

# TAC5112 Low-power stereo audio codec with 100dB dynamic range ADC and 106dB dynamic range DAC

## 1 Features

- ADC channel
  - Stereo high performance ADC
  - Performance:
    - Line differential input dynamic range: 100 dB
    - Mic differential input dynamic range: 100 dB
    - THD+N: –95 dB
    - Channel summing mode supports high SNR
  - Input voltage:
    - Differential, 2- $V_{RMS}$  full-scale inputs
    - Single-ended, 1- $V_{RMS}$  full-scale inputs
  - Input mix / mux options
  - Sample rate ( $f_s$ ) = 8 kHz to 768 kHz
  - Programmable microphone bias (Up to 3V)
- DAC channel
  - Stereo high performance DAC
  - DAC performance:
    - DAC to line out dynamic range: 106 dB
    - DAC to HP out dynamic range: 106 dB
    - THD+N: –95 dB
  - Head phone / line Out output voltage:
    - Differential, 2- $V_{RMS}$  full-scale
    - Single-ended, 1- $V_{RMS}$  full-scale
  - DAC sample Rates ( $f_s$ ) = 8 KHz to 768 KHz
- Common features
  - Up to 4 record channels
    - 2 Channel analog + 2 channel digital
    - 1 Channel analog + 3 channel digital
    - 4 Channel digital
  - Analog input to output by-pass
  - Voice activity detection
  - Battery protection
  - Signal distortion limiter
  - Thermal foldback
  - Low latency filter selection
  - Programmable HPF and biquad filters
  - I<sup>2</sup>C & SPI control interface
  - Audio serial interface
    - Format: TDM, I<sup>2</sup>S or left justified
    - Word length: 16,20,24 or 32 bits
  - Programmable PLL for flexible clocking
  - Low power modes
    - TBD mW for playback
    - TBD mW for record
  - Single supply operation: 1.8 V or 3.3 V
  - I/O supply operation: 1.2 V or 1.8 V or 3.3 V
  - Temperature grade 1: –40°C ≤ T<sub>A</sub> ≤ +125°C

## 2 Applications

- [IP Network Camera](#)
- [IP Telephone](#)
- [Video Conference System](#)
- [Professional audio mixer/control surface](#)

## 3 Description

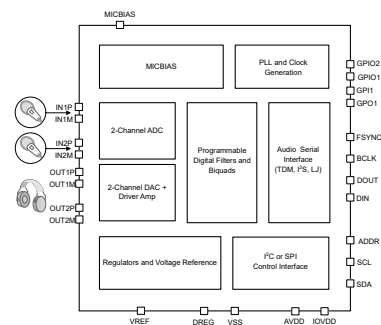

The TAC5112 is a low power Stereo Codec with 2  $V_{RMS}$  differential Input, 100 dB Stereo ADC and 2  $V_{RMS}$  Stereo DAC. The TAC5112 supports both differential and Single-ended input and output. The device supports both Microphone and Line In input on the ADC Channel. DAC Output can be configured for either Line Out or Head Phone Load. TAC5112 can drive up to 62.5 mW into a Headphone Load. The TAC5112 integrates programable channel gain, digital volume control, a low-jitter phase-locked loop (PLL), a programmable high-pass filter (HPF), programmable EQ and biquad filters, low-latency filter modes, and allows for sample rates up to 768 kHz. The TAC5112 supports time-division multiplexing (TDM), I<sup>2</sup>S, or left-justified (LJ) audio formats, and can be controlled with I<sup>2</sup>C or SPI. These integrated high-performance features, along with a single supply operation, makes TAC5112 an excellent choice for space-constrained audio applications.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over the operating ambient temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage	AVDD to AVSS	-0.3	3.9	V
Supply voltage	IOVDD to VSS (thermal pad)	-0.3	3.9	V
Ground voltage differences	AVSS to VSS (thermal pad)	-0.3	0.3	V
Analog input voltage	Analog input pins voltage to AVSS	-0.3	5.656	V
Digital input voltage	Digital input pins voltage to VSS (thermal pad)	-0.3	IOVDD + 0.3	V
Temperature	Functional ambient, T <sub>A</sub>	-55	125	°C
	Operating ambient, T <sub>A</sub>	-40	125	
	Junction, T <sub>J</sub>	-40	150	
	Storage, T <sub>stg</sub>	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	V
V <sub>(ESD)</sub>	Electrostatic discharge	Charged-device model (CDM), per AEC Q100-011	±500	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

- (1) Ratio of output level with 1-kHz full-scale sine-wave input, to the output level with the AC signal input shorted to ground, measured A-weighted over a 20-Hz to 20-kHz bandwidth using an audio analyzer.
- (2) All performance measurements done with 20-kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter can result in higher THD and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, can affect dynamic specification values.

## 7 Detailed Description

### 7.1 Overview

The TAC5112 is from a scalable family of devices. As part of the extended family of devices, the TAC5112 consists of a high-performance, low-power, flexible, mono/stereo, audio analog-to-digital converter (ADC) and audio digital-to-analog converter (DAC) with extensive feature integration. This device is intended for automotive applications such as ruggedized communication equipment, IP network cameras, Professional Audio, and multimedia applications. The high dynamic range of this device enables far-field audio recording with high fidelity. This device integrates a host of features that reduce cost, board space, and power consumption in space-constrained system designs. Package, performance, and compatible configuration registers across extended families make this device well-suited for scalable system designs.

The TAC5112 consists of the following blocks:

- 2-channel, multibit, high-performance delta-sigma ( $\Delta\Sigma$ ) ADCs
- Configurable single-ended or differential audio inputs with 2V<sub>rms</sub> signal swing
- Low-noise programmable microphone bias output
- 2-channel, multibit, high-performance delta-sigma ( $\Delta\Sigma$ ) DACs
- Configurable single-ended, differential, or pseudo-differential audio outputs
- Over Current Diagnostics and Protection for MICBIAS and analog outputs
- Automatic gain controller (AGC)
- Advanced Thermal foldback and protection
- Advanced Battery guard and distortion limiter
- Programmable decimation filters with linear-phase or low-latency filter
- Programmable channel gain, volume control, and biquad filters for each channel
- Programmable phase and gain calibration with fine resolution for each channel
- Programmable high-pass filter (HPF) and digital channel mixer
- Pulse density modulation (PDM) digital microphone interface with a high-performance decimation filter
- Dual I<sup>2</sup>S or TDM Interface with Independent Sample Rate(Synchronous)
- Synchronous Sample Rate Converter(SRC)
- Integrated low-jitter, phase-locked loop (PLL) supporting a wide range of system clocks
- Integrated digital and analog voltage regulators to support single-supply operation

Communication to the TAC5112 for configuring the control registers is supported using an I<sup>2</sup>C and SPI interface. The device supports a highly flexible audio serial interface [time-division multiplexing (TDM), I<sup>2</sup>S, or left-justified (LJ)] to transmit audio data seamlessly in the system across devices.

## 7.3 Feature Description

### 7.3.1 Serial Interfaces

This device has two serial interfaces: control and audio data. The control serial interface is used for device configuration. The audio data serial interface is used for transmitting audio data to the host device.

#### 7.3.1.1 Control Serial Interfaces

The device contains configuration registers and programmable coefficients that can be set to the desired values for a specific system and application use. All these registers can be accessed using either I<sup>2</sup>C or SPI communication to the device. For more information, see the [Section 7.5](#) section.

#### 7.3.1.2 Audio Serial Interfaces

Digital audio data flows between the host processor and the TAC5112 on the digital audio serial interface (ASI), or audio bus. This highly flexible ASI bus includes a TDM mode for multichannel operation, support for I<sup>2</sup>S or left-justified protocols format, programmable data length options, very flexible controller-target configurability for bus clock lines, and the ability to communicate with multiple devices within a system directly.

The TAC5112 supports up to two ASI Interfaces. Secondary ASI Clock and Data Pins can be configured by setting GPIO's. Frame Sync of two ASI's must be synchronous. See the for more details on Secondary ASI.

The bus protocol TDM, I<sup>2</sup>S, or left-justified (LJ) format can be selected for primary ASI by using the PASI\_FORMAT[1:0], P0\_R26\_D[7:6] register bits. As shown in [Table 7-1](#) and [Table 7-2](#), these modes are all most significant byte (MSB)-first, pulse code modulation (PCM) data format, with the output channel data word-length programmable as 16, 20, 24, or 32 bits by configuring the PASI\_WLEN[1:0], P0\_R26\_D[5:4] register bits.

**Table 7-1. Primary Audio Serial Interface Format**

P0_R26_D[7:6] : PASI_FORMAT[1:0]	PRIMARY AUDIO SERIAL INTERFACE FORMAT
00 (default)	Time-division multiplexing (TDM) mode
01	Inter IC sound (I <sup>2</sup> S) mode
10	Left-justified (LJ) mode
11	Reserved (do not use this setting)

**Table 7-2. Primary Audio Serial Interface Data Word-Length**

P0_R7_D[5:4] : PASI_WLEN[1:0]	PRIMARY AUDIO OUTPUT CHANNEL DATA WORD-LENGTH
00	Data word-length set to 16 bits
01	Data word-length set to 20 bits
10	Data word-length set to 24 bits
11 (default)	Data word-length set to 32 bits

The frame sync pin, FSYNC, is used in this audio bus protocol to define the beginning of a frame and has the same frequency as the output data sample rates. The bit clock pin, BCLK, is used to clock out the digital audio data across the serial bus. The number of bit-clock cycles in a frame must accommodate multiple device active output channels with the programmed data word length.

A frame consists of multiple time-division channel slots (up to 32) to allow all input/output channel audio data transmissions to be completed on the audio bus by a device or multiple devices sharing the same audio bus. The device supports up to eight input channels and eight output channels that can be configured on the primary ASI bus to place their audio data on bus slot 0 to slot 31. [Table 7-3](#) lists the output channel-1 slot configuration settings. In I<sup>2</sup>S and LJ mode, the slots are divided into two sets, left-channel slots, and right-channel slots, as described in the [Section 7.3.1.2.2](#) and [Section 7.3.1.2.3](#) sections.

**Table 7-3. Output Channel-1 Slot Assignment Settings**

P0_R30_D[4:0] : PASI_TX_CH1_SLOT[4:0]	OUTPUT CHANNEL 1 SLOT ASSIGNMENT
0 0000 = 0d (default)	Slot 0 for TDM or left slot 0 for I <sup>2</sup> S, LJ.
0 0001 = 1d	Slot 1 for TDM or left slot 1 for LJ.
...	...
0 1111 = 15d	Slot 15 for TDM or left slot 15 for LJ.
1 0000 = 32d	Slot 16 for TDM or right slot 0 for I <sup>2</sup> S, LJ.
...	...
1 1110 = 30d	Slot 30 for TDM or right slot 14 for LJ.
1 1111 = 31d	Slot 31 for TDM or right slot 15 for LJ.

Similarly, the slot assignment setting for output channel 2 to channel 8 can be done using the PASI\_TX\_CH2\_SLOT (P0\_R31) to PASI\_TX\_CH8\_SLOT (P0\_R37) registers and for input channel 1 to channel 8 by using the PASI\_RX\_CH1\_SLOT (P0\_R40) to PAS\_RX\_CH8\_SLOT (P0\_R47), respectively.

The slot word length is the same as the primary ASI channel word length set for the device. The output channel data word length must be set to the same value for all TAC5112 devices if all devices share the same ASI bus in a system. The maximum number of slots possible for the ASI bus in a system is limited by the available bus bandwidth, which depends upon the BCLK frequency, output data sample rate used, and the channel data word length configured.

The device also includes a feature that offsets the start of the slot data transfer concerning the frame sync by up to 31 cycles of the bit clock. Offset can be configured independently for input and output data paths. [Table 7-4](#) and [Table 7-5](#) lists the programmable offset configuration settings for transmission and receive paths respectively.

**Table 7-4. Programmable Offset Settings for the ASI Slot Start for transmission**

P0_R28_D[4:0] : PASI_TX_OFFSET[4:0]	PROGRAMMABLE OFFSET SETTING FOR SLOT DATA TRANSMISSION START
0 0000 = 0d (default)	The device follows the standard protocol timing without any offset.
0 0001 = 1d	Slot start is offset by one BCLK cycle, as compared to standard protocol timing. For I <sup>2</sup> S or LJ, the left and right slot start is offset by one BCLK cycle, as compared to standard protocol timing.
.....	.....
1 1110 = 30d	Slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. For I <sup>2</sup> S or LJ, the left and right slot start is offset by 30 BCLK cycles, as compared to standard protocol timing.
1 1111 = 31d	Slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. For I <sup>2</sup> S or LJ, the left and right slot start is offset by 31 BCLK cycles, as compared to standard protocol timing.

.....	.....
1 1110 = 30d	Slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. For I <sup>2</sup> S or LJ, the left and right slot start is offset by 30 BCLK cycles, as compared to standard protocol timing.
1 1111 = 31d	Slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. For I <sup>2</sup> S or LJ, the left and right slot start is offset by 31 BCLK cycles, as compared to standard protocol timing.

The device also features the ability to invert the polarity of the frame sync pin, FSYNC, used to transfer the audio data as compared to the default FSYNC polarity used in standard protocol timing. This feature can be set using the PASI\_FSYNC\_POL, P0\_R26\_D3 register bit. Similarly, the device can invert the polarity of the bit clock pin, BCLK, which can be set using the PASI\_BCLK\_POL, P0\_R26\_D2 register bit.

In addition, the word clock and bit clock can be independently configured in either Controller or Target mode, for flexible connectivity to a wide variety of processors. The word clock is used to define the beginning of a frame and may be programmed as either a pulse or a square-wave signal. The frequency of this clock corresponds to the maximum of the selected ADC and DAC sampling frequencies.

### 7.3.1.2.1 Time Division Multiplexed Audio (TDM) Interface

In TDM mode, also known as DSP mode, the rising edge of FSYNC starts the data transfer with the slot 0 data first. Immediately after the slot 0 data transmission, the remaining slot data are transmitted in order. FSYNC and each data bit (except the MSB of slot 0 when TX\_OFFSET equals 0) is transmitted on the rising edge of BCLK. [Figure 7-2](#) to [Figure 7-5](#) illustrate the protocol timing for TDM operation with various configurations.

Figure 7-2. TDM Mode Standard Protocol Timing (PASI\_TX\_OFFSET = 0)

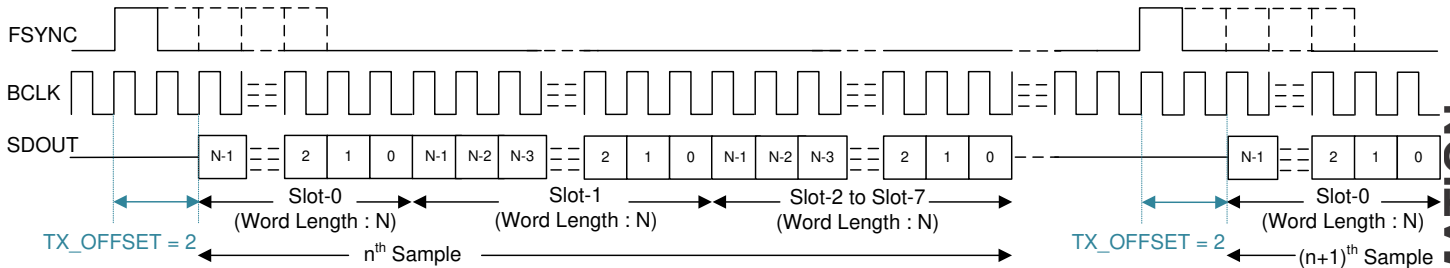

Figure 7-3. TDM Mode Protocol Timing (PASI\_TX\_OFFSET = 2)

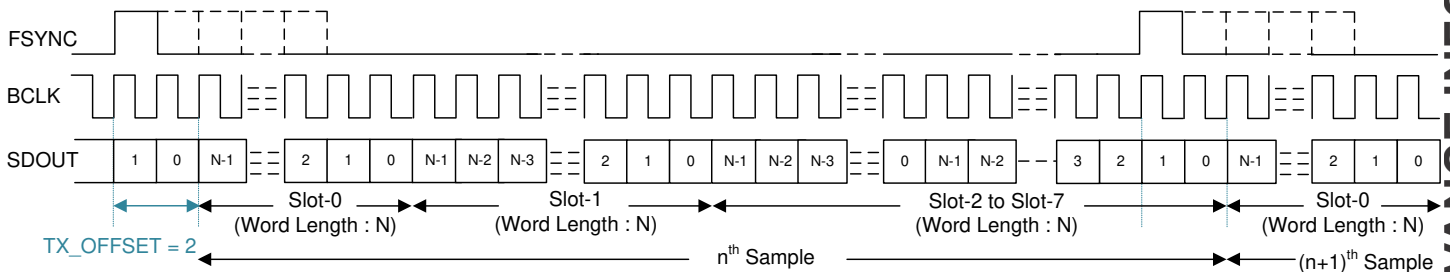

Figure 7-4. TDM Mode Protocol Timing (No Idle BCLK Cycles, PASI\_TX\_OFFSET = 2)

Figure 7-5. TDM Mode Protocol Timing (PASI\_TX\_OFFSET = 0 and PASI\_BCLK\_POL = 1)

For proper operation of the audio bus in TDM mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels times the programmed word length of the output channel data. The device supports FSYNC as a pulse with a 1-cycle-wide bit clock but also supports multiples as well. For a higher BCLK frequency operation, using TDM mode with a PASI\_TX\_OFFSET value higher than 0 is recommended.

### 7.3.1.2.2 Inter IC Sound (I<sup>2</sup>S) Interface

The standard I<sup>2</sup>S protocol is defined for only two channels: left and right. The device extends the same protocol timing for multichannel operation. In I<sup>2</sup>S mode, the MSB of the left slot 0 is transmitted on the falling edge of BCLK in the second cycle after the falling edge of FSYNC. Immediately after the left slot 0 data transmission, the remaining left slot data are transmitted in order. The MSB of the right slot 0 is transmitted on the falling edge of

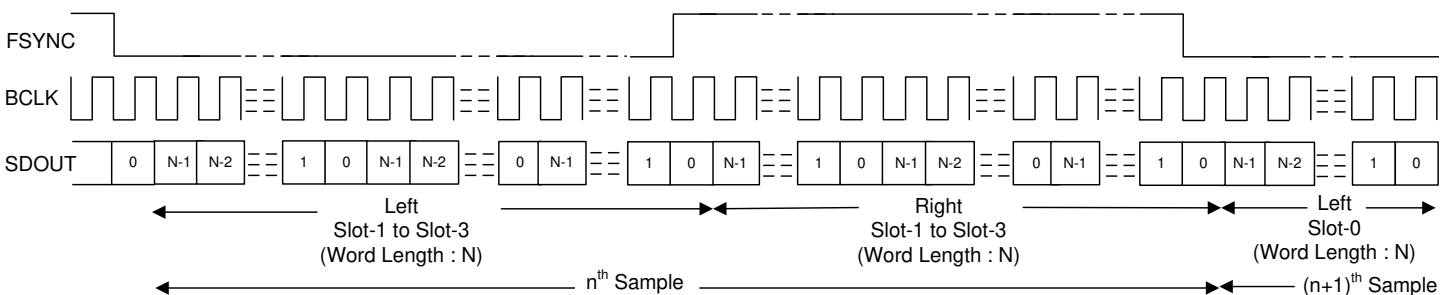

BCLK in the second cycle after the *rising* edge of FSYNC. Immediately after the right slot 0 data transmission, the remaining right slot data are transmitted in order. FSYNC and each data bit is transmitted on the falling edge of BCLK. Figure 7-6 to Figure 7-9 illustrate the protocol timing for I<sup>2</sup>S operation with various configurations.

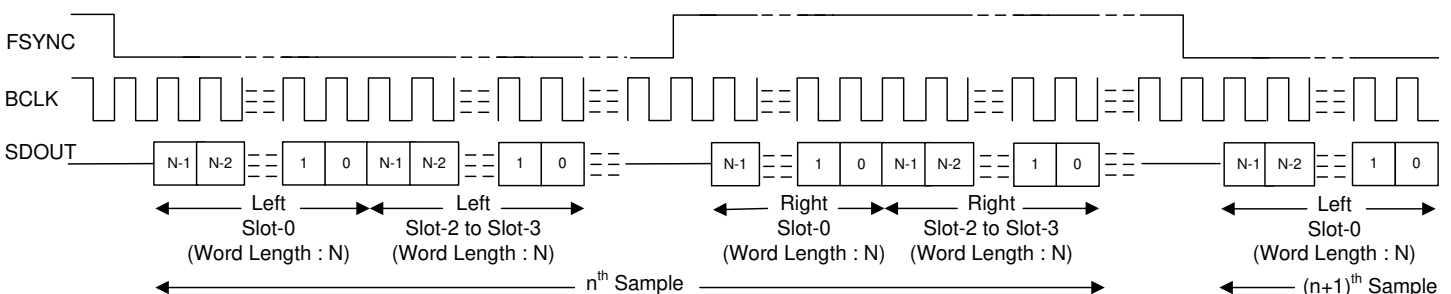

**Figure 7-6. I<sup>2</sup>S Mode Standard Protocol Timing (PASI\_TX\_OFFSET = 0)**

**Figure 7-7. I<sup>2</sup>S Protocol Timing (PASI\_TX\_OFFSET = 1)**

**Figure 7-8. I<sup>2</sup>S Protocol Timing (No Idle BCLK Cycles, PASI\_TX\_OFFSET = 0)**

**Figure 7-9. I<sup>2</sup>S Protocol Timing (PASI\_TX\_OFFSET = 0 and PASI\_BCLK\_POL = 1)**

For proper operation of the audio bus in I<sup>2</sup>S mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels (including left and right slots) times the programmed word length of the output channel data. The device FSYNC low pulse must be several BCLK cycles wide that is greater than or equal to the number of active left slots times the data word length configured. Similarly, the FSYNC high pulse

ADVANCE INFORMATION

must be several BCLK cycles wide that is greater than or equal to the number of active right slots times the data word length configured.

### 7.3.1.2.3 Left-Justified (LJ) Interface

The standard LJ protocol is defined for only two channels: left and right. The device extends the same protocol timing for multichannel operation. In LJ mode, the MSB of the left slot 0 is transmitted in the same BCLK cycle after the *rising* edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. Immediately after the left slot 0 data transmission, the remaining left slot data are transmitted in order. The MSB of the right slot 0 is transmitted in the same BCLK cycle after the *falling* edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. Immediately after the right slot 0 data transmission, the remaining right slot data are transmitted in order. FSYNC is transmitted on the falling edge of BCLK. Figure 7-10 to Figure 7-13 illustrate the protocol timing for LJ operation with various configurations.

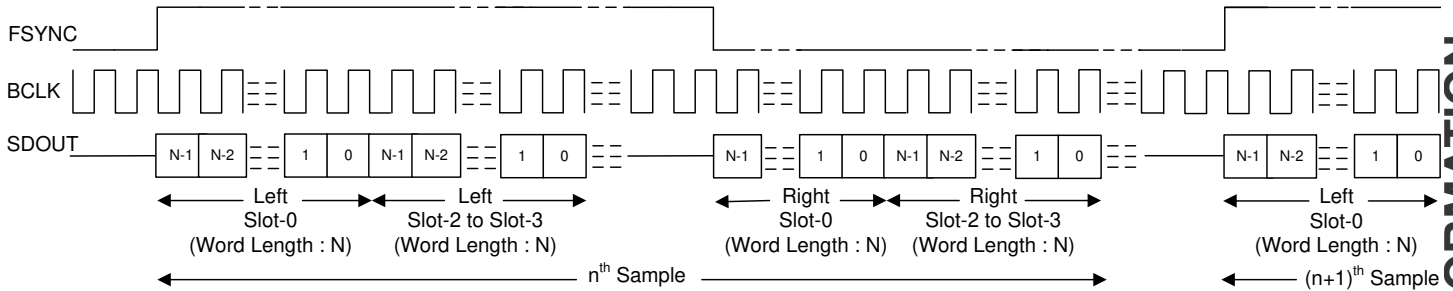

Figure 7-10. LJ Mode Standard Protocol Timing (TX\_OFFSET = 0)

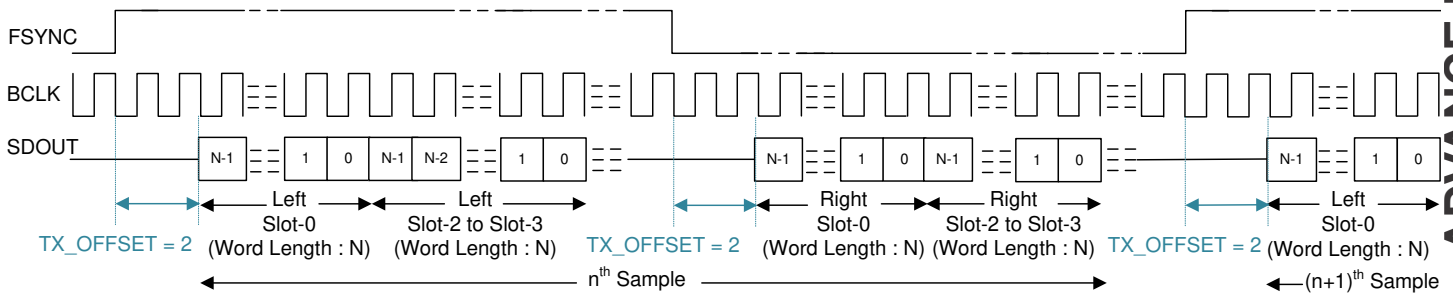

Figure 7-11. LJ Protocol Timing (TX\_OFFSET = 2)

Figure 7-12. LJ Protocol Timing (No Idle BCLK Cycles, TX\_OFFSET = 0)

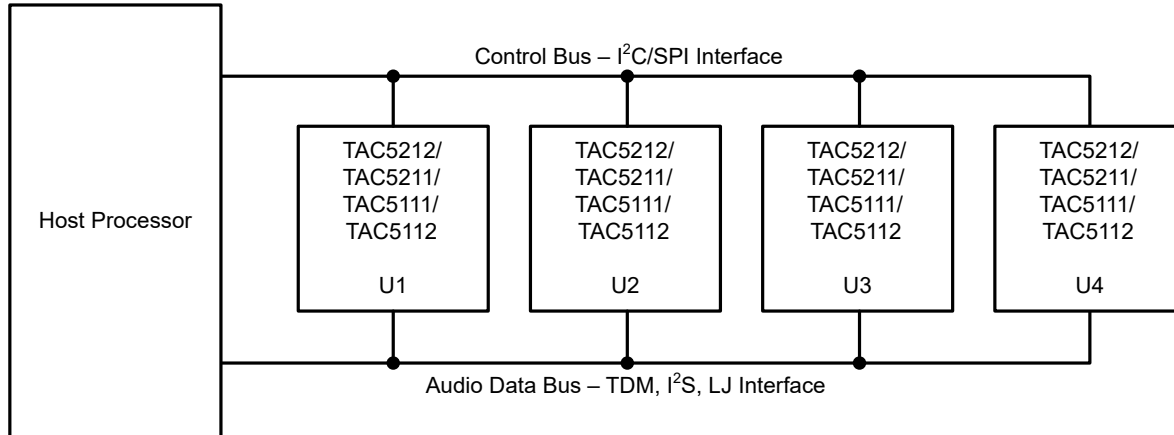

**Figure 7-13. LJ Protocol Timing (TX\_OFFSET = 1 and BCLK\_POL = 1)**

For proper operation of the audio bus in LJ mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels (including left and right slots) times the programmed word length of the output channel data. The device FSYNC high pulse must be several BCLK cycles wide that is greater than or equal to the number of active left slots times the data word length configured. Similarly, the FSYNC low pulse must be several BCLK cycles wide that is greater than or equal to the number of active right slots times the data word length configured. For a higher BCLK frequency operation, using LJ mode with a TX\_OFFSET value higher than 0 is recommended.

### 7.3.1.3 Using Multiple Devices With Shared Buses

The device has many supported features and flexible options that can be used in the system to seamlessly connect multiple TAC5112 devices by sharing a single common I<sup>2</sup>C or SPI control bus and an audio serial interface bus. This architecture enables multiple applications to be applied to a system that require a microphone or speaker array for beam-forming operation, audio conferencing, noise cancellation, and so forth. [Figure 7-14](#) shows a diagram of multiple TAC5112 devices in a configuration where the control and audio data buses are shared.

**Figure 7-14. Multiple TAC5112 Devices With Shared Control and Audio Data Buses**

The TAC5112 consists of the following features to enable seamless connection and interaction of multiple devices using a shared bus:

- Supports up to four pin-programmable I<sup>2</sup>C target addresses
- I<sup>2</sup>C broadcast simultaneously writes to (or triggers) all TAC5112 devices
- Supports up to 32 configuration input/output channel slots for the audio serial interface
- Tri-state feature (with enable and disable) for the unused audio data slots of the device
- Supports a bus-holder feature (with enable and disable) to keep the last driven value on the audio bus
- The GPIOx, GPI1 or GPO1 pin can be configured as a secondary input/output data lane or as a secondary audio serial interface
- The GPIOx, GPI1 or GPO1 pin can be used in a daisy-chain configuration of multiple TAC5112 devices

- Supports one BCLK cycle data latching timing to relax the timing requirement for the high-speed interface
- Programmable controller and target options for both primary and secondary audio serial interface
- Ability to synchronize the multiple devices for the simultaneous sampling requirement across devices
- Inter Channel Gain Alignment(ICGA) feature to align the DAC Channel gain across devices.

See the [Multiple TAC5x1x Devices With a Shared TDM and I<sup>2</sup>C/SPI Bus application report](#) for further details.

### 7.3.2 Phase-Locked Loop (PLL) and Clock Generation

The device has a smart auto-configuration block to generate all necessary internal clocks required for the ADC and DAC modulators and the digital filter engine used for signal processing. This configuration is done by monitoring the frequency of the FSYNC and BCLK signals on the audio buses.

The device supports the various data sample rates (of the FSYNC signal frequency) and the BCLK to FSYNC ratio to configure all clock dividers, including the PLL configuration, internally without host programming. [Table 7-6](#) and [Table 7-7](#) list the supported FSYNC and BCLK frequencies.

**Table 7-6. Supported FSYNC (Multiples or Submultiples of 48 kHz) and BCLK Frequencies**

The TAC5112 also supports non-Audio sample rates beyond those listed in prior tables. Refer to [Configuring Non-Audio Sample Rates for TAC5x1x devices](#) for more details.

The TAC5112 sample rate can be configured using registers CLK\_DET0 (P0\_R62) and CLK\_DET1 (P0\_R63) for primary and secondary ASI respectively. These registers also capture the device auto-detect result for the FSYNC frequency in auto-detection mode. The registers CLK\_DET2 (P0\_R64) and CLK\_DET3 (P0\_R65)

capture the BCLK to FSYNC ratio detected by the device. If the device finds any unsupported combinations of FSYNC frequency and BCLK to FSYNC ratios, the device generates an ASI clock error interrupt and mutes all the channels accordingly.

The TAC5112 also supports enabling channels while ADC or DAC channels are already in operation. This requires a pre-configuration before power to describe the maximum number of channels that can be enabled while in operation to ensure proper clock generation and use. This can be configured by using register DYN\_PUPD\_CFG (P0\_R119). ADC\_DYN\_PUPD\_EN and DAC\_DYN\_PUPD\_EN bits can be used to independently enable ADC or DAC Channels' dynamic power up. Several channels can be configured using ADC\_DYN\_MAXCH\_SEL and DAC\_DYN\_MAXCH\_SEL bits.

The device uses an integrated, low-jitter, phase-locked loop (PLL) to generate internal clocks required for the modulators and digital filter engine, as well as other control blocks. The device also supports an option to use BCLK, GPIOx, or the GPI1 pin (as CCLK) as the audio clock source without using the PLL to reduce power consumption. However, the ADC performance may degrade based on jitter from the external clock source, and some processing features may not be supported if the external audio clock source frequency is not high enough. Therefore, TI recommends using the PLL for high-performance applications. More details and information on how to configure and use the device in low-power mode without using the PLL are discussed in the [TAC5x1x Power Consumption Matrix Across Various Usage Scenarios application report](#).

The device also supports an audio bus controller mode operation using the GPIOx or GPI1 pin (as CCLK) as the reference input clock source and supports various flexible options and a wide variety of system clocks. More details and information on controller mode configuration and operation are discussed in the [Configuring and Operating TAC5x1x as an Audio Bus Controller application report](#).

The audio bus clock error detection and auto-detect feature automatically generates all internal clocks but can be disabled using the IGNORE\_CLK\_ERR (P0\_R4\_D6) and CUSTOM\_CLK\_CFG (P0\_R50\_D0) register bits, respectively. In the system, this disable feature can be used to support custom clock frequencies that are not covered by the auto-detect scheme. For such application use cases, care must be taken to ensure that the multiple clock dividers are all configured appropriately. Therefore, TI recommends using the PPC3 GUI for device configuration settings; for more details see the [TAC512EVM-PDK Evaluation module user's guide](#) and the [PurePath™ console graphical development suite](#).

### 7.3.3 Input Channel Configurations

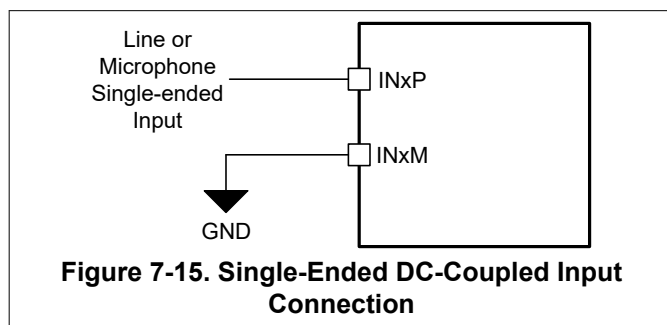

The device consists of two pairs of analog input pins (INxP and INxM) that can be configured as differential inputs or single-ended inputs for the recording channel. The device supports simultaneous recording of up to two channels using the high-performance multichannel ADC. The input source for the analog pins can be from electret condenser analog microphones, microelectrical-mechanical system (MEMS) analog microphones, or line-in (auxiliary) inputs from the system board. Analog inputs support differential input, single-ended inputs (two pin and one-pin) with AC and DC coupling options. Additionally, if the application uses digital PDM microphones for the recording, GPIO, GPI and GPO pins can be reconfigured in the device to support up to four channels for the digital microphone recording. TAC5112 supports incremental mode of ADC where analog input channels can be used for DC measurements. This can be configured by setting IADC\_EN(P0\_R81\_D7). [Table 7-8](#) shows the input source selection for the record channel.

**Table 7-8. Input Source Selection for the Record Channel**

P0_R80_D[7:6] : ADC_CH1_INSRC[1:0]	INPUT CHANNEL 1 RECORD SOURCE SELECTION
00 (default)	Analog differential input for channel 1
01	Analog single-ended Input for channel 1 (Signal on one input pin and Ground on other pin)
10	Analog single-ended Input on IN1P
11	Analog single-ended Input on IN1M

Similarly, the input source selection setting for input channel 2 can be configured using the ADC\_CH2\_INSRC[1:0] (P0\_R85\_D[7:6]) register bits.

Typically, voice or audio signal inputs are capacitively coupled (AC-coupled) to the device; however, the device also supports an option for DC-coupled inputs to save board space. This configuration can be done independently for each channel by setting the input common mode tolerance in ADC\_CH1\_CM\_TOL (P0\_R60\_D[3:2]), ADC\_CH2\_CM\_TOL (P0\_R85\_D[3:2]) register bits. The INM pin can be directly grounded in Rail to Rail Common Mode (see [Figure 7-15](#)), but the INM pin must be grounded after the AC-coupling capacitor whenever ADC\_CHx\_INSRC is set to 2'b01 and ADC\_CHx\_CM\_TOL is set to 2'b01 (see [Figure 7-16](#)) for the single-ended input configuration. For the best dynamic range performance, the differential AC-coupled input must be used.

The device supports the typical input impedance on INxP or INxM of 40 kΩ.

The value of the coupling capacitor in AC-coupled mode must be chosen so that the high-pass filter formed by the coupling capacitor and the input impedance do not affect the signal content. Before proper recording can begin, this coupling capacitor must be charged up to the common-mode voltage at power-up. To enable quick charging, the device has modes to speed up the charging of the coupling capacitor. The default value of the quick-charge timing is set for a coupling capacitor up to 1 μF. However, if a higher-value capacitor is used in the system, then the quick-charging timing can be increased by using the INCAP\_QCHG (P0\_R5\_D[7:6]) register bits. For best distortion performance, use the low-voltage coefficient capacitors for AC coupling.

### 7.3.4 Output Channel Configurations

The device consists of two pairs of analog output pins (OUTxP and OUTxM) that can be configured as differential inputs or single-ended outputs for playback channels. The device supports simultaneous playback of up to four channels of single-ended output or up to two channel differential output using the high-performance multichannel DAC. [Table 7-9](#) shows the input source selection for the playback channels.

**Table 7-9. Input Source Selection for the Playback Channel**

P0_R100_D[7:5] : OUT1x_SRC[2:0]	OUT1P/OUT1M Source Selection
000 (default)	Output driver disabled
001	DAC signal chain
010	Analog bypass signal chain
011	Mixing of DAC and analog bypass signal chains
100	OUT1P for DAC and OUT1M for analog bypass signal chain
101	OUT1P for analog bypass and OUT1M for DAC signal chain.
11x	Reserved. Do not use this setting.

Similarly, the input source selection setting for output channel 2 can be configured using the OUT2x\_SRC[2:0] (P0\_R107\_D[7:5]) register bits.

The TAC5112 supports up to 2-channel differential output, up to 2-channel pseudo-differential output, and up to 4-channel single-ended output. Each of the output channels can be independently configured for differential or single-ended output.

[Table 7-10](#) shows the configuration modes for the output pins

**Table 7-10. Output Pin Configuration for the Playback Channel**

P0_R100_D[4:2] : OUT1x_CFG[2:0]	OUT1P/OUT1M Pin Configuration
000 (default)	OUT1P/OUT1M as a differential pair
001	OUT1P and OUT1M as independent single-ended outputs
010	Mono Single Ended output on OUT1P only
011	Mono Single Ended output on OUT1M only
100	Pseudo-differential output with OUT1P as signal and OUT1M as VCOM
101	Pseudo differential output with OUT1P as signal, OUT1M as VCOM and OUT2M as VCOM sense.
110	Pseudo differential output with OUT1M as signal and OUT1P as VCOM
111	Reserved. Do not use this setting.

Similarly, the output pin configuration for output channel 2 can be done using the OUT2x\_CFG[2:0] (P0\_R107\_D[4:2]) register bits.

The TAC5112 can support a variety of loads including headphone, lineout, and receiver amplifiers. Load drive configurations are available for each pin independently. OUT1P\_DRIVE[1:0] (OUT1x\_CFG[7:6]) configures the load drive capability for the OUT1P pin. OUT1M\_DRIVE[1:0], OUT2P\_DRIVE[1:0], OUT2M\_DRIVE[1:0] are the output drive control for OUT1M, OUT2P and OUT2M respectively.

### 7.3.5 Reference Voltage

All audio data converters require a DC reference voltage. The TAC5112 achieves low-noise performance by internally generating a low-noise reference voltage. This reference voltage is generated using a band-gap circuit with high PSRR performance. This audio converter reference voltage must be filtered externally using a minimum 1- $\mu$ F capacitor connected from the VREF pin to the analog ground (VSS).

The value of this reference voltage can be configured using the P0\_R77\_D[1:0] register bits and must be set to an appropriate value based on the desired full-scale input for the device and the AVDD supply voltage available in the system. The default VREF value is set to 2.75 V, which in turn supports a 2- $V_{RMS}$  differential full-scale input to the device. The required minimum AVDD voltage for this mode is 3 V. The TAC5112 also supports double swing mode with 4- $V_{RMS}$  differential swing which can be enabled by setting ADC\_CHx\_FULLSCALE\_VAL to 1. [Table 7-11](#) lists the various VREF settings supported along with the required AVDD range and the supported full-scale input signal for that configuration.

**Table 7-11. VREF Programmable Settings**

P0_R77_D[1:0]: VREF[1:0]	VREF OUTPUT VOLTAGE	DIFFERENTIAL FULL-SCALE INPUT SUPPORTED	SINGLE-ENDED FULL-SCALE INPUT SUPPORTED	AVDD RANGE REQUIREMENT
00 (default)	2.75 V	2 $V_{RMS}$ (4 $V_{RMS}$ supported in high swing mode)	1 $V_{RMS}$	3 V to 3.6 V
01	2.5 V	1.818 $V_{RMS}$	0.909 $V_{RMS}$	2.8 V to 3.6 V
10	1.375 V	1 $V_{RMS}$	0.5 $V_{RMS}$	1.7 V to 1.9 V
11	Reserved	Reserved	Reserved	Reserved

To achieve low power consumption, this audio reference block is powered down as described in the Device Functional Modes section. When exiting sleep mode, the audio reference block is powered up using the internal fast-charge scheme and the VREF pin settles to its steady-state voltage after the settling time (a function of the decoupling capacitor on the VREF pin). This time is approximately equal to 3.5 ms when using a 1- $\mu$ F decoupling capacitor. If a higher-value decoupling capacitor is used on the VREF pin, the fast-charge setting must be reconfigured using the VREF\_QCHG (P0\_R2\_D[4:3]) register bits, which support options of 3.5 ms (default), 10 ms, 50 ms, or 100 ms.

### 7.3.6 Programmable Microphone Bias

The device integrates a built-in, low-noise microphone bias pin that can be used in the system for biasing electret-condenser microphones or providing the supply to the MEMS analog or digital microphone. The integrated bias amplifier supports up to 10 mA of load current that can be used for multiple microphones and is designed to provide a combination of high PSRR, low noise, and programmable bias voltages to allow the biasing to be fine-tuned for specific microphone combinations.

When using this MICBIAS pin for biasing or supplying to multiple microphones, avoid any common impedance on the board layout for the MICBIAS connection to minimize coupling across microphones. [Table 7-12](#) shows the available microphone bias programmable options.

**Table 7-12. MICBIAS Programmable Settings**

P0_R77_D[3:2] : MICBIAS_VAL[1:0]	P0_R77_D[1:0] : VREF_FSCALE[1:0]	MICBIAS OUTPUT VOLTAGE
00 (default)	00 (default)	2.75 V (same as the VREF output)
	01	2.5 V (same as the VREF output)
	10	1.375 V (same as the VREF output)
	11	Reserved (do not use these settings)
01	00 (default)	1.375 V (0.5 times the VREF output)
	01	1.250 V (0.5 times the VREF output)
	10 or 11	Reserved (do not use these settings)
10	XX	Reserved (do not use these settings)
11	XX	Same as AVDD

The microphone bias output can be powered on or powered off (default) by configuring the MICBIAS\_PDZ, P0\_R120\_D5 register bit. Additionally, the device provides an option to configure the GPIO1 or GPIx pin to directly control the microphone bias output powering on or off. This feature is useful to control the microphone directly without engaging the host for I<sup>2</sup>C or SPI communication. The MICBIAS\_PDZ, P0\_R120\_D5 register bit value is ignored if the GPIO1 or GPIx pin is configured to set the microphone bias on or off.

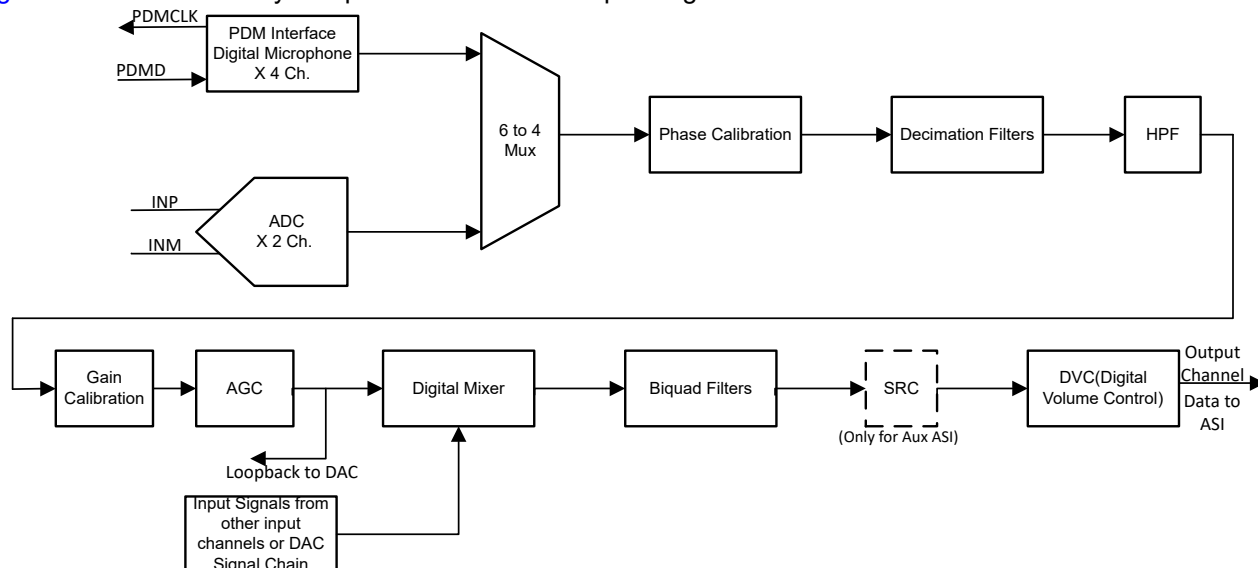

### 7.3.7 Signal-Chain Processing

The TAC5112 signal chain is comprised of very low-noise, high-performance, and low-power analog blocks and highly flexible and programmable digital processing blocks. The high performance and flexibility combined with a compact package make the TAC5112 is optimized for a variety of end-equipments and applications that require multichannel audio capture and playback. [Section 7.3.7.1](#) and [Section 7.3.7.2](#) describes key components in ADC and DAC signal chain further.

### 7.3.7.1 ADC Signal-Chain

Figure 7-17 shows the key components of the record path signal chain.

**Figure 7-17. ADC Signal-Chain Processing Flowchart**

The front-end ADC is very low noise, with a 115-dB dynamic range performance. This low-noise and low-distortion, multibit, delta-sigma ADC enables the TAC5112 to record a far-field audio signal with very high fidelity, both in quiet and loud environments. Moreover, the ADC architecture has inherent antialias filtering with a high rejection of out-of-band frequency noise around multiple modulator frequency components. Therefore, the device prevents noise from aliasing into the audio band during ADC sampling. Further on in the signal chain, an integrated, high-performance multistage digital decimation filter sharply cuts off any out-of-band frequency noise with high stop-band attenuation.

The device also has an integrated programmable biquad filter that allows for custom low-pass, high-pass, or any other desired frequency shaping. Thus, the overall signal chain architecture removes the requirement to add external components for antialiasing low-pass filtering and thus saves drastically on the external system component cost and board space. See the [TAC5212 Integrated Analog Antialiasing Filter and Flexible Digital Filter application report](#) for further details.

The signal chain also consists of various highly programmable digital processing blocks such as phase calibration, gain calibration, high-pass filter, digital summer or mixer, biquad filters, synchronous sample rate converter, and volume control. The details of these processing blocks are discussed further in this section. The device also supports up to four digital PDM microphone recording channels when the analog recording channels are not used.

The desired input channels for recording can be enabled or disabled by using the CH\_EN (P0\_R118) register, and the output channels for the audio serial interface can be enabled or disabled by using the ASI\_TX\_CHx\_CFG register. In general, the device supports simultaneous power-up and power-down of all active channels for simultaneous recording. However, based on the application needs, if some channels must be powered up or powered down dynamically when the other channel recording is on, then that use case is supported by setting the DYN\_PUPD\_CFG register.

The device supports an input signal bandwidth up to 100 kHz, which allows the high-frequency non-audio signal to be recorded by using a 216-kHz (or higher) sample rate. Wide bandwidth mode can be enabled or disabled by setting ADC\_CHx\_BW\_MODE bit.

For sample rates of 48 kHz or lower, the device supports all features and various programmable processing blocks. However, for sample rates higher than 48 kHz, there are limitations in the number of simultaneous

channel recordings and playback supported and the number of biquad filters and such. See the [TAC5212 Sampling Rates and Programmable Processing Blocks Supported application report](#) for further details.

### 7.3.7.1.1 Programmable Channel Gain and Digital Volume Control

The device has an independent programmable channel gain setting for each input channel that can be set to the appropriate value based on the maximum input signal expected in the system and the ADC VREF setting used (see the [Section 7.3.5](#) section), which determines the ADC full-scale signal level.

The device has a programmable digital volume control with a range from –80 dB to 47 dB in steps of 0.5 dB with the option to mute the channel recording. The digital volume control value can be changed dynamically while the ADC channel is powered up and recorded. During volume control changes, the soft ramp-up or ramp-down volume feature is used internally to avoid any audible artifacts. Soft-stepping can be entirely disabled using the ADC\_DSP\_DISABLE\_SOFT\_STEP (P0\_R114\_D1) register bit.

The digital volume control setting is independently available for each output channel, including the digital microphone record channel. However, the device also supports an option to gang up the volume control setting for all channels together using the channel 1 digital volume control setting, regardless if channel 1 is powered up or powered down. This gang-up can be enabled using the ADC\_DSP\_DVOL\_GANG (P0\_R114\_D0) register bit.

[Table 7-13](#) shows the programmable options available for the digital volume control.

**Table 7-13. Digital Volume Control (DVC) Programmable Settings**

P0_R82_D[7:0] : ADC_CH1_DVOL[7:0]	DVC SETTING FOR OUTPUT CHANNEL 1
0000 0000 = 0d	Output channel 1 DVC is set to mute
0000 0001 = 1d	Output channel 1 DVC is set to –80 dB
0000 0010 = 2d	Output channel 1 DVC is set to –79.5 dB
0000 0011 = 3d	Output channel 1 DVC is set to –79 dB
...	...
1010 0000 = 160d	Output channel 1 DVC is set to –0.5 dB
1010 0001 = 161d (default)	Output channel 1 DVC is set to 0 dB
1010 0010 = 162d	Output channel 1 DVC is set to 0.5 dB
...	...
1111 1101 = 253d	Output channel 1 DVC is set to 46 dB
1111 1110 = 254d	Output channel 1 DVC is set to 46.5 dB
1111 1111 = 255d	Output channel 1 DVC is set to 47 dB

Similarly, the digital volume control setting for output channel 2 to channel 4 can be configured using the CH2\_DVOL (P0\_R87) to CH4\_DVOL (P0\_R95) register bits, respectively.

The internal digital processing engine soft ramps up the volume from a muted level to the programmed volume level when the channel is powered up, and the internal digital processing engine soft ramps down the volume from a programmed volume to mute when the channel is powered down. This soft-stepping of volume is done to prevent abruptly powering up and powering down the record channel. This feature can also be entirely disabled using the ADC\_DSP\_DISABLE\_SOFT\_STEP (P0\_R114\_D1) register bit.

### 7.3.7.1.2 Programmable Channel Gain Calibration

Along with the digital volume control, this device also provides programmable channel gain calibration. The gain of each channel can be finely calibrated or adjusted in steps of 0.1 dB for a range of –0.8-dB to 0.7-dB gain error. This adjustment is useful when trying to match the gain across channels resulting from external components and microphone sensitivity. This feature, in combination with the regular digital volume control, allows the gains across all channels to be matched for a wide gain error range with a resolution of 0.1 dB. [Table 7-14](#) shows the programmable options available for the channel gain calibration.

**Table 7-14. Channel Gain Calibration Programmable Settings**

P0_R83_D[7:4] : ADC_CH1_FGAIN[3:0]	CHANNEL GAIN CALIBRATION SETTING FOR INPUT CHANNEL 1
0000 = 0d	Input channel 1 gain calibration is set to -0.8 dB
0001 = 1d	Input channel 1 gain calibration is set to -0.7 dB
...	...
1000 = 8d (default)	Input channel 1 gain calibration is set to 0 dB
...	...
1110 = 14d	Input channel 1 gain calibration is set to 0.6 dB
1111 = 15d	Input channel 1 gain calibration is set to 0.7 dB

Similarly, the channel gain calibration setting for input channel 2 to channel 4 can be configured using the ADC\_CH2\_CFG3 (P0\_R88) to ADC\_CH4\_CFG3 (P0\_R96) register bits, respectively.

### 7.3.7.1.3 Programmable Channel Phase Calibration

In addition to the gain calibration, the phase delay in each channel can be finely calibrated or adjusted in steps of one modulator clock cycle for a cycle range of 0 to 255 for the phase error. The modulator clock, the same clock used for ADC\_MOD\_CLK, is 6.144 MHz (the output data sample rate is multiples or submultiples of 48 kHz) or 5.6448 MHz (the output data sample rate is multiples or submultiples of 44.1 kHz) irrespective of the analog microphone or digital microphone use case. This feature is very useful for many applications that must match the phase with fine resolution between each channel, including any phase mismatch across channels resulting from external components or microphones. [Table 7-15](#) shows the available programmable options for channel phase calibration.

**Table 7-15. Channel Phase Calibration Programmable Settings**

P0_R64_D[7:0] : CH1_PCAL[7:0]	CHANNEL PHASE CALIBRATION SETTING FOR INPUT CHANNEL 1
0000 0000 = 0d (default)	Input channel 1 phase calibration with no delay
0000 0001 = 1d	Input channel 1 phase calibration delay is set to one cycle of the modulator clock
0000 0010 = 2d	Input channel 1 phase calibration delay is set to two cycles of the modulator clock
...	...
1111 1110 = 254d	Input channel 1 phase calibration delay is set to 254 cycles of the modulator clock
1111 1111 = 255d	Input channel 1 phase calibration delay is set to 255 cycles of the modulator clock

Similarly, the channel phase calibration setting for input channel 2 to channel 8 can be configured using the CH2\_PCAL (P0\_R69) to CH8\_PCAL (P0\_R99) register bits, respectively.

The phase calibration feature must not be used when the analog input and PDM input are used together for simultaneous conversion.

### 7.3.7.1.4 Programmable Digital High-Pass Filter

To remove the DC offset component and attenuate the undesired low-frequency noise content in the record data, the device supports a programmable high-pass filter (HPF). The HPF is not a channel-independent filter setting but is globally applicable for all ADC channels. This HPF is constructed using the first-order infinite impulse response (IIR) filter and is efficient enough to filter out possible DC components of the signal. [Table 7-16](#) shows the predefined -3-dB cutoff frequencies available that can be set by using the ADC\_DSP\_HPF\_SEL[1:0] register bits of P0\_R114. Additionally, to achieve a custom -3-dB cutoff frequency for a specific application, the device also allows the first-order IIR filter coefficients to be programmed when the HPF\_SEL[1:0] register bits are set to 2'b00. The inability to set a frequency response plot for the HPF filter.

**Table 7-16. HPF Programmable Settings**

10	$0.00025 \times f_s$	4 Hz	12 Hz
11	$0.002 \times f_s$	32 Hz	96 Hz

**Figure 7-18. HPF Filter Frequency Response Plot**

Equation 1 gives the transfer function for the first-order programmable IIR filter:

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{31} - D_1 z^{-1}} \quad (1)$$

The frequency response for this first-order programmable IIR filter with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the IIR coefficients in Table 7-17 to achieve the desired frequency response for high-pass filtering or any other desired filtering. If HPF\_SEL[1:0] is set to 2'b00, the host device must write these coefficient values for the desired frequency response before powering-up any ADC channel for recording. Table 7-17 shows the filter coefficients for the first-order IIR filter.

**Table 7-17. 1st-Order IIR Filter Coefficients**

FILTER	FILTER COEFFICIENT	DEFAULT COEFFICIENT VALUE	COEFFICIENT REGISTER MAPPING
Programmable 1st-order IIR filter (can be allocated to HPF or any other desired filter)	N <sub>0</sub>	0x7FFFFFFF	P4_R72-R75
	N <sub>1</sub>	0x00000000	P4_R76-R79
	D <sub>1</sub>	0x00000000	P4_R80-R83

### 7.3.7.1.5 Programmable Digital Biquad Filters

The device supports up to 12 programmable digital biquad filters available for ADC signal chain limited to 3/channel. These highly efficient filters achieve the desired frequency response. The TAC5112 also supports on-the-fly programmable Biquad filters for two-channel record use cases. In digital signal processing, a digital biquad filter is a second-order, recursive linear filter with two poles and two zeros. Equation 2 gives the transfer function of each biquad filter:

$$H(z) = \frac{N_0 + 2N_1 z^{-1} + N_2 z^{-2}}{2^{31} - 2D_1 z^{-1} - D_2 z^{-2}} \quad (2)$$

The frequency response for the biquad filter section with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the biquad coefficients to achieve the desired frequency response for low-pass, high-pass, or any other desired frequency shaping. The programmable coefficients for the mixer operation are located in the and sections. If biquad filtering is required, then the host device must write these coefficient values before powering up any ADC channels for recording. In two-channel use case, the TAC5112 also supports on-the-fly programmable filters. In this case, the Device uses two banks of filters for one channel with a switch bit to perform the switch from one filter bank to the other. As described in Table 7-18, these biquad filters can be allocated for each output channel based on the ADC\_DSP\_BQ\_CFG[1:0] register setting of P0\_R114. By setting BIQUAD\_CFG[1:0] to 2'b00, the biquad filtering for all record channels is disabled and the host device can choose this setting if no additional filtering is required for the system application. See the [TAC5212 Programmable Biquad Filter Configuration and Applications application report](#) for further details.

### 7.3.7.1.6 Programmable Channel Summer and Digital Mixer

For applications that require an even higher SNR than that supported for each channel, the device's digital summing mode can be used. In this mode, the digital record data are summed up across the channel with an equal weightage factor, which helps in reducing the effective record noise.

The device supports a fully programmable mixer feature that can mix the various input channels with their custom programmable scale factor to generate the final output channels. Figure 7-19 shows a block diagram that describes the mixer 1 operation to generate output channel 1. The programmable coefficients for the mixer operation are located in the section.

**Figure 7-19. Programmable Digital Mixer Block Diagram**

A similar mixer operation is performed by mixer 2, mixer 3, and mixer 4 to generate output channel 2, channel 3, and channel 4, respectively.

### 7.3.7.1.7 Configurable Digital Decimation Filters

The device record channel includes a high dynamic range and a built-in digital decimation filter to process the oversampled data from the multibit delta-sigma ( $\Delta\Sigma$ ) modulator to generate digital data at the same Nyquist sampling rate as the FSYNC rate. As illustrated in [Figure 7-17](#), this decimation filter can also be used for processing the oversampled PDM stream from the digital microphone. The decimation filter can be chosen from four different types, depending on the required frequency response, group delay, power consumption, and phase linearity requirements for the target application. The selection of the decimation filter option can be done by configuring the ADC\_DSP\_DECI\_FILT, P0\_R114\_D[7:6] register bits. Low power filter can be configured by setting ADC\_LOW\_PWR\_FILT, P0\_R78\_D2 bit. [Table 7-20](#) shows the configuration register setting for the decimation filter mode selection for the record channel.

**Table 7-20. Decimation Filter Mode Selection for the Record Channel**

#### 7.3.7.1.7.1 Linear Phase Filters

The linear phase decimation filters are the default filters set by the device and can be used for all applications that require a perfect linear phase with zero-phase deviation within the pass-band specification of the filter. The filter performance specifications and various plots for all supported output sampling rates are listed in this section.

**7.3.7.1.7.1.1 Sampling Rate: 16 kHz or 14.7 kHz**

Figure 7-20 and Figure 7-21 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 16 kHz or 14.7 kHz. Table 7-21 lists the specifications for a decimation filter with a 16-kHz or 14.7-kHz sampling rate.

ADVANCE INFORMATION

### 7.3.7.2 DAC Signal-Chain

Figure 7-32 shows the key components of the playback signal chain.

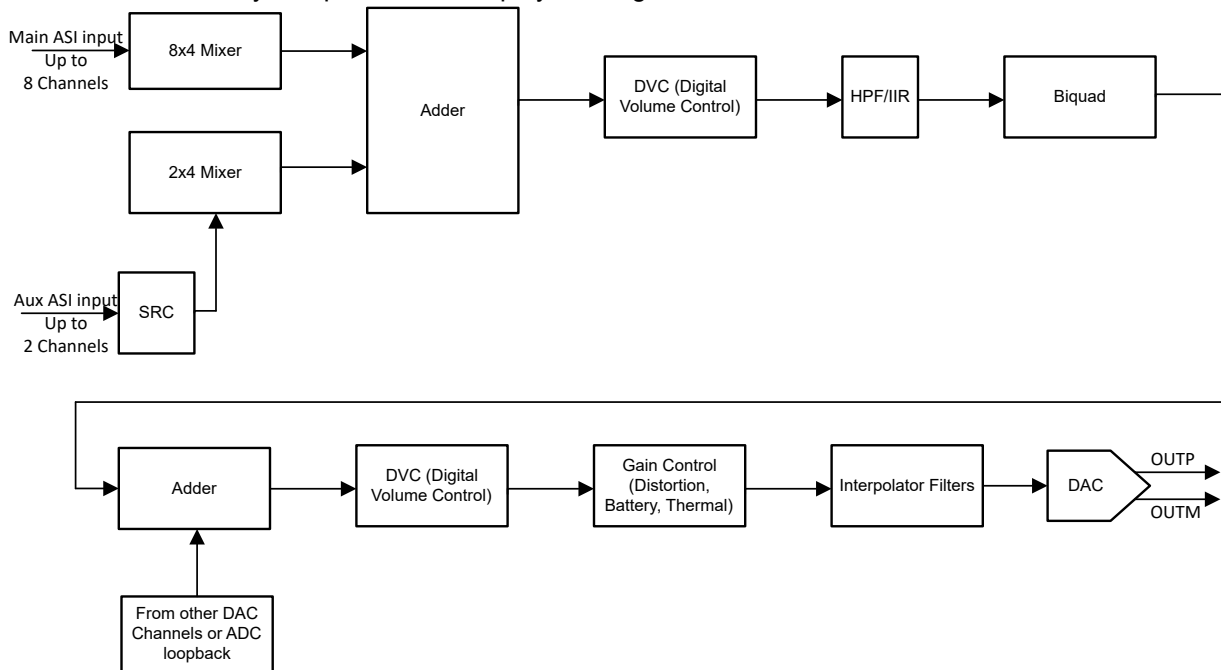

Figure 7-32. DAC Signal-Chain Processing Flowchart

The DAC signal chain offers a highly flexible low-noise playback path for low-noise and high-fidelity audio applications. This low-noise and low-distortion, multibit, delta-sigma DAC enables the TAC5112 to achieve 120 dB dynamic range in very low power. Moreover, the DAC architecture has inherent antialias filtering with a high rejection of out-of-band frequency noise around multiple modulator frequency components. Therefore, the device prevents noise from aliasing into the audio band. Further on in the signal chain, an integrated, high-performance multistage digital interpolation filter sharply cuts off any out-of-band frequency noise with high stop-band attenuation.

The signal chain also consists of various highly programmable digital processing blocks such as biquad filters, phase calibration, gain calibration, high-pass filter, digital summer or mixer, synchronous sample rate converter, distortion limiter, thermal foldback, brownout prevention, and volume control. The details of these processing blocks are discussed further in this section. The device also supports up to four channel single-ended output modes and an analog bypass option from ADC input to DAC output.

The output channels for playback can be enabled or disabled by using the CH\_EN (P0\_R118) register, and the input channels for the audio serial interface can be enabled or disabled by using the PASI\_RX\_CHx\_CFG or SASI\_RX\_CHx\_CFG bits. The device supports simultaneous power-up and power-down of all active channels for simultaneous playback. However, based on the application needs, if some channels must be powered-up or powered-down dynamically when the other channel playback is on, then that use case is supported by setting the DYN\_PUPD\_CFG register.

The device supports multiple data mixing options where up to 8 Input Channels from Main ASI, 2 Input Channels from Aux ASI, ADC loopback data, and tone generator can be mixed with flexible gain options for each path before playback on DAC output. By default, these mixers are disabled and channels are configured for only one channel of data. Mixers can be configured by setting ASI\_DIN\_Mixers on Page 17.

The device supports an output signal bandwidth of up to 100 kHz, which allows the high-frequency non-audio signal to be played by using a 216 kHz (or higher) sample rate. Wideband mode can be enabled or disabled by using the DAC\_CHx\_BW\_Mode bit.

For sample rates of 48 kHz or lower, the device supports all features and various programmable processing blocks. However, for sample rates higher than 48 kHz, there are limitations in the number of simultaneous channel recordings and playback supported and the number of biquad filters and such. See the [TAC5212 Sampling Rates and Programmable Processing Blocks Supported application report](#) for further details.

### 7.3.7.2.1 Programmable Channel Gain and Digital Volume Control

The device has an independent programmable channel gain setting for each output channel that can be set to the appropriate value based on the maximum input signal expected in the system. This can be done by configuring OUT1x\_LVL\_CTRL and OUT2x\_LVL\_CTRL bits. Coarse gain configuration from -6dB to +24dB is available with these controls in steps of 6dB. .

The device has a programmable digital volume control with a range from -100 dB to 27 dB in steps of 0.5 dB with the option to mute the channel recording. The digital volume control value can be changed dynamically while the DAC channel is powered-up and playing. During volume control changes, the soft ramp-up or ramp-down volume feature is used internally to avoid any audible artifacts. Soft-stepping can be entirely disabled using the DAC\_DSP\_DISABLE\_SOFT\_STEP (P0\_R115\_D1) register bit.

The digital volume control setting is independently available for each of the 4 single-ended output channels. In the case of 2 Channel Differential DAC, Only settings for DAC\_CH1A and DAC\_CH2A are applicable. The device also supports an option to gang up the volume control setting for all channels together using the channel 1 A digital volume control setting, regardless if channel 1A is powered up or powered down. This gang-up can be enabled using the DAC\_DSP\_DVOL\_GANG (P0\_R115\_D0) register bit.

Table 7-27 shows the programmable options available for the digital volume control.

**Table 7-27. Digital Volume Control (DVC) Programmable Settings**

P0_R103_D[7:0] : DAC_CH1A_DVOL[7:0]	DVC SETTING FOR OUTPUT CHANNEL 1A
0000 0000 = 0d	Output channel 1 DVC is set to mute
0000 0001 = 1d	Output channel 1 DVC is set to -100 dB
0000 0010 = 2d	Output channel 1 DVC is set to -99.5 dB
0000 0011 = 3d	Output channel 1 DVC is set to -99 dB
...	...
1100 1000 = 200d	Output channel 1 DVC is set to -0.5 dB
1100 1001 = 201d (default)	Output channel 1 DVC is set to 0 dB
1100 1010 = 202d	Output channel 1 DVC is set to 0.5 dB
...	...
1111 1101 = 253d	Output channel 1 DVC is set to 26 dB
1111 1110 = 254d	Output channel 1 DVC is set to 26.5 dB
1111 1111 = 255d	Output channel 1 DVC is set to 27 dB

Similarly, the digital volume control setting for output channels 1B,2A, and 2B can be configured using the CH1B\_DVOL (P0\_R103) to CH2B\_DVOL (P0\_R112) register bits, respectively.

The internal digital processing engine soft ramps up the volume from a muted level to the programmed volume level when the channel is powered up, and the internal digital processing engine soft ramps down the volume from a programmed volume to mute when the channel is powered down. This soft-stepping of volume is done to prevent abruptly powering up and powering down the playback channel which can cause audible artifacts. This feature can also be entirely disabled using the DAC\_DSP\_DISABLE\_SOFT\_STEP (P0\_R115\_D1) register bit.

### 7.3.7.2.2 Programmable Channel Gain Calibration

Along with the digital volume control, this device also provides programmable channel gain calibration. The gain of each channel can be finely calibrated or adjusted in steps of 0.1 dB for a range of -0.8-dB to 0.7-dB gain error. This adjustment is useful when trying to match the gain across channels resulting from transducer sensitivity and load impedance mismatch. This feature, in combination with the regular digital volume control,

allows the gains across all channels to be matched for a wide gain error range with a resolution of 0.1 dB. [Table 7-28](#) shows the programmable options available for the channel gain calibration.

**Table 7-28. DAC Channel Gain Calibration Programmable Settings**

P0_R104_D[7:4] : DAC_CH1A_FGAIN[3:0]	CHANNEL GAIN CALIBRATION SETTING FOR INPUT CHANNEL 1A
0000 = 0d	Input channel 1 gain calibration is set to -0.8 dB
0001 = 1d	Input channel 1 gain calibration is set to -0.7 dB
...	...
1000 = 8d (default)	Input channel 1 gain calibration is set to 0 dB
...	...
1110 = 14d	Input channel 1 gain calibration is set to 0.6 dB
1111 = 15d	Input channel 1 gain calibration is set to 0.7 dB

Similarly, the channel gain calibration setting for input channel 1B,2A and 2B can be configured using the DAC\_CH1B\_CFG1 (P0\_R106), DAC\_CH2A\_CFG1 (P0\_R111), and DAC\_CH2B\_CFG1 (P0\_R113) register bits, respectively.

### 7.3.7.2.3 Programmable Digital High-Pass Filter

To remove the DC offset component and attenuate the undesired low-frequency noise content in the record data, the device supports a programmable high-pass filter (HPF). The HPF is not a channel-independent filter setting but is globally applicable for all DAC channels. This HPF is constructed using the first-order infinite impulse response (IIR) filter, and is efficient enough to filter out possible DC components of the signal. [Table 7-29](#) shows the predefined -3-dB cutoff frequencies available that can be set by using the DAC\_DSP\_HPF\_SEL[1:0] register bits of P0\_R115. Additionally, to achieve a custom -3-dB cutoff frequency for a specific application, the device also allows the first-order IIR filter coefficients to be programmed when the DAC\_DSP\_HPF\_SEL[1:0] register bits are set to 2'b00. [Figure 7-33](#) illustrates a frequency response plot for the HPF filter.

**Table 7-29. HPF Programmable Settings**

P0_R115_D[5:4] : DAC_DSP_HPF_SEL[1:0]	-3-dB CUTOFF FREQUENCY SETTING	-3-dB CUTOFF FREQUENCY AT 16-kHz SAMPLE RATE	-3-dB CUTOFF FREQUENCY AT 48-kHz SAMPLE RATE
00	Programmable 1st-order IIR filter	Programmable 1st-order IIR filter	Programmable 1st-order IIR filter
01 (default)	$0.00002 \times f_s$	0.25 Hz	1 Hz
10	$0.00025 \times f_s$	4 Hz	12 Hz
11	$0.002 \times f_s$	32 Hz	96 Hz

**Figure 7-33. HPF Filter Frequency Response Plot**

[Equation 3](#) gives the transfer function for the first-order programmable IIR filter:

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{31} - D_1 z^{-1}} \quad (3)$$

The frequency response for this first-order programmable IIR filter with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the IIR coefficients in [Table 7-30](#) to achieve the desired frequency response for high-pass filtering or any other desired filtering. If DAC\_DSP\_HPF\_SEL[1:0] are set to 2'b00, the host device must write these coefficients values for the desired frequency response before powering-up any DAC channel for playback. [Table 7-30](#) shows the filter coefficients for the first-order IIR filter.

**Table 7-30. 1st-Order IIR Filter Coefficients**

#### 7.3.7.2.4 Programmable Digital Biquad Filters

The device supports up to 12 programmable digital biquad filters available for DAC signal chain limited to 3/channel. These highly efficient filters achieve the desired frequency response. The TAC5112 also supports on the fly programmable Biquad filters for two channel playback use case. In digital signal processing, a digital biquad filter is a second-order, recursive linear filter with two poles and two zeros. Equation 2 gives the transfer function of each biquad filter:

$$H(z) = \frac{N_0 + 2N_1z^{-1} + N_2z^{-2}}{2^{31} - 2D_1z^{-1} - D_2z^{-2}} \quad (4)$$

The frequency response for the biquad filter section with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the biquad coefficients to achieve the desired frequency response for a low-pass, high-pass, or any other desired frequency shaping. The programmable coefficients for the mixer operation are located in the and sections. If biquad filtering is required, then the host device must write these coefficients values before powering up any ADC channels for recording. In two channel use case, the TAC5112 also supports on the fly programmable filters. In this case, Device uses two banks of filters for one channel with a switch bit to perform the switch from one filter bank to the other. As described in Table 7-31, these biquad filters can be allocated for each output channel based on the DAC\_DSP\_BQ\_CFG[1:0] register setting of P0\_R115. By setting DAC\_DSP\_BQ\_CFG[1:0] to 2'b00, the biquad filtering for all playback channels are disabled and the host device can choose this setting if no additional filtering is required for the system application. See the [TAC5212 Programmable Biquad Filter Configuration and Applications application report](#) for further details.

#### 7.3.7.2.5 Programmable Digital Mixer

The device supports a fully programmable mixer feature that can mix the various input channels with their custom programmable scale factor to generate the final output channels. [Figure 7-19](#) shows a block diagram that describes the mixer 1 operation to generate output channel 1. The programmable coefficients for the mixer operation are located in the section.

A similar mixer operation is performed by mixer 2, mixer 3, and mixer 4 to generate output channel 2, channel 3, and channel 4, respectively.

### 7.3.7.2.6 Configurable Digital Interpolation Filters

The device playback channel includes a high dynamic range, built-in digital interpolation filter to process the input data stream to generate digital data stream for multibit delta-sigma ( $\Delta\Sigma$ ) modulator. The interpolation filter can be chosen from four different types, depending on the required frequency response, group delay, power consumption, and phase linearity requirements for the target application. The selection of the interpolation filter option can be done by configuring the DAC\_DSP\_INTX\_FILT, P0\_R115\_D[7:6] register bits. Low power filter can be configured by setting DAC\_LOW\_PWR\_FILT, P0\_R79\_D2 bit. [Table 7-33](#) shows the configuration register setting for the decimation filter mode selection for the record channel.

**Table 7-33. Interpolation Filter Mode Selection for the Playback Channel**

#### 7.3.7.2.6.1 Linear Phase Filters

The linear phase interpolation filters are the default filters set by the device and can be used for all applications that require a perfect linear phase with zero-phase deviation within the pass-band specification of the filter. The filter performance specifications and various plots for all supported output sampling rates are listed in this section.

**7.3.7.2.6.1.1 Sampling Rate: 16 kHz or 14.7 kHz**

Figure 7-34 and Figure 7-35 respectively show the magnitude response and the pass-band ripple for a interpolation filter with a sampling rate of 16 kHz or 14.7 kHz. Table 7-34 lists the specifications for a interpolation filter with an 16-kHz or 14.7-kHz sampling rate.

### 7.3.8 Interrupts, Status, and Digital I/O Pin Multiplexing

Certain events in the device require host processor intervention and can be used to trigger interrupts to the host processor. One such event is an audio serial interface (ASI) bus error. The device powers down the record channels if any faults are detected with the ASI bus error clocks, such as:

- Invalid FSYNC frequency
- Invalid SBCLK to FSYNC ratio
- Long pauses of the SBCLK or FSYNC clocks

When an ASI bus clock error is detected, the device shuts down all the record and playback channels as quickly as possible. After all ASI bus clock errors are resolved, the device volume ramps back to its previous state to recover the audio. During an ASI bus clock error, the internal interrupt request (IRQ) interrupt signal asserts low if the clock error interrupt mask register bit INT\_MASK0[7] (P1\_R47\_D7) is set low. The clock fault is also available for readback in the latched fault status register bit INT\_LTCH0 (P1\_R52), which is a read-only register. Reading the latched fault status register, INT\_LTCH0, clears all latched fault status. The device can be additionally configured to route the internal IRQ interrupt signal on the GPIOx or GPO1 pins and also can be configured as open-drain outputs so that these pins can be wire-ANDed to the open-drain interrupt outputs of other devices.

The IRQ interrupt signal can either be configured as active low or active high polarity by setting the INT\_POL (P0\_R66\_D7) register bit. This signal can also be configured as a single pulse or a series of pulses by programming the INT\_EVENT[1:0] (P0\_R66\_D[6:5]) register bits. If the interrupts are configured as a series of pulses, the events trigger the start of pulses that stop when the latched fault status register is read to determine the cause of the interrupt.

The device also supports read-only live-status registers to determine if the channels are powered up or down and if the device is in sleep mode or not. These status registers are located in the DEV\_STS0 (P0\_R121) and DEV\_STS1 (P0\_R122) register bits.

The device has a multifunctional GPIO1 pin that can be configured for a desired specific function. [Table 7-40](#) lists all possible allocations of these multifunctional pins for the various features.

**Table 7-40. Multifunction Pin Assignments**

- (1) S means the feature mentioned in this row is *supported* for the respective GPIO1, GPOx, or GPIx pin mentioned in this column.  
(2) NS means the feature mentioned in this row is *not supported* for the respective GPIO1, GPOx, or GPIx pin mentioned in this column.

Each GPOx or GPIOx pin can be independently set for the desired drive configurations setting using the GPIOx\_DRV[2:0] or GPO1\_DRV[2:0] register bits. [Table 7-41](#) lists the drive configuration settings.

**Table 7-41. GPIO or GPOx Pins Drive Configuration Settings**

000	The GPIO1 pin is set to high impedance (floated)
001	The GPIO1 pin is set to be driven active low or active high
010 (default)	The GPIO1 pin is set to be driven active low or weak high (on-chip pullup)
011	The GPIO1 pin is set to be driven active low or Hi-Z (floated)
100	The GPIO1 pin is set to be driven weak low (on-chip pulldown) or active high
101	The GPIO1 pin is set to be driven Hi-Z (floated) or active high
110 and 111	Reserved (do not use these settings)

Similarly, the GPO1 pin can be configured using the GPO1\_DRV(P0\_R12) register bits.

When configured as a general-purpose output (GPO), the GPIOx or GPO1 pin values can be driven by writing the GPO\_GPI\_VAL (P0\_R14) registers. The GPIO\_MON bits (P0\_R14\_D[3:1]) can be used to readback the status of the GPIOx or GPI1 pin when configured as a general-purpose input (GPI).

## 7.4 Device Functional Modes

## 7.5 Register Maps

This section describes the control registers for the device in detail. All these registers are eight bits in width and allocated to device configuration and programmable coefficients settings. These registers are mapped internally using a page scheme that can be controlled using either I<sup>2</sup>C or SPI communication to the device. Each page contains 128 bytes of registers. All device configuration registers are stored in page 0, page 1 and page 3. Page 0 is the default page setting at power up (and after a software reset). The device current page can be switch to a new desired page by using the PAGE[7:0] bits located in register 0 of every page.

Do not read from or write to reserved pages or reserved registers. Write only default values for the reserved bits in the valid registers.

The procedure for register access across pages is:

- Select page  $N$  (write data  $N$  to register 0 regardless of the current page number)
- Read or write data from or to valid registers in page  $N$
- Select the new page  $M$  (write data  $M$  to register 0 regardless of the current page number)
- Read or write data from or to valid registers in page  $M$
- Repeat as needed

## 7.5.1 TAC5212 Registers

Table 7-42 lists the memory-mapped registers for the TAC5212 registers. All register offset addresses not listed in Table 7-42 should be considered as reserved locations and the register contents should not be modified.

### 7.5.1.1 PAGE\_CFG Register (Address = 0x0) [Reset = 0x00]

PAGE\_CFG is shown in [Table 7-43](#).

Return to the [Summary Table](#).

The device memory map is divided into pages. This register sets the page.

**Table 7-43. PAGE\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	PAGE[7:0]	R/W	00000000b	These bits set the device page. 0d = Page 0 1d = Page 1 2d to 254d = Page 2 to page 254 respectively 255d = Page 255

### 7.5.1.2 SW\_RESET Register (Address = 0x1) [Reset = 0x00]

SW\_RESET is shown in [Table 7-44](#).

Return to the [Summary Table](#).

This register is the software reset register. Asserting a software reset places all register values in their default power-on-reset (POR) state.

**Table 7-44. SW\_RESET Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	RESERVED	R	0000000b	Reserved bits; Write only reset value

**Table 7-44. SW\_RESET Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
0	SW_RESET	R/W	0b	Software reset. This bit is self clearing. 0d = Do not reset 1d = Reset all registers to their reset values

### 7.5.1.3 VREF\_CFG Register (Address = 0x2) [Reset = 0x00]

VREF\_CFG is shown in [Table 7-45](#).

0	RESERVED	R/W	0b	Reserved bit; Write only reset value

### 7.5.1.6 MISC\_CFG1 Register (Address = 0x5) [Reset = 0x15]

MISC\_CFG1 is shown in [Table 7-48](#).

Return to the [Summary Table](#).

**Table 7-48. MISC\_CFG1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	INCAP_QCHG[1:0]	R/W	00b	The duration of the quick-charge for the external AC-coupling capacitor is set using an internal series impedance of 800 Ω. 0d = INxP, INxM quick-charge duration of 2.5 ms (typical) 1d = INxP, INxM quick-charge duration of 12.5 ms (typical) 2d = INxP, INxM quick-charge duration of 25 ms (typical) 3d = INxP, INxM quick-charge duration of 50 ms (typical)
5-4	SHDN_CFG[1:0]	R/W	01b	Shutdown configuration. 0d = DREG is powered down immediately after IOVDD is deasserted 1d = DREG remains active to enable a clean shut down until a time-out(DREG_KA_TIME) is reached; after the time-out period, DREG is forced to power off 2d = DREG remains active until the device cleanly shuts down 3d = Reserved; Don't use
3-2	DREG_KA_TIME[1:0]	R/W	01b	These bits set how long DREG remains active after IOVDD is deasserted. 0d = DREG remains active for 30 ms (typical) 1d = DREG remains active for 25 ms (typical) 2d = DREG remains active for 10 ms (typical) 3d = DREG remains active for 5 ms (typical)
1-0	RESERVED	R/W	01b	Reserved bits; Write only reset values

### 7.5.1.7 DAC\_CFG\_A0 Register (Address = 0x6) [Reset = 0x55]

DAC\_CFG\_A0 is shown in [Table 7-49](#).

Return to the [Summary Table](#).

This register configures the device DAC DEPOP

Bit	Field	Type	Reset	Description
7-0	PAGE[7:0]	R/W	00000000b	These bits set the device page. 0d = Page 0 1d = Page 1 2d to 254d = Page 2 to page 254 respectively 255d = Page 255

### 7.5.3.2 SASI\_CFG0 Register (Address = 0x1A) [Reset = 0x30]

SASI\_CFG0 is shown in [Table 7-209](#).

Return to the [Summary Table](#).

This register is the ASI configuration register 0.

**Table 7-209. SASI\_CFG0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	SASI_FORMAT[1:0]	R/W	00b	Secondary ASI protocol format. 0d = TDM mode 1d = I <sup>2</sup> S mode 2d = LJ (left-justified) mode 3d = Reserved; Don't use
5-4	SASI_WLEN[1:0]	R/W	11b	Secondary ASI word or slot length. 0d = 16 bits (Recommended this setting to be used with 10-kΩ input impedance configuration) 1d = 20 bits 2d = 24 bits 3d = 32 bits
3	SASI_FSYNC_POL	R/W	0b	ASI FSYNC polarity (for SASI protocol only). 0d = Default polarity as per standard protocol 1d = Inverted polarity with respect to standard protocol
2	SASI_BCLK_POL	R/W	0b	ASI BCLK polarity (for SASI protocol only). 0d = Default polarity as per standard protocol 1d = Inverted polarity with respect to standard protocol
1	SASI_BUS_ERR	R/W	0b	ASI bus error detection. 0d = Enable bus error detection 1d = Disable bus error detection
0	SASI_BUS_ERR_RCOV	R/W	0b	ASI bus error auto resume. 0d = Enable auto resume after bus error recovery 1d = Disable auto resume after bus error recovery and remain powered down until host configures the device

Bit	Field	Type	Reset	Description
7	SASI_TX_EDGE	R/W	0b	Secondary ASI data output (on the primary and secondary data pin) transmit edge. 0d = Default edge as per the protocol configuration setting in SASI_BCLK_POL 1d = Inverted following edge (half cycle delay) with respect to the default edge setting

**Table 7-210. SASI\_TX\_CFG0 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
6	SASI_TX_FILL	R/W	0b	Secondary ASI data output (on the primary and secondary data pin) for any unused cycles 0d = Always transmit 0 for unused cycles 1d = Always use Hi-Z for unused cycles
5	SASI_TX_LSB	R/W	0b	Secondary ASI data output (on the primary and secondary data pin) for LSB transmissions. 0d = Transmit the LSB for a full cycle 1d = Transmit the LSB for the first half cycle and Hi-Z for the second half cycle
4-3	SASI_TX_KEEPER[1:0]	R/W	00b	Secondary ASI data output (on the primary and secondary data pin) bus keeper. 0d = Bus keeper is always disabled 1d = Bus keeper is always enabled 2d = Bus keeper is enabled during LSB transmissions only for one cycle 3d = Bus keeper is enabled during LSB transmissions only for one and half cycles
2	SASI_TX_USE_INT_FSYNC	R/W	0b	Secondary ASI uses internal FSYNC for output data generation in controller mode configuration as applicable. 0d = Use external FSYNC for ASI protocol data generation 1d = Use internal FSYNC for ASI protocol data generation
1	SASI_TX_USE_INT_BCLK	R/W	0b	Secondary ASI uses internal BCLK for output data generation in controller mode configuration. 0d = Use external BCLK for ASI protocol data generation 1d = Use internal BCLK for ASI protocol data generation
0	SASI_TDM_PULSE_WIDTH	R/W	0b	Secondary ASI fsync pulse width in TDM format. 0d = Fsync pulse is 1 bclk period wide 1d = Fsync pulse is 2 bclk period wide

## 8 Application and Implementation

---

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

---

### 8.1 Application Information

The TAC5112 is a stereo, high-performance audio codec that supports sample rates of up to 768 kHz. The device supports up to a total of 4 microphones for simultaneous recording which can be selected from up to 2 analog microphones or 4 digital pulse density modulation (PDM) microphones. The device also supports up to 4 channel simultaneous playback which can be configured as a 2 channel differential or psuedo differential output or up to 4 channel single-ended output with options for headphone and lineout drive capabilities.

Communication to the TAC5112 for configuration of the control registers is supported using an I<sup>2</sup>C or SPI interface. The device supports a highly flexible, audio serial interface (TDM, I<sup>2</sup>S, and LJ) to transmit audio data seamlessly in the system across devices.

### 8.2 Typical Application

#### 8.2.1 Application

[Figure 8-1](#) shows a typical configuration of the TAC5112 for an application using two analog ECM microphones for simultaneous recording and two channel lineout operation with an I<sup>2</sup>C control interface and a time-division multiplexing (TDM) audio data target interface. For best distortion performance, use input AC-coupling capacitors with a low-voltage coefficient.

Figure 8-1. Stereo Microphone with Stereo Lineout Block Diagram

### 8.2.2 Design Requirements

Table 8-1a lists the design parameters for this application.

Table 8-1. Design Parameters

PARAMETER	VALUE
AVDD	3.3 V
IOVDD	1.2 V or 1.8 V or 3.3 V
AVDD supply current consumption	TBD
IOVDD supply current consumption	TBD
Maximum MICBIAS current	5 mA
Load on OUT1M, OUT1P, OUT2M, OUT2P	>600 ohms

### 8.2.3 Detailed Design Procedure

This section describes the necessary steps to configure the TAC5112 for this specific application. The following steps provide a sequence of items that must be executed in the time between powering the device up and reading data from the device or transitioning from one mode to another mode of operation.

1. Apply power to the device:
  - a. Power up the IOVDD and AVDD power supplies
  - b. Wait for at least 1ms to allow the device to initialize the internal registers.
  - c. The device now goes into sleep mode (low-power mode < 10  $\mu$ A)
2. Transition from sleep mode to active mode whenever required for the operation:
  - a. Wake up the device by writing to P0\_R2 to disable sleep mode
  - b. Wait for at least 1 ms to allow the device to complete the internal wake-up sequence

- c. Override the default configuration registers or programmable coefficients value as required (this step is optional)
- d. Enable all desired input channels by writing to P0\_R118
- e. Enable all desired audio serial interface input/output channels by writing to P0\_R40 to P0\_R47 for DAC and P0\_R30 to P0\_R37 for ADC
- f. Power-up the ADC, DAC and MICBIAS by writing to P0\_R120
- g. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio

This specific step can be done at any point in the sequence after step a.

See the [Section 7.3.2](#) section for supported sample rates and the BCLK to FSYNC ratio.

- h. The device recording data is now sent to the host processor using the TDM audio serial data bus and playback data from TDM is now played on the lineout
3. Transition from active mode to sleep mode (again) as required in the system for low-power operation:
    - a. Enter sleep mode by writing to P0\_R2 to enable sleep mode
    - b. Wait at least 6 ms (when FSYNC = 48 kHz) for the volume to ramp down and for all blocks to power down
    - c. Read P0\_R122 to check the device shutdown and sleep mode status
    - d. If the device P0\_R122\_D[7:5] status bit is 3'b100 then stop FSYNC and BCLK in the system
    - e. The device now goes into sleep mode (low-power mode < 10  $\mu$ A) and retains all register values
  4. Transition from sleep mode to active mode (again) as required for the recording operation:
    - a. Wake up the device by writing to P0\_R2 to disable sleep mode
    - b. Wait at least 1 ms to allow the device to complete the internal wake-up sequence
    - c. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio
    - d. The device recording data is now sent to the host processor using the TDM audio serial data bus and playback data from TDM is now played on the lineout
  5. Repeat step 4 and step 5 as required for mode transitions

## 9 Power Supply Recommendations

The power-supply sequence between the IOVDD and AVDD rails can be applied in any order. However, after all supplies are stable, then only initiate the I<sup>2</sup>C or SPI transactions to initialize the device.

For the supply power-up requirement,  $t_1$ ,  $t_2$  must be at least 2 ms to allow the device to initialize the internal registers. See the [Section 7.4](#) section for details on how the device operates in various modes after the device power supplies are settled to the recommended operating voltage levels. For the supply power-down requirement,  $t_4$ ,  $t_5$  and  $t_6$  must be at least 10 ms. This timing (as shown in [Figure 9-1](#)) allows the device to ramp down the volume on the record data, power down the analog and digital blocks, and put the device into shutdown mode. The device can also be immediately put into shutdown mode by ramping down power supplies, but doing so causes an abrupt shutdown.

**Figure 9-1. Power-Supply Sequencing Requirement Timing Diagram**

Make sure that the supply ramp rate is slower than  $0.1\text{V}/\mu\text{s}$  and that the wait time between a power-down and a power-up event is at least 100 ms. For supply ramp rate slower than  $0.1\text{ V/ms}$ , host device must apply a software reset as first transaction before doing any device configuration. Make sure all digital input pins are at valid input levels and not toggling during supply sequencing.

The TAC5112 supports a single AVDD supply operation by integrating an on-chip digital regulator, DREG, and an analog regulator, AREG.

## 10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 10.1 Documentation Support

### 10.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

### 10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
