

REF35-Q1 Ultra Low-Power, High-Precision Voltage Reference

1 Features

- AEC-Q100 qualified with the following results:
 - Device temperature grade 1: -40°C to 125°C ambient operating temperature range
- Ultra-low quiescent current:
 - 650 nA (typical)
- Initial accuracy: $\pm 0.05\%$ (maximum)
- Temperature coefficient:
 - 15 ppm/ $^{\circ}\text{C}$ maximum for -40°C to 125°C
- Output 1/f noise (0.1 Hz to 10 Hz): 3.3 ppm_{p-p}
- NR pin to reduce noise
- EN pin to reduce shutdown current consumption
- Long-term stability: 30 ppm at 1k hour
- Specified temperature range: -40°C to $+125^{\circ}\text{C}$
- Operating temperature range: -55°C to $+125^{\circ}\text{C}$
- Output current: +10 mA, -5 mA
- Input voltage: $V_{\text{REF}} + V_{\text{DO}}$ to 6 V
- Output voltage options:
 - 1.2 V, 1.25 V, 1.8 V, 2.048 V, 2.5 V, 3.0 V, 3.3 V, 4.096 V, 5.0 V
- Small footprint 6-pin SOT-23 package

2 Applications

- [Automotive front camera](#)
- [Driver monitoring](#)
- [Battery control unit](#)
- [Electric power steering](#)

3 Description

The REF35-Q1 is a family of nanopower, low-drift, high-precision series reference devices. The REF35-Q1 family features $\pm 0.05\%$ initial accuracy with typical 650 nA power consumption. The temperature coefficient (15 ppm/ $^{\circ}\text{C}$) and long-term stability (30 ppm at 1000 hours) of the device can help improve system stability and reliability. The low power consumption combined with high precision specifications are designed for a wide variety of low current applications.

The REF35-Q1 supplies up to 10 mA current with 3.3 ppm_{p-p} noise and 20 ppm/mA load regulation. With this feature set, REF35-Q1 creates a strong low-noise, high accuracy power supply for precision sensors and 12–16b data converters.

The family is fully specified for operation from -40°C to 125°C and is functional over -55°C to 125°C .

The REF35-Q1 is available in wide output voltage variants starting from 1.20 V to 5.0 V. The device is offered in space saving SOT23-6 pin package. Contact the TI sales representative for available voltage options.

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
REF35xxx-Q1	SOT-23 (6)	2.90 mm × 1.60 mm

(1) For all available voltage variants and packages, see the orderable addendum at the end of the data sheet.

6 Pin Configuration and Functions

**Figure 6-1. Package
6-Pin DBV
Top View**

Table 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	DBV		
GND	1	Ground	Device ground connection
GND	2	Ground	Device ground connection
EN	3	Input	Enable connection. Enables or disables the device.
VIN	4	Power	Input supply voltage connection
NR	5	Output	Noise reduction pin. Connect a capacitor to reduce noise.
VREF	6	Output	Reference voltage output

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Input voltage	V _{IN}	-0.3	6.5	V
Enable voltage	EN	-0.3	V _{IN} + 0.3 ⁽²⁾	V
Output voltage	V _{REF}	-0.3	V _{IN} + 0.3 ⁽²⁾	V
Output short circuit current	I _{SC}		20	mA
Operating temperature range	T _A	-55	125	°C
Storage temperature range	T _{stg}	-65	170	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) I_N + 0.3 V or 6.5 V, whichever is lower

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins ⁽²⁾	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage ⁽¹⁾	V _{REF} + V _{DO} ⁽²⁾		6	V
EN	Enable voltage	0		V _{IN}	V
I _L	Output current	-5		10	mA
T _A	Operating temperature	-40	25	125	°C

- (1) For V_{REF} = 1.2 V and 1.25 V, minimum V_{IN} = 1.7 V
- (2) V_{DO} = Dropout voltage

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		REF35-Q1	UNIT
		DBV (SOT-23)	
		6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	164.4	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	102.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	59.6	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	44.0	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	59.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

At $V_{IN} = V_{REF} + 0.5\text{ V}$, $V_{EN} = V_{IN}$, $C_L = 10\ \mu\text{F}$, $C_{IN} = 0.1\ \mu\text{F}$, $I_L = 0\ \text{mA}$, minimum and maximum specifications at $T_A = -40^\circ\text{C}$ to 125°C , typical specifications $T_A = 25^\circ\text{C}$; unless otherwise noted

PARAMETER		TEST CONDITION		MIN	TYP	MAX	UNIT
ACCURACY AND DRIFT							
	Output voltage accuracy	$T_A = 25^\circ\text{C}$		-0.05		0.05	%
	Output voltage temperature coefficient	$-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$				15	ppm/ $^\circ\text{C}$
LINE AND LOAD REGULATION							
$\Delta V_{REF}/\Delta V_{IN}$	Line regulation	$V_{REF} < 2.5\ \text{V}; V_{IN} = V_{REF} + V_{DO}$ to V_{INMAX}			40	160	ppm/V
		$V_{REF} \geq 2.5\ \text{V}; V_{IN} = V_{REF} + V_{DO}$ to V_{INMAX}			40	120	ppm/V
$\Delta V_{REF}/\Delta I_L$	Load regulation	$I_L = 0\ \text{mA}$ to $10\ \text{mA}$, $V_{IN} = V_{REF} + V_{DO}$	Source		20	60	ppm/mA
		$I_L = 0\ \text{mA}$ to $5\ \text{mA}$, $V_{IN} = V_{REF} + V_{DO}$	Sink		40	350	ppm/mA
POWER SUPPLY							
V_{IN}	Input voltage ⁽¹⁾			$V_{REF} + V_{DO}$		6	V
I_Q	Quiescent current	Active mode	$T_A = 25^\circ\text{C}$		0.65	0.9	μA
			$-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$			2.6	
		Shutdown mode	$T_A = 25^\circ\text{C}$			0.1	
			$-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$			0.5	
V_{EN}	Enable pin voltage	Active mode (EN = 1 or Float)		$0.7 \times V_{IN}$			V
		Shutdown mode (EN = 0)			$0.3 \times V_{IN}$		
I_{EN}	Enable pin current	$V_{EN} = V_{IN}$			0.05	0.1	μA
V_{DO}	Dropout voltage	$I_L = 5\ \text{mA}$				120	mV
		$I_L = 10\ \text{mA}$				250	
I_{SC}	Short circuit current, Sourcing	$V_{REF} = 0\ \text{V}$, $T_A = 25^\circ\text{C}$			33		mA
I_{SC}	Short circuit current, Sinking	$V_{REF} = V_{IN}\ \text{V}$, $T_A = 25^\circ\text{C}$			21		mA
TURN-ON TIME							
t_{ON}	Turn-on time ⁽²⁾	0.1% settling, $C_L = 1\ \mu\text{F}$, $V_{REF} = 2.5\ \text{V}$			2		ms
NOISE							
e_n	Output voltage noise	$f = 10\ \text{Hz}$ to $1\ \text{kHz}$, $C_L = 1\ \mu\text{F}$			0.7		ppm _{rms}
e_{np-p}	Low-frequency noise	$f = 0.1\ \text{Hz}$ to $10\ \text{Hz}$, $V_{REF} \geq 2.5\ \text{V}$			3.8		ppm _{p-p}
		$f = 0.1\ \text{Hz}$ to $10\ \text{Hz}$, $V_{REF} < 2.5\ \text{V}$			3.3		ppm _{p-p}
HYSTERESIS AND LONG-TERM STABILITY							
	Long-term stability	0 to 1000h at 35°C			30		ppm
	Output voltage hysteresis	25°C , -40°C , 125°C , 25°C (cycle 1)			90		ppm
	Output voltage hysteresis	25°C , -40°C , 125°C , 25°C (cycle 2)			70		ppm
STABLE CAPACITANCE RANGE							
	Input capacitor range				0.1		μF
	Output capacitor range ⁽³⁾				0.1	10	μF

(1) For $V_{REF} = 1.2\ \text{V}$ and $1.25\ \text{V}$, minimum $V_{IN} = 1.7\ \text{V}$

(2) Scales linearly with V_{REF} .

(3) ESR for the capacitor $\leq 400\ \text{m}\Omega$

7.6 Typical Characteristics

at $T_A = 25^\circ\text{C}$, $V_{IN} = V_{EN} = V_{REF} + 0.3\text{ V}$, $I_L = 0\text{ mA}$, $C_L = 10\ \mu\text{F}$, $C_{IN} = 0.1\ \mu\text{F}$ (unless otherwise noted)

8 Parameter Measurement Information

8.1 Solder Heat Shift

The materials used in the manufacture of the REF35-Q1 have differing coefficients of thermal expansion, resulting in stress on the device die when the part is heated. Mechanical and thermal stress on the device die can cause the output voltages to shift, degrading the initial accuracy specifications of the product. Reflow soldering is a common cause of this error.

To illustrate this effect, a total of 32 devices were soldered on one printed circuit board using lead-free solder paste and the paste manufacturer suggested reflow profile. [Figure 8-1](#) shows the reflow profile. The printed circuit board is comprised of FR4 material. The board thickness is 1.66 mm and the area is 174 mm × 135 mm.

Figure 8-1. Reflow Profile

The reference output voltage is measured before and after the reflow process; [Figure 8-2](#) shows the typical shift. Although all tested units exhibit very low shifts (< 0.03%), higher shifts are also possible depending on the size, thickness, and material of the printed circuit board (PCB). An important note is that the histograms display the typical shift for exposure to a single reflow profile. Exposure to multiple reflows, as is common on PCBs with surface-mount components on both sides, causes additional shifts in the output bias voltage. If the PCB is exposed to multiple reflows, the device must be soldered in the last pass to minimize its exposure to thermal stress.

Figure 8-2. Solder Heat Shift Distribution, V_{REF} (%)

8.2 Temperature Coefficient

The REF35-Q1 is designed and tested for a low output voltage temperature coefficient, which is defined as the change in output voltage over temperature. The temperature coefficient is calculated using the box method in which a box is formed by the minimum/maximum limits for the nominal output voltage over the operating temperature range. REF35-Q1 has a low maximum temperature coefficient of 15 ppm/°C from –40°C to +125°C. The box method specifies limits for the temperature error but does not specify the exact shape and slope of the device under test. Due to temperature curvature correction to achieve low-temperature drift, the temperature drift is expected to be non-linear. See TI's Analog Design Journal, [Precision voltage references](#), for more information on the box method. Use [Equation 1](#) for the box method.

$$\text{Drift} = \left(\frac{V_{\text{REF(MAX)}} - V_{\text{REF(MIN)}}}{V_{\text{REF(25}^\circ\text{C)}} \times \text{Temperature Range}} \right) \times 10^6 \quad (1)$$

Figure 8-3 shows a typical voltage versus temperature curves for various reference voltages.

Figure 8-3. Output Voltage Drift Vs Free-Air Temperature

8.3 Long-Term Stability

One of the key performance parameters of the REF35-Q1 references is long-term stability also known as long-term drift. The long-term stability value is tested in a typical setup that reflects standard PCB board manufacturing practices. The boards are made of standard FR4 material and the board does not have special cuts or grooves around the devices to relieve the mechanical stress of the PCB. The devices and boards in this test do not undergo high temperature burn in post-soldering prior to testing. These conditions reflect a real world use case scenario and common manufacturing techniques.

During the long-term stability testing, precautions are taken to ensure that only the long-term stability drift is being measured. The boards are maintained at 35°C in an oil bath. The oil bath ensures that the temperature is constant across the device over time compared to an air oven. The measurements are captured every 30 minutes with a calibrated 8.5 digit multimeter.

The typical long-term stability characteristic is expressed as a deviation of the reference voltage output over time.

Figure 8-4 shows the typical drift value for the REF35-Q1 in 6-pin SOT-23 package is 30 ppm from 0 to 1000 hours. It is important to understand that long-term stability is not ensured by design and that the value is typical.

The REF35-Q1 will experience the highest drift in the initial 1000 hr. Subsequent deviation is typically lower than first 1000 hr.

Figure 8-4. Long Term Stability - 1000 hours (V_{REF})

8.4 Thermal Hysteresis

Thermal hysteresis is measured with the REF35-Q1 soldered to a PCB, similar to a real-world application. Thermal hysteresis for the device is defined as the change in output voltage after operating the device at 25°C, cycling the device through the specified temperature range, and returning to 25°C. The PCB was baked at 150°C for 30 minutes before thermal hysteresis was measured. Use [Equation 2](#) to calculate the thermal hysteresis.

$$V_{HYST} = \left(\frac{|V_{PRE} - V_{POST}|}{V_{NOM}} \right) \times 10^6 \text{ (ppm)} \quad (2)$$

where

- V_{HYST} = thermal hysteresis (in units of ppm)
- V_{NOM} = the specified output voltage
- V_{PRE} = output voltage measured at 25°C pre-temperature cycling
- V_{POST} = output voltage measured after the device has cycled from 25°C through the specified temperature range of –40°C to +125°C and returns to 25°C.

[Figure 8-5](#) and [Figure 8-6](#) show the typical thermal hysteresis distribution across various temperature ranges in two cycles.

Figure 8-5. Thermal Hysteresis Distribution -40°C to 125°C, Cycle 1

Figure 8-6. Thermal Hysteresis Distribution -40°C to 125°C, Cycle 2

8.5 Noise Performance

The reference pin output noise is categorized as low frequency and broadband noise. The following sections describe these categories in detail.

8.5.1 Low-Frequency (1/f) Noise

Flicker noise, also known as 1/f noise, is a low-frequency noise that affects the device output voltage which can affect precision measurements in ADCs. This noise increases proportionally with output voltage and operating temperature. The noise is measured by filtering the output from 0.1 Hz to 10 Hz. The 1/f noise is an extremely low value, therefore the frequency of interest must be amplified and band-pass filtered. This is done by using a high-pass filter to block the DC voltage. The resulting noise is then amplified by a gain of 1000. The bandpass filter is created by a series of high-pass and low-pass filter that adds additional gain to make it more visible on an oscilloscope as shown in [Figure 8-7](#). [Figure 8-8](#) shows the effect of flicker noise over 10 second. Flicker noise must be tested in a Faraday cage enclosure to block environmental noise.

Figure 8-7. Low-Frequency (1/f) Noise Test Setup

Figure 8-8. 0.1 Hz to 10 Hz Voltage Noise

Figure 8-9 shows the typical 1/f noise (0.1 Hz to 10 Hz) distribution across various load conditions. The REF35-Q1 device also offers noise reduction functionality by adding an optional capacitor between NR (pin 5) and ground pins.

Figure 8-10 shows the typical 1/f noise (0.1 Hz to 10 Hz) distribution across REF35-Q1 devices with various capacitance between NR pin and GND.

Figure 8-9. 0.1 Hz to 10 Hz Noise Distribution vs Load Conditions

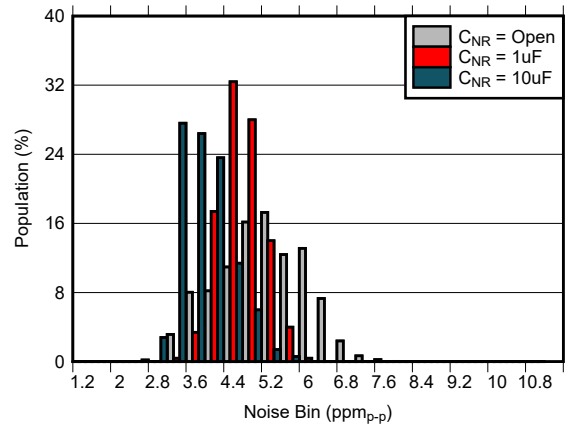

Figure 8-10. 0.1 Hz to 10 Hz Noise Distribution vs NR Capacitance

8.5.2 Broadband Noise

Broadband noise is a noise that appears at higher frequency compared to 1/f noise. The broadband noise is measured by high-pass filtering the output of the reference device, followed by a gain stage and measuring the result on a spectrum analyzer as shown in Figure 8-11

Figure 8-11. Broadband Noise Test Setup

For noise sensitive designs, a low-pass filter can be used to reduce broadband noise output noise levels by removing the high frequency components. When designing a low-pass filter, take special care to make sure the output impedance of the filter does not degrade AC performance. This can occur in RC low-pass filters where a large series resistance can impact the load transients due to output current fluctuations. The REF35-Q1 device also offers noise reduction functionality by adding an optional capacitor between NR (pin 5) and ground pins. [Figure 8-12](#) and [Figure 8-13](#) show the noise spectrum for REF35250 and REF35500 devices respectively across various NR pin capacitance.

**Figure 8-12. Noise Spectrum 10 Hz to 100 kHz
(V_{REF} = 2.5 V)**

**Figure 8-13. Noise Spectrum 10 Hz to 100 kHz
(V_{REF} = 5 V)**

8.6 Power Dissipation

The REF35-Q1 voltage references are capable of source up to 10 mA and sink up to 5 mA of load current across the rated input voltage range. However, when used in applications subject to high ambient temperatures, the input voltage and load current must be carefully monitored to ensure that the device does not exceed its maximum power dissipation rating. The maximum power dissipation of the device can be calculated with [Equation 3](#):

$$T_J = T_A + P_D \times R_{\theta JA} \quad (3)$$

where

- P_D is the device power dissipation
- T_J is the device junction temperature
- T_A is the ambient temperature
- $R_{\theta JA}$ is the package (junction-to-air) thermal resistance

Because of this relationship, acceptable load current in high temperature conditions may be less than the maximum current-sourcing capability of the device. In no case should the device be operated outside of its maximum power rating because doing so can result in premature failure or permanent damage to the device.

9 Detailed Description

9.1 Overview

The REF35-Q1 is family of ultralow current, low-noise, precision band-gap voltage references that are specifically designed for excellent initial voltage accuracy and drift. The [Functional Block Diagram](#) is a simplified block diagram of the REF35-Q1 showing basic band-gap topology.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Supply Voltage

The REF35-Q1 family of references features an extremely low dropout voltage. For 10 mA loaded conditions, a maximum dropout voltage is 250 mV. [Figure 7-25](#) shows a typical dropout voltage (V_{DO}) versus load current. The device supports operation with input voltage range from $V_{REF} + V_{DO}$ to 6 V. The typical quiescent current is 680 nA and maximum quiescent current over temperature is only 2.6 μ A. The low dropout voltage coupled with ultralow current enable the operation across multiple battery powered applications.

9.3.2 EN Pin

The REF35-Q1 family supports device enable and disable functionality through logic level control on EN pin. The EN pin of REF35-Q1 does not use an internal pull-up resistor. Instead, the pin uses new 'clean EN' technology. This allows the EN pin to be in a no connect condition at start-up, and no extra current is drawn from the supply when the EN pin is pulled low in shutdown mode. When EN pin is pulled high or left unconnected, the device is in active mode. When EN pin is drive by an open-drain outputs, a pull-up resistor to V_{IN} is required. The device must be in active mode for normal operation. The EN pin must not be pulled higher than V_{IN} supply voltage.

The device can be placed in shutdown mode by pulling the EN pin low. When in shutdown mode, the output of the device becomes high impedance and the quiescent current of the device drops to 50 nA.

Also note that for applications where EN pin is no-connect, total parasitic capacitance on EN pin should be restricted within 30 pF.

See the [Section 7.5](#) for logic high and logic low voltage levels.

9.3.3 NR Pin

The REF35-Q1 pin allows access to the band gap through the NR pin. Placing a capacitor from the NR pin to GND creates a low-pass filter in combination with the internal resistance of 60 k Ω . Leakage of the capacitance directly impacts the accuracy and temperature drift. If NR functionality is used, choose a low leakage capacitor. A capacitance of 1 μ F creates a low-pass filter with corner frequency around 2.7 Hz. Such a filter decreases the overall noise on the VREF pin. Higher capacitance results in a lower filter cut off frequency, further reducing output noise. Please note, using the capacitor on NR pin also increases start-up time.

9.4 Device Functional Modes

9.4.1 Basic Connections

Figure 9-1 shows the typical connections for the REF35-Q1. TI recommends a supply bypass capacitor (C_{IN}) ranging from 0.1 μF to 10 μF . A 0.1 μF to 10 μF output capacitor (C_L) must be connected from REF to GND. The equivalent series resistance (ESR) value of C_L must be lower than 400 m Ω to ensure output stability.

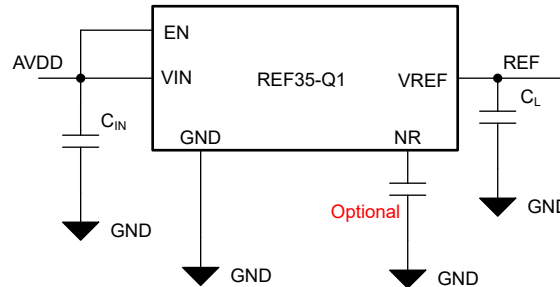

Figure 9-1. Basic Connections

9.4.2 Start-Up

Figure 9-2 shows the start-up behavior of REF35250 device with 1 μF load capacitance. REF35-Q1 device ensures the output voltage settles to the expected output voltage within specified accuracy without oscillations. The start-up time is dependent on the output voltage variant, output capacitance and NR pin capacitance. Higher capacitance leads to longer start-up time.

Figure 9-2. REF35250 Start-Up Behavior, $C_L = 1 \mu\text{F}$

9.4.3 Output Transient Behavior

The REF35-Q1 output buffer is capable of sourcing 10 mA load current as well as sink 5 mA of load current. The output stage is designed using class AB architecture with ultra-low quiescent current. This architecture avoids the dead zone around the no load condition. The output buffer uses a fast start-up implementation to achieve 2ms typical turn-on time at $C_L = 1 \mu\text{F}$ and no-load current condition.

Figure 9-3 and Figure 9-4 show the output settling behavior for light load transient and high load transient respectively.

Figure 9-3. Load Transient Response 0 μA to 100 μA , $C_{REF} = 1 \mu\text{F}$

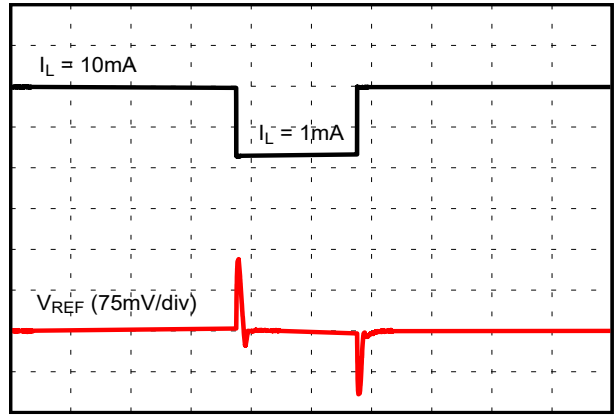

Figure 9-4. Load Transient Response 1 mA to 10 mA, $C_{REF} = 1 \mu\text{F}$

10 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

REF35-Q1 with low current consumption and class leading performance specifications is suitable reference for multiple applications. The device can also be used as a precision low noise power supply to sensor or data converter instead of traditional LDO or DC/DC based power supply. Basic applications includes positive/negative voltage reference and data acquisition.

10.2 Typical Application: Negative Reference Voltage

For applications requiring a negative and positive reference voltage, the REF35-Q1 and OPA188-Q1 can be used to provide a dual-supply reference from a 5 V supply. Figure 10-1 shows the REF35250 used to provide a 2.5 V supply reference voltage. The low drift performance of the REF35250-Q1 complements the low offset voltage and low-drift of the OPA188-Q1 to provide an accurate solution for split-supply applications. Take care to match the temperature coefficients of R1 and R2.

Figure 10-1. REF35-Q1 and OPA188-Q1 Create Positive and Negative Reference Voltages

10.3 Typical Application: Precision Power Supply and Reference

Figure 10-2 shows the basic configuration for the REF35-Q1 device as precision power supply to ADS7038-Q1 data converter which uses its power supply AVDD as reference. Connect bypass capacitors according to the guidelines in Section 10.3.2.2 section.

Figure 10-2. Basic Reference Connection

10.3.1 Design Requirements

A detailed design procedure is described based on a design example. For this design example, use the parameters listed in Table 10-1 as the input parameters.

Table 10-1. Design Example Parameters

DESIGN PARAMETER	VALUE
Input voltage range V_{IN}	0 V - 5 V
Output resolution	12-bit
REF input capacitor	1 μ F
REF output capacitor	10 μ F

10.3.2 Detailed Design Procedure

10.3.2.1 Selection of Reference

The REF35500-Q1 reference is selected for this design. The REF35500-Q1 device operates of very low quiescent current while offering ± 0.05 % initial accuracy and very low noise. These parameters help improve system accuracy as compared to external LDO based power supply. The 5 V reference voltage supports the 0 V to 5 V input range specification.

10.3.2.2 Input and Output Capacitors

A 1 μ F to 10 μ F electrolytic or ceramic capacitor can be connected to the input to improve transient response in applications where the supply voltage may fluctuate.

A ceramic capacitor of at least a 0.1 μF must be connected to the output to improve stability and help filter out high frequency noise. Add an additional 10 μF capacitor in parallel to improve transient performance in response to sudden changes in load current; however, keep in mind that doing so increases the start-up time of the device.

Best performance and stability is attained with low-ESR, low-inductance ceramic chip-type output capacitors (X5R, X7R, or similar). If using an electrolytic capacitor on the output, place a 0.1 μF ceramic capacitor in parallel to reduce overall ESR on the output. Place the input and output capacitors as close as possible to the device.

10.3.2.3 Selection of ADC

[ADS7038-Q1](#) 12-bit 8 channel multiplexed ADC is chosen for this application. The ADC offers low current operation with averaging mode to increase the resolution to 16-bit with internal averaging modes while operating with slow sampling speed.

10.3.3 Application Curves

[Table 10-2](#) shows the captured measurement results for various DC inputs. The ADC output is captured and analyzed for output accuracy, code spread and sigma with REF35500-Q1 as power supply vs LDO as power supply.

REF35-Q1 offers better accuracy and lower noise than the LDO device at lower quiescent current. This results in lower error in measurement as well as lower ADC output code variation across various OSR settings.

Table 10-2. DC Input Performance Test Results

INPUT V	ADC OSR SETTING	REF35500		LDO	
		ERROR	CODE SPREAD	ERROR	CODE SPREAD
1.0 V	0	0.01 mV	32 LSB	8.9 mV	48 LSB
	8	0.3 mV	10 LSB	9.21 mV	16 LSB
	128	0.38 mV	6 LSB	9.26 mV	6 LSB
2.5 V	0	0.69 mV	32 LSB	22.89 mV	64 LSB
	8	1.44 mV	10 LSB	23.63 mV	18 LSB
	128	1.17 mV	3 LSB	23.41 mV	5 LSB
4 V	0	2.27 mV	32 LSB	37.84 mV	48 LSB
	8	3.01 mV	24 LSB	38.62 mV	24 LSB
	128	2.46 mV	3 LSB	38.09 mV	17 LSB

10.4 Power Supply Recommendations

The REF35 family of references feature an extremely low-dropout voltage. These references can be operated with a supply of only 50 mV above the output voltage at no load. TI recommends a supply bypass capacitor ranging between 0.1 μF to 10 μF .

10.5 Layout

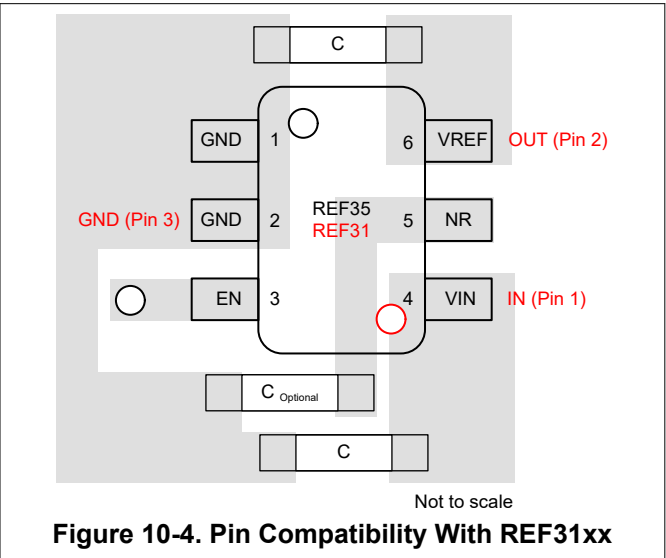

10.5.1 Layout Guidelines

[Figure 10-3](#) shows an example of a PCB layout for a data acquisition system using the REF35-Q1. Some key considerations are:

- Connect low-ESR, 0.1 μF ceramic bypass capacitors at V_{IN} , V_{REF} of the REF35-Q1.
- Decouple other active devices in the system per the device specifications.
- Using a solid ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup.
- Place the external components as close to the device as possible.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when absolutely necessary.

[Figure 10-4](#) shows the pin compatibility with TI REF31xx series reference in the 3-pin SOT-23 package when using the REF35xxx family footprint. You must rotate the REF31xx reference device by 180° before assembly.

10.5.2 Layout Examples

11 Device and Documentation Support

11.1 Documentation Support

11.1.1 Related Documentation

For related documentation see the following:

- [INA21x Voltage Output, Low- or High-Side Measurement, Bidirectional, Zero-Drift Series, Current-Shunt Monitors](#)
- [Low-Drift Bidirectional Single-Supply Low-Side Current Sensing Reference Design](#)

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

11.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
REF35125QDBVRQ1	ACTIVE	SOT-23	DBV	6	3000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	34BI	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
