

# TLVM365R1x 3-V to 65-V, 100-mA and 150-mA Wide $V_{IN}$ Synchronous Buck Converter Power Module Optimized for Size and Light Load Efficiency

## 1 Features

- **Functional Safety-Capable**
  - Documentation available to aid functional safety system design
- Versatile synchronous buck DC/DC module:
  - Integrated MOSFETs, inductor, and controller
  - 3-V to 65-V wide input voltage range
  - Up to 70-V input transient
  - $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  junction temperature range
  - 4.5-mm  $\times$  3.5-mm  $\times$  2-mm overmolded package
  - Frequency adjustable from 200 kHz to 2.2 MHz using the RT pin
- Output voltage and current options:
  - Fixed output variants of 3.3-V or 5-V  $V_{OUT}$
  - Adjustable output voltage from 1 V to 6 V
- Inherent protection features for robust design
  - Precision enable input and open-drain PGOOD indicator for control, sequencing, and  $V_{IN}$  UVLO
  - Overcurrent and thermal shutdown protections
- Designed for scalable industrial power supplies:
  - Pin compatible family with [TPSM365R3](#) (65 V, 300 mA), [TPSM365R6](#) (65 V, 600 mA), [TLVM23615](#) (36 V, 1.5 A), and [TLVM23625](#) (36 V, 2.5 A)
- Create a custom design using the TLVM365R15 with the [WEBENCH® Power Designer](#)

## 2 Applications

- [Factory automation](#)
- [Building automation](#)
- [Appliances](#)

**Simplified Schematic**

## 3 Description

The TLVM365R15 and TLVM365R1 are 150-mA or 100-mA, 65-V input, synchronous step-down DC/DC power modules that combine power MOSFETs, integrated inductor, and boot capacitor in a compact and easy-to-use 3.5-mm  $\times$  4.5-mm  $\times$  2-mm, 11-pin QFN package. The small HotRod™ QFN package technology enhances the thermal performance and low EMI. The device features the ultra-low operating IQ of 4  $\mu\text{A}$  at no load (24-V to 3.3-V  $V_{OUT}$ ). The TLVM365R15 and TLVM365R1 support fixed 3.3-V and 5-V outputs, as well as adjustable output voltages ranging from 1 V to 6 V. The devices only require four external components for a 3.3-V and 5-V fixed output design. The TLVM365R15 and TLVM365R1 are designed for excellent EMI performance and space constraint applications.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
TLVM365R15	RDN (QFN-FCMOD, 11)	4.50 mm $\times$ 3.50 mm
TLVM365R1		

(1) For more information, see [Section 11](#).

(2) The package size (length  $\times$  width) is a nominal value and includes pins, where applicable.

### Device Information

PART NUMBER	RATED OUTPUT CURRENT <sup>(1)</sup>
TLVM365R15	150 mA
TLVM365R1	100 mA

(1) See the [Device Comparison Table](#).

## 4 Device Comparison Table

ORDERABLE PART NUMBER <sup>(1)</sup>	RATED CURRENT	OUTPUT VOLTAGE	EXTERNAL SYNC	F <sub>sw</sub>	SPREAD SPECTRUM
TLVM365R15RDNR	150 mA	Fixed 3.3 V / adjustable (1 V – 6 V)	No (default PFM at light load)	Adjustable with RT resistor	No
TLVM365R1RDNR	100 mA	Fixed 5-V / adjustable (1 V – 6 V)	No (default PFM at light load)	Adjustable with RT resistor	No

- (1) For more information on device orderable part numbers, see [Device Nomenclature](#). Contact TI for details and availability of other device options.

## 5 Pin Configuration and Functions

Figure 5-1. RDN Package, 11-Pin QFN-FCMOD, Top View

Table 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	PGOOD	A	Open-drain power-good flag output. Connect to suitable voltage supply through a current limiting resistor. High = power OK, low = power bad. This pin goes low when EN = low. This pin can be open or grounded when not used.
2	EN	A	Enable input to regulator. High = ON, Low = OFF. Can be connected directly to VIN. <i>Do not float this pin.</i>
3	VIN	P	Input supply to regulator. Connect a high-quality bypass capacitor, $C_{IN}$ , or capacitors directly to this pin and GND.
4	VOUT	P	Output voltage. The pin is connected to the internal output inductor. Connect the pin to the output load and connect external output capacitors between the pin and GND.
5, 6	SW	P	Power module switch node. Do not place any external component on this pin or connect to any signal. The amount of copper placed on these pins must be kept to a minimum to prevent issues with noise and EMI.
7	BOOT	P	Bootstrap pin for internal high-side driver circuitry. Do not place any external component on this pin or connect to any signal. A 100-nF bootstrap capacitor is internally connected from this pin to SW within the module to provide the bootstrap voltage.
8	VCC	P	Internal LDO output. Used as supply to internal control circuits. Do not connect to external loads. Can be used as logic supply for power-good flag. Connect a high-quality 1- $\mu$ F capacitor from this pin to GND.
9	FB/BIAS	A	Feedback input. When operating as an adjustable output device, connect the mid-point of the feedback resistor divider to this pin. Connect the upper resistor ( $R_{FBT}$ ) of the feedback divider to VOUT at the desired point of regulation. Connect the lower resistor ( $R_{FBB}$ ) of the feedback divider to GND. When connecting to a feedback resistor divider, keep this FB trace short and as small as possible to avoid noise coupling. See <a href="#">Output Voltage Selection</a> for how to select feedback resistor divider values. Check <a href="#">Device Comparison Table</a> for more details. When operating with a fixed output voltage, connect this pin directly to the VOUT rail. This connection sets the output voltage to a fixed value and biases the internal circuitry. <i>Do not float this pin or connect to ground.</i>
10	GND	G	Power ground terminal. Connect to system ground. Connect to $C_{IN}$ with short, wide traces.
11	RT	A	As the RT variant, the switching frequency can be adjusted from 200 kHz to 2.2 MHz by placing an appropriately sized resistor between this pin and GND. See <a href="#">Section 7.3.2</a> for details. <i>Do not float this pin.</i>

A = Analog, P = Power, G = Ground

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	VIN to GND	-0.3	70	V
	EN to GND	-0.3	70	V
	SW to GND	-0.3	70.3	V
	RT to GND	-0.3	5.5	V
Voltage	FB to GND	-0.3	16	V
Voltage	PGOOD to GND	0	20	V
	BOOT to SW	-0.3	5.5	V
Voltage	VCC to GND	-0.3	5.5	V
Voltage	VOUT to GND	-0.3	16	V
Peak reflow case temperature			260	°C
Maximum number of reflows allowed			3	
Mechanical shock	Mil-STD-883D, Method 2002.3, 1 ms, 1/2 sine, mounted		1500	G
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20 to 2000 Hz		20	G
T <sub>J</sub>	Operating Junction Temperature	-40	125	°C
T <sub>A</sub>	Operating Ambient temperature	-40	105	°C
T <sub>stg</sub>	Storage Temperature	-55	125	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	±1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

Over the recommended operating junction temperature range of -40°C to 125°C (unless otherwise noted). <sup>(1)</sup> <sup>(2)</sup>

		MIN	NOM	MAX	UNIT	
Input voltage	V <sub>IN</sub>	Input voltage range after start-up		3	65	V
Output voltage	V <sub>OUT</sub>	Adjustable output voltage range		1	6	V
Output current	I <sub>OUT</sub>	(TLVM365R15) Load current range <sup>(3)</sup>		0	0.15	A
Output current	I <sub>OUT</sub>	(TLVM365R1) Load current range <sup>(3)</sup>		0	0.1	A
Frequency setting	RT	Selectable frequency range with RT		0.2	2.2	MHz
Temperature	T <sub>J</sub>	Operating Junction Temperature		-40	125	°C
Temperature	T <sub>A</sub>	Operating Ambient Temperature		-40	105	°C

- (1) Recommended operating conditions indicate conditions for which the device is intended to be functional, but do not ensure specific performance limits. For ensured specifications, see the Electrical Characteristics table.  
(2) High junction temperatures degrade operating lifetimes. Operating lifetime is de-rated for junction temperatures greater than 125°C.  
(3) Maximum continuous DC current can be de-rated when operating with high switching frequency or high ambient temperature. See Applications section for details.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TLVM365R15 / TLVM365R1		UNIT
		RDN		
		11 PINS		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance <sup>(2)</sup>	42.9		°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter <sup>(3)</sup>	4.4		°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter <sup>(4)</sup>	17.2		°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) The value of R<sub>θJA</sub> given in this table is valid for comparison with other packages and can not be used for design purposes. This value was calculated in accordance with JESD 51-7, and simulated on a 4-layer JEDEC board. It does not represent the performance obtained in an actual application.
- (3) The junction-to-top board characterization parameter, ψ<sub>JT</sub>, estimates the junction temperature, T<sub>J</sub>, of a device in a real system, using a procedure described in JESD51-2A (section 6 and 7). T<sub>J</sub> = ψ<sub>JT</sub> · P<sub>dis</sub> + T<sub>T</sub>; where P<sub>dis</sub> is the power dissipated in the device and T<sub>T</sub> is the temperature of the top of the device.
- (4) The junction-to-board characterization parameter, ψ<sub>JB</sub>, estimates the junction temperature, T<sub>J</sub>, of a device in a real system, using a procedure described in JESD51-2A (section 6 and 7). T<sub>J</sub> = ψ<sub>JB</sub> · P<sub>dis</sub> + T<sub>B</sub>; where P<sub>dis</sub> is the power dissipated in the device and T<sub>B</sub> is the temperature of the board 1-mm from the device.

## 6.5 Electrical Characteristics

Limits apply over the recommended operating junction temperature (T<sub>J</sub>) range of –40°C to +125°C, unless otherwise stated. Minimum and maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at T<sub>J</sub> = 25°C, and are provided for reference purposes only. Unless otherwise stated, the following conditions apply: V<sub>IN</sub> = 24 V. <sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY VOLTAGE (VIN PIN)</b>						
V <sub>IN_R</sub>	Minimum operating input voltage (rising)	Rising threshold		3.4	3.55	V
V <sub>IN_F</sub>	Minimum operating input voltage (falling)	Once operating; falling threshold	2.45	3.0		V
I <sub>SD_13p5</sub>	Shutdown quiescent current; measured at VIN pin <sup>(2)</sup>	V <sub>EN</sub> = 0 V; V <sub>IN</sub> = 13.5 V		0.55	1.1	µA
I <sub>SD_24p0</sub>	Shutdown quiescent current; measured at VIN pin <sup>(2)</sup>	V <sub>EN</sub> = 0 V; V <sub>IN</sub> = 24 V		1	1.7	µA
I <sub>Q_13p5_Fixed</sub>	Non-switching input current; measured at VIN pin <sup>(2)</sup>	V <sub>IN</sub> = V <sub>EN</sub> = 13.5 V; V <sub>OUT/FB</sub> = 5.25 V, V <sub>MODE/SYNC</sub> = 0 V; fixed output	0.25	0.672	1.05	µA
I <sub>Q_13p5_Adj</sub>	Non-switching input current; measured at VIN pin <sup>(2)</sup>	V <sub>IN</sub> = V <sub>EN</sub> = 13.5 V; V <sub>FB</sub> = 1.05 V, V <sub>MODE/SYNC</sub> = 0 V; adjustable output	13	17	23	µA
I <sub>Q_24p0_Fixed</sub>	Non-switching input current; measured at VIN pin <sup>(2)</sup>	V <sub>IN</sub> = V <sub>EN</sub> = 24 V; V <sub>OUT/FB</sub> = 5.25 V, V <sub>MODE/SYNC</sub> = 0 V; fixed output	0.8	1.2	1.7	µA
I <sub>Q_24p0_Adj</sub>	Non-switching input current; measured at VIN pin <sup>(2)</sup>	V <sub>IN</sub> = V <sub>EN</sub> = 24 V; V <sub>FB</sub> = 1.05 V, V <sub>MODE/SYNC</sub> = 0 V; adjustable output	14	18	22	µA
I <sub>B_13p5</sub>	Current into BIAS pin (not switching) <sup>(2)</sup>	V <sub>IN</sub> = 13.5 V, V <sub>OUT/FB</sub> = 5.25 V, V <sub>RT</sub> = 0 V; fixed output	12	17	24	µA
I <sub>B_24p0</sub>	Current into BIAS pin (not switching) <sup>(2)</sup>	V <sub>IN</sub> = 24 V, V <sub>OUT/FB</sub> = 5.25 V, V <sub>MODE/SYNC</sub> = 0 V; fixed output	12	18	24	µA
<b>ENABLE (EN PIN)</b>						
V <sub>EN-WAKE</sub>	Enable wake-up threshold		0.4			V
V <sub>EN-VOUT</sub>	Precision enable high level		1.16	1.263	1.36	V
V <sub>EN-HYST</sub>	Enable threshold hysteresis		0.3	0.35	0.4	V
I <sub>LKG-EN</sub>	Enable input leakage current	V <sub>EN</sub> = 3.3 V		0.7	8	nA
<b>INTERNAL LDO</b>						
V <sub>CC</sub>	Internal VCC voltage	3.6 V ≤ V <sub>IN</sub> ≤ 65 V; adjustable output	3.1	3.15	3.26	V
I <sub>CC</sub>	Bias regulator current limit			60	120	mA

## 6.5 Electrical Characteristics (continued)

Limits apply over the recommended operating junction temperature ( $T_J$ ) range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ , unless otherwise stated. Minimum and maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at  $T_J = 25^{\circ}\text{C}$ , and are provided for reference purposes only. Unless otherwise stated, the following conditions apply:  $V_{IN} = 24\text{ V}$ . <sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{CC-UVLO}$	Internal VCC undervoltage lockout	VCC rising undervoltage threshold	3	3.3	3.65	V
$V_{CC-UVLO-HYST}$	Internal VCC under voltage lock-out hysteresis	Hysteresis below $V_{CC-UVLO}$	0.3	0.8	1.2	V
<b>CURRENT LIMITS</b>						
$I_{SC-100mA}$	Short circuit high side current limit <sup>(3)</sup>	100-mA version	140	167	200	mA
$I_{LS-LIMIT-100mA}$	Low side current limit <sup>(3)</sup>	100-mA version	99	116	135	mA
$I_{PEAK-MIN-100mA}$	Minimum peak inductor current limit <sup>(3)</sup>	PFM Operation, 100-mA version; duty cycle = 0%	30	40	50	mA
$I_{SC-150mA}$	Short circuit high side current limit <sup>(3)</sup>	150-mA version	210	250	298	mA
$I_{LS-LIMIT-150mA}$	Low side current limit <sup>(3)</sup>	150-mA version	150	175	204	mA
$I_{PEAK-MIN-150mA}$	Minimum peak inductor current <sup>(3)</sup>	PFM operation, 150-mA version; duty cycle = 0%	55	70	85	mA
$I_{ZC}$	Zero cross current <sup>(3)</sup>	Auto mode	0	2.5	5	mA
<b>MOSFETS</b>						
$R_{DS(on)-HS}$	High-side MOSFET on-resistance	Load = 100 mA		2.2		$\Omega$
$R_{DS(on)-LS}$	Low-side MOSFET on-resistance	Load = 100 mA		1		$\Omega$
$V_{BOOT-UVLO}$	BOOT - SW UVLO threshold <sup>(4)</sup>		2.14	2.3	2.42	V
<b>OSCILLATOR (RT)</b>						
$f_{OSC\_2p2MHz}$	Internal oscillator frequency	RT = GND	2.1	2.2	2.3	MHz
$f_{OSC\_1p0MHz}$	Internal oscillator frequency	RT = VCC	0.93	1	1.05	MHz
$f_{ADJ\_400kHz}$	Accuracy of external frequency, 400 kHz	RT = 39.2 k $\Omega$	0.34	0.4	0.46	MHz
<b>VOLTAGE FEEDBACK (VOUT/FB PIN)</b>						
$V_{OUT}$	Output voltage accuracy for fixed $V_{OUT}$	$V_{OUT} = 3.3\text{ V}$ , $V_{IN} = 3.6\text{ V}$ to 65 V, $I_{OUT} = 150\text{ mA}$	3.24	3.3	3.34	V
$V_{OUT}$	Output voltage accuracy for fixed $V_{OUT}$	$V_{OUT} = 5\text{ V}$ , $V_{IN} = 5.5\text{ V}$ to 65 V, $I_{OUT} = 100\text{ mA}$	4.93	5	5.08	V
$V_{REF}$	Internal reference voltage	$V_{IN} = 3.6\text{ V}$ to 65 V, $I_{OUT} = 150\text{ mA}$	0.985	1	1.01	V
$I_{FB}$	FB input current	Adjustable output, FB = 1 V		1	30	nA
<b>SOFT START</b>						
$t_{SS}$	Time from first SW pulse to $V_{FB}$ at 90% of $V_{REF}$	$V_{IN} \geq 3.6\text{ V}$	1.85	2.58	3.2	ms
<b>POWER GOOD</b>						
PG-OV	PGOOD upper threshold - rising	% of FB (adjustable output) or % of VOUT/FB (fixed output)	106	107	110	%
PG-UV	PGOOD lower threshold - falling	% of FB (adjustable output) or % of VOUT/FB (fixed output)	93	94	96.5	%
PG-HYS	PGOOD hysteresis - rising/falling	% of FB (adjustable output) or % of VOUT/FB (fixed output)	0.8	1.2	1.8	%
$V_{PG-VALID}$	Minimum input voltage for proper PG function		0.7	0.9	2	V
$R_{PG-EN5p0}$	PGOOD pulldown resistance	$V_{EN} = 5.0\text{ V}$ , 1 mA pullup current	20	40	70	$\Omega$
$R_{PG-EN0}$	PGOOD pulldown resistance	$V_{EN} = 0\text{ V}$ , 1 mA pullup current	15	24	46	$\Omega$
$t_{RESET\_FILTER}$	Glitch filter time constant for PG function		15	25	40	$\mu\text{s}$
$t_{PGOOD\_ACT}$	Delay time to PG high signal		1.7	1.956	2.16	ms

## 6.5 Electrical Characteristics (continued)

Limits apply over the recommended operating junction temperature ( $T_J$ ) range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ , unless otherwise stated. Minimum and maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at  $T_J = 25^{\circ}\text{C}$ , and are provided for reference purposes only. Unless otherwise stated, the following conditions apply:  $V_{IN} = 24\text{ V}$ . <sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>PWM LIMITS (SW)</b>						
$t_{ON-MIN}$	Minimum switch on-time	$V_{IN} = 24\text{ V}$ , $I_{OUT} = 100\text{ mA}$	40	57	80	ns
$t_{OFF-MIN}$	Minimum switch off-time		40	58	77	ns
$t_{ON-MAX}$	Maximum switch on-time	HS timeout in dropout	7.6	9	9.8	$\mu\text{s}$

- (1) MIN and MAX limits are 100% production tested at  $25^{\circ}\text{C}$ . Limits over the operating temperature range verified through correlation using Statistical Quality Control (SQC) methods. Limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) This is the current used by the device open loop. It does not represent the total input current of the system when in regulation.
- (3) The current limit values in this table are tested, open loop, in production. They can differ from those found in a closed loop application.
- (4) When the voltage across the  $C_{BOOT}$  capacitor falls below this voltage, the low side MOSFET is turned on to recharge the boot capacitor.

## 6.6 System Characteristics

The following specifications apply only to the typical applications circuit, with nominal component values. Specifications in the typical (TYP) column apply to  $T_J = 25^{\circ}\text{C}$  only. Specifications in the minimum (MIN) and maximum (MAX) columns apply to the case of typical components over the temperature range of  $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . These specifications are not ensured by production testing.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY VOLTAGE (VIN)</b>						
$I_{SUPPLY}$	Input supply current when in regulation	$V_{IN} = 13.5\text{ V}$ , $V_{BIAS} = 3.3\text{-V}$ $V_{OUT}$ , $I_{OUT} = 0\text{ A}$ , PFM mode (fixed output voltage)		6.5		$\mu\text{A}$
$I_{SUPPLY}$	Input supply current when in regulation	$V_{IN} = 24\text{ V}$ , $V_{BIAS} = 3.3\text{-V}$ $V_{OUT}$ , $I_{OUT} = 0\text{ A}$ , PFM mode (fixed output voltage)		4		$\mu\text{A}$
$D_{MAX}$	Maximum switch duty cycle <sup>(1)</sup>			98		%
<b>THERMAL SHUTDOWN</b>						
$T_{SD-R}$	Thermal shutdown rising	Shutdown threshold	158	168	180	$^{\circ}\text{C}$
$T_{SD-HYS}$	Thermal shutdown hysteresis		8	10	15	$^{\circ}\text{C}$

- (1) In dropout the switching frequency drops to increase the effective duty cycle. The lowest frequency is clamped at approximately:  $f_{MIN} = 1 / (t_{ON-MAX} + T_{OFF-MIN})$ .  $D_{MAX} = t_{ON-MAX} / (t_{ON-MAX} + t_{OFF-MIN})$ .

### 6.7 Typical Characteristics

Unless otherwise specified, the following conditions apply:  $T_A = 25^\circ\text{C}$ ,  $V_{IN} = 13.5\text{ V}$ .

## 7 Detailed Description

### 7.1 Overview

The TLVM365R15 or TLVM365R1 is an easy-to-use, synchronous buck, DC/DC power module that operates from a 3-V to 65-V supply voltage. With an integrated power controller, inductor, and MOSFETs, the TLVM365R15 or TLVM365R1 delivers up to 150-mA or 100-mA DC load current with high efficiency and ultra-low input quiescent current in a very compact design size. The TLVM365R15 or TLVM365R1 can operate over a wide range of switching frequencies and duty ratios. If the minimum ON-time or OFF-time cannot support the desired duty ratio, the switching frequency is reduced automatically, maintaining the output voltage regulation. Although designed for simple implementation, this device offers flexibility to optimize the usage according to the target application.

The TLVM365R15 or TLVM365R1 module also includes inherent protection features for robust system requirements:

- An open-drain PGOOD indicator for power-rail sequencing and fault reporting
- Precision enable input with hysteresis, providing:
  - Programmable line undervoltage lockout (UVLO)
  - Remote ON and OFF capability
- Internally fixed output-voltage soft start with monotonic start-up into prebiased loads
- Current limiting implemented by cycle-by-cycle peak and valley current limits
- Thermal shutdown with automatic recovery

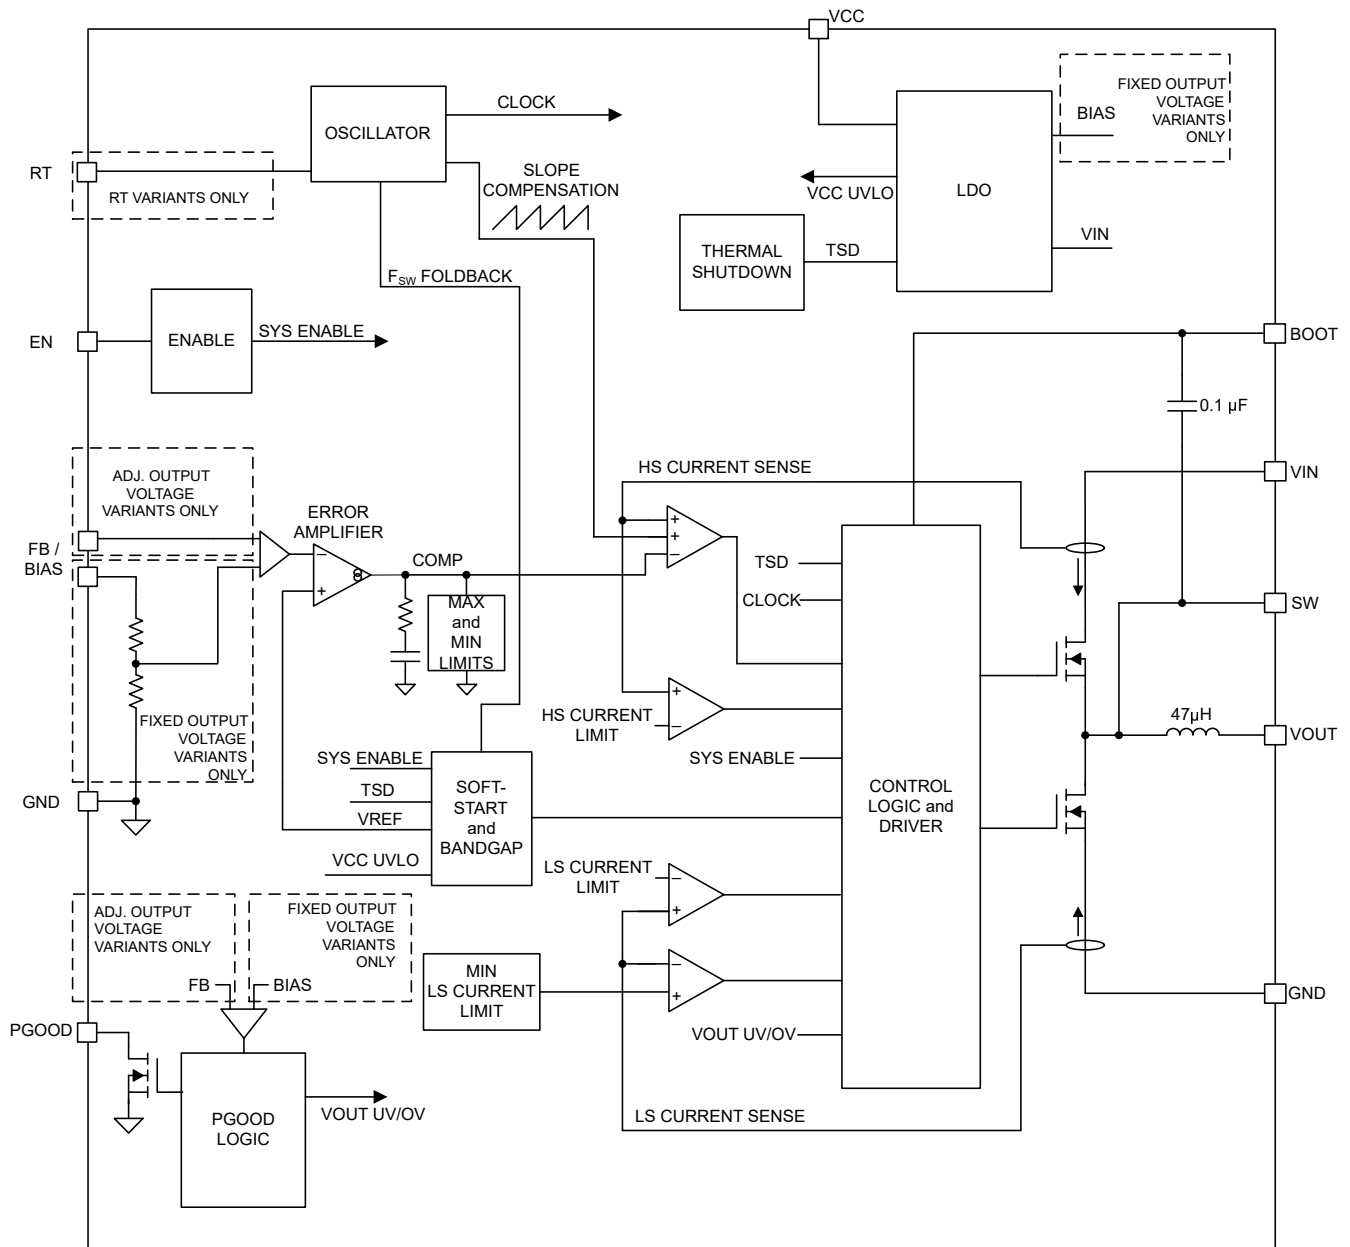

These features enable a flexible and easy-to-use platform for a wide range of applications. The pin arrangement is designed for a simple layout, requiring few external components. See [Layout](#) for a layout example.

The TLVM365R15 or TLVM365R1 incorporates specific features to improve EMI performance in noise-sensitive applications:

- An optimized package that incorporates flip chip on lead (FCOL) technology and pinout design which enables a shielded switch-node layout that mitigates radiated EMI
- A programmable switching frequency from 200 kHz to 2.2 MHz enables optimization of external passives and promotes the avoidance of noise sensitive bands

Together, these features reduce the need for any common-mode choke, shielding, and input filter inductor, greatly reducing the complexities and cost of the EMI/EMC mitigation measures.

## 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Enable, Shutdown, and Start-Up

The voltage at the EN/UVLO pin controls the start-up voltage and shutdown voltage of the TLVM365R1x. There are three distinct modes set by the EN/UVLO pin: shutdown, standby, and active. As long as the EN/UVLO pin voltage is less than  $V_{EN-WAKE}$  the device is in shutdown mode. During shutdown mode, the input current drawn by the device typically is  $0.55\ \mu\text{A}$  ( $V_{IN} = 13.5\ \text{V}$ ). The internal LDO regulator is not operational. When the voltage at the EN/UVLO pin is greater than the  $V_{EN-WAKE}$  but less than  $V_{EN-VOUT}$  the device enters the standby mode. In standby mode, the internal LDO is enabled. As the EN/UVLO pin voltage increases above  $V_{EN-VOUT}$ , the device enters active mode starting the feedback resistor detection. After feedback detect is completed, soft-start functionality is released to slowly increase the output voltage and switching starts. To stop switching and enter standby mode the EN/UVLO pin must fall below  $(V_{EN-VOUT} - V_{EN-HYST})$ . Any further decrease in the EN/UVLO pin voltage below  $V_{EN-WAKE}$  the device is in shutdown. The various EN/UVLO threshold parameters and the values are listed in [Section 6.5](#). See [Section 7.3.6](#) for information about feedback resistor detection. [Figure 7-1](#) shows the precision enable behavior.

**Figure 7-1. Precision Enable Behavior**

Remote precision undervoltage lockout can be implemented with this functionality as shown in [Figure 7-2](#). See [Section 8.2.2.8](#) for component selection.

**Figure 7-2.  $V_{IN}$  Undervoltage Lockout Using the EN/UVLO Pin**

The high-voltage compliant EN/UVLO pin can be connected directly to the  $V_{IN}$  input pin if remote precision control is not needed. The EN/UVLO pin must not be allowed to float. The various EN threshold parameters are listed in the [Section 6.5](#). [Figure 7-1](#) shows the precision enable behavior. After EN/UVLO goes above  $V_{EN-VOUT}$  with a delay of about 1 ms, the output voltage begins to rise with a soft start and reaches close to the final value in about 2.58 ms ( $t_{SS}$ ). After a delay of about 2 ms ( $t_{PGOOD\_ACT}$ ), the PGOOD flag goes high. Check [Section 8.2.2.8](#) for component selection.

### 7.3.2 Adjustable Switching Frequency (With RT)

The TLVM365R1x family allow the power designer to set any desired operating frequency between 200 kHz and 2.2 MHz by placing a resistor between the RT pin and ground. See [Figure 7-3](#) to determine the resistor value needed for the desired switching frequency. In addition, the RT resistor can be programmed without a resistor to ground by connecting the RT pin to the appropriate voltage level. See [Table 7-1](#) for selection on programming the RT pin.

**Table 7-1. RT Pin Setting**

RT INPUT	SWITCHING FREQUENCY
VCC	1 MHz
GND	2.2 MHz
RT to GND	Adjustable according to <a href="#">Figure 7-3</a>
Float (not recommended)	No switching

Use [Equation 1](#) to calculate the value of RT for a desired frequency.

$$RT = \frac{18286}{F_{sw}^{1.021}} \quad (1)$$

where

- RT is the frequency setting resistor value (kΩ).
- F<sub>SW</sub> is the switching frequency (kHz).

**Figure 7-3. RT Values vs Frequency**

### 7.3.3 Power-Good Output Operation

Use the power-good feature using the PGOOD pin of the TLVM365R1x to reset a system microprocessor whenever the output voltage is out of regulation. This open-drain output remains low under device fault conditions, such as current limit and thermal shutdown, as well as during normal start-up. A glitch filter prevents false flag operation for any short duration excursions in the output voltage, such as during line and load transients. Output voltage excursions lasting less than  $t_{RESET\_FILTER}$  do not trip the power-good flag. Power-good operation can best be understood in reference to [Figure 7-4](#). [Table 7-2](#) gives a more detailed breakdown the PGOOD operation. Here,  $V_{PG-UV}$  is defined as the PG-UV scaled version of the  $V_{OUT-Reg}$  (target regulated output voltage) and  $V_{PG-HYS}$  as the PG-HYS scaled version of the  $V_{OUT-Reg}$ , where both PG-UV and PG-HYS are listed in [Section 6.5](#). During the initial power up, a total delay of 5 ms (typical) is encountered from the time the  $V_{EN-VOUT}$  is triggered to the time that the power-good is flagged high. This delay only occurs during the device start-up and is not encountered during any other normal operation of the power-good function. When EN/UVLO is pulled low, the power-good flag output is also forced low. With EN/UVLO low, power good remains valid as long as the input voltage ( $V_{PG-VALID}$  is  $\geq 0.9$  V (typical)).

The power-good output scheme consists of an open-drain n-channel MOSFET, which requires an external pullup resistor connected to a suitable logic supply. The power-good output scheme can also be pulled up to either  $V_{CC}$

### 7.3.6 Output Voltage Selection

In the TLVM365R1x, each variant can be configured as a fixed output voltage or an adjustable output voltage. During device initialization the device configures the target output voltage to an internally selected value or an adjustable version by detecting if feedback resistors are present. When configuring the output voltage to be fixed value, simply connect the VOUT/FB pin to the system output voltage node. See [Section 4](#) for the fixed output voltage setting of each variant.

To configure an adjustable output voltage, external feedback resistors are required as shown in [Figure 7-5](#). By connecting external feedback resistors with a parallel resistance greater than 5 kΩ but less than or equal to 10 kΩ (see [Equation 2](#)) the output voltage is set according as needed. The internal voltage reference is 1 V. Refer to [Section 8.2.2.3](#) for more details on how to adjust the output voltage.

**Figure 7-5. Setting Output Voltage for Adjustable Output Variant**

$$5 \text{ k}\Omega < R_{FBT} \parallel R_{FBB} \leq 10 \text{ k}\Omega \quad (2)$$

- $R_{FBT}$  is the top resistor of the feedback divider
- $R_{FBB}$  is the bottom resistor of the feedback divider

When configured in adjustable output voltage mode, an addition feed-forward capacitor,  $C_{FF}$ , in parallel with the  $R_{FBT}$ , can be used to optimize the phase margin and transient response. See [Section 8.2.2.7](#) for more details. No additional resistor divider or feed-forward capacitor,  $C_{FF}$ , is needed in fixed-output variants.

Please refer to [Table 7-3](#) for selecting passive component values for typical, output voltages.

**Table 7-3. Standard  $R_{FBT}$  Values, Recommended  $F_{SW}$  and Minimum  $C_{OUT}$**

$V_{OUT}$ (V)	$R_{FBT}$ (k $\Omega$ )	$R_{FBB}$ (k $\Omega$ )	RECOMMENDED $F_{SW}$ (kHz)	$C_{OUT(MIN)}$ ( $\mu$ F) (EFFECTIVE)	$V_{OUT}$ (V)	$R_{FBT}$ (k $\Omega$ )	$R_{FBB}$ (k $\Omega$ )	RECOMMENDED $F_{SW}$ (kHz)	$C_{OUT(MIN)}$ ( $\mu$ F) (EFFECTIVE)
1.0	10	DNP	300	47	3.3	33.2	14.3	1000	4.7
1.2	12.1	60.4	300	47	3.8	38.3	13.7	1000	4.7
1.5	15	30.1	400	33	4	40.2	13.3	1000	4.7

3.0	30	15	800	4.7	6	60.4	12.1	1000	4.7

### 7.3.7 Soft Start and Recovery from Dropout

When designing with the TLVM365R1x, both soft start and recovery from dropout can cause slow rise in output voltage and must be considered as a two separate operating conditions, as shown in [Figure 7-6](#) and [Figure 7-7](#). These features ramp the output voltage at a controlled rate, keeping the output voltage from overshooting. See [Section 7.3.7.1](#) and [Section 7.3.7.2](#) for more details.

#### 7.3.7.1 Soft Start

The soft-start feature allows the converter to gradually reach the steady state output voltage, reducing the startup stress in the system. Soft start is triggered by any of the following conditions:

- Appropriate voltage level is applied to the VIN pin of the device, releasing undervoltage lockout.
- EN/UVLO voltage is sufficient to enter active mode while the voltage on VIN pin is at least  $V_{IN\_R}$ .
- Recovery from shutdown due to overtemperature protection.

After soft start is triggered, the internal reference is slowly ramped up. Assuming the output voltage is initially 0 V, the reference is ramped to 90% of the target output voltage in  $t_{SS}$ . During the soft-start time, the switching mode is set to AUTO mode. AUTO mode activates diode emulation for the low-side MOSFET, not allowing negative inductor current. This activation allows the output voltage to be prebiased, voltage already present on the output, during start-up without discharging the output capacitor. [Figure 7-6](#) shows the difference between a non biased soft start and a prebiased soft start.

**Figure 7-6. Soft Start With and Without Prebiased Voltage**

#### 7.3.7.2 Recovery from Dropout

Any time the output voltage falls more than a few percent, output voltage ramps up slowly. This condition, called graceful recovery, differs from soft start. During the graceful recovery period, the reference voltage is set to approximately 1% above what is needed to achieve the existing output voltage.

Figure 7-7. Recovery from Dropout

Whether output voltage falls due to high load or low input voltage, after the condition that causes output to fall below set point is removed, the output climbs at the same speed as during start-up.

### 7.3.8 Current Limit and Short Circuit

The TLVM365R1x are protected from overcurrent conditions by cycle-by-cycle current limiting on both high-side and low-side MOSFETs.

High-side (HS) MOSFET overcurrent protection is implemented by the typical peak-current mode control scheme. The HS switch current is sensed when the HS is turned on after a short blanking time. The HS switch current is compared to either the minimum of a fixed current set point or the output of the internal error amplifier loop minus the slope compensation every switching cycle. Because the output of the internal error amplifier loop has a maximum value and slope compensation increases with duty cycle, HS current limit decreases with increased duty factor if duty factor is typically above 35%.

When the low-side (LS) switch is turned on, the current going through it is also sensed and monitored. Like the high-side device, the low-side device has a turn-off commanded by the internal error amplifier loop. In the case of the low-side device, turn-off is prevented if the current exceeds this value, even if the oscillator normally starts a new switching cycle. Also like the high-side device, there is a limit on how high the turn-off current is allowed to be. This limit is called the low-side current limit,  $I_{LS-LIMIT}$  in Figure 7-8. If the LS current limit is exceeded, the LS MOSFET stays on and the HS switch is not to be turned on. The LS switch is turned off after the LS current falls below this limit and the HS switch is turned on again as long as at least one clock period has passed since the last time the HS device has turned on.

Figure 7-8. Current Limit Waveforms

Because the current waveform assumes values between  $I_{SC}$  and  $I_{LS-LIMIT}$ , the maximum output current is very close to the average of these two values unless duty factor is very high. After operating in current limit, hysteric control is used and current does not increase as output voltage approaches zero.

If the duty factor is very high, current ripple must be very low to prevent instability. Because current ripple is low, the part is able to deliver full current. The current delivered is very close to  $I_{LS-LIMIT}$ .

**Figure 7-9. Output Voltage versus Output Current**

### 7.3.9 Thermal Shutdown

Thermal shutdown limits total power dissipation by turning off the internal switches when the device junction temperature exceeds 168°C (typical). Thermal shutdown does not trigger below 158°C (minimum). After thermal shutdown occurs, hysteresis prevents the part from switching until the junction temperature drops to approximately 158°C (typical). When the junction temperature falls below 158°C (typical), the TLVM365R1x attempts another soft start.

While the TLVM365R1x is shut down due to high junction temperature, power continues to be provided to VCC. To prevent overheating due to a short circuit applied to VCC, the LDO that provides power for VCC has reduced current limit while the part is disabled due to high junction temperature. The LDO only provides a few milliamperes during thermal shutdown.

### 7.3.10 Input Supply Current

The TLVM365R1x is designed to have very low input supply current when regulating light loads. When configured as a fixed output voltage, the FB/BIAS pin is the input to the LDO that powers the majority of the control circuits. By connecting the FB/BIAS input pin to the output node of the regulator, a small amount of current is drawn from the output. This current is reduced at the input by the ratio of  $V_{OUT} / V_{IN}$ .

When configured as an adjustable output voltage, the internal LDO is powered by VIN. This action results in higher power loss through the internal LDO which results in lower efficiency compared to a fixed output configuration.

## 7.4 Device Functional Modes

### 7.4.1 Shutdown Mode

The EN/UVLO pin provides electrical on and off control of the device. When the EN/UVLO pin voltage is below 0.4 V, the internal LDO is disabled and there is no switching of the internal power MOSFETs. In shutdown mode, the quiescent current drops to 0.55  $\mu$ A (typical) when  $V_{IN}$  is 13.5 V.

### 7.4.2 Standby Mode

When the EN/UVLO pin voltage is greater than the  $V_{EN-WAKE}$  but less than  $V_{EN-VOUT}$ , the internal LDO is enabled. The precision enable circuitry is enabled after VCC is above the undervoltage threshold ( $V_{CC-UVLO}$ ). The internal power MOSFETs remain off unless the voltage on EN/UVLO pin voltage goes above the precision enable threshold ( $V_{EN-VOUT}$ ) and the input voltage on VIN pin is greater than  $V_{IN-R}$ .

### 7.4.3 Active Mode

The TLVM365R1x is in active mode whenever the EN/UVLO pin is above  $V_{EN-VOUT}$ ,  $V_{IN}$  is high enough to satisfy  $V_{IN-R}$ , and no other fault conditions are present. The simplest way to enable the operation is to connect the EN/UVLO pin to  $V_{IN}$ , which allows self start-up when the applied input voltage exceeds the minimum  $V_{IN-R}$ .

In active mode, depending on the load current, input voltage, and output voltage, the TLVM365R1x is in one of four modes:

- **Continuous conduction mode (CCM)** with fixed switching frequency when load current is above half of the inductor current ripple
- **AUTO Mode** - Light Load Operation: PFM when switching frequency is decreased at very light load
- **Minimum on-time:** At high input voltage and low output voltages, the switching frequency is reduced to maintain regulation.
- **Dropout mode:** When switching frequency is reduced to minimize voltage dropout between input and output.

#### 7.4.3.1 CCM Mode

The following operating description of the TLVM365R1x refers to [Section 7.2](#) and to the waveforms in [Figure 7-10](#). The TLVM365R1x operates in AUTO mode while lightly loaded. Regardless of the light load operation configuration, the converter operates in CCM when the load current is greater than half the inductor ripple current.

In CCM, the TLVM365R1x supplies a regulated output voltage by turning on the internal high-side (HS) and low-side (LS) switches with varying duty cycle (D). During the HS switch on-time, the SW pin voltage,  $V_{SW}$ , swings up to approximately  $V_{IN}$ , and the inductor current,  $i_L$ , increases with a linear slope. The HS switch is turned off by the control logic. During the HS switch off-time,  $t_{OFF}$ , the LS switch is turned on. Inductor current discharges through the LS switch, which forces the  $V_{SW}$  to swing below ground by the voltage drop across the LS switch. The converter loop adjusts the duty cycle to maintain a constant output voltage. Duty cycle is defined by the on-time of the HS switch over the switching period:

$$D = T_{ON} / T_{SW} \tag{3}$$

In an ideal buck converter where losses are ignored, duty cycle is proportional to the output voltage and inversely proportional to the input voltage:

$$D = V_{OUT} / V_{IN} \tag{4}$$

**Figure 7-10. SW Voltage and Inductor Current Waveforms in Continuous Conduction Mode (CCM)**

#### 7.4.3.2 AUTO Mode - Light Load Operation

AUTO mode operation allows for seamless transition between normal current mode operation while heavily loaded and highly efficient light load operation.

The light load operation is employed in the TLVM365R1x only in the AUTO mode. The light load operation employs two techniques to improve efficiency:

- Diode emulation, which allows DCM operation. See [Figure 7-11](#).
- Frequency reduction. See [Figure 7-12](#).

Note that while these two features operate together to improve light load efficiency, these features operate independent of each other.

##### 7.4.3.2.1 Diode Emulation

Diode emulation prevents reverse current through the inductor which requires a lower frequency needed to regulate given a fixed peak inductor current. Diode emulation also limits ripple current as frequency is reduced. With a fixed peak current, as output current is reduced to zero, frequency must be reduced to near zero to maintain regulation.

In AUTO mode, the low-side device is turned off after SW node current is near zero. As a result, after output current is less than half of what inductor ripple can be in CCM, the part operates in DCM which is equivalent to the statement that diode emulation is active.

**Figure 7-11. PFM Operation**

The TLVM365R1x has a minimum peak inductor current setting (see  $I_{PEAK-MIN}$  in [Section 6.5](#)) while in AUTO mode. After current is reduced to a low value with fixed input voltage, on-time is held constant. Regulation is then achieved by adjusting frequency. This mode of operation is called Pulse Frequency Modulation (PFM) mode.

#### 7.4.3.2.2 Frequency Reduction

The TLVM365R1x reduces frequency whenever output voltage is high. This function is enabled whenever the internal error amplifier compensation output, COMP, an internal signal, is low and there is an offset between the regulation set point of FB and the voltage applied to FB. The net effect is that there is larger output impedance while lightly loaded in auto mode than in normal operation. Output voltage must be approximately 1% high when the part is completely unloaded.

In AUTO mode, after output current drops below approximately 1/10th the rated current of the part, output resistance increases so that output voltage is 1% high while the buck is completely unloaded.

**Figure 7-12. Steady State Output Voltage versus Output Current in Auto Mode**

In PFM operation, a small DC positive offset is required on the output voltage to activate the PFM detector. The lower the frequency in PFM, the more DC offset is needed on  $V_{OUT}$ . If the DC offset on  $V_{OUT}$  is not acceptable, a dummy load at  $V_{OUT}$  or a device enabled with FPWM Mode can be used to reduce or eliminate this offset.

#### 7.4.3.3 Minimum On-time Operation

The TLVM365R1x continue to regulate output voltage even if the input-to-output voltage ratio requires an on-time less than the minimum ( $t_{ON-MIN}$ ). This action is accomplished using valley current control. At all times, the compensation circuit dictates both a maximum peak inductor current and a maximum valley inductor current. If for any reason, valley current is exceeded, the clock cycle is extended until valley current falls below that

determined by the compensation circuit. If the converter is not operating in current limit, the maximum valley current is set above the peak inductor current, preventing valley control from being used unless there is a failure to regulate using peak current only. If the input-to-output voltage ratio is too high, such that the inductor current peak value exceeds the peak command dictated by compensation, the high-side device cannot be turned off quickly enough to regulate output voltage. As a result, the compensation circuit reduces both peak and valley current. After a low enough current is selected by the compensation circuit, valley current matches that being commanded by the compensation circuit. Under these conditions, the low-side device is kept on and the next clock cycle is prevented from starting until inductor current drops below the desired valley current. Because on-time is fixed at the minimum value, this type of operation resembles that of a device using a Constant On-Time (COT) control scheme; see [Figure 7-13](#).

In valley control mode, minimum inductor current is regulated, not peak inductor current.

**Figure 7-13. Valley Current Mode Operation**

#### 7.4.3.4 Dropout

Dropout operation is defined as any input-to-output voltage ratio that requires frequency to drop to achieve the required duty cycle. At a given clock frequency, duty cycle is limited by minimum off-time. After this limit is reached, as shown in [Figure 7-15](#), if clock frequency is maintained, the output voltage falls. Instead of allowing the output voltage to drop, the TLVM365R1x extends the high side switch on-time past the end of the clock cycle until the needed peak inductor current is achieved. The clock is allowed to start a new cycle after peak inductor current is achieved or after a predetermined maximum on-time,  $t_{ON-MAX}$ , of approximately 9  $\mu$ s passes. As a result, after the needed duty cycle cannot be achieved at the selected clock frequency due to the existence of a minimum off-time, frequency drops to maintain regulation. As shown in [Figure 7-14](#) if input voltage is low enough so that output voltage cannot be regulated even with an on-time of  $t_{ON-MAX}$ , output voltage drops to slightly below the input voltage by  $V_{DROP}$ . For additional information on recovery from dropout, refer back to [Figure 7-7](#).

Output voltage and frequency versus input voltage: if there is little difference between input voltage and output voltage setting, the IC reduces frequency to maintain regulation. If input voltage is too low to provide the desired output voltage at approximately 110 kHz, input voltage tracks output voltage.

**Figure 7-14. Frequency and Output Voltage in Dropout**

Switching waveforms while in dropout. Inductor current takes longer than a normal clock to reach the desired peak value. As a result, frequency drops. This frequency drop is limited by  $t_{ON-MAX}$ .

**Figure 7-15. Dropout Waveforms**

## 8 Application and Implementation

---

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

---

### 8.1 Application Information

The TLVM365Rx only requires a few external components to convert from a wide range of supply voltages to a fixed output voltage. The following section describes the design procedure to configure the TLVM365Rx power module.

### Note

All of the capacitance values given in the following application information refer to *effective* values unless otherwise stated. The *effective* value is defined as the actual capacitance under DC bias and temperature, not the rated or nameplate values. Use high-quality, low-ESR, ceramic capacitors with an X7R or better dielectric throughout. All high value ceramic capacitors have a large voltage coefficient in addition to normal tolerances and temperature effects. Under DC bias the capacitance drops considerably. Large case sizes and higher voltage ratings are better in this regard. To help mitigate these effects, use multiple capacitors in parallel to bring the minimum *effective* capacitance up to the required value. This action can also ease the RMS current requirements on a single capacitor. A careful study of bias and temperature variation of any capacitor bank must be made to make sure that the minimum value of *effective* capacitance is provided.

---

## 8.2 Typical Application

Figure 8-1 shows a typical application circuit for the TLVM365R15.

Figure 8-1 switching frequency can be programmed from 200 kHz to 2.2 MHz with a RT resistor. Connecting RT to VCC or GND (or comparable source) programs the frequency for either 1 MHz or 2.2 MHz, respectively. The output voltage can be configured for fixed, 3.3-V configuration by shorting VOUT to FB and depopulating R<sub>FBB</sub>.

This design is capable of generating an output voltage ranging from 1 V to 6 V. [Detailed Design Procedure](#) outlines the procedure to designing a 3.3-V output voltage with TLVM365R15. This design can be used in factory automation, 4-20mA loop design due to the low-noise, small design size, and modest efficiency over the entire load range.

**Figure 8-1. Example Application Circuit (TLVM365R15)**

## 8.2.1 Design Requirements

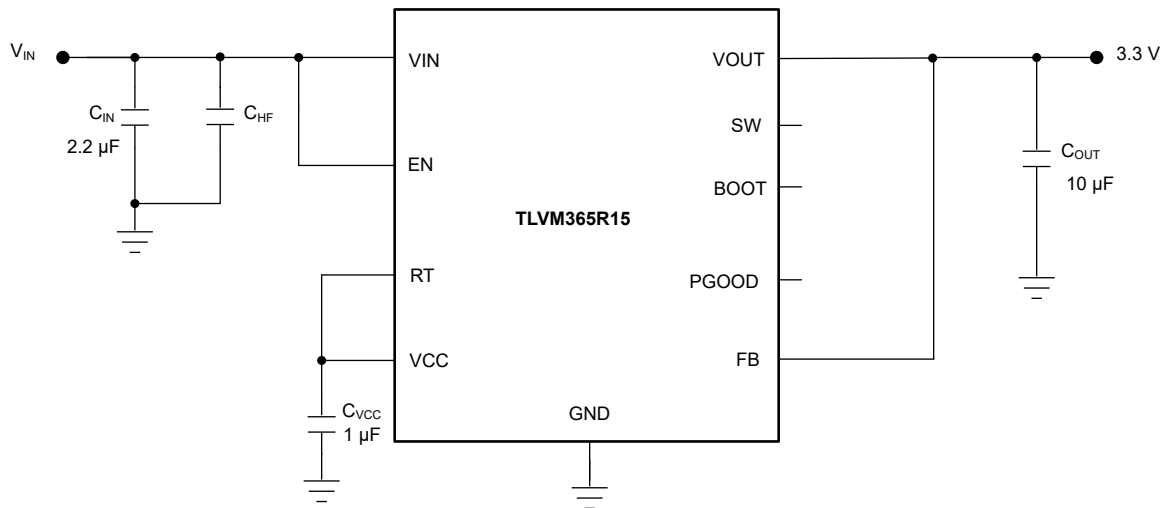

Section 8.2.2 provides instructions to design and select components according to Table 8-1.

**Table 8-1. Detailed Design Parameters**

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	4 V to 65 V
Output voltage	3.3 V
Maximum output current	0 to 150 mA
Switching frequency	1 MHz

## 8.2.2 Detailed Design Procedure

The design procedure that follows and the resulting component selection is illustrated in Figure 8-2.

**Figure 8-2. 3.3-V Output Design Example**

### 8.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TLVM365R1x with the WEBENCH® Power Designer.

1. Start by entering the input voltage (VIN), output voltage (VOUT), and output current (IOUT) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible devices from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability. In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance.
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

### 8.2.2.2 Choosing the Switching Frequency

The recommended switching frequency for standard output voltages can be found in [Standard R<sub>FBT</sub> Values, Recommended F<sub>SW</sub> and Minimum C<sub>OUT</sub>](#). For a 5-V output, the recommended switching frequency is 1 MHz, which TPS365R15F operates at by default.

### 8.2.2.3 Setting the Output Voltage

Fixed output configuration allows the feedback resistors to be eliminated and the layout to be simplified. TLVM365R15 can be configured for 3.3 V, fixed configuration by shorting V<sub>OUT</sub> to FB, for which this design does. See [Device Comparison Table](#) for the selection of fixed output voltage versions.

The device can be configured for adjustable output voltage in the case a different output voltage is required, as example. For more information on how to choose the feedback resistor values, please see [Section 7.3.6](#). The recommended value of R<sub>FB</sub> is 10 kΩ. The value for R<sub>FBT</sub> can be selected from [Standard R<sub>FBT</sub> Values](#), [Recommended F<sub>SW</sub> and Minimum C<sub>OUT</sub>](#) or calculated using [Equation 5](#):

$$R_{FBT}[\text{k}\Omega] = R_{FB}[\text{k}\Omega] \times \left( \frac{V_{OUT}[\text{V}]}{1\text{V}} - 1 \right) \quad (5)$$

### 8.2.2.4 Input Capacitor Selection

The design uses a 2.2-μF input capacitor to keep the input, voltage ripple small. TI recommends an additional 0.1-μF capacitor in parallel for improved bypassing (lower noise). High-quality ceramic type capacitors with sufficient voltage and temperature rating are required. The voltage rating of input capacitors must be greater than the maximum input voltage. For this design, a 2.2-μF, 100-V rated capacitor is used.

Using an electrolytic capacitor on the input in parallel with the ceramics is often desirable. This fact is especially true if long leads or traces are used to connect the input supply to the regulator. The moderate ESR of this capacitor can help damp any ringing on the input supply caused by the long power leads. The use of this additional capacitor also helps with voltage dips caused by input supplies with unusually high impedance.

### 8.2.2.5 Output Capacitor Selection

For a 3.3-V output, the TLVM365R15 requires a minimum of 4.7-μF effective output capacitance for proper operation (see [Standard R<sub>FBT</sub> Values](#), [Recommended F<sub>SW</sub> and Minimum C<sub>OUT</sub>](#)). High-quality ceramic type capacitors with sufficient voltage and temperature rating are required. Additional output capacitance can be added to reduce ripple voltage or for applications with transient load requirements.

In practice, the output capacitor has the most influence on the transient response and loop-phase margin. Load transient testing and bode plots are the best way to validate any given design and must always be completed before the application goes into production.

Limit the maximum value of total output capacitance to about 10 times the design value, or 1000 μF, whichever is smaller. Large values of output capacitance can adversely affect the start-up behavior of the regulator as well as the loop stability. If values larger than noted here must be used, then a careful study of start-up at full load and loop stability must be performed.

This design uses a 10-μF, 10-V, 1206 capacitor which is approximately 8-μF at 3.3-V DC bias. A smaller case size capacitor, or lower DC rating, does not provide adequate, effective capacitance for this design.

### 8.2.2.6 VCC

The VCC pin is the output of the internal LDO used to supply the control circuits of the regulator. This output requires a 1-μF, 16-V ceramic capacitor connected from VCC to GND for proper operation. In general, this output must not be loaded with any external circuitry. However, this output can be used to supply the pullup for the power-good function (see [Power-Good Output Operation](#)). A value in the range of 10 kΩ to 100 kΩ is a good choice in this case. The nominal output voltage on VCC is 3.3 V; see [Section 6.5](#) for limits.

### 8.2.2.7 C<sub>FF</sub> Selection

In some cases, a feedforward capacitor can be used across R<sub>FBT</sub> to improve the load transient response or improve the loop-phase margin. [Optimizing Transient Response of Internally Compensated DC-DC Converters with Feedforward Capacitor application report](#) is helpful when experimenting with a feedforward capacitor.

Due to the nature of the feedback detect circuitry, limit the value of C<sub>FF</sub> to make sure that the desired output voltage is established when configuring for adjustable output voltages. Follow [Equation 6](#) to make sure C<sub>FF</sub> remains below the maximum value.

$$C_{FF} < C_{OUT} \times \frac{\sqrt{V_{OUT}}}{1.2 \times 10^6} \quad (6)$$

### 8.2.2.8 External UVLO

In some cases, an input UVLO level different than that provided internal to the device is needed. This need can be accomplished by using the circuit shown in [Figure 8-3](#). The input voltage at which the device turns on is designated as  $V_{ON}$  while the turn-off voltage is  $V_{OFF}$ . First, a value for  $R_{ENB}$  is chosen in the range of 10 k $\Omega$  to 100 k $\Omega$ , then [Equation 7](#) and [Equation 8](#) are used to calculate  $R_{ENT}$  and  $V_{OFF}$ , respectively.

**Figure 8-3. Setup for External UVLO Application**

$$R_{ENT} = \left( \frac{V_{ON}}{V_{EN} - V_{OUT}} - 1 \right) \times R_{ENB} \quad (7)$$

$$V_{OFF} = V_{ON} \times \left( 1 - \frac{V_{EN} - HYS}{V_{EN} - V_{OUT}} \right) \quad (8)$$

where

- $V_{ON}$  is the  $V_{IN}$  turn-on voltage.
- $V_{OFF}$  is the  $V_{IN}$  turn-off voltage.

### 8.2.2.9 Power-Good Signal

Applications requiring a power-good signal to indicate that the output voltage is present and in regulation must use a pullup resistor between the PGOOD pin and a valid voltage source. This voltage source can be VCC or VOUT, as example.

### 8.2.2.10 Maximum Ambient Temperature

As with any power conversion device, the TLVM365R15 dissipates internal power while operating. The effect of this power dissipation is to raise the internal temperature of the power module above ambient. The internal die and inductor temperature ( $T_J$ ) is a function of the ambient temperature, the power loss, and the effective thermal resistance,  $R_{\theta JA}$ , of the module and PCB combination. The maximum junction temperature for the TLVM365R15 must be limited to 125°C. This limit establishes a limit on the maximum module power dissipation and, therefore, the load current. [Equation 9](#) shows the relationships between the important parameters. Seeing that larger ambient temperatures ( $T_A$ ) and larger values of  $R_{\theta JA}$  reduce the maximum available output current is easy. Being that the power dissipation is relatively low in this module, this device must be capable of supporting the maximum ambient temperature rating, across the majority of power conditions with a modest size 2 layer or 4 layer PCB. Further thermal analysis can be done by measuring the top case temperature on the [EVM](#) which is nearly equivalent to the junction due to the thin case.

As stated in the [Semiconductor and IC Package Thermal Metrics application report](#), the values given in [Section 6.4](#) section are not valid for design purposes and must not be used to estimate the thermal performance of the application. The values reported in that table were measured under a specific set of conditions that are rarely obtained in an actual application.

$$I_{OUT, \max} = \frac{(T_J - T_A)}{R_{\theta JA}} \times \frac{\eta}{(1 - \eta)} \times \frac{1}{\eta} \quad (9)$$

where

- $\eta$  is the efficiency.

The effective  $R_{\theta JA}$  is a critical parameter and depends on many factors such as the following:

- Power dissipation
- Air temperature and flow
- PCB area
- Copper heat-sink area
- Number of thermal vias under the package
- Adjacent component placement

The IC Power loss mentioned above is the overall power loss minus the loss that comes from the inductor DC resistance. The overall power loss can be approximated by using WEBENCH for a specific operating condition and temperature.

Use the following resources as guides to optimal thermal PCB design and estimating  $R_{\theta JA}$  for a given application environment:

- [PowerPAD™ Made Easy application report](#)
- [Using New Thermal Metrics application report](#)
- [PCB Thermal Calculator](#)

#### 8.2.2.11 Other Connections

- The RT pin can be connected to AGND for a switching frequency of 2.2 MHz or tied to VCC for a switching frequency of 1 MHz. A resistor connected between the RT pin and GND can be used to set the desired operating frequency between 200 kHz and 2.2 MHz.
- A resistor divider network on the EN pin can be added for a precision input undervoltage lockout (UVLO)
- Place a 1- $\mu$ F capacitor between the VCC pin and PGND, located near to the device.
- A pullup resistor between the PGOOD pin and a valid voltage source to generate a power-good signal.

### 8.2.3 Application Curves

Figure 8-9. 48VIN Efficiency

### 8.2.3 Application Curves (continued)

$V_{IN} = 24\text{ V}$   
75 mA to 150 mA, 50 mA/ $\mu$ s

$V_{OUT} = 3.3\text{ V (Fixed)}$   
 $C_{OUT} = 1 \times 10\ \mu\text{F (1206, 10VDC)}$

2.2 MHz

**Figure 8-10. Load Transient**

### 8.3 Best Design Practices

- Do not exceed the [Absolute Maximum Ratings](#).
- Do not exceed the [Recommended Operating Conditions](#).
- Do not exceed the [ESD Ratings](#).
- Do not allow the EN input to float.
- Do not allow the output voltage to exceed the input voltage, nor go below ground.
- Follow all the guidelines and suggestions found in this data sheet before committing the design to production. TI application engineers are ready to help critique your design and PCB layout to help make your project a success.

### 8.4 Power Supply Recommendations

The TLVM365R15 buck module is designed to operate over a wide input voltage range of 3 V to 65 V. The characteristics of the input supply must be compatible with the [Absolute Maximum Ratings](#) and [Recommended Operating Conditions](#) in this data sheet. In addition, the input supply must be capable of delivering the required input current to the loaded regulator circuit. Use [Equation 10](#) to estimate the average input current.

$$I_{IN} = \frac{V_{OUT} \times I_{OUT}}{V_{IN} \times \eta} \quad (10)$$

where

- $\eta$  is the efficiency

If the module is connected to an input supply through long wires or PCB traces with a large impedance, take special care to achieve stable performance. The parasitic inductance and resistance of the input cables can have an adverse affect on module operation. More specifically, the parasitic inductance in combination with the low-ESR ceramic input capacitors form an underdamped resonant circuit, possibly resulting in instability, voltage transients, or both, each time the input supply is cycled ON and OFF. The parasitic resistance causes the input voltage to dip during a load transient. If the module is operating close to the minimum input voltage, this dip can cause false UVLO triggering and a system reset.

The best way to solve such issues is to reduce the distance from the input supply to the module and use an electrolytic input capacitor in parallel with the ceramics. The moderate ESR of the electrolytic capacitor helps damp the input resonant circuit and reduce any overshoot or undershoot at the input. A capacitance in the range of 10  $\mu$ F to 47  $\mu$ F is usually sufficient to provide input parallel damping and helps hold the input voltage steady during large load transients. A typical ESR of 0.1  $\Omega$  to 0.4  $\Omega$  provides enough damping for most input circuit configurations.

### 8.5 Layout

The performance of any switching power supply depends as much upon the layout of the PCB as the component selection. Use the following guidelines to design a PCB with the best power conversion performance, optimal thermal performance, and minimal generation of unwanted EMI.

#### 8.5.1 Layout Guidelines

The PCB layout of any DC/DC module is critical to the optimal performance of the design. Poor PCB layout can disrupt the operation of an otherwise good schematic design. Even if the module regulates correctly, bad PCB layout can mean the difference between a robust design and one that cannot be mass produced. Furthermore, to a great extent, the EMI performance of the regulator is dependent on the PCB layout. In a buck converter module, the most critical PCB feature is the loop formed by the input capacitor or capacitors and power ground, as shown in [Figure 8-11](#). This loop carries large transient currents that can cause large transient voltages when reacting with the trace inductance. These unwanted transient voltages disrupt the proper operation of the power module. Because of this, the traces in this loop must be wide and short, and the loop area as small as possible to reduce the parasitic inductance. [Layout Example](#) shows a recommended layout for the critical components of the TLVM365R15.

1. *Place the input capacitors as close as possible to the VIN and GND terminals.* VIN and GND pins are adjacent, simplifying the input capacitor placement.
2. *Place bypass capacitor for VCC close to the VCC pin.* This capacitor must be placed close to the device and routed with short, wide traces to the VCC and GND pins.
3. *Place the feedback divider as close as possible to the FB pin of the device.* Place  $R_{FBB}$ ,  $R_{FBT}$ , and  $C_{FF}$ , if used, physically close to the device. The connections to FB and GND must be short and close to those pins on the device. The connection to  $V_{OUT}$  can be somewhat longer. However, the latter trace must not be routed near any noise source (such as the SW node) that can capacitively couple into the feedback path of the regulator.
4. *Use at least one ground plane in one of the middle layers.* This plane acts as a noise shield and as a heat dissipation path.
5. *Provide wide paths for VIN, VOUT, and GND.* Making these paths as wide and direct as possible reduces any voltage drops on the input or output paths of the power module and maximizes efficiency.
6. *Provide enough PCB area for proper heat-sinking.* Sufficient amount of copper area must be used to make sure of a low  $R_{\theta JA}$ , commensurate with the maximum load current and ambient temperature. The top and bottom PCB layers must be made with two ounce copper and no less than one ounce. If the PCB design uses multiple copper layers (recommended), these thermal vias can also be connected to the inner layer heat-spreading ground planes.
7. *Use multiple vias to connect the power planes to internal layers.*

## 9 Device and Documentation Support

### 9.1 Device Support

#### 9.1.1 Device Nomenclature

Figure 9-1 shows the device naming nomenclature of the TLVM365R1x. See Section 4 for the availability of each variant. Contact TI sales representatives or on TI's [E2E forum](#) for detail and availability of other options; minimum order quantities apply.

Figure 9-1. Device Naming Nomenclature

#### 9.1.2 Development Support

##### 9.1.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TLVM365R1x with the WEBENCH® Power Designer.

1. Start by entering the input voltage (VIN), output voltage (VOUT), and output current (IOUT) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible devices from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability. In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance.
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

## 9.2 Documentation Support

### 9.2.1 Related Documentation

### 9.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.5 Trademarks

HotRod™, PowerPAD™, and TI E2E™ are trademarks of Texas Instruments.  
WEBENCH® is a registered trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

### 9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
December 2023	*	Initial Release

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TLVM365R15RDNR	ACTIVE	QFN-FCMOD	RDN	11	3000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	LVM365R15	<a href="#">Samples</a>
TLVM365R1RDNR	ACTIVE	QFN-FCMOD	RDN	11	3000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	LVM365R1	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 20X

4226623/C 07/2024

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
