

TPS6291x 3V to 17V, 4.5A/6A/8A, Low Noise and Low Ripple Buck Converter With Integrated Ferrite Bead Filter Compensation

1 Features

- Low output 1/f noise < 20 μ V_{RMS}(100Hz to 100kHz)
- Low output voltage ripple < 10 μ V_{RMS} after ferrite bead
- High PSRR of > 65dB (up to 100kHz)
- 2.2MHz, 1.4MHz, or 1.0MHz fixed frequency peak current mode control
- Synchronizable with external clock (optional)
- Integrated loop compensation supports ferrite bead for second stage L-C filter with 30dB attenuation (optional)
- Spread spectrum modulation (optional)
- 3.0V to 17V input voltage range
- 0.8V to 5.5V output voltage range
- 25m Ω /7m Ω R_{DSon}
- Output voltage accuracy of \pm 1% over temperature
- Precise enable input allows
 - User-defined undervoltage lockout
 - Exact sequencing
- Adjustable soft start
- Power-good output
- Output discharge (optional)
- –40°C to 150°C junction temperature range
- 2. mm \times 3.0mm QFN with 0.5mm pitch
- Create a custom design using the TPS6291x with the [WEBENCH® Power Designer](#)

2 Applications

- [Telecom infrastructure](#)
- [Test and measurement](#)
- [Aerospace and defense \(radar, avionics\)](#)
- [Medical](#)

Output Noise Versus Frequency

3 Description

The TPS6291x devices are a family of high-efficiency, low noise, and low ripple current mode synchronous buck converters. The devices are designed for noise sensitive applications that normally use an LDO for post regulation such as high-speed ADCs, clock and jitter cleaner, serializer, de-serializer, and radar applications.

To reduce the output voltage ripple, the device loop compensation is designed to operate with an optional second-stage ferrite bead L-C filter. Low-frequency noise levels, similar to a low-noise LDO, are further achieved by filtering the internal voltage reference with a capacitor connected to the NR/SS pin. Combined, these features allow for an output voltage ripple below 10 μ V_{RMS}.

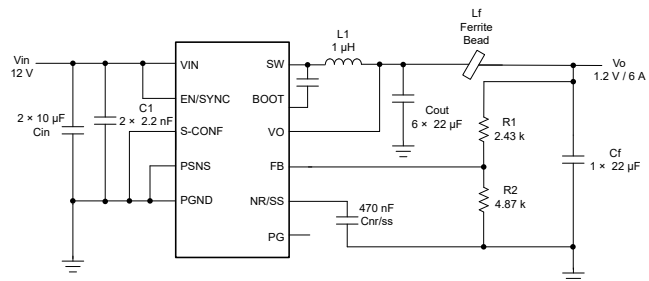

The device operates at a fixed switching frequency of 2.2MHz, 1.4MHz, or 1MHz, and can be synchronized to an external clock. An optional spread spectrum modulation scheme spreads the DC/DC switching frequency over a wider span, which lowers the mixing spurs.

Device Information

DEVICE NAME	OUTPUT CURRENT	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
TPS62916	6A	RPY (VQFN-HR, 14)	2.5mm \times 3.0mm
TPS62914	4.5A		
TPS62918	8A		

(1) For more information, see [Section 10](#).

(2) The package size (length \times width) is a nominal value and includes pins, where applicable.

4 Pin Configuration and Functions

Figure 4-1. 14-Pin VQFN-HR, RPY Package (Top View)

Table 4-1. Pin Functions

PIN		TYPE (1)	DESCRIPTION
NO.	NAME		
2	NR/SS	O	A capacitor connected to this pin sets the soft-start time and low frequency noise level of the device.
4	VO	I	Output voltage sense pin. This pin must be connected directly after the first inductor.
8, 12	VIN	I	Power supply input voltage pin
9, 11	PGND	—	Power ground connection
10	SW	O	Switch pin of the power stage. Connect this pin to the start winding of the output inductor .
13	SW	O	Switch pin. Connect a capacitor from this pin to the BOOT pin.
7	EN/SYNC	I	Enable, Disable pin including threshold-comparator. Connect to logic low to disable the device. Pull high to enable the device. This pin has an internal pulldown resistor of typically 500 kΩ when the device is disabled. Apply a clock to this pin to synchronize the device
14	BOOT	I	Supply for the internal high-side MOSFET gate driver. Connect a capacitor from this pin to SW.
1	PSNS	—	Power sense ground, connect directly to GND plane
3	FB	O	Feedback pin of the device
5	PG	O	Open-drain power-good output. This pin is pulled to GND when V_{OUT} is below the power-good threshold. this pin requires a pullup resistor to output a logic high. This pin can be left open or tied to GND if not used.
6	S-CONF	O	Smart Configuration pin. This pin configures the operation modes of the device. See Table 6-1 .

(1) I = input, O = output

5 Specifications

5.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage ⁽²⁾	VIN, EN/SYNC, PG, S-CONF	-0.3	18	V
	SW (DC)	-0.3	V _{IN} + 0.3	V
	SW (AC, less than 10 ns) ⁽³⁾	-2.5	21	V
	BOOT	-0.3	V _{IN} + 6	
	BOOT to SW	-0.3	6	
	VO, FB, NR/SS	-0.3	6	V
	VSNS-	-0.3	0.3	V
Sink Current	PG		10	mA
T _J	Junction temperature	-40	150	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to the network ground terminal.
- (3) While switching.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage	3.0		17	V
V _{OUT}	Output voltage	0.8		5.5	V
C _{IN}	Effective input capacitance	5	10		µF
L ₁	Effective output inductance	-30%	1	20%	µH
C _{OUT}	Effective output capacitance	80	120	200	µF
L _f	Effective filter inductance	0	10	50	nH
C _f	Effective filter capacitance	20	40	160	µF
C _{OUT} + C _f	Effective total output capacitance, including first and second L-C filter	80		400	µF
I _{OUT}	Output current for TPS62914	0		4.5	A
I _{OUT}	Output current for TPS62916	0		6	A
I _{OUT}	Output current for TPS62918	0		8	A
f _{SYNC}	Synchronization Range (2.2 MHz setting)	1.9	2.2	2.4	MHz
f _{SYNC}	Synchronization Range (1.4 MHz setting)	1.2	1.4	1.6	MHz
f _{SYNC}	Synchronization Range (1.0 MHz setting)	0.8	1.0	1.2	MHz

5.3 Recommended Operating Conditions (continued)

over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T_J ⁽¹⁾	Junction temperature	-40		150	°C

(1) Operating lifetime is derated at junction temperatures above 125°C.

5.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS6291 x		UNIT
		RPY 14-pin QFN		
		JEDEC 51-7 PCB	TPS6291 xEVM	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	58.9	29.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	37.8	n/a ⁽²⁾	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	7.3	n/a ⁽²⁾	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.9	1.8	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

(2) Not applicable to an EVM.

5.5 Electrical Characteristics

Over recommended input voltage range, $T_J = -40^\circ\text{C}$ to 150°C . Typical values are at $V_{in} = 12\text{ V}$ and $T_J = 25^\circ\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY						
I_Q	Quiescent current	EN = High, no load, device switching, fsw = 1 MHz		5		mA
I_{SD}	Shutdown current	EN = GND, $T_J = -40^\circ\text{C}$ to 125°C		0.3	70	μA
V_{UVLO}	Undervoltage lockout	V_{IN} rising, $T_J = -40^\circ\text{C}$ to 125°C	2.85	2.92	3.0	V
V_{HYS}	Undervoltage lockout hysteresis			200		mV
T_{JSD}	Thermal shutdown threshold	T_J rising		170		°C
	Thermal shutdown hysteresis	T_J falling		20		°C
CONTROL and INTERFACE						
V_{H_EN}	High-level input-threshold voltage at EN/ SYNC		0.97	1.01	1.04	V
V_{L_EN}	Low-level input-threshold voltage at EN/ SYNC		0.87	0.9	0.93	V
V_{H_SYNC}	High-level input-threshold clock signal on EN/SYNC	EN/SYNC = clock	1.1			V
V_{L_SYNC}	Low-level input-threshold clock signal on EN/SYNC	EN/SYNC = clock			0.4	V
$I_{EN,LKG}$	Input leakage current into EN/SYNC	EN/SYNC = GND or V_{IN} , $-40^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$		5	160	nA
R_{PD}	Pulldown resistor on EN/SYNC	EN/SYNC = Low	330	500		kΩ
t_{delay}	Enable delay time	Time from EN/SYNC high to device starts switching, $R_{S_CONF} = 80.6\text{ k}\Omega$		1		ms
$I_{NR/SS}$	NR/SS source current		67.5	75	82.5	μA
R_{S_CONF}	S-CONF resistor step range accuracy	R_{S_CONF} tolerance for all settings according to S-CONF Table	-4		+4	%
V_{PG}	Power-good threshold	V_{FB} rising, referenced to V_{FB} nominal	93	95	98	%

5.5 Electrical Characteristics (continued)

Over recommended input voltage range, $T_J = -40^\circ\text{C}$ to 150°C . Typical values are at $V_{IN} = 12\text{ V}$ and $T_J = 25^\circ\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{PG}	Power-good threshold	V_{FB} falling, referenced to V_{FB} nominal	88	90	93	%
$V_{PG,OL}$	Low-level output voltage at PG pin	$I_{SINK} = 1\text{ mA}$			0.4	V
$I_{PG,LKG}$	Input leakage current into PG pin	$V_{PG} = 5\text{ V}; -40^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$		5	500	nA

6 Detailed Description

6.1 Overview

The TPS6291x low-noise, low-ripple synchronous buck converter is a fixed frequency current mode converter. The converter has a filtered internal reference to achieve a low-noise output similar to low noise LDOs. The converter achieves lower output voltage ripple by using a switching frequency of either 2.2 MHz, 1.4 MHz, or 1 MHz and a larger inductance. The output voltage ripple can be further reduced by adding a small second stage L-C filter to the output. This can be a ferrite bead or a small inductor, followed by an output capacitor. Internal compensation maintains stability with an external filter inductor up to 50 nH. To avoid voltage drops across this second stage filter, the device regulates the output voltage after the filter. The TPS6291x family supports an optional spread spectrum modulation. When powering ADCs, for example, spread spectrum modulation reduces the mixing spurs. Switching frequency, spread spectrum modulation, and output discharge are set using the S-CONF pin.

6.2 Functional Block Diagram

6.3 Feature Description

6.3.1 Smart Config (S-CONF)

This S-CONF pin configures the device based on the resistor value. This pin is read after EN/SYNC goes high. The device configuration cannot be changed during operation. The S-CONF value is re-read if EN is pulled below 200 mV or if VIN falls below UVLO. [Table 6-1](#) shows the configuration options of switching frequency, spread spectrum modulation, output discharge, and synchronization.

To make sure the internal circuit detects the resistor value correctly, minimize the distance between the resistor and the S-CONF pin and do not place any capacitors on the S-CONF pin.

Table 6-1. S-CONF Device Configuration Modes

S-CONF	SWITCHING FREQUENCY	SPREAD SPECTRUM	OUTPUT DISCHARGE	SYNC
VIN	2.2 MHz	OFF	OFF	No
GND	1 MHz	OFF	OFF	No
4.87 kΩ	1.4 MHz	OFF	OFF	No
6.04kΩ	1.4 MHz	OFF	OFF	1.2 MHz to 1.6 MHz
7.5 kΩ	2.2 MHz	OFF	OFF	1.9 MHz to 2.42 MHz
9.31 kΩ	1 MHz	OFF	OFF	0.9 MHz to 1.2 MHz
11.5kΩ	1 MHz	Random	OFF	No
14.3 kΩ	1.4 MHz	Random	OFF	No
18.2 kΩ	2.2 MHz	Random	OFF	No
22.1 kΩ	1 MHz	OFF	ON	No
27.4 kΩ	1.4 MHz	OFF	ON	No
34kΩ	2.2 MHz	OFF	ON	No
42.2 kΩ	1 MHz	OFF	ON	0.9 MHz to 1.2 MHz
52.3 kΩ	1.4 MHz	OFF	ON	1.2 MHz to 1.6 MHz
64.9kΩ	2.2 MHz	OFF	ON	1.9 MHz to 2.42 MHz
80.6 kΩ	1 MHz	Random	ON	No
100 kΩ	1.4 MHz	Random	ON	No
124 kΩ	2.2 MHz	Random	ON	No

6.3.2 Device Enable (EN/SYNC)

The device is enabled by pulling the EN/SYNC pin high, and has an accurate rising threshold voltage of typically 1.01 V. After the device is enabled, the operation mode is set by the configuration of the S-CONF pin. This action occurs during the device start-up delay time t_{delay} . After t_{delay} expires, the internal soft-start circuitry ramps up the output voltage over the soft-start time set by the $C_{\text{NR/SS}}$ capacitor. The start-up delay time t_{delay} varies depending on the selected S-CONF value. The start-up delay time is shortest with smaller S-CONF resistors.

The EN/SYNC pin has an active pulldown resistor R_{PD} . This resistor prevents an uncontrolled start-up of the device, in case the EN/SYNC pin cannot be driven to a low level. The pulldown resistor is disconnected after start-up. With EN set to a low level, the device enters shutdown and the pulldown resistor is activated again.

6.3.3 Device Synchronization (EN/SYNC)

The EN/SYNC pin is also used for device synchronization. After a clock signal is applied to this pin, the device is enabled and reads the configuration of the S-CONF pin. The external clock frequency must be within the clock synchronization frequency range set by the S-CONF pin. When the clock signal changes from a clock to a static high, then the device switches from external clock to internal clock. To shutdown the device when using an external clock, EN/SYNC must go low for at least 10 μs .

The clock signal can be a logic signal with a logic level as specified in the electrical table, and can be applied directly to the EN/SYNC pin. External logic, such as an AND gate, can be used to combine separate enable and clock inputs, as shown in [Figure 6-1](#).

Figure 6-1. Synchronization with Separate Enable Signal (Optional)

6.3.4 Spread Spectrum Modulation

Using the S-CONF pin enables or disables spread spectrum modulation. DC/DC converter generate an output voltage ripple at the switching frequency. When powering ADCs or an analog front-end (AFE), the switching frequency generates high frequency mixing spurs as well as a low frequency spur in the output frequency spectrum. Using the optional second stage L-C filter reduces the ripple of the converter and spurs by up to 30 dB.

The device has an integrated random spread spectrum modulation (SSM) scheme, selected by the resistor connected to the S-CONF pin according to [Table 6-1](#). Selecting random modulation to spread the switching frequency over a larger frequency range is possible. The modulation spread is $\pm 10\%$ of the device switching frequency. This SSM provides high attenuation when the receiver bandwidth is \leq the modulation frequency, typically the case for systems using Fast Fourier Transforms (FFT) post processing as in high speed ADC applications. For applications sensitive to noise at the modulation frequency, random SSM is used. Using a random spread spectrum modulation also reduces the spurs in the output spectrum as shown in [Figure 5-2](#). The randomized modulation uses a Fibonacci Linear-Feedback Shift Register (LFSR) so that every tone is generated once during the pseudo-random generation period. The frequency spreading is shown in [Figure 6-2](#).

Figure 6-2. Spread Spectrum Modulation

6.3.5 Output Discharge

Output discharge is enabled or disabled, depending on the S-CONF setting. With output discharge enabled, the output voltage is pulled low by a discharge resistor R_{DIS} of typically $7\ \Omega$. The output discharge function is enabled during thermal shutdown, UVLO, or when EN/SYNC is pulled low.

6.3.6 Undervoltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages, the device is enabled after the input voltage is above the undervoltage lockout threshold. The device is disabled after the input voltage falls below the undervoltage threshold.

6.3.7 Power-Good Output

The device has a power-good output. The PG pin goes high impedance after the FB pin voltage is above 95% of the nominal voltage, and is driven low after the voltage falls below typically 90% of the nominal voltage. Table 6-2 shows the typical PG pin logic. The PG pin is an open-drain output and is specified to sink up to 10 mA. The power-good output requires a pullup resistor connecting to any voltage rail less than 18 V. The PG signal can be used for sequencing of multiple rails by connecting to the EN pin of other converters. If not used, the PG pin can be left floating or connected to GND. PG has a deglitch time of typically $8\ \mu\text{s}$ before going low.

Table 6-2. Power-Good Pin Logic

DEVICE STATE		PG LOGIC STATUS	
		HIGH IMPEDANCE	LOW
Enabled (EN/SYNC = High)	$V_{FB} \geq V_{PG}$	√	
	$V_{FB} < V_{PG}$ after t_{PG}		√
Shutdown (EN/SYNC = Low)			√
UVLO	$0.7\ \text{V} < V_{IN} < V_{UVLO}$		√
Thermal shutdown	$T_J > T_{JSD}$		√
Power supply removal	$V_{IN} < 0.7\ \text{V}$	√	

6.3.8 Noise Reduction and Soft-Start Capacitor (NR/SS)

A capacitor connected to this pin reduces the low frequency noise of the converter and sets the soft-start time. The larger the capacitor, the lower the noise and the longer the start-up time of the converter. A 470 nF capacitor is typically connected to this pin for a start-up time of 5 ms, although longer and shorter start-up times can be used. During soft start with a light load, the device skips switching pulses as needed to not discharge the output voltage. The device can start into a prebiased output voltage.

The device achieves low noise by adding an R-C filter to the reference voltage, as shown in [Section 6.2](#). During start-up, the NR/SS capacitor is charged with a constant current of 75 μA (typical) to 0.8 V. Larger NR/SS capacitors provide for lower low frequency noise. The maximum NR/SS cap is 3.3 μF for a start-up time of 35 ms. The minimum start-up time is set internally to 0.7 ms, which occurs when there is a small NR/SS capacitor or no NR/SS capacitor.

6.3.9 Current Limit and Short-Circuit Protection

The device is protected against short circuits and overcurrent. The switch current limit prevents the device from high inductor current and from drawing excessive current from the input voltage rail. Excessive current can occur with a shorted, saturated inductor or a heavy load, shorted output circuit condition. If the inductor current reaches the threshold I_{SWpeak} , the high-side MOSFET is turned off and the low-side MOSFET is turned on to ramp down the inductor current. The high-side MOSFET is turned on again only when the low-side current is below the low-side sourcing current limit $I_{SWvalley}$.

Due to internal propagation delay, the actual current can exceed the static current limit, especially if the input voltage is high and very small inductances are used. The dynamic current limit is calculated as follows in [Equation 1](#):

$$I_{PEAK}(typ) = I_{SWpeak} + \left(\frac{V_L}{L}\right) \times t_{PD} \quad (1)$$

where

- I_{SWpeak} is the static current limit, specified in [Electrical Characteristics](#)
- L is the inductance
- V_L is the voltage across the inductor ($V_{IN} - V_{OUT}$)
- t_{PD} is the internal propagation delay, typically 50 ns

The low-side MOSFET also contains a negative current limit to prevent excessive current from flowing back through the inductor to the input. If the low-side sinking current limit is exceeded, the low-side MOSFET is turned off. In this scenario, both MOSFETs are off until the start of the next cycle.

6.3.10 Thermal Shutdown

The device goes into thermal shutdown after the junction temperature exceeds typically 170°C with a 20°C hysteresis.

6.4 Device Functional Modes

6.4.1 Fixed Frequency Pulse Width Modulation

To minimize output voltage ripple, the device operates in fixed frequency PWM operation down to no load. The switching frequency of 1 MHz, 1.4 MHz, or 2.2 MHz is selected using the S-CONF pin.

6.4.2 Low Duty Cycle Operation

For high input voltages or low output voltages, the 70 ns minimum on-time limits the maximum input to output voltage difference and the switching frequency selected. When the minimum on-time is reached, the output voltage rises above the regulation point. Refer to [Table 7-2](#) for detailed design recommendations.

6.4.3 High Duty Cycle Operation (100% Duty Cycle)

The device offers a low input-to-output voltage differential by entering 100% duty cycle mode. In this mode, the high-side MOSFET switch is constantly turned on. The minimum input voltage to maintain output voltage regulation, depending on the load current and the output voltage level, is calculated as:

$$V_{IN(min)} = V_{OUT(min)} + I_{OUT} \times (R_{DS(ON)} + R_L) \quad (2)$$

where

- $V_{OUT(min)}$ is the minimum output voltage the load can accept

- I_{OUT} is the output current
- $R_{DS(ON)}$ is the $R_{DS(ON)}$ of the high-side MOSFET
- R_L is the DC resistance of the inductor used

To maintain fixed frequency switching, the device requires a minimum off-time of 50 ns (typical), 60 ns (maximum). If this limit is reached during a switching pulse, the device skips switching pulses to maintain output voltage regulation. If the input voltage decreases further, the device enters 100% mode.

6.4.4 Second Stage L-C Filter Compensation (Optional)

Most low-noise and low-ripple applications use a ferrite bead and bypass capacitor before the load. Using a second L-C filter is especially useful for low-noise and low-ripple applications with constant load current such as ADCs, DACs, and Jitter Cleaner. The second stage L-C filter is optional, and the device can be used without this filter. Without the filter, the device has a low output voltage noise of typically 16.9 μV_{RMS} with an output voltage ripple of 280 μV_{RMS} shown in [Figure 5-10](#). The second stage L-C filter attenuates the output voltage ripple by another approximately 30 dB shown in [Figure 5-12](#). To improve load regulation, the device can remote sense the output voltage after the second stage L-C filter and is internally compensated for the additional double pole generated by the L-C filter.

To keep the second stage L-C filter as small as possible, the internal compensation is optimized for a 10 nH to 50 nH inductance. A small ferrite bead or even a PCB trace provides sufficient inductance for output voltage ripple filtering. See [Section 7.2.2.4](#) for details.

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The TPS6291x family of devices are designed for low noise and low output voltage ripple.

7.2 Typical Applications

Figure 7-1. Typical Schematic

Table 7-1 shows the list of recommended components for most applications.

Table 7-1. List of Components

REFERENCE	PART NUMBER	DESCRIPTION	MANUFACTURER
TPS6291x	TPS6291x	Low noise and low ripple buck converter	Texas Instruments
L ₁	XGL4030-102MEC or XGL5030-102MEC	Inductor: 1.0 µH	Coilcraft
C _{IN}	C2012X7S1E106K125AC	Ceramic capacitors: 2 × 10 µF ±10% 25-V Ceramic Capacitor X7S 0805	TDK
C _{OUT}	C2012X7S1A226M125AC	Ceramic capacitors: 6 × 22 µF, 10 V, ±20%, X7S, 0805	TDK
L _f	BLE32SN120SN1L	Ferrite Bead	MuRata
C _f	C2012X7S1A226M125AC	Ceramic capacitor: 1 × 22 µF, 10 V, ±20%, X7S, 0805	TDK
C ₁	GRM155R71H222KA01D	Ceramic capacitor: 2 × 2200 pF, 50 V, ±10%, X7R, 0402	MuRata
C _{NR/SS} , C _{FF}		Ceramic capacitor	Standard
R1, R2, R3, R4		Resistor	Standard

7.2.1 Design Requirements

The external components have to fulfill the needs of the application, but also meet the stability criteria of the control loop of the device. The device is designed to work within a range of external components, and can be optimized for efficiency, output ripple, component count, or lowest 1/f noise.

Typical applications that have input voltages of $\leq 6\text{ V}$ use a $1\ \mu\text{H}$ inductor with a 2.2 MHz switching frequency. Applications that have input voltages $> 6\text{ V}$ can be optimized for efficiency using a $1\ \mu\text{H}$ inductor with a 1 MHz or 1.4 MHz switching frequency depending on the output voltage. Optimization for powering clock and PLL circuits that need a 3.3 V output use a $1\ \mu\text{H}$ inductor with 2.2 MHz switching frequency, minimizing output voltage ripple and low frequency noise.

For the application cases that are not found in [Table 7-2](#), there are two methods to design the TPS6291x circuit. [Section 7.2.2.1](#) uses WEBENCH to design the circuit automatically or the calculations in [Section 7.2.2.2](#) can be used instead.

Table 7-2. Typical Single L-C Filter Design Recommendations

DESIGN GOAL	V _{IN}	V _{OUT}	F _{sw}	INDUCTOR ⁽²⁾	OUTPUT CAPACITORS ⁽³⁾
Typical	12 V ⁽¹⁾	$\leq 1.4\text{ V}$ ⁽¹⁾	1 MHz	1 μH	6 × 22 μF , 10 V, 0805
Typical	12 V	1.4 V < V _{OUT} $\leq 2.2\text{ V}$	1.4 MHz	1 μH	6 × 22 μF , 10 V, 0805
Typical	12 V	> 2.2 V	2.2 MHz	1 μH	8 × 22 μF , 10 V, 0805
Typical	5 V	$\leq 3.3\text{ V}$	2.2 MHz	1 μH	6 × 22 μF , 10 V, 0805
Typical	5 V	> 3.3V	2.2 MHz	1 μH	8 × 22 μF , 10 V, 0805

(1) The maximum input to output voltage difference is limited by the device maximum minimum on-time of 70 ns. This limit is especially important for input voltages above 12 V or output voltages below 1 V. See [Section 7.2.2.1](#).

(2) For inductor part numbers, see [Table 7-4](#).

(3) For output capacitor part numbers, see [Table 7-5](#).

The second stage L-C filter is optional, as the device can be used without this filter to achieve below 20 μV_{RMS} noise typically. A second stage filter is added to provide additional attenuation of the output ripple voltage. The output voltage is sensed after the second L-C filter by connecting the FB resistors to the second stage L-C filter capacitor. This action provides remote sense, minimizing output voltage drop due to the ferrite bead. Refer to [Table 7-3](#) for second stage L-C filter recommendations based on the output voltage.

Table 7-3. Second Stage L-C (Ferrite Bead) Filter Design Recommendations

V _{OUT} (V)	FERRITE BEAD IMPEDANCE (AT 100 MHZ) ⁽²⁾	OUTPUT CAPACITORS ⁽¹⁾
$\leq 2.2\text{ V}$	8 to 20 Ω	1 × 22 μF , 10 V, 0805
> 2.2 V	8 to 20 Ω	2 × 22 μF , 10 V, 0805

(1) For output capacitor part numbers, see [Table 7-5](#).

(2) For second stage L-C filter part numbers, see [Table 7-6](#).

7.2.2 Detailed Design Procedure

If the specific design is not found in [Table 7-2](#), TI recommends WEBENCH to generate the design. Alternatively, follow the manual design procedure in [External Component Selection](#).

7.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TPS6291x device with the WEBENCH Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost.
3. Open the advanced tab to optimize for output voltage ripple.
4. After in a TPS6291x design, you can enable the second stage L-C filter and change other settings from the drop-down on the left.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

7.2.2.2 External Component Selection

7.2.2.2.1 Switching Frequency Selection

The switching frequency can be chosen to optimize efficiency (lower) or ripple noise (higher). Using the higher 1.4 MHz or 2.2 MHz setting increases the gain of the feedback loop and can result in lower output noise. However, additional considerations for minimum on-time and duty cycle must also be considered. First, calculate the duty cycle using Equation 3. Higher efficiency results in a shorter on-time, so a conservative approach is to use a higher efficiency than expected in the application.

$$D = \frac{V_{OUT}}{V_{IN} \times \eta} \quad (3)$$

where:

- η = estimated efficiency (use the value from the efficiency curves or 0.9 as an conservative assumption)

Then, calculate the on-time with 1 MHz, 1.4 Mhz, and 2.2 MHz using Equation 4. The on-time must always remain above the minimum on-time of 70 ns. Use the maximum input voltage and maximum efficiency to determine the minimum duty cycle, D_{min} . Use the maximum switching frequency for f_{SW} .

$$T_{ON} = \frac{D_{min}}{f_{SW_min}} \quad (4)$$

then

- If t_{ON_min} minimum < 70 ns with 2.2 MHz, use 1.4 MHz.
- If t_{ON_min} minimum < 70 ns with 1.4 MHz, use 1 MHz
- If t_{ON_min} minimum < 70 ns with 1 MHz, reduce the maximum input voltage.
- If t_{ON_min} minimum \geq 70 ns, use a lower frequency for highest efficiency, or the highest frequency for the lowest noise and ripple.

7.2.2.2.2 Inductor Selection for the First L-C Filter

The inductor must be rated for the appropriate saturation current. Equation 5 and Equation 6 calculate the maximum inductor current under static load conditions. The formula takes the converter efficiency into account. The calculation must be done for the maximum input voltage where the peak switch current is highest.

$$\Delta I_L = \frac{\frac{V_{OUT}}{\eta} \times \left(1 - \frac{V_{OUT}}{V_{IN} \times \eta}\right)}{f_{SW} \times L} \quad (5)$$

$$I_{PEAK} = I_{OUT} + \frac{\Delta I_L}{2} \quad (6)$$

where:

- f_{SW} is the switching frequency (1 MHz, 1.4 MHz, or 2.2 MHz)
- L = inductance
- η = estimated efficiency (use the value from the efficiency curves or 0.9 as an conservative assumption)

Note

The calculation must be done for the maximum input voltage of the application.

Calculating the maximum inductor current using the actual operating conditions gives the minimum saturation current. TI recommends a margin of 20% be added to cover for load transients during operation.

See [Table 7-4](#) for typical inductors.

Table 7-4. Inductor Selection

INDUCTOR VALUE	MANUFACTURER	PART NUMBER	SIZE (L × W × H IN mm)	ISAT/DCR (30% DROP)
1 μH	Coilcraft	XGL4020-102	4 × 4 × 2.1	8.8 A / 8.2 mΩ
1 μH	Coilcraft	XGL4030-102	4 × 4 × 3.1	10.3 A / 6.5 mΩ
1 μH	Würth Elektronik	74438356010	4.1 × 4.1 × 2.1	9 A / 12 mΩ
1 μH	Würth Elektronik	74438357010	4.1 × 4.1 × 3.1	9.6 / 11.6 mΩ
1 μH	Coilcraft	XGL5020-102	5 × 5 × 2.1	11.4 A / 7.5 mΩ
1 μH	Coilcraft	XGL5030-102	5 × 5 × 3.1	14 A / 4.8 mΩ

7.2.2.2.3 Output Capacitor Selection

The effective output capacitance can range from 80 μF (minimum) up to 400 μF (maximum) for a single L-C system design. When using a second L-C filter, the first L-C filter must have output capacitance between 80 μF and 160 μF, the second stage L-C filter (if used) must have at least 20 μF of capacitance, and the total capacitance for both L-C filters must be less than 400 μF. Load transient testing and measuring the bode plot are good ways to verify stability.

Note

For designs requiring cold temperature (< -10°C) operation, TI recommends to use a minimum effective output capacitance of 120 μF for a single L-C system design or within the first L-C filter when using a second L-C filter design.

TI recommends ceramic capacitors (X5R or X7R). Ceramic capacitors have a DC-Bias effect, which has a strong influence on the final effective capacitance. Choose the right capacitor carefully in combination with considering the package size and voltage rating. The ESR and ESL of the output capacitor are also important considerations in selecting the output capacitors for low noise applications. Smaller package sizes typically have lower ESL and ESR. TI recommends 0805 or smaller packages, as long as the packages provide the required capacitance and voltage rating for stable operation. [Table 7-5](#) lists recommended output capacitors.

Table 7-5. Recommended Output Capacitors

CAPACITOR TYPE	CAPACITOR VALUE	MANUFACTURER	VOLTAGE (V)	PACKAGE
Bulk Capacitor	22 μF, X7S	TDK C2012X7S1A226M125AC	10	0805
Bulk Capacitor	47 μF, X7R	Murata GRM32ER71A476ME15L	10	1210

7.2.2.2.4 Ferrite Bead Selection for Second L-C Filter

Using a ferrite bead for the second stage L-C filter minimizes the external component count because most of the noise sensitive circuits use a RF bead for high frequency attenuation as a default component at their inputs.

Make sure to select a ferrite bead with sufficiently high inductance at full load, and with low DC resistance (below 10 mΩ) to keep the converter efficiency as high as possible. The ferrite bead inductance decreases with increased load current. Therefore, the ferrite bead must have a current rating much higher than the desired load current.

The recommendation is to choose a ferrite bead with an impedance of 8 Ω to 20 Ω at 100 MHz. Ferrite beads can be used in parallel if higher current is needed, however this can halve the inductance and filtering. Refer to [Table 7-6](#) for possible ferrite beads.

Table 7-6. Recommended Ferrite Beads

PART NUMBER	MANUFACTURER	SIZE	IMPEDANCE AT 100 MHz	INDUCTANCE AT 100 MHz (CALCULATED)	DC RESISTANCE	CURRENT RATING
BLE18PS080SN1	MuRata	0603	8.5 Ω	13.5 nH	4 mΩ	5 A
BLE32SN120SN1L	MuRata	1210	12 Ω	18 nH	0.78 mΩ	20 A
74279221100	Würth Elektronik	1206	10 Ω	15.9 nH	3 mΩ	10.5 A
7427922808	Würth Electronik	0603	8 Ω	12.7 nH	5 mΩ	9.5 A

The internal compensation has been designed to be stable with up to 50 nH of inductance in the second stage filter. To achieve low ripple, the second L-C filter requires only 5-nH to 10-nH inductance. The inductance can be estimated from the ferrite bead impedance specification at 100 MHz, with the assumption that the inductance is similar at the selected converter switching frequency of 1 MHz, 1.4 MHz, or 2.2 MHz, and can be verified through tools available on some manufacturer websites. Use [Equation 7](#) to calculate the inductance of a ferrite bead:

$$L = \frac{Z}{2\pi \times f} \quad (7)$$

where

- Z is the impedance of the ferrite bead in ohms at the specified frequency (usually 100 MHz)
- f is the specified frequency (usually 100 MHz)

7.2.2.2.5 Input Capacitor Selection

For the best output and input voltage filtering, TI recommends X5R or X7R ceramic capacitors. The input bulk capacitor minimizes input voltage ripple, suppresses input voltage spikes, and provides a stable system rail for the device. TI recommends a 10-μF or larger input capacitor. Having two in parallel further improves the input voltage ripple filtering, minimizing noise coupling into adjacent circuits. The voltage rating of the cap must also be taken into consideration, and must provide the required 5-μF minimum effective capacitance after DC bias derating.

In addition to the bulk input cap, a smaller cap must be placed directly from the VIN pin to the PGND pin to minimize input loop parasitic inductance, thereby minimizing the high frequency noise of the device. The input cap placement affects the output noise, so care needs to be taken in placing both the bulk cap and bypass caps as shown in [Section 7.4.2](#). [Table 7-7](#) lists recommended input capacitors.

Table 7-7. Recommended Input Capacitors

INPUT CAP TYPE	CAPACITOR VALUE	MANUFACTURER	VOLTAGE RATING (V)	PACKAGE SIZE
Bulk Cap	10 μF, X7S	TDK C2012X7S1E106K125AC	25	0805
Bypass Cap	2.2 nF, X7R	Murata GRM155R71E222KA01D	25	0402

7.2.2.2.6 Setting the Output Voltage

Choose resistors R1 and R2 to set the output voltage within a range of 0.8 V to 5.5 V, according to [Equation 8](#). To keep the feedback network robust from noise, and to reduce the self-generated noise of resistors, set R2 equal to or lower than 5 kΩ. Lower values of FB resistors achieve better noise immunity, and lower light load efficiency, as explained in the [Design Considerations for a Resistive Feedback Divider in a DC/DC Converter analog design journal](#).

$$R_1 = R_2 \times \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) = R_2 \times \left(\frac{V_{OUT}}{0.8V} - 1 \right) \quad (8)$$

VOUT (V)	R1	R2
0.9	604 Ω	4.87 kΩ
1.0	1.21 kΩ	4.87 kΩ
1.2	2.43 kΩ	4.87 kΩ
1.8	6.04 kΩ	4.87 kΩ
2.5	10.4 kΩ	4.87 kΩ
3.3	15.2 kΩ	4.87 kΩ
5	25.5 kΩ	4.87 kΩ

A feedforward capacitor (C_{FF}) is not required for proper operation, but can further improve output noise. However, care must be taken in choosing the C_{FF} because the power-good (PG) function can not be valid with a large C_{FF} during start-up, and can cause spurious triggering of the PG pin during a large load transient. Refer to the [Pros and Cons Using a Feedforward Capacitor with a Low Dropout Regulator application report](#) for a discussion of the pros and cons of using a feedforward capacitor.

7.2.2.2.7 Bootstrap Capacitor Selection

A 0.1-μF ceramic capacitor must be connected between the BOOT and SW pins for proper operation. The capacitor must be rated for at least 10 V to minimize DC bias derating.

A resistor must be added in series with the BOOT capacitor to slow down the turn-on of the high-side MOSFET and rising edge overshoot on the SW pin for applications with input voltage greater than 13.5 V, which comes with the trade off of more power loss and lower efficiency. As a best practice, include a 0-Ω placeholder in all prototype designs in case parasitic inductance in the PCB layout results in more voltage overshoot at the SW pin than is normal, which helps keep the voltage within the ratings of the device and reduces the high frequency noise on the SW node. The recommended BOOT resistor value to decrease the SW pin overshoot is 2.2 Ω.

7.2.2.2.8 NR/SS Capacitor Selection

As described in [Section 6.3.8](#), the NR/SS cap affects both the total noise and the soft-start time. The recommended value for a 5-ms soft-start time and good noise performance is 470 nF. The maximum NR/SS cap is 3.3 μF for a start-up time of 35 ms. Values greater than 1 μF have minimal improvement in noise performance. Use [Equation 9](#) and [Equation 10](#) to calculate the soft-start time based on desired soft-start time or the chosen capacitor value.

$$t_{ss} (s) = \frac{C_{NRSS} \times 0.8V}{I_{NRSS}} \quad (9)$$

$$C_{NRSS} (F) = \frac{I_{NRSS} \times t_{ss}}{0.8V} \quad (10)$$

7.2.3 Application Curves

$V_{IN} = 12\text{ V}$, $V_{OUT} = 1.2\text{ V}$, $T_A = 25^\circ\text{C}$, BOM = [Table 7-1](#)

7.3 Power Supply Recommendations

The power supply to the TPS6291x must have a current rating according to the supply voltage, output voltage, and output current of the TPS6291x.

7.4 Layout

7.4.1 Layout Guidelines

A proper layout is critical for the operation of any switched mode power supply, especially at high switching frequencies. Therefore, the PCB layout of the TPS6291x demands careful attention to make sure of best performance. A poor layout can lead to issues like bad line and load regulation, instability, increased EMI radiation, and noise sensitivity. Refer to the [Five Steps to a Great PCB Layout for a Step-Down Converter analog design journal](#) for a detailed discussion of general best practices. Specific recommendations for the device are listed below.

- Place the input capacitor or capacitors as close as possible to the VIN and PGND pins of the device. This placement is the most critical component placement. Route the input capacitors directly to the VIN and PGND pins avoiding vias.
- Place the inductor close to the SW pin. Minimize the copper area at the switch node.
- Place the output capacitor ground close to the PGND pin and route directly avoiding vias. Minimize the length of the connection from the inductor to the output capacitor.
- Connect the VO pin directly to the first output capacitor, C_{OUT} .
- Connect sensitive traces, such as the connections to the NR/SS, VO, and FB pins with short traces and be routed away from any noise source, such as the SW pin.
- Connect the PSNS pin directly to the system GND plane with a via.
- Place the second L-C filter, L_f and C_f , near the load to reduce any radiated coupling around the second L-C filter
- Avoid placing the ferrite bead in the keep out region as shown in [Figure 7-23](#)
- Place the FB resistors, R1 and R2, close to the FB pin and route the VOUT connection from R1 to the load as a remote sense trace. If a second L-C filter is used, this connection must be made after L_f .
- See the recommended layout implemented on the EVM and shown in the EVM user's guide, [TPS62916EVM Evaluation Module](#), as well as in [Figure 7-23](#).

7.4.2 Layout Example

Figure 7-22. Recommended Layout for Single L-C Filter

Note

The start winding of the inductor, as shown in the figures as a black dot, must be connected to the DC/DC converter switch pin, SW, to minimize capacitive coupling to the surrounding area.

Note

The red dot indicates where the feedback sense must be placed for the best DC regulation. For a single L-C configuration, the feedback sense is placed near the VOUT capacitors. For a second L-C filter design, the feedback sense is placed near the load after the VOUT_FILTER capacitors.

Figure 7-23. Recommended Layout for Design with Second L-C Filter

Note

The ferrite bead can be placed closer to the device as long as it is *not* placed between the inductor and output capacitors. Placing the ferrite bead further away avoids capacitive and electromagnetic coupling to the output of the ferrite bead. If the ferrite bead is placed in the keep out area, the filtering effect of the ferrite bead is greatly reduced. If the ferrite bead is routed through a via to the back side of the board, make sure adequate ground plane between the layers if the ferrite bead are in this area.

8 Device and Documentation Support

8.1 Device Support

8.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

8.1.2 Development Support

8.1.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TPS6291x device with the WEBENCH Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost.
3. Open the advanced tab to optimize for output voltage ripple.
4. After in a TPS6291x design, you can enable the second stage L-C filter and change other settings from the drop-down on the left.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (April 2024) to Revision C (June 2024) Page

- Deleted the Advanced Information note from TPS62918 and TPS62914..... 1

Changes from Revision A (December 2023) to Revision B (April 2024) Page

- Changed document status from Advance Information to Production Data 1

Changes from Revision * (November 2023) to Revision A (December 2023) Page

- Deleted the preview note from TPS62918 and TPS62914..... 1

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
PTPS62914RPYR	ACTIVE	VQFN-HR	RPY	14	3000	TBD	Call TI	Call TI	-40 to 150		Samples
PTPS62918RPYR	ACTIVE	VQFN-HR	RPY	14	3000	TBD	Call TI	Call TI	-40 to 150		Samples
TPS62916RPYR	ACTIVE	VQFN-HR	RPY	14	3000	RoHS & Green	SN	Level-2-260C-1 YEAR	-40 to 150	T62916	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.
