![Texas Instruments]

TMP390 Ultra-Small, Dual-Channel (Hot and Cold Trip), 0.5-µA, Resistor-Programmable Temperature Switch

1 Features

- Resistor programmable temperature trip points and hysteresis options
  - Resistor tolerances contribute zero error
  - Hysteresis options: 5°C, 10°C and 20°C
- Separate outputs for overtemperature or undertemperature detection
  - Channel A (overtemperature): +30 to +124°C, 2°C steps
  - Channel B (undertemperature): –50 to +25°C, 5°C steps
- Accuracy level options (maximum at −55°C to +130°C):
  - A2 Level: ±3.0°C (±1.5°C from 0°C to +70°C)
  - A3 Level: ±3.5°C (±2.0°C from 0°C to +70°C)
- Ultra-low power consumption: 0.5 µA typical at 25°C
- Supply voltage: 1.62 to 5.5 V
- Open-drain outputs
- Trip test function enables in-system testing
- Available in a SOT-563 (1.60-mm × 1.20-mm), 6-pin package

2 Applications

- DC/AC inverter
- DC/DC converter
- Temperature transmitters
- Environmental control systems (ECS)
- Power tools
- Power banks
- Wireless infrastructure
  - WLAN/Wi-Fi access points
  - Core routers
  - Edge routers
  - Macro remote radio units (RRU)
3 Description

The TMP390 device is part of a family of ultra-low power, dual channel, resistor programmable temperature switches that enable protection and detection of system thermal events from –50°C to 130°C. The TMP390 offers independent overtemperature (hot) and undertemperature (cold) detection . The trip temperatures (T_{TRIP}) and thermal hysteresis (T_{HYST}) options are programmed by two E96-series resistors (1% tolerance) on the SETA and SETB pins. Channel A resistors can range from 1.05 KΩ to 909 KΩ, representing one of 48 unique values. Channel B resistors can range from 10.5 KΩ to 909 KΩ

The value of the resistor to ground on SETA input sets the T_{TRIP} threshold of Channel A. The value of the resistor to ground on SETB input sets the T_{TRIP} threshold of Channel B, as well as the T_{HYST} options of 5°C, or 10°C for both channels, to prevent undesired digital output switching. When the SETB input is connected to ground, Channel A operates with 20°C hysteresis. Resistors accuracy has no impact to T_{TRIP} accuracy.

To enable customer board-level manufacturing, the TMP390 supports a trip test function where the digital outputs are activated by exercising the SETA or SETB pin.

Device Information

PART NUMBER	PACKAGE[1]	BODY SIZE (NOM)
TMP390	SOT-563 (6)	1.60 mm × 1.20 mm

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision * (May 2019) to Revision A (August 2020)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document	1
• Added Hot and Cold Trip in the Title	1
• Updated T_J to 150°C from 155°C	4
• Updated T_{stg} to 150°C from 155°C	4
• Removed T_A section on unspecified performance	4
• Updated $R_{\Theta JA}$ from 210.3 °C/W to 230 °C/W	4
• Updated $R_{\Theta JC(top)}$ from 105 °C/W to 103.4 °C/W	4
• Updated $R_{\Theta JB}$ from 87.5 °C/W to 111.6 °C/W	4
• Updated ψ_{JT} from 6.1 °C/W to 5.3 °C/W	4
• Updated ψ_{JB} from 87 °C/W to 110.5 °C/W	4
• Added Thermal Mass paramater	4
• Added 20°C hysteresis option for single channel operation	5
• Updated to separate SETA and SETB resistor ranges	5
• Added test condition for average quiescent current	5
• Changed standby current from 0.2µA to 0.25µA	5
• Changed power-on reset threshold voltage from 1.55V to 1.5V	5

5 Pin Configuration and Functions
Figure 5-1. DRL Package 6-Pin SOT-563 Top View

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	SETA	Input	Channel A temperature set point. Connect a standard E96, 1% resistance between SETA and GND.
2	SETB	Input	Channel B temperature and Hysteresis set point. Connect a standard E96, 1% resistance between SETB and GND.
3	GND	Ground	Device ground.
4	$\overline{\text{OUTB}}$	Logic Output	Channel B logic open-drain active low output. If unused, the output can be left floating or connected to GND.
5	VDD	Supply	Power supply voltage (1.62 V – 5.5 V).
6	$\overline{\text{OUTA}}$	Logic Output	Channel A logic open-drain active low output. If unused, the output can be left floating or connected to GND.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1] [2]

		MIN	MAX	UNIT
Supply voltage	VDD	−0.3	6	V
Voltage at	$\overline{OUTA}$, $\overline{OUTB}$	-0.3	6	V
Voltage at	SETA, SETB	−0.3	VDD + 0.3	V
Junction temperature, T_J		−55	150	°C
Storage temperature, T_{stg}		−60	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Powering the device when the operating junction temperature is outside the *Recommended Operating Conditions*, may affect the functional operation of the device. The device must be power cycled after the system has returned to conditions as indicated under *Recommended Operating Conditions*.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
VDD	Supply voltage	1.62	3.3	5.5	V
V_{OUTA}	Channel A output pull-up voltage (open-drain)			VDD + 0.3	V
V_{OUTB}	Channel B output pull-up voltage (open-drain)			VDD + 0.3	V
I_{SETA}	SETA pin circuit leakage current	-20		20	nA
I_{SETB}	SETB pin circuit leakage current	-20		20	nA
R_{PA}	Pullup resistor connected from $\overline{OUTA}$ to VDDIO[1]	1	10		kΩ
R_{PB}	Pullup resistor connected from $\overline{OUTB}$ to VDDIO[1]				
T_A	Operating free-air temperature (specified performance)	−55		130	°C

(1) Where VDDIO is an independent power supply other than VDD, and shall not exceed (VDD + 0.3) V.

6.4 Thermal Information

|		TMP390 DRL (SOT) 6 PINS	UNIT
THERMAL METRIC[1]			
$R_{\theta JA}$	Junction-to-ambient thermal resistance	230	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	103.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	111.6	°C/W
ψ_{JT}	Junction-to-top characterization parameter	5.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	110.5	°C/W
M_T	Thermal Mass	1.83	mJ/°C

(1) For more information about traditional and new thermal metrics, see the *Semiconductor IC Package Thermal Metrics* application report, (SPRA953).

6.5 Electrical Characteristics

Minimum and maximum specifications are over -55°C to 130°C and VDD = 1.62V - 5.5V (unless otherwise noted); typical specifications are at T_A = 25°C and VDD = 3.3 V.

7 Detailed Description

7.1 Overview

The TMP390 ultra-low power, dual channel, resistor programmable temperature switches enable detection and protection of system thermal events over a wide temperature range. The TMP390 offers independent overtemperature (hot) and undertemperature (cold) detection. The trip temperatures and hysteresis options are programmed by two E96-series (1%) standard decade value resistors on the SETA and SETB pins. The TMP390 can enable a customer board-level manufacturing test through the trip test function that can force the SETA or SETB pins to logic high to activates the digital outputs.

7.2 Functional Block Diagram

R_{SETA} and R_{SETB} select trip thresholds and hysteresis options.
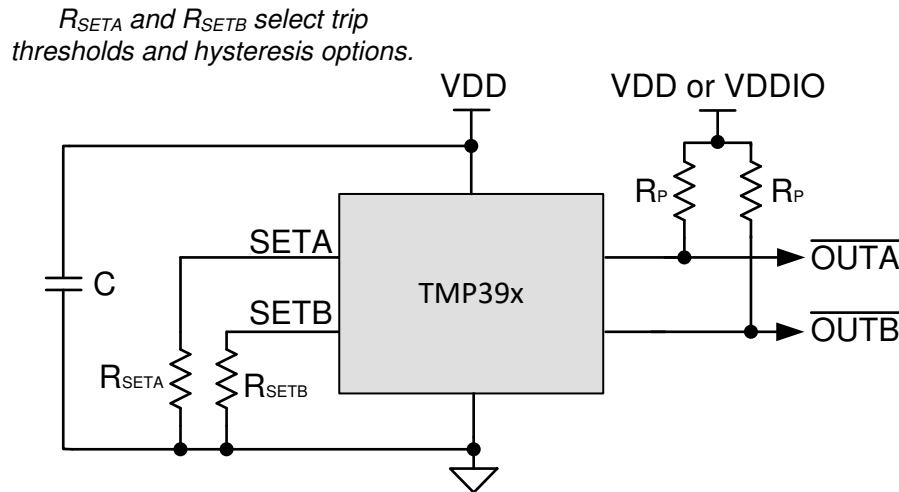

Figure 7-1. Simplified Schematic

7.3 Feature Description

The TMP390 requires two resistors to set the two trip points and hysteresis, according to Table 7-1 and Table 7-2, for the hot and cold channel device. The output of the TMP390 is open-drain and requires two pullup resistors. TI recommends to use a pullup voltage supply that does not exceed VDD + 0.3 V. The pullup resistors used in between the $\overline{OUTA}$ and $\overline{OUTB}$ pins and the pullup supply should be greater than 1 kΩ. The device powers on when the supply voltage goes beyond 1.5 V, and starts sampling the input resistors to set the two trip points and hysteresis value after power-on. These values will remain the same until the device goes through a power cycle. After the device sets the trip points and hysteresis level, the device will update the output every half a second. The conversion time is typically 0.65 ms when the temperature is checked against the trip points and the outputs are updated. The device remains in standby mode between conversions. If either channel is not used, the output can be grounded or left floating.

7.3.1 TMP390 Programming Tables

The temperature threshold and hysteresis options for the TMP390 device are programmed using two external 1% E96 standard resistors. The specific resistor value to ground on the SETA input sets the temperature threshold of channel A. The specific resistor value to ground on the SETB input sets the temperature threshold of channel B, as well as the hysteresis for both channel A and channel B.

7.3.2 Trip Test

The purpose of the trip test is in system manufacturing test without putting the TMP390 through costly temperature verification of the assembly of TMP390 and pullup resistors. When the SETA or SETB pin is set to a high logic level, the associated output goes low. When the input pin level goes low, the output goes to its previous condition before the trip test. The trip test does not affect the current condition of the device. The trip test signals should stay above 0.8 × VDD for logic high and below 0.2 × VDD for logic low.

The trip test operation is shown in Figure 7-2. The trip test must be performed with a single toggle when the device is operating at a temperature that will not cause the corresponding output to trip. The trip test is intended for production testing after assembly, and must not be used as a functional feature.
Figure 7-2. TMP390 Trip Test Operation

7.3.3 20°C Hysteresis

The 20°C hysteresis feature is only available on Channel A. To activate the feature, the SETB pin must be connected to ground and SETA pin connected to the resistor to set the appropriate trip point on Channel A.

7.4 Device Functional Modes

The device has one mode of operation, as described above, that applies when operated within the *Recommended Operating Conditions*.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Applications Information

The TMP390 device is part of a family of ultra-low power, dual channel, resistor programmable temperature switches that can enable detection and protection of system thermal events over a wide temperature range. The trip temperatures (T_{TRIP}) and hysteresis options are programmed by two E96-series (1%) standard decade value resistors on the SETA and SETB pins. The thermal hysteresis (T_{HYST}) function is to prevent undesired digital output switching due to small temperature changes.

8.2 Typical Applications

8.2.1 Simplified Application Schematic

Figure 8-1 shows the simplified schematic where R_{SETA} and R_{SETB} are used to set channel A trip point (SETA) and channel B trip point and hysteresis for both channels (SETB). SETA and SETB can be programmed at a variety of temperatures based on the device, as described in Table 7-1 for channel A trip point, and Table 7-2 for channel B trip point and hysteresis for both channels. $\overline{OUTA}$ and $\overline{OUTB}$ outputs correspond to the temperature threshold detection at SETA and SETB, respectively.
Figure 8-1. Simplified Schematic

8.2.1.1 Design Requirements

The TMP390 requires two resistors to set the high and low trip points and hysteresis, and two pullup resistors for the open-drain device. TI also highly recommends to place a 0.1-µF, power-supply bypassing capacitor close to the VDD supply pin. To minimize the internal power dissipation, use two pullup resistors greater than 1 kΩ from the $\overline{OUTA}$ and $\overline{OUTB}$ pins to the VDD pin. A separate supply, VDDIO, may be used for the pullup voltage to set the output voltage level to the level required by the MCU, as shown in Figure 8-1. The open-drain output gives flexibility of pulling up to any voltage independent of VDD (VDDIO must be less than or equal to VDD + 0.3 V). This allows for use of longer cables or different power supply options. If a separate voltage level is not required, TI recommends to tie the pullup to the TMP390 VDD.

If the SETA or SETB connected resistor value is outside the legal range, the associated output goes to permanent output zero stage and the channel cannot be used. The other channel still will be in operating condition, and device can be used in one channel mode. If the SETB input is grounded or left floating, the Channel B cannot be used and the hysteresis for Channel A will be 20°C. The SETA and SETB connected resistors are measured during POR. If two consecutive measurements are not matching each other, then the device sets the associated channel output to zero and repeats the resistor measurements until the

measurements match. When the measurements match, the channel output is released. Note that it is possible to connect some device outputs together by shorting the $\overline{\text{OUTA}}$ or $\overline{\text{OUTB}}$ line.

8.2.1.2 Detailed Design Procedure

The resistor to ground values on the SETA input sets the T_{TRIP} threshold of Channel A. The resistor to ground value on the SETB input sets the T_{TRIP} threshold of Channel B as well as the T_{HYST} 5°C and 10°C options. TI recommends that the resistors at SETA and SETB have a 1% tolerance at room temperature. Each resistor can range from 1.05 KΩ to 909 KΩ, representing one of 48 unique values. The exact temperature thresholds and trip points are shown in Table 7-1 and Table 7-2. The pullup resistors should be at least 1 kΩ to minimize internal power dissipation. To get the correct threshold for resistor values, take care to minimize the board level capacitance and leakage at the SETA and SETB pins.

The waveform for the TMP390 output under the hot/cold thresholds is shown in Figure 8-2. The hysteresis can be set to 5°C, 10°C or 20°C. When the temperature exceeds the hot trip point threshold, $\overline{\text{OUTA}}$ goes low until the temperature drops below the hysteresis threshold. When the temperature drops below the cold trip threshold, $\overline{\text{OUTB}}$ goes low and returns high after the temperature rises above the hysteresis threshold. If the switch has already tripped and the temperature is in the hysteresis band, a POR event will cause the output to go high after the power is restored.
8.2.1.3 Application Curves

Figure 8-2. TMP390 Output With Hot/Cold Thresholds With Hysteresis

8.2.2 TMP390 With 10°C Hysteresis

Figure 8-3 shows an example circuit for overtemperature and undertemperature protection using the TMP390. In this example, the trip points are set at –25°C and +90°C with 10°C hysteresis.

**Figure 8-3. TMP390 Example Circuit at +90°C and –25°C Thresholds With 10°C Hysteresis**

8.2.2.1 Design Requirements

In this example, VDD can be ≥ 3 V. The output pins may be tied to a switch to control a fan or other analog circuitry. Figure 8-3 uses 10-kΩ pullup resistors at the $\overline{OUTA}$ and $\overline{OUTB}$ outputs. Place a 0.1-µF bypass capacitor close to the TMP390 device to reduce noise coupled from the power supply. If needed, the output of multiple parts can be connected together.

8.2.2.2 Detailed Design Procedure

SETA sets the +90°C threshold using 78.7 kΩ. SETB sets the –25°C trip point and 10°C hysteresis using 215 kΩ. These values were determined using Table 7-1 and Table 7-2. These resistors should have maximum of 1% tolerance and 100 ppm/°C or less over the desired temperature range. A summary of the resistor settings used in this example is shown in Table 8-1. See Table 7-1 and Table 7-2 for additional trip points and hysteresis configurations.

The switching output of the TMP390 can be visualized with the output diagram shown in Figure 8-4. It is key to notice that hysteresis is subtracted from the Channel A threshold and added to the Channel B threshold values. $\overline{OUTA}$ remains high until the sensor reaches +90°C where the output goes low, and returns high after the temperature drops back down to +80°C. $\overline{OUTB}$ trips when the temperature stays below –25°C and goes low until the temperature rises above –15°C.

8.2.3.1 Application Curve
Figure 8-6. TMP390 One Channel (Hot) Operation Thresholds and Hysteresis

8.2.4 One Channel Operation for Cold Trip Point

Figure 8-7 shows the TMP390 configured for one channel operation, with a single resistor to set the warm trip point and hysteresis. The resistor values for one channel warm trip point is same as described in Table 7-2.
Figure 8-7. TMP390 One Channel (Cold) Operation Example Circuit With –20°C Trip Point and 10°C Hysteresis
8.2.4.1 Application Curve

9 Power Supply Recommendations

The low supply current and wide supply range of the TMP390 allow the device to be powered from many sources. VDDIO must always be lower than or equal to VDD + 0.3 V.

Power supply bypassing is strongly recommended by adding a 0.1-µF capacitor from VDD to GND. In noisy environments, TI recommends to add a filter with 0.1-µF capacitor and 100-Ω resistor between external supply and VDD to limit the power supply noise.

10 Layout

10.1 Layout Guidelines

The TMP390 is extremely simple to layout. Place the power supply bypass capacitor as close to the device as possible, and connect the capacitor as shown in Figure 10-1. Place the R_{SETA} and R_{SETB} resistors as close to the device as possible. Carefully consider the resistor placement to avoid additional leakage or parasitic capacitance, as this may affect the actual resistor sense value for the trip thresholds and hysteresis. If there is a possibility of moisture condensation on the SETA and SETB circuits, which may lead to additional leakage current, consider adding a conformal coating to the circuits.

10.2 Layout Example

11 Device and Documentation Support

11.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

11.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.5 Glossary

TI Glossary   This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMP390A2DRLR	ACTIVE	SOT-5X3	DRL	6	4000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-55 to 130	1C4	Samples
TMP390A3DRLR	ACTIVE	SOT-5X3	DRL	6	4000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-55 to 130	1C6	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
