LMH6702QML-SP
SNOSAQ2F – JULY 2005 – REVISED AUGUST 2024

LMH6702QML-SP 1.7GHz, Ultra-Low-Distortion, Wideband Op Amp

1 Features

- V_S = ±5V, T_A = 25°C, A_V = +2V/V, R_L = 100Ω, V_{OUT} = 2V_{PP}, typical unless noted otherwise
- Available with radiation ensurance
  - High dose rate 300krad(Si)
  - ELDRS free 300krad(Si)
- −3dB bandwidth (V_{OUT} = 0.2V_{PP}) 720MHz
- Low noise 1.83nV/√Hz
- Fast settling to 0.1% 13.4ns
- Fast slew rate 3100V/μs
- Supply current 12.5mA
- Output current 80mA
- Low intermodulation distortion (75MHz) −67dBc
- Improved replacement for CLC409 and CLC449

2 Applications

- Flash A/D driver
- D/A transimpedance buffer
- Wide dynamic range IF amp
- Radar and communication receivers
- Line driver
- High-resolution video

3 Description

The LMH6702QML-SP is a very wideband, dc-coupled, monolithic operational amplifier designed specifically for wide-dynamic-range systems requiring exceptional signal fidelity. Benefiting from TI's current-feedback architecture, the LMH6702QML-SP offers unity gain stability at exceptional speed without need for external compensation.

With a 720MHz bandwidth (A_V = 2V/V, V_O = 2V_{PP}), 10-bit distortion levels through 60MHz (R_L = 100Ω), 1.83nV/√Hz input-referred noise, and 12.5mA supply current, the LMH6702QML-SP is an excellent driver or buffer for high-speed flash analog-to-digital (A/D) and digital-to-analog (D/A) converters.

The LMH6702QML-SP benefits wide dynamic range systems, such as radar and communication receivers, that require a wideband amplifier offering exceptional signal purity. The low input-referred noise and low harmonic and intermodulation distortion make this device an excellent choice for high-speed applications.

The LMH6702QML-SP is constructed using TI's VIP10 complimentary bipolar process and TI's proven current-feedback architecture.
Package Information

PART NUMBER	PACKAGE[1]	PACKAGE SIZE[2]
LMH6702QML-SP	NAB (CDIP, 8)	10.16mm × 7.87mm
	NAC (CFP, 10)	9.91mm × 6.45mm

(1) For more information, see Section 9.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

	VALUE
Supply voltage (V_{CC})	±6.75V_{DC}
Common-mode input voltage (V_{CM})	V^- to V^+
Power dissipation (P_D) [2]	1W
Junction temperature (T_J)	175°C
Lead temperature (soldering, 10 seconds)	300°C
Storage temperature	−65°C ≤ T_A ≤ +150°C
Thermal resistance	
θ_{JA}	
CDIP (still air)	170°C/W
CDIP (500LF/min air flow)	100°C/W
CLGA (still air)	220°C/W
CLGA (500LF/min air flow)	150°C/W
θ_{JC}	
CDIP	35°C/W
CLGA	37°C/W
Package weight (typical)	
CDIP	1078mg
CLGA	227mg
ESD tolerance [3]	1000V

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{Jmax} (maximum junction temperature), θ_{JA} (package junction to ambient thermal resistance), and T_A (ambient temperature). The maximum allowable power dissipation at any temperature is $P_{Dmax} = (T_{Jmax} - T_A) / \theta_{JA}$ or the number given in the *Absolute Maximum Ratings*, whichever is lower.
(3) Human body model, 1.5kΩ in series with 100pF.

5.2 Recommended Operating Conditions

	VALUE
Supply voltage (V_{CC})	±5V_{DC} to ±6V_{DC}
Gain	±1 to ±10
Ambient operating temperature (T_A)	−55°C to +125°C

5.3 Quality Conformance Inspection

MIL-STD-883, Method 5005, Group A

5.4 Electrical Characteristics: DC Parameters

The following conditions apply (unless otherwise specified)[1] [2]:
R_L = 100Ω, V_{CC} = ±5V_{DC}, A_V = +2 feedback resistor (R_F) = 250Ω, gain resistor (R_G) = 250Ω

PARAMETER		TEST CONDITIONS	NOTES	MIN	MAX	UNIT	SUB-GROUPS
I_{BN}	Input bias current, noninverting			−15	15	µA	1, 2
				−21	21	µA	3
I_{BI}	Input bias current, inverting			−30	30	µA	1, 2
				−34	34	µA	3
V_{IO}	Input offset voltage			−4.5	4.5	mV	1, 3
				−6.0	6.0	mV	2
I_{CC}	Supply current, no load	R_L = ∞			15	mA	1, 2, 3
PSSR	Power supply rejection ratio	−V_{CC} = −4.5V to −5.0V, +V_{CC} = 4.5V to 5.0V		45		dB	1, 2, 3

(1)   The algebraic convention, whereby the most negative value is a minimum and most positive is a maximum, is used in this table. Negative current shall be defined as conventional current flow out of a device terminal.
(2)   Pre- and post-irradiation limits are identical to those listed under the dc parameter tables. Post-irradiation testing is conducted at room temperature, 25°C, only. Testing is performed as specified in MIL-STD-883 Test Method 1019 Condition A. The ELDRS-Free part is also tested per Test Method 1019 Conditions D.

5.5 Electrical Characteristics: AC Parameters

The following conditions apply (unless otherwise specified)[1] [2]:
R_L = 100Ω, V_{CC} = ±5V_{DC}, A_V = +2 feedback resistor (R_F) = 250Ω, gain resistor (R_G) = 250Ω

PARAMETER		TEST CONDITIONS	NOTES	MIN	MAX	UNIT	SUB-GROUPS
HD_3	3rd harmonic distortion	2V_{PP} at 20MHz			−62	dBc	4
GFPL	Gain flatness peaking	0.1MHz to 75MHz, V_O < 0.5V_{PP}			0.4	dB	4
GFPH	Gain flatness peaking	> 75MHz, V_O < 0.5V_{PP}			2.0	dB	4
GFRH	Gain flatness rolloff	75MHz to 125MHz, V_O < 0.5V_{PP}			0.2	dB	4
HD_2	2nd harmonic distortion	2V_{PP} at 20MHz			−52	dBc	4

(1)   The algebraic convention, whereby the most negative value is a minimum and most positive is a maximum, is used in this table. Negative current shall be defined as conventional current flow out of a device terminal.
(2)   These parameters are not post irradiation tested.

5.6 Electrical Characteristics: Drift Values Parameters

The following conditions apply (unless otherwise specified)[1]:
R_L = 100Ω, V_{CC} = ±5V_{DC}, A_V = +2 feedback resistor (R_F) = 250Ω, gain resistor (R_G) = 250Ω
Delta not required on B level product. Delta required for S-level product at Group B5 only, or as specified on the internal processing instruction (IPI).

PARAMETER		TEST CONDITIONS	PACKAGE	MIN	MAX	UNIT	SUB-GROUPS
I_{BN}	Input bias current noninverting		NAB	−0.3	0.3	µA	1
			NAC	−0.75	0.75		
I_{BI}	Input bias current inverting			−3.0	3.0	µA	1
V_{IO}	Input offset voltage		NAB	−0.3	0.3	mV	1
			NAC	−1.0	1.0		

(1)   The algebraic convention, whereby the most negative value is a minimum and most positive is a maximum, is used in this table. Negative current shall be defined as conventional current flow out of a device terminal.

6 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

6.1 Application Information

6.1.1 Feedback Resistor

$$A_V = 1 + R_F/R_G = V_{OUT}/V_{IN}$$
Figure 6-1. Recommended Noninverting Gain Circuit

$$A_V = -\frac{R_F}{R_G} = \frac{V_{OUT}}{V_{IN}}$$

SELECT R_T TO YIELD DESIRED $R_{IN} = R_T || R_G$
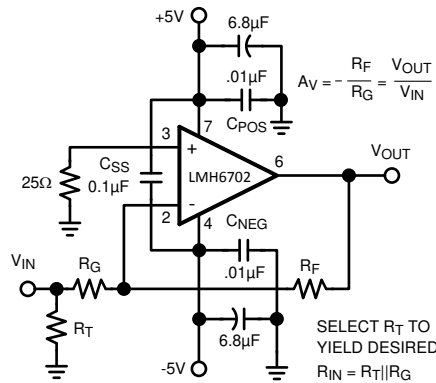

Figure 6-2. Recommended Inverting Gain Circuit

The LMH6702 achieves excellent pulse and distortion performance by using current feedback topology. The loop gain for a current-feedback op amp, and thus the frequency response, is predominantly set by the feedback-resistor value. The LMH6702 is optimized for use with a 237Ω feedback resistor. Using lower values can lead to excessive ringing in the pulse response while a higher value limits the bandwidth. Application Note OA-13 SNOA366 discusses this configuration in detail along with the occasions where a different R_F can be advantageous.

6.1.2 Harmonic Distortion

The LMH6702 has been optimized for exceptionally low harmonic distortion while driving very demanding resistive or capacitive loads. Generally, when used as the input amplifier to very high-speed flash ADCs, the distortions introduced by the converter dominate over the low LMH6702 distortions. Capacitor C_{SS}, shown across the supplies in Figure 6-1 and Figure 6-2, is critical to achieving the lowest 2nd harmonic distortion.

For absolute minimum distortion levels, keep the supply decoupling currents (ground connections to C_{POS}, and C_{NEG} in Figure 6-1 and Figure 6-2) separate from the ground connections to sensitive input circuitry (such as R_G, R_T, and R_{IN} ground connections). Splitting the ground plane in this manner, and separately routing the high frequency current spikes on the decoupling caps back to the power supply (similar to a *star connection* layout technique) provides minimum coupling back to the input circuitry and results in best harmonic distortion response (especially 2nd-order distortion).

If this layout technique has not been observed on a particular application board, the supply decoupling capacitors can adversely affect HD2 performance by increasing the coupling phenomenon already mentioned. Figure 6-3 shows actual HD2 data on a board where the ground plane is shared between the supply decoupling capacitors and the rest of the circuit. After these capacitors are removed, the HD2 distortion levels reduce significantly, especially between 10MHz to 20MHz, as shown in Figure 6-3.
Figure 6-3. Decoupling Current Adverse Effect on a Board With Shared Ground Plane

At these extremely low distortion levels, the high-frequency behavior of decoupling capacitors themselves can be significant. In general, lower-value decoupling capacitors tend to have higher resonance frequencies, making lower-value decoupling capacitors more effective for higher-frequency regions. A particular application board that has been laid out correctly with ground returns split to minimize coupling benefits the most by having low-value and higher-value capacitors paralleled to take advantage of the effective bandwidth of each, and extend the low-distortion frequency range.

6.1.3 Capacitive Load Drive

Figure 6-4 shows a typical application using the LMH6702 to drive an ADC.
Figure 6-4. Input Amplifier to ADC

The series resistor, R_S, between the amplifier output and the ADC input is critical to achieving best system performance. This load capacitance, if applied directly to the output pin, can quickly lead to unacceptable levels of ringing in the pulse response. The plot of *R_S and Settling Time vs C_L* in the *Typical Characteristics* is an

excellent starting point for selecting R_S. The value derived in that plot minimizes the step settling time into a fixed discrete capacitive load with the output driving a very light resistive load (1kΩ). Sensitivity to capacitive loading is greatly reduced after the output is loaded more heavily. Therefore, for cases where the output is heavily loaded, R_S value can be reduced. The exact value can best be determined experimentally for these cases.

In applications where the LMH6702 is replacing the CLC409, take care when the device is lightly loaded and some capacitance is present at the output. As a result of the much higher frequency response of the LMH6702 compared to the CLC409, increased susceptibility to low value output capacitance (parasitic or inherent to the board layout or otherwise being part of the output load) is possible. As previously mentioned, this susceptibility is most noticeable when the LMH6702 resistive load is light. Parasitic capacitance can be minimized by careful layout. Addition of an output snubber R-C network also helps by increasing the high-frequency resistive loading.

Referring back to Figure 6-4, consider several additional constraints in driving the capacitive input of an ADC. There is an option to increase R_S, band-limiting at the ADC input for either noise or Nyquist band-limiting purposes. However, increasing R_S too much can induce an unacceptably large input glitch due to switching transients coupling through from the convert signal. Also, C_{IN} is often a voltage-dependent capacitance. This input impedance nonlinearity induces distortion terms that increase as R_S is increased. Therefore, attempt only slight adjustments up or down from the recommended R_S value in optimizing system performance.

6.1.4 DC Accuracy and Noise

Example below shows the output offset computation equation for the noninverting configuration using the typical bias current and offset specifications for A_V = +2:

Output Offset: $V_O = (\pm I_{BN} \times R_{IN} \pm V_{IO}) (1 + R_F/R_G) \pm I_{BI} \times R_F$

Where R_{IN} is the equivalent input impedance on the noninverting input.

Example computation for A_V = +2, R_F = 237Ω, R_{IN} = 25Ω:

$V_O = (\pm6\mu A \times 25\Omega \pm 1mV) (1 + 237/237) \pm 8\mu A \times 237 = \pm4.20mV$

A good design, however, includes a worst-case calculation using minimum and maximum numbers in the data sheet tables to provide worst-case operation.

Further improvement in the output offset voltage and drift is possible using composite amplifiers. The two input bias currents are physically unrelated in both magnitude and polarity for the current feedback topology. Therefore, to cancel the effects by matching the source impedance for the two inputs (as is commonly done for matched input bias current devices) is not possible.

The total output noise is computed in a similar fashion to the output offset voltage. Using the input noise voltage and the two input noise currents, the output noise is developed through the same gain equations for each term but combined as the square root of the sum of squared contributing elements. See the *OA-12 Noise Analysis for Comlinear Amplifiers* application report for a full discussion of noise calculations for current-feedback amplifiers.

6.2 Layout

6.2.1 Layout Guidelines

Generally, a good high frequency layout keeps power supply and ground traces away from the inverting input and output pins. Parasitic capacitance on these nodes to ground cause frequency-response peaking and possible circuit oscillations (see the *OA-15 Frequent Faux Pas in Applying Wideband Current Feedback Amplifiers* application report for more information). Texas Instruments suggests the following evaluation boards as a guide for high-frequency layout and as an aid in device testing and characterization:

DEVICE	PACKAGE	EVALUATION BOARD PART NUMBER
LMH6702QMLMF	SOT-23-5	CLC730216
LMH6702QMLMA	Plastic SOIC	CLC730227

7 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

7.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

7.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

7.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

7.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.5 Glossary

TI Glossary   This glossary lists and explains terms, acronyms, and definitions.

8 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (March 2013) to Revision F (August 2024)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document................	1
• Changed input bias current noninverting limits from ±0.3µA to ±0.75µA for NAC package type in *LMH6702 Electrical Characteristics Drift Values Parameters*	5
• Changed input offset voltage limits from ±0.3mA to ±1mV for NAC package type in *LMH6702 Electrical Characteristics Drift Values Parameters*	5

Changes from Revision D (October 2011) to Revision E (March 2013)	Page
• Changed layout of National data sheet to TI format..	1

9 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

PACKAGE OPTION ADDENDUM

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
