Reset Source: ecap_rst_mod_g_rst_n

Table 3-566. ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	APWMPOL	R/W	0h	APWM output polarity select. This is applicable only in APWM operating mode. Reset Source: ecap_rst_mod_g_rst_n 1 Ecap_output_active_l Output is active low (Compare ow value defines low time)
9	CAP_APWM	R/W	0h	CAP/APWM operating mode select Reset Source: ecap_rst_mod_g_rst_n 1 Ecap_module_APWM ECAP module operates in APWM mode. This mode forces the following configuration: - Resets TSCTR on CTR = PRD event (period boundary) - Permits shadow loading on CAP1 and 2 registers - Disables loading of time-stamps into CAP1-4 registers - CAPx/APWMx pin operates as a APWM output
8	SWSYNC	R/W1TS	0h	Software-forced Counter [TSCTR] Synchronizer. This provides the user a method to generate a synchronization pulse through software. In APWM mode, the synchronization pulse can also be sourced from the CTR = PRD event. Reset Source: ecap_rst_mod_g_rst_n 1 Ecap_write_TSCTR Writing a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to a zero. Note: Selection CTR = PRD is meaningful only in APWM mode; however, you can choose it in CAP mode if you find doing so useful.
7:6	SYNCO_SEL	R/W	0h	Sync-Out Select Reset Source: ecap_rst_mod_g_rst_n 3 Ecap_disable_sync_ou Disable sync out signal t 1 Ecap_CTR_PRD_to_sync Select CTR = PRD event to be out the sync-out signal
5	SYNCI_EN	R/W	0h	Counter [TSCTR] Sync-In select mode Reset Source: ecap_rst_mod_g_rst_n 1 Ecap_enable_counter_ Enable counter (TSCTR) to be register loaded from CTRPHS register upon either a SYNCI signal or a S/W force event.
4	TSCTRSTOP	R/W	0h	Time Stamp [TSCTR] Counter Stop [freeze] Control Reset Source: ecap_rst_mod_g_rst_n 1 Ecap_TSCTR_free_runn TSCTR free-running ing
3	REARM	R/W1TS	0h	Re-Arming Control. Note: The re-arm function is valid in one shot or continuous mode Reset Source: ecap_rst_mod_g_rst_n 1 Ecap_arms_oneshot Arms the one-shot sequence as follows: (1) Resets the Mod4 counter to zero (2) Unfreezes the Mod4 counter (3) Enables capture register loads
2:1	STOP_WRAP	R/W	3h	Stop value for one-shot mode. This is the number [between 1-4] of captures allowed to occur before the CAP[1-4] registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number [between 1-4] of the capture register in which the circular buffer wraps around and starts again. Notes: STOP_WRAP is compared to Mod4 counter and, when equal, 2 actions occur: - Mod4 counter is stopped [frozen] - Capture register loads are inhibited In one-shot mode, further interrupt events are blocked until re-armed. Reset Source: ecap_rst_mod_g_rst_n 3 Ecap_StopEvent4_Wrap Stop after Capture Event 4 in Event2 one-shot mode Wrap after Capture Event 4 in continuous mode. 2 Ecap_StopEvent3_Wrap Stop after Capture Event 3 in Event2 one-shot mode Wrap after Capture Event 3 in continuous mode. 1 Ecap_StopEvent2_Wrap Stop after Capture Event 2 in Event2 one-shot mode Wrap after Capture Event 2 in continuous mode.
0	CONT_ONESHT	R/W	0h	Continuous or one-shot mode control [applicable only in capture mode] Reset Source: ecap_rst_mod_g_rst_n 1 Ecap_opp_one Operate in one-Shot mode

3.8.10 MEM_ECEINT Registers

3.8.10.1 MEM_ECEINT Register (Offset = 2Ch) [reset = 0h]

Short Description: The interrupt enable bits

Long Description: The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ ECCLR registers. The proper procedure for configuring peripheral modes and interrupts is as follows: - Disable global interrupts - Stop eCAP counter - Disable eCAP interrupts - Configure peripheral registers - Clear spurious eCAP interrupt flags - Enable eCAP interrupts - Start eCAP counter - Enable global interrupts

Bit	Field	Type	Reset	Description
5:4	CALIB_INPUT_SEL	R/W	0h	Select bit for calibration input, can be used to get fault coverage using these inputs 00 CAPIN is one of 128 inputs selected by INPUTSEL 01 CAPIN is connected to CAPIN_MEMMAP_SOURCE 10 CAPIN is internally generated signal waveform with 8*HRCLK cycle high and 8*HRCLK cycle low, used for linearity check of capture delay line 1 11 CAPIN is internally generated signal waveform with 8*HRCLK cycle high and 8*HRCLK cycle low, delayed by half HRCLK, used for linearity check of capture delay line 2 Reset Source: ecap_rst_mod_g_rst_n
3	RESERVED_1	R	0h	Reserved Reset Source: ecap_rst_mod_g_rst_n
2	CAPIN_MMAP_SOURCE	R/W	0h	Memory mapped CAPIN source Note : select CALIN source first, it may happen that you may see interrupt if MMAP source is different from current value of CAPIN. This is debug feature hence no additional HW is necessary to prevent this. Reset Source: ecap_rst_mod_g_rst_n
1	DELAYRESETDLINE	R/W	0h	Controls the reset delayline timing 0 reset is forced on next falling edge of HRCLK [1/2 cycle after capture] 1 reset is applied a cycle later [1 1/2 cycles after capture] Reset Source: ecap_rst_mod_g_rst_n
0	DISABLEINVSEL	R/W	0h	Disable INVSEL Logic: 0 State machine controls inversion on input signal 1 CAPIN signal propagated into delay line without inversion, this means only rising edges can be measured Reset Source: ecap_rst_mod_g_rst_n

Table 3-682. TBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events 00: Stop after the next time-base counter increment or decrement 01: Stop when counter completes a whole cycle: - Up-count mode: stop when the time-base counter = period [TBCTR = TBPRD] - Down-count mode: stop when the time-base counter = 0x00 [TBCTR = 0x00] - Up-down-count mode: stop when the time-base counter = 0x00 [TBCTR = 0x00] 1x: Free run Reset Source: epwm_rst_mod_g_rst_n
13	PHSDIR	R/W	0h	Phase Direction Bit This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter [TBCTR] will count after a synchronization event occurs and a new phase value is loaded from the phase [TBPHS] register. This is irrespective of the direction of the counter before the synchronization event.. In the up-count and down-count modes this bit is ignored. 0: Count down after the synchronization event. 1: Count up after the synchronization event. Reset Source: epwm_rst_mod_g_rst_n
12:10	CLKDIV	R/W	0h	Time Base Clock Pre-Scale Bits These bits select the time base clock pre-scale value [TBCLK = EPWMCLK/[HSPCLKDIV * CLKDIV]: 000: /1 [default on reset] 001: /2 010: /4 011: /8 100: /16 101: /32 110: /64 111: /128 Reset Source: epwm_rst_mod_g_rst_n
9:7	HSPCLKDIV	R/W	1h	High Speed Time Base Clock Pre-Scale Bits These bits determine part of the time-base clock prescale value. TBCLK = EPWMCLK / [HSPCLKDIV x CLKDIV]. This divisor emulates the HSPCLK in the TMS320x281x system as used on the Event Manager [EV] peripheral. 000: /1 001: /2 [default on reset] 010: /4 011: /6 100: /8 101: /10 110: /12 111: /14 Reset Source: epwm_rst_mod_g_rst_n
6	SWFSYNC	R/W1TS	0h	Software Forced Sync Pulse 0: Writing a 0 has no effect and reads always return a 0. 1: Writing a 1 forces a one-time synchronization pulse to be generated. SWFSYNC can be enabled to affect EPWMxSYNCO by setting the EPWMSYNCOUTEN.SWEN bit. Reset Source: epwm_rst_mod_g_rst_n
5:4	RESERVED_1	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
3	PRDLD	R/W	0h	Active Period Reg Load from Shadow Select 0: The period register [TBPRD] is loaded from its shadow register when the time-base counter, TBCTR, is equal to zero and/or a sync event as determined by the TBCTL2[PRDLDSYNC] bit. A write/read to the TBPRD register accesses the shadow register. 1: Immediate Mode [Shadow register bypassed]: A write or read to the TBPRD register accesses the active register. Reset Source: epwm_rst_mod_g_rst_n
2	PHSEN	R/W	0h	Counter Reg Load from Phase Reg Enable 0: Do not load the time-base counter [TBCTR] from the time-base phase register [TBPHS]. 1: Allow Counter to be loaded from the Phase register [TBPHS] and shadow to active load events when an EPWMxSYNCI input signal occurs or a software-forced sync signal, see bit 6. Reset Source: epwm_rst_mod_g_rst_n

Table 3-682. TBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1:0	CTRMODE	R/W	3h	Counter Mode The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 00: Up-count mode 01: Down-count mode 10: Up-down count mode 11: Freeze counter operation [default on reset] Reset Source: epwm_rst_mod_g_rst_n

Bit	Field	Type	Reset	Description
15:3	RESERVED_1	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
2	CTRMAX	R/W1TC	0h	Time-Base Counter Max Latched Status Bit 0: Reading a 0 indicates the time-base counter never reached its maximum value. Writing a 0 will have no effect. 1: Reading a 1 on this bit indicates that the time-base counter reached the max value 0xFFFF. Writing a 1 to this bit will clear the latched event. Reset Source: epwm_rst_mod_g_rst_n
1	SYNCI	R/W1TC	0h	Input Synchronization Latched Status Bit 0: Writing a 0 will have no effect. Reading a 0 indicates no external synchronization event has occurred. 1: Reading a 1 on this bit indicates that an external synchronization event has occurred [EPWMxSYNCI]. Writing a 1 to this bit will clear the latched event. Reset Source: epwm_rst_mod_g_rst_n
0	CTRDIR	R	1h	Time Base Counter Direction Status Bit 0: Time-Base Counter is currently counting down. 1: Time-Base Counter is currently counting up. Note: This bit is only valid when the counter is not frozen. Reset Source: epwm_rst_mod_g_rst_n

Bit	Field	Type	Reset	Description
15:8	RESERVED_2	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
7	RESERVED_1	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
6	DCBEVT1EN	R/W	0h	This bit enables the DCBEVT1.sync event to set the EPWMxSYNCO signal. 0 Disabled 1 The EPWMxSYNCO signal is pulsed for one PWM clock period upon a DCBEVT1.sync event Reset Source: epwm_rst_mod_g_rst_n
5	DCAEVT1EN	R/W	0h	This bit enables the DCAEVT1.sync event to set the EPWMxSYNCOUT signal. 0 Disabled 1 The EPWMxSYNCOUT signal is pulsed for one PWM clock period upon a DCAEVT1.sync event Reset Source: epwm_rst_mod_g_rst_n
4	CMPDEN	R/W	0h	This bit enables the TBCTR = CMPD event to set the EPWMxSYNCO signal. 0 Disabled 1 The EPWMxSYNCO signal is pulsed for one PWM clock period upon a time-base counter equal to counter compare D event [TBCTR = CMPD] Reset Source: epwm_rst_mod_g_rst_n
3	CMPCEN	R/W	0h	This bit enables the TBCTR = CMPC event to set the EPWMxSYNCO signal. 0 Disabled 1 The EPWMxSYNCO signal is pulsed for one PWM clock period upon a time-base counter equal to counter compare C event [TBCTR = CMPC] Reset Source: epwm_rst_mod_g_rst_n
2	CMPBEN	R/W	0h	This bit enables the TBCTR = CMPB event to set the EPWMxSYNCO signal. 0 Disabled 1 The EPWMxSYNCO signal is pulsed for one PWM clock period upon a time-base counter equal to counter compare B event [TBCTR = CMPB] Reset Source: epwm_rst_mod_g_rst_n
1	ZEROEN	R/W	0h	This bit enables the TBCTR = 0x0000 event to set the EPWMxSYNCOUT signal. 0 Disabled 1 The EPWMxSYNCOUT signal is pulsed for one PWM clock period upon the value of TBCTR changing to 0x0000 Reset Source: epwm_rst_mod_g_rst_n
0	SWEN	R/W	1h	This bit enables the TBCTL.SWFSYNC bit to set the EPWMxSYNCO signal. 0 Disabled 1 The EPWMxSYNCO signal is pulsed for one PWM clock period when the TBCTL.SWFSYNC bit is set Reset Source: epwm_rst_mod_g_rst_n

Table 3-696. CMPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	LINKDUTYHR	R/W	0h	CMPAHR, CMPBHR Register Linking: 0 PWMA and PWMB outputs generated independently and CMPAHR, CMPBHR are independent values as on Type-4 1 When this bit is set CMPBHR assumes the same value as CMPAHR. This is typically used in complimentary PWM output generation [Section 7 details of the operation] Reset Source: epwm_rst_mod_g_rst_n
14	RESERVED_3	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
13:12	LOADBSYNC	R/W	0h	Shadow to Active CMPB Register Load on SYNC event 00: Shadow to Active Load of CMPB:CMPBHR occurs according to LOADBMODE [bits 1,0] [same as legacy] 01: Shadow to Active Load of CMPB:CMPBHR occurs both according to LOADBMODE bits and when SYNC occurs 10: Shadow to Active Load of CMPB:CMPBHR occurs only when a SYNC is received 11: Reserved Note: This bit is valid only if CMPCTL[SHDWBMODE] = 0. Reset Source: epwm_rst_mod_g_rst_n
11:10	LOADASYNC	R/W	0h	Shadow to Active CMPA Register Load on SYNC event 00: Shadow to Active Load of CMPA:CMPAHR occurs according to LOADAMODE [bits 1,0] [same as legacy] 01: Shadow to Active Load of CMPA:CMPAHR occurs both according to LOADAMODE bits and when SYNC occurs 10: Shadow to Active Load of CMPA:CMPAHR occurs only when a SYNC is received 11: Reserved Note: This bit is valid only if CMPCTL[SHDWAMODE] = 0. Reset Source: epwm_rst_mod_g_rst_n
9	SHDWBFULL	R	0h	Counter-compare B [CMPB] Shadow Register Full Status Flag This bit self clears once a loadstrobe occurs. 0: CMPB shadow FIFO not full yet 1: Indicates the CMPB shadow FIFO is full a CPU write will overwrite current shadow value Reset Source: epwm_rst_mod_g_rst_n
8	SHDWAFULL	R	0h	Counter-compare A [CMPA] Shadow Register Full Status Flag The flag bit is set when a 32-bit write to CMPA:CMPAHR register or a 16-bit write to CMPA register is made. A 16-bit write to CMPAHR register will not affect the flag. This bit self clears once a load-strobe occurs. 0: CMPA shadow FIFO not full yet 1: Indicates the CMPA shadow FIFO is full, a CPU write will overwrite the current shadow value Reset Source: epwm_rst_mod_g_rst_n
7	RESERVED_2	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
6	SHDWBMODE	R/W	0h	Counter-compare B [CMPB] Register Operating Mode 0: Shadow mode. Operates as a double buffer. All writes via the CPU access the shadow register 1: Immediate mode. Only the active compare B register is used. All writes and reads directly access the active register for immediate compare action Reset Source: epwm_rst_mod_g_rst_n
5	RESERVED_1	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit 0: Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1: Half cycle clocking enabled. The dead-band counters are clocked at TBCLK*2. Reset Source: epwm_rst_mod_g_rst_n
14	DEDB_MODE	R/W	0h	Dead Band Dual-Edge B Mode Control [S8 switch] 0: Rising edge delay applied to InA/InB as selected by S4 switch [IN-MODE bits] on A signal path only. Falling edge delay applied to InA/InB as selected by S5 switch [INMODE bits] on B signal path only. 1: Rising edge delay and falling edge delay applied to source selected by S4 switch [INMODE bits] and output to B signal path only. Note: When this bit is set to 1, user should always either set OUT_MODE bits such that Apath = InA OR OUTSWAP bits such that OutA=Bpath otherwise, OutA will be invalid. 13:12	OUTSWAP	R/W	0h	Dead Band Output Swap Control Bit 13 controls the S6 switch and bit 12 controls the S7 switch. 00: OutA and OutB signals are as defined by OUT-MODE bits. 01: OutA = A-path as defined by OUT-MODE bits. OutB = A-path as defined by OUT-MODE bits [rising edge delay or delay-bypassed A signal path]. 10: OutA = B-path as defined by OUT-MODE bits [falling edge delay or delay-bypassed B signal path]. OutB = B-path as defined by OUT-MODE bits. 11: OutA = B-path as defined by OUT-MODE bits [falling edge delay or delay-bypassed B signal path]. OutB = A-path as defined by OUT-MODE bits [rising edge delay or delay-bypassed A signal path]. Reset Source: epwm_rst_mod_g_rst_n
11	SHDWDBFEDMODE	R/W	0h	FED Dead-Band Load Mode 0: Immediate mode. Only the active DBFED register is used. All writes/reads via the CPU directly access the active register for immediate "FED dead-band action." 1: Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode [for compatibility with legacy]. Reset Source: epwm_rst_mod_g_rst_n
10	SHDWDBREDMODE	R/W	0h	RED Dead-Band Load Mode 0: Immediate mode. Only the active DBRED register is used. All writes/reads via the CPU directly access the active register for immediate "RED dead-band action." 1: Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode [for compatibility with legacy]. Reset Source: epwm_rst_mod_g_rst_n

7:6	LOADREDMODE	R/W	0h	Active DBRED Load from Shadow Select Mode 00: Load on Counter = 0 [CNT_eq] 01: Load on Counter = Period [PRD_eq] 10: Load on either Counter = 0, or Counter = Period 11: Freeze [no loads possible] Note: has no effect in Immediate mode. Reset Source: epwm_rst_mod_g_rst_n

Table 3-700. DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5:4	IN_MODE	R/W	0h	Dead-Band Input Mode Control Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays. 00: EPWMxA In [from the action-qualifier] is the source for both falling-edge and rising-edge delay. 01: EPWMxB In [from the action-qualifier] is the source for rising-edge delayed signal. EPWMxA In [from the action-qualifier] is the source for falling-edge delayed signal. 10: EPWMxA In [from the action-qualifier] is the source for rising-edge delayed signal. EPWMxB In [from the action-qualifier] is the source for falling-edge delayed signal. 11: EPWMxB In [from the action-qualifier] is the source for both rising-edge delay and falling-edge delayed signal. Reset Source: epwm_rst_mod_g_rst_n
3:2	POLSEL	R/W	0h	Polarity Select Control Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 1,1 and DBCTL[IN_MODE] = 0x0. Other enhanced modes are also possible, but not regarded as typical usage modes. 00: Active high [AH] mode. Neither EPWMxA nor EPWMxB is inverted [default]. 01: Active low complementary [ALC] mode. EPWMxA is inverted. 10: Active high complementary [AHC]. EPWMxB is inverted. 11: Active low [AL] mode. Both EPWMxA and EPWMxB are inverted. Reset Source: epwm_rst_mod_g_rst_n
1:0	OUT_MODE	R/W	0h	Dead-Band Output Mode Control Bit 1 controls the S1 switch and bit 0 controls the S0 switch. 00: DBM is fully disabled or by-passed. In this mode the POLSEL and IN-MODE bits have no effect. 01: Apath = InA [delay is by-passed for A signal path] Bpath = FED [Falling Edge Delay in B signal path] 10: Apath = RED [Rising Edge Delay in A signal path] Bpath = InB [delay is by-passed for B signal path] 11: DBM is fully enabled [i.e. both RED and FED active] Reset Source: epwm_rst_mod_g_rst_n

Note: Valley capture sequence triggered by the selected event in this register field. Once the chosen event occurs the capture sequence is armed. Event captures occur based of the event chosen in DCFCTL[SRCSEL] register. Note: Same event may not be chosen in both DCFCTL[SRCSEL] and VCAPCTL[TRIGSEL] registers. Note: Once the chosen event in VCAPCTL[TRIGSEL] occurs, irrespective of the current capture status, capture sequence is retriggered. Reset Source: epwm_rst_mod_g_rst_n

Table 3-714. HRCNFG Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	LINESEL	R/W	0h	Delay Line Selection Bits: Selects which of the 4 delay lines for a particular ePWM/EPWM module to send to CALIN for calibration. Reset Source: epwm_rst_mod_g_rst_n
13	RESERVED_1	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
12:11	HRLOADB	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPBHR shadow value into the active register. 00: Load on CTR = Zero: Time-base counter equal to zero [TBCTR = 0x0000] 01: Load on CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 10: Load on either CTR = Zero or CTR = PRD 11: Load on CMPB_EQ [Translator Event CMPB-3] Reset Source: epwm_rst_mod_g_rst_n
10	CTLMODEB	R/W	0h	Control Mode Bits Selects the register [CMP/TBPRD or TBPHS] that controls the MEP: 0: CMPBHR[8] or TBPRDHR[8] Register controls the edge position [i.e., this is duty or period control mode]. [Default on Reset] 1: TBPHSHR[8] Register controls the edge position [i.e., this is phase control mode]. Reset Source: epwm_rst_mod_g_rst_n
9:8	EDGMODEB	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position [MEP] logic: 00: HRPWM capability is disabled [default on reset] 01: MEP control of rising edge [CMPBHR] 10: MEP control of falling edge [CMPBHR] 11: MEP control of both edges [TBPHSHR or TBPRDHR] Reset Source: epwm_rst_mod_g_rst_n
7	SWAPAB	R/W	0h	Swap ePWM A & B Output Signals This bit enables the swapping of the A & B signal outputs. The selection is as follows: 0: ePWMxA and ePWMxB outputs are unchanged. 1: ePWMxA signal appears on ePWMxB output and ePWMxB signal appears on ePWMxA output. Reset Source: epwm_rst_mod_g_rst_n
6	AUTOCONV	R/W	0h	Auto Convert Delay Line Value Selects whether the fractional duty cycle/period/phase in the CMPAHR/TBPRDHR/TBPHSHR register is automatically scaled by the MEP scale factor in the HRMSTEP register or manually scaled by calculations in application software. The SFO library function automatically updates the HRMSTEP register with the appropriate MEP scale factor. 0: Automatic HRMSTEP scaling is disabled. 1: Automatic HRMSTEP scaling is enabled. If application software is manually scaling the fractional duty cycle, or phase [i.e. software sets CMPAHR = [fraction[PWMduty * PWMperiod] * MEP Scale Factor]<<8 + 0x080 for duty cycle], then this mode must be disabled. Reset Source: epwm_rst_mod_g_rst_n
5	SELOUTB	R/W	0h	EPWMxB Output Select Bit This bit selects which signal is output on the ePWMxB channel output. The inversion will take the high resolution mode into account and the inverted signal will contain any high resolution modification. The inversion takes place as the last step in modifying the ePWMxB signal. 0: ePWMxB output is normal. 1: ePWMxB output is inverted version of ePWMxA signal. Reset Source: epwm_rst_mod_g_rst_n

Bit	Field	Type	Reset	Description
4:3	HRLOAD	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPAHR shadow value into the active register. 00: Load on CTR = Zero: Time-base counter equal to zero [TBCTR = 0x0000] 01: Load on CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 10: Load on either CTR = Zero or CTR = PRD 11: Load on CMPA_EQ [Translator Event CMPA-3] Reset Source: epwm_rst_mod_g_rst_n
2	CTLMODE	R/W	0h	Control Mode Bits Selects the register [CMP/TBPRD or TBPHS] that controls the MEP: 0: CMPAHR[8] or TBPRDHR[8] Register controls the edge position [i.e., this is duty or period control mode]. [Default on Reset] 1: TBPHSHR[8] Register controls the edge position [i.e., this is phase control mode]. Reset Source: epwm_rst_mod_g_rst_n
1:0	EDGMODE	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position [MEP] logic: 00: HRPWM capability is disabled [default on reset] 01: MEP control of rising edge [CMPAHR] 10: MEP control of falling edge [CMPAHR] 11: MEP control of both edges [TBPHSHR or TBPRDHR] Reset Source: epwm_rst_mod_g_rst_n

Bit	Field	Type	Reset	Description
15	NOBYPASS	R/W	0h	No Bypass Delay Line Update Bit: For internal test purposes, this bit disables the 1 SYSCLK cycle bypass before delay line is updated. Reset Source: epwm_rst_mod_g_rst_n
14	DELLOADFRC	R/W	0h	Delay Line Load Software Force: For internal test purposes, software force generates a pulse which forces a delay line update [similar to PRD_eq/CNT_zero strobe]. Reset Source: epwm_rst_mod_g_rst_n
13:6	RESERVED_1	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
5:4	CTLMODEDBFED	R/W	0h	Shadow Mode Bit - selection should match DBCTL[LOADFEDMODE] Selects the time event that loads the DBFEDHR shadow value into the active register. 00 Load on CTR = Zero: Time-base counter equal to zero [TBCTR = 0x0000] 01 Load on CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 10 Load on either CTR = Zero or CTR = PRD 11 Reserved Reset Source: epwm_rst_mod_g_rst_n
3:2	CTLMODEDBRED	R/W	0h	Shadow Mode Bit - selection should match DBCTL[LOADREDMODE] Selects the time event that loads the DBREDHR shadow value into the active register. 00 Load on CTR = Zero: Time-base counter equal to zero [TBCTR = 0x0000] 01 Load on CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 10 Load on either CTR = Zero or CTR = PRD 11 Reserved Reset Source: epwm_rst_mod_g_rst_n
1:0	EDGMODEDB	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position [MEP] logic: 00 HRPWM capability is disabled [default on reset] 01 MEP control of rising edge [DBREDHR] 10 MEP control of falling edge [DBFEDHR] 11 MEP control of both edges [rising edge of DBREDHR or falling edge of DBFEDHR] Reset Source: epwm_rst_mod_g_rst_n

3.9.19 MEM_HRPCTL Registers

3.9.19.1 MEM_HRPCTL Register (Offset = 5Ah) [reset = 0h]

Bit	Field	Type	Reset	Description
15:7	RESERVED_1	R	0h	Reserved Reset Source: epwm_rst_mod_g_rst_n
6:4	PWMSYNCSELX	R/W	0h	Extended selection bits for EPWMSYNCPER 000: EPWMSYNCPER is defined by PWMSYNCSEL - ' default condition [compatible with previous EPWM versions] 001: Reserved 010: Reserved 011: Reserved 100: CTR = CMPC, Count direction Up 101: CTR = CMPC, Count direction Down 110: CTR = CMPD, Count direction Up 111: CTR = CMPD, Count direction Down Reset Source: epwm_rst_mod_g_rst_n
3	HRPSYNCE	R/W	0h	SYNC Enable Bit [TRSYNCE]/High Resolution Period SYNC Enable Bit [HRPSYNCE] Reset Source: epwm_rst_mod_g_rst_n
2	TBPHSHRLOADE	R/W	0h	TBPHSHR Load Enable This bit allows you to synchronize ePWM modules with a high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event. This allows for multiple ePWM modules operating at the same frequency to be phase aligned with high-resolution. 0: Disables synchronization of high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event: 1: Synchronize the high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital comparator synchronization event. The phase is synchronized using the contents of the high-resolution phase TBPHSHR register. The TBCTL[PHSEN] bit which enables the loading of the TBCTR register with TBPHS register value on a SYNCIN or TBCTL[SWFSYNC] event works independently. However, users need to enable this bit also if they want to control phase in conjunction with the high-resolution period feature. This bit and the TBCTL[PHSEN] bit must be set to 1 when high-resolution period is enabled for up-down count mode even if TBPHSHR = 0x0000. This bit does not need to be set when only high-resolution duty is enabled. Reset Source: epwm_rst_mod_g_rst_n
1	PWMSYNCSEL	R/W	0h	PWMSYNC Source Select Bit: This bit selects the source for the EPWMSYNCPER signal that goes to the CMPSS and GPDAC: 0 CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 1 CTR = zero: Time-base counter equal to zero [TBCTR = 0x00] Reset Source: epwm_rst_mod_g_rst_n
0	HRPE	R/W	0h	High Resolution Period Enable Bit 0: High resolution period feature disabled. In this mode the ePWM behaves as a Type 0 ePWM. 1: High resolution period enabled. In this mode the HRPWM module can control high-resolution of both the duty and frequency. When high-resolution period is enabled, TBCTL[CTRMODE] = 0,1 [down-count mode] is not supported. Reset Source: epwm_rst_mod_g_rst_n

Table 3-730. QPOSCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	QPOSCNT	R/W	0h	Position Counter This 32-bit position counter register counts up/ down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. This Register acts as a Read ONLY register while counter is counting up/down. Note: It is recommended to only write to the position counter register [QPOSCNT] during initialization, i.e. when the eQEP position counter is disabled [QPEN bit of QEPCTL is zero]. Once the position counter is enabled [QPEN bit is one], writing to the eQEP position counter register [QPOSCNT] may cause unexpected results. Reset Source: eqep_rst_mod_g_rst_n

Bit	Field	Type	Reset	Description
15:8	KEY	W	0h	Write Key. In order to write to this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every change to this register. Reset Source: fsi_rx_rst_mod_g_rst_n
7:5	RESERVED_1	R	0h	Reserved Reset Source: fsi_rx_rst_mod_g_rst_n
4	DATA_FILTER_EN	R/W	0h	Data Filter Enable Bit. 0h [R/W] = Data filtering is disabled. 1h [R/W] = Data filtering is enabled. Reset Source: fsi_rx_rst_mod_g_rst_n
3	INPUT_ISOLATE	R/W	0h	When set to 1, the FSI RX inputs [RXCLK, RXD0 and RXD1] will be isolated from what is driven from the device pins and will be held at inactive level of '1'.This isolation facilitates the user to switch the RX inputs to a different set of device pins and hence any potential glitch that could occur during the process of switching will not affect the RX module itself. Reset Source: fsi_rx_rst_mod_g_rst_n
2	SPI_PAIRING	R/W	0h	Clock Pairing for SPI-like Behavior Enable bit This bit enables the internal clock pairing with the FSI TX module. This feature internally connects the TXCLK to RXCLK allowing the FSI TX module, acting as a SPI master, to clock data into the receiver and out of the transmitter like a standard SPI module. This configuration is valid when the Module is in SPI mode only [RX_OPER_CTRL.SPI_MODE = 1] 0h [R/W] = SPI clock pairing is not enabled. 1h [R/W] = SPI clock pairing is enabled. The RXCLK will be internally connected to the TXCLK of the corresponding FSI module. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect. Reset Source: fsi_rx_rst_mod_g_rst_n

Table 3-789. RX_MASTER_CTRL_ALTC_ Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	INT_LOOPBACK	R/W	0h	Internal Loopback Enable bit This bit enables the internal loopback functionality of the FSI receiver. By enabling this bit, a mux will select the signals coming directly from the corresponding FSI transmitter module rather than from the pins. 0h [R/W] = Internal loopback is disabled. The FSI RX module will receive signals coming from the pins. 1h [R/W] = Internal loopback is enabled. The FSI RX module will receive signals from the directly from FSI TX module rather than the pins. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect. Reset Source: fsi_rx_rst_mod_g_rst_n
0	CORE_RST	R/W	0h	Receiver Master Core Reset bit This bit controls the receiver master core reset. In order to receive any frame, this bit must be cleared. Note: For reset to take affect, the FSI RX module must be held in reset for at least 4 SYSCLK cycles. 0h [R/W] = Receiver core is not in reset and can receive frames. 1h [R/W] = Receiver core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect. Reset Source: fsi_rx_rst_mod_g_rst_n

8	PING_WD_RST_MODE	R/W	0h	Ping Watchdog Timeout Mode Select bit This bit selects the mode by which the ping watchdog counter is reset. The watchdog counter can be reset and restarted only by ping frames or by any received frame. 0h [R/W] = The ping watchdog counter will reset and restart only by ping frames. 1h [R/W] = The ping watchdog counter will reset and restart by any received frame. 7	ECC_SEL	R/W	0h	ECC Data Width Select bit This bit selects between whether the ECC computation is done on 16-bit or 32-bit words. 0h [R/W] = 32-bit ECC is used. 1h [R/W] = 16-bit ECC is used. Reset Source: fsi_rx_rst_mod_g_rst_n
6:3	N_WORDS	R/W	0h	Number of Words to Receive This field defines the number of words which will be received in a DATA_N_WORD frame. This is a user-defined field that must match the corresponding field in the transmitter. Set this bitfield to be one less than the number of words to be received. This value is only applicable when the frame type received is DATA_N_WORD. 0h [R/W] = 1 data word frame [16-bit data]. 1h [R/W] = 2 data word frame [32-bit data]. .. Fh [R/W] = 16 data word frame [256-bit data]. Reset Source: fsi_rx_rst_mod_g_rst_n
2	SPI_MODE	R/W	0h	SPI Mode Enable bit This bit enables and disables the SPI compatibility mode of the FSI RX. The received data must be formatted as an FSI frame in order for the data to properly be received. SPI compatibility mode will allow FSI RX to receive data that is sent using SPI signal format. Refer to the applicable section in the FSI TRM chapter for more information. 0h [R/W] = FSI is in normal mode of operation. 1h [R/W] = FSI is operating in SPI compatibility mode. Bit	Field	Type	Reset	Description
15:8	KEY	W	0h	Write Key In order to write to any bit in this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every change to this register. Reset Source: fsi_tx_rst_mod_g_rst_n
7:2	RESERVED_1	R	0h	Reserved Reset Source: fsi_tx_rst_mod_g_rst_n
1	FLUSH	R/W	0h	Flush Operation Start bit This bit will cause the transmitter to initiate a flush pattern of a single toggle on the TXD0 and TXD1 followed by five full cycles of TXCLK. This bit should be written only when the CORE_RST bit is 0 and the clock to the Transmitter core is turned on. 0h [R/W] = Clear this bit. 1h [R/W] = Setting this bit will Initiate flush sequence. To properly execute a flush sequence, Set FLUSH to 1, wait for five TXCLK cycles then clear FLUSH to 0. Note: The KEY field must contain 0xA5 for any write to this bit to take effect. The software must keep this bit set to 1 for at least five TXCLK cycles before setting it back to 0. Reset Source: fsi_tx_rst_mod_g_rst_n
0	CORE_RST	R/W	0h	Transmitter Master Core Reset bit This bit controls the transmitter master core reset. In order to send any frame, this bit must be cleared. 0h [R/W] = Transmitter core is not in reset and can transmit frames. 1h [R/W] = Transmitter core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect. Reset Source: fsi_tx_rst_mod_g_rst_n

8:3	EXT_TRIG_SEL	R/W	0h	External Trigger Select bits This bitfield will select one of the 64 external trigger inputs to as the source to generate a ping frame. A ping frame will only be generated if the EXT_TRIG_EN bit is set. 0h [R/W] = Trigger 1 will be used to generate a ping frame. 1h [R/W] = Trigger 2 will be used to generate a ping frame. .. 3Fh [R/W] = Trigger 64 will be used to generate a ping frame. Table 3-902. TX_ECC_DATA Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	DATA_HIGH	R/W	0h	Upper 16 bits of ECC Data Writing to this bitfield will cause the ECC logic to compute the ECC[SEC-DED] the entire 32-bit register and update TX_ECC_VAL register with the results. Software should write to these 16 bits of the register in a 32-bit write when needing to compute ECC for 32-bits for the full TX_ECC_DATA register. Reset Source: fsi_tx_rst_mod_g_rst_n
15:0	DATA_LOW	R/W	0h	Lower 16 bits of ECC Data Writing to this bitfield will cause the ECC logic to compute the ECC[SEC-DED] for these 16 bits and update the TX_ECC_VAL register with the results. Software should write to these register bits as a 16-bit write when needing to compute ECC for 16-bits. Reset Source: fsi_tx_rst_mod_g_rst_n

7:0	HRMSTEP	R/W	0h	High Resolution MEP Step When auto-conversion is enabled [HRCNFG[AUTOCONV] = 1], This 8-bit field contains the MEP_ScaleFactor [number of MEP steps per coarse steps] used by the hardware to automatically convert the value in the CMPAHR, CMPBHR, DBFEDHR, DBREDHR , TBPHSHR, or TBPRDHR register to a scaled micro-edge delay on the high-resolution ePWM output. The value in this register is written by the SFO calibration software at the end of each calibration run. Reset Source: ottocal_rst_mod_g_rst_n

3.22.2 MEM_SDIFLGCLR Registers

3.22.2.1 MEM_SDIFLGCLR Register (Offset = 4h) [reset = 0h]

Short Description: SD Module Interrupt Flag

Long Description: SD Module Interrupt Flag Clear Bits: Writing a "1" will clear the respective flag bit in the SDIFLG register. Writes of "0" are ignored. Note: If user writes a "1" to clear a bit on the same cycle that the hardware is trying to set the bit to "1", then hardware has priority and the bit will not be cleared.

31-16	ECC_ROW	R	0h	Indicates the row/address where the single or double-bit error occurred.
15-11	RESERVED	R	0h	Reserved
10	CLR_ECC_OTHER	R/W1C	0h	1 indicates a successive single-bit error. Writing a 1 clears the status bit.
9	CLR_ECC_DED	R/W1C	0h	1 indicates a pending double-bit error. Writing a 1 clears the status bit.
8	CLR_ECC_SEC	R/W1C	0h	1 indicates a pending single-bit error. Writing a 1 clears the status bit.
7-3	RESERVED	R	0h	Reserved
2	ECC_OTHER	R/W1S	0h	1 indicates that successive single-bit errors have occurred while a writeback is still pending. Software can also write a 1 to set the pending status and write a ‘1’ to the corresponding clear bit to clear the status.
1	ECC_DED	R/W1S	0h	1 indicates pending double-bit error. Since the double-bit error from the ECC logic is a pulsed interrupt, this is also a status set register. The software can also write a ‘1’ to set the pending status and write a ‘1’ to the corresponding clear bit to clear the status.
0	ECC_SEC	R/W1S	0h	1 indicates pending single-bit error status. Since the single-bit error from the ECC logic is a pulsed interrupt, this is also a status set register. The software can also write a ‘1’ to set the pending status and write a ‘1’ to the corresponding clear bit to clear the status.

4.5.2.9 ECC_ERROR_STATUS2 Register (Offset = 24h) [reset = 0h]

ECC_INT_STATUS_0 to ECC_INT_STATUS_15 is shown in Figure 4-24 and described in Table 4-68.

These are the raw level interrupt status bits where each bit corresponds to the pending status from an ECC RAM. The bit associations with the ECC RAMs are assigned by the ECC aggregator module. There is 1 register for upto 32 ECC RAMs. The addresses increment for every additional 32-bit register required to hold the interrupt status for all the ECC RAMs (0 to N-1).

Bit	Field	Type	Reset	Description
31-16	PCOUNTER_RST_VAL	R/W	0h	Program Counter Reset Value: This field controls the address where the PRU will start executing code from after it is taken out of reset.
15	RUNSTATE	R	0h	Run State: This bit indicates whether the PRU is currently executing an instruction or is halted. 0 = PRU is halted and host has access to the instruction RAM and debug registers regions. 1 = PRU is currently running and the host is locked out of the instruction RAM and debug registers regions. This bit is used by an external debug agent to know when the PRU has actually halted when waiting for a HALT instruction to execute, a single step to finish, or any other time when the pru_enable has been cleared.
14	BIG_ENDIAN	R	0h	
13-9	RESERVED	R	0h	Reserved
8	SINGLE_STEP	R/W	0h	Single Step Enable: This bit controls whether or not the PRU will only execute a single instruction when enabled. 0 = PRU will free run when enabled. 1 = PRU will execute a single instruction and then the pru_enable bit will be cleared. Note that this bit does not actually enable the PRU, it only sets the policy for how much code will be run after the PRU is enabled. The pru_enable bit must be explicitly asserted. It is legal to initialize both the single_step and pru_enable bits simultaneously. (Two independent writes are not required to cause the stated functionality.)
7-4	RESERVED	R	0h	Reserved

Table 4-76. PRU_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	COUNTER_ENABLE	R/W	0h	PRU Cycle Counter Enable: Enables PRU cycle counters. 0 = Counters not enabled 1 = Counters enabled
2	SLEEPING	R/W	0h	PRU Sleep Indicator: This bit indicates whether or not the PRU is currently asleep. 0 = PRU is not asleep 1 = PRU is asleep If this bit is written to a 0, the PRU will be forced to power up from sleep mode.
1	ENABLE	R/W	0h	Processor Enable: This bit controls whether or not the PRU is allowed to fetch new instructions. 0 = PRU is disabled. 1 = PRU is enabled. If this bit is de-asserted while the PRU is currently running and has completed the initial cycle of a multi-cycle instruction (LBxO,SBxO,SCAN, etc.), the current instruction will be allowed to complete before the PRU pauses execution. Otherwise, the PRU will halt immediately. Because of the unpredictability timing sensitivity of the instruction execution loop, this bit is not a reliable indication of whether or not the PRU is currently running. The pru_state bit should be consulted for an absolute indication of the run state of the core. When the PRU is halted, its internal state remains coherent therefore this bit can be reasserted without issuing a software reset and the PRU will resume processing exactly where it left off in the instruction stream.
0	SOFT_RST_N	R/W	1h	Soft Reset: When this bit is cleared, the PRU will be reset. This bit is set back to 1 on the next cycle after it has been cleared.

Setting any bit in this vector will allow the corresponding status input to wake up the core when it is asserted high. The PRU should set this enable vector prior to executing a SLP (sleep) instruction to ensure that the desired sources can wake up the core.

4.5.3.4 PRU_CYCLE Register (Offset = Ch) [reset = 0h]

PRU_CYCLE is shown in Figure 4-30 and described in Table 4-82.

Counting halts while the PRU is disabled or counter is disabled, and resumes when re-eneabled. Counter clears the COUNTENABLE bit in the PRU control register when the count reaches FFFFFFFFh. (Count does does not wrap). The register can be read at any time. The register can be cleared when the counter or PRU is disabled. Clearing this register also clears the PRU Stall Count Register.

4.5.3.5 PRU_STALL Register (Offset = 10h) [reset = 0h]

PRU_STALL is shown in Figure 4-31 and described in Table 4-84.

STALL COUNT. This register counts the number of cycles for which the PRU has been enabled, but unable to fetch a new instruction. It is linked to the Cycle Count Register (0Ch) such that this register reflects the stall cycles measured over the same cycles as counted by the cycle count register. Thus the value of this register is always less than or equal to cycle count.

4.5.3.6 PRU_CTBIR0 Register (Offset = 20h) [reset = 0h]

PRU_CTBIR0 is shown in Figure 4-32 and described in Table 4-86.

CONSTANT TABLE BLOCK INDEX REGISTER 0. This register is used to set the block indices which are used to modify entries 24 and 25 in the PRU Constant Table. This register can be written by the PRU whenever it needs to change to a new base pointer for a block in the State Scratchpad RAM. This function is useful since the PRU is often processing multiple processing threads which require it to change contexts. The PRU can use this register to avoid requiring excessive amounts of code for repetitive context switching.

4.5.4.59 PRU_ICSS_DBG_CT_REG26 Register (Offset = E8h) [reset = 0h]

PRU_ICSS_DBG_CT_REG26 is shown in Figure 4-94 and described in Table 4-212.

Return to Summary Table.

DEBUG PRU CONSTANTS TABLE ENTRY 26. This register allows an external agent to debug the PRU while it is disabled. Since some of the constants table entries may actually depend on system inputs / and or the internal state of the PRU, these registers are provided to allow an external agent to easily determine the state of the constants table.

PRU_ICSS_INTC_GNLR is shown in Figure 4-103 and described in Table 4-232.

The Global Nesting Level Register allows the checking and setting of the global nesting level across all host interrupts when automatic global nesting mode is set. The nesting level is the channel (and all of lower priority) that are nested out because of a current interrupt. This register is only available when nesting is configured.

4.5.5.52 PRU_ICSS_INTC_SITR1 Register (Offset = D84h) [reset = 0h]

PRU_ICSS_INTC_SITR1 is shown in Figure 4-151 and described in Table 4-328.

The System Interrupt Type Register1 define the type of the system interrupts 32 to 63. There is a type for each system interrupt. The type of all system interrupts is pulse; always write 0 to the bits of this register.

PRU_ICSS_UART_RBR_THR is shown in Figure 4-163 and described in Table 4-354.

Return to Summary Table.

In the non-FIFO mode, when a character is placed in Receiver buffer register and the receiver data-ready interrupt is enabled (DR = 1 in Interrupt identification register), an interrupt is generated. This interrupt is cleared when the character is read from Receiver buffer register. In the FIFO mode, the interrupt is generated when the FIFO is filled to the trigger level selected in the FIFO control register, and it is cleared when the FIFO contents drop below the trigger level.
In the non-FIFO mode, if Transmitter holding register is empty and the THR empty (THRE) interrupt is enabled (ETBEI = 1 in Interrupt enable register), an interrupt is generated. This interrupt is cleared when a character is loaded into Transmitter holding register or the Interrupt identification register is read. In the FIFO mode, the interrupt is generated when the transmitter FIFO is empty, and it is cleared when at least one byte is loaded into the FIFO or Interrupt identification register is read.

4.5.6.3 PRU_ICSS_UART_INTERRUPT_IDENTIFICATION_FIFO_CONTROL Register (Offset = 8h) [reset = 1h]

PRU_ICSS_UART_INTERRUPT_IDENTIFICATION_FIFO_CONTROL is shown in Figure 4-165 and described in Table 4-358.

Return to Summary Table.

The Interrupt identification register is a read-only register at the same address as the FIFO control register, which is a write-only register. When an interrupt is generated and enabled in the Interrupt enable register, Interrupt identification register indicates that an interrupt is pending in the IPEND bit and encodes the type of interrupt in the INTID bits. Reading Interrupt identification register clears any THR empty (THRE) interrupts that are pending. The FIFOEN bit in Interrupt identification register can be checked to determine whether the UART is in the FIFO mode or the non-FIFO mode.
Use FIFO control register to enable and clear the FIFOs and to select the receiver FIFO trigger level. The FIFOEN bit in FIFO control register must be set to 1 before other FIFO control register bits are written to or the FIFO control register bits are not programmed.

4.5.6.4 PRU_ICSS_UART_LINE_CONTROL Register (Offset = Ch) [reset = 0h]

PRU_ICSS_UART_LINE_CONTROL is shown in Figure 4-166 and described in Table 4-360.

Return to Summary Table.

The system programmer controls the format of the asynchronous data communication exchange by using Line control register. In addition, the programmer can retrieve, inspect, and modify the content of line control register; this eliminates the need for separate storage of the line characteristics in system memory.

6	TEMT	R	1h	Transmitter empty (TEMT) indicator. **In non-FIFO mode:** 0h: Either the transmitter holding register (THR) or the transmitter shift register (TSR) contains a data character. 1h: Both the transmitter holding register (THR) and the transmitter shift register (TSR) are empty.
				In FIFO mode: 0h: Either the transmitter FIFO or the transmitter shift register (TSR) contains a data character. 1h: Both the transmitter FIFO and the transmitter shift register (TSR) are empty.
5	THRE	R	1h	Transmitter holding register empty (THRE) indicator. If the THRE bit is set and the corresponding interrupt enable bit is set (ETBEI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: Transmitter holding register (THR) is not empty. THR has been loaded by the CPU. 1h: Transmitter holding register (THR) is empty (ready to accept a new character). The content of THR has been transferred to the transmitter shift register (TSR).
				In FIFO mode: 0h: Transmitter FIFO is not empty. At least one character has been written to the transmitter FIFO. You can write to the transmitter FIFO if it is not full. 1h: Transmitter FIFO is empty. The last character in the FIFO has been transferred to the transmitter shift register (TSR).
4	BI	R	0h	Break indicator. The BI bit is set whenever the receive data input (UARTn_RXD) was held low for longer than a full-word transmission time. A full-word transmission time is defined as the total time to transmit the START, data, PARITY, and STOP bits. If the BI bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver buffer register (RBR). 1h: A break has been detected with the character in the receiver buffer register (RBR).
				In FIFO mode: 0h: No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver FIFO and the next character to be read from the FIFO has no break indicator. 1h: A break has been detected with the character at the top of the receiver FIFO.

Bit	Field	Type	Reset	Description
3	FE	R	0h	Framing error (FE) indicator. A framing error occurs when the received character does not have a valid STOP bit. In response to a framing error, the UART sets the FE bit and waits until the signal on the RX pin goes high. Once the RX signal goes high, the receiver is ready to detect a new START bit and receive new data. If the FE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 1h: A framing error has been detected with the character in the receiver buffer register (RBR).
				In FIFO mode: 0h: No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no framing error. 1h: A framing error has been detected with the character at the top of the receiver FIFO.
2	PE	R	0h	Parity error (PE) indicator. A parity error occurs when the parity of the received character does not match the parity selected with the EPS bit in the line control register (LCR). If the PE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 1h: A parity error has been detected with the character in the receiver buffer register (RBR).
				In FIFO mode: 0h: No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no parity error. 1h: A parity error has been detected with the character at the top of the receiver FIFO.

Table 4-364. PRU_ICSS_UART_LINE_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	OE	R	0h	Overrun error (OE) indicator. An overrun error in the non-FIFO mode is different from an overrun error in the FIFO mode. If the OE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 1h: Overrun error has been detected. Before the character in the receiver buffer register (RBR) could be read, it was overwritten by the next character arriving in RBR.
				In FIFO mode: 0h: No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 1h: Overrun error has been detected. If data continues to fill the FIFO beyond the trigger level, an overrun error occurs only after the FIFO is full and the next character has been completely received in the shift register. An overrun error is indicated to the CPU as soon as it happens. The new character overwrites the character in the shift register, but it is not transferred to the FIFO.
0	DR	R	0h	Data-ready (DR) indicator for the receiver. If the DR bit is set and the corresponding interrupt enable bit is set (ERBI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: Data is not ready, or the DR bit was cleared because the character was read from the receiver buffer register (RBR). 1h: Data is ready. A complete incoming character has been received and transferred into the receiver buffer register (RBR).
				In FIFO mode: 0h: Data is not ready, or the DR bit was cleared because all of the characters in the receiver FIFO have been read. 1h: Data is ready. There is at least one unread character in the receiver FIFO. If the FIFO is empty, the DR bit is set as soon as a complete incoming character has been received and transferred into the FIFO. The DR bit remains set until the FIFO is empty again.

PRU_ICSS_UART_DIVISOR_LSB is shown in Figure 4-171 and described in Table 4-370.

Return to Summary Table.

Two 8-bit register fields (DLL and DLH), called divisor latches, store the 16-bit divisor for generation of the baud clock in the baud generator. DLH holds the most-significant bits of the divisor, and DLL holds the least-significant bits of the divisor. These divisor latches must be loaded during initialization of the UART in order to ensure desired operation of the baud generator. Writing to the divisor latches results in two wait states being inserted during the write access while the baud generator is loaded with the new value.

PRU_ICSS_UART_DIVISOR_MSB is shown in Figure 4-172 and described in Table 4-372.

Return to Summary Table.

Two 8-bit register fields (DLL and DLH), called divisor latches, store the 16-bit divisor for generation of the baud clock in the baud generator. DLH holds the most-significant bits of the divisor, and DLL holds the least-significant bits of the divisor. These divisor latches must be loaded during initialization of the UART in order to ensure desired operation of the baud generator. Writing to the divisor latches results in two wait states being inserted during the write access while the baud generator is loaded with the new value.

(d) ECAP input/APWM ouput pin operates as a APWM output.

Table 4-396. PRU_ICSS_ECAP_ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SWSYNC	R/W	0h	Software-forced Counter (TSCNT) Synchronizing. This provides a convenient software method to synchronize some or all ECAP time bases. In APWM mode, the synchronizing can also be done via the CTR = PRD event. Note: Selection CTR = PRD is meaningful only in APWM mode. However, you can choose it in CAP mode if you find doing so useful. 0h: Writing a zero has no effect. Reading always returns a zero 1h: Writing a one forces a TSCNT shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 1'b00. After writing a 1, this bit returns to a zero.
7-6	SYNCO_SEL	R/W	0h	Sync-Out Select 0h: Select sync-in event to be the sync-out signal (pass through) 1h: Select CTR = PRD event to be the sync-out signal 2h: Disable sync out signal 3h: Disable sync out signal

4	TSCNTSTP	R/W	0h	Time Stamp (TSCNT) Counter Stop (freeze) Control 0h: TSCNT stopped 1h: TSCNT free-running
3	REARMRESET	R/W	0h	One-Shot Re-Arming Control, that is, wait for stop trigger. Note: The re-arm function is valid in one shot or continuous mode. 0h: Has no effect (reading always returns a 0) 1h: Arms the one-shot sequence as follows: 1) Resets the Mod4 counter to zero. 2) Unfreezes the Mod4 counter. 3) Enables capture register loads.

Table 4-396. PRU_ICSS_ECAP_ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2-1	STOPVALUE	R/W	3h	Stop value for one-shot mode. This is the number (between 1 and 4) of captures allowed to occur before the CAP (1 through 4) registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number (between 1 and 4) of the capture register in which the circular buffer wraps around and starts again. Notes: STOPVALUE is compared to Mod4 counter and, when equal, the following two actions occur. (1) Mod4 counter is stopped (frozen). (2) Capture register loads are inhibited. In one-shot mode, further interrupt events are blocked until re-armed. 0h: Stop after Capture Event 1 in one-shot mode. Wrap after Capture Event 1 in continuous mode. 1h: Stop after Capture Event 2 in one-shot mode. Wrap after Capture Event 2 in continuous mode. 2h: Stop after Capture Event 3 in one-shot mode. 25-16	TX_START_DELAY	R/W	40h	Defines the minimum time interval (delay) between receiving the RXDV for the current frame and the start of the transmit interface sending data to the MII interface. Delay value is in units of MII_RT clock cycles, which uses the ICSS_i_VCLK_CLK (default is 200MHz, or 5ns). Default TX_START_DELAY value is 320ns, which is optimized for minimum latency at 16 bit processing. Counter is started with RX_DV signal going active. Transmit interface stops sending data when no more data is written into transmit interface by PRU along with TX_EOF marker bit set. If the TX FIFO has data when the delay expires, then TX will start sending data. But if the TX FIFO is empty, it will not start until the TX FIFO is not empty. It is possible to overflow the TX FIFO with the max delay setting when auto-forwarding is enabled since the time delay is larger than the amount of data it needs to store. As long as TX L1 FIFO overflows, software will need to issue a TX_RESET to reset the TX FIFO. The total delay is 96-byte times (size of TX FIFO), but you need to allow delays for synchronization. Do to this fact, the maximum delay should be 80ns less when auto forwarding is enabled. Therefore, 0x3F0 is the maximum in this configuration.

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	MDIO state machine IDLE. Set to 1 when the state machine is in the idle state.
30	ENABLE	R/W	0h	Enable control. Writing a 1 to this bit enables the MDIO state machine, writing a 0 disables it. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register.
29	RESERVED	R	0h	Reserved
28-24	HIGHEST_USER_CHANNEL	R	1h	Highest user channel. This field specifies the highest useraccess channel that is available in the module and is currently set to 1. This implies that **MDIOUserAccess1** is the highest available user access channel.
23-21	RESERVED	R	0h	Reserved
20	PREAMBLE	R/W	0h	Preamble disable. Writing a 1 to this bit disables this device from sending MDIO frame preambles.
19	FAULT	RWr1Clr	0h	Fault indicator. This bit is set to 1 if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1 to it clears this bit.
18	FAULT_DETECT_ENABLE	R/W	0h	Fault detect enable. This bit has to be set to 1 to enable the physical layer fault detection.

15-0	CLKDIV	R/W	FFh	Clock Divider. This field specifies the division ratio between CLK and the frequency of MDCLK. MDCLK is disabled when clkdiv is set to 0. MDCLK frequency = clk frequency/(clkdiv+1).

31-0	ALIVE	RWr1Clr	0h	MDIO Alive bitfield. Each of the 32 bits of this register is set if the most recent access to the PHY with address corresponding to the register bit number was acknowledged by the PHY, the bit is reset if the PHY fails to acknowledge the access. Both the user and polling accesses to a PHY will cause the corresponding alive bit to be updated. The alive bits are only meant to be used to give an indication of the presence or not of a PHY with the corresponding address. Writing a 1 to any bit will clear it, writing a 0 has no effect.

The bit is set if the PHY with the corresponding address has link and the PHY acknowledges the read transaction. The bit is reset if the PHY indicates it does not have link or fails to acknowledge the read transaction. Writes to the register have no effect. In addition, the status of the two PHYs specified in the **MDIOUserPhySel** registers can be determined using the **MLINK** input pins. This is determined by the **linksel** bit in the **MDIOUserPhySel** register.

31-2	RESERVED	R	0h	Reserved
1-0	LINKINTRAW	RWr1Clr	0h	MDIO link change event, raw value. When asserted 1 , a bit indicates that there was an **MDIO link** change event (i.e. change in the MDIOLink register) corresponding to the PHY address in the **MDIOUserPhySel** register. **linkintraw[0] and linkintraw[1]** correspond to **MDIOUserPhySel0 and MDIOUserPhysel1**, respectively. Writing a 1 will clear the event and writing 0 has no effect.**If the int_test bit in the MDIOControl register is set, the host may set the linkintraw bits to a 1 .**This mode may be used for test purposes.

Bit	Field	Type	Reset	Description
31	GO	R/W1S	0h	Go. Writing a 1 to this bit causes the MDIO state machine to perform an MDIO access when it is convenient for it to do so, this is not an instantaneous process. Writing a 0 to this bit has no effect. This bit is write able only if the MDIO state machine is enabled. This bit will self clear when the requested access has been completed. Any writes to the MDIOUserAccess0 register are blocked when the go bit is 1 . If byte access is being used, the go bit should be written last.
30	WRITE	R/W	0h	Write enable. Setting this bit to a 1 causes the MDIO transaction to be a register write, otherwise it is a register read.
