

TAC5212 High-performance stereo audio codec with 119dB dynamic range ADC and 120dB dynamic range DAC

1 Features

- Stereo high-performance audio ADC
 - Performance:
 - Line/Microphone differential input dynamic range: 119dB
 - THD+N: –98dB
 - Channel summing mode supports high SNR: 122dB
 - Input voltage:
 - Differential, 2V_{RMS} full-scale input
 - Single-ended, 1V_{RMS} full-scale input
 - Input mix/mux options
 - ADC sample rate (f_S) = 4kHz to 768kHz
 - Programmable microphone bias (up to 3V)
 - Up to 4 Record Channels
 - 2 Channel Analog + 2 Channel Digital
 - 1 Channel Analog + 3 Channel Digital
 - 4 Channel Digital
- Stereo differential or Quad single-ended high performance audio DAC
 - Performance:
 - DAC to differential line-out dynamic range: 120dB
 - DAC to differential headphone-out dynamic range: 118dB
 - THD+N: –104dB
 - Line-out/headphone output voltage :
 - Differential, 2V_{RMS} full-scale
 - Pseudo-differential, 1V_{RMS} full-scale
 - Single-ended, 1V_{RMS} full-scale
 - DAC sample rate (f_S) = 4kHz to 768kHz
- Common features
 - Analog input to output bypass
 - Voice activity detection
 - Ultrasonic activity detection
 - Battery and thermal foldback protection
 - Signal distortion limiter
 - Low and Ultra-low latency filter options
 - Programmable HPF and Biquad filters
 - I²C or SPI control interface
 - Audio serial interface
 - Format: TDM, I²S or Left-justified (LJ)
 - Word length: 16, 20, 24 or 32 bits
 - Bus controller and target modes
 - Programmable PLL for flexible clocking
 - Auto clock and sample rate detection

- Low power modes
 - 8mW for 2-Ch recording (1.8V Supply)
 - 11mW for 2-Ch playback (1.8V Supply)
- Single supply operation AVDD: 1.8V or 3.3V
- I/O supply operation: 1.2V or 1.8V or 3.3V
- Temperature grade 1: –40°C ≤ T_A ≤ +125°C

2 Applications

- [Land Mobile Radio](#)
- [IP Network Camera](#)
- [IP Telephone](#)
- [Video Conference System](#)
- [Smart Speakers](#)
- [Professional audio mixer/control surface](#)

3 Description

The TAC5212 is a high-performance stereo audio codec with 2V_{RMS} differential input, 119dB stereo ADC and 2V_{RMS} differential output, 120dB stereo or 1V_{RMS} single-ended output, 111dB quad DAC. The TAC5212 supports both differential and single-ended inputs and outputs. The ADC supports both line/microphone input signals with options for AC or DC coupling configurations. The DAC outputs can be configured for either line-output or headphone loads. The DAC can drive up to 62.5mW into a 16Ω headphone load. The TAC5212 integrates programmable channel gain, digital volume control, a low-jitter phase-locked loop (PLL), a programmable high-pass filter (HPF), programmable EQ and biquad filters, low-latency and ultra-low latency filter modes, and allows for sample rates up to 768kHz for both ADC and DAC signal chains. The TAC5212 supports time-division multiplexing (TDM), I²S, or left-justified (LJ) audio formats, and can be controlled with I²C or SPI. These integrated high-performance features, along with a single supply operation, makes TAC5212 an excellent choice for space-constrained audio applications.

Device Information

| PART NUMBER | PACKAGE ⁽¹⁾ | PACKAGE SIZE (NOM) ⁽²⁾ |
|-------------|------------------------|-----------------------------------|
| TAC5212 | VQFN (24) | 4mm x 4mm with 0.5mm pitch |

- (1) For all available packages, see the orderable addendum at the end of the data sheet.
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

5 Pin Configuration and Functions

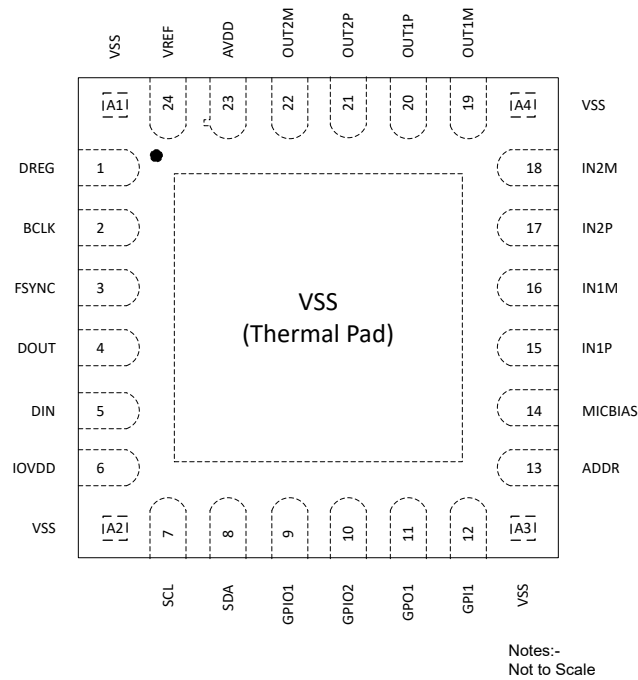

Figure 5-1. 24-Pin QFN Package with Exposed Thermal Pad and Corner Pins, Top View

Table 5-1. Pin Functions

| PIN | | TYPE ⁽¹⁾ | DESCRIPTION |
|-------|-----|---------------------|---|
| NAME | NO. | | |
| VSS | A1 | Ground | Ground pin. Short directly to board ground plane. |
| DREG | 1 | Digital Supply | Digital on-chip regulator output voltage for digital supply (1.55V, nominal) |
| BCLK | 2 | Digital I/O | Audio serial data interface bus bit clock |
| FSYNC | 3 | Digital I/O | Audio serial data interface bus frame synchronization signal |
| DOUT | 4 | Digital I/O | Audio serial data interface bus output |
| DIN | 5 | Digital Input | Audio serial data interface bus input |
| IOVDD | 6 | Digital Supply | Digital I/O power supply (1.2V or 1.8V or 3.3V, nominal) |
| VSS | A2 | Ground | Ground pin. Short directly to board ground plane. |
| SCL | 7 | Digital Input | Clock for I ² C control interface |
| SDA | 8 | Digital Input | Data for I ² C control interface |
| GPIO1 | 9 | Digital I/O | General-purpose digital input/output 1 (multipurpose functions such as daisy-chain input, audio data output, PLL input clock source, interrupt, and so forth) |
| GPIO2 | 10 | Digital I/O | General-purpose digital input/output 2 (multipurpose functions such as daisy-chain input, audio data output, PLL input clock source, interrupt, and so forth) |
| GPO1 | 11 | Digital Output | General-purpose digital output 1 (multipurpose functions such as audio data output, interrupt, and so forth) |
| GPI1 | 12 | Digital Input | General-purpose digital input 1 (multipurpose functions such as daisy-chain input, PLL input clock source, and so forth) |

Table 5-1. Pin Functions (continued)

| PIN | | TYPE ⁽¹⁾ | DESCRIPTION |
|---------|-------------|---------------------|--|
| NAME | NO. | | |
| VSS | A3 | Ground | Ground pin. Short directly to board ground plane. |
| ADDR | 13 | Analog Input | I ² C address pin |
| MICBIAS | 14 | Analog | Microphone bias output (Programmable output up to 3V) |
| IN1P | 15 | Analog Input | Analog input 1P pin |
| IN1M | 16 | Analog Input | Analog input 1M pin |
| IN2P | 17 | Analog Input | Analog input 2P pin |
| IN2M | 18 | Analog Input | Analog input 2M pin |
| VSS | A4 | Ground | Ground pin. Short directly to board ground plane. |
| OUT1M | 19 | Analog Output | Analog output 1M pin |
| OUT1P | 20 | Analog Output | Analog output 1P pin |
| OUT2P | 21 | Analog Output | Analog output 2P pin |
| OUT2M | 22 | Analog Output | Analog output 2M pin |
| AVDD | 23 | Analog Supply | Analog power supply (1.8V or 3.3V, nominal) |
| VREF | 24 | Analog | Analog reference voltage filter output |
| VSS | Thermal Pad | Ground | Thermal pad shorted to internal device ground. Short directly to board ground plane. |

(1) I = Input, O = Output, I/O = Input or Output, G = Ground, P = Power.

6 Specifications

6.1 Absolute Maximum Ratings

over the operating ambient temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|----------------------------|---|------|-------------|------|
| Supply voltage | AVDD to VSS (thermal pad) | -0.3 | 3.9 | V |
| Supply voltage | IOVDD to VSS (thermal pad) | -0.3 | 3.9 | V |
| Ground voltage differences | VSS to VSS (thermal pad) | -0.3 | 0.3 | V |
| Analog input voltage | Analog input pins voltage to VSS (thermal pad) | -0.3 | 5.656 | V |
| Digital input voltage | Digital input pins voltage to VSS (thermal pad) | -0.3 | IOVDD + 0.3 | V |
| Temperature | Functional ambient, T _A | -55 | 125 | °C |
| | Operating ambient, T _A | -40 | 125 | |
| | Junction, T _J | -40 | 150 | |
| | Storage, T _{stg} | -65 | 150 | |

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

| | | | VALUE | UNIT |
|--------------------|-------------------------|---|-------|------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 | V |
| V _(ESD) | Electrostatic discharge | Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾ | ±500 | |

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over the operating ambient temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|---------------------|---|------|-----|-------|------|
| POWER | | | | | |
| AVDD ⁽¹⁾ | Analog supply voltage to VSS (thermal pad) - AVDD 3.3V operation | 3.0 | 3.3 | 3.6 | V |
| | Analog supply voltage to VSS (thermal pad) - AVDD 1.8V operation ⁽²⁾ | 1.65 | 1.8 | 1.95 | |
| IOVDD | IO supply voltage to VSS (thermal pad) - IOVDD 3.3V operation | 3.0 | 3.3 | 3.6 | V |
| | IO supply voltage to VSS (thermal pad) - IOVDD 1.8V operation ⁽³⁾ | 1.65 | 1.8 | 1.95 | |
| | IO supply voltage to VSS (thermal pad) - IOVDD 1.2V operation ⁽³⁾ | 1.08 | 1.2 | 1.32 | |
| INPUTS | | | | | |
| INxx | Analog input pins voltage to VSS (thermal pad) for line-in recording | 0 | | 5.6 | V |
| IO | Digital input pins voltage to VSS (thermal pad) | 0 | | IOVDD | V |
| ADDR | ADDR pin w.r.t VSS (thermal pad) | 0 | | AVDD | V |
| TEMPERATURE | | | | | |
| T _A | Operating ambient temperature | -40 | | 125 | °C |

over the operating ambient temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|----------------|---|-----|-----|-----------------------|------|
| OTHERS | | | | | |
| CCLK | GPIOx or GPIx controller mode clock frequency (CCLK) | | | 36.864 ⁽⁴⁾ | MHz |
| C _b | SCL and SDA bus capacitance for I ² C interface supports standard-mode and fast-mode | | | 400 | pF |
| | SCL and SDA bus capacitance for I ² C interface supports fast-mode plus | | | 550 | |
| C _L | Digital output load capacitance | | 20 | 50 | pF |

- (1) VSS and VSS (thermal pad); all ground pins must be tied together and must not differ in voltage by more than 0.2V.
- (2) Set the AVDD_MODE bit correctly for AVDD 1.8V Operation. Refer Section 9.3 for more details.
- (3) Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.
- (4) CCLK input rise time (V_{IL} to V_{IH}) and fall time (V_{IH} to V_{IL}) must be less than 5ns. For better audio noise performance, CCLK input must be used with low jitter.

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | TAC5212 | UNIT |
|-------------------------------|--|------------|------|
| | | RGE (VQFN) | |
| | | 24 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 38.4 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 26.3 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance | 15.9 | °C/W |
| Ψ _{JT} | Junction-to-top characterization parameter | 0.5 | °C/W |
| Ψ _{JB} | Junction-to-board characterization parameter | 15.8 | °C/W |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 13.8 | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

At T_A = 25°C, AVDD = 3.3V, IOVDD = 3.3V, f_{IN} = 1kHz sinusoidal signal, f_S = 48kHz, 32-bit audio data, BCLK = 256×f_S, TDM target mode, linear phase decimation/interpolation filters, 5kΩ input impedance setting, AC-coupled differential input with ADC_CHX_CM_TOL = 2'b00 or DC-coupled differential input with ADC_CHX_CM_TOL = 2'b10 as applicable, 1200Ω/600Ω line-out load in differential/single-ended configuration or 32Ω/16Ω receiver/headphone load as applicable, PLL on, channel gain = 0dB, MICBIAS programmed to VREF and other default configurations; measured filter free with an Audio Precision with a 20Hz to 20kHz un-weighted bandwidth, unless otherwise noted

| PARAMETER | TEST CONDITIONS | MIN | NOM | MAX | UNIT |
|--|--|--|-----|-----|------------------|
| ADC PERFORMANCE FOR INPUT RECORDING | | | | | |
| | Differential input full-scale DC signal voltage | AC-coupled or DC-coupled input | | 2 | V _{RMS} |
| | | DC-coupled input (High Swing Mode) ⁽³⁾ | | 4 | |
| | Single-ended input full-scale AC signal voltage | AC-coupled or DC-coupled input | | 1 | V _{RMS} |
| | | DC-coupled input (High Swing Mode) ⁽³⁾ | | 2 | |
| SNR | Signal-to-noise ratio, A-weighted ^{(1) (2)} | INxx differential AC-coupled input and AC signal shorted to ground, 0dB channel gain | | 119 | dB |
| | | INxx differential AC-coupled input and AC signal shorted to ground, 12dB channel gain | | 107 | |
| | | INxx differential DC-coupled input and AC signal shorted to ground, 0dB channel gain | | 111 | |
| | | INxx differential DC-coupled input and AC signal shorted to ground, 12dB channel gain | | 99 | |
| SNR | Signal-to-noise ratio, A-weighted ^{(1) (2)} | Wideband Mode ⁽⁴⁾ : INxx differential DC-coupled input and AC signal shorted to ground, 0dB channel gain (Integrated till 20kHz and A-Weighted) | | 100 | dB |

At $T_A = 25^\circ\text{C}$, $AVDD = 3.3\text{V}$, $IOVDD = 3.3\text{V}$, $f_{IN} = 1\text{kHz}$ sinusoidal signal, $f_S = 48\text{kHz}$, 32-bit audio data, $BCLK = 256 \times f_S$, TDM target mode, linear phase decimation/interpolation filters, $5\text{k}\Omega$ input impedance setting, AC-coupled differential input with $ADC_CHx_CM_TOL = 2'b00$ or DC-coupled differential input with $ADC_CHx_CM_TOL = 2'b10$ as applicable, $1200\Omega/600\Omega$ line-out load in differential/single-ended configuration or $32\Omega/16\Omega$ receiver/headphone load as applicable, PLL on, channel gain = 0dB , MICBIAS programmed to VREF and other default configurations; measured filter free with an Audio Precision with a 20Hz to 20kHz un-weighted bandwidth, unless otherwise noted

| PARAMETER | | TEST CONDITIONS | MIN | NOM | MAX | UNIT |
|-----------|--|--|-----|-----|-----|------|

- (1) Ratio of output level with 1kHz full-scale sine-wave input, to the output level with the AC signal input shorted to ground, measured A-weighted over a 20Hz to 20kHz bandwidth using an audio analyzer.
- (2) All performance measurements done with 20kHz low-pass filter and, where noted, an A-weighted filter. Failure to use such a filter can result in higher THD+N and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, can affect dynamic specification values.
- (3) $ADC_CHx_FULLSCALE_VAL = 1'b1$ and $10\text{k}\Omega$ input impedance for High Swing Mode
- (4) $ADC_CHx_BW_MODE = 1'b1$ and $40\text{k}\Omega$ input impedance for Wideband Mode
- (5) $PWR_TUNE_CFG0 = 0xD4$, $PWR_TUNE_CFG1 = 0x96$ and $PLL_DIS = 1'b1$ for Power Tune Mode

6.6 Timing Requirements: I²C Interface

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V (unless otherwise noted); see Figure 5-1 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| t _{BUF} | Bus free time between a STOP and START condition | 0.5 | | | μs |

6.7 Switching Characteristics: I²C Interface

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V (unless otherwise noted); see Figure 5-1 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---------------------|------------------|-----------------|-----|-----|------|------|
| $t_{d(\text{SDA})}$ | SCL to SDA delay | Standard-mode | 200 | | 1250 | ns |
| | | Fast-mode | 200 | | 850 | ns |
| | | Fast-mode plus | | | 400 | ns |

6.8 Timing Requirements: SPI Interface

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V and 20pF load on all outputs (unless otherwise noted); see Figure 5-2 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| PARAMETER | | TEST CONDITIONS | MIN | NOM | MAX | UNIT |
|------------------------|---------------------------|---------------------|-----|-----|-----|------|
| $t_{(\text{SCLK})}$ | SCLK period | | 40 | | | ns |
| $t_{H(\text{SCLK})}$ | SCLK high pulse duration | | 18 | | | ns |
| $t_{L(\text{SCLK})}$ | SCLK low pulse duration | | 18 | | | ns |
| t_{LEAD} | Enable lead time | | 16 | | | ns |
| t_{TRAIL} | Enable trail time | | 16 | | | ns |
| t_{DSEQ} | Sequential transfer delay | | 20 | | | ns |
| $t_{\text{SU(PICO)}}$ | PICO data setup time | | 8 | | | ns |
| $t_{\text{HLD(PICO)}}$ | PICO data hold time | | 8 | | | ns |
| $t_{r(\text{SCLK})}$ | SCLK rise time | 10% - 90% rise time | | | 6 | ns |
| $t_{f(\text{SCLK})}$ | SCLK fall time | 90% - 10% fall time | | | 6 | ns |

6.9 Switching Characteristics: SPI Interface

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V and 20pF load on all outputs (unless otherwise noted); see Figure 5-2 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------|--------------------|--|-----|-----|-----|------|
| $t_{a(\text{POCI})}$ | POCI access time | IOVDD = 1.2V | | | 18 | ns |
| | | IOVDD = 1.8V | | | 18 | ns |
| | | IOVDD = 3.3V | | | 14 | ns |
| $t_{d(\text{POCI})}$ | SCLK to POCI delay | 50% of SCLK to 50% of POCI, IOVDD = 1.2V | | | 19 | ns |
| | | 50% of SCLK to 50% of POCI, IOVDD = 1.8V | | | 19 | ns |
| | | 50% of SCLK to 50% of POCI, IOVDD = 3.3V | | | 15 | ns |
| $t_{\text{dis(POCI)}}$ | POCI disable time | IOVDD = 1.2V | | | 18 | ns |
| | | IOVDD = 1.8V | | | 18 | ns |
| | | IOVDD = 3.3V | | | 14 | ns |

6.10 Timing Requirements: TDM, I²S or LJ Interface

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V and 20pF load on all outputs (unless otherwise noted); see Figure 5-3 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| PARAMETER | | TEST CONDITIONS | MIN | NOM | MAX | UNIT |
|-------------------------|---|-----------------|-----|-----|-----|------|
| $t_{(\text{BCLK})}$ | BCLK period | | 40 | | | ns |
| $t_{H(\text{BCLK})}$ | BCLK high pulse duration ⁽¹⁾ | | 18 | | | ns |
| $t_{L(\text{BCLK})}$ | BCLK low pulse duration ⁽¹⁾ | | 18 | | | ns |
| $t_{\text{SU(FSYNC)}}$ | FSYNC setup time | | 8 | | | ns |
| $t_{\text{HLD(FSYNC)}}$ | FSYNC hold time | | 8 | | | ns |
| $t_{\text{SU(DIN)}}$ | DIN setup time | | 8 | | | ns |

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V and 20pF load on all outputs (unless otherwise noted); see Figure 5-3 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| | | MIN | NOM | MAX | UNIT |
|-----------------------|----------------|---------------------|-----|-----|------|
| $t_{\text{HLD(DIN)}}$ | DIN hold time | 8 | | | ns |
| $t_{\text{r(BCLK)}}$ | BCLK rise time | 10% - 90% rise time | | 10 | ns |
| $t_{\text{f(BCLK)}}$ | BCLK fall time | 90% - 10% fall time | | 10 | ns |

- (1) To meet the timing specifications, the BCLK minimum high or low pulse duration must be higher than 25ns, if the DOUT data line is latched on the opposite BCLK edge polarity from the one used by the device to transmit the DOUT data.

6.11 Switching Characteristics: TDM, I²S or LJ Interface

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V and 20pF load on all outputs (unless otherwise noted); see Figure 5-3 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|----------------------------|---|---|-----|-----|--------|------|
| $t_{\text{d(DOUT-BCLK)}}$ | BCLK to DOUT delay | 50% of BCLK to 50% of DOUT, IOVDD = 1.2V | | | 18 | ns |
| | | 50% of BCLK to 50% of DOUT, IOVDD = 1.8V | | | 18 | |
| | | 50% of BCLK to 50% of DOUT, IOVDD = 3.3V | | | 14 | |
| $t_{\text{d(DOUT-FSYNC)}}$ | FSYNC to DOUT delay in TDM or LJ mode (for MSB data with TX_OFFSET = 0) | 50% of FSYNC to 50% of DOUT, IOVDD = 1.2V | | | 18 | ns |
| | | 50% of FSYNC to 50% of DOUT, IOVDD = 1.8V | | | 18 | |
| | | 50% of FSYNC to 50% of DOUT, IOVDD = 3.3V | | | 14 | |
| $f_{\text{(BCLK)}}$ | BCLK output clock frequency; controller mode ⁽¹⁾ | | | | 24.576 | MHz |
| $t_{\text{H(BCLK)}}$ | BCLK high pulse duration; controller mode | IOVDD = 1.2V | 14 | | | ns |
| | | IOVDD = 1.8V | 14 | | | |
| | | IOVDD = 3.3V | 14 | | | |
| $t_{\text{L(BCLK)}}$ | BCLK low pulse duration; controller mode | IOVDD = 1.2V | 14 | | | ns |
| | | IOVDD = 1.8V | 14 | | | |
| | | IOVDD = 3.3V | 14 | | | |
| $t_{\text{d(FSYNC)}}$ | BCLK to FSYNC delay; controller mode | 50% of BCLK to 50% of FSYNC, IOVDD = 1.2V | | | 18 | ns |
| | | 50% of BCLK to 50% of FSYNC, IOVDD = 1.8V | | | 18 | |
| | | 50% of BCLK to 50% of FSYNC, IOVDD = 3.3V | | | 14 | |
| $t_{\text{r(BCLK)}}$ | BCLK rise time; controller mode | 10% - 90% rise time, IOVDD = 1.2V | | | 10 | ns |
| | | 10% - 90% rise time, IOVDD = 1.8V | | | 10 | |
| | | 10% - 90% rise time, IOVDD = 3.3V | | | 10 | |
| $t_{\text{f(BCLK)}}$ | BCLK fall time; controller mode | 90% - 10% fall time, IOVDD = 1.2V | | | 8 | ns |
| | | 90% - 10% fall time, IOVDD = 1.8V | | | 8 | |
| | | 90% - 10% fall time, IOVDD = 3.3V | | | 8 | |

- (1) To meet the timing specifications, the BCLK output clock frequency must be lower than 18.5 MHz, if the DOUT data line is latched on the opposite BCLK edge polarity from the one used by the device to transmit DOUT data.

6.12 Timing Requirements: PDM Digital Microphone Interface

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V and 20pF load on all outputs (unless otherwise noted); see Figure 5-4 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| | | MIN | NOM | MAX | UNIT |
|---------------------------------|-------------------|-----|-----|-----|------|
| $t_{\text{SU}}(\text{PDMINx})$ | PDMINx setup time | 30 | | | ns |
| $t_{\text{HLD}}(\text{PDMINx})$ | PDMINx hold time | 0 | | | ns |

6.13 Switching Characteristics: PDM Digital Microphone Interface

At $T_A = 25^\circ\text{C}$, IOVDD = 3.3V or 1.8V or 1.2V and 20pF load on all outputs (unless otherwise noted); see Figure 5-4 for timing diagram. Set the IOVDD_IO_MODE bit correctly for IOVDD 1.8V and 1.2V Operation. Refer Section 9.3 for more details.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-------------------------------|----------------------------|---------------------|-----|-------|------|
| f_{PDMCLK} | PDMCLK clock frequency | 0.768 | | 6.144 | MHz |
| $t_{\text{H}}(\text{PDMCLK})$ | PDMCLK high pulse duration | 72 | | | ns |
| $t_{\text{L}}(\text{PDMCLK})$ | PDMCLK low pulse duration | 72 | | | ns |
| $t_{\text{r}}(\text{PDMCLK})$ | PDMCLK rise time | 10% - 90% rise time | | 18 | ns |
| $t_{\text{f}}(\text{PDMCLK})$ | PDMCLK fall time | 90% - 10% fall time | | 18 | ns |

7 Detailed Description

7.1 Overview

The TAC5212 is from a scalable family of audio converter devices. As part of the extended family of devices, the TAC5212 consists of a high-performance, low-power, flexible, stereo audio analog-to-digital converter (ADC) and audio digital-to-analog converter (DAC) with extensive feature integration. This device is intended for broad market applications such as ruggedized communication equipment, IP network cameras and phones, professional audio and multimedia applications. The high dynamic range of this device enables far-field audio recording and playback with high fidelity. This device integrates a host of features that reduce cost, board space, and power consumption in space-constrained system designs. Package, performance, and compatible configuration registers across extended families make this device well-suited for scalable system designs.

The TAC5212 consists of the following blocks:

- 2-channel, multibit, high-performance delta-sigma ($\Delta\Sigma$) ADCs
- Configurable single-ended or differential audio inputs
- Low-noise programmable microphone bias output
- 4-channel, multibit, high-performance delta-sigma ($\Delta\Sigma$) DACs
- Configurable single-ended, differential, or pseudo-differential audio outputs
- Over current diagnostics and protection for MICBIAS and analog outputs
- Automatic gain controller (AGC) for ADC channels and Dynamic range controller (DRC) for DAC channels
- Advanced thermal foldback and protection
- Advanced battery guard and distortion limiter
- Programmable decimation and interpolation filters with linear-phase, low-latency and ultra low-latency response options
- Programmable channel gain, volume control, and biquad filters for each ADC and DAC channel
- Programmable phase and gain calibration with fine resolution for each ADC channel
- Programmable high-pass filter (HPF) and digital channel mixer for ADC and DAC channels
- Incremental ADC support for DC measurement and low frequency signal monitoring/sensing applications
- Up to 4 pulse density modulation (PDM) digital microphone interface with a high-performance decimation filter
- Dual I²S or TDM interface with independent sample rate (synchronous)
- Synchronous sample rate converter (SRC)
- Integrated low-jitter, phase-locked loop (PLL) supporting a wide range of system clocks
- Integrated digital and analog voltage regulators to support single-supply operation

Communication to the TAC5212 for configuring the control registers is supported using an I²C or SPI interface. The device supports a highly flexible audio serial interface [time-division multiplexing (TDM), I²S, or left-justified (LJ)] to transmit audio data seamlessly in the system across devices.

The TAC5212 can support multiple devices by sharing the common TDM bus across devices. Moreover, the device includes a daisy-chain feature as well. These features relax the shared TDM bus timing requirements and board design complexities when operating multiple devices for applications requiring high audio data bandwidth.

[Table 7-1](#) lists the reference abbreviations used throughout this document to registers that control the device.

Table 7-1. Abbreviations for Register References

| REFERENCE | ABBREVIATION | DESCRIPTION | EXAMPLE |
|------------------------------|--------------|--|---|
| Page y, register z, bit k | Py_Rz_D[k] | Single data bit. The value of a single bit in a register. | Page 1, register 36, bit 0 = P1_R36_D[0] |
| Page y, register z, bits k-m | Py_Rz_D[k:m] | Range of data bits. A range of data bits (inclusive). | Page 1, register 36, bits 3-0 = P1_R36_D[3:0] |
| Page y, register z | Py_Rz | One entire register. All eight bits in the register as a unit. | Page 1, register 36 = P1_R36 |
| Page y, registers z-n | Py_Rz-Rn | Range of registers. A range of registers in the same page. | Page 1, registers 36, 37, 38 = P1_R36-R38 |

7.2 Functional Block Diagram

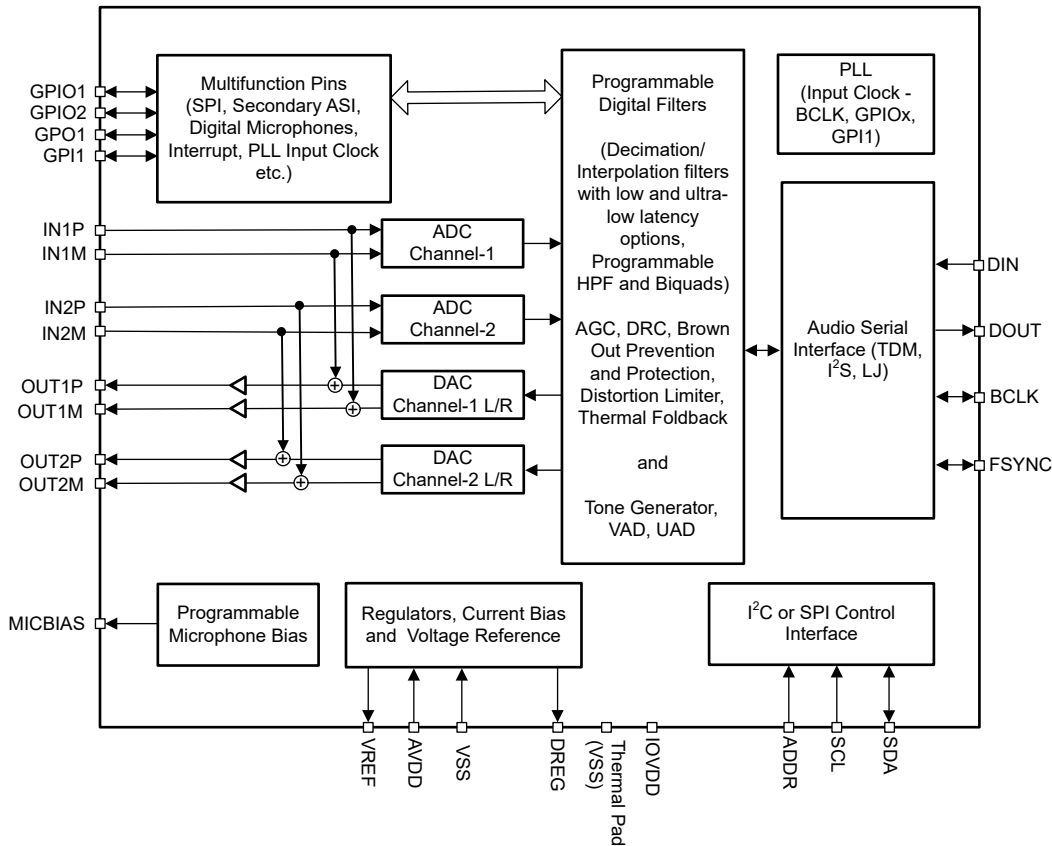

Figure 7-1. Functional Block Diagram

7.3 Feature Description

7.3.1 Serial Interfaces

This device has two serial interfaces: control and audio data. The control serial interface is used for device configuration. The audio data serial interface is used for transmitting audio data to the host device.

7.3.1.1 Control Serial Interfaces

The device contains configuration registers and programmable coefficients that can be set to the desired values for a specific system and application use. All these registers can be accessed using either I²C or SPI communication to the device. For more information, see [Section 7.5](#) and [Section 8](#).

7.3.1.2 Audio Serial Interfaces

Digital audio data flows between the host processor and the TAC5212 on the digital audio serial interface (ASI), or audio bus. This highly flexible ASI bus includes a TDM mode for multichannel operation, support for I²S or left-justified protocols format, programmable data length options, very flexible controller-target configurability for bus clock lines, and the ability to communicate with multiple devices within a system directly.

The TAC5212 supports up to two ASI Interfaces. Secondary ASI Clock and Data Pins can be configured by setting GPIO's. Frame Sync of two ASI's must be synchronous. See the [TAX5X1X Synchronous Sample Rate Conversion application report](#) for more details on Secondary ASI.

The bus protocol TDM, I²S, or left-justified (LJ) format can be selected for primary ASI by using the PASI_FORMAT[1:0] (P0_R26_D[7:6]) register bits. As shown in [Table 7-2](#) and [Table 7-3](#), these modes are all most significant byte (MSB)-first, pulse code modulation (PCM) data format, with the output channel data word-length programmable as 16, 20, 24, or 32 bits by configuring the PASI_WLEN[1:0] (P0_R26_D[5:4]) register bits.

Table 7-2. Primary Audio Serial Interface Format

| P0_R26_D[7:6] : PASI_FORMAT[1:0] | PRIMARY AUDIO SERIAL INTERFACE FORMAT |
|----------------------------------|--|
| 00 (default) | Time-division multiplexing (TDM) mode |
| 01 | Inter IC sound (I ² S) mode |
| 10 | Left-justified (LJ) mode |
| 11 | Reserved (do not use this setting) |

Table 7-3. Primary Audio Serial Interface Data Word-Length

| P0_R26_D[5:4] : PASI_WLEN[1:0] | PRIMARY AUDIO OUTPUT CHANNEL DATA WORD-LENGTH |
|--------------------------------|---|
| 00 | Data word-length set to 16 bits |
| 01 | Data word-length set to 20 bits |
| 10 | Data word-length set to 24 bits |
| 11 (default) | Data word-length set to 32 bits |

The frame sync pin, FSYNC, is used in this audio bus protocol to define the beginning of a frame and has the same frequency as the output data sample rates. The bit clock pin, BCLK, is used to clock out the digital audio data across the serial bus. The number of bit-clock cycles in a frame must accommodate multiple device active output channels with the programmed data word length.

A frame consists of multiple time-division channel slots (up to 32) to allow all input/output channel audio data transmissions to be completed on the audio bus by a device or multiple devices sharing the same audio bus. The device supports up to eight input channels and eight output channels that can be configured on the primary ASI bus to place their audio data on bus slot 0 to slot 31. [Table 7-4](#) lists the output channel-1 slot configuration settings. In I²S and LJ mode, the slots are divided into two sets, left-channel slots, and right-channel slots, as described in [Section 7.3.1.2.2](#) and [Section 7.3.1.2.3](#).

Table 7-4. Output Channel-1 Slot Assignment Settings

| P0_R30_D[4:0] : PASI_TX_CH1_SLOT[4:0] | OUTPUT CHANNEL 1 SLOT ASSIGNMENT |
|---------------------------------------|---|
| 0 0000 = 0d (default) | Slot 0 for TDM or left slot 0 for I ² S, LJ. |
| 0 0001 = 1d | Slot 1 for TDM or left slot 1 for LJ. |
| ... | ... |
| 0 1111 = 15d | Slot 15 for TDM or left slot 15 for LJ. |
| 1 0000 = 16d | Slot 16 for TDM or right slot 0 for I ² S, LJ. |
| ... | ... |
| 1 1110 = 30d | Slot 30 for TDM or right slot 14 for LJ. |
| 1 1111 = 31d | Slot 31 for TDM or right slot 15 for LJ. |

Similarly, the slot assignment setting for output channel 2 to channel 8 can be done using the PASI_TX_CH2_SLOT_NUM (P0_R31_D[4:0]) to PASI_TX_CH8_SLOT_NUM (P0_R37) registers and for input channel 1 to channel 8 by using the PASI_RX_CH1_SLOT (P0_R40) to PAS_RX_CH8_SLOT (P0_R47_D[4:0]) registers, respectively.

The slot word length is the same as the primary ASI channel word length set for the device. The output channel data word length must be set to the same value for all TAC5212 devices if all devices share the same ASI bus in a system. The maximum number of slots possible for the ASI bus in a system is limited by the available bus

bandwidth, which depends upon the BCLK frequency, output data sample rate used, and the channel data word length configured.

The device also includes a feature that offsets the start of the slot data transfer concerning the frame sync by up to 31 cycles of the bit clock. Offset can be configured independently for input and output data paths. [Table 7-5](#) and [Table 7-6](#) lists the programmable offset configuration settings for transmission and receive paths respectively.

Table 7-5. Programmable Offset Settings for the ASI Slot Start for transmission

| P0_R28_D[4:0] : PASI_TX_OFFSET[4:0] | PROGRAMMABLE OFFSET SETTING FOR SLOT DATA TRANSMISSION START |
|-------------------------------------|--|
| 0 0000 = 0d (default) | The device follows the standard protocol timing without any offset. |
| 0 0001 = 1d | Slot start is offset by one BCLK cycle, as compared to standard protocol timing. For I ² S or LJ, the left and right slot start is offset by one BCLK cycle, as compared to standard protocol timing. |
| | |
| 1 1110 = 30d | Slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. For I ² S or LJ, the left and right slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. |
| 1 1111 = 31d | Slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. For I ² S or LJ, the left and right slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. |

Table 7-6. Programmable Offset Settings for the ASI Slot Start for Receive

| P0_R38_D[4:0] : PASI_RX_OFFSET[4:0] | PROGRAMMABLE OFFSET SETTING FOR SLOT DATA RECEIVE START |
|-------------------------------------|--|
| 0 0000 = 0d (default) | The device follows the standard protocol timing without any offset. |
| 0 0001 = 1d | Slot start is offset by one BCLK cycle, as compared to standard protocol timing. For I ² S or LJ, the left and right slot start is offset by one BCLK cycle, as compared to standard protocol timing. |
| | |
| 1 1110 = 30d | Slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. For I ² S or LJ, the left and right slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. |
| 1 1111 = 31d | Slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. For I ² S or LJ, the left and right slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. |

The device also features the ability to invert the polarity of the frame sync pin, FSYNC, used to transfer the audio data as compared to the default FSYNC polarity used in standard protocol timing. This feature can be set using the PASI_FSYNC_POL (P0_R26_D[3]) register bit. Similarly, the device can invert the polarity of the bit clock pin, BCLK, which can be set using the PASI_BCLK_POL (P0_R26_D[2]) register bit.

In addition, the word clock and bit clock can be independently configured in either controller or target mode, for flexible connectivity to a wide variety of processors. The word clock is used to define the beginning of a frame and may be programmed as either a pulse or a square-wave signal. The frequency of this clock corresponds to the maximum of the selected ADC and DAC sampling frequencies.

7.3.1.2.1 Time Division Multiplexed Audio (TDM) Interface

In TDM mode, also known as DSP mode, the rising edge of FSYNC starts the data transfer with the slot 0 data first. Immediately after the slot 0 data transmission, the remaining slot data are transmitted in order. FSYNC and each data bit (except the MSB of slot 0 when TX_OFFSET equals 0) is transmitted on the rising edge of BCLK. [Figure 7-2](#) to [Figure 7-5](#) illustrate the protocol timing for TDM operation with various configurations for transmit DOUT line. The same protocol is applicable for the receive DIN line as well.

Figure 7-2. TDM Mode Standard Protocol Timing (PASI_TX_OFFSET = 0)

Figure 7-3. TDM Mode Protocol Timing (PASI_TX_OFFSET = 2)

Figure 7-4. TDM Mode Protocol Timing (No Idle BCLK Cycles, PASI_TX_OFFSET = 2)

Figure 7-5. TDM Mode Protocol Timing (PASI_TX_OFFSET = 0 and PASI_BCLK_POL = 1)

For proper operation of the audio bus in TDM mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels times the programmed word length of the output channel data. The device supports FSYNC as a pulse with a 1-cycle-wide bit clock but also supports multiples as well. For a higher BCLK frequency operation, using TDM mode with a PASI_TX_OFFSET value higher than 0 is recommended.

7.3.1.2.2 Inter IC Sound (I²S) Interface

The standard I²S protocol is defined for only two channels: left and right. The device extends the same protocol timing for multichannel operation. In I²S mode, the MSB of the left slot 0 is transmitted on the falling edge of BCLK in the second cycle after the falling edge of FSYNC. Immediately after the left slot 0 data transmission, the remaining left slot data are transmitted in order. The MSB of the right slot 0 is transmitted on the falling edge of

BCLK in the second cycle after the *rising* edge of FSYNC. Immediately after the right slot 0 data transmission, the remaining right slot data are transmitted in order. FSYNC and each data bit is transmitted on the falling edge of BCLK. Figure 7-6 to Figure 7-9 illustrate the protocol timing for I²S operation with various configurations for the transmit DOUT line. The same protocol is applicable for the receive DIN line as well.

Figure 7-6. I²S Mode Standard Protocol Timing (PASI_TX_OFFSET = 0)

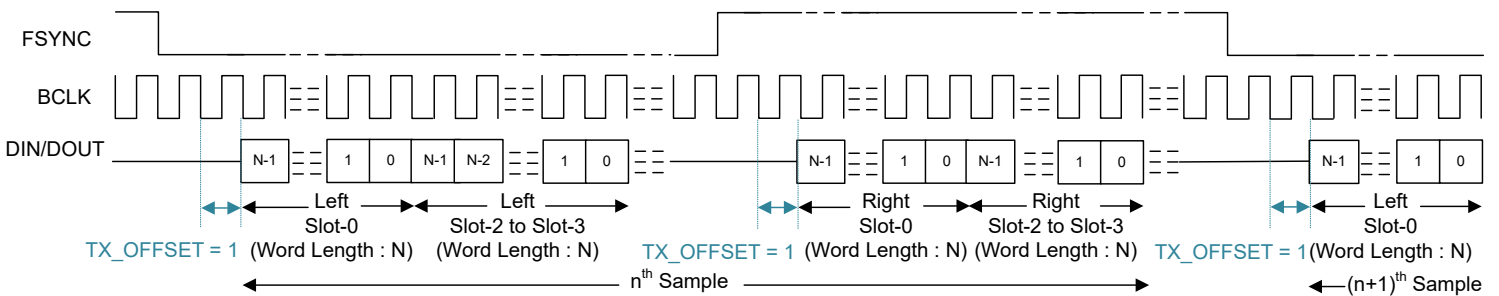

Figure 7-7. I²S Protocol Timing (PASI_TX_OFFSET = 1)

Figure 7-8. I²S Protocol Timing (No Idle BCLK Cycles, PASI_TX_OFFSET = 0)

Figure 7-9. I²S Protocol Timing (PASI_TX_OFFSET = 0 and PASI_BCLK_POL = 1)

For proper operation of the audio bus in I²S mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels (including left and right slots) times the programmed word length of the output channel data. The device FSYNC low pulse must be several BCLK cycles wide that is greater than

or equal to the number of active left slots times the data word length configured. Similarly, the FSYNC high pulse must be several BCLK cycles wide that is greater than or equal to the number of active right slots times the data word length configured.

7.3.1.2.3 Left-Justified (LJ) Interface

The standard LJ protocol is defined for only two channels: left and right. The device extends the same protocol timing for multichannel operation. In LJ mode, the MSB of the left slot 0 is transmitted in the same BCLK cycle after the rising edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. Immediately after the left slot 0 data transmission, the remaining left slot data are transmitted in order. The MSB of the right slot 0 is transmitted in the same BCLK cycle after the falling edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. Immediately after the right slot 0 data transmission, the remaining right slot data are transmitted in order. FSYNC is transmitted on the falling edge of BCLK. Figure 7-10 to Figure 7-13 illustrate the protocol timing for LJ operation with various configurations for the transmit DOUT line. The same protocol is applicable for the receive DIN line as well.

Figure 7-10. LJ Mode Standard Protocol Timing (TX_OFFSET = 0)

Figure 7-11. LJ Protocol Timing (TX_OFFSET = 2)

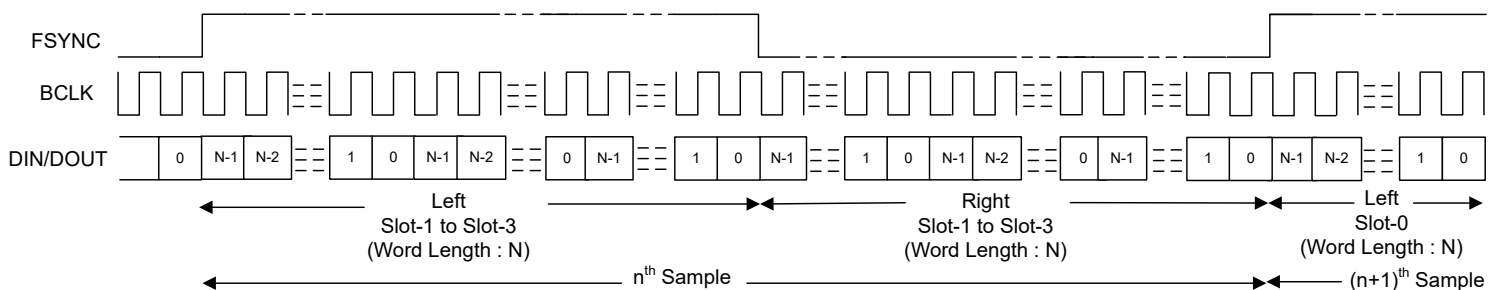

Figure 7-12. LJ Protocol Timing (No Idle BCLK Cycles, TX_OFFSET = 0)

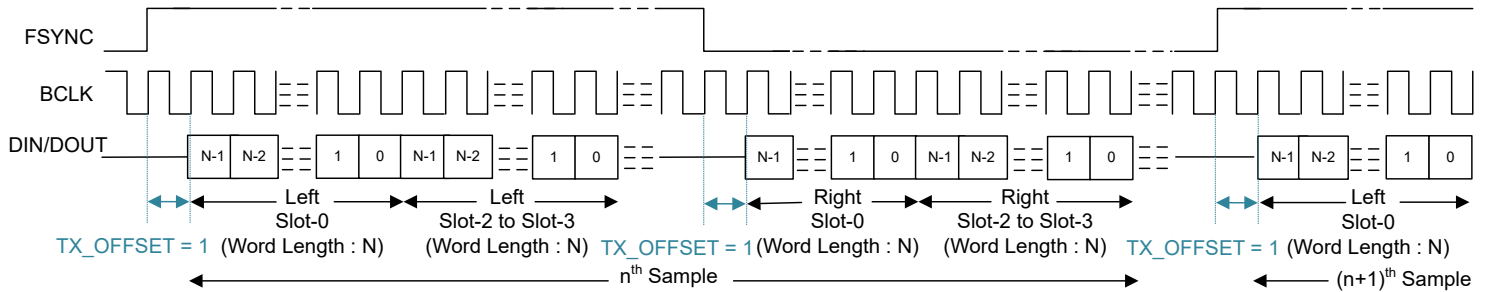

Figure 7-13. LJ Protocol Timing (TX_OFFSET = 1 and BCLK_POL = 1)

For proper operation of the audio bus in LJ mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels (including left and right slots) times the programmed word length of the output channel data. The device FSYNC high pulse must be several BCLK cycles wide that is greater than or equal to the number of active left slots times the data word length configured. Similarly, the FSYNC low pulse must be several BCLK cycles wide that is greater than or equal to the number of active right slots times the data word length configured. For a higher BCLK frequency operation, using LJ mode with a TX_OFFSET value higher than 0 is recommended.

7.3.1.3 Using Multiple Devices With Shared Buses

The device has many supported features and flexible options that can be used in the system to seamlessly connect multiple TAC5212 devices by sharing a single common I²C or SPI control bus and an audio serial interface bus. This architecture enables multiple applications to be applied to a system that require a microphone or speaker array for beam-forming operation, audio conferencing, noise cancellation, and so forth. [Figure 7-14](#) shows a diagram of multiple TAC5212 devices in a configuration where the control and audio data buses are shared.

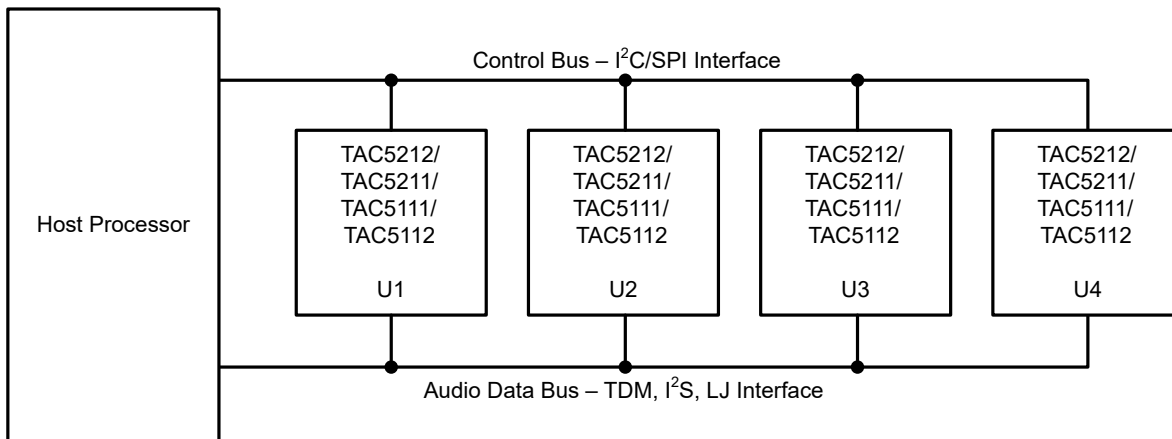

Figure 7-14. Multiple TAC5212 Devices With Shared Control and Audio Data Buses

The TAC5212 consists of the following features to enable seamless connection and interaction of multiple devices using a shared bus:

- Supports up to four pin-programmable I²C target addresses
- I²C broadcast simultaneously writes to (or triggers) all TAC5212 devices
- Supports up to 32 configuration input/output channel slots for the audio serial interface
- Tri-state feature (with enable and disable) for the unused audio data slots of the device
- Supports a bus-holder feature (with enable and disable) to keep the last driven value on the audio bus
- The GPIOx, GPI1 or GPO1 pin can be configured as a secondary input/output data lane or as a secondary audio serial interface
- The GPIOx, GPI1 or GPO1 pin can be used in a daisy-chain configuration of multiple TAC5212 devices

- Supports one BCLK cycle data latching timing to relax the timing requirement for the high-speed interface
- Programmable controller and target options for both primary and secondary audio serial interface
- Ability to synchronize the multiple devices for the simultaneous sampling requirement across devices
- Inter Channel Gain Alignment (ICGA) feature to align the DAC Channel gain across devices.

See the [Multiple TAC5x1x Devices With a Shared TDM and I²C/SPI Bus application report](#) for further details.

7.3.2 Phase-Locked Loop (PLL) and Clock Generation

The device has a smart auto-configuration block to generate all necessary internal clocks required for the ADC and DAC modulators and the digital filter engine used for signal processing. This configuration is done by monitoring the frequency of the FSYNC and BCLK signals on the audio buses.

The device supports the various data sample rates (of the FSYNC signal frequency) and the BCLK to FSYNC ratio to configure all clock dividers, including the PLL configuration, internally without host programming. [Table 7-7](#) and [Table 7-8](#) list the supported FSYNC and BCLK frequencies.

Table 7-7. Supported FSYNC (Multiples or Submultiples of 48 kHz) and BCLK Frequencies

| BCLK TO FSYNC RATIO | BCLK (MHz) | | | | | | | | | |
|---------------------|---------------|---------------|----------------|----------------|----------------|----------------|----------------|-----------------|-----------------|-----------------|
| | FSYNC (4 kHz) | FSYNC (8 kHz) | FSYNC (16 kHz) | FSYNC (24 kHz) | FSYNC (32 kHz) | FSYNC (48 kHz) | FSYNC (96 kHz) | FSYNC (192 kHz) | FSYNC (384 kHz) | FSYNC (768 kHz) |

The TAC5212 also supports non-Audio sample rates beyond those listed in prior tables. Refer to [Clocking Configuration of Device and Flexible Clocking For TAx5x1x Family application report](#) for more details.

The TAC5212 sample rate can be configured using registers CLK_CFG0 (P0_R50) and CLK_CFG1 (P0_R51) for primary and secondary ASI respectively. CLK_DET_STS0 (P0_R62) and CLK_DET_STS1 (P0_R63)

registers also capture the device auto detect result for the FSYNC frequency in auto detection mode for the primary and secondary ASI respectively. The registers CLK_DET_STS2 (P0_R64) and CLK_DET_STS3 (P0_R65) capture the BCLK to FSYNC ratio detected by the device in the auto detection mode for the selected ASI which is chosen to be the PLL reference through the CLK_SRC_SEL (P0_R52_D[3:1]) registers. If the device finds any unsupported combinations of FSYNC frequency and BCLK to FSYNC ratios, the device generates an ASI clock-error interrupt and shuts down various blocks of the device accordingly.

The TAC5212 also supports enabling channels while ADC or DAC channels are already in operation. This requires a pre-configuration before power to describe the maximum number of channels that can be enabled while in operation to ensure proper clock generation and use. This can be configured by using register DYN_PUPD_CFG (P0_R119). ADC_DYN_PUPD_EN (P0_R119_D[7]) and DAC_DYN_PUPD_EN (P0_R119_D[5]) bits can be used to independently enable ADC or DAC Channels' dynamic power up. Number of maximum channels supported for dynamic power-up and power-down can be configured using ADC_DYN_MAXCH_SEL (P0_R119_D[6]) and DAC_DYN_MAXCH_SEL (P0_R119_D[4]) bits.

The device uses an integrated, low-jitter, phase-locked loop (PLL) to generate internal clocks required for the modulators and digital filter engine, as well as other control blocks. The device also supports an option to use BCLK, GPIOx, or the GPI1 pin (as CCLK) as the audio clock source without using the PLL to reduce power consumption. However, the ADC performance may degrade based on jitter from the external clock source, and some processing features may not be supported if the external audio clock source frequency is not high enough. Therefore, TI recommends using the PLL for high-performance applications. More details and information on how to configure and use the device in low-power mode without using the PLL are discussed in the [TAC5x1x Power Consumption Matrix Across Various Usage Scenarios application report](#).

The device also supports an audio bus controller mode operation using the GPIOx or GPI1 pin (as CCLK) as the reference input clock source and supports various flexible options and a wide variety of system clocks. More details and information on controller mode configuration and operation are discussed in the [Clocking Configuration of Device and Flexible Clocking For TAx5x1x Family application report](#).

The audio bus clock error detection and auto-detect feature automatically generates all internal clocks, but can be disabled using the IGNORE_CLK_ERR (P0_R4_D[6]) and CUSTOM_CLK_CFG (P0_R50_D[0]) register bits, respectively. In the system, this disable feature can be used to support custom clock frequencies that are not covered by the auto detect scheme. For such application use cases, care must be taken to ensure that the multiple clock dividers are all configured appropriately. TI recommends using the PPC3 GUI for device configuration settings; for more details see the [TAC5212EVM-PDK Evaluation module user's guide](#) and the [PurePath™ console graphical development suite](#). The [Clocking Configuration of Device and Flexible Clocking For TAx5x1x Family application report](#) also covers various aspects of the custom clock configurations. Refer [Clock Error Configuration, Detection, and Modes Supported in TAx5x1x Family application report](#) for more details about the clock detection module of the device.

When the PLL is turned off, the digital volume control and other features using programmable coefficients like biquads, mixer, AGC etc., except the high pass filter (HPF) are not applicable.

7.3.3 Input Channel Configurations

The TAC5212 consists of two pairs of analog input pins (INxP and INxM) that can be configured as differential inputs or single-ended inputs for the recording channel. The device supports simultaneous recording of up to two analog channels using the high-performance multichannel ADC. The input source for the analog pins can be from electret condenser analog microphones, microelectrical-mechanical system (MEMS) analog microphones, or line-in (auxiliary) inputs from the system board. Analog inputs support differential input, single-ended inputs (two pin and one-pin) with AC and DC coupling options. [Table 7-9](#) shows the input source selection for the record channel 1.

Table 7-9. Input Source Selection for the Record Channel

| P0_R80_D[7:6] : ADC_CH1_INSRC[1:0] | INPUT CHANNEL 1 RECORD SOURCE SELECTION |
|------------------------------------|---|
| 00 (default) | Analog differential input for channel 1 using IN1P and IN1M |
| 01 | Analog single-ended input for channel 1 using IN1P and IN1M (signal on one input pin and ground on other pin) |

Table 7-9. Input Source Selection for the Record Channel (continued)

| P0_R80_D[7:6] : ADC_CH1_INSRC[1:0] | INPUT CHANNEL 1 RECORD SOURCE SELECTION |
|------------------------------------|---|
| 10 | Analog single-ended input on IN1P |
| 11 | Analog single-ended Input on IN1M |

Similarly, the input source selection setting for input channel 2 can be configured using the ADC_CH2_INSRC[1:0] (P0_R85_D[7:6]) register bits.

Typically, voice or audio signal inputs are capacitively coupled (AC-coupled) to the device and the common-mode variation at the device input is limited to less than 100mVpp for differential inputs for best performance. However, for applications that cannot avoid large common-mode fluctuations or when needed to save board space, the device also supports options for increasing the common mode tolerance and for DC-coupled inputs. This configuration can be done independently for each channel by setting the input common mode tolerance in ADC_CH1_CM_TOL (P0_R80_D[3:2]) and ADC_CH2_CM_TOL (P0_R85_D[3:2]) register bits. [Table 7-10](#) shows these options for Channel 1. Setting higher common mode tolerance offers improved CMRR performance at the expense of noise performance by a few decibels.

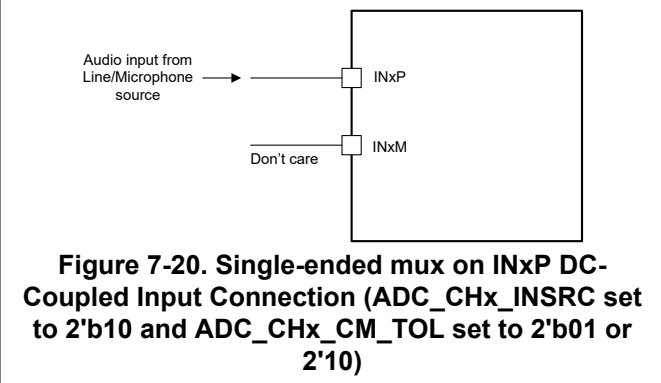

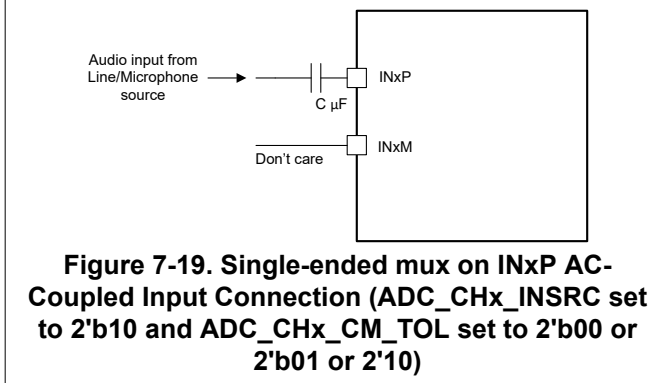

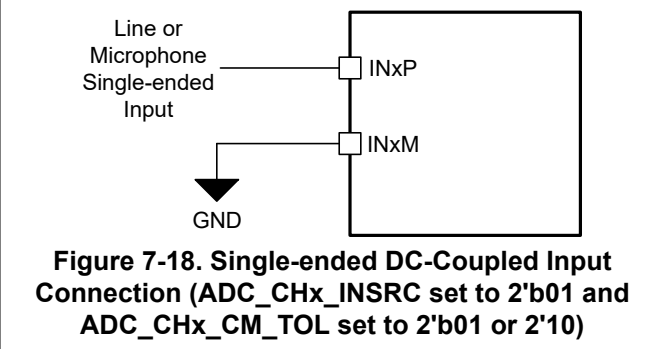

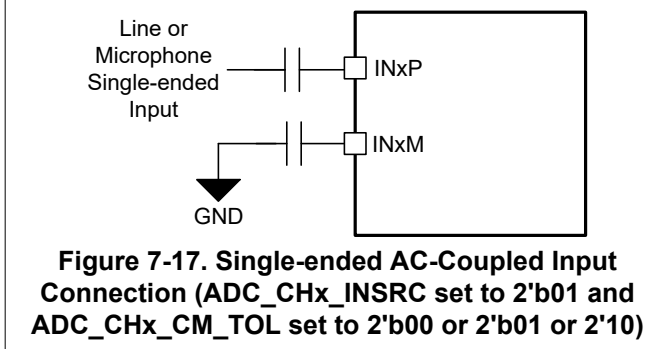

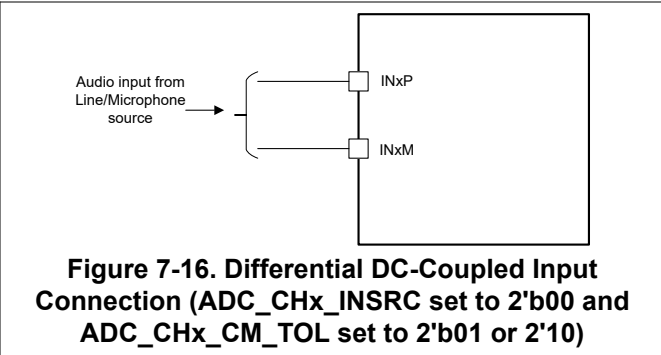

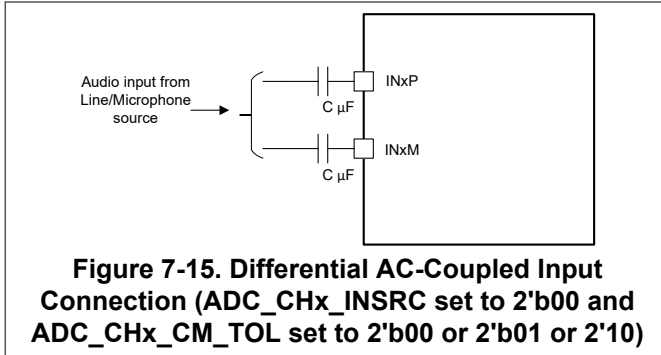

Table 7-10. Common-Mode Tolerance Mode Selection for Record Channel

| P0_R80_D[3:2] : ADC_CH1_CM_TOL[1:0] | CHANNEL 1 INPUT COMMON-MODE TOLERANCE |
|-------------------------------------|--|
| 00 (default) | AC-coupled input with common mode variance tolerance of 50mVpp for single-ended and 100mVpp for differential configuration |
| 01 | AC-coupled / DC-coupled input with common mode variance tolerance supported 500mVpp for single-ended and 1Vpp for differential configuration |
| 10 | AC-coupled / DC-coupled input with common mode variance tolerance supported rail to rail (supply to ground) (High CMRR tolerance mode) |
| 11 | Reserved (do not use this setting) |

Table 7-11. Input Common Mode Tolerance for the Record Channel

| P0_R80_D[3:2] : ADC_CH1_CM_TOL[1:0] | INPUT CHANNEL 1 COMMON MODE TOLERANCE |
|-------------------------------------|--|
| 00 (default) | AC-coupled input with common mode variance tolerance supported 50mVpp for single ended and 100mVpp for differential configuration |
| 01 | AC-coupled / DC-coupled input with common mode variance tolerance supported 500mVpp for single ended and 1Vpp for differential configuration |
| 10 | AC-coupled / DC-coupled input with common mode variance tolerance supported rail to rail (supply to ground) (High CMRR tolerance mode) |
| 11 | Reserved |

See [Figure 7-15](#) to [Figure 7-20](#) for the various typical input configuration diagrams. For single-ended inputs, the INxM pin can be directly grounded in DC-coupled configuration, but the INxM pin must be grounded after the AC-coupling capacitor in the AC-coupled configuration. For the best dynamic range performance, the differential AC-coupled input setting should be used and the common-mode variation at the device input should be limited to less than 100mVpp. For more details, refer [Analog Input Configurations, Mixing and Muxing of TAx5x1x Devices application report](#).

The device also allows for flexibility in choosing the typical input impedance on INxP or INxM from 5kΩ (default), 10kΩ, and 40kΩ based on the input source impedance selection. There can be a ±20% variation on the selected input impedance value. The higher input impedance results in slightly higher noise or lower dynamic range. [Table 7-12](#) lists the configuration register settings for the input impedance for the record channel.

Table 7-12. Input Impedance Selection for the Record Channel

| P0_R80_D[5:4] : ADC_CH1_IMP[1:0] | CHANNEL 1 INPUT IMPEDANCE SELECTION |
|----------------------------------|--|
| 00 (default) | Channel 1 input impedance typical value is 5 kΩ on INxP or INxM |
| 01 | Channel 1 input impedance typical value is 10 kΩ on INxP or INxM |
| 10 | Channel 1 input impedance typical value is 40 kΩ on INxP or INxM |
| 11 | Reserved (do not use this setting) |

Similarly, the input impedance selection setting for input channel 2 can be configured using the ADC_CH2_IMP[1:0] (P0_R85_D[5:4]).

Input impedance setting of 5 kΩ is not supported when the ADC inputs are configured for single ended mux (ADC_CHx_INSRC = 2'b10 or 2'b11) and also not supported in the high swing mode ([Section 7.3.5](#)).

The value of the coupling capacitor in AC-coupled mode must be chosen so that the high-pass filter formed by the coupling capacitor and the input impedance do not affect the signal content. Before proper recording can begin, this coupling capacitor must be charged up to the common-mode voltage at power-up. To enable quick charging, the device has modes to speed up the charging of the coupling capacitor. The default value of the quick-charge timing is set for a coupling capacitor up to 1 μ F. However, if a higher-value capacitor is used in the system, then the quick-charging timing can be increased by using the INCAP_QCHG (P0_R5_D[7:6]) register bits. For low distortion performance, use the low-voltage coefficient capacitors for AC coupling.

Additionally, if the application uses digital PDM microphones for the recording, GPIOx, GPI1 and GPO1 pins can be reconfigured in the device to support up to four channels for the digital microphone recording (when the analog channels are not used). The device can also support simultaneous recording on two analog and two digital microphone channels or one analog channel and three digital microphone channels. These combinations can be enabled using the INTF4_CFG (B0_P0_R19) register. More details on enabling the PDM channels are present [Section 7.3.7](#).

The TAC5212 also supports an incremental mode of ADC where analog input channels can be used for DC measurements. This can be configured by setting IADC_EN (P0_R81_D[7]). For more details on the incremental mode of ADC, refer [Section 7.3.8](#).

7.3.4 Output Channel Configurations

The device consists of two pairs of analog output pins (OUTxP and OUTxM) that can be configured as differential inputs or single-ended outputs for playback channels. The device supports simultaneous playback of up to four channels of single-ended outputs or up to two channel differential output using the high-performance multichannel DAC. [Table 7-13](#) shows the input source selection for the playback channels.

Table 7-13. Input Source Selection for the Playback Channel

| P0_R100_D[7:5] : OUT1x_SRC[2:0] | OUT1P/OUT1M Input Source Selection |
|---------------------------------|---|
| 000 | Output driver disabled |
| 001 (default) | DAC signal chain |
| 010 | Analog bypass signal chain |
| 011 | Mixing of DAC and Analog bypass signal chains |
| 100 | OUT1P for DAC and OUT1M for Analog bypass signal chain |
| 101 | OUT1P for Analog bypass and OUT1M for DAC signal chain. |
| 11x | Reserved. Do not use this setting. |

Similarly, the input source selection setting for output channel 2 can be configured using the OUT2x_SRC[2:0] (P0_R107_D[7:5]) register bits.

The TAC5212 supports up to 2-channel differential output, up to 2-channel pseudo-differential output, and up to 4-channel single-ended output. Each of the output channels can be independently configured for differential or single-ended output.

[Table 7-14](#) shows the configuration modes for the output pins.

Table 7-14. Output Pin Configuration for the Playback Channel

| P0_R100_D[4:2] : OUT1x_CFG[2:0] | OUT1P/OUT1M Pin Configuration |
|---------------------------------|--|
| 000 (default) | OUT1P/OUT1M as a differential pair |
| 001 | OUT1P and OUT1M as independent single-ended outputs |
| 010 | Mono single-ended output on OUT1P only |
| 011 | Mono single-ended output on OUT1M only |
| 100 | Pseudo-differential output with OUT1P as signal and OUT1M as VCOM |
| 101 | Pseudo differential output with OUT1P as signal, OUT1M as VCOM and OUT2M as VCOM sense (external common mode sense). |
| 110 | Pseudo-differential output with OUT1M as signal and OUT1P as VCOM |

Table 7-14. Output Pin Configuration for the Playback Channel (continued)

| P0_R100_D[4:2] : OUT1x_CFG[2:0] | OUT1P/OUT1M Pin Configuration |
|---------------------------------|------------------------------------|
| 111 | Reserved. Do not use this setting. |

Similarly, the output pin configuration for output channel 2 can be done using the OUT2x_CFG[2:0] (P0_R107_D[4:2]) register bits.

See [Figure 7-21](#) to [Figure 7-24](#) for the various typical output configuration diagrams.

The TAC5212 can support a variety of loads including headphone, lineout, and receiver amplifiers. Load drive configurations are available for each pin independently. OUT1P_DRIVE[1:0] (P0_R101_D[7:6]) configures the load drive capability for the OUT1P pin. Similarly, OUT1M_DRIVE[1:0], OUT2P_DRIVE[1:0], OUT2M_DRIVE[1:0] control the output drive for OUT1M, OUT2P and OUT2M respectively.

7.3.5 Reference Voltage

All audio data converters require a DC reference voltage. The TAC5212 achieves low-noise performance by internally generating a low-noise reference voltage. This reference voltage is generated using a band-gap circuit with high PSRR performance. This audio converter reference voltage must be filtered externally using a minimum 1μF capacitor connected from the VREF pin to the device ground (VSS).

The value of this reference voltage can be configured using the VREF_FSCALE (P0_R77_D[1:0]) register bits and must be set to an appropriate value based on the desired full-scale input for the device and the AVDD supply voltage available in the system. The default VREF value is set to 2.75V, which in turn supports a 2V_{RMS} differential full-scale input to the device. The required minimum AVDD voltage for this mode is 3V. The TAC5212 also supports a high swing mode with 4V_{RMS} differential swing which can be enabled by setting ADC_CHx_FULLSCALE_VAL (P0_R80_D[1] and P0_R85_D[1]) to 1'b1 for each channel independently. [Table 7-15](#) lists the various VREF settings supported along with the required AVDD range and the supported full-scale input signal for that configuration.

Table 7-15. VREF Programmable Settings

| P0_R77_D[1:0]: VREF_FSCALE[1:0] | VREF OUTPUT VOLTAGE | DIFFERENTIAL FULL- SCALE INPUT SUPPORTED | SINGLE-ENDED FULL- SCALE INPUT SUPPORTED | AVDD OPERATION MODE |
|------------------------------------|------------------------|--|--|------------------------|
| 00 (default) | 2.75V | 2V _{RMS} (4 V _{RMS} supported in high swing mode) | 1V _{RMS} (2 V _{RMS} supported in high swing mode) | AVDD 3.3V Operation |
| 01 | 2.5V | 1.818V _{RMS} | 0.909V _{RMS} | AVDD 3.3V Operation |
| 10 | 1.375V | 1V _{RMS} | 0.5V _{RMS} | AVDD 1.8V Operation |
| 11 | Reserved | Reserved | Reserved | Reserved |

To achieve low power consumption, this audio reference block is powered down during the sleep or software shutdown modes as described in [Section 7.4](#). When exiting sleep mode, the audio reference block should be powered up by setting SLEEP_EXIT_VREF_EN (P0_R2_D[3]) to 1'b1. An internal fast-charge scheme helps the VREF pin settle to its steady-state voltage after the settling time (which is a function of the decoupling capacitor on the VREF pin). This time is approximately equal to 3.5ms when using a 1µF decoupling capacitor. If a higher-value decoupling capacitor is used on the VREF pin, the fast-charge setting must be reconfigured using the VREF_QCHG (P0_R2_D[5:4]) register bits, which support options of 3.5ms (default), 10ms, 50ms, or 100ms.

7.3.6 Programmable Microphone Bias

The device integrates a built-in, low-noise microphone bias pin that can be used in the system for biasing electret-condenser microphones or providing the supply to the MEMS analog or digital microphone. The integrated bias amplifier supports up to 5mA of load current that can be used for multiple microphones and is designed to provide a combination of high PSRR, low noise, and programmable bias voltages to allow the biasing to be fine-tuned for specific microphone combinations.

When using this MICBIAS pin for biasing or supplying to multiple microphones, avoid any common impedance on the board layout for the MICBIAS connection to minimize coupling across microphones. [Table 7-16](#) shows the available microphone bias programmable options.

Table 7-16. MICBIAS Programmable Settings

| P0_R77_D[3:2] : MICBIAS_VAL[1:0] | P0_R77_D[1:0] : VREF_FSCALE[1:0] | MICBIAS OUTPUT VOLTAGE |
|----------------------------------|----------------------------------|--------------------------------------|
| 00 (default) | 00 (default) | 2.75 V (same as the VREF output) |
| | 01 | 2.5 V (same as the VREF output) |
| | 10 | 1.375 V (same as the VREF output) |
| | 11 | Reserved (do not use these settings) |
| 01 | 00 (default) | 1.375 V (0.5 times the VREF output) |
| | 01 | 1.250 V (0.5 times the VREF output) |
| | 10 or 11 | Reserved (do not use these settings) |
| 10 | XX | Reserved (do not use these settings) |
| 11 | XX | Same as AVDD |

The microphone bias output can be powered on or powered off (default) by configuring the MICBIAS_PDZ (P0_R120_D[5]) register bit. Additionally, the device provides an option to configure the GPIOx or GPI1 pin to directly control the microphone bias output powering on or off. This feature is useful to control the microphone directly without engaging the host for I²C or SPI communication. The MICBIAS_PDZ (P0_R120_D[5]) register bit value is ignored if the GPIOx or GPI1 pin is configured to set the microphone bias on or off.

7.3.7 Digital PDM Microphone Record Channel

In addition to supporting analog microphones, the TAC5212 also interfaces to digital pulse-density-modulation (PDM) microphones and uses high-order and high-performance decimation filters to generate pulse code modulation (PCM) output data that can be transmitted on the audio serial interface to the host. The device supports up to four digital microphone recording channels (when the analog channels are not used). The device

can also support simultaneous recording on two analog and two digital microphone channels or one analog channel and three digital microphone channels.

The GPIOx, GPI1 and GPO1 pins can be configured for the PDM data lines (PDM DINx) and PDM Clock (PDMCLK) functions as per the Table 7-70 for the digital PDM microphone recording.

The device internally generates PDMCLK with a programmable frequency of either 6.144MHz, 3.072MHz, 1.536MHz, or 768kHz (for output data sample rates in multiples or submultiples of 48kHz) or 5.6448MHz, 2.8224MHz, 1.4112MHz, or 705.6kHz (for output data sample rates in multiples or submultiples of 44.1kHz) using the PDM_CLK_CFG[1:0] (P0_R53_D[7:6]) register bits. PDMCLK can be routed on the GPIOx and GPO1 pins using the respective configuration registers: GPIO1_CFG (P0_R10[7:4]), GPIO2_CFG (P0_R11[7:4]) and GPO1_CFG (P0_R12[7:4]). This clock can be connected to the external digital microphone device. Figure 7-25 shows a connection diagram of the digital PDM microphones.

Figure 7-25. Digital PDM Microphones Connection Diagram for the TAC5212

The single-bit output of the external digital microphone device can be connected to the GPI1 or GPIOx pin. The device supports two PDM data lines: PDM DIN1 and PDM DIN2 set through the registers PDM DIN1_SEL (P0_R19_D[3:2]) and PDM DIN2_SEL (P0_R19_D[1:0]). When using GPI1, make sure that the GPI1 function is enabled using the GPI1_CFG (P0_R13[1]). This single data line can be shared by two digital microphones to place their data on the opposite edge of PDMCLK. Internally, the device latches the steady value of the data on either the rising or falling edge of PDMCLK based on the configuration register bits set in PDM DIN1_EDGE (P0_R19_D[4]) and PDM DIN2_EDGE (P0_R19_D[5]). Figure 7-26 shows the digital PDM microphone interface timing diagram.

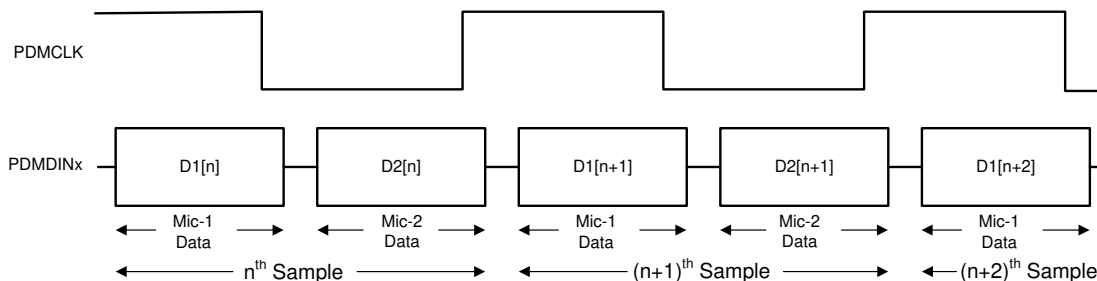

Figure 7-26. Digital PDM Microphone Protocol Timing Diagram

When the digital microphone is used for recording, the analog blocks of the respective ADC channel are powered down and bypassed for power efficiency. Channel 3 and channel 4 support only the digital microphone

interface. Use the PDM_CH1_SEL[1:0] (P0_R19_D[7]) and PDM_CH2_SEL[1:0] (P0_R19_D[6]) register bits to select the analog microphone or digital microphone for channel 1 to channel 2 respectively.

7.3.8 Incremental ADC (IADC) Mode

In the incremental ADC (IADC) mode user can convert the average value of the input, into a 24-bit code. This is useful for applications that need to sense a voltage rather than needing a continuous time domain capture.

The various configurations for the IADC mode can be set using IADC_CH_CFG (P0_R81) register. The IADC_MODE (P0_R81_D[6:5]) can be configured for single shot conversion or sequential conversion. In single shot conversion, the device enters into the conversion cycle when the user enables conversion. At the end of conversion, the IADC_ONESHOT_CONV_DONE_STS (P0_R81_D[2]) bit is set. The user can read the data register after this bit is set. In sequential conversion, the device keeps converting the input sequentially. The rate of conversion is dependent on the “SKIP”, “CONVERT” and “RESET” values set in the IADC_CFG (P0_R76) registers.

This operation has 3 distinct phases “SKIP”, “CONVERT” and “RESET”. In “SKIP” phase, the input is converted, however the output corresponding to the first “SKIP” number of cycles isn’t considered for final code generation. During “CONVERT” phase the ADC outputs are considered for final code generation. During “RESET” phase the various memory elements inside the ADC are reset.

The IADC inputs can also be configured as single-ended or differential using the ADC_CHx_CFG0 registers to configure the ADC_CHx_INSRC.

GPIOx or GP11 pins can be used by the user to begin the IADC mode through the IADC_CONVST_GPIO (P0_R21_D[5:4]) register for ease of control. In this case the setting of IADC_EN (P0_R81_D[7]) will be ignored.

For more details, refer the [Configuring and using the IADC Mode in TAx5x1x device application report](#).

7.3.9 Signal-Chain Processing

The TAC5212 signal chain is comprised of very low-noise, high-performance, and low-power analog blocks and highly flexible and programmable digital processing blocks. The high performance and flexibility combined with a compact package make the TAC5212 is optimized for a variety of end-equipments and applications that require multichannel audio capture and playback. [Section 7.3.9.1](#) and [Section 7.3.9.2](#) describes key components in ADC and DAC signal chain further.

7.3.9.1 ADC Signal-Chain

Figure 7-27 shows the key components of the record path signal chain.

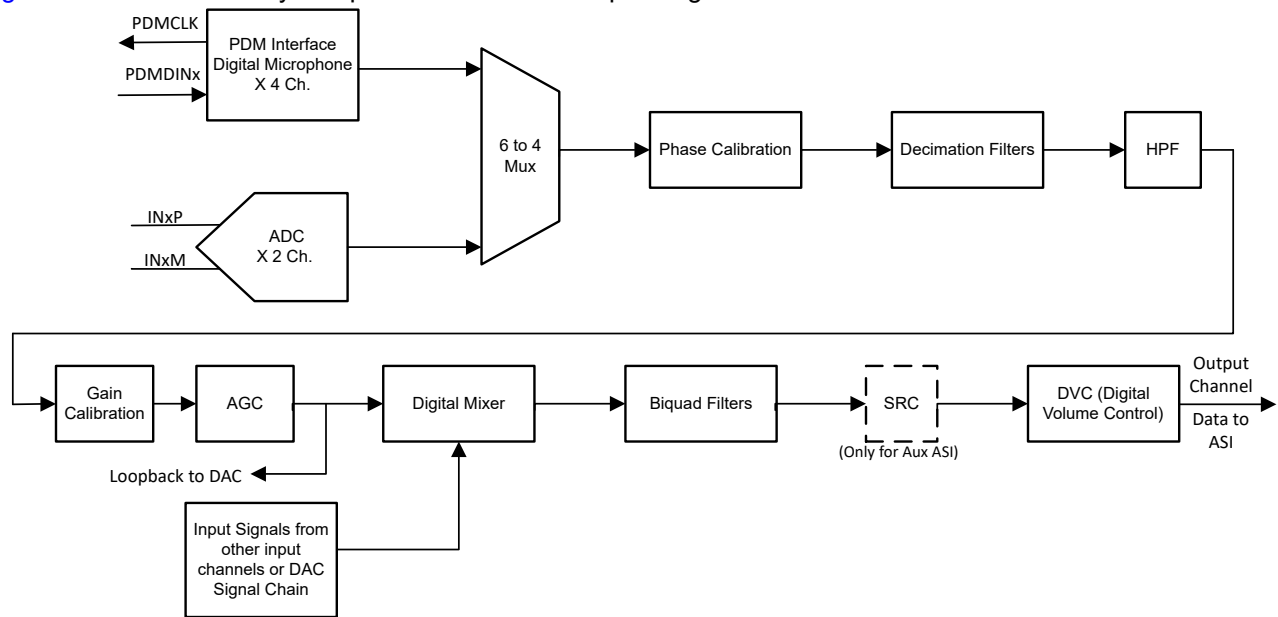

Figure 7-27. ADC Signal-Chain Processing Flowchart

The front-end ADC is very low noise, with a 119dB dynamic range performance. This low-noise and low-distortion, multibit, delta-sigma ADC enables the TAC5212 to record a far-field audio signal with very high fidelity, both in quiet and loud environments. Moreover, the ADC architecture has inherent antialias filtering with a high rejection of out-of-band frequency noise around multiple modulator frequency components. Therefore, the device prevents noise from aliasing into the audio band during ADC sampling. Further on in the signal chain, an integrated, high-performance multistage digital decimation filter sharply cuts off any out-of-band frequency noise with high stop-band attenuation.

The device also has an integrated programmable biquad filter that allows for custom low-pass, high-pass, or any other desired frequency shaping. Thus, the overall signal chain architecture removes the requirement to add external components for antialiasing low-pass filtering and thus saves drastically on the external system component cost and board space. See the [TAC5212 Integrated Analog Antialiasing Filter and Flexible Digital Filter application report](#) for further details.

The signal chain also consists of various highly programmable digital processing blocks such as phase calibration, gain calibration, high-pass filter, digital summer or mixer, biquad filters, synchronous sample rate converter, and volume control. The details of these processing blocks are discussed further in this section. The device also supports up to four digital PDM microphone recording channels when the analog recording channels are not used.

The desired input channels for recording can be enabled or disabled by using the CH_EN (P0_R118) register, and the output channels for the audio serial interface can be enabled or disabled by using the ASI_TX_CHx_CFG registers. In general, the device supports simultaneous power-up and power-down of all active channels for simultaneous recording. However, based on the application's needs, if some channels must be powered up or powered down dynamically when the other channel recording is on, then that use case is supported by setting the DYN_PUPD_CFG (P0_R119) register.

The device supports an input signal bandwidth up to 90kHz, which allows the high-frequency non-audio signal to be recorded by using a 216kHz (or higher) sample rate. Wide bandwidth mode can be enabled or disabled by setting ADC_CHx_BW_MODE bit (P0_R80_D[0] and P0_R85_D[0]). Wide bandwidth mode is supported only with the 40kΩ input impedance setting (Table 7-12) and not supported for the high swing mode (Section 7.3.5).

For sample rates of 48kHz or lower, the device supports all features and various programmable processing blocks. However, for sample rates higher than 48kHz, there are limitations in the number of simultaneous channel recordings and playback supported and the number of biquad filters and such. See the [TAC5212 Sampling Rates and Programmable Processing Blocks Supported application report](#) for further details.

7.3.9.1.1 6 to 4 Input Select Multiplexer (6:4 MUX)

The device supports up to two analog and up to four digital microphone channels and can support the simultaneous recording on four channels at a given time. The ADC input signal chain consists of a 6:4 Multiplexer to enable these combinations:

1. All 4 digital PDM channels.
2. 3 digital PDM channels and 1 analog channel.
3. 2 digital PDM channels and 2 analog channels

These combinations can be enabled using the INTF4_CFG (B0_P0_R19) register. More details on enabling the PDM channels are present in [Section 7.3.7](#).

7.3.9.1.2 Programmable Channel Gain and Digital Volume Control

The device has an independent programmable channel gain setting for each input channel that can be set to the appropriate value based on the maximum input signal expected in the system and the ADC VREF setting used (see the [Section 7.3.5](#)), which determines the ADC full-scale signal level.

The device has a programmable digital volume control with a range from –80dB to 47dB in steps of 0.5dB with the option to mute the channel recording. The digital volume control value can be changed dynamically while the ADC channel is powered up and recorded. During volume control changes, the soft ramp-up or ramp-down volume feature is used internally to avoid any audible artifacts. Soft-stepping can be entirely disabled using the ADC_DSP_DISABLE_SOFT_STEP (P0_R114_D[1]) register bit.

The digital volume control setting is independently available for each output channel, including the digital microphone record channel. However, the device also supports an option to gang up the volume control setting for all channels together using the channel 1 digital volume control setting, regardless if channel 1 is powered up or powered down. This gang-up can be enabled using the ADC_DSP_DVOL_GANG (P0_R114_D[0]) register bit.

[Table 7-17](#) shows the programmable options available for the digital volume control.

Table 7-17. Digital Volume Control (DVC) Programmable Settings

| P0_R82_D[7:0] : ADC_CH1_DVOL[7:0] | DVC SETTING FOR OUTPUT CHANNEL 1 |
|-----------------------------------|--|
| 0000 0000 = 0d | Output channel 1 DVC is set to mute |
| 0000 0001 = 1d | Output channel 1 DVC is set to –80dB |
| 0000 0010 = 2d | Output channel 1 DVC is set to –79.5dB |
| 0000 0011 = 3d | Output channel 1 DVC is set to –79dB |
| ... | ... |
| 1010 0000 = 160d | Output channel 1 DVC is set to –0.5dB |
| 1010 0001 = 161d (default) | Output channel 1 DVC is set to 0dB |
| 1010 0010 = 162d | Output channel 1 DVC is set to 0.5dB |
| ... | ... |
| 1111 1101 = 253d | Output channel 1 DVC is set to 46dB |
| 1111 1110 = 254d | Output channel 1 DVC is set to 46.5dB |
| 1111 1111 = 255d | Output channel 1 DVC is set to 47dB |

Similarly, the digital volume control setting for output channel 2 to channel 4 can be configured using the CH2_DVOL (P0_R87) to CH4_DVOL (P0_R95) register bits, respectively.

The internal digital processing engine soft ramps up the volume from a muted level to the programmed volume level when the channel is powered up, and the internal digital processing engine soft ramps down the volume from a programmed volume to mute when the channel is powered down. This soft-stepping of volume is done to prevent abruptly powering up and powering down the record channel. This feature can also be entirely disabled using the ADC_DSP_DISABLE_SOFT_STEP (P0_R114_D[1]) register bit.

The programmable channel digital volume control feature is not applicable if the PLL is turned off. For setting channel attenuation, user can configure this by using the programmable high pass filter coefficients as described in [Section 8.2.4](#).

7.3.9.1.3 Programmable Channel Gain Calibration

Along with the digital volume control, this device also provides programmable channel gain calibration. The gain of each channel can be finely calibrated or adjusted in steps of 0.1dB for a range of –0.8dB to 0.7dB gain error. This adjustment is useful when trying to match the gain across channels resulting from external components and microphone sensitivity. This feature, in combination with the regular digital volume control, allows the gains across all channels to be matched for a wide gain error range with a resolution of 0.1dB. [Table 7-18](#) shows the programmable options available for the channel gain calibration.

Table 7-18. Channel Gain Calibration Programmable Settings

| P0_R83_D[7:4] : ADC_CH1_FGAIN[3:0] | CHANNEL GAIN CALIBRATION SETTING FOR INPUT CHANNEL 1 |
|------------------------------------|--|
| 0000 = 0d | Input channel 1 gain calibration is set to –0.8dB |
| 0001 = 1d | Input channel 1 gain calibration is set to –0.7dB |
| ... | ... |
| 1000 = 8d (default) | Input channel 1 gain calibration is set to 0dB |
| ... | ... |
| 1110 = 14d | Input channel 1 gain calibration is set to 0.6dB |
| 1111 = 15d | Input channel 1 gain calibration is set to 0.7dB |

Similarly, the channel gain calibration setting for input channel 2 to channel 4 can be configured using the ADC_CH2_CFG3 (P0_R88) to ADC_CH4_CFG3 (P0_R96) register bits, respectively.

7.3.9.1.4 Programmable Channel Phase Calibration

In addition to the gain calibration, the phase delay in each record channel can be finely calibrated or adjusted in steps of one modulator clock cycle for a cycle range of 1 to 63 for the phase error. The modulator clock for analog and digital microphones is set independently. For analog microphones, it is the clock used for ADC MOD CLK, and is 3.072MHz (the output data sample rate is multiples or submultiples of 48kHz) or 2.8224MHz (the output data sample rate is multiples or submultiples of 44.1 kHz) in default configurations. For power savings, the ADC modulator clock can also be reduced to 1.536MHz (the output data sample rate is multiples or submultiples of 48kHz) or 1.4112MHz (the output data sample rate is multiples or submultiples of 44.1 kHz) by using ADC_CLK_BY2_MODE (B0_P78_D[7]) register bit. For the digital microphone use case, it is the clock used for PDM_CLK, and is also 3.072MHz (the output data sample rate is multiples or submultiples of 48kHz) or 2.8224MHz (the output data sample rate is multiples or submultiples of 44.1 kHz) in default configurations. User can configure the PDM_CLK using the PDM_CLK_CFG[1:0] (P0_R53_D[7:6]) register bits. The programmable channel phase calibration feature is very useful for many applications that must match the phase with fine resolution between each channel, including any phase mismatch across channels resulting from external components or microphones. [Table 7-19](#) shows the available programmable options for channel phase calibration when operating with default modulator clocks.

Table 7-19. Channel Phase Calibration Programmable Settings

| P0_R84_D[7:2] : ADC_CH1_PCAL[5:0] | CHANNEL PHASE CALIBRATION SETTINGS FOR INPUT CHANNEL 1 |
|-----------------------------------|--|
| 00 0000 = 0d (default) | No phase calibration |
| 00 0001 = 1d | Phase calibration delay is set to one cycle of the modulator clock |
| ... | ... |

Table 7-19. Channel Phase Calibration Programmable Settings (continued)

| P0_R84_D[7:2] : ADC_CH1_PCAL[5:0] | CHANNEL PHASE CALIBRATION SETTINGS FOR INPUT CHANNEL 1 |
|-----------------------------------|--|
| 11 1111 = 63d | Phase calibration delay is set to 63 cycles of the modulator clock |

Similarly, the channel phase calibration setting for input channel 2 to channel 4 can be configured using the ADC_CH2_PCAL (P0_R89_D[7:2]) to ADC_CH4_PCAL (P0_R97_D[7:2]) register bits, respectively.

By default, the phase calibration is enabled for both analog and digital microphone channels. This can be changed to only analog or only digital microphones through the PCAL_ANA_DIG_SEL (P0_R84_D[1:0]) register bits. When using analog input and PDM input together for simultaneous conversion, there is a limit on the available phase calibration options for the analog channels when analog and PDM clocks are different. When using ADC MOD CLK = 1.536MHz or 1.4112MHz and PDM_CLK = 6.144MHz or 5.6448MHz, phase calibration delays of only up to 16 cycles of the modulator clock are supported for the analog channels. When using ADC MOD CLK = 3.072MHz or 2.8224 and PDM_CLK = 6.144MHz or 5.6448MHz, phase calibration delays of only up to 32 cycles of the modulator clock are supported for the analog channels. When using ADC MOD CLK = 1.536MHz or 1.4112MHz and PDM_CLK = 3.072MHz or 2.8224MHz also, phase calibration delays of only up to 32 cycles of the modulator clock are supported for the analog channels.

7.3.9.1.5 Programmable Digital High-Pass Filter

To remove the DC offset component and attenuate the undesired low-frequency noise content in the record data, the device supports a programmable high-pass filter (HPF). The HPF is not a channel-independent filter setting but is globally applicable for all ADC channels. This HPF is constructed using the first-order infinite impulse response (IIR) filter and is efficient enough to filter out possible DC components of the signal. Table 7-20 shows the predefined -3dB cutoff frequencies available that can be set by using the ADC_DSP_HP_SEL[1:0] register bits of P0_R114_D[5:4]. Additionally, to achieve a custom -3dB cutoff frequency for a specific application, the device also allows the first-order IIR filter coefficients to be programmed when the HPF_SEL[1:0] register bits are set to 2'b00. Figure 7-28 illustrates the frequency response plot for the HPF filter.

Table 7-20. HPF Programmable Settings

| P0_R114_D[5:4] : ADC_DSP_HP_SEL L[1:0] | -3dB CUTOFF FREQUENCY SETTING | -3dB CUTOFF FREQUENCY AT 16kHz SAMPLE RATE | -3dB CUTOFF FREQUENCY AT 48-kHz SAMPLE RATE |
|--|-----------------------------------|--|---|
| 00 | Programmable 1st-order IIR filter | Programmable 1st-order IIR filter | Programmable 1st-order IIR filter |
| 01 (default) | $0.00002 \times f_s$ | 0.25 Hz | 1 Hz |
| 10 | $0.00025 \times f_s$ | 4 Hz | 12 Hz |
| 11 | $0.002 \times f_s$ | 32 Hz | 96 Hz |

Figure 7-28. HPF Filter Frequency Response Plot

D003

Equation 1 gives the transfer function for the first-order programmable IIR filter:

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{31} - D_1 z^{-1}} \quad (1)$$

The frequency response for this first-order programmable IIR filter with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the IIR coefficients in Table 7-21 to achieve the desired frequency response for high-pass filtering or any other desired filtering. If ADC_DSP_HP_SEL[1:0] is set to 2'b00, the host device must write these coefficient values for the desired frequency response before powering-up any ADC channel for recording. Table 7-21 shows the filter coefficients for the first-order IIR filter. For additional details on configuring the programmable coefficients, refer Section 8.2.

Table 7-21. 1st-Order IIR Filter Coefficients

| FILTER | FILTER COEFFICIENT | DEFAULT COEFFICIENT VALUE | COEFFICIENT REGISTER MAPPING |
|---|--------------------|---------------------------|------------------------------|
| Programmable 1st-order IIR filter (can be allocated to HPF or any other desired filter) | N ₀ | 0x7FFFFFFF | P10_R120-R123 |
| | N ₁ | 0x00000000 | P10_R124-R127 |
| | D ₁ | 0x00000000 | P11_R8-R11 |

7.3.9.1.6 Programmable Digital Biquad Filters

The device supports up to 12 programmable digital biquad filters available for ADC signal chain limited to 3/channel. These highly efficient filters achieve the desired frequency response. The TAC5212 also supports on-the-fly programmable Biquad filters for two-channel record use cases. In digital signal processing, a digital biquad filter is a second-order, recursive linear filter with two poles and two zeros. Equation 2 gives the transfer function of each biquad filter:

$$H(z) = \frac{N_0 + 2N_1 z^{-1} + N_2 z^{-2}}{2^{31} - 2D_1 z^{-1} - D_2 z^{-2}} \quad (2)$$

The frequency response for the biquad filter section with default coefficients is flat at a gain of 0dB (all-pass filter). The host device can override the frequency response by programming the biquad coefficients to achieve the desired frequency response for low-pass, high-pass, or any other desired frequency shaping. The programmable coefficients for the biquads are located in the Section 8.2.1 and Section 8.2.2. If biquad filtering is required, then the host device must write these coefficient values before powering up any ADC channels for recording. In two-channel use case, the TAC5212 also supports on-the-fly programmable filters. In this case, the device uses two banks of filters for one channel with a switch bit to perform the switch from one filter bank to the other. As described in Table 7-22, these biquad filters can be allocated for each output channel based on the ADC_DSP_BQ_CFG[1:0] register setting of P0_R114_D[3:2]. By setting ADC_DSP_BQ_CFG[1:0] to 2'b00, the biquad filtering for all record channels is disabled and the host device can choose this setting if no additional filtering is required for the system application. See the [TAC5x1x and TAC5x1x-Q1 Programmable Biquad Filters - Configuration and Applications application report](#) for further details.

Table 7-22. Biquad Filter Allocation to the Record Output Channel

| PROGRAMMABLE BIQUAD FILTER | RECORD OUTPUT CHANNEL ALLOCATION USING P0_R114_D[3:2] REGISTER SETTING | | |
|----------------------------|--|---|--|
| | ADC_DSP_BQ_CFG[1:0] = 2'b01 (1 Biquad per Channel) | ADC_DSP_BQ_CFG[1:0] = 2'b10 (Default) (2 Biquads per Channel) | ADC_DSP_BQ_CFG[1:0] = 2'b11 (3 Biquads per Channel) |
| Biquad filter 1 | Allocated to output channel 1 | Allocated to output channel 1 | Allocated to output channel 1 |
| Biquad filter 2 | Allocated to output channel 2 | Allocated to output channel 2 | Allocated to output channel 2 |
| Biquad filter 3 | Allocated to output channel 3 | Allocated to output channel 3 | Allocated to output channel 3 |
| Biquad filter 4 | Allocated to output channel 4 | Allocated to output channel 4 | Allocated to output channel 4 |
| Biquad filter 5 | Not used | Allocated to output channel 1 | Allocated to output channel 1 |

Table 7-22. Biquad Filter Allocation to the Record Output Channel (continued)

| PROGRAMMABLE BIQUAD FILTER | RECORD OUTPUT CHANNEL ALLOCATION USING P0_R114_D[3:2] REGISTER SETTING | | |
|----------------------------|--|---|--|
| | ADC_DSP_BQ_CFG[1:0] = 2'b01 (1 Biquad per Channel) | ADC_DSP_BQ_CFG[1:0] = 2'b10 (Default) (2 Biquads per Channel) | ADC_DSP_BQ_CFG[1:0] = 2'b11 (3 Biquads per Channel) |
| Biquad filter 6 | Not used | Allocated to output channel 2 | Allocated to output channel 2 |

| Biquad filter 6 | P8_R108-R127 | Biquad filter 12 | P9_R108-R127 |

7.3.9.1.7 Programmable Channel Summer and Digital Mixer

For applications that require an even higher SNR than that supported for each channel, the device's digital summing mode can be used. In this mode, the digital record data are summed up across the channel with an equal weightage factor, which helps in reducing the effective record noise. The device supports a fully programmable mixer feature that can mix the various input channels with their custom programmable scale factor to generate the final output channels. Figure 7-29 shows a block diagram that describes the mixer 1 operation to generate output channel 1. The programmable coefficients for the mixer operation are located in the Section 8.2.3. The co-efficient of programmable mixer range starts from 7FFFFFFF to FFFFFFFF(-1 to +1), where 7FFFFFFF = +1, FFFFFFFF = -1 and 00000000 = 0.

Figure 7-29. Programmable Digital Mixer Block Diagram

A similar mixer operation is performed by mixer 2, mixer 3, and mixer 4 to generate output channel 2, channel 3, and channel 4, respectively. TI recommends using the PPC3 GUI for configuring the programmable coefficients settings; for more details see the [Mixer Configuration for TAC5x1x and TAC5x1x-Q1 CODECs](#) and the [PurePath™ console graphical development suite](#). Additional details on the configurations can be found in the [Using the TA5x1x Programmable Digital Channel Mixer](#) application report.

7.3.9.1.8 Configurable Digital Decimation Filters

The device record channel includes a high dynamic range and a built-in digital decimation filter to process the oversampled data from the multibit delta-sigma ($\Delta\Sigma$) modulator to generate digital data at the same Nyquist sampling rate as the FSYNC rate. As illustrated in Figure 7-27, this decimation filter can also be used for processing the oversampled PDM stream from the digital microphone. The decimation filter can be chosen from four different types, depending on the required frequency response, group delay, power consumption, and phase linearity requirements for the target application. The selection of the decimation filter option can be done by configuring the ADC_DSP_DECI_FILTER (P0_R114_D[7:6]) register bits. Low power filter can be configured by setting ADC_LOW_PWR_FILTER (P0_R78_D[2]) bit. Table 7-24 shows the configuration register setting for the decimation filter mode selection for the record channel. This makes them suitable for a wide variety of audio applications.

Table 7-24. Decimation Filter Mode Selection for the Record Channel

| P0_R78_D[2] : ADC_LOW_PWR_FILTER | P0_R114_D[7:6] : ADC_DSP_DECI_FILTER[1:0] | DECIMATION FILTER MODE SELECTION |
|-------------------------------------|--|---|
| 0 | 00 (default) | Linear phase filters are used for the decimation |
| 0 | 01 | Low latency filters are used for the decimation |
| 0 | 10 | Ultra-low latency filters are used for the decimation |
| 0 | 11 | Reserved (do not use this setting) |
| 1 | x | Low power filters are used for the decimation |

The following sections describe the filter response for the different latency options and samples rates.

7.3.9.1.8.1 Linear-phase filters

The linear-phase decimation filters are the default filters set by the device and can be used for all applications that require a perfect linear phase with zero-phase deviation within the pass-band specification of the filter. The filter performance specifications and various plots for all supported output sampling rates are listed in this section.

7.3.9.1.8.1.1 Sampling Rate: 8kHz or 7.35kHz

Figure 7-30 and Figure 7-31 respectively show the magnitude response and the pass-band ripple for this decimation filter with a sampling rate of 8kHz or 7.35kHz, Table 7-25 and lists its specifications.

Table 7-25. Linear-phase Decimation Filter Specifications

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------------------|---|-------|-----|------|------|
| Pass-band ripple | Frequency range is 0 to $0.454 \times f_S$ | -0.04 | | 0.04 | dB |
| Stop-band attenuation | Frequency range is $0.6 \times f_S$ to $4 \times f_S$ | 80.2 | | | dB |
| | Frequency range is $4 \times f_S$ onwards | 84.7 | | | |

Table 7-25. Linear-phase Decimation Filter Specifications (continued)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------|--|-----|------|-----|---------|
| Group delay or latency | Frequency range is 0 to $0.454 \times f_S$ | | 16.1 | | $1/f_S$ |

7.3.9.1.8.1.2 Sampling Rate: 16kHz or 14.7kHz

Figure 7-32 and Figure 7-33 respectively show the magnitude response and the pass-band ripple for this decimation filter with a sampling rate of 16kHz or 14.7kHz, and Table 7-26 lists its specifications.

**Figure 7-32. Linear-phase Decimation Filter Magnitude Response****Figure 7-33. Linear-phase Decimation Filter Pass-Band Ripple****Table 7-26. Linear-phase Decimation Filter Specifications**

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------|---|-------|------|------|---------|

7.3.9.1.8.2 Low-latency Filters

For applications where low latency with minimal phase deviation (within the audio band) is critical, the low-latency decimation filters on the TAC5212 can be used. The device supports these filters with a group delay of approximately seven samples with an almost linear phase response within the $0.376 \times f_S$ frequency band. This section provides the filter performance specifications and various plots for all supported output sampling rates for the low-latency filters.

7.3.9.1.8.2.1 Sampling Rate: 24kHz or 22.05kHz

Figure 7-48 shows the magnitude response and Figure 7-49 shows the pass-band ripple and phase deviation for this decimation filter with a sampling rate of 24kHz or 22.05kHz. Table 7-34 lists its specifications.

Figure 7-48. Low-latency Decimation Filter Magnitude Response

7.3.9.1.8.3 Ultra Low-latency Filters

For applications where ultra low latency with minimal phase deviation (within the audio band) is critical, the ultra low-latency decimation filters on the TAC5212 can be used. The device supports these filters with a group delay of approximately four samples with a fair phase response within the $0.325 \times f_S$ frequency band. This section provides the filter performance specifications and various plots for all supported output sampling rates for the ultra low-latency filters.

7.3.9.1.8.3.1 Sampling Rate: 24kHz or 22.05kHz

Figure 7-58 shows the magnitude response and Figure 7-59 shows the pass-band ripple and phase deviation for this decimation filter with a sampling rate of 24kHz or 22.05kHz. Table 7-39 lists its specifications.

Figure 7-58. Ultra Low-latency Decimation Filter Magnitude Response

| Phase deviation | Frequency range is 0 to $0.325 \times f_S$ | -6.8 | | 9.8 | Degrees |

7.3.9.1.9 Automatic Gain Controller (AGC)

The device includes an automatic gain controller (AGC) for ADC recording. As shown in Figure 7-68, the AGC can be used to maintain a nominally constant output level when recording speech. Instead of manually setting the channel gain in AGC mode, the circuitry automatically adjusts the channel gain when the input signal becomes overly loud or very weak, such as when a person speaking into a microphone moves closer to or farther from the microphone. The AGC algorithm has several programmable parameters, including target level, maximum gain allowed, attack and release (or decay) time constants, and noise thresholds that allow the algorithm to be fine-tuned for any particular application. These are part of the programmable coefficients of the device for flexibility and can be configured using the registers in Section 8.2.12 and Section 8.2.13.

Figure 7-68. AGC Characteristics

The target level (AGC_LVL) represents the nominal approximate output level at which the AGC attempts to hold the ADC output signal level. The TAC5212 allows programming of different target levels. The target level is recommended to be set with enough margin to prevent clipping when loud sounds occur. For further details on the AGC various configurable parameter and application use, see [Using the Automatic Gain Controller \(AGC\) in TAx5x1x Family application report](#). TI recommends using the PPC3 GUI for configuring the programmable coefficients settings; for more details see the [TAC5212EVM-PDK Evaluation module user's guide](#) and the [PurePath™ console graphical development suite](#).

7.3.9.1.10 Voice Activity Detection (VAD)

The TAC5212 supports voice activity detection (VAD) mode as part of low power activity detection (LPAD) schemes. In this mode, the TAC5212 continuously monitors one of the input channels for voice detection. The device consumes low quiescent current from the AVDD supply in this mode. This feature can be enabled by setting VAD_EN (P0_R120_D[2]) to 1'b1. On detecting voice activity, the TAC5212 can alert the host through an interrupt or auto wake up and start recording based on the I²C programmed configuration. This alert can be configured through the LPAD_MODE (P1_R30_D[7:6]) register bits.

This feature is supported on both the analog and digital microphone interfaces. For lowest power VAD, the digital microphone interface is recommended. The input channel for the VAD can be selected by setting the LPAD_CH_SEL (P1_R30_D[5:4]) register bits to an appropriate value. See the [How to use the Voice Activity Detection in the TAx511x and TAx521x application report](#) for further details.

7.3.9.1.11 Ultrasonic Activity Detection (UAD)

The TAC5212 supports ultrasonic activity detection (UAD) mode as part of low power activity detection (LPAD) schemes. In this mode, the TAC5212 continuously monitors one of the input channels for signals in the ultrasonic frequency band. The device consumes low quiescent current from the AVDD supply in this mode. This feature can be enabled by setting UAD_EN (P0_R120_D[3]) to 1'b1. On detecting ultrasonic activity, the TAC5212 can alert the host through an interrupt or auto wake up and start recording based on the I²C programmed configuration. This alert can be configured through the LPAD_MODE (P1_R30_D[7:6]) register bits.

This feature is supported on both the analog and digital microphone interfaces. For lowest power UAD, the digital microphone interface is recommended. The input channel for the UAD can be selected by setting the LPAD_CH_SEL (P1_R30_D[5:4]) register bits to an appropriate value. See the [How to use the Ultrasonic Activity Detection in the TAx511x and TAx521x](#) for further details.

7.3.9.2 DAC Signal-Chain

Figure 7-69 shows the key components of the playback signal chain.

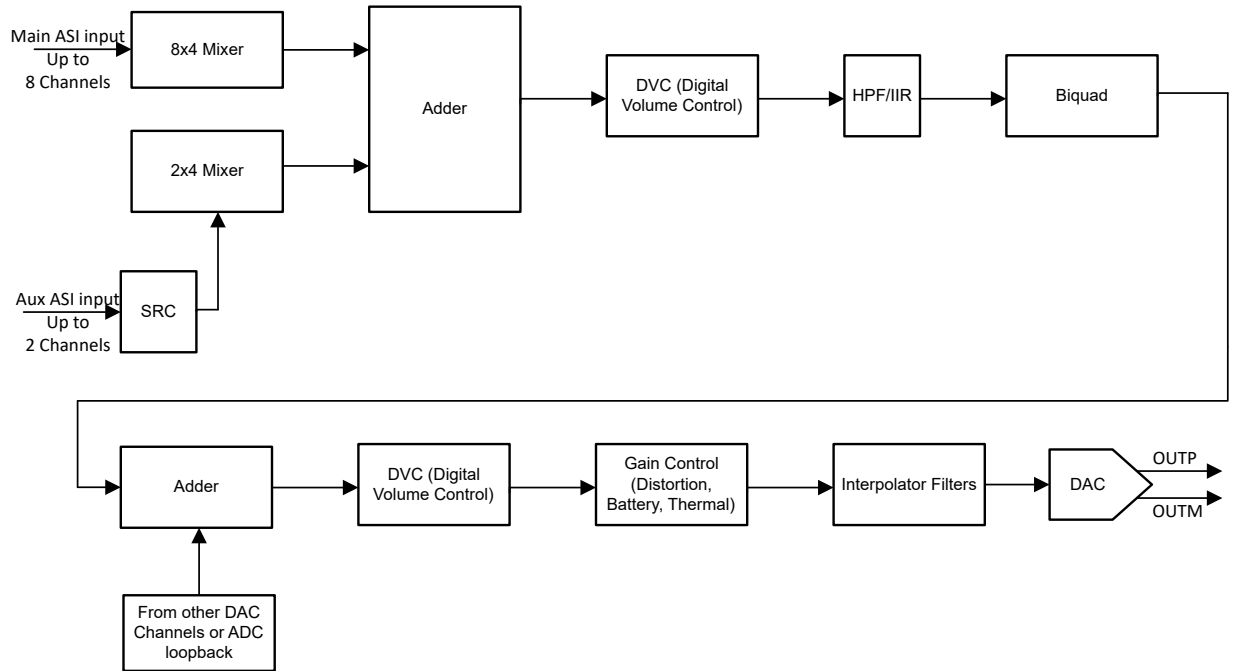

Figure 7-69. DAC Signal-Chain Processing Flowchart

The DAC signal chain offers a highly flexible low-noise playback path for low-noise and high-fidelity audio applications. This low-noise and low-distortion, multibit, delta-sigma DAC enables the TAC5212 to achieve 120dB dynamic range in very low power. Moreover, the DAC architecture has inherent antialias filtering with a high rejection of out-of-band frequency noise around multiple modulator frequency components. Therefore, the device prevents noise from aliasing into the audio band. Further on in the signal chain, an integrated, high-performance multistage digital interpolation filter sharply cuts off any out-of-band frequency noise with high stop-band attenuation.

The signal chain also consists of various highly programmable digital processing blocks such as biquad filters, phase calibration, gain calibration, high-pass filter, digital summer or mixer, synchronous sample rate converter, distortion limiter, thermal foldback, brownout prevention, and volume control. The details of these processing blocks are discussed further in this section. The device also supports up to four-channel single-ended output modes and an analog bypass option from ADC input to DAC output.

The output channels for playback can be enabled or disabled by using the CH_EN (P0_R118) register, and the input channels for the audio serial interface can be enabled or disabled by using the PASI_RX_CHx_CFG or SASI_RX_CHx_CFG bits. The device supports simultaneous power-up and power-down of all active channels for simultaneous playback. However, based on the application needs, if some channels must be powered-up or powered-down dynamically when the other channel playback is on, then that use case is supported by setting the DYN_PUPD_CFG (P0_R119) register.

The device supports multiple data mixing options where up to 8 Input Channels from Main ASI, 2 Input Channels from Aux ASI, ADC loopback data, and tone generator can be mixed with flexible gain options for each path before playback on DAC output. By default, these mixers are disabled and channels are configured for only one channel of data. Mixers can be configured by setting ASI_DIN_Mixers programmable coefficient registers described in [Section 8.2.7](#).

The device supports an output signal bandwidth of up to 90kHz, which allows the high-frequency non-audio signal to be played by using a 216kHz (or higher) sample rate. Wideband mode can be enabled or disabled by using the DAC_CHx_BW_Mode bit (P0_R101_D[0], P0_R108_D[0]).

For sample rates of 48kHz or lower, the device supports all features and various programmable processing blocks. However, for sample rates higher than 48kHz, there are limitations in the number of simultaneous channel recordings and playback supported and the number of biquad filters and such. See the [TAC5212 Sampling Rates and Programmable Processing Blocks Supported application report](#) for further details.

7.3.9.2.1 Programmable Channel Gain and Digital Volume Control

The device has an independent programmable channel gain setting for each output channel that can be set to the appropriate value based on the maximum input signal expected in the system. This can be done by configuring OUT1x_LVL_CTRL and OUT2x_LVL_CTRL bits. Coarse gain configuration from -12dB to +12dB is available with these controls in steps of 6dB.

The device has a programmable digital volume control with a range from -100dB to 27dB in steps of 0.5dB with the option to mute the channel recording. The digital volume control value can be changed dynamically while the DAC channel is powered-up and playing. During volume control changes, the soft ramp-up or ramp-down volume feature is used internally to avoid any audible artifacts. Soft-stepping can be entirely disabled using the DAC_DSP_DISABLE_SOFT_STEP (P0_R115_D[1]) register bit.

The digital volume control setting is independently available for each of the 4 single-ended output channels. In the case of 2-Channel Differential DAC, only settings for DAC_CH1A and DAC_CH2A are applicable. The device also supports an option to gang up the volume control setting for all channels together using the channel 1A digital volume control setting, regardless if channel 1A is powered up or powered down. This gang-up can be enabled using the DAC_DSP_DVOL_GANG (P0_R115_D[0]) register bit.

Table 7-44 shows the programmable options available for the digital volume control.

Table 7-44. Digital Volume Control (DVC) Programmable Settings

| P0_R103_D[7:0] : DAC_CH1A_DVOL[7:0] | DVC SETTING FOR OUTPUT CHANNEL 1A |
|-------------------------------------|--|
| 0000 0000 = 0d | Output channel 1 DVC is set to mute |
| 0000 0001 = 1d | Output channel 1 DVC is set to -100dB |
| 0000 0010 = 2d | Output channel 1 DVC is set to -99.5dB |
| 0000 0011 = 3d | Output channel 1 DVC is set to -99dB |
| ... | ... |
| 1100 1000 = 200d | Output channel 1 DVC is set to -0.5dB |
| 1100 1001 = 201d (default) | Output channel 1 DVC is set to 0dB |
| 1100 1010 = 202d | Output channel 1 DVC is set to 0.5dB |
| ... | ... |
| 1111 1101 = 253d | Output channel 1 DVC is set to 26dB |
| 1111 1110 = 254d | Output channel 1 DVC is set to 26.5dB |
| 1111 1111 = 255d | Output channel 1 DVC is set to 27dB |

Similarly, the digital volume control setting for output channels 1B, 2A, and 2B can be configured using the CH1B_DVOL (P0_R103) to CH2B_DVOL (P0_R112) register bits, respectively.

The internal digital processing engine soft ramps up the volume from a muted level to the programmed volume level when the channel is powered up, and the internal digital processing engine soft ramps down the volume from a programmed volume to mute when the channel is powered down. This soft-stepping of volume is done to prevent abruptly powering up and powering down the playback channel which can cause audible artifacts. This feature can also be entirely disabled using the DAC_DSP_DISABLE_SOFT_STEP (P0_R115_D[1]) register bit.

7.3.9.2.2 Programmable Channel Gain Calibration

Along with the digital volume control, this device also provides programmable channel gain calibration. The gain of each channel can be finely calibrated or adjusted in steps of 0.1dB for a range of -0.8dB to 0.7dB gain error. This adjustment is useful when trying to match the gain across channels resulting from transducer sensitivity and load impedance mismatch. This feature, in combination with the regular digital volume control, allows the gains

across all channels to be matched for a wide gain error range with a resolution of 0.1dB. [Table 7-45](#) shows the programmable options available for the channel gain calibration.

Table 7-45. DAC Channel Gain Calibration Programmable Settings

| P0_R104_D[7:4] : DAC_CH1A_FGAIN[3:0] | CHANNEL GAIN CALIBRATION SETTING FOR INPUT CHANNEL 1A |
|--------------------------------------|---|
| 0000 = 0d | Input channel 1 gain calibration is set to -0.8 dB |
| 0001 = 1d | Input channel 1 gain calibration is set to -0.7 dB |
| ... | ... |
| 1000 = 8d (default) | Input channel 1 gain calibration is set to 0 dB |
| ... | ... |
| 1110 = 14d | Input channel 1 gain calibration is set to 0.6 dB |
| 1111 = 15d | Input channel 1 gain calibration is set to 0.7 dB |

Similarly, the channel gain calibration setting for input channel 1B, 2A and 2B can be configured using the DAC_CH1B_CFG1 (P0_R106), DAC_CH2A_CFG1 (P0_R111), and DAC_CH2B_CFG1 (P0_R113) register bits, respectively.

7.3.9.2.3 Programmable Digital High-Pass Filter

To remove the DC offset component and attenuate the undesired low-frequency noise content in the record data, the device supports a programmable high-pass filter (HPF). The HPF is not a channel-independent filter setting but is globally applicable for all DAC channels. This HPF is constructed using the first-order infinite impulse response (IIR) filter, and is efficient enough to filter out possible DC components of the signal. [Table 7-46](#) shows the predefined -3dB cutoff frequencies available that can be set by using the DAC_DSP_HPF_SEL[1:0] register bits of P0_R115. Additionally, to achieve a custom -3dB cutoff frequency for a specific application, the device also allows the first-order IIR filter coefficients to be programmed when the DAC_DSP_HPF_SEL[1:0] register bits are set to 2'b00. [Figure 7-70](#) illustrates a frequency response plot for the HPF filter.

Table 7-46. HPF Programmable Settings

| P0_R115_D[5:4] : DAC_DSP_HPF_SEL[1:0] | -3dB CUTOFF FREQUENCY SETTING | -3dB CUTOFF FREQUENCY AT 16kHz SAMPLE RATE | -3dB CUTOFF FREQUENCY AT 48-kHz SAMPLE RATE |
|--|-----------------------------------|---|--|
| 00 | Programmable 1st-order IIR filter | Programmable 1st-order IIR filter | Programmable 1st-order IIR filter |
| 01 (default) | $0.00002 \times f_s$ | 0.25 Hz | 1 Hz |
| 10 | $0.00025 \times f_s$ | 4 Hz | 12 Hz |
| 11 | $0.002 \times f_s$ | 32 Hz | 96 Hz |

Figure 7-70. HPF Filter Frequency Response Plot

D003

Equation 3 gives the transfer function for the first-order programmable IIR filter:

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{31} - D_1 z^{-1}} \quad (3)$$

The frequency response for this first-order programmable IIR filter with default coefficients is flat at a gain of 0dB (all-pass filter). The host device can override the frequency response by programming the IIR coefficients in Table 7-47 to achieve the desired frequency response for high-pass filtering or any other desired filtering. If DAC_DSP_HPF_SEL[1:0] are set to 2'b00, the host device must write these coefficients values for the desired frequency response before powering-up any DAC channel for playback. Table 7-47 shows the filter coefficients for the first-order IIR filter. For additional details on configuring the programmable coefficients, refer Section 8.2.

Table 7-47. 1st-Order IIR Filter Coefficients

| FILTER | FILTER COEFFICIENT | DEFAULT COEFFICIENT VALUE | COEFFICIENT REGISTER MAPPING |
|---|--------------------|---------------------------|------------------------------|
| Programmable 1st-order IIR filter (can be allocated to HPF or any other desired filter) | N ₀ | 0x7FFFFFFF | P17_R120-R124 |
| | N ₁ | 0x00000000 | P17_R125-R128 |
| | D ₁ | 0x00000000 | P18_R8-R11 |

7.3.9.2.4 Programmable Digital Biquad Filters

The device supports up to 12 programmable digital biquad filters available for DAC signal chain limited to 3/channel. These highly efficient filters achieve the desired frequency response. The TAC5212 also supports on the fly programmable Biquad filters for two channel playback use case. In digital signal processing, a digital biquad filter is a second-order, recursive linear filter with two poles and two zeros. Equation 2 gives the transfer function of each biquad filter:

$$H(z) = \frac{N_0 + 2N_1 z^{-1} + N_2 z^{-2}}{2^{31} - 2D_1 z^{-1} - D_2 z^{-2}} \quad (4)$$

The frequency response for the biquad filter section with default coefficients is flat at a gain of 0dB (all-pass filter). The host device can override the frequency response by programming the biquad coefficients to achieve the desired frequency response for a low-pass, high-pass, or any other desired frequency shaping. The programmable coefficients for the biquads are located in the Section 8.2.5 and Section 8.2.6. If biquad filtering is required, then the host device must write these coefficients values before powering up any ADC channels for recording or DAC channels for playback. In two channel use case, the TAC5212 also supports on the fly programmable filters. In this case, the device uses two banks of filters for one channel with a switch bit to

perform the switch from one filter bank to the other. As described in [Table 7-48](#), these biquad filters can be allocated for each output channel based on the DAC_DSP_BQ_CFG[1:0] register setting of P0_R115. By setting DAC_DSP_BQ_CFG[1:0] to 2'b00, the biquad filtering for all playback channels are disabled and the host device can choose this setting if no additional filtering is required for the system application. See the [TAC5x1x and TAC5x1x-Q1 Programmable Biquad Filters - Configuration and Applications application report](#) for further details.

Table 7-48. Biquad Filter Allocation to the Record Output Channel

| PROGRAMMABLE BIQUAD FILTER | PLAYBACK OUTPUT CHANNEL ALLOCATION USING P0_R115_D[3:2] REGISTER SETTING | | |
|----------------------------|--|---|--|
| | DAC_DSP_BQ_CFG[1:0] = 2'b01 (1 Biquad per Channel) | DAC_DSP_BQ_CFG[1:0] = 2'b10 (Default) (2 Biquads per Channel) | DAC_DSP_BQ_CFG[1:0] = 2'b11 (3 Biquads per Channel) |
| Biquad filter 1 | Allocated to output channel 1 | Allocated to output channel 1 | Allocated to output channel 1 |
| Biquad filter 2 | Allocated to output channel 2 | Allocated to output channel 2 | Allocated to output channel 2 |
| Biquad filter 3 | Allocated to output channel 3 | Allocated to output channel 3 | Allocated to output channel 3 |
| Biquad filter 4 | Allocated to output channel 4 | Allocated to output channel 4 | Allocated to output channel 4 |
| Biquad filter 5 | Not used | Allocated to output channel 1 | Allocated to output channel 1 |
| Biquad filter 6 | Not used | Allocated to output channel 2 | Allocated to output channel 2 |
| Biquad filter 7 | Not used | Allocated to output channel 3 | Allocated to output channel 3 |
| Biquad filter 8 | Not used | Allocated to output channel 4 | Allocated to output channel 4 |
| Biquad filter 9 | Not used | Not used | Allocated to output channel 1 |
| Biquad filter 10 | Not used | Not used | Allocated to output channel 2 |
| Biquad filter 11 | Not used | Not used | Allocated to output channel 3 |
| Biquad filter 12 | Not used | Not used | Allocated to output channel 4 |

[Table 7-49](#) shows the biquad filter coefficients mapping to the register space.

Table 7-49. Biquad Filter Coefficients Register Mapping

| PROGRAMMABLE BIQUAD FILTER | BIQUAD FILTER COEFFICIENTS REGISTER MAPPING | PROGRAMMABLE BIQUAD FILTER | BIQUAD FILTER COEFFICIENTS REGISTER MAPPING |
|----------------------------|---|----------------------------|---|
| Biquad filter 1 | P16_R8-R27 | Biquad filter 7 | P17_R8-R27 |
| Biquad filter 2 | P16_R28-R47 | Biquad filter 8 | P17_R28-R47 |
| Biquad filter 3 | P16_R48-R67 | Biquad filter 9 | P17_R48-R67 |
| Biquad filter 4 | P16_R68-R87 | Biquad filter 10 | P17_R68-R87 |
| Biquad filter 5 | P16_R88-R107 | Biquad filter 11 | P17_R88-R107 |
| Biquad filter 6 | P16_R108-R127 | Biquad filter 12 | P17_R108-R127 |

7.3.9.2.5 Programmable Digital Mixer

The device supports a fully programmable mixer feature that can mix the various input channels with their custom programmable scale factor to generate the final output channels. [Figure 7-29](#) shows a block diagram that describes the mixer 1 operation to generate output channel 1. The programmable coefficients for the mixer operation are located in the section.

A similar mixer operation is performed by mixer 2, mixer 3, and mixer 4 to generate output channel 2, channel 3, and channel 4, respectively.

7.3.9.2.6 Configurable Digital Interpolation Filters

The device playback channel includes a high dynamic range, built-in digital interpolation filter to process the input data stream to generate digital data stream for multibit delta-sigma ($\Delta\Sigma$) modulator. The interpolation filter can be chosen from four different types, depending on the required frequency response, group delay, power consumption, and phase linearity requirements for the target application. The selection of the interpolation filter option can be done by configuring the DAC_DSP_INTX_FILT (P0_R115_D[7:6]) register bits. Low power filter can be configured by setting DAC_LOW_PWR_FILT (P0_R79_D[2]) bit. Table 7-50 shows the configuration register setting for the decimation filter mode selection for the record channel.

Table 7-50. Interpolation Filter Mode Selection for the Playback Channel

| P0_R79_D[2] : DAC_LOW_PWR_FILT | P0_R115_D[7:6] : DAC_DSP_INTX_FILT[1:0] | INTERPOLATION FILTER MODE SELECTION |
|-----------------------------------|--|--|
| 0 | 00 (default) | Linear phase filters are used for the interpolation |
| 0 | 01 | Low latency filters are used for the interpolation |
| 0 | 10 | Ultra-low latency filters are used for the interpolation |
| 0 | 11 | Reserved (do not use this setting) |
| 1 | XX | Low power filters are used for the interpolation |

7.3.9.2.6.1 Linear-phase filters

The linear-phase interpolation filters are the default filters set by the device and can be used for all applications that require a perfect linear phase with zero-phase deviation within the pass-band specification of the filter. The filter performance specifications and various plots for all supported output sampling rates are listed in this section.

7.3.9.2.6.1.1 Sampling Rate: 8kHz or 7.35kHz

Figure 7-71 and Figure 7-72 respectively show the magnitude response and the pass-band ripple for this interpolation filter with a sampling rate of 8kHz or 7.35kHz, and Table 7-51 lists its specifications.

Figure 7-71. Linear-phase Interpolation Filter Magnitude Response

Figure 7-72. Linear-phase Interpolation Filter Pass-Band Ripple

Table 7-51. Linear-phase Interpolation Filter Specifications

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------|---|-------|-----|------|---------|
| Pass-band ripple | Frequency range is 0 to $0.455 \times f_s$ | -0.17 | | 0.03 | dB |
| Stop-band attenuation | Frequency range is $0.6 \times f_s$ to $4 \times f_s$ | 80.4 | | | dB |
| | Frequency range is $4 \times f_s$ to $7.431 \times f_s$ | 86.9 | | | |
| Group delay or latency | Frequency range is 0 to $0.455 \times f_s$ | | 16 | | $1/f_s$ |

7.3.9.2.6.1.2 Sampling Rate: 16kHz or 14.7kHz

Figure 7-73 and Figure 7-74 respectively show the magnitude response and the pass-band ripple for this interpolation filter with a sampling rate of 16kHz or 14.7kHz, and Table 7-52 lists its specifications.

Figure 7-73. Linear-phase Interpolation Filter Magnitude Response

Figure 7-74. Linear-phase Interpolation Filter Pass-Band Ripple

Table 7-52. Linear-phase Interpolation Filter Specifications

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------|---|-------|-----|------|---------|
| Pass-band ripple | Frequency range is 0 to $0.455 \times f_s$ | -0.17 | | 0.03 | dB |
| Stop-band attenuation | Frequency range is $0.6 \times f_s$ to $4 \times f_s$ | 80.4 | | | dB |
| | Frequency range is $4 \times f_s$ to $7.431 \times f_s$ | 86.9 | | | |
| Group delay or latency | Frequency range is 0 to $0.455 \times f_s$ | | 16 | | $1/f_s$ |

7.3.9.2.6.1.3 Sampling Rate: 24kHz or 22.05kHz

Figure 7-75 and Figure 7-76 respectively show the magnitude response and the pass-band ripple for this interpolation filter with a sampling rate of 24kHz or 22.05kHz, and Table 7-53 lists its specifications.

Figure 7-75. Linear-phase Interpolation Filter Magnitude Response

Figure 7-76. Linear-phase Interpolation Filter Pass-Band Ripple

|------------------------|---|-------|------|------|---------|
| Pass-band ripple | Frequency range is 0 to $0.258 \times f_s$ | -0.67 | | 0.67 | dB |
| Stop-band attenuation | Frequency range is $0.391 \times f_s$ to $1 \times f_s$ | 77.7 | | | dB |
| | Frequency range is $1 \times f_s$ to $1.612 \times f_s$ | 81.1 | | | |
| Group delay or latency | Frequency range is 0 to $0.258 \times f_s$ | | 10.7 | | $1/f_s$ |

7.3.9.2.6.1.8 Sampling Rate: 384kHz or 352.8kHz

Figure 7-85 and Figure 7-86 respectively show the magnitude response and the pass-band ripple for this interpolation filter with a sampling rate of 384kHz or 352.8kHz, and Table 7-58 lists its specifications.

Figure 7-85. Linear-phase Interpolation Filter Magnitude Response

Figure 7-86. Linear-phase Interpolation Filter Pass-Band Ripple

Table 7-58. Linear-phase Interpolation Filter Specifications

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------|---|-------|------|------|---------|
| Pass-band ripple | Frequency range is 0 to $0.258 \times f_s$ | -0.67 | | 0.67 | dB |
| Stop-band attenuation | Frequency range is $0.391 \times f_s$ to $1 \times f_s$ | 77.7 | | | dB |
| | Frequency range is $1 \times f_s$ to $1.612 \times f_s$ | 81.1 | | | |
| Group delay or latency | Frequency range is 0 to $0.258 \times f_s$ | | 10.7 | | $1/f_s$ |

7.3.9.2.6.1.9 Sampling Rate 768kHz or 705.6kHz

Figure 7-87 and Figure 7-88 respectively show the magnitude response and the pass-band ripple for this interpolation filter with a sampling rate of 768kHz or 705.6kHz, and Table 7-59 lists its specifications.

Table 7-59. Linear-phase Interpolation Filter Specifications

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------|--|-------|-----|------|---------|
| Pass-band ripple | Frequency range is 0 to $0.153 \times f_s$ | -0.15 | | 0.15 | dB |
| Stop-band attenuation | Frequency range is $0.43 \times f_s$ to $1 \times f_s$ | 79.1 | | | dB |
| | Frequency range is $1 \times f_s$ onwards | 82.2 | | | |
| Group delay or latency | Frequency range is 0 to $0.113 \times f_s$ | | 5.9 | | $1/f_s$ |

7.3.9.2.6.2 Low-latency Filters

For applications where low latency with minimal phase deviation (within the audio band) is critical, the low-latency interpolation filters on the TAC5212 can be used. The device supports these filters with a group delay of approximately seven samples with an almost linear phase response within the $0.376 \times f_S$ frequency band. This section provides the filter performance specifications and various plots for all supported output sampling rates for the low-latency filters.

7.3.9.2.6.2.1 Sampling Rate: 24kHz or 22.05kHz

Figure 7-89 shows the magnitude response and Figure 7-90 shows the pass-band ripple and phase deviation for this interpolation filter with a sampling rate of 24kHz or 22.05kHz. Table 7-60 lists its specifications.

Figure 7-89. Low-latency Interpolation Filter Magnitude Response

7.3.9.2.6.3 Ultra-Low-Latency Filters

For applications where ultra-low latency (within the audio band) is critical, the ultra-low-latency interpolation filters on the TAC5212 can be used. The device supports these filters with a group delay of approximately four samples with an almost linear phase response within the $0.325 \times f_S$ frequency band. This section provides the filter performance specifications and various plots for all supported output sampling rates for the ultra-low-latency filters.

7.3.9.2.6.3.1 Sampling Rate: 24 kHz or 22.05 kHz

Figure 7-99 shows the magnitude response and Figure 7-100 shows the pass-band ripple and phase deviation for a interpolation filter with a sampling rate of 24 kHz or 22.05 kHz. Table 7-65 lists its specifications.

Figure 7-99. Ultra-Low-Latency interpolation Filter Magnitude Response

7.3.10 Interrupts, Status, and Digital I/O Pin Multiplexing

Certain events in the device require host processor intervention and can be used to trigger interrupts to the host processor. One such event is an audio serial interface (ASI) bus error. The device powers down the record channels if any faults are detected with the ASI bus error clocks, such as:

- Invalid FSYNC frequency
- Invalid BCLK to FSYNC ratio
- Long pauses of the BCLK or FSYNC clocks

When an ASI bus clock error is detected, the device shuts down all the record and playback channels as quickly as possible. After all ASI bus clock errors are resolved, the device volume ramps back to its previous state to recover the audio. During an ASI bus clock error, the internal interrupt request (IRQ) interrupt signal asserts low if the clock error interrupt mask register bit INT_MASK0[7] (P1_R47_D[7]) is set low. The clock fault is also available for readback in the latched fault status register bit INT_LTCH0 (P1_R52), which is a read-only register. Reading the latched fault status register, INT_LTCH0, clears all latched fault status. The device can be additionally configured to route the internal IRQ interrupt signal on the GPIOx or GPO1 pins and also can be configured as open-drain outputs so that these pins can be wire-ANDed to the open-drain interrupt outputs of other devices.

The IRQ interrupt signal can either be configured as active low or active high polarity by setting the INT_POL (P0_R66_D[7]) register bit. This signal can also be configured as a single pulse or a series of pulses by programming the INT_EVENT[1:0] (P0_R66_D[6:5]) register bits. If the interrupts are configured as a series of pulses, the events trigger the start of pulses that stop when the latched fault status register is read to determine the cause of the interrupt.

The device also supports read-only live-status registers to determine if the channels are powered up or down and if the device is in sleep mode or not. These status registers are located in the DEV_STS0 (P0_R121) and DEV_STS1 (P0_R122) register bits.

The device has a multifunctional GPIOx, GPI1 and GPO1 pins that can be configured for a desired specific function. [Table 7-70](#) lists all possible allocations of these multifunctional pins for the various features.

Table 7-70. Multifunction Pin Assignments

| ROW | PIN FUNCTION | GPIO1 | GPIO2 | GPO1 | GPI1 |
|-----|----------------------------------|------------------|-------------|-------------|-------------------|
| — | — | GPIO1_CFG | GPIO2_CFG | GPO1_CFG | GPI1_CFG |
| — | — | P0_R10[7:4] | P0_R11[7:4] | P0_R12[7:4] | P0_R13[1] |
| A | Pin disabled | S ⁽¹⁾ | S (default) | S (default) | S (default) |
| B | General-purpose output (GPO) | S | S | S | NS ⁽²⁾ |
| C | Interrupt output (IRQ) | S (default) | S | S | NS |
| D | Power down for all ADC channels | S | S | NS | S |
| E | Power down for all DAC channels | S | S | NS | S |
| F | PDM clock output (PDMCLK) | S | S | S | NS |
| G | MiCBIAS on/off input (BIASEN) | S | S | NS | S |
| H | General-purpose input (GPI) | S | S | NS | S |
| I | Controller clock input (CCLK) | S | S | S | S |
| J | ASI daisy-chain input | S | S | NS | S |
| K | PDM data input 1 (PDMIN1) | S | S | NS | S |
| L | PDM data input 2 (PDMIN2) | S | S | NS | S |
| M | ASI DOUT | S | S | S | NS |
| N | ASI BCLK | S | S | S | S |
| O | ASI FSYNC | S | S | S | S |
| P | General Purpose Clock Out | S | S | S | NS |
| Q | ASI daisy-chain output | S | S | S | NS |
| R | Incremental ADC Conversion Start | S | S | NS | S |

(1) S means the feature mentioned in this row is *supported* for the respective GPIO1, GPOx, or GPIx pin mentioned in this column.

(2) NS means the feature mentioned in this row is *not supported* for the respective GPIO1, GPOx, or GPIx pin mentioned in this column.

Each GPO1 or GPIOx pin can be independently set for the desired drive configurations setting using the GPIOx_DRV[2:0] or GPO1_DRV[2:0] register bits in P0_R10_D[2:0], P0_R11_D[2:0] and P0_R12_D[2:0] respectively. [Table 7-71](#) lists the drive configuration settings.

Table 7-71. GPIO or GPOx Pins Drive Configuration Settings

| P0_R10_D[2:0] : GPIO1_DRV[2:0] | GPIO OUTPUT DRIVE CONFIGURATION SETTINGS FOR GPIO1 |
|--------------------------------|--|
| 000 | The GPIO1 pin is set to high impedance (floated) |
| 001 | The GPIO1 pin is set to be driven active low or active high |
| 010 (default) | The GPIO1 pin is set to be driven active low or weak high (on-chip pullup) |
| 011 | The GPIO1 pin is set to be driven active low or Hi-Z (floated) |
| 100 | The GPIO1 pin is set to be driven weak low (on-chip pulldown) or active high |
| 101 | The GPIO1 pin is set to be driven Hi-Z (floated) or active high |
| 110 and 111 | Reserved (do not use these settings) |

When configured as a general-purpose output (GPO), the GPIOx or GPO1 pin values can be driven by writing the GPO_GPI_VAL (P0_R14) registers. The GPIO_MON bits (P0_R14_D[3:1]) can be used to readback the status of the GPIOx or GPI1 pin when configured as a general-purpose input (GPI).

7.3.11 Power Tune Mode

For low power applications, the TAC5212 offers options to configure the device in a power tune mode with typical power consumption 8mW for 2-Ch recording and 11mW for 2-Ch playback for a 1.8V supply. This mode can be configured by setting the PWR_TUNE_CFG0 (P0_R78) register to 0xD4 and PWR_TUNE_CFG1 (P0_R79) register to 0x96. For power savings, the ADC and DAC modulator clocks are set to run at 1.536MHz (the input and output data sample rates are multiples or submultiples of 48kHz) or 1.4112MHz (the input and output data sample rates are multiples or submultiples of 44.1kHz). In this mode, not all combinations of VREF voltages, common mode tolerance (ADC_CHx_CM_TOL) settings and input channel configuration (ADC_CHx_INSRC) settings are recommended. For more details refer the [TAC5x1x Power Consumption Matrix Across Various Usage Scenarios application report](#) for the supported input impedance, VREF voltages, common

mode tolerance (ADC_CHx_CM_TOL) settings and input channel configuration (ADC_CHx_INSRC) settings in this mode.

7.4 Device Functional Modes

7.4.1 Sleep Mode or Software Shutdown

In sleep mode or software shutdown mode, the device consumes very low quiescent current from the AVDD supply and, at the same time, allows the I²C or SPI communication to wake the device for active operation.

The device can also enter sleep mode when the host device sets the SLEEP_ENZ (P0_R2_D[0]) bit to 1'b0. If the SLEEP_ENZ bit is asserted low when the device is in active mode, the device ramps down the volume on the record and playback data, powers down the analog and digital blocks, and enters sleep mode. However, the device still continues to retain the last programmed value of the device configuration registers and programmable coefficients.

In sleep mode, do not perform any I²C or SPI transactions, except for exiting sleep mode in order to enter active mode. After entering sleep mode, wait at least 10ms before starting I²C or SPI transactions to exit sleep mode.

7.4.2 Active Mode

If the host device exits sleep mode by setting the SLEEP_ENZ bit to 1'b1, the device enters active mode. In active mode, I²C or SPI transactions can be done to configure and power-up the device for active operation. After entering active mode, wait at least 2ms before starting any I²C or SPI transactions in order to allow the device to complete the internal wake-up sequence.

Read and write operations to the programmable coefficient registers ([Section 8.2](#)), and to the channel configuration registers must be done 10ms after exiting sleep mode.

After configuring all other registers for the target application and system settings, configure the input channel enable registers, P0_R118 (CH_EN). Lastly, configure the device power-up register, P0_R120 (PWR_CFG). All the programmable coefficient values must be written before powering up the respective channel.

In active mode, the power-up and power-down status of various blocks is monitored by reading the read-only device status bits located in the P0_R121 (DEV_STS0) and P0_R122 (DEV_STS1) registers.

7.4.3 Software Reset

A software reset can be done any time by asserting the SW_RESET bit (P0_R1_D[0]), which is a self-clearing bit. This software reset immediately shuts down the device, and restores all device configuration registers and programmable coefficients to their default values.

7.5 Programming

The device contains configuration registers and programmable coefficients that can be set to the desired values for a specific system and application use. These registers are called *device control registers* and are each eight bits in width, mapped using a page scheme.

Each page contains 128 configuration registers. All device configuration registers are stored in page 0, which is the default page setting at power up and after a software reset. All programmable coefficient registers are located in page 0, page 1, and page 3. The current page of the device can be switched to a new desired page by using the PAGE[7:0] bits located in register 0 of every page.

7.5.1 Control Serial Interfaces

The device control registers can be accessed using either I²C or SPI communication to the device.

By monitoring the SDA_PICO, SCL_SCLK, GPO1_POCI, and GPI1_CSZ device pins, which are the multiplexed pins for the I²C or SPI Interface, the device automatically detects whether the host device is using I²C or SPI communication to configure the device. For a given end application, the host device must always use either the I²C or SPI interface, but not both, to configure the device refer to the [Table 7-72](#).

Table 7-72. I²C and SPI Address Configuration

| ADDR Setting | Mode | Device Address (7-bit) | Device Address (8-bit) |
|-----------------------------|------------------|------------------------|------------------------|
| Short to Ground | I ² C | 0x50 | 0xA0 |
| Pull down 4.7KOhm to ground | I ² C | 0x51 | 0xA2 |
| Pull up 22KOhm to AVDD | I ² C | 0x52 | 0xA4 |
| Pull up 4.7KOhm to AVDD | I ² C | 0x53 | 0xA6 |
| Short to AVDD | SPI | NA | NA |

7.5.1.1 I²C Control Interface

The device supports the I²C control protocol as a target device, and is capable of operating in standard mode, fast mode, and fast mode plus. The I²C control protocol requires a 7-bit target address. The five most significant bits (MSBs) of the target address are fixed at 5'b10100 and cannot be changed. The two least significant bits (LSBs) are programmable and are controlled by the ADDR pin. Refer [Table 7-72](#) for the four possible device addresses supported by TAC5212 in I²C mode. If the I2C_BRDCAST_EN (P0_R4_D[1]) bit is set to 1'b1, then the 7-bit I²C target address is fixed to 7'b1010000 in order to allow simultaneous I²C broadcast communication to all TAC5212 devices in the system.

7.5.1.1.1 General I²C Operation

The I²C bus employs two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system using serial data transmission. The address and data 8-bit bytes are transferred MSB first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the controller device driving a start condition on the bus and ends with the controller device driving a stop condition on the bus. The bus uses transitions on the data pin (SDA) while the clock is at logic high to indicate start and stop conditions. A high-to-low transition on SDA indicates a start, and a low-to-high transition indicates a stop. Normal data-bit transitions must occur within the low time of the clock period.

The controller device drives a start condition followed by the 7-bit target address and the read/write (R/W) bit to open communication with another device and then waits for an acknowledgment condition. The target device holds SDA low during the acknowledge clock period to indicate acknowledgment. When this occurs, the controller device transmits the next byte of the sequence. Each target device is addressed by a unique 7-bit target address plus the R/W bit (1 byte). All compatible devices share the same signals via a bidirectional bus using a wired-AND connection.

There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the controller device generates a stop condition to release the bus. Figure 7-109 shows a generic data transfer sequence.

Figure 7-109. Typical I²C Sequence

In the system, use external pullup resistors for the SDA and SCL signals to set the logic high level for the bus. The SDA and SCL voltages must not exceed the device supply voltage, IOVDD.

7.5.1.1.2 I²C Single-Byte and Multiple-Byte Transfers

The device I²C interface supports both single-byte and multiple-byte read/write operations for all registers. During multiple-byte read operations, the device responds with data, a byte at a time, starting at the register assigned, as long as the controller device continues to respond with acknowledgements.

The device supports sequential I²C addressing. For write transactions, if a register is issued followed by data for that register and all the remaining registers that follow, a sequential I²C write transaction takes place. For I²C sequential write transactions, the register issued then serves as the starting point, and the amount of data subsequently transmitted, before a stop or start is transmitted, determines how many registers are written.

7.5.1.1.2.1 I²C Single-Byte Write

As shown in Figure 7-110, a single-byte data write transfer begins with the controller device transmitting a start condition followed by the I²C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write-data transfer, the read/write bit must be set to 0. After receiving the correct I²C target address and the read/write bit, the device responds with an acknowledge bit (ACK). Next, the controller device transmits the register byte corresponding to the device internal register address being accessed. After receiving the register byte, the device again responds with an acknowledge bit (ACK). Then, the controller device transmits the byte of data to be written to the specified register. When finished, the target device responds with an acknowledge bit (ACK). Finally, the controller device transmits a stop condition to complete the single-byte data write transfer.

Figure 7-110. I²C Single-Byte Write Transfer

7.5.1.1.2.2 I²C Multiple-Byte Write

As shown in [Figure 7-111](#), a multiple-byte data write transfer is identical to a single-byte data write transfer except that multiple data bytes are transmitted by the controller device to the target device. After receiving each data byte, the device responds with an acknowledge bit (ACK). Finally, the controller device transmits a stop condition after the last data-byte write transfer.

Figure 7-111. I²C Multiple-Byte Write Transfer

7.5.1.1.2.3 I²C Single-Byte Read

As shown in [Figure 7-112](#), a single-byte data read transfer begins with the controller device transmitting a start condition followed by the I²C target address and the read/write bit. For the data read transfer, both a write followed by a read are done. Initially, a write is done to transfer the address byte of the internal register address to be read. As a result, the read/write bit is set to 0.

After receiving the target address and the read/write bit, the device responds with an acknowledge bit (ACK). The controller device then sends the internal register address byte, after which the device issues an acknowledge bit (ACK). The controller device transmits another start condition followed by the target address and the read/write bit again. This time, the read/write bit is set to 1, indicating a read transfer. Next, the device transmits the data byte from the register address being read. After receiving the data byte, the controller device transmits a not-acknowledge (NACK) followed by a stop condition to complete the single-byte data read transfer.

Figure 7-112. I²C Single-Byte Read Transfer

7.5.1.1.2.4 I²C Multiple-Byte Read

As shown in [Figure 7-113](#), a multiple-byte data read transfer is identical to a single-byte data read transfer except that multiple data bytes are transmitted by the device to the controller device. With the exception of the last data byte, the controller device responds with an acknowledge bit after receiving each data byte. After receiving the last data byte, the controller device transmits a not-acknowledge (NACK) followed by a stop condition to complete the data read transfer.

Figure 7-113. I²C Multiple-Byte Read Transfer

7.5.1.2 SPI Control Interface

The general SPI protocol allows full-duplex, synchronous, serial communication between a host processor (the controller) and peripheral devices. The SPI controller (in this case, the host processor) generates the synchronizing clock (driven on to SCLK) and initiates transmissions by taking the peripheral-select pin CSZ from high to low. The SPI peripheral devices (such as the TAC5212) depend on a controller device to start and synchronize transmissions. A transmission begins when initiated by an SPI controller. The byte from the SPI controller begins shifting in on the peripheral PICO pin under the control of the controller serial clock (driven onto SCLK). When the byte shifts in on the PICO pin, a byte shifts out on the POCI pin to the controller shift register.

Refer to [Table 7-73](#) to configure the device for SPI control. [Table 7-73](#) mentions the pin assignment for SPI mode of control.

Table 7-73. Pin Assignments for SPI Control

| Pin Number | Pin Name | Pin Name in SPI Mode | Description |
|------------|----------|----------------------|---------------------------|
| 7 | SCL | SCLK | SPI serial bit clock |
| 8 | SDA | PICO | SPI peripheral input pin |
| 11 | GP01 | POCI | SPI peripheral output pin |
| 12 | GPI1 | CSZ | SPI chip select pin |

The TAC5212 supports a standard SPI control protocol with a clock polarity setting of 0 (typical microprocessor SPI control bit CPOL = 0) and a clock phase setting of 1 (typical microprocessor SPI control bit CPHA = 1). The CSZ pin can remain low between transmissions; however, the device only interprets the first eight bits transmitted after the falling edge of CSZ as a command byte, and the next eight bits as a data byte only if writing to a register. The device is entirely controlled by registers. Reading and writing these registers is accomplished by an 8-bit command sent to the PICO pin prior to the data for that register. [Table 7-74](#) shows the command structure. The first seven bits specify the address of the register that is being written or read, from 0 to 127 (decimal). The command word ends with an R/W bit, which specifies the direction of data flow on the serial bus.

In the case of a register write, set the R/W bit to 0. A second byte of data is sent to the PICO pin and contains the data to be written to the register. A register read is accomplished in a similar fashion. The 8-bit command word sends the 7-bit register address, followed by the R/W bit equal to 1 to signify a register read. The 8-bit register data is then clocked out of the device on the POCI pin during the second eight SCLK clocks in the frame. The device supports sequential SPI addressing for a multiple-byte data write/read transfer until the CSZ pin is pulled high. A multiple-byte data write or read transfer is identical to a single-byte data write or read transfer, respectively, until all data byte transfers complete. The host device must keep the CSZ pin low during all data byte transfers. [Figure 7-114](#) shows the single-byte write transfer and [Figure 7-115](#) shows the single-byte read transfer.

Table 7-74. SPI Command Word

| BIT 7 | BIT 6 | BIT 5 | BIT 4 | BIT 3 | BIT 2 | BIT 1 | BIT 0 |
|---------|---------|---------|---------|---------|---------|---------|-------|
| ADDR(6) | ADDR(5) | ADDR(4) | ADDR(3) | ADDR(2) | ADDR(1) | ADDR(0) | R/WZ |

Figure 7-114. SPI Single-Byte Write Transfer

Figure 7-115. SPI Single-Byte Read Transfer

8 Register Maps

This section describes the control registers for the device in detail. All these registers are eight bits in width and allocated to device configuration and programmable coefficients settings. These registers are mapped internally using a page scheme that can be controlled using either I²C or SPI communication to the device. Each page contains 128 bytes of registers. All device configuration registers are stored in page 0, page 1 and page 3. Page 0 is the default page setting at power up (and after a software reset). The device current page can be switch to a new desired page by using the PAGE[7:0] bits located in register 0 of every page.

Do not read from or write to reserved pages or reserved registers. Write only default values for the reserved bits in the valid registers.

The procedure for register access across pages is:

- Select page *N* (write data *N* to register 0 regardless of the current page number)
- Read or write data from or to valid registers in page *N*
- Select the new page *M* (write data *M* to register 0 regardless of the current page number)
- Read or write data from or to valid registers in page *M*
- Repeat as needed

8.1 Device Configuration Registers

This section describes the device configuration registers for Page 0, Page 1 and Page 3 of the device. [Table 8-1](#) lists the access codes for the device registers.

Table 8-1. Access Type Codes

| Access Type | Code | Description |
|-------------|------|---------------|
| Read Type | | |
| R | R | Read |
| R-W | R/W | Read or write |
| Write Type | | |
| W | W | Write |

8.1.1 Book0_P0 Registers

Table 8-2 lists the memory-mapped registers for the Book0_P0 registers. All register offset addresses not listed in Table 8-2 should be considered as reserved locations and the register contents should not be modified.

Table 8-2. BOOK0_P0 Registers

| Address | Acronym | Register Name | Reset Value | Section |

8.1.1.1 PAGE_CFG Register (Address = 0x0) [Reset = 0x00]

PAGE_CFG is shown in [Table 8-3](#).

Return to the [Summary Table](#).

The device memory map is divided into pages. This register sets the page.

Table 8-3. PAGE_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------|------|-----------|--|
| 7-0 | PAGE[7:0] | R/W | 00000000b | These bits set the device page. 0d = Page 0 1d = Page 1 2d to 254d = Page 2 to page 254 respectively 255d = Page 255 |

8.1.1.2 SW_RESET Register (Address = 0x1) [Reset = 0x00]

SW_RESET is shown in [Table 8-4](#).

Return to the [Summary Table](#).

This register is the software reset register. Asserting a software reset places all register values in their default power-on-reset (POR) state.

Table 8-4. SW_RESET Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|---------------------------------------|
| 7-1 | RESERVED | R | 0b | Reserved bits; Write only reset value |

Table 8-4. SW_RESET Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|---|
| 0 | SW_RESET | R/W | 0b | Software reset. This bit is self clearing. 0d = Do not reset 1d = Reset all registers to their reset values |

8.1.1.3 DEV_MISC_CFG Register (Address = 0x2) [Reset = 0x00]

DEV_MISC_CFG is shown in [Table 8-5](#).

Return to the [Summary Table](#).

This register configures miscellaneous device registers.

Table 8-5. DEV_MISC_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|--------------------|------|-------|---|
| 7-6 | RESERVED | R | 0b | Reserved bits; Write only reset values |
| 5-4 | VREF_QCHG[1:0] | R/W | 00b | The duration of the quick-charge for the VREF external capacitor is set using an internal series impedance of 200Ω. 0d = VREF quick-charge duration of 3.5 ms (typical) 1d = VREF quick-charge duration of 10 ms (typical) 2d = VREF quick-charge duration of 50 ms (typical) 3d = VREF quick-charge duration of 100 ms (typical) |
| 3 | SLEEP_EXIT_VREF_EN | R/W | 0b | Sleep mode exit configuration 0d = Only DREG Enabled 1d = DREG and VREF enabled |
| 2 | AVDD_MODE | R/W | 0b | AVDD mode configuration. 0d = Internal AREG regulator is used (Should be used for AVDD 3.3V Operation) 1d = AVDD 1.8V used directly for AREG (Strictly use this setting for AVDD 1.8V Operation) |
| 1 | IOVDD_IO_MODE | R/W | 0b | IOVDD mode configuration. 0d = IOVDD at 3.3V / 1.8V / 1.2V (speed limitation applicable for 1.8V and 1.2V Operation) 1d = IOVDD at 1.8V / 1.2V only (no speed limitation - Strictly don't use this setting for IOVDD 3.3V Operation). |
| 0 | SLEEP_ENZ | R/W | 0b | Sleep mode setting. 0d = Device is in sleep mode 1d = Device is not in sleep mode |

8.1.1.4 AVDD_IOVDD_STS Register (Address = 0x3) [Reset = 0x00]

AVDD_IOVDD_STS is shown in [Table 8-6](#).

Return to the [Summary Table](#).

This register contains status of the supply detection and brown-out.

Table 8-6. AVDD_IOVDD_STS Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-------|---|
| 7 | AVDD_MODE_STS | R | 0b | AVDD mode status flag register. 0d = AVDD_MODE as per configured 1d = AVDD 3.3V Operation (AVDD_MODE forced to 0d) |
| 6 | IOVDD_IO_MODE_STS | R | 0b | IOVDD mode status flag register. 0d = IOVDD_MODE as per configured 1d = IOVDD 3.3V Operation (IOVDD_IO_MODE forced to 0d) |
| 5-2 | RESERVED | R | 0b | Reserved bits; Write only reset values |

Table 8-6. AVDD_IOVDD_STS Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-------------------------|------|-------|--|
| 1 | BRWNOUT_SHDN_STS | R | 0b | Brownout shutdown status 0d = No brownout shutdown 1d = Brownout shutdown |
| 0 | BRWNOUT_SHDN_EXIT_SLEEP | R/W | 0b | Brownout shutdown sleep exit config 0d = Stay in sleep mode 1d = Exit sleep mode |

8.1.1.5 MISC_CFG Register (Address = 0x4) [Reset = 0x00]

MISC_CFG is shown in [Table 8-7](#).

Return to the [Summary Table](#).

This register configures miscellaneous configuration registers.

Table 8-7. MISC_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------|------|-------|---|
| 7 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 6 | IGNORE_CLK_ERR | R/W | 0b | Clock error detection action 0b = Clock error enabled 1b = Clock error disabled |

8.1.1.21 ASI_CFG0 Register (Address = 0x18) [Reset = 0x40]

ASI_CFG0 is shown in [Table 8-23](#).

Return to the [Summary Table](#).

This register is the ASI configuration register 0.

Table 8-23. ASI_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-------|--|
| 7 | PASI_DIS | R/W | 0b | Disable or enable primary ASI (PASI). 0d = Primary ASI enabled 1d = Primary ASI disabled |
| 6 | SASI_DIS | R/W | 1b | Disable or enable secondary ASI (SASI). 0d = Secondary ASI enabled 1d = Secondary ASI disabled |
| 5 | SASI_CFG_GANG | R/W | 0b | All configurations of secondary ASI ganged with primary ASI. 0d = Secondary ASI has independent configurations 1d = Secondary ASI configurations same as primary ASI |
| 4-3 | DAISY_EN[1:0] | R/W | 00b | Daisy chain feature enable (Only 1 ASI with 1 DOUT AND DIN available) 0d = Daisy chain disabled 1d = PASI daisy chain enabled (Secondary ASI not available) 2d = SASI daisy chain enabled (Primary ASI not available) 3d = Reserved; Don't use |
| 2-0 | DAISY_IN_SEL[2:0] | R/W | 000b | Daisy input select configuration. 0d = Daisy input disabled 1d = GPIO1 2d = GPIO2 3d = GPI1 4d = Reserved 5d = DIN 6d to 7d = Reserved |

8.1.1.22 ASI_CFG1 Register (Address = 0x19) [Reset = 0x00]

ASI_CFG1 is shown in [Table 8-24](#).

Return to the [Summary Table](#).

This register is the ASI configuration register 1.

Table 8-24. ASI_CFG1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-------|--|
| 7-6 | ASI_DOUT_CFG[1:0] | R/W | 00b | ASI data output configuration. 0d = 1 data output for Primary ASI and 1 data output for Secondary ASI 1d = 2 data outputs for Primary ASI 2d = 2 data outputs for Secondary ASI 3d = Reserved; Don't use |

Table 8-24. ASI_CFG1 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|------------------|------|-------|---|
| 5-4 | ASI_DIN_CFG[1:0] | R/W | 00b | ASI data input configuration. 0d = 1 data input for Primary ASI and 1 data input for Secondary ASI 1d = 2 data inputs for Primary ASI 2d = 2 data inputs for Secondary ASI 3d = Reserved; Don't use |
| 3 | DAISY_DIR | R/W | 0b | Daisy direction configuration. 0d = ASI DOUT daisy 1d = ASI DIN daisy |
| 2 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 1 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 0 | RESERVED | R | 0b | Reserved bit; Write only reset value |

8.1.1.23 PASI_CFG0 Register (Address = 0x1A) [Reset = 0x30]

PASI_CFG0 is shown in [Table 8-25](#).

Return to the [Summary Table](#).

This register is the ASI configuration register 0.

Table 8-25. PASI_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-------|--|
| 7-6 | PASI_FORMAT[1:0] | R/W | 00b | Primary ASI protocol format. 0d = TDM mode 1d = I ² S mode 2d = LJ (left-justified) mode 3d = Reserved; Don't use |
| 5-4 | PASI_WLEN[1:0] | R/W | 11b | Primary ASI word or slot length. 0d = 16 bits (Recommended this setting to be used with 10kΩ input impedance configuration) 1d = 20 bits 2d = 24 bits 3d = 32 bits |
| 3 | PASI_FSYNC_POL | R/W | 0b | ASI FSYNC polarity (for PASI protocol only). 0d = Default polarity as per standard protocol 1d = Inverted polarity with respect to standard protocol |
| 2 | PASI_BCLK_POL | R/W | 0b | ASI BCLK polarity (for PASI protocol only). 0d = Default polarity as per standard protocol 1d = Inverted polarity with respect to standard protocol |
| 1 | PASI_BUS_ERR | R/W | 0b | ASI bus error detection. 0d = Enable bus error detection 1d = Disable bus error detection |
| 0 | PASI_BUS_ERR_RCOV | R/W | 0b | ASI bus error auto resume. 0d = Enable auto resume after bus error recovery 1d = Disable auto resume after bus error recovery and remain powered down until host configures the device |

8.1.1.24 PASI_TX_CFG0 Register (Address = 0x1B) [Reset = 0x00]

PASI_TX_CFG0 is shown in [Table 8-26](#).

Return to the [Summary Table](#).

This register is the PASI TX configuration register 0.

Table 8-26. PASI_TX_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-------|--|
| 7 | PASI_TX_EDGE | R/W | 0b | Primary ASI data output (on the primary and secondary data pin) transmit edge. 0d = Default edge as per the protocol configuration setting in PASI_BCLK_POL 1d = Inverted following edge (half cycle delay) with respect to the default edge setting |
| 6 | PASI_TX_FILL | R/W | 0b | Primary ASI data output (on the primary and secondary data pin) for any unused cycles 0d = Always transmit 0 for unused cycles 1d = Always use Hi-Z for unused cycles |
| 5 | PASI_TX_LSB | R/W | 0b | Primary ASI data output (on the primary and secondary data pin) for LSB transmissions. 0d = Transmit the LSB for a full cycle 1d = Transmit the LSB for the first half cycle and Hi-Z for the second half cycle |
| 4-3 | PASI_TX_KEEPER[1:0] | R/W | 00b | Primary ASI data output (on the primary and secondary data pin) bus keeper. 0d = Bus keeper is always disabled 1d = Bus keeper is always enabled 2d = Bus keeper is enabled during LSB transmissions only for one cycle 3d = Bus keeper is enabled during LSB transmissions only for one and half cycles |
| 2 | PASI_TX_USE_INT_FSYN C | R/W | 0b | Primary ASI uses internal FSYN C for output data generation in Controller mode configuration as applicable. 0d = Use external FSYN C for ASI protocol data generation 1d = Use internal FSYN C for ASI protocol data generation |
| 1 | PASI_TX_USE_INT_BCL K | R/W | 0b | Primary ASI uses internal BCL K for output data generation in Controller mode configuration. 0d = Use external BCL K for ASI protocol data generation 1d = Use internal BCL K for ASI protocol data generation |
| 0 | PASI_TDM_PULSE_WIDT H | R/W | 0b | Primary ASI fsync pulse width in TDM format. (Valid for Controller mode) 0d = Fsync pulse is 1 bclk period wide 1d = Fsync pulse is 2 bclk period wide |

8.1.1.25 PASI_TX_CFG1 Register (Address = 0x1C) [Reset = 0x00]

PASI_TX_CFG1 is shown in [Table 8-27](#).

Return to the [Summary Table](#).

This register is the PASI TX configuration register 1.

Table 8-27. PASI_TX_CFG1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|--|
| 7-5 | RESERVED | R | 0b | Reserved bits; Write only reset values |

Table 8-27. PASI_TX_CFG1 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------------------|------|--------|---|
| 4-0 | PASI_TX_OFFSET[4:0] | R/W | 00000b | Primary ASI output data MSB slot 0 offset (on the primary and secondary data pin). 0d = ASI data MSB location has no offset and is as per standard protocol 1d = ASI data MSB location (TDM mode is slot 0 or I ² S, LJ mode is the left and right slot 0) offset of one BCLK cycle with respect to standard protocol 2d = ASI data MSB location (TDM mode is slot 0 or I ² S, LJ mode is the left and right slot 0) offset of two BCLK cycles with respect to standard protocol 3d to 30d = ASI data MSB location (TDM mode is slot 0 or I ² S, LJ mode is the left and right slot 0) offset assigned as per configuration 31d = ASI data MSB location (TDM mode is slot 0 or I ² S, LJ mode is the left and right slot 0) offset of 31 BCLK cycles with respect to standard protocol |

8.1.1.26 PASI_TX_CFG2 Register (Address = 0x1D) [Reset = 0x00]

PASI_TX_CFG2 is shown in [Table 8-28](#).

Return to the [Summary Table](#).

This register is the PASI TX configuration register 2.

Table 8-28. PASI_TX_CFG2 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------|------|-------|---|
| 7 | PASI_TX_CH8_SEL | R/W | 0b | Primary ASI output channel 8 select. 0d = Primary ASI channel 8 output is on DOUT 1d = Primary ASI channel 8 output is on DOUT2 |
| 6 | PASI_TX_CH7_SEL | R/W | 0b | Primary ASI output channel 7 select. 0d = Primary ASI channel 7 output is on DOUT 1d = Primary ASI channel 7 output is on DOUT2 |
| 5 | PASI_TX_CH6_SEL | R/W | 0b | Primary ASI output channel 6 select. 0d = Primary ASI channel 6 output is on DOUT 1d = Primary ASI channel 6 output is on DOUT2 |
| 4 | PASI_TX_CH5_SEL | R/W | 0b | Primary ASI output channel 5 select. 0d = Primary ASI channel 5 output is on DOUT 1d = Primary ASI channel 5 output is on DOUT2 |
| 3 | PASI_TX_CH4_SEL | R/W | 0b | Primary ASI output channel 4 select. 0d = Primary ASI channel 4 output is on DOUT 1d = Primary ASI channel 4 output is on DOUT2 |
| 2 | PASI_TX_CH3_SEL | R/W | 0b | Primary ASI output channel 3 select. 0d = Primary ASI channel 3 output is on DOUT 1d = Primary ASI channel 3 output is on DOUT2 |
| 1 | PASI_TX_CH2_SEL | R/W | 0b | Primary ASI output channel 2 select. 0d = Primary ASI channel 2 output is on DOUT 1d = Primary ASI channel 2 output is on DOUT2 |
| 0 | PASI_TX_CH1_SEL | R/W | 0b | Primary ASI output channel 1 select. 0d = Primary ASI channel 1 output is on DOUT 1d = Primary ASI channel 1 output is on DOUT2 |

8.1.1.27 PASI_TX_CH1_CFG Register (Address = 0x1E) [Reset = 0x20]

PASI_TX_CH1_CFG is shown in [Table 8-29](#).

Return to the [Summary Table](#).

This register is the PASI TX Channel 1 configuration register.

Table 8-29. PASI_TX_CH1_CFG Register Field Descriptions

|-----|---------------------------------|------|-------|---|
| 7 | PASI_USE_INT_BCLK_F OR_FSYNC | R/W | 0b | Use internal BCLK for FSYNC generation in PASI during controller mode configuration. 0d = Use external BCLK for FSYNC generation 1d = Use internal BCLK for FSYNC generation |
| 6 | PASI_INV_BCLK_FOR_F SYNC | R/W | 0b | Invert PASI BCLK polarity only for PASI FSYNC generation in controller mode configuration. 0d = Do not invert PASI BCLK polarity for PASI FSYNC generation 1d = Invert PASI BCLK polarity for PASI FSYNC generation |

Table 8-53. CNT_CLK_CFG3 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|---------|--|
| 5-0 | PASI_BCLK_FS_RATIO_MSB[5:0] | R/W | 000000b | MSB bits for primary ASI BCLK to FSYNC ratio in controller mode. |

8.1.1.52 CNT_CLK_CFG4 Register (Address = 0x39) [Reset = 0x00]

CNT_CLK_CFG4 is shown in [Table 8-54](#).

Return to the [Summary Table](#).

This register is the controller mode clock configuration register 4.

Table 8-54. CNT_CLK_CFG4 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|-----------|--|
| 7-0 | PASI_BCLK_FS_RATIO_LSB[7:0] | R/W | 00000000b | LSB byte for primary ASI BCLK to FSYNC ratio in controller mode. |

8.1.1.53 CNT_CLK_CFG5 Register (Address = 0x3A) [Reset = 0x00]

CNT_CLK_CFG5 is shown in [Table 8-55](#).

Return to the [Summary Table](#).

This register is the controller mode clock configuration register 5.

Table 8-55. CNT_CLK_CFG5 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|---------|---|
| 7 | SASI_USE_INT_BCLK_FOR_FSYNC | R/W | 0b | Use internal BCLK for FSYNC generation in SASI during controller mode configuration. 0d = Use external BCLK for FSYNC generation 1d = Use internal BCLK for FSYNC generation |
| 6 | SASI_INV_BCLK_FOR_FSYNC | R/W | 0b | Invert SASI BCLK polarity only for SASI FSYNC generation in controller mode configuration. 0d = Do not invert SASI BCLK polarity for SASI FSYNC generation 1d = Invert SASI BCLK polarity for SASI FSYNC generation |
| 5-0 | SASI_BCLK_FS_RATIO_MSB[5:0] | R/W | 000000b | MSB bits for secondary ASI BCLK to FSYNC ratio in controller mode. |

8.1.1.54 CNT_CLK_CFG6 Register (Address = 0x3B) [Reset = 0x00]

CNT_CLK_CFG6 is shown in [Table 8-56](#).

Return to the [Summary Table](#).

This register is the controller mode clock configuration register 6.

Table 8-56. CNT_CLK_CFG6 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|-----------|--|
| 7-0 | SASI_BCLK_FS_RATIO_LSB[7:0] | R/W | 00000000b | LSB byte for secondary ASI BCLK to FSYNC ratio in controller mode. |

8.1.1.55 CLK_ERR_STS0 Register (Address = 0x3C) [Reset = 0x00]

CLK_ERR_STS0 is shown in [Table 8-57](#).

Return to the [Summary Table](#).

This register is the clock error and status register 0.

Table 8-57. CLK_ERR_STS0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|---------------------------|------|-------|--|
| 7 | DSP_CLK_ERR | R | 0b | Flag indicating ratio error between FSYNC and selected clock source. 0d = No ratio error 1d = Ratio error between primary or secondary ASI FSYNC and selected clock source |
| 6 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 5 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 4 | SRC_RATIO_ERR | R | 0b | Flag indicating that SRC m:n ratio is unsupported. (not valid for custom m/n ratio config). 0d = m:n ratio supported 1d = Unsupported m:n ratio error |
| 3 | DEM_RATE_ERR | R | 0b | Flag indicating that clock configuration does not allow valid DEM rate. 0d = No DEM clock rate error 1d = DEM clock rate error in selected clock configuration |
| 2 | PDM_CLK_ERR | R | 0b | Flag indicating that clock configuration does not allow valid PDM clock generation. 0d = No PDM clock generation error 1d = PDM clock generation error in selected clock configuration |
| 1 | RESET_ON_CLK_STOP_DET_STS | R | 0b | Flag indicating that audio clock source stopped for at least 1ms. 0d = No audio clock source error 1d = Audio clock source stopped for at least 1ms |
| 0 | RESERVED | R | 0b | Reserved bit; Write only reset value |

8.1.1.56 CLK_ERR_STS1 Register (Address = 0x3D) [Reset = 0x00]

CLK_ERR_STS1 is shown in [Table 8-58](#).

Return to the [Summary Table](#).

This register is the clock error and status register 1.

Table 8-58. CLK_ERR_STS1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-------|---|
| 7 | PASI_BCLK_FS_RATIO_ERR | R | 0b | Flag indicating PASI bclk fsync ratio error. 0d = No PASI bclk fsync ratio error 1d = PASI bclk fsync ratio error in selected clock configuration |
| 6 | SASI_BCLK_FS_RATIO_ERR | R | 0b | Flag indicating SASI bclk fsync ratio error. 0d = No SASI bclk fsync ratio error 1d = SASI bclk fsync ratio error in selected clock configuration |
| 5 | CCLK_FS_RATIO_ERR | R | 0b | Flag indicating CCLK fsync ratio error. 0d = No CCLK fsync ratio error 1d = CCLK fsync ratio error |
| 4 | PASI_FS_ERR | R | 0b | Flag indicating PASI FS rate change or halt error. 0d = No PASI FS error 1d = PASI FS rate change or halt detected |
| 3 | SASI_FS_ERR | R | 0b | Flag indicating SASI FS rate change or halt error. 0d = No SASI FS error 1d = SASI FS rate change or halt detected |
| 2-0 | RESERVED | R | 0b | Reserved bits; Write only reset values |

8.1.1.57 CLK_DET_STS0 Register (Address = 0x3E) [Reset = 0x00]

CLK_DET_STS0 is shown in [Table 8-59](#).

Return to the [Summary Table](#).

This register is the clock ratio detection register 0.

Table 8-59. CLK_DET_STS0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------------|------|---------|---|
| 7-2 | PASI_SAMP_RATE_STS[5:0] | R | 000000b | Primary ASI Sample rate detected status. 0d = Reserved 1d = 768000 (670320-791040) 2d = 614400 (536256-632832) 3d = 512000 (446880-527360) 4d = 438857 (383040-452022) 5d = 384000 (335160-395520) 6d = 341333 (297920-351573) 7d = 307200 (268128-316416) 8d = 256000 (223440-263680) 9d = 219429 (191520-226011) 10d = 192000 (167580-197760) 11d = 170667 (148960-175786) 12d = 153600 (134064-158208) 13d = 128000 (111720-131840) 14d = 109714 (95760-113005) 15d = 96000 (83790-98880) 16d = 85333 (74480-87893) 17d = 76800 (67032-79104) 18d = 64000 (55860-65920) 19d = 54857 (47880-56502) 20d = 48000 (41895-49440) 21d = 42667 (37240-43946) 22d = 38400 (33516-39552) 23d = 32000 (27930-32960) 24d = 27429 (23940-28251) 25d = 24000 (20947-24720) 26d = 21333 (18620-21973) 27d = 19200 (16758-19776) 28d = 16000 (13965-16480) 29d = 13714 (11970-14125) 30d = 12000 (10473-12360) 31d = 10667 (9310-10986) 32d = 9600 (8379-9888) 33d = 8000 (6982-8240) 34d = 6857 (5985-7062) 35d = 6000 (5236-6180) 36d = 5333 (4655-5493) 37d = 4800 (4189-4944) 38d = 4000 (3491-4120) 39d = 3429 (2992-3531) 40d = 3000 (2618-3090) 41d-63d = Reserved |

8.1.1.59 CLK_DET_STS2 Register (Address = 0x40) [Reset = 0x00]

CLK_DET_STS2 is shown in [Table 8-61](#).

Return to the [Summary Table](#).

This register is the clock ratio detection register 2.

Table 8-61. CLK_DET_STS2 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------------|------|---------|---|
| 7-6 | RESERVED | R | 0b | Reserved bits; Write only reset values |
| 5-0 | FS_CLKSRC_RATIO_DE T_MSB_STS[5:0] | R | 000000b | MSB bits for primary ASI or secondary ASI FSYNC to clock source ratio detected. |

8.1.1.60 CLK_DET_STS3 Register (Address = 0x41) [Reset = 0x00]

CLK_DET_STS3 is shown in [Table 8-62](#).

Return to the [Summary Table](#).

This register is the clock ratio detection register 3.

Table 8-62. CLK_DET_STS3 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------------|------|-----------|---|
| 7-0 | FS_CLKSRC_RATIO_DE T_LSB_STS[7:0] | R | 00000000b | LSB byte for primary ASI or secondary ASI FSYNC to clock source ratio detected. |

8.1.1.61 INT_CFG Register (Address = 0x42) [Reset = 0x00]

INT_CFG is shown in [Table 8-63](#).

Return to the [Summary Table](#).

This register is the interrupt configuration register.

Table 8-63. INT_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|--------------------|------|-------|---|
| 7 | INT_POL | R/W | 0b | Interrupt polarity. 0b = Active low (IRQZ) 1b = Active high (IRQ) |
| 6-5 | INT_EVENT[1:0] | R/W | 00b | Interrupt event configuration. 0d = INT asserts on any unmasked latched interrupts event 1d = INT asserts on any unmasked live interrupts event 2d = INT asserts for 2 ms (typical) for every 4-ms (typical) duration on any unmasked latched interrupts event 3d = INT asserts for 2 ms (typical) one time on each pulse for any unmasked interrupts event |
| 4-3 | PD_ON_FLT_CFG[1:0] | R/W | 00b | Power down configuration during fault for chx and micbias. 0d = Faults are not considered for power down 1d = Only unmasked faults are considered for power down 2d = All faults are considered for power down 3d = Reserved |
| 2 | LTCH_READ_CFG | R/W | 0b | Interrupt latch registers readback configuration. 0b = All interrupts can be read through the LTCH registers 1b = Only unmasked interrupts can be read through the LTCH registers |
| 1 | PD_ON_FLT_RCV_CFG | R/W | 0b | Configuration for Power down ADC channels on fault 0b = Auto recovery, ADC channels are re-powered up when fault goes away 1b = Manual recovery, ADC channels are not re-powered up when fault goes away |
| 0 | LTCH_CLR_ON_READ | R/W | 0b | Cfgn for clearing LTCH register bits 0 = LTCH reg bits are cleared on reg read only if live status is zero 1 = LTCH reg bits are cleared on reg read irrespective of live status |

8.1.1.62 DAC_FLT_CFG Register (Address = 0x43) [Reset = 0x54]

DAC_FLT_CFG is shown in [Table 8-64](#).

Return to the [Summary Table](#).

This register is the interrupt configuration register.

Table 8-64. DAC_FLT_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-------|---|
| 7 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 6-5 | DAC_PD_ON_FLT_CFG[1:0] | R/W | 10b | Power down configuration during fault for DAC . 0d = Faults are not considered for power down 1d = Only unmasked faults are considered for power down 2d = All faults are considered for power down 3d = Reserved |
| 4 | DAC_PD_ON_FLT_RCV_CFG | R/W | 1b | Configuration for Power down DAC channels on fault 0b = Auto recovery, DAC channels are re-powered up when fault goes away 1b = Manual recovery, DAC channels are not re-powered up when fault goes away |
| 3 | OUT_CHx_PD_FLT_STS | R | 0b | Status for PD on OUTxx faults 0d = No DAC Channel is Powered Down due to fault/s 1d = Some DAC Channel is Powered Down due to fault/s |
| 2 | DAC_DIS_PD_W_PU | R/W | 1b | Disable power down on DRVR VG fault while powering up DAC 0b = Power down DAC on DRVR VG fault while power up 1b = Disable power down DAC on DRVR VG fault while power up |
| 1 | DAC_FLT_DET_DIS | R/W | 0b | DAC vg_fault/sc_fault detect config 0b = enable 1b = disable |
| 0 | AREG_SC_FLAG_DET_DIS | R/W | 0b | AREG short circuit detect config 0b = enable 1b = disable |

8.1.1.63 ADC_DAC_MISC_CFG Register (Address = 0x4B) [Reset = 0x00]

ADC_DAC_MISC_CFG is shown in [Table 8-65](#).

Return to the [Summary Table](#).

This register is the ADC overload response configuration register. It gives option to mute the ADC channel in overload recovery phase to avoid audible artifacts. Overload recovery phase is protection mechanism for inputs like step input where there is abrupt change in level.

Table 8-65. ADC_DAC_MISC_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------|------|-------|--|
| 7 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 6 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 5 | RESERVED | R | 0b | Reserved bit; Write only reset value |

| 3-2 | IADC_OSR_SEL[1:0] | R/W | 11b | IADC OSR select configuration. 0d = 32 1d = 64 2d = 96 3d = 128 |
| 1-0 | RESERVED | R | 0b | Reserved bits; Write only reset values |

8.1.1.65 VREF_MICBIAS_CFG Register (Address = 0x4D) [Reset = 0x00]

VREF_MICBIAS_CFG is shown in [Table 8-67](#).

Return to the [Summary Table](#).

This register is the configuration register for VREF and MICBIAS.

Table 8-67. VREF_MICBIAS_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------|------|-------|---|
| 7-5 | RESERVED | R | 0b | Reserved bits; Write only reset values |
| 4 | MICBIAS_LDO_GAIN | R/W | 0b | MICBIAS Output Gain Setting 0d = LDO gain = 1 1d = LDO gain = 1.096 |
| 3-2 | MICBIAS_VAL[1:0] | R/W | 00b | MICBIAS Output Setting 0d = Microphone Bias is set to VREF 1d = Microphone Bias is set to VREF/2 (Valid only for VREF_FSCALE 0 or 1 setting) 2d = Reserved 3d = Microphone Bias output is bypassed to AVDD |
| 1-0 | VREF_FSCALE[1:0] | R/W | 00b | VREF/Full-Scale Setting (Need to configure this based on AVDD min voltage used) 0d = VREF set to 2.75 V to support 2 V _{RMS} for Differential Input or 1 V _{RMS} for Single-Ended Input 1d = VREF set to 2.5 V to support 1.818 V _{RMS} for Differential Input or 0.909 V _{RMS} for Single-Ended Input 2d = VREF set to 1.375 V to support 1 V _{RMS} for Differential Input or 0.5 V _{RMS} for Single-Ended Input 3d = Reserved |

8.1.1.66 PWR_TUNE_CFG0 Register (Address = 0x4E) [Reset = 0x00]

PWR_TUNE_CFG0 is shown in [Table 8-68](#).

Return to the [Summary Table](#).

This register is configuration register 0 for power tune configuration.

Table 8-68. PWR_TUNE_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|--------------------|------|-------|---|
| 7 | ADC_CLK_BY2_MODE | R/W | 0b | ADC MOD CLK select configuration. 0d = MOD CLK 3.072MHz or 2.8224MHz 1d = MOD CLK 1.536MHz or 1.4112MHz |
| 6 | ADC_CIC_ORDER | R/W | 0b | ADC CIC order configuration. 0d = 5th order CIC 1d = 4th order CIC |
| 5 | ADC_FIR_BYPASS | R/W | 0b | ADC FIR bypass configuration. 0d = Bypass disable 1d = Bypass enable |
| 4 | ADC_DEM_RATE_OVRD | R/W | 0b | ADC DEM rate override configuration. 0d = Default 1d = 2x |
| 3 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 2 | ADC_LOW_PWR_FILTER | R/W | 0b | Low Power filter configuration for ADC 0d = Disable 1d = Enable |
| 1-0 | RESERVED | R | 0b | Reserved bits; Write only reset values |

8.1.1.67 PWR_TUNE_CFG1 Register (Address = 0x4F) [Reset = 0x00]

PWR_TUNE_CFG1 is shown in [Table 8-69](#).

Return to the [Summary Table](#).

This register is configuration register for power tune configuration.

Table 8-69. PWR_TUNE_CFG1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|--------------------|------|-------|---|
| 7 | DAC_CLK_BY2_MODE | R/W | 0b | DAC MOD CLK select configuration. 0d = MOD CLK 3MHz 1d = MOD CLK 1.5MHz |
| 6 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 5 | RESERVED | R | 0b | Reserved bit; Write only reset value |

| 0 | RESERVED | R | 0b | Reserved bit; Write only reset value |

8.1.1.68 ADC_CH1_CFG0 Register (Address = 0x50) [Reset = 0x00]

ADC_CH1_CFG0 is shown in [Table 8-70](#).

Return to the [Summary Table](#).

This register is configuration register 0 for ADC channel 1.

Table 8-70. ADC_CH1_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------|------|-------|--|
| 7-6 | ADC_CH1_INSRC[1:0] | R/W | 00b | ADC Channel 1 input configuration. 0d = Analog differential input 1d = Analog single-ended input 2d = Analog single-ended mux INP1 input 3d = Analog single-ended mux INM1 input |
| 5-4 | ADC_CH1_IMP[1:0] | R/W | 00b | ADC Channel 1 input impedance (applicable for the analog input). 0d = Typical 5kΩ input impedance (For 4 Vrms case it will be 10kΩ) 1d = Typical 10kΩ input impedance 2d = Typical 40kΩ input impedance 3d = Reserved |
| 3-2 | ADC_CH1_CM_TOL[1:0] | R/W | 00b | ADC Channel 1 input coupling (applicable for the analog input). 0d = AC-coupled input with common mode variance tolerance supported 50 mVpp for single ended and 100 mVpp for differential configuration 1d = AC-coupled / DC-coupled input with common mode variance tolerance supported 500 mVpp for single ended and 1 Vpp for differential configuration 2d = AC-coupled / DC-coupled input with common mode variance tolerance supported rail to rail (supply to ground) (High CMRR tolerance mode) 3d = Reserved |
| 1 | ADC_CH1_FULLSCALE_VAL | R/W | 0b | ADC Channel 1 Full-scale value for VREF=2.75 V (applicable for the analog input). 0d = 2 Vrms differential (1 Vrms for single ended operation) 1d = 4 Vrms differential (2 Vrms for single ended operation) (For AC-coupled configuration external biasing is required for input common mode, this mode supported with common mode variance tolerance rail to rail) (only 2.75 VREF supported, only supported in audio band-width mode) |
| 0 | ADC_CH1_BW_MODE | R/W | 0b | ADC Channel 1 band-width selection. coupling (applicable for the analog input). 0d = audio band-width (24 kHz mode) 1d = wide band-width (96 kHz mode) (Supported only for 40kΩ input impedance case) |

8.1.1.69 IADC_CH_CFG Register (Address = 0x51) [Reset = 0x00]

IADC_CH_CFG is shown in [Table 8-71](#).

Return to the [Summary Table](#).

This register is configuration register for ADC channels in IADC mode.

Table 8-71. IADC_CH_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|---------------------|------|-------|--|
| 7 | IADC_EN | R/W | 0b | IADC enable configuration. 0d = IADC disabled 1d = IADC enabled |
| 6-5 | IADC_MODE[1:0] | R/W | 00b | IADC mode configuration. (for single channel mode channel select is controlled by ADC_INSRC SE_MUX config) 0d = One-shot single channel 1d = One-shot multi channel 2d = Sequential single channel 3d = Sequential multi channel |
| 4 | IADC_CONVST_ONESHOT | R/W | 0b | IADC conversion start one short configuration. 0d = No conversion 1d = Start one shot conversion |
| 3 | IADC_STOP_SEQ_CONV | R/W | 0b | IADC stop sequential conversion configuration. 0d = Sequential conversion running 1d = Stop sequential conversion |

Table 8-71. IADC_CH_CFG Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------------------------|------|-------|---|
| 2 | IADC_ONESHOT_CONV_DONE_STS | R | 0b | IADC one shot conversion done configuration. 0d = Conversion not done 1d = One shot conversion done |
| 1-0 | RESERVED | R | 0b | Reserved bits; Write only reset value |

8.1.1.70 ADC_CH1_CFG2 Register (Address = 0x52) [Reset = 0xA1]

ADC_CH1_CFG2 is shown in [Table 8-72](#).

Return to the [Summary Table](#).

This register is configuration register 2 for ADC channel 1.

Table 8-72. ADC_CH1_CFG2 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-----------|---|
| 7-0 | ADC_CH1_DVOL[7:0] | R/W | 10100001b | Channel 1 digital volume control. 0d = Digital volume is muted 1d = Digital volume control is set to -80 dB 2d = Digital volume control is set to -79.5 dB 3d to 160d = Digital volume control is set as per configuration 161d = Digital volume control is set to 0 dB 162d = Digital volume control is set to 0.5 dB 163d to 253d = Digital volume control is set as per configuration 254d = Digital volume control is set to 46.5 dB 255d = Digital volume control is set to 47 dB |

8.1.1.71 ADC_CH1_CFG3 Register (Address = 0x53) [Reset = 0x80]

ADC_CH1_CFG3 is shown in [Table 8-73](#).

Return to the [Summary Table](#).

This register is configuration register 3 for ADC channel 1.

Table 8-73. ADC_CH1_CFG3 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|--------------------|------|-------|--|
| 7-4 | ADC_CH1_FGAIN[3:0] | R/W | 1000b | ADC channel 1 fine gain calibration. 0d = Fine gain is set to -0.8 dB 1d = Fine gain is set to -0.7 dB 2d = Fine gain is set to -0.6 dB 3d to 7d = Fine gain is set as per configuration 8d = Fine gain is set to 0 dB 9d = Fine gain is set to 0.1 dB 10d to 13d = Fine gain is set as per configuration 14d = Fine gain is set to 0.6 dB 15d = Fine gain is set to 0.7 dB |
| 3-0 | RESERVED | R | 0b | Reserved bits; Write only reset value |

8.1.1.72 ADC_CH1_CFG4 Register (Address = 0x54) [Reset = 0x00]

ADC_CH1_CFG4 is shown in [Table 8-74](#).

Return to the [Summary Table](#).

This register is configuration register 4 for ADC channel 1.

Table 8-74. ADC_CH1_CFG4 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------|------|---------|--|
| 7-2 | ADC_CH1_PCAL[5:0] | R/W | 000000b | ADC channel 1 phase calibration with modulator clock resolution. 0d = No phase calibration 1d = Phase calibration delay is set to one cycle of the modulator clock 2d = Phase calibration delay is set to two cycles of the modulator clock 3d to 62d = Phase calibration delay as per configuration 63d = Phase calibration delay is set to 63 cycles of the modulator clock |
| 1-0 | PCAL_ANA_DIG_SEL[1:0] | R/W | 00b | PCAL support configuration. 0d = Pcal for both Ana-Dig supported 1d = Pcal for only Ana 2d = Pcal for only Dig 3d = Reserved |

8.1.1.73 ADC_CH2_CFG0 Register (Address = 0x55) [Reset = 0x00]

ADC_CH2_CFG0 is shown in [Table 8-75](#).

Return to the [Summary Table](#).

This register is configuration register 0 for ADC channel 2.

Table 8-75. ADC_CH2_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------|------|-------|--|
| 7-6 | ADC_CH2_INSRC[1:0] | R/W | 00b | ADC Channel 2 input configuration. 0d = Analog differential input 1d = Analog single-ended input 2d = Analog single-ended mux INP2 input 3d = Analog single-ended mux INM2 input |
| 5-4 | ADC_CH2_IMP[1:0] | R/W | 00b | ADC Channel 2 input impedance (applicable for the analog input). 0d = Typical 5kΩ input impedance (For 4 Vrms case it will be 10kΩ) 1d = Typical 10kΩ input impedance 2d = Typical 40kΩ input impedance 3d = Reserved |
| 3-2 | ADC_CH2_CM_TOL[1:0] | R/W | 00b | ADC Channel 2 input coupling (applicable for the analog input). 0d = AC-coupled input with common mode variance tolerance supported 50 mVpp for single ended and 100 mVpp for differential configuration 1d = AC-coupled / DC-coupled input with common mode variance tolerance supported 500 mVpp for single ended and 1 Vpp for differential configuration 2d = AC-coupled / DC-coupled input with common mode variance tolerance supported rail to rail (supply to ground) (High CMRR tolerance mode) 3d = Reserved |
| 1 | ADC_CH2_FULLSCALE_VAL | R/W | 0b | ADC Channel 2 Full-scale value for VREF=2.75 V (applicable for the analog input). 0d = 2 Vrms differential (1 Vrms for single ended operation) 1d = 4 Vrms differential (2 Vrms for single ended operation) (For AC-coupled configuration external biasing is required for input common mode, this mode supported with common mode variance tolerance rail to rail) (only 2.75 VREF supported, only supported in audio band-width mode) |
| 0 | ADC_CH2_BW_MODE | R/W | 0b | ADC Channel 2 band-width selection. coupling (applicable for the analog input). 0d = audio band-width (24 kHz mode) 1d = wide band-width (96 kHz mode) (Supported only for 40kΩ input impedance case) |

8.1.1.74 ADC_CH2_CFG2 Register (Address = 0x57) [Reset = 0xA1]

ADC_CH2_CFG2 is shown in [Table 8-76](#).

Return to the [Summary Table](#).

This register is configuration register 2 for channel 2.

Table 8-76. ADC_CH2_CFG2 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-----------|---|
| 7-0 | ADC_CH2_DVOL[7:0] | R/W | 10100001b | Channel 1 digital volume control. 0d = Digital volume is muted 1d = Digital volume control is set to -80 dB 2d = Digital volume control is set to -79.5 dB 3d to 160d = Digital volume control is set as per configuration 161d = Digital volume control is set to 0 dB 162d = Digital volume control is set to 0.5 dB 163d to 253d = Digital volume control is set as per configuration 254d = Digital volume control is set to 46.5 dB 255d = Digital volume control is set to 47 dB |

8.1.1.75 ADC_CH2_CFG3 Register (Address = 0x58) [Reset = 0x80]

ADC_CH2_CFG3 is shown in [Table 8-77](#).

Return to the [Summary Table](#).

This register is configuration register 3 for ADC Channel 2.

Table 8-77. ADC_CH2_CFG3 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|--------------------|------|-------|--|
| 7-4 | ADC_CH2_FGAIN[3:0] | R/W | 1000b | ADC Channel 2 fine gain calibration. 0d = Fine gain is set to -0.8 dB 1d = Fine gain is set to -0.7 dB 2d = Fine gain is set to -0.6 dB 3d to 7d = Fine gain is set as per configuration 8d = Fine gain is set to 0 dB 9d = Fine gain is set to 0.1 dB 10d to 13d = Fine gain is set as per configuration 14d = Fine gain is set to 0.6 dB 15d = Fine gain is set to 0.7 dB |
| 3-0 | RESERVED | R | 0b | Reserved bits; Write only reset value |

8.1.1.76 ADC_CH2_CFG4 Register (Address = 0x59) [Reset = 0x00]

ADC_CH2_CFG4 is shown in [Table 8-78](#).

Return to the [Summary Table](#).

This register is configuration register 4 for ADC Channel 2.

Table 8-78. ADC_CH2_CFG4 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|---------|--|
| 7-2 | ADC_CH2_PCAL[5:0] | R/W | 000000b | ADC Channel 2 phase calibration with modulator clock resolution. 0d = No phase calibration 1d = Phase calibration delay is set to one cycle of the modulator clock 2d = Phase calibration delay is set to two cycles of the modulator clock 3d to 62d = Phase calibration delay as per configuration 63d = Phase calibration delay is set to 63 cycles of the modulator clock |

| 7-5 | MODE_STS[2:0] | R | 100b | Device mode status. 0-3d = Reserved 4d = Device is in sleep mode or software shutdown mode 5d = Reserved 6d = Device is in active mode with all record and playback channels turned off 7d = Device is in active mode with at least one record or playback channel turned on |
| 4 | PLL_STS | R | 0b | PLL status. 0d = PLL is not enabled 1d = PLL is enabled |
| 3 | MICBIAS_STS | R | 0b | MICBIAS status. 0d = MICBIAS is disabled 1d = MICBIAS is enabled |
| 2 | BOOST_STS | R | 0b | Boost status. 0d = Boost is disabled 1d = Boost is enabled |
| 1 | CHx_PD_FLT_STS | R | 0b | Status for PD on INxx Analog inputs faults 0d = No ADC Channel is Powered Down due to fault/s on Analog inputs INxx 1d = Some ADC Channel is Powered Down due to fault/s on Analog inputs INxx |

Table 8-108. DEV_STS1 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|--------------------|------|-------|--|
| 0 | ALL_CHx_PD_FLT_STS | R | 0b | Status for PD on Micbias faults 0d = No ADC Channel is Powered Down due to fault/s related to Micbias 1d = All ADC Channels are Powered Down due to fault/s related to Micbias |

8.1.1.107 I2C_CKSUM Register (Address = 0x7E) [Reset = 0x00]

I2C_CKSUM is shown in [Table 8-109](#).

Return to the [Summary Table](#).

This register returns the I²C transactions checksum value.

Table 8-109. I2C_CKSUM Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------|------|-----------|--|
| 7-0 | I2C_CKSUM[7:0] | R/W | 00000000b | These bits return the I ² C transactions checksum value. Writing to this register resets the checksum to the written value. This register is updated on writes to other registers on all pages. |

8.1.2 B0_P1 Registers

Table 8-110 lists the memory-mapped registers for the B0_P1 registers. All register offset addresses not listed in Table 8-110 should be considered as reserved locations and the register contents should not be modified.

Table 8-110. B0_P1 Registers

| Address | Acronym | Register Name | Reset Value | Section |
|---------|--------------------|--|-------------|----------------------------------|
| 0x0 | PAGE_CFG | Device page register | 0x00 | Section 8.1.2.1 |
| 0x3 | DSP_CFG0 | DSP configuration register 0 | 0x00 | Section 8.1.2.2 |
| 0xD | CLK_CFG0 | Clock configuration register 0 | 0x00 | Section 8.1.2.3 |
| 0xE | CHANNEL_CFG1 | ADC channel configuration register | 0x00 | Section 8.1.2.4 |
| 0xF | CHANNEL_CFG2 | DAC channel configuration register | 0x00 | Section 8.1.2.5 |
| 0x17 | SRC_CFG0 | SRC configuration register 1 | 0x00 | Section 8.1.2.6 |
| 0x18 | SRC_CFG1 | SRC configuration register 2 | 0x00 | Section 8.1.2.7 |
| 0x19 | JACK_DET_CFG0 | Jack Detection configuration register 0 | 0x00 | Section 8.1.2.8 |
| 0x1A | JACK_DET_CFG1 | Jack Detection configuration register 1 | 0x00 | Section 8.1.2.9 |
| 0x1B | JACK_DET_CFG2 | Jack Detection configuration register 2 | 0x00 | Section 8.1.2.10 |
| 0x1C | JACK_DET_CFG3 | Jack Detection configuration register 3 | 0x00 | Section 8.1.2.11 |
| 0x1E | LPAD_CFG1 | Low power activity detection configuration register | 0x20 | Section 8.1.2.12 |

8.1.2.1 PAGE_CFG Register (Address = 0x0) [Reset = 0x00]

PAGE_CFG is shown in [Table 8-111](#).

Return to the [Summary Table](#).

The device memory map is divided into pages. This register sets the page.

Table 8-111. PAGE_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------|------|-----------|--|
| 7-0 | PAGE[7:0] | R/W | 00000000b | These bits set the device page. 0d = Page 0 1d = Page 1 2d to 254d = Page 2 to page 254 respectively 255d = Page 255 |

8.1.2.2 DSP_CFG0 Register (Address = 0x3) [Reset = 0x00]

DSP_CFG0 is shown in [Table 8-112](#).

Return to the [Summary Table](#).

This register is the configuration register for on-the-fly filter updates.

Table 8-112. DSP_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|--------------------------------------|
| 7 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 6 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 5 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 4 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 3 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 2 | RESERVED | R | 0b | Reserved bit; Write only reset value |

Table 8-112. DSP_CFG0 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------------|------|-------|--|
| 1 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 0 | EN_BQ_OTF_CHG | R/W | 0b | Enable run-time changes to Biquad settings. 0d = Disable on the fly biquad changes 1d = Enable on the fly biquad changes |

8.1.2.3 CLK_CFG0 Register (Address = 0xD) [Reset = 0x00]

CLK_CFG0 is shown in [Table 8-113](#).

Return to the [Summary Table](#).

This register is the Clock configuration register 0.

Table 8-113. CLK_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------|------|-------|---|
| 7 | CNT_TGT_CFG_OVR_PASI | R/W | 0b | ASI controller target Config Override Register 0d = controller-target Config as per PASI_CNT_CFG bit. 1d = Override the standard behavior of the PASI_CNT_CFG. In this case the clock auto detect feature is not available. PASI_CNT_CFG = 0 : BCLK is input but FSYNC is output. PASI_CNT_CFG = 1 : BCLK is output but FSYNC in input. |
| 6 | CNT_TGT_CFG_OVR_SASI | R/W | 0b | ASI controller target Config Override Register 0d = controller-target Config as per SASI_CNT_CFG bit. 1d = Override the standard behavior of the SASI_CNT_CFG. In this case the clock auto detect feature is not available. SASI_CNT_CFG = 0 : BCLK is input but FSYNC is output. SASI_CNT_CFG = 1 : BCLK is output but FSYNC in input. |
| 5-3 | RESERVED | R | 0b | Reserved bits; Write only reset value |
| 2 | PASI_USE_INT_FSYNC | R/W | 0b | For Primary use internal FSYNC in controller mode configuration. 0d = Use external FSYNC 1d = Use internal FSYNC |
| 1 | SASI_USE_INT_FSYNC | R/W | 0b | For Secondary use internal FSYNC in controller mode configuration. 0d = Use external FSYNC 1d = Use internal FSYNC |
| 0 | RESERVED | R | 0b | Reserved bit; Write only reset value |

8.1.2.4 CHANNEL_CFG1 Register (Address = 0xE) [Reset = 0x00]

CHANNEL_CFG1 is shown in [Table 8-114](#).

Return to the [Summary Table](#).

This is the ADC channel dynamic power-on or off configuration register.

Table 8-114. CHANNEL_CFG1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------------|------|-------|--|
| 7 | FORCE_DYN_MODE_CUST_MAX_CH | R/W | 0b | ADC Force dynamic mode custom max channel 0d = In Dynamic, Max channel is based on ADC_DYN_MAXCH_SEL 1d = In Dynamic mode, max channel is custom as DYN_MODE_CUST_MAX_CH |
| 6-3 | DYN_MODE_CUST_MAX_CH[3:0] | R/W | 0000b | ADC Dynamic mode custom max channel configuration [3]->CH4_EN [2]->CH3_EN [1]->CH2_EN [0]->CH1_EN |
| 2-0 | RESERVED | R | 0b | Reserved bits; Write only reset values |

8.1.2.5 CHANNEL_CFG2 Register (Address = 0xF) [Reset = 0x00]

CHANNEL_CFG2 is shown in [Table 8-115](#).

Return to the [Summary Table](#).

This is the DAC channel dynamic power-on or off configuration register.

Table 8-115. CHANNEL_CFG2 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|--------------------------------|------|-------|--|
| 7 | DAC_FORCE_DYN_MODE_CUST_MAX_CH | R/W | 0b | DAC Force dynamic mode custom max channel 0d = In Dynamic, Max channel is based on DAC_DYN_MAXCH_SEL 1d = In Dynamic mode, max channel is custom as per DAC_DYN_MODE_CUST_MAX_CH |
| 6-3 | DAC_DYN_MODE_CUST_MAX_CH[3:0] | R/W | 0000b | DAC Dynamic mode custom max channel configuration ([3]->CH4_EN, [2]->CH3_EN, [1]->CH2_EN, [0]->CH1_EN) [3]->CH4_EN [2]->CH3_EN [1]->CH2_EN [0]->CH1_EN |

8.1.2.14 LPAD_LPSG_CFG1 Register (Address = 0x20) [Reset = 0x00]

LPAD_LPSG_CFG1 is shown in [Table 8-124](#).

Return to the [Summary Table](#).

This register is configuration register 1 for VAD/UAD/UAG.

Table 8-124. LPAD_LPSG_CFG1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------------|------|-------|---|
| 7-6 | LPAD_LPSG_CLK_CFG[1:0] | R/W | 00b | Clock select for VAD/UAD/UAG 0d = VAD/UAD/UAG processing using internal oscillator clock 1d = VAD/UAD/UAG processing using external clock on BCLK input 2d = VAD/UAD/UAG processing using external clock on CCLK input 3d = Custom clock configuration based on CNT_CFG, CLK_SRC and CLKGEN_CFG registers in page 0 |
| 5-4 | LPAD_LPSG_EXT_CLK_CFG[1:0] | R/W | 00b | Clock configuration using external clock for VAD/UAD/UAG 0d = External clock is 24.576 MHz 1d = Reserved 2d = External clock is 12.288 MHz 3d = External clock is 18.432 MHz |
| 3 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 2 | LPAD_PH1_EN | R/W | 0b | Enable LPAD Phase 1 detection through Jack Detection comparator. 0d = LPAD phase 1 disabled 1d = LPAD phase 1 enabled |
| 1-0 | RESERVED | R | 0b | Reserved bits; Write only reset values |

8.1.2.15 LIMITER_CFG Register (Address = 0x23) [Reset = 0x00]

LIMITER_CFG is shown in [Table 8-125](#).

Return to the [Summary Table](#).

This register is configuration register for Limiter.

Table 8-125. LIMITER_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------|------|-------|---|
| 7-6 | LIMITER_INP_SEL[1:0] | R/W | 00b | Limiter input select config 0d = max(dacin_ch0, dacin_ch1) 1d = dacin_ch1 2d = dacin_ch0 3d = avg(dacin_ch0, dacin_ch1) |
| 5-4 | LIMITER_OUT_SEL[1:0] | R/W | 00b | Limiter output select config 0d = applied on both 1d = dacin_ch1 2d = dacin_ch0 3d = applied none |
| 3-0 | RESERVED | R | 0b | Reserved bits; Write only reset values |

8.1.2.16 AGC_DRC_CFG Register (Address = 0x24) [Reset = 0x00]

AGC_DRC_CFG is shown in [Table 8-126](#).

Return to the [Summary Table](#).

This register is configuration register for AGC and DRC.

Table 8-126. AGC_DRC_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------|------|-------|--|
| 7 | AGC_CH1_EN | R/W | 0b | AGC Channel 1 enable config 0d = disable 1d = enable |
| 6 | AGC_CH2_EN | R/W | 0b | AGC Channel 2 enable config 0d = disable 1d = enable |
| 5 | AGC_CH3_EN | R/W | 0b | AGC Channel 3 enable config 0d = disable 1d = enable |
| 4 | AGC_CH4_EN | R/W | 0b | AGC Channel 4 enable config 0d = disable 1d = enable |
| 3 | DRC_CH1_EN | R/W | 0b | DRC Channel 1 enable config 0d = disable 1d = enable |
| 2 | DRC_CH2_EN | R/W | 0b | DRC Channel 2 enable config 0d = disable 1d = enable |
| 1 | DRC_CH3_EN | R/W | 0b | DRC Channel 3 enable config 0d = disable 1d = enable |
| 0 | DRC_CH4_EN | R/W | 0b | DRC Channel 4 enable config 0d = disable 1d = enable |

8.1.2.17 PLIM_CFG0 Register (Address = 0x2B) [Reset = 0x00]

PLIM_CFG0 is shown in [Table 8-127](#).

Return to the [Summary Table](#).

This register is configuration register 0 for PLIM.

Table 8-127. PLIM_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|---------------------|------|-------|--|
| 7 | EN_PLIM | R/W | 0b | Enable PLIM 0d = Disable 1d = Enable |
| 6-4 | PLIM_ATTEN_VAL[2:0] | R/W | 000b | PLIM attenuation factor 0d = 0dB 1d = -6dB 2d = -12dB 3d = -18dB 4d = -24dB 5d = -30dB 6d = -36dB 7d = -42dB |
| 3 | PLIM_BY_SAR_GPA | R/W | 0b | PLIM attenuation value source 0d = Plimit attenuation based on GPIO and reg_plimi_attn_val 1d = Plimit attenuation based on GPA Analog voltage. LUT will map SAR ADC data to Attenuation factor |
| 2 | PLIM_RECOVERY | R/W | 0b | PLIM attenuation recovery 0d = Plimit func doesn't recover. It stays at same attenuation level or can apply more attenuation if required 1d = Plimit func recovers (reduces the attenuation) if "gpio_val=0" or "sar_adc_gpa" data suggest that Battery Voltage has recovered then we can reduce the attenuation being applied |
| 1-0 | RESERVED | R | 0b | Reserved bits; Write only reset value |

8.1.2.18 MIXER_CFG0 Register (Address = 0x2C) [Reset = 0x00]

MIXER_CFG0 is shown in [Table 8-128](#).

Return to the [Summary Table](#).

This register is the MIXER configuration register 0.

Table 8-128. MIXER_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------|------|-------|---|
| 7 | EN_DAC_ASI_MIXER | R/W | 0b | Enable DAC ASI Mixer 0b = Disabled 1b = Enabled |
| 6 | EN_SIDE_CHAIN_MIXER | R/W | 0b | Enable Side Chain Mixer 0b = Disabled 1b = Enabled |
| 5 | EN_ADC_CHANNEL_MIXER | R/W | 0b | Enable ADC Channel Mixer 0b = Disabled 1b = Enabled |
| 4 | EN_LOOPBACK_MIXER | R/W | 0b | Enable Loopback Mixer 0b = Disabled 1b = Enabled |
| 3-0 | RESERVED | R | 0b | Reserved bits; Write only reset value |

8.1.2.19 MISC_CFG0 Register (Address = 0x2D) [Reset = 0x00]

MISC_CFG0 is shown in [Table 8-129](#).

Return to the [Summary Table](#).

This register is the miscellaneous configuration register 0.

Table 8-129. MISC_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------------------|------|-------|---|
| 7 | EN_DISTORTION | R/W | 0b | Distortion Limiter enable config 0b = Distortion Limiter disable 1b = Distortion Limiter enable |
| 6 | EN_BOP | R/W | 0b | BOP enable config 0b = BOP disable 1b = BOP enable |
| 5 | EN_THERMAL_FOLDBACK | R/W | 0b | Thermal Foldback enable config 0b = Thermal Foldback disable 1b = Thermal Foldback enable |
| 4 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 3 | DAC_SIGNAL_GENERATOR_1_ENABLE | R/W | 0b | DAC signal generator 1 enable config 0b = Signal generator disabled 1b = Signal generator enabled |
| 2 | DAC_SIGNAL_GENERATOR_2_ENABLE | R/W | 0b | DAC signal generator 2 enable config 0b = Signal generator disabled 1b = Signal generator enabled |
| 1 | DSP_AVDD_SEL | R/W | 0b | SAR data source select for DSP Limiter, BOP, DRC 0b = Reserved 1b = SAR AVDD data to DSP |
| 0 | BRWNOUT_EN | R/W | 0b | Brownout enable config 0b = Brownout disable 1b = Brownout enable |

8.1.2.20 BRWNOUT Register (Address = 0x2E) [Reset = 0xBF]

BRWNOUT is shown in [Table 8-130](#).

Return to the [Summary Table](#).

This register is the brownout configuration register.

Table 8-130. BRWNOUT Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-----------|--|
| 7-0 | BRWNOUT_THRS[7:0] | R/W | 10111111b | Threshold for brownout shutdown Default = 7.8V ((IF P1_R45_D1->DSP_AVDD_SEL=1) = 2.7V) Nd = ((0.9*(N*16)/4095)-0.211764)*17 (V) ((IF P1_R45_D1->DSP_AVDD_SEL=1) = ((0.9*(N*16)/4095)-0.225)*6 (V)) |

8.1.2.21 INT_MASK0 Register (Address = 0x2F) [Reset = 0xFF]

INT_MASK0 is shown in [Table 8-131](#).

Return to the [Summary Table](#).

This register is the interrupt mask register 0.

Table 8-131. INT_MASK0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------|------|-------|---|
| 7 | INT_MASK0 | R/W | 1b | Clock error interrupt mask. 0b = Don't Mask 1b = Mask |
| 6 | INT_MASK0 | R/W | 1b | PLL Lock interrupt mask. 0b = Don't Mask 1b = Mask |
| 5 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 4 | RESERVED | R | 0b | Reserved bit; Write only reset value |

Table 8-131. INT_MASK0 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|--------------------------------------|
| 3 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 2 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 1 | RESERVED | R | 0b | Reserved bit; Write only reset value |

8.1.2.22 INT_MASK4 Register (Address = 0x32) [Reset = 0x00]

INT_MASK4 is shown in [Table 8-132](#).

Return to the [Summary Table](#).

This register is the interrupt mask register 4.

Table 8-132. INT_MASK4 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------|------|-------|--|
| 7 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 6 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 5 | INT_MASK4 | R/W | 0b | OUT Short Circuit Fault Interrupt Mask. 0b = Don't Mask 1b = Mask |
| 4 | INT_MASK4 | R/W | 0b | DRVR Virtual Ground Fault Interrupt Mask. 0b = Don't Mask 1b = Mask |
| 3 | INT_MASK4 | R/W | 0b | Headset insert detection interrupt mask. 0b = Don't Mask 1b = Mask |
| 2 | INT_MASK4 | R/W | 0b | Headset remove detection interrupt mask. 0b = Don't Mask 1b = Mask |
| 1 | INT_MASK4 | R/W | 0b | Headset detection hook(button) interrupt mask. 0b = Don't Mask 1b = Mask |
| 0 | RESERVED | R | 0b | Reserved bit; Write only reset value |

8.1.2.23 INT_MASK5 Register (Address = 0x33) [Reset = 0x30]

INT_MASK5 is shown in [Table 8-133](#).

Return to the [Summary Table](#).

This register is the interrupt mask register 5.

Table 8-133. INT_MASK5 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------|------|-------|---|
| 7 | INT_MASK5 | R/W | 0b | GPA up threshold fault mask. 0b = Don't Mask 1b = Mask |
| 6 | INT_MASK5 | R/W | 0b | GPA low threshold fault mask. 0b = Don't Mask 1b = Mask |
| 5 | INT_MASK5 | R/W | 1b | VAD power up detect interrupt mask. 0b = Don't Mask 1b = Mask |

Table 8-133. INT_MASK5 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-----------|------|-------|---|
| 4 | INT_MASK5 | R/W | 1b | VAD power down detect interrupt mask. 0b = Don't Mask 1b = Mask |

8.1.2.38 DIAGDATA_CFG Register (Address = 0x55) [Reset = 0x00]

DIAGDATA_CFG is shown in [Table 8-148](#).

Return to the [Summary Table](#).

This register is the input diagnostics data configuration register.

Table 8-148. DIAGDATA_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-------|---|
| 7-4 | RESERVED | R | 0b | Reserved bits; Write only reset values |
| 3 | IADC_DATA_IN_DIAG_REGS | R/W | 0b | IADC channel data in diagnostics channel data registers 0b= Disabled 1b= Enabled |
| 2 | HOLD_IADC_DATA | R/W | 0b | Hold IADC data update during register readback 0b= Data update is not held, Data register is continuously updated 1b= Data update is held, Data register readback can be done |
| 1 | OVRD_TEMP_DATA | R/W | 0b | Override TEMP data 0b= Override Disabled 1b= Override Enabled |
| 0 | HOLD_SAR_DATA | R/W | 0b | Hold SAR data update during register readback 0b= Data update is not held, Data register is continuously updated 1b= Data update is held, Data register readback can be done |

8.1.2.39 DIAG_MON_MSB_MBIAS Register (Address = 0x58) [Reset = 0x00]

DIAG_MON_MSB_MBIAS is shown in [Table 8-149](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR MICBIAS monitor data MSB byte register.

Table 8-149. DIAG_MON_MSB_MBIAS Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_MBIAS[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.40 DIAG_MON_LSB_MBIAS Register (Address = 0x59) [Reset = 0x01]

DIAG_MON_LSB_MBIAS is shown in [Table 8-150](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR MICBIAS monitor data LSB nibble.

Table 8-150. DIAG_MON_LSB_MBIAS Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_MBIAS[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |
| 3-0 | Channel[3:0] | R | 0001b | Channel ID |

8.1.2.41 DIAG_MON_MSB_OUT1P Register (Address = 0x62) [Reset = 0x00]

DIAG_MON_MSB_OUT1P is shown in [Table 8-151](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR OUT1P monitor data MSB byte register.

Table 8-151. DIAG_MON_MSB_OUT1P Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_OUT_CH1P[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.42 DIAG_MON_LSB_OUT1P Register (Address = 0x63) [Reset = 0x06]

DIAG_MON_LSB_OUT1P is shown in [Table 8-152](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR OUT1P monitor data LSB nibble register.

Table 8-152. DIAG_MON_LSB_OUT1P Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_OUT_C H1P[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |
| 3-0 | Channel[3:0] | R | 0110b | Channel ID |

8.1.2.43 DIAG_MON_MSB_OUT1M Register (Address = 0x64) [Reset = 0x00]

DIAG_MON_MSB_OUT1M is shown in [Table 8-153](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR OUT1M monitor data MSB byte register.

Table 8-153. DIAG_MON_MSB_OUT1M Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_OUT_CH1N[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.44 DIAG_MON_LSB_OUT1M Register (Address = 0x65) [Reset = 0x07]

DIAG_MON_LSB_OUT1M is shown in [Table 8-154](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR OUT1M monitor data LSB nibble register.

Table 8-154. DIAG_MON_LSB_OUT1M Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_OUT_C H1N[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |

Table 8-154. DIAG_MON_LSB_OUT1M Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|--------------|------|-------|-------------|
| 3-0 | Channel[3:0] | R | 0111b | Channel ID |

8.1.2.45 DIAG_MON_MSB_OUT2P Register (Address = 0x66) [Reset = 0x00]

 DIAG_MON_MSB_OUT2P is shown in [Table 8-155](#).

 Return to the [Summary Table](#).

This register is the diagnostics SAR OUT2P monitor data MSB byte register.

Table 8-155. DIAG_MON_MSB_OUT2P Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_OUT_CH2P[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.46 DIAG_MON_LSB_OUT2P Register (Address = 0x67) [Reset = 0x08]

 DIAG_MON_LSB_OUT2P is shown in [Table 8-156](#).

 Return to the [Summary Table](#).

This register is the diagnostics SAR OUT2P monitor data LSB nibble register.

Table 8-156. DIAG_MON_LSB_OUT2P Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_OUT_C_H2P[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |
| 3-0 | Channel[3:0] | R | 1000b | Channel ID |

8.1.2.47 DIAG_MON_MSB_OUT2M Register (Address = 0x68) [Reset = 0x00]

 DIAG_MON_MSB_OUT2M is shown in [Table 8-157](#).

 Return to the [Summary Table](#).

This register is the diagnostics SAR OUT2M monitor data MSB byte register.

Table 8-157. DIAG_MON_MSB_OUT2M Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_OUT_CH2M[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.48 DIAG_MON_LSB_OUT2M Register (Address = 0x69) [Reset = 0x09]

 DIAG_MON_LSB_OUT2M is shown in [Table 8-158](#).

 Return to the [Summary Table](#).

This register is the diagnostics SAR OUT2M monitor data LSB nibble register.

Table 8-158. DIAG_MON_LSB_OUT2M Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_OUT_C_H2M[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |
| 3-0 | Channel[3:0] | R | 1001b | Channel ID |

8.1.2.49 DIAG_MON_MSB_TEMP Register (Address = 0x6A) [Reset = 0x00]

DIAG_MON_MSB_TEMP is shown in [Table 8-159](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR Temperature monitor data MSB byte register.

Table 8-159. DIAG_MON_MSB_TEMP Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_TEMP[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.50 DIAG_MON_LSB_TEMP Register (Address = 0x6B) [Reset = 0x0A]

DIAG_MON_LSB_TEMP is shown in [Table 8-160](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR Temperature monitor data LSB nibble register.

Table 8-160. DIAG_MON_LSB_TEMP Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_TEMP[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |
| 3-0 | Channel[3:0] | R | 1010b | Channel ID |

8.1.2.51 DIAG_MON_MSB_MBIAS_LOAD Register (Address = 0x6C) [Reset = 0x00]

DIAG_MON_MSB_MBIAS_LOAD is shown in [Table 8-161](#).

Return to the [Summary Table](#).

This register is the diagnostics SAR MICBIAS LOAD Current monitor data MSB byte register.

Table 8-161. DIAG_MON_MSB_MBIAS_LOAD Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_MBIAS_LOAD[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.52 DIAG_MON_LSB_MBIAS_LOAD Register (Address = 0x6D) [Reset = 0x0B]

DIAG_MON_LSB_MBIAS_LOAD is shown in [Table 8-162](#).

Return to the [Summary Table](#).

This register is the diagnostic SAR MICBIAS LOAD Current monitor data LSB nibble register.

Table 8-162. DIAG_MON_LSB_MBIAS_LOAD Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_MBIAS_LOAD[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |
| 3-0 | Channel[3:0] | R | 1011b | Channel ID |

8.1.2.53 DIAG_MON_MSB_AVDD Register (Address = 0x6E) [Reset = 0x00]

DIAG_MON_MSB_AVDD is shown in [Table 8-163](#).

Return to the [Summary Table](#).

This register is the diagnostic SAR AVDD monitor data MSB byte register.

Table 8-163. DIAG_MON_MSB_AVDD Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_AVDD[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.54 DIAG_MON_LSB_AVDD Register (Address = 0x6F) [Reset = 0x0C]

DIAG_MON_LSB_AVDD is shown in [Table 8-164](#).

Return to the [Summary Table](#).

This register is the diagnostic SAR AVDD monitor data LSB nibble register

Table 8-164. DIAG_MON_LSB_AVDD Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_AVDD[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |
| 3-0 | Channel[3:0] | R | 1100b | Channel ID |

8.1.2.55 DIAG_MON_MSB_GPA Register (Address = 0x70) [Reset = 0x00]

DIAG_MON_MSB_GPA is shown in [Table 8-165](#).

Return to the [Summary Table](#).

This register is the diagnostic SAR GPA monitor data MSB byte register.

Table 8-165. DIAG_MON_MSB_GPA Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------|------|-----------|--------------------------------------|
| 7-0 | DIAG_MON_MSB_GPA[7:0] | R | 00000000b | Diagnostic SAR Monitor Data MSB Byte |

8.1.2.56 DIAG_MON_LSB_GPA Register (Address = 0x71) [Reset = 0x0D]

DIAG_MON_LSB_GPA is shown in [Table 8-166](#).

Return to the [Summary Table](#).

This register is the diagnostic SAR GPA monitor data LSB nibble register.

Table 8-166. DIAG_MON_LSB_GPA Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------|------|-------|--|
| 7-4 | DIAG_MON_LSB_GPA[3:0] | R | 0000b | Diagnostic SAR Monitor Data LSB Nibble |
| 3-0 | Channel[3:0] | R | 1101b | Channel ID |

8.1.3 Book0_Page3 Registers

Table 8-167 lists the memory-mapped registers for the Book0_Page3 registers. All register offset addresses not listed in Table 8-167 should be considered as reserved locations and the register contents should not be modified.

Table 8-167. BOOK0_PAGE3 Registers

| Address | Acronym | Register Name | Reset Value | Section |
|---------|-----------------|--|-------------|----------------------------------|
| 0x0 | PAGE_CFG | Device page register | 0x00 | Section 8.1.3.1 |
| 0x1A | SASI_CFG0 | Secondary ASI configuration register 0 | 0x30 | Section 8.1.3.2 |
| 0x1B | SASI_TX_CFG0 | SASI TX configuration register 0 | 0x00 | Section 8.1.3.3 |
| 0x1C | SASI_TX_CFG1 | SASI TX configuration register 1 | 0x00 | Section 8.1.3.4 |
| 0x1D | SASI_TX_CFG2 | SASI TX configuration register 2 | 0x00 | Section 8.1.3.5 |
| 0x1E | SASI_TX_CH1_CFG | SASI TX Channel 1 configuration register | 0x00 | Section 8.1.3.6 |
| 0x1F | SASI_TX_CH2_CFG | SASI TX Channel 2 configuration register | 0x01 | Section 8.1.3.7 |
| 0x20 | SASI_TX_CH3_CFG | SASI TX Channel 3 configuration register | 0x02 | Section 8.1.3.8 |
| 0x21 | SASI_TX_CH4_CFG | SASI TX Channel 4 configuration register | 0x03 | Section 8.1.3.9 |
| 0x22 | SASI_TX_CH5_CFG | SASI TX Channel 5 configuration register | 0x04 | Section 8.1.3.10 |

| 0x49 | SARCLK_CFG1 | SAR clock configuration register 1 | 0x00 | Section 8.1.3.41 |

Table 8-167. BOOK0_PAGE3 Registers (continued)

| Address | Acronym | Register Name | Reset Value | Section |
|---------|---------------|----------------------------|-------------|----------------------------------|
| 0x5B | ADC_OVRD_FLAG | ADC overload flag register | 0x00 | Section 8.1.3.42 |

8.1.3.1 PAGE_CFG Register (Address = 0x0) [Reset = 0x00]

PAGE_CFG is shown in [Table 8-168](#).

Return to the [Summary Table](#).

The device memory map is divided into pages. This register sets the page.

Table 8-168. PAGE_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------|------|----------|--|
| 7-0 | PAGE[7:0] | R/W | 0000000b | These bits set the device page. 0d = Page 0 1d = Page 1 2d to 254d = Page 2 to page 254 respectively 255d = Page 255 |

8.1.3.2 SASI_CFG0 Register (Address = 0x1A) [Reset = 0x30]

SASI_CFG0 is shown in [Table 8-169](#).

Return to the [Summary Table](#).

This register is the ASI configuration register 0.

Table 8-169. SASI_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-------|--|
| 7-6 | SASI_FORMAT[1:0] | R/W | 00b | Secondary ASI protocol format. 0d = TDM mode 1d = I ² S mode 2d = LJ (left-justified) mode 3d = Reserved; Don't use |
| 5-4 | SASI_WLEN[1:0] | R/W | 11b | Secondary ASI word or slot length. 0d = 16 bits (Recommended this setting to be used with 10kandx3A9;# input impedance configuration) 1d = 20 bits 2d = 24 bits 3d = 32 bits |
| 3 | SASI_FSYNC_POL | R/W | 0b | ASI FSYNC polarity (for SASI protocol only). 0d = Default polarity as per standard protocol 1d = Inverted polarity with respect to standard protocol |
| 2 | SASI_BCLK_POL | R/W | 0b | ASI BCLK polarity (for SASI protocol only). 0d = Default polarity as per standard protocol 1d = Inverted polarity with respect to standard protocol |
| 1 | SASI_BUS_ERR | R/W | 0b | ASI bus error detection. 0d = Enable bus error detection 1d = Disable bus error detection |
| 0 | SASI_BUS_ERR_RCOV | R/W | 0b | ASI bus error auto resume. 0d = Enable auto resume after bus error recovery 1d = Disable auto resume after bus error recovery and remain powered down until host configures the device |

8.1.3.3 SASI_TX_CFG0 Register (Address = 0x1B) [Reset = 0x00]

SASI_TX_CFG0 is shown in [Table 8-170](#).

Return to the [Summary Table](#).

This register is the SASI TX configuration register 0.

Table 8-170. SASI_TX_CFG0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------|------|-------|--|
| 7 | SASI_TX_EDGE | R/W | 0b | Secondary ASI data output (on the primary and secondary data pin) transmit edge. 0d = Default edge as per the protocol configuration setting in SASI_BCLK_POL 1d = Inverted following edge (half cycle delay) with respect to the default edge setting |
| 6 | SASI_TX_FILL | R/W | 0b | Secondary ASI data output (on the primary and secondary data pin) for any unused cycles 0d = Always transmit 0 for unused cycles 1d = Always use Hi-Z for unused cycles |
| 5 | SASI_TX_LSB | R/W | 0b | Secondary ASI data output (on the primary and secondary data pin) for LSB transmissions. 0d = Transmit the LSB for a full cycle 1d = Transmit the LSB for the first half cycle and Hi-Z for the second half cycle |
| 4-3 | SASI_TX_KEEPER[1:0] | R/W | 00b | Secondary ASI data output (on the primary and secondary data pin) bus keeper. 0d = Bus keeper is always disabled 1d = Bus keeper is always enabled 2d = Bus keeper is enabled during LSB transmissions only for one cycle 3d = Bus keeper is enabled during LSB transmissions only for one and half cycles |
| 2 | SASI_TX_USE_INT_FSYNC | R/W | 0b | Secondary ASI uses internal FSYNC for output data generation in controller mode configuration as applicable. 0d = Use external FSYNC for ASI protocol data generation 1d = Use internal FSYNC for ASI protocol data generation |
| 1 | SASI_TX_USE_INT_BCLK | R/W | 0b | Secondary ASI uses internal BCLK for output data generation in controller mode configuration. 0d = Use external BCLK for ASI protocol data generation 1d = Use internal BCLK for ASI protocol data generation |
| 0 | SASI_TDM_PULSE_WIDTH | R/W | 0b | Secondary ASI fsync pulse width in TDM format. 0d = Fsync pulse is 1 bclk period wide 1d = Fsync pulse is 2 bclk period wide |

8.1.3.4 SASI_TX_CFG1 Register (Address = 0x1C) [Reset = 0x00]

SASI_TX_CFG1 is shown in [Table 8-171](#).

Return to the [Summary Table](#).

This register is the SASI TX configuration register 1.

Table 8-171. SASI_TX_CFG1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|---------------------------------------|
| 7-5 | RESERVED | R | 0b | Reserved bits; Write only reset value |

Table 8-171. SASI_TX_CFG1 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------------------|------|--------|---|
| 4-0 | SASI_TX_OFFSET[4:0] | R/W | 00000b | Secondary ASI output data MSB slot 0 offset (on the primary and secondary data pin). 0d = ASI data MSB location has no offset and is as per standard protocol 1d = ASI data MSB location (TDM mode is slot 0 or I ² S, LJ mode is the left and right slot 0) offset of one BCLK cycle with respect to standard protocol 2d = ASI data MSB location (TDM mode is slot 0 or I ² S, LJ mode is the left and right slot 0) offset of two BCLK cycles with respect to standard protocol 3d to 30d = ASI data MSB location (TDM mode is slot 0 or I ² S, LJ mode is the left and right slot 0) offset assigned as per configuration 31d = ASI data MSB location (TDM mode is slot 0 or I ² S, LJ mode is the left and right slot 0) offset of 31 BCLK cycles with respect to standard protocol |

8.1.3.5 SASI_TX_CFG2 Register (Address = 0x1D) [Reset = 0x00]

SASI_TX_CFG2 is shown in [Table 8-172](#).

Return to the [Summary Table](#).

This register is the SASI TX configuration register 2.

Table 8-172. SASI_TX_CFG2 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------|------|-------|---|
| 7 | SASI_TX_CH8_SEL | R/W | 0b | Secondary ASI output channel 8 select. 0d = Secondary ASI channel 8 output is on DOUT 1d = Secondary ASI channel 8 output is on DOUT2 |
| 6 | SASI_TX_CH7_SEL | R/W | 0b | Secondary ASI output channel 7 select. 0d = Secondary ASI channel 7 output is on DOUT 1d = Secondary ASI channel 7 output is on DOUT2 |
| 5 | SASI_TX_CH6_SEL | R/W | 0b | Secondary ASI output channel 6 select. 0d = Secondary ASI channel 6 output is on DOUT 1d = Secondary ASI channel 6 output is on DOUT2 |
| 4 | SASI_TX_CH5_SEL | R/W | 0b | Secondary ASI output channel 5 select. 0d = Secondary ASI channel 5 output is on DOUT 1d = Secondary ASI channel 5 output is on DOUT2 |
| 3 | SASI_TX_CH4_SEL | R/W | 0b | Secondary ASI output channel 4 select. 0d = Secondary ASI channel 4 output is on DOUT 1d = Secondary ASI channel 4 output is on DOUT2 |
| 2 | SASI_TX_CH3_SEL | R/W | 0b | Secondary ASI output channel 3 select. 0d = Secondary ASI channel 3 output is on DOUT 1d = Secondary ASI channel 3 output is on DOUT2 |
| 1 | SASI_TX_CH2_SEL | R/W | 0b | Secondary ASI output channel 2 select. 0d = Secondary ASI channel 2 output is on DOUT 1d = Secondary ASI channel 2 output is on DOUT2 |
| 0 | SASI_TX_CH1_SEL | R/W | 0b | Secondary ASI output channel 1 select. 0d = Secondary ASI channel 1 output is on DOUT 1d = Secondary ASI channel 1 output is on DOUT2 |

8.1.3.6 SASI_TX_CH1_CFG Register (Address = 0x1E) [Reset = 0x00]

SASI_TX_CH1_CFG is shown in [Table 8-173](#).

Return to the [Summary Table](#).

This register is the SASI TX Channel 1 configuration register.

Table 8-173. SASI_TX_CH1_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|---------------------------|------|--------|---|
| 7-6 | RESERVED | R | 0b | Reserved bits; Write only reset value |
| 5 | SASI_TX_CH1_CFG | R/W | 0b | Secondary ASI output channel 1 configuration. 0d = Secondary ASI channel 1 output is in a tri-state condition 1d = Secondary ASI channel 1 output corresponds to ADC Channel 1 data |
| 4-0 | SASI_TX_CH1_SLOT_NUM[4:0] | R/W | 00000b | Secondary ASI output channel 1 slot assignment. 0d = TDM is slot 0 or I ² S, LJ is left slot 0 1d = TDM is slot 1 or I ² S, LJ is left slot 1 2d to 14d = Slot assigned as per configuration 15d = TDM is slot 15 or I ² S, LJ is left slot 15 16d = TDM is slot 16 or I ² S, LJ is right slot 0 17d = TDM is slot 17 or I ² S, LJ is right slot 1 18d to 30d = Slot assigned as per configuration 31d = TDM is slot 31 or I ² S, LJ is right slot 15 |

8.1.3.7 SASI_TX_CH2_CFG Register (Address = 0x1F) [Reset = 0x01]

SASI_TX_CH2_CFG is shown in [Table 8-174](#).

Return to the [Summary Table](#).

This register is the SASI TX Channel 2 configuration register.

Table 8-174. SASI_TX_CH2_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |

|-----|---------------------------|------|--------|--|
| 4-0 | SASI_RX_CH5_SLOT_NUM[4:0] | R/W | 00100b | Secondary ASI input channel 5 slot assignment. 0d = TDM is slot 0 or I ² S, LJ is left slot 0 1d = TDM is slot 1 or I ² S, LJ is left slot 1 2d to 14d = Slot assigned as per configuration 15d = TDM is slot 15 or I ² S, LJ is left slot 15 16d = TDM is slot 16 or I ² S, LJ is right slot 0 17d = TDM is slot 17 or I ² S, LJ is right slot 1 18d to 30d = Slot assigned as per configuration 31d = TDM is slot 31 or I ² S, LJ is right slot 15 |

8.1.3.21 SASI_RX_CH6_CFG Register (Address = 0x2D) [Reset = 0x05]

SASI_RX_CH6_CFG is shown in [Table 8-188](#).

Return to the [Summary Table](#).

This register is the SASI RX Channel 6 configuration register.

Table 8-188. SASI_RX_CH6_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|---------------------------|------|--------|--|
| 7 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 6-5 | SASI_RX_CH6_CFG[1:0] | R/W | 00b | Secondary ASI input channel 6 configuration. 0d = Secondary ASI channel 6 input is disabled 1d = Secondary ASI channel 6 input corresponds to DAC Channel 6 data 2d = Secondary ASI channel 6 input corresponds to ADC Channel 2 output loopback 3d = Secondary ASI channel 6 input corresponds to ICLA device 1 data |
| 4-0 | SASI_RX_CH6_SLOT_NUM[4:0] | R/W | 00101b | Secondary ASI input channel 6 slot assignment. 0d = TDM is slot 0 or I ² S, LJ is left slot 0 1d = TDM is slot 1 or I ² S, LJ is left slot 1 2d to 14d = Slot assigned as per configuration 15d = TDM is slot 15 or I ² S, LJ is left slot 15 16d = TDM is slot 16 or I ² S, LJ is right slot 0 17d = TDM is slot 17 or I ² S, LJ is right slot 1 18d to 30d = Slot assigned as per configuration 31d = TDM is slot 31 or I ² S, LJ is right slot 15 |

8.1.3.22 SASI_RX_CH7_CFG Register (Address = 0x2E) [Reset = 0x06]

SASI_RX_CH7_CFG is shown in [Table 8-189](#).

Return to the [Summary Table](#).

This register is the SASI RX Channel 7 configuration register.

Table 8-189. SASI_RX_CH7_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------|------|-------|---|
| 7 | RESERVED | R | 0b | Reserved bit; Write only reset value |
| 6-5 | SASI_RX_CH7_CFG[1:0] | R/W | 00b | Secondary ASI input channel 7 configuration. 0d = Secondary ASI channel 7 input is disabled 1d = Secondary ASI channel 7 input corresponds to DAC Channel 7 data 2d = Secondary ASI channel 7 input corresponds to ADC Channel 3 output loopback 3d = Secondary ASI channel 7 input corresponds to ICLA device 2 data |

Table 8-189. SASI_RX_CH7_CFG Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------------------------|------|--------|--|
| 4-0 | SASI_RX_CH7_SLOT_NUM[4:0] | R/W | 00110b | Secondary ASI input channel 7 slot assignment. 0d = TDM is slot 0 or I ² S, LJ is left slot 0 1d = TDM is slot 1 or I ² S, LJ is left slot 1 2d to 14d = Slot assigned as per configuration 15d = TDM is slot 15 or I ² S, LJ is left slot 15 16d = TDM is slot 16 or I ² S, LJ is right slot 0 17d = TDM is slot 17 or I ² S, LJ is right slot 1 18d to 30d = Slot assigned as per configuration 31d = TDM is slot 31 or I ² S, LJ is right slot 15 |

8.1.3.23 SASI_RX_CH8_CFG Register (Address = 0x2F) [Reset = 0x07]

SASI_RX_CH8_CFG is shown in [Table 8-190](#).

Return to the [Summary Table](#).

This register is the SASI RX Channel 8 configuration register.

Table 8-190. SASI_RX_CH8_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|---------------------------|------|--------|--|
| 7 | RESERVED | R | 0b | Reserved bit; Write only reset value |

8.1.3.26 CLK_CFG14 Register (Address = 0x34) [Reset = 0x10]

CLK_CFG14 is shown in [Table 8-193](#).

Return to the [Summary Table](#).

This register is the clock configuration register 14.

Table 8-193. CLK_CFG14 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-----------------------------|------|-------|---|
| 7-6 | DIG_NM_DIV_CLK_SRC_SEL[1:0] | R/W | 00b | Source clock selection for DIG NMDIV CLK clock. 0d = DIG NM divider input clock is Primary ASI BCLK 1d = DIG NM divider input clock is Secondary ASI BCLK 2d = DIG NM divider input clock is CCLK 3d = DIG NM divider input clock is internal oscillator clock (only supported in custom clock configuration) |
| 5-4 | ANA_NM_DIV_CLK_SRC_SEL[1:0] | R/W | 01b | Source clock selection for NMDIV CLK clock. 0d = NM divider input clock is PLL Output 1d = NM divider input clock is PLL Output 2d = NM divider input clock is DIG NM Divider Clock Source 3d = NM divider input clock is Primary ASI BCLK (Low Jitter Path) |
| 3-2 | RESERVED | R | 0b | Reserved bits; Write only reset values |
| 1-0 | RESERVED | R | 0b | Reserved bits; Write only reset values |

8.1.3.27 CLK_CFG15 Register (Address = 0x35) [Reset = 0x01]

CLK_CFG15 is shown in [Table 8-194](#).

Return to the [Summary Table](#).

This register is the clock configuration register 15.

Table 8-194. CLK_CFG15 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|---------------|------|-----------|---|
| 7-0 | PLL_PDIV[7:0] | R/W | 00000001b | PLL pre-scaler P-divisor value (Don't care when auto detection is enabled) 0d = PLL PDIV value is 256 1d = PLL PDIV value is 1 2d = PLL PDIV value is 2 3d to 254d = PLL PDIV value is as per configuration 255d = PLL PDIV value is 255 |

8.1.3.28 CLK_CFG16 Register (Address = 0x36) [Reset = 0x00]

CLK_CFG16 is shown in [Table 8-195](#).

Return to the [Summary Table](#).

This register is the clock configuration register 16.

Table 8-195. CLK_CFG16 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|----------------------|------|---------|--|
| 7 | PLL_JMUL_MSB | R/W | 0b | PLL integer portion J-multiplier value MSB bit. (Don't care when auto detection is enabled) |
| 6 | PLL_DIV_CLK_DIG_BY_2 | R/W | 0b | PLL DIV clock divide by 2 configuration 0d = No divide/2 inside PLL 1d = PLL does a divide/2 |
| 5-0 | PLL_DMUL_MSB[5:0] | R/W | 000000b | PLL fractional portion D-multiplier value MSB bits. (Don't care when auto detection is enabled) |

8.1.3.29 CLK_CFG17 Register (Address = 0x37) [Reset = 0x00]

CLK_CFG17 is shown in [Table 8-196](#).

Return to the [Summary Table](#).

This register is the clock configuration register 17.

Table 8-196. CLK_CFG17 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-----------|---|
| 7-0 | PLL_DMUL_LSB[7:0] | R/W | 00000000b | PLL fractional portion D-multiplier value LSB byte. Above D-multiplier value MSB bits (PLL_DMUL_MSB) along with this LSB byte (PLL_DMUL_LSB) is concatenated to determine final D-multiplier value. (Don't care when auto detection is enabled) 0d = PLL DMUL value is 0 1d = PLL DMUL value is 1 2d = PLL DMUL value is 2 3d to 9998d = PLL JMUL value is as per configuration 9999d = PLL JMUL value is 9999 10000d to 16383d = Reserved; Don't use |

8.1.3.30 CLK_CFG18 Register (Address = 0x38) [Reset = 0x08]

CLK_CFG18 is shown in [Table 8-197](#).

Return to the [Summary Table](#).

This register is the clock configuration register 18.

Table 8-197. CLK_CFG18 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|-------------------|------|-----------|--|
| 7-0 | PLL_JMUL_LSB[7:0] | R/W | 00001000b | PLL integer portion J-multiplier value LSB byte. Above J-multiplier value MSB bit (PLL_JMUL_MSB) along with this LSB byte (PLL_JMUL_LSB) is concatenated to determine final J-multiplier value. (Don't care when auto detection is enabled) 0d = Reserved; Don't use 1d = PLL JMUL value is 1 2d = PLL JMUL value is 2 3d to 510d = PLL JMUL value is as per configuration 511d = PLL JMUL value is 511 |

8.1.3.31 CLK_CFG19 Register (Address = 0x39) [Reset = 0x20]

CLK_CFG19 is shown in [Table 8-198](#).

Return to the [Summary Table](#).

This register is the clock configuration register 19.

8.2 Programmable Coefficient Registers

The register pages in this section consists of the programmable coefficients of the device. TI recommends using the PPC3 GUI for configuring the programmable coefficients settings; for more details see the [TAC5212EVM-PDK Evaluation module user's guide](#) and the [PurePath™ console graphical development suite](#). To optimize the coefficients register transaction time for the register pages in this section, the device also supports (by default) auto-incremented pages for the I²C and SPI burst writes and reads. After a transaction of register address 0x7F, the device auto increments to the next page at register 0x08 to transact the next coefficient value. These programmable coefficients are 32-bit, two's complement numbers. For a successful coefficient register transaction, the host device must write and read all four bytes starting with the most significant byte (BYT1) for a target coefficient register transaction. When using SPI for a coefficient register read transaction, the device transmits the first byte as a dummy read byte; therefore, the host must read five bytes, including the first dummy read byte and the last four bytes corresponding to the coefficient register value starting with the most significant byte (BYT1).

8.2.1 Programmable Coefficient Registers: Page 8

This register page shown in [Table 8-210](#) consists of the programmable coefficients for the ADC biquad 1 to biquad 6 filters.

Table 8-210. Page 8 Programmable Coefficient Registers

| ADDRESS | REGISTER | RESET | DESCRIPTION |

8.2.3 Programmable Coefficient Registers: Page 10

This register page shown in [Table 8-212](#) consists of the programmable coefficients for the ADC mixer 1 to 4, ADC to DAC loopback mixer and the ADC first-order IIR filter. All channel mixer coefficients are 32-bit, two's complement numbers using a 1.31 number format. The value of 0x7FFFFFFF is equivalent to +1 (0-dB gain), the value 0x00000000 is equivalent to mute (zero data) and all values in between set the mixer attenuation computed accordingly ($hex2dec(value)/2^{31}$). If the MSB is set to '1' then the attenuation remains the same but the signal phase is inverted.

Table 8-212. Page 10 Programmable Coefficient Registers

| ADDRESS | REGISTER | RESET | DESCRIPTION |
|---------|------------------------|-------|--|
| 0x00 | PAGE[7:0] | 0x00 | Device Page Register |

8.2.4 Programmable Coefficient Registers: Page 11

This register page shown in [Table 8-213](#) consists of the programmable coefficients for the ADC first-order IIR filter, ADC digital volume control and fine gain control for channels 1 to 4, ADC Auxiliary mixer and UAD filters.

8.2.6 Programmable Coefficient Registers: Page 16

This register page shown in [Table 8-215](#) consists of the programmable coefficients for the DAC biquad 7 to biquad 12 filters.

Table 8-215. Page 16 Programmable Coefficient Registers

| ADDRESS | REGISTER | RESET | DESCRIPTION |
|---------|----------------------|-------|---|
| 0x00 | PAGE[7:0] | 0x00 | Device Page Register |
| 0x08 | DAC_BQ7_N0_BYT1[7:0] | 0x7F | Programmable DAC biquad 7, N0 coefficient byte[31:24] |

8.2.7 Programmable Coefficient Registers: Page 17

This register page shown in [Table 8-216](#) consists of the programmable coefficients for the ASI DIN mixer for DAC channels 1 to 4, DAC Aux mixer, Loopback mixer, Signal-generator mixer and the DAC first-order IIR filter.

Table 8-216. Page 17 Programmable Coefficient Registers

| ADDRESS | REGISTER | RESET | DESCRIPTION |
|---------|--|-------|--|
| 0x00 | PAGE[7:0] | 0x00 | Device Page Register |
| 0x08 | ASI_DIN_MIX_ASI_CH1_RDAC_MIX_BYT1[7:0] | 0x00 | ASI DIN MIXER, ASI CH1 to RDAC coefficient byte[15:8] |

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The TAC5212 is a stereo, high-performance audio codec that supports sample rates of up to 768kHz. The device supports up to a total of 4 microphones for simultaneous recording which can be selected from up to 2 analog microphones or 4 digital pulse density modulation (PDM) microphones. The device also supports up to 4 channel simultaneous playback which can be configured as a 2-channel differential or psuedo-differential outputs or up to 4-channel single-ended outputs with options for headphone and line-out drive capabilities.

Communication to the TAC5212 for configuration of the control registers is supported using an I²C or SPI interface. The device supports a highly flexible, audio serial interface (TDM, I²S, and LJ) to transmit audio data seamlessly in the system across devices.

9.2 Typical Application

9.2.1 Application

[Figure 9-1](#) shows a typical configuration of the TAC5212 for an application using two analog ECM microphones for simultaneous recording and a two-channel differential line-out for playback with an I²C control interface and a time-division multiplexing (TDM) audio data target interface. For low distortion, use input AC-coupling capacitors with a low-voltage coefficient.

Figure 9-1. Stereo Microphone with Stereo Lineout Block Diagram

9.2.2 Design Requirements

Table 9-1 lists the design parameters for this application.

Table 9-1. Design Parameters

| PARAMETER | VALUE |
|------------------------------------|---|
| AVDD | 1.8V or 3.3V |
| IOVDD | 1.2V or 1.8V or 3.3V |
| AVDD supply current consumption | 28.5mA, with AVDD = 3.3V (MICBIAS on, PLL on, stereo recording and playback, $f_s = 48\text{kHz}$) |
| IOVDD supply current consumption | 0.3mA, with IOVDD = 3.3V |
| Maximum MICBIAS current | 5mA |
| Load on OUT1M, OUT1P, OUT2M, OUT2P | >600 Ω |

9.2.3 Detailed Design Procedure

This section describes the necessary steps to configure the TAC5212 for this specific application. The following steps provide a sequence of items that must be executed in the time between powering the device up and reading data from the device or transitioning from one mode to another mode of operation.

- Apply power to the device:
 - Power up the IOVDD and AVDD power supplies
 - Wait for at least 2ms to allow the device to initialize the internal registers.
 - The device now goes into sleep mode (low-power mode < 10 μA)
- Transition from sleep mode to active mode whenever required for the operation:
 - Wake up the device by writing to P0_R2 to disable sleep mode
 - Wait for at least 2ms to allow the device to complete the internal wake-up sequence

- c. Override the default configuration registers or programmable coefficients value as required (this step is optional)
- d. Enable all desired input channels by writing to P0_R118
- e. Enable all desired audio serial interface input/output channels by writing to P0_R40 to P0_R47 for DAC and P0_R30 to P0_R37 for ADC
- f. Power-up the ADC, DAC and MICBIAS by writing to P0_R120
- g. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio

This specific step can be done at any point in the sequence after step a.

See the [Section 7.3.2](#) section for supported sample rates and the BCLK to FSYNC ratio.

- h. The device recording data is now sent to the host processor using the TDM audio serial data bus and playback data from TDM is now played on the lineout
3. Transition from active mode to sleep mode (again) as required in the system for low-power operation:
 - a. Enter sleep mode by writing to P0_R2 to enable sleep mode
 - b. Wait at least 10ms (when FSYNC = 48kHz) for the volume to ramp down and for all blocks to power down
 - c. Read P0_R122 to check the device shutdown and sleep mode status
 - d. If the device P0_R122_D[7:5] status bit is 3'b100 then stop FSYNC and BCLK in the system
 - e. The device now goes into sleep mode (low-power mode < 10µA) and retains all register values
 4. Transition from sleep mode to active mode (again) as required for the recording operation:
 - a. Wake up the device by writing to P0_R2 to disable sleep mode
 - b. Wait at least 2ms to allow the device to complete the internal wake-up sequence
 - c. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio
 - d. The device recording data is now sent to the host processor using the TDM audio serial data bus and playback data from TDM is now played on the lineout
 5. Repeat the steps as required for different device configurations and modes of operation

9.2.4 Application Performance Plots

At $T_A = 25^\circ\text{C}$, $AVDD = 3.3\text{V}$, $IOVDD = 3.3\text{V}$, $f_{IN} = 1\text{kHz}$ sinusoidal signal, $f_S = 48\text{kHz}$, 32-bit audio data, $BCLK = 256 \times f_S$, TDM target mode, PLL on, channel gain = 0dB, linear phase decimation/interpolation filters, 5kΩ input impedance setting, AC-coupled differential input with $ADC_CHx_CM_TOL = 2'b00$, 1200Ω line-out load in differential configuration, MICBIAS programmed to VREF and other default configurations; measured filter free with an audio precision with a 20Hz to 20kHz un-weighted bandwidth, unless otherwise noted

9.3 Power Supply Recommendations

The power-supply sequence between the IOVDD and AVDD rails can be applied in any order. However, only initiate the I²C or SPI transactions to initialize the device after all supplies are stable.

For the supply power-up requirement, t_1 , t_2 must be at least 2ms to allow the device to initialize the internal registers. See the [Section 7.4](#) section for details on how the device operates in various modes after the device power supplies are settled to the recommended operating voltage levels. For the supply power-down requirement, t_4 , t_5 and t_6 must be at least 10ms. This timing (as shown in [Figure 9-6](#)) allows the device to ramp down the volume on the record data, power down the analog and digital blocks, and put the device into shutdown mode. The device can also be immediately put into shutdown mode by ramping down power supplies, but doing so causes an abrupt shutdown.

Figure 9-6. Power-Supply Sequencing Requirement Timing Diagram

Make sure that the supply ramp rate is slower than $0.1\text{V}/\mu\text{s}$ and that the wait time between a power-down and a power-up event is at least 100ms. For supply ramp rate slower than $0.1\text{V}/\text{ms}$, host device must apply a software reset as first transaction before doing any device configuration. Make sure all digital input pins are at valid input levels and not toggling during supply sequencing.

The TAC5212 supports a single AVDD supply operation by integrating an on-chip digital regulator, DREG, and an integrated analog regulator. Ensure AVDD_MODE (P0_R2_D[2]) and IOVDD_IO_MODE (P0_R2_D[1]) registers are set correctly for AVDD 1.8V operation and for IOVDD 1.8V and 1.2V operation as described in [Section 9.3.1](#) and [Section 9.3.2](#) respectively.

9.3.1 AVDD_MODE for 1.8V Operation

After the supplies are stable, whenever using AVDD 1.8V operation, always set the AVDD_MODE (P0_R2_D[2]) setting to 1'b1 right after power-up to set the correct analog regulator (AREG) voltage. This setting is not needed when using AVDD 3.3V operation.

9.3.2 IOVDD_IO_MODE for 1.8V and 1.2V Operation

After the supplies are stable, the default register configuration of the device has a speed limitation on the maximum clock speed that can be supported for IOVDD = 1.8V or 1.2V at first power up of device with default configurations except for the first write operation. Whenever using IOVDD 1.8V and 1.2V operation, the first operation by user should always be to write the IOVDD_IO_MODE (P0_R2_D[1]) setting to 1'b1 after power-up or reset, and then there are no speed limitations in subsequent operation of device. This setting is not needed or applicable when using IOVDD 3.3V operation.

9.4 Layout

9.4.1 Layout Guidelines

Each system design and printed circuit board (PCB) layout is unique. The layout must be carefully reviewed in the context of a specific PCB design. However, the following guidelines can optimize the device performance:

- Connect the thermal pad to ground. Use a via pattern to connect the device thermal pad, which is the area directly under the device, to the ground planes. This connection helps dissipate heat from the device.
- Star connect all ground pins to the board ground plane. Use the same ground between VSS pins to avoid any potential voltage difference between them.
- The decoupling capacitors for the power supplies must be placed close to the device pins.
- Route the analog differential audio signals differentially on the PCB for better noise immunity. Avoid crossing digital and analog signals to prevent undesirable crosstalk.
- Avoid running high-frequency clock and control signals near INxx and OUTxx pins where possible.
- The device internal voltage references must be filtered using external capacitors. Place the filter capacitors near the VREF pin for good performance.
- Directly tap the MICBIAS pin to avoid common impedance when routing the biasing or supply traces for multiple microphones to avoid coupling across microphones.
- Provide a direct connection from the VREF and MICBIAS external capacitor ground terminal to VSS.
- Place the MICBIAS capacitor (with low equivalent series resistance) close to the device with minimal trace impedance.
- Use ground planes to provide the lowest impedance for power and signal current between the device and the decoupling capacitors. Treat the area directly under the device as a central ground area for the device, and all device grounds must be connected directly to that area.

10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.3 Support Resources

TI E2E™ [support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision * (January 2024) to Revision A (January 2025) | Page |
|--|-------------------|
| • Updated device status to production data..... | 1 |

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|-----------------|------|-------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|---------|
| TAC5212IRGER | ACTIVE | VQFN | RGE | 24 | 3000 | RoHS & Green | NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | TAC5212 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
