12	RESERVED	R-0/W1S	0h	Reserved
11	MCANA_FEVT2	R-0/W1S	0h	Writing 1 to this bit clears the MCANA_FEVT2 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
10	MCANA_FEVT1	R-0/W1S	0h	Writing 1 to this bit clears the MCANA_FEVT1 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
9	MCANA_FEVT0	R-0/W1S	0h	Writing 1 to this bit clears the MCANA_FEVT0 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
8	RESERVED	R-0/W1S	0h	Reserved
7	SD2FLT4_DRINT	R	0h	Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
6	SD2FLT4_COMPZ	R	0h	Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
5	SD2FLT3_DRINT	R	0h	Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
4	SD2FLT3_COMPZ	R	0h	Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

Table 11-36. XBARCLR4 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	SD2FLT2_DRINT	R	0h	Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
2	SD2FLT2_COMPZ	R	0h	Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
1	SD2FLT1_DRINT	R	0h	Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
0	SD2FLT1_COMPZ	R	0h	Writing 1 to a bit in this register clears the corresponding bit in the XBARILAT3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

11.3.4 EPWM_XBAR_REGS Registers

Table 11-37 lists the memory-mapped registers for the EPWM_XBAR_REGS registers. All register offset addresses not listed in Table 11-37 should be considered as reserved locations and the register contents should not be modified.

Table 11-37. EPWM_XBAR_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	TRIP4MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP4	EALLOW	Go
2h	TRIP4MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP4	EALLOW	Go
4h	TRIP5MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP5	EALLOW	Go
6h	TRIP5MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP5	EALLOW	Go
8h	TRIP7MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP7	EALLOW	Go
Ah	TRIP7MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP7	EALLOW	Go
Ch	TRIP8MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP8	EALLOW	Go
Eh	TRIP8MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP8	EALLOW	Go
10h	TRIP9MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP9	EALLOW	Go
12h	TRIP9MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP9	EALLOW	Go
14h	TRIP10MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP10	EALLOW	Go
16h	TRIP10MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP10	EALLOW	Go
18h	TRIP11MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP11	EALLOW	Go
1Ah	TRIP11MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP11	EALLOW	Go
1Ch	TRIP12MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP12	EALLOW	Go
1Eh	TRIP12MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP12	EALLOW	Go
20h	TRIP4MUXENABLE	ePWM XBAR Mux Enable for TRIP4	EALLOW	Go
22h	TRIP5MUXENABLE	ePWM XBAR Mux Enable for TRIP5	EALLOW	Go
24h	TRIP7MUXENABLE	ePWM XBAR Mux Enable for TRIP7	EALLOW	Go
26h	TRIP8MUXENABLE	ePWM XBAR Mux Enable for TRIP8	EALLOW	Go
28h	TRIP9MUXENABLE	ePWM XBAR Mux Enable for TRIP9	EALLOW	Go
2Ah	TRIP10MUXENABLE	ePWM XBAR Mux Enable for TRIP10	EALLOW	Go
2Ch	TRIP11MUXENABLE	ePWM XBAR Mux Enable for TRIP11	EALLOW	Go
2Eh	TRIP12MUXENABLE	ePWM XBAR Mux Enable for TRIP12	EALLOW	Go
38h	TRIPOUTINV	ePWM XBAR Output Inversion Register	EALLOW	Go
3Eh	TRIPLOCK	ePWM XBAR Configuration Lock register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 11-38 shows the codes that are used for access types in this section.

Table 11-38. EPWM_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

Table 11-38. EPWM_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

11.3.4.1 TRIP4MUX0TO15CFG Register (Offset = 0h) [Reset = 0000000h]

TRIP4MUX0TO15CFG is shown in [Figure 11-32](#) and described in [Table 11-39](#).

Return to the [Summary Table](#).

Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-55. TRIP4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-55. TRIP4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-55. TRIP4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of Mux0 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.4.18 TRIP5MUXENABLE Register (Offset = 22h) [Reset = 0000000h]

TRIP5MUXENABLE is shown in [Figure 11-49](#) and described in [Table 11-56](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP5

Table 11-56. TRIP5MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-56. TRIP5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-56. TRIP5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-56. TRIP5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-56. TRIP5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.4.19 TRIP7MUXENABLE Register (Offset = 24h) [Reset = 0000000h]

TRIP7MUXENABLE is shown in [Figure 11-50](#) and described in [Table 11-57](#).

Return to the [Summary Table](#).

Reset type: CPU1.SYSRSn

Table 11-57. TRIP7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-57. TRIP7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-57. TRIP7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-57. TRIP7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.4.20 TRIP8MUXENABLE Register (Offset = 26h) [Reset = 0000000h]

TRIP8MUXENABLE is shown in [Figure 11-51](#) and described in [Table 11-58](#).

Return to the [Summary Table](#).

Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-58. TRIP8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-58. TRIP8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.4.21 TRIP9MUXENABLE Register (Offset = 28h) [Reset = 0000000h]

TRIP9MUXENABLE is shown in [Figure 11-52](#) and described in [Table 11-59](#).

Return to the [Summary Table](#).

28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-59. TRIP9MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-59. TRIP9MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-59. TRIP9MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-59. TRIP9MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.4.22 TRIP10MUXENABLE Register (Offset = 2Ah) [Reset = 0000000h]

TRIP10MUXENABLE is shown in [Figure 11-53](#) and described in [Table 11-60](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-60. TRIP10MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-60. TRIP10MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-60. TRIP10MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-60. TRIP10MUXENABLE Register Field Descriptions (continued)

Table 11-61. TRIP11MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-61. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-61. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-61. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-61. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.4.24 TRIP12MUXENABLE Register (Offset = 2Eh) [Reset = 0000000h]

TRIP12MUXENABLE is shown in [Figure 11-55](#) and described in [Table 11-62](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP12

Table 11-62. TRIP12MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-62. TRIP12MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-62. TRIP12MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-62. TRIP12MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-62. TRIP12MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP12 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP12 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP12 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.4.25 TRIPOUTINV Register (Offset = 38h) [Reset = 0000000h]

TRIPOUTINV is shown in [Figure 11-56](#) and described in [Table 11-63](#).

Return to the [Summary Table](#).

Complex bit access types are encoded to fit into small table cells. Table 11-66 shows the codes that are used for access types in this section.

Table 11-66. CLB_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

Table 11-66. CLB_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

11.3.5.1 AUXSIG0MUX0TO15CFG Register (Offset = 0h) [Reset = 0000000h]

AUXSIG0MUX0TO15CFG is shown in [Figure 11-58](#) and described in [Table 11-67](#).

Return to the [Summary Table](#).

Table 11-72. AUXSIG2MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-20	MUX26	R/W	0h	Group Select Bits for MUX26: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX26 01 : Select .1 input for MUX26 10 : Select .2 input for MUX26 11 : Select .3 input for MUX26 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
19-18	MUX25	R/W	0h	Group Select Bits for MUX25: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX25 01 : Select .1 input for MUX25 10 : Select .2 input for MUX25 11 : Select .3 input for MUX25 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX24	R/W	0h	Group Select Bits for MUX24: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX24 01 : Select .1 input for MUX24 10 : Select .2 input for MUX24 11 : Select .3 input for MUX24 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX23	R/W	0h	Group Select Bits for MUX23: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX23 01 : Select .1 input for MUX23 10 : Select .2 input for MUX23 11 : Select .3 input for MUX23 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX22	R/W	0h	Group Select Bits for MUX22: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX22 01 : Select .1 input for MUX22 10 : Select .2 input for MUX22 11 : Select .3 input for MUX22 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX21	R/W	0h	Group Select Bits for MUX21: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX21 01 : Select .1 input for MUX21 10 : Select .2 input for MUX21 11 : Select .3 input for MUX21 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX20	R/W	0h	Group Select Bits for MUX20: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX20 01 : Select .1 input for MUX20 10 : Select .2 input for MUX20 11 : Select .3 input for MUX20 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-72. AUXSIG2MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX19	R/W	0h	Group Select Bits for MUX19: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX19 01 : Select .1 input for MUX19 10 : Select .2 input for MUX19 11 : Select .3 input for MUX19 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX18	R/W	0h	Group Select Bits for MUX18: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX18 01 : Select .1 input for MUX18 10 : Select .2 input for MUX18 11 : Select .3 input for MUX18 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX17	R/W	0h	Group Select Bits for MUX17: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX17 01 : Select .1 input for MUX17 10 : Select .2 input for MUX17 11 : Select .3 input for MUX17 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX16	R/W	0h	Group Select Bits for MUX16: Selects 4X1 group output for AUXSIG2 of CLB-XBAR 00 : Select .0 input for MUX16 01 : Select .1 input for MUX16 10 : Select .2 input for MUX16 11 : Select .3 input for MUX16 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.7 AUXSIG3MUX0TO15CFG Register (Offset = Ch) [Reset = 0000000h]

AUXSIG3MUX0TO15CFG is shown in [Figure 11-64](#) and described in [Table 11-73](#).

Return to the [Summary Table](#).

Table 11-73. AUXSIG3MUX0TO15CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	MUX15	R/W	0h	Group Select Bits for MUX15: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX15 01 : Select .1 input for MUX15 10 : Select .2 input for MUX15 11 : Select .3 input for MUX15 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX14	R/W	0h	Group Select Bits for MUX14: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX14 01 : Select .1 input for MUX14 10 : Select .2 input for MUX14 11 : Select .3 input for MUX14 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX13	R/W	0h	Group Select Bits for MUX13: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX13 01 : Select .1 input for MUX13 10 : Select .2 input for MUX13 11 : Select .3 input for MUX13 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX12	R/W	0h	Group Select Bits for MUX12: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX12 01 : Select .1 input for MUX12 10 : Select .2 input for MUX12 11 : Select .3 input for MUX12 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX11	R/W	0h	Group Select Bits for MUX11: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX11 01 : Select .1 input for MUX11 10 : Select .2 input for MUX11 11 : Select .3 input for MUX11 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-73. AUXSIG3MUX0TO15CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-20	MUX10	R/W	0h	Group Select Bits for MUX10: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX10 01 : Select .1 input for MUX10 10 : Select .2 input for MUX10 11 : Select .3 input for MUX10 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
19-18	MUX9	R/W	0h	Group Select Bits for MUX9: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX9 01 : Select .1 input for MUX9 10 : Select .2 input for MUX9 11 : Select .3 input for MUX9 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX8	R/W	0h	Group Select Bits for MUX8: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX8 01 : Select .1 input for MUX8 10 : Select .2 input for MUX8 11 : Select .3 input for MUX8 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX7	R/W	0h	Group Select Bits for MUX7: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX7 01 : Select .1 input for MUX7 10 : Select .2 input for MUX7 11 : Select .3 input for MUX7 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX6	R/W	0h	Group Select Bits for MUX6: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX6 01 : Select .1 input for MUX6 10 : Select .2 input for MUX6 11 : Select .3 input for MUX6 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX5	R/W	0h	Group Select Bits for MUX5: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX5 01 : Select .1 input for MUX5 10 : Select .2 input for MUX5 11 : Select .3 input for MUX5 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX4	R/W	0h	Group Select Bits for MUX4: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX4 01 : Select .1 input for MUX4 10 : Select .2 input for MUX4 11 : Select .3 input for MUX4 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-73. AUXSIG3MUX0TO15CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX3	R/W	0h	Group Select Bits for MUX3: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX3 01 : Select .1 input for MUX3 10 : Select .2 input for MUX3 11 : Select .3 input for MUX3 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX2	R/W	0h	Group Select Bits for MUX2: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX2 01 : Select .1 input for MUX2 10 : Select .2 input for MUX2 11 : Select .3 input for MUX2 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX1	R/W	0h	Group Select Bits for MUX1: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX1 01 : Select .1 input for MUX1 10 : Select .2 input for MUX1 11 : Select .3 input for MUX1 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX0	R/W	0h	Group Select Bits for MUX0: Selects 4X1 group output for AUXSIG3 of CLB-XBAR 00 : Select .0 input for MUX0 01 : Select .1 input for MUX0 10 : Select .2 input for MUX0 11 : Select .3 input for MUX0 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-82. AUXSIG7MUX16TO31CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	MUX31	R/W	0h	Group Select Bits for MUX31: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX31 01 : Select .1 input for MUX31 10 : Select .2 input for MUX31 11 : Select .3 input for MUX31 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX30	R/W	0h	Group Select Bits for MUX30: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX30 01 : Select .1 input for MUX30 10 : Select .2 input for MUX30 11 : Select .3 input for MUX30 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX29	R/W	0h	Group Select Bits for MUX29: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX29 01 : Select .1 input for MUX29 10 : Select .2 input for MUX29 11 : Select .3 input for MUX29 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX28	R/W	0h	Group Select Bits for MUX28: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX28 01 : Select .1 input for MUX28 10 : Select .2 input for MUX28 11 : Select .3 input for MUX28 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX27	R/W	0h	Group Select Bits for MUX27: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX27 01 : Select .1 input for MUX27 10 : Select .2 input for MUX27 11 : Select .3 input for MUX27 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-82. AUXSIG7MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-20	MUX26	R/W	0h	Group Select Bits for MUX26: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX26 01 : Select .1 input for MUX26 10 : Select .2 input for MUX26 11 : Select .3 input for MUX26 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
19-18	MUX25	R/W	0h	Group Select Bits for MUX25: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX25 01 : Select .1 input for MUX25 10 : Select .2 input for MUX25 11 : Select .3 input for MUX25 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX24	R/W	0h	Group Select Bits for MUX24: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX24 01 : Select .1 input for MUX24 10 : Select .2 input for MUX24 11 : Select .3 input for MUX24 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX23	R/W	0h	Group Select Bits for MUX23: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX23 01 : Select .1 input for MUX23 10 : Select .2 input for MUX23 11 : Select .3 input for MUX23 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX22	R/W	0h	Group Select Bits for MUX22: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX22 01 : Select .1 input for MUX22 10 : Select .2 input for MUX22 11 : Select .3 input for MUX22 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX21	R/W	0h	Group Select Bits for MUX21: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX21 01 : Select .1 input for MUX21 10 : Select .2 input for MUX21 11 : Select .3 input for MUX21 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX20	R/W	0h	Group Select Bits for MUX20: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX20 01 : Select .1 input for MUX20 10 : Select .2 input for MUX20 11 : Select .3 input for MUX20 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-82. AUXSIG7MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX19	R/W	0h	Group Select Bits for MUX19: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX19 01 : Select .1 input for MUX19 10 : Select .2 input for MUX19 11 : Select .3 input for MUX19 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX18	R/W	0h	Group Select Bits for MUX18: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX18 01 : Select .1 input for MUX18 10 : Select .2 input for MUX18 11 : Select .3 input for MUX18 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX17	R/W	0h	Group Select Bits for MUX17: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX17 01 : Select .1 input for MUX17 10 : Select .2 input for MUX17 11 : Select .3 input for MUX17 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX16	R/W	0h	Group Select Bits for MUX16: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX16 01 : Select .1 input for MUX16 10 : Select .2 input for MUX16 11 : Select .3 input for MUX16 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.17 AUXSIG0MUXENABLE Register (Offset = 20h) [Reset = 0000000h]

AUXSIG0MUXENABLE is shown in [Figure 11-74](#) and described in [Table 11-83](#).

Return to the [Summary Table](#).

Table 11-83. AUXSIG0MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.18 AUXSIG1MUXENABLE Register (Offset = 22h) [Reset = 0000000h]

AUXSIG1MUXENABLE is shown in [Figure 11-75](#) and described in [Table 11-84](#).

Return to the [Summary Table](#).

Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-84. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-84. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-84. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.19 AUXSIG2MUXENABLE Register (Offset = 24h) [Reset = 0000000h]

AUXSIG2MUXENABLE is shown in [Figure 11-76](#) and described in [Table 11-85](#).

Return to the [Summary Table](#).

Table 11-85. AUXSIG2MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-85. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-85. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-85. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-85. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.20 AUXSIG3MUXENABLE Register (Offset = 26h) [Reset = 0000000h]

AUXSIG3MUXENABLE is shown in [Figure 11-77](#) and described in [Table 11-86](#).

Return to the [Summary Table](#).

Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.21 AUXSIG4MUXENABLE Register (Offset = 28h) [Reset = 0000000h]

AUXSIG4MUXENABLE is shown in [Figure 11-78](#) and described in [Table 11-87](#).

Return to the [Summary Table](#).

Table 11-87. AUXSIG4MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-87. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-87. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-87. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG5MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-88. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.23 AUXSIG6MUXENABLE Register (Offset = 2Ch) [Reset = 0000000h]

AUXSIG6MUXENABLE is shown in [Figure 11-80](#) and described in [Table 11-89](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-6

Table 11-89. AUXSIG6MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.24 AUXSIG7MUXENABLE Register (Offset = 2Eh) [Reset = 0000000h]

AUXSIG7MUXENABLE is shown in [Figure 11-81](#) and described in [Table 11-90](#).

Return to the [Summary Table](#).

Table 11-90. AUXSIG7MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-90. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-90. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-90. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-90. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.5.25 AUXSIGOUTINV Register (Offset = 38h) [Reset = 0000000h]

AUXSIGOUTINV is shown in [Figure 11-82](#) and described in [Table 11-91](#).

Return to the [Summary Table](#).

2Eh	OUTPUT8MUXENABLE	Output X-BAR Mux Enable for Output 8	EALLOW	Go
30h	OUTPUTLATCH	Output X-BAR Output Latch		Go
32h	OUTPUTLATCHCLR	Output X-BAR Output Latch Clear		Go
34h	OUTPUTLATCHFRC	Output X-BAR Output Latch Clear		Go
36h	OUTPUTLATCHENABLE	Output X-BAR Output Latch Enable	EALLOW	Go
38h	OUTPUTINV	Output X-BAR Output Inversion	EALLOW	Go
3Eh	OUTPUTLOCK	Output X-BAR Configuration Lock register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 11-94 shows the codes that are used for access types in this section.

Table 11-94. OUTPUT_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write

Table 11-94. OUTPUT_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
W1S	W 1S	Write 1 to set
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

11.3.6.1 OUTPUT1MUX0TO15CFG Register (Offset = 0h) [Reset = 0000000h]

OUTPUT1MUX0TO15CFG is shown in [Figure 11-84](#) and described in [Table 11-95](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-111. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-111. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-111. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-111. OUTPUT1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT1 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT1 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT1 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.6.18 OUTPUT2MUXENABLE Register (Offset = 22h) [Reset = 0000000h]

OUTPUT2MUXENABLE is shown in [Figure 11-101](#) and described in [Table 11-112](#).

Return to the [Summary Table](#).

Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-112. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-112. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-112. OUTPUT2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT2 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT2 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT2 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.6.19 OUTPUT3MUXENABLE Register (Offset = 24h) [Reset = 0000000h]

OUTPUT3MUXENABLE is shown in [Figure 11-102](#) and described in [Table 11-113](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 3

Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-113. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-113. OUTPUT3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT3 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT3 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT3 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.6.20 OUTPUT4MUXENABLE Register (Offset = 26h) [Reset = 0000000h]

OUTPUT4MUXENABLE is shown in [Figure 11-103](#) and described in [Table 11-114](#).

Return to the [Summary Table](#).

Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-114. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-114. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-114. OUTPUT4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT4 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT4 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT4 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.6.21 OUTPUT5MUXENABLE Register (Offset = 28h) [Reset = 0000000h]

OUTPUT5MUXENABLE is shown in [Figure 11-104](#) and described in [Table 11-115](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 5

Table 11-115. OUTPUT5MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux31 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux31 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux30 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux30 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux29 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux29 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux28 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux28 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-115. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux27 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux27 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux26 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux26 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux25 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux25 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-115. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-115. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-115. OUTPUT5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT5 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT5 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT5 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.6.22 OUTPUT6MUXENABLE Register (Offset = 2Ah) [Reset = 0000000h]

OUTPUT6MUXENABLE is shown in [Figure 11-105](#) and described in [Table 11-116](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 6

Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux24 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux24 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux23 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux23 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux22 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux22 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux21 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux21 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux20 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux20 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-116. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-116. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-116. OUTPUT6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT6 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT6 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT6 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.6.23 OUTPUT7MUXENABLE Register (Offset = 2Ch) [Reset = 0000000h]

OUTPUT7MUXENABLE is shown in [Figure 11-106](#) and described in [Table 11-117](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 7

Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-117. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-117. OUTPUT7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT7 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT7 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT7 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.6.24 OUTPUT8MUXENABLE Register (Offset = 2Eh) [Reset = 0000000h]

OUTPUT8MUXENABLE is shown in [Figure 11-107](#) and described in [Table 11-118](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 8

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux19 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux19 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux18 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux18 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux17 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux17 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux16 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux16 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux15 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux15 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux14 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux14 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux13 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux13 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux12 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux12 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-118. OUTPUT8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux11 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux11 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux10 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux10 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux9 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux9 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux8 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux8 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux7 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux7 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux6 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux6 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux5 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux5 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux4 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux4 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 11-118. OUTPUT8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux3 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux3 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux2 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux2 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux1 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux1 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive OUTPUT8 of OUTPUT-XBAR 0: Respective output of Mux0 is disabled to drive the OUTPUT8 of OUTPUT-XBAR 1: Respective output of Mux0 is enabled to drive the OUTPUT8 of OUTPUT-XBAR Refer to the Output X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

11.3.6.25 OUTPUTLATCH Register (Offset = 30h) [Reset = 0000000h]

OUTPUTLATCH is shown in [Figure 11-108](#) and described in [Table 11-119](#).

Return to the [Summary Table](#).

Chapter 12
Direct Memory Access (DMA)

The direct memory access (DMA) module provides a hardware method of transferring data between peripherals and memory without intervention from the CPU; thereby, freeing up bandwidth for other system functions. Additionally, the DMA has the capability to orthogonally rearrange the data as the data is transferred as well as “ping-pong” data between buffers. These features are useful for structuring data into blocks for CPU processing.

12.9 DMA Registers	1610

12.1 Introduction

The strength of a controller is not measured purely in processor speed, but in total system capabilities. As a part of the equation, any time the CPU bandwidth for a given function can be reduced, the greater the system capabilities. Many times applications spend a significant amount of the bandwidth moving data, whether moving data from off-chip memory to on-chip memory, from a peripheral such as an analog-to-digital converter (ADC) to RAM, or from one peripheral to another. Furthermore, many times this data comes in a format that is not conducive to the optimum processing powers of the CPU. The DMA module described in this chapter has the ability to free up CPU bandwidth and rearrange the data into a pattern for more streamlined processing.

The DMA module is an event-based machine, meaning the DMA module requires a peripheral or software trigger to start a DMA transfer. Although the DMA module can be made into a periodic time-driven machine by configuring a timer as the DMA trigger source, there is no mechanism within the module to start memory transfers periodically. The DMA module has six independent DMA channels that can be configured separately and each channel contains an independent PIE interrupt to let the CPU know when a DMA transfer has either started or completed. Five of the six channels are exactly the same, while Channel 1 has the ability to be configured at a higher priority than the others. At the heart of the DMA is a state machine and tightly coupled address control logic. This address control logic allows for rearrangement of the block of data during the transfer as well as the process of ping-ponging data between buffers. Each of these features is discussed in detail in this chapter.

12.1.1 Features

DMA features include:

- Six channels with independent PIE interrupts
- Each DMA channel can be triggered from multiple peripheral trigger sources independently
- Word Size: 16-bit or 32-bit (SPI limited to 16-bit)
- Throughput: 3 cycles/word without arbitration

12.1.2 Block Diagram

Figure 12-1 shows a device-level block diagram of the DMA.

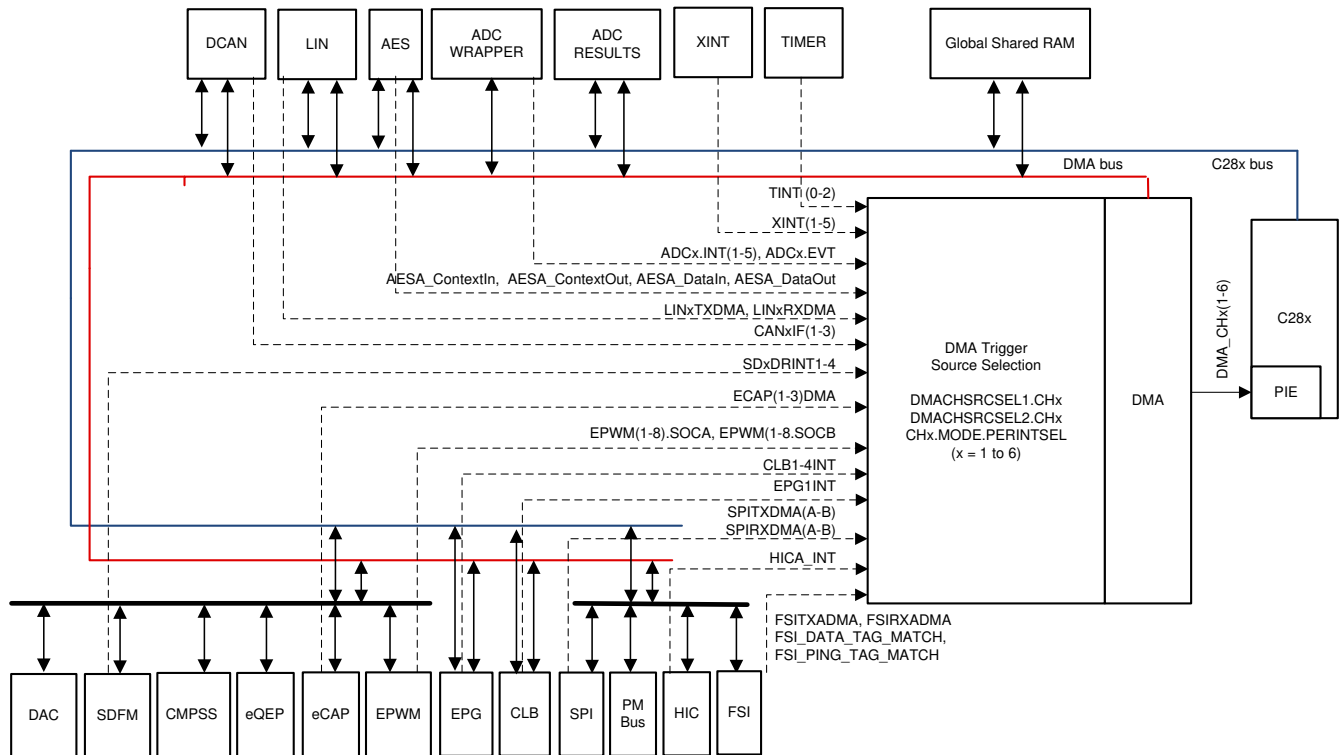

Figure 12-1. DMA Block Diagram

12.2 Architecture

12.2.1 Peripheral Interrupt Event Trigger Sources

Each DMA Channel can be configured to trigger by software and other peripheral triggers events. DMACHSRCSELx register can be used to configure DMA Trigger sources for each DMA channel. CHx.MODE.PERINTSEL register bit field can be set to channel number (CHx.MODE.PERINTSEL = x) as shown in [Figure 12-2](#). Included in these DMA Trigger sources are five external interrupt signals that can be connected to most of the general-purpose input/output (GPIO) pins on the device. This adds significant flexibility to the event trigger capabilities. Upon receipt of a peripheral interrupt event signal, the DMA automatically sends a clear signal to the interrupt source so that subsequent interrupt events occur.

Note

To use the system-level DMA Trigger source selection, the DMA internal trigger source selection configuration for each channel can be done using the DMACHSRCSELx register and the CHx.MODE.PERINTSEL register. See [Table 12-1](#) or the DMACHSRCSELx register definition for a complete list of DMA trigger sources.

Regardless of the value of the MODE.CHx[PERINTSEL] bit field, software can always force a trigger by using the CONTROL.CHx[PERINTFRC] bit. Likewise, software can always clear a pending DMA trigger using the CONTROL.CHx[PERINTCLR] bit.

Once a particular peripheral trigger event sets a channel's PERINTFLG bit, the bit remains pending until the priority logic of the state machine starts the burst transfer for that channel. Once the burst transfer starts, the flag is cleared. If a new peripheral trigger event is generated while a burst is in progress, the burst completes before responding to the new peripheral trigger event (after proper prioritization). If a third peripheral trigger event occurs before the pending event is serviced, an error flag is set in the CONTROL.CHx[OVRFLG] bit. If a peripheral trigger event occurs at the same time as the latched flag is being cleared, the trigger event has priority and the PERINTFLG remains set.

[Figure 12-3](#) shows a diagram of the trigger select circuit.

[Table 12-1](#) shows the peripheral trigger source options that are available for each channel.

CAUTION

See the Device Errata "ADC:DMA Read of Stale Result" Advisory regarding the potential for the DMA to read the ADC result registers before the result is ready

Figure 12-2. DMA Trigger Architecture

Note: See [Figure 12-2](#).

12.2.2 DMA Bus

The DMA bus architecture consists of a 32-bit address bus, a 32-bit data read bus, and a 32-bit data write bus. Memories and register locations connected to the DMA bus by way of interfaces that sometimes share resources with the CPU memory or peripheral bus.

12.3 Address Pointer and Transfer Control

The DMA state machine is, at the most basic level, two nested loops.

Burst (Inner) Loop:

The burst (inner) loop transfers a programmable number of words set by (BURST_SIZE + 1) register when a DMA channel trigger (Peripheral or Software trigger) is received. The BURST_SIZE register allows a maximum of 32 sixteen-bit words to be transferred in one burst. Each DMA channel supports both 16-bit or 32-bit word burst that can be controlled by MODE.DATASIZE bit field. Each DMA channel contains a shadowed address pointer for the source (SRC_ADDR_SHADOW) and the destination (DST_ADDR_SHADOW) address. At the beginning of each transfer, the shadowed version of each pointer is copied into the respective active (SRC_ADDR_ACTIVE or DST_ADDR_ACTIVE) register. During the burst loop, after each word is transferred, the signed value contained in the appropriate source or destination BURST_STEP register is added to the active register:

$$\text{SRC_ADDR_ACTIVE} = \text{SRC_ADDR_ACTIVE} + \text{SRC_BURST_STEP}$$

$$\text{DST_ADDR_ACTIVE} = \text{DST_ADDR_ACTIVE} + \text{DST_BURST_STEP}$$

The burst (inner) loop transfers a burst of data when a DMA Channel Trigger (Peripheral or Software trigger) is received.

Transfer (Outer) Loop:

The Transfer (outer) loop transfers a programmable number of bursts set by (TRANSFER_SIZE + 1) register for each channel. Since TRANSFER_SIZE is a 16-bit register, the total size of a transfer allowed is well beyond any practical requirement. During the transfer loop, after each burst is complete, there are two methods that can be used to modify the active address pointer:

Method 1 (Default): When address wrapping is disabled (SRC_WRAP_SIZE or DST_WRAP_SIZE is greater than TRANSFER_SIZE), active address pointer is updated as shown below

$$\text{SRC_ADDR_ACTIVE} = \text{SRC_ADDR_ACTIVE} + \text{SRC_TRANSFER_STEP}$$

$$\text{DST_ADDR_ACTIVE} = \text{DST_ADDR_ACTIVE} + \text{DST_TRANSFER_STEP}$$

Method 2: Address wrapping gets enabled when SRC_WRAP_SIZE or DST_WRAP_SIZE is less than TRANSFER_SIZE. This allows the channel to wrap multiple times within a single transfer. When the number of bursts is equal to (SRC/DST_WRAP_SIZE + 1) register, the state machine modifies the active address pointers as:

$$\text{SRC_BEG_ADDR_ACTIVE} = \text{SRC_BEG_ADDR_ACTIVE} + \text{SRC_WRAP_STEP}$$

$$\text{DST_BEG_ADDR_ACTIVE} = \text{DST_BEG_ADDR_ACTIVE} + \text{DST_WRAP_STEP}$$

$$\text{SRC_ADDR_ACTIVE} = \text{SRC_BEG_ADDR_ACTIVE}$$

$$\text{DST_ADDR_ACTIVE} = \text{DST_BEG_ADDR_ACTIVE}$$

At the end of DMA transfer, DMA can have transferred (BURST_SIZE + 1) x (TRANSFER_SIZE + 1) words.

OneShot Mode:

OneShot mode is disabled by default.

When OneShot mode is disabled (MODE.CHx[ONESHOT] = 0), DMA transfers one burst [(BURST_SIZE + 1) words] of data each time a DMA Channel Trigger is received. After the burst is completed, the state machine moves on to the next pending channel in the priority scheme, even if another trigger for the channel just completed is pending. This feature keeps any single channel from monopolizing the DMA bus.

When OneShot mode is enabled (MODE.CHx[ONESHOT] = 1), DMA transfers all the bursts [(BURST_SIZE + 1) x (TRANSFER_SIZE + 1) words] on a single DMA channel trigger. Be careful when using this mode, since this can create a condition where one trigger uses up the majority of the DMA bandwidth.

Continuous Mode:

Continuous mode is disabled by default.

When Continuous mode is disabled (MODE.CHx[CONTINUOUS] = 0), DMA state machine disables channel after all bursts in a transfer loop (TRANSFER_COUNT = 0) are complete. The channel must be re-enabled by setting the RUN bit in the CONTROL register before another transfer can be started on that channel.

When Continuous mode is enabled (MODE.CHx[CONTINUOUS] = 1), DMA state machine keep channel active even after all bursts in a transfer loop (TRANSFER_COUNT = 0) are complete.

Each DMA channel can trigger an EPIE interrupt for each DMA transfer either at start of DMA transfer or end of DMA transfer using MODE.CHx[CHINTMODE] bit.

Source/Destination Address Pointers (SRC/DST_ADDR) The value written into the shadow register is the start address of the first location where data is read or written to.

At the beginning of a transfer the shadow register (SRC/DST_ADDR_SHADOW) is copied into the active register (SRC/DST_ADDR_ACTIVE). The active register performs as the current address pointer.

Source/Destination Begin Address Pointers (SRC/DST_BEG_ADDR) This is the wrap pointer.

The value written into the shadow register (SRC/DST_BEG_ADDR_SHADOW) is loaded into the active register (SRC/DST_BEG_ADDR_ACTIVE) at the start of a transfer. On a wrap condition, the active register (SRC/DST_BEG_ADDR_ACTIVE) is incremented by the signed value in the appropriate SRC/DST_WRAP_STEP register prior to being loaded into the active register (SRC/DST_ADDR_ACTIVE).

For each channel, the transfer process can be controlled with the following size values:

**Source and
Destination
Burst Size
(BURST_SIZE)**

This specifies the number of words to be transferred in a burst.

This value is loaded into the BURST_COUNT register at the beginning of each burst. The BURST_COUNT decrements each word that is transferred and when the register reaches a zero value, the burst is complete, indicating that the next channel can be serviced. The behavior of the current channel is defined by the ONE_SHOT bit in the MODE register. The maximum size of the burst is dictated by the type of peripheral. For the ADC, the burst size can be all 16 registers (if all 16 registers are used). For RAM, the burst size can be up to the maximum allowed by the BURST_SIZE register, which is 32. See [Table 12-2](#) to understand how BURST_SIZE register affects the number of 16-bit words transferred with respect to DATASIZE.

Table 12-2. BURSTSIZE versus DATASIZE Behavior

BURSTSIZE	Number of 16-bit words transferred in	
	DataSize = 16-bit data	DataSize = 32-bit data
0	1	2
1	2	2
2	3	4
3	4	4
4	5	6
5	6	6
6	7	8
7	8	8
8	9	10
9	10	10
10	11	12
11	12	12
*	*	*
*	*	*
*	*	*
30	31	32
31	32	32

**Source and
Destination
Transfer Size
(TRANSFER_SIZE)**

This specifies the number of bursts to be transferred per CPU interrupt (if enabled).

Whether this interrupt is generated at the beginning or the end of the transfer is defined in the CHINTMODE bit in the MODE register. Whether the channel remains enabled or not after the transfer is completed is defined by the CONTINUOUS bit in the MODE register. The TRANSFER_SIZE register is loaded into the TRANSFER_COUNT register at the beginning of each transfer. The TRANSFER_COUNT register keeps track of how many bursts of data the channel has transferred and when the register reaches zero, the DMA transfer is complete.

Source/Destination Wrap Size (SRC/DST_WRAP_SIZE) This specifies the number of bursts to be transferred before the current address pointer wraps around to the beginning.

This feature is used to implement a circular addressing type function. This value is loaded into the appropriate SRC/DST_WRAP_COUNT register at the beginning of each transfer. The SRC/DST_WRAP_COUNT registers keep track of how many bursts of data the channel has transferred and when the registers reach zero, the wrap procedure is performed on the appropriate source or destination address pointer. A separate size and count register is allocated for source and destination pointers. To disable the wrap function, assign the value of these registers to be larger than the TRANSFER_SIZE.

Note

The value written to the SIZE registers is one less than the intended size. So, to transfer three 16-bit words, the value 2 can be placed in the SIZE register.

Regardless of the state of the DATASIZE bit, the value specified in the SIZE registers are for 16-bit addresses. So, to transfer three 32-bit words, the value 5 can be placed in the SIZE register.

For each source/destination pointer, the address changes can be controlled with the following step values:

Source/Destination Burst Step (SRC/DST_BURST_STEP) Within each burst transfer, the address source and destination step sizes are specified by these registers.

This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required. If no increment is desired, such as when accessing the data receive or transmit registers in a communication peripheral, the value of these registers can be set to zero.

Source/Destination Transfer Step (SRC/DST_TRANSFER_STEP) This specifies the address offset to start the next burst transfer after completing the current burst transfer.

This is used in cases where registers or data memory locations are spaced at constant intervals. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required.

Source/Destination Wrap Step (SRC/DST_WRAP_STEP) When the wrap counter reaches zero, this value specifies the number of words to add/subtract from the SRC/DST_BEG_ADDR pointer and hence sets the new start address.

This implements a circular type of addressing mode, useful in many applications. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required.

Note

Regardless of the state of the DATASIZE bit, the value specified in the STEP registers are for 16-bit addresses. So, to increment one 32-bit address, a value of 2 can be placed in these registers.

Channel Interrupt Mode (CHINTMODE) This mode bit selects whether the DMA interrupt from the respective channel is generated at the beginning of a new transfer or at the end of the transfer.

If implementing a ping-pong buffer scheme with continuous mode of operation, then the interrupt can be generated at the beginning, just after the working registers are copied to the shadow set. If the DMA does not operate in continuous mode, then the interrupt is typically generated at the end when the transfer is complete.

All of the previous features and modes are shown in [Figure 12-4](#). The following items are in reference to [Figure 12-4](#).

- The *HALT* points represent where the channel halts operation when interrupted by a high priority channel 1 trigger, or when the HALT command is set, or when an emulation halt is issued and the FREE bit is cleared to 0.
- The SRC/DST_ADDR_ACTIVE registers are not affected by SRC/DST_BEG_ADDR_ACTIVE at the start of a transfer. SRC/DST_BEG_ADDR_ACTIVE only affects the SRC/DST_ADDR_ACTIVE registers on a wrap. Following is what happens when a transfer first starts:
 - SRC/DST_BEG_ADDR_SHADOW remains unchanged.
 - SRC/DST_ADDR_SHADOW remains unchanged.
 - SRC/DST_BEG_ADDR_ACTIVE = SRC/DST_BEG_ADDR_SHADOW
 - SRC/DST_ADDR_ACTIVE = SRC/DST_ADDR_SHADOW
- The active registers get updated when a wrap occurs. The shadow registers remain unchanged. Specifically:
 - SRC/DST_BEG_ADDR_SHADOW remains unchanged.
 - SRC/DST_ADDR_SHADOW remains unchanged.
 - SRC/DST_BEG_ADDR_ACTIVE += SRC/DST_WRAP_STEP
 - SRC/DST_ADDR_ACTIVE = SRC/DST_BEG_ADDR_ACTIVE
- The best way to remember this is:
 - The shadow registers never change except by software.
 - The active registers never change except by hardware, and a shadow register is only copied into the active register, never an active register by another name.

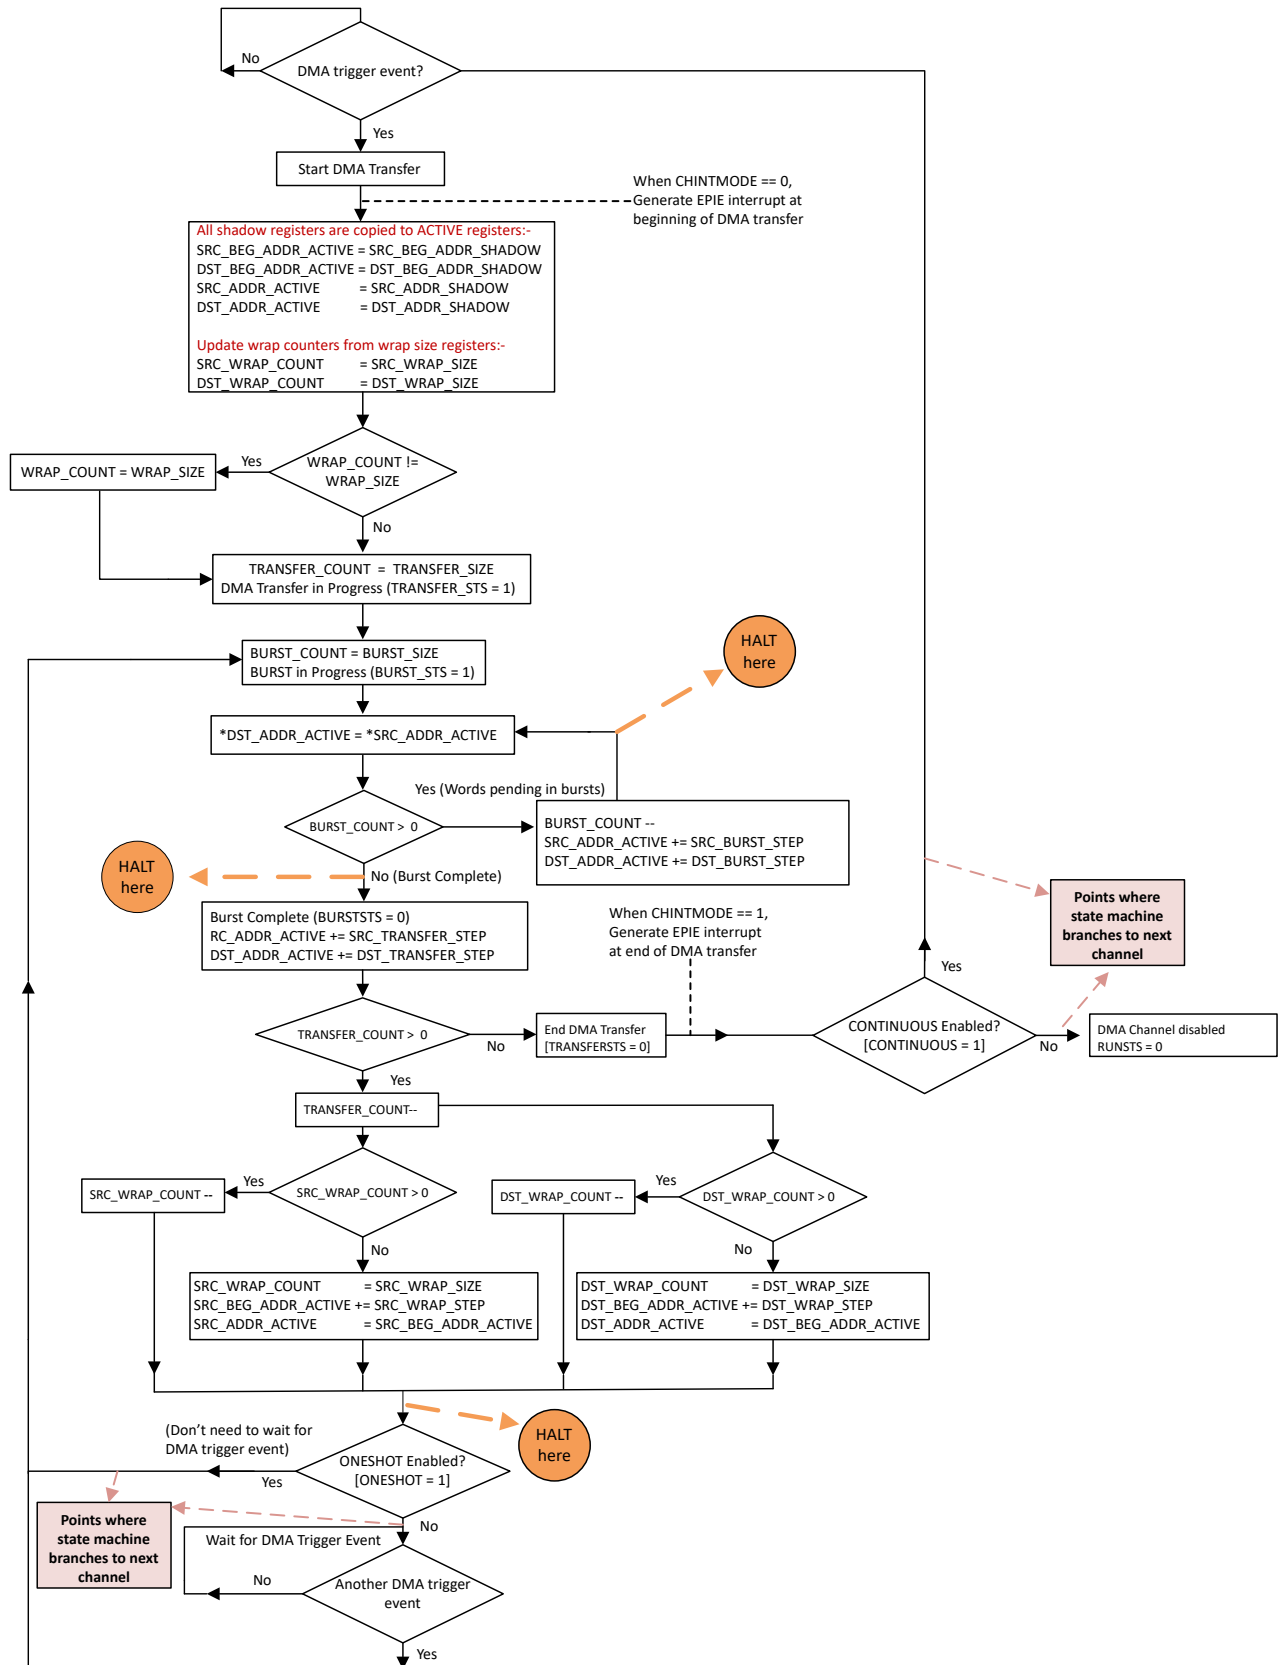

Figure 12-4. DMA State Diagram

12.4 Pipeline Timing and Throughput

In addition to the pipeline there are a few other behaviors of the DMA that affect the total throughput:

- A 1-cycle delay is added at the beginning of each burst
- A 1-cycle delay is added when returning from a CH1 high-priority interrupt
- Collisions with the CPU can add delay slots
- 32-bit transfers run at double the speed of a 16-bit transfer (takes the same amount of time to transfer a 32-bit word as to transfer a 16-bit word)

For example, to transfer 128 16-bit words from GS0 RAM to GS3 RAM, a channel can be configured to transfer 8 bursts of 16 words/burst. This gives:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 16 \text{ words/burst}) + 1] = 392 \text{ cycles}$$

If instead the channel were configured to transfer the same amount of data 32 bits at a time (the word size is configured to 32 bits), the transfer can take:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 8 \text{ words/burst}) + 1] = 200 \text{ cycles}$$

The DMA module consists of a 3-stage pipeline as shown in [Figure 12-5](#) and [Figure 12-6](#).

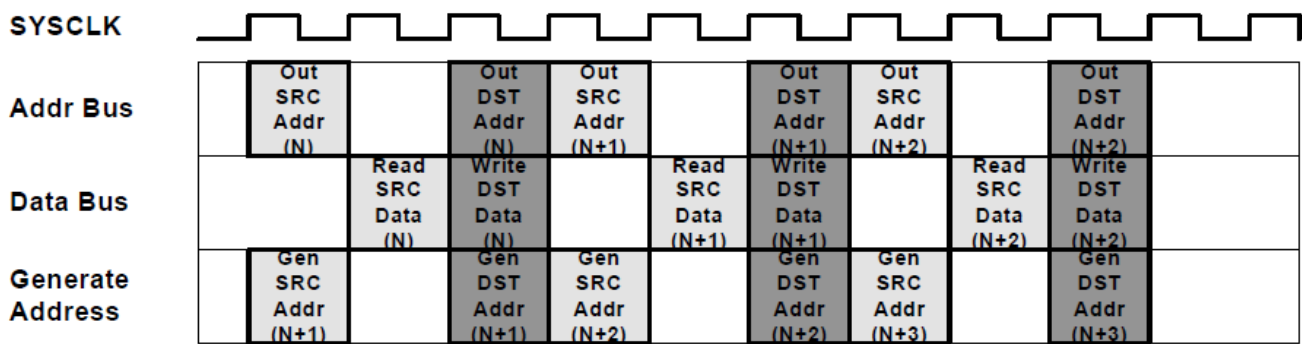

Figure 12-5. 3-Stage Pipeline DMA Transfer

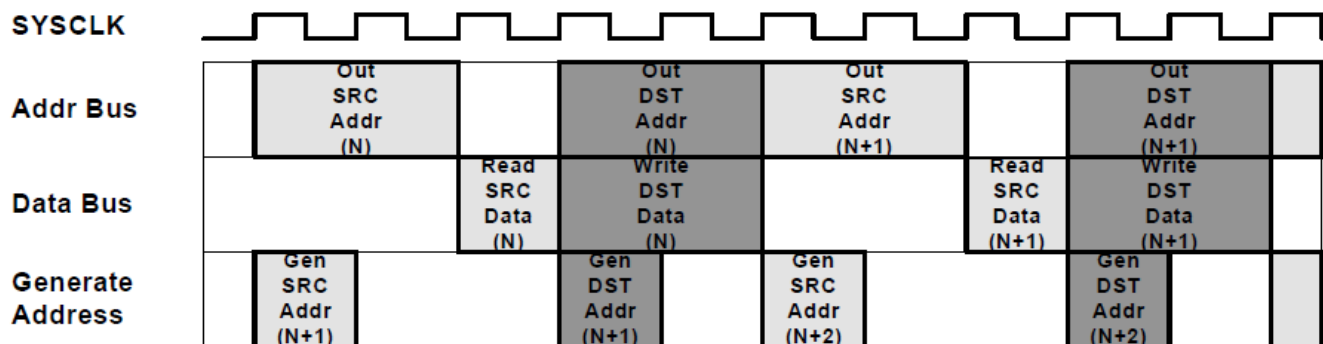

Figure 12-6. 3-stage Pipeline with One Read Stall

12.5 CPU and CLA Arbitration

Typically, DMA activity is independent of CPU and CLA activity. However, when the DMA and CPU (or CLA) try to access the same peripheral at the same time, an arbitration procedure is required to resolve the conflict. All instances of the same peripheral type conflict with each other. For instance, CAN-A and CAN-B conflict. Accesses to global shared RAM, across different instances, do not have this conflict. Different peripheral types can share a bus interface, which creates further opportunities for conflicts. These bus interfaces are:

- Peripheral frame 1: ePWM, eCAP, eQEP, CMPSS, DAC , SDFM
- Peripheral frame 2: PMBus, SPI , FSI

Conflict Example: The CLA is accessing DAC-A while the DMA is simultaneously accessing DAC-B.

Conflict Example: The CPU is accessing an SPI FIFO while the DMA is simultaneously accessing a PMBus register.

Non-conflict Example: The CPU is accessing a shared ePWM while the DMA is accessing an SPI.

Non-conflict Example: The CPU is accessing GS0 while the DMA is accessing GS1

The exception to all this is the ADC result registers, which are duplicated for each bus master. The CPU, DMA, and CLA can all simultaneously read these result registers with no stalls or arbitration needed for any master.

A DMA transfer consists of four phases: send source address, read source data, send destination address, and write destination data (see [Section 12.4](#)). Suppose CPU accesses a peripheral/memory causing conflict in middle of a DMA transfer, CPU is stalled till the current DMA access is complete and not until the completion of whole DMA transfer.

The following priority schemes are implemented for the various interfaces on the device:

- The arbitration follows a fixed arbitration scheme with highest priority first:
 - DMA WRITE
 - DMA READ
 - CLA WRITE
 - CLA READ
 - CPU WRITE
 - CPU READ
- The priority scheme for GSx RAM accesses is round-robin.
- The ADC results are duplicated for CPU, CLA, and DMA so that no arbitration is needed when reading the result registers. This allows all masters to access the ADC result registers simultaneously without delay.

Note

If the CPU is performing a read-modify-write operation and the DMA performs a write to the same location, the DMA write can be lost if the operation occurs in between the CPU read and the CPU write. Avoid mixing CPU writes with DMA writes to the same locations.

Arbitration within DMA channels is based on a round-robin priority or Channel 1 high-priority scheme described in [Section 12.6](#).

12.6 Channel Priority

Two priority schemes exist when determining channel priority: Round-robin mode and Channel 1 high-priority mode.

12.6.1 Round-Robin Mode

In this mode, all channels have *equal* priority and each enabled channel is serviced in round-robin fashion as:

$$\text{CH1} \rightarrow \text{CH2} \rightarrow \text{CH3} \rightarrow \text{CH4} \rightarrow \text{CH5} \rightarrow \text{CH6} \rightarrow \text{CH1} \rightarrow \text{CH2} \rightarrow \dots$$

In the case above, after each channel has transferred a burst of words, the next channel is serviced. The user can specify the size of the burst for each channel. Once CH6 (or the last enabled channel) has been serviced, and no other channels are pending, the round-robin state machine enters an idle state.

From the idle state, channel 1 (if enabled) is always serviced first. However, if the DMA is currently processing another channel *x*, all other pending channels between *x* and the end of the round are serviced before CH1. All the channels are of *equal* priority. For instance, take an example where CH1, CH4, and CH5 are enabled in round-robin mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from the respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When CH4 completes the burst, CH5 is serviced next. Only after CH5 completes is CH1 serviced. Upon completion of CH1, if there are no more channels pending, the round-robin state machine enters an idle state.

A more complicated example is:

- Assume all channels are enabled, and the DMA is in an idle state,
- Initially a trigger occurs on CH1, CH3, and CH5 on the same cycle,
- When the CH1 burst transfer starts, requests from CH3 and CH5 are pending,
- Before completion of the CH1 burst, the DMA receives a request from CH2. Now the pending requests are from CH2, CH3, and CH5,
- After completing the CH1 burst, CH2 is serviced since this channel is next in the round-robin scheme after CH1.
- After the burst from CH2 is finished, the CH3 burst is serviced, followed by CH5 burst.
- Now while the CH5 burst is being serviced, the DMA receives a request from CH1, CH3, and CH6.
- The burst from CH6 starts after the completion of the CH5 burst, since this channel is the next channel after CH5 in the round-robin scheme.
- This is followed by the CH1 burst and then the CH3 burst
- After the CH3 burst finishes, assuming no more triggers have occurred, the round-robin state machine enters an idle state.

The round-robin state machine can be reset to the idle state using the DMACTRL[PRIORITYRESET] bit.

12.6.2 Channel 1 High-Priority Mode

In this mode, Channel 1 has high priority over all the other channels. Channels 2 to 6 have equal priority and each enabled channel is serviced in a round-robin fashion.

Higher priority: CH1
 Lower priority: CH2 → CH3 → CH4 → CH5 → CH6 → CH2 → ...

Given an example where CH1, CH4, and CH5 are enabled in Channel 1 high-priority mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from the respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When the current CH4 word transfer is completed, regardless of whether the DMA has completed the entire CH4 burst, CH4 execution is suspended and CH1 is serviced. After the CH1 burst completes, CH4 resumes execution.

Upon completion of CH4, CH5 is serviced. After CH5 completes, if there are no more channels pending, the round-robin state machine enters an idle state.

Typically Channel 1 is used in this mode for the ADC, since the data rate is so high. However, Channel 1 high-priority mode can be used in conjunction with any peripheral.

Note

High-priority mode and ONESHOT mode cannot be used at the same time on Channel 1. Other channels can use ONESHOT mode when Channel 1 is in high-priority mode.

12.7 Overrun Detection Feature

The DMA contains overrun detection logic. When a peripheral event trigger is received by the DMA, the PERINTFLG bit in the CONTROL register is set, pending the channel to the DMA state machine. When the burst for that channel is started, the PERINTFLG is cleared. If however, between the time that the PERINTFLG bit is set by an event trigger and cleared by the start of the burst, an additional event trigger arrives, the second trigger is lost. This condition sets the OVRFLG bit in the CONTROL register as in Figure 12-7. If the overrun interrupt is enabled, the channel interrupt is generated to the PIE module.

Figure 12-7. Overrun Detection Logic

12.8 Software

12.8.1 DMA Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
 C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/dma

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

12.8.1.1 DMA GSRAM Transfer (dma_ex1_gsram_transfer)

FILE: dma_ex1_gsram_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

Watch Variables

- *sData* - Data to send
- *rData* - Received data

12.8.1.2 DMA GSRAM Transfer (dma_ex2_gsram_transfer)

FILE: dma_ex2_gsram_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

Watch Variables

- *sData* - Data to send

12.9 DMA Registers

This section describes the Direct Memory Access Registers.

12.9.1 DMA Base Address Table

Table 12-3. DMA Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected
Instance	Structure							
DmaRegs	DMA_REGS	DMA_BASE	0x0000_1000	YES	-	-	-	-
Dmach1Regs	DMA_CH_REGS	DMA_CH1_BASE	0x0000_1020	YES	-	-	-	-
Dmach2Regs	DMA_CH_REGS	DMA_CH2_BASE	0x0000_1040	YES	-	-	-	-
Dmach3Regs	DMA_CH_REGS	DMA_CH3_BASE	0x0000_1060	YES	-	-	-	-
Dmach4Regs	DMA_CH_REGS	DMA_CH4_BASE	0x0000_1080	YES	-	-	-	-
Dmach5Regs	DMA_CH_REGS	DMA_CH5_BASE	0x0000_10A0	YES	-	-	-	-
Dmach6Regs	DMA_CH_REGS	DMA_CH6_BASE	0x0000_10C0	YES	-	-	-	-

12.9.2 DMA_REGS Registers

Table 12-4 lists the memory-mapped registers for the DMA_REGS registers. All register offset addresses not listed in Table 12-4 should be considered as reserved locations and the register contents should not be modified.

Table 12-4. DMA_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	DMACTRL	DMA Control Register	EALLOW	Go
1h	DEBUGCTRL	Debug Control Register	EALLOW	Go
4h	PRIORITYCTRL1	Priority Control 1 Register	EALLOW	Go
6h	PRIORITYSTAT	Priority Status Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 12-5 shows the codes that are used for access types in this section.

Table 12-5. DMA_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

12.9.2.1 DMACTRL Register (Offset = 0h) [Reset = 0000h]

DMACTRL is shown in [Figure 12-8](#) and described in [Table 12-6](#).

Return to the [Summary Table](#).

Table 12-6. DMACTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-2	RESERVED	R	0h	Reserved
1	PRIORITYRESET	R-0/W1S	0h	The priority reset bit resets the round-robin state machine when a 1 is written. Service starts from the first enabled channel. Writes of 0 are ignored and this bit always reads back a 0. When a 1 is written to this bit, any pending burst transfer completes before resetting the channel priority machine. If CH1 is configured as a high-priority channel, and this bit is written to while CH1 is servicing a burst, both the CH1 burst and the next pending low-priority burst are completed before the state machine is reset. If CH1 is high-priority, the state machine restarts from CH2 (or the next highest enabled channel). Reset type: SYSRSn
0	HARDRESET	R-0/W1S	0h	Writing a 1 to the hard reset bit resets the whole DMA and aborts any current access (similar to applying a device reset). Writes of 0 are ignored and this bit always reads back a 0. For a soft reset, a bit is provided for each channel to perform a gentler reset. Refer to the channel control registers. When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register. Reset type: SYSRSn

12.9.2.2 DEBUGCTRL Register (Offset = 1h) [Reset = 0000h]

DEBUGCTRL is shown in [Figure 12-9](#) and described in [Table 12-7](#).

Return to the [Summary Table](#).

Table 12-12. MODE Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CHINTE	R/W	0h	Channel Interrupt Enable Bit This bit enables the DMA channel's CPU interrupt. Reset type: SYSRSn 0h (R/W) = Interrupt disabled 1h (R/W) = Interrupt enabled
14	DATASIZE	R/W	0h	Data Size Mode Bit This bit determines whether the DMA channel transfers 16 bits or 32 bits of data per read/write operation. Regardless of this setting, all data lengths and offsets in other DMA registers refer to 16-bit words. The pointer step increments must be configured to accommodate 32-bit words. Reset type: SYSRSn 0h (R/W) = 16-bit data transfer size 1h (R/W) = 32-bit data transfer size
13	RESERVED	R/W	0h	Reserved
12	RESERVED	R/W	0h	Reserved
11	CONTINUOUS	R/W	0h	Continuous Mode Bit If this bit is set to 1, then the channel re-initializes when TRANSFER_COUNT is zero and waits for the next event trigger. Otherwise, the DMA stops and clears the RUNSTS bit. Reset type: SYSRSn
10	ONESHOT	R/W	0h	One Shot Mode If this bit is set to 1, each peripheral event trigger causes the channel to perform an entire transfer. Otherwise, the channel only performs one burst per trigger. Reset type: SYSRSn
9	CHINTMODE	R/W	0h	Channel Interrupt Generation Mode This bit specifies when the DMA channel generates a CPU interrupt for a transfer. Reset type: SYSRSn 0h (R/W) = Generate interrupt at beginning of new transfer 1h (R/W) = Generate interrupt at end of transfer.
8	PERINTE	R/W	0h	Peripheral Event Trigger Enable This bit enables peripheral event triggers on the DMA channel. Reset type: SYSRSn 0h (R/W) = Peripheral event trigger disabled. Neither the selected peripheral nor software can start a DMA burst. 1h (R/W) = Peripheral event trigger enabled.

Table 12-12. MODE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	OVRINTE	R/W	0h	Overflow Interrupt Enable The bit determines whether the DMA module generates a CPU interrupt when it detects an overflow event. Reset type: SYSRSn 0h (R/W) = Overflow interrupt disabled 1h (R/W) = Overflow interrupt enabled
6-5	RESERVED	R	0h	Reserved
4-0	PERINTSEL	R/W	0h	Peripheral Event Trigger Source Select These are legacy bits and should be set to the channel number. The actual source selection is done via the DMACHSRCSELn registers, which are part of the DMA_CLA_SRC_SEL_REGS group. Reset type: SYSRSn

12.9.3.2 CONTROL Register (Offset = 1h) [Reset = 0000h]

CONTROL is shown in [Figure 12-13](#) and described in [Table 12-13](#).

Return to the [Summary Table](#).

This bit is cleared when TRANSFER_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = No transfer activity</p> <p>1h (R/W) = The channel is currently in the middle of a transfer regardless of whether a burst of data is actively being transferred or not</p>
10	RESERVED	R	0h	Reserved
9	RESERVED	R	0h	Reserved

Table 12-13. CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	PERINTFLG	R	0h	Peripheral Event Trigger Flag This bit indicates whether a peripheral event trigger has arrived. This bit is automatically cleared when the first burst transfer begins. Reset type: SYSRSn 0h (R/W) = Waiting for event trigger 1h (R/W) = Event trigger pending
7	ERRCLR	R-0/W1S	0h	Clear Error Writing a 1 to this bit will clear the OVRFLG bit. This is normally done when initializing the DMA module or if an overflow condition is detected. If an overflow event occurs at the same time this bit is set, the overrun has priority and the OVRFLG bit is set. Reset type: SYSRSn
6	RESERVED	R-0/W1S	0h	Reserved
5	RESERVED	R-0/W1S	0h	Reserved
4	PERINTCLR	R-0/W1S	0h	Clear Peripheral Event Trigger Writing a 1 to this bit clears PERINTFLG, which cancels a pending event trigger. This is normally done when initializing the DMA module. If an event trigger arrives at the same time this bit is set, the trigger has priority and PERINTFLG is set. Reset type: SYSRSn
3	PERINTFRC	R-0/W1S	0h	Force Peripheral Event Trigger If the PERINTE bit of the MODE register is set, writing a 1 to this bit sets PERINTFLG, which triggers a DMA burst. This bit can be used to start a DMA transfer in software. Reset type: SYSRSn
2	SOFTRESET	R-0/W1S	0h	Channel Soft Reset Writing a 1 to this bit places the channel into its default state after the current read/write access has completed: RUNSTS = 0 TRANSFERSTS = 0 BURSTSTS = 0 BURST_COUNT = 0 TRANSFER_COUNT = 0 SRC_WRAP_COUNT = 0 DST_WRAP_COUNT = 0 When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register. Reset type: SYSRSn
1	HALT	R-0/W1S	0h	Halt Channel Writing a 1 to this bit halts the DMA channel in its current state after any ongoing read/write access has completed. Reset type: SYSRSn
0	RUN	R-0/W1S	0h	Run Channel Writing a 1 to this bit enables the DMA channel and sets the RUNSTS bit to 1. This bit is also used to resume after a channel halt. The RUN bit is typically used to start the DMA channel after configuration. The channel will then wait for the first peripheral event trigger (PERINTFLG == 1) to start a burst. Reset type: SYSRSn

12.9.3.3 BURST_SIZE Register (Offset = 2h) [Reset = 0000h]

BURST_SIZE is shown in [Figure 12-14](#) and described in [Table 12-14](#).

Return to the [Summary Table](#).

Embedded Real-time Analysis and Diagnostic (ERAD)

This chapter describes the features and operation of the embedded real-time analysis and diagnostic (ERAD) module. The ERAD module enhances the debug and system analysis capabilities of the device. The debug and system analysis enhancements provided by the ERAD module are implemented external to the CPU. The ERAD module consists of the enhanced bus comparator (EBC) units, the system event counter (SEC) units, and the cyclic redundancy check (CRC) units. The EBC units are used to generate hardware breakpoints, hardware watch points, and other output events. The SEC units are used to analyze and profile the system. The CRC units monitor CPU buses and compute the CRC when the self-test code is executed. This capability aids in achieving simpler, non-intrusive and interruptible self-test mechanisms with the Software Test Library (STL). The ERAD module is accessible both by the debugger and the application software, which significantly increases the debug capabilities of many real-time systems, especially in situations where the debugger is not connected.

13.9 ERAD Registers	1675

13.1 Introduction

The ERAD module is shown in [Figure 13-1](#).

The ERAD enhances the debug and system analysis capabilities of the device external to the CPU. The CPU has two analysis resources; Analysis Unit 1 (AU1) and Analysis Unit 2 (AU2). The first analysis unit counts events or monitors address buses. The second analysis unit monitors address and data buses. The two analysis units can be configured for hardware breakpoints or hardware watch points, and additionally the first analysis unit can be configured as a benchmark counter or event counter. The ERAD module further expands this capability to provide additional hardware breakpoints, hardware watch points, and counters for profiling, as well as other advanced features. The ERAD module can be utilized by the debugger, and also by the application software. For many real-time systems, it is not always possible to connect a debugger and perform an intrusive debug. Under these situations, the user's code has the ability to set up and control the ERAD module to debug and profile the system without disturbing the end application.

The ERAD module consists of eight enhanced bus comparator (EBC) units and four system event counter (SEC) units. The EBC units monitor buses and generate output events. The SEC units can be used with EBC units to profile and analyze the system. These units are described in detail in the following sections.

13.2 Enhanced Bus Comparator Unit

The Enhanced Bus Comparator (EBC) units connect to the CPU using a direct memory interface. This includes the program address and data buses, the data address, write and read data buses, debug qualifiers for memory access, and the ability to set breakpoints, watch points, and trace points on the CPU. Typically, the EBC is owned and controlled by the debugger application (for example, Code Composer Studio™ IDE). A user application running on the CPU can also configure and use the EBC units to generate events and interrupts for real-time diagnostic purposes. Note that ownership is exclusive—the debugger and application software cannot simultaneously control an EBC unit. For more information on EBC unit ownership, see [Section 13.4](#).

The EBC units have the following capabilities:

- Generate hardware breakpoints
- Generate hardware watch points
- Generate trace tags for instruction fetch matches and generate real-time interrupts (RTOSINT)
- Monitor data address and read and write buses and generate real-time interrupts (RTOSINT)
- Generate event outputs that can be used by other modules.

The following features are not supported by the EBC units:

- Chained breakpoints
- Ability to monitor DMA transfers
- Ability to monitor CLA buses

Each EBC unit has the capability to monitor a range of addresses by defining masks and generating outputs based on greater than, less than, or equal events.

The EBC units can also be used with the System Event Counter (SEC) units for system or code profiling and analysis purposes.

13.2.1 Enhanced Bus Comparator Unit Operations

The following operations are supported by each EBC unit:

- **Hardware Breakpoints:** The EBC unit generates a breakpoint tag when the specified instruction address is accessed on the program address bus. When the instruction reaches the DECODE-2 (D2) stage of the pipeline, the CPU is halted.
- **Watch Points:** A watch point detects a read or write to specified locations in data memory, and halts the CPU. Unlike hardware breakpoints, watch points do not have precise timing for halting the CPU—this is entirely dependent on the current state of the CPU pipeline. The CPU halts at the next interruptible boundary.
- **Program Trace:** Program traces are very similar to hardware breakpoints. The difference here is that instead of halting the CPU, a program trace generates a real-time interrupt (RTOSINT) when the instruction reaches the D2 stage of the pipeline. If the instruction is discarded in the fetch buffer due to discontinuity, no RTOSINT is generated.
- **Data Trace:** A data trace is similar to a watch point, except that a data trace generates a real-time interrupt (RTOSINT) instead of halting the CPU on an access to the specified data memory.

Note that hardware breakpoints only halt the CPU if a debugger is connected.

13.2.2 Event Masking and Exporting

The events generated by different EBC units can be combined using OR and AND logic to generate new events as required. There are four AND and four OR combinations that can be exported using masks to suppress undesired events. These events can be configured to generate an RTOSINT. In addition, the AND and OR events can also be used to qualify CRC computation using the cyclic redundancy check unit. The AND and OR events are also available as inputs to the system event counter unit for event counting and system profiling.

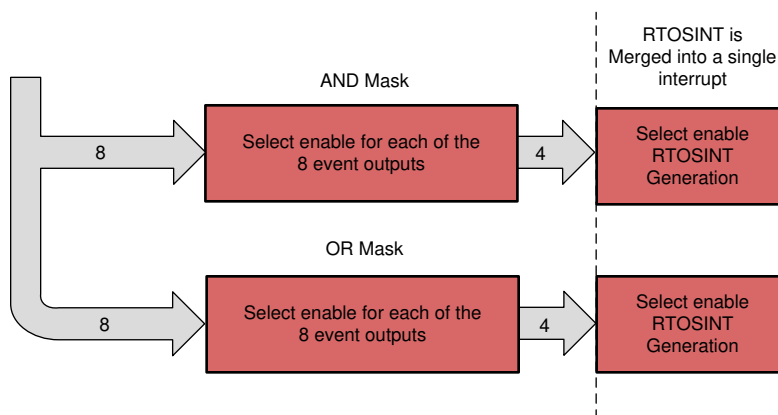

Figure 13-2. EBC Units Event Masking

To use the AND and OR masks:

1. Configure the `GLBL_EVENT_AND_MASK` and `GLBL_OR_EVENT_MASK` registers to select the desired EBC unit outputs for any of the available four masks.
2. To enable an RTOSINT for the configured mask, write 1 to the corresponding bit in the `GLBL_AND_EVENT_INT_MASK` or `GLBL_OR_EVNT_INT_MASK` register.
3. To use the mask output as an input to the system event counter unit, configure the `CTM_INPUT_SEL` register with the mux value for the desired mask. The input mux values are listed in [Section 13.3.1.4](#).
4. To use the mask output as a qualifier to the CRC unit, configure the `CRC_QUALIFIER` register.

For example, to generate a real-time interrupt on MASK1 when EBC units 2, 3, AND 6 events are triggered, write 0x46 to `GLBL_EVENT_AND_MASK`, and then write 0x1 to `GLBL_AND_EVENT_INT_MSK`.

13.3 System Event Counter Unit

The SEC units provide system profiling, analysis, and debug capability. The SEC units contain counters that can enhance the debug and profiling process in various types of system scenarios such as:

- Profiling code segments
- Counting duration between specified memory reads and writes
- Counting system events (such as interrupts)
- Counting duration between system events
- System timer
- Measuring the number of wait states in code segments
- Measuring the maximum amount of time spent in between a pair of events, measured over multiple iterations
- Chaining counters to link events or create larger counters

Furthermore, the SEC unit has the capability to:

- Function as a counter capable of counting:
 - Any of the match events generated by the EBC units.
 - Events generated by the EBC units. These events can be used to start and stop the counting.
 - System events including the PIE interrupts, timer interrupts, and CLA task interrupts. These system events can be used to start and stop the counting.
 - More information on the input sources for the SEC units can be found in [Section 13.3.1.4](#).
- Generate an interrupt or a watch point if the count reaches a reference value.
- Perform counter operation in one of the following two modes:
 - Duration mode: The counter counts the CPU cycles as long as the event is active.
 - Event mode: The counter counts only the positive edge of the event signal. This is effectively counting the number of times the event transitions from inactive to active.

13.3.1 System Event Counter Modes

The following are the operating modes of the SEC unit. The counters are initialized to zero when the SEC module receives a reset input signal, and always count up.

- Continuous Count: In this mode, the counter continues to count as specified by the input selector. The counter can count the CPU cycles without any events selected. In this mode, the module can be used as a software-controlled SYSCLK counter. Continuous mode is active when CTM_CNTL.START_STOP_MODE and CTM_REF are both set to 0.
- Timer Mode Count: In this mode, the counter counts up to a set reference value, defined in the CTM_REF register. Upon reaching the reference value, the counter generates an event that can send an interrupt to the CPU or generate a watch point. The RST_ON_MATCH bit in the CTM_CNTL register configures the counter to either continue incrementing or reset when a match event occurs.
- Start-Stop Count: In this mode, two events are configured to act as start and stop indicators to the counter. The counter commences counting only when the defined start event occurs. The counter then continues to count up until the stop event occurs. Once the first start event has occurred, further start events are ignored until the stop event occurs.

In any of the counter modes of operation, there is a possibility that the 32-bit counter value overflows. If an overflow occurs, the counter value resets to zero and continues to count up, and the OVERFLOW bit in the CTM_STATUS register is set high. The OVERFLOW bit remains high until either the counter is reset, or the application writes 1 to the OVERFLOW_CLEAR bit of the CTM_CLEAR register.

13.3.1.1 Counting Active Levels Versus Edges

The SEC units can be configured to either count active levels or edges of the selected inputs.

Each SEC unit has eight inputs from the EBC units and many inputs from other events in the device. Each SEC unit can be configured to count any of the input events or just count up on every cycle. For example, if an input event occurs and is active for 25 cycles, the SEC unit counter increments only by 1 in event mode; whereas in the duration mode, the counter increments by 25.

13.3.1.2 Max Mode

Max mode is also supported by the SEC units. This mode allows the user to detect the maximum count that has occurred during various count iterations in start-stop mode. For example, a user can set up the counter in the start-stop count mode to count the duration of a critical code loop. Every time the stop event occurs and the counter stops, the counter value is checked against the current MAX_COUNT present in the register. If the new value is greater, then the MAX_COUNT register is updated. The counter always resets to zero at the stop event and is ready to start counting on the next start event. Therefore, the MAX_COUNT contains the maximum number of cycles that occurred between the start and stop condition over many iterations.

13.3.1.3 Cumulative Mode

The SEC units can be used to yield the cumulative count over several start and stop events. In this mode the, unlike Max mode, the counter does not reset due to a stop event. Instead it stops counting and resumes counting when a start event occurs. In cumulative count mode, the MAX_COUNT is not valid.

13.3.1.4 Input Signal Selection

The SEC inputs can be selected from various signals from in the system to enable debug and system analysis. [Figure 13-3](#) shows the SEC inputs. Each event selector MUX can select from various signals on in the system. These signals are shown in [Table 13-1](#).

13.3.2 Reset on Event

Resetting the counters on external events is also possible. Additionally all the counter event outputs are applied back to each of counter input MUX, which selects the event that can be used as a reset input. When enabled, an active high on the reset input causes the counter to reset. This gives a powerful feature that allows setting up threshold monitors. This can be used to flag an interrupt or a watch point, if the distance between two events crosses a certain threshold.

13.3.3 Operation Conditions

The SEC units count accurately only when the CPU is operating in normal conditions. If the counters are running and capturing the CPU cycles while the CPU is controlled through the debugger to single-step through the code, then the result can differ from when the CPU was executing the code in normal conditions.

Note that if the counters are set up to use the value of the raw program counter register (VPC) as the source for the start and stop events, the value of the CPU cycles measured can be off by a few cycles when the CALL instruction is executed.

13.4 ERAD Ownership, Initialization and Reset

Although the features of the ERAD module are typically used by the debugger, user applications can also take advantage of the capabilities to monitor buses and generate interrupts and events. There are three possible ownership scenarios:

1. The user elects to give ownership of the ERAD module to the application software or the debugger.
2. Both the application code and the debugger share use of the ERAD module. Only the current owner of the module (application code or debugger) is allowed to use the module at a given time. When ownership is shared between application and debugger, the user application has the responsibility of resolving any ownership conflicts.
3. There is no ERAD owner. In this mode, both application code and debugger can access the module at any given time. The software, both on the application side and the debugger side, to resolve any potential conflicts is critical. An example scenario in this mode can be for the debugger to use some of the EBC and SEC units, while the application software uses the remaining units.

The ERAD module initializes the internal states and all registers to the initial/reset states under the following conditions:

- At power-on-reset (POR)
- With DCON and SYSRSN
 - Debug logic disconnected when the debugger owns the module
 - Functional reset when application owns the module

13.5 ERAD Programming Sequence

The ERAD module can be used to set hardware breakpoints and hardware watch points. The programming sequences to set hardware breakpoints, hardware watch points, or to use the timers to profile and analyze the system are described in this section. The same sequences can be used by both the debugger software and user application code.

Refer to the Driverlib example projects in C2000Ware for JavaScript files to configure the ERAD module. Example projects are also available to showcase the usage of these script files. These examples can be found in the `driverlib\F28003x\examples\erad` directory under the C2000Ware installation directory.

13.5.1 Hardware Breakpoint and Hardware Watch Point Programming Sequence

The programming sequence is identical when using the EBC units, regardless of whether the debug software or the application is programming the units. A typical programming sequence for a unit is:

- Read and make sure the ownership is set as expected; if not, acquire the ownership before proceeding further if required.
- Make sure the unit is in IDLE mode.
- Set up the address reference, mask, bus select and stop bits.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write 1 to clear the `EVENT_FIRED` sticky bit. This takes the module back to the enabled state.

The example programming sequences for hardware breakpoints and hardware watch points are:

Set a hardware breakpoint on address 0x201000:

- Read `GLBL_OWNER` to confirm ownership.
- Read `HWBP_STATUS` to confirm the module is in IDLE state.
- Write 0x0 to `HWBP_MASK`.
- Write 0x201000 to `HWBP_REF`.
- Set `HWBP_CNTL.STOP = 1` and `HWBP_CNTL.BUS_SEL = 0000 (PAB)`. If a trace is to be generated instead of a breakpoint, set `HWBP_CNTL.STOP = 0`.
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on read of addresses from 0x121010 to 0x12101F:

- Read `GLBL_OWNER` to confirm ownership.
- Read `HWBP_STATUS` to confirm the module is in IDLE state.
- Write 0xF to `HWBP_MASK`.
- Write 0x121010 to `HWBP_REF`.
- Write `HWBP_CNTL.STOP = 1` and `HWBP_CNTL.BUS_SEL = 0011 (DRAB)`. If an `RTOSINTn` is to be generated instead of a watch point, set `HWBP_CNTL.STOP = 0`.
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on write to address 0xFF10101A:

- Read `GLBL_OWNER` to confirm ownership
- Read `HWBP_STATUS` to confirm the module is in IDLE state
- Write 0x0 to `HWBP_MASK`
- Write 0xFF10101A to `HWBP_REF`
- Write `HWBP_CNTL.STOP = 1`, `HWBP_CNTL.BUS_SEL = 0010 (DWAB)`. If an `RTOSINTn` is to be generated instead of a watch point, set `HWBP_CNTL.STOP = 0`.
- Enable the corresponding module bit in the global enable register.

13.5.2 Timer and Counter Programming Sequence

The programming sequence is identical when using the SEC units, regardless of whether the debug software or the application is programming the units. Typical programming sequence for a unit is:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further if required.
- Make sure the unit is in IDLE mode.
- Set up the counter reference, counter registers (clear/reset if a clean start is required) and CTM_CNTL.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write 1 to clear the EVENT_FIRED sticky bit. This takes the module back to the enabled state.

Set up a free running counter:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Write 0x0 to CTM_INPUT_SEL.
- Write 0x0 to CTM_CNTL.
- Enable the module in the GLBL_ENABLE register.

Set up the counter to count the duration spent between addresses 0x1000 and 0x1210:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x1000.
- Set up the EBC unit 2 to generate an event for VPC = 0x1210.
- Set up the start and stop input selects to use comparator event 1 and 2, respectively. This is achieved by writing CTM_INPUT_SEL.STA_INP_SEL = 0x0 and CTM_INPUT_SEL_2.STO_INP_SEL = 0x1.
- Enable the counter in the START_STOP_MODE of operation. This is achieved by writing CTM_CNTL.START_STOP_MODE = 1.
- Enable the module in the GLBL_ENABLE register.

Set up the counter to count the number of times a function at address 0x2010 is called and fire an RTOSINT if this count reaches 0x300:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x2010.
- Setup the counter to select comparator event 1 as the event to count. This is achieved by writing CTM_INPUT_SEL.CNT_INP_SEL = 0 and CTM_CNTL.CNT_INP_SEL_EN = 1.
- Write 0x300 CTM_REF.
- Enable the counter in the EVENT_MODE, and also allow the counter to generate an RTOSINT when the count matches the reference. This is achieved by writing 0x88 to CTM_CNTL (bit 3 = 1 and bit 7 = 1).
- Enable the module in the GLBL_ENABLE register.

13.6 Cyclic Redundancy Check Unit

The cyclic redundancy check (CRC) units monitor CPU buses and compute CRC when the self-test code is executed. This capability aids in achieving simpler, non-intrusive and interruptible self-test mechanisms with Software Test Library (STL). Each CRC unit is used to monitor a different CPU interface. For example, CRC unit 1 is used to monitor the Program Counter, while CRC unit 2 is used to monitor the data read address bus. [Table 13-2](#) identifies the CPU interface monitored by each of the CRC units.

Table 13-2. CPU Interfaces Monitored by CRC Units

CRC Unit	CPU Interface
CRC Unit 1	Program Counter Register
CRC Unit 2	Data Read Address Bus
CRC Unit 3	Data Read Data Bus
CRC Unit 4	Data Write Address Bus
CRC Unit 5	Data Write Data Bus
CRC Unit 6	Instruction Register Value (Unsecured)
CRC Unit 7	Instruction Register Value (Secure-Zone 1)
CRC Unit 8	Instruction Register Value (Secure-Zone 2)

The main purpose of the CRC units is to make sure that the CPU functionally remains intact when the CRC unit is executing the same software test library over multiple iterations. This is done by comparing the computed CRC values after each iteration, with a pre-computed golden value.

CRC units 7 and 8 are intended to compute the instruction register values for secure-zone 1 and secure-zone 2 instruction execution. Computed CRC values for the a given secure-zone is available only for accesses originating from that zone.

13.6.1 CRC Unit Qualifier

By default, all the valid events on a given interface enables a CRC unit for computation. However there are optional qualifiers that can be used to gate the CRC computation when valid events occur. If required, these qualifiers can be generated by masking the EBC units events. The AND/OR masks discussed in Section 13.2.2 are used to generate these qualifiers. Refer to the CRC_QUALIFIER register for a full list of available qualifiers. Figure 13-4 shows the connection between EBC event masking and exporting with the CRC qualifiers.

EBC units have the capability to monitor the Program Counter, data writes and data reads. CRC units can use the EBC units to decide when the check values can be calculated. For example, if required to calculate the check values only when the CPU is executing a specific function, the user can set up an EBC unit to monitor the PC and generate a CRC qualifier when that function is executed. This allows the CRC unit to calculated the check value only when desired.

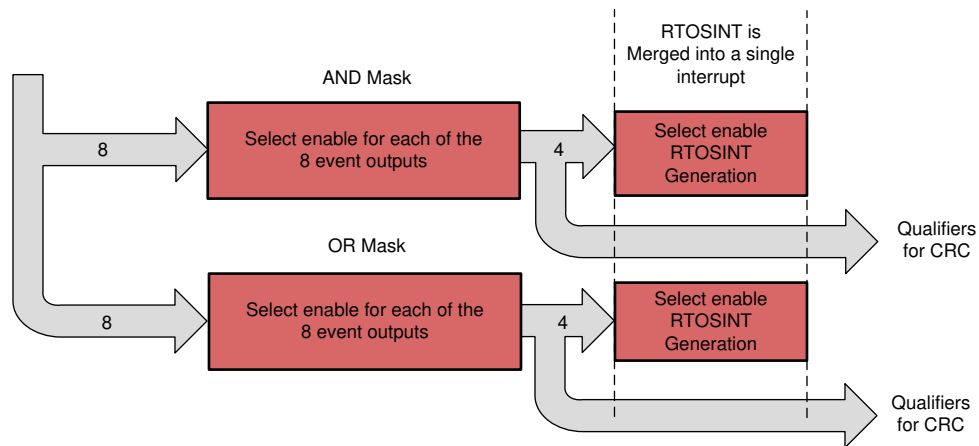

Figure 13-4. Event Masking and Exporting for CRC Qualifiers

13.6.2 CRC Unit Programming Sequence

The following sequence can be used to initialize a CRC unit to calculate the check value for the corresponding CPU interface.

1. Initialize the CRC unit by writing a 1 to the corresponding CRC_INIT field in the CRC_GLOBAL_CTRL register.
2. Configure the seed value (if required) using CRC_SEED register (CRC_EN can be 0 for when modifying the CRC_SEED register).
3. Configure the CRC_QUALIFIER register if additional qualification from EBC units is required; If not additional qualification is not required, set the CRC_QUALIFIER register to 0.
4. Enable the CRC unit by setting the CRC_EN to 1 at the beginning of the software for which the CRC calculation is done.
5. Disable the CRC unit by setting the CRC_EN to 0 at the end of the software for which the CRC calculation is done.
6. Read the CRC_CURRENT register to record the computed CRC. This check value can be compared with previous check values to make sure no changes have occurred.
7. Repeat steps 1-7 periodically as needed.

Note

Sufficient NOP's must be added immediately after the CRC submodule is enabled to make sure the pipeline contains predictable code as soon as the CRC is enabled. Similarly, sufficient NOP's must be added before the CRC submodule is disabled. Disabling the CRC write access takes a few cycles, therefore there must be predictable code in the pipeline stages until the write takes place.

13.7 Program Counter Trace

The Program Counter (PC) Trace module can be used to keep track of PC discontinuities or jumps, as a means to trace an entire program execution sequence over a period of time. When trace is completed or stopped, trace data can be read out using a debugger and analyzed to reconstruct the code execution sequence. The PC Trace module provides multiple modes and controls to govern when to trace and when not to trace. The trace module is tightly coupled with the Enhanced Bus Comparator, the System Event Counter Unit, and certain critical system level event signals.

Trace data is stored in an addressable memory buffer that can be read by software or a debugger. The trace data stored in this buffer includes additional status information on trace validity that can be used to correctly reconstruct the code execution system. For each discontinuity, two PC values are stored: the source of the discontinuity, and the destination. Figure 13-5 illustrates the operation of the PC trace module. The trace buffer is a circular buffer with overflow: when the buffer becomes full, new trace data is written starting from the top of the buffer, and an overflow status bit is set.

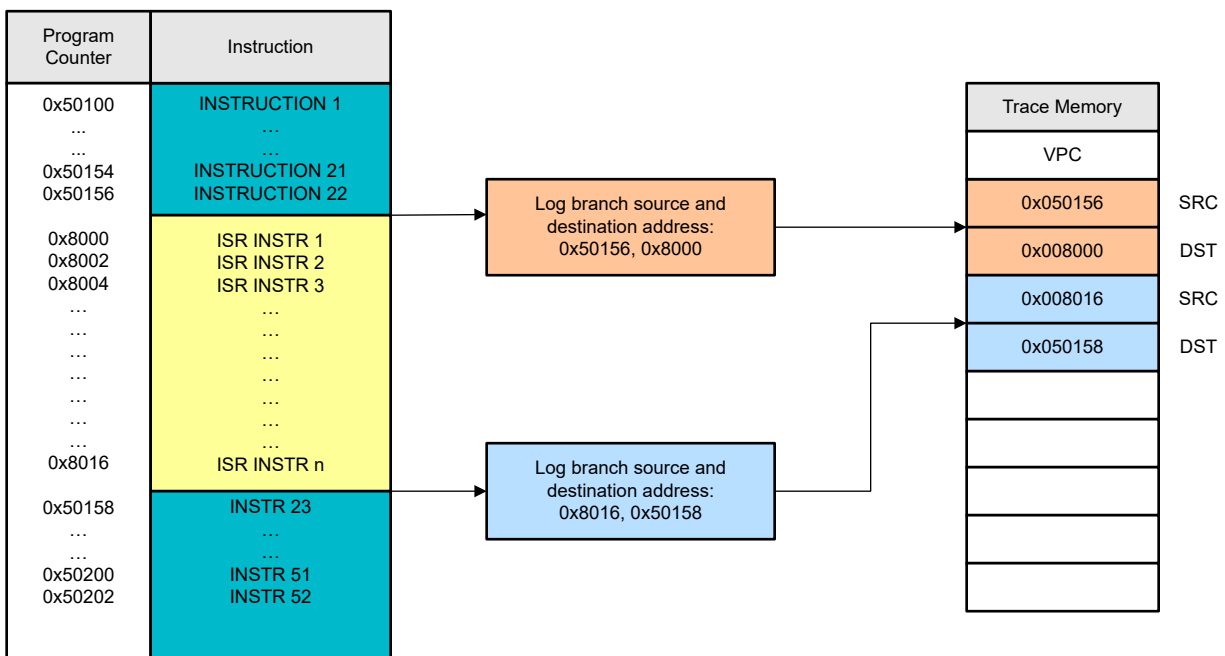

Figure 13-5. PC Trace Operation

13.7.1 Functional Block Diagram

Figure 13-6 describes the device PC trace architecture. The trace module is tightly coupled with the CPU, and receives the current program counter (VPC), program address (PAB), and various qualifying signals from the CPU interface. The Trace core captures these values whenever a PC discontinuity (for example, branch operation) is detected. The DCSM also interfaces with the PC Trace module, providing security zone data to prevent unauthorized trace information from being exposed in trace memory. The PC Trace module interfaces with the Enhanced Bus Comparator Unit and System Event Counter Unit, providing the ability to select events from these units as triggers to start a trace, stop a trace, or determine the bounding conditions for a windowed trace operation.

The Trace Core qualifies trace source and destination addresses, and stores these addresses sequentially in the trace memory buffer. Additionally, the Trace Core can generate hit events every time a new trace is stored in the memory buffer; this event signal is connected to the ERAD counter block so that the number of entries in the buffer can be tracked. This counter value can in turn be used to create a STOP event at a predefined threshold.

Note

Discontinuities that arise due to block repeats (RPTB instruction blocks) are not captured by the PC trace module.

Debugger accesses are always treated as unsecure accesses. Unlike other ERAD components, there is no concept of debug or application ownership in the PC Trace module.

The Trace Core generates a trace hit event for a discontinuity arising from a speculative instruction fetch, even if the fetched instruction does not reach the execution phase in the CPU pipeline. As a result, the BUFFER_FULL signal can be set prematurely due to a speculative prefetch. The user can always safely discard the oldest discontinuity pair present in the memory buffer when a full buffer is detected, to mitigate this scenario.

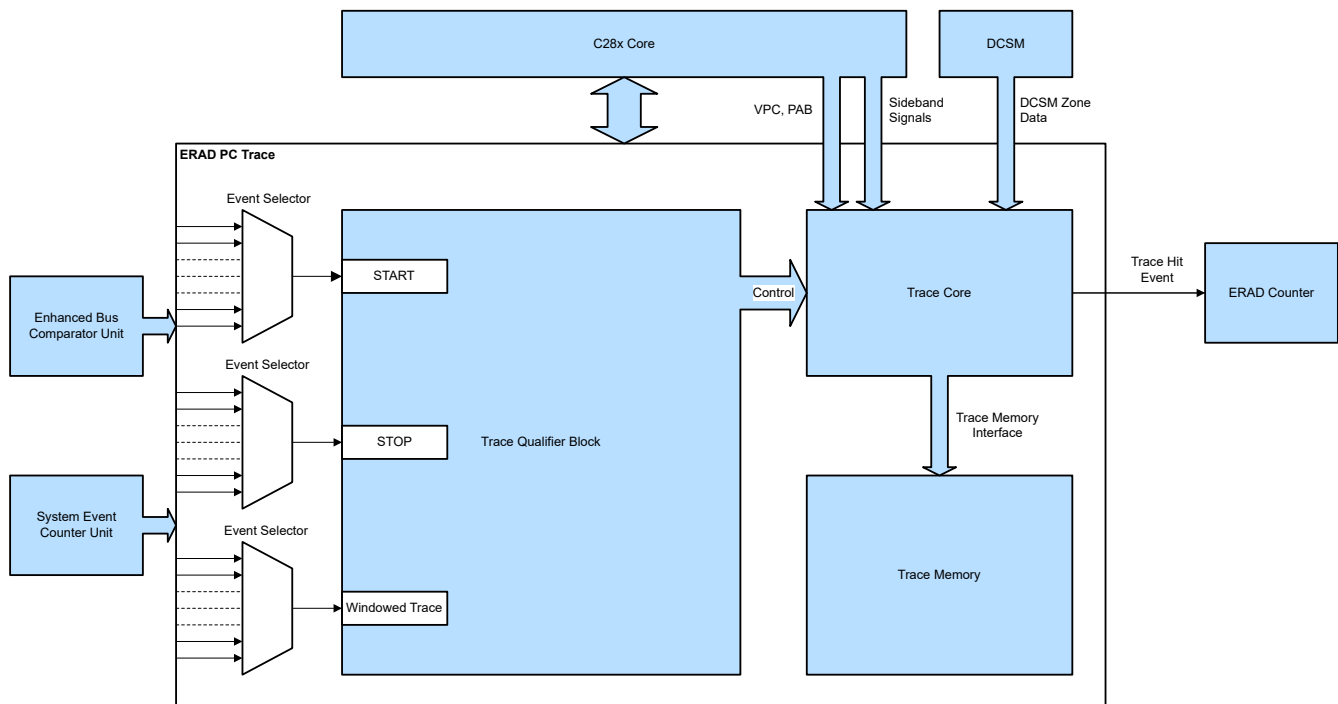

Figure 13-6. PC Trace Block Diagram

13.7.2 Trace Qualification Modes

There are three modes of trace qualification available:

1. Normal mode: In this mode, trace is enabled without any qualifiers. Trace control happens purely through software writing to the PCTRACE_GLOBAL register. When operating PC Trace in normal mode, The PCTRACE_LOGPC_SOFTENABLE captures the program counter value at the point when PCTRACE_GLOBAL.EN is set to 1, and the PCTRACE_LOGPC_SOFTDISABLE register captures the program counter value at the point PCTRACE_GLOBAL.EN is set to 0.
2. Windowed Trace mode: In windowed mode, PC Trace can be activated or stopped based on the value of a signal coming from the Event Bus Comparator, System Event Counter, or other system events. The WINDOWED_INP_SEL field in the PCTRACE_QUAL1 register specifies the input signal used to qualify PC Trace operation in windowed mode. By default trace is active when the input signal is high and inactive when the input signal is low; this behavior can be reversed by setting the PCTRACE_QUAL1.WINDOWED_INP_INV bit high.
3. Start-Stop mode: In this mode, one input signal starts the PC trace operation, and a different input signal stops the trace operation. Event Bus Comparator signals, System Event Counter signals and other system event signals can be used as inputs to start or stop the PC Trace. The START_INP_SEL and STOP_INP_SEL fields in the PCTRACE_QUAL2 register specify the input signals used to qualify PC Trace operation in start-stop mode. Once a start event arrives and PC trace operation begins, the PC Trace module ignores all further start events until a stop event is received. Trace start and stop operations are triggered on the rising edge of the input event; this behavior can be reversed by setting the START_INP_INV and STOP_INP_INV bits in the PCTRACE_QUAL1 register.

To set the PC Trace operation mode, write to the TRACE_MODE bit in the PCTRACE_QUAL1 register.

13.7.2.1 Trace Qualifier Input Signals

Table 13-3 describes the various input signals that can be used to qualify PC Trace operation in Windowed or Start-Stop modes.

Table 13-3. Event Selector Mux Signals

13.7.3 Trace Memory

PC Trace memory is a 32-bit-wide read-only memory buffer that holds each 22-bit PC value, together with a security BLOCKED status bit. The memory-map section of the device data sheet specifies the size of the PC Trace memory buffer. Trace memory entries are stored in pairs: the discontinuity source and destination addresses. [Table 13-4](#) describes the bit field structure of each trace memory entry.

Table 13-4. Trace Memory Entry Bit Fields

Bits	Field Name	Description
21:0	PROGRAM_COUNTER	Program counter source or destination address value where discontinuity occurred
22	BLOCKED	1 = PROGRAM_COUNTER[21:0] is invalid due to security permissions 0 = PROGRAM_COUNTER[21:0] is valid
31:23	RESERVED	Reserved

Note

For addresses that are blocked due to security zone restrictions, the PROGRAM_COUNTER value is set to 0.

Trace memory is intended solely for debug purposes and does not have parity or Error Correction Code (ECC) support.

13.7.4 Trace Input Signal Conditioning

The PC Trace module provides input conditioning options for signals that are used to qualify operation in Start-Stop or Windowed modes. For each of these (START, STOP, WINDOWED), there is a two-stage synchronizer for asynchronous input signals, and an inverter. The PC Trace input conditioning options are controllable using the PCTRACE_QUAL1 register with the following bits:

- **WINDOWED_INP_INV:** This bit inverts the input signal for Windowed trace mode selected in WINDOWED_INP_SEL. When set to 1, the trace operation starts on the falling edge of the input, and stops on the rising edge of the input. When this bit is set to 0, the trace operation starts on the rising edge of the input, and stops on the falling edge of the input.
- **WINDOWED_INP_SYNCH:** This bit passes the input signal selected in WINDOWED_INP_SEL through a two-stage synchronizer.
- **START_INP_INV:** This bit inverts the input signal for trace START operation selected in PCTRACE_QUAL2.START_INP_SEL. When set to 1, the trace operation starts on the falling edge of the input. When this bit is set to 0, the trace operation starts on the rising edge of the input.
- **START_INP_SYNCH:** This bit passes the input signal selected in PCTRACE_QUAL2.START_INP_SEL through a two-stage synchronizer.
- **STOP_INP_INV:** This bit inverts the input signal for trace STOP operation selected in PCTRACE_QUAL2.STOP_INP_SEL. When set to 1, the trace operation stops on the falling edge of the input. When this bit is set to 0, the trace operation stops on the rising edge of the input.
- **STOP_INP_SYNCH:** This bit passes the input signal selected in PCTRACE_QUAL2.STOP_INP_SEL through a two-stage synchronizer.

Figure 13-7 describes the signal conditioning circuit available for each input qualifier signal.

Figure 13-7. Trace Qualifier Input Conditioning Circuit

13.7.5 PC Trace Software Operation

An example software sequence to perform PC Trace operation is as follows:

1. Initialize the PC Trace module by writing 1 to PCTRACE_GLOBAL.INIT. The trace initialize operation resets the buffer pointer and overflow flags, and clears the values of the PCTRACE_LOGPC_SOFTENABLE and PCTRACE_LOGPC_SOFTDISABLE registers.
2. Start the PC Trace operation by writing 1 to PCTRACE_GLOBAL.EN.
3. Execute the desired code sequence to be profiled.
4. Stop the PC Trace operation by writing 0 to PCTRACE_GLOBAL.EN. This step is optional, as the PC Trace buffer can be read while trace operation is active.
5. To determine if there are valid entries in the trace buffer and how many:
 - a. Examine the buffer pointer by reading PCTRACE_BUFFER.PTR. If the pointer value is 0, then no discontinuities have been detected since PC Trace was initialized. A non-zero value indicates the number of locations in the buffer that contain valid entries. For instance, PTR=4 indicates that locations 0, 1, 2 and 3 contain valid entries (SRC, DST, SRC, DST).
 - b. Examine the BUFFER_FULL bit in the PCTRACE_BUFFER register. If BUFFER_FULL=1, then the following possibilities apply:
 - If PTR = 0, then the buffer is simply full and contains the maximum number of entries possible.
 - If PTR > 0, then a buffer overflow has occurred. The value of PTR indicates by how many entries the buffer has overflowed: this is a circular buffer.
6. Read PCTRACE_LOGPC_SOFTENABLE (and optionally PCTRACE_LOGPC_SOFTDISABLE) if needed to determine the bounding addresses of the trace operation, in case the code sequence being traced does not begin or end at a discontinuity boundary (for example, partial function trace).
7. Trace discontinuities are recorded in the trace buffer in pairs (SRC, DST). Use this data to reconstruct the code execution sequence. While reading the trace buffer, be sure to examine the BLOCKED status bit to confirm the validity of each trace entry.

13.7.6 Trace Operation in Debug Mode

PC Trace is designed to capture data while the CPU is executing code. Debugger operations such as halt, step, and manual PC modification can compromise the reliability of PC trace data collection. Only use or interpret PC Trace data in the context of a continuous CPU run without debugger interruption or intervention.

CPU execution does not preclude debugger operation of the PC trace module. While the CPU is running and executing code, the debugger can read and write PC Trace registers, read the trace buffer, and enable or disable PC trace operation. The PCTRACE_LOGPC_SOFTENABLE and PCTRACE_LOGPC_SOFTDISABLE registers record the start and stop PC addresses to provide accurate trace window information during manual trace starts or stops triggered by writing to the PCTRACE_GLOBAL.EN bit.

13.8 Software

13.8.1 ERAD Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/erad

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

13.8.1.1 ERAD Profiling Interrupts

FILE: erad_ex1_profileinterrupts.c

This example configures CPU Timer0, 1, and 2 to be profiled using the ERAD module. Included is a JavaScript file, `profile_interrupts.js`, which is used with the scripting console to program ERAD registers and view profiling data.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- `var PROJ_NAME = "erad_debugger_ex1_profileinterrupts"`
- `var PROJ_WKSPC_LOC = "<proj_workspace_path>"`
- `var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"`

To run the ERAD script, use the following command in the scripting console:

- `loadJSFile("<proj_workspace_path>\\\erad_debugger_ex1_profileinterrupts\\erad_ex1_profile_interrupts.js", 0);`

The included JavaScript file, `erad_ex1_profile_interrupts.js`, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html

Note that the script must be run after loading and running the `.out` on the C28x core. Only CPU timer 2 ISR is profiled in this example.

This example uses 2 HW breakpoints and 4 counters:

- `HWBP_1` : PC = start address of `cpuTimer2ISR`
- `HWBP_2` : PC = end address of `cpuTimer2ISR`
- `CTM_1` : Used to count the `cpuTimer2ISR` execution cycles. Configured in start-stop mode with start event as `HWBP_1` and stop event as `HWBP_2`
- `CTM_2` : Used to count the number of times the system event `TIMER2_TINT2` has occurred. Configured in rising-edge count mode with counting input as system event `TIMER2_TINT2` (`INP_SEL[25]`)
- `CTM_3` : Used to count the number of times `cpuTimer2ISR` executes. Configured in rising-edge count mode with counting input as `HWBP_1` (`INP_SEL[0]`)
- `CTM_4` : Used to count the latency from the system event `TIMER2_TINT2` to `cpuTimer2ISR` entry. Configured in start-stop mode with start event as `TIMER2_TINT2` and stop event as `HWBP_1`

External Connections

- None

Watch Variables

- `cpuTimer0IntCount`
- `cpuTimer1IntCount`
- `cpuTimer2IntCount`

Profiling Script Output

- Current ISR cycle count (`CTM_1`)
- Max ISR cycle count (maximum value of `CTM_1`)
- Interrupt occurrence count (`CTM_2`)

- ISR execution count (CTM_3)
- ISR entry delay cycle count (maximum value of CTM_4)

Note that the large difference between Interrupt occurrence count (CTM_2) and ISR execution count (CTM_3) is because the ISR takes more number of cycles than the actual interrupt period. ISR entry delay cycle count will also be higher due to the same reason.

13.8.1.2 ERAD Profile Function

FILE: erad_ex1_profile_function.c

This example uses BUSCOMP1, BUSCOMP2 and COUNTER1 of the ERAD module to profile a function (delayFunction). It calculates the CPU cycles taken between the the start address of the function to the end address of the function

Two dummy variable are written to inside the function - startCount and endCount. BUSCOMP3, BUSCOMP4 and COUNTER2 are used to profile the time taken between the access to startCount variable till the access to endCount variable.

Both the counters are setup to operate in START-STOP mode and count the number of CPU cycles spend between the respective bus comparator events.

Watch Variables

- cycles_Function - the maximum number of cycles between the start of function to the end of function
- cycles_Data - the maximum number of cycles taken between accessing startCount variable to endCount variable

External Connections

None

13.8.1.3 ERAD Profile Function

FILE: erad_ex1_profile_function_syscfg.c

This example uses BUSCOMP1, BUSCOMP2 and COUNTER1 of the ERAD module to profile a function (delayFunction). It calculates the CPU cycles taken between the the start address of the function to the end address of the function

Two dummy variable are written to inside the function - startCount and endCount. BUSCOMP3, BUSCOMP4 and COUNTER2 are used to profile the time taken between the access to startCount variable till the access to endCount variable.

Both the counters are setup to operate in START-STOP mode and count the number of CPU cycles spend between the respective bus comparator events.

Watch Variables

- cycles_Function - the maximum number of cycles between the start of function to the end of function
- cycles_Data - the maximum number of cycles taken between accessing startCount variable to endCount variable

External Connections

None

13.8.1.4 ERAD HWBP Monitor Program Counter

FILE: erad_ex2_bus_monitor.c

In this example, the function delayFunction is called multiple times. The function does read and writes to the global variables startCount and endCount.

The BUSCOMP1 and COUNTER1 is used to count the number of times the function delayFunction was invoked. BUSCOMP2 is used to generate an interrupt when there is read access to the startCount variable and BUSCOMP3 is used to generate an interrupt when there is a write access to the endCount variable

Watch Variables

- funcCount - number of times the function delayFunction was invoked
- isrCount - number of times the ISR was invoked

External Connections

- None

13.8.1.5 ERAD HWBP Monitor Program Counter

FILE: erad_ex2_bus_monitor_syscfg.c

In this example, the function delayFunction is called multiple times. The function does read and writes to the global variables startCount and endCount.

The BUSCOMP1 and COUNTER1 is used to count the number of times the function delayFunction was invoked. BUSCOMP2 is used to generate an interrupt when there is read access to the startCount variable and BUSCOMP3 is used to generate an interrupt when there is a write access to the endCount variable

Watch Variables

- funcCount - number of times the function delayFunction was invoked
- isrCount - number of times the ISR was invoked

External Connections

- None

13.8.1.6 ERAD Profile Function

FILE: erad_ex2_profilefunction.c

This example contains a basic FIR calculation and sorting algorithm to help demonstrate the function profiling capability of the ERAD peripheral. A number of FIR sums are calculated within a loop and are then sorted using the insertion sort algorithm. Cycle counts of both the FIR calculations and the sorting algorithm are output to the screen through the scripting console. In this example, it can be seen that sorting the data takes up a majority of the CPU cycles executed in this program.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex2_profilefunction"
- var PROJ_WKSPC_LOC = "<proj_workspace_path>"
- var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\erad_debugger_ex2_profilefunction\erad_ex2_profile_function.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, erad_ex2_profile_function.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html

This example uses 4 HW breakpoints and 2 counters:

- HWBP_1 : PC = start address of performFIR
- HWBP_2 : PC = end address of performFIR
- HWBP_3 : PC = start address of sortMax
- HWBP_4 : PC = end address of sortMax
- CTM_1 : Used to count the performFIR execution cycles. Configured in start-stop mode with start event as HWBP_1 and stop event as HWBP_2
- CTM_2 : Used to count the sortMax execution cycles. Configured in start-stop mode with start event as HWBP_3 and stop event as HWBP_4

External Connections

- None.

Watch Variables

- FIR_iterationCounter - A counter for the number of times FIR calculation and sorting was performed

Profiling Script Output

- Current FIR cycle count (CTM_1)
- Max FIR cycle count (maximum value of CTM_1)
- Current sorting function cycle count (CTM_2)
- Max sorting function cycle count (maximum value of CTM_2)

Note that the the counters are reset after the stop event. The counter value remains 0 till the next start event occurs. The javascript continuously reads the counter value in a while(1) and hence the current counter may return 0.

13.8.1.7 ERAD HWBP Stack Overflow Detection

FILE: erad_ex3_stack_overflow_detect.c

This example uses BUSCOMP1 to monitor the stack. The Bus comparator is set to monitor the data write access bus and generate an RTOS interrupt CPU when a write is detected to end of the STACK within a threshold.

Watch Variables

- functionCallCount - the number of times the recursive function overflowing the STACK is called.
- x indicates that the ISR has been entered

External Connections

None

13.8.1.8 ERAD HWBP Stack Overflow Detection

FILE: erad_ex3_stack_overflow_detect_syscfg.c

This example uses BUSCOMP1 to monitor the stack. The Bus comparator is set to monitor the data write access bus and generate an RTOS interrupt CPU when a write is detected to end of the STACK within a threshold.

Watch Variables

- functionCallCount - the number of times the recursive function overflowing the STACK is called.
- x indicates that the ISR has been entered

External Connections

None

13.8.1.9 ERAD Stack Overflow

FILE: erad_ex3_stackoverflow.c

This example shows the basic setup of CAN in order to transmit and receive messages on the CAN bus. The CAN peripheral is configured to transmit messages with a specific CAN ID. A message is then transmitted once per second, using a simple delay loop for timing. The message that is sent is a 2 byte message that contains an incrementing pattern.

This example sets up the CAN controller in External Loopback test mode. Data transmitted is visible on the CANTXA pin and is received internally back to the CAN Core.

A buffer is created to store message history up to 50 messages for the duration of the program. A logic error is intentionally made to allow the buffer to overflow, eventually causing a stack overflow. The included JavaScript file, stack_overflow.js, programs ERAD registers in order to detect the stack overflow and halt the CPU once the illegal write is made. The illegal write is made after 507 messages are received.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex3_stackoverflow"
- var PROJ_WKSPC_LOC = <proj_workspace_path>

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\lerad_debugger_ex3_stackoverflow\lerad_ex3_stack_overflow.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, erad_ex3_stack_overflow.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html

This example uses 1 HW watchpoint :

- HWBP_1 : Data Write Address Bus = Stack end address + 1

External Connections

- None.

Watch Variables

- msgCount - A counter for the number of successful messages received
- txMsgData - An array with the data being sent
- rxMsgData - An array with the data that was received
- msgHistoryBuff - An array meant to store the last 50 messages received

Profiling Script Output

- "STACK OVERFLOW detected. Halting CPU." will be printed in the scripting console when a stack overflow occurs (that is, when the watchpoint is hit)

13.8.1.10 ERAD Profile Interrupts CLA

FILE: erad_ex4_profileinterrupts_cla.c

This example configures EPWM1A to run at 1 KHz (period = 1 ms) to trigger a start-of-conversion on ADC channel A0. This channel will, in turn, sample EPWM4A which is set to run at 100Hz. At the end-of-conversion the ADC interrupt is fired. The interrupt signal will be used to trigger a CLA task that runs an FIR filter. The filter is designed to be low pass with a cutoff frequency of 100Hz; it will remove the odd harmonics in the input signal smoothing the square wave to a sinusoidal shape. The CLA background task will continuously buffer the filtered output in a circular buffer.

This example also utilizes the ERAD peripheral to profile the Interrupt Service Routine (ISR) cla1ISR1 (on the C28x core). The ISR contains a loop that simulates storing a random amount of data to a location in order to introduce variability into the cycle measurements. The ERAD peripheral is also configured to count the number of times the system event CLA_INTERRUPT1 occurs.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex4_profileinterrupts_cla"
- var PROJ_WKSPC_LOC = "<proj_workspace_path>"
- var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\lerad_debugger_ex4_profileinterrupts_cla\lerad_ex4_profile_interrupts_cla.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, `erad_ex4_profile_interrupts_cla.js`, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html

This example uses 4 HW breakpoints and 2 counters:

- `HWBP_1` : PC = start address of `cla1Isr1`
- `HWBP_2` : PC = end address of `cla1Isr1`
- `CTM_1` : Used to count the `cla1Isr1` execution cycles. Configured in start-stop mode with start event as `HWBP_1` and stop event as `HWBP_2`
- `CTM_2` : Used to count the number of times the system event `CLA_INTERRUPT1` event has occurred. Configured in rising-edge count mode with counting input as system event `CLA_INTERRUPT1` (`INP_SEL[26]`)

External Connections

- connect A0 to EPWM4A

Watch Variables

- `ISR_count` - A counter that signifies how many times `cla1ISR1` executes

Profiling Script Output

- Current ISR cycle count (`CTM_1`)
- Max ISR cycle count (maximum value of `CTM_1`)
- Interrupt occurrence count (`CTM_2`)

13.8.1.11 ERAD Profiling Interrupts

FILE: `erad_ex4_profile_interrupt.c`

This example shows how an ISR can be profiled by ERAD. The CPU timer generates interrupts periodically. We set up the counters to count the CPU cycles elapsed while executing the ISR, to count the number of interrupts, the number of ISR executions and the CPU cycles elapsed between the interrupt and the execution of the ISR.

This example uses 2 bus comparators and 4 counters:

- `BUSCOMP_1` : PC = start address of `cpuTimer1ISR`
- `BUSCOMP_2` : PC = address of `cpuTimer1IntCount` variable access. This specifies the end address of the code of interest.
- `COUNTER_1` : Used to count the `cpuTimer1ISR` execution cycles. Configured in start-stop mode with start event as `BUSCOMP_1` and stop event as `BUSCOMP_2`
- `COUNTER_2` : Used to count the number of times the system event `TIMER1_TINT1` has occurred. Configured in rising-edge count mode with counting input as system event `TIMER1_TINT1`
- `COUNTER_3` : Used to count the number of times `cpuTimer2ISR` executes. Configured in rising-edge count mode with counting input as `BUSCOMP_1`
- `COUNTER_4` : Used to count the latency from the system event `TIMER1_TINT1` to `cpuTimer1ISR` entry. Configured in start-stop mode with start event as `TIMER1_TINT1` and stop event as `BUSCOMP_1`

We configure the `COUNTER1` to generate an interrupt once it reaches a threshold value.

External Connections

- None

Profiling Output

- Current ISR cycle count (`COUNTER_1`)
- Interrupt occurrence count (`COUNTER_2`)
- ISR execution count (`COUNTER_3`)
- ISR entry delay cycle count (maximum value of `COUNTER_4`)
- x - To show that the ISR executed

13.8.1.12 ERAD Profiling Interrupts

FILE: erad_ex4_profile_interrupt_syscfg.c

This example shows how an ISR can be profiled by ERAD. The CPU timer generates interrupts periodically. We set up the counters to count the CPU cycles elapsed while executing the ISR, to count the number of interrupts, the number of ISR executions and the CPU cycles elapsed between the interrupt and the execution of the ISR.

This example uses 2 bus comparators and 4 counters:

- BUSCOMP_1 : PC = start address of cpuTimer1ISR
- BUSCOMP_2 : PC = address of cpuTimer1IntCount variable access. This specifies the end address of the code of interest.
- COUNTER_1 : Used to count the cpuTimer1ISR execution cycles. Configured in start-stop mode with start event as BUSCOMP_1 and stop event as BUSCOMP_2
- COUNTER_2 : Used to count the number of times the system event TIMER1_TINT1 has occurred. Configured in rising-edge count mode with counting input as system event TIMER1_TINT1
- COUNTER_3 : Used to count the number of times cputimer2ISR executes. Configured in rising-edge count mode with counting input as BUSCOMP_1
- COUNTER_4 : Used to count the latency from the system event TIMER1_TINT1 to cpuTimer1ISR entry. Configured in start-stop mode with start event as TIMER1_TINT1 and stop event as BUSCOMP_1

We configure the COUNTER1 to generate an interrupt once it reaches a threshold value.

External Connections

- None

Profiling Output

- Current ISR cycle count (COUNTER_1)
- Interrupt occurrence count (COUNTER_2)
- ISR execution count (COUNTER_3)
- ISR entry delay cycle count (maximum value of COUNTER_4)
- x - To show that the ISR executed

13.8.1.13 ERAD MEMORY ACCESS RESTRICT

FILE: erad_ex5_restricted_write_detect.c

This example uses BUSCOMP1 to monitor the Data Write Address Bus. It monitors the bus and generates an RTOS interrupt if a certain region of memory is accessed by the PC. The user may disable the Bus Comparator to access that region.

Use the COM port (Baud=9600) to try to write to the restricted area.

Watch Variables

- x : stores the number of times the region of memory is accessed

External Connections

- None

13.8.1.14 ERAD INTERRUPT ORDER

FILE: erad_ex6_interrupt_order.c

This example uses a COUNTER to monitor the sequence of ISRs executed. An interrupt is generated if the ISRs executed are not in the expected order. The expected order is CPUtimer0 ,then CPUtimer1 and then CPUtimer2

The counter is configured in Start-Stop Mode to count the number of times CPUtimer interrupt occurs between the CPUtimer1 interrupt and CPUtimer2 ISRs. Ideally, this count should be zero if the interrupts are occurring in the expected order. we configure a threshold value of 1 to generate an RTOS interrupt. This indicates that the CPUtimer2 interrupt has come out of order.

For demonstration purposes, this example disables CPUTimer1 to simulate this error.

Watch Variables

- cpuTimer0IntCount: Number of executions of ISR0
- cpuTimer1IntCount: Number of executions of ISR1
- cpuTimer2IntCount: Number of executions of ISR2

External Connections

- None

13.8.1.15 ERAD AND CLB

FILE: erad_ex7_reg_write_clb.c

This example uses 4 BUS COMPARATORS of ERAD along with the CLB. One bus comparator monitors a write to x, another one monitors a write to y. The other two monitor a write of 0x1 and 0x0. By using the LUTs in the CLB1 tile, we can monitor a write of 0x1 to x or 0x0 to x. These are used to change the state of FSM2 in the CLB1 tile. If y is accessed before writing a 0x1 to x, an interrupt is generated and y is changed to 0x0 again. The LED2 indicates when access to y is allowed(it is off at this point) The LED1 indicates if an invalid access is attempted. A COUNTER in ERAD is used to count the number of access attempts to y.

Watch Variables

- y
- x
- a - counts the number of access attempts to y

External Connections

None

13.8.1.16 ERAD PWM PROTECTION

FILE: erad_ex8_pwm_protection.c

This example uses a BUS COMPARATOR and the CLB to detect the event when the delay between the interrupt and the ISR execution is longer than expected. The PWM output is also tripped in this case.

Watch Variables

- adcAResults stores the results of the conversions from the ADC

External Connections

- Monitor the PWM output (GPIO0)

13.9 ERAD Registers

This section describes the Embedded Real-Time Analysis and Diagnostic Registers.

13.9.1 ERAD Base Address Table

Table 13-5. ERAD Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected

13.9.2 ERAD_GLOBAL_REGS Registers

Table 13-6 lists the memory-mapped registers for the ERAD_GLOBAL_REGS registers. All register offset addresses not listed in Table 13-6 should be considered as reserved locations and the register contents should not be modified.

Table 13-6. ERAD_GLOBAL_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	GLBL_EVENT_STAT	Global Event Status Register		Go
2h	GLBL_HALT_STAT	Global Halt Status Register		Go
4h	GLBL_ENABLE	Global Enable Register	EALLOW	Go
6h	GLBL_CTM_RESET	Global Counter Reset	EALLOW	Go
8h	GLBL_NMI_CTL	Global Debug NMI control	EALLOW	Go
Ah	GLBL_OWNER	Global Ownership	EALLOW	Go
Ch	GLBL_EVENT_AND_MASK	Global Bus Comparator Event AND Mask Register	EALLOW	Go
Eh	GLBL_EVENT_OR_MASK	Global Bus Comparator Event OR Mask Register	EALLOW	Go
10h	GLBL_AND_EVENT_INT_MASK	Global AND Event Interrupt Mask Register	EALLOW	Go
12h	GLBL_OR_EVENT_INT_MASK	Global OR Event Interrupt Mask Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 13-7 shows the codes that are used for access types in this section.

Table 13-7. ERAD_GLOBAL_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

13.9.2.1 GLBL_EVENT_STAT Register (Offset = 0h) [Reset = 0000h]

GLBL_EVENT_STAT is shown in [Figure 13-8](#) and described in [Table 13-8](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the EVENT_FIRED bit of the corresponding module. This facilitates software to just read one register and find out if any of the debug modules had fired.

13.9.2.3 GLBL_ENABLE Register (Offset = 4h) [Reset = 0000h]

GLBL_ENABLE is shown in [Figure 13-10](#) and described in [Table 13-10](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly acts as a global enable for the corresponding module. This bit has to be set to 1 for the module to be functional.

13.9.2.4 GLBL_CTM_RESET Register (Offset = 6h) [Reset = 0000h]

GLBL_CTM_RESET is shown in [Figure 13-11](#) and described in [Table 13-11](#).

Return to the [Summary Table](#).

This register contains one bit for each of the counter modules that are present in a device. Each bit directly acts as a reset for the counters for the corresponding module. (It does not affect anything else except resetting the counter.

Example: If the counter was previously incrementing before reset, then on a reset event the counter gets reset and continues to increment again).

2	CTM3	R-0/W	0h	This bit directly resets the state the Counter unit 3. 0 No Effect 1 Reset Reset type: ERAD_RESET
1	CTM2	R-0/W	0h	This bit directly resets the state the Counter unit 2. 0 No Effect 1 Reset Reset type: ERAD_RESET
0	CTM1	R-0/W	0h	This bit directly resets the state the Counter unit 1. 0 No Effect 1 Reset Reset type: ERAD_RESET

13.9.2.5 GLBL_NMI_CTL Register (Offset = 8h) [Reset = 0000h]

GLBL_NMI_CTL is shown in [Figure 13-12](#) and described in [Table 13-12](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that can cause an NMI to the CPU. When the corresponding bit of a unit is set to 1, then if an event occurs from that module, then an NMI will be generated.

R/W-0h	R/W-0h	R-0h	R/W-0h	R/W-0h	R/W-0h	R-0h	

Table 13-27. CTM_CNTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-12	RESERVED	R	0h	Reserved
11	CNT_INP_SEL_EN	R/W	0h	0 = Disable using the input_select register for the count input. The counter will always count CPU cycles. 1 = Enable using the input_select register for the count input. The counter will count the event selected by the count input register. Reset type: ERAD_RESET
10	RST_EN	R/W	0h	This bit decides if the reset input is enabled or not. Setting this to 1 will cause the counter to reset to zero whenever the selected reset input goes active high. No event will be generated when the counter is reset. Setting this bit to 0 will cause the counter to ignore the reset inputs. Reset type: ERAD_RESET
9	RESERVED	R	0h	Reserved
8	START_STOP_CUMULATIVE	R/W	0h	This bit decides whether the counter counts to give the cumulative cycle count for 'n' number of successive start stop events or clears the counter on every stop event to record the MAX_COUNT across successive start stop sequences. 0 When in START_STOP mode counter gets cleared on every stop event and MAX_COUNT records the max value 1 When in START_STOP mode counter keeps counting between successive start stop events to generate a cumulative count w/o clearing the counter on any stop events. MAX_COUNT register is invalid when this bit is set. Reset type: ERAD_RESET
7	RTOSINT	R/W	0h	This bit decides whether the counter module will generate RTOSINTn interrupt when count value matches the reference. Note that the event outputs will always be generated regardless of the state of this bit. 0 The counter unit will not cause any action towards the CPU. 1 The counter unit will assert RTOSINTn when the count value matches the reference value. Reset type: ERAD_RESET

Table 13-27. CTM_CNTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	STOP	R/W	0h	This bit decides whether the counter module will generate a watchpoint to the CPU when the count value matches the reference. Note that the event outputs will always be generated regardless of the state of this bit. 0 The counter unit will not generate a watchpoint. 1 The counter unit will assert ANASTOP when the count value matches the reference. Reset type: ERAD_RESET
5	RESERVED	R	0h	Reserved
4	RST_ON_MATCH	R/W	0h	This bit is used to decide whether the counter will reset to zero once it reaches the reference value. 0 Counter will stay at the reference value and the counter will go to COMPLETED state and further counting will be stopped. 1 The counter will reset to zero once it reaches the match value and will stay enabled. Reset type: ERAD_RESET
3	EVENT_MODE	R/W	0h	This bit is used to decide whether the counter will count the level of the event or the edge of the event. 0 Counter will increment the count as long as the count input is active high. 1 The counter will count only on the rising edge of the count input. Reset type: ERAD_RESET
2	START_STOP_MODE	R/W	0h	This bit is used to decide whether the counter will count in the START_STOP mode or not. 0 Normal count mode. The counter will not depend on the START and STOP events 1 This is the START-STOP mode of the counter. The counter will start counting only after the START input has been asserted. It will continue to count the selected event till the STOP event is seen. Reset type: ERAD_RESET
1-0	RESERVED	R	0h	Reserved

13.9.4.2 CTM_STATUS Register (Offset = 1h) [Reset = 0010h]

CTM_STATUS is shown in [Figure 13-24](#) and described in [Table 13-28](#).

Return to the [Summary Table](#).

Chapter 14
Host Interface Controller (HIC)

The HIC module allows an external host controller to directly access resources of the device using the ASRAM protocol.

14.1 Introduction	1728
14.2 Functional Description	1729
14.3 Operation	1733
14.4 Usage Scenarios for Reduced Number of Pins	1744
14.5 Software	1745
14.6 HIC Registers	1746

14.1 Introduction

The HIC module allows an external host controller to directly access resources of the device by emulating the ASRAM protocol. It has two modes of operation: direct access and mailbox access. In direct access mode, device resources are written to and read from directly by the external host. In mailbox access mode, external host and device write to and read from a buffer and notify each other when the buffer write/read is complete. For security reasons, the HIC has to be enabled by the device before the external host can access it by using the HICGCR.HICEN and HICMODECR.EN_DEVACC registers.

14.1.1 Features

The HIC module has the following features:

- Configurable I/O data lines of 8 and 16 bit
- Direct and mailbox access modes
- 8 address lines and 8 configurable base addresses for a total of 2048 possible addressable regions
- Two 64-byte buffers for external host and device when using mailbox access mode
- Interrupt generation on buffer full/empty
- High throughput
- Trigger HIC activity from other peripherals
- Error indicators to the system or interface
- Commit feature that blocks writes to configuration registers

Note

The C28x processor is not byte addressable. The minimum addressable region in memory is 16 bits.

14.1.2 Block Diagram

Figure 14-1 shows the block diagram of the HIC.

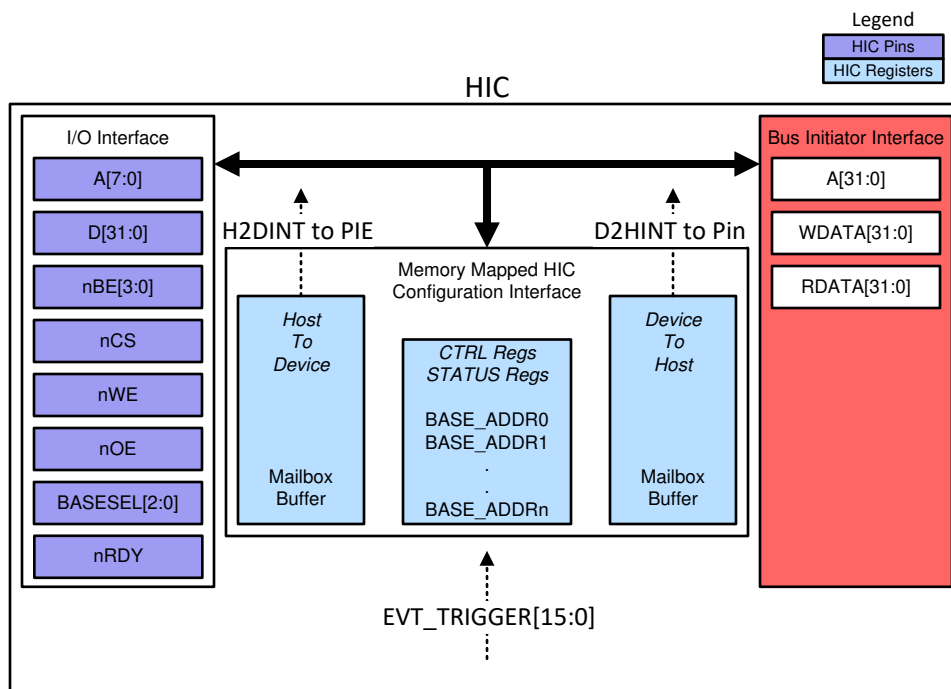

Figure 14-1. HIC Block Diagram

14.1.3 HIC Related Collateral

Getting Started Materials

- [Design Guide for Enabling Peripheral Expansion Applications Using the HIC Application Report](#)

14.2 Functional Description

The HIC consists of 3 main components:

- **I/O Interface:** The Input and Output (I/O) Interface emulates the ASRAM protocol to perform read and write operations between the external host and the device.
- **Configuration Interface:** The configuration interface consists of the registers that make up the HIC module. These registers include the control, data and status registers of the HIC and are accessible by both the external host and processors within the device.
- **Bus Initiator Interface:** The bus initiator interface is the port that accesses the device memory and peripheral registers. Reads from and writes to the device from the external host are handled by the bus initiator interface.

14.2.1 Memory Map

Figure 14-2 shows the memory and peripherals accessible by the HIC module and by extension, the external host.

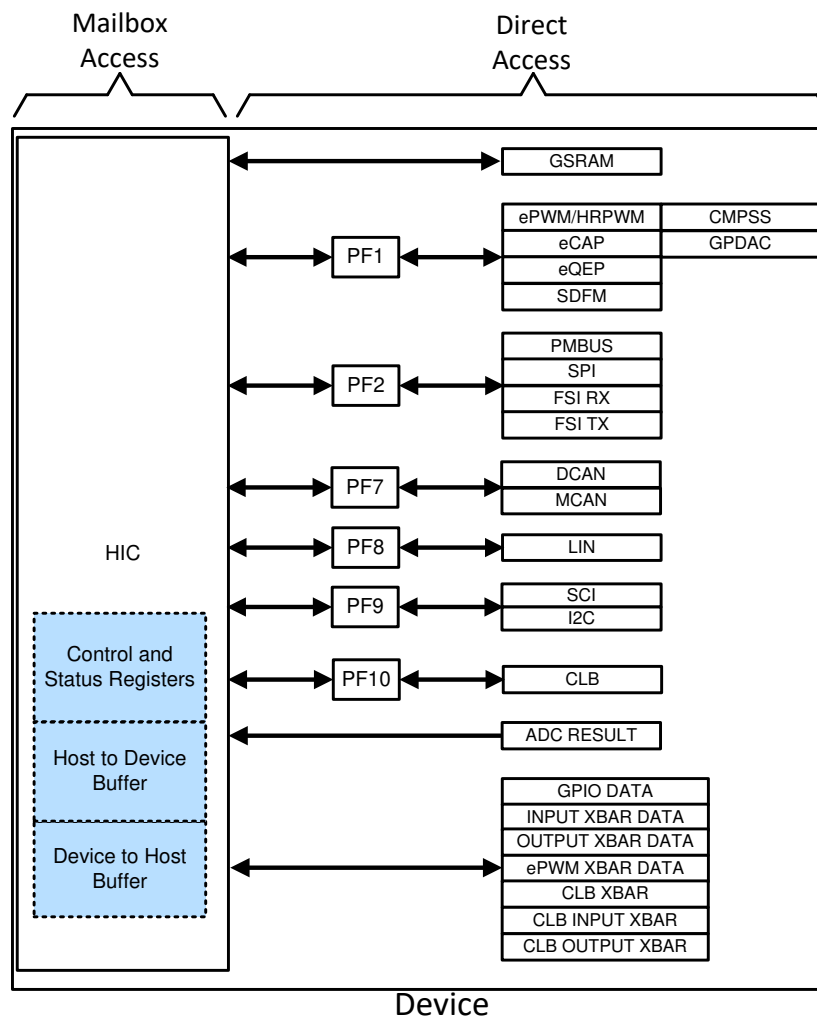

Figure 14-2. HIC Memory Map

14.2.2 Connections

Figure 14-3 shows the possible connections that can be made between the external host and the HIC module. Not all connections are available on all devices. Check the data sheet to determine the connections supported on your device.

Table 14-1 is a brief description of what each connection means.

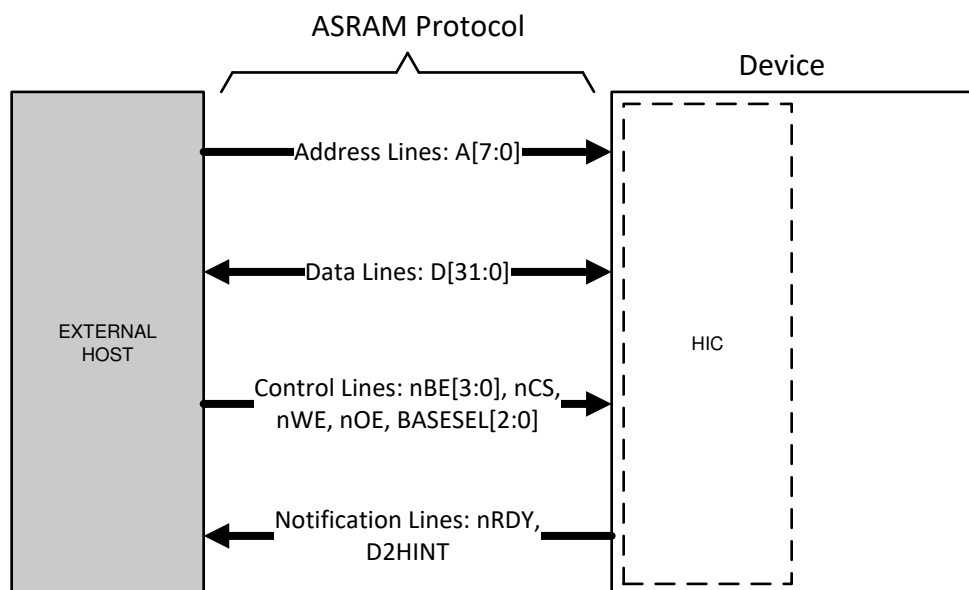

Figure 14-3. HIC Connections

Table 14-1. HIC Connections Table

Connection Group	Connection Name	Direction	Description
Address Lines	A[7:0]	Input	Address Lines Bit0 to Bit7
Data Lines	D[31:0]	Input/Output	Data Lines Bit0 to Bit31
Control Lines	nBE[3:0]	Input	Byte Enable Bit0 to Bit3
	nCS	Input	Chip Select
	nWE	Input	Write Enable
	nOE/RnW	Input	Output Enable/Read not Write
	BASESEL[2:0]	Input	Base Select Bit0 to Bit2
Notification Lines	nRDY	Output	Ready/Wait
	D2HINT	Output	Device to Host Interrupt

14.2.2.1 Functions of the Connections

- **Address Lines:** The address lines are part of the signals the external hosts uses to select which region of the device to read from or write to.
- **Data Lines:** The data lines carry the actual data read from or written to the device.
- **Control Lines**
 - **nBE:** The HIC supports 8-bit and 16-bit data transfers. The Byte Enable signal is used to select which of these modes the data transfer happens.
 - **nCS:** The Chip Select signal enables or disables the HIC interface.
 - **nWE:** The Write Enable signal enables or disables writes from the external host to the device.
 - **nOE:** The Output Enable signal enables or disables reads from the device to the external host.
 - **BASESEL:** The HIC supports access to device memory and peripherals or the HIC registers. The Base Select signal is used to select which region the external host accesses.
- **Notification Lines**
 - **nRDY:** The Ready signal is used by the HIC to indicate to the external host that the HIC is ready for a new read or write access.
 - **D2HINT:** The Device to Host Interrupt signal is used by the HIC to indicate to the external host that data transaction is complete.

Note

By default, nBE, nCS, nWE, nOE, and nRDY are active-low signals. The polarity can be changed by configuring the HICPINPOLCR register.

14.2.3 Interrupts and Triggers

The external host interrupts the device using H2DINT that goes to the PIE. A write to the HICH2DTOKEN register triggers H2DINT. The H2DINT sources are shown in Figure 14-4.

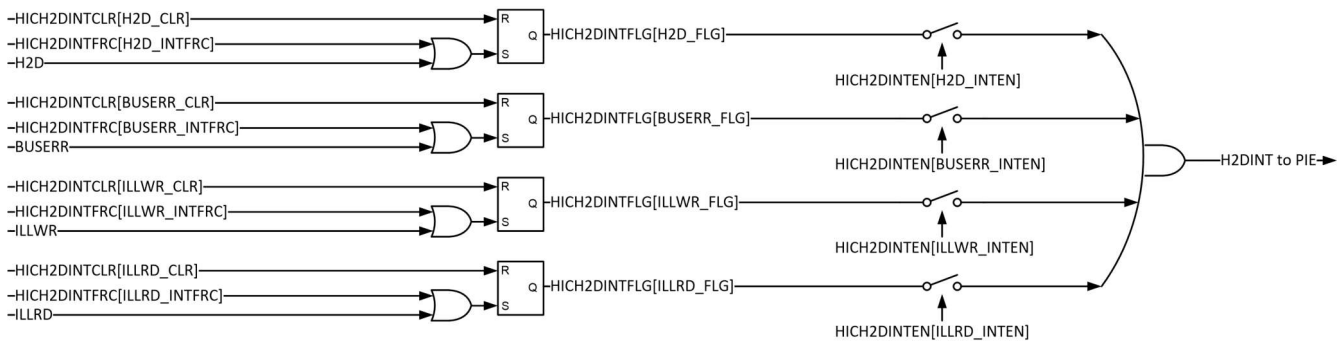

Figure 14-4. HIC Host to Device Interrupt Sources

The device interrupts the external host using D2HINT that comes out on a pin. A write to the HICD2HTOKEN register triggers D2HINT. The D2HINT sources are shown in Figure 14-5.

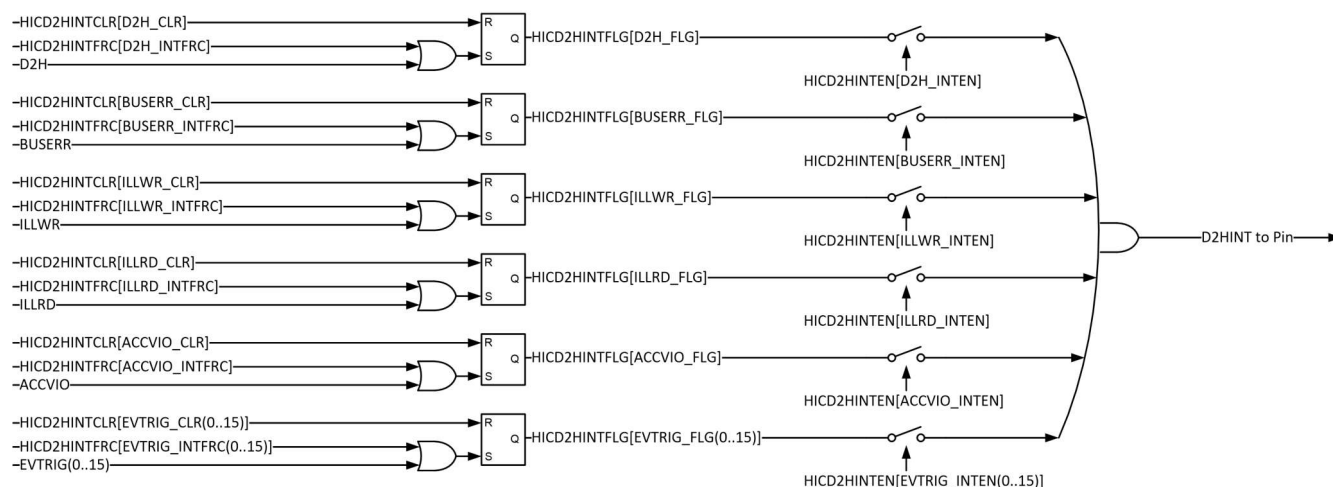

Figure 14-5. HIC Device to Host Interrupt Sources

D2HINT can also be triggered by peripherals in the device (EVTRIG) as indicated in Figure 14-5. The sources for EVTRIG are listed in Table 14-2.

Table 14-2. Event Trigger (EVTRIG) Sources

Event Trigger	Peripheral Interrupt Source
EVTRIG[0]	FSIRX_INT1, FSIRX_INT2
EVTRIG[1]	FSITX_INT1, FSITX_INT2
EVTRIG[2]	SPIB_TX, SPIB_RX
EVTRIG[3]	SPIA_TX, SPIA_RX

EVTRIG[7]	CLB1
EVTRIG[8]	CLB4
EVTRIG[9]	CLB3
EVTRIG[10]	DMA Transfer
EVTRIG[11..15]	Reserved

14.3 Operation

14.3.1 Mailbox Access Mode Overview

In Mailbox Access Mode, the external host only sees the HIC memory mapped region and not the device resources and peripherals. This memory mapped region of the HIC includes the HIC control, status and data registers.

128 bytes of this region is reserved for HIC control and status registers. The remaining 128 bytes is used as a data/buffer space and is split 64 bytes each as Host to Device (H2D) buffer and Device to Host (D2H) buffer. Note that this distinction between H2D and D2H buffer is only in name. Device and external host can each access the combined H2D and D2H buffers of 128 bytes by configuring the H2DBUF_DEVWREN and D2HBUF_HOSTWREN fields in the HICMODECR register. Figure 14-6 shows the Mailbox Access Mode and the minimum external connections required for this mode.

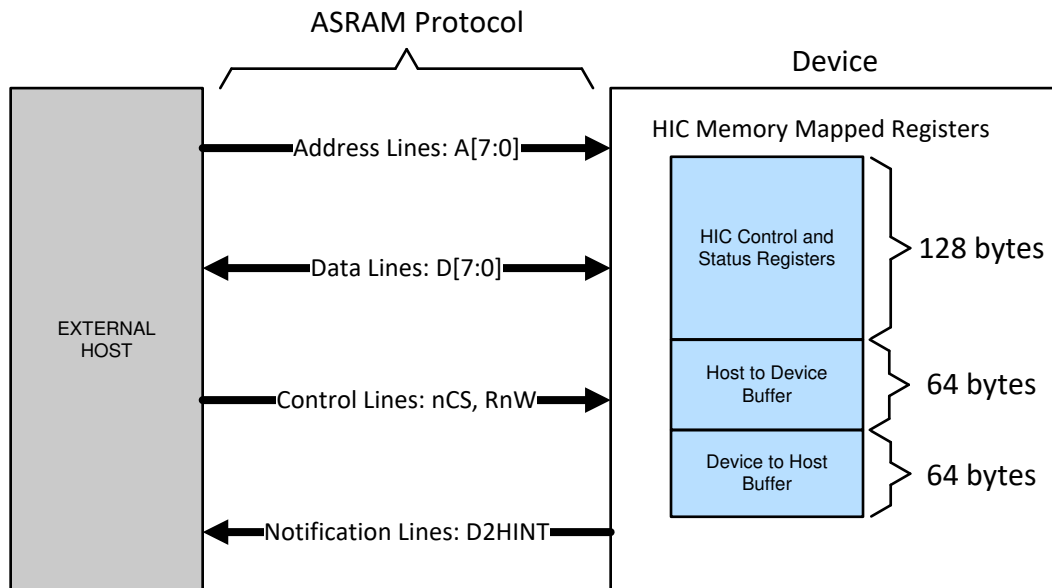

Figure 14-6. HIC Mailbox Access Mode Diagram

14.3.1.1 Mailbox Access Mode Operation

To place the HIC in Mailbox Access Mode, the BASESEL[2:0] pins must be set to 000. Address lines A[7:0] can then be used to select which of the 256 bytes of the HIC memory-mapped registers to access.

14.3.1.2 Configuring HIC Registers With External Host

The external host can only configure the HIC registers and read the status in Mailbox Access Mode. The HIC control and status registers reside in the first 128 bytes of the HIC memory-mapped region.

14.3.1.3 Mailbox Access Mode Read/Write

The remaining 128 bytes of the HIC memory-mapped region can be used as a general-purpose buffer. To write to or read from this region:

- The device enables the HIC by writing 0xA to the HICGCR.HICEN register
- The device configures the availability and polarity of the HIC pins using the HICMODECR.RW_MODE, HICMODECR.BEN_PRESENT, HICMODECR.RDY_PRESENT, and HICPINPOLCR registers

To write data to the device:

- The external host writes to the H2D buffer, that is, H2D_BUF register
- After completing the write, the external host triggers an interrupt (H2DINT) to the device by writing a pattern to the HICH2DTOKEN register. This pattern can be any value and a useful value to write to the HICH2DTOKEN register is the number of bytes written by the external host. Any write to the HICH2DTOKEN register triggers H2DINT.
- The device acknowledges this interrupt by transferring the data from the H2D buffer (H2D_BUF register) to the required location.

To read data from the device:

- The device writes to the D2H buffer, that is, D2H_BUF register
- After completing the write, the device triggers an interrupt (D2HINT) to the external host by writing a pattern to the HICD2HTOKEN register. This pattern can be any value and a useful value to write to the HICD2HTOKEN register is the number of bytes written by the device.
- The external host acknowledges this interrupt by reading the contents of the D2H buffer (D2H_BUF register).

Note

An error is not generated if writes to the D2H_BUF and H2D_BUF exceed the memory region, that is, 128 bytes. The application needs to make sure writes to the above regions are appropriately bounded.

14.3.2 Direct Access Mode Overview

In Direct Access Mode, the external host through the HIC can directly read from and write to device locations specified in the memory map. The device location to read is a combination of the 8-bit address lines A[7:0] and the 24-bit HICDBADDR{#} register.

These two address pieces are concatenated as:

$$\text{Full 32-bit Address} = \{\text{HICDBADDR}\{\#\}, \text{BASE_ADDR}[31:8], \text{A}[7:0]\}$$

There are 8 HICDBADDR{#} registers for a total of 2048 address locations in combination with A[7:0] address lines. Which HICDBADDR{#} register to concatenate with A[7:0] is selectable by the HICBASESEL register or BASESEL[2:0] pins. Figure 14-7 shows the Direct Access Mode and the minimum external connections required for this mode.

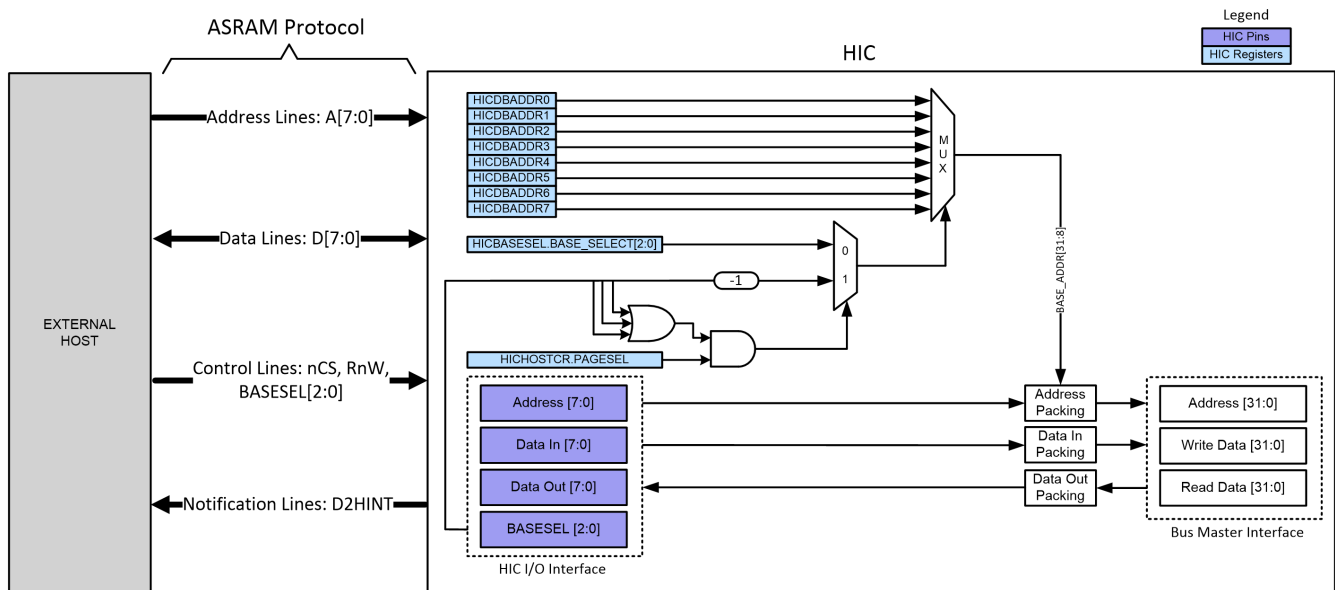

Figure 14-7. HIC Direct Access Mode Diagram

14.3.2.1 Direct Access Mode Operation

To place the HIC in Direct Access mode, the BASESEL[2:0] pins can be greater than 000. Address lines A[7:0] are used in conjunction with the HICDBADDR{#} register to read from or write to a location in the device. [Table 14-3](#) shows the device address space view for the external host.

Note

BASESEL[2:0] pins cannot select HICDBADDR7 register, BASESEL[2:0] pins can only select HICDBADDR0-6 registers. HICDBADDR7 can only be selected through software using the HICBASESEL.BASE_SELECT[2:0] register.

Table 14-3. Address Space View for External Host

(1) "x" indicates don't care.

14.3.2.2 Direct Access Mode Read/Write

The following steps assume all HIC pins are available. To write to or read from the device:

- The device enables the HIC by writing 0xA to the HICGCR.HICEN register
- The device enables direct access mode using HICMODECR.EN_DEVACC register
- The device configures the availability and polarity of the HIC pins using the HICMODECR.RW_MODE, HICMODECR.BEN_PRESENT, HICMODECR.RDY_PRESENT and HICPINPOLCR registers
- The device configures the HICDBADDR{#} registers
- To write data to the device, the external host selects a HICDBADDR{#} using the BASESEL[2:0] pins, drives the 8-bit portion of the address on the address lines A[7:0] and the data to write on the data lines D[15:0]
- To read data from the device, the external host selects a HICDBADDR{#} using the BASESEL[2:0] pins, drives the 8-bit portion of the address on the address lines A[7:0] and reads the data on the data lines D[15:0]

14.3.3 Controlling Reads and Writes

The HIC has two modes of controlling reads and writes: single-pin mode and dual-pin mode.

14.3.3.1 Single-Pin Read/Write Mode (nOE/RnW Pin)

In single-pin read/write access (Figure 14-8), nOE(RnW) determines whether the transaction being performed is a read or a write. If nOE is low, data is written from the host to the device; when nOE is high, data is read from the device by the host.

Figure 14-8. Read/Write Access in Single-Pin Mode

14.3.3.2 Dual-Pin Read/Write Mode (nOE and nWE Pins)

In dual-pin read/write access (Figure 14-9), nOE and nWE pins determine whether the transaction being performed is a read or a write. In the default polarity state, nOE going low indicates a data read from the device to the host and nWE going low indicates a data write to the device by the host.

Figure 14-9. Read/Write Access in Dual-Pin Mode

14.3.4 Data Lines, Data Width, Data Packing and Unpacking

The HIC supports 8 and 16 data lines and host data transfers can be made in 8-bit and 16-bit modes. The host data transfer mode is selected using the byte enable (nBE) pins. In the absence of the nBE pins, host data transfer mode can be selected using the HICMODECR.DW_MODE register.

At the initiator port level, the HIC internal access is restricted to 16-bit and 32-bit modes selectable using the HICHOSTCR.ACCSIZE register. If there is a mismatch between host access mode and initiator port access mode, the HIC internally packs and unpacks the data automatically as needed.

For instance, if host access mode is set to 16-bit using the nBE pins or the HICMODECR.DW_MODE register and initiator port access mode is set to 16-bit using the HICHOSTCR.ACCSIZE register, no data packing or unpacking is done. If host access mode is set to 8-bit and initiator port access mode is set to 16-bit, a single 8-bit access waits for another 8-bit access to pack the two 8-bit accesses into one 16-bit access.

Table 14-4 shows the combinations for write access.

Table 14-4. Data Packing and Unpacking for Writes

HICMODECR. DW_MODE	Host Port Write			Initiator Port Write (16-bit Aligned)		Error	Comment
	A[7:0]	D[7:0] for 8-bit DW_MODE D[15:0] for 16-bit DW_MODE	nBE[1:0]	DWAB[31:0]	DWDB[31:0]		
8-bit (0)	0x0	B0	-			No	8-bit write to even address, waits for packing.
	0x1	B1	-	BADDRx + 0x0	[15:0]=B1B0	No	8-bit write to odd address, packed into 16-bit.
	0x2	B2	-			No	8-bit write to even address, waits for packing.
	0x3	B3	-	BADDRx + 0x1	[31:16]=B3B2	No	8-bit write to odd address, packed into 16-bit.
	0x1	B1	-	BADDRx + 0x0	[15:0]=B1B0	No	8-bit write to odd address, packed into 16-bit with previous even byte data.
	0x3	B3	-	BADDRx + 0x1	[31:16]=B3XX	No	8-bit write to odd address, packed into 16-bit with previous even byte data.
	0xA	B0	-			No	8-bit write to even address, waits for packing.
	0xA+n (n > 1)	XX	-			Yes	Consecutive byte writes beyond 16-bit boundary are illegal, previous byte discarded.

Table 14-4. Data Packing and Unpacking for Writes (continued)

HICMODECR. DW_MODE	Host Port Write			Initiator Port Write (16-bit Aligned)		Error	Comment
	A[7:0]	D[7:0] for 8-bit DW_MODE D[15:0] for 16-bit DW_MODE	nBE[1:0]	DWAB[31:0]	DWDB[31:0]		
16-bit (1)	0x0	B1B0	2'b00	BADDRx + 0x0	[15:0]=B1B0	No	Full 16-bit write sent through.
	0x1	B3B2	2'b00	BADDRx + 0x1	[31:16]=B3B2	No	Full 16-bit write sent through.
	0x2	B5B4	2'b00	BADDRx + 0x2	[15:0]=B5B4	No	Full 16-bit write sent through.
	0x3	B7B6	2'b00	BADDRx + 0x3	[31:16]=B7B6	No	Full 16-bit write sent through.
	0x0	XXB0	2'b10			No	8-bit write to even address, waits for packing.
	0x0	B1XX	2'b01	BADDRx + 0x0	[15:0]=B1B0	No	8-bit write to odd address, packed into 16-bit.
	0x1	XXB2	2'b10			No	8-bit write to even address, waits for packing.
	0x1	B3XX	2'b01	BADDRx + 0x1	[31:16]=B3B2	No	8-bit write to odd address, packed into 16-bit.
	0x0	B1XX	2'b01	BADDRx + 0x0	[15:0]=B1BXX	No	Any odd 8-bit write triggers 16-bit write packed with previous even byte data.
	0x1	B3XX	2'b01	BADDRx + 0x1	[31:16]=B3XX	No	Any odd 8-bit write triggers 16-bit write packed with previous even byte data.
	0xA	XXB0	2'b10			No	8-bit write to even address, waits for packing.
	0xA+n (n > 1)	XXB0	2'b10			Yes	Consecutive byte writes beyond 16-bit boundary are illegal, previous byte discarded.

Table 14-5 shows the combinations for read access.

Table 14-5. Data Packing and Unpacking for Reads

HICMODECR. DW_MODE	Host Port Read		Initiator Port Read		Comment
	A[7:0]	D[7:0] for 8-bit DW_MODE D[15:0] for 16-bit DW_MODE	DRAB[31:0]	DRDB[31:0]	
8-bit (0)	0x0	B0	BADDRx + 0x0	[31:0]=B3B2B1B0	A random read from the host triggers a 32-bit read on the initiator port.
	0x1	B1			A sequential byte read within the aligned 32-bit word is returned from the internal data buffer.
	0x2	B2			
	0x3	B3			
	0x4	B4	BADDRx + 0x2	[31:0]=B7B6B5B4	A byte read outside of an aligned 32-bit word boundary triggers a 32-bit read on the initiator port.
16-bit (1)	0x0	B1B0	BADDRx + 0x0	[31:0]=B7B6B5B4	A random read from the host triggers a 32-bit read on the initiator port.
	0x1	B3B2			A sequential 16-bit read within an aligned 32-bit word is returned from the internal data buffer.
	0x2	B5B4	BADDRx + 0x2	[31:0]=B3B2B1B0	A 16-bit read from the host port outside of an aligned 32-bit word triggers a 32-bit read on the initiator port.
	0x3	B7B6			A sequential 16-bit read within an aligned 32-bit word is returned from the internal data buffer.

14.3.5 Address Translation

Since the initiator port uses 16-bit aligned addressing while the host port can operate in 8 and 16-bit modes, address translation is needed for correct operation. [Table 14-6](#) shows an example of address translation performed in 8-bit data width mode while [Table 14-7](#) shows the same for 16-bit data width mode.

Table 14-6. Address Translation for 8-bit Data Width Mode

HICMODECR. DW_MODE	Host Port Address	Initiator Port Address {HICDBADDR.BASE_ADDR[31:7],A[6:1]}
8-bit ("0")	0x0	0x0
	0x1	0x0
	0x2	0x1
	0x3	0x1
	0x4	0x2
	0x5	0x2
	0x6	0x3
	0x7	0x3
	0x7F	0x3F
	0x80	0x40
	0x81	0x40
	0xFE	0x7F
	0xFF	0x7F

Table 14-7. Address Translation for 16-bit Data Width Mode

HICMODECR. DW_MODE	Host Port Address	Initiator Port Address{HICDBADDR.BASE_ADDR[31 :8],A[7:0]}
16-bit ("1")	0x0	0x0
	0x1	0x1
	0x2	0x2
	0x7F	0x7F
	0x80	0x80
	0x81	0x81
	0xFE	0xFE
	0xFF	0xFF

14.3.6 Access Errors

The HIC has the HICH2DINTFLG, HICD2HINTFLG, HICERRADDR and HICACCVIOADDR registers that capture the state of the HIC when an access error occurs. The errors captured are:

Illegal Write Error

This error occurs during a write when the host mode bit size is greater than the initiator port bit size. For instance, if the host is configured in 32-bit mode using either nBE or HICMODECR.DW_MODE, a write error occurs if HICHOSTCR.ACCSIZE is set to 16-bit. This error also occurs if an incorrect address range is specified for write access.

See [Table 14-4](#).

Illegal Read Error

This error occurs during a read when the host mode bit size is greater than the initiator port bit size. For instance, if the host is configured in 32-bit mode using either nBE or HICMODECR.DW_MODE, a read error occurs if HICHOSTCR.ACCSIZE is set to 16-bit. This error also occurs if a read is made from a location that was incompletely written in a previous transaction. For instance, the HIC is waiting on another byte to complete a 16-bit write transaction but gets a read access before this second byte.

Bus Error

This error occurs when a memory location is simultaneously written by both host and device. The host data is discarded and device data is retained.

Initiator Port Access Violation Error

This error occurs when the host tries to access a memory region that has access protection enabled, is reserved or a Parity/ECC occurred while performing a read access.

Other Errors

The previous errors do not capture all the possible errors that can occur with the HIC. The following errors either hang the HIC module or fail silently:

- The HIC module or device is under reset and an access is initiated.
- The HIC clock is disabled or the device is in a low-power mode and an access is initiated.
- The HIC clock is disabled in the middle of a transaction by the host.

It is recommended that the application perform data integrity checks, for instance, read back written data in order to catch these silent errors.

14.3.7 Security

There are multiple security levels implemented in the device and HIC module to prevent unauthorized access:

- **Level 1:** The device must turn on the clock for HIC and enable the HIC using HICGCR.HICEN before any access to the device region can be made. The configuration registers are read-only by the host.
- **Level 2:** MEM_CFG_REGS.GSxACCPROT0.HICWRPROT_GSy enables and disables write access to the GSRAM by the HIC.
- **Level 3:** HICMODECR.EN_HOSTWREALLOW, HICMODECR.EN_DEVACC, and HICHOSTCR.EALLOW_EN further restricts access by enabling/disabling EALLOW and device region access by host.
- **Level 4:** HICLOCK register can be used to lock the configuration registers from further writes. This register is read-only by the host.
- **Level 5:** The state of the lock register can be committed with the HICCOMMIT register which will prevent further changes until device is reset.

14.3.8 HIC Usage

To get started using the HIC, first map out the pins needed for the application. See the device data sheet for the set of HIC pins available on the device.

In addition, read the [Enabling Peripheral Expansion Applications Using the HIC Application Report](#) before getting started with using the HIC in an application. The application report contains examples of use-cases and is written from an application point of view. Some of the content in this chapter is repeated in the application report. This is done to make sure the application report is a standalone document.

14.4 Usage Scenarios for Reduced Number of Pins

The HIC does not require all pins for operation. The following describes use-cases for a reduced set of pins.

Read/Write Control Pins

Controlling read/write can be achieved using just one pin, nOE/RnW pin, instead of the traditional two pins: nOE and nWE pins. Configuration is achieved through the HICMODECR.RW_MODE register. See [Section 14.3.3](#) for details.

BASESEL Pins

If no BASESEL pins are available, the HIC is restricted to mailbox access mode where the external host can only access the HIC memory mapped registers. However to access device registers through direct access mode, only one BASESEL pin is required.

In this configuration, the BASESEL0 pin determines whether the access being made is mailbox access or direct access. BASESEL0 set to 0 is a mailbox access; BASESEL0 set to 1 is a direct access. This configuration restricts base address selection to only HICDBADDR0. Configuration is achieved through the HICHOSTCR.PAGESEL register. See [Section 14.3.2.1](#) for details.

Data Pins

The HIC supports 8-bit and 16-bit transfers. 16-bit data transfers can still be achieved with 8 data lines. This is handled internally by the HIC through data packing and unpacking. See [Section 14.3.4](#) for details.

Note

8 data lines is the minimum supported.

Byte-Enable Pins

If no byte-enable pins are available, the HIC defaults to 16-bit data transfers but can be re-configured using the HICMODECR.DW_MODE register. Configuration is achieved through the HICMODECR.BEN_PRESENT register. See [Section 14.3.4](#) for details.

Ready Pin

If no nRDY pin is available, the host must add sufficiently large setup/hold times during data transmission to prevent clashes. Configuration is achieved through the HICMODECR.RDY_PRESENT register.

14.5 Software

14.5.1 HIC Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/hic

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

14.5.1.1 HIC 16-bit Memory Access Example

FILE: hic_ex1_config_16bit.c

Example sets up Host Interface Controller Module in 16-bit mode the data memory of device is accessed by the *External Host*.

This example is validated on an TI Internal Validation Platform will not run in F28002x Control Card The example initializes the GPIOs for 16 bit Memory access mode with separate Read and Write Control Pins, Extended Wait, and nRDY pin The example demonstrates the following sequences

1. Sending a message to the Host using Device to Host buffer, Passing a token which triggers an interrupt at the Host.
2. Waits for the Host to clear the interrupt.
3. Then waits for a message from Host which contains the code 0x1 in buffer index 0 and index 1 contains the Base address to be configured
4. Configures the base address for Page 0
5. Sends a message to Host after that is configured
6. After this step the external host can use the address 0-0xFF to access the Base address region in System memory

External Connections

This is tested on TI Internal validation platform hence no connection needed on Control card. This has been tested with F2838x EMIF interface.

Watch Variables

None

14.5.1.2 HIC 8-bit Memory Access Example

FILE: hic_ex2_config_8bit_adc.c

Example sets up Host Interface Controller Module in 8-bit mode the data memory of device is accessed by the External Host.

- This follows example configuration for pin constrained applications described in the Application note titled Application guide for peripheral expansion using HIC(SPRACR2). -This example is validated on an TI Internal Validation Platform will not run in F28002x Control Card. This is to be run with a corresponding Host side code emif_ex8_8bit_asram_hic_adc is run on F2838x based host first and then this example is run.
- The example initializes the HIC for 8 bit Memory access mode with Single Read and Write Control Pin
- DMA is configured to do transfer of the ADC result from ADCRESULT0-15 to HIC D2H buffer.
- The example configures CPUTIMER0 to generate an event every second on which the ADC SOC0-15 start conversion.
- The timer is enabled on receiving HIC_START_TOKEN on the H2D Token from the host.
- The end of ADC_SOC15 will generate a DMA event
- The DMA ISR signals the host with HIC_DATA_TOKEN to signal data write.
- The Host is interrupted with HIC_INT on ADC End of conversion event
- The DMA Channel is stopped after HIC_TEST_NUM_SAMPLES samples are collected This example can be used as a reference to implement Communication between Host and HIC with minimal number of pins. Please refer to device TRM and application note titled 'Application guide for peripheral expansion using HIC'(SPRACR2) for further details about Host interface Controller applications.

External Connections

This is tested on TI Internal validation platform hence no connection needed on Control card. This has been tested with F2838x EMIF interface with emif_ex8_8bit_asram_hic_adc example Analog channel A7 has been used as Analog Input to Sample

14.5.1.3 HIC 16-bit Memory Access FSI Example

FILE: hic_ex3_config_16bit_fsi.c

Example sets up Host Interface Controller Module in 16-bit mode the FSI Memory region of device is accessed by the External Host. This follows example configuration for performance critical applications described in the Application note titled "Application guide for peripheral expansion using HIC"(SPRACR2).

emif_ex7_16bit_asram_hic_fsi is to be run on the host before running this example on F28003x side.

This example is validated on an TI Internal Validation Platform will not run in F28003x Control Card

1. The example initializes the GPIOs for 16 bit HIC Memory access mode with separate Read and Write Control Pins, Extended Wait, and nRDY pin
2. Configures the base address for Region 0 to access FSI Tx Memory region
3. Sets up the FSI module in Loopback mode
4. The EVTTRIG interface of HIC is enabled to route FSI Rx events to the Host through the HIC_INT
5. Sending a message to the Host using Device to Host buffer, Passing a token
6. This sets up the FSI direct bridge over HIC. The host can then access the FSI registers over HIC

External Connections

This is tested on TI Internal validation platform hence no connection needed on Control card. This has been tested with F2838x EMIF interface.

Watch Variables

None - Use the Host to access FSI region

14.6 HIC Registers

This section describes the Host Interface Controller Registers.

14.6.1 HIC Base Address Table

Table 14-25. HICDBADDR4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	BASE_ADDR	R/W	0h	Base address of the region inside Device address space that Host intends to access. The valide bits from register are concatenated to the incoming Host address appropriately to form the full 32-bit address on the Initiator port of HIC. When DW_MODE = 8-bit, BASE_ADDR[31..7] should be programmed. In this case, Host can access 256 bytes of Device region through the Initiator port. When DW_MODE = 16-bit, BASE_ADDR[31..8] should be programmed. In this case, Host can access 512 bytes of Device region through the Initiator port. Note: Exact HICDBADDR4 register being used for an access is determined by the HICBASESEL.BASE_SELECT field value. Read-only for Host. Reset type: SYSRSn
6-0	RESERVED	R-0	0h	Reserved

14.6.2.16 HICDBADDR5 Register (Offset = 1Eh) [Reset = 0000000h]

HICDBADDR5 is shown in [Figure 14-25](#) and described in [Table 14-26](#).

Table 14-38. HICCOMMIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	WRITE_ENABLE_KEY	W	0h	These 16 bits act as a key to enable writes to Bit 0 of this register. The only time a '1' can be written to Bit 0 is by a single 32-bit write where bits 31:16 equal 0x5a5a. All other writes are ignored including separate 16-bit writes. Read returns 0 for this field always. Read-only for Host Reset type: SYSRSn
15-1	RESERVED	R-0	0h	Reserved
0	COMMIT	R/WOnce	0h	Enable for COMMIT feature that blocks writes to certain config registers. This field can be written as '1' only along with a valid WRITE_ENABLE_KEY value. 0: Register lock configuration is not committed. 1: Register lock configuration is committed. Once configuration is committed, only reset can change the configuration. Read-only for Host Reset type: SYSRSn

14.6.2.29 H2D_BUF0 Register (Offset = 40h) [Reset = 00000000h]

Chapter 15
Analog Subsystem

The analog subsystem module is described in this chapter.

15.1 Introduction	1820
15.2 Optimizing Power-Up Time	1825
15.3 Digital Inputs on ADC Pins (AIOs)	1826
15.4 Digital Inputs and Outputs on ADC Pins (AGPIOs)	1826
15.5 Analog Pins and Internal Connections	1827
15.6 Analog Subsystem Registers	1830

15.1 Introduction

The analog modules on this device include the Analog-to-Digital Converter (ADC), Temperature Sensor, Buffered Digital-to-Analog Converter (DAC), and Comparator Subsystem (CMPSS).

15.1.1 Features

The analog subsystem has the following features:

- Flexible voltage references
 - The ADCs are referenced to VREFH_{ix} and VSSA pins
 - VREFH_{ix} pin voltage can be driven in externally or can be generated by an internal bandgap voltage reference
 - The internal voltage reference range can be selected to be 0V to 3.3V or 0V to 2.5V
 - The buffered DACs are referenced to VREFH_{ix} and VSSA
 - Alternately, these DACs can be referenced to the VDAC pin and VSSA
 - The comparator DACs are referenced to VDDA and VSSA
 - Alternately, these DACs can be referenced to the VDAC pin and VSSA
- Flexible pin usage
 - Buffered DAC outputs, comparator subsystem inputs, and digital inputs (AIOs)/outputs (AGPIOs) are multiplexed with ADC inputs
 - Internal connection to V_{REFLO} on all ADCs for offset self-calibration

15.1.2 Block Diagram

The following analog subsystem block diagrams show the connections between the different integrated analog modules to the device pins. These pins fall into two categories: analog module inputs/outputs and reference pins.

The analog pins are organized into analog groups around the CMPSS module. The block diagram shows which pins connect to each group. The pins which connect to CMPSS inputs can be used for the CMPSS without further action and without preventing use as an ADC input simultaneously.

The VDAC reference pin can be used to set an alternate range for DAC A, DAC B and for the DACs inside the CMPSS modules (the CMPSS DACs are referenced to VDDA and VSSA by default). Using this pin as a reference prevents the channel from being used as an ADC input (but the ADC can be used to sample the VDAC voltage, if desired). The choice of reference is configurable per-module for each CMPSS or buffered DAC, and the selection is made using the module's configuration registers.

Some analog pins support digital functionality through muxed AIOs and AGPIOs. AIOs support only digital input functionality while AGPIOs support full digital input and output functionality.

The following notes apply to all packages:

- Not all analog pins are available on all devices. See the device data sheet to determine which pins are available.
- See the device data sheet to determine the allowable voltage range for VREFHI and VREFLO.
- An external capacitor is required on the VREFHI pins. See the device data sheet for the specific value required.
- For buffered DAC modules, VSSA is the low reference whether VREFH_{ix} or VDAC is selected as the high reference.
- For CMPSS modules, VSSA is the low reference whether VDAC or VDDA is selected as the high reference.

The following figures show how each analog group is structured. [Table 15-2](#) lists the analog pins and internal connections.

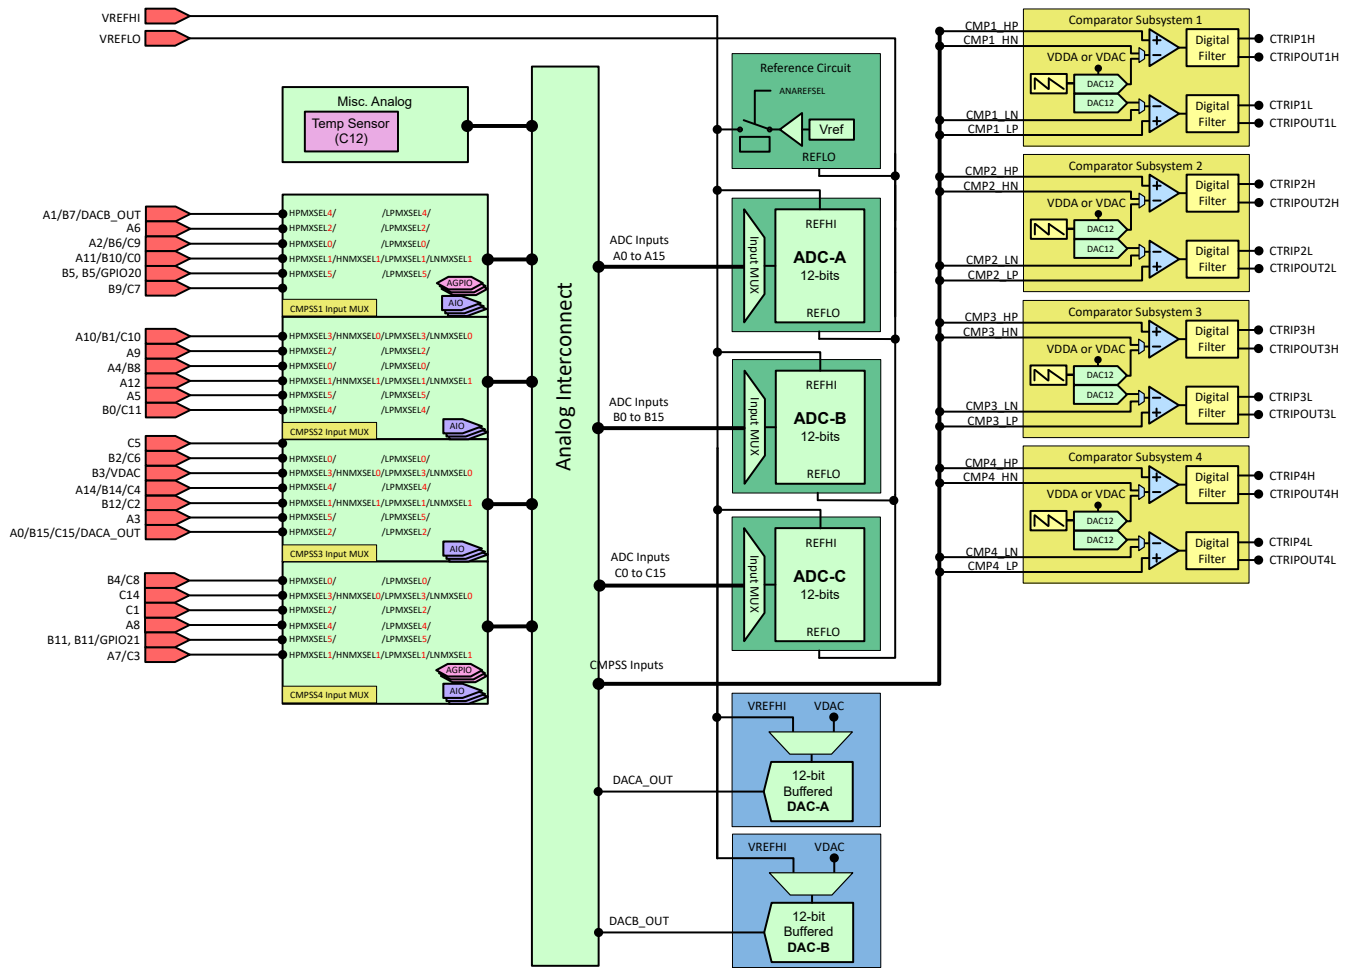

Figure 15-1. Analog Subsystem Block Diagram (100-Pin QFP)

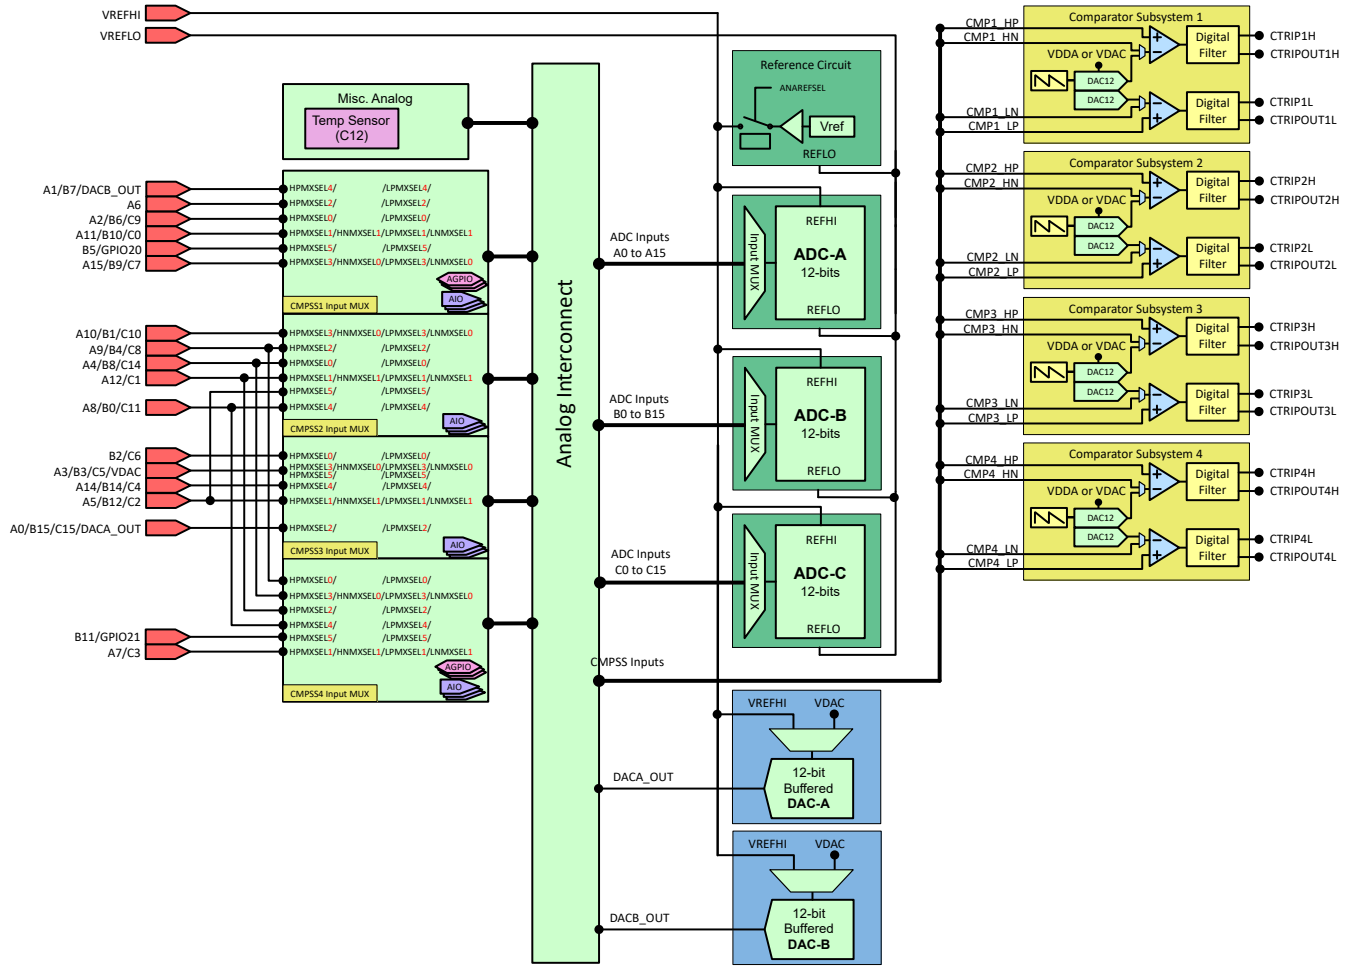

Figure 15-2. Analog Subsystem Block Diagram (80-Pin QFP)

Figure 15-3. Analog Subsystem Block Diagram (64-Pin QFP)

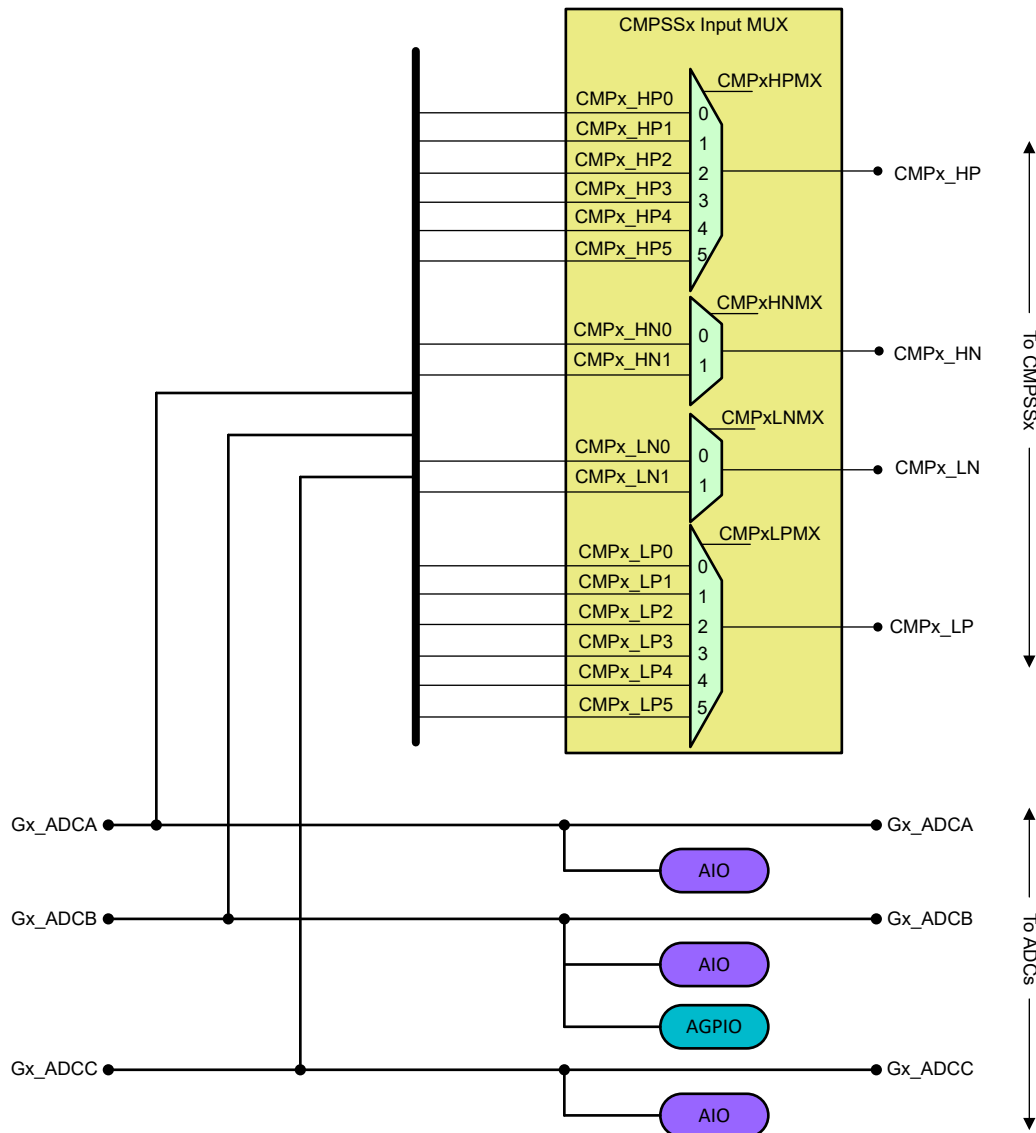

Figure 15-4. Analog Subsystem Block Diagram (48-Pin QFP)

Note: AIOs support digital input mode only.

Figure 15-5. Analog Group Connections

15.2 Optimizing Power-Up Time

The analog-to-digital converters (ADC) and buffered digital-to-analog converters (DAC) share a common reference circuit. If needed, an application using one or more of these modules can optimize power-up time by taking advantage of the shared reference. Once one of the modules using the shared reference has been initialized in internal reference mode, the power-up time for subsequent modules can be optimized by subtracting the reference power-up time from the minimum power-up time requirement.

For instance, if ADCA requires $t_{ADCPUIINT}$ to power up in internal reference mode, and $t_{ADCPUEXT}$ to power up in external reference mode, the application does not need to wait $t_{ADCPUIINT}$ to power up a second ADC instance such as ADCC in internal reference mode. In this case, the application can simply wait for $t_{ADCPUEXT}$ after powering up ADCC, even though both ADCs are used in internal reference mode. In the same scenario, if the application wished to use DACA in internal reference mode, the required wait time after power-up is $t_{DACPUEXT}$, not the longer $t_{DACPUIINT}$.

There is also a wait time associated with power-up in internal reference mode when switching between 2.5V and 3.3V range. See the device data sheet for wait time values.

15.3 Digital Inputs on ADC Pins (AIOs)

Some GPIOs are multiplexed with analog pins and only have digital input functionality. These are also referred to as AIOs. Pins with only an AIO option on this port can only function in input mode. See the device data sheet for list of AIO signals. By default, these pins function as analog pins and the GPIOs are in a high-impedance state. The GPyAMSEL register is used to configure these pins for digital or analog operation.

Note

If digital signals with sharp edges (high dv/dt) are connected to the AIOs, cross-talk can occur with adjacent analog signals. Therefore, limit the edge rate of signals connected to AIOs if adjacent channels are being used for analog functions.

15.4 Digital Inputs and Outputs on ADC Pins (AGPIOs)

Some GPIOs on this device are multiplexed with analog pins. These are also referred to as AGPIOs. Unlike AIOs, AGPIOs have full input and output capability. This device has two GPIOs (GPIO20 and GPIO21) that offer this feature on the 100-pin PZ and 80-pin PN packages.

100-Pin PZ: On this package, there are dedicated pins for B5 (pin 32) and B11 (pin 30) that also have AIO252 and AIO251 functionality, respectively. In addition, GPIO20 (pin 48) and GPIO21 (pin 49) are also available as B5 and B11, respectively. Since B5 and B11 are dedicated pins on this package, use these pins instead of the pins on GPIO20/21.

80-Pin PN: On this package, GPIO20 (pin 33) and GPIO21 (pin 34) are also available as B5 and B11, respectively. There are no dedicated pin for B5 and B11.

By default, the AGPIOs are not connected and are configured. [Table 15-1](#) shows how to configure the AGPIOs using B5 (pin 32) and GPIO20 (pin 48) on the 100-pin PZ as an example.

Table 15-1. AGPIO Configuration

AGPIOTRLA.bit. GPIO20	GPAAMSEL.bit. GPIO20	GPHAMSEL.bit. GPIO252	B5 Connected To			GPIO20 Connected To		
			ADC	GPIO20	AIO252	ADC	GPIO20	AIO252
0	0	1	Yes	-	-	-	Yes	-
0	1	1	Yes	-	-	-	-	-
1	0	1	Yes	-	-	-	Yes	-
1	1	1	-	-	-	Yes	-	-
0	0	0	Yes	-	Yes	-	Yes	-
0	1	0	Yes	-	Yes	-	-	-
1	0	0	Yes	-	Yes	-	Yes	-
1	1	0	-	-	Yes	Yes	-	-

Note

If digital signals with sharp edges (high dv/dt) are connected to the AGPIOs, cross-talk can occur with adjacent analog signals. The user must therefore limit the edge rate of signals connected to AGPIOs, if adjacent channels are being used for analog functions.

15.5 Analog Pins and Internal Connections

Table 15-2. Analog Pins and Internal Connections

Pin Name	Package Pin				ADC			Comparator Subsystem (MUX)				AIO Input

B11/GPIO21 ⁽³⁾	49	34	-	-	-		-					GPIO21
TempSensor ⁽⁴⁾	-	-	-	-	-	-	C12					

- (1) A6 and C6 is double bonded as pin # 4.
- (2) Optional external reference voltage for on-chip COMPDACs/GPDACs. There is an internal capacitance to VSSA on this pin whether used for ADC input or COMPDAC/GPDAC reference. If used as a VDAC reference, place at least a 1µF capacitor on this pin.
- (3) The GPIOs on these analog pins support full digital input and output functionality and are referred to as AGPIOs. By default, the AGPIOs are unconnected; that is, the analog and digital functions are both disabled. For configuration details, see the *Digital Inputs and Outputs on ADC Pins (AGPIOs)* section.
- (4) Internal connection only; does not come to a device pin.

Table 15-3. Analog Signal Descriptions

Signal Name	Description
AIOx	Digital input on ADC pin
GPIOn	Digital input/output pin with ADC functionality
Ax	ADC A Input
Bx	ADC B Input
Cx	ADC C Input
CMPx_DACH	Comparator subsystem high DAC output
CMPx_DACL	Comparator subsystem low DAC output
CMPx_HNy	Comparator subsystem high comparator negative input
CMPx_HPy	Comparator subsystem high comparator positive input

Table 15-3. Analog Signal Descriptions (continued)

Signal Name	Description
CMPx_LNy	Comparator subsystem low comparator negative input
CMPx_LPy	Comparator subsystem low comparator positive input
DACx_OUT	Buffered DAC Output
TempSensor	Internal temperature sensor
VDAC	Optional external reference voltage for on-chip COMPDACs. This pin has a higher capacitance compared to the other analog pins. <i>See the Per-Channel Parasitic Capacitance</i> table for details. This capacitance is present whether the pin is being used for ADC input or COMPDAC/GPDAC reference and cannot be disabled. If this pin is being used as a reference for the on-chip COMPDAC/GPDACs, place at least a 1µF capacitor on this pin.

Table 15-4. Reference Summary

Module	Reference Option	Configured Where?	Register	Driverlib Function	Notes
ADC	Internal or External	Analog System	AnalogSubsysRegs. ANAREFCTL.bit. ANAREFSEL	ADC_setVREF	Both options require use of the VREFHI pin
	3.3V or 2.5V Internal Reference Range	Analog System	AnalogSubsysRegs. ANAREFCTL.bit. ANAREF2P5SEL	ADC_setVREF	Only applicable when using internal reference mode
Buffered DAC	VREFHI or VDAC	DAC Module	DacxRegs. DACCTL.bit. DACREFSEL	DAC_setReferenceVoltage	
	Internal or External	Analog System	(follows ADC configuration)	ADC_setVREF	Only applicable when using VREFHI
	3.3V or 2.5V Internal Reference Range	Analog System	(follows ADC configuration)		ADC_setVREF
DAC Module		DacxRegs. DACCTL.bit. MODE	DAC_setGainMode	Gain = 2 must be set when using 3.3V internal reference mode	
CMPSS DACs	VDDA or VDAC	CMPSS Module	CmpssxRegs. COMPDACCTL.bit. SELREF	CMPSS_configDAC	

15.6 Analog Subsystem Registers

This section describes the Analog Subsystem Registers.

15.6.1 ASBSYS Base Address Table

Table 15-5. ASBSYS Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected
Instance	Structure							
AnalogSubsysRe gs	ANALOG_SUBSYS _REGS	ANALOGSUBSYS_BASE	0x0005_D700	YES	-	-	-	YES

15.6.2 ANALOG_SUBSYS_REGS Registers

Table 15-6 lists the memory-mapped registers for the ANALOG_SUBSYS_REGS registers. All register offset addresses not listed in Table 15-6 should be considered as reserved locations and the register contents should not be modified.

Table 15-6. ANALOG_SUBSYS_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
4Ah	INTERNALTESTCTL	INTERNALTEST Node Control Register	EALLOW	Go
5Eh	CONFIGLOCK	Lock Register for all the config registers.	EALLOW	Go
60h	TSNSCTL	Temperature Sensor Control Register	EALLOW	Go
68h	ANAREFCTL	Analog Reference Control Register	EALLOW	Go
70h	VMONCTL	Voltage Monitor Control Register	EALLOW	Go
82h	CMPPHMXSEL	Bits to select one of the many sources on CompHP inputs. Refer to Pimux diagram for details.	EALLOW	Go
84h	CMPLPMXSEL	Bits to select one of the many sources on CompLP inputs. Refer to Pimux diagram for details.	EALLOW	Go
86h	CMPHNMXSEL	Bits to select one of the many sources on CompHN inputs. Refer to Pimux diagram for details.	EALLOW	Go
87h	CMPLNMXSEL	Bits to select one of the many sources on CompLN inputs. Refer to Pimux diagram for details.	EALLOW	Go
88h	ADCDALOOPBACK	Enable loopback from DAC to ADCs		Go
8Eh	LOCK	Lock Register	EALLOW	Go
102h	AGPIOCTRLA	AGPIO Control Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 15-7 shows the codes that are used for access types in this section.

Table 15-7. ANALOG_SUBSYS_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
WOnce	WOnce	Write Write once
WOnce	WOnce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

Table 15-7. ANALOG_SUBSYS_REGS Access Type Codes (continued)

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

15.6.2.1 INTERNALTESTCTL Register (Offset = 4Ah) [Reset = 0000000h]

INTERNALTESTCTL is shown in [Figure 15-6](#) and described in [Table 15-8](#).

Return to the [Summary Table](#).

Chapter 16
Analog-to-Digital Converter (ADC)

The analog-to-digital converter (ADC) module described in this chapter is a Type 5 ADC. See the [C2000 Real-Time Control Peripheral Reference Guide](#) for a list of all devices with modules of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

16.1 Introduction

The ADC module is a 12-bit successive approximation (SAR) style ADC. The ADC is composed of a core and a wrapper. The core is composed of the analog circuits which include the channel select MUX, the sample-and-hold (S/H) circuit, the successive approximation circuits, voltage reference circuits, and other analog support circuits. The wrapper is composed of the digital circuits that configure and control the ADC. These circuits include the logic for programmable conversions, result registers, interfaces to analog circuits, interfaces to the peripheral buses, post-processing circuits, and interfaces to other on-chip modules.

Each ADC module consists of a single sample-and-hold (S/H) circuit. The ADC module is designed to be duplicated multiple times on the same chip, allowing simultaneous sampling or independent operation of multiple ADCs. The ADC wrapper is start-of-conversion (SOC) based (see [Section 16.3](#)).

16.1.2 Features

Each ADC has the following features:

- 12-bit resolution
- Ratiometric external reference set by VREFHI and VREFLO pins
- Selectable internal reference of 2.5V or 3.3V
- Single-ended signal conversions
- Input multiplexer with up to 16 channels
- 16 configurable SOCs
- 16 individually addressable result registers
- Multiple trigger sources
 - S/W - software immediate start
 - All ePWMs - ADCSOC A or B
 - GPIO XINT2
 - CPU Timers 0/1/2
 - ADCINT1/2
- Four flexible PIE interrupts
- Configurable interrupt placement
- Burst mode
- Four post-processing blocks, each with:
 - Saturating offset calibration
 - Error from set-point calculation
 - High, low, and zero-crossing compare, with interrupt and ePWM trip capability
 - Trigger-to-sample delay capture

Note

Not every channel is pinned out from all ADCs. Check the device data sheet to determine which channels are available.

16.1.3 Block Diagram

Figure 16-1 shows the block diagram for the ADC core and ADC wrapper.

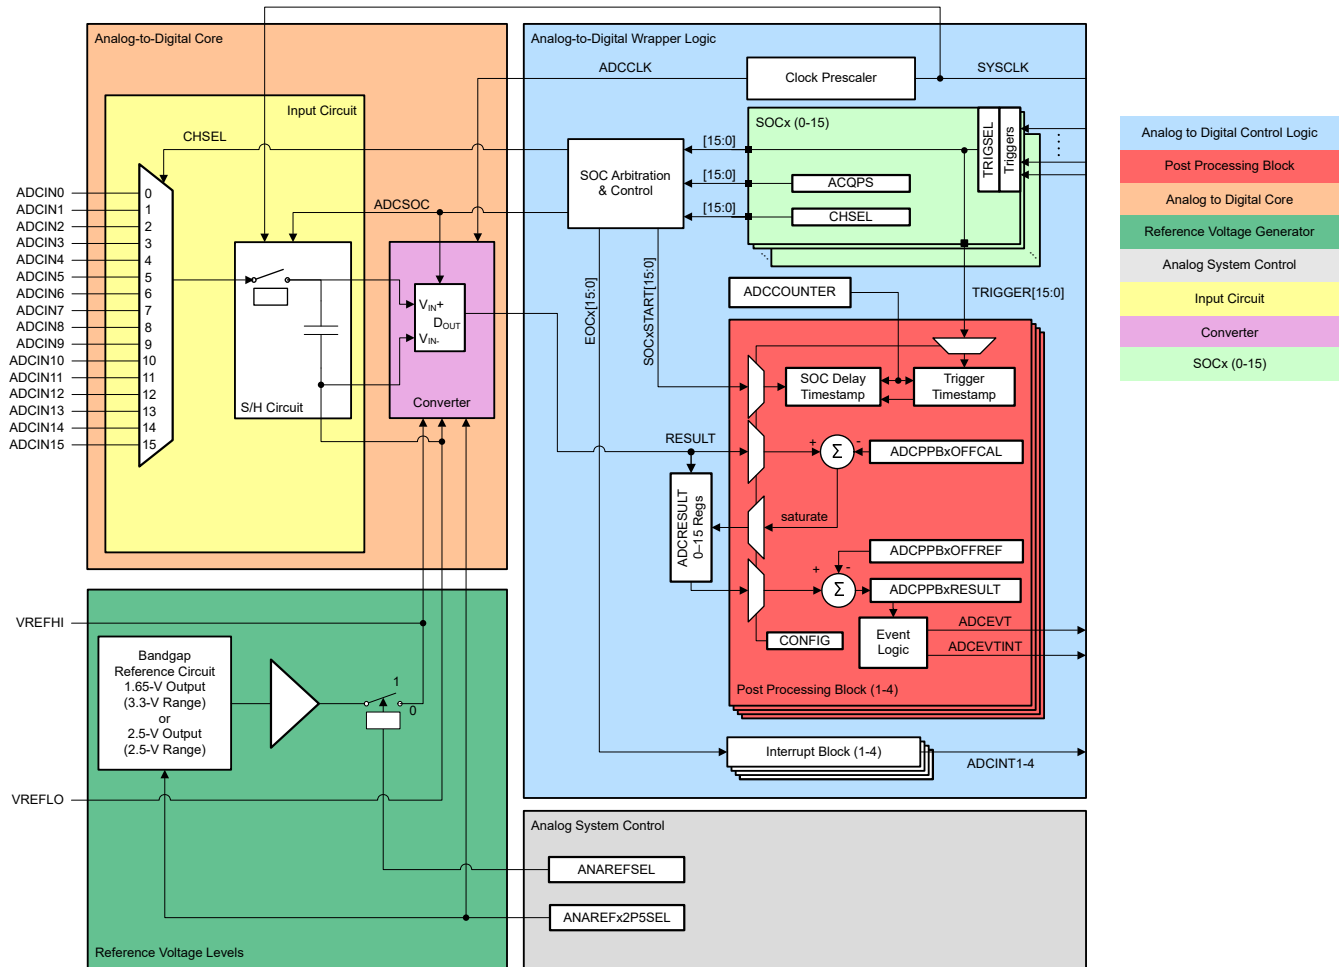

Figure 16-1. ADC Module Block Diagram

Note

The ADC block diagram reflects the number of ADC channels internally configurable on the device. The actual number of available external ADC inputs varies depending on part and package.

16.2 ADC Configurability

Some ADC configurations are individually controlled by the SOCs, while others are globally controlled per ADC module. [Table 16-1](#) summarizes the basic ADC options and the level of configurability. The subsequent sections discuss these configurations.

Table 16-1. ADC Options and Configuration Levels

Options	Configurability
Clock	Per module ⁽¹⁾
Resolution	Not configurable (12-bit only)
Signal mode	Not configurable (single-ended only)
Reference voltage source	Either external or internal for all modules
Trigger source	Per SOC ⁽¹⁾
Converted channel	Per SOC
Acquisition window duration	Per SOC ⁽¹⁾
EOC location	Per module
Burst Mode	Per module ⁽¹⁾

(1) Writing these values differently to different ADC modules can cause the ADCs to operate asynchronously. See [Section 16.13.1](#) for guidance on when the ADCs are operating synchronously or asynchronously.

16.2.1 Clock Configuration

The base ADC clock is provided directly by the system clock (SYSCLK). SYSCLK is used to generate the ADC acquisition window. The register ADCCTL2 has a PRESCALE field that determines the ADCCLK. ADCCLK is used to clock the converter, and is only active during the conversion phase. At all other times, including during the sample-and-hold window, the ADCCLK signal is gated off.

The core requires approximately 10.5 ADCCLK cycles to process a voltage into a conversion result. The user must determine the required duration of the acquisition window, see [Section 16.13.2](#).

Note

To determine an appropriate value for ADCCTL2.PRESCALE, see the device data sheet to determine the maximum SYSCLK and ADCCLK frequency.

16.2.2 Resolution

The resolution of the ADC determines how finely the analog range is quantized into digital values. Each ADC module supports a fixed resolution of 12 bits.

16.2.3 Voltage Reference

16.2.3.1 External Reference Mode

The ADC modules share VREFHI and VREFLO inputs. In external reference mode, these pins are used as a ratiometric reference to determine the ADC conversion input range.

See [Section 16.13.6](#) for information on how to supply the reference voltage.

Note

- On devices with no external VREFLO pin, VREFLO is internally connected to the device analog ground, VSSA.
 - See the device data sheet to determine the allowable voltage range for VREFHI and VREFLO.
 - The external reference mode requires an external capacitor on the VREFHI pin. See the device data sheet for the specific value required.
-

16.2.3.2 Internal Reference Mode

In internal reference mode, the device drives a voltage out onto the VREFHI pin. The VREFHI and VREFLO pins then set the ADC conversion range.

The internal reference voltage can be configured to be either 2.5V or 1.65V. When the 1.65V internal reference voltage is selected, the ADC input signal is internally divided by 2 before conversion, which effectively makes the ADC conversion range from VREFLO to 3.3V.

Note

The internal reference mode also requires an external capacitor on the VREFHI pin. See the device data sheet for the specific value required.

16.2.3.3 Selecting Reference Mode

The voltage reference mode must be configured by using either the ADC_setVREF() or the SetVREF() functions, depending on the header files used, provided in C2000Ware. Using either of these functions makes sure that the correct trim is loaded in the ADC trim registers. This function must be called at least once after a device reset. Do not configure the voltage reference mode by directly writing to the ANAREFCTL register.

16.2.4 Signal Mode

The ADC supports single-ended signaling.

In single-ended mode, the input voltage to the converter is sampled through a single pin (ADCINx), referenced to VREFLO.

16.2.5 Expected Conversion Results

Based on a given analog input voltage, the expected digital conversion is given in [Table 16-2](#). Fractional values are truncated.

Table 16-2. Analog to 12-bit Digital Formulas

Analog Input	Digital Result
when $ADCINy \leq VREFLO$	$ADCRESULTx = 0$
when $VREFLO < ADCINy < VREFHI$	$ADCRESULTx = 4096 \left(\frac{ADCINy - VREFLO}{VREFHI - VREFLO} \right)$
when $ADCINy \geq VREFHI$	$ADCRESULTx = 4095$

16.2.6 Interpreting Conversion Results

Based on a given ADC conversion result, the corresponding analog input is given in [Table 16-3](#). This corresponds to the center of the possible range of analog voltages that can produce this conversion result.

Table 16-3. 12-Bit Digital-to-Analog Formulas

Digital Value	Analog Equivalent
when ADCRESULT _y = 0	$ADCIN_x \leq VREFLO$ (2)
when $0 < ADCRESULT_y < 4095$	$ADCIN_x = (VREFHI - VREFLO) \left(\frac{ADCRESULT_y}{4096} \right) + VREFLO$ (3)
when ADCRESULT _y = 4095	$ADCIN_x \geq VREFHI$ (4)

16.3 SOC Principle of Operation

The ADC triggering and conversion sequencing is accomplished through configurable start-of-conversions (SOCs). Each SOC is a configuration set defining the single conversion of a single channel. In that set, there are three configurations: the trigger source that starts the conversion, the channel to convert, and the acquisition (sample) window duration. Upon receiving the trigger configured for a SOC, the wrapper makes sure that the specified channel is captured using the specified acquisition window duration.

Multiple SOCs can be configured for the same trigger, channel, and acquisition window as desired. Configuring multiple SOCs to use the same trigger allows the trigger to generate a sequence of conversions. Configuring multiple SOCs to use the same trigger and channel allows for oversampling.

Figure 16-2. SOC Block Diagram

16.3.1 SOC Configuration

Each SOC has a configuration register, ADCSOCxCTL. Within this register, SOCx can be configured for trigger source, channel to convert, and acquisition (sample) window duration.

16.3.2 Trigger Operation

Each SOC can be configured to start on one of many input triggers. The primary trigger select for SOCx is in the ADCSOCxCTL.TRIGSEL register, which can select between:

- Disabled (software only)
- CPU Timers 0/1/2
- GPIO: Input X-Bar INPUT5
- ADCSOCA or ADCSOCB from each ePWM module

In addition, each SOC can also be triggered when the ADCINT1 flag or ADCINT2 flag is set. This is achieved by configuring the ADCINTSOCSEL1 register (for SOC0 to SOC7) or the ADCINTSOCSEL2 register (for SOC8 to SOC15). This is useful for creating continuous conversions.

16.3.3 ADC Acquisition (Sample and Hold) Window

External signal sources vary in the ability to drive an analog signal quickly and effectively. To achieve rated resolution, the signal source needs to charge the sampling capacitor in the ADC core to within 0.5 LSBs of the signal voltage. The acquisition window is the amount of time the sampling capacitor is allowed to charge and is configurable for SOCx by the ADCSOCxCTL.ACQPS register.

ACQPS is a 9-bit register that can be set to a value between 0 and 511, resulting in an acquisition window duration of:

$$\text{Acquisition window} = (\text{ACQPS} + 1) \cdot (\text{System Clock (SYSCLK) cycle time})$$

- The acquisition window duration is based on the System Clock (SYSCLK), not the ADC clock (ADCCLK).
- The selected acquisition window duration must be at least as long as one ADCCLK cycle.
- The data sheet specifies a minimum acquisition window duration (in nanoseconds). The user is responsible for selecting an acquisition window duration that meets this requirement.

16.3.4 ADC Input Models

For single-ended operation, the ADC input characteristics for values in the single-ended input model (see [Figure 16-3](#)) can be found in the device data sheet.

Figure 16-3. Single-Ended Input Model

These input models must be used along with actual signal source impedance to determine the acquisition window duration. See [Section 16.13.2](#) for more information.

16.3.5 Channel Selection

Each SOC can be configured to convert any of the ADC channels. This behavior is selected for SOCx by the ADCSOCxCTL.CHSEL register. This is summarized in [Table 16-4](#).

Table 16-4. Channel Selection of Input Pins

Input Mode	CHSEL	Input
Single-Ended	0	ADCIN0
	1	ADCIN1
	2	ADCIN2
	3	ADCIN3
	4	ADCIN4
	5	ADCIN5
	6	ADCIN6
	7	ADCIN7
	8	ADCIN8
	9	ADCIN9
	10	ADCIN10
	11	ADCIN11
	12	ADCIN12
	13	ADCIN13
	14	ADCIN14
	15	ADCIN15

16.4 SOC Configuration Examples

The following sections provide some specific examples of how to configure the SOC5s to produce some conversions.

16.4.1 Single Conversion from ePWM Trigger

To configure ADC5 to perform a single conversion on channel ADCINA1 when the ePWM timer reaches the period match, a few things are necessary. First, ePWM3 must be configured to generate an SOCA or SOCB signal (in this statement, SOC refers to a signal in the ePWM module). See the *Enhanced Pulse Width Modulator Module (ePWM)* chapter on how to do this. Assume that SOCB was chosen.

SOC5 is chosen arbitrarily. Any of the 16 SOC5s can be used.

Assuming a 100ns sample window is desired with a SYSCLK frequency of 120MHz, then the acquisition window duration must be $100\text{ns}/8.333\text{ns} = 12$ cycles. The ACQPS field must be set to $12 - 1 = 11$.

```
AdcaRegs.ADCSOC5CTL.bit.CHSEL = 1;      //SOC5 converts ADCINA1
AdcaRegs.ADCSOC5CTL.bit.ACQPS = 11;    //SOC5 uses a sample duration of 12 SYSCLK cycles
AdcaRegs.ADCSOC5CTL.bit.TRIGSEL = 10;   //SOC5 begins conversion on ePWM3 SOCB
```

As configured, when ePWM3 matches the period and generates the SOCB signal, the ADC begins sampling channel ADCINA1 (SOC5) immediately if the ADC is idle. If the ADC is busy, ADCINA1 begins sampling when SOC5 gains priority (see [Section 16.5](#)). The ADC control logic samples ADCINA1 with the specified acquisition window width of 100ns. Immediately after the acquisition is complete, the ADC begins converting the sampled voltage to a digital value. When the ADC conversion is complete, the results are available in the ADCRESULT5 register (see [Section 16.12](#) for exact sample, conversion, and result latch timings).

16.4.2 Oversampled Conversion from ePWM Trigger

To configure the ADC to oversample ADCINA1 4 times, we use the same configurations as the previous example, but apply them to SOC5, SOC6, SOC7, and SOC8.

```
AdcaRegs.ADCSOC5CTL.bit.CHSEL = 1;      //SOC5 converts ADCINA1
AdcaRegs.ADCSOC5CTL.bit.ACQPS = 9;      //SOC5 uses a sample duration of 10 SYSCLK cycles
AdcaRegs.ADCSOC5CTL.bit.TRIGSEL = 10;   //SOC5 begins conversion on ePWM3 SOCB
AdcaRegs.ADCSOC6CTL.bit.CHSEL = 1;      //SOC6 converts ADCINA1
AdcaRegs.ADCSOC6CTL.bit.ACQPS = 9;      //SOC6 uses a sample duration of 10 SYSCLK cycles
AdcaRegs.ADCSOC6CTL.bit.TRIGSEL = 10;   //SOC6 begins conversion on ePWM3 SOCB
AdcaRegs.ADCSOC7CTL.bit.CHSEL = 1;      //SOC7 converts ADCINA1
AdcaRegs.ADCSOC7CTL.bit.ACQPS = 9;      //SOC7 uses a sample duration of 10 SYSCLK cycles
AdcaRegs.ADCSOC7CTL.bit.TRIGSEL = 10;   //SOC7 begins conversion on ePWM3 SOCB
AdcaRegs.ADCSOC8CTL.bit.CHSEL = 1;      //SOC8 converts ADCINA1
AdcaRegs.ADCSOC8CTL.bit.ACQPS = 9;      //SOC8 uses a sample duration of 10 SYSCLK cycles
AdcaRegs.ADCSOC8CTL.bit.TRIGSEL = 10;   //SOC8 begins conversion on ePWM3 SOCB
```

As configured, when ePWM3 matches the period and generates the SOCB signal, the ADC begins sampling channel ADCINA1 (SOC5) immediately if the ADC is idle. If the ADC is busy, ADCINA1 begins sampling when SOC5 gains priority (see [Section 16.5](#)). Once the conversion is complete for SOC5, SOC6 begins converting ADCINA1 and the results for SOC5 are placed in the ADCRESULT5 register. All four conversions eventually are completed sequentially, with the results in ADCRESULT5, ADCRESULT6, ADCRESULT7, and ADCRESULT8 for SOC5, SOC6, SOC7, and SOC8, respectively.

Note

It is possible, but unlikely, that the ADC can begin converting SOC6, SOC7, or SOC8 before SOC5 depending on the position of the round-robin pointer when the ePWM trigger is received. See [Section 16.5](#) to understand how the next SOC to be converted is chosen.

16.4.3 Multiple Conversions from CPU Timer Trigger

This example shows how to sample multiple signals with different acquisition window requirements. CPU1 Timer 2 is used to generate the trigger. To see how to configure the CPU timer, see the *System Control and Interrupts* chapter.

A good first step when designing a sampling scheme with many signals is to list out the signals and the required acquisition window. From this, calculate the necessary number of SYSCLK cycles for each signal, then the ACQPS register setting. This is shown in [Table 16-5](#), where a SYCLK of 120MHz is assumed (8.333ns cycle time).

Table 16-5. Example Requirements for Multiple Signal Sampling

Signal Name	Acquisition Window Requirement	Acquisition Window (SYSCLK Cycles)	ACQPS Register Value
Signal 1	>200ns	200ns/8.333ns = 24	24 – 1 = 23
Signal 2	>740ns	740ns/8.333ns = 89 (round up)	89 – 1 = 88
Signal 3	>183.33ns	183.33ns/8.333ns = 22	22 – 1 = 21
Signal 4	>485ns	485ns/8.333ns = 59 (round up)	59 – 1 = 58

Next decide which ADC pins to connect to each signal. This is highly dependent on the application board layout. Once the pins are selected, determining the value of CHSEL is straightforward (see [Table 16-6](#)).

Table 16-6. Example Connections for Multiple Signal Sampling

Signal Name	ADC Pin	CHSEL Register Value
Signal 1	ADCINA5	5
Signal 2	ADCINA0	0
Signal 3	ADCINA3	3
Signal 4	ADCINA2	2

With the information tabulated, generate the SOC configurations:

```

AdcaRegs.ADCSOC0CTL.bit.CHSEL = 5;           //SOC0 converts ADCINA5
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 23;         //SOC0 uses a sample duration of 24 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 3;        //SOC0 begins conversion on CPU1 Timer 2
AdcaRegs.ADCSOC1CTL.bit.CHSEL = 0;          //SOC1 converts ADCINA0
AdcaRegs.ADCSOC1CTL.bit.ACQPS = 88;         //SOC1 uses a sample duration of 89 SYSCLK cycles
AdcaRegs.ADCSOC1CTL.bit.TRIGSEL = 3;        //SOC1 begins conversion on CPU1 Timer 2
AdcaRegs.ADCSOC2CTL.bit.CHSEL = 3;          //SOC2 converts ADCINA3
AdcaRegs.ADCSOC2CTL.bit.ACQPS = 21;         //SOC2 uses a sample duration of 22 SYSCLK cycles
AdcaRegs.ADCSOC2CTL.bit.TRIGSEL = 3;        //SOC2 begins conversion on CPU1 Timer 2
AdcaRegs.ADCSOC3CTL.bit.CHSEL = 2;          //SOC3 converts ADCINA2
AdcaRegs.ADCSOC3CTL.bit.ACQPS = 58;         //SOC3 uses a sample duration of 59 SYSCLK cycles
AdcaRegs.ADCSOC3CTL.bit.TRIGSEL = 3;        //SOC3 begins conversion on CPU1 Timer 2
    
```

As configured, when CPU1 Timer 2 generates an event, SOC0, SOC1, SOC2, and SOC3 eventually is sampled and converted, in that order. The conversion results for ACINA5 (Signal 1) are in ADCRESULT0. Similarly, The results for ADCINA0 (Signal 2), ADCINA3 (Signal 3), and ADCINA2 (Signal 4) are in ADCRESULT1, ADCRESULT2, and ADCRESULT3, respectively.

Note

There is a possibility, but unlikely, that the ADC can begin converting SOC1, SOC2, or SOC3 before SOC0 depending on the position of the round-robin pointer when the CPU Timer trigger is received. See [Section 16.5](#) to understand how the next SOC to be converted is chosen.

16.4.4 Software Triggering of SOC's

At any point, whether or not the SOC's have been configured to accept a specific trigger, a software trigger can set the SOC's to be converted. This is accomplished by writing bits in the ADCSOCFRC1 register.

Software triggering of the previous example without waiting for the CPU1 Timer 2 to generate the trigger can be accomplished by the statement:

```
AdcaRegs.ADCSOCFRC1.a11 = 0x000F;           //set SOC flags for SOC0 to SOC3
```

16.5 ADC Conversion Priority

When multiple SOC flags are set at the same time, one of two forms of priority determines the converted order. The default priority method is round-robin. In this scheme, no SOC has an inherent higher priority than another. Priority depends on the round-robin pointer (RRPOINTER). The RRPOINTER reflected in the ADCSOCPRIORITYCTL register points to the last SOC converted. The highest priority SOC is given to the next value greater than the RRPOINTER value, wrapping around back to SOC0 after SOC15. At reset the value is 16 since 0 indicates a conversion has already occurred. When RRPOINTER equals 16 the highest priority is given to SOC0. The RRPOINTER is reset when the ADC module is reset or when the reset value is written to the SOCPRIORITY register. The ADC module is reset by writing and clearing the SOFTPRES bit corresponding to the ADC instance.

An example of the round-robin priority method is given in [Figure 16-4](#).

The SOCPRIORITY field in the ADCSOCPRIORITYCTL register can be used to assign high priority from a single to all of the SOC's. When configured as high priority, an SOC interrupts the round-robin wheel after any current conversion completes and inserts in as the next conversion. After the conversion completes, the round-robin wheel continues where the conversion was interrupted. If two high priority SOC's are triggered at the same time, the SOC with the lower number takes precedence.

High priority mode is assigned first to SOC0, then in increasing numerical order. The value written in the SOCPRIORITY field defines the first SOC that is not high priority. In other words, if a value of 4 is written into SOCPRIORITY, then SOC0, SOC1, SOC2, and SOC3 are defined as high priority, with SOC0 the highest.

An example using high priority SOC's is given in [Figure 16-5](#).

- A** After reset, SOC0 is highest priority SOC ; SOC7 receives trigger ; SOC7 configured channel is converted immediately .
- B** RRPOINTER changes to point to SOC 7 ; SOC8 is now highest priority SOC .
- C** SOC2 & SOC12 triggers rcvd . simultaneously ; SOC12 is first on round robin wheel ; SOC12 configured channel is converted while SOC2 stays pending .
- D** RRPOINTER changes to point to SOC 12 ; SOC2 configured channel is now converted .
- E** RRPOINTER changes to point to SOC 2 ; SOC3 is now highest priority SOC .

Figure 16-4. Round Robin Priority Example

Example when SOC PRIORITY = 4

- A** After reset, SOC4 is 1st on round robin wheel ;
SOC7 receives trigger ;
SOC7 configured channel is converted immediately .
- B** RRPOINTER changes to point to SOC 7 ;
SOC8 is now 1st on round robin wheel .
- C** SOC2 & SOC12 triggers rcvd. simultaneously ;
SOC2 interrupts round robin wheel and SOC 2 configured channel is converted while SOC 12 stays pending .
- D** RRPOINTER stays pointing to 7 ;
SOC12 configured channel is now converted .
- E** RRPOINTER changes to point to SOC 12 ;
SOC13 is now 1st on round robin wheel .

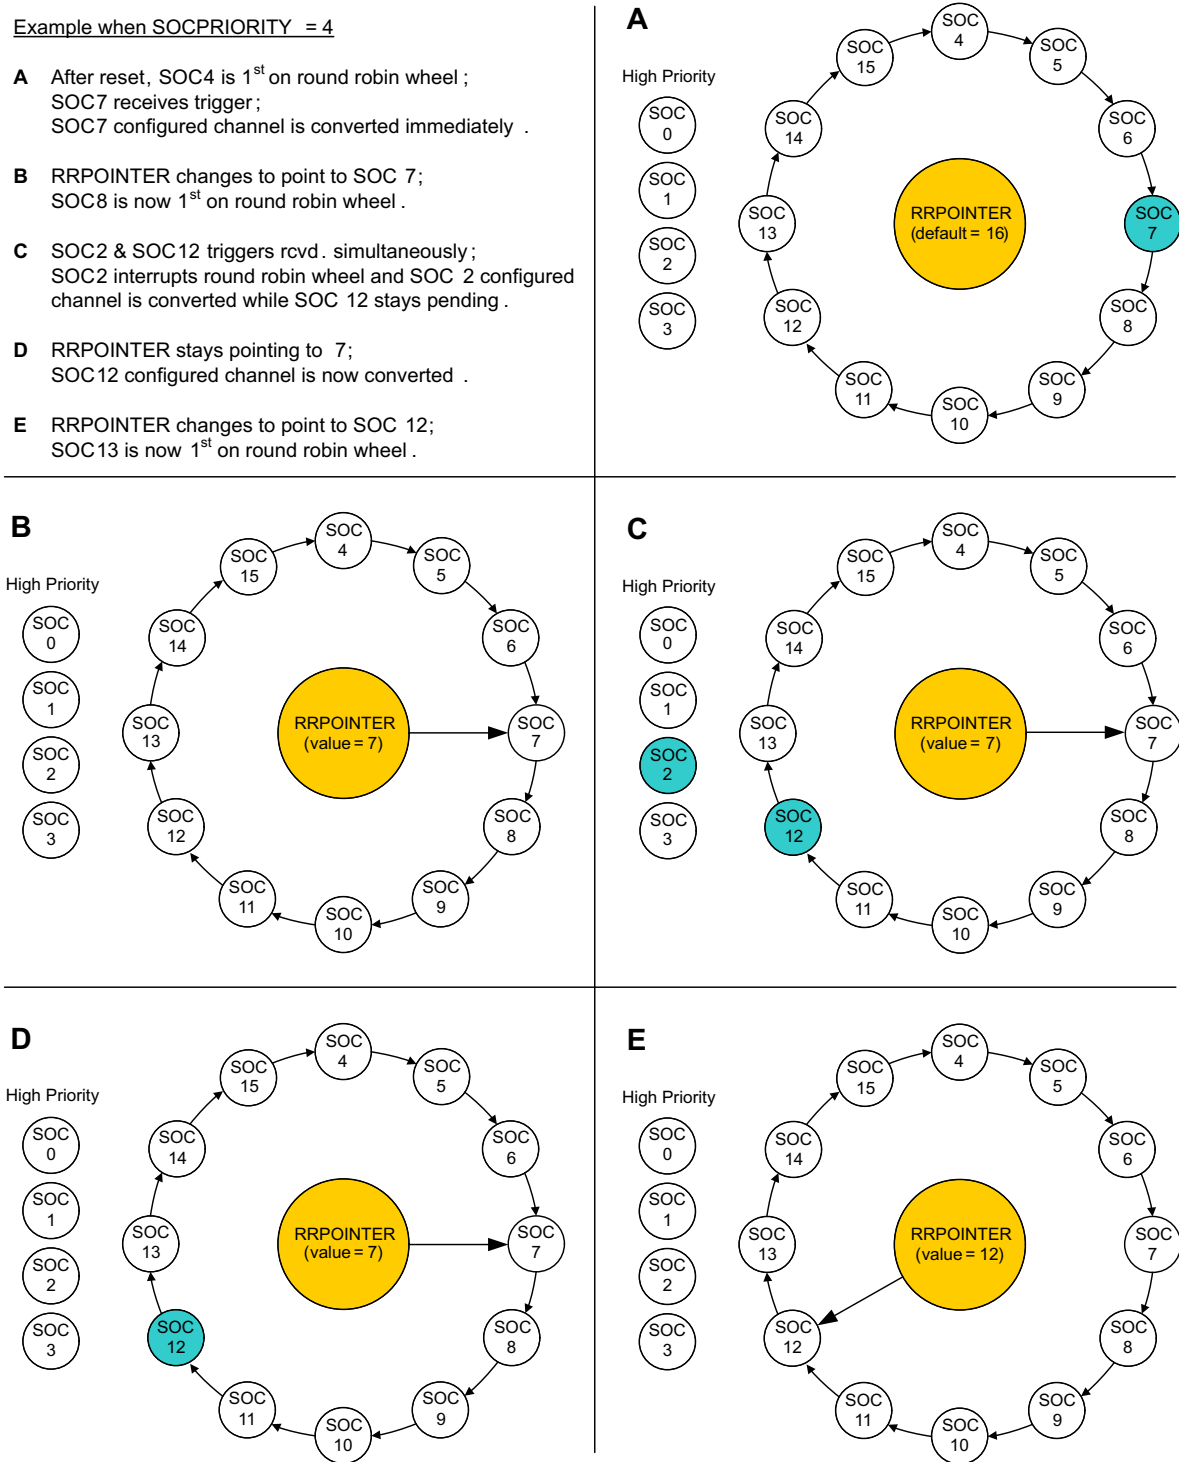

Figure 16-5. High Priority Example

16.6 Burst Mode

Burst mode allows a single trigger to walk through the round-robin SOCs one or more at a time. Setting the bit BURSTEN in the ADCBURSTCTL register configures the ADC wrapper for burst mode. This causes the TRIGSEL field to be ignored, but only for SOCs that are configured for round-robin operation (not high priority). Instead of the TRIGSEL field, all round-robin SOCs are triggered based on the BURSTTRIG field in the ADCBURSTCTL register. Upon reception of the burst trigger, the ADC wrapper does not set all round-robin SOCs to be converted, but only (ADCBURSTCTL.BURSTSIZE + 1) SOCs. The first SOC to be set is the SOC with the highest priority based on the round-robin pointer, and subsequent SOCs are set until BURSTSIZE SOCs have been set.

Note

When configuring the ADC for burst mode, the user is responsible for ensuring that each burst of conversions is allowed to complete before the next burst trigger is received. The value of (ADCBURSTCTL.BURSTSIZE + 1) must be less than or equal to the number of SOCs configured for round-robin priority.

For example, if SOCPRIORITY = 12, that is, SOC12, SOC13, SOC14, and SOC15 are in round-robin, ADCBURSTCTL.BURSTSIZE setting must be ≤ 3 for burst mode to operate correctly.

16.6.1 Burst Mode Example

Burst mode can be used to sample a different set of signals on every other trigger. In the following example, ADCIN7 and ADCIN5 are converted on the first trigger from CPU1 Timer 2 and every other trigger thereafter. ADCIN2 and ACIN3 are converted on the second trigger from CPU1 Timer 2 and every other trigger thereafter. All signals are converted with 20 SYSCLK cycle wide acquisition windows, but different durations can be configured for each SOC as desired.

```

AdcaRegs.BURSTCTL.BURSTEN = 1;           //Enable ADC burst mode
AdcaRegs.BURSTCTL.BURSTTRIG = 3;         //CPU1 Timer 2 triggers burst of conversions
AdcaRegs.BURSTCTL.BURSTSIZE = 1;         //conversion bursts are 1 + 1 = 2 conversions long
AdcaRegs.SOCPRICL.bit.SOCPRIORITY = 12; //SOC0 to SOC11 are high priority
AdcaRegs.ADCSOC12CTL.bit.CHSEL = 7;      //SOC12 converts ADCINA7
AdcaRegs.ADCSOC12CTL.bit.ACQPS = 19;     //SOC12 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC13CTL.bit.CHSEL = 5;      //SOC13 converts ADCINA5
AdcaRegs.ADCSOC13CTL.bit.ACQPS = 19;     //SOC13 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC14CTL.bit.CHSEL = 2;      //SOC14 converts ADCINA2
AdcaRegs.ADCSOC14CTL.bit.ACQPS = 19;     //SOC14 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC15CTL.bit.CHSEL = 3;      //SOC15 converts ADCINA3
AdcaRegs.ADCSOC15CTL.bit.ACQPS = 19;     //SOC15 uses sample duration of 20 SYSCLK cycles

```

When the first CPU1 Timer 2 trigger is received, SOC12 and SOC13 are converted immediately if the ADC is idle. If the ADC is busy, SOC12 and SOC13 are converted once the SOCs gain priority. The results for SOC12 and SOC13 are in ADCRESULT12 and ADCRESULT13, respectively. After SOC13 completes, the round-robin pointer gives the highest priority to SOC14. Because of this, when the next CPU1 Timer 2 trigger is received, SOC14 and SOC15 is set as pending and eventually converted. The results for SOC14 and SOC15 are in ADCRESULT14 and ADCRESULT15, respectively. Subsequent triggers continue to toggle between converting SOC12 and SOC13, and converting SOC14 and SOC15.

While the above example toggles between two sets of conversions, three or more different sets of conversions can be achieved using a similar approach.

16.6.2 Burst Mode Priority Example

An example of priority resolution using burst mode and high-priority SOC's is presented in Figure 16-6.

Example when SOC PRIORITY = 4, BURSTEN = 1, and BURSTSIZE = 1

- A After reset, SOC4 is 1st on round robin wheel; BURSTTRIG trigger is received; SOC4 & SOC5 are set and configured channels converted immediately.
- B RRPOINTER changes to point to SOC5; SOC6 is now 1st on round robin wheel.
- C BURSTTRIG & SOC1 triggers rcvd. simultaneously; SOC1, SOC6, and SOC7 are set; SOC1 interrupts round robin wheel and SOC1 configured channel is converted while SOC6 and SOC7 stay pending.
- D RRPOINTER stays pointing to 5; SOC6/SOC7 configured channels are now converted.
- E RRPOINTER changes to point to SOC7; SOC8 is now 1st on round robin wheel, waiting for BURSTTRIG.

Figure 16-6. Burst Priority Example

16.7 EOC and Interrupt Operation

Each SOC has a corresponding end-of-conversion (EOC) signal. This EOC signal can be used to trigger an ADC interrupt. The ADC can be configured to generate the EOC pulse at either the end of the acquisition window or at the end of the voltage conversion. This is configured using the bit `INTPULSEPOS` in the `ADCCTL1` register. See [Section 16.12](#) for exact EOC pulse location.

Each ADC module has 4 configurable ADC interrupts. These interrupts can be triggered by any of the 16 EOC signals. The flag bit for each `ADCINT` can be read directly to determine if the associated SOC is complete or the interrupt can be passed on to the PIE.

Note

The `ADCCTL1.ADCBSY` bit being clear does not indicate that all conversions in a set of SOCs have completed, only that the ADC is ready to process the next conversion. To determine if a sequence of SOCs is complete, link an `ADCINT` flag to the last SOC in the sequence and monitor that `ADCINT` flag.

Figure 16-7 shows a block diagram of the ADC interrupt structure.

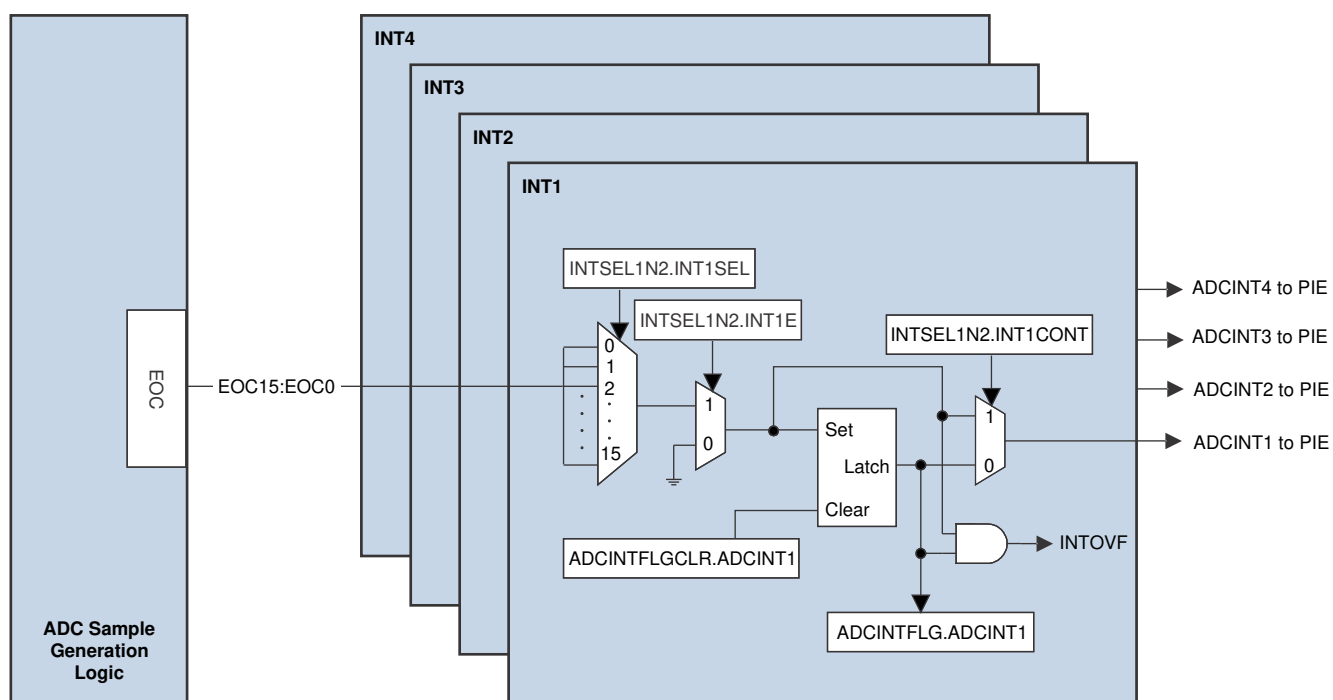

Figure 16-7. ADC EOC Interrupts

16.7.1 Interrupt Overflow

If the EOC signal sets a flag in the ADCINTFLG register, but that flag is already set, an interrupt overflow occurs. By default, overflow interrupts are not passed on to the PIE module. When an overflow occurs on a given flag in the ADCINTFLG register, the corresponding flag in the ADCINOVF register is set. This overflow flag is only used to detect that an overflow has occurred; the flag does not block further interrupts from propagating to the PIE module.

When an ADC interrupt overflow occurs, the application must check the appropriate ADCINTOVF flag inside the ISR or in the background loop and take appropriate action when an overflow is detected. The following code snippets demonstrate how to check the ADCINTOVF flag inside the ISR after attempting to clear the ADCINT flag.

```
// Clear the interrupt flag
AdcaRegs.ADCINTFLGCLR.bit.ADCINT1 = 1;    //clear INT1 flag for ADC-A

// check if an overflow has occurred
if(1 == AdcaRegs.ADCINTOVF.bit.ADCINT1)    //ADCINT overflow occurred
{
    AdcaRegs.ADCINTOVFCLR.bit.ADCINT1 = 1    //clear overflow flag
    AdcaRegs.ADCINTFLGCLR.bit.ADCINT1 = 1    //Re-clear ADCINT flag
}
```

```
//
// Clear the interrupt flag
//
ADC_clearInterruptStatus(ADCA_BASE, ADC_INT_NUMBER1);

//
// Check if an overflow has occurred
//
if(true == ADC_getInterruptOverflowStatus(ADCA_BASE, ADC_INT_NUMBER1))
{
    ADC_clearInterruptOverflowStatus(ADCA_BASE, ADC_INT_NUMBER1);
    ADC_clearInterruptStatus(ADCA_BASE, ADC_INT_NUMBER1);
}
```

16.7.2 Continue to Interrupt Mode

The INTxCONT bits in the ADCINTSEL1N2 and ADCINTSEL3N4 registers configure how interrupts are handled when an ADCINTFLG has not yet been cleared from a prior interrupt. This mode is disabled by default and additional overlapping interrupts are not issued to the PIE. By activating this mode, ADC interrupts always reach the PIE. If interrupts occur while ADCINTFLG is set, the ADCINTOVF register remains set regardless of the configuration of the INTxCONT bits.

16.7.3 Early Interrupt Configuration Mode

Enabling early interrupt mode can allow the application to enter the ADC interrupt service routine before the ADC results are ready. This allows the application to do any necessary pre-work so that the application can act on the ADC results immediately when the ADC results become available. If the timing of the early interrupt is too early, then the application needs to waste time until the updated ADC results become available. To prevent this situation, the time the ADC interrupt is entered in early interrupt mode is configurable by way of the DELAY field in the ADCINTCYCLE register.

- To use the configurable interrupt time, the ADC must be in early interrupt mode. To achieve this, clear the bit INTPULSEPOS to 0 in ADCCTL1.
- The DELAY value in the ADCINTCYCLE register sets the number of additional SYSCLK cycles after the falling edge of the SOC pulse before the ADCINT flag is set.
- If the value of DELAY goes beyond EOC, the ADC interrupt is generated along with EOC.
- Writing values to DELAY when INTPULSEPOS is set to 1 does not have any effect on the interrupt generation.

16.8 Post-Processing Blocks

Each ADC module contains four post-processing blocks (PPB). These blocks can be associated with any of the 16 RESULT registers using the ADCPPBxCONFIG.CONFIG bit field. The post-processing blocks have the ability to:

- Remove an offset associated with the ADCIN channel
- Subtract out a reference value
- Flag a zero-crossing point, with the option to trip a PWM and generate an interrupt
- Flag a high or low compare limit, with the option to trip a PWM and generate an interrupt
- Record the delay between the associated SOC trigger and when sampling actually begins

Figure 16-8 presents the structure of each PPB. Subsequent sections explain the use of each submodule.

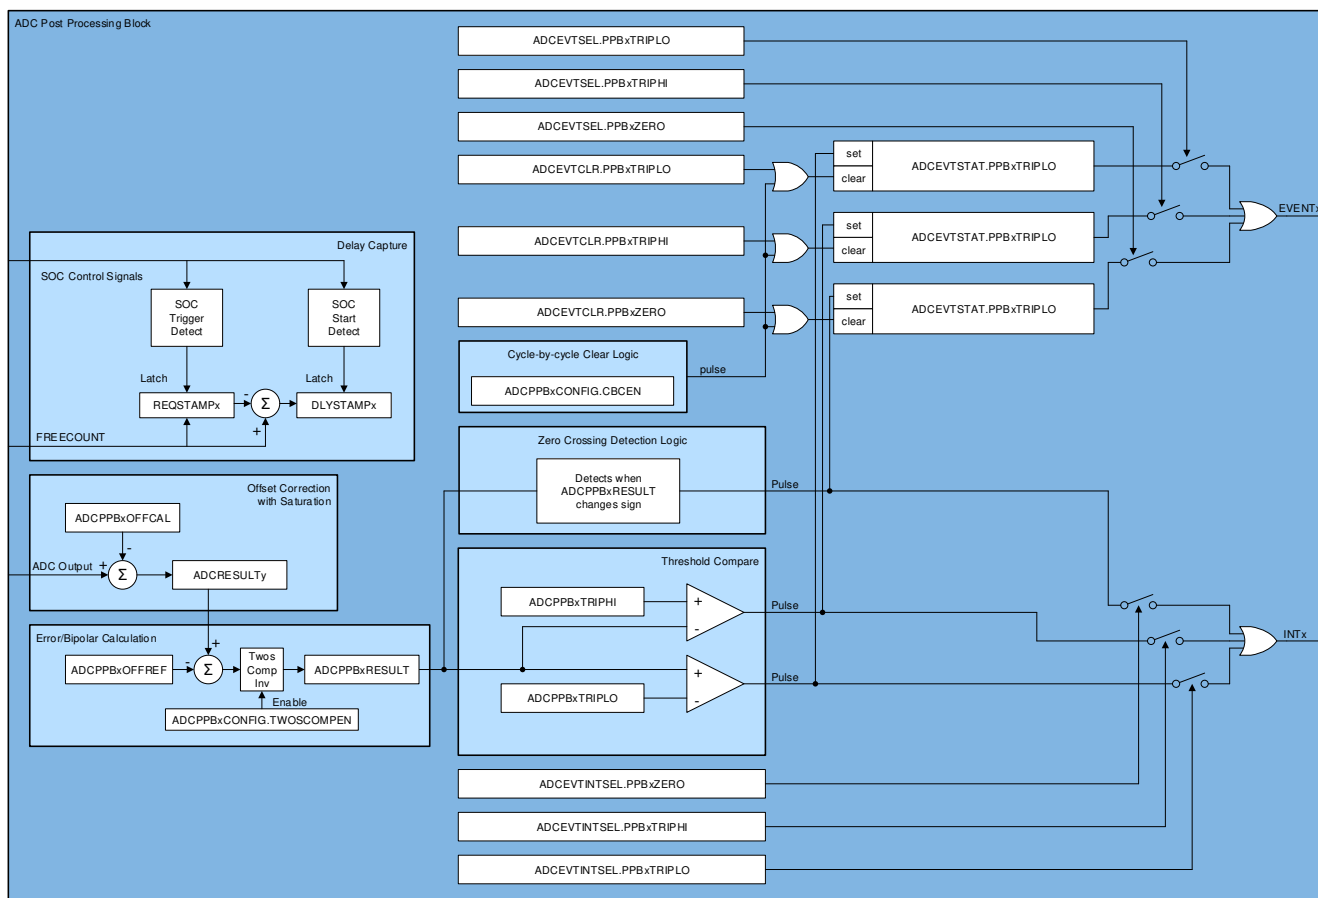

Figure 16-8. ADC PPB Block Diagram

16.8.1 PPB Offset Correction

In many applications, external sensors and signal sources produce an offset. A global trimming of the ADC offset is not enough to compensate for these offsets, which vary from channel to channel. The post-processing block can remove these offsets with zero overhead, saving numerous cycles in tight control loops.

Offset correction is accomplished by first pointing the ADCPPBxCONFIG.CONFIG to the desired SOC, then writing an offset correction value to the ADCPPBxOFFCAL.OFFCAL register. The post-processing block automatically adds or subtracts the value in the OFFCAL register from the raw conversion result and stores the value in the ADCRESULT register. This addition/subtraction saturates at 0 on the low end and 4095 on the high end.

Note

- Writing a 0 to the OFFCAL register effectively disables the offset correction feature, passing the raw result unchanged to the ADCRESULT register.
 - To point multiple PPBs to the same SOC is possible. In this case, the OFFCAL value that is actually applied comes from the PPB with the highest number.
 - In particular, care needs to be taken when using the PPB on SOC0, as all PPBs point to this SOC by default. This can cause unintentional overwriting of offset correction of a lower numbered PPB by a higher numbered PPB.
-

16.8.2 PPB Error Calculation

In many applications, an error from a set point or expected value must be computed from the digital output of an ADC conversion. In other cases, a bipolar signal is necessary or convenient for control calculations. The PPB can perform these functions automatically, reducing the sample to output latency and reducing software overhead.

Error calculation is accomplished by first pointing the ADCPPBxCONFIG.CONFIG to the desired SOC, then writing a value to the ADCPPBxOFFCAL.OFFREF register. The post-processing block automatically subtracts the value in the OFFREF register from the ADCRESULT value and stores the value in the ADCPPBxRESULT register. This subtraction produces a sign-extended 32-bit result. It is also possible to selectively invert the calculated value before storing in the ADCPPBxRESULT register by setting the TWOSCOMPEN bit in the ADCPPBxCONFIG register.

Note

- Do not write a value larger than 12 bits to the ADCPPBxOFFREF register.
 - Since the ADCPPBxRESULT register is unique for each PPB, to point multiple PPBs to the same SOC and get different results for each PPB is possible.
 - Writing a 0 to the ADCPPBxOFFREF register effectively disables the error calculation feature, passing the ADCRESULT value unchanged to the ADCPPBxRESULT register.
 - Writing a new value to ADCPPBxOFFREF causes an immediate update to the ADCPPBxRESULT register. However, the flags coming out of the PPB do not change until the next end-of-conversion (EOC). For instance, if changing the ADCPPBxOFFREF register causes ADCPPBxRESULT to change signs, but the next conversion brings the result back to the same sign as before the OFFREF change, no ADCPPBxZERO flag is set.
-

16.8.3 PPB Limit Detection and Zero-Crossing Detection

Many applications perform a limit check against the ADC conversion results. The PPB can automatically perform a check against high and low limits, or whenever ADCPPBxRESULT changes sign. Based on these comparisons, the PPB can generate a trip to the PWM and an interrupt automatically, lowering the sample to

ePWM latency and reducing software overhead. This functionality also enables safety-conscious applications to trip the ePWM based on an out-of-range ADC conversion without any CPU intervention.

To enable this functionality, first point the ADCPPBxCONFIG.CONFIG to the desired SOC, then write a value to one or both of the registers ADCPPBxTRIPHI.LIMITHI and ADCPPBxTRIPLO.LIMITLO (zero-crossing detection does not require further configuration). Whenever these limits are exceeded, the PPBxTRIPHI bit or PPBxTRIPLO bit is set in the ADCEVTSTAT register. Note that the PPBxZERO bit in the ADCEVTSTAT register is gated by end-of-conversion (EOC), not by the sign change in the ADCPPBxRESULT register. The ADCEVTCLR register has corresponding bits to clear these event flags. The ADCEVTSEL register has corresponding bits which allow the events to propagate through to the PWM. The ADCEVTINTSEL register has corresponding bits that allow the events to propagate through to the PIE.

One PIE interrupt is shared between all the PPBs for a given ADC module as shown in [Figure 16-9](#).

Note

- If different actions need to be taken for different PPB events from the same ADC module, then the ADCEVTINT ISR has to read the PPB event flags in the ADCEVTSTAT register to determine which event caused the interrupt.
- If different ePWM trips need to be generated separately for high compare, low compare, and zero-crossing, this can be achieved by pointing multiple PPBs to the same SOC.
- The zero-crossing detect circuit considers a result of zero to be positive.

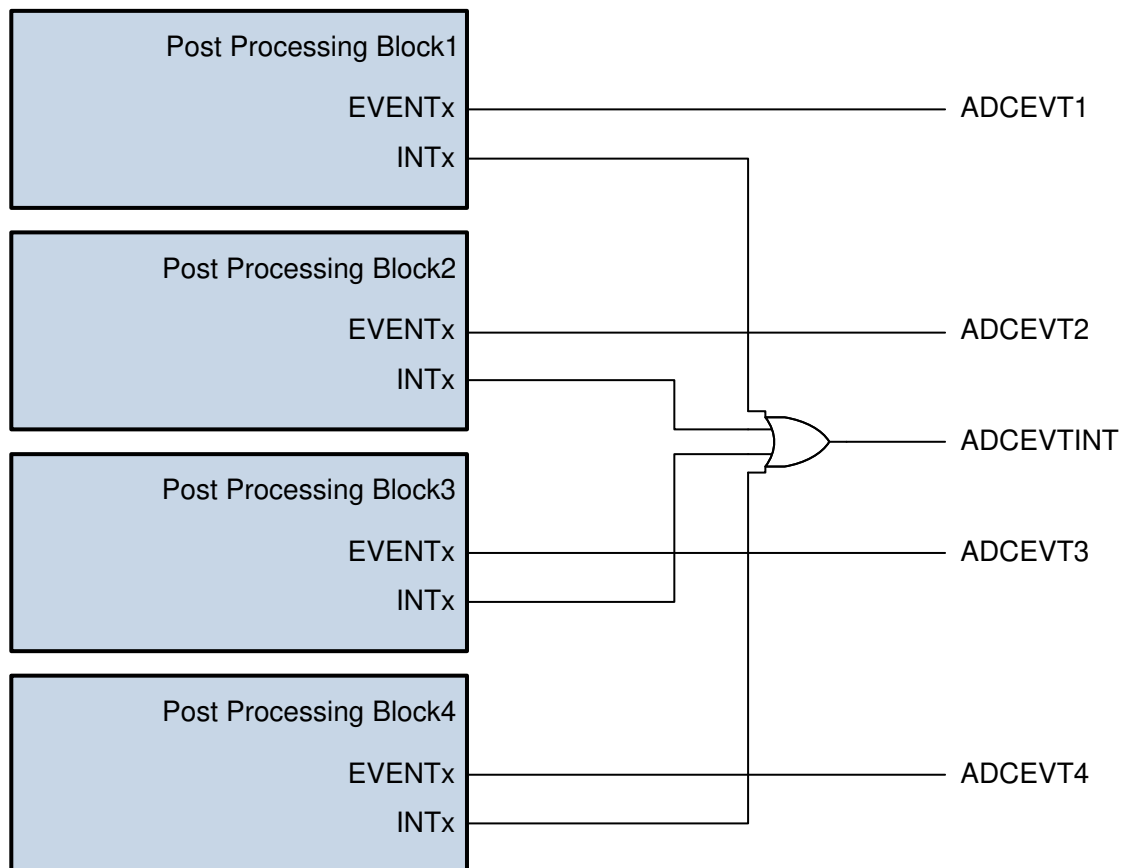

Figure 16-9. ADC PPB Interrupt Event

16.8.4 PPB Sample Delay Capture

When multiple control loops are running asynchronously on the same ADC, there is a chance that an ADC request from two or more loops collide, causing one of the samples to be delayed. This shows up as a measurement error in the system. By knowing when this delay occurs and the amount of delay that has occurred, software can employ extrapolation techniques to reduce the error.

To this effect, each PPB has the field DLYSTAMP in the ADCPPBxSTAMP register. This field contains the number of SYSCLK cycles between when the associate SOC was triggered and when the SOC began converting.

This is achieved by having a global 12-bit free running counter based off of SYSCLK, which is in the field FREECOUNT in the ADCCOUNTER register. When the trigger for the associated SOC arrives, the value of this counter is loaded into the bit field ADCPPBxTRIPLO.REQSTAMP. When the actual sample window for that SOC begins, the value in REQSTAMP is subtracted from the current FREECOUNT value and stored in DLYSTAMP.

Note

If more than 4096 SYSCLK cycles elapse between the SOC trigger and the actual start of the SOC acquisition, the FREECOUNT register can overflow more than once, leading to incorrect DLYSTAMP value. Be cautious when using very slow conversions to prevent this from happening.

The sample delay capture does not function, if the associated SOC is triggered using software. The sample delay capture, however, correctly records the delay, if the software triggering of a different SOC causes the SOC associated with the PPB to be delayed

16.9 Opens/Shorts Detection Circuit (OSDETECT)

The opens/shorts detection circuit (OSDETECT) can be used to detect pin faults in the system. The circuit connects to the ADC input after the channel select multiplexer but before the S+H circuit as shown in Figure 16-10.

Note

- The divider resistance tolerances can vary widely; hence, this feature must not be used to check for conversion accuracy.
- See the data sheet for implementation and availability of analog input channels.
- Due to high drive impedance, a S+H duration much longer than the ADC minimum is needed.

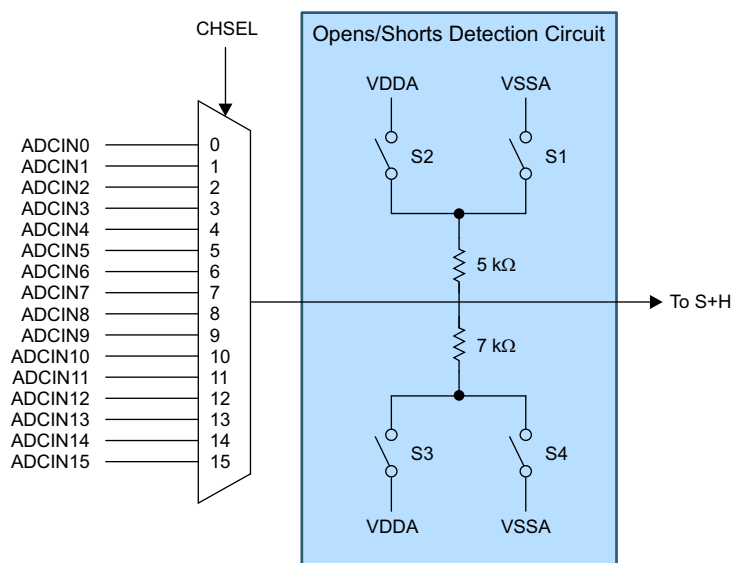

Figure 16-10. Opens/Shorts Detection Circuit

The circuit can be operated by writing a value to the DETECTCFG field in the ADCOSDETECT register. This causes the circuit to source a voltage onto the input during the S+H phase of any conversion. The voltage and drive strength of the OSDETECT circuit for different DETECTCFG settings is given in Table 16-7.

Table 16-7. DETECTCFG Settings

ADCOSDETECT. DETECTCFG	Source Voltage	S4	S3	S2	S1	Drive Impedance
0	Off	Open	Open	Open	Open	Open
1	Zero Scale	Closed	Open	Open	Closed	5K 7K
2	Full Scale	Open	Closed	Closed	Open	5K 7K
3	5/12 VDDA	Open	Closed	Open	Closed	5K 7K
4	7/12 VDDA	Closed	Open	Closed	Open	5K 7K
5	Zero Scale	Open	Open	Open	Closed	5K
6	Full Scale	Open	Open	Closed	Open	5K
7	Zero Scale	Closed	Open	Open	Open	7K

16.9.1 Implementation

A representative circuit with the OSDETECT implementation consists of the signal source with series resistance R_S , shunt capacitor C_P , the equivalent OSDETECT resistance $R_{OSDETECT}$ and voltage $V_{OSDETECT}$ is shown in Figure 16-11 and can be used as a basis to calculate the signal level going in to the sampling capacitor. $R_{OSDETECT}$ and $V_{OSDETECT}$ are the equivalent input resistance and voltage source contributed by the OSDETECT circuit with values shown in Table 16-7 for the different configuration settings. Refer to Figure 16-11 when deriving the input signal to S/H if signal source V_S is driving while the OSDETECT feature is enabled.

Figure 16-11. Input Circuit Equivalent with OSDETECT Enabled

The input impedance R_S and C_P are integral parts of the signal source or can have been implemented in the design to precondition the signal or to control signal settling time to meet S/H requirements. The input path has to be considered when using the OSDETECT feature, as this affects the conversion results. For instance, driving an input signal when this feature is enabled connects signal V_S to the OSDETECT circuit through R_S and affects the ADC results. Larger C_P values (in the order greater than hundreds of pF) require using higher ACQPS to make sure the signal at the input has settled prior to conversion.

To enable the circuit:

1. Configure the ADC for conversion (for example, channel, SOC, ACQPS, prescaler, trigger, and so on).
2. Set up the ADCOSDETECT register for the desired voltage divider connection as shown in Table 16-7.
3. Initiate a conversion and inspect the conversion result.

Interpret the results based on what is driving on the input side and what are the values of R_S and C_P . If the V_S signal can be disconnected from the input pin, the circuit can be used to detect open and shorted input pins as described in the following sections.

16.9.2 Detecting an Open Input Pin

By cycling through the various OSDETECT settings, the input signal is pulled towards the sourced voltages. An input with good drive strength (pin not open) is minimally affected. However, if the pin is open, the sampled voltages is close to the source voltages specified in Table 16-7.

16.9.3 Detecting a Shorted Input Pin

By cycling through the various OSDETECT settings, the input signal is pulled towards the sourced voltages. An input with finite drive strength (pin not shorted) is pulled toward each sourced voltage. However, if the pin is shorted, the signal remains at the same voltage.

16.10 Power-Up Sequence

Upon device power-up or system level reset, the ADC is powered down and disabled. When powering up the ADC, use the following sequence:

1. Set the bit to enable the desired ADC clock in the PCLKCR13 register.
2. Set the desired ADC clock divider in the PRESCALE field of ADCCTL2.
3. Power up the ADC by setting the ADCPWDNZ bit in ADCCTL1.
4. Allow a delay before sampling. See the data sheet for the necessary time.

If multiple ADCs are powered up simultaneously, steps 1 and step 3 can each be done for all ADCs in one write instruction. Also, only one delay is necessary as long as the delay occurs after all the ADCs have begun powering up.

16.11 ADC Calibration

During the fabrication and test process, Texas Instruments calibrates the gain, offset, and linearity of the ADCs and the offset of the buffered DACs. These trim settings are stored in TI reserved OTP memory, and can be loaded using C-callable functions.

- The Device_cal() function copies the trim values for ADC from OTP memory to the respective trim registers.
- The trim functions in Device_cal() are callable in C2000ware as ADC_setOFFSETTRIM(), ADC_setINLTRIM(), and DAC_setDACTRIM(). These functions fetch production test trim values from TI reserved OTP memory locations, and write the values to the corresponding analog module register destinations.

Until the appropriate factory trim is loaded, the ADC and other analog modules are not specified to operate within the data sheet specifications. Similarly, if trim values other than the factory settings are placed into the trim registers, the ADC (and other modules) is not specified to operate within the data sheet specifications.

The boot ROM calls the calibration functions, so trim values are initially populated without user intervention. However, if the trims are cleared due to a module reset or modified for some other reason, then the user must call the calibration functions (defined in the C2000Ware header files).

16.11.1 ADC Zero Offset Calibration

ADC offset error is determined and calibrated during factory testing. However, the user still has the option to perform offset calibration if the end application specifically requires this. This section describes how to perform offset calibration using internal VREFLO connection for single-ended operation.

Zero offset error is defined as the difference from 0 that occurs when converting a voltage at VREFLO. The zero offset error can be positive or negative. To correct this error, an adjustment of equal magnitude and opposite polarity is written into the ADCOFFTRIM register. The value contained in this register is applied before the results are available in the ADC result registers. This operation is fully contained within the ADC core, so the timing of the results is not affected, and the full dynamic range of the ADC is maintained for any trim value.

Note

Regardless of the converter resolution, the size of each ADCOFFTRIM step is (VREFHI-VREFLO)/65536.

Use the following procedure to re-calibrate the ADC offset in 12-bit single-ended mode:

1. Set ADCOFFTRIM to +112 steps (0x70). This adds an artificial offset to account for negative offset that can reside in the ADC core.
2. Perform some multiple of 16 conversions on VREFLO (internal connection), accumulating the results (for example, 32*16 conversions = 512 conversions). Use the maximum value of ACQPS to make sure longer settling time to account for parasitic impedance of internal VREFLO connections.
3. Divide the accumulated result by the multiple of 16 (for example, for 512 conversions, divide by 32).
4. Set ADCOFFTRIM to 112 – result from step 3.

16.12 ADC Timings

The process of converting an analog voltage to a digital value is broken down into an S+H phase and a conversion phase. The ADC sample and hold circuits (S+H) are clocked by SYSCLK while the ADC conversion process is clocked by ADCCLK. ADCCLK is generated by dividing down SYSCLK based on the PRESCALE field in the ADCCTL2 register.

The S+H duration is the value of the ACQPS field of the SOC being converted, plus one, times the SYSCLK period. The user must make sure that this duration exceeds both 1 ADCCLK period and the minimum S+H duration specified in the data sheet. The conversion time is approximately 10.5 ADCCLK cycles. The exact conversion time is always a whole number of SYSCLK cycles. See the timing diagrams and tables in [Section 16.12.1](#) for exact timings.

16.12.1 ADC Timing Diagrams

The following diagrams show the ADC conversion timings for two SOC's given the following assumptions:

- SOC0 and SOC1 are configured to use the same trigger.
- No other SOC's are converting or pending when the trigger occurs.
- The round robin pointer is in a state that causes SOC0 to convert first.
- ADCINTSEL is configured to set an ADCINT flag upon end of conversion for SOC0 (whether this flag propagates through to the CPU to cause an interrupt is determined by the configurations in the PIE module).

[Table 16-8](#) describes the parameters in the following timing diagrams. [Table 16-9](#).

Table 16-8. ADC Timing Parameter Descriptions

Parameter	Description
t_{SH}	<p>The duration of the S+H window.</p> <p>At the end of this window, the value on the S+H capacitor becomes the voltage to be converted into a digital value. The duration is given by $(ACQPS + 1)$ SYSCLK cycles. ACQPS can be configured individually for each SOC, so t_{SH} is not necessarily the same for different SOC's.</p> <p>Note: The value on the S+H capacitor is captured approximately 5ns before the end of the S+H window regardless of device clock settings.</p>
t_{LAT}	<p>The time from the end of the S+H window until the ADC results latch in the ADCRESULTx register.</p> <p>If the ADCRESULTx register is read before this time, the previous conversion results are returned.</p>
t_{EOC}	<p>The time from the end of the S+H window until the S+H window for the next ADC conversion can begin. The subsequent sample can start before the conversion results are latched.</p>
t_{INT}	<p>The time from the end of the S+H window until an ADCINT flag is set (if configured).</p> <p>If the INTPULSEPOS bit in the ADCCTL1 register is set, t_{INT} coincides with the end of conversion (EOC) signal.</p> <p>If the INTPULSEPOS bit is 0, and the OFFSET field in the ADCINTCYCLE register is not 0, then there is a delay of OFFSET SYSCLK cycles before the ADCINT flag is set. This delay can be used to enter the ISR or trigger the DMA exactly when the sample is ready.</p> <p>If the INTPULSEPOS bit is 0, t_{INT} coincides with the end of the S+H window. If t_{INT} triggers a read of the ADC result register (directly through DMA or indirectly by triggering an ISR that reads the result), care must be taken to make sure the read occurs after the results latch (otherwise, the previous results are read).</p>

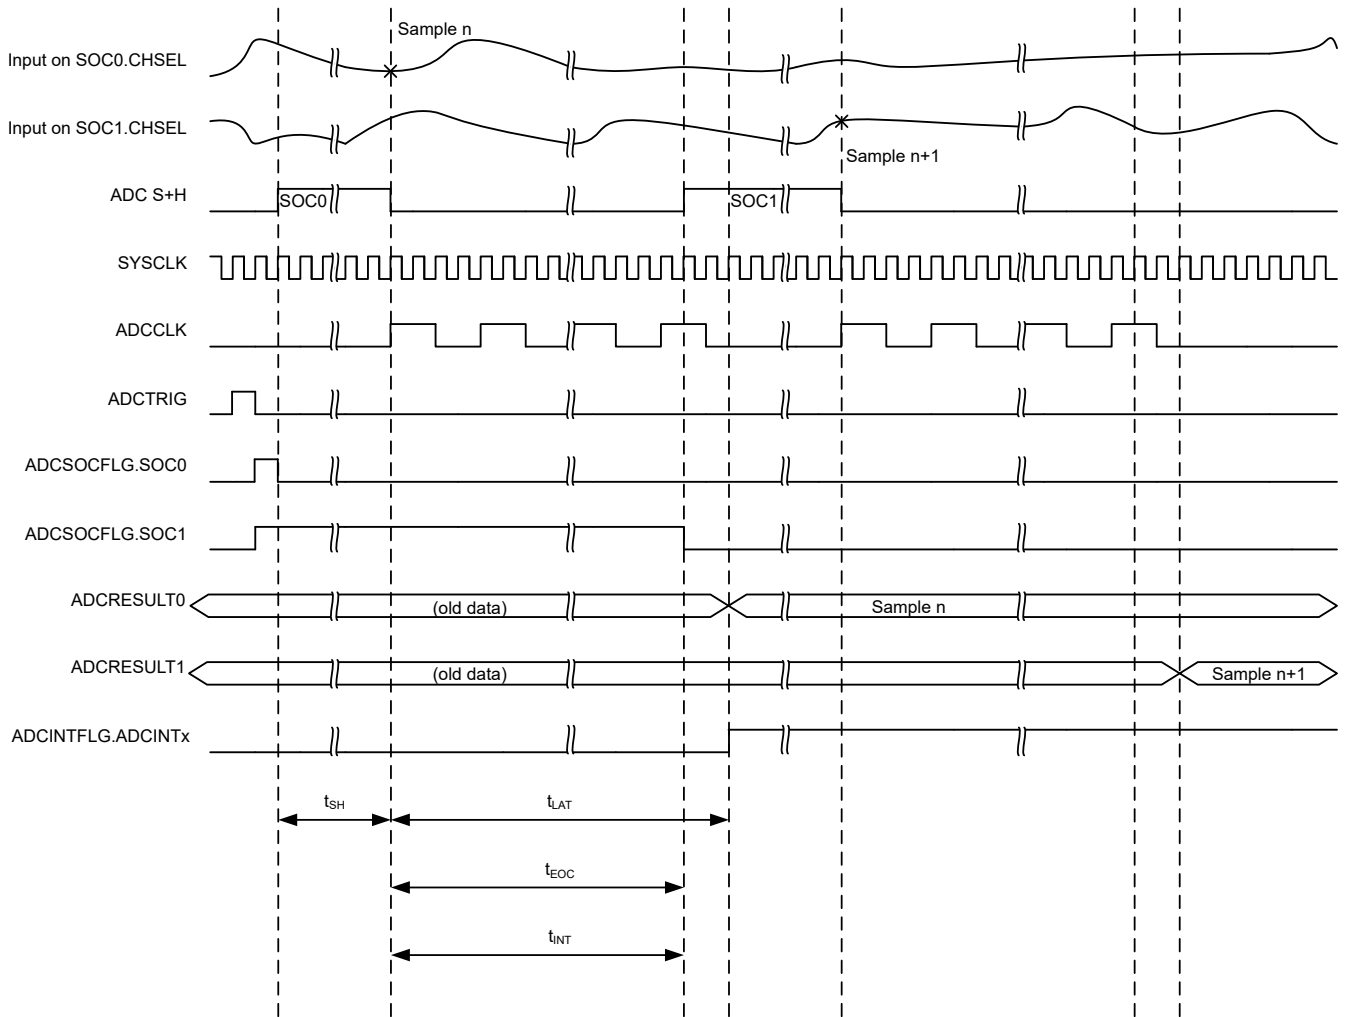

Figure 16-13. ADC Timings for 12-bit Mode in Late Interrupt Mode

Table 16-9. ADC Timings in 12-bit Mode

ADCCLK Prescale		SYSCLK Cycles			
ADCCTL2.PRESCALE	Prescale Ratio	t_{EOC}	t_{LAT}	t_{INT} (Early)	t_{INT} (Late)
0	1	11	13	1	11
2	2	21	23	1	21
4	3	31	34	1	31
6	4	41	44	1	41
8	5	51	55	1	51
10	6	61	65	1	61
12	7	71	76	1	71
14	8	81	86	1	81

16.13 Additional Information

The following sections contain additional practical information.

16.13.1 Ensuring Synchronous Operation

For best performance, all ADCs on the device must be operated synchronously. The device data sheet specifies the performance in both synchronous and asynchronous mode for those parameters which differ between the modes of operation.

To make sure synchronous operation, all ADCs on the device must operate in lockstep. This is accomplished by writing configurations to all ADCs that cause the sampling and conversion phases of all ADCs to be exactly aligned. The easiest way to accomplish this is to write identical values to the SOC configurations for each ADC for trigger select and ACQPS (S+H duration). In addition, synchronous ADCs must also configure identical values for the SOC priority control, burst mode, burst trigger, and burst size.

16.13.1.1 Basic Synchronous Operation

The following example configures two SOC's each on ADCA and ADCC with identical trigger select and ACQPS values. This results in synchronous operation between ADCA and ADCC. For devices with more than two ADCs, the same principles can be used to synchronize all the ADCs.

Example: Basic Synchronous Operation

```

AdcaRegs.ADCSOC0CTL.bit.CHSEL = 4; //SOC0 converts ADCINA4
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19; //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10; //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 0; //SOC0 converts ADCINC0
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19; //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 10; //SOC0 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC1CTL.bit.CHSEL = 4; //SOC1 converts ADCINA4
AdcaRegs.ADCSOC1CTL.bit.ACQPS = 30; //SOC1 uses sample duration of 31 SYSCLK cycles
AdcaRegs.ADCSOC1CTL.bit.TRIGSEL = 10; //SOC1 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC1CTL.bit.CHSEL = 1; //SOC1 converts ADCINC1
AdccRegs.ADCSOC1CTL.bit.ACQPS = 30; //SOC1 uses sample duration of 31 SYSCLK cycles
AdccRegs.ADCSOC1CTL.bit.TRIGSEL = 10; //SOC1 begins conversion on ePWM3 SOCB
    
```

Figure 16-14. Example: Basic Synchronous Operation

Several things can be noted from [Figure 16-14](#). First, while the ACQPS values must be the same for SOC's with the same number, different ACQPS values can be used for SOC's with different numbers. Because of this, synchronous operation does not require a single global S+H time, but instead only channels sampled simultaneously require identical S+H durations. Another important point from this example is that any channel select value can be used for any SOC. Finally, this example assumes round-robin operation. If high-priority SOC's are to be used, the priority must be configured the same on all ADCs.

16.13.1.2 Synchronous Operation with Multiple Trigger Sources

As long as each set of SOCs has identical trigger select and ACQPS settings, multiple trigger sources can be used while still achieving synchronous operation.

The following example demonstrates synchronous operation between ADCA and ADCC while using three SOCs and two trigger sources. Figure 16-15 demonstrates that any combination of relative trigger timings still results in synchronous operation.

Example: Synchronous Operation with Multiple Trigger Sources

```

AdcaRegs.ADCSOC0CTL.bit.CHSEL = 4; //SOC0 converts ADCINA4
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19; //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10; //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 0; //SOC0 converts ADCINC0
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19; //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 10; //SOC0 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC1CTL.bit.CHSEL = 4; //SOC1 converts ADCINA4
AdcaRegs.ADCSOC1CTL.bit.ACQPS = 30; //SOC1 uses sample duration of 31 SYSCLK cycles
AdcaRegs.ADCSOC1CTL.bit.TRIGSEL = 10; //SOC1 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC1CTL.bit.CHSEL = 1; //SOC1 converts ADCINC1
AdccRegs.ADCSOC1CTL.bit.ACQPS = 30; //SOC1 uses sample duration of 31 SYSCLK cycles
AdccRegs.ADCSOC1CTL.bit.TRIGSEL = 10; //SOC1 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC2CTL.bit.CHSEL = 0; //SOC2 converts ADCINA0
AdcaRegs.ADCSOC2CTL.bit.ACQPS = 19; //SOC2 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC2CTL.bit.TRIGSEL = 2; //SOC2 begins conversion on CPU Timer1
AdccRegs.ADCSOC2CTL.bit.CHSEL = 2; //SOC2 converts ADCINC2
AdccRegs.ADCSOC2CTL.bit.ACQPS = 19; //SOC2 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC2CTL.bit.TRIGSEL = 2; //SOC2 begins conversion on CPU Timer1
    
```

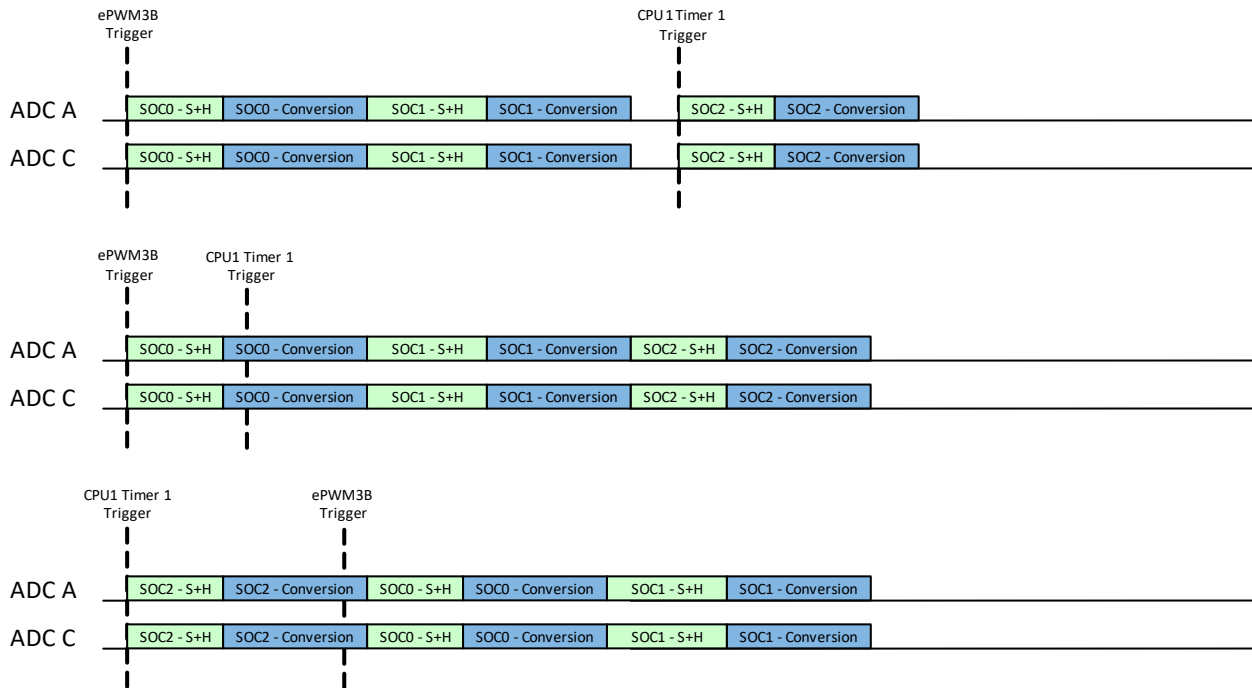

Figure 16-15. Example: Synchronous Operation with Multiple Trigger Sources

Note that any trigger source that can be selected in the TRIGSEL field can be used except for software triggering. There is no way to issue the software triggers for all ADCs simultaneously, so likely results in asynchronous operation. ADCINT1 or ADCINT2 can also be used as a trigger as long as the ADCINTSOCSEL1 and ADCINTSOCSEL2 registers are configured identically for all ADCs and software triggering is not used to start the chain of conversions.

16.13.1.3 Synchronous Operation with Uneven SOC Numbers

If only one trigger source is used, one ADC can use more SOC's than the other ADCs while still operating synchronously.

Example: Synchronous Operation with Uneven SOC Numbers

```

AdcaRegs.ADCSOC0CTL.bit.CHSEL = 4; //SOC0 converts ADCINA4
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19; //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10; //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 0; //SOC0 converts ADCINC0
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19; //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 10; //SOC0 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC1CTL.bit.CHSEL = 4; //SOC1 converts ADCINA4
AdcaRegs.ADCSOC1CTL.bit.ACQPS = 30; //SOC1 uses sample duration of 31 SYSCLK cycles
AdcaRegs.ADCSOC1CTL.bit.TRIGSEL = 10; //SOC1 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC1CTL.bit.CHSEL = 1; //SOC1 converts ADCINC1
AdccRegs.ADCSOC1CTL.bit.ACQPS = 30; //SOC1 uses sample duration of 31 SYSCLK cycles
AdccRegs.ADCSOC1CTL.bit.TRIGSEL = 10; //SOC1 begins conversion on ePWM3 SOCB

AdcaRegs.ADCSOC2CTL.bit.CHSEL = 0; //SOC2 converts ADCINA0
AdcaRegs.ADCSOC2CTL.bit.ACQPS = 30; //SOC2 uses sample duration of 31 SYSCLK cycles
AdcaRegs.ADCSOC2CTL.bit.TRIGSEL = 10; //SOC2 begins conversion on ePWM3 SOCB
    
```

Figure 16-16. Example: Synchronous Operation with Uneven SOC Numbers

Note that if the trigger comes again before all SOC's have completed the conversions, ADCC begins converting immediately on SOC0 while ADCA does not start converting SOC0 again until SOC2 is complete. This results in asynchronous operation, so care must be taken to not overflow the trigger.

Figure 16-17. Example: Asynchronous Operation with Uneven SOC Numbers – Trigger Overflow

16.13.1.4 Non-overlapping Conversions

If conversion timings can be made sure to not overlap by the user, then it is not necessary to configure all SOC0s identically on all ADCs to achieve performance equivalent to synchronous operation. For example, if the two ADC triggers in a system come from two ePWM sources that are always 180-degrees out-of-phase, then SOC0 can be used for both ADCA and ADCC with different trigger sources and different ACQPS values.

Example: Operation with Non-overlapping Conversions

```
//ePWM3 SOCA and SOCB are 180 degrees out of phase
AdcaRegs.ADCSOC0CTL.bit.CHSEL = 4; //SOC0 converts ADCINA4
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19; //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10; //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 0; //SOC0 converts ADCINC0
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19; //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 9; //SOC0 begins conversion on ePWM3 SOCA
```

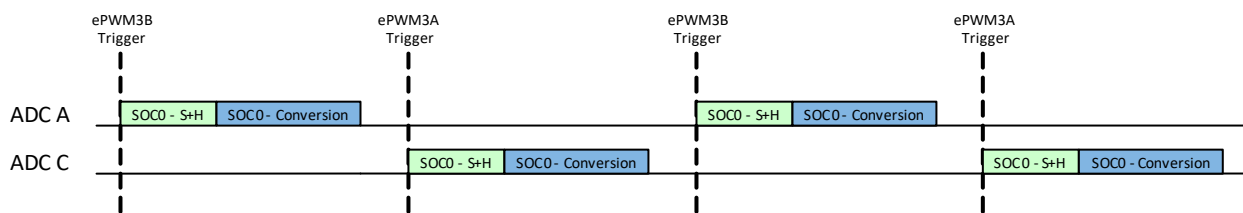

Figure 16-18. Example: Synchronous Equivalent Operation with Non-Overlapping Conversions

16.13.2 Choosing an Acquisition Window Duration

For correct operation, the input signal to the ADC must be allowed adequate time to charge the sample and hold capacitor, Ch. Typically, the S+H duration is chosen such that the sampling capacitor is charged to within 1/2 LSB or 1/4 LSB of the final value, depending on the tolerable settling error.

The best methodology to determine the required settling time is to simulate the ADC and ADC driving circuits to make sure adequate settling performance. See [ADC Input Circuit Evaluation for C2000 MCUs](#) and [Charge-Sharing Driving Circuits for C2000 ADCs](#) for additional guidance on ADC signal conditioning circuit design and evaluation.

An approximation of the required settling time can also be determined using an RC settling model. The time constant for the model is given by the equation:

$$\tau = (R_S + R_{on}) \times C_h + R_S \times (C_S + C_p) \tag{5}$$

And the number of time constants needed is given by the equation:

$$k = \ln\left(\frac{2^n}{\text{settling error}}\right) - \ln\left(\frac{C_S + C_P}{CH}\right) \tag{6}$$

So the total S+H time must be set to at least:

$$t = k \cdot \tau \tag{7}$$

Where the following parameters are provided by the ADC input model in the device data sheet:

- n = ADC resolution (in bits)
- R_{ON} = ADC sampling switch resistance (provided in Ω)
- C_H = ADC sampling capacitor (provided in pF)
- C_p = ADC channel parasitic input capacitance (provided in pF)

And the following parameters are dependent on the application design:

- settling error = tolerable settling error (in LSBs)
- R_s = ADC driving circuit source impedance (typically in Ω or $k\Omega$)
- C_s = capacitance on ADC input pin (typically in pF or nF)

For example, assuming the following parameters:

- n = 12-bits
- R_{ON} = 500Ω
- C_H = 12.5pF
- C_p = 12.7pF
- settling error = $\frac{1}{4}$ LSB
- R_s = 180Ω
- C_s = 150pF

The time constant is calculated as:

$$\tau = (180\Omega + 500\Omega) \times 12.5\text{pF} + 180\Omega \times (150\text{pF} + 12.7\text{pF}) = 37.8\text{ns} \quad (8)$$

And the number of required time constants is:

$$k = \ln\left(\frac{2^{12}}{0.25}\right) - \ln\left(\frac{150\text{pF} + 12.7\text{pF}}{12.5\text{pF}}\right) = 9.70 - 2.57 = 7.13 \quad (9)$$

So the S+H time must be set to at least: $37.8\text{ns} \times 7.13 = 270\text{ns}$

If $\text{SYSCLK} = 120\text{MHz}$, then each SYSCLK cycle is 8.33ns . S+H duration is $270\text{ns}/8.33\text{ns} = 32.4$ SYSCLK cycles, so ACQPS for this input is set to at least $\text{CEILING}(32.4) - 1 = 31$.

While this gives a rough estimate of the required acquisition window, a better method is to setup a circuit with the ADC input model, a model of the source impedance/capacitance, and any board parasitics in SPICE (or similar software) and simulate to verify that the sampling capacitor settles to the desired accuracy.

Note

The device data sheet specifies a minimum ADC S+H window duration. Do not use an ACQPS value that gives a duration less than this specification.

16.13.3 Achieving Simultaneous Sampling

While each ADC does not have dual S+H circuits, achieving simultaneous sampling is accomplished by setting the SOC triggers on two or more ADC modules to use the same trigger source. The following example demonstrates simultaneous sampling on 3 ADCs based on an ePWM3 event. ADCINA3, ADCINB2, and ADCINC5 are sampled. An acquisition window of 20 SYSCLK cycles is used, but different durations are possible.

```

AdcaRegs.ADCSOC0CTL.bit.CHSEL = 3;           //SOC0 converts ADCINA3
AdcaRegs.ADCSOC0CTL.bit.ACQPS = 19;          //SOC0 uses sample duration of 20 SYSCLK cycles
AdcaRegs.ADCSOC0CTL.bit.TRIGSEL = 10;        //SOC0 begins conversion on ePWM3 SOCB
AdcbRegs.ADCSOC0CTL.bit.CHSEL = 2;           //SOC0 converts ADCINB2
AdcbRegs.ADCSOC0CTL.bit.ACQPS = 19;          //SOC0 uses sample duration of 20 SYSCLK cycles
AdcbRegs.ADCSOC0CTL.bit.TRIGSEL = 10;        //SOC0 begins conversion on ePWM3 SOCB
AdccRegs.ADCSOC0CTL.bit.CHSEL = 5;           //SOC0 converts ADCINC5
AdccRegs.ADCSOC0CTL.bit.ACQPS = 19;          //SOC0 uses sample duration of 20 SYSCLK cycles
AdccRegs.ADCSOC0CTL.bit.TRIGSEL = 10;        //SOC0 begins conversion on ePWM3 SOCB
    
```

When the ePWM3 trigger is received, all three ADCs begin converting in parallel immediately. All results are stored in the ADCRESULT0 register for each ADC. Note that this assumes that all ADCs are idle when the trigger is received. If one or more ADCs is busy, the samples do not happen at exactly the same time.

16.13.4 Result Register Mapping

The ADC results and the ADC PPB results are duplicated for each memory bus controller in the system. Bus controllers include all CPUs, DMAs, and CLAs present on the specific part family and part number. For each bus controller, no access configuration is needed to allow read access to the result registers, and no contention occurs in cases where multiple bus controllers try to read the ADC results simultaneously.

16.13.5 Internal Temperature Sensor

The internal temperature sensor measures the junction temperature of the device. The output of the sensor can be sampled with the ADC through an internal connection. This can be enabled on channel ADCIN12 on ADCC by setting the ENABLE bit in the TSNSCTL register.

To convert the temperature sensor reading into a temperature, pass the temperature sensor reading to the ADC_getTemperatureC() function in the ADC driverlib.

16.13.6 Designing an External Reference Circuit

Figure 16-19 shows the basic organization of the external voltage reference generation circuitry. For best performance, the externally generated reference voltage must be buffered by a precision op-amp with good bandwidth and low output impedance before being driven into the ADC reference pin. A capacitor between the high and low reference pins must be placed on the PCB as close to the pins as practical to help absorb high-frequency currents. A series resistor (typically $<1\Omega$) in series with this capacitor is sometimes necessary to maintain op-amp stability.

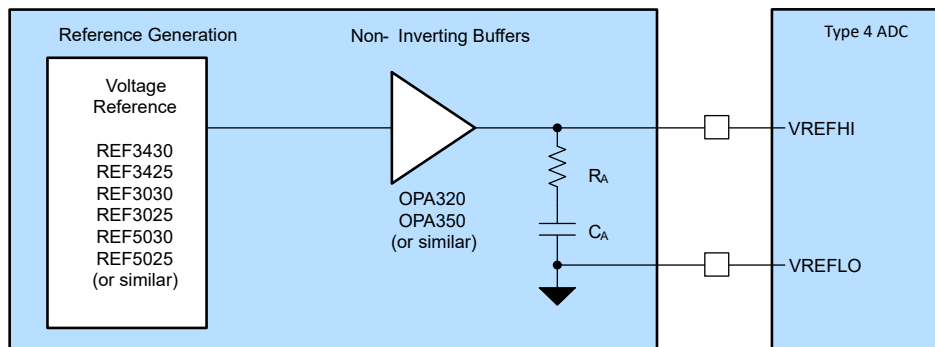

Figure 16-19. ADC Reference System

16.13.7 ADC-DAC Loopback Testing

For system diagnostic or functional safety purposes, the user application can perform a loopback test of the ADC module to verify that the ADC is converting correctly. Using the output of the DAC in the first CMPSS module, the device can be configured to supply a series of known voltages to the input of the converter, and the conversion result verified against expected results. Loopback test mode is enabled by setting the bit corresponding to the ADC module under test in the ADCLOOPBACK register in the analog subsystem module to 1. Figure 16-20 shows the connection between the CMPSS DAC output and the ADC.

Figure 16-20. CMPSS to ADC Loopback Connection

In ADC loopback test mode, the following special considerations apply:

- The ADC module always samples the CMPSS1 DACL output, regardless of what channel is selected in the ADCSOCxCTL.CHSEL field.
- The minimum sampling window size (ACQPS) when converting the DAC output is 4.27 μ s (512 SYSCLK cycles at 120MHz SYSCLK).
- The output resolution of the CMPSS DAC is 6 bits. The lower 6 bits of the input DACVAL are discarded.
- ADC loopback test mode affects CMPSS trip voltages. Avoid enabling ADC loopback mode during regular CMPSS operation.

For more information on the CMPSS module and how to configure the CMPSS DAC, see the *Comparator Subsystem (CMPSS)* chapter.

16.13.8 Internal Test Mode

For diagnostic purposes, the ADC can sample various internal node voltages using a special input selection mux called INTERNALTEST. When internal test mode is enabled, the INTERNALTEST mux selection overrides the ADC-A input channel mux: ADC-A samples the INTERNALTEST selection instead of the channel selected by ADCSOCxCTL.CHSEL. Internal test mode can be used to sample the VDDCORE voltage, VREFLO, VDDA, VSSA, and the CMPSS DAC outputs.

To enable internal test mode, write the desired node selection to the TESTSEL field of the INTERNALTESTCTL analog subsystem register. For safety, INTERNALTESTCTL includes a write key field that must be simultaneously written with the value 0xA5A5 for writes to take effect; otherwise, writes to this register are ignored. For details of internal test mux connections to various internal device voltage nodes, refer to the INTERNALTESTCTL register description.

To disable internal test mode, write 0 to the TESTSEL field of the INTERNALTESTCTL register.

When using internal test mode, the following special considerations apply:

- INTERNALTESTCTL.TESTSEL overrides the value of ADCSOCxCTL.CHSEL on ADCA when a non-zero value is configured.
- The minimum sampling window size (ACQPS) when converting INTERNALTEST is 4.27 μ s (512 SYSCLK cycles at 120MHz SYSCLK).
- The effective resolution of the CMPSS DAC outputs to INTERNALTEST is 6 bits.

For more information on the CMPSS module and how to configure the CMPSS DAC, see the *Comparator Subsystem (CMPSS)* chapter.

16.13.9 ADC Gain and Offset Calibration

Using the INTERNALTEST mux, gain balancing between multiple ADCs can be performed. By calculating the relative gain error between the ADCs, conversion results can be post-processed in software such that each ADC has the same output for each equivalent input.

To activate gain calibration mode, configure the TESTSEL field of the INTERNALTESTCTL analog subsystem register to select ENZ_CALIB_GAIN_3P3V. In this mode, the voltage sampled by all ADCs when triggered is (VREFHI * 0.9), overriding the channel selection in ADCSOCxCTL.CHSEL. To turn off gain calibration mode and return to normal operation, configure the TESTSEL field of INTERNALTESTCTL to 0.

16.14 Software

16.14.1 ADC Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/adc

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

16.14.1.1 ADC Software Triggering

FILE: adc_ex1_soc_software.c

This example converts some voltages on ADCA and ADCC based on a software trigger.

The ADCC will not convert until ADCA is complete, so the ADCs will not run asynchronously. However, this is much less efficient than allowing the ADCs to convert synchronously in parallel (for example, by using an ePWM trigger).

External Connections

- A0, A1, C2, and C3 should be connected to signals to convert

Watch Variables

- *myADC0Result0* - Digital representation of the voltage on pin A0
- *myADC0Result1* - Digital representation of the voltage on pin A1
- *myADC1Result0* - Digital representation of the voltage on pin C2
- *myADC1Result1* - Digital representation of the voltage on pin C3

16.14.1.2 ADC ePWM Triggering

FILE: adc_ex2_soc_epwm.c

This example sets up ePWM1 to periodically trigger a conversion on ADCA.

External Connections

- A0 should be connected to a signal to convert

Watch Variables

- *myADC0Results* - A sequence of analog-to-digital conversion samples from pin A0. The time between samples is determined based on the period of the ePWM timer.

16.14.1.3 ADC Temperature Sensor Conversion

FILE: adc_ex3_temp_sensor.c

This example sets up the ePWM to periodically trigger the ADC. The ADC converts the internal connection to the temperature sensor, which is then interpreted as a temperature by calling the `ADC_getTemperatureC()` function.

Watch Variables

- *sensorSample* - The raw reading from the temperature sensor
- *sensorTemp* - The interpretation of the sensor sample as a temperature in degrees Celsius.

16.14.1.4 ADC Synchronous SOC Software Force (*adc_soc_software_sync*)

FILE: adc_ex4_soc_software_sync.c

This example converts some voltages on ADCA and ADCC using input 5 of the input X-BAR as a software force. Input 5 is triggered by toggling GPIO0, but any spare GPIO could be used. This method will ensure that both ADCs start converting at exactly the same time.

External Connections

- A2, A3, C2, C3 pins should be connected to signals to convert

Watch Variables

- *myADC0Result0* : a digital representation of the voltage on pin A2
- *myADC0Result1* : a digital representation of the voltage on pin A3
- *myADC1Result0* : a digital representation of the voltage on pin C2
- *myADC1Result1* : a digital representation of the voltage on pin C3

16.14.1.5 ADC Continuous Triggering (*adc_soc_continuous*)

FILE: *adc_ex5_soc_continuous.c*

This example sets up the ADC to convert continuously, achieving maximum sampling rate.

External Connections

- A0 pin should be connected to signal to convert

Watch Variables

- *adcAResults* - A sequence of analog-to-digital conversion samples from pin A0. The time between samples is the minimum possible based on the ADC speed.

16.14.1.6 ADC Continuous Conversions Read by DMA (*adc_soc_continuous_dma*)

FILE: *adc_ex6_soc_continuous_dma.c*

This example sets up two ADC channels to convert simultaneously. The results will be transferred by the DMA into a buffer in RAM.

External Connections

- A3 & C3 pins should be connected to signals to convert

Watch Variables

- *myADC0DataBuffer* : a digital representation of the voltage on pin A3
- *myADC1DataBuffer* : a digital representation of the voltage on pin C3

16.14.1.7 ADC PPB Offset (*adc_ppb_offset*)

FILE: *adc_ex7_ppb_offset.c*

This example software triggers the ADC. Some SOCs have automatic offset adjustment applied by the post-processing block. After the program runs, the memory will contain ADC & post-processing block(PPB) results.

External Connections

- A2, C2 pins should be connected to signals to convert

Watch Variables

- *myADC0Result* : a digital representation of the voltage on pin A2
- *myADC0PPBResult* : a digital representation of the voltage on pin A2, minus 100 LSBs of automatically added offset
- *myADC1Result* : a digital representation of the voltage on pin C2
- *myADC1PPBResult* : a digital representation of the voltage on pin C2 plus 100 LSBs of automatically added offset

16.14.1.8 ADC PPB Limits (*adc_ppb_limits*)

FILE: *adc_ex8_ppb_limits.c*

This example sets up the ePWM to periodically trigger the ADC. If the results are outside of the defined range, the post-processing block will generate an interrupt.

The default limits are 1000LSBs and 3000LSBs. With VREFHI set to 3.3V, the PPB will generate an interrupt if the input voltage goes above about 2.4V or below about 0.8V.

External Connections

- A0 should be connected to a signal to convert

Watch Variables

- None

16.14.1.9 ADC PPB Delay Capture (*adc_ppb_delay*)

FILE: *adc_ex9_ppb_delay.c*

This example demonstrates delay capture using the post-processing block.

Two asynchronous ADC triggers are setup:

- ePWM1, with period 2048, triggering SOC0 to convert on pin A0
 - ePWM2, with period 9999, triggering SOC1 to convert on pin A2
- Each conversion generates an ISR at the end of the conversion. In the ISR for SOC0, a conversion counter is incremented and the PPB is checked to determine if the sample was delayed.
- After the program runs, the memory will contain:

conversion : the sequence of conversions using SOC0 that were delayed

- *delay* : the corresponding delay of each of the delayed conversions

16.14.1.10 ADC ePWM Triggering Multiple SOC

FILE: *adc_ex10_multiple_soc_epwm.c*

This example sets up ePWM1 to periodically trigger a set of conversions on ADCA and ADCC. This example demonstrates multiple ADCs working together to process a batch of conversions using the available parallelism across multiple ADCs.

ADCA Interrupt ISRs are used to read results of both ADCA and ADCC.

External Connections

- A0, A1, A2 and C2, C3, C4 pins should be connected to signals to be

Watch Variables

- *adcAResult0* - Digital representation of the voltage on pin A0
- *adcAResult1* - Digital representation of the voltage on pin A1
- *adcAResult2* - Digital representation of the voltage on pin A2
- *adcCResult0* - Digital representation of the voltage on pin C2
- *adcCResult1* - Digital representation of the voltage on pin C3
- *adcCResult2* - Digital representation of the voltage on pin C4

16.14.1.11 ADC Burst Mode

FILE: *adc_ex11_burst_mode_epwm.c*

This example sets up ePWM1 to periodically trigger ADCA using burst mode. This allows for different channels to be sampled with each burst.

Each burst triggers 3 conversions. A0 and A1 are part of every burst while the third conversion rotates between A2, A3, and A4. This allows high importance signals to be sampled at high speed while lower priority signals can be sampled at a lower rate.

ADCA Interrupt ISRs are used to read results for ADCA.

External Connections

- A0, A1, A2, A3, A4

Watch Variables

- *adcAResult0* - Digital representation of the voltage on pin A0
- *adcAResult1* - Digital representation of the voltage on pin A1
- *adcAResult2* - Digital representation of the voltage on pin A2
- *adcAResult3* - Digital representation of the voltage on pin A3
- *adcAResult4* - Digital representation of the voltage on pin A4

16.14.1.12 ADC Burst Mode Oversampling

FILE: adc_ex12_burst_mode_oversampling.c

This example is an ADC oversampling example implemented with software. The ADC SOC's are configured in burst mode, triggered by the ePWM SOC A event trigger.

External Connection

- A2

Watch Variables

- *Iv_results* - Array of digital values measured on pin A2 (oversampling is configured by *Oversampling_Amount*)

16.14.1.13 ADC SOC Oversampling

FILE: adc_ex13_soc_oversampling.c

This example sets up ePWM1 to periodically trigger a set of conversions on ADCA including multiple SOC's that all convert A2 to achieve oversampling on A2.

ADCA Interrupt ISRs are used to read results of ADCA.

External Connections

- A0, A1, A2 should be connected to signals to be converted.

Watch Variables

- *adcAResult0* - Digital representation of the voltage on pin A0
- *adcAResult1* - Digital representation of the voltage on pin A1
- *adcAResult2* - Digital representation of the voltage on pin A2

16.14.1.14 ADC PPB PWM trip (*adc_ppb_pwm_trip*)

FILE: adc_ex14_ppb_pwm_trip.c

This example demonstrates EPWM tripping through ADC limit detection PPB block. ADCAINT1 is configured to periodically trigger the ADCA channel 2 post initial software forced trigger. The limit detection post-processing block (PPB) is configured and if the ADC results are outside of the defined range, the post-processing block will generate an ADCxEVTy event. This event is configured as EPWM trip source through configuring EPWM XBAR and corresponding EPWM's trip zone and digital compare sub-modules. The example showcases

- one-shot
- cycle-by-cycle
- and direct tripping of PWMs through ADCAEVT1 source via Digital compare submodule.

The default limits are 0LSBs and 3600LSBs. With VREFHI set to 3.3V, the PPB will generate a trip event if the input voltage goes above about 2.9V.

External Connections

- A2 should be connected to a signal to convert
- Observe the following signals on an oscilloscope
 - ePWM1(GPIO0 - GPIO1)
 - ePWM2(GPIO2 - GPIO3)
 - ePWM3(GPIO4 - GPIO5)

Watch Variables

- *adcA2Results* - digital representation of the voltage on pin A2

16.14.1.15 ADC Open Shorts Detection (*adc_open_shorts_detection*)

FILE: adc_ex15_open_shorts_detection.c

This example demonstrates the ADC open/shorts detection(ADCOSDETECT) circuit configuration for detecting pin faults in the system. The example enables the open/shorts detection circuit along with mandatory ADC configurations and diagnoses ADCA A0 input pin state before starting normal ADC conversions.

To enable the ADC OSDetect circuit:

1. Configure the ADC for conversion (E.g. channel, SOC, ACQPS, prescaler, trigger etc). The OSDetect functionality is available in 12-bit only.
2. Set up the ADCOSDETECT register for the desired voltage divider connection. Refer device TRM for details on available OSDetect configurations.
3. Initiate a conversion and inspect the conversion result. Note: The results must be interpreted based on what is driving on the input side and what are the values of Rs and Cp. If the Vs signal can be disconnected from the input pin, the circuit can be used to detect open and shorted input pins. In the example, ADCA A0 channel is configured and following algorithm is used to check the A0 pin status: Step 1: Configure full scale OSDETECT mode & capture ADC results(resultHi) Step 2: Configure zero scale OSDETECT mode & capture ADC results(resultLo) Step 3: Disable OSDETECT mode and capture ADC results(resultNormal) Step 4: Determine the state of the ADC pin a. If the pin is open, resultLo would be equal to Vreflo and resultHi would be equal to Vrefhi b. If the pin is shorted to Vrefhi, resultLo should be approximately equal to Vrefhi and resultHi should be equal to Vrefhi c. If the pin is shorted to Vreflo, resultLo should be equal to Vreflo and resultHi should be approximately equal to Vreflo d. If the pin is connected to a valid signal, resultLo should be greater than osdLoLimit but less than resultNormal while resultHi

should be less than osdHiLimit but greater than resultNormal Input | Full-Scale output | Zero-scale Output | Pin Status

Unknown| VREFHI | VREFLO | Open VREFHI | VREFHI | approx. VREFHI | Shorted to VREFHI VREFLO | approx. VREFLO | VREFLO | Shorted to VREFLO

V_n | $V_n < \text{resultHi} < VREFHI$ | $VREFLO < \text{resultLo} < V_n$ | Good

Step 5: osDetectStatusVal of value greater than 4 would mean that there is no pin fault. a. If osDetectStatusVal == 1, means pin A0 is OPEN b. If osDetectStatusVal == 2, means pin A0 is shorted to VREFLO c. If osDetectStatusVal == 4, means pin A0 is shorted to VREFHI d. If osDetectStatusVal == 8, means pin A0 is in GOOD/VALID state e. Any value of osDetectStatusVal > 4, means pin A0 is in VALID state

Following points should be noted while configuring the ADC in OSDETECT mode.

1. The divider resistance tolerances can vary widely, hence this feature should not be used to check for conversion accuracy.
2. Consult the device data manual for implementation and availability of analog input channels.
3. Due to high drive impedance, a S+H duration much longer than the ADC minimum will be needed.

External Connections

- A0 pin should be connected to signals to convert

Watch Variables

- *osDetectStatusVal* : OS detection status of voltage on pin A0
- *adcAResult0* : a digital representation of the voltage on pin A0

16.15 ADC Registers

This section describes the Analog-to-Digital Converter Registers.

16.15.1 ADC Base Address Table

Table 16-10. ADC Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected
Instance	Structure

16.15.2 ADC_RESULT_REGS Registers

Table 16-11 lists the memory-mapped registers for the ADC_RESULT_REGS registers. All register offset addresses not listed in Table 16-11 should be considered as reserved locations and the register contents should not be modified.

Table 16-11. ADC_RESULT_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	ADCRESULT0	ADC Result 0 Register		Go
1h	ADCRESULT1	ADC Result 1 Register		Go
2h	ADCRESULT2	ADC Result 2 Register		Go
3h	ADCRESULT3	ADC Result 3 Register		Go
4h	ADCRESULT4	ADC Result 4 Register		Go
5h	ADCRESULT5	ADC Result 5 Register		Go
6h	ADCRESULT6	ADC Result 6 Register		Go
7h	ADCRESULT7	ADC Result 7 Register		Go
8h	ADCRESULT8	ADC Result 8 Register		Go
9h	ADCRESULT9	ADC Result 9 Register		Go
Ah	ADCRESULT10	ADC Result 10 Register		Go
Bh	ADCRESULT11	ADC Result 11 Register		Go
Ch	ADCRESULT12	ADC Result 12 Register		Go
Dh	ADCRESULT13	ADC Result 13 Register		Go
Eh	ADCRESULT14	ADC Result 14 Register		Go
Fh	ADCRESULT15	ADC Result 15 Register		Go
10h	ADCPPB1RESULT	ADC Post Processing Block 1 Result Register		Go
12h	ADCPPB2RESULT	ADC Post Processing Block 2 Result Register		Go
14h	ADCPPB3RESULT	ADC Post Processing Block 3 Result Register		Go
16h	ADCPPB4RESULT	ADC Post Processing Block 4 Result Register		Go

Complex bit access types are encoded to fit into small table cells. Table 16-12 shows the codes that are used for access types in this section.

Table 16-12. ADC_RESULT_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

16.15.2.1 ADCRESULT0 Register (Offset = 0h) [Reset = 0000h]

ADCRESULT0 is shown in [Figure 16-21](#) and described in [Table 16-13](#).

Return to the [Summary Table](#).

Complex bit access types are encoded to fit into small table cells. [Table 16-34](#) shows the codes that are used for access types in this section.

Table 16-34. ADC_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		

Table 16-34. ADC_REGS Access Type Codes (continued)

Access Type	Code	Description
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

16.15.3.1 ADCCTL1 Register (Offset = 0h) [Reset = 0000h]

ADCCTL1 is shown in [Figure 16-41](#) and described in [Table 16-35](#).

Return to the [Summary Table](#).

15-10	RESERVED	R	0h	Reserved
9-5	RRPOINTER	R	10h	Round Robin Pointer. Holds the value of the last converted round robin SOCx to be used by the round robin scheme to determine order of conversions. 00h SOC0 was last round robin SOC to convert, SOC1 is highest round robin priority. 01h SOC1 was last round robin SOC to convert, SOC2 is highest round robin priority. 02h SOC2 was last round robin SOC to convert, SOC3 is highest round robin priority. 03h SOC3 was last round robin SOC to convert, SOC4 is highest round robin priority. 04h SOC4 was last round robin SOC to convert, SOC5 is highest round robin priority. 05h SOC5 was last round robin SOC to convert, SOC6 is highest round robin priority. 06h SOC6 was last round robin SOC to convert, SOC7 is highest round robin priority. 07h SOC7 was last round robin SOC to convert, SOC8 is highest round robin priority. 08h SOC8 was last round robin SOC to convert, SOC9 is highest round robin priority. 09h SOC9 was last round robin SOC to convert, SOC10 is highest round robin priority. 0Ah SOC10 was last round robin SOC to convert, SOC11 is highest round robin priority. 0Bh SOC11 was last round robin SOC to convert, SOC12 is highest round robin priority. 0Ch SOC12 was last round robin SOC to convert, SOC13 is highest round robin priority. 0Dh SOC13 was last round robin SOC to convert, SOC14 is highest round robin priority. 0Eh SOC14 was last round robin SOC to convert, SOC15 is highest round robin priority. 0Fh SOC15 was last round robin SOC to convert, SOC0 is highest round robin priority. 10h Reset value to indicate no SOC has been converted. SOC0 is highest round robin priority. Set to this value when the ADC module is reset by SOFTPRES or when the ADCSOCPRICTL register is written. In the latter case, if a conversion is currently in progress, it will complete and then the new priority will take effect. Others Invalid value. Reset type: SYSRSn

Table 16-44. ADCSOCPRCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4-0	SOC PRIORITY	R/W	0h	<p>SOC Priority</p> <p>Determines the cutoff point for priority mode and round robin arbitration for SOCx</p> <p>00h SOC priority is handled in round robin mode for all channels.</p> <p>01h SOC0 is high priority, rest of channels are in round robin mode.</p> <p>02h SOC0-SOC1 are high priority, SOC2-SOC15 are in round robin mode.</p> <p>03h SOC0-SOC2 are high priority, SOC3-SOC15 are in round robin mode.</p> <p>04h SOC0-SOC3 are high priority, SOC4-SOC15 are in round robin mode.</p> <p>05h SOC0-SOC4 are high priority, SOC5-SOC15 are in round robin mode.</p> <p>06h SOC0-SOC5 are high priority, SOC6-SOC15 are in round robin mode.</p> <p>07h SOC0-SOC6 are high priority, SOC7-SOC15 are in round robin mode.</p> <p>08h SOC0-SOC7 are high priority, SOC8-SOC15 are in round robin mode.</p> <p>09h SOC0-SOC8 are high priority, SOC9-SOC15 are in round robin mode.</p> <p>0Ah SOC0-SOC9 are high priority, SOC10-SOC15 are in round robin mode.</p> <p>0Bh SOC0-SOC10 are high priority, SOC11-SOC15 are in round robin mode.</p> <p>0Ch SOC0-SOC11 are high priority, SOC12-SOC15 are in round robin mode.</p> <p>0Dh SOC0-SOC12 are high priority, SOC13-SOC15 are in round robin mode.</p> <p>0Eh SOC0-SOC13 are high priority, SOC14-SOC15 are in round robin mode.</p> <p>0Fh SOC0-SOC14 are high priority, SOC15 is in round robin mode.</p> <p>10h All SOCx are in high priority mode, arbitrated by SOC number.</p> <p>Others Invalid selection.</p> <p>Reset type: SYSRSn</p>

16.15.3.11 ADCINTSOCSEL1 Register (Offset = Ah) [Reset = 0000h]

ADCINTSOCSEL1 is shown in [Figure 16-51](#) and described in [Table 16-45](#).

Return to the [Summary Table](#).

Table 16-45. ADCINTSOCSEL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	SOC7	R/W	0h	SOC7 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC7. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC7. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC7. 10 ADCINT2 will trigger SOC7. 11 Invalid selection. Reset type: SYSRSn
13-12	SOC6	R/W	0h	SOC6 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC6. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC6. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC6. 10 ADCINT2 will trigger SOC6. 11 Invalid selection. Reset type: SYSRSn
11-10	SOC5	R/W	0h	SOC5 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC5. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC5. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC5. 10 ADCINT2 will trigger SOC5. 11 Invalid selection. Reset type: SYSRSn
9-8	SOC4	R/W	0h	SOC4 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC4. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC4. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC4. 10 ADCINT2 will trigger SOC4. 11 Invalid selection. Reset type: SYSRSn

Table 16-45. ADCINTSOCSEL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	SOC3	R/W	0h	SOC3 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC3. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC3. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC3. 10 ADCINT2 will trigger SOC3. 11 Invalid selection. Reset type: SYSRSn
5-4	SOC2	R/W	0h	SOC2 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC2. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC2. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC2. 10 ADCINT2 will trigger SOC2. 11 Invalid selection. Reset type: SYSRSn
3-2	SOC1	R/W	0h	SOC1 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC1. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC1. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC1. 10 ADCINT2 will trigger SOC1. 11 Invalid selection. Reset type: SYSRSn
1-0	SOC0	R/W	0h	SOC0 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC0. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC0. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC0. 10 ADCINT2 will trigger SOC0. 11 Invalid selection. Reset type: SYSRSn

16.15.3.12 ADCINTSOCSEL2 Register (Offset = Bh) [Reset = 0000h]

Bit	Field	Type	Reset	Description
12	SOC12	R-0/W1S	0h	<p>SOC12 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC12 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC12 flag bit to 1. This will cause a conversion to start once priority is given to SOC12.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC12 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
11	SOC11	R-0/W1S	0h	<p>SOC11 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC11 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC11 flag bit to 1. This will cause a conversion to start once priority is given to SOC11.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC11 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
10	SOC10	R-0/W1S	0h	<p>SOC10 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC10 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC10 flag bit to 1. This will cause a conversion to start once priority is given to SOC10.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC10 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
9	SOC9	R-0/W1S	0h	<p>SOC9 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC9 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC9 flag bit to 1. This will cause a conversion to start once priority is given to SOC9.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC9 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>

Table 16-48. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SOC8	R-0/W1S	0h	<p>SOC8 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC8 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC8 flag bit to 1. This will cause a conversion to start once priority is given to SOC8.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC8 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
7	SOC7	R-0/W1S	0h	<p>SOC7 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC7 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC7 flag bit to 1. This will cause a conversion to start once priority is given to SOC7.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC7 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
6	SOC6	R-0/W1S	0h	<p>SOC6 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC6 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC6 flag bit to 1. This will cause a conversion to start once priority is given to SOC6.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC6 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
5	SOC5	R-0/W1S	0h	<p>SOC5 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC5 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC5 flag bit to 1. This will cause a conversion to start once priority is given to SOC5.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC5 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>

Table 16-48. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SOC4	R-0/W1S	0h	<p>SOC4 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC4 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC4 flag bit to 1. This will cause a conversion to start once priority is given to SOC4.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC4 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
3	SOC3	R-0/W1S	0h	<p>SOC3 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC3 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC3 flag bit to 1. This will cause a conversion to start once priority is given to SOC3.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC3 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
2	SOC2	R-0/W1S	0h	<p>SOC2 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC2 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC2 flag bit to 1. This will cause a conversion to start once priority is given to SOC2.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC2 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>
1	SOC1	R-0/W1S	0h	<p>SOC1 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC1 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC1 flag bit to 1. This will cause a conversion to start once priority is given to SOC1.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC1 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>

Table 16-48. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	SOC0	R-0/W1S	0h	<p>SOC0 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC0 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC0 flag bit to 1. This will cause a conversion to start once priority is given to SOC0.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC0 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> <p>Reset type: SYSRSn</p>

16.15.3.15 ADCSOCOVF1 Register (Offset = Eh) [Reset = 0000h]

ADCSOCOVF1 is shown in [Figure 16-55](#) and described in [Table 16-49](#).

Return to the [Summary Table](#).

ADC SOC Overflow 1 Register

Figure 16-55. ADCSOCOVF1 Register

15	14	13	12	11	10	9	8

Table 16-49. ADCSOCOVF1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R	0h	SOC15 Start of Conversion Overflow Flag. Indicates an SOC15 event was generated in hardware while an existing SOC15 event was already pending. 0 No SOC15 event overflow. 1 SOC15 event overflow. An overflow condition does not stop SOC15 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
14	SOC14	R	0h	SOC14 Start of Conversion Overflow Flag. Indicates an SOC14 event was generated in hardware while an existing SOC14 event was already pending. 0 No SOC14 event overflow. 1 SOC14 event overflow. An overflow condition does not stop SOC14 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
13	SOC13	R	0h	SOC13 Start of Conversion Overflow Flag. Indicates an SOC13 event was generated in hardware while an existing SOC13 event was already pending. 0 No SOC13 event overflow. 1 SOC13 event overflow. An overflow condition does not stop SOC13 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn
12	SOC12	R	0h	SOC12 Start of Conversion Overflow Flag. Indicates an SOC12 event was generated in hardware while an existing SOC12 event was already pending. 0 No SOC12 event overflow. 1 SOC12 event overflow. An overflow condition does not stop SOC12 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit. Reset type: SYSRSn

Table 16-49. ADCSOCOVF1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	SOC11	R	0h	<p>SOC11 Start of Conversion Overflow Flag. Indicates an SOC11 event was generated in hardware while an existing SOC11 event was already pending.</p> <p>0 No SOC11 event overflow. 1 SOC11 event overflow.</p> <p>An overflow condition does not stop SOC11 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.</p> <p>Reset type: SYSRSn</p>
10	SOC10	R	0h	<p>SOC10 Start of Conversion Overflow Flag. Indicates an SOC10 event was generated in hardware while an existing SOC10 event was already pending.</p> <p>0 No SOC10 event overflow. 1 SOC10 event overflow.</p> <p>An overflow condition does not stop SOC10 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.</p> <p>Reset type: SYSRSn</p>
9	SOC9	R	0h	<p>SOC9 Start of Conversion Overflow Flag. Indicates an SOC9 event was generated in hardware while an existing SOC9 event was already pending.</p> <p>0 No SOC9 event overflow. 1 SOC9 event overflow.</p> <p>An overflow condition does not stop SOC9 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.</p> <p>Reset type: SYSRSn</p>
8	SOC8	R	0h	<p>SOC8 Start of Conversion Overflow Flag. Indicates an SOC8 event was generated in hardware while an existing SOC8 event was already pending.</p> <p>0 No SOC8 event overflow. 1 SOC8 event overflow.</p> <p>An overflow condition does not stop SOC8 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.</p> <p>Reset type: SYSRSn</p>
7	SOC7	R	0h	<p>SOC7 Start of Conversion Overflow Flag. Indicates an SOC7 event was generated in hardware while an existing SOC7 event was already pending.</p> <p>0 No SOC7 event overflow. 1 SOC7 event overflow.</p> <p>An overflow condition does not stop SOC7 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.</p> <p>Reset type: SYSRSn</p>
6	SOC6	R	0h	<p>SOC6 Start of Conversion Overflow Flag. Indicates an SOC6 event was generated in hardware while an existing SOC6 event was already pending.</p> <p>0 No SOC6 event overflow. 1 SOC6 event overflow.</p> <p>An overflow condition does not stop SOC6 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.</p> <p>Reset type: SYSRSn</p>

Chapter 17

Buffered Digital-to-Analog Converter (DAC)

The buffered digital-to-analog converter (DAC) is an analog module that can output a programmable, arbitrary reference voltage.

17.1 Introduction	2032
17.2 Using the DAC	2033
17.3 Lock Registers	2034
17.4 Software	2035
17.5 DAC Registers	2035

17.1 Introduction

The buffered DAC module consists of an internal 12-bit DAC and an analog output buffer that is capable of driving an external load. For driving even higher loads than typical, a trade-off can be made between load size and output voltage swing. For the load conditions of the buffered DAC, see the device-specific data sheet. The buffered DAC is a general-purpose DAC that can be used to generate a DC voltage in addition to AC waveforms such as sine waves, square waves, triangle waves and so forth. Software writes to the DAC value register can take effect immediately or can be synchronized with EPWMSYNCPER events.

17.1.1 DAC Related Collateral

Foundational Materials

- [C2000 Academy - DAC](#)
- [High Speed, Digital to Analog Converters Basics Application Report](#)
- [Real-Time Control Reference Guide](#)
 - Refer to the DAC section
- [Understanding Data Converters Application Report](#)

17.1.2 Features

Each buffered DAC has the following features:

- 12-bit programmable internal DAC
- Selectable reference voltage source
- x1 and x2 gain modes when using internal VREFHI
- Ability to synchronize with EPWMSYNCPER

17.1.3 Block Diagram

The block diagram for the buffered DAC is shown in [Figure 17-1](#).

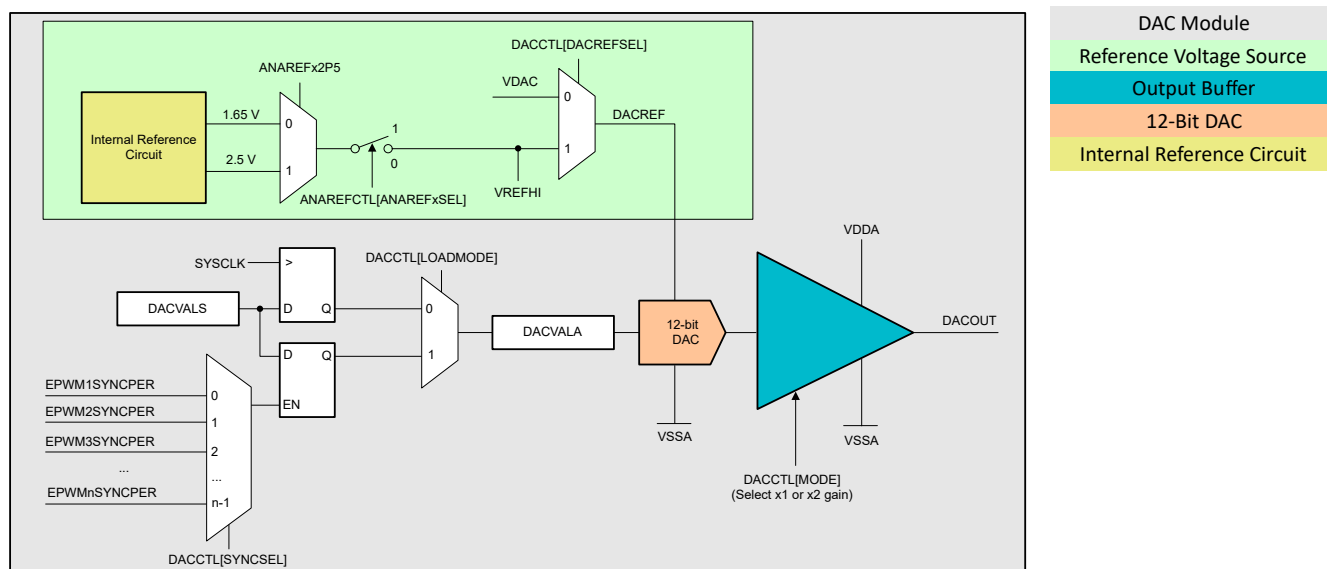

Figure 17-1. DAC Module Block Diagram

17.2 Using the DAC

The internal DAC's reference voltage source, DACREF, is selectable between VDACC and VREFHI. The x2 gain mode is only available when VREFHI is set as DACREF and internal reference mode is used, which can be configured by DACCTL[MODE] register. The internal reference circuit generates 1.65V and 2.5V. To select either 2.5V or 1.65V, configure ANAREF2P5 register and set ANAREFSEL register to 0 (see the *Analog Subsystem* chapter on how to switch to internal reference mode). Even though the buffered DAC has an x2 gain mode, the maximum output voltage from the buffered DAC is not greater than VDDA. Table 17-1 lists the gain mode combinations supported by the buffered DAC. In this table, x = A or B, X = Don't Care, VDACC/ VREFHI = 2.5v, VDDA = 3.3v, and DACVAL = 4095.

Table 17-1. DAC Supported Gain Mode Combinations

DACREFSEL	ANAREFSEL	ANAREF2P5	Reference Source	Reference Voltage (V)	Mode	Maximum DAC Output (V)	Support Status
0	X	X	External	VDACC	0	2.5	Supported
0	X	X	External	VDACC	1	2.5	Not Supported
1	0	0	Internal	1.65	0	1.65	Not Supported
1	0	0	Internal	1.65	1	3.3	Supported
1	0	1	Internal	2.5	0	2.5	Supported
1	0	1	Internal	2.5	1	2.5	Not Supported
1	1	X	External	VREFHI	0	2.5	Supported
1	1	X	External	VREFHI	1	2.5	Not Supported

Two sets of DACVAL registers, DACVALA and DACVALS, are present in the buffered DAC module. DACVALA is a read-only register that actively controls the buffered DAC value. DACVALS is a writable shadow register that loads into DACVALA either immediately or synchronized with the next EPWMSYNCPER event. If the clock to the buffered DAC is disabled while the buffered DAC is outputting a voltage, the output voltage remains unaffected, but DACVALA and DACVALS is no longer updated with register writes. Enabling the clock to the buffered DAC restores the DAC to the state before the clock was disabled.

The output of the internal DAC is calculated with the following equation:

$$DACOUT = \frac{DACVALA * DACREF}{4096} \quad (10)$$

The output buffer of the buffered DAC can exhibit non-linear behavior near the supply rails (VDDA/VSSA). To determine the linear range of the buffered DAC, see the device-specific data sheet.

17.2.1 Initialization Sequence

1. Enable the buffered DAC clock.
2. Set DACREF with DACREFSEL.
3. Power up the buffered DAC with DACOUTEN.
4. Wait for the power-up time to elapse before outputting a voltage. To determine the power-up time of the buffered DAC, see the device data sheet.
5. For predictable behavior of the buffered DAC, consecutive writes to DACVALS must be spaced apart according to the settling time of the buffered DAC. To determine the settling time of the buffered DAC, see the device data sheet.

17.2.2 DAC Offset Adjustment

Zero offset error is defined as the difference between the voltage at midcode (2048) and 1.25V (for 2.5V reference voltage). DAC offset error is calibrated at 2.5V reference voltage and loaded into the DAC offset trim register as part of the `Device_cal()` function. If the DAC is used at any reference voltage other than 2.5V, the offset trim must be adjusted to make sure the offset error performance stays within the device-specific data sheet limits. The DAC offset register is a 16-bit register that contains the 8-bit signed offset trim in the lower half of the register. Use the function call `DAC_tuneOffsetTrim()` found in `C2000Ware` to adjust the offset.

17.2.3 EPWMSYNCPER Signal

EPWMSYNCPER comes from the Time-Base submodule of the EPWM. For a detailed description of how this signal is generated, refer to the *Time-Base Submodule* section of the *Enhanced Pulse Width Modulator (ePWM)* chapter.

The EPWMSYNCPER signal that loads DACVALA when DACCTL [LOADMODE] = 1 is a level trigger load. If TBCTR and TBPRD of the EPWM are both 0, EPWMSYNCPER is held at a high level and DACVALA is immediately loaded from DACVALS irrespective of the value of DACCTL [LOADMODE]. Due to this, configure the EPWM first before setting DACCTL [LOADMODE] to 1.

Note

The name of the sync signal that the GPDAC receives from the EPWM has been updated from PWMSYNC to EPWMSYNCPER (SYNCPER/PWMSYNCPER/EPWMxSYNCPER) to avoid confusion with the other EPWM sync signals EPWMSYNCI and EPWMSYNCO. For a description of these signals, see the *Enhanced Pulse Width Modulator (ePWM)* chapter.

17.3 Lock Registers

A DACLOCK register is provided to prevent spurious writes from modifying the DACCTL, DACVALS, and DACOUTEN registers. Once a register is protected through DACLOCK, write access are locked out until the device is reset.

17.4 Software

17.4.1 DAC Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/dac

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](https://dev.ti.com/C2000Ware/Examples).

17.4.1.1 Buffered DAC Enable

FILE: buffdac_ex1_enable.c

This example generates a voltage on the buffered DAC output, DACOUTA/ADCINA0 and uses the default DAC reference setting of VDAC.

ExternalConnections

- When the DAC reference is set to VDAC, an external reference voltage must be applied to the VDAC pin. This can be accomplished by connecting a jumper wire from 3.3V to ADCINB3.

17.4.1.2 Buffered DAC Random

FILE: buffdac_ex2_random.c

This example generates random voltages on the buffered DAC output, DACOUTA/ADCINA0 and uses the default DAC reference setting of VDAC.

ExternalConnections

- When the DAC reference is set to VDAC, an external reference voltage must be applied to the VDAC pin. This can be accomplished by connecting a jumper wire from 3.3V to ADCINB3.

17.4.1.3 Buffered DAC Sine (buffdac_sine)

FILE: buffdac_ex3_waveform.c

This example generates a sine wave on the buffered DAC output, DACOUTA/ADCINA0 (HSEC Pin 9) and uses the default DAC reference setting of VDAC.

When the DAC reference is set to VDAC, an external reference voltage must be applied to the VDAC pin. This can be accomplished by connecting a jumper wire from 3.3V to ADCINB3.

17.5 DAC Registers

This section describes the Buffered Digital to Analog Converter registers.

17.5.1 DAC Base Address Table

Table 17-2. DAC Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected
Instance	Structure							
DacaRegs	DAC_REGS	DACA_BASE	0x0000_5C00	YES	YES	YES	YES	YES
DacbRegs	DAC_REGS	DACB_BASE	0x0000_5C10	YES	YES	YES	YES	YES

17.5.2 DAC_REGS Registers

Table 17-3 lists the memory-mapped registers for the DAC_REGS registers. All register offset addresses not listed in Table 17-3 should be considered as reserved locations and the register contents should not be modified.

Table 17-3. DAC_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	DACREV	DAC Revision Register		Go
1h	DACCTL	DAC Control Register	EALLOW	Go

Chapter 18 Comparator Subsystem (CMPSS)

The Comparator Subsystem (CMPSS) consists of analog comparators and supporting circuits that are useful for power applications such as peak current mode control, switched-mode power, power factor correction, voltage trip monitoring, and so forth.

See the [C2000 Real-Time Control Peripheral Reference Guide](#) for a list of all devices with modules of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

18.1 Introduction	2046
18.2 Comparator	2047
18.3 Reference DAC	2048
18.4 Ramp Generator	2049
18.5 Digital Filter	2052
18.6 Using the CMPSS	2053
18.7 Software	2055
18.8 CMPSS Registers	2056

18.1 Introduction

The comparator subsystem is built around a number of modules. Each subsystem contains two comparators, two reference 12-bit DACs, and two digital filters. The subsystem also includes one ramp generator. The ramp generator ramps down only. Comparators are denoted "H" or "L" within each module where "H" and "L" represent high and low, respectively. Each comparator generates a digital output which indicates whether the voltage on the positive input is greater than the voltage on the negative input. The positive input of the comparator is driven from an external pin (see the *Analog Subsystem* chapter for mux options available to the CMPSS). The negative input can be driven by an external pin or by the programmable reference 12-bit DAC. Each comparator output passes through a programmable digital filter that can remove spurious trip signals. An unfiltered output is also available if filtering is not required.

A ramp generator circuit is optionally available to control the reference 12-bit DAC value for the high comparator in the subsystem.

18.1.1 CMPSS Related Collateral

Foundational Materials

- [C2000 Academy - CMPSS](#)
- [Real-Time Control Reference Guide](#)
 - Refer to the Comparator section

Expert Materials

- [Peak Current Mode Controlled PSFB Converter Reference Design Using C2000™ Real-time MCU](#)
- [Understanding and Applying Current-Mode Control Theory Application Report](#)

18.1.2 Features

Each CMPSS includes:

- Two analog comparators
- Two programmable reference 12-bit DACs
- One decrementing ramp generator
- Two digital filters, max filter clock prescale = 2^{16}
- Ability to synchronize submodules with EPWMSYNCPER
- Ability to extend clear signal with EPWMBLANK
- Ability to synchronize output with SYSCLK
- Ability to latch output
- Ability to invert output
- Option to use hysteresis on the input
- Option for negative input of comparator to be driven by an external signal or by the reference DAC
- The DAC reference voltage can be set to VDDA or VDAC

18.1.3 Block Diagram

The block diagram for the CMPSS is shown in Figure 18-1.

- CTRIPx(x= "H" or "L") signals are connected to the ePWM X-BAR for ePWM trip response. See the *Enhanced Pulse Width Modulator (ePWM)* chapter for more details on the ePWM X-BAR mux configuration.
- CTRIPxOUTx(x= "H" or "L") signals are connected to the Output X-BAR for external signaling. See the *General-Purpose Input/Output (GPIO)* chapter for more details on the Output X-BAR mux configuration.

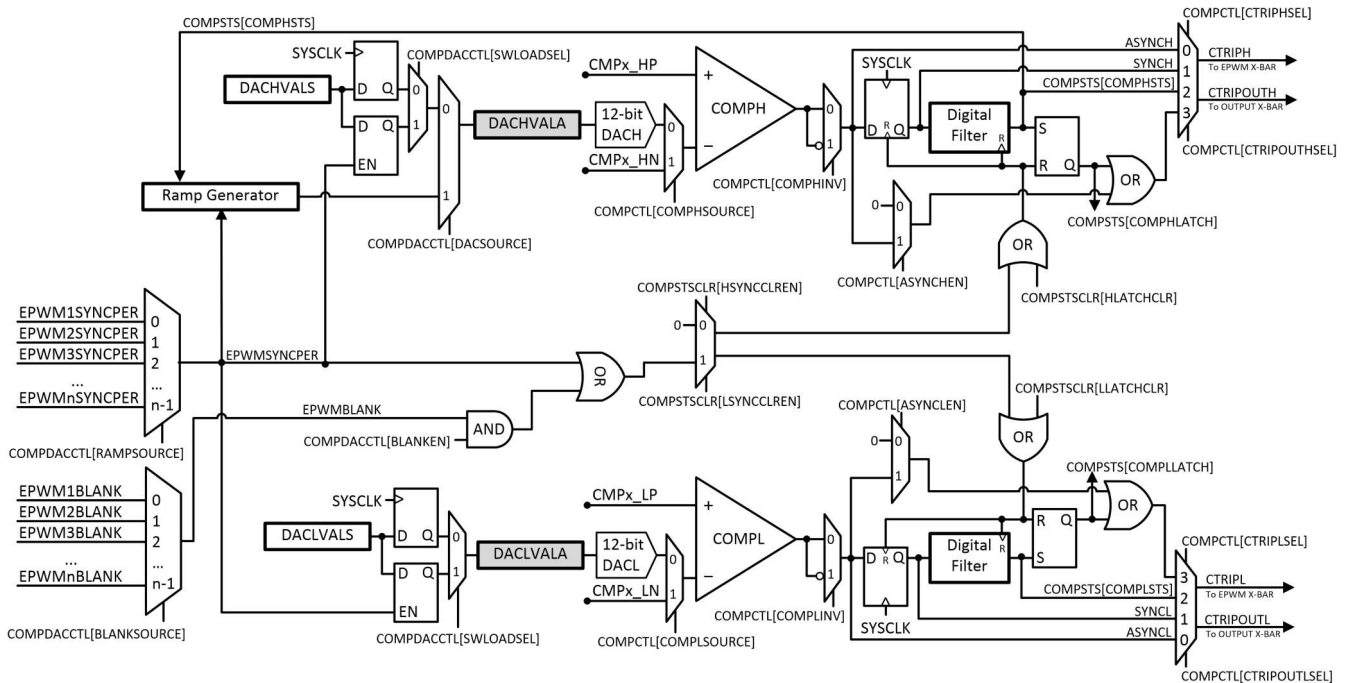

Figure 18-1. CMPSS Module Block Diagram

18.2 Comparator

The comparator generates a high digital output when the voltage on the positive input is greater than the voltage on the negative input, and a low digital output when the voltage on the positive input is less than the voltage on the negative input. The comparator is illustrated in Figure 18-2.

Figure 18-2. Comparator Block Diagram

Voltages	Output
Voltage A > Voltage B	1
Voltage A < Voltage B	0

18.3 Reference DAC

Each reference 12-bit DAC can be configured to drive a reference voltage into the negative input of the respective comparator. The reference 12-bit DAC output is internal only and cannot be observed externally.

Two sets of DACxVAL registers, DACxVALA and DACxVALS, are present for each reference 12-bit DAC. DACxVALA is a read-only register that actively controls the reference 12-bit DAC value. DACxVALS is a writable shadow register that loads into DACxVALA either immediately or synchronized with the next EPWMSYNCPER event. The high and low reference 12-bit DAC (DACx) can optionally source the register DACxVALA value from the ramp generator instead of the register DACxVALS.

The operating range of the reference 12-bit DAC is bounded by DACREF and VSSA. The high-voltage reference is VDDA by default, but the high voltage reference can be configured to be VDAC using the COMPDACCTL register. The reference 12-bit DAC is illustrated in Figure 18-3.

Figure 18-3. Reference DAC Block Diagram

The output of the reference 12-bit DAC can be calculated as:

$$DACOUT = \frac{(1 + DACVALA) * DACREF}{4096} \quad (11)$$

Note

- In the situations where both the DACH and DACL are driving the high and low comparators, a trip on one comparator can temporarily disturb the DAC output of the other comparator. The amount and length of time of this disturbance is specified in the device data sheet as “CMPSS DAC output disturbance” and “CMPSS DAC disturbance time”, respectively.

Users must design the system carefully so that if the input signal crosses either DACH or DACL and trips the associated comparator, the input signal stays more than a “CMPSS DAC output disturbance” away from the other comparator trip point for “CMPSS DAC disturbance time”.

- The DACH setting must always be higher than the DACL setting. If the user is not using the DACL, the DACLVALS register must be set to 0 to avoid the comparator COMPL from tripping and affecting the DACH. In this case, there is no limitation on the DACHVALS setting. Accordingly, when not using the DACH, the user must set the DACHVALS register to the maximum.
- The CMPSS instance can be enabled before programming the reference DAC values.

18.4 Ramp Generator

This section discusses the characteristics and behavior of the ramp generator.

18.4.1 Ramp Generator Overview

The ramp generator produces a falling ramp input for the high-reference 12-bit DAC when selected. In this mode, the reference 12-bit DAC uses the most-significant 12 bits of the RAMPSTS countdown register as the input. The low 4 bits of the RAMPSTS countdown register effectively act as a prescale for the falling ramp rate configurable with RAMPDECVALA.

The ramp generator is enabled by setting DACSOURCE = 1. When DACSOURCE = 1 is selected, the value of RAMPSTS is loaded from RAMPMAXREFS and the register remains static until the selected EPWMSYNCPER signal is received. After receiving the selected EPWMSYNCPER signal, the value of RAMPDECVALA is subtracted from RAMPSTS on every subsequent SYSCLK cycle.

To prevent the subtraction from commencing a SYSCLK cycle after a EPWMSYNCPER event, the RAMPDLYA register that serves as a delay counter can be used to hold off the RAMPSTS subtraction. On receiving a EPWMSYNCPER event, the value of RAMPDLYA is decremented by one on every SYSCLK cycle until the register reaches zero. So, the RAMPSTS subtraction only begins when RAMPDLYA is zero.

18.4.2 Ramp Generator Behavior

The ramp generator makes state changes on every rising edge of DACSOURCE, EPWMSYNCPER, and COMPHSTS.

On the rising edge of DACSOURCE: RAMPMAXREFA, RAMPDECVALA, and RAMPDLYA are loaded with the shadow registers. RAMPSTS is loaded with RAMPMAXREFS.

On the rising edge of the selected EPWMSYNCPER: RAMPMAXREFA, RAMPDECVALA, and RAMPDLYA are loaded with the shadow registers. RAMPSTS is loaded with RAMPMAXREFS and starts decrementing when RAMPDLYA counter reaches zero.

On the rising edge of COMPHSTS with RAMPLOADSEL = 1: RAMPMAXREFA, RAMPDECVALA, and RAMPDLYA are loaded with the shadow registers. RAMPSTS is loaded with RAMPMAXREFS and stops decrementing.

On the rising edge of COMPHSTS with RAMPLOADSEL = 0: RAMPSTS is loaded with RAMPMAXREFA and stops decrementing.

Additionally, if the value of RAMPSTS reaches zero, the RAMPSTS register remains static at zero until the next EPWMSYNCPER is received. These state changes are illustrated in the ramp generator block diagram in [Figure 18-4](#).

Figure 18-4. Ramp Generator Block Diagram

18.4.3 Ramp Generator Behavior at Corner Cases

Since the ramp generator makes state changes on every rising edge of EPWMSYNCPER and COMPHSTS, the following behavior can be expected on instances when these two events occur simultaneously or very close together.

Case 1: COMPHSTS rising edge occurs one or more cycles before EPWMSYNCPER rising edge. RAMPSTS stops decrementing on COMPHSTS rising edge event. RAMPSTS starts decrementing on EPWMSYNCPER rising edge event when RAMPDLYA reaches 0.

Case 2: COMPHSTS rising edge occurs simultaneously as EPWMSYNCPER rising edge. EPWMSYNCPER rising edge event takes precedence and RAMPSTS starts decrementing when RAMPDLYA reaches 0. COMPHSTS rising edge event is ignored and does not halt RAMPSTS.

Case 3: COMPHSTS rising edge occurs one or more cycles after EPWMSYNCPER rising edge but before RAMPDLYA reaches 0. RAMPSTS does not decrement when RAMPDLYA reaches 0.

Case 4: COMPHSTS rising edge occurs simultaneously as RAMPDLYA reaches 0 from EPWMSYNCPER rising edge. RAMPSTS does not decrement.

This behavior is also illustrated in [Figure 18-5](#).

Figure 18-5. Ramp Generator Behavior

18.5 Digital Filter

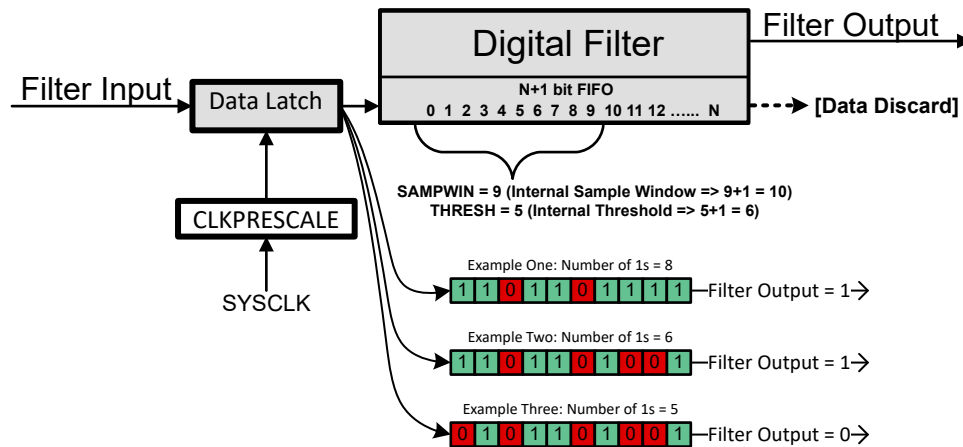

The digital filter works on a window of FIFO samples (SAMPWIN) taken from the input. The filter output resolves to the majority value of the sample window, where majority is defined by the threshold (THRESH) value. If the majority threshold is not satisfied, the filter output remains unchanged.

For proper operation, the value of THRESH must be greater than $SAMPWIN / 2$ and less than or equal to SAMPWIN.

A prescale function (CLKPRESCALE) determines the filter sampling rate, where the filter FIFO captures one sample every prescale system clocks. Old data from the FIFO is discarded.

Note that for SAMPWIN, THRESH and CLKPRESCALE, the internal number used by the digital filter is + 1 in all cases. In essence, samples = SAMPWIN + 1, threshold = THRESH + 1 and prescale = CLKPRESCALE + 1.

A conceptual model of the digital filter is shown in Figure 18-6.

Equivalent C code of the filter implementation is:

```

if (FILTER_OUTPUT == 0) {
    if (Num_1s_in_SAMPWIN >= THRESH) {
        FILTER_OUTPUT = 1;
    }
}
else {
    if (Num_0s_in_SAMPWIN >= THRESH) {
        FILTER_OUTPUT = 0;
    }
}
    
```

18.5.1 Filter Initialization Sequence

For proper operation of the digital filter, the following initialization sequence is recommended:

1. Configure and enable the comparator for operation.
2. Configure the digital filter parameters for operation:
 - Set SAMPWIN for the number of samples to monitor in the FIFO window.
 - Set THRESH for the threshold required for majority qualification.
 - Set CLKPRESCALE for the digital filter clock prescale value.
3. Initialize the sample values in the digital FIFO window by setting FILINIT.
4. Clear COMPSTS latch using COMPSTSCLR, if the latched path is desired.
5. Configure the CTRIP and CTRIPOUT signal paths.
6. If desired, configure the destination module, for example, ePWM, GPIO, and so on to accept the filtered signals.

18.6 Using the CMPSS

18.6.1 LATCHCLR, EPWMSYNCPER, and EPWMBLANK Signals

The LATCHCLR signal holds the digital filter, synchronization block, and the latch output in reset (0) after the required delays. The LATCHCLR signal is activated in software using xLATCHCLR (x = H or L). The LATCHCLR signal can also be activated by EPWMSYNCPER when xSYNCCLREN (x = H or L) is set. If a longer LATCHCLR signal is required, the EPWMBLANK signal can be used to extend the LATCHCLR signal by setting BLANKEN.

EPWMSYNCPER and EPWMBLANK (BLANKWDW) come from the Time-Base and Digital Compare submodules of the EPWM, respectively. For a detailed description of how these two signals are generated, refer to the respective submodule section in the *Enhanced Pulse Width Modulator (ePWM)* chapter.

The EPWMSYNCPER signal that loads DACxVALA when COMPDACCTL[SWLOADSEL] = 1 is a level trigger load. If TBCTR and TBPRD of the EPWM are both 0, EPWMSYNCPER is held at level high and DACxVALA is loaded immediately from DACxVALS irrespective of the value of COMPDACCTL[SWLOADSEL]. Due to this, configure the EPWM first before setting COMPDACCTL[SWLOADSEL] to 1.

Note

The name of the sync signal that the CMPSS receives from the EPWM has been updated from PWMSYNC to EPWMSYNCPER (SYNCPER/PWMSYNCPER/EPWMxSYNCPER) to avoid confusion with the other EPWM sync signals EPWMSYNCL and EPWMSYNCO. For a description of what are these signals, see the *Enhanced Pulse Width Modulator (ePWM)* chapter.

18.6.2 Synchronizer, Digital Filter, and Latch Delays

The synchronization block adds a delay of 1-2 sysclks. If the digital filter is bypassed (all filter settings are 0), the digital filter adds a delay of 2 sysclks. The latch adds 1 sysclk delay.

18.6.3 Calibrating the CMPSS

The CMPSS has two sources of offset errors: comparator offset error and compdac offset error. In the data sheet, the comparator offset error is referred to as **Input referred offset error** and compdac offset error is referred to as **Static offset error**. See the device data sheet for the values.

If both inputs of the comparator are driven from a pin, only the comparator offset error applies. However if the inverting input of the comparator is driven from the compdac, then only the compdac offset error applies. This is because the compdac offset error includes comparator offset error.

Due to the offset errors, the CMPSS must be calibrated to make sure trips happen at the expected levels. The following flow outlines how the calibration can be performed if the inverting input of the comparator is driven from the compdac.

Notes before calibration:

1. A static DC signal is required on the non-inverting input of the comparator.
2. Hysteresis can be disabled for calibration and can be re-enabled after calibration is complete.
3. A noisy input can make calibration difficult, so use the latch with non-zero filter settings depending on how noisy is the signal on the non-inverting input.

This approach sweeps down the compdac:

1. Set the starting compdac value to max, 0xFFFF.
 - Optional: Instead of setting the starting compdac value to maximum, set to **Vtarget + Static offset error + Margin**. Where **Vtarget** is the approximate DC voltage on the non-inverting input, **Static offset error** is the compdac offset error specification and **Margin** is some amount of guard band. This can lead to a faster calibration but only works if **Vtarget** is known. Alternatively, if **Vtarget** is unknown, the ADC can be used to convert **Vtarget**.
2. Decrement compdac value by 1.
3. Wait for compdac to settle.
4. Clear latch.
5. Wait for possible latch set.
6. If latch is set, trip code is found exit.
 - Optional: The trip code can be double checked by:
 - a. Increasing compdac value by 1.
 - b. Clear latch.
 - c. Wait for possible latch set.
 - d. Latch can be unset.
7. If latch is unset, go back to step 2 and repeat.

It is also possible to calibrate the CMPSS, if both inputs of the comparator are driven from a pin. For this case, the flow stays the same but the voltage on the inverting pin of the comparator is swept externally.

18.6.4 Enabling and Disabling the CMPSS Clock

If the clock to the CMPSS module is disabled while the comparator is active, the following behavior can be expected:

- The comparator remains unaffected and continues to trip from voltages on the inputs.
- If the reference 12-bit DAC is driving the negative input of the comparator, the voltage on the negative input remains static and unaffected but DACVALA can no longer be updated from the ramp generator or DACVALS.
- The ramp generator, synchronize block and digital filter freeze on the current states.

Enabling the clock to the CMPSS restores the clock to the state before the clock was disabled.

18.7 Software

18.7.1 CMPSS Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/cmpss

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

18.7.1.1 CMPSS Asynchronous Trip

FILE: cmpss_ex1_asynch.c

This example enables the CMPSS1 COMPH comparator and feeds the asynchronous CTRIPOUTH signal to the GPIO14/OUTPUTXBAR3 pin and CTRIPH to GPIO13/EPWM7B.

CMPSS is configured to generate trip signals to trip the EPWM signals. CMPIN1P is used to give positive input and internal DAC is configured to provide the negative input. Internal DAC is configured to provide a signal at VDD/2. An EPWM signal is generated at GPIO13 and is configured to be tripped by CTRIPOUTH.

When a low input(VSS) is provided to CMPIN1P,

- Trip signal(GPIO14) output is low
- PWM7B(GPIO13) gives a PWM signal

When a high input(higher than VDD/2) is provided to CMPIN1P,

- Trip signal(GPIO14) output turns high
- PWM7B(GPIO13) gets tripped and outputs as high

External Connections

- Give input on CMPIN1P (The pin is shared with ADCINA2)
- Outputs can be observed on GPIO14 and GPIO13 using an oscilloscope

Watch Variables

- None

18.7.1.2 CMPSS Digital Filter Configuration

FILE: cmpss_ex2_digital_filter.c

This example enables the CMPSS1 COMPH comparator and feeds the output through the digital filter to the GPIO14/OUTPUTXBAR3 pin.

CMPIN1P is used to give positive input and internal DAC is configured to provide the negative input. Internal DAC is configured to provide a signal at VDD/2.

When a low input(VSS) is provided to CMPIN1P,

- GPIO14 output is low

When a high input(higher than VDD/2) is provided to CMPIN1P,

- GPIO14 output turns high

18.8 CMPSS Registers

This section describes the CMPSS Registers.

18.8.1 CMPSS Base Address Table

Table 18-1. CMPSS Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected
Instance	Structure

Complex bit access types are encoded to fit into small table cells. Table 18-3 shows the codes that are used for access types in this section.

Table 18-3. CMPSS_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
WOnce	WOnce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		

Table 18-3. CMPSS_REGS Access Type Codes (continued)

Access Type	Code	Description
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

18.8.2.1 COMPCTL Register (Offset = 0h) [Reset = 0000h]

COMPCTL is shown in [Figure 18-7](#) and described in [Table 18-4](#).

Chapter 19
Sigma Delta Filter Module (SDFM)

The sigma delta filter module (SDFM) is a four-channel digital filter designed specifically for current measurement and resolver position decoding in motor control applications. Each input channel can receive an independent delta-sigma ($\Delta\Sigma$) modulator bit stream. The bit streams are processed by four individually-programmable digital decimation filters. The filter set includes a fast comparator (secondary filter) for immediate digital threshold comparisons for over-current and under-current monitoring, and zeros crossing detection.

19.1.2 Features

SDFM features include:

- Eight external pins per SDFM module
 - Four sigma-delta data input pins per SDFM module (SD-Dx, where x = 1 to 4)
 - Four sigma-delta clock input pins per SDFM module (SD-Cx, where x = 1 to 4)
- Different configurable modulator clock modes supported:
 - Mode 0: Modulator clock rate equals the modulator data rate.
- Four independent, configurable secondary filter (comparator) units per SDFM module:
 - Four different filter type selection (Sinc1/Sinc2/SincFast/Sinc3) options available
 - Ability to detect over-value condition, under-value condition, and Threshold-crossing conditions
 1. Two independent Higher Threshold comparators (used to detect over-value condition)
 2. Two independent Lower Threshold comparators (used to detect under-value condition)
 3. One independent Threshold-Crossing comparator (used to measure duty cycle/frequency with eCAP)
 - OSR value for comparator filter unit (COSR) programmable from 1 to 32
- Four independent configurable primary filter (data filter) units per SDFM module:
 - Four different filter type selection (Sinc1/Sinc2/SincFast/Sinc3) options available
 - OSR value for data filter unit (DOSR) programmable from 1 to 256
 - Ability to enable or disable (or both) individual filter module
 - Ability to synchronize all four independent filters of an SDFM module by using the Master Filter Enable (MFE) bit or by using PWM signals
- Data filter output can be represented in either 16 bits or 32 bits.
- Data filter unit has a programmable mode FIFO to reduce interrupt overhead. The FIFO has the following features:
 - The primary filter (data filter) has a 16-deep x 32-bit FIFO.
 - The FIFO can interrupt the CPU after programmable number of data-ready events.
 - FIFO Wait-for-Sync feature: Ability to ignore data-ready events until the PWM synchronization signal (SDSYNC) is received. Once the SDSYNC event is received, the FIFO is populated on every data-ready event.
 - Data filter output can be represented in either 16 bits or 32 bits.
- PWMx.SOCA/SOCB can be configured to serve as SDSYNC source on a per-data-filter-channel basis.
- PWMs can be used to generate a modulator clock for sigma-delta modulators.
- Configurable Input Qualification available for both SD-Cx and SD-Dx
- Ability to use one filter channel clock (SD-C1) to provide clock to other filter clock channels.
- Configurable digital filter available on comparator filter events to blankout comparator events caused by spurious noise

19.1.3 Block Diagram

Each SDFM module has four independent filter modules. These filter modules are identical and can be configured independently. Each individual filter module has the following units:

- Input control unit
- Primary filter (data filter) unit
- Secondary filter (comparator filter) unit with 4 independent comparators

Figure 19-2 shows the SDFM module block diagram. The SDFM port operation is configured and controlled by the registers listed in Section 19.12.

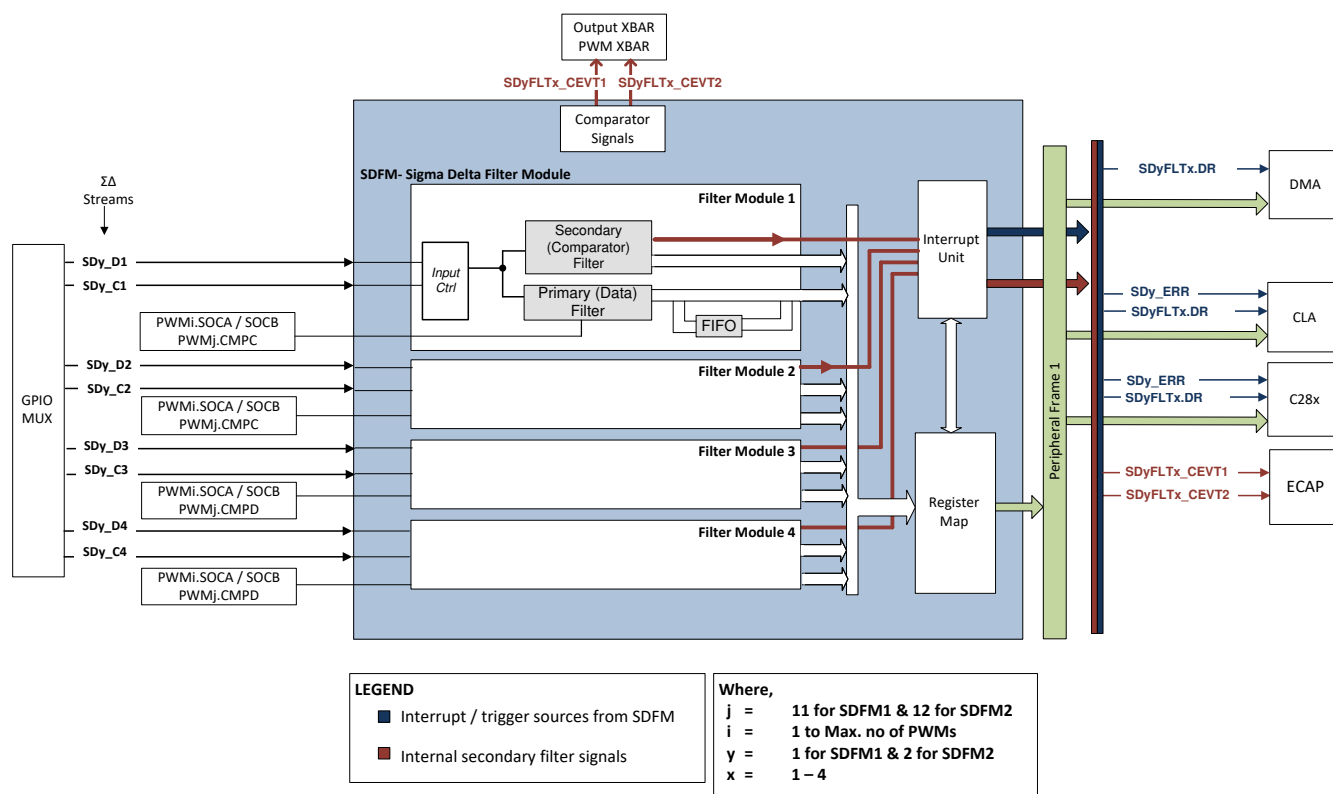

Figure 19-2. Sigma Delta Filter Module (SDFM) Block Diagram

Each filter module shown in Figure 19-3 has a primary (data) filter and a secondary (comparator) filter pair that receives the same bit stream. Except for the input bit stream, both the primary and secondary filter are completely independent of each other. Each of these filter modules can be independently configured. So, in a SDFM module, there is a total of four primary filters and four secondary filters.

Figure 19-3. Block Diagram of One Filter Module

19.2 Configuring Device Pins

The GPIO mux registers must be configured to connect this peripheral to the device pins. To avoid glitches on the pins, the GPyGMUX bits must be configured first (while keeping the corresponding GPyMUX bits at the default of zero), followed by writing the GPyMUX register to the desired value.

For proper SDFM operation, use the following GPIO input qualification. Other GPIO qualifications are not supported.

- GPIO Input qualification is ASYNC, make sure to check the SDFM Electrical Data and Timing (Using ASYNC) requirement is met and be aware of the following caution message. SDFM Input Qualification feature is used to provide protection against random noise glitches.

CAUTION

The SDFM clock inputs (SDx_Cy pins) directly clock the SDFM module. Any glitches or ringing noise on these inputs can corrupt the SDFM module operation. Special precautions must be taken on these signals to make sure of a clean and noise-free signal that meets SDFM timing requirements. Precautions such as series termination for ringing due to any impedance mismatch of the clock driver and spacing of traces from other noisy signals are recommended.

Note

The SDFM module expects SD-Dx to change on the falling edge of SD-Cx and strobes for SD-Dx on the rising edge. But some SD-modulators in the market change SD-Dx on the rising edge and expect SDFM to strobe for data on the falling edge. In such cases, the GPIO inversion feature (GPxINV) is used on SD-Cx pin to change polarity and make it compatible with the SDFM.

See the *General-Purpose Input/Output (GPIO)* chapter for more details on GPIO mux and settings.

19.3 Input Qualification

Impulse noise sources such as EMI, crosstalk, and so on, has the possibility of corrupting SDCLK and SDDATA bit streams, resulting in corrupted SDFM filtered data. This impulse noise effects can be mitigated when using the input qualification feature that synchronizes SDCLK/SDDATA signals with PLLRAWCLK. By default, both SDCLK and SDDATA bit stream are not synchronized. SDCLK can be synchronized to PLLRAWCLK by setting SDCTLPARAMx.SDCLKSYNC = 1 and SDDATA can be synchronized to PLLRAWCLK by setting SDCTLPARAMx.SDDATASYNC = 1. Figure 19-4 shows optional Input Qualification option on SDCLK and SDDATA lines.

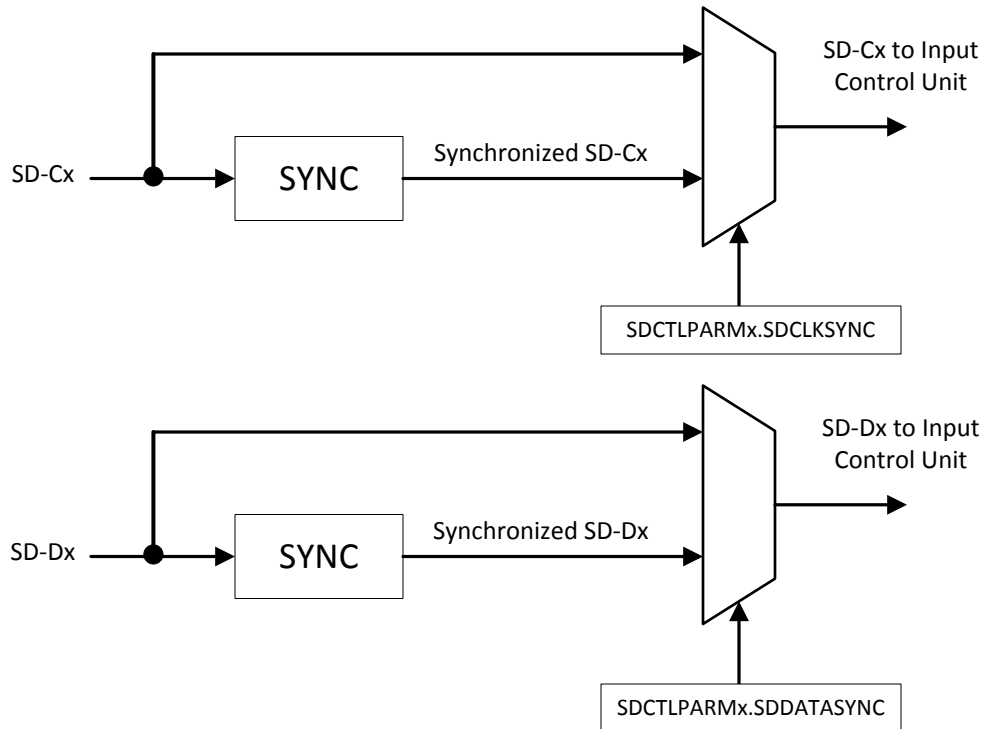

Figure 19-4. Input Qualification on SD-Cx and SD-Dx

Note

Using GPIO input synchronization when SDFM input qualification feature is enabled can cause unexpected results. The user must make sure that the GPIO pin is configured for asynchronous in this case.

19.4 Input Control Unit

The input control unit receives sigma delta modulated data and a sigma delta modulated clock. The modulated data received is captured and passed on to the data filter unit and comparator unit. This unit can be configured to receive the modulated data in Mode 0. [Table 19-1](#) and [Figure 19-5](#) show how SDCTLPARAMx.MOD bits can be configured in Mode 0.

Table 19-1. Modulator Clock Modes

Modulator Mode [MOD]	Description
0	The modulator clock is running with the modulator data rate. The modulator data is strobed at every rising edge of the modulator clock.
1	Reserved
2	Reserved
3	Reserved

Note

To achieve the maximum value, the sigma-delta modulator has to be operated at absolute maximum positive or negative full scale, which is outside of the recommended full scale range of 80% of most sigma-delta modulators.

Mode 0 Operation

Figure 19-5. Different Modulator Modes Supported

19.5 SDFM Clock Control

In systems, the modulator clock can be generated using PWMs. Assuming all the SD-CLKs see the same delay on board traces, you can potentially use just one clock to clock multiple filters; thereby, saving on the number of pins used for SDFM. To enable this, Filter1 SDCLK (SD-C1) can possibly apply to other filter channels if required. The SDCTLPARAMx.SDCLKSEL register bit field can be configured to select filter channel SDCLK. See [Figure 19-6](#) to view this feature.

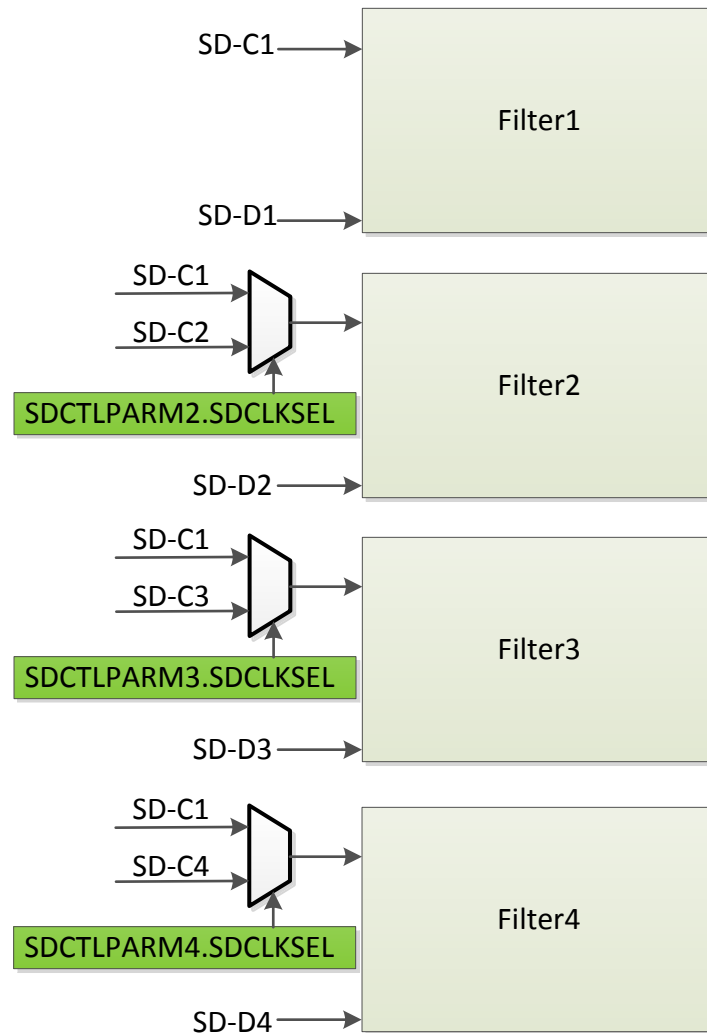

Figure 19-6. SDFM Clock Control

19.6 Sinc Filter

Both the comparator filter and data filter available in SDFM have the Sinc^N filter as the core. The Sinc^N filter is essentially a low-pass filter that converts the input bit stream into digital data by digital filtering and decimation. This filtered digital data represents analog input given to the sigma delta modulator. Simplified Sinc^N architecture consists of cascaded integrators and differentiators separated by a down-sampler as shown in Figure 19-7. The Z-transfer function of the Sinc filter of order N is shown in Figure 19-8.

Figure 19-7. Simplified Sinc Filter Architecture

$$H(Z) = \left[\frac{1 - Z^{-OSR}}{1 - Z^{-1}} \right]^N$$

N = Order of Sinc filter
OSR = Over Sampling Ratio

Figure 19-8. Z-Transform of Sinc Filter of Order N

Effective resolution of the Sinc filter (ENOB) depends upon filter type, OSR and sigma-delta modulator frequency. Typically, higher resolution or ENOB can be achieved by higher OSR for a given filter type; however, the tradeoff is increased filter delay. It is important to choose the right sigma delta modulator by studying the optimal speed versus resolution tradeoff. Refer to the corresponding sigma delta modulator data sheet to determine the effective resolution for a given Sinc filter configuration. [Figure 19-9](#) shows the frequency response of different filter structures when OSR = 32 and when the sigma delta modulator frequency is 10MHz.

Figure 19-9. Frequency Response of Different Sinc Filters

The order of different sinc filter is shown in [Table 19-2](#).

Table 19-2. Order of Sinc Filter

Filter Type	Order of Sinc Filter
Sinc1	1
Sinc2	2
Sinc3	3
SincFast	3

19.6.1 Data Rate and Latency of the Sinc Filter

The data rate of the sinc filter (filter throughput) represented in samples/sec is calculated by the following formula:

$$\text{Data rate of Sinc filter} = \frac{\text{Modulator data rate}}{\text{OSR}} \quad (12)$$

The latency of the sinc filter represented in secs is defined as the amount of time taken by a sinc filter type to deliver the correct filtered output upon initiation. For a given filter type, latency is calculated by the following formula:

$$\text{Latency of Sinc filter} = \frac{\text{Order of Sinc filter}}{\text{Data rate of Sinc filter}} \quad (13)$$

Example configuration:

Sinc filter type	= sinc3
Modulator data rate	= 10MHz
OSR	= 256
Data rate of Sinc Filter	= 10MHz/256 = 39.1K samples/second
Sinc filter latency	= 76.8µs
Sinc filter type	= sinc2
Modulator data rate	= 10MHz
OSR	= 256
Data rate of Sinc Filter	= 10MHz/256 = 39.1K samples/second
Sinc filter latency	=51.2µs

19.7 Data (Primary) Filter Unit

The data filter is a configurable Sinc filter which supports the following filter types: Sinc1, Sinc2, Sinc3, and SincFast. The data filter OSR (DOSR) settings can be configured from 1 to 256 and is independent of the comparator filter. Effective resolution of the data filter (ENOB) depends upon Data filter type, DOSR, and sigma-delta modulator frequency. By default, the data filter is disabled and setting of SDDFPARMx.FEN = 1 enables the data filter. The data filter output is represented in 26-bit signed integer in two's complement format. This filter unit translates a low input signal as '-1' and a high input signal as '1'. The resulting calculation gives both positive and negative values for the output of the data filter. [Table 19-3](#) shows the different full scale values that the data filter can store using different OSRs.

See [Section 19.6.1](#) to understand how to calculate data rate and latency of data filter.

Table 19-3. Peak Data Values for Different DOSR/Filter Combinations

DOSR	Sinc1	Sinc2	Sinc3	SincFast
x	x	x^2	x^3	$2x^2$
4	-4 to 4	-16 to 16	-64 to 64	-32 to 32
8	-8 to 8	-64 to 64	-512 to 512	-128 to 128
16	-16 to 16	-256 to 256	-4096 to 4096	-512 to 512
32	-32 to 32	-1024 to 1024	-32,768 to 32,768	-2048 to 2048
64	-64 to 64	-4096 to 4096	-262,144 to 262,144	-8192 to 8192
128	-128 to 128	-16,384 to 16,384	-2,097,152 to 2,097,152	-32,768 to 32,768
256	-256 to 256	-65,536 to 65,536	-16,777,216 to 16,777,216	-131,072 to 131,072

19.7.1 32-bit or 16-bit Data Filter Output Representation

The data filter output can be represented in either 32-bit or 16-bit format.

32-bit data filter representation:

- When SDDPARMx.DR = 1, data filter output is represented in 32-bit format. Writes to shift control bits do not have any bearing on the output of the data filter in this configuration.

16-bit data filter representation:

- By default, data filter output is represented in 16-bit format
- When SDDPARMx.DR = 0, data filter output is represented in 16-bit format. But it is the responsibility of the user to configure the corresponding shift control bits in the SDDPARMx register to control which 16-bit part of the 32-bit word is sent to the register map.

For example, for the data filter configuration below:

- Filter type = Sinc3
- OSR = 128
- SDDPARMx.DR = 0

The data filter with a 26-bit signed output value can be in the range of $-2,097,152$ to $2,097,152$. But, 16-bit signed output supports values only from $-32,768$ to $32,767$. Therefore, it is required to configure shift control bits (SDDPARMx.SH) to 7 to represent the data filter output correctly in 16-bit format. [Table 19-4](#) shows the configuration settings of shift control bits for different OSR and filter types.

Table 19-4. Shift Control Bit Configuration Settings

OSR	Sinc1	Sinc2	SincFast	Sinc3
1 to 31	0	0	0	0
32 to 40	0	0	0	1
41 to 50	0	0	0	2
51 to 63	0	0	0	3
64 to 80	0	0	0	4
81 to 101	0	0	0	5
102 to 127	0	0	0	6
128 to 161	0	0	1	7
162 to 181	0	0	1	8
182 to 203	0	1	2	8
204 to 255	0	1	2	9
256	0	2	3	10

CAUTION

Configuring shift control bits incorrectly results in getting an incorrect 16-bit data filter output.

19.7.2 Data FIFO

Each primary (data) filter channel has a 16-level deep, 32-bit FIFO.

FIFOs can be configured to collect a programmable number of data filter samples before issuing data-ready interrupt. This reduces the number of data-ready interrupts generated and resulting interrupt overhead for managed data flow.

By default, FIFO operation is disabled. FIFOs can be enabled by setting SDFIFOCTLx.FFEN = 1. When FIFO is enabled, each data-ready event from the data filter populates the FIFO, and the status of the FIFO at any given time is updated in the SDFIFOCTLx.SDFFST bit field.

Setting up FIFO to interrupt after receiving programmable number of data ready events:

- Enable SDFM FIFO (Set SDFIFOCTLx.FFEN = 1)
- Enable SDFM FIFO interrupt (Set SDFIFOCTLx.FFIEN = 1)
- Configure SDFIFOCTLx.SDFFIL bit field to any value between 0 to 16
- Configure SDFM data ready event to interrupt on FIFO interrupt (SDFFINT) (Set SDFFINTx = 1)
- Select data-ready interrupt source is SDFFINTx (DRINTx = SDFFINTx) (SDFIFOCTLx.DRINTSEL = 1)

When the SDFIFOCTLx.SDFFST >= SDFIFOCTLx.SDFFIL condition is met, the SDIFLG.SDFFINTx bit is set and an interrupt is generated on the DRINTx. SDIFLG.SDFFINTx flag can be cleared by setting the SDIFLGCLR.SDFFINTx bit field.

Wait for Sync feature:

The FIFO wait for sync feature can be used to ignore data-ready events from the data filter until the SDSYNC (from PWM) event is triggered.

By default, the Wait for Sync feature is disabled. This feature can be enabled by setting SDSYNcx.WTSYNCEN = 1

When the wait for sync feature is disabled:

FIFOs get populated on every data ready event until the FIFO gets full (or) when SDFIFOCTLx.SDFFST >= SDFIFOCTLx.SDFFIL.

When the wait for sync feature enabled:

FIFOs do not get populated on every data ready event until the FIFO receives a SDSYNC event. On a SYSYNC event, the FIFO sets SDSYNcx.WTSYNFLG = 1 and data ready events from the primary filter start populating the FIFO until either the FIFOs get full or when SDFIFOCTLx.SDFFST >= SDFIFOCTLx.SDFFIL. WTSYNFLG can be cleared either automatically or manually.

When WTSYNFLG = 0, FIFOs contents are frozen and subsequent data ready events do not populate FIFO until next SDSYNC event.

WTSYNFLG automatic clear mode:

By default, this mode is enabled. When SDSYNcx.WTSCLEN = 1, WTSYNFLG is automatically cleared on SDFFINT event.

WTSYNFLG manual clear mode:

Setting SDSYNcx.WTSYNCLR = 1 can be used to clear WTSYNFLG manually.

Clearing FIFO contents:

FIFO contents can be cleared by any of the following methods:-

- Disabling FIFO clear FIFO contents. This can be done by clearing SDFIFOCTLx.FFEN = 0.
- Disabling Primary filter clear FIFO contents. This can be done by either clearing SDDFPARMx.FEN = 0 (or) by clearing SDMFILEN.MFE = 0.
- FIFO contents can also be automatically cleared upon receiving the SDSYNC event. By default, this feature is disabled and this feature can be enabled by setting FIFO Clear-on-SDSYNC enable (SDSYNcx.FFSYNCCLEN = 1).

Note: The above feature is only enabled when wait for sync feature is enabled (SDSYNcx.WTSYNCEN = 1).

FIFO debug access behavior:

Debug access of the SDDATFIFOx registers does not affect the FIFO pointers. On a CPU/CLA/DMA access to the SDDATFIFOx register, the FIFO read pointers advance to the next available entry in the FIFO.

19.7.3 SDSYNC Event

Primary (data) filters can be synchronized with respect to the PWM event (called SDSYNC event). The SDSYNC signal from the PWM module is used to reset the DOSR counter. This feature is by default disabled and can be enabled by setting `SDDFPARMx.SDSYNCEN = 1`. Each primary filter can be synchronized from any of the available PWMx SOCA/SOCB signals (see [Table 19-5](#)). The `SDSYNCx.SDSYNCSEL` bits allow the user to configure which PWM signal provides the SDSYNC pulse to the primary filter. [Figure 19-10](#) shows how device PWM signals are connected to the SDFM modules.

Table 19-5. SDSYNCx.SYNCSEL

SDSYNCxSYNCSEL	Input Signal
0	EPWM1_SOCA
1	EPWM1_SOCB
2-3	Reserved
4	EPWM2_SOCA
5	EPWM2_SOCB
6-7	Reserved
8	EPWM3_SOCA
9	EPWM3_SOCB
10-11	Reserved
12	EPWM4_SOCA
13	EPWM4_SOCB
14-15	Reserved
16	EPWM5_SOCA
17	EPWM5_SOCB
18-19	Reserved
20	EPWM6_SOCA
21	EPWM6_SOCB
22-23	Reserved
24	EPWM7_SOCA
25	EPWM7_SOCB

28	EPWM8_SOCA
29	EPWM8_SOCB
30-63	Reserved

Figure 19-10. SDSYNC Event

Because of the inherent architecture of the Sinc filter (Sinc1, Sinc2, Sinc3, SincFast), the first few samples, depending upon filter type, are incorrect. [Table 19-6](#) shows the number of incorrect samples on the following conditions:

- When Sinc filter is enabled and configured for first time.
- When Sinc filter is disabled and re-enabled or reconfigured in the middle of operation.
- When data filter receives SDSYNC event from PWM.

Table 19-6. Number of Incorrect Samples Tabulated

Filter Type	Number of Incorrect Samples After the Filter is Enabled and Configured
Sinc1	No incorrect sample.
Sinc2	The first sample of the Sinc2 filter is incorrect.
SincFast	The first two samples of the SincFast filter are incorrect.
Sinc3	The first two samples of the Sinc3 filter are incorrect.

CAUTION

SDFM comparator interrupts can be enabled only after providing sufficient settling time to make sure the comparator filter does not trip on these incorrect samples. Therefore, SDFM comparator interrupts (CEVT1 and CEVT2) can be enabled only after a sufficient delay is provided after the comparator filter is configured. This sufficient delay is calculated by adding the latency of the comparator filter and 5 SD-Cx clock cycles.

19.8 Comparator (Secondary) Filter Unit

Most control systems require protection of the system by tripping the PWM in case the current or voltage goes out of bounds. The primary purpose of the secondary (comparator) filter is to allow the user to monitor input conditions with a fast settling time. This allows the user to trip PWMs to protect the system from potential damage.

Note

The secondary (comparator) filter cannot be synchronized with respect to the PWM event (SDSYNC event).

The comparator filter is a configurable Sinc filter that supports the following filter types: Sinc1, Sinc2, Sinc3, and SincFast. The comparator OSR (COSR) settings can be configured from 1 to 32 and is independent of the data filter. Effective resolution of the comparator filter (ENOB) depends upon the comparator filter type, COSR, and sigma-delta modulator frequency. By default, the comparator filter is disabled and setting SDCPARMx.CEN = 1 enables the comparator filter. The comparator filter output is represented in 16-bit unsigned format. This filter unit translates a low input signal as 0 and a high input signal as 1. The resulting calculations give only positive values for the output of the comparator filter. [Table 19-7](#) shows the different full-scale values that the comparator filter can store using different OSRs.

Table 19-7. Peak Data Values for Different OSR/Filter Combinations

OSR	Sinc1	Sinc2	Sinc3	SincFast
x	0 to x	0 to x ²	0 to x ³	0 to 2x ²
4	0 to 4	0 to 16	0 to 64	0 to 32
8	0 to 8	0 to 64	0 to 512	0 to 128
16	0 to 16	0 to 256	0 to 4096	0 to 512
32	0 to 32	0 to 1024	0 to 32,768	0 to 2048

See [Section 19.6.1](#) to understand how to calculate data rate and latency of comparator filter.

The output of the comparator filter is memory-mapped and can be read in the SDCDATAx register. This register, SDCDATAx, is updated every COSR number of SD-Cx cycles. The comparator filter digital output is connected to digital comparators explained below.

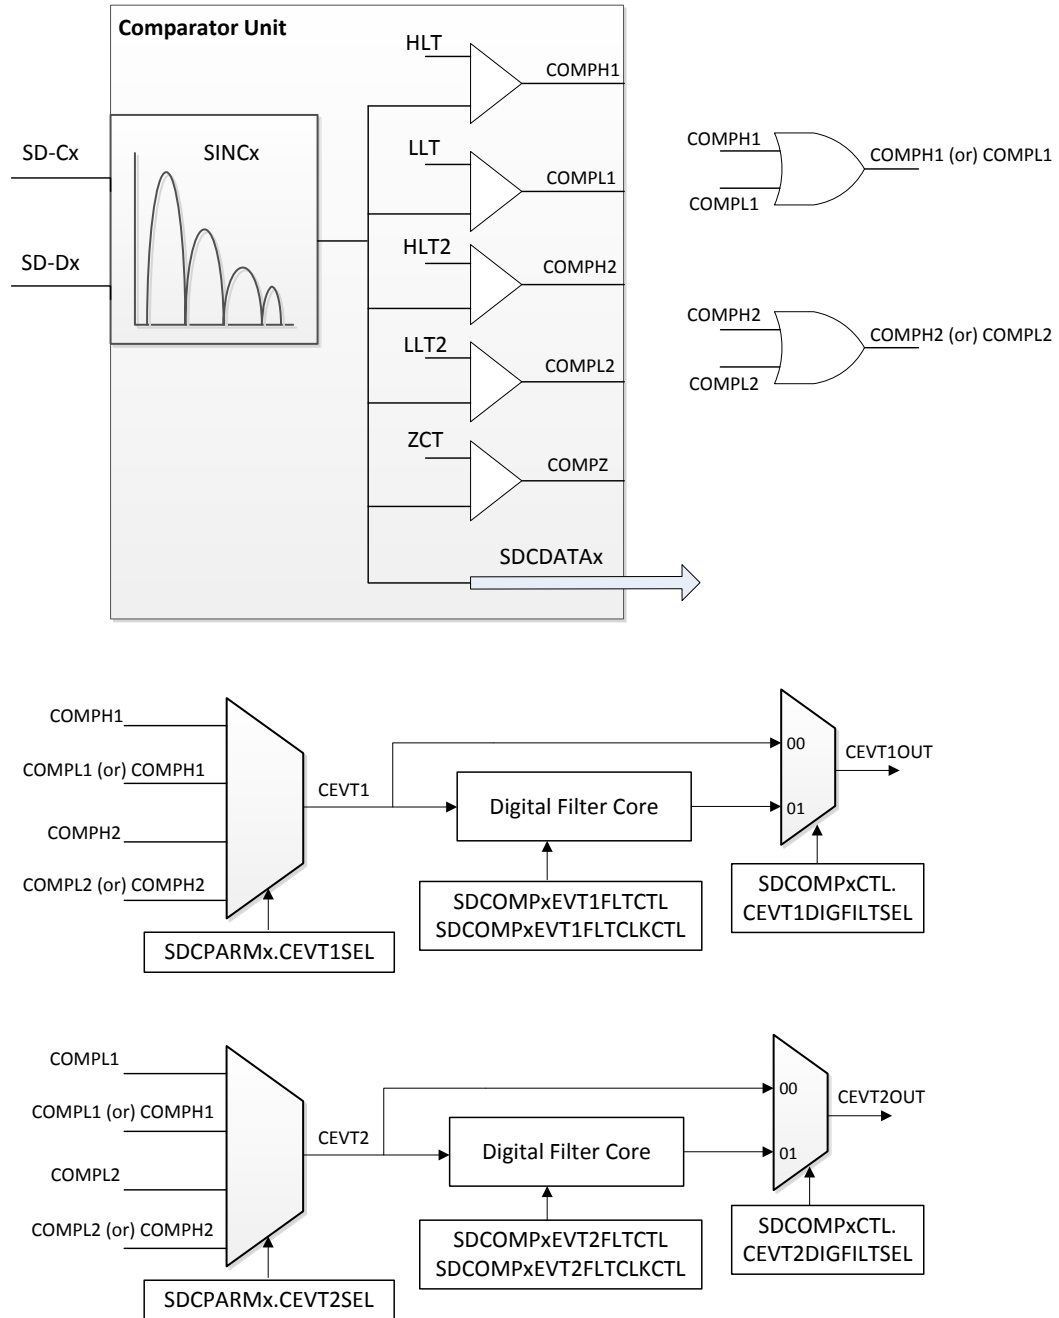

Figure 19-11. Comparator Unit Structure

19.8.1 Higher Threshold (HLT) Comparators

- High threshold comparator can be used to detect over-value condition.
- When comparator data \geq higher threshold register, a high threshold event is generated.
- Higher threshold comparator events except for COMPHZx can be configured to trigger following events: CPU interrupt, CLA task, PWM trip.
- This device has three high threshold comparators:
 - **Higher Threshold 1 (HLT1) Comparator:**
 - When comparator data \geq (SDFLTxCMPH1.HLT), HLT1 comparator generates COMPH1 event.
 - The COMPH1 event is connected to both CEVT1 and CEVT2.
 - **Higher Threshold 2 (HLT2) Comparator:**
 - When comparator data \geq (SDFLTxCMPH2.HLT), HLT2 comparator generates COMPH2 event.
 - The COMPH2 event is connected to both CEVT1 and CEVT2.
 - **Higher Threshold (HTLZ) Comparator:**
 - When comparator data \geq (SDFLT1CMPHZ.CMPHZ), it can generate a Higher Threshold (B) event (COMPHZx) and sets the corresponding SDSTATUS.HZx flag. But, this event cannot be configured to generate SDFM interrupt (SDx_ERR). The COMPHZ signals from HTLZ comparator are connected to CLB XBAR.

19.8.2 Lower Threshold (LLT) Comparators

- The low threshold comparator can be used to detect under-value condition.
- When comparator data \leq Lower Threshold register, a low threshold event is generated.
- Lower threshold comparator events can be configured to trigger following events: CPU interrupt, CLA task, PWM trip.
- Lower threshold comparator events can be used in conjunction with ECAP to measure the frequency / duty cycle of Threshold crossing
- This device has two low threshold comparators. .
 - **Lower Threshold 1 (LLT1) Comparator**
 - When comparator data \leq (SDFLTxCMPL1.LLT), the LLT1 comparator generates COMPL1 event.
 - The COMPL1 event is connected to both CEVT1 and CEVT2.
 - **Lower Threshold 2 (LLT2) Comparator**
 - When comparator data \leq (SDFLTxCMPL2.LLT), LLT2 comparator generates COMPL2 event.
 - The COMPL2 event is connected to both CEVT1 and CEVT2.

19.8.3 Digital Filter

The digital filter works on a window of FIFO samples ($SAMPWIN + 1$) taken from the input. The filter output resolves to the majority value of the sample window, where majority is defined by the threshold (THRESH) value. If the majority threshold is not satisfied, the filter output remains unchanged.

For proper operation, the value of THRESH must be greater than $SAMPWIN / 2$.

A prescale function (CLKPRESCALE) determines the filter sampling rate, where the filter FIFO captures one sample every CLKPRESCALE system clocks. Old data from the FIFO is discarded.

A conceptual model of the digital filter is shown in [Figure 19-12](#).

Figure 19-12. Digital Filter

Equivalent C code of the filter implementation is:

```

if (FILTER_OUTPUT == 0) {
    if (Num_1s_in_SAMPWIN >= THRESH) {
        FILTER_OUTPUT = 1;
    }
}
else {
    if (Num_0s_in_SAMPWIN >= THRESH) {
        FILTER_OUTPUT = 0;
    }
}
    
```

Filter Initialization Sequence

To make sure of proper operation of the digital filter, the following initialization sequence is recommended:

1. Configure the digital filter parameters for operation:
 - Set SAMPWIN for the number of samples to monitor in the FIFO window.
 - Set THRESH for the threshold required for majority qualification.
 - Set CLKPRESCALE for the digital filter clock prescale value.
2. Initialize the sample values in the digital FIFO window by setting FILINIT = 1.

19.9 Theoretical SDFM Filter Output

The following equations can be used to derive a theoretical filter output of an SDFM filter output for both a comparator filter and a data filter.

$$\text{Density of ones in bitstream} = \frac{\text{Input Voltage} + V_{\text{clipping}}}{2 \times V_{\text{clipping}}} \quad (14)$$

Where:

- V_{clipping} = maximum differential voltage input range of modulator
- Input voltage = Differential input voltage applied to the modulator

$$\begin{aligned} \text{Comparator Filter Output (Theoretical)} = \\ \text{Density of ones in bitstream} \times \text{Maximum Filter Output (FilterType, COSR)} \end{aligned} \quad (15)$$

$$\text{FilterOutput} = \left\{ \frac{\text{absolute}(\text{Input voltage})}{V_{\text{clipping}}} \right\} \times \text{Maximum Filter Output (FilterType, DOSR)} \quad (16)$$

$$\text{Data Filter Output}_{32\text{bit}}(\text{Theoretical}) = \begin{cases} \text{FilterOutput} & \text{if Input Voltage is +ve voltage} \\ 2\text{'s complement} & \text{if input voltage is -ve voltage} \\ \text{of FilterOutput} & \end{cases} \quad (17)$$

$$\begin{aligned} \text{Data Filter Output}_{16\text{bit}}(\text{Theoretical}) = \\ \text{Data Filter Output}_{32\text{bit}}(\text{Theoretical}) \gg \text{Shift value}(\text{FilterType, OSR}) \end{aligned} \quad (18)$$

For example, when using the AMC1306x25 modulator:

AMC1306x25	Vclipping = Input voltage (AINP - AINN) =	320mV 100mV
SDFM filter settings	Filter type = Comparator OSR (COSR) = Data filter OSR (DOSR) =	3 32 100

Density of 1s in bit stream	Using Equation 14	0.65625
Comparator filter output Filter type = Sinc3 COSR = 32	Using Equation 15	21504
Data filter output (32-bit) Filter type = Sinc3 DOSR = 100	Using Equation 16 and Equation 17	312500
Data filter output (32-bit) Filter type = Sinc3 DOSR = 100 (Right shift by 5)	Using Equation 18	9765

19.10 Interrupt Unit

Each SDFM can generate five CPU interrupts such as SDFM Error (SDy_ERR) and SDFM data ready (SDy_DRINT1 / SDy_DRINT2, SDy_DRINT3, SDy_DRINT4) interrupts for each filter module.

19.10.1 SDFM (SDyERR) Interrupt Sources

Figure 19-13 shows the structure of SDy_ERR interrupt. SDy_ERR interrupt can be triggered by any of these 16 events.

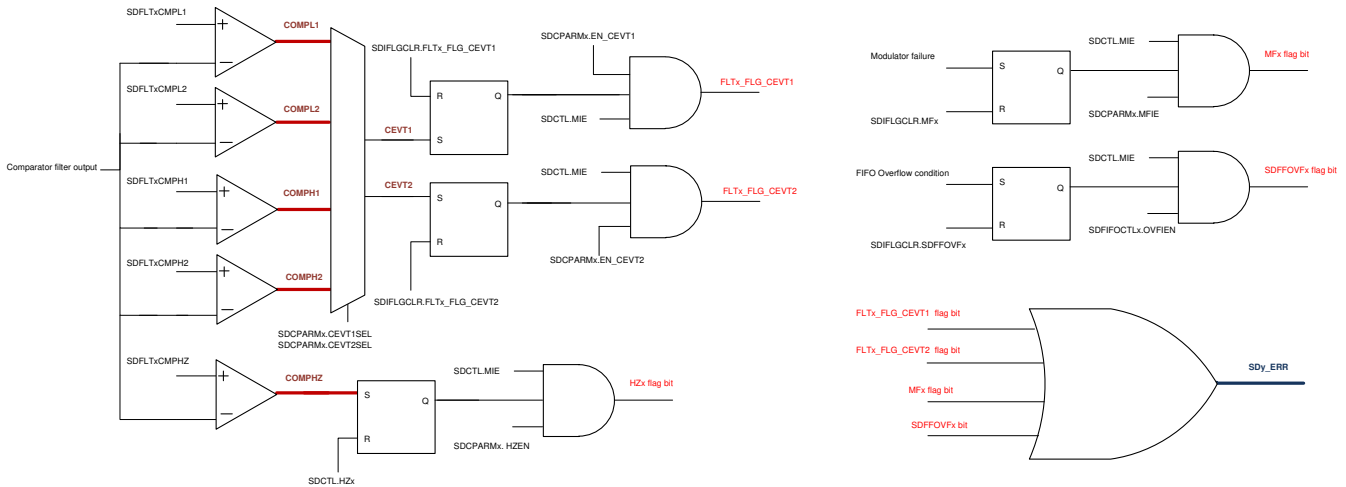

Figure 19-13. SDFM Error (SD_ERR) Interrupt Sources

1. Comparator Event1 (CEVT1)

CEVT1 events from any of the four comparator filter module can trigger CPU interrupt. This event can be configured to trigger SDy_ERR interrupt only if below configurations are made:

- Enable Main interrupt enable (SDCTL.MIE = 1)
- Enable comparator Event1 interrupt (SDCPARMx.EN_CEV1 = 1)

On a CEVT1 event, SDIFLG.FLTx_FLG_CEV1 flag bit is set. This flag bit can only be reset if the corresponding bit in SDIFLGCLR register is set and if the interrupt source is no longer active.

2. Comparator Event2 (CEVT2)

CEVT2 events from any of the four comparator filter module can trigger CPU interrupt. This event can be configured to trigger SDy_ERR interrupt only if below configurations are made:

- Enable Main interrupt enable (SDCTL.MIE = 1)
- Enable comparator event1 interrupt (SDCPARMx.EN_CEV2 = 1)

On a CEVT2 event, SDIFLG.FLTx_FLG_CEV2 flag bit is set. This flag bit can only be reset if the corresponding bit in SDIFLGCLR register is set and if the interrupt source is no longer active.

3. Modulator Failure (MFx) event

Modulator failures (MFx) are generated when SD-Cx goes missing. The modulator clock is considered missing if SD-Cx does not toggle for 64-SYSCLKs. MFx events from any of the four filter modules can trigger CPU interrupt. This event can be configured to trigger SDy_ERR interrupt only if below configurations are made:

- Enable Main Interrupt Enable (SDCTL.MIE = 1)
- Enable modulator clock failure interrupt source (SDCPARMx.MFIE = 1)

On a MFx event, SDIFLG.MFx flag bit is set. This flag bit can only be reset if the corresponding bit in SDIFLGCLR register is set and if the interrupt source is no longer active.

4. FIFO overflow (SDFFOVx) event

The number of filter data available in FIFO at any given point can be tracked in SDFIFOCTLx.SDFFST. If the number of words received in FIFO is greater than Max FIFO depth (16), SDFFOVx event is generated. SDFFOVx events from any of the four filter modules can trigger CPU interrupt. This event can be configured to trigger SDy_ERR interrupt, only if below configurations are made:

- Enable SDFM FIFO (Set SDFIFOCTLx.FFEN = 1)
- Enable SDFM FIFO overflow interrupt (Set SDFIFOCTLx.OVFIEN = 1) and
- Enable Main interrupt enable (Set SDCTL.MIE = 1)

On a SDFFOVx event, all subsequent data (primary) filter data is lost and is not stored in FIFO. SDIFLG.SDFFOVx flag bit is set on a FIFO overflow event and this bit can be cleared if the corresponding bit in SDIFLGCLR register is set and if the interrupt source is no longer active.

19.10.2 Data Ready (DRINT) Interrupt Sources

Figure 19-14 shows the structure of interrupt SDy_DRINTx interrupt. Each SDy_DRINTx interrupt is triggered by corresponding Data Filter channel.

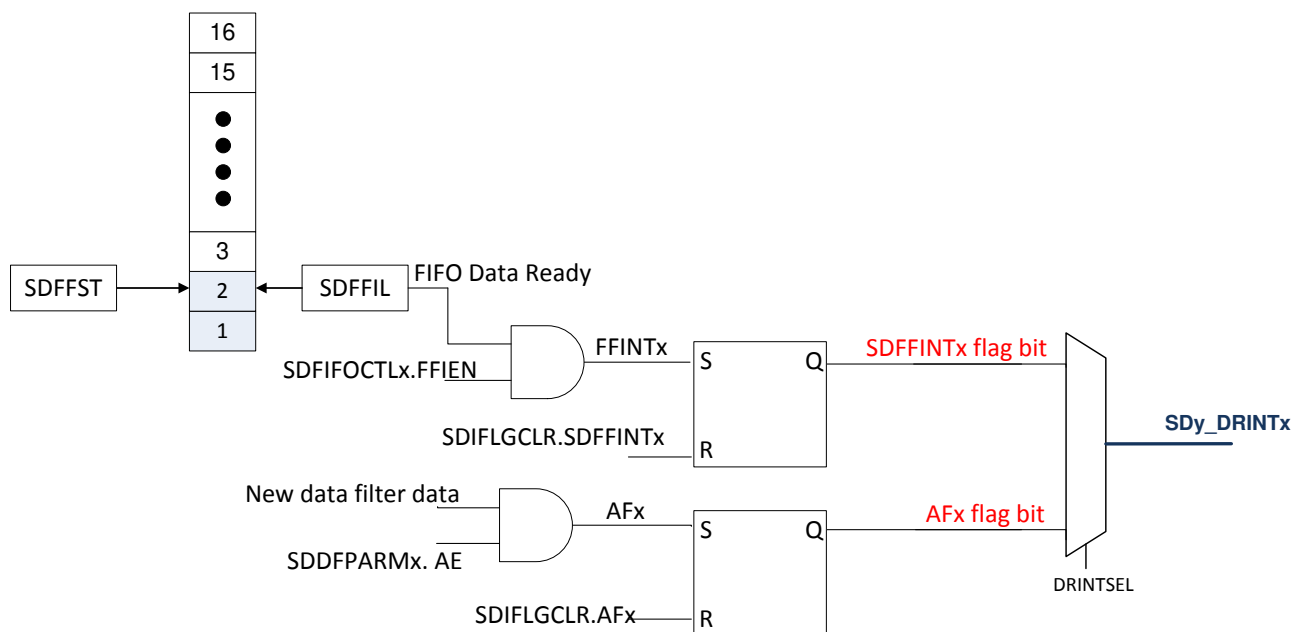

Figure 19-14. SDFM Data Ready (SDy_DRINTx) Interrupt

1. Data Acknowledge (AFx)

When the primary filter is ready with a new filter data, AFx event is generated. AFx events from each filter can generate an SDy_DRINTx interrupt. This event can be configured to trigger SDy_DRINTx interrupt only if below configurations are made:

- Enable individual filter interrupts (SDDFPARMx.AE = 1)
- Select data-ready interrupt source AFx (DRINTx = AFx) (SDFIFOCTLx.DRINTSEL = 0)

On an AFx event, the SDIFLG.AFx flag bit is set. This flag bit can only be reset, if the corresponding bit in SDIFLGCLR register is set and if the interrupt source is no longer active.

2. Four FIFO Data ready interrupt (SDFFINTx)

FIFO Data Ready event is generated whenever SDFIFOCTLx.SDFFST >= SDFIFOCTLx.SDFFIL condition is met. FIFO data ready events from each filter can generate an SDy_DRINTx interrupt. This event can be configured to trigger SDy_DRINTx interrupt only if below configurations are made:

Table 19-8 shows how the DRINTx output is selected.

- Enable SDFM FIFO (Set SDFIFOCTLx.FFEN = 1) and
- Enable SDFM FIFO interrupt (Set SDFIFOCTLx.FFIEN = 1)
- Select data-Ready interrupt source is SDFFINTx (DRINTx = SDFFINTx) (SDFIFOCTLx.DRINTSEL = 1)

Table 19-8. SDFM Data-Ready Interrupt (SDy_DRINTx) Output Selection

DRINTSEL	AE	FFIEN	FFEN	DRINTx
0	0	x	X	0
0	1	x	X	AFx
1	x	0	X	0
1	x	x	0	0
1	x	1	1	SDFFINTx

19.11 Software

19.11.1 SDFM Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/sdfm

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

19.11.1.1 SDFM Filter Sync CPU

FILE: `sdfm_ex1_filter_sync_cpuread.c`

In this example, SDFM filter data is read by CPU in SDFM ISR routine. The SDFM configuration is shown below:

- SDFM used in this example - SDFM1
- Input control mode selected - MODE0
- Comparator settings
 - Sinc3 filter selected
 - OSR = 32
 - HLT = 0x7FFF (Higher threshold setting)
 - LLT = 0x0000(Lower threshold setting)
- Data filter settings
 - All the 4 filter modules enabled
 - Sinc3 filter selected
 - OSR = 128
 - All the 4 filters are synchronized by using MFE (Master Filter enable bit)
 - Filter output represented in 16 bit format
 - In order to convert 25 bit Data filter into 16 bit format user needs to right shift by 7 bits for Sinc3 filter with OSR = 128
- Interrupt module settings for SDFM filter
 - All the 4 higher threshold comparator interrupts disabled
 - All the 4 lower threshold comparator interrupts disabled
 - All the 4 modulator failure interrupts disabled
 - All the 4 filter will generate interrupt when a new filter data is available.

External Connections

- SDFM_PIN_MUX_OPTION1 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4,SDx-C4) on GPIO16-GPIO31
- SDFM_PIN_MUX_OPTION2 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4,SDx-C4) on GPIO46-GPIO61

Watch Variables

- *filter1Result* - Output of filter 1
- *filter2Result* - Output of filter 2
- *filter3Result* - Output of filter 3
- *filter4Result* - Output of filter 4

19.11.1.2 SDFM Filter Sync CLA

FILE: `sdfm_ex2_filter_sync_claread.c`

In this example, SDFM filter data is read by CLA in Cla1Task1. The SDFM configuration is shown below:

- SDFM1 used in this example. For using SDFM2, few modifications would be needed in the example.
- MODE0 Input control mode selected
- Comparator settings
 - Sinc3 filter selected
 - OSR = 32

- hlt = 0x7FFF (Higher threshold setting)
- llt = 0x0000(Lower threshold setting)
- Data filter settings
 - All the 4 filter modules enabled
 - Sinc3 filter selected
 - OSR = 256
 - All the 4 filters are synchronized by using MFE (Master Filter enable bit)
 - Filter output represented in 16 bit format
 - In order to convert 25 bit Data filter into 16 bit format user needs to right shift by 10 bits for Sinc3 filter with OSR = 256
- Interrupt module settings for SDFM filter
 - All the 4 higher threshold comparator interrupts disabled
 - All the 4 lower threshold comparator interrupts disabled
 - All the 4 modulator failure interrupts disabled
 - All the 4 filter will generate interrupt when a new filter data is available

External Connections

- SDFM_PIN_MUX_OPTION1 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4,SDx-C4) on GPIO16-GPIO31
- SDFM_PIN_MUX_OPTION2 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4,SDx-C4) on GPIO46-GPIO61

Watch Variables

- *filter1Result* - Output of filter 1
- *filter2Result* - Output of filter 2
- *filter3Result* - Output of filter 3
- *filter4Result* - Output of filter 4

19.11.1.3 SDFM Filter Sync DMA

FILE: `sdfm_ex3_filter_sync_dmaread.c`

In this example, SDFM filter data is read by DMA. The SDFM configuration is shown below:

- SDFM1 used in this example. For using SDFM2, few modifications would be needed in the example.
- MODE0 Input control mode selected
- Comparator settings
 - Sinc3 filter selected
 - OSR = 32
 - hlt = 0x7FFF (Higher threshold setting)
 - llt = 0x0000(Lower threshold setting)
- Data filter settings
 - All the 4 filter modules enabled
 - Sinc3 filter selected
 - OSR = 256
 - All the 4 filters are synchronized by using MFE (Master Filter enable bit)
 - Filter output represented in 16 bit format
 - In order to convert 25 bit Data filter into 16 bit format user needs to right shift by 10 bits for Sinc3 filter with OSR = 256
- Interrupt module settings for SDFM filter
 - All the 4 higher threshold comparator interrupts disabled
 - All the 4 lower threshold comparator interrupts disabled
 - All the 4 modulator failure interrupts disabled
 - All the 4 filter will generate interrupt when a new filter data is available

External Connections

- SDFM_PIN_MUX_OPTION1 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4,SDx-C4) on GPIO16-GPIO31
- SDFM_PIN_MUX_OPTION2 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4,SDx-C4) on GPIO46-GPIO61

Watch Variables

- *filter1Result* - Output of filter 1
- *filter2Result* - Output of filter 2
- *filter3Result* - Output of filter 3
- *filter4Result* - Output of filter 4

19.11.1.4 SDFM PWM Sync

FILE: `sdfm_ex4_pwm_sync_cpuread.c`

In this example, SDFM filter data is read by CPU in SDFM ISR routine. The SDFM configuration is shown below:

- SDFM1 is used in this example. For using SDFM2, few modifications would be needed in the example.
- MODE0 Input control mode selected
- Comparator settings
 - Sinc3 filter selected
 - OSR = 32
 - hlt = 0x7FFF (Higher threshold setting)
 - llt = 0x0000(Lower threshold setting)

Data filter settings

- All the 4 filter modules enabled
- Sinc3 filter selected
- OSR = 256
- All the 4 filters are synchronized by using PWM (Master Filter enable bit)
- Filter output represented in 16 bit format
- In order to convert 25 bit Data filter into 16 bit format user needs to right shift by 10 bits for Sinc3 filter with OSR = 256

Interrupt module settings for SDFM filter

- All the 4 higher threshold comparator interrupts disabled
- All the 4 lower threshold comparator interrupts disabled
- All the 4 modulator failure interrupts disabled
- All the 4 filter will generate interrupt when a new filter data is available

External Connections

- SDFM_PIN_MUX_OPTION1 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4,SDx-C4) on GPIO16-GPIO31
- SDFM_PIN_MUX_OPTION2 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4,SDx-C4) on GPIO46-GPIO61

Watch Variables

- *filter1Result* - Output of filter 1
- *filter2Result* - Output of filter 2
- *filter3Result* - Output of filter 3
- *filter4Result* - Output of filter 4

19.11.1.5 SDFM Type 1 Filter FIFO

FILE: `sdfm_ex5_type1_filter_fifo_cpuread.c`

This example configures SDFM1 filter in type 1 to demonstrate data read through CPU in FIFO & non-FIFO mode. Data filter is configured in mode 0 to select SINC3 filter with OSR of 256. Filter output is configured for 16-bit format and data shift of 10 is used.

This example demonstrates the FIFO usage if enabled. FIFO length is set at 16 and data ready interrupt is configured to be triggered when FIFO is full. In this example, SDFM filter data is read by CPU in SDFM Data Ready ISR routine.

External Connections

- SDFM_PIN_MUX_OPTION1 Connect Sigma-Delta streams(SD1-D1, SD1-C1) to (GPIO16, GPIO17)
- SDFM_PIN_MUX_OPTION2 Connect Sigma-Delta streams(SD1-D1, SD1-C1) to (GPIO48, GPIO49)

Watch Variables

- *filter1Result* - Output of filter 1

19.11.1.6 SDFM Filter Sync CLA

FILE: `sdfm_ex6_FIFO_freeze_claread.c`

In this example, SDFM FIFO will not be filled until a SDSYNC event. On a SDSYNC event, SDFM data filter output will start filling FIFO and stop filling after programmable number 'N' of FIFO is filled.

SDy-C1 (Filter1 channel clock) is internally configured to connected SDy-C2 / SDy-C3 / SDy-C4 SDFM configuration is shown below:

- SDFM1 used in this example. For using SDFM2, few modifications would be needed in the example.
- MODE0 Input control mode selected
- Comparator settings
 - Sinc3 filter selected
 - OSR = 32
 - hlt = 0x7FFF (Higher threshold setting)
 - llt = 0x0000 (Lower threshold setting)
- Data filter settings
 - All the 4 filter modules enabled
 - Sinc3 filter selected
 - OSR = 256
 - All the 4 filters are synchronized by using MFE (Master Filter enable bit)
 - Filter output represented in 16 bit format
 - In order to convert 25 bit Data filter into 16 bit format user needs to right shift by 10 bits for Sinc3 filter with OSR = 256
- Interrupt module settings for SDFM filter
 - All the 4 higher threshold comparator interrupts disabled
 - All the 4 lower threshold comparator interrupts disabled
 - All the 4 modulator failure interrupts disabled
 - All the 4 filter will generate interrupt when a new filter data is available

External Connections

- SDFM_PIN_MUX_OPTION1 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4, SDx-C4) on GPIO16-GPIO31
- SDFM_PIN_MUX_OPTION2 Connect Sigma-Delta streams to (SDx-D1, SDx-C1 to SDx-D4, SDx-C4) on GPIO46-GPIO61

Watch Variables

- *filter1Result* - Output of filter 1
- *filter2Result* - Output of filter 2
- *filter3Result* - Output of filter 3
- *filter4Result* - Output of filter 4

19.12 SDFM Registers

This section describes the Sigma Delta Filter Module registers.

19.12.1 SDFM Base Address Table

Table 19-9. SDFM Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected
Instance	Structure							
Sdfm1Regs	SDFM_REGS	SDFM1_BASE	0x0000_5E00	YES	YES	YES	YES	YES
Sdfm2Regs	SDFM_REGS	SDFM2_BASE	0x0000_5E80	YES	YES	YES	YES	YES

19.12.2 SDFM_REGS Registers

Table 19-10 lists the memory-mapped registers for the SDFM_REGS registers. All register offset addresses not listed in Table 19-10 should be considered as reserved locations and the register contents should not be modified.

Table 19-10. SDFM_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	SDIFLG	SD Interrupt Flag Register		Go

7Fh	SDCOMP4LOCK	SD compartor event filter4 Lock Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. [Table 19-11](#) shows the codes that are used for access types in this section.

Table 19-11. SDFM_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
WOnce	WOnce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

19.12.2.1 SDIFLG Register (Offset = 0h) [Reset = 0000000h]

SDIFLG is shown in [Figure 19-15](#) and described in [Table 19-12](#).

Return to the [Summary Table](#).

19.12.2.2 SDIFLGCLR Register (Offset = 2h) [Reset = 0000000h]

SDIFLGCLR is shown in [Figure 19-16](#) and described in [Table 19-13](#).

Return to the [Summary Table](#).

SD Module Interrupt Flag Clear Bits:

Writing a '1' will clear the respective flag bit in the SDIFLG register.

Writes of '0' are ignored.

Note: If user writes a '1' to clear a bit on the same cycle that the hardware is trying to set the bit to '1', then hardware has priority and the bit will not be cleared.

Chapter 20 Enhanced Pulse Width Modulator (ePWM)

The enhanced pulse width modulator (ePWM) peripheral is a key element in controlling many of the power electronic systems found in both commercial and industrial equipment. These systems include digital motor control, switch mode power supply control, uninterruptible power supplies (UPS), and other forms of power conversion. The ePWM peripheral can also perform a digital-to-analog (DAC) function, where the duty cycle is equivalent to a DAC analog value; it is sometimes referred to as a power DAC.

This chapter is applicable for ePWM type 4 with added register protection capability. See the [C2000 Real-Time Control Peripheral Reference Guide](#) for a list of all devices with an ePWM module of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

20.1 Introduction

This chapter includes an overview and information about each submodule:

- [Time Base \(TB\) Submodule](#)
- [Counter Compare \(CC\) Submodule](#)
- [Action Qualifier \(AQ\) Submodule](#)
- [Dead-Band Generator \(DB\) Submodule](#)
- [PWM Chopper \(PC\) Submodule](#)
- [Trip Zone \(TZ\) Submodule](#)
- [Event Trigger \(ET\) Submodule](#)
- [Digital Compare \(DC\) Submodule](#)

The ePWM Type 4 is functionally compatible to Type 2 (a Type 3 does not exist). Type 4 has the following enhancements in addition to the Type 2 features:

- **Register Address Map:** Additional registers are required for new features on ePWM Type 4. The ePWM register address space has been remapped for better alignment and easy usage.
- **Delayed Trip Functionality:** Changes have been added to achieve deadband insertion capabilities to support, for example, delayed trip functionality needed for peak current mode control type application scenarios. This has been accomplished by allowing comparator events to go into the Action Qualifier as a trigger event (Events T1 and T2). If comparator T1 / T2 events are used to edit the PWM, changes to the PWM waveform do not take place immediately. Instead, the waveform synchronizes to the next TBCLK.
- **Dead-Band Generator Submodule Enhancements:** Shadowing of the DBCTL register to allow dynamic configuration changes.
- **One Shot and Global Load of Registers:** The ePWM Type 4 allows one shot and global load capability from shadow to active registers to avoid partial loads in, for example, multiphase applications. ePWM Type 4 also allows a programmable prescale of shadow to active load events. ePWM Type 4 Global Load can simplify ePWM software by removing interrupts and making sure that all registers are loaded at the same time.
- **Trip-Zone Submodule Enhancements:** Independent flags have been added to reflect the trip status for each of the TZ sources. Changes have been made to the trip-zone submodule to support certain power converter switching techniques like valley switching.
- **Digital Compare Submodule Enhancements:** Blanking window filter register width has been increased from 8 to 16 bits. DCCAP functionality has been enhanced to provide more programmability.
- **PWM SYNC Related Enhancements:** The ePWM Type 4 allows PWM SYNCOUT generation based on CMPC and CMPD events. These events can also be used for PWMSYNC pulse selection.

The ePWM Type 2 is fully compatible to Type 1. Type 2 has the following enhancements in addition to the Type 1 features:

- **High-Resolution Dead-Band Capability:** High-resolution capability is added to dead-band RED and FED in half-cycle clocking mode.
- **Dead-Band Generator Submodule Enhancements:** The ePWM Type 2 has features to enable both RED and FED on either PWM outputs. Provides increased dead band with 14-bit counters and dead-band / dead-band high-resolution registers are shadowed
- **High-Resolution Extension available on ePWMxB outputs:** Provides the ability to enable high-resolution period and duty cycle control on ePWMxB outputs. This is discussed in more detail in [Section 20.15](#).
- **Counter Compare Submodule Enhancements:** The ePWM Type 2 allows interrupts and SOC events to be generated by additional counter compares CMPC and CMPD.
- **Event Trigger Submodule Enhancements:** Prescaling logic to issue interrupt requests and ADC start of conversion expanded up to every 15 events. This submodule allows software initialization of event counters on SYNC event.
- **Digital Compare Submodule Enhancements:** Digital Compare Trip Select logic [DCTRIPSEL] has up to 12 external trip sources selected by the Input X-BAR logic in addition to an ability to OR all of them (up to 14 [external and internal sources]) to create the respective DCxEVTs.

- **Simultaneous Writes to TBPRD and CMPx Registers:** This feature allows writes to TBPRD, CMPA:CMPAHR, CMPB:CMPBHR, CMPC and CMPD of any ePWM module to be tied to any other ePWM module, and also allows all ePWM modules to be tied to a particular ePWM module if desired.
- **Shadow to Active Load on SYNC of TBPRD and CMP Registers:** This feature supports simultaneous writes of TBPRD and CMPA/B/C/D registers.

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention and must be highly programmable and very flexible while being easy to understand and use. The ePWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the ePWM is built up from smaller single channel submodules with separate resources that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand the operation quickly.

In this document, the letter x within a signal or submodule name is used to indicate a generic ePWM instance on a device. For example, output signals EPWMxA and EPWMxB refer to the output signals from the ePWMx instance. Thus, EPWM1A and EPWM1B belong to ePWM1 and likewise EPWM4A and EPWM4B belong to ePWM4.

Type0 to Type1 Enhancements

- **Increased Dead-Band Resolution:** Dead-band clocking has been enhanced to allow half-cycle clocking to double resolution.
- **Enhanced Interrupt and SOC Generation:** Interrupts and ADC start-of-conversion can now be generated on both the TBCTR == zero and TBCTR == period events. This feature enables dual edge PWM control. Additionally, the ADC start-of-conversion can be generated from an event defined in the digital compare submodule.
- **High-Resolution Period Capability:** Provides the ability to enable high-resolution period. This is discussed in more detail in [Section 20.15](#).
- **Digital Compare Submodule:** The digital compare submodule enhances the event triggering and trip zone submodules by providing filtering, blanking and improved trip functionality to digital compare signals. Such features are essential for peak current mode control and for support of analog comparators.

Note

The name of the sync signal that goes to the CMPSS has been updated from PWMSYNC to EPWMSYNCPER (SYNCPER/PWMSYNCPER/EPWMxSYNCPER) to avoid confusion with the other EPWM sync signals EPWMSYNCI and EPWMSYNCO. For a description of these signals, see [Table 20-2](#).

20.1.2 Submodule Overview

The ePWM module represents one complete PWM channel composed of two PWM outputs: EPWMxA and EPWMxB. Multiple ePWM modules are instanced within a device as shown in [Figure 20-1](#). Each ePWM instance is identical with one exception. Some instances include a hardware extension that allows more precise control of the PWM outputs. This extension is the high-resolution pulse width modulator (HRPWM) and is described in [Section 20.15](#). See the device data sheet to determine which ePWM instances include this feature. Each ePWM module is indicated by a numerical value starting with 1. For example, ePWM1 is the first instance and ePWM3 is the third instance in the system and ePWMx indicates any instance.

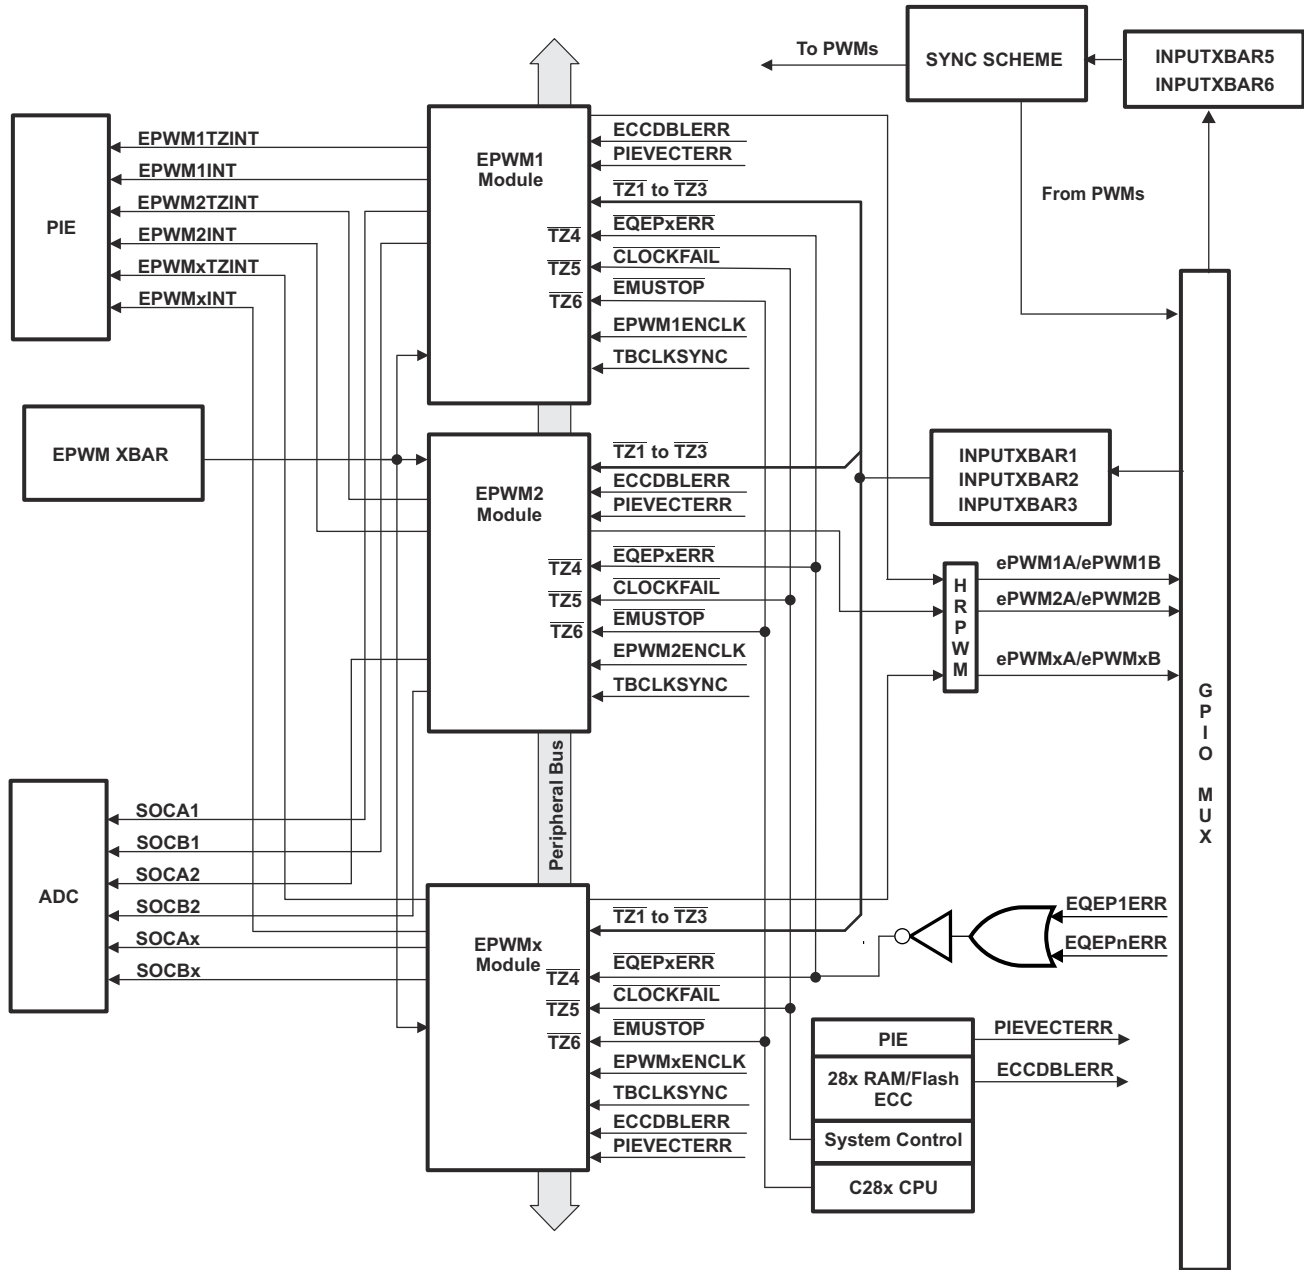

The ePWM modules are chained together by way of a clock synchronization scheme that allows them to operate as a single system when required. Additionally, this synchronization scheme can be extended to the capture peripheral submodules (eCAP). The number of submodules is device-dependent and based on target application needs. Submodules can also operate standalone.

Each ePWM module supports the following features:

- Dedicated 16-bit time-base counter with period and frequency control
- Two PWM outputs (EPWMxA and EPWMxB) that can be used in the following configurations:
 - Two independent PWM outputs with single-edge operation
 - Two independent PWM outputs with dual-edge symmetric operation
 - One independent PWM output with dual-edge asymmetric operation
- Asynchronous override control of PWM signals through software.
- Programmable phase-control support for lag or lead operation relative to other ePWM modules.
- Hardware-locked (synchronized) phase relationship on a cycle-by-cycle basis.
- Dead-band generation with independent rising and falling edge delay control.
- Programmable trip zone allocation of both cycle-by-cycle trip and one-shot trip on fault conditions.
- A trip condition can force either high, low, or high-impedance state logic levels at PWM outputs.
- All events can trigger both CPU interrupts and ADC start of conversion (SOC)
- Programmable event prescaling minimizes CPU overhead on interrupts.
- PWM chopping by high-frequency carrier signal, useful for pulse transformer gate drives.

Each ePWM module is connected to the input/output signals shown in [Figure 20-1](#). The signals are described in detail in subsequent sections.

The order in which the ePWM modules are connected can differ from what is shown in [Figure 20-1](#). See [Section 20.4.3.3](#) for the synchronization scheme for a particular device. Each ePWM module consists of eight submodules and is connected within a system by way of the signals shown in [Figure 20-2](#).

A. This signal exists only on devices with an eQEP submodule.

Figure 20-1. Multiple ePWM Modules

Figure 20-2. Submodules and Signal Connections for an ePWM Module

Figure 20-3 shows more internal details of a single ePWM module. The main signals used by the ePWM module are:

- **PWM output signals (EPWMxA and EPWMxB)**

The PWM output signals are made available external to the device.

- **Trip-zone signals ($\overline{TZ1}$ to $\overline{TZ6}$)**

These input signals alert the ePWM module of fault conditions external to the ePWM module. Each submodule on a device can be configured to either use or ignore any of the trip-zone signals. The $\overline{TZ1}$ to $\overline{TZ3}$ trip-zone signals can be configured as asynchronous inputs through the GPIO peripheral using the Input X-BAR logic, refer to Figure 20-51. $\overline{TZ4}$ is connected to an inverted EQEPx error signal (EQEPxERR), which can be generated from any one of the EQEP submodule (for those devices with an EQEP module). $\overline{TZ5}$ is connected to the system clock fail logic, and $\overline{TZ6}$ is connected to the EMUSTOP output from the CPU. This allows configuring a trip action when the clock fails or the CPU halts.

- **Time-base synchronization input (EPWMxSYNCl), output (EPWMxSYNCO), and peripheral (EPWMxSYNCPER) signals**

Each ePWM module can be synchronized with other ePWM modules or other peripherals, using EPWMSYNCINSEL. Each ePWM module can also generate a synchronization output signal. The source of the EPWMxSYNCO can be selected and enabled by EPWMSYNCOEN and TBCTL2.OSHTSYNCPER. For more information, see Section 20.4.3.3.

Each ePWM module also generates another PWMSYNC signal called EPWMxSYNCPER. EPWMxSYNCPER goes to the GPDAC and CMPSS for synchronization purposes. Functionality is configured using the HRPCTL register, but has no relation with the HRPWM. For more information on how EPWMxSYNCPER is used by the GPDAC and CMPSS, see the respective chapters.

- **ADC start-of-conversion signals (EPWMxSOCA and EPWMxSOCB)**

Each ePWM module has two ADC start of conversion signals. Any ePWM module can trigger a start of conversion. Whichever event triggers the start of conversion is configured in the event-trigger submodule of the ePWM.

- **Comparator output signals (COMPxOUT)**

Output signals from the comparator module can be fed through the Input X-BAR and EPWM X-BAR to one or all of the 12 trip inputs [TRIPIN1 - TRIPIN12] and in conjunction with the trip zone signals can generate digital compare events.

- **Peripheral bus**

The peripheral bus is 32-bits wide and allows both 16-bit and 32-bit writes to the ePWM register file.

A. These events are generated by the ePWM Digital Compare (DC) submodule based on the levels of the TRIPIN inputs.

Figure 20-3. ePWM Modules and Critical Internal Signal Interconnects

20.2 Configuring Device Pins

To connect the device input pins to the module, the Input X-BAR and EPWM X-BAR must be used. Some examples of when an external signal can be needed are TZx, TRIPx, and EXTSYNCIN. Any GPIO on the device can be configured as an input. The GPIO input qualification can be set to asynchronous mode by setting the appropriate GPxQSEL register bits to 11b. The internal pullups can be configured in the GPyPUD register. Since the GPIO mode is used, the GPyINV register can invert the signals. Additionally, some TRIPx (TRIP4-12 excluding TRIP6) signals must be routed through the ePWM X-Bar in addition to the Input X-Bar.

The GPIO mux registers must be configured for this peripheral. To avoid glitches on the pins, the GPyGMUX bits must be configured first (while keeping the corresponding GPyMUX bits at the default of zero), followed by writing the GPyMUX register to the desired value.

See the *General-Purpose Input/Output (GPIO)* chapter for more details on GPIO mux, GPIO settings, and XBAR configuration.

20.3 ePWM Modules Overview

Eight submodules are included in every ePWM peripheral. Each of these submodules performs specific tasks that can be configured by software.

[Table 20-1](#) lists the key submodules together with a list of the main configuration parameters. For example, if you need to adjust or control the duty cycle of a PWM waveform, see the counter-compare submodule in [Section 20.5](#) for relevant details.

Table 20-1. Submodule Configuration Parameters

Submodule	Configuration Parameter or Option
Time Base (TB)	<ul style="list-style-type: none"> • Scale the time-base clock (TBCLK) relative to the ePWM clock (EPWMCLK). • Configure the PWM time-base counter (TBCTR) frequency or period. • Set the mode for the time-base counter: <ul style="list-style-type: none"> – count-up mode: used for asymmetric PWM – count-down mode: used for asymmetric PWM – count-up-and-down mode: used for symmetric PWM • Configure the time-base phase relative to another ePWM module. • Synchronize the time-base counter between modules through hardware or software. • Configure the direction (up or down) of the time-base counter after a synchronization event. • Simultaneous writes to the TBPRD registers on all PWM's corresponding to the configuration on EPWMXLINK. • Configure how the time-base counter behaves when the device is halted by an emulator. • Specify the source for the synchronization output of the ePWM module • Configure one shot and global load of registers in this module.
Counter Compare (CC)	<ul style="list-style-type: none"> • Specify the PWM duty cycle for output EPWMxA and output EPWMxB • Specify the time at which switching events occur on the EPWMxA or EPWMxB output • Specify the programmable delay for interrupt and SOC generation with additional comparators • Simultaneous writes to the CMPA, CMPB, CMPC, CMPD registers on all PWM's corresponding to the configuration on EPWMXLINK. • Configure one shot and global load of registers in this module.

Table 20-1. Submodule Configuration Parameters (continued)

Submodule	Configuration Parameter or Option
Action Qualifier (AQ)	<ul style="list-style-type: none"> • Specify the type of action taken when a time-base counter-compare, trip-zone submodule, or comparator event occurs: <ul style="list-style-type: none"> – No action taken – Output EPWMxA and EPWMxB switched high – Output EPWMxA and EPWMxB switched low – Output EPWMxA and EPWMxB toggled • Force the PWM output state through software control • Configure and control the PWM dead band through software • Configure one shot and global load of registers in this module.
Dead-Band Generator (DB)	<ul style="list-style-type: none"> • Control of traditional complementary dead-band relationship between upper and lower switches • Specify the output rising-edge-delay value • Specify the output falling-edge delay value • Bypass the dead-band module entirely. In this case the PWM waveform is passed through without modification. • Option to enable half-cycle clocking for double resolution. • Allow ePWMxB phase shifting with respect to the ePWMxA output. • Configure one shot and global load of registers in this module.
PWM Chopper (PC)	<ul style="list-style-type: none"> • Create a chopping (carrier) frequency. • Pulse width of the first pulse in the chopped pulse train. • Duty cycle of the second and subsequent pulses. • Bypass the PWM chopper module entirely. In this case the PWM waveform is passed through without modification.
Trip Zone (TZ)	<ul style="list-style-type: none"> • Configure the ePWM module to react to one, all, or none of the trip-zone signals or digital compare events. • Specify the trip action taken when a fault occurs: <ul style="list-style-type: none"> – Force EPWMxA and EPWMxB high – Force EPWMxA and EPWMxB low – Force EPWMxA and EPWMxB to a high-impedance state – Configure EPWMxA and EPWMxB to ignore any trip condition. • Configure how often the ePWM reacts to each trip-zone signal: <ul style="list-style-type: none"> – One-shot – Cycle-by-cycle • Enable the trip-zone to initiate an interrupt. • Bypass the trip-zone module entirely. • Programmable option for cycle-by-cycle trip clear • If desired, independently configure trip actions taken when time-base counter is counting down.
Event Trigger (ET)	<ul style="list-style-type: none"> • Enable the ePWM events that trigger an interrupt. • Enable ePWM events that trigger an ADC start-of-conversion event. • Specify the rate at which events cause triggers (every occurrence or every 2nd or up to 15th occurrence) • Poll, set, or clear event flags
Digital Compare (DC)	<ul style="list-style-type: none"> • Enables comparator (COMP) module outputs and trip zone signals which are configured using the Input X-BAR to create events and filtered events • Specify event-filtering options to capture TBCTR counter, generate blanking window, or insert delay in PWM output or time-base counter based on captured value.

20.4 Time-Base (TB) Submodule

Each ePWM module has a time-base submodule that determines all of the event timing for the ePWM module. Built-in synchronization logic allows the time-base of multiple ePWM modules to work together as a single system.

Figure 20-4 illustrates the time-base submodule within the ePWM.

Figure 20-4. Time-Base Submodule

20.4.1 Purpose of the Time-Base Submodule

The time-base submodule can be configured for the following:

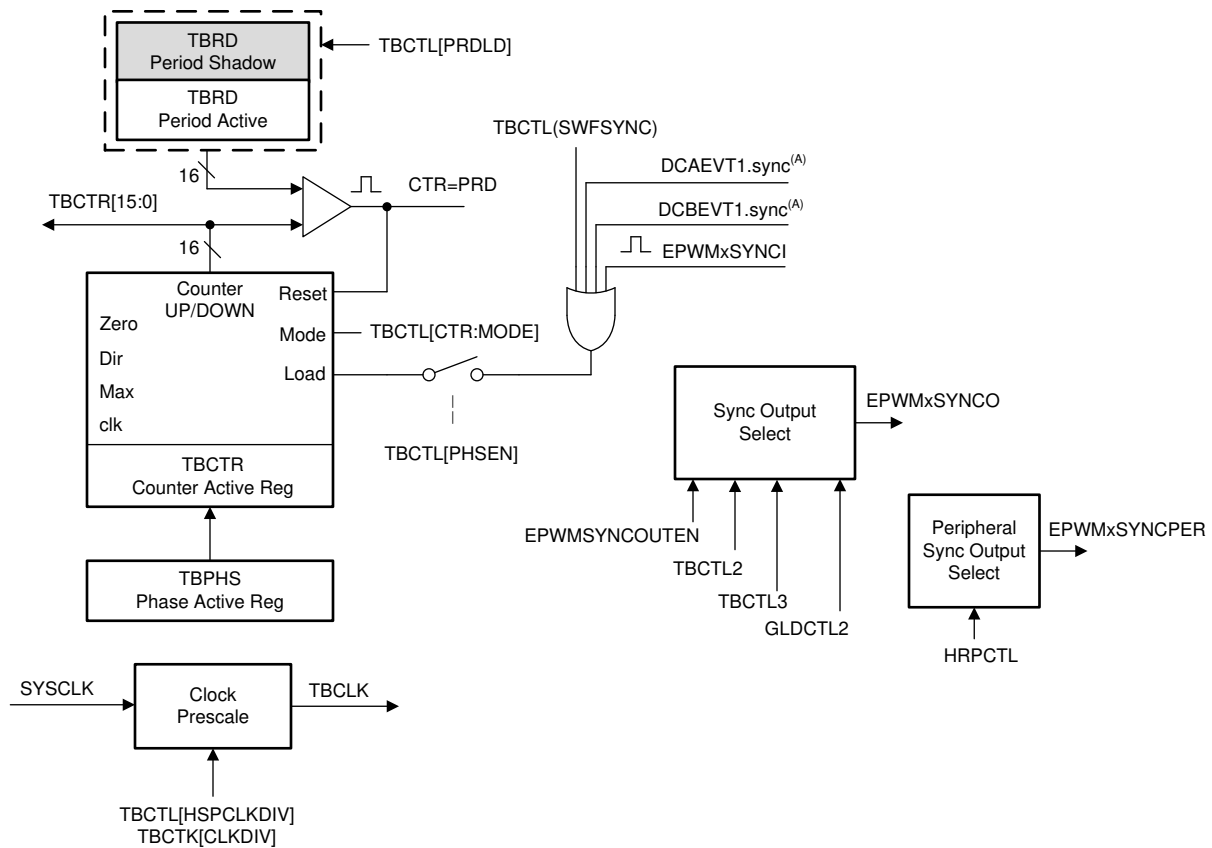

- Specify the ePWM time-base counter (TBCTR) frequency or period to control how often events occur.
- Manage time-base synchronization with other ePWM modules.
- Maintain a phase relationship with other ePWM modules.
- Set the time-base counter to count-up, count-down, or count-up-and-down mode.
- Generate the following events:
 - CTR = PRD: Time-base counter equal to the specified period (TBCTR = TBPRD).
 - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00).
- Configure the rate of the time-base clock; a prescaled version of the ePWM clock (EPWMCLK). This allows the time-base counter to increment/decrement at a slower rate.

Note

If required by the application code to update the TBCTR value through software while the TBCTR is counting, note that the time-base module needs at least 1 TBCLK cycle for the time-base related events to be realized. Hence, the TBCTR can be written with TBCTR = PRD-1 instead of TBCTR = PRD (in case the counter is counting up) and can be written as TBCTR = 1 instead of TBCTR = 0 (in case the counter is counting down) for the events to be realized.

20.4.2 Controlling and Monitoring the Time-Base Submodule

The block diagram in Figure 20-5 shows the critical signals and registers of the time-base submodule. Table 20-2 provides descriptions of the key signals associated with the time-base submodule.

A. These signals are generated by the digital compare (DC) submodule.

Figure 20-5. Time-Base Submodule Signals and Registers

Table 20-2. Key Time-Base Signals

Signal	Description
EPWMxSYNCl	Time-base synchronization input. Input pulse used to synchronize the time-base counter with the counter of other ePWM modules. For more information on all of the signals available for synchronization, see EPWMSYNClNSEL. For information on the synchronization order of a particular device, see Section 20.4.3.3 .
EPWMxSYNCO	Time-base synchronization output. This output pulse is used to synchronize the counter of other ePWM modules. Using EPWMSYNCOUEN, TBCTL2, TBCTL3 and GLDCTL2, the source of the output pulse is selected.
EPWMxSYNCPER	Time-base peripheral synchronization output. This output signal is used to synchronize the CMPSS to the EPWM. The output signal can be configured using the HRPCTL register. Note that this signal has no relation with the HRPWM.
CTR = PRD	Time-base counter equal to the specified period. This signal is generated whenever the counter value is equal to the active period register value. That is when TBCTR = TBPRD.
CTR = Zero	Time-base counter equal to zero This signal is generated whenever the counter value is zero. That is when TBCTR equals 0x00.
CTR = CMPB	Time-base counter equal to active counter-compare B register (TBCTR = CMPB). This event is generated by the counter-compare submodule and used by the synchronization out logic
CTR_dir	Time-base counter direction. Indicates the current direction of the ePWM's time-base counter. The signal is high when the counter is increasing and the signal is low when the counter is decreasing.
CTR_max	Time-base counter equal max value. (TBCTR = 0xFFFF) Generated event when the TBCTR value reaches the maximum value. This signal is only used only as a status bit
TBCLK	Time-base clock. This is a prescaled version of the ePWM clock (EPWMCLK) and is used by all submodules within the ePWM. This clock determines the rate at which time-base counter increments or decrements.

20.4.3 Calculating PWM Period and Frequency

The frequency of PWM events is controlled by the time-base period (TBPRD) register and the mode of the time-base counter. Figure 20-6 shows the period (T_{PWM}) and frequency (F_{PWM}) relationships for the up-count, down-count, and up-down-count time-base counter modes when the period is set to 4 (TBPRD = 4). The time increment for each step is defined by the time-base clock (TBCLK) which is a prescaled version of the ePWM clock (EPWMCLK).

The time-base counter has three modes of operation selected by the time-base control register (TBCTL):

- **Up-Down Count Mode:** In up-down count mode, the time-base counter starts from zero and increments until the period (TBPRD) value is reached. When the period value is reached, the time-base counter then decrements until the counter reaches zero. At this point, the counter repeats the pattern and begins to increment.
- **Up-Count Mode:** In up-count mode, the time-base counter starts from zero and increments until the counter reaches the value in the period register (TBPRD). When the period value is reached, the time-base counter resets to zero and begins to increment once again.
- **Down-Count Mode:** In down-count mode, the time-base counter starts from the period (TBPRD) value and decrements until the counter reaches zero. When the counter reaches zero, the time-base counter is reset to the period value and begins to decrement once again.

Figure 20-6. Time-Base Frequency and Period

20.4.3.1 Time-Base Period Shadow Register

The time-base period register (TBPRD) has a shadow register. Shadowing allows the register update to be synchronized with the hardware. The following definitions are used to describe all shadow registers in the ePWM module:

- **Active Register:** The active register controls the hardware and is responsible for actions that the hardware causes or invokes.
- **Shadow Register:** The shadow register buffers provide a temporary holding location for the active register and have no direct effect on any control hardware. At a strategic point in time, the shadow register content is transferred to the active register. This prevents corruption or spurious operation due to the register being asynchronously modified by software.

The memory address of the shadow period register is the same as the active register. Which register is written to or read from is determined by the TBCTL[PRDL] bit. This bit enables and disables the TBPRD shadow register as follows:

- **Time-Base Period Shadow Mode:** The TBPRD shadow register is enabled when TBCTL[PRDL] = 0. Reads from and writes to the TBPRD memory address go to the shadow register. The shadow register contents are transferred to the active register (TBPRD (Active) ← TBPRD (shadow)) when the time-base counter equals zero (TBCTR = 0x00) and/or a sync event as determined by the TBCTL2[PRDLDSYNC] bit. The PRDLDSYNC bit is valid only if TBCTL[PRDL] = 0. By default the TBPRD shadow register is enabled. The sources for the SYNC input is explained in [Section 20.4.3.3](#).

The global load control mechanism can also be used with the time-base period register by configuring the appropriate bits in the global load configuration register (GLDCFG). When global load mode is selected the transfer of contents from shadow register to active register, for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in Global Shadow to Active Load Control Register (GLDCTL). Global load control mechanism is explained in [Section 20.4.7](#).

- **Time-Base Period Immediate Load Mode:** If immediate load mode is selected (TBCTL[PRDL] = 1), then a read from or a write to the TBPRD memory address goes directly to the active register.

20.4.3.2 Time-Base Clock Synchronization

The TBCLKSYNC bit in the peripheral clock enable registers allows all users to globally synchronize all enabled ePWM modules to the time-base clock (TBCLK). When set, all enabled ePWM module clocks are started with the first rising edge of TBCLK aligned. For synchronized TBCLKs, the prescalers for each ePWM module must be set identically.

The proper procedure for enabling ePWM clocks is as follows:

1. Enable ePWM module clocks in the PCLKCRx register
2. Set TBCLKSYNC= 0
3. Configure ePWM modules
4. Set TBCLKSYNC= 1

20.4.3.3 Time-Base Counter Synchronization

The ePWM synchronization scheme allows for increased flexibility of synchronization of the ePWM modules. Each ePWM module has a synchronization input (SYNCI), a synchronization output (SYNCO) and a peripheral synchronization output (SYNCPER). In Figure 20-7, EXTSYN CIN1 is sourced from INPUTXBAR5 and EXTSYN CIN2 is sourced from INPUTXBAR6, which can be configured to select any GPIO as the synchronization input. Refer to Section 20.4.3.4 for a list of all sync inputs including INPUTXBAR5 and INPUTXBAR6. Figure 20-8 shows the sources that can be used for EXTSYN COUT.

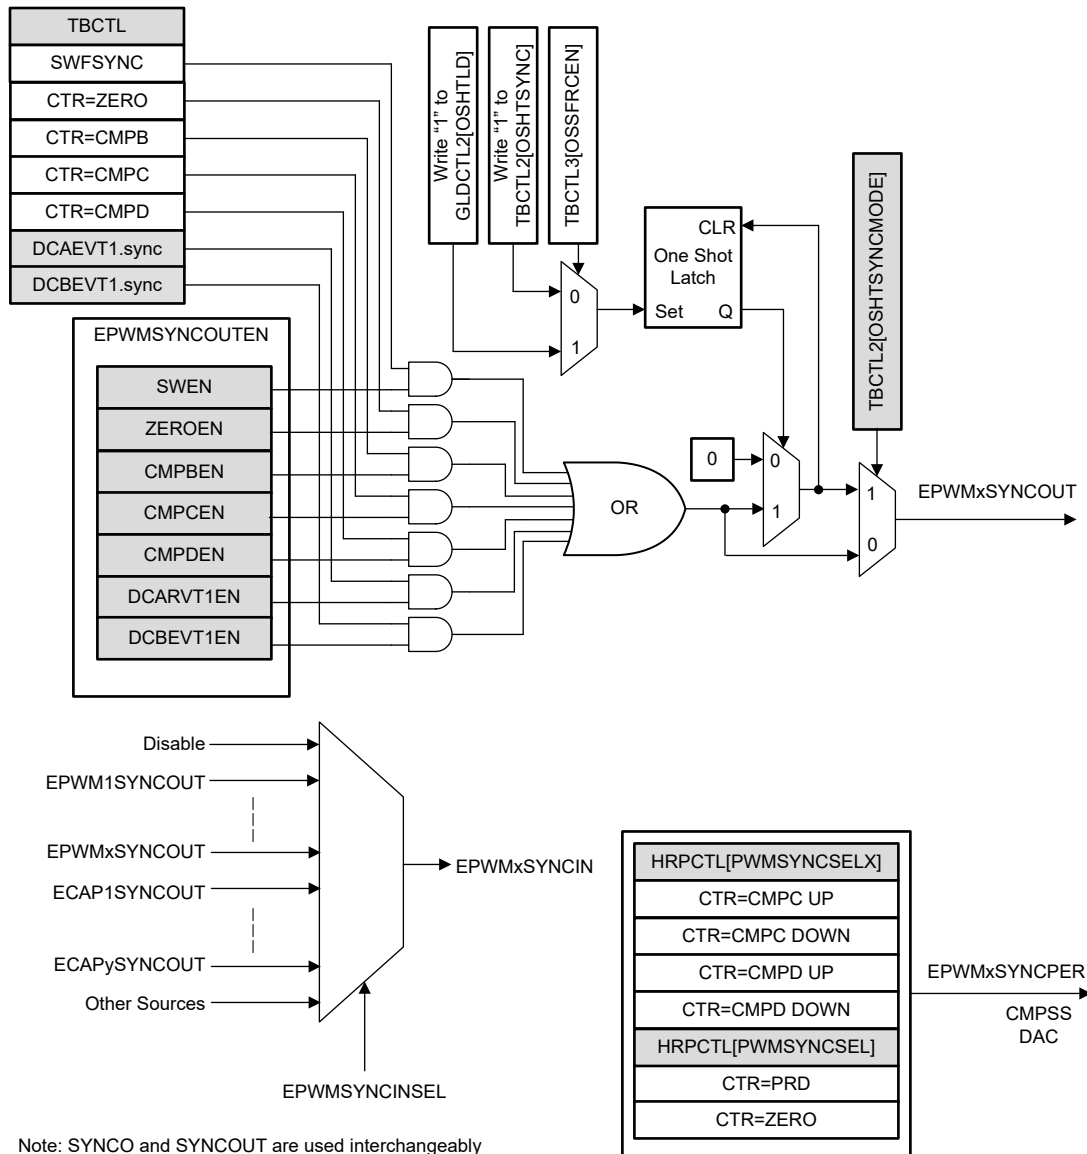

Figure 20-7. Time-Base Counter Synchronization Scheme

Figure 20-8. ePWM External SYNC Output

Note

See the data sheet for the number of ePWM and eCAP modules available on your specific device.

Each ePWM module can be configured to use or ignore the synchronization input. If the TBCTL[PHSEN] bit is set, then the time-base counter (TBCTR) of the ePWM module is automatically loaded with the phase register (TBPHS) contents when one of the following conditions occur:

- **EPWMxSYNCl: Synchronization Input Pulse:** The value of the phase register is loaded into the counter register when an input synchronization pulse is detected (TBPHS → TBCTR). This operation occurs on the next valid time-base clock (TBCLK) edge.

The delay from internal control module to target modules is given by:

- if (TBCLK = EPWMCLK): 2 x EPWMCLK
- if (TBCLK < EPWMCLK): 1 x TBCLK
- **Software Forced Synchronization Pulse:** Writing a 1 to the TBCTL[SWFSYNC] control bit invokes a software forced synchronization. This pulse is ORed with the synchronization input signal, and therefore has the same effect as a pulse on EPWMxSYNCl.
- **Digital Compare Event Synchronization Pulse:** DCAEVT1 and DCBEVT1 digital compare events can be configured to generate synchronization pulses which have the same affect as EPWMxSYNCl.

Note

If the EPWMxSYNCl signal is held high, the sync does not continuously occur. The EPWMxSYNCl is rising edge activated.

This feature enables the ePWM module to be automatically synchronized to the time base of another ePWM module. Lead or lag phase control can be added to the waveforms generated by different ePWM modules to synchronize them. In up-down-count mode, the TBCTL[PHSDIR] bit configures the direction of the time-base counter immediately after a synchronization event. The new direction is independent of the direction prior to the synchronization event. The PHSDIR bit is ignored in count-up or count-down modes. See [Figure 20-9](#) through [Figure 20-12](#) for examples.

Clearing the TBCTL[PHSEN] bit configures the ePWM to ignore the synchronization input pulse.

20.4.3.4 ePWM SYNC Selection

[Table 20-3](#) specifies the sources for the ePWM SYNC input and output.

Table 20-3. ePWM SYNC Selection

EPWMSYNCINSEL.SEL, ECAPSYNCINSEL.SEL	SYNC Source
0x0	Reserved
0x1	EPWM1.SYNCOUT
0x2	EPWM2.SYNCOUT
0x3	EPWM3.SYNCOUT
0x4	EPWM4.SYNCOUT

0x1F	FSLRX_RX.RX_TRIG1

20.4.4 Phase Locking the Time-Base Clocks of Multiple ePWM Modules

The TBCLKSYNC bit can be used to globally synchronize the time-base clocks of all enabled ePWM modules on a device. This bit is part of the device's clock enable registers and is described in the *System Control and Interrupts* section of this manual. When TBCLKSYNC = 0, the time-base clock of all ePWM modules is stopped (default). When TBCLKSYNC = 1, all ePWM time-base clocks are started with the rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescaler bits in the TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is:

1. Enable the individual ePWM module clocks. This is described in the *System Control and Interrupts* chapter.
2. Set TBCLKSYNC= 0. This stops the time-base clock within any enabled ePWM module.
3. Configure the prescaler values and desired ePWM modes.
4. Set TBCLKSYNC = 1.

20.4.5 Simultaneous Writes to TBPRD and CMPx Registers Between ePWM Modules

For variable frequency applications, there is a need for simultaneous writes of TBPRD and CMPx registers between ePWM modules. This prevents situations where a CTR = 0 or CTR = PRD pulse forces a shadow to active load of these registers before all registers are updated between ePWM modules (resulting in some registers being loaded from new shadow values while others are loaded from old shadow values). To support this, an ePWM register linking scheme for TBPRD:TBPRDHR, CMPA:CMPAHR, CMPB:CMPBHR, CMPC, and CMPD registers between PWM modules has been added.

Refer to the register description for EPWMXLINK to see the linked register bit-field values for corresponding ePWM. An example of using the EPWMXLINK is linking ePWM2 CMPA with CMPA of ePWM1 through ePWM2's EPWMXLINK[CMPALINK] register bit-field. In this case, a write to CMPA of ePWM1 also changes the CMPA value for ePWM2.

20.4.6 Time-Base Counter Modes and Timing Waveforms

The time-base counter operates in one of four modes:

- Up-count mode that is asymmetrical
- Down-count mode that is asymmetrical
- Up-down-count that is symmetrical
- Frozen where the time-base counter is held constant at the current value

To illustrate the operation of the first three modes, the following timing diagrams show when events are generated and how the time-base responds to an EPWMxSYNCl signal.

Figure 20-9. Time-Base Up-Count Mode Waveforms

Figure 20-10. Time-Base Down-Count Mode Waveforms

Figure 20-11. Time-Base Up-Down-Count Waveforms, TBCTL[PHSDIR = 0] Count Down On Synchronization Event

Figure 20-12. Time-Base Up-Down Count Waveforms, TBCTL[PHSDIR = 1] Count Up On Synchronization Event

20.4.7 Global Load

Figure 20-13 shows the signals and registers associated with the global load feature.

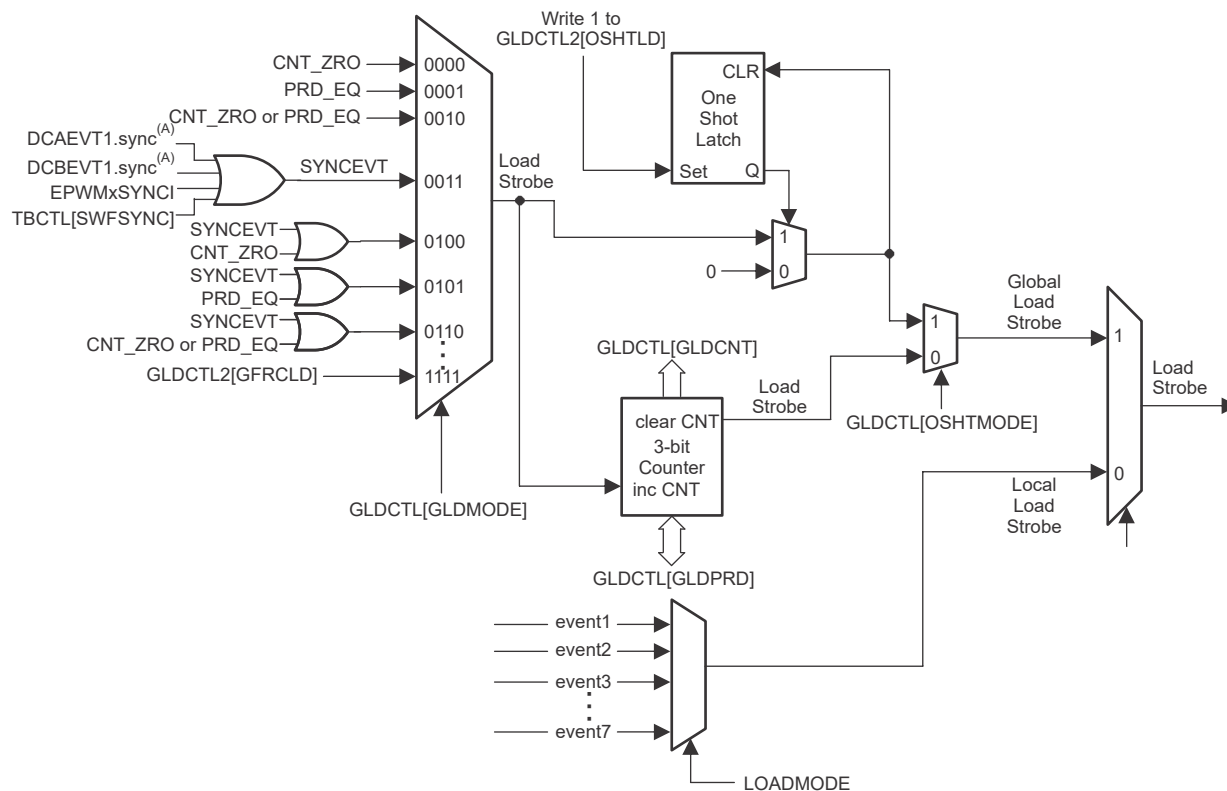

Figure 20-13. Global Load: Signals and Registers

Note

The SYNCEVT signal is only propagated through when PHSEN is SET.

When this feature is enabled, the transfer of contents from the shadow register to the active register, for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in Global Shadow to Active Load Control Register (GLDCTL[GLDMODE]). When GLDCTL[GLD] = 1, shadow to active load event selection bits for individual shadowed registers are ignored and global load mode takes effect for the corresponding registers enabled by GLDCFG[REGx].

When GLDCTL[GLD] = 1 and GLDCFG[REGx] = 0, global load mode does not affect the corresponding register (REGx). Shadow to active load event selection bits for individual shadowed registers decide how the transfer of contents from shadow register to active register takes place.

20.4.7.1 Global Load Pulse Pre-Scalar

This feature provides the capability to choose shadow to active transfers to happen once in 'N' occurrences of selected global load pulse (GLDCTL[GLDMODE]). This pre-scale functionality is not available for registers that cannot or are not configured to use the global load mechanism (that is, GLDCTL[GLD] = 0 or GLDCFG[REGx] = 0).

20.4.7.2 One-Shot Load Mode

This feature allows users to cause the shadow register to active register transfers to occur once. When $GLDCTL2[OSHTLD] = 1$ the shadow to active register transfer, for registers that are configured to use the global load mechanism, takes place on the event selected by $GLDCTL[GLDMODE]$.

Software force loading of contents from shadow register to active register is possible by using $GLDCTL2[GFRCLD]$. The $GLDCTL2$ register can also be linked across multiple PWM modules by using $EPWMXLINK[GLDCTL2LINK]$. This, along with the one-shot load mode feature discussed above, provides a method to correctly update multiple PWM registers in one or more PWM modules at certain PWM events or, if desired, in the same clock cycle. This is very useful in variable frequency applications and/or multi-phase interleaved applications.

Note

One-shot load mode must not be used when high-resolution mode is enabled.

20.4.7.3 One-Shot Sync Mode

To enable the one-shot sync mode to generate a SYNCOUT pulse, configure the $TBCTL2[OSHTSYNCMODE]$ bit and set the $TBCTL2[OSHTSYNC]$ bit as shown in Figure 20-14.

Figure 20-14. One-Shot Sync Mode

20.5 Counter-Compare (CC) Submodule

Figure 20-15 illustrates the counter-compare submodule within the ePWM.

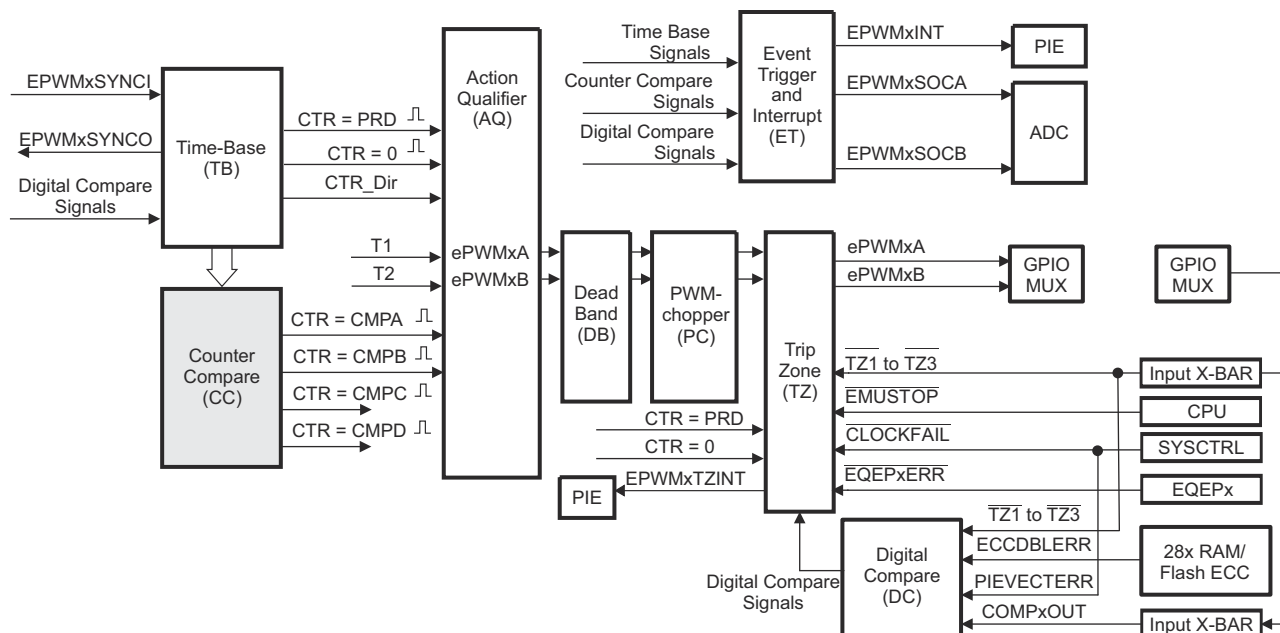

Figure 20-15. Counter-Compare Submodule

20.5.1 Purpose of the Counter-Compare Submodule

The counter-compare submodule takes as input the time-base counter value. This value is continuously compared to the counter-compare A (CMPA), counter-compare B (CMPB), counter-compare C (CMPC), and counter-compare D (CMPD) registers. When the time-base counter is equal to one of the compare registers, the counter-compare unit generates an appropriate event.

The counter-compare:

- Generates events based on programmable time stamps using the CMPA, CMPB, CMPC, and CMPD registers:
 - CTR = CMPA: Time-base counter equals counter-compare A register (TBCTR = CMPA)
 - CTR = CMPB: Time-base counter equals counter-compare B register (TBCTR = CMPB)
 - CTR = CMPC: Time-base counter equals counter-compare C register (TBCTR = CMPC)
 - CTR = CMPD: Time-base counter equals counter-compare D register (TBCTR = CMPD)
- Controls the PWM duty cycle, if the action-qualifier submodule is configured appropriately using counter-compare A (CMPA) and counter-compare B (CMPB)
- Shadows new compare values to prevent corruption or glitches during the active PWM cycle

20.5.2 Controlling and Monitoring the Counter-Compare Submodule

The counter-compare submodule operation is shown in Figure 20-16.

A. These events are generated by the ePWM digital compare (DC) submodule based on the levels of the TRIPIN inputs (for example, CMPSSx and TZ signals).

Figure 20-16. Detailed View of the Counter-Compare Submodule

20.5.3 Operational Highlights for the Counter-Compare Submodule

The counter-compare submodule is responsible for generating events that can be used in the action-qualifier and event-trigger submodules. There are four independent compare events:

1. CTR = CMPA: Time-base counter equal to counter-compare A register (TBCTR = CMPA).
2. CTR = CMPB: Time-base counter equal to counter-compare B register (TBCTR = CMPB).
3. CTR = CMPC: Time-base counter equal to counter-compare C register (TBCTR = CMPC). This event can be used to generate an event in the event trigger submodule only.
4. CTR = CMPD: Time-base counter equal to counter-compare D register (TBCTR = CMPD). This event can be used to generate an event in the event trigger submodule only.

For up-count or down-count mode, each event occurs only once per cycle. For up-down count mode, each event occurs twice per cycle if the compare value is between 0x00-TBPRD; and once per cycle if the compare value is equal to 0x00 or equal to TBPRD. These events are applied to the action-qualifier submodule where the events are qualified by the counter direction and converted into actions if enabled. Refer to [Section 20.6.1](#) for more details.

The counter-compare registers CMPA and CMPB each have an associated shadow register. Shadowing provides a way to keep updates to the registers synchronized with the hardware. When shadowing is used, updates to the active registers only occur at strategic points. This prevents corruption or spurious operation due to the register being asynchronously modified by software. The memory address of the active register and the shadow register is identical. The register that is written to or read from is determined by the CMPCTL[SHDWAMODE] and CMPCTL[SHDWBMODE] bits. These bits enable and disable the CMPC shadow register and CMPD shadow register, respectively. The behavior of the two load modes is:

Shadow Mode:

The shadow mode for the CMPA is enabled by clearing the CMPCTL[SHDWAMODE] bit and the shadow register for CMPB is enabled by clearing the CMPCTL[SHDWBMODE] bit. Shadow mode is enabled by default for both CMPA and CMPB.

If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the CMPCTL[LOADAMODE], CMPCTL[LOADBMODE], CMPCTL[LOADASYNC], and CMPCTL[LOADBSYNC] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero
- SYNC event caused by DCAEVT1 or DCBEVT1 or EPWMxSYNCl or TBCTL[SWFSYNC]
- Both SYNC event or a selection made by LOADAMODE/LOADBMODE

Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.

Note

Refer to [Section 20.6.5](#) for valid configurations of CMPA/CMPB and LOADAMODE/LOADBMODE.

Immediate Load Mode:

If the immediate load mode is selected (that is, CMPCTL[SHDWAMODE] = 1 or CMPCTL[SHDWBMODE] = 1), then a read from or a write to the register goes directly to the active register.

Additional Comparators

The counter-compare submodule on ePWMs type 2 and later are responsible for generating two additional independent compare events based on two compare registers, which is fed to Event Trigger submodule:

1. CTR = CMPC: Time-base counter equal to counter-compare C register (TBCTR = CMPC).
2. CTR = CMPD: Time-base counter equal to counter-compare D register (TBCTR = CMPD).

The counter-compare registers CMPC and CMPD each have an associated shadow register. By default this register is shadowed. The memory address of the active register and the shadow register is identical. The value in the active CMPC and CMPD register is compared to the time-base counter (TBCTR). When the values are equal, the counter compare module generates a “time-base counter equal to counter compare C or counter compare D” event respectively. Shadowing of this register is enabled and disabled by the CMPCTL2[SHDWCMODE] and CMPCTL2[SHDWDMODE] bit. These bits enable and disable the CMPC shadow register and CMPD shadow register respectively. The behavior of the two load modes is described below:

Shadow Mode:

The shadow mode for the CMPC is enabled by clearing the CMPCTL2[SHDWCMODE] bit and the shadow register for CMPD is enabled by clearing the CMPCTL2[SHDWDMODE] bit. Shadow mode is enabled by default for both CMPC and CMPD.

If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the CMPCTL2[LOADCMODE], CMPCTL2[LOADDMODE], CMPCTL2[LOADCSYNC], and CMPCTL2[LOADDSYNC] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero
- SYNC event caused by DCAEVT1 or DCBEVT1 or EPWMxSYNCl or TBCTL[SWFSYNC]
- Both SYNC event or a selection made by LOADCMODE/LOADDMODE

Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.

Immediate Load Mode:

If the immediate load mode is selected (that is, CMPCTL2[SHDWCMODE] = 1 or CMPCTL2[SHDWDMODE] = 1), then a read from or a write to the register goes directly to the active register.

Global Load Support

The global load control mechanism can also be used for all counter-compare registers by configuring the appropriate bits in the global load configuration register (GLDCFG). When the global load mode is selected the transfer of contents from shadow register to active register, for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in the Global Shadow to Active Load Control Register (GLDCTL). The global load control mechanism is explained in [Section 20.4.7](#).

20.5.4 Count Mode Timing Waveforms

The counter-compare module can generate compare events in all three count modes:

- Up-count mode: used to generate an asymmetrical PWM waveform.
- Down-count mode: used to generate an asymmetrical PWM waveform.
- Up-down-count mode: used to generate a symmetrical PWM waveform.

To best illustrate the operation of the first three modes, the timing diagrams in [Figure 20-17](#) through [Figure 20-20](#) show when events are generated and how the EPWMxSYNCl signal interacts.

An EPWMxSYNCl external synchronization event can cause a discontinuity in the TBCTR count sequence. This can lead to a compare event being skipped. This skipping is considered normal operation and must be taken into account.

Figure 20-19. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 0] Count Down On Synchronization Event

Figure 20-20. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 1] Count Up On Synchronization Event

20.6 Action-Qualifier (AQ) Submodule

The action-qualifier submodule has the most important role in waveform construction and PWM generation. The action-qualifier submodule decides which events are converted into various action types, thereby, producing the required switched waveforms at the EPWMxA and EPWMxB outputs.

Figure 20-21 illustrates the action-qualifier submodule within the ePWM.

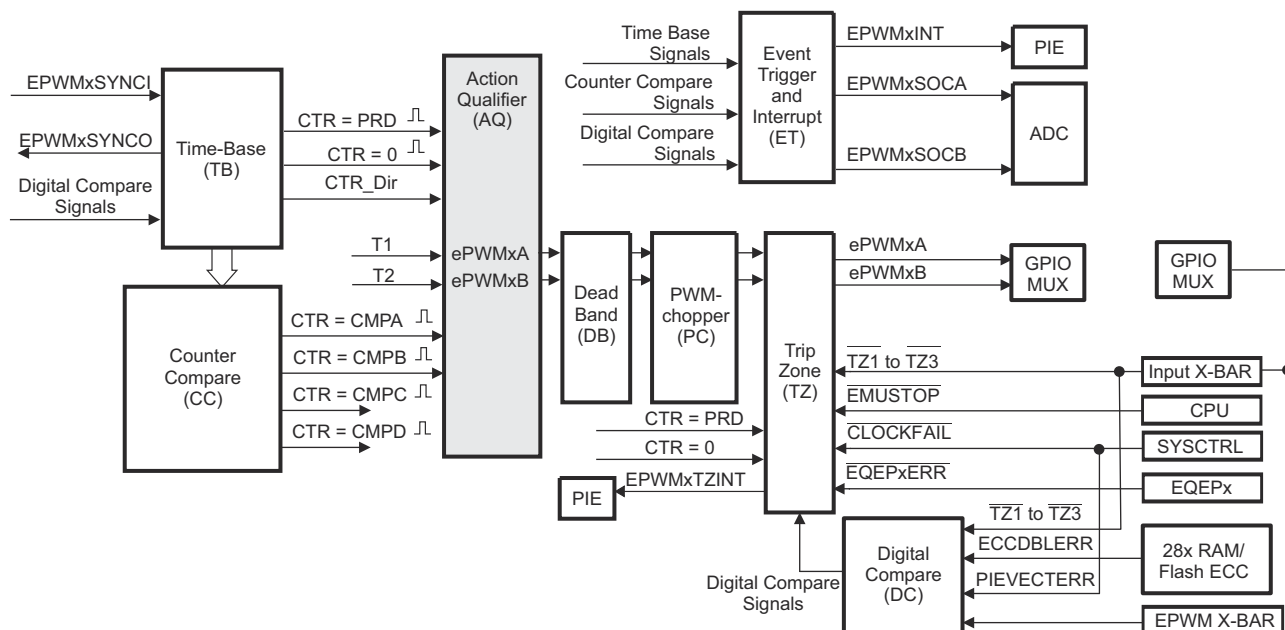

Figure 20-21. Action-Qualifier Submodule

20.6.1 Purpose of the Action-Qualifier Submodule

The action-qualifier submodule is responsible for the following:

- Qualifying and generating actions (set, clear, toggle) based on the following events:
 - CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
 - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
 - CTR = CMPA: Time-base counter equal to the counter-compare A register (TBCTR = CMPA)
 - CTR = CMPB: Time-base counter equal to the counter-compare B register (TBCTR = CMPB)
- T1, T2 events: Trigger events based on comparator, trip or syncin events
- Managing priority when these events occur concurrently
- Providing independent control of events when the time-base counter is increasing and when it is decreasing

20.6.2 Action-Qualifier Submodule Control and Status Register Definitions

The action-qualifier submodule operation is shown in Figure 20-22 and monitored by way of the registers in Section 20.17.

Figure 20-22. Action-Qualifier Submodule Inputs and Outputs

For convenience, the possible input events are summarized again in Table 20-4.

Table 20-4. Action-Qualifier Submodule Possible Input Events

Signal	Description	Registers Compared
CTR = PRD	Time-base counter equal to the period value	TBCTR = TBPRD
CTR = Zero	Time-base counter equal to 0	TBCTR = 0x00
CTR = CMPA	Time-base counter equal to the counter-compare A	TBCTR = CMPA
CTR = CMPB	Time-base counter equal to the counter-compare B	TBCTR = CMPB
T1 event	Based on comparator, trip, or syncin events	None
T2 event	Based on comparator, trip, or syncin events	None
Software forced event	Asynchronous event initiated by software	

The software forced action is a useful asynchronous event. This control is handled by the AQSFRC and AQCSFRC registers.

Note

If the CSFA is not used in shadow mode, the RLDCSF bit must be configured to disable shadow mode.

The action-qualifier submodule controls how the two outputs EPWMxA and EPWMxB behave when a particular event occurs. The event inputs to the action-qualifier submodule are further qualified by the counter direction (up or down). This allows for independent action on outputs on both the count-up and count-down phases.

The possible actions imposed on outputs EPWMxA and EPWMxB are:

- **Set High:** Set output EPWMxA or EPWMxB to a high level.
- **Clear Low:** Set output EPWMxA or EPWMxB to a low level.
- **Toggle:** If EPWMxA or EPWMxB is currently pulled high, then pull the output low. If EPWMxA or EPWMxB is currently pulled low, then pull the output high.
- **Do Nothing:** Keep outputs EPWMxA and EPWMxB at same level as currently set. Although the "Do Nothing" option prevents an event from causing an action on the EPWMxA and EPWMxB outputs, this event can still trigger interrupts and ADC start of conversion. See the description in [Section 20.10](#) for details.

Actions are specified independently for either output (EPWMxA or EPWMxB). Any or all events can be configured to generate actions on a given output. For example, both CTR = CMPA and CTR = CMPB can operate on output EPWMxA. All qualifier actions are configured using the control registers found in the *ePWM Registers* section.

For clarity, the illustrations in this chapter use a set of symbolic actions. These symbols are summarized in [Figure 20-23](#). Each symbol represents an action as a marker in time. Some actions are fixed in time (zero and period) while the CMPA and CMPB actions are moveable and the time positions are programmed by way of the counter-compare A and B registers, respectively. To turn off or disable an action, use the "Do Nothing option"(the default at reset).

SW force	TB Counter equals			Trigger Events			Actions
	Zero	Comp A	Comp B	Period	T1	T2	
							Do Nothing
							Clear Lo
							Set Hi
							Toggle

Figure 20-23. Possible Action-Qualifier Actions for EPWMxA and EPWMxB Outputs

The Action Qualifier Trigger Event Source Selection register (AQTSRCSEL) is used to select the source for T1 and T2 events. T1/T2 selection and configuration of a trip/digital-compare event in Action Qualifier submodule is independent of the configuration of that event in the Trip-Zone submodule. A particular trip event can or cannot

be configured to cause trip action in the Trip Zone submodule, but the same event can be used by the Action Qualifier to generate T1/T2 for controlling PWM generation.

20.6.3 Action-Qualifier Event Priority

It is possible for the ePWM action qualifier to receive more than one event at the same time. In this case, events are assigned a priority by the hardware. The general rule is events occurring later in time have a higher priority and software forced events always have the highest priority. The event priority levels for up-down count mode are shown in [Table 20-5](#). A priority level of 1 is the highest priority and level 10 is the lowest. The priority changes slightly depending on the direction of TBCTR.

Table 20-5. Action-Qualifier Event Priority for Up-Down-Count Mode

Priority Level	Event If TBCTR is Incrementing TBCTR = Zero up to TBCTR = TBPRD	Event If TBCTR is Decrementing TBCTR = TBPRD down to TBCTR = 1
1 (Highest)	Software forced event	Software forced event
2	T1 on up-count (T1U)	T1 on down-count (T1D)
3	T2 on up-count (T2U)	T2 on down-count (T2D)
4	Counter equals CMPB on up-count (CBU)	Counter equals CMPB on down-count (CBD)
5	Counter equals CMPA on up-count (CAU)	Counter equals CMPA on down-count (CAD)
6 (Lowest)	Counter equals zero	Counter equals period (TBPRD)

[Table 20-6](#) shows the action-qualifier priority for up-count mode. In this case, the counter direction is always defined as up; therefore, down-count events never are taken.

Table 20-6. Action-Qualifier Event Priority for Up-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to period (TBPRD)
3	T1 on up-count (T1U)
4	T2 on up-count (T2U)
5	Counter equal to CMPB on up-count (CBU)
6	Counter equal to CMPA on up-count (CAU)
7 (Lowest)	Counter equal to Zero

[Table 20-7](#) shows the action-qualifier priority for down-count mode. In this case, the counter direction is always defined as down; therefore, up-count events never are taken.

Table 20-7. Action-Qualifier Event Priority for Down-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to Zero
3	T1 on down-count (T1D)
4	T2 on down-count (T2D)
5	Counter equal to CMPB on down-count (CBD)
6	Counter equal to CMPA on down-count (CAD)
7 (Lowest)	Counter equal to period (TBPRD)

It is possible to set the compare value greater than the period. In this case, the action takes place as shown in [Table 20-8](#).

Table 20-8. Behavior if CMPA/CMPB is Greater than the Period

Counter Mode	Compare on Up-Count Event CAD/CBD	Compare on Down-Count Event CAD/CBD
Up-Count Mode	If $CMPA/CMPB \leq TBPRD$ period, then the event occurs on a compare match ($TBCTR=CMPA$ or $CMPB$). If $CMPA/CMPB > TBPRD$, then the event does not occur.	Never occurs.
Down-Count Mode	Never occurs.	If $CMPA/CMPB < TBPRD$, the event occurs on a compare match ($TBCTR=CMPA$ or $CMPB$). If $CMPA/CMPB \geq TBPRD$, the event occurs on a period match ($TBCTR=TBPRD$).
Up-Down Count Mode	If $CMPA/CMPB < TBPRD$ and the counter is incrementing, the event occurs on a compare match ($TBCTR=CMPA$ or $CMPB$). If $CMPA/CMPB \geq TBPRD$, the event occurs on a period match ($TBCTR = TBPRD$).	If $CMPA/CMPB < TBPRD$ and the counter is decrementing, the event occurs on a compare match ($TBCTR=CMPA$ or $CMPB$). If $CMPA/CMPB \geq TBPRD$, the event occurs on a period match ($TBCTR=TBPRD$).

20.6.4 AQCTLA and AQCTLB Shadow Mode Operations

To enable Action Qualifier mode changes which must occur at the end of a period even when the phase changes, shadowing of the AQCTLA and AQCTLB registers has been added on ePWMs type 2 and later. Additionally, shadow to active load on SYNC of these registers is supported as well. Shadowing of this register is enabled and disabled by the AQCTL[SHDWAQAMODE] and AQCTL[SHDWAQBMODE] bits. These bits enable and disable the AQCTLA shadow register and AQCTLB shadow register, respectively. The behavior of the two load modes is:

Shadow Mode:

The shadow mode for the AQCTLA is enabled by setting the AQCTL[SHDWAQAMODE] bit, and the shadow register for AQCTLB is enabled by setting the AQCTL[SHDWAQBMODE] bit. Shadow mode is disabled by default for both AQCTLA and AQCTLB

If the shadow register is enabled, then the content of the shadow register is transferred to the active register on one of the following events as specified by the AQCTL[LDAQAMODE], AQCTL[LDAQBMODE], AQCTL[LDAQASYNC], and AQCTL[LDAQBSYNC] register bits:

- CTR = PRD: Time-base counter equal to the period ($TBCTR = TBPRD$).
- CTR = Zero: Time-base counter equal to zero ($TBCTR = 0x00$)
- Both CTR = PRD and CTR = Zero
- SYNC event caused by DCAEVT1 or DCBEVT1 or EPWMxSYNCl or TBCTL[SWFSYNC]
- Both SYNC event or a selection made by LDAQAMODE/LDAQBMODE

Global Load Support

Global load control mechanism can also be used for AQCTLA:AQCTLA2, AQCTLB:AQCTLB2, and AQCSFRC registers by configuring the appropriate bits in the global load configuration register (GLDCFG). When global load mode is selected, the transfer of contents from shadow register to active register for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in the Global Shadow to Active Load Control Register (GLDCTL). The global load control mechanism is explained in [Section 20.4.7](#).

Immediate Load Mode:

If the immediate load mode is selected (that is, AQCTL[SHDWAQAMODE] = 0 or AQCTL[SHDWAQBMODE] = 0), then a read from or a write to the register goes directly to the active register. See [Figure 20-24](#) and [Figure 20-25](#).

Note

Shadow to Active Load of Action Qualifier Output A/B Control Register [AQCTLA and AQCTLB] on CMPA = 0 or CMPB = 0 boundary

If the Counter-Compare A Register (CMPA) or Counter-Compare B Register (CMPB) is set to a value of 0 and the action qualifier action on AQCTLA and AQCTLB is configured to occur in the same instant as a shadow to active load (that is, CMPA=0 and AQCTLA shadow to active load on TBCTR=0 using AQCTL register LDAQAMODE and LDAQAMODE bits), then both events enter contention. It is recommended to use a Non-Zero Counter-Compare when using Shadow to Active Load of Action Qualifier Output A/B Control Register on TBCTR = 0 boundary.

- A. These events are generated by the ePWM digital compare (DC) submodule based on the levels of the TRIPIN inputs (for example, CMPSSx and TZ signals).

Figure 20-24. AQCTL[SHDWAQAMODE]

- A. These events are generated by the ePWM digital compare (DC) submodule based on the levels of the TRIPIN inputs (for example, CMPSSx and TZ signals).

Figure 20-25. AQCTL[SHDWAQBMODE]

20.6.5 Configuration Requirements for Common Waveforms

Note

The waveforms in this chapter show the behavior of the ePWMs for a static compare register value. In a running system, the active compare registers (CMPA and CMPB) are typically updated from the respective shadow registers once every period. Specify when the update takes place: either when the time-base counter reaches zero or when the time-base counter reaches the period. There are some cases when the action based on the new value can be delayed by one period or the action based on the old value can take effect for an extra period. Some PWM configurations avoid this situation. These include, but are not limited to, the following:

Use up-down count mode to generate a symmetric PWM:

- If loading CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1.
- If loading CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD-1.

This means there is always a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

Use up-down count mode to generate an asymmetric PWM:

- To achieve 50%-0% asymmetric PWM use the following configuration: Load CMPA/CMPB on period and use the period action to clear the PWM and a compare-up action to set the PWM. Modulate the compare value from 0 to TBPRD to achieve 50%-0% PWM duty.

When using up-count mode to generate an asymmetric PWM:

- To achieve 0-100% asymmetric PWM, you **must** load CMPA/CMPB on TBPRD. When CMPA/CMPB is not loaded on TBCTR=PRD, boundary conditions can occur depending on the timing of the write and the value written to CMPA/CMPB. Use the Zero action to set the PWM and a compare-up action to clear the PWM. Modulate the compare value from 0 to TBPRD+1 to achieve 0-100% PWM duty.

When using up-count mode to generate an asymmetric PWM with deadband enabled:

- To achieve 0%-100% PWM use the following configuration: When the CMPA value is too close to 0 or PRD such that the following conditions are met ($CMPX < \text{Deadband}$) or ($CMPX > \text{PRD} - \text{Deadband}$), the actions specified by the AQCTL register for CMPX do not take effect. To avoid this, the AQCTL settings must be altered under these conditions only to generate either high or low pulses for both CAU or CAD events (both set or both clear). Make sure that this software update is occurring synchronous to the PWM carrier cycle, and shadow mode is enabled.

When using up-down count mode to generate an asymmetric PWM with deadband enabled:

- To achieve 0%-100% PWM use the following configuration: When the CMPA value is too close to 0 or PRD such that the following conditions are met ($CMPX < \text{Deadband}/2$) or ($CMPX > \text{PRD} - (\text{Deadband})/2$), the actions specified by the AQCTL register for CMPX do not take effect. To avoid this, the AQCTL settings must be altered under these conditions only to generate either high or low pulses for both CAU or CAD events (both set or both clear). Make sure that this software update is occurring synchronous to the PWM carrier cycle, and shadow mode is enabled.

See [Using Enhanced Pulse Width Modulator \(ePWM\) Module for 0-100% Duty Cycle Control](#).

Figure 20-26 shows how a symmetric PWM waveform can be generated using the up-down-count mode of the TBCTR. In this mode, 0%-100% DC modulation is achieved by using equal compare matches on the up count and down count portions of the waveform. In the example shown, CMPA is used to make the comparison. When the counter is incrementing, the CMPA match pulls the PWM output high. Likewise when the counter is decrementing, the compare match pulls the PWM signal low. When $CMPA = 0$, the PWM signal is high for the entire period giving a 100% duty waveform. When $CMPA = TBPRD$, the PWM signal is low achieving 0% duty.

When using this configuration in practice, if loading CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1. If loading CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD-1. This means there is always a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

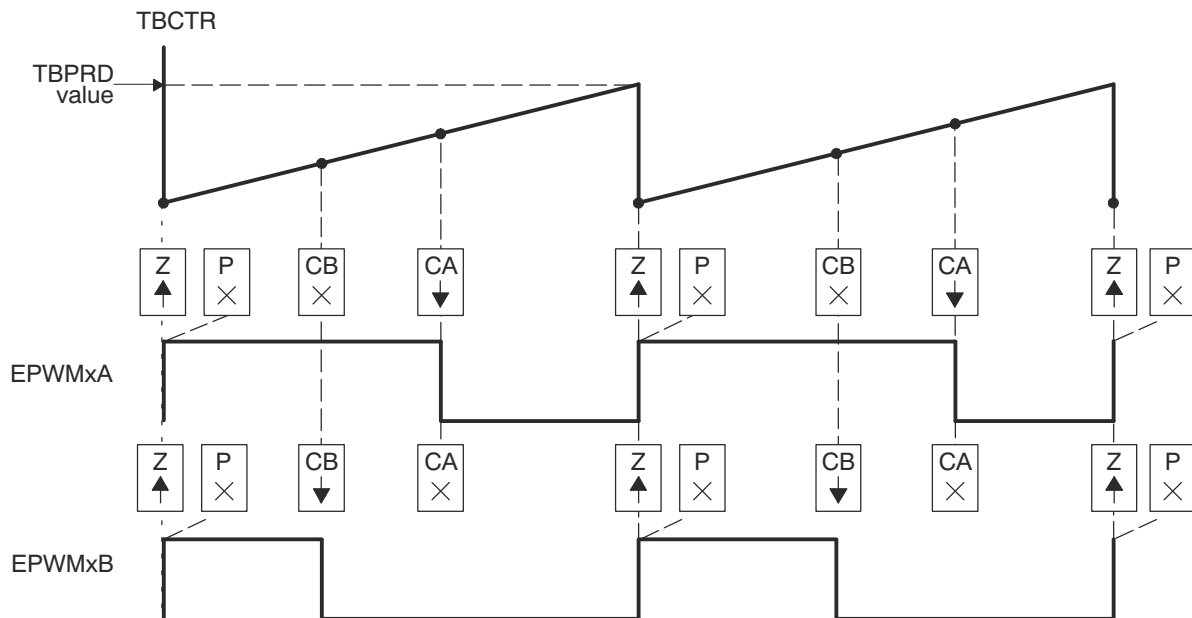

Figure 20-26. Up-Down Count Mode Symmetrical Waveform

The PWM waveforms in [Figure 20-27](#) through [Figure 20-32](#) show some common action-qualifier configurations. Some conventions used in the figures and examples are as follows:

- TBPRD, CMPA, and CMPB refer to the value written in the respective registers. The active register, not the shadow register, is used by the hardware.
- CMPx, refers to either CMPA or CMPB.
- EPWMxA and EPWMxB refer to the output signals from ePWMx
- Up-Down means count-up-and count-down mode, Up means up-count mode and Down means down-count mode
- Sym = Symmetric, Asym = Asymmetric

- PWM period = $(TBPRD + 1) \times T_{TBCLK}$
- Duty modulation for EPWMxA is set by CMPA, and is active high (that is, high time duty proportional to CMPA).
- Duty modulation for EPWMxB is set by CMPB and is active high (that is, high time duty proportional to CMPB).
- The "Do Nothing" actions (X) are shown for completeness, but are not shown on subsequent diagrams.
- Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

Figure 20-27. Up, Single Edge Asymmetric Waveform, with Independent Modulation on EPWMxA and EPWMxB—Active High

- A. $PWM\ period = (TBPRD + 1) \times T_{TBCLK}$
- B. Duty modulation for EPWMxA is set by CMPA, and is active low (that is, the low time duty is proportional to CMPA).
- C. Duty modulation for EPWMxB is set by CMPB and is active low (that is, the low time duty is proportional to CMPB).
- D. Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

Figure 20-28. Up, Single Edge Asymmetric Waveform with Independent Modulation on EPWMxA and EPWMxB—Active Low

- A. $\text{PWM frequency} = 1/((\text{TBPRD} + 1) \times T_{\text{TBCLK}})$
- B. Pulse can be placed anywhere within the PWM cycle (0000 - TBPRD)
- C. High time duty proportional to $(\text{CMPB} - \text{CMPA})$

Figure 20-29. Up-Count, Pulse Placement Asymmetric Waveform With Independent Modulation on EPWMxA

- A. $\text{PWM period} = 2 \times \text{TBPRD} \times T_{\text{TBCLK}}$
- B. Duty modulation for EPWMxA is set by CMPA, and is active low (that is, the low time duty is proportional to CMPA).
- C. Duty modulation for EPWMxB is set by CMPB and is active low (that is, the low time duty is proportional to CMPB).
- D. Outputs EPWMxA and EPWMxB can drive independent power switches.

Figure 20-30. Up-Down Count, Dual-Edge Symmetric Waveform, with Independent Modulation on EPWMxA and EPWMxB — Active Low

- A. PWM period = $2 \times TBPRD \times T_{TBCLK}$
- B. Duty modulation for EPWMxA is set by CMPA, and is active low, that is, low time duty proportional to CMPA.
- C. Duty modulation for EPWMxB is set by CMPB and is active high, that is, high time duty proportional to CMPB.
- D. Outputs EPWMx can drive upper/lower (complementary) power switches.
- E. Dead-band = $CMPB - CMPA$ (fully programmable edge placement by software). Note the dead-band module is also available if the more classical edge delay method is required.

Figure 20-31. Up-Down Count, Dual-Edge Symmetric Waveform, with Independent Modulation on EPWMxA and EPWMxB — Complementary

- A. PWM period = $2 \times TBPRD \times TBCLK$
- B. Rising edge and falling edge can be asymmetrically positioned within a PWM cycle. This allows for pulse placement techniques.
- C. Duty modulation for EPWMxA is set by CMPA and CMPB.
- D. Low time duty for EPWMxA is proportional to $(CMPA + CMPB)$.
- E. To change this example to active high, CMPA and CMPB actions need to be inverted (that is, Clear on CMPA, Set on CMPB).
- F. Duty modulation for EPWMxB is fixed at 50% (utilizes spare action resources for EPWMxB).

Figure 20-32. Up-Down Count, Dual-Edge Asymmetric Waveform, with Independent Modulation on EPWMxA—Active Low

- A. $\text{PWM period} = 2 \times \text{TBPRD} \times \text{TTBCLK}$
- B. Independent T1 event actions when counter is counting up and when the counter is counting down are used to generate EPWMxA output.
- C. Independent T2 event actions when counter is counting up and when the counter is counting down are used to generate EPWMxB output.
- D. TZ1 is selected as the source for T1.
- E. TZ2 is selected as the source for T2.

Figure 20-33. Up-Down Count, PWM Waveform Generation Utilizing T1 and T2 Events

20.7 Dead-Band Generator (DB) Submodule

Figure 20-34 illustrates the dead-band submodule within the ePWM.

Figure 20-34. Dead_Band Submodule

20.7.1 Purpose of the Dead-Band Submodule

The action-qualifier (AQ) module section discussed how the AQ module can generate the required dead band by having full control over edge placement using both the CMPA and CMPB resources of the ePWM module. However, if the more classical edge delay-based dead band with polarity control is required, then the dead-band submodule described here must be used.

The key functions of the dead-band module are:

- Generating appropriate signal pairs (EPWMxA and EPWMxB) with dead-band relationship from a single EPWMxA input
- Programming signal pairs for:
 - Active high (AH)
 - Active low (AL)
 - Active high complementary (AHC)
 - Active low complementary (ALC)
- Adding programmable delay to rising edges (RED)
- Adding programmable delay to falling edges (FED)
- Can be totally bypassed from the signal path (note dotted lines in diagram)

20.7.2 Dead-band Submodule Additional Operating Modes

On type 1 ePWM RED can appear on one channel output and FED can appear on the other channel output.

The following list shows the distinct difference between type 1 and type 4 modules with respect to dead-band operating modes:

- By adding S6, S7, and S8 in [Figure 20-35](#), RED and FED can appear on both the A-channel and B-channel outputs. Additionally, both RED and FED together can be applied to either the A-channel or B-channel outputs to allow B-channel phase shifting with respect to the A-channel.

Note

Phase shifting B-channel with respect to the A-channel using the dead-band submodule additional operating modes has limitations with respect to the choice of RED and FED delay with respect to the operating duty cycle of the ePWMxA and ePWMxB outputs.

- The dead-band counters have also been increased to 14 bits
- Deadband and deadband high-resolution registers are now shadowed
- High-resolution deadband RED and FED have been enabled using the DBREDHR and DBFEDHR registers

Note

The PWM chopper is not enabled when high-resolution deadband is enabled.

High-resolution deadband RED and FED requires half-cycle clocking mode (DBCTL[HALFCYCLE] = 1).

Cannot have both RED and FED together applied to both ePWMxA and ePWMxB. RED and FED together can be applied only to either OutA OR OutB.

Phase shifting B-channel with respect to the A-channel: When PWMxB is derived from PWMxA using the DEDB_MODE bit and by delaying rising edge and falling edge by the phase shift amount. When the duty cycle value on PWMxA is less than this phase shift amount, PWMxA's falling edge has precedence over the delayed rising edge for PWMxB. Make sure the duty cycle value of the current waveform applied to the dead-band module is greater than the required phase shift amount.

The Type 4 action qualifier and dead-band outputs of the ePWM module are delayed by one TBCLK cycle in comparison to the Type 2 ePWM module, although the Type 4 behavior is the same as the Type 3 PWM. Both PWMA and PWMB signals are delayed under all circumstances.

Shadow Mode:

The shadow mode for the DBRED is enabled by setting the DBCTL[SHDWDBREDDMODE] bit and the shadow register for DBFED is enabled by setting the DBCTL [SHDWDBFEDMODE] bit. Shadow mode is disabled by default for both DBRED and DBFED

If the shadow register is enabled, then the content of the shadow register is transferred to the active register on one of the following events as specified by the DBCTL [LOADREDDMODE] and DBCTL [LOADFEDMODE] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero

The DBCTL register can be shadowed. The shadow mode for DBCTL is enabled by setting the DBCTL2[SHDWDBCTLMODE] bit. If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the DBCTL2[LOADDBCTLMODE] register bit:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD)
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x00)
- Both CTR = PRD and CTR = Zero

Note

The application software must enable shadow load mode in the DBCTL[SHDWDBREDDMODE] and DBCTL[SHDWDBFEDMODE] **before** programming values for the DBRED and DBFED registers. If the shadow register is enabled **after** programming the DBRED and DBFED registers, the DBRED and DBFED registers are loaded with a value of 0.

Global Load Support

Global load control mechanism can also be used for DBRED:DBREDHR, DBFED:DBFEDHR, and DBCTL registers by configuring the appropriate bits in the global load configuration register (GLDCFG). When global load mode is selected the transfer of contents from shadow register to active register, for all registers that have this mode enabled, occurs at the same event as defined by the configuration bits in the Global Shadow to Active Load Control Register (GLDCTL). The Global load control mechanism is explained in [Section 20.4.7](#).

Note

When DBRED/DBFED active is loaded with a new shadow value while DB counters are counting, the new DBRED/DBFED value only affects the NEXT PWMx edge and not the current edge.

A Deadband value of zero cannot be used when the Global Shadow to Active Load is set to occur at CTR=ZERO. Similarly, a Deadband value of PRD cannot be used when the Global Shadow to Active Load is set to occur at CTR=PRD.

TBPRDHR cannot be used with Global load. If high-resolution period must be changed in the application, users must write to the individual period registers from an ePWM ISR (The ISR must be synchronous with the PWM switching period), where the Global Load One-Shot bit is also written to.

20.7.3 Operational Highlights for the Dead-Band Submodule

The configuration options for the dead-band submodule are shown in [Figure 20-35](#).

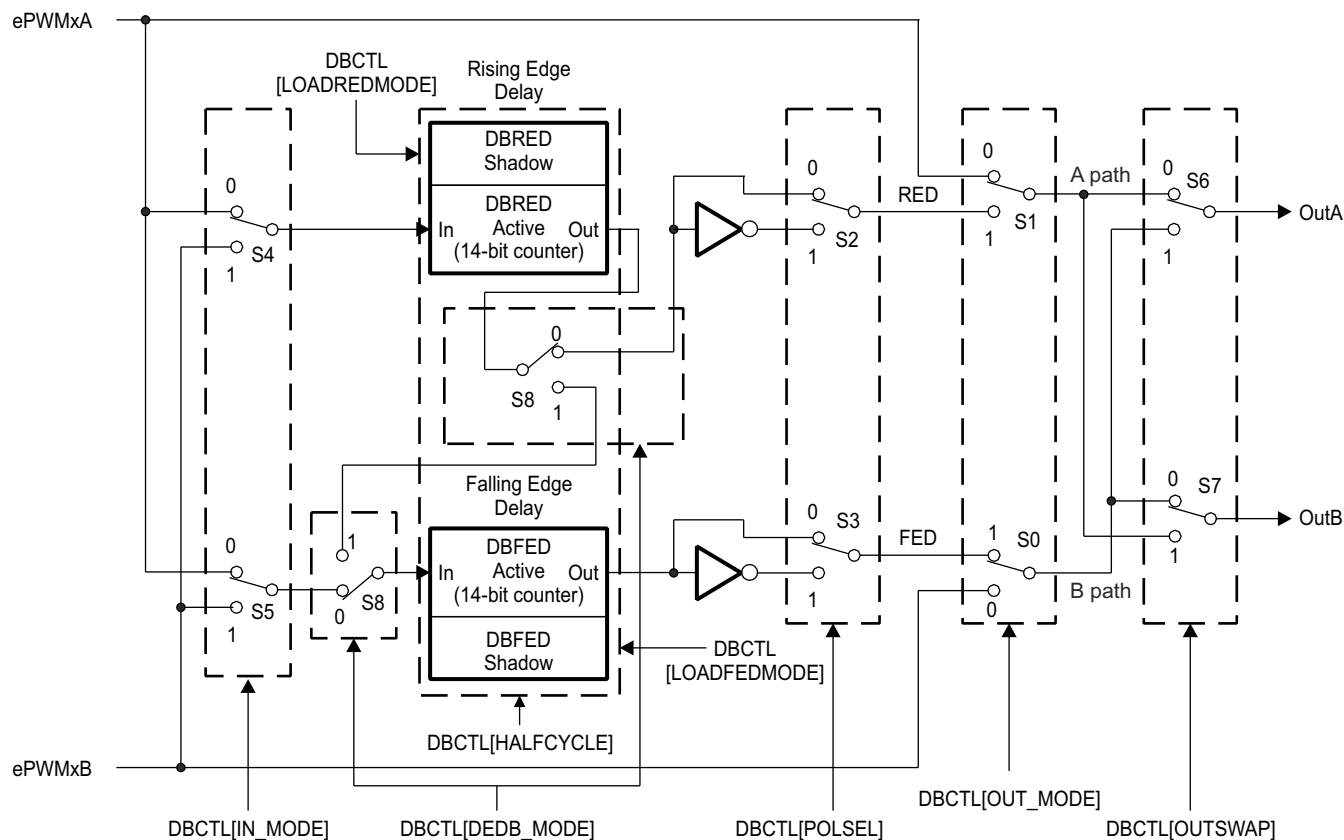

Figure 20-35. Configuration Options for the Dead-Band Submodule

Although all combinations are supported, not all are typical usage modes. [Table 20-9](#) documents some classical dead-band configurations. These modes assume that the DBCTL[IN_MODE] is configured such that EPWMxA In is the source for both falling-edge and rising-edge delay. Enhanced, or non-traditional modes can be achieved by changing the input signal source. The modes shown in [Table 20-9](#) fall into the following categories:

- **Mode 1: Bypass both falling-edge delay (FED) and rising-edge delay (RED):** Allows the user to fully disable the dead-band submodule from the PWM signal path.
- **Mode 2-5: Classical Dead-Band Polarity Settings:** These represent typical polarity configurations that can address all the active-high and active-low modes required by available industry power switch gate drivers. The waveforms for these typical cases are shown in [Figure 20-36](#). Note that to generate equivalent waveforms to [Figure 20-36](#), configure the action-qualifier submodule to generate the signal as shown for EPWMxA.
- **Mode 6: Bypass rising-edge delay (RED) and Mode 7: Bypass falling-edge delay (FED):** Finally the last two entries in [Table 20-9](#) show combinations where either the falling-edge delay (FED) or rising-edge delay (RED) blocks are bypassed.

[Figure 20-36](#) shows waveforms for typical cases where $0% < \text{duty} < 100%$.

Table 20-9. Classical Dead-Band Operating Modes

Mode	Mode Description	DBCTL[POLSEL]		DBCTL[OUT_MODE]	
		S3	S2	S1	S0
1	EPWMxA and EPWMxB Passed Through (No Delay)	X	X	0	0
2	Active High Complementary (AHC)	1	0	1	1
3	Active Low Complementary (ALC)	0	1	1	1
4	Active High (AH)	0	0	1	1
5	Active Low (AL)	1	1	1	1
6	EPWMxA Out = EPWMxA In (No Delay)	0 or 1	0 or 1	0	1
	EPWMxB Out = EPWMxA In with Falling-Edge Delay				
7	EPWMxA Out = EPWMxA In with Rising-Edge Delay	0 or 1	0 or 1	1	0
	EPWMxB Out = EPWMxB In with No Delay				

Table 20-10. Additional Dead-Band Operating Modes

Mode Description	DBCTL[DEDB-MODE]	DBCTL[OUTSWAP]	
	S8	S6	S7
EPWMxA and EPWMxB signals are as defined by OUT-MODE bits.	0	0	0
EPWMxA = A-path as defined by OUT-MODE bits.	0	0	1
EPWMxB = A-path as defined by OUT-MODE bits (rising-edge delay or delay-bypassed A-signal path)			
EPWMxA = B-path as defined by OUT-MODE bits (falling-edge delay or delay-bypassed B-signal path)	0	1	0
EPWMxB = B-path as defined by OUT-MODE bits			
EPWMxA = B-path as defined by OUT-MODE bits (falling-edge delay or delay-bypassed B-signal path)	0	1	1
EPWMxB = A-path as defined by OUT-MODE bits (rising-edge delay or delay-bypassed A-signal path)			
Rising-edge delay applied to EPWMxA / EPWMxB as selected by S4 switch (IN-MODE bits) on A signal path only.	0	X	X
Falling-edge delay applied to EPWMxA / EPWMxB as selected by S5 switch (IN-MODE bits) on B signal path only.			
Rising-edge delay and falling-edge delay applied to source selected by S4 switch (IN-MODE bits) and output to B signal path only. ⁽¹⁾	1	X	X

- (1) When this bit is set to 1, the user can always either set OUT_MODE bits such that Apath = InA or set OUTSWAP bits such that EPWMxA=Bpath. Otherwise, EPWMxA is invalid.

Figure 20-36. Dead-Band Waveforms for Typical Cases (0% < Duty < 100%)

The dead-band submodule supports independent values for rising-edge (RED) and falling-edge (FED) delays. The amount of delay is programmed using the DBRED and DBFED registers. These are 10-bit registers and the value represents the number of TBCLK (time-base clock) pulses by which a signal edge is delayed. For example, the formula to calculate falling-edge-delay and rising-edge-delay is:

$$\text{FED} = \text{DBFED} \times T_{\text{TBCLK}}$$

$$\text{RED} = \text{DBRED} \times T_{\text{TBCLK}}$$

Where T_{TBCLK} is the period of TBCLK, the prescaled version of EPWMCLK.

For convenience, delay values for various TBCLK options are shown in [Table 20-11](#). The ePWM input clock frequency that these delay values been computed by is 100MHz.

Table 20-11. Dead-Band Delay Values in μ s as a Function of DBFED and DBRED

Dead-Band Value		Dead-Band Delay (μ s)		
DBFED, DBRED	TBCLK = EPWMCLK/1	TBCLK = EPWMCLK /2	TBCLK = EPWMCLK/4	
1	0.01	0.02	0.04	
5	0.05	0.10	0.20	
10	0.10	0.20	0.40	
100	1.00	2.00	4.00	
200	2.00	4.00	8.00	
400	4.00	8.00	16.00	
500	5.00	10.00	20.00	
600	6.00	12.00	24.00	
700	7.00	14.00	28.00	
800	8.00	16.00	32.00	
900	9.00	18.00	36.00	
1000	10.00	20.00	40.00	

When half-cycle clocking is enabled, the formula to calculate the falling-edge-delay and rising-edge-delay becomes:

$$FED = DBFED \times T_{TBCLK}/2$$

$$RED = DBRED \times T_{TBCLK}/2$$

20.8 PWM Chopper (PC) Submodule

The PWM chopper submodule allows a high-frequency carrier signal to modulate the PWM waveform generated by the action-qualifier and dead-band submodules. This capability is important if pulse transformer-based gate drivers to control the power switching elements are needed.

Figure 20-37 illustrates the PWM chopper submodule within the ePWM.

Figure 20-37. PWM Chopper Submodule

20.8.1 Purpose of the PWM Chopper Submodule

The key functions of the PWM chopper submodule are:

- Programmable chopping (carrier) frequency
- Programmable pulse width of first pulse
- Programmable duty cycle of second and subsequent pulses
- Can be fully bypassed if not required

20.8.2 Operational Highlights for the PWM Chopper Submodule

Figure 20-38 shows the operational details of the PWM chopper submodule. The carrier clock is derived from EPWMCLK. The clock frequency and duty cycle are controlled using the CHPFREQ and CHPDUTY bits in the PCCTL register. The one-shot block is a feature that provides a high energy first pulse to make sure hard and fast power switch turn on, while the subsequent pulses sustain pulses, making sure the power switch remains on. The one-shot width is programmed using the OSHTWTH bits. The PWM chopper submodule can be fully disabled (bypassed) using the CHPEN bit.

Figure 20-38. PWM Chopper Submodule Operational Details

20.8.3 Waveforms

Figure 20-39 shows simplified waveforms of the chopping action only; one-shot and duty-cycle control are not shown. Details of the one-shot and duty-cycle control are discussed in the following sections.

Figure 20-39. Simple PWM Chopper Submodule Waveforms Showing Chopping Action Only

20.8.3.1 One-Shot Pulse

The width of the first pulse can be programmed to any of 16 possible pulse width values. The width or period of the first pulse is given by:

$$T_{1\text{stpulse}} = T_{\text{EPWMCLK}} \times 8 \times \text{OSHTWTH}$$

Where T_{EPWMCLK} is the period of the system clock (EPWMCLK) and OSHTWTH is the four control bits (value from 1 to 16)

Figure 20-40 shows the first and subsequent sustaining pulses and Table 20-12 gives the possible pulse width values for a EPWMCLK = 80MHz.

Figure 20-40. PWM Chopper Submodule Waveforms Showing the First Pulse and Subsequent Sustaining Pulses

Table 20-12. Possible Pulse Width Values for EPWMCLK = 80MHz

OSHTWTH (hex)	Pulse Width (ns)
0	100
1	200
2	300
3	400
4	500
5	600
6	700
7	800
8	900
9	1000
A	1100
B	1200
C	1300
D	1400
E	1500
F	1600

20.8.3.2 Duty Cycle Control

Pulse transformer-based gate drive designs need to comprehend the magnetic properties or characteristics of the transformer and associated circuitry. Saturation is one such consideration. To assist the gate drive designer, the duty cycles of the second and subsequent pulses have been made programmable. These sustaining pulses make sure the correct drive strength and polarity is maintained on the power switch gate during the on period, and hence a programmable duty cycle allows a design to be tuned or optimized using software control.

Figure 20-41 shows the duty cycle control that is possible by programming the CHPDUTY bits. One of seven possible duty ratios can be selected ranging from 12.5% to 87.5%.

Figure 20-41. PWM Chopper Submodule Waveforms Showing the Pulse Width (Duty Cycle) Control of Sustaining Pulses

20.9 Trip-Zone (TZ) Submodule

Each ePWM module is connected to six \overline{TZn} signals ($\overline{TZ1}$ to $\overline{TZ6}$). $\overline{TZ1}$ to $\overline{TZ3}$ are sourced from the GPIO mux. $\overline{TZ4}$ is sourced from an inverted EQEPxERR signal on those devices with an EQEP module. $\overline{TZ5}$ is connected to the system clock fail logic, and $\overline{TZ6}$ is sourced from the EMUSTOP output from the CPU. These signals indicate external fault or trip conditions, and the ePWM outputs can be programmed to respond accordingly when faults occur.

Figure 20-42 illustrates the trip-zone submodule within the ePWM.

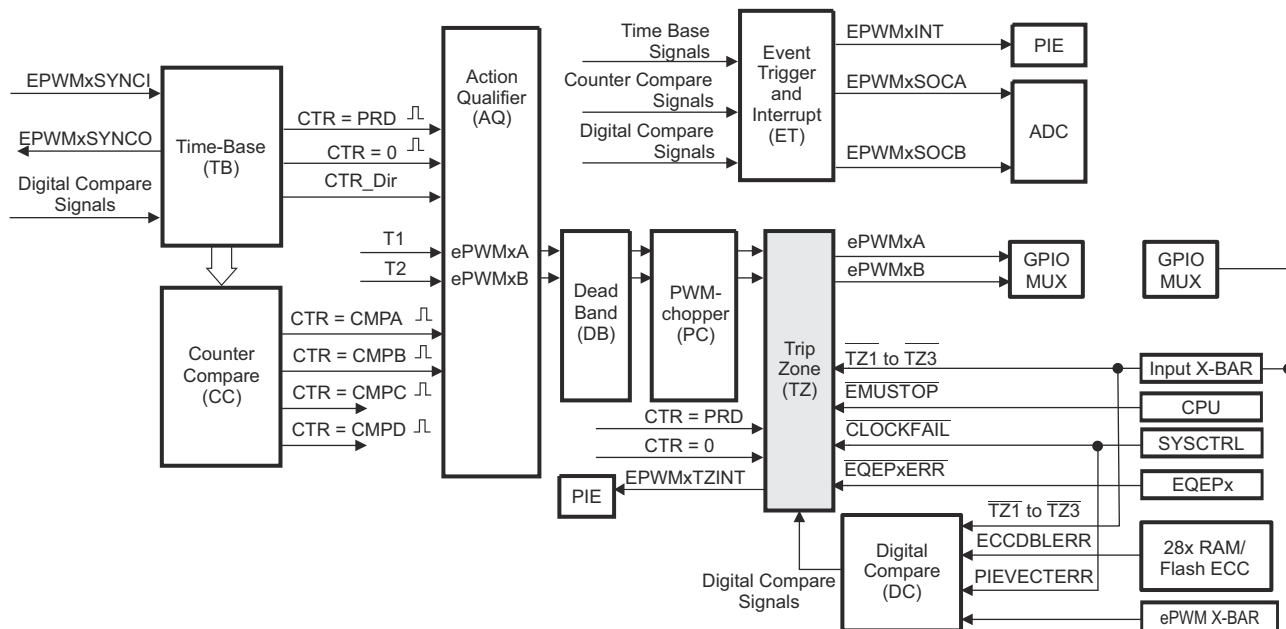

Figure 20-42. Trip-Zone Submodule

20.9.1 Purpose of the Trip-Zone Submodule

The key functions of the trip-zone submodule are:

- Trip inputs $\overline{TZ1}$ to $\overline{TZ6}$ can be flexibly mapped to any ePWM module.
- Upon a fault condition, outputs EPWMxA and EPWMxB can be forced to one of the following:
 - High
 - Low
 - High-impedance
 - No action taken
- Support for one-shot trip (OSHT) for major short circuits or over-current conditions.
- Support for cycle-by-cycle tripping (CBC) for current limiting operation.
- Support for digital compare tripping (DC) based on state of on-chip analog comparator module outputs and $\overline{TZ1}$ to $\overline{TZ3}$ signals.
- Each trip-zone input and digital compare (DC) submodule DCAEVT1/2 or DCBEVT1/2 force event can be allocated to either one-shot or cycle-by-cycle operation.
- Interrupt generation is possible on any trip-zone input.
- Software-forced tripping is also supported.
- The trip-zone submodule can be fully bypassed if the trip-zone submodule is not required.

20.9.2 Operational Highlights for the Trip-Zone Submodule

The following sections describe the operational highlights and configuration options for the trip-zone submodule.

The trip-zone signals $\overline{TZ1}$ to $\overline{TZ6}$ (also collectively referred to as \overline{TZn}) are active-low input signals. When one of these signals goes low, or when a DCAEVT1/2 or DCBEVT1/2 force happens based on the TZDCSEL register event selection, the indication is that a trip event has occurred. Each ePWM module can be individually configured to ignore or use each of the trip-zone signals or DC events. Which trip-zone signals or DC events are used by a particular ePWM module is determined by the TZSEL register for that specific ePWM module. The trip-zone signals can or cannot be synchronized to the ePWMclock (EPWMCLK) and digitally filtered within the GPIO MUX block. A minimum of $3 \cdot TBCLK$ low pulse width on \overline{TZn} inputs is sufficient to trigger a fault condition on the ePWM module. If the pulse width is less than this, the trip condition cannot be latched by CBC or OST latches. The asynchronous trip makes sure that if clocks are missing for any reason, the outputs can still be tripped by a valid event present on \overline{TZn} inputs. The GPIOs or peripherals must be appropriately configured. For more information, see the *System Control and Interrupts* chapter.

Each \overline{TZn} input can be individually configured to provide either a cycle-by-cycle or one-shot trip event for an ePWM module. DCAEVT1 and DCBEVT1 events can be configured to directly trip an ePWM module or provide a one-shot trip event to the module. Likewise, DCAEVT2 and DCBEVT2 events can also be configured to directly trip an ePWM module or provide a cycle-by-cycle trip event to the module. This configuration is determined by the TZSEL[DCAEVT1/2], TZSEL[DCBEVT1/2], TZSEL[CBCn], and TZSEL[OSHTn] control bits (where n corresponds to the trip input), respectively.

- **Cycle-by-Cycle (CBC):**

When a cycle-by-cycle trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and EPWMxB outputs. [Table 20-13](#) lists some of the possible actions. Independent actions can be specified based on the occurrence of the event while the counter is counting up or while the counter is counting down by appropriately configuring bits in the TZCTL2 register. Actions specified in the TZCTL2 register take effect only when the ETZE bit in TZCTL2 is set.

Additionally, when a cycle-by-cycle trip event occurs, the cycle-by-cycle trip event flag (TZFLG[CBC]) is set and a EPWMx_TZINT interrupt is generated when enabled in the TZEINT register and interrupt controller. A corresponding flag for the event that caused the CBC event is also set in register TZCBCFLG.

If the CBC interrupt is enabled using the TZEINT register and DCAEVT2 or DCBEVT2 are selected as CBC trip sources using the TZSEL register, it is not necessary to also enable the DCAEVT2 or DCBEVT2 interrupts in the TZEINT register, as the DC events trigger interrupts through the CBC mechanism.

The specified condition on the inputs is automatically cleared based on the selection made with TZCLR[CBCPULSE] if the trip event is no longer present. Therefore, in this mode, the trip event is cleared or reset every PWM cycle. The TZFLG[CBC] and TZCBCFLG flag bits remain set until the flag bits are manually cleared by writing to the TZCLR[CBC] and TZCBCCLR flag bits. If the cycle-by-cycle trip event is still present when the TZFLG[CBC] and TZCBCFLG register bits are cleared, then these bits are again immediately set.

- **One-Shot (OSHT):**

When a one-shot trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and EPWMxB output. [Table 20-13](#) lists some of the possible actions. Independent actions can be specified based on the occurrence of the event while the counter is counting up and while the counter is counting down by appropriately configuring bits in TZCTL2 register. Actions specified in TZCTL2 register take effect only when ETZE bit in TZCTL2 is set.

Additionally, when a one-shot trip event occurs, the one-shot trip event flag (TZFLG[OST]) is set and a EPWMx_TZINT interrupt is generated when enabled in the TZEINT register and interrupt controller. A corresponding flag for the event that caused the OST event is also set in register TZOSTFLG. The one-shot trip condition must be cleared manually by writing to the TZCLR[OST] bit. If desired, the TZOSTFLG register bit can be cleared by manually writing to the corresponding bit in the TZOSTCLR register.

If the one-shot interrupt is enabled using the TZEINT register and DCAEVT1 or DCBEVT1 are selected as OSHT trip sources using the TZSEL register, it is not necessary to also enable the DCAEVT1 or DCBEVT1 interrupts in the TZEINT register, as the DC events trigger interrupts through the OSHT mechanism.

Note

Clear the TZFLG and TZOSTFLG flags after making sure that the TRIPIN source of the OST has become inactive. Otherwise, if interrupts are enabled, depending on when the flags are cleared, an OST interrupt can occur and the OST flags are zero.

- **Digital Compare Events (DCAEVT1/2 and DCBEVT1/2):**

A digital compare DCAEVT1/2 or DCBEVT1/2 event is generated based on a combination of the DCAH/DCAL and DCBH/DCBL signals as selected by the TZDCSEL register. The signals which source the DCAH/DCAL and DCBH/DCBL signals are selected using the DCTRIPSEL register and can be either trip zone input pins or analog comparator CMPSSx signals. For more information on the digital compare submodule signals, see [Section 20.11](#).

When a digital compare event occurs, the action specified in the TZCTL[DCAEVT1/2] and TZCTL[DCBEVT1/2] bits is carried out immediately on the EPWMxA and EPWMxB output. [Table 20-13](#) lists the possible actions. Independent actions can be specified based on the occurrence of the event while the counter is counting up and while the counter is counting down by appropriately configuring bits in TZCTLDCA and TZCTLDCB register. Actions specified in TZCTLDCA and TZCTLDCB registers take effect only when ETZE bit in TZCTL2 is set.

In addition, the relevant DC trip event flag (TZFLG[DCAEVT1/2] / TZFLG[DCBEVT1/2]) is set and a EPWMx_TZINT interrupt is generated when enabled in the TZEINT register and interrupt controller.

The specified condition on the pins is automatically cleared when the DC trip event is no longer present. The TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag bit remains set until the flag is manually cleared by writing to the TZCLR[DCAEVT1/2] or TZCLR[DCBEVT1/2] bit. If the DC trip event is still present when the TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag is cleared, then the flag is again immediately set.

The action taken when a trip event occurs can be configured individually for each of the ePWM output pins by way of the TZCTL, TZCTL2, TZCTLDCA, and TZCTLDCB register bit fields. Some of the possible actions, shown in [Table 20-13](#), can be taken on a trip event.

Table 20-13. Possible Actions On a Trip Event

TZCTL Register Bitfield Settings	EPWMxA and EPWMxB	Comment
0,0	High-Impedance	Tripped
0,1	Force to High State	Tripped
1,0	Force to Low State	Tripped
1,1	No Change	Do Nothing. No change is made to the output.

Example 20-1. Trip-Zone Configurations

Scenario A:

A one-shot trip event on $\overline{TZ1}$ pulls both EPWM1A, EPWM1B low and also forces EPWM2A and EPWM2B high.

- Configure the ePWM1 registers as follows:
 - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWM1
 - TZCTL[TZA] = 2: EPWM1A is forced low on a trip event.
 - TZCTL[TZB] = 2: EPWM1B is forced low on a trip event.
- Configure the ePWM2 registers as follows:
 - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWM2
 - TZCTL[TZA] = 1: EPWM2A is forced high on a trip event.
 - TZCTL[TZB] = 1: EPWM2B is forced high on a trip event.

Scenario B:

A cycle-by-cycle event on $\overline{TZ5}$ pulls both EPWM1A, EPWM1B low.

A one-shot event on $\overline{TZ1}$ or $\overline{TZ6}$ puts EPWM2A into a high impedance state.

- Configure the ePWM1 registers as follows:
 - TZSEL[CBC5] = 1: enables $\overline{TZ5}$ as a cycle-by-cycle event source for ePWM1
 - TZCTL[TZA] = 2: EPWM1A is forced low on a trip event.
 - TZCTL[TZB] = 2: EPWM1B is forced low on a trip event.
- Configure the ePWM2 registers as follows:
 - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWM2
 - TZSEL[OSHT6] = 1: enables $\overline{TZ6}$ as a one-shot event source for ePWM2
 - TZCTL[TZA] = 0: EPWM2A is put into a high-impedance state on a trip event.
 - TZCTL[TZB] = 3: EPWM2B ignores the trip event.

Note

When configuring the GPIOs and INPUT X-BAR/EPWM X-BAR options, be aware that a change in the X-BAR input selections can cause an unwanted event. Therefore, set up the GPIO and X-BAR input configurations before enabling the ePWM Trip-Zone. If a requirement is to change the GPIO/X-BAR configurations while the ePWM Trip-Zone is enabled, the user can turn off the TRIPs by clearing the TZSEL register and reconfiguring the TRIP selection (TZSEL) after the INPUT XBAR selection is changed.

20.9.3 Generating Trip Event Interrupts

Figure 20-43 and Figure 20-44 illustrate the trip-zone submodule control and interrupt logic, respectively. DCAEVT1/2 and DCBEVT1/2 signals are described in further detail in Section 20.11.

Figure 20-43. Trip-Zone Submodule Mode Control Logic

Figure 20-44. Trip-Zone Submodule Interrupt Logic

These individual flags for the CBC, OST and DCxEVTy can be used to detect the source of the EPWMxTZINT Interrupt. When multiple sources are used to generate the EPWMxTZINT interrupt, reading and clearing the flags takes different actions based on the specific event.

20.10 Event-Trigger (ET) Submodule

The key functions of the event-trigger submodule are:

- Receives event inputs generated by the time-base, counter-compare, and digital-compare submodules
- Uses the time-base direction information for up/down event qualification
- Uses prescaling logic to issue interrupt requests and ADC start of conversion at:
 - Every event
 - Every second event
 - Up to every fifteenth event
- Provides full visibility of event generation using event counters and flags
- Allows software forcing of Interrupts and ADC start of conversion

The event-trigger submodule manages the events generated by the time-base submodule, the counter-compare submodule, and the digital-compare submodule to generate an interrupt to the CPU and a start of conversion pulse to the ADC when a selected event occurs.

Figure 20-45 illustrates the event-trigger submodule within the ePWM.

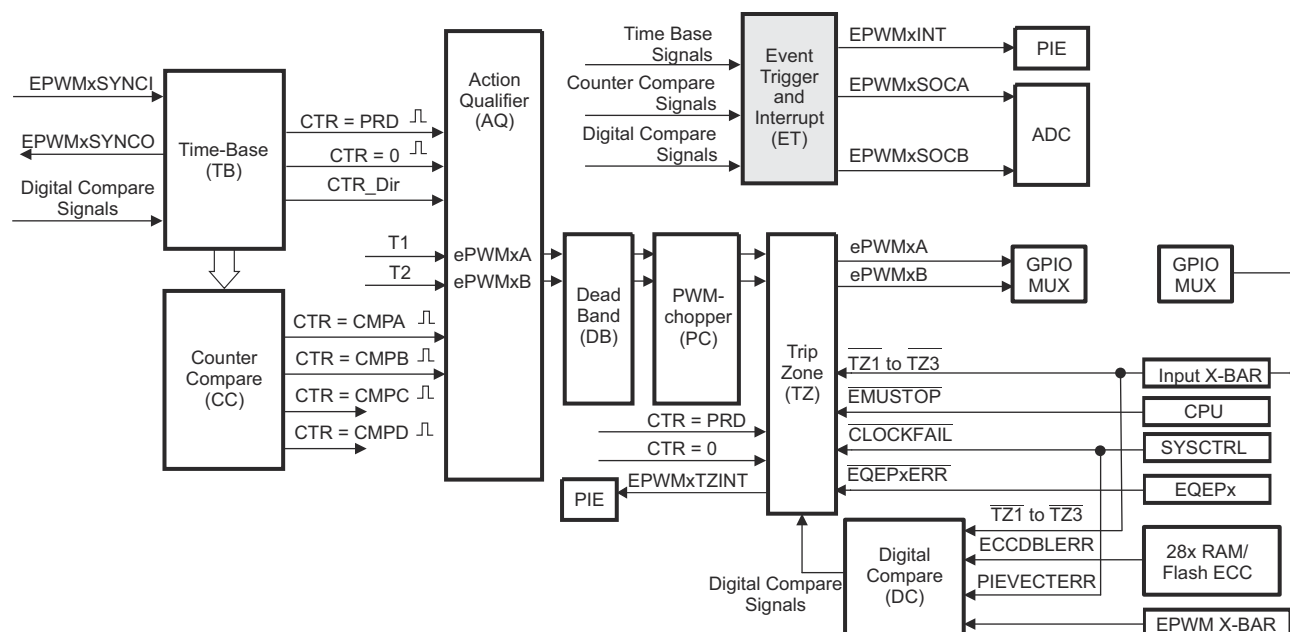

Figure 20-45. Event-Trigger Submodule

20.10.1 Operational Overview of the ePWM Event-Trigger Submodule

The event-trigger submodule monitors various event conditions (shown as inputs on the left side of Figure 20-46) and can be configured to prescale these events before issuing an Interrupt request or an ADC start of conversion. The event-trigger prescaling logic can issue Interrupt requests and ADC start of conversion at:

- Every event
- Every second event
- Up to every fifteenth event

Figure 20-46. Event-Trigger Submodule Showing Event Inputs and Prescaled Outputs

- ETSEL - This selects which of the possible events trigger an interrupt or start an ADC conversion.
- ETPS - This programs the event prescaling options mentioned above.
- ETFLG - These are flag bits indicating status of the selected and prescaled events.
- ETCLR - These bits allow clearing the flag bits in the ETFLG register using software.
- ETFRC - These bits allow software forcing of an event. Useful for debugging or software intervention.
- ETINTPS - This programs the interrupt event prescaling options, supporting count and period up to 15 events.
- ETSOCPS - This programs the SOC event prescaling options, supporting count and period up to 15 events.
- ETCNINITCTL - These bits enable ETCNINIT initialization using SYNC event or using software force.
- ETCNINIT - These bits allow initializing INT/SOCA/SOCB counters on SYNC events (or software force) with user programmed value.

A more detailed look at how the various register bits interact with the Interrupt and ADC start of conversion logic are shown in Figure 20-47, Figure 20-48, and Figure 20-49.

Figure 20-47 shows the event-trigger's interrupt generation logic. The interrupt-period (ETPS[INTPRD]) bits specify the number of events required to cause an interrupt pulse to be generated. The choices available are:

- Do not generate an interrupt.
- Generate an interrupt on every event.
- Generate an interrupt on every second event.
- Generate an interrupt on every third event.

The selection made on ETPS[INTPSEL] bit determines whether ETINTPS register, INTCNT2 and INTPRD2 bit fields determine frequency of events (interrupt once every 0-15 events).

The event that can cause an interrupt is configured by the interrupt selection (ETSEL[INTSEL]) and (ETSEL[INTSELCMP]) bits. The event can be one of the following:

- Time-base counter equal to zero (TBCTR = 0x00).
- Time-base counter equal to period (TBCTR = TBPRD).
- Time-base counter equal to zero or period (TBCTR = 0x00 || TBCTR = TBPRD).
- Time-base counter equal to the compare A register (CMPA) when the timer is incrementing.
- Time-base counter equal to the compare A register (CMPA) when the timer is decrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is incrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is decrementing.
- Time-base counter equal to the compare C register (CMPC) when the timer is incrementing.
- Time-base counter equal to the compare C register (CMPC) when the timer is decrementing.
- Time-base counter equal to the compare D register (CMPD) when the timer is incrementing.
- Time-base counter equal to the compare D register (CMPD) when the timer is decrementing.

The number of events that have occurred can be read from the interrupt event counter ETPS[INTCNT] or ETINTPS[INTCNT2] register bits based off of the selection made using ETPS[INTPSEL]. That is, when the specified event occurs the ETPS[INTCNT] or ETINTPS[INTCNT2] bits are incremented until the bits reach the value specified by ETPS[INTPRD] or ETINTPS[INTPRD2] determined again by the selection made in ETPS[INTPSEL]. When ETPS[INTCNT] = ETPS[INTPRD], the counter stops counting and the counter output is set. The counter is only cleared when an interrupt is sent to the interrupt controller.

When ETPS[INTCNT] reaches ETPS[INTPRD], the following behavior occurs. [The following behavior is also applicable to ETINTPS[INTCNT2] and ETINTPS[INTPRD2]:

- If interrupts are enabled, ETSEL[INTEN] = 1 and the interrupt flag is clear, ETFLG[INT] = 0, then an interrupt pulse is generated and the interrupt flag is set, ETFLG[INT] = 1, and the event counter is cleared ETPS[INTCNT] = 0. The counter begins counting events again.
- If interrupts are disabled, ETSEL[INTEN] = 0, or the interrupt flag is set, ETFLG[INT] = 1, the counter stops counting events when the counter reaches the period value ETPS[INTCNT] = ETPS[INTPRD].
- If interrupts are enabled, but the interrupt flag is already set, then the counter holds the output high until the ENTFLG[INT] flag is cleared. This allows for one interrupt to be pending while one is serviced.

Writing a 0 to the INTPRD bits automatically clears the counter (INTCNT = 0) and the counter output resets (so no interrupts are generated). For all other writes to INTPRD, INTCNT retains the previous value. INTCNT resets when INTCNT overflows. Writing a 1 to the ETFRC[INT] bit increments the event counter INTCNT. The counter behaves as previously described when INTCNT = INTPRD. When INTPRD = 0, the counter is disabled and hence no events are detected and the ETFRC[INT] bit is also ignored. The same applies to ETINTPS[INTCNT2] and ETINTPS[INTPRD2].

The previous definition means that an interrupt on every event, on every second event, or on every third event if using the INTCNT and INTPRD can be generated. An interrupt on every event up to 15 events if using the INTCNT2 and INTPRD2 can be generated.

The INTCNT2 value can be initialized with the value from ETCNTINIT[INTINIT] based on the selection made in ETCNTINITCTL[INTINITEN]. When ETCNTINITCTL[INTINITEN] is set, then initialization of INTCNT2 counter with contents of ETCNTINIT[INTINIT] on a SYNC event or software force is determined by ETCNTINITCTL[INTINITFRC].

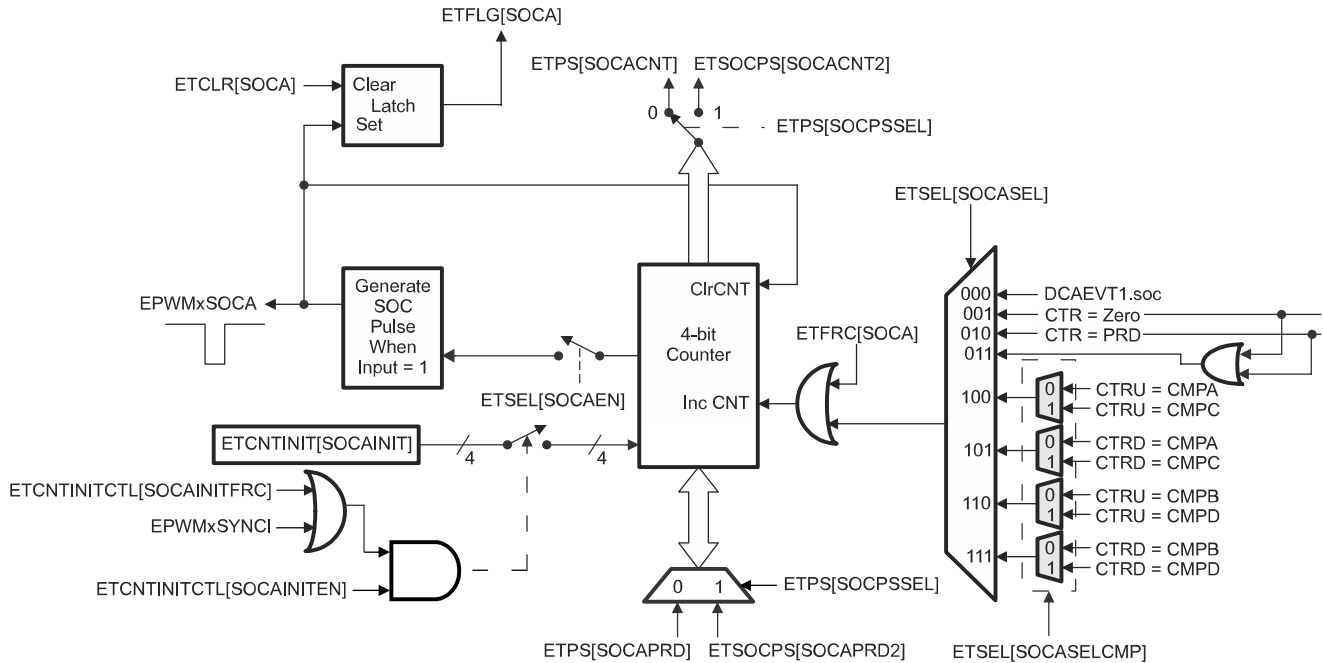

Figure 20-47. Event-Trigger Interrupt Generator

Figure 20-48 shows the operation of the event-trigger's start-of-conversion-A (SOCA) pulse generator. The enhancements include SOCASELCMP and SOCBSELCMP bit fields defined in the ETSEL register enable CMPC and CMPD events respectively to cause a start of conversion. The ETPS[SOCPSSEL] bit field determines whether SOCACNT2 and SOCAPRD2 take control or not. The ETPS[SOCACNT] counter and ETPS[SOCAPRD] period values behave similarly to the interrupt generator except that the pulses are continuously generated. That is, the pulse flag ETFLG[SOCA] is latched when a pulse is generated, but the interrupt generator does not stop further pulse generation. The enable and disable bit ETSEL[SOCAEN] stops pulse generation, but input events can still be counted until the period value is reached as with the interrupt generation logic. The event that triggers an SOCA and SOCB pulse can be configured separately in the ETSEL[SOCASEL] and ETSEL[SOCBSEL] bits. The possible events are the same events that can be specified for the interrupt generation logic with the addition of the DCAEVT1.soc and DCBEVT1.soc event signals from the digital compare (DC) submodule. The SOCACNT2 initialization scheme is very similar to the interrupt generator with respective enable, value initialize and SYNC or software force options.

NOTE: The DCAEVT1.soc signals are generated by the Digital Compare (DC) submodule in [Section 20.11](#).

Figure 20-48. Event-Trigger SOCA Pulse Generator

Figure 20-49 shows the operation of the event-trigger's start-of-conversion-B (SOCB) pulse generator. The event-trigger's SOCB pulse generator operates the same way as the SOCA.

NOTE: The DCBEVT1.soc signals are generated by the Digital Compare (DC) submodule in [Section 20.11](#).

Figure 20-49. Event-Trigger SOCB Pulse Generator

20.11 Digital Compare (DC) Submodule

Figure 20-50 illustrates where the digital compare (DC) submodule signals interface to other submodules in the ePWM system.

The eCAP input signals are sourced from the Input X-BAR signals as shown in Figure 20-51.

On this device, any of the GPIO pins can be flexibly mapped to be the trip-zone input and trip inputs to the trip-zone submodule and digital compare submodule. The Input X-BAR Input Select (INPUTxSELECT) register defines which GPIO pins gets assigned to be the trip-zone inputs / trip inputs.

The digital compare (DC) submodule compares signals external to the ePWM module (for instance, CMPSSx signals from the analog comparators) to directly generate PWM events/actions which then feed to the event-trigger, trip-zone, and time-base submodules. Additionally, blanking window functionality is supported to filter noise or unwanted pulses from the DC event signals.

Note

The user is responsible for driving the correct state on the selected pin before enabling the clock and configuring the trip input for the respective ePWM peripheral to avoid spurious latch of the TRIP signal.

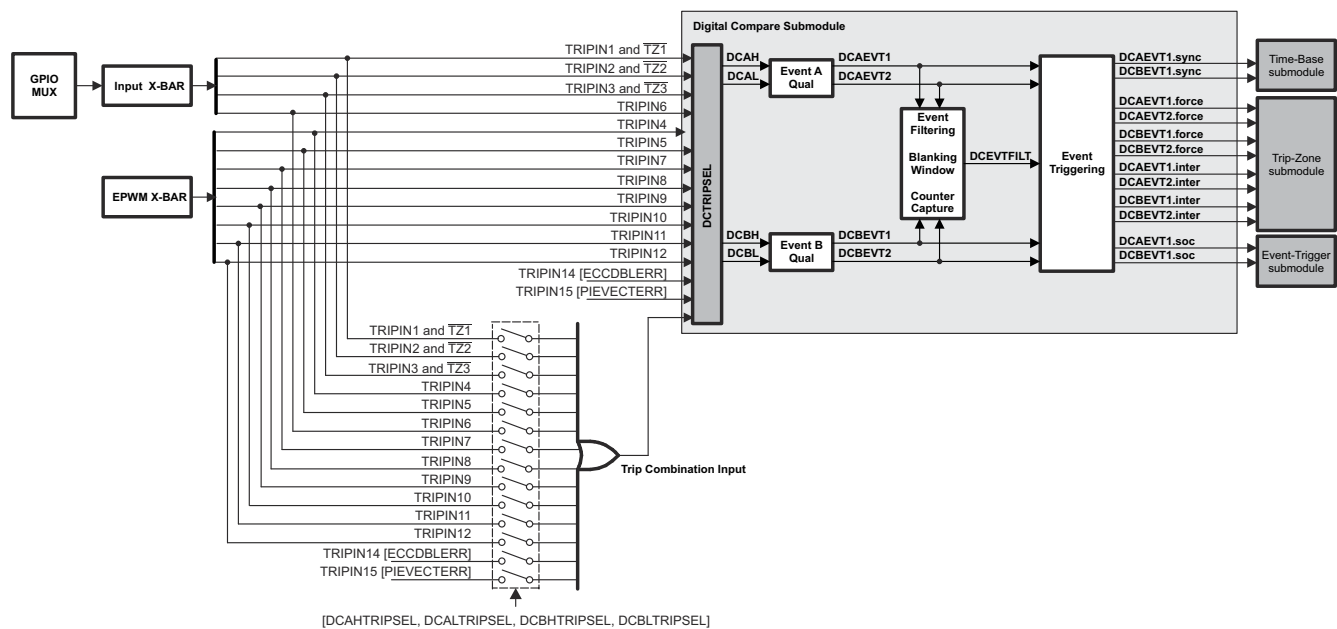

Figure 20-50. Digital-Compare Submodule High-Level Block Diagram

Figure 20-51. GPIO MUX-to-Trip Input Connectivity

20.11.1 Purpose of the Digital Compare Submodule

The key functions of the digital compare submodule are:

- Analog comparator (COMP) module outputs fed through the Input X-BAR, EPWM X-BAR, externally using the GPIO peripheral, interrupt controller signals, ECC error signals, TZ1, $\overline{TZ2}$, and $\overline{TZ3}$ inputs generate Digital Compare A High/Low (DCAH, DCAL) and Digital Compare B High/Low (DCBH, DCBL) signals.
- DCAH/L and DCBH/L signals trigger events that can then either be filtered or applied directly to the trip-zone, event-trigger, and time-base submodules to:
 - generate a trip zone interrupt
 - generate an ADC start of conversion
 - force an event
 - generate a synchronization event for synchronizing the ePWM module TBCTR.
- Event filtering (blanking window logic) can optionally blank the input signal to remove noise.

20.11.2 Enhanced Trip Action Using CMPSS

To allow multiple CMPSS at a time to affect DCA/BEVTx events and trip actions, there is a OR logic to bring together ALL trip inputs (up to 15) from sources external to the ePWM module and feed into DCAH, DCAL, DCBH, and DCBL as a “combinational input” using the DCTRIPSEL register. This is configured by selecting “Trip combination input” (value of 0xF) in the DCTRIPSEL register.

There is a discrete choice of which trip inputs to put through the combinational logic for generating the DCAH, DCAL, DCBH, and DCBL signals. This is achieved using the DCAHTRIPSEL, DCALTRIPSEL, DCBHTRIPSEL, and DCBLTRIPSEL register selections. Inputs selected for combinational input are passed through to the DCTRIPSEL register.

20.11.3 Using CMPSS to Trip the ePWM on a Cycle-by-Cycle Basis

When using the CMPSS to trip the ePWM on a cycle-by-cycle basis, steps can be taken to prevent an asserted comparator trip state in one PWM cycle from extending into the following cycle. The CMPSS can be used to signal a trip condition to the downstream ePWM modules. For applications like peak current mode control, only one trip event per PWM cycle is expected. Under certain conditions, it is possible for a sustained or late trip event (arriving near the end of a PWM cycle) to carry over into the next PWM cycle if precautions are not taken. If either the CMPSS Digital Filter or the ePWM Digital Compare (DC) submodule is configured to qualify the comparator trip signal, “N” number of clock cycles of qualification are introduced before the ePWM trip logic can respond to logic changes of the trip signal. Once an ePWM trip condition is qualified, the trip condition remains active for N clock cycles after the comparator trip signal has de-asserted. If a qualified comparator trip signal remains asserted within N clock cycles prior to the end of a PWM cycle, the trip condition is not cleared until after the following PWM cycle has started. Thus, the new PWM cycle detects a trip condition as soon as the cycle begins.

To avoid this undesired trip condition, the application can take steps to make sure that the qualified trip signal seen by the ePWM trip logic is deasserted prior to the end of each PWM cycle. This can be accomplished through various methods:

- Design the system such that a comparator trip is not asserted within N clock cycles prior to the end of the PWM cycle.
- Activate blanking of the comparator trip signal using the ePWM event filter at least two clock cycles prior to the PWMSYNCPER signal and continue blanking for at least N clock cycles into the next PWM cycle.
- If the CMPSS COMPxLATCH path is used, clear the COMPxLATCH at least N clock cycles prior to the end of the PWM cycle. The latch can be cleared by software (using COMPSTSCLR) or by generating an early PWMSYNCPER signal. The ePWM modules on this device include the ability to generate PWMSYNCPER upon a CMPC or CMPD match (using HRPCTL) for arbitrary PWMSYNCPER placement within the PWM cycle.

20.11.4 Operation Highlights of the Digital Compare Submodule

The following sections describe the operational highlights and configuration options for the digital compare submodule.

20.11.4.1 Digital Compare Events

As described in [Section 20.11.1](#), trip zone inputs ($\overline{TZ1}$, $\overline{TZ2}$, and $\overline{TZ3}$) and CMPSSx signals from the analog comparator (COMP) module can be selected using the DCTRIPSEL bits to generate the Digital Compare A High and Low (DCAH/L) and Digital Compare B High and Low (DCBH/L) signals. Then, the configuration of the TZDCSEL register qualifies the actions on the selected DCAH/L and DCBH/L signals, which generate the DCAEVT1/2 and DCBEVT1/2 events (Event Qualification A and B).

Note

The \overline{TZn} signals, when used as a DCEVT tripping functions, are treated as a normal input signal and can be defined to be active-high or active-low inputs. ePWM outputs are asynchronously tripped when either the \overline{TZn} , DCAEVTx.force, or DCBEVTx.force signals are active. For the condition to remain latched, a minimum of $3 \times TBCLK$ sync pulse width is required. If pulse width is $< 3 \times TBCLK$ sync pulse width, the trip condition can or can not get latched by CBC or OST latches.

The DCAEVT1/2 and DCBEVT1/2 events can then be filtered to provide a filtered version of the event signals (DCEVTFILT) or the filtering can be bypassed. Filtering is discussed further in [Event Filtering](#). Either the DCAEVT1/2 and DCBEVT1/2 event signals or the filtered DCEVTFILT event signals can generate a force to the trip zone module, a TZ interrupt, an ADC SOC, or a PWM sync signal.

- force signal:** DCAEVT1/2.force signals force trip zone conditions which either directly influence the output on the EPWMxA pin (using TZCTL, TZCTLDCA, TZCTLDCB register configurations) or, if the DCAEVT1/2 signals are selected as one-shot or cycle-by-cycle trip sources (using the TZSEL register), the DCAEVT1/2.force signals can effect the trip action using the TZCTL or TZCTL2 register configurations. The DCBEVT1/2.force signals behaves similarly, but affect the EPWMxB output pin instead of the EPWMxA output pin.

The priority of conflicting actions on the TZCTL, TZCTL2, TZCTLDCA and TZCTLDCB registers is as follows (highest priority overrides lower priority):

Output EPWMxA:

- TZA (highest) -> DCAEVT1 -> DCAEVT2 (lowest)
- TZAU (highest) -> DCAEVT1U -> DCAEVT2U (lowest)
- TZAD (highest) -> DCAEVT1D -> DCAEVT2D (lowest)

Output EPWMxB:

- TZB (highest) -> DCBEVT1 -> DCBEVT2 (lowest)
- TZBU (highest) -> DCBEVT1U -> DCBEVT2U (lowest)
- TZBD (highest) -> DCBEVT1D -> DCBEVT2D (lowest)

- interrupt signal:** DCAEVT1/2.interrupt signals generate trip zone interrupts to the interrupt controller. To enable the interrupt, set the DCAEVT1, DCAEVT2, DCBEVT1, or DCBEVT2 bits in the TZEINT register. Once one of these events occurs, an EPWMxTZINT interrupt is triggered, and the corresponding bit in the TZCLR register must be set to clear the interrupt.
- soc signal:** The DCAEVT1.soc signal interfaces with the event-trigger submodule and can be selected as an event which generates an ADC start-of-conversion-A (SOCA) pulse using the ETSEL[SOCASEL] bit. Likewise, the DCBEVT1.soc signal can be selected as an event which generates an ADC start-of-conversion-B (SOCB) pulse using the ETSEL[SOCBSEL] bit.
- sync signal:** The DCAEVT1.sync and DCBEVT1.sync events are ORed with the EPWMxSYNCl input signal and the TBCTL[SWFSYNC] signal to generate a synchronization pulse to the time-base counter.

Figure 20-52 and Figure 20-53 show how the DCxEVT1, DCxEVT2, or DCEVTFLT signals are processed to generate the digital compare A and B event force, interrupt, soc and sync signals.

In some of the applications like Phase Shifted Full Bridge (PSFB) Converters, it is required that different actions are taken on a CBC trip event and an OST trip event. This can be achieved using the DCxEVT1LAT.

- This latch can be cleared on CNT=0, CTR=PRD, and CNT=0 OR CTR=PRD events based on the setting of DCxCTL.EVTy.LATCLRSEL setting. This is similar to CBC latch clear mechanism.
- DCxEVTy.force signal can be chosen to be either the latched version or the unlatched version based on DCxCTL.EVTyLATSEL value.
- The status of DCxEVTyLAT signal can be accessed by reading DCxCTL.EVTyLAT field.

Figure 20-52. DCxEVT1 Event Triggering

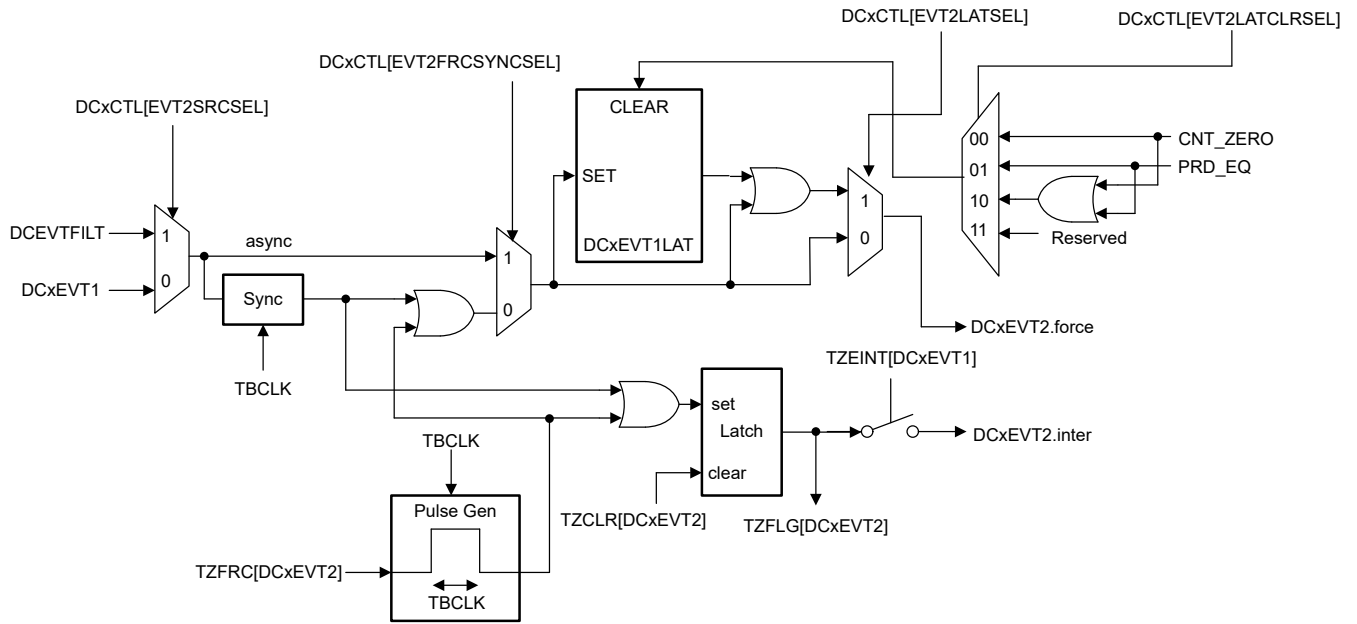

Figure 20-53. DCxEVT2 Event Triggering

20.11.4.2 Event Filtering

Blank Control Logic: The DCAEVT1/2 and DCBEVT1/2 events can be filtered using event filtering logic to remove noise by optionally blanking events for a certain period of time. This is useful for cases where the analog comparator outputs can be selected to trigger DCAEVT1/2 and DCBEVT1/2 events, and the blank control logic is used to filter out potential noise on the signal prior to tripping the PWM outputs or generating an interrupt or ADC start-of-conversion. Blank control logic is used to define a blanking window, which ignores all event occurrences on the signal while the window is active. The blanking window is configured in the DCFCTL, DCFOFFSET, and DCFWINDOW registers. The DCFCTL register enables the blanking window and aligns the blanking window to either a CTR = PRD pulse or a CTR = 0 pulse or both CTR = PRD and CTR = 0 as specified by DCFCTL[PULSESEL]. DCFCTL[SRCSSEL] selects the DCxEV_{Ty} event source for the DCEVTFILT signal. An offset value in TBCLK counts is programmed into the DCFOFFSET register, which determines at what point after the CTR = PRD or CTR = 0 pulse the blanking window starts. The duration of the blanking window, in number of TBCLK counts after the offset counter expires, is written to the DCFWINDOW register. Before and after the blanking window ends, events can generate soc, sync, interrupt, and force signals as before.

Figure 20-54 shows the details of the event filtering logic.

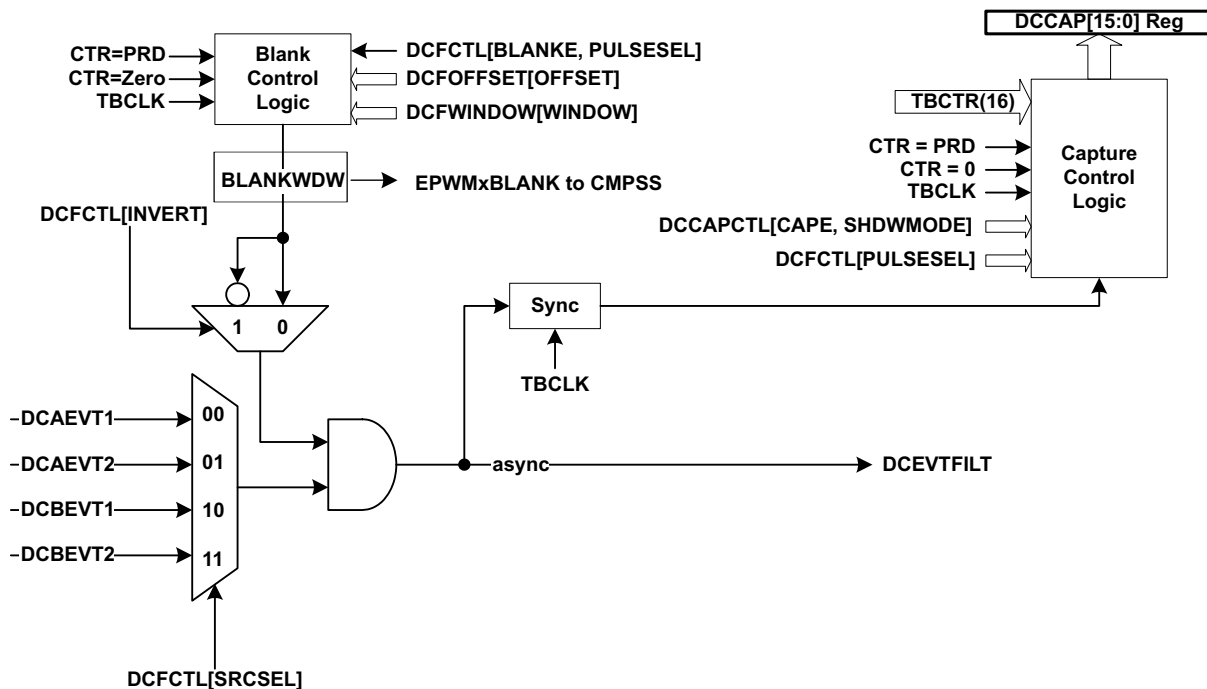

Figure 20-54. Event Filtering

Capture Control Logic: The event filtering can also capture the TBCTR value of the selected DCxEV_{Ty} event as configured in the DCCAPCTL register. When capture control logic is enabled, the selected DCxEV_{Ty} event triggers capture of the TBCTR to the active register. The CPU reads directly from the active register unless shadow mode is enabled by DCCAPCTL[SHDWMODE]. When shadow mode is enabled, the active register information is copied to shadow register on the event specified by DCFCTL[PULSESEL], and the CPU reads from the shadow register. After the selected DCxEV_{Ty} event, no further capture events occur until the event specified by DCCAPCTL[CAPMODE]. The CAPMODE can be configured two ways: (1) no further capture events occur until the event defined by DCFCTL[PULSESEL] or (2) no further capture events occur until the compare-event flag at DCCAPCTL[CAPSTS] is cleared by DCCAPCTL[CAPCLR].

Note

You must configure the ePWM blanking window appropriately so that the Trip Input stays valid for at least 3 ePWM cycles after the blanking window has expired.

Figure 20-55 illustrates several timing conditions for the offset and blanking window within an ePWM period. Notice that if the blanking window crosses the CTR = 0 or CTR = PRD boundary, the next window still starts at the same offset value after the CTR = 0 or CTR = PRD pulse.

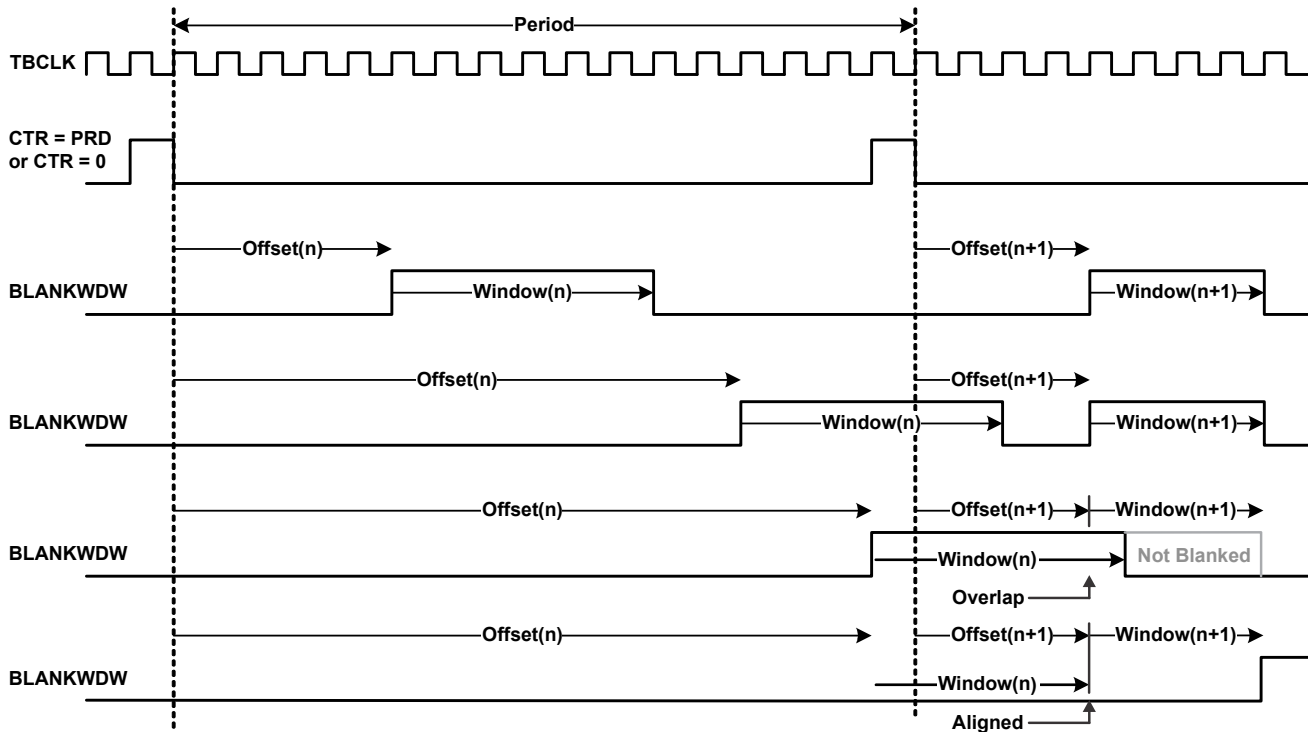

Figure 20-55. Blanking Window Timing Diagram

BLANKPULSEMIX Signals

The DCFCTL MUX (available for Blank Control Logic and Capture Control Logic) has new options that allows the mux to select the BLANKPULSEMIX signal. The BLANKPULSEMIX signal is used, if the signal is selected by DCFCTL[PULSESEL]

20.11.4.3 Valley Switching

Event filtering depicts the valley switching function along with the event filtering logic described in Event Filtering. This function can be used to achieve programmable valley switching without any additional external circuitry. This module provides an on-chip hardware mechanism that can:

- Capture the oscillation period
- Accurately delay the PWM switching instant
- Allow a programmable number of edges before the delay takes effect
- Provide multiple choices of triggers and events
- Allow easy adaptability for optimum performance under changing system/operating conditions

The DCxEV_{Ty} signal needs further processing to support valley switching. Here is a brief description of how valley switching function is enabled:

1. Select one of the DCxEV_{Ty} events as input to the valley switching block (DCFCTL[*SRCSEL*]) with an option to add the blanking window (Blank Control Logic). This is where the comparator output (or external input) above is selected as an input to the valley switching block.
2. Configure the edge filter to capture 'n' rising, falling or both edges through the edge selection logic (DCFCTL[*EDGEMODE*, *EDGECOUNT*]).
3. Select the correct event to reset and restart the edge filter (VCAPCTL[*TRIGSEL*]). Edge capturing event is triggered or armed by this selected edge.
4. Enable valley capture logic (VCAPCTL[*VCAPE*]).
5. Select the start edge that indicates the start of capture for oscillation period measurement (VCNTCFG[*STARTEDGE*]). This is where the 16-bit counter starts counting.
6. Select the stop edge (VCNTCFG[*STOPEDGE*]) that indicates the edge at which the 16-bit counter stops counting. The captured counter value (CNTVAL) provides oscillation period information.
 - The *STOPEDGE* value must always be greater than *STARTEDGE* value.
7. Configure and apply the captured delay (CNTVAL) to the edge filtered DCxEV_{Ty} signal. The CNTVAL value can be applied as is or applied in conjunction with a software programmed value (useful for offset adjustment) (SWVDELVAL) or only a fraction of the delay can be applied with or without SWVDELVAL. This is useful to correctly apply a delay corresponding to the valley point. (VCAPCTL[*VDELAYDIV*])
8. Configure VCAPCTL[*EDGEFILTDLYSEL*] to apply hardware delay based on the captured value above.

Once the counter is stopped, counter value is copied into CNTVAL register and counter is reset to zero. No further captures are done until the logic is triggered again by occurrence of event selected by VCAPCTL[*TRIGSEL*]. In this implementation, the software trigger is used as the source for VCAPCTL[*TRIGSEL*]. Upon occurrence of the trigger event, irrespective of the current status of the counter, the counter is reset and starts counting from zero upon occurrence of the *STARTEDGE*. Similarly, upon occurrence of the trigger event, the edge filter is reset and starts counting from zero upon occurrence of the *STARTEDGE*.

Output from the valley switching block (DCEVTFILT) is then used to synchronize the PWM time-base. The process is shown in [Figure 20-56](#).

Note

A specific application example showcasing the usage of valley switching hardware and software is available in C2000Ware.

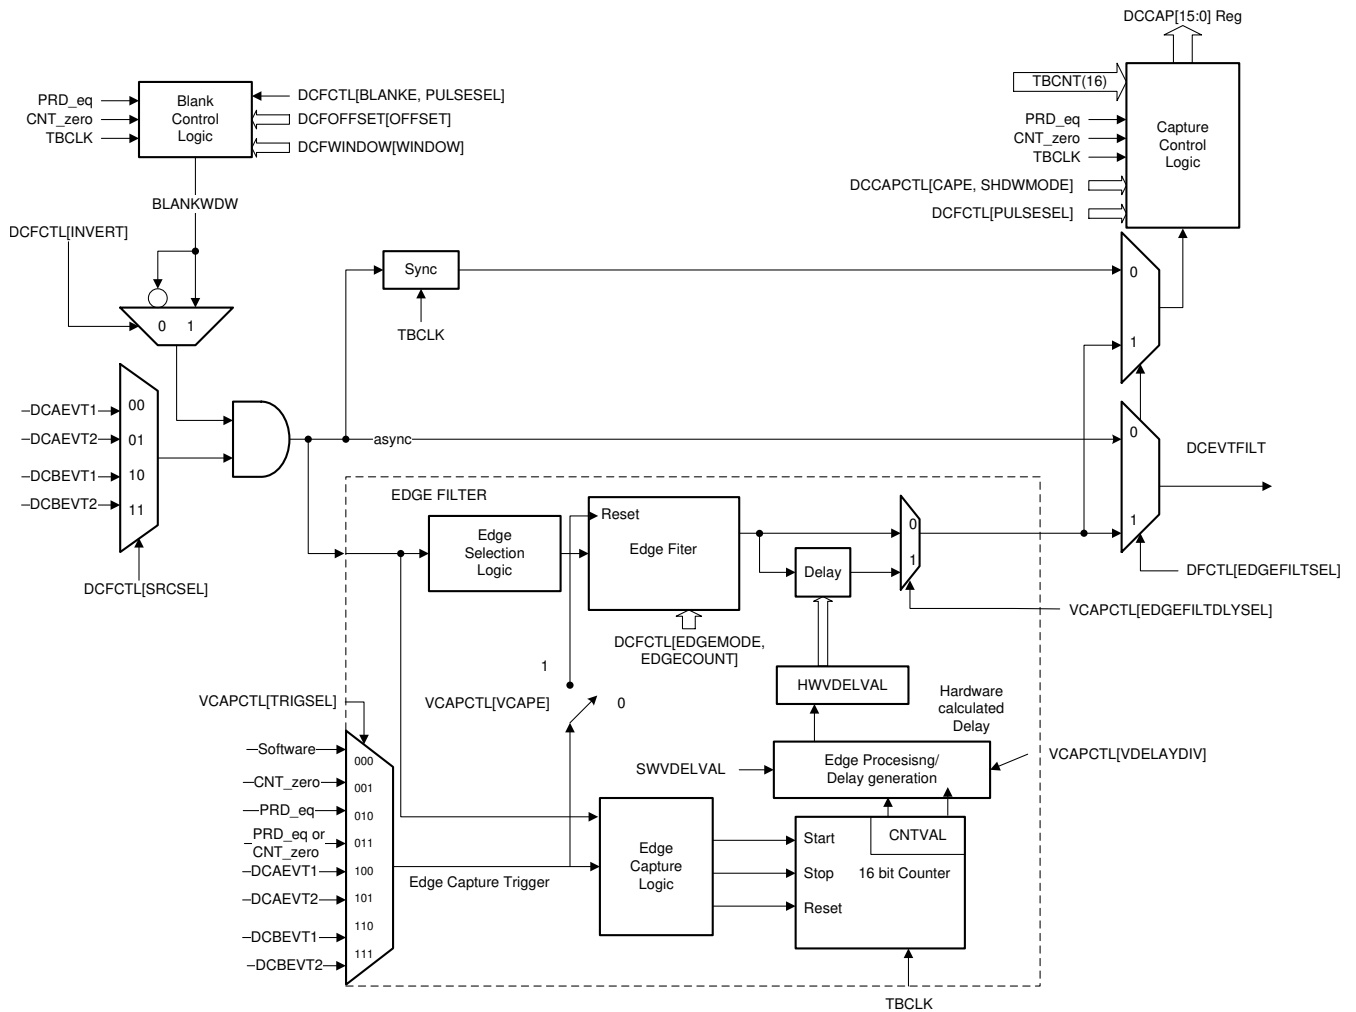

Figure 20-56. Valley Switching

20.12 ePWM Crossbar (X-BAR)

Figure 20-57 shows the architecture of the ePWM Crossbar (X-BAR). This module enables selection of various trigger sources into any of the eight dedicated EPWM trips inputs, namely the TRIP4, TRIP5, TRIP7, TRIP8, TRIP9, TRIP10, TRIP11, and TRIP12.

Note

Refer to the *Crossbar (X-BAR)* chapter for more information on the X-BAR modules, including X-BAR flags.

Figure 20-57. ePWM X-BAR

20.13 Applications to Power Topologies

An ePWM module has all the local resources necessary to operate completely as a standalone module or to operate in synchronization with other identical ePWM modules.

20.13.1 Overview of Multiple Modules

Previously in this chapter, all discussions have described the operation of a single module. To facilitate the understanding of multiple modules working together in a system, the ePWM module described in reference is represented by the more simplified block diagram shown in Figure 20-58. This simplified ePWM block shows only the key resources needed to explain how a multiswitch power topology is controlled with multiple ePWM modules working together.

Figure 20-58. Simplified ePWM Module

20.13.2 Key Configuration Capabilities

The key configuration choices available to each module are as follows:

- Options for SyncIn
 - Load own counter with phase register on an incoming sync strobe—enable (EN) switch closed
 - Do nothing or ignore incoming sync strobe—enable switch open
 - Sync flow-through - SyncOut connected to SyncIn
 - Master mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
 - Master mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
 - Module is in standalone mode and provides no sync to other modules—SyncOut connected to X (disabled)
- Options for SyncOut
 - Sync flow-through - SyncOut connected to SyncIn
 - Master mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
 - Master mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
 - Module is in standalone mode and provides no sync to other modules—SyncOut connected to X (disabled)

For each choice of SyncOut, a module can also choose to load the counter with a new phase value on a SyncIn strobe input or choose to ignore the value (that is, by the enable switch). Although various combinations are possible, the two most common—Master module and Slave module modes—are shown in [Figure 20-59](#).

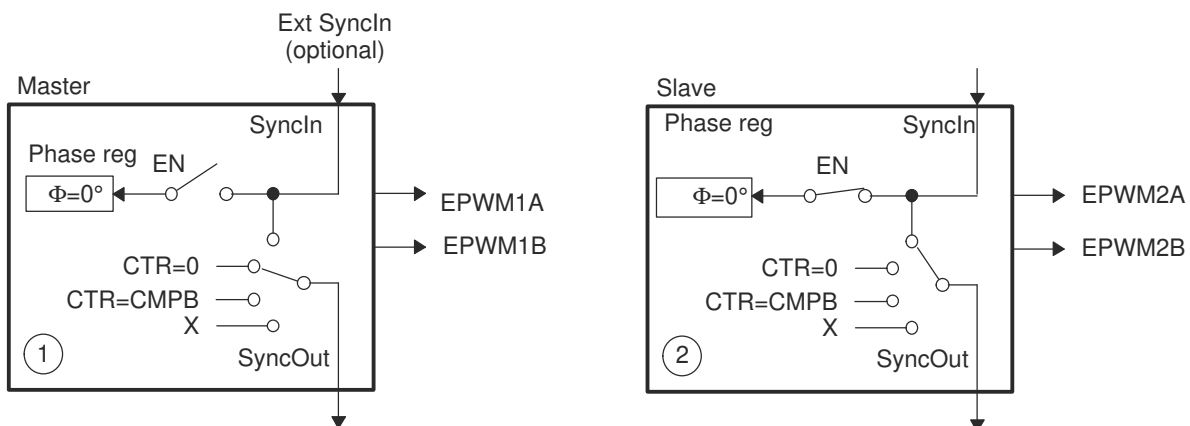

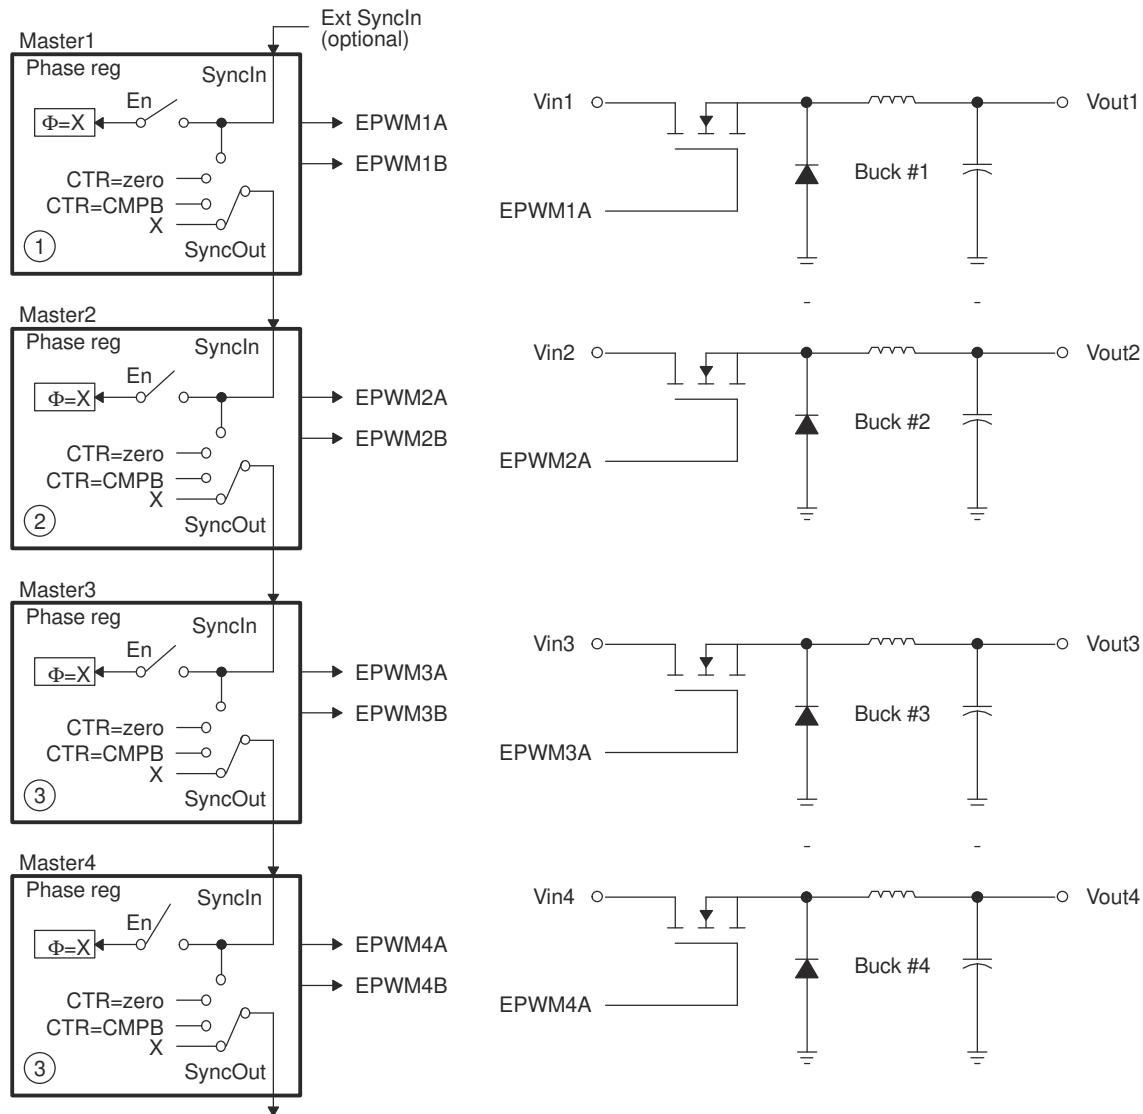

Figure 20-59. EPWM1 Configured as a Typical Master, EPWM2 Configured as a Slave

20.13.3 Controlling Multiple Buck Converters With Independent Frequencies

One of the simplest power converter topologies is the buck. A single ePWM module configured as a master can control two buck stages with the same PWM frequency. If independent frequency control is required for each buck converter, then one ePWM module must be allocated for each converter stage. Figure 20-60 shows four buck stages, each running at independent frequencies. In this case, all four ePWM modules are configured as Masters and no synchronization is used. Figure 20-61 shows the waveforms generated by the setup shown in Figure 20-60; note that only three waveforms are shown, although there are four stages.

A. $\phi = X$ indicates value in phase register is a "don't care"

Figure 20-60. Control of Four Buck Stages. Here $F_{PWM1} \neq F_{PWM2} \neq F_{PWM3} \neq F_{PWM4}$

Figure 20-61. Buck Waveforms for Control of Four Buck Stages (Note: Only three bucks shown here)

20.13.4 Controlling Multiple Buck Converters With Same Frequencies

If synchronization is a requirement, ePWM module 2 is configured as a slave and operates at integer multiple (N) frequencies of module 1. The sync signal from master to slave makes sure these modules remain locked. Figure 20-62 shows such a configuration; Figure 20-63 shows the waveforms generated by the configuration.

A. $\phi = X$ indicates value in phase register is a "don't care"

Figure 20-62. Control of Four Buck Stages. (Note: $F_{PWM2} = N \times F_{PWM1}$)

A. Starts ADC conversion.

Figure 20-63. Buck Waveforms for Control of Four Buck Stages (Note: $F_{PWM2} = F_{PWM1}$)

20.13.5 Controlling Multiple Half H-Bridge (HHB) Converters

Topologies that require control of multiple switching elements can also be addressed with these same ePWM modules. It is possible to control a Half-H bridge stage with a single ePWM module. This control can be extended to multiple stages. Figure 20-64 shows control of two synchronized Half-H bridge stages where stage 2 can operate at integer multiple (N) frequencies of stage 1. Figure 20-65 shows the waveforms generated by the configuration shown in Figure 20-64.

ePWM module 2 (slave) is configured for Sync flow-through; if required, this configuration allows for a third Half-H bridge to be controlled by ePWM module 3 and also, most importantly, to remain in synchronization with master ePWM module 1.

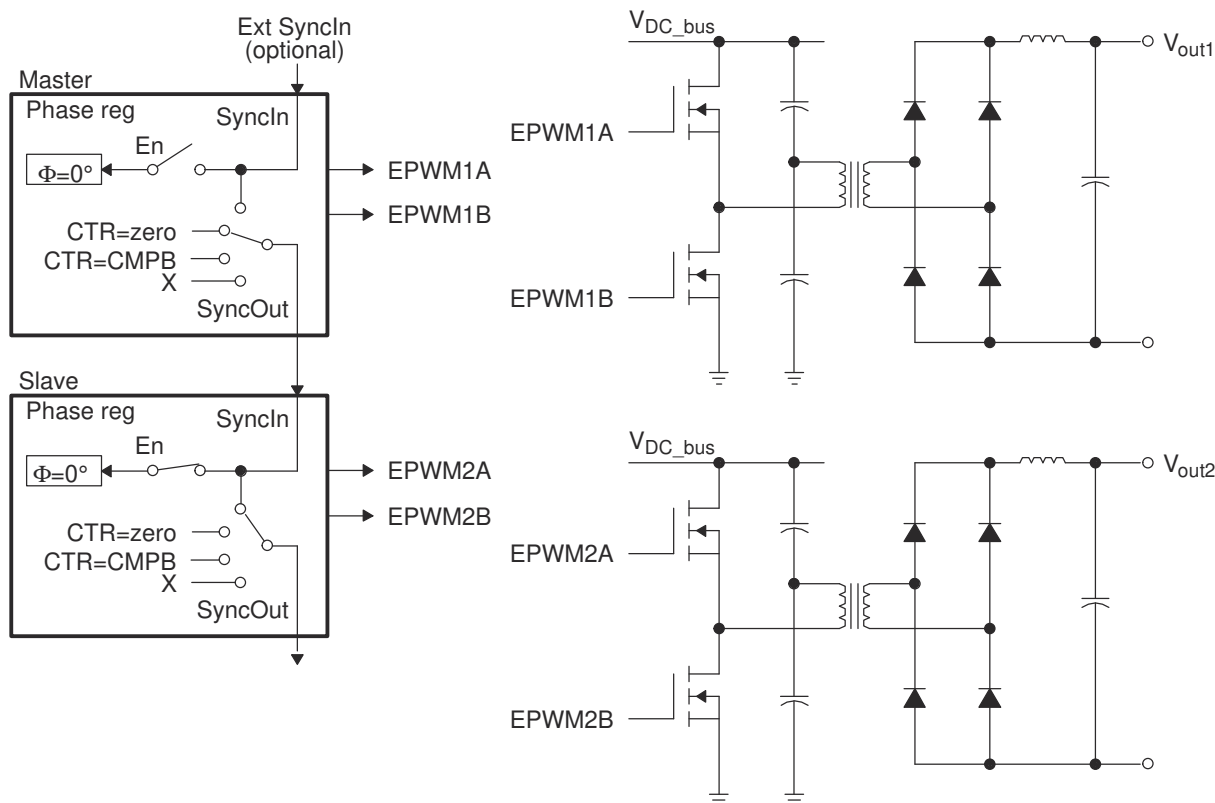

Figure 20-64. Control of Two Half-H Bridge Stages ($F_{PWM2} = N \times F_{PWM1}$)

Figure 20-65. Half-H Bridge Waveforms for Control of Two Half-H Bridge Stages (Note: Here $F_{PWM2} = F_{PWM1}$)

20.13.6 Controlling Dual 3-Phase Inverters for Motors (ACI and PMSM)

The idea of multiple modules controlling a single power stage can be extended to the 3-phase inverter case. In such a case, six switching elements are controlled using three PWM modules, one for each leg of the inverter. Each leg must switch at the same frequency and all legs must be synchronized. A master slaves configuration easily addresses this requirement. Figure 20-66 shows how six PWM modules control two independent 3-phase inverters; each running a motor.

As in the cases shown in the previous sections, we have a choice of running each inverter at a different frequency (module 1 and module 4 are masters as in Figure 20-66), or both inverters can be synchronized by using one master (module 1) and five slaves. In this case, the frequency of modules 4, 5, and 6 (all equal) can be integer multiples of the frequency for modules 1, 2, and 3 (also all equal).

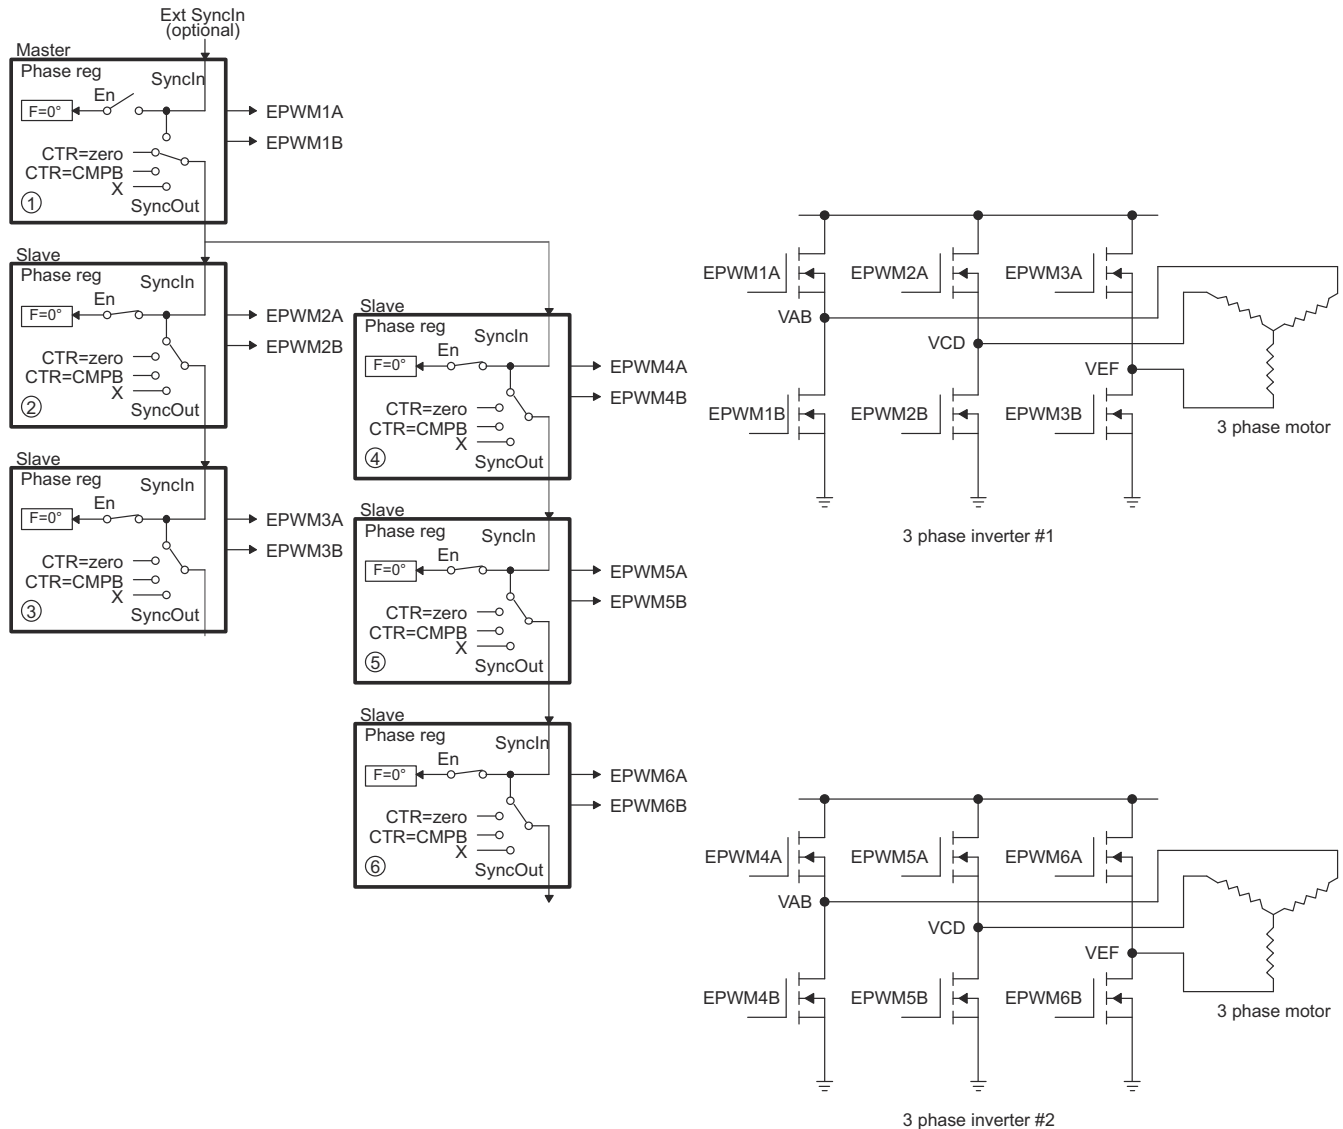

Figure 20-66. Control of Dual 3-Phase Inverter Stages as Is Commonly Used in Motor Control

Figure 20-67. 3-Phase Inverter Waveforms for Control of Dual 3-Phase Inverter Stages (Only One Inverter Shown)

20.13.7 Practical Applications Using Phase Control Between PWM Modules

So far, none of the examples have made use of the phase register (TBPHS). It has either been set to zero or a don't care. However, by programming appropriate values into TBPHS, multiple PWM modules can address another class of power topologies that rely on phase relationship between legs (or stages) for correct operation. As described in the time-base submodule section, a PWM module can be configured to allow a SyncIn pulse to cause the TBPHS register to be loaded into the TBCTR register. To illustrate this concept, [Figure 20-68](#) shows a master and slave module with a phase relationship of 120° (that is, the slave leads the master).

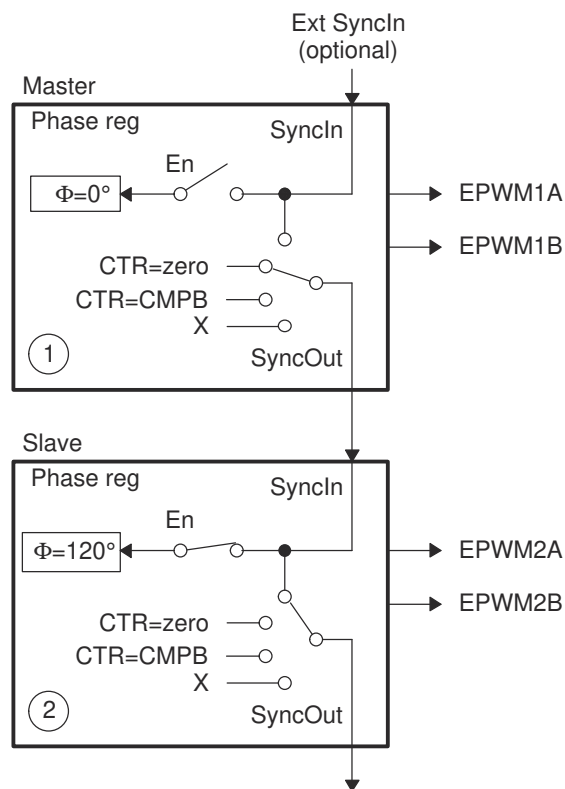

Figure 20-68. Configuring Two PWM Modules for Phase Control

[Figure 20-69](#) shows the associated timing waveforms for this configuration. Here, $TBPRD = 600$ for both master and slave. For the slave, $TBPHS = 200$ (that is, $200/600 \times 360^\circ = 120^\circ$). Whenever the master generates a SyncIn pulse ($CTR = PRD$), the value of $TBPHS = 200$ is loaded into the slave TBCTR register so the slave time-base is always leading the master time-base by 120° .

Figure 20-69. Timing Waveforms Associated with Phase Control Between Two Modules

20.13.8 Controlling a 3-Phase Interleaved DC/DC Converter

A popular power topology that makes use of phase-offset between modules is shown in [Figure 20-70](#). This system uses three PWM modules, with module 1 configured as the master. To work, the phase relationship between adjacent modules must be $F = 120^\circ$. This is achieved by setting the slave TBPHS registers 2 and 3 with values of 1/3 and 2/3 of the period value, respectively. For example, if the period register is loaded with a value of 600 counts, then TBPHS (slave 2) = 200 and TBPHS (slave 3) = 400. Both slave modules are synchronized to the master module 1.

This concept can be extended to four or more phases, by setting the TBPHS values appropriately. The following formula gives the TBPHS values for N phases:

$$TBPHS(N,M) = (TBPRD/N) \times (M-1)$$

Where:

N = number of phases

M = PWM module number

For example, for the 3-phase case (N=3), TBPRD = 600,

TBPHS(3,2) = (600/3) x (2-1) = 200 (that is, Phase value for Slave module 2)

TBPHS(3,3) = 400 (that is, Phase value for Slave module 3)

[Figure 20-71](#) shows the waveforms for the configuration in [Figure 20-70](#).

Figure 20-70. Control of 3-Phase Interleaved DC/DC Converter

Figure 20-71. 3-Phase Interleaved DC/DC Converter Waveforms for Control of 3-Phase Interleaved DC/DC Converter

20.13.9 Controlling Zero Voltage Switched Full Bridge (ZVSFB) Converter

The example given in [Figure 20-72](#) assumes a static or constant phase relationship between legs (modules). In such a case, control is achieved by modulating the duty cycle. It is also possible to dynamically change the phase value on a cycle-by-cycle basis. This feature lends to controlling a class of power topologies known as *phase-shifted full bridge*, or *zero voltage switched full bridge*. Here the controlled parameter is not duty cycle (this is kept constant at approximately 50 percent); instead it is the phase relationship between legs. Such a system can be implemented by allocating the resources of two PWM modules to control a single power stage, which in turn requires control of four switching elements. [Figure 20-73](#) shows a master and slave module combination synchronized together to control a full H-bridge. In this case, both master and slave modules are required to switch at the same PWM frequency. The phase is controlled by using the slave phase register (TBPHS). The master phase register is not used and therefore can be initialized to zero.

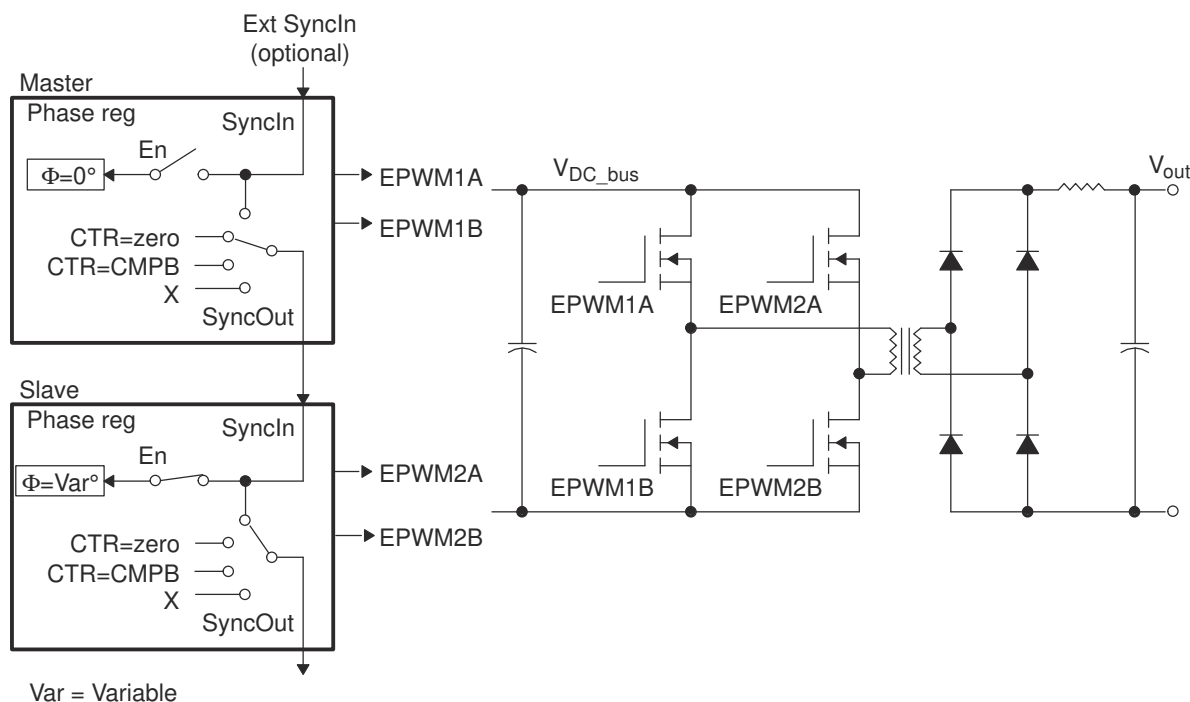

Figure 20-72. Control of Full-H Bridge Stage ($F_{PWM2} = F_{PWM1}$)

Figure 20-73. ZVS Full-H Bridge Waveforms

20.13.10 Controlling a Peak Current Mode Controlled Buck Module

Peak current control techniques offer a number of benefits like automatic over current limiting, fast correction for input voltage variations and reducing magnetic saturation. Figure 20-74 shows the use of ePWM1A along with the on-chip analog comparator for buck converter topology. The output current is sensed through a current sense resistor and fed to the positive terminal of the on-chip comparator. The internal programmable 12-bit DAC can be used to provide a reference peak current at the negative terminal of the comparator. Alternatively, an external reference can be connected at this input. The comparator output is an input to the Digital compare sub-module. The ePWM module is configured in such a way so as to trip the ePWM1A output as soon as the sensed current reaches the peak reference value. A cycle-by-cycle trip mechanism is used. Figure 20-75 shows the waveforms generated by the configuration.

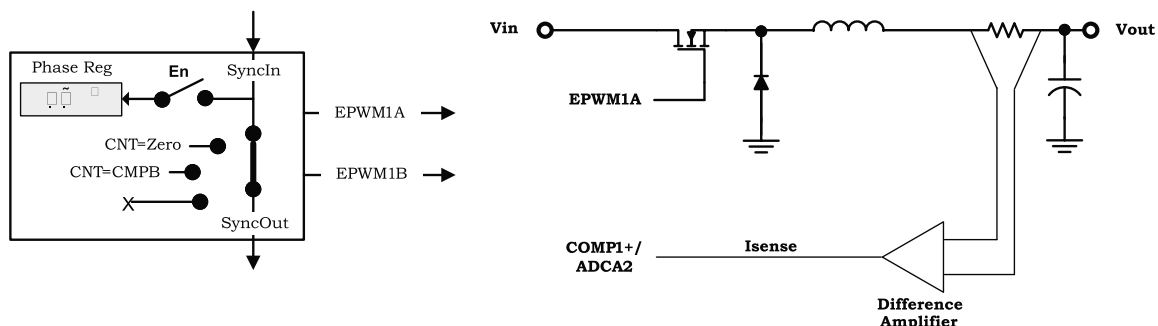

Figure 20-74. Peak Current Mode Control of Buck Converter

Figure 20-75. Peak Current Mode Control Waveforms for Control of Buck Converter

20.13.11 Controlling H-Bridge LLC Resonant Converter

Various topologies of resonant converters are well-known in the field of power electronics for many years. In addition to these, H-bridge LLC resonant converter topology has recently gained popularity in many consumer electronics applications where high efficiency and power density are required. In this example, single channel configuration of ePWM1 is detailed, yet the configuration can easily be extended to multichannel. Here the controlled parameter is not duty cycle (this is kept constant at approximately 50 percent); instead the parameter is frequency. Although the deadband is not controlled and kept constant as 300ns (that is, 30 at 100MHz TBCLK), the user can update the deadband in real time to enhance the efficiency by adjusting enough time delay for soft switching.

NOTE: $\Theta = X$ indicates value in phase register is 'don't care'

Figure 20-76. Control of Two Resonant Converter Stages

P I Indicates this event triggers an interrupt

CB A Indicates this event triggers an ADC start of conversion

Figure 20-77. H-Bridge LLC Resonant Converter PWM Waveforms

20.14 Register Lock Protection

The register lock protection mechanism is added to protect the critical ePWM registers from being corrupted by accidental writes in case of runaway code. The register EPWMLOCK contains the definition of Lock bits (Table 20-14 shows the lock bits and the corresponding registers). This register also has a KEY field; writes to this register succeed only if the KEY field is written with a value of 0xa5a5. Refer to the register descriptions for more details.

Table 20-14. Lock Bits and Corresponding Registers

Bit Field	Definition	Registers Locked
HRLOCK	HRPWM Register Set Lock	HRCNFG, HRPWR, HRMSTEP, HRPCTL
GLLOCK	Global Load Register Set Lock	GLDCTL, GLDCFG
TZCFGLOCK	TripZone Register Set Lock	TZSEL, TZDCSEL, TZCTL, TZCTL2, TZCTLDCA, TZCTLDCB, TZEINT
TZCLRLOCK	TripZone Clear Register Set Lock	TZCLR, TZCBCCLR, TZOSTCLR, TZFRC
DCLOCK	Digital Compare Register Set Lock	DCTRIPSEL, DCACTL, DCBCTL, DCFCTL, DCCAPCTL, DCAHTRIPSEL, DCALTRIPSEL, DCBHTRIPSEL, DCBLTRIPSEL

Note

Due to the presence of the KEY field in the same register, only 32-bit writes succeed if the KEY matches. The 16-bit writes to the upper or lower half of this register are ignored.

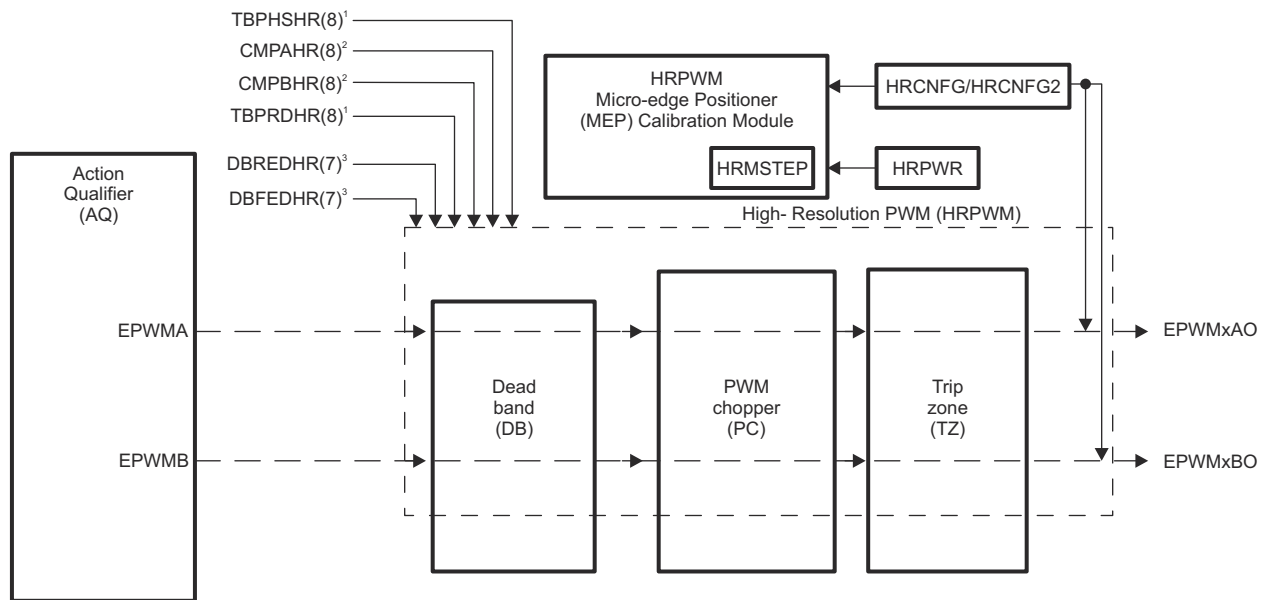

20.15 High-Resolution Pulse Width Modulator (HRPWM)

Figure 20-78 shows a block diagram of the HRPWM. This module extends the time resolution capabilities of the conventionally derived digital pulse width modulator (PWM). HRPWM is typically used when PWM resolution falls below approximately 9-10 bits. The key features of HRPWM are:

- Extended time resolution capability
- Used in both duty cycle and phase-shift control methods
- Finer time granularity control or edge positioning using extensions to the Compare A, Compare B and Phase registers
- Implemented using the A and B signal path of PWM, that is, on the EPWMxA and EPWMxB output
- Dead band high-resolution control for falling and rising edge delay in half cycle clocking operation
- Self-check diagnostics software mode to check if the micro edge positioner (MEP) logic is running how designed
- Enables high-resolution output swapping on the EPWMxA and EPWMxB output
- Enables high-resolution output on EPWMxB signal output using inversion of EPWMxA signal output
- Enables high-resolution period, duty and phase control on the EPWMxA and EPWMxB output on devices with an ePWM module

Note

See the device data sheet to determine if your device has an ePWM module with high-resolution period support.

- A. From ePWM Time-base (TB) submodule
- B. From ePWM counter-compare (CC) submodule
- C. From ePWM Deadband (DB) submodule

Figure 20-78. HRPWM Block Diagram

The ePWM peripheral is used to perform a function mathematically equivalent to a digital-to-analog converter (DAC). As shown in Figure 20-79, the effective resolution for conventionally generated PWM is a function of PWM frequency (or period) and system clock frequency.

Figure 20-79. Resolution Calculations for Conventionally Generated PWM

If the required PWM operating frequency does not offer sufficient resolution in PWM mode, consider using HRPWM. As an example of improved performance offered by HRPWM, Table 20-15 shows resolution in bits for various PWM frequencies. These values assume a MEP step size of 180ps. See the device data sheet for typical and maximum performance specifications for the MEP.

Table 20-15. Resolution for PWM and HRPWM

PWM Frequency (kHz)	Regular Resolution (PWM) 100MHz EPWMCLK		High Resolution (HRPWM)	
	Bits	%	Bits	%
20	12.3	0.02	18.1	0.000
50	11	0.05	16.8	0.001
100	10	0.1	15.8	0.002
150	9.4	0.15	15.2	0.003
200	9	0.2	14.8	0.004
250	8.6	0.25	14.4	0.005
500	7.6	0.5	13.4	0.009
1000	6.6	1	12.4	0.018
1500	6.1	1.5	11.9	0.027
2000	5.6	2	11.4	0.036

Although each application can differ, typical low-frequency PWM operation (below 250kHz) does not require HRPWM. HRPWM capability is most useful for high-frequency PWM requirements of power conversion topologies such as:

- Single-phase buck, boost, and flyback
- Multiphase buck, boost, and flyback
- Phase-shifted full bridge
- Direct modulation of D-Class power amplifiers

20.15.1 Operational Description of HRPWM

The HRPWM is based on micro-edge positioner (MEP) technology. MEP logic is capable of positioning an edge very finely by sub-dividing one coarse system clock of a conventional PWM generator. The time step accuracy is on the order of 150ps. See the device data sheet for the typical MEP step size on a particular device. The HRPWM also has a self-check software diagnostics mode to check if the MEP logic is running as designed under all operating conditions. Details on software diagnostics and functions are in [Section 20.15.1.7](#).

[Figure 20-80](#) shows the relationship between one coarse system clock and edge position in terms of MEP steps, which are controlled using an 8-bit field in the Compare A extension register (CMPAHR). The same operating logic applies to CMPBHR as well.

To generate an HRPWM waveform, configure the ePWM registers to generate a conventional PWM of a given frequency and polarity. The HRPWM works together with the ePWM registers to extend edge resolution. Although many programming combinations are possible, only a few are needed and practical. These methods are described in [Section 20.15.1.8](#).

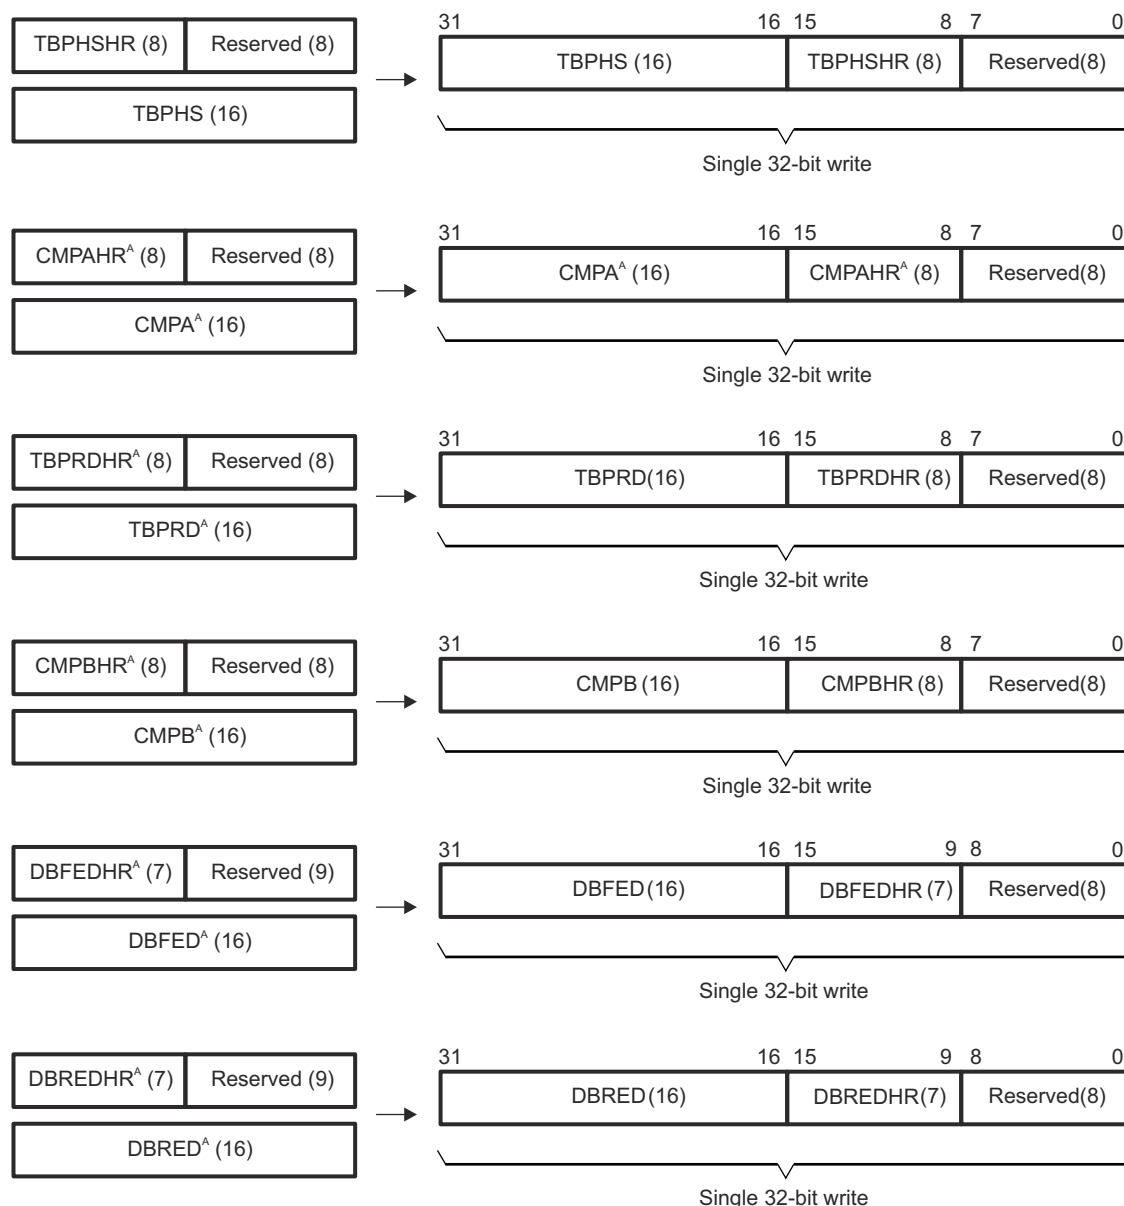

Figure 20-80. Operating Logic Using MEP

20.15.1.1 Controlling the HRPWM Capabilities

The MEP of the HRPWM is controlled by six extension registers. These HRPWM registers are concatenated with the 16-bit TBPHS, TBPRD, CMPA, CMPBM, DBREDM, and DBFEDM registers used to control PWM operation.

- TBPHSHR - Time Base Phase High Resolution Register
- CMPAHR - Counter Compare A High Resolution Register; CMPAHR is for use with the AQ output of Channel A, and is not related to CMPA
- TBPRDHR - Time Base Period High Resolution Register. (available on some devices)
- CMPBHR - Counter Compare B High Resolution Register; CMPBHR is for use with the AQ output of Channel B, and is not related to CMPB
- DBREDHR - Dead-band Generator Rising Edge Delay High Resolution Register
- DBFEDHR - Dead-band Generator Falling Edge Delay High Resolution Register

A. Dependent upon your device, these registers can be mirrored and can be written to at two different memory locations.

Figure 20-81. HRPWM Extension Registers and Memory Configuration

Note

HRPWM capabilities on Deadband Rising Edge Delay and Falling Edge Delay is applicable only during dead band half cycle clocking Operation. The number of MEP steps is half in size [bits 15:9] than duty and phase high-resolution registers for the same reason.

HRPWM capabilities are controlled using the Channel A and B PWM signal path. HRPWM support on the Dead band signal path is available by properly configuring the HRCNFG2 register. [Figure 20-82](#) shows how the HRPWM interfaces with the 8-bit extension registers.

A. These events are generated by the ePWM Digital Compare (DC) submodule based on the levels of the TRIPIN inputs.

Figure 20-82. HRPWM System Interface

20.15.1.2 HRPWM Source Clock

Each HRPWM module is clocked from the respective EPWMxCLK. HRCAL has a separate clock. For example, HRPWM1 is sourced from EPWM1CLK while HRPWM2 is clocked from the EPWM2CLK. Figure 20-83 shows the HRCAL and HRPWM modules are sourced from their respective ePWM clock source.

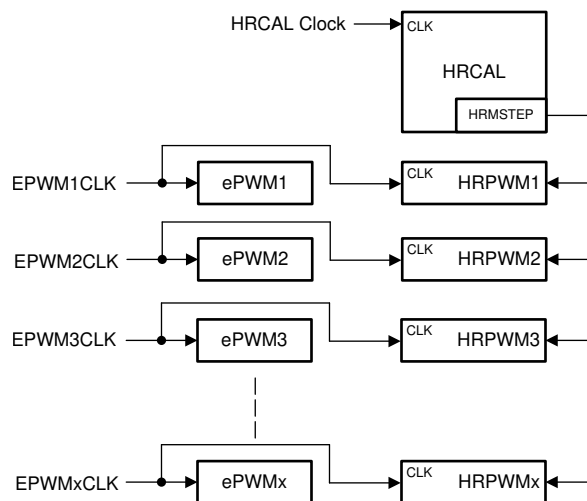

Figure 20-83. HRPWM and HRCAL Source Clock

20.15.1.3 Configuring the HRPWM

Once the ePWM has been configured to provide conventional PWM of a given frequency and polarity, the HRPWM is configured by programming the HRCNFG register in that particular ePWM module's register space. This register provides the following configuration options:

- Edge Mode** The MEP can be programmed to provide precise position control on the rising edge (RE), falling edge (FE) or both edges (BE) at the same time. FE and RE are used for power topologies requiring duty cycle control (CMPA or CMPB high-resolution control), while BE is used for topologies requiring phase shifting, for example, phase shifted full bridge (TBPHS or TBPRD high-resolution control).
- Control Mode** The MEP is programmed to be controlled either from the CMPAHR/CMPBHR register in case of duty cycle control or the TBPHSHR register (phase control). RE or FE control mode can be used with the CMPAHR or CMPBHR register. BE control mode can be used with the TBPHSHR register. When the MEP is controlled from the TBPRDHR register (period control), the duty cycle and phase can also be controlled using their respective high-resolution registers.
- Shadow Mode** This mode provides the same shadowing (double buffering) option as in regular PWM mode. This option is valid only when operating from the CMPAHR, CMPBHR, and TBPRDHR registers and can be chosen to be the same as the regular load option for the CMPA/CMPB register. If TBPHSHR is used, then this option has no effect.
- High-Resolution B Signal Control** The B signal path of an ePWM channel can generate a high-resolution output by outputting an inverted version of the high-resolution ePWMxA signal on the ePWMxB pin. A Type 2 or Type 4 HRPWM module can also enable high-resolution features on the B signal path independently of the A signal path as well.
- Swap ePWMxA and ePWMxB Outputs** This mode enables the swapping of the high-resolution A and B outputs. The mode selection allows either A and B Outputs Unchanged or A Output Comes Out On B and B Output Comes Out On A.

**Auto-
conversion
Mode**

This mode is used in conjunction with the scale factor optimization (SFO) software only. For a type 4 HRPWM module, below is a description of the Auto-conversion Mode taking CMPAHR as an example. If auto-conversion is enabled, $\text{CMPAHR} = \text{fraction}(\text{PWMduty} * \text{PWMperiod}) \ll 8$. The scale factor optimization software calculates the MEP scale factor in the background code and automatically updates the HRMSTEP register with the calculated number of MEP steps per coarse step. The MEP Calibration Module then uses the values in the HRMSTEP and CMPAHR registers to automatically calculate the appropriate number of MEP steps represented by the fractional duty cycle and moves the high-resolution ePWM signal edge accordingly. If auto-conversion is disabled, the CMPAHR register behaves like a type 0 HRPWM module and $\text{CMPAHR} = (\text{fraction}(\text{PWMduty} * \text{PWMperiod}) * \text{MEP Scale Factor} + 0.5) \ll 8$. All calculations need to be performed by your code in this mode, and the HRMSTEP register is ignored. Auto-conversion for high-resolution period has the same behavior as auto-conversion for high-resolution duty cycle. Auto-conversion must always be enabled for high-resolution period mode.

Note

If the HRPWM module is configured in UP-DOWN counter mode, the shadow mode for the HRPWM registers must be set to load on both ZERO AND PERIOD. New values from the user are loaded to the shadow registers only at CTR=ZERO, but the shadow mode of for the registers must be set to both ZERO AND PERIOD. The CTR=PRD event is used for specific internal logic inside the HRPWM module.

Auto-conversion Mode performs the calculation for CMPBHR, DBREDHR, and DBFEDHR. The scale factor optimization software calculates the MEP scale factor in the background code and automatically updates the HRMSTEP register with the calculated number of MEP steps per coarse step. The MEP Calibration Module then uses the values in the HRMSTEP and CMPBHR or DBREDHR/DBFEDHR register to automatically calculate the appropriate number of MEP steps represented by the fractional components and moves the high-resolution ePWM signal edge accordingly. If auto-conversion is disabled, CMPBHR behaves the same as CMPAHR. $\text{CMPBHR} = (\text{fraction}(\text{PWMduty} * \text{PWMperiod}) * \text{MEP Scale Factor} + 0.5) \ll 8$.

20.15.1.4 Configuring High-Resolution in Deadband Rising-Edge and Falling-Edge Delay

Once the ePWM has been configured to provide conventional PWM of a given frequency, polarity, and dead band enabled in half-cycle clocking mode, the high-resolution operation on dead band RED and FED lines are enabled by programming the HRCNFG2 register in that particular ePWM module register space. This register provides the following configuration options:

- Edge Mode** The MEP can be programmed to provide precise position control on the dead band rising edge (RED), dead band falling edge (FED), or both edges (rising edge of DBRED signal and falling edge of DBFED signal) at the same time.
- Control Mode** Selects the time event that loads the shadow value in the active register for DBRED and DBFED in high-resolution mode. Select the pulse to match the selection in the ePWM DBCTL[LOADREDMODE] and DBCTL[LOADFEDMODE] bits.

20.15.1.5 Principle of Operation

The MEP logic is capable of placing an edge in one of 255 (8 bits) discrete time steps (see the device data sheet for typical MEP step size). The MEP works with the TBM and CCM registers to be certain that time steps are applied and that edge placement accuracy is maintained over a wide range of PWM frequencies, system clock frequencies, and other operating conditions. [Table 20-16](#) shows the typical range of operating frequencies supported by the HRPWM.

Table 20-16. Relationship Between MEP Steps, PWM Frequency, and Resolution

System (MHz)	MEP Steps Per EPWMCLK ^{(1) (2) (3)}	PWM Minimum (Hz) ⁽⁴⁾	PWM Maximum (MHz)	Resolution at Maximum (Bits) ⁽⁵⁾
60.0	93	916	3.00	10.9
70.0	79	1068	3.50	10.6
80.0	69	1221	4.00	10.4
90.0	62	1373	4.50	10.3
100.0	56	1526	5.00	10.1

- (1) TBCLK = EPWMCLK.
 (2) Table data based on a MEP time resolution of 180ps (this is an example value. See the device data sheet for MEP limits)
 (3) MEP steps applied = $T_{EPWMCLK}/180ps$ in this example.
 (4) PWM minimum frequency is based on a maximum period value, (TBPRD = 65535). PWM mode is asymmetrical up-count.
 (5) Resolution in bits is given for the maximum PWM frequency stated.

20.15.1.5.1 Edge Positioning

Note

The following example is presented using the [CMPA:CMPAHR] register combination. The theory of operation and equations are the same, if intending to use the [CMPBM:CMPBHRM] for duty cycle control.

In a typical power control loop, a digital controller issues a duty command, usually expressed in a per unit or percentage terms. Assume that for a particular operating point, the demanded duty cycle is 0.405 or 40.5% on time and the required converter PWM frequency is 1.25MHz. In conventional PWM generation with a system clock of 100MHz, the duty cycle choices are in the vicinity of 40.5%. As shown in Figure 20-84, a compare value of 32 counts (duty = 40%) is the closest to 40.5% that can be attained. This is equivalent to an edge position of 320ns instead of the desired 324ns. This data is shown in Table 20-17.

By utilizing the MEP, an edge position much closer to the desired point of 324ns can be achieved. Table 20-17 shows that in addition to the CMPA value, 22 steps of the MEP (CMPAHR register) positions the edge at 323.96ns, resulting in almost zero error. In this example, assume that the MEP has a step resolution of 180ps.

Figure 20-84. Required PWM Waveform for a Requested Duty = 40.5%

Table 20-17. CMPA versus Duty (left), and [CMPA:CMPAHR] versus Duty (right)

CMPA (count) ^{(1) (2) (3)}	Duty (%)	High Time (ns)	CMPA (count)	CMPAHR (count)	Duty (%)	High Time (ns)
28	35.0	280	32	18	40.405	323.24
29	36.3	290	32	19	40.428	323.42
30	37.5	300	32	20	40.450	323.60
31	38.8	310	32	21	40.473	323.78
32	40.0	320	32	22	40.495	323.96
33	41.3	330	32	23	40.518	324.14
34	42.5	340	32	24	40.540	324.32
			32	25	40.563	324.50
Required			32	26	40.585	324.68
32.40	40.5	324	32	27	40.608	324.86

(1) Assumed MEP step size for the above example = 180ps. See the device-specific data sheet for typical and maximum MEP values.
 (2) TBCLK = 100MHz, 10ns
 (3) For a PWM Period register value of 80 counts, PWM Period = 80 × 10ns = 800ns, PWM frequency = 1/800ns = 1.25MHz

20.15.1.5.2 Scaling Considerations

The mechanics of how to position an edge precisely in time has been demonstrated using the resources of the standard CMPA and MEP (CMPAHR) registers. In a practical application, however, it is necessary to seamlessly provide the CPU a mapping function from a per-unit (fractional) duty cycle to a final integer (non-fractional) representation that is written to the [CMPA:CMPAHR] register combination.

To do this, first examine the scaling or mapping steps involved. It is common in control software to express duty cycle in a per-unit or percentage basis. This has the advantage of performing all needed math calculations without concern for the final absolute duty cycle, expressed in clock counts or high time in nanoseconds (ns). Furthermore, it makes the code more transportable across multiple converter types running different PWM frequencies.

To implement the mapping scheme, a two-step scaling procedure is required.

Assumptions for this example:

TBCLK	=	10ns (100MHz)
PWM frequency	=	1.25MHz (1/800ns)
Required PWM duty cycle, PWMDuty	=	0.405 (40.5%)
PWM period in terms of coarse steps, PWMPeriod (800ns/10ns)	=	80
Number of MEP steps per coarse step at 180ps (10ns/180ps), MEP_ScaleFactor	=	55
Value to keep CMPAHR within the range of 1-255 and fractional rounding constant (default value)	=	0.5 (0080h in Q8 format)

Step 1: Percentage Integer Duty value conversion for CMPA register

CMPA register value	=	$\text{int}(\text{PWMDuty} * \text{PWMPeriod})$; int means integer part
	=	$\text{int}(0.405 * 80)$
	=	$\text{int}(32.4)$
CMPA register value	=	32 (20h)

Step 2: Fractional value conversion for CMPAHR register

CMPAHR	=	$(\text{frac}(\text{PWMDuty} * \text{PWMPeriod}) * \text{MEP_ScaleFactor} + 0.5) \ll 8$; frac means fractional part
	=	$(\text{frac}(32.4) * 55 + 0.5) \ll 8$; Shifting is to move the value to the high byte of CMPAHR.
	=	$(0.4 * 55 + 0.5) \ll 8$
	=	$(22 + 0.5) \ll 8$
	=	$22.5 * 256$; Shifting left by 8 is the same as multiplying by 256.
	=	5760 (1680h)
CMPAHR	=	1680h CMPAHR value = 1600h (lower 8 bits are ignored by hardware).

Note

If the AUTOCONV bit (HRCNFG.6) is set and the MEP_ScaleFactor is in the HRMSTEP register, then CMPAHR / CMPBHR register value = $\text{frac}(\text{PWMDuty} * \text{PWMperiod} << 8)$. The rest of the conversion calculations are performed automatically in hardware, and the correct MEP-scaled signal edge appears on the ePWM channel output. If AUTOCONV is not set, the above calculations must be performed by software.

The MEP scale factor (MEP_ScaleFactor) varies with the system clock and DSP operating conditions. TI provides an MEP scale factor optimizing (SFO) software C function, which uses the built in diagnostics in each HRPWM and returns the best scale factor for a given operating point.

The scale factor varies slowly over a limited range so the optimizing C function can be run very slowly in a background loop.

The CMPA, CMPB, CMPAHR and CMPBHR registers are configured in memory so that the 32-bit data capability of the CPU can write this as a single concatenated value, that is, [CMPA:CMPAHR], [CMPB:CMPBHR], and so on.

The mapping scheme has been implemented in both C and assembly, as shown in [Section 20.15.1.8](#). The actual implementation takes advantage of the 32-bit CPU architecture and is somewhat different from the steps shown in [Section 20.15.1.5.2](#).

For time-critical control loops where every cycle counts, the assembly version is recommended. This is a cycle optimized function (11 EPWMCLK cycles) that takes a Q15 duty value as input and writes a single [CMPA:CMPAHR] value.

20.15.1.5.3 Duty Cycle Range Limitation

In high-resolution mode, the MEP is not active for 100% of the PWM period and becomes operational:

- Three EPWMCLK cycles after the period starts when high-resolution period (TBPRDHR) control is not enabled.
- When high-resolution period (TBPRDHR) control is enabled using the HRPCTL register:
 - In up-count mode: three EPWMCLK cycles after the period starts until three EPWMCLK cycles before the period ends.
 - In up-down count mode: when counting up, three cycles after CTR = 0 until three cycles before CTR = PRD, and when counting down, three cycles after CTR = PRD until three cycles before CTR = 0.
- When using DBREDHR or DBFEDHR, DBRED or DBFED (the register corresponding to the edge with high-resolution displacement) must be greater than or equal to 7.

Duty cycle range limitations are illustrated in [Figure 20-85](#) to [Figure 20-88](#). This limitation imposes a duty cycle limit on the MEP. For example, precision edge control is not available all the way down to 0% duty cycle. When high-resolution period control is disabled, regular PWM duty control is fully operational down to 0% duty cycle despite the unavailability of HRPWM features in the first three cycles. In most applications, this cannot be an issue as the controller regulation point is usually not designed to be close to 0% duty cycle. To better understand the useable duty cycle range, see [Table 20-18](#). When high-resolution period control is enabled (HRPCTL[HRPE]=1), the duty cycle must not fall within the restricted range; otherwise, there can be undefined behavior on the ePWMxA output.

Figure 20-85. Low % Duty Cycle Range Limitation Example (HRPCTL[HRPE] = 0)

Table 20-18. Duty Cycle Range Limitation for Three EPWMCLK/TBCLK Cycles

PWM Frequency ⁽¹⁾ (kHz)	3 Cycles Minimum Duty	3 Cycles Maximum Duty ⁽²⁾
200	0.6%	99.4%
400	1.2%	98.8%
600	1.8%	98.2%
800	2.4%	97.6%
1000	3%	97%
1200	3.6%	96.4%
1400	4.2%	95.8%
1600	4.8%	95.2%
1800	5.4%	94.6%
2000	6%	94%

(1) EPWMCLK = TBCLK = 100MHz

(2) This limitation applies only if high-resolution period (TBPRDHR) control is enabled.

If the application demands HRPWM operation below the minimum duty cycle limitation, then the HRPWM can be configured to operate in count-down mode with the rising edge position (REP) controlled by the MEP when high-resolution period is disabled (HRPCTL[HRPE] = 0). This is illustrated in [Figure 20-86](#). In this configuration, the minimum duty cycle limitation is no longer an issue. However, there is a maximum duty limitation with same percent numbers as given in [Table 20-18](#).

CAUTION

If the application has enabled high-resolution period control (HRPCTL[HRPE]=1), the duty cycle must not fall within the restricted range; otherwise, there can be undefined behavior on the ePWM output.

Figure 20-86. High % Duty Cycle Range Limitation Example (HRPCTL[HRPE] = 0)

Figure 20-87. Up-Count Duty Cycle Range Limitation Example (HRPCTL[HRPE] = 1)

Figure 20-88. Up-Down Count Duty Cycle Range Limitation Example (HRPCTL[HRPE] = 1)

20.15.1.5.4 High-Resolution Period

High-resolution period control using the MEP logic is supported on devices with a Type 1 ePWM module or greater.

Note

When high-resolution period control is enabled, on ePWMxA only, and not ePWMxB output and conversely, the non high-resolution output has ± 1 TBCLK cycle jitter in up-count mode and ± 2 TBCLK cycle jitter in up-down count mode.

The scaling procedure described for duty cycle in [Section 20.15.1.5.2](#) applies for high-resolution period as well:

Assumptions for this example:

TBCLK	= 10ns (100MHz)
Required PWM frequency	= 175kHz (period of 571.428)
Number of MEP steps per coarse step at 180ps (10ns/180ps), (MEP_ScaleFactor)	= 55
Value to keep TBPRDHR within range of 1-255 and fractional rounding constant (default value)	= 0.5 (0080h in Q8 format)

Problem:

In up-count mode:

- If TBPRD = 571, then PWM frequency = 174.82kHz (period = $(571+1) * T_{TBCLK}$).
- If TBPRD = 570, then PWM frequency = 175.13kHz (period = $(570+1) * T_{TBCLK}$).

In up-down count mode:

- If TBPRD = 286, then PWM frequency = 174.82kHz (period = $(286*2) * T_{TBCLK}$).
- If TBPRD = 285, then PWM frequency = 175.44kHz (period = $(285*2) * T_{TBCLK}$).

Solution:

With 55 MEP steps per coarse step at 180ps each:

Step 1: Percentage Integer Period value conversion for TBPRD register

$$\begin{aligned} \text{Integer period value} &= 571 * T_{TBCLK} \\ &= \text{int}(571.428) * T_{TBCLK} \\ &= \text{int}(\text{PWMperiod}) * T_{TBCLK} \end{aligned}$$

In up-count mode:

$$\begin{aligned} \text{TBPRD} &= 570 \text{ (TBPRD = period value - 1)} \\ &= 023Ah \end{aligned}$$

In up-down count mode:

$$\begin{aligned} \text{TBPRD} &= 285 \text{ (TBPRD = period value/2)} \\ &= 011Dh \end{aligned}$$

Step 2: Fractional value conversion for TBPRDHR register

In up-count mode:

$$\text{TBPRDHR register value} = (\text{frac}(\text{PWMperiod}) * \text{MEP_ScaleFactor} + 0.5)$$

If auto-conversion enabled and HRMSTEP =

$$\text{MEP_ScaleFactor value (55):} = \text{frac}(\text{PWMperiod}) \ll 8 \text{ (Shifting is to move the value to the high byte of TBPRDHR)}$$

$$\begin{aligned} \text{TBPRDHR register value} &= \text{frac}(571.428) \ll 8 \\ &= 0.428 \times 256 \\ &= 6D00\text{h} \end{aligned}$$

The auto-conversion then automatically performs the calculation, such that TBPRDHR MEP delay is scaled by hardware to:

$$= ((\text{TBPRDHR}(15:0) \gg 8) \times \text{HRMSTEP} + 80\text{h}) \ll 8$$

$$= (006D\text{h} \times 55 + 80\text{h}) \gg 8$$

$$= (17EB\text{h}) \gg 8$$

$$\text{Period MEP delay} = 0017\text{h MEP Steps}$$

In up-down count mode:

$$\text{TBPRDHR register value} = (\text{frac}(\text{PWMperiod}) * \text{MEP_ScaleFactor} + 0.5)$$

If auto-conversion enabled and HRMSTEP =

$$\text{MEP_ScaleFactor value (55):} = \text{frac}(\text{PWMperiod} / 2) \ll 8 \text{ (Shifting is to move the value to the high byte of TBPRDHR)}$$

$$\begin{aligned} \text{TBPRDHR register value} &= \text{frac}(285.714) \ll 8 \\ &= 0.714 \times 256 \\ &= B600\text{h} \end{aligned}$$

The auto-conversion then automatically performs the calculation, such that TBPRDHR MEP delay is scaled by hardware to:

$$= ((\text{TBPRDHR}(15:0) \gg 8) \times \text{HRMSTEP} + 80\text{h}) \ll 8$$

$$= (00B6\text{h} \times 55 + 80\text{h}) \gg 8$$

$$= (279A\text{h}) \gg 8$$

$$\text{Period MEP delay} = 0027\text{h MEP Steps}$$

20.15.1.5.4.1 High-Resolution Period Configuration

To use high-resolution period, the ePWMx module must be initialized in the exact order presented.

The following steps use CMPA with shadow registers and the corresponding HRCNFG bits for high-resolution operation on EPWMxA. For high-resolution operation on EPWMxB, make the appropriate substitutions with the B channel fields.

1. Enable ePWMx clock
2. Enable HRPWM clock
3. Disable TBCLKSYNC
4. Configure ePWMx registers - AQ, TBPRD, CC, and so on.
 - ePWMx can only be configured for up-count or up-down count modes. High-resolution period is not compatible with down-count mode.
 - TBPRD and CC registers must be configured for shadow loads.
 - CMPCTL[LOADAMODE]
 - In up-count mode: CMPCTL[LOADAMODE] = 1 (load on CTR = PRD)
 - In up-down count mode: CMPCTL[LOADAMODE] = 2 (load on CTR=0 or CTR=PRD)
5. Configure the HRCNFG register such that:
 - HRCNFG[HRLOAD] = 2 (load on either CTR = 0 or CTR = PRD)
 - HRCNFG[AUTOCONV] = 1 (Enable auto-conversion)
 - HRCNFG[EDGMODE] = 3 (MEP control on both edges)
6. For TBPHS:TBPHSHR synchronization with high-resolution period, set both HRPCTL[TBPSHRLOADE] = 1 and TBCTL[PHSEN] = 1. In up-down count mode these bits must be set to 1 regardless of the contents of TBPHSHR.
7. Enable high-resolution period control (HRPCTL[HRPE] = 1)
8. Enable TBCLKSYNC
9. TBCTL[SWFSYNC] = 1
10. HRMSTEP must contain an accurate MEP scale factor (# of MEP steps per EPWMCLK coarse step) because auto-conversion is enabled. The MEP scale factor can be acquired using the SFO() function described in [Section 20.15.2](#).
11. To control high-resolution period, write to the TBPRDHR(M) registers.

Note

When high-resolution period mode is enabled, an EPWMxSYNC pulse introduces ± 1 -2 cycle jitter to the PWM (± 1 cycle in up-count mode and ± 2 cycle in up-down count mode). For this reason, EPWMxSYNCO source cannot be set to CTR = 0 or CTR = CMPB. Otherwise, the jitter occurs on every PWM cycle with the synchronization pulse.

When EPWMxSYNCl is EPWMxSYNCO source, a software synchronization pulse can be issued only once during high-resolution period initialization. If a software sync pulse is applied while the PWM is running, the jitter appears on the PWM output at the time of the sync pulse.

20.15.1.6 Deadband High-Resolution Operation

Note

In up-count mode, the dead-band module is not available when any high-resolution mode is enabled.

Assumptions for this example:

System clock	= 10ns (100MHz)
Deadband enabled in half-cycle mode, TBCLK = EPWMCLK	
Required PWM frequency	1.33MHz (1/750ns)
Required PWM duty cycle	0.5 (50%)
Required Deadband Rising-Edge Delay	5% over duty
Required Deadband Rising-Edge Delay in ns	(0.05 * 375ns) = 18.75ns

Note

Similar to the duty cycle restrictions when using HRPWM, the DBRED and DBFED values must be greater than 3 to use high-resolution deadband.

Deadband delay values as a function of DBFED and DBRED:

When half-cycle clocking is enabled, the formula to calculate the falling-edge delay (FED) and rising-edge delay (RED) becomes:

$$FED = DBFED * TBCLK / 2$$

$$RED = DBRED * TBCLK / 2$$

DBRED and DBFED calculated values:

Required Deadband Rising-Edge Delay in ns = 18.75ns

$$DBRED = RED / (TBCLK / 2)$$

$$DBRED = 18.75ns/5ns$$

$$DBRED \text{ Required} = 3.75ns$$

With 55 MEP steps per coarse step at 180ps each:

Step 1: Integer Deadband value conversion for DBREDM register

Integer DBRED value	= int (RED / (TBCLK / 2))
	= int (3.75)
DBRED	= 3

Step 2: Fractional value conversion for Deadband high-resolution register DBREDHR

DBREDHR register value	= (frac(DBRED Required) * MEP_ScaleFactor + 0.5) << 8 (Shifting is to move the value to the high byte of DBREDHR)
	= (frac (3.75) * 55 + 0.5) << 8
	= (0.75 * 55 + 0.5) << 8
	= (41.75) * 256 Shifting left by 8 is the same as multiplying by 256.
DBREDHR value	= 29C0h MEP Steps
	Hardware ignores lower 9 bits in the above calculated DBREDHR value

Note

If the AUTOCONV bit (HRCNFG.6) is set and the MEP_ScaleFactor is in the HRMSTEP register, then DBREDHR:DBRED = frac((required DB value) < <8). The rest of the conversion calculations are performed automatically in hardware, and the correct MEP-scaled signal edge appears on the ePWM channel output. If AUTOCONV is not set, the above calculations must be performed by software.

20.15.1.7 Scale Factor Optimizing Software (SFO)

The micro edge positioner (MEP) logic is capable of placing an edge in one of 255 discrete time steps. As previously mentioned, the size of these steps is on the order of 150ps (see the device data sheet for typical MEP step size on your device). The MEP step size varies based on worst-case process parameters, operating temperature, and voltage. MEP step size increases with decreasing voltage and increasing temperature and decreases with increasing voltage and decreasing temperature. Applications that use the HRPWM feature can use the TI-supplied MEP scale factor optimization (SFO) software function. The SFO function helps to dynamically determine the number of MEP steps per EPWMCLK period while the HRPWM is in operation.

To utilize the MEP capabilities effectively, the correct value for the MEP scaling factor needs to be known by the software. To accomplish this, the HRPWM module has built in self-check and diagnostic capabilities that can be used to determine the optimum MEP scale factor value for any operating condition. TI provides a C-callable library containing one SFO function that utilizes this hardware and determines the optimum MEP scale factor. As such, MEP control and diagnostics registers are reserved for TI use.

A detailed description of the SFO library - SFO_TI_Build_V8.lib software can be found in [SFO Library Software - SFO TI_Build_V8.lib](#).

20.15.1.8 HRPWM Examples Using Optimized Assembly Code

The best way to understand how to use the HRPWM capabilities is through two real examples:

1. Simple buck converter using asymmetrical PWM (count-up) with active high polarity.
2. DAC function using simple R+C reconstruction filter.

The following examples all have initialization and configuration code written in C. To make these easier to understand, the #defines shown below are used.

[Example 20-2](#) assumes MEP step size of 150ps and does not use the SFO library.

Example 20-2. #Defines for HRPWM Header Files

```
// HRPWM (High Resolution PWM) //
=====
// HRCNFG
#define HR_Disable 0x0
#define HR_REP 0x1 // Rising Edge position

20.15.1.8.1 Implementing a Simple Buck Converter

In this example, the PWM requirements are:

- PWM frequency = 1MHz (that is, TBPRD = 100)
- PWM mode = asymmetrical, up-count
- Resolution = 12.7 bits (with a MEP step size of 150ps)

Figure 20-89 and Figure 20-90 show the required PWM waveform. As explained previously, configuration for the ePWM1 module is almost identical to the normal case except that the appropriate MEP options need to be enabled/selected.

Figure 20-89. Simple Buck Controlled Converter Using a Single PWM

Figure 20-90. PWM Waveform Generated for Simple Buck Controlled Converter

The example code shown consists of two main parts:

- Initialization code (executed once)
- Run time code (typically executed within an ISR)

Example 20-3 shows the Initialization code. The first part is configured for conventional PWM. The second part sets up the HRPWM resources.

This example assumes MEP step size of 150ps and does not use the SFO library.

Example 20-4 shows an assembly example of run-time code for the HRPWM buck converter.

Example 20-3. HRPWM Buck Converter Initialization Code

```

void HrBuckDrvCnf(void)
{
// Config for conventional PWM first
EPwm1Regs.TBCTL.bit.PRDL = TB_IMMEDIATE;           // set Immediate load
EPwm1Regs.TBPRD = 100;                             // Period set for 1000kHz PWM
hrbuck_period = 200;                                // Used for Q15 to Q0 scaling
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;           // EPWM1 is the Master

EPwm1Regs.EPWSYNCOUTEN.all = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1;
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
// Note: ChB is initialized here only for comparison purposes, it is not required

EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;     // optional
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;       // optional
EPwm1Regs.AQCTLA.bit.ZRO = AQ_SET;
EPwm1Regs.AQCTLA.bit.CAU = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.ZRO = AQ_SET;               // optional
EPwm1Regs.AQCTLB.bit.CBU = AQ_CLEAR;             // optional
// Now configure the HRPWM resources
EALLOW;                                           // Note these registers are protected
                                                    // and act only on ChA
EPwm1Regs.HRCNFG.all = 0x0;                       // clear all bits first
EPwm1Regs.HRCNFG.bit.EDGMODE = HR_FEP;           // Control Falling Edge Position
EPwm1Regs.HRCNFG.bit.CTLMODE = HR_CMP;           // CMPAHR controls the MEP
EPwm1Regs.HRCNFG.bit.HRLOAD = HR_CTR_ZERO;       // Shadow load on CTR=Zero
EDIS;
MEP_ScaleFactor = 66*256;                         // Start with typical Scale Factor
                                                    // value for 100MHZ
                                                    // Note: Use SFO functions to update
                                                    // MEP_ScaleFactor dynamically
}

```

Example 20-4. HRPWM Buck Converter Run-Time Code

```

EPWM1_BASE .set 0x6800
CMPAHR1 .set EPWM1_BASE+0x8
;=====
HRBUCK_DRV; (can execute within an ISR or loop)
;=====
    MOVW DP, #_HRBUCK_In
    MOVL XAR2,@_HRBUCK_In      ; Pointer to Input Q15 Duty (XAR2)
    MOVL XAR3,#CMPAHR1        ; Pointer to HRPWM CMPA reg (XAR3)

; Output for EPWM1A (HRPWM)
    MOV T,*XAR2 ; T <= Duty
    MPYU ACC,T,@_hrbuck_period ; Q15 to Q0 scaling based on Period
    MOV T,@_MEP_ScaleFactor    ; MEP scale factor (from optimizer s/w)
    MPYU P,T,@AL               ; P <= T * AL, Optimizer scaling
    MOVH @AL,P                 ; AL <= P, move result back to ACC
    ADD ACC, #0x080            ; MEP range and rounding adjustment
    MOVL *XAR3,ACC             ; CMPA: CMPAHR(31:8) <= ACC

; Output for EPWM1B (Regular Res) Optional - for comparison purpose only
    MOV *+XAR3[2],AH           ; Store ACCH to regular CMPB

```

20.15.1.8.2 Implementing a DAC Function Using an R+C Reconstruction Filter

In this example, the PWM requirements are:

- PWM frequency = 400kHz (that is, TBPRD = 250)
- PWM mode = Asymmetrical, Up-count
- Resolution = 14 bits (MEP step size = 150ps)

Figure 20-91 and Figure 20-92 show the DAC function and the required PWM waveform. As explained previously, configuration for the ePWM1 module is almost identical to the normal case except that the appropriate MEP options need to be enabled/selected.

Figure 20-91. Simple Reconstruction Filter for a PWM-based DAC

Figure 20-92. PWM Waveform Generated for the PWM DAC Function

The example code shown consists of two main parts:

- Initialization code (executed once)
- Run time code (typically executed within an ISR)

This example assumes a typical MEP_SP and does not use the SFO library.

Example 20-5 shows the Initialization code. The first part is configured for conventional PWM. The second part sets up the HRPWM resources.

Example 20-6 shows an assembly example of run-time code that can execute in a high-speed ISR loop.

Example 20-5. PWM DAC Function Initialization Code

```

void HrPwmDacDrvCnf(void)
{
// Config for conventional PWM first
EPwm1Regs.TBCTL.bit.PRDL = TB_IMMEDIATE;           // Set Immediate load
EPwm1Regs.TBPRD = 250;                             // Period set for 400kHz PWM
hrDAC_period = 250;                                 // Used for Q15 to Q0 scaling
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;           // EPWM1 is the Master

EPwm1Regs.EPWSYNCOUTEN.all = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1;
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
// Note: ChB is initialized here only for comparison purposes, it is not required

EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;    // optional
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;      // optional

EPwm1Regs.AQCTLA.bit.ZRO = AQ_SET;
EPwm1Regs.AQCTLA.bit.CAU = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.ZRO = AQ_SET;               // optional
EPwm1Regs.AQCTLB.bit.CBU = AQ_CLEAR;             // optional
// Now configure the HRPWM resources
EALLOW;                                           // Note these registers are protected
                                                    // and act only on ChA.
EPwm1Regs.HRCNFG.all = 0x0;                       // Clear all bits first
EPwm1Regs.HRCNFG.bit.EDGMODE = HR_FEP;           // Control falling edge position
EPwm1Regs.HRCNFG.bit.CTLMODE = HR_CMP;           // CMPAHR controls the MEP.
EPwm1Regs.HRCNFG.bit.HRLOAD = HR_CTR_ZERO;       // Shadow load on CTR=Zero.
EDIS;
MEP_ScaleFactor = 66*256;                         // Start with typical scale factor
                                                    // value for 100MHz.
                                                    // Use SFO functions to update MEP_ScaleFactor
                                                    // dynamically.
}

```

Example 20-6. PWM DAC Function Run-Time Code

```

EPWM1_BASE .set 0x6800
CMPAHR1 .set EPWM1_BASE+0x8
;=====
HRPWM_DAC_DRV; (can execute within an ISR or loop)
;=====
    MOVW DP, #_HRDAC_In
    MOVL XAR2,@_HRDAC_In           ; Pointer to input Q15 duty (XAR2)
    MOVL XAR3,#CMPAHR1            ; Pointer to HRPWM CMPA reg (XAR3)

; Output for EPWM1A (HRPWM)
    MOV T,*XAR2                   ; T <= duty
    MPY ACC,T,@_hrDAC_period       ; Q15 to Q0 scaling based on period
    ADD ACC,@_hrDAC_period<<15    ; Offset for bipolar operation
    MOV T,@_MEP_ScaleFactor        ; MEP scale factor (from optimizer s/w)
    MPYU P,T,@AL                  ; P <= T * AL, optimizer scaling
    MOVH @AL,P                    ; AL <= P, move result back to ACC
    ADD ACC,#0x080                ; MEP range and rounding adjustment
    MOVL *XAR3,ACC                ; CMPA: CMPAHR(31:8) <= ACC

; Output for EPWM1B (Regular Res) Optional - for comparison purpose only
    MOV *+XAR3[2],AH              ; Store ACCH to regular CMPB

```

20.15.2 SFO Library Software - SFO_TI_Build_V8.lib

Table 20-19 lists several features of the SFO_TI_Build_V8.lib library.

Table 20-19. SFO Library Features

	SFO_TI_Build_V8.lib	Unit
Completion-checking?	Yes	Function return value
Typical cycles required for SFO() to update MEP_ScaleFactor if called repetitively without interrupts	130,000	EPWMCLK cycles

20.15.2.1 Scale Factor Optimizer Function - int SFO()

This routine drives the micro-edge positioner (MEP) calibration module to run SFO diagnostics and determine the appropriate MEP scale factor (number of MEP steps per coarse EPWMCLK step) for a device at any given time.

If EPWMCLK = TBCLK = 100MHz and assuming the MEP step size is 150ps, the typical scale factor value at 100MHz = 66 MEP steps per TBCLK unit (10ns)

The function returns a MEP scale factor value:

MEP_ScaleFactor = Number of MEP steps per EPWMCLK

Constraints when using this function:

- SFO() can be used with a minimum EPWMCLK = TBCLK = 50MHz. MEP diagnostics logic uses EPWMCLK and not TBCLK, so the EPWMCLK restriction is an important constraint. Below 50MHz with device process variation, the MEP step size can decrease under cold temperature and high core voltage conditions to such a point that 255 MEP steps do not span an entire EPWMCLK cycle.
- At any time, SFO() can be called to run SFO diagnostics on the MEP calibration module.

Usage:

- SFO() can be called at any time in the background while the ePWM channels are running in HRPWM mode. The scale factor result obtained can be applied to all ePWM channels running in HRPWM mode because the function makes use of the diagnostics logic in the MEP calibration module (which runs independently of ePWM channels).
- This routine returns a 1 when calibration is finished and a new scale factor has been calculated or returns a 0 if calibration is still running. The routine returns a 2 if there is an error, and the MEP_ScaleFactor is greater than the maximum 255 fine steps per coarse EPWMCLK cycle. In this case, the HRMSTEP register maintains the last MEP scale factor value less than 256 for auto conversion.
- All ePWM modules operating in HRPWM incur only a 3 EPWMCLK cycle minimum duty cycle limitation when high-resolution period control is not used. If high-resolution period control is enabled, there is an additional duty cycle limitation 3-EPWMCLK cycles before the end of the PWM period (see [Section 20.15.1.5.3](#)).
- The SFO() function also updates the HRMSTEP register with the scale factor result. If the HRCNFG[AUTOCONV] bit is set, the application software is responsible only for setting CMPAHR = fraction(PWMduty*PWMperiod) << 8 or CMPBHR = fraction(PWMduty*PWMperiod) << 8 or TBPRDHR = fraction(PWMperiod) while running SFO() in the background. The MEP Calibration Module then uses the values in the HRMSTEP and CMPAHR/CMPBHR/TBPRDHR register to automatically calculate the appropriate number of MEP steps represented by the fractional duty cycle or period and move the high-resolution ePWM signal edge accordingly.
- If the HRCNFG[AUTOCONV] bit is clear, the HRMSTEP register is ignored. The application software needs to perform the necessary calculations manually so that:
 - $CMPAHR = (\text{fraction}(\text{PWMduty} * \text{PWMperiod}) * \text{MEP Scale Factor}) \ll 8 + 0x080$.
 - Similar behavior applies for TBPHSHR, CMPBHR, DBREDHR, and DBFEDHR. Auto-conversion must be enabled when using TBPRDHR.

The following code snippet shows how to use the HRPWM DUTY using driverlib functions.

```
float32_t dutyFine = 85.62;
float32_t count = (dutyFine * (float32_t)(EPWM_TIMER_TBPRD << 8))/100;
uint32_t compCount = (count);
HRPWM_setCounterCompareValue(EPWM1_BASE, HRPWM_COUNTER_COMPARE_A, compCount);
HRPWM_setCounterCompareValue(EPWM1_BASE, HRPWM_COUNTER_COMPARE_B, compCount);
```

The routine can be run as a background task in a slow loop requiring negligible CPU cycles. The repetition rate at which an SFO function needs to be executed depends on the application's operating environment. As with all digital CMOS devices, temperature and supply voltage variations have an effect on MEP operation. However, in most applications these parameters vary slowly and therefore is often sufficient to execute the SFO function once every 5 to 10 seconds. If more rapid variations are expected, then execution can be performed more frequently to match the application. Note there is no high limit restriction on the SFO function repetition rate; hence, the SFO function can execute as quickly as the background loop is capable.

While using the HRPWM feature, HRPWM logic is not active for the first 3 EPWMCLK cycles of the PWM period (and the last 3 EPWMCLK cycles of the PWM period if TBPRDHR is used). While running the application in this configuration, if high-resolution period control is disabled (HRPCTL[HRPE=0]) and the CMPA/CMPB register value is less than three cycles, then the CMPAHR/CMPBHR register must be cleared to zero. If high-resolution period control is enabled (HRPCTL[HRPE=1]), the CMPA register value must not fall below 3 or above TBPRD-3. This can avoid any unexpected transitions on the PWM signal.

20.15.2.2 Software Usage

The software library function SFO(), calculates the MEP scale factor for the HRPWM-supported ePWM modules. The scale factor is an integer value in the range 1-255, and represents the number of micro step edge positions available for a system clock period. The scale factor value is returned in an integer variable called MEP_ScaleFactor. For example, see [Table 20-20](#).

Table 20-20. Factor Values

Software Function call	Functional Description	Updated Variables
SFO()	Returns MEP scale factor in the HRMSTEP register	MEP_ScaleFactor and HRMSTEP register.

To use the HRPWM feature of the ePWMs, it is recommended that the SFO function be used as described here.

Step 1. Add "Include" Files

The SFO_V8.h file needs to be included as follows. This include file is mandatory while using the SFO library function. For the SFO() to operate, the appropriate (Device)_Device.h and (Device)_Epwm_defines.h must be included in the project. These include files are optional if customized header files are used in the end applications.

Example 20-7. A Sample of How to Add "Include" Files

```
#include "F28x7x_Device.h" // F28x7x Headerfile
#include "F28x7x_EPwm_defines.h" // init defines
#include "SFO_V8.h" // SFO lib functions (needed for HRPWM)
```

Step 2. Element Declaration

Declare an integer variable for the scale factor value as shown below.

Example 20-8. Declaring an Element

```
int MEP_ScaleFactor = 0; //scale factor value
volatile struct EPWM_REGS *ePWM[] = {0, &EPwm1Regs, &EPwm2Regs, &EPwm3Regs,
&EPwm4Regs};
```

Step 3. MEP_ScaleFactor Initialization

The SFO() function does not require a starting scale factor value in MEP_ScaleFactor. Prior to using the MEP_ScaleFactor variable in application code, SFO() can be called to drive the MEP calibration module to calculate an MEP_ScaleFactor value.

As part of the one-time initialization code prior to using MEP_ScaleFactor, include the following:

Example 20-9. Initializing With a Scale Factor Value

```
MEP_ScaleFactor initialized using function SFO ()
while (SFO() == 0) {} // MEP_ScaleFactor calculated by MEP Cal Module
```

Step 4. Application Code

While the application is running, fluctuations in both device temperature and supply voltage can be expected. To be sure that good Scale Factors are used for each ePWM module, the SFO function can be re-run periodically as part of a slower back-ground loop. Some examples of this are shown here.

Note

See the HRPWM_SFO example in the device-specific C/C++ header files and peripheral examples available from the TI website.

Example 20-10. SFO Function Calls

```
main ()
{
    int status;
    // User code
    // ePWM1, 2, 3, 4 are running in HRPWM mode
    // The status variable returns 1 once a new MEP_ScaleFactor has been
    // calculated by the MEP Calibration Module running SFO
    // diagnostics.
    status = SFO();
    if(status==2) {ESTOP0;} // The function returns a 2 if MEP_ScaleFactor is greater
    // than the maximum 255 allowed (error condition)
}
```

20.16 Software

20.16.1 EPWM Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/epwm

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

20.16.1.1 ePWM Trip Zone

FILE: epwm_ex1_trip_zone.c

This example configures ePWM1 and ePWM2 as follows

- ePWM1 has TZ1 as one shot trip source
- ePWM2 has TZ1 as cycle by cycle trip source

Initially tie TZ1 high. During the test, monitor ePWM1 or ePWM2 outputs on a scope. Pull TZ1 low to see the effect.

External Connections

- ePWM1A is on GPIO0
- ePWM2A is on GPIO2
- TZ1 is on GPIO12

This example also makes use of the Input X-BAR. GPIO12 (the external trigger) is routed to the input X-BAR, from which it is routed to TZ1.

The TZ-Event is defined such that ePWM1A will undergo a One-Shot Trip and ePWM2A will undergo a Cycle-By-Cycle Trip.

20.16.1.2 ePWM Up Down Count Action Qualifier

FILE: epwm_ex2_updown_aq.c

This example configures ePWM1, ePWM2, ePWM3 to produce a waveform with independent modulation on ePWMxA and ePWMxB.

The compare values CMPA and CMPB are modified within the ePWM's ISR.

The TB counter is in up/down count mode for this example.

View the ePWM1A/B(GPIO0 & GPIO1), ePWM2A/B(GPIO2 & GPIO3) and ePWM3A/B(GPIO4 & GPIO5) waveforms on oscilloscope.

20.16.1.3 ePWM Synchronization

FILE: epwm_ex3_synchronization.c

This example configures ePWM1, ePWM2, ePWM3 and ePWM4 as follows

- ePWM1 without phase shift as sync source
- ePWM2 with phase shift of 300 TBCLKs
- ePWM3 with phase shift of 600 TBCLKs
- ePWM4 with phase shift of 900 TBCLKs

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO2 EPWM2A
- GPIO3 EPWM2B
- GPIO4 EPWM3A
- GPIO5 EPWM3B

- GPIO6 EPWM4A
- GPIO7 EPWM4B

Watch Variables

- None.

20.16.1.4 ePWM Digital Compare

FILE: epwm_ex4_digital_compare.c

This example configures ePWM1 as follows

- ePWM1 with DCAEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25's PULL-UP resistor is enabled, in order to test the trip, PULL this pin to GND

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO25 TZ1, pull this pin low to trip the ePWM

Watch Variables

- None.

20.16.1.5 ePWM Digital Compare Event Filter Blanking Window

FILE: epwm_ex5_digital_compare_event_filter.c

This example configures ePWM1 as follows

- ePWM1 with DCAEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25's PULL-UP resistor is enabled, in order to test the trip, PULL this pin to GND
- ePWM1 with DCBEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25's PULL-UP resistor is enabled, in order to test the trip, PULL this pin to GND
- DCBEVT1 uses the filtered version of DCBEVT1
- The DCFILT signal uses the blanking window to ignore the DCBEVT1 for the duration of DC Blanking window

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO25 TRIPIN1, pull this pin low to trip the ePWM

Watch Variables

- None.

20.16.1.6 ePWM Valley Switching

FILE: epwm_ex6_valley_switching.c

This example configures ePWM1 as follows

- ePWM1 with DCAEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25 is set to output and toggled in the main loop to trip the PWM
- ePWM1 with DCBEVT1 forcing the ePWM output LOW
- GPIO25 is used as the input to the INPUT XBAR INPUT1

- INPUT1 (from INPUT XBAR) is used as the source for DCAEVT1
- GPIO25 is set to output and toggled in the main loop to trip the PWM
- DCBEVT1 uses the filtered version of DCBEVT1
- The DCFILT signal uses the valley switching module to delay the
- DCFILT signal by a software defined DELAY value.

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO25 TRIPIN1 (Output Pin, toggled through software)

Watch Variables

- None.

20.16.1.7 ePWM Digital Compare Edge Filter

FILE: epwm_ex7_edge_filter.c

This example configures ePWM1 as follows

- ePWM1 with DCBEVT2 forcing the ePWM output LOW as a CBC source
- GPIO25 is used as the input to the INPUT XBAR INPUT1
- INPUT1 (from INPUT XBAR) is used as the source for DCBEVT2
- GPIO25 is set to output and toggled in the main loop to trip the PWM
- The DCBEVT2 is the source for DCFILT
- The DCFILT will count edges of the DCBEVT2 and generate a signal to to trip the ePWM on the 4th edge of DCBEVT2

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO25 TRIPIN1 (Output Pin, toggled through software)

Watch Variables

- None.

20.16.1.8 ePWM Deadband

FILE: epwm_ex8_deadband.c

This example configures ePWM1 through ePWM6 as follows

- ePWM1 with Deadband disabled (Reference)
- ePWM2 with Deadband Active High
- ePWM3 with Deadband Active Low
- ePWM4 with Deadband Active High Complimentary
- ePWM5 with Deadband Active Low Complimentary
- ePWM6 with Deadband Output Swap (switch A and B outputs)

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO2 EPWM2A
- GPIO3 EPWM2B
- GPIO4 EPWM3A
- GPIO5 EPWM3B
- GPIO6 EPWM4A
- GPIO7 EPWM4B
- GPIO8 EPWM5A
- GPIO9 EPWM5B

- GPIO10 EPWM6A
- GPIO11 EPWM6B

Watch Variables

- None.

20.16.1.9 ePWM DMA

FILE: epwm_ex9_dma.c

This example configures ePWM1 and DMA as follows:

- ePWM1 is set up to generate PWM waveforms
- DMA5 is set up to update the CMPAHR, CMPA, CMPBHR and CMPB every period with the next value in the configuration array. This allows the user to create a DMA enabled fifo for all the CMPx and CMPxHR registers to generate unconventional PWM waveforms.
- DMA6 is set up to update the TBPHSHR, TBPHS, TBPRDHR and TBPRD every period with the next value in the configuration array.
- Other registers such as AQCTL can be controlled through the DMA as well by following the same procedure. (Not used in this example)

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B

Watch Variables

- None.

20.16.1.10 ePWM Chopper

FILE: epwm_ex10_chopper.c

This example configures ePWM1, ePWM2, ePWM3 and ePWM4 as follows

- ePWM1 with Chopper disabled (Reference)
- ePWM2 with chopper enabled at 1/8 duty cycle
- ePWM3 with chopper enabled at 6/8 duty cycle
- ePWM4 with chopper enabled at 1/2 duty cycle with One-Shot Pulse enabled

External Connections

- GPIO0 EPWM1A
- GPIO1 EPWM1B
- GPIO2 EPWM2A
- GPIO3 EPWM2B
- GPIO4 EPWM3A
- GPIO5 EPWM3B
- GPIO6 EPWM4A
- GPIO7 EPWM4B

Watch Variables

- None.

20.16.1.11 EPWM Configure Signal

FILE: epwm_ex11_configure_signal.c

This example configures ePWM1, ePWM2, ePWM3 to produce signal of desired frequency and duty. It also configures phase between the configured modules.

Signal of 10kHz with duty of 0.5 is configured on ePWMxA & ePWMxB with ePWMxB inverted. Also, phase of 120 degree is configured between ePWM1 to ePWM3 signals.

During the test, monitor ePWM1, ePWM2, and/or ePWM3 outputs on an oscilloscope.

- ePWM1A is on GPIO0
- ePWM1B is on GPIO1
- ePWM2A is on GPIO2
- ePWM2B is on GPIO3
- ePWM3A is on GPIO4
- ePWM3B is on GPIO5

20.16.1.12 Realization of Monoshot mode

FILE: epwm_ex12_monoshot_mode.c

This example showcases how to generate monoshot PWM output based on external trigger, that is, generating just a single pulse output on receipt of an external trigger. And the next pulse is generated only when the next trigger comes. The example utilizes external synchronization and T1 action qualifier event features to achieve the desired output.

ePWM1 is used to generate the monoshot output and ePWM2 is used as an external trigger for that. No external connections are required as ePWM2A is fed as the trigger using Input X-BAR automatically.

ePWM1 is configured to generate a single pulse of 0.5 μ s when received an external trigger. This is achieved by enabling the phase synchronization feature and configuring EPWMxSYNCl as EXTSYNCIN1. And this EPWMxSYNCl is also configured as T1 event of action qualifier to set output HIGH while CTR = PRD action is used to set output LOW.

ePWM2 is configured to generate a 100 KHz signal with a duty of 1% (to simulate a rising edge trigger) which is routed to EXTSYNCIN1 using Input XBAR.

Observe GPIO0 (EPWM1A : Monoshot Output) and GPIO2 (EPWM2 : External Trigger) on oscilloscope.

NOTE : In the following example, the ePWM timer is still running in a continuous mode rather than a one-shot mode thus for more reliable implementation, refer to CLB based one shot PWM implementation demonstrated in "clb_ex17_one_shot_pwm" example

20.16.1.13 EPWM Action Qualifier (epwm_up_aq)

FILE: epwm_ex13_up_aq.c

This example configures ePWM1, ePWM2, ePWM3 to produce an waveform with independent modulation on EPWMxA and EPWMxB.

The compare values CMPA and CMPB are modified within the ePWM's ISR.

The TB counter is in up count mode for this example.

View the EPWM1A/B(GPIO0 & GPIO1), EPWM2A/B(GPIO2 & GPIO3) and EPWM3A/B(GPIO4 & GPIO5) waveforms via an oscilloscope.

20.16.2 HRPWM Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location: C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/hrpwm

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](https://dev.ti.com/C2000Ware/Examples).

20.16.2.1 HRPWM Duty Control with SFO

FILE: hrpwm_ex1_duty_sfo.c

This example modifies the MEP control registers to show edge displacement for high-resolution period with ePWM in Up count mode due to the HRPWM control extension of the respective ePWM module.

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

```
int SFO();
```

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)
- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

External Connections

- Monitor ePWM1/2/3/4 A/B pins on an oscilloscope.

20.16.2.2 HRPWM Slider

FILE: hrpwm_ex2_slider.c

This example modifies the MEP control registers to show edge displacement due to HRPWM. Control blocks of the respective ePWM module channel A and B have fine edge movement due to HRPWM logic.

Monitor ePWM1 A/B pins on an oscilloscope.

20.16.2.3 HRPWM Period Control

FILE: hrpwm_ex3_prd_updown_sfo.c

This example modifies the MEP control registers to show edge displacement for high-resolution period with ePWM in Up-Down count mode due to the HRPWM control extension of the respective ePWM module.

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)
- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

External Connections

- Monitor ePWM1/2/3/4 A/B pins on an oscilloscope.

20.16.2.4 HRPWM Duty Control with UPDOWN Mode

FILE: hrpwm_ex4_duty_updown_sfo.c

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)
- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

External Connections

- Monitor ePWM1/2/3/4 A/B pins on an oscilloscope.

20.16.2.5 HRPWM Slider Test

FILE: hrpwm_ex5_slider_qformat.c

This example modifies the MEP control registers to show edge displacement due to HRPWM. Control blocks of the respective ePWM module channel A and B will have fine edge movement due to HRPWM logic. Load the hrpwm_slider.gel file. Select the HRPWM_eval from the GEL menu. A FineDuty slider graphics will show up in CCS. Load the program and run. Use the Slider to and observe the EPWM edge displacement for each slider step change. This explains the MEP control on the EPwmxA channels.

Monitor ePWM1 & ePWM2 A/B pins on an oscilloscope.

20.16.2.6 HRPWM Duty Up Count

FILE: hrpwm_ex6_duty_sfo_qformat.c

This example modifies the MEP control registers to show edge displacement for high-resolution period with ePWM in Up count mode due to the HRPWM control extension of the respective ePWM module.

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)
- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

To run this example:

1. Run this example at maximum SYSCLKOUT
2. Activate Real time mode
3. Run the code

External Connections

- Monitor ePWM1/2 A/B pins on an oscilloscope.

Watch Variables

- status - Example run status
- updateFine - Set to 1 use HRPWM capabilities and observe in fine MEP steps(default) Set to 0 to disable HRPWM capabilities and observe in coarse SYSCLKOUT cycle steps

20.16.2.7 HRPWM Period Up-Down Count

FILE: hrpwm_ex7_prd_updown_sfo_qformat.c

This example modifies the MEP control registers to show edge displacement for high-resolution period with ePWM in Up-Down count mode due to the HRPWM control extension of the respective ePWM module.

This example calls the following TI's MEP Scale Factor Optimizer (SFO) software library V8 functions:

int SFO();

- updates MEP_ScaleFactor dynamically when HRPWM is in use
- updates HRMSTEP register (exists only in EPwm1Regs register space) with MEP_ScaleFactor value
- returns 2 if error: MEP_ScaleFactor is greater than maximum value of 255 (Auto-conversion may not function properly under this condition)

- returns 1 when complete for the specified channel
- returns 0 if not complete for the specified channel

This example is intended to explain the HRPWM capabilities. The code can be optimized for code efficiency. Refer to TI's Digital power application examples and TI Digital Power Supply software libraries for details.

To run this example:

1. Run this example at maximum SYSCLKOUT
2. Activate Real time mode
3. Run the code

External Connections

- Monitor ePWM1/2 A/B pins on an oscilloscope.

Watch Variables

- updateFine - Set to 1 use HRPWM capabilities and observe in fine MEP steps(default) Set to 0 to disable HRPWM capabilities and observe in coarse SYSCLKOUT cycle steps

20.17 ePWM Registers

This section describes the Enhanced Pulse Width Modulator registers.

20.17.1 EPWM Base Address Table

Table 20-21. EPWM Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected
Instance	Structure							
EPwm1Regs	EPWM_REGS	EPWM1_BASE	0x0000_4000	YES	YES	YES	YES	YES
EPwm2Regs	EPWM_REGS	EPWM2_BASE	0x0000_4100	YES	YES	YES	YES	YES

Complex bit access types are encoded to fit into small table cells. [Table 20-23](#) shows the codes that are used for access types in this section.

Table 20-23. EPWM_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1C	W1C	Write 1 to clear
W1S	W1S	Write 1 to set
WOnce	WOnce	Write Write once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

20.17.2.1 TBCTL Register (Offset = 0h) [Reset = 0083h]

TBCTL is shown in [Figure 20-93](#) and described in [Table 20-24](#).

Return to the [Summary Table](#).

Time Base Control Register

Figure 20-93. TBCTL Register

15	14	13	12	11	10	9	8
FREE_SOFT		PHSDIR	CLKDIV			HSPCLKDIV	
R/W-0h		R/W-0h	R/W-0h			R/W-1h	
7	6	5	4	3	2	1	0

R/W-1h	R-0/W1S-0h	R-0h		R/W-0h	R/W-0h	R/W-3h	

Table 20-24. TBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events 00: Stop after the next time-base counter increment or decrement 01: Stop when counter completes a whole cycle: - Up-count mode: stop when the time-base counter = period (TBCTR = TBPRD) - Down-count mode: stop when the time-base counter = 0x00 (TBCTR = 0x00) - Up-down-count mode: stop when the time-base counter = 0x00 (TBCTR = 0x00) 1x: Free run Reset type: SYSRSn
13	PHSDIR	R/W	0h	Phase Direction Bit This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter (TBCTR) will count after a synchronization event occurs and a new phase value is loaded from the phase (TBPHS) register. This is irrespective of the direction of the counter before the synchronization event. In the up-count and down-count modes this bit is ignored. 0: Count down after the synchronization event. 1: Count up after the synchronization event. Reset type: SYSRSn
12-10	CLKDIV	R/W	0h	Time Base Clock Pre-Scale Bits These bits select the time base clock pre-scale value (TBCLK = EPWMCLK/(HSPCLKDIV * CLKDIV): 000: /1 (default on reset) 001: /2 010: /4 011: /8 100: /16 101: /32 110: /64 111: /128 Reset type: SYSRSn

Table 20-24. TBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-7	HSPCLKDIV	R/W	1h	High Speed Time Base Clock Pre-Scale Bits These bits determine part of the time-base clock prescale value. $TBCLK = EPWMCLK / (HSPCLKDIV \times CLKDIV)$. This divisor emulates the HSPCLK in the TMS320x281x system as used on the Event Manager (EV) peripheral. 000: /1 001: /2 (default on reset) 010: /4 011: /6 100: /8 101: /10 110: /12 111: /14 Reset type: SYSRSn
6	SWFSYNC	R-0/W1S	0h	Software Forced Sync Pulse 0: Writing a 0 has no effect and reads always return a 0. 1: Writing a 1 forces a one-time synchronization pulse to be generated. SWFSYNC can be enabled to affect EPWMxSYNCO by setting the EPWMSYNCOOUTEN.SWEN bit. Reset type: SYSRSn
5-4	RESERVED	R	0h	Reserved
3	PRDL	R/W	0h	Active Period Reg Load from Shadow Select 0: The period register (TBPRD) is loaded from its shadow register when the time-base counter, TBCTR, is equal to zero and/or a sync event as determined by the TBCTL2[PRDLDSYNC] bit. A write/read to the TBPRD register accesses the shadow register. 1: Immediate Mode (Shadow register bypassed): A write or read to the TBPRD register accesses the active register. Reset type: SYSRSn
2	PHSEN	R/W	0h	Counter Reg Load from Phase Reg Enable 0: Do not load the time-base counter (TBCTR) from the time-base phase register (TBPHS). 1: Allow Counter to be loaded from the Phase register (TBPHS) and shadow to active load events when an EPWMxSYNCl input signal occurs or a software-forced sync signal, see bit 6. Reset type: SYSRSn
1-0	CTRM	R/W	3h	Counter Mode The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 00: Up-count mode 01: Down-count mode 10: Up-down count mode 11: Freeze counter operation (default on reset) Reset type: SYSRSn

20.17.2.2 TBCTL2 Register (Offset = 1h) [Reset = 0000h]

TBCTL2 is shown in [Figure 20-94](#) and described in [Table 20-25](#).

Return to the [Summary Table](#).

Table 20-33. DBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit 0: Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1: Half cycle clocking enabled. The dead-band counters are clocked at TBCLK*2. Reset type: SYSRSn
14	DEDB_MODE	R/W	0h	Dead Band Dual-Edge B Mode Control (S8 switch) 0: Rising edge delay applied to InA/InB as selected by S4 switch (IN-MODE bits) on A signal path only. Falling edge delay applied to InA/InB as selected by S5 switch (INMODE bits) on B signal path only. 1: Rising edge delay and falling edge delay applied to source selected by S4 switch (INMODE bits) and output to B signal path only. Note: When this bit is set to 1, user should always either set OUT_MODE bits such that Apath = InA OR OUTSWAP bits such that OutA=Bpath otherwise, OutA will be invalid. Reset type: SYSRSn
13-12	OUTSWAP	R/W	0h	Dead Band Output Swap Control Bit 13 controls the S6 switch and bit 12 controls the S7 switch. 00: OutA and OutB signals are as defined by OUT-MODE bits. 01: OutA = A-path as defined by OUT-MODE bits. OutB = A-path as defined by OUT-MODE bits (rising edge delay or delay-bypassed A signal path). 10: OutA = B-path as defined by OUT-MODE bits (falling edge delay or delay-bypassed B signal path). OutB = B-path as defined by OUT-MODE bits. 11: OutA = B-path as defined by OUT-MODE bits (falling edge delay or delay-bypassed B signal path). OutB = A-path as defined by OUT-MODE bits (rising edge delay or delay-bypassed A signal path). Reset type: SYSRSn
11	SHDWDBFEDMODE	R/W	0h	FED Dead-Band Load Mode 0: Immediate mode. Only the active DBFED register is used. All writes/reads via the CPU directly access the active register for immediate 'FED dead-band action.' 1: Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode (for compatibility with legacy). Reset type: SYSRSn

Table 20-33. DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	SHDWDBREDMODE	R/W	0h	<p>RED Dead-Band Load Mode</p> <p>0: Immediate mode. Only the active DBRED register is used. All writes/reads via the CPU directly access the active register for immediate 'RED dead-band action.'</p> <p>1: Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode (for compatibility with legacy).</p> <p>Reset type: SYSRSn</p>
9-8	LOADFEDMODE	R/W	0h	<p>Active DBFED Load from Shadow Select Mode</p> <p>00: Load on Counter = 0 (CNT_eq)</p> <p>01: Load on Counter = Period (PRD_eq)</p> <p>10: Load on either Counter = 0, or Counter = Period</p> <p>11: Freeze (no loads possible)</p> <p>Note: has no effect in Immediate mode.</p> <p>Reset type: SYSRSn</p>
7-6	LOADREDMODE	R/W	0h	<p>Active DBRED Load from Shadow Select Mode</p> <p>00: Load on Counter = 0 (CNT_eq)</p> <p>01: Load on Counter = Period (PRD_eq)</p> <p>10: Load on either Counter = 0, or Counter = Period</p> <p>11: Freeze (no loads possible)</p> <p>Note: has no effect in Immediate mode.</p> <p>Reset type: SYSRSn</p>
5-4	IN_MODE	R/W	0h	<p>Dead-Band Input Mode Control</p> <p>Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays.</p> <p>00: EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay.</p> <p>01: EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal.</p> <p>EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal.</p> <p>10: EPWMxA In (from the action-qualifier) is the source for rising-edge delayed signal.</p> <p>EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal.</p> <p>11: EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal.</p> <p>Reset type: SYSRSn</p>
3-2	POLSEL	R/W	0h	<p>Polarity Select Control</p> <p>Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 1,1 and DBCTL[IN_MODE] = 0x0. Other enhanced modes are also possible, but not regarded as typical usage modes.</p> <p>00: Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default).</p> <p>01: Active low complementary (ALC) mode. EPWMxA is inverted.</p> <p>10: Active high complementary (AHC). EPWMxB is inverted.</p> <p>11: Active low (AL) mode. Both EPWMxA and EPWMxB are inverted.</p> <p>Reset type: SYSRSn</p>

Table 20-33. DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1-0	OUT_MODE	R/W	0h	Dead-Band Output Mode Control Bit 1 controls the S1 switch and bit 0 controls the S0 switch. 00: DBM is fully disabled or by-passed. In this mode the POLSEL and IN-MODE bits have no effect. 01: Apath = InA (delay is by-passed for A signal path) Bpath = FED (Falling Edge Delay in B signal path) 10: Apath = RED (Rising Edge Delay in A signal path) Bpath = InB (delay is by-passed for B signal path) 11: DBM is fully enabled (i.e. both RED and FED active) Reset type: SYSRSn

6-4	PWMSYNCSSELX	R/W	0h	Extended selection bits for EPWMSYNCSSEL 000: EPWMSYNCSSEL is defined by PWMSYNCSSEL - > default condition (compatible with previous EPWM versions) 001: Reserved 010: Reserved 011: Reserved 100: CTR = CMPC, Count direction Up 101: CTR = CMPC, Count direction Down 110: CTR = CMPD, Count direction Up 111: CTR = CMPD, Count direction Down Reset type: SYSRSn
3	RESERVED	R/W	0h	Reserved
2	TBPHSHRLOADE	R/W	0h	TBPHSHR Load Enable This bit allows you to synchronize ePWM modules with a high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event. This allows for multiple ePWM modules operating at the same frequency to be phase aligned with high-resolution. 0: Disables synchronization of high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event: 1: Synchronize the high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital comparator synchronization event. The phase is synchronized using the contents of the high-resolution phase TBPHSHR register. The TBCTL[PHSEN] bit which enables the loading of the TBCTR register with TBPHS register value on a SYNCIN or TBCTL[SWFSYNC] event works independently. However, users need to enable this bit also if they want to control phase in conjunction with the high-resolution period feature. This bit and the TBCTL[PHSEN] bit must be set to 1 when high-resolution period is enabled for up-down count mode even if TBPHSHR = 0x0000. This bit does not need to be set when only high-resolution duty is enabled. Reset type: SYSRSn
1	PWMSYNCSSEL	R/W	0h	PWMSYNCS Source Select Bit: This bit selects the source for the EPWMSYNCS signal that goes to the CMPSS and GPDAC: 0 CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 1 CTR = zero: Time-base counter equal to zero (TBCTR = 0x00) Reset type: SYSRSn

Table 20-44. HRPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	HRPE	R/W	0h	High Resolution Period Enable Bit 0: High resolution period feature disabled. In this mode the ePWM behaves as a Type 4 ePWM. 1: High resolution period enabled. In this mode the HRPWM module can control high-resolution of both the duty and frequency. When high-resolution period is enabled, TBCTL[CTRMODE] = 0,1 (down-count mode) is not supported. Reset type: SYSRSn

20.17.2.22 TRREM Register (Offset = 2Eh) [Reset = 0000h]

TRREM is shown in [Figure 20-114](#) and described in [Table 20-45](#).

Return to the [Summary Table](#).

HRPWM High Resolution Remainder Register

This register is only accessible on EPWM modules with HRPWM capabilities.

20.17.2.25 EPWMXLINK Register (Offset = 38h) [Reset = 000XXXXXh]

EPWMXLINK is shown in [Figure 20-117](#) and described in [Table 20-48](#).

Return to the [Summary Table](#).

EPWMx Link Register

This register controls which EPWMs are linked to other EPWM modules. The default reset value will vary for each module. The reset value will link each EPWM module to itself to prevent unintentional linking of modules.

20.17.2.36 TBPHS Register (Offset = 60h) [Reset = 0000000h]

TBPHS is shown in [Figure 20-128](#) and described in [Table 20-59](#).

Return to the [Summary Table](#).

Time Base Phase High

Figure 20-128. TBPHS Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TBPHS																TBPHSHR															
R/W-0h																R/W-0h															

Table 20-59. TBPHS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TBPHS	R/W	0h	Phase Offset Register These bits set time-base counter phase of the selected ePWM relative to the time-base that is supplying the synchronization input signal. - If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase. - If TBCTL[PHSEN] = 1, then the time-base counter (TBCTR) will be loaded with the phase (TBPHS) when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal (EPWMxSYNCI) or by a software forced synchronization. Reset type: SYSRSn
15-0	TBPHSHR	R/W	0h	Phase Offset (High Resolution) Register. TBPHSHR must not be used. Instead TRREM (HRPWM remainder register) must be used to mimic the functionality of TBPHSHR. The lower 8 bits in this register are ignored - writes are ignored and reads return zero Reset type: SYSRSn

20.17.2.37 TBPRDHR Register (Offset = 62h) [Reset = 0000h]

TBPRDHR is shown in [Figure 20-129](#) and described in [Table 20-60](#).

Return to the [Summary Table](#).

6	DCBEVT2	R	0h	Latched Status Flag for Digital Compare Output B Event 2 0: Indicates no trip event has occurred on DCBEVT2 1: Indicates a trip event has occurred for the event defined for DCBEVT2 Reset type: SYSRSn
5	DCBEVT1	R	0h	Latched Status Flag for Digital Compare Output B Event 1 0: Indicates no trip event has occurred on DCBEVT1 1: Indicates a trip event has occurred for the event defined for DCBEVT1 Reset type: SYSRSn
4	DCAEVT2	R	0h	Latched Status Flag for Digital Compare Output A Event 2 0: Indicates no trip event has occurred on DCAEVT2 1: Indicates a trip event has occurred for the event defined for DCAEVT2 Reset type: SYSRSn
3	DCAEVT1	R	0h	Latched Status Flag for Digital Compare Output A Event 1 0: Indicates no trip event has occurred on DCAEVT1 1: Indicates a trip event has occurred for the event defined for DCAEVT1 Reset type: SYSRSn
2	OST	R	0h	Latched Status Flag for A One-Shot Trip Event 0: No one-shot trip event has occurred. 1: Indicates a trip event has occurred on a pin selected as a one-shot trip source. This bit is cleared by writing the appropriate value to the TZCLR register. Reset type: SYSRSn

Table 20-75. TZFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CBC	R	0h	Latched Status Flag for Cycle-By-Cycle Trip Event 0: No cycle-by-cycle trip event has occurred. 1: Indicates a trip event has occurred on a signal selected as a cycle-by-cycle trip source. The TZFLG[CBC] bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the signal is automatically cleared when the ePWM time-base counter reaches zero (TBCTR = 0x00) if the trip condition is no longer present. The condition on the signal is only cleared when the TBCTR = 0x00 no matter where in the cycle the CBC flag is cleared. This bit is cleared by writing the appropriate value to the TZCLR register. Reset type: SYSRSn
0	INT	R	0h	Latched Trip Interrupt Status Flag 0: Indicates no interrupt has been generated. 1: Indicates an EPWMx_TZINT PIE interrupt was generated because of a trip condition. No further EPWMx_TZINT PIE interrupts will be generated until this flag is cleared. If the interrupt flag is cleared when either CBC or OST is set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts. This bit is cleared by writing the appropriate value to the TZCLR register. Reset type: SYSRSn

20.17.2.53 TZCBCFLG Register (Offset = 94h) [Reset = 0000h]

TZCBCFLG is shown in [Figure 20-145](#) and described in [Table 20-76](#).

Return to the [Summary Table](#).

Table 20-96. DCFOFFSET Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	DCFOFFSET	R/W	0h	Blanking Window Offset These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted. Reset type: SYSRSn

20.17.2.74 DCFOFFSETCNT Register (Offset = CAh) [Reset = 0000h]

DCFOFFSETCNT is shown in [Figure 20-166](#) and described in [Table 20-97](#).

Return to the [Summary Table](#).

Table 20-101. DCCAP Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	DCCAP	R	0h	Digital Compare Time-Base Counter Capture To enable time-base counter capture, set the DCCAPCLT[CAPE] bit to 1. If enabled, reflects the value of the time-base counter (TBCTR) on the low to high edge transition of a filtered (DCEVTFLT) event. Further capture events are ignored until the next period or zero as selected by the DCFCTL[PULSESEL] bit. Shadowing of DCCAP is enabled and disabled by the DCCAPCTL[SHDWMODE] bit. By default this register is shadowed. - If DCCAPCTL[SHDWMODE] = 0, then the shadow is enabled. In this mode, the active register is copied to the shadow register on the TBCTR = TBPRD or TBCTR = zero as defined by the DCFCTL[PULSESEL] bit. CPU reads of this register will return the shadow register value. - If DCCAPCTL[SHDWMODE] = 1, then the shadow register is disabled. In this mode, CPU reads will return the active register value. The active and shadow registers share the same memory map address. Reset type: SYSRSn

20.17.2.79 DCAHTRIPSEL Register (Offset = D2h) [Reset = 0000h]

Chapter 21

Enhanced Capture (eCAP)

This chapter describes the enhanced capture (eCAP) module, which is used in systems where accurate timing of external events is important.

The enhanced capture (eCAP) module is a Type 2 eCAP. See the [C2000 Real-Time Control Peripheral Reference Guide](#) for a list of all devices with an eCAP module of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

21.1 Introduction	2488
21.2 Description	2489
21.3 Configuring Device Pins for the eCAP	2489
21.4 Capture and APWM Operating Mode	2493
21.5 Capture Mode Description	2495
21.6 Application of the eCAP Module	2503
21.7 Application of the APWM Mode	2507
21.8 Software	2508
21.9 eCAP Registers	2509

21.1 Introduction

21.1.1 Features

The features of the eCAP module include:

- Speed measurements of rotating machinery (for example, toothed sprockets sensed by way of Hall sensors)
- Elapsed time measurements between position sensor pulses
- Period and duty cycle measurements of pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

The eCAP module features described in this chapter include:

- 4-event time-stamp registers (each 32 bits)
- Edge polarity selection for up to four sequenced time-stamp capture events
- Interrupt on either of the four events
- Single-shot capture of up to four event time-stamps
- Continuous mode capture of time stamps in a four-deep circular buffer
- Absolute time-stamp capture
- Difference (Delta) mode time-stamp capture
- When not used in capture mode, the eCAP module can be configured as a single-channel PWM output

The capture functionality of the Type 1 eCAP is enhanced from the Type 0 eCAP with the following added features:

- Event filter reset bit
 - Writing a 1 to ECCTL2[CTRFILTRESET] clears the event filter, the modulo counter, and any pending interrupts flags. Resetting the bit is useful for initialization and debug.
- Modulo counter status bits
 - The modulo counter (ECCTL2 [MODCNTRSTS]) indicates which capture register is loaded next. In the Type 0 eCAP, to know the current state of the modulo counter was not possible
- DMA trigger source
 - eCAPxDMA was added as a DMA trigger. CEVT[1-4] can be configured as the source for eCAPxDMA.
- Input multiplexer
 - ECCTL0 [INPUTSEL] selects one of 128 input signals, which are detailed in [Section 21.3](#).
- EALLOW protection
 - EALLOW protection was added to critical registers. To maintain software compatibility with Type-0, configure DEV_CFG_REGS.ECAPTYPE to make these registers unprotected.

The capture functionality of the Type 2 eCAP is enhanced from the Type 1 eCAP with the following added features:

- Added ECAPxSYNCINSEL register
 - ECAPxSYNCINSEL register is added for each eCAP to select an external SYNCIN. Every eCAP can have a separate SYNCIN signal.

21.1.2 ECAP Related Collateral

Foundational Materials

- [C2000 Academy - ECAP](#)

Getting Started Materials

- [Leveraging High Resolution Capture \(HRCAP\) for Single Wire Data Transfer Application Report](#)

21.2 Description

The eCAP module represents one complete capture channel that can be instantiated multiple times, depending on the target device. In the context of this guide, one eCAP channel has the following independent key resources:

- Capture inputs can be connected using the Input X-BAR
- 128:1 input multiplexer
- Output X-BAR is used to configure output in APWM mode
- 32-bit time base (counter)
- 4 x 32-bit time-stamp capture registers (CAP1-CAP4)
- Four-stage sequencer (modulo4 counter) that is synchronized to external events, eCAP pin rising/falling edges.
- Modulo counter status register (MODCNTRSTS) to indicate sequencer state
- Independent edge polarity (rising/falling edge) selection for all four events
- Input capture signal prescaling (from 2-62 or bypass)
- One-shot compare register (two bits) to freeze captures after 1-4 time-stamp events
- Control for continuous time-stamp captures using a four-deep circular buffer (CAP1-CAP4) scheme
- Ability to reset event filter, modulo counter, and interrupt flags
- Interrupt capabilities on any of the four capture events
- Separate DMA trigger
- EALLOW protection to control registers

21.3 Configuring Device Pins for the eCAP

The Input X-BAR connects the device pins to the module as input. Any GPIO on the device can be configured as an input. The GPIO input qualification can be set to synchronous or asynchronous mode by setting the GPxQSELn register bits. Using synchronized inputs can help with noise immunity but affects the eCAP accuracy by ± 2 cycles. The internal pull-ups can be configured in the GPyPUD register. Since the GPIO mode is used, the GPyINV register can invert the signals.

New to the Type 1 eCAP module, a 128:1 input multiplexer must also be configured (see [Figure 21-3](#)). This multiplexer can select a variety of inputs detailed in [Table 21-1](#) by configuring ECCTL0.INPUTSEL.

The Output X-BAR must be used to connect output signals to the OUTPUTXBAR_x output locations. The GPIO mux must then be configured to connect the OUTPUTXBAR_x lines to any of several IO pins with the GPIO mux. To avoid glitches on the pins, the GPyGMUX bits must be configured first (while keeping the corresponding GPyMUX bits at the default of zero), followed by writing the GPyMUX register to the desired value.

See the *General-Purpose Input/Output (GPIO)* chapter for more details on GPIO mux, GPIO settings, and XBAR configuration.

Note

ECAP_xIN has to be at least 2 × SYSCLK-cycles wide to be properly captured by the eCAP module; otherwise, the input pulse can get missed from sampling by the SYSCLK.

21.4 Capture and APWM Operating Mode

Use the eCAP module resources to implement a single-channel PWM generator (with 32-bit capabilities) when the eCAP module is not being used for input captures. The counter operates in count-up mode, providing a time-base for asymmetrical pulse width modulation (PWM) waveforms. The CAP1 and CAP2 registers become the active period and compare registers, respectively, while CAP3 and CAP4 registers become the period and compare shadow registers, respectively. Figure 21-1 is a high-level view of both the capture and auxiliary pulse-width modulator (APWM) modes of operation.

Figure 21-2 further describes the output of the eCAP in APWM mode based on the CMP and PRD values.

- A. A single pin is shared between CAP and APWM functions. In capture mode, the pin is an input; in APWM mode, the pin is an output.
- B. In APWM mode, writing any value to CAP1/CAP2 active registers also writes the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 invokes the shadow mode.

Figure 21-1. Capture and APWM Modes of Operation

Figure 21-2. Counter Compare and PRD Effects on the eCAP Output in APWM Mode

21.5 Capture Mode Description

Figure 21-3 shows the various components that implement the capture function.

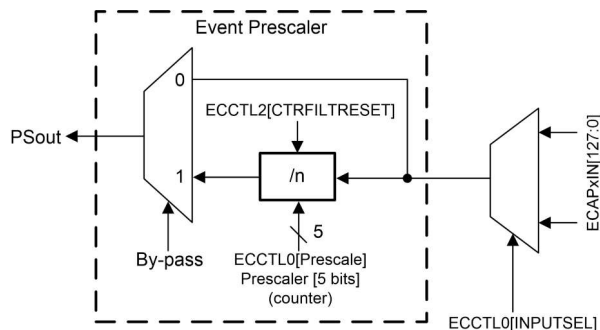

Copyright © 2018, Texas Instruments Incorporated

A. The HRCAP submodule is not available on all eCAP modules; in this case, the high-resolution muxes and hardware are not implemented.

Figure 21-3. eCAP Block Diagram

21.5.1 Event Prescaler

An input capture signal (pulse train) can be prescaled by $N = 2-62$ (in multiples of 2) or can bypass the prescaler. This is useful when very high frequency signals are used as inputs. Figure 21-4 shows a functional diagram and Figure 21-5 shows the operation of the prescale function. The event prescaler can be reset by setting the ECCTL2.CTRFILTRESET register bit.

- A. When a prescale value of 1 is chosen (ECCTL1[13:9] = 0,0,0,0,0), the input capture signal bypasses the prescale logic completely.
- B. The first Rise edge after Prescale configuration change is not passed to Capture logic, prescaler value takes into effect on the second rising edge after the configuration.

Figure 21-4. Event Prescale Control

Figure 21-5. Prescale Function Waveforms

21.5.2 Edge Polarity Select and Qualifier

Functionality and features include:

- Four independent edge polarity (rising edge/falling edge) selection muxes are used, one for each capture event.
- Each edge (up to 4) is event qualified by the Modulo4 sequencer.
- The edge event is gated to the respective CAPx register by the Mod4 counter. The CAPx register is loaded on the falling edge.

21.5.3 Continuous/One-Shot Control

Operation of eCAP in Continuous/One-Shot mode:

- The Mod4 (2-bit) counter is incremented using edge qualified events (CEVT1-CEVT4).
- The Mod4 counter continues counting (0->1->2->3->0) and wraps around unless stopped.
- During one-shot operation, a 2-bit stop register (STOP_WRAP) is used to compare the Mod4 counter output, and when equal, stops the Mod4 counter and inhibits further loads of the CAP1-CAP4 registers. In this mode, if TSCCTR counter is configured to reset on capture event (CEVTx) by configuring ECCTL1.CTRRSTx bit, the operation still keeps resetting the TSCCTR counter on capture event (CEVTx) after the STOP_WRAP value is reached and re-arm (REARM) has not occurred.

The continuous/one-shot block controls the start, stop and reset (zero) functions of the Mod4 counter, using a mono-shot type of action that can be triggered by the stop-value comparator and re-armed using software control.

Once armed, the eCAP module waits for 1-4 (defined by stop-value) capture events before freezing both the Mod4 counter and contents of CAP1-4 registers (time stamps).

Re-arming prepares the eCAP module for another capture sequence. Also, re-arming clears (to zero) the Mod4 counter and permits loading of CAP1-4 registers again, providing the CAPLDEN bit is set.

In continuous mode, the Mod4 counter continues to run (0->1->2->3->0, the one-shot action is ignored, and capture values continue to be written to CAP1-4 in a circular buffer sequence.

Figure 21-6. Details of the Continuous/One-shot Block

21.5.4 32-Bit Counter and Phase Control

This counter provides the time-base for event captures, and is clocked using the system clock.

A phase register is provided to achieve synchronization with other counters using a hardware and software forced sync. This is useful in APWM mode when a phase offset between modules is needed.

On any of the four event loads, an option to reset the 32-bit counter is given. This is useful for time difference capture. The 32-bit counter value is captured first, then the counter value is reset to 0 by any of the LD1-LD4 signals.

21.5.5 CAP1-CAP4 Registers

These 32-bit registers are supplied by the 32-bit counter timer bus, CTR[0-31], and are loaded (capture a time-stamp) when the respective LD inputs are strobed.

Control bit CAPLDEN can inhibit loading of the capture registers. During one-shot operation, this bit is cleared (loading is inhibited) automatically when a stop condition occurs, StopValue = Mod4.

CAP1 and CAP2 registers become the active period and compare registers, respectively, in APWM mode.

CAP3 and CAP4 registers become the respective shadow registers (APRD and ACMP) for CAP1 and CAP2 during APWM operation.

21.5.6 eCAP Synchronization

eCAP modules can be synchronized with each other by selecting a common SYNCIN source. SYNCIN source for eCAP can be either software sync-in or external sync-in. The external sync-in signal can come from eCAP, X-Bar or EPWM. The SWSYNC of the eCAP module is logical ORed with the SYNC signal as shown in Figure 21-7. The SYNC signal is defined by the selection of ECAPxSYNCINSEL[SEL] as shown in Figure 21-8.

Note

If SWSYNC is forced from ECAPx, then the Sync pulse is delayed by one clock cycle for sync pulse receiving ECAPs. This cycle delay/lag for the sync pulse receiving ECAPs can be corrected with the CTRPHS register. If there is an external SYNC signal, then all ECAPs see the signal at the same time.

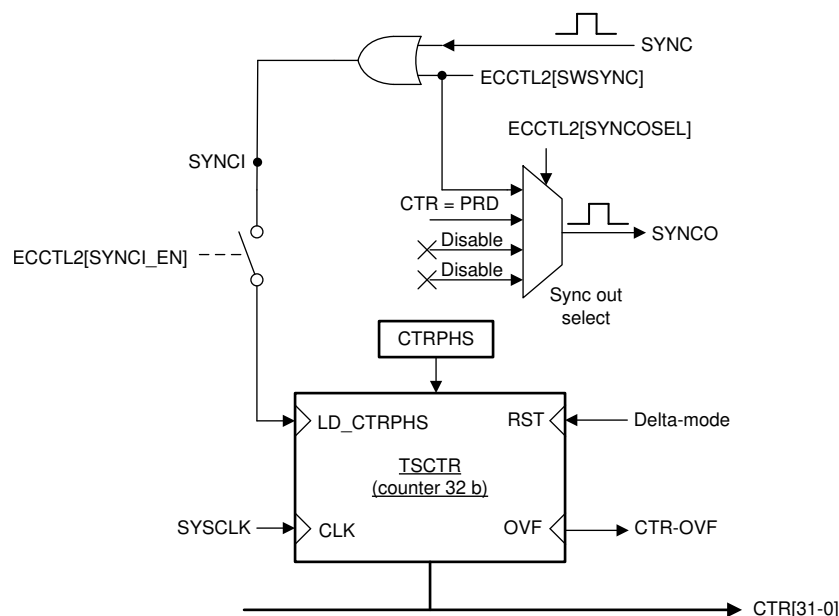

Figure 21-7. Details of the Counter and Synchronization Block

Figure 21-8. eCAP Synchronization Scheme

21.5.6.1 Example 1 - Using SWSYNC with ECAP Module

Implement the following steps to use SWSYNC with ECAP1 and ECAP2.

- Configure ECAP[1..2].ECAPSYNCINSEL.SEL = 0x0 to disable external SYNCIN coming to eCAP1.
- Configure ECAP[1..2].ECCTL2.SWSYNC = 0x1, to force Software Synchronization of the TSCTR counter.

To use SWSYNC with other eCAP modules, make sure that the previous eCAP chain is not generating a SYNCOUT signal that interferes with the software synchronization.

21.5.7 Interrupt Control

Operation and features of the eCAP interrupt control include (see [Figure 21-9](#)):

- An interrupt can be generated on capture events (CEVT1-CEVT4, CTROVF) or APWM events (CTR = PRD, CTR = CMP).
- A counter overflow event (FFFFFFFF->00000000) is also provided as an interrupt source (CTROVF).
- The capture events are edge and sequencer-qualified (ordered in time) by the polarity select and Mod4 gating, respectively.
- One of these events can be selected as the interrupt source (from the eCAPx module) going to the PIE and CLA.
- Seven interrupt events (CEVT1, CEVT2, CEVT3, CEVT4, CNTOVF, CTR=PRD, CTR=COMP) can be generated.
- The interrupt enable register (ECEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (ECFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT). An interrupt pulse is generated to the PIE only if any of the interrupt events are enabled, the flag bit is 1, and the INT flag bit is 0. The interrupt service routine must clear the global interrupt flag bit and the serviced event using the interrupt clear register (ECCLR) before any other interrupt pulses are generated. All interrupt flags are cleared upon an event filter reset by writing a 1 to ECCTL2[CLRFILTRESET]. To force an interrupt event, use the interrupt force register (ECFRC). This is useful for test purposes.

Note

The CEVT1, CEVT2, CEVT3, CEVT4 flags are only active in capture mode (ECCTL2[CAP/APWM == 0]). The CTR=PRD, CTR=COMP flags are only valid in APWM mode (ECCTL2[CAP/APWM == 1]). CNTOVF flag is valid in both modes.

Figure 21-9. Interrupts in eCAP Module

21.5.8 DMA Interrupt

On Type 0 eCAP modules, the CPU was required to begin data transfers using DMA. New to the Type 1 eCAP, a separate DMA Trigger (ECAP_DMA_INT) enables continuous transfer of capture data from eCAP registers to on-chip memory using DMA. Any one of the four available interrupt events (CEVT1, CEVT2, CEVT3, and CEVT4) can be selected as the trigger source for ECAP_DMA_INT using ECCTL2 [DMAEVTSEL].

21.5.9 Shadow Load and Lockout Control

In capture mode, this logic inhibits (locks out) any shadow loading of CAP1 or CAP2 from APRD and ACMP registers, respectively.

In APWM mode, shadow loading is active and two choices are permitted:

- Immediate - APRD or ACMP are transferred to CAP1 or CAP2 immediately upon writing a new value.
- On period equal, $CTR[31:0] = PRD[31:0]$.

21.5.10 APWM Mode Operation

Main operating highlights of the APWM section:

- The time-stamp counter bus is made available for comparison by way of 2 digital (32-bit) comparators.
- When CAP1/2 registers are not used in capture mode, the contents can be used as Period and Compare values in APWM mode.
- Double buffering is achieved using shadow registers APRD and ACMP (CAP3/4). The shadow register contents are transferred over to CAP1/2 registers, either immediately upon a write, or on a $CTR = PRD$ trigger.
- In APWM mode, writing to CAP1/CAP2 active registers also writes the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 invokes the shadow mode.
- During initialization, write to the active registers for both period and compare. This automatically copies the initial values into the shadow values. For subsequent compare updates during run-time, use the shadow registers.

Figure 21-10. PWM Waveform Details Of APWM Mode Operation

The behavior of APWM active high mode (APWMPOL == 0) is as follows:

CMP = 0x00000000, output low for duration of period (0% duty)

CMP = 0x00000001, output high 1 cycle

CMP = 0x00000002, output high 2 cycles

CMP = PERIOD, output high except for 1 cycle (<100% duty)

CMP = PERIOD+1, output high for complete period (100% duty)

CMP > PERIOD+1, output high for complete period

The behavior of APWM active low mode (APWMPOL == 1) is as follows:

CMP = 0x00000000, output high for duration of period (0% duty)

CMP = 0x00000001, output low 1 cycle

CMP = 0x00000002, output low 2 cycles

CMP = PERIOD, output low except for 1 cycle (<100% duty)

CMP = PERIOD+1, output low for complete period (100% duty)

CMP > PERIOD+1, output low for complete period

Figure 21-11. Time-Base Frequency and Period Calculation

21.6 Application of the eCAP Module

The following sections provide applications examples to show how to operate the eCAP module.

21.6.1 Example 1 - Absolute Time-Stamp Operation Rising-Edge Trigger

Figure 21-12 shows an example of continuous capture operation (Mod4 counter wraps around). In this figure, TSCTR counts-up without resetting and capture events are qualified on the rising edge only, this gives period (and frequency) information.

On an event, the TSCTR contents (time-stamp) is first captured, then Mod4 counter is incremented to the next state. When the TSCTR reaches FFFFFFFF (maximum value), the Mod4 counter wraps around to 00000000 (not shown in Figure 21-12), if this occurs, the CTROVF (counter overflow) flag is set, and an interrupt (if enabled) occurs. Captured Time-stamps are valid at the point indicated by the diagram (after the fourth event); hence, event CEVT4 can conveniently be used to trigger an interrupt and the CPU can read data from the CAPx registers.

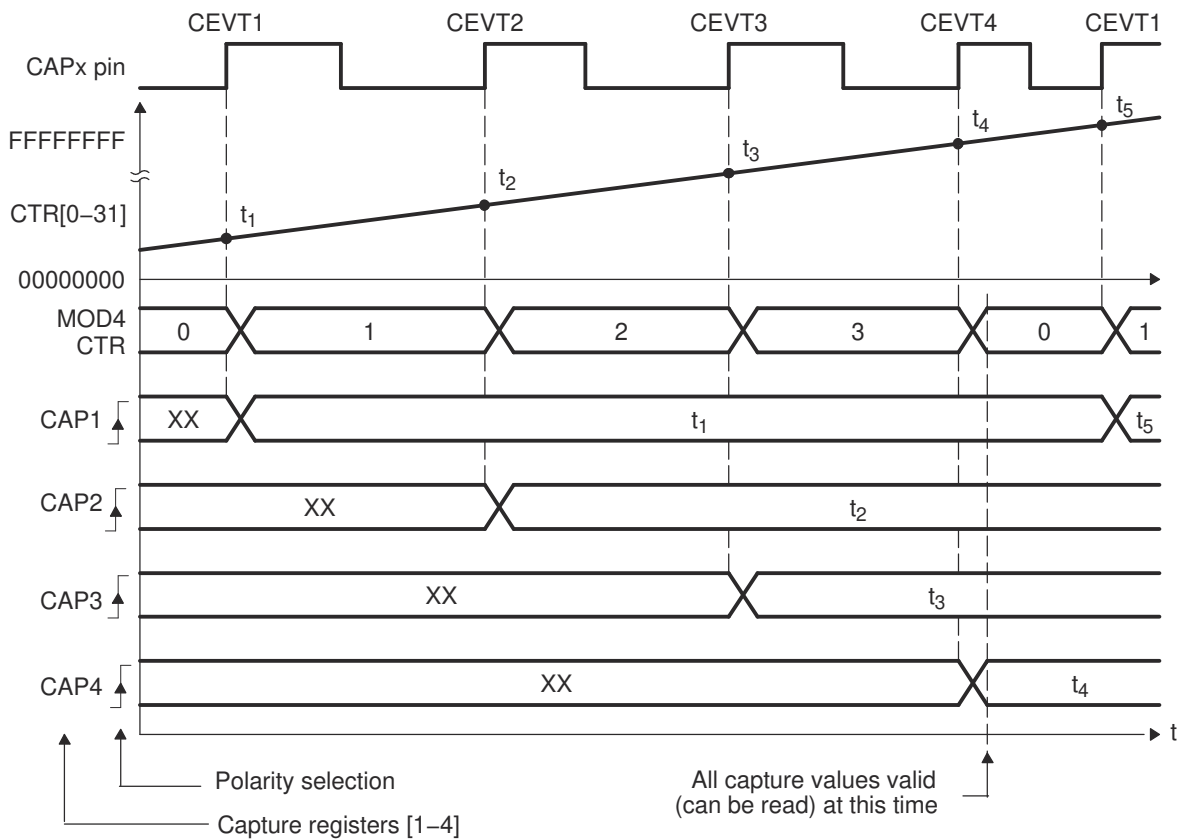

Figure 21-12. Capture Sequence for Absolute Time-stamp and Rising-Edge Detect

21.6.2 Example 2 - Absolute Time-Stamp Operation Rising- and Falling-Edge Trigger

In Figure 21-13, the eCAP operating mode is almost the same as in the previous section except capture events are qualified as either rising or falling edge, this now gives both period and duty cycle information, that is: Period1 = $t_3 - t_1$, Period2 = $t_5 - t_3$, ...and so on. Duty Cycle1 (on-time %) = $(t_2 - t_1) / \text{Period1} \times 100\%$, and so on. Duty Cycle1 (off-time %) = $(t_3 - t_2) / \text{Period1} \times 100\%$, and so on.

Figure 21-13. Capture Sequence for Absolute Time-stamp with Rising- and Falling-Edge Detect

21.6.3 Example 3 - Time Difference (Delta) Operation Rising-Edge Trigger

Figure 21-14 shows how the eCAP module can be used to collect delta timing data from pulse train waveforms. Here Continuous Capture mode (TSCTR counts-up without resetting, and Mod4 counter wraps around) is used. In Delta-time mode, TSCTR is reset back to zero on every valid event. Here capture events are qualified as rising edge only. On an event, TSCTR contents (Time-Stamp) is captured first, and then TSCTR is reset to zero. The Mod4 counter then increments to the next state. If TSCTR reaches FFFFFFFF (maximum value), before the next event, the Mod4 counter wraps around to 00000000 and continues, a CNTOVF (counter overflow) flag is set, and an interrupt (if enabled) occurs. The advantage of Delta-time mode is that the CAPx contents directly give timing data without the need for CPU calculations, that is, Period1 = T_1 , Period2 = T_2 , and so on. As shown in Figure 21-14, the CEVT1 event is a good trigger point to read the timing data, T_1 , T_2 , T_3 , T_4 are all valid here.

Figure 21-14. Capture Sequence for Delta Mode Time-stamp and Rising Edge Detect

21.6.4 Example 4 - Time Difference (Delta) Operation Rising- and Falling-Edge Trigger

In [Figure 21-15](#), the eCAP operating mode is almost the same as in previous section except capture events are qualified as either rising or falling edge, this now gives both period and duty cycle information, that is: $\text{Period1} = T_1 + T_2$, $\text{Period2} = T_3 + T_4$, and so on. $\text{Duty Cycle1 (on-time \%)} = T_1 / \text{Period1} \times 100\%$, $\text{Duty Cycle1 (off-time \%)} = T_2 / \text{Period1} \times 100\%$, and so on.

During initialization, write to the active registers for both period and compare. This action automatically copies the init values into the shadow values. For subsequent compare updates during run-time, the shadow registers must be used.

Figure 21-15. Capture Sequence for Delta Mode Time-stamp with Rising- and Falling-Edge Detect

21.7 Application of the APWM Mode

In this example, the eCAP module is configured to operate as a PWM generator. Here, a very simple single-channel PWM waveform is generated from the APWMx output pin. The PWM polarity is active high, which means that the compare value (CAP2 reg is now a compare register) represents the on-time (high level) of the period. Alternatively, if the APWMPOL bit is configured for active low, then the compare value represents the off-time.

21.7.1 Example 1 - Simple PWM Generation (Independent Channels)

Figure 21-16. PWM Waveform Details of APWM Mode Operation

21.8 Software

21.8.1 ECAP Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/ecap

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

21.8.1.1 eCAP APWM Example

FILE: `ecap_ex1_apwm.c`

This program sets up the eCAP module in APWM mode. The PWM waveform will come out on GPIO5. The frequency of PWM is configured to vary between 5Hz and 10Hz using the shadow registers to load the next period/compare values.

21.8.1.2 eCAP Capture PWM Example

FILE: `ecap_ex2_capture_pwm.c`

This example configures ePWM3A for:

- Up count mode
- Period starts at 500 and goes up to 8000
- Toggle output on PRD

eCAP1 is configured to capture the time between rising and falling edge of the ePWM3A output.

External Connections

- eCAP1 is on GPIO16
- ePWM3A is on GPIO4
- Connect GPIO4 to GPIO16.

Watch Variables

- `ecap1PassCount` - Successful captures.
- `ecap1IntCount` - Interrupt counts.

21.8.1.3 eCAP APWM Phase-shift Example

FILE: `ecap_ex3_apwm_phase_shift.c`

This program sets up the eCAP1 and eCAP2 modules in APWM mode to generate the two phase-shifted PWM outputs of same duty and frequency value. The frequency, duty and phase values can be programmed of choice by updating the defined macros. By default 10 Khz frequency, 50% duty and 30% phase shift values are used. eCAP2 output leads the eCAP1 output by 30%. GPIO5 and GPIO6 are used as eCAP1/2 outputs and can be probed using analyzer/CRO to observe the waveforms.

21.8.1.4 eCAP Software Sync Example

FILE: `ecap_ex4_sw_sync.c`

This example configures ePWM3A for:

- Up count mode
- Period starts at 500 and goes up to 8000
- Toggle output on PRD

eCAP1, eCAP2 and eCAP3 are configured to capture the time between rising and falling edge of the ePWM3A output.

External Connections

- eCAP1, eCAP2, eCAP3 are on GPIO16
- ePWM3A is on GPIO4

- Connect GPIO4 to GPIO16.

Watch Variables

- *ecapPassCount* - Successful captures.
- *ecap3IntCount* - Interrupt counts.

21.9 eCAP Registers

This section describes the Enhanced Capture Registers.

21.9.1 ECAP Base Address Table

Table 21-2. ECAP Base Address Table

Bit Field Name		DriverLib Name	Base Address	CPU1	DMA	HIC	CLA	Pipeline Protected
Instance	Structure							
ECap1Regs	ECAP_REGS	ECAP1_BASE	0x0000_5200	YES	YES	YES	YES	YES
ECap2Regs	ECAP_REGS	ECAP2_BASE	0x0000_5240	YES	YES	YES	YES	YES
ECap3Regs	ECAP_REGS	ECAP3_BASE	0x0000_5280	YES	YES	YES	YES	YES

21.9.2 ECAP_REGS Registers

Table 21-3 lists the memory-mapped registers for the ECAP_REGS registers. All register offset addresses not listed in Table 21-3 should be considered as reserved locations and the register contents should not be modified.

Table 21-3. ECAP_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	TSCTR	Time-Stamp Counter		Go
2h	CTRPHS	Counter Phase Offset Value Register		Go
4h	CAP1	Capture 1 Register		Go
6h	CAP2	Capture 2 Register		Go
8h	CAP3	Capture 3 Register		Go
Ah	CAP4	Capture 4 Register		Go
12h	ECCTL0	Capture Control Register 0	EALLOW	Go
14h	ECCTL1	Capture Control Register 1	EALLOW	Go
15h	ECCTL2	Capture Control Register 2	EALLOW	Go

R/W-0h		R/W-0h	R/W-0h	R-0/W1S-0h	R/W-3h		R/W-0h

Table 21-13. ECCTL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	MODCNRSTS	R	0h	This bit field reads current status on modulo counter 00b (R) = CAP1 register gets loaded on next capture event. 01b (R) = CAP2 register gets loaded on next capture event. 10b (R) = CAP3 register gets loaded on next capture event. 11b (R) = CAP4 register gets loaded on next capture event. Reset type: CPU1.SYSRSn
13-12	DMAEVTSEL	R/W	0h	DMA event select 00b (R/W) = DMA interrupt source is CEVT1 01b (R/W) = DMA interrupt source is CEVT2 10b (R/W) = DMA interrupt source is CEVT3 11b (R/W) = DMA interrupt source is CEVT4 Note: ECCTL1.CAPLDEN also needs to be set to '1' for ECAPxDMA_INT to be generated Reset type: CPU1.SYSRSn
11	CTRFILTRESET	R-0/W1C	0h	Reset Bit 0h (R) = No effect 1h (W) = Resets event filter, counter, modulo counter and CEVT[1,2,3,4] and CNTOVF, HRERROR flags Note: This provides an ability start capture module from known state in case spurious inputs are captured while ECAP is configured. Reset type: CPU1.SYSRSn
10	APWMPOL	R/W	0h	APWM output polarity select. This is applicable only in APWM operating mode. Reset type: SYSRSn 0h (R/W) = Output is active high (Compare value defines high time) 1h (R/W) = Output is active low (Compare value defines low time)
9	CAP_APWM	R/W	0h	CAP/APWM operating mode select Reset type: SYSRSn 0h (R/W) = ECAP module operates in capture mode. This mode forces the following configuration: - Inhibits TSCTR resets via CTR = PRD event - Inhibits shadow loads on CAP1 and 2 registers - Permits user to enable CAP1-4 register load - CAPx/APWMx pin operates as a capture input 1h (R/W) = ECAP module operates in APWM mode. This mode forces the following configuration: - Resets TSCTR on CTR = PRD event (period boundary) - Permits shadow loading on CAP1 and 2 registers - Disables loading of time-stamps into CAP1-4 registers - CAPx/APWMx pin operates as a APWM output

Table 21-13. ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SWSYNC	R-0/W1S	0h	Software-forced Counter (TSCTR) Synchronizer. This provides the user a method to generate a synchronization pulse through software. In APWM mode, the synchronization pulse can also be sourced from the CTR = PRD event. Reset type: SYSRSn 0h (R/W) = Writing a zero has no effect. Reading always returns a zero 1h (R/W) = Writing a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to a zero.
7-6	SYNCO_SEL	R/W	0h	Sync-Out Select Reset type: SYSRSn 0h (R/W) = sync out signal is SWSYNC 1h (R/W) = Select CTR = PRD event to be the sync-out signal. Note: Selection CTR = PRD is meaningful only in APWM mode 2h (R/W) = Disable sync out signal 3h (R/W) = Disable sync out signal
5	SYNCI_EN	R/W	0h	Counter (TSCTR) Sync-In select mode Reset type: SYSRSn 0h (R/W) = Disable sync-in option 1h (R/W) = Enable counter (TSCTR) to be loaded from CTRPHS register upon either a SYNCI signal or a S/W force event.
4	TSCTRSTOP	R/W	0h	Time Stamp (TSCTR) Counter Stop (freeze) Control Reset type: SYSRSn 0h (R/W) = TSCTR stopped 1h (R/W) = TSCTR free-running
3	REARM	R-0/W1S	0h	Re-Arming Control. Note: The re-arm function is valid in one shot or continuous mode Reset type: SYSRSn 0h (R/W) = Has no effect (reading always returns a 0) 1h (R/W) = Arms the one-shot sequence as follows: 1) Resets the Mod4 counter to zero 2) Unfreezes the Mod4 counter 3) Enables capture register loads
2-1	STOP_WRAP	R/W	3h	Stop value for one-shot mode. This is the number (between 1-4) of captures allowed to occur before the CAP(1-4) registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number (between 1-4) of the capture register in which the circular buffer wraps around and starts again. Notes: STOP_WRAP is compared to Mod4 counter and, when equal, 2 actions occur: - Mod4 counter is stopped (frozen) - Capture register loads are inhibited In one-shot mode, further interrupt events are blocked until re-armed. Reset type: SYSRSn 0h (R/W) = Stop after Capture Event 1 in one-shot mode Wrap after Capture Event 1 in continuous mode. 1h (R/W) = Stop after Capture Event 2 in one-shot mode Wrap after Capture Event 2 in continuous mode. 2h (R/W) = Stop after Capture Event 3 in one-shot mode Wrap after Capture Event 3 in continuous mode. 3h (R/W) = Stop after Capture Event 4 in one-shot mode Wrap after Capture Event 4 in continuous mode.
0	CONT_ONESHT	R/W	0h	Continuous or one-shot mode control (applicable only in capture mode) Reset type: SYSRSn 0h (R/W) = Operate in continuous mode 1h (R/W) = Operate in one-Shot mode

21.9.2.10 ECEINT Register (Offset = 16h) [Reset = 0000h]

ECEINT is shown in [Figure 21-26](#) and described in [Table 21-14](#).

Return to the [Summary Table](#).

The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ECCLR registers. The proper procedure for configuring peripheral modes and interrupts is as follows:

- Disable global interrupts
- Stop eCAP counter
- Disable eCAP interrupts
- Configure peripheral registers
- Clear spurious eCAP interrupt flags
- Enable eCAP interrupts
- Start eCAP counter
- Enable global interrupts

Chapter 22
High Resolution Capture (HRCAP)

This chapter describes the operation of the high resolution capture (HRCAP) module. The HRCAP submodule described here is part of the Type1 eCAP. HRCAP measures the width of external pulses to a higher degree of accuracy than the eCAP module. See the [C2000 Real-Time Control Peripheral Reference Guide](#) for a list of all devices with an HRCAP module of the same type, to determine the differences between types, and for a list of device-specific differences within a type. A detailed description of all referenced functions can be found in the C2000Ware documentation.

22.1 Introduction	2532
22.2 Operational Details	2533
22.3 Known Exceptions	2537
22.4 Software	2538
22.5 HRCAP Registers	2538

22.1 Introduction

Uses for the HRCAP module include:

- Capacitive touch applications
- High-resolution period and duty cycle measurements of pulse train cycles
- Instantaneous speed measurements
- Instantaneous frequency measurements
- Voltage measurements across an isolation boundary
- Distance/sonar measurement and scanning
- Measuring flow

22.1.1 HRCAP Related Collateral

Foundational Materials

- [C2000 Academy - Control Peripherals](#)

Getting Started Materials

- [Leveraging High Resolution Capture \(HRCAP\) for Single Wire Data Transfer Application Report](#)

22.1.2 Features

The HRCAP module includes the following features:

- Pulse-width capture in either non-high-resolution or high-resolution modes
- Absolute mode pulse-width capture
- Continuous or one-shot capture
- Interrupt on either falling or rising edge
- Continuous mode capture of pulse widths in 4-deep buffer
- Hardware calibration logic for precision high-resolution capture

All of the previous resources are available on any pin using the Input X-BAR.

22.1.3 Description

Improvements from the Type 0 HRCAP are:

- Simplified calibration scheme:
 - HRCAP is always functional; never offline to perform calibration
 - Calibration is always running in the background; drastically reduced software overhead to calibrate
- Reduced software overhead to compute fractional bits
- Fractional and integer portions are packed into 32 bits
- All eCAP hardware is accessible when using the HRCAP enhancements. See [Section 22.3](#) for practical considerations.
- Usage of the HRCAP is now unified with the eCAP

The HRCAP enhancement has been added to eCAP 3 to allow signals to be captured asynchronously to SYSCLK. Each HRCAP submodule includes one capture channel in addition to a hardware calibration block. All eCAP hardware is accessible when using the HRCAP enhancements; however, using the Event Filter or the Input Qualifier is not valid, as these are synchronous to SYSCLK.

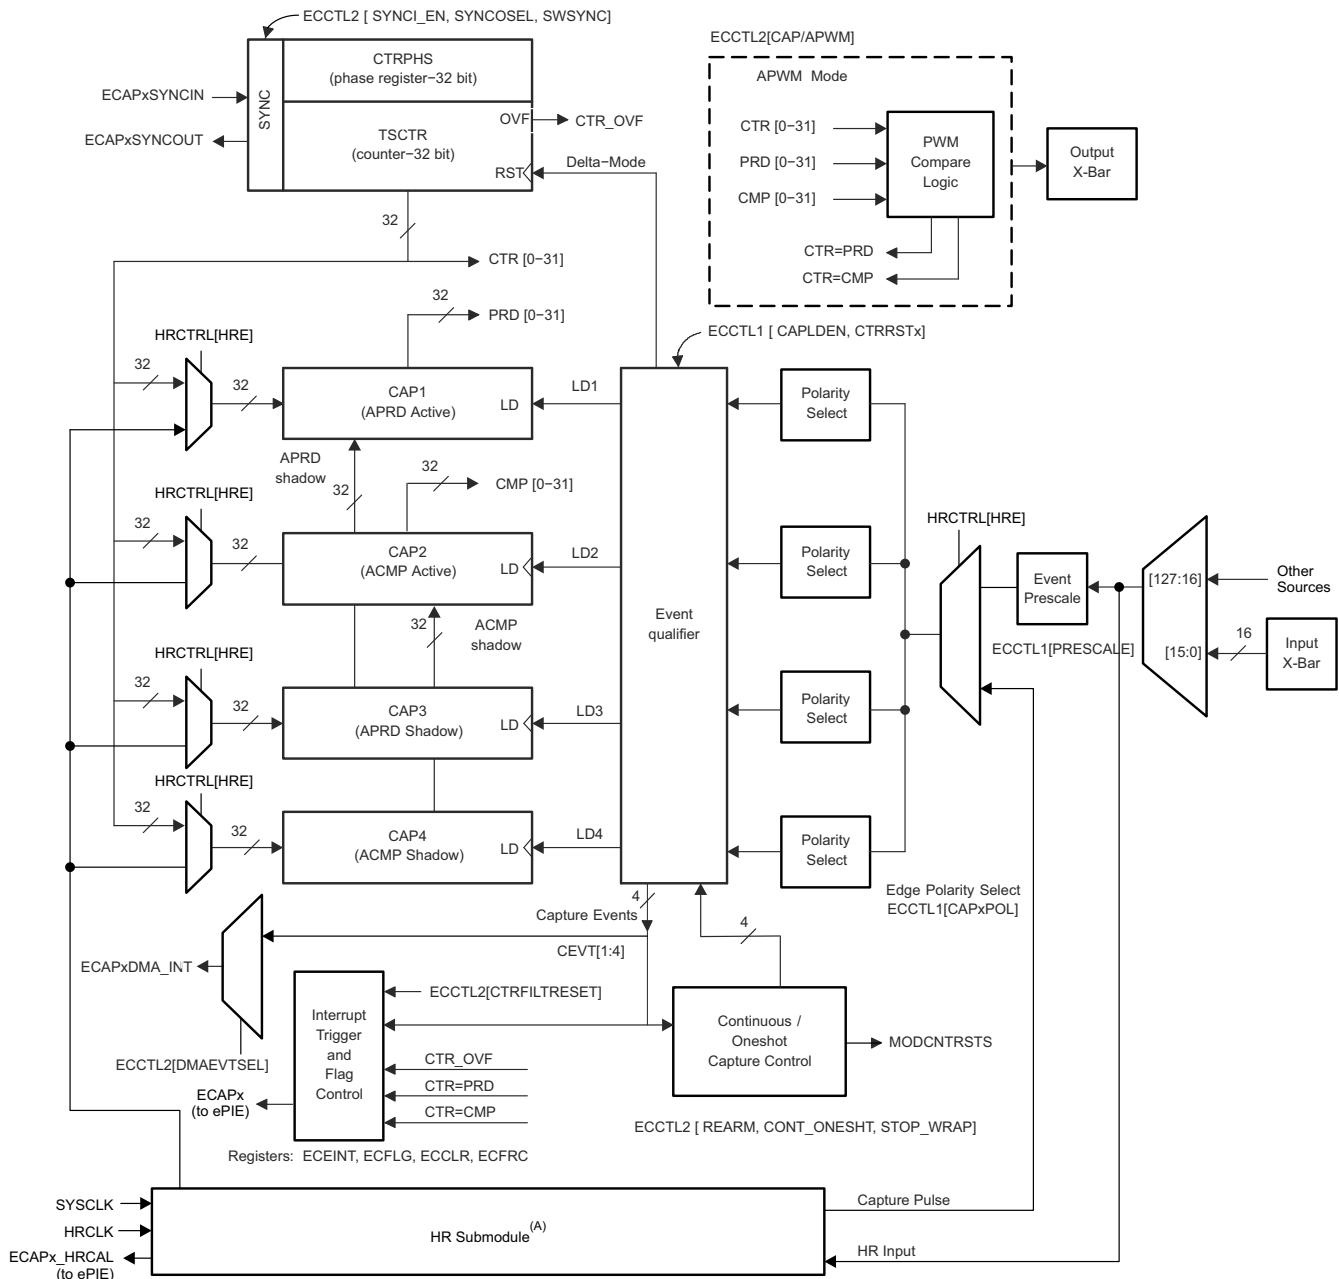

Each HRCAP-capable channel has the following independent key resources:

- All hardware of the respective eCAP
- High-resolution calibration logic
- Dedicated calibration interrupt

22.2 Operational Details

[Figure 22-1](#) shows the various components that implement the high-resolution capture functionality of the eCAP module. Note that existing eCAP resources are reused, which requires that the eCAP module is set up before using the HRCAP enhancements. For simplicity, absolute timestamp measurements are recommended. See [Section 22.3](#) for more details.

All HRCAP measurements are relative-time measures, in terms of minimum step size. Calibration hardware as well as software functions, have been provided to convert relative-time measurements to time-converted measurements in terms of seconds. The calibration hardware and software is only required if time-converted measurements are required.

Copyright © 2018, Texas Instruments Incorporated

A. The HRCAP submodule is not available on all eCAP modules; in this case, the high-resolution muxes and hardware are not implemented.

Figure 22-1. HRCAP Operations Block Diagram

22.2.1 HRCAP Clocking

Unlike previous Type-0 HRCAP modules, the Type-1 eCAP, with HRCAP functionality, does not require a second PLL. However, the module still requires both SYSCLK and a second asynchronous clock source called HRCLK. The HRCLK is sensitive to changes in both temperature and voltage. For this reason, when using time-converted measurements, it is required to make periodic continuous calibrations.

22.2.2 HRCAP Initialization Sequence

Following are the HRCAP initialization sequence steps. When using the HRCAP to take relative-time measurements, only steps 1-5 are required. When using the HRCAP to take time-converted measurements, all steps are required.

1. Enable HRCLK using HRCAP_enableHighResolutionClock()
2. Delay 1µs
3. Enable HR mode using HRCAP_enableHighResolution()
4. Delay 1µs
5. Configure the eCAP module as desired, including interrupts
6. Set calibration period using HRCAP_setCalibrationPeriod()
7. Enable continuous calibration using HRCAP_setCalibrationMode()
8. Enable interrupts using HRCAP_enableCalibrationInterrupt()
9. Start calibration using HRCAP_startCalibration()

22.2.3 HRCAP Interrupts

The HRCAP enhancements leverage the existing eCAP interrupts (see *Interrupt Control* in the ECAP chapter) in addition to HRCALINT, which is used exclusively by the hardware calibration block. HRCALINT can be triggered by the following conditions:

1. SYSCLKCTR = HRCALIBPERIOD
2. SYSCLKCTR or HRCLKCTR experience an overflow condition

Figure 22-2 shows this logic.

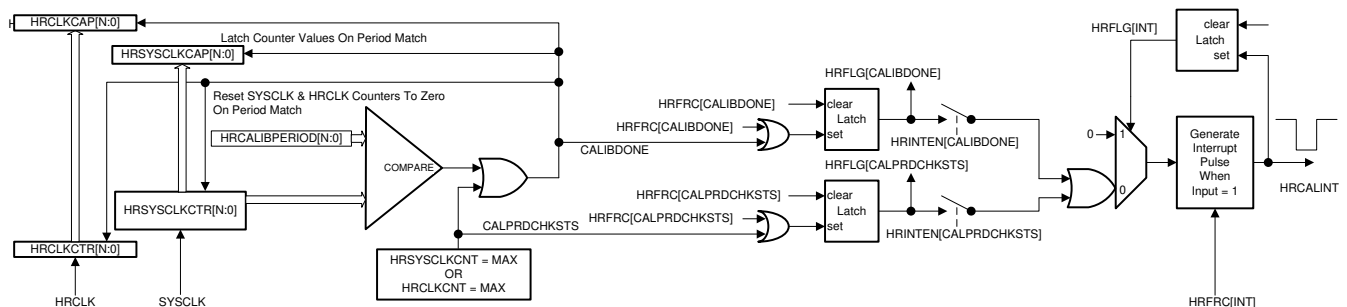

Figure 22-2. HRCAP Calibration

22.2.4 HRCAP Calibration

Note

For HRCAP calibration to work, the system needs to operate at SYSCLK frequency > 100MHz.

The following section applies only to time-converted measurements; calibration for relative-time measurements is not required. All values captured by the HRCAP submodule are in number of HRCLK cycles. The HRCLK speed varies widely with temperature and voltage, thus a scale factor is required to convert the capture value to the SYSCLK domain. For the same reason, periodically recalculate the scale factor. The HRCAP submodule has a calibration block to reduce software overhead when calculating a scale factor between HRCLK and SYSCLK.

The calibration block contains the following key resources:

- **HRSYSCLKCNT:** A 32-bit counter connected to SYSCLK. The counter starts counting when CALIBSTART is set.
- **HRCLKCNT:** A 32-bit counter connected to HRCLK. The counter starts counting when CALIBSTART is set.
- **HRCALIBPERIOD:** Calibration period, calibration is stopped when HRSYSCLKCNT is equal to the value in this register.
- **HRSYSCLKCAP:** On a calibration period match, the value of HRSYSCLKCNT is captured into HRSYSCLKCAP.
- **HRCLKCAP:** On a calibration period match, the value of HRCLKCNT is captured into HRCLKCAP.
- **HRCALINT:** An interrupt that occurs on a calibration period match, or when one of the counter registers experiences an overflow condition.

The calibration logic consists of two free-running counters; one clocked by HRCLK(HRCLKCTR) and one clocked by SYSCLK(HRSYSCLKCTR). When HRSYSCLKCTR is equal to HRCALIBPERIOD, the calibration block captures and resets both counter values, then triggers an interrupt, indicating a new scale factor is ready to be calculated. The scale factor can be found by dividing HRSYSCLKCAP by HRCLKCAP (see [Equation 19](#)). A DriverLib function, HRCAP_getScaleFactor, has been provided to determine the scale factor. This function can be called inside of the calibration interrupt service routine. If one of the counters experiences overflow, the CALPRDCHKSTS flag is set. The full details of the calibration block are described in [Figure 22-2](#).

$$ScaleFactor = \frac{HRSYSCLKCAP}{HRCLKCAP} \quad (19)$$

Note

- Even with calibration, noise on the 1.2V VDD supply negatively affects the standard deviation of the HRCAP submodule. Care can be taken to make sure that the 1.2V supply is clean, and that noisy internal events such as enabling and disabling clock trees have been minimized while using the HRCAP submodule.
 - When HRCLK > SYSCLK, calibration stops immaturely to mitigate improper calibration, SYSCLK must be set to at least 100MHz.
-

22.2.4.1 Applying the Scale Factor

A DriverLib function has been provided to apply the scale factor to a capture value, `HRCAP_getEventTimeStampNanoseconds()`. [Equation 20](#) shows how to convert a raw count to seconds without using the DriverLib function.

$$Measurement(ns) = \frac{RawCount \times scaleFactor}{128} * SysClkPrd(ns) \quad (20)$$

Table 22-1. Scale Factor

Parameter	Explanation
RawCount	Capture value as read from ECAP_REGS_CAP1-4
ScaleFactor ⁽¹⁾	The Scale factor as calculated from Equation 20
128	Constant determined by the hardware of the HRCAP submodule
SysClkPrd(nS)	Period of the system clock
Measurement(nS)	Signal converted to nS

(1) The scale factor is not automatically applied to captured values. The user is required to apply the scale factor to all captured values as shown in [Equation 20](#).

22.3 Known Exceptions

In HRCAP mode:

- Enabling and disabling core clocks negatively affects the standard deviation of the HRCAP submodule. Do not enable or disable core clocks while taking measurements.
- TSCTR is not writable; however, TSCTR can be reset using `ECCTL2[CTRFLTRESET]`
- Input synchronization is not applicable when using the HRCAP enhancements, because the HRCAP submodule is asynchronous to SYSCLK.
- The Event Filter functionality is not applicable for HRCAP, which defeats the purpose of HRCAP as the Event Filter's output is synchronous to SYSCLK.
- The best practice is to use absolute time mode for high-resolution mode. If time difference mode is used, it can lead to inaccurate results if the fractional value is not taken into consideration for capture events that have reset the time base counter.
 - Actual Capture Value = (Capture Value) – (fractional value of reference event that reset the counter)
- For high-frequency input signals, the CPU can not be able to cope with the speed of the captures. In such a case, one-shot mode is recommended. This mode allows the device to capture up to four edges before waiting to be serviced when the CPU is ready. This is applicable for the eCAP as well; however, in that case the event filter can be used to reduce the rate of captures.

22.4 Software

22.4.1 HRCAP Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/hrcap

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

22.4.1.1 HRCAP Capture and Calibration Example

FILE: hrcap_ex1_capture.c

This example configures an ECAP to use HRCAP functionality to capture time between edges on input GPIO2.

External Connections

The user must provide a signal to GPIO2. XCLKOUT has been configured to an output GPIO and can be externally jumped to serve this purpose. See Sysconfig file for XCLKOUT GPIO selected.

Watch Variables

- onTime1, onTime2
- offTime1, offTime2
- period1, period2

22.5 HRCAP Registers

This section describes the High-Resolution Capture Registers.

22.5.1 HRCAP Base Address Table

Table 22-2. HRCAP Base Address Table

Chapter 23 Enhanced Quadrature Encoder Pulse (eQEP)

The enhanced Quadrature Encoder Pulse (eQEP) module described here is a Type 2 eQEP. See the [C2000 Real-Time Control Peripheral Reference Guide](#) for a list of all devices with a module of the same type to determine the differences between types and for a list of device-specific differences within a type.

The enhanced quadrature encoder pulse (eQEP) module is used for direct interface with a linear or rotary incremental encoder to get position, direction, and speed information from a rotating machine for use in a high-performance motion and position-control system.

23.1 Introduction

An incremental encoder disk is patterned with a track of slots along the periphery, as shown in Figure 23-1. These slots create an alternating pattern of dark and light lines. The disk count is defined as the number of dark and light line pairs that occur per revolution (lines per revolution). As a rule, a second track is added to generate a signal that occurs once per revolution (index signal: QEPI), which can be used to indicate an absolute position. Encoder manufacturers identify the index pulse using different terms such as index, marker, home position, and zero reference

Figure 23-1. Optical Encoder Disk

To derive direction information, the lines on the disk are read out by two different photo-elements that "look" at the disk pattern with a mechanical shift of 1/4 the pitch of a line pair between them. This shift is detected with a reticle or mask that restricts the view of the photo-element to the desired part of the disk lines. As the disk rotates, the two photo-elements generate signals that are shifted 90° out of phase from each other. These are commonly called the quadrature QEPA and QEPB signals. The clockwise direction for most encoders is defined as the QEPA channel going positive before the QEPB channel and conversely, as shown in Figure 23-2.

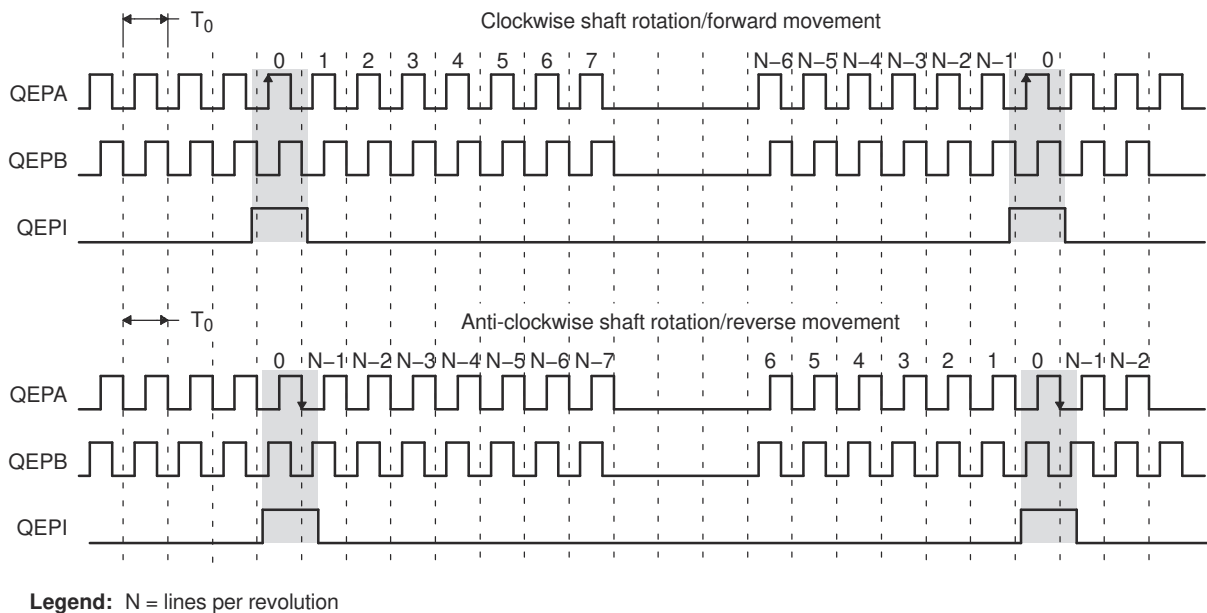

Figure 23-2. QEP Encoder Output Signal for Forward/Reverse Movement

The encoder wheel typically makes one revolution for every revolution of the motor, or the wheel can be at a geared rotation ratio with respect to the motor. Therefore, the frequency of the digital signal coming from the QEPA and QEPB outputs varies proportionally with the velocity of the motor. For example, a 2000-line encoder

directly coupled to a motor running at 5000 revolutions-per-minute (rpm) results in a frequency of 166.6kHz, so by measuring the frequency of either the QEPA or QEPB output, the processor can determine the velocity of the motor.

Quadrature encoders from different manufacturers come with two forms of index pulse (gated index pulse or ungated index pulse) as shown in Figure 23-3. A nonstandard form of index pulse is ungated. In the ungated configuration, the index edges are not necessarily coincident with A and B signals. The gated index pulse is aligned to any of the four quadrature edges and width of the index pulse and can be equal to a quarter, half, or full period of the quadrature signal.

Figure 23-3. Index Pulse Example

Some typical applications of shaft encoders include robotics and computer input in the form of a mouse. Inside your mouse you can see where the mouse ball spins a pair of axles (a left/right, and an up/down axle). These axles are connected to optical shaft encoders that effectively tell the computer how fast and in what direction the mouse is moving.

General Issues: Estimating velocity from a digital position sensor is a cost-effective strategy in motor control. Two different first order approximations for velocity can be written as:

$$v(k) \approx \frac{x(k) - x(k - 1)}{T} = \frac{\Delta X}{T} \quad (21)$$

$$v(k) \approx \frac{X}{t(k) - t(k - 1)} = \frac{X}{\Delta T} \quad (22)$$

where:

- $v(k)$ = Velocity at time instant k
- $x(k)$ = Position at time instant k
- $x(k-1)$ = Position at time instant $k-1$
- T = Fixed unit time or inverse of velocity calculation rate
- ΔX = Incremental position movement in unit time
- $t(k)$ = Time instant " k "
- $t(k-1)$ = Time instant " $k-1$ "
- X = Fixed unit position
- ΔT = Incremental time elapsed for unit position movement

[Equation 21](#) is the conventional approach to velocity estimation and requires a time base to provide a unit time event for velocity calculation. Unit time is basically the inverse of the velocity calculation rate.

The encoder count (position) is read once during each unit time event. The quantity $[x(k) - x(k-1)]$ is formed by subtracting the previous reading from the current reading. Then the velocity estimate is computed by multiplying by the known constant $1/T$ (where T is the constant time between unit time events and is known in advance).

Estimation based on [Equation 21](#) has an inherent accuracy limit directly related to the resolution of the position sensor and the unit time period T . For example, consider a 500 line-per-revolution quadrature encoder with a velocity calculation rate of 400Hz. When used for position, the quadrature encoder gives a four-fold increase in resolution; in this case, 2000 counts-per-revolution. The minimum rotation that can be detected is, therefore, 0.0005 revolutions, which gives a velocity resolution of 12rpm when sampled at 400Hz. While this resolution can be satisfactory at moderate or high speeds, for example 1% error at 1200rpm, this resolution clearly proves inadequate at low speeds. In fact, at speeds below 12rpm, the speed estimate is erroneously zero much of the time.

At low speed, [Equation 22](#) provides a more accurate approach. It requires a position sensor that outputs a fixed interval pulse train, such as the aforementioned quadrature encoder. The width of each pulse is defined by motor speed for a given sensor resolution. [Equation 22](#) can be used to calculate motor speed by measuring the elapsed time between successive quadrature pulse edges. However, this method suffers from the opposite limitation, as does [Equation 21](#). A combination of relatively large motor speeds and high sensor resolution makes the time interval ΔT small, and thus more greatly influenced by the timer resolution. This can introduce considerable error into high-speed estimates.

For systems with a large speed range (that is, speed estimation is needed at both low and high speeds), one approach is to use [Equation 22](#) at low speed and have the DSP software switch over to [Equation 21](#) when the motor speed rises above some specified threshold.

23.2 Configuring Device Pins

The GPIO mux registers must be configured to connect this peripheral to the device pins. To avoid glitches on the pins, the GPyGMUX bits must be configured first (while keeping the corresponding GPyMUX bits at the default of zero), followed by writing the GPyMUX register to the desired value.

For proper operation of the eQEP module, input GPIO pins must be configured using the GPxQSELn registers for synchronous input mode (with or without qualification). The asynchronous mode cannot be used for eQEP input pins. The internal pullups can be configured in the GPyPUD register.

See the *General-Purpose Input/Output (GPIO)* chapter for more details on GPIO mux and settings.

23.3 Description

This section provides the eQEP inputs, memory map, and functional description.

23.3.1 EQEP Inputs

The eQEP inputs include two pins for quadrature-clock mode or direction-count mode, an index (or 0 marker), and a strobe input. The eQEP module requires that the QEPA, QEPB, and QEPI inputs are synchronized to SYSClk prior to entering the module. The application code can enable the synchronous GPIO input feature on any eQEP-enabled GPIO pins (see the *General-Purpose Input/Output (GPIO)* chapter for more details).

- **QEPA/XCLK and QEPB/XDIR:** These two pins can be used in quadrature-clock mode or direction-count mode.
 - Quadrature-clock Mode: The eQEP encoders provide two square wave signals (A and B) 90 electrical degrees out of phase. This phase relationship is used to determine the direction of rotation of the input shaft and number of eQEP pulses from the index position to derive the relative position information. For forward or clockwise rotation, QEPA signal leads QEPB signal and conversely. The quadrature decoder uses these two inputs to generate quadrature-clock and direction signals.
 - Direction-count Mode: In direction-count mode, direction and clock signals are provided directly from the external source. Some position encoders have this type of output instead of quadrature output. The QEPA pin provides the clock input and the QEPB pin provides the direction input.
- **QEPI: Index or Zero Marker:** The eQEP encoder uses an index signal to assign an absolute start position from which position information is incrementally encoded using quadrature pulses. This pin is connected to the index output of the eQEP encoder to optionally reset the position counter for each revolution. This signal can be used to initialize or latch the position counter on the occurrence of a desired event on the index pin.
- **QEPS: Strobe Input:** This general-purpose strobe signal can initialize or latch the position counter on the occurrence of a desired event on the strobe pin. This signal is typically connected to a sensor or limit switch to notify that the motor has reached a defined position.

Input signals to the eQEP (QEPA, QEPB, QEPI and QEPS) can come from multiple sources; that is, device pin, CMPSSx, or PWMXBARx. One typical use case is if SinCos transducers are used in the motor control system to estimate the position of motor shaft and Index signal is coming from traditional rotary encoder, source of the eQEP signals (QEPA, QEPB and QEPI) can be configured as output of CMPSSx that decodes the Sin, Cos, and Index signals. [Figure 23-4](#) illustrates the use case.

Selection of the source of Input signals (QEPA, QEPB, and QEPI) is user-configurable through the QEPSRCSEL register as shown in [Table 23-1](#).

Note

Configuration of QEPSRCSEL register to select the source of QEPA, QEPB, and QEPI signals can lead to unexpected transition on these signals, which can cause an undesirable outcome if eQEP is already running. Make sure that the eQEP is disabled before configuring the QEPSRCSEL register for input signals.

23.3.2 Functional Description

The eQEP peripheral contains the following major functional units (as shown in Figure 23-5):

- Programmable input qualification for each pin (part of the GPIO MUX)
- Quadrature decoder unit (QDU)
- Position counter and control unit for position measurement (PCCU)
- Quadrature edge-capture unit for low-speed measurement (QCAP)
- Unit time base for speed/frequency measurement (UTIME)
- Watchdog timer for detecting stalls (QWDOG)
- Quadrature Mode Adapter (QMA)

23.4 Quadrature Decoder Unit (QDU)

Figure 23-6 shows a functional block diagram of the QDU.

Figure 23-6. Functional Block Diagram of Decoder Unit

23.4.1 Position Counter Input Modes

Clock and direction input to the position counter is selected using QDECCTL[QSRC] bits, based on interface input requirement as follows:

- Quadrature-count mode
- Direction-count mode
- UP-count mode
- DOWN-count mode

23.4.1.1 Quadrature Count Mode

The quadrature decoder generates the direction and clock to the position counter in quadrature count mode.

Direction Decoding The direction decoding logic of the eQEP circuit determines which one of the sequences (QEPA, QEPB) is the leading sequence and accordingly updates the direction information in the QEPSTS[QDF] bit. Table 23-3 and Figure 23-7 show the direction decoding logic in truth table and state machine form. Both edges of the QEPA and QEPB signals are sensed to generate count pulses for the position counter. Therefore, the frequency of the clock generated by the eQEP logic is four times that of each input sequence. Figure 23-8 shows the direction decoding and clock generation from the eQEP input signals.

Table 23-3. Quadrature Decoder Truth Table

	QB↑	TOGGLE	Increment or Decrement

Figure 23-7. Quadrature Decoder State Machine

Figure 23-8. Quadrature-clock and Direction Decoding

Phase Error Flag In normal operating conditions, quadrature inputs QEPA and QEPB is 90 degrees out of phase. The phase error flag (PHE) is set in the QFLG register and the QPOSCNT value can be incorrect and offset by multiples of 1 or 3. That is, when edge transition is detected simultaneously on the QEPA and QEPB signals to optionally generate interrupts. State transitions marked by dashed lines in [Figure 23-7](#) are invalid transitions that generate a phase error.

Count Multiplication The eQEP position counter provides 4x times the resolution of an input clock by generating a quadrature-clock (QCLK) on the rising/falling edges of both eQEP input clocks (QEPA and QEPB) as shown in [Figure 23-8](#).

Reverse Count In normal quadrature count operation, QEPA input is applied to the QA input of the quadrature decoder and the QEPB input is applied to the QB input of the quadrature decoder. Reverse counting is enabled by setting the SWAP bit in the QDECCTL register. This swaps the input to the quadrature decoder; thereby, reversing the counting direction.

23.4.1.2 Direction-Count Mode

Some position encoders provide direction and clock outputs, instead of quadrature outputs. In such cases, direction-count mode can be used. The QEPA input provides the clock for the position counter and the QEPB input has the direction information. The position counter is incremented on every rising edge of a QEPA input when the direction input is high, and decremented when the direction input is low.

23.4.1.3 Up-Count Mode

The counter direction signal is hard-wired for up-count and the position counter is used to measure the frequency of the QEPA input. Clearing the QDECCTL[XCR] bit enables clock generation to the position counter on both edges of the QEPA input; thereby, increasing the measurement resolution by a factor of 2x. In up-count mode, we recommend that the application not configure QEPB as a GPIO mux option, or make sure that a signal edge is not generated on the QEPB input.

23.4.1.4 Down-Count Mode

The counter direction signal is hardwired for a down-count and the position counter is used to measure the frequency of the QEPA input. Clearing the QDECCTL[XCR] bit enables clock generation to the position counter on both edges of a QEPA input, thereby increasing the measurement resolution by a factor of 2x. In down-count mode, the application must not configure QEPB as a GPIO mux option or make sure that a signal edge is not generated on the QEPB input.

23.4.2 eQEP Input Polarity Selection

Each eQEP input can be inverted using QDECCTL[8:5] control bits. As an example, setting the QDECCTL[QIP] bit inverts the index input.

23.4.3 Position-Compare Sync Output

The enhanced eQEP peripheral includes a position-compare unit that is used to generate the position-compare sync signal on compare match between the position-counter register (QPOSCNT) and the position-compare register (QPOSCMP). This sync signal can be output using an index pin or strobe pin of the EQEP peripheral.

Setting the QDECCTL[SOEN] bit enables the position-compare sync output and the QDECCTL[SPSEL] bit selects either an eQEP index pin or an eQEP strobe pin.

23.5 Position Counter and Control Unit (PCCU)

The position-counter and control unit provides two configuration registers (QEPCTL and QPOSCTL) for setting up position-counter operational modes, position-counter initialization/latch modes and position-compare logic for sync signal generation.

23.5.1 Position Counter Operating Modes

Position-counter data can be captured in different manners. In some systems, the position counter is accumulated continuously for multiple revolutions and the position-counter value provides the position information with respect to the known reference. An example of this is the quadrature encoder mounted on the motor controlling the print head in the printer. Here the position counter is reset by moving the print head to the home position and then the position counter provides absolute position information with respect to home position.

In other systems, the position counter is reset on every revolution using index pulse, and the position counter provides a rotor angle with respect to the index pulse position.

The position counter can be configured to operate in following four modes

- Position-Counter Reset on Index Event
- Position-Counter Reset on Maximum Position
- Position-Counter Reset on the first Index Event
- Position-Counter Reset on Unit Time Out Event (Frequency Measurement)

In all the above operating modes, the position counter is reset to 0 on overflow and to the QPOSMAX register value on underflow. Overflow occurs when the position counter counts up after the QPOSMAX value. Underflow occurs when the position counter counts down after 0. The Interrupt flag is set to indicate overflow/underflow in QFLG register.

23.5.1.1 Position Counter Reset on Index Event (QEPCTL[PCRM]=00)

If the index event occurs during the forward movement, then the position counter is reset to 0 on the next eQEP clock. If the index event occurs during the reverse movement, then the position counter is reset to the value in the QPOS MAX register on the next eQEP clock.

The first index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (QEPSTS[FIMF]) and direction on the first index event marker (QEPSTS[FIDF]) in QEPSTS registers, the eQEP peripheral also remembers the quadrature edge on the first index marker so that same relative quadrature transition is used for index event reset operation.

For example, if the first reset operation occurs on the falling edge of QEPB during the forward direction, then all the subsequent reset must be aligned with the falling edge of QEPB for the forward rotation and on the rising edge of QEPB for the reverse rotation as shown in [Figure 23-9](#).

The position-counter value is latched to the QPOSILAT register and direction information is recorded in the QEPSTS[QDLF] bit on every index event marker. The position-counter error flag (QEPSTS[PCEF]) and error interrupt flag (QFLG[PCE]) are set if the latched value is not equal to 0 or QPOS MAX. The position-counter error flag (QEPSTS[PCEF]) is updated on every index event marker and an interrupt flag (QFLG[PCE]) is set on error that can be cleared only through software.

The index event latch configuration QEPCTL[IEL] must be configured to 00 or 11 when pcr=0 and the position counter error flag/interrupt flag are generated only in index event reset mode. The position counter value is latched into the IPOS LAT register on every index marker.

Figure 23-9. Position Counter Reset by Index Pulse for 1000-Line Encoder (QPOS MAX = 3999 or 0xF9F)

Note

In case of a boundary condition where the time period between the Index Event and the previous QCLK edge is less than SYSCLK period, then QPOSCNT gets reset to zero or QPOS MAX in the same SYSCLK cycle and does not wait for the next QCLK edge to occur.

23.5.1.2 Position Counter Reset on Maximum Position (QEPCTL[PCRM]=01)

If the position counter is equal to QPOSMAX, then the position counter is reset to 0 on the next eQEP clock for forward movement and position counter overflow flag is set. If the position counter is equal to ZERO, then the position counter is reset to QPOSMAX on the next QEP clock for reverse movement and position-counter underflow flag is set. [Figure 23-10](#) shows the position-counter reset operation in this mode.

The first index marker fields (QEPSTS[FIDF] and QEPSTS[FIMF]) are not applicable in this mode.

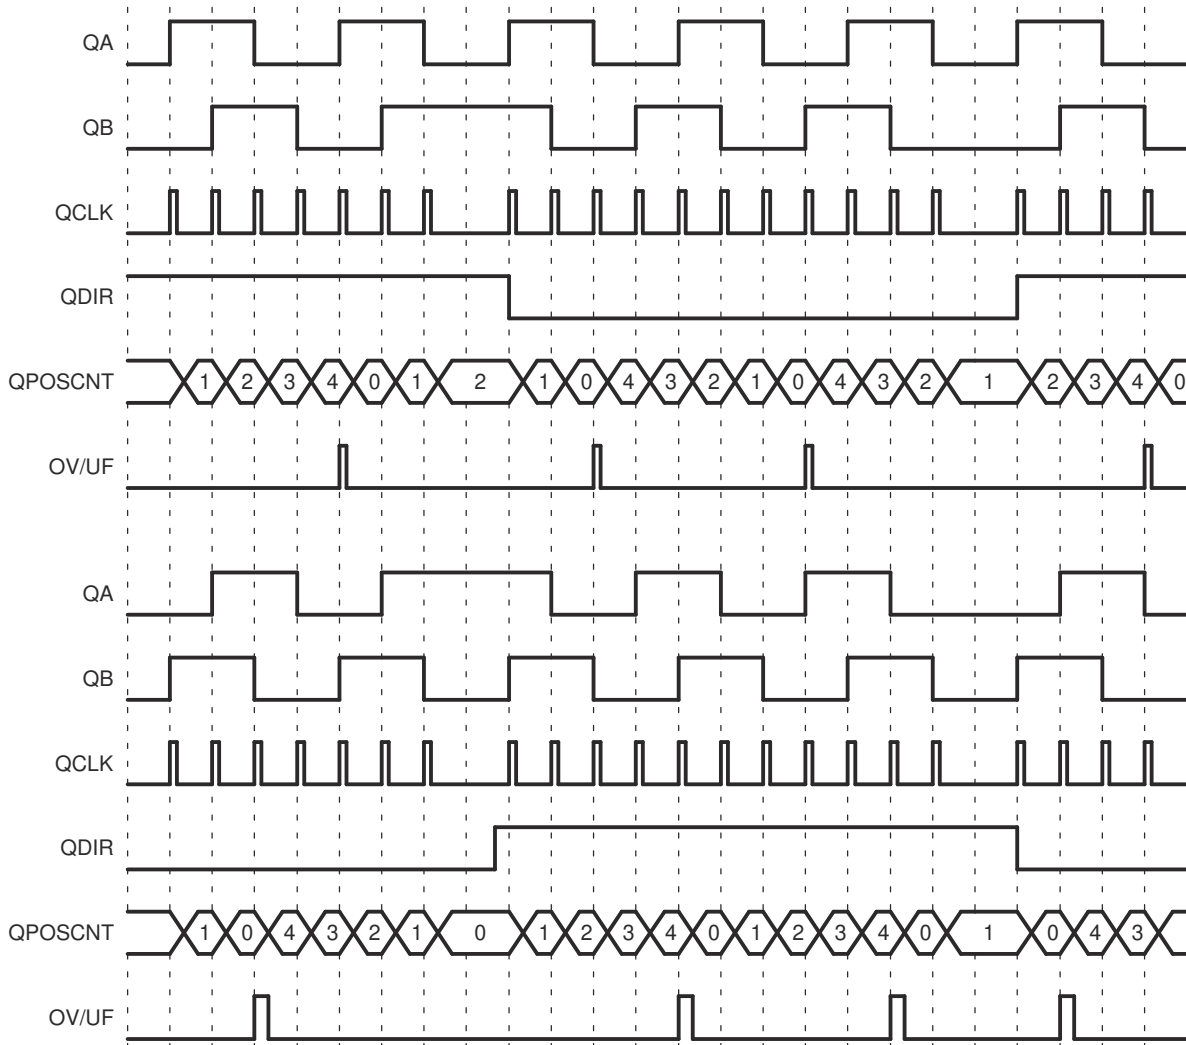

Figure 23-10. Position Counter Underflow/Overflow (QPOSMAX = 4)

23.5.1.3 Position Counter Reset on the First Index Event (QEPCTL[PCRM] = 10)

If the index event occurs during forward movement, then the position counter is reset to 0 on the next eQEP clock. If the index event occurs during the reverse movement, then the position counter is reset to the value in the QPOSMAX register on the next eQEP clock. Note that this is done only on the first occurrence and subsequently the position-counter value is not reset on an index event; rather, the position-counter value is reset based on the maximum position as described in [Section 23.5.1.2](#).

The first index marker fields (QEPSTS[FIDF] and QEPSTS[FIMF]) are not applicable in this mode.

23.5.1.4 Position Counter Reset on Unit Time-out Event (QEPCTL[PCRM] = 11)

In this mode, QPOSCNT is set to 0 or QPOMAX, depending on the direction mode selected by QDECCTL[QSRC] bits on a unit time event. This is useful for frequency measurement.

23.5.2 Position Counter Latch

The eQEP index and strobe input can be configured to latch the position counter (QPOSCNT) into QPOSILAT and QPOSSLAT, respectively, on occurrence of a definite event on these pins.

23.5.2.1 Index Event Latch

In some applications, it is not desirable to reset the position counter on every index event and instead it can be required to operate the position counter in full 32-bit mode (QEPCTL[PCRM] = 01 and QEPCTL[PCRM] = 10 modes).

In such cases, the eQEP position counter can be configured to latch on the following events and direction information is recorded in the QEPSTS[QDLF] bit on every index event marker.

- Latch on Rising edge (QEPCTL[IEL]=01)
- Latch on Falling edge (QEPCTL[IEL]=10)
- Latch on Index Event Marker (QEPCTL[IEL]=11)

This is particularly useful as an error checking mechanism to check if the position counter accumulated the correct number of counts between index events. As an example, the 1000-line encoder must count 4000 times when moving in the same direction between the index events.

The index event latch interrupt flag (QFLG[IEL]) is set when the position counter is latched to the QPOSILAT register. The index event latch configuration bits (QEPCTL[IEL]) are ignored when QEPCTL[PCRM] = 00.

Latch on Rising Edge (QEPCTL[IEL]=01)	The position-counter value (QPOSCNT) is latched to the QPOSILAT register on every rising edge of an index input.
Latch on Falling Edge (QEPCTL[IEL] = 10)	The position-counter value (QPOSCNT) is latched to the QPOSILAT register on every falling edge of index input.
Latch on Index Event Marker/Software Index Marker (QEPCTL[IEL] = 11)	The first index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (QEPSTS[FIMF]) and the direction on the first index event marker (QEPSTS[FIDF]) in the QEPSTS registers. The eQEP peripheral also remembers the quadrature edge on the first index marker so that the same relative quadrature transition is used for latching the position counter (QEPCTL[IEL]=11).

Figure 23-11 shows the position counter latch using an index event marker.

Figure 23-11. Software Index Marker for 1000-line Encoder (QEPCTL[IEL] = 1)

23.5.2.2 Strobe Event Latch

The position-counter value is latched to the QPOSSLAT register on the rising edge of the strobe input by clearing the QEPCTL[SEL] bit.

If the QEPCTL[SEL] bit is set, then the position-counter value is latched to the QPOSSLAT register on the rising edge of the strobe input for forward direction, and on the falling edge of the strobe input for reverse direction as shown in Figure 23-12.

The strobe event latch interrupt flag (QLFG[SEL]) is set when the position counter is latched to the QPOSSLAT register.

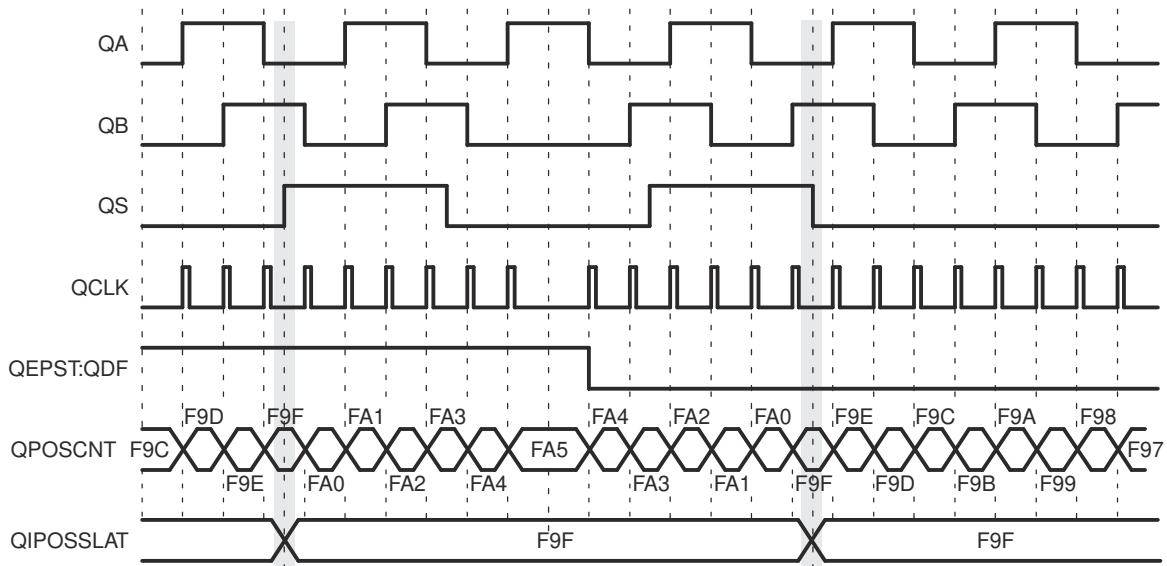

Figure 23-12. Strobe Event Latch (QEPCTL[SEL] = 1)

There is an added feature on Type 2.0 eQEP where position-counter value can also be latched on ADCSOCA and ADCSOCB events by configuring the register QEPSTROBESEL.STROBESEL as shown in Figure 23-13. To use the ADCSOCA/B events for the QS signal, configuration of the QEPSRCSEL.QEPSSEL to be non-zero is needed..

Figure 23-13. Latching Position Counter on ADCSOCA/ADCSOCB Event

23.5.3 Position Counter Initialization

The position counter can be initialized using the following events:

- Index event
- Strobe event
- Software initialization

Index Event Initialization (IEI)

The QEPI index input can be used to trigger the initialization of the position counter at the rising or falling edge of the index input. If the QEPCTL[IEI] bits are 10, then the position counter (QPOSCNT) is initialized with a value in the QPOSINIT register on the rising edge of index input. Conversely, if the QEPCTL[IEI] bits are 11, initialization is on the falling edge of the index input.

Strobe Event Initialization (SEI)

If the QEPCTL[SEI] bits are 10, then the position counter is initialized with a value in the QPOSINIT register on the rising edge of strobe input.

If QEPCTL[SEL] bits are 11, then the position counter is initialized with a value in the QPOSINIT register on the rising edge of strobe input for forward direction and on the falling edge of strobe input for reverse direction.

Software Initialization (SWI)

The position counter can be initialized in software by writing a 1 to the QEPCTL[SWI] bit. This bit is not automatically cleared. While the bit is still set, if a 1 is written to the bit again, the position counter is re-initialized.

23.5.4 eQEP Position-compare Unit

The eQEP peripheral includes a position-compare unit that is used to generate a sync output and interrupt on a position-compare match. Figure 23-14 shows a diagram. The position-compare (QPOSCMP) register is shadowed and shadow mode can be enabled or disabled using the QPOSCTL[PSSHDW] bit. If the shadow mode is not enabled, the CPU writes directly to the active position compare register.

Figure 23-14. eQEP Position-compare Unit

In shadow mode, you can configure the position-compare unit (QPOSCTL[PCLOAD]) to load the shadow register value into the active register on the following events, and to generate the position-compare ready (QFLG[PCR]) interrupt after loading.

- Load on compare match
- Load on position-counter zero event

The position-compare match (QFLG[PCM]) is set when the position-counter value (QPOSCNT) matches with the active position-compare register (QPOSCMP) and the position-compare sync output of the programmable pulse width is generated on compare-match to trigger an external device.

For example, if QPOSCMP = 2, the position-compare unit generates a position-compare event on 1 to 2 transitions of the eQEP position counter for forward counting direction and on 3 to 2 transitions of the eQEP position counter for reverse counting direction (see Figure 23-15).

See the register section for the layout of the eQEP Position-Compare Control Register (QPOSCTL) and description of the QPOSCTL bit fields.

Figure 23-15. eQEP Position-compare Event Generation Points

The pulse stretcher logic in the position-compare unit generates a programmable position-compare sync pulse output on the position-compare match. In the event of a new position-compare match while a previous position-compare pulse is still active, then the pulse stretcher generates a pulse of specified duration from the new position-compare event as shown in [Figure 23-16](#).

Figure 23-16. eQEP Position-compare Sync Output Pulse Stretcher

23.6 eQEP Edge Capture Unit

The eQEP peripheral includes an integrated edge capture unit to measure the elapsed time between the unit position events as shown in [Figure 23-17](#). This feature is typically used for low-speed measurement using the following formula:

$$v(k) = \frac{X}{t(k) - t(k - 1)} = \frac{X}{\Delta T} \quad (23)$$

where:

- X = Unit position is defined by integer multiple of quadrature edges (see [Figure 23-18](#))
- ΔT = Elapsed time between unit position events
- $v(k)$ = Velocity at time instant "k"

The eQEP capture timer (QCTMR) runs from prescaled SYSCLKOUT and the prescaler is programmed by the QCAPCTL[CCPS] bits. The capture timer (QCTMR) value is latched into the capture period register (QCPRD) on every unit position event and then the capture timer is reset, a flag is set in QEPSTS:UPEVNT to indicate that new value is latched into the QCPRD register. Software can check this status flag before reading the period register for low speed measurement, and clear the flag by writing 1.

Time measurement (ΔT) between unit position events is correct if the following conditions are met:

- No more than 65,535 counts have occurred between unit position events.
- No direction change between unit position events.

If the QEP capture timer overflows between unit position events, then the timer sets the QEP capture overflow flag (QEPSTS[COEF]) in the status register and the QCPRDLAT register is set to 0xFFFF. If direction change occurs between the unit position events, then the error flag is set in the status register (QEPSTS[CDEF]) and the QCPRDLAT register is set to 0xFFFF.

The Capture Timer (QCTMR) and Capture Period register (QCPRD) can be configured to latch on the following events:

- CPU read of QPOSCNT register
- Unit time-out event

If the QEPCTL[QCLM] bit is cleared, then the capture timer and capture period values are latched into the QCTMRLAT and QCPRDLAT registers, respectively, when the CPU reads the position counter (QPOSCNT).

If the QEPCTL[QCLM] bit is set, then the position counter, capture timer, and capture period values are latched into the QPOSLAT, QCTMRLAT and QCPRDLAT registers, respectively, on unit time out.

[Figure 23-19](#) shows the capture unit operation along with the position counter.

Figure 23-17. eQEP Edge Capture Unit

CAUTION

The QCAPCTL[UPPS] prescaler cannot be modified dynamically (such as switching the unit event prescaler from QCLK/4 to QCLK/8). Doing so can result in undefined behavior. The QCAPCTL[CCPS] prescaler can be modified dynamically (such as switching CAPCLK prescaling mode from SYSCLK/4 to SYSCLK/8) only after the capture unit is disabled.

N = Number of quadrature periods selected using QCAPCTL[UPPS] bits

Figure 23-18. Unit Position Event for Low Speed Measurement (QCAPCTL[UPPS] = 0010)

Figure 23-19. eQEP Edge Capture Unit - Timing Details

Velocity calculation equation:

$$v(k) = \frac{x(k) - x(k - 1)}{T} = \frac{\Delta X}{T} \quad (24)$$

where:

- $v(k)$ = Velocity at time instant k
- $x(k)$ = Position at time instant k
- $x(k-1)$ = Position at time instant $k-1$
- T = Fixed unit time or inverse of velocity calculation rate
- ΔX = Incremental position movement in unit time
- X = Fixed unit position
- ΔT = Incremental time elapsed for unit position movement
- $t(k)$ = Time instant "k"
- $t(k-1)$ = Time instant "k-1"

Unit time (T) and unit period (X) are configured using the QUPRD and QCAPCTL[UPPS] registers. Incremental position output and incremental time output is available in the QOSLAT and QCPRDLAT registers.

Parameter	Relevant Register to Configure or Read the Information
T	Unit Period Register (QUPRD)
ΔX	Incremental Position = QOSLAT(k) - QOSLAT($k-1$)
X	Fixed-unit position defined by sensor resolution and QCAPCTL[UPPS] bits
ΔT	Capture Period Latch (QCPRDLAT)

23.7 eQEP Watchdog

The eQEP peripheral contains a 16-bit watchdog timer (Figure 23-20) that monitors the quadrature clock to indicate proper operation of the motion-control system. The eQEP watchdog timer is clocked from SYSCLKOUT/64 and the quadrature clock event (pulse) resets the watchdog timer. If no quadrature clock event is detected until a period match (QWDPRD = QWDTMR), then the watchdog timer times out and the watchdog interrupt flag is set (QFLG[WTO]). The time-out value is programmable through the watchdog period register (QWDPRD).

Figure 23-20. eQEP Watchdog Timer

23.8 eQEP Unit Timer Base

The eQEP peripheral includes a 32-bit timer (QUTMR) that is clocked by SYSCLKOUT to generate periodic interrupts for velocity calculations, see Figure 23-21. Whenever the unit timer (QUTMR) matches the unit period register (QUPRD), the eQEP peripheral resets the unit timer (QUTMR) and also generates the unit time out interrupt flag (QFLG[UTO]). The unit timer gets reset whenever timer value equals to configured period value.

The eQEP peripheral can be configured to latch the position counter, capture timer, and capture period values on a unit time out event so that latched values are used for velocity calculation as described in Section 23.6.

Figure 23-21. eQEP Unit Timer Base

23.9 QMA Module

The QEP Mode Adapter (QMA) is designed to extend the C2000™ eQEP module capabilities to support the additional modes described. [Figure 23-22](#) depicts how the QMA module is integrated into the eQEP module.

At reset, by default QMA logic is bypassed and the EQEPA and EQEPB inputs from the pins go directly into the eQEP module. When QMA module is enabled by configuring the QMACTRL[MODE] register, the EQEPA and EQEPB input are processed by this module and modified version of EQEPA and EQEPB signals are sent to the eQEP module. The QMA module requires the eQEP module to be configured in the Direction-Count mode and generates a clock signal on EQEPA input and direction signal on EQEPB input as needed for the proper operation of the intended mode.

- The xCLKMOD block inside the QMA module looks at the transitions on external EQEPA and EQEPB signals to generate the clock signal on the EQEPA input to the eQEP module.
- The xDIRMOD block inside the QMA module looks at the transitions on external EQEPA and EQEPB signals to generate the direction signal on the EQEPB input to the eQEP module.

The QMA module has error detection logic to detect illegal transitions on EQEPA and EQEPB input signals. The QMA module's error and interrupt are integrated inside the eQEP module as described in [Section 23.10](#). In addition, the QMACTRL register configuration can be locked using the QMALOCK register. Refer to the register description for more details.

Figure 23-22. QMA Module Block Diagram

23.9.1 Modes of Operation

The QMA module can be operated in the following modes by configuring the QMACTRL register:

- QMA Mode-1 (QMACTRL[MODE]=1)
- QMA Mode-2 (QMACTRL[MODE]=2)

23.9.1.1 QMA Mode-1 (QMACTRL[MODE]=1)

This mode is used when the default state of EQEPA and EQEPB inputs is high. In this mode, outputs of QMA correspond to the following as shown in Figure 23-23:

- EQEPA Output of QMA is the AND of EQEPA and EQEPB inputs coming from the pin
- EQEPB Output of QMA is the direction signal generated by QMA based on EQEPA and EQEPB inputs

Figure 23-23. QMA Mode-1

23.9.1.2 QMA Mode-2 (QMACTRL[MODE]=2)

This mode is used when the default state of EQEPA and EQEPB inputs is low. In this mode, outputs of QMA correspond to the following as shown in Figure 23-24:

- EQEPA Output of QMA is the OR of EQEPA and EQEPB inputs coming from the pin
- EQEPB Output of QMA is the direction signal generated by QMA based on EQEPA and EQEPB inputs

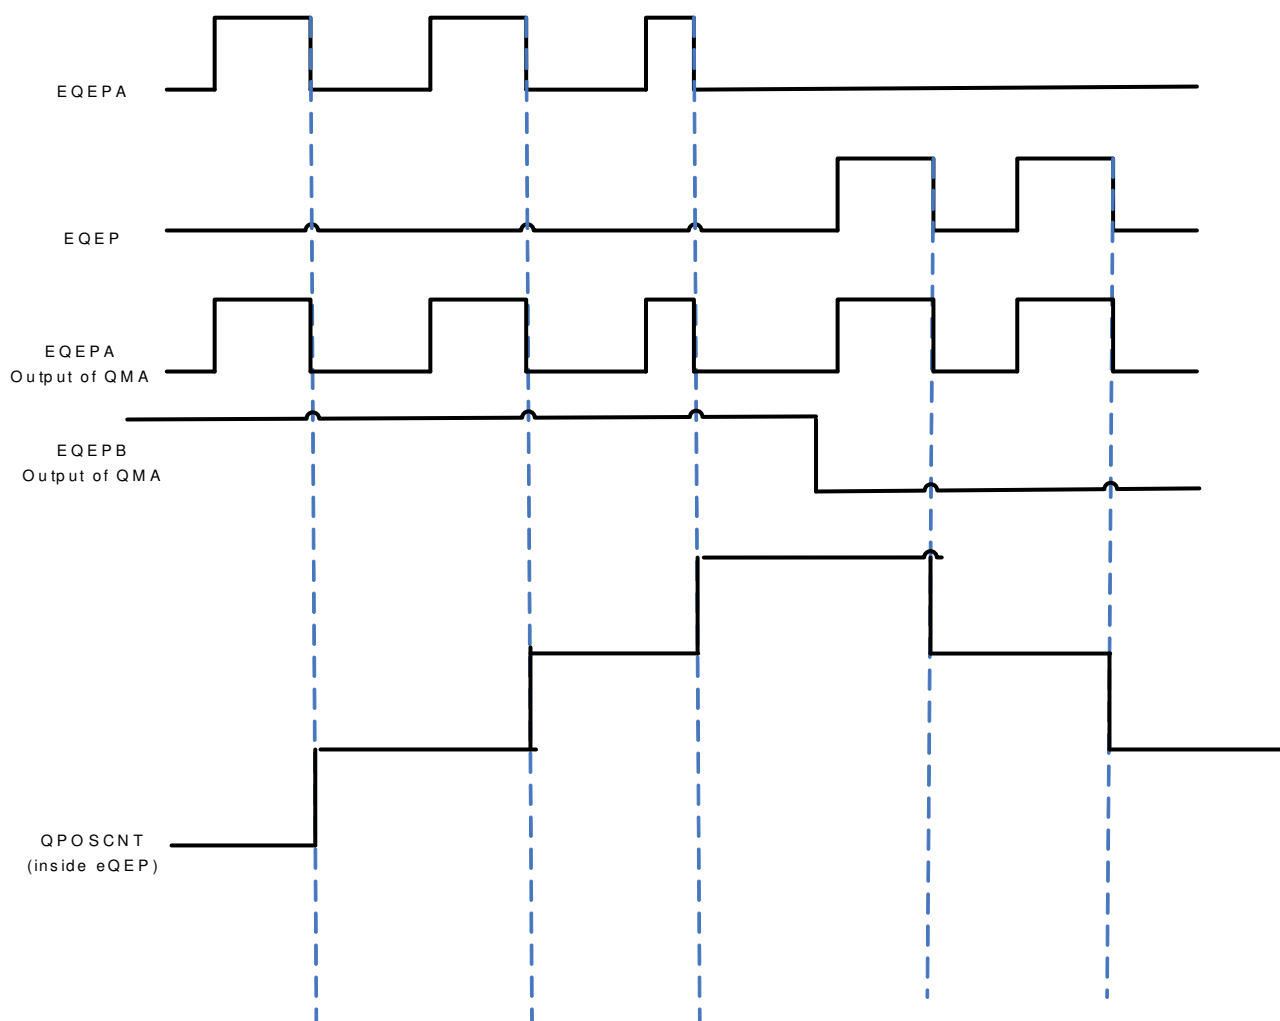

Figure 23-24. QMA Mode-2

23.9.2 Interrupt and Error Generation

The error detection logic detects illegal transitions on EQEPA and EQEPB signals and generates an error signal. This error signal can be used to generate eQEP interrupt and error output. Refer to Section 23.10 for details.

23.10 eQEP Interrupt Structure

Figure 23-25 shows how the interrupt mechanism works in the eQEP module.

Figure 23-25. eQEP Interrupt Generation

Eleven interrupt events (PCE, PHE, QDC, WTO, PCU, PCO, PCR, PCM, SEL, IEL and UTO) can be generated. The interrupt control register (QEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (QFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT).

An interrupt pulse is generated to PIE when:

1. Interrupt is enabled for eQEP event inside QEINT register
2. Interrupt flag for eQEP event inside QFLG register is set, and
3. Global interrupt status flag bit QFLG[INT] had been cleared for previously generated interrupt event. The interrupt service routine needs to clear the global interrupt flag bit and the serviced event, by way of the interrupt clear register (QCLR), before any other interrupt pulses are generated. If either flags inside the QFLG register are not cleared, further interrupt events do not generate an interrupt to PIE. You can force an interrupt event by way of the interrupt force register (QFRC), which is useful for test purposes.

23.11 Software

23.11.1 EQEP Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location: C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/eqep

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

23.11.1.1 Frequency Measurement Using eQEP

FILE: eqep_ex1_freq_cal.c

This example will calculate the frequency of an input signal using the eQEP module. ePWM1A is configured to generate this input signal with a frequency of 5 kHz. It will interrupt once every period and call the frequency calculation function. This example uses the IQMath library to simplify high-precision calculations.

In addition to the main example file, the following files must be included in this project:

- *eqep_ex1_calculation.c* - contains frequency calculation function
- *eqep_ex1_calculation.h* - includes initialization values for frequency structure

The configuration for this example is as follows

- Maximum frequency is configured to 10KHz (baseFreq)
- Minimum frequency is assumed at 50Hz for capture pre-scaler selection

SPEED_FR: High Frequency Measurement is obtained by counting the external input pulses for 10ms (unit timer set to 100Hz). $\lfloor \text{SPEED_FR} = \frac{\text{Count} \Delta}{10\text{ms}} \rfloor$

SPEED_PR: Low Frequency Measurement is obtained by measuring time period of input edges. Time measurement is averaged over 64 edges for better results and the capture unit performs the time measurement using pre-scaled SYSCLK.

Note that the pre-scaler for capture unit clock is selected such that the capture timer does not overflow at the required minimum frequency. This example runs indefinitely until the user stops it.

For more information about the frequency calculation see the comments at the beginning of eqep_ex1_calculation.c and the XLS file provided with the project, eqep_ex1_calculation.xls.

For External connections, Control Card settings are used by default. To use launchpad pins for eQEP1A select them in SysConfig. *ExternalConnections* for Control Card

- Connect GPIO25/eQEP1A to GPIO0/ePWM1A

ExternalConnections for LaunchPad

- Connect GPIO40/eQEP1A to GPIO0/ePWM1A

23.11.1.2 Position and Speed Measurement Using eQEP

FILE: eqep_ex2_pos_speed.c

This example provides position and speed measurement using the capture unit and speed measurement using unit time out of the eQEP module. ePWM1 and a GPIO are configured to generate simulated eQEP signals. The ePWM module will interrupt once every period and call the position/speed calculation function. This example uses the IQMath library to simplify high-precision calculations.

In addition to the main example file, the following files must be included in this project:

- *eqep_ex2_calculation.c* - contains position/speed calculation function
- *eqep_ex2_calculation.h* - includes initialization values for position/speed structure

The configuration for this example is as follows

- Maximum speed is configured to 6000rpm (baseRPM)
- Minimum speed is assumed at 10rpm for capture pre-scaler selection

- Pole pair is configured to 2 (polePairs)
- Encoder resolution is configured to 4000 counts/revolution (mechScaler)
- Which means: $4000 / 4 = 1000$ line/revolution quadrature encoder (simulated by ePWM1)
- ePWM1 (simulating QEP encoder signals) is configured for a 5kHz frequency or 300 rpm ($= 4 * 5000 \text{ cnts/sec} * 60 \text{ sec/min} / 4000 \text{ cnts/rev}$)

SPEEDRPM_FR: High Speed Measurement is obtained by counting the QEP input pulses for 10ms (unit timer set to 100Hz).

$$\text{SPEEDRPM_FR} = (\text{Position Delta} / 10\text{ms}) * 60 \text{ rpm}$$

SPEEDRPM_PR: Low Speed Measurement is obtained by measuring time period of QEP edges. Time measurement is averaged over 64 edges for better results and the capture unit performs the time measurement using pre-scaled SYSCLK.

Note that the pre-scaler for capture unit clock is selected such that the capture timer does not overflow at the required minimum frequency. This example runs indefinitely until the user stops it.

For more information about the position/speed calculation see the comments at the beginning of eqep_ex2_calculation.c and the XLS file provided with the project, eqep_ex2_calculation.xls.

External Connections

For External connections, Control Card settings are used by default. To use launchpad pins for output select them in SysConfig.

- On controlCARD, Connect GPIO25/eQEP1A to GPIO0/ePWM1A (simulates eQEP Phase A signal)
- On controlCARD, Connect GPIO29/eQEP1B to GPIO1/ePWM1B (simulates eQEP Phase B signal)
- On controlCARD, Connect GPIO23/eQEP1I to GPIO2 (simulates eQEP Index Signal)
- On LaunchPad, Connect GPIO40/eQEP1A to GPIO10/ePWM6A (simulates eQEP Phase A signal)
- On LaunchPad, Connect GPIO41/eQEP1B to GPIO11/ePWM6B (simulates eQEP Phase B signal)
- On LaunchPad, Connect GPIO59/eQEP1I to GPIO8 (simulates eQEP Index Signal)

Watch Variables

- *posSpeed.speedRPMFR* - Speed meas. in rpm using QEP position counter
- *posSpeed.speedRPMPR* - Speed meas. in rpm using capture unit
- *posSpeed.thetaMech* - Motor mechanical angle (Q15)
- *posSpeed.thetaElec* - Motor electrical angle (Q15)

23.11.1.3 ePWM frequency Measurement Using eQEP via xbar connection

FILE: eqep_ex3_epwm_xbar.c

This example will calculate the frequency of an PWM signal using the eQEP module. ePWM1A is configured to generate this input signal with a frequency of 5 kHz. This ePWM signal is connected to input of eQEP using Input CrossBar and EPWM XBAR. ePWM module will interrupt once every period and call the frequency calculation function. This example uses the IQMath library to simplify high-precision calculations.

In addition to the main example file, the following files must be included in this project:

- *eqep_ex1_calculation.c* - contains frequency calculation function
- *eqep_ex1_calculation.h* - includes initialization values for frequency structure

The configuration for this example is as follows

- Maximum frequency is configured to 10KHz (baseFreq)
- Minimum frequency is assumed at 50Hz for capture pre-scaler selection
- GPIO0 is connected to output of INPUT_XBAR1
- INPUT_XBAR1 is connected to output of PWMXBAR at TRIP4
- eQEPA source is configured as PWMXBAR.1 output (TRIP4)

SPEED_FR: High Frequency Measurement is obtained by counting the external input pulses for 10ms (unit timer set to 100Hz). $\lfloor \text{SPEED_FR} = \frac{\text{Count} \Delta}{10\text{ms}} \rfloor$

SPEED_PR: Low Frequency Measurement is obtained by measuring time period of input edges. Time measurement is averaged over 64 edges for better results and the capture unit performs the time measurement using pre-scaled SYSCLK.

Note that the pre-scaler for capture unit clock is selected such that the capture timer does not overflow at the required minimum frequency. This example runs indefinitely until the user stops it.

For more information about the frequency calculation see the comments at the beginning of `eqep_ex1_calculation.c` and the XLS file provided with the project, `eqep_ex1_calculation.xls`.

Watch Variables

- `freq.freqHzFR` - Frequency measurement using position counter/unit time out
- `freq.freqHzPR` - Frequency measurement using capture unit

23.11.1.4 Frequency Measurement Using eQEP via unit timeout interrupt

FILE: `eqep_ex4_freq_cal_interrupt.c`

This example will calculate the frequency of an input signal using the eQEP module. ePWM1A is configured to generate this input signal with a frequency of 5 kHz. EQEP unit timeout is set which will generate an interrupt every `UNIT_PERIOD` microseconds and frequency calculation occurs continuously

The configuration for this example is as follows

- PWM frequency is specified as 5000Hz
- `UNIT_PERIOD` is specified as 10000 us
- Min frequency is $(1/(2*10ms))$ i.e 50Hz
- Highest frequency can be $(2^{32}/((2*10ms)))$
- Resolution of frequency measurement is 50hz

`freq` : Frequency Measurement is obtained by counting the external input pulses for `UNIT_PERIOD` (unit timer set to 10 ms).

For External connections, Control Card settings are used by default. To use launchpad pins for eQEP1A select them in SysConfig.

ExternalConnections for Control Card

- Connect GPIO25/eQEP1A to GPIO0/ePWM1A

ExternalConnections for LaunchPad

- Connect GPIO40/eQEP1A to GPIO10/ePWM6A

Watch Variables

- `freq` - Frequency measurement using position counter/unit time out
- `pass` - If measured frequency matches with PWM frequency then `pass = 1` else 0

23.11.1.5 Motor speed and direction measurement using eQEP via unit timeout interrupt

FILE: `eqep_ex5_speed_dir_motor.c`

This example can be used to sense the speed and direction of motor using eQEP in quadrature encoder mode. ePWM1A is configured to simulate motor encoder signals with frequency of 5 kHz on both A and B pins with 90 degree phase shift (so as to run this example without motor). EQEP unit timeout is set which will generate an interrupt every `UNIT_PERIOD` microseconds and speed calculation occurs continuously based on the direction of motor

The configuration for this example is as follows

- PWM frequency is specified as 5000Hz
- `UNIT_PERIOD` is specified as 10000 us
- Simulated quadrature signal frequency is 20000Hz (4 * 5000)
- Encoder holes assumed as 1000

- Thus Simulated motor speed is 300rpm ($5000 * (60 / 1000)$)

freq : Simulated quadrature signal frequency measured by counting the external input pulses for UNIT_PERIOD (unit timer set to 10 ms). *speed* : Measure motor speed in rpm *dir* : Indicates clockwise (1) or anticlockwise (-1)

External Connections (if motor encoder signals are simulated by ePWM)

For External connections, Control Card settings are used by default. To use launchpad pins for output select them in SysConfig.

- On controlCARD, Connect GPIO25/eQEP1A to GPIO0/ePWM1A
- On controlCARD, Connect GPIO29/eQEP1B to GPIO1/ePWM1B
- On LaunchPad, Connect GPIO40/eQEP1A to GPIO10/ePWM6A (simulates eQEP Phase A signal)
- On LaunchPad, Connect GPIO41/eQEP1B to GPIO11/ePWM6B (simulates eQEP Phase B signal)
- Comment in "MOTOR" in includes For External connections, Control Card settings are used by default. To use launchpad pins for output select them in SysConfig.
- On controlCARD, Connect GPIO25/eQEP1A to encoder A output
- On controlCARD, Connect GPIO29/eQEP1B to encoder B output

Watch Variables

- *freq* : Simulated motor frequency measurement is obtained by counting the external input pulses for UNIT_PERIOD (unit timer set to 10 ms).
- *speed* : Measure motor speed in rpm
- *dir* : Indicates clockwise (1) or anticlockwise (-1)
- *pass* - If measured quadrature frequency matches with i.e. input quadrature frequency ($4 * \text{PWM frequency}$) then pass = 1 else fail = 1 (** only when "MOTOR" is commented out)

23.12 eQEP Registers

This section describes the Enhanced Quadrature Encoder Pulse Registers.

23.12.1 EQEP Base Address Table

Table 23-4. EQEP Base Address Table

Complex bit access types are encoded to fit into small table cells. Table 23-6 shows the codes that are used for access types in this section.

Table 23-6. EQEP_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear

Table 23-6. EQEP_REGS Access Type Codes (continued)

Access Type	Code	Description
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

23.12.2.1 QPOSCNT Register (Offset = 0h) [Reset = 0000000h]

QPOSCNT is shown in [Figure 23-26](#) and described in [Table 23-7](#).

Return to the [Summary Table](#).

Position Counter

Table 23-7. QPOSCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	QPOSCNT	R/W	0h	Position Counter This 32-bit position counter register counts up/down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. This Register acts as a Read ONLY register while counter is counting up/down. Note: It is recommended to only write to the position counter register (QPOSCNT) during initialization, i.e. when the eQEP position counter is disabled (QPEN bit of QEPCNTL is zero). Once the position counter is enabled (QPEN bit is one), writing to the eQEP position counter register (QPOSCNT) may cause unexpected results. Reset type: SYSRSn

23.12.2.2 QPOSINIT Register (Offset = 2h) [Reset = 0000000h]

QPOSINIT is shown in [Figure 23-27](#) and described in [Table 23-8](#).

Return to the [Summary Table](#).

Table 23-10. QPOSCMP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	QPOSCMP	R/W	0h	Position Compare The position-compare value in this register is compared with the position counter (QPOSCNT) to generate sync output and/or interrupt on compare match. Writes to this register should always be full 32-bit writes. Reset type: SYSRSn

23.12.2.5 QPOSILAT Register (Offset = 8h) [Reset = 0000000h]

QPOSILAT is shown in [Figure 23-30](#) and described in [Table 23-11](#).

Return to the [Summary Table](#).

Index Position Latch

Figure 23-30. QPOSILAT Register

Table 23-11. QPOSILAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	QPOSILAT	R	0h	Index Position Latch The position-counter value is latched into this register on an index event as defined by the QEPCTL[IEL] bits. Reset type: SYSRSn

23.12.2.6 QPOSSLAT Register (Offset = Ah) [Reset = 0000000h]

QPOSSLAT is shown in [Figure 23-31](#) and described in [Table 23-12](#).

Return to the [Summary Table](#).

Strobe Position Latch

Figure 23-31. QPOSSLAT Register

Table 23-12. QPOSSLAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	QPOSSLAT	R	0h	Strobe Position Latch The position-counter value is latched into this register on a strobe event as defined by the QEPCTL[SEL] bits. Reset type: SYSRSn

23.12.2.7 QPOSLAT Register (Offset = Ch) [Reset = 0000000h]

QPOSLAT is shown in [Figure 23-32](#) and described in [Table 23-13](#).

Return to the [Summary Table](#).

Position Latch

Figure 23-32. QPOSLAT Register

Table 23-13. QPOSLAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	QPOSLAT	R	0h	Position Latch The position-counter value is latched into this register on a unit time out event. Reset type: SYSRSn

23.12.2.8 QUTMR Register (Offset = Eh) [Reset = 0000000h]

QUTMR is shown in [Figure 23-33](#) and described in [Table 23-14](#).

Return to the [Summary Table](#).

QEP Unit Timer

Figure 23-33. QUTMR Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
QUTMR																															
R/W-0h																															

Table 23-14. QUTMR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	QUTMR	R/W	0h	QEP Unit Timer This register acts as time base for unit time event generation. When this timer value matches the unit time period value a unit time event is generated. Writes to this register should always be full 32-bit writes. Reset type: SYSRSn

23.12.2.9 QUPRD Register (Offset = 10h) [Reset = 0000000h]

QUPRD is shown in [Figure 23-34](#) and described in [Table 23-15](#).

Return to the [Summary Table](#).

QEP Unit Period

Figure 23-34. QUPRD Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
QUPRD																															
R/W-0h																															

Table 23-15. QUPRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	QUPRD	R/W	0h	QEP Unit Period This register contains the period count for the unit timer to generate periodic unit time events. These events latch the eQEP position information at periodic intervals and optionally generate an interrupt. Writes to this register should always be full 32-bit writes. Reset type: SYSRSn

23.12.2.10 QWDTMR Register (Offset = 12h) [Reset = 0000h]

QWDTMR is shown in [Figure 23-35](#) and described in [Table 23-16](#).

Return to the [Summary Table](#).

13-12	PCRM	R/W	0h	Position counter reset Reset type: SYSRSn 0h (R/W) = Position counter reset on an index event 1h (R/W) = Position counter reset on the maximum position 2h (R/W) = Position counter reset on the first index event 3h (R/W) = Position counter reset on a unit time event
11-10	SEI	R/W	0h	Strobe event initialization of position counter Reset type: SYSRSn 0h (R/W) = Does nothing (action disabled) 1h (R/W) = Does nothing (action disabled) 2h (R/W) = Initializes the position counter on rising edge of the QEPS signal 3h (R/W) = Clockwise Direction: Initializes the position counter on the rising edge of QEPS strobe Counter Clockwise Direction: Initializes the position counter on the falling edge of QEPS strobe

Table 23-19. QEPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	IEI	R/W	0h	Index event init of position count Reset type: SYSRSn 0h (R/W) = Do nothing (action disabled) 1h (R/W) = Do nothing (action disabled) 2h (R/W) = Initializes the position counter on the rising edge of the QEPI signal (QPOSCNT = QPOSINIT) 3h (R/W) = Initializes the position counter on the falling edge of QEPI signal (QPOSCNT = QPOSINIT)
7	SWI	R/W	0h	Software init position counter Reset type: SYSRSn 0h (R/W) = Do nothing (action disabled) 1h (R/W) = Initialize position counter (QPOSCNT=QPOSINIT). This bit is not cleared automatically
6	SEL	R/W	0h	Strobe event latch of position counter Reset type: SYSRSn 0h (R/W) = The position counter is latched on the rising edge of QEPS strobe (QPOSSLAT = POSCCNT). Latching on the falling edge can be done by inverting the strobe input using the QSP bit in the QDECCTL register 1h (R/W) = Clockwise Direction: Position counter is latched on rising edge of QEPS strobe Counter Clockwise Direction: Position counter is latched on falling edge of QEPS strobe
5-4	IEL	R/W	0h	Index event latch of position counter (software index marker) Reset type: SYSRSn 0h (R/W) = Reserved 1h (R/W) = Latches position counter on rising edge of the index signal 2h (R/W) = Latches position counter on falling edge of the index signal 3h (R/W) = Software index marker. Latches the position counter and quadrature direction flag on index event marker. The position counter is latched to the QPOSILAT register and the direction flag is latched in the QEPSTS[QDLF] bit. This mode is useful for software index marking.
