R-0h								R/W-0h																							

LEGEND: R = Read Only; R/W = Read/Write; *-n* = value after reset

Table 4-486. PRU_ICSS_IEP_COMPENSATION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	0h	Reserved
23-0	COMPEN_CNT	R/W	0h	Compensation counter. Read returns the current COMPEN_CNT value. 0h: Compensation is disabled and counter will increment by DEFAULT_INC. Nh: Compensation is enabled until COMPEN_CNT decrements to 0. The COMPEN_CNT value decrements on every IEP_CLK cycle. When COMPEN_CNT is greater than 0, then count value increments by CMP_INC. **Note** NOTE: SLOW_COMPEN_CNT MUST be set to zero IF COMPEN_CNT is not zero.

4.5.10.4 PRU_ICSS_IEP_SLOW_COMPENSATION Register (Offset = Ch) [reset = 0h]

PRU_ICSS_IEP_SLOW_COMPENSATION is shown in Figure 4-226 and described in Table 4-488.

SLOW COMPENSATION

SLOW_COMPEN_CNT																															
R/W-0h																															

LEGEND: R/W = Read/Write; *-n* = value after reset

Table 4-488. PRU_ICSS_IEP_SLOW_COMPENSATION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SLOW_COMPEN_CNT	R/W	0h	Slow compensation counter. Write 0h: Slow compensation is disabled and counter will increment by DEFAULT_INC. Write Nh: Compensation is enabled for 1 count for every SLOW_COMPEN_CNT cycle, this is free running and continuous until software clears the MMR. For example, SLOW_COMPEN_CNT = 16, every 16 clock cycles the compensation value is used for 1 count. Note: COMPEN_CNT MUST be set to zero IF SLOW_COMPEN_CNT is not zero. Software can read the number of cycles left until the compensation event. For example, software writes SLOW_COMPEN_CNT = 100h and reads SLOW_COMPEN_CNT = 7h. This means in 6 more IEP_CLK cycles before the counter reaches 1h for the compensation event. If software writes SLOW_COMPEN_CNT = 8000h before compensation event, then the counter will reset to 8000h.

4.5.10.5 PRU_ICSS_IEP_LOW_COUNTER Register (Offset = 10h) [reset = 0h]

PRU_ICSS_IEP_LOW_COUNTER is shown in Figure 4-227 and described in Table 4-490.

This register enables SW to define the reset state of the Master Counter, which can be reset by the following events (if enabled): CMP0 event; eHRPWM0_SYNCO event; eHRPWM3_SYNCO event. The RESET_VAL should be in increments of the DEFAULT_INC (default state is 5). For example, 0000_000Ah.

4.5.10.66 PRU_ICSS_IEP_HIGH_COUNTER_RESET_VALUE Register (Offset = 104h) [reset = 0h]

PRU_ICSS_IEP_HIGH_COUNTER_RESET is shown in Figure 4-288 and described in Table 4-612.

Reset value of the Master Counter (upper 32-bits).

Table 4-644. PRU_ICSS_IEP_DIGIO_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-6	OUT_MODE	R/W	0h	Defines events that triggers data out to be updated. Note if OUTVALID_MODE is set, then data out is forced to zero if a WD PD expiration occurs (PD_WD_EXP) from the WD block and pr<k>_edio_oe_ext = 1. 0h: PRU0/1_RX_EOF 1h: Reserved 2h: DC SYNC0 event 3h: DC SYNC1 event
5-4	IN_MODE	R/W	0h	Defines event that triggers data in to be sampled 0h: PRU0/1_RX_SOF 1h: Rising edge of external PR<k>_EDC_LATCH0_IN signal 2h: DC rising edge of SYNC0 event 3h: DC rising edge of SYNC1 event
3	WD_MODE	R/W	0h	Defines Watchdog behavior 0h: Outputs are reset immediately after watchdog expires 1h: Outputs are reset with next output event that follows watchdog expiration

Table 4-644. PRU_ICSS_IEP_DIGIO_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	BIDI_MODE	R	1h	Defines the digital input/output direction. NOTE THAT DUE TO INTEGRATION, ACTUAL MODE IS UNIDIRECTIONAL IN THIS DEVICE. 0h: Unidirectional mode: digital input/output direction of pins configured individually 1h: Bidirectional mode: all I/O pins are bidirectional and direction configuration is ignored
1	OUTVALID_MODE	R/W	0h	Defines the outvalid mode behavior. 0h: Output event signaling 1h: Output data is updated if watchdog is triggered. Output data is forced to zero if PD_WD_EXP from the WD block and pr1_edio_oe_ext = 1
0	OUTVALID_POL	R	0h	Defines OUTVALID polarity 0h: Active High 1h: Active Low

4.5.10.83 PRU_ICSS_IEP_DIGIO_STATUS Register (Offset = 304h) [reset = 0h]

PRU_ICSS_IEP_DIGIO_STATUS is shown in Figure 4-305 and described in Table 4-646.

Table 4-648. PRU_ICSS_IEP_DIGIO_DATA_IN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DATA_IN	R	-h	Data input. Digital inputs can be configured to be sampled in four ways. 1h: Digital inputs are sampled at the start of each frame. The SOF signal can be used externally to update the input data, because the SOF is signaled before input data is sampled. 2h: The sample time can be controlled externally by using them PR<k>_EDC_LATCH0_IN signal. 3h: Digital inputs are sampled at SYNC0 events. 4h: Digital inputs are sampled at SYNC1 events. These can be configured by [5-4] IN_MODE bit field in the PRU_ICSS_IEP_DIGIO_CTRL register.

4.5.10.85 PRU_ICSS_IEP_DIGIO_DATA_IN_RAW Register (Offset = 30Ch) [reset = -h]

PRU_ICSS_IEP_DIGIO_DATA_IN_RAW is shown in Figure 4-307 and described in Table 4-650.

Table 4-809. STCTPR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	TO_PRELOAD	R/W	FFFFFFFFh	Self test time out preload [RWP - Read, Priviledge Mode Write only] This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run. This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective. This register value [preload count value] gets loaded into the self test timeout down counter whenever a self test run is initiated [ST_ENA is enabled]. and gets disabled on completion of a self test run. Reset Source: r5ss_core_rst_mod_g_rst_n

Table 4-889. CORE1_CURMISR_27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	C1MISR27	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed. Reset Source: r5ss_core_rst_mod_g_rst_n

Table 4-925. CORE2_CURMISR_17 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	C2MISR17	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed. Reset Source: r5ss_core_rst_mod_g_rst_n

4.6.127 STC_CORE2_CURMISR_18 Registers

Table 4-1080. DCC_DCCGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE		Reserved
15:12	DONEENA	R/W	5h	The DONEENA bit enables/disables the done interrupt signal, but has no effect on the done status flag in DCCSTAT register. User, privilege, and debug mode (read): 0101 = the done signal is disabled others = the done signal is enabled Privilege and debug mode (write): 0101 = disable done signal generation others = enable done signal generation
11:8	SINGLESHOT	R/W	5h	The SINGLESHOT bit enables/disables repetitive operation of the DCC. User, privilege, and debug mode (read): 1010 = stop counting when counter0 and valid0 both reach zero 1011 = stop counting when counter1 reaches zero others = continuously repeat (until error) Privilege and debug mode (write): 1010 = stop counting when counter0 and valid0 both reach zero 1011 = stop counting when counter1 reaches zero others = continuously repeat (until error)
7:4	ERRENA	R/W	5h	The ERRENA bit enables/disables the error signal. User, privilege, and debug mode (read): 0101 = the error signal is disabled others = the error signal is enabled Privilege and debug mode (write): 0101 = disable error signal generation others = enable error signal generation
3:0	DCCENA	R/W	5h	The DCCENA bit starts and stops the operation of the dcc. User, privilege, and debug mode (read): 0101 = counters are stopped others = counters are running Privilege and debug mode (write): 0101 = stop counters and error-checking others = load the counters with their seed values and begin counting

4.8.2 DCC_DCCREV Registers

4.8.2.1 DCCREV Register (Offset = 4h) [reset = 40010b00h]

Short Description: DCC Revision ID

Long Description: Specifies the module version.

Return to Summary Table

Table 4-1081. Instance Table

Instance Name	Physical Address

Table 4-1102. DCC_DCCGCTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:12	RESERVED	NONE		Reserved
11:8	FIFO_NONERR	R/W	5h	Enables/disables FIFO writes without the error event on completion of comparison window. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Source values: 0101: Counter values are captured to non-full FIFO only upon Error event. Others: Write counter values to non-full FIFO upon completion of comparison window regardless of error or not.
7:4	FIFO_READ	R/W	5h	Enables the counter read registers reflect FIFO output instead of the live counter value. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Source values: 0101: Counter value is read directly. Others: Counters FIFO output is read.
3:0	CONT_ON_ERR	R/W	5h	Continues to next window of comparison despite the error condition. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Enable values: 0101: Comparison and counter reload is stopped from advancing if error is detected. Others: Counters get reloaded with seed and continue counting despite the error condition.

4.8.13 DCC_DCCSTATUS2 Registers

I2C3	5250 3004h

Access Types Legend

Table 4-1157. ICIMR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 7	NU	RW	0h	Reserved
6	AAS	RW	0h	Address As Slave interrupt mask bit. Setting a"1" to this bit unmasks the Address As Slave interrupt. Setting a"0" to this bit masks the Address As Slave interrupt.
5	SCD	RW	0h	Stop Condition Detection mask bit. Setting a"1" to this bit unmasks the Stop Condition Detection interrupt. Setting a "0" to this bit masks the Stop Condition Detection interrupt.
4	ICXRDY	RW	0h	Transmit Data Ready interrupt mask bit. Setting a"1" to this bit unmasks the Transmit Data Ready interrupt. Setting a"0" to this bit masks the Transmit Data Ready interrupt.
3	ICRRDY	RW	0h	Receive Data Ready interrupt mask bit. Setting a"1" to this bit unmasks the Receive Data Ready interrupt. Setting a"0" to this bit masks the Receive Data Ready interrupt.
2	ARDY	RW	0h	Register access ready interrupt mask bit. Setting a"1" to this bit unmasks the Register access ready interrupt. Setting a"0" to this bit masks the Register access ready interrupt.
1	NACK	RW	0h	No Acknowledgement interrupt mask bit. Setting a"1" to this bit unmasks the No Acknowledgement interrupt. Setting a"0" to this bit masks the No Acknowledgement interrupt.
0	AL	RW	0h	Arbitration Lost interrupt mask bit. Setting a"1" to this bit unmasks the Arbitration Lost interrupt. Setting a"0" to this bit masks the Arbitration Lost interrupt.

4.10.4 MSS_I2Cn_ICSTR Registers

4.10.4.1 I2Cn_ICSTR Register (Offset = 8h) [reset = h]

Short Description: I2C Interrupt Status register

Long Description:

Return to Summary Table

Table 4-1158. Instance Table

Instance Name	Physical Address
I2C0	5250 0008h
I2C1	5250 1008h
I2C2	5250 2008h
I2C3	5250 3008h

Access Types Legend

Table 4-1159. ICSTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 15	NU2	RW	0h	Reserved
14	SDIR	RW	0h	Slave Direction. This bit is clear to '0' indicating the I2C is a master transmitter/receiver or a slave receiver. This bit is also clear by STOP condition or START condition. It is set to '1' when the I2C slave is a transmitter. In DLB mode (which the configuration should be master-transmitter slave-receiver) this bit is clear to '0'. Writing a"1" to this bit to clear it.
13	NACKSNT	RW	0h	A No Acknowledge is sent due to NACKMOD is set to a"1". NACKSNT =0: A No Acknowledge is not sent. NACKSNT =1: A No Acknowledge is sent. Writing a"1" to this bit to clear it.
12	BB	RW	0h	Bus Busy. This bit indicates the state of the serial bus. BB=0: The bus is free. BB=1: The bus is occupied. On reception of a"start" condition the device sets BB to 1. This bit is also set if the I2C detects SCL low state. BB is clear to 0 after reception of a"stop" condition. BB is kept to"0" regardless SCL state when the I2C is in reset (IRS_=0). If the IRS_ is set to"1" during transaction between other I2C devices the BB bit is set at the first falling edge of SCL or START condition. - (RW)
11	RSFULL	RW	0h	Receive shift full. This bit indicates whether the receiver has experienced overrun. Overrun occurs when the receive shift register (ICRSR) is full and ICDRR has not been read since the ICRSR-to-ICDRR transfer. The FSM is holding for ICDRR read access. RSFULL is clear when reading the ICDRR. RSFULL is set to"1" when the I2C has recognized an overrun. The contents of ICDRR are NOT lost in this case. In repeat mode since double buffer (ICRSR and ICDRR) behaves like a single buffer RSFULL is set to"1" every time the data is received. RSFULL is clear as a result of reading the ICDRR. - (RW)
10	XSMT	RW	0h	Transmit shift empty not. This bit indicates whether the transmitter has experienced underflow. Underflow occurs when the transmit shift register (ICXSR) is empty and ICDXR has not been loaded. The FSM is holding for ICDXR write access. XSMT_ is cleared when underflow has occurred. XSMT_ is set to"1" as a result of writing to ICDXR. In repeat mode if the I2C in master transmitter mode is holding transfer with XSMT_=0 (i.e. waiting for further action) and the STT or STP bit is set XSMT_ is set to"1" by hardware.
9	AAS	RW	0h	Address As Slave. This bit is set to 1 by the device when it has recognized its own slave address or an address of all (8) zeros. The AAS bit is reset by stop condition or detection of any address byte that does not match ICOAR. - (RW)

Table 4-1159. ICSTR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	AD0	RW	0h	Address Zero Status: This bit is set to 1 by device if it detects the address of all (8) zeros (i.e. general call). The AD0 bit is reset to 0 (default value) when a"start" or"stop" condition is detected. - (RW)
7 - 6	NU1	RW	0h	Reserved
5	SCD	RW	0h	Stop Condition Detection bit SCD is set when the I2C sends or receives STOP condition. This bit is cleared by reading ICIVR (as 110) or writing '1' to itself.
4	ICXRDY	RW	0h	Transmit Data Ready interrupt flag bit. ICXRDY is set to"1" is generated when the transmitted data has been copied from ICDXR to the transmit-shift register (ICXSR). ICRXDY is clear to"0" when the ICDXR is written. This bit can also be polled by the CPU to write a new transmitted data into the ICDXR. Write '1' to this bit will set it and DXR Write will clear it.
3	ICRRDY	RW	0h	Receive Data Ready interrupt flag bit. ICRRDY is set to"1" when the received data has been copied from ICRSR into the ICDRR. ICRRDY is cleared to"0" when the ICDRR is read. This bit can also be polled by the CPU to read the received data in the ICDRR. Write '1' or DRR Read will clear it.
2	ARDY	RW	0h	Register-access-ready interrupt flag bit. ARDY is generated by the hardware if the I2C is in the master mode when the previously programmed data and command has been performed and status bit has been updated. This flag is used by the CPU to let it knows that the I2C registers are ready to be accessed again. When RM=0 ARDY is set when the internal data count is passed 0 if STP register bit has not been set. When RM=1 ARDY is set at each byte end. If the I2C is in FDF mode(FDF=1) ARDY is set just after Start condition. This bit is automatically cleared by hardware when writing data to ICDXR in transmit mode reading data from ICDRR in receive mode or setting STT or STP bit. Write '1' will clear it.
1	NACK	RW	0h	No-Acknowledgement interrupt flag bit. The No Acknowledge flag bit is set when the hardware in "master" mode detects no acknowledge has been received. This bit is NOT set by no-acknowledgement after Start byte Write '1' or Read the ICIVR (as 010) will clear it.
0	AL	RW	0h	Arbitration-Lost interrupt flag bit. The Arbitration Lost flag bit is set to 1 when the device in the "master" mode senses it has lost an arbitration when two or more transmitters start a transmission almost simultaneously or when the I2C attempts to start a transfer while BB (bus busy) is 1. When this is set to 1 due to arbitration lost the MST/STT/STP bits are clear the I2C becomes a slave. Write '1' or Read the ICIVR (as 001) will clear it.

4.10.5 MSS_I2Cn_ICCLKL Registers

4.10.5.1 I2Cn_ICCLKL Register (Offset = Ch) [reset = h]

Short Description: I2C Clock Divider Low register

Long Description:

Return to Summary Table

Table 4-1160. Instance Table

Instance Name	Physical Address
I2C0	5250 000Ch

7 - 0	D7_D0	RW	0h	Transmit data

4.10.11 MSS_I2Cn_ICMDR Registers

4.10.11.1 I2Cn_ICMDR Register (Offset = 24h) [reset = h]

Short Description: I2C Mode register

Long Description:

Return to Summary Table

Table 4-1172. Instance Table

Instance Name	Physical Address
I2C0	5250 0024h
I2C1	5250 1024h
I2C2	5250 2024h
I2C3	5250 3024h

Access Types Legend

Table 4-1173. ICMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	NU2	RW	0h	Reserved
15	NACKMOD	RW	0h	No Acknowledge (NACK) mode. This bit is used to send an Acknowledge (ACK) or a No Acknowledge (NACK) to the transmitter. This bit is only applicable when the I2C is in receiver mode. In master receiver mode when the internal data count counter decrements to zero the I2C sends a NACK. The master receiver I2C finishes a transfer when it sends a NACK. The I2C ignores ICCNT when NACKMOD is '1'. The NACKMOD bit should be set before the rising edge of the last data bit (bit 8) if a NACK must be sent and this bit is cleared once a NACK has been sent. NACKMOD=0 the I2C sends an ACK to the transmitter during the acknowledge cycle. NACKMOD=1 the I2C sends a NACK to the transmitter during the acknowledge cycle.
14	FREE	RW	0h	Free Running. This bit is used to determine the state of the I2C when a breakpoint is encountered in the HLL debugger. FREE=0: (default) Stops immediately if SCL is low and keep driving SCL low whether I2C is master transmitter/receiver. If SCL is high I2C waits until SCL becomes low and then stops. If the I2C is a slave it will stop when the transmission/receiving completes. FREE=1: The I2C runs free.
13	STT	RW	0h	Start Condition (Master only mode). This bit can be set to a"1" by the CPU to generate a Start condition. In master mode when setting Start to"1" generates a Start condition. It is reset to "0" by the hardware after the Start condition has been generated. The Start/ Stop bits can be configured to generate different transfer formats. Note that the STT and STP can be used to terminate the repeat mode. ST T STP Conditions Bus Activities 1 0 Start S-A-D 0 1 Stop P 1 1 Start-Stop (ICCNT= n) S-A-D..(n)..D-P 1 0 Start (ICCNT= n) S-A-D..(n)..D
12	NU1	RW	0h	Reserved for IDLEEN (IDLE Enable on 5509). - (RW)
11	STP	RW	0h	Stop Condition (Master mode only). This bit can be set to a"1" by the CPU to generate a Stop condition. It is reset to "0" by the hardware after the Stop condition has been generated. The Stop condition is generated when ICCNT passes 0 when the I2C is in non-repeat mode(RM=0).

Table 4-1173. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	MST	RW	0h	Master. MST=0: The I 2 C peripheral is in the"slave" mode and clock is received from the"master" device. MST=1: The I 2 C peripheral is in the"master" mode and it generates the clock. This bit is clear when the transfer completed.
9	TRX	RW	0h	Transmitter. TRX=0: The I 2 C is in the"receiver" mode and data on data line SDA is shifted into the data register ICDRR. TRX=1: The I 2 C is in the"transmitter" mode and the data in ICDXR is shifted out on data line SDA. The operating modes (not in FDF mode) are defined as follows. In FDF mode TRX must be configured even if the I2C is in slave mode because there is no address/direction byte in FDF mode. _____MST___TRX___Operating Modes _0_____x_____"slave receiver" _0_____x_____"slave transmitter" _1_____0_____"master receiver" _1_____1_____"master transmitter" _____
8	XA	RW	0h	Expanded Address. XA=0: (default) 7-bit address mode (normal address mode). XA=1: 10-bit address mode (expanded address mode) Please note that XA needs to be configured even if the I2C is in slave mode.
7	RM	RW	0h	Repeat Mode. This bit is set to a"1" by the CPU to put the I2C in the repeat mode. In this mode data is continuously transmitted out of the ICDXR until the STP bit is set to"1" regardless of ICCNT value. This bit is don"t care if the I2C is configured in slave mode. _____ __RM___STT___STP___Conditions_____Bus Activities_____Mode _0_____0_____0_____Idle_____None_____NA _0_____0_____1_____Stop_____P_____NA _0_____1_____0_____(Re)Start_____S-A-D..(n)..D____Repeat n _0_____1_____1_____(Re)Start-Stop___S-A-D..(n)..D-P__Repeat n _1_____0_____0_____Idle_____none_____NA _1_____0_____1_____Stop_____P _____NA _1_____1_____0_____(Re)Start_____S-A-D-D-D..____Continuous _1_____1_____1_____Reserved_____None_____NA _____ __
6	DLB	RW	0h	Digital Loop Back (in master transmit mode only). This bit is set to a"1" by the CPU to put the I2C in the loop back mode. In this mode data transmitted out of the ICDXR will be received in the ICDRR after ((CPU freq/I2C freq)8) CPU cycles via an internal path. The address of the ICOAR is output on SDA.
5	IRS	RW	0h	I2C Reset Not. This can be set to a"0" by the CPU to put the I2C in reset or to a"1" to take the I2C out of reset. When this bit is reset to 0 all status bits in ICSTR and ICIVR are set to default values. Note that if this bit is reset during a transfer it can cause the I2C bus hang (SDA and SCL are tri-stated).
4	STB	RW	0h	Start Byte (Master only mode). The Start Byte mode bit is set to 1 by the CPU to configure the I2C in Start byte mode the I2C sends "00000001"? regardless ICSAR value. Refer to the Philip I2C spec for more details.
3	FDF	RW	0h	Free Data Format. This bit can be set to"1" by the CPU to configure the I2C in Free Data Format mode. _____FDF___M ST___TRX_____Operating mode _0_____0_____ x____Slave in non FDF mode _0_____1_____0____Master receive in non FDF mode _0_____1_____1____Master transmit in non FDF mode _1_____0_____0____Slave receiver in FDF mode _1_____0_____1____Slave transmitter in FDF mode _1_____1_____0____Master receiver in FDF mode _1_____1_____1____Master transmitter in FDF mode _____

Table 4-1173. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2 - 0	BC2_BC1_BC0	RW	0h	Bit Count : Bit Count 2, Bit Count 1 and Bit Count 0 define the number of bits starting from the lsb (excluding the acknowledge bit) of the next byte which are yet to be received or transmitted. BC2_BC1_BC0 Bits/byte in FDF Bits/byte w/ ACK 0 0 0 8 9 0 0 1 1 NA (reserved) 0 1 0 2 3 0 1 1 3 4 1 0 0 4 5 1 0 1 5 6 1 1 0 6 7 1 1 1 7 8 NA (reserved)

4.10.12 MSS_I2Cn_ICIVR Registers

4.10.12.1 I2Cn_ICIVR Register (Offset = 28h) [reset = h]

Short Description: I2C Interrupt Vector register

Long Description:

Return to Summary Table

Table 4-1174. Instance Table

Instance Name	Physical Address
I2C0	5250 0028h
I2C1	5250 1028h

Access Types Legend

Table 4-1175. ICIVR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 12	NU2	RW	0h	Reserved.
11 - 8	TESTMD	RW	0h	Reserved for internal testing.
7 - 3	NU1	RW	0h	Reserved.
2 - 0	INTCODE	RW	0h	Interrupt code. The binary-coded-interrupt vector indicates which interrupt has occurred. Reading the ICIVR clears the interrupt code except ARDY(011) RRDY(100) and XRDY(101). Interrupt code for ARDY RRDY and XRDY is cleared when ARDY ICRRDY and ICXRDY bits in the ICSTR is cleared to default value respectively. If other interrupts are pending a new interrupt is generated. If there are more than one interrupt flag reading the ICIVR clears the highest priority interrupt code. Reading the ICIVR also clears corresponding status bit in the ICSTR except ARDY ICRRDY ICXRDY and AAS. Note that users must read (clear) the ICIVR before doing another start otherwise the ICIVR could contain incorrect (old interrupt flags) value. Interrupt Code Interrupt Occurred 000 (default) None 001 (highest priority) Arbitration Lost interrupt 010 No Acknowledgement interrupt 011 Register Access Ready interrupt 100 Receive Data Ready interrupt 101 Transmit Data Ready interrupt 110 Stop Condition Detection 111 (lowest priority) Address As Slave - (RW)

4.10.13 MSS_I2Cn_ICEMDR Registers

4.10.13.1 I2Cn_ICEMDR Register (Offset = 2Ch) [reset = h]

Table 4-1216. SCIGCR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:26	RESERVED_3	R	0h	Reserved
25	TXENA	R/W	0h	Transmit enable. This bit is effective in LIN and SCI modes. Data is transferred from SCITD or the TDy [with y=0, 1,...7] buffers in LIN mode to the SCITXSHF shift out register only when the TXENA bit is set. Note: Data written to SCITD or the transmit multi-buffer before TXENA is set is not transmitted. If TXENA is cleared while transmission is ongoing, the data previously written to SCITD is sent [including the checksum byte in LIN mode]. 1 TXENA_ENABLE Enable transfers of data from SCITD or TDy to SCITXSHF

Table 4-1216. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	RXENA	R/W	0h	Receive enable. This bit is effective in LIN or SCI-compatible mode. RXENA allows or prevents the transfer of data from SCIRXSHF to SCIRD or the receive multibuffers. Note: Clearing RXENA stops received characters from being transferred into the receive buffer or multi-buffers, prevents the RX status flags [see Table 7] from being updated by receive data, and inhibits both receive and error interrupts. However, the shift register continues to assemble data regardless of the state of RXENA. Note: If RXENA is cleared before the time the reception of a frame is complete, the data from the frame is not transferred into the receive buffer. Note: If RXENA is set before the time the reception of a frame is complete, the data from the frame is transferred into the receive buffer. If RXENA is set while SCIRXSHF is in the process of assembling a frame, the status flags are not guaranteed to be accurate for that frame. To ensure that the status flags correctly reflect what was detected on the bus during a particular frame, RXENA should be set before the detection of that frame 1 RXENA_RUN Allows the receiver to transfer data from the shift buffer to the receive buffer or multi-buffers
23:18	RESERVED_2	R	0h	Reserved
17	CONT	R/W	0h	Continue on suspend. This bit has an effect only when a program is being debugged with an emulator, and it determines how the SCI/LIN operates when the program is suspended. This bit affects the LIN counters. When this bit is set, the counters are not stopped during debug. When this bit is cleared, the counters are stopped during debug. 1 CONT_RUN When debug mode is entered, the SCI/LIN continues to operate until the current transmit and receive functions are complete.
16	LOOPBACK	R/W	0h	Loopback bit. This bit is effective in LIN or SCI-compatible mode. The self-checking option for the SCI/LIN can be selected with this bit. If the LINTX and LINRX pins are configured with SCI/LIN functionality, then the LINTX pin is internally connected to the LINRX pin. Externally, during loop back operation, the LINTX pin outputs a high value and the LINRX pin is in a high-impedance state. If this bit value is changed while the SCI/LIN is transmitting or receiving data, errors may result. 1 LOOPBACK_ENABLE Loopback mode is enabled.
15:14	RESERVED_1	R	0h	Reserved
13	STOPEXTFRAME	R/W	0h	Stop extended frame communication. This bit is effective in LIN mode only. This bit can be written only during extended frame communication. When the extended frame communication is stopped, this bit is cleared automatically. 1 STOPEXTFRAME_EFFECT Extended frame communication will be stopped, once current frame transmission/reception is completed.
12	HGENCTRL	R/W	0h	HGEN control bit. This bit is effective in LIN mode only. This bit controls the type of mask filtering comparison. 1 HGENCTRL_IDSLAVE ID filtering using ID- SlaveTask byte (Recommended). RECEIVEDID and IDSLAVETASKBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in ALWAYS match
11	CTYPE	R/W	0h	Checksum type. This bit is effective in LIN mode only. This bit controls the type of checksum to be used: classic or enhanced. 1 CTYPE_ENHANCED Enhanced checksum is used. The enhanced checksum is compatible with LIN 2.0 and newer slave nodes. The enhanced checksum contains the modulo-256 sum with carry over all data bytes AND the protected Identifier.
10	MBUFMODE	R/W	0h	Multibuffer mode. This bit is effective in LIN or SCI-compatible mode. This bit controls receive/transmit buffer usage, that is, whether the RX/TX multibuffers are used or a single register, RD0/TD0, is used. 1 MBUFMODE_ENABLED The multi-buffer mode is enabled.

Table 4-1216. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	ADAPT	R/W	0h	Adapt mode enable. This mode is effective in LIN mode only. This bit has an effect during the detection of the Sync Field. There are two LIN protocol bit rate modes that could be enabled with this bit according to the Node capability file definition: automatic or select. Software and network configuration will decide which of the previous two modes. When this bit is cleared, the LIN 2.0 protocol fixed bit rate should be used. If the ADAPT bit is set, a LIN slave node detecting the baudrate will compare it to the prescalers in BRSR register and update it if they are different. The BRSR register will be updated with the new value. If this bit is not set there will be no adjustment to the BRSR register. This field is writable in LIN mode only. 1 ADAPT_ENABLE Automatic baudrate adjustment is enabled.
8	SLEEP	R/W	0h	SCI sleep. SCI compatibility mode only. In a multiprocessor configuration, this bit controls the receive sleep function. Clearing this bit brings the SCI out of sleep mode. The receiver still operates when the SLEEP bit is set; however, RXRDY is updated and SCIRD is loaded with new data only when an address frame is detected. The remaining receiver status flags are updated and an error interrupt is requested if the corresponding interrupt enable bit is set, regardless of the value of the SLEEP bit. In this way, if an error is detected on the receive data line while the SCI is asleep, software can promptly deal with the error condition. The SLEEP bit is not automatically cleared when an address byte is detected. This field is writable in SCI mode only. 1 SLEEP_ENABLE Sleep mode is enabled.
7	SWNRST	R/W	0h	Software reset [active low]. This bit is effective in LIN or SCI-compatible mode. The SCI/LIN should only be configured while SWnRST = 0. Only the following configuration bits can be changed in runtime [i.e., while SWnRESET = 1]: - STOP EXT Frame [SCIGCR1[13]] - CC bit [SCIGCR2[17]] - SC bit [SCIGCR2[16]] 1 SWnRST_READY The SCI/LIN is in its ready state; transmission and reception can occur. After this bit is set to 1, the configuration of the module should not change.
6	LINMODE	R/W	0h	LIN mode This bit controls the mode of operation of the module. 1 LINMODE_ENABLE LIN mode is enabled; SCI compatibility mode is disabled.
5	CLK_MASTER	R/W	0h	SCI internal clock enable or LIN Master/Slave configuration. In the SCI mode, this bit enables the clock to the SCI module. In LIN mode, this bit determines whether a LIN node is a slave or master. 1 CLK_MASTER_ON SCI-compatible mode: Enable clock to the SCI module. LIN mode: The node is in master mode.
4	STOP	R/W	0h	SCI number of stop bits. This bit is effective in SCI-compatible mode only. Note: The receiver checks for only one stop bit. However in idle-line mode, the receiver waits until the end of the second stop bit [if STOP = 1] to begin checking for an idle period. This field is writable in SCI mode only. 1 STOP_TWO Two stop bits are used.
3	PARITY	R/W	0h	SCI parity odd/even selection. This bit is effective in SCI-compatible mode only. If the PARITY ENA bit [SCIGCR1.2] is set, PARITY designates odd or even parity. The parity bit is calculated based on the data bits in each frame and the address bit [in address-bit mode]. The start and stop fields in the frame are not included in the parity calculation. This field is writable in SCI mode only. 1 PARITY_EVEN Even parity is used. The SCI transmits and expects to receive a value in the parity bit that makes even the total number of bits in the frame with the value of 1.
2	PARITYENA	R/W	0h	Parity enable. Enables or disables the parity function. 1 PARITYENA_ENABLE SCI compatible mode: Parity enabled. A parity bit is generated during transmission and is expected during reception. LIN mode: ID- parity verification is enabled.
1	TIMINGMODE	R/W	0h	SCI timing mode bit. This bit is effective in SCI-compatible mode only. It must be set to 1 when the SCI mode is used. This bit configures the SCI for asynchronous operation. 1 TIMINGMODE_SET Must be set to 1 when module is configured for SCI operation

Table 4-1216. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	COMMMODE	R/W	0h	SCI/LIN communication mode bit. In compatibility mode, it selects the SCI communication mode. In LIN mode it selects length control option for ID-field bits ID4 and ID5. 1 COMMMODE_USE SCI-compatible mode: Address- bit mode is used. LIN mode: ID4 and ID5 are used for length control.

4.12.3 LIN_SCIGCR2 Registers

4.12.3.1 LIN_SCIGCR2 Register (Offset = 8h) [reset = 0h]

Short Description: The SCIGCR2 register is u

Long Description: The SCIGCR2 register is used to send or compare a checksum byte during extended frames, to generate a wakeup and for low-power mode control of the LIN module.

Table 4-1218. SCIGCR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:18	RESERVED_3	R	0h	Reserved
17	CC	R/W	0h	Compare Checksum. This mode is effective in LIN mode only. This bit is used by the receiver for extended frames to trigger a checksum compare. The user will initiate this transaction by writing a one to this bit. In non multibuffer mode, once the CC bit is set, the checksum will be compared on the byte that is currently being received, expected to be the checkbyte. During Multi-buffer mode, following are the scenarios associated with the CC bit : - If CC bit is set during the reception of the data, then the byte that is received after the reception of the programmed no. of data bytes indicated by SCIFORMAT[18:16], is treated as a checksum byte. - If CC bit is set during the IDLE period [i.e. during inter-frame space], then the next immediate byte will be treated as a checksum byte. A CE will immediatly be flagged if there is a checksum error. This bit is automatically cleared once the checksum is successfully compared. 1 CC_EFFECT Compare checksum on expected checkbyte
16	SC	R/W	0h	Send Checksum This mode is effective in LIN mode only. This bit is used by the transmitter with extended frames to send a checkbyte. In non multibuffer mode the checkbyte will be sent after the current byte transmission. In multibuffer mode the checkbyte will be sent after the last byte count, indicated by the SCIFORMAT[18:16]]. This field is writable in LIN mode only. 1 SC_CHECK A checkbyte will be sent. This bit will automatically get cleared after the checkbyte is transmitted. The checksum will not be sent if this bit is set before transmitting the very first byte, that is, during interframe space.

Table 4-1218. SCIGCR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:9	RESERVED_2	R	0h	Reserved
8	GENWU	R/W	0h	Generate wakeup signal. This bit controls the generation of a wakeup signal, by transmitting the TDO buffer value. This bit is cleared on reception of a valid sync break. 1 GENWU_EFFECT Transmit TDO for wakeup. This bit will be cleared on a SWnRST (SCIGCR1.7)
7:1	RESERVED_1	R	0h	Reserved
0	POWERDOWN	R/W	0h	Power down. This bit is effective in LIN or SCI-compatible mode. When the powerdown bit is set, the SCI/LIN module attempts to enter local low-power mode. If the POWERDOWN bit is set while the receiver is actively receiving data and the wakeup interrupt is disabled, then the SCI/LIN will delay low-power mode from being entered until completion of reception. In LIN mode the user may set the POWERDOWN bit on Sleep Command reception or on idle bus detection [more than 4 seconds, i.e. 80,000 cycles at 20kHz] 1 POWERDOWN_LOW Request local low-power mode

4.12.4 LIN_SCISETINT Registers

4.12.4.1 LIN_SCISETINT Register (Offset = Ch) [reset = 0h]

Short Description: The SCISETINT register is

Long Description: The SCISETINT register is used to enable the various interrupts available in the LIN module.

Table 4-1220. SCISETINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SETBEINT	R/W1TS	0h	Set bit error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is a bit error. This field is writable in LIN mode only. 1 SETBEINT_ENABLE Interrupt is enabled.
30	SETPBEINT	R/W1TS	0h	Set physical bus error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when a physical bus error occurs. This field is writable in LIN mode only. 1 SETPBEINT_ENABLE Interrupt is enabled.
29	SETCEINT	R/W1TS	0h	Set checksum-error Interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is a checksum error. This field is writable in LIN mode only. 1 SETCEINT_DEABLE Interrupt is enabled.
28	SETISFEINT	R/W1TS	0h	Set inconsistent-sync-field-error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is an inconsistent sync field error. This field is writable in LIN mode only. 1 SETISFEINT_ENABLE Interrupt is enabled.
27	SETNREINT	R/W1TS	0h	Set no-response-error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when a no-response error occurs. This field is writable in LIN mode only. 1 SETNREINT_ENABLE Interrupt is enabled.

Table 4-1220. SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	SETFEINT	R/W1TS	0h	Set framing-error interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a framing error occurs. 1 SETFEINT_ENABLE Interrupt is enabled.
25	SETOEINT	R/W1TS	0h	Set overrun-error interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when an overrun error occurs. 1 SETOEINT_ENABLE Interrupt is enabled.
24	SETPEINT	R/W1TS	0h	Set parity interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a parity error occurs. 1 SETPEINT_ENABLE Interrupt is enabled.
23:19	RESERVED_5	R	0h	Reserved
18	SET_RX_DMA_ALL	R/W1TS	0h	Set receiver DMA for Address & Data frames. This bit is effective in LIN or SCI-compatible mode. To enable RX DMA request for address and data frames this bit must be set. If it is cleared, RX interrupt request is generated for address frames and DMA requests are generated for data frames. 1 SERXDMAALL_ENABLE Receiver DMA request is enabled for address and data frames
17	SET_RX_DMA	R/W1TS	0h	Set receiver DMA. This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the receiver this bit must be set. If it is cleared, interrupt requests are generated depending on SETRXINT. 1 SERXDMA_ENABLE Receiver DMA request is enabled.
16	SET_TX_DMA	R/W1TS	0h	Set transmit DMA. This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the transmitter, this bit must be set. If it is cleared, interrupt requests are generated depending on SETTXINT. 1 SETXDMA_ENABLE Transmit DMA request is enabled
15:14	RESERVED_4	R	0h	Reserved
13	SETIDINT	R/W1TS	0h	Set Identification interrupt. This bit is effective in LIN mode only. This bit is set to enable interrupt once a valid matching identifier is received. 1 SETIDINT_ENABLE Interrupt is enabled.
12:10	RESERVED_3	R	0h	Reserved
9	SETRXINT	R/W1TS	0h	Set Receiver interrupt. Setting this bit enables the SCI/LIN to generate a receive interrupt after a frame has been completely received and the data is being transferred from SCIRXSHF to SCIRD. 1 SETRXINT_ENABLE Interrupt is enabled.
8	SETTXINT	R/W1TS	0h	Set Transmitter interrupt. Setting this bit enables the SCI/LIN to generate a transmit interrupt as data is being transferred from SCITD to SCITXSHF and the TXRDY bit is being set. 1 SETTXINT_ENABLE Interrupt is enabled.
7	SETTOA3WUSINT	R/W1TS	0h	Set Timeout After 3 Wakeup Signals interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after 3 wakeup signals have been sent. This field is writable in LIN mode only. 1 SETTOA3WUSINT_ENABLE Interrupt is enabled.
6	SETTOAWUSINT	R/W1TS	0h	Set Timeout After Wakeup Signal interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after one wakeup signal has been sent. This field is writable in LIN mode only. 1 SETTOAWUSINT_ENABLE Interrupt is enabled.
5	RESERVED_2	R	0h	Reserved
4	SETTIMEOUTINT	R/W1TS	0h	Set timeout interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when no LIN bus activity [bus idle] occurs for at least 4 seconds. This field is writable in LIN mode only. 1 SETTIMEOUTINT_ENABLE Interrupt is enabled.
3:2	RESERVED_1	R	0h	Reserved

Table 4-1220. SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	SETWAKEUPINT	R/W1TS	0h	Set wake-up interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN to generate a wake-up interrupt and thereby exit low-power mode. The wake-up interrupt is asserted on falling edge of the wake-up pulse. If enabled, the wake-up interrupt is asserted when local low-power mode is requested while the receiver is busy or if a low level is detected on the SCIRX pin during low-power mode. Wake-up interrupt is not asserted upon a wakeup pulse if the module is not in power down mode. 1 SETWAKEUPINT_ENABLE Interrupt is enabled.
0	SETBRKDTINT	R/W1TS	0h	Set break-detect interrupt. This bit is effective in SCI-compatible mode only. Setting this bit enables the SCI/LIN to generate an interrupt if a break condition is detected on the LINRX pin. This field is writable in SCI mode only. 1 SETBRKDTINT_ENABLE Interrupt is enabled.

4.12.5 LIN_SCICLEARINT Registers

4.12.5.1 LIN_SCICLEARINT Register (Offset = 10h) [reset = 0h]

Short Description: The SCICLEARINT register

Long Description: The SCICLEARINT register is used to disable the enabled interrupts without accessing the SCISETINT register.

Table 4-1222. SCICLEARINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CLRBEINT	R/W1TC	0h	Clear Bit Error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the bit error interrupt. This field is writable in LIN mode only. 1 CLRBEINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
30	CLRPBEINT	R/W1TC	0h	Clear Physical Bus Error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the physical-bus error interrupt. This field is writable in LIN mode only. 1 CLRPBEINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
29	CLRCEINT	R/W1TC	0h	Clear checksum-error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the checksum-error interrupt. This field is writable in LIN mode only. 1 CLRCEINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
28	CLRISFEINT	R/W1TC	0h	Clear Inconsistent-Sync-Field-Error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the ISFE interrupt. This field is writable in LIN mode only. 1 CLRISFEINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.

Table 4-1222. SCICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	CLRNREINT	R/W1TC	0h	Clear No-Reponse-Error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the no-response error interrupt. This field is writable in LIN mode only. 1 CLRNREINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
26	CLRFEINT	R/W1TC	0h	Clear Framing-Error Interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables framing-error interrupt. 1 CLRFEINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
25	CLROEINT	R/W1TC	0h	Clear Overrun-Error Interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the overrun interrupt. 1 CLROEINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
24	CLRPEINT	R/W1TC	0h	Clear Parity Interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the parity error interrupt. 1 CLRPEINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
23:19	RESERVED_6	R	0h	Reserved
18	RESERVED_5	R	0h	Reserved
17	SETRXDMA	R/W1TC	0h	Clear receiver DMA. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the receive DMA request. 1 CLRRXDMA_ENABLE Receiver DMA request is enabled. Writing a 1 to this bit will disable the DMA request and clear this bit.
16	CLRTXDMA	R/W1TC	0h	Clear transmit DMA. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the transmit DMA request. 1 CLRTXDMA_ENABLE Transmit DMA request is enabled. Writing a 1 to this bit will disable the DMA request and clear this bit.
15:14	RESERVED_4	R	0h	Reserved
13	CLRIDINT	R/W1TC	0h	Clear Identifier interrupt. This bit is effective in LIN mode only. Setting this bit disables the ID interrupt. 1 CLRIDINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
12:10	RESERVED_3	R	0h	Reserved
9	CLRRXINT	R/W1TC	0h	Clear Receiver interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the receiver interrupt. 1 CLRRXINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
8	CLRTXINT	R/W1TC	0h	Clear Transmitter interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the transmitter interrupt. 1 CLRTXINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
7	CLRTOA3WUSINT	R/W1TC	0h	Clear Timeout After 3 Wakeup Signals interrupt. This bit is effective in LIN mode only. Setting this bit disables the timeout after 3 wakeup signals interrupt. This field is writable in LIN mode only. 1 CLRTOA3WUSINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
6	CLRTOAWUSINT	R/W1TC	0h	Clear Timeout After Wakeup Signal interrupt. This bit is effective in LIN mode only. Setting this bit disables the timeout after one wakeup signal interrupt. This field is writable in LIN mode only. 1 CLRTOAWUSINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
5	RESERVED_2	R	0h	Reserved
4	CLRTIMEOUTINT	R/W1TC	0h	Clear Timeout interrupt. This bit is effective in LIN mode only. Setting this bit disables the timeout [LIN bus idle] interrupt. This field is writable in LIN mode only. 1 CLRTIMEOUTINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
3:2	RESERVED_1	R	0h	Reserved

Table 4-1222. SCICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CLRWAKEUPINT	R/W1TC	0h	Clear Wake-up interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the wake-up interrupt. 1 CLRWAKEUPINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
0	CLRBRKDTINT	R/W1TC	0h	Clear Break-detect interrupt. This bit is effective in SCI-compatible mode only. Setting this bit disables the Break-detect interrupt. This field is writable in SCI mode only. 1 CLRBRKDTINT_ENABLE Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.

4.12.6 LIN_SCISETINTLVL Registers

4.12.6.1 LIN_SCISETINTLVL Register (Offset = 14h) [reset = 0h]

Short Description: The SCISETINTLVL register

Long Description: The SCISETINTLVL register is used to map individual interrupt sources to the INT1 interrupt line.

Table 4-1224. SCISETINTLVL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SETBEINTLVL	R/W1TS	0h	Set Bit Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Bit Error interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETBEINTLVL_INT1 Interrupt level mapped to INT1 line.
30	SETPBEINTLVL	R/W1TS	0h	Set Physical Bus Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Physical Bus Error interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETPBEINTLVL_INT1 Interrupt level mapped to INT1 line.
29	SETCEINTLVL	R/W1TS	0h	Set Checksum-error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Checksum-error interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETCEINTLVL_INT1 Interrupt level mapped to INT1 line.
28	SETISFEINTLVL	R/W1TS	0h	Set Inconsistent-Sync-Field-Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Inconsistent-Sync-Field-Error interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETISFEINTLVL_INT1 Interrupt level mapped to INT1 line.

Table 4-1224. SCISETINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	SETNREINTLVL	R/W1TS	0h	Set No-Reponse-Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the No-Response-Error interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETNREINTLVL_INT1 Interrupt level mapped to INT1 line.
26	SETFEINTLVL	R/W1TS	0h	Set Framing-Error interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Framing-Error interrupt level to the INT1 line. 1 SETFEINTLVL_INT1 Interrupt level mapped to INT1 line.
25	SETOEINTLVL	R/W1TS	0h	Set Overrun-Error Interrupt Level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Overrun-Error interrupt level to the INT1 line. 1 SETOEINTLVL_INT1 Interrupt level mapped to INT1 line.
24	SETPEINTLVL	R/W1TS	0h	Set Parity Error interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Parity error interrupt level to the INT1 line. 1 SETPEINTLVL_INT1 Interrupt level mapped to INT1 line.
23:19	RESERVED_7	R	0h	Reserved
18	RESERVED_6	R	0h	Reserved
17:16	RESERVED_5	R	0h	Reserved
15:14	RESERVED_4	R	0h	Reserved
13	SETIDINTLVL	R/W1TS	0h	Set ID interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the ID interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETIDINTLVL_INT1 Interrupt level mapped to INT1 line.
12:10	RESERVED_3	R	0h	Reserved
9	SETRXINTOVO	R/W1TS	0h	Set Receiver interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the receiver interrupt level to the INT1 line. 1 SETRXINTOVO_INT1 Interrupt level mapped to INT1 line.
8	SETTXINTLVL	R/W1TS	0h	Set Transmitter interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the transmitter interrupt level to the INT1 line. 1 SETTXINTLVL_INT1 Interrupt level mapped to INT1 line.
7	SETTOA3WUSINTLVL	R/W1TS	0h	Set Timeout After 3 Wakeup Signals interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout after 3 wakeup signals interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETTOA3WUSINTLVL_INT Interrupt level mapped to INT1 1 line.
6	SETTOAWUSINTLVL	R/W1TS	0h	Set Timeout After Wakeup Signal interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the the timeout after wakeup interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETTOAWUSINTLVL_INT1 Interrupt level mapped to INT1 line.
5	RESERVED_2	R	0h	Reserved
4	SETTIMEOUTINTLVL	R/W1TS	0h	Set Timeout interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout interrupt level to the INT1 line. This field is writable in LIN mode only. 1 SETTIMEOUTINTLVL_INT Interrupt level mapped to INT1 1 line.
3:2	RESERVED_1	R	0h	Reserved
1	SETWAKEUPINTLVL	R/W1TS	0h	Set Wake-up interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Wake-up interrupt level to the INT1 line. 1 SETWAKEUPINTLVL_INT1 Interrupt level mapped to INT1 line.
0	SETBRKDTINTLVL	R/W1TS	0h	Set Break-detect interrupt level. This bit is effective in SCI-compatible mode only. Writing to this bit maps the Break-detect interrupt level to the INT1 line. This field is writable in SCI mode only. 1 SETBRKDTINTLVL_INT1 Interrupt level mapped to INT1 line.

4.12.7 LIN_SCICLEARINTLVL Registers

4.12.7.1 LIN_SCICLEARINTLVL Register (Offset = 18h) [reset = 0h]

Short Description: The SCICLEARINTLVL regist

Long Description: The SCICLEARINTLVL register is used to map individual interrupt sources to the INT0 line.

Table 4-1226. SCICLEARINTLVL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CLRBEINTLVL	R/W1TC	0h	Clear Bit Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Bit Error interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRBEINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
30	CLRPBEINTLVL	R/W1TC	0h	Clear Physical Bus Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Physical Bus Error interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRPBEINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
29	CLRCEINTLVL	R/W1TC	0h	Clear Checksum-error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Checksum-error interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRCEINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
28	CLRISFEINTLVL	R/W1TC	0h	Clear Inconsistent-Sync-Field-Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Inconsistent-Sync-Field-Error interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRISFEINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.

Table 4-1226. SCICLEARINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	CLRNREINTLVL	R/W1TC	0h	Clear No-Reponse-Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the No-Response-Error interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRNREINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
26	CLRFEINTLVL	R/W1TC	0h	Clear Framing-Error interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Framing-Error interrupt level to the INT0 line. 1 CLRFEINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
25	CLROEINTLVL	R/W1TC	0h	Clear Overrun-Error Interrupt Level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Overrun-Error interrupt level to the INT0 line. 1 CLROEINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
24	CLRPEINTLVL	R/W1TC	0h	Clear Parity Error interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Parity Error interrupt level to the INT0 line. 1 CLRPEINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
23:19	RESERVED_7	R	0h	Reserved
18	RESERVED_6	R	0h	Reserved
17:16	RESERVED_5	R	0h	Reserved
15:14	RESERVED_4	R	0h	Reserved
13	CLRIDINTLVL	R/W1TC	0h	Clear ID interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the ID interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRIDINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
12:10	RESERVED_3	R	0h	Reserved
9	CLRRXINTLVL	R/W1TC	0h	Clear Receiver interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the receiver interrupt level to the INT0 line. 1 CLRRXINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
8	CLRTXINTLVL	R/W1TC	0h	Clear Transmitter interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the transmitter interrupt level to the INT0 line. 1 CLRTXINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
7	CLRTOA3WUSINTLVL	R/W1TC	0h	Clear Timeout After 3 Wakeup Signals interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout after 3 wakeup signals interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRTOA3WUSINTLVL_INT Interrupt level mapped to INT1 1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
6	CLRTOAWUSINTLVL	R/W1TC	0h	Clear Timeout After Wakeup Signal interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the the timeout after wakeup interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRTOAWUSINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
5	RESERVED_2	R	0h	Reserved
4	CLRTIMEOUTINTLVL	R/W1TC	0h	Clear Timeout interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout interrupt level to the INT0 line. This field is writable in LIN mode only. 1 CLRTIMEOUTINTLVL_INT Interrupt level mapped to INT1 1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
3:2	RESERVED_1	R	0h	Reserved

Table 4-1226. SCICLEARINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CLRWAKEUPINTLVL	R/W1TC	0h	Clear Wake-up interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Wake-up interrupt level to the INT0 line. 1 CLRWAKEUPINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
0	CLRBRKDTINTLVL	R/W1TC	0h	Clear Break-detect interrupt level. This bit is effective in SCI-compatible mode only. Writing to this bit maps the Break-detect interrupt level to the INT0 line. This field is writable in SCI mode only. 1 CLRBRKDTINTLVL_INT1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.

4.12.8 LIN_SCIFLR Registers

4.12.8.1 LIN_SCIFLR Register (Offset = 1Ch) [reset = 904h]

Short Description: The SCIFLR register indic

Long Description: The SCIFLR register indicates the current status of the various interrupt sources of the LIN module.

Return to Summary Table

Table 4-1228. SCIFLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BE	R/W1TC	0h	Bit Error Flag. This bit is effective in LIN mode only. This bit is set when there has been a bit error. This is detected by the bit monitor in the internal bit monitor. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 1 BE_EFFECT Bit error detected.
30	PBE	R/W1TC	0h	Physical Bus Error Flag. This bit is effective in LIN mode only. This bit is set when there has been a physical bus error. This is detected by the bit monitor in TED. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break Note: thie PBE will ony be flagged if no sync break can be generated. [because of a bus shortage to VBAT] or if no sync break delimeter can be generated [because of a bus shortage to GND]. This field is writable in LIN mode only. 1 PBE_EFFECT Physical bus error detected.

Table 4-1228. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	CE	R/W1TC	0h	Checksum Error Flag. This bit is effective in LIN mode only. This bit is set when there is checksum error detected by a receiving node. The type of checksum to be used depends on the SCIGCR1.CTYPE bit. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 1 CE_EFFECT Checksum error detected.
28	ISFE	R/W1TC	0h	Inconsistent Sync Field Error Flag. This bit is effective in LIN mode only. This bit is set when there has been an inconsistent Sync Field error detected by the synchronizer during header reception. See the "Header Reception and Adaptive Baudrate" section for more information. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 1 ISFE_EFFECT Inconsistent Sync Field error detected.
27	NRE	R/W1TC	0h	No-Response Error Flag. This bit is effective in LIN mode only. This bit is set when there is no response to a master's header completed within TFRAME_MAX. This timeout period is applied for message frames of unknown length [identifiers 0 to 61]. This error is detected by the synchronizer of the module. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 1 NRE_EFFECT No-Response error detected.
26	FE	R/W1TC	0h	Framing error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when an expected stop bit is not found. In SCI compatible mode, only the first stop bit is checked. The missing stop bit indicates that synchronization with the start bit has been lost and that the character is incorrectly framed. Detection of a framing error causes the SCI to generate an error interrupt if the RXERR INT ENA bit is set. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new character [SCI-compatible mode], or frame [LIN mode] In multibuffer mode the frame is defined in the SCIFORMAT register. 1 FE_EFFECT Framing error detected.
25	OE	R/W1TC	0h	Overrun error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when the transfer of data from SCIRXSHF to SCIRD overwrites unread data already in SCIRD or the RDy buffers. Detection of an overrun error causes the LIN to generate an error interrupt if the SET OE INT bit is one. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit 1 OE_EFFECT Overrun error detected.
24	PE	R/W1TC	0h	Parity error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when a parity error is detected in the received data. In SCI address-bit mode, the parity is calculated on the data and address bit fields of the received frame. In idle-line mode, only the data is used to calculate parity. An error is generated when a character is received with a mismatch between the number of 1s and its parity bit. For more information on parity checking, see the "SCI Global Control Register [SCIGCR1]" description. If the parity function is disabled [that is, SCIGCR1.2 = 0], the PE flag is disabled and read as 0. Detection of a parity error causes the LIN to generate an error interrupt if the SET PE INT bit = 1. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Reception of a new charcter [SCI-compatible mode] or frame [LIN mode] - Writing a 1 to this bit 1 PE_EFFECT Parity error detected.

Table 4-1228. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23:16	RESERVED_3	R	0h	Reserved
15	RESERVED_2	R	0h	Reserved
14	IDRXFLAG	R/W1TC	0h	Identifier On Receive Flag. This bit is effective in LIN mode only. This flag is set once an identifier is received with an RX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on an RX match. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Reading the LINID register - Writing a 1 to this bit This field is writable in LIN mode only. 1 IDRXFLAG_EFFECT Valid ID RX received in LINID[23:16] on RX match.
13	IDTXFLAG	R/W1TC	0h	Identifier On Transmit Flag. This bit is effective in LIN mode only. This flag is set once an identifier is received with a TX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on a TX match. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - RESET bit [SCIGCR0.0] - Setting SWnRESET - System reset - Reading the LINID register - Writing a 1 to this bit This field is writable in LIN mode only. 1 IDTXFLAG_EFFECT Valid ID received in LINID[23:16] on TX match.
12	RXWAKE	R	0h	Receiver wakeup detect flag. This bit is effective in SCI-compatible mode only. The SCI sets this bit to indicate that the data currently in SCIRD is an address. This bit is cleared by: - RESET bit - Setting the SWnRESET bit [SCIGCR1.7] - System reset - Receipt of a data frame This bit is writable in SCI mode only. 1 RXWAKE_EFFECT The data in SCIRD is an address. See [1] Section 3.4.4, Sleep Mode for Multiprocessor Communication, on page 16 for more information on using the RXWAKE bit with sleep mode.
11	TXEMPTY	R	1h	Transmitter Empty flag. The value of this flag indicates the contents of the transmitter's buffer register[s] [SCITD/TDy] and shift register [SCITXSHF]. In multibuffer mode, this flag indicates the value of the TDx registers and shift register [SCITXSHF]. In non multibuffer mode, this flag indicates the value of LINTD0 [byte] and shift register [SCITXSHF]. This bit is set by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET bit [SCIGCR1.7] - System reset. Note: This bit does not cause an interrupt request. 1 TXEMPTY_EFFECT Compatible mode or LIN with no multibuffer: Transmitter buffer and shift registers are both empty. In LIN mode using multibuffer mode: Multibuffer and shift registers are all empty.
10	TXWAKE	R/W	0h	SCI transmitter wakeup method select. This bit is effective in SCI-compatible mode only. The TXWAKE bit controls whether the data in SCITD should be sent as an address or data frame using multiprocessor communication format. This bit is set to 1 or 0 by software before a byte is written to SCITD and is cleared by the SCI when data is transferred from SCITD to SCITXSHF or by a system reset. TXWAKE is not cleared by the SWnRESET bit [SCIGCR1.7]. 1 TXWAKE_ADDR1 Address-bit mode: Frame to be transmitted will be an address (address bit=1). Idle-line mode: Following frame to be transmitted will be an address (writing a 1 to this bit followed by writing dummy data to the SCITD will result in a idle period of 11 bit periods before the next frame is transmitted).

Table 4-1228. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	RXRDY	R/W1TC	0h	Receiver ready flag. In SCI compatibility mode, the receiver sets this bit to indicate that the SCIRD contains new data and is ready to be read by the CPU. In LIN mode, RXRDY is set once a valid frame is received in multibuffer mode, a valid frame being a message frame received with no errors. In non multibuffer mode RXRDY is set for each received byte and will be set for the last byte of the frame if there are no errors. The SCI/LIN generates a receive interrupt when RXRDY flag bit is set if the interrupt-enable bit is set [SCISETINT.9]. RXRDY is cleared by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET - System reset - Writing a 1 to this bit - Reading SCIRD in while in SCI compatibility mode - Reading last data byte RDy of the response in LIN mode Note: The RXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0/1 register. 1 RXRDY_EFFECT New data ready to be read from SCIRD.
8	TXRDY	R	1h	Transmitter buffer register ready flag. When set, this bit indicates that the transmit buffer[s] register [SCITD in compatibility mode and LINTD0, LINTD1 in MBUF mode] is/are ready to get another character from a CPU write. In SCI compatibility mode, writing data to SCITD automatically clears this bit. In LIN mode, this bit is cleared once byte 0 [TD0] is written to LINTD0. This bit is set after the data of the TX buffer are shifted into the SCITXSHF register. This event can trigger a transmit DMA event if the DMA enable bit is set. This bit is set to 1 by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET [SCIGCR1.7] - System reset Note: The TXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0/1 register. Note: The transmit interrupt request can be eliminated until the next series of data is written into the transmit buffers LINTD0 and LINTD1, by disaLINg the corresponding interrupt via the SCICLEARINT register or by disaLINg the transmitter via the TXENA bit [SCIGCR1.25=0]. 1 TXRDY_EMPTY Compatible mode: SCITD is ready to receive the next character. LIN mode: The multibuffers are ready to receive the next character(s).
7	TOA3WUS	R/W1TC	0h	Timeout After 3 Wakeup Signals flag. This bit is effective in LIN mode only. This flag is set if there is no Sync Break received after 3 wakeup signals and a period of 1.5 seconds have passed. Such expiration time is used before issuing another round of wakeup signals. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 1 TOA3WUS_EFFECT Timeout after 3 wakeup signals and 1.5s time.
6	TOAWUS	R/W1TC	0h	Timeout After Wakeup Signal flag. This bit is effective in LIN mode only. This bit is set if there is no Sync Break received after a wakeup signal has been sent. A minimum of 150 ms expiration time is used before issuing another wakeup signal. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 1 TOAWUS_EFFECT Timeout after one wakeup signal.
5	RESERVED_1	R	0h	Reserved
4	TIMEOUT	R/W1TC	0h	LIN Bus IDLE timeout flag. This bit is effective in LIN mode only. This bit is set if there is no LIN bus activity for at least 4 seconds. LIN bus activity being a transition from recessive to dominant. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 1 TIMEOUT_EFFECT LIN bus idle detected.

Table 4-1228. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	BUSY	R	0h	Bus BUSY flag. This bit is effective in LIN mode and SCI-compatible mode. This bit indicates whether the receiver is in the process of receiving a frame. As soon as the receiver detects the beginning of a start bit, the BUSY bit is set to 1. When the reception of a frame is complete, the BUSY bit is cleared. If SET WAKEUP INT is set and power down is requested while this bit is set, the SCI/LIN automatically prevents low-power mode from being entered and generates wakeup interrupt. The BUSY bit is controlled directly by the SCI receiver but can be cleared by: - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset. 1 BUSY_EFFECT Receiver is currently receiving a frame.
2	IDLE	R	1h	SCI receiver in idle state. This bit is effective in SCI-compatible mode only. While this bit is set, the SCI looks for an idle period to resynchronize itself with the bit stream. The receiver does not receive any data while the bit is set. The bus must be idle for 11 bit periods to clear this bit. The SCI enters this state: - After a system reset - Setting the SWnRESET bit [SCIGCR1.7] - After coming out of power down This bit is writable in SCI mode only. 1 IDLE_EFFECT Idle period not detected, the SCI will not receive any data.
1	WAKEUP	R/W1TC	0h	Wake-up flag. This bit is effective in LIN mode only. This bit is set by the SCI/LIN when receiver or transmitter activity has taken the module out of power-down mode. An interrupt is generated if the SET WAKEUP INT bit [SCISETINT.1] is set. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit. This field is writable in LIN mode only. 1 WAKEUP_EFFECT Wake up from power-down mode.
0	BRKDT	R/W1TC	0h	SCI break-detect flag. This bit is effective in SCI-compatible mode only. This bit is set when the SCI detects a break condition on the LINRX pin. A break condition occurs when the LINRX pin remains continuously low for at least 10 bits after a missing first stop bit, that is, after a framing error. Detection of a break condition causes the SCI to generate an error interrupt if the BRKDT INT ENA bit is set. The BRKDT bit is cleared by the following: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - By writing a 1 to this bit. This bit is writable in SCI mode only. 1 BRKDT_EFFECT Break condition detected.

4.12.9 LIN_SCIINTVECT0 Registers

4.12.9.1 LIN_SCIINTVECT0 Register (Offset = 20h) [reset = 0h]

Short Description: The SCIINTVECT0 register

Long Description: The SCIINTVECT0 register indicates the offset for the INT0 interrupt line.

Table 4-1234. SCIFORMAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:19	RESERVED_2	R	0h	Reserved
18:16	LENGTH	R/W	0h	Frame length control bits. In LIN mode, these bits indicate the number of bytes in the response field from 1 to 8 bytes. In buffered SCI mode, these bits indicate the number of characters. When these bits are used to indicate LIN response length [SCIGCR1[0] = 1], then when there is an ID RX match, this value should be updated with the expected length of the response. In buffered SCI mode, these bits indicate the number of characters with SCIFORMAT[2:0] bits per character. i.e. these bits indicate the transmitter/receiver format for the number of characters: 1 to 8. There can be up to eight characters with eight bits each. 7 FIELD_8 The response field has 8 bytes/ characters. 6 FIELD_7 The response field has 7 bytes/characters. 5 FIELD_6 The response field has 6 bytes/characters. 4 FIELD_5 The response field has 5 bytes/characters. 3 FIELD_4 The response field has 4 bytes/characters. 2 FIELD_3 The response field has 3 bytes/ characters. 1 FIELD_2 The response field has 2 bytes/characters.

Table 4-1234. SCIFORMAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:0	CHAR	R/W	0h	Character length control bits. These bits are effective in SCI compatible mode only. These bits set the SCI character length from 1 to 8 bits. Note: In compatibility mode or buffered SCI mode, when data of fewer than eight bits in length is received, it is left justified in SCIRD/RDy and padded with trailing zeros. Data read from the SCIRD should be shifted by software to make the received data right justified. Note: Data written to the SCITD should be right justified but does not need to be padded with leading zeros. These bits are witable in SCI mode only. 7 CHAR_8 The character is 8 bits long. 6 CHAR_7 The character is 7 bits long. 5 CHAR_6 The character is 6 bits long. 4 CHAR_5 The character is 5 bits long. 3 CHAR_4 The character is 4 bits long. 2 CHAR_3 The character is 3 bits long. 1 CHAR_2 The character is 2 bits long.

Bit	Field	Type	Reset	Description
31	RESERVED_1	R	0h	Reserved
30:28	U	R/W	0h	Superfractional Divider Selection. [U] These bits are an additional fractional part for the baudrate specification. These bits allow a super fine tuning of the fractional baudrate with 7 more intermediate values for each of the M fractional divider values. See the Superfractional Divider section for more details.
27:24	M	R/W	0h	SCI/LIN 4-bit Fractional Divider Selection. [M] These bits are effective in LIN or SCI asynchronous mode. These bits are used to select a baud rate for the SCI/LIN module, and they are a fractional part for the baud rate specification. The M divider allows fine-tuning of the baud rate over the P prescaler with 15 additional intermediate values for each of the P integer values.
23:16	SCI_LIN_PSH	R/W	0h	PRESCALER P [High Bits]. SCI/LIN 24-bit Integer Prescaler Selection. These bits are used to select a baudrate for the SCI/LIN module. These bits are effective in LIN mode and SCI compatible mode. The SCI/LIN has an internally generated serial clock determined by the LIN module input clock and the prescalers P and M in this register. The SCI/LIN uses the 24-bit integer prescaler P value to select 1 of over 16,700,000 available baud rates. The additional 4-bit fractional prescaler M refines the baudate selection.

Table 4-1236. BRSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:0	SCI_LIN_PSL	R/W	0h	PRESCALER P [Low Bits]. SCI/LIN 24-bit Integer Prescaler Selection. These bits are used to select a baudrate for the SCI/LIN module. These bits are effective in LIN mode and SCI compatible mode. The SCI/LIN has an internally generated serial clock determined by the LIN module input clock and the prescalers P and M in this register. The SCI/LIN uses the 24-bit integer prescaler P value to select 1 of over 16,700,000 available baud rates. The additional 4-bit fractional prescaler M refines the baudate selection.

4.12.13 LIN_SCIED Registers

4.12.13.1 LIN_SCIED Register (Offset = 30h) [reset = 0h]

Short Description: The SCIED register is a d

Long Description: The SCIED register is a duplicate copy of SCIRD register that has no affect on the RXRDY flag for use with an emulator.

Return to Summary Table

Table 4-1237. Instance Table

Instance Name	Physical Address
LIN0	5240 0030h

Access Types Legend

Table 4-1240. SCIRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_1	R	0h	Reserved
7:0	RD	R	0h	Received Data. This bit is effective in SCI-compatible mode only. When a frame has been completely received, the data in the frame is transferred from the receiver shift register SCIRXSHF to this register. As this transfer occurs, the RXRDY flag is set and a receive interrupt is generated if RX INT ENA [SCISETINT0.9] is set. When the data is read from SCIRD, the RXRDY flag is automatically cleared. When the SCI receives data that is fewer than eight bits in length, it loads the data into this register in a left justified format padded with trailing zeros. Therefore, your software should perform a logical shift on the data by the correct number of positions to make it right justified.

4.12.15 LIN_SCITD Registers

4.12.15.1 LIN_SCITD Register (Offset = 38h) [reset = 0h]

Short Description: The SCITD register is whe

Long Description: The SCITD register is where data to be transmitted is written to by application software.

Table 4-1242. SCITD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_1	R	0h	Reserved
7:0	TD	R/W	0h	Transmit data This bit is effective in SCI-compatible mode only. Data to be transmitted is written to this register. The transfer of data from this register to the transmit shift register SCITXSHF sets the TXRDY flag [SCIFLR.23], which indicates that SCITD is ready to be loaded with another byte of data. Note: If TX INT ENA [SCISETINT.8] is set, this data transfer also causes an interrupt. Note: Data written to the SCIRD register that is fewer than eight bits long must be right justified, but it does not need to be padded with leading zeros.

4.12.16 LIN_SCIPIO0 Registers

4.12.16.1 LIN_SCIPIO0 Register (Offset = 3Ch) [reset = 0h]

Short Description: The SCIPIO0 register is u

Table 4-1268. LINMASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	RESERVED_2	R	0h	Reserved
23:16	RXIDMASK	R/W	0h	Receive ID mask. This field is effective in LIN mode only.This 8-bit mask is used for filtering an incoming ID message and compare it to the ID-byte. A compare match of the received ID witht the RX ID mask will set the ID RX flag and trigger and ID interrupt if enabled. A 0 bit in the mask indicates that bit is compared to the ID-byte. A 1 bit in the mask indicates that that bit is filtered and therefore not used in the compare. When HGENCTRL is set to 1, this field must be set to 0xFF.
15:8	RESERVED_1	R	0h	Reserved
7:0	TXIDMASK	R/W	0h	Transmit ID mask. This field is effective in LIN mode only. This 8-bit mask is used for filtering an incoming ID message and compare it to the ID-byte. A compare match of the received ID with the TX ID Mask will set the ID TX flag and trigger an ID interrupt if enabled. A 0 bit in the mask indicates that bit is compared to the ID-byte. A 1 bit in the mask indicates that bit is filtered and therefore not used for the compare. When HGENCTRL is set to 1, this field must be set to 0xFF.

4.12.29 LIN_LINID Registers

4.12.29.1 LIN_LINID Register (Offset = 70h) [reset = 0h]

Short Description: The LINID register contai

Long Description: The LINID register contains the identification fields for LIN communication.
NOTE: For software compatibility with future LIN modules, the HGEN CTRL bit must be set to 1, the RX ID MASK field must be set to FFh, and the TX ID MASK field must be set to FFh.

Table 4-1270. LINID Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	RESERVED_1	R	0h	Reserved
23:16	RECEIVEDID	R	0h	Received ID. This bit is effective in LIN mode only. This byte contains the current message identifier. During header reception the received ID is copied from the SCIRXSHF register to this byte if there is no ID-parity error and there has been an RX/TX match. Note: If a framing error [FE] is detected during ID reception, the received ID will also not be copied to the LINID register.
15:8	IDSLAVETASKBYTE	R/W	0h	ID Slave Task byte. This field is effective in LIN mode only. This byte contains the identifier to which the received ID of an incoming header will be compared in order to decide whether a RX response, a TX response, or no action needs to be done by the LIN node. These bits are writable in LIN mode only.
7:0	IDBYTE	R/W	0h	ID byte. This field is effective in LIN mode only. This byte is the LIN mode message ID. On a master node, a write to this register by the CPU initiates a header transmission. For a slave task, this byte is used for message filtering when HGENCTRL [SCIGCR1.12] is '0'. These bits are writable in LIN mode only.

4.12.30 LIN_LINTD0 Registers

4.12.30.1 LIN_LINTD0 Register (Offset = 74h) [reset = 0h]

Short Description: The LINTD0 register conta

Long Description: The LINTD0 register contains the lower 4 bytes of the data to be transmitted.
NOTE: TD<x-1> is equivalent to Data byte <x> of the LIN frame.

Return to Summary Table

Table 4-1276. MBRSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:13	RESERVED_1	R	0h	Reserved
12:0	MBR	R/W	DACh	Maximum Baud Rate Prescaler. This field is effective in LIN mode only. This 13-bit prescaler is used during the synchronization phase [see the "Header Reception and Adaptive Baudrate" section] of a slave module if the ADAPT bit is set. In this way, a SCI/LIN slave using an automatic or select bit rate modes detects any LIN bus legal rate automatically. The MBR value should be programmed to allow a maximum baud rate that is not more than 10% above the expected operating baud rate in the LIN network. Otherwise a s 0x00 data byte could mistakenly be detected as sync break. The default value is for a 70MHz LINCLK [0xDAC]. This MBR prescaler is used by the wake-up and idle time counters for a constant expiration time relative to a 20kHz rate.

4.12.33 LIN_RESERVED_N Registers

Table 4-1280. IODFTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BERRENA	R/W	0h	Bit Errror Enable bit. This bit is effective in LIN mode only. This bit is used to create a Bit error. When this bit is set, the bit received is ORed with 1 and passed to the Bit monitor circuitry.
30	PBERRENA	R/W	0h	Physical Bus Error Enable bit. This bit is effective in LIN mode only. This bit is used to create a Physical Bus Error. When this bit is set, the bit received during Sync Break field transmission is ORed with 1 and passed to the Bit monitor circuitry
29	CERRENA	R/W	0h	Checksum Error Enable bit. This bit is effective in LIN mode only. This bit is used to create a checksum error. When this bit is set, the polarity of the CTYPE [checksum type] in the receive checksum calculator is changed so that a checksum error is generated.
28	ISFERRENA	R/W	0h	Inconsistent Sync Field Error Enable bit. This bit is effective in LIN mode only. This bit is used to create an ISF error. When this bit is set, the bit widths in the sync field are varied so that the ISF check fails and the error flag is set.
27	RESERVED_4	R	0h	Reserved
26	FERRENA	R/W	0h	This bit is used to create a Frame Error. This bit is effective in SCI-compatible mode only. When this bit is set, the stop bit received is ANDed with '0' and passed to the stop bit check circuitry.
25	PERRENA	R/W	0h	Compatible Mode only This bit is effective in SCI-compatible mode only. This bit is used to create a Parity Error. When this bit is set, in compatible mode, the parity bit received is toggled so that a parity error occurs.

Table 4-1280. IODFTCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	BRKDTERRENA	R/W	0h	Compatible Mode only This bit is effective in SCI-compatible mode only. This bit is used to create BRKDT error [SCI mode only]. When this bit is set, the stop bit of the frame is ANDed with '0' and passed to the RSM so that a frame error occurs. Then the RX Pin is forced to continuous low for 10 Tbits so that a BRKDT error occurs.
23:21	RESERVED_3	R/W	0h	Reserved
20:19	PINSAMPLEMASK	R/W	0h	Pin sample mask. These bits define the sample number at which the TX Pin value that is being transmitted will be inverted to verify the receive pin samples correctly with the majority detection circuitry. Note: During IODFT mode testing for the pin sample mask, the prescalar P must be programmed to be greater than 2. 3 PINSAMPLEMASK_2SCLK Invert the TX Pin value at TBIT_CENTER + 2 SCLK 2 PINSAMPLEMASK_SCLK Invert the TX Pin value at TBIT_CENTER + SCLK 1 PINSAMPLEMASK_TBIT Invert the TX Pin value at TBIT_CENTER
18:16	TXSHIFT	R/W	0h	Transmit shift. These bits define the delay by which the value on LINTX is delayed so that the value on LINRX is asynchronous. [Not applicable to Start Bit] 7 TXSHIFT_DELAY_7 Delay by 7 SCLK 6 TXSHIFT_DELAY_6 Delay by 6 SCLK 5 TXSHIFT_DELAY_5 Delay by 5 SCLK 4 TXSHIFT_DELAY_4 Delay by 4 SCLK 3 TXSHIFT_DELAY_3 Delay by 3 SCLK 2 TXSHIFT_DELAY_2 Delay by 2 SCLK 1 TXSHIFT_DELAY_1 Delay by 1 SCLK
15:12	RESERVED_2	R	0h	Reserved
11:8	IODFTENA	R/W	5h	IO DFT Enable Key This field is used to enable the IODFT mode of the SCI/LIN module for testing. 15 IODFTENA_DISABLE_15 IODFT is disabled 14 IODFTENA_DISABLE_14 IODFT is disabled 13 IODFTENA_DISABLE_13 IODFT is disabled 12 IODFTENA_DISABLE_12 IODFT is disabled 11 IODFTENA_DISABLE_11 IODFT is disabled 10 IODFTENA_DISABLE_10 IODFT is enabled 9 IODFTENA_DISABLE_9 IODFT is disabled 8 IODFTENA_DISABLE_8 IODFT is disabled 7 IODFTENA_DISABLE_7 IODFT is disabled 6 IODFTENA_DISABLE_6 IODFT is disabled 5 IODFTENA_DISABLE_5 IODFT is disabled 4 IODFTENA_DISABLE_4 IODFT is disabled 3 IODFTENA_DISABLE_3 IODFT is disabled 2 IODFTENA_DISABLE_2 IODFT is disabled 1 IODFTENA_DISABLE_1 IODFT is disabled
7:2	RESERVED_1	R	0h	Reserved
1	LPBENA	R/W	0h	Module loopback enable. In analog loopback mode the complete communication path through the I/Os can be tested, whereas in digital loopback mode the I/O buffers are excluded from this path. 1 LPBENA_ANALOG Analog loopback is enabled in module I/O DFT mode (when IODFTENA = 1010)
0	RXPENA	R/W	0h	Module Analog loopback through receive pin enable. This bit defines whether the I/O buffers for the transmit or the receive pin are included in the communication path in analog loopback mode only. 1 RXPENA_RECEIVE Analog loopback through the receive pin is enabled.

4.12.35 LIN_LIN_GLB_INT_EN Registers

4.12.35.1 LIN_GLB_INT_EN Register (Offset = E0h) [reset = 0h]

Short Description: The LIN_GLB_INT_EN regist

Long Description: The LIN_GLB_INT_EN register is used to enable the INT0 and INT1 interrupt lines to propagate to the PIE block.

Return to Summary Table

Table 4-1488. CRC_CURSEC_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED1	R	0h	Reset Source: mcrc_rst_mod_g_rst_n
15:0	CRC_CURSEC1	R/W	0h	Channel 1 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erro- neous sector number. Reset Source: mcrc_rst_mod_g_rst_n

4.14.12 MEM_CRC_WDTOPLD1 Registers

4.14.12.1 MEM_WDTOPLD1 Register (Offset = 4Ch) [reset = 0h]

Table 4-1514. CRC_CURSEC_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED1	R	0h	Reset Source: mcrc_rst_mod_g_rst_n
15:0	CRC_CURSEC2	R/W	0h	Channel 2 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erro- neous sector number. Reset Source: mcrc_rst_mod_g_rst_n

4.14.25 MEM_CRC_WDTOPLD2 Registers

4.14.25.1 MEM_WDTOPLD2 Register (Offset = 8Ch) [reset = 0h]

R				R				R		R					
3h				2h				0h		bh					

Access Types Legend

Table 4-1655. HL_REV Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	Used to distinguish between old scheme and current
29:28	RSVD	R	0h	Reserved These bits are initialized to zero, and writes to them are ignored
27:16	FUNC	R	30h	Function indicates a software compatible module family If there is no level of software compatibility a new Func number [and hence REVISION] should be assigned
15:11	R_RTL	R	3h	RTL Version [R], maintained by IP design owner RTL follows a numbering such as XYRZ which are explained in this table R changes ONLY when: [1] PDS uploads occur which may have been due to spec changes [2] Bug fixes occur [3] Resets to '0' when X or Y changes Design team has an internal 'Z' [customer invisible] number which increments on every drop that happens due to DV and RTL updates Z resets to 0 when R increments
10:8	X_MAJOR	R	2h	Major Revision [X], maintained by IP specification owner X changes ONLY when: [1] There is a major feature addition An example would be adding Master Mode to Utopia Level2 The Func field [or Class/ Type in old PID format] will remain the same X does NOT change due to: [1] Bug fixes [2] Change in feature parameters
7:6	CUSTOM	R	0h	Indicates a special version for a particular device Consequence of use may avoid use of standard Chip Support Library [CSL] / Drivers

Table 4-1655. HL_REV Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5:0	Y_MINOR	R	Bh	Minor Revision [Y], maintained by IP specification owner Y changes ONLY when: [1] Features are scaled [up or down] Flexibility exists in that this feature scalability may either be represented in the Y change or a specific register in the IP that indicates which features are exactly available [2] When feature creeps from Is-Not list to Is list But this may not be the case once it sees silicon; in which case X will change Y does NOT change due to: [1] Bug fixes [2] Typos or clarifications [3] major functional/feature change/addition/ deletion Instead these changes may be reflected via R, S, X as applicable Spec owner maintains a customer-invisible number 'S' which changes due to: [1] Typos/clarifications [2] Bug documentation Note that this bug is not due to a spec change but due to implementation Nevertheless, the spec tracks the IP bugs An RTL release [say for silicon PG11] that occurs due to bug fix should document the corresponding spec number [XYS] in its release notes

4.16.2 CFG_HL_HWINFO Registers

4.16.2.1 CFG_HWINFO Register (Offset = 4h) [reset = 9h]

Short Description: Information about the IP

Long Description: Information about the IP module's hardware configuration, i.e. typically the module's HDL generics (if any). Actual field format and encoding is up to the module's designer to decide.

Return to Summary Table

Table 4-1656. Instance Table

Instance Name	Physical Address

Table 4-1675. MODULCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:9	RESERVED	N/A		Reads returns 0
8	FDAA	R/W	0h	FIFO DMA Address 256-bit aligned This register is used when a FIFO is managed by the module and DMA connected to the controller provides only 256 bit aligned address If this bit is set the enabled channel which uses the FIFO has its datas managed through MCSPI_DAFTX and MCSPI_DAFRX registers instead of MCSPI_TX[i] and MCSPI_RX[i] registers
7	MOA	R/W	0h	Multiple word ocp access: This register can only be used when a channel is enabled using a FIFO It allows the system to perform multiple SPI word access for a single 32-bit OCP word access This is possible for WL < 16
6:4	INITDLY	R/W	0h	Initial spi delay for first transfer: This register is an option only available in SINGLE master mode, The controller waits for a delay to transmit the first spi word after channel enabled and corresponding TX register filled This Delay is based on SPI output frequency clock, No clock output provided to the boundary and chip select is not active in 4 pin mode within this period
3	SYSTEM_TEST	R/W	0h	Enables the system test mode
2	MS	R/W	1h	Master/ Slave
1	PIN34	R/W	0h	Pin mode selection: This register is used to configure the SPI pin mode, in master or slave mode If asserted the controller only use SIMO,SOMI and SPICLK clock pin for spi transfers
0	SINGLE	R/W	0h	Single channel / Multi Channel [master mode only]

4.16.12 CFG_CH0CONF Registers

4.16.12.1 CFG_CH0CONF Register (Offset = 12Ch) [reset = 60000h]

Table 4-1677. CH0CONF Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	RESERVED	N/A		read returns 0
29	CLKG	R/W	0h	Clock divider granularity This register defines the granularity of channel clock divider: power of two or one clock cycle granularity When this bit is set the register MCSPI_CHCTRL[EXTCLK] must be configured to reach a maximum of 4096 clock divider ratio Then The clock divider ratio is a concatenation of MCSPI_CHCONF[CLKD] and MCSPI_CHCTRL[EXTCLK] values
28	FFER	R/W	0h	FIFO enabled for receive:Only one channel can have this bit field set
27	FFEW	R/W	0h	FIFO enabled for Transmit:Only one channel can have this bit field set
26:25	TCS0	R/W	0h	Chip Select Time Control This 2-bits field defines the number of interface clock cycles between CS toggling and first or last edge of SPI clock
24	SBPOL	R/W	0h	Start bit polarity
23	SBE	R/W	0h	Start bit enable for SPI transfer
22:21	SPIENSLV	R/W	0h	Channel 0 only and slave mode only: SPI slave select signal detection Reserved bits for other cases
20	FORCE	R/W	0h	Manual SPIEN assertion to keep SPIEN active between SPI words [single channel master mode only]
19	TURBO	R/W	0h	Turbo mode
18	IS	R/W	1h	Input Select
17	DPE1	R/W	1h	Transmission Enable for data line 1 [SPIDATAGZEN[1]]
16	DPE0	R/W	0h	Transmission Enable for data line 0 [SPIDATAGZEN[0]]

Table 4-1677. CH0CONF Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	DMAR	R/W	0h	DMA Read request The DMA Read request line is asserted when the channel is enabled and a new data is available in the receive register of the channel The DMA Read request line is deasserted on read completion of the receive register of the channel
14	DMAW	R/W	0h	DMA Write request The DMA Write request line is asserted when The channel is enabled and the transmitter register of the channel is empty The DMA Write request line is deasserted on load completion of the transmitter register of the channel
13:12	TRM	R/W	0h	Transmit/Receive modes
11:7	WL	R/W	0h	SPI word length
6	EPOL	R/W	0h	SPIEN polarity
5:2	CLKD	R/W	0h	Frequency divider for SPICLK [only when the module is a Master SPI device] A programmable clock divider divides the SPI reference clock [CLKSPIREF] with a 4-bit value, and results in a new clock SPICLK available to shift-in and shift-out data By default the clock divider ratio has a power of two granularity when MCSPI_CHCONF[CLKG] is cleared, Otherwise this register is the 4 LSB bit of a 12-bit register concatenated with clock divider extension MCSPI_CHCTRL[EXTCLK] registerThe value description below defines the clock ratio when MCSPI_CHCONF[CLKG] is set to 0
1	POL	R/W	0h	SPICLK polarity
0	PHA	R/W	0h	SPICLK phase

Table 4-1717. XFERLEVEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	WCNT	R/W	0h	Spi word counterThis register holds the programmable value of number of SPI word to be transferred on channel which is using the FIFO bufferWhen transfer had started, a read back in this register returns the current SPI word transfer index
15:8	AFL	R/W	0h	Buffer Almost Full This register holds the programmable almost full level value used to determine almost full buffer condition If the user wants an interrupt or a DMA read request to be issued during a receive operation when the data buffer holds at least n bytes, then the buffer MCSPI_MODULCTRL[AFL] must be set with n-1The size of this register is defined by the generic parameter FFNBYTE
7:0	AEL	R/W	0h	Buffer Almost EmptyThis register holds the programmable almost empty level value used to determine almost empty buffer condition If the user wants an interrupt or a DMA write request to be issued during a transmit operation when the data buffer is able to receive n bytes, then the buffer MCSPI_MODULCTRL[AEL] must be set with n-1

4.16.33 CFG_DAFTX Registers

4.16.33.1 CFG_DAFTX Register (Offset = 180h) [reset = 0h]

Short Description: This register contains th

Long Description: This register contains the SPI words to transmit on the serial link when FIFO used and DMA address is aligned on 256 bit.This register is an image of one of MCSPI_TX(i) register corresponding to the channel which have its FIFO enabled.

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE		Reserved
15	DECREMENT_TTL	R/W	0h	Decrement Time To Live: When set, the Time To Live (TTL) field in the header is decremented.
14	DEST_FORCE_UNTAGGED_EGRESS	R/W	0h	Destination VLAN Force Untagged Egress: When set, this bit indicates that the VLAN should be removed on egress for the routed packet.
13	REPLACE_DA_SA	R/W	0h	Replace Destination Address and Source Address: When set this bit indicates that the routed packet destination address should be replaced by da[47:0] and the source address should be replaced by sa[47:0].
12	REPLACE_VID	R/W	0h	Replace VLAN ID: When set this bit indicates that the VLAN ID should be replaced for the routed packet.
11:0	VID	R/W	0h	VLAN ID

4.18.417 CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_STATUS Registers

4.18.417.1 CPSW_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_STATUS Register (Offset = 3E004h) [reset = 80000400h]

Short Description: ALE Status

Long Description: The ALE status provides information on the ALE configuration and state. The ~iramdepth is used to determine how IPv6 entries are stored in the table. IPv6 entries are stored in two entries where IPv6 Entry hi is designated by the odd slice index and lo is designated by the even slice index. The slice index is above the ram depth like {SlixeIndex,RamIndex}. So for a 64 deep RAM index of 0x005, the Hi portion of the IPv6 entry is located at 0x005|0x040 and the Lo portion is located at 0x005&(~0x040).

Table 4-2668. CPSW_NC_CPSW_NC_ALE_ALE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE_ALE	R/W	0h	Enable ALE 0 - Drop all packets 1 - Enable ALE packet processing
30	CLEAR_TABLE	R/W	0h	Clear ALE address table - Setting this bit causes the ALE hardware to write all table bit values to zero. Software must perform a clear table operation as part of the ALE setup/configuration process. Setting this bit causes all ALE accesses to be held up for 64 clocks while the clear is performed. Access to all ALE registers will be blocked (wait states) until the 64 clocks have completed. This bit cannot be read as one because the read is blocked until the clear table is completed at which time this bit is cleared to zero.
29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now - Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
28:26	RESERVED	NONE		Reserved
25:24	MIRROR_DP	R/W	0h	Mirror Destination Port - This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the ~imirror_top port.

Table 4-2668. CPSW_NC_CPSW_NC_ALE_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23:21	UPD_BW_CTRL	R/W	0h	The ~iupd_bw_ctrl field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the ~iupd_bw_ctrl can be programmed more aggressive. If the ~iupd_bw_ctrl is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0 - 350Mhz, 5M 1 - 359Mhz, 11M 2 - 367Mhz, 16M 3 - 375Mhz, 22M 4 - 384Mhz, 28M 5 - 392Mhz, 34M 6 - 400Mhz, 39M 7 - 409Mhz, 45M
20:18	RESERVED	NONE		Reserved
17:16	MIRROR_TOP	R/W	0h	Mirror To Port - This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.
15	UPD_STATIC	R/W	0h	Update Static Entries - A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be '0' for most switch configurations.
14	LRN_HOST_DST	R/W	0h	Learn Host Destination - This field is set to only learn unicast packet source addresses that are destined to the host port. This bit is only valid for 3 port switches and allows the ALE table to only contain addresses the host port is concerned about. This bit is affectively disabled when ~ien_host_uni_flood is set since any unknown unicast is also sent to the host port for extended bridging operations.
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn - This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable - This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the ~imirror_midx entry index will have that traffic also sent to the ~imirror_top port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable - This field enables the destination port mirror option. When this bit is set any traffic destined for the ~imirror_dp port will have its transmit traffic also sent to the ~imirror_top port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable - This field enables the source port mirror option. When this bit is set any port with the ~ipX_mirror_sp set in the ALE Port Control registers set will have its received traffic also sent to the ~imirror_top port.
9	RESERVED	NONE		Reserved
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host 0 - unknown unicast packets are not sent to the host 1 - unknown unicast packets flood to host port as well as other ports
7	LEARN_NO_VLANID	R/W	0h	Learn No VID - 0 - VID is learned with the source address 1 - VID is not learned with the source address (source address is not tied to VID). Determines the entry type.
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode 0 - Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1 - Process the priority tagged packet with VID = 0.
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode - When set, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry. When cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass - When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0 - no bypass 1 - bypass the ALE

Table 4-2668. CPSW_NC_CPSW_NC_ALE_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode 0 - Broadcast and multicast rate limit counters are received port based 1 - Broadcast and multicast rate limit counters are transmit port based
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware - Determines how traffic is forwarded using VLAN rules. 0 - Simple switch rules, packets forwarded to all ports for unknown destinations. 1 - VLAN Aware rules, packets forwarded based on VLAN members
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode - Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0 - The ALE is not in MAC authorization mode 1 - The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0 - Broadcast/Multicast rates not limited 1 - Broadcast/Multicast packet reception limited to the port control register rate limit fields.

4.18.419 CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_CTRL2 Registers

4.18.419.1 CPSW_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_CTRL2 Register (Offset = 3E00Ch) [reset = 0h]

Short Description: ALE Control 2

Long Description: The ALE Control 2 Register is used to set the extended features used for all ports.

Return to Summary Table

Table 4-2670. CPSW_NC_CPSW_NC_ALE_ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address - This field enables the destination MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address - This field enables the source MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority - This field enables the VLAN Priority bits to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
28	RESERVED	NONE		Reserved
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN - This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
26	RESERVED	NONE		Reserved
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address - This field enables the source IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address - This field enables the destination IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.

Table 4-2670. CPSW_NC_CPSW_NC_ALE_ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the ~iALE_NXT_HDR register values.
19	RESERVED	NONE		Reserved
18:16	TRK_BASE	R/W	0h	Trunk Base - This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the ~itrk_en_dst, ~itrk_en_src, ~itrk_en_pri and ~itrk_en_vlan are '0', this value is used as the distribution index. That is a '0' will select the 1st bit of an 'N' link trunk, a '1' will select the second, etc. Below is the distribution across the trunk links. The first number in the ~iitalic sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0 will go to the base port (0), hash result 1 will go to the highest port of the trunk group (2), hash result 2 will go to the middle port (1), etc. 1 - ~i00000000 2 - ~i01010101 3 - ~i02102102 4 - ~i03210321
15	MULTIHOST	R/W	0h	The ~multihost allows host traffic to be sent bact to the host if the DA is market for the host port.
14:9	RESERVED	NONE		Reserved
8:0	MIRROR_MIDX	R/W	0h	Mirror Index - This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the ~imirror_top port. That is any VLAN, ONU or address with or withou VLAN can be selected for traffic mirroring.

4.18.420 CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_PRESCALE Registers

4.18.420.1 CPSW_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_PRESCALE Register (Offset = 3E010h) [reset = 0h]

Short Description: ALE Prescale

Long Description: The ALE Prescale Register is used to set the Broadcast and Multicast rate limiting prescaler value.

23:0	ALE_AGING_TIMER	R/W	0h	ALE Aging Timer - This field specifies the number of clock cycles times 1,000,000 between aging operations.

4.18.422 CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_NXT_HDR Registers

4.18.422.1 CPSW_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_NXT_HDR Register (Offset = 3E01Ch) [reset = 0h]

Short Description: ALE Next Header

Long Description: The ALE Next Header is used to limit the IPv6 Next header or IPv4 Protocol values found in the IP header. It is enabled via the ~iLmtNxtHdr bit in the VLAN entry. All four ~iip_nxt_hdr0-3 are compared when enabled, so if only one is required, set them all to the one value to be tested.

Table 4-2686. CPSW_NC_CPSW_NC_ALE_I0_ALE_PORTCTL0_N Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	I0_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23:16	I0_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field.The ~imcast_limit is the number of Multicast packets that will be forwaded per ~iale_prescale time.
15	I0_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	I0_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.
13	I0_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with ~imaconly set.

Table 4-2686. CPSW_NC_CPSW_NC_ALE_I0_ALE_PORTCTL0_N Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	I0_REG_P0_DIS_PAUTH MOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	I0_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the ~ip0_maconly bit set and the ~ip0_no_learn also set. If ~ip0_maconly bit is set and the ~ip0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	I0_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the ~ip0_trunken its set and having the same ~ip0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.
9:8	I0_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the ~ip0_trunken is also set. Ports with the same trunk number that have the ~ip0_trunken also set will have traffic distributed within the trunk based on the result of the hash function descrived above.
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the ~imirror_top port.
6	RESERVED	NONE		Reserved
5	I0_REG_P0_NO_SA_UP DATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
3	I0_REG_P0_VID_INGRE SS_CHECK	R/W	0h	VLAN Ingress Check - When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	I0_REG_P0_DROP_UN_ TAGGED	R/W	0h	If Drop Untagged - When set will drop packets without a VLAN tag.
1:0	I0_REG_P0_PORTSTATE	R/W	0h	Port State - Defins the current port state used for lookup operations. 0 - Disabled 1 - Blocked 2 - Learning 3 - Forwarding

4.18.428 CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC_ALE_ALE_UVLAN_MEMBER Registers

2:0	OAM_LB_CTRL	R/W	0h	The ~ioam_lb_ctrl allows any port to be put into OAM loopback, that is any packet received will be returned to the same port with an egressop of 0xFF which swaps the source and destination address. BPDUs will still flow through as normal so that OAM can be remotly requested and disabled.

4.18.435 CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC_ALE_EGRESSOP Registers

4.18.435.1 CPSW_VBUSP_CPSW_NC_CPSW_NC_ALE_EGRESSOP Register (Offset = 3E0FCh) [reset = 0h]

Short Description: Egress Operation

Long Description: The Egress Operation register allows enabled classifiers with any match like IPSA or IPDA match to use the CPSW Egress Packet Operations Inter VLAN Routing sub functions. If the packet was destined for the host or is destined to any port without any errors, but matches a clasifier that has a programmed egress opcode, it will be forwarded to the destination ports where the destination ports will use the thier egress opcode entry to modify the packet. InterVLAN Routing and mirroring need to be understood, they are orthogonal functions. Care must be taken not to violate VLAN rules as this can redirect packets based on classifier matches.

Table 4-2702. CPSW_NC_CPSW_NC_ALE_EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0: NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. 0xff: Swap SA and DA of packet, this is intended to allow OAM diagnostics for a link.
23:21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements elclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
19:3	RESERVED	NONE		Reserved
2:0	DEST_PORTS	R/W	0h	The Destination Ports is a list of the ports the classified packet will be set to. If a destination is a Trunk, all the port bits for that trunck must be set.

Table 4-2720. CPSW_NC_CPSW_NC_ALE_POLICECONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POLICING_EN	R/W	0h	Policing Enable - Enables the policing to color the packets, this also enables red or yellow drop capabilities.
30	RESERVED	NONE		Reserved
29	RED_DROP_EN	R/W	0h	RED Drop Enable - Enables the ALE to drop the red colored packets.
28	YELLOW_DROP_EN	R/W	0h	WELLOW Drop Enable - Enables the ALE to drop yellow packets based on the ~iyellowthresh value. This field would normally not be used as to let the switch drop packets at a buffer threshold instead. In the event that the switch does not enable buffer threshold dropping, YELLOW packets can be dropped based on this feature.
27	RESERVED	NONE		Reserved
26:24	YELLOWTHRESH	R/W	0h	Yellow Threshold - When set enables a portion of the yellow packets to be dropped based on the ~iyellow_drop_en enable. 0-100% 1=50% 2-33% 3-25% 4=20% 5-17% 6-14% 7-13%
23:22	POLMCHMODE	R/W	0h	Policing Match Mode - This field determines what happens to packets that fail to hit any policing/classifier entry. 0 - No Hit packets are marked GREEN 1 - No Hit packets are marked YELLOW 2 - No Hit packets are marked RED 3 - No Hit packets are marked based on policing/classifier entry=0 state.
21	PRIORITY_THREAD_EN	R/W	0h	Priority Thread Enable - This field determines if priority is OR'd to the default thread when no classifiers hit and the default thread is enabled.
20	MAC_ONLY_DEF_DIS	R/W	0h	MAC Only Default Disable - This field when set disables the default thread on MAC Only Ports. That is the default thread will be {port,priority}. If the traffic matches a classifier with a thread mapping, the classifier thread mapping still occurs.

31:16	RESERVED	NONE		Reserved
15	DEFTHREAD_EN	R/W	0h	Default Tread Enable - When set the switch will use the ~idefthreadval for the host interface thread ID if no classifier is matched. If clear the switch will generate its own thread ID based on port and priority if there is no classifier match.
14:6	RESERVED	NONE		Reserved
5:0	DEFTHREADVAL	R/W	0h	Default Thread Value - This field specifies the default thread ID value.

4.18.448 CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC_ALE_THREADMAPCTL Registers

4.18.448.1 CPSW_VBUSP_CPSW_NC_CPSW_NC_ALE_THREADMAPCTL Register (Offset = 3E138h) [reset = 0h]

Short Description: THREAD Mapping Control

Long Description: The THREAD Mapping Control register allows the highest matched classifier to return a particular thread ID for traffic sent to the host. This allows particular classifier matched traffic to be placed an a particular hosts queue.

Access Types Legend

Table 4-2795. RTIGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:20	RESERVED2	R/W	0h	Reserved. Reads return 0 and writes have no effect
19:16	NTUSEL	R/W	0h	NTUSEL: Select NTU signal. These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL. User and privilege mode [read]: 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to 0 Privilege mode [write]: 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to 0
15	COS	R/W	0h	COS: Continue On Suspend. This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting. User and privilege mode [read]: 0 = counters are stopped while in debug mode 1 = counters are running while in debug mode Privilege mode [write]: 0 = stop counters in debug mode 1 = continue counting in debug mode
14:2	RESERVED1	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CNT1EN	R/W	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 [UC1 and FRC1]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bit destination address [physical].

Table 4-2795. RTIGCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	CNT0EN	R/W	0h	CNT0EN: Counter 0 Enable.The CNT0EN bit starts and stops the operation of counter block 0 [UC0 and FRC0]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bits source address [physical].

4.19.2 MEM_RTITBCTRL Registers

Table 4-2797. RTITBCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	RESERVED3	R/W	0h	Reserved
1	INC	R/W	0h	INC: Increment Free Running Counter 0. This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected. User and privilege mode [read]: 0 = FRC0 will not be incremented 1 = FRC0 will be incremented Privilege mode [write]: 0 = Do not increment FRC0 on failing external clock 1 = Increment FRC0 on failing external clock
0	TBEXT	R/W	0h	TBEXT: Timebase External. The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx. When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset. The selection if the external signal should be used, can only be done by software. User and privilege mode [read]: 0 = UC0 clocks FRC0 1 = NTUx clocks FRC0 Privilege mode [write]: 0 = MUX is switched to internal UC0 clocking scheme 1 = MUX is switched to external NTUx clocking scheme

4.19.3 MEM_RTICAPCTRL Registers

Table 4-2827. RTICOMP1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	COMP1	R/W	0h	COMP1: compare1. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode [read]: current compare value Privilege mode [write]: update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

4.19.18 MEM_RTIUDCP1 Registers

4.19.18.1 MEM_RTIUDCP1 Register (Offset = 5Ch) [reset = 0h]

Short Description: Update Compare 1 value to

Long Description: Update Compare 1 value to be added to the compare register 1 value on compare match

Table 4-2851. RTIDWDPRLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:12	RESERVED17	R/W	0h	Reserved. Reads return 0 and writes have no effect
11:0	DWDPRLD	R/W	0h	DWDPRLD: Digital Watchdog Preload Value. User and priviledge mode [read]: A read from this register in any CPU mode returns the current preload value. Priviledge mode [write]: If the DWD is always enabled after reset is released: The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires. When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value. If the DWD is implemented such that the down counter is enabled by software: The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter. The expiration time of the DWD Down Counter can be determined with following equation: texp = [RTIDWDPRLD+1] x 2 ^ 13 / RTICLK1 where: RTIDWDPRLD = 0...4095

4.19.30 MEM_RTIWDSTATUS Registers

4.19.30.1 MEM_RTIWDSTATUS Register (Offset = 98h) [reset = 0h]

Short Description: Watchdog Status reflects

Long Description: Watchdog Status reflects the status of Analog and Digital Watchdog

Table 4-2853. RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:6	RESERVED18	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and priviledge mode [read]: 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and priviledge mode [read]: 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.

Table 4-2853. RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and priviledge mode [read]: 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and priviledge mode [read]: 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and priviledge mode [read]: 0 = DWD timeout period not expired 1 = DWD timeout period has expired Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and priviledge mode [read]: 0 = AWD pin 0 > 1 threshold not exceeded 1 = AWD pin 0 > 1 threshold exceeded Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0

4.19.31 MEM_RTIWDKEY Registers

4.19.31.1 MEM_RTIWDKEY Register (Offset = 9Ch) [reset = 0h]

Short Description: Watchdog Key correct writ

Long Description: Watchdog Key correct written key values discharge the external capacitor

Table 4-2855. RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED19	R/W	0h	Reserved. Reads return 0 and writes have no effect
15:0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode [write]: A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3. Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

4.19.32 MEM_RTIDWDCNTR Registers

4.19.32.1 MEM_RTIDWDCNTR Register (Offset = A0h) [reset = 0h]

Table 4-2876. RTIGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:20	RESERVED2	R/W	0h	Reserved. Reads return 0 and writes have no effect
19:16	NTUSEL	R/W	0h	NTUSEL: Select NTU signal. These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL. User and privilege mode [read]: 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to 0 Privilege mode [write]: 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to 0
15	COS	R/W	0h	COS: Continue On Suspend. This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting. User and privilege mode [read]: 0 = counters are stopped while in debug mode 1 = counters are running while in debug mode Privilege mode [write]: 0 = stop counters in debug mode 1 = continue counting in debug mode
14:2	RESERVED1	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CNT1EN	R/W	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 [UC1 and FRC1]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bit destination address [physical].

Table 4-2876. RTIGCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	CNT0EN	R/W	0h	CNT0EN: Counter 0 Enable.The CNT0EN bit starts and stops the operation of counter block 0 [UC0 and FRC0]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bits source address [physical].

4.20.2 MEM_RTITBCTRL Registers

Table 4-2878. RTITBCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	RESERVED3	R/W	0h	Reserved
1	INC	R/W	0h	INC: Increment Free Running Counter 0. This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected. User and privilege mode [read]: 0 = FRC0 will not be incremented 1 = FRC0 will be incremented Privilege mode [write]: 0 = Do not increment FRC0 on failing external clock 1 = Increment FRC0 on failing external clock
0	TBEXT	R/W	0h	TBEXT: Timebase External. The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx. When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset. The selection if the external signal should be used, can only be done by software. User and privilege mode [read]: 0 = UC0 clocks FRC0 1 = NTUx clocks FRC0 Privilege mode [write]: 0 = MUX is switched to internal UC0 clocking scheme 1 = MUX is switched to external NTUx clocking scheme

Access Types Legend

Table 4-2886. RTIUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	UC0	R/W	0h	UC0: Up Counter 0. This registers holds the current value of the Up Counter 0 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 0. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 0 and Free Running Counter 0. User and privilege mode [read]: value of the counter when the Free Running Counter 0 was read Privilege mode [write]: the counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC0 then it can take a long time until a compare matches, since RTIUC0 has to count up until it overflows.

4.20.7 MEM_RTICPUC0 Registers

4.20.7.1 MEM_RTICPUC0 Register (Offset = 18h) [reset = 0h]

Short Description: Compare Up Counter 0 comp

Long Description: Compare Up Counter 0 compare value compared with prescale counter 0

Table 4-2896. RTIUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	UC1	R/W	0h	UC1: Up Counter 1. This registers holds the current value of the Up Counter 1 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 1. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 1 and Free Running Counter 1. User and privilege mode [read]: value of the counter when the Free Running Counter 1 was read Privilege mode [write]: the counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC1 then it can take a long time until a compare matches, since RTIUC1 has to count up until it overflows.

4.20.12 MEM_RTICPUC1 Registers

4.20.12.1 MEM_RTICPUC1 Register (Offset = 38h) [reset = 0h]

Short Description: Compare Up Counter 1 comp

Long Description: Compare Up Counter 1 compare value compared with prescale counter 1

Table 4-2902. RTICAUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	CAUC1	R/W	0h	CAUC1: Capture Up Counter 1. This registers captures the current value of the Up Counter 1 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 1 and Free Running Counter 1. So the RTICAFRC1 register has to be read first, before the RTICAUC1 register is read. This sequence ensures that the value of the RTICAUC1 register is the corresponding value to the RTICAFRC1 register, even if another capture event happens in between the two reads. User and privilege mode [read]: value of Up Counter 1 on a capture event

4.20.15 MEM_RTICOMP0 Registers

4.20.15.1 MEM_RTICOMP0 Register (Offset = 50h) [reset = 0h]

Short Description: Compare 0 compare value t

Long Description: Compare 0 compare value to be compared with the counters

Bit	Field	Type	Reset	Description
31:0	DWDCTRL	R/W	0h	DWDCTRL: Digital Watchdog Control. User and priviledge mode [read]: 0x5312ACED = DWD counter is disabled. This is the default value. 0xA98559DA = DWD counter is enabled Any other value = DWD counter state is unchanged [enabled or disabled] Priviledge mode [write]: 0xA98559DA = DWD counter is enabled Any other value = State of DWD counter is unchanged [stays enabled or disabled] Note: One-Write Functionality of DWDCTRL Register The RTIDWDCTRL register implements a one-write functionality, such that the application cannot write to this registermore than once. Writing the default value will not enable the watchdog as described above. Writing the enable value will start the watchdog counters. A write to RTIDWDCTRL will only be enabled after a system reset again.

4.20.29 MEM_RTIDWDPRLD Registers

4.20.29.1 MEM_RTIDWDPRLD Register (Offset = 94h) [reset = 0h]

Short Description: Digital Watchdog Preload

Table 4-2932. RTIDWDPRLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:12	RESERVED17	R/W	0h	Reserved. Reads return 0 and writes have no effect
11:0	DWDPRLD	R/W	0h	DWDPRLD: Digital Watchdog Preload Value. User and priviledge mode [read]: A read from this register in any CPU mode returns the current preload value. Priviledge mode [write]: If the DWD is always enabled after reset is released: The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires. When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value. If the DWD is implemented such that the down counter is enabled by software: The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter. The expiration time of the DWD Down Counter can be determined with following equation: texp = [RTIDWDPRLD+1] x 2 ^ 13 / RTICLK1 where: RTIDWDPRLD = 0...4095

4.20.30 MEM_RTIWDSTATUS Registers

4.20.30.1 MEM_RTIWDSTATUS Register (Offset = 98h) [reset = 0h]

Table 4-2934. RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:6	RESERVED18	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and priviledge mode [read]: 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and priviledge mode [read]: 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.

Table 4-2934. RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and priviledge mode [read]: 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and priviledge mode [read]: 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and priviledge mode [read]: 0 = DWD timeout period not expired 1 = DWD timeout period has expired Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and priviledge mode [read]: 0 = AWD pin 0 > 1 threshold not exceeded 1 = AWD pin 0 > 1 threshold exceeded Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0

4.20.31 MEM_RTIWDKEY Registers

4.20.31.1 MEM_RTIWDKEY Register (Offset = 9Ch) [reset = 0h]

Short Description: Watchdog Key correct writ

Long Description: Watchdog Key correct written key values discharge the external capacitor

Return to Summary Table

Table 4-2936. RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED19	R/W	0h	Reserved. Reads return 0 and writes have no effect
15:0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode [write]: A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3. Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

4.20.32 MEM_RTIDWDCNTR Registers

4.20.32.1 MEM_RTIDWDCNTR Register (Offset = A0h) [reset = 0h]

4.23.2 UART_RHR Registers

4.23.2.1 RHR Register (Offset = 0h) [reset = 0h]

Short Description: The receiver section cons

Long Description: The receiver section consists of the receiver holding register (RHR) and the receiver shift register. The RHR is actually a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the RHR. If the FIFO is disabled location zero of the FIFO is used to store the single data character. Note: If an overflow occurs the data in the RHR is not overwritten.

4.23.3 UART_THR Registers

4.23.3.1 THR Register (Offset = 0h) [reset = 0h]

Short Description: The transmitter section c

Long Description: The transmitter section consists of the transmit holding register (THR) and the transmit shift register. The transmit holding register is actually a 64-byte FIFO. The LH writes data to the THR. The data is placed into the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled location zero of the FIFO is used to store the data.

4.23.7 UART_IER_UART Registers

4.23.7.1 IER_UART Register (Offset = 4h) [reset = 0h]

Short Description: The interrupt enable regi

Long Description: The interrupt enable register (IER) can be programmed to enable/disable any interrupt. There are seven types of interrupt in this mode: receiver error, RHR interrupt, THR interrupt, XOFF received and CTS*/RTS* change of state from low to high. Each interrupt can be enabled/disabled individually. There is also a sleep mode enable bit.

Table 4-2987. UART_EFR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED	NONE		Reserved
7	AUTO_CTS_EN	R/W	0h	Auto-CTS enable bit. 0: Normal operation. 1: Auto-CTS flow control is enabled i.e. transmission is halted when the CTS* pin is high (inactive). Reset Source: mod_g_arstn
6	AUTO_RTS_EN	R/W	0h	Auto-RTS enable bit. 0: Normal operation. 1: Auto- RTS flow control is enabled i.e. RTS* pin goes high (inactive) when the receiver FIFO HALT trigger level, TCR[3:0], is reached, and goes low (active) when the receiver FIFO RESTORE transmission trigger level is reached. Reset Source: mod_g_arstn
5	SPECIAL_CHAR_DETECT	R/W	0h	0: Normal operation. 1: Special character detect enable. Received data is compared with XOFF2 data. If a match occurs the received data is transferred to RX FIFO and IIR bit 4 is set to 1 to indicate a special character has been detected. Reset Source: mod_g_arstn
4	ENHANCED_EN	R/W	0h	Enhanced functions write enable bit. 0: Disables writing to IER bits 4-7, FCR bits 4-5, and MCR bits 5-7. 1: Enables writing to IER bits 4-7, FCR bits 4-5, and MCR bits 5-7. Reset Source: mod_g_arstn
3:0	SW_FLOW_CONTROL	R/W	0h	Combinations of Software flow control can be selected by programming bit 3 - bit 0. See Software Flow Control Options Reset Source: mod_g_arstn

4.23.9 UART_FCR Registers

4.23.9.1 FCR Register (Offset = 8h) [reset = 0h]

Short Description: Notes: Bits 4 and 5 can

Long Description: Notes: Bits 4 and 5 can only be written to when EFR[4] = 1 Bits 0 to 3 can be changed only when the baud clock is not running (DLL and DLH set to 0) See Table 31 for FCR[5:4] setting restriction when SCR[6]=1 See Table 32 for FCR[7:6] setting restriction when SCR[7]=1

Table 4-2997. UART_LCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_24	R	0h	Reset Source: mod_g_arstn
7	DIV_EN	R/W	0h	Reset Source: mod_g_arstn 1 DIV_EN_Value_1 Divisor latch enable. Allows to access to DLL, DLH and other registers (refer to the registers mapping)
6	BREAK_EN	R/W	0h	Break control bit. Reset Source: mod_g_arstn 1 BREAK_EN_Value_1 Forces the transmitter output to go low to alert the communication terminal
5	PARITY_TYPE2	R/W	0h	Selects the forced parity format [if LCR[3] = 1]. If LCR[5] = 1 and LCR[4] = 0, the parity bit is forced to 1 in the transmitted and received data. If LCR[5] = 1 and LCR[4] = 1, the parity bit is forced to 0 in the transmitted and received data. Reset Source: mod_g_arstn
4	PARITY_TYPE1	R/W	0h	Reset Source: mod_g_arstn 1 PARITY_TYPE1_Value_1 Even parity is generated (if LCR[3] = 1)
3	PARITY_EN	R/W	0h	Reset Source: mod_g_arstn 1 PARITY_EN_Value_1 A parity bit is generated during transmission and the receiver checks for received parity.
2	NB_STOP	R/W	0h	Specifies the number of stop bits: Reset Source: mod_g_arstn 1 NB_STOP_Value_1 1.5 stop bits (word length = 5) in USART mode. 2 stop bits (word length = 6, 7, 8)

Table 4-2997. UART_LCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1:0	CHAR_LENGTH	R/W	0h	Specifies the word length to be transmitted or received. Reset Source: mod_g_arstn 3 CHAR_LENGTH_Value_3 8 bits 2 CHAR_LENGTH_Value_2 7 bits 1 CHAR_LENGTH_Value_1 6 bits

4.23.14 UART_MCR Registers

4.23.14.1 MCR Register (Offset = 10h) [reset = 0h]

Short Description: MCR[3:0] controls the int

Long Description: MCR[3:0] controls the interface with the modem, data set or peripheral device that is emulating the modem.

7	THR_EMPTY	R	1h	Reset Source: mod_g_arstn 1 THR_EMPTY_Value_1 Transmit hold register (TX FIFO) is empty. The transmission is not necessarily completed
6	STS_FIFO_FULL	R	0h	Reset Source: mod_g_arstn 1 STS_FIFO_FULL_Value_ Status FIFO full 1
5	RX_LAST_BYTE	R	0h	Reset Source: mod_g_arstn 1 RX_LAST_BYTE_Value_1 The RX FIFO (RHR) contains the last byte of the frame to be read.This bit is only set when the last byte of a frame is available to be read. It is used to determine the frame boundary. It is cleared on a single read of the LSR register
4	FRAME_TOO_LONG	R	0h	Reset Source: mod_g_arstn 1 FRAME_TOO_LONG_Value Frame-too-long error in the _1 frame at the top of the STATUS FIFO, [next character to be read]. This bit is set to 1 when a frame exceeding the maximum length (set by RXFLH and RXFLL registers) has been received. When this error is detected, current frame reception is terminated. Reception is stopped until the next START flag is detected
3	ABORT	R	0h	Reset Source: mod_g_arstn 1 ABORT_Value_1 Abort pattern is received. SIR & MIR: Abort pattern. FIR: Illegal symbol
2	CRC	R	0h	Reset Source: mod_g_arstn 1 CRC_Value_1 CRC error in the frame at the top of the STATUS FIFO (next character to be read)

Table 4-3005. UART_LSR_IRDA Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	STS_FIFO_E	R	1h	Reset Source: mod_g_arstn 1 STS_FIFO_E_Value_1 Status FIFO empty
0	RX_FIFO_E	R	1h	Reset Source: mod_g_arstn 1 RX_FIFO_E_Value_1 At least one data character in the RX FIFO

4.23.27 UART_MDR2 Registers

4.23.27.1 MDR2 Register (Offset = 24h) [reset = 0h]

Short Description: IR-IrDA and IR-CIR modes

Long Description: IR-IrDA and IR-CIR modes only. MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0]. Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.

4.23.30 UART_RESUME Registers

4.23.30.1 RESUME Register (Offset = 2Ch) [reset = 0h]

Short Description: IR-IrDA and IR-CIR modes

Long Description: IR-IrDA and IR-CIR modes only. This register is used to clear internal flags, which halt transmission/reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.

Table 4-3047. UART_ACREG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_24	R	0h	Reset Source: mod_g_arstn
7	PULSE_TYPE	R/W	0h	SIR pulse width select: Reset Source: mod_g_arstn 1 PULSE_TYPE_Value_1 1.6us
6	SD_MOD	R/W	0h	Primary output used to configure transceivers. Connected to the SD/MODE input pin of IrDA transceivers. Reset Source: mod_g_arstn 1 SD_MOD_Value_1 SD pin is set to low
5	DIS_IR_RX	R/W	0h	Reset Source: mod_g_arstn 1 DIS_IR_RX_Value_1 Disables RX input (permanent state - independent of transmit).
4	DIS_TX_UNDERRUN	R/W	0h	It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting ACREG[4]=1, garbage data is sent over TX line. Reset Source: mod_g_arstn 1 DIS_TX_UNDERRUN_Valu Long stop bits can be e_1 transmitted, TX underrun is disabled
3	SEND_SIP	R/W1TS	0h	MIR/FIR Modes only.Send Serial Infrared Interaction Pulse [SIP] If this bit is set during a MIR/FIR transmission, the SIP will be send at the end of it.This bit automatically gets cleared at the end of the SIP transmission. Reset Source: mod_g_arstn 1 SEND_SIP_Value_1 Send SIP pulse.
2	SCTX_EN	R/W1TS	0h	Store and controlled TX start. When MDR1[5] = 1 and the LH writes 1 to this bit the TX state machine starts frame transmission. This bit is self-clearing. Reset Source: mod_g_arstn

Table 4-3047. UART_ACREG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	ABORT_EN	R/W	0h	Frame Abort. The LH can intentionally abort transmission of a frame by writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame. If transmit FIFO is not empty and MDR1[5]=1, UART IrDA will start a new transfer with data of previous frame as soon as abort frame has been sent. Therefore, TX FIFO must be reset before sending an abort frame. Reset Source: mod_g_arstn
0	EOT_EN	R/W1TS	0h	EOT [end of transmission] bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit automatically gets cleared when the LH writes to the THR [TX FIFO]. Reset Source: mod_g_arstn

4.23.39 UART_SCR Registers

4.23.39.1 SCR Register (Offset = 40h) [reset = 0h]

Short Description: Note: Bit 4 enables the w

Long Description: Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.

4.23.41 UART_EBLR Registers

4.23.41.1 EBLR Register (Offset = 48h) [reset = 0h]

Short Description: IR-IrDA and IR-CIR modes

Long Description: IR-IrDA and IR-CIR modes only. In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF. In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags). In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to

7:0	EBLR	R/W	0h	IR-IRDA mode: This register allows to define up to 176 xBOFs, the maximum required by IrDA specification. IR-CIR mode: This register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt [IIR[2]]. 0x00: feature disabled. 0x01: generate RX_STOP interrupt after receiving one zero bit. ... 0xFF: generate RX_STOP interrupt after receiving 255 zero bits. Reset Source: mod_g_arstn

4.23.42 UART_MVR Registers

4.23.42.1 MVR Register (Offset = 50h) [reset = 47424e03h]

Short Description: The reset value is fixed

Long Description: The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returned Notes: UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification). UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification). UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification). For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8

4.23.43 UART_SYSC Registers

4.23.43.1 SYSC Register (Offset = 54h) [reset = 0h]

Short Description: The auto idle bit control

Long Description: The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.

4.23.45 UART_WER Registers

4.23.45.1 WER Register (Offset = 5Ch) [reset = ffh]

Short Description: The UART wakeup enable re

Long Description: The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.

4.23.46 UART_CFPS Registers

4.23.46.1 CFPS Register (Offset = 60h) [reset = 69h]

Short Description: Since the Consumer IR wor

Long Description: Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.
