

# INA21x-Q1 Automotive-Grade, Voltage Output, Low-Side or High-Side Measurement, Bidirectional, Zero-Drift Series, Current-Shunt Monitors

## 1 Features

- AEC-Q100 qualified for automotive applications:
  - Temperature grade 1:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $T_A$
- Functional Safety-Capable
  - Documentation available to aid functional safety system design
- Wide common-mode range:  $-0.3\text{ V}$  to  $26\text{ V}$
- Offset voltage:  $\pm 100\ \mu\text{V}$  (maximum) (enables shunt drops of 10-mV full-scale)
- Accuracy:
  - Gain error:
    - $\pm 1\%$  (max over temperature, versions A, B)
    - $\pm 0.5\%$  (version C)
  - Offset drift:  $0.5\text{-}\mu\text{V}/^{\circ}\text{C}$  (maximum)
  - Gain drift:  $10\text{-ppm}/^{\circ}\text{C}$  (maximum)
- Choice of gain:
  - INA210-Q1: 200 V/V
  - INA211-Q1: 500 V/V
  - INA212-Q1: 1000 V/V
  - INA213-Q1: 50 V/V
  - INA214-Q1: 100 V/V
  - INA215-Q1: 75 V/V
- Quiescent current:  $100\ \mu\text{A}$  (maximum)
- Package: 6-pin SC70

## 2 Applications

- Body control module
- Valve control
- Motor control
- Electronic stability control
- Wireless charging transmitters

## 3 Description

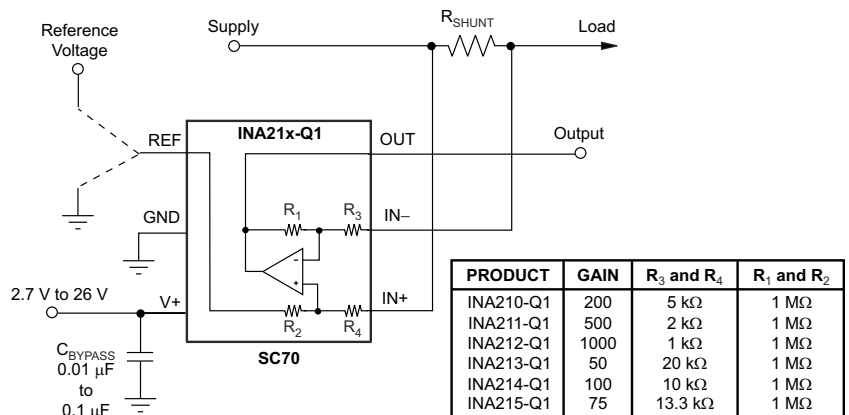

The INA21x-Q1 family of devices is a voltage-output, current-shunt monitor (also called a current-sense amplifier) that can sense drops across shunts at common-mode voltages from  $-0.3\text{ V}$  to  $26\text{ V}$ , independent of the supply voltage. Five fixed gains are available: 50 V/V, 75 V/V, 100 V/V, 200 V/V, 500 V/V, and 1000 V/V. This family of devices is commonly used for overcurrent detection, voltage feedback control loops, or as a power monitor. The low offset of the zero-drift architecture enables current sensing with maximum drops across the shunt as low as 10-mV full-scale.

The devices operate from a single 2.7-V to 26-V power supply, drawing a maximum of  $100\ \mu\text{A}$  of supply current. The devices are specified over the operating temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  and are offered in a 6-pin SC70 package.

### Device Information

PART NUMBER	PACKAGE <sup>(1)</sup>	BODY SIZE (NOM)
INA210-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA211-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA212-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA213-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA214-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA215-Q1	SC70 (6)	2.00 mm × 1.25 mm

(1) For all available packages, see the package option addendum at the end of the data sheet.

$$V_{\text{OUT}} = (I_{\text{LOAD}} \times R_{\text{SHUNT}}) \text{Gain} + V_{\text{REF}}$$

## 4 Pin Configuration and Functions

**Figure 4-1. DCK Package 6-Pin SC70 Top View**

**Table 4-1. Pin Functions**

PIN		I/O	DESCRIPTION
NAME	NO.		
GND	2	—	Ground
IN-	5	I	Connect to load side of shunt resistor.
IN+	4	I	Connect to supply side of shunt resistor
OUT	6	O	Output voltage
REF	1	I	Reference voltage, 0 V to V+
V+	3	—	Power supply, 2.7 V to 26 V

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage, $V_S$ <sup>(5)</sup> <sup>(3)</sup>			28	V
Analog inputs, $V_{IN+}$ , $V_{IN-}$ <sup>(3)</sup> <sup>(2)</sup>	Differential: $V_{DIF} = (V_{IN+}) - (V_{IN-})$	-28	28	V
	Common-mode (Version A)	GND - 0.3	28	V
	Common-mode (Versions B and C)	GND - 0.1	28	V
REF input		GND - 0.3	$(V_S) + 0.3$	V
Output <sup>(4)</sup>		GND - 0.3	$(V_S) + 0.3$	V
Input current into any pin <sup>(4)</sup>			5	mA
Operating temperature		-40	125	°C
Junction temperature			150	°C
Storage temperature, $T_{stg}$		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2)  $V_{IN+}$  and  $V_{IN-}$  are the voltages at the IN+ and IN- pins, respectively.
- (3) Sustained operation between 26 V and 28 V for more than a few minutes may cause permanent damage to the device.
- (4) Input voltage at any pin can exceed the voltage shown if the current at that pin is limited to 5 mA.
- (5)  $V_S$  refers to the voltage at the V+ pin.

### 5.2 ESD Ratings

			VALUE	UNIT
<b>INA21x-Q1 (VERSION A)</b>				
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup> HBM ESD classification level 2	±2000	V
		Charged device model (CDM), per AEC Q100-011 CDM ESD classification level C6	±1000	
<b>INA21x-Q1 (VERSIONS B AND C)</b>				
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup> HBM ESD classification level 2	±3500	V
		Charged device model (CDM), per AEC Q100-011 CDM ESD classification level C6	±1000	

- (1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{CM}$	Common-mode input voltage		12		V
$V_S$	Supply voltage	2.7		26	V
$T_J$	Junction temperature	-40		125	°C

## 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		INA21x-Q1	
		DCK (SC70)	
		6 PINS	
UNIT			
$R_{\theta JA}$	Junction-to-ambient thermal resistance	227.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	79.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	72.1	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	3.6	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	70.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

## 5.5 Electrical Characteristics

at  $T_A = 25^\circ\text{C}$  and  $V_{SENSE} = V_{IN+} - V_{IN-}$

INA210-Q1, INA213-Q1, INA214-Q1, and INA215-Q1:  $V_S = 5\text{ V}$ ,  $V_{IN+} = 12\text{ V}$ , and  $V_{REF} = V_S / 2$ , (unless otherwise noted)

INA211-Q1 and INA212-Q1:  $V_S = 12\text{ V}$ ,  $V_{IN+} = 12\text{ V}$ , and  $V_{REF} = V_S / 2$ , (unless otherwise noted)

PARAMETER	TEST CONDITIONS		MIN	TYP	MAX	UNIT	
<b>INPUT</b>							
$V_{CM}$	Common-mode input	Version A $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$	-0.3		26	V	
		Versions B and C $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$	-0.1		26		
CMRR	Common-mode rejection ratio	$V_{IN+} = 0\text{ V}$ to $26\text{ V}$ $V_{SENSE} = 0\text{ mV}$ $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$	INA210-Q1 INA211-Q1 INA212-Q1 INA214-Q1 INA215-Q1	105	140	dB	
			INA213-Q1	100	120		
$V_{OS}$	Offset voltage, RTI <sup>(1)</sup>	$V_{SENSE} = 0\text{ mV}$ $T_A = 25^\circ\text{C}$	INA210-Q1 INA211-Q1 INA212-Q1		$\pm 0.55$	$\pm 35$	$\mu\text{V}$
			INA213-Q1		$\pm 5$	$\pm 100$	
			INA214-Q1 INA215-Q1		$\pm 1$	$\pm 60$	
$dV_{OS}/dT$	Offset voltage vs temperature <sup>(3)</sup>	$T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$		0.1	0.5	$\mu\text{V}/^\circ\text{C}$	
PSR	Offset voltage vs power supply	$V_S = 2.7\text{ V}$ to $18\text{ V}$ $V_{IN+} = 18\text{ V}$ $V_{SENSE} = 0\text{ mV}$ $T_A = 25^\circ\text{C}$		$\pm 0.1$	$\pm 10$	$\mu\text{V}/\text{V}$	
$I_B$	Input bias current	$V_{SENSE} = 0\text{ mV}$ $T_A = 25^\circ\text{C}$	15	28	35	$\mu\text{A}$	
$I_{OS}$	Input offset current	$V_{SENSE} = 0\text{ mV}$ $T_A = 25^\circ\text{C}$		$\pm 0.02$		$\mu\text{A}$	

## 5.5 Electrical Characteristics (continued)

at  $T_A = 25^\circ\text{C}$  and  $V_{\text{SENSE}} = V_{\text{IN}+} - V_{\text{IN}-}$

INA210-Q1, INA213-Q1, INA214-Q1, and INA215-Q1:  $V_S = 5\text{ V}$ ,  $V_{\text{IN}+} = 12\text{ V}$ , and  $V_{\text{REF}} = V_S / 2$ , (unless otherwise noted)

INA211-Q1 and INA212-Q1:  $V_S = 12\text{ V}$ ,  $V_{\text{IN}+} = 12\text{ V}$ , and  $V_{\text{REF}} = V_S / 2$ , (unless otherwise noted)

## 6 Detailed Description

### 6.1 Overview

The INA210-Q1 to INA215-Q1 are 26-V, common-mode, zero-drift topology, current-sensing amplifiers that can be used in both low-side and high-side configurations. These specially-designed, current-sensing amplifiers are able to accurately measure voltages developed across current-sensing resistors on common-mode voltages that far exceed the supply voltage powering the device. Current can be measured on input voltage rails as high as 26 V and the device can be powered from supply voltages as low as 2.7 V.

The zero-drift topology enables high-precision measurements with maximum input offset voltages as low as 35  $\mu\text{V}$  with a maximum temperature contribution of 0.5  $\mu\text{V}/^\circ\text{C}$  over the full temperature range of  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ .

### 6.2 Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 Basic Connections

Figure 6-1 shows the basic connections of the INA210-Q1 to INA215-Q1. Connect the input pins (IN+ and IN-) as closely as possible to the shunt resistor to minimize any resistance in series with the shunt resistor.

Copyright © 2017, Texas Instruments Incorporated

**Figure 6-1. Typical Application**

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies can require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

### 6.3.2 Selecting $R_S$

The zero-drift offset performance of the INA21x-Q1 family of devices offers several benefits. In general, the primary advantage of the low offset characteristic enables lower full-scale drops across the shunt. For example, non-zero-drift current-shunt monitors typically require a full-scale range of 100 mV.

The INA21x-Q1 family of devices provides equivalent accuracy at a full-scale range on the order of 10 mV. This accuracy reduces shunt dissipation by an order of magnitude with many additional benefits.

Alternatively, some applications must measure current over a wide dynamic range and can take advantage of the low offset on the low end of the measurement. Most often, these applications can use the lower-gain INA213-Q1, INA214-Q1, or INA215-Q1 to accommodate larger shunt drops on the upper end of the scale. For instance, an INA213-Q1 device operating on a 3.3-V supply can easily support a full-scale shunt drop of 60 mV, with only 100  $\mu$ V of offset.

## 6.4 Device Functional Modes

### 6.4.1 Input Filtering

An obvious and straightforward location for filtering is at the output of the INA21x-Q1 family of devices. However, this location negates the advantage of the low output impedance of the internal buffer. The only other filtering option is at the input pins of the INA21x-Q1 family of devices. This location, however, requires consideration of the  $\pm 30\%$  tolerance of the internal resistances. [Figure 6-2](#) shows a filter placed at the input pins.

**Figure 6-2. Filter at Input Pins**

The addition of external series resistance, however, creates an additional error in the measurement so the value of these series resistors must be kept to  $10\ \Omega$  (or less, if possible) to reduce impact to accuracy. The internal bias network shown in [Figure 6-2](#) that is present at the input pins creates a mismatch in input bias currents when a differential voltage is applied between the input pins. If additional external series filter resistors are added to the circuit, the mismatch in bias currents results in a mismatch of voltage drops across the filter resistors. This mismatch creates a differential error voltage that subtracts from the voltage developed at the shunt resistor. This error results in a voltage at the device input pins that is different than the voltage developed across the shunt resistor. Without the additional series resistance, the mismatch in input bias currents has little effect on device operation. The amount of error these external filter resistors add to the measurement can be calculated using [Equation 2](#) where the gain error factor is calculated using [Equation 1](#).

The amount of variance in the differential voltage present at the device input relative to the voltage developed at the shunt resistor is based both on the external series resistance value as well as the internal input resistors,  $R_3$  and  $R_4$  (or  $R_{INT}$  as shown in [Figure 6-2](#)). The reduction of the shunt voltage reaching the device input pins appears as a gain error when comparing the output voltage relative to the voltage across the shunt resistor. A factor can be calculated to determine the amount of gain error that is introduced by the addition of external series resistance. Use [Equation 1](#) to calculate the expected deviation from the shunt voltage to what is measured at the device input pins.

$$\text{Gain Error Factor} = \frac{(1250 \times R_{INT})}{(1250 \times R_S) + (1250 \times R_{INT}) + (R_S \times R_{INT})} \quad (1)$$

where:

- $R_{INT}$  is the internal input resistor ( $R_3$  and  $R_4$ ), and
- $R_S$  is the external series resistance.

With the adjustment factor from [Equation 1](#) including the device internal input resistance, this factor varies with each gain version, as shown in [Table 6-1](#). [Table 6-2](#) lists each individual device gain-error factor.

**Table 6-1. Input Resistance**

PRODUCT	GAIN	R <sub>INT</sub> (kΩ)
INA210-Q1	200	5
INA211-Q1	500	2
INA212-Q1	1000	1
INA213-Q1	50	20
INA214-Q1	100	10
INA215-Q1	75	13.3

**Table 6-2. Device Gain Error Factor**

PRODUCT	SIMPLIFIED GAIN ERROR FACTOR
INA210-Q1	$\frac{1000}{R_S + 1000}$
INA211-Q1	$\frac{10,000}{(13 \times R_S) + 10,000}$
INA212-Q1	$\frac{5000}{(9 \times R_S) + 5000}$
INA213-Q1	$\frac{20,000}{(17 \times R_S) + 20,000}$
INA214-Q1	$\frac{10,000}{(9 \times R_S) + 10,000}$
INA215-Q1	$\frac{8,000}{(7 \times R_S) + 8,000}$

Use [Equation 2](#) to calculate the gain error that can be expected from the addition of the external series resistors.

$$\text{Gain Error (\%)} = 100 - (100 \times \text{Gain Error Factor}) \quad (2)$$

For example, using an INA212-Q1 device and the corresponding gain error equation from [Table 6-2](#), a series resistance of 10 Ω results in a gain error factor of 0.982. The corresponding gain error is then calculated using [Equation 2](#), resulting in a gain error of approximately 1.77% solely because of the external 10-Ω series resistors. Using an INA213-Q1 with the same 10-Ω series resistor results in a gain error factor of 0.991 and a gain error of 0.84% again solely because of these external resistors.

### 6.4.2 Shutting Down the INA21x-Q1 Series

While the INA21x-Q1 family of devices does not have a shutdown pin, the low-power consumption of the device allows the output of a logic gate or transistor switch to power the device. This gate or switch turns on and turns off the INA21x-Q1 power-supply quiescent current.

However, in current-shunt monitoring applications, the amount of current drained from the shunt circuit in shutdown conditions must be considered. Evaluating this current drain involves considering the simplified schematic of the INA21x-Q1 family of devices in shutdown mode shown in [Figure 6-3](#).

Copyright © 2017, Texas Instruments Incorporated

1-MΩ paths from shunt inputs to reference and INA21x-Q1 outputs.

**Figure 6-3. Basic Circuit for Shutting Down INA21x-Q1 With a Grounded Reference**

Slightly more than a 1-MΩ impedance (from the combination of 1-MΩ feedback and 5-kΩ input resistors) exists from each input of the INA21x-Q1 family of devices to the OUT pin and to the REF pin. The amount of current flowing through these pins depends on the respective ultimate connection. For example, if the REF pin is grounded, the calculation of the effect of the 1-MΩ impedance from the shunt to ground is straightforward. However, if the reference or operational amplifier (op amp) is powered when the INA21x-Q1 family of devices is shut down, the calculation is direct. Instead of assuming 1 MΩ to ground, however, assume 1 MΩ to the reference voltage. If the reference or op amp is also shut down, some knowledge of the reference or op amp output impedance under shutdown conditions is required. For instance, if the reference source behaves as an open circuit when not powered, little or no current flows through the 1-MΩ path.

Regarding the 1-MΩ path to the output pin, the output stage of a disabled INA21x-Q1 device does constitute a good path to ground; consequently, this current is directly proportional to a shunt common-mode voltage present across a 1-MΩ resistor.

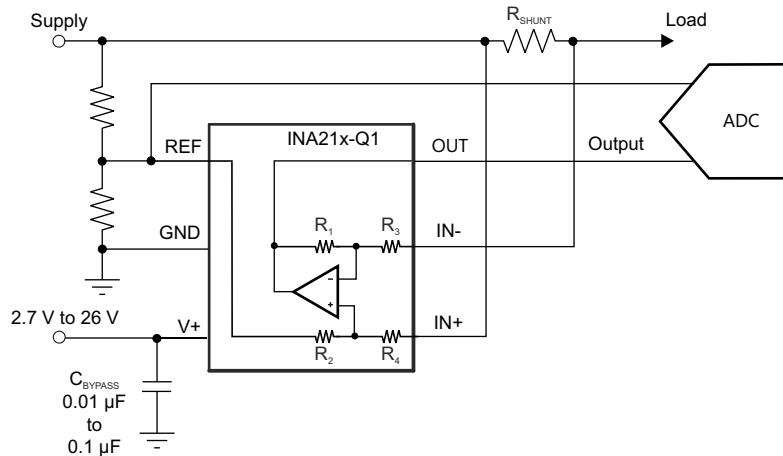

#### Note

When the device is powered up, an additional, nearly constant and well-matched 25-μA current flows in each of the inputs as long as the shunt common-mode voltage is 3 V or higher. Below 2-V common-mode, the only current effects are the result of the 1-MΩ resistors.

### 6.4.3 REF Input Impedance Effects

As with any difference amplifier, the INA21x-Q1 common-mode rejection ratio is affected by any impedance present at the REF input. This concern is not a problem when the REF pin is connected directly to most references or power supplies. When using resistive dividers from the power supply or a reference voltage, buffer the REF pin by an op amp.

In systems where the INA21x-Q1 output can be sensed differentially, such as by a differential input analog-to-digital converter (ADC) or by using two separate ADC inputs, the effects of external impedance on the REF input can be cancelled. [Figure 6-4](#) shows a method of taking the output from the INA21x-Q1 family of devices by using the REF pin as a reference.

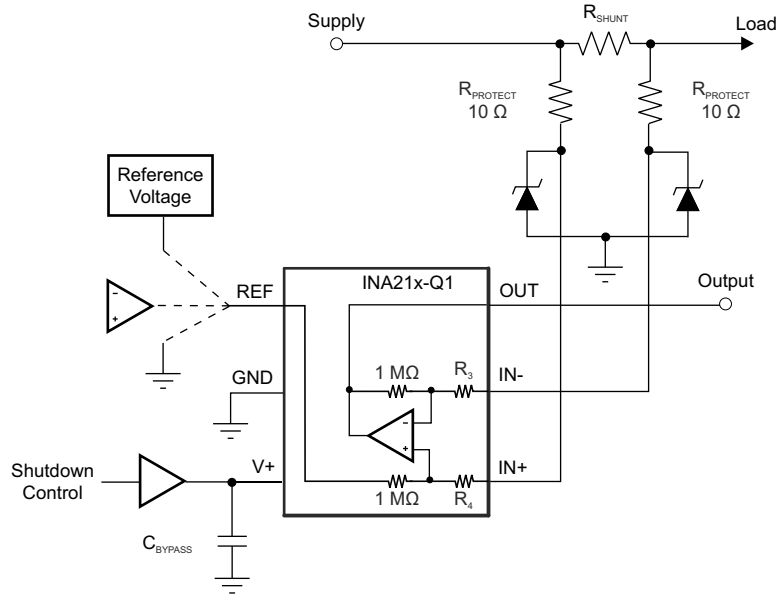

Copyright © 2017, Texas Instruments Incorporated

**Figure 6-4. Sensing INA21x-Q1 to Cancel Effects of Impedance on the REF Input**

### 6.4.4 Using the INA21x-Q1 with Common-Mode Transients Above 26 V

With a small amount of additional circuitry, the INA21x-Q1 family of devices can be used in circuits subject to transients higher than 26 V, such as automotive applications. Use only Zener diode or Zener-type transient absorbers (sometimes referred to as *transzorb*s)—any other type of transient absorber has an unacceptable time delay. Begin by adding a pair of resistors as a working impedance for the Zener diode, as shown in [Figure 6-5](#). Keeping these resistors as small as possible is preferable, typically around 10 Ω. Larger values can be used with an effect on gain that is discussed in the [Section 6.4.1](#) section. Because this circuit limits only short-term transients, many applications are satisfied with a 10-Ω resistor along with conventional Zener diodes of the lowest power rating that can be found. This combination uses the least amount of board space. These diodes can be found in packages as small as SOT-523 or SOD-523.

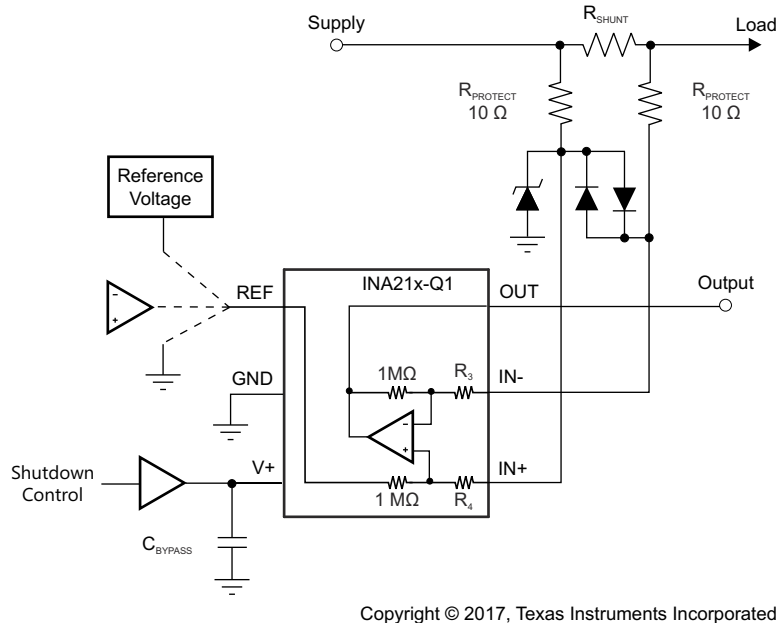

Copyright © 2017, Texas Instruments Incorporated

**Figure 6-5. INA21x-Q1 Transient Protection Using Dual Zener Diodes**

In the event that low-power Zener diodes do not have sufficient transient absorption capability and a higher power transzorb must be used, the most package-efficient solution then involves using a single transzorb and back-to-back diodes between the device inputs. The most space-efficient solutions are dual series-connected diodes in a single SOT-523 or SOD-523 package. Figure 6-6 shows this method. In either of these examples, the total board area required by the INA21x-Q1 family of devices with all protective components is less than that of an SO-8 package, and only slightly greater than that of an MSOP-8 package.

### 6.4.5 Improving Transient Robustness

#### CAUTION

Applications involving large input transients with excessive  $dV/dt$  above 2 kV per microsecond present at the device input pins can cause damage to the internal ESD structures on version A devices.

The potential damage from large input transients is a result of the internal latching of the ESD structure to ground when this transient occurs at the input. With significant current available in most current-sensing applications, the large current flowing through the input transient-triggered, ground-shorted ESD structure quickly results in damage to the silicon. External filtering can be used to attenuate the transient signal prior to reaching the inputs to avoid the latching condition. Care must be taken to ensure that external series input resistance does not significantly impact gain error accuracy. For accuracy purposes, keep these resistances under  $10\ \Omega$  if possible. Ferrite beads are recommended for this filter because of the inherently low-dc ohmic value. Ferrite beads with less than  $10\ \Omega$  of resistance at dc and over  $600\ \Omega$  of resistance at 100 MHz to 200 MHz are recommended. The recommended capacitor values for this filter are between  $0.01\ \mu\text{F}$  and  $0.1\ \mu\text{F}$  to ensure adequate attenuation in the high-frequency region. Figure 6-7 illustrates this protection scheme.

Copyright © 2017, Texas Instruments Incorporated

**Figure 6-7. Transient Protection**

To minimize the cost of adding these external components to protect the device in applications where large transient signals may be present, version B and C devices are now available with new ESD structures that are not susceptible to this latching condition. Version B and C devices are incapable of sustaining these damage-causing latched conditions so they do not have the same sensitivity to the transients that the version A devices have, thus making the version B and C devices a better fit for these applications.

## 7 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 7.1 Application Information

The INA21x-Q1 family of devices measure the voltage developed across a current-sensing resistor when current passes through the resistor. The ability to drive the reference pin to adjust the functionality of the output signal offers multiple configurations, as discussed throughout the [Section 7.2](#) section.

### 7.2 Typical Applications

#### 7.2.1 Unidirectional Operation

Unidirectional operation allows the INA21x-Q1 family of devices to measure currents through a resistive shunt in one direction. The most frequent case of unidirectional operation sets the output at ground by connecting the REF pin to ground. In unidirectional applications where the highest possible accuracy is desirable at very low inputs, bias the REF pin to a convenient value above 50 mV to get the device output swing into the linear range for zero inputs.

A less frequent case of unipolar output biasing is to bias the output by connecting the REF pin to the supply. In this case, the quiescent output for zero input is at quiescent supply. This configuration only responds to negative currents (inverted voltage polarity at the device input).

Copyright © 2017, Texas Instruments Incorporated

**Figure 7-1. Unidirectional Application Schematic**

#### 7.2.1.1 Design Requirements

The device can be configured to monitor current flowing in one direction (unidirectional) or in both directions (bidirectional) depending on how the REF pin is configured. The most common case is unidirectional where the output is set to ground when no current is flowing by connecting the REF pin to ground, as shown in [Figure 7-1](#). When the input signal increases, the output voltage at the OUT pin increases.

### 7.2.1.2 Detailed Design Procedure

The linear range of the output stage is limited in how close the output voltage can approach ground under zero input conditions. In unidirectional applications where measuring very-low input currents is desirable, bias the REF pin to a convenient value above 50 mV to get the output into the linear range of the device. To limit common-mode rejection errors, TI recommends buffering the reference voltage connected to the REF pin.

A less frequently-used output biasing method is to connect the REF pin to the supply voltage,  $V+$ . This method results in the output voltage saturating at 200 mV below the supply voltage when no differential input signal is present. This method is similar to the output-saturated low condition with no input signal when the REF pin is connected to ground. The output voltage in this configuration only responds to negative currents that develop negative differential input voltage relative to the device  $IN-$  pin. Under these conditions, when the differential input signal increases negatively, the output voltage moves downward from the saturated supply voltage. The voltage applied to the REF pin must not exceed the device supply voltage.

### 7.2.1.3 Application Curve

Figure 7-2 shows an example output response of a unidirectional configuration. With the REF pin connected directly to ground, the output voltage is biased to this zero output level. The output rises above the reference voltage for positive differential input signals but cannot fall below the reference voltage for negative differential input signals because of the grounded reference voltage.

Figure 7-2. Unidirectional Application Output Response

## 7.2.2 Bidirectional Operation

Copyright © 2017, Texas Instruments Incorporated

**Figure 7-3. Bidirectional Application Schematic**

### 7.2.2.1 Design Requirements

The device is a bidirectional, current-sense amplifier capable of measuring currents through a resistive shunt in two directions. This bidirectional monitoring is common in applications that include charging and discharging operations where the current flow-through resistor can change directions.

### 7.2.2.2 Detailed Design Procedure

The ability to measure this current flowing in both directions is enabled by applying a voltage to the REF pin, as shown in Figure 7-3. The voltage applied to REF ( $V_{REF}$ ) sets the output state that corresponds to the zero-input level state. The output then responds by increasing above the  $V_{REF}$  value for positive differential signals (relative to the IN- pin) and responds by decreasing below the  $V_{REF}$  value for negative differential signals. This reference voltage applied to the REF pin can be set anywhere between 0 V to  $V_+$ . For bidirectional applications, the  $V_{REF}$  value is typically set at mid-scale for equal signal range in both current directions. In some cases, however, the  $V_{REF}$  value is set at a voltage other than mid-scale when the bidirectional current and corresponding output signal are not required to be symmetrical.

### 7.2.2.3 Application Curve

Figure 7-4 shows an example output response of a bidirectional configuration. With the REF pin connected to a reference voltage, 2.5 V in this case, the output voltage is biased upwards by this reference level. The output rises above the reference voltage for positive differential input signals and falls below the reference voltage for negative differential input signals.

**Figure 7-4. Bidirectional Application Output Response**

## 8 Power Supply Recommendations

The input circuitry of the INA21x-Q1 family of devices can accurately measure beyond the power-supply voltage,  $V+$ . For example, the  $V+$  power supply can be 5 V, whereas the load power-supply voltage can be as high as 26 V. However, the output voltage range of the OUT pin is limited by the voltages on the power-supply pin. The INA21x-Q1 family of devices can withstand the full input-signal range up to 26 V at the input pins, regardless of whether the device has power applied or not.

## 9 Layout

### 9.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very-low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- Place the power-supply bypass capacitor as closely as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1  $\mu\text{F}$ . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

#### 10.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

#### 10.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

#### 10.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

#### 10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

#### 10.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision J (April 2020) to Revision K (October 2023)	Page
<ul style="list-style-type: none"> <li>Updated format to match new TI layout and flow. Tables, figures and cross-references use a new numbering sequence throughout the document.....</li> </ul>	1
Changes from Revision I (August 2019) to Revision J (April 2020)	Page
<ul style="list-style-type: none"> <li>Added Functional Safety-Capable information.....</li> </ul>	1
Changes from Revision H (September 2017) to Revision I (August 2019)	Page
<ul style="list-style-type: none"> <li>Changed <math>V_S</math> and <math>V_{IN}</math> maximum values from 26 V to 28 V in <i>Absolute Maximum Ratings</i> table.....</li> <li>Changed differential <math>V_{IN}</math> minimum value from -26 V to -28 V in <i>Absolute Maximum Ratings</i> table.....</li> <li>Added new Note 3 with caution regarding operation between 26 V and 28 V.....</li> </ul>	4
Changes from Revision G (May 2016) to Revision H (September 2017)	Page
<ul style="list-style-type: none"> <li>Deleted <i>Device Options</i> table .....</li> <li>Added <math>V_{DIF}</math> to analog input parameter in <i>Absolute Maximum Ratings</i> table .....</li> <li>Added <math>V_S</math> table note in <i>Absolute Maximum Ratings</i> table .....</li> <li>Changed formatting of <i>Thermal Information</i> table note .....</li> <li>Deleted first table note in <i>Electrical Characteristics</i> table .....</li> <li>Added version C to input test conditions in <i>Electrical Characteristics</i> table .....</li> <li>Added version C test conditions to gain error parameter in <i>Electrical Characteristics</i> table .....</li> <li>Changed <a href="#">Figure 5-7</a>, <a href="#">Figure 5-10</a> , <a href="#">Figure 5-15</a>, <a href="#">Figure 5-17</a>, <a href="#">Figure 5-18</a>, <a href="#">Figure 5-19</a>, <a href="#">Figure 5-20</a> , <a href="#">Figure 5-21</a> and <a href="#">Figure 5-22</a> to match commercial data sheet .....</li> <li>Added test conditions to <a href="#">Figure 5-8</a>, <a href="#">Figure 5-9</a>, <a href="#">Figure 5-10</a>, and <a href="#">Figure 5-11</a> and <a href="#">Figure 5-12</a> from INA21x commercial data sheet .....</li> <li>Changed x-axis unit in <a href="#">Figure 5-17</a> from "ms" to "µs".....</li> </ul>	3

<ul style="list-style-type: none"> <li>Released INA210-Q1, INA211-Q1, and INA215-Q1 to production.....</li> <li>Deleted second footnote from <i>Device Information</i> table .....</li> </ul>	1

**Changes from Revision E (December 2014) to Revision F (February 2015) Page**

- Changed *Choice of Gain* Features bullet: added INA210-Q1, INA211-Q1, and INA215-Q1 sub-bullets, deleted A from INA213-Q1..... 1
- Changed *Device Information* table: added INA210-Q1, INA211-Q1, INA215-Q1 rows, deleted A from INA213A-Q1, changed package term from SOT to SC70..... 1
- Changed first Features bullet..... 1
- Changed first paragraph of Description section ..... 1
- Changed Simplified Schematic: changed figure table..... 1
- Deleted footnote 1 from *Pin Functions* table ..... 3
- Changed *Absolute Maximum Ratings* operating temperature from –55°C to 150°C to –40°C to 125°C ..... 4
- Changed *ESD Ratings* table: changed title, made CDM values all one row because corner pins and all other pins tested the same, added separation of specs for versions A and B, and moved the storage temperature to *Absolute Maximum Ratings* table; added version B devices ..... 4
- Changed *Electrical Characteristics* table: changed conditions and changed all INA213A-Q1 to INA213-Q1..... 5
- Changed Input,  $V_{CM}$  parameter in *Electrical Characteristics* table ..... 5
- Changed Input,  $CMRR$  and  $V_{OS}$  parameters in *Electrical Characteristics* table ..... 5
- Changed Output, *Gain* parameter in *Electrical Characteristics* table ..... 5
- Deleted test conditions from Output, *Nonlinearity error* parameter in *Electrical Characteristics* table ..... 5
- Changed Frequency Response,  $BW$  parameter in *Electrical Characteristics* table..... 5
- Changed conditions of *Typical Characteristics* section ..... 7
- Changed Figure 7..... 7
- Changed Figure 15 ..... 7
- Changed first sentence of *Overview* section ..... 11
- Changed first sentence of *Basic Connections* section ..... 12
- Changed last paragraph of *Selecting  $R_S$*  section ..... 12
- Changed Table 1 and Table 2 ..... 13
- Changed Figure 25 ..... 15
- Changed *Improving Transient Robustness* section: changed first paragraph, added caution and last paragraph..... 18

**Changes from Revision D (October 2013) to Revision E (October 2014) Page**

- Added *Handling Rating* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ..... 4
- Deleted  $\theta_{JA}$  thermal resistance parameter from *Electrical Characteristics* ..... 5

**Changes from Revision C (August 2013) to Revision D (October 2013) Page**

- Changed INA213-Q1 device to INA213A-Q1 device throughout document..... 1
- Deleted  $T_A$ , Operating Temperature from *ABSOLUTE MAXIMUM RATINGS* table..... 4

---

**Changes from Revision B (June 2010) to Revision C (July 2013)**

**Page**

• Changed device names to -Q1 throughout.....	1
• Added INA212-Q1: 1000 V/V to Features.....	1
• Changed Applications bullets to be all automotive specific.....	1
• Added INA212-Q1 offers a fixed gain of 1000 V/V to Description.....	1
• Added INA212-Q1 to image.....	1
• Deleted Ordering Information table.....	4
• Changed HBM to 2000 V, removed MM.....	4
• Changed $T_A$ to -40 to 125°C.....	4
• Added INA212-Q1 values to CMRR $V_{OS}$ and Gain in Electrical Characteristics table.....	5
• Changed Bandwidth parameter in the <i>ELECTRICAL CHARACTERISTICS</i> to differentiate between devices..	5
• Changed <i>GAIN vs FREQUENCY</i> graph to show difference between devices.....	7
• Added INA212-Q1 device name in App Information.....	12
• Added INA212-Q1 to image.....	15

---

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:18X

SOLDER MASK DETAILS

4214835/C 08/2024

NOTES: (continued)

5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE  
BASED ON 0.125 THICK STENCIL  
SCALE:18X

4214835/C 08/2024

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
