

## LM2751 Regulated 2X, 1.5X Switched Capacitor White LED Driver

Check for Samples: [LM2751](#)

### FEATURES

- Regulated Output Options: 4.5V, 5.0V
- Output Voltage Regulated Within 3%
- Peak Efficiency Over 90%
- 150mA (4.5V) or 80mA (5.0V) Output Current Capability
- Input Voltage Range: 2.8V to 5.5V
- Low Input and Output Voltage Ripple
- <math><1\mu\text{A}</math> Typical Shutdown Current
- Small Solution Size - NO INDUCTOR
- Programmable 725kHz, 300kHz, 37kHz, or 9.5kHz Switching Frequencies
- 10-pin SON No-Pullback Package: 3mm x 3mm x 0.8mm

### APPLICATIONS

- White LED Display Backlights
- White LED Keypad Backlights
- General Purpose 2x, 1.5x Regulated Charge Pump

### DESCRIPTION

The LM2751 is a constant frequency switched capacitor charge pump with regulated output voltage options of 4.5V, and 5.0V. Over the input voltage range of 2.8V to 5.5V the LM2751 provides up to 150mA of output current and requires only four low-cost ceramic capacitors.

### Typical Application Circuit

### LM2751 2x/1.5x Efficiency vs. 2x Charge Pump Efficiency

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

## DESCRIPTION (CONTINUED)

The LM2751 provides excellent efficiency without the use of an inductor by operating the charge pump in a gain of 3/2 or 2. The proper gain for maintaining regulation is chosen so that efficiency is maximized over the input voltage range.

LM2751 uses constant frequency pre-regulation to minimize conducted noise on the input and provide a predictable switching frequency. The switching frequency is programmable to 725kHz, 300kHz, 37kHz, or 9.5kHz.

LM2751 is available in a 10-pin SON No-Pullback Package.

## Connection Diagram

**Figure 1. 10-pin SON No Pullback Package (3mm x 3mm x 0.8mm)  
See Package Number DSC0010A**

## PIN DESCRIPTIONS

Pin #	Name	Description
1	$V_{OUT}$	Pre-Regulated Output.
2	$C_{1+}$	Flying Capacitor C1 Connection.
3	$V_{IN}$	Input Supply Range: 2.8V to 5.5V.
4	$CS_0$	Frequency Select Input 0.
5	$CS_1$	Frequency Select Input 1.
6	EN	Enable Pin Logic Input.
7	$C_{2-}$	Flying Capacitor C2 Connection.
8	GND	Ground.
9	$C_{1-}$	Flying Capacitor C1 Connection.
10	$C_{2+}$	Flying Capacitor C2 Connection.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**ABSOLUTE MAXIMUM RATINGS<sup>(1)(2)(3)</sup>**

$V_{IN}$ Pin		-0.3V to 6.0V
EN, CS0, CS1 Pins		-0.3V to ( $V_{IN}+0.3$ ) w/ 6.0V max
Continuous Power Dissipation <sup>(4)</sup>		Internally Limited
Junction Temperature ( $T_{J-MAX-ABS}$ )		150°C
Storage Temperature Range		-65°C to 150°C
Maximum Lead Temperature	(Soldering, 10sec.)	265°C
ESD Rating <sup>(5)</sup>	Human-body model	2kV
	Machine model	200V

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the component may occur. Operating Ratings are conditions under which operation of the device is specified. Operating Ratings do not imply ensured performance limits. For specified performance limits and associated test conditions, see the Electrical Characteristics tables.
- (2) All voltages are with respect to the potential at the GND pin.
- (3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (4) Internal thermal shutdown circuitry protects the device from permanent damage. Thermal shutdown engages at  $T_J=150^\circ\text{C}$  (typ.) and disengages at  $T_J=140^\circ\text{C}$  (typ.).
- (5) The Human body model is a 100 pF capacitor discharged through a 1.5k $\Omega$  resistor into each pin. The machine model is a 200pF capacitor discharged directly into each pin (MIL-STD-883 3015.7).

**OPERATING RATINGS<sup>(1)(2)</sup>**

Input Voltage Range		2.8V to 5.5V
EN, CS0, CS1 Input Voltage Range		0V to $V_{IN}$
Junction Temperature ( $T_J$ ) Range		-40°C to 115°C
Ambient Temperature ( $T_A$ ) Range <sup>(3)</sup>		-40°C to 85°C
Recommended Maximum Load Current		
Version B	Freq. = 725kHz	150mA
	Freq. = 300kHz	120mA
	Freq. = 37kHz	40mA
	Freq. = 9.5kHz	10mA
Version A	Freq. = 725kHz	80mA
	Freq. = 300kHz	60mA
	Freq. = 37kHz	16mA
	Freq. = 9.5kHz	4mA

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the component may occur. Operating Ratings are conditions under which operation of the device is specified. Operating Ratings do not imply ensured performance limits. For specified performance limits and associated test conditions, see the Electrical Characteristics tables.
- (2) All voltages are with respect to the potential at the GND pin.
- (3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature ( $T_{A-MAX}$ ) is dependent on the maximum operation junction temperature ( $T_{J-MAX-OP} = 115^\circ\text{C}$ ), the maximum power dissipation of the device in the application ( $P_{D-MAX}$ ), and the junction-to ambient thermal resistance of the part/package in the application ( $\theta_{JA}$ ), as given by the following equation:  

$$T_{A-MAX} = T_{J-MAX-OP} - (\theta_{JA} \times P_{D-MAX})$$

**THERMAL PROPERTIES**

Junction-to-Ambient Thermal Resistance, 10-pin SON	Package ( $\theta_{JA}$ ) <sup>(1)</sup>	55°C/W
--	--	--------

- (1) Junction-to-ambient thermal resistance ( $\theta_{JA}$ ) is taken from a thermal modeling result, performed under the conditions and guidelines set forth in the JEDEC standard JESD51-7. The test board is a 4 layer FR-4 board measuring 102mm x 76mm x 1.6mm with a 2 x 1 array of thermal vias. The ground plane on the board is 50mm x 50mm. Thickness of copper layers are 36 $\mu\text{m}/18\mu\text{m}$  / 18 $\mu\text{m}/36\mu\text{m}$  (1.5oz/1oz/1oz/1.5oz). Ambient temperature in simulation is 22°C, still air. Power dissipation is 1W. The value of  $\theta_{JA}$  of the LM2751 in 10-pin SON could fall in a range as wide as 50°C/W to 150°C/W (if not wider), depending on PWB material, layout, and environmental conditions. In applications where high maximum power dissipation exists (high  $V_{IN}$ , high  $I_{OUT}$ ), special care must be paid to thermal dissipation issues. For more information on these topics, see the TI AN-1187 Application Report (SNOA401) and the [Power Efficiency](#) and [Power Dissipation](#) section of this datasheet.

**ELECTRICAL CHARACTERISTICS**<sup>(1)(2)</sup>

Limits in standard typeface are for  $T_A = 25^\circ\text{C}$ . Limits in **boldface** type apply over the full operating ambient temperature range ( $-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$ ). Unless otherwise noted, specifications apply to the LM2751 Typical Application Circuit (pg. 1) with:  $V_{IN} = 3.6\text{V}$ ,  $V(\text{EN}) = V_{IN}$ ,  $\text{CS0} = \text{CS1} = V_{IN}$ ,  $C_1 = C_2 = 1.0\mu\text{F}$ ,  $C_{IN} = C_{OUT} = 2.2\mu\text{F}$ <sup>(3)</sup>.

## APPLICATION INFORMATION

### CIRCUIT DESCRIPTION

The LM2751 is a Switched Capacitor Converter with gains of 2x and 1.5x. It is capable of continuously supplying up to 150mA at 4.5V or up to 80mA at 5V depending on the output voltage option. The LM2751's fixed frequency pre-regulation maintains the output voltage to within 3% (typ.), making it well suited for driving White LEDs. There are also four user programmable switching frequencies to reduce the quiescent current consumption at light loads.

Aside from powering LEDs, the LM2751 is suitable for driving other devices with power requirements up to 150mA. The LM2751 operates over the extended Li-Ion battery range from 2.8V to 5.5V. The LM2751 limits output current to 250mA (typ.) during an output short circuit condition. LED brightness is controlled by applying a PWM (Pulse Width Modulation) signal to the Enable pin (EN). See [PWM BRIGHTNESS CONTROL](#).

### SOFT START

Soft Start is engaged when the device is taken out of Shutdown mode (EN = logic HIGH) or when voltage is supplied simultaneously to the  $V_{IN}$  and EN pins. During Soft Start, the voltage on  $V_{OUT}$  will ramp up in proportion to the rate that the reference voltage is being ramped up. The output voltage is programmed to rise from 0V to the regulated output voltage level (4.5V or 5V) in 300 $\mu$ s (typ.).

### ENABLE MODE

The Enable logic pin (EN) disables the part and reduces the quiescent current to 0.77 $\mu$ A (typ.). The LM2751 has an active-high enable pin (LOW = shut down, HIGH = operating) which can be driven with a low-voltage CMOS logic signal (1.5V logic, 1.8V logic, etc). There is an internal 1M $\Omega$  pull-down resistor between the EN and GND pins of the LM2751.

### FREQUENCY MODE SELECT

The LM2751 switching frequency is user programmable via two logic input pins, CS0 and CS1. Both logic input pins have active-high logic (LOW = un-selected, HIGH = selected) and can be driven with a low-voltage CMOS logic signal (1.5V logic, 1.8V logic, etc). There are no internal pull-down or pull-up resistors between the CSx and GND pins of the LM2751. The CS0 and CS1 can be controlled independently or with the same logic signal.

The selectable switching frequencies are 9.5kHz, 37kHz, 300kHz, 725kHz. The switching frequency is programmed according to [Table 1](#).

**Table 1. Frequency Modes**

CS0	CS1	Frequency
0	0	37kHz
0	1	300kHz
1	0	9.5kHz
1	1	725kHz

### $V_{OUT}$ REGULATION

The LM2751 uses pre-regulation to regulate the output voltage to 4.5V or 5.0V depending on the voltage option. Pre-regulation uses the voltage present at  $V_{OUT}$  to limit the gate drive of the switched capacitor charge pump. This regulation is done before the voltage is gained up by the charge pump, giving rise to the term "pre-regulation". Pre-regulation helps to reduce input current noise and large input current spikes normally associated with switched capacitor charge pumps.

The LM2751 switched capacitor charge pump has gains of 2x and 1.5x. When the input voltage to the device is greater than 3.58V (typ.), the LM2751 operates in a gain of 1.5x. When the input voltage falls below 3.5V (typ.), the device switches to a gain of 2x.

## OUTPUT VOLTAGE RIPPLE

The primary contributor in keeping the output voltage ripple of the LM2751 low is its switching topology. The output capacitance, input voltage, switching frequency and output current also play a significant part in determining the output voltage ripple. Due to the complexity of the LM2751 operation, providing equations or models to approximate the magnitude of the ripple cannot be easily accomplished. However, the following general statements can be made.

The LM2751 has very low output ripple when compared to typical boost regulators due to its double-pump topology, where charge is continually supplied to the output during both 2x and 1.5x modes. Combined with fixed frequency operation modes, double-pumping allows for the use of a very small, low value ceramic capacitor on the output node while still achieving minimal output ripple. Increasing the capacitance by adding a higher value capacitor or placing multiple capacitors in parallel can further reduce the ripple magnitude.

## CAPACITOR SELECTION

The LM2751 requires 4 external capacitors for proper operation. Surface-mount multi-layer ceramic capacitors are recommended. These capacitors are small, inexpensive and have very low equivalent series resistance (ESR,  $\leq 15\text{m}\Omega$  typ.). Tantalum capacitors, OS-CON capacitors, and aluminum electrolytic capacitors are generally not recommended for use with the LM2751 due to their high ESR, as compared to ceramic capacitors.

For most applications, ceramic capacitors with X7R or X5R temperature characteristic are preferred for use with the LM2751. These capacitors have tight capacitance tolerance (as good as  $\pm 10\%$ ), hold their value over temperature (X7R:  $\pm 15\%$  over  $-55^\circ\text{C}$  to  $125^\circ\text{C}$ ; X5R:  $\pm 15\%$  over  $-55^\circ\text{C}$  to  $85^\circ\text{C}$ ), and typically have little voltage coefficient when compared to other types of capacitors. However selecting a capacitor with a voltage rating much higher than the voltage it will be subjected to, will ensure that the capacitance will stay closer to the capacitor's nominal value. Capacitors with Y5V or Z5U temperature characteristic are generally not recommended for use with the LM2751. Capacitors with these temperature characteristics typically have wide capacitance tolerance ( $+80\%$ ,  $-20\%$ ), vary significantly over temperature (Y5V:  $+22\%$ ,  $-82\%$  over  $-30^\circ\text{C}$  to  $+85^\circ\text{C}$  range; Z5U:  $+22\%$ ,  $-56\%$  over  $+10^\circ\text{C}$  to  $+85^\circ\text{C}$  range), and have poor voltage coefficients. Under some conditions, a nominal  $1\mu\text{F}$  Y5V or Z5U capacitor could have a capacitance of only  $0.1\mu\text{F}$ . Such detrimental deviation is likely to cause Y5V and Z5U capacitors to fail to meet the minimum capacitance requirements of the LM2751.

The voltage rating of the output capacitor should be 10V or more. All other capacitors should have a voltage rating at or above the maximum input voltage of the application.

## DRIVING WHITE LEDs

The desired LED current is set by placing a resistor (R) in series with each LED, and is determined by the equation:

$$I_{\text{LED}} = (V_{\text{OUT}} - V_{\text{LED}}) \div R \quad (1)$$

In the equation above,  $I_{\text{LED}}$  is the current that flows through a particular LED, and  $V_{\text{LED}}$  is the forward voltage of the LED at the given current. The output voltage ( $V_{\text{OUT}}$ ) of the LM2751 is tightly regulated to 4.5V or 5V depending on the output voltage option. However, LED forward voltage varies from LED to LED, and LED current will vary accordingly. Mismatch of LED currents will result in brightness mismatch from one LED to the next. Therefore it is suggested that LED groups with tightly controlled I-V characteristics ("Binned" LEDs) be used. LEDs with looser tolerance can be used in applications where brightness matching is not critical, such as in keypad or general backlighting. The typical and maximum diode forward voltage depends highly on the manufacturer and their technology.

## PWM BRIGHTNESS CONTROL

Perceived LED brightness can be adjusted using a PWM control signal on the Enable pin of the LM2751, to turn the voltage output ON and OFF at a rate faster than perceptible by the eye. When this is done, the total brightness perceived is proportional to the duty cycle (D) of the PWM signal (D = the percentage of time that the LED is on in every PWM cycle). A simple example: if the LEDs are driven at 15mA each with a PWM signal that has a 50% duty cycle, perceived LED brightness will be about half as bright as compared to when the LEDs are driven continuously with 15mA.

For linear brightness control over the full duty cycle adjustment range, the PWM frequency (f) should be limited to accommodate the turn-on time (typ.  $T_{ON} = 300\mu s$ ) of the device.

$$D \times (1/f) > T_{ON} \quad (2)$$

$$f_{MAX} = D_{MIN} \div T_{ON} \quad (3)$$

The minimum recommended PWM frequency is 100Hz. Frequencies below this may be visibly noticeable as flicker or blinking. The maximum recommended PWM frequency is 1kHz. Frequencies above this may cause noise in the audible range.

## THERMAL PROTECTION

When the junction temperature exceeds 150°C (typ.), internal thermal protection circuitry disables the device. This feature protects the LM2751 from damage due to excessive power dissipation. The device will recover and operate normally when the junction temperature falls below 140°C (typ.). It is important to have good thermal conduction with a proper layout to reduce thermal resistance.

## POWER EFFICIENCY

Charge-Pump efficiency is derived in the following two ideal equations (supply current and other losses are neglected for simplicity):

$$I_{IN} = G \times I_{OUT} \quad (4)$$

$$E = (V_{OUT} \times I_{OUT}) \div (V_{IN} \times I_{IN}) = V_{OUT} \div (G \times V_{IN}) \quad (5)$$

In the equations, G represents the charge pump gain. Efficiency is at its highest as  $G \times V_{IN}$  approaches  $V_{OUT}$ . Refer to the efficiency graph in the [Typical Performance Characteristics](#) for the detailed efficiency data.

## POWER DISSIPATION

The power dissipation ( $P_{DISSIPATION}$ ) and junction temperature ( $T_J$ ) can be approximated with the equations below.  $P_{IN}$  is the product of the input current and input voltage,  $P_{OUT}$  is the power consumed by the load connected to the output,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance for the 10-pin SON package.  $V_{IN}$  is the input voltage to the LM2751,  $V_{VOUT}$  is the voltage at the output of the device, and  $I_{OUT}$  is the total current supplied to the load connected to  $V_{OUT}$ .

$$P_{DISSIPATION} = P_{IN} - P_{OUT} \quad (6)$$

$$= (V_{IN} \times I_{IN}) - (V_{VOUT} \times I_{OUT}) \quad (7)$$

$$T_J = T_A + (P_{DISSIPATION} \times \theta_{JA}) \quad (8)$$

The junction temperature rating takes precedence over the ambient temperature rating. The LM2751 may be operated outside the ambient temperature rating, so long as the junction temperature of the device does not exceed the maximum operating rating of 115°C. The maximum ambient temperature rating must be derated in applications where high power dissipation and/or poor thermal resistance causes the junction temperature to exceed 115°C.

---

**REVISION HISTORY**

<b>Changes from Revision A (May 2013) to Revision B</b>	<b>Page</b>
• Changed layout of National Data Sheet to TI format .....	<a href="#">12</a>

---

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM2751SD-B/NOPB	ACTIVE	WSO8	DSC	10	1000	RoHS & Green	SN	Level-1-260C-UNLIM	-40 to 85	L146B	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LM2751SD-B/NOPB	WSON	DSC	10	1000	178.0	12.4	3.3	3.3	1.0	8.0	12.0	Q1

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
LM2751SD-B/NOPB	WSON	DSC	10	1000	210.0	185.0	35.0
