## 1 Setup

This section describes the test points and connectors on the EVM and how to properly connect, set up, and use the LM63615QDRREVM. Either the banana jacks on the top of the board or the card edge connector can be used for connections. See [Figure 1-1](#) for the top of board connections and [Figure 1-2](#) for the card edge connections. See the [LM636x5-Q1 3.5-V to 36-V, 1.5-A, and 2.5-A Automotive Step-down Voltage Converter Data Sheet](#) for details. The following lists the functions of the connections:

- VINEMI** Input supply to EVM. Connect to a suitable input supply.
- GND** System ground.
- VOU** Output of EVM. Connect to desired load.
- VOS** Output voltage sense connection (do not use for power; sense only).
- VIS** Input voltage sense connection (do not use for power; sense only).
- GNDS** Ground sense point for analog measurements (do not use for power; sense only).

**Figure 1-1. EVM Board Connections**

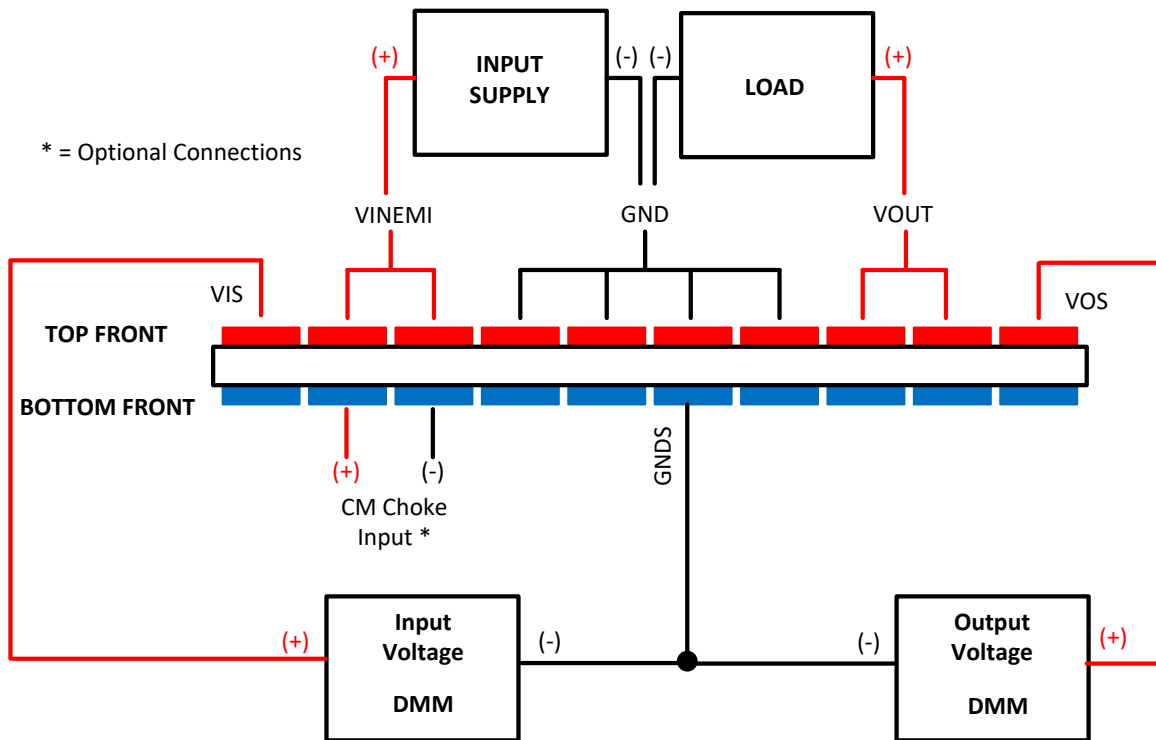

Figure 1-2. EVM Card Edge Connections

### 1.1 Jumpers

See Figure 1-3 for jumper locations.

**VSEL** This jumper allows output voltage selection of either 3.3 V or 5 V. See Section 2 for details.

**MODE** This jumper allows the selection of either AUTO mode or FPWM mode. In addition, by removing this jumper and supplying a clock signal to the SYNC/MODE test point, the device can be synchronized to an external clock.

**EN** This jumper turns the device on or off. In addition, by removing this jumper and supplying a signal to the EN test point, the device can be controlled externally.

Figure 1-3. Jumper Locations

## 1.2 Test Points

- **VINEMI** - Input supply to EVM. Connect to a suitable input supply.
- **GND** - System power ground.
- **VOUT** - Power output of EVM. Connect to desired load.
- **VOS** - Output voltage sense connection. Connect to DMM.
- **VINS** - Input voltage sense connection. Connect to DMM.
- **GNDS** - Ground sense point for analog measurements. Connect to DMM.
- **EN** - Connected to the EN input of the device.
- **RESET** - Connected to the  $\overline{\text{RESET}}$  pin of the IC. It is used as a flag output. The reset function can be monitored at this test point. Pull-up resistor, RPU, must be populated. A typical value for pullup resistor is 100 k $\Omega$ .
- **SYNC/MODE** - Connected to the SYNC/MODE pin of the IC.
- **VCC** - Connected to the VCC output of the device. Can be used for logic level pullups, if needed.
- **OPEN PADS** - Connections for frequency response analyzer (on bottom of board) to take Bode plots. See [Figure 1-4](#) for details of connections.

**Figure 1-4. FRA Setup**

## 2 Operation

Once the above connections are made and the appropriate jumpers are set, the EVM is ready to use.

The output voltage of the EVM can be selected by the VSEL jumper to either 3.3 V or 5 V. EN must be cycled when the jumper is changed, in order for the selection to be programmed. Other values of output voltage can be set by removing the VSEL jumper and populating Radj (on bottom) with a 10 k $\Omega$ . Values for R<sub>FBT</sub> and R<sub>FBB</sub> are then selected and populated in the designated locations. See the [LM636x5-Q1 3.5-V to 36-V, 1.5-A, and 2.5-A Automotive Step-down Voltage Converter Data Sheet](#) for more information.

The switching mode of the EVM can be changed by using the SYNC/MODE jumper; this selection can be made "on-the-fly".

To use the  $\overline{\text{RESET}}$  function, a pullup resistor is required. A place for this resistor is provided on the bottom of the PCB (RPU). Values of 10 k $\Omega$  to 100 k $\Omega$  are appropriate. Be sure to limit the voltage on this pullup to less than the specified Abs max for this pin.

Some components in the EMI filter are not populated. The user is free to experiment with different EMI filter components as desired.

Loop gain measurements (Bode plots) can be made using the setup shown in [Figure 1-4](#).

The EVM has been designed for maximum flexibility regarding component selection. This allows the user to place preferred components such as the inductor, the capacitors, or both, on the board and test the performance of the regulator. This way the power supply system can be tested before committing the design to production.

## 3 Performance Curves

Curves showing typical efficiency data are found in [Figure 3-1](#) and [Figure 3-2](#). For other conditions and/or other data, consult the device data sheet.
