Table 4-3775. INTVECTOR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-3789. INTVECTOR_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

4.24.342 VIM_MSS_VIM_INTVECTOR_8 Registers

4.24.342.1 VIM_8 Register (Offset = 2020h) [reset = h]

Short Description: Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h12

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-3865. INTVECTOR_45 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-3891. INTVECTOR_58 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-3917. INTVECTOR_71 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-3993. INTVECTOR_109 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-4069. INTVECTOR_147 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-4145. INTVECTOR_185 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-4221. INTVECTOR_223 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

4.28.8 TPCC_EMR Registers

4.28.8.1 TPCC_EMR Register (Offset = 300h) [reset = 0h]

Short Description: Event Missed Reg

Long Description: Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

4.28.9 TPCC_EMRH Registers

4.28.9.1 TPCC_EMRH Register (Offset = 304h) [reset = 0h]

Short Description: Event Missed Reg

Long Description: Event Missed Register (High Part): The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

Table 4-4498. CCERR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:17	RES33	R	0h	RESERVE FIELD Reset Source: edma_rst_mod_g_rst_n
16	TCERR	R	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors were previously clear] then an error will be signaled with TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n
15:8	RES34	R	0h	RESERVE FIELD Reset Source: edma_rst_mod_g_rst_n
7	QTHRXCD7	R	0h	Queue Threshold Error for Q7: QTHRXCD7 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD7 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD7 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n
6	QTHRXCD6	R	0h	Queue Threshold Error for Q6: QTHRXCD6 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD6 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD6 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n
5	QTHRXCD5	R	0h	Queue Threshold Error for Q5: QTHRXCD5 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD5 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD5 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n

Table 4-4498. CCERR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	QTHRXCD4	R	0h	Queue Threshold Error for Q4: QTHRXCD4 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD4 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD4 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n
3	QTHRXCD3	R	0h	Queue Threshold Error for Q3: QTHRXCD3 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD3 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD3 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n
2	QTHRXCD2	R	0h	Queue Threshold Error for Q2: QTHRXCD2 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD2 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD2 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n
1	QTHRXCD1	R	0h	Queue Threshold Error for Q1: QTHRXCD1 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD1 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD1 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n
0	QTHRXCD0	R	0h	Queue Threshold Error for Q0: QTHRXCD0 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD0 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD0 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt. Reset Source: edma_rst_mod_g_rst_n

4.28.42 TPCC_ER Registers

4.28.42.1 TPCC_ER Register (Offset = 1000h) [reset = 0h]

Short Description: Event Register:

Long Description: Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.28.48 TPCC_CER Registers

4.28.48.1 TPCC_CER Register (Offset = 1018h) [reset = 0h]

Short Description: Chained Event Re

Long Description: Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.28.49 TPCC_CERH Registers

4.28.49.1 TPCC_CERH Register (Offset = 101Ch) [reset = 0h]

Short Description: Chained Event Re

Long Description: Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.

4.28.50 TPCC_EER Registers

4.28.50.1 TPCC_EER Register (Offset = 1020h) [reset = 0h]

Short Description: Event Enable Reg

Long Description: Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

4.28.59 TPCC_SECRH Registers

4.28.59.1 TPCC_SECRH Register (Offset = 1044h) [reset = 0h]

Short Description: Secondary Event

Long Description: Secondary Event Clear Register (High Part): The secondary event clear register is used to clear the status of the SERH registers. CPU write of '1' to the SECRH.En bit clears the SERH register. CPU write of '0' has no effect.

4.28.68 TPCC_ICR Registers

4.28.68.1 TPCC_ICR Register (Offset = 1070h) [reset = 0h]

Short Description: Interrupt Clear

Long Description: Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.

Bit	Field	Type	Reset	Description
31:2	RES69	R	0h	RESERVE FIELD Reset Source: edma_rst_mod_g_rst_n
1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable [IERn] and status [IPRn]. CPU write of '0' has no effect. Reset Source: edma_rst_mod_g_rst_n
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts [IERn] are still pending [IPRn]. CPU write of '0' has no effect.. Reset Source: edma_rst_mod_g_rst_n

4.28.71 TPCC_QER Registers

4.28.71.1 TPCC_QER Register (Offset = 1080h) [reset = 0h]

Short Description: QDMA Event Regis

Long Description: QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

4.28.72 TPCC_QEER Registers

4.28.72.1 TPCC_QEER Register (Offset = 1084h) [reset = 0h]

Short Description: QDMA Event Enabl

Long Description: QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

4.28.75 TPCC_QSER Registers

4.28.75.1 TPCC_QSER Register (Offset = 1090h) [reset = 0h]

Short Description: QDMA Secondary E

Long Description: QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

4.28.76 TPCC_QSECR Registers

4.28.76.1 TPCC_QSECR Register (Offset = 1094h) [reset = 0h]

Short Description: QDMA Secondary E

Long Description: QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

4.28.77 TPCC_ER_RN Registers

4.28.77.1 TPCC_RN Register (Offset = 2000h) [reset = 0h]

Short Description: Event Register:

Long Description: Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.28.83 TPCC_CER_RN Registers

4.28.83.1 TPCC_RN Register (Offset = 2018h) [reset = 0h]

Short Description: Chained Event Re

Long Description: Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.28.85 TPCC_EER_RN Registers

4.28.85.1 TPCC_RN Register (Offset = 2020h) [reset = 0h]

Short Description: Event Enable Reg

Long Description: Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

4.28.86 TPCC_EERH_RN Registers

4.28.86.1 TPCC_RN Register (Offset = 2024h) [reset = 0h]

Short Description: Event Enable Reg

Long Description: Event Enable Register (High Part): Enables DMA transfers for ERH.En pending events. ERH.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CERH) or Event Set Register (ESRH). Note that if a bit is set in ERH.En while EERH.En is disabled no action is taken. If EERH.En is enabled at a later point (and ERH.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EERH.En is not directly writeable. Events can be enabled via writes to EESRH and can be disabled via writes to EECRH register. EERH.En = 0: ER.En is not enabled to trigger DMA transfers. EERH.En = 1: ER.En is enabled to trigger DMA transfers.

4.28.91 TPCC_SER_RN Registers

4.28.91.1 TPCC_RN Register (Offset = 2038h) [reset = 0h]

Short Description: Secondary Event

Long Description: Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

4.28.95.1 TPCC_RN Register (Offset = 2050h) [reset = 0h]

Short Description: Int Enable Regis

Long Description: Int Enable Register: IER.In is not directly writeable. Interrupts can be enabled via writes to IESR and can be disabled via writes to IECR register. IER.In = 0: IPR.In is NOT enabled for interrupts. IER.In = 1: IPR.In IS enabled for interrupts.

1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable [IERn] and status [IPRn]. CPU write of '0' has no effect. Reset Source: edma_rst_mod_g_rst_n
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts [IERn] are still pending [IPRn]. CPU write of '0' has no effect.. Reset Source: edma_rst_mod_g_rst_n

4.28.106 TPCC_QER_RN Registers

4.28.106.1 TPCC_RN Register (Offset = 2080h) [reset = 0h]

Short Description: QDMA Event Regis

Long Description: QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

4.28.107 TPCC_QEER_RN Registers

4.28.107.1 TPCC_RN Register (Offset = 2084h) [reset = 0h]

Short Description: QDMA Event Enabl

Long Description: QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

Table 4-4698. ABCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	BCNT	R/W	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 [64K-1 arrays]. BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ... Reset Source: edma_rst_mod_g_rst_n
15:0	ACNT	R/W	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes [64K-1 bytes]. ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation [to translate between a word count and a byte count] will drop the 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT. Reset Source: edma_rst_mod_g_rst_n

Table 4-4704. LNK Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	BCNTRLD	R/W	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT [conceptually] reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field. Reset Source: edma_rst_mod_g_rst_n

Table 4-4704. LNK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:0	LINK	R/W	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination [i.e. after count fields are decremented to '0'] with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case [5-lsbs] behavior is undefined for the user [i.e. don't have to test it]. In the former case [2 msbs] user should be able to take advantage of this feature [i.e. do have to test it]. If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field. Reset Source: edma_rst_mod_g_rst_n

5 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from December 15, 2022 to December 15, 2023 (from Revision C (December 2022) to Revision D (December 2023)) **Page**

- AM263x TRM refinement - remove mention of CTRLMMR, change to sub-topic of Control Overview, add note below table....19

Changes from October 1, 2022 to December 15, 2022 (from Revision B (October 2022) to Revision C (December 2022)) **Page**

- Including AM263x collateral links.... 5
- Updated PRU-ICSS Data RAM2 End Address from 0x0000 FFFF to 0x0001 FFFF.... 17
- Updated table vertical alignment. Updated descriptive text to prevent confusion.... 19
- Lock/Kick protection register unlock values added....19
- Adding note regarding CONTROLSS 16-bit register access requirements....1287
- Updated for ADC_RESULT_REGS instance count....1391
