

# PCF8574A Remote 8-Bit I/O Expander for I<sup>2</sup>C Bus

## 1 Features

- Low standby-current consumption of 10µA max
- I<sup>2</sup>C to parallel-port expander
- Open-drain interrupt output
- Compatible with most microcontrollers
- Latched outputs with high-current drive capability for directly driving LEDs
- Latch-up performance exceeds 100 mA Per JESD 78, Class II

## 2 Applications

- Telecom shelters: filter units
- Servers
- Routers (telecom switching equipment)
- [Personal computers](#)
- [Personal electronics](#)
- [Industrial automation](#)
- Products with GPIO-Limited Processors

## 3 Description

This 8-bit input/output (I/O) expander for the two-line bidirectional bus (I<sup>2</sup>C) is designed for 2.5V to 6V V<sub>CC</sub> operation.

The PCF8574A device provides general-purpose remote I/O expansion for most microcontroller families via the I<sup>2</sup>C interface [serial clock (SCL), serial data (SDA)].

The device features an 8-bit quasi-bidirectional I/O port (P0–P7), including latched outputs with high-current drive capability for directly driving LEDs. Each quasi-bidirectional I/O can be used as an input or output without the use of a data-direction control signal. At power on, the I/Os are high. In this mode, only a current source to V<sub>CC</sub> is active.

### Device Information

PART NUMBER	PACKAGE <sup>(1)</sup>	BODY SIZE (NOM)
PCF8574A	VQFN (20)	4.50mm × 3.50mm
	PDIP (16)	19.30mm × 6.35mm
	SOIC (16)	10.30mm × 7.50mm
	TSSOP (20)	6.50mm × 4.40mm
	TVSOP (20)	5.00mm × 4.40mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage range	-0.5	6.5	V
V <sub>I</sub>	Input voltage range <sup>(2)</sup>	-0.5	V <sub>CC</sub> + 0.5	V
V <sub>O</sub>	Output voltage range <sup>(2)</sup>	-0.5	V <sub>CC</sub> + 0.5	V
I <sub>IK</sub>	Input clamp current	V <sub>I</sub> < 0	-20	mA
I <sub>OK</sub>	Output clamp current	V <sub>O</sub> < 0	-20	mA
I <sub>OK</sub>	Input/output clamp current	V <sub>O</sub> < 0 or V <sub>O</sub> > V <sub>CC</sub>	±400	µA
I <sub>OL</sub>	Continuous output low current	V <sub>O</sub> = 0 to V <sub>CC</sub>	50	mA
I <sub>OH</sub>	Continuous output high current	V <sub>O</sub> = 0 to V <sub>CC</sub>	-4	mA
	Continuous current through V <sub>CC</sub> or GND		±100	mA
T <sub>J</sub>	Junction temperature		150	°C
T <sub>stg</sub>	Storage temperature range	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Section 5.3](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

### 5.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage	2.5	6	V
V <sub>IH</sub>	High-level input voltage	0.7 × V <sub>CC</sub>	V <sub>CC</sub> + 0.5	V
V <sub>IL</sub>	Low-level input voltage	-0.5	0.3 × V <sub>CC</sub>	V
I <sub>OH</sub>	High-level output current		-1	mA
I <sub>OL</sub>	Low-level output current		25	mA
T <sub>A</sub>	Operating free-air temperature	-40	85	°C

### 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		PCF8574A					UNIT
		DGV	DW	N	PW	RGY

## 5.5 Electrical Characteristics

over recommended operating free-air temperature range (unless otherwise noted)

		TEST CONDITIONS	VCC	MIN	TYP <sup>(1)</sup>	MAX	UNIT
V <sub>IK</sub>	Input diode clamp voltage	I <sub>I</sub> = -18 mA	2.5 V to 6 V	-1.2			V
V <sub>POR</sub>	Power-on reset voltage	V <sub>I</sub> = V <sub>CC</sub> or GND, I <sub>O</sub> = 0	6 V		1.3	2.4	V
I <sub>OH</sub>	P port	V <sub>O</sub> = GND	2.5 V to 6 V	-310		-30	μA
I <sub>OHT</sub>	P port transient pullup current	High during acknowledge, V <sub>OH</sub> = GND	2.5 V		-1		mA
I <sub>OL</sub>	SDA	V <sub>O</sub> = 0.4 V	2.5 V to 6 V		3		mA
	P port	V <sub>O</sub> = 1 V	5 V		10	25	
	INT	V <sub>O</sub> = 0.4 V	2.5 V to 6 V		1.6		
I <sub>I</sub>	SCL, SDA	V <sub>I</sub> = V <sub>CC</sub> or GND	2.5 V to 6 V			±5	μA
	INT					±5	
	A0, A1, A2					±5	
I <sub>IHL</sub>	P port	-250mV < V <sub>I</sub> < GND	2.5 V to 6 V			±400	μA
I <sub>CC</sub>	Operating mode	V <sub>I</sub> = V <sub>CC</sub> or GND, I <sub>O</sub> = 0, f <sub>SCL</sub> = 100 kHz	6 V		40	100	μA
	Standby mode	V <sub>I</sub> = V <sub>CC</sub> or GND, I <sub>O</sub> = 0			2.5	10	
C <sub>i</sub>	SCL	V <sub>I</sub> = V <sub>CC</sub> or GND	2.5 V to 6 V		1.5	7	pF
C <sub>io</sub>	SDA	V <sub>IO</sub> = V <sub>CC</sub> or GND	2.5 V to 6 V		3	7	pF
	P port				4	10	

(1) All typical values are at V<sub>CC</sub> = 5 V, T<sub>A</sub> = 25°C.

## 5.6 I<sup>2</sup>C Interface Timing Requirements

over recommended operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
f <sub>scl</sub>	I <sup>2</sup> C clock frequency		100	kHz
t <sub>sch</sub>	I <sup>2</sup> C clock high time	4		μs
t <sub>scl</sub>	I <sup>2</sup> C clock low time	4.7		μs
t <sub>sp</sub>	I <sup>2</sup> C spike time		70	ns
t <sub>sds</sub>	I <sup>2</sup> C serial data setup time	250		ns
t <sub>sdh</sub>	I <sup>2</sup> C serial data hold time	0		ns
t <sub>icr</sub>	I <sup>2</sup> C input rise time		1	μs
t <sub>icf</sub>	I <sup>2</sup> C input fall time		0.3	μs
t <sub>ocf</sub>	I <sup>2</sup> C output fall time (10-pF to 400-pF bus)		300	ns
t <sub>buf</sub>	I <sup>2</sup> C bus free time between stop and start	4.7		μs
t <sub>sts</sub>	I <sup>2</sup> C start or repeated start condition setup	4.7		μs
t <sub>sth</sub>	I <sup>2</sup> C start or repeated start condition hold	4		μs
t <sub>sps</sub>	I <sup>2</sup> C stop condition setup	4		μs
t <sub>vd</sub>	Valid data time	SCL low to SDA output valid		3.4
C <sub>b</sub>	I <sup>2</sup> C bus capacitive load		400	pF

## 5.7 Switching Characteristics

over recommended operating free-air temperature range,  $C_L \leq 100$  pF (unless otherwise noted)

PARAMETER		FROM (INPUT)	TO (OUTPUT)	MIN	MAX	UNIT
$t_{pv}$	Output data valid	SCL	P port		4	$\mu$ s
$t_{su}$	Input data setup time	P port	SCL	0		$\mu$ s
$t_h$	Input data hold time	P port	SCL	4		$\mu$ s
$t_{iv}$	Interrupt valid time	P port	$\overline{INT}$		4	$\mu$ s
$t_{ir}$	Interrupt reset delay time	SCL	$\overline{INT}$		4	$\mu$ s

## 7 Detailed Description

### 7.1 Overview

The PCF8574A device provides general-purpose remote I/O expansion for most microcontroller families via the I<sup>2</sup>C interface [serial clock (SCL), serial data (SDA)].

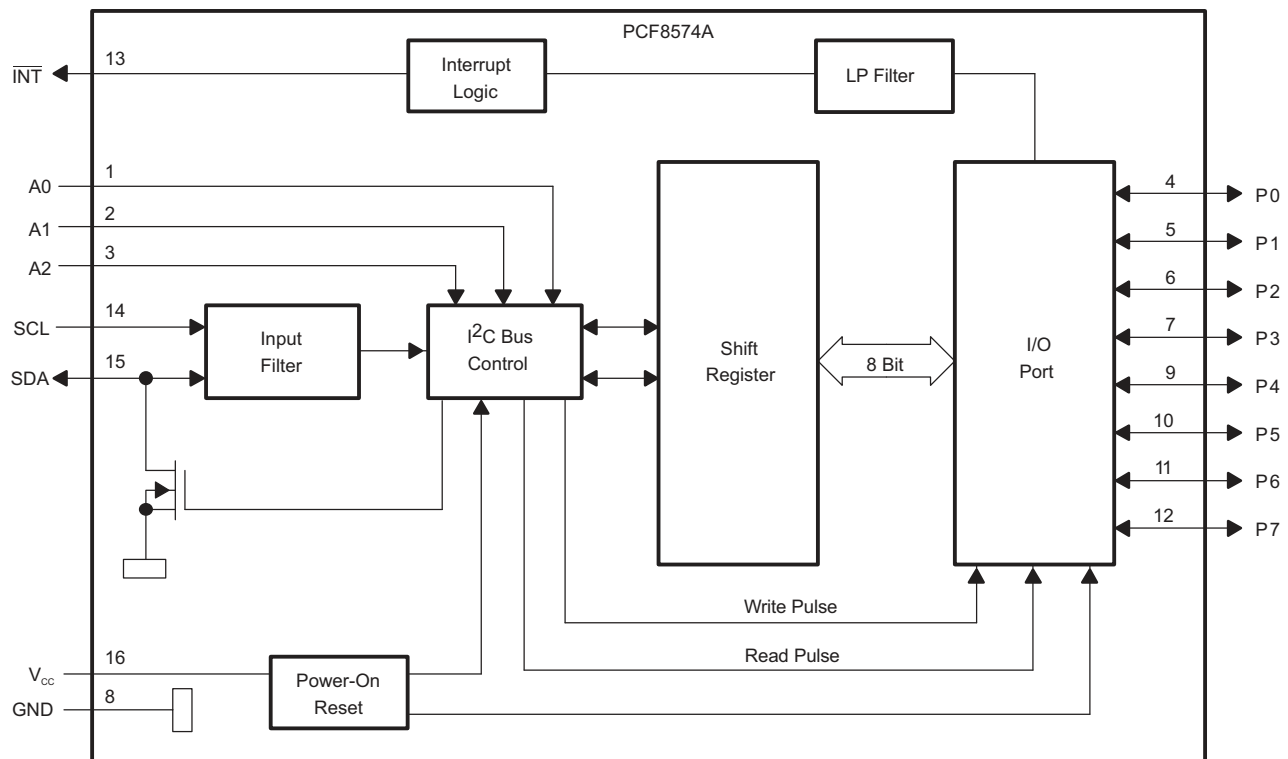

The device features an 8-bit quasi-bidirectional I/O port (P0–P7), including latched outputs with high-current drive capability for directly driving LEDs. Each quasi-bidirectional I/O can be used as an input or output without the use of a data-direction control signal. At power on, the I/Os are high. In this mode, only a current source to V<sub>CC</sub> is active. An additional strong pullup to V<sub>CC</sub> allows fast rising edges into heavily loaded outputs. This device turns on when an output is written high and is switched off by the negative edge of SCL. The I/Os should be high before being used as inputs.

The PCF8574A device provides an open-drain output ( $\overline{\text{INT}}$ ) that can be connected to the interrupt input of a microcontroller. An interrupt is generated by any rising or falling edge of the port inputs in the input mode. After time,  $t_{iv}$ ,  $\overline{\text{INT}}$  is valid. Resetting and reactivating the interrupt circuit is achieved when data on the port is changed to the original setting or data is read from, or written to, the port that generated the interrupt. Resetting occurs in the read mode at the acknowledge bit after the rising edge of the SCL signal, or in the write mode at the acknowledge bit after the high-to-low transition of the SCL signal. Interrupts that occur during the acknowledge clock pulse can be lost (or be very short) due to the resetting of the interrupt during this pulse. Each change of the I/Os after resetting is detected and, after the next rising clock edge, is transmitted as  $\overline{\text{INT}}$ . Reading from, or writing to, another device does not affect the interrupt circuit.

By sending an interrupt signal on this line, the remote I/O can inform the microcontroller if there is incoming data on its ports without having to communicate via the I<sup>2</sup>C bus. Therefore, the PCF8574A device can remain a simple responder device.

### 7.2 Functional Block Diagram

#### 7.2.1 Simplified Block Diagram of Device

Pin numbers shown are for the DW and N packages.

### 7.2.2 Simplified Schematic Diagram of Each P-Port Input/Output

## 7.3 Feature Description

### 7.3.1 I<sup>2</sup>C Interface

I<sup>2</sup>C communication with this device is initiated by a commander sending a start condition, a high-to-low transition on the SDA I/O while the SCL input is high. After the start condition, the device address byte is sent, most-significant bit (MSB) first, including the data direction bit ( $R/\bar{W}$ ). This device does not respond to the general call address. After receiving the valid address byte, this device responds with an acknowledge, a low on the SDA I/O during the high of the acknowledge-related clock pulse. The address inputs (A0–A2) of the responder device must not be changed between the start and the stop conditions.

The data byte follows the address acknowledge. If the  $R/\bar{W}$  bit is high, the data from this device are the values read from the P port. If the  $R/\bar{W}$  bit is low, the data are from the commander, to be output to the P port. The data byte is followed by an acknowledge sent from this device. If other data bytes are sent from the commander, following the acknowledge, they are ignored by this device. Data are output only if complete bytes are received and acknowledged. The output data will be valid at time,  $t_{pv}$ , after the low-to-high transition of SCL and during the clock cycle for the acknowledge.

A stop condition, a low-to-high transition on the SDA I/O while the SCL input is high, is sent by the commander.

### 7.3.2 Interface Definition

BYTE	BIT							
	7 (MSB)	6	5	4	3	2	1	0 (LSB)
I <sup>2</sup> C responder address	L	H	H	H	A2	A1	A0	$R/\bar{W}$
I/O data bus	P7	P6	P5	P4	P3	P2	P1	P0

### 7.3.3 Address Reference

INPUTS			I <sup>2</sup> C BUS responder 8-BIT READ ADDRESS	I <sup>2</sup> C BUS responder 8-BIT WRITE ADDRESS
A2	A1	A0		
L	L	L	113 (dec), 71 (hex)	112 (dec), 70 (hex)
L	L	H	115 (dec), 73 (hex)	114 (dec), 72 (hex)
L	H	L	117 (dec), 75 (hex)	116 (dec), 74 (hex)
L	H	H	119 (dec), 77 (hex)	118 (dec), 76 (hex)
H	L	L	121 (dec), 79 (hex)	120 (dec), 78 (hex)
H	L	H	123 (dec), 7B (hex)	122 (dec), 7A (hex)
H	H	L	125 (dec), 7D (hex)	124 (dec), 7C (hex)
H	H	H	127 (dec), 7F (hex)	126 (dec), 7E (hex)

### 7.4 Device Functional Modes

Figure 7-1 and Figure 7-2 show the address and timing diagrams for the write and read modes, respectively.

Figure 7-1. Write Mode (Output)

A. A low-to-high transition of SDA while SCL is high is defined as the stop condition (P). The transfer of data can be stopped at any moment by a stop condition. When this occurs, data present at the latest ACK phase is valid (output mode). Input data is lost.

**Figure 7-2. Read Mode (Input)**

## 8 Application Information Disclaimer

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

Figure 8-1 shows an application in which the PCF8574A device can be used.

### 8.2 Typical Application

- The SCL and SDA pins must be pulled up to  $V_{CC}$  because if SCL and SDA are pulled up to an auxiliary power supply that could be powered on while  $V_{CC}$  is powered off, then the supply current,  $I_{CC}$ , will increase as a result.
- Device address is configured as 0111000 for this example.
- P0, P2, and P3 are configured as outputs.
- P1, P4, and P5 are configured as inputs.
- P6 and P7 are not used and must be configured as outputs.

**Figure 8-1. Application Schematic**

## 8.2.1 Design Requirements

### 8.2.1.1 Minimizing $I_{CC}$ When I/Os Control LEDs

When the I/Os are used to control LEDs, normally they are connected to  $V_{CC}$  through a resistor as shown in Figure 8-10. For a P-port configured as an input,  $I_{CC}$  increases as  $V_I$  becomes lower than  $V_{CC}$ . The LED is a diode, with threshold voltage  $V_T$ , and when a P-port is configured as an input the LED will be off but  $V_I$  is a  $V_T$  drop below  $V_{CC}$ .

For battery-powered applications, it is essential that the voltage of P-ports controlling LEDs is greater than or equal to  $V_{CC}$  when the P-ports are configured as input to minimize current consumption. Figure 8-2 shows a high-value resistor in parallel with the LED. Figure 8-3 shows  $V_{CC}$  less than the LED supply voltage by at least  $V_T$ . Both of these methods maintain the I/O  $V_I$  at or above  $V_{CC}$  and prevents additional supply current consumption when the P-port is configured as an input and the LED is off.

Figure 8-2. High-Value Resistor in Parallel With LED

Figure 8-3. Device Supplied by a Lower Voltage

## 8.2.2 Detailed Design Procedure

The pull-up resistors,  $R_P$ , for the SCL and SDA lines need to be selected appropriately and take into consideration the total capacitance of all responders on the I<sup>2</sup>C bus. The minimum pull-up resistance is a function of  $V_{CC}$ ,  $V_{OL(max)}$ , and  $I_{OL}$ :

$$R_{p(min)} = \frac{V_{CC} - V_{OL(max)}}{I_{OL}} \quad (1)$$

The maximum pull-up resistance is a function of the maximum rise time,  $t_r$  (300 ns for fast-mode operation,  $f_{SCL} = 400$  kHz) and bus capacitance,  $C_b$ :

$$R_{p(max)} = \frac{t_r}{0.8473 \times C_b} \quad (2)$$

The maximum bus capacitance for an I<sup>2</sup>C bus must not exceed 400 pF for standard-mode or fast-mode operation. The bus capacitance can be approximated by adding the capacitance of the PCF8574A device,  $C_i$  for SCL or  $C_{i0}$  for SDA, the capacitance of wires/connections/traces, and the capacitance of additional responders on the bus.

## 8.2.3 Application Curves

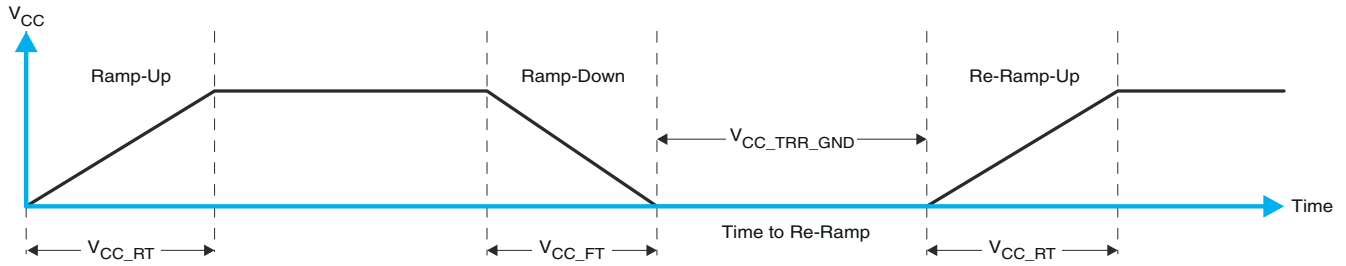

## 8.3 Power Supply Recommendations

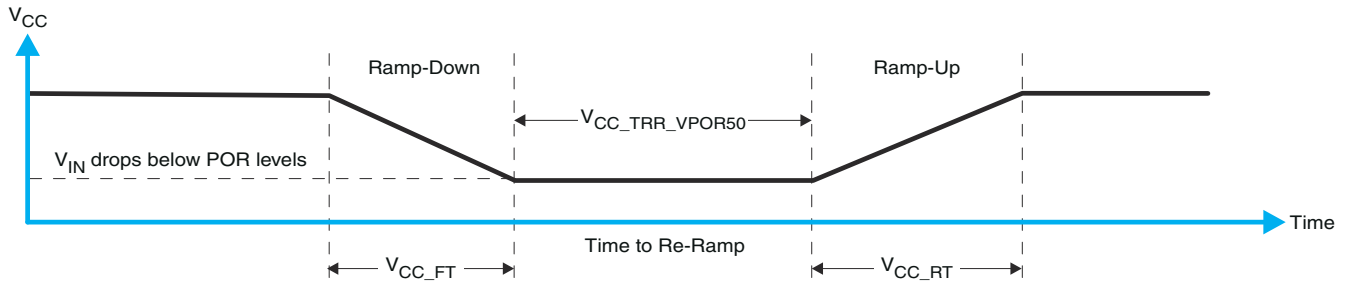

### 8.3.1 Power-On Reset Requirements

In the event of a glitch or data corruption, PCF8574A can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

The two types of power-on reset are shown in [Figure 8-6](#) and [Figure 8-7](#).

**Figure 8-6.  $V_{CC}$  is Lowered Below 0.2 V or 0 V and Then Ramped Up to  $V_{CC}$**

**Figure 8-7.  $V_{CC}$  is Lowered Below the POR Threshold, Then Ramped Back Up to  $V_{CC}$**

Table 8-1 specifies the performance of the power-on reset feature for PCF8574A for both types of power-on reset.

**Table 8-1. Recommended Supply Sequencing and Ramp Rates <sup>(1)</sup>**

PARAMETER			MIN	TYP	MAX	UNIT
$V_{CC\_FT}$	Fall rate	See Figure 8-6	1		100	ms
$V_{CC\_RT}$	Rise rate	See Figure 8-6	0.01		100	ms
$V_{CC\_TRR\_GND}$	Time to re-ramp (when $V_{CC}$ drops to GND)	See Figure 8-6	0.001			ms
$V_{CC\_TRR\_VPOR50}$	Time to re-ramp (when $V_{CC}$ drops to $V_{POR\_MIN} - 50$ mV)	See Figure 8-7	0.001			ms
$V_{CC\_GH}$	Level that $V_{CCP}$ can glitch down to, but not cause a functional disruption when $V_{CCX\_GW} = 1$ $\mu$ s	See Figure 8-8			1.2	V
$V_{CC\_GW}$	Glitch width that will not cause a functional disruption when $V_{CCX\_GH} = 0.5 \times V_{CCX}$	See Figure 8-8				$\mu$ s
$V_{PORF}$	Voltage trip point of POR on falling $V_{CC}$		0.99		1.28	V
$V_{PORR}$	Voltage trip point of POR on rising $V_{CC}$		1.190		1.410	V

(1)  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$  (unless otherwise noted)

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width ( $V_{CC\_GW}$ ) and height ( $V_{CC\_GH}$ ) are dependent on each other. The bypass capacitance, source impedance, and device impedance are factors that affect power-on reset performance. Figure 8-8 and Table 8-1 provide more information on how to measure these specifications.

**Figure 8-8. Glitch Width and Glitch Height**

$V_{POR}$  is critical to the power-on reset.  $V_{POR}$  is the voltage level at which the reset condition is released and all the registers and the I<sup>2</sup>C/SMBus state machine are initialized to their default states. The value of  $V_{POR}$  differs based on the  $V_{CC}$  being lowered to or from 0. Figure 8-9 and Table 8-1 provide more details on this specification.

Figure 8-9.  $V_{POR}$

## 8.4 Layout

### 8.4.1 Layout Guidelines

For printed circuit board (PCB) layout of PCF8574A, common PCB layout practices should be followed but additional concerns related to high-speed data transfer such as matched impedances and differential pairs are not a concern for I<sup>2</sup>C signal speeds.

In all PCB layouts, it is a best practice to avoid right angles in signal traces, to fan out signal traces away from each other upon leaving the vicinity of an integrated circuit (IC), and to use thicker trace widths to carry higher amounts of current that commonly pass through power and ground traces. By-pass and de-coupling capacitors are commonly used to control the voltage on the  $V_{CC}$  pin, using a larger capacitor to provide additional power in the event of a short power supply glitch and a smaller capacitor to filter out high-frequency ripple. These capacitors should be placed as close to the PCF8574A device as possible. These best practices are shown in Figure 8-10.

For the layout example provided in Figure 8-10, it would be possible to fabricate a PCB with only 2 layers by using the top layer for signal routing and the bottom layer as a split plane for power ( $V_{CC}$ ) and ground (GND). However, a 4 layer board is preferable for boards with higher density signal routing. On a 4 layer PCB, it is common to route signals on the top and bottom layer, dedicate one internal layer to a ground plane, and dedicate the other internal layer to a power plane. In a board layout using planes or split planes for power and ground, vias are placed directly next to the surface mount component pad which needs to attach to  $V_{CC}$  or GND and the via is connected electrically to the internal layer or the other side of the board. Vias are also used when a signal trace needs to be routed to the opposite side of the board, but this technique is not demonstrated in Figure 8-10.

### 8.4.2 Layout Example

### 9.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision G (August 2021) to Revision H (September 2024)	Page
• Update <i>Absolute Max Voltage</i> from 7V to 6.5V.....	4
• Update <i>Thermal Information</i> for RGY, PW, and DW packages.....	4
• Update I <sub>OH</sub> polarity and increase limit from -300μA to -310μA.....	5
• Removed footnote #2 from <i>Electrical Characteristics</i> .....	5
• Updated I <sub>IHL</sub> test condition.....	5
• Changed Spike filter limit from 100ns to 70ns max.....	5
• Updated VPORF and VPORR values.....	18

Changes from Revision F (January 2015) to Revision G (August 2021)	Page
• Globally changed instances of legacy terminology to commander and responder where mentioned.....	1
• Changed <a href="#">Figure 6-2</a> Responder address from: S0100 To: S0111.....	9
• Changed <a href="#">Figure 7-1</a> .....	14
• Changed Note B from: configured as 0100000to: configured as 0111000.....	16

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser based versions of this data sheet, refer to the left hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
PCF8574ADGVR	ACTIVE	TVSOP	DGV	20	2000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	PF574A	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

N (R-PDIP-T\*\*)

PLASTIC DUAL-IN-LINE PACKAGE

16 PINS SHOWN

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - Falls within JEDEC MS-001, except 18 and 20 pin minimum body length (Dim A).
  - The 20 pin end lead shoulder width is a vendor option, either half or full width.

# PW0020A

# PACKAGE OUTLINE

## TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

4220206/A 02/2017

### NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.

# EXAMPLE BOARD LAYOUT

PW0020A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 10X

4220206/A 02/2017

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

PW0020A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE: 10X

4220206/A 02/2017

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

DGV (R-PDSO-G\*\*)

PLASTIC SMALL-OUTLINE

24 PINS SHOWN

- NOTES: A. All linear dimensions are in millimeters.  
 B. This drawing is subject to change without notice.  
 C. Body dimensions do not include mold flash or protrusion, not to exceed 0,15 per side.  
 D. Falls within JEDEC: 24/48 Pins – MO-153  
 14/16/20/56 Pins – MO-194

## GENERIC PACKAGE VIEW
