Figure 7-117. ISS ISP IPIPE RGB2YCbCr Module Block Diagram

camisp-161

7.3.3.5.12 ISS ISP IPIPE 4:2:2 Conversion Module

The 4:2:2 conversion module converts the image data to YCbCr-4:2:2 format by taking the average of every two Cb and Cr components. Y and Cb/Cr sampling point of spatial cosited or spatial centering are selectable using the IPIPE_YUV_PHS[0] POS bit. Horizontal 3 taps and 4- or 2-tap filters are used for spatial cosited and spatial centering, respectively. The module is enabled from the IPIPE_YUV_PHS[1] PLF bit.

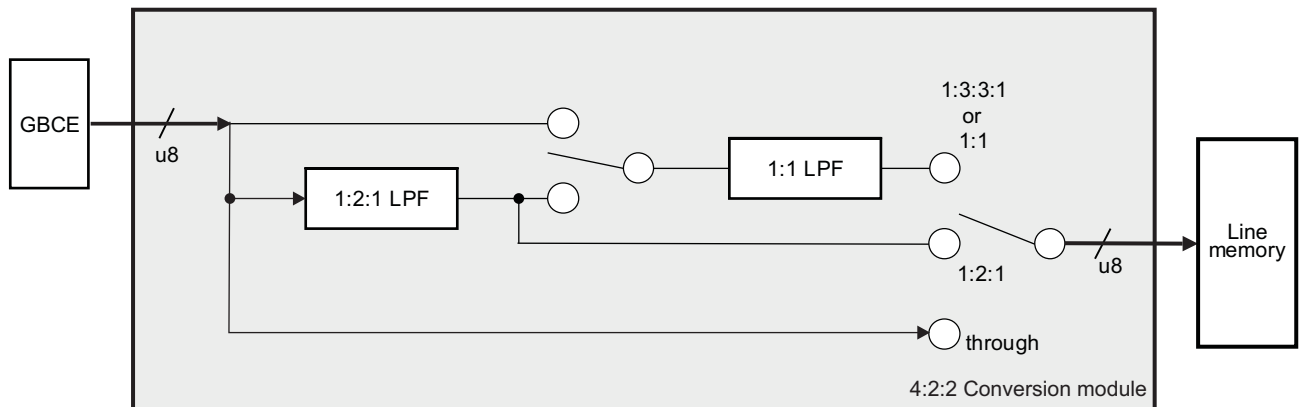

Figure 7-118. ISS ISP IPIPE Chroma Subsampling Position

camisp-164

Figure 7-119 is a block diagram of the 4:2:2 conversion module.

Figure 7-119. ISS ISP IPIPE 4:2:2 Conversion Module Block Diagram

camisp-165

7.3.3.5.13 ISS ISP IPIPE 2D Edge-Enhancer

NOTE: For the location of 2D edge-enhancer memory accesses, see [Section 7.3.3.11, ISS ISP Memory Mapping](#).

The edge-enhancer module operates on the Luma (Y data) component of images to improve the image quality and can be enabled from the `IPIPE_YEE_EN[0]` EN bit. Edges in input images are detected by a 2D high-pass filter, and its sharpness is increased by the value from a nonlinear table. [Figure 7-121](#) shows a block diagram of the Luma nonlinear edge-enhancer. Entry for the nonlinear table is 10-bit and the output is in signed 9-bit.

In edge-enhancer mode when `IPIPE_YEE_TYP[0]` SEL is set to 0, linear filter with programmable coefficient is applied to the Y input. Here, M is a 5 × 5 matrix with programmable coefficients (`IPIPE_YEE_MUL_xx`, where xx = 00, 01, 02, 10, 11, 12, 20, 21, 22). A down shift of high-pass filter is applied to the edge-enhancer from the `IPIPE_YEE_SHF[3:0]` SHF bit field (`shfHPF` in the formula in [Figure 7-120](#)).

Figure 7-120. ISS ISP IPIPE 2D Edge-Enhancer Linear Filter

$$HPF(h, v) = \left(\sum_{j=-2}^2 \sum_{i=-2}^2 M_{i,j} Y(h+i, v+j) \right) \gg shf_{HPF}$$

$$M = \begin{pmatrix} M_{2,2} & M_{1,2} & M_{0,2} & M_{1,2} & M_{2,2} \\ M_{2,1} & M_{1,1} & M_{0,1} & M_{1,1} & M_{2,1} \\ M_{2,0} & M_{1,0} & M_{0,0} & M_{1,0} & M_{2,0} \\ M_{2,1} & M_{1,1} & M_{0,1} & M_{1,1} & M_{2,1} \\ M_{2,2} & M_{1,2} & M_{0,2} & M_{1,2} & M_{2,2} \end{pmatrix}$$

camisp-801

Then, the HPF value is shrunk by a threshold value (`u6`) specified by the `IPIPE_YEE_THR` register (`thresholdHPF` in the formula), and clipped to signed 10 bits to get the index for the LUT.

Figure 7-121. ISS ISP IPIPE 2D Edge-Enhancer Indexing

$$index = clip \left(shrink \left(HPF, threshold_{HPF} \right), -512, 511 \right)$$

$$shrink(x, threshold) = \begin{cases} x + threshold & x < -threshold \\ 0 & -threshold \leq x \leq threshold \\ x - threshold & threshold < x \end{cases}$$

$$clip(x, limit_{LOW}, limit_{HIGH}) = \begin{cases} -limit_{LOW} & x < -limit_{LOW} \\ x & -limit_{LOW} \leq x \leq limit_{HIGH} \\ limit_{HIGH} & limit_{HIGH} < x \end{cases}$$

camss-661

Moreover, the edge-enhancement intensity is looked up from the LUT through the formula shown in [Figure 7-122](#) and in [Table 7-641](#).

Figure 7-122. ISS ISP IPIPE 2D Edge Intensity LUT Formula

$$E_{int} = LUT[index]$$

camss-662

Table 7-641. ISS ISP IPIPE Edge-Enhancer LUT Mapping

Address (32-bit Word Address)	Bit Position	LUT Index

Figure 7-123 shows the LUT packing, and Figure 7-124 shows the 2D edge-enhancer block diagram.

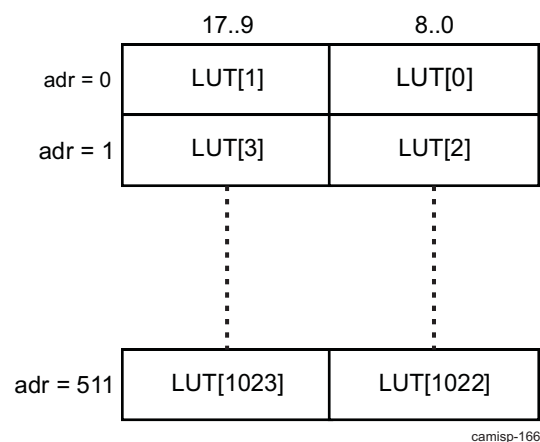

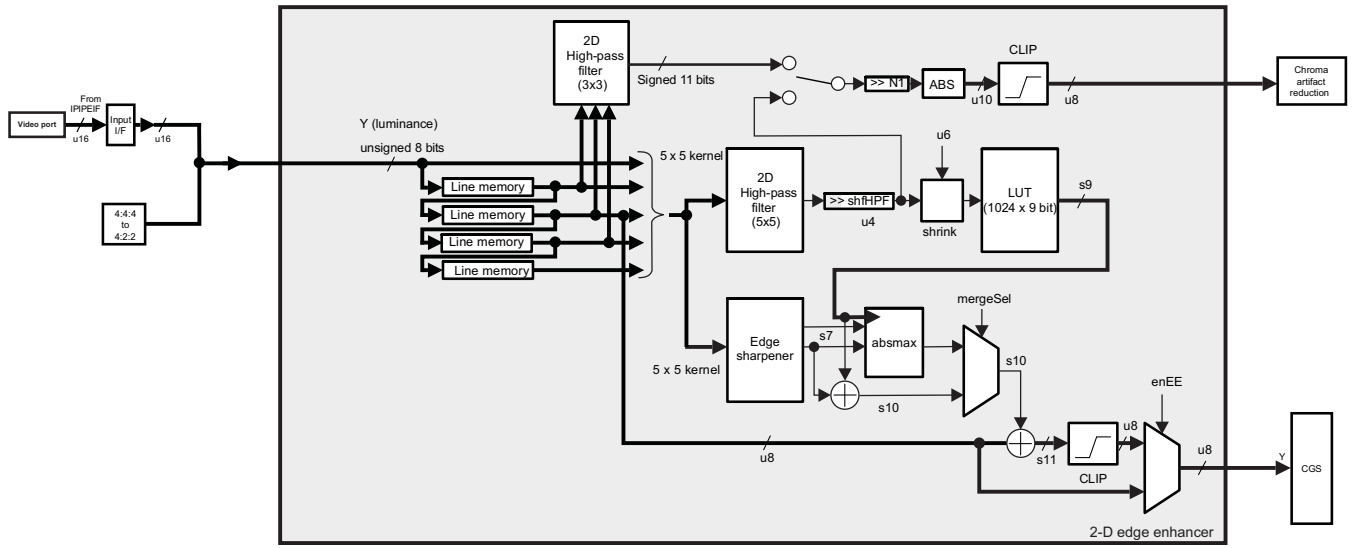

Figure 7-123. ISS ISP IPIPE 2D Edge-Enhancer LUT Packing

Figure 7-124. ISS ISP IPIPE 2D Edge-Enhancer Block Diagram

camisp-167

In edge sharpener mode, enabled when `IPIPE_YEE_TYP[0] SEL = 1`, edge clarity is enhanced without producing a halo artifact. In this module, edge intensity is derived by the 2D linear filter with fixed coefficients shown in Figure 7-125.

Figure 7-125. ISS ISP IPIPE Edge Sharpener Details

$$S_{i,j} = \begin{bmatrix} 0 & -1 & -2 & -1 & 0 \\ -1 & 0 & 2 & 0 & -1 \\ -2 & 2 & 8 & 2 & -2 \\ -1 & 0 & 2 & 0 & -1 \\ 0 & -1 & -2 & -1 & 0 \end{bmatrix}$$

$$sharpness(h,v) = clip \left(shrink \left(g \times \left(\sum_{j=-2}^2 \sum_{i=-2}^2 S_{i,j} Y(h+i, v+j) \right) \gg 3, threshold_{LOW} \right) \gg 6, -threshold_{HIGH}, threshold_{HIGH} \right)$$

camisp-663

The gain (g) and threshold values for the shrink/clip function ($threshold_{LOW}$, $threshold_{HIGH}$) are determined by the `IPIPE_YEE_E_GAN`, `IPIPE_YEE_E_THR_1`, and `IPIPE_YEE_E_THR_2` registers. The bit width of g and $threshold_{HIGH}$ is in U6, and $threshold_{LOW}$ is in U12Q6.

This edge intensity is then clipped by a threshold value in the formula shown in Figure 7-126.

Figure 7-126. ISS ISP IPIPE 2D Edge-Intensity Clipping Formula

$$S_{int} = \begin{cases} clip(sharpness, -grad, grad) & \text{Halo reduction on} \\ sharpness & \text{Halo reduction off} \end{cases}$$

camisp-664

The threshold value ($grad$) is a function of the activity around the target pixel, which is derived from gradient values. Gain and offset are specified by `IPIPE_YEE_G_GAN` and `IPIPE_YEE_G_OFT`

Capping with gradient value prevents overly enhancing edges, and suppresses halo artifacts around edges.

The output from edge-enhancer and edge sharpener are merged with the function shown in Figure 7-127.

Figure 7-127. ISS ISP IPIPE 2D Edge Enhancer and Sharpener Merger Formula

$$E_{merge} = \begin{cases} E_{int} + S_{int} & IPIPE_YEE_TYP[0]SEL = 0 \\ \text{absmax}(E_{int}, S_{int}) & IPIPE_YEE_TYP[0]SEL = 1 \end{cases}$$

$$\text{absmax}(x, y) = \begin{cases} x & \text{abs}(y) \leq \text{abs}(x) \\ y & \text{otherwise} \end{cases}$$

camisp-666

The E_{merge} value is added to the Y input value to make the final output.

For Chroma suppression, another 2D high-pass filter (HPF) is implemented. One of the four coefficient sets shown in [Figure 7-128](#) is selectable.

Figure 7-128. ISS ISP IPIPE 2D Edge Chroma-Suppression Coefficient Sets

$$\begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \quad \text{or} \quad \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

camss-667

At the end of the edge-enhancer process, brightness and contrast adjustment are applied to the Y signal. The formula shown in [Figure 7-129](#) describes the process.

Figure 7-129. ISS ISP IPIPE 2D Edge-Brightness and Contrast Adjustments Formula

$$Y_{ctr_brt} = \text{clip8}(\text{clip8}(Y_{EE} \times \text{CTR}) \gg 4) + \text{BRT}$$

$$\text{clip8}(x) = \begin{cases} x & x \leq 255 \\ 255 & 255 < x \end{cases}$$

camisp-668

In the formula from [Figure 7-129](#), Y_{EE} is the output (Y) of the Edge-Enhancer, as shown in [Figure 7-124](#). CTR is a U8Q4 contrast enhancement factor (configured through the `IPIPE_YUV_ADJ[7:0]` CTR bit field), BRT is a U8 brightness enhancement factor (configured through the `IPIPE_YUV_ADJ[15:8]` BRT bit field), and Y_{CTR_BRT} is the output with brightness and contrast adjustment applied.

7.3.3.5.14 ISS ISP IPIPE Histogram

NOTE: The boxcar function can be used simultaneously with the histogram function if needed.

NOTE: For the locations of histogram memory access, see [Section 7.3.3.11, ISS ISP Memory Mapping](#).

The histogram module counts the number of pixels that have a value in a region and can be enabled from the `IPIPE_HST_EN[0]` EN bit. In addition to RAW input mode, Histogram can be performed on on YUV input in `YUVtoRGB_MODE` or `YUV444_MODE` ((`SRC_FMT [FMT]=3`, `SRC_FMT [FMT2]=1` or `2`). Moreover, if enabled, the `IPIPE_HST_MODE` register can be set to work constantly or one time. If the `IPIPE_HST_MODE[0]` OST bit is set to 1, the histogram is disabled by clearing the `IPIPE_HST_EN[0]` EN bit to 0 after one run (one-shot mode).

After enabling the module, the following features are available:

- The data to be summed is taken from the DPC memory or RGB2YCbCr module. The choice is made in the `IPIPE_HST_SEL[2]` SEL bit.
- When data are collected from the DPC memory, the sampled colors are R/G/B/Y. Y is derived in the following method:

$$Y = (\text{HST_MUL_R} * R + \text{HST_MUL_GR} * Gr + \text{HST_MUL_GB} * Gb + \text{HST_MUL_B} * B) \quad (1)$$

For the G histogram, Gb, Gr, or the average is used, through the `IPIPE_HST_SEL[1:0]` TYP bit field.

- Two sets of 512 × 20-bit memory are used.
- The number of bins can be set from 32 to 256 in the `IPIPE_HST_PARA[13:12]` BIN bit field.
- The number of regions (areas) from 1 to 4; each region can be enabled through `IPIPE_HST_PARA[x]` RGNx (where x = 0 to 3). The positions of the regions are defined in `IPIPE_HST_x_VPS` and `IPIPE_HST_x_HPS`, and the vertical and horizontal size are defined by `IPIPE_HST_x_VSZ` and `IPIPE_HST_x_HSZ`, respectively (where x = 0 to 3).
- The number of regions × the number of bins ≤ 256.
- Each region can be turned on/off counting.
- The regions have priority orders.
- Each region has its own start coordinate X/Y (12 bits) and horizontal/vertical sizes (12 bits)
- When regions are overlapped, the value in the overlapped region is accumulated only in the region with the highest priority.
- The number of colors to be counted is from 1 to 4. Each color in all regions can be turned off counting (the `IPIPE_HST_PARA[7:4]` bit field).
- The value of each pixel is down-shifted (0–11) before counting using the `IPIPE_HST_PARA[11:8]` SHF bit field.
- When the value of a bin reaches ($2^{20} - 1$), the value is saturated until the memory is cleared.
- Number of bins: 32, 64, 128, or 256

The histogram memory can be cleared at the VD signal. When the memory is cleared, the first line of each frame cannot be sampled by the histogram if the width of the frame is larger than 512. If the width of the frame is smaller than 512, the first ceil (512/width) lines cannot be collected, where ceil(x) is the smallest integer value above x. If the clearing function is not enabled, the histogram bins are accumulated over the previous values.

The histogram has two banks of memories, which can be switched alternatively. The two memory banks are slipped into four histogram memory tables. Only two tables can be used at a time: output memory tables 0 and 1, or tables 2 and 3. To initialize tables, set the `IPIPE_HST_TBL[1]` CLR bit to 1, and to select which set of tables to uses, switch the `IPIPE_HST_TBL[0]` SEL bit between 0 and 1.

The mapping of histogram memory is shown in [Table 7-642](#). The switching of the two memories is done through `HST_TBL[SEL]`, which is latched at VD. Example of the use of this switching is as following

- For frame-0, set `HST_TBL [SEL]=0`. Histogram engine uses memory 0 and 1 (Bank 0).
- After IPIPE starts processing frame-0 and the register update is allowed, which is indicated by `ipipe_int_reg`, CPU sets `HST_TBL [SEL]=1`. This makes histogram module use memory 2 and 3 in the next frame.
- After IPIPE completes the histogram collection of frame-0 (`ipipe_int_hst`), CPU or DMA starts transferring memory 0 and 1 to SDRAM.
- Repeat step 2 and 3 for each of the following frames. `HST_TBL [SEL]` changes alternatively every frame. CPU/DMA accesses the memory that is not accessed by the histogram module.

Table 7-642. ISS ISP IPIPE Histogram memory mapping

A gain for each color can be applied using the IPIPE_HST_MUL_x registers, where x = R, GR, GB, or B.

7.3.3.5.15 ISS ISP IPIPE Boxcar

The boxcar module generates a boxcar by taking mosaic image data and averaging the red, green, and blue pixels in an 8 × 8 or 16 × 16 block to produce one red, green, and blue output, as shown in [Figure 7-130](#) and in [Figure 7-131](#). Here, similar to the histogram module, the boxcar is enabled from the IPIPE_BOX_EN[0] EN bit, and if the mode is set to run once (one shot) (IPIPE_BOX_MODE[0] OST = 1), the enable bit is cleared after the run. The size of the blocks is determined from the IPIPE_BOX_SHF[0] SEL bit, where if set to 0 = 8 × 8, and 1 = 16 × 16.

The result of this operation is a full-color image with (1/64) or (1/256) area of the original image. The maximum input horizontal width is 8190 pixels when a 16 × 16 block is used; the width is 4096 when an 8 × 8 block is used. Also, the image size (width and height) must be a multiple of 16 for a 16 × 16 block, and a multiple of 8 for an 8 × 8 block. Boxcar operation works on 12-bit Bayer data and outputs 16-bit data. The output data is 48-bit RGB data for each 8 × 8 or 16 × 16 block. The 48-bit data is aligned in 64-bit format in SDRAM as shown in [Figure 7-132](#). The first address of SDRAM access is specified by the IPIPE_BOX_SDR_SAD_H and IPIPE_BOX_SDR_SAD_L registers. The output data are written to SDRAM continuously line by line; there is no address offset between lines. After the image transfer of each frame completes, the ipipe_eof signal is sent to buffer logic. This signal is issued at the same timing as ipipe_int_dma.

Figure 7-130. ISS ISP IPIPE Boxcar Operation (8 × 8 Block)

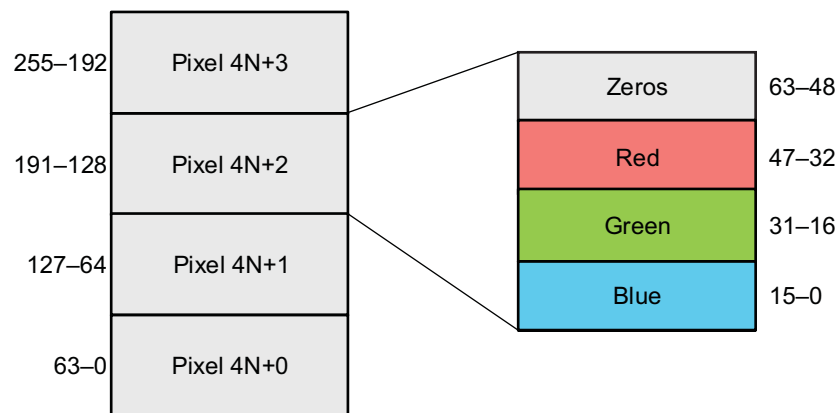

camisp-192

Figure 7-131. ISS ISP IPIPE Boxcar Operation (16 × 16 Block)

camisp-193

Figure 7-132. ISS ISP IPIPE Boxcar Data Packing in SDRAM

camisp-194

The right-shift value is specified by the `IPIPE_BOX_SHF` register, which has a range of 0 to 4. (The shift down is performed to fit the 20-bit accumulated value into 16-bit output.) For green signal processing, a divide-by-two operation rounds off the LSB.

7.3.3.6 ISS ISP RSZ Functional Description

7.3.3.6.1 ISS ISP RSZ Overview

The RSZ module rescales images into various sizes ranging from x1/4096 scale-down to x16 scale-up. The RSZ data slave interfaces support a parallel VP. The RSZ module can produce two output images simultaneously, because there are two independent resizer engines. The input data used by the two resizer engines is the same.

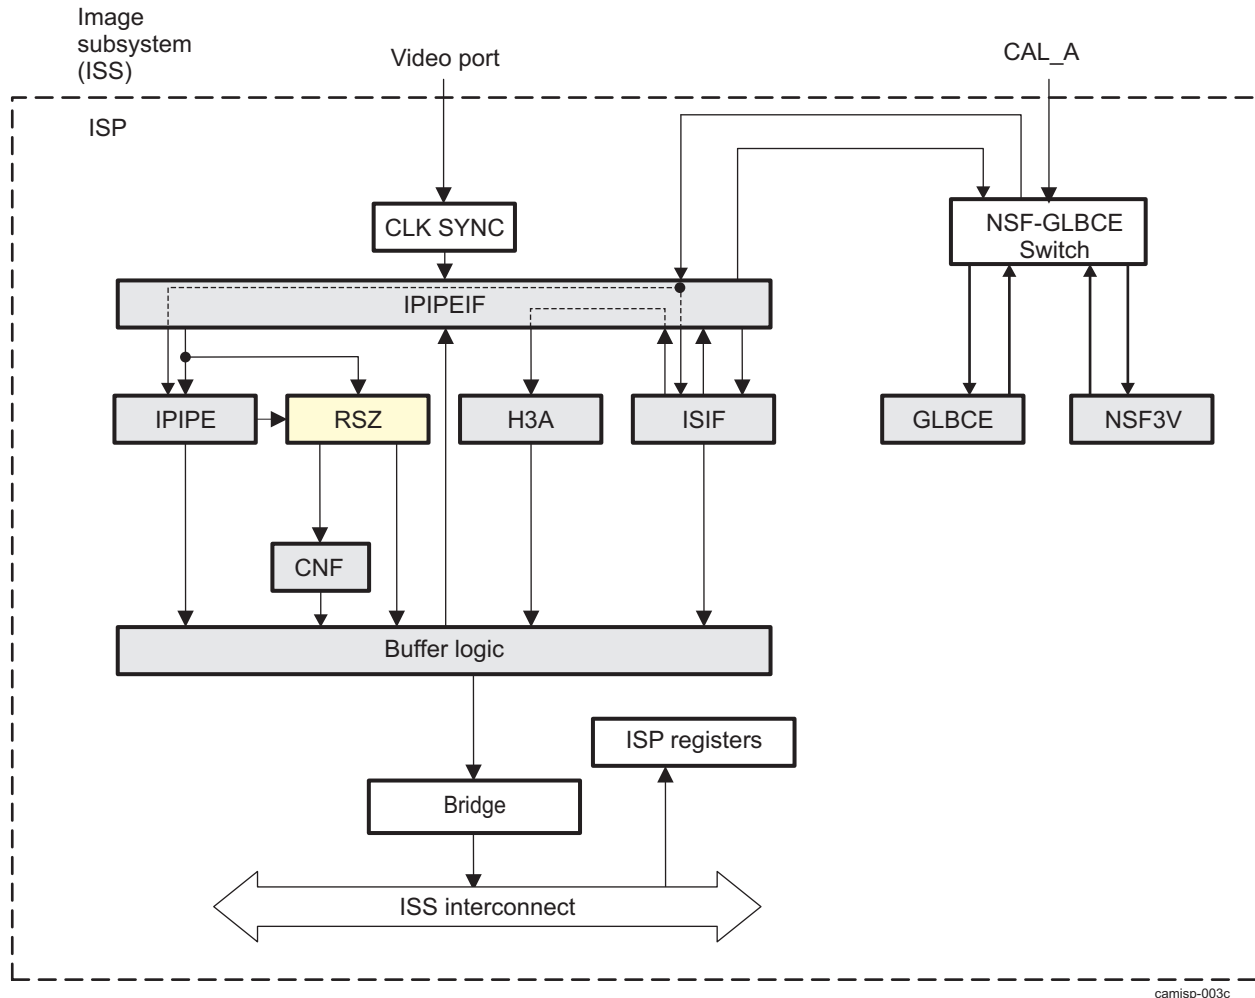

The RSZ module has the following capabilities:

- Input/output data formats:
 - Common input data for the two resizer engines
 - Independent output data formats for the two resizer engines
 - Supports YUV4:2:2 input and then supports YUV4:2:2/YUV4:2:0 or RGB5:6:5/ARGB32 output:
 - Output rates up to 212.8 MPix/s for YUV4:2:2/YUV4:2:0 or RGB5:6:5 output:
 - Output rates up to 212.8 MPix/s for ARGB32 output
 - Supports YUV4:2:0 input data and then supports only YUV4:2:0
 - YUV4:2:0 input format not supported natively:
 - Two passes required: Luma followed by Chroma or vice versa
 - Input and output rates up to 106,4 MPix/s in this configuration (YUV4:2:0)
 - Only supported from memory to memory
 - Supports RAW Bayer input and RAW Bayer output:
 - RAW format invariant. Takes whichever RAW format at the input and writes it out unmodified: 16 bits are read, 16 bits are written out.
 - No resizing can take place on RAW data.
- Resizer capabilities:
 - Input image cropping:
 - Common for the two resizer engines: Same input data before and after cropping
 - Supported on YUV4:2:2 and RAW data formats
 - Supported on pass-through mode data path
 - Supported on bypass mode data path
 - Dual resizer engines: RSZ-A and RSZ-B:
 - Up to x20 upsampling and x1/4096 downsampling on both engines
 - Up to 212.8-MHz pixel throughput on both resizer engines
 - Programmable data rate control to smooth the peak memory bandwidth
 - RSZ-A: Horizontal resolution of up to 8K pixels on RSZ-A
 - RSZ-B: Horizontal resolution of up to 8K pixels on RSZ-B
 - Independent Y and Cb/Cr phases on horizontal and vertical axis:
 - Enables to take care of different YUV4:2:0 phases used in different video formats
 - Enables frame division mode: Images can be stitched together with the right phase.
 - Rescaling: two modes supported:
 - Normal mode for upscale and downscale: Higher flexibility but lower downscale quality
 - Downscale mode for downscale only: Lower flexibility but higher downscale quality
 - Filtering: two modes supported:
 - Independent settings for the horizontal and vertical directions
 - 3-tap low-pass filter with 2-tap linear interpolation
 - 4-tap cubic interpolation
 - Flip support of the output image:

- Horizontal flip
- Vertical flip
- Pixel duplication on the top/bottom, left/right sides: Avoids losing pixels at the image boundaries because of the filtering
- Support pass-through and bypass modes: Resizer engines bypassed:
 - Pass-through mode
 - RAW and YUV4:2:2 data support
 - Lower power consumption mode to transfer data to memory
 - Can transfer images larger than 8K pixels to memory
 - Bypass mode
 - RAW and YUV4:2:2 data support
 - Input buffer used. Can benefit from additional buffering in case the BL module memory is not big enough and back pressure occurs.
- Slave data interface: VP interface:
 - Two VP interfaces: The programming model selects which VP is used to input data to the RSZ module. Both VPs cannot be active simultaneously.
 - VP 1: Typically connected to the IPIPE module.
 - VP 2: Typically connected to the IPIPEIF module.
 - Up to 212.8-MHz pixel clock
- Master data interface:
 - Two interfaces to the BL module:
 - Up to 212.8 MHz
 - 32-bit-wide, 32-byte-long requests
 - Accesses are aligned on 32-byte boundaries.
 - Used to transfer data to memory
 - Each interface is dedicated to a single output image.
 - Addressing modes:
 - Linear
 - Circular
- Chroma Noise Filter
 - RSZ-A works with CNF (Chroma Noise Filter) to filter Cb/Cr of YCbCr420 output
 - Filtering is done by the external CNF module. RSZ provides the tap-in/out points for CNF function, and control of CNF enable/disable and CDS enable/disable
 - CNF function on RSZA and RSZB can be independently programmed
- Configuration interface:
 - Up to 106,4 MHz
 - 32 bits wide
 - Used to configure the resizer registers
- Power management: Independent clock domains for the two resizers (Each resizer engine can be gated off separately)
- Error management: FIFO overflow detection on the input buffers

[Figure 7-133](#) show the RSZ module connections to other submodules of the ISP.

Figure 7-133. ISS ISP RSZ High-Level Diagram

camisp-003c

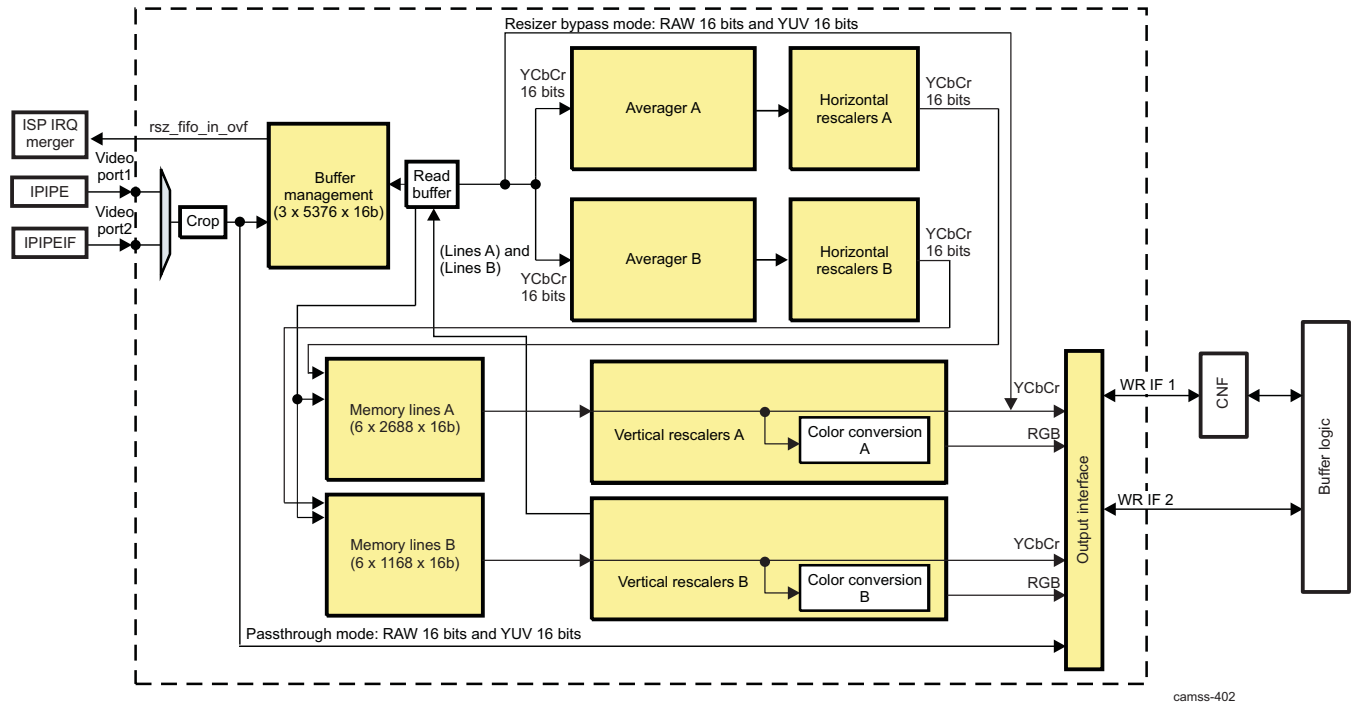

7.3.3.6.2 ISS ISP RSZ Top-Level Block Diagram

Figure 7-134 is the top-level block diagram of the RSZ module. The RSZ module comprises the following submodules: cropping, input data buffering, data requestor, averager, data saturation, and resizer interpolation (comprised of horizontal rescaler, vertical rescaler, color conversion, and output interface). See the following sections for more information.

The RSZ module comprises two independent resizer engines with the same capabilities (except for the memory line size). The input data can come from VP 1 or VP 2. Software must determine and control which interface is selected.

The RSZ module includes one VBUSP slave port, which is used to control the RSZ registers. It also includes two MTC master ports, which are used to pass the pixels to CFN module for RSZ1 or to the BL for RSZ2. If not needed CFN module can be bypassed. The BL in turn creates the burst requests to the memory subsystem (see Section 7.3.3.6.3, ISS ISP RSZ Interfaces).

Figure 7-134. ISS ISP RSZ Top-Level Block Diagram

7.3.3.6.3 ISS ISP RSZ Interfaces

The RSZ module has the following data interfaces:

- One 32-bit read/write point-to-point pending VBUSP interface
- Two slave VP interfaces for transport YUV and RAW data
- Two MTC interfaces to BL for RSZ-A and RSZ-B, with only write capabilities
- Interface of RSZ1 to CNF

7.3.3.6.3.1 ISS ISP RSZ VBUSP Interface

The VBUSP interface is a 32-bit read/write capable interface. The VBUSP interface must be programmed in a way that back-to-back requests are possible for read and write. The [RSZ_GCK_MMR\[0\]](#) MMR bit enables the memory register access from the VBUSP interface to enable transfer and signal such as MMR request, direction, enable write/read data can be enabled.

7.3.3.6.3.2 ISS ISP RSZ Video Port Interfaces

The VP interfaces are slave interfaces; one is connected to IPIPE, and the other to IPIPEIF (or GLBCE from the NSF-GLBCE data flow switch). These interfaces are for data transfer. [Table 7-643](#) lists the format supported across IPIPE/IPIPEIF and RSZ. Signals coming from IPIPE and IPIPEIF can be write-enable signals. The [RSZ_SRC_MODE\[1\]](#) WRT bit is set whether or not the write enable signals are considered. This is a line-valid qualifier. This signal is sampled on the rising edge of HD, and the value is used for the full line.

Table 7-643. ISS ISP RSZ VP Supported Formats

NOTE: The formats are set from the IPIPE and IPIPEIF registers. For more information, see [Section 7.3.3.5, ISS ISP IPIPE Functional Description](#), and [Section 7.3.3.4, ISS ISP IPIPEIF Functional Description](#).

7.3.3.6.3.3 ISS ISP RSZ MTC Interfaces

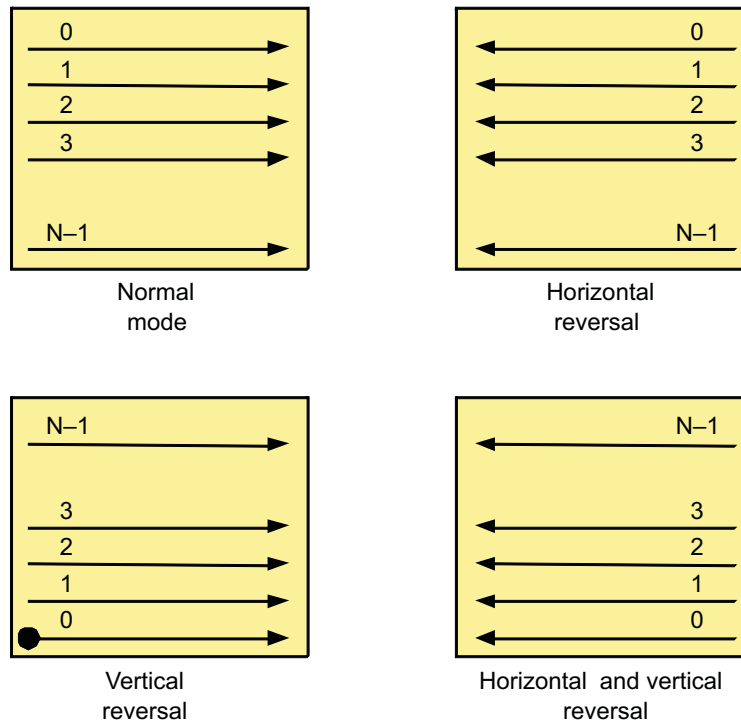

The RSZ module includes two write-only MTC interfaces. Their implementation enables passing a maximum of eight 32-byte requests in 10 clock cycles. The RSZ must be programmed to obtain smooth and average bandwidth to buffer logic module by setting a minimum interval between two successive requests (set the `RSZ_DMA_RZA[15:0]` RZA and `RSZ_DMA_RZB[15:0]` RZB bit fields for the A and B resizers as appropriate). This setting is not expected to be dynamic. It can be a fixed setting from request to request and frame to frame. When the bandwidth is set appropriately, between the first valid translated pixel and the EOF signal sent to buffer logic, the `RSZ_DMA_STA[0]` STATUS bit can be seen, and it is high if the transfer over the MTC interfaces is active. [Figure 7-135](#) shows how `RSZ_DMA_RZx` for resizers A and B affects the MTC data request generator.

Figure 7-135. ISS ISP RSZ MTC DMA Bandwidth Control

[Figure 7-136](#) shows the pixel order in memory written by the MTC. The arrows do not represent the order in which data is written. Data are always written from left to right, whether horizontal reversal is enabled or not.

Figure 7-136. ISS ISP RSZ MTC Image Data Storage Pixel Order

camss-684

The RSZ MTC interfaces can be stalled by the input MTC STALL signal. The assertion of the MTC STALL signal is a result of a hardware mechanism that monitors the CBUFF module to prevent its overflow. When this signal is asserted, the current 32-byte MTC request is finished and then the RSZ MTC output ports are stalled. For further details on the output ports, see [Section 7.3.3.6.6.7, ISS ISP RSZ Output Interface](#).

7.3.3.6.3.4 ISS ISP RSZ CNF Interface

When CNF receives a pixel data from RSZ, it asserts acknowledge signal. The acknowledge and data receive can be at the same clock, allowing 1pix/cycle transfer. When CNF sends a pixel back to RSZ, it raises req signal on the same clock cycle as the data. RSZ raises ACK signal when it receives the data. Req and Ack can be at the same clock to enable 1 pix/cycle transfer.

Table 7-644. ISS ISP RSZ CNF Data Interfaces (CNF output to RSZ)

Signal	Direction (from RSZ)	Description	Format
RZAtoCNFA_DOUT	OUT	RZA to CNFA data	8bit (Cb or Cr per cycle)
RZAtoCNFA_ACK	OUT	Acknowledge signal of the data from RZA to CNFA	1 bit. 1 cycle active high pulse
RZAtoCNFA_REQ	IN	Request signal of the data from RZA to CNFA	
CNFAtoRZA_DOUT	IN	CNFA to RZA data	8bit (Cb or Cr per cycle)
CNFAtoRZA_REQ	IN	Request signal of the data from CNFA to RZA	1 bit. 1 cycle active high pulse
CNFAtoRZA_ACK	OUT	Acknowledge signal of the data from RZA to CNFA	1 bit. 1 cycle active high pulse
CNFA_HE	IN	Line End signal from CNFA to RZA	1 bit. 1 cycle active high pulse
CNFA_VE	IN	Frame End signal from CNFA to RZA	1 bit. 1 cycle active high pulse

The following configuration are sent to CNF from ISP top (ISP6_SYS3):

- [ISP_CNF_EN\[0\]](#) CNFA_EN
- [ISP_CNF_EN\[1\]](#) CNFA_CDSEN

7.3.3.6.4 ISS ISP RSZ ICM Handshake Signals

The RESIZER module can do handshaking with ICM. For this purpose, RESIZER has two input signals (P_START_A/B) and two output signals (P_DONE_A/B) for each channel.

Table 7-645. ISS ISP RSZ ICM Handshake Interfaces

Signal name	Direction	Description
P_START_A	Input	Process start signal from ICM to RSZ_A. This signal is used for YUV422 mode and Y channel of YUV420.
P_DONE_A	Output	Process done signal from RSZ_A to ICM. This signal is used for YUV422 mode and Y channel of YUV420.
P_DONE_AC	Output	Process done signal from RSZ_A Chroma Channel to ICM. This signal is used only for C channel of YUV420.
P_START_B	Input	Process start signal from ICM to RSZ_B. This signal is used for YUV422 mode and Y channel of YUV420. In ISS configuration, this signal is tied '1' at ISS level.
P_DONE_B	Output	Process done signal from RSZ_B to ICM. This signal is used for YUV422 mode and Y channel of YUV420. In ISS6 configuration, this signal is left open.
P_DONE_BC	Output	Process done signal from RSZ_B Chroma Channel to ICM. This signal is used only for C channel of YUV420.

P_DONE_X (X=A/AC/B/BC) is high for 2 to 4 ISS_MAIN_FCLK cycles.

In ISS implementation, handshake between RSZB and ICM is not implemented. Therefore, P_START_B is tied "high" at ISS6 level. RSZ is designed so that, it can operate if any of P_START_A/AC/B/BC is always "1".

When handshaking is enabled ([RSZ_IRQ_RZA\[16\]](#) ICMA_EN=1 or [RSZ_IRQ_RZB\[16\]](#) ICMB_EN=1), RESIZE operate its RSZ_A output port in the following manner.

1. RSZ waits until P_START_A signal input from ICM.
2. RSZ output [RSZ_IRQ_RZA](#).RZA lines to SDRAM/SRAM
3. RSZ output P_DONE_A signal (2 to 4 ISS_MAIN_FCLK)
4. Repeat the cycle 1 through 3 until RSZ reaches the end of frame.
5. If [RSZ_IRQ_RZA](#).ICMA_EOF=1, issue P_DONE_A at the end of frame if it is not the end of RZA cycle

For RSZ_B, the process is exactly the same except the signals are P_START_B and P_DONE_B, and the parameters is [RSZ_IRQ_RZB](#) RZB. ([RSZ_IRQ_RZA](#) RZA and [RSZ_IRQ_RZB](#) RZB are shared with IRQ cycles.)

If P_START_A/B signal is not asserted for an extended period, and if the input buffer becomes close to buffer over flow, RSZ_INPUT_STALL signal must be asserted to suspend the input stream

RSZ starts ICM handshake and starts checking P_START_x signals only after it is enabled.

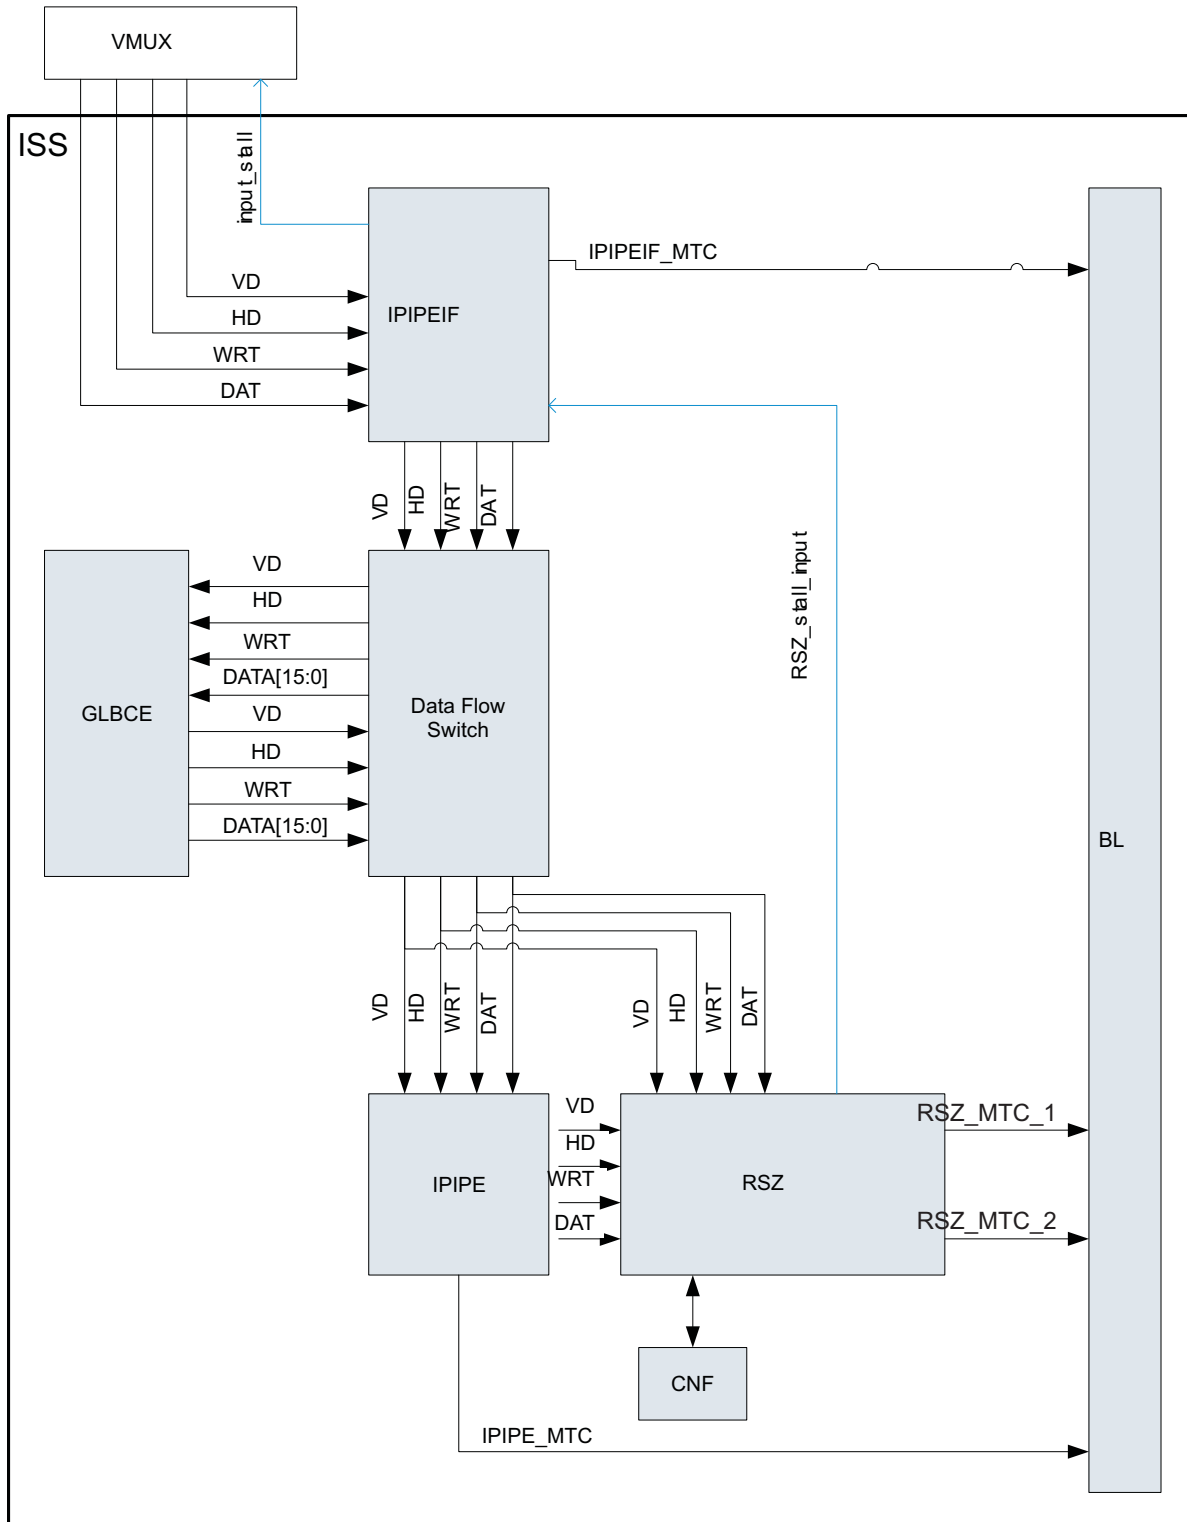

Example-1: RSZ in single shot mode: RSZ is enabled at the frame start after the first crop, and this timing is notified to SW through rsz_int_reg event. If P_START is sent to RSZ before this moment (rsz_int_reg), it is ignored. ICM Handshake must start after rsz_int_reg interrupt.

Example-2: RSZ in single shot mode: For each frame, RSZ is enabled at the frame start after the first crop (= rsz_int_reg issue timing). Any P_START received between the EOF of the last frame and the current frame start (rsz_int_reg) is ignored. ICM handshake for each frame must be started after rsz_int_reg interrupt.

7.3.3.6.5 ISS ISP RSZ Integration

[Figure 7-137](#) shows how the VP and interfaces of the RSZ module are connected to surrounding modules at the ISP level. The RSZ module gets data from the IPIPEIF module or IPIPE module.

Figure 7-137. ISS ISP RSZ Module Integration: High-Level Summary

camss-400

The following constraints apply to the RSZ module:

- The data coming from the IPIPEIF module can be RAW or YUV4:2:2 data. Because the RSZ module can rescale only YUV4:2:2 data, the RSZ module must be configured in pass-through mode when RAW data is received on VP 2. It is possible to bypass the resizer engine if YUV4:2:2 data is sent but

rescaling is not needed (bypass mode).

- The data coming from the IPIPE module can be RAW or YUV4:2:2 data. Eventually, YUV4:2:0 data can be sent through this path, but the data must be sent in two passes. Because the RSZ module can rescale only YUV4:2:2 data, the RSZ module must be configured in pass-through mode when RAW data is received on VP 1. It is possible to bypass the resizer engine if YUV4:2:2 data is sent but rescaling is not needed (bypass mode).

VP 2 provides a way to bypass the IPIPE module when YUV4:2:2 data is received from the images sensor or when YUV4:2:2 is read back from memory with the CAL_A or ISIF module.

[Table 7-646](#) summarizes the different RSZ configuration possibilities as a function of the input data format.

Table 7-646. ISS ISP RSZ Data Flow vs. Input Data Format Constraints

VP 1 Data Format	VP 2 Data Format	RSZ-A Configuration	RSZ-B Configuration	Comments
RAW	N/A	Disabled	Disabled	RSZ module in pass-through mode or bypass mode
N/A	RAW	Disabled	Disabled	RSZ module in pass-through mode or bypass mode
YUV4:2:2	N/A	Disabled	Disabled	RSZ module in pass-through mode or bypass mode
YUV4:2:2	N/A	Enabled	Disabled	One output image
YUV4:2:2	N/A	Disabled	Enabled	One output image
YUV4:2:2	N/A	Enabled	Enabled	Two output images
N/A	YUV4:2:2	Disabled	Disabled	RSZ module in pass-through mode or bypass mode
N/A	YUV4:2:2	Enabled	Disabled	One output image
N/A	YUV4:2:2	Disabled	Enabled	One output image
N/A	YUV4:2:2	Enabled	Enabled	Two output images

7.3.3.6.6 ISS ISP RSZ Functional Description

To start up, the RSZ configuration can be set from the [RSZ_SYSCONFIG](#) register, which provides enabling the RSZ-A and RSZ-B clocks. The RSZ module does not have stand-alone reset and status check. Software reset must be done at the ISP level. Moreover, when enabled, the RSZ module can control the input data buffer, and when the `rsz_stall_input` signals are set from the [RSZ_IN_FIFO_CTRL](#) register, the RSZ module generates a stall signal that can be used by the master module sending data to the RSZ module when the data threshold is too high.

The [RSZ_SRC_EN\[0\]](#) EN bit starts the resizer processing. If the processing mode is set to one shot (one run and then turn off) from the [RSZ_SRC_MODE\[0\]](#) OST bit, the EN bit is cleared to 0.

The RSZ module can be configured to be bypassed in certain cases (see [Figure 7-137](#) for the module constraints) from the [RSZ_SRC_FMT0\[1\]](#) BYPASS bit. The data can be sent directly from here to the output interface (bypass mode) or imported to the module buffer, but not manipulated and sent to the output interface (pass-through mode). The master device sending data to the RSZ can be switched between IPIPEIF and IPIPE using the [RSZ_SRC_FMT0\[0\]](#) SEL bit. The RSZ understanding of the data input is set from the [RSZ_SRC_FMT1](#) register (for more information, see [Table 7-648](#)). The [RSZ_SEQ.VRVX](#) and [RSZ_SEQ.HRVX](#) registers can be set to flip the image horizontally or vertically, respectively (see [Figure 7-136](#)).

Depending on the mode to which the RSZ is set, the core clock can be enabled from the [RSZ_GCK_SDR](#) register. [Table 7-647](#) summarizes the behavior of the RSZ module for the different settings.

Table 7-647. ISS ISP RSZ Module Modes: Register Settings

Configuration Number	RSZ_SR C_EN	RZA_EN	RZA_CL K_EN	RZB_EN	RZB_CLK_EN	RSZ_GC K_SDR_CORE	RSZ_SR C_FMT0 .BYPASS	Comments

Table 7-647. ISS ISP RSZ Module Modes: Register Settings (continued)

0	0	X	X	X	X	X	X	Data cannot go through the RSZ module. Interrupts are not issued.
1	1	0	X	0	X	1	0	RSZ-A is disabled. RSZ-B is disabled. It is best to have $RZA_EN = RZB_EN = 0$ to save power, but $RZA_EN = RZB_EN = 1$ is also supported.
2	1	1	1	0	X	1	0	This configuration is supported but does not make sense because data cannot go through the module. RSZ-A is enabled. RSZ-B is disabled. It is best to have $RZB_EN = 0$ to save power, but $RZB_EN = 1$ is supported as well.
3	1	0	X	1	1	1	0	RSZ-A is disabled. RSZ-B is enabled. It is best to have $RZA_EN = 0$ to save power, but $RZA_EN = 1$ is also supported.
4	1	1	1	1	1	1	0	Resizer A is enabled. Resizer B is enabled.
5	1	X	X	X	X	0	0	Bypass mode is enabled. Resizer core functional clock is disabled.
6	1	X	X	X	X	0	1	Pass-through mode enabled. Resizer core functional clock is disabled.
7	1	X	X	X	X	1	1	Pass-through mode is enabled. Resizer core functional clock is enabled. Not a preferred configuration. Configuration 6 saves power.

Table 7-648. ISS ISP RSZ Module Input Control: Register Settings

RSZ_SRC_FMT1.IN420	RSZ_SRC_FMT1.COL	Comments
0	X	YUV4:2:2 input. Chroma is co-sited.
1	0	YUV4:2:0 input. Valid data is Y, C is dummy. On the VP, YUV4:2:2 data is always assumed.
1	1	YUV4:2:0 input. Valid data is C, Y is dummy. On the VP, YUV4:2:2 data is always assumed.

The $RSZ_YUV_PHS[0]$ POS bit sets the Chroma output. The RSZ module does not change the relative position of the Chroma samples versus the Luma samples between the input and output, and the Chroma position at the output of the IPIPE module and at the output of the RSZ module must be identical. In other words, $RSZ_YUV_PHS.POS = IPIPE_YUV_PHS.POS$.

Settings are common for both resizer engines inside the RSZ module. Each engine (RSZ-A or RSZ-B) can be enabled from the RZx_EN register: select the mode from RZx_MODE , and select the input and output in the YUV color scheme from the RZx_420 register (valid only if YUV4:2:2 is the input set from $RSZ_SRC_FMT1.IN420$). [Table 7-649](#) summarizes the combination of settings available in the RZx_420 register.

Table 7-649. ISS ISP RSZ-A/RSZ-B Output Format Selection

RZx_420.YEN	RZx_420.CEN	Comments
0	0	Input is YUV4:2:2. Output is YUV4:2:2 if $RZX_RGB_EN = 0$ and RGB if $RZB_RGB_EN = 1$.

Table 7-649. ISS ISP RSZ-A/RSZ-B Output Format Selection (continued)

RZx_420.YEN	RZx_420.CEN	Comments
0	1	Input is YUV4:2:2. Output is the Chroma of YUV4:2:0. RZX_RGB_EN is ignored. Must be used to rescale YUV4:2:0 data: First/second pass
1	0	Input is YUV4:2:2. Output is the Luma of YUV4:2:0. RZX_RGB_EN is ignored. Must be used to rescale YUV4:2:0 data: Second/first pass
1	1	Input is YUV4:2:2. Output is YUV4:2:0. RZX_RGB_EN is ignored.

7.3.3.6.1 ISS ISP RSZ Operating Modes

The RSZ module offers two basic rescaling modes. These modes are not built-in but are particular configurations, which means that other hybrid modes can be programmed. The normal mode provides more flexibility (the rescale ratio granularity is smaller) than downscale mode, but downscale mode produces better image quality (averager performs anti-aliasing):

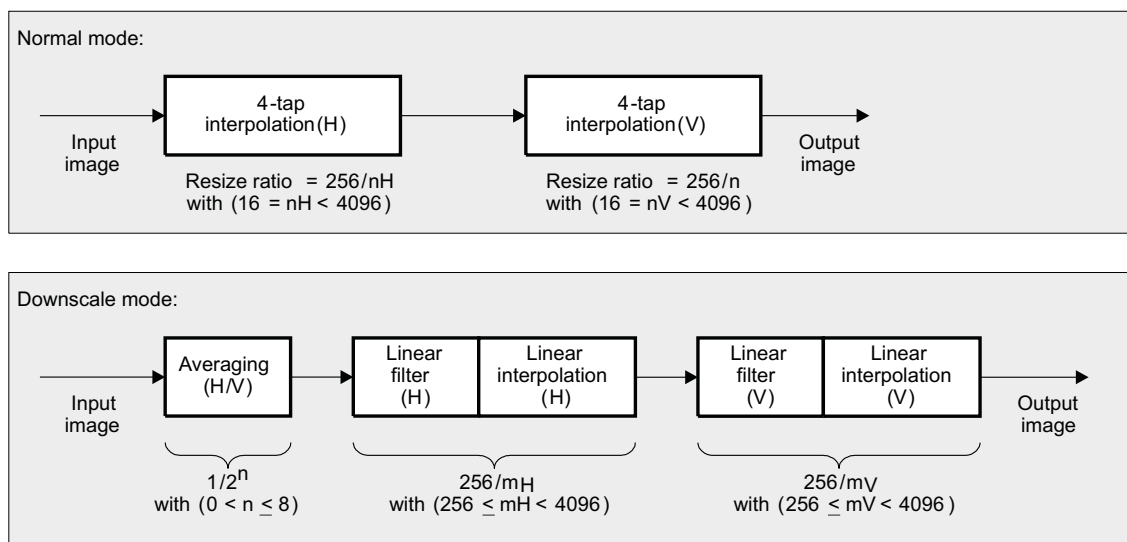

- Normal mode: The scaling process is carried out using interpolation with a 4-tap filter. The interpolation method is a 4-tap cubic convolution or a 3-tap linear filter + 2-tap linear interpolation. The user controls the type of interpolation that is used. The possible rescale ratios range from 1/16x to 20x.
- Downscale mode: The scaling process is the same as for normal mode, but an averaging function is placed before. It enables reaching much higher reduction factors while avoiding anti-aliasing artifacts. The interpolation method is a 4-tap cubic convolution or a 3-tap linear filter + 2-tap linear interpolation. The possible rescale ratios range from 1/4096x to 1x.

NOTE: The selection of the mode is independent for each resizer engine. One resizer engine can be configured in normal mode, while another is configured in downscale mode.

The RSZ module can produce two output images simultaneously, because there are two independent resizer engines. The input data used by the two resizer engines is the same. The RSZ output image sizes are limited to RSZ_GNC[12:0] RSZA_MEM_LINE_SIZE pixels/line for RSZ-A (2816 pixels/line) and RSZB_MEM_LINE_SIZE[28:16] for RSZ-B (3072 pixels/line).

Figure 7-138 shows the RSZ operating modes. Nothing prevents the use of linear interpolation in normal mode or bicubic interpolation in downscale mode; similarly, it is possible to mix the interpolation modes for horizontal and vertical filtering. This is fully programmable.

Figure 7-138. ISS ISP RSZ Operating Modes

camss-401

7.3.3.6.6.1 ISS ISP RSZ Operating Modes and Maximum Input Clock

The maximum output pixel clock on both resizers is 212.8 MHz (OPP_NOM); that is, a pixel throughput of 212.8 MPix/s. Moreover, hardware takes care of the following constraints:

- When both resizer engines are configured to perform downscaling, there is no particular constraint on the VP pixel clock. The VP pixel clock can be as high as 212.8 MHz.
- When one resizer engine is configured to perform upscaling and the second resizer engine is configured to perform downscaling, the VP pixel clock must be limited. The VP must be lower than:

$$\text{clk_pix} \leq (212.8 \text{ MHz} / (\text{Vertical Upscale Ratio} \times \text{Horizontal Upscale Ratio})) \quad (2)$$

For example, if a 4x upscale ratio happens horizontally and vertically, then the input pixel clock must be lower than $212.8 / (4 \times 4) = 13.3$ MHz.

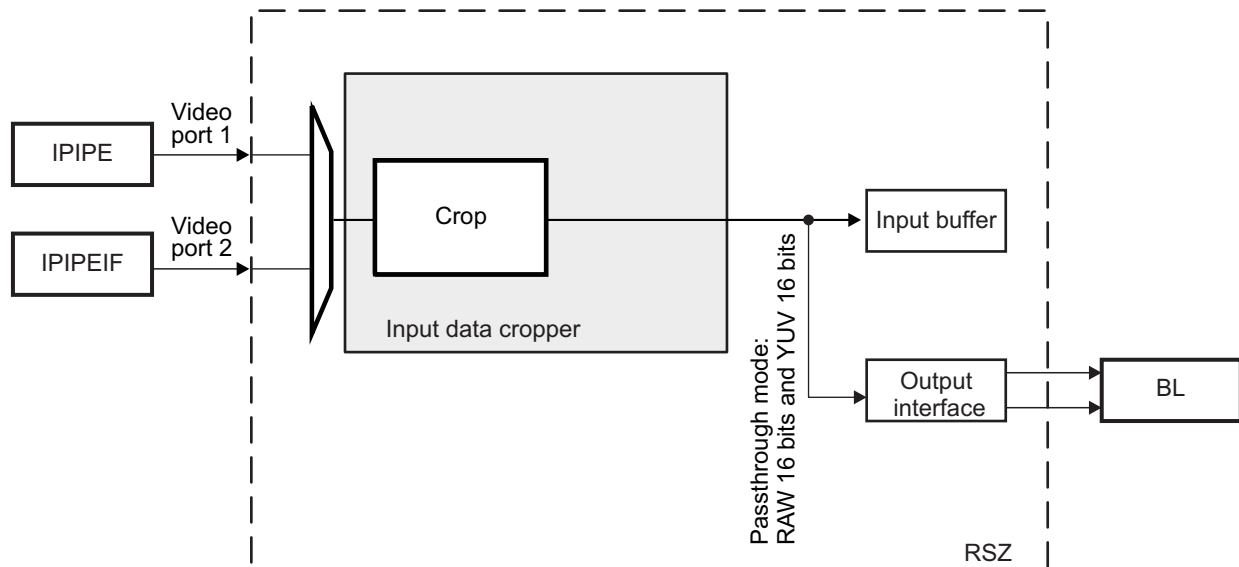

It is the reason why it is not possible to perform digital zoom upscaling on the fly. It is necessary to acquire the pixels to memory first and to read them back at a pace that does not exceed the previously discussed constraints. At the ISS level, data can be read back from memory from the CAL_A or ISIF module.

- When the two resizer engines are configured to perform upscaling, the VP pixel clock must be limited. In that case, the VP frequency is limited by the resizer engine having the larger rescale ratios.

7.3.3.6.6.2 ISS ISP RSZ Input Data Cropper

The data coming from the VPs into the RSZ module can be cropped: this applies to RAW and YUV4:2:2 data. It is mandatory to crop the data as early as possible in the RSZ processing pipeline to reduce power consumption. It is mandatory to crop the data before storing it in the input data buffer. [Figure 7-139](#) is the block diagram of the RSZ input data cropper.

Figure 7-139. ISS ISP RSZ Input Data Cropper Block Diagram

camss-708

The input data are in YUV4:2:2 interleaved format or RAW format.

For YUV4:2:2 format, the data come as Cb0, Y0, Cr0, Y1, Cb2, Y2, Cr2, Y3, etc. Y denotes the Luma component value and Cb/Cr denotes the Chroma component values. There are as many Y components as Cb/Cr components per line.

Figure 7-140 shows input data cropping. Only the cropped data is stored in the input data buffer. The names used in the figure correspond to the register names. If no cropping is desired, the `RSZ_SRC_HPS` and `RSZ_SRC_VPS` registers, which set the horizontal and vertical positions, respectively, must be set to 0; the start size from the `RSZ_SRC_HSZ` register must be set to the input image width minus 1, and the `RSZ_SRC_VSZ` register must be set to the input image height minus 1. These are common settings for both resize engines inside the RSZ module. After setting, more flexibility is present through the `RZx_i_VPS` and `RZx_i_HPS` registers for vertical and horizontal positioning, respectively, of the input/output (where $x = A$ or B , $i = I$ or O).

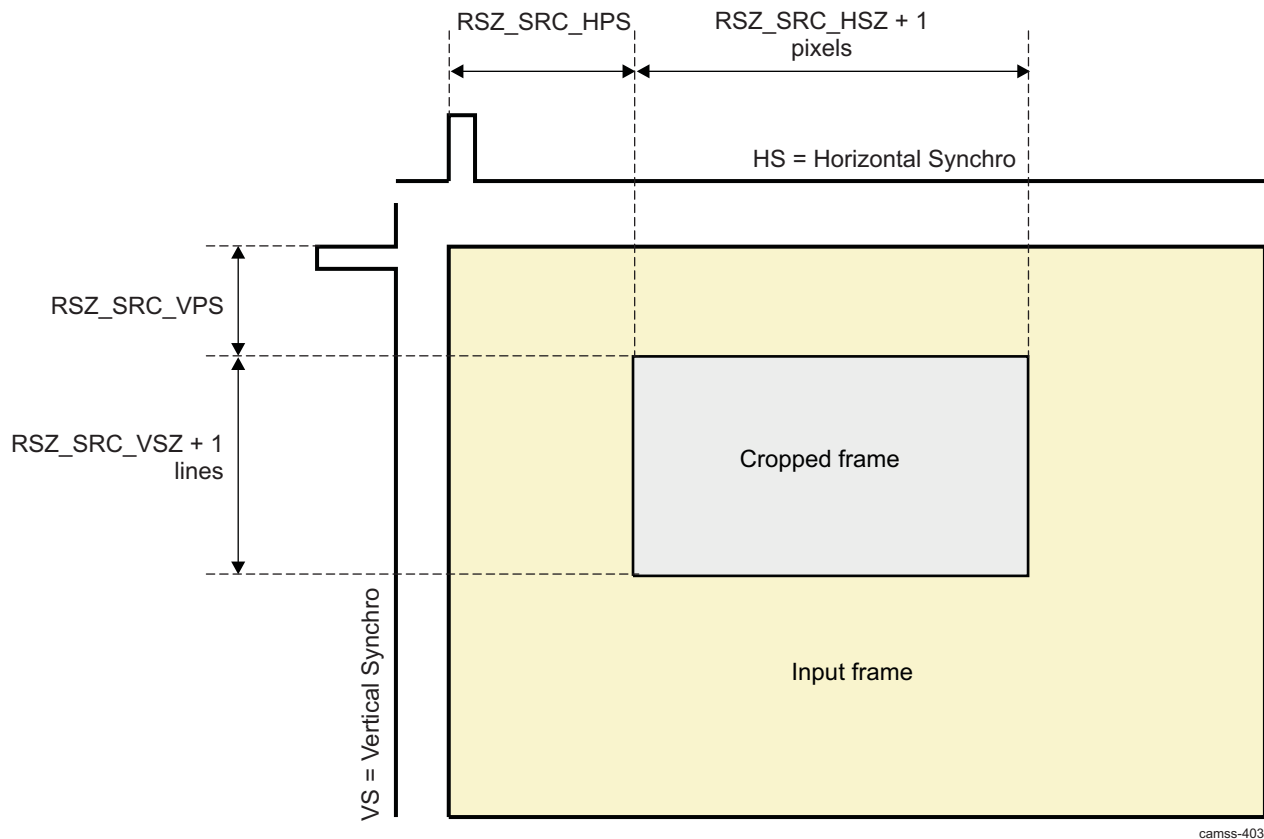

NOTE: After the RSZ second level cropping (defined by `RZA_I_VPS` and `RZB_I_VPS` register settings), the height of the image frame must be two lines or larger. A one-line image is not allowed.

Depending on the input data format, different constraints apply to the registers that set the cropping parameters:

- For YUV4:2:2 format, the vertical start positions of the cropped frame can be even or odd. However, the horizontal start position must be even: the reason is to always start with the same pattern: Cb_{2n} , Y_{2n} , Cr_{2n} , Y_{2n+1} , etc. For the same reason, the horizontal size of the cropped frame (`RSZ_SRC_HSZ + 1`) must be an even number. Finally, the vertical size of the cropped frame can be odd or even.
- For RAW format, the vertical start position of the cropped frame can be even or odd. The vertical size can be even or odd. The horizontal resolution must be even.

These features and constraints are common for both resizer engines inside the RSZ module. Figure 7-140 shows the input data cropping.

Figure 7-140. ISS ISP RSZ Input Data Cropping

7.3.3.6.6.3 ISS ISP RSZ Averager

7.3.3.6.6.3.1 ISS ISP RSZ Use Cases

The two resizer engines can have independent averager settings:

- Both resizers can use the averager.
- One resizer can bypass it and the other can use the averager.
- Both resizers can bypass the averager.

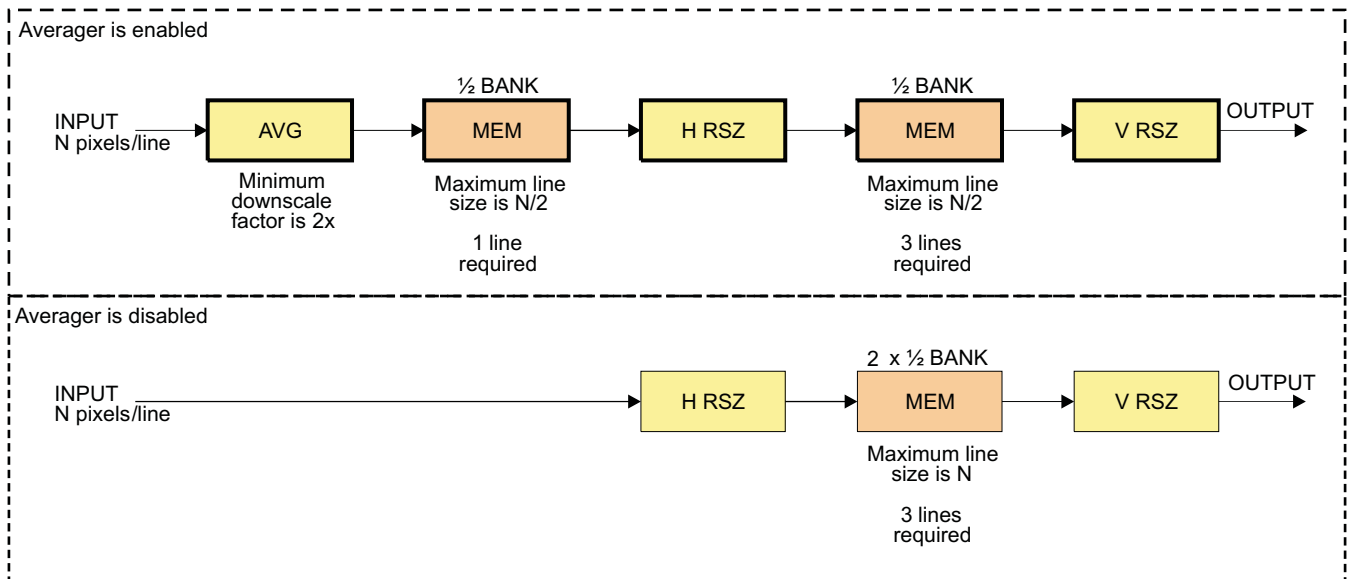

7.3.3.6.6.3.2 ISS ISP RSZ Memory Use

Vertical averaging requires memory to perform pixel data accumulation. It shares the vertical memory lines that are used for vertical filtering: this is the reason why the vertical memory lines are organized as two banks of half lines.

- The averagers output lines that are at most half the size of the input image in one memory bank.
- The horizontal resizers write their output data in the second memory banks.

Figure 7-141 shows the use of memory when the averager is enabled or disabled.

Figure 7-141. ISS ISP RSZ Averager Memory Utilization

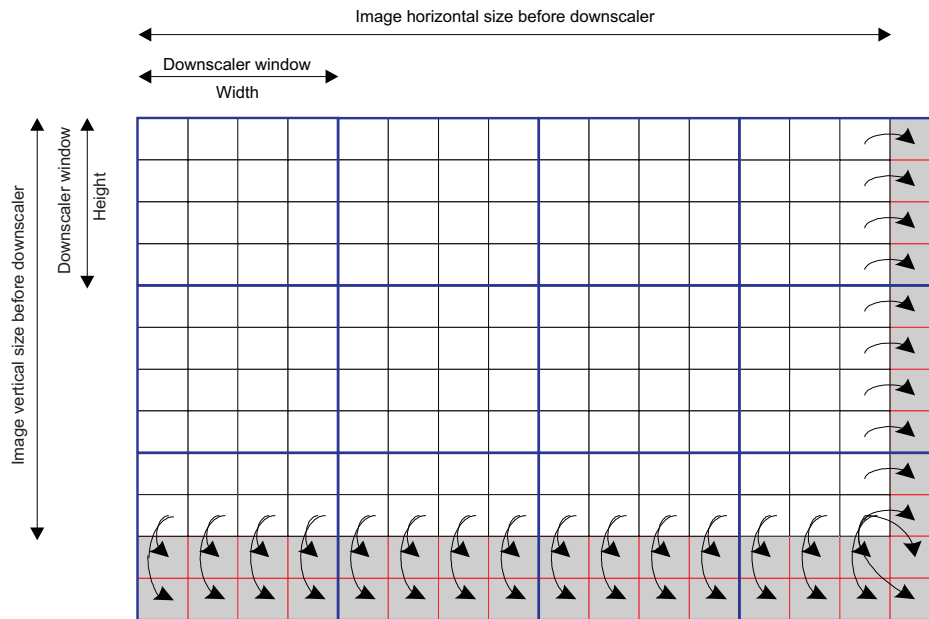

camss-407

7.3.3.6.6.3.3 ISS ISP RSZ Border Conditions

Figure 7-142 shows the averager behavior for border conditions. If the input image is not big enough, border duplication must occur.

Figure 7-142. ISS ISP RSZ Averager Border Conditions

camss-408

Downscaling is enabled from the RZi_DWN_EN register. Moreover, the vertical averaging size is set by the RZA_DWN_AV[5:3] V bit field. The actual downscale ratio is given by $1/2^{(RZA_DWN_AV[5:3] V + 1)}$. The range is from 1/2 to 1/256 in power of 2. The horizontal averaging size is set by the RZA_DWN_AV[0:2] H bit field. The actual downscale ratio is given by $1/2^{(RZA_DWN_AV[0:2] H + 1)}$. The equations are the same for RSZ-B. The range goes from 1/2 to 1/256 in power of 2.

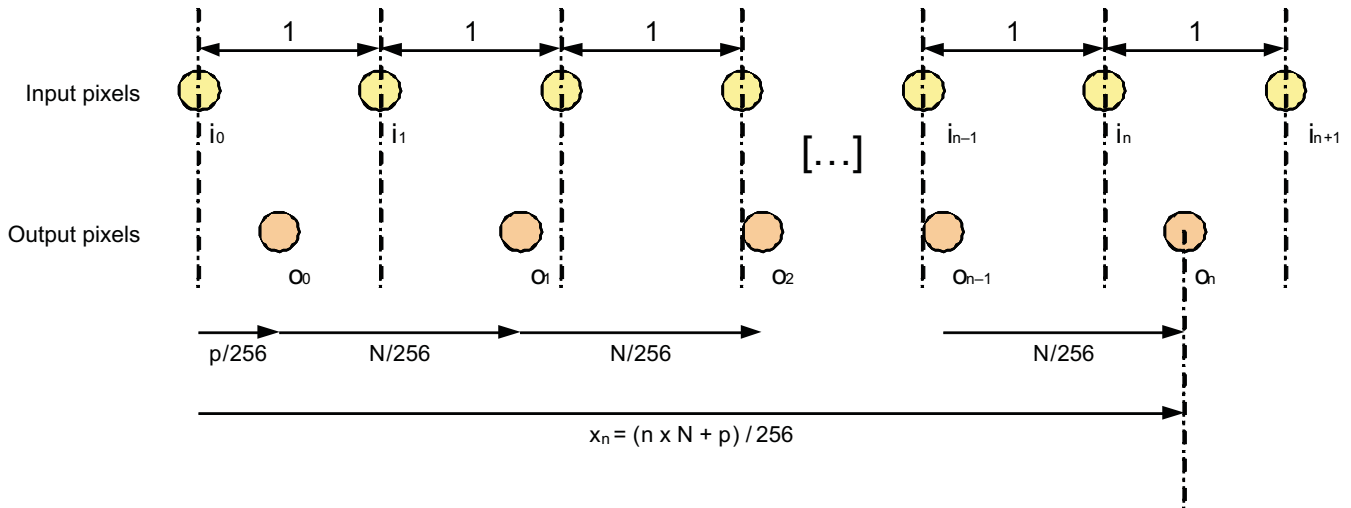

7.3.3.6.6.4 ISS ISP RSZ Interpolation

Figure 7-143 shows the basic interpolation method used in the RSZ module. The following assumptions are made:

- The distance between each input pixel is 1.
- The magnification ration is given by $256/N$ and $p/256$ is the initial phase of the output data.

The output pixels are also evenly spaced. The distance between each output pixel is given by $N/256$. In the example in Figure 7-143, N is greater than 256. The position of the n^{th} output pixel is given by $(n \times N + p) / 256$.

Figure 7-143. ISS ISP RSZ Basic Interpolation Method

camss-682

Assuming the intensity of input pixels is $i_0, i_1, i_2,$ etc. and the resized (output) pixels are $o_0, o_1, o_2,$ etc., the n^{th} output pixel (o_n) is determined using the nearest 4 input pixels as follows:

$$o_n = h(1 + d) \times i_1 + h(d) \times i_m + h(d - 1) \times i_{m+1} + h(d - 2) \times i_{m+2}$$

In the previous equation $h(x)$ is the interpolation main function. The RSZ module supports linear and bicubic convolution interpolation functions.

Figure 7-144 shows the interpolation principle at the n^{th} output pixel (o_n) at position x_n . Furthermore, the m and d parameters are as follows:

$$m = \text{floor}((n \times N + p) / 256) \text{ and } d = ((n \times N + p) / 256) - m$$

Figure 7-144. ISS ISP RSZ Interpolation Filtering

camss-683

For each resizer (RSZ-A or RSZ-B), and for Chroma and Luma, the interpolation method for vertical interpolation can be a 2-tap linear interpolation or a 4-tap cubic convolution (default) method. The choice is made in RZi_V_TYP[0] Y for Luma and RZi_V_TYP[1] C for Chroma, where i = A or B and is the resizer number. It is similar for horizontal interpolation from RZi_H_TYP[0] Y for Luma and RZi_H_TYP[1] C for Chroma, where i = A or B and is the resizer number.

7.3.3.6.6.4.1 ISS ISP RSZ Liner Interpolation Input Data

Before data interpolation, a low pass filtering (LPF) operation is required on the input data. The following equation gives the LPF function. The equation is evaluated at pixel position d_i but neighbor pixels d_{i-1} and d_{i+1} are required. The gain value g is set up by the register RZi_V_LPF and RZi_H_LPF. Different gains are possible horizontally and vertically as well as for Luma and Chroma.

$$LPF_g(d_{i-1}, d_i, d_{i+1}) = d_i + g \times (d_{i-1} - 2d_{i+1} + d_{i+2})/128$$

7.3.3.6.6.4.1.1 ISS ISP RSZ Cubic Convolution Mode

The input data is not modified in bicubic mode. The input is equal to the output.

7.3.3.6.6.4.1.2 ISS ISP RSZ Phase Settings

The initial value for the phase value for vertical resizing is set by the RZi_V_PHS_Y for Luma and RZi_V_PHS_C for Chroma. These values are in the U14Q8 fractional format (values in the range [0 – 63.996]). When YUV4:2:2 data are output, the phase value for Luma and Chroma must be aligned; that is, RZi_V_PHS_Y = RZi_V_PHS_C.

The following constraint equation applies: $|RZi_V_PHS_Y - RZx_V_PHS_C| \leq RZi_V_DIF$. This constraint means that at most the distance between the initial phases for Luma and Chroma is not expected to exceed the distance between two Luma pixels. The absolute value is used; therefore, the initial Luma phase can be greater than the initial Chroma phase or vice versa. As a reminder, the distance between two output pixels for Luma is given by RZi_V_DIF.

The initial value for the phase value for horizontal resizing is set by the RZi_H_PHS register. The RZi_H_PHS_ADJ register enables adjusting the horizontal phase for the Luma component when averaging is enabled (the averager disrupts the relative sampling point between Luma and Chroma when YUV4:2:2 co-sited data is input). The relative phase between Luma and Chroma is different before and after the horizontal averager. The vertical phase is not affected by the averager. [Figure 7-145](#) shows the effect of the averager on the phases. RZi_H_PHS_ADJ is expected to be equal to 0 if the averager is disabled.

Figure 7-145. ISS ISP RSZ-A/RSZ-B Phase Averager Effect

Input Chroma is co-sited: relative input I/O phases btw Y and UV are different, correction is needed.

Input Chroma is centered: relative input I/O phases btw Y and UV are identical, no correction is needed.

camss-685

7.3.3.6.6.5 ISS ISP RSZ Data Saturator

After vertical rescaling and before color conversion, the output data is saturated (clipped) to programmable values that are given by the following registers:

- [RSZ_YUV_Y_MIN](#)
- [RSZ_YUV_Y_MAX](#)
- [RSZ_YUV_C_MIN](#)
- [RSZ_YUV_C_MAX](#)

The maximum Y value is set up with the [RSZ_YUV_Y_MAX](#) register. If the input Y value is greater than the MAX value, it is clipped to MAX.

The minimum Y value is set up with the [RSZ_YUV_Y_MIN](#) register. If the input Y value is smaller than the MIN value, it is clipped to MIN.

The maximum Cb/Cr value is set up with the [RSZ_YUV_C_MAX](#) register. If the input Cb/Cr value is greater than the MAX value, it is clipped to MAX.

The minimum Cb/Cr value is set up with the [RSZ_YUV_C_MIN](#) register. If the input Cb/Cr value is smaller than the MIN value, it is clipped to MIN.

7.3.3.6.6 ISS ISP RSZ Color Converter

As mentioned previously, the resizer can support RAW, YUV4:2:0, and YUV4:2:2 formats. The resizer engines can also support RGB output: RGB5:6:5 and ARGB32.

The RGB5:6:5 data is 16 bits wide and consists of 5 bits for red, 6 bits for green, and 5 bits for blue.

The following table shows the way RGB5:6:5 is stored to memory. This data format is compatible with the display controller. Only the little-endian memory representation is supported.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R1					G1						B1					R0				G0			B0								

The ARGB32 data is 32 bits wide and consists of 8 bits for alpha, 8 bits for red, 8 bits for green, and 8 bits for blue. The alpha value is global and is set for the entire frame; registers control the alpha value: the RZx_RGB_BLD register controls the alpha values of resizer A and resizer B.

The following table shows the way ARGB32 is stored to memory. This data format is compatible with the display controller. This representation is endianness invariant: it is the same for little endian and big endian.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A								R								G								B							

The RGB output is enabled by setting the RZx_RGB_EN[0] RGB_EN bit to 1.

The RGB format is set by the RZx_RGB_TYP[0] TYP bit (0 for ARGB32 format and 1 for RGB5:6:5).

To handle the horizontal border conditions, the left-most Chroma sample or the right-most Chroma sample is duplicated on the left or the right.

Software must make it possible to remove 2 pixels on the left and/or right to take care of the issues that Chroma duplication introduces on the borders. The RZx_RGB_TYP[1] MSK0 and RZx_RGB_TYP[2] MSK1 bits control this feature.

[Figure 7-146](#) shows the ISS ISP RSZ chroma position and upsampling.

Figure 7-146. ISS ISP RSZ Chroma Position and Upsampling

NOTE: In case Cb/Cr in the input image is flipped, the `RSZ_SRC_FMT1[3] CHR` bit must be set to 1 to assure correct color conversion. This setting restores the right order in YUV to RGB conversion, and generates correct RGB colors.

7.3.3.6.6.7 ISS ISP RSZ Output Interface

The output interface receives the data generated by the two resizer engines and generates the addresses and the port requests to the BL module.

- The port 1 interface is dedicated to the RSZ-A module. If the RSZ module is set up in pass-through mode, then the data is output on the port 1 interface. This interface can transfer RAW, YUV4:2:2, YUV4:2:0, and RGB data
- The port 2 interface is dedicated to the RSZ-B module. This interface can transfer RAW, YUV4:2:2, YUV4:2:0, and RGB data.

The YUV4:2:0 data format is handled differently from the other formats because the output data are written at two different memory locations: Luma in one buffer and Chroma in a second buffer. For all other formats the data are written in the same buffer.

Each data format must be stored in memory in a dedicated manner, which is summarized in [Table 7-650](#).

Table 7-650. ISS ISP RSZ Output Interface: Data Formats

Output Format	Bytes per Pixel	Output Buffers per Image	Interface Supporting the Data Format
RAW	2	1	MTC port 1
YUV4:2:2	2 average	1	MTC port 1 port 2
YUV4:2:0	1.5 average	2	MTC port 1 port 2
RGB16	2	1	MTC port 1 port 2
ARGB32	4	1	MTC port 1 port 2

7.3.3.6.6.7.1 ISS ISP RSZ Circular Buffer

Figure 7-147 shows the parameters that are required to set up the circular buffers. As mentioned previously, there can be up to four circular buffers in case the two resizer engines are outputting YUV4:2:0 data.

The circular buffer management requires the following parameters (RSZ-A or RSZ-B A or B, Chroma or Luma Y or C, low or high part of the address, L or H. Sets the base address of the circular buffer):

- Baseline address (BAD, in registers, where x is the resizer A or B, and i is Y or C)
- Start address (SAD, in RZx_SDR_i_SAD_j registers)
- Start pointer (PTR_S, in RZx_SDR_i_PTR_S registers)
- End pointer (PTR_E, in RZx_SDR_i_PTR_E registers)
- Line offset (OFT, in RZx_SDR_i_OFT registers)

Table 7-651. ISS ISP RSZ Circular Buffer

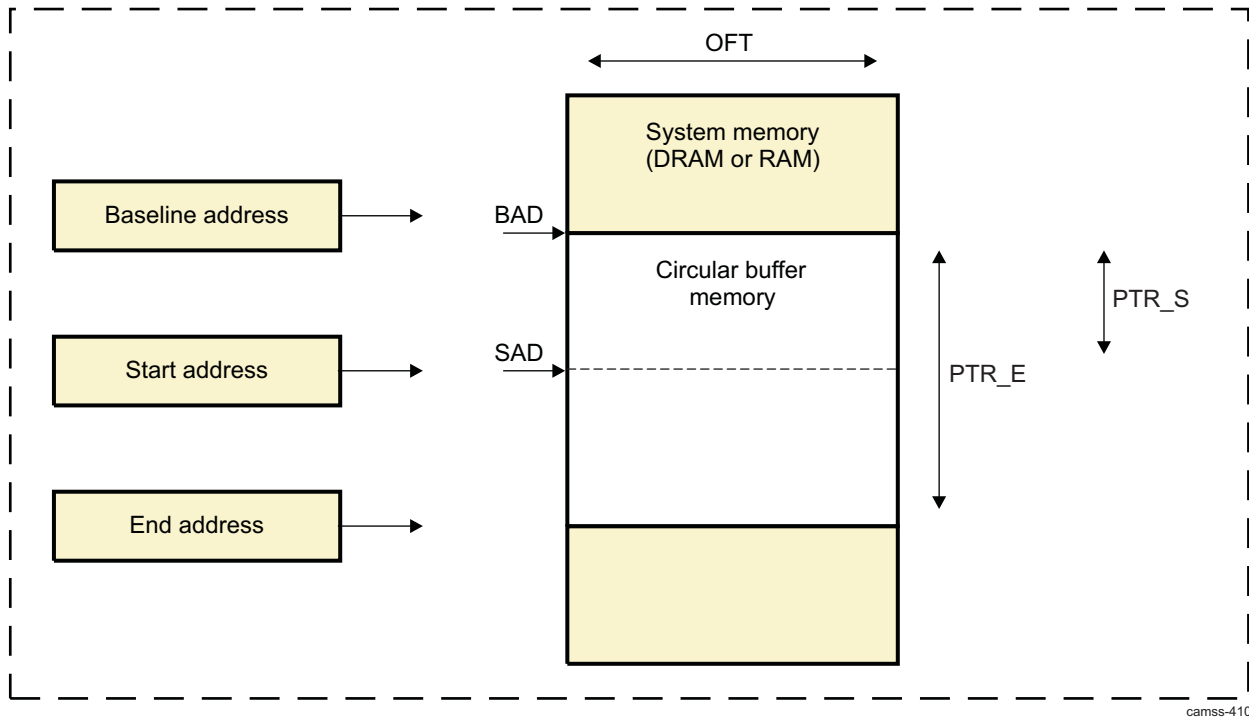

Circular Buffer Parameter	Register (for RSZ-A and RSZ-B)	Description
Baseline address	RZA_SDR_Y_BAD_H RZA_SDR_Y_BAD_L RZA_SDR_C_BAD_H RZA_SDR_C_BAD_L RZB_SDR_Y_BAD_H RZB_SDR_Y_BAD_L RZB_SDR_C_BAD_H RZB_SDR_C_BAD_L	Sets the base address of the circular buffer
Start address	RZA_SDR_Y_SAD_H RZA_SDR_Y_SAD_L RZA_SDR_C_SAD_H RZA_SDR_C_SAD_L RZB_SDR_Y_SAD_H RZB_SDR_Y_SAD_L RZB_SDR_C_SAD_H RZB_SDR_C_SAD_L	Sets the start address of the circular buffer. The first data output is written to this address. If the first line of a frame must be written at the beginning of the circular buffer memory, then SAD = BAD and PTR_S = 0.
Start pointer	RZA_SDR_Y_PTR_S RZA_SDR_C_PTR_S RZB_SDR_Y_PTR_S RZB_SDR_C_PTR_S	Sets the initial value of the circular buffer internal counter. It must be set up as PTR_S = (SAD – BAD)/OFT. PTR_S is expressed in the number of lines.
End pointer	RZA_SDR_Y_PTR_E RZA_SDR_C_PTR_E RZB_SDR_Y_PTR_E RZB_SDR_C_PTR_E	Sets the size of the circular buffer. PTR_E is expressed in the number of lines. The circular buffer can contain up to PTR_E lines.
Line offset	RZA_SDR_Y_OFT RZA_SDR_C_OFT RZB_SDR_Y_OFT RZB_SDR_C_OFT	This is the offset expressed in bytes between two lines in the circular buffer. Here: Line 0 = SAD, Line 1 = SAD + 1 × OFT, Line 2 = SAD + 2 × OFT, etc. OFT does not necessarily correspond to the size of a line in a frame; it can be bigger.

More generally, the following equations hold:

- $SAD = BAD + (PTR_S \times OFT)$ and $PTR_S < PTR_E$

Interrupts can be triggered every time a certain number of lines are written to the circular buffer. There are independent settings for each RSZ and for each possible output of each RSZ.

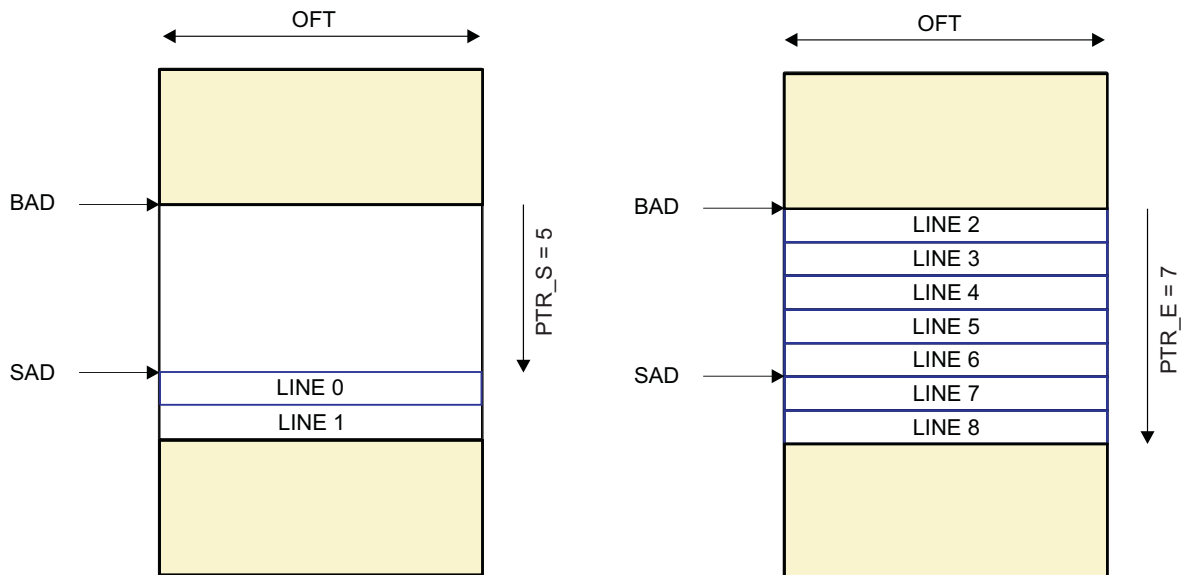

Figure 7-147. ISS ISP RSZ and Circular Buffer Settings

camss-410

Figure 7-148 shows how the data are stored in the circular buffer over time when vertical flip is disabled. In this example, PTR_S = 5 and PTR_E = 7. There can be up to PTR_E = 7 lines in the circular buffer.

Figure 7-148. ISS ISP RSZ and Circular Buffer Settings – Example 1

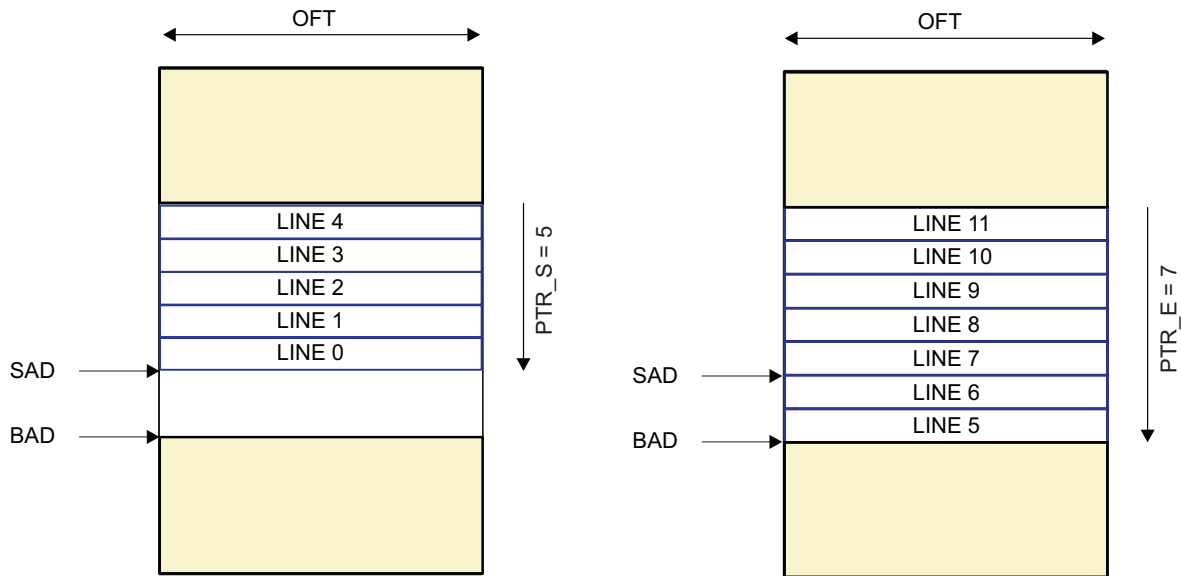

Vertical flip enabled:

1. Start from SAD.
2. Output PTR_E – PTR_S lines.
3. Wrap to BAD.
4. Output PTR_E lines and continue wrapping to BAD.

camss-412

Figure 7-149 shows how the data are stored in the circular buffer over time when vertical flip is enabled. In this example, PTR_S = 5 and PTR_E = 7. There can be up to PTR_E = 7 lines in the circular buffer.

Figure 7-149. ISS ISP RSZ and Circular Buffer Settings – Example 2

Vertical flip enabled:

1. Start from SAD.
2. Output PTR_E – PTR_S lines.
3. Wrap to BAD.
4. Output PTR_E lines and continue wrapping to BAD.

camss-413

7.3.3.7 ISS ISP CNF Functional Description

7.3.3.7.1 ISS ISP CNF Overview

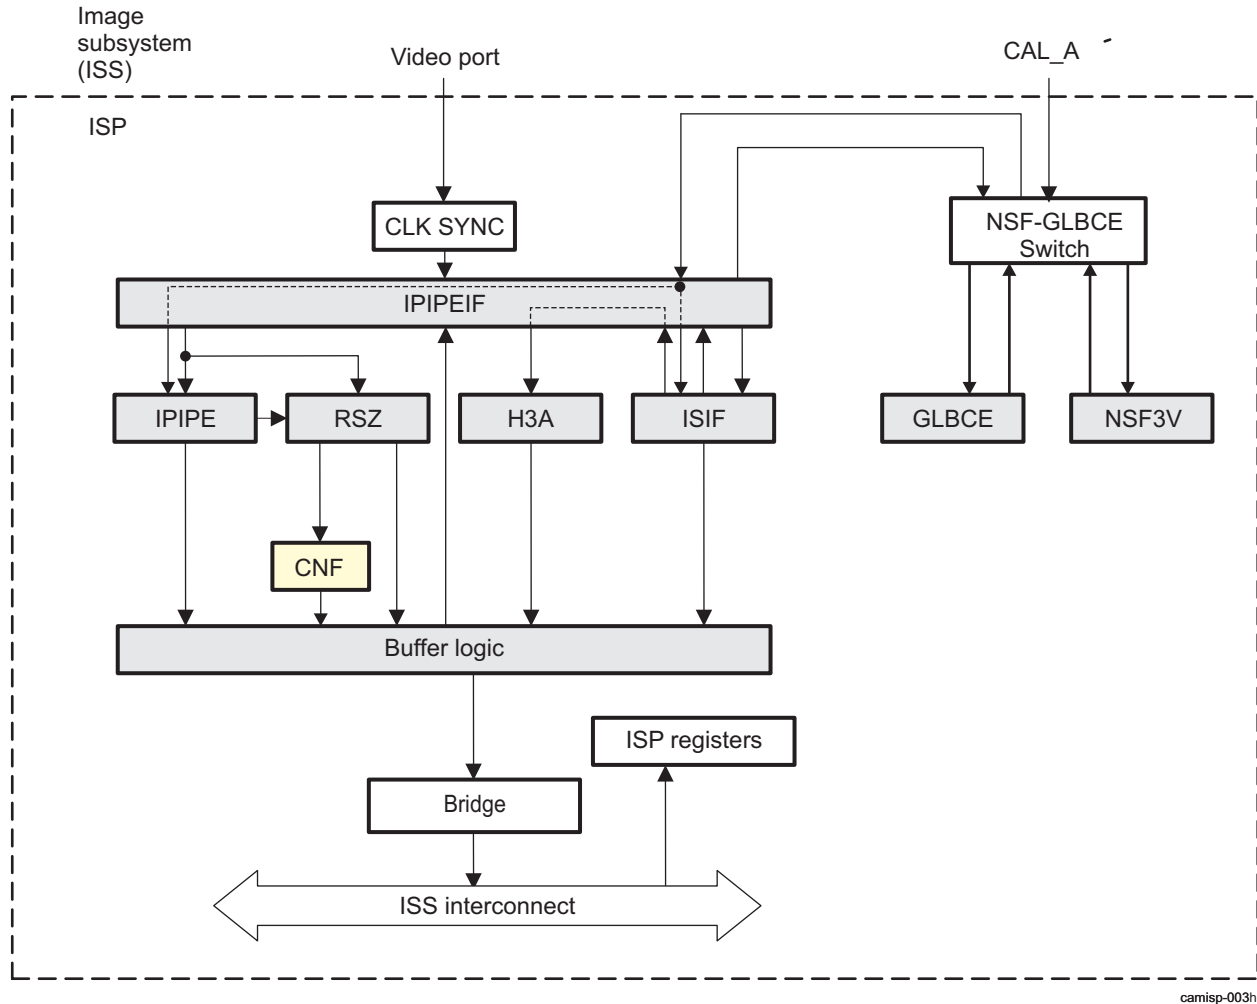

CNF removes residual chroma noise (color variation seen in dark area of low light images; usually in low frequency) by filtering UV data component of the image with noise filter. CNF is resided beside RSZ, and takes in UV and gives them back to RSZ.

CNF works with RSZ, and filters noises in chroma (UV or Cb/Cr) channel. CNF filters UV part of YUV420 image data. CNF only works on YUV420-UV, YUV420-YUV. It does not support YUV422 and YUV420-Y. One (CNFA) is attached to RSZ-A. CNFA supports up to 2816 pixels/line. The core of CNF is based on NSF3V UV processing. The functions of CNF are

- Noise filter, which uses the same core as NSF3V UV filter
- Advanced threshold control inherited from NSF3V
- On-the-fly processing without round trip to external memories
- x1/2 chroma down sampling and x2 chroma upsampling
- Works only on YUV-420
- CNF module works with the line width supported by the RSZ1 output.
- Top/bottom border pixels are always replicated to maintain the size of the output
- Left/Right border pixels replication may be turned on or off. By turning on the replication, the output size is same as input. By turning off, frame division mode stitching is supported.
- Provide chroma noise filtering necessary for low-light images and video.
- Optionally noise-filter downsampled chroma to provide additional level of noise reduction.

Figure 7-150 show the CNF module connections to other submodules of the ISP.

Figure 7-150. ISS ISP CNF High-Level Diagram

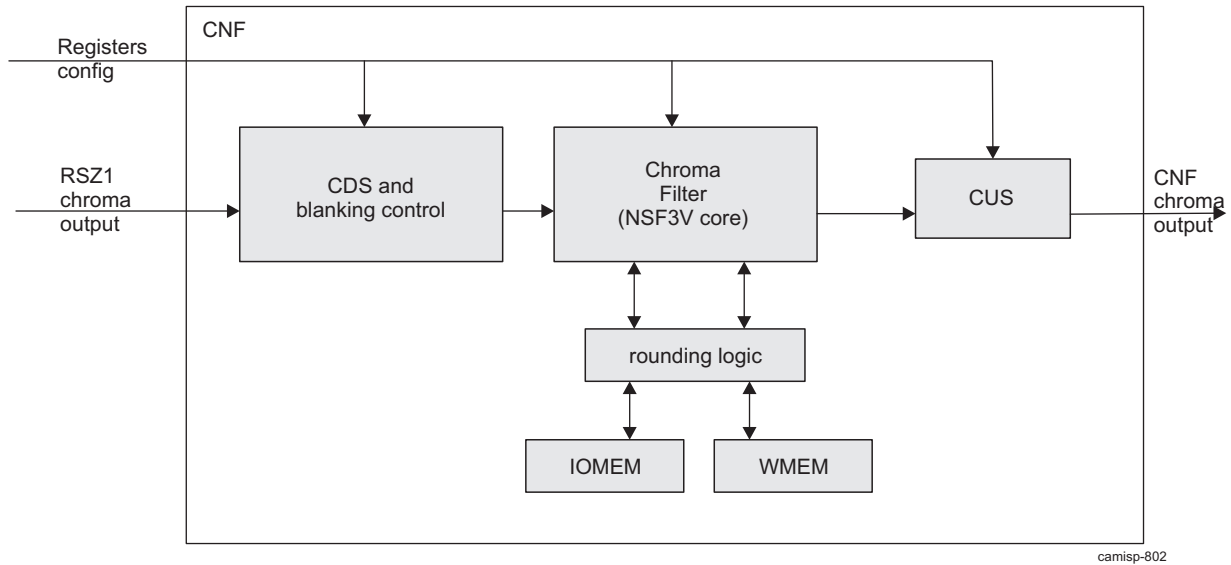

camisp-003h

7.3.3.7.2 ISS ISP CNF Top Level Block Diagram

Figure 7-151 is the top-level block diagram of the CNF module.

Figure 7-151. ISS ISP CNF Top Level Block Diagram

NOTE: Although CNF does not generate horizontal blanking violation error interrupts. This is because CDS module will always generate enough blanking. Instead, inadequate number of horizontal blanking cycles will eventually generate back pressure to RSZ1 input buffer, and will cause buffer over flow if the upstream receiver module can not be stalled.

7.3.3.7.3 ISS ISP CNF Noise Filter Algorithm

The CNF module integrates an NSF3V instance. The CNF block contains chroma downsampling and upsampling blocks before and after the NSF3V instance. See [Section 7.3.3.3](#) for details on NSF3V functionality and noise filter algorithm.

7.3.3.7.4 ISS ISP CNF Chroma Downsampling and Upsampling

When configured CDS-on (`ISP_CNFA_EN[0] CNFA_EN`), chroma is downsampled before the chroma filter core, and upsampled after the chroma filter core.

For downsampling, a simple 2x2 non-overlapping averaging scheme is used. For upsampling, overlapping bilinear interpolation is used. [Figure 7-152](#) shows the spatial relationship between the original and downsampled data points, and the downsampling/upsampling schemes.

Figure 7-152. ISS ISP CNF original and downsampled grid, and downsample/upsample schemes

NOTE: Chroma downsampling/upsampling is performed outside the chroma filter core (NSF3V reuse), so the core is not aware of the downsampling option. When CDS-on, the core should be programmed with half the width and height, as that's the size of the image the core is receiving and producing.

As chroma downsampling utilizes non-overlapping 2x2 averaging, no special border treatment is needed. Chroma upsampling, however, utilizes overlapping bilinear interpolation, and border treatment is needed. The left/right/top/bottom data points are replicated to produce the missing border data needed, as shown in the [Figure 7-153](#)

Figure 7-153. ISS ISP CNF Chroma upsampling border replication scheme

NOTE: This is just the algorithm specification, and does not imply that the hardware implementation literally replicate border data points this way; hardware implementation seek to produce the equivalent outcome efficiently.

7.3.3.7.5 ISS ISP CNF Vertical and Horizontal Blanking

CNF, by instantiating NSF3V, inherits NSF3V vertical and horizontal blanking requirements. In YUV420UV mode with all border replication enabled, minimal horizontal blanking is 58 pixels, and minimal vertical blanking is 9 lines.

Note that:

- Horizontal blanking is not additional pixels or data points, but is the additional clock cycles required. As the chroma filter core operates at divided-by-2 clock, there is a 2x multiplier in number of functional clock cycles
- For example, when $IW = 1920$, there is 1920 data points per line (U and V together), so time between first data point of each line should be $(1920 + 52) * 2$ functional clock cycles.
- Vertical blanking is counted as number of dummy (data don't care) lines in the input.
- CDS block takes care of providing sufficient vertical and horizontal blanking.

CNF's downstream module, MTC interface, may occasionally negate `rsz_out_rdy` to suspend CNF sending pixel output, and this suspension may lead to `vpout_suspend` being asserted to the chroma filter core, and this may or may not lead to `vpin_suspend` being asserted by the chroma filter core, due to the FIFO mechanism inside the chroma filter core. In order to maintain sufficient HS interval to the chroma filter core, the CDS block needs to delay sending `VPin_HS` until

- `VPin_HE` is asserted by CDS block (all input pixels delivered) followed by `T_input_pipeline_delay`.
- `VPout_HE` is asserted by the chroma filter core (all output pixels delivered).
- Datapath processing time is met or $image_width + dp_pipeline_delay$ cycles under the specific mode and left/right border replication condition CNF operates in.

Refer to [Section 7.3.3.3](#) for specific delay cycle counts.

7.3.3.7.6 ISS ISP CNF configuring ranges/restrictions

As CNF is reusing NSF3V logic for the core functionality, most of the programming model follows that of NSF3V (see [Section 7.3.3.3.3](#)).

NSF3V in YUV420UV mode has the following constraints:

- Register (luma) image width multiple of 4.
- Register (luma) Image height multiple of 2.
- Minimal (luma) output width of 64, and since border replication is enabled, this directly applies to (luma) input width
- Minimal (luma) output height of 2, and since border replication is enabled, this directly applies to (luma) input height.

When the optional chroma downsampling is enabled, the CNF core gets half of the width and half of the height. In addition, CDS/CUS stages need to work with downsampled chroma having minimal height of 2 lines.

- Resizer output (luma) image width multiple of 8.
- Resizer output (luma) Image height multiple of 4.
- Resizer output (luma) minimal width of 128.
- Resizer output (luma) minimal height of 8 (thus chroma minimal height of 4, downsampled to 2)

In addition, the following constraints exist:

- Mode of operation is limited to YUV420UV (no interleaved YUV420UV either)
- Border replication, all 4 borders, are enabled
- Software reset is not supported.

NOTE: The image width/height programmed in the ISP-top level is to be consistent with the image width/height programmed in the CNF-core (NSF3V reuse) register space, and should be 1/2 of the resizer output when CDS is enabled. [Table 7-652](#) shows some example configurations.

Table 7-652. ISS ISP CNF CNF image width/height configuration examples

Resizer output width	Resizer output height	CDS	ISP-top CNF image width = CNF-core image width	ISP-top CNF image width = CNF-core image width	CNF input/output U/V data points
1920	1080	OFF	1920	1080	960 x 540 x 2
1920	1080	ON	960	540	480 x 270 x 2

The following NSF3V features are to be preserved:

- Radial shading gain
- Soft thresholding
- Edge enhancement
- Desaturation
- Output pixel clock
- One-shot and video mode
- Register shadowing

7.3.3.8 ISS ISP H3A Functional Description

7.3.3.8.1 ISS ISP H3A Overview

The H3A module supports the control loops for autofocus, auto white balance, and auto exposure by collecting metrics about the imaging/video data. The metrics are used to adjust parameters for processing the imaging/video data. There are two main blocks in the H3A module:

- Autofocus (AF) engine:

The AF submodule extracts and filters the red, green, and blue data from input image data and provides the accumulation or peaks of the data in a specified region. The specified region is a 2D block of data referred to as a paxel. The AF engine supports the following features:

 - Peak mode in a paxel: Accumulation of the maximum focus value (FV) of each line in a paxel
 - Accumulation mode in a paxel
 - Accumulation of horizontal and vertical focus value in a paxel
 - Up to 12 paxels in the horizontal direction and up to 12 paxels in the vertical direction with vertical focus
 - Up to 36 paxels in the horizontal direction and up to 128 paxels in the vertical direction with horizontal focus only
 - Programmable width and height for the paxel/window
 - Programmable red, green, and blue position within a 2 × 2 matrix
 - Separate horizontal start for paxel and filtering
 - Programmable vertical and horizontal line increments within a paxel
 - Horizontal FV uses parallel infinite impulse response (IIR) filters configured in a dual-biquad configuration with individual coefficients (two filters with 11 coefficients each). The filters are intended to compute the sharpness/peaks in the frame on which to focus.
 - Vertical FV uses a 5-tap FIR filter with 8-bit coefficients. With horizontal steps each paxel has up to 32 columns to be maintained for vertical FV calculation.
- Auto exposure and auto white balance (AE/AWB) engine:

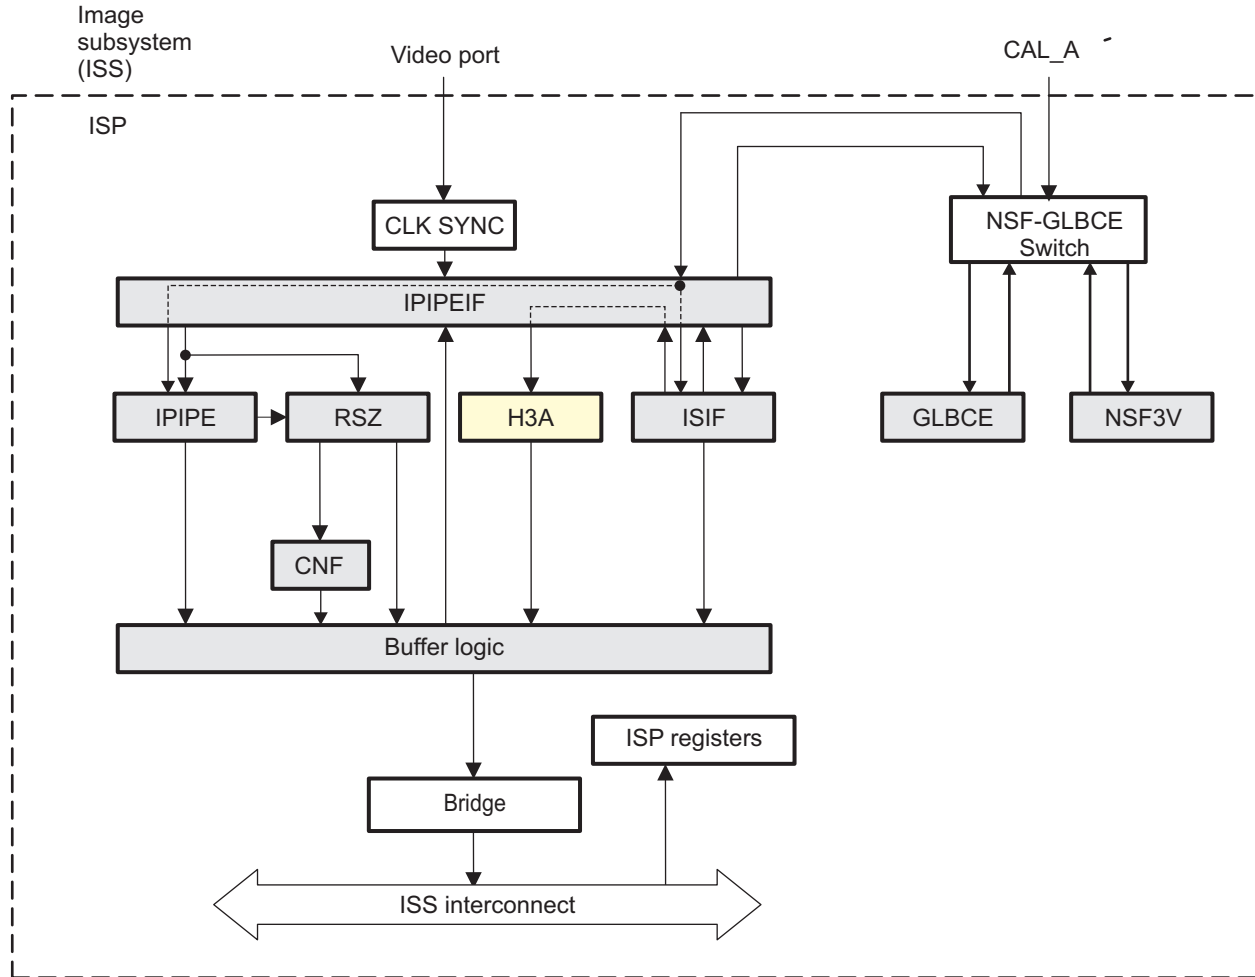

The AE/AWB engine accumulates values and checks for saturated values in a subsampling of the

video data. In the case of the AE/AWB, the 2D block of data is referred to as a window. Thus, other than having different names, paxels and windows are essentially the same. However, the numbers, dimensions, and starting positions of AF paxels and AE/AWB windows are programmable separately. AE/AWB supports the following features:

- Accumulate clipped pixels along with all nonsaturated pixels in each window per color
- Accumulate the sum of squared pixels in each window per color
- Minimum and maximum pixel values in each window per color
- Support for up to 36 horizontal windows with sum + { sum_sq or min+max} output
- Support for up to 56 horizontal windows with sum output
- Support for up to 128 vertical windows
- Programmable width and height for the windows. All windows in the frame are the same size.
- Separate vertical start coordinate and height for a black row of paxels that is different than the remaining color paxels
- Programmable horizontal sampling points in a window
- Programmable vertical sampling points in a window
- Maximum pixel throughput of 212.8 MPix/s
- Double-buffer for paxel/window accumulation
- H3A data path is 10 bits.
- Maximum input size is 2816 pixels.

[Figure 7-154](#) shows the H3A module connections to other submodules of the ISP.

Figure 7-154. ISS ISP H3A High-Level Diagram

camisp-003b

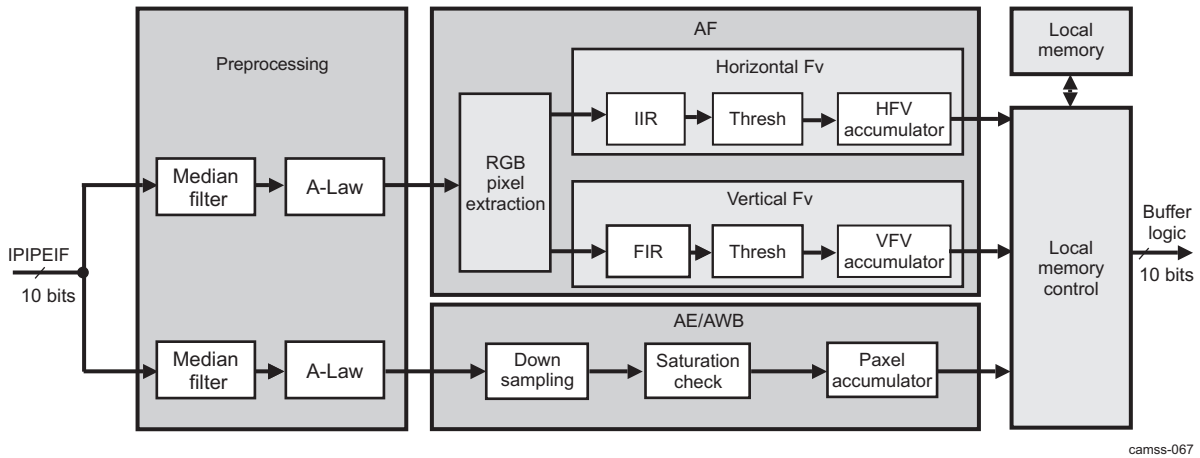

7.3.3.8.2 ISS ISP H3A Top-Level Block Diagram

The block diagram in [Figure 7-155](#) shows the process of the AF and AE/AWB data paths through the H3A module.

The data flow before H3A is:

1. Data comes from the VP or BL.
2. The data is processed by the ISIF.
3. The data is processed by the IPIPEIF.
4. The data is 10 bits from the IPIPEIF at H3A input.

Figure 7-155. ISS ISP H3A Top-Level Block Diagram

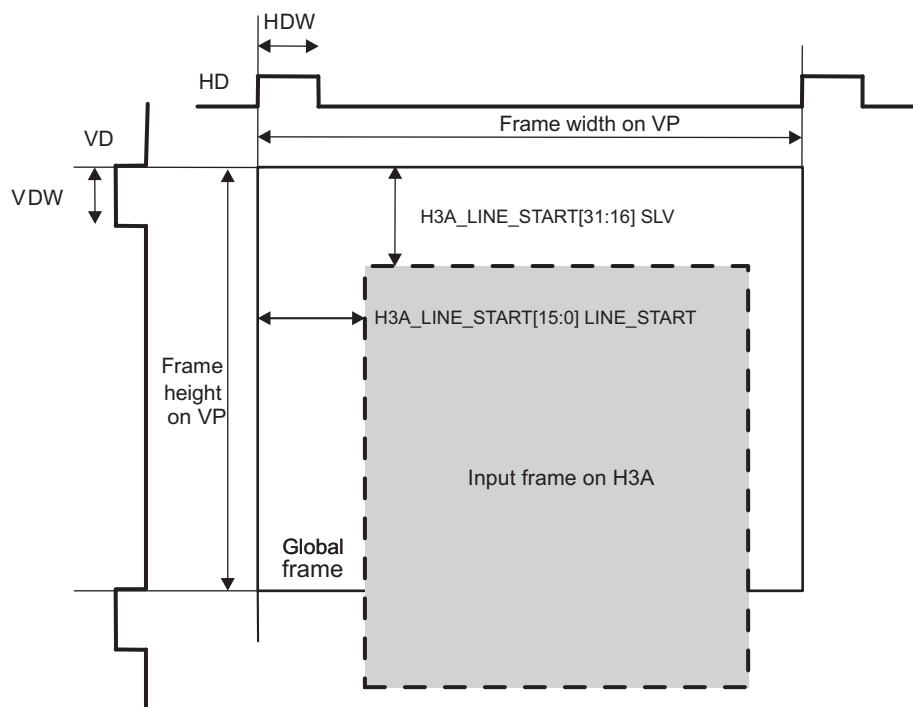

camss-067

7.3.3.8.3 ISS ISP H3A Line Framing Logic

In certain cases the number of clock cycles between HD pulses is greater than the line buffer included in the H3A. To solve this problem a framing module was added before the line buffer. The framing module uses the `H3A_LINE_START` register to find the position of the first pixel to place into the line buffer. All other registers reference this point as the 0 pixel for their start positions. The line size is 2816 pixels. After 2816 clock cycles the framing logic disables the line buffer and waits until the next HD. If the next HD comes before 2816 clock cycles, then the active region ends immediately and the counter waits for the `H3A_LINE_START` register count to be reached again. For the vertical position the `H3A_LINE_START[31:16]` SLV bit field can be used to determine where the start point of the frame is relative to the rising edge of VD. This logic allows for an active frame to cross VD boundaries and remain in the same frame.

Figure 7-156 shows the ISS ISP H3A frame format settings.

Figure 7-156. ISS ISP H3A Frame Format Settings

camisp-073

NOTE: (Frame width on VP) - (H3A_LINE_START[15:0] LINE_START) must be less than or equal to 2816, because the H3A memory lines are limited to 2816 pixels.

7.3.3.8.4 ISS ISP H3A Optional Preprocessing

The input to the H3A module is 10-bit RAW data from the IPIPEIF. A 10-bit to 8-bit A-Law compression step can be enabled and disabled separately for the AF engine (the H3A_PCR[1] AF_ALAW_EN bit) and the AE/AWB engine (the H3A_PCR[17] AEW_ALAW_EN bit). A-Law compression offers added protection against overflowing the accumulators.

If the A-Law table is enabled, the output is 10 bits, with the upper two bits filled with 0.

For the AF process, a horizontal median filter can be enabled and disabled (the H3A_PCR[2] AF_MED_EN bit) before A-Law compression. This filter is useful for reducing temperature-induced noise. The horizontal median filter calculates the absolute difference between the current pixel (i) and pixel ($i - 2$), and between the current pixel (i) and pixel ($i + 2$). If the absolute difference exceeds a threshold, and the sign of the differences is the same, the average of pixel ($i - 2$) and pixel ($i + 2$) replaces pixel (i). The threshold of the horizontal median filter can be set in the H3A_PCR[10:3] MED_TH bit field.

7.3.3.8.5 ISS ISP H3A Autofocus Engine

The AF engine works by extracting each green (Gr or Gb) pixel from the video stream and subtracts a fixed offset of 128 or 512 (depending on whether A-Law is enabled or disabled) from the pixel value. The offset value is then passed through an IIR filter and the absolute value of the filter output is the focus value (FV). Both FV and FV^2 are produced. The FV and FV^2 values can be accumulated or the maximum for each line/column can be accumulated. The following sections describe this process in more detail.

7.3.3.8.5.1 ISS ISP H3A Poxel Extraction

From the poxel starting coordinate (the H3A_AFPAXSTART[27:16] PAXSH and H3A_AFPAXSTART[11:0] PAXSV bit fields) specifies the starting point of the poxel grid, with respect to first pixel of the input image frame.

The poxel starting coordinate also indicates which color pixels are extracted if VF is enabled (that is, if H3A_PCR[20] AF_VF_EN = 1). Normally, either Gr or Gb is used for AF, but it is not important to the hardware whether it is red, green, or blue. If VF is not enabled, then the red, green, and blue pixel extraction is controlled by the H3A_PCR[13:11] RGBPOS bit field to extract the correct colors from the input stream. Figure 7-157 shows the available options for this bit field. The red and blue pixel positions are interchangeable. For each 2×2 grid, the green pixels are summed to create a single value. Because of this, the amplitude of the green output contains 2 pixels, while the red and blue outputs each contain 1 pixel.

Figure 7-157. ISS ISP H3A Red, Green, and Blue Pixel Extraction Examples

camisp-068

Each paxel is $H3A_AFPAX1[23:16]$ PAXW x $H3A_AFPAX1[7:0]$ PAXH (width x height) pixels. Inside each paxel, horizontal FV can skip lines, operating on one every $H3A_AFPAX2[16:13]$ AFINCV lines. Vertical FV can skip columns, operating on one every $H3A_AFPAX2[20:17]$ AFINCH columns. Up to 32 columns are supported for each paxel. If floor (PAXW/AFINCH) \geq 32, only the first 32 designated columns are operated on. Because PAXW, PAXH, AFINCV, and AFINCH are all even numbers, AF always operates on the same green color, Gr or Gb. IIR filters for the horizontal FVs start operation at column $H3A_AFIIRSH[11:0]$ IIRSH.

Figure 7-158 shows the ISS ISP H3A horizontal/vertical fv paxel configuration.

Figure 7-158. ISS ISP H3A Horizontal/Vertical FV Poxel Configuration

NOTE: $(\text{H3A_AFPAXSTART}[27:16] \text{ PAXSH}) + (\text{H3A_AFPAX2}[5:0] \text{ PAXHC}) \times (\text{H3A_AFPAX1}[23:16] \text{ PAXW}) \leq [(\text{Frame width on VP}) - (\text{H3A_LINE_START}[15:0] \text{ LINE_START})] \leq 2816$

Table 7-653 lists the bit fields that configure the size and number of paxels.

Table 7-653. ISS ISP H3A Poxel Register Field Descriptions

Bit Field	Bit Width	Description
H3A_AFPAX1[23:16] PAXW	8	Poxel width (in pixels)
H3A_AFPAX1[7:0] PAXH	8	Poxel height (in lines)
H3A_AFPAX2[5:0] PAXHC	6	Poxel count for horizontal direction
H3A_AFPAX2[12:6] PAXVC	7	Poxel count for vertical direction
H3A_AFPAX2[16:13] AFINCV	4	Line increments in a poxel
H3A_AFPAX2[20:17] AFINCH	4	Column increments in a poxel
H3A_AFPAXSTART[27:16] PAXSH	12	Poxel start position H
H3A_AFPAXSTART[11:0] PAXSV	12	Poxel start position V
H3A_AFIIRSH[11:0] IIRSH	12	IIR filter start position

The H3A AF engine also has an option for an advanced or normal stats collection mode. When 0xCA00 is written to the [H3A_ADVANCED\[31:15\]](#) ID bit field, then [H3A_ADVANCED\[0\]](#) AF_MODE can be used to toggle between normal and advanced AF stats collection mode. When the advanced AF stats collection mode is enabled, the ZEROS section of the AF poxel packet is filled with the sum of the maximum FVs, regardless of the color, from HFV_1 and HFV_2.

7.3.3.8.5.2 ISS ISP H3A Horizontal FV Calculator

The FV calculator takes the unsigned red/green/blue extracted data and subtracts 128 or 512 (depending on whether A-Law is enabled) to place the data in the range -128 to 127 or -512 to 511 .

After removing the offset, the data is sent through two parallel IIR filters configured in a dual-biquad configuration. Each filter uses a unique set of 11 programmable coefficients. Each coefficient is 12-bits-wide with 6 bits of decimal, S12Q6 (H3A_AF0COEF010 to H3A_AF0COEF0010 for SET0, and H3A_AF0COEF110 to H3A_AF0COEF1010 for SET1). The filter-shift registers are cleared on each horizontal line at the position set by the register IIR horizontal start register (the H3A_AFIIRSH[11:0] IIRSH bit field). The absolute values of the output (16 bits wide with 4 bits of decimal, U16Q4) of both filters are then sent to the AF accumulator module. Signed clipping is performed during the FV calculation. If the input value is m bits (signed) and the required output value is n bits, clipping transforms the input to between -2^1 and 2^1 . Values lower than -2^1 are set to -2^1 , and values higher than 2^1 are set to 2^1 .

Figure 7-159 shows the IIR filter model.

Figure 7-159. ISS ISP H3A IIR Filter Model

7.3.3.8.5.3 ISS ISP H3A HFV Accumulator

The horizontal focus value (HFV) accumulator takes the output of the horizontal IIR filter and accumulates values for each pixel. The size and number of pixels is configurable by registers.

Table 7-653 lists the register fields that configure the size and number of pixels:

- In peak mode (H3A_PCR[14] FVMODE = 0x1), the maximum value is accumulated.
- In sum mode (H3A_PCR[14] FVMODE = 0x0), all HFV_n are accumulated in a pixel.

The following equations detail the calculation for:

- Sum of pixel values used in HFV: The pixel values that are used for filtering and accumulation of HFV are also accumulated in this sum of pixel values.
- HFV_n (HFV_{n_peak} for peak mode or HFV_{n_sum} for sum mode)
- HFV_count_n
- HFV_sq_n (HFV_sq_{n_peak} for peak mode or HFV_sq_{n_sum} for sum mode)

$n = 1$ or 2 for IIR1 and IIR2, respectively.

For each pixel, these six values are available for each R, G, and B component.

```
for (k=0; k<PAXH) // Loop on pixel rows
{
    rowpeak_n = 0;

    for (l=0; l<PAXW; l++) // Loop on values within a row
    {
        aIIRout_n = ABS(IIRout_n);
    }
}
```

```

    if (aIIRout_n >= threshold_n)
    {
    hfval = aIIRout_n - threshold_n;
    HFV_count_n++;
    }
    else hfval = 0;
    if (hfval > rowpeak_n)
    {
    rowpeak_n = HFV_n;
    }
    HFV_n_sum += hfval;
    HFV_sq_n_sum += (hfval* hfval + RNDADD) >> RNDSHIFT;
  } // Finished looping on values in a row
  HFV_n_peak += rowpeak_n;
  HFV_sq_n_peak += (rowpeak_n * rowpeak_n + RNDADD) >> RNDSHIFT;
}

```

- threshold_n is [H3A_HVF_THR\[15:0\]](#) HTHR1 and [H3A_HVF_THR\[31:16\]](#) HTHR2, respectively.
- IIRout_n is the IIRout_1 and IIRout_2 outputs, respectively.
- HFV_count_n and HFV_sq_n are not sent to the DMA interface if VF is disabled.
- RNDADD and RNDSHIFT depend on whether input pixels are 8-bit or 10-bit, and achieves rounding. This is automatically performed by the module.
- If VF is enabled, only the green color channel values are output to the DMA interface.
- In sum mode:
 - HFV_n = HFV_n_sum
 - HFV_sq_n = HFV_sq_n_sum
- In peak mode:
 - HFV_n = HFV_n_peak
 - HFV_sq_n = HFV_sq_n_peak

7.3.3.8.5.4 ISS ISP H3A VFV Calculator

The VFV calculator takes the unsigned extracted data through two FIR filters, each with a set of five coefficients (VCOEF1_x, where x = 0 to 4, in the [H3A_VFV_CFG1](#) and [H3A_VFV_CFG2](#) registers for FIR 1, and VCOEF2_x, where x = 0 to 4, in the [H3A_VFV_CFG3](#) and [H3A_VFV_CFG4](#) registers). Each coefficient is 8 bits wide with 4 bits of decimal (S8Q4). The filter outcome is downshifted by 4 bits and takes an absolute value to produce a 16-bit unsigned value. This is then sent to threshold [H3A_VFV_CFG2\[31:16\]](#) VTHR1 for FIR 1, and [H3A_VFV_CFG4\[31:16\]](#) VTHR2 for FIR 2, and square logic to produce VFV_n and VFV_sq_n.

7.3.3.8.5.5 ISS ISP H3A VFV Accumulator

The VFV accumulator takes the output of the vertical FIR filters and accumulates values for each pixel. The size and number of pixels is configurable by registers.

[Table 7-653](#) lists the bitfields that configure the size and number of pixels.

The following equations detail the calculation for:

- VFV_n
- VFV_count_n
- VFV_sq_n

n = 1 or 2 for FIR1 and FIR2, respectively.

For each pixel, these six values are available for each R, G, and B component.

```

FIR_coef_n = [VCOEFn_0, VCOEFn_1, VCOEFn_2, VCOEFn_3, VCOEFn_4]; /* coefficient values in S8.4
format */
aFIRout_n = (ABS(inner_product(extracted_G, FIR_coef_n)) + 8) >> 4;

```

```

if (aFIRout_n >= threshold_n)
{
  VFV_n = aFIRout_n - threshold_n;
  VFV_count_n++;
}
else VFV_n = 0;

```

```

VFV_sq_n = (VFV_n * VFV_n + RNDADD) >> RNDSHIFT;

```

- threshold_n is H3A_VFV_CFG2[31:16] VTHR1 and H3A_VFV_CFG4[31:16] VTHR2, respectively.
- FIRout_n is the FIRout_1 and FIRout_2 outputs, respectively.
- RNDADD and RNDSHIFT depend on whether the input pixels are 8-bit or 10-bit, and achieves rounding. This is automatically performed by the module.

7.3.3.8.6 ISS ISP H3A AE/AWB Engine

The AE/AWB engine starts by dividing the frames into windows, and then subsamples each window into 2 × 2 blocks. For each subsampled 2 × 2 block, each pixel is accumulated. Also, each pixel is compared to a limit set in a register. If any pixels in a 2 × 2 block are greater than or equal to the limit, the block is not counted in the unsaturated block counter. Pixels greater than the limit are replaced by the limit, and the value of the pixel is accumulated.

The AE/AWB module has three output format modes, which are set through the H3A_AEWCFG[9:8] AEFMT bit field:

- Sum of square mode: H3A_AEWCFG[9:8] AEFMT = 0x0
- Min/max mode: H3A_AEWCFG[9:8] AEFMT = 0x1
- Sum-only mode: H3A_AEWCFG[9:8] AEFMT = 0x2

7.3.3.8.6.1 ISS ISP H3A Subsembler

The subsampler partitions the frame into windows using the size, count, and starting location parameters shown on the left in Figure 7-160. Each window is further sampled down to a set of 2 × 2 blocks. The horizontal and vertical distances between the start of blocks within a window is programmable using the parameters shown on the right in Figure 7-160.

Figure 7-160. ISS ISP H3A AE/AWB Window Configurations

camisp-072

Table 7-654 lists the bit fields that configure the window and block sizes, counts, and starting positions.

Table 7-654. ISS ISP H3A AE/AWB Window Register Field Descriptions

Bit Field	Bit Width	Description
H3A_AEWWIN1[20:13] WINW	7	Window width (in pixels)
H3A_AEWWIN1[31:24] WINH	7	Window height (in lines)
H3A_AEWWIN1[5:0] WINHC	6	Window count for horizontal direction
H3A_AEWWIN1[12:6] WINVC	7	Window count for vertical direction
H3A_AEWINSTART[11:0] WINSH	12	Window start position H
H3A_AEWINSTART[27:16] WINSV	12	Window start position V
H3A_AEWSUBWIN[3:0] AEWINCH	4	Horizontal distance between subsamples
H3A_AEWSUBWIN[11:8] AEWINCV	4	Vertical distance between subsamples

7.3.3.8.6.2 ISS ISP H3A Additional Black Row of AE/AWB Windows

In addition to the 128 rows of windows, the AE/AWB module provides support for an additional row of windows for black data. This data may be useful in determining the DC offset noise of the rest of the data. The black row of windows can be before or after the regular rows of windows. The vertical start line for the black row of windows is specified in the H3A_AEWINBLK[27:16] WINSV bit field, and the height is specified in the H3A_AEWINBLK[6:0] WINH bit field. The horizontal starting pixel and horizontal width of the black row of windows are the same as for the regular rows of windows.

Figure 7-161 shows a black row of windows before rows of windows.

Figure 7-161. ISS ISP H3A Black Row of Windows Before Regular Rows of Windows

camisp-075

Table 7-655 lists the bit fields that configure the window and block sizes, counts, and starting positions.

Table 7-655. ISS ISP H3A AE/AWB Window With Additional Black Row Register Field Descriptions

Bit Field	Bit Width	Description
H3A_AEWWIN1[20:13] WINW	7	Window width (in pixels)
H3A_AEWWIN1[31:24] WINH	7	Window height (in lines)
H3A_AEWWIN1[5:0] WINHC	6	Window count for horizontal direction
H3A_AEWWIN1[12:6] WINVC	7	Window count for vertical direction
H3A_AEWINSTART[11:0] WINSH	12	Window start position H

Table 7-655. ISS ISP H3A AE/AWB Window With Additional Black Row Register Field Descriptions (continued)

Bit Field	Bit Width	Description
H3A_AEWINSTART [27:16] WINSV	12	Window start position V
H3A_AEWSUBWIN [3:0] AEWINCH	4	Horizontal distance between subsamples
H3A_AEWSUBWIN [11:8] AEWINCV	4	Vertical distance between subsamples
H3A_AEWINBLK [27:16] WINSV	12	Window start position H for single black line
H3A_AEWINBLK [6:0] WINH	7	Window height (in lines) for single black line

7.3.3.8.6.3 ISS ISP H3A Saturation Check

The saturation check module compares the data from the subsampler to the value programmed in the [H3A_PCR](#)[31:22] AVE2LMT bit field. This value is the maximum clipping value. If all 4 pixels in the 2 × 2 block are less than the AVE2LMT value, the value of the unsaturated block counter is incremented. There is one unsaturated block counter per window. The unsaturated block counters are later written to memory.

7.3.3.8.6.4 ISS ISP H3A AE/AWB Accumulators

The output from the saturation check module and the subsampler module are separately accumulated for each pixel in every 2 × 2 pixel block for each window. Therefore, there are eight accumulators per window (one accumulator for each pixel in a 2 × 2 pixel block, times two sets of accumulators: clipped/saturated data and presaturated data). Each of the 4 pixels in the 2 × 2 pixel grid is associated with a color (R, Gr, B, Gb); however, the output of these accumulators is referenced by position in the grid, not color.

The accumulators are 16 bits wide, and the accumulated data is 10 bits wide. Therefore, when a window contains more than 64 pixels of the same color, an overflow risk exists. This risk can be reduced by enabling the A-Law conversion in the preprocessing stage. See [Section 7.3.3.8.4](#) for details.

The AE/AWB module has a shift value for the accumulation of pixel values that is set in the [H3A_AEWCFG](#)[3:0] SUMSHFT bit field.

7.3.3.8.7 ISS ISP H3A DMA Interface

The DMA interface module takes the data from the AF engine and AE/AWB engine and builds packets to be sent to the memory through the BL module.

The data interface has separate start pointers for the AF and AE/AWB engines.

- The starting address for the AF engine is the [H3A_AFBUFST](#)[31:5] AFBUFST bit field.
- The starting address for the AE/AWB engine is the [H3A_AEWBUFST](#)[31:5] AEWBUFST bit field.

The DMA interface module continuously loops through this data as it builds the packets. To optimize the transfer sizes, the DMA interface sends out an AF or AE transfer for each row of pixels or windows. This requires that each horizontal row of pixels or windows starts and ends on a 32-byte boundary. If a horizontal row of pixels or windows ends on a non-32 byte boundary, the hardware packs zeroes. The counts for the AEW that occur every eight windows is sent in the row with the eighth consecutive window.

[Table 7-656](#) lists the packet formats for AF with vertical AF disabled.

Table 7-656. ISS ISP H3A AF Packet Format With Vertical AF Disabled

Buffer Start Address (Byte Address)	31	16	15	0

Then the remaining three windows are written at +0, +32, and +64 bytes. The counts are written out at +96 instead of +256-byte boundary.				

7.3.3.8.8 ISS ISP H3A Events and Status Checking

The AF and AEW engines generate an interrupt event at the end of processing each frame. However, these two interrupts are internally tied together so that only one H3A interrupt signal is generated. If the AF engine and AEW engine do not process the same frame concurrently, this should not be an issue. However, if they do run concurrently, one of two outcomes may occur:

- The H3A interrupt may seem to trigger only once for each frame. This can happen when the processing for the AF and AEW engines finishes at or near the same time. The interrupt service routine (ISR) does not have enough time to clear the interrupt flag for the first interrupt before the second interrupt occurs.
- The H3A interrupt may trigger twice for each frame. This can happen when the AF engine or the AEW engine finishes processing the frame much earlier than the other engine. In this case, the ISR does have enough time to clear the interrupt flag for the first interrupt by the time the second interrupt occurs.

The outcome depends on the difference in location of the last pixel/window in the frame (determines when processing is finished), the frequency of the relative clocks in the system, the occurrence and triggering of other interrupts in the system, and the latencies of the context switching and ISR execution.

The [H3A_PCR\[15\] BUSYAF](#) and/or [H3A_PCR\[18\] BUSYAEAWB](#) status bits are set when the start of frame occurs (if the [H3A_PCR\[0\] AF_EN](#) and/or [H3A_PCR\[16\] AEW_EN](#) bits are 1 at that time). They are automatically reset to 0 at the end of processing a frame. The [H3A_PCR\[15\] BUSYAF](#) and/or [H3A_PCR\[18\] BUSYAEAWB](#) status bits may be polled to determine the end of frame status.

7.3.3.9 ISS ISP ISIF Functional Description

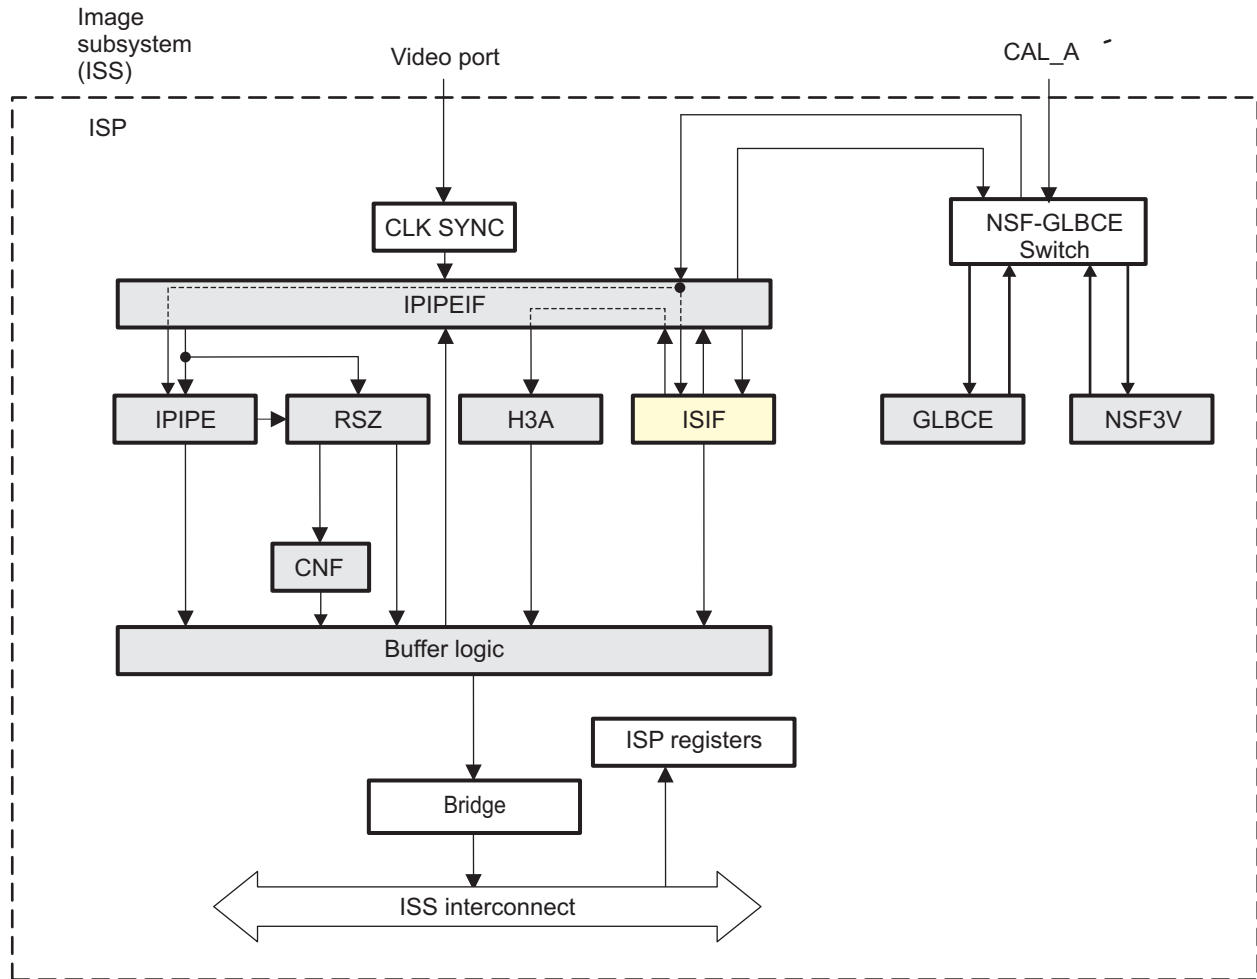

7.3.3.9.1 ISS ISP ISIF Overview

The ISIF module receives RAW or YUV4:2:2 data from the IPIPEIF module. The module outputs data back to the IPIPEIF module and can also output data to memory through the BL module. The ISIF module can process the incoming data and supports the following functions:

- Maximum supported image size is 32,768 × 32,768
- Supports up to 16-bit analog front end
- Sensor data linearization
- Supports Bayer and Foveon® input data format (RGB and CMYG color support)
- Supports VGA read out mode
- Supports various image data format
- Color space conversion
- Digital clamp with horizontal/vertical offset drift compensation
- Vertical line defect correction
- Programmable 2D-matrix LSC
- Gain and offset control
- Programmable horizontal/vertical culling pattern
- Maximum pixel rate clock of 212.8 MPix/s on the VP interface.
- 10-to-8-bit A-Law compression table inside
- 12-bit pack supported when written to memory

[Figure 7-163](#) show the ISIF module connections to other submodules of the ISP.

Figure 7-163. ISS ISP ISIF High-Level Diagram

camisp-003a

7.3.3.9.2 ISS ISP ISIF Top-Level Block Diagram

Figure 7-164 shows the different blocks of the ISIF module.

Figure 7-164. ISS ISP ISIF Top-Level Block Diagram

camisp-074

The following sections describe the blocks in the ISIF module.

7.3.3.9.3 ISS ISP ISIF Input Interface

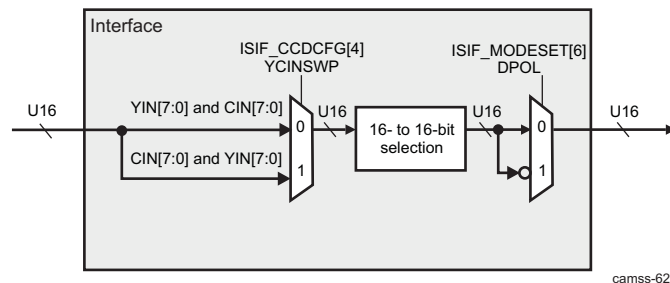

The input interface is a video interface. It comprises the horizontal (HD) and vertical (VD) synchronization signal, pixel clock (PCLK), and data (DATA). Table 7-661 gives more information about these different signals. The ISIF uses the HD and VD signals provided by the sensor through the VP and IPIPEIF. The pixel clock clocks data into the ISIF at a maximum rate of 212.8 MHz.

Table 7-661. ISS ISP ISIF Input Interface Signals

Name	I/O	Function
VD	I	Vertical sync signal
HD	I	Horizontal sync signal
PCLK	I	Pixel clock. This signal is the pixel clock used to load image data into the ISIF. The clock controller can configure to trigger on the rising or falling edge of the PCLK signal.
DATA	I	Data. The data interface is a 16-bit interface. When the ISIF is configured to write data to SDRAM, the write-enable signal allows an external device to control which data is to be written to SDRAM. The data input can be configured from the ISIF_MODESET.INPMOD register where it can be set to RAW, YCbCr (16 bits and 8 bits). The polarity of the data can be changed from the ISIF_MODESET.DPOL as shown in Figure 7-165 .

7.3.3.9.4 ISS ISP ISIF Interface

Figure 7-165. ISS ISP ISIF Interface Block Diagram

The ISIF supports 8- to 16-bit-wide RAW data signals and 8-/16-bit YCbCr signals, as described in [Table 7-662](#). The interface can be set in the three different modes from the [ISIF_MODESET\[13:12\]](#) INPMOD bit field. The [ISIF_CCDCFG\[11\]](#) Y8POS bit selects the y signal positioning whenever YUV4:2:2 is input. Moreover, if CCIR656 input is used the width of selected bit can be set through the [ISIF_CCDCFG\[5\]](#) BT656 bit.

Table 7-662. ISS ISP ISIF Data Input Formats

ISIF Input Port Name	RAW Data	16-bit YCbCr	8-bit YCbCr
Y17	C_DATA15	Y7	
Y16	C_DATA14	Y6	
Y15	C_DATA13	Y5	
Y14	C_DATA12	Y4	
Y13	C_DATA11	Y3	
Y12	C_DATA10	Y2	
Y11	C_DATA9	Y1	
Y10	C_DATA8	Y0	
Cl7	C_DATA7	Cb7,Cr7	Y7,Cb7,Cr7
Cl6	C_DATA6	Cb6,Cr6	Y6,Cb6,Cr6
Cl5	C_DATA5	Cb5,Cr5	Y5,Cb5,Cr5
Cl4	C_DATA4	Cb4,Cr4	Y4,Cb4,Cr4
Cl3	C_DATA3	Cb3,Cr3	Y3,Cb3,Cr3

Table 7-662. ISS ISP ISIF Data Input Formats (continued)

ISIF Input Port Name	RAW Data	16-bit YCbCr	8-bit YCbCr
CI2	C_DATA2	Cb2,Cr2	Y2,Cb2,Cr2
CI1	C_DATA1	Cb1,Cr1	Y1,Cb1,Cr1
CI0	C_DATA0	Cb0,Cr0	Y0,Cb0,Cr0

Y and C input signals can be swapped through the [ISIF_CCDCFG\[4\]](#) YCINSWP bit.

In case of RAW data at ISIF input, a 16- to-16-bit selection can be done: when the number of RAW data lines is less than 16, data can be connected to the upper or lower lines of C_DATA[15:0]. Lines not connected must be tied low. As shown in [Table 7-663](#), the [ISIF_CGAMMAWD\[4:1\]](#) GWDI bit field must be configured correctly so that the MSB of the input is connected to the MSB of the 16-bit data bus in ISIF.

Table 7-663. ISS ISP ISIF Raw Data Connection: Selects MSB Position of Input Data

ISIF_CGAMMAWD[4:1] GWDI	16-to-16-bit Selection
0	C_DATA[15:0] = C_DATA[15:0]
1	C_DATA[15:0] = C_DATA[14:0] &0
2	C_DATA[15:0] = C_DATA[13:0] &00
3	C_DATA[15:0] = C_DATA[12:0] &000
4	C_DATA[15:0] = C_DATA[11:0] &0000
5	C_DATA[15:0] = C_DATA[10:0] &00000
6	C_DATA[15:0] = C_DATA[9:0] &000000
7	C_DATA[15:0] = C_DATA[8:0] &0000000
8	C_DATA[15:0] = C_DATA[7:0] &00000000

The polarity of the input image data can be switched through the [ISIF_MODESET\[6\]](#) DPOL bit.

7.3.3.9.5 ISS ISP ISIF Sensor Linearization

NOTE: For the memory access locations of the sensor linearization table, see [Section 7.3.3.11, ISS ISP Memory Mapping](#).

Figure 7-166. ISS ISP ISIF Sensor Linearization Block Diagram

The sensor linearization module can correct for the nonlinear response of image sensors. A LUT is programmed with an offset value to add to the original pixel value based on the original pixel value.

The LUT is a sampling of the linearization correction curve based on calibration of the image sensor. Intermediate values between sampling points are computed using linear interpolation. The entire correction curve is divided into seven regions, as listed in [Table 7-664](#). The regions for the darkest part and the brightest part of the response curve have dense sampling. The linearization mode can be a uniform or a nonuniform sampling and can be set through the [ISIF_LINCFG0\[1\]](#) LINMD bit.

Table 7-664. ISS ISP ISIF Linearization LUT

Region	Number of Sample Points	LUT Address
table_in[15:11] == 00000	32	table_in[10:6]
table_in[15:11] == 00001	4	table_in[10:9] + 32
table_in[15:12] == 0001	4	table_in[11:10] + 36
table_in[15:13] == 001	4	table_in[12:11] + 40
table_in[15:14] == 01	4	table_in[13:12] + 44
table_in[15:14] == 10	16	table_in[13:10] + 48
table_in[15:14] == 01	128	table_in[13:7] + 64

The LUT has 192 entries and is split into two 96 × 10-bit memories, as shown in Figure 7-167. Table 7-665 is mapped in the memory map. The LUT entries are interleaved between memory 0 and memory 1.

Figure 7-167. ISS ISP ISIF Linearization LUT Memories

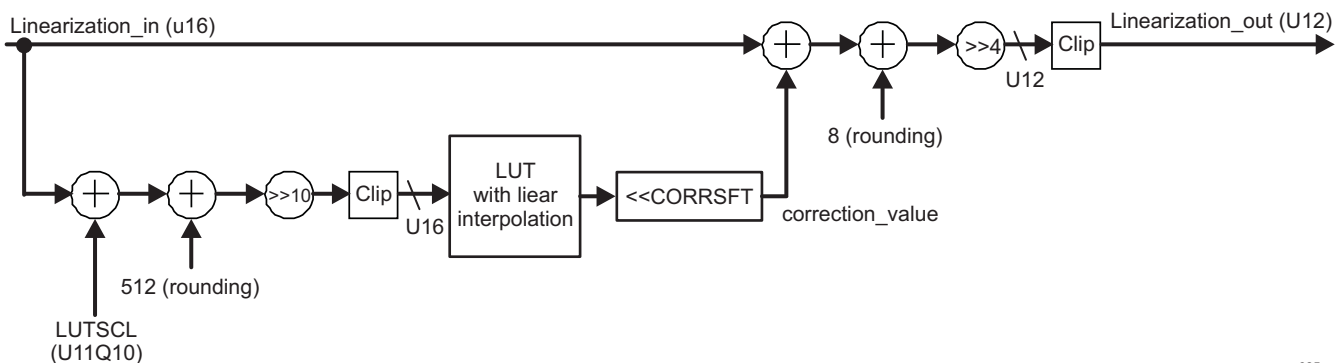

camss-613

Table 7-665. ISS ISP ISIF LUT Memory Region

Memory Region	Address Range	Description
Memory 0	0xC000 – 0xC17F	ISIF linearity compensation LUT 0
Memory 1	0xC400 – C57F	ISIF linearity compensation LUT 1

A scale factor is applied to the input before lookup through the ISIF_LINCFG1[10:0] LUTSCL bit field. The LUT entries are signed 10-bit data (u16). After linear interpolation, the correction value is left-shifted by a programmable amount (the ISIF_LINCFG0[6:4] CORRSFT bit field), and then added to the input. This is then converted to unsigned 12-bit by right shift, followed by clipping.

Figure 7-168. ISS ISP ISIF Linearization Block Diagram

camss-625

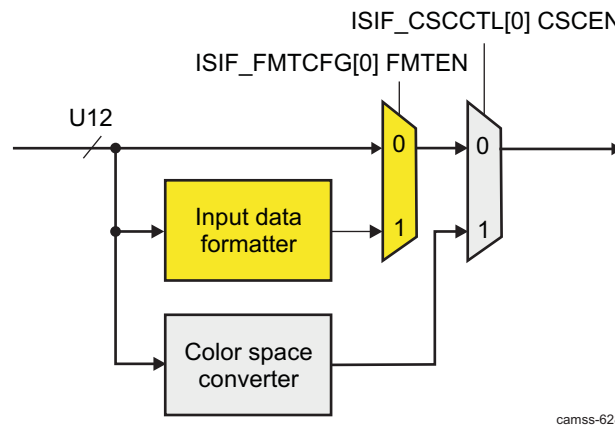

To enable the linearization module, set the [ISIF_LINCFG0\[0\] LINEN](#) bit to 1.

If the linearization module is disabled ([ISIF_LINCFG0\[0\] LINEN](#) = 0x0), a 16- to-12-bit transformation is done, and the upper 12 bits of U16 input are sent to the next block.

7.3.3.9.6 ISS ISP ISIF Input Data Formatter

Figure 7-169 shows the ISS ISP ISIF input data formatter block diagram.

Figure 7-169. ISS ISP ISIF Input Data Formatter Block Diagram

There are two functional blocks: input data formatter and color space converter, which use two 2816 × 12-bit memories (corresponds to one line of maximum 2816 pixels with each pixel equal to 12 bits). Only one of the function blocks can be enabled.

The input data formatter block allows the ISIF to handle a wide variety of current and future readout schemes other than Bayer format. Two line memories and a programmable address generator are used to translate those patterns into a standard Bayer pattern (or any other pattern). This allows the back-end processing (noise filters, interpolation, histogram, 3A statistics) to remain unchanged.

The input data formatter block also supports divided input lines. In case an input line is divided into multiple lines and fed to the ISIF, the formatter gathers the divided lines and organizes a single line. Up to four divided lines can be supported.

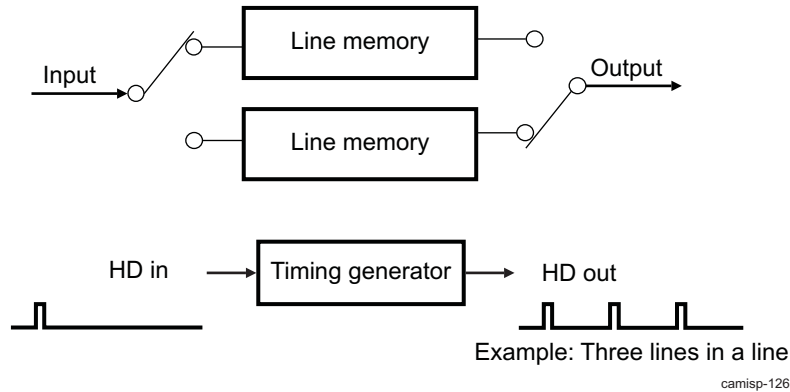

The input data formatter is enabled through the [ISIF_FMTCFG\[0\] FMTEN](#) bit.

The input data formatter can split an input line into one, two, three, or four output lines, or can combine the divided by one, two, three, or four input lines into a single line.

- Set the [ISIF_FMTCFG\[1\] FMTCBL](#) bit to 0 for split mode.
- Set the [ISIF_FMTCFG\[1\] FMTCBL](#) bit to 1 for combine mode.
- Select the number of lines in the [ISIF_FMTCFG\[5:4\] LNUM](#) bit field.

The input data formatter can work in normal or line alternative mode. The choice is done through the [ISIF_FMTCFG\[2\] LNALT](#) bit.

Figure 7-170 shows an example of generating three output lines from an input line with a new, internally generated HD signal.

Figure 7-170. ISS ISP ISIF Splits an Input Line Into Three Output Lines

This HD signal then gates the downstream processing rather than the original sensor HD signal. Descriptions of how to configure the formatter are provided in the following sections.

Because the size of the line memories is 2816×12 bits, the following restrictions apply for the data formatter:

- Split mode:
 - The maximum number of pixels that can be supported in an output line if the input line is transformed into one output line is 2816.
 - The maximum number of pixels that can be supported in an output line if the input line is transformed into two output lines is 1408.
 - The maximum number of pixels that can be supported in an output line if the input line is transformed into three output lines is 938.
 - The maximum number of pixels that can be supported in an output line if the input line is transformed into four output lines is 704.
- Combine mode:
 - The maximum number of pixels that can be supported in an input line if one input line is transformed into an output line is 2816.
 - The maximum number of pixels that can be supported in an input line if two input lines are transformed into an output line is 1408.
 - The maximum number of pixels that can be supported in an input line if three input lines are transformed into an output line is 938.
 - The maximum number of pixels that can be supported in an input line if four input lines are transformed into an output line is 704.

7.3.3.9.6.1 ISS ISP ISIF Formatter Area Settings

As shown in [Figure 7-171](#), the following registers are used to set the formatter area:

- [ISIF_FMTSPH](#)
- [ISIF_FMTLNH](#)
- [ISIF_FMTLSV](#)
- [ISIF_FMTLNV](#)

Figure 7-171. ISS ISP ISIF Input Data Formatter Area Settings

camisp-112

Table 7-666 and Table 7-667 describe these registers. The input line is input to the formatter, and the output line is output from the formatter.

Table 7-666. ISS ISP ISIF Input Data Formatter Area Setting Registers

Register	Description
ISIF_FMTSPH	The first valid pixel of an input line
ISIF_FMTLNH	Valid length of a input line = FMTLNH + 1
ISIF_FMTLSV	The first valid input line
ISIF_FMTLNV	The number of the valid input lines = FMTLNV + 1

Table 7-667. ISS ISP ISIF Output Data Formatter Area Setting Registers

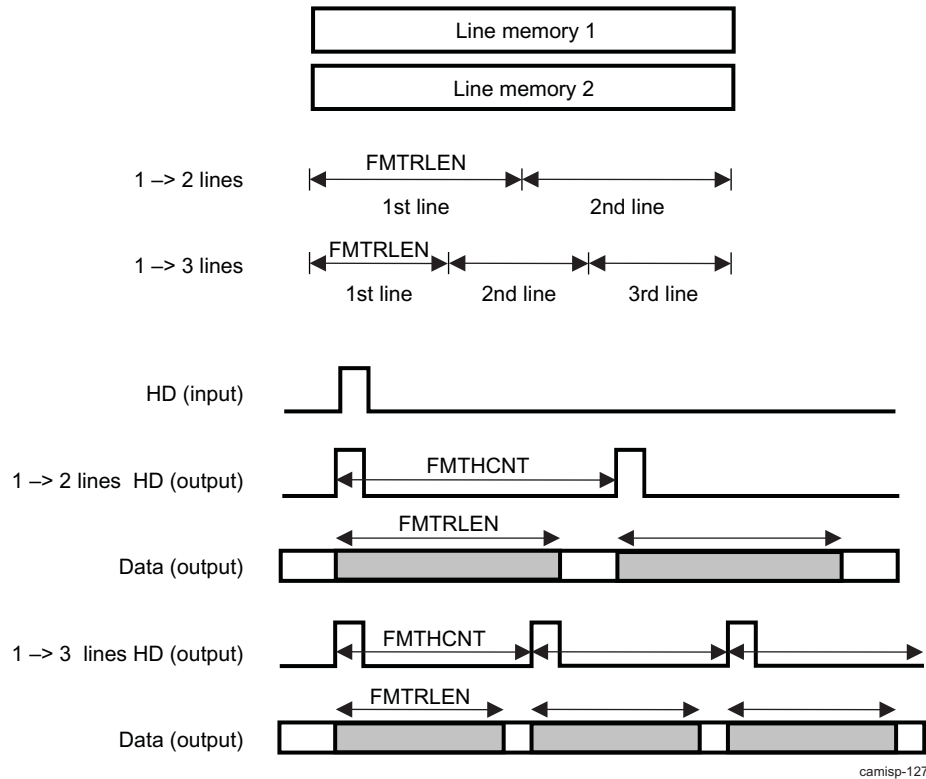

Register	Description
ISIF_FMTRLEN	The length of an output line
ISIF_FMTHCNT	HD interval for output lines
ISIF_SPH	The first pixel in an output line to be stored to SDRAM
ISIF_LNH	The number of pixels in an output line to be stored to SDRAM = LN + 1 (Actual number of output pixels is a multiple of 16)
ISIF_LNV	The number of the output lines to be stored to SDRAM = LNV + 1
ISIF_CBN	The number of the output lines stored in the circular buffer. If CBN=0, circular buffer is not used and the memory space is used as a flat space

The number of pixels in an output line to be stored to SDRAM is a multiple of 16. If the number of pixels is not aligned, the last few pixels are not written to SDRAM. For example, if CULH=0xFFFF, actual output pixels to SDRAM is equal to 16 x floor((LNH+1)/16). If CULH is not 0xFFFF, output pixels to SDRAM is equal to 16 x floor(w/16), where w is the number of pixels after horizontal culling specified by CULH.

The number of pixels in an output line must be set to the ISIF_FMTRLEN register, and the HD output interval must be set to the ISIF_FMTHCNT register. It is not necessary to set the ISIF_FMTHCNT register if multiple input lines are combined into a single line.

Figure 7-172 shows an example of splitting an input line into two or three output lines.

Figure 7-172. ISS ISP ISIF Data Formatter Output Control Example

7.3.3.9.6.2 ISS ISP ISIF Formatter Programming

The data formatter derives its flexibility by supporting up to 16 different addresses and a program that can contain up to 32 entries.

Address pointer

There are 16 address pointer registers ([ISIF_FMTAPTR0](#) to [ISIF_FMTAPTR15](#)), which contain:

- The [ISIF_FMTAPTRx\[14:13\]](#) LINE bit field: 2-bit line number to specify the output line to which it belongs: 0, 1, 2, or 3. It is valid only for the line splitting.
- The [ISIF_FMTAPTRx\[12:0\]](#) INIT bit field: 13-bit initial address for pointer x (where x = 0 to 15)

Each address value is auto-incremented or auto-decremented by a programmable value (the [ISIF_FMTCFG\[11:8\]](#) FMTAINC bit field).

Program

There are 32 program entry registers, which contain:

- In the [ISIF_FMTPGMVFO](#) and [ISIF_FMTPGMVF1](#) registers: The PGMxxEN fields set the program entry valid flag (where xx = 00 to 31) .
- In the [ISIF_FMTPGMAPS0](#) to [ISIF_FMTPGMAPS7](#) registers: The PGMxxAPTR fields specify the program xx address pointer (where xx = 00 to 31).
- In the [ISIF_FMTPGMAPU0](#) and [ISIF_FMTPGMAPU1](#) registers: The PGMxxUPDT fields set the program xx address update (increment or decrement) (where xx = 00 to 31).

Because each program entry has a valid flag, the formatter can also support images larger than the memory limit (length: 4480) by not choosing some of the entries.

The total program memory of 32 entries is divided into two or four sets:

- Program memory of 16 entries each for odd and even lines to split the line:

- SET0 for even input line: Program entry 015
- SET1 for odd input line: Program entry 1631
- Program memory of eight entries for up to four input lines to combine the lines:
 - SET0 for first input line: Program entry 07
 - SET1 for second input line: Program entry 815
 - SET2 for third input line: Program entry 1623
 - SET3 for fourth input line: Program entry 2431

The number of program entries per set must be specified by the **ISIF_FMTPLEN** register as follows:

- Number of program entries for SET0: **ISIF_FMTPLEN**[3:0] FMTPLEN0
- Number of program entries for SET1: **ISIF_FMTPLEN**[7:4] FMTPLEN1
- Number of program entries for SET2: **ISIF_FMTPLEN**[10:8] FMTPLEN2
- Number of program entries for SET3: **ISIF_FMTPLEN**[14:12] FMTPLEN3

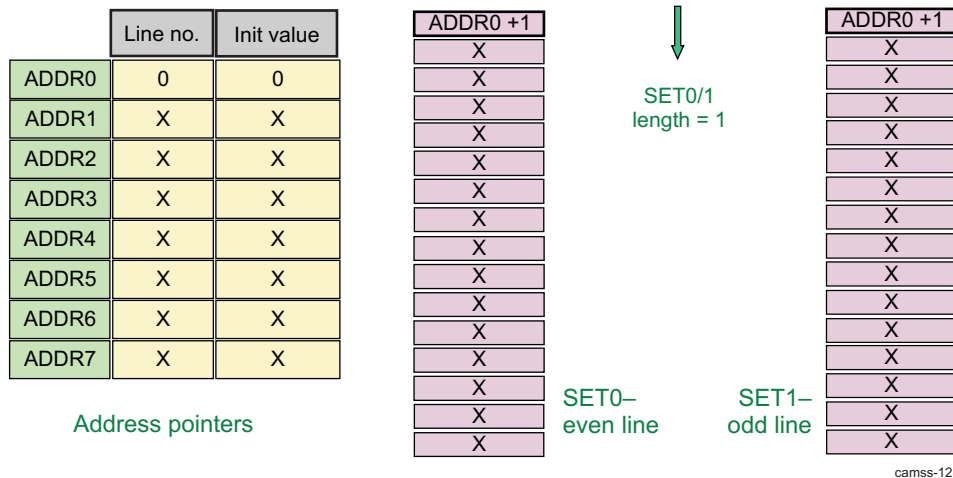

The program entry must be set from the lower registers within a set. For instance, start from program entry 16 for odd input lines.

The following examples show the programmability of the data formatter:

- Register settings:
 - **ISIF_FMTCFG**[0] FMTEN = 0x1
 - **ISIF_FMTCFG**[1] FMTCBL = 0x0
 - **ISIF_FMTCFG**[11:8] FMTAINC = 0x0 (add or subtract 1)
- 1 input line → 1 output line

NOTE: ADDR0 is set to an example value. Addresses with no value in the following example are marked with X.

Figure 7-173. ISS ISP ISIF Conventional Read-Out Pattern

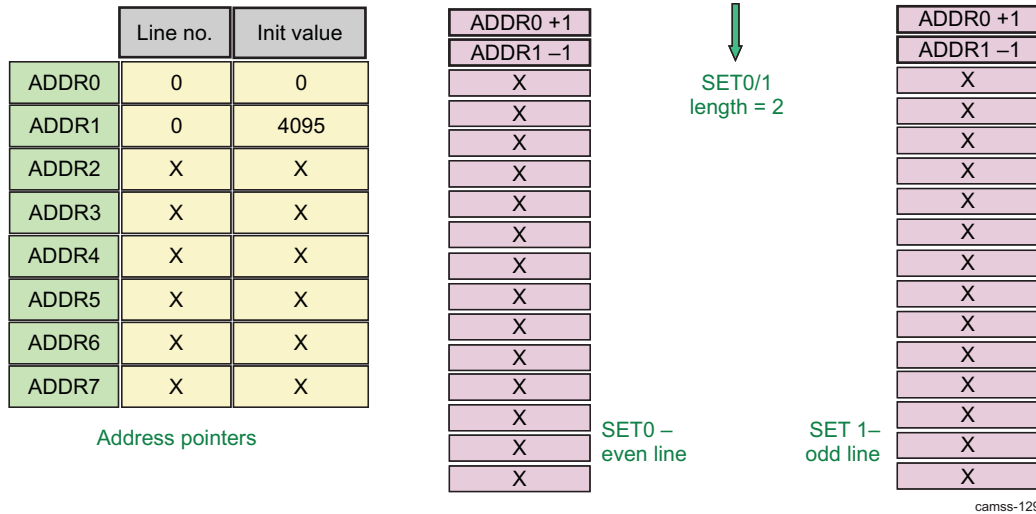

The following examples show the programmability of the data formatter with a 2-tap analog front end (AFE):

- Register settings:
 - **ISIF_FMTCFG**[0] FMTEN = 0x1
 - **ISIF_FMTCFG**[1] FMTCBL = 0x0
 - **ISIF_FMTCFG**[11:8] FMTAINC = 0x0 (add or subtract 1)
 - **ISIF_FMTCFG**[5:4] LNUM = 0x0
- One input line (4096): one output line with left and right read-out

- Input: First pixel, last pixel, first pixel + 1, last pixel – 1, and so on
- Input: 0, 4095, 1, 4094, 2, 4093, 3, 4092, ..., 2047 and 2048
- Output: 0, 1, 2, 3, ..., 4094 and 4095

Figure 7-174. ISS ISP ISIF Conventional Read-Out Pattern With 2-tap AFE

7.3.3.9.6.3 ISS ISP ISIF Combine the Divided Input Lines

The formatter can gather the divided input lines and organize a single line. Figure 7-175 shows an example generating a single output line from three input lines and masking two out of three HD input pulses.

Figure 7-175. ISS ISP ISIF Combine Three Input Lines Into Single Line

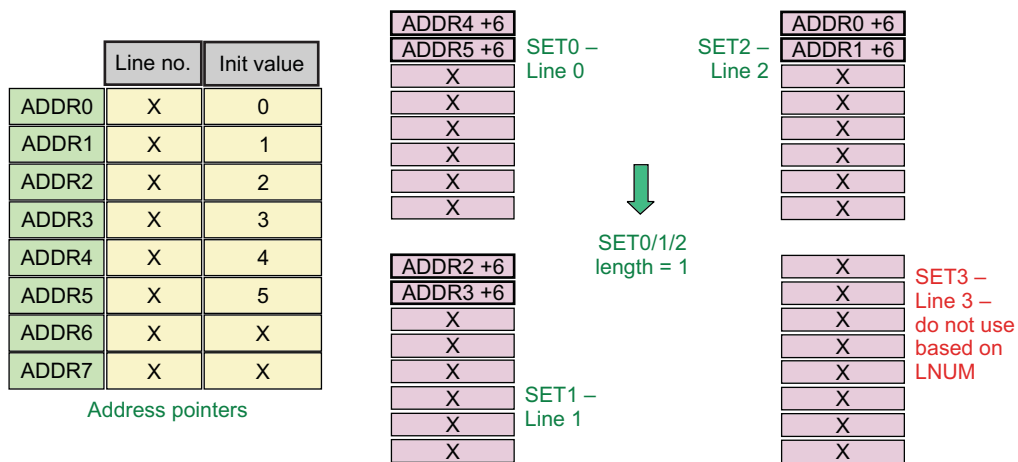

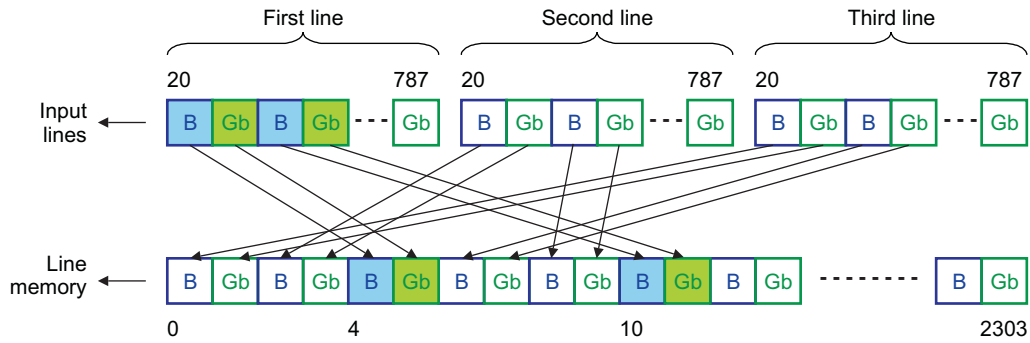

Figure 7-176 is an example that shows the register setting.

- Multiple input lines combined into one output line (use three input lines to one output line in this example)
- Input: 4, 5, 10, 11, ..., 2, 3, 8, 9, ..., 0, 1, 6, 7, ... (three lines read from sensor)
- Output: 0, 1, 2, 3, ... (1 line output)
- Register settings:
 - ISIF_FMTCFG[0] FMTEN = 0x1
 - ISIF_FMTCFG[1] FMTCBL = 0x1
 - ISIF_FMTCFG[11:8] FMTAINC = 0x5 (add or subtract 6)
 - ISIF_FMTCFG[5:4] LNUM = 0x2
 - Sets recycled based on LNUM

Figure 7-176. ISS ISP ISIF Example of Combining Three Input Lines Into a Single Line

camisp-131

Table 7-668 lists an example of the ISS ISP ISIF combining three input lines into a single line.

Table 7-668. ISS ISP ISIF Example of Combining Three Input Lines Into a Single Line: Register Setting Example

Step	Configuration Required	Size
Formatter enable	ISIF_FMTCFG[0] FMTEN	1
Combine input lines.	ISIF_FMTCFG[1] FMTCBL	1

7.3.3.9.7 ISS ISP ISIF Color Space Converter

Figure 7-177 shows the ISS ISP ISIF Color Space Converter Block Diagram.

Figure 7-177. ISS ISP ISIF Color Space Converter Block Diagram

The color space converter (CSC) includes four 8-bit × 12-bit multipliers and one adder for the color space conversion. These multiplier/adder units are used for the operation described in Figure 7-178. Data are taken from two input lines during the operation.

Coefficients are signed 8-bit (decimal is 5 bits). Coefficients are set through the following registers:

- Coefficient M00: [ISIF_CSCM0\[7:0\]](#) CSCM00
- Coefficient M01: [ISIF_CSCM0\[15:8\]](#) CSCM01
- Coefficient M02: [ISIF_CSCM1\[7:0\]](#) CSCM02
- Coefficient M03: [ISIF_CSCM1\[15:8\]](#) CSCM03
- Coefficient M10: [ISIF_CSCM2\[7:0\]](#) CSCM10
- Coefficient M11: [ISIF_CSCM2\[15:8\]](#) CSCM11
- Coefficient M12: [ISIF_CSCM3\[7:0\]](#) CSCM12
- Coefficient M13: [ISIF_CSCM3\[15:8\]](#) CSCM13
- Coefficient M20: [ISIF_CSCM4\[7:0\]](#) CSCM20
- Coefficient M21: [ISIF_CSCM4\[15:8\]](#) CSCM21
- Coefficient M22: [ISIF_CSCM5\[7:0\]](#) CSCM22
- Coefficient M23: [ISIF_CSCM5\[15:8\]](#) CSCM23
- Coefficient M30: [ISIF_CSCM6\[7:0\]](#) CSCM30
- Coefficient M31: [ISIF_CSCM6\[15:8\]](#) CSCM31
- Coefficient M32: [ISIF_CSCM7\[7:0\]](#) CSCM32
- Coefficient M33: [ISIF_CSCM7\[15:8\]](#) CSCM33

camss-118

Figure 7-185. ISS ISP ISIF First Pixel/Last Line Generation

camisp-119

Figure 7-186. ISS ISP ISIF Second Pixel/Last Line Generation

camisp-120

Also, the operation for the last line and the second last line uses the same input data (see [Figure 7-187](#) and [Figure 7-188](#)).

Figure 7-187. ISS ISP ISIF Second Last Pixel/Last Line Generation

camisp-121

Figure 7-188. ISS ISP ISIF Last Pixel/Last Line Generation

camisp-122

In addition to the registers specific to the CSC, some of the registers are shared with the input data formatter to configure the valid area:

- [ISIF_FMTSPH](#)
- [ISIF_FMTLNH](#)
- [ISIF_FMTLSV](#)
- [ISIF_FMTLNV](#)

There must be at least 1 invalid pixel at the end of the line and one invalid line at the end of the frame.

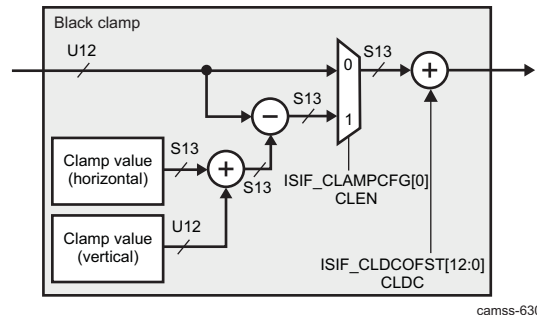

To enable the color space conversion, set the `ISIF_CSCCTL[0]` CSCEN bit to 1.

7.3.3.9.8 ISS ISP ISIF Black Clamp

NOTE: For the memory access locations of the ISIF clamp, see [Section 7.3.3.11, ISS ISP Memory Mapping](#).

Figure 7-189 shows the ISS ISP ISIF black clamp block diagram.

Figure 7-189. ISS ISP ISIF Black Clamp Block Diagram

The clamp value is calculated based on the pixel value of the OB region of the sensor. The clamp value is calculated separately for horizontal and vertical directions to compensate the offset drift in the horizontal and vertical directions. The sum of the horizontal and vertical clamp values is subtracted from the image data, and then the additional DC offset is added (the `ISIF_CLDCOFST[12:0]` CLDC bit field, an S13Q0 value). This value is added whether the black clamp module is enabled or not.

The horizontal clamp is disabled through the `ISIF_CLAMPCFG[2:1]` CLHMD bit field.

To enable the black clamp module, set the `ISIF_CLAMPCFG[0]` CLEN bit to 1. The `ISIF_PPLN[15:0]` PPLN bit field sets the pixel per line, and the number of pixel clock periods in one line HD period equals PPLN + 1 pixel clock. The `ISIF_PPLN[15:0]` bit field is not used when the input is already HD/VD.

7.3.3.9.8.1 ISS ISP ISIF Clamp Value for Horizontal Direction

The clamp value for horizontal direction is calculated using the pixel values at the upper OB region.

The maximum pixel value to be used for the clamp value calculation can be limited to 1023 if the pixel value limitation is enabled (`ISIF_CLHWIN0[6]` CLHLMT = 1).

Clamp value calculation for horizontal direction can be disabled if there is no upper OB region. The operating modes are:

- The horizontal clamp value calculation is enabled. The calculated horizontal clamp value is subtracted from the image data along with the vertical clamp value (`ISIF_CLAMPCFG[2:1]` CLHMD = 0x1).
- The horizontal clamp value is not updated. The horizontal clamp value used for the previous image is subtracted from the image data along with the vertical clamp value (`ISIF_CLAMPCFG[2:1]` CLHMD = 0x2).
- The horizontal clamp value is not updated. Only the vertical clamp value is subtracted from the image data (`ISIF_CLAMPCFG[2:1]` CLHMD = 0x0).

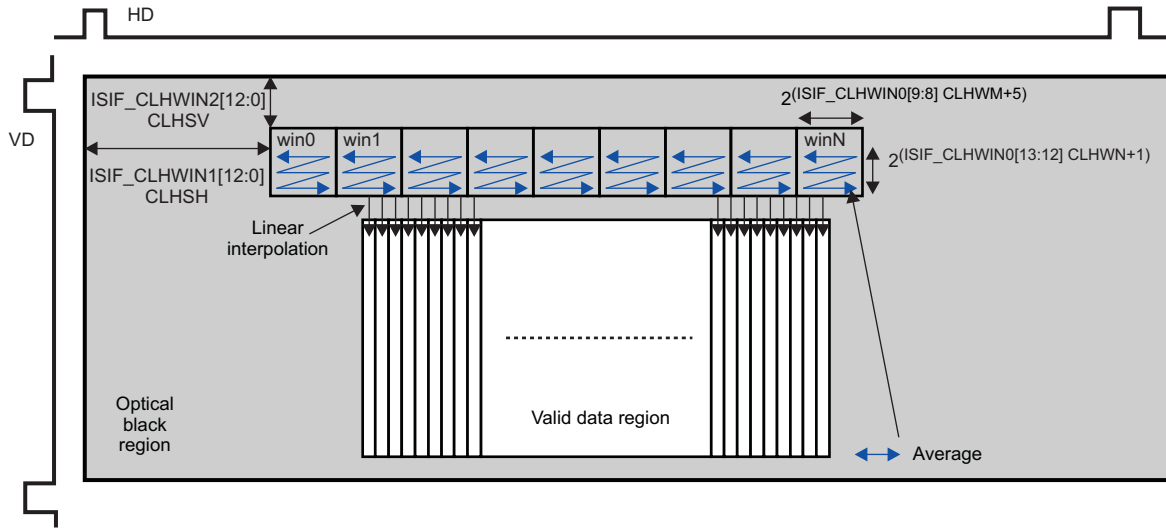

The number of windows in a row is set with the `ISIF_CLHWIN0[4:0]` CLHWC bit field.

Up to 32 windows in a row can be set for clamp value calculation. All the windows have the same size in a format $2^{(ISIF_CLHWIN0[9:8] CLHWM+5)}$ pixels by $2^{(ISIF_CLHWIN0[13:12] CLHWN+1)}$ lines.

The `ISIF_CLHWIN2[12:0]` CLHSV and `ISIF_CLHWIN1[12:0]` CLHSH bit fields enable setting the position of the first optical black clamp window in the frame. The pixel and line offset are in a range 0 to 8191. The `ISIF_HDW` register sets the width of the HD.

Figure 7-190 shows the ISS ISP ISIF clamp value for the horizontal direction.

Figure 7-190. ISS ISP ISIF Clamp Value for Horizontal Direction

Windows settings details

camisp-132

The clamp value for horizontal direction calculation steps is:

1. Calculate the average of the pixel value in each window (ave_win₀ to ave_win_N).

Calculation Steps	win0	win1	win2	...	wini	wini + 1	...	winN
Average of the pixel value	ave_win ₀	ave_win ₁	ave_win ₂		ave_win _i	ave_win _{i+1}		ave_win _N

2. Set the average of the left-most window or the right-most window as the base value B_V:
 - B_V = ave_win₀ (if ISIF_CLHWIN0[5] CLHWBS = 0x0, case 1)
 - B_V = ave_win_N (if ISIF_CLHWIN0[5] CLHWBS = 0x1, case 2)

3. Subtract the base value from the average of each window. Use this value as a clamp value for each window.

Calculation Steps	win0	...	wini	wini+1	...	winN
Clamp value for each window	clamp_win ₀ = ave_win ₀ - B_V		clamp_win _i = ave_win _i - B_V	clamp_win _{i+1} = ave_win _{i+1} - B_V		clamp_win _N = ave_win _N - B_V

4. Acquire the horizontal distance (X and CLHWM - X) from the valid pixel to be processed to the center of the closest two windows.
5. Calculate the clamp value of the valid pixel by linear interpolation, using the clamp value of the closest two windows (i and i + 1).
 - Case 1: interpolated_clamp_win_x = (clamp_win_{i+1} - clamp_win_i) × X / CLHWM

- Case 2: $\text{interpolated_clamp_win}_x = (\text{clamp_win}_i - \text{clamp_win}_N) \times (\text{CLHWM} - X) / \text{CLHWM} + (\text{clamp_win}_{i+1} - \text{clamp_win}_N) \times X / \text{CLHWM}$
6. If the valid pixel is on the left of the center of the left-most window, the clamp value of the left-most window is applied. If the valid pixel is on the right of the center of the right-most window, the clamp value of the right-most window is applied.

The clamp values calculated (A), (B), and (C) are:

- Case1: Base is win_0 (Left-most window: `ISIF_CLHWIN0[5]` CLHWBS = 0x0)
 - (A): zero
 - (B): $(\text{clamp_win}_{i+1} - \text{clamp_win}_i) \times X / \text{CLHWM}$
 - (C): $(\text{clamp_win}_N - \text{clamp_win}_0)$
- Case2: Base is win_N (Right-most window: `ISIF_CLHWIN0[5]` CLHWBS = 0x1)
 - (A): $(\text{clamp_win}_0 - \text{clamp_win}_N)$
 - (B): $(\text{clamp_win}_i - \text{clamp_win}_N) \times (\text{CLHWM} - X) / \text{CLHWM} + (\text{clamp_win}_{i+1} - \text{clamp_win}_N) \times X / \text{CLHWM}$
 - (C): zero

Each interpolated value $\text{interpolated_clamp_win}_x$ is then subtracted to the associated column.

7.3.3.9.8.2 ISS ISP ISIF Clamp Value for Vertical Direction

The clamp value for vertical direction is calculated using the pixel values at the left or right OB region. Line average is calculated for the OB H valid period ($2^{(\text{ISIF_CLVWIN0}[2:0] \text{ CLVOBH} + 1)}$). The averages for the previous lines are also added back to reduce the difference between the lines, as shown in Figure 7-191.

Figure 7-191. ISS ISP ISIF Clamp Value for Vertical Direction Calculation

camss-619

- Clamp Value (V_n) = Line Average (V_n) * k + Clamp Value (V_1) * (1-k)
- $k = \text{ISIF_CLVWIN0}[15:8] \text{ CLVCOEF}$

The position of the first vertical black clamp window is set with the `ISIF_CLVWIN2[12:0]` CLVSV and `ISIF_CLVWIN1[12:0]` CLVSH bit fields. The number of vertical windows is set with the `ISIF_CLVWIN3[12:0]` CLVOBV bit field. `ISIF_VDW` sets the width of the VD.

The accumulator, which holds the vertical clamp value for the previous line, is reset at the beginning of the OB V valid. The reset value can be selected through the `ISIF_CLVWIN0[5:4]` CLVRVSL bit field:

- `ISIF_CLVWIN0[5:4]` CLVRVSL = 0x0: The base value is calculated for horizontal direction (left-most window win_0 or right-most win_n set with `ISIF_CLHWIN0[5]` CLHWBS).
- `ISIF_CLVWIN0[5:4]` CLVRVSL = 0x1: The base value is set through the configuration register (`ISIF_CLVRV[11:0]` CLVRV).
- `ISIF_CLVWIN0[5:4]` CLVRVSL = 0x2: No update (same as the previous image)

The following figures show the OB valid settings and associated vertical clamp value calculation when OB region is at the left (see Figure 7-192) and when OB region is at the right (see Figure 7-193). Each line average value is subtracted from the associated line valid region data.

Figure 7-192. ISS ISP ISIF Clamp Value for Vertical Direction With OB Region at the Left

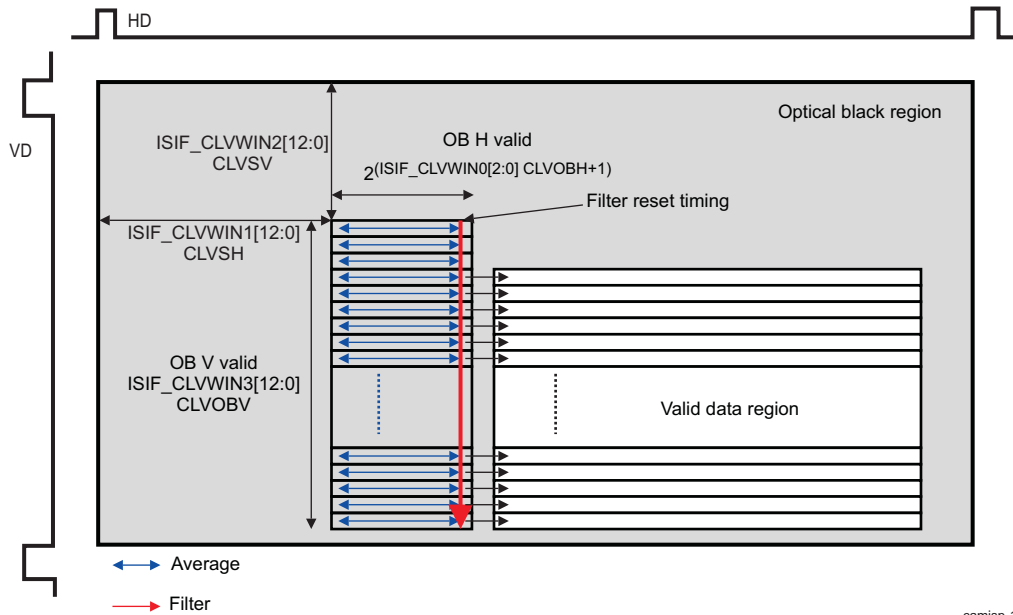

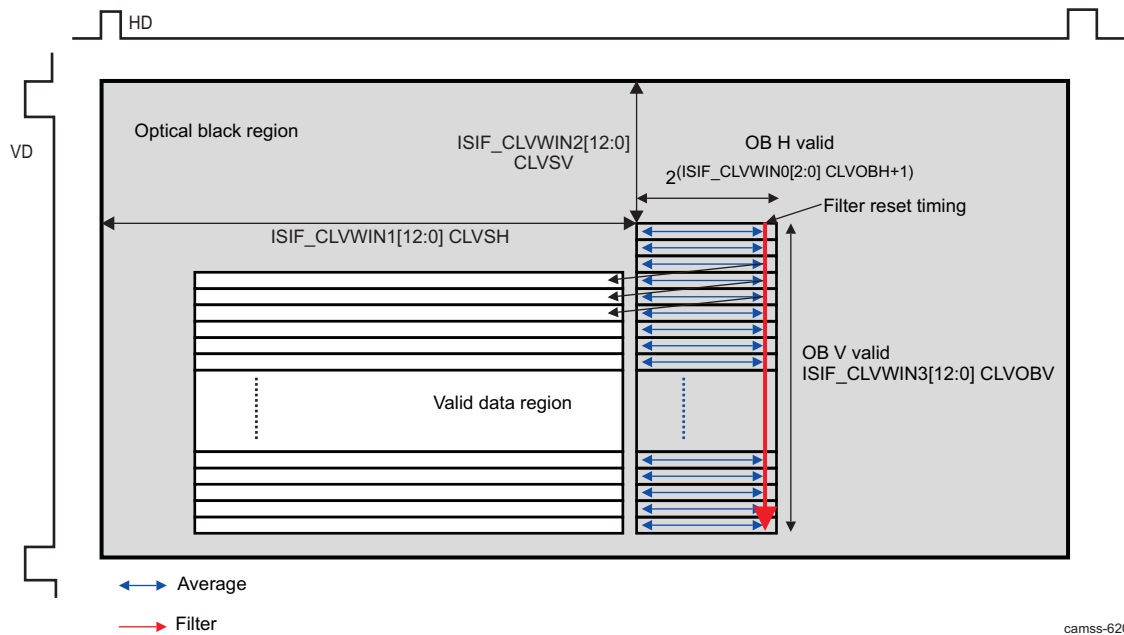

Figure 7-193. ISS ISP ISIF Clamp Value for Vertical Direction With OB Region at the Right

7.3.3.9.9 ISS ISP ISIF Vertical Line Defect Correction (VDFC)

Figure 7-194 shows the block diagram of the vertical line defect (VDFC) correction.

Figure 7-194. ISS ISP ISIF Vertical Line Defect Correction Block Diagram

The VDFC block can correct up to eight vertical line defects (see Figure 7-195).

Figure 7-195. ISS ISP ISIF Vertical Line Defects

The correction method is common to all the defects and can be selected through the `ISIF_DFCCTL[6:5]` VDFCSL bit field.

There are two different methods to correct vertical line defects (`ISIF_DFCCTL[6:5]` VDFCSL):

- Method 1: Data is replaced by an average (`ISIF_DFCCTL[6:5]` VDFCSL = 0x2):
 - The defect is replaced by the average of pixel (i - 2) and pixel (i + 2).
- Method 2: Data is subtracted by a defect level (`ISIF_DFCCTL[6:5]` VDFCSL = 0x0 or 0x1):
 - A saturation level is defined in the `ISIF_VDFSATLV[11:0]` VDFSLV bit field.
 - The coordinates of the defect:
 - Are defined in the `ISIF_DFCMEM0[12:0]` DFCMEM0 and `ISIF_DFCMEM1[12:0]` DFCMEM1 bit fields
 - Are 13 bits wide for horizontal and vertical direction, so an image size up to 8192 × 8192 is supported
 - If the data is not saturated (data < VDFSLV):
 - The defect is corrected by subtracting the defect level. A different defect level is defined for:
 - The point of the defect (V = Vdefect): SUB1 defect level is defined in the `ISIF_DFCMEM2[7:0]` DFCMEM2 bit field.
 - The pixels lower than the defect (V < Vdefect): SUB2 defect level is defined in the `ISIF_DFCMEM3[7:0]` DFCMEM3 bit field.
 - The pixels above the defect (V > Vdefect): Defect level is defined in the `ISIF_DFCMEM4[7:0]` DFCMEM4 bit field.
 - Each defect level (value to be subtracted from the data) described previously can be up-shifted through the `ISIF_DFCCTL[10:8]` VDFLSFT bit field.
 - Vertical line defect correction for upper pixels can be disabled through the `ISIF_DFCCTL[7]` VDFCUDA bit.
 - If the data is saturated (VDFSLV), there are two possibilities:
 - `ISIF_DFCCTL[6:5]` VDFCSL = 0x0: Data is simply fed through (not subtracted).
 - `ISIF_DFCCTL[6:5]` VDFCSL = 0x1: Horizontal interpolation ((i - 2) + (i + 2)) / 2 (data is replaced

by interpolation or data is subtracted with interpolation)

The [ISIF_LPFR](#) register sets the number of half lines per frame or field: $VD \text{ period} = (L \text{ PFR} + 1) / 2 \text{ lines}$. LPFR is not used when HD and VD are inputs.

The following paragraphs concern only method 2 correction.

The coordinates of the defects and the defect levels to be subtracted from the data must be set to the processing listed in [Table 7-669](#).

Table 7-669. ISS ISP ISIF Vertical Line Defect Table in Memory

Bit	Defect Information
12:0	Vertical position of the defects
25:13	Horizontal position of the defects
33:26	Defect level of the vertical line defect position ($V = V_{\text{defect}}$)
41:34	Defect level of the pixels above the vertical line defect ($V < V_{\text{defect}}$)
49:42	Defect level of the pixels below the vertical line defect ($V > V_{\text{defect}}$)

The defect must be set from left to right, as shown in [Figure 7-196](#).

Figure 7-196. ISS ISP ISIF Vertical Line Defects

camisp-135

Vertical line defect correction is enable by setting the [ISIF_DFCCTL\[4\]](#) VDFCEN bit to 1, but the procedure in [Section 7.3.3.9.9.1, ISS ISP ISIF Vertical Line Defect Table Update Procedure](#), must be followed.

7.3.3.9.9.1 ISS ISP ISIF Vertical Line Defect Table Update Procedure

This procedure must be followed to write the vertical line defect table in memory.

1. [ISIF_DFCMEMCTL\[4\]](#) DFCMCLR = 0x1
2. Ensure that [ISIF_DFCCTL\[4\]](#) VDFCEN is disabled (0x0).
3. Write the V coordinate of the first defect to the [ISIF_DFCMEM0\[12:0\]](#) DFCMEM0 bit field.
4. Write the H coordinate of the first defect to the [ISIF_DFCMEM1\[12:0\]](#) DFCMEM1 bit field.
5. Set the defect level to:
 - [ISIF_DFCMEM2\[7:0\]](#) DFCMEM2
 - [ISIF_DFCMEM3\[7:0\]](#) DFCMEM3
 - [ISIF_DFCMEM4\[7:0\]](#) DFCMEM4
6. Set the [ISIF_DFCMEMCTL\[0\]](#) DFCMWR bit to 1 with the [ISIF_DFCMEMCTL\[2\]](#) DFCMARST bit set to 1.
7. Wait until the [ISIF_DFCMEMCTL\[0\]](#) DFCMWR bit is cleared.
8. Write the next data to:
 - [ISIF_DFCMEM0\[12:0\]](#) DFCMEM0

- [ISIF_DFCMEM1\[12:0\]](#) DFCMEM1
 - [ISIF_DFCMEM2\[7:0\]](#) DFCMEM2
 - [ISIF_DFCMEM3\[7:0\]](#) DFCMEM3
 - [ISIF_DFCMEM4\[7:0\]](#) DFCMEM4
9. Set the [ISIF_DFCMEMCTL\[0\]](#) DFCMWR bit to 1 with the [ISIF_DFCMEMCTL\[2\]](#) DFCMARST bit cleared.
 10. Repeat four or five times until all entries (up to eight) are written to the vertical line defect table.
 11. If the defect entry is less than eight, an extra write cycle is required to fill the next table location with a certain value.
 12. Clear the [ISIF_DFCMEM0\[12:0\]](#) DFCMEM0 bit field to all 0's, set the [ISIF_DFCMEM1\[12:0\]](#) DFCMEM1 to all 1's, and set the [ISIF_DFCMEMCTL\[0\]](#) DFCMWR bit to 1 with the [ISIF_DFCMEMCTL\[2\]](#) DFCMARST bit cleared.
 13. Enable VDFC by setting the [ISIF_DFCCTL\[1\]](#) VDFCEN bit.

7.3.3.9.10 ISS ISP ISIF Lens Shading Correction Module (2D-LSC)

NOTE: For the memory access locations of the 2D-LSC table, see [Section 7.3.3.11, ISS ISP Memory Mapping](#).

Figure 7-197. ISS ISP ISIF 2D-LSC Block Diagram

Lens shading correction (LSC) is useful for correcting optical artifacts that cause image brightness to decrease starting at the center of the image and going to the edges.

The LSC implements a per-pixel offset and gain adjustment in the RAW Bayer domain (2 × 2 color pattern).

- In 8-bit gain mode, when the [ISIF_2DLSCCFG\[6\]](#) GAIN_RANGE bit is set to 0, the offset is applied before gain multiplication.
- In 16-bit gain mode, when the [ISIF_2DLSCCFG\[6\]](#) GAIN_RANGE bit is set to 1, the offset function is disabled, and the loaded offset value is used to constitute the lower 8 bits of the 16-bit gain table offset table.

The offset and gains are stored in a LUT, which is stored in SDRAM and is loaded in real time. The submodule prefetches the data from SDRAM such that no underflow occurs. Underflow occurs when the offset and gain data required for the current pixel are not available.

The data stored in the LUT is downsampled; that is, there is no gain or offset per pixel. The downsampling factor is programmable. High downsampling ratios lead to a smaller LUT, lower accuracy, and lower memory bandwidth. A low downsampling ratio leads to a bigger LUT, higher accuracy, and higher memory bandwidth.

When the offset and gain values are loaded, they are upscaled to the incoming image resolution. The missing table values are computed through bilinear interpolation.

To enable the 2D-LSC module, set the [ISIF_2DLSCCFG\[0\]](#) ENABLE bit to 1.

7.3.3.9.10.1 ISS ISP ISIF 2D-LSC Active Region Settings

The gain and offset maps are internally upsampled to full resolution before being applied to the image. To account for all the possible cropping schemes and zoom ratios, the 2D-LSC can be configured to store a single gain map in memory that maps to sensor lens. [Figure 7-198](#) shows the 2D-LSC active region.

Figure 7-198. ISS ISP ISIF 2D-LSC Active Region for ISIF Input Frame

7.3.3.9.10.1.1 ISS ISP ISIF 2D-LSC Gain and Offset Tables

The gain and offset map are $M \times N$ downsampled:

- M is the horizontal sampling factor.
- N is the vertical sampling factor.
- M and N are $\{8, 16, 32, 64, 128\}$ independently.
- $N = M$. M is set in the [ISIF_2DLSCCFG\[14:12\]](#) GAIN_MODE_M bit field.
- N is set in the [ISIF_2DLSCCFG\[10:8\]](#) GAIN_MODE_N bit field.

The starting point of the preconfigured lens shading map can be modified in software to align with the ISIF input image frame. The location of the gain and offset mask data in memory is specified as follows:

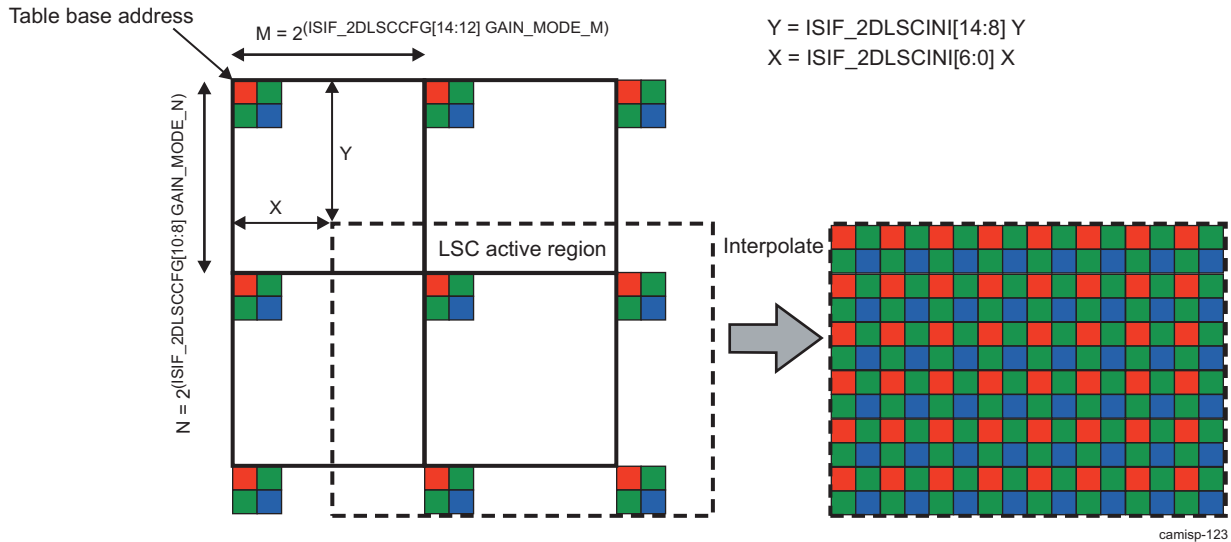

- For gain map:
 - Table base address: [ISIF_2DLSCGRBU\[15:0\]](#) BASE31_16 and [ISIF_2DLSCGRBL\[15:0\]](#) BASE15_0
- For offset map:
 - Table base address: [ISIF_2DLSCORBU\[15:0\]](#) BASE and [ISIF_2DLSCORBL\[15:0\]](#) BASE

The input address must be aligned to a 4-byte boundary.

In the full resolution case, the address is set to the beginning of the map. When the LSC active region is defined over a cropped region of the full image, the SDRAM input address can be set to the upper-left corner of the grid closest to the beginning of the active region, and the [ISIF_2DLSCINI\[6:0\]](#) X and [ISIF_2DLSCINI\[14:8\]](#) Y bit fields mark the offset into the upsampled gain and offset map where the active region begins. [Figure 7-199](#) shows the LSC active region with respect to the gain and offset map grid. Because (X, Y) deals with the pixel phase inside a gain and offset map grid, X and Y must each be less than M and N , respectively.

Before applying the gain or offset table, the table is internally upsampled and interpolated back to full resolution via bilinear interpolation.

Figure 7-199. ISS ISP ISIF Gain and Offset Mask Upsampling via Bilinear Interpolation

The gain table format is set in the [ISIF_2DLSCCFG\[4:1\] GAIN_FORMAT](#) bit field. Eight-bit entries are supported in the gain map (in U8Q8, U8Q7, U8Q6, and U8Q5 format with an optional base of 1.0 to shift the range up).

Eight-bit entries are supported in the offset map (in S8Q0 format). An optional shifting up for offsets is possible. The shift-up value is selected through the [ISIF_2DLSCOFST\[6:4\] OFSTSFT](#) bit field. A scaling factor for offsets is defined in the [ISIF_2DLSCOFST\[15:8\] OFSTS](#) bit field.

A 16-bit gain map is supported by combining the gain map and offset map (in U16Q16, U16Q15, U16Q14, U16Q13, U16Q12, U16Q11, U16Q10, and U16Q9 format with an optional base of 1.0 to shift the range up). This function is exclusive to offset control function, and can be configured through the [ISIF_2DLSCCFG\[6\] GAIN_RANGE](#) bit.

The offset control in the 2D-LSC module can be enabled or disabled through the [ISIF_2DLSCOFST\[0\] OFSTEN](#) bit.

For an LSC active region size of $W \times H$ (the output and input are the same size), and the gain and offset maps are $M \times N$ downsampled, a table with the following values is needed:

- $(\text{ceil}[(X + W) / M] + 1) \times (\text{ceil}[(Y + H) / N] + 1) \times 4$ bytes data in external memory organized as:
 - $(\text{ceil}[(\text{InitX} + W) / M] + 1)$ lines of data
 - Each line having at least $(\text{ceil}[(\text{InitY} + H) / N] + 1) \times 4$ data points

Extra data at end of each line can be skipped by the line offset register parameter:

- For gain map:
 - Line offset: [ISIF_2DLSCGROF\[15:0\] OFFSET](#)
- For offset map:
 - Line offset: [ISIF_2DLSCOROF\[15:0\] OFFSET](#)
- Each line offset must start at a 32-bit aligned boundary.

7.3.3.9.10.1.2 ISS ISP ISIF 2D-LSC Gain and Offset Table Upsampling

Upsampling of the pixel-by-pixel gains is performed by locating the four same-color anchors for each destination gain value and applying bilinear interpolation.

The gain and offset mask function is neutral to color pattern. The starting color of the gain and offset mask must be consistent with the starting color of the image, and can be any color. To align starting colors, the X and Y values must be even. The 2D-LSC engine upsamples each phase of the mask data as a separate plane and applies the upsampled mask to the image with the same color phasing. In other words, the red gains are interpolated with red gains, and applied to the red input pixels. The same process is done for the other three colors in the color pattern. The 2D-LSC module is designed to work with Bayer CFA data, having the R/Gr/Gb/B color pattern. For the purpose of functional description, assume red is the starting color, but any other starting color or other 2 x 2 pattern can be used by placing color gains in the appropriate order.

7.3.3.9.10.1.3 ISS ISP ISIF Application of Gain and Offset to Image Pixels

The gain value interpolated for each pixel is multiplied with a corresponding input pixel. An offset is applied before the gain. The product is rounded to the nearest integer and then clipped or saturated to the valid range of 13 bits.

The following equation describes the operation of the LSC in terms of offset and gain:

$$\text{out}[x,y] = (\text{in}[x,y] + a \times (\text{ofst}[x,y] \ll T)) \times \text{gain}[x,y] \quad (3)$$

- in[x, y] are the input pixels, 13 bits signed.
- ofst[x, y] are the upsampled offset points.
- T is the upshift value applied to the result of the offset interpolation points (0–5) set through the [ISIF_2DLSCOFST\[6:4\]](#) OFSTSFT bit field.
- a is the offset gain value in U8Q7 format set through the [ISIF_2DLSCOFST\[15:8\]](#) OFSTSF bit field.
- gain[x, y] are the upsampled gain points.
- out[x, y] are the resulting output pixels, 13 bits signed.

7.3.3.9.10.1.4 ISS ISP ISIF Enabling and Disabling the 2D-LSC Module

LSC operates on a single frame or continuously, depending on the firmware programming.

Upon power-on reset (POR), the 2D-LSC module is disabled and input pixels are copied to the output, thus bypassing any shading operation.

When enabling or disabling the 2D-LSC, caution must be taken on the timing of register modifications. To avoid causing a prefetch error or other unexpected behavior, the following safeguards must be implemented:

1. While configuring the 2D-LSC registers, the input clock into the ISIF should be toggling.
2. All of the 2D-LSC registers must be configured appropriately before enabling the [ISIF_2DLSCCFG\[0\]](#) ENABLE bit.
3. After setting the ENABLE bit to 1, the hardware immediately begins fetching the first two rows of gain and offset data entries from external memory. When this is complete, the [ISIF_2DLSCIRQST\[2\]](#) PREFETCH_COMPETED status flag is set.

NOTE: If the ENABLE bit is disabled before the [ISIF_2DLSCIRQST\[3\]](#) SOF status flag is set, the [ISIF_2DLSCIRQST\[1\]](#) PREFETCH_ERROR flag is set and the state of the 2D-LSC module may lead to unexpected errors. Therefore, the ENABLE bit must not be disabled until after the [ISIF_2DLSCIRQST\[3\]](#) SOF status flag is set.

4. Appropriate gains and offsets are applied to the image pixels. Pixels outside the LSC active region are passed through unaltered. When the 2D-LSC operation on the active region completes, the [ISIF_2DLSCIRQST\[0\]](#) DONE status flag is set.
5. At this point:
 - If the ENABLE bit is still set to 1, the hardware immediately begins to prefetch the gain and offset data entries for the next frame and waits for the active region of the next frame to arrive.
 - If the ENABLE bit is set to 0, it stops LSC operation once the active region is passed, and goes into idle mode until the ENABLE bit is reset to 1.

NOTE: To provide a mechanism for firmware to recover from the LSC module waiting indefinitely for the input image, if the LSC_ENABLE bit is set to 0 after it has started gain/offset map prefetching, but before the LSC gets to the next active region, the LSC operation is aborted and turned idle, and any prefetched gain/offset entries are discarded. This can happen before or after the next start-of-frame.

NOTE: Therefore, because of the constraints set in point 3, the ENABLE bit must be disabled only after the [ISIF_2DLSCIRQST\[3\]](#) SOF status flag is set and before the [ISIF_2DLSCIRQST\[0\]](#) DONE status flag is set for that same frame.

It is suggested that when the 2D-LSC or the whole ISIF must be disabled for switching modes, the [ISIF_2DLSCIRQST\[3\]](#) SOF interrupt be enabled so that software knows when it is safe to disable the 2D-LSC. Then the ISIF can be disabled after the [ISIF_2DLSCIRQST\[0\]](#) DONE status signal is set for that frame.

NOTE: The LSC_ENABLE bit, once set to 1, must not be cleared until at least one vpi_clk clock cycle after start-of-frame, to ensure correct processing.

7.3.3.9.10.1.5 ISS ISP ISIF 2D-LSC Events and Status Checking

The 2D-LSC module can generate events on a single interrupt line. These events are further remapped at the ISP level in the ISP5_IRQENABLE_SET_i[3] ISIF_INT_3 bit, where i = 0 to 3.

Four 2D-LSC events can be generated:

- **DONE:** LSC done. This event triggers when the LSC submodules transition from ACTIVE state to IDLE state.
- **PREFETCH_ERROR:** Gain table prefetch error. This event triggers when the tables stored in SDRAM are read too slowly. After this event is asserted, the LSC disables the LSC computation until the beginning of the next frame.
- **PREFETCH_COMPLETE:** Gain table prefetch complete. This event triggers when data prefetching from SDRAM completes. Data prefetching must complete by the time the first pixel of a frame arrives. The event triggers when the buffer contains three full rows of data.
- **SOF:** This event signals the start of the LSC valid region. The LSC configuration registers for the next frame can be updated after the LSC SOF triggers.

The [ISIF_2DLSCIRQEN](#) register can be configured to select which events are masked and which are propagated to the LSC interrupt signal. The [ISIF_2DLSCIRQST](#) register can be read and cleared to identify which events have occurred.

In addition, the 2D-LSC module provides the following status bit:

- **BUSY:** This indicates that LSC has entered the active region vertically. This bit remains on during horizontal blanking, and turns off only after the entire active region of the current frame is processed.

7.3.3.9.10.1.6 ISS ISP ISIF Supported On-the-Fly 2D-LSC Configurations

The 2D-LSC prefetch memory is equal to $2 \times 1536 \times 32$ bits. This memory is sized to fetch three lines of 8-bit gain and 8-bit offset \times four color components per paxel. Given an image sensor of horizontal resolution H, there are $\text{floor}[(H / \text{ISIF_2DLSCCFG}[14:12] \text{ GAIN_MODE_M}) + 1]$ paxels per line, where M is the horizontal LSC paxel size.

[Table 7-670](#) shows the LSC horizontal paxel size, which can be supported for different image sensor resolutions. When M = 8, some resolutions cannot be supported on the fly (orange-shaded cells in the table); the way to process such large images is to use vertical frame division.

Table 7-670. ISS ISP ISIF Supported On-the-Fly LSC Configurations

MPix	Aspect Ratio		Line Size	Horizontal LSC Pixel Size: $M = 2^{\lfloor \text{ISIF_2DLSCCFG}[14:12] \text{ GAIN_MODE_M} \rfloor}$				
				8	16	32	64	128

7.3.3.9.10.1.7 ISS ISP ISIF Bandwidth Requirements on BL Read Port

For details, see [Section 7.3.3.9.19.2, ISS ISP ISIF Read Port](#).

7.3.3.9.11 ISS ISP ISIF White Balance

Figure 7-200 shows the white balance block diagram.

Figure 7-200. ISS ISP ISIF White Balance Block Diagram

Color pattern settings are set through the [ISIF_CCOLP](#) register. Moreover, through this register the pixel position from 0 to 3 can be set to the needed Bayer universal camera filter color pattern (RGB/CYGM).

The CFA pattern can be in two modes, stripe or mosaic, and is set through the [ISIF_CGAMMAWD](#)[5] CFAP bit.

There are color-dependent gain controls for the three outputs:

- BL output
- IPIPEIF (IPIPE path) output

- IPIPEIF (H3A path) output

The gain applied to each data is selected according to the pixel position and the color pattern settings. Gain factors are common for the three data paths. Gain is in U11Q9 format, which ranges from 0 to 3 + 511/512. The gain factor is set through the following registers:

- R/Ye gain: [ISIF_CRGAIN\[11:0\]](#) CGR
- Gr/Cy gain: [ISIF_CGRGAIN\[11:0\]](#) CGGR
- Gb/Cy gain: [ISIF_CGBGAIN\[11:0\]](#) CGGB
- B/Mg gain: [ISIF_CBGAIN\[11:0\]](#) CGB

Gain control can be enabled or disabled individually for each path.

- Enable or disable gain for the BL path: [ISIF_CGAMMAWD\[12\]](#) WBEN0
- Enable or disable gain for the IPIPEIF (IPIPE) path: [ISIF_CGAMMAWD\[13\]](#) WBEN1
- Enable or disable gain for the IPIPEIF (H3A) path: [ISIF_CGAMMAWD\[14\]](#) WBEN2

After the gain control, a single offset value can be added to each path individually. This offset is common for the three paths and is set through the [ISIF_COFSTA\[11:0\]](#) COFT bit field. The offset value is U12, which ranges from 0 to 4095. Data (S13) are then truncated to U12.

- Enable or disable offset for the BL path: [ISIF_CGAMMAWD\[8\]](#) OFSTEN0
- Enable or disable offset for the IPIPEIF (IPIPE) path: [ISIF_CGAMMAWD\[9\]](#) OFSTEN1
- Enable or disable offset for the IPIPEIF (H3A) path: [ISIF_CGAMMAWD\[10\]](#) OFSTEN2

7.3.3.9.12 ISS ISP ISIF Low-Pass Filter

Figure 7-201 shows the low-pass filter (LPF) block diagram.

Figure 7-201. ISS ISP ISIF Low-Pass Filter Block Diagram

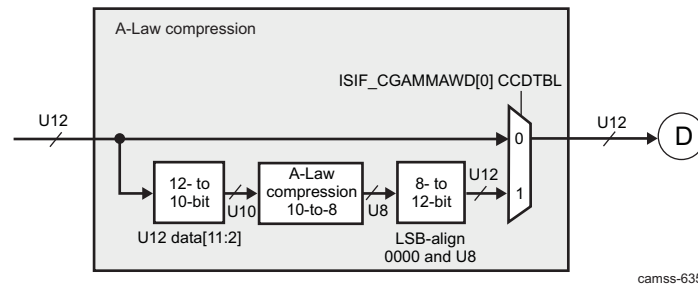

An optional horizontal low-pass anti-aliasing filter (LPF) can be applied (the [ISIF_MODESET\[14\]](#) HLPF bit) after reframing. The LPF consists of a simple 3-tap (1/4, 1/2, and 1/4) filter. Two pixels on the left and two pixels on the right of each line are cropped if the filter is enabled. Use of the LPF is intended for bandwidth reduction if culling is enabled.

NOTE: For YUV data, the LPF must be disabled ([ISIF_MODESET\[14\]](#) HLPF = 0x0).

7.3.3.9.13 ISS ISP ISIF A-Law Compression

Figure 7-202 shows the A-Law compression block diagram.

Figure 7-202. ISS ISP ISIF A-Law Compression Block Diagram

An optional 10-to-8-bit A-Law compression using a fixed A-Law table can be applied (the [ISIF_CGAMMAWD\[0\] CCDTBL](#) bit) as the final processing stage. Using this compression causes the data width to be reduced to 8 bits and allows packing to 8 bits/pixel when saving to memory. Because data resolution can be greater than 10 bits at this stage, the 10 bits for input to the A-Law operation must be selected (the [ISIF_CGAMMAWD\[4:1\]](#) GWDI bit field).

The IPIPEIF module has an inverse A-Law table (A-Law decompression) option so that this nonlinear operation can be reversed if this saved data is to be read back in for further processing.

NOTE: Do not use A-Law compression ([ISIF_CGAMMAWD\[0\] CCDTBL](#) = 0) with YUV data.

[Figure 7-203](#) shows the A-Law table diagram, and [Figure 7-204](#) shows the A-Law table values.

camisp-263

7.3.3.9.14 ISS ISP ISIF Culling

Figure 7-205 shows the culling block diagram.

Figure 7-205. ISS ISP ISIF Culling Block Diagram

The culling block performs a programmable decimation function for horizontal, vertical, and YUV4:2:2 data directions. The horizontal and vertical decimation of image data can be controlled by two registers.

The horizontal culling operation allows selected pixel data to be culled (deleted) from a line. The **ISIF_CULH** register specifies the horizontal culling pattern for even and odd lines:

- Even lines: **ISIF_CULH**[15:8] CLHE
- Odd lines: **ISIF_CULH**[16:0] CLHO

The vertical culling operation allows selected lines to be culled from a frame. The **ISIF_CULV** register specifies the pattern for the vertical direction. The LSBs of **CULV** represent the top line of the CCD; the MSB is the seventh line. For proper operation, LSB of **CULV** must be always 1 (**ISIF_CULV**[7:0]=1).

Figure 7-206 is an example of how register values apply the decimation pattern to the data. The red pixels are saved to memory and the white pixels are discarded. In this example, **CULH** = 0x59C4 and **CULV** = 0x0066.

NOTE: Culling can be used with YUV data, but care must be taken to preserve the YUV4:2:2 output format.

Figure 7-206. ISS ISP ISIF Example for Decimation Pattern

7.3.3.9.15 ISS ISP ISIF 12-to-8-Bit DPCM Compression Block

In the ISIF, a DPCM compression block is between the culling module and the storage formatter module. This block can compress 12-bit image data to 8 bits for bandwidth reduction in transmission between the ISIF and SDRAM. An 8-to-12-bit DPCM decoder at the IPIPEIF decompresses data for IPIPE processing.

Two different predictors are used for the compression system. The first predictor is simple (simple predictor), and the second predictor is slightly more complex (advanced predictor). Because the advanced predictor gives a slightly better prediction for the pixel value, the image quality can be improved using it. Because the simple predictor is very basic, the processing power and memory requirements are reduced using it, when the image quality is already sufficiently high.

- Advanced predictor: This predictor uses only the previous same color component value as a prediction value. Therefore, only 2-pixel memory is required.
- This predictor uses four previous pixel values when the prediction value is evaluated. This means that the other color component values are also used when the prediction value is defined.

The function is controlled from the [ISIF_MISC\[12\] DPCMEN](#) and [ISIF_MISC\[13\] DPCMPRE](#) bits.

7.3.3.9.16 ISP ISIF Storage Formatter

[Figure 7-207](#) shows the storage formatter block diagram.

Figure 7-207. ISS ISP ISIF Storage Formatter Block Diagram

Data are stored to the lower bits of a 16-bit SDRAM word, or can be 8- or 12-bit packed. The [ISIF_HSIZE\[11:0\]](#) HSIZE bit field can specify the memory address offsets between lines of memory (offset in 32-byte units). If set, the [ISIF_HSIZE\[12\]](#) ADCR bit can decrement the memory address line and the line can be horizontally flipped in memory.

In case of RAW data, a data shift module is used: data to be stored can be right-shifted according to the value set at the [ISIF_MODESET\[10:8\]](#) CCDW bit field, as described in [Table 7-671](#).

Table 7-671. ISS ISP ISIF RAW Data Shifting

ISIF_MODESET[10:8] CCDW	Output Format
	MSB LSB
000	0000 &U12 data[11:0]
001	00000 &U12 data[11:1]
010	000000 &U12 data[11:2]
011	0000000 &U12 data[11:3]
100	00000000 &U12 data[11:4]

Table 7-672 shows the format where data are stored to the lower bits of a 16-bit word and the format where data are packed to 8 bits. The unused bits are filled with zeros.

Table 7-672. ISS ISP ISIF SDRAM Data Format

	Upper Word		Lower Word	
	MSB(31)	LSB(16)	MSB(15)	LSB(0)
12 bit	0	Pixel 1	0	Pixel 0
11 bit	0	Pixel 1	0	Pixel 0
10 bit	0	Pixel 1	0	Pixel 0
9 bit	0	Pixel 1	0	Pixel 0
8 bit	0	Pixel 1	0	Pixel 0
8-bit packed	Pixel 3	Pixel 2	Pixel 1	Pixel 0

Table 7-673 shows the format where data are packed to 12 bits.

Table 7-673. ISS ISP ISIF SDRAM Data Format for 12-bit Packed

	Upper Word		Lower Word	
	MSB(31)	LSB(16)	MSB(15)	LSB(0)
12 bit	Pixel2[7:0]	Pixel1	Pixel 0	
	Pixel5[3:0]	Pixel4	Pixel3	Pixel2[11:8]
	Pixel7	Pixel6	Pixel5[11:4]	

In case of YUV, YUV data is stored in memory in packed YUV4:2:2 mode, using 2 pixels per 32 bits, as shown in [Table 7-674](#).

The output formatter can configure to any image format by using the SDRAM line offset register and offset control registers. [Figure 7-208](#) shows how to construct a frame format in SDRAM. The `ISIF_CADU[10:0]` CADU bit field specifies the memory destination (upper 11 bits) to SDRAM (the address is the value of the set bit multiplied by 32 bytes). On the other hand, the `ISIF_CADL[15:0]` CADL bit field sets the memory destination to SDRAM (lower 16 bits) (the address is the value of the set bit multiplied by 32 bytes).

- `ISIF_SPH` defines the first pixel in a line to be stored to memory.
- `ISIF_LNH` defines the number of pixels in an line to be stored to memory.
- `ISIF_LNV` defines the number of lines to be stored to memory.
- `ISIF_SLV0` sets line at which data output to SDRAM will begin.
- `ISIF_SLV1` sets line at which data output to SDRAM will begin, measured from the start of VD.
- `ISIF_SDOFST`, `ISIF_MODESET[15]` MDFS, and `ISIF_MODESET[4]` FIPOL sets the setting for line FID polarity and the offset of even/odd lines in SDRAM.

Figure 7-208. ISS ISP ISIF Frame Image Format Conversion

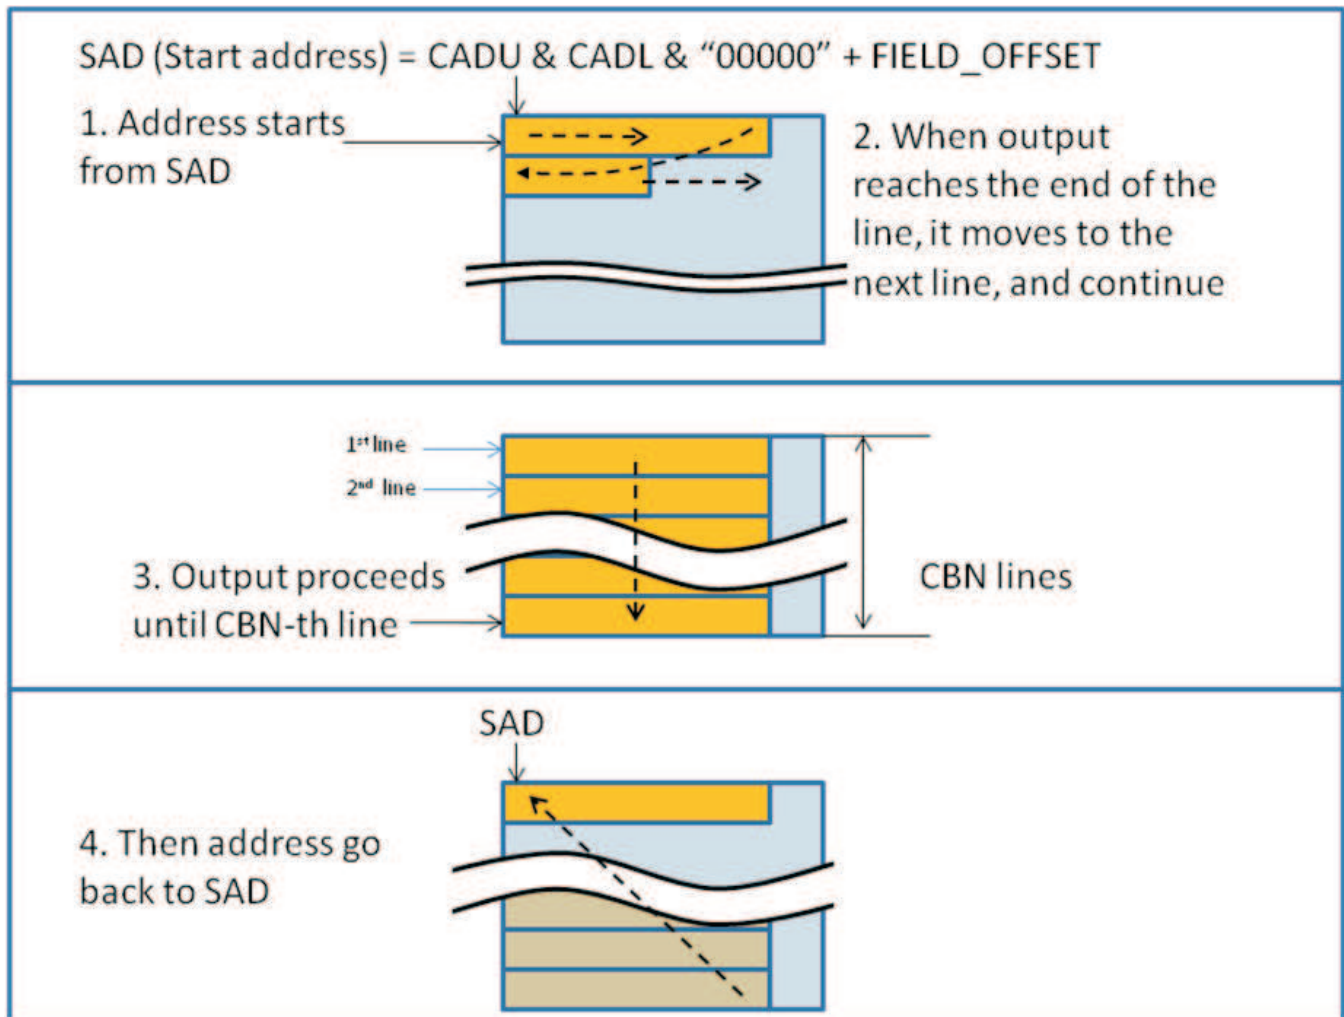

camisp-125

7.3.3.9.17 ISS ISP ISIF Circular Buffer

In addition to the [Section 7.3.3.9.16](#), ISIF support circular buffer addressing. [Figure 7-209](#) shows this circular buffer function.

Figure 7-209. ISS ISP ISIF Circular Buffer control

camisp-808

1. The write address starts from the start address (SAD), specified by the `ISIF_CADU` and `ISIF_CADL` registers.

$$\text{SAD} = (\text{ISIF_CADU} \ll 21) + (\text{ISIF_CADL} \ll 5)$$
 If field offset is enabled, field offset (FOFST: `ISIF_SDOFST[13:12]` FOFST) value may be added to this value

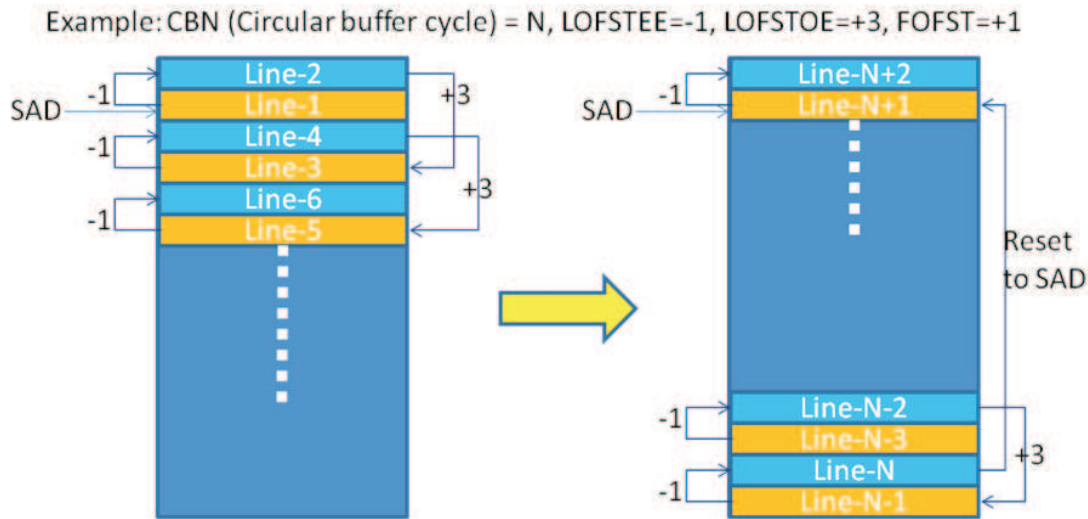

$$\text{SAD} = (\text{ISIF_CADU} \ll 21) + (\text{ISIF_CADL} \ll 5) + \text{ISIF_SDOFST}[13:12] \text{ FOFST}$$
2. After each line is written to the SDRAM, the address pointer moves to the first address of the next line. For example, if the line offset (LOFSTxx) is all +1, the first address of each line is:
 Address (0 line) = SAD
 Address (1st line) = SAD + HSIZE
 Address (2nd line) = SAD + HSIZE x 2
 ...
 (If the line offset is not +1, the address change will be in the way specified in [Figure 7-208](#))
3. This process continues until the number of output lines reaches CBN lines.
4. When CBN-th line is complete, the address goes back to SAD Restart counting the number of lines from 1.
5. Repeat 2 to 4, until all output lines are written to memory.
 If CBN=0, the circular buffer function is not used. The memory address is used as a linear space, and does not go back to the start address at CBN-th line.

Circular buffer function can be used in combination with Output Formatter. Since Output Formatter allows the line offset to be -4 to +4 lines, the address may go earlier than SAD after reset. SW should make sure to allocate memories for such case. See [Figure 7-210](#)

For circular buffer to work effectively, interrupt is available. After every CYN lines, an interrupt (isif_cb) is issued. This notifies how many lines in the circular buffer is filled.

NOTE: This event (isif_cb) is also exposed to ICM, and ICM can use this as P_DONE. However, ISIF does not implement ICM handshake, and does not receive P_START signal.

Figure 7-210. ISS ISP ISIF Combination of Circular Buffer and Output Formatter

When used with Output Formatter, the address is reset to SAD when the number of lines reaches CBN

camisp-809

7.3.3.9.18 ISS ISP ISIF YCbCr Signal Processing

The ISIF accepts 4:2:2 sampled YCbCr input data. The Luma and color difference signals are 8 bits each, scaled 0 to 255. The color difference signals are multiplexed into one 8-bit bus beginning with a Cb sample. The Y and CbCr buses can be input parallel (16-bit mode) or time-multiplexed and input as a single bus (8-bit mode).

The 16- or 8-bit YCbCr data is stored in SDRAM as 4:2:2 format. [Table 7-674](#) lists the data format in SDRAM. Y data typically has a range of 16 to 235; however, it is possible to subtract a DC value from the Y signal.

Table 7-674. ISS ISP ISIF Memory Output Format for YUV Data

Memory Address	Upper Word		Lower Word	
	MSB(31)	LSB(16)	MSB(15)	LSB(0)
N	Y1	Cr0	Y0	Cb0
N + 1	Y3	Cr1	Y2	Cb1
N + 2	Y5	Cr2	Y4	Cb2

7.3.3.9.19 ISS ISP ISIF Expected Bandwidth on BL Ports

The ISIF has a write port and a read port connected to the BL. This section summarizes the expected bandwidth on these ports.

7.3.3.9.19.1 ISS ISP ISIF Write Port

The write port is used to write pixels to memory after the data have passed through the storage formatter. Data storage to SDRAM is controlled by the [ISIF_SYNCEN\[1\]](#) DWEN bit. The ISIF allows writing the data as 16, 12, and 8 bpp. The bit width is controlled by the [ISIF_CCDCFG\[1:0\]](#) SDRPACK bit field.

The write port generates a burst of 32 bytes on the MTC interface. The delay between consecutive bursts is proportional to the input pixel clock. Hence, the write port does not request peak bandwidth traffic.

[Table 7-675](#) lists the estimated delay between 32-byte MTC requests for different pixel clock frequencies and assumes the L3_MAIN clock is 212.8 MHz.

Table 7-675. ISP ISIF ISIF Module: Write Port Bandwidth

Pixel Clock	Maximum Bandwidth 2 Bytes/s Pixel MB/s	Expected Delay Between MTC Requests
212.8	400	16 cycles = 80 ns
100	200	32 cycles = 160 ns
10	20	320 cycles = 1600 ns

7.3.3.9.19.2 ISS ISP ISIF Read Port

The read port is used to read gain and offset data from SDRAM required for the LSC computation. When LSC is enabled, 8-bit gain values are read and 8-bit offset values can optionally also be read. The LSC gain computation can be enabled or disabled by setting the [ISIF_2DLSCCFG\[0\]](#) ENABLE bit. The LSC offset computation can be enabled by setting the [ISIF_2DLSCOFST\[0\]](#) OFSTEN bit.

LSC fetches four 8-bit gain values per paxel and optionally four 8-bit offset values per paxel. This is a maximum 8 bytes per paxel.

The bandwidth that is generated by the LSC module is also proportional to the paxel size. The paxel size is set up by the [ISIF_2DLSCCFG\[14:12\]](#) GAIN_MODE_M and [ISIF_2DLSCCFG\[10:8\]](#) GAIN_MODE_N bit fields. The possible values are 8, 16, 32, 64, and 128. Smaller values lead to higher memory bandwidth requirements. Hence, the worst case is achieved by setting an 8 x 8 paxel size.

When LSC is enabled it automatically prefetches two lines of gain values and two lines of offset values (if this is enabled). When the first VD comes, it again requests one line of gain values and one line of offset values (if this is enabled). Then, it again fetches one line of gain values and one line of offset values (if this is enabled) after [ISIF_2DLSCCFG\[10:8\]](#) GAIN_MODE_N lines. It continues to do so until the last row of paxels. For the last row of paxels, it fetch two lines of gain values and two lines of offset values (if this is enabled), which are used for the following frame.

By default, LSC creates peak bandwidth requirements. To avoid this, the MTC bandwidth limiter must be used to space the request over time.

The MTC bandwidth limiter must be used to smooth the bandwidth requirements of the LSC module. The MTC bandwidth limiter can be set with the [ISP5_BL_MTC_1.ISIF_R](#) register.

The principle is that instead of reading the gain and offset data as fast as possible, use the time that it takes for [ISIF_2DLSCCFG\[10:8\]](#) GAIN_MODE_N lines to pass through the ISP to read the data.

[Table 7-676](#) gives the estimated delay between 32-byte MTC requests for different pixel clock frequencies and assumes the L3_MAIN clock at 212.8 MHz.

Table 7-676. ISS ISP ISIF Read Port Bandwidth

Pixel Clock	Max Bandwidth MB/s	Expected Delay Between MTC Requests
212.8	25.07	255 cycles = 1275 ns
100	12.5	510 cycles = 2550 ns
10	1.25	5103 cycles = 2515 ns

When the bandwidth limiter is used, ensure that there is enough time for the data prefetching.

- LSC must be enabled at least $2 \times \text{ISIF_2DLSCCFG}[10:8]$ GAIN_MODE_N lines before the first VD.
- There must be at least $\text{ISIF_2DLSCCFG}[10:8]$ GAIN_MODE_N lines of blanking. If there is not enough blanking, multiply the bandwidth requirement by 2 (that is, ensure two lines of gain and offset data can be fetched within the time of $\text{ISIF_2DLSCCFG}[10:8]$ GAIN_MODE_N lines.

7.3.3.9.20 ISS ISP ISIF Events and Status Checking

The ISIF module can generate four different interrupts: VDINT0, VDINT1, VDINT2, and 2DLSCINT. The $\text{ISIF_SYNCEN}[0]$ SYEN bit must be enabled to receive any of the ISIF interrupts.

7.3.3.9.20.1 ISS ISP ISIF VDINT0, VDINT1, and VDINT2 Interrupts

As shown in [Figure 7-211](#), the VDINT0, VDINT1, and VDINT2 interrupts occur relative to the VD pulse. The trigger timing is selected by using the $\text{ISIF_MODESET}[2]$ VDPOL bit setting. VDINT0, VDINT1, and VDINT2 occur after receiving the number of horizontal lines (HD pulse signals) set in the $\text{ISIF_VDINT0}[14:0]$ CDV0, $\text{ISIF_VDINT1}[14:0]$ CDV1, and $\text{ISIF_VDINT2}[14:0]$ CDV2 register fields, respectively.

NOTE: In the case of BT.656 input mode, there is a VD at the beginning of each field. Therefore, there are two interrupts for each frame (that is, one for each field).

If the $\text{ISIF_MODESET}[2]$ VDPOL bit is set to 0, the VDINT0, VDINT1, and VDINT2 HD counters begin counting HD pulses from the rising edge of the external VD.

Figure 7-211. ISS ISP ISIF VDINT0/VDINT1/VDINT2 Interrupt Behavior When VDPOL = 0

If the $\text{ISIF_MODESET}[2]$ VDPOL bit is set to 1, the VDINT0, VDINT1, and VDINT2 HD counters begin counting HD pulses from the falling edge of the external VD.

Figure 7-212. ISS ISP ISIF VDINT0/VDINT1/VDINT2 Interrupt Behavior When VDPOL = 1

7.3.3.9.20.2 ISS ISP ISIF 2DLSCINT Interrupt

For more information, see [Section 7.3.3.9.10.1.5, ISS ISP ISIF 2D-LSC Events and Status Checking](#).

7.3.3.9.20.3 ISS ISP ISIF Status Checking

The [ISIF_MODESET](#)[15] MDFS bit is set when the field status is on an even field, and it is cleared when the field status is on an odd field.

The 2D-LSC has a register that monitors the status of the LSC. For more information, see [Section 7.3.3.9.10.1.5](#), ISS ISP ISIF 2D-LSC Events and Status Checking.

7.3.3.10 ISS ISP BL Functional Description

7.3.3.10.1 ISS ISP BL Overview

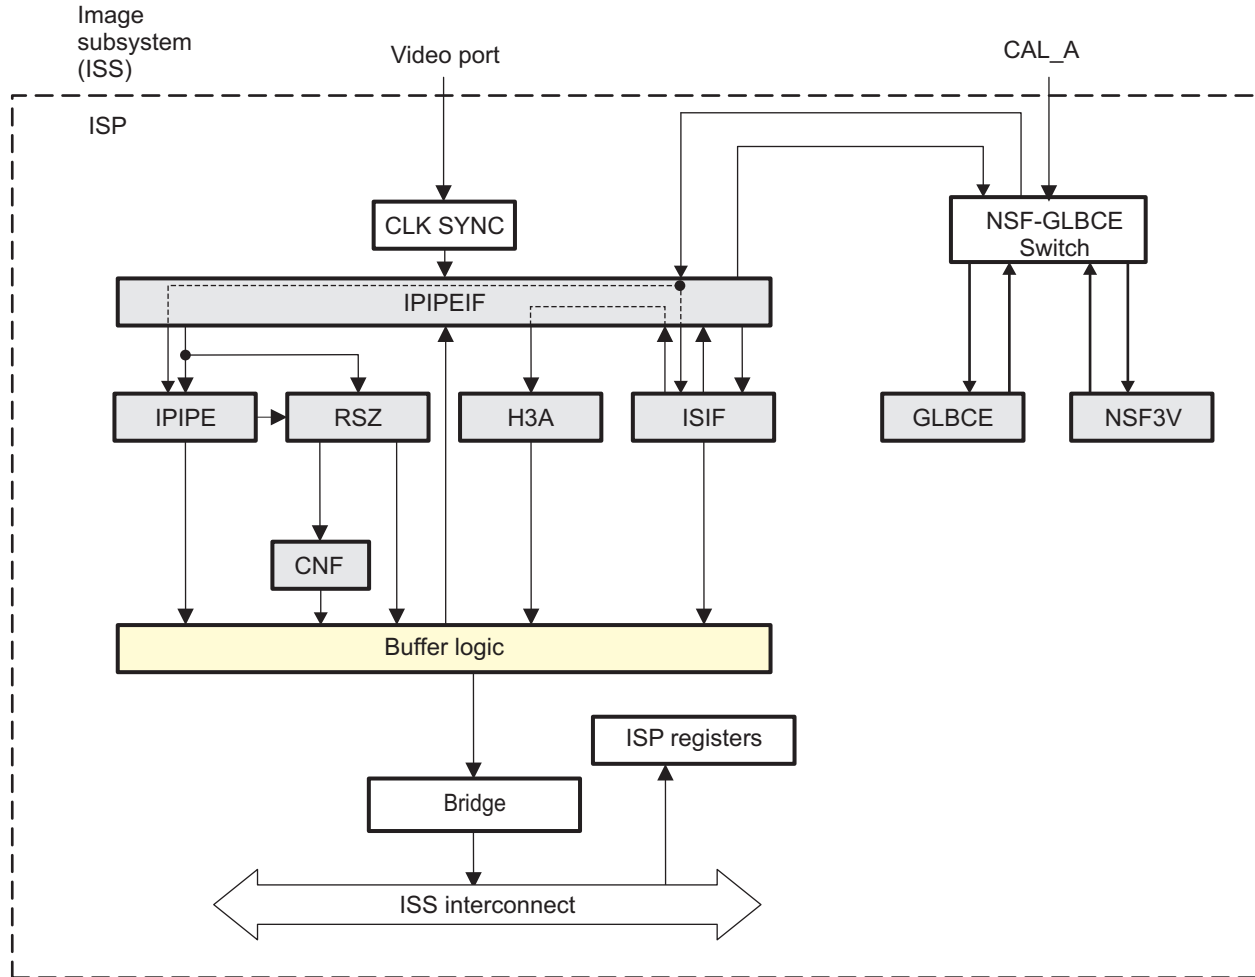

The BL module arbitrates and merges the memory requests of the ISP master module. The BL module also generates interrupts upon frame completion for the following modules. The interrupt generation is delayed until the transfer completes (acknowledge signal is returned). The following interrupts are delayed by the BL module:

- RSZ module resizer RSZ-A EOF
- RSZ module resizer RSZ-B EOF
- H3A module EOF
- IPIPE module EOF

The BL uses two different types of interfaces:

- MTC protocol is used between the ISP modules and the BL.
- VBUSM is use on the BL master port interface.

[Figure 7-213](#) show the BL module connections to other submodules of the ISP.

Figure 7-213. ISS ISP BL High-Level Diagram

camisp-003f

7.3.3.10.2 ISS ISP BL Functional Description

The BL merges the memory requests of the ISP master module to memory (read/write). The BL interfaces with all the ISP modules through a 32-bit-wide bus.

The ISP modules make memory requests of 32 bytes. Additional signals, SOF for read and EOF for write, are included to deal with boundary conditions in frame transitions.

The BL arbitration is divided into two parts: a bus hog and a fixed priority arbitration. Bus hog refers to the property of the buffer logic that gives higher priority to the module that last sent or received data. RSZ module MTC write port 0 and RSZ module MTC write port 1 are excluded from the bus hog.

The buffer logic is to be programmed to maximize the memory bandwidth: it makes maximum burst requests of 128 bytes (8×128 bits) for reads and writes. The BL can generate burst sizes of 2×128 , 4×128 , 6×128 , and 8×128 bits.

NOTE: The ISP interface supports burst sizes of only 1, 2, 4, and 8×128 bits. If the BL generates a 6×128 -bit request, it is divided into a 4×128 -bit request, followed by a 2×128 -bit request.

To use the memory bandwidth efficiently, the BL interfaces with the memory through a high-bandwidth bus (128 bits wide).

The BL handles memory requests for the following modules:

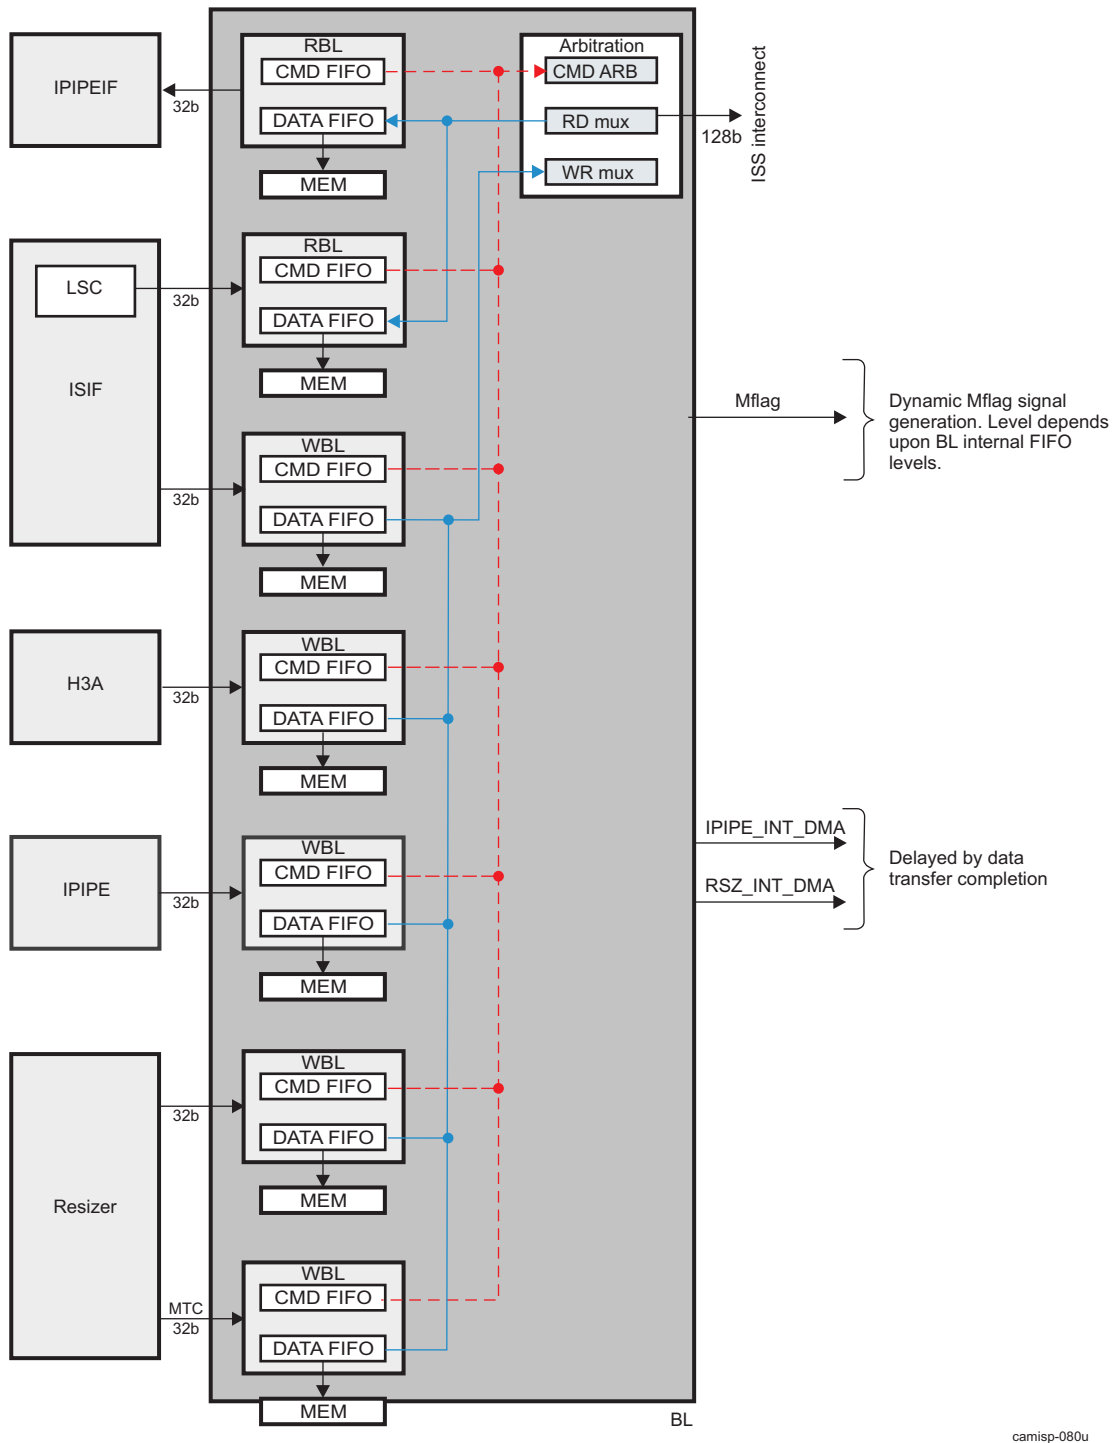

- IPIPEIF module read port
- ISIF-LSC module read port
- ISIF module write port
- H3A module write port
- RSZ module write port 0
- RSZ module write port 1

From a use case point of view, the following sharing and priority arrangement is used. All reads have higher priority than writes; for reads: IPIPEIF > ISIF-LSC, and for writes: ISIF > IPIPE > RSZ 0 > RSZ 1 > H3A.

NOTE: The BL can generate a static or a dynamic MFlag signal. The MFlag signal is used by the ISS arbitration to consider the urgency of the requests coming from the ISP. The dynamic MFlag feature is enabled from the [ISP5_CTRL\[21\]](#) MFLAG bit.

[Figure 7-214](#) shows the BL top-level block diagram. The figure highlights the two clock domains that are used.

Figure 7-214. ISS ISP BL Block Diagram

NOTE: The BL module has no registers. The configurations come from the top level of the ISP. See for register details.

7.3.3.10.3 ISS ISP BL Address Alignment

The BL module ensures maximum memory efficiency by realigning data to a 128-byte address boundary. In all cases, the BL accesses are 32-byte-aligned: address [4:0] is always 0.

This is required when the input address is a multiple of 32 bytes, not 128 bytes. The BL issues a nonaligned burst until it reaches a 128-byte boundary, and then keeps making a 128-byte request until the end of the line. Eventually, although the last burst in a line may not be a multiple of 128 bytes, it will always be a multiple of 32 bytes, as shown in Figure 7-215.

Figure 7-215. ISS ISP BL Address Alignment

camss-687

7.3.3.10.4 ISS ISP BL Out-of-Order Responses

BL supports out-of-order responses. The out-of-order response is handled by having up to 16 outstanding CIDs (reads and writes).

If any of the CIDs are not outstanding, a command is accepted from the highest prioritized buffer with a request. The CID availability is cleared when status complete is received. The outstanding commands can be all reads or all writes or any combination. The CID that is allocated is the lowest number of the 16 that are available when the command is accepted. As soon as a CID is released it is used if a command is available.

The VBUSM2OCP module transforms the VBUMS CIDs into OCP MFlag signals. There can be only one outstanding CID per tag. It is not authorized to make a new request on a tag which is already waiting for a response.

7.3.3.10.5 ISS ISP BL Stalling

The BL can stall the requests from the initiator modules for reads and writes

7.3.3.10.5.1 ISS ISP BL Stalling Write Requests

One reason for the BL to stall write requests is that because back pressure usually exists on the system memory and requests cannot be issued as fast as required. In that case the BL must stall requests from the initiator modules. The BL module cannot know whether stalling the request will lead to an initiator overflow or not. The RSZ module can support back pressure from the BL module when it is configured in bypass mode. The input buffer memory can be used to store data from the IPIPE and IPIPEIF modules. If the RSZ input buffer overflows, an interrupt is issued.

7.3.3.10.5.2 ISS ISP BL Stalling Read Requests

The BL may also stall read requests from the ISIF-LSC and IPIPEIF modules. When data comes from an image sensor, there is no way to stop the sensor. If the read request is stalled too long, the LSC module may eventually underflow. When the IPIPEIF reads all its data from memory, the IPIPEIF stalls transfers to successive modules by masking the clock.

7.3.3.10.6 ISS ISP BL Dynamic and Static MFlag Generation

NOTE: The following applies when `ISP5_CTRL[21] MFLAG = 1`. The MFlag value is static.

The BL outputs `cpriority[2:0]` and `cepriority[2:0]` signals on its VBUS master port interface. On the VBUSM side, these signals are aligned with the request (`creq`). Both values actually repeat register input signals. The lower value (0) corresponds to the higher priority.

The MFlag signal does not need to be aligned with the request. The signal can change value anytime.

In the ISP VBUSM2 interface bridge, the `cepriority` signal is ignored and only the `cpriority` signal is used. Because the priority value is set up by a register setting, the value is not dynamically modified. [Table 7-677](#) shows how the `cpriority` values are mapped to the interface MFlag signal, which is present on the ISP master interface and set in the `ISP5_CTRL[3:1] VBUSM_CPRIORITY` bit field.

Table 7-677. ISS ISP BL `cpriority` to MFlag With `ISP5_CTRL[21] MFLAG = 1`

MFlag[1:0]	Description
00	Normal priority <code>cpriority[2:0] = 4, 5, 6, 7</code>
01	Medium priority <code>cpriority[2:0] = 2, 3</code>
10	Reserved
11	High priority <code>cpriority[2:0] = 0, 1</code>

NOTE: The following applies when the `ISP5_CTRL[21] MFLAG = 0`. The MFlag value is dynamic.

This feature is enabled at reset. The purpose for dynamic MFlag generation is to monitor the FIFO levels. Thresholds are used to increase or decrease the MFlag values. There are different implementations for read and write requestors.

An individual MFlag value is generated for each FIFO and then ORed altogether and exported at the BL boundary. The MFlag signal generation does not affect the BL arbitration scheme.

- Writes: To prevent overflows in the BL, dynamic MFlag signal generation gives higher priority to FIFOs that are almost full:
 - Low FIFO level = 50 percent
 - High FIFO level = 75 percent
 - FIFOs with more than 75 percent fill level have high priority: MFlag = 11
 - FIFOs between 50 and 75 percent fill level have medium priority: MFlag = 01
 - FIFOs below 50 percent fill level have low priority: MFlag = 00

[Table 7-678](#) gives the low- and high-level priority thresholds for write initiators.

Table 7-678. ISS ISP BL MFlag Write Low- and High-Level Priority Thresholds

	ISIF	H3A	IPIPE	RSZ
Access type	Write	Write	Write	Write
Buffer size	64 x 128	64 x 128	48 x 128	64 x 136
50% low level	32 x 128	32 x 128	24 x 128	32 x 136
75% high level	48 x 128	48 x 128	36 x 128	48 x 128

- Reads: The dynamic MFlag signal generation depends on the reserved data units in the initiator data FIFO. The reserved data units correspond to read commands waiting to be sent on the interface bus, plus the read commands that have been sent on the interface bus and for which data responses have not yet arrived.
- The total FIFO size in bytes can be expressed as reserved data units (bytes) + data bytes stored (bytes) + empty space (bytes). By definition, empty space is lower than a burst size (128 bytes).
 - Low FIFO level = 25 percent

- High FIFO level = 50 percent
- Data bytes stored + empty space (bytes) = 50 percent of FIFO size: MFlag = 00
- Data bytes stored + empty space (bytes) = 50 percent of FIFO size: MFlag = 01
- Data bytes stored + empty space (bytes) = 25 percent of FIFO size: MFlag = 11

Table 7-679 gives the low- and high-level priority thresholds for read initiators

Table 7-679. ISS ISP BL MFlag Read Low- and High-Level Priority Thresholds

	IPIPEIF	ISIF-LSC
Access type	Read	Read
Buffer size	64 × 128	32 × 128
25% buffer size	16 × 128	8 × 128
50% buffer size	32 × 128	16 × 128

7.3.3.10.7 ISS ISP BL VBUSM2OCP Last Beat Command Delay

The VBUSM2OCP module bridge implements the following function to work around a limitation of the BL module, which does not send back-to-back requests to the ISS, thereby leading to possible situations where the ISP loses arbitration at the ISS level.

To fully benefit from dynamic MFlag generation (see [Section 7.3.3.10.6, ISS ISP BL Dynamic and Static MFlag Generation](#)), the following function is present in the VBUSM2OCP module bridge:

- The delay occurs only if BL MFlag = `ISP5_BL_VBUSM[5] MFLAG_THRES`.
- The MFlag value used is whatever is available when the last beat comes on the interface bus.
- The last beat of the interface request (read or write) is held until one cycle before a new command (read or write). This is achieved by masking the last beat of the interface command at the ISP interface.

The last beat is unmasked on the first event of one cycle before a new interface command, or the delay counter that uses the value counter of the `ISP5_BL_VBUSM[4:0] LASTCMD_DLY` bit field expires (has decremented to 0). The `ISP5_BL_VBUSM[4:0] LASTCMD_DLY` bit field must be set before the request on the BL starts. If the value of the `ISP5_BL_VBUSM[4:0] LASTCMD_DLY` bit field is changed during the pending requests, the delay counter is not updated.

7.3.3.10.8 ISS ISP BL Peak Memory Bandwidth Reduction

To limit the peak memory bandwidth generated by the IPIPEIF (read port), ISIF (read port), and H3A (write port) modules, a bandwidth limiter is placed between the modules and the BL. The RSZ module has this function built in and therefore does not need a bandwidth limiter.

The bandwidth limiter enables control of the minimum interval between two consecutive memory requests.

This function is controlled by the `ISP5_BL_MTC_1` and `ISP5_BL_MTC_2` registers. When the registers are set to 0, the function is not modified (that is, the bandwidth limiter is disabled). For the RSZ module, it is controlled by the `RSZ_DMA_RZA` and `RSZ_DMA_RZB` registers.

7.3.3.11 ISS ISP Memory Mapping

A total of 64 KiB is reserved for the ISP registers and memories. [Table 7-680](#) describes the memory map.

Backup mode, for debug only.</p> <p>0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only.</p> <p>0x3: Reserved</p> <p>0x2: Smart-standby mode: local initiator standby status depends on local conditions, i.e. the module's functional requirement from the initiator. IP module shall not generate (initiator-related) wakeup events. Generation of the MStandby signal shall be initiated by the firmware by writing <code>ISP5_CTRL.MSTANDBY = ?1?</code>.</p>	RW	0x2
3:2	RESERVED		R	0x0
1	SOFTRESET	<p>Software reset. The soft reset will cause the MStandby to be asserted as the reset value of the <code>ISP5_CTRL.MSTANDBY</code> bit is 1. After a soft reset, the software shall ensure not to perform any access for 16 clock cycles (OCP-slave port frequency) after writing this bit. The OCP slave port is running at half the frequency of the functional clock. Before issuing a soft reset, the software shall ensure that no more traffic is being generated by the ISP. Basically, it means that either the camera module shall be stopped from sending data and/or that the ISP modules are disabled. The last interrupt triggered by the ISP design upon completion of the frame processing is <code>rsz_int_dma</code>. This <code>rsz_int_dma</code> event shall be used to enable clean termination of the processing. The software shall wait a few hundred cycles to trigger the soft reset after upon assertion of the <code>rsz_int_dma</code>, this is to ensure that the BL is completely drained. Furthermore the software shall set the ISP in standbymode before issuing the soft reset: Set <code>ISP5_SYSCONFIG.STANDBYMODE = 2</code> (smart standby) Set <code>ISP5_CTRL.MSTANDBY</code> to ?1? Poll for <code>ISP5_CTRL.MSTANDBY_WAIT = 1</code>. Then, the soft reset can be applied <code>ISP5_SYSCONFIG.SOFTRESET = 1</code>.</p> <p>0x0: Reset done, no pending action</p> <p>0x1: Reset (software or other) ongoing</p>	RW	0x0
0	AUTO_IDLE	Auto clock gating. Always enabled.	R	0x1

24	H3A_INT_EOF	0x0: No action 0x1: Set event (debug)	RW	0x0
23	RSZ_INT_EOF1	RESIZER module event: This event signals that the BL has received the eof signal from the resizer B engine which happens one the last transfer in the frame has happened. Note that because the BL has FIFOs it may take some additional time before true data transfer completion to memory. 0x0: No action 0x1: Set event (debug)	RW	0x0
22	RSZ_INT_EOF0	RESIZER module event: This event signals that the BL has received the eof signal from the resizer A engine which happens one the last transfer in the frame has happened. Note that because the BL has FIFOs it may take some additional time before true data transfer completion to memory. 0x0: No action 0x1: Set event (debug)	RW	0x0
21:20	RESERVED		R	0x0
19	RSZ_FIFO_IN_BLK_ERR	This event signals that the minimum vertical blanking period has not been respected causing errors in the input data buffering submodule. This event will be triggered when the rsz_int_reg event of frame N is triggered before the rsz_int_dma of frame N + 1. This event would typically happen at the transition between two frames because there is not enough vertical blanking between frames: the firmware shall take care to ensure enough vertical blanking. The hardware cannot recover from this error. It will be required to perform a reset of the IP. 0x0: No action 0x1: Set event (debug)	RW	0x0

Bits	Field Name	Description	Type	Reset
18	RSZ_FIFO_OVF	<p>Resizer module overflow This event is set when overflow happens in the RESIZER module. This event would typically happen while processing a frame because the video port pixel clock is too high: the firmware shall take care to use a lower pixel clock at the input of the resizer module. Depending on the mode being used, the overflow can happen at different places: 1. Bypass mode: overflow happened in the input circular buffer. 2. Pass through mode: overflow happened on the module output interface (MTC) 3. Normal resize mode: overflow happened in the input circular buffer. This event signals that overflow happened in the input data buffering submodule. 1. In normal resizer mode or bypass mode, this event will be triggered when the This event would typically happen while processing a frame because the video port pixel clock is too high: the firmware shall take care to use a lower pixel clock at the input of the resizer module. The hardware cannot recover from this error. It will be required to perform a reset of the IP.</p> <p>0x0: No action 0x1: Set event (debug)</p>	RW	0x0
17	RSZ_INT_CYC_RZB	<p>RESIZER module event: This event is the circular interrupt for RESIZER #B. An event can be triggered every time that RSZ_IRQ_RZB output lines have been written out to the RZB_SDR_Y buffer. The range can go from 1 to 8192 lines. Usually, this value should be such that the circular buffer vertical size (set by the RZB_SDR_Y_PTR_E register) is a multiple of RSZ_IRQ_RZB. Note that at the time the interrupt is triggered, the actual data write has not taken place. It may take a few hundred of cycles to complete the data write into system memory. This is not an issue since the start of the buffer is read first.</p> <p>0x0: No action 0x1: Set event (debug)</p>	RW	0x0
16	RSZ_INT_CYC_RZA	<p>RESIZER module event: This event is the circular interrupt for RESIZER #A. An event can be triggered every time that RSZ_IRQ_RZA output lines have been written out to the RZA_SDR_Y buffer. The range can go from 1 to 8192 lines. Usually, the circular buffer vertical size (set by the RZA_SDR_Y_PTR_E register) should be a multiple of RSZ_IRQ_RZA. Note that at the time the interrupt is triggered, the actual data write has not taken place. It may take a few hundred of cycles to complete the data write into system memory. This is not an issue since the start of the buffer is read first.</p> <p>0x0: No action 0x1: Set event (debug)</p>	RW	0x0
15	RSZ_INT_DMA	<p>This event is triggered when the last eof (of the two MTC interfaces) is sent out to the BL and that the resizer core has returned to idle. <code>rsz_int_dma</code> is a true indication that all processing is finished for the particular frame on both resizer engines.</p> <p>0x0: No action 0x1: Set event (debug)</p>	RW	0x0

24	H3A_INT_EOF	0x0: No action 0x1: Disable interrupt	RW	0x0
23	RSZ_INT_EOF1	RESIZER module event: This event signals that the BL has received the eof signal from the resizer B engine which happens one the last transfer in the frame has happened. Note that because the BL has FIFOs it may take some additional time before true data transfer completion to memory. 0x0: No action 0x1: Disable interrupt	RW	0x0
22	RSZ_INT_EOF0	RESIZER module event: This event signals that the BL has received the eof signal from the resizer A engine which happens one the last transfer in the frame has happened. Note that because the BL has FIFOs it may take some additional time before true data transfer completion to memory. 0x0: No action 0x1: Disable interrupt	RW	0x0

Bits	Field Name	Description	Type	Reset
21:20	RESERVED		R	0x0
19	RSZ_FIFO_IN_BLK_ERR	<p>This event signals that the minimum vertical blanking period has not been respected causing errors in the input data buffering submodule. This event will be triggered when the <code>rsz_int_reg</code> event of frame N is triggered before the <code>rsz_int_dma</code> of frame N + 1. This event would typically happen at the transition between two frames because there is not enough vertical blanking between frames: the firmware shall take care to ensure enough vertical blanking. The hardware cannot recover from this error. It will be required to perform a reset of the IP.</p> <p>0x0: No action 0x1: Disable interrupt</p>	RW	0x0
18	RSZ_FIFO_OVF	<p>This event would typically happen while processing a frame because the video port pixel clock is too high: the firmware shall take care to use a lower pixel clock at the input of the resizer module. The hardware cannot recover from this error. It will be required to perform a reset of the IP.</p> <p>0x0: No action 0x1: Disable interrupt</p>	RW	0x0
17	RSZ_INT_CYC_RZB	<p>RESIZER module event: This event is the circular interrupt for RESIZER #B. An event can be triggered every time that <code>RSZ_IRQ_RZB</code> output lines have been written out to the <code>RZB_SDR_Y</code> buffer. The range can go from 1 to 8192 lines. Usually, this value should be such that the circular buffer vertical size (set by the <code>RZB_SDR_Y_PTR_E</code> register) is a multiple of <code>RSZ_IRQ_RZB</code>. Note that at the time the interrupt is triggered, the actual data write has not taken place. It may take a few hundred of cycles to complete the data write into system memory. This is not an issue since the start of the buffer is read first.</p> <p>0x0: No action 0x1: Disable interrupt</p>	RW	0x0
16	RSZ_INT_CYC_RZA	<p>RESIZER module event: This event is the circular interrupt for RESIZER #A. An event can be triggered every time that <code>RSZ_IRQ_RZA</code> output lines have been written out to the <code>RZA_SDR_Y</code> buffer. The range can go from 1 to 8192 lines. Usually, the circular buffer vertical size (set by the <code>RZA_SDR_Y_PTR_E</code> register) should be a multiple of <code>RSZ_IRQ_RZA</code>. Note that at the time the interrupt is triggered, the actual data write has not taken place. It may take a few hundred of cycles to complete the data write into system memory. This is not an issue since the start of the buffer is read first.</p> <p>0x0: No action 0x1: Disable interrupt</p>	RW	0x0
15	RSZ_INT_DMA	<p>RESIZER module event: This event is triggered when the last eof (of the two MTC interfaces) is sent out to the BL and that the resizer core has returned to idle. <code>rsz_int_dma</code> is a true indication that all processing is finished for the particular frame on both resizer engines.</p> <p>0x0: No action 0x1: Disable interrupt</p>	RW	0x0
14	RSZ_INT_LAST_PIX	<p>RESIZER module event: This event is triggered when the last pixel of the valid area is received.</p> <p>0x0: No action 0x1: Disable interrupt</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
13	RSZ_INT_REG	RESIZER module event: This event is triggered when the first pixel of the valid area is received. Shadowed registers can be updated at any time but the new value will take effect on the next rsz_int_reg event. 0x0: No action 0x1: Disable interrupt	RW	0x0
12	H3A_INT	0x0: No action 0x1: Disable interrupt	RW	0x0

24	H3A_INT_EOF	0x0: No action 0x1: Enable interrupt	RW	0x0
23	RSZ_INT_EOF1	RESIZER module event: This event signals that the BL has received the eof signal from the resizer B engine which happens one the last transfer in the frame has happened. Note that because the BL has FIFOs it may take some additional time before true data transfer completion to memory. 0x0: No action 0x1: Enable interrupt	RW	0x0
22	RSZ_INT_EOF0	RESIZER module event: This event signals that the BL has received the eof signal from the resizer A engine which happens one the last transfer in the frame has happened. Note that because the BL has FIFOs it may take some additional time before true data transfer completion to memory. 0x0: No action 0x1: Enable interrupt	RW	0x0
21:20	RESERVED		R	0x0

Bits	Field Name	Description	Type	Reset
19	RSZ_FIFO_IN_BLK_ERR	<p>This event signals that the minimum vertical blanking period has not been respected causing errors in the input data buffering submodule. This event will be triggered when the <code>rsz_int_reg</code> event of frame N is triggered before the <code>rsz_int_dma</code> of frame N + 1. This event would typically happen at the transition between two frames because there is not enough vertical blanking between frames: the firmware shall take care to ensure enough vertical blanking. The hardware cannot recover from this error. It will be required to perform a reset of the IP.</p> <p>0x0: No action 0x1: Enable interrupt</p>	RW	0x0
18	RSZ_FIFO_OVF	<p>This event would typically happen while processing a frame because the video port pixel clock is too high: the firmware shall take care to use a lower pixel clock at the input of the resizer module. The hardware cannot recover from this error. It will be required to perform a reset of the IP.</p> <p>0x0: No action 0x1: Enable interrupt</p>	RW	0x0
17	RSZ_INT_CYC_RZB	<p>RESIZER module event: This event is the circular interrupt for RESIZER #B. An event can be triggered every time that <code>RSZ_IRQ_RZB</code> output lines have been written out to the <code>RZB_SDR_Y</code> buffer. The range can go from 1 to 8192 lines. Usually, this value should be such that the circular buffer vertical size (set by the <code>RZB_SDR_Y_PTR_E</code> register) is a multiple of <code>RSZ_IRQ_RZB</code>. Note that at the time the interrupt is triggered, the actual data write has not taken place. It may take a few hundred of cycles to complete the data write into system memory. This is not an issue since the start of the buffer is read first.</p> <p>0x0: No action 0x1: Enable interrupt</p>	RW	0x0
16	RSZ_INT_CYC_RZA	<p>RESIZER module event: This event is the circular interrupt for RESIZER #A. An event can be triggered every time that <code>RSZ_IRQ_RZA</code> output lines have been written out to the <code>RZA_SDR_Y</code> buffer. The range can go from 1 to 8192 lines. Usually, the circular buffer vertical size (set by the <code>RZA_SDR_Y_PTR_E</code> register) should be a multiple of <code>RSZ_IRQ_RZA</code>. Note that at the time the interrupt is triggered, the actual data write has not taken place. It may take a few hundred of cycles to complete the data write into system memory. This is not an issue since the start of the buffer is read first.</p> <p>0x0: No action 0x1: Enable interrupt</p>	RW	0x0
15	RSZ_INT_DMA	<p>This event is triggered when the last eof (of the two MTC interfaces) is sent out to the BL and that the resizer core has returned to idle. <code>rsz_int_dma</code> is a true indication that all processing is finished for the particular frame on both resizer engines.</p> <p>0x0: No action 0x1: Enable interrupt</p>	RW	0x0
14	RSZ_INT_LAST_PIX	<p>This event is triggered when the last pixel of the valid area is received.</p> <p>0x0: No action 0x1: Enable interrupt</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
13	RSZ_INT_REG	This event is triggered when the first pixel of the valid area is received. Shadowed registers can be updated at any time but the new value will take effect on the next rsz_int_reg event. 0x0: No action 0x1: Enable interrupt	RW	0x0
12	H3A_INT	0x0: No action 0x1: Enable interrupt	RW	0x0

Table 7-719. ISP5_IRQSTATUS_3

Address Offset	0x0000 0058	Instance	ISP6P5_SYS1
Physical Address	0x5204 0058		
Description	Per-event 'enabled' interrupt status vector. Enabled status isn't set unless event is enabled. Write 1 to clear the status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled). The ISP5 outputs 4 interrupt lines ISP5_IRQ0 to ISP5_IRQ3. Any internal ISP5 event can be merged on the 4 lines. A same event shall be enabled on only one interrupt line. There is another interrupt register in the memory map, look for ISP5_IRQSTATUS2

Bits	Field Name	Description	Type	Reset
31:30	DMA3_CFG	<p>This bitfield selects the DMA transfer configuration which is used with the ISP5_DMA_REQ[3] DMA request signal. This DMA request is generated from IPIPE_INT_LAST_PIXEL event. One can choose to use this DMA request to either transfer the DPC initialization data, the gamma table or both.</p> <p>0x0: No DMA request associated with ISP5_DMA_REQ[3].</p> <p>0x1: DPC DMA request associated with ISP5_DMA_REQ[3]. Expected DMA transfer size is 2 KBytes in the range 0x8000-0x87FF. DPC_EVT_INI shall be set to 0.</p> <p>0x3: DPC + GAMMA DMA request associated with ISP5_DMA_REQ[3]. Expected DMA transfer size is 8 KBytes in the range 0x8000-0x87FF and 0xA800-0xBFFF. DPC_EVT_INI shall be set to 0.</p> <p>0x2: GAMMA DMA request associated with ISP5_DMA_REQ[3]. Expected DMA transfer size is 6 KBytes in the range 0xA800-0xBFFF.</p>	RW	0x0
29:28	RESERVED		R	0x0
27	BSC_RD_CHK	<p>When the BSC computation is enabled and the BSC DMA request not used to read out the data, this register enables to ensure that the data were read fast enough, else an interrupt IPIPE_BSC_ERR is triggered. The hardware sets automatically this bit to 1 when software can start reading the memory. It is the software responsibility to set this bit to 0 after reading the data. Once the CPU has read the BSC data, it SHALL clear this register, else the PIPE_BSC_ERR will occur.</p> <p>0x0: No interrupt generation can happen</p> <p>0x1: The CPU can read the data from the memory. Needs to complete fast enough to avoid the interrupt generation.</p>	RW	0x0
26	HST_RD_CHK	<p>When the HISTOGRAM computation is enabled and the HST DMA request not used to read out the data, this register enables to ensure that the data were read fast enough, else an interrupt IPIPE_HST_ERR is triggered. The hardware sets automatically this bit to 1 when software can start reading the memory. It is the software responsibility to set this bit to 0 after reading the data. Once the CPU has read the histogram data, it SHALL clear this register, else the PIPE_HST_ERR will occur.</p> <p>0x0: No interrupt generation can happen</p> <p>0x1: The CPU can read the data from the memory. Needs to complete fast enough to avoid the interrupt generation.</p>	RW	0x0
25	DPC_EVT_INI	<p>Select the IPIPE module event to be used to generate the DMA requests for the DPC submodule.</p> <p>0x0: IPIPE_INT_LAST_PIX event is selected.</p> <p>0x1: IPIPE_INT_DPC_INI event is selected.</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
24	MSTANDBY	<p>MStandby signal assertion and de-assertion control for power management transitions. After software reset, this bit is asserted. Write '1' to transition from normal mode to idle mode. The firmware needs to ensure that no more ISP5 processing is ongoing before setting up this bit. Write '0' to transition from idle mode to normal mode. The software should poll <code>ISP5_CTRL.MSTANDBY_WAIT = ?0?</code> after writing <code>ISP5_CTRL.MSTANDBY = ?0?</code> in a transition from idle to normal mode.</p> <p>0x0: De-assert MStandby signal. May not be immediate due to power management handshaking btw the MStandby and Wait signals.</p> <p>0x1: Assert MStandby signal</p>	RW	0x1
23	VD_PULSE_EXT	<p>VD pulse extension enable This bit enables or disables the VD extension bridge. By default, the bridge is enabled. At ISS level, it is expected that <code>IPS5_CTRL.VD_PULSE_EXT = 1</code> when the VPORT gets data from the CSI2 RX module and <code>IPS5_CTRL.VD_PULSE_EXT = 0</code> when the VPORT gets data from the parallel interface or the CCP2 RX module. There shall be at least three clock cycles between the time this bit is modified and the HD/VD pulse for start of frame comes.</p> <p>0x0: Disabled</p> <p>0x1: Enabled</p>	RW	0x1
22	PCLK_INV	<p>Pixel clock inversion This bit enables or disables pixel clock inversion. The ISP5 always samples the data on the rising edge of the pixel clock. Enabling the inversion shifts the resampling period by 1/2 a pixel clock period. PCLK needs to be disabled at ISS level before setting this bit.</p> <p>0x0: Normal</p> <p>0x1: Inversed</p>	RW	0x0
21	MFLAG	<p>MFlag signal generation control This bit controls how the OCP MFlag signal is generated on the ISS NOC.</p> <p>0x0: The MFlag value is dynamic.</p> <p>0x1: The MFlag value is static. The value is set with the <code>ISP5_CTRL.VBUSM_CPRIORITY</code> bitfield.</p>	RW	0x0
20	MSTANDBY_WAIT	<p>MStandby / Wait power management status bit. The power management framework of the ISP5 is based on the handshaking of the MStandby and Wait signals. The software is not supposed to write inside the ISP5 slave port and initiate traffic when <code>ISP5_CTRL.MSTANDBY</code> bit is written. The software can poll this bit to know when MStandby signal is deasserted.</p> <p>0x0: MStandby signal is de-asserted</p> <p>0x1: MStandby signal is asserted</p>	R	0x0
19	GLBCE_CLK_ENABLE	<p>GLBCE clock enable</p> <p>0x0: Disable</p> <p>0x1: Enable</p>	RW	0x0
18	NSF3V_CLK_ENABLE	<p>NSF3V clock enable</p> <p>0x0: Disable</p> <p>0x1: Enable</p>	RW	0x0
17	CNFB_CLK_ENABLE	<p>CNFB clock enable</p> <p>0x0: Disable. Since CNF-B is removed , it doesn't have any effect</p> <p>0x1: Enable. Since CNF-B is removed , it doesn't have any effect.</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
16	CNFA_CLK_ENABLE	CNFA clock enable 0x0: Disable 0x1: Enable	RW	0x0
15	BL_CLK_ENABLE	BL clock enable 0x0: Disable 0x1: Enable	RW	0x0
14	ISIF_CLK_ENABLE	ISIF clock enable The ISP5 will return OCP_ERROR if one tries to program the module MMR or memory when the clock is disabled. There shall be at least three clock cycles between the time this bit is modified and the HD/VD pulse for start of frame comes. 0x0: Disable 0x1: Enable	RW	0x0
13	H3A_CLK_ENABLE	H3A clock enable The ISP5 will return OCP_ERROR if one tries to program the module MMR or memory when the clock is disabled. 0x0: Disable 0x1: Enable	RW	0x0
12	RSZ_CLK_ENABLE	RESIZER clock enable The ISP5 will return OCP_ERROR if one tries to program the module MMR or memory when the clock is disabled. 0x0: Disable 0x1: Enable	RW	0x0
11	IPIPE_CLK_ENABLE	IPIPE clock enable The ISP5 will return OCP_ERROR if one tries to program the module MMR or memory when the clock is disabled. If DPC is working before NSF3V (working as pre-NSF3V DPC), this bit must be asserted for SW to access DPC MMR entries. 0x0: Disable 0x1: Enable	RW	0x0
10	IPIPEIF_CLK_ENABLE	IPIPEIF clock enable The ISP5 will return OCP_ERROR if one tries to program the module MMR or memory when the clock is disabled. 0x0: Disable 0x1: Enable	RW	0x0
9	SYNC_ENABLE	PCLK Sync module enable 0x0: Disable. Shall only be used when the video port is not receiving data, e.g., data is read from the IPIPEIF module memory read port. 0x1: Enable. Shall be used when the video port is receiving data.	RW	0x0
8	PSYNC_CLK_SEL	PCLK Sync clock select. This bit selects the clock which is used to resynchronize the input pixel clock. 0x0: Use CFG_CLK. Can be used if the input pixel clock is always lower than 213 MHz. Also, this option must not be chosen if DPC is used with CAL if (CAL - DPC - NSF3V - CAL case.) 0x1: FUNC_CLK. Shall be used if the pixel clock is higher than 213 MHz or DPC is used with CAL port. (CAL - DPC - NSF3V - CAL)	RW	0x0
7:4	VBUSM_CIDS	BL MAX VBUSM CIDs The BL module supports up to 16 CIDs/tags. This bitfield setup the maximum number of CIDs/tags that the BL can use. The actual number of CIDs/tags is setup by VBUSM_CIDS + 1. Tag number 0 to VBUSM_CIDS are used.	RW	0xf

Bits	Field Name	Description	Type	Reset
3:1	VBUSM_CPRIORITY	BL VBUSM priority setting 0x6: Normal Priority VBUSM cpriority[2:0] = 6 0x1: High Priority VBUSM cpriority[2:0] = 1 0x7: Normal Priority VBUSM cpriority[2:0] = 7 0x0: High Priority VBUSM cpriority[2:0] = 0 0x2: Medium Priority VBUSM cpriority[2:0] = 2 0x4: Normal Priority VBUSM cpriority[2:0] = 4 0x5: Normal Priority VBUSM cpriority[2:0] = 5 0x3: Medium Priority VBUSM cpriority[2:0] = 3	RW	0x4
0	OCP_WRNP	ISP5 OCP master port non-posted write control. 0x0: All writes are non posted. 0x1: All writes are posted.	RW	0x0

Table 7-737. ISP5_MPSR

Address Offset	0x0000 007C	Instance	ISP6P5_SYS1
Physical Address	0x5204 007C		
Description	ISP5 memory access register. One need to pay attention when setting the bit fields in this register such that there is no conflict between the cpu and module accesses. Usually, the ISP5 modules shall have access to the memories and it's only when the isp5 is idle (vertical blanking period or module disabled that the cpu can access the memories. CPU has memory access If the cpu has memory access (read or write) and CPU has priority, it will cause data corruption if the module tries to perform concurrent memory accesses. The module cannot know that the read or write access has not taken place because of cpu accesses.		
Type	RW

5	IPIPE_DPC_TB	IPIPE defect pixel memory arbitration This memory is expected to be written during ISP5 initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0x0
4	ISIF_DCLAMP	ISIF DC accumulation memory arbitration This memory is expected to be written during ISP5 initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0x0
3	ISIF_LSC_TB1	ISIF LSC memory 1 access This memory is expected to be written during ISP5 initialization and potentially updated during vertical blanking periods. 0x0: MODULE has memory access When the module has memory access, the potential concurrent CPU accesses (on the ISP5 memory map) to read the memory are stalled. The CPU will eventually get back the data during the horizontal or vertical blanking periods when the module is not making access anymore. 0x1: CPU has memory access When the cpu has memory access (read or write), it will cause data corruption if the module tries to perform concurrent memory accesses. The module cannot know that the read or write access has not taken place because of cpu accesses.	RW	0x0
2	ISIF_LSC_TB0	ISIF LSC memory 0 access This memory is expected to be written during ISP5 initialization and potentially updated during vertical blanking periods. 0x0: MODULE has memory access. When the module has memory access, the potential concurrent CPU accesses (on the ISP5 memory map) to read the memory are stalled. The CPU will eventually get back the data during the horizontal or vertical blanking periods when the module is not making access anymore. 0x1: CPU has memory access When the cpu has memory access (read or write), it will cause data corruption if the module tries to perform concurrent memory accesses. The module cannot know that the read or write access has not taken place because of cpu accesses.	RW	0x0

Bits	Field Name	Description	Type	Reset
1	ISIF_LIN_TB	ISIF linearity compensation memory arbitration. This memory is expected to be written during ISP5 initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0x0
0	RESERVED		R	0x0

Table 7-743. ISP5_BL_VBUSM

Address Offset	0x0000 0088	Instance	ISP6P5_SYS1
Physical Address	0x5204 0088		
Description	BL VBUSM TUNING REGISTER The settings in the register are static and not expected to be modified dynamically.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																MFLAG_THRES		LASTCMD_DLY													

Bits	Field Name	Description	Type	Reset
31:6	RESERVED		R	0x0
5	MFLAG_THRES	MFLAG Threshold value The value of this bit field is a threshold which is compared to the MFlag output of the ISP5. If the BL MFlag signal is greater or equal to this threshold the last beat of the VBUSM command is delayed by LASTCMD_DLY cycles. Only values 0, 1 are valid, the least significant bit is tied off to 1 to make a 2-bit bitfield. 0x0: Thres = 1 0x1: Thres = 3	RW	0x1
4:0	LASTCMD_DLY	The value of this bitfield represents a delay expressed in cycles (L3 clock). This value is used to delay the last beat of the VBUSM command such that the ISP5 does not lose arbitration at the NOC level because the BL does not generate back to back requests by default. The last beat is delayed until the counter expires or the new request is accepted. This delay is used when the MFlag output of the ISP5 is greater or equal to MFLAG_THRES. One can set this value to 0 to disable the last command beat delay.	RW	0x4

RESERVED																RSZ_FRACDIV															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:0	RSZ_FRACDIV	Fractional clock divider value. The fractional clock divider gates the read requests made to the input data buffer such that the input data buffer is read at an average frequency equal to FFCLK instead of FCLK. The value of FFCLK depends upon the upscaling ratios as well as the input pixel clock. We have $FFCLK = FCLK / FRACDIV$ MHz and $RSZ_FRACDIV = 65536 / FRACDIV$. When $RSZ_FRACDIV = 65536$, we have: $FFCLK = FCLK$.	RW	0xffff

Table 7-827. RZA_V_PHS_Y

Address Offset	0x0000 0094	Instance	ISP6P5_RESIZER
Physical Address	0x5204 0494		
Description	RESIZER A - INITIAL LUMINANCE PHASE OF VERTICAL RESIZING PROCESS When YUV422 data are output, the phase values for luma and chroma should typically be equal, i.e., $RZX_V_PHS_Y = RZX_V_PHS_C$. The following constraints apply when setting the initial vertical phases $ABS(RZX_V_PHS_Y - RZX_V_PHS_C) \leq RZX_V_DIF$. This constraint means that at most the distance between the initial phases for luminance and chrominance is not expected to exceed the distance between two luma pixels. Note that the absolute value is used, hence, the initial luma phase can be greater than the initial chroma phase or the other way around. As a reminder, the distance between two output pixels for luma is given by RZX_V_DIF .

Physical Address	0x5204 0498		
Description	RESIZER A - INITIAL CHROMINANCE PHASE OF VERTICAL RESIZING PROCESS When YUV422 data are output, the phase values for luma and chroma should typically be equal, i.e., $RZX_V_PHS_Y = RZX_V_PHS_C$. The following constraints apply when setting the initial vertical phases $ABS(RZX_V_PHS_Y - RZX_V_PHS_C) \leq RZX_V_DIF$. This constraint means that at most the distance between the initial phases for luminance and chrominance is not expected to exceed the distance between two luma pixels. Note that the absolute value is used, hence, the initial luma phase can be greater than the initial chroma phase or the other way around. As a reminder, the distance between two output pixels for luma is given by RZX_V_DIF .

RESERVED																PHS															

Bits	Field Name	Description	Type	Reset
31:14	RESERVED		R	0x0
13:0	PHS	Initial value for the phase in horizontal resizing process, i.e., the sampling position is shifted. This value is in U14Q8 fractional format. Example: If RZX_H_PHS = 128, the first output pixel is sampled at the center of the first two valid input pixels. If RZX_L_PHS=100 and RZX_H_PHS=128, the first output pixel is re-sampled at the center of the 100-th and the 101-st input pixels.	RW	0x0

Table 7-947. RZB_SDR_C_SAD_H

Address Offset	0x0000 0184	Instance	ISP6P5_RESIZER
Physical Address	0x5204 0584		
Description	RESIZER B - OUTPUT MEMORY START ADDRESS REGISTER FOR CHROMA DATA (YUV420) This register is used if the output data format is YUV420. U and V data are written into this buffer.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																C_SAD_H															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:0	C_SAD_H	Memory Base Address Sets the 16 upper bits of the 32-bit start address in memory.	RW	0x0

Table 7-949. RZB_SDR_C_SAD_L

Address Offset	0x0000 0188	Instance	ISP6P5_RESIZER
Physical Address	0x5204 0588		
Description	RESIZER B - OUTPUT MEMORY START ADDRESS REGISTER FOR CHROMA DATA (YUV420) This register is used if the output data format is YUV420. U and V data are written into this buffer.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																C_SAD_L															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:0	C_SAD_L	Memory Base Address Sets the 16 lower bits of the 32-bit start address in memory. It is a byte address. For every frame, the first line of data will be written to this address (C_SAD_H/C_SAD_L). We have: SAD = BAD + (PTR_S x OFT) and PTR_S PTR_E If the first line shall be written at the beginning of the circular buffer memory then SAD = BAD and PTR_S = 0. YUV420 format (output data on 8 bits): The two least significant bits shall be set to '00' when horizontal reversal mode is off. The two least significant bits shall be set to '11' when horizontal reversal mode is on.	RW	0x0

Table 7-951. RZB_SDR_C_OFT

Address Offset	0x0000 018C	Instance	ISP6P5_RESIZER
Physical Address	0x5204 058C		
Description	RESIZER B - OUTPUT MEMORY OFFSET REGISTER FOR CHROMA DATA (YUV420) This register is used if the output data format is YUV420		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																C_OFT															

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16:0	C_OFT	Memory Line Offset Sets the size of each line in the circular buffer. It is expressed in bytes and unsigned. Note that OFT does not necessary corresponds to the size of a line in a frame, it can be much bigger. The line offset shall be a multiple of 128 bytes (bits [6:0] of RZX_SDR_Y_OFT and RZX_SDR_C_OFT shall be set to 0). Example: line 0 address = SAD line 1 address = SAD + 1 x OFT line 2 address = SAD + 2 x OFT	RW	0x0

Table 7-953. RZB_SDR_C_PTR_S

Address Offset	0x0000 0190	Instance	ISP6P5_RESIZER
Physical Address	0x5204 0590		
Description	RESIZER B - OUTPUT MEMORY START ADDRESS REGISTER FOR CHROMA DATA (YUV420) This register is used if the output data format is YUV420		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																C_PTR_S															

Bits	Field Name	Description	Type	Reset
31:13	RESERVED		R	0x0
12:0	C_PTR_S	Start Line of Memory Pointer Sets the vertical position of the first output line in the output memory space. This value is expressed in number of lines. The hw uses it to setup the initial value of the circular buffer. It shall be setup such as PTR_S = (SAD ? BAD) / OFT. This value shall be set to 0 when RSZ_RZA_SDR_C_BAD = RSZ_RZA_SDR_C_SAD.	RW	0x0

7.3.4.5.2 ISS ISP6P5_IPIPE Register Description

Table 7-958. IPIPE_SRC_EN

Address Offset	0x0000 0000	Instance	ISP6P5_IPIPE
Physical Address	0x5204 0800		
Description	This register is not shadowed		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																RESERVED											Z				

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:1	RESERVED		R	0x0
0	EN	The start flag of the IPIPE module. When EN is 1, the IPIPE module starts a processing from the next rising edge of the VD. If the processing mode of the IPIPE module is 'one shot', the EN is cleared to 0 immediately after the processing has started. 0x0: waiting 0x1: start/busy	RW	0x0

Table 7-960. IPIPE_SRC_MODE

Address Offset	0x0000 0004	Instance	ISP6P5_IPIPE
Physical Address	0x5204 0804		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																RESERVED											WRT	OST			

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:2	RESERVED		R	0x0
1	WRT	The mode selection of the ipipeif_wrt which is an input port of the IPIPE module. If WRT is 0, the IPIPE module doesn't use the ipipeif_wrt. Else the IPIPE module uses it. 0x0: Disable 0x1: Enable	RW	0x0
0	OST	The processing mode selection of the IPIPE module. Value 0 indicates the mode of 'free run', value 1 indicates the mode of 'one shot'. 0x0: Free run 0x1: One shot	RW	0x0

Table 7-1312. IPIPE_YUV_PHS

Address Offset	0x0000 02C8	Instance	ISP6P5_IPIPE
Physical Address	0x5204 0AC8		
Description	YUV422 down sampling register. This register controls the YUV444 to YUV422 chroma downsampling. This register is valid if IPIPE_SRC_FMT.FMT = 0 (RAW input and YUV output). IPIPE_YUV_PHS = 0 leads to pure subsampling, no filtering, cosited chroma output. IPIPE_YUV_PHS = 1 leads to (1, 1) 1 filtering, centered chroma output. IPIPE_YUV_PHS = 2 leads to (1, 2, 1) 1 filtering, cosited chroma output. IPIPE_YUV_PHS = 3 leads to (1, 3, 3, 1) 3 filtering, centered chroma output. When the chroma output is cosited, and that downsampling is enabled in the RESIZER module, one need to take care that the averager disrupts the relative phase for luma and chroma color components. The RZA_H_PHS_ADJ and RZB_H_PHS_ADJ registers need to be used to fix the disruption.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:2	RESERVED		R	0x0
1	LPF	121-LPF enable for chrominance samples. This register is valid if IPIPE_SRC_FMT.FMT = 0 (RAW input and YUV output). 0x0: off 0x1: on	RW	0x0
0	POS	This bit sets the output position of the chrominance sample with regards to the luma sample positions. One can choose between centered and cosited. This register is valid if IPIPE_SRC_FMT.FMT = 0 (RAW input and YUV output). The RESIZER module does not change the relative position of the chroma samples vs. the luma samples between the input and output and the chroma position at the output of the IPIPE module and at the output of the RESIZER module shall be identical. In other words, we shall have RSZ_YUV_PHS.POS = IPIPE_YUV_PHS.POS . 0x0: Cosited = same position with luminance 0x1: Centered = middle of the luminance	RW	0x0

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:2	RESERVED		R	0x0
1	CLR	Histogram memory clear. The histogram can be cleared before the start of operations. However, the clear takes 512 cycles and therefore: + if line size 512, the first line shall not be used for histogram computation. + if line size 512, ceil (512/line size) lines shall not be used for histogram computation. It's the programmer's responsibility to set the histogram computation area outside the 'clear' area. 0x0: Disable 0x1: Enable	RW	0x0
0	SEL	This bit shall be used to select which memory is used to store the histogram data. By selecting alternatively one or the other bit, one can double buffer the histogram output buffer. The 4 KB memory can either be read by the CPU or a DMA request. 0x0: Use Table 0 and 1 = 4 KBytes in the memory ISP5 map. 0x1: Use Table 2 and 3 = 4 KBytes in the memory ISP5 map.	RW	0x0

7.3.4.6.2 ISS ISP6P5_ISIF Register Description
Table 7-1511. ISIF_SYNCEN

Address Offset	0x0000 0000	Instance	ISP6P5_ISIF
Physical Address	0x5204 1000		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																RESERVED											DWEN	SYEN			

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:2	RESERVED		R	0x0
1	DWEN	Controls the storage of image sensor RAW data in memory. This bit is loaded with the timing of the internal VD signal: it becomes active starting at the lead of the VD signal that comes after 1 is written in this bit. 0x0: Disable 0x1: Enable	RW	0x0
0	SYEN	Controls ON/OFF of VD/HD output. Internal timing generator becomes active and VD/HD output begins starting when 1 is written in this bit. In case of input, VD/HD loading begins. 0x0: Disable 0x1: Enable	RW	0x0

Table 7-1513. ISIF_MODESET

Address Offset	0x0000 0004	Instance	ISP6P5_ISIF
Physical Address	0x5204 1004		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																MDFS	HLPF	INPMOD	OVF	CCDW	CCDMD	DPOL	SWEN	FIPOL	HDPOL	VDPOL	FIDD	HDVDD			

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15	MDFS	Field Status This bit indicates the status of the current FLD signal when the ISIF module is in interlaced mode. 0x0: Odd field 0x1: Even field	R	0x0
14	HLPF	Low pass filter enable. When this bit is enabled, a 3-tap ($1/4 + 1/2 Z^{-2} + 1/4 Z^{-4}$) filtering process is performed on the sensor data. 0x0: Disable 0x1: Enable	RW	0x0
13:12	INPMOD	Data input mode: 0x0: RAW data 0x1: YCbCr 16bit 0x3: Reserved 0x2: YCbCr 8bit	RW	0x2
11	OVF	ISIF module write port overflow status bit. If the write port of the ISIF module overflows when writing data to SDRAM, this bit will toggle. An interrupt (ISIF_OVF) is added to reflect the status of this bit and avoid polling. 0x0: No overflow pending (r) No action (w) 0x1: Overflow pending (r) Clear overflow (w)	RW	0x0
10:8	CCDW	This bit enables to shift right (divide) the up-to-12-bit RAW data value when writing out to SDRAM. The effect is that the dynamic of the output signal is decreased. The ISIF_MODESET.CCDW , ISIF_HSIZE.ADCR , ISIF_HSIZE.HSIZE , ISIF_CCDCFG.BSWD , ISIF_CCDCFG.MSBINV , ISIF_CCDCFG.SDRPACK bit fields control how pixel data are stored to SDRAM. 0x6: Reserved 0x1: 1-bit right shift out[15:0] = 00000 data[11:1] 0x7: Reserved 0x0: No shift out[15:0] = 0000 data[11:0] 0x2: 2-bit right shift out[15:0] = 000000 data[11:2] 0x4: 4-bit right shift out[15:0] = 00000000 data[11:4] 0x5: Reserved 0x3: 3-bit right shift out[15:0] = 0000000 data[11:3]	RW	0x0
7	CCDMD	Field mode: This bit selects the type of image sensor: interlaced or progressive 0x0: Progressive image sensor 0x1: Interlaced image sensor	RW	0x0
6	DPOL	Image sensor input data polarity 0x0: No change 0x1: One's complement	RW	0x0
5	SWEN	External WEN selection In case this bit and SYNCEN.DWEN are set to 1, the external WEN signal is used to store image sensor data to memory. 0x0: WEN not used 0x1: Use external WEN	RW	0x0
4	FIPOL	FLD Signal Polarity 0x0: Positive 0x1: Negative	RW	0x0
3	HDPOL	HD Sync Signal Polarity 0x0: Positive 0x1: Negative	RW	0x0

Bits	Field Name	Description	Type	Reset
2	VDPOL	VD Sync Signal Polarity 0x0: Positive 0x1: Negative	RW	0x0
1	FIDD	FLD Signal Direction There shall be at least three clock cycles between the time this bit is modified and the HD/VD pulse for start of frame comes. 0x0: Input 0x1: Output	RW	0x0
0	HDVDD	VD,HD Sync Signal Direction There shall be at least three clock cycles between the time this bit is modified and the HD/VD pulse for start of frame comes. 0x0: Input 0x1: Output	RW	0x0

Table 7-1533. ISIF_CULH

Address Offset	0x0000 002C	Instance	ISP6P5_ISIF
Physical Address	0x5204 102C		
Description	This register specifies horizontal culling. Please also refer to ISIF_LNH for the effect to the number of pixels written to SDRAM.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLHE								CLHO															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:8	CLHE	Culling Pattern in EVEN Line: Sets culling pattern when data is loaded into memory (even lines). Example:0xAA: 1 / 2 horizontal direction culling. LSB becomes left side on screen. 0x0: Pixel invalid 0x1: Pixel valid	RW	0xff
7:0	CLHO	Culling Pattern in ODD Line: Sets culling pattern when data is loaded into memory (odd lines). 0x0: Pixel invalid 0x1: Pixel valid	RW	0xff

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15	VLDC	On/off control of CPU registers re-synchronize function by VSYNC. All the others are shadowed registers, where register values are updated at V-sync timing by default. If VDLC=1, ISIF register values are updated immediately after register write just like non-shadowed registers. 0x0: Enable 0x1: Disable	RW	0x0
14	RESERVED	Reserved. Shall always be set to 0.	RW	0x0
13	MSBINVI	MSB inverse of CIN port when the data are captured to SDRAM. The ISIF_MODESET.CCDW , ISIF_HSIZE.ADCR , ISIF_HSIZE.HSIZE , ISIF_CCDCFG.BSWD , ISIF_CCDCFG.MSBINVI , ISIF_CCDCFG.SDRPACK bit fields control how pixel data are stored to SDRAM. 0x0: Disable 0x1: Enable	RW	0x0
12	BSWD	On/off control of Byte SWAP function when SDRAM capturing. The ISIF_MODESET.CCDW , ISIF_HSIZE.ADCR , ISIF_HSIZE.HSIZE , ISIF_CCDCFG.BSWD , ISIF_CCDCFG.MSBINVI , ISIF_CCDCFG.SDRPACK bit fields control how pixel data are stored to SDRAM. 0x0: Disable 0x1: Enable (swap)	RW	0x0

Bits	Field Name	Description	Type	Reset
11	Y8POS	Selects Y signal position when in 8bit input mode 0x0: even pixel 0x1: odd pixel	RW	0x0
10	EXTRG	Setting ?1? to this register, the SDRAM address is initialized at the rising edge of FID input signal or DWEN register.	RW	0x0
9	TRGSEL	Select trigger source signal of SDRAM address initializing in case EXTRG=1. 0x0: DWEN register 0x1: FID input port	RW	0x0
8	WENLOG	Specifies the CCD valid area. 0x0: internal valid signal and WEN signal is ANDed logically. 0x1: internal valid signal and WEN signal is ORed logically.	RW	0x0
7:6	FIDMD	Specifies FID detection mode 0x0: latch the FID at the VSYNC timing 0x1: no latch the FID 0x3: Reserved 0x2: Reserved	RW	0x0
5	BT656	Selects bit width of CCIR656. This bit applies only if ISIF_REC656IF.R656ON = 1. 0x0: 8 bits 0x1: 10 bits	RW	0x0
4	YCINSWP	The ISIF module has a 16-bit interface. When 16-bit YUV data are input, the luma data (YIN7-0) are expected to be on the 8 MS bits and the chroma (CIN7-0) data are expected to be on the LS bits. This bit enables to swap the 8 MS bits with the 8 LS bits of the interface in case the luma and chroma do not come in the correct order. Refer to the top-level ISIF block diagram. 0x0: YIN7-0 = Y signal / CIN7-0 = C signal 0x1: YIN7-0 = C signal / CIN7-0 = Y signal	RW	0x0
3	RESERVED	Reserved. Shall always be set to 0.	RW	0x0
2	RESERVED	Reserved. Shall always be set to 0.	RW	0x0
1:0	SDRPACK	This bit field selects how the data are stored to SDRAM. There can be 8, 12 or 16 bits per pixel. The ISIF_MODESET.CCDW , ISIF_HSIZE.ADCR , ISIF_HSIZE.HSIZE , ISIF_CCDCFG.BSWD , ISIF_CCDCFG.MSBINV , ISIF_CCDCFG.SDRPACK bit fields control how pixel data are stored to SDRAM. 0x0: 16 bits / pixel 0x1: 12 bits / pixel 0x3: Reserved 0x2: 8 bits / pixel	RW	0x0

Address Offset	0x0000 010C	Instance	ISP6P5_ISIF
Physical Address	0x5204 110C		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								RESERVED								SOF			PREFETCH_COMPLETED	PREFETCH_ERROR	DONE										

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:4	RESERVED		R	0x0
3	SOF	Interrupt status for LSC SOF Indicates the start of the LSC valid region. LSC configuration registers can be updated after LSC SOF for the next frame. 0x0: Interrupt is masked 0x1: Interrupt is enabled	RW	0x0
2	PREFETCH_COMPLETED	Interrupt enable for Prefetch Complete Indicates current state of the prefetch buffer. Could be used to start sending the data once the buffer is full to minimize the risk of an underflow. This event is triggered when the buffer contains 3 full paxel rows. 0x0: Interrupt is masked 0x1: Interrupt is enabled	RW	0x0
1	PREFETCH_ERROR	Interrupt enable for Prefetch Error The prefetch error indicates when the gain table was read to slowly from SDRAM. When this event is pending the module goes into transparent mode (output=input). Normal operation can be resumed at the start of the next frame after 1) clearing this event 2) disabling the LSC module 3) enabling it 0x0: Interrupt is masked 0x1: Interrupt is enabled	RW	0x0

Bits	Field Name	Description	Type	Reset
0	DONE	Interrupt enable for LSC Done The event is triggered when the internal state of LSC toggles from BUSY to IDLE. 0x0: Interrupt is masked 0x1: Interrupt is enabled	RW	0x0

Description	IPIPEIF Enable.			
Type	RW			

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SYNCOFF		ENABLE													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED		R	0x0
1	SYNCOFF	VD output mask This register masks the VD output to the IPIPE module. This can be useful when one wants to read data from SDRAM which are stored in a double buffer. If the VD is not masked each time we start the module an new VD will be generated to the IPIPEIF module. Let's consider two buffers A and B of N lines each. *This bit field is latched by VD. 0x0: VD output mask is disabled. 0x1: VD output mask is enabled.	RW	0x0
0	ENABLE	IPIPE I/F Enable This register is used to start the operation of SDRAM buffer memory read and generates SYNC signals. This register is available when INPSRC1 or INPSCR2 = 1, 2 or 3. 0x0: IPIPE SDRAM I/F Disabled 0x1: IPIPE SDRAM I/F Enabled	RW	0x0

Bits	Field Name	Description	Type	Reset
0	DTUDF	Data under flow error status register. Reading ?1? shows there is data under flow and at least one data is corrupted while reading from SDRAM. Writing ?1? to this register clears (=0) the error (=1) status. Underflow errors are non recoverable at ISP5 level, need to do a soft reset at ISS level. The IPIPEIF_UDF interrupt is generated when an underflow happens. The interrupt avoids polling this register for errors. If ENM2MSTALL is enabled, then programmers need to ensure that the SW does not clear DTUDF[0] as this would reset the MTC read interface. DTUDF[0] can be cleared only in the on-the-fly operation where the stall mechanism will not work.	RW	0x0

Bits	Field Name	Description	Type	Reset
31:22	AVE2LMT	AE/AWB Saturation Limit This is the value that all sub sampled pixels in the AE/AWB engine are compared to. If the data is greater or equal to this data then the block is considered saturated.	RW	0x3ff
21	OVF	H3A module overflow status bit. If the H3A module overflows it will keep sending data. The software can read this status bit during vertical blanking period to ensure that no overflow happened while writing out the data to SDRAM. There is also an interrupt at ISP5 level (H3A_OVF) which can be used to monitor this. 0x0: Read 0: No overflow pending Write 0: Status bit unchanged 0x1: Read 1: Overflow happened while writing out the data. Output data likely to be corrupted. Write 1: Clear the status bit.	RW	0x0
20	AF_VF_EN	AF Vertical Focus Enable 0x0: 4 Color Horizontal FV only 0x1: 1 Color Horizontal FV and 1 Color Vertical FV	RW	0x0
19	AEW_MED_EN	AE/AWB Median filter Enable If the median filter is enabled, then the 1st 2 and last 2 pixels in the frame are not filtered. 0x0: Disable Auto Focus median filter 0x1: Enable Auto Focus median filter	RW	0x0
18	BUSYAEAWB	Busy bit for AE/AWB	R	0x0
17	AEW_ALAW_EN	AE/AWB A-law Enable 0x0: Disable Auto exposure/white balance A-law table 0x1: Enable Auto exposure/white balance A-law table.	RW	0x0
16	AEW_EN	AE/AWB enable 0x0: Disable Auto exposure/white balance 0x1: Enable Auto exposure/white balance	RW	0x0
15	BUSYAF	Busy bit for AF.	R	0x0
14	FVMODE	Focus Value Accumulation Mode 0x0: Sum mode. 0x1: Peak mode.	RW	0x0
13:11	RGBPOS	Red, Green, and blue pixel location in the AF windows RGBPOS(0): GR and GB as Bayer pattern RGBPOS(1): RG and GB as Bayer pattern RGBPOS(2): GR and BG as Bayer pattern RGBPOS(3): RG and BG as Bayer pattern RGBPOS(4): GG and RB as custom pattern RGBPOS(5): RB and GG as custom pattern 6 and 7 are reserved This Value is only used if VF is disabled	RW	0x0

Bits	Field Name	Description	Type	Reset
10:3	MED_TH	Median filter threshold.	RW	0xff
2	AF_MED_EN	Auto Focus Median filter Enable If the median filter is enabled, then the 1st 2 and last 2 pixels in the frame are not in the valid region. Therefore the paxel start/end and IIR filter start positions should not be set within the 1st and last 2 pixels. 0x0: Disable AF median filter. 0x1: Enable AF median filter.	RW	0x0
1	AF_ALAW_EN	AF A-law table enable 0x0: Disable Auto Focus A-law table 0x1: Enable Auto Focus A-law table	RW	0x0
0	AF_EN	AF enable 0x0: Disable Auto Focus Engine 0x1: Enable Auto Focus Engine	RW	0x0

Description	Setup for the AF Engine Poxel Configuration		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								AFINCH				AFINCV				PAXVC				PAXHC											

Bits	Field Name	Description	Type	Reset
31:21	RESERVED		R	0x0
20:17	AFINCH	AF Engine Column Increments Number of columns to increment in a paxel plus 1 multiplied by 2. Thus, the number of columns that can be skipped between two processed line pairs is 2-32 (even). The starting two columns in a paxel are first processed before this field is applied. This must be set so that there are at least 4 samples on a line when combined with the number of horizontal paxels. * This value is shadowed and latched on the rising edge of VSYNC.	RW	0x0
16:13	AFINCV	AF Engine Line Increments Number of lines to increment in a Poxel plus 1 multiplied by 2. Incrementing the line in a paxel is always done on a line pair due to the fact that the RGB pattern falls in two lines. If all the lines are to be processed, this field should be set to zero, and thus line count is incremented by 2 following a line pair. Thus, the number of lines that can be skipped between two processed line pairs is 0-30 (even). The starting two lines in a paxel are first processed before this field is applied. * This value is shadowed and latched on the rising edge of VSYNC.	RW	0x0
12:6	PAXVC	AF Engine Vertical Poxel Count The number of paxels in the vertical direction plus 1. The maximum number of vertical paxels in a frame should not exceed 128. The value should be set to ensure that the bandwidth requirements and buffer size are not exceeded. * This value is shadowed and latched on the rising edge of VSYNC.	RW	0x0
5:0	PAXHC	AF Engine Horizontal Poxel Count The number of paxels in the horizontal direction plus 1. It is illegal to set a number that is greater than 35 (total of 36 paxels in the horizontal direction). The minimum number of paxels should be 2 (valid range for the field is 1-35). * This value is shadowed and latched on the rising edge of VSYNC.	RW	0x0

Description	Horizontal/Vertical Delay of VP1 port		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED	RESERVED	RESERVED						DLV						RESERVED						DLH											

Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0x0
30	DELAY_SWT	<p>This bit changes the delay between NSF3V input VD/HD and output VD/HD. Usually, this bit is '0'. This bit is supposed to be used when NSF3V works with ISP (VP1), and IPIPEIF is in DFS/WDR mode. In this case VD must be at least one line earlier than the first valid line.</p> <p>0x0: The output of VD (VD_OUT) is at the same clock as the first pixel output of the frame. The output of HD (HD_OUT) is at the same clock as the first pixel output in each line.</p> <p>0x1: The VD/HD timing is controlled by DLV/DLH. VD output (VD_OUT) timing is DLV lines after VD input (VD_IN), on the same clock as HD output (HD_OUT). HD output (HD_OUT) timing is DLH pixel clocks after HD input (HD_IN).</p>	RW	0x0
29:24	RESERVED		R	0x0
23:16	DLV	<p>Vertical Delay of VP1 port from VS_IN to VD_OUT. This field is only used if DELAY_SWT=='1', and ignored if DELAY_SWT=='0'. This register is latched at VS. If DELAY_SWT is '1', after number of lines specified here following VD_IN, VD_OUT is output. This value should be equal to or smaller than NSF3V line latency for meaningful operation. The only possible case that this field is used is when NSF3V is used with ISP, and IPIPEIF is in DFS or WDR mode. A value between 0 and 3 should be specified for TB_BORDER=00 or 10 case. A value between 0 and 17 should be specified for TB_BORDER=01 or 11 case. Since there is DLV lines between VD and the first valid line, the downstream modules need to be programmed accordingly.</p>	RW	0x0
15:8	RESERVED		R	0x0
7:0	DLH	<p>This field is only used if DELAY_SWT=='1', and ignored if DELAY_SWT=='0'. VP1 port horizontal delay from HS_IN (derived from HD_IN) to HD_OUT, which affects the cycles between HD_OUT and first valid pixel. This register is latched at VS. The meaning of this value changes depending on the input format (ISP_NSF3V_MODESET.INPMOD). For YCbCr-16bit (ISP_NSF3V_MODESET.INPMOD==1) The maximum DLH value allowed is 8. If DLH=8, HD output is at the same clock as the first pixel output in each line. If DLH=8, HD output is (8-DLH) clock before the first pixel output. For Bayer input or YCbCr-8bit input (ISP_NSF3V_MODESET.INPMOD==0 or 2) Maximum DLH allowed is 16. If DLH=16, HD output is at the same clock as the first pixel output in each line. If DLH=16, HD output is (16-DLH) clock before the first pixel output.</p>	RW	0x0

RESERVED																												OST			

Bits	Field Name	Description	Type	Reset
31:1	RESERVED		R	0x0
0	OST	<p>One shot mode or continuous mode. One shot mode turns itself off after each frame. Note that this bit only controls the enable signal, and does not revert the statistics to the default status. To revert the cache content to the default status, you either need to SW reset GLBCE module, or load the default value from SDRAM to cache memory. To perform the latter option, default cache table needs to be copied to SDRAM before hand.</p> <p>0x0: Continuous mode. GLBCE module keep running after each frame until the enable bit is turned off.</p> <p>0x1: One shot mode. GLBCE turns off it self at the beginning of each frame.</p>	RW	0x0

Physical Address	0x5205 1008		
Description	GLBCE Configuration Port GLBCE Control Register 0 (control_0)		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																RESERVED												CCTL	MB	RESERVED	ONOFF

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:5	RESERVED		R	0x0
4	CCTL	Color Control (CCTL) - Enabling this processing will result in more accurate colors processing. The color correction algorithm is required on gamma corrected sources It reduces the saturation in dark areas when they are being amplified, and saturates bright parts when they get darker. This bit is reserved and tied zero in ISS6 0b: Disable color correction 1b: Enable color correction	R	0x0
3	MB	Max Bayer Type- Use this bit to select the algorithm used for calculating intensity. 0b: Algorithm 1 1b: Algorithm 2 (Recommended) 0x0: 0b: Algorithm 1 0x1: 1b: Algorithm 2 (Recommended)	RW	0x1
2:1	RESERVED	These bits are read only. Controls the storage of image sensor RAW data in memory. This bit is loaded with the timing of the internal VD signal: it becomes active starting at the lead of the VD signal that comes after 1 is written in this bit.	R	0x0
0	ONOFF	GLBCE On/Off - This bit turns GLBCE processing ON and OFF. When GLBCE is OFF, the video data passes to the output without any changes. Disabling GLBCE using this bit is equivalent to setting the Strength parameter to 0. Many internal modules run in idle mode when this bit is 0. The Latency Delays between the input and the output signals are the same in both ON and OFF modes. 0b: Disable GLBCE processing 1b: Enable GLBCE processing 0x0: Disable 0x1: Enable	RW	0x0

Table 7-2162. GLBCE_VARIANCE

Address Offset	0x0000 0018	Instance	ISP6P5_GLBCE
Physical Address	0x5205 1018		
Description	GLBCE Configuration Port Affects the sensitivity of the transform to different areas of the image, and can be increased in order to emphasize small regions (e.g. faces). If this parameter is set to zero, the sensitivity to the small areas is maximal. The transform becomes more local. When the parameter is set to 0xFF the transform deemphasizes small local details, and transform becomes more global e.g. the sky at the top of the frame can affect flowers at the bottom of the frame.		

Table 7-2162. GLBCE_VARIANCE (continued)

Type		RW																													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																								VARIANCEINTENSITY				VARIANCESPACE			
Bits	Field Name	Description																				Type	Reset								
31:8	RESERVED																					R	0x0								
7:4	VARIANCEINTENSITY	Variance Intensity - Sets the degree of sensitivity in the luminance domain. Maximum Variance is 0xF, and minimum Variance is 0x0.																				RW	0x4								
3:0	VARIANCESPACE	Variance Space - Sets the degree of spatial sensitivity of the algorithm. As this parameter is made smaller, the algorithm focuses on smaller regions within the image. Maximum Variance is 0xF, and minimum Variance is 0x0.																				RW	0x1

Table 7-2168. GLBCE_SLOPE_MAX

Address Offset	0x0000 0024	Instance	ISP6P5_GLBCE
Physical Address	0x5205 1024		
Description	GLBCE Configuration Port Slope Max Limit Register (slope_max)		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SLOPEMAXLIMIT															

Bits	Field Name	Description	Type	Reset
31:8	RESERVED		R	0x0
7:0	SLOPEMAXLIMIT	Slope Max Limit - Slope Max Limit is used to restrict the slope of the tone-curve generated by GLBCE. When Slope Max Limit parameter is set to 0xFF, the tone curve slope, generated by GLBCE is not limited (maximum slope 15). When this value is set to 00 GLBCE will not generate the tone-curve with slope greater than 16/15 (48?). Intermediate values of Slope Limit are linear interpolation between minimum and maximum values. Recommended Slope Max Limit range is 20h-60h. For noisy images less value should be used.	RW	0x28

RESERVED																AUTOSIZE	AUTOPOS	FCMODE	RESERVED	VSPOL	HSPOL										

Bits	Field Name	Description	Type	Reset
31:8	RESERVED		R	0x0
7	AUTOSIZE	This value is read only. GLBCE in ISP never use Auto-size mode. 0x0: Auto size off. The GLBCE core will use frame_width, frame_height ports values. 0x1: Auto size on. The GLBCE core will calculate the frame geometry based on the active line and field signals. The size of current frame will be used for the estimation of the next frame. The Frame size will be updated when the Field signal toggles.	R	0x0
6	AUTOPOS	This value is read only. GLBCE in ISP always runs in Auto Position mode. 0x0: Auto Position off 0x1: Auto Position On	R	0x1
5:4	FCMODE	Field Correction Mode 0x0: Internal field signal will be the same as external field signal. Internal generation of field is not available in this mode 0x1: Adjust field signal with v_sync 0x2: Adjust field signal with active line	R	0x0
3:2	RESERVED		R	0x0
1	VSPOL	Vertical Sync Polarity This value is read only. The SWITCH block always convert the polarity to rising edge active. 0x0: Rising edge active 0x1: Falling edge active	R	0x0
0	HSPOL	Horizontal Sync Polarity This value is read only. The SWITCH block always convert the polarity to rising edge active. 0x0: Rising edge active 0x1: Falling edge active	R	0x0

7.4 ISS Still Image Coprocessor

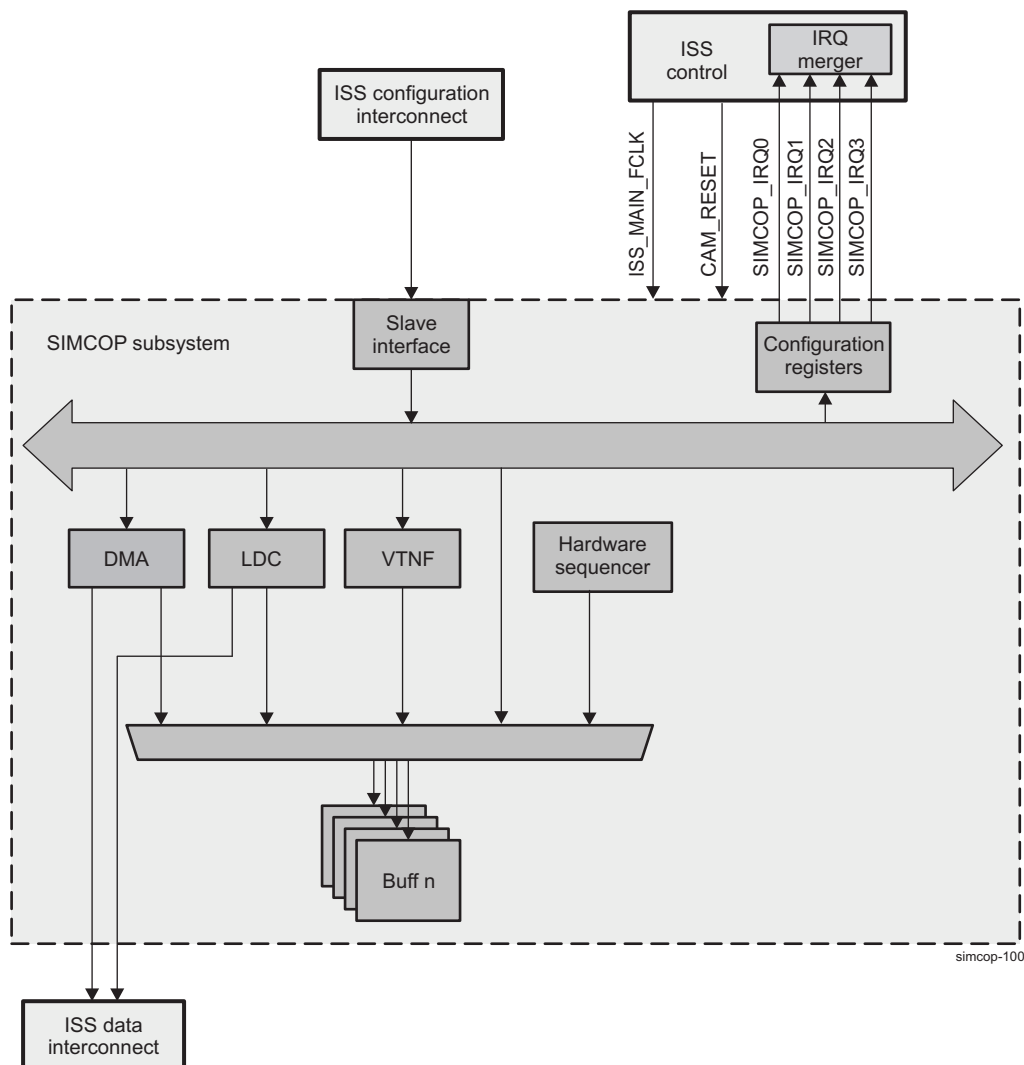

This section gives a high-level description of the ISS still iMage coprocessor (SIMCOP) in the device. For a high-level description of ISS level, see [Section 7.1, ISS: Overview](#).

7.4.1 ISS SIMCOP Overview

The SIMCOP subsystem is designed to process image data. SIMCOP is a macroblock-based memory-to-memory processing engine. It fetches macroblocks from system memory and stores them into local memories. Different accelerators take the fetched data, perform processing, and send the processing outcome back to local memories. From there the data could be further processed by other accelerators or sent back to system memory. The SIMCOP needs an external central processing unit (CPU) to perform high-level control tasks and configurations.

Figure 7-216 shows a block diagram of the SIMCOP subsystem.

Figure 7-216. SIMCOP Subsystem Overview

The ISS SIMCOP subsystem consists of:

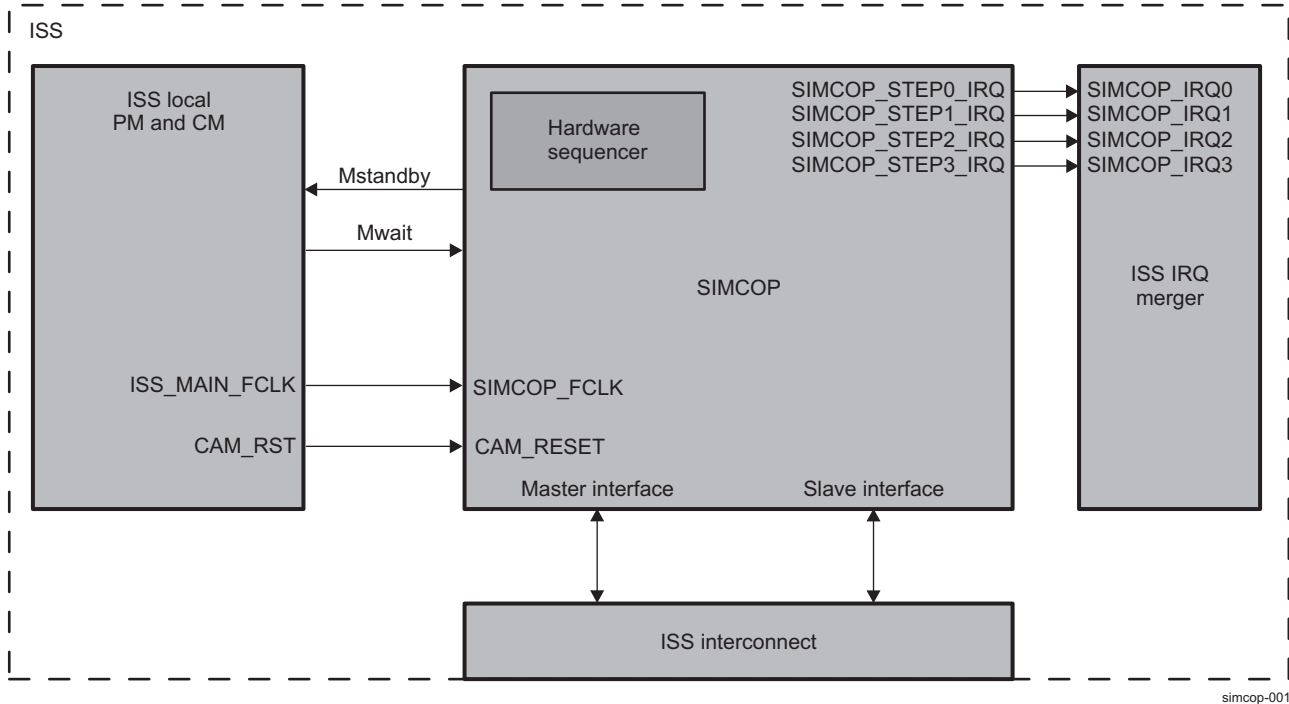

- Temporal Video Noise Filter (VTNF) - performs temporal video noise filtering.
- Hardware Sequencer - for low-level sequencing tasks and memory operations
- Direct memory access (DMA) controller – Data transfers from SIMCOP memories to system memory or from system memory to SIMCOP memories

- Lens distortion correction (LDC) - rotation, affine warp and perspective correction

7.4.1.1 ISS SIMCOP Integration

The SIMCOP subsystem is connected to the rest of the system through the ISS local interconnect. Figure 7-217 shows the integration of the SIMCOP subsystem in the ISS.

Figure 7-217. SIMCOP Integration

simcop-001

NOTE: For more information about the IDLE hardware handshake and the wake-up request, see Section 3.1.1.1, *Clock Management* in Chapter 3, *Power, Reset, and Clock Management*.

This section gives an overview of typical uses of the module. See Chapter 3, *Power, Reset, and Clock Management* for more information and settings of the PRCM relationship to ISS clocks and resets.

Table 7-3034 lists the Integration Attributes.

Table 7-3034. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
SIMCOP	PD_ISS	ISS interconnect

Table 7-3035 lists the Clocks and Resets values.

Table 7-3035. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SIMCOP	SIMCOP_FCLK	ISS_MAIN_FCLK	PRCM	Functional clock provided by CORE_ISS_MAIN_CLK from the PRCM. It is used by all ISS submodules and ISS top-level resources.

Resets

Table 7-3035. Clocks and Resets (continued)

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SIMCOP	CAM_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset

Table 7-3036 lists the hardware resets.

Table 7-3036. Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
SIMCOP	SIMCOP_STEP_0_IRQ	SIMCOP_IRQ0	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
SIMCOP	SIMCOP_STEP_1_IRQ	SIMCOP_IRQ1	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
SIMCOP	SIMCOP_STEP_2_IRQ	SIMCOP_IRQ2	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
SIMCOP	SIMCOP_STEP_3_IRQ	SIMCOP_IRQ3	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer

For more information about interrupt requests, see *Interrupt Merger*.

7.4.1.2 ISS SIMCOP Functional Description

7.4.1.2.1 ISS SIMCOP Local Power and Clock Management

7.4.1.2.1.1 ISS SIMCOP Local Clock Management

SIMCOP receives one functional from ISS (ISS_MAIN_FCLK).

A clock-enable signal provided externally is used. Multiple subdomains exist internally to reduce dynamic power consumption. This feature does not require intervention by the PRCM module. For high-level description of the SIMCOP clock domain and configuration inside ISS, see [Section 7.1.1.1.1, ISS Clock Domains](#) and [Section 7.1.2.4, ISS Clocks](#).

Moreover, at high level the functional clock of ISS SIMCOP submodules can be cut by software to reduce power consumption by cutting off or turning on the modules from the [SIMCOP_CLKCTRL](#) register (see [Table 7-3037](#)).

For software to enable a submodule:

- Software sets the appropriate bit in the [SIMCOP_CLKCTRL](#) register.
- Hardware enables the submodule functional and interface clocks.
- Hardware connects the configuration port of the submodule to the coprocessor bus.
- Hardware sets the appropriate bit in the [SIMCOP_CLKCTRL](#) register. Software must check if this bit is set before accessing the submodule.

[Table 7-3037](#) shows the ISS SIMCOP clock control register settings.

Table 7-3037. ISS SIMCOP Clock Control Register Settings

Module Name	Bit Field Name	Description
VTNF	SIMCOP_CLKCTRL [9] VTNF	Writing 0x1 enables the module
LDC	SIMCOP_CLKCTRL [1] LDC	Writing 0x1 enables the module
DMA	SIMCOP_CLKCTRL [0] DMA	Writing 0x1 enables the module

For software to shut down a submodule:

- Software ensures that the submodule is idle. Mainly:
 - The submodule must not generate new events.
 - The submodule must not have any pending events.
 - For initiators, the submodule must stop interconnect transaction generation.
- Software clears the appropriate bit in the [SIMCOP_CLKCTRL](#) register.
- Hardware disconnects the configuration port of the module from the coprocessor bus, no more accesses are routed to the submodule. Ongoing transactions are finished (hardware stays in this state as long as required).
- For initiators, hardware waits until there are no more outstanding transactions:
 - The SIMCOP DMA provides an MStandBy signal used for that purpose.
 - The SIMCOP LDC provides an MStandBy signal used for that purpose.
- Hardware cuts the submodules clock.
- Hardware clears the appropriate [SIMCOP_CLKCTRL](#) registers.

SIMCOP submodules support autogating. They can gate their functional and interface clock internally based on functional requirements. This feature can be disabled for debug or power consumption measurement purposes.

7.4.1.2.1.2 Local Clock Autogating

The SIMCOP subsystem modules support autogating. They can gate their functional and interface clock internally based on functional requirements. This feature can be disabled. [Table 7-3038](#) summarizes what modules support autogating control and which control bit is used.

Table 7-3038. Autoclock Gating Bit Control

SIMCOP resource	Autogating override
SIMCOP top-level resources	NA
SIMCOP DMA	NA
VTNF	VTNF_CTRL[10] AUTOGATING

7.4.1.2.1.3 ISS SIMCOP Power Management

The SIMCOP supports the STANDBY power management protocol. It is used by the SIMCOP to indicate when it has no more interconnect transactions to perform. This information is used at the ISS level to control the SIMCOP and ISS shut-down sequence. The SIMCOP does not have any internal wake-up events. DISCONNECT and IDLE protocols are not supported.

The typical SIMCOP shut-down sequence is:

- Software disables all SIMCOP submodules. This ensures the SIMCOP does not:
 - Generate any traffic on its master port; SIMCOP asserts the MStandby signal.
 - Generate new events (IRQs).
- Software clears all pending events at the SIMCOP level; all interrupt lines become inactive.
- Software initiates the SIMCOP shut-down sequence by writing the appropriate bit at the ISS level.
- ISS hardware:
 - Disconnects the SIMCOP configuration port. Any access attempts to the SIMCOP are blocked at the ISS level. The DISCONNECT protocol is handled at the ISS level; the SIMCOP does not provide any handshake signals to support it.
 - Waits until MStandby from SIMCOP is asserted (always true in a normal case because SIMCOP submodules are inactive)
 - Asserts the SWait input of SIMCOP
 - Cuts the SIMCOP clock

The typical SIMCOP enable sequence is:

- Software initiates the SIMCOP enable sequence by writing the appropriate bit at the ISS level.
- ISS hardware:
 - Enables the SIMCOP clock
 - Deasserts the SWait input of SIMCOP
 - Connects the SIMCOP configuration port

7.4.1.2.2 ISS SIMCOP Reset

SIMCOP supports 2 reset sources:

- Hardware reset from PRCM
- Software reset from [SIMCOP_HL_SYSCONFIG\[0\] SOFTRESET](#)

The HW reset is unconditional and resets SIMCOP as well as its sub-modules. It typically requires a complete device reset as the OCP and PM protocol integrity is not guaranteed.

The SIMCOP module is able to accept a general software reset, propagated through all the hierarchy. This reset can be done to initialize the module and has the same effect as the hardware reset. Unlike HW reset, SW reset can safely be performed during SIMCOP operation: OCP and STANDBY protocol integrity is guaranteed by HW. This is done by the sequence below:

- Disable all SIMCOP DMA channels.
- Select smart standby mode for LDC and SIMCOP DMA
- Set [SIMCOP_HL_SYSCONFIG\[0\] SOFTRESET](#) to "1"
- Read [SIMCOP_HL_SYSCONFIG\[0\] SOFTRESET](#) back until the returned value is 0.

The SIMCOP HW does the following when a SW reset command is received:

- Stop accepting new OCP commands on its slave port by stalling the port on a clean transaction boundary.
- Wait until all OCP responses have been returned to the slave port. This also includes the response of the SW reset command itself.
- LDC will stop issuing OCP requests immediately and will assert Standby when it receives responses of all the requests. Internal processing will be stopped once the ongoing block processing is done.
- DMA will complete any ongoing channel transfer and will go into standby state.

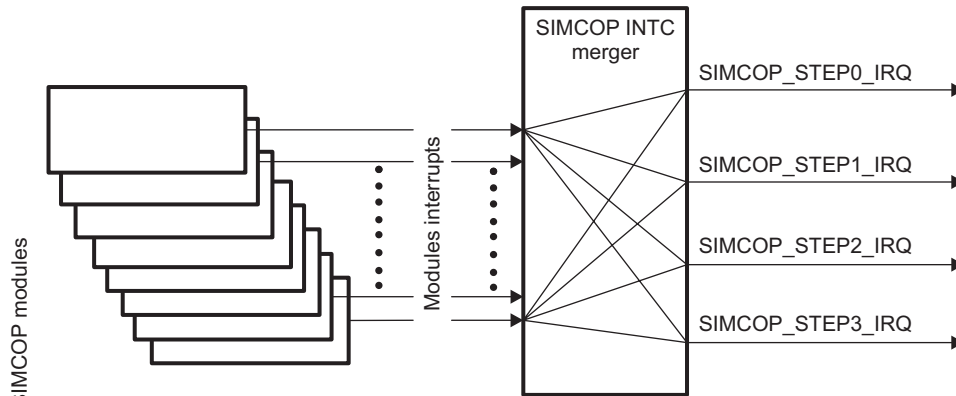

SIMCOP then performs the internal reset. A SW reset at SIMCOP level is seen as a HW reset for SIMCOP sub-modules. However, as SIMCOP has isolated sub-modules by stalling the OCP ports, no protocol violation can occur.

SW reset does not directly affect the state of the power management handshake signals (i.e. the protocol handshake is preserved).

7.4.1.2.3 ISS SIMCOP Interrupt Merger

SIMCOP interrupts are merged at the SIMCOP subsystem level into four interrupts as shown in [Figure 7-218](#).

Figure 7-218. SIMCOP Interrupt Merger Overview

simcop-011

These four outputs interrupts can be configured using the [SIMCOP_HL_IRQENABLE_SET_i](#) and [SIMCOP_HL_IRQENABLE_CLR_i](#) (i = 0 to 3, corresponding to output interrupt) to enable or disable interrupt mask for each interrupt output. Software can poll the value of interrupt before masking [SIMCOP_HL_IRQSTATUS_RAW_i](#) and after masking [SIMCOP_HL_IRQSTATUS_i](#).

Software can configure how outputs interrupts are generated by using the [SIMCOP_CTRL\[I\] IRQi_MODE](#) (i = 0 to 3) bit field(s):

- 0x0: OR – The interrupt is asserted when one of the selected events has occurred
- 0x1: AND – The interrupt is asserted when all selected events have occurred

[Table 7-3039](#) shows how interrupts are mapped on the [SIMCOP_HL_IRQSTATUS_RAW_i](#), [SIMCOP_HL_IRQSTATUS_i](#), [SIMCOP_HL_IRQENABLE_SET_i](#) and [SIMCOP_HL_IRQENABLE_CLR_i](#) registers.

Table 7-3039. ISS SIMCOP Interrupts

Bit	Name	Description
0	SIMCOP_DMA_IRQ0	Interrupt triggered by SIMCOP DMA
1	LDC_FRAME_IRQ	This event is triggered by LDC when a full frame has been processed
8	VTNF_IRQ	Interrupt triggered by VTNF when one processed block is done
9	LDC_BLOCK_IRQ	This event is triggered by LDC when a macro-block has been processed
10	SIMCOP_STEP0_IRQ	Event triggered when a SIMCOP context is activated by the HW sequencer
11	SIMCOP_STEP1_IRQ	
12	SIMCOP_STEP2_IRQ	
13	SIMCOP_STEP3_IRQ	
14	DONE_IRQ	Event triggered when the HW sequencer finishes the sequence: - the sequence step counter has reached the limit - All accelerator and DMA events for the last sequence step have been received.
16	OCP_ERR_IRQ	An error has been received on the SIMCOP master port on L3 interconnect.
18	SIMCOP_DMA_IRQ1	Interrupt triggered by SIMCOP DMA
19	CPU_PROC_START_IRQ	This interrupt is used when CPU data processing is used in a macroblock processing pipeline. When CPU receives this IRQ, data for ready to be processed. When CPU is done with processing it acknowledges by setting the SIMCOP_HWSEQ_CTRL.CPU_PROC_DONE bit. The interrupt is cleared as usual.

7.4.1.2.4 ISS SIMCOP Modules Description

This section provides links to each subchapter for each submodule in the ISS SIMCOP module.

The ISS module provides a unique ISS_MAIN_FCLK for all the submodules inside the SIMCOP, see [Section 7.4.1.2.1.1](#).

For information about hardware and software resets for each module, see [Table 7-3039](#).

For interrupt request information for each module, see [Table 7-3036](#).

The ISS SIMCOP consists of the following submodules:

- Hardware Sequencer and buffers, for more information, see [Section 7.4.2](#).
- DMA, for more information, see [Section 7.4.3](#).

7.4.1.3 ISS SIMCOP Programming Models

7.4.1.3.1 Global Initialization

7.4.1.3.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the ISS SIMCOP module is to be used for the first time after a device reset. This initialization of the surrounding modules is based on the integration of the ISS SIMCOP.

Table 7-3040. ISS SIMCOP Global Initialization of Surrounding Modules

Surrounding Modules	Comments
ISS local PM and CM	Module interface and functional clocks must be enabled. For more information, see Section 7.4.1.2.1 , <i>ISS SIMCOP Local Power and Clock Management</i> .

7.4.1.3.1.2 ISS SIMCOP Module Global Initialization

This procedure initializes the ISS SIMCOP module after a power-on or software reset.

Table 7-3041. ISS SIMCOP Global Initialization

Step	Register/ Bitfield / Programming Model	Value
Execute software reset	SIMCOP_HL_SYSCONFIG [0] SOFTRESET	0x1
Wait until reset completed?	SIMCOP_HL_SYSCONFIG [0] SOFTRESET	0x0
Configure submodules interface and functional clock	SIMCOP_CLKCTRL [7:0]	xxx
Interrupt configuration		
Set interrupt enable bit for the submodules	SIMCOP_HL_IRQENABLE_SET_i [7:0]	xxx

7.4.1.3.2 ISS SIMCOP Operational Modes Configuration

7.4.1.3.2.1 Interrupts

To unmask an interrupt for generation of the SIMCOP_IRQ_i output interrupts, software must set the corresponding bit of the [SIMCOP_HL_IRQENABLE_SET_i](#) (I = 0 to 3) register to 1.

Example 1:

SIMCOP_IRQ1 is generated when VTNF_IRQ is generated:

- [SIMCOP_HL_IRQENABLE_SET_i](#)[8] VTNF_IRQ = 0x1 (I = 1)
- [SIMCOP_CTRL](#)[1] IRQ1_MODE = 0x0

Example 2:

SIMCOP_IRQ3 is generated when DMA_IRQ is generated:

- [5] IMX_A_IRQ = 0x1 (I = 3)
- [SIMCOP_HL_IRQENABLE_SET_i](#)[18] SIMCOP_DMA_IRQ1 = 0x1 (I = 3)
- [SIMCOP_CTRL](#)[3] IRQ3_MODE = 0x1

To mask an interrupt for generation of the SIMCOP_IRQ_i output interrupts, software must clear the corresponding bit of the SIMCOP_HL_IRQENABLE_CLEAR_i (I = 0 to 3) register by setting it to 0.

When an event occurs, the corresponding bit in the SIMCOP_HL_IRQSTATUS_RAW_i (I = 0 to 3) register is set regardless of whether or not the event has been enabled. Bits in the SIMCOP_HL_IRQSTATUS_i (I = 0 to 3) registers are only set when an enabled event occurs. Software can clear a pending event by setting the appropriate bit in the SIMCOP_HL_IRQSTATUS_i (I = 0 to 3) register.

7.4.1.4 ISS SIMCOP Registers Manual

7.4.1.4.1 SIMCOP Instance Summary

Table 7-3042 summarizes the SIMCOP instance.

Table 7-3046. SIMCOP_HL_HWINFO

Address Offset	0x0000 0004	Instance	SIMCOP
Physical Address	0x5202 0004		
Description	Information about the IP module's hardware configuration. It provides information about the RTL generic parameters.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																VTNF_ENABLE	LDCIMXNSF_BOOST	RESERVED				IMAGE_BUFFERS	NSF3_ENABLE	ROT_A_ENABLE	IMX_B_ENABLE	IMX_A_ENABLE	NSF_ENABLE	VLCDJ_ENABLE	DCT_ENABLE	LDC_ENABLE	

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16	VTNF_ENABLE	The VTNF module is present when this parameter is set.	R	0x1
15:14	LDCIMXNSF_BOOST	0x0: SIMCOP receives a 200 MHz clock driving all sub-modules 0x1: SIMCOP receives a 400 MHz clock. Some modules receive the 400 Mhz clock and others receive 400/2=200 Mhz. 0x3: SIMCOP receives only one main clock for all the modules. 0x2: SIMCOP receives a main clock @ 304 Mhz plus a clock @ 426 Mhz for LDC, NSF and iMX.	R	0x3
13:10	RESERVED		R	0x0
9:8	IMAGE_BUFFERS	This parameter defines the image buffer count. 0x0: 4 Image buffers (#e, #f, #g, #h) 0x1: 8 Image buffers	R	0x0
7	NSF3_ENABLE	The NSF3 module is present when this parameter is set. 0x0: Disabled at design time 0x1: Enabled at design time	R	0x0
6	ROT_A_ENABLE	The ROT #a module is present when this parameter is set. 0x0: Disabled at design time 0x1: Enabled at design time	R	0x0
5	IMX_B_ENABLE	The iMX #b module and the CMD#b, COEFF#b memories are present when this parameter is set. 0x0: Disabled at design time 0x1: Enabled at design time	R	0x0
4	IMX_A_ENABLE	The iMX #a module and the CMD#a, COEFF#a memories are present when this parameter is set. 0x0: Disabled at design time 0x1: Enabled at design time	R	0x0
3	NSF_ENABLE	The NSF2 module is present when this parameter is set. 0x0: Disabled at design time 0x1: Enabled at design time	R	0x0

Bits	Field Name	Description	Type	Reset
2	VLCDJ_ENABLE	The VLCD module and the QUANT, HUFFMAN, BITSTREAM memories are present when this parameter is set. 0x0: Disabled at design time 0x1: Enabled at design time	R	0x0
1	DCT_ENABLE	The DCT module is present when this parameter is set. 0x0: Disabled at design time 0x1: Enabled at design time	R	0x0
0	LDC_ENABLE	The LDC module and the LDC LUT are present when this parameter is set. 0x0: Disabled at design time 0x1: Enabled at design time	R	0x1

7.4.2 ISS SIMCOP Hardware Sequencer and Buffers Module

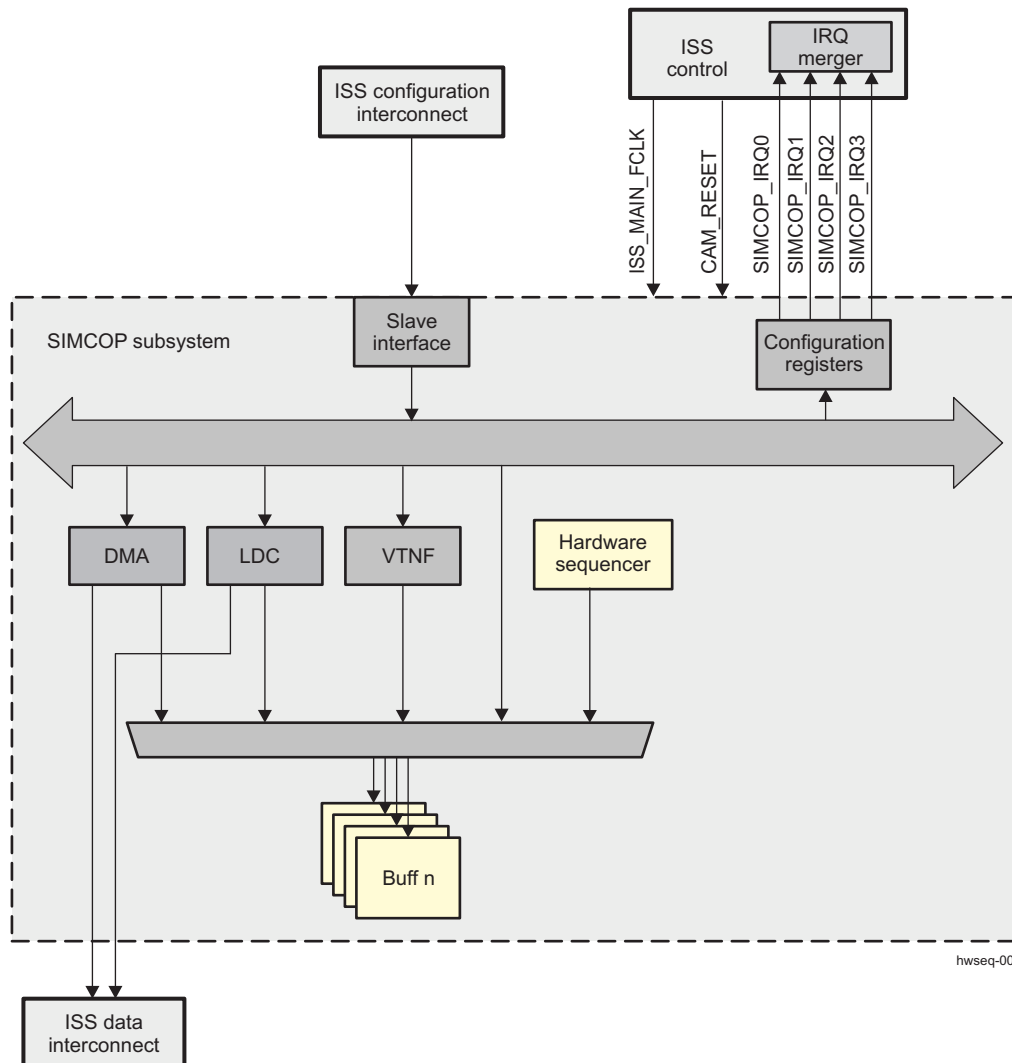

This section describes the hardware sequencer and buffers in the still image coprocessor (SIMCOP) subsystem.

7.4.2.1 ISS SIMCOP Hardware Sequencer and Buffers Overview

The SIMCOP hardware sequencer control all the modules included in the SIMCOP subsystem with their memories.

[Figure 7-219](#) shows an overview of the hardware sequencer and buffers in the SIMCOP subsystem.

Figure 7-219. Hardware Sequencer and Buffers in the SIMCOP Subsystem

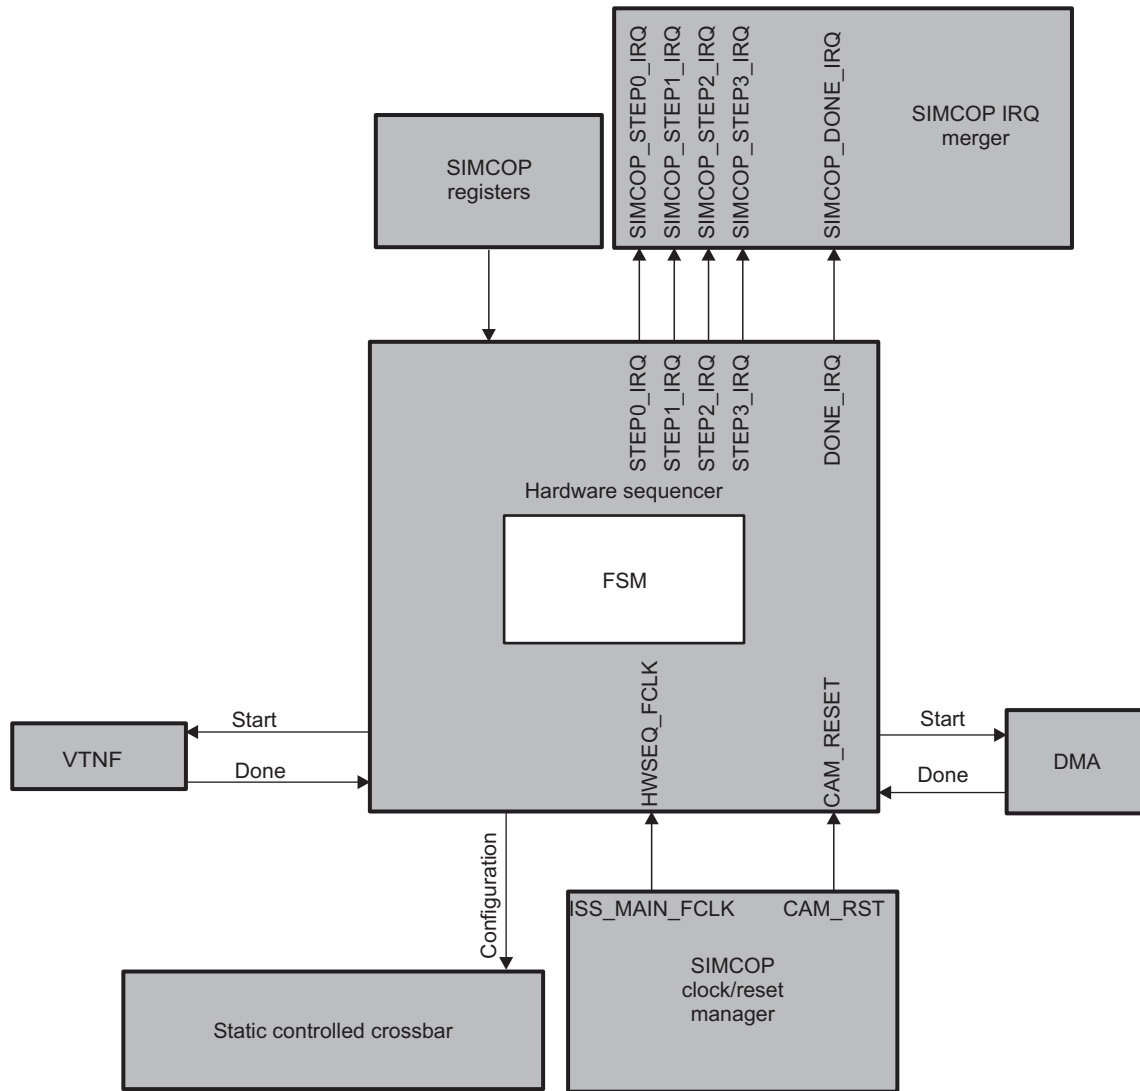

- Hardware acceleration for low-level sequencing tasks:
 - Synchronizes with DMA and VTNF
 - Supports 4 memory crossbar contexts
- Power management support

7.4.2.2 ISS SIMCOP Hardware Sequencer and Buffer Integration

The hardware sequencer and buffers module is part of the SIMCOP subsystem in the ISS.

Figure 7-220 shows the integration of the hardware sequencer and buffers in the SIMCOP subsystem.

Figure 7-220. Hardware Sequencer and Buffer Integration

hwseq-011

Table 7-3066 lists the integration attributes, Table 7-3067 lists the clocks and resets, and Table 7-3068 lists the hardware requests.

For more information about power management, see [Section 7.4.1.2.1.3, ISS SIMCOP Power Management](#).

7.4.2.3.3 ISS SIMCOP Hardware Sequencer and Buffer Interrupt Requests

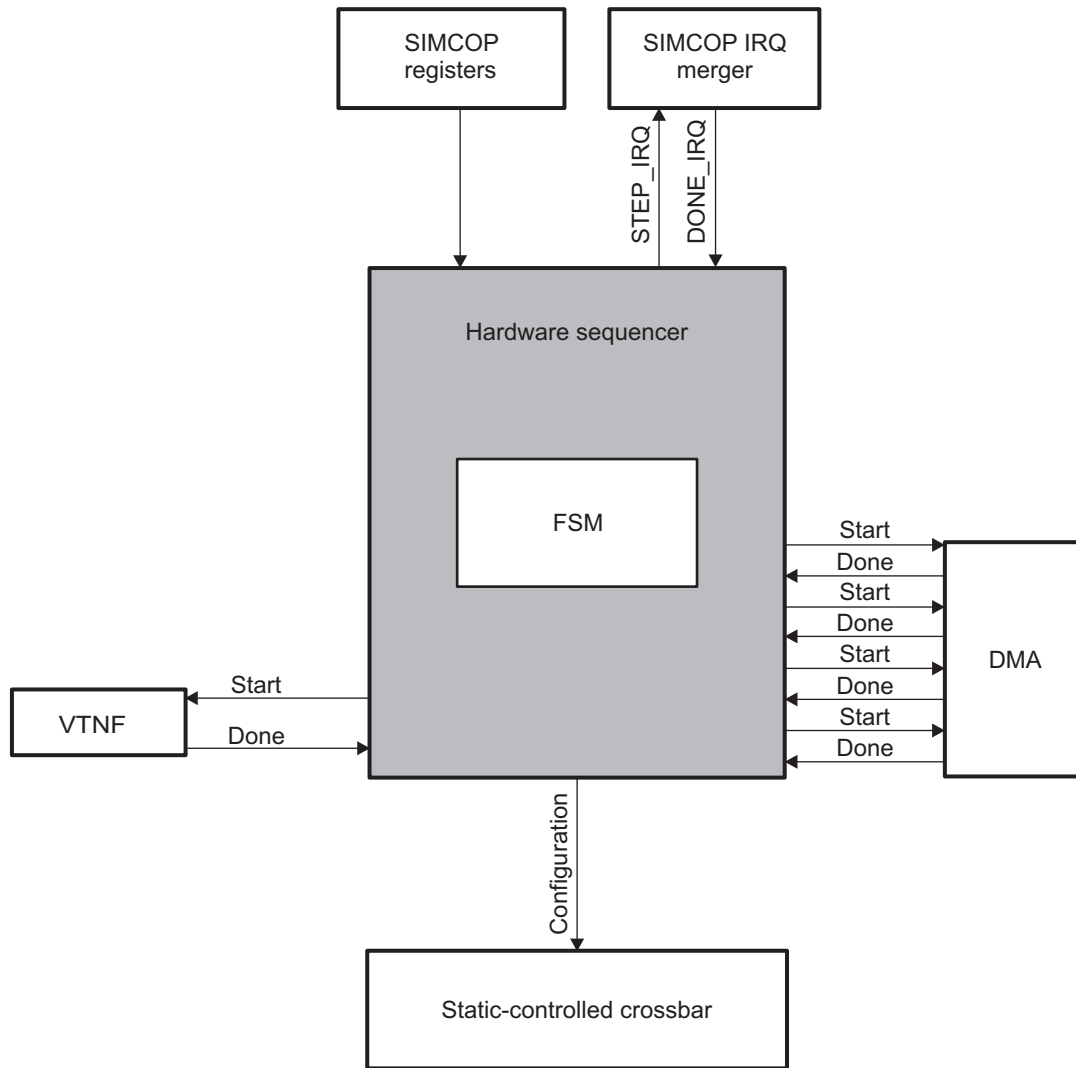

This module sends four interrupts to the ISS top level. For more information about interrupt management, see [Section 7.4.1.2.3, ISS SIMCOP Interrupt Merger](#).

7.4.2.3.4 ISS SIMCOP Hardware Sequencer

The SIMCOP typically processes a full frame on a macroblock-by-macroblock basis. The SIMCOP modules and the DMA controller trigger an interrupt when they have completed a macroblock. This event can either trigger an interrupt to an external initiator (CPU) (manual mode) or trigger a context switch and resume DMA/SIMCOP module processing. Typically, initiator intervention is needed to fill the macroblock pipeline (called pipe-up, that is, the first n macroblocks of an image) and to flush the macroblock pipeline (called pipe-down, that is, the last n macro-blocks of an image). Automatic sequencing mode is typically used for the rest of the image.

[Figure 7-221](#) depicts the SIMCOP hardware sequencer overview.

Figure 7-221. SIMCOP Hardware Sequencer Overview

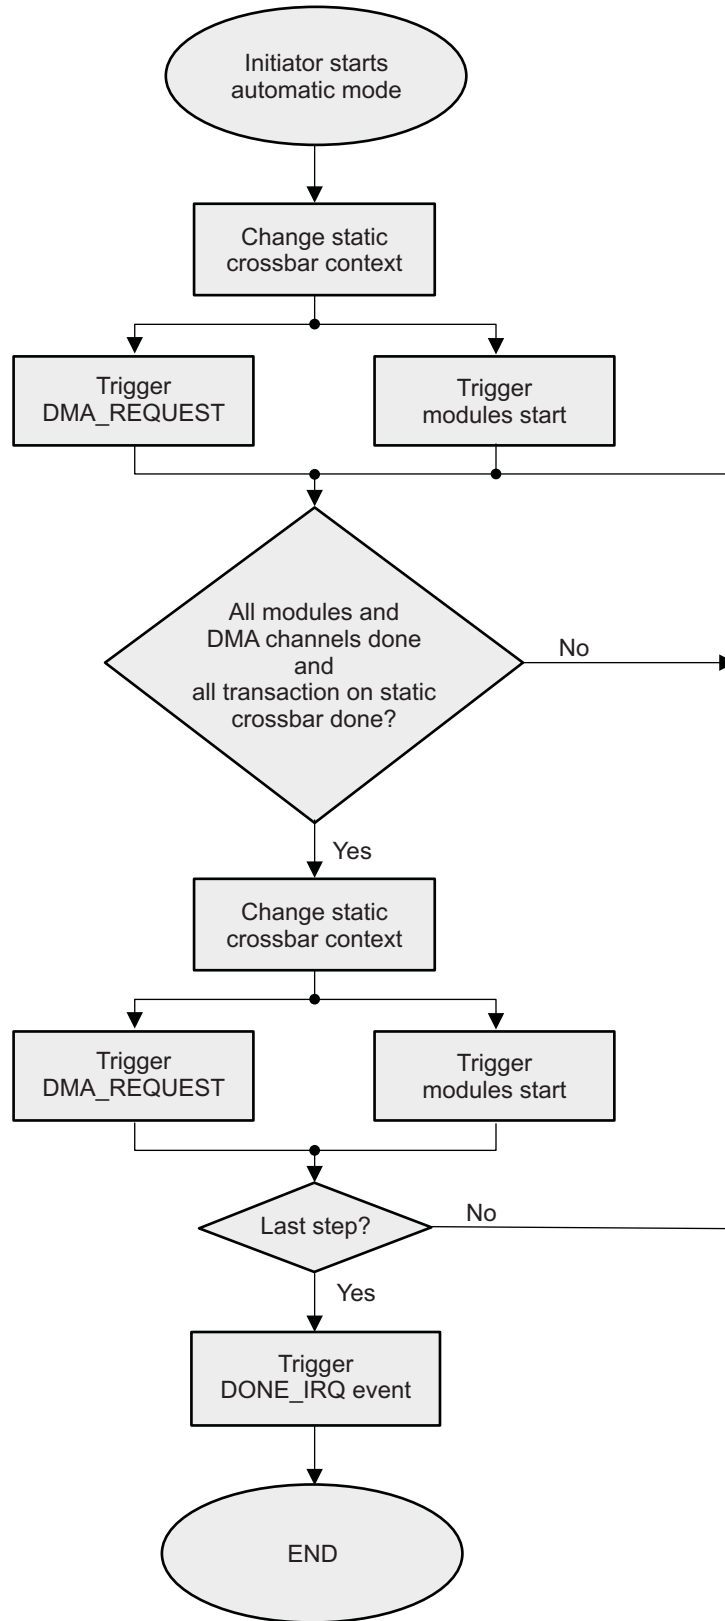

hwseq-008

The hardware sequencer can automatically execute a predefined number of sequencing steps without software intervention. This is called automatic operation. Automatic operation can also be used for pipeline filling and flushing with some limited software intervention. During automatic operation, the hardware sequencer controls the generation of START/DONE pulses and the connections in the static controlled crossbar. Software can take control over some resources while the hardware sequencer is running. This is called hardware sequencer override.

7.4.2.3.4.1 Automatic Operation

Figure 7-222 shows the flow diagram executed by the hardware sequencer.

Figure 7-222. Hardware Sequencing Example

hwseq-009

The external initiator configures the different SIMCOP modules and DMA channels. When this is complete, it enables the hardware sequencer. This resets the internal state of the hardware sequencer (pending events and context switch counter).

It starts by running sequence step `SIMCOP_HWSEQ_CTRL[12:11] STEP`:

- Clear all pending completion events that have been selected for Step 0 in the hardware sequencer. Note: This does not affect the `SIMCOP_IRQSTATUS` register.
- Apply step `SIMCOP_HWSEQ_CTRL[12:11] STEP` configuration to the static crossbar
- Start DMA transfers. Multiple channels can be enabled sequentially (that is, YUV4:2:0 data transfers or SIMCOP-SDRAM followed by SDRAM-SIMCOP) by using the SIMCOP DMA linking feature.
- Start hardware accelerators. The list of accelerators to start can be selected by software using the `SIMCOP_HWSEQ_STEP_CTRL_i[7:0] *_SYNC` register

The hardware sequencer then waits for completion of events from the selected SIMCOP modules and SIMCOP DMA channels.

The hardware sequencer also ensures that all SIMCOP memory accesses requested by the accelerators and DMA channels enabled for the synchronization step have completed. This condition prevents data corruption due to early switching.

Steps can be chained to define the sequence to execute. Steps are started until the step counter reaches the limit defined by software. When the last step has completed, a `DONE_IRQ` event is triggered.

The SIMCOP can execute one hardware sequence at the time. However, software can be used to execute multiple independent sequences in parallel (that is, two unrelated macroblock pipelines) using the override feature.

The hardware sequencer has no specific support for macroblock pipeline filling (pipe-up) or flushing (pipe-down). It needs some software intervention.

The hardware sequencer supports sequences composed of up to four steps. Longer sequences require software intervention.

Figure 7-222 illustrates the hardware sequencer operation.

Figure 7-223. Hardware Sequencer Operation Example

hwseq-010

The example involves utilization of two SIMCOP modules (or DMA channels) that are synchronized using the hardware sequencer. A total of five sequencing steps are executed (`SIMCOP_HWSEQ_CTRL[31:6] HW_SEQ_STEP_COUNTER=5`). The sequence is 2 steps long and starts with Step 1. Those two steps are configured using the `SIMCOP_HWSEQ_STEP_*_i` registers (where $i = 0$ and 1).

The SIMCOP modules processing is started using START pulses (green). When the SIMCOP modules are done, they return a DONE pulse (red). Software can choose which accelerators to run for a given step using the `SIMCOP_HWSEQ_STEP_CTRL_i[7:0] *_SYNC` registers. They do not need to finish at the same time because the hardware sequencer waits for reception of all DONE pulses of used accelerators before moving to the next step.

The hardware sequencer also triggers a series of interrupts that can be used by software. It is possible, for example, for software to change the configuration of inactive sequencing steps. This can be particularly useful to run longer sequences than what is supported by hardware.

For example, software can setup a 4-step long looping sequence: Step 0 → 1 → 2 → 3 → 0 → 1 → When the STEP1_IRQ event is triggered, software can load the configuration to be used next time Step 0 becomes active in the `SIMCOP_HWSEQ_STEP_*_i` registers.

7.4.2.3.4.2 Hardware Sequencer Override

By default, the hardware sequencer controls START/DONE pulses of all SIMCOP modules as well as the static controlled crossbar. Software can take the control over some resources by setting the appropriate bits in the `SIMCOP_HWSEQ_OVERRIDE` register. Sequencing resources under software control are managed using the `SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE` and `SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE` registers.

Changes done to the `SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE[27:11] *_OFST` and `SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE` registers have immediate effect. It is the responsibility of software to ensure there is no active traffic on the impacted connection in the static controlled crossbar.

The settings in the `SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE` and `SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE` registers for resources controlled by the hardware sequencer have no effect.

The SIMCOP DMA START/DONE control is slightly different. Software can trigger one or multiple DMA channels by writing into the `SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE[7:5] DMA_TRIGGER` bit field. The `DMA_TRIGGER` bit field returns the written value when all expected DONE pulses have been received from SIMCOP DMA.

Alternatively, SIMCOP modules may be triggered by direct writes into their configuration registers. However, this approach lead to higher initiator load because multiple writes must be done.

7.4.2.3.4.3 Static Crossbar

The static crossbar connect SIMCOP modules to the SIMCOP memories as shown in [Figure 7-224](#).

Figure 7-224. SIMCOP Static Crossbar Overview

Image buffers are used to store the data to be processed and processing results. Those memories can be accessed by the SIMCOP DMA, SIMCOP bus, and SIMCOP modules. [Table 7-3069](#) shows possible connections in the SIMCOP static crossbar. For example, the DMA Freq port could access image buffer a when SIMCOP_HWSEQ_SWITCH_i[2:0] IMBUFF_E = 0x1 (i = 0, 1, 2, or 3 corresponds to the active context).

The SIMCOP supports multiple contexts for the configuration of those memories. Software or the hardware sequencer can activate different contexts.

The BITSTREAM data flow is asynchronous from the macroblock pipeline, therefore, it supports dynamic buffer switching logic.

Table 7-3069. Static Crossbar Control Summary

Memory	Register (SIMCOP_HWSEQ_STEP_SWITCH_i and SIMCOP_HWSEQ_STEP_CTRL2_i)	Value		
		Bus	DMA	VTNF
IMBUFF e	[18:16] IMBUFF_E	0	1	8
IMBUFF f	[22:20] IMBUFF_F	0	1	8
IMBUFF g	[27:24] IMBUFF_G	0	1	8
IMBUFF h	[31:28] IMBUFF_H	0	1	8

7.4.2.3.4.4 Image Buffers

Image buffers are 4 banks × 256 × 32 bits (4K bytes) working memories used by the SIMCOP modules to perform image processing operations. Image buffers are shared between the DMA, VTNF, and SIMCOP bus accesses. All initiators cannot access the image buffers simultaneously.

Switches are controlled by the hardware sequencer or an external initiator through register configuration. Data is always organized in little endian form.

One or multiple image buffers can be attached to a given accelerator port by configuring the appropriate bits in the [SIMCOP_HWSEQ_STEP_SWITCH_i](#) registers.

The image buffer address offsets to different busses shown in [Table 7-3070](#) is controlled using the appropriate [SIMCOP_HWSEQ_STEP_CTRL_i](#) register bit fields.

Table 7-3070. Image Buffer Address Offsets

Port	OFST	0x0000	0x1000	0x2000	0x3000	0x4000	0x5000	0x6000	0x7000

hwseq-003

7.4.2.4 ISS SIMCOP Hardware Sequencer and Buffers Basic Programming Model

7.4.2.4.1 ISS SIMCOP Hardware Sequencer and Buffers Application Programming Principle

Software must first configure the SIMCOP access tag handling (SIMCOP_DMA_CTRL[7:4] TAG_CNT). Software must ensure there is no active traffic on the SIMCOP master port before changing those registers.

Similarly, software can also preload data like filter coefficient image buffers. This can be handled by the SIMCOP DMA:

- The buffers must first be attached to the SIMCOP DMA using the [SIMCOP_HWSEQ_OVERRIDE](#) and [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#) registers.
- Alternatively, software can use the SIMCOP_HWSEQ_STEP_*_0 registers instead of the override feature. The hardware sequencer ensures that the configuration of Step 0 is applied when the hardware sequencer is disabled.
- Software then configures and starts one or multiple data transfers using the SIMCOP DMA.
- Software monitors SIMCOP DMA events to know when DMA transfers are complete. Other configuration tasks may happen concurrently, but software must ensure that transfers have completed before attaching the memories to another module.

It must then enable the modules going to be used.

Typically, the first and last steps of the macroblock pipeline are different from those in the middle of the pipeline. The hardware sequencer has no specific support for pipe-up and pipe-down. However, software can cut the sequence into smaller ones to still benefit from the hardware sequencing and to avoid software sequencing.

Figure 7-226 shows an example of a 10-step sequence involving two DMA transfers and three modules.

Figure 7-226. Typical Hardware Sequencer Controlled Sequencer With Pipe-Up and Pipe-Down

hwseq-012

The macroblock pipeline is composed of a chain of three accelerators. Data between modules is exchanged using ping-pong buffering.

Pipe-up and pipe-down require four sequencing steps each. The main processing can be done with two steps.

Software configures the hardware sequencer with the four step pipe-up sequence. Each step is executed once. When pipe-up is done, the SIMCOP triggers the DONE_IRQ event.

Software then reconfigures the hardware sequencer for the two step main sequence. The number of steps is defined by the amount of data to process. When the main pipe is done, the SIMCOP triggers the DONE_IRQ event.

Software finally reconfigures the hardware sequencer with the four step pipe-down sequence. Each step is executed once. When pipe-down is done, the SIMCOP triggers the DONE_IRQ event.

Figure 7-227 shows an example of pipe-up and pipe-down.

Figure 7-227. Pipe-Up and Pipe-Down

hwseq-013

The hardware sequencer configuration determines which module can access a given SIMCOP memory for a sequence step.

7.4.2.4.2 External CPU Use for Data Processing

An external CPU can be used to perform some data processing as the SIMCOP hardware accelerators do. A similar mechanism to the START/DONE pulse interaction with the SIMCOP hardware accelerators is implemented.

The external CPU receives the request to start processing by the CPU_PROC_START_IRQ interrupt merged at the SIMCOP subsystem level. This interrupt is enabled and acknowledged as usual.

When processing has completed, the CPU generates the DONE pulse to the hardware sequencer by writing 1 into the [SIMCOP_HWSEQ_CTRL\[10\]](#) CPU_PROC_DONE register.

HW_SEQ_STEP_COUNTER																BBM_LDC	RESERVED	STEP	CPU_PROC_DONE	BBM_SYNC_CHAN	BBM_STATUS	BITSTREAM	BITSTR_XFER_SIZE	HW_SEQ_STOP	HW_SEQ_START						

Bits	Field Name	Description	Type	Reset
31:16	HW_SEQ_STEP_COUNTER	Number of steps executed by the HW sequencer. HW_SEQ_STEP_COUNTER=0 corresponds to manual sequencing.	RW	0x0
15	BBM_LDC	This bit field is reserved and users should write the reset value to this bit location. Choses if the automatic BBM interface is connected to VLCDJ or LDC (for SCS data). This register shall only be modified when there's no active traffic between VLCDJ/LDC and the BITSTREAM buffer 0x0: VLCDJ 0x1: LCD	RW	0x0
14:13	RESERVED	This bit field is reserved and users should write the reset value to this bit location.	R	0x0
12:11	STEP	This register is automatically updated by the HW sequencer when it is active. Otherwise, SW could use it to activate the content of a given set of step registers (SIMCOP_HWSEQ_STEP_*) or to chose the 1st step number of a sequence.	RW	0x0
10	CPU_PROC_DONE	Used by the CPU to tell that it has completed data processing. This feature should be used together with the CPU_PROC_START_IRQ event Read's always return 0. 0x0: No effect. 0x1: CPU processing completed.	W	0x0
9:8	BBM_SYNC_CHAN	This bit field is reserved and users should write the reset value to this bit location. Defines the SIMCOP DMA HW synchronization channel to be used for BBM. This register is only used when BITSTREAM=ENCODE or DECODE. SW must ensure that the same DMA HW synchronization channel isn't used by the HW sequencer.	RW	0x0
7	BBM_STATUS	This bit field is reserved and users should write the reset value to this bit location. Status of the Bitstream Buffer Management HW. Used only during automatic mode [BITSTREAM=5 or 6] Equals 0 (IDLE) in manual mode [BITSTREAM=0..4]. Set when automatic mode is entered. Automatic encode mode: used to detect when all banks have been flushed after the processing has completed (i.e. but request bank signals have been de-asserted by BBM). Automatic decode mode (BITSTREAM=DECODE): returns to 0 (IDLE) when automatic mode is left (BITSTREAM=COPR). 0x0: BBM is idle 0x1: BBM is busy.	R	0x0

Bits	Field Name	Description	Type	Reset
6:4	BITSTREAM	<p>This bit field is reserved and users should write the reset value to this bit location. BITSTREAM buffer access control</p> <p>0x6: The BITSTREAM buffer is managed by HW as a PING/PONG buffer to support JPEG decode use case. It could be accessed by the SIMCOP DMA or the the VLCDJ module. The BITSTREAM HW sequence is reset when the mode is changed to COPR, VLCDJ or DMA.</p> <p>0x1: Bank 0: DMA (0x1000-0x17FF) Bank 1: DMA (0x1800-0x1FFF)</p> <p>0x0: Bank 0: coprocessor bus (0x1000-0x17FF) Bank 1: coprocessor bus (0x1800-0x1FFF)</p> <p>0x2: Bank 0: VLCDJ.B / LDC (0x000-0x7FF) Bank 1: VLCDJ.B / LDC (0x800-0xFFFF)</p> <p>0x4: Bank 0: VLCDJ.B / LDC (0x000-0x7FF) Bank 1: DMA (0x1800-0x1FFF)</p> <p>0x5: The BITSTREAM buffer is managed by HW as a PING/PONG buffer to support JPEG encode / SCS use case. It could be accessed by the SIMCOP DMA or the the VLCDJ / LDC module. The BITSTREAM HW sequence is reset when the mode is changed to COPR, VLCDJ or DMA. This mode shall not be used when BBM / LDC =1</p> <p>0x3: Bank 0: DMA (0x1000-0x17FF) Bank 1: VLCDJ.B / LDC (0x800-0xFFFF)</p>	RW	0x0
3:2	BITSTR_XFER_SIZE	<p>This bit field is reserved and users should write the reset value to this bit location. Defines the amount of data to be transferred per HW request to the SIMCOP DMA. Bigger sizes lead to better SDRAM efficiency but prevents fine grained DMA transfer arbitration. This register is only used by HW when BITSTREAM=ENCODE or BITSTREAM=DECODE.</p> <p>0x0: 2048 bytes</p> <p>0x1: 1024 bytes</p> <p>0x3: 256 bytes</p> <p>0x2: 512 bytes</p>	RW	0x0
1	HW_SEQ_STOP	<p>Stop the HW sequencer. This feature is typically used to recover from an error condition. Read's always return 0.</p> <p>0x0: No effect.</p> <p>0x1: Stop the HW sequence immediately (dont wait for expected DONE events). Setting this bit while the sequencer is idle has no effect.</p>	W	0x0
0	HW_SEQ_START	<p>Start the HW sequencer. Read's always return 0.</p> <p>0x0: No effect.</p> <p>0x1: Starts step number SIMCOP_HWSEQ_CTRL.STEP of the HW sequence. Setting this bit while the sequencer is running has no effect.</p>	W	0x0

Table 7-3077. SIMCOP_HWSEQ_OVERRIDE

Address Offset	0x0000 0070	Instance	HWSEQ
Physical Address	0x5202 0070		
Description	HW sequencer override control register. Bits in this register select what configuration register control a resource. 0: Resource controlled by HW sequencer. HW uses the value from SIMCOP_HWSEQ_STEP_xx registers for the chosen resource 1: Resource controlled by SW HW uses the value from SIMCOP_HWSEQ_STEP_xx_OVERRIDE registers for the chosen resource The bit field name matches the one of the resource. For example, IMX_A_D_OFST_OVR selects if SIMCOP_HWSEQ_STEP_CTRL_x.IMX_A_D_OFST or SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE.IMX_A_D_OFST controls how image buffers are arranged in the IMX #A address map.

7.4.3 ISS SIMCOP DMA Module

This section describes the direct memory access (DMA) module in the still image coprocessor (SIMCOP) subsystem.

7.4.3.1 ISS SIMCOP DMA Overview

The direct memory access (DMA) module transfers data from system memory to the still image coprocessor (SIMCOP) memories and from SIMCOP memories. [Figure 7-228](#) is an overview of the DMA module in the SIMCOP subsystem.

Figure 7-228. IS DMA in the SIMCOP Subsystem

The SIMCOP DMA supports the following features:

- Configuration interface, for register access
- Image subsystem (ISS) data interconnect master interface, for system memory access
 - Supports 1-dimensional (1D) and 2-dimensional (2D) burst
- SIMCOP crossbar master interface, for SIMCOP memories access
- Eight logical channels supported
- Hardware synchronization support
- 2-dimensional (2D) addressing transfers

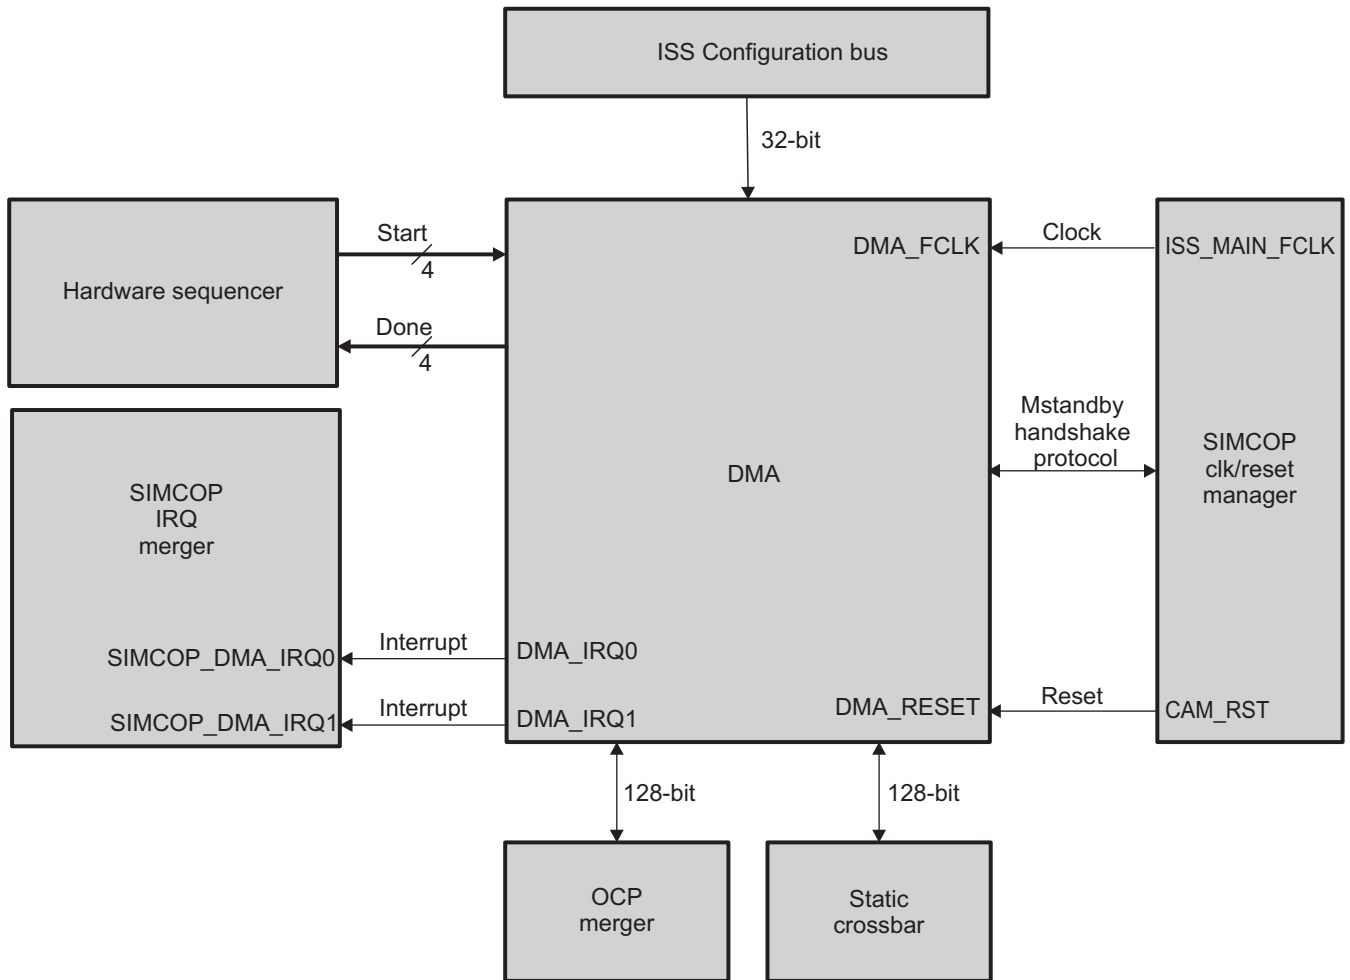

- 2D data block transfer (base address, stride, height, width)
- Array of 2D block transfer support
- Performance: Software-controllable bandwidth limiter

The SIMCOP DMA is not a general-purpose DMA. It can perform only 16-byte aligned transfers and does not have access to the ISS configuration interconnect. SDMA must be used instead.

7.4.3.2 ISS SIMCOP DMA Integration

The DMA module is part of the SIMCOP subsystem in the ISS. Figure 7-229 shows the integration of the DMA in the SIMCOP subsystem.

Figure 7-229. DMA Engine Integration

7.4.3.3 ISS SIMCOP DMA Functional Description

7.4.3.3.1 ISS SIMCOP DMA Block Diagram

Figure 7-230 is a block diagram of the SIMCOP DMA.

Figure 7-230. ISS SIMCOP DMA Block Diagram

An external initiator sets up logical channels using the configuration interface.

When a logical channel becomes active, a transfer must be executed. A transfer corresponds to a 2D block of data copied from system memory to SIMCOP memory and vice versa.

A transfer is decomposed into one or multiple transactions by the transaction generation unit.

The scheduler issues transactions when tags are available. There can be one outstanding command per tag on the ISS data interconnect.

7.4.3.3.2 ISS SIMCOP DMA Power Management

Table 7-3097 lists the power-management features available in the DMA module.

Table 7-3097. Local Power-Management Features

Feature	Registers	Description
Master standby modes	SIMCOP_DMA_SYSCONFIG [5:4] STANDBYMODE	Force-standby, no-standby, and smart-standby modes are available.

7.4.3.3.3 ISS SIMCOP DMA Interrupt Requests

The SIMCOP DMA module can generate two interrupts, SIMCOP_DMA_IRQ0 and SIMCOP_DMA_IRQ1. These two interrupts are controlled by four registers:

- [SIMCOP_DMA_IRQSTATUS_RAW_j](#): The status of the interrupt before masking
- [SIMCOP_DMA_IRQSTATUS_j](#): The status of the interrupt after masking
- [SIMCOP_DMA_IRQENABLE_SET_j](#): Enable an interrupt to propagate to SIMCOP_DMA_IRQi signal (unmask)
- [SIMCOP_DMA_IRQENABLE_CLR_j](#): Disable an interrupt to propagate to SIMCOP_DMA_IRQi signal (mask)

To clear an interrupt, software must write 1 in the corresponding bit of the [SIMCOP_DMA_IRQSTATUS_j](#) register even if the event is not enabled ([SIMCOP_DMA_IRQSTATUS_RAW_j](#) is also cleared).

[Table 7-3098](#) list all the SIMCOP DMA events that can lead to an interrupt generation.

Table 7-3098. ISS SIMCOP DMA Events List

Bit Name	Bit	Event
BUS_ERR	0	Error occurred on bus
CHAN0_BLOCK_DONE_IRQ	16	Channel 0 has completed transfer of one 2D block.
CHAN1_BLOCK_DONE_IRQ	17	Channel 1 has completed transfer of one 2D block.
CHAN2_BLOCK_DONE_IRQ	18	Channel 2 has completed transfer of one 2D block.
CHAN3_BLOCK_DONE_IRQ	19	Channel 3 has completed transfer of one 2D block.
CHAN4_BLOCK_DONE_IRQ	20	Channel 4 has completed transfer of one 2D block.
CHAN5_BLOCK_DONE_IRQ	21	Channel 5 has completed transfer of one 2D block.
CHAN6_BLOCK_DONE_IRQ	22	Channel 6 has completed transfer of one 2D block.
CHAN7_BLOCK_DONE_IRQ	23	Channel 7 has completed transfer of one 2D block.
CHAN0_FRAME_DONE_IRQ	24	Channel 0 has completed transfer of the full frame.
CHAN1_FRAME_DONE_IRQ	25	Channel 1 has completed transfer of the full frame.
CHAN2_FRAME_DONE_IRQ	26	Channel 2 has completed transfer of the full frame.
CHAN3_FRAME_DONE_IRQ	27	Channel 3 has completed transfer of the full frame.
CHAN4_FRAME_DONE_IRQ	28	Channel 4 has completed transfer of the full frame.
CHAN5_FRAME_DONE_IRQ	29	Channel 5 has completed transfer of the full frame.
CHAN6_FRAME_DONE_IRQ	30	Channel 6 has completed transfer of the full frame.
CHAN7_FRAME_DONE_IRQ	31	Channel 7 has completed transfer of the full frame.

7.4.3.3.4 ISS SIMCOP DMA Logical Channels

In the context of the SIMCOP, multiple logical channels are required to offload the external initiator. Typical uses of multiple contexts are:

- Run a read transfer followed by a write transfer. When this transfer is complete, new input data is fetched from system memory and stored in the image buffers.
- Read or write YUV4:2:0 data from system memory; YUV4:2:0 data is stored in two different system memory buffers.

7.4.3.3.4.1 Logical Channel States

The SIMCOP DMA supports up to eight (([SIMCOP_DMA_HWINFO](#)[2] CHAN+1) × 4) logical channels. Each logical channel can be configured and triggered separately.

Idle logical channels must be configured and enabled ([SIMCOP_DMA_CHAN_CTRL_i](#)[0] ENABLE = 1) to be used.

[Figure 7-231](#) shows the different states of a logical channel. Software can poll the current state from the [SIMCOP_DMA_CHAN_CTRL_i](#)[4:3] STATUS bit field.

Figure 7-231. DMA Logical Channel States

scpdma-003

When a trigger event is received by a channel in the ACTIVE state, it moves to the PENDING state. Trigger events received when the channel is in the IDLE, PENDING, or RUNNING state are discarded.

A logical channel is automatically disabled by hardware when a complete frame (all 2D blocks) is transferred. It can be disabled earlier by software by writing the `SIMCOP_DMA_CHAN_CTRL_i[1]` DISABLE bit. When a disable request occurs in the RUNNING state, it is memorized and executed when the channel leaves the RUNNING state. Pending disable requests have higher priority than channel trigger events.

When multiple logical channels are pending simultaneously, the following rules apply:

- An ongoing transfer of a 2D block is never stopped. It must complete before the next one starts.
- The logical channel with the lowest ID wins the arbitration (that is, CHAN0 has higher priority than CHAN1). Software can give higher priority to a channel by choosing a lower ID.

This situation can, for example, occur when software triggers a channel while a transfer is ongoing for another one. Two types of interrupts can be generated:

- `CHANx_BLOCK_DONE_IRQ` (where x = channel number): It is generated when the channel leaves the RUNNING state (RUNNING -> ACTIVE or RUNNING -> IDLE).
- `CHANx_FRAME_DONE_IRQ` (where x = channel number): It is generated when the channel enters the IDLE state.

7.4.3.3.4.2 Logical Channel Chaining, Trigger, and Hardware Synchronization

Active logical channels can be triggered:

- By software. Writes the `SIMCOP_DMA_CHAN_CTRL_i[2]` SWTRIGGER bit
- By a hardware DMA request. A channel can be made sensitive to a pulse on the `START[y]` input when `SIMCOP_DMA_CHAN_CTRL_i[19:17]` HWSTART = y has been configured by software.
- When the previous channel in the linked list finishes. This feature is enabled through the `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED bit field of the preceding channel in the chain.

When a channel completes, it can optionally send a pulse to the `DONE[y]` output. Software enables this feature by configuring `SIMCOP_DMA_CHAN_CTRL_i[22:20]` HWDONE = y.

Typically, the START + DONE synchronization mechanism is used together with the SIMCOP hardware sequencer. The hardware sequencer sends a pulse to START[y] a data transfer and the SIMCOP DMA responds with a DONE[y] pulse when the transfer completes. A transfer can be composed of one or multiple logical channels. For example, a YUV4:2:0-NV12 block copy from system memory to SIMCOP local memories requires two chained logical channels.

CAUTION

Software must ensure that only one trigger event source is selected at a given time for a logical channel; otherwise, unpredictable behavior may occur.

Typically, the following combinations can be used:

- Single channel triggered by software: Hardware synchronization and linking are disabled. Software writes the [SIMCOP_DMA_CHAN_CTRL_i\[2\]](#) SWTRIGGER bit to start the transfer of one 2D block. Software must not trigger the channel again before the CHANx_BLOCK_DONE_IRQ (where x = channel number) event is generated by the DMA.
- Channels chain-triggered by software: Multiple channels are linked together using the [SIMCOP_DMA_CHAN_CTRL_i\[16:12\]](#) LINKED bit field. Software triggers the first one in the chain and monitors the CHANx_BLOCK_DONE_IRQ (where x = channel number) event to know when the chain can be triggered again.
- Single channel triggered by hardware synchronization: Sensitivity on START pulses is activated through the [SIMCOP_DMA_CHAN_CTRL_i\[19:17\]](#) HWSTART bit field. DONE pulse generation is activated using the [SIMCOP_DMA_CHAN_CTRL_i\[22:20\]](#) HWSTOP bit field.
- Channels chain-triggered by hardware: Multiple channels are linked together using the [SIMCOP_DMA_CHAN_CTRL_i\[16:12\]](#) LINKED bit field. Sensitivity on START pulses is activated for the first channel in the chain through the [SIMCOP_DMA_CHAN_CTRL_i\[19:17\]](#) HWSTART bit field. DONE pulse generation for the last channel in the chain is activated using the [SIMCOP_DMA_CHAN_CTRL_i\[22:20\]](#) HWDONE bit field.

7.4.3.3.4.3 Logical Channel Data Transfer

Each logical channel can handle 4D transfers from system memory to SIMCOP memory and vice versa.

A frame is composed of [SIMCOP_DMA_CHAN_FRAME_i\[9:0\]](#) XCNT * [SIMCOP_DMA_CHAN_FRAME_i\[25:16\]](#) YCNT 2D blocks of data. A single 2D block of data is transferred each time a logical channel is in the RUNNING state.

The size of a 2D block is [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[13:4\]](#) XNUM * [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[28:16\]](#) YNUM words of 128 bits. The SIMCOP DMA can transfer only full 128-bit words.

2D blocks may overlap in system memory. This feature is typically used for source data fetches from system memory to handle filter dependencies. If this feature is not used, software must set:

- [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[13:4\]](#) XNUM = [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[14:4\]](#) XSTEP
- [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[28:16\]](#) YNUM = [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[29:16\]](#) YSTEP

Figure 7-232 shows DMA addressing.

Figure 7-232. DMA Addressing

scpdma-014

The base position of 2D blocks in system memory is automatically computed by the SIMCOP DMA. The base address is computed using the following formula:

$$\text{SMEM_BASE} = \text{SIMCOP_DMA_CHAN_SMEM_ADDR_i}[31:4] \text{ ADDR} + \text{Bx} \times \text{SIMCOP_DMA_CHAN_BLOCK_STEP_i}[14:4] \text{ XSTEP} + \text{By} \times \text{SIMCOP_DMA_CHAN_BLOCK_STEP_i}[29:16] \text{ YSTEP} \times \text{SIMCOP_DMA_CHAN_SMEM_OFST_i}[19:4] \text{ OFST}$$

All 2D blocks of a logical channel have the same location in SIMCOP local memories:

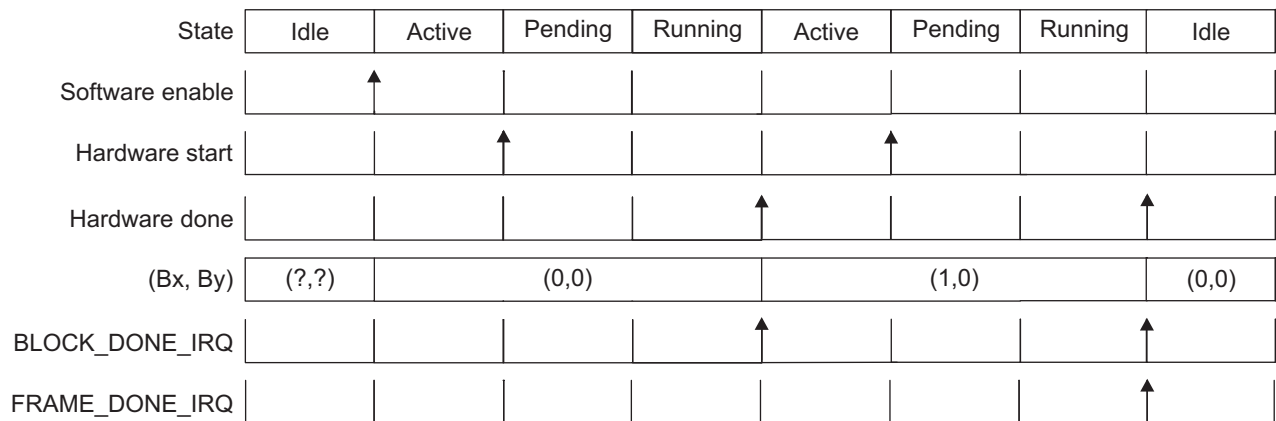

$$\text{BUF_BASE} = \text{SIMCOP_DMA_CHAN_BUF_ADDR_i}[23:4] \text{ ADDR}$$

The same functionality can also be used to read or write sparse data from SDRAM.

Software can poll the status of a channel using the `SIMCOP_DMA_CHAN_CURRENT_BLOCK_i` register. It holds the Bx, By values of the last-transferred 2D block. The Bx, By values are reset when a channel is enabled (set the `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE bit) and they are updated when a channel enters the RUNNING state.

Figure 7-233 shows an example of a 2-block large transfer.

Figure 7-233. 2-Block Large Transfer Example

scpdma-005

7.4.3.3.5 Transaction Generation

Each transfer is decomposed into one or multiple transactions by the DMA engine. The firmware can define:

- Burst generation for regular or tiled accesses ([SIMCOP_DMA_CHAN_CTRL_j\[6\] TILERMODE](#)). Additional parameters must be defined for tiled accesses. See , *Block Bursts for Tiled Transfers*.
- The maximum burst size ([SIMCOP_DMA_CTRL\[1:0\] MAX_BURST_SIZE](#)). It must be aligned with the interconnect configuration.
- Use of posted or nonposted writes ([SIMCOP_DMA_CTRL\[3\] POSTED_WRITES](#)). It must be aligned with the interconnect configuration. Mainly, in a multichannel system memory, system bursts must be issued nonposted.

7.4.3.3.5.1 Incrementing Bursts for Regular Transfers

Lines of 2D blocks are processed sequentially. The following transaction process is used for a given line:

1. Perform a single nonaligned burst from the start address to the next [SIMCOP_DMA_CTRL\[1:0\] MAX_BURST_SIZE](#) boundary (or less if the transfer is smaller).
2. Perform "n" aligned bursts (n can be 0).
3. Perform a single nonaligned burst up to the end address (if needed).

A transaction is aligned when the start address modulo burst length is 0.

7.4.3.4 ISS SIMCOP DMA Basic Programming Model

7.4.3.4.1 Initialization of Surrounding Modules

To initialize the DMA, the surrounding modules must be initialized. [Table 7-3099](#) lists these modules.

Table 7-3099. Initialization of Surrounding Modules

Module	Minimum Required Setting	Optional Settings
CLKC	Enable SIMCOP clock	
Buffers	Configure DMA access to image buffer	
SIMCOP CTRL		Configure SIMCOP CTRL to handle DMA interrupts

7.4.3.4.2 ISS SIMCOP DMA Channel Configuration and Hardware Synchronization

Software must fully configure a DMA channel before enabling it. It then configures channel linking and the used synchronization method.

The following example shows four logical channels chained with hardware synchronization used to copy YUV4:2:0-NV12 data from SIMCOP local memories to system memory, and then to copy YUV4:2:0-NV12 data from system memory to SIMCOP local memories.

YUV4:2:0-NV12 data is stored in two separate buffers in SDRAM. Therefore, two channels are used for the SIMCOP -> system copy, and two channels are used for the system -> SIMCOP copy.

In this example, the intent is to transfer a 2 x 2 array of 64 x 32 pixel blocks. It is assumed that input data is stored contiguously in system memory and that the output buffer size in system memory is 256 x 32 pixels. In SIMCOP local memories, data is contiguously stored starting at address 0

The following configuration is used:

- Channel $i = 0$, input Y buffer:
 - `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of Y input buffer
 - `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
 - `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 0
 - `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 32
 - `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
 - `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
 - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 32
- Channel $i = 1$, input UV buffer:
 - `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of UV input buffer
 - `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
 - `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 128 (2 KiB)
 - `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 16
 - `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
 - `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
 - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 16
- Channel $i = 2$, output Y buffer:

- `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of Y output buffer
- `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
- `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 0
- `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
- `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
- `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 32
- `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
- `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
- `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
- `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 32
- Channel $i = 3$, output UV buffer
 - `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of UV output buffer
 - `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
 - `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 128 (= 2 KiB)
 - `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 16
 - `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
 - `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
 - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
 - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 16

Figure 7-234 shows the channel linking chain used. All four channels are executed sequentially. Doing so prevents access collision in SIMCOP local memories or system memories. Channel 0 is started by a `START[0]` pulse from SIMCOP. When Channel 3 completes the last transfer, a pulse to `DONE[0]` is sent back to SIMCOP.

Figure 7-235 shows the temporal channel sequence.

Figure 7-234. YUV4:2:0-NV12 Read/Write Chain

scpdma-006

Figure 7-235. Temporal Channel Sequence

The following configuration is used for each channel:

- Channel $i = 0$, input Y buffer, first in sequence:
 - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x11 (= CHAN 1)
 - `SIMCOP_DMA_CHAN_CTRL_i[19:17]` HWSTART = 0x4 (= CHAN 0)
 - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 1 (= SIMCOP buffers -> system memory)
 - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1
- Channel $i = 1$, input UV buffer, second in sequence:
 - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x12 (= CHAN 2)
 - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 1 (= SIMCOP buffers -> system memory)
 - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1
- Channel $i = 2$, output Y buffer, third in sequence:
 - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x13 (= CHAN 3)
 - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 0 (= system memory -> SIMCOP buffers)
 - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1
- Channel $i = 3$, output UV buffer, last in sequence:
 - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = CHAN 1
 - `SIMCOP_DMA_CHAN_CTRL_i[22:20]` HWSTOP = 0x4 (= CHAN 0)
 - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 0 (= system memory -> SIMCOP buffers)
 - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1

Software can read the status of a logical channel at any time. However, logical channel configuration registers can be changed only when the channel is in the IDLE state.

Software can disable a logical channel by writing the `SIMCOP_DMA_CHAN_CTRL_i[1]` DISABLE bit. A channel is effectively disabled when `SIMCOP_DMA_CHAN_CTRL_i[4:3]` STATUS = IDLE. In case of linked channels, software must disable all channels in the chain and wait until all of them are back in the IDLE state before channels can be reprogrammed.

7.4.3.4.3 Software Synchronization

Software performs the following sequence:

1. Configures the channel
2. Enables the channel
3. Triggers the channel by writing the [SIMCOP_DMA_CHAN_CTRL_i\[2\]](#) SWTRIGGER bit
4. Waits for BLOCK_DONE_IRQ

Step 2 and Step 4 are repeated until all 2D blocks have been transferred.

7.4.4 ISS SIMCOP VTNF Module

This section describes the Temporal Video Noise Filter (VTNF) module in the still image coprocessor (SIMCOP) subsystem.

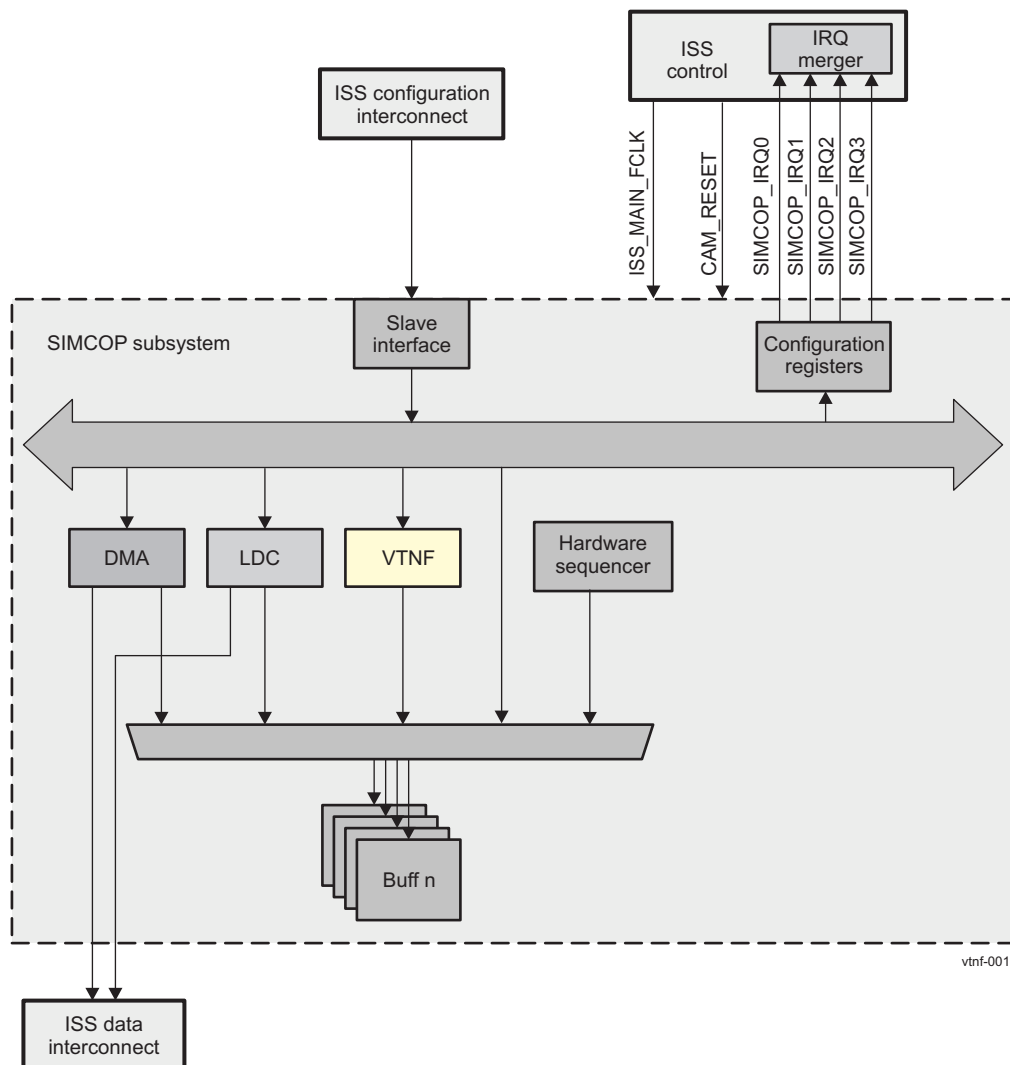

7.4.4.1 ISS SIMCOP VTNF Overview

The VTNF module implements temporal filtering to improve visual quality and video compression efficiency of typical video source sequences.

The module works in YUV420 NV12, NV21 and YV12 formats, accepts a current frame input, previous frame input, and generates a filtered current frame output.

The module is one of the coprocessors inside SIMCOP subsystem, relying on SIMCOP DMA to read/write blocks of current frame input/output and previous frame output, and using shared memory to exchange data with DMA and other coprocessors. Figure 7-236 is an overview of the VTNF module in the SIMCOP subsystem.

Figure 7-236. ISS SIMCOP VTNF in the SIMCOP Subsystem

The VTNF supports the following features:

- YUV420 data format, following NV12, NV21 and YV12 formats
- Programmable multiple-of-16 block width for NV12/NV21, and multiple-of-32 block width for YV12
- Programmable multiple-of-4 block height

- Block data aligned to 128-bit local memory words
- Programmable IIR filtering coefficients (blending factor in lookup tables)
- Flexibility in input/output memory allocation (1/2/4 image buffers)
- Performance up to 700 Mpix/sec

The VTNF does not support:

- YUV422 or Bayer data format
- Luma-only or chroma-only operation
- Misaligned data blocks for previous frame
- Misaligned data blocks for current frame input
- Misaligned data blocks for current frame output

7.4.4.2 ISS SIMCOP VTNF Environment

VTNF is typically used in video record use cases, after ISP (image signal processing) and right before video codec. As the system reduces memory/external SDRAM traffic, it executes a few processing steps that are compatible in dependency, block dimension, etc, in one memory pass. The [Figure 7-237](#) diagram shows VTNF chaining through image buffers (IM).

vtnf-002

VTNF has one slave interface for programming the config registers. It has 32-bit data bus, and operates at half the frequency of functional clock. VTNF has an 128-bit memory bus for connecting to the image buffers. It issues one 128-bit memory request per cycle, and the memory bus interface can connect to multiple image buffers via decoding logic at the SIMCOP level.

VTNF connects up to 4 image buffers (4KB) each at a time, with 128-bit wide data bus. Address range = $4 \times 4\text{KB} / 128\text{-bit} = 4 \times 4\text{KB} / 16\text{B} = 1\text{K}$, therefore address width = 10 bits.

7.4.4.2.1 ISS SIMCOP VTNF Protocols and Data Formats

VTNF input YUV420 data complies to the NV12 or NV21 format

VTNF output YUV420 data can be either NV12 or NV21 or YV12. For YV12 format output, input should be NV12

U and V processing is symmetrical, so current frame input, previous frame input, and current frame output should be either all NV12, or all NV21, and not mix between the two.

All combinations of YUV420 formats and whether each is supported is shown in the [Table 7-3138](#)

Table 7-3138. ISS SIMCOP VTNF color format support matrix

		Previous frame output = current frame output		
		NV12	NV21	YV12
Current frame input	NV12	x		x
	NV21		x	
	YV12			

YUV420 NV12 data format has the luma (Y) of one entire frame stored together, and the chroma components (U and V) interleaved pixel-by-pixel, and stored separately. NV21 is the same, except with U and V exchanged in the interleaving order.

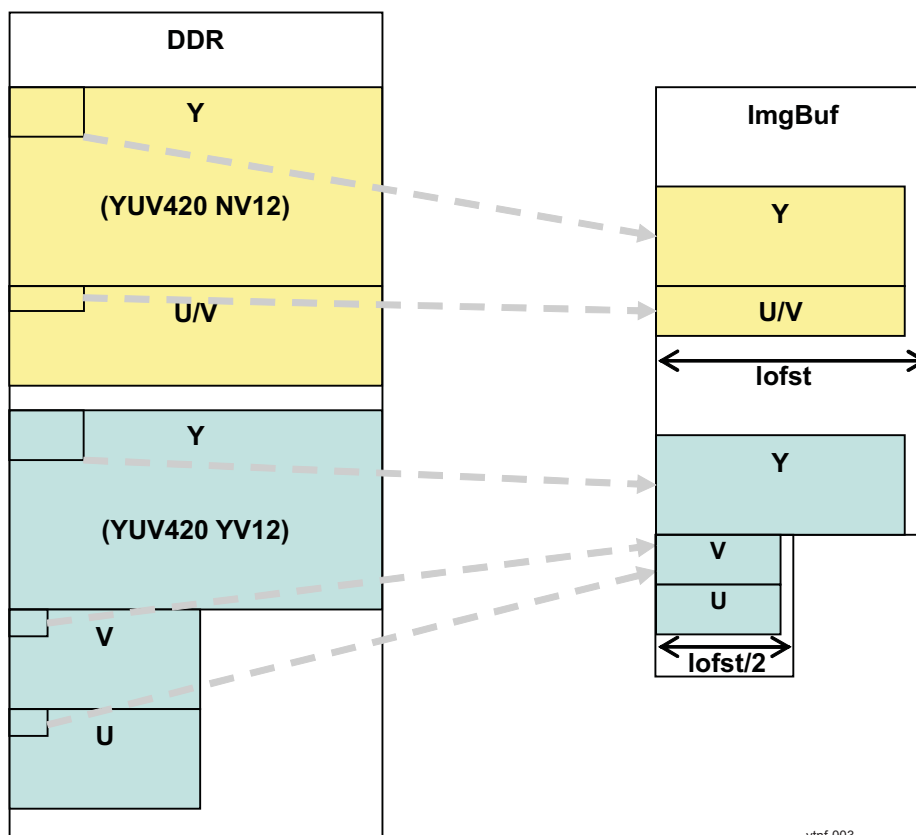

YUV420 YV12 data format has the luma (Y) of one entire frame stored together, followed by the V component for entire frame (half width and half height Y), then followed by the U component for entire frame (same size as V).

As VTNF processes one block at a time, each pointer (current frame input/output, previous frame output) points to Y for one block, followed by the U/V data, interleaved for NV12/NV21, separate arrays for YV12.

The line offset parameter `VTNF_LOFST[15:4]` LOFST is used for line offset for luma array and for NV12/NV21 interleaved UV array, and can be any multiple of 16 greater than or equal to block width.

For the YV12 separate U and V arrays, as the data width is half of luma array, line offset of LOFST/2 is used. In this case, LOFST must be a multiple of 32, to avoid straddling 128-bit memory words. Block width is also a multiple of 32.

Figure 7-238. VTNF YUV420 NV12/NV21 and YV12 data formats

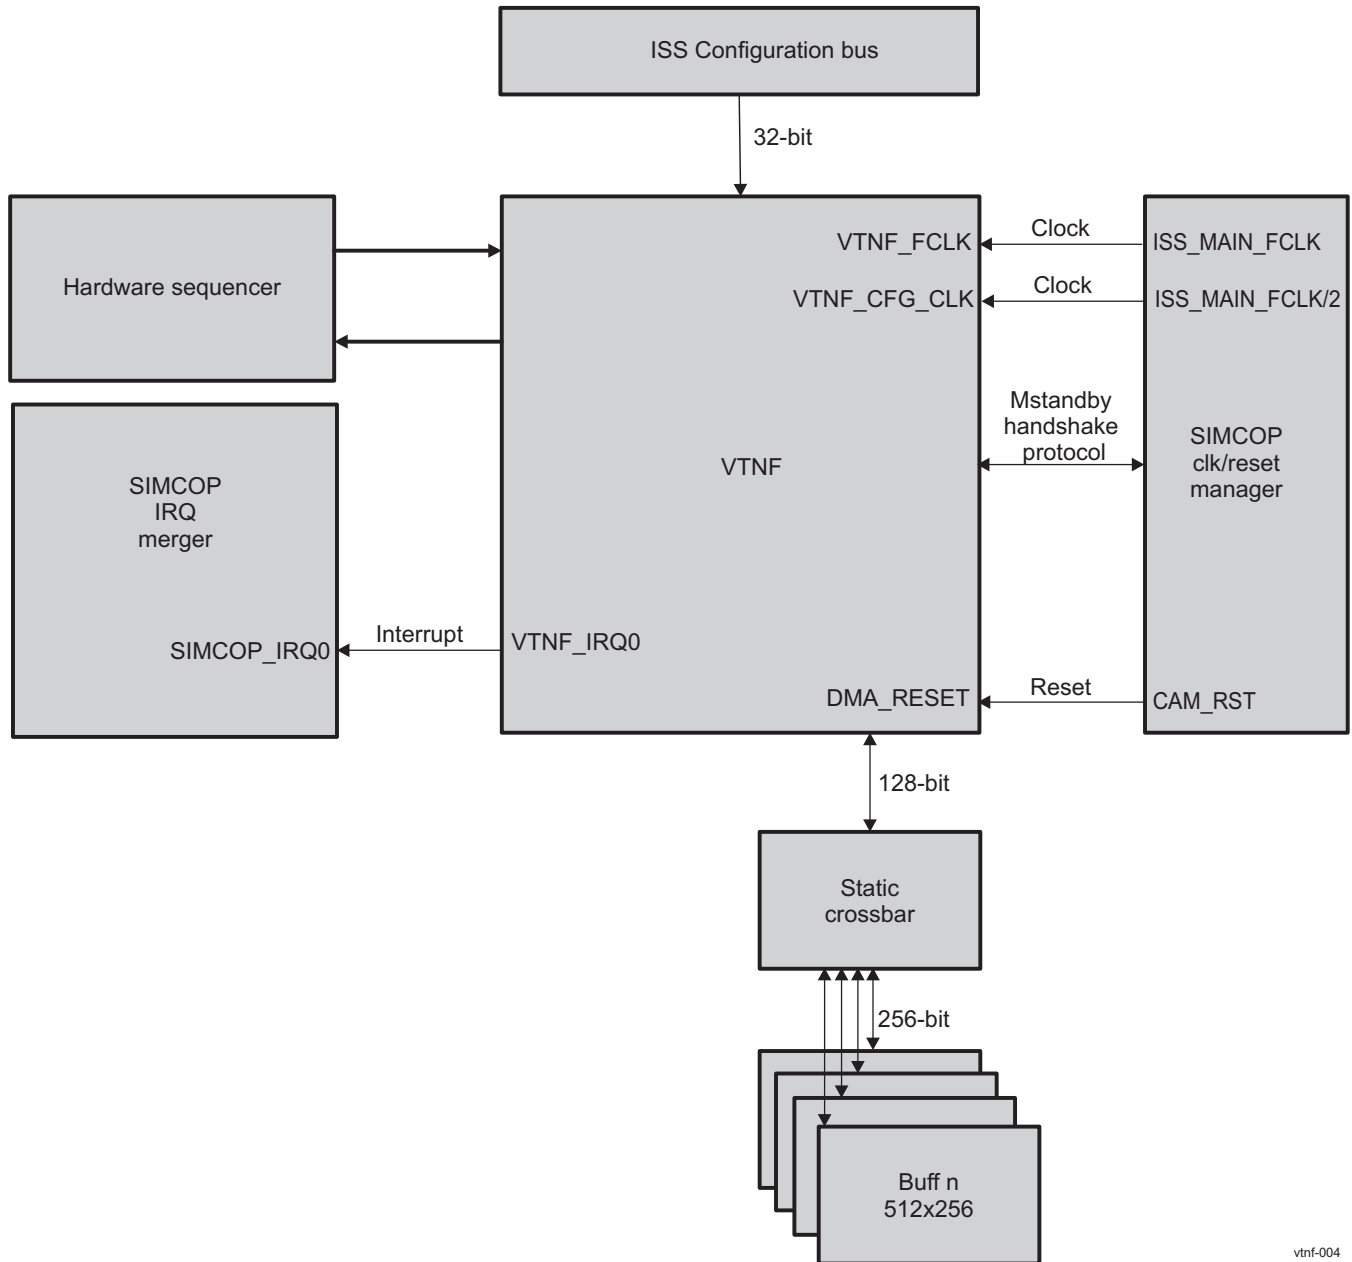

vtnf-003

7.4.4.3 ISS SIMCOP VTNF Integration

The VTNF module is part of the SIMCOP subsystem in the ISS. Figure 7-239 shows the integration of the VTNF in the SIMCOP subsystem.

Figure 7-239. VTNF Engine Integration

vtnf-004

Table 7-3139. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
VTNF	PD_ISS	L4_MAIN

Table 7-3140. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VTNF	VTNF_FCLK	ISS_MAIN_FCLK	ISS	Functional clock provided by CORE_ISS_MAIN_CLK from PRCM . It is used by all ISS sub-modules and ISS top level resources.
	VTNF_CFG_CLK	ISS_MAIN_FCLK	SIMCOP TOP	Synchronos configuration clock running at half the speed of the functional clock.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VTNF	VTNF_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset

For information about clock and reset management, see [Section 7.4.1.2.1, ISS SIMCOP Local Power and Clock Management](#).

Table 7-3141. Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
VTNF	VTNF_IRQ0	SIMCOP_IRQ0	SIMCOP IRQ merger	Interrupt triggered by SIMCOP VTNF. It indicates that one block of VTNF task has been completed. It is synchronous to the config clock and active for one config clock cycle.

For more information about interrupt requests, see [Section 7.4.1.2.3, ISS SIMCOP Interrupt Merger](#).

NOTE: VTNF does not generate any DMA request, though VTNF_IRQ0 done signal to the SIMCOP HW sequencer is often used to trigger DMA.

7.4.4.4 ISS SIMCOP VTNF Functional Description

7.4.4.4.1 ISS SIMCOP VTNF Block Diagram

Figure 7-240 is a block diagram of the SIMCOP VTNF.

Figure 7-240. ISS SIMCOP VTNF Block Diagram

vtnf-005

VTNF module consists of:

- Config registers, for module enable (start a block), module status, block dimension, and other parameters.
- Control: controls block level interaction (start/done) and generate memory read/write and address.
- RDFIFO: read data FIFO, holds read data from the SIMCOP shared memory interface, and delivers it to datapath.
- Datapath: algorithm implementation logic, pulls data from RDFIFO. compute output, and pushes output to WDFIFO.
- WDFIFO: write data FIFO, holds outcome data from datapath, and delivers to the SIMCOP shared memory interface

NOTE: There is just one memory transaction per cycle, to allow for minimal resources in SIMCOP, but it is feasible to connects to multiple image buffers to allow bigger block size.

7.4.4.4.2 ISS SIMCOP VTNF Clocks Management

Table 7-3142 lists the clocks-management features available in the VTNF module.

Table 7-3142. VTNF Clocks-Management Features

Feature	Registers	Description
Autogating clocks	VTNF_CTRL [10] STANDBYMODE	Internal clock gating on interface and functional clock 0 = clocks are free-running 1 = clocks are gated off in subblocks that are not needed for operation

7.4.4.4.3 ISS SIMCOP VTNF Interrupt Requests

The SIMCOP VTNF module can generate one interrupt, VTNF_IRQ0. It is a task completion interrupt when it completes a task. It is synchronous to the config clock and active for one config clock cycle. This interrupt is controlled by the [VTNF_CTRL\[8\] INTEN](#)

7.4.4.4.4 ISS SIMCOP VTNF Configuration

7.4.4.4.4.1 ISS SIMCOP VTNF Initialization

The following parameters should be programmed before starting VTNF task:

- Trigger source [VTNF_CTRL\[9\] TRIG_SRC](#): either from config register write or HW sequencer sending pulse on VTNF_start signal
- Data format [VTNF_CFG\[0\] FMT](#): 0 for YUV420-NV12/NV21, 1 for YUV420-YV12
- Block width [VTNF_SZ\[15:0\] BLKW](#): must be multiple of 16 for NV12/NV21, and multiple of 32 for YV12, up to 512
- Block height [VTNF_SZ\[31:16\] BLKH](#): must be a multiple of 4 and up to 128
- Current input frame byte address in image buffer [VTNF_CADR\[15:4\] ADDR](#): 128-bit aligned or multiple of 16
- Previous output frame byte address in image buffer [VTNF_PADR\[15:4\] ADDR](#): 128-bit aligned or multiple of 16
- Output frame byte address in image buffer [VTNF_OADR\[15:4\] ADDR](#): 128-bit aligned or multiple of 16
- Line offset [VTNF_LOFST\[15:4\] LOFST](#): must be multiple of 16 for NV12/NV21, and multiple of 32 for YV12
- [VTNF_LOFST\[15:4\] LOFST](#) >= [VTNF_SZ\[15:0\] BLKW](#)
- Color weights [VTNF_WEIGHTS\[5:0\] W1](#), [VTNF_WEIGHTS\[21:16\] W2](#), each 0~63, one byte of space per weight
- Rounding bit count before lookup, [VTNF_CFG\[7:4\]T](#) = 0~15
- Lookup tables [VTNF_LUT1\[0..31\]](#), [VTNF_LUT2\[0..31\]](#), each entry 0~255, one byte of space per entry

After the parameters are configured, computation can be started by software (or DMA) writing to the [VTNF_CTRL\[0\] EN](#) bitfield, or by SIMCOP HW sequencer sending a pulse on VTNF_start signal. [VTNF_CTRL\[9\] TRIG_SRC](#) must be set to be consistent with the starting mechanism.

Once VTNF starts execution, before it's idle, any further signaling on the start signal or writing to [VTNF_CTRL\[0\] EN](#) bitfield is ignored.

Access to other register fields are optional:

- Revision [VTNF_REVISION](#) (read-only)
- Busy/idle status [VTNF_CTRL\[16\] BUSY](#) (read-only)
- Interrupt enable [VTNF_CTRL\[8\] INTEN](#)
- Autogating [VTNF_CTRL\[10\] AUTOGATING](#)

The VTNF module signals task completion by interrupt and VTNF_done signal. The interrupt is sent only when it's enabled, via [VTNF_CTRL\[8\] INTEN](#). The VTNF_done signal is always sent.

The VTNF provides a busy bit ([VTNF_CTRL\[16\] BUSY](#)) for software to poll the busy/idle status, for debug or for initial software development that bypasses interrupts and hardware sequencer. Relative latency of done, interrupt, and [VTNF_CTRL\[16\] BUSY](#) is within 2 [VTNF_CFG_CLK](#) (configuration clock) cycles or 1 [VTNF_FCLK](#) cycle (twice the speed of cfg clock).

NOTE: VTNF does not have any shadow registers; as this is a block-based coprocessor, parameters apply to the whole frame and only one set of config registers is constructed. Parameter change should happen in between active frame processing.

7.4.4.4.2 ISS SIMCOP VTNF Programming Ranges and Restrictions

Individual register field restrictions are stated in the VTNF Initialization section. Besides those, SIMCOP programming must provide sufficient image buffer(s) with correct address offset to cover the C, P, and O arrays for VTNF input and output.

The line offset `VTNF_LOFST` should be programmed to be equal to or greater than `BLKW[15:0] VTNF_SZ`

Assuming size = `VTNF_LOFST[15:4] LOFST * VTNF_SZ[31:16] BLKH * 1.5` block size in bytes.

- `C_range = [VTNF_CADR[15:4] ADDR + size - 1]`
- `P_range = [VTNF_PADR[15:4] ADDR + size - 1]`
- `O_range = [VTNF_OADR[15:4] OADR + size - 1]`

`C_range`, `P_range`, `O_range` must map to valid memory.

C and P must not overlap. O can overlap C or P, however, it must be a complete overlap, `O = C` or `O = P`.

Figure 7-241. ISS SIMCOP VTNF C, P, O array memory allocation constraints

vtnf-006

In [Figure 7-241](#), cases (a), (b), and (c) are valid use cases. (a) has no overlap. (b) has complete overlap between O and C. (c) has complete overlap between O and P.

Cases (d) and (e) are invalid use cases. Case (d) has C and P overlap, so VTNF cannot read `C[i]` for certain range of `i`. Case (e) has O and P overlap.

In case overlapping conditions are present to render the use case invalid, outcome is indeterminate.

NOTE: As each block is aligned to 128-bit, over-writing `O[i]` upon `C[i]` or `P[i]` would maximize memory utilization and block size flexibility.

Implementation must take care in luma/chroma read/write accesses so that overlapping cases do work.

7.4.4.4.3 ISS SIMCOP VTNF Resets

There is no software reset. Hardware reset at SIMCOP level resets all configuration registers to default values, and turns VTNF internal state (whatever it is) to idle.

VTNF does not retain any state information from one block to the next block. Therefore if a frame of VTNF is to be terminated, allowing a block to complete processing, then reprogram VTNF with processing parameters for a new frame is sufficient. No reset is needed at all.

7.4.4.4.4 ISS SIMCOP VTNF Programming Parameters Tuning

NOTE: Parameter register fields can be programmed in any order, as long as before the computation is initiated, desired parameter values are in place.

Tuning video quality is mainly in the color weights (VTNF_WEIGHTS[5:0] W1 and W2), rounding bit count (VTNF_CFG[7:4] T), and the two lookup tables VTNF_LUT1_0 to VTNF_LUT2_28 (LUT1[0..31] and LUT2[0..31] bitfields) .

The weights are used to adjust the contribution of luma and chroma differences to the combined start address value, and the combined SAD value is rounded down by T bits for the lookup table index.

The lookup table contents are the alpha blending values to blend the previous frame output and current frame input. Lower value means lower contribution from the previous frame output, 0 means no contribution.

Roughly, low SAD value means the current input pixel does not differ much from previous output pixel of the same location, so the difference is due to noise, and user should blend harder, so the lower index lookup tables should contain larger alpha blending value.

Conversely, high SAD value means the current input pixel differs from previous output pixel of the same location, and this is an indication of moving video contents, so user should not blend at all, and alpha should be 0.

A typical table represents the curve in the Figure 7-242. max_alpha should be between 50% and 75%, to achieve effective noise reduction. index1 should reflect noise threshold, as absolute difference between current input frame pixel and previous output frame pixel beyond this is attributed to moving contents, as opposed to noise. The weights and number of bits to round down are tuned so that max_index falls within the lookup table index.

Between the (0, max_alpha) and (index1, 0) points, how alpha should transition is really up to experimentation and optimization. There should be a gradual down slope, as user want noise spikes with values close the noise threshold to be somewhat reduced, not totally eliminated or totally retained based on boolean decision.

Figure 7-242. ISS SIMCOP VTNF Typical lookup table contents

The two lookup tables are used to blend luma and chroma respectively. Normally user want to blend chroma stronger than luma. Moderate level of luma noise makes the image appears sharper and more pleasing, where as chroma noise appears as color patches, so image would look better if user suppress chroma noise.

7.4.5 ISS SIMCOP LDC Module

This chapter describes the lens distortion correction (LDC) module in the still image coprocessor (SIMCOP) subsystem.

7.4.5.1 ISS SIMCOP LDC Overview

The lens distortion correction (LDC) module deals with lens geometric distortion issues, chromatic aberration, and affine transformation for camera images. [Figure 7-243](#) is an overview of the LDC in the SIMCOP subsystem.

Figure 7-243. ISS SIMCOP LDC Subsystem

For still image or video applications the LDC supports:

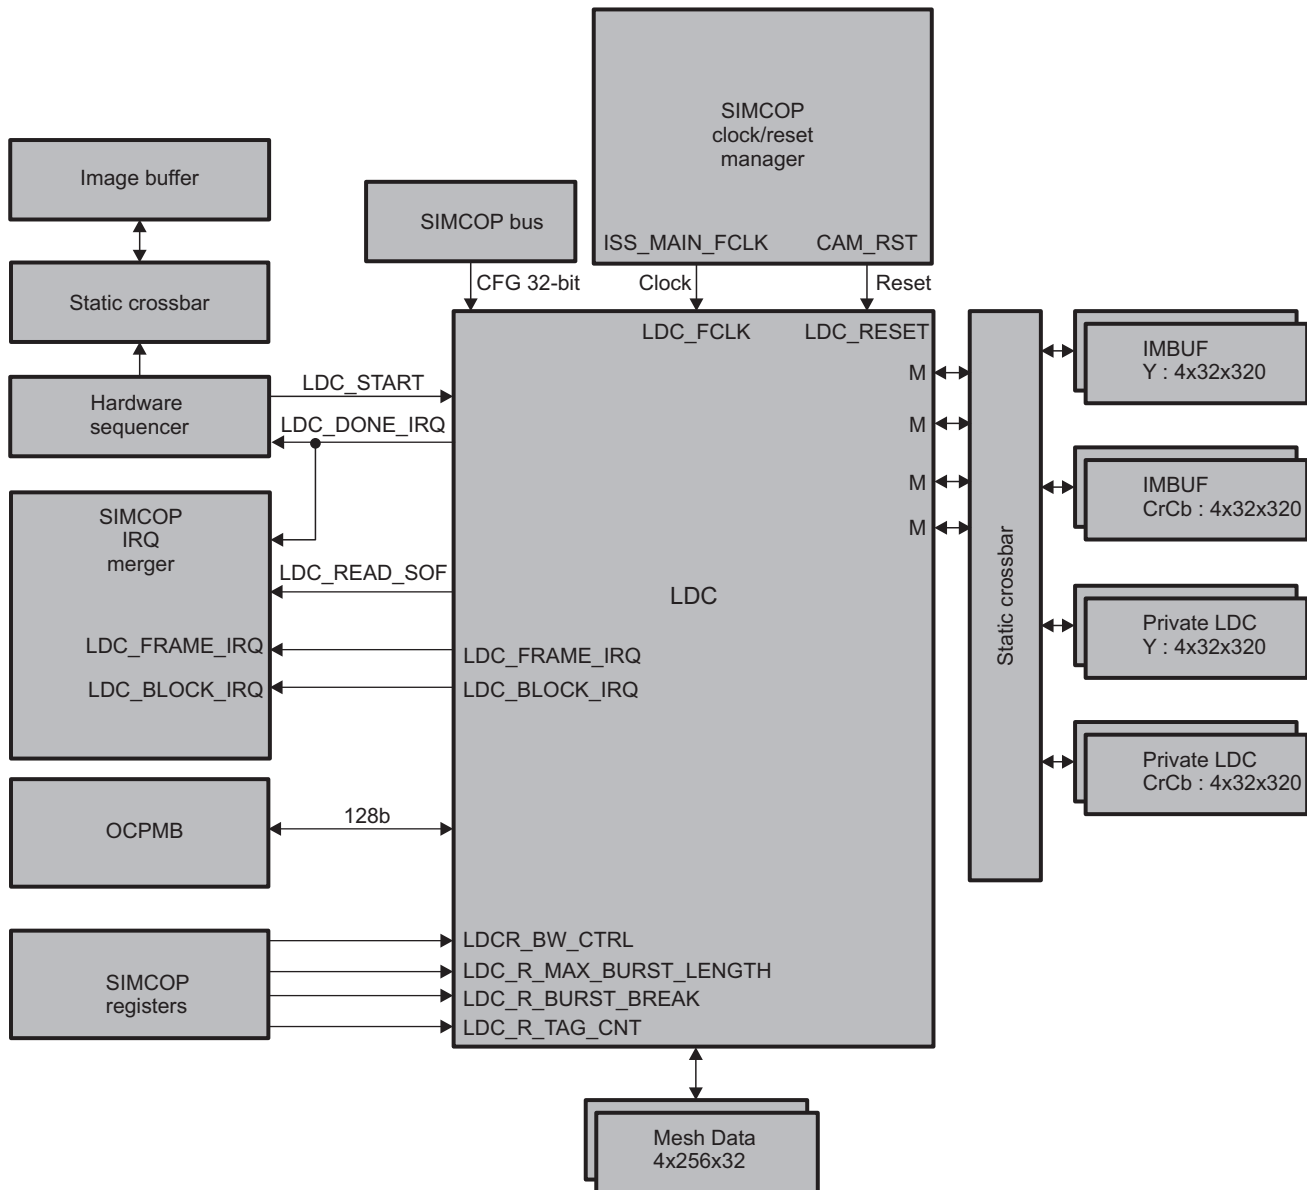

- Lens distortion correction:
 - YCbCr4:2:2/YCbCr4:2:0 data format input/output for post-image-pipe correction
 - Uses a generic distortion model to correct multiple distortion types.
 - 8 bits for YCbCr
 - Bicubic interpolation for Y and bilinear interpolation for Cb/Cr
 - Bilinear interpolation mode for Y to offer faster processing
 - Up to 8192 x 8192 image dimension

- Format restriction:
 - YCbCr4:2:2 format: Tile width must be a multiple of 16.
 - YCbCr4:2:0 format: Tile width must be a multiple of 32.
- Image warping, scaling, and rotation:
 - Affine transformation for image warping, scaling, and rotation
 - 8 bits for YCbCr
 - Supports Bayer data in unpacked 12-bit per pixel, 8-bit per pixel A-law, 8-bit per pixel unpacked, and 12-bit per pixel packed formats
 - Bicubic interpolation for Y and bilinear interpolation for Cb/Cr
 - Bilinear interpolation mode for Y, Bayer
 - Format restriction:
 - YCbCr4:2:2 format: Tile width must be a multiple of 16.
 - YCbCr4:2:0 format: Tile width must be a multiple of 32.
- Chromatic aberration correction:
 - Supports Bayer data in unpacked 12-bit per pixel, 8-bit per pixel A-Law, 8-bit per pixel unpacked, and 12-bit per pixel packed formats
 - Generic distortion
 - Model is used to describe corrections on red and blue image planes in Bayer image
 - Red and blue distortion only. Green pixels are copied to output.
 - Red and blue distortions are described independently
 - Bilinear interpolation
 - Up to 8192 x 8192 image dimension
 - Format restriction:
 - Unpacked 12-bit format: Tile width must be a multiple of 16.
 - A-Law 8-bit format: Tile width must be a multiple of 32.
 - Unpacked 8-bit format: Tile width must be a multiple of 32.
 - Packed 12-bit format: Tile width must be a multiple of 64.

7.4.5.2 ISS SIMCOP LDC Integration

The LDC module is part of the SIMCOP subsystem in the ISS. [Figure 7-244](#) shows the integration of the LDC in the SIMCOP sybystem.

Figure 7-244. ISS SIMCOP LDC Integration

Module Instance	Attributes	
	Power Domain	Interconnect
LDC	PD_ISS	

Table 7-3194. ISS SIMCOP LDC Clocks and Resets

Module Instance	Destination Signal Name	Source Signal Name	Clocks	
			Source	Description
LDC	LDC_FCLK	ISS_MAIN_FCLK	ISS	Functional clock provided by CORE_ISS_MAIN_CLK from PRCM . It is used by all ISS sub-modules and ISS top level resources.

Table 7-3194. ISS SIMCOP LDC Clocks and Resets (continued)

Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
LDC	LDC_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset

For information about clock and reset management, see [Section 7.4.1.2.1, ISS SIMCOP Local Power and Clock Management](#).

Table 7-3195. ISS SIMCOP LDC Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
LDC	LDC_FRAME_IRQ	LDC_FRAME_IRQ	SIMCOP IRQ merger	A full frame has been processed by LDC module.
LDC	LDC_BLOCK_IRQ	LDC_BLOCK_IRQ	SIMCOP IRQ merger	A macroblock has been processed by LDC module.

For more information about interrupt requests, see [Section 7.4.1.2.3, Interrupt Merger](#).

7.4.5.3 ISS SIMCOP LDC Functional Description

7.4.5.3.1 ISS SIMCOP LDC Block Diagram

Most digital cameras suffer from some degree of nonlinear geometric distortion. A spatial transformation is required to correct the distortion. In automotive applications, cameras use wide angle lenses, including fisheye lenses to provide 180+° field of view. To visually present the scene to the user in an easy-to-consume representation, these distortions need to be corrected.

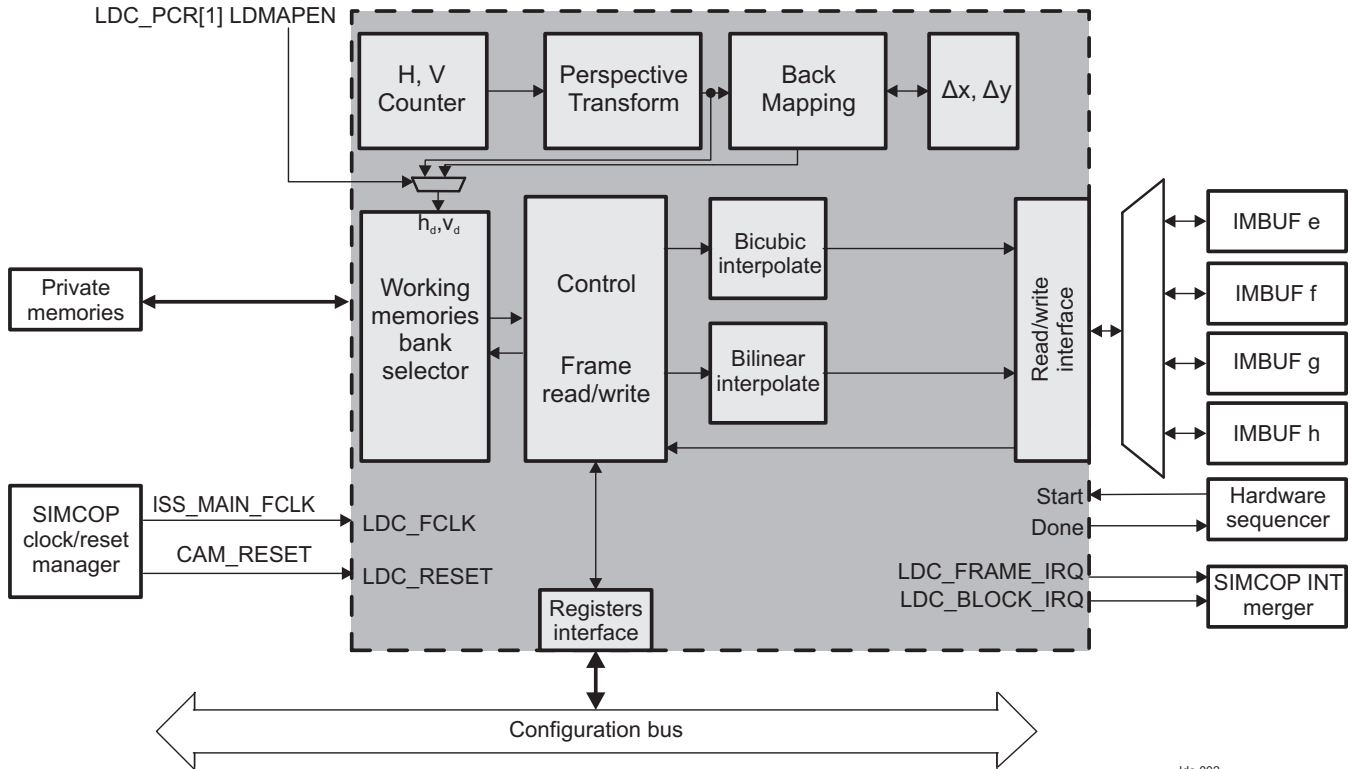

Back mapping gives coordinates of the distorted image as a function of coordinates of the undistorted output image. Correction involves back-mapping each output pixel to a location in the source distorted image, and thus the corrected image is fully populated. As the distorted pixel locations mostly fall onto fractional coordinates, correction involves interpolation among the nearest available pixels.

For any distortion, the user must determine the overlap between the distorted space and the input image coordinates. Valid image data is produced only for those points where the distorted space lies completely within the valid input image.

As shown in [Figure 7-245](#), the LDC consists of a back mapping block, a x/y offset table, image buffer interface, buffer, and an interpolation block.

[Figure 7-245](#) is a block diagram of the LDC.

Figure 7-245. ISS SIMCOP LDC Block Diagram

ldc-002

Given the coordinates of the undistorted image, the corresponding coordinates of the distorted image are calculated by combining the output coordinates and the offsets from the offset table. Distorted pixels are read from the image buffer, and buffered for the bilinear interpolation. After the interpolation, corrected image is written back to the image buffer.

The LDC processes the image in small two-dimensional (2D) blocks. The software configures appropriate parameters, then initiates the LDC function by writing to an LDC register. The LDC controls the sequencing through 2D blocks, DMA transfers, and computation to process an entire image autonomously. Interrupt, if enabled, is asserted at the completion of the image.

The LDC can also be stalled and controlled on a macroblock basis by an external controller. The LDC provides an intermediate interrupt to facilitate this. The LDC can be stalled by deasserting the write request enable on the output write port.

To start the LDC, software must set the [LDC_PCR\[0\] EN](#) bit to 1. The [LDC_PCR\[2\] BUSY](#) bit is a status that reflects LDC activity.

7.4.5.3.2 ISS SIMCOP LDC Interrupt Requests

[Table 7-3196](#) lists the event flags, and their mask, that can cause module interrupts.

Table 7-3196. ISS SIMCOP LDC Events

Event Flag	Event Mask	Map to	Description
n/a	N/A	LDC_FRAME_IRQ	End of frame processing
n/a	N/A	LDC_BLOCK_IRQ	End of macroblock processing

7.4.5.3.3 ISS SIMCOP LDC Input/Output Format Data

7.4.5.3.3.1 ISS SIMCOP LDC YCbCr Format

The LDC supports YCbCr4:2:2 in the UYVY format. [Figure 7-246](#) shows the UYUV format in memory.

Figure 7-246. YCbCr4:2:2 (UYVY) Format

		Byte offset						
		0	1	2	3	4	5	6
Row 0	Cb(0,0)	Y(0,0)	Cr(0,0)	Y(1,0)	Cb(2,0)	Y(2,0)	Cr(2,0)	
Row 1	Cb(0,1)	Y(0,1)	Cr(0,1)	Y(1,1)	Cb(2,1)	Y(2,1)	Cr(2,1)	

Idc-003

The LDC supports YCbCr4:2:0 data stored in 8-bit per color components and in two planes, Y by itself and Cb/Cr interleaved. [Figure 7-247](#) shows the NV12 format in memory.

Figure 7-247. ISS SIMCOP LDC YCbCr4:2:0 (NV12) Format

		Byte offset			
Y plane		0	1	2	3
Row 0	Y(0,0)	Y(1,0)	Y(2,0)	Y(3,0)	
Row 1	Y(0,1)	Y(1,1)	Y(2,1)	Y(3,1)	
		⋮			
Cb/Cr plane					
Row 0	U(0,0)	V(0,0)	U(2,0)	V(2,0)	
Row 1	U(0,2)	V(0,2)	U(2,2)	V(2,2)	

Idc-004

7.4.5.3.3.2 ISS SIMCOP LDC Bayer Format

The LDC supports Bayer data processing. In this mode, only the red and blue channels can be distorted. The LDC copies the original green pixels to the output image without modification. The mesh table provides pixel shift information for both the red and the blue channels. The starting pixel color is configurable (see [Figure 7-248](#)). This mode supports chromatic aberration correction by aligning the red and blue channels with the green channel.

Figure 7-248. ISS SIMCOP LDC Supported Bayer Data Format (Starting Color)

R	Gr	R	Gr	Gr	R	Gr	R
Gb	B	Gb	B	B	Gb	B	Gb
R	Gr	R	Gr	Gr	R	Gr	R
Gb	B	Gb	B	B	Gb	B	Gb
Gb	B	Gb	B	B	Gb	B	Gb
R	Gr	R	Gr	Gr	R	Gr	R
Gb	B	Gb	B	B	Gb	B	Gb
R	Gr	R	Gr	Gr	R	Gr	R

Idc-006

Bayer mode can support Bayer data in several formats. For supported data format in memory, see [Figure 7-249](#).

Figure 7-249. ISS SIMCOP LDC Supported Bayer Data Format

12-bit normal unpack mode

8-bit A-law data

8-bit linear data

12-bit packed mode

ldc-005

While reading data from the external frame buffer, the LDC unpacks the data and stores each pixel in normal unpacked mode in the internal buffer. In the case of A-Law data, LDC performs an inverse A-Law conversion before storing the input data in the internal buffer. Likewise, when writing the output data, the LDC stores the data in the same format as it reads. [Figure 7-250](#) shows the inverse A-Law table (8-bit to 10-bit). [Figure 7-251](#) shows the forward A-Law table (10-bit to 8-bit).

Figure 7-250. ISS SIMCOP LDC Inverse A-Law (8-Bit to 10-Bit)

ldc-008

Figure 7-251. ISS SIMCOP LDC Forward A-Law (10-Bit to 8-Bit)

7.4.5.3.4 ISS SIMCOP Lens Distortion Back-Mapping

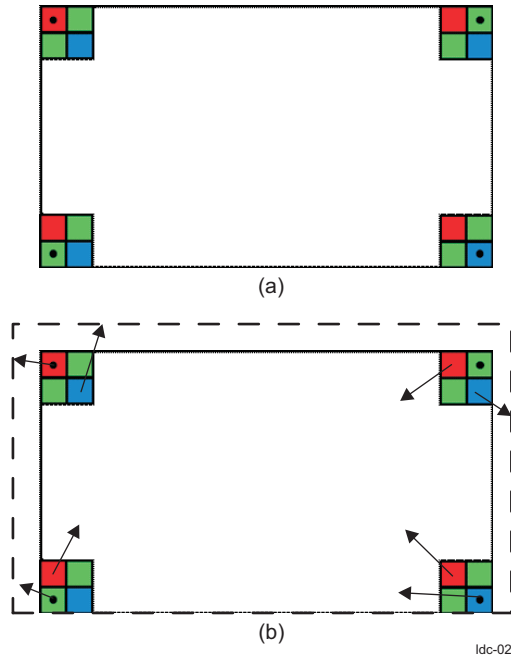

Both modes of LDC, YCbCr mode and Bayer mode use offset tables to define the back mapping between output pixel locations and input pixel locations. The contents of the tables differ between the two modes. These modes are described in the next sections.

7.4.5.3.5 ISS SIMCOP LCD Bayer Chromatic Aberration Correction Implementation

The implementation of Bayer mode CAC differs slightly from the YCbCr mode used for distortion correction. Because there are three colors in the image and only two are being modified, the details for calculating the input bounding box must be specified separately. The affine transform is disabled internally, so the mesh interpolation is the only transformation on the coordinates. For each output tile, the four corners are analyzed to determine the input bounding box. In Bayer mode, the corner is defined by a 2x2 Bayer block. The red and blue coordinates are transformed using the mesh table calculation. A third coordinate is the original location of the corner, defined as the location of the actual corner pixel with no transform applied. FIGURE shows this, with the corner pixels marked with a dot. This gives 12 coordinates for each output tile. The bounding box is determined by finding the minimum and maximum for both x and y. These four numbers then determine the range of the input bounding box. To this bounding box, the PIXPAD parameter adds additional pixels.

Figure 7-252 (a) Example output tile of Bayer data. Each corner is a 2x2 Bayer block. The four corner pixels used in the calculation are marked with a dot. (b) In each corner, red and blue pixels within the Bayer block are transformed using the mesh calculation. After transformation, the minimum and maximum of all of the final 12 x locations is used as the horizontal range of the bounding box. The minimum and maximum of all of the final 12 y locations is used as the vertical range of the bounding box. The dotted line shows the computed input bounding box. PIXPAD adds pixels around this prior to fetching input data.

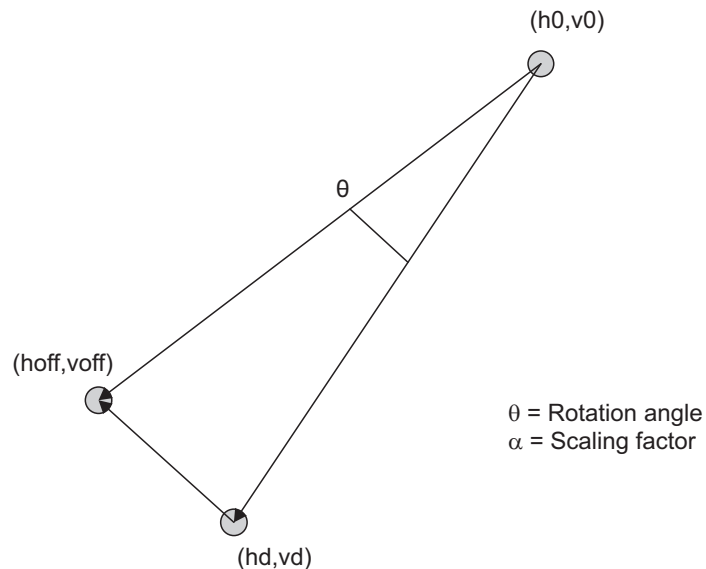

Figure 7-252. Example output tile of Bayer data

7.4.5.3.6 ISS SIMCOP LDC Affine Transform

The LDC first performs an affine transform, which can be used for rotations and scaling, as shown in Figure 7-253. The output of the pixel coordinate is used as the input address to the affine transform.

Figure 7-253. Affine Transformation

$$\begin{bmatrix} \text{hoff} \\ \text{voff} \end{bmatrix} = \begin{bmatrix} a \times \cos(\theta) & a \times \sin(\theta) \\ -a \times \sin(\theta) & a \times \cos(\theta) \end{bmatrix} \begin{bmatrix} \text{hd} \\ \text{vd} \end{bmatrix} + \begin{bmatrix} \text{h0} - \text{h0} \times a \times \cos(\theta) - \text{v0} \times a \times \sin(\theta) \\ \text{v0} + \text{h0} \times a \times \cos(\theta) - \text{v0} \times a \times \sin(\theta) \end{bmatrix}$$

ldc-010

The mapping from destination coordinate to the source coordinate is expressed as:

$$\text{haff} = a \times \text{hd} + b \times \text{vd} + c$$

$$v_{\text{aff}} = d \times h_d + e \times v_d + f$$

This transform allows full rotation, expansion, contraction, and translation. The parameters {a, b, d, e} are in S16Q12 (signed number on 14 bits with 2 bits for integer and 12 bits of fraction) format, and parameters {c, f} are in S16Q3 format (signed number on 16 bits with 13 bits for integer and 3 bits of fraction). These parameters must be set in following bit fields:

- a = LDC_AB[13:0] A
- b = LDC_AB[29:16] B
- c = LDC_CD[15:0] C
- d = LDC_CD[29:16] D
- e = LDC_EF[13:0] E
- f = LDC_EF[31:16] F

NOTE: The affine transform is not supported in Bayer mode.

7.4.5.3.7 ISS SIMCOP LDC Perspective Transformation

When a camera is viewing a scene from two different positions or when multiple cameras are viewing the scene from different positions, a transformation between the two viewing angles is needed to align the images. Under specific conditions, the class of geometric transformations known as homography, or planar-perspective transformation, will capture the geometric relationship between the images accurately. Common applications of homography transforms are to align (or stitch) multiple frames of the same scene to compute a panoramic output image. A second application is the alignment of planar surfaces in the world. Finally, perspective transforms are also useful in computing depth maps from a stereo image pair. By rectifying the two views, the search to compute disparity between the two views is simplified to a 1-D search problem. The homography is defined by a 3x3 transformation matrix, as in

$$h_{\text{aff}} = a * h_d + b * v_d + c \tag{4}$$

$$v_{\text{aff}} = d * h_d + e * v_d + f \tag{5}$$

$$z = g * h_d + h * v_d + 1 \tag{6}$$

-

$$h_p = h_{\text{aff}} / z \tag{7}$$

$$v_p = v_{\text{aff}} / z. \tag{8}$$

The affine transform is a subset of the perspective transformation. By setting $g = h = 0$, $h_p = h_{\text{aff}}$ and $v_p = v_{\text{aff}}$.

In image alignment applications, the homography matrices are computed by locating corresponding points in the two frames and estimating the matrix parameters to transform the set of points in one frame onto the corresponding points in the second frame. In the stereo rectification application, the matrix is determined (pre-computed) at the calibration step and remains fixed.

When LDC is requested to provide a change in the frame size between the input and output, the affine/perspective parameters must be programmed to implement the coordinate scaling (see [Section 7.4.5.4.5](#) for programming details) . The perspective transform is not supported in Bayer mode. This function is disabled inside the HW design.

7.4.5.3.8 ISS SIMCOP LDC Pixel Interpolation

In UYVY and NV12 mode, the pixel interpolation type can be set to bicubic interpolation for best quality or bilinear interpolation for faster performance. In Bayer mode, bilinear interpolation is always used.

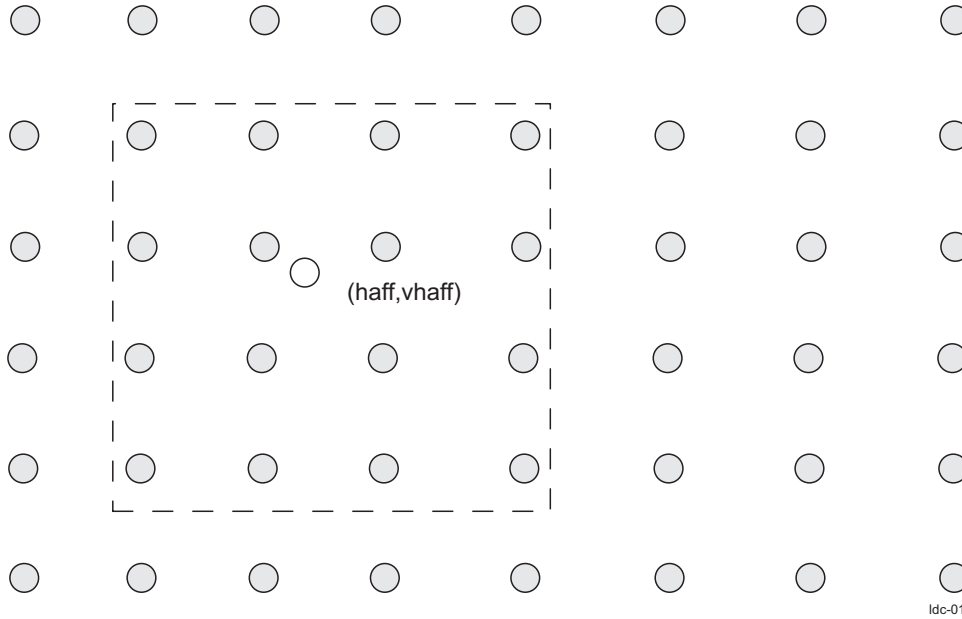

As the coordinates (h_{aff} , v_{aff}) calculated by the back-mapping function are not generally integer values, bicubic or bilinear interpolation is applied to the distorted pixels.

Depending on register configuration, bicubic or bilinear interpolation is used to interpolate the output Y pixels:

- LDC_CONFIG[6] YINT_TYP = 0, bicubic interpolation for Y, bilinear for other components
- LDC_CONFIG[6] YINT_TYP = 1, bilinear interpolation for all components

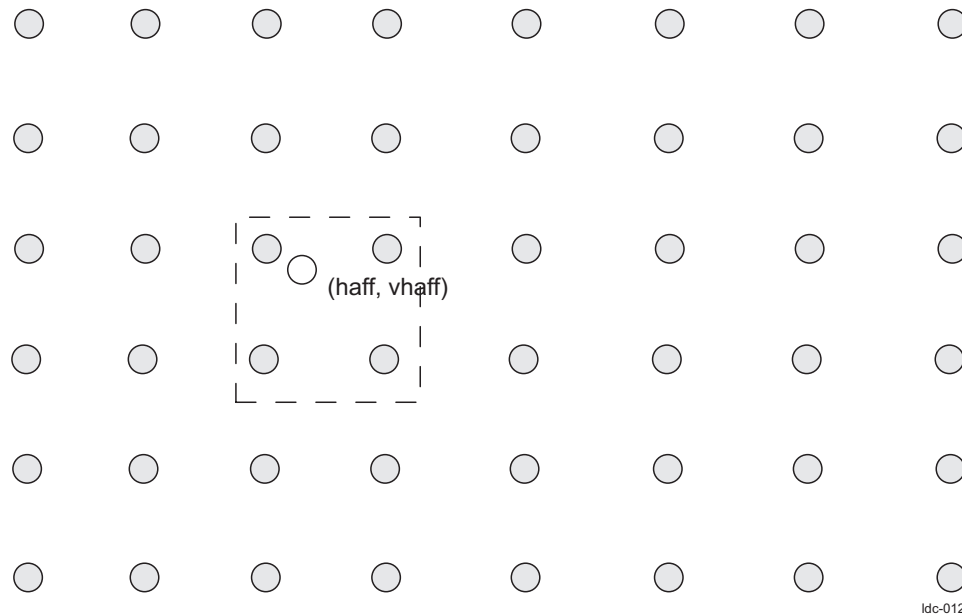

In the case of bicubic interpolation, the distorted pixel is interpolated from the 16 Y pixels in the 4 x 4 grid around the distorted location, as shown in [Figure 7-254](#). Bicubic interpolation is used first along the horizontal direction, then the vertical direction.

Figure 7-254. ISS SIMCOP LDC Bicubic Interpolation for Y

If bilinear interpolation is selected, the distorted pixel is interpolated from the four Y pixels in the 2 x 2 grid around the distorted location, as shown in [Figure 7-255](#).

Figure 7-255. ISS SIMCOP LDC Bilinear Interpolation for Y

For Cb and Cr components, simple bilinear interpolation is used. Each distorted pixel is interpolated from the four same-color pixels on the 2 x 2 grid around the distorted location. For UYVY data, the Cb/Cr grid is not square, but is 2x wider compared to the height. This is shown in [Figure 7-256](#).

Figure 7-256. ISS SIMCOP LDC Bilinear Interpolation for CB/Cr in UYVY and NV12 Format

ldc-013

In Bayer mode processing, bilinear interpolation is used. The red and blue distorted pixels are interpolated from the four same-color pixels on the 2 x 2 grid around the distorted location.

7.4.5.3.9 ISS SIMCOP LDC Buffer Management

The LDC processes a block of $LDC_BLOCK[7:0]$ OBW x $LDC_BLOCK[15:8]$ OBH (output block width by output block height) pixels at a time in a raster-scan order throughout the image. OBW is constrained to be a multiple of a base width, depending on the operating mode. This is described in [Table 7-3197](#). OBH should be even. The LDC uses four corners of the output block plus some padding to fetch the input block. Software must supply OBW, OBH, and $LDC_BLOCK[19:16]$ PIXPAD, the amount of padding in input pixels. Software must guarantee that, for EVERY output pixel in the OBW x OBH output block, the input pixels required are bounded by back mapping of the four corners plus/minus the padding. More precisely, the input block is determined by:

- $IBX_start = \min(\text{truncate}(\text{distortx}(\text{corner1})), \text{truncate}(\text{distortx}(\text{corner3}))) - \text{PixelPad}$
- $IBX_end = \max(\text{truncate}(\text{distortx}(\text{corner2})), \text{truncate}(\text{distortx}(\text{corner4}))) + \text{PixelPad}$
- $IBY_start = \min(\text{truncate}(\text{distorty}(\text{corner1})), \text{truncate}(\text{distorty}(\text{corner2}))) - \text{PixelPad}$
- $IBY_end = \max(\text{truncate}(\text{distorty}(\text{corner3})), \text{truncate}(\text{distorty}(\text{corner4}))) + \text{PixelPad}$

where corner1, corner2, corner3, and corner4 are upper-left, upper-right, lower-left, and lower-right corners of the OBW x OBH output block, and $\text{distortx}(\cdot)$, $\text{distorty}(\cdot)$ are X and Y distorted coordinates of the corners. Distorted coordinates computed by the back-mapping process described in [Section 7.4.5.3.4, ISS SIMCOP Lens Distortion Back-Mapping](#). [Figure 7-257](#) shows the input block bound calculation. [Table 7-3197](#) lists the OBW requirements.

Figure 7-257. ISS SIMCOP LDC Input Block Bound

Table 7-3197. ISS SIMCOP LDC OBW Requirements

Data Format	OBW must be a multiple of
YCbCr4:2:2	8
YCbCr4:2:0	16
Bayer unpack	8
Bayer 8-bit	16
Bayer A-Law	16
Bayer 12-bit	32

Typically for geometric distortion, the `LDC_BLOCK[19:16]` PIXPAD bit field must be 4 to accommodate neighbor sets for all colors. Chromatic aberration, where the back-mapping depends on the color of output pixel, incurs additional levels in PIXPAD. For example, to correct 3 pixels of chromatic aberration, specify `PIXPAD = 4 + 3 = 7`. Software must set the PIXPAD bit field correctly.

NOTE: A tool is available to calculate PIXPAD for a given frame size and distortion mapping. Another utility is provided with the functional C model that computes the minimum PixelPad given a configuration and the processing block size: OBW, OBHT. To obtain these tools, contact your TI representative.

OBH and OBW must be large enough for efficient operation of the lens distortion operation. As shown in [Table 7-3197](#), OBW is constrained to ensure efficient external memory write. Another constraint is that input block size, $(IBX_end - IBX_start + 1) \times (IBY_end - IBY_start + 1)$, for EVERY input block of the image, must fit the allocated input buffer. These parameters must not be specified pessimistically (OBH, OBW too small, or PixelPad too large). Pessimistic parameter setting degrades performance and incurs unnecessary external memory transfer.

The LDC can process a portion of the image, rather than the entire image. This saves time by letting an image process through multiple software/LDC interactions to correct only a portion of the image.

An intermediate interrupt can occur after processing each macroblock. This lets the LDC operation be pipelined with other tasks.

To process only a portion of the image, the following parameters are required:

- `LDC_INITXY[13:0]` INITX: X coordinate of upper-left corner of output frame
- `LDC_INITXY[29:16]` INITY: Y coordinate of upper-left corner of output frame
- `LDC_FRAME_SIZE[13:0]` W: Width of output frame
- `LDC_FRAME_SIZE[29:16]` H: Height of output frame
- `LDC_WR_BASE[31:0]` WBASE: SDRAM address of upper-left corner of output frame (Y and Cb/Cr base required for YCbCr4:2:0: `LDC_420C_WR_BASE[31:0]` WBASE)
- `LDC_WR_OFST[15:0]` WOFST: SDRAM frame width (in bytes)

[LDC_FRAME_SIZE\[13:0\]](#) W must be a multiple of [LDC_BLOCK\[7:0\]](#) OBW, [LDC_FRAME_SIZE\[29:16\]](#) H a multiple of [LDC_BLOCK\[15:8\]](#) OBH, and [LDC_WR_BASE\[31:0\]](#) WBASE a multiple of 32 (byte address)

[Figure 7-258](#) is an example of multiple-pass processing with middle-of-the-image skipped.

Figure 7-258. ISS SIMCOP LDC Multiple-Pass Correction Example

INITX	INITY	W	H	WBASE
0	0	32	72	0x10000
32	0	48	12	0x10040
80	0	32	72	0x100A0
32	60	48	12	0x134C0

ldc-015

The LDC does not copy skipped blocks from the input frame to the output frame (necessary task unless output frame = input frame); software must set up and initiate this memory copy.

A note on in-place operation to conserve external memory: Depending on the offset table and configuration parameters, it may not be feasible to point the output image at the input image and have corrected pixels overwriting the source image. Software must determine whether it is feasible to overwrite, and allocate a separate frame buffer when it is not feasible. The LDC does not care if the input and output image pointers coincide, nor does it check any dependency violations.

The starting address of the input frame, corresponding to input coordinate (0, 0), is specified in the [LDC_RD_BASE\[31:0\]](#) RBASE bit field and offset in the [LDC_RD_OFST\[15:0\]](#) ROFST bit field ((Y and Cb/Cr base required for YCbCr4:2:0: [LDC_420C_RD_BASE\[31:0\]](#) RBASE)). The LDC does not check whether any of the input block falls outside the input frame. Software must pad the input frame with zeros or borders, if an input block falls outside the input frame, so that there is no adverse effect in the corrected image.

NOTE:

- Each input block bounding box, as defined by distorted coordinate of output corners plus the pixel pad, is NEVER to be violated in the sense that any output pixel in the block must have interpolation source pixels from the input block.
- Any number of input blocks CAN fall partially or totally outside the input frame by assuming coordinates that are outside valid range (negative or exceeding maximum image width defined by the line offset).
- If any output pixel refers to any input pixel outside the input frame, the computed value for that output pixel is not guaranteed. The other output pixels can still have correct outcomes.

7.4.5.3.10 ISS SIMCOP LDC Input Circular Buffer

To better enable slice-based processing with a random access algorithm such as LDC/perspective warp, LDC module must be able to read its input image data from a circular buffer. The amount of data needed by LDC module depends on the configuration and the warp factors, so there is a variable rate of input data consumed by LDC during processing of an entire frame.

The [LDC_RD_OFST\[29:16\] MOD](#) parameter controls the size of the circular buffer (in number of rows, must be even). The user sets the size of the circular buffer and the absolute address for the input data is then computed by:

$$\text{Address} = \text{base} + (\text{row} \% \text{LDC_RD_OFST}[29:16] \text{ MOD}) * \text{line_offset} + \text{column}$$

NV12 or NV21 Modes In NV12 or NV21, the image data is split between two buffers, the luma plane and the interleaved chroma plane. The [LDC_RD_OFST\[29:16\] MOD](#) register computes the size of the luma plane. By definition, the chroma plane is half the height of the luma plane. The modulo operation for the chroma plane uses [LDC_RD_OFST\[29:16\] MOD/2](#) as the divisor.

UYVY and Bayer Modes In UYVY mode, the image data is in a single buffer. Therefore, the [LDC_RD_OFST\[29:16\] MOD](#) register directly gives the height (in rows) of the buffer.

In Bayer mode, the image data is also in a single buffer, so the circular buffer height can be directly set by [LDC_RD_OFST\[29:16\] MOD](#) register.

To enable circular addressing mode, the firmware must configure [LDC_PCR\[9\] CIRCEN = 1](#). It is the responsibility of the firmware to ensure that the circular buffer size is sized appropriately for the given LDC configuration. If the buffer size is set too small, incorrect data output is expected.

Circular buffering is only supported for the input image data. Mesh table data is not read through a circular buffer.

7.4.5.3.11 ISS SIMCOP LDC and Hardware Sequencer

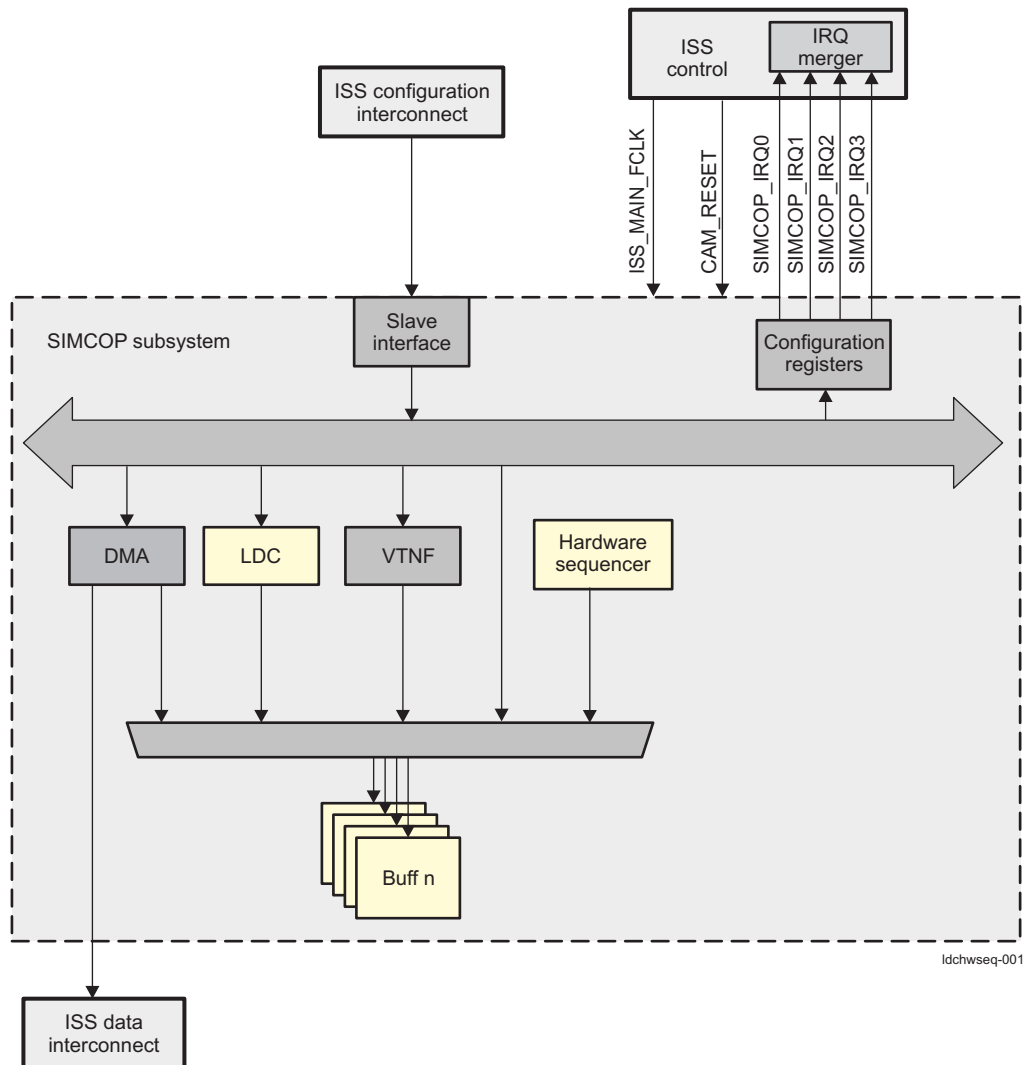

NOTE: This section provides only LDC associated functionality. For details on Hardware Sequencer and its configuration refer to [Section 7.4.2, ISS SIMCOP Hardware Sequencer and Buffers Module](#).

7.4.5.3.11.1 ISS SIMCOP LDC and Hardware Sequencer and Buffers Overview

The SIMCOP hardware sequencer control all the modules included in the SIMCOP subsystem with their memories.

[Figure 7-259](#) shows an overview of the hardware sequencer and buffers along the LDC in the SIMCOP subsystem.

Figure 7-259. LDC and Hardware Sequencer and Buffers in the SIMCOP Subsystem

- Hardware acceleration for low-level sequencing tasks:
 - Synchronizes with LDC, DMA, and VTNF
 - Supports 4 memory crossbar contexts
- Power management support
- On chip memories (RAM):
 - LDC look-up table storage: 256 entries

7.4.5.3.11.2 ISS SIMCOP LDC and Hardware Sequencer and Buffers Functional Description

7.4.5.3.11.2.1 ISS SIMCOP Hardware Sequencer Buffer Description

The SIMCOP subsystem includes the LDC private working memory

7.4.5.3.11.2.1.1 ISS SIMCOP LDC Static Crossbar

The static crossbar connect SIMCOP modules to the SIMCOP memories as shown in [Figure 7-260](#).

Figure 7-260. SIMCOP Static Crossbar Overview

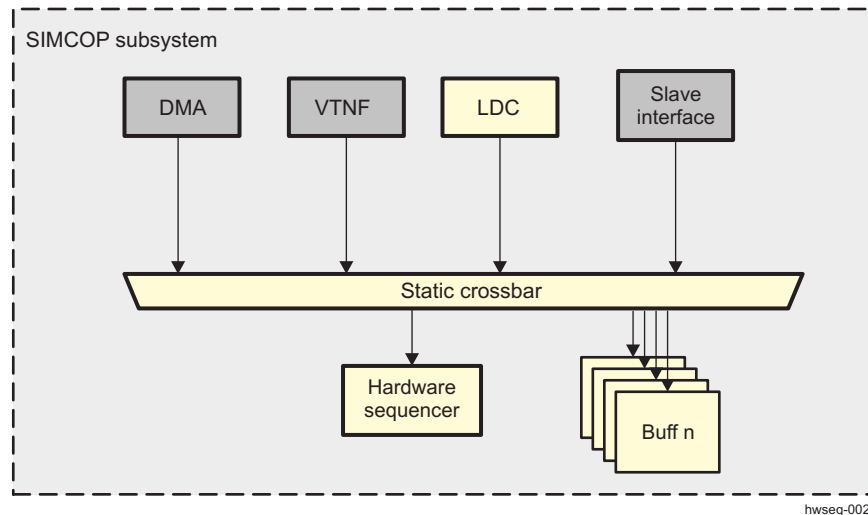

Image buffers and coefficient memories are used to store the data to be processed and processing results. Those memories can be accessed by the SIMCOP DMA, SIMCOP bus, and SIMCOP modules. [Table 7-3198](#) shows possible connections in the SIMCOP static crossbar. For example, the LDC Freq port could access image buffer a when `SIMCOP_HWSEQ_SWITCH_i[2:0] IMBUFF_E = 0x6` ($i = 0, 1, 2, \text{ or } 3$ corresponds to the active context).

The SIMCOP supports multiple contexts for the configuration of those memories. Software or the hardware sequencer can activate different contexts.

Table 7-3198. Static Crossbar Control Summary (2/2)

Memory	Register (<code>SIMCOP_HWSEQ_STEP_SWITCH_i</code> and <code>SIMCOP_HWSEQ_STEP_CTRL2_i</code>)	Value				
		Bus	DMA	LDC 0	LDC WMEM	VTNF
IMBUFF e	[18:16] IMBUFF_E	0	1	6	-	8
IMBUFF f	[22:20] IMBUFF_F	0	1	6	-	8
IMBUFF g	[27:24] IMBUFF_G	0	1	9	-	8
IMBUFF h	[31:28] IMBUFF_H	0	1	9	-	8

7.4.5.3.11.2.1.2 ISS SIMCOP LDC Private Input Memory

The LDC has a private input memory that can be used when the LDC operates in YUV4:2:0 mode. For YUV4:2:2 and RAW operation, the LDC must use image buffers as input memories.

The LDC input memory is dedicated for LDC operation. It cannot be accessed from the SIMCOP bus or by any other SIMCOP module.

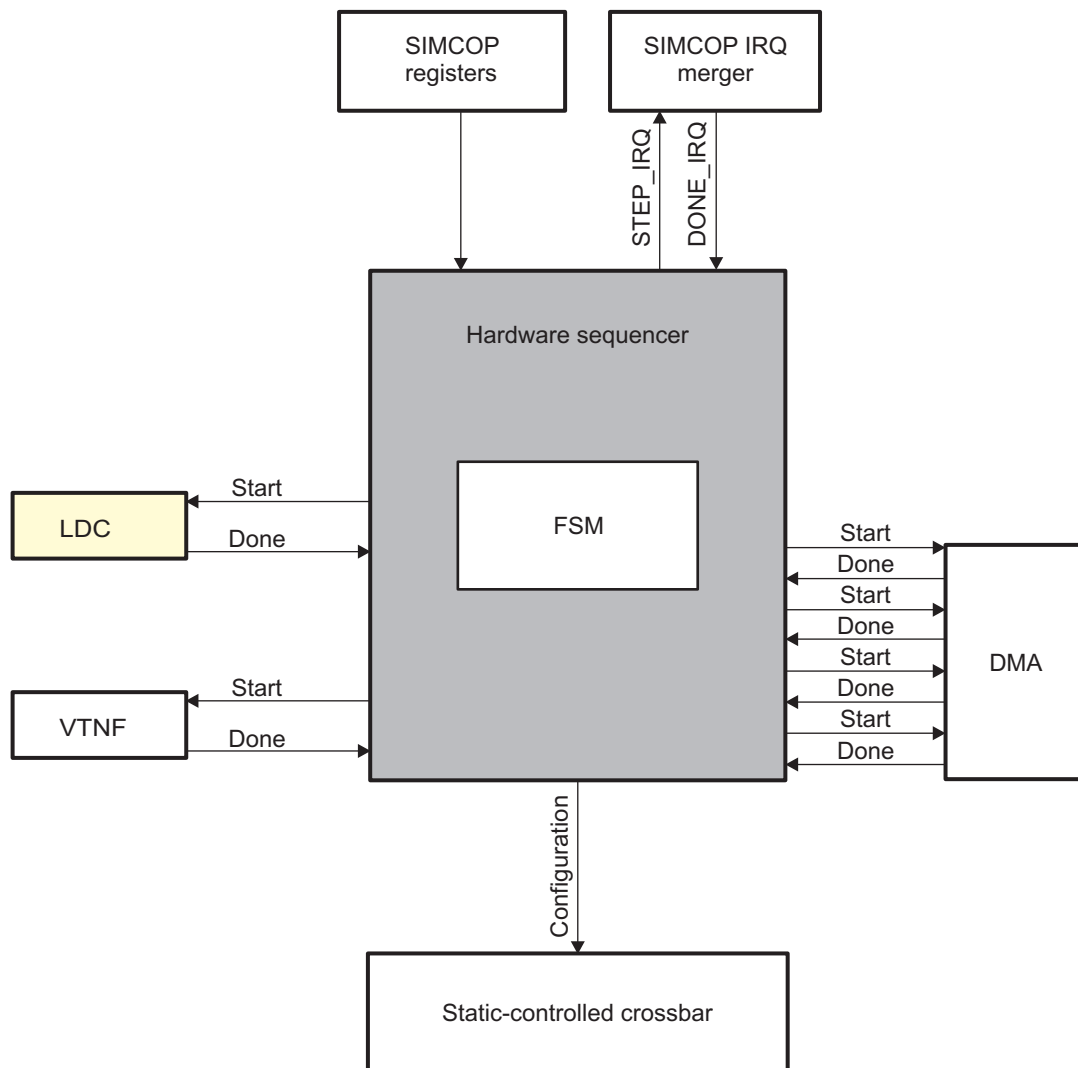

7.4.5.3.11.2.2 ISS SIMCOP Hardware Sequencer

The SIMCOP typically processes a full frame on a macroblock-by-macroblock basis. The SIMCOP modules and the DMA controller trigger an interrupt when they have completed a macroblock. This event can either trigger an interrupt to an external initiator (CPU) (manual mode) or trigger a context switch and resume DMA/SIMCOP module processing. Typically, initiator intervention is needed to fill the macroblock pipeline (called pipe-up, that is, the first n macroblocks of an image) and to flush the macroblock pipeline (called pipe-down, that is, the last n macro-blocks of an image). Automatic sequencing mode is typically used for the rest of the image.

The hardware sequencer is particularly useful to offload the initiator during LDC processing.

Figure 7-261 depicts the SIMCOP hardware sequencer overview.

Figure 7-261. SIMCOP Hardware Sequencer Overview

ldc_hwseq-008

The hardware sequencer can automatically execute a predefined number of sequencing steps without software intervention. This is called automatic operation. Automatic operation can also be used for pipeline filling and flushing with some limited software intervention. During automatic operation, the hardware sequencer controls the generation of START/DONE pulses and the connections in the static controlled crossbar. Software can take control over some resources while the hardware sequencer is running. This is called hardware sequencer override.

7.4.5.3.11.2.2.1 Hardware Sequencer Override

By default, the hardware sequencer controls START/DONE pulses of all SIMCOP modules as well as the static controlled crossbar. Software can take the control over some resources by setting the appropriate bits in the SIMCOP_HWSEQ_OVERRIDE register. Sequencing resources under software control are managed using the SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE and SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE registers.

Changes done to the SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE[27:11] *_OFST and SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE registers have immediate effect. It is the responsibility of software to ensure there is no active traffic on the impacted connection in the static controlled crossbar.

The settings in the SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE and SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE registers for resources controlled by the hardware sequencer have no effect.

Synchronization with SIMCOP submodules is controlled using the SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE[7:0] *_TRIGGER bit fields. For LDC a START pulse is sent to the module when a 1 is written into the appropriate bit field. Software can trigger one or multiple start pulses at the time. The *_TRIGGER bit field is cleared by writing 1. It is automatically set by hardware when a DONE pulse is received from the relevant SIMCOP submodule.

7.4.5.4 ISS SIMCOP LDC Basic Programming Model

7.4.5.4.1 ISS SIMCOP LDC Initialization of Surrounding Modules

To initialize the LDC, surrounding modules must be initialized. [Table 7-3199](#) lists these modules.

Table 7-3199. ISS SIMCOP LDC Initialization of Surrounding Modules

Module	Minimum Required Setting	Optional Settings
CLKC	Enable the SIMCOP clock.	
Buffers	Configure LDC access to the image buffer.	
SIMCOP CTRL		Configure SIMCOP CTRL to handle LDC interrupts.

7.4.5.4.2 ISS SIMCOP LDC Geometric Distortion Mode

Geometric distortions (barrel and pincushion), can be corrected on UYVY and NV12 data formats. Radial back mapping is used in this mode. An additional affine transform can be configured at the same time.

1. Check and wait for the [LDC_PCR\[2\]](#) BUSY bit to become IDLE (0x0).
2. Set the [LDC_PCR\[4:3\]](#) MODE bit field for UYVY (0x0) or NV12 data (0x2).
3. Set the [LDC_PCR\[1\]](#) LDMAPEN bit to 1 to enable lens distortion back mapping.
4. Set the input frame base address in the [LDC_RD_BASE\[31:0\]](#) RBASE bit field. The frame base address must be aligned on a 32-byte boundary.
5. Set the input frame line offset in the [LDC_RD_OFST\[15:0\]](#) ROFST bit field.
6. If reading the input image from a circular buffer:
 - Set [LDC_PCR\[9\]](#)CIRCEN = 1.
 - LDC computes the row number and applies a modulo operation. The absolute address in the buffer is computed from this wrap-around row and the column number and then data is fetched from the circular buffer. Set the circular buffer size in [LDC_RD_OFST.MOD](#). In UYVY mode, the number of rows in the buffer is [LDC_RD_OFST.MOD](#). In NV12 and NV21 modes, the number of rows in the Y buffer is [LDC_RD_OFST.MOD](#) and the number of rows in the Cb/Cr buffers is ([LDC_RD_OFST.MOD](#) / 2).
7. Set the tile size in the [LDC_BLOCK\[15:8\]](#) OBH and [LDC_BLOCK\[7:0\]](#) OBW bit fields. See constraints on OBW in [Table 7-3197](#)
8. Set the pixel pad in the [LDC_BLOCK\[19:16\]](#) PIXPAD bit field.
9. Set the input frame size in [LDC_INPUT_FRAME_SIZE\[29:16\]](#) H and [LDC_INPUT_FRAME_SIZE\[13:0\]](#) W.
10. Set the output frame size in the [LDC_FRAME_SIZE\[29:16\]](#) H and [LDC_FRAME_SIZE\[13:0\]](#) W bit fields. H and W values must be multiples of OBH and OBW, respectively.
11. Set the starting output point in the [LDC_INITXY\[13:0\]](#) INITX and [LDC_INITXY\[29:16\]](#) INITY bit fields.
12. Set the output frame starting address in the [LDC_WR_BASE\[31:0\]](#) WBASE bit field. The output frame must be 32-byte aligned.
13. Set the output frame line offset in the [LDC_WR_OFST\[15:0\]](#) WOFST bit field.
14. If the data format is NV12, set the 4:2:0 UV input plane base address in the [LDC_420C_RD_BASE\[31:0\]](#) RBASE bit field. This address must be 16-byte aligned.
15. If the data format is NV12, set the 4:2:0 UV output plane base address in the [LDC_420C_WR_BASE\[31:0\]](#) WBASE bit field. This address must be 16-byte aligned.
16. Set the mesh offset table pointer to the correct address ([LDC_MESHTABLE_BASE\[31:0\]](#) BASE and [LDC_MESHTABLE_OFST\[15:0\]](#) OFST). Set the table downsampling factor for MxM downsampling in [LDC_MESHTABLE_CONFIG\[2:0\]](#) M.
17. If the LDC is connected to image buffers where the output address is not updated for each tile, set the constant mode to 0x1 in the [LDC_CONFIG\[7\]](#) CNST_MD bit field.
18. Set the Y plane interpolation type to bilinear or bicubic in the [LDC_CONFIG\[6\]](#) YINT_TYP bit.

19. If also using affine transform, set the six affine transform parameters in the following bit fields:

- [LDC_AB\[13:0\]](#) A
- [LDC_AB\[31:16\]](#) B
- [LDC_CD\[15:0\]](#) C
- [LDC_CD\[31:16\]](#) D
- [LDC_EF\[13:0\]](#) E
- [LDC_EF\[31:16\]](#) F

If affine transform is not used, these need to be set to the following values:

- [LDC_AB\[15:0\]](#) A = 4096
- [LDC_AB\[31:16\]](#) B = 0
- [LDC_CD\[15:0\]](#) C = 0
- [LDC_CD\[31:16\]](#) D = 0
- [LDC_EF\[15:0\]](#) E = 4096
- [LDC_EF\[31:16\]](#) F = 0

20. Set [LDC_PCR\[0\]](#) EN = 1 to start the LDC operation.

21. Wait for the [LDC_PCR\[2\]](#) BUSY bit to become IDLE (0x0) or wait for the completion interrupt.

7.4.5.4.3 ISS SIMCOP LDC Bayer Chromatic Aberration Mode

In Bayer chromatic aberration mode, the red and blue image planes are warped to align with the green image. The radial back-mapping is the main utility for this, although the affine transform can also be used.

1. Check and wait for the [LDC_PCR\[2\]](#) BUSY bit to become IDLE (0x0).
2. Set the [LDC_PCR\[4:3\]](#) MODE bit field for Bayer (0x1).
3. Set the [LDC_PCR\[6:5\]](#) BMODE bit field according to the Bayer format (3: 8-bit A-Law, 2: Packed 8-bit, 1: Packed 12-bit, or 0: Unpacked 12-bit).
4. Set the [LDC_CONFIG\[5:4\]](#) INITC bit field to the initial Bayer color (3: B, 2: Gb, 1: Gr, or 0: R).
5. If lens distortion correction is performed at the same time as the affine transform, set the [LDC_PCR\[2\]](#) LDMAPEN bit to 1. Otherwise, set the [LDC_PCR\[1\]](#) LDMAPEN bit to 0.
6. Set the input frame base address in the [LDC_RD_BASE\[31:0\]](#) RBASE bit field. The frame base address must be aligned on a 16-byte boundary.
7. Set the input frame line offset in the [LDC_RD_OFST\[15:0\]](#) ROFST bit field.
8. If reading the input image from a circular buffer:
 - [LDC_PCR\[9\]](#) CIRCEN = 1
 - LDC computes the row number and applies a modulo operation. The absolute address in the buffer is computed from this wrap-around row and the column number and then data is fetched from the circular buffer. Set the circular buffer size in [LDC_RD_OFST.MOD](#). In Bayer mode, the number of rows in the buffer is [LDC_RD_OFST.MOD](#).
9. Set the tile size in the [LDC_BLOCK\[15:8\]](#) OBH and [LDC_BLOCK\[7:0\]](#) OBW bit fields. See constraints on OBW in [Table 7-3197](#).
10. Set the pixel pad in the [LDC_BLOCK\[19:16\]](#) PIXPAD bit field.
11. Set the input frame size in [LDC_INPUT_FRAME_SIZE\[29:16\]](#) H and [LDC_INPUT_FRAME_SIZE\[13:0\]](#) W.
12. Set the output frame size in the [LDC_FRAME_SIZE\[29:16\]](#) H and [LDC_FRAME_SIZE\[13:0\]](#) W bit fields. H and W values must be multiples of OBH and OBW, respectively.
13. Set the starting output point in the [LDC_INITXY\[13:0\]](#) INITX and [LDC_INITXY\[29:16\]](#) INITY bit fields.
14. Set the output frame starting address in the [LDC_WR_BASE\[31:0\]](#) WBASE bit field. The output frame must be 16-byte aligned.
15. Set the output frame line offset in the [LDC_WR_OFST\[15:0\]](#) WOFST bit field.
16. Set the mesh offset table pointer to the correct address ([LDC_MESHTABLE_BASE\[31:0\]](#) BASE and [LDC_MESHTABLE_OFST\[15:0\]](#) OFST). Set the table downsampling factor for MxM downsampling in

LDC_MESHTABLE_CONFIG[2:0] M.

17. If the LDC is connected to image buffers where the output address is not updated for each tile, set the constant mode to 0x1 in the **LDC_CONFIG[7] CNST_MD** bit field.
18. If also using affine transform, set the six affine transform parameters in the following bit fields:
 - **LDC_AB[15:0] A**
 - **LDC_AB[31:16] B**
 - **LDC_CD[15:0] C**
 - **LDC_CD[31:16] D**
 - **LDC_EF[15:0] E**
 - **LDC_EF[31:16] F**
 If affine transform is not used, these must be set to the following values:
 - **LDC_AB[15:0] A = 4096**
 - **LDC_AB[31:16] B = 0**
 - **LDC_CD[15:0] C = 0**
 - **LDC_CD[31:16] D = 0**
 - **LDC_EF[15:0] E = 4096**
 - **LDC_EF[31:16] F = 0**
19. Set the **LDC_PCR[0] EN** bit to 1 to start the LDC operation.
20. Wait for the **LDC_PCR[2] BUSY** bit to become IDLE (0x0) or wait for the end of frame completion interrupt.

7.4.5.4.4 ISS SIMCOP LDC Programming Affine Transformation

Camera motions cause the frames to have translation or rotation differences. The affine transform offers control to account for scaling, rotation, and translation transforms.

For example, the rotation use case can be parameterized with the affine transform parameters shown in [Figure 7-262](#).

Figure 7-262. ISS SIMCOP LDC Parameters for Rotation

$$\begin{bmatrix} \text{hoff} \\ \text{voff} \end{bmatrix} = \begin{bmatrix} a & b \\ d & e \end{bmatrix} \begin{bmatrix} \text{hd} \\ \text{vd} \end{bmatrix} + \begin{bmatrix} c \\ f \end{bmatrix}$$

$$\begin{bmatrix} \text{hoff} \\ \text{voff} \end{bmatrix} = \begin{bmatrix} \cos(\theta) & \sin(\theta) \\ -\sin(\theta) & \cos(\theta) \end{bmatrix} \begin{bmatrix} \text{hd} \\ \text{vd} \end{bmatrix} + \begin{bmatrix} h_0 - h_0 \times \cos(\theta) - v_0 \times \sin(\theta) \\ v_0 + h_0 \times \cos(\theta) - v_0 \times \sin(\theta) \end{bmatrix}$$

ldc-016

where theta is the angle of rotation. In the scaling case, the affine transform uses the parameters shown in [Figure 7-263](#).

Figure 7-263. ISS SIMCOP LDC Parameters for Scaling

$$\begin{bmatrix} \text{hoff} \\ \text{voff} \end{bmatrix} = \begin{bmatrix} a & b \\ d & e \end{bmatrix} \begin{bmatrix} \text{hd} \\ \text{vd} \end{bmatrix} + \begin{bmatrix} c \\ f \end{bmatrix}$$

$$\begin{bmatrix} \text{hoff} \\ \text{voff} \end{bmatrix} = \begin{bmatrix} \alpha & 0 \\ 0 & \alpha \end{bmatrix} \begin{bmatrix} \text{hd} \\ \text{vd} \end{bmatrix} + \begin{bmatrix} h_0(1 - \alpha) \\ v_0(1 - \alpha) \end{bmatrix}$$

ldc-017

where alpha is the scale factor. Translation uses an identity matrix with the translation vector as the affine transform parameters, as in [Figure 7-264](#), where Th and Tv are the translation parameters. More complex transforms can be derived and the affine transformation is general so that optimization routines can be used to provide the best parameters to align two frames.

Figure 7-264. ISS SIMCOP LDC Parameters for Translation

$$\begin{bmatrix} \text{hoff} \\ \text{voff} \end{bmatrix} = \begin{bmatrix} a & b \\ d & e \end{bmatrix} \begin{bmatrix} \text{hd} \\ \text{vd} \end{bmatrix} + \begin{bmatrix} c \\ f \end{bmatrix}$$

$$\begin{bmatrix} \text{hoff} \\ \text{voff} \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \left[\begin{bmatrix} \text{hd} \\ \text{vd} \end{bmatrix} + \begin{bmatrix} \text{Th} \\ \text{Tv} \end{bmatrix} \right]$$

ldc-018

To initialize and run the LDC to perform affine transform, the application must:

1. Check and wait for the [LDC_PCR\[2\]](#) BUSY bit to become IDLE (0x0).
2. Set the [LDC_PCR\[4:3\]](#) MODE bit field for UYVY (0x0) or NV12 data (0x2).
3. If lens distortion correction is performed at the same time as the affine transform, set the [LDC_PCR\[2\]](#) LDMAPEN bit to 1. Otherwise, set the [LDC_PCR\[1\]](#) LDMAPEN bit to 0.
4. Set the input frame base address in the [LDC_RD_BASE\[31:0\]](#) RBASE bit field. The frame base address must be aligned on a 16-byte boundary.
5. Set the input frame line offset in the [LDC_RD_OFST\[15:0\]](#) ROFST bit field.
6. If reading the input from a circular buffer:
 - Set [LDC_PCR\[9\]](#) CIRCEN = 1
 - b. If using row address, LDC computes the row number and applies a modulo operation. The absolute address in the buffer is computed from this wrap-around row and the column number and then data is fetched from the circular buffer. Set the circular buffer size in [LDC_RD_OFST.MOD](#). In UYVY mode, the number of rows in the buffer is [LDC_RD_OFST.MOD](#). In NV12 and NV21 modes, the number of rows in the Y buffer is [LDC_RD_OFST.MOD](#) and the number of rows in the Cb/Cr buffers is ([LDC_RD_OFST.MOD](#) / 2).
7. Set the tile size in the [LDC_BLOCK\[15:8\]](#) OBH and [LDC_BLOCK\[7:0\]](#) OBW bit fields. See constraints on OBW in [Table 7-3197](#)
8. Set the pixel pad in the [LDC_BLOCK\[19:16\]](#) PIXPAD bit field.
9. Set the input frame size in [LDC_INPUT_FRAME_SIZE\[29:16\]](#) H and [LDC_INPUT_FRAME_SIZE\[13:0\]](#) W.
10. Set the output frame size in the [LDC_FRAME_SIZE\[29:16\]](#) H and [LDC_FRAME_SIZE\[13:0\]](#) W bit fields. H and W values must be multiples of OBH and OBW, respectively.
11. Set the starting output point in the [LDC_INITXY\[13:0\]](#) INITX and [LDC_INITXY\[29:16\]](#) INITY bit fields.
12. Set the output frame starting address in the [LDC_WR_BASE\[31:0\]](#) WBASE bit field. The output frame must be 16-byte aligned.
13. Set the output frame line offset in the [LDC_WR_OFST\[15:0\]](#) WOFST bit field.
14. If the data format is NV12, set the 4:2:0 UV input plane base address in the [LDC_420C_RD_BASE\[31:0\]](#) RBASE bit field. This address must be 16-byte aligned.
15. If the data format is NV12, set the 4:2:0 UV output plane base address in the [LDC_420C_WR_BASE\[31:0\]](#) WBASE bit field. This address must be 16-byte aligned.
16. Set the mesh offset table pointer to the correct address ([LDC_MESHTABLE_BASE\[31:0\]](#) BASE and [LDC_MESHTABLE_OFST\[15:0\]](#) OFST). Set the table downsampling factor for MxM downsampling in [LDC_MESHTABLE_CONFIG\[2:0\]](#) M.
17. If the LDC is connected to image buffers where the output address is not updated for each tile, set the constant mode to 0x1 in the [LDC_CONFIG\[7\]](#) CNST_MD bit.
18. Set the Y plane interpolation type to bilinear or bicubic in the [LDC_CONFIG\[6\]](#) YINT_TYP bit.
19. Set the six affine transform parameters in the following bit fields:
 - [LDC_AB\[15:0\]](#) A
 - [LDC_AB\[31:16\]](#) B
 - [LDC_CD\[15:0\]](#) C
 - [LDC_CD\[31:16\]](#) D

- [LDC_EF\[15:0\]](#) E
 - [LDC_EF\[31:16\]](#) F
- If affine transform is not used, then these need to be set to the following values: [LDC_AB\[15:0\]](#) A = 4096, [LDC_AB\[31:16\]](#) B = 0, [LDC_CD\[15:0\]](#) C = 0, [LDC_CD\[31:16\]](#) D = 0, [LDC_EF\[15:0\]](#) E = 4096, and [LDC_EF\[31:16\]](#) F = 0.
20. Disable perspective warp transform with [LDC_PCR.PWARPEN](#) = 0. Set the two perspective transform parameters [LDC_GH.G](#) = 0 and [LDC_GH.H](#) = 0.
 21. Set the [LDC_PCR\[0\]](#) EN bit to 1 to start the LDC operation.
 22. Wait for the [LDC_PCR\[2\]](#) BUSY bit to become IDLE (0x0) or wait for the completion interrupt.

7.4.5.4.5 ISS SIMCOP LDC Programming Perspective Transformation

Perspective transforms are used to align the image data of two different cameras viewing the same scene from different positions. It can also be used in the case of stereo image rectification to align the epipolar lines of the left/right image pair with their scanlines.

The following steps need to be performed by the application to initialize and run LDC to perform perspective transform.

1. Check and wait for [LDC_PCR\[2\]](#) BUSY to become IDLE (0x0).
2. Set [LDC_PCR\[4:3\]](#) MODE for UYVY (0x0) or NV12 data (0x2).
3. If lens distortion correction is performed at the same time as the perspective transform, set [LDC_PCR\[1\]](#) LDMAPEN = 0x1. Otherwise, set [LDC_PCR\[1\]](#) LDMAPEN = 0x0.
4. Set the input frame base address in [LDC_RD_BASE\[31:0\]](#) RBASE. Note that the frame base address must be aligned on a 16-byte boundary.
5. Set the input frame line offset in [LDC_RD_OFST\[15:0\]](#) ROFST.
6. Set the tile size in [LDC_BLOCK\[15:8\]](#) OBH and [LDC_BLOCK\[7:0\]](#) OBW. Note the constraints on OBW in [Table 7-3197](#).
7. Set the pixel pad in [LDC_BLOCK\[19:16\]](#) PIXPAD.
8. Set the input frame size in [LDC_INPUT_FRAME_SIZE\[29:16\]](#) H and [LDC_INPUT_FRAME_SIZE\[13:0\]](#) W.
9. Set the output frame size in [LDC_FRAME_SIZE\[29:16\]](#) H and [LDC_FRAME_SIZE\[13:0\]](#) W. These values must be a multiple of OBH and OBW respectively.
10. Set the starting output point in [LDC_INITXY\[13:0\]](#) INITX and [LDC_INITXY\[29:16\]](#) INITY.
11. Set the output frame starting address in [LDC_WR_BASE\[31:0\]](#) WBASE. The output frame must be 16-byte aligned.
12. Set the output frame line offset in [LDC_WR_OFST\[15:0\]](#) WOFST.
13. If the data format is NV12, set the 420 UV input plane base address in [LDC_420C_RD_BASE\[31:0\]](#) RBASE. This address must be 16-byte aligned.
14. If the data format is NV12, set the 420 UV output plane base address in [LDC_420C_WR_BASE\[31:0\]](#) WBASE. This address must be 16-byte aligned.
15. Set the mesh offset table pointer to the correct address ([LDC_MESHTABLE_BASE\[31:0\]](#) BASE and [LDC_MESHTABLE_OFST\[15:0\]](#) OFST). Set the table downsampling factor for MxM downsampling in [LDC_MESHTABLE_CONFIG\[2:0\]](#) M.
16. If LDC module is connected to image buffers where the output address is not updated for each tile, set constant mode = 0x1 in [LDC_CONFIG\[7\]](#) CNST_MD.
17. Set the Y plane interpolation type to bilinear or bicubic in [LDC_CONFIG\[8\]](#) YINT_TYP.
18. Set the eight perspective transform parameters in the following bit fields:
 - [LDC_AB\[15:0\]](#) A
 - [LDC_AB\[31:16\]](#) B
 - [LDC_CD\[15:0\]](#) C
 - [LDC_CD\[31:16\]](#) D

- [LDC_EF\[15:0\]](#) E
- [LDC_EF\[31:16\]](#) F
- [LDC_GH\[0:15\]](#)G
- [LDC_GH\[31:16\]](#) H

. If affine transform is not used, then these need to be set to the following values: [LDC_AB\[15:0\]](#) A = 4096, [LDC_AB\[31:16\]](#) B = 0, [LDC_CD\[15:0\]](#) C = 0, [LDC_CD\[31:16\]](#) D = 0, [LDC_EF\[15:0\]](#) E = 4096, [LDC_EF\[31:16\]](#) F = 0, [LDC_GH\[0:15\]](#)G = 0 and [LDC_GH\[31:16\]](#) H = 0. Enable [LDC_PCR\[7\]](#) PWARPEN = 1.

19. If smart codec statistics are desired:

1. Enable by setting [LDC_PCR\[8\]](#) SCSEN = 1.
2. Set the number of regions in [LDC_SCS_CTL\[6:5\]](#) REGION (0=1x1, 1=2x2, 2=3x3, 3=4x4).
3. Set the division factor for the sum and sum of squares statistics in [LDC_SCS_CTL\[4:0\]](#) ACCSHIFT. The division is a power-of-two division, so this value is the right shift parameter.
4. Program the number of lines computed before the row macroblock statistics are transferred to memory in [LDC_SCS_CTL\[29:16\]](#) SLICE_SIZE. This feature is useful for slice-based processing to ensure that statistics for the macroblock rows are available at the same time that the LDC output data is available. This must be a multiple of 16.

20. Set [LDC_PCR\[0\]](#) EN = 0x1 to start the LDC operation.

21. Wait for [LDC_PCR\[2\]](#) BUSY to become IDLE (0x0) or wait for the end of frame completion interrupt.

Bits	Field Name	Description	Type	Reset
31:18	RESERVED	Reserved.	R	0x0
17:16	STANDBYMODE	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state. 0x0 FORCE Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only. 0x1 NO No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only. 0x2 SMART Smart-standby mode: local initiator standby status depends on local conditions, i.e. the module's functional requirement from the initiator.	RW	0x2
15:12	RESERVED	Reserved.	R	0x0
11	SCS_SUPPORT	Reports '1' if SCS feature is supported by LDC.	R	0x0
10	AFF_EXPANDEN	Enables expanded format of affine warp coefficients (A, B, D, and E). 0: A, B, D, E are treated as S14Q12 1: A, B, D, E are treated as S16Q12	RW	0x0
9	CIRCEN	Enables circular addressing mode. 0 - Disable circular addressing for input data. 1 - Enable circular addressing.	RW	0x0
8	SCSEN	Enable/Disable smart codec statistic (SCS) function. 0 - Disable SCS 1 - Enable SCS	RW	0x0
7	PWARPEN	Enable perspective warp transform. Set to 1 to enable use of LDC_GH[15:0] G and LDC_GH[31:16] H.	RW	0x0
6:5	BMODE	Bayer data format (only applicable when MODE=1). 3: A-law data in/out, 2: Packed 8-bit data in/out, 1: Packed 12-bit data in/out, 0: Unpacked 12-bit data in/out	RW	0x0
4:3	MODE	2: YCbCr 4:2:0 Lens Distortion, 1: Bayer chromatic aberration mode, 0: YCbCr 4:2:2 Lens Distortion	RW	0x0
2	BUSY	Idle/busy status, 0: Idle, 1: Busy, asserted when function is started, cleared when function is complete	R	0x0

Bits	Field Name	Description	Type	Reset
1	LDMAPEN	LD Mapping Enable, 1: Enabled, 0: Disabled	RW	0x0
0	EN	Write 1 to start the function, as specified in MODE	RW	0x0

Table 7-3234. LDC_SCS_CTL

Address Offset	0x0000 0054	Instance	LDC
Physical Address	0x5202 0154		
Description	Define number of regions and output divider for region based statistics.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED		SLICE_SIZE										RESERVED							REGION	ACCSHIFT											

Bits	Field Name	Description	Type	Reset
31:30	RESERVED	Reserved.	R	0x0
29:16	SLICE_SIZE	Sets the number of output lines computed by LDC before the computed macroblock row statistics are transferred to system memory. This must be a multiple of 16 so bits [19:16] are internally fixed to zero. The maximum possible value is 8176 (0x1FF0).	RW	0x0
15:7	RESERVED	Reserved.	R	0x0
6:5	REGION	Sets the number of regions in both directions for the region based statistics. Possible values: 0 - 1x1 1 - 2x2 2 - 3x3 3 - 4x4	RW	0x0
4:0	ACCSHIFT	Sets the output divider for sum of pixels in a region and sum of squares of pixels in a region. This parameter right shifts the final accumulator prior to writing the output statistics.	RW	0x0

Video Input Port

This chapter describes the Video Input Port (VIP) module for the device.

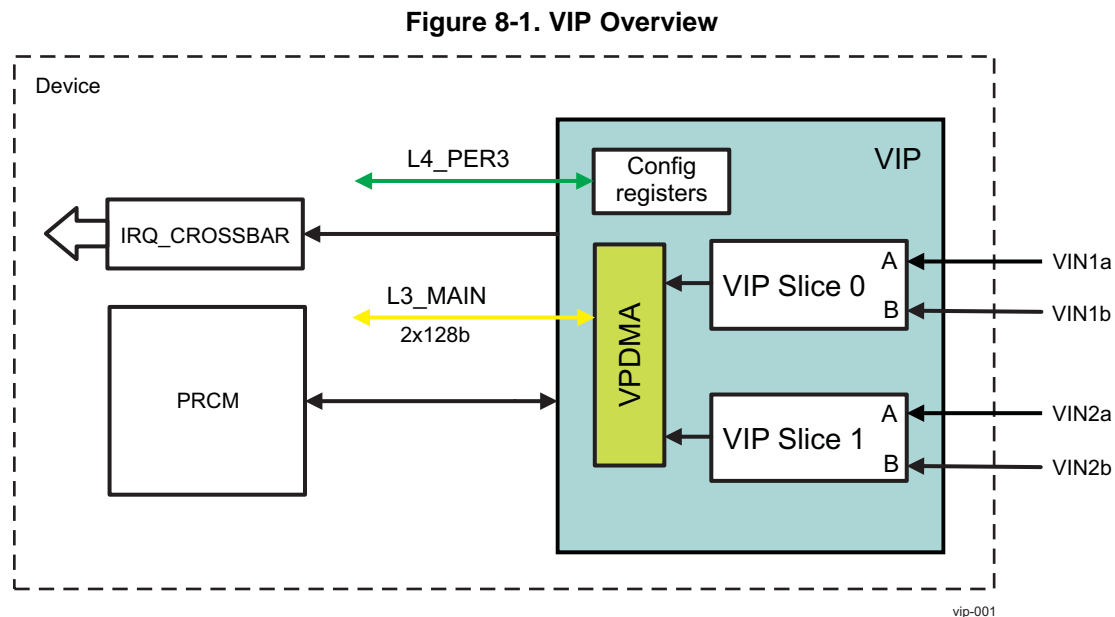

Topic	Page
8.1 VIP Overview	3054
8.2 VIP Environment	3055
8.3 VIP Integration	3059
8.4 VIP Functional Description	3060
8.5 VIP Register Manual	3199

8.1 VIP Overview

NOTE: The number of supported VIN ports is device part number dependent. Refer to device Data Manual for more information.

The VIP module provides video capture functions for the device. VIP incorporates a multi-channel raw video parser, various video processing blocks, and a flexible Video Port Direct Memory Access (VPDMA) engine to store incoming video in various formats. The device integrates a single instantiation of the VIP module giving the ability of capturing up to four video streams.

Figure 8-1 shows a block diagram with the VIP module within the device.

A VIP module includes the following main features:

- Two independently configurable external video input capture slices (Slice 0 and Slice 1) each providing up to two video input ports, Port A and Port B:
 - Port A can be configured as a 16/8-bit port.
 - Port B is a fixed 8-bit port.
 - At device level, the same device pads may be shared between Port A and Port B of each slice. For more information, see the multiplexing characteristics in device Data Manual.
- Each video Port A can be operated as a port with clock independent input channels (with interleaved or separated Y/C data input). Embedded sync and external sync modes are supported for all input configurations.
- Support for a single external asynchronous pixel clock, up to 165MHz per port.
- Pixel Clock Input Domain Port A supports up to one 16-bit input data bus, including BT.1120 style embedded sync for 16-bit data.
- Embedded Sync data interface mode supports single or multiplexed sources
- Discrete Sync data interface mode supports only single source input
- 16-bit data input plus discrete syncs can be configured to include:
 - 8-bit YUV422 (Y and U/V time interleaved)
 - 16-bit YUV422 (CbY and CrY time interleaved)
 - 16-bit RGB565
 - 16-bit RAW Capture
- Discrete sync modes include:

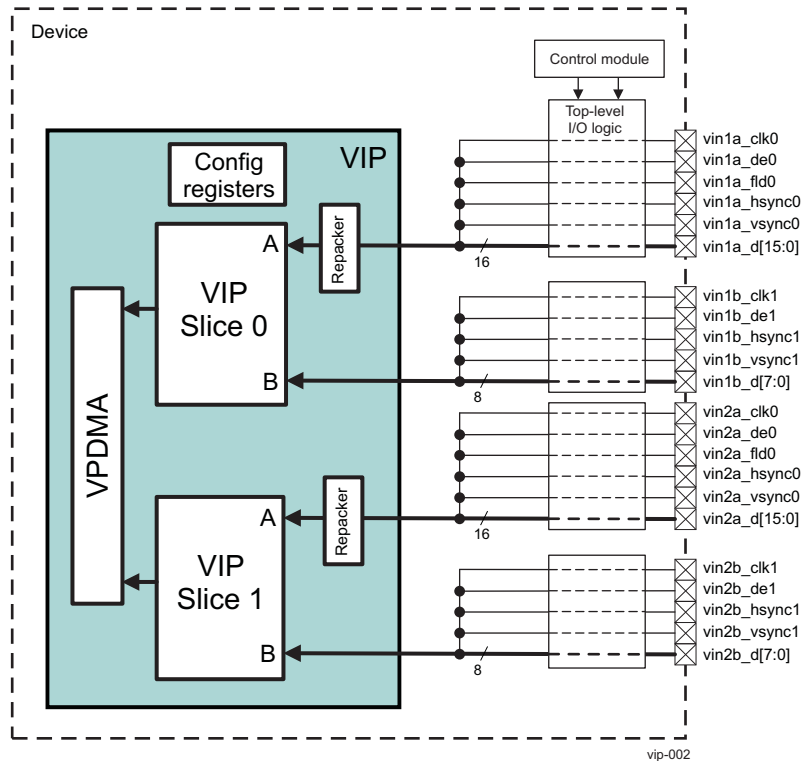

- VSYNC + HSYNC (FID determined by FID signal pin or HSYNC/VSYNC skew)
- VSYNC + ACTVID + FID
- VBLANK + ACTVID (ACTVID toggles in VBLANK) + FID
- VBLANK + ACTVID (no ACTVID toggles in VBLANK) + FID
- Multichannel parser (embedded syncs only):
 - Embedded syncs only
 - Pixel (2x or 4x) or Line multiplexed modes supported
 - Performs demultiplexing and basic error checking
 - Supports maximum of 9 channels in Line Mux (8 normal + 1 split line)
- Ancillary data capture support:
 - For 16-bit input, ancillary data may be extracted from any single channel
 - For 8-bit time interleaved input, ancillary data can be chosen from the Luma channel, the Chroma channel, or both channels
 - Horizontal blanking interval data capture only supported when using discrete syncs (VSYNC + HSYNC or VSYNC + HBLANK)
 - Ancillary data extraction supported on multichannel capture as well as single source streams
- Format conversion and scaling:
 - Programmable color space conversion
 - YUV422 to YUV444 conversion
 - YUV444 to YUV422 conversion
 - YUV422 to YUV420 conversion
 - YUV422 Source: YUV422 to YUV422, YUV422 to YUV420, YUV422 to YUV444, YUV422 to RGB888
 - Supports RAW to RAW (no processing)
 - Scaling and format conversions do not work for multiplexed input
- Supports up to 2047 pixels wide input - when scaling is engaged
- Supports up to 3840 pixels wide input - when only chroma up/down sampling is engaged, without scaling
- Supports up to 4095 pixels wide input - without scaling and chroma up/down sampling
- The maximum supported input resolution is further limited by pixel clock and feature-dependent constraints

A VPDMA module includes the following main features:

- VPDMA output buffer size restriction feature, which ensures that writes do not exceed allocated memory buffer size
- Support for Tiled (2D) and raster addressing without bandwidth penalty
- Dual clients per channel allows for capture of scaled and nonscaled versions of the data stream (non-multiplexed mode only)
- Start on new frame capability
- Interrupt every X number of frames
- Interrupt every X lines (synced to frame start)
- Dynamic MFLAG generation

8.2 VIP Environment

This section describes the VIP module from an environment point of view (external connections). It describes the VIP connectivity options and lists all possible interfaces. [Figure 8-2](#) is a block diagram of the VIP environment.

Figure 8-2. VIP Environment

NOTE: The number of supported VIN ports is device part number dependent. Refer to device Data Manual for more information.

NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to different pads of the device and is programmable in the device Control Module registers and/or dedicated module registers. For more information, see [Section 14.4.6.1, Pad Configuration Registers](#) in [Chapter 14, Control Module](#).

Table 8-1. VIP Interface Signals

Sub-module Name	Signal Name	Type ⁽¹⁾	Description
Slice 0	vin1a_d[15:0]	I	Pixel data.
Port A	vin1a_clk0	I	Pixel clock.
	vin1a_vsync0	I	Vertical synchronization.
	vin1a_hsync0	I	Horizontal synchronization.
	vin1a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin1a_fid0	I	The FID signal indicates the field identifier for the video input field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.
Slice 0	vin1b_d[7:0]	I	Pixel data.

⁽¹⁾ I = Input, O = Output, I/O = Input/Output

Table 8-1. VIP Interface Signals (continued)

Sub-module Name	Signal Name	Type ⁽¹⁾	Description
Port B	vin1b_clk1	I	Pixel clock.
	vin1b_vsync1	I	Vertical synchronization.
	vin1b_hsync1	I	Horizontal synchronization.
	vin1b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
Slice 1	vin2a_d[15:0]	I	Pixel data.
Port A	vin2a_clk0	I	Pixel clock.
	vin2a_vsync0	I	Vertical synchronization.
	vin2a_hsync0	I	Horizontal synchronization.
	vin2a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin2a_fld0	I	The FID signal indicates the field identifier for the video input field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.
Slice 1	vin2b_d[7:0]	I	Pixel data.
Port B	vin2b_clk1	I	Pixel clock.
	vin2b_vsync1	I	Vertical synchronization.
	vin2b_hsync1	I	Horizontal synchronization.
	vin2b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.

NOTE: At device level, the same device pads may be shared between Port A and Port B of each slice. For more information, see the multiplexing characteristics in device Data Manual.

Table 8-2 summarizes the mapping of YUV color components to VIP input data signals, with corresponding settings of `VIP_MAIN[1:0] DATA_INTERFACE_MODE` register bit-field.

Table 8-2. VIP Input Data Signals to YUV Color Components Mapping

VIP Port A Data Signals	VIP Port B Data Signals	16-bit YUV422 Input Mode ⁽¹⁾	8-bit YUV422 Input Mode ⁽²⁾
X = 1 to 2	X = 1 to 2	DATA_INTERFACE_MODE = 01b	DATA_INTERFACE_MODE = 10b
vinXa_d15	-	Y7 (MS bit)	-
vinXa_d14	-	Y6	-
vinXa_d13	-	Y5	-
vinXa_d12	-	Y4	-
vinXa_d11	-	Y3	-
vinXa_d10	-	Y2	-

⁽¹⁾ Chroma is time division multiplexed (interleaved). For more details, see [Section 8.4.5.6.2, 16b Interface Mode](#).

⁽²⁾ Luma and Chroma are time division multiplexed (interleaved). For more details, see [Section 8.4.5.6.1, 8b Interface Mode](#).

Table 8-2. VIP Input Data Signals to YUV Color Components Mapping (continued)

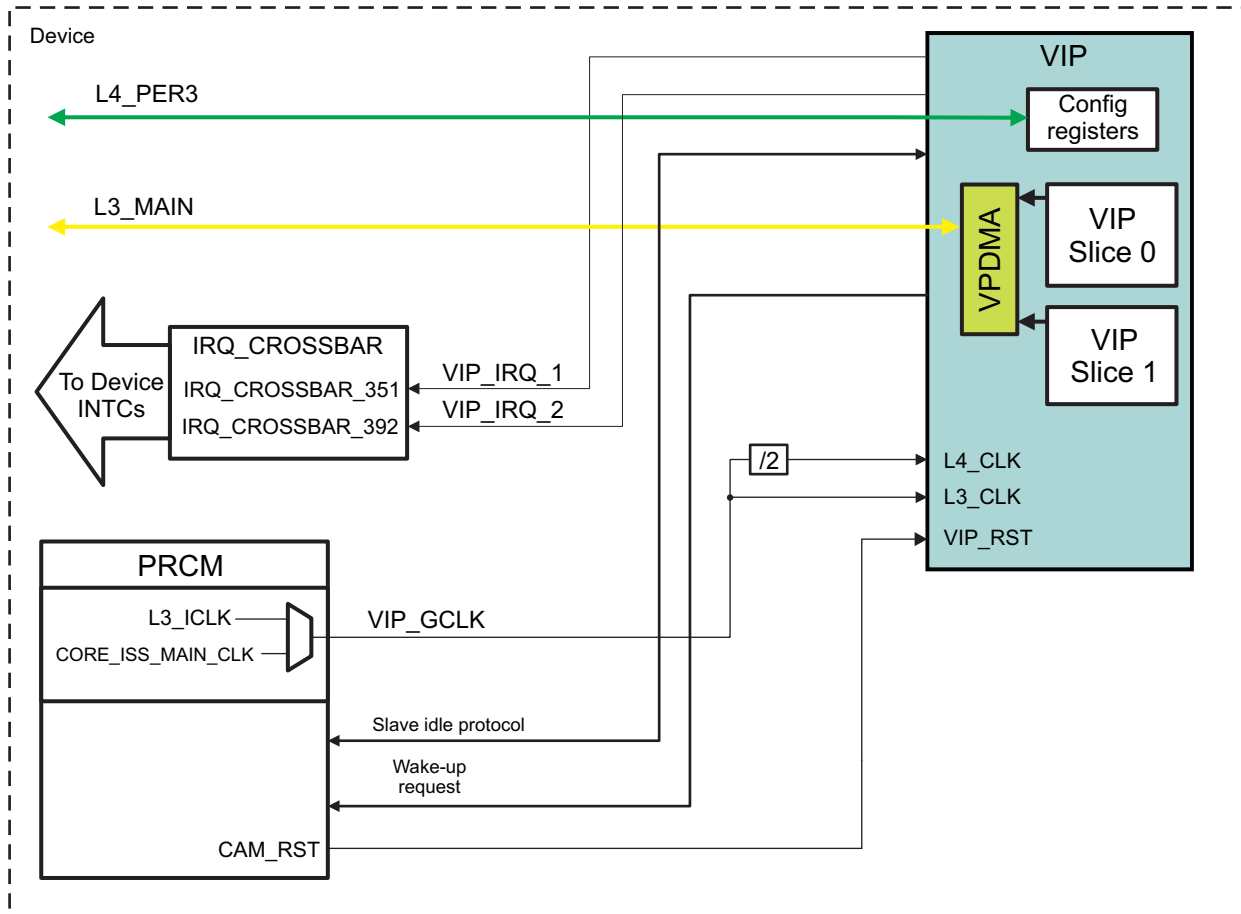

VIP Port A Data Signals	VIP Port B Data Signals	16-bit YUV422 Input Mode ⁽¹⁾	8-bit YUV422 Input Mode ⁽²⁾
vinXa_d9	-	Y1	-
vinXa_d8	-	Y0	-
vinXa_d7	vinXb_d7	Cb7/Cr7/...	Cb7/Y7/Cr7/... (MS bit)
vinXa_d6	vinXb_d6	Cb6/Cr6/...	Cb6/Y6/Cr6/...
vinXa_d5	vinXb_d5	Cb5/Cr5/...	Cb5/Y5/Cr5/...
vinXa_d4	vinXb_d4	Cb4/Cr4/...	Cb4/Y4/Cr4/...
vinXa_d3	vinXb_d3	Cb3/Cr3/...	Cb3/Y3/Cr3/...
vinXa_d2	vinXb_d2	Cb2/Cr2/...	Cb2/Y2/Cr2/...
vinXa_d1	vinXb_d1	Cb1/Cr1/...	Cb1/Y1/Cr1/...
vinXa_d0	vinXb_d0	Cb0/Cr0/... (LS bit)	Cb0/Y0/Cr0/... (LS bit)

NOTE: 16-bit RGB data can also be captured on the vinXa_d[15:0] input data bus of Port A. The 16-bit RGB data captured by the VIP_PARSER will be passed to VPDMA, as if it is a 16-bit YUV data. The [VIP_MAIN\[1:0\] DATA_INTERFACE_MODE](#) register bit-field must be configured for a 16-bit input mode. The VPDMA will then directly store this data in memory as a 16-bit data, provided that any 16-bit data type in the VPDMA outbound descriptor is set.

8.3 VIP Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests. [Figure 8-3](#) summarizes the integration of the module in the device.

Figure 8-3. VIP Integration

vip-003

[Table 8-3](#) and [Table 8-4](#) list the integration attributes and clock and resets, respectively.

Table 8-3. VIP Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
VIP	PD_CAM	L4_PER3 for configuration L3_MAIN for data (through VPDMA module)

Table 8-4. VIP Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VIP	L3_CLK PROC_CLK	VIP_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VIP subsystem uses this clock to fetch external data and transfer this data to internal processing PROC_CLK is the clock used to drive data processing within the VIP subsystem.
	L4_CLK	VIP_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VIP	VIP_RST	CAM_RST	PRCM	VIP1 Reset

Table 8-5. VIP Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
VIP	VIP_IRQ1	IRQ_CROSSBAR_351	N/A	VIP interrupt requests. These IRQ source signals are not mapped by default to any device INTC.
	VIP_IRQ2	IRQ_CROSSBAR_392	N/A	

NOTE: The “Default Mapping” column in [Table 8-5 VIP Hardware Requests](#) shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.

For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#).

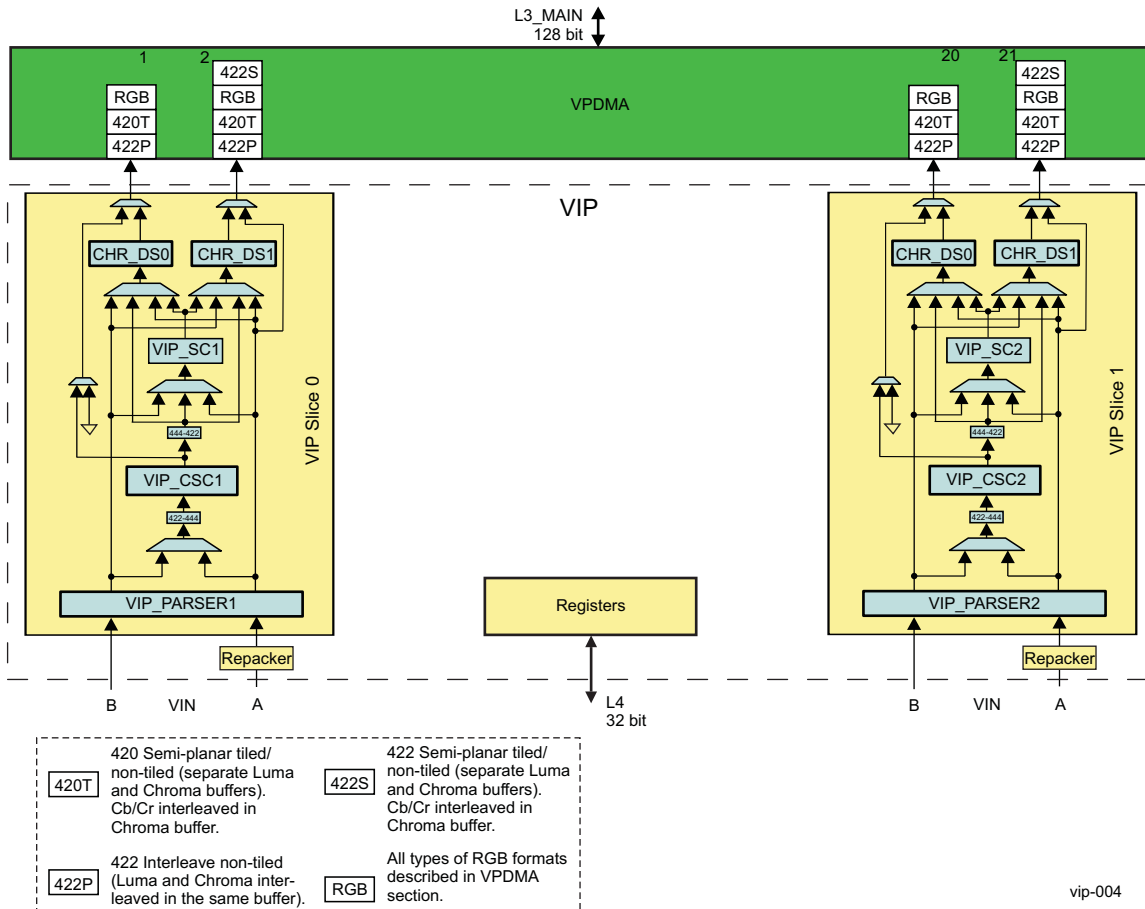

For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#).

8.4 VIP Functional Description

8.4.1 VIP Block Diagram

[Figure 8-4](#) shows the internal structure of a single VIP module in the device.

Figure 8-4. VIP Block Diagram

8.4.2 VIP Software Reset

Software reset in the VIP module can be done by setting the `VIP_CLKC_RST[16]` `VIP1_DP_RST` for Slice 0, `VIP_CLKC_RST[17]` `VIP2_DP_RST` for Slice 1, `VIP_CLKC_RST[0]` `VPDMA_RST` for VIP VPDMA to 0x1. By setting `VIP_CLKC_RST[31]` `MAIN_RST` reset is performed for all modules within the instance. Software must ensure that the software reset completes before performing operations within the VIP module.

8.4.3 VIP Power and Clocks Management

The VIP modules support the MStandby/Wait and IdleReq/SidleAck protocols as defined in [Chapter 3, Power, Reset, and Clock Management](#).

Power Management within the VIP module can be accomplished in several ways:

- L4 MConnect/SConnect can disable the internal L4 clock network
- L3 MConnect/Sconnect can disable the internal L3 clock network

These items are accomplished using the standard slave idle (for L4) and master standby (for L3) protocols. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shut down applies to the clock signals - `L3_CLK` and `L4_CLK`.

8.4.3.1 VIP Clocks

The VIP internal clock domains can only be shut down by writing the appropriate register bit within the Clock Enable register - [VIP_CLKC_CLKEN\[16\]](#) VIP1_DP_EN for slice0, [VIP_CLKC_CLKEN\[17\]](#) VIP2_DP_EN for slice1 and [VIP_CLKC_CLKEN\[0\]](#) VPDMA_EN for the VPDMA engine

8.4.3.2 VIP Idle Mode

The VIP supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the [VIP_SYSCONFIG\[3:2\]](#) IDLEMODE bit field.

Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state.

- Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements.
- No-idle mode: local target never enters idle state.
- Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA related requests) wakeup events

8.4.3.3 VIP StandBy Mode

The VIP supports no-standby mode and force-standby mode. The mode is set in the [VIP_SYSCONFIG\[5:4\]](#) STANDBYMODE bit field.

Configuration of the local initiator state management mode:

- Force-standby mode: local initiator is unconditionally placed in standby state.
- No-standby mode: local initiator is unconditionally placed out of standby state.

8.4.4 VIP Slice

8.4.4.1 VIP Slice Processing Path Overview

[Figure 8-5](#) shows in details the internal processing path and output signals to VPDMA for a single VIP Slice. External video source drives the input side of the VIP Slice. Port A[x:y] can be in YUV422 format (A[15:0] in the diagram). Port B[x:y] can be in YUV422 format (B[15:0] in the diagram). Multiplexer selections and controls shown in [Figure 8-5](#) are described in register [VIP_CLKC_VIP0DPS](#) for Slice 0, and register [VIP_CLKC_VIP1DPS](#) for Slice 1. The outputs of each VIP Slice drive the VPDMA module, which sends the resulting data to DDR memory.

NOTE: [VIP_MAIN\[1:0\]](#) DATA_INTERFACE_MODE bit-field must be properly configured for the expected data format on Port A.

By default, DATA_INTERFACE_MODE bit-field is set for 24-bit input data interface on Port A. It is SW responsibility to select 16-bit or 8-bit data interface, depending on the use case.

Port B input data interface is always 8-bit.

8.4.4.2 VIP Slice Processing Path Multiplexers

8.4.4.2.1 VIP_CSC Multiplexers

The following registers are controlling the VIP Color Space Converter (CSC) multiplexers: [VIP_CLKC_VIP0DPS\[2:0\]](#) VIP1_CSC_SRC_SELECT for Slice 0 and [VIP_CLKC_VIP1DPS\[2:0\]](#) VIP2_CSC_SRC_SELECT for Slice 1.

The VIP_CSC block (for each slice within the VIP subsystem) receives data from one the following sources:

- VIP_PARSER Port A Output (422)
- VIP_PARSER Port B Output (422)

The default state for this multiplexer is disabled, so there is no VIP_CSC input.

8.4.4.2.2 VIP_SC Multiplexer

The multiplexer for Slice 0 and Slice 1 is controlled by [VIP_CLKC_VIP0DPS\[5:3\]](#) VIP1_SC_SRC_SELECT and [VIP_CLKC_VIP1DPS\[5:3\]](#) VIP2_SC_SRC_SELECT, respectively.

The scaler module (VIP_SC) within the VIP subsystem (for a single slice) receives data from one of the following sources:

- VIP_CSC
- VIP_PARSER Port A Output
- VIP_PARSER Port B Output

The default state for this multiplexer is disabled, so there is no VIP_SC input.

8.4.4.2.3 Output to VPDMA Multiplexers

This section is under development and is included as a placeholder for future updates.

8.4.4.3 VIP Slice Processing Path Examples

The following sections provide VIP Slice data path examples for different types of input data, and describe the corresponding multiplexer configurations.

In the block diagrams of the following sections, Output A refers to `_LO[15:0]` outputs, an Output B refers to `_UP[15:0]` outputs.

8.4.4.3.1 Input: B:YUV422; Output: B:RGB

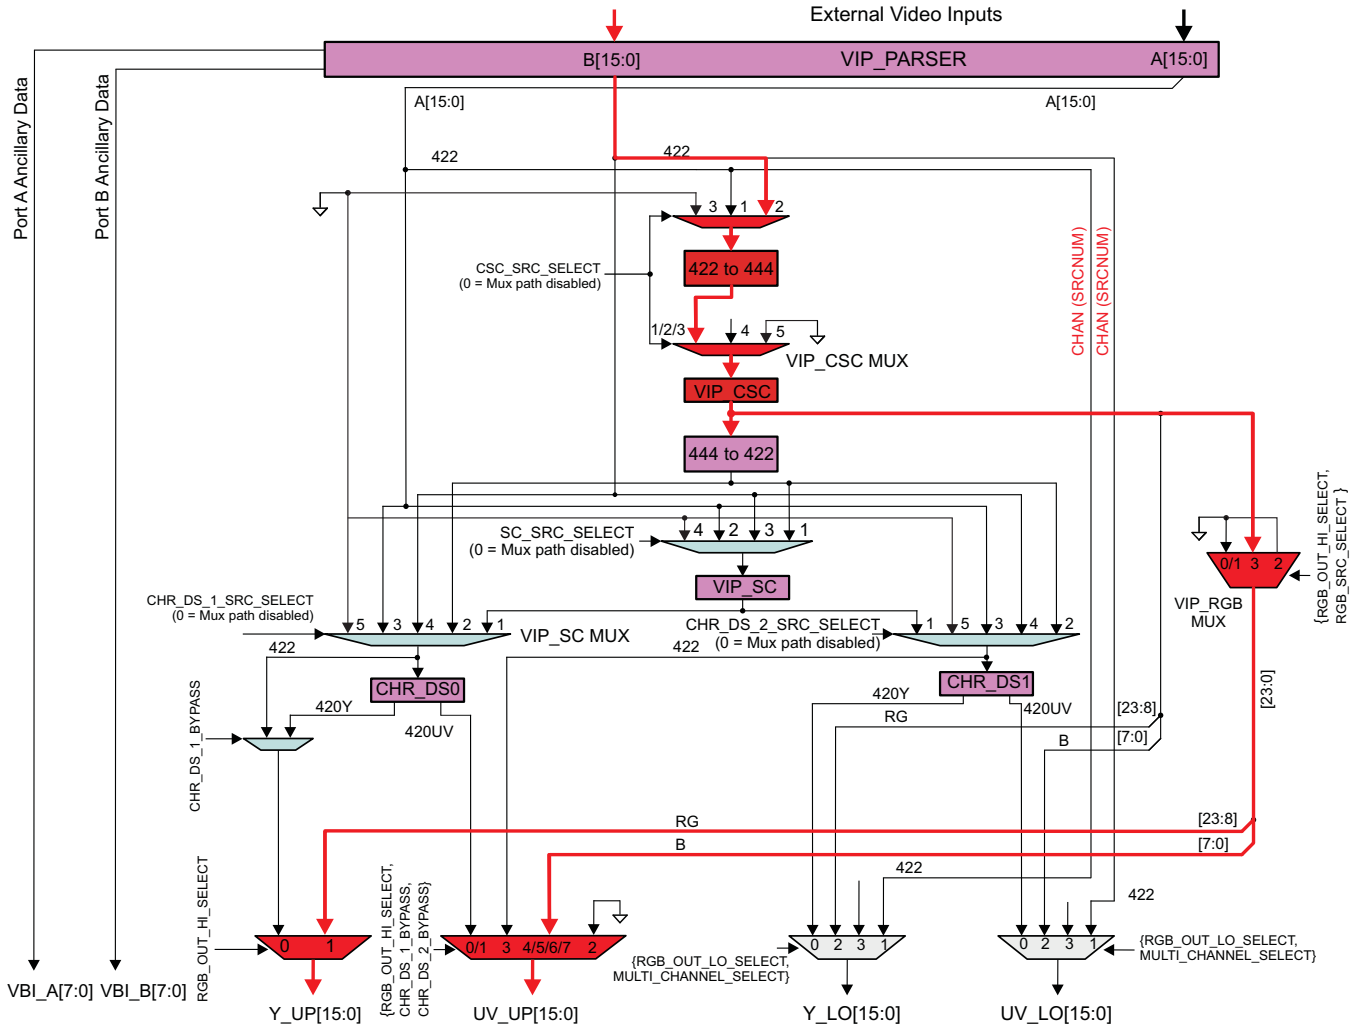

Tested in single channel embedded and discrete mode.

Input: B:YUV422; Output: B:RGB

Multiplexers Settings:

- VIPx_CSC_SRC_SELECT = 2
- VIPx_SC_SRC_SELECT = 0
- VIPx_CHR_DS_1_SRC_SELECT = 0
- VIPx_CHR_DS_1_BYPASS = 0
- VIPx_CHR_DS_2_SRC_SELECT = 0
- VIPx_CHR_DS_2_BYPASS = 0

8.4.5 VIP Parser

The VIP Parser (VIP_PARSER) module is used to capture the external video data into the VIP module.

8.4.5.1 Features

Each VIP module contains two VIP_PARSER modules (one VIP_PARSER per slice).

For a single VIP_PARSER, the video capture functions include:

- Two Pixel Clock Input Domains are supported (Port A and Port B):
 - Each Pixel Clock Input Domain has separate clock and framing signals.
 - Each Pixel Clock Input Domain can support embedded (BT.656/1120 style in 16-bit, or BT.656 in 8-bit) or discrete (BT.601 style) sync.
 - Pixel Clock Input Domain Port B supports one 8-bit input data bus. Port A supports one 16-bit input data bus. At device level, the same device pads may be shared between Port A and Port B. For more information, see the multiplexing characteristics in device Data Manual.
- Embedded Sync data interface mode supports single or multiplexed sources;
- Discrete Sync data interface mode supports only single source input;
- The two Pixel Clock Input Domains can be individually configured in any combination of Embedded or Discrete Sync;

- Vertical Ancillary Data capture is supported for each input source;
- A maximum of 8 + 1 (8 normal line sources + 1 split-line source) multiplexed sources are supported for a single Pixel Clock Input Domain using TI Line Mux Mode;
- Multiplexed data can only appear in embedded sync mode;
- Where possible, blanking pixels that may contain embedded vertical ancillary data will be stored in a dedicated buffer per each video source;
- Optional selection of channel (Luma or Chroma, or both) from which Vertical Ancillary data is extracted for YUV422 source;
- Ancillary Data can appear in the Horizontal Blanking as well as the Vertical Blanking. Typically, only Vertical Blanking Ancillary Data is captured. However, Horizontal Blanking Ancillary Data can be captured as well using HSYNC style discrete sync capture mode;
- Video up to WUXGA (1920 × 1200) can be supported using Port A in 16-bit mode.

8.4.5.2 Repacker

The Repacker module rearranges the input bit ordering of the 16-bit data bus on Port A of each VIP slice. This module allows external input data to be presented to the datapath such that various data packing formats can be achieved in memory. As shown in Figure 8-12, a Repacker exists for each 16-bit input port.

The Repacker module is a simple multiplexer that serves to move input bits to different locations on the its output bus to VIP Parser. Figure 8-12 shows the supported bytelane swapping modes corresponding to different `VIP_XTRA_PORT_A[30:28] REPACK_SEL` settings.

Figure 8-12. Bytelane Swapping Modes

16-bit RAW data entering the VIP subsystem is packed as a contiguous input bus from bits 15 to 0. This 16-bit RAW input must be remapped to the RGB565 format, so that it can be saved to DDR memory properly, because the VPDMA does not support the RAW16 input format natively. Instead, the RAW 16 format is first remapped as RGB565 data and then given to the VPDMA. Figure 8-13 describes the `VIP_XTRA_PORT_A[30:28] REPACK_SEL = 6` option to remap a contiguous [15:0] RAW input data bus to a RGB565 compliant output bus. This RAW16 data will use RGB565 data types in the VPDMA Data Descriptors.

Figure 8-13. RAW16 to RGB565 Mapping

NOTE: There is no repacker for the 8-bit input port (Port B of each VIP slice).
The RAW16 mapping mode does not work for embedded sync streams.

8.4.5.3 Analog Video

A digital interface stream is based on analog video. The waveform for a line of NTSC analog video is shown in [Figure 8-14](#).

Figure 8-14. NTSC Analog Video Waveform for One Horizontal Line

T is a time constant. For NTSC, $T=1/13.5 \text{ MHz} = 74\text{ns}$.

8.4.5.4 Digitized Video

Digitized video is based on scan lines in found in analog video. BT.601 uses various sync signals to specify when a new field and a new line starts. BT.656 and BT.1120 uses sync words embedded in the data stream to specify start of field and start of line.

An image can be digitized into regions shown in [Figure 8-15](#).

Figure 8-15. Digitized Video

With the capability to encode sync words inside the data stream, there is more flexibility for adding non-video related data, called Ancillary Data. Also, code words embedded in the digital stream can be used as a type of identifier for multiplexing several sources of video into one data stream.

Figure 8-16 shows End-of-Active-Video (EAV) and Start-of-Active-Video (SAV) code words added to a video transmission. The period between the EAV and SAV is equivalent to Horizontal Blanking. The period between the SAV to the next EAV is active video or vertical blanking.

In the BT.656 or BT.1120 embedded code word scheme, three bits of the EAV/SAV code word are important: F (field), H (horizontal blanking), and V (vertical blanking).

Figure 8-16. Code Word Embedded Video Format

Figure 8-17 shows the values of F, V, and H flags at different locations in the picture. The Field flag represents the state of the Field ID for the picture. For progressive frames, F is always '0.' The V flag specifies vertical blanking areas. The H flag specifies horizontal blanking portions of the picture.

Figure 8-17. Digitized Video with F, V, and H Flags in EAV/SAV

8.4.5.5 Frame Buffers

The VIP/VPDMA support Frame Buffers in DDR memory for Active Video and Ancillary Data.

4:2:2 data is always saved in packed pixel buffers.

4:2:0 data is saved in Planar Luma buffers and Planar CbCr pair buffers.

A Luma Frame Buffer is a Planar storage area. Each line is the width in pixels (1Byte/pixel) of the output picture size format. The frame buffer contains the number of active video lines in the output picture size format.

A Chroma Pair Frame Buffer is Planar storage of CbCr pixel pairs, with each pixel being a byte. For 4:2:0 storage, N lines in the output picture active video results in N/2 lines of CbCr pairs being stored.

The Ancillary Data buffer is different than the Active Video Frame Buffers. The Ancillary Data buffer only stores Vertical Blanking Ancillary Data. The number of lines in the Ancillary Data buffer is the same as the number of Vertical Blanking lines. Typically, only one channel is extracted from the Vertical Blanking data, so the width of the Ancillary Data buffer is the same as the width of the Luma Buffer.

In 8-bit input mode, it is possible for both Luma and Chroma sites to be extracted for Vertical Ancillary data. Each color component is strobed on separate input clock cycles. In this case, the line width of the Ancillary data is twice the Luma line width of the picture. Both Luma and Chroma sites cannot be extracted for 16-bit input mode because both Luma and Chroma are sent on the same input clock cycle and the Ancillary port to the VPDMA VPI is only 8 bits wide.

Figure 8-18 shows how the planar data regions are stored in DDR memory. The vertical blanking data is stored in a set of Planar Buffers. Note that the bottom of the Vertical Ancillary Data from the previous field or frame is stored in the same buffer as the top of the Vertical Ancillary Data from the current field or frame.

Figure 8-18. Planar Buffer Storage Description

The Luma representing Active Video is stored in a set of Planar Buffers. The CbCr Chroma Pairs are stored in a set of Planar Buffers.

8.4.5.6 Input Data Interface

This section describes how the data (luma and chroma data for YUV422 format capture) is muxed for the various interface modes.

8.4.5.6.1 8b Interface Mode

In 8-bit data interface mode, the input pixels are multiplexed according to [Figure 8-19](#). The Chroma Format is 4:2:2. Sites with Cb/Cr pixels are known as Chroma sites. Those sites with Y pixels are known as Luma sites. The 8-bit data interface mode is selected by setting `VIP_MAIN[1:0] DATA_INTERFACE_MODE` bit-field to 0x2.

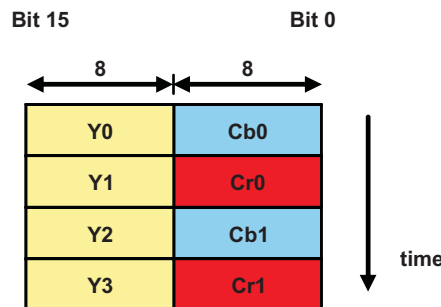

Figure 8-19. 8-bit Interface Discrete Sync Pixel Multiplexing

8.4.5.6.2 16b Interface Mode

In 16-bit interface mode, Luma is on 8 MSB bits of the data bus and Cb/Cr chroma pixels alternate on the other 8 bits of the data bus as shown in [Figure 8-20](#). The 16-bit data interface mode is selected by setting `VIP_MAIN[1:0] DATA_INTERFACE_MODE` bit-field to 0x1.

Figure 8-20. 16-bit Interface Discrete Sync Pixel Multiplexing

8.4.5.6.3 Signal Relationships

A digital representation of video can be realized by using HSYNC and VSYNC signals to identify frame start and line start. Suppose HSYNC and VSYNC are active high, [Figure 8-21](#) shows the general relationship of these signals.

Figure 8-21. Discrete Sync Signals

Every PIXCLK cycle carries either an active pixel or a blanking pixel. VSYNC pulses between two fields (or frames, in the case of progressive video). HSYNC pulses to signify the beginning of every line. An ACTVID signal can be used as a data valid to specify active video.

Discrete Sync cannot be used with any multi-camera multiplexed stream inputs. In the device, if Port A is configured for 24-bit discrete sync, then Port B must be disabled since there are no more data input pins left over for Port B.

If Port A is not 24 bits, then the 8-bit Port B can be configured and enabled for either discrete or embedded sync.

8.4.5.6.4 General 5 Pin Interfaces

Discrete Sync signal handling varies among different sending devices. The information that must be conveyed includes the pixel data value, field ID, horizontal blanking, and vertical blanking. Many devices can be configured to adjust the timing of the signals relative to each other.

In this section, DATA will be depicted as 8 bits. However, discrete sync does optionally support 16-bit data input. Type 1 is named after a generic five pin interface between the sending and receiving devices.

In Figure 8-22, P0 represents the first pixel in the horizontal blanking interval following the last vertical blanking line of the previous field or frame. HSYNC specifies the horizontal blanking region and VSYNC specifies that the P0 pixel is in the vertical sync area. HSYNC can be a strobe that is active one or more cycles and can deassert before the actual end of horizontal blanking or HSYNC may be active for the full duration of horizontal blanking.

Likewise, VSYNC can be a strobe that is active one or more cycles and can deassert before the actual end of vertical blanking or VSYNC may be active for the full duration of vertical blanking.

FID can change at this pixel or it may change later. For interlaced source, though, the FID will be inverted for this pixel at the same time point in the next field. So, it does not really matter when FID is captured. Many sending devices allow the location of FID changes to be programmable.

In this diagram and all others in this document, the active polarities of the interface signals can be either high or low. For the sake of uniformity in this document, all polarities are drawn active high. Also, different vendors have different datasheet names for the interface signals.

Figure 8-22. Type 1, First Horizontal Blanking Pixel

Figure 8-23 shows the P0 pixel being the first Chroma Channel data value in the Vertical Ancillary Data region. HSYNC is definitely de-asserted by now since P0 is no longer in horizontal blanking. ACTVID may or may not be active for Vertical Ancillary Data. Some devices consider these pixels to be Active (as in non-horizontal blanking). Other devices consider only video to be ACTIVE Video.

Figure 8-23. Type 1, First Vertical Ancillary Data Pixel

Following the vertical blanking region, the video portion of the field or frame starts. [Figure 8-24](#) shows the horizontal blanking area in this video portion of the field or frame. P0 is the first pixel in the horizontal blanking. HSYNC is active for one or more pixel clocks. VSYNC is inactive in this video area. FID can change here. ACTVID is low since P0 is horizontal blanking.

Figure 8-24. Type 1, Horizontal Blanking in Video Region

In [Figure 8-25](#), P0 represents the first Chroma pixel in the Active video line. HSYNC is inactive, since P0 is in the active video region. Likewise, VSYNC is inactive. FID may or may not change here. ACTVID is high to signal capturing of video pixels.

Figure 8-25. Type 1, First Video Pixel

8.4.5.6.5 Signal Subsets—4 Pin VSYNC, ACTVID, and FID

A sending device may use only a subset of the signals described in [Section 8.4.5.6.3](#). The sending device just needs to convey important signals required to capture the field or frame. It can be shown that various selections of four pins can be used to satisfy all Type 1 conditions.

Three pins, VSYNC, ACTVID, and FID, plus a pixel clock can be used to support discrete sync. VSYNC would bump the capture buffer. An inactive to active level of ACTVID specifies a line of data to capture. FID determines the field ID polarity. The scenario in which the sending device wants the receiving end to capture Vertical Ancillary Data using 4-pin signaling is shown in [Figure 8-26](#).

Figure 8-26. 4-Pin Reduced ACTVID Signaling with Vertical Ancillary Data

Figure 8-27 describes the case using the 4-pin interface in which the sending device does not send Vertical Ancillary Data.

Figure 8-27. 4-Pin Reduced ACTVID Signaling with No Vertical Ancillary Data

8.4.5.6.6 Signal Subsets—4 Pin VSYNC, HSYNC, and FID

In this style of Discrete Sync, as shown in Figure 8-28, four pins are used including the Pixel Clock. HSYNC signals the beginning of the line. All data in the line is captured, including Horizontal Blanking Data. In fact, this signaling mode is the only one which allows Horizontal Blanking Data to be captured.

Of course, by capturing the horizontal blanking pixels in the frame buffers, there is no way to be certain exactly where the blanking ends and the active video starts. One would have to rely solely on video format specs to find the active video inside the frame buffer.

Figure 8-28. 4-Pin Reduced HSYNC Signaling with Vertical Ancillary Data

8.4.5.6.7 Vertical Sync

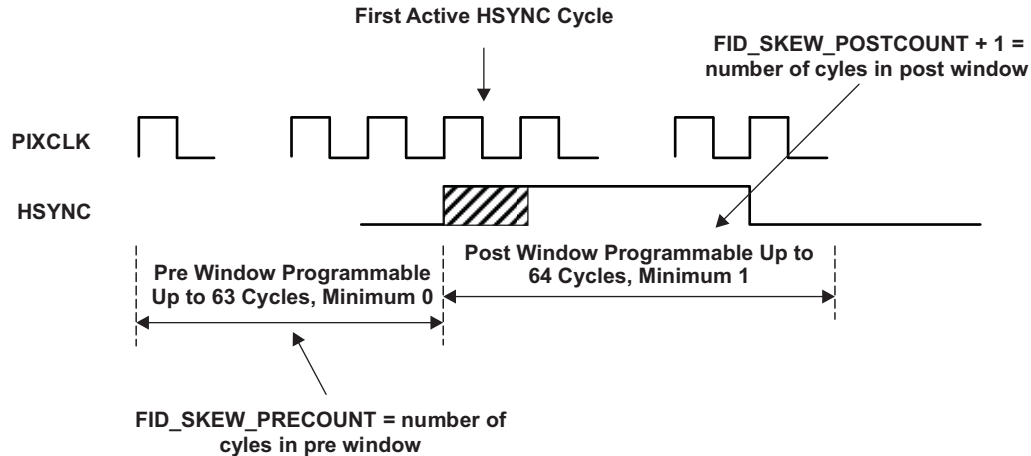

Vertical Sync is used to indicate lines that are in the vertical blanking interval. The VSYNC also separates fields or frames. To be spec compliant, VSYNC should be active for a few lines at the bottom of the picture. The exact number of vertical blanking lines at the bottom depends on the specification for the picture format (480i, 480p, 720p, 1080i, 1080p).

Likewise, the number of vertical blanking lines at the top of the picture depends on the video format specification corresponding to the incoming picture.

In the VIP_PARSER, lines associated with an Active VSYNC are stored in the vertical ancillary data buffers using the ANC VPI port to the VPDMA. Lines without an Active VSYNC are stored in the active video Luma and Chroma-pair buffers using the Y and UV VPI ports, respectively, to the VPDMA.

When using HSYNC signaling instead of ACTVID, the VSYNC signal may be derived from an analog source such as an NTSC/PAL decoder. In this case, VSYNC may not transition on the exact cycle as HSYNC. Thus, the VIP_PARSER supports a window region around HSYNC in which VSYNC transitions will be detected. A VSYNC transition occurring within the window is identified the same way as if VSYNC transitioned on the same cycle as HSYNC going active.

The window is defined by a pre-window, which is determined by the VIP_PORT_A[21:16] FID_SKEW_PRECOUNT and VIP_PORT_B[21:16] FID_SKEW_PRECOUNT registers. There is also a post-window that is defined by VIP_PORT_A[29:24] FID_SKEW_POSTCOUNT and VIP_PORT_B[29:24] FID_SKEW_POSTCOUNT for port B. Note that although the configuration registers are named FID_SKEW, they are also used for defining the VSYNC transition window. The window region definition is shown in Figure 8-29.

Figure 8-29. VSYNC Pre and Post Window

The results of VSYNC behavior in the transition window are shown in [Figure 8-30](#). A low to high transition in the window is equivalent to VSYNC going low to high on the active HSYNC cycle.

Likewise, a high to low transition in the window is equivalent to VSYNC going high to low on the active HSYNC cycle.

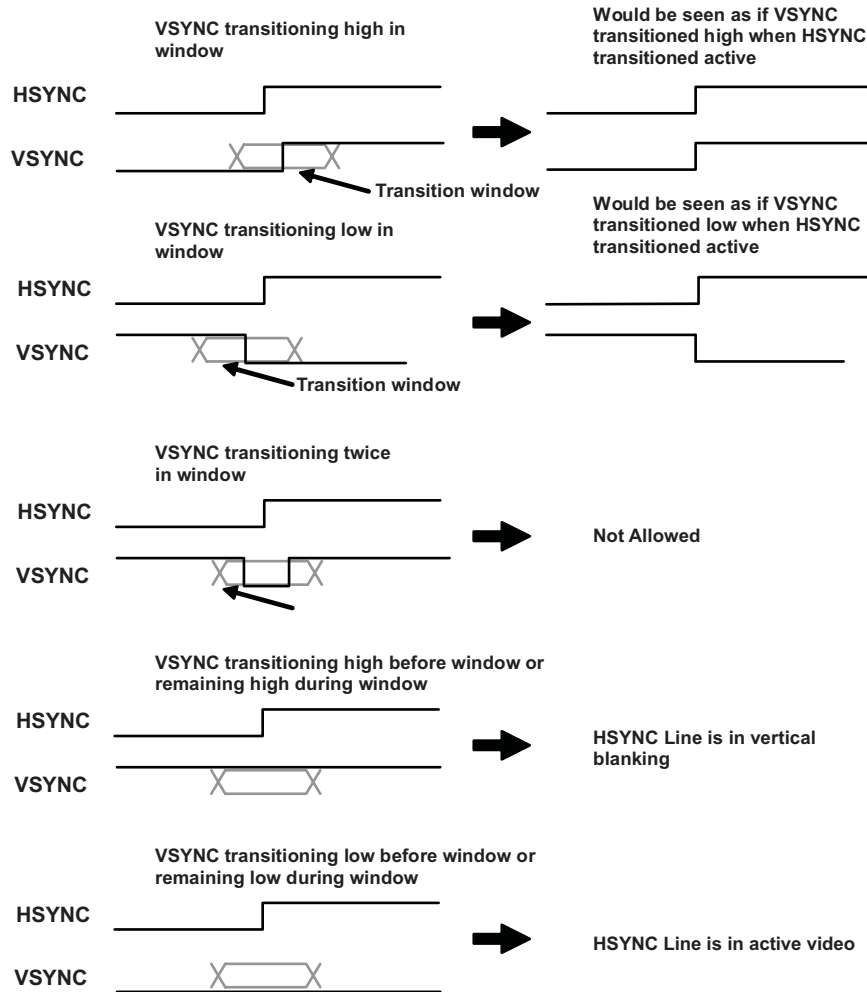

Two transitions of VSYNC within the VSYNC window is not allowed and is undefined behavior.

If VSYNC is high throughout the transition window, then the HSYNC line is in vertical blanking.

If VSYNC is low throughout the transition window, then the HSYNC line is in active video.

Note that VSYNC skew generally only applies to input signals that have been sampled from an analog source, as in a NTSC/PAL decoder. If the VSYNC is a VBLANK-type signal or if the sending device is another all-digital IC, then the VSYNC signal does not have a skew since VSYNC will be aligned to HSYNC. In this case, setting FID_SKEW_PRECOUNT = '0' and FID_SKEW_POSTCOUNT = '0' (within PORT_A and PORT_B registers) defines a minimum size window which will capture the value of VSYNC on the same cycle that HSYNC goes active.

Figure 8-30. VSYNC Equivalence When Using Transition Window

8.4.5.6.8 Field ID Determination Using Dedicated Signal

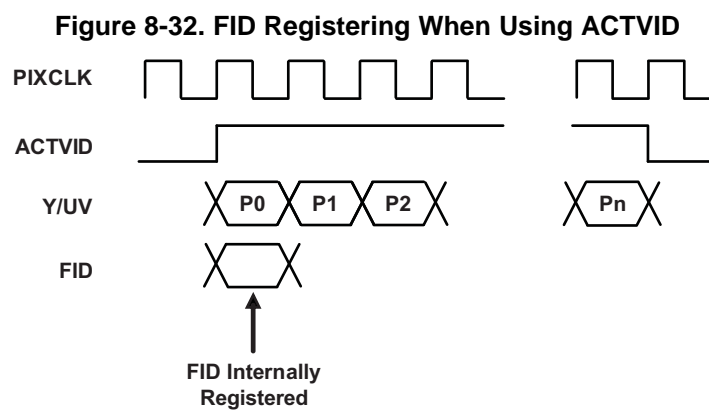

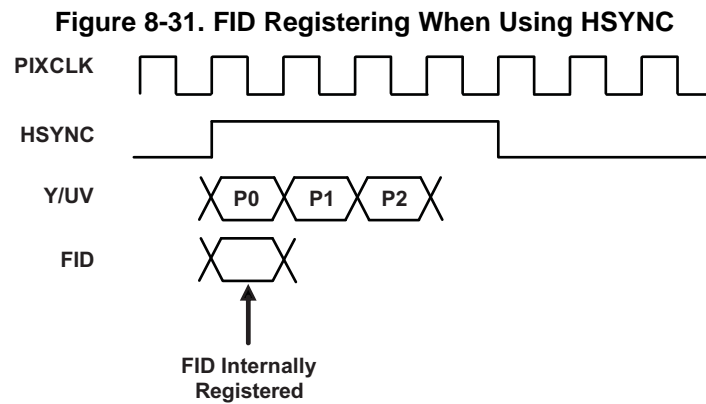

For Progressive Source, FIELD ID is always '0.'

For Interlaced Source, FIELD ID needs to be extracted consistently.

In some cases, vertical sync is active on the first pixel of a line in the vertical blanking period and it stays active until the last line in the vertical blanking period.

However, the pixel where the FIELD ID signal transitions can be quite variable and depends on the external chip driving the VIP_PARSER. Many parts that generate digitized raw video have a programmable feature to specify when FIELD ID changes. FIELD ID is valid at the same point for every field. That is, if FIELD ID is read at one particular place in a field, the polarity of the signal will be reversed at the same location in the next field. So, FIELD ID can be corrected with a programmable polarity configuration bit FID_POLARITY (within VIP_PORT_A and VIP_PORT_B registers) that is XOR'ed with the captured value.

For discrete sync mode, FIELD ID will be registered on the first active pixel capture cycle of each line in both styles of HSYNC and ACTVID usage as specified in Figure 8-31 and Figure 8-32.

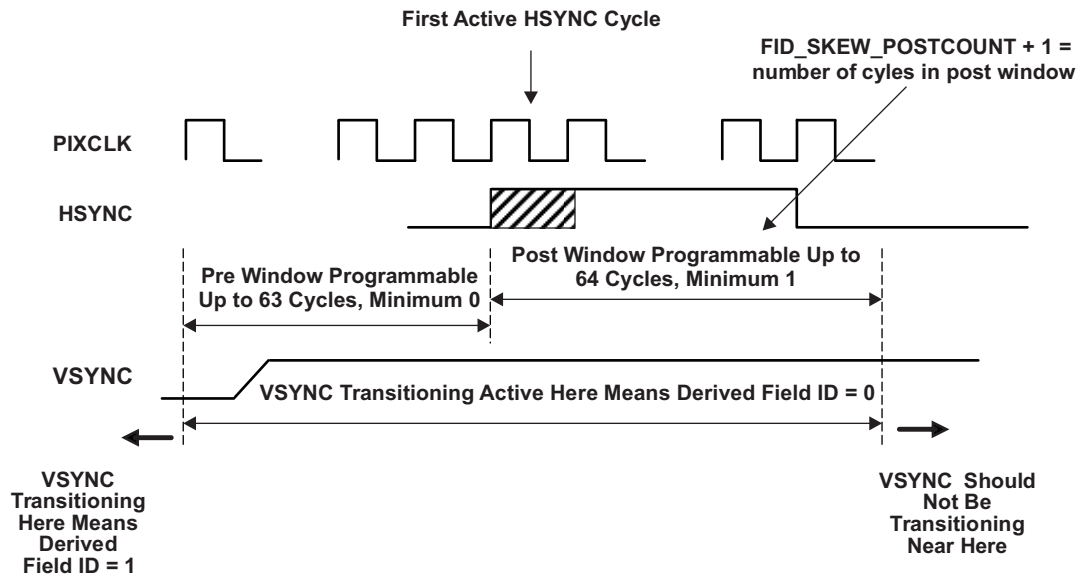

8.4.5.6.9 Field ID Determination Using VSYNC Skew

In order to save a device pin, there is a case where a skew may be inserted into VSYNC (with respect to HSYNC) when HSYNC is used as a start of line indicator as described in [Figure 8-28](#). In this case, no FIELD ID signal is sent by the source chip. A description of Field ID determination by VSYNC skew is shown in [Figure 8-33](#).

The active polarity of VSYNC falling within n pixel clock cycles of the first active cycle of HSYNC indicates the field id. If VSYNC is active before this time window, then the FIELD_ID = '1' for the next picture. If VSYNC becomes active within this window, then FIELD_ID = '0' for the next picture.

Figure 8-33. Field ID Determination By VSYNC Skew

When using FID determination by VSYNC skew, the value for VSYNC is also determined by transitions in the window as shown in [Figure 8-30](#).

The VIP_PARSER supports a configuration FID_POLARITY bit within [VIP_PORT_A](#) and [VIP_PORT_B](#) registers. For FID determination by VSYNC Skew, the fid determination functions are described in [Table 8-7](#).

Table 8-7. Polarity Table for FID Determination By VSYNC Skew

FID_POLARITY	Transition in Pre/Post Range	FID Determination
0	No	1
0	Yes	0
1	No	0
1	Yes	1

8.4.5.6.10 Rationale for FID Determination By VSYNC Skew

FID determination by VSYNC skew is a method for field ID determination derived from the analog NTSC and PAL interlaced specifications. Under this method, the sending device will not be providing a FID signal. NTSC has 525 total lines split between two fields. PAL has 625 total lines split between two fields. Each of these interlaced standards support an odd number of lines.

Let's consider just the 525 active line NTSC signal. For the sake of consistency, let's call Line 1 the first line of the 2-field pair and Line 525 the last line of the 2-field pair.

Figure 8-34. Example of 525-line FID Determination By VSYNC Skew

A waveform is shown in [Figure 8-34](#). VSYNC is defined to go active at the same time as HSYNC for the first line of the first field in a two-field picture pair. For this first field, VSYNC will go inactive after Line 20.

For the second field, VSYNC will go active in the middle of Line 263 to signal that Line 264 is the start of a vertical blanking interval. When HSYNC for Line 264 arrives, coinciding with the vertical blanking interval for the beginning of the second field, VSYNC has already been active for half of Line 263. For the second field, VSYNC will go inactive midway through Line 282 to indicate that Line 283 is active video. When HSYNC for Line 283 appears, VSYNC has already been inactive for half a line.

By seeing whether VSYNC transitions at the beginning of a line or whether it transitions at the midway point of a line, one can determine whether the upcoming group of lines represents the first field or the second field. The derived FID is shown in dashed lines.

The analog NTSC specification defines the field ID changing part way into the vertical blanking. That is, the first few lines of vertical blanking belong to the previous field and the next several lines of vertical blanking belong to the upcoming field. The VIP_PARSER saves one channel of the entire vertical blanking interval between two active video fields into a single buffer. The hardware does not discriminate between whether the vertical blanking lines belong to the bottom of the previous field or those belonging to the start of the next field. This usage model is consistent with vertical ancillary data capture for embedded sync mode of operation.

Obviously, FID Determination by VSYNC skew cannot be used when framing does not use the VSYNC signal but rather relies on the ACTVID signal instead.

8.4.5.6.11 ACTVID Framing

Instead of an HSYNC signal, the VIP_PARSER can use ACTVID framing as described in [Figure 8-27](#). Under ACTVID Framing, VSYNC is used to separate vertical blanking lines from active video lines.

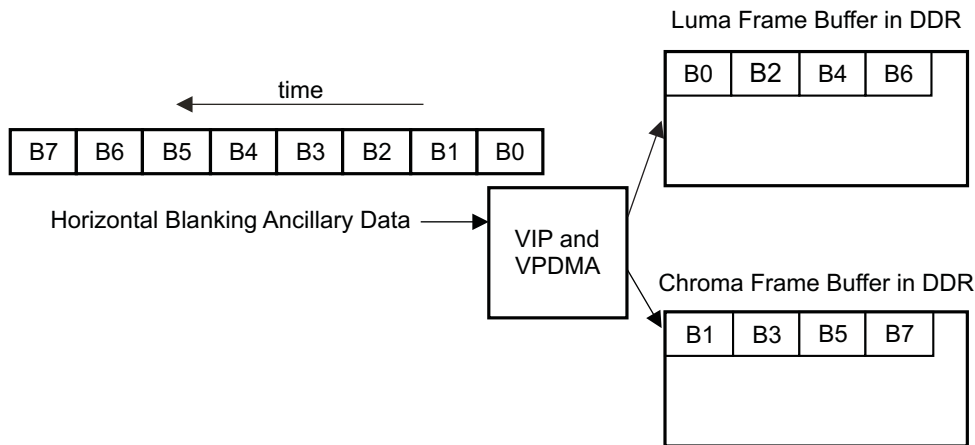

FID determination by VSYNC Skew is not allowed for ACTVID framing because there is no HSYNC input signal in this mode. Also, the VSYNC transition window is not employed. VSYNC is captured at the first pixel of each ACTVID grouping of pixels. Lines are separated by ACTVID transitioning inactive.

8.4.5.6.12 Ancillary Data Storage in Discrete Sync Mode

Ancillary data appearing in horizontal blanking is called Horizontal Blanking Ancillary Data. Ancillary Data in vertical blanking is called Vertical Blanking Ancillary Data.

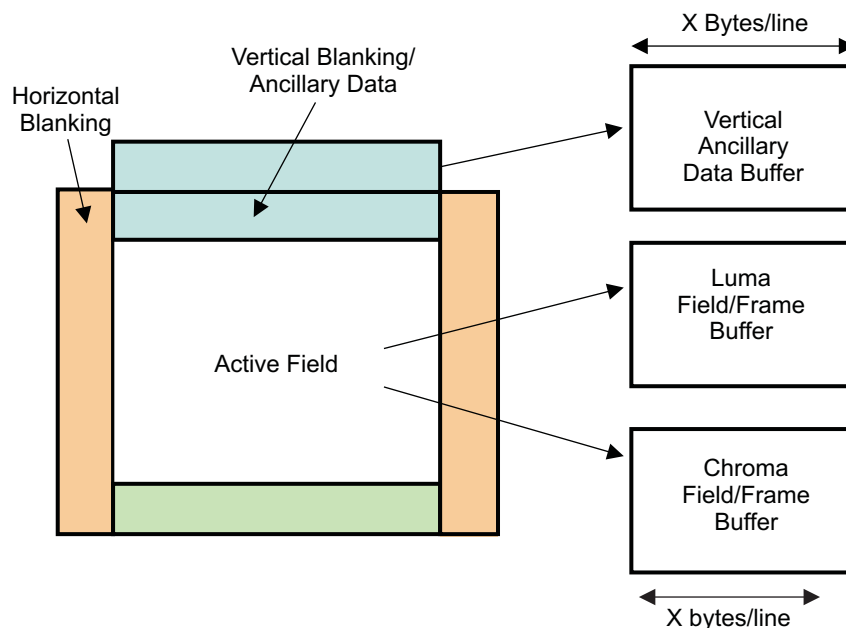

Horizontal Blanking Ancillary Data is not commonly used. For the ACTVID data valid mode described in [Figure 8-26](#), there is no way to capture Horizontal Blanking Ancillary Data. Using the HSYNC mode in [Figure 8-28](#), all blanking pixels are captured. However, the horizontal ancillary data is byte-by-byte distributed between the Luma and Chroma frame buffers. Chroma sited bytes are saved in the Chroma frame buffer and Luma sited bytes are saved in the Luma frame buffer. Some CPU effort would be needed in order to extract ancillary data from the desired Luma or Chroma channel frame buffers. Also, the video on each line starts after the horizontal blanking period. This situation is shown in [Figure 8-35](#).

Figure 8-35. Horizontal Ancillary Data Packing When HSYNC Used as Sync Signal

With Interlaced source material, Vertical Blanking Ancillary data will be stored in a separate Vertical Ancillary Data Buffer as shown in [Figure 8-36](#). The Channel from which vertical ancillary data is extracted is a configuration option. For an input image of x active pixels per line, each line of Vertical Blanking Ancillary Data will have x bytes. Unlike the horizontal case, the CPU parsing this Ancillary Data will see a contiguous section of Vertical Ancillary Data that is not intermixed with Video data.

Figure 8-36. Interlaced Field Vertical Blanking Ancillary Data Storage

For Progressive source video, the FIELD ID does not change. So, the Vertical Ancillary Data Buffer will contain all the information beginning from the vertical blanking of the previous frame. This situation is shown in [Figure 8-37](#).

Figure 8-37. Progressive Frame Vertical Blanking Ancillary Data Storage

8.4.5.7 BT.656 Style Embedded Sync

8.4.5.7.1 Data Input

Like Discrete Sync Input, Embedded Sync mode takes data from the input bus. Input data can be 8, 16 bits wide. A sample is retrieved each and every Pixel Clock cycle. There is no valid signal gating data entry. [Figure 8-38](#) shows a valid data sample each Pixel Clock period.

Figure 8-38. Embedded Sync Data Entry

8.4.5.7.2 Sync Words

In embedded sync mode, code words are inserted into the stream at pixel clock rates. For external devices that send out 10 bits (single pixel interface) or 20 bits (parallel Y-Cb/Cr interface) of data, only the 8 (single pixel interface) or 16 (parallel 8bY-8bCb/Cr interface) most significant bits of each pixel are used.

The key code words are Start of Active Video (SAV) and End of Active Video (EAV). Three flags are found in these code words: F (field), V (vertical sync), and H (horizontal sync). These flags signify the position in the frame corresponding to the data immediately following the codeword. The flags determine whether the code is EAV or SAV and where they lie in the picture. The first byte of the code word is 0xFF. The second and third bytes are 0x00. The bit ordering of the fourth byte is detailed in [Table 8-8](#).

Table 8-8. Fourth Byte of EAV/SAV Code Word

7 (fixed)	6 (F)	5 (V)	4 (H)	3 (P3=V^H)	2 (P2=F^H)	1 (P1=F^V)	0 (P0=F^V^H)	Description
1	0	0	0	0	0	0	0	SAV, Field 0, Active Video
1	0	0	1	1	1	0	1	EAV, Field 0, Horizontal Blanking
1	0	1	0	1	0	1	1	SAV, Field 0, Vertical Blanking
1	0	1	1	0	1	1	0	EAV, Field 0, Horizontal Blanking in Vertical Blanking Region
1	1	0	0	0	1	1	1	SAV, Field 1, Active Video
1	1	0	1	1	0	1	0	EAV, Field 1, Horizontal Blanking
1	1	1	0	1	1	0	0	SAV, Field 1, Vertical Blanking
1	1	1	1	0	0	0	1	EAV, Field 1, Horizontal Blanking in Vertical Blanking Region

An example of the input ordering of the embedded code word, followed by active video, is shown in [Figure 8-39](#). The input data mode is 8 bits for the example.

Figure 8-39. Code Word Format Example Followed by Video Data

8.4.5.7.3 Error Correction

The FVH flags are sent with four protection bits to support double error detection, single error correction. A non-correctable detected error is simply ignored. An option exists for the protection bits to correct a single bit error in the FVH flags. The correction table is shown in [Table 8-9](#). n/c means that the error condition is detected, but it is non-correctable.

Table 8-9. Error Correction Matrix

P3, P2, P1, P0	F, V, and H Flags							
	000	001	010	011	100	101	110	111
0000	000	000	000	n/c	000	n/c	n/c	111

1111	n/c	001	010	n/c	100	n/c	n/c	n/c

8.4.5.7.4 Embedded Sync Ancillary Data

With Embedded Sync streams, only Vertical Ancillary Data can be extracted. The Vertical Ancillary Data buffer is the same width as the corresponding Luma and Chroma buffers. The channel from which Vertical Ancillary Data is extracted is a configuration option.

Horizontal Ancillary data cannot be extracted using embedded sync mode.

The Vertical Ancillary Data is captured starting from the end of the previous active video. See [Figure 8-40](#) for a more detailed description of embedded sync packing.

Figure 8-40. Embedded Sync Packing

8.4.5.8 Source Multiplexing

8.4.5.8.1 Multiplexing Scenarios

Some applications require multiple camera sources to be used at the same time. For this type of device, one solution would be to support N-number of 8-bit or 16-bit data interfaces for each of N cameras. However, this solution does not efficiently minimize pin count. One set of 8-bit or 16-bit interfaces has the bandwidth to support more than one video source, depending on the resolution of the video. [Table 8-10](#) is explanatory only and shows the number of sources that can be multiplexed in one VIP for 8-bit and 16-bit interface modes. Note that it does not reflect the capabilities of the VIP_PARSER. In addition, the interface pixel clock rates are shown. The VPDMA limits 16 camera sources to be saved to DDR memory per Pixel Clock Input Domain.

Table 8-10. Multiplexing Configurations and Pixel Clock Rates

	Maximum Channels in Single 16-bit Data Interface Mode	Maximum Channels in Dual 8-bit Data Interface Mode - Interleaved Channels per Single 8-bit Port. One 16-bit VIP can be configured to support two such 8-bit ports.	Interface Clock Rate (MHz)
HD Interlaced	2	1	148.5
D1 Interlaced	8	4	108.1
CIF Interlaced	n/a	n/a	n/a
HD Progressive	1	n/a	148.5

Table 8-10. Multiplexing Configurations and Pixel Clock Rates (continued)

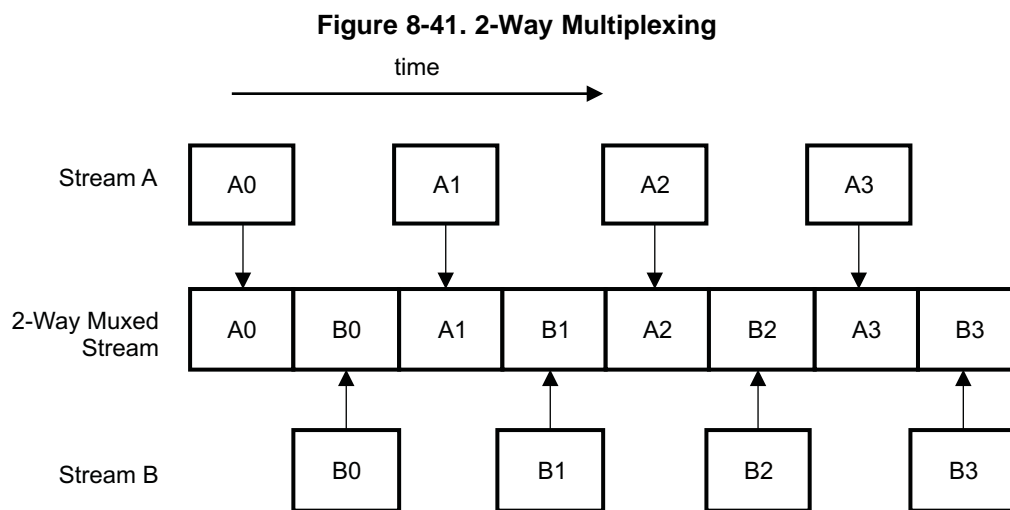

D1 Progressive	4	2	108.1
CIF Progressive ⁽¹⁾	32	16	162.2

⁽¹⁾ Blanking pixels are not used in the CIF clock rate calculations. Addition of blanking pixels would require a slightly higher clock rate.

NOTE: These Channel Density values reflect one VIP subsystem.

8.4.5.8.2 2-Way Multiplexing

For 2-Way Multiplexing, two embedded sync streams are interleaved a pixel at a time as shown in Figure 8-41.

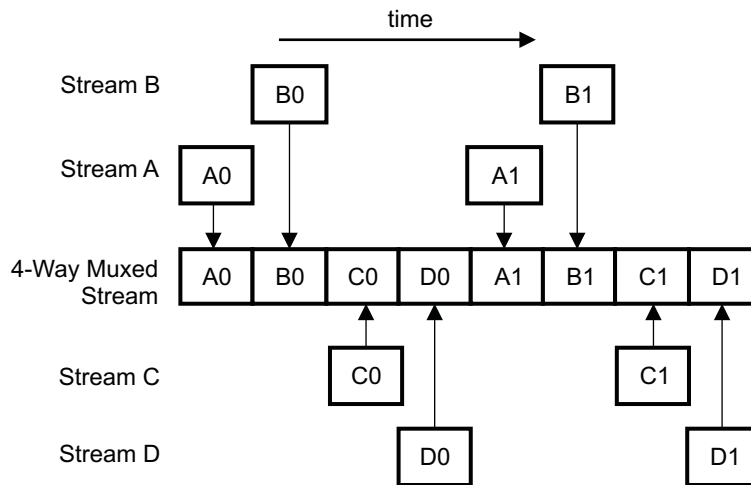

The sync codeword, FF-00-00-XY, is replicated in both source streams. In 2-Way Multiplexing, the sizes of both camera sources must be the same. Likewise, the Vertical Ancillary Data size for both sources must be identical. However, the two streams are not necessarily sending the same pixel site in adjacent clock cycles.

8.4.5.8.3 4-Way Multiplexing

For 4-Way Multiplexing, four embedded sync streams are multiplexed into one as seen in Figure 8-42.

Again, the sync codeword is in all four sources. Like 2-Way Multiplexing, the sizes of the four camera sources are the same and the sizes of the Vertical Ancillary Data regions are the same. The four streams are not necessarily sending the same pixel site in adjacent clock cycles.

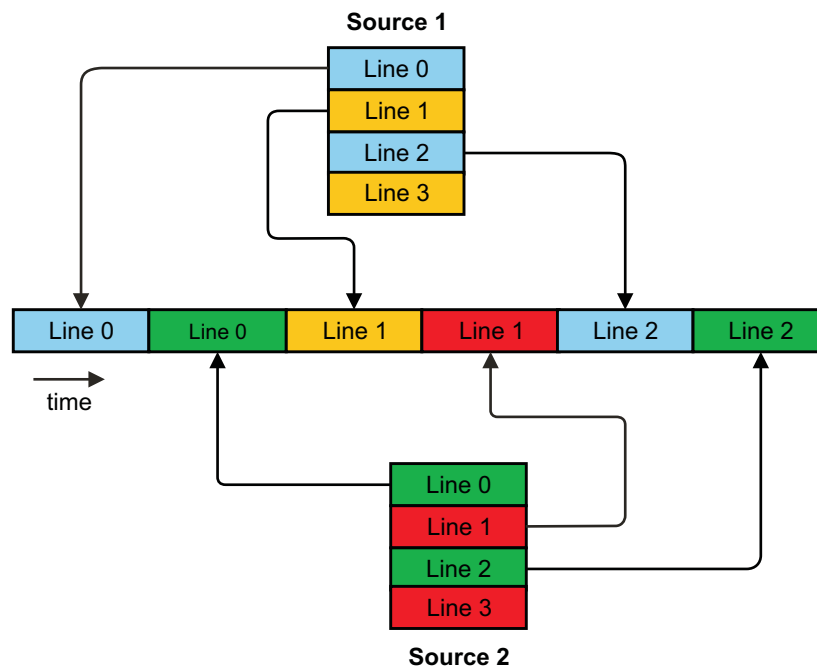

Figure 8-42. Example of 4-Way Multiplexing

8.4.5.8.4 Line Multiplexing

In Line Multiplexing, n-different sources are sent into the VIP a complete line at a time using a modified version of embedded sync. An example of Line Multiplexing for two sources is shown in Figure 8-43.

Figure 8-43. Example of Line Multiplexing

The width and height of each source in Line Multiplexed data can be different. For instance, one source can be PAL while another one can be NTSC. A line is comprised of YUV422 pixels in repeating patterns of CbYCrY.

8.4.5.8.5 Super Frame Concept in Line Multiplexing

Different camera sources are interleaved on a line-by-line basis. The beginning of each line carries a Metadata tag that provides key information about that line. This Metadata tag is preceded by a SAV codeword in which F=0, V=0, and H=0.

At the end of the line, an EAV code is inserted with an appropriate number of padding pixels following it. This EAV code has F=0, V=0, and H=1. The startcodes used for the Metadata wrapped lines and the dummy lines form the Super Frame. The VIP_PARSER module has logic to parse out the super frame, analyze the Metadata tags, and frame buffer the line contents appropriately.

8.4.5.8.6 8-bit Data Interface in Line Multiplexing

Figure 8-44 is an example of an 8-bit line multiplexing interface. Channel Data is the CbYCrY sequence representing a line. Preceding Channel Data is the four byte Meta Data tags. Note that the Meta Data bytes are replicated in both the Luma and the Chroma sites. The entire structure is bounded by a traditional SAV/EAV code in which the V flag is 0.

Figure 8-44. 8-bit Line Mux Interface

8.4.5.8.7 16-bit Data Interface in Line Multiplexing

Figure 8-45 describes the 16-bit line multiplexing interface. Channel Data is the active line. All the Y pixels are in the Luma Channel. The CbCr pixels are in the Chroma Channel. Each cycle, a 16-bit value representing one Luma sample and one Chroma sample enters the VIP_PARSER. The Meta Data tags are replicated in both channels. Likewise, the SAV/EAV startcodes are found in both channels. The V flags for the SAV/EAV startcodes are always 0.

Figure 8-45. 16-bit Line Mux Interface

8.4.5.8.8 Split Lines in Line Multiplex Mode

Suppose an external device is sending two dissimilar sources in Line Multiplex mode. One narrower source has X pixels per line. The wider source has 2X pixels per line.

The Meta Data has provisions for the external device to split a line. The Beginning of Line (BOL) and End of Line (EOL) flags tag a split line as described in Table 8-11.

Table 8-11. Split Line Table

BOL	EOL	Function
0	0	Undefined
0	1	Line Segment is the second half of a line
1	0	Line Segment is the first half of a line
1	1	Line has not been segmented into two.

8.4.5.8.9 Meta Data

Table 8-12 shows the bitfields in the Meta Data start codes.

Table 8-12. Meta Data Layout

Byte	7	6	5	4	3	2	1	0
SC3	1	BOP	EOP	RSVD	CH_ID[3:0]			
SC3	1	BOP	EOP	RSVD	CH_ID[3:0]			
SC2	0	BOL	EOL	VDET	LINE_ID[10:7]			
SC1	~LINE_ID[6]	LINE_ID[6:0]						
SC0	PAD	F	V	H	P3	P2	P1	P0

BOP tags the line as a startline in a period. A period is defined as the contiguous lines in a vertical blanking period or the contiguous lines in a field or frame. For the vertical blanking period case, the vertical blanking at the bottom of the previous field or frame combined with the vertical blanking at the top of the current field or frame is combined to create one period.

EOP tags the line as an endline in a period. Figure 8-46 shows the definition of the two types of Periods as outlined by BOP and EOP.

Figure 8-46. BOP/EOP Definition of a Period

For the Split Line at the top of a Period, the BOP bit is set for both halves of the split line. Likewise, for the Split Line at the bottom of a Period, the EOP bit is set for both halves of the split line.

CH_ID is the channel ID, which tags the camera source that generated the incoming line. A maximum of 16 camera sources are support per Pixel Input Clock Domain.

LINE_ID is the line number, starting from 0 and incrementing by one for each subsequent line from the same source.

PAD is a flag which tags the line as an artificially inserted padding line. When PAD is '0', the line should be discarded.

F, V, H, P3, P2, P1, and P0 are the bits representing the normal XY code. F is the Field ID associated with line, V signals when the line is in the vertical blanking, H specifies that the line is in the Horizontal Blanking, and P3:P0 are the protection bits.

Since only active video and vertical ancillary data lines are encapsulated in the Meta Data, the H bit in the SC0 byte should never be '1'.

8.4.5.8.10 TI Line Mux Mode, Split Lines, and Channel ID Remapping

The VIP_PARSER supports a maximum of 8 different Channel IDs per Port. The Channel IDs must be in the range {0:7} (3 bits). In the source multiplex, only one source can be a split line source and have the same Channel ID as one of the non-split line sources.

This scenario involves an external NTSC decoder which supports 8 D1 cameras. The external NTSC decoder will downscale the 8 sources to SIF format. However, one camera source will be sent in the multiplex as both the downscaled version and the original D1 sized version. They will both have the same Channel ID. However, the D1 version will be sent as a split-line. The source multiplex will thus have 9 maximum streams.

The VIP_PARSER (for TI Line Mux Mode only), will left shift the Channel ID by one. Bit 0 is used as an indicator whether the Source is a split-line source or a normal non-split line source. Only one of the nine inputs can be a split line source.

Table 8-13. TI Line Mux Mode Channel ID Remapping

Source Input Channel ID	Channel ID Sent to VPDMA	
	Non-split Line	Split Line
0x0	0x0	0x1
0x1	0x2	0x3
0x2	0x4	0x5
0x3	0x6	0x7
0x4	0x8	0x9
0x5	0xA	0xB
0x6	0xC	0xD
0x7	0xE	0xF

All subsequent references to the Camera Source, such as in a VPDMA return descriptor, will reference the remapped Channel ID.

The [VIP_OUTPUT_PORT_A_SRC0_SIZE](#) through [VIP_OUTPUT_PORT_A_SRC15_SIZE](#) registers for Port A, and [VIP_OUTPUT_PORT_B_SRC0_SIZE](#) through [VIP_OUTPUT_PORT_B_SRC15_SIZE](#) registers for Port B and the [VIP_OUTPUT_PORT_A_SRC_FID](#) and [VIP_OUTPUT_PORT_B_SRC_FID](#) status registers reflect the remapped Channel ID when the port is in TI Line Mux mode.

8.4.5.9 Channel ID Extraction for 2x/4x Multiplexed Source

8.4.5.9.1 Channel ID Extraction Overview

For 2-way and 4-way multiplexed source, the Channel ID is either embedded in the four protection bits inside the EAV/SAV code words or in the horizontal blanking pixel data. A configuration setting determines where the VIP_PARSER would search for the Channel ID.

8.4.5.9.2 Channel ID Embedded in Protection Bits for 2- and 4-Way Multiplexing

The four-bit channel ID is an identifier corresponding with the source number (camera) of the incoming video. As shown in [Table 8-14](#), the Channel ID is placed in the code fourth byte of the EAV/SAV code words normally used for protection bits. With 4 bits, the maximum number of sources that can be defined in this range is 16. However, only Channel IDs in the range {0:7} are supported. Obviously, error correction cannot be performed on the FVH flags since the protection bits are no longer there.

Table 8-14. Channel ID Embedded in EAV/SAV

7 (fixed)	6 (F)	5 (V)	4 (H)	3 (ch_id[3])	2 (ch_id[2])	1 (ch_id[1])	0 (ch_id[0])	Description
1	0	0	0	Ch_id = {0:15}				SAV, Field 0, Active Video
1	0	0	1	Ch_id = {0:15}				EAV, Field 0, Horizontal Blanking
1	0	1	0	Ch_id = {0:15}				SAV, Field 0, Vertical Blanking

Table 8-14. Channel ID Embedded in EAV/SAV (continued)

7 (fixed)	6 (F)	5 (V)	4 (H)	3 (ch_id[3])	2 (ch_id[2])	1 (ch_id[1])	0 (ch_id[0])	Description
1	0	1	1	Ch_id = {0:15}				EAV, Field 0, Horizontal Blanking in Vertical Blanking Region
1	1	0	0	Ch_id = {0:15}				SAV, Field 1, Active Video
1	1	0	1	Ch_id = {0:15}				EAV, Field 1, Horizontal Blanking
1	1	1	0	Ch_id = {0:15}				SAV, Field 1, Vertical Blanking
1	1	1	1	Ch_id = {0:15}				EAV, Field 1, Horizontal Blanking in Vertical Blanking Region

8.4.5.9.3 Channel ID Embedded in Horizontal Blanking Pixel Data for 2- and 4-Way Multiplexing

In Horizontal Blanking and Vertical Blanking, non-ancillary data pixels should be Y=0x10 and Cb=Cr=0x80. When the Channel ID is embedded in the Horizontal Blanking for 2 and 4-way multiplexing, the lower nibbles of all Luma and Chroma pixels are replaced by the 4 bit Channel ID. This scenario is shown in Figure 8-47. The maximum number of values defined by this 4-bit range is 2⁴ = 16. However, only Channel IDs in the range {0:7} are supported.

Figure 8-47. Channel ID Inserted Into Horizontal Blanking
Regular Horizontal Blanking Following EAV

Channel ID Inserted Into Horizontal Blanking Following EAV

8.4.5.10 Embedded Sync Mux Modes and Data Bus Widths

Legal combinations of Embedded Sync Mux Modes and Data Bus Widths are described in Table 8-15.

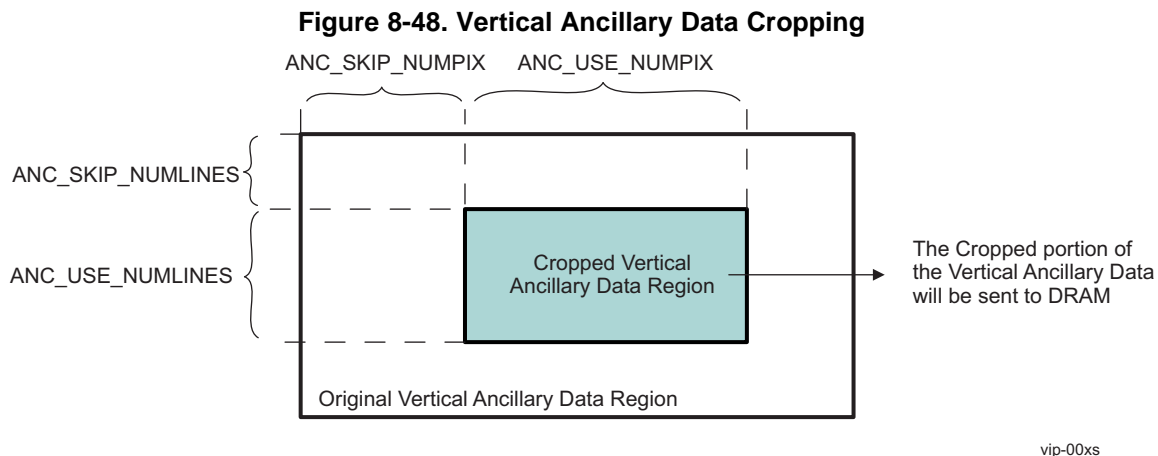

Table 8-15. Valid Embedded Sync Mux Mode and Data Bus Width Combinations

	1x Mux	2x Mux	4x Mux	Line Mux
8 Bit	v	v	v	v
16 Bit	v	n/a	n/a	v

8.4.5.11 Ancillary and Active Video Cropping

One Source Number for each Port can be cropped. Cropping is available for both Ancillary Data and Active Video.

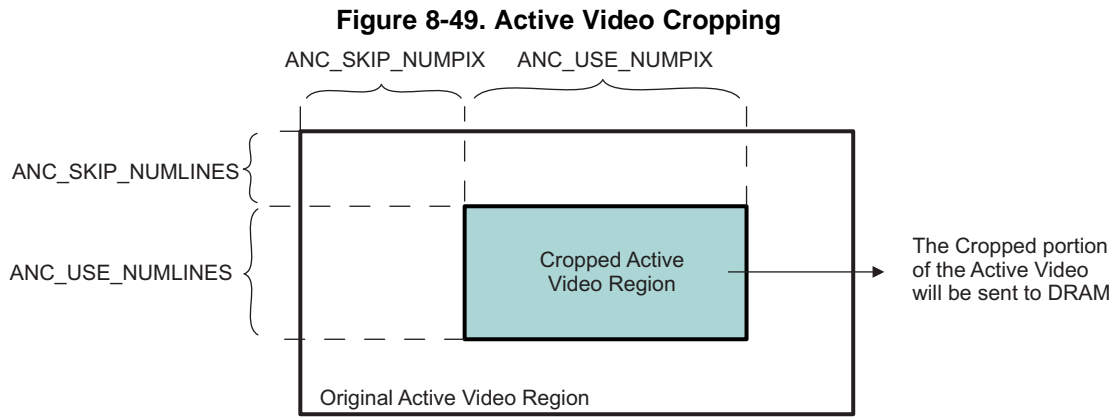

For the Vertical Ancillary Data from Port A, cropping is enabled by setting the `VIP Anc Crop Horiz Port A[15] ANC_BYPASS_N` bit. The Source Number from Port A that gets cropped is defined by the `VIP Anc Crop Horiz Port A[31:28] ANC_TARGET_SRCNUM` register. `VIP Anc Crop Horiz Port A[11:0] ANC_SKIP_NUMPIX`, `VIP Anc Crop Horiz Port A[27:16] ANC_USE_NUMPIX`, `VIP Anc Crop Vert Port A[11:0] ANC_SKIP_NUMLINES`, and `VIP Anc Crop Vert Port A[27:16] ANC_USE_NUMLINES` define the region of the selected Source Number that is cropped and sent to DRAM. The Vertical Ancillary Data Cropping region is described in Figure 8-48.

Note that for 8-bit input mode only, a setting exists that allow Vertical Ancillary data from both the Luma and Chroma channels to be captured. Both channels of Vertical Ancillary Data are captured when `VIP Xtra Port A[14:13] ANC_CHAN_SEL_8B` is set to "1x". Thus, the number of data elements per line in this case is twice the equivalent number of Luma pixels per line. In other words, for this particular dual channel capture example, if there are 720 Luma pixels per line, then the total number of Vertical Ancillary Data Pixels in the source picture can be $2 \times 720 = 1440$ pixels.

For Active Video from Port A, cropping is enabled by setting the `VIP Crop Horiz Port A[15] ACT_BYPASS_N` bit. The Source Number from Port A that gets cropped is defined by the `VIP Crop Horiz Port A[31:28] ACT_TARGET_SRCNUM` register.

`VIP Crop Horiz Port A[11:0] ACT_SKIP_NUMPIX`, `VIP Crop Horiz Port A[27:16] ACT_USE_NUMPIX`, `VIP Crop Vert Port A[11:0] ACT_SKIP_NUMLINES`, and `VIP Crop Vert Port A[27:16] ACT_USE_NUMLINES` define the region of the selected Source Number that is cropped and sent to DRAM. The Vertical Ancillary Data Cropping region is described in Figure 8-49

vip-00xs

Cropping for Port B works in a similar way to Port A. Since picture data is in 4:2:2 format, ANC_SKIP_NUMPIX(ACT_SKIP_NUMPIX) and ANC_USE_NUMPIX (ACT_USE_NUMPIX) must be evenly divisible by 2. If the output of VIP_PARSER is sent to a 4:2:2 to 4:2:0 converter, then ANC_USE_NUMLINES(ACT_USE_NUMLINES) must also be evenly divisible by 2.

Error cases in cropping occur when the crop window programmed is larger than the incoming video frame. Crop window errors normally result in the return of the crop region where the crop window overlays the incoming video frame. However, there is one problematic error cropping case, as illustrated in [Figure 8-50](#).

The programmed crop window extends below the input picture and the last pixel of the input picture is not a part of the selected crop region. In this case, at the last pixel of the last line in the green crop output, there is no way to determine that this pixel is the last pixel of the cropped output.

Figure 8-50. Problematic Error Cropping Case

vip-00x

In this case, the crop tool sends out a single pixel with an endline and endframe when it reaches the last pixel of the input picture. If the green cropped region has n lines, the actual output from the crop tool will have n+1 lines and the width of the last line will be 1 pixel.

[Figure 8-51](#) shows the endline (EL) and endframe (EF) signals corresponding to the last line of the cropped region. At the last line and last pixel of the cropped region, the crop tool will only output an endline. It cannot output an endframe at this point because the crop tool might get another line from the streaming input.

Later, on the same input line, the last pixel of the input frame appears. Here, the crop tool knows that the cropped region has ended. In this case, a single endline/endframe pixel is sent out to signal that the frame has ended.

NOTE: There is no interrupt to notify that application level that a crop error has occurred.

Figure 8-51. Endline/Endframe Behavior for Error Cropping Case

8.4.5.12 Interrupts

The VIP_PARSER module has 19 interrupts out of which one can be mapped to VIP top level.

When an interrupt occurs and is determined to be from the VIP_PARSER module, the VIP_PARSER level of masks, clears, and status registers must be checked and updated first.

Table 8-16 describes each of the interrupts events supported by the VIP_PARSER, together with associated Interrupt Mask (VIP_FIQ_MASK), Interrupt Clear (VIP_FIQ_CLEAR), and Interrupt Status (VIP_FIQ_STATUS) registers.

Table 8-16. VIP_PARSER Interrupt Events

Event Flag	Event Mask	Map to	Description
VIP_FIQ_STATUS[21] PORT_A_YUV_PROTOCOL_VIOLATION	VIP_FIQ_MASK[21] PORT_A_YUV_PROTOCOL_VIOLATION_MASK	PrtBDisableComplete	When a port is running and VIP_PORT_B[8] ENABLE bit is turned off, logic exists to ensure that a complete frame is sent out of the Ancillary and Active Video VPI ports. That is, a frame is not stopped in the middle. This interrupt is activated when all active frames have been sent out Port B following a disable.
VIP_FIQ_STATUS[20] PORT_A_ANC_PROTOCOL_VIOLATION	VIP_FIQ_MASK[20] PORT_A_ANC_PROTOCOL_VIOLATION_MASK	PrtADisableComplete	When a port is running and VIP_PORT_A[8] ENABLE bit is turned off, logic exists to ensure that a complete frame is sent out of the Ancillary and Active Video VPI ports. That is, a frame is not stopped in the middle. This interrupt is activated when all active frames have been sent out Port A following a disable.
VIP_FIQ_STATUS[19] PORT_B_YUV_PROTOCOL_VIOLATION	VIP_FIQ_MASK[19] PORT_B_YUV_PROTOCOL_VIOLATION_MASK	PrtBANCProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Ancillary VPI of Port B.
VIP_FIQ_STATUS[18] PORT_B_ANC_PROTOCOL_VIOLATION	VIP_FIQ_MASK[18] PORT_B_ANC_PROTOCOL_VIOLATION_MASK	PrtBYUVProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Active Video VPI of Port B.
VIP_FIQ_STATUS[17] PORT_A_CFG_DISABLE_COMPLETE	VIP_FIQ_MASK[17] PORT_A_CFG_DISABLE_COMPLETE_MASK	PrtAANCProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Ancillary VPI of Port A.
VIP_FIQ_STATUS[16] PORT_B_CFG_DISABLE_COMPLETE_CLR	VIP_FIQ_MASK[16] PORT_B_CFG_DISABLE_COMPLETE_MASK	PrtAYUVProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Active Video VPI of Port A.
VIP_FIQ_STATUS[15] PORT_B_SRC0_SIZE_STATUS	VIP_FIQ_MASK[15] PORT_B_SRC0_SIZE	PrtBSrc0Size	The output size for Srcnum=0 on Port B differs from the XTRA_PORT_B[11:0] SRC0_NUMLINES and [27:16] SRC0_NUMPIX register settings
VIP_FIQ_STATUS[14] PORT_A_SRC0_SIZE_STATUS	VIP_FIQ_MASK[14] PORT_A_SRC0_SIZE	PrtASrc0Size	The output size for Srcnum=0 on Port A differs from the XTRA_PORT_B[11:0] SRC0_NUMLINES and [27:16] SRC0_NUMPIX register settings
VIP_FIQ_STATUS[13] PORT_B_DISCONN_STATUS	VIP_FIQ_MASK[13] PORT_B_DISCONN	PrtBDisconn	Port B Link Disconnect for Srcnum 0
VIP_FIQ_STATUS[12] PORT_B_CONN_STATUS	VIP_FIQ_MASK[12] PORT_B_CONN	PrtBConn	Port B Link Connect for Srcnum 0
VIP_FIQ_STATUS[11] PORT_A_DISCONN_STATUS	VIP_FIQ_MASK[11] PORT_A_DISCONN	PrtADisConn	Port A Link Disconnect for Srcnum 0
VIP_FIQ_STATUS[10] PORT_A_CONN_STATUS	VIP_FIQ_MASK[10] PORT_A_CONN	PrtAConn	Port A Link Connect for Srcnum 0
VIP_FIQ_STATUS[9] OUTPUT_FIFO_PRTB_ANC_STATUS	VIP_FIQ_MASK[9] OUTPUT_FIFO_PRTB_ANC_OF	OpPrtBAnc	Overflow at Ancillary Data VPDMA interface for the Port B
VIP_FIQ_STATUS[7] OUTPUT_FIFO_PRTB_LUMA_STATUS	VIP_FIQ_MASK[7] OUTPUT_FIFO_PRTB_YUV_OF	OpPrtBYUV	Overflow at Luma VPDMA interface for Port B

Table 8-16. VIP_PARSER Interrupt Events (continued)

Event Flag	Event Mask	Map to	Description
VIP_FIQ_STATUS[6] OUTPUT_FIFO_PRTA Anc_STATUS	VIP_FIQ_MASK[6] OUTPUT_FIFO_PRTA Anc_OF	OpPrtAAnc	Overflow at Ancillary Data VPDMA interface for the Port A
VIP_FIQ_STATUS[4] OUTPUT_FIFO_PRTA LUMA_STATUS	VIP_FIQ_MASK[4] OUTPUT_FIFO_PRTA_YUV_OF	OpPrtAYUV	Overflow at Luma VPDMA interface for Port A
VIP_FIQ_STATUS[3] ASYNC_FIFO_PRTB_STATUS	VIP_FIQ_MASK[3] ASYNC_FIFO_PRTB_OF	InPrtB	Overflow at Input Async FIFO for Port B
VIP_FIQ_STATUS[2] ASYNC_FIFO_PRTA_STATUS	VIP_FIQ_MASK[2] ASYNC_FIFO_PRTA_OF	InPrtA	Overflow at Input Async FIFO for Port A
VIP_FIQ_STATUS[1] PRTB_VDET_STATUS	VIP_FIQ_MASK[1] PRTB_VDET_MASK	PrtBVdet	Video Detect Interrupt for Port B
VIP_FIQ_STATUS[0] PRTA_VDET_STATUS	VIP_FIQ_MASK[0] PRTA_VDET_MASK	PrtAVdet	Video Detect Interrupt for Port A

A '1' in the Status register associated with an Interrupt source shows that the interrupt source is pending. The Status register is read-only. To clear a bit in the Status register, the associated bit in the Clear register must be written with a '1.'

A '1' in the bit position of the Mask register associated with an Interrupt source ensures that the hardware interrupt will never be passed on to the VIP top level. A '0' in the bit position of the Mask register associated with an Interrupt source will cause the interrupt controller to see a VIP_PARSER interrupt in the event the hardware in the parser triggers it.

A '1' in the bit position of the Clear register associated with an Interrupt source clears the hardware interrupt status register until the next time the hardware triggers it. After a Clear, the CPU should set the bit back to a '0.' Otherwise, the hardware would not be able to set any subsequent interrupts of the same type.

8.4.5.13 VDET Interrupt

For Line Multiplexing Embedded Sync mode only, the Meta Data Header includes a Video Detect (VDET) flag. The device sets this VDET flag whenever NTSC or PAL sync is found. Some other external devices using Line Multiplexing mode may not use VDET. However, when VDET changes, a VDET interrupt is issued (see [Table 8-16](#), *Interrupts*, for more details on the interrupt). Each Pixel Clock Input Domain (Port A and Port B) has a separate VDET interrupt.

The VDET status register is comprised of 32 bits, each bit representing the value of the VDET flag found in the meta data of the Channel ID. Bit 0 is the VDET value from Channel ID 0, Bit 1 is the VDET value from Channel ID 1, and so on. There is a separate status register for each Pixel Input Clock Domain ([VIP_PORT_A_VDET_VEC](#) and [VIP_PORT_B_VDET_VEC](#) registers).

In Line Mux mode, the meta-data field defining the srcnum is 5-bits wide. Only the last three bits of this field and the upper two bits are reserved. This bit should always be set to 1 in TI Line Mux mode.

8.4.5.14 Source Video Size

For each Pixel Input Clock Domain, status registers are available to log the last active video height and width found from 16 camera sources. There is no interrupt activated on the change in the source size in any of the input sources. These readonly registers only inform the application of the width and the height of the last active field or frame associated with each channel ID.

In 2x/4x pixel multiplexing, the four bit nibble carrying the Srcnum defines a maximum of 16 sources.

8.4.5.15 Clipping

In ITU-656/BT.1120 embedded sync streams, the values 0x00 and 0xFF are reserved for sync detection. These values are illegal in the rest of the stream. Only when the ITU-1364 standard came out to for digitally inserted vertical blanking data structures did the 0x00 and 0xFF codes get re-used in the packet synchronization structure.

The VIP_PARSER supports one configuration bit that, when enabled, changes all 0x00 to 0x01 and 0xFF to 0xFE in the vertical ancillary data. Another configuration bit, when enabled, changes all 0x00 to 0x01 and 0xFF to 0xFE in the active video portion of the input picture.

Generally, clipping is only desired for discrete sync input data captured from a NTSC/PAL decoder type of device which does not follow pixel range rules. For Discrete Sync input, the possibility to clip inputs to legal values exists. Clipping is desired if the picture sent to DRAM will be streamed out of the IC again using an ITU-656/BT.1120 style output port. If the picture is processed inside the SOC before it is streamed out, then the processing procedure or the output streaming hardware needs to ensure that illegal values are not in the stream.

For Embedded Sync input, illegal values should not exist except for the ITU-1364 data sync sequence 00-FF-FF. Otherwise, the VIP Parser cannot determine good EAV/SAV. In the hardware, clipping is allowed for Embedded Sync streams even though it is not particularly a useful feature.

Note that if the clipping is enabled for ancillary data, the post processing software will never be able to find a data packet sync header, since the 00-FF-FF sequence will be changed to 01-FE-FE.

For 24-bit YUV, clipping is done on each 8 bit channel. If $\text{data}[23:16] == 0xFF$, the clipped value will be 0xFE. If $\text{data}[23:16] == 0x00$, the clipped value will be 0x01. Likewise, clipping is done for data bit ranges 15:8 and 7:0

From a software point of view, clipping should never be enabled for 24-bit RGB. RGB should use the full 8-bit quantization range for each color component. The hardware, however, will clip RGB in active video, if [VIP_MAIN\[5\] CLIP_ACTIVE='1'](#). The clipping will be done on each 8-bit channel as described for 24-bit YUV.

8.4.5.16 Current and Last FID Value

The FID values for the current field or frame are reported in the Status Registers. When a new field or frame enters, the current FID values are saved into the previous FID status registers and the new FID value is loaded into the current FID register.

Following a reset, the previous and current FID status registers are set to '1.' The first two fields or frames are ignored. On the third input field or frame after a reset, the previous FID is loaded with the current FID ('1'), and the current FID is loaded with the actual FID. By the fourth field or frame after a reset, both the previous and current FID values should represent the values found in the input stream.

The FID values are reported for each camera source in both Pixel Input Clock Domains.

8.4.5.17 Disable Handling

A feature was defined for the case of single stream (either discrete sync or embedded sync) input handling where `VIP_PORT_A[8] ENABLE` for Port A and `VIP_PORT_B[8] ENABLE` for Port B is taken inactive. The single stream case was deemed more important than the multi-stream one since the output of the `VIP_PARSER` may be used to drive the Scaler module. The Scaler needs to work on a frame boundary (startframe to endframe) or it may lock up without a reset. The goal of the disable handling for the single stream case is to complete a field or frame of output data to the downstream module. Then, upon enabling of the port again, the system should start up properly without a need to reset the individual modules within the VIP instance.

In this scenario, suppose the `VIP_PARSER` has been processing a single input stream. Then, `ENABLE` is brought inactive. The `VIP_PARSER` will continue to output data downstream until it sends out an endframe pixel and the downstream module accepts the endframe pixel.

8.4.5.18 Picture Size Interrupt

Each VIP port can be set up to trigger an interrupt if the picture size varies from a pre-programmed expected picture size. This interrupt is supported only for the Active Video portion of the input video and not for the Vertical Ancillary portion. Also this interrupt is only support for source number 0 in multi channel capture.

The interrupts are named `PrtASrc0Size` and `PrtBSrc0Size`. They are described in [Table 8-16](#), *VIP_PARSER Interrupt Events*

For Port A, the expected active video picture size values are programmed in `VIP_XTRA_PORT_A[11:0] SRC0_NUMLINES` and `VIP_XTRA_PORT_A[27:16] SRC0_NUMPIX`. For PortB, the expected active video picture size values are programmed in `VIP_XTRA_PORT_B[11:0] SRC0_NUMLINES` and `VIP_XTRA_PORT_B[27:16] SRC0_NUMPIX`.

NOTE: Picture Size Interrupt reflects the Active Video going into the DRAM. If cropping is enabled for `Srcnum=0`, the Picture Size is the post-cropped size.

8.4.5.19 Discrete Sync Signals

External ICs generally produce discrete sync interface signals seen in [Figure 8-52](#).

VBLNK represents the vertical blanking interval. Generally, vertical blanking is at the top of a NTSC/PAL field. In certain standards, the last few lines of a field or frame are in vertical blanking in addition to the beginning few lines in the following field or frame.

VSYNC is the vertical sync indicator. `VSYNC` is active during a portion of the vertical blanking. For NTSC and PAL, since these standards define an odd number of lines for a field pair, `VSYNC` can be use in conjunction with `HSYNC` to determine FID polarity. Generally, `VSYNC` is defined to transition inactive to active sometime during vertical blanking. This signal then transitions to an inactive state before the end of vertical blanking. Certain standards define the line numbers where `VSYNC` transitions.

HBLNK is the horizontal blanking interval for each line. The horizontal blanking is the same number of pixels whether the line is in the active video region or in the vertical blanking region of the scan.

ACTVID is the region of a line that is active video. It is the inverse of the `HBLNK` signal. The number of pixels in the `ACTVID` region is the same for a line in vertical blanking as a line in active video. `ACTVID(1)` is a situation where the signal toggles in vertical blanking as well as active video. `ACTVID(2)` shows the signal toggling only in non-vertical blanking regions. Once `ACTVID` transitions active, it stays active for every `PIXCLK` until the end of the line.

HSYNC transitions from inactive to active for the first pixel of each line, which is a horizontal blanking pixel. HSYNC will transition to the inactive state before the end of the line. HSYNC is similar to HBLNK in that they both transition active on the same PIXCLK cycle. However, HBLNK transitions inactive at the end of the horizontal blanking period. HSYNC can transition inactive either before or after the horizontal blanking period.

Group 1 signals define the vertical separation between fields or frames. Group 2 signals define the separation between lines. One of the Group 1 signals can be tied to the VSYNC input. The ACTVID(1) and ACTVID(2) signals from Group 2 are tied to the ACTVID input. One of the other two Group 2 signals, HBLNK or HSYNC, can be tied to the HSYNC input.

VIP_PORT_A[15] USE_ACTVID_HSYNC_N for Port A and **VIP_PORT_B[15] USE_ACTVID_HSYNC_N** for Port B defines whether the line separation method uses the signal from the ACTVID or the HSYNC input of the VIP_PARSER module.

VIP_PORT_A[22] DISCRETE_BASIC_MODE for Port A **VIP_PORT_B[22] DISCRETE_BASIC_MODE** for Port B determines whether discrete sync works as described in [Section 8.4.5.6 Input Data Interface](#) or whether a “basic mode” input handler is invoked.

By choosing one signal from Group 1 and one signal from Group 2, there should be a way to capture the external data.

Figure 8-52. Generic External Sync Signals

- NOTE:**
1. VIP_PARSER module defines three discrete sync control signals: ACTVID, HSYNC, and VSYNC.
 2. In order to capture external data PIXCLK must never stop, for either horizontal or vertical blanking.

8.4.5.19.1 VBLNK and HBLNK

Figure 8-53 shows VBLNK from Group 1 and HBLNK from Group 2 being used. In this case, set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output at Active Video will be sent out the Active Video output.

If DISCRETE_BASIC_MODE='1' is chosen, all lines including vertical blanking ones will be sent to the Active Video buffer. Since a line is delineated by HBLNK and HBLNK toggles in vertical blanking as well as active video, every incoming pixel will be save to the Active Video buffer.

Figure 8-53. vblnk and hblnk

8.4.5.19.2 **BLNK and ACTVID (1)**

Figure 8-54 shows VBLNK from Group 1 and ACTVID(1) from Group 2 being used. ACTVID is toggling during Vertical Blanking. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output and Active Video will be sent out the Active Video output.

If DISCRETE_BASIC_MODE='1' is chosen, all lines will be sent to the Active Video output.

8.4.5.19.3 **VBLNK and ACTVID(2)**

Figure 8-55 shows VBLNK from Group 1 and ACTVID(2) from Group 2 being used. ACTVID is not toggling during Vertical Blanking. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='1'. Since there are no line sync/clocking signals in the Vertical Blanking period, only Active Video lines will be sent to the Active Video output.

If DISCRETE_BASIC_MODE='0' is set, then the hardware will lock up as there is no way for it to determine a frame boundary.

8.4.5.19.4 **VBLNK and HSYNC**

Figure 8-56 shows VBLNK from Group 1 and HSYNC from Group 2 being used. In this scenario, set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output at Active Video will be sent out the Active Video output.

8.4.5.19.5 **VSYNC and HBLNK**

Figure 8-57 shows VSYNC from Group 1 and HBLINK from Group 2 being used. Set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='1'.

Also, no automatic parsing of vertical ancillary data will be performed so the Ancillary VPI port to the VPDMA should be disabled. All lines, including both vertical ancillary and active video, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Every data element strobed on the Pixel clock's active edge will be stored in the Active Video Buffer.

In [Figure 8-57](#), it is likely the HBLNK will toggle when VSYNC is active. In this case, setting `USE_ACTVID_HSYNC_N='0'` and `DISCRETE_BASIC_MODE='0'` mean that those lines appearing under the active VSYNC will be sent to the Ancillary Data Buffer. All other captured lines will be sent to the Active Video Buffer.

Figure 8-57. VSYNC and HBLNK

8.4.5.19.6 VSYNC and ACTIVID(1)

[Figure 8-58](#) shows VSYNC from Group 1 and ACTIVID(1) from Group 2 being used. ACTIVID is toggling during the VBLNK interval. ACTIVID does not necessarily toggle during VSYNC. Set `USE_ACTVID_HSYNC_N='1'` and `DISCRETE_BASIC_MODE='1'`.

Also, no automatic parsing of vertical ancillary data will be performed so there is no activity on the Ancillary VPI port to the VPDMA. All lines, including both vertical ancillary and active video, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Lines are denoted by an inactive to active transition of ACTIVID. Only those pixels gated by an active ACTIVID will be saved.

Figure 8-58. VSYNC and ACTIVID(1)

8.4.5.19.7 VSYNC and ACTIVID(2)

[Figure 8-59](#) shows VSYNC from Group 1 and ACTIVID(2) from Group 2 being used. ACTIVID is not toggling during the entire VBLNK interval. Set `USE_ACTVID_HSYNC_N='1'` and `DISCRETE_BASIC_MODE='1'`.

Also, no automatic parsing of vertical ancillary data will be performed so the the Ancillary VPI port to the VPDMA should be turned off. All active video lines, since there are no vertical ancillary data lines, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Lines are denoted by an inactive to active transition of ACTIVID. Once a line starts, ACTIVID stays active for every pixel clock until the end of the line. Only those pixels gated by an active ACTIVID will be saved.

Figure 8-59. VSYNC and ACTIVID(2)

8.4.5.19.8 VSYNC and HSYNC

Figure 8-60 shows VSYNC from Group 1 and HSYNC from Group 2 being used. Set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='1'.

In the event that the machine is set to DISCRETE_BASIC_MODE='0', lockup will not occur as long as there is an HSYNC active transition during the time that VSYNC is active. This scenario is likely. However, if there is not at least one such transition on HSYNC, then the machine experiences a lock up. It cannot distinguish the end of one frame from the start of the next frame.

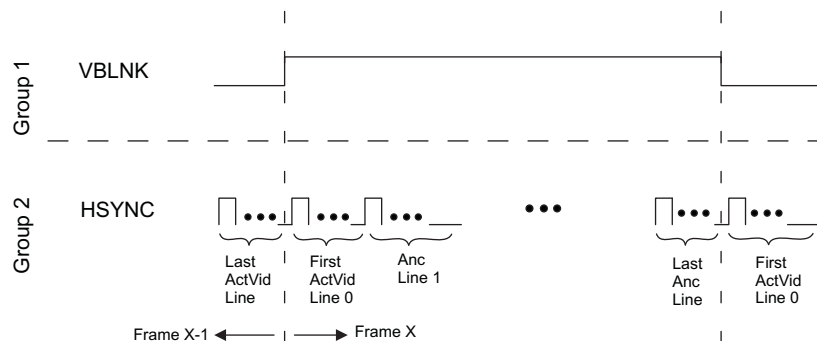

Figure 8-60. VSYNC and HSYNC

8.4.5.19.9 Line and Pixel Capture Examples

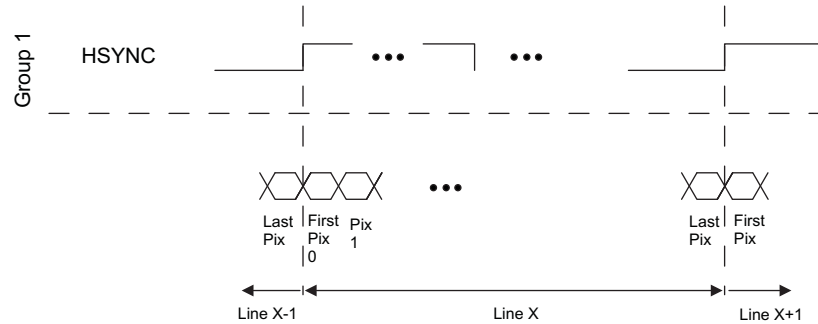

When DISCRETE_BASIC_MODE='0', VBLNK is generally used. All the lines where the start of line is under an active VBLNK are sent to the Ancillary Data buffer. All the lines where the start of line is not under an active VBLNK are sent to the Active Video framebuffer. This situation is shown in Figure 8-61.

Figure 8-61. Ancillary and Active Video Line Determination

The start of line is the pixel represented by the inactive to active transition on HSYNC when USE_ACTVID_HSYNC_N = '1'. Figure 8-62 illustrates the delineation of a line when using USE_ACTVID_HSYNC_N = '1'.

Figure 8-62. HSYNC Pixel Capture

The start of line is the pixel represented by the inactive to active transition on ACTVID when USE_ACTVID_HSYNC_N = '0.' Note that ACTVID stays active for the entire duration of active video portion of the line. This scenario is shown in Figure 8-63

Figure 8-63. ACTVID Pixel Capture

In 8-bit mode, the 4:2:2 YUV input color component order is Cb, Y followed by Cr and Y. For 16-bit input mode, all the components are sent in the same cycle.

8.4.5.20 VIP Overflow Detection and Recovery

It is possible that an overflow can occur in the VIP_PARSER. Overflow detection is determined by reading the [VIP_FIQ_STATUS](#) register and checking for bits 8, 7, 5, 4, 3 and 2. If video is being captured, and any of these bits are set, it indicates that not all of the incoming video data was sent to DDR memory. VIP overflow can be caused by one of the following:

1. External pixel clock is faster than processing clock
2. DDR bandwidth is temporarily over-consumed
3. VIP scaler is being used inline with external video input, and is upscaling.
 - VIP scaler in this use case can only be used for downscaling
4. VIP scaler is being used inline with external video input, but has not been configured with scaler coefficients
 - VIP scaler will not accept video input if it is not first configured with scaler coefficients. This will cause overflow
5. VIP scaler is being used inline, but has not been enabled
6. External cables are connected or disconnected while the system is running, resulting in corrupted video streams going into the VIP
7. Bad external video cable, which causes corrupted video streams going into the VIP

Items 6 and 7 above are typically seen as noise events, where it is likely that multiple horizontal syncs per line and/or multiple vertical syncs per frame will be observed. These result in high peak throughput requirements, leading to DDR bandwidth being temporarily over-consumed, and thus VIP overflow.

The high level recovery method for VIP overflow on Port A is outlined in the steps below. Port B is similar.

1. Set `VIP_XTRA6_PORT_A[31:16]` `YUV_SRCNUM_STOP_IMMEDIATELY` = `0xFFFF_FFFF`
2. Set `VIP_XTRA6_PORT_A[15:0]` `ANC_SRCNUM_STOP_IMMEDIATELY` = `0xFFFF_FFFF`
3. Set `VIP_PORT_A[8]` `ENABLE` = 0
4. Set `VIP_PORT_A[7]` `CLR_ASYNC_FIFO_RD` and `VIP_PORT_A[6]` `CLR_ASYNC_FIFO_WR` to 1
5. Set `VIP_PORT_A[23]` `SW_RESET` to 1
6. Reset other VIP modules
 - For each module used downstream of `VIP_PARSER`, write 1 to the bit location of the `VIP_CLKC_RST` register which is connected to `VIP_PARSER`
7. Abort VPDMA channels
 - Write to list attribute to stop list 0
 - Write to list address register location of abort list
 - Write to list attribute register list 0 and size of abort list
8. Set `VIP_PORT_A[23]` `SW_RESET` to 0
9. Un-reset other VIP modules
 - For each module used downstream of `VIP_PARSER`, write 0 to the bit location of the `VIP_CLKC_RST` register which is connected to `VIP_PARSER`
10. (Delay)
11. SC coeff downloaded (if `VIP_SCALER` is being used)
12. (Delay)
13. Set `VIP_XTRA6_PORT_A[31:16]` `YUV_SRCNUM_STOP_IMMEDIATELY` = `0x0000_0000`
14. Set `VIP_XTRA6_PORT_A[15:0]` `ANC_SRCNUM_STOP_IMMEDIATELY` = `0x0000_0000`
15. Set `VIP_PORT_A[8]` `ENABLE` = 1
16. Set `VIP_PORT_A[7]` `CLR_ASYNC_FIFO_RD` and `VIP_PORT_A[6]` `CLR_ASYNC_FIFO_WR` to 0

8.4.6 VIP Color Space Converter (CSC)

The Color Space Converter (CSC) module is used to convert video data from one color space to another with nine programmable integer multipliers.

8.4.6.1 CSC Features

- All parameters are programmable
- Each parameter is configurable in signed 13-bits
- Support for Bypass Mode

8.4.6.2 CSC Functional Description

The conversion between the different color spaces requires addition and multiplication operations on color and intensity components. The mathematical expression of the conversion can be written as:

$$\begin{aligned}
 Y &= A0 * R + B0 * G + C0 * B + D0 \\
 Cb &= A1 * R + B1 * G + C1 * B + D1 \\
 Cr &= A2 * R + B2 * G + C2 * B + D2
 \end{aligned}$$

Color space coefficients are set through the following registers:

- For luma component:
 - `VIP_CSC00[12:0]` A0
 - `VIP_CSC00[28:16]` B0

- VIP_CSC01[28:16] C0
- VIP_CSC04[27:16] D0
- For Cb component:
 - VIP_CSC01[28:16] A1
 - VIP_CSC02[12:0] B1
 - VIP_CSC02[27:16] C1
 - VIP_CSC05[11:0] D1
- For Cr component :
 - VIP_CSC03[12:0] A2
 - VIP_CSC03[27:16] B2
 - VIP_CSC04[12:0] C2
 - VIP_CSC05[27:16] D2

Using YUV to RGB conversion as an example: YUV represents one color space and RGB represents another color space. The conversion can be written in the matrix format shown in [Figure 8-64](#).

Figure 8-64. Matrix Format

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} A0 & B0 & C0 \\ A1 & B1 & C1 \\ A2 & B2 & C2 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} D0 \\ D1 \\ D2 \end{bmatrix}$$

Since HDTV and SDTV have different conversion requirements, both conversions of RGB-to-YCbCr and YCbCr-to-RGB are described. The details of derivations of these matrixes will be given in the following subsections.

8.4.6.2.1 HDTV Application

8.4.6.2.1.1 HDTV Application with Video Data Range

The two equations presented in this section are for the HDTV application. The chromaticity parameters are defined by ITU-R709 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 8-65. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.2126 & 0.7152 & 0.0722 \\ -0.1172 & -0.3942 & 0.5114 \\ 0.5114 & -0.4646 & -0.0468 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 8-66. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1.5396 \\ 1 & -0.1831 & -0.4577 \\ 1 & 1.8142 & 0 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -197 \\ 82 \\ -232 \end{bmatrix} D$$

8.4.6.2.1.2 HDTV Application with Graphics Data Range

The two equations presented in this section are for the HDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R709 standard.

The input data ranges for these equations are as follows.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 8-67. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.1826 & 0.6142 & 0.0620 \\ -0.1006 & -0.3385 & 0.4392 \\ 0.4392 & -0.3990 & -0.0402 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 8-68. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1.1644 & -0.0003 & 1.7927 \\ 1.1644 & -0.2132 & -0.5329 \\ 1.1642 & 2.1125 & -0.0001 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -248 \\ 77 \\ -289 \end{bmatrix} D$$

8.4.6.2.1.3 Quantized Coefficients for Color Space Converter in HDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for HDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

Table 8-17. Quantized Coefficients of HDTV Application with Video Data Range

8.4.6.2.2 SDTV Application

8.4.6.2.2.1 SDTV Application with Video Data Range

The two equations presented in this section are for the SDTV application. The chromaticity parameters are defined by ITU-R601 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 8-69. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.172 & -0.339 & 0.511 \\ 0.511 & -0.428 & -0.083 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 8-70. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & -0.0003 & 1.3717 \\ 1 & -0.3365 & -0.6984 \\ 1 & 1.7336 & -0.0016 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -176 \\ 132 \\ -222 \end{bmatrix} D$$

8.4.6.2.2.2 SDTV Application with Graphics Data Range

The two equations presented in this section are for the SDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R601 standard.

The input data ranges for these equations are as following.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 8-71. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.257 & 0.504 & 0.098 \\ -0.148 & -0.291 & 0.439 \\ 0.439 & -0.368 & -0.071 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 8-72. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1.1641 & -0.0018 & 1.5958 \\ 1.1641 & -0.3914 & -0.8135 \\ 1.1641 & 2.0178 & -0.0012 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -223 \\ 136 \\ -277 \end{bmatrix} D$$

8.4.6.2.2.3 Quantized Coefficients for Color Space Converter in SDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for SDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

Table 8-19. Quantized Coefficients of SDTV Application with Video Data Range

8.4.6.3 CSC Bypass Mode

CSC module can be bypassed by setting [VIP_CSC05\[28\]](#) BYPASS bit-field to 1.

8.4.7 VIP Scaler (SC)

This section describes the highly optimized video resizers, SC (scalers), in the VIP modules.

8.4.7.1 SC Features

- Independent vertical and horizontal up and down scaling
- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Maximum horizontal scaling ratio only limited by output line buffer (2047 pixels)
- Scaling filter Coefficient memory download via VPI (Video Port Interface) Control interface

8.4.7.2 SC Functional Description

Scaler takes in a 10-bit YCbCr 422 video frame from an upstream module, performs vertical/horizontal scaling and outputs a YCbCr422 scaled image to a next downstream module. All configurations are done via the MMR interface except for the scaler coefficient memory configuration that is done via the common VPI control interface bus by VPDMA. Figure 8-73 shows the high-level block diagram of the scaler module.

Figure 8-73. High Level Block Diagram

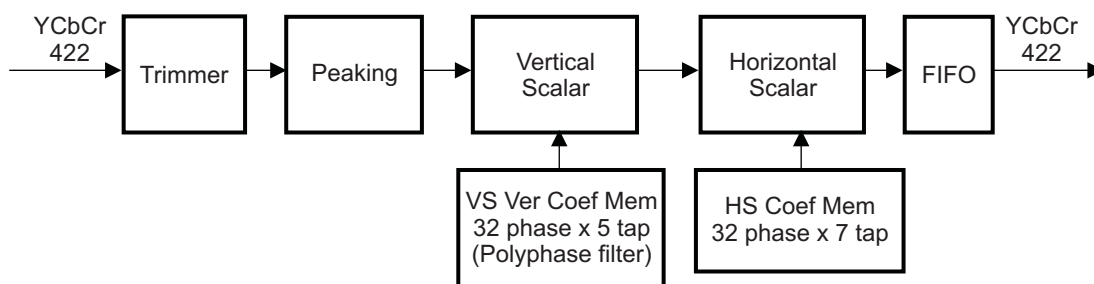

The SC is used in the video path and in all other video write-back data paths in the VIP module.

Scaling is performed in following three steps:

1. Trimming and Pre-peaking filtering
2. Vertical Scaling (Polyphase/Running Average Filter)
3. Horizontal polyphase scaling

Figure 8-74. SC Block Diagram

8.4.7.2.1 Trimmer

The trimmer can be programmed to re-define a new source image within the input video frame sent from an upstream module before it is sent to the scaling sub-modules. This feature enables small area zoom out, source pan/scan, or removal of unwanted area in the video (such as black box / curtains / noisy line-21 video) without modifying the VPDMA parameters.

Horizontal and vertical offset is set through [VIP_CFG_SC25\[26:16\] CFG_OFF_W](#) and [VIP_CFG_SC25\[10:0\] CFG_OFF_H](#) registers.

Width and height are set through [VIP_CFG_SC24\[26:16\] CFG_ORG_W](#) and [VIP_CFG_SC24\[10:0\] CFG_ORG_H](#) registers.

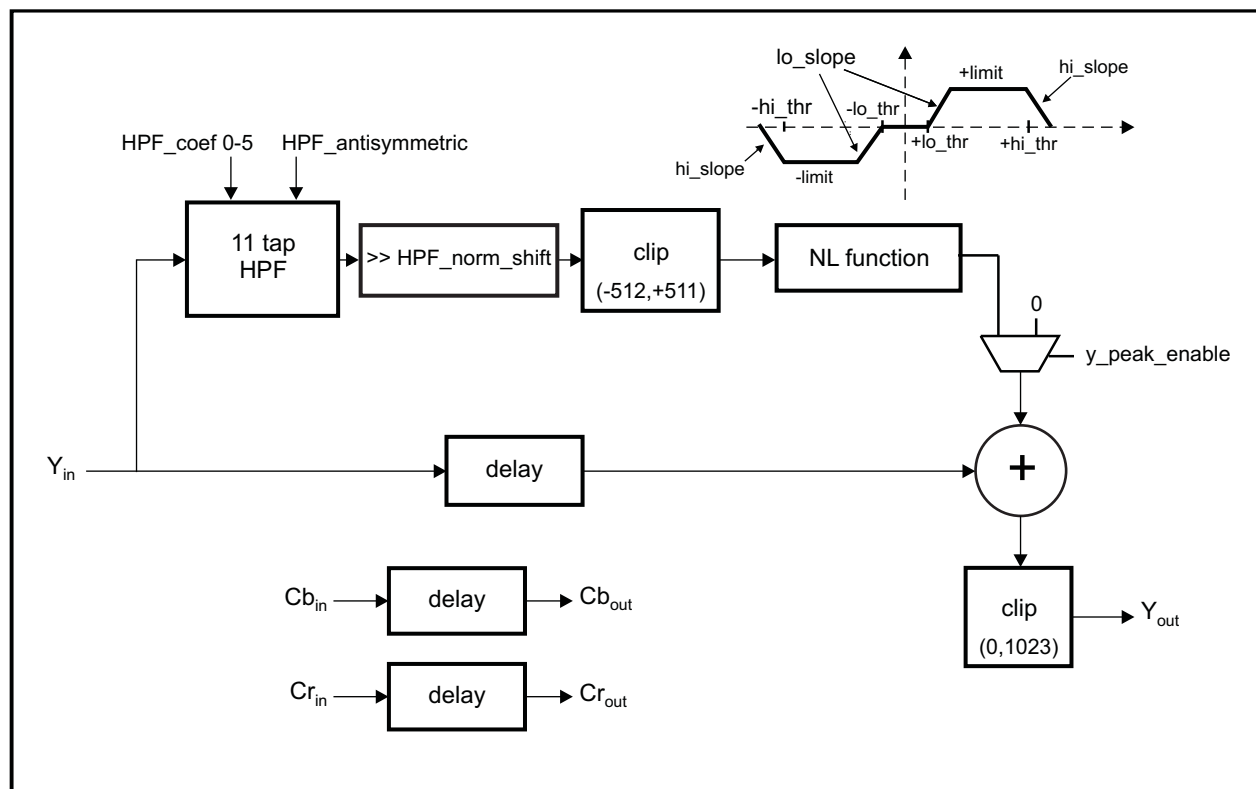

Figure 8-75. Input Image Trimming

NOTE: Width and height of the source image are global parameters and are set with [VIP_CFG_SC5\[22:12\]](#) CFG_SRC_W and [VIP_CFG_SC5\[10:0\]](#) CFG_SRC_H registers.

It is required that the input image frame ($CFG_SRC_W \times CFG_SRC_H$) to be at least 32×32 (after trimming, if the trimming is enabled) to properly fill the input filter stage pipelines.

8.4.7.2.2 Peaking

The peaking block increases the amplitude of high frequency luminance information in horizontal direction to increase the sharpness of a video image before it is scaled. As shown in [Figure 8-76](#), the high-frequency luminance is increased using an 11-tap High-Pass filter with adjustable gain. The non-linear coring function removes low-level noise and the modified luminance is then added to the original luminance signal. The implementation details are shown in [Figure 8-76](#).

Figure 8-76. Filter Implementation and Parameter Description

vip-057

Table 8-21. Parameter Description

Parameter	Description	Bits	Default
VIP_CFG_SC19[7:0] CFG_HPF_COEF0 to VIP_CFG_SC20[15:8] CFG_HPF_COEF5	FIR coefficients	8	[0 0 0-4 0 8]

VIP_CFG_SC21[23:16] CFG_NL_LO_SLOPE	Lo slope = - CFG_NL_LO_SLOPE/16	8	16
VIP_CFG_SC22[18:16] CFG_NL_HI_SLOPE_SHIFT	Hi slope = $2^{(CFG_NL_HI_SLOPE_SHIFT-3)}$	3	4
VIP_CFG_SC20[28:20] CFG_NL_LIMIT	Clipping limit	9	200
VIP_CFG_SC0[14] CFG_Y_PK_EN	Control	1	0

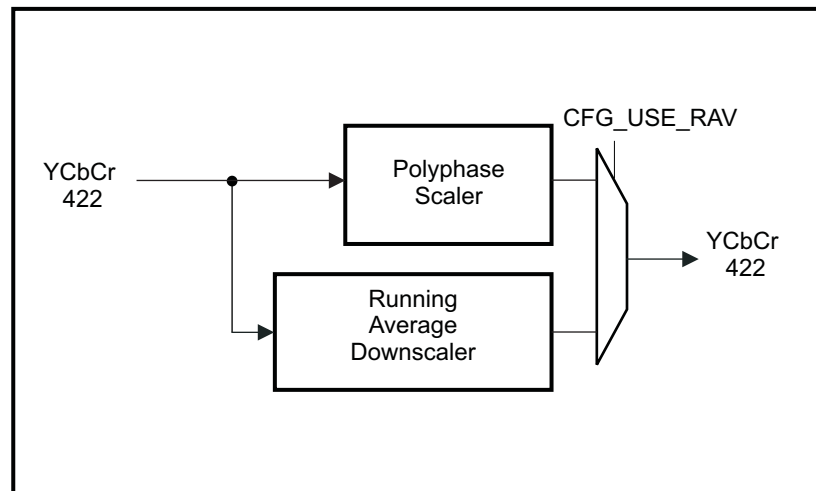

Parameters for the Peaking filters are defined in VIP_CFG_SC19 through VIP_CFG_SC22 registers. The frequency responses of the peaking-filter with different sets of coefficients are shown in Figure 8-77. If the source of the input video is NTSC or PAL format, the peaking filter can be configured to reject the color subcarrier frequency.

Figure 8-77. Peaking Filter at fs/4

8.4.7.2.3 Vertical Scaler

The vertical scaler has a polyphase (32-phase \times 5-tap) filter and a running average filter as shown in Figure 8-78. While the polyphase filter can be used for any up-scaling and preferably downscaling to 3/16 scale factor, the running average filter is used only for downscaling to a 1/2 or less size. Selection between these two scalers is based on the user setting of VIP_CFG_SC0[4] CFG_USE_RAV parameter (CFG_USE_RAV= '0' for poliphase filter, and CFG_USE_RAV= '1' for running average filter), according to the user preference of the tradeoff between sharpness preserving and introduced artifacts.

Figure 8-78. Vertical Scaler Block Diagram

8.4.7.2.3.1 Running Average Filter

When a poly-phase filter is used, usually it has to have many taps in order to achieve acceptable quality for very small downscaling ratio, which requires the use of many line buffers. In VIP, there is a weighted Running Average filter for downscaling when the scaling factor is small (for example, when the scaling ratio is less than 0.5). This highly optimized design requires only one line buffer for luma and one for chroma, which still achieving acceptable quality. The output of the running average filter is based on weighted average of pixels in the current and previous rows in vertical direction. Initializations of accumulators affect the weights.

8.4.7.2.3.2 Vertical Scaler Configuration Parameters

Table 8-22. Vertical Scaler Configuration Parameters

Parameter	Typical Value	Controls	Description
VIP_CFG_SC0[10] CFG_INTERLACE_I		Frame or Field	0 = progressive, 1 = interlace

VIP_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR	4	Bilinear Scaler	Range for chroma soft switch based on pixel differences (max limit = 8)

Table 8-22. Vertical Scaler Configuration Parameters (continued)

Parameter	Typical Value	Controls	Description
VIP_CFG_SC13[21:12] CFG_CHROMA_INTP_THR	64		Threshold used in chroma soft switch based on pixel differences
VIP_CFG_SC13[9:0] CFG_SC_FACTOR_RAV		Running Average Scaler	Scale factor = round(1024 × tarH/srcH)
VIP_CFG_SC6[9:0] CFG_ROW_ACC_INIT_RAV			Initial row accumulator value for progressive frame and top field
VIP_CFG_SC6[19:10] CFG_ROW_ACC_INIT_RAV_B			Initial row accumulator value for bottom field

NOTE: Bi-linear scaler is not present in this device

8.4.7.2.4 Horizontal Scaler

The Horizontal scaler is implemented using a 32-phase × 7-tap polyphase filter preceded by two sets of 1/2x decimators. The general configuration of the Horizontal scaler is performed as follows:

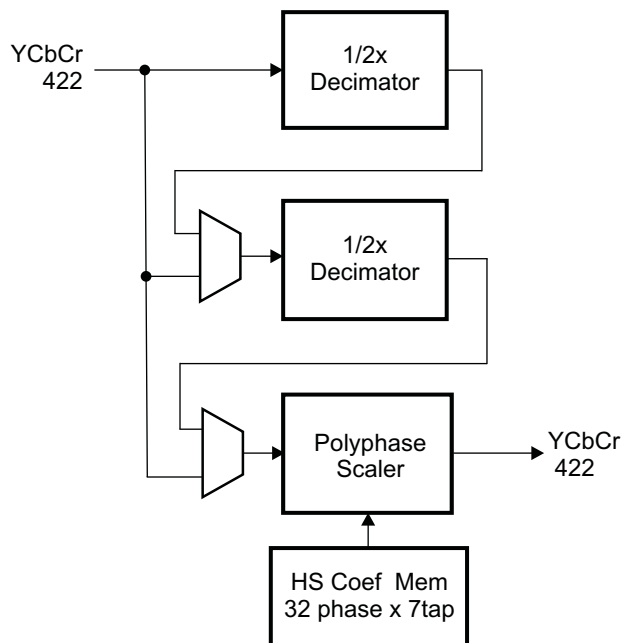

- For up scaling, the input video is interpolated using the polyphase scaler.
- For downscaling, it is recommended that input video is decimated by 2 until the modified scale factor falls between 1/2 and 1. Then, a polyphase filter is configured with coefficients selected based on the mod_scale_factor calculated as shown below from one of nine different sets of coefficients: (8,9,10,11,12,13,14,15,16)/16.

```

if (scale_factor >= 1/2) {
    mux=0; mod_scale_factor=scale_factor;
} else if (scale_factor >= 1/4) {
    mux=1; mod_scale_factor=2*scale_factor;
} else {
    mux=2; mod_scale_factor=4*scale_factor;
}

```

Figure 8-79. Horizontal Scaler Block Diagram

In auto mode ($\text{CFG_AUTO_HS} == 1$), scaler will operate as per above recommendation. In addition to this, for ($\text{CFG_AUTO_HS} == 1$), polyphase filtering will be bypassed when ($\text{scale_factor} == 1$) or ($\text{scale_factor} == \frac{1}{2}$) or ($\text{scale_factor} == \frac{1}{4}$). If $\text{CFG_AUTO_HS} == 0$ is used, user must provide proper values for dcm_2x , dcm_4x , proper values for all inputs to polyphase filter in the registers as well as appropriate coefficient sets. There is no constraint on polyphase filtering in terms of scaling ratio. However, there are constraints on input and output image width for scaler. Frame dimensions are limited from 64×64 to 2047×2047 .

8.4.7.2.4.1 Half Decimation Filter

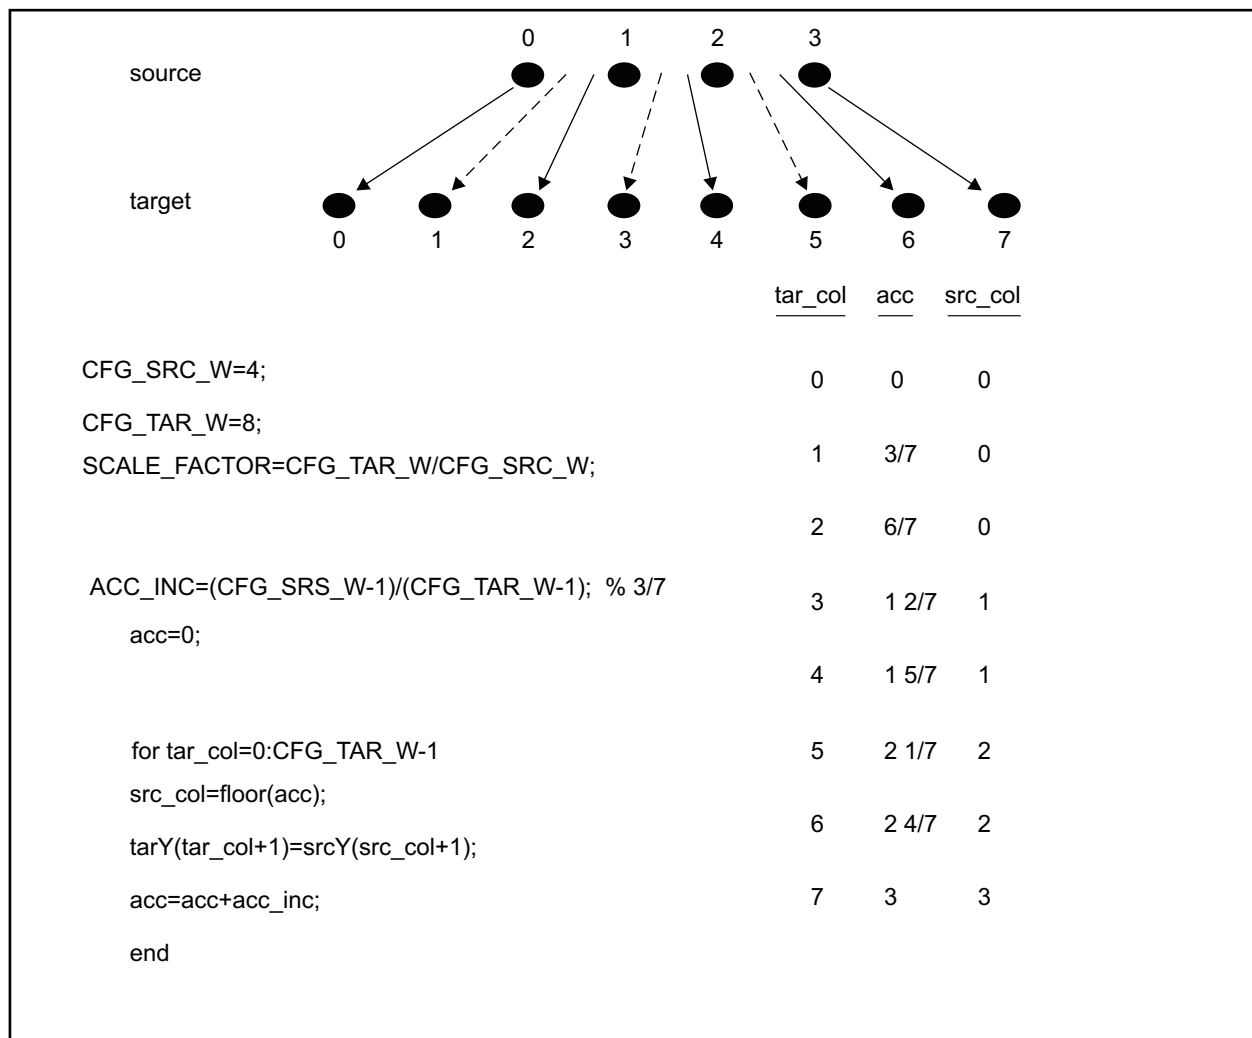

The half-decimation filter is an 11-tap filter with following coefficients: (14, 0, -29, 0, 79, 128, 79, 0, -29, 0, 14). For processing left and right edge pixels, the first and last data are repeated to pre-fill and extend the filter data pipeline respectively. These coefficients are hard-coded into scaler design and user cannot modify these.

8.4.7.2.4.2 Polyphase Filter

The horizontal scaling is done by stepping across the target row and interpolating target pixels based on source pixels. Accumulator points to the source pixel that corresponds to the target pixel.

Figure 8-80 shows an up-scaling example.

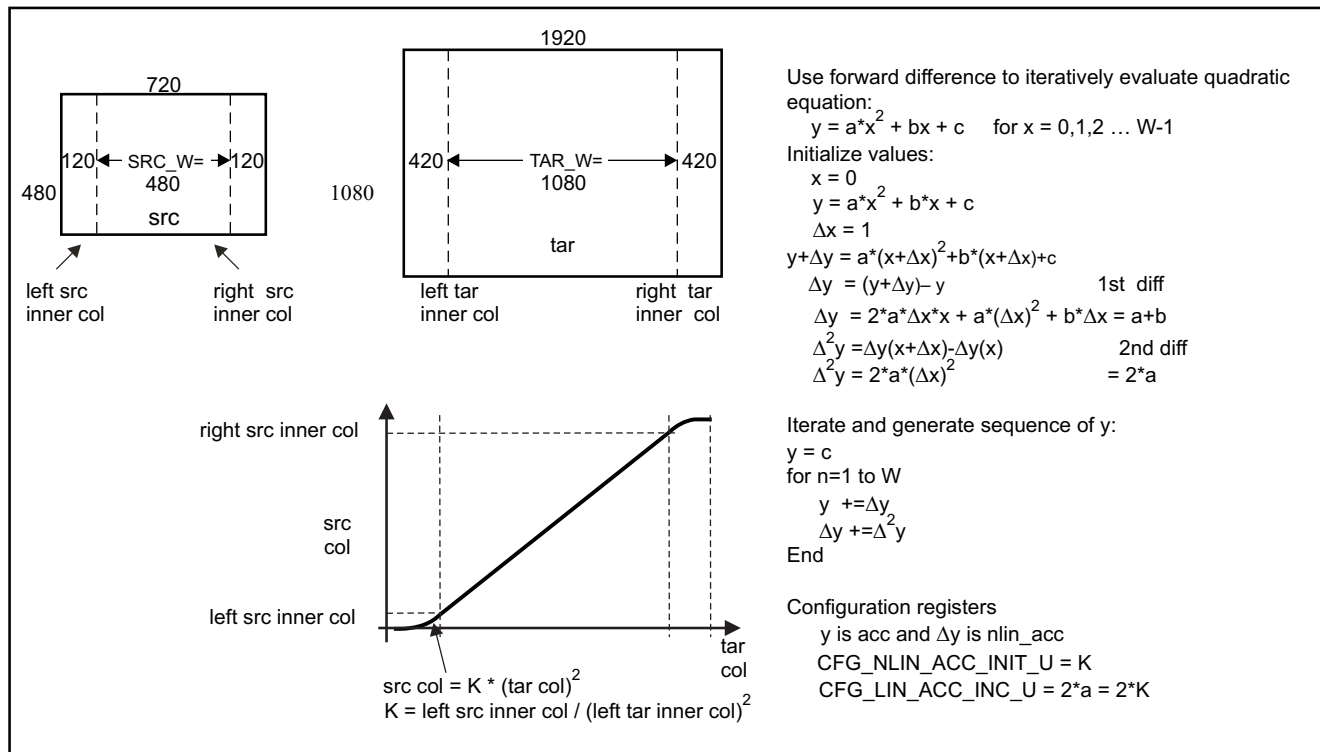

Figure 8-80. Polyphase Filtering Example

8.4.7.2.4.3 Nonlinear Horizontal Scaling

The horizontal scaler supports non-linear scaling to maintain the same aspect ratio for inner picture while stretching picture edges to fill the required resolution when capturing a 4 x 3 picture and fetching it as a 16 x 9 to memory. Non-linear scaling parameters are set with [VIP_CFG_SC4\[30:28\]](#) [CFG_NLIN_ACC_INIT_U](#) and [VIP_CFG_SC4\[26:24\]](#) [CFG_LIN_ACC_INC_U](#) registers. When setting up a non-linear scaling application, the inner picture is defined as the center square portion of the image with width and height equal to the height of the source image. Remaining side regions are then scaled non-linearly. [Figure 8-81](#) shows a non-linear scaling case.

Figure 8-81. Non-linear Scaling Example

8.4.7.2.6 Coefficient Memory

8.4.7.2.6.1 Overview

The scaler requires initialization of eight coefficient SRAMs prior to processing a video frame. These coefficients are stored in the external DDR memories and downloaded by the VPDMA. The VPDMA writes the coefficient data through the VPI Control Interface bus.

The eight coefficient SRAMs are:

- HS horizontal polyphase scaler, Luma and Chroma (7tap)
- VS vertical polyphase scaler, Luma and Chroma (5tap or 3tap)

8.4.7.2.6.2 Physical Coefficient SRAM Layout

Each of the six legacy coefficient SRAMs is 32 phases × 91 bits. A single coefficient value is 13 bits. Therefore, one word of the SRAM contains 7 coefficient values as shown in [Figure 8-82](#), and 224 coefficient values are stored in each SRAM.

Figure 8-82. SRAM Layout for 7tap Coefficient

Phase 0	C6	C5	C4	C3	C2	C1	C0
Phase 31	C223	C222	C221	C220	C219	C218	C217

The two vertical polyphase SRAMs are 32 phases × 65 bits. A single coefficient is 13 bits. Therefore, one word of SRAM contains 5 coefficient values as shown in [Figure 8-83](#).

Figure 8-83. SRAM Layout for 5tap Coefficient

Phase 0	C4	C3	C2	C1	C0
Phase 31	C221	C220	C219	C218	C217

8.4.7.2.6.3 Scaler Coefficients Packing on 128-bit VPI Control I/F

A coefficient value is 13 bits wide and takes a single half word. Thus, one VPI Control write carries one phase’s worth of coefficients. The last half-word in a quad-word is not used for 7tap coefficients.

Figure 8-84. VPI Control I/F Coef Data Format (7tap)

The Vertical Polyphase scaler coefficients have only five or three values per phase, so the last three (or five) entries are unused. The Vertical Polyphase coefficient packing is shown in Figure 8-85 and Figure 8-86.

Figure 8-85. VPI Control I/F Coef Data Format (5tap)

Figure 8-86. VPI Control I/F Coef Data Format (3tap)

8.4.7.2.6.4 VPI Control I/F Memory Map for Scaler Coefficients

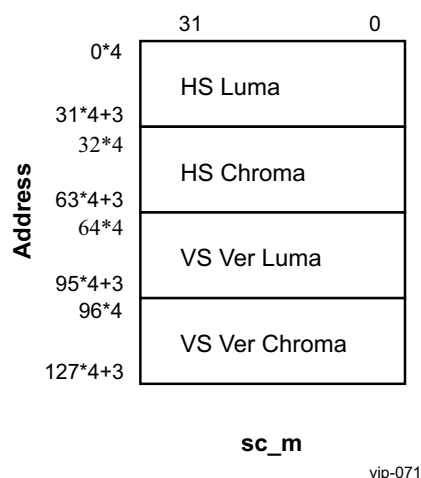

The memory map of the VPI Control I/F for the Scaler coefficients is shown in Figure 8-87. All coefficients can be filled up by a single VPI Control write command. The update address feature of VPI Control I/F enables individual access to a certain location of memories.

Figure 8-87. VPI Control I/F Memory Map (Write)

vip-070

The module supports the VPI Control Read to read back the contents in the coefficient memories for debug purpose. Figure 8-88 shows the memory map of the VPI Control Read. As the VPI Control Read has only 32 bit data bus, it requires the word addressing while the write does the quad-word addressing.

Figure 8-88. VPI Control I/F Memory Map (Read)

8.4.7.2.6.5 VPI Control Interface

VPDMA is used to configure the coefficient memories of scaler through VPI control interface. Since the coefficient memories are not shadowed (unlike the memory mapped registers), VPI control write access needs to be done only during the gap between video frame processing times. If a write request is made while the Scaler is active, the access will be held off by the hardware until the last data of the currently processed frame is sent out. Care must be given to the order of the DMA descriptors so that blocking of VPI control bus does not occur.

8.4.7.2.6.6 Coefficient Table Selection Guide

The scaler filter coefficient tables are pre-generated using a MATLAB® program for various scaling factor ranges. [Table 8-28](#) provides a general selection guide table for coefficient data files.

The mentioned .dat files are available in [Section 8.4.7.4](#).

8.4.7.3.3 Typical Configuration Values

The following is the list of all scaler register fields that are set to constant values, representing typical settings:

- VIP_CFG_SC0[3] CFG_INV_T_FID = 0 (Field ID will be used without inversion)
- VIP_CFG_SC0[5] CFG_ENABLE_EV = 1 (Field ID will be used without inversion)
- VIP_CFG_SC0[6] CFG_AUTO_HS = 1 (The hardware will automatically decide, if current operation is up or down scaling. In down-scaling, it will also decide, if 2X or 4X decimation filter is needed)
- VIP_CFG_SC0[7] CFG_DCM_2X = 0 (The 2X decimation filter is disabled)
- VIP_CFG_SC0[8] CFG_DCM_4X = 0 (The 4X decimation filter is disabled)
- VIP_CFG_SC0[11] CFG_ENABLE_SIN2_VER_INTP = 1 (Modified bilinear interpolation is used)
- VIP_CFG_SC0[14] CFG_Y_PK_EN = 0 (Luma peaking is disabled)
- VIP_CFG_SC0[15] CFG_TRIM = 1 (Trimming is enabled)
- VIP_CFG_SC12[24:0] CFG_COL_ACC_OFFSET = 0 (No horizontal offset is involved)
- VIP_CFG_SC13[21:12] CFG_CHROMA_INTP_THR = 64 (If the difference is less than this threshold, the interpolation of chroma should be done along edge direction. Otherwise, the interpolation of chroma should be done vertically)
- VIP_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR = 4 (max limit=8)

VIP_CFG_SC18[24:16] CFG_CONF_DEFAULT = 0x100 (Defines confidence factor when edge detection is disabled (VIP_CFG_SC0[5] CFG_ENABLE_EV bit = 0))

8.4.8 VIP Video Port Direct Memory Access (VPDMA)

8.4.8.1 VPDMA Introduction

The VPDMA primary function is to move data between external memory and internal processing modules that source or sink data. VPDMA is capable buffering this data and then delivering the data as demanded to the modules as programmed. The modules that source or sink data are referred to as clients. A channel is setup inside the VPDMA to connect a specific memory buffer to a specific client. The VPDMA centralizes the DMA control functions and buffering required to allow all the clients to minimize the effect of long latency times. The VPDMA also supports a descriptor based mode where lists of descriptors can be setup to configure all the channels as they become available.

Additionally, in a third-party configuration, the VPDMA is capable of performing DMA transfers as requested by the pulsing of an event strobe. The VPDMA is capable of generation of an address which may reach any location in the range for which it is configured. It is capable of moving this data either to or from a Shared Buffer and ultimately to or from a Client Buffer. For the two type of Client Buffers that are used to drive data into a subsystem (Streaming Buffer and Random Access Buffer) data is either pushed into the buffer or pulled out of the buffer dependent upon the direction of the data transfer. For third-party DMA operations the data is transferred into a Client buffer, and then transferred out of the Client Buffer to the transfer destination. These transfers are triggered by an Event pulse to each of the Client Buffers which are Routing Buffer types.

8.4.8.2 VPDMA Basic Definitions

8.4.8.2.1 Client

The modules that source or sink data are referred to as clients. The clients of the VPDMA are the physical between the processing modules (VIP) and external memory. A channel is the mechanism inside the VPDMA that connects a specific memory buffer or transfer to a specific client.

The start event can also be selected by a channel attribute or to be controlled by an internal frame signal controlled by the List Manager.

8.4.8.2.2 Channel

The VPDMA requires a channel to be setup for each group of transfers. All the channels are described through a Data Transfer Descriptor that has a common format. The client that the channel is mapped to interprets the information in the descriptor to perform the requested data transfer.

Each of the channels has a type of data that it can support based upon the client that it services. The VPDMA supports three types of channels:

- **YUV Channel** - Clients taking data YUV data
- **RGB Channel** - Clients taking RGB data
- **Miscellaneous Channel** - The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client.

8.4.8.2.3 List

A list is a group of descriptors that makes up a set of DMA transfers that need to be completed. The VPDMA supports one kind of list only:

- The **Regular List** is a single list that the VPDMA will execute each descriptor once and initiate an interrupt when the list has completed. A regular list can contain any kind of descriptor without limitation and be of any size.

The VPDMA Controller works on lists of descriptors. In this mode the processor writes the lists of descriptors in the order it wants them executed. It then writes the location of the list to the [VIP_LIST_ADDR](#) register, followed by writing the size (bit LIST_SIZE) and type (bit LIST_TYPE) of the list, and list number (bit LIST_NUM) to the [VIP_LIST_ATTR](#) register. The List Manager module then schedules a DMA transfer to pull in the portion of the list that it can store in internal VPDMA memory. The List Manager will sequentially process the active list of descriptors until either the descriptor requires the use of a client that is currently active, or if it is waiting for the next portion of the list to be transferred from a DMA request. If there is no active list to process the list manager will go into an IDLE mode waiting for any client that is blocking a list or a list DMA transfer to complete.

All the DMA transfers are controlled by List Manager module inside VPDMA. List Manager needs to be loaded with FIRMWARE, before any DMA transfer from memory, after the VPDMA reset. The first MMR write to [VIP_LIST_ADDR](#) register after VPDMA reset should be the address of the memory buffer(128-bit aligned, that is, last four bits of the buffer address should be zero) where the firmware is stored. List Manager then schedules a DMA transaction to fetch the firmware and sets the [VIP_LIST_ATTR\[19\]](#) RDY bit after the firmware loading is complete.

8.4.8.2.4 Data Formats Supported

Following list summarizes the data formats supported in the VPDMA. For more information see [Section 8.4.8.9, VPDMA Data Formats](#).

- RGB Data Types:
 - RGB16-565
 - ARGB-1555
 - ARGB-4444
 - RGBA-5551
 - RGBA-4444
 - ARGB24-6666
 - RGB24-888
 - ARGB32-8888
 - RGBA24-6666
 - RGBA32-8888
 - BGR16-565
 - ABGR-1555

- ABGR-4444
- BGRA-5551
- BGRA-4444
- ABGR24-6666
- BGR24-888
- ABGR32-8888
- BGRA24-6666
- BGRA32-8888
- YUV Data Types:
 - Y 4:4:4
 - Y 4:2:2
 - Y 4:2:0
 - C 4:4:4
 - C 4:2:2
 - C 4:2:0
 - CY 4:2:2
 - YCbC 4:4:4
 - YC 4:2:2

NOTE: VPDMA supports swapping formats (RGB/BGR and Cb/Cr)

8.4.8.3 VPDMA Client Buffering and Functionality

Table 8-29 lists for each client:

- The channels used, amount of buffering allocated for it, and the shared buffer used for its memory
- The line sizes it handles for tiled and non-tiled memory spaces, as well as any additional features it supports

Table 8-29. VPDMA Client Buffering and Functionality

Client	Channel(s)	Tiled Memory Max Line Size	Non-Tiled Memory Max Line Size	Additional Features

8.4.8.4 VPDMA Channels Assignment

Table 8-30 lists all of the channels in VPDMA and its base attributes. The Data Type column states what type of data YUV, RGB or OTHER the channel handles and in parentheses are the legal data type values that can be entered into a data transfer descriptor. The Client field states the name of the Client and in parentheses it states the reference number in [Figure 8-4](#), *VIP Block Diagram*.

Table 8-30. VPDMA Channels Assignment

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src0	Video Input 1 Port A Channel 0	38	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src1	Video Input 1 Port A Channel 1	39	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src2	Video Input 1 Port A Channel 2	40	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src3	Video Input 1 Port A Channel 3	41	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src4	Video Input 1 Port A Channel 4	42	YUV (0x7)	vip1_lo_y (2)

Table 8-30. VPDMA Channels Assignment (continued)

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src5	Video Input 1 Port A Channel 5	43	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src6	Video Input 1 Port A Channel 6	44	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src7	Video Input 1 Port A Channel 7	45	YUV (0x7)	vip1_lo_y (2)

8.4.8.5 VPDMA MFLAG Mechanism

The device L3_MAIN interconnect accepts MFLAG signals from certain initiators that can influence the internal L3_MAIN arbitration mechanisms. As a result, a higher priority is given to the data traffic initiated by these initiators. The VIP VPDMA can directly drive such MFLAG signals dynamically. The MFLAG generation for VIP VPDMA is enabled by default, and there is no register control over it.

The VPDMA arbitrates between multiple DMA sources within the VIP based on FIFO levels of DMA channels connected to VPDMA. Priority escalation mechanism implemented within VIP subsystem is based on overflow threshold and FIFO margin.

The following is a summary of priority and MFLAG levels provided by the VIP:

- High priority (MFLAG = 3) when FIFO margin is below 25%
- Medium priority (MFLAG = 1) when FIFO margin is between 25% and 50%
- Low priority (MFLAG = 0) when FIFO margin is above 50%

Additionally, the VIP subsystem also generates MReqPriority based upon a programmed descriptor configuration. The MReqPriority configuration influences the arbitration mechanism in the Memory Subsystem only and has no influence on the arbitration that takes place within L3_MAIN interconnect. For more information see [Section 8.4.8.7.1.4, Data Packet Descriptor Word 3](#).

8.4.8.6 VPDMA Interrupts

The VPDMA has 4 interrupt group(s). Each group has an interrupt for all the client interrupts, an interrupt for every 32 channels, a interrupt for each list complete, an interrupt for each list notify and an interrupt for all of the descriptor interrupts. Each of these groups can be individually masked so that only the interrupts specified will trigger the higher level interrupt.

Each interrupt source can be individually masked independently for each separate interrupt group. A status register bit exists for each interrupt source for each interrupt group, that is set whenever the interrupt event occurs even when if the interrupt is masked. The status register bit will remain set until cleared by software by writing a one to the status bit.

[Table 8-31](#) shows all interrupt events from VPDMA that go to VIP top level. The interrupt events are mapped to two interrupt lines, INT0 and INT1, that go to VIP top level.

Table 8-31. VPDMA Interrupt Events

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group0	VIP_INT0_CHANNEL0_INT_STAT VIP_INT1_CHANNEL0_INT_STAT	VIP_INT0_CHANNEL0_INT_MASK VIP_INT1_CHANNEL0_INT_MASK	An unmasked channel interrupt for interrupt group 0 in channel register 0 or 1 has fired.
vpdma_int_channel_group1	VIP_INT0_CHANNEL1_INT_STAT VIP_INT1_CHANNEL1_INT_STAT	VIP_INT0_CHANNEL1_INT_MASK VIP_INT1_CHANNEL1_INT_MASK	An unmasked channel interrupt for interrupt group 1 in channel register 0 or 1 has fired.
vpdma_int_channel_group2	VIP_INT0_CHANNEL2_INT_STAT VIP_INT1_CHANNEL2_INT_STAT	VIP_INT0_CHANNEL2_INT_MASK VIP_INT1_CHANNEL2_INT_MASK	An unmasked channel interrupt for interrupt group 2 in channel register 0 or 1 has fired.
vpdma_int_channel_group3	VIP_INT0_CHANNEL3_INT_STAT VIP_INT1_CHANNEL3_INT_STAT	VIP_INT0_CHANNEL3_INT_MASK VIP_INT1_CHANNEL3_INT_MASK	An unmasked channel interrupt for interrupt group 3 in channel register 0 or 1 has fired.
vpdma_int_channel_group4	VIP_INT0_CHANNEL4_INT_STAT VIP_INT1_CHANNEL4_INT_STAT	VIP_INT0_CHANNEL4_INT_MASK VIP_INT1_CHANNEL4_INT_MASK	An unmasked channel interrupt for interrupt group 4 in channel register 0 or 1 has fired.
vpdma_int_channel_group5	VIP_INT0_CHANNEL5_INT_STAT VIP_INT1_CHANNEL5_INT_STAT	VIP_INT0_CHANNEL5_INT_MASK VIP_INT1_CHANNEL5_INT_MASK	An unmasked channel interrupt for interrupt group 5 in channel register 0 or 1 has fired.
vpdma_int_list0_complete			List 0 has completed
vpdma_int_list0_notify			The data transfer in list 0 with the Notify Field set in the descriptor has completed
vpdma_int_list1_complete			List 1 has completed

Table 8-31. VPDMA Interrupt Events (continued)

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_list1_notify			The data transfer in list 1 with the Notify Field set in the descriptor has completed
vpdma_int_list2_complete			List 2 has completed
vpdma_int_list2_notify			The data transfer in list 2 with the Notify Field set in the descriptor has completed
vpdma_int_list3_complete			List 3 has completed
vpdma_int_list3_notify			The data transfer in list 3 with the Notify Field set in the descriptor has completed
vpdma_int_list4_complete	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_MASK VIP_INT1_LIST0_INT_MASK	List 4 has completed
vpdma_int_list4_notify			The data transfer in list 4 with the Notify Field set in the descriptor has completed
vpdma_int_list5_complete			List 5 has completed
vpdma_int_list5_notify			The data transfer in list 5 with the Notify Field set in the descriptor has completed
vpdma_int_list6_complete			List 6 has completed
vpdma_int_list6_notify			The data transfer in list 6 with the Notify Field set in the descriptor has completed
vpdma_int_list7_complete			List 7 has completed
vpdma_int_list7_notify			The data transfer in list 7 with the Notify Field set in the descriptor has completed
vpdma_int_client	VIP_INT0_CLIENT0_INT_STAT VIP_INT0_CLIENT1_INT_STAT VIP_INT1_CLIENT0_INT_STAT VIP_INT1_CLIENT1_INT_STAT	VIP_INT0_CLIENT0_INT_MASK VIP_INT0_CLIENT1_INT_MASK VIP_INT1_CLIENT0_INT_MASK VIP_INT1_CLIENT1_INT_MASK	Client Interrupt
vpdma_int_descriptor	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	Descriptor Interrupt

In [Table 8-31](#) above, the “channel_group”, “client” and “descriptor” interrupts are actually a set of additional interrupts. When software receives an interrupt from a “channel_group,” “client,” or “descriptor” it must read the appropriate register within the VPDMA (refer to [Table 8-32](#) to determine what the actual interrupt was).

Table 8-32. VIP Interrupt Sources

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_ancb_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src10	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src11	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src12	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src13	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src14	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src15	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_ancb_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_porta_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src10	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src11	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_porta_src12	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src13	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src14	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src15	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_porta_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_luma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point.
channel_vip1_portb_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_luma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip2_mult_anc_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anc_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anc_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anc_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_ancb_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src10	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src11	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src12	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src13	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src14	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src15	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_ancb_src4	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src5	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src6	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src7	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src8	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src9	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_porta_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src10	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src11	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src12	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src13	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_porta_src14	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src15	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src4	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src5	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src6	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src7	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src8	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src9	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_portb_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_porta_chroma	channel_group5	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_porta_luma	channel_group5	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_porta_rgb	channel_group5	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point.
channel_vip2_portb_chroma	channel_group5	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_portb_luma	channel_group5	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_portb_rgb	channel_group5	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
client_vip1_anc_a	client	The client interface vip1_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_anc_b	client	The client interface vip1_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_lo_uv	client	The client interface vip1_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_lo_y	client	The client interface vip1_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
client_vip1_up_uv	client	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_y	client	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_anc_a	client	The client interface vip2_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_anc_b	client	The client interface vip2_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_lo_uv	client	The client interface vip2_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_lo_y	client	The client interface vip2_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_up_uv	client	The client interface vip2_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_up_y	client	The client interface vip2_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vpi_ctl	client	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
control_descriptor_int0	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0.
control_descriptor_int1	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1.
control_descriptor_int10	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10.
control_descriptor_int11	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11.
control_descriptor_int12	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12.
control_descriptor_int13	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13.
control_descriptor_int14	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14.
control_descriptor_int15	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15.

Table 8-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
control_descriptor_int2	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2.
control_descriptor_int3	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3.
control_descriptor_int4	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4.
control_descriptor_int5	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5.
control_descriptor_int6	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6.
control_descriptor_int7	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7.
control_descriptor_int8	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8.
control_descriptor_int9	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9.
list0_complete	list0_complete	List 0 has completed
list0_notify	list0_notify	The data transfer in list 0 with the Notify Field set in the descriptor has completed
list1_complete	list1_complete	List 1 has completed
list1_notify	list1_notify	The data transfer in list 1 with the Notify Field set in the descriptor has completed
list2_complete	list2_complete	List 2 has completed
list2_notify	list2_notify	The data transfer in list 2 with the Notify Field set in the descriptor has completed
list3_complete	list3_complete	List 3 has completed
list3_notify	list3_notify	The data transfer in list 3 with the Notify Field set in the descriptor has completed
list4_complete	list4_complete	List 4 has completed
list4_notify	list4_notify	The data transfer in list 4 with the Notify Field set in the descriptor has completed
list5_complete	list5_complete	List 5 has completed
list5_notify	list5_notify	The data transfer in list 5 with the Notify Field set in the descriptor has completed
list6_complete	list6_complete	List 6 has completed
list6_notify	list6_notify	The data transfer in list 6 with the Notify Field set in the descriptor has completed
list7_complete	list7_complete	List 7 has completed
list7_notify	list7_notify	The data transfer in list 7 with the Notify Field set in the descriptor has completed

8.4.8.7 VPDMA Descriptors

The VPDMA needs to be programmed through descriptors (a pre-defined structure of eight or four 32-bit words depending on type of descriptors) other than VPDMA Memory Mapped Registers (MMR). Descriptors are of three types:

- i. **Data Transfer Descriptors** - A memory structure used to describe a desired memory transaction to or from a client.
- ii. **Control Descriptors** - A memory structure used to perform a control operation inside the DMA controller
- iii. **Configuration Descriptors** - A memory structure used to described a setup that should be applied to an processing modules like MMR write, scalar coefficient write etc.

8.4.8.7.1 Data Transfer Descriptors

In order to set up data transfers from the VPDMA, a data transfer descriptor is added into a list. The fields used for an Inbound and Outbound descriptor vary slightly. An outbound transfer can have two different outbound transfers. The two transfers are the main data transfer and a write of an Inbound Descriptor. The created inbound descriptor is formatted so it can be read back in directly to the next channel specified in the original descriptor.

Figure 8-89. Inbound Data Transfer Descriptor Format

	31:24			23:16				15:8			7:0		
Word 0	Data Type	Notify	Field	1D	Even Line Skip	RSV	Odd Line Skip	Line Stride					
Word 1	Line Length						Transfer Height

Figure 8-90. Outbound Data Transfer Descriptor Format

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word 0	Data Type			Notify	Field	1D	Reserved	Even Line Skip	Reserved	Odd Line Skip	Line Stride																					
Word 1	Reserved																															
Word 2	Start Address																															
Word 3	Packet Type	Mode	Dir	Channel			NoReject	Reserved	Pri	Next Channel																						
Word 4	Descriptor Write Address																									Reserved	write descriptor	Reserved				
Word 5	Reserved																									Max Width	Reserved	Max Height				
Word 6	Reserved																															
Word 7	Reserved																															

The general data transfer Descriptor formats can be seen in the above figures. The descriptor consists of 8×32 bit words. A Data Transfer Descriptor will be removed from the list when the resource specified by the Channel field is free. If the Channel is not free when the list reaches a data transfer descriptor then the list will stall until the current transfer on the channel has completed.

8.4.8.7.1.1 Data Packet Descriptor Word 0 (Data)
Table 8-33. Data Packet Descriptor Word 0 Field Descriptions

Bit	Field	Value	Description
31:26	Data Type		Miscellaneous Channel Sets the pixel size in bits plus 1
			RGB Channel
		0	RGB16-565
		1h	ARGB-1555
		2h	ARGB-4444
		3h	RGBA-5551
		4h	RGBA-4444
		5h	ARGB24-6666
		6h	RGB24-888
		7h	ARGB32-8888
		8h	RGBA24-6666
		9h	RGBA32-8888
		10h	BGR16-565
		11h	ABGR-1555
		12h	ABGR-4444
		13h	BGRA-5551
		14h	BGRA-4444
		15h	ABGR24-6666
		16h	BGR24-888

27h	YC 4:2:2		
37h	YCb 4:2:2		
25	Notify	0-1	Send List Notification Interrupt upon last transfer of this channel
24	Field	0-1	Field Value
23	1D	0	The transfer is one dimensional. The transfer and frame sizes are combined to make a single 32 bit transfer size. For writes this value is passed to the generated descriptor. This feature is not supported by all clients. Only clients that support the feature will recognize this bit. Note: 1D mode is not supported by VIP modules

Table 8-33. Data Packet Descriptor Word 0 Field Descriptions (continued)

Bit	Field	Value	Description
22:20	Even Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
19	Reserved		Reserved for future use
18:16	Odd Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
15:0	Line Stride	0-FFFFh	Address stride between lines in bytes

8.4.8.7.1.1.1 Data Type

Bits 31-26 indicate the type of data that is to be transferred. This value is used to compute the number of bytes per pixel so that transactions may be made for the appropriate amount of data. The types of data are dependent on the type of channel. The VPDMA descriptor data types RGB or YUV are defined associated with the VPDMA channel assignment. This helps the engine to distinguish between the overlapping values of the descriptor data types for RGB and YUV data.

- For the Miscellaneous channel, the Data Type selects the size in bits of the data. The range is from 0 to 63 to represent the sizes from 1 to 64 bits.
- For a YUV channel, the Data Type determines, if the data channel is interleaved or color space separate. If color spaced separate, it is still assumed that the two chroma pixels are interleaved.

CAUTION

VPDMA defines the component ordering for its RGB data types in the opposite direction of what commonly used image identifiers expect. To avoid color component swapping in the display and/or in the video/image data written out to the memory, the proper Data Type settings for both RGB and YUV data types must be made. The following paragraphs provide more details on how to set Data Type correctly, in order to match the data stored or expected in the memory.

Setting RGB Data Types

The commonly used RGB format identifiers require the color components to be stored in a little-endian style, where the left most component is the LSB component.

- For an ARGB data type, the A component is the LSB location, as shown in [Table 8-34](#) and [Table 8-35](#);
- For a BGRA data type, the B component would be in the LSB location;

Table 8-34. Common ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
A	R	G	B

Table 8-35. Common ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
B	G	R	A

VPDMA specifies its component ordering in the big-endian style, which requires the data to be stored in the reversed order. Example with ARGB data type is shown in [Table 8-36](#) and [Table 8-37](#). The VPDMA ordering for ARGB data type matches the common BGRA data format.

Table 8-36. VPDMA ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
B	G	R	A

Table 8-37. VPDMA ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
A	R	G	B

In order color components to be mapped correctly and to avoid swapping, the reversal must be taken into consideration when configuring the Data Type in the VPDMA transfer descriptor.

[Table 8-38](#) shows the proper settings required for RGB data types for both storage schemes.

Table 8-38. VPDMA Descriptor RGB Data Type Mapping

Source/Destination Image		VPDMA Data Type Mapping Value	
RGB Component order	Common Image Format Names	Column A Source data stored in the VPDMA defined order	Column B Source data stored in the opposite of VPDMA defined order
RGB	RGB16-565	0x0	0x10
	ARGB-1555	0x1	0x13
	ARGB-4444	0x2	0x14
	RGBA-5551	0x3	0x11
	RGBA-4444	0x4	0x12
	ARGB24-6666	0x5	0x18
	RGB24-888	0x6	0x16
	ARGB32-8888	0x7	0x19
	RGBA24-6666	0x8	0x15
	RGBA32-8888	0x9	0x17
BGR	BGR16-565	0x10	0x0
	ABGR-1555	0x11	0x3
	ABGR-4444	0x12	0x4
	BGRA-5551	0x13	0x1
	BGRA-4444	0x14	0x2
	ABGR24-6666	0x15	0x8
	BGR24-888	0x16	0x6
	ABGR32-8888	0x17	0x7
	BGRA24-6666	0x18	0x5
	BGRA32-8888	0x19	0x9

In [Table 8-38](#), if the application uses the same data type definition as the VPDMA (that is, RGB24 refers to the B in the LSB), the data types in Column A should be used. But, if the application expects the common data type component order for RGB data type names, the VPDMA data types in Column B should be used.

For example:

- To display an ARGB32-8888 source image data with A in the LSB, the data type in the descriptor should be set to 0x19. But, to display an ARGB32-888 source image data with B in the LSB, the data type in the descriptor should be set to 0x7.
- To capture and write out a RGB24-888 image in the memory with R in the LSB, the data type in the

descriptor should be set to 0x16 (this case assumes the VIP VIN d[23:0] data input is mapped to RGB bus with B component in the LSB).

Setting YUV Data Types

There is no component order reversal for YUV data types. The VPDMA uses generic data type names to specify the memory storage format and the application simply needs to follow the VPDMA defined ordering.

[Table 8-39](#) shows how common YUV data types map to the VPDMA YUV data types in order to clarify the YUV data type configuration.

Table 8-39. VPDMA Descriptor YUV Data Type Mapping

Source YUV Image Types			VPDMA Data Type Mapping (Value)		
Chroma Sub-sample	Common YUV Image Format Type Names	Memory Packed Order [MSB - LSB]	Luma/Chroma Interleaved Channel	Luma-only Channel	Chroma-only Channel
444	YUV	V U Y	YC 4:4:4 (0x8)		
	UVY	Y V U	Cb 4:4:4 (0x14)		
422	NV16 (YUV422SP_UV)	V U		Y 4:2:2 (0x1)	C 4:2:2 (0x5)
	NV16 (YUV422SP_VU)	U V		Y 4:2:2 (0x1)	Cb 4:2:2 (0x15)
	YUV2/YUYV/V422 (YUV422I_YUYV)	V Y U Y	YC 4:2:2 (0x7)		
	YUV422I_YVYU	U Y V Y	CbY 4:2:2 (0x17)		
	Y422/UYYV (YUV422I_UYYV)	Y V Y U	YC 4:2:2 (0x27)		
	YUV422I_VYUY	Y U Y V	YCb 4:2:2 (0x37)		
420	NV12 (YUV420SP_UV)	V U		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	C 4:2:0 (0x6) YC 4:2:2 (0x7) (see ⁽¹⁾)
	NV21 (YUV420SP_VU)	U V		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	Cb 4:2:0 (0x16) YC 4:2:2 (0x7) (see ⁽¹⁾)

⁽¹⁾ If 422 source data is used, unused component data fetched (either Luma or Chroma) will be discarded.

For further details on the data formats, refer to [Section 8.4.8.9, VPDMA Data Formats](#).

8.4.8.7.1.1.2 Notify

The Notify bit is used in conjunction with the Notify interrupts and when the channel has completed the DMA transfer the Notify Interrupt for the list that contains the descriptor will fire. The last Notify bit set for a specific list will be used so only a single Notify should be set in a list.

8.4.8.7.1.1.3 Field

The Field bit is the field value of the data that will be passed down to the clients. If the data is interlaced, then this value should be cleared to 0.

8.4.8.7.1.1.4 Even Line Skip

The Even Line skip is used with Line Stride to generate the next line address on an even line. All frames start on line 0. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

8.4.8.7.1.1.5 Odd Line Skip

The Odd Line skip is used with Line Stride to generate the next line address on an odd line. All frames start on line 0, so this will apply starting with the second line. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

8.4.8.7.1.1.6 Line Stride

Bits 15:0 are the stride between lines in bytes at the external address. This value is added or subtracted based upon an adjustment using the current skip value. Operation of the external address pointer shall load the Source Address upon start of the transfer, then at the end of each line increment or decrement by the value computed using the Line Stride and Skip value for the line. The line stride must be aligned to an L3 data bus width. The lower bits of the stride will always be treated as zero to force the alignment.

8.4.8.7.1.2 Data Packet Descriptor Word 1

Table 8-40. Data Packet Descriptor Word 1 Field Description

Bits	Name	Description
31:16	Line Length	Line Length in Pixels
15:0	Transfer Height	Number of rows in transfer.

8.4.8.7.1.2.1 Line Length

Bits 31-16 are the line length in pixels of the current channel. This is ignored for the outbound transfer as the client will provide the line length with the end of line signal on the client interface. The maximum supported line length is currently 4096.

8.4.8.7.1.2.2 Transfer Height

Bits 15-0 are the number of lines to be transferred in the current channel. This is ignored for outbound transfers as the client will provide the line length with the end of frame signal on the client interface. The maximum supported transfer size is currently 2048.

8.4.8.7.1.3 Data Packet Descriptor Word 2

Table 8-41. Data Packet Descriptor Word 2 Field Descriptions

Bit	Field	Value	Description
31:0	Start Address		32-bit data source address [31:0] If Mode is TILED, then TILER specific ADDRESS Map is used: Bits 31-29: 0 0-degree view 1h 180-degree view + mirroring 2h 0-degree view + mirroring 3h 180-degree view 4h 270-degree view + mirroring 5h 270-degree view 6h 90-degree view 7h 90-degree view + mirroring Bits 28-27: 0 8-bit container 1h 16-bit container 2h 32-bit container 3h Page Mode If Mode is NORMAL, then bits 31-26 are the upper bits of the address.

8.4.8.7.1.3.1 Start Address

This is the byte aligned address for the first data transfer. The address on the OCP bus will always be word aligned.

8.4.8.7.1.4 Data Packet Descriptor Word 3

Table 8-42. Data Packet Descriptor Word 3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xa
26	Mode	0= Normal, 1=TILED
25	Direction	Inbound = 0, Outbound = 1
24:16	Channel	Channel for which this descriptor describes
15	Reserved	Reserved for future use
11:9	Priority	Only Bit 9 and Bit 11 are used to set the priority. Bit 10 is ignored. Highest = 0, Lowest = 3 By default, hardware assigns priority = 3. This priority level is used in the arbitration between the masters (for DDR access). See Section 8.4.8.7.1.4.5, Priority , for more details.
8:0	Next Channel	Next Channel to execute on a line or the channel to use in the generated write descriptor.

8.4.8.7.1.4.1 Packet Type

Bits 31:27 are a unique code which indicates that this Descriptor is a VPDMA descriptor.

8.4.8.7.1.4.2 Mode

Bit 26 is used to indicate if the transfer is to regular memory space or to Tiled memory space. The VPDMA will use this to determine if it does standard raster based addressing or if it assumes that the data is stored in TILER format. If data is stored in TILER format then the buffer is turned into 2 or 4 line buffers depending on the container type. For shared clients that use the memory, such as the ancillary data and the VIP port, only one can be active, if the mode field is set. Only clients that support Tiling will properly pack the data for tiling on the output interface. This must only be set for channels going to clients that support the TILING feature in the client configuration.

8.4.8.7.1.4.3 Direction

Bit 25 is used to indicate the direction of transfer. This bit indicates that the data flow is from an external source to an internal buffer (inbound) or data transfers form an internal buffer to an external location (outbound).

8.4.8.7.1.4.4 Channel

Bits 24:16 are the Channels which is supported by the descriptor. This is the identification of the specific Channel which is controlled by the contents of the descriptor. The channel assignments can be found in the channel table.

8.4.8.7.1.4.5 Priority

Bits 11:9 are set to indicate priority of the transfer, these are directly mapped to the OCP reqinfo bits.

8.4.8.7.1.4.6 Next Channel

Bits 8:0 give the next channel to use to create a composite frame. The next channel must be to a free channel. The last channel of a row should point back to the initial channel which must be a channel tied directly to a client. The Descriptor for the Next Channel must be of the same type as the current descriptor.

8.4.8.7.1.5 Data Packet Descriptor Word 4

8.4.8.7.1.5.1 Inbound data

Table 8-43. Data Packet Descriptor Word 4 Inbound Data Field Descriptions

Bits	Name	Description
31:16	Frame Width	Width of the client frame.
15:0	Frame Height	Height of the client frame

8.4.8.7.1.5.1.1 Frame Width

Bits 31:16 indicate the width in pixels of the frame. This is the width of the entire frame and not just the width of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum width is 4096.

8.4.8.7.1.5.1.2 Frame Height

Bits 15:0 indicate the height in pixels of the entire frame. This is the height of the entire frame and not just the height of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum height is 2048.

8.4.8.7.1.5.2 Outbound data

Table 8-44. Data Packet Descriptor Word 4 Outbound Data Field Descriptions

Bits	Name	Description
31:5	Descriptor Write Address	The 32 byte aligned location to write an inbound descriptor
2	Write Descriptor	If set to 1, a descriptor will be generated when the client completes a frame.
1	Drop Data	If set to 1, the data will not be written out. Also, if this is set, the write descriptor bit must be set. This allows for descriptors to only be written out so that software can determine the size of the required buffer before data is written out.
0	Use Descriptor Register	If set to 1, the CURRENT_DESCRIPTOR register will be used for the write address location. If set to 0, the Descriptor Write Address field in this word will be used for the Descriptor Write Address.

8.4.8.7.1.5.2.1 Descriptor Write Address

Bits 31:5 set the 32 byte address to write the generated descriptor. This address is only used if the Write Descriptor bit is set to 1 and the Use Descriptor Register bit is set to 0. If this case is met when the channel is complete a descriptor that meets the inbound descriptor format will be written to the location specified by this field. This allows for software to have a specific channel write its descriptor to a specific address no matter what order the channel completes compared to other outbound channels.

8.4.8.7.1.5.2.2 Write Descriptor

Bit 2 determines if a descriptor should be written out when the client is completed. If this bit is set the descriptor will be written. The format of the descriptor will be of an Inbound Data Transfer descriptor with the LINE LENGTH and TRANSFER HEIGHT fields determined by the counters in the clients. This means that the direction bit will be the opposite of the inbound descriptor. The FRAME WIDTH and FRAME HEIGHT values will match the LINE LENGTH and TRANSFER HEIGHT fields. The CHANNEL and NEXT CHANNEL fields will match the NEXT CHANNEL field of the original descriptor. The FIELD bit will match the source field captured by the client. The NOTIFY bit will always be 0. All other fields will match the original outbound descriptor. If the Outbound descriptor MODE is set to TILED data then the descriptor address used will be in TILED data space and software must ensure that the address is in page mode for the address of the descriptor.

8.4.8.7.1.5.2.3 Drop Data

Bit 1 determines if the data should be written out or not. In some cases software might only want to write the descriptor out to determine the size of the buffer that will be required to store incoming data. By setting this bit, no data will be written out. If this bit is set then the Write Descriptor bit MUST be set. Bit 0 determines where the descriptor should be written.

8.4.8.7.1.6 Data Packet Descriptor Word 5

8.4.8.7.1.6.1 Outbound data

Width and Height are set in the following register bit-fields:

- For Max_Size1: [VIP_MAX_SIZE1](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE1](#)[15:0] MAX_HEIGHT registers
- For Max_Size2: [VIP_MAX_SIZE2](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE2](#)[15:0] MAX_HEIGHT registers
- For Max_Size3: [VIP_MAX_SIZE3](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE3](#)[15:0] MAX_HEIGHT registers

Table 8-45. Data Packet Descriptor Word 5 Outbound Data Field Descriptions

Bits	Name	Description
6:4	Max Width	The maximum allowable pixels per line. 0: Unlimited Line Size 1: Use Max_Size1 Max Width field 2: Use Max_Size2 Max Width field 3: Use Max_Size3 Max Width field 4: 352 pixels 5: 768 pixels 6: 1280 pixels 7: 1920 pixels Others: Reserved
2:0	Max Height	The maximum allowable lines per frame. 0: Unlimited Frame Size 1: Use Max_Size1 Max Height field 2: Use Max_Size2 Max Height field 3: Use Max_Size3 Max Height field 4: 288 lines 5: 576 lines 6: 720 lines 7: 1080 lines Others: Reserved

8.4.8.7.1.6.1.1 Max Width

Bits 6:4 are encoded to set the maximum transferred line size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed pixels the data will continue to be received from the client but will not be sent to external memory until an end of line is received from the client sending data. The outbound descriptor if created will still have the transmitted size of the last line of the frame which will match the max width. If the frame does not exceed the max width then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0. If Max Width is 0 and the line size is larger than 4096 pixels then the address counters will overflow and the data at the start of the line will be overwritten.

8.4.8.7.1.6.1.2 Max Height

Bits 2:0 are encoded to set the maximum transferred frame size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed lines the data will continue to be received from the client but will not be sent to external memory until an end of frame is received from the client sending data. The outbound descriptor if created will still have the transmitted number of lines received which would match the max height. If the frame does not exceed the max height then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0.

8.4.8.7.2 Configuration Descriptor

The Configuration Descriptor is used in a List to setup a client configuration. The configuration descriptor consists of a header and a payload portion. The payload can either be part of the list that the descriptor is contained in or it can be at a separate location. The VPDMA will pass the payload of the configuration descriptor down to the client over the VPI Control port interface or through the MMR configuration port depending on the destination field. A Configuration Descriptor to any single destination except Destination 0 must be on a single list. Configuration Descriptors to different destinations may be on different lists..

The Configuration Descriptor Header is 4 × 32 bit words. A configuration descriptor is not consumed until the destination specified has received the entire configuration payload. Therefore the list is expected to stall while the configuration takes place. This ensures that all descriptors after a configuration descriptor in the list will occur after the desired configuration.

8.4.8.7.2.1 Configuration Descriptor Header Word0

Table 8-46. Configuration Descriptor Header Word0 Field Descriptions

Bits	Name	Description
31:0	Address Offset of the Destination	This is the address offset location in the destination that the block of data in the payload should be written. This field is only used if the descriptor Class is a block type. Otherwise this field is reserved.

8.4.8.7.2.2 Configuration Descriptor Header Word1

Table 8-47. Configuration Descriptor Header Word1 Field Descriptions

Bits	Name	Description
15:0	Number of Data Words	Length of First Data Packet for Class 1(block).

8.4.8.7.2.2.1 Number of Data Words

Bits 15:0 indicate the length of the first data block if the class is 1 as specified in Configuration Descriptor Header Word3. If the class is not 1 then this field should be set to 0.

8.4.8.7.2.3 Configuration Descriptor Header Word2

Table 8-48. Configuration Descriptor Header Word2 Field Descriptions

Bits	Name	Description
31:0	Payload Location	Pointer to the data payload

8.4.8.7.2.3.1 Payload Location

Bits 31:0 contain the pointer to the data payload if the command packet is an indirect type. This value along with the Payload Length will be combined to issue a DMA transaction that must complete before the List Manager can finish processing this descriptor. The list will be made inactive pending this DMA completion. This address should be on a 16 byte boundary so the lower 4 bits should always be 0.

8.4.8.7.2.4 Configuration Descriptor Header Word3

Table 8-49. Configuration Descriptor Header Word3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xb
26	Direct	Direct Command = 1 Indirect Command = 0
25:24	Class	0 = Address, Data Set 1 = Block 2,3 Reserved for Future Use
23:16	Destination	Destination of the configuration payload
15:0	Payload Length	Length of Payload in Words.

8.4.8.7.2.4.1 Packet Type

Bits 31:27, this field indicates the type of descriptor and should be set 0xB for configuration descriptor.

8.4.8.7.2.4.2 Direct

Bit 26, this field indicates that the descriptor is a direct command or indirect command. A direct command means that the payload is contiguous with the descriptor and will be pulled in by the list manager descriptor control as it processes the list. A direct payload must end on or before a 256 byte boundary in the list. An indirect command is when the Address is located in Word2 is a pointer to the data payload. A DMA transaction will be scheduled to bring the payload into the List Manager to allow for the payload to be sent to the destination.

8.4.8.7.2.4.3 Class

Bits 25:24, this field indicates the type of payload is associated with command descriptor, and thus how to handle the payload.

A 0 indicates that the payload consists of blocks of data with each block having an address and length. The first word after a sub-block contains the next address and length in bytes. This allows for writing to multiple configuration regions in a client. The Configuration Descriptor word1 is the first address and length pair. All addresses used must be larger than the previous address for all destinations except for the MMR destination. If a sub block length is not evenly divisible into 16 then zeroes should be padded in the payload so that the Next Client Address and Length field start on a 16 byte boundary.

8.4.8.7.2.4.3.1 Address Data Block Format

Table 8-50. Address Data Block Format Field Descriptions

Bits	Name	Description
31-0		Next Client Address
31-0		Configuration for Next Client Address
31-0		Configuration for Next Client Address + 4
31-0		Configuration for Next Client Address + 8
31-0		Configuration for Next Client Address + 12
31-0		Configuration for Next Client Address + 16
31-0		Next Client Address 2
15-0		Sub Block Length

A 1 indicates the payload is simply block data. The data is contiguous and starts at the offset of the destination as specified in word1.

8.4.8.7.2.4.4 Destination

The Destination field is used to determine where the configuration payload should be sent. The values for the destination field can be seen in the table below.

Table 8-51. Destination Field Description

Destination Value	Actual Destination	Description
0	mmr_client	Write to MMR registers to setup other modules
7	VIP Slice 0	VIP Slice 0 Scaler Coefficient Tables
8	VIP Slice 1	VIP Slice 1 Scaler Coefficient Tables

8.4.8.7.2.4.5 Descriptor Length

Bits 15:0, this field indicates the size of the payload in words for the command. This is 128 bit words. The maximum number of words is 1023 words in a single payload

8.4.8.7.3 Control Descriptor

8.4.8.7.3.1 Generic Control Descriptor Format

A control descriptor is the mechanism that is used in a list to give commands to the List Manager. These descriptors are not considered consumed until the List Manager has done the instruction required by the descriptor. All control descriptors have a common Header located at Word 3 but the remaining words are based on the specific control descriptor.

8.4.8.7.3.2 Control Descriptor Header Description

Table 8-52. Control Descriptor Header Description

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xc
26:25	Reserved	Reserved
24:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	The type of control descriptor that should be run by the List Manager

8.4.8.7.3.2.1 Packet Type

This field indicates a VPDMA control descriptor.

8.4.8.7.3.2.2 Source

The source is combined with the control field to determine what the control descriptor should use as the source for its synchronization event.

8.4.8.7.3.2.3 Control

The Control field defines the specific function of the descriptor. [Table 8-53](#) lists the different control descriptors.

8.4.8.7.3.3 Control Descriptor Types

Table 8-53. Control Descriptor Types Summary

Control Descriptor	Control Field Value	Description
Sync on Client	0	Wait for the client attached to the channel specified to reach a certain event before proceeding.
Sync on List	1h	Wait for another list(s) to reach its Sync on List Descriptor
Sync on External Event	2h	Wait for a Register write to the LIST_STAT_SYNC bit specified or for an external event.
Sync on Channel	4h	Wait for the channel specified to complete
Change Client Interrupt	5h	Change the interrupt event for a client interrupt but do not wait for the event to occur.
Send Interrupt	6h	Generate an interrupt event on one of the Control Descriptor Interrupts
Reload List	7h	Reload the list from the location and size specified.
Abort Channel	8h	Abort the transfer in the channel specified.

8.4.8.7.3.3.1 Sync on Client

A Sync on Client Control descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. For a client that supports multiple channels then only an event on the portion of the client that supports that client will cause the interrupt to be generation. After configuring the interrupt generation event the list will then stall until that event has occurred.

Table 8-54. Sync on Client Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger

Table 8-55. Sync on Client Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 8-55. Sync on Client Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 0

8.4.8.7.3.3.2 Sync on List

The Sync on List Control descriptor is a mechanism to ensure that multiple lists have all reached a common point. The Sync on List descriptor uses the Source field as a mask for each list that should be synchronized which must include the list where the control descriptor resides. Once all lists specified in the source field have reached their Sync on List descriptor all lists will resume with the lowest list number resuming first. All Sync on List Control descriptors in each of the lists must have the same source field so that all lists will synchronize upon reaching that point.

If it is desired to synchronize list 0 and list 1 then the source field would be 0x3. If it is desired to synchronize list 1, list 3, and list 4 then the source field would be 0x1a. Word 0, Word 1 and Word 2 are reserved.

Table 8-56. Sync on List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 1h

8.4.8.7.3.3.3 Sync on External Event

A Sync on External Event descriptor ensures an external event has occurred before proceeding. The external event can be a write to a bit of the LIST_STAT_SYNC register or other external events that are determined at VPDMA elaboration to have occurred. This descriptor can be used to allow for external software to control progression of the list. The descriptor can also be used to select external signals that are brought into the VPDMA. The current implementation just synchronize on the LIST_STAT_SYNC bit for the list number that called the descriptor.

Table 8-57. Sync on External Event Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 2h

8.4.8.7.3.3.4 Sync on Channel

A Sync on Channel descriptor stalls the list until the channel specified is free. If the channel is already free then the descriptor will not cause the list to stall. Word 0, Word 1 and Word 2 are reserved.

Table 8-58. Sync on Channel Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 8-58. Sync on Channel Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 4h

8.4.8.7.3.3.5 Sync on LM Timer

A Sync on LM Timer descriptor sets a value from the current timer position to wait. The LM timer is a free running counter at the LM processing clock. The Timer Value in the descriptor is added to the value of the timer at the time the descriptor is received and the list will stall for this many cycles before it becomes active again.

8.4.8.7.3.3.6 Change Client Interrupt

A Change Channel Interrupt Source descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. The list will not stall on this descriptor. The format of the fields is identical to the Sync on Client Descriptor. Word 0 is reserved.

Table 8-59. Change Client Interrupt Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger.

Table 8-60. Change Client Interrupt Field Descriptions (Word - 2)

Bits	Name	Description
31:4	Reserved	Reserved
3:0	Event	Specify the event which should trigger the client interrupt.

Table 8-61. Change Client Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 5h

8.4.8.7.3.3.7 Send Interrupt

A Send Interrupt descriptor will cause the VPDMA to generate an interrupt on the list manager controlled interrupts as specified by the Source Field. The list will not stall on this descriptor. For example, if source is 0 then control_descriptor_int0 will fire. If source is 12, then control_descriptor_int12 will fire. For more information of VPDMA interrupt events, see [Section 8.4.8.6, VPDMA Interrupts](#).

Table 8-62. Send Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 6h

8.4.8.7.3.3.8 Reload List

A Reload List descriptor causes ending descriptors after this descriptor in the original list to be dropped and a new list at the location and of the size specified in the descriptor. This descriptor can be used to allow for linked lists in the VPDMA as the list will continue from this point and fetch the list specified and it does not have to be continuous with the current list.

Table 8-63. Reload List Field Descriptions (Word - 0)

Bits	Name	Description
31:0	LIST_ADDRESS	31 most-significant Bits of the memory address where the descriptors to be loaded are stored. Address must be 16 byte aligned.

Table 8-64. Reload List Field Descriptions (Word - 1)

Bits	Name	Description
31:16	Reserved	Reserved
15:0	LIST_SIZE	Size of the list to load

Table 8-65. Reload List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 7h

8.4.8.7.3.3.9 Abort Channel

An Abort Channel descriptor is used to clear a channel. This clears the channel from issuing any more requests. Any outstanding requests for that channel will complete as originally scheduled. All data inside the client will be flushed. For Tiled Clients such as the noise filter it is required to issue two consecutive abort channel descriptors to ensure the channel is aborted for both the current tile and next tile. Word 0, Word 1 and Word 2 are reserved.

Table 8-66. Abort Channel Field Descriptions (Word - 3)

Bit	Name	Description
31:27	Packet Type	Host Packet Descriptor type = 0xC
26:24	Reserved	Reserved
23:16	Source	VPDMA Channel Number whose transfers are to be aborted
15:4	Reserved	Reserved
3:0	Control	Control type = 9h

8.4.8.8 VPDMA Configuration

The following section describes the different ways of configuring VPDMA for data transfers.

8.4.8.8.1 Regular List

A regular list executes each descriptor in order until the end of the list is reached. When the end of the list is reached an interrupt is sent and the list can be reused by software. A regular list can contain any descriptor types. Software creates the list at some location in external memory. After completing writing the list software then writes the location of the list to the `VIP_LIST_ADDR[31:0]` `VIP_LIST_ADDR` register and then writes the `VIP_LIST_ATTR` register. If the NUMBER in the `VIP_LIST_ATTR[26:24]` `LIST_NUM` is not an active list then the List will be loaded and begin to execute the next time the List Manager gets to IDLE after processing previous loaded lists. If the NUMBER in the `VIP_LIST_ATTR[26:24]` `LIST_NUM` is busy then the `VIP_LIST_ADDR` and `VIP_LIST_ATTR` registers will be locked until the active list specified by NUMBER completes.

The different ports inside VPDMA requires different list setup, as explained in the following sections.

8.4.8.8.2 Video Input Ports

The Video Input Ports can be used in multiple ways. Depending on how the input ports are configured will determine how the lists to manage them need to be setup. The ways in which the ports can work are multiplexed data stream, single YUV color separate stream, dual YUV interleaved or single RGB stream. Each port also has an ancillary data port that can run either multiplexed or single data stream and shares the buffering with the main data stream. For all cases the descriptor must be loaded into the client before the vertical sync is received on the VIP port or the entire frame will be dropped. As with all write clients the VIP channels can be shadowed so the next frame/field descriptor can be loaded while the previous frame is running without stalling the list.

8.4.8.8.2.1 Multiplexed Data Streams

In the case of a multiplexed data stream input the channels that should be used are `VIP(X)_MULT_PORT(Y)_SRC(Z)`. Where X is the specific VIP slice of the instance that wants to be used and port Y is the port A or port B that is receiving the data. Finally Z is the channel number. For Split line mux mode the LSB of the channel will determine, if the line is a split line or a complete line. This is required so that the data streams do not get mixed when a channel ends without completing a line. In this mode the data will always be sent out as 422 Interleaved data to the destination specified in the descriptor.

8.4.8.8.2.2 Single YUV Color Separate

If the port is configured to be used as sending out color separated YUV data then the channels that must be used are `VIPX_PORTY_LUMA` and `VIPX_PORTY_CHROMA` for the luma and chroma components respectively. The data type can be either 420 or 422 color separate in this case.

8.4.8.8.2.3 Dual YUV Interleaved

If the port is configured to be used to send out 422 interleaved data from a non-multiplexed source then the channels that must be used are `VIPX_PORTY_LUMA` or `VIPX_PORTY_CHROMA` depending on if the data stream is connected to the luma or chroma port. The data type must be 422 interleaved in this case.

8.4.8.9 VPDMA Data Formats

Each of the channels has a type of data that it can support based upon the client that it services. Also for each channel, the data type will assume that data is packed in memory a certain way and will be prevented to the client in the same manner to the client no matter what the format of the data in memory.

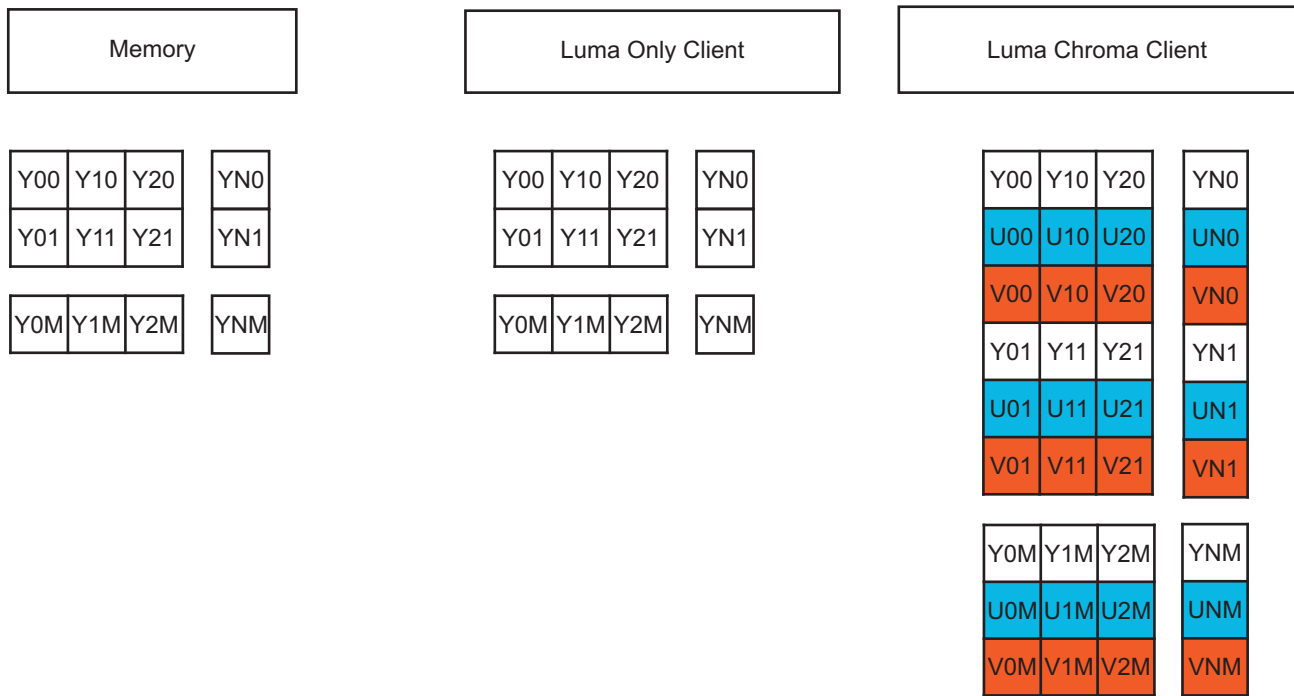

8.4.8.9.1 YUV Data Formats

The YUV formatted channels expect video data that is in YUV color space. The YUV data can be type is for YUV data and it can support both interleaved data where Luma and Chroma are in the same data buffer or it can support co-planar data where the Luma and Chroma are in separate data buffers. The YUV channel also can be given a position to give a different start position for the client instead of the default upper left corner of the frame. The storage format for YUV data depends on the data type field. The data type must be set to a data type that the channel can support. All the clients that data are provided too will either accept Luma Only, Chroma Only or Luma and Chroma in a parallel data bus.

8.4.8.9.1.1 Y 4:4:4 (Data Type 0)

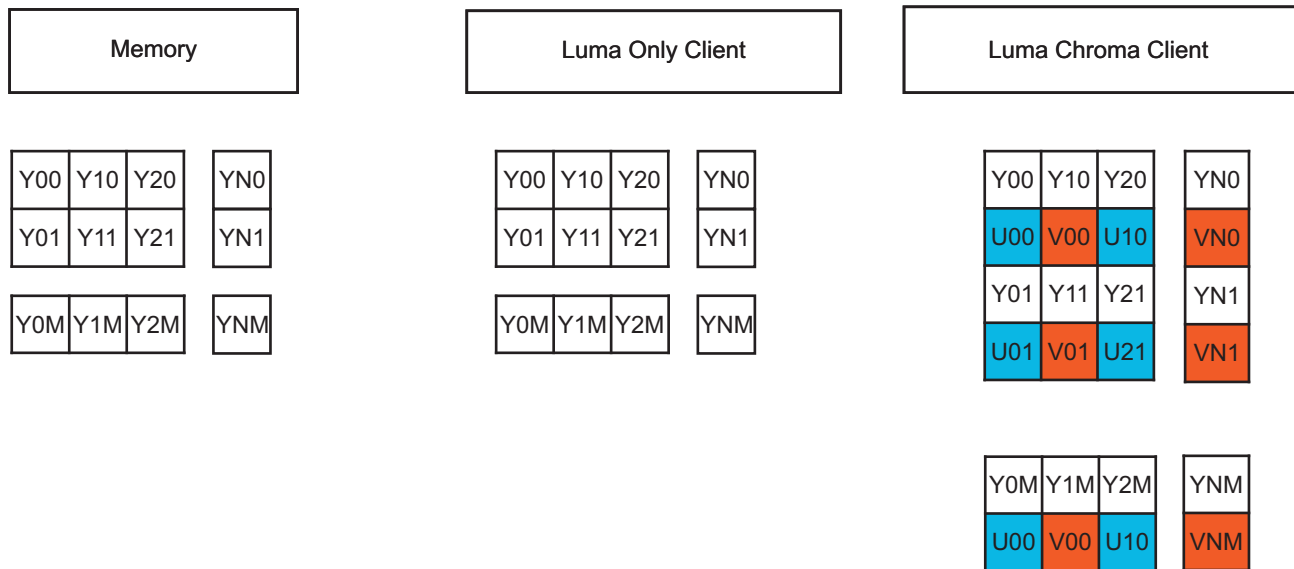

The Y 4:4:4 data type is used for a co-planar 4:4:4 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and height set to the desired frame size expected by the receiving client.

Figure 8-91. Y 4:4:4 (Data Type 0)

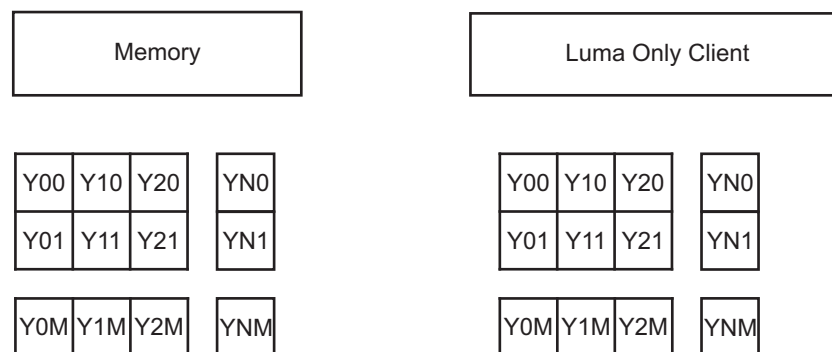

8.4.8.9.1.2 Y 4:2:2 (Data Type 1)

The Y 4:2:2 data type is used for a co-planar 4:2:2 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the desired frame sent by the VPDMA to the receive client.

Figure 8-92. Y 4:2:2 (Data Type 1)

8.4.8.9.1.3 Y 4:2:0 (Data Type 2)

The Y 4:2:0 data type is used for a co-planar 4:2:0 data type. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the expected frame for the client.

Figure 8-93. Y 4:2:0 (Data Type 2)

8.4.8.9.1.4 C 4:4:4 (Data Type 4)

The C 4:4:4 data type is used for a co-planar 4:4:4 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and height of the expected client frame.

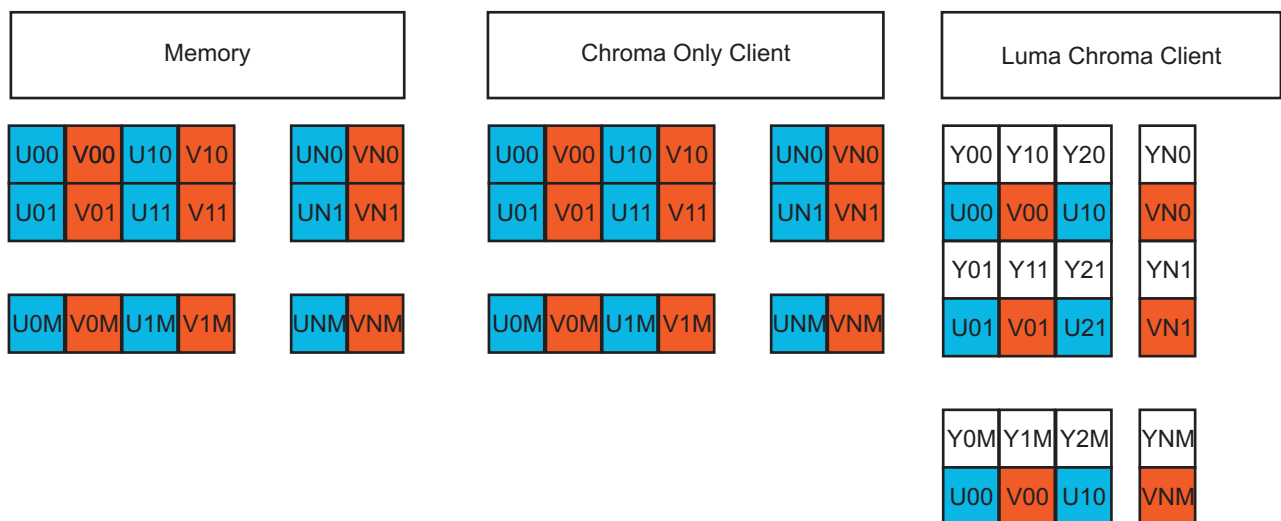

Figure 8-94. C 4:4:4 (Data Type 4)

8.4.8.9.1.5 C 4:2:2 (Data Type 5)

The C 4:2:2 data type is used for co-planar 4:2:2 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and the height of the expected client frame.

Figure 8-95. C 4:2:2 (Data Type 5)

8.4.8.9.1.6 C 4:2:0 (Data Type 6)

The C 4:2:0 data type is used for a co-planar 4:2:0 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in a 16 bit container. This data block should have the width and half the height of the expected clients frame.

Figure 8-96. C 4:2:0 (Data Type 6)

8.4.8.9.1.7 YC 4:2:2 (Data Type 7)

The YC 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Y1 finally Cr in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

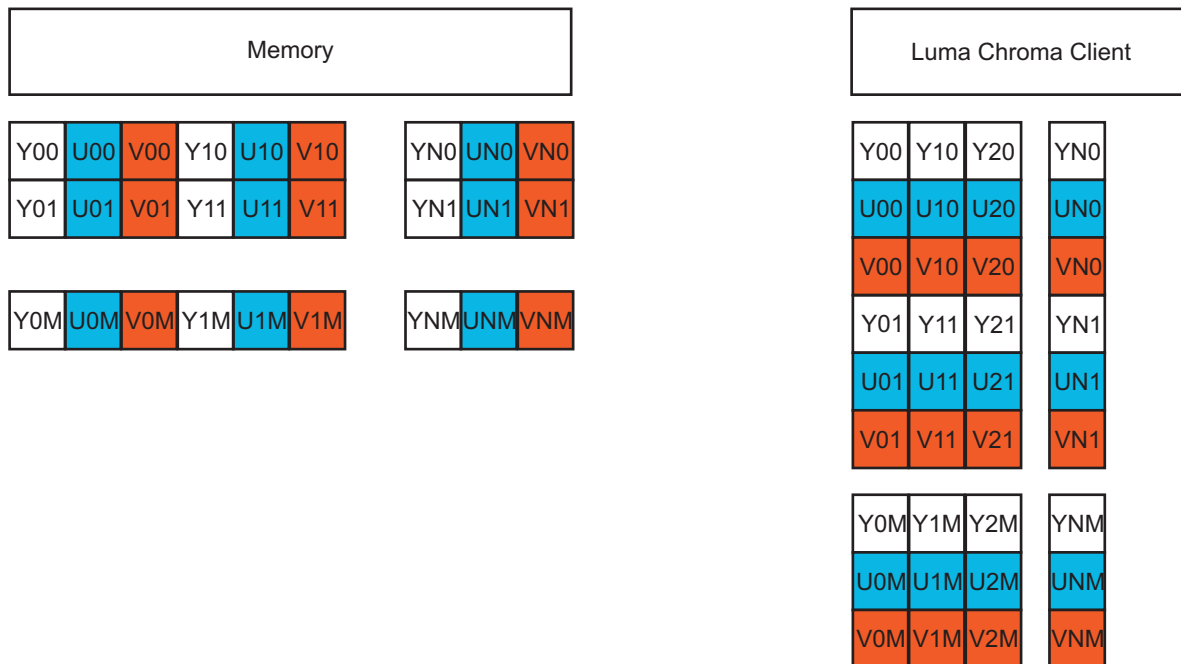

Figure 8-97. YC 4:2:2 (Data Type 7)

8.4.8.9.1.8 YC 4:4:4 (Data Type 8)

The YC 4:4:4 data type is used for interleaved 4:4:4 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Cr. The transfer counts each YCbCr triplet in a 24 bit word as a pixel. A 2D transfer of the data is NOT supported in the VPDMA. The data block width and height should be set to the number of pixels and lines that are expected by the client.

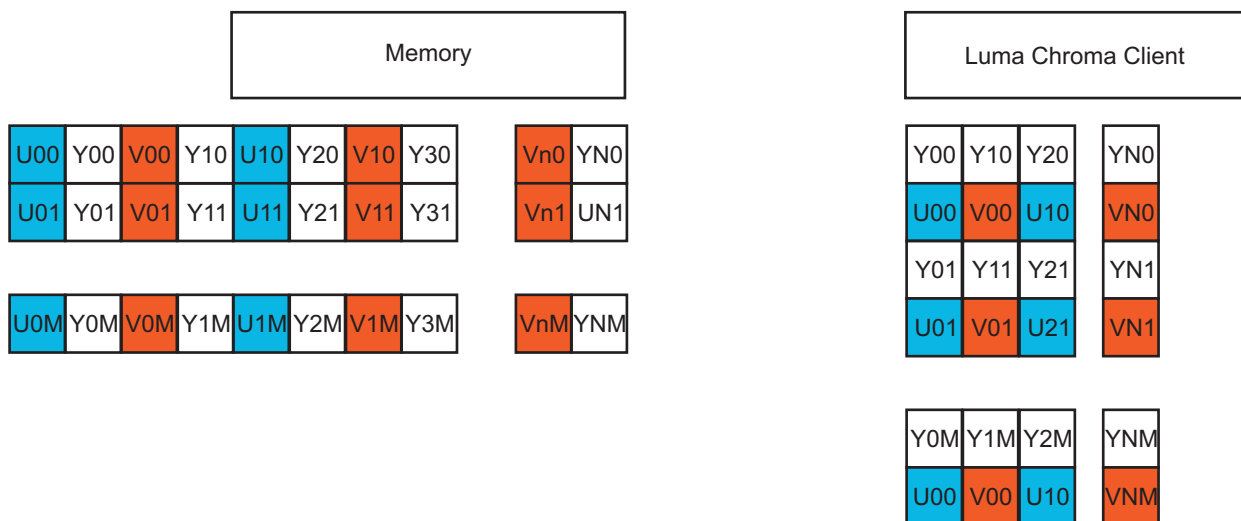

Figure 8-98. YC 4:4:4 (Data Type 8)

8.4.8.9.1.9 CY 4:2:2 (Data Type 23)

The CY 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Cb in the lowest byte followed by Y0 followed by Cr finally Y1 in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 8-99. CY 4:2:2 (Data Type 23h)

8.4.8.9.2 RGB Data Formats

The RGB channel type is used to provide data for a client that expects to transmit RGB data. In all modes the client is always RGBA 8888 data. The lower bits, if not provided by the data stream, are a replication of the lower bit of the data. For outbound data the input is assumed to be RGB 888 and the Alpha value is taken from the Background Color register to make a full ARGB 8888. The lower bits are dropped from this data, if a data type specifies less than the full 8 bits per color. The client has individual data buses for each component so they have no order dependency in the data bus.

8.4.8.9.2.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Figure 8-100. RGB16-565 (Data Type 0)

8.4.8.9.2.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

Figure 8-101. ARGB-1555 (Data Type 1)

8.4.8.9.2.3 ARGB-4444 (Data Type 2)

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

Figure 8-102. ARGB-4444 (Data Type 2)

8.4.8.9.2.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

Figure 8-103. RGBA-5551 (Data Type 3)

8.4.8.9.2.5 RGBA-4444 (Data Type 4)

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

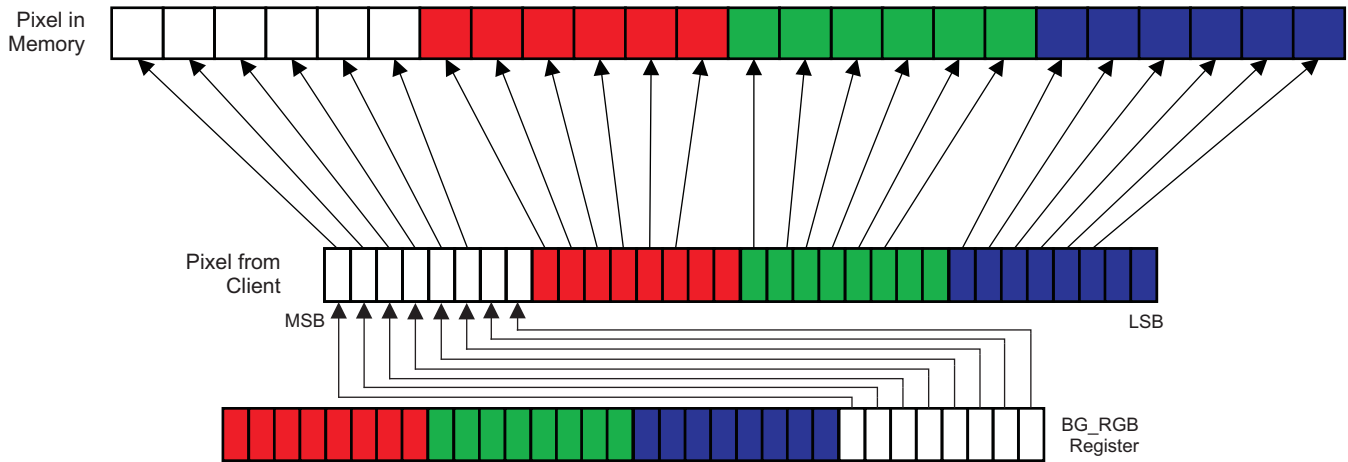

Figure 8-104. RGBA-4444 (Data Type 4)

8.4.8.9.2.6 ARGB24-6666 (Data Type 5)

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

Figure 8-105. ARGB24-6666 (Data Type 5)

8.4.8.9.2.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the BG_RGB Blend value for the Blend value.

Figure 8-106. RGB24-888 (Data Type 6)

8.4.8.9.2.8 ARGB32-8888 (Data Type 7)

In ARGB32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the next 8 bits for red data it uses the upper most bits for the blend value.

Figure 8-107. ARGB32-8888 (Data Type 7)

8.4.8.9.2.9 RGBA24-6666 (Data Type 8)

In RGBA24-6666 mode, each pixel is a single RGBA pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper 6 bits for red data.

Figure 8-108. RGBA24-6666 (Data Type 8)

8.4.8.9.2.10 RGBA32-8888 (Data Type 9)

In RGBA32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for the blend value the next 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data.

Figure 8-109. RGBA32-8888 (Data Type 9)

8.4.8.9.3 Miscellaneous Data Type

The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client. The size of the miscellaneous data type is always determined by the Data Type field of the descriptor which specifies the number of bits in the descriptor.

A memory structure used to describe a desired memory transaction to or from a client. The descriptor at a minimum gives an address location for the memory portion of the transfer, the channel to use for this transaction and the size of the transaction. The data descriptor can also contain attributes to be passed down to the client or be linked to another data descriptor to form a larger frame from many smaller frames.

17	VIP1_CHR_DS_2_BYPASS	Video Input Port 1 Chroma Downsampler 2 Bypass 0 : VIP Chroma Downsampler 1 selected 1 : VIP Chroma Downsampler 1 Bypassed Chroma Downsampler Bypassed means the output format from the VIP will be 422 data. Selected means the output format will be 420	RW	0x0
16	VIP1_CHR_DS_1_BYPASS	Video Input Port 1 Chroma Downsampler 1 Bypass 0 : VIP Chroma Downsampler 1 selected 1 : VIP Chroma Downsampler 1 Bypassed Chroma Downsampler Bypassed means the output format from the VIP will be 422 data. Selected means the output format will be 420	RW	0x0
15	VIP1_MULTI_CHANNEL_SELECT	Video Input Port 1 Multi Channel Select 0 : VIP_PARSER A and B channels operate in single channel mode 1 : VIP_PARSER A and B channels directly drive VPDMA (multi-channel case) Multi-Channel means that the A and B sources are from multiple channels and used in a multiplexed stream mode. The VIP Parser extracts the channel ID from each source and outputs this information to VPDMA, and thus to memory. When operating in a multiplexed stream mode, this bit must be set to 1 to enable the channel information to be passed to memory. If this is not set, the channel number (or source number) will be 0 for all streams. If vip1_rgb_out_select = 1, then VIP_PARSER A port is connected to VPDMA	RW	0x0

Address Offset	0x0000 0004	Instance	VIP_Slice0_parser VIP_Slice1_parser
Physical Address	0x4897 5504 0x4897 5A04		
Description	Configuration for Input Port A		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
ANALYZER_FVH_ERR_CORRECTION_ENABLE	ANALYZER_2X4X_SRCNUM_POS	FID_SKEW_POSTCOUNT						SW_RESET	DISCRETE_BASIC_MODE						FID_SKEW_PRECOUNT						USE_ACTVID_HSYNC_N	FID_DETECT_MODE	ACTVID_POLARITY	VSYNC_POLARITY	HSYNC_POLARITY	PIXCLK_EDGE_POLARITY	FID_POLARITY	ENABLE	CLR_ASYNC_FIFO_RD	CLR_ASYNC_FIFO_WR	CTRL_CHAN_SEL			SYNC_TYPE		

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_ENABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port A logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0
13	ACTVID_POLARITY	Discrete Sync Only 0 = ACTVID is active low 1 = ACTVID is active high	RW	0x0
12	VSYNC_POLARITY	Discrete Sync Only 0 = VSYNC is active low 1 = VSYNC is active high	RW	0x0
11	HSYNC_POLARITY	Discrete Sync Only 0 = HSYNC is active low 1 = HSYNC is active high	RW	0x0
10	PIXCLK_EDGE_POLARITY	0 = Rising Edge is active PIXCLK edge 1 = Falling Edge is active PIXCLK edge	RW	0x0
9	FID_POLARITY	0 = Keep FID as found 1 = Invert Determined Value of FID	RW	0x0
8	ENABLE	0 = Disable Port 1 = Enable Port	RW	0x0
7	CLR_ASYNC_FIFO_RD	0 = Normal 1 = Clear Async FIFO Read Logic	RW	0x0
6	CLR_ASYNC_FIFO_WR	0 = Normal 1 = Clear Async FIFO Write Logic	RW	0x0

Bits	Field Name	Description	Type	Reset
5:4	CTRL_CHAN_SEL	Embedded Sync Only In 8b mode.. there is only one channel on data[7:0]. In 16b mode.. there are two channels. The Luma Channel is on data[15:8]. The Chroma Channel is on data[7:0]. In 24b mode.. there are three channels. The R channel is on data[23:16].. the G channel is on [15:8]. and the B channel is on data[7:0]. 00 = Use data[7:0] to extract control codes. 01 = Use data[15:8] to extract control codes. 10 = Use data[23:16] to extract control codes. 11 = Undefined In 16b and 24b modes.. this register is also used to select the channel from which Ancillary Data is extracted. The Ancillary Data channel must be the same as the control code channel. For 8b mode.. the anc_chan_sel_8b register is used to select the Luma or Chroma channel from which Ancillary Data is taken.	RW	0x0
3:0	SYNC_TYPE	0000 = embedded sync single 4:2:2 YUV stream 0001 = embedded sync 2x multiplexed 4:2:2 YUV stream 0010 = embedded sync 4x multiplexed 4:2:2 YUV stream 0011 = embedded sync line multiplexed 4:2:2 YUV stream 0100 = discrete sync single 4:2:2 YUV stream 0101 = embedded sync single RGB stream or single 444 YUV stream 0110 = reserved 0111 = reserved 1000 = reserved 1001 = reserved 1010 = discrete sync single 24b RGB stream	RW	0x0

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_ENABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port B logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0

YUV_SRCNUM_STOP_IMMEDIATELY																ANC_SRCNUM_STOP_IMMEDIATELY															

Bits	Field Name	Description	Type	Reset
31:16	YUV_SRCNUM_STOP_IMMEDIATELY	For the Active Video Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. Each bit in this vector represents a <code>srcnum</code> (remapped <code>srcnum</code> for T1 line mux mode) going to the VPDMA. For example, bit 0 is <code>srcnum 0</code> , bit 1 is <code>srcnum 1</code> , etc. A <code>?0?</code> in a bit position means that the hardware will wait for that <code>srcnum</code> , if it is in the middle of a frame, to continue until the end of the frame before stopping. A <code>?1?</code> in a bit position means that it is ok for a <code>srcnum</code> to stop in the middle of a frame. For example, suppose a source is removed and the input will never complete sending a frame. If the bit position representing that <code>srcnum</code> is set to <code>?0?</code> , the port will never disable.	RW	0x0
15:0	ANC_SRCNUM_STOP_IMMEDIATELY	For the Ancillary Data Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. If the bit position representing that <code>srcnum</code> is set to <code>?0?</code> , the port will never disable.	RW	0x0

Bits	Field Name	Description	Type	Reset
15:0	ANC_SRCNUM_STOP_IMMEDIATELY	For the Ancillary Data Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. Each bit in this vector represents a <code>srcnum</code> (remapped <code>srcnum</code> for TI line mux mode) going to the VPDMA. For example, bit 0 is <code>srcnum 0</code> , bit 1 is <code>srcnum 1</code> , etc. A <code>?0?</code> in a bit position means that the hardware will wait for that <code>srcnum</code> , if it is in the middle of a frame, to continue until the end of the frame before stopping. A <code>?1?</code> in a bit position means that it is ok for a <code>srcnum</code> to stop in the middle of a frame. For example, suppose a source is removed and the input will never complete sending a frame. If the bit position representing that <code>srcnum</code> is set to <code>?0?</code> , the port will never disable.	RW	0x0

RESERVED								B0								RESERVED								A0							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED		RW	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. (Same format conversion as A0)	RW	0x0
15:13	RESERVED		RW	0x0
12:0	A0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. Rules for converting a real number coefficient to a 12-bit hex number for this register: - If the real number is positive, then simply multiply it by 1024, and convert the integer part to hex format. For example, 0.673 X 1024 = 689.152, then 0x2B1 should fill in to this register - If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is -1.893, by *1024 to this number, it becomes -1938. The 2'S compliment format of -1938 is 0x186E (in 13-bit width). Then 0x186E should be the number assigned to this register.	RW	0x0

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16	CFG_FID_SELFGEN	FID self generate enable. When input is progressive and this bit is set, the SC generates self-toggling (top/bottom) output FID when performing interlacing.	RW	0x0
15	CFG_TRIM	Trimming enable. When 1, the input image whose size is specified by orgW and orgH registers is trimmed to the size with srcW and srcH from the offset specified by offW and offH. 0: disable trimming 1: enable trimming	RW	0x0
14	CFG_Y_PK_EN	This parameter is used by peaking block. 0: disable luma peaking 1: enable luma peaking	RW	0x0
13:11	RESERVED		R	0x0
10	CFG_INTERLACE_I	This parameter is used by both horizontal and vertical scaling 0: the input video format is progressive 1: the input video format is interlace	RW	0x0
9	CFG_HP_BYPASS	This parameter is used by horizontal scaling. If cfg_auto_hs is 0, horizontal polyphase filter is always enabled. In this case, this register is DON?T CARE. If cfg_auto_hs is 1, 0 : The polyphase scaler is always used regardless of the scaling ratio. 1 : The polyphase scaler is bypassed only when (tar_w == src_w) or (tar_w == src_w/2) or (tar_w == src_w/4)	RW	0x0
8	CFG_DCM_4X	This parameter is used by horizontal scaling. 0: the 4X decimation filter is disabled 1: the 4X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (horizontal scale ratio 0.25). (3) This register is DON?T CARE when cfg_auto_hs = 1.	RW	0x0
7	CFG_DCM_2X	This parameter is used by horizontal scaling. 0: the 2X decimation filter is disabled 1: the 2X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (0.25 horizontal scale ratio 0.5). (3) This register is DON?T CARE when cfg_auto_hs = 1.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	CFG_AUTO_HS	This parameter is used by horizontal scaling. 0: the cfg_dcm_2x and cfg_dcm_4x bits will enable appropriate decimation filters 1: HW will decide whether up-scaling or down-scaling is required based on horizontal scaling ratio (SR). SR 0.5 : horizontal polyphase filter is enabled, all decimation filters are disabled SR = 0.5 : dcm_2x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.5 SR 0.25 : dcm_2x and horizontal polyphase filter both are enabled SR = 0.25 : dcm_4x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.25 SR 0.125 : dcm_4x and horizontal polyphase filter are both enabled SR = 0.125 : Functionally supported, but not recommended in auto mode for image quality concerns	RW	0x0
5	CFG_ENABLE_EV	This parameter is used by the edge-detection block. 0: The output of edge-detection block will be force to ?0? 1: The calculation results of edge-detection block will be output normally	RW	0x0
4	CFG_USE_RAV	This parameter is used by vertical scaling. 0: Poly-phase filter will be used for the vertical scaling 1: Running average filter will be used for the vertical scaling (down scaling only)	RW	0x0
3	CFG_INV_T_FID	This parameter is used by vertical scaling. 0: Progressive input 1: Interlaced input Must be set to 1 when CFG_INTERFACE_I = 1.	RW	0x0
2	CFG_SC_BYPASS	This parameter is a general purpose. 0: Scaling module will engaged 1: Scaling module will be bypassed	RW	0x0
1	CFG_LINEAR	This parameter is used by horizontal scaling. 0: Anamorphic scaling 1: Linear scaling	RW	0x0
0	CFG_INTERLACE_O	This parameter is used by vertical scaling. 0: The output format of SC is progressive 1: The output format of SC is interlace	RW	0x0
