F cores to ensure the DSP power down. DSS_RCM:DSP_PD_STATUS_PD_STATUS field

5.9.2 DSP Subsystem L3 Power Domain

The DSS L3 memory can be controlled from DSS_RCM registers by the software.

By default, all the L3 memory is Power ON.

When partially switching off banks, it is the software's responsibility to ensure that the banks are disabled from the last 256 KB bank, that is, DSS L3 BANK . A bank should not be powered off if all its higher banks are not powered off. For example, if DSS L3 BANK is powered down, BANK are also powered down.

5.9.3 MSS L2 Power Domain

The MSS L2 memory can be controlled from the MSS_RCM registers by the software. By default, all the MSS_L2 memory is Power ON.

5.9.3.1 Power Sequence

Below is the sequence to Power off a bank:

1. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_ISO field.
2. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AONIN field.
3. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AONOUT field is 0x0.
4. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AGOODIN field.
5. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AGOODOUT field is 0x0.

Below is the sequence to Power on a bank:

1. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AONIN field.
2. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AONOUT field is 0x1.
3. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AGOODIN field.
4. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AGOODOUT field is 0x1.
5. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_ISO field.

When a block is powered off, a bus error is generated on access. It is always safe to have decent delay between each step because memory might take some time before reaching to total power-on state.

Table 5-1772. Registers Controls For Each Memory Block

Bank 512KB	Bank Name	Control Registers
0	MSS L2 BANK A	MSS_L2_BANKA_PD_CTRL_AGOODIN MSS_L2_BANKA_PD_CTRL_AONIN MSS_L2_BANKA_PD_CTRL_ISO
1	MSS L2 BANK B	MSS_L2_BANKB_PD_CTRL_AGOODIN MSS_L2_BANKB_PD_CTRL_AONIN MSS_L2_BANKB_PD_CTRL_ISO

HWA Power Domain

The HWA can be controlled from DSS_RCM registers by SW. By Default, all the HWA is Power ON.

Power Sequence

Below is the sequence to Power off the HWA

1. Write 0x7 to DSS_RCM:DSS_HWA_PD_CTRL:ISO field
2. Write 0x0 to DSS_RCM:DSS_HWA_PD_CTRL:AONIN field
3. Wait till DSS_RCM:DSS_HWA_PD_STATUS:AONOUT field is 0x0
4. Write 0x0 to DSS_RCM:DSS_HWA_PD_CTRL:AGOODIN field
5. Wait till DSS_RCM:DSS_HWA_PD_STATUS:AGOODOUT field is 0x0

Below is the sequence to Power on the HWA

1. Write 0x7 to DSS_RCM:DSS_HWA_PD_CTRL:AONIN field
2. Wait till DSS_RCM:DSS_HWA_PD_STATUS:AONOUT field is 0x1
3. Write 0x7 to DSS_RCM:DSS_HWA_PD_CTRL:AGOODIN field
4. Wait till DSS_RCM:DSS_HWA_PD_STATUS:AGOODOUT field is 0x1
5. Write 0x0 to DSS_RCM:DSS_HWA_PD_CTRL:ISO field

It is always safe to have decent delay between each step because HWA might take some time before reaching to total power on state. So even though AONOUT is 1'b1 does not mean HWA is ON.

Registers

Below is the corresponding register controls for each block of memory

Bank 512KB	Bank Name	Control Register
0	HWA (Hard Macro)	DSS_RCM:DSS_HWA_PD_CTRL:AGOODIN DSS_RCM:DSS_HWA_PD_CTRL:AONIN DSS_RCM:DSS_HWA_PD_CTRL:ISO DSS_RCM:DSS_HWA_PD_STATUS

5.10 Resets

Two device resets are available that can be controlled from the device pins: the power-on reset pin NRESET and the bidirectional WARM_RESET signal. The warm reset signal is implemented as an I/O, so that an external monitor can be used to detect changes to the state of the internal warm reset control signal.

5.11 Temperature Sensor

The AWR2944P device has multiple on-chip temperature sensors (TS) which are distributed in and around different components of silicon. The RF front-end of the device contains multiple TS, which RadarSS can access to measure the temperature for RX and TX components. The application can read these TS through RadarSS using the mmWaveLink API (AWR_RF_TEMPERATURE_GET_SB, rIRfGetTemperatureReport).

Note

Refer to the GPADC driver and unit-test application from [MMWAVE-MCUPLUS-SDK](#) for reference code to read these temperature sensors.

Device includes the following processor core and accelerators:

- MCU Subsystem ARM Cortex lockstep R5F
- DSP Subsystem TI C66x DSP
- Radar Processing Hardware Accelerators
- Radar Subsystem ARM Cortex lockstep R4F

6.1 Main Subsystem Cortex R5F

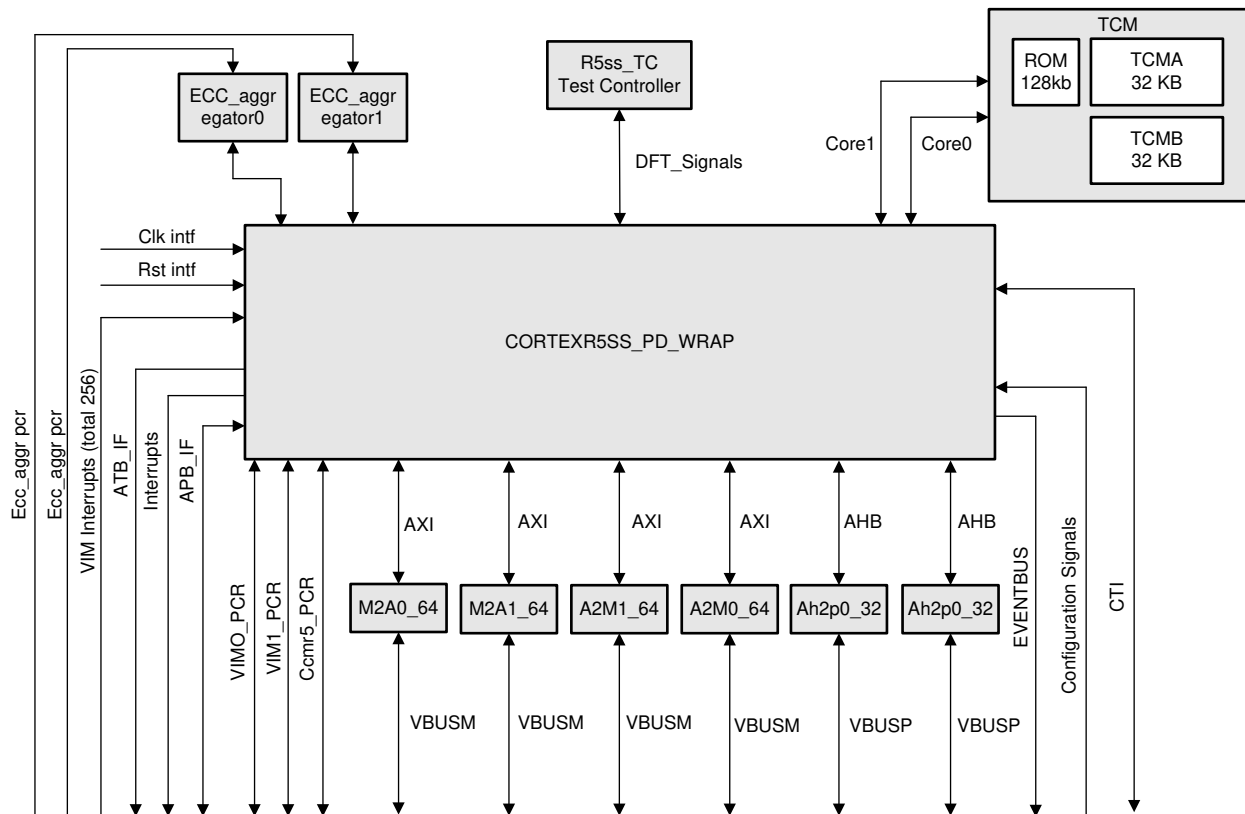

Figure 6-1. Main Subsystem

The Main SubSystem is a lock-step implementation of the Arm Cortex-R5F processor. It also includes accompanying memories (L1 caches and tightly-coupled memories), standard Arm® CoreSight™ debug and trace architecture, integrated Vectored Interrupt Manager (VIM), ECC Aggregators, and various other modules for protocol conversion and address translation for easy integration into the SoC.

6.1.1 Main ARM SubSystem Features

The MSS supports the following features:

- ARMv7-R architecture with the following extensions:
 - Basic SIMD extension for integer and floating-point vector operations
 - Vector Floating Point Version 3 (VFPv3) with Single/Double Precision
 - Dynamic branch prediction with a global history buffer, and a 4-entry return stack
- Lock step mode is supported.
- L1 memory architecture :
 - 16KByte I-Cache with 64-bit ECC
 - 16Kbyte D-cache with 32-bit ECC
- L2 Interface
 - 64-bit Controller interface for peripheral access
 - 64-bit Target interface for cache and TCM access
 - 32-bit Controller interface for MCU peripherals
 - ECC on data. Redundancy on Control bus
- Vectored Interrupt Manager with ECC protection on Vector Table RAM
 - VIM1 and VIM2 in lockstep pair when CPU cores are in lock step mode
- Static (boot time) configuration for either lockstep mode or dual-CPU mode
- Mechanism to clock gate the CPU and comparator logic in a non-Lockstep mode.
- CPU Self-Test Controller for CPU core, VIM, and Comparator modules
- PBIST controller for test of all the RAMs
- Support to test ECC functionality in safety-critical applications
- Built in debug features
 - Up to 8 hardware breakpoints per CPU
 - Up to 8 watch points per CPU
- 32-bit Target Debug interface to access Debug components (CTI, ETM, ATB)
- Trace interface to a Core Sight ETM-R5
- Performance Monitoring Unit (PMU)

6.1.2 TCM Initialization

Auto-init module has been implemented for initializing the TCMs. Paths from TCMA and TCMB are timing-critical, so the initialization of these memories occur through the test path. Initialization of TCMA and TCMB occurs in parallel.

Below are the registers used for the TCM initialization

- Writing 1 to MSS_CTRL:MSS_<A/B>TCM_MEM_INIT:MSS_<A/B>TCM_MEM_INIT_MEM_INIT starts the mem-init for MSS_TCM<A/B>_CR5A/B.
- Reading 1 from MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_DONE: MSS_<A/B>TCM_MEM_INIT_DONE_MEM_INIT_DONE confirms the end of initialization for MSS_TCM<A/B>_CR5A/B.
- Writing 1 to MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_DONE: MSS_<A/B>TCM_MEM_INIT_DONE_MEM_INIT_DONE clears the field.
- Reading 1 from MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_STATUS: MSS_<A/B>TCM_MEM_INIT_STATUS_MEM_STATUS confirms progress of initialization for MSS_TCM<A/B>_CR5A/B.

6.1.3 Vectored Interrupt Manager (VIM) Module

This chapter describes the behavior of the vectored interrupt manager (VIM) module of the device family.

6.1.3.1 VIM Overview

The VIM aggregates device interrupts and sends them to the R5F CPU(s). It can be used in either split or lockstep configuration. In split, it has two independent interrupt cores, one per CPU. In lockstep, CPU1 acts as a diagnostic on CPU0; only CPU0's outputs are used but all outputs are compared to CPU1 to provide diagnostic coverage.

The VIM module supports the following features:

- 256 interrupt inputs per R5F core
- Each interrupt has its own 4-bit programmable priority
 - Defined via the `INTPRIORITY_j` register
 - The VIM provides support for priority interruption of interrupts
- Each interrupt has its own enable mask
 - Interrupt enable is done via the `INTR_EN_SET_j` register
 - Interrupt disable is done via the `INTR_EN_CLR_j` register
- Each interrupt can be programmed as either an IRQ or FIQ
 - Defined via the `INTMAP_j` register
- Each interrupt has its own programmable 32-bit vector address associated with it
 - Defined via the `INTVECTOR_j` register
 - Protected with `SECDED`
- One IRQn and one FIQn output per core
- Vectored interrupt interface
 - Compatible with R5F VIC port
- Default vector provided when a double-bit error is detected
- Split or lockstep capable
 - In lockstep mode, only interrupts connected to VIM interrupt core 0 are available
- Software interrupt generation

6.1.3.2 VIM Interrupt Inputs

The VIM supports 256 interrupt inputs per core. Each interrupt can be either a level or a pulse (both active-high). The interrupt mapping for the two R5F cores can be found in [Chapter 7, Interrupts](#).

6.1.3.3 VIM Interrupt Outputs

The VIM has two interrupt outputs per core:

- *CoreN_IRQn*: This is a normal interrupt for core *N* (active-low level). It can be serviced via the VIC interface or through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an IRQ (via the `INTMAP_j` register) and is enabled (via the `INTR_EN_SET_j` register), then it will cause an IRQ to assert
- *CoreN_FIQn*: This is a fast (or non-maskable) interrupt for core *N* (active-low level). FIQs always have priority over IRQs. An FIQ can be serviced through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an FIQ and is enabled, then it will cause an FIQ to assert

6.1.3.4 VIM Interrupt Vector Table (VIM RAM)

For each VIM interrupt core, there is an associated interrupt vector table (VIM RAM) that is used to store the address of ISRs. During register vectored interrupt and hardware vectored interrupt, VIM accesses the interrupt vector table using the vector value to fetch the address of the corresponding ISR. Note that both interrupt vector tables are identical in their memory organization.

The VIM RAM is basically comprised of a set of interrupt vector registers (`INTVECTOR_j`). Hence, the interrupt vector table is organized in 256 words of 30 bits, with a base address corresponding to the physical address of the first register in the group.

Note

The lower two bits of the 32-bit interrupt vector are always 0s.

Figure 6-2 shows the VIM RAM interrupt vector map.

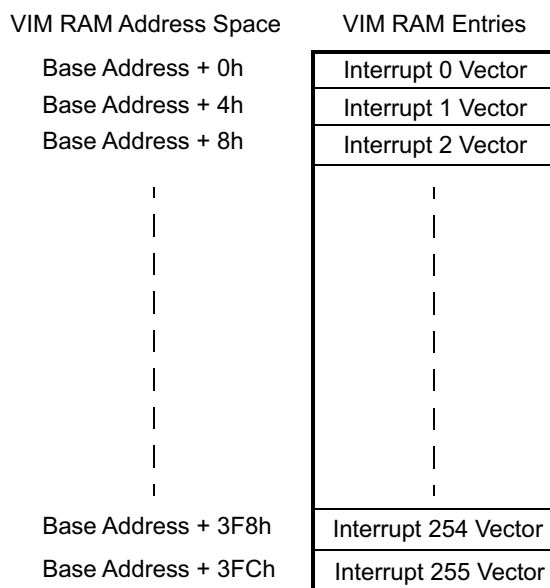

Figure 6-2. VIM RAM Interrupt Vector Map

The interrupt vector table has protection by ECC to indicate corruption due to soft errors. The ECC logic inside VIM supports SECDED. Refer to the ECC aggregator map for the VIM RAM ID.

6.1.3.5 VIM Interrupt Prioritization

The VIM supports the interruption of the currently active interrupt by one with a higher priority. FIQs and IRQs are completely separate but both use the same mechanism.

When an interrupt goes from pending to active (FIQ: reading the FIQVEC register; IRQ: reading the IRQVEC register, then the interrupt is loaded into the corresponding active register (ACTFIQ / ACTIRQ), and all interrupts of an equal or lesser priority are masked (discarded). If prior to this interrupt being cleared (by writing to the FIQVEC register, or IRQVEC register) another interrupt of higher priority arrives, then the FIQn/IRQn will be asserted and that interrupt made pending as normal. If the CPU switches this interrupt to active (by reading the FIQVEC / IRQVEC register), then the currently active interrupt will be pushed onto a stack. When an interrupt is cleared by reading the FIQVEC / IRQVEC register, if there are any interrupts on the stack, the first entry is popped off and put back into the ACTFIQ / ACTIRQ register, so that software may continue where it left off.

6.1.3.6 VIM ECC Support

The memory that holds the interrupt vector for each interrupt is protected by SECDED ECC. Single-bit errors are corrected and written back. Double-bit errors are not corrected. If a double-bit error occurs while trying to load a vector, then the DEDVEC register is used to provide the default vector for the *coreN_IRQADDRV* signal, the IRQVEC register, and the FIQVEC register. The DEDVEC should point to an ISR that handles the fact that there was an uncorrectable error in the interrupt handling.

Some possible remediating actions would be to:

1. Reconstruct the vector table and re-start the application
 - a. Potentially switch to a completely software interrupt handler in the mean time
2. Restart the application from scratch
3. Reset the device
4. Sit in a loop (or WFI) while something external (for example, the ESM) responds to the DED interrupt that will be generated

It is up to the user and the application to determine the appropriate action.

Note

An interrupt that has an uncorrectable vector error (and thus uses the DED vector) will still have the priority of the original interrupt. This makes it possible for a higher priority interrupt to supercede the handling of the error.

Control and reporting are done by the ECC aggregator.

6.1.3.7 VIM Lockstep Mode

In lockstep mode, CPU1 is used as a diagnostic for CPU0. In this mode, only the interrupt inputs for CPU0 are used. Besides to CPU0, these interrupt inputs are also internally routed to CPU1 (through the level-sync / edge-detect logic dedicated to CPU1, and additionally through some delay circuits). The outputs from both VIM interrupt cores are then sent to the MSS CCMR5 module through dedicated compare buses (with CPU0's outputs delayed). The CCMR5 module is responsible for comparing the two sets of output signals and for reporting any mismatches by generating an interrupt (MSS_CCMR5_ERR).

Note

In lockstep mode, only the RAM dedicated to CPU0 is used, so software *must not* do anything with the ECC interface on the RAM dedicated to CPU1.

6.1.3.8 VIM IDLE State

The VIM will indicate IDLE when there are no pending unmasked interrupts or MMR accesses. The VIM does not have a clock stop interface.

6.1.3.9 VIM Interrupt Handling

There are multiple ways to service an interrupt depending on how much of the hardware assistance offered by the VIM the software wants to take advantage of.

For IRQs, it is recommended to use the procedure in [Section 6.1.3.9.1](#), but the procedures in [Section 6.1.3.9.2](#) or [Section 6.1.3.9.3](#) (if a user wants to implement a fully software prioritization scheme) may be used as alternatives.

For FIQs, it is recommended to use the procedure in [Section 6.1.3.9.4](#), but the procedure in [Section 6.1.3.9.5](#) may be used as an alternative.

Note

These descriptions do not include steps such as stack pushes and state retention that software must take in order to return from the ISR. It is assumed that the programmer is aware of these steps.

6.1.3.9.1 Servicing IRQ Through Vector Interface

If the associated CPU has the vector (VIC) interface enabled, then the following method is used for servicing IRQs:

1. Hardware handshake
 - a. CPU asserts *coreN_IRQACK* high
 - b. VIM asserts *coreN_IRQADDRV* to indicate that the *coreN_IRQADDR* bus is stable with the correct vector address
 - c. CPU reads *coreN_IRQADDR*, jumps to that address, and de-asserts *coreN_IRQACK* low
 - d. VIM de-asserts *coreN_IRQn* and *coreN_IRQADDRV*, VIM masks (discards) all IRQs with the same or lower priority
 - e. VIM loads the value from the PRIIRQ[9:0] NUM bit field (which corresponds to the vector address) into the ACTIRQ[9:0] NUM bit field, which causes the ACTIRQ[31] VALID bit to be set
2. Service the interrupt

3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTIRQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE_j register to determine type)
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the IRQSTS_j register, or STS_j register
 - ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
 - b. Level
 - i. Clear the interrupt at the source
 - ii. Clear the status by writing a '1' to the appropriate bit in the IRQSTS_j register, or STS_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the IRQVEC register
 - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
 - b. This will also clear the ACTIRQ[31] VALID bit

6.1.3.9.2 Servicing IRQ Through MMR Interface

When an IRQ interrupt is received, the CPU should follow these steps if not using the vector interface:

1. Read the IRQVEC register and jump to that address to service the ISR
 - a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN_IRQn* output. If another interrupt of a higher priority becomes available, the *coreN_IRQn* will re-assert, allowing priority interruption of an interrupt
 - b. Reading this register will cause the value from the PRIIRQ[9:0] NUM bit field to be loaded into the ACTIRQ[9:0] NUM bit field, and the ACTIRQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
 - ii. Clear the interrupt at the source
 - b. Level
 - i. Clear the interrupt at the source
 - ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
4. Write any value to the IRQVEC register
 - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
 - b. This will also clear the ACTIRQ[31] VALID bit

6.1.3.9.3 Servicing IRQ Through MMR Interface (Alternative)

If a user does not want to use the IRQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the IRQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
 - a. Read the PRIIRQ register to determine which interrupt is the highest priority IRQ currently asserted, OR
 - b. Optionally read the IRQGSTS register to determine which groups have IRQs pending, then read the IRQSTS_j register and use a software prioritization scheme to determine which IRQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
 - ii. Clear the interrupt at the source.
 - b. Level

- i. Clear the interrupt at the source
- ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register

6.1.3.9.4 Servicing FIQ

When an FIQ interrupt is received, the CPU should follow these steps:

1. Read the FIQVEC register and jump to that address to service the ISR
 - a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN_FIQn* output. If another interrupt of a higher priority becomes available, the *coreN_FIQn* will re-assert, allowing priority interruption of an interrupt.
 - b. Reading this register will cause the value from the PRIFIQ[9:0] NUM bit field to be loaded into the ACTFIQ[9:0] NUM bit field, and the ACTFIQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTFIQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE_j register to determine type)
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register
 - ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
 - b. Level
 - i. Clear the interrupt at the source
 - ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the FIQVEC register
 - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
 - b. This will also clear the ACTFIQ[31] VALID bit

6.1.3.9.5 Servicing FIQ (Alternative)

If a user does not want to use the FIQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the FIQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
 - a. Read the PRIFIQ register to determine which interrupt is the highest priority FIQ currently asserted, OR
 - b. Optionally read the FIQGSTS register to determine which groups have IRQs pending, then read the FIQSTS_j register and use a software prioritization scheme to determine which FIQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
 - a. Pulse
 - i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register
 - ii. Clear the interrupt at the source.
 - b. Level
 - i. Clear the interrupt at the source
 - ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register.

6.1.3.10 MSS_VIM Registers

Table 6-1 lists the memory-mapped registers for the MSS_VIM registers. All register offset addresses not listed in Table 6-1 should be considered as reserved locations and the register contents should not be modified.

23FCh	INTVECTOR_255	INTVECTOR	Go

Complex bit access types are encoded to fit into small table cells. [Table 6-2](#) shows the codes that are used for access types in this section.

Table 6-2. MSS_VIM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

6.1.3.10.1 PID Register (Offset = 0h) [Reset = 0000000h]

PID is shown in [Table 6-3](#).

Return to the [Summary Table](#).

The Revision Register contains the major and minor revisions for the module.

Table 6-3. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	1h	PID register scheme
29-28	BU	R	2h	Business Unit: 10 = Processors
27-16	FUNC	R	90h	Module ID
15-11	RTL	R	0h	RTL revision. Will vary depending on release.
10-8	MAJOR	R	0h	Major revision
7-6	CUSTOM	R	0h	Custom
5-0	MINOR	R	1h	Minor revision

6.1.3.10.2 INFO Register (Offset = 4h) [Reset = 00000000h]

INFO is shown in [Table 6-4](#).

Return to the [Summary Table](#).

The Info Register gives the configuration Information of this VIM.

Table 6-4. INFO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RES1	R	0h	RESERVE FIELD
10-0	INTERRUPTS	R	100h	Total number of Interrupts

6.1.3.10.3 PRIIRQ Register (Offset = 8h) [Reset = 0000000h]

PRIIRQ is shown in [Table 6-5](#).

Return to the [Summary Table](#).

The Prioritized IRQ Register shows the number of the highest priority pending IRQ.

Table 6-5. PRIIRQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid.
30-20	RES2	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES3	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the highest priority pending IRQ. valid only if the valid flag is set.

6.1.3.10.4 PRIFIQ Register (Offset = Ch) [Reset = 0000000h]

PRIFIQ is shown in [Table 6-6](#).

Return to the [Summary Table](#).

The Prioritized FIQ Register shows the number of the highest priority pending FIQ.

Table 6-6. PRIFIQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid.
30-20	RES4	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending FIQ. valid only if the valid flag is set.
15-10	RES5	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the highest priority pending FIQ. valid only if the valid flag is set.

6.1.3.10.5 IRQGSTS Register (Offset = 10h) [Reset = 00000000h]

IRQGSTS is shown in [Table 6-7](#).

Return to the [Summary Table](#).

The IRQ Group Status Register indicates which groups have pending IRQ interrupts.

Table 6-7. IRQGSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R	0h	Indicates that the num field is valid.

6.1.3.10.6 FIQGSTS Register (Offset = 14h) [Reset = 00000000h]

FIQGSTS is shown in [Table 6-8](#).

Return to the [Summary Table](#).

The FIQ Group Status Register indicates which groups have pending FIQ interrupts.

Table 6-8. FIQGSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R	0h	Indicates that the num field is valid.

6.1.3.10.7 IRQVEC Register (Offset = 18h) [Reset = 0000000h]

IRQVEC is shown in [Table 6-9](#).

Return to the [Summary Table](#).

The IRQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pending IRQ.

Table 6-9. IRQVEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address. Only valid if the Prioritized IRQ Register valid flag is true.
1-0	RES21	R	0h	RESERVE FIELD

6.1.3.10.8 FIQVEC Register (Offset = 1Ch) [Reset = 0000000h]

FIQVEC is shown in [Table 6-10](#).

Return to the [Summary Table](#).

The FIQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pending FIQ.

Table 6-10. FIQVEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address. Only valid if the Prioritized FIQ Register valid flag is true.
1-0	RES22	R	0h	RESERVE FIELD

6.1.3.10.9 ACTIRQ Register (Offset = 20h) [Reset = 0000000h]

ACTIRQ is shown in [Table 6-11](#).

Return to the [Summary Table](#).

The Active IRQ Register shows the number of the currently active IRQ.

Table 6-11. ACTIRQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid. Set when the IRQ Vector Address Register is read and cleared whenever the IRQ Vector Address Register is written.
30-20	RES6	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES7	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the currently active IRQ. Loaded from teh Prioritized IRQ Register whenever the IRQ Vector Address is read. Valid only if the valid flag is set.

6.1.3.10.10 ACTFIQ Register (Offset = 24h) [Reset = 00000000h]

ACTFIQ is shown in [Table 6-12](#).

Return to the [Summary Table](#).

The Active FIQ Register shows the number of the currently active FIQ.

Table 6-12. ACTFIQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid. Set when the FIQ Vector Address Register is read and cleared whenever the FIQ Vector Address Register is written.
30-20	RES8	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES9	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the currently active FIQ. Loaded from teh Prioritized FIQ Register whenever the FIQ Vector Address is read. Valid only if the valid flag is set.

6.1.3.10.11 DEDVEC Register (Offset = 30h) [Reset = 0000000h]

DEDVEC is shown in [Table 6-13](#).

Return to the [Summary Table](#).

The DED Vector Address contains a default vector address for when an uncorrectable error is detected for an active IRQ or FIQ.

Table 6-13. DEDVEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address.
1-0	RES23	R	0h	RESERVE FIELD

6.1.3.10.12 RAW Register (Offset = 400h) [Reset = 00000000h]

RAW is shown in [Table 6-14](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 6-14. RAW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

6.1.3.10.13 STS Register (Offset = 404h) [Reset = 00000000h]

STS is shown in [Table 6-15](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h04$

Table 6-15. STS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

6.1.3.10.14 INTR_EN_SET Register (Offset = 408h) [Reset = 00000000h]

INTR_EN_SET is shown in [Table 6-16](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7) $h400 + M \times h20 + h08$

Table 6-16. INTR_EN_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

6.1.3.10.15 INTER_EN_CLR Register (Offset = 40Ch) [Reset = 0000000h]

INTER_EN_CLR is shown in [Table 6-17](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7) $h400 + M \times h20 + h0C$

Table 6-17. INTER_EN_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

6.1.3.10.16 IRQSTS Register (Offset = 410h) [Reset = 0000000h]

IRQSTS is shown in [Table 6-18](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h10$

Table 6-18. IRQSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

6.1.3.10.17 FIQSTS Register (Offset = 414h) [Reset = 0000000h]

FIQSTS is shown in [Table 6-19](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h14$

Table 6-19. FIQSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Inactive, Disabled, or not an FIQ. Read 1 Active/Pending, Enabled, and FIQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if FIQ).

6.1.3.10.18 INTMAP Register (Offset = 418h) [Reset = 00000000h]

INTMAP is shown in [Table 6-20](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7) $h400 + M \times h20 + h18$

Table 6-20. INTMAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ 0 IRQ Interrupt (default) 1 FIQ Interrupt

6.1.3.10.19 INTTYPE Register (Offset = 41Ch) [Reset = 0000000h]

INTTYPE is shown in [Table 6-21](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) $h400 + M \times h20 + 0x1C$

Table 6-21. INTTYPE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where $Q = Mx32 + \text{Bit } 0 \text{ Level}$ (default) 1 Pulse</p>

6.1.3.10.20 RAW_1 Register (Offset = 420h) [Reset = 00000000h]

RAW_1 is shown in [Table 6-22](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7) $h400 + M \times h20 + h00$

Table 6-22. RAW_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

6.1.3.10.21 STS_1 Register (Offset = 424h) [Reset = 0000000h]

STS_1 is shown in [Table 6-23](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h04$

Table 6-23. STS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

6.1.3.10.22 INTR_EN_SET_1 Register (Offset = 428h) [Reset = 0000000h]

INTR_EN_SET_1 is shown in [Table 6-24](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7) $h400 + M \times h20 + h08$

Table 6-24. INTR_EN_SET_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

6.1.3.10.23 INTER_EN_CLR_1 Register (Offset = 42Ch) [Reset = 0000000h]

INTER_EN_CLR_1 is shown in [Table 6-25](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 6-25. INTER_EN_CLR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

6.1.3.10.24 IRQSTS_1 Register (Offset = 430h) [Reset = 0000000h]

IRQSTS_1 is shown in [Table 6-26](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 6-26. IRQSTS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

6.1.3.10.25 FIQSTS_1 Register (Offset = 434h) [Reset = 0000000h]

FIQSTS_1 is shown in [Table 6-27](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h14$

Table 6-27. FIQSTS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Inactive, Disabled, or not an FIQ. Read 1 Active/Pending, Enabled, and FIQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if FIQ).

6.1.3.10.26 INTMAP_1 Register (Offset = 438h) [Reset = 0000000h]

INTMAP_1 is shown in [Table 6-28](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7) $h400 + M \times h20 + h18$

Table 6-28. INTMAP_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ 0 IRQ Interrupt (default) 1 FIQ Interrupt

6.1.3.10.27 INTTYPE_1 Register (Offset = 43Ch) [Reset = 0000000h]

INTTYPE_1 is shown in [Table 6-29](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) $h400 + M \times h20 + 0x1C$

Table 6-29. INTTYPE_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where $Q = Mx32 + \text{Bit } 0 \text{ Level}$ (default) 1 Pulse

6.1.3.10.28 RAW_2 Register (Offset = 440h) [Reset = 00000000h]

RAW_2 is shown in [Table 6-30](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7) $h400 + M \times h20 + h00$

Table 6-30. RAW_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

6.1.3.10.29 STS_2 Register (Offset = 444h) [Reset = 0000000h]

STS_2 is shown in [Table 6-31](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h04$

Table 6-31. STS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

6.1.3.10.30 INTR_EN_SET_2 Register (Offset = 448h) [Reset = 0000000h]

INTR_EN_SET_2 is shown in [Table 6-32](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 6-32. INTR_EN_SET_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

6.1.3.10.31 INTER_EN_CLR_2 Register (Offset = 44Ch) [Reset = 0000000h]

INTER_EN_CLR_2 is shown in [Table 6-33](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7) $h400 + M \times h20 + h0C$

Table 6-33. INTER_EN_CLR_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

6.1.3.10.32 IRQSTS_2 Register (Offset = 450h) [Reset = 0000000h]

IRQSTS_2 is shown in [Table 6-34](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 6-34. IRQSTS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

6.1.3.10.33 FIQSTS_2 Register (Offset = 454h) [Reset = 0000000h]

FIQSTS_2 is shown in [Table 6-35](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h14$

Table 6-35. FIQSTS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Inactive, Disabled, or not an FIQ. Read 1 Active/Pending, Enabled, and FIQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if FIQ).

6.1.3.10.34 INTMAP_2 Register (Offset = 458h) [Reset = 0000000h]

INTMAP_2 is shown in [Table 6-36](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7) $h400 + M \times h20 + h18$

Table 6-36. INTMAP_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ 0 IRQ Interrupt (default) 1 FIQ Interrupt

6.1.3.10.35 INTTYPE_2 Register (Offset = 45Ch) [Reset = 0000000h]

INTTYPE_2 is shown in [Table 6-37](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) $h400 + M \times h20 + 0x1C$

Table 6-37. INTTYPE_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where $Q = Mx32 + \text{Bit } 0 \text{ Level}$ (default) 1 Pulse</p>

6.1.3.10.36 RAW_3 Register (Offset = 460h) [Reset = 00000000h]

RAW_3 is shown in [Table 6-38](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7) $h400 + M \times h20 + h00$

Table 6-38. RAW_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

6.1.3.10.37 STS_3 Register (Offset = 464h) [Reset = 0000000h]

STS_3 is shown in [Table 6-39](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h04$

Table 6-39. STS_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

6.1.3.10.38 INTR_EN_SET_3 Register (Offset = 468h) [Reset = 0000000h]

INTR_EN_SET_3 is shown in [Table 6-40](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7) $h400 + M \times h20 + h08$

Table 6-40. INTR_EN_SET_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

6.1.3.10.39 INTER_EN_CLR_3 Register (Offset = 46Ch) [Reset = 0000000h]

INTER_EN_CLR_3 is shown in [Table 6-41](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7) $h400 + M \times h20 + h0C$

Table 6-41. INTER_EN_CLR_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

6.1.3.10.40 IRQSTS_3 Register (Offset = 470h) [Reset = 0000000h]

IRQSTS_3 is shown in [Table 6-42](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 6-42. IRQSTS_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

6.1.3.10.41 FIQSTS_3 Register (Offset = 474h) [Reset = 0000000h]

FIQSTS_3 is shown in [Table 6-43](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h14$

Table 6-43. FIQSTS_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Inactive, Disabled, or not an FIQ. Read 1 Active/Pending, Enabled, and FIQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if FIQ).

6.1.3.10.42 INTMAP_3 Register (Offset = 478h) [Reset = 0000000h]

INTMAP_3 is shown in [Table 6-44](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7) $h400 + M \times h20 + h18$

Table 6-44. INTMAP_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit 0}$ IRQ Interrupt (default) 1 FIQ Interrupt

6.1.3.10.43 INTTYPE_3 Register (Offset = 47Ch) [Reset = 0000000h]

INTTYPE_3 is shown in [Table 6-45](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) $h400 + M \times h20 + 0x1C$

Table 6-45. INTTYPE_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where $Q = Mx32 + \text{Bit } 0 \text{ Level}$ (default) 1 Pulse</p>

6.1.3.10.44 RAW_4 Register (Offset = 480h) [Reset = 00000000h]

RAW_4 is shown in [Table 6-46](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 6-46. RAW_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

6.1.3.10.45 STS_4 Register (Offset = 484h) [Reset = 0000000h]

STS_4 is shown in [Table 6-47](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h04$

Table 6-47. STS_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

6.1.3.10.46 INTR_EN_SET_4 Register (Offset = 488h) [Reset = 0000000h]

INTR_EN_SET_4 is shown in [Table 6-48](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7) $h400 + M \times h20 + h08$

Table 6-48. INTR_EN_SET_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

6.1.3.10.47 INTER_EN_CLR_4 Register (Offset = 48Ch) [Reset = 0000000h]

INTER_EN_CLR_4 is shown in [Table 6-49](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7) $h400 + M \times h20 + h0C$

Table 6-49. INTER_EN_CLR_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

6.1.3.10.48 IRQSTS_4 Register (Offset = 490h) [Reset = 00000000h]

IRQSTS_4 is shown in [Table 6-50](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 6-50. IRQSTS_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

6.1.3.10.49 FIQSTS_4 Register (Offset = 494h) [Reset = 0000000h]

FIQSTS_4 is shown in [Table 6-51](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h14$

Table 6-51. FIQSTS_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Inactive, Disabled, or not an FIQ. Read 1 Active/Pending, Enabled, and FIQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if FIQ).

6.1.3.10.50 INTMAP_4 Register (Offset = 498h) [Reset = 0000000h]

INTMAP_4 is shown in [Table 6-52](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7) $h400 + M \times h20 + h18$

Table 6-52. INTMAP_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit 0}$ IRQ Interrupt (default) 1 FIQ Interrupt

6.1.3.10.51 INTTYPE_4 Register (Offset = 49Ch) [Reset = 0000000h]

INTTYPE_4 is shown in [Table 6-53](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) $h400 + M \times h20 + 0x1C$

Table 6-53. INTTYPE_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where $Q = Mx32 + \text{Bit } 0 \text{ Level}$ (default) 1 Pulse</p>

6.1.3.10.52 RAW_5 Register (Offset = 4A0h) [Reset = 0000000h]

RAW_5 is shown in [Table 6-54](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 6-54. RAW_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

6.1.3.10.53 STS_5 Register (Offset = 4A4h) [Reset = 00000000h]

STS_5 is shown in [Table 6-55](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 6-55. STS_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

6.1.3.10.54 INTR_EN_SET_5 Register (Offset = 4A8h) [Reset = 0000000h]

INTR_EN_SET_5 is shown in [Table 6-56](#).

Return to the [Summary Table](#).

Table 6-65. INTER_EN_CLR_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

6.1.3.10.64 IRQSTS_6 Register (Offset = 4D0h) [Reset = 00000000h]

IRQSTS_6 is shown in [Table 6-66](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 6-66. IRQSTS_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

6.1.3.10.65 FIQSTS_6 Register (Offset = 4D4h) [Reset = 0000000h]

FIQSTS_6 is shown in [Table 6-67](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 6-67. FIQSTS_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an FIQ. Read 1 Active/Pending, Enabled, and FIQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if FIQ).

6.1.3.10.66 INTMAP_6 Register (Offset = 4D8h) [Reset = 0000000h]

INTMAP_6 is shown in [Table 6-68](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7) $h400 + M \times h20 + h18$

Table 6-68. INTMAP_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit 0}$ IRQ Interrupt (default) 1 FIQ Interrupt

6.1.3.10.67 INTTYPE_6 Register (Offset = 4DCh) [Reset = 0000000h]

INTTYPE_6 is shown in [Table 6-69](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) $h400 + M \times h20 + 0x1C$

Table 6-69. INTTYPE_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where $Q = Mx32 + \text{Bit } 0 \text{ Level}$ (default) 1 Pulse

6.1.3.10.68 RAW_7 Register (Offset = 4E0h) [Reset = 0000000h]

Table 6-74. IRQSTS_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

6.1.3.10.73 FIQSTS_7 Register (Offset = 4F4h) [Reset = 0000000h]

FIQSTS_7 is shown in [Table 6-75](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) $h400 + M \times h20 + h14$

Table 6-75. FIQSTS_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$. Read 0 Inactive, Disabled, or not an FIQ. Read 1 Active/Pending, Enabled, and FIQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if FIQ).

6.1.3.10.74 INTMAP_7 Register (Offset = 4F8h) [Reset = 00000000h]

INTMAP_7 is shown in [Table 6-76](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 6-76. INTMAP_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

6.1.3.10.75 INTTYPE_7 Register (Offset = 4FCh) [Reset = 0000000h]

INTTYPE_7 is shown in [Table 6-77](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) $h400 + M \times h20 + 0x1C$

Table 6-77. INTTYPE_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where $Q = Mx32 + \text{Bit } 0 \text{ Level}$ (default) 1 Pulse</p>

6.1.3.10.76 INTPRIORITY Register (Offset = 1000h) [Reset = 00000000h]

INTPRIORITY is shown in [Table 6-78](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h4

Table 6-78. INTPRIORITY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.77 INTPRIORITY_1 Register (Offset = 1004h) [Reset = 00000000h]

INTPRIORITY_1 is shown in [Table 6-79](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h5

Table 6-79. INTPRIORITY_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.78 INTPRIORITY_2 Register (Offset = 1008h) [Reset = 00000000h]

INTPRIORITY_2 is shown in [Table 6-80](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h6

Table 6-80. INTPRIORITY_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.79 INTPRIORITY_3 Register (Offset = 100Ch) [Reset = 0000000h]

INTPRIORITY_3 is shown in [Table 6-81](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h7

Table 6-81. INTPRIORITY_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.80 INTPRIORITY_4 Register (Offset = 1010h) [Reset = 00000000h]

INTPRIORITY_4 is shown in [Table 6-82](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h8

Table 6-82. INTPRIORITY_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.81 INTPRIORITY_5 Register (Offset = 1014h) [Reset = 00000000h]

INTPRIORITY_5 is shown in [Table 6-83](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h9

Table 6-83. INTPRIORITY_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.82 INTPRIORITY_6 Register (Offset = 1018h) [Reset = 00000000h]

INTPRIORITY_6 is shown in [Table 6-84](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h10

Table 6-84. INTPRIORITY_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.83 INTPRIORITY_7 Register (Offset = 101Ch) [Reset = 0000000h]

INTPRIORITY_7 is shown in [Table 6-85](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h11

Table 6-85. INTPRIORITY_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.84 INTPRIORITY_8 Register (Offset = 1020h) [Reset = 00000000h]

INTPRIORITY_8 is shown in [Table 6-86](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h12

Table 6-86. INTPRIORITY_8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.85 INTPRIORITY_9 Register (Offset = 1024h) [Reset = 00000000h]

INTPRIORITY_9 is shown in [Table 6-87](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h13

Table 6-87. INTPRIORITY_9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.86 INTPRIORITY_10 Register (Offset = 1028h) [Reset = 0000000h]

INTPRIORITY_10 is shown in [Table 6-88](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h14

Table 6-88. INTPRIORITY_10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

6.1.3.10.87 INTPRIORITY_11 Register (Offset = 102Ch) [Reset = 0000000h]

INTPRIORITY_11 is shown in [Table 6-89](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h15

Table 6-89. INTPRIORITY_11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h4

Table 6-334. INTVECTOR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

6.1.4 Resets

supports the following resets:

- CR5SS_POR_RST: This is the full MCU R5F subsystem reset. It is also the Power On Reset.
- CR5ASS_RST: This reset is only for the Cortex R5F and the Vectored Interrupt Manager of the CoreA. None of the other logics are reset.
- CR5A_RST: This only reset the cortex of the R5F of the CoreA.
- VIMA_RST: This only reset the vectored interrupt manager of the CoreA.

6.1.4.1 R5F Subsystem Reset Trigger

For the safe reset of the R5F subsystem, follow this reset sequence:

1. Write 3'b111 to MSS_CTRL: R5_CONTROL: R5_CONTROL_RESET_FSM_TRIGGER starts the sequencer.
2. The sequencer is waiting for WFI from only CR5A if WFI_CHECKEN for corresponding resets is programmed. The sequencer isolates CR5SS when it receives WFI from CR5A.
3. The sequencer triggers CR5SS_POR_RST, which triggers resets to all resets mentioned in resets-table.
4. The intent is to reset CR5SS when it is in isolation. Thus, before Step 1, ensure MSS_RCM:RST2ASSERTDLY is programmed to 0;
5. Reset is asserted for RST_ASSERTDLY: RST_ASSERTDLY_COMMON number of clock cycles, and released.

6.2 C66x DSP Subsystem

This section describes the C66x Digital Signal Processor Subsystem (C66SS) in the device.

6.2.1 C66x DSP Subsystem.....	3613
6.2.2 C66x Cache Subsystem.....	3620

6.2.1 C66x DSP Subsystem

The purpose of this section is to provide an overview of the DSP subsystem (C66x CorePac) along with some integration details.

6.2.1.1 DSP Subsystem Overview

The DSP subsystem (C66x CorePac) supports the following key features:

- Fixed/Floating-point C66x CPU based on a superset of the C64x+ and C67x+ ISA
- Program Memory Controller (PMC):
 - 32KB Level 1 Program (L1P) Cache/SRAM
- Data Memory Controller (DMC):
 - 32KB L1 Data (L1D) Cache/SRAM
- L2 Memory Controller:
 - 384KB L2 RAM with up to 256KB of configurable into cache
- External Memory Controller (EMC):
 - Internal DMA (IDMA) engine
 - One 128-bit VBUSM slave port from DMA access at Div-by-2 clock
 - One 32-bit VBUSP master port to CFG access at Div-by-2 clock
- XMC (Extended Memory Controller):
 - One 256-bit port to L3 memory at Div-by-2 clock
- Multistream prefetch buffer
- Address extension/translation (32-bit to 36-bit)
- Memory protection for multiple segments
- Memory protection for all internal L1/L2 RAM
- Error Detection for L1P
- Error Detection and Correction for L1D
- Error Detection and Correction for all L2
- Integrated C66x CorePac interrupt controller (INTC) that works in conjunction with Chip-level Interrupt Controller (CIC) for distribution of system interrupts to the C66x core. Interrupts can be routed directly to the C66x core or through the CIC module in a flexible manner
- Integrated leakage and dynamic power management
- Debug/emulation capabilities:
 - Support for halt mode, real time and monitor mode debug capabilities
 - Support for processor instruction trace and system trace (**printf**-style debug)
- Error Detection for L1P Data and Tag RAMs
- Error Detection and Correction for L1D Data and Tag RAMs
- Error Detection and Correction for all L2 Data and Tag RAMs

Figure 6-3 shows an overview of the C66x CorePac.

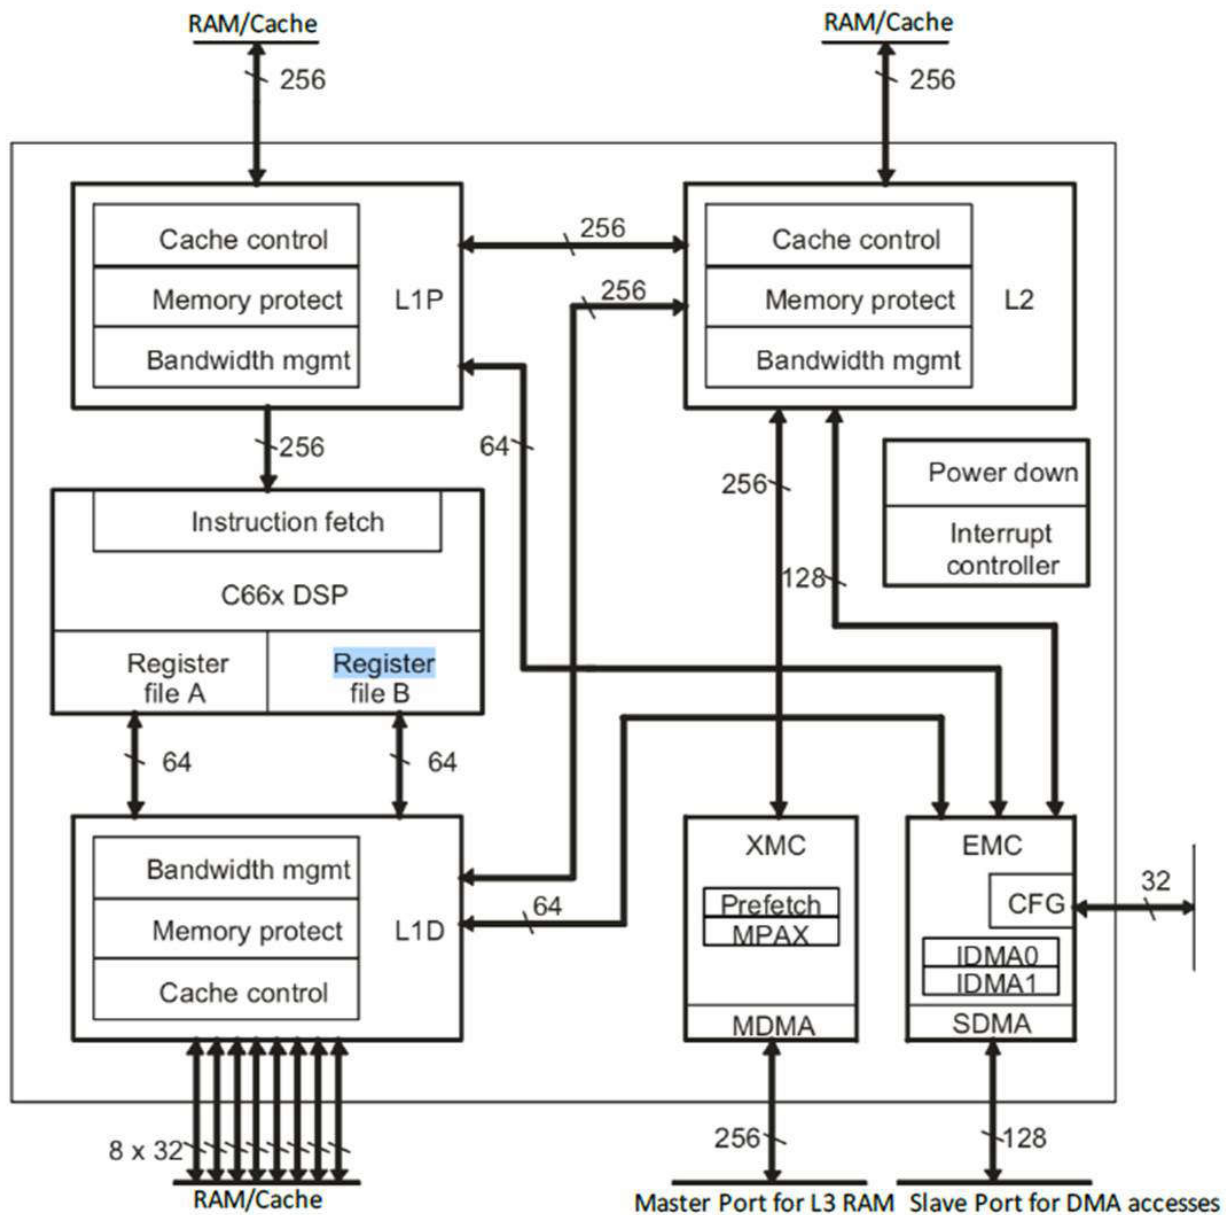

Figure 6-3. C66x CorePac Overview

For more information about:

- C66x CorePac, see the *TMS320C66x DSP CorePac User Guide* ([SPRUGW0](#)).
- C66x CPU core, see the *TMS320C66x DSP CPU and Instruction Set Reference Guide* ([SPRUGH7](#)).
- C66x cache memory system, see the *TMS320C66x DSP Cache User Guide* ([SPRUGY8](#)).
- C66x debug/trace support, see [Section 20.1](#).

6.2.1.2 DSP Subsystem Integration

To turn on DSP power, please follow [DSP power domain](#) for details. To configure the DSP clock, please refer to [section 1.5.3.3](#), DSS_DSP_CLK for clock source, divider, and gating selections details.

6.2.1.3 DSP Interrupt Sources

Refer to [Section 7.2](#)

6.2.1.4 DSP Subsystem Functional Description

For detailed DSP subsystem functional description, see the documents referenced in [Section 7.2.1.1](#) .

6.2.1.5 DSP Subsystem Registers

Table 6-590 lists the memory-mapped registers for the C66x CorePac. All register offset addresses not listed in Table 6-590 should be considered as reserved locations and the register contents should not be modified. For base addresses of the DSP subsystem internal modules, see Chapter 2.

The C66x CorePac registers (DSP_ICFG) are described in detail in the *TMS320C66x DSP CorePac User Guide (SPRUGW0)*.

Table 6-590. C66x CorePac Registers

Address	Acronym	Register Name
0180000h to 018000Ch	EVTFLAG_0 to EVTFLAG_3	Event Flag Registers
0180020h to 018002Ch	EVTSET_0 to EVTSET_3	Event Set Registers
0180040h to 018004Ch	EVTCLR_0 to EVTCLR_3	Event Clear Registers

6.2.2 C66x Cache Subsystem

The purpose of this section is to provide an overview of the C66x cache memory architecture and to specify its configuration in this device. Details on the C66x cache functionality can be found in the *TMS320C66x DSP Cache User Guide* ([SPRUGY8](#)).

The device contains a 384KB level-2 memory (L2), a 32KB level-1 program memory (L1P), and a 32KB level-1 data memory (L1D). Each memory has a unique location in the memory map (see [Chapter 2](#)).

After device reset, L1P and L1D cache are configured as all cache, by default. The L1P and L1D cache can be reconfigured via software through the L1PMODE field of the L1P Configuration Register (L1PMODE) and the L1DMODE field of the L1D Configuration Register (L1DCFG) of the C66x CorePac. L1D is a two-way set-associative cache, while L1P is a direct-mapped cache.

6.2.2.1 L1P Memory

The L1P memory configuration for this device is as follows:

- Region 0 size is 0K bytes (disabled)
- Region 1 size is 32K bytes with no wait states

[Figure 6-4](#) shows the available SRAM/cache configurations for L1P.

Note

L1P can only be configured as cache.

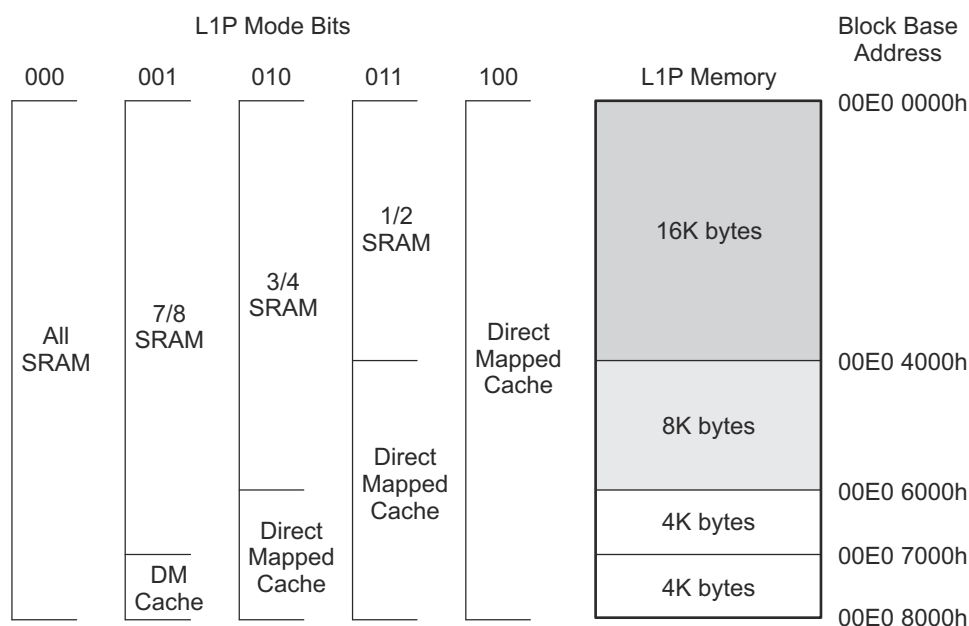

Figure 6-4. L1P Memory Configurations

6.2.2.2 L1D Memory

The L1D memory configuration for this device is as follows:

- Region 0 size is 0K bytes (disabled)
- Region 1 size is 32K bytes with no wait states.

[Figure 6-5](#) shows the available SRAM/cache configurations for L1D.

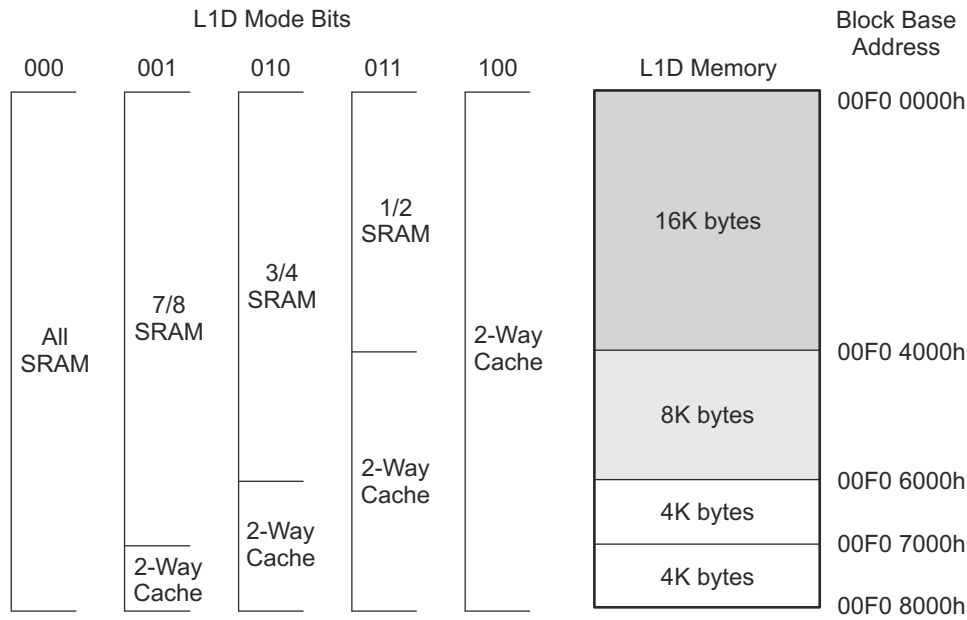

Figure 6-5. L1D Memory Configurations

6.2.2.3 L2 Memory

The L2 memory configuration for this device is as follows:

- 384KB of memory
- Local starting address is 0080 0000h.

L2 memory can be configured as all SRAM, all 4-way set-associative cache, or a mix of the two. The amount of L2 memory that is configured as cache is controlled through the L2MODE field of the L2 Configuration Register (L2CFG) of the C66x CorePac. Figure 6-6 shows the available SRAM/cache configurations for L2. By default, L2 is configured as all SRAM after device reset.

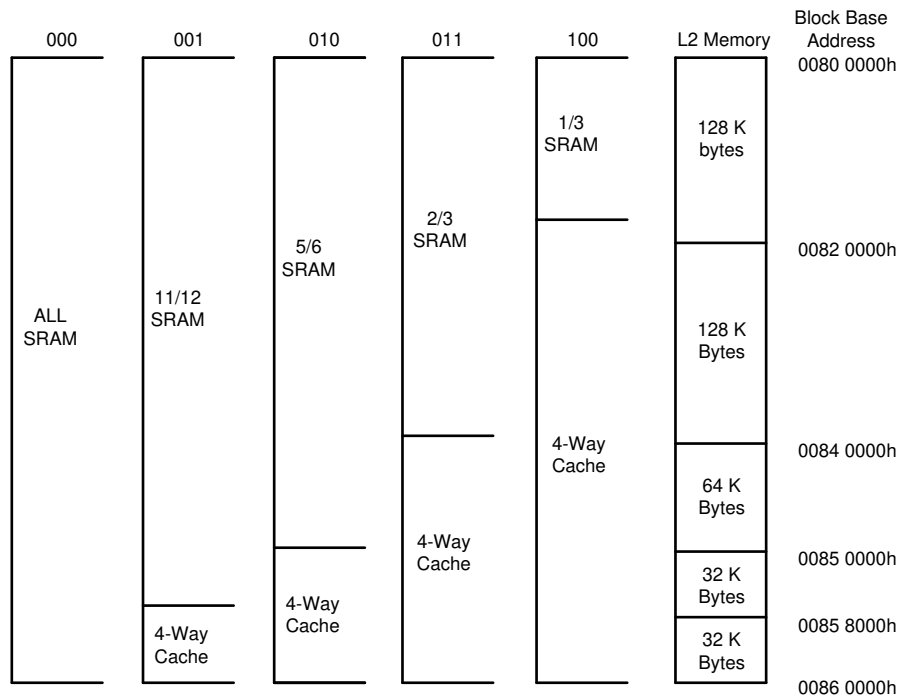

Figure 6-6. L2 Memory Configurations

6.2.2.4 DSP ECC Configuration

The device supports ECC/parity on all DSP internal SRAMs. All the ECC/parity features are enabled by default (that is, after device reset). Software can disable the features per SRAM type if not required.

Table 6-591 summarizes the ECC/parity support in DSP.

Table 6-591. DSP ECC/Parity Support

DSP Memory	ECC/Parity Support
L1P Data RAM	Parity
L1P Tag	Parity
L1D Data RAM	ECC-SECDED (Single Error Correction, Double Error Detection)
L1D Tag	ECC-SECDED
L2 Data RAM	ECC-SECDED
L2 Tag	ECC-SECDED

6.3 Radar Processing Hardware Accelerator

In addition to the DSP cores, the device incorporates Radar Hardware Accelerators HWA 2.1 to offload the DSP from pre-processing computations.

6.3.1 Radar Accelerator Features Overview

- Flexible enough to offload almost all the operations from the initial compensation (DC estimation-correction, interference mitigation, and so forth) on raw ADC data before first dimension FFT until point cloud detection, with the least possible intervention from the DSP.
- Operating clock frequency is 400 MHz
- Data path bit-width of 24-bits (24-bit I)
- Input and output data formatter: scaling, truncation, head/tail sample skipping, zero padding/insertion of data, sample access pattern for DDMA use case.
- Capability to do all these operations in a single iteration: DC correction, interference zeroing out, complex multiplication, windowing, FFT, log, magnitude, stats computation with a capability of selecting/enabling or disabling/bypassing each of these computation blocks individually.
- 128KB local buffer/RAM split into eight 16KB banks, with each bank configurable as input or output for any compute/data transfer functionality.
- Flexible data flow and data sample arrangement to support efficient multi-dimensional operations and transpose accesses as required.
- Processing for inline (range FFT) and inter-frame (Doppler FFT, angle FFT, detection) threads simultaneously
- Support for CSI2 data input either in Rx interleaved or in serial manner
- Support for DC estimation and correction
- Support for interference mitigation
 - Estimation and zeroing out of the interference samples by estimating the average of the magnitude of sudden spikes of vector elements, and applying scaled values as a threshold.
- Support for complex vector/scalar multiplications
- Support for a synthesizer channel combining and MIMO demodulation for DDMA
- Complex windowing – 2K samples window RAM with a capability to split 1KB ping- 1KB pong to allow programming new coefficients while older ones are used.
- Up to 2K point FFT with efficiency of 1 sample output per cycle and possibility to go higher in size until 4K/8K, with stitching (reduced efficiency).
- Doppler de-rotation of the FFT output
- Support for magnitude (absolute value) and Log-Magnitude computation.
- Nested loop support in PARAM sets
- Compression/decompression engine with block floating and exponential Golomb modes with performance of 1 complex sample processing per cycle
- Detection algorithm-specific accelerators (for example: CFAR CA/OS and other variants)

- 2D Local Maxima/Peak search algorithm with efficiency of 1 cell processing per cycle
- Lock-step state machine
- ECC on the PARAM RAMs and parity on local buffers

6.3.2 Radar Accelerator Architecture

The Radar accelerator details are covered in [Chapter 28](#), which consists of 2 parts.

The first part covers the high-level architecture and key features such as windowing, FFT, and log-magnitude. The (optional) second part covers additional features such as CFAR, complex multiplication, advanced statistics, radar data compression engine, and so forth.

6.4 HWA Cortex M4

6.4.1 HWA Cortex M4 Features Overview

The ARM Cortex-M4 processor provides a core for a high-performance platform that meets the needs of minimal memory implementation and low power consumption, while delivering outstanding computational performance and exception system response to interrupts.

- 32-bit ARM Cortex-M4 operating at 200MHz
- Thumb-2 mixed 16/32-bit instruction set delivers the high performance expected of a 32-bit ARM core in a compact memory size usually associated with 8/16-bit devices
 - Single-cycle multiply instruction and hardware divide
 - Atomic bit manipulation (bit-banding), delivering maximum memory utilization and streamlined peripheral control
 - Unaligned data access, enabling data to be efficiently packed into memory
- 3-stage pipeline Harvard architecture characterized by separate buses for instruction and data
- Deterministic, high-performance interrupt handling for time-critical applications.
- Memory protection unit (MPU) to provide a privileged mode for protected operating system functionality
- Little Endian instruction and data memory accesses
- Support for 64 interrupts

6.4.1.1 System Timer (SysTick)

The ARM Cortex-M4 includes an integrated system timer, SysTick. SysTick provides a simple, 24-bit, clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used as a Real-Time Operating System (RTOS) tick timer or as a simple counter.

6.4.1.2 Nested Vectored Interrupt Controller (NVIC)

The ARM Cortex-M4 closely integrates the ARM Nested Vectored Interrupt Controller (NVIC). The NVIC and Cortex-M4 prioritize and handle all interrupts in Handler Mode. The processor state is automatically stored to the stack on an interrupt and automatically restored from the stack at the end of the Interrupt Service Routine (ISR). The interrupt vector is fetched in parallel to the state saving, enabling efficient interrupt entry. The processor supports tail-chaining, meaning that back-to-back interrupts can be performed without the overhead of state saving and restoration.

- Deterministic, fast interrupt processing: always 12 cycles, or just 6 cycles with tail-chaining
- External non-maskable interrupt signal (NMI) available for immediate execution of NMI handler for safety critical applications
- Dynamically reprioritizable interrupts

6.4.1.3 System Control Block (SCB)

The SCB provides system implementation information and system control, including configuration, control, and reporting of system exceptions.

6.4.1.4 Memory Protection Unit (MPU)

The MPU supports the standard ARM7 Protected Memory System Architecture (PMSA) model. The MPU provides full support for protection regions, overlapping protection regions, access permissions, and exporting memory attributes to the system. The MPU improves system reliability by providing up to eight different regions and an optional predefined background region.

6.4.2 Integration of Cortex-M4 with DSS (HWA_CM4)

The Cortex-M4 processor is integrated with the Hardware Accelerator module (HWA) in the AWR2x44P. Both the HWA and Cortex-M4 are part of the DSP subsystem (DSS).

- The Cortex-M4 can access all HWA registers, including the paramset registers and registers of the accelerator engine blocks (e.g. histogram registers). The Cortex-M4 can trigger the HWA to start or stop operations.
- The HWA can trigger an interrupt to the Cortex-M4 at the end of any paramset. Two interrupts are available, which can be enabled by setting the CPU_INTR_EN1 and/or CPU_INTREN2 in any paramset. This is described in [Section 28.2.1.3](#).
- The HWA can wait on a SW trigger. This can be enabled by setting the TRIGMODE field in the paramset to SW-triggered mode. In this mode, the paramset execution waits until the Cortex-M4 writes a particular SW register bit, described in [Section 28.2.1.2](#).
- The HWA can trigger a DMA transfer of the contents from the HWA memory bank to L3 RAM.
- The Cortex-M4 can directly access L3 memory using the same address as used by the DSS.

Details of the HWA can be found in [Chapter 28](#).

6.4.3 HWA Cortex-M4 Interrupt Sources

64 interrupts are implemented in the NVIC. Refer to [#unique_135](#) for the interrupt sources connected to the Cortex-M4 NVIC. The default priority of the interrupts are in the same order as the interrupt numbers, with lower numbers having higher priority.

- The DSP can trigger interrupts (DSS_DSP_SW_INT0 & DSS_DSP_SW_INT1) on the Cortex-M4 by setting bits DSS_CTRL.DSS_SW_INT[0] & DSS_CTRL.DSS_SW_INT[1], respectively.
- The R5F can trigger interrupts (MSS_CR5_SW_INT0 & MSS_CR5_SW_INT1) on the Cortex-M4 by setting bits MSS_CTRL.MSS_SW_INT.MSS_SW_INT_PULSE[0] & MSS_CTRL.MSS_SW_INT.MSS_SW_INT_PULSE[1], respectively.

There are two DSS_CM4 interrupts to indicate the status of paramset execution on the HWA in both threads (contexts), as described below.

- Loop complete interrupt (DSS_HWA_THREAD1_LOOP_INT & DSS_HWA_THREAD2_LOOP_INT): If enabled on the Cortex-M4, these interrupts are generated once the loop completes in the HWA. Thread 1 refers to the background thread and Thread 2 is for the high priority thread.

6.4.4 HWA_CM4_CTRL/DSS_CM4_CTRL Registers

Table 6-592 lists the memory-mapped registers for the HWA_CM4_CTRL registers. All register offset addresses not listed in Table 6-592 should be considered as reserved locations and the register contents should not be modified.

Table 6-592. HWA_CM4_CTRL/DSS_CM4_CTRL Registers

19-17	RESERVED	R	0h	
16	proc_4	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 4
15-13	RESERVED	R	0h	
12	proc_3	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 3
11-9	RESERVED	R	0h	
8	proc_2	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 2
7-5	RESERVED	R	0h	
4	proc_1	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 1
3-1	RESERVED	R	0h	
0	proc_0	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): This register should be written once finishing reading from hsm's mailbox written by proc 0

6.4.4.21 HWA_CM4_IRQ_REQ Register (Offset = 50h) [Reset = 0000000h]

HWA_CM4_IRQ_REQ is shown in [Table 6-614](#).

Return to the [Summary Table](#).

Table 6-614. HWA_CM4_IRQ_REQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	select	R/W	0h	Write pulse bit field: Software configuration for INT Request

6.4.4.22 HWA_CM4_POR_RST_CTRL Register (Offset = 54h) [Reset = 0000000h]

HWA_CM4_POR_RST_CTRL is shown in [Table 6-615](#).

Return to the [Summary Table](#).

Table 6-615. HWA_CM4_POR_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	assert	R/W	0h	Write pulse bit field: Por reset control for CM4

6.4.4.23 HWA_CM4_SYS_RST_CTRL Register (Offset = 58h) [Reset = 0000000h]

HWA_CM4_SYS_RST_CTRL is shown in [Table 6-616](#).

Return to the [Summary Table](#).

Table 6-616. HWA_CM4_SYS_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	assert	R/W	0h	Write pulse bit field: Reset control for CM4

6.4.4.24 HWA_CM4_CFG Register (Offset = 5Ch) [Reset = 00007XXXh]

HWA_CM4_CFG is shown in [Table 6-617](#).

Return to the [Summary Table](#).

Table 6-617. HWA_CM4_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R	0h	
14-12	cm4_sys_reset_hold	R/W	7h	In development mode by default cm4 will be held in reset. Writing 3'b000 will remove it from reset.
11-9	RESERVED	R	0h	
8	cm4_clk_gate	R/W	1h	CM4 Clock Gate. 0 : Un-gate the clock, 1 : Clock gated.
7-3	RESERVED	R	0h	
2	wicenreq	R/W	1h	WIC mode Request from PMU
1	sleep_hold_reqn	R/W	1h	Hold core in sleep mode. '0' : When in sleep mode, enable continue to hold the core in sleep '1' : This feature is disabled
0	force_hclk_active	R/W	1h	Force HCLK to run , overrides GATEHCLK

6.4.4.25 HWA_CM4_RST_CAUSE_CLR Register (Offset = 60h) [Reset = 0000000h]

HWA_CM4_RST_CAUSE_CLR is shown in [Table 6-618](#).

Return to the [Summary Table](#).

Table 6-618. HWA_CM4_RST_CAUSE_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	clear	R/W	0h	Write pulse bit field: Writing '111' will clear the HWA_CM4_RST_STATUS_REG

6.4.4.26 HWA_CM4_RST_CAUSE Register (Offset = 64h) [Reset = 0000000h]

HWA_CM4_RST_CAUSE is shown in [Table 6-619](#).

Return to the [Summary Table](#).

Table 6-619. HWA_CM4_RST_CAUSE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	status	R	0h	Reset Cause Register. Value of 1'b1 indicates reset from different sources. [0] : POR_RSTN, [1] : SYS_RSTN (Warm reset), [2] : STC Reset, [3] : Register HWA_CM4_POR_RST_CTRL, [4] : Register HWA_CM4_SYS_RST_CTRL, [5] : Reset trigger from GSM, [7:6] : Reserved

6.4.4.27 HWA_CM4_FSM_RST_CTRL Register (Offset = 68h) [Reset = 0X0F00XXh]

HWA_CM4_FSM_RST_CTRL is shown in [Table 6-620](#).

Return to the [Summary Table](#).

Table 6-620. HWA_CM4_FSM_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	
30-28	rst_fsm_trig	R/W	0h	Write pulse bit field: writing '111' will trigger the reset fsm for CM4
27	RESERVED	R	0h	
26-24	rst_wfcheck	R/W	0h	writing '111' will check for WFI before asserting reset to CM4
23-16	rst_assertdly_common	R/W	Fh	This field the decides number of cycles reset to CM4 should be asserted
15-8	rst2assertdly	R/W	0h	This field the decides number cycles for which the reset should be held before asserting reset for CM4. This register should be programmed only for debug, otherwise the value should be 8'h00.
7-0	RESERVED	R	0h	

6.4.4.28 HWA_CM4_WFI_OVERRIDE Register (Offset = 6Ch) [Reset = 0000000h]

HWA_CM4_WFI_OVERRIDE is shown in [Table 6-621](#).

Return to the [Summary Table](#).

Table 6-621. HWA_CM4_WFI_OVERRIDE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	
2-0	wfi_override	R/W	0h	writing '111' will override the wfi signal from CM4

6.4.4.29 HWA_CM4_PERIPH_ERRAGG_MASK Register (Offset = 70h) [Reset = 0000000h]

HWA_CM4_PERIPH_ERRAGG_MASK is shown in [Table 6-622](#).

Return to the [Summary Table](#).

Table 6-622. HWA_CM4_PERIPH_ERRAGG_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	
11	rcss_ctrl_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
10	rcss_ctrl_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
9	rcss_rcm_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
8	rcss_rcm_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
7	dss_hwa_cfg_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
6	dss_hwa_cfg_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
5	dss_cm4_ctrl_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
4	dss_cm4_ctrl_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
3	dss_ctrl_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
2	dss_ctrl_rd	R/W	0h	Writing '1' will mask the respective peripheral error line
1	dss_rcm_wr	R/W	0h	Writing '1' will mask the respective peripheral error line
0	dss_rcm_rd	R/W	0h	Writing '1' will mask the respective peripheral error line

6.4.4.30 HWA_CM4_PERIPH_ERRAGG_STATUS Register (Offset = 74h) [Reset = 0000000h]

HWA_CM4_PERIPH_ERRAGG_STATUS is shown in [Table 6-623](#).

Return to the [Summary Table](#).

Table 6-623. HWA_CM4_PERIPH_ERRAGG_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	
11	rcss_ctrl_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
10	rcss_ctrl_rd	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line
9	rcss_rcm_wr	R/W1C	0h	Rising Edge Capture reg (write 1 to clear): Indicates the post mask status of the respective peripheral error line

6.4.5 Cortex-M4 Boot

The following sequence must be followed to boot the Cortex-M4.

Step No.	Step	Register/Bit Field Programming	Value
1	Ungate the clock to CM4	HWA_CM4_CTRL:HWA_CM4_CFG:HWA_CM4_CFG_CM4_CLK_GATE	0x0
2	Deassert the reset for CM4	HWA_CM4_CTRL:HWA_CM4_CFG:HWA_CM4_CFG_CM4_SYS_RESET_HOLD	0x0

Refer to [Table 5-726](#) for details on the specific register fields.

To start up the CM4 in HWA, first the DSS needs to be woken up. The clocks need to be enabled. The CM4 memory needs to be initialized. Dummy code must be loaded in the CM4 memory range. Then, the CM4 can be brought out of reset using the steps listed in the table above. Code loading into the CM4 must be done by the MSS (SBL) as the CM4 memory (at address 0x2800 0000) is visible to the MSS.

6.5 Radar Subsystem

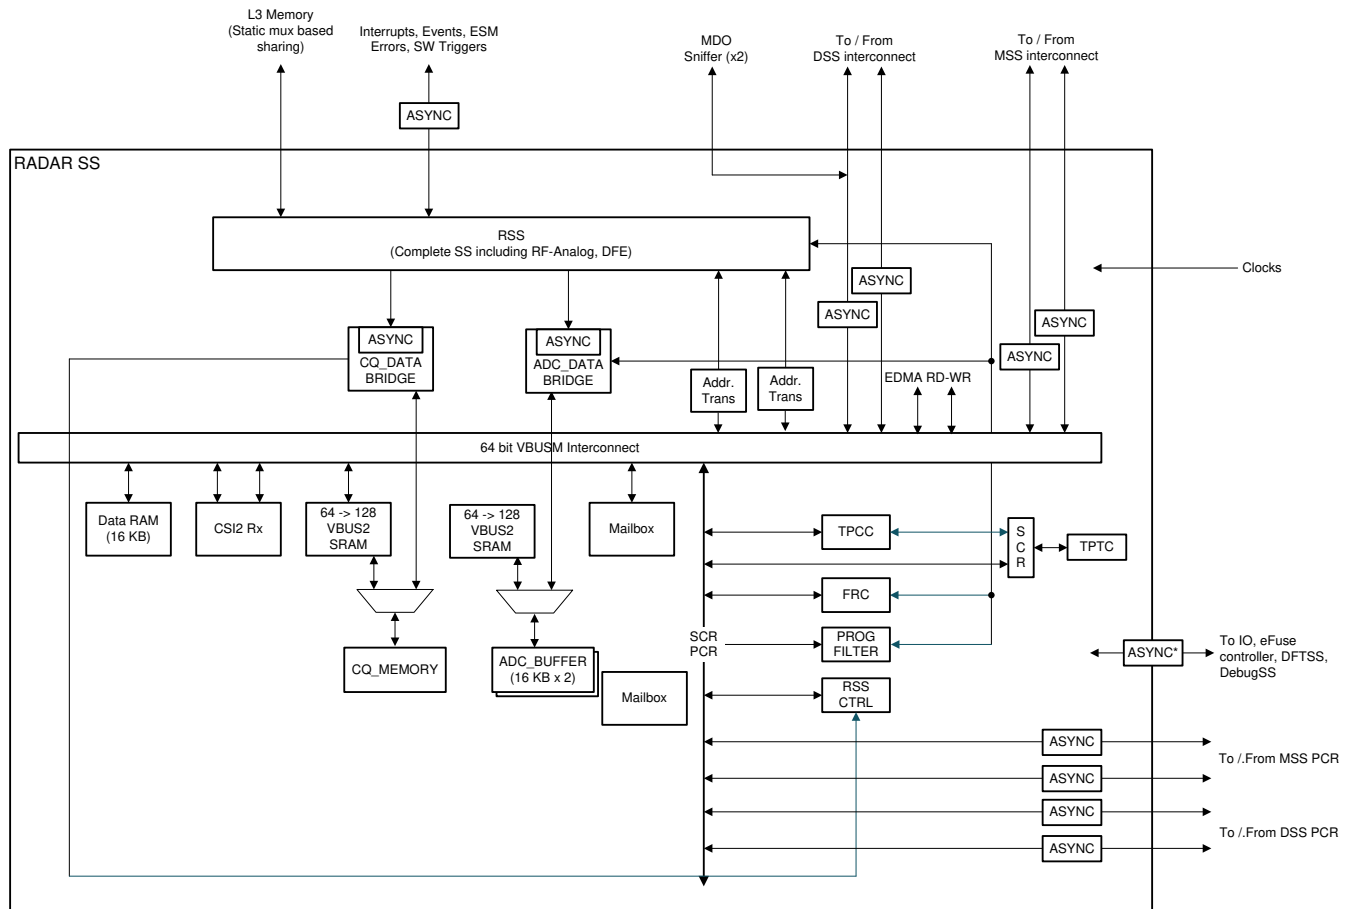

Figure 6-7. Block Diagram

6.5.1 BIST Subsystem

Figure 6-8 shows the BIST subsystem (BSS) block diagram.

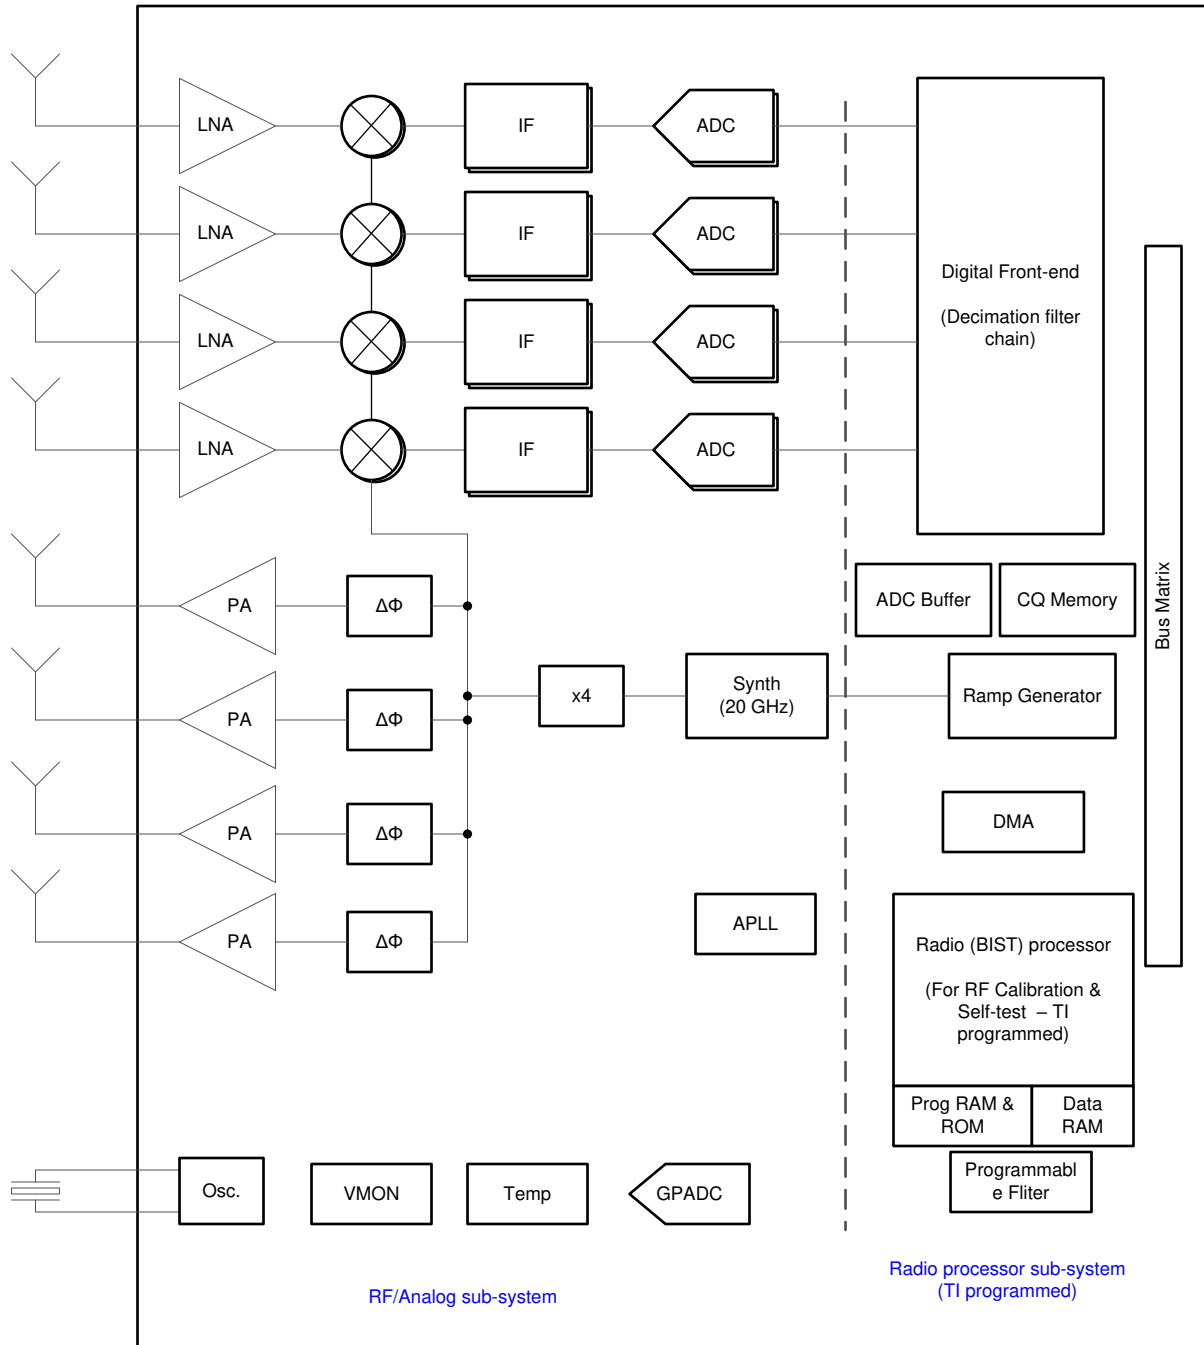

Figure 6-8. BIST Subsystem (BSS) Block Diagram

The BSS consists of the RF/Analog subsystem and the radio processor subsystem.

The RF/analog subsystem implements the frequency-modulated continuous-wave transceiver system with RF and analog circuitry – namely, the synthesizer, PA, LNA, mixer, IF, and ADC. This subsystem also includes the crystal oscillator and temperature sensors. The four transmit channels can be operated up to a maximum of two at a time simultaneously. The four receive channels can all be operated simultaneously.

The radio processor subsystem includes the digital front-end, the ramp generator, and an internal processor for controlling and configuring the low-level RF/analog and ramp generator registers, based on well-defined API messages from the main subsystem. This radio processor is programmed by TI, and addresses both RF

calibration needs and some basic self-test and monitoring functions (BIST); this processor is not available directly for customer use. The digital front-end filters and decimates the raw sigma-delta ADC output, and provides the final ADC data samples at a programmable sampling rate.

BSS core is by default under reset on device power-up, SBL (secondary bootloader) or user application needs to follow below sequence to bootup BSS core

1. Prepare BSS core and memory
 - a. `RSS_CTRL.BSS_CONTROL[30:28] = 0x0`
 - b. `RSS_CTRL.BSS_CONTROL[11:0] = 0x0`
 - c. `DSS_RCM.DSS_L3_BANKD1_PD_CTRL[2:0] = 0x0`
 - d. `RSS_CTRL.BSS_TCM_MEMINIT[0] = 0x1`
 - e. wait `RSS_CTRL.BSS_TCM_MEMINIT_DONE[0]` to be value 1
 - f. wait `RSS_CTRL.BSS_TCM_MEMINIT_STATUS[0]` to be 0
 - g. `RSS_PROC_CTRL.RSS_STATIC_MEM_MEMINIT[0] = 0x1`
 - h. wait `RSS_PROC_CTRL.RSS_STATIC_MEM_MEMINIT_DONE[0]` to be value 1
2. Load the BSS firmware or Patch content from sFlash to corresponding BSS RAMs (addresses are part of FW/Patch header content).
3. Unhalt the BSS core
 - a. `MSS_CTRL.MSS_PBIST_KEY_RST[0] = 0x0`
 - b. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG0[31:16] = 0x0`
 - c. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG1[31:16] = 0x0`
 - d. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG0[15:0] = 0x28` (set XTAL Frequency 40MHz)
 - e. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG1[15:0] = 0x28` (shadow)
 - f. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG3[15:0] =`
 - g. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG4[15:0] =` same shadow value as REG3 (above register)
 - h. `RSS_CTRL.BSS_CONTROL[26-24] = 0x0`
 - i. wait `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG0` to be value 0x18F0028 (for successful bootup complete)

Table 6-652. Description of RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG0

Field Name	Bits	Description

		Field Name	Bits	Description										
23	MSS MBOX Config success													
24	DSS MBOX Config success													
26:25	RESERVED													
Reserved	31:27													

Note

Few set of registers from RSS_PROC_CTRL register space are needed for the application to read/write, those are provided in below table. Base address of RSS_PROC_CTRL is 0x0520 0000.

Table 6-653. RSS_PROC_CTRL Registers

Register Name	Description	Offset
RSS_CR4_BOOT_INFO_REG0	Bits defined by BSS FW, explained in above table	20h
RSS_CR4_BOOT_INFO_REG1	Shadow copy of REG0 register	24h
RSS_CR4_BOOT_INFO_REG2	Reserved	28h
RSS_CR4_BOOT_INFO_REG3	Boot time mailbox memory configuration by BSS. Bits 7:0 -> MSS Bits 15:8 -> DSS	2Ch
RSS_CR4_BOOT_INFO_REG4	Shadow copy of REG3 register	30h
RSS_CR4_BOOT_INFO_REG5	Configure BSS Logger: current configuration is Disabled. To Enable the BSS logger, set b[2:0] to 0x1. The debug data is transferred to a programmable MSS L2 memory buffer with a size of 2KB. The BSS splits this 2KB into two halves (ping and pong) to copy the debug logger data.	34h
RSS_CR4_BOOT_INFO_REG6	Configure MSS L2 offset for BSS Logger. Set MSS L2 translated address offset for BSS. e.g. 0xC0260000 is the translated address of MSS L2 memory 0x10260000. 2KB of memory is needed for BSS to transfer the BSS logger data. Applications are required to make sure the 2KB starting from 0x10260000 is reserved for BSS logger.	38h
RSS_CR4_BOOT_INFO_REG7	Reserved	3Ch

Table 6-653. RSS_PROC_CTRL Registers (continued)

Register Name	Description	Offset
RSS_STATIC_MEM_MEMINIT	Start Memory initialization of memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed.	40h
RSS_STATIC_MEM_MEMINIT_DONE	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.	44h
RSS_STATIC_MEM_MEMINIT_STATUS	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.	48h

The programming of this BSS is abstracted at a TI-defined API interface. Figure 6-9 explains the high-level architecture and programming model.

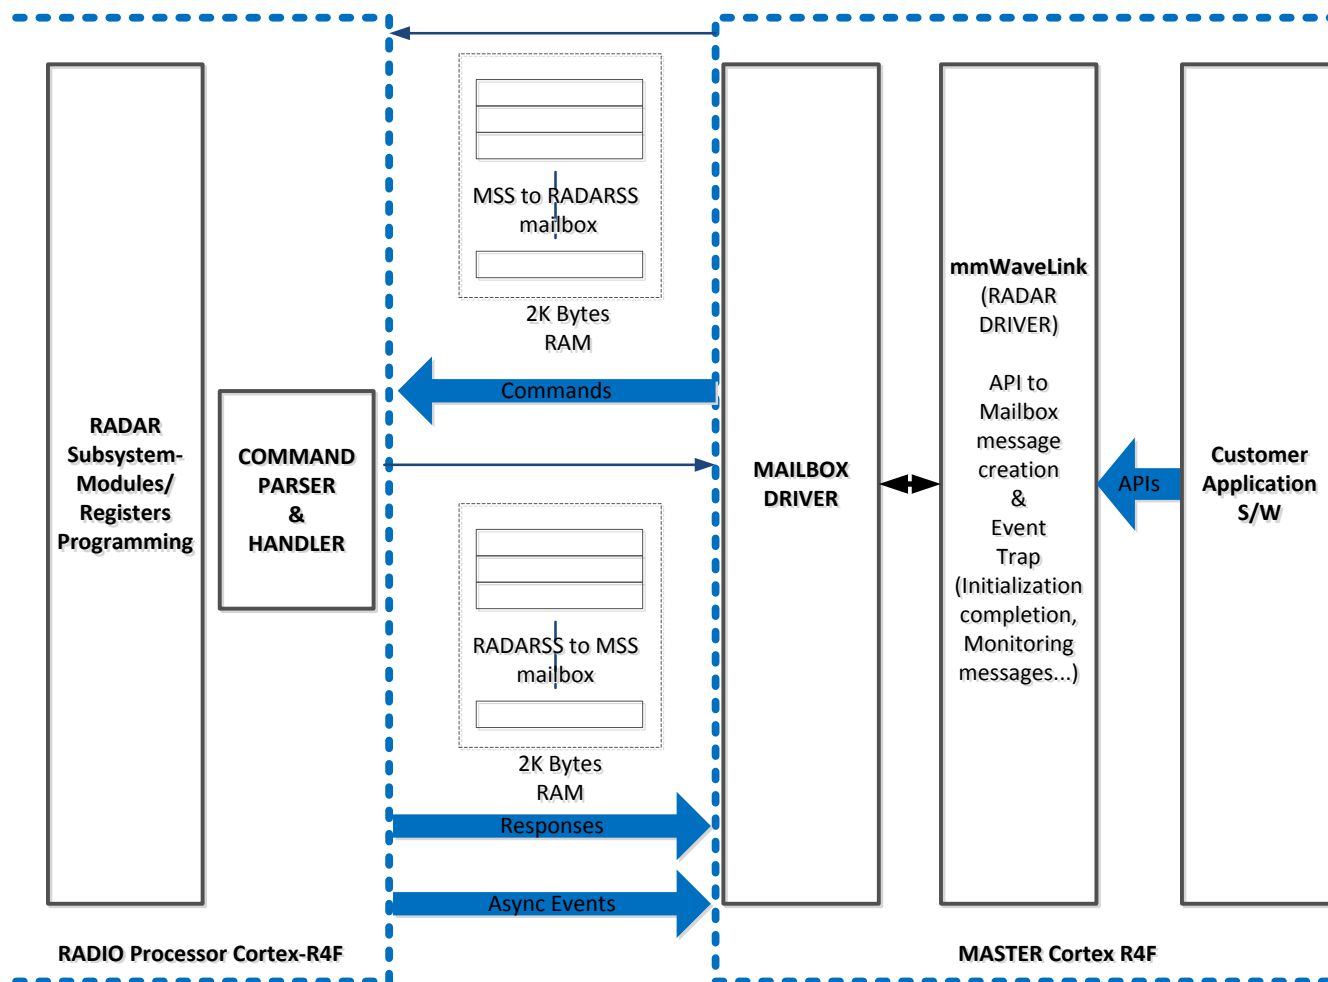

Figure 6-9. Programming Model

The radar subsystem is accessed through a well-defined set of APIs. The application software running on the main Cortex-R5F processor, through the API call, invokes the mmWaveLink-Radar driver, which then converts these APIs into mailbox-based messages. When a message is written into the mailbox memory, an interrupt is raised to the radio processor, which then passes the message and executes the command conveyed through the mailbox message. A mailbox message read event is raised to the main R5F to indicate the radio processor has read the message.

For more details, refer to the API interface control document (ICD).

Communication to BSS can also be done by C66x as well where user needs to implement communication protocol over mailbox to BSS using mmWaveLink library.

Note

On device bootup, RadarSS will be in the reset state. It is responsibility of SBL (secondary bootloader) or main-application (R5F), to bring RadarSS core (R4F) out of reset, load BSS firmware/patch and then un-halts (execute) it. Please refer SBL source code in [MCU-PLUS-SDK-AWR294x](#) for the right sequence.

6.5.2 Clock Subsystem

The AWR2x44P clock subsystem generates 76-81 GHz from an input reference of a 40-MHz crystal. The subsystem has a built-in oscillator circuit, followed by a clean-up PLL and an RF synthesizer circuit, as shown in [Clocking Subsystem](#). The output of the RF synthesizer is then processed by an X4 multiplier to create the required frequency in the 76-81 GHz spectrum. The RF synthesizer output is modulated by the timing engine block to create the required waveforms for effective sensor operation. The timing engine is highly flexible and is programmed through the R4F-based radio controller subsystem. For details on waveforms and programming models, refer to the Radio Control API application note.

The clean-up PLL provides a reference clock for the host processor after system wakeup.

The clock subsystem has built-in mechanisms for detecting the presence of a crystal and monitoring the quality of the generated clock.

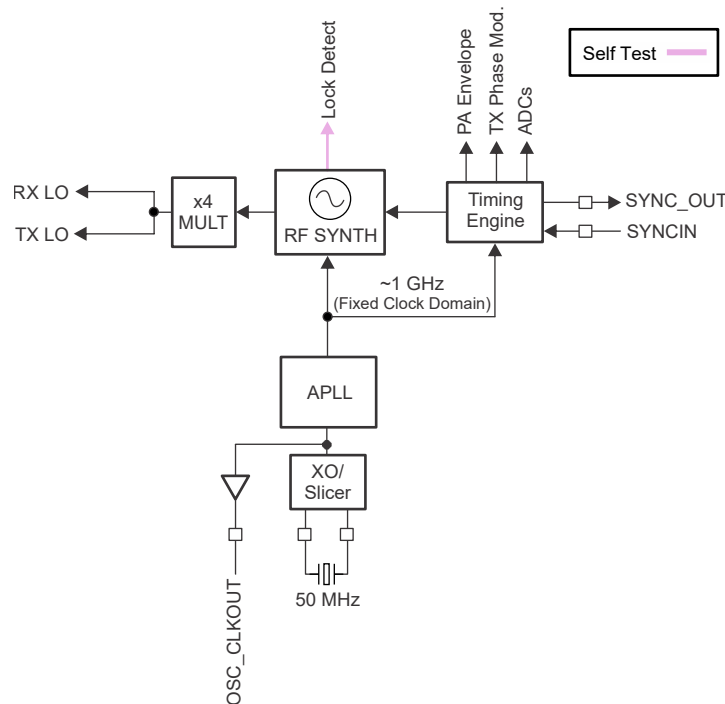

Figure 6-10. Clocking Subsystem

6.5.3 Transmit Subsystem

The transmit subsystem consists of four parallel transmit chains, each with independent phase and amplitude control, as shown in Figure 6-11. All transmit chains can be operational at the same time. The device supports binary phase modulation for MIMO radar and interference mitigation.

Each transmit chain is capable of delivering optimal power at the antenna port on the PCB, and supports programmable back-off for system optimization.

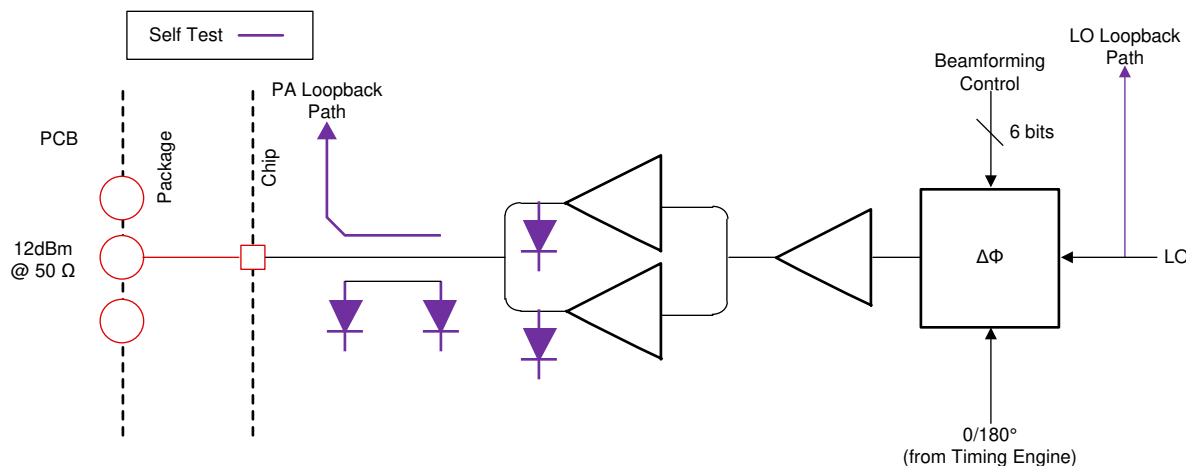

Figure 6-11. Transmit Subsystem

6.5.4 Receive Subsystem

The AWR2x44P receive subsystem consists of four parallel channels, as shown in Receive Subsystem (Per Channel). A single receive channel consists of an LNA, mixer, IF filtering, A2D conversion, and decimation. All four receive channels can be operational at the same time. An individual power down option is also available for system optimization.

The AWR2x44P device supports an I-Only baseband architecture for each receiver channel. The AWR2x44P is targeted for fast chirp systems. The bandpass IF chain has configurable lower cutoff frequencies above 350 kHz, and can support bandwidths up to 15 MHz.

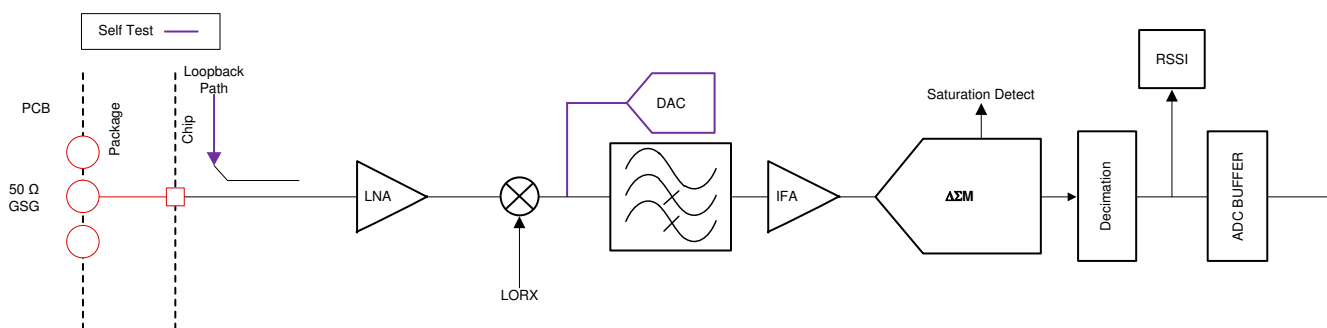

Figure 6-12. Receive Subsystem (Per Channel)

6.5.5 Real(I-only) Receiver in AWR2x44P

In FMCW radar with complex baseband (IQ) receiver, the beat frequency signals from various objects are on one-side of the complex baseband spectrum as shown in the diagram below.

Therefore, a real-only receiver chain is sufficient for FMCW radar operation, including range, velocity, and angle estimation.

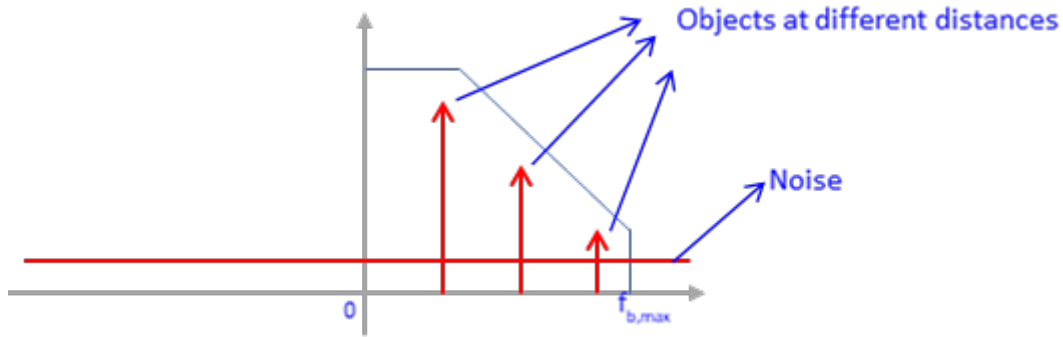

Figure 6-13. Complex Baseband Spectrum

Although theoretically, IQ receiver can provide 3 dB SNR improvement over I-only receiver, in practice, the SNR improvement is less than 1dB for IQ over I-only receiver, after taking into consideration the IQ splitter losses. Also, with circuit optimizations, the AWR2x44P device is able to achieve comparable noise-figure with real-only implementation (in comparison with IQ architecture).

There is significant power and area savings for I-only architecture, and hence it is chosen as the architecture for single chip radar device like AWR2x44P. Using HWA 2.1, the interference detection and mitigation capability is also improved, and this enables interference-related glitches in the real ADC data to be suppressed.

This section lists the various interrupts sources supported in the different subsystem of AWR2x44P device

7.1 Main Subsystem Cortex R5F Interrupt Map

51	MSS_MCANB_FE_INT2	Pulse	MSS_MCANB message filter interrupt2
52	MSS_I2C_INT	Pulse	MSS_I2C interrupt
53	MSS_SCIA_INT0	Level	MSS_SCIA level0 input
54	MSS_SCIA_INT1	Level	MSS_SCIA level1 input
55	MSS_SCIB_INT0	Level	MSS_SCIB level0 input
56	MSS_SCIB_INT1	Level	MSS_SCIB level1 input
57	TOP_PBIST_DONE_INT	Pulse	TOP_PBIST done interrupt
58	MSS_GIO_PAD_INT0	Pulse	Interrupt Triger from GIO[0][0]
59	MSS_GIO_PAD_INT1	Pulse	Interrupt Triger from GIO[0][1]
60	MSS_GIO_PAD_INT2	Pulse	Interrupt Triger from GIO[0][2]
61	MSS_GIO_PAD_INT3	Pulse	Interrupt Triger from GIO[0][3]
62	MSS_MCANA_FE_INT3	Pulse	MSS_MCANA message filter interrupt3
63	MSS_MCANA_FE_INT4	Pulse	MSS_MCANA message filter interrupt4

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
64	MSS_MCANA_FE_INT5	Pulse	MSS_MCANB message filter interrupt5
65	MSS_MCANA_FE_INT6	Pulse	MSS_MCANA message filter interrupt6
66	MSS_MCANA_FE_INT7	Pulse	MSS_MCANB message filter interrupt7
67	MSS_TPCC_A_INTAGG	Level	MSS_TPCC_A Aggregated Functional Interrupt
68	MSS_TPCC_B_INTAGG	Level	MSS_TPCC_B Aggregated Functional Interrupt
69	MSS_TPCC_A_ERRAGG	Level	MSS_TPCC_A Aggregated Error Interrupt
70	MSS_TPCC_B_ERRAGG	Level	MSS_TPCC_B Aggregated Error Interrupt
71	MSS_GPADC_IFM_DONE	Level	MSS_GPADC ifm done interrupt
72	MSS_CPSW_TH_TRSH_INT	Pulse	MSS CPSW T-host threshold interrupt
73	MSS_CPSW_TH_INT	Pulse	MSS CPSW T-host interrupt
74	MSS_CPSW_FH_INT	Pulse	MSS CPSW F-host interrupt
75	MSS_CPSW_MISC_INT	Pulse	MSS CPSW interrupt
76	RESERVED	RESERVED	RESERVED
77	MSS_CR5A_MBOX_READ_REQ	Level	Aggregated interrupt to MSS CR5A from other processor asking it to read
78	MSS_CR5A_MBOX_READ_ACK	Level	Aggregated interrupt to MSS CR5A from other processor saying the reading from their mailbox is done.
79	MSS_CR5B_MBOX_READ_REQ	Level	Aggregated interrupt to MSS CR5B from other processor asking it to read
80	MSS_CR5B_MBOX_READ_ACK	Level	Aggregated interrupt to MSS CR5B from other processor saying the reading from their mailbox is done.
81	RESERVED	RESERVED	RESERVED
82	TOP_DEBUGSS_TXDATA_AVAILABLE	Pulse	Interrupt from TOP_DEBUGSS
83	MSS_CR5A_PMU_INT	Pulse	Pmu Interrupt from MSS_CR5A
84	MSS_CR5B_PMU_INT	Pulse	Pmu Interrupt from MSS_CR5B
85	MSS_CR5A_FPU_INT	Pulse	Floating point exception from MSS_CR5A
86	MSS_CR5B_FPU_INT	Pulse	Floating point exception from MSS_CR5B
87	RESERVED	RESERVED	RESERVED
88	CR5A_CTI_IRQ	Level	IRQ request from CTI module from CR5A
89	CR5B_CTI_IRQ	Level	IRQ request from CTI module from CR5B
90	RESERVED	RESERVED	RESERVED
91	MSS_SW_INT0	Pulse	Software Interrupt from MSS_CTRL

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
92	MSS_SW_INT1	Pulse	Software Interrupt from MSS_CTRL
93	MSS_SW_INT2	Pulse	Software Interrupt from MSS_CTRL
94	MSS_SW_INT3	Pulse	Software Interrupt from MSS_CTRL
95	MSS_SW_INT4	Pulse	Software Interrupt from MSS_CTRL
96	RESERVED	RESERVED	RESERVED
97	MSS_PERIPH_ACCESS_ERRAGG	Level	Aggregation of all access-errors from mpu and control spaces
98	MSS_CR5A_AHB_WR_ERR	Pulse	MSS_CR5A ahb bridge getting write response as a error
99	MSS_CR5B_AHB_WR_ERR	Pulse	MSS_CR5B ahb bridge getting write response as a error
100	DTHE_SHA_S_INT		Interrupt from HSM_SHA
101	DTHE_SHA_P_INT		Interrupt from HSM_SHA
102	DTHE_TRNG_INT		Interrupt from HSM_TRNG
103	DTHE_PKAE_INT		Interrupt from HSM_PKAE
104	DTHE_AES_S_INT		Interrupt from HSM_AES
105	DTHE_AES_P_INT		Interrupt from HSM_AES
106	RESERVED	RESERVED	RESERVED
107	MSS_RTIB_INT2	Level	RTIB compare interrupt
108	MSS_RTIB_INT3	Level	RTIB compare interrupt
109	MSS_RTIC_INT2	Level	RTIC compare interrupt
110	MSS_RTIC_INT3	Level	RTIC compare interrupt
111	RESERVED	RESERVED	RESERVED
112	RESERVED	RESERVED	RESERVED
113	MSS_MCANB_FE_INT3	Pulse	MSS_MCANB message filter interrupt3

122	DSS_TPCC_B_INTAGG	Level	DSS_TPCC_B Aggregated Functional Interrupt
123	DSS_TPCC_B_ERRAGG	Level	DSS_TPCC_B Aggregated Error Interrupt
124	DSS_TPCC_C_INTAGG	Level	DSS_TPCC_C Aggregated Functional Interrupt

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
125	DSS_TPCC_C_ERRAGG	Level	DSS_TPCC_C Agregated Error Interrupt
126	DSS_PERIPH_ACCESS_ERRAGG	Level	Aggregation of access-erros from DSS peripherals. See Error access Response Section for more details
127	TOP_MDO_INFRA_INT	Level	TOP MDO INFRA Interrupt
128	RESERVED	RESERVED	RESERVED
129	DSS_DSP_PBIST_CTRL_DONE	Pulse	DSS DSP PBIST Controller Done Interrupt
130	DSS_SW_INT0	Pulse	SW interrupt generated by writing 0x1 to register DSS_CTRL.DSS_SW_INT[0]
131	DSS_SW_INT1	Pulse	SW interrupt generated by writing 0x1 to register DSS_CTRL.DSS_SW_INT[1]
132	DSS_SW_INT2	Pulse	SW interrupt generated by writing 0x1 to register DSS_CTRL.DSS_SW_INT[2]
133	DSS_SW_INT3	Pulse	SW interrupt generated by writing 0x1 to register DSS_CTRL.DSS_SW_INT[3]
134	RESERVED	RESERVED	RESERVED
135	RESERVED	RESERVED	RESERVED
136	DSS_MCRC_INT	Level	DSS MCRC Interrupt
137	DSS_DSP_STC_DONE	Pulse	DSS DSP STC Done Interrupt
138	RESERVED	RESERVED	RESERVED
139	DSS_SCIA_INT0	Level	DSS SCIA Interrupt 0
140	DSS_SCIA_INT1	Level	DSS SCIA Interrupt 1
141	RESERVED	RESERVED	RESERVED
142	RSS_ADC_CAPTURE_COMPLETE	Pulse	Raw ADC capture complete interrupt from DFE-DSP bridge
143	DSS_CBUFF_INT	Pulse	DSS CBUFF Interrupt
144	DSS_CBUFF_INT_ERR	Pulse	DSS CBUFF Error Interrupt
145	DSS_HWA_LOOP_INTR1	Pulse	DSS_HWA Loop complete interrupt1
146	DSS_HWA_PARAM_DONE_INTR1	Pulse	DSS_HWA Param done interrupt1
147	RESERVED	RESERVED	RESERVED
148	RESERVED	RESERVED	RESERVED
149	RESERVED	RESERVED	RESERVED
150	DFE_FRAME_START_TO_DSS	Pulse	Frame start interrupt from BSS which is masked with "BSS_GPCFG::DSS_FS_INTR_MASK" register
151	RSS_TPCC_A_INTAGG	Level	RSS_TPCC_A Agregated Functional Interrupt
152	RSS_TPCC_A_ERRAGG	Level	RSS_TPCC_A Agregated Error Interrupt
153	ADC_VALID_FALL_EDGE	Pulse	Interrupt is trigger during Falling edge of ADC valid

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
154	DFE_FRAME_START_TO_MSS	Pulse	Frame start interrupt from BSS which is masked with "BSS_GPCFG::MSS_FS_INTR_MASK" register
155	DFE_CHIRP_CYCLE_START	Pulse	Chirp cycle start interrupt from dfe
156	DFE_CHIRP_CYCLE_END	Pulse	Chirp cycle end interrupt from dfe
157	DFE_END_OF_FRAME	Pulse	End of Frame interrupt from Dfe
158	RSS_FRC_FRAME_START	Pulse	Frame start interrupt from FRC
159	RSS_ADC_CAPTURE_COMPLETE_DITH	Pulse	ADC capture complete interrupt from DFE-DSP bridge after dithering
160	DSS_HWA_LOOP_INTR2	Pulse	DSS_HWA Loop complete interrupt2
161	DSS_HWA_PARAM_DONE_INTERRUPT2	Pulse	DSS_HWA Param done interrupt2
162	DSS_WDT_TB_INT	Level	DSS WDT Time Base Interrupt
163	DSS_HWA_LOCAL_RAM_ERR	Level	DSS_HWA Local RAM access error
164	DSS_DCCA_INT	Level	DSS DCCA Interrupt
165	DSS_DCCB_INT	Level	DSS DCCB Interrupt
166	DSS_RTIA_OVERFLOW_0	Level	DSS_RTIA Overflow 0
167	DSS_RTIA_OVERFLOW_1	Level	DSS_RTIA Overflow 1
168	DSS_RTIA_0	Level	DSS_RTIA Interrupt 0
169	DSS_RTIA_1	Level	DSS_RTIA Interrupt 1
170	DSS_RTIA_2	Level	DSS_RTIA Interrupt 2
171	DSS_RTIA_3	Level	DSS_RTIA Interrupt 3
172	DSS_RTIB_OVERFLOW_0	Level	DSS_RTIB Overflow 0
173	DSS_RTIB_OVERFLOW_1	Level	DSS_RTIB Overflow 1
174	DSS_RTIB_0	Level	DSS_RTIB Interrupt 0
175	DSS_RTIB_1	Level	DSS_RTIB Interrupt 1
176	DSS_RTIB_2	Level	DSS_RTIB Interrupt 2
177	DSS_RTIB_3	Level	DSS_RTIB Interrupt 3
178	DSS_WDT_OVERFLOW_0	Level	DSS_WDT Overflow 0
179	DSS_WDT_OVERFLOW_1	Level	DSS_WDT Overflow 1
180	DSS_WDT_0	Level	DSS_WDT Interrupt 0
181	DSS_WDT_1	Level	DSS_WDT Interrupt 1
182	DSS_WDT_2	Level	DSS_WDT Interrupt 2
183	DSS_WDT_3	Level	DSS_WDT Interrupt 3
184	RSS_CSI2A_INT	Level	RSS CSI2A Interrupt
185	RSS_CSI2A_EOL_INT	Pulse	RSS CSI2A End of Line Interrupt
186	RSS_CSI2A_SOF_INT0	Pulse	RSS CSI2A Start of Frame Interrupt 0
187	RSS_CSI2A_SOF_INT1	Pulse	RSS CSI2A Start of Frame Interrupt 1
188	DSS_SW_INT_RSS_PROC_CTRL0	Pulse	Interrupt from RSS_PROC_CTRL
189	DSS_SW_INT_RSS_PROC_CTRL1	Pulse	Interrupt from RSS_PROC_CTRL

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
190	DSS_SW_INT_RSS_PROC_CTL2	Pulse	Interrupt from RSS_PROC_CTRL
191	DSS_SW_INT_RSS_PROC_CTL3	Pulse	Interrupt from RSS_PROC_CTRL
192	RSS_DATA_CAPTURE_ENABLE_FALL	Pulse	Interrupt is triggered data_capture enable fall from DFE-DSP bridge (toggles after completion of every chirp)
193	RESERVED	RESERVED	RESERVED
194	RESERVED	RESERVED	RESERVED
195	RESERVED	RESERVED	RESERVED

-----	------------------------	--

The ADC buffer is on-chip memory arranged as a ping-pong buffer, with ECC support for each ping and pong memory. The raw ADC output data from RADAR-SS is stored on this memory, to be consumed by the DSP, or by the hardware FFT accelerator for the post processing.

For the application software, the ADC buffer (either ping or pong) is seen as a single memory at the base address.

RadarSS generates Chirp Parameter (CP) and Chirp Quality (CQ) data along with ADC data. Interface Control Document (ICD) explains CP/CQ data format and steps to enable this feature. Refer ICD for the latest supported features towards CP/CQ/ADC of the device.

8.1 Functional Description

Figure 8-1 shows the block diagram of the ADC buffer scheme. The two data input sources to the ADC buffer are:

- Raw ADC output data from the digital front end (DFE)
- Ramp pattern data from the test pattern generator

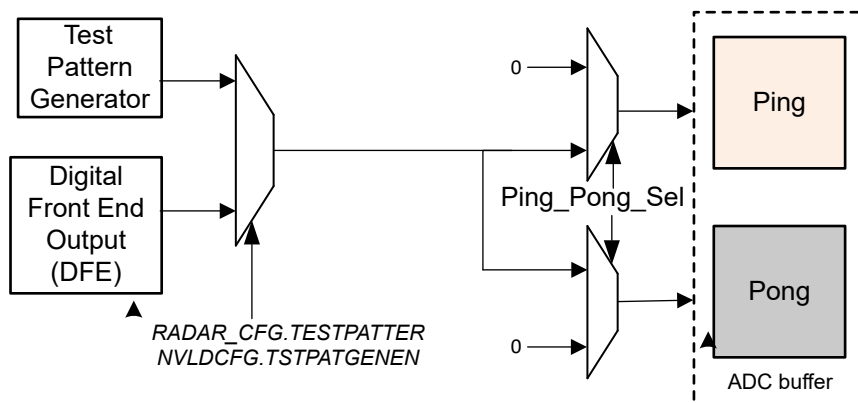

Figure 8-1. ADC Buffer Block Diagram

8.1.1 DFE Data Write Operation

The ADC buffer can be written from DFE in any of the three modes by configuring the control registers ADCBUFCFG1, ADCBUFCFG2, ADCBUFCFG3, and ADCBUFCFG4 in APP_HWA_ADCBUF_CTRL address space:

1. Single-chirp mode
2. Multi-chirp mode
3. Continuous mode

The DFE data from the three Rx channels can be independently enabled by programming the register ADCBUFCFG1.

In single-chirp mode, the FMCW chirp data from the DFE is written to the ADC buffer on a per chirp basis, and a chirp available interrupt is generated on the completion of the write data operation at the end of the chirp,

as shown in Figure 8-2. ADC buffer control logic generates the Ping_Pong_Sel signal, as shown in Figure 8-2, which controls whether the data is written into either ping or pong buffer. Data write can start from either the ping or pong buffer.

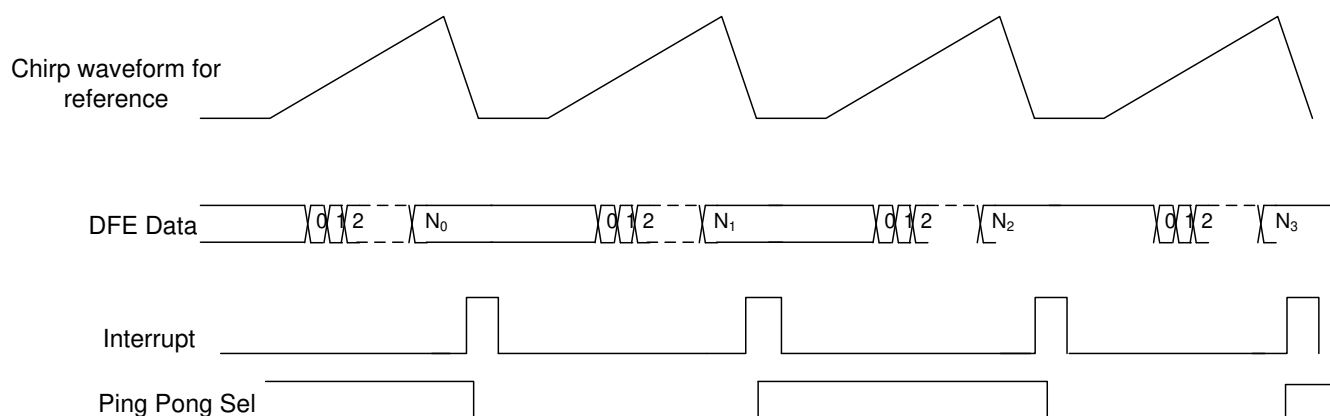

Figure 8-2. Single-Chirp Mode

In multi-chirp mode, ADC samples for N chirps are stored in a ping/pong buffer before the Ping Pong Select toggles and the Chirp Available Interrupt is generated. The number of chirps stored in the ping and the pong buffer are configured in the register field ADCBUFNUMCHRPING.

ADC Buffer Single-Chirp and Multi-Chirp Mode Programming Sequence shows the programming sequence for the ADC buffer single-chirp and multi-chirp modes.

Note

Registers for ping and pong must be programmed with the same value for correct functionality.

Table 8-1. ADC Buffer Single-Chirp and Multi-Chirp Mode Programming Sequence

Steps	Register/Bit Field/Programming
Enable the Rx channels for which data will be captured in the ADC buffer	ADCBUF CFG1.RX0EN
	ADCBUF CFG1.RX1EN
	ADCBUF CFG1.RX2EN
Configure the number of samples to be stored in each ping/pong buffer as N	ADCBUF CFG4.ADCBUFNUMCHRP1NG

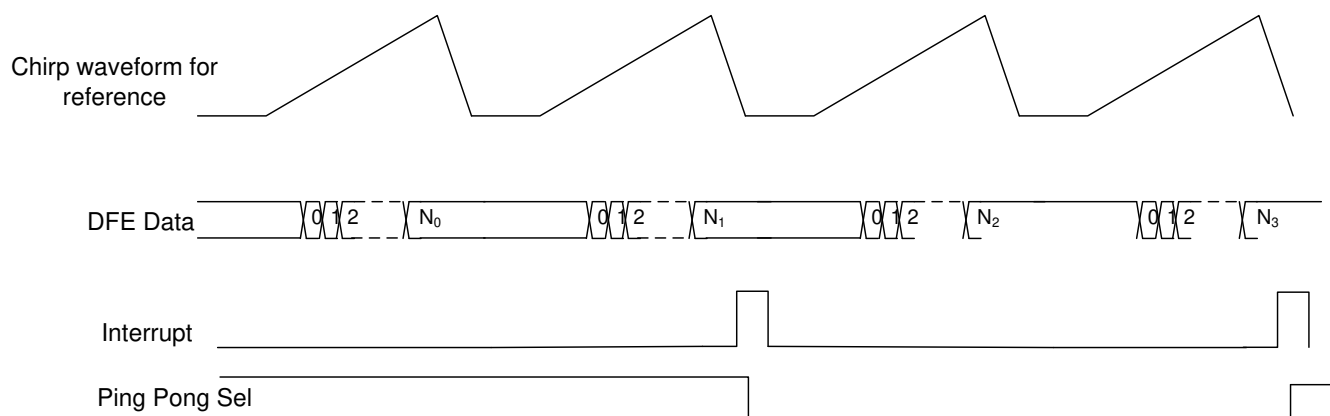

Figure 8-3. Multi-Chirp Mode

In continuous mode, where the FMCW transceiver is configured to output a single frequency tone in the range of X-Y GHz (where X is start and Y is end frequency supported by the device), 'N' ADC samples are stored in a ping/pong buffer before the Ping Pong Select toggles and the Chirp Available Interrupt is generated. The value N is configured in the field APP_HWA_ADCBUF_CTRL.ADCBUFCFG4.ADCBUFSAMPCNT. In real mode, this value N refers to the number of real samples per channel, and in complex mode, this refers to the number of complex samples per channel. This counter increments once for every new sample (as long as 1 or more Rx channels are enabled). Continuous mode is expected to be only used for CZ and ADC buffer testpattern mode.

ADC Buffer Continuous Mode Programming Sequence shows the programming sequence for ADC buffer continuous mode.

Table 8-2. ADC Buffer Continuous Mode Programming Sequence

Steps	Register/Bit Field/Programming
Enable the Rx channels for which data will be captured in the ADC buffer	ADCBUFCFG1.RX0EN
	ADCBUFCFG1.RX1EN
	ADCBUFCFG1.RX2EN
Configure the number of samples to be store in each ping/pong buffer	ADCBUFCFG4.ADCBUFSAMPCNT
Enable the ADC buffer in continuous mode	ADCBUFCFG1.ADCBUFCONTMODEEN
To start the capture of samples in the ADC buffer	ADCBUFCFG1.ADCBUFCONTSTRTPPL
To stop the capture of samples in the ADC buffer	ADCBUFCFG1.ADCBUFCONTSTOPPL

8.1.2 Test Pattern Generator Support

An internal test pattern generator which outputs a ramp pattern helps during the initial software development and debug. The output of this module is muxed with the DFE data before sending it to the ADC buffers, as shown in [Figure 8-1](#). Because this is meant for testing the path from the ADC buffer until the final output through LVDS, the ADC buffer configurations must be set to continuous streaming mode, in which the ping-pong switch is based on the number of samples. The test pattern generator can be configured by programming the register TESTPATTERNVLDCFG in the RADAR_CFG address space. Additional configurable registers are provided for configuring the ramp pattern output from the test pattern generator, such as offset at the start of ramp, step size, and so forth. Refer to the RSS_CTRL address space and test pattern generator-related registers for further information.

8.1.3 ADC Buffer Data Formats

The data is written in the following formats to the ADC buffer:

- Non-interleaved data format

8.1.3.1 Non-Interleaved Data Format

In non-interleaved mode storage, each channel data is stored in different memory locations, as shown in [Table 8-3](#).

Table 8-3. Non-Interleaved Data Format

RX0(3)	RX0(2)	RX0(1)	RX0(0)
RX0(7)	RX0(6)	RX0(5)	RX0(4)
RX1(3)	RX1(2)	RX1(1)	RX1(0)
RX1(7)	RX1(6)	RX1(5)	RX1(4)
RX2(3)	RX2(2)	RX2(1)	RX2(0)
RX2(7)	RX2(6)	RX2(5)	RX2(4)

Chapter 9
Ethernet SubSystem (MCU_CPSW0)

This chapter describes the Ethernet MAC (Media Access Controller). For conceptual purposes the below documentation refers to this MAC as being a two port CPSW with port 0 being the CPPI DMA host port and port 1 being the Ethernet port.

9.1 MCU_CPSW0 Overview.....	3725
9.2 MCU_CPSW0 Environment.....	3728
9.3 MCU_CPSW0 Integration.....	3731
9.4 MCU_CPSW0 Functional Description.....	3733
9.5 MCU_CPSW0 Programming Guide.....	3828
9.6 MSS_CPSW Registers.....	3831

9.1 MCU_CPSW0 Overview

The two-port Ethernet MAC (MCU_CPSW0) subsystem provides Ethernet packet communication for the device and is configured in a similar manner as a two-port Ethernet switch. MCU_CPSW0 features the Reduced Gigabit Media Independent Interface (RGMI), Reduced Media Independent Interface (RMII), and the Management Data Input/Output (MDIO) interface for physical layer device (PHY) management.

The device has integrated two-port Ethernet Switch subsystem into device MCU domain named MCU_CPSW0.

Figure 9-1 shows the MCU_CPSW0 module overview.

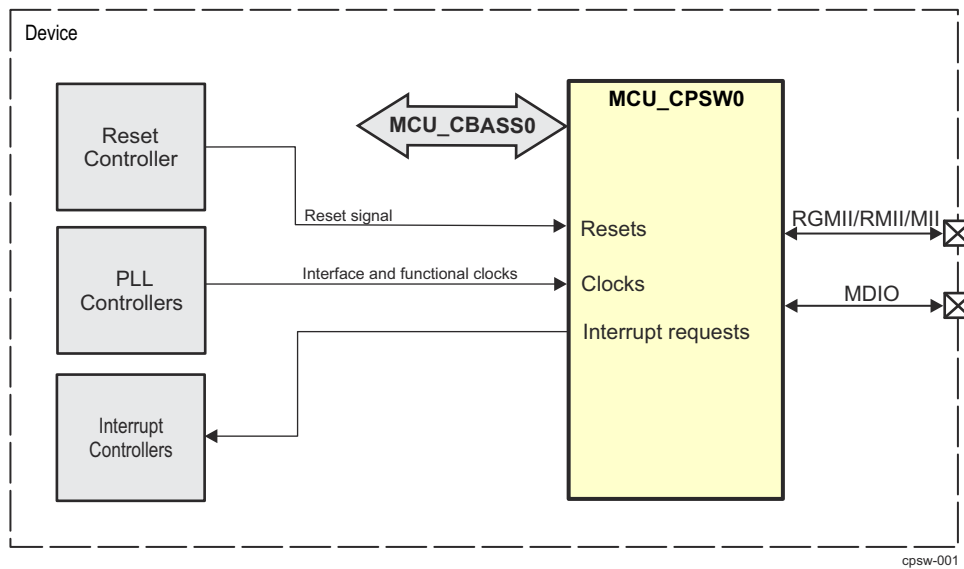

Figure 9-1. MCU_CPSW0 Overview

9.1.1 MCU_CPSW0 Features

The MCU_CPSW0 subsystem provides the following features:

- One Ethernet port with selectable MII, RMII and RGMII interfaces (port 1).
- One CPDMA CPPI DMA Host Interface (Port 0)
- Synchronous 10/100 Mbit operation
- Flexible logical FIFO-based packet buffer structure
- Eight priority level Quality Of Service (QOS) support (802.1p)
- Support for Audio/Video Bridging (P802.1Qav/D6.0) (**C**redit **B**ased **S**haper)
- Support for IEEE 1588 Clock Synchronization (2008 Annex D, Annex E and Annex F)
 - Timestamp module capable of time stamping external timesync events like Pulse-Per-Second and also generating Pulse-Per-Second outputs
 - CPTS module that supports time stamping for IEEE1588 with support for 4 hardware push events and generation of compare output pulses
- DSCP Priority Mapping (IPv4 and IPv6)
- Energy Efficient Ethernet (EEE) support (802.3az)
- Flow Control (802.3x) Support
- Non Blocking switch fabric
- Time Sensitive Network Support
 - IEEE 802.1Qbv/D2.2 Enhancements for Scheduled Traffic
- Address Lookup Engine (ALE)
 - Configurable number of addresses plus VLANs
 - Wire rate lookup
 - Host controlled time-based aging and/or auto-aging
 - Spanning tree support

- L2 address lock and L2 filtering support
- MAC authentication (802.1x)
- Receive-based or destination-based Multicast and Broadcast rate limits
- MAC address blocking
- Source port locking
- OUI (Vendor ID) host accept/deny feature
- Configurable number of classifier/policers
- VLAN support
 - 802.1Q compliant
 - Auto add port VLAN for untagged frames on ingress
 - Auto VLAN removal on egress and with pad to minimum frame size
- EtherStats and 802.3Stats Remote network Monitoring (RMON) statistics gathering (per port)
- Ethernet or Castagnoli CRC selectable on Ethernet egress
- Digital Loopback supported (Ethernet egress to Ethernet ingress)
- OAM Loopback supported (FIFO Loopback - port ingress to egress including host port)
- CPSGMII Loopback Modes (Ethernet egress to Ethernet ingress)
- Maximum frame size of 2024 bytes (including VLAN)
- Management Data Input/Output (MDIO) module for PHY Management with Clause 45 support
- Programmable interrupt control with selected interrupt pacing
- Emulation support
- Full duplex mode supported in 10/100 Mbps. Half-duplex mode supported only in 10/100 Mbps modes only.
- RAM Error Detection and Correction (SECCED)
- InterVLAN Routing is supported - 4 routes per egress port.
- Automotive Security Features
 - VLANs can be configured to not allow fragmented IPv4 frames (that is, fragmented IPv4 traffic)
 - VLANs can be configured to only allow up to four different IPv4 Protocols or IPv6 Next Header values
 - Drop invalid source addresses, that is drop Source Addresses with bit 40 set (Multicast/Broadcast indicator on Destination Addresses)
 - Drop frames that the IEEE802.3 length is not contained within the frame. (Ether Types 0-1500)
 - Any source address can be secured to a port dropping any attempts from other ports to masquerade as a service
 - Any source or destination address can be blocked
 - Per port or per VLAN ingress checking, dropping traffic from non-member ports
 - Classification, policing on L2 and L3 information

9.1.2 MCU_CPSW0 Not Supported Features

The following MCU_CPSW0 features are not supported:

- GMII Mode
- SGMII Mode
- MACSEC
- Synchronous Ethernet
- Software reset
- Rate-limiting is not supported in half-duplex mode
- Dual VLAN switch operations are not supported
- RGMII Internal Delay Mode disabled.
- Priority based flow control is not supported.
- InterVLAN routed packets will be dropped if the FIFO room is insufficient regardless of receive 803.3x flow control.

9.1.3 Terminology

Terminology:

AVB	Audio Video Bridging
AVBTP	Audio Video Bridging Transport Protocol
BMCA	Best Master Clock Algorithm
CFI	Canonical Format Indicator
CPPI	Communications Port Programming Interface
DLR	Device Level Ring
DSCP	Differentiated Services Code Point
EEE	Energy Efficient Ethernet
EMAC	Ethernet Media Access Control
EOP	End of Packet
EOQ	End of Queue
IPG	Inter-Packet Gap
LPI	Low Power Indicator
MDIO	Management Data Input/Output
MOF	Middle of Frame
OUI	Organizationally Unique Identifier
PTP	Precision Time Protocol
RMON	Remote Monitoring
RTCP	RTP Control Protocol
RTP	Real-time Transport Protocol
SCR	Switched Central Resource
SRP	Stream Reservation Protocol
TOS	Type of Service
VLAN	Virtual Local Area Network
CPSW_2G	CPSW two port

9.2 MCU_CPSW0 Environment

9.2.1 MCU_CPSW0 RMI Interface

Figure 9-2 shows a device with integrated RMI and MDIO interface connection in a typical system. The individual MCU_CPSW0 and MDIO signals for the RMI interface are summarized in Table 9-1.

For more information, refer to either the IEEE 802.3 standard or ISO/IEC 8802-3:2000(E).

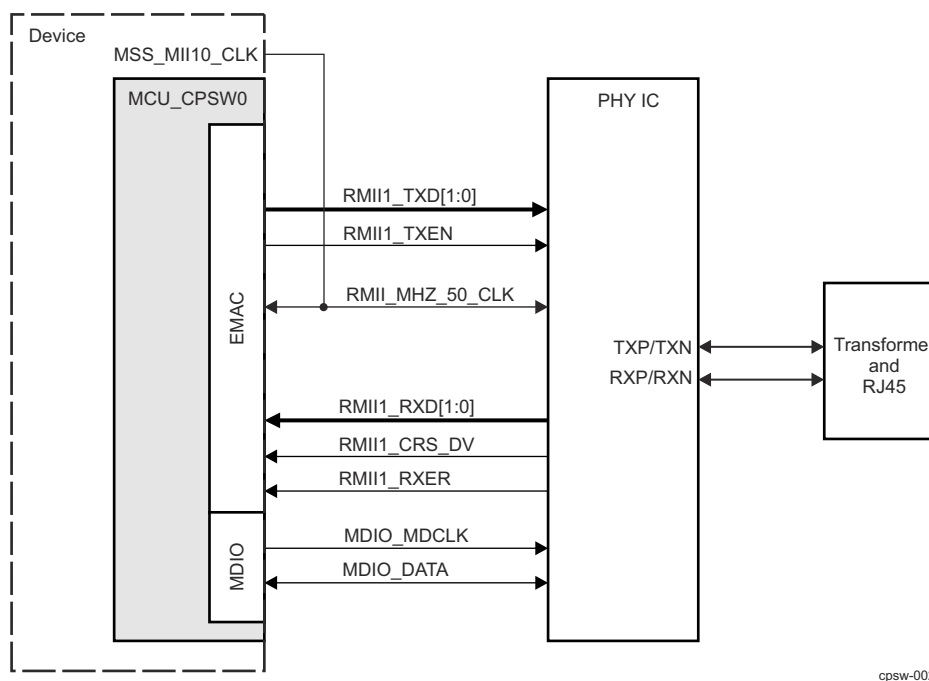

Figure 9-2. RMI Interface Typical Application

Table 9-1. RMI I/O Description

Signal	Device Pin	I/O ⁽¹⁾	Description
RMI1_TXD[1:0]	MCU_RMI1_TXD[1:0]	O	Transmit data. The transmit data pins are a collection of 2 bits of data. TXD0 is the least-significant bit (LSB). The signals are synchronized by RMI1_MHZ_50_CLK and valid only when RMI1_TXEN is asserted.
RMI1_TXEN	MCU_RMI1_TX_EN	O	RMI1 transmit enable. The transmit enable signal indicates that the MCU_RMI1_TXD pins are generating data for use by the PHY. RMI1_TXEN is synchronous to RMI1_MHZ_50_CLK.
RMI1_MHZ_50_CLK	MCU_RMI1_REF_CLK	I	RMI1 50MHz reference clock. The reference clock is used to synchronize all RMI1 signals. RMI1_MHZ_50_CLK must be continuous and fixed at 50 MHz. This bit controls the clock source MSS_CTRL::CPSW_CONTROL::CPSW_CONTROL_RMI1_REF_CLK_OE_N
RMI1_RXD[1:0]	MCU_RMI1_RXD[1:0]	I	Receive data. The receive data pins are a collection of 2 bits of data. RXD0 is the least-significant bit (LSB). The signals are synchronized by RMI1_MHZ_50_CLK and valid only when RMI1_CRS_DV is asserted and RMI1_RXER is de-asserted.
RMI1_CRS_DV	MCU_RMI1_CRS_DV	I	Carrier sense/receive data valid. Multiplexed signal between carrier sense and receive data valid.
RMI1_RXER	MCU_RMI1_RX_ER	I	Receive error. The receive error signal is asserted to indicate that an error was detected in the received frame.
MDIO_MDCLK	MCU_MDIO_CLK	O	Management data clock (MDIO_MDCLK). The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MCU_MDIO0_DATA pin.

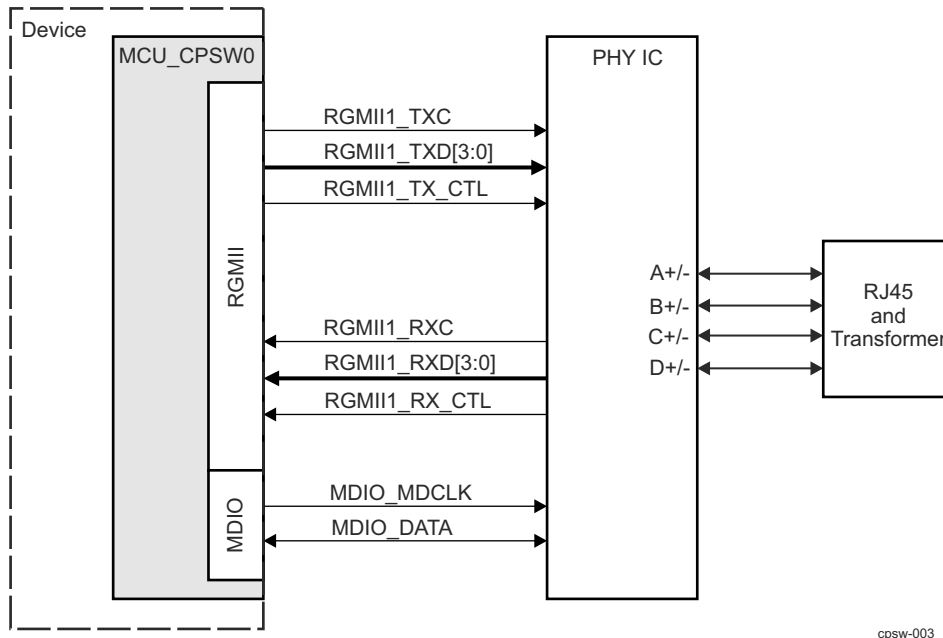

Table 9-1. RGMII I/O Description (continued)

Signal	Device Pin	I/O ⁽¹⁾	Description
MDIO_DATA	MCU_MDIO_DATA	I/O	MDIO data pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication, PHY address, register address, and data bit cycles. The MCU_MDIO0_DATA pin acts as an output for all but the data bit cycles at which time it is an input for read operations.

(1) I = Input; O = Output

9.2.2 MCU_CPSW0 RGMII Interface

Figure 9-3 shows a device with integrated RGMII and MDIO interface connection in a typical system. The individual MCU_CPSW0 and MDIO signals for the RGMII interface are summarized in Table 9-2.

cpsw-003

Figure 9-3. RGMII Interface Typical Application

Table 9-2. RGMII I/O Description

Signal	Device Pin(s)	I/O ⁽¹⁾	Description
RGMII_TXD[3:0]	MCU_RGMII_TD[3:0]	O	The transmit data pins are a collection of 4 bits of data. TD0 is the least-significant bit (LSB). The signals are valid only when RGMII_TX_CTL is asserted.
RGMII_TX_CTL	MCU_RGMII_TX_CTL	O	Transmit Control/enable. The transmit enable signal indicates that the TD pins are generating data for use by the PHY.
RGMII_TXC	MCU_RGMII_TXC	O	The transmit reference clock. The clock is 2.5 MHz at 10 Mbps operation, 25 MHz at 100 Mbps operation, and 125 MHz at 1000 Mbps* of operation.
RGMII_RXD[3:0]	MCU_RGMII_RD[3:0]	I	The receive data pins are a collection of 4 bits of data. RD0 is the least-significant bit (LSB). The signals are valid only when RGMII_RX_CTL is asserted
RGMII_RX_CTL	MCU_RGMII_RX_CTL	I	The receive data valid/control signal indicates that the RD pins are nibble data for use by the EMAC.
RGMII_RXC	MCU_RGMII_RXC	I	The receive clock is a continuous clock that provides the timing reference for receive operations. The clock is generated by the PHY and is 2.5 MHz at 10 Mbps operation, 25 MHz at 100 Mbps operation, 125 MHz at 1000 Mbps* of operation.

Table 9-2. RGMII I/O Description (continued)

Signal	Device Pin(s)	I/O ⁽¹⁾	Description
MDIO_MDCLK	MCU_MDIO_CLK	O	Management data clock (MDIO_MDCLK). The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MCU_MDIO0_DATA pin.
MDIO_DATA	MCU_MDIO_DATA	I/O	The MCU_MDIO0_DATA pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication, PHY address, register address, and data bit cycles. The MCU_MDIO0_DATA pin acts as an output for all but the data bit cycles at which time it is an input for read operations.

(1) I = Input; O = Output

Note

The Control Module registers assign the specific function to the device pads. For more information on Control Module settings, see , Pad Configuration Registers in *Control Module (CTRL_MMR)* and the device-specific Datasheet.

9.3 MCU_CPSW0 Integration

Figure 9-4 shows the integration of the MCU_CPSW0 module in the device.

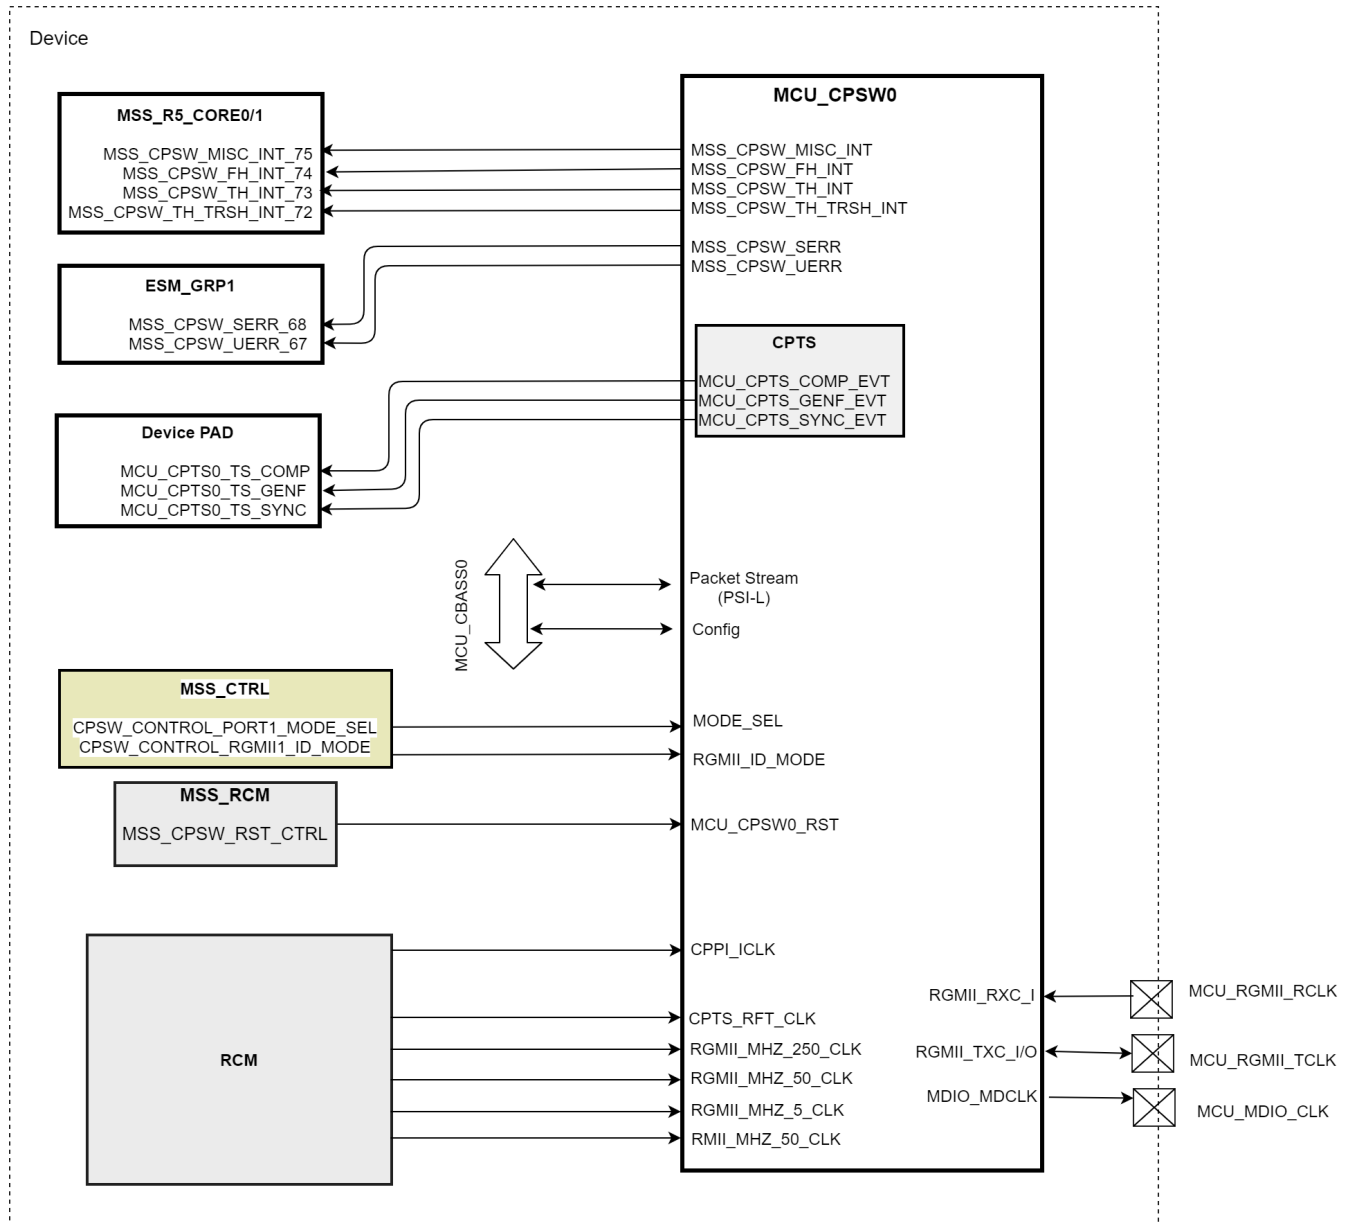

Figure 9-4. MCU_CPSW0 Integration

Below Tables summarize the integration of the MCU_CPSW0 module in the device.

Table 9-3. MCU_CPSW0 Clocks and Resets

Clocks			
Module Instance	Module Clock Input	Reference/Source	Description
MCU_CPSW0	CPPI_CLK	MSS_RCM::CPSW_CLK	CPPI packet streaming interface clock. Main clock for MCU_CPSW0.
	CPTS_RFT_CLK	MSS_RCM::MSS_CPTS_CLK	Time sync Reference Clock 400/250/divided
	RGMII_MHZ_5_CLK	MSS_RCM::MSS_MII10_CLK	5-MHz RGMII reference clock.
	RGMII_MHZ_50_CLK	MSS_RCM::MSS_MII100_CLK	50-MHz RGMII reference clock.

Table 9-3. MCU_CPSW0 Clocks and Resets (continued)

RGMII_MHZ_250_CLK	MSS_RCM::MSS_RGMII_CLK	250-MHz RGMII reference clock.
RMII_MHZ_50_CLK	MSS_RCM::MSS_MII100_CLK	50-MHz RMI reference clock.

Resets			
Module Instance	Module Reset Input	Reference/Source	Description
MCU_CPSW0	MCU_CPSW0_RST	MCSS_RCM::MSS_CPSW_RST_CTRL	IP Reset

Table 9-4. MCU_CPSW0 Hardware Requests

Interrupt Requests				
Module Instance	Module Interrupt Signal	Destination Interrupt Input	Description	Type
MCU_CPSW0	MCU_CPSW_STAT_PEND	MSS_CPSW_MISC_INT_75	MCU_CPSW0 statistic pending interrupt 0	Pulse
	MCU_CPSW_EVNT_PEND	MSS_CPSW_MISC_INT_75	MCU_CPSW0 event pending interrupt	Pulse
	MCU_CPSW_MDIO_INTR	MSS_CPSW_MISC_INT_75	MCU_CPSW0 MDIO interrupt	Pulse
	MCU_CPSW_THost_INT	MSS_CPSW_TH_INT_73	MCU_CPSW0 T-host interrupt	Pulse
	MCU_CPSW_FHost_INT	MSS_CPSW_FH_INT_74	MCU_CPSW0 F-host interrupt	Pulse
	MCU_CPSW_TH_TRSH_INT	MSS_CPSW_TH_TRSH_INT_72	MCU_CPSW0 TH-threshold interrupt	Pulse
	MCU_CPSW_ECC_SEC_INT	MCU_ESM_EVT_68	MCU_CPSW0 SEC ECC error interrupt	Pulse
	MCU_CPSW_ECC_DED_INT	MCU_ESM_EVT_67	MCU_CPSW0 SEC DED error interrupt	Pulse

Time Sync and Compare Events				
Module Instance	Module Event	Device Pin	Description	Type
MCU_CPSW0	MCU_CPSW_COMP_EVT	MCU_CPTS0_TS_COMP	MCU_CPSW0 compare event interrupt	Edge
	MCU_CPSW_GENF_EVT	MCU_CPTS0_TS_GENF	MCU_CPSW0 CPTS generator function event interrupt	Edge
	MCU_CPSW_SYNC_EVT	MCU_CPTS0_TS_SYNC	MCU_CPSW0 CPTS sync event interrupt	Edge

Note

For more information about interrupts, see *Local Interrupt Controller*.

For more information on the interconnects, see [Chapter 3](#).

For more information on the power, reset and clock management, see the corresponding sections within [Chapter 5](#).

For more information on the device interrupt controllers, see *Interrupt Controllers*.

9.4 MCU_CPSW0 Functional Description

The two-port switch Ethernet subsystem modules (CPSW) are compliant to the IEEE Std 802.3 Specification. CPSW top level functional block diagram is shown in Figure 9-5.

9.4.1 Functional Block Diagram

The two-port Ethernet subsystem consists of:

- CPSW_2G
- One RGMII interface module
- One RMII interface module
- One Host Port 0 CPPI Packet Streaming Interface
- CPSW subsystem control registers (REG)
- One MDIO interface module
- One Interrupt Controller module

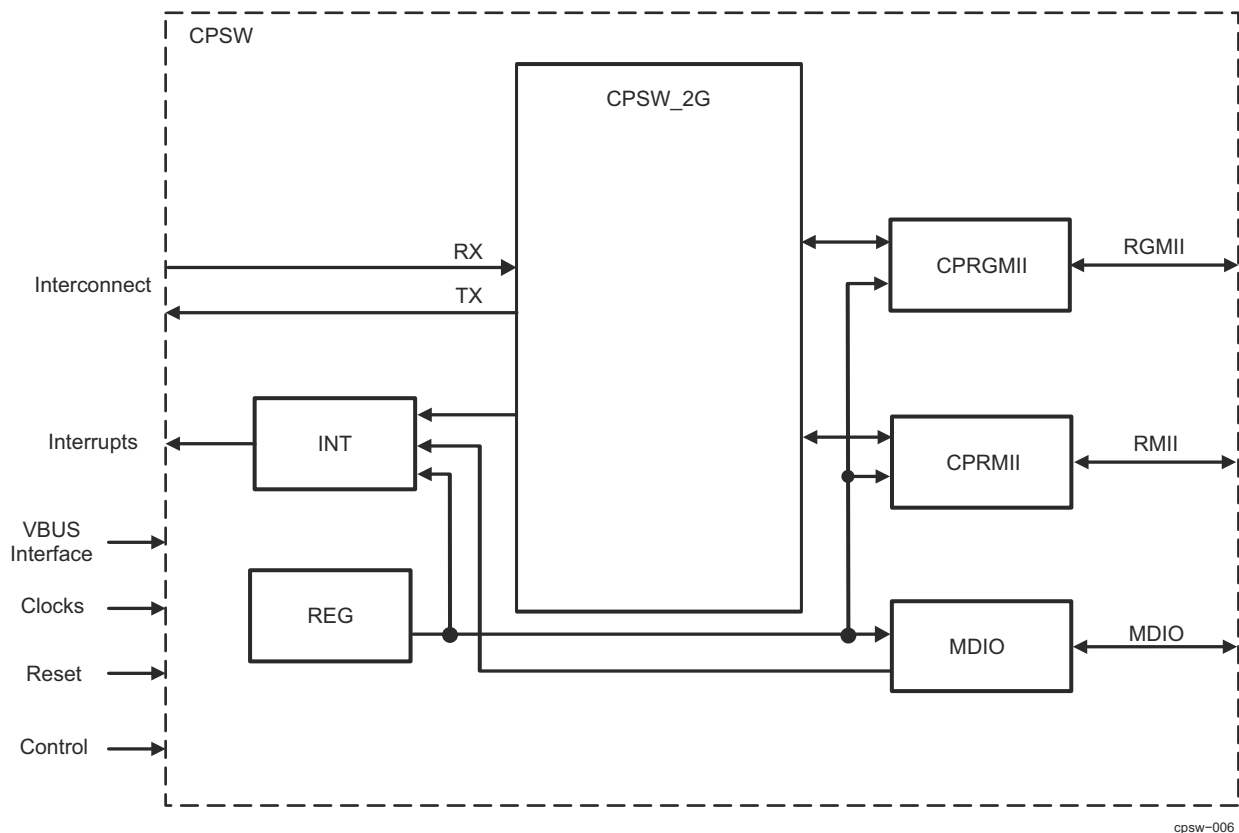

Figure 9-5. CPSW Top Level Block Diagram

9.4.2 CPSW Ports

The Ethernet Subsystem has two ports. Port 0 is the Host port (internal to the Subsystem). Port 1 is the external port connected to RGMII, or RMII interfaces as per the interface selected.

Naming conventions followed in this chapter:

- Port0 is referred to the CPPI CPDMA Host Port
- Port1 is referred to the interfaces RGMII/RMII

9.4.2.1 Ethernet Port Operation

9.4.2.1.1 Interface Mode Selection

The two-port switch (CPSW) Ethernet Subsystem has one 10/100/1000 Ethernet port with selectable MII, RMII, and RGMII interfaces. These interfaces can be enabled by

MSS_CTRL:CPSW_CONTROL:CPSW_CONTROL_PORT1_MODE_SEL

For specific interface mode further features is selected by configuring the Ethernet bits (EXT_EN, GIG, FULLDUPLEX, IFCTL_A) in the **PN_MAC_CONTROL** register.

See the device-specific Datasheet for configuring the pin mux mode as per the interface selected.

CPSW_CONTROL_PORT1_MODE_SEL	Link Type
00	GMII/MII
01	RMII
10	RGMII

9.4.2.1.2 RMII Operation

The **IFCTL_A** bit determines the RMII link speed (0=10mbps, 1=100mbps). The **FULLDUPLEX** bit controls RMII duplexity. The **IFCTL_B** is not used.

9.4.2.1.3 RGMII Operation

Each port RGMII interface can operate in a forced mode or an in-band mode as determined by the **EXT_EN** bit. Forced mode is with **EXT_EN** cleared. In-band mode is with **EXT_EN** set.

9.4.2.1.3.1 RGMII In-Band Operation

A port CPRGMII is operating in the in-band mode of operation when the **EXT_EN** is set. The link status, duplexity, and speed are determined from the RGMII input data stream as defined in the RGMII specification and can be read in the **SS_RGMII1_STATUS** register. The link speed is indicated as shown in [Table 9-5](#).

Table 9-5. RGMII Link Speed

SPEED(1:0)	Link Speed
00	10 Mbs mode
01	100 Mbs mode
10	1000 Mbs mode
11	reserved

9.4.2.1.3.2 RGMII Forced Mode Operation

9.4.3 Clocking

9.4.3.1 Subsystem Clocking

CPSW clocking summary is shown in [Section 9.3, CPSW Integration](#).

9.4.3.2 Interface Clocking

Data is transmitted and received with respect to the reference clocks of the interface pins.

9.4.3.2.1 RGMII Interface Clocking

RGMII_RXC, RGMII_TXC frequencies are:

- 2.5 MHz at 10 Mbps
- 25 MHz at 100 Mbps

9.4.3.2.2 RMII Interface Clocking

RMII interface clock RMII_50MHZ_CLK frequency is:

- 50 MHz at 10 Mbps

- 50 MHz at 100 Mbps

CTRLMMR_MCU_CLKOUT0_CTRL[4]CLK_EN and CTRLMMR_MCU_CLKOUT0_CTRL[0]CLK_SEL bits are used to enable and select the clock source for MCU_CLKOUT pin.

9.4.3.2.3 MDIO Clocking

The MDIO clock is based on a divide-down of the interface (CPPI_ICLK) clock. The application software or driver must control the divide-down value.

See the CPSW_MDIO_CONTROL_REG register for configuring the Clock Divider ([15-0]CLKDIV) value.

9.4.4 Interrupt Functionality

Table 9-6. Interrupt Functionality

Interrupt	Description
MSS_CPSW_FH_INT	FHost (from host to Ethernet) interrupt
MSS_CPSW_TH_INT	THost (from Ethernet to host) interrupt
MSS_CPSW_TH_TRSH_INT	THost (from Ethernet to host) Threshold interrupt
MSS_CPSW_MISC_INT	Miscellaneous interrupt
MSS_CPSW_SERR	ECC SEC interrupt – output from CPSW ECC module. This interrupt is also included in the MSS_CPSW_MISC_INT if enabled or this interrupt can be used separately.
MSS_CPSW_UERR	ECC DED interrupt – output from CPSW ECC module. This interrupt is also included in the MSS_CPSW_MISC_INT if enabled or this interrupt can be used separately.

9.4.4.1 MSS_CPSW_TH_TRSH_INT Interrupt Description

The MSS_CPSW_TH_TRSH_INT interrupts are each an immediate (non-paced) pulse interrupt selected from the CPSW_2G TH_THRESH_PEND[7:0] interrupts. The THost threshold pending interrupt(s) is selected by setting one or more bits in the SS_TH_THRESH_PULSE_EN_REG[7:0] register. The masked interrupt status can be read in the SS_TH_THRESH_PULSE_STATUS_REG[7:0] register. Upon reception of an interrupt, software should perform the following:

- Read the SS_TH_THRESH_PULSE_STATUS_REG[7:0] register to determine which channel(s) caused the interrupt.
- Process THost packets in order to add more buffers to any channel that is below the threshold value.
- Write the CPSW_2G completion pointer(s) to acknowledge the CPDMA interrupt.
- Write 0x0 to the CPDMA_EOI_VECTOR register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

9.4.4.2 MSS_CPSW_TH_INT Interrupt Description

The MSS_CPSW_TH_INT interrupts are each a paced pulse interrupt selected from the CPSW_2G TH_PEND[7:0] interrupts. The THost pending interrupt(s) is selected by setting one or more bits in the SS_TH_PULSE_EN_REG[7:0] register. The masked interrupt status can be read in the SS_TH_PULSE_STATUS_REG[7:0] register. Upon reception of an interrupt, software should perform the following:

- Read the SS_TH_PULSE_STATUS_REG[7:0] register to determine which channel(s) caused the interrupt.
- Process THost packets for the interrupting channel(s) to acknowledge the CPDMA interrupt.
- Write the CPSW_2G completion pointer(s).
- Write 0x1 to the CPDMA_EOI_VECTOR_REG register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

9.4.4.3 MSS_CPSW_FH_INT Interrupt Description

The MSS_CPSW_FH_INT interrupts are each a pulse interrupt selected from the CPSW_2G FH_PEND[7:0] interrupts. The transmit pending interrupt(s) is selected by setting one or more bits in the SS_FH_PULSE_EN_REG[7:0] register. The masked interrupt status can be read in the

SS_FH_PULSE_STATUS_REG[7:0] register. Upon reception of an interrupt, software should perform the following:

- Read the **SS_FH_PULSE_STATUS_REG[7:0]** register to determine which channel(s) caused the interrupt.
- Process THost packets for the interrupting channel(s).
- Write the CPSW_2G completion pointer(s) to acknowledge the CPDMA interrupt.
- Write 0x2 to the **CPDMA_EOI_VECTOR_REG** register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

9.4.4.4 MSS_CPSW_MISC_INT Interrupt Description

The **MSS_CPSW_MISC_INT** interrupts are each an immediate (non-paced) pulse interrupt selected from the miscellaneous interrupts (**DED_PEND, SEC_PEND, EVNT_PEND, STAT_PEND, HOST_PEND, MDIO_LINKINT, MDIO_USERINT**). The miscellaneous interrupt bits are enabled by setting one or more bits in the **SS_MISC_EN_REG** register. The masked interrupt status can be read in the **SS_MISC_STATUS_REG** register. Upon reception of an interrupt, software should perform the following:

- Read the **SS_MISC_STATUS_REG** register to determine the cause of the interrupt.
 - **MDIO_USERINT** is the logical “OR” of the CPSW_2G MDIO **MDIO_USERINT[1:0]**.
 - **MDIO_LINKINT** is the logical “OR” of the CPSW_2G MDIO **MDIO_LINKINT[1:0]**
 - **HOST_PEND** is the CPSW_2G CPDMA host error interrupt.
 - **STAT_PEND** is the logical “OR” of the CPSW_2G statistics interrupt **STAT_PEND[2:0]**.
 - **EVNT_PEND** is the CPSW_2G CPTS event interrupt.
 - **SEC_PEND** is the ECC Single bit error interrupt.
 - **DED_PEND** is the ECC double bit error interrupt.
- Process the interrupt.
- Write 0x3 to the **CPDMA_EOI_VECTOR** register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

9.4.4.5 ECC SEC ESM Interrupt (MSS_CPSW_SERR)

ESM interrupt indicating a CPSW_2G ECC single error has been detected and corrected. Although the **MSS_CPSW_SERR** value can be read in the **CPDMA_IN_VECTOR** register, there is no EOI associated with this interrupt. It is a direct output of the CPSW_2G ECC aggregator module. MSS can enable this interrupt from **SS_MISC_EN_REG[5]** and read status from **SS_TH_PULSE_STATUS_REG[5]**

9.4.4.6 ECC DED ESM Interrupt (MSS_CPSW_UERR)

ESM interrupt indicating a CPSW_2G ECC double error has been detected. Although the **MSS_CPSW_UERR** value can be read in the **CPDMA_IN_VECTOR** register, there is no EOI associated with this interrupt. It is a direct output of the CPSW_2G ECC aggregator module. MSS can enable this interrupt from **SS_MISC_EN_REG[6]** and read status from **SS_MISC_STATUS_REG[6]**.

9.4.4.7 THost Threshold Interrupts for CPDMA

Each of the eight THost channels has a corresponding THost threshold interrupt (**TH_THRESH_PEND[7:0]**). The THost threshold interrupts are level interrupts that remain asserted until the triggering condition is cleared by the host. Each of the eight threshold interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_TH_INTSTAT_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_TH_INTSTAT_CLR** register. The raw and masked interrupt receive interrupt status may be read by reading the **CPDMA_TH_INTSTAT_RAW** and **CPDMA_TH_INTSTAT_MASKED** registers respectively. A **TH_THRESH_PEND[7:0]** interrupt bit is asserted when enabled and when the channel’s associated freebuffer count (**CPDMA_TH(0/7)_FREEBUFFER**) is less than or equal to the channel’s associated flow control threshold register (**CPDMA_TH(0/7)_PENDTHRESH**). The threshold interrupts are intended to give the host an indication that resources are running low for a particular channel(s).

9.4.4.8 THost Packet Completion Interrupts for CPDMA

The THost DMA controller has eight channels with each channel having a corresponding interrupt (**TH_PEND[7:0]**). The THost interrupts are level interrupts that remain asserted until cleared by the host.

Each of the eight channel interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_TH_INTSTAT_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_TH_INTSTAT_CLR** register. The raw and masked interrupt status may be read by reading the **CPDMA_TH_INTSTAT_RAW** and **CPDMA_TH_INTSTAT_MASKED** registers respectively. When a packet transfer is complete, the CPDMA issues an interrupt to the host by writing the packet's last buffer descriptor address to the appropriate channel queue's **CPDMA_TH(0..7)_CP** completion pointer. The interrupt is generated by the write, regardless of the value written. Upon interrupt reception, the host processes one or more packets from the queue and then acknowledges one or more interrupt(s) by writing the address of the last buffer descriptor processed to the queue's associated **CPDMA_TH(0..7)_CP** Completion Pointer. If the host written buffer address value is different from the buffer address written by the port, then the level interrupt remains asserted which means that the CPDMA has transferred more packets than the host has processed interrupts for. If the host written buffer address value is equal to the port written value then the host has processed all packets that the CPDMA has transferred and the level interrupt is deasserted. The CPDMA write to the completion pointer actually stores the value. The host written value is actually not written to the register location. The host written value is compared to the register contents which was written by the CPDMA. If the two values are equal then the interrupt is removed, otherwise the interrupt remains asserted. The host may process multiple packets previous to acknowledging an interrupt, or the host may acknowledge interrupts for every packet.

9.4.4.9 FHost Packet Completion Interrupts for CPDMA

The FHost DMA controller has eight channels with each channel having a corresponding interrupt (**FH_PEND[7:0]**). The FHost interrupts are level interrupts that remain asserted until cleared by the host. Each of the eight channel interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_FH_INTSTAT_MASKED_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_FH_INTSTAT_MASKED_CLR** register. The raw and masked interrupt status may be read by reading the **CPDMA_FH_INTSTAT_RAW** and **CPDMA_FH_INTSTAT_MASKED** registers respectively. When each packet transfer is complete, the CPDMA issues an interrupt to the host by writing the packet's last buffer descriptor address to the appropriate channel **CPDMA_FH(0..7)_CP** completion pointer register. The interrupt is generated by the write, regardless of the value written. Upon interrupt reception, the host processes one or more packets from the queue and then acknowledges an interrupt by writing the address of the last buffer descriptor processed to the queue's associated FHost Completion Pointer. If the host written buffer address value is different from the buffer address written by the port, then the level interrupt remains asserted which means that the CPDMA has transferred more packets than the host has processed interrupts for. If the host written buffer address value is equal to the port written value then the host has processed all packets that the CPDMA has transferred and the level interrupt is deasserted. The CPDMA write to the completion pointer actually stores the value. The host written value is actually not written to the register location. The host written value is compared to the register contents which was written by the CPDMA and if the two values are equal then the interrupt is removed, otherwise the interrupt remains asserted. The host may process multiple packets previous to acknowledging an interrupt, or the host may acknowledge interrupts for every packet.

9.4.5 Media Independent Interfaces (XGMII/GMII)

For the purposes of this document, Ethernet transmit is egress and Ethernet receive is ingress.

9.4.5.1 Receive Control

Data received from the PHY is interpreted and forwarded by the MAC into the switch. Interpretation involves detection and removal of the preamble and start of frame delimiter, extraction of the address and frame length, data handling, error checking and reporting, cyclic redundancy checking (CRC), and statistics control signal generation.

9.4.5.1.1 Receive Inter-Frame Interval

The 802.3 required inter-packet gap (IPG) is 24 GMII clocks (96 bit times) for 10/100 Mbit modes, and 12 GMII clocks (96 bit times) for 1000 Mbit mode. However, the MAC can tolerate a reduced IPG (2 GMII clocks in 10/100 mode and 5 GMII clocks in 1000 mode) with a correct preamble and start frame delimiter.

This interval between frames must comprise (in the following order):

1. An Inter-Packet Gap (IPG).
2. A seven octet preamble (all octets 0x55).
3. A one octet start frame delimiter (0x5d).

9.4.5.1.2 Received Frame Classification

Received frames are proper (good) frames if they are between 64 and **PN_RX_MAXLEN** in length (inclusive) and contain no errors (code/align/CRC).

Received frames are long frames if their frame count exceeds the value in the **PN_RX_MAXLEN** register. The **PN_RX_MAXLEN** register reset (default) value is 1518 (dec). Long received frames are either oversized or jabber frames. Long frames with no errors are oversized frames. Long frames with CRC, code, or alignment errors are jabber frames.

Received frames are short frames if their frame count is less than 64 bytes. Short frames that contain no errors are runt frames. Short frames with CRC, code, or alignment errors are fragment frames. If **RX_CSF_EN** in **PN_MAC_CONTROL** is set, undersized frames from 33 to 63 bytes will be forwarded only to the host on a best effort basis (meaning that the ALE may or may not be able to keep up with the packet rate and the short packet may be dropped due to bandwidth limitations). If **RX_CSF_EN** and **RX_CEF_EN** in **PN_MAC_CONTROL** are set, fragment frames from 33 to 63 bytes will also be forwarded only to the host on a best effort basis. Ethernet port received frames shorter than 33 bytes are dropped in all cases.

A received long packet will always contain **PN_RX_MAXLEN** number of bytes transferred to memory (if **RX_CEF_EN** = 1). Examples with **PN_RX_MAXLEN** = 1518 is below:

- If the frame length is 1518, then the packet is not a long packet and there will be 1518 bytes transferred to memory.
- If the frame length is 1519, there will be 1518 bytes transferred to memory. The last three bytes will be the first three CRC bytes.
- If the frame length is 1520, there will be 1518 bytes transferred to memory. The last two bytes will be the first two CRC bytes.
- If the frame length is 1521, there will be 1518 bytes transferred to memory. The last byte will be the first CRC byte.
- If the frame length is 1522, there will be 1518 bytes transferred to memory. The last byte will be the last data byte.

9.4.5.2 Transmit Control

A jam sequence is output if a collision is detected on a transmit packet in half-duplex mode. If the collision was late (after the first 64 bytes have been transmitted) then the collision is ignored. If the collision is not late, then the controller will back off before retrying the frame transmission. When operating in full duplex mode the carrier sense (CRS) and collision sensing modes are disabled.

9.4.5.2.1 Adaptive Performance Optimization (APO)

The Ethernet MAC port incorporates Adaptive Performance Optimization (APO) logic that may be enabled by setting the **TX_PACE** bit in the **PN_MAC_CONTROL** register. Transmission pacing to enhance performance is enabled when set. Adaptive performance pacing introduces delays into the normal transmission of frames, delaying transmission attempts between stations, reducing the probability of collisions occurring during heavy traffic (as indicated by frame deferrals and collisions) thereby increasing the chance of successful transmission.

When a frame is deferred, suffers a single collision, multiple collisions or excessive collisions, the pacing counter is loaded with an initial value of 31. When a frame is transmitted successfully (without experiencing a deferral, single collision, multiple collision or excessive collision) the pacing counter is decremented by one, down to zero.

With pacing enabled, a new frame is permitted to immediately (after one IPG) attempt transmission only if the pacing counter is zero. If the pacing counter is non-zero, the frame is delayed by the pacing delay, a delay of approximately four inter-packet gap delays. APO only affects the IPG preceding the first attempt at transmitting a frame. It does not affect the back-off algorithm for retransmitted frames.

9.4.5.2.2 Inter-Packet-Gap Enforcement

The measurement reference for the IPG of 96 bit times is changed depending on frame traffic conditions. If a frame is successfully transmitted without collision, and **MCRS** is de-asserted within approximately 48 bit times of **MTXEN** being de-asserted, then 96 bit times is measured from **MTXEN**. If the frame suffered a collision, or if **MCRS** is not de-asserted until more than approximately 48 bit times after **MTXEN** is de-asserted, then 96 bit times (approximately, but not less) is measured from **MCRS**.

The Ethernet port transmit inter-packet gap (IPG) may be shortened by eight bit times when short gap is enabled and triggered. Setting the **TX_SHORT_GAP_ENABLE** bit each **PN_MAC_CONTROL** register enables the gap to be shortened when triggered. The condition is triggered when the ports associated transmit packet FIFO has a user defined number of FIFO blocks used. The associated transmit FIFO blocks used value determines if the gap is shortened, and so on. The **GAP_THRESH** register value determines the short gap threshold. If the FIFO blocks used is greater than or equal to the **GAP_THRESH** value then short gap is triggered.

9.4.5.2.3 Programmable Transmit Inter-Packet Gap

The transmit inter-packet gap (IPG) is programmable through the **PN_MAC_TX_GAP** register. The default value is decimal 12. The transmit IPG may be increased to the maximum value of 0x1ff. Increasing the IPG is not compatible with transmit pacing. The short gap feature will override the increased gap value, so the short gap feature may not be compatible with an increased IPG.

9.4.5.2.4 Back Off

The Ethernet Mac implements the 802.3 binary exponential back-off algorithm for half-duplex based collisions.

9.4.5.3 Emulation Control

The emulation control input (**TBEMUSUP**) and register bits (**SOFT** and **FREE** in the **PN_MAC_EMCONTROL** register) allow Mac operation to be suspended. When the emulation suspend state is entered, the MAC will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. For receive, frames that are detected by the MAC after the suspend state is entered are ignored. Emulation control is implemented for compatibility with other peripherals. [Table 9-7](#) shows the operations of emulation control input and register bits.

Table 9-7. Emulation Control Input and Register Bits

TBEMUSUP	SOFT	FREE	Description
0	X	X	Normal Operation
1	0	0	Normal Operation
1	1	0	Emulation Suspend
1	X	1	Normal Operation

9.4.5.4 Command IDLE

The **CMD_IDLE** bit in the **PN_MAC_CONTROL** register allows MAC operation to be suspended by software. When the idle state is commanded, the MAC will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. Received frames that are detected after the suspend state is entered are ignored (dropped without any processing or statistics). Commanded idle is similar in operation to emulation control and hardware clock stop.

9.4.6 Software IDLE

The submodule software idle register bits enable CPSW operation to be completely or partially suspended by software control. There are two CPSW submodules that contain software idle register bits. Each of the two submodules may be individually commanded to enter the idle state. The idle state is entered at packet boundaries, and no further packet operations will occur on an idled submodule until the idle command is removed. The CPSW module enters the idle state when all two submodules are commanded to enter and have entered the idle state. Idle status is determined by reading or polling the two submodule idle bits. The CPSW_2G is in the idle state when all two submodules are in the idle state. The CPSW_SOFT_IDLE_REG[0] SOFT_IDLE

bit may be set if desired after the submodules are in the idle state. The SOFT_IDLE bit causes packets to not be transferred from one FIFO to another FIFO internal to the switch.

9.4.7 CPSW_2G

The CPSW_2G RMII/ RGMII interface is compliant to the IEEE Std 802.3 Specification.

The CPSW_2G contains one Ethernet port interface (Ethernet port 1), one CPPI packet streaming interface host port (port 0), Common Platform Time Sync (CPTS), ALE Engine and Statistics (STATS). A top-level block diagram of the CPSW_2G is shown in [Figure 9-6](#).

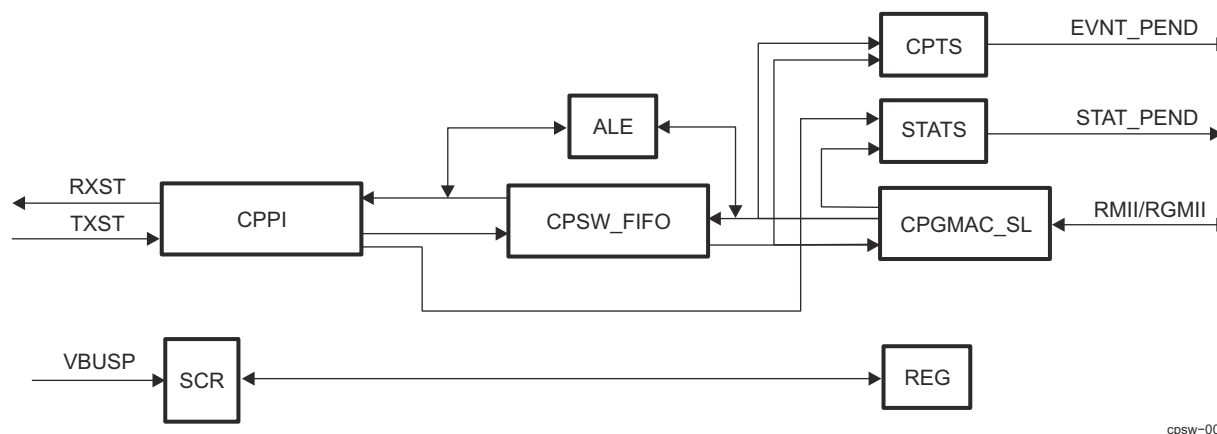

Figure 9-6. CPSW_2G Block Diagram

9.4.7.1 Address Lookup Engine (ALE)

The Address Lookup Engine (ALE) is a sub-block of the CPSW Switch and it processes all received packets and determines to which port(s) the packet should be forwarded. The ALE uses the incoming packet received port number, destination address, source address, length/type, and VLAN information to determine how the packet should be forwarded. The ALE outputs the port mask to the switch fabric that indicates the port(s) the packet should be forwarded to. The ALE is enabled when the ENABLE bit in the ALE_CONTROL_REG register is set. All packets are dropped when the ENABLE bit is cleared to 0.

9.4.7.1.1 Error Handling

In normal operation, the Ethernet port is configured to issue an abort, instead of an end of packet, at the end of a packet that contains an error (runt, frag, oversize, jabber, crc, alignment, code etc.) or at the end of a MAC control packet. However, when the PN_MAC_CONTROL_REG configuration bit(s) RX_CEF_EN, RX_CSF_EN, or RX_CMF_EN are set, error frames, short frames or MAC control frames have a normal end of packet instead of an abort at the end of the packet. When the ALE receives a packet that contains errors (due to a set header error bit), or a MAC control frame and does not receive an abort, the packet will be forwarded only to the host port (port 0). Packets with errors that are forwarded to the host have no VLAN untagging or drop due to rate limiting. No ALE learning occurs on packets with errors or mac control frames. Learning is based on source address and lookup is based on destination address. Directed packets from the host are not learned, updated, or touched.

9.4.7.1.2 Bypass Operations

The ALE may be configured to operate in bypass mode by setting the BYPASS bit in the ALE_CONTROL_REG register. When in bypass mode, all Ethernet port received packets are forwarded only to the host port (port 0). In bypass mode, the ALE processes host port transmit packets the same as in normal mode. In general, packets would be directed by the host in bypass mode.

9.4.7.1.3 OUI Deny or Accept

The ALE may be configured to operate in OUI deny mode by setting the enable_oui_deny bit in the ALE_CONTROL register. When in OUI deny mode, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches with a supervisory table entry. (Non-matching OUI source address broadcast/multicast packets will be dropped to the host unless the packet destination address is entered into the table with the super bit set. Non-matching OUI source address unicast packets will be dropped to the host unless the unicast destination address is in the table with block and Secure both set). When enable_oui_deny is cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory address table entry. (Broadcast packets matching the OUI source address will be dropped to the host unless the broadcast destination address is entered into the table with the super bit set. Unicast packets matching the OUI source address will be dropped to the host unless the unicast destination address is in the table with block and Secure both set)

9.4.7.1.4 Statistics Counting

ALE sends many statistics along with the frame routing so the CPSW can count them on a per port basis. The events specified through the CPSW_ALE_STAT_DIAG[3-0] STAT_DIAG field are individually counted in CPSW per port statistics counters.

9.4.7.1.5 Supervisory packets

Multicast supervisory packets are designated by the SUPER bit in the table entry. Unicast supervisory packets are indicated when BLOCK and SECURE are both set. Supervisory packets are not dropped due to rate limiting, OUI, or VLAN processing. The purpose of supervisory packets is to allow packets that would be otherwise blocked to be forwarded for special purposes.

9.4.7.1.6 ALE Lookup Table Entry Definitions

The ALE table contains multiple table entry types. Each table entry represents a free entry, an address, a VLAN, an address/VLAN pair, or an OUI address. Software should ensure that there are not double address entries in the table. The double entry used would be indeterminate. Reserved table bits must be written with zeroes.

Source Address learning occurs for packets with a unicast, multicast or broadcast destination address and a unicast or multicast (including broadcast) source address. Multicast source addresses have the group bit (bit 40) cleared before ALE processing begins, changing the multicast source address to a unicast source address. A multicast address of all ones is the broadcast address which may be added to the table. A learned unicast source address is added to the table with the following control bits:

Table 9-8. Learned Address Control Bits

Bit(s)	Value
Ageable	1
Touch	1
BLOCK	0
SECURE	0

If a received packet has a source address that is equal to the destination address then the following occurs:

- The address is learned if the address is not found in the table.
- The address is updated if the address is found.
- The packet is dropped.

Table Entry Type

00 - Free Entry

01 - Address Entry : unicast or multicast determined by destination **address bit 40**. (1:Multicast, 0:Unicast)

10 - VLAN entry

11 - VLAN Address Entry : unicast or multicast determined by **address bit 40**.(1:Multicast, 0:Unicast)

9.4.7.1.6.1 Free Table Entry

Table 9-9. Free (Unused) Address Table Entry Bit Values

70:62	61:60	59:0
Reserved	ENTRY_TYPE (00)	Reserved

9.4.7.1.6.2 Multicast Address Table Entry (Bit 40==1)

Table 9-10. Multicast Address Table Entry Bit Values

70:68	67:66	65	64	63:62	61:60	59:48	47:0
Reserved	PORT_MASK	SUPER	IgnoreMbits	MCAST_FWD_STATE	ENTRY_TYPE (01)	Reserved	MULTICAST_ADDRESS

IgnoreMbits

Ignore Multicast Bits - Indication that the Multicast Address has ignored bits.

Supervisory Packet (SUPER)

When set, this field indicates that the packet with a matching multicast destination address is a supervisory packet.

0: Non-supervisory packet

1: Supervisory packet

Port Mask(1:0) (PORT_MASK)

This 2-bit field is the port bit mask that is returned with a found multicast destination address. There may be multiple bits set indicating that the multicast packet may be forwarded to multiple ports (but not the receiving port).

Multicast Forward State (MCAST_FWD_STATE)

Indicates the port state(s) required for the received port on a destination address lookup in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state in order to forward the packet. If the transmit PORT_MASK has multiple set bits then each forward decision is independent of the other transmit port(s) forward decision.

00 - Forwarding

01 - Blocking/Forwarding/Learning

10 - Forwarding/Learning

11 - Forwarding

The forward state test returns a true value if both the RX and TX ports are in the required state.

Table Entry Type (ENTRY_TYPE)

Address entry type. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

Packet Address (MULTICAST_ADDRESS)
