PCM4204EVM User's Guide

This document provides the information needed to set up and operate the PCM4204EVM evaluation module (EVM). For a more detailed description of the PCM4204, please refer to the product datasheet available from the Texas Instruments web site at http://www.ti.com. Additional support documents are listed in the sections of this guide entitled **Related Documentation from Texas Instruments** and **Additional Documentation**. Throughout this document, the acronym **EVM** and the phrase *evaluation module* are synonymous with the PCM4204EVM. This user's guide includes setup and configuration instructions, information regarding absolute operating conditions for power supplies and input/output connections, an electrical schematic, PCB layout drawings, and a bill of materials (BOM) for the EVM.

1   Introduction

The PCM4204 is a high-performance, four-channel audio analog-to-digital (A/D) converter designed for use in professional and broadcast audio applications. The PCM4204 features simultaneous 24-bit linear PCM or 1-bit Direct Stream Digital (DSD) data output for all four channels. Sampling rates up to 216kHz are supported for PCM output formats, while 64x or 128x oversampled 1-bit data is supported for DSD output and input modes. Native support for both PCM and DSD data formats makes the PCM4204 ideal for use in a variety of audio recording and processing applications.

The PCM4204 features 1-bit delta-sigma (ΔΣ) modulators employing a novel density modulated dithering scheme, yielding improved dynamic performance. Differential voltage inputs are utilized for the modulators, providing excellent common-mode rejection. On-chip voltage references are provided for the modulators, in addition to generating DC common-mode bias voltage outputs for use with external input circuitry. Linear phase digital decimation filtering is provided for the 24-bit PCM output, with a minimum stop band attenuation of -100dB for all sampling modes.

The PCM output mode features clipping flag outputs for each of the four channels, as well as a digital high-pass filter for DC removal. The PCM4204 is configured using dedicated input pins for sampling mode and audio data format selection, high-pass filter enable/disable, and reset/power-down operation.

A +5V power supply is required for the analog section of the device, while a +3.3V power supply is required for the digital circuitry. Figure 1 shows the functional block diagram of the PCM4204.
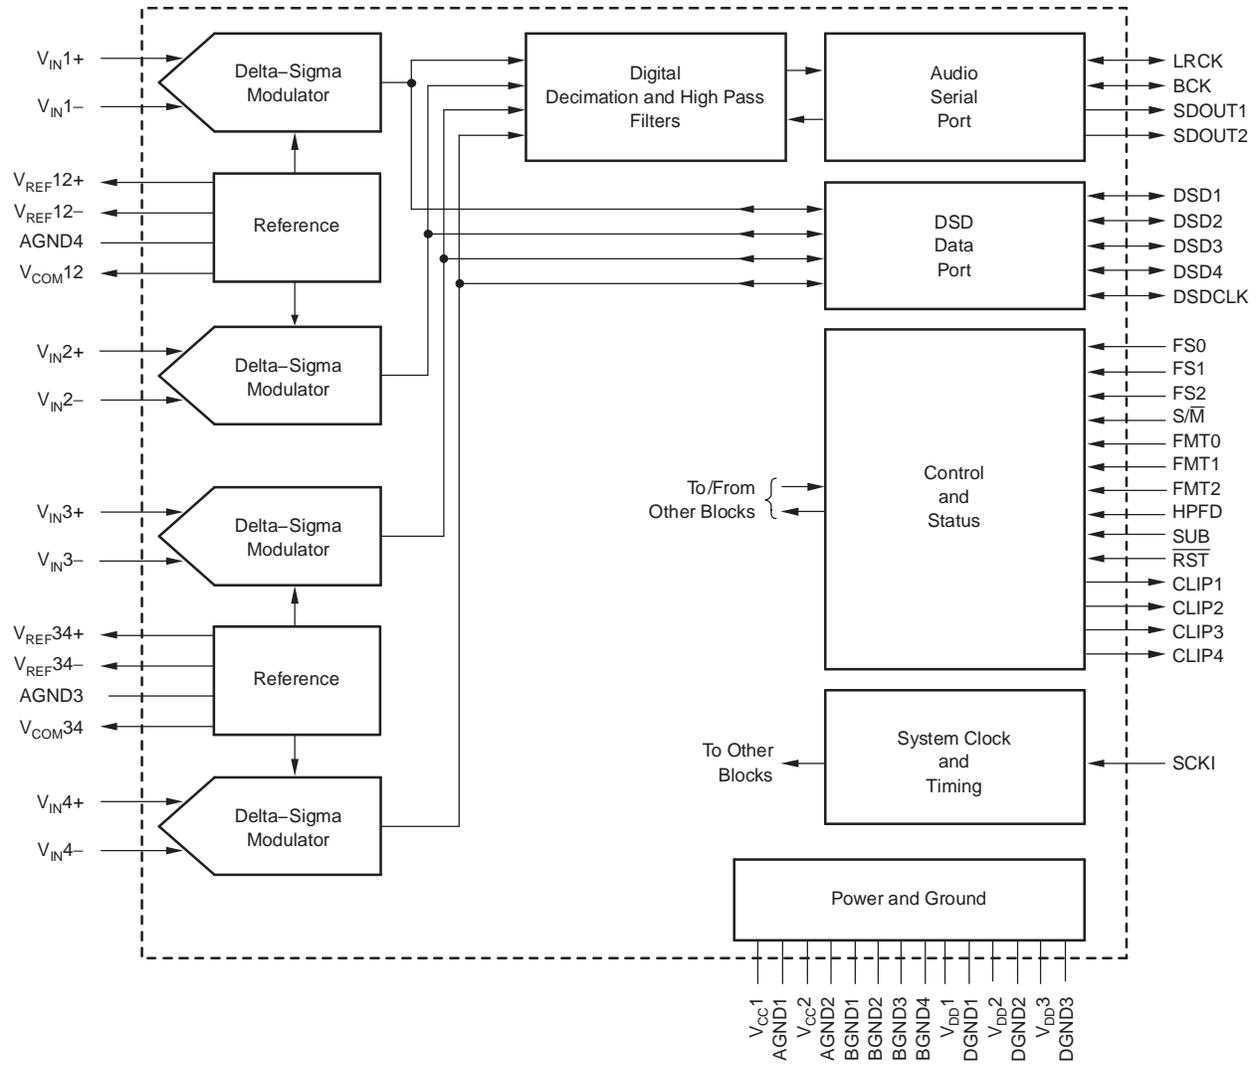

Figure 1. PCM4204 Functional Block Diagram

1.1 *PCM4204EVM Features*

The PCM4204EVM provides a convenient platform for evaluating the performance and functionality of the PCM4204 product. The primary EVM features include:

- Simple configuration using onboard DIP switches
- Four differential voltage inputs supporting either 3-pin XLR or Balanced TRS connections
- Low-noise input buffer circuits utilizing the OPA1632 fully differential audio amplifier
- Four 75Ω AES3-encoded outputs, supporting operation up to 216kHz sampling rates
- Buffered Audio Serial Port supports a four-channel, 24-bit linear PCM data interface for external hardware and signal processors. Sampling rates up to 216kHz are supported.
- DSD Data Port supports a four-channel, 1-bit output or input data interface at 64x or 128x data rates
- A second PCM4204 provides a test mode for 1-bit DSD to 24-bit linear PCM format conversions
- Two onboard system clock oscillators, operating at 22.5792MHz and 24.576MHz respectively, supporting standard PCM sampling rates, including 44.1kHz, 48kHz, 88.2kHz, 96kHz, 176.4kHz, and 192kHz.
- External system clock inputs supporting alternative sampling rates up to 216kHz.

The PCM4204EVM requires +15V, -15V, and +5V analog power supplies. Additionally, a +5V digital power supply is required, with a +3.3V digital supply being derived onboard using a linear voltage regulator IC.

1.2 *PCM4204EVM General Description and Functional Block Diagram*

The PCM4204EVM provides a complete platform for evaluating the performance and features of the PCM4204 four-channel audio A/D converter. Figure 2 illustrates the functional block diagram for the evaluation module.

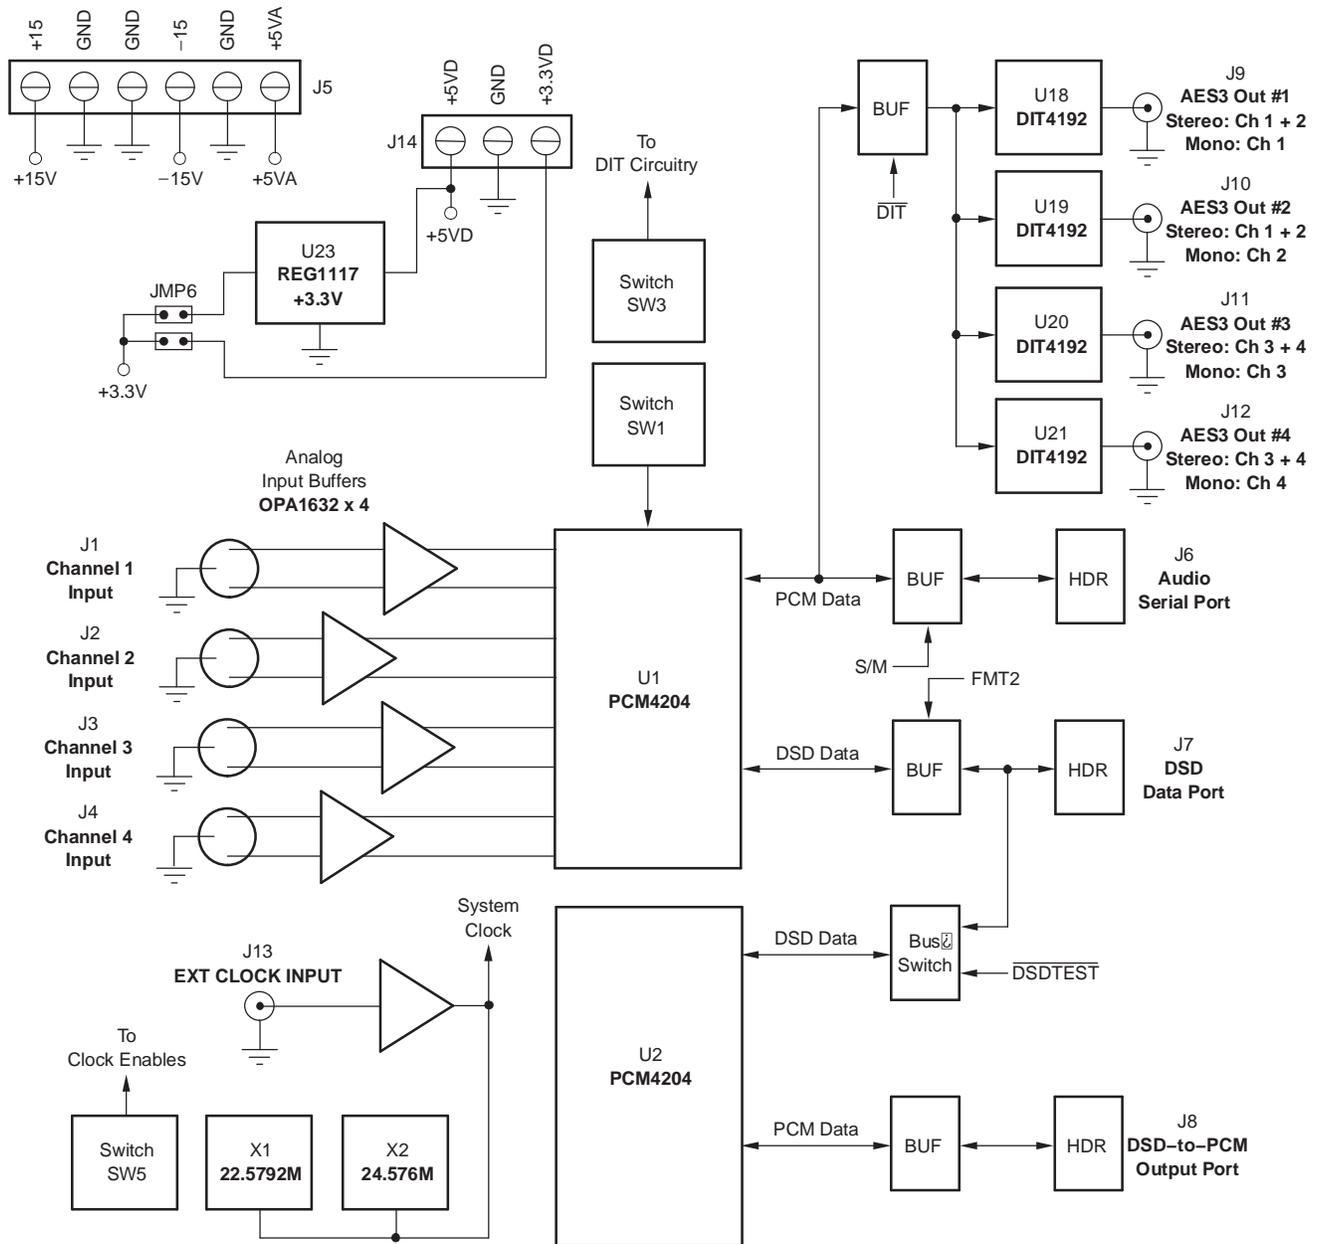

Figure 2. PCM4204EVM Functional Block Diagram

Four differential analog inputs are supported at connectors J1 through J4, corresponding to analog input channels 1 through 4, respectively. These connectors support either 3-pin male XLR or balanced TRS input plugs. Each of the analog inputs is buffered and filtered using a low noise input circuit, utilizing a Texas Instruments OPA1632 fully differential amplifier. The output of each buffer circuit is connected to a corresponding differential input of the PCM4204 (U1). The PCM4204 is then used to convert the analog signal to either a 24-bit linear PCM or 1-bit DSD representation in the digital domain.

The 24-bit PCM data output is made available at header J6, or at the AES3-encoded data outputs provided at jacks J9 through J12. The buffered header is convenient for interfacing to external development hardware or digital signal processors, while the AES3-encoded outputs may be connected to audio test systems or commercial audio equipment.

The 1-bit DSD data is available at header J7. This header is bi-directional, and may be used for either DSD output or input mode operation. A second PCM4204 (U2) is included for supporting a DSD-to-PCM format conversion test or demo mode. The resulting PCM-formatted output data is made available at header J8.

Power is connected to the board at either terminal block J5 for the analog supplies, or at terminal block J14 for the digital supplies.

Manual reset circuits are provided for both the PCM4204 (U1 and U2) and the AES3 transmitters (U18 through U21). The ADC RESET switch (SW2) is utilized for resetting the A/D converters (U1 and U2), while the DIT RESET switch (SW4) is utilized for resetting the AES3 transmitters (U18 through U21).

The system or master clock for the evaluation module may be generated onboard or by an external clock source. Oscillators X1 and X2 operate at fixed clock frequencies of 22.5792MHz and 24.576MHz, respectively. The oscillators provide low jitter clock sources for measuring the performance of the PCM4204 in Master mode operation. Alternatively, an external clock source may be connected at J13 for Master mode operation, supporting alternate system clock and sampling frequencies. For Slave mode operation, the system clock is provided from an external source through header J6 and buffer U12. Switch SW5 provides clock configuration control for the oscillators and the external clock input at connector J13.

1.3   Related Documentation from Texas Instruments

The following documents provide information regarding Texas Instrument integrated circuits used in the assembly of the PCM4204EVM. The latest revisions of these documents are available from the TI web site at http://www.ti.com.

2 Getting Started

This section provides information regarding handling and unpacking the PCM4204EVM, as well as absolute operating conditions for the unit.

2.1 Electrostatic Discharge Warning

CAUTION

Failure to observe proper ESD handling precautions may result in damage to EVM components.

Many of the components on the PCM4204EVM are susceptible to damage by electrostatic discharge (ESD). Customers are advised to observe proper ESD handling procedure when unpacking and handling the EVM, including the use of a grounded wrist strap at an approved ESD workstation. Failure to observe ESD handling procedures may result in damage to EVM components.

2.2 EVM Package Contents

Upon opening the PCM4204EVM package, please check to make sure that the following items are included:

- One PCM4204EVM
- One printed copy of the PCM4204 product datasheet
- One printed copy of this PCM4204EVM User's Guide

If any of these items are missing, please contact the Texas Instruments Product Information Center nearest you to inquire about replacements.

2.3 Absolute Operating Conditions

> **CAUTION**
>
> Exceeding the absolute operating conditions may result in damage to the evaluation module and/or the equipment connected to it.

The user should be aware of the absolute operating conditions for the PCM4204EVM. Table 1 summarizes the critical data points.

Table 1. Absolute Operating Conditions

	Min	Max	Units
Power Supplies			
+15V	+5.0	+16.0	V
-15V	-5.0	-16.0	V
+5VA	+4.5	+5.5	V
+5VD	+4.5	+5.5	V
EXT +3.3V	+3.0	+3.6	V
Audio Serial Port (J6), DSD Data Port (J7)			
V_{IH}, Input High Voltage (V_{DD} = +3.0V to +3.6V)	0.7 x V_{DD}	V_{DD} + 0.3	V
V_{IL}, Input Low Voltage (V_{DD} = +3.0V to +3.6V)	-0.3	0.3 x V_{DD}	V
Analog Inputs (connectors J1 and J2)			
Differential Input Voltage, RMS		7.9	V_{RMS}
Differential Input Voltage, Peak-to-Peak		22.3	V_{PP}

3 Hardware Description and Configuration

This section provides hardware description and configuration information for the PCM4204EVM.

3.1 Power Supply Configuration

The PCM4204EVM requires three analog power supplies and one digital power supply for operation. The analog supplies are connected at terminal block J5, while the digital supply is connected at terminal block J14.

Analog supplies include +15V and -15V DC for powering the input buffer circuits, as well as +5.0V DC for powering the analog section of the PCM4204. All supplies should be rated for at least 500mA of output current.

The digital supply requires +5.0V DC and should be rated for at least 500mA of output current. The +5.0V supply is regulated to +3.3V DC by an onboard Texas Instruments REG1117 linear voltage regulator (U23), which is used to power the digital section of the PCM4204 and the majority of the support logic circuitry. The core logic and line driver sections of the AES3 transmitters (U18 through U21) utilize the +5.0V digital supply directly.

An optional external +3.3V DC digital power supply is supported at terminal block J14. Jumper JMP6 is utilized to select either the onboard voltage regulator (U23) or an external +3.3V power source. Shorting pins 1 and 2 together using the supplied jumper block selects the onboard +3.3V voltage regulator. Shorting pins 3 and 4 together will select the external +3.3V supply terminal (EXT +3.3VD) on terminal block J14. Only one source may be selected at any time.

3.2 Analog Inputs

The PCM4204EVM includes four Neutrik combo XLR connectors, which accept either 3-pin male XLR or ¼-inch TRS phono plugs. The connectors are numbered J1 through J4, corresponding to Channels 1 through 4, respectively.

The analog inputs can accept up to a $7.9V_{RMS}$ (or $22.3V_{PP}$) differential input signal. This signal is then attenuated by a factor of 3.7 by the input buffer circuit, which corresponds to the $6.0V_{PP}$ full-scale differential input voltage for the PCM4204 analog inputs.

The input buffer circuits are each comprised of a single OPA1632 fully differential audio amplifier and associated passive components. The input buffer provides active attenuation and low pass filtering for the analog input signal. The OPA1632 outputs are DC level-shifted by approximately +2.5V using the amplifiers $V_{COM}IN$ input (pin 2), which are connected to a buffered version of either the PCM4204 $V_{COM}12$ (pin 61) or $V_{COM}34$ outputs (pin 52).

3.3 Audio Data Format Selection

Switch SW1 is used to select the audio data format for the PCM4204 (U1). Table 2 and Table 3 summarize the available audio data formats for both Slave and Master mode operation and the corresponding SW1 switch settings.

Table 2. Audio Data Format Selection: Slave Mode Operation

S/M	FMT2	FMT1	FMT0	Audio Data Format
HI	LO	LO	LO	24-Bit Left Justified
HI	LO	LO	HI	24-Bit I²S
HI	LO	HI	LO	24-Bit Right Justified
HI	LO	HI	HI	TDM with No BCK Delay for Start of Frame
HI	HI	LO	LO	TDM with One BCK Delay for Start of Frame
HI	HI	LO	HI	Reserved
HI	HI	HI	LO	Reserved
HI	HI	HI	HI	Reserved

Table 3. Audio Data Format Selection: Master Mode Operation

S/M	FMT2	FMT1	FMT0	Audio Data Format
LO	LO	LO	LO	24-Bit Left Justified
LO	LO	LO	HI	24-Bit I^{2}S
LO	LO	HI	LO	24-Bit Right Justified
LO	LO	HI	HI	DSD Output with PCM Output Disabled
LO	HI	LO	LO	DSD Input with 24-Bit Right Justified PCM Output
LO	HI	LO	HI	Reserved
LO	HI	HI	LO	Reserved
LO	HI	HI	HI	Reserved

For Slave mode operation, the Audio Serial Port header (connector J6) is utilized to interface to a Master device, such as a digital signal processor, FPGA, or an audio test system with a synchronous serial port interface. The system clock (SCKI), bit clock (BCK), and left/right word clock (LRCK) are generated by the Master device and are used to drive the SCKI (pin 15), BCK (pin 29), and LRCK (pin 30) inputs of the PCM4204. Serial audio data is output at SDOUT1 (pin 31) and SDOUT2 (pin 32). Slave mode supports PCM-formatted output data only. DSD output data is available only in Master mode.

For TDM data formats, the SUB switch on SW1 allows the user to select the sub-frame assignment for the PCM4204. Table 4 summarizes the operation of the SUB switch. Refer to the PCM4204 product datasheet for more details concerning the TDM data formats and operation.

Table 4. Sub-Frame Selection for TDM Data Formats

SUB	TDM Sub-Frame Selection
LO	Sub-frame 0 (time slots 1 through 4)
HI	Sub-frame 1 (time slots 5 through 8)

For Master mode, the system clock is provided by one of the sources described in Section 3.4 of this document. The PCM4204 internally generates the BCK and LRCK clocks, which are then output to the Audio Serial Port header (connector J6) and the AES3 digital interface transmitters, which then drive output connectors J9 through J12.

Master mode may also be configured to support 1-bit DSD-formatted audio output data. For the DSD mode formats, header J7 provides the direct input/output interface for the PCM 4204 (U1) DSD data port. In addition, there is a second PCM4204 (U2), configured to perform 1-bit DSD to 24-bit PCM format conversion with the PCM output provided at header J8. The DSD output from U1 may be routed to the DSD input of U2, providing a DSD-to-PCM test or demonstration mode.

The $\overline{\text{DSDTEST}}$ switch on SW1 is used to enable or disable the DSD test mode, as shown in Table 5. The data format for U1 must be set up for DSD Output mode, as shown in Table 3. Then the DSD test mode is enabled, routing the DSD data output from U1, through bus switch U16, and then to the DSD port of U2, which is configured for DSD Input mode. The DSD-to-PCM format conversion is then performed and 24-bit PCM data is output at header J8.

Table 5. DSD-to-PCM Conversion Test Mode Selection

DSDTEST	DSD-to-PCM Test Mode
LO	Enabled
HI	Disabled

3.4 System Clock Configuration

Switch SW5 is used to select the system clock source for the PCM4204EVM. Table 6 summarizes the available clock source options. The onboard oscillators support standard PCM sampling rates in Master mode, including 44.1kHz, 48kHz, 88.2kHz, 96kHz, 176.4kHz, and 192kHz. The external clock input (connector J13) may be used to supply alternate system clock frequencies that support additional sample rates.

For Slave mode operation, the system clock is input at the SCKI pin of header J6.

Table 6. System Clock Source Selection

Switch SW5			System Clock Source	Used for Master or Slave Mode Operation?
EXT	OSC1	OSC0		
LO	LO	LO	External clock input at J13	Master
HI	LO	LO	External clock input at the SCKI pin of header J6	Slave
HI	LO	HI	Oscillator X1, 22.5792MHz	Master
HI	HI	LO	Oscillator X2, 24.576MHz	Master

3.5 Sampling Mode Selection

The sampling mode of the PCM4204 (U1 and U2) is selected using switch SW1. Table 7 through Table 10 summarize the available sampling modes for both PCM and DSD output modes.

Single Rate sampling mode is designed for output sampling rates up to 54kHz. The modulator oversampling rate is set to 128x.

Dual Rate sampling mode is designed for output sampling rates greater than 54kHz and up to 108kHz. The modulator oversampling rate is set to 64x.

Quad Rate sampling mode is designed for output sampling rates greater than 108kHz and up to 216kHz. The modulator oversampling rate is set to 32x.

Table 7. Sampling Mode Selection: PCM Slave Mode Audio Formats

FS2	FS1	FS0	Sampling Mode
LO	LO	LO	Single Rate with Clock Auto-Detection
LO	LO	HI	Dual Rate with Clock Auto-Detection
LO	HI	LO	Quad Rate with Clock Auto-Detection
LO	HI	HI	Reserved
HI	LO	LO	Reserved

HI	HI	LO	Reserved
HI	HI	HI	Reserved

3.6 Digital High-Pass Filter

The PCM4204 includes a digital high-pass filter function for all four channels, designed for removing the DC component from the digitized signal. The high-pass filter is not available when using the DSD output mode. The high-pass filter function may be enabled or disabled using the HPFD switch on SW1. Table 11 summarizes the operation of the HPFD switch.

Table 11. Digital High-Pass Filter Configuration

HPFD	Digital High-Pass Filter Function
LO	Enabled
HI	Disabled

3.7 *Digital Interface Transmitter Configuration*

Four Texas Instruments DIT4192 digital interface transmitters provide AES3-encoded outputs for the PCM4204EVM. Switch SW3 is utilized to configure the transmitters. The outputs of the transmitters are available at connectors J9 through J12, which are RCA phono jacks. These outputs are designed for use with 75Ω coaxial cable connections.

The transmitters are enabled using the $\overline{\text{DIT}}$ switch of SW3. The $\overline{\text{DIT}}$ switch operation is summarized in Table 12.

Table 12. Digital Interface Transmitter Configuration

$\overline{\text{DIT}}$	Digital Interface Filter Function
LO	Enabled
HI	Disabled

Like the PCM4204, the DIT4192 transmitters must be configured for the proper master (or system) clock frequency. The transmitter master clock is driven by the same source as the PCM4204 system clock, as described in Section 3.4 of this document. Table 13 summarizes the master clock options for the DIT4192 transmitters using switch SW3.

Table 13. Transmitter Master Clock Configuration

CLK1	CLK0	Transmitter MCLK Frequency
LO	LO	$128f_S$
LO	HI	$256f_S$
HI	LO	$384f_S$
HI	HI	$512f_S$

The audio data input format for the transmitters must also be set to match the PCM output data format for the PCM4204. Table 14 shows the transmitter data format settings, configured using switch SW3. The transmitters do not support TDM or DSD data formats.

Table 14. Transmitter Audio Data Format Selection

FMT1	FMT0	Transmitter Audio Data Format (PCM Only)
LO	LO	24-Bit Left Justified
LO	HI	24-Bit I^{2}S
HI	LO	24-Bit Right Justified
HI	HI	16-Bit Right Justified (not used)

The DIT4192 transmitters may be operated in either Stereo or Mono mode. In Stereo mode, two channels of audio data are transmitted at the input sampling frequency. In Mono mode, two consecutive samples of only one channel are transmitted at one-half the input sampling rate. The Mono mode is useful for performance testing with f_S = 176.4kHz or f_S = 192kHz with a system that can only accept only half these rates. This is the case with the Audio Precision System Two Cascade or Cascade Plus test system, which was used for factory performance testing of the PCM4204. Mono mode can be used in conjunction with the Audio Precision Dual BNC digital input mode to test at sampling rates up to 216kHz.

The MONO12 and MONO34 switches on SW3 are used to enable or disable Mono mode operation. Table 15 summarizes the operation of these switches.

Table 15. Mono Mode Configuration

MONO12	Transmitter U18 and U19 Operation
LO	Stereo Mode Connectors J9 and J10 will both output AES3-encoded data for Channels 1 and 2
HI	Mono Mode Connector J9 will output AES3-encoded data for Channel 1 Connector J10 will output AES3-encoded data for Channel 2
MONO34	**Transmitter U20 and U21 Operation**
LO	Stereo Mode Connectors J11 and J12 will both output AES3-encoded data for Channels 3 and 4
HI	Mono Mode Connector J11 will output AES3-encoded data for Channel 3 Connector J12 will output AES3-encoded data for Channel 4

3.8 Reset Operations

The PCM4204EVM includes two reset switches, SW2 and SW4. Both are momentary contact pushbutton switches that are normally open. SW2 provides the manual reset for the PCM4204 devices (U1 and U2), while switch SW4 provides the manual reset for the four DIT4192 transmitters (U18 through U21). Figure 3 and Figure 4 illustrate the onboard reset circuitry.
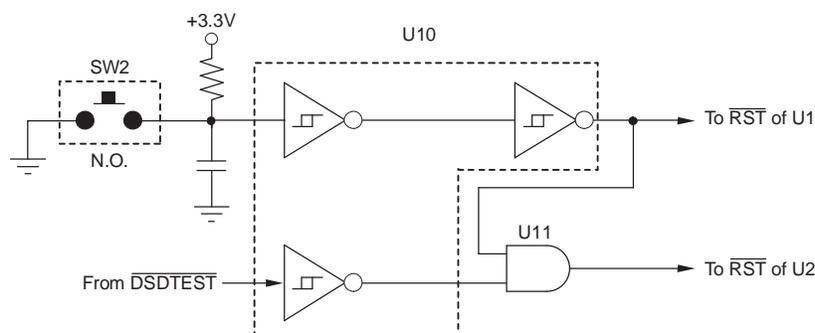

Figure 3. ADC Reset Circuitry
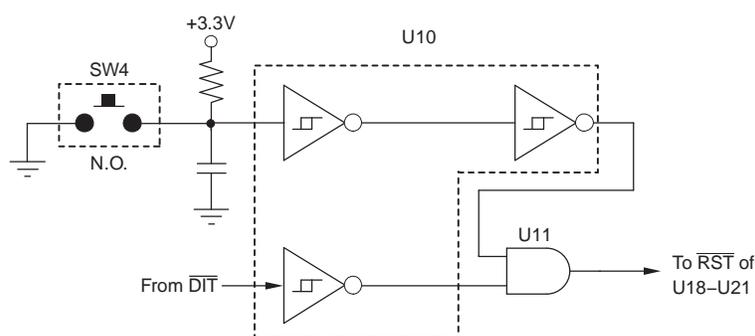

Figure 4. $\overline{\text{DIT}}$ (Transmitter) Reset Circuitry

For the ADC reset function, there are two outputs from the reset circuit, one for U1 and the other for U2. U1 may be reset at any time by momentarily pressing and then releasing switch SW1. U2 may be reset by SW2 only when the $\overline{\text{DSDTEST}}$ switch of SW1 is set to LO. If $\overline{\text{DSDTEST}}$ is set HI, the AND gate output of the reset circuit is forced low, which will force U2 into power-down mode.

For the DIT reset function, the output of the reset circuit is connected to the $\overline{\text{RST}}$ pins of DIT4192 transmitters (U18 through U21). The transmitters may be reset only when the $\overline{\text{DIT}}$ switch of SW3 is set LO by momentarily pressing and then releasing switch SW4. If the $\overline{\text{DIT}}$ switch is set HI, the AND gate output of the reset circuit is forced low, which will force U18 through U21 into power-down mode.

4 Schematic, PCB Layout, and Bill of Materials

This section provides the electrical schematic and physical layout information for the PCM4204EVM. The bill of materials is included as a component reference.

> **NOTE:** Board layouts are not to scale. These figures are intended to show how the board is laid out; they are not intended to be used for manufacturing PCM4204EVM PCBs.

4.1 *Schematic*

The electrical schematics for the PCM4204EVM are shown in Figure 5 and Figure 6. The components shown in the schematics are listed in Table 16 for reference.
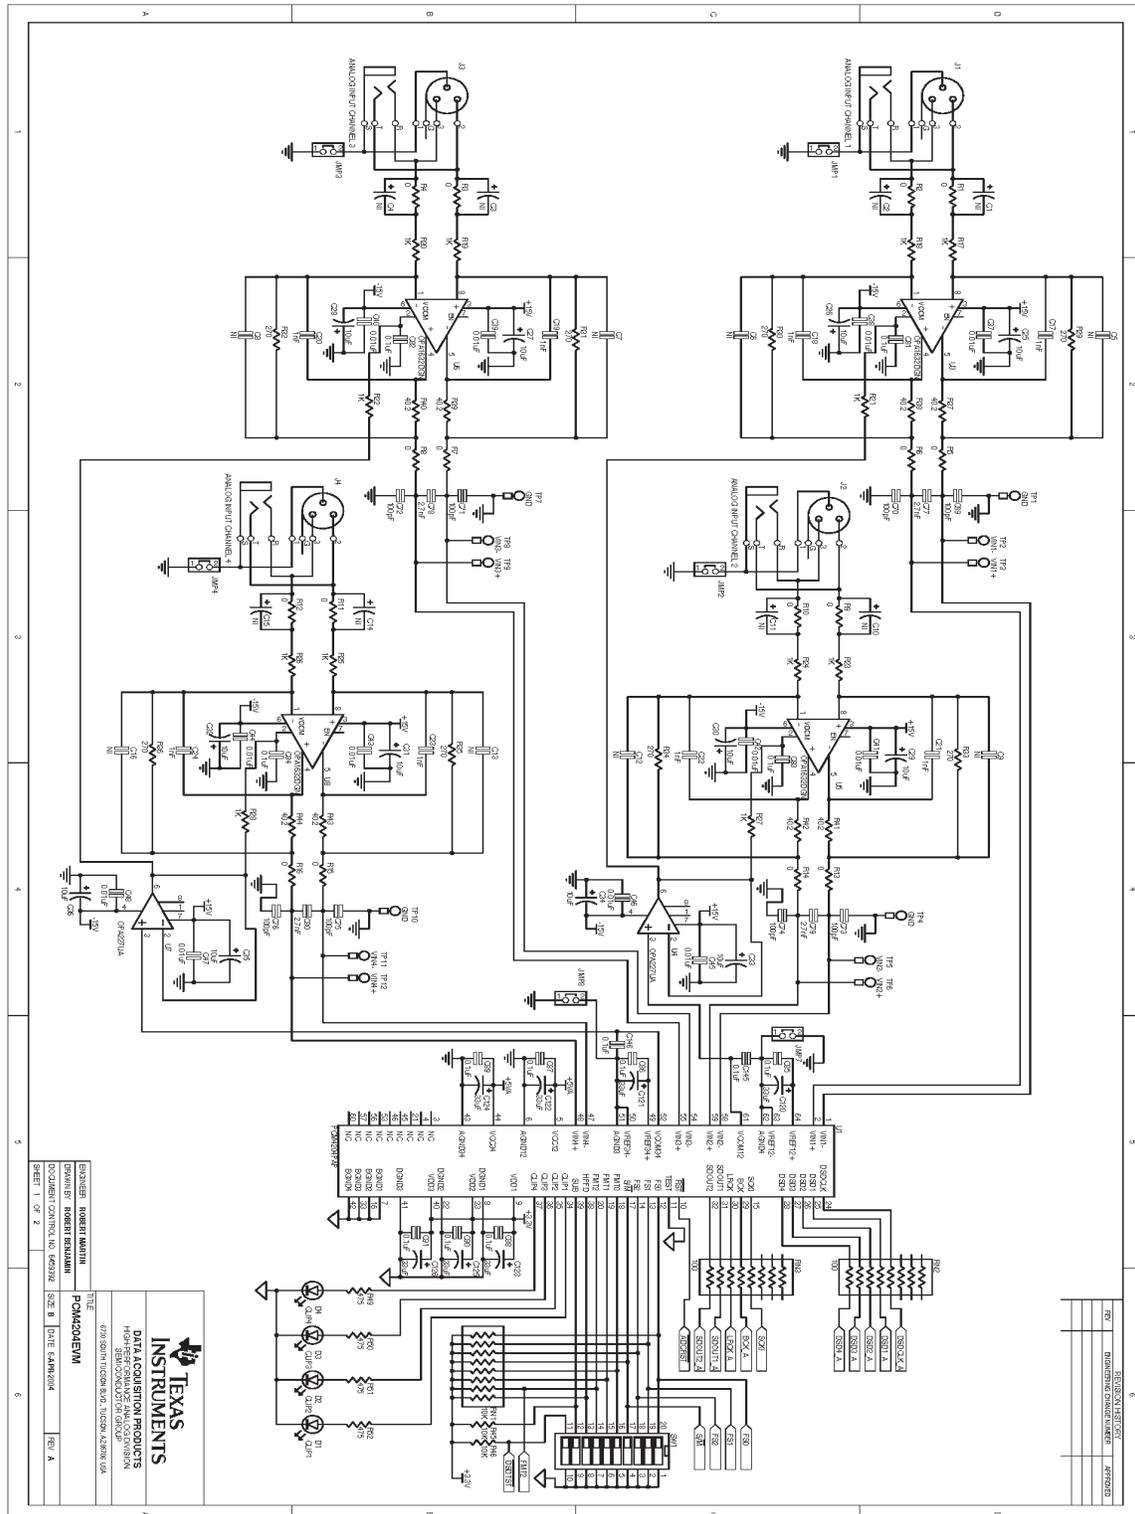

Figure 5. PCM4204EVM Schematic-Analog Section

Figure 6. PCM4204EVM Schematic-Digital Section

4.2   PCB Layout

The PCM4204EVM is a 4-layer printed circuit board with the following layer structure:

- Layer 1: Top (Component Side)
- Layer 2: Ground Plane
- Layer 3: Power
- Layer 4: Bottom (Solder Side)

The ground plane doubles as a heat sink for the PCM4204 PowerPAD package. Refer to the product data sheet for more information on the purpose and application of the PowerPAD connection.

Figure 7 through Figure 12 show the top and bottom side silkscreen images, along with the top, ground plane, power, and bottom layers of the PCB.

Revision History

Changes from Original (August 2004) to A Revision   **Page**

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

ADDITIONAL TERMS AND CONDITIONS, WARNINGS, RESTRICTIONS, AND DISCLAIMERS FOR EVALUATION MODULES

Texas Instruments Incorporated (TI) markets, sells, and loans all evaluation boards, kits, and/or modules (EVMs) pursuant to, and user expressly acknowledges, represents, and agrees, and takes sole responsibility and risk with respect to, the following:

1. User agrees and acknowledges that EVMs are intended to be handled and used for feasibility evaluation only in laboratory and/or development environments. Notwithstanding the foregoing, in certain instances, TI makes certain EVMs available to users that do not handle and use EVMs solely for feasibility evaluation only in laboratory and/or development environments, but may use EVMs in a hobbyist environment. All EVMs made available to hobbyist users are FCC certified, as applicable. Hobbyist users acknowledge, agree, and shall comply with all applicable terms, conditions, warnings, and restrictions in this document and are subject to the disclaimer and indemnity provisions included in this document.

2. Unless otherwise indicated, EVMs are not finished products and not intended for consumer use. EVMs are intended solely for use by technically qualified electronics experts who are familiar with the dangers and application risks associated with handling electrical mechanical components, systems, and subsystems.

3. User agrees that EVMs shall not be used as, or incorporated into, all or any part of a finished product.

4. User agrees and acknowledges that certain EVMs may not be designed or manufactured by TI.

5. User must read the user's guide and all other documentation accompanying EVMs, including without limitation any warning or restriction notices, prior to handling and/or using EVMs. Such notices contain important safety information related to, for example, temperatures and voltages. For additional information on TI's environmental and/or safety programs, please visit www.ti.com/esh or contact TI.

6. User assumes all responsibility, obligation, and any corresponding liability for proper and safe handling and use of EVMs.

7. Should any EVM not meet the specifications indicated in the user's guide or other documentation accompanying such EVM, the EVM may be returned to TI within 30 days from the date of delivery for a full refund. THE FOREGOING LIMITED WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY TI TO USER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. TI SHALL NOT BE LIABLE TO USER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES RELATED TO THE HANDLING OR USE OF ANY EVM.

8. No license is granted under any patent right or other intellectual property right of TI covering or relating to any machine, process, or combination in which EVMs might be or are used. TI currently deals with a variety of customers, and therefore TI's arrangement with the user is not exclusive. TI assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services with respect to the handling or use of EVMs.

9. User assumes sole responsibility to determine whether EVMs may be subject to any applicable federal, state, or local laws and regulatory requirements (including but not limited to U.S. Food and Drug Administration regulations, if applicable) related to its handling and use of EVMs and, if applicable, compliance in all respects with such laws and regulations.

10. User has sole responsibility to ensure the safety of any activities to be conducted by it and its employees, affiliates, contractors or designees, with respect to handling and using EVMs. Further, user is responsible to ensure that any interfaces (electronic and/or mechanical) between EVMs and any human body are designed with suitable isolation and means to safely limit accessible leakage currents to minimize the risk of electrical shock hazard.

11. User shall employ reasonable safeguards to ensure that user's use of EVMs will not result in any property damage, injury or death, even if EVMs should fail to perform as described or expected.

12. User shall be solely responsible for proper disposal and recycling of EVMs consistent with all applicable federal, state, and local requirements.

Certain Instructions. User shall operate EVMs within TI's recommended specifications and environmental considerations per the user's guide, accompanying documentation, and any other applicable requirements. Exceeding the specified ratings (including but not limited to input and output voltage, current, power, and environmental ranges) for EVMs may cause property damage, personal injury or death. If there are questions concerning these ratings, user should contact a TI field representative prior to connecting interface electronics including input power and intended loads. Any loads applied outside of the specified output range may result in unintended and/or inaccurate operation and/or possible permanent damage to the EVM and/or interface electronics. Please consult the applicable EVM user's guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative. During normal operation, some circuit components may have case temperatures greater than 60°C as long as the input and output are maintained at a normal ambient operating temperature. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors which can be identified using EVMs' schematics located in the applicable EVM user's guide. When placing measurement probes near EVMs during normal operation, please be aware that EVMs may become very warm. As with all electronic evaluation tools, only qualified personnel knowledgeable in electronic measurement and diagnostics normally found in development environments should use EVMs.

Agreement to Defend, Indemnify and Hold Harmless. User agrees to defend, indemnify, and hold TI, its directors, officers, employees, agents, representatives, affiliates, licensors and their representatives harmless from and against any and all claims, damages, losses, expenses, costs and liabilities (collectively, "Claims") arising out of, or in connection with, any handling and/or use of EVMs. User's indemnity shall apply whether Claims arise under law of tort or contract or any other legal theory, and even if EVMs fail to perform as described or expected.

Safety-Critical or Life-Critical Applications. If user intends to use EVMs in evaluations of safety critical applications (such as life support), and a failure of a TI product considered for purchase by user for use in user's product would reasonably be expected to cause severe personal injury or death such as devices which are classified as FDA Class III or similar classification, then user must specifically notify TI of such intent and enter into a separate Assurance and Indemnity Agreement.

RADIO FREQUENCY REGULATORY COMPLIANCE INFORMATION FOR EVALUATION MODULES

Texas Instruments Incorporated (TI) evaluation boards, kits, and/or modules (EVMs) and/or accompanying hardware that is marketed, sold, or loaned to users may or may not be subject to radio frequency regulations in specific countries.

General Statement for EVMs Not Including a Radio

For EVMs not including a radio and not subject to the U.S. Federal Communications Commission (FCC) or Industry Canada (IC) regulations, TI intends EVMs to be used only for engineering development, demonstration, or evaluation purposes. EVMs are not finished products typically fit for general consumer use. EVMs may nonetheless generate, use, or radiate radio frequency energy, but have not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC or the ICES-003 rules. Operation of such EVMs may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

General Statement for EVMs including a radio

User Power/Frequency Use Obligations: For EVMs including a radio, the radio included in such EVMs is intended for development and/or professional use only in legally allocated frequency and power limits. Any use of radio frequencies and/or power availability in such EVMs and their development application(s) must comply with local laws governing radio spectrum allocation and power limits for such EVMs. It is the user's sole responsibility to only operate this radio in legally acceptable frequency space and within legally mandated power limitations. Any exceptions to this are strictly prohibited and unauthorized by TI unless user has obtained appropriate experimental and/or development licenses from local regulatory authorities, which is the sole responsibility of the user, including its acceptable authorization.

U.S. Federal Communications Commission Compliance

For EVMs Annotated as FCC – FEDERAL COMMUNICATIONS COMMISSION Part 15 Compliant

Caution

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation. Changes or modifications could void the user's authority to operate the equipment.

FCC Interference Statement for Class A EVM devices

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at its own expense.

FCC Interference Statement for Class B EVM devices

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Industry Canada Compliance (English)

For EVMs Annotated as IC – INDUSTRY CANADA Compliant:

This Class A or B digital apparatus complies with Canadian ICES-003.

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Concerning EVMs Including Radio Transmitters

This device complies with Industry Canada licence-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

Concerning EVMs Including Detachable Antennas

Under Industry Canada regulations, this radio transmitter may only operate using an antenna of a type and maximum (or lesser) gain approved for the transmitter by Industry Canada. To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that necessary for successful communication.

This radio transmitter has been approved by Industry Canada to operate with the antenna types listed in the user guide with the maximum permissible gain and required antenna impedance for each antenna type indicated. Antenna types not included in this list, having a gain greater than the maximum gain indicated for that type, are strictly prohibited for use with this device.

Canada Industry Canada Compliance (French)

Cet appareil numérique de la classe A ou B est conforme à la norme NMB-003 du Canada

Les changements ou les modifications pas expressément approuvés par la partie responsable de la conformité ont pu vider l'autorité de l'utilisateur pour actionner l'équipement.

Concernant les EVMs avec appareils radio

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes : (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

Concernant les EVMs avec antennes détachables

Conformément à la réglementation d'Industrie Canada, le présent émetteur radio peut fonctionner avec une antenne d'un type et d'un gain maximal (ou inférieur) approuvé pour l'émetteur par Industrie Canada. Dans le but de réduire les risques de brouillage radioélectrique à l'intention des autres utilisateurs, il faut choisir le type d'antenne et son gain de sorte que la puissance isotrope rayonnée équivalente (p.i.r.e.) ne dépasse pas l'intensité nécessaire à l'établissement d'une communication satisfaisante.

Le présent émetteur radio a été approuvé par Industrie Canada pour fonctionner avec les types d'antenne énumérés dans le manuel d'usage et ayant un gain admissible maximal et l'impédance requise pour chaque type d'antenne. Les types d'antenne non inclus dans cette liste, ou dont le gain est supérieur au gain maximal indiqué, sont strictement interdits pour l'exploitation de l'émetteur.

Important Notice for Users of EVMs Considered "Radio Frequency Products" in Japan

EVMs entering Japan are NOT certified by TI as conforming to Technical Regulations of Radio Law of Japan.

If user uses EVMs in Japan, user is required by Radio Law of Japan to follow the instructions below with respect to EVMs:

1. Use EVMs in a shielded room or any other test facility as defined in the notification #173 issued by Ministry of Internal Affairs and Communications on March 28, 2006, based on Sub-section 1.1 of Article 6 of the Ministry's Rule for Enforcement of Radio Law of Japan,
2. Use EVMs only after user obtains the license of Test Radio Station as provided in Radio Law of Japan with respect to EVMs, or
3. Use of EVMs only after user obtains the Technical Regulations Conformity Certification as provided in Radio Law of Japan with respect to EVMs. Also, do not transfer EVMs, unless user gives the same notice above to the transferee. Please note that if user does not follow the instructions above, user will be subject to penalties of Radio Law of Japan.

【無線電波を送信する製品の開発キットをお使いになる際の注意事項】 本開発キットは技術基準適合証明を受けておりません。 本製品のご使用に際しては、電波法遵守のため、以下のいずれかの措置を取っていただく必要がありますのでご注意ください。

1. 電波法施行規則第6条第1項第1号に基づく平成18年3月28日総務省告示第173号で定められた電波暗室等の試験設備でご使用いただく。
2. 実験局の免許を取得後ご使用いただく。
3. 技術基準適合証明を取得後ご使用いただく。。

なお、本製品は、上記の「ご使用にあたっての注意」を譲渡先、移転先に通知しない限り、譲渡、移転できないものとします

上記を遵守頂けない場合は、電波法の罰則が適用される可能性があることをご留意ください。

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
