Table 8-293. VIP_LIST_ATTR

Address Offset	0x0000 0008	Instance	VIP_VPDMA
Physical Address	0x4897 D008		
Description	The attributes of a new list. This register should always be written after VIP_LIST_ADDR .		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED							LIST_NUM	RESERVED	STOP	RDY	LIST_TYPE	LIST_SIZE																			

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at VIP_LIST_ADDR . If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VIP_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the VIP_LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated.\n0: Normal List\n1: Self-Modifying List\n2: List Doorbell\nOthers Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP1_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP1_MULT_ANCB_SRC9	The interrupt for Video Input 1 Port B Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP1_MULT_ANCB_SRC8	The interrupt for Video Input 1 Port B Ancillary Data Channel 8 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP1_MULT_ANCB_SRC7	The interrupt for Video Input 1 Port B Ancillary Data Channel 7 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP1_MULT_ANCB_SRC6	The interrupt for Video Input 1 Port B Ancillary Data Channel 6 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP1_MULT_ANCB_SRC5	The interrupt for Video Input 1 Port B Ancillary Data Channel 5 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int0</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel <code>nf_write_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel <code>vip2_portb_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_lo_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel <code>vip2_porta_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_up_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel <code>vip2_portb_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel <code>vip2_portb_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel <code>vip2_porta_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel <code>vip2_porta_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src15</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src14</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_GRPX1	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27:20	RESERVED	Reserved	R	0x00
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_HQ_VID2_CHROMA	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_HQ_VID2_LUMA	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_HQ_VID1_CHROMA	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_HQ_VID1_LUMA	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrwbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrwbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrwbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel <code>nf_write_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel <code>vip2_portb_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_lo_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel <code>vip2_porta_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_up_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel <code>vip2_portb_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel <code>vip2_portb_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel <code>vip2_porta_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel <code>vip2_porta_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src15</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src14</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
27	INT_STAT_VIP1_ANC_B	The client interface vip1_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
26	INT_STAT_VIP1_ANC_A	The client interface vip1_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
25	INT_STAT_TRANS2_LUMA	The client interface trans2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
24	INT_STAT_TRANS2_CHROMA	The client interface trans2_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
23	INT_STAT_TRANS1_LUMA	The client interface trans1_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
22	INT_STAT_TRANS1_CHROMA	The client interface trans1_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_HDMI_WRBK_OUT	The client interface hdmi_wrbk_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
20	INT_STAT_VPI_CTL	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
19	INT_STAT_VBI_SDVENC	The client interface vbi_sdvenc has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
18	RESERVED	Reserved	R	0
17	INT_STAT_NF_420_UV_OUT	The client interface nf_420_uv_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
16	INT_STAT_NF_420_Y_OUT	The client interface nf_420_y_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
15	INT_STAT_NF_420_UV_IN	The client interface nf_420_uv_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
14	INT_STAT_NF_420_Y_IN	The client interface nf_420_y_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
13	INT_STAT_NF_422_IN	The client interface nf_422_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_GRPX3_ST	The client interface grpx3_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
11	INT_STAT_GRPX2_ST	The client interface grpx2_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
10	INT_STAT_GRPX1_ST	The client interface grpx1_st has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
9	INT_STAT_VIP2_UP_UV	The client interface vip2_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
8	INT_STAT_VIP2_UP_Y	The client interface vip2_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
7	INT_STAT_VIP2_LO_UV	The client interface vip2_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
6	INT_STAT_VIP2_LO_Y	The client interface vip2_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
5	INT_STAT_VIP1_UP_UV	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_UP_Y	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
3	INT_STAT_VIP1_LO_UV	The client interface vip1_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
2	INT_STAT_VIP1_LO_Y	The client interface vip1_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
1	INT_STAT_GRPX3_DATA	The client interface grpx3_data has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0
0	INT_STAT_GRPX2_DATA	The client interface grpx2_data has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW W0toClr	0

Description	The register can be used to capture timing differences between events in the VPDMA.\n		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CAPTURE_MODE				STOP_CLIENT		RESERVED		STOP_COUNT		RESERVED		START_CLIENT		RESERVED		START_COUNT		CURR_COUNT													

Bits	Field Name	Description	Type	Reset
31:30	CAPTURE_MODE	Sets how the counter should be updated. Updating this value will also clear the current counter stored value. 0: Running Average 1: Minimum Value 2: Maximum Value 3: Last Value	RW	0x0
29:28	STOP_CLIENT	Sets the client whose event stops the performance monitor counter. 0: vip2_anc_b 1: vip2_anc_a 2: 3:	RW	0x0
27	RESERVED		R	0x0
26:24	STOP_COUNT	Sets the value that stops the performance monitor counter. 0: command request 1: command accept 2: data request 3: data rcvd 4: data empty 5: data full 6: frame start 7: frame end	RW	0x0
23:22	RESERVED		R	0x0
21:20	START_CLIENT	Sets the client whose event starts the performance monitor counter. 0: vip2_anc_b 1: vip2_anc_a 2: 3:	RW	0x0
19	RESERVED		R	0x0
18:16	START_COUNT	Sets the value that starts the performance monitor counter. 0: command request 1: command accept 2: data request 3: data rcvd 4: data empty 5: data full 6: frame start 7: frame end	RW	0x0
15:0	CURR_COUNT	The current value of the performance monitor counter	R	0x0

REQ_DELAY								REQ_RATE								BUSY	DMA_ACTIVE	FRAME_START	RESERVED												

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles..This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles.This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0
13:10	FRAME_START	The source of the start frame event for the client.\n0 : Change in value of hdmi_field_id\n1 : Change in value of dvo2_field_id\n2 : Change in value of hdcomp_field_id\n3 : Change in value of sd_field_id\n4 : Use List Manager Internal Field0\n5 : Use List Manager Internal Field1\n6 : Use List Manager Internal Field2\n7 : Start on channel active	RW	0x0

Display Subsystem

This chapter describes the display subsystem for the device.

Topic	Page
9.1 Display Subsystem Overview	3467
9.2 Display Controller	3478
9.3 Video Encoder	3647

9.1 Display Subsystem Overview

The Display Subsystem (DSS) provides the logic to interface display peripherals. DSS integrates a DMA engine as part of DISPC module, which allows direct access to the memory frame buffer. Various pixel processing capabilities are supported, such as: color space conversion, filtering, scaling, blending, color keying, etc.

The supported display interfaces are:

- One parallel CMOS output, which can be used for MIPI® DPI 2.0, or BT-656 or BT-1120.
- One TV output, which is connected to the internal Video Encoder module (VENC). The VENC drives a single video digital-to-analog converter (SD_DAC) supporting composite video mode.

The modules integrated in the display subsystem are:

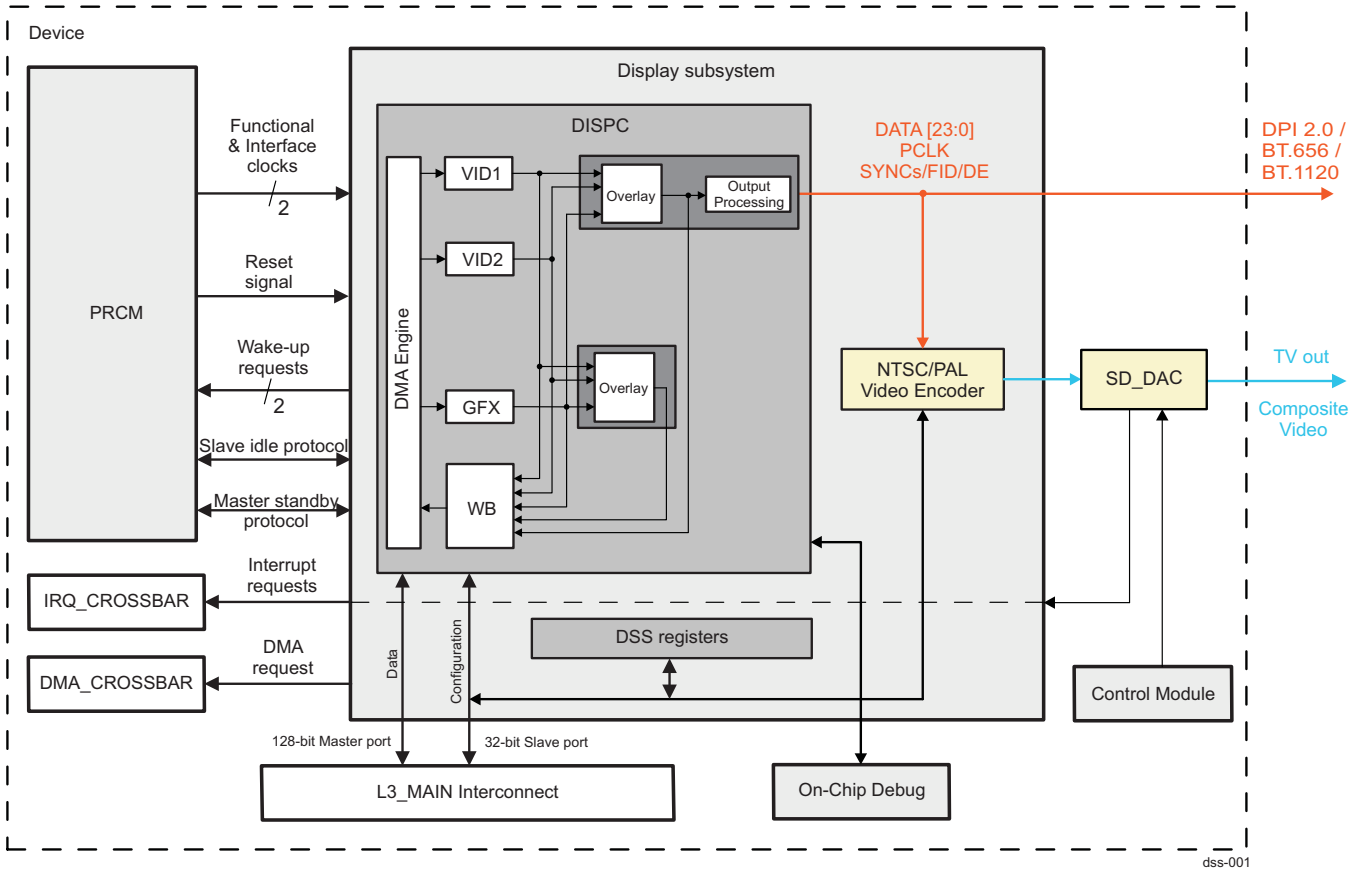

- Display controller (DISPC), with the following main features
 - One direct memory access (DMA) engine
 - One graphics pipeline (GFX), two video pipelines (VID1 and VID2), and one write-back pipeline (WB)
 - Two overlay managers
 - Active Matrix color support for 12/16/18/24-bit (truncated or dithered encoded pixel values)
 - One Video Port (VP) with programmable timing generator to support:
 - DPI: up to 165 MHz pixel clock video formats defined in CEA-861-E and VESA DMT standards
 - VENC: NTSC/PAL standards with 60Hz/50Hz refresh rates
 - Supported maximum FrameBuffer width of 4096 for all pixel formats
 - Configurable output mode: progressive or interlaced
 - Selection between RGB and YUV422 output pixel formats (YUV4:2:2 only available when BT-656 or BT-1120 output mode is enabled)
 - Refer to [Section 9.2, Display Controller](#), for more details
- Video Encoder (VENC) with 10-bit standard definition video DAC (SD_DAC). Refer to [Section 9.3, Video Encoder](#), for more details.

DSS provides two interfaces to L3_MAIN interconnect

- One 128-bit master port (with MFLAG support). The DMA engine in DISPC uses this single master to read/write data from/to device system memory.
- One 32-bit slave port. Used for registers configuration. It is further connected internally to DISPC and VENC modules.

[Figure 9-1](#) is a high-level diagram of the display subsystem.

Figure 9-1. Display Subsystem Overview

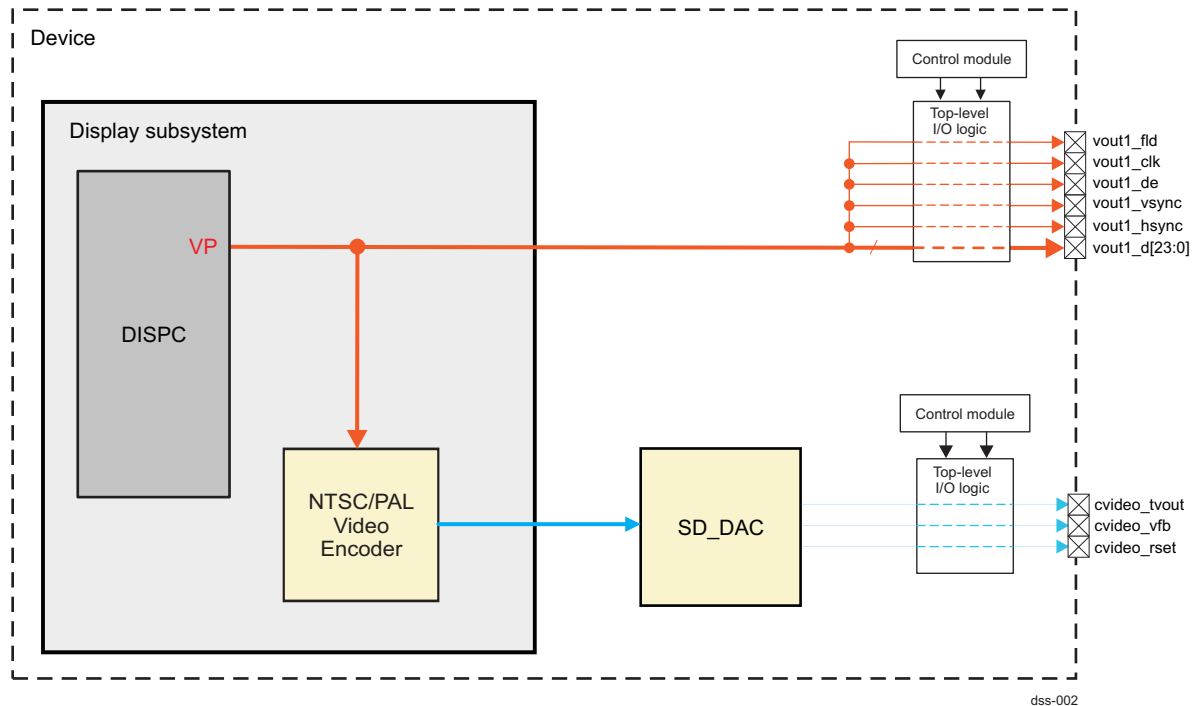

9.1.1 Display Subsystem Environment

This section describes the various outputs handled by the display subsystem:

- Parallel interface (MIPI DPI 2.0, or BT-656 or BT-1120) support
- TV (composite video) output support

Figure 9-2 is a diagram of the display subsystem environment.

Figure 9-2. Display Subsystem Environment

NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see [Section 14.4.6.3 Pad Configuration Registers](#) in [Chapter 14, Control Module](#).

CAUTION

The parallel and TV out interfaces cannot be used simultaneously.

- When the `DSS_DPI_CTRL[0] DPI_ENABLE` is set to 0x1, the parallel DPI output is enabled.
- When the `DSS_DPI_CTRL[0] DPI_ENABLE` is set to 0x0, the parallel DPI output is disabled. The TV composite output through VENC and SD_DAC modules can be used.

9.1.1.1 Display Subsystem Parallel Interface

In a parallel interface configuration, the DISPC outputs the VP data and interface signals on device I/O pads: DATA[23:0] (data bus), HSYNC (horizontal synchronization signal), VSYNC (vertical synchronization signal), DE (data enable), FID (field identification, odd/even) and PCLK (pixel clock). The required data and control signals can be provided directly to an external MIPI DPI-compatible LCD panels.

For more details on the output pixel data formats for the parallel interface, see [Section 9.2.2 DISPC Environment](#), in *Display Controller*.

9.1.1.2 Display Subsystem TV Output

In a TV output configuration, the DISPC, VENC and video SD_DAC modules are used in the data path. The DISPC receives synchronization signals from the VENC and synchronously sends pixel data to the VENC with these signals. The digital output of the DISPC is always a 24-bit RGB value based on a pixel request from the VENC. The VENC converts RGB video signals to conform to the NTSC/PAL standards for analog video.

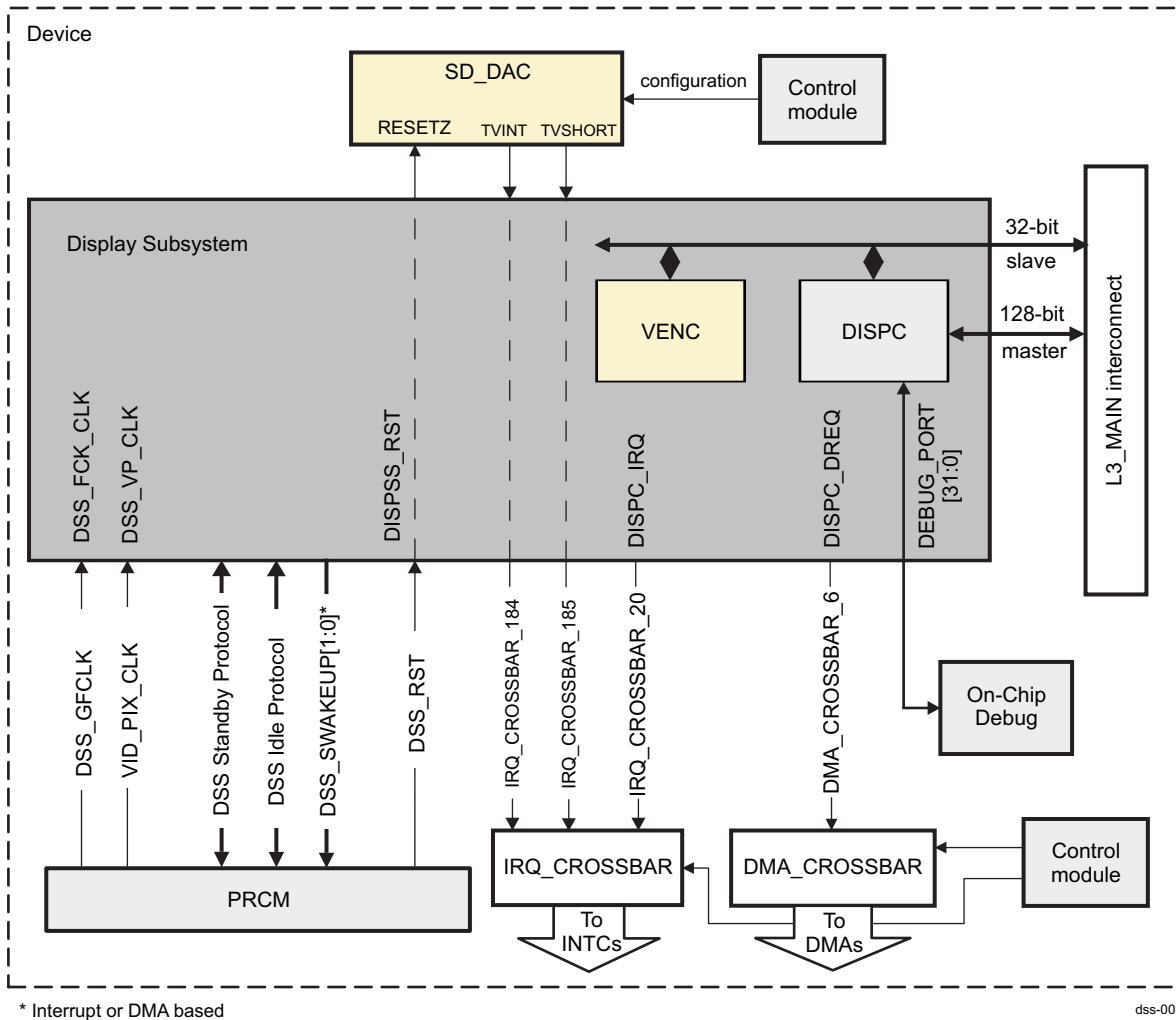

For more details, see [Section 9.3, Video Encoder](#).

9.1.2 Display Subsystem Integration

This section describes the integration of the display subsystem module in the device, including information about clocks, resets, and hardware requests.

Figure 9-3 shows the integration of the display subsystem in the device.

Figure 9-3. Display Subsystem Integration

* Interrupt or DMA based

dss-003

9.1.2.1 Display Subsystem Interrupt and DMA Requests

Table 9-1 shows the interrupt and DMA requests generated by the DISPC and SD_DAC module.

Table 9-1. Display Subsystem Hardware Requests

Module Instance	Source Signal Name	Destination	Interrupt Requests		Description
			IRQ_CROSSBAR Input	Default Mapping	
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20		DSP1_IRQ_51 DSP2_IRQ_51 IPU1_IRQ_23	DISPC interrupt request
SD_DAC	SD_DAC_IRQ_TVINT	IRQ_CROSSBAR_184		-	Interrupt for TV load detection from SD_DAC
	SD_DAC_IRQ_TVSHORT	IRQ_CROSSBAR_185		-	Interrupt for TV short detection from SD_DAC

Table 9-1. Display Subsystem Hardware Requests (continued)

DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5	The line trigger signal used for synchronization of a logical channel in the device-level EDMA for memory-to-memory transfer, generated by the DISPC module. There is no data received by the DISPC based on the DMA request.

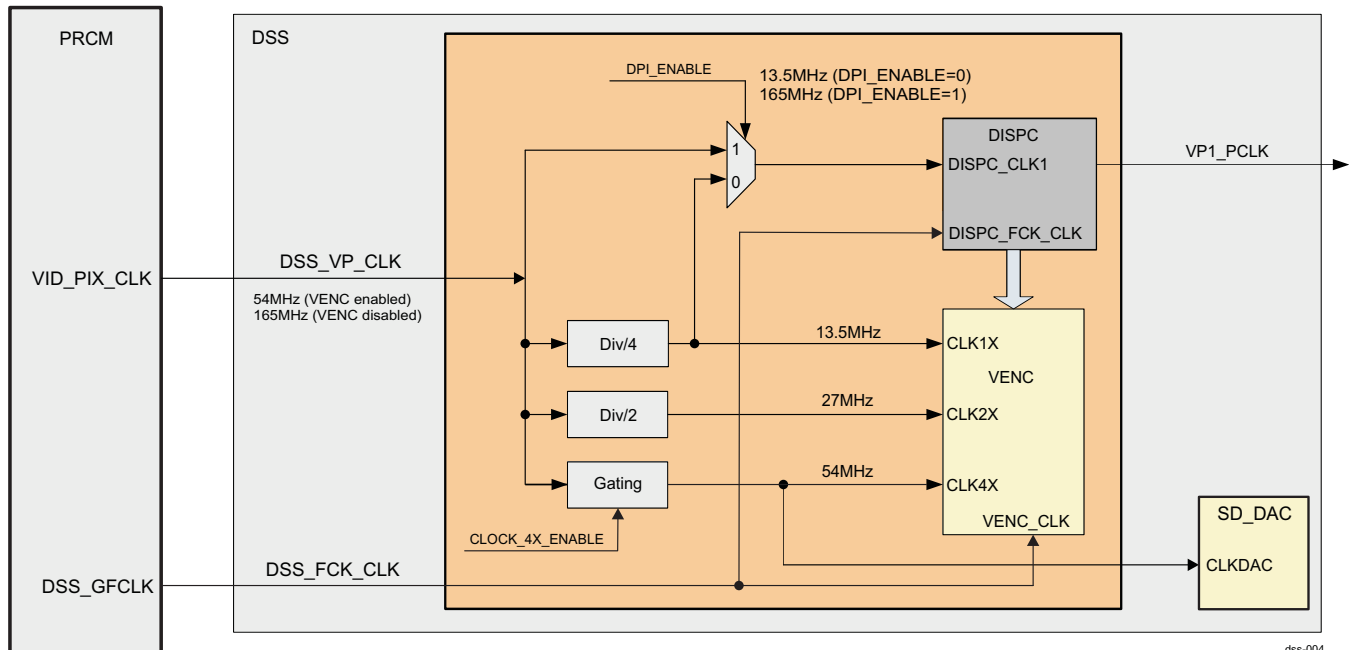

NOTE: The “Default Mapping” column in [Table 9-1 Display Subsystem Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively. For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the DMA_CROSSBAR module, see [Section 14.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#). For more information about the device EDMA module, see [Chapter 12, Enhanced DMA](#).

9.1.2.2 Display Subsystem Clocks

The power, reset, and clock management (PRCM) module provides the clock signals, and status for their activity, to the display subsystem.

[Figure 9-4](#) shows the details of the display subsystem clock tree.

Figure 9-4. Display Subsystem Clock Tree

[Table 9-2](#) lists the main DSS clocks and their sources.

Table 9-2. Display Subsystem Clocks

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DSS	DSS_VP_CLK	VID_PIX_CLK	PRCM module	Functional clock used for the VP pixel clock, Sync buffer and Timing generator modules within DISPC, and VENC/SD_DAC modules
	DSS_FCK_CLK	DSS_GFCLK	PRCM module	DISPC functional and interface clock; VENC interface clock

The DPI_ENABLE signal in [Figure 9-4](#) is driven by [DSS_DPI_CTRL\[0\]](#) DPI_ENABLE register bit.

The gating of VENC clock CLK4X is controlled via [DSS_VENC_CTRL\[0\]](#) VENC_CLOCK_4X_ENABLE bit.

9.1.2.3 Display Subsystem Reset

The PRCM module provides one HW reset signal (DSS_RST) to the display subsystem, which is propagated to the DISPC, VENC and SD_DAC modules.

The DSS submodules can also be reset by a corresponding SW reset on submodule level.

The [DSS_SYSSTATUS\[0\]](#) DSS_RESETDONE register bit indicates the completion of the DISPC reset, following a HW or SW reset.

In order VENC reset status to be indicated in the [DSS_SYSSTATUS\[6\]](#) VENC_RESETDONE bit, the VENC functional clock (VENC_CLK) must be running.

9.1.2.4 Display Subsystem Power Management

The display subsystem and submodules are in the PD_DSS power domain.

The DSS supports no-idle mode, force-idle mode, and smart-idle modes. The mode can be selected by programming the appropriate value in the [DSS_SYSCONFIG\[1:0\]](#) SIDLEMODE register bitfield.

9.1.2.4.1 Display Subsystem Standby Mode

As part of the system-wide power-management scheme, the display subsystem supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

- MStandby/MWait
 - DISPC
- SIdleReq/SIdleAck
 - DISPC

The PRCM module asserts the MWait and receives MStandby directly from DISPC. When the display subsystem initiates a standby procedure, it also initiates a master standby/wait protocols with the PRCM module that lets the PRCM cut the display subsystem clocks. For information about the conditions that allow the subsystem to exit standby mode, see [Section 9.2.4.3.2 DISPC StandBy Mode](#), in [Section 9.2 Display Controller](#).

The PRCM also asserts the SIdleReq. Then, it is split at the display subsystem level and send to the appropriate modules. Consequently, all SIdleAck are merged into one and sent back to PRCM.

9.1.2.4.2 Display Subsystem Wake-Up Mode

The DISPC module supports the wake-up protocol. DSS_SWAKEUP[1:0] signals are associated with DISPC_DREQ and DISPC_IRQ. For the events that generate an Swakeup and the description and configuration of the registers, see [Section 9.2.4.3.3 DISPC StandBy Mode](#), in [Section 9.2 Display Controller](#).

9.2 Display Controller

9.2.1 DISPC Overview

Figure 9-5 shows a block diagram of the display controller (DISPC) within the display subsystem.

Figure 9-5. DISPC Overview

The DISPC includes the following main features:

- Pipelines for processing:
 - One Graphics (GFX) pipeline:
 - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, BITMAP1, BITMAP2, BITMAP4, BITMAP8. (A component can be ignored by not selecting Alpha pixel)
 - Premultiplied ARGB and RGBA formats
 - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the most significant bits [MSBs])

- Support for color look-up table (CLUT): 256 × 24-bit entries palette in RGB
- Support for anti-aliasing on RGB pixel formats using 3-tap filter
- Up to 4K-by-4K frame buffer size
- Two Video pipelines (VID1 and VID2):
 - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, RGB565-A8, BITMAP1, BITMAP2, BITMAP4, BITMAP8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12, YUV420-NV21 and in addition RGBx, xRGB, xBGR, and BGRx pixel formats defined considering that A component of RGBA, ARGB, ABGR, BGRA pixel format is ignored by HW (e.g. ARGB->xRGB)
 - Premultiplied ARGB and RGBA formats
 - Support for color look-up table (CLUT): 256 × 24-bit entries palette in RGB
 - Programmable poly-phase filter:
 - Independent horizontal and vertical resampling. Upsampling up to x16, and downsampling down to 1/4
 - Maximum input width of 1280 pixels (2560 in 3-tap mode)
 - No limitation on the input height
 - Supported input formats are all above listed formats, except BITMAP formats. The alpha blending factor is rescaled like the R, G and B color components. 16 phases with symmetrical coefficients are implemented.
 - Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB48-12121212.
 - Programmable VC-1 range mapping
 - Up to 4K-by-4K frame buffer size
- One Write-back (WB) pipeline: Allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame
 - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, RGB565-A8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12, YUV420-NV21 and in addition RGBx, xRGB, xBGR, and BGRx pixel formats defined considering that A component of RGBA, ARGB, ABGR, BGRA pixel format is ignored by HW (e.g. ARGB->xRGB)
 - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21
 - Programmable poly-phase filter:
 - Independent horizontal and vertical resampling. Upsampling up to x16, and downsampling down to 1/4. When the output format of WB pipeline includes a format change from RGB or YUV4:2:2 to YUV4:2:0, the maximum downscaling provided by the WB scaler is 1/2.
 - Maximum input width of 1280 pixels using 32-bit pixels and 5-tap, and 2560 pixels using 32-bit pixels and 3-tap
 - No limitation on the input height
 - The supported formats are RGB888/RGBA-8888/ARGB32-8888, ARGB48-12121212, RGB565-A8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12 and YUV420-NV21
 - Alpha blending factor is rescaled like the R, G, and B color components
 - 16 phases with symmetrical coefficients are implemented
 - Selection of the source of the data:
 - One of the overlay manager outputs
 - One of the pipeline outputs

- One Video Port (VP1) output:
 - Up to 24-bit per pixel on the output interface, with selection between 12, 16, 18 or 24-bit
 - Independent programmable timing generator to support up to 165 MHz pixel clock video formats defined in CEA-861-E and VESA-DMT standards
 - Independent programmable multiple cycles output format on 8/9/12/16-bit interface (TDM)
 - Configurable output mode: progressive or interlaced mode
 - Selection between RGB and YUV422 output pixel format (YUV4:2:2 only available when BT output is enabled)
- Two Overlay Managers (OVR1 and OVR2):
 - Input Pixel format: ARGB48-12121212
 - Output Pixel format: ARGB48-12121212 (A component is only used for Write-back)
 - Overlay of the graphics and video pipelines
 - Transparency color keys (source and destination)
 - Global and pixel alpha blending
 - Programmable Z-order (full flexibility)
- Common:
 - Programmable 8-bit gamma curve support on VP1 output
 - Programmable color phase rotation (CPR)
 - Alpha blending support:
 - Embedded pixel factor (ARGB and RGBA)
 - Global pixel
 - Combination of global pixel and pixel factor
- DMA (internal to the DISPC):
 - No support for rotation, flip-flop, mirroring and memory fragmentation
 - Integrated shared buffers between DMA engine and pipelines
 - Programmable buffer thresholds
 - Bandwidth limiter on write request (insertion on idle cycles between requests)
- Advanced:
 - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
 - Arbitration between normal and low priority pipelines (GFX, VID1, VID2 and WB pipelines)
- Power modes:
 - Low-power saving modes
 - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
 - Merge capability of the DMA buffers to support greater OFF period on the L3_MAIN interconnect
 - All buffers associated to a single pipeline
 - Reallocation of the buffers of the nonactive pipelines to the active pipelines

NOTE: The display resolution is programmable and can be any width in the range [1:4096] pixels. The following limitations, related to the type of display or the processing done, apply:

- Active Matrix screen + dithering forces a width multiple of 2 pixels
- Active Matrix + TDM may force a width multiple of 2 pixels

The display buffers in the system memory consist of contiguous pixels.

9.2.2 DISPC Environment

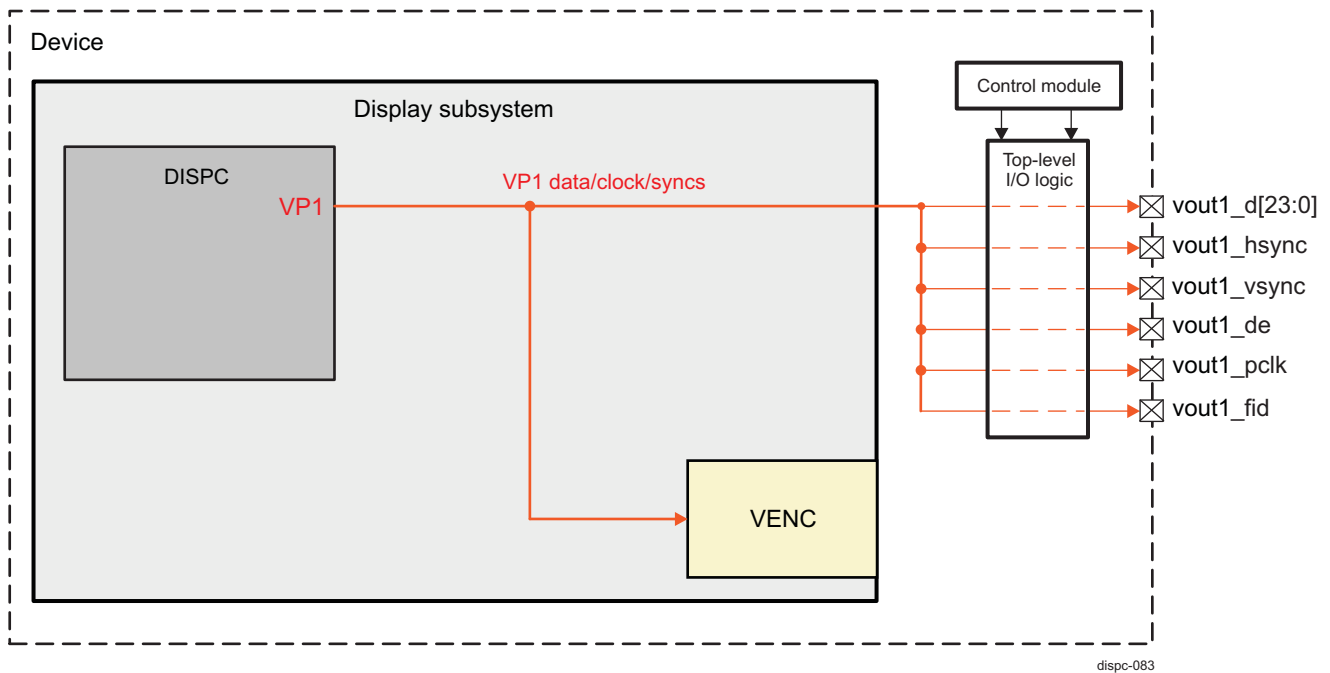

The DISPC VP1 provides the required data and control signals to interface:

- Directly to device CMOS pads for MIPI DPI 2.0, or BT.656 or BT.1120 interface support
- Video Encoder (VENC) module with dedicated standard definition video DAC (SD_DAC) for composite TV out support

Figure 9-6 shows the supported interfaces.

NOTE: The parallel and TV out interfaces cannot be used simultaneously. The selection can be done at DSS top level. For more information, see Section 9.1.1, *Display Subsystem Environment*.

Figure 9-6. DISPC VP1 Output Interfaces

NOTE: The path from a module pin to device pad (or pads) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see Section 14.4.6.1, Pad Configuration Registers, in Chapter 14 *Control Module*.

Table 9-17 describes the VP1 interface signals.

Table 9-17. DISPC VP1 Interface Signals

Signal Name	Type ⁽¹⁾	Description
vout1_d[23:0]	O	Pixel data
vout1_pclk	O	Pixel clock
vout1_vsync	O	Vertical synchronization. The frame synchronization pulse (vsync) toggles after all the lines in a frame are transmitted and a programmable number of line clock cycles has elapsed at the beginning and the end of each frame.

⁽¹⁾ I = Input, O = Output, I/O = Input/Output

Table 9-17. DISPC VP1 Interface Signals (continued)

Signal Name	Type ⁽¹⁾	Description
vout1_hsync	O	Horizontal synchronization. The line synchronization pulse (hsync) toggles after all pixels in a line are transmitted and a programmable number of pixel clock wait-states has elapsed at the beginning and the end of each line.
vout1_de	O	Pixel data output-enable signal to indicate when data must be latched using the pixel clock.
vout1_fid	O	The FID signal indicates the output field identifier: <ul style="list-style-type: none"> • 0 means even • 1 means odd The FID signal is 0 when the progressive mode is selected for the VP output.

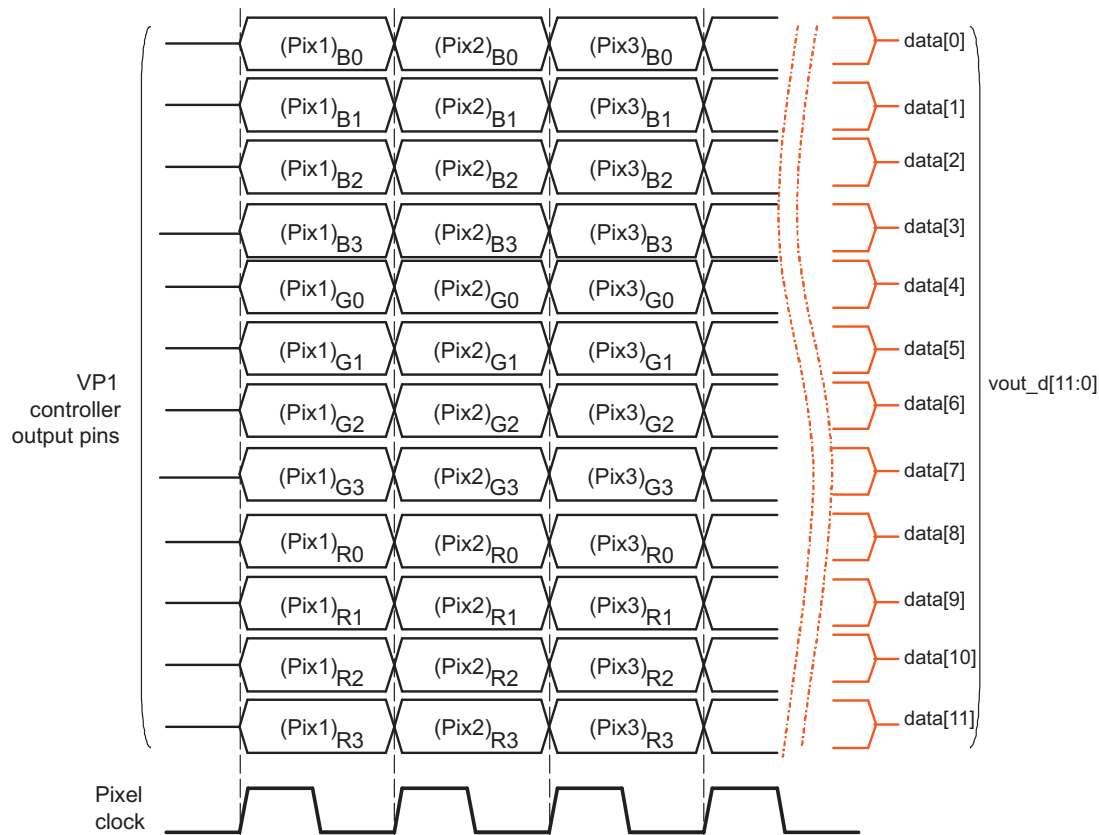

9.2.2.1 DISPC VP1 Output and Data Formats

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

In the Active matrix display type, one pixel per pixel clock is displayed. The diagrams represent the configuration of assertion of the data on the rising edge of the pixel clock. It is possible to program the interface timing to output the data on the falling edge of the pixel clock.

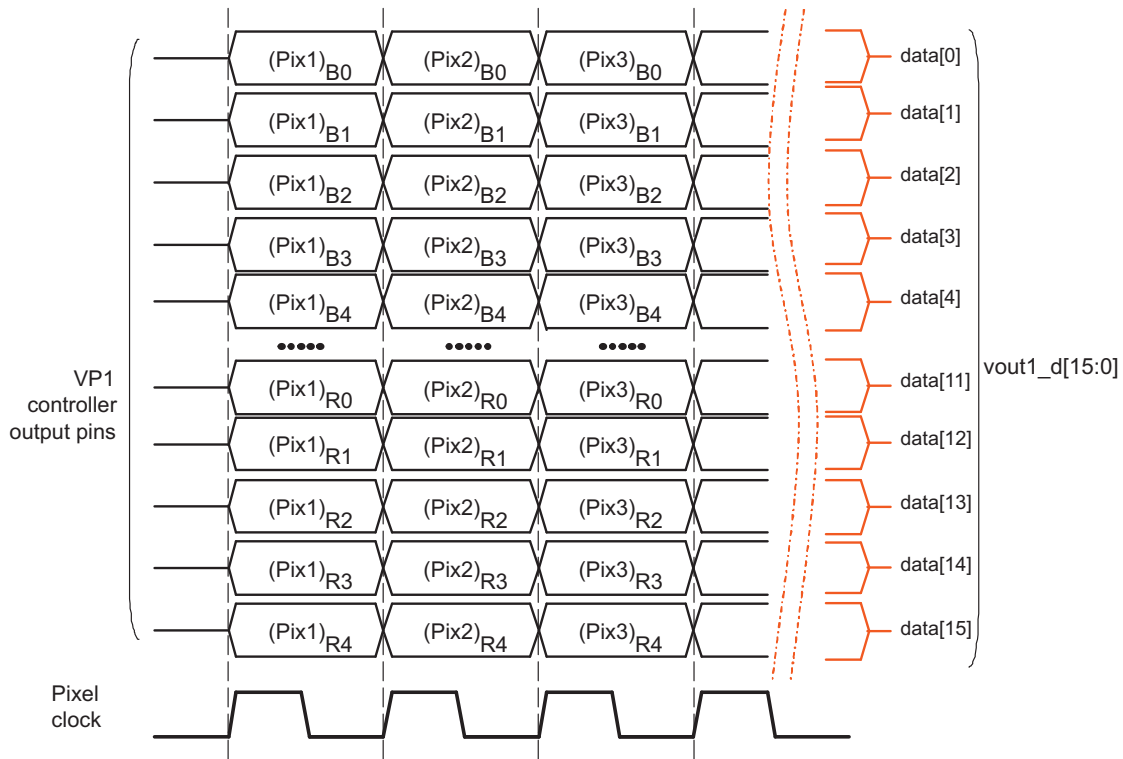

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel. Figure 9-7 through Figure 9-10 show 12-, 16-, 18-, and 24-active matrix displays, respectively. The width of the data bus can be configured through DISPC_VP1_CONTROL[10:8] DATALINES register bitfield.

9.2.2.2 DISPC VP1 Active Marix Display Timing Diagrams

Figure 9-11 through Figure 9-14 show timing diagrams of synchronization signals and pixel clocks for active matrix panels. The DISPC directly drives these signals, which are related to the programmable fields listed in Table 9-19.

Table 9-19. DISPC VP1 Programmable Fields for Active Matrix Display

Name	Register	Description
PPL	DISPC_VP1_SIZE_SCREEN[11:0] PPL value + 1	Pixels per line
LPP	DISPC_VP1_SIZE_SCREEN[27:16] LPP value + 1	Lines per panel
HBP	DISPC_VP1_TIMING_H[31:20] HBP value + 1	Horizontal back porch
HFP	DISPC_VP1_TIMING_H[19:8] HFP value + 1	Horizontal front porch
HSW	DISPC_VP1_TIMING_H[7:0] HSW value + 1	Horizontal synchronization pulse width
VBP	DISPC_VP1_TIMING_V[31:20] VBP value	Vertical back porch
VFP	DISPC_VP1_TIMING_V[19:8] VFP value	Vertical front porch
VSW	DISPC_VP1_TIMING_V[7:0] VSW value + 1	Vertical synchronization pulse width
ONOFF ⁽¹⁾	DISPC_VP1_POL_FREQ[17] ONOFF	DISPC_HSYNC and DISPC_VSYNC pixel clock control
RF ⁽²⁾	DISPC_VP1_POL_FREQ[16] RF	DISPC_HSYNC and DISPC_VSYNC pixel clock edge control
IEO	DISPC_VP1_POL_FREQ[15] IEO	Invert output enable
IPC ⁽³⁾	DISPC_VP1_POL_FREQ[14] IPC	Invert DISPC_PCLK
IHS	DISPC_VP1_POL_FREQ[13] IHS	Invert DISPC_HSYNC
IVS	DISPC_VP1_POL_FREQ[12] IVS	Invert DISPC_VSYNC

⁽¹⁾ DISPC_VP1_POL_FREQ[17] ONOFF and Control Module register CTRL_CORE_SMA_SW_1[DSS_CH0_ON_OFF] must match.

⁽²⁾ DISPC_VP1_POL_FREQ[16] RF and Control Module register CTRL_CORE_SMA_SW_1[DSS_CH0_RF] must match.

⁽³⁾ DISPC_VP1_POL_FREQ[14] IPC and Control Module register CTRL_CORE_SMA_SW_1[DSS_CH0_IPC] must match.

- Active matrix timing configuration 1:
 - DISPC_VP1_POL_FREQ[17] ONOFF = 0 and CTRL_CORE_SMA_SW_1[DSS_CH0_ON_OFF] = 0
 - DISPC_VP1_POL_FREQ[16] RF = 0 and CTRL_CORE_SMA_SW_1[DSS_CH0_RF] = 0
The HSYNC and VSYNC signals are driven on the opposite edge of PCLK from the pixel data.
 - DISPC_VP1_POL_FREQ[15] IEO = 0
The DE signal is active high.
 - DISPC_VP1_POL_FREQ[14] IPC = 0 and CTRL_CORE_SMA_SW_1[DSS_CH0_IPC] = 0
The pixel data are driven on the rising edge of PCLK.
 - DISPC_VP1_POL_FREQ[13] IHS = 0
The HSYNC signal is active high.
 - DISPC_VP1_POL_FREQ[12] IVS = 0
The VSYNC signal is active high.

9.2.3 DISPC Integration

This section describes the DISPC integration in the device (see Figure 9-23). For complete details about clocks and resets, see Section 9.1, *Display Subsystem Overview*.

Figure 9-23. DISPC Integration

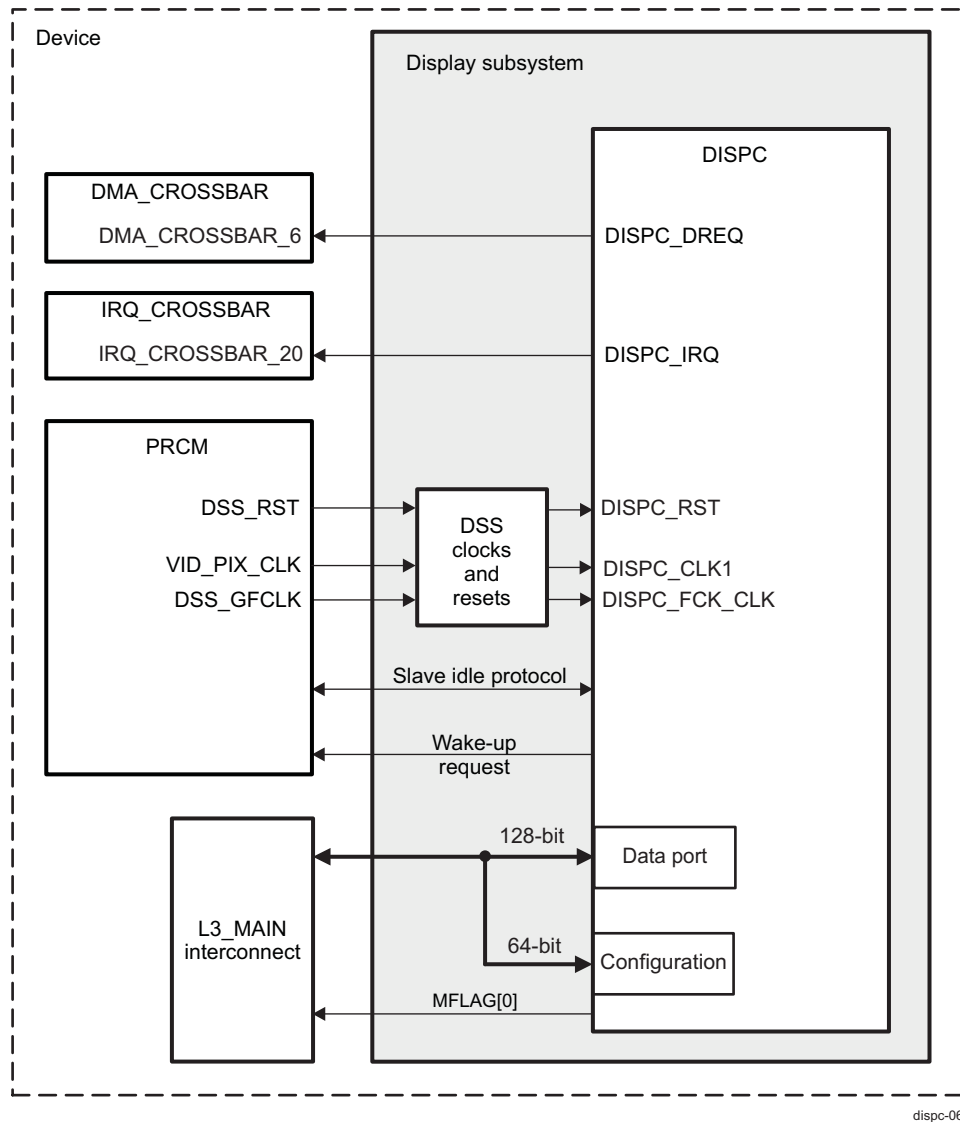

Table 9-20 and Table 9-21 list the integration attributes and clock and resets, respectively.

Table 9-20. DISPC Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
DISPC	PD_DSS	128-bit master port to L3_MAIN for data transfer to/from system memory 32-bit slave port to L3_MAIN for configuration

Table 9-21. DISPC Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	DISPC_FCK_CLK	DSS_GFCLK	PRCM	Functional clock for the internal DISPC logic. Also DISPC interface clock. For additional details, see Section 9.1.2, Display Subsystem Integration .
	DISPC_CLK1	VID_PIX_CLK	PRCM	Clock used to generate the pixel clock (VP1_PCLK) for the video port (VP1) interface. For additional details, see Section 9.1.2, Display Subsystem Integration .
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	DISPC_RST	DSS_RST	PRCM	Hardware reset is coming from the PRCM module. For additional details, see Section 9.1.2, Display Subsystem Integration . NOTE: The DSS_RST signal is provided to the entire display subsystem. When inside the display subsystem boundaries, it is named DISPSS_RST, which on its end is provided to the DISPC and is named DISPC_RST.

Table 9-22. DISPC Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	DSP1_IRQ_51 DSP2_IRQ_51 IPU1_IRQ_23	DISPC interrupt request
DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5	Associated with the line trigger signal used for synchronization of a logical channel in the device-level EDMA for memory-to-memory transfer, generated by the DISPC module. There is no data received by the DISPC based on the DMA request. Indicates when the programmable line number matches the current primary VP1 panel refresh line number. See Section 9.2.4.5, DISPC DMA Requests , for more details.

NOTE: The “Default Mapping” column in [Table 9-22 DISPC Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.

For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#).

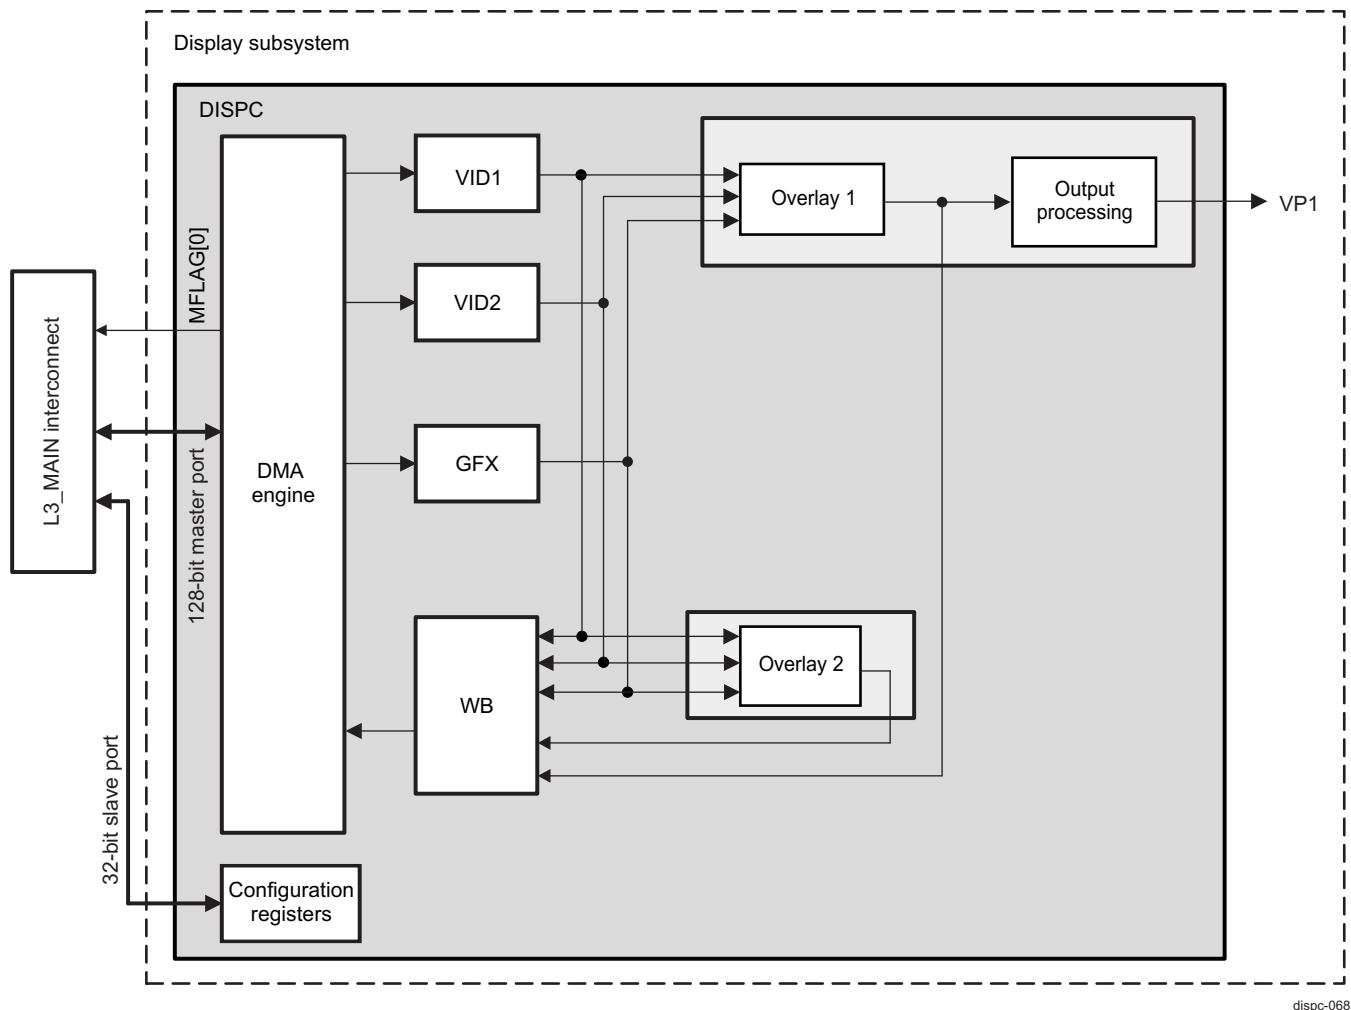

For more information about the DMA_CROSSBAR module, see [Section 14.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#).

For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#).

For more information about the device EDMA module, see [Chapter 12, Enhanced DMA](#).

9.2.4 DISPC Functional Description

Figure 9-24. DISPC Architecture Overview

dispc-068

The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (antialiasing) and video pipelines (VC-1, color space conversion, scaling, and so forth).

The data coming out of a pipeline is sent to the overlay managers (and from there to VP1 or WB), or to the WB pipeline directly. An overlay manager manages inputs of multiple pipelines. Transparency settings and user timing configurations for VP1 output are available, based on VESA-DMT and CEA-861 standards.

The DISPC allows the capturing of one of the pipeline outputs, or one of the overlay manager outputs, to redirect it into the WB pipeline. It allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing, and so forth, to perform memory-to-memory transfer with data processing. It can be used as a HW front end compositing unit in order to pre-compose the output frame and write in memory before being fetched again by DISPC for display on VP1.

NOTE: DISPC does not support any tiled frame buffer, nor any compressed frame buffer, and is not able to generate any compressed output to memory through the write-back pipeline. The DISPC has no capability to support by itself rotation of the frame buffer.

DISPC can be used for composition using memory to memory transfer. In that case the frame buffer on the input and output can be split into smaller blocks of pixels, processed separately by DISPC. Scaling/filtering of the split blocks requires fetching extra pixels around the processed pixel-block. This can be achieved by properly programming the initial accumulator (accu) value of the polyphase filter inside VID/WB pipelines. The number of taps used by the polyphase filter implies the number of extra pixels to fetch (5-tap requires 2 pixels on left/right/bottom/top to be fetched).

9.2.4.1 DISPC Clock Configuration

The VP1_PCLK clock for the VP1 output is provided directly from the DISPC_CLK1 input clock. There is no internal divisor on this clock.

The pixel clock transitions continuously as long as the VP1 is enabled and [DISPC_VP1_CONFIG\[0\] PIXELGATED](#) register bit is 0x0.

The DISPC functional clock FCK_CLK is the internal logic clock, and also acts as the interface clock.

The FCK_CLK has to be greater or equal to the VP1_PCLK, in order for DISPC internal logic to function properly.

The FCK_CLK must be faster or equal to the highest clock required by the user application, in order to support the processing for the VP1 output.

The minimum ratio between the pixel clock frequency and the core functional clock does not depend on the vertical scaling ratio. It is possible to rescale vertically between 16x and 0.25x with a clock ratio between functional clock and pixel clock of 1x. For the horizontal scaling, the minimum clock ratio does not depend on the video window width but on the display width. Considering for example 1080p video frame downscaled by 0.25 on a 1080p screen, the minimum clock ratio is 1x.

The pixel clock and the core functional clocks are asynchronous. There is re-synchronization logic between internal logic and the VP1 output interface.

9.2.4.2 DISPC Software Reset

To perform a software reset on the DISPC, set the [DISPC_SYSCONFIG\[1\] SOFTRESET](#) bit to 0x1. The [DISPC_SYSSTATUS\[0\] DISPC_FUNC_RESETDONE](#) bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the [DISPC_SYSCONFIG\[1\] SOFTRESET](#) bit is automatically reset. Software must ensure that the software reset completes before performing DISPC operations.

The completion of the software reset for the VP logic is indicated in the [DISPC_SYSSTATUS\[1\] DISPC_VP1_RESETDONE](#) bit.

9.2.4.3 DISPC Power Management

The DISPC supports the MStandby/Wait, IdleReq/SidleAck, Disconnect and Wake-up protocols as defined in [Chapter 3, Power, Reset, and Clock Management](#).

9.2.4.3.1 DISPC Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the `DISPC_SYSCONFIG[4:3]` SIDLEMODE bit field.

Condition of assertion of the SIdleAck signal:

- In no-idle mode: SIdleAck is never asserted.
- In force-idle mode: SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle delay with respect to an IdleReq assertion.

NOTE: The proper use of force-idle mode assumes that no interrupt needs to be generated.

- In smart-idle mode: SIdleAck is asserted when at least the following conditions are satisfied:
 - No interrupt is pending.
 - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted, the DISPC interface clock used by the slave port can be shut down at any time. Any transactions on the configuration port are ignored.

The conditions of deassertion of the SIdleAck signal are:

- In force-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.
- In smart-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.

Once SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

9.2.4.3.2 DISPC StandBy Mode

The DISPC supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the `DISPC_SYSCONFIG[13:12]` MIDLEMODE bit field. The functional clock is always active, if the module is enabled. The L3_MAIN clock can be shut down at any time independently of the status of MStandby.

The conditions of assertion of the MStandby signal are:

- In no-standby mode: MStandby is never asserted.
- In force-standby mode: MStandby is asserted when the module is disabled.
- In smart-standby: In the case of one of the following conditions:
 - The GFX pipeline is disabled or enabled and the data fetch is complete for the GFX window, or the GFX pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - A VID pipeline (VID1 or VID2) is disabled or enabled and the data fetch is complete for the VID window, or the VID pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The WB pipeline is disabled or enabled and the data store to memory is complete for the WB picture, or the WB pipeline is enabled but the data storage did not complete and data in the DMA buffer is lower than the low threshold value.

The MStandby signal asserts whenever all the above events have occurred or the DISPC is disabled. While MStandby is asserted, the DISPC does not generate any transaction on the L3_MAIN master port.

The conditions of deassertion of the MStandby signal are:

- In force-standby mode: MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode: In the case of one of the following conditions:
 - The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
 - A VID pipeline (VID1 or VID2) is enabled but the data fetch did not complete for the VID window, and the data in the DMA buffer is less than the low threshold value.

- The WB pipeline is enabled but the data store did not complete for the WB picture, and the data in the DMA buffer more than the high threshold value.

The above events are conditions for MStandby signal de-assertion. MStandby signal is de-asserted whenever any one the above event happens.

Detection of the deassertion conditions assumes that the interface clocks are active.

9.2.4.3.3 DISPC Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG\[2\]](#) ENAWAKEUP bit. Because the SWakeup signal is asynchronous, it does not require the interface clock.

The conditions of assertion of the SWakeup signal are:

- The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
- At least one of the the video pipelines (VID1 or VID2) is enabled but the data fetch did not complete for the VID window, and the data in the DMA buffer is less than the low threshold value.
- The WB pipeline is enabled and the data in the DMA buffer is more than the high threshold value.
- The last pixel displayed into the VP1 panel if it is not the last frame

The SWakeup signal is asserted whenever any one of the abpveevents occurs and IdleAck is asserted, and Idlemode is set to smart-idle.

The condition of deassertion of the SWakeup signal is:

- Immediately after deassertion of IdleReq

9.2.4.4 DISPC Interrupt Requests

The interrupt line, DISPC_IRQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the [DISPC_IRQENABLE_SET](#) register.

To check when a particular interrupt event occurs and to reset a particular event, the [DISPC_IRQSTATUS](#) register must be accessed. This register regroups the status of internal events in the module that generate an interrupt (read 0: no interrupt occurred; read 1: interrupt occurred; write 1: status bit reset).

There are two level of interrupts. The first level, controlled by the [DISPC_IRQENABLE_SET](#), [DISPC_IRQENABLE_CLR](#) and [DISPC_IRQSTATUS](#) registers, is used to indicate common events and also source for the second level of interrupt. The second level of interrupts consists of status and enable interrupt registers for each pipeline and the video port.

Table 9-23. DISPC Interrupts - First Level

Interrupt Name	Description
VP1_IRQ	At least one event of the Video Port 1 interrupt events occurred
GFX_IRQ	At least one event of the GFX pipeline interrupt events occurred
VID1_IRQ	At least one event of the VID1 pipeline interrupt events occurred
VID2_IRQ	At least one event of the VID2 pipeline interrupt events occurred
WB_IRQ	At least one event of the WB pipeline interrupt events occurred
WAKEUP_IRQ	WakeUp: Occurs when the SWakeup signal is asserted.

The second level of interrupts for GXF pipeline is controlled through the [DISPC_GFX1_IRQENABLE](#) and [DISPC_GFX1_IRQSTATUS](#) registers.

Table 9-24. DISPC Interrupts - Second Level - GFX Pipeline

Interrupt Name	Description
GFXENDWINDOW_IRQ	End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame.

Table 9-24. DISPC Interrupts - Second Level - GFX Pipeline (continued)

Interrupt Name	Description
GFXBUFFERUNDERFLOW_IRQ	GFX DMA buffer underflow: The input graphics DMA buffer goes underflow.
GFXREGIONBASEDPIPESTART_IRQ	Graphics window started on overlay. Used for Region-based feature.
GFXREGIONBASEDPIPEEND_IRQ	Graphics window ended on overlay. Used for Region-based feature.

The second level of interrupts for VID pipelines is controlled through the [DISPC_VID_IRQENABLE](#) and [DISPC_VID_IRQSTATUS](#) registers.

Table 9-25. DISPC Interrupts - Second Level - VID Pipelines

Interrupt Name	Description
VIDENDWINDOW_IRQ	End of the VID window: The DMA engine has fetched all the data from memory for the VID for the current frame.
VIDBUFFERUNDERFLOW_IRQ	VID DMA buffer underflow: The input VID DMA buffer goes underflow. Does not necessary means that the buffer is empty (out of order refill), but simply that the required pixel is not in yet.
VIDREGIONBASEDPIPESTART_IRQ	Video window started on overlay. Used for Region-based feature.
VIDREGIONBASEDPIPEEND_IRQ	Video window ended on overlay. Used for Region-based feature.

The second level of interrupts for WB pipeline is controlled through the [DISPC_WB_IRQENABLE](#) and [DISPC_WB_IRQSTATUS](#) registers.

Table 9-26. DISPC Interrupts - Second Level - WB Pipeline

Interrupt Name	Description
WBUNCOMPLETEERROR_IRQ	The WB pipe is reset before all data of the frame currently written back are output to the system memory.
WBBUFFEROVERFLOW_IRQ	Write-back DMA buffer Overflow. The output Write-back DMA buffer goes overflow. It can not occur when write-back channel is used in memory to memory transfer mode, but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory to memory mode, there is timing constraint.
WBREGIONBASEDEVENT_IRQ	For Write-back region-based feature, event indicating end of current window.
WBSYNC_IRQ	Indicates that Write-back has synced to new configuration (configuration copied from shadow registers to work).
WBFRAMEDONE_IRQ	FrameDone interrupt for WriteBack. Indicates that the WB frame has been completely flushed out of WB-DMA.

The second level of interrupts for VP1 output is controlled through the [DISPC_VP1_IRQENABLE](#) and [DISPC_VP1_IRQSTATUS](#) registers.

Table 9-27. DISPC Interrupts - Second Level - VP1 Output

Interrupt Name	Description
FRAMEDONE_IRQ	Frame Done for VP1 output. After disabling the VP output of the DISPC, the interrupt is set when the active frame related to the VP has completed.
VSYNC_IRQ	VSYNC for VP1 output: VSYNC interrupt for the VP1 has occurred at the end of the frame.
VSYNC_ODD_IRQ	VSYNC for odd field. VSYNC_ODD interrupt has occurred at the end of the frame(EVSYNC received and the field polarity is odd).
PROGRAMMEDLINENUMBER_IRQ	Programmed line number: The VP1 has reached the user programmed line number.
SYNCLOST_IRQ	Synchronization lost on VP1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (VP1 output).

9.2.4.5 DISPC DMA Requests

The DISPC DMA request signal, DISPC_DREQ, is not a classical one, but rather a synchronization signal between the DISPC and device DMA controller. The device DMA controller is informed that a programmable number of lines are output to the VP1 and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER_IRQ described in [Table 9-27](#). This allows the device DMA controller channel to be synchronized with the internal DMA controller of the DISPC.

In other words, it allows synchronizing a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DISPC_DREQ request is generated at a programmable line number defined in the [DISPC_VP1_LINE_NUMBER\[11:0\]](#) LINENUMBER bit field. This process allows an application to use a single frame buffer and to update it after a certain number of lines are read by the DISPC.

9.2.4.6 DISPC DMA Engine

The DISPC DMA engine:

- Requests and supplies data from system memory to the GFX, VID1 and VID2 pipelines through the interconnect, based on the configuration of the DISPC and GFX/VID pipelines settings.
- Stores composed frames from GFX/VID pipelines or overlay managers to system memory through the WB pipeline and interconnect, based on the configuration of the DISPC and WB pipeline settings.
- Is fully programmable to support configuration with only 1D burst.

Each pipeline has a dedicated buffer and a channel with independent settings. [Table 9-28](#) lists the default size and allocation of the DMA buffer. Each DMA buffer is divided into two spaces, top and bottom. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each pipeline is from 0 (pipeline inactive) to the number of pipelines $\times 2$ (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of available spaces. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and system latency. The space assignments are done in the [DISPC_GLOBAL_BUFFER](#) register.

Table 9-28. DISPC DMA Buffer Size

Pipelines	DMA Buffer Size
GFX	4 lines \times 640 \times 128 bits
VID1	4 lines \times 640 \times 128 bits
VID2	4 lines \times 640 \times 128 bits
WB	4 lines \times 640 \times 128 bits

9.2.4.6.1 DISPC DMA Addressing and Bursts

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address
- Aligns the address
- Defines the burst structure:
 - Type of burst (1D only)
 - Length of the burst

The DMA engine generates scan addresses to read and write data to and from system memory. The base address defines the start address of the first pixel, and then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The ROW_INC registers of GFX/VID pipelines allow to access a frame using 1D bursts, but as a two-dimensional block by adding a fixed address offset at the end of a line. The ROW_INC can also be used to skip lines from the input frame. The byte address of each pixel in the frame buffer in the system memory is determined by:

$$\text{Pixel address} = \text{Base address} + x \times \text{bpp} + (y \times ((\text{width} \times \text{bpp}) + \text{increment}))$$

where:

- Base address corresponds to the base address (for YUV–NV12 or YUV4:2:0–NV21 format) defined by:
 - [DISPC_GFX1_BA_j\[31:0\]](#) BA bit fields
 - [DISPC_VID_BA_j\[31:0\]](#) BA bit fields
 - [DISPC_VID_BA_UV_j\[31:0\]](#) BA bit fields
- bpp corresponds to the number of bits per pixel defined by the [DISPC_GFX1_ATTRIBUTES\[6:1\]](#) FORMAT bit field or the [DISPC_VID_ATTRIBUTES\[6:1\]](#) FORMAT bit field.
- width corresponds to the number of pixels per line defined by the [DISPC_GFX1_SIZE\[11:0\]](#) SIZEX + 1 bit field or [DISPC_VID_SIZE\[11:0\]](#) SIZEX + 1 bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by the [DISPC_GFX1_ROW_INC\[31:0\]](#) ROWINC – 1 bit field or the [DISPC_VID_ROW_INC\[31:0\]](#) ROWINC – 1 bit field.
- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

NOTE: For YUV420–NV12 or YUV420–NV21 format, the pixel values are defined in two buffers (Y and UV). The base address of the Y buffers is defined in the [DISPC_VID_BA_j\[31:0\]](#) BA bit field. The base address of the UV buffers is defined in the [DISPC_VID_BA_UV_j\[31:0\]](#) BA bit field.

In case of interlaced mode, [DISPC_VID_BA_0](#) and [DISPC_VID_BA_UV_0](#) registers define the base address of the even field, and [DISPC_VID_BA_1](#) and [DISPC_VID_BA_UV_1](#) registers define the base address of the odd field.

[Table 9-29](#) summarizes the register settings for a simple access of a picture in the system memory.

Table 9-29. DISPC Register Settings for Accessing Image in Internal Memory

Registers	Value
DISPC_GFX1_BA_j/DISPC_VID_BA_j/DISPC_WB_BA_j	PBA, the physical base address of image in the memory
DISPC_VID_BA_UV_j/DISPC_WB_BA_UV_j	PBA, the physical base address of UV buffers image in the memory
DISPC_GFX1_PIXEL_INC/DISPC_VID_PIXEL_INC	1 or other in pixel incremental value
DISPC_GFX1_ROW_INC/DISPC_VID_ROW_INC	1 or other in row incremental value

An interconnect request (128 bits) corresponds to one or several pixels, depending on the bits per pixel. Therefore, the DMA engine determines the appropriate burst sequence to optimize the fetching/storing of each new line. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports only 1D burst. 1D burst is used, if the fetch/storage is linear in memory. The size of the burst can be one of the following values: 1x128bit, 2x128-bit, 4x128-bit or 8x128-bit. The default burst size at reset time is 8 × 128 bits. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue one or more smaller burst requests.

9.2.4.6.2 DISPC DMA Buffers

9.2.4.6.2.1 DISPC READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3_MAIN interconnect. Enabling or disabling the DISPC flushes the DMA buffers (except the WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3_MAIN interconnect.

- When low threshold (set in the [DISPC_GFX1_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD or [DISPC_VID_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3_MAIN interconnect to fill the DMA buffer.
- When high threshold (set in the [DISPC_GFX1_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD or [DISPC_VID_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.

NOTE: The following limitations on [DISPC_VID_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD must be considered:

- If VID scaler is disabled, BUFLOWTHRESHOLD can be programmed as low as interconnect latency and pixel output rate allow it
 - If VID scaler is enabled, BUFLOWTHRESHOLD must be programmed to guarantee that at least four full lines can be stored
-

To avoid underflow at the beginning of a frame and have sufficient encoded pixel data to start some processing, a preloading of the DMA buffer is configurable between a fixed value of bytes or the high threshold value. The preload ensures a minimum number of pixels present in the buffer. When the preload value is reached, the associated channel must start pulling pixels out of the DMA buffer. To enable the preload based on the value entered in the [DISPC_GFX1_PRELOAD\[11:0\]](#) PRELOAD or [DISPC_VID_PRELOAD\[11:0\]](#) PRELOAD bit field, the [DISPC_GFX1_BUF_THRESHOLD\[11\]](#) BUFPRELOAD bit, or the [DISPC_VID_BUF_THRESHOLD\[19\]](#) BUFPRELOAD bit must be set to 0x0.

NOTE: When self-refresh mode is selected, meaning the data in the DMA buffers are used for multiple frames, and at the end of each frame, the DMA buffers are not flushed.

9.2.4.6.2.2 DISPC WRITE DMA Buffer (WB Pipeline)

Two modes are supported by the WB channel, selectable through the [DISPC_WB_ATTRIBUTES\[19\]](#) WRITEBACKMODE bit:

- Capture mode, WRITEBACKMODE bit set to 0: The OVR1 output, connected to external interface, is captured and at the same time the data are sent on the VP1 output. The WB timings are controlled by the VP1 timings. The output of a VID/GFX pipeline is not sent to the write back, when the WB pipeline is connected to an overlay used in capture mode.
- Memory-to-memory mode, WRITEBACKMODE bit set to 1: One of the overlay outputs or one of the pipeline outputs is captured to perform a memory-to-memory transfer, with some processing by the DISPC (rescaling, overlaying, color space conversion, etc.).

In capture mode: The DMA engine starts storing data to memory through the L3_MAIN-based interconnect as soon as enough data is available for the programmed burst size. When enabling/disabling the DISPC, the DMA buffer is flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

NOTE: In WB capture mode, if a new frame starts before the WB DMA buffers contents are fully written onto external memory, then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). The [DISPC_WB_IRQSTATUS\[1\]](#) WBUNCOMPLETEERROR_IRQ interrupt bit indicates this situation and triggers every frame. The WBUNCOMPLETEERROR interrupt can be enabled through the [DISPC_WB_IRQSTATUS\[1\]](#) WBUNCOMPLETEERROR_EN register bit.

In memory-to-memory mode: The WB pipeline is not synchronized to any internal or external timing generator. The WB pipeline stores the output of one of the overlay outputs or one of the pipelines. When enabling or disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

Programmable high and low thresholds are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

- When high threshold (set in the [DISPC_WB_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit

field) is reached, the DMA engine starts sending data on the L3_MAIN interconnect to empty buffer.

- When low threshold (set in the [DISPC_WB_BUF_THRESHOLD](#)[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine stops sending encoded pixels.

At the end of the frame, to completely drain the DMA buffer, some smaller bursts (even single requests) must be issued. To limit the number of interconnect requests from the DISPC, a number of IDLE cycles between requests can be inserted. IDLE cycles can be inserted only when WB is used in memory-to-memory mode. It is ignored when WB is in capture mode.

The number of IDLE cycles between requests can be activated and determined by:

- Setting the [DISPC_WB_ATTRIBUTES](#)[27] IDLESIZE bit to 0x0 (default value) and entering the number of idles between requests in the [DISPC_WB_ATTRIBUTES](#)[31:28] IDLENUMBER bit field. Idle numbers vary from 0 to 15.
- Setting the [DISPC_WB_ATTRIBUTES](#)[27] IDLESIZE bit to 0x1, which considers the size of the burst to determine the number of IDLE cycles. In this case, the number of IDLE cycles equals IDLENUMBER × 8 (0 to 120).

9.2.4.6.3 DISPC DMA MFLAG Mechanism and Arbitration

The MFLAG mechanism allows a dynamic increase of the priority of DISPC real-time traffic, when required, based on the fullness of the DISPC DMA read and write buffers.

The mechanism is implemented for all DMA buffers (GFX, VID1, VID2, and WB).

Programmable buffer thresholds (hysteresis) for each pipeline are used to indicate when the local MFLAG signal for each pipeline is generated. All local MFLAG signals are OR-ed to generate a single DSS MFLAG out band signal, which is provided to the L3 interconnect for granting OCP requests. The out band DSS MFLAG signal is asynchronous to any ongoing OCP transaction.

The threshold for each pipeline corresponds to the fullness of the associated DMA buffer, and is defined by two threshold parameters:

- HT_MFLAG: High threshold.
 - For read access from the GFX, VID1 and VID2 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
 - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
 - This threshold can be programmed in the following bit fields:
 - For the GFX pipeline in the [DISPC_GFX1_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
 - For the VID pipelines in the [DISPC_VID_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit fields
 - For the WB pipeline in the [DISPC_WB_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
- LT_MFLAG: Low threshold.
 - For read access from the GFX, VID1 and VID2 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
 - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
 - This threshold can be programmed in the following bit fields:
 - For the GFX pipeline in the [DISPC_GFX1_MFLAG_THRESHOLD](#)[15:0] LT_MFLAG bit field
 - For the VID pipelines in the [DISPC_VID_MFLAG_THRESHOLD](#)[15:0] LT_MFLAG bit fields
 - For the WB pipeline in the [DISPC_WB_MFLAG_THRESHOLD](#) [15:0] LT_MFLAG bit field

By default, the MFLAG mechanism is disabled ([DISPC_GLOBAL_MFLAG_ATTRIBUTE](#)[1:0] MFLAG_CTRL bit field = 0x0), and the DSS MFLAG out band signal is low (de-asserted). The arbitration scheme for the DISPC pipelines is the same as described in [Section 9.2.4.6.5, DISPC Arbitration](#). That is, round-robin either between high-priority pipelines, or between normal-priority pipelines (if all pipelines are of normal priority).

When the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field is set to 0x2, the MFLAG mechanism is enabled, and the DSS MFLAG out band signal is dynamically set to 0 or 1, depending on DMA buffers fullness and programmed threshold levels, as explained previously in this section. In this case, the arbitration scheme for DISPC pipelines is round-robin between those high-priority pipelines, which have asserted local MFLAG signals. If there are no high-priority pipelines with asserted local MFLAG signals, then the arbitration scheme is the same as described in [Section 9.2.4.6.5](#), *DISPC Arbitration*.

The [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[2\]](#) MFLAG_START bit defines additional rules for the MFLAG mechanism:

- If the MFLAG_START bit is set to 0x0 (default value), then in the beginning of the frame when the DMA buffer is empty, the local MFLAG signal of each pipeline is kept at 0 until PRELOAD is reached (for more information on preloading, see [Section 9.2.4.6.2.1](#), *DISPC READ DMA Buffers (GFX and VID Pipelines)*). Then, based on the setting of the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field, the MFLAG signal is generated and internal logic is arbitrating between pipeline requests.
- If the MFLAG_START bit is set to 0x1, then even in the beginning of the frame when the DMA buffer is empty, the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field defines the generation of the MFLAG signal for each pipeline.

9.2.4.6.4 DISPC DMA Predecimation

The predecimation process consists of downscaling an image by fetching only the necessary pixels in the memory. Vertical and horizontal predecimation are possible:

- Vertical predecimation: The picture stored in memory can be predecimated vertically by skipping lines. Burst mode is used to fetch the data when skipping lines. Only the lines that will be used by the DISPC are fetched from memory; the other lines are skipped. The DMA engine sends requests only for the useful lines using 1D burst. The base address indicates the first valid pixel to fetch from memory. The number of lines to skip is set in the [DISPC_GFX1_ROW_INC\[31:0\]](#) ROWINC or [DISPC_VID_ROW_INC\[31:0\]](#) ROWINC bit field.
- Horizontal predecimation: When fetching data from memory, it is possible to skip 1 of 2 pixel data containers, up to 1 of 2047 pixel data containers, by setting the [DISPC_GFX1_PIXEL_INC\[7:0\]](#) PIXELINC or [DISPC_VID_PIXEL_INC\[7:0\]](#) PIXELINC bit field to the number of pixel data containers to skip (n), multiplied by the size of a pixel data container (in bytes), + 1. See the following note for more details.

NOTE: The restriction to horizontal predecimation is that there is at least one useful pixel per 128-bit request. In that case, the DMA engine uses burst mode instead of singles to optimize the requests in terms of latency and SDRAM efficiency.

No decimation is supported when the input format is 1, 2, 4, or 8-bit BITMAP.

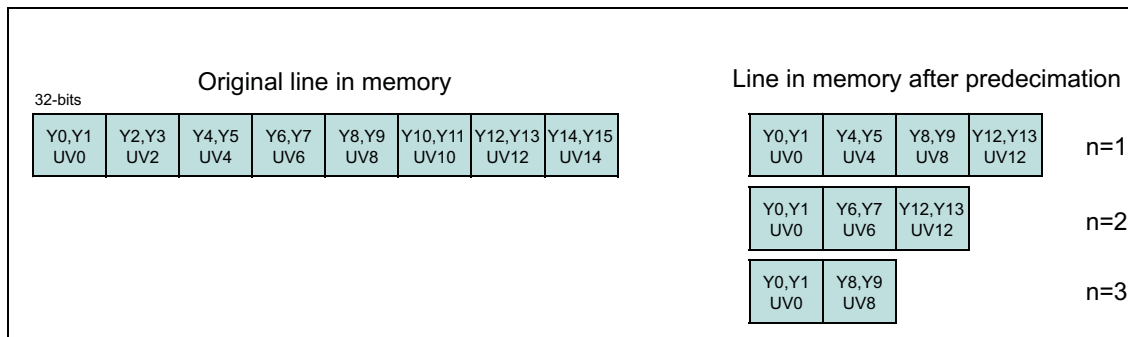

For RGB and YUV4:2:0 data formats, each pixel data container in memory holds 1 pixel. Thus, when configuring the PIXELINC bit field, the value of n equals the number of pixels to skip:

- For RGB format, one pixel data container = 32 bits = 1 pixel
- For YUV format:
 - One Y pixel data container = 8 bits = 1 pixel
 - One UV pixel data container = 16 bits = 1 pixel

For YUV4:2:2 format, each 32-bit pixel data container holds the Luma components for 2 pixels, and the Chrominance component of 1 pixel (see Figure 9-25). Therefore, for the valid values of the PIXELINC bit field in the case of the following YUV4:2:2 format, caution must be taken because n equals the number of pixel data containers to skip, not the number of pixels:

- For n = 1, PIXELINC = 5
- For n = 2, PIXELINC = 9
- For n = 3, PIXELINC = 13
- For n = 4, PIXELINC = 17, etc.

Figure 9-25. DISPC YUV4:2:2 Predecimation

dispc-094

9.2.4.6.5 DISPC DMA Arbitration

The requests (reads or writes) sent to the L3_MAIN interconnect are pipelined and arbitrated in a round-robin scheme. The default arbitration scheme must be modified by setting the priority attribute of each pipeline as defined in the following bits:

- [DISPC_GFX1_ATTRIBUTES\[14\] ARBITRATION](#)
- [DISPC_VID_ATTRIBUTES\[14\] ARBITRATION](#)
- [DISPC_WB_ATTRIBUTES\[14\] ARBITRATION](#)

By default, all pipelines have the same priority (normal), which means all pipeline requests are treated in a round-robin order manner. If one or more pipelines require a higher number of requests going to the L3_MAIN interconnect, its priority can be moved up to high priority. In this case, the high-priority pipeline is granted access before any pipeline in normal priority. If more than one active pipeline is in high priority, the behavior is the same as all active pipelines in normal priority. Normal active pipelines are not treated until all high active pipelines are finished. The ARBITRATION bit cannot be modified during the entire frame.

This functionality balances the bandwidth of the pipeline depending on its constraint. It can be used to give higher priority to the pipelines with real-time constraints versus non-real-time pipelines. For example, pipelines associated with the WB (used in memory-to-memory mode) must have lower priority than the pipelines associated with VP1 output.

9.2.4.6.6 DISPC DMA Power Modes

9.2.4.6.6.1 DISPC DMA Low-Power Mode

Each DMA buffer is divided into two spaces. Each space can be associated with the pipeline or merged with other DMA buffers. The total number of DMA buffers for each pipeline is from 0 (pipeline inactive) to the number of pipelines \times 2 (in that case all the DMA buffers are associated with a single pipeline). The sum of the number of DMA buffers allocated for each pipeline must not be greater than the maximum available. The correct number of DMA buffers must be allocated to ensure no underflow. The number of DMA buffers allocated to each pipeline must be greater than or equal to the minimum required to support the throughput and the system latency.

NOTE: When the number of buffers is changed, the thresholds must be reprogrammed to reflect the new configuration of the DMA buffer.

9.2.4.6.6.2 DISPC DMA Ultralow-Power Mode

In low-power mode, the L3_MAIN interconnect is used to fill up the DMA buffers to store all the data required to display a full frame. The L3_MAIN interconnect is not used to fetch new pixels for the following frames. The data in the DMA buffer are reused to display on the screen.

The setting of the mode is independent for each pipeline. One pipeline may have all the frame pixels in its DMA buffer and the other pipelines may have to refill their respective DMA buffers along the display scan because the frame buffer is too big to be stored in the DMA buffer.

The DMA buffers can be merged to optimize the L3_MAIN interconnect off time. Merging the DMA buffers into a single buffer can be used at the same time to improve ultralow-power mode (see [Section 9.2.4.6.6.1, Low-Power Mode](#)).

During the time in which the frames are fetched in the internal DMA buffer, MStandby must be asserted if the [DISPC_SYSCONFIG](#)[13:12] MIDDLEMODE bit field is set to 0x2 (smart-standby mode).

Two ultralow-power modes can be entered manually or automatically:

- Self-refresh mode: Starting self-refresh mode is done manually by setting the [DISPC_GFX1_ATTRIBUTES](#)[15] SELFREFRESH or [DISPC_VID_ATTRIBUTES](#)[15] SELFREFRESH bit to 0x1 after capturing a frame in the DMA buffers. Self-refresh mode is stopped by setting the SELFREFRESH bit to 0x0.
- Automatic self-refresh mode: By setting the [DISPC_GFX1_ATTRIBUTES](#)[17] SELFREFRESHAUTO or [DISPC_VID_ATTRIBUTES](#)[17] SELFREFRESHAUTO bit to 0x1, the transition from off to on self-refresh mode is done by hardware after capturing the first frame. The hardware reflects the status of the self-refresh mode by setting the SELFREFRESH bit to 0x1, which means that the data are read inside the DMA buffer without accessing the interconnect and system memory during the frame. Setting the SELFREFRESH bit to 0x0 updates the DMA buffer.

NOTE: The WB pipeline does not support ultralow-power mode.

9.2.4.7 DISPC Memory Formats

The graphic, video and write-back pipelines support various types of memory formats. [Table 9-30](#) lists all supported formats for each pipeline.

For the BITMAP formats in GFX pipeline the nibble mode can be enabled by setting the [DISPC_GFX1_ATTRIBUTES](#)[7] NIBBLEMODE bit to 0x1. For VID pipelines the nibble mode can be selected in [DISPC_VID_ATTRIBUTES](#)[10] NIBBLEMODE register bit.

Table 9-30. DISPC Memory Formats Supported

Formats	GFX	VID1	VID2	WB
BITMAP 1-bpp	x	x	x	
BITMAP 2-bpp	x	x	x	
BITMAP 4-bpp	x	x	x	
BITMAP 8-bpp	x	x	x

9.2.4.8 DISPC Graphics Pipeline

The input port of the graphics pipeline (GFX) is connected to the graphics DMA buffer controller. The output port of the GFX pipeline is connected to the overlay managers or WB pipeline. The pixel output is directed to the OVR1, OVR2 or WB path by setting the [DISPC_GFX1_ATTRIBUTES\[8\] CHANNELOUT](#) bit. [Table 9-41](#) lists the bit field settings to orient a pipeline to OVR1, OVR2 or WB output. The default value directs the GFX pipeline to OVR1. The GFX pipeline can be enabled by setting the [DISPC_GFX1_ATTRIBUTES\[0\] ENABLE](#) bit to 0x1.

- NOTE:** It is not possible to change the direction of the GFX pipeline on the fly. If the graphics pipeline must be connected to an overlay manager different from the one to which it is currently connected, then the following steps must be performed:
1. Disable the GFX pipeline by setting the [DISPC_GFX1_ATTRIBUTES\[0\] ENABLE](#) bit to 0x0.
 2. Direct the GFX pipeline to the new overlay manager by modifying the [DISPC_GFX1_ATTRIBUTES\[8\] CHANNELOUT](#) bit.
 3. Disable the DISPC output which corresponds with the overlay manager to which the GFX pipeline will be connected next. This is done by setting the in the following bits to 0x0 for the listed outputs:
 - The [DISPC_VP1_CONTROL1\[0\] VPENABLE](#) bit for VP1 output
 4. Enable the GFX pipeline by setting the [DISPC_GFX1_ATTRIBUTES\[0\] ENABLE](#) bit to 0x1.
 5. Enable the DISPC output that corresponds with the overlay manager to which the GFX pipeline will be connected. This is done by setting the following bits to 0x1 for the listed outputs:
 - The [DISPC_VP1_CONTROL1\[0\] VPENABLE](#) bit for VP1 output

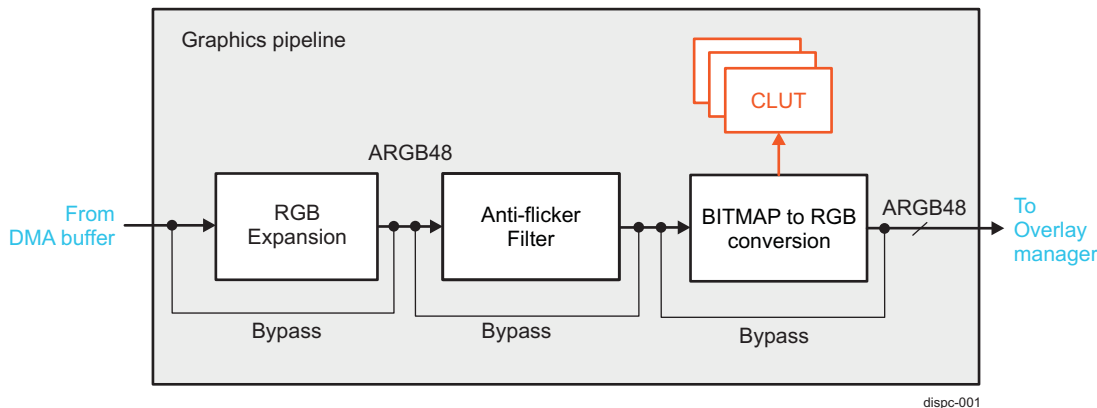

The pipeline contains replication logic, an anti-aliasing filter, and one 256-entry Color Look-up Table (CLUT). The anti-aliasing filter processes the graphics data in RGB format to remove some of the vertical aliasing. The replication logic is used to convert the RGB, ARGB, RGBA pixel formats into ARGB48 format. The 256-entry CLUT is used to convert BITMAP (1, 2, 4, or 8-bit indexed formats) into RGB format.

NOTE: The GFX pipeline does not include a scaler.

Table 9-30 lists the input formats supported by the graphics pipeline.

Figure 9-26 shows the graphics pipeline.

Figure 9-26. DISPC Graphics Pipeline

9.2.4.8.1 DISPC GFX Replication Logic

The replication logic (RGB expansion) increases the color depth of the graphics-encoded pixels (from true color RGB 12 and 16, to 48 bpp).

- The replication logic is always enabled, and the MSBs are copied to the missing LSBs. Table 9-31 describes the remapping of the RGB pixels into ARGB 48-bit values.

Table 9-31. DISPC GFX Replication: RGB Pixel Formats Remapping Into ARGB48-12.12.12.12

Format	A[11:0]	R[11:0]	G[11:0]	B[11:0]

RGBA16-4444	A[3:0]A[3:0]A[3:0]	R[3:0]R[3:0]R[3:0]	G[3:0]G[3:0]G[3:0]	B[3:0]B[3:0]B[3:0]

9.2.4.8.2 DISPC GFX Anti-Aliasing Filter

The anti-aliasing filter processes the graphics data to remove some of the vertical aliasing. It is based on a 3-tap FIR filter with fixed coefficients. For each pixel to be output from the graphics pipeline, the pixel above and below the current line must be read from the DMA graphics FIFO. Therefore, three lines of pixels must be stored in the DMA graphics FIFO.

The anti-aliasing equations for A, R, G, and B components are:

$$A_{out}(x,y) = 0.25 \times A_{in}(x,y - 1) + 0.5 \times A_{in}(x,y) + 0.25 \times A_{in}(x,y + 1)$$

$$R_{out}(x,y) = 0.25 \times R_{in}(x,y - 1) + 0.5 \times R_{in}(x,y) + 0.25 \times R_{in}(x,y + 1)$$

$$G_{out}(x,y) = 0.25 \times G_{in}(x,y - 1) + 0.5 \times G_{in}(x,y) + 0.25 \times G_{in}(x,y + 1)$$

$$B_{out}(x,y) = 0.25 \times B_{in}(x,y - 1) + 0.5 \times B_{in}(x,y) + 0.25 \times B_{in}(x,y + 1)$$

For the first line of processing, because there is no pixel above, the value (x,y) is duplicated.

$$Out(x,y) = 0.25 \times In(x,y) + 0.5 \times In(x,y) + 0.25 \times In(x,y + 1)$$

For the last line of processing, because there is no pixel below, the value (x,y) is duplicated.

$$Out(x,y) = 0.25 \times In(x,y-1) + 0.5 \times In(x,y) + 0.25 \times In(x,y)$$

NOTE: Anti-aliasing filtering is supported only in RGB formats and not in BITMAP formats.

Anti-aliasing is not supported for pictures with fewer than two lines. In this case, the user must disable the anti-aliasing processing.

By default, the anti-aliasing filtering is disabled. It can be enabled by setting the [DISPC_GFX1_ATTRIBUTES\[24\]](#) anti-aliasing bit to 0x1.

9.2.4.8.3 DISPC GFX Color Look-Up Table (CLUT)

The graphics pipeline supports conversion of BITMAP formats (1, 2, 4, or 8-bit indexed) into RGB24 format through a Color Look-Up Table (CLUT).

The look-up table consists of 3 separate 256 x 8-bit memories and is indexed by the source BITMAP data. The table is loaded through direct register access by writing to [DISPC_GFX1_CLUT](#) register.

The sequence to load the table is:

1. SW writes (only writes are supported) 32-bit values using single access, or burst access in linear increment burst mode, into [DISPC_GFX1_CLUT](#) register. The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table (see [Figure 9-27](#)).
2. Loop to Step 1, if there is a new access to the CLUT register. The SW can access other registers between two accesses to the CLUT register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

The usage of the CLUT is activated when a BITMAP format is selected in the [DISPC_GFX1_ATTRIBUTES\[6:1\]](#) FORMAT register bit-field.

Figure 9-27. DISPC GFX CLUT Data Memory Organization

9.2.4.9 DISPC Video Pipelines

Two identical video pipelines are available, VID1 and VID2. Each video pipeline is connected to the video DMA buffer controller for the input port, and to the overlay managers or WB pipeline. The pixel output is directed to the OVR1, OVR2 or WB path by configuring the [DISPC_VID_ATTRIBUTES\[16\]](#) CHANNELOUT register bit. [Table 9-41](#) summarizes the bit field settings to orient a pipeline to the OVR1, OVR2 or VP1 output. The default value directs all video pipelines to OVR1.

- NOTE:** It is not possible to change the direction of the video pipelines on the fly. If a video pipeline needs to be connected to a different overlay manager than what it is currently connected, then the following steps need to be performed:
1. Disable the VIDp pipeline by setting the `DISPC_VID_ATTRIBUTES[0]` ENABLE bit to 0x0.
 2. Direct the VIDp pipeline to the new overlay manager by modifying the [16] CHANNELOUT bit in the `DISPC_VID_ATTRIBUTES` register.
 3. Disable the DISPC output that corresponds with the overlay manager to which the VIDp pipeline will be connected next. This is done by setting the following bits to 0x0 for the listed outputs:
 - The `DISPC_VP1_CONTROL1[0]` VPENABLE bit for VP1 output
 4. Enable the VIDp pipeline by writing 0x1 to the `DISPC_VID_ATTRIBUTES [0]` ENABLE bit.
 5. Enable the DISPC output that corresponds with the overlay manager to which the VIDp pipeline will be connected next. This is done by setting the following bits to 0x1 for the listed outputs:
 - The `DISPC_VP1_CONTROL1[0]` VPENABLE bit for VP1 output

A video pipeline consists of a scaler unit, color space conversion (CSC) unit, VC-1 range mapping unit, one 256-entry Color Look-up Table (CLUT), and some programmable replication logic. The order of the video pipeline unit is configured like follows (see [Figure 9-28](#)):

- VC-1 range mapping unit, followed by a color look-up table, then a scaler unit and then a CSC unit. The configuration is used to support RGB, ARGB, and RGBA formats, YUV4:2:2 and YUV420-NV12 (NV21) formats, taking advantage of the scaler to resample the chrominance using five taps horizontally and three or five taps vertically. Each block can be independently bypassed. The 256-entry CLUT is used to convert BITMAP (1, 2, 4, or 8-bit indexed formats) into RGB format.

NOTE: For a BITMAP format data, scaling is not supported. Scaling and color look-up table features are mutually exclusive. If color look-up feature is enabled, then video pipeline scaler has to be disabled.

[Table 9-30](#) lists the input formats supported by the video pipelines.

The video pipeline is enabled by setting the `DISPC_VID_ATTRIBUTES[0]` ENABLE bit to 0x1.

Figure 9-28. DISPC Video Pipeline Configuration

9.2.4.9.1 DISPC VID Replication Logic

The replication logic (RGB expansion) is used to convert the ARGB pixels into ARGB48 format.

Table 9-32. DISPC VID Replication: ARGB Pixel Formats Remapping Into ARGB48-12121212

RGBA16-4444	A[3:0]A[3:0]A[3:0]	R[3:0]R[3:0]R[3:0]	G[3:0]G[3:0]G[3:0]	B[3:0]B[3:0]B[3:0]

9.2.4.9.2 DISPC VID VC-1 Range Mapping Unit

The VC-1 range mapping unit is used when the video frame picture is decoded using a VC-1 codec by the video accelerator. It remaps the Y, Cb, and Cr components. The unit is used primarily for YUV4:2:0-NV12 (NV21) pixel format, but also can be applied to YUV4:2:2 pixel formats (YUV2 and UYVY).

The VC-1 range mapping unit is enabled by setting the `DISPC_VID_ATTRIBUTES2[0]` VC1ENABLE bit to 0x1. The `DISPC_VID_ATTRIBUTES2[3:1]` VC1_RANGE_Y and `DISPC_VID_ATTRIBUTES2[6:4]` VC1_RANGE_CBCR bit fields are two 3-bit values programmed by the user and are independent for each video pipeline. The module is governed by the equations:

$$Y_{out} = CLIP((((Y_{int} - 128) \times (VC1_RANGE_Y + 9) + 4) / 8) + 128)$$

$$C_b = CLIP((((C_b - 128) \times (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)$$

$$C_r = CLIP((((C_r - 128) \times (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)$$

NOTE: The input and output pixel values are unsigned (Y, Cr, and Cb).

The function CLIP () clips to 0 or 255 when minimum or maximum, respectively, are reached; otherwise, the resulting output remains identical.

9.2.4.9.3 DISPC VID Color Look-Up Table (CLUT)

The video pipelines support conversion of BITMAP formats (1, 2, 4, or 8-bit indexed) into RGB24 format through a Color Look-Up Table (CLUT).

The look-up table consists of 3 separate 256 x 8-bit memories and is indexed by the source BITMAP data. The table is loaded through direct register access by writing to `DISPC_VID_CLUT` register.

The sequence to load the table is:

1. SW writes (only writes are supported) 32-bit values using single access, or burst access in linear increment burst mode, into `DISPC_VID_CLUT` register. The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table (see [Figure 9-29](#)).
2. Loop to Step 1, if there is a new access to the CLUT register. The SW can access other registers between two accesses to the CLUT register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

The usage of the CLUT is activated when a BITMAP format is selected in the `DISPC_VID_ATTRIBUTES[6:1]` FORMAT register bit-field.

Figure 9-29. DISPC VID CLUT Data Memory Organization

9.2.4.9.4 DISPC VID CSC Unit YUV to RGB

The CSC unit converts the video-encoded pixel values from YUV4:4:4 format into RGB36 format (12-bit value per color component: red, green, and blue).

In case of YUV4:2:0 or YUV4:2:2 formats, a chrominance resampling to YUV4:4:4 is required before converting the YUV into RGB values (see [Section 9.2.4.9.4.1, Chrominance Resampling](#)). YUV4:2:2 or YUV4:2:0 to YUV4:4:4 chrominance resampling is a preprocessing to the color space conversion.

[Figure 9-30](#) through [Figure 9-31](#) show the 3 × 3 11-bit coefficients used to convert from YUV4:4:4 into RGB36. The coefficients are set according to the standard used to encode the pixel data in YUV color space. [Table 9-33](#) summarizes the coefficients with their respective register bit fields.

Table 9-33. DISPC VID Color Space Conversion YUV to RGB Register Bitfield Settings

Coefficients	Bit Field Registers
R _Y	DISPC_VID_CONV_COEF0[10:0] RY
R _{Cr}	DISPC_VID_CONV_COEF0[26:16] RCR
R _{Cb}	DISPC_VID_CONV_COEF1[10:0] RCB
G _Y	DISPC_VID_CONV_COEF1[26:16] GY
G _{Cr}	DISPC_VID_CONV_COEF2[10:0] GCR
G _{Cb}	DISPC_VID_CONV_COEF2[26:16] GCB
B _Y	DISPC_VID_CONV_COEF3[10:0] BY
B _{Cr}	DISPC_VID_CONV_COEF3[26:16] BCR
B _{Cb}	DISPC_VID_CONV_COEF4[10:0] BCB
G offset	DISPC_VID_CONV_COEF5[31:19] GOFFSET
R offset	DISPC_VID_CONV_COEF5[15:3] ROFFSET
B offset	DISPC_VID_CONV_COEF6[15:3] BOFFSET

If the active range for the luminance samples (Y) is [256:3760] and [256:3840] for the chrominance samples (Cb and Cr), the range selection is done by setting the [DISPC_VID_ATTRIBUTES\[11\] FULLRANGE](#) bit to 0x0. The values of R, G, and B output components are clipped to the range [0:4095].

NOTE: The scaling and CSC clipping is set by the same bit, [DISPC_VID_ATTRIBUTES\[11\] FULLRANGE](#).

Figure 9-30. DISPC VID YCbCr to RGB Registers (FULLRANGE = 0), 12-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 256 \\ Cr_{IN} - 2048 \\ Cb_{IN} - 2048 \end{bmatrix}$$

dispc-005

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:4095], the range selection is done by setting the [DISPC_VID_ATTRIBUTES\[11\] FULLRANGE](#) bit to 0x1. The values of R, G, and B output components are clipped to the range [0:4095].

Figure 9-31. DISPC VID YCbCr to RGB Registers (FULLRANGE = 1), 12-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 2048 \\ Cb_{IN} - 2048 \end{bmatrix}$$

dispc-006

9.2.4.9.4.1 DISPC VID Chrominance Resampling

The chrominance resampling is always performed using filtering (the scaler unit filter). Chrominance resampling and rescaling can be combined to support native rescaling of YUV format.

The usage of the scaler unit for resampling the chrominance of YUV4:2:0 and YUV4:2:2 is shown in Figure 9-32 and Figure 9-33, respectively. The settings of the scaler unit to perform chrominance resampling are described in Section 9.2.4.9.5, *DISPC Scaler Unit*.

Figure 9-32. DISPC VID YUV4:2:0 to RGB36 Using Scaler Unit for Resampling Chrominance

Figure 9-33. DISPC VID YUV4:2:2 to RGB36 Using Scaler Unit for Resampling Chrominance

9.2.4.9.5 DISPC VID Scaler Unit

All video formats are supported, including formats with alpha blending. Alpha blending is scaled with the same parameters as RGB color components. For the YUV formats, Y and Cb/Cr are processed independently. The filter is based on a finite impulse response (FIR) filter with 16 phases. The filter is a 5-tap for horizontal filtering, and can be configured for 3 or 5 taps for vertical filtering. The filtering can be used for different processing:

- Upsampling of the picture
- Downsampling of the picture
- Anti-aliasing reduction
- Chrominance resampling in case of YUV data formats

NOTE: The user must ensure that the resizing frame displays in the screen boundaries.

Figure 9-34 shows an example of video upsampling.

Figure 9-34. DISPC Video Upsampling

The upsampling/downsampling filter is a polyphase filter with 5 taps and 16 phases for the horizontal filter, and a programmable number of taps (3 or 5) and 16 phases for the vertical filter. The input buffer has six input memory lines. The following limitations must be considered:

- The upsampling ratio is up to x16.
- The downsampling ratio using 3-tap configuration is down to x0.5 for RGB format.
- The downsampling ratio using 5-tap configuration is down to x0.25 for RGB format.
- If the input format is changed from YUV4:2:2 to YUV4:2:0 (WB pipeline), the downsampling ratio is further reduced:
 - Using 5-tap configuration, the ratio is down to x0.5 for RGB format.
 - Using 3-tap configuration, no downscaling is available.
- Scaling capability of VID pipelines and WB pipeline can be combined to double the maximum rescaling factor.

For vertical upsampling and downsampling in a 3-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi) * A_{in}(n+i)) \gg 7$	$Y_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi_y) * Y_{in}(n+i)) \gg 7$
$R_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi) * R_{in}(n+i)) \gg 7$	$Cr_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\phi_c) * Cb_{in}(n+i)) \gg 7$
$G_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi) * G_{in}(n+i)) \gg 7$	$Cb_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\phi_c) * Cr_{in}(n+i)) \gg 7$
$B_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\phi) * B_{in}(n+i)) \gg 7$	

dispc-013

(9)

For vertical upsampling and downsampling in a 5-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi) * A_{in}(n+i) \right) \gg 7$ $R_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi) * R_{in}(n+i) \right) \gg 7$ $G_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi) * G_{in}(n+i) \right) \gg 7$ $B_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi) * B_{in}(n+i) \right) \gg 7$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vi}(\Phi_y) * Y_{in}(n+i) \right) \gg 7$ $Cb_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cb_{in}(n+i) \right) \gg 7$ $Cr_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cr_{in}(n+i) \right) \gg 7$
--	---

dispc-012 (10)

For horizontal upsampling and downsampling in a 5-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * A_{in}(n+i) \right) \gg 7$ $R_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * R_{in}(n+i) \right) \gg 7$ $G_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * G_{in}(n+i) \right) \gg 7$ $B_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * B_{in}(n+i) \right) \gg 7$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi_y) * Y_{in}(n+i) \right) \gg 7$ $Cb_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hci}(\Phi_c) * Cb_{in}(n+i) \right) \gg 7$ $Cr_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hci}(\Phi_c) * Cr_{in}(n+i) \right) \gg 7$
--	---

dispc-014 (11)

NOTE: The pixel (n + 1) is the previous pixel with respect to pixel (n). The line (n + 1) is the previous line with respect to line (n).

The coefficients Ci() depend on the phase between input and output pixels.

NOTE: The coefficients are different for Y and Cr, Cb filtering because the calculations are independent due to the chrominance resampling for YUV4:2:2 and YUV4:2:0.

First, the vertical filter is applied to the encoded input pixel data, and then the horizontal filter is applied on the resulting pixel values to generate the output pixel values. The vertical input of the filter consists of six lines of 1280 × 32 bits for 5-tap configurations (see [Table 9-34](#)). In case of 3-tap configuration, the scaler input width capability is extended to 2560 pixels wide.

Table 9-34. DISPC VID Line Buffer Width for Scaler Unit

Vertical Taps	Maximum Input Width (Pixels)
3	2560
5	1280 ⁽¹⁾

⁽¹⁾ For the 5-tap configuration, the 6th video line is used on the output of the horizontal scaler, so that horizontal down-scaling can be supported with a minimum clock ratio equal to 1. The maximum output width is limited to 1280 pixels in order to be able to support clock ratio of 1 due to the 6th video line buffer.

At the beginning of frame scaling processing, the first line may be duplicated multiple times depending on the initial vertical phase programmed for the poly-phase filter.

At the end of frame scaling processing, the last line is duplicated if the scaling logic requires loading more lines and the last line has been reached.

Similarly, the first pixel may be duplicated multiple times depending on the initial horizontal phase programmed for the poly-phase filter. The last pixel is duplicated if the scaling logic requires loading more pixels and the last pixel has been reached.

The programmable coefficients of the polyphase filters are signed 10-bit values (except for the central coefficient, which is unsigned). The vertical video scaler has an 8-bit input and a 10-bit output. The vertical scaling changes the 8-bit input into a 10-bit clipped output, and the horizontal scaling takes the 10-bit input.

Figure 9-35 and Figure 9-36 show the scaler macro-architecture for the component A, R, G, B, and Y. Figure 9-37 and Figure 9-38 show the scaler macro-architecture for component Cr and Cb.

NOTE: The scaling and CSC clipping is set by the same bit, `DISPC_VID_ATTRIBUTES[11]` FULLRANGE.

NOTE: The table cells without color are duplicated from the grey cells.

Similar table approach applies to the vertical scaler (registers [DISPC_VID_FIR_COEF_V0_i](#) and [DISPC_VID_FIR_COEF_V12_k](#) are used).

Similar table approach applies to the coefficients for CbCr filtering in case of YUV format (registers [DISPC_VID_FIR_COEF_H0_C_i](#) and [DISPC_VID_FIR_COEF_H12_C_k](#), and [DISPC_VID_FIR_COEF_V0_C_i](#) and [DISPC_VID_FIR_COEF_V12_C_k](#)).

The VID scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC_VID_ATTRIBUTES\[8:7\]](#) RESIZEENABLE bit field.

A set of configurations must be valid before enabling the video upsampling and downsampling block.

The following fields define the configuration of the video upsampling downsampling block for VID pipelines:

- Vertical upsampling and downsampling increments the value of the [23:0] FIRVINC bit field in [DISPC_VID_FIRV](#) and [DISPC_VID_FIRV2](#) registers. The unsigned integer value range is 2^{23} . Software calculates the value using the following equation:

$$FIRVINC = 2^{21} * \left(\frac{MEMSIZEY+1}{SIZEY+1} \right)$$

dispc-066

(12)

- Horizontal upsampling and downsampling increments the value of the the [23:0] FIRHINC bit field in the [DISPC_VID_FIRH](#) and [DISPC_VID_FIRH2](#) registers. The unsigned integer value range is 2^{23} . Software calculates the value using the following equation:

$$FIRHINC = 2^{21} * \left(\frac{MEMSIZEH+1}{SIZEH+1} \right)$$

dispc-067

(13)

- Vertical up/downsampling accumulator value, [23:0] VERTICALACCU bit field in [DISPC_VID_ACCUV_j](#) and [DISPC_VID_ACCUV2_j](#) registers: The accumulator value indicates on which phase the vertical filtering starts. The register [DISPC_VID_ACCUV_0](#) is used for progressive output, and for interlace output [DISPC_VID_ACCUV_0](#) and [DISPC_VID_ACCUV_1](#) registers are used. Similarly, [DISPC_VID_ACCUV2_0](#) and [DISPC_VID_ACCUV2_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
- Vertical upsampling and downsampling line buffer configuration [DISPC_VID_ATTRIBUTES\[21\]](#)

VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.

- Horizontal upsampling and downsampling accumulator value, [23:0] HORIZONTALACCU bit field in [DISPC_VID_ACCUH_j](#) and [DISPC_VID_ACCUH2_j](#) registers: The accumulator value indicates on which phase the horizontal filtering starts. The register [DISPC_VID_ACCUH_0](#) is used for progressive output, and for interlace output the [DISPC_VID_ACCUH_0](#) and [DISPC_VID_ACCUH_1](#) registers are used. Similarly, [DISPC_VID_ACCUH2_0](#) and [DISPC_VID_ACCUH2_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.

[Table 9-36](#) lists the DISPC vertical and horizontal accumulator values and phases.

Table 9-36. DISPC VID Vertical and Horizontal Accumulator Phases

Accumulator Value (MSB bits)	Phases f
0	0
256 or -3840	1
512 or -3584	2
768 or -3328	3
1024 or -3072	4
1280 or -2816	5
1536 or -2560	6
1792 or -2304	7
2048 or -2048	8
2304 or -1792	9
2560 or -1536	10
2816 or -1280	11
3072 or -1024	12
3328 or -768	13
3584 or -512	14
3840 or -256	15

- Vertical upsampling and downsampling central coefficients:
 - The vertical upsampling and downsampling central coefficients are defined in the [DISPC_VID_FIR_COEF_V0_i](#) registers. There are 9 registers for the 16 phases with 1 coefficient for each of them. Symmetrical implementation is used, so only 9 coefficients are used. Each register contains one 10-bit unsigned coefficient (the central one).
 - Four YUV, the vertical upsampling and downsampling central coefficients are set in [DISPC_VID_FIR_COEF_V0_C_i](#) registers.
- Vertical upsampling and downsampling coefficients:
 - The vertical upsampling and downsampling coefficients are defined in the [DISPC_VID_FIR_COEF_V12_k](#) registers. There are 16 registers for the 16 phases with 2 coefficient for each of them, so a total of 32 programmable coefficients for the vertical up/down-sampling block. Each register contains two 10-bit signed coefficients.
 - Four YUV, the vertical upsampling and downsampling coefficients are set in [DISPC_VID_FIR_COEF_V12_C_k](#) registers.
- Horizontal upsampling and downsampling central coefficients:
 - The horizontal upsampling and downsampling central coefficients are defined in the [DISPC_VID_FIR_COEF_H0_i](#) registers. There are 9 registers for the 16 phases with 1 coefficient for each of them. Symmetrical implementation is used, so only 9 coefficients are used. Each register contains one 10-bit unsigned coefficient (the central one).
 - Four YUV, the horizontal upsampling and downsampling central coefficients are set in [DISPC_VID_FIR_COEF_H0_C_i](#) registers.
- Horizontal upsampling and downsampling coefficients:

- The horizontal upsampling and downsampling coefficients are defined in the [DISPC_VID_FIR_COEF_H12_k](#) registers. There are 16 registers for the 16 phases with 2 coefficient for each of them, so a total of 32 programmable coefficients for the horizontal up/down-sampling block. Each register contains two 10-bit signed coefficients.
- Four YUV, the horizontal upsampling and downsampling coefficients are set in [DISPC_VID_FIR_COEF_H12_C_k](#) registers.

9.2.4.9.5.1 DISPC Scaling Algorithms

Figure 9-39 and Figure 9-40 show details of the vertical and horizontal upsampling and downsampling finite state-machines (FSMs), respectively.

dispc-086

Figure 9-40 shows the horizontal up/downsampling FSM.

Figure 9-40. DISPC Horizontal Up/Downsampling Algorithm

- 1: New pixel (no pixel to load)
- 2: New pixel (pixel(s) to load)
- 3: End of line
- 4: Restart of a line

INIT	Initialization of buffer with duplication, accu value reset with register value based on the field polarity if present
Phase calculation	Phase = accu[20:17]
Number of line(s) to load	Number of element(s) = $((\text{accu} + 2^{20} + \text{inc}) \gg 21) - ((\text{accu} + 2^{20}) \gg 21)$
FIR calculation	$R_{out}(n) = \left(\sum_{i=-p}^{i=p} C_i(\phi) * R_{in}(n+i) \right) \gg 7$
Accumulator calculation	Accu = accu + inc

dispc-087

9.2.4.9.6 DISPC VID Progressive to Interlace conversion

It is possible, in case of YUV420 format, to fetch only one out of two lines of the Y buffer and fetch all the CbCr lines in order to read a field (even lines, if the base address of the Y buffer points to an even line and odd lines, if it points to an odd line) from a YUV420 frame buffers (Y and CrCr buffers). The register configuration required is as follows:

- [DISPC_VID_ATTRIBUTES\[6:1\] FORMAT = 0x3D](#) (YUV420 NV12/NV21 format)
- [DISPC_VID_BA_j\[31\]](#) and [DISPC_VID_BA_UV_j\[31\]](#) = 0x0
- [DISPC_VID_ATTRIBUTES\[22\] DOUBLESTRIDE = 0x0](#)

9.2.4.10 DISPC Write-Back Pipeline

The write-back pipeline is used to store in the system memory the capture of one of the overlay outputs, or the output of one of the pipelines. The WB pipeline consists of a CSC unit, a scaler unit, and an RGB truncation logic. Because the overlay works on ARGB48 format and the video accelerator works on YUV format, the color space conversion from RGB to YUV is used to directly output to memory the format that can be encoded with no extra processing.

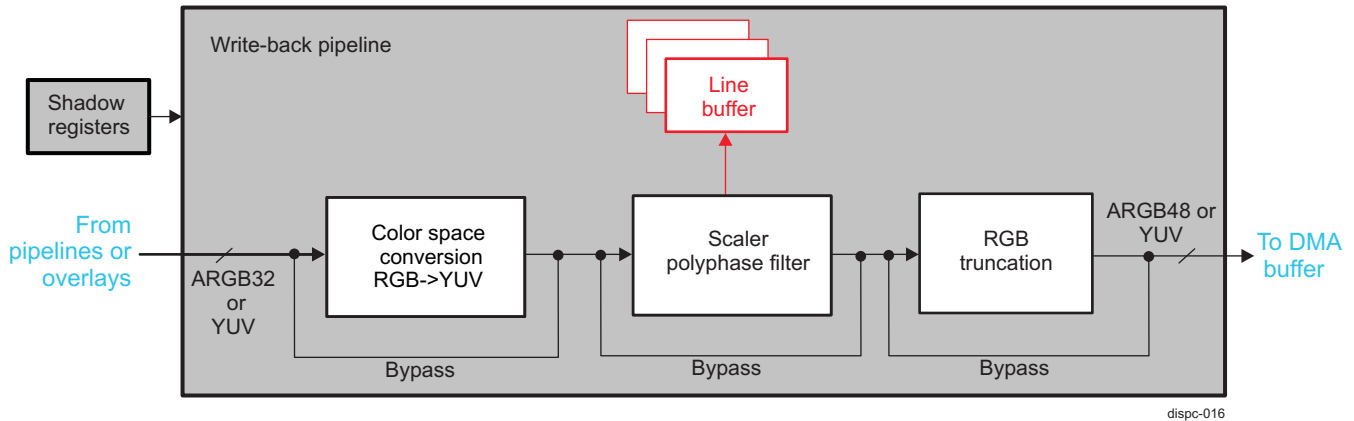

The write-back pipeline is connected to either one of the pipeline outputs (GFX, VID1 or VID2), or to one of the outputs of the overlay managers (OVR1 or OVR2). The input is selected by setting the [DISPC_WB_ATTRIBUTES\[18:15\] CHANNELIN](#) bit field, and the capture frame rate is set in the [DISPC_WB_ATTRIBUTES\[26:24\] CAPTUREMODE](#) bit field.

The output format of the overlay managers is ARGB48-12121212. The graphics pipeline output is ARGB48. The video pipeline outputs are YUV4:2:2, YUV4:2:0, or ARGB48.

The WB pipeline is enabled by setting the [DISPC_WB_ATTRIBUTES\[0\] ENABLE](#) bit to 0x1.

Figure 9-41 shows the WB pipeline.

Figure 9-41. DISPC Write-Back Pipeline

9.2.4.10.1 DISPC WB CSC Unit RGB to YUV

The RGB-to-YUV CSC unit converts the encoded pixel values from RGB24 into YUV4:4:4 format. For YUV4:2:0 or YUV4:2:2 formats, a chrominance sub-sampling is required after converting the RGB into YUV values. Because of the subsampling, the following limitations must be considered:

- When converting RGB into YUV4:2:0 NV12 (NV21) format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.5
- When converting RGB into YUV4:2:2 format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.25

Figure 9-42 and Figure 9-43 show the 3 × 3 11-bit coefficients used to convert from RGB24 into YUV4:4:4. The user sets the coefficients according to the standard used to encode the pixel data in YUV color space. Table 9-37 lists the coefficients with their respective bit fields.

Table 9-37. DISPC WB CSC RGB to YUV Bit Field Setting

Coefficients	Bit Fields
Y _R	DISPC_WB_CONV_COEF0[10:0] YR
Y _G	DISPC_WB_CONV_COEF0[26:16] YG
Y _B	DISPC_WB_CONV_COEF1[10:0] YB
Cr _R	DISPC_WB_CONV_COEF1[26:16] CRR
Cr _G	DISPC_WB_CONV_COEF2[10:0] CRG
Cr _B	DISPC_WB_CONV_COEF2[26:16] CRB
Cb _R	DISPC_WB_CONV_COEF3[10:0] CBR
Cb _G	DISPC_WB_CONV_COEF3[26:16] CBG
Cb _B	DISPC_WB_CONV_COEF4[10:0] CBB
G offset	DISPC_WB_CONV_COEF5[31:19] GOFFSET
R offset	DISPC_WB_CONV_COEF5[15:3] ROFFSET
B offset	DISPC_WB_CONV_COEF6[15:3] BOFFSET

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the `DISPC_WB_ATTRIBUTES[12]` FULLRANGE bit to 0x0.

Figure 9-42. DISPC WB RGB to YCbCr (FULLRANGE = 0)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 256 \\ 2048 \\ 2048 \end{bmatrix}$$

dispc-017

If the active range for the luminance samples (Y) and or the chrominance samples (Cb and Cr) is [0:255], the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the `DISPC_WB_ATTRIBUTES[12]` FULLRANGE bit to 0x1.

Figure 9-43. DISPC WB RGB to YCbCr (FULLRANGE = 1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 0 \\ 2048 \\ 2048 \end{bmatrix}$$

dispc-018

9.2.4.10.2 DISPC WB Scaler Unit

The functional aspect of the WB pipeline scaler unit is identical to the video pipeline scaler unit (see [Section 9.2.4.9.5, DISPC VID Scaler Unit](#)), except in the output width when scaling ARGB components. The resulting output format is ARGB32 instead of ARGB48.

The programmable coefficients of the polyphase filters are signed 10-bit values (except for the central coefficient, which is unsigned). The WB scaler component has an 8-bit input and an 8-bit output.

[Figure 9-44](#) and [Figure 9-45](#) show the scaler macro-architecture for the component A, R, G, B, and Y. [Figure 9-46](#) and [Figure 9-47](#) show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:255] or [16:240] by configuring the `DISPC_WB_ATTRIBUTES[12]` FULLRANGE bit.

NOTE: The Table 9-38 cells without color are duplicated from the grey cells.

Similar table approach applies to the vertical scaler (registers [DISPC_WB_FIR_COEF_V0_i](#) and [DISPC_WB_FIR_COEF_V12_k](#)).

Similar table approach applies to the coefficients for CbCr filtering in case of YUV format (registers [DISPC_WB_FIR_COEF_H0_C_i](#) and [DISPC_WB_FIR_COEF_H12_C_k](#), and [DISPC_WB_FIR_COEF_V0_C_i](#) and [DISPC_WB_FIR_COEF_V12_C_k](#)).

The WB scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC_WB_ATTRIBUTES](#)[8:7] RESIZEENABLE bit field.

A set of configuration must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for WB:

- Vertical up/downsampling increments the value of [23:0] FIRVINC bitfield in the [DISPC_WB_FIRV](#) and [DISPC_WB_FIRV2](#) registers. The unsigned integer value range is $[1:2^{23}]$. Software calculates the value using the following equation:

$$FIRVINC = 2^{21} * \left(\frac{SIZEY+1}{MEMSIZEY+1} \right)$$

dispc-066wb

(14)

- Horizontal up/downsampling increments the value of the [23:0] FIRHINC bit field in the [DISPC_WB_FIRH](#) and [DISPC_WB_FIRH2](#) registers. The unsigned integer value range is [1:2²³]. Software calculates the value using the following equation:

$$FIRHINC = 2^{21} * \left(\frac{SIZEX+1}{MEMSIZEX+1} \right)$$

dispc-067wb

(15)

- Vertical up/downsampling accumulator value, [23:0] VERTICALACCU bit field in [DISPC_WB_ACCUV_j](#) and [DISPC_WB_ACCUV2_j](#) registers. The accumulator value indicates on which phase the vertical filtering starts. The register [DISPC_WB_ACCUV_0](#) is used for progressive output, and for interlace output the [DISPC_WB_ACCUV_0](#) and [DISPC_WB_ACCUV_1](#) registers are used. Similarly, [DISPC_WB_ACCUV2_0](#) and [DISPC_WB_ACCUV2_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
- Vertical up/downsampling line buffer configuration [DISPC_WB_ATTRIBUTES](#)[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
- Horizontal up/downsampling accumulator value, [23:0] HORIZONTALACCU bit field in [DISPC_WB_ACCUH_j](#) and [DISPC_WB_ACCUH2_j](#) registers. The accumulator value indicates on which phase the horizontal filtering starts. The register [DISPC_WB_ACCUH_0](#) is used for progressive output, and for interlace output the [DISPC_WB_ACCUH_0](#) and [DISPC_WB_ACCUH_1](#) registers are used. Similarly, [DISPC_WB_ACCUH2_0](#) and [DISPC_WB_ACCUH2_1](#) are used in progressive or interlace output to set the accumulator value of Cb and Cr components when scaling YUV format.

[Table 9-39](#) lists the DISPC WB vertical and horizontal accumulator values and phases.

Table 9-39. DISPC WB Vertical/Horizontal Accumulator Phase

Accumulator Value (MSB bits)	Phases f

3840 or -256	15

- Vertical up/downsampling coefficients:
 - The vertical up/downsampling central coefficients are defined in the [DISPC_WB_FIR_COEF_V0_j](#) registers. There are 9 registers for the 16 phases with 1 coefficient for each of them. Symmetrical implementation is used, so only 9 coefficients are required. Each register contains 10-bit unsigned coefficient (the central one).
 - The vertical up/downsampling coefficients are defined in the [DISPC_WB_FIR_COEF_V12_k](#)

registers. There are 16 registers for the 16 phases with 2 coefficients for each of them, so a total of 32 programmable coefficients for the vertical up/downsampling block are used. Each register contains two 10-bit signed coefficients.

Four YUV, the vertical up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_V0_C_i](#) and [DISPC_WB_FIR_COEF_V12_C_k](#) registers. [Table 9-38](#) summarizes all coefficients and their respective registers.

- Horizontal up/downsampling coefficients:
 - The horizontal up/downsampling central coefficients are defined in the [DISPC_WB_FIR_COEF_H0_i](#) registers. There are 9 registers for the 16 phases with 1 coefficient for each of them. Symmetrical implementation is used, so only 9 coefficients are required. Each register contains 10-bit unsigned coefficient (the central one).
 - The vertical up/downsampling coefficients are defined in the [DISPC_WB_FIR_COEF_H12_k](#) registers. There are 16 registers for the 16 phases with 2 coefficients for each of them, so a total of 32 programmable coefficients for the vertical up/downsampling block are used. Each register contains two 10-bit signed coefficients.

Four YUV horizontal up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_H0_C_i](#) and [DISPC_WB_FIR_COEF_H12_C_k](#) registers. [Table 9-38](#) summarizes all coefficients and their respective registers.

9.2.4.10.3 DISPC WB RGB Truncation Logic

Truncation logic is used to convert a pixel from ARGB 32-bit format into a lower color depth: 12- or 16-bit format based. The truncation is done by removing the necessary LSB of each component to match the output format.

NOTE: If there is no alpha field in the pixel format description, 0s are used. For example, in RGB12 pixel format, the upper 4 bits are set to 0s because the RGB value is only 12 bits inside a 16-bit container.

9.2.4.11 DISPC Region-Based Mechanism

9.2.4.11.1 Region-Based Mechanism Overview

The region-based mechanism is used in order to display multiple windows using the same layer. The layer can be graphics layer or a video layer. The reconfiguration of a pipeline is performed based on the different region-based interrupts (see [Section 9.2.4.4, DISPC Interrupt Requests](#)). When all the pixels for the current window have been output, then the pipeline uses the new configuration provided through the shadow registers in order to display the new window re-using the same layer.

It is possible to display unlimited number of windows on the screen using same layer considering the following restriction: only one window horizontally per layer at a given time.

In order to enable the feature, the SW needs to set to 0x1 the [24] [REGION_BASED](#) bit within [DISPC_GFX1_ATTRIBUTES2](#), [DISPC_VID_ATTRIBUTES2](#) or [DISPC_WB_ATTRIBUTES2](#) registers.

For the WB pipeline, an additional register [DISPC_WB_REGION_BASED_TOTAL_PICTURE_SIZEY](#), defining the total SIZEY value (total number of lines) of all the windows written back to the memory, needs to be programmed when the Region-based mechanism is enabled for the WB pipeline.

9.2.4.11.2 Region-Based Mechanism for a Single Region Write-Back

A typical use-case for the Region-Based Mechanism in the Write-Back pipeline is to capture one single region at a time per frame, while doing write-back in capture mode. This allows writing back only the region of interest from the entire frame displayed, thereby reducing the write-back bandwidth compared to when the whole frame is written back in a non region-based mode.

In a generic write-back region-based mechanism multiple regions are captured per frame. The last region to capture in a frame is indicated to the HW by resetting the [DISPC_WB_ATTRIBUTES2\[24\] REGION_BASED](#) bit. Due to this, when only a single region capture is needed, a specific programming sequence needs to be followed, which is described in [Table 9-40, DISPC Write-Back Region-Based Configuration Steps](#).

[Table 9-40](#) summarizes the configuration steps when the region-based mechanism for a single region is enabled for the WB pipeline.

Table 9-40. DISPC Write-Back Region-Based Configuration Steps

Step	Register/Bit-Field	Value
Initial programming (the very first frame)		
Enable the regional-based feature for WB pipeline.	DISPC_WB_ATTRIBUTES2[24] REGION_BASED	0x1
Configure the attributes of the region.	DISPC_WB_POSITION DISPC_WB_SIZE DISPC_WB_PICTURE_SIZE	- - -
Configure the total number of lines to be captured in the frame to be same as the number of lines in the region DISPC_WB_REGION_BASED_TOTAL_PICTURE_SIZEY .	DISPC_WB_REGION_BASED_TOTAL_PICTURE_SIZEY = DISPC_WB_PICTURE_SIZE[27:16] MEMSIZEY	-
Configure all other shadow registers, associated with the use case.		
Enable WBREGIONBASEDEVENT_IRQ.	DISPC_WB_IRQENABLE[3] WBREGIONBASEDEVENT_EN	0x1
Enable WBSYNC_IRQ.	DISPC_WB_IRQENABLE[4] WBSYNC_EN	0x1
Enable the Video Port (VP1) output.	DISPC_VP1_CONTROL[0] VPENABLE	0x1
Wait for the GOBIT bit to get reset by HW.	DISPC_VP1_CONTROL[5] GOBIT	0x0
From here on the region-based feature is active and will trigger both WBREGIONBASEDEVENT_IRQ and WBSYNC_IRQ every frame until the feature is completely disabled.		
The following actions need to be taken by SW in WBSYNC_IRQ and WBREGIONBASEDEVENT_IRQ routines every time those interrupts are triggered, until region-based feature is disabled.		
In WBSYNC_IRQ routine, reset the regional-based bit.	DISPC_WB_ATTRIBUTES2[24] REGION_BASED	0x0
In WBREGIONBASEDEVENT_IRQ routine, set the region-based bit.	DISPC_WB_ATTRIBUTES2[24] REGION_BASED	0x1
If the attributes of the region to be captured during next frame (position, size, base address) are different than the current region, then the corresponding changes must be applied to WB registers.		

9.2.4.12 DISPC Overlay Managers

DISPC implements two identical Overlay Managers (see [Figure 9-24, DISPC Architecture Overview](#)):

- OVR1, with output assigned to the Video Port (VP1).
- OVR2, with output assigned to the WB pipeline.

The overlay mechanism consists of displaying more than one layer (GFX, VID1 or VID2 pipeline layers) using:

- A priority rule based on a Z-order: Application can set the ordering layer of the frames.
- Transparency color keys: Destination and source transparency color keys can be set.
- Alpha blending values: Using the A component of a pixel or a blending set by the user for a layer, a level of transparency can be determined.

All pipelines (GFX, VID1 and VID2) can be assigned to one of the overlay managers (OVR1 or OVR2), or directly to the WB pipeline. The overlay managers can be connected to all pipeline outputs simultaneously. The GFX pipeline output is directed using the [DISPC_GFX1_ATTRIBUTES\[10:8\] CHANNELOUT](#) bitfield, while the VID1 and VID2 pipeline outputs are directed using the [DISPC_VID_ATTRIBUTES\[16:14\] CHANNELOUT](#) bit fields. [Table 9-41](#) summarizes the bit field settings to direct a pipeline to the OVR1, OVR2 or WB. The default register value directs all pipelines to OVR1.

Table 9-41. DISPC Pipeline Connection to VP1 or WB Output

Overlay Manager/Output	DISPC_GFX1_ATTRIBUTES	DISPC_VID_ATTRIBUTES
	[10:8] CHANNELOUT Bitfield	[16:14] CHANNELOUT Bitfield
OVR1/VP1	0x0	0x0
OVR2	0x1	0x1
WB	0x4	0x4

The output of OVR1 is connected to VP1 Color Phase Rotation (CPR) unit through the Gamma table.

NOTE:

- When the pixel format is ARGB or RGBA, the color key match logic uses only the RGB value defined by ARGB or RGBA. The alpha blending factor is ignored.

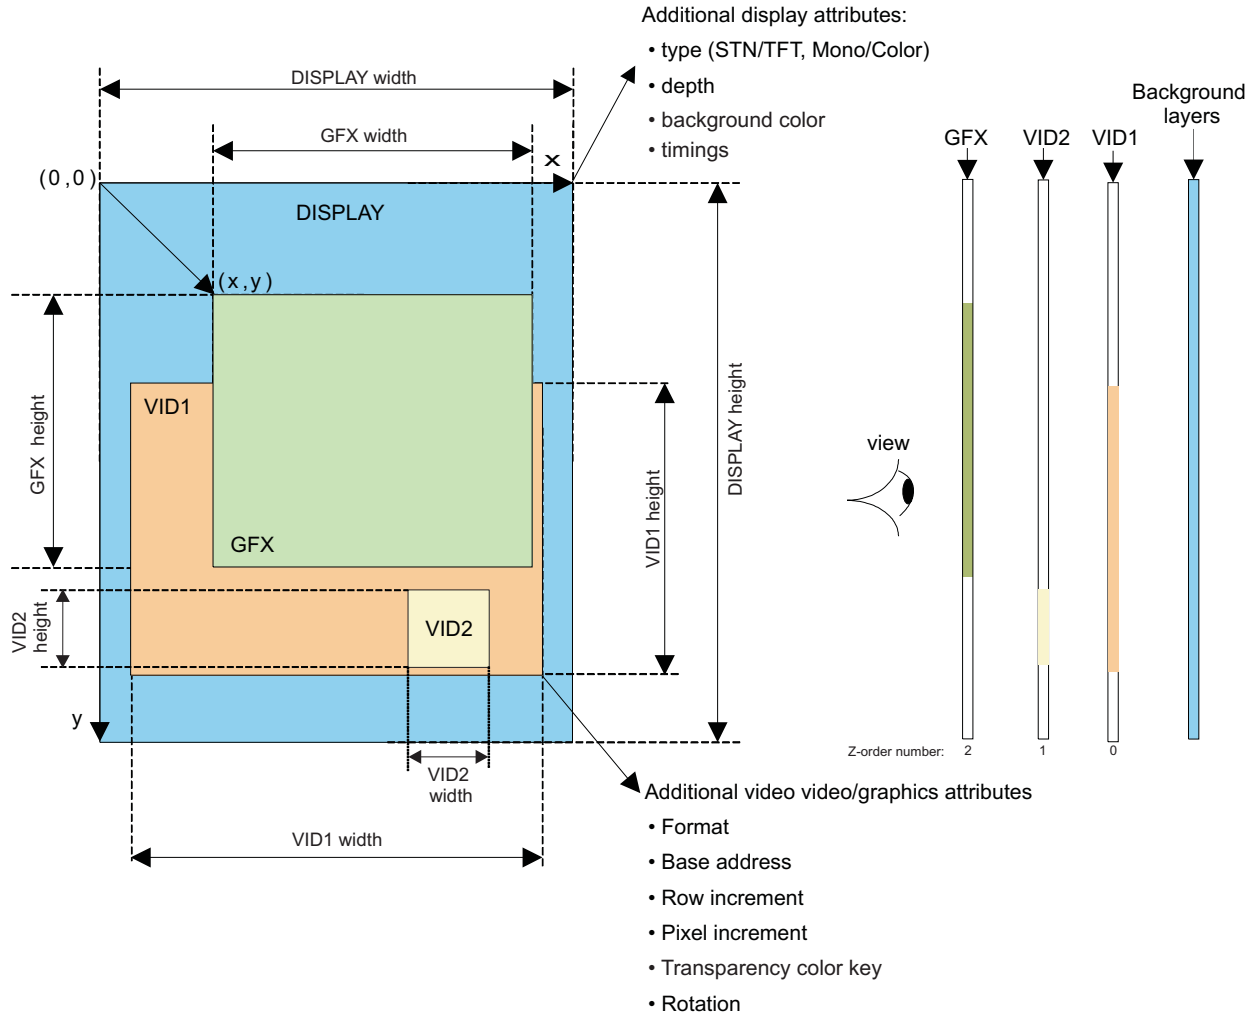

9.2.4.12.1 DISPC Overlay Priority Rule

The overlay manager is configured using the Z-order parameter. The Z-order value defined for each pipeline indicates the visibility order to the window on the screen. If the Z-order value of window A is lower than the Z-order to layer B, layer A is displayed below layer B. The transparency color keys and the alpha blending factors are then used to blend the layers together (see [Section 9.2.4.12.2, DISPC Alpha Blender](#), and [Section 9.2.4.12.3, DISPC Transparency Color Keys](#)). The Z-order for each pipeline is defined in the [DISPC_GFX1_ATTRIBUTES\[27:25\] ZORDER](#) and [DISPC_VID_ATTRIBUTES\[27:25\] ZORDER](#) register bit fields. Each ZORDER bit-field setting must be different for each active pipeline. It is not possible to use the same value for more than one pipeline.

The height and width of each enabled layer (pipeline) must be defined in the [11:0] SIZEX and [27:16] SIZEY bit fields of [DISPC_GFX1_SIZE](#) and [DISPC_VID_SIZE](#) registers. The x and y positions of each layer must be defined in the [11:0] POSX and [27:16] POSY bit fields of [DISPC_GFX1_POSITION](#) and [DISPC_VID_POSITION](#) registers. If there are no graphics or video-encoded pixels at a specific position, the programmable, solid background color appears. The solid background color is set in the [DISPC_OVR_DEFAULT_COLOR](#) register. [Figure 9-48](#) is an example of priority rule.

The Z-order reordering block must always map the pipelines to the blender logic in the same order - from background to foreground.

Figure 9-48. DISPC Overlay Example of Priority Rule: From Lower to Higher VID1, VID2, GFX

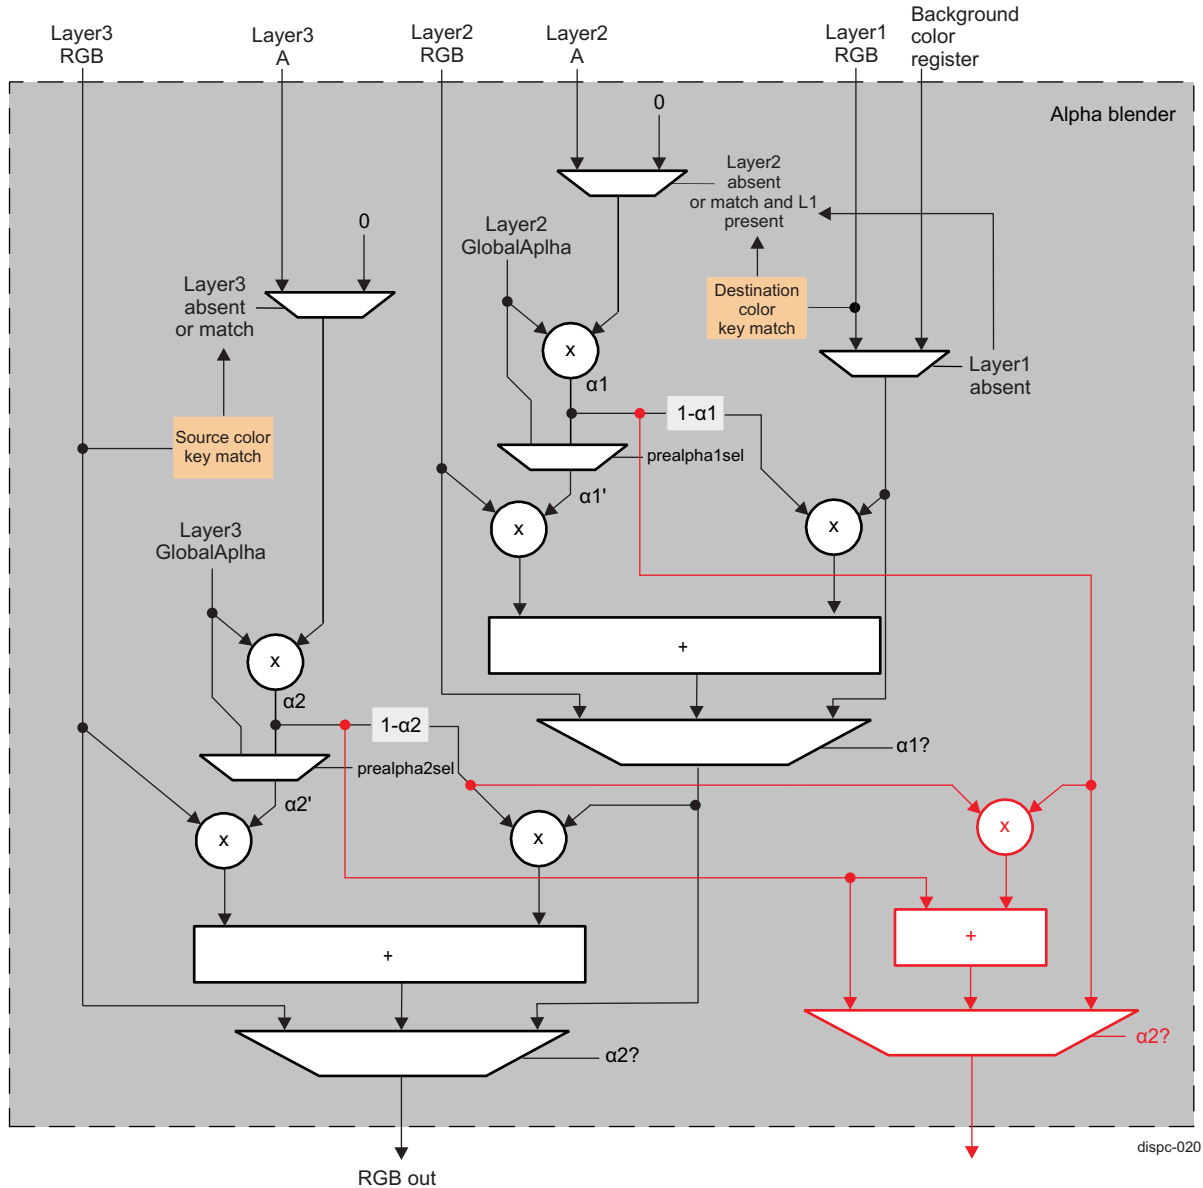

dispc-019

9.2.4.12.2 DISPC Overlay Alpha Blender

Figure 9-49 shows the alpha blending processing in detail.

Figure 9-49. DISPC Overlay Alpha Blending Architecture With Premultiplied Alpha Support

CAUTION

The Z order of the Source Transparency Layer must have the value 2 (0x2: Z-order 2: layer above all the other layers).

NOTE: 1-alpha operator corresponds to the basic 1s-complement operation.

The alpha blending value is defined by:

- The component value A when using an ARGB or RGBA pixel format.
 - For ARGB-1555, the alpha blending is defined using a 1-bit value. It is converted into an 8-bit value by duplicating the 1-bit value (see Table 9-42).
 - For ARGB-4444, the alpha blending is defined using a 4-bit value. It is converted into an 8-bit value by duplicating the 4-bit value (see Table 9-42).

- If the pixel format contains no alpha blending value, the pixel alpha value is considered to be 0xFF, and if alpha is equal to 0xFF, there is no multiplication.
- For BITMAP or YUV formats, there is no alpha blending factor associated with each pixel value. Only the global alpha blending factor associated with the window displaying the BITMAP or YUV format is used.
- Each 12x12 multiplication gives a result on 24 bits, which are shifted to the right to become an 12-bit value. All the values are unsigned.
- The global alpha blending value is set in the [DISPC_GFX1_GLOBAL_ALPHA](#) and [DISPC_VID_GLOBAL_ALPHA](#) registers, and is updated in synch with the selected output channel.

Table 9-42 lists the percentage of alpha blending in the function of the alpha blending value on 8 bits.

Table 9-42. DISPC Overlay Alpha Blending – ARGB

Alpha Blending 1-Bit Value (ARGB16-1555)	Alpha Blending 4-Bit Value (ARGB16-4444)	Alpha Blending 8-Bit Value (Converted Value or Resulting Alpha)	Percent Blending
0x0	0x0	0x00	100 (transparent)
N/A	0x1	0x11	93.33
N/A	0x2	0x22	86.6
N/A
N/A	0xE	0xEE	6.6
0x1	0xF	0xFF	0 (opaque)

Premultiplied Alpha

The image ARGB may have its RGB component already premultiplied with the alpha (ARGB) where:

- $R = A * R$
- $G = A * G$
- $B = A * B$

In that case, the processing is as follows:

- Color component of premultiplied layers are multiplied with the Global Alpha, if Global Alpha is not equal to 0.
- Color component of the composed underlying layers are multiplied with $(1 - A \times \text{Global Alpha})$.

The additional premultiplied alpha option is associated with the pipelines GFX, VID1 and VID2. The option is accessible through the [28] PREMULIPLYALPHA bit for the respective pipeline register:

- [DISPC_GFX1_ATTRIBUTES](#)
- [DISPC_VID_ATTRIBUTES](#)

The following settings are available:

- PREMULIPLYALPHA bit = 0: Source is not premultiplied with alpha. Full blending is done in the DISPC.
- PREMULIPLYALPHA bit = 1: Source is premultiplied with alpha. Partial blending is done.

NOTE: The *prealpha* controls in [Figure 9-49](#), correspond to the PREMULIPLYALPHA of the pipelines mapped on the respective layers.

The logic marked in red in [Figure 9-49](#) corresponds to the alpha value, computed when the write-back channel copies back to memory the premultiplied color component:

$$A (\text{destination}) = A (\text{source}) + (1 - A (\text{source}) \times A (\text{destination}))$$

The default value for [DISPC_WB_ATTRIBUTES](#)[7] ALPHAENABLE bit is 0x0. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available:

- The ALPHAENABLE bit is set to 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay.

- The ALPHAENABLE bit is set to 0x0: The alpha value is not written back.

NOTE: The [DISPC_WB_ATTRIBUTES](#)[7] ALPHAENABLE bit is effective only when one of the output channels is written back, otherwise it is ignored.

9.2.4.12.3 DISPC Overlay Transparency Color Keys

There are two transparency color keys: the source transparency color key and the destination transparency color key. The source transparency color key can be used with BITMAP formats (1-, 2-, 4-, and 8-bpp), YUV, and RGB formats (ARGB, RGB, RGBA, xRGB, and RGBx). In this case the A information is ignored for the comparison between the pixel value and the color key value. It is possible to use YUV formats with some caution, because the comparison is between the input pixel value of the overlay manager from pipeline (GFX or one of the VID pipelines depending on the Z-order) and the color key value. The YUV data is converted to RGB format. If the original format is YUV, the user must consider the color space conversion processing to define the RGB color key value used for the comparison.

The transparency color key is enabled by setting the following bits to 0x1:

- [DISPC_OVR_CONFIG](#)[10] TCKLCDENABLE

The transparency color key is determined in the TRANSCOLORKEY bit fields of the following registers:

- [DISPC_OVR_TRANS_COLOR_MAX](#), [DISPC_OVR_TRANS_COLOR_MAX2](#), [DISPC_OVR_TRANS_COLOR_MIN](#) and [DISPC_OVR_TRANS_COLOR_MIN2](#)

NOTE:

- The video source transparency color key and graphics destination transparency color key cannot be active at the same time.
 - For CLUT bitmaps, the palette index is compared to the transparency color key and not to the palette value pointed out by the palette index.
-

- **Source transparency color key**

The value of the video source transparency color key defines the range of encoded pixel data considered as a transparent pixel. The encoded pixel values with the source color key value inside the valid range are not visible, and the encoded pixel values of the under layers or solid background color are visible.

The scaler can be enabled as a preprocessor in the VID pipelines, but it is necessary to consider the pixel scaling preprocessing in order to define the color key value to be used after the rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The source transparency color key mode is selected by setting the following bit to 0x1:

- [DISPC_OVR_CONFIG](#)[11] TCKLCDSELECTION

[Figure 9-50](#) shows an example of source color key. The pixels with the transparency color key are not displayed; instead, pixels of the resulting layer underneath are shown.

Figure 9-50. DISPC Overlay Source Transparency Color Key Example

disp-021

- **Destination transparency color key**

The graphics destination transparency color key values define the range of the encoded pixels in layer 1, which are not displayed. Other layer 1 pixels (not in the range of destination transparency color key value) are displayed over layer 2. The encoded pixels within the range of destination color key values are pixels not visible on the screen because pixels at the same position in layer 2 are visible; otherwise, encoded pixels are visible above layer 2. The destination transparency color key applies only if layer 1 overlaps layer 2 (see the Z-order section for details on layer position depending on the Z-order parameter in [Section 9.2.4.12.1](#), *DISPC Overlay Priority Rule*); otherwise, the destination transparency color key is ignored.

The scaler can be enabled as a preprocessor in the VID pipelines. It is necessary, however, to consider the pixel scaling preprocessing in order to define the color key value to be used after rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The destination transparency color key mode is selected by setting the following bit to 0x0:

- `DISPC_OVR_CONFIG[11] TCKLCDSELECTION`

[Figure 9-51](#) shows an example of the destination color key. The pixels, equal to the transparency color key, are not displayed and are replaced by layer 2 pixels. All other layer 1 pixels, different from the transparency color key, are displayed over layer 2.

Figure 9-51. DISPC Overlay Destination Transparency Color Key Example

dispc-022

9.2.4.13 DISPC Video Port Output

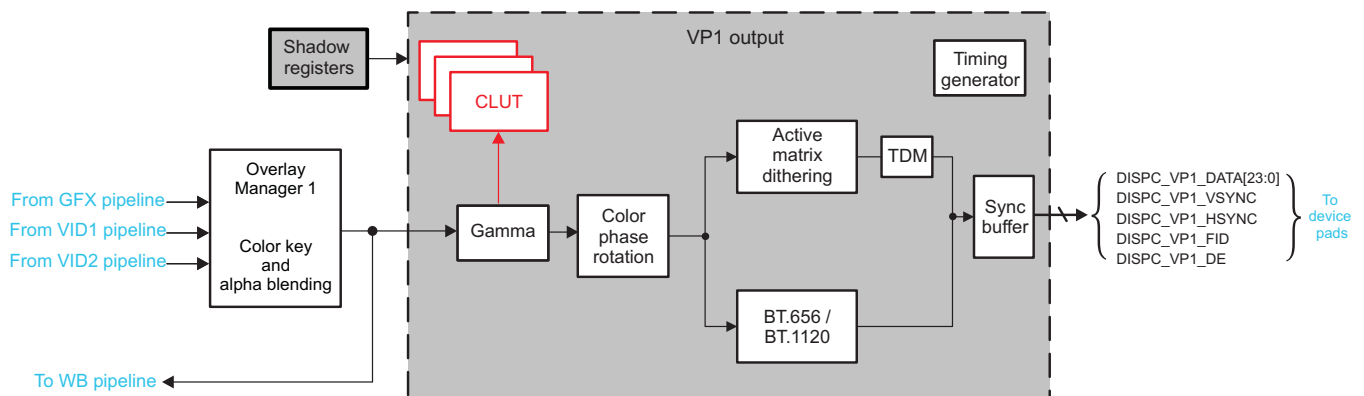

DISPC implements a single video port output (VP1). It processes data received from Overlay Manager 1 (OVR1). The VP1 output path consists of several processing blocks (see Figure 9-52):

- Gamma correction unit
- Color phase rotation (CPR) (also used for RGB-to-YUV conversion)
- Active matrix dithering with TDM
- BT.656
- BT.1120
- Timing generator

The display subsystem supports active matrix display technology. The configuration of colors depends on the color depth:

- 24 bpp supports 16,777,216 colors.
- 18 bpp supports 262,144 colors.
- 16 bpp supports 65,536 colors.
- 12 bpp supports 4096 colors.

Figure 9-52. DISPC VP1 Output Architecture

dispc-028

NOTE: In BT.656 mode only bits 9 through 0 are used from DISPC_VP1_DATA[23:0] data bus.

9.2.4.13.1 DISPC VP1 Gamma Correction Unit

When performing gamma correction, the selected encoded pixel values based on the color keys by the overlay manager from the video or graphics paths are sent to the gamma curve table. Each component of encoded pixel value is used as a pointer to index 1 out of 256 24-bit gamma curve entries in the table. Each 8-bit component is replaced with the 8-bit table value corresponding to R, G, or B component. The table is loaded by software. It is possible to load only part of the table. For each access to the table, the 24-bit value is associated with index in the table by concatenating the 24-bit value (LSB of 32-bit access) and the 8-bit index value (MSB of the 32-bit access).

The sequence to load the gamma table is:

1. SW writes (only writes are supported) 32-bit gamma correction values using single access, or burst access in streaming mode, into `DISPC_VP1_GAMMA_TABLE` register. The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table.
2. Loop to Step 1, if there is a new access to the gamma table register. The SW can access other registers between two accesses to the gamma table register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

The usage of the gamma table is activated by setting `DISPC_VP1_CONFIG[2]` GAMMAENABLE register bit to 0x1.

Figure 9-53 describes the format of one of the gamma curve values in the memory.

Figure 9-53. DISPC Data Memory Organization for Gamma Mode in VP1 Output

9.2.4.13.2 DISPC VP1 Color Phase Rotation Unit

The Color Phase Rotation (CPR) unit can be used to correct the display output colorimetry in case of nonpure white backlight.

The CPR is enabled by setting the `DISPC_VP1_CONFIG[15]` CPR bit to 0x1. The coefficients are programmed in the following registers:

- Red 10-bit signed coefficients in `DISPC_VP1_CPR_COEF_R`
- Green 10-bit signed coefficients in `DISPC_VP1_CPR_COEF_G`
- Blue 10-bit signed coefficients in `DISPC_VP1_CPR_COEF_B`

The CPR logic is integrated after the overlay manager while using the gamma correction and before the spatial/temporal dithering. The CPR can be selected to correct the nonpure white backlight of the display module by using a programmable matrix to convert the 36-bit RGB pixel value into a new 30-bit RGB pixel value. The matrix is programmed through a set of nine 10-bit signed coefficients. The output of the calculation is clipped to [0:4095]. The CPR is processed by the equation shown in Figure 9-54. Table 9-43 lists all coefficients with their respective register bitfields for settings.

Figure 9-54. DISPC VP1 CPR Matrix

$$\begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} R_r & R_g & R_b \\ G_r & G_g & G_b \\ B_r & B_g & B_b \end{bmatrix} * \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix}$$

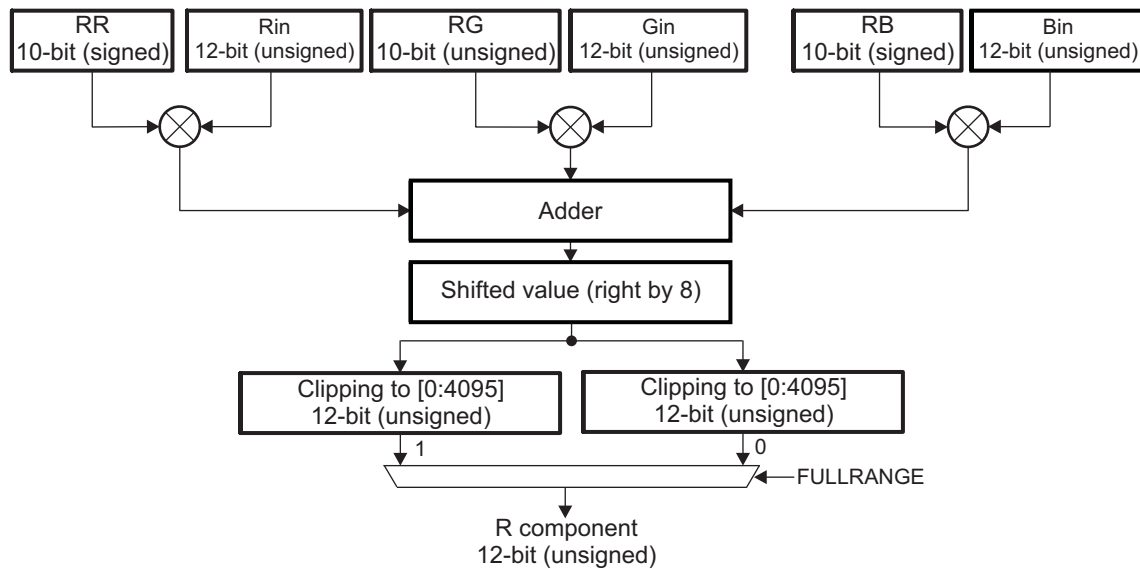

dispc-023

Table 9-43. DISPC VP1 CPR, or RGB to YUV Conversion Coefficients with Associated Register Bitfields

Registers	Bit Field	Color Phase Rotation	RGB to YUV
DISPC_VP1_CPR_COEF_R	RR	Rr	Yr
	RG	Rg	Yg
	RB	Rb	Yb
DISPC_VP1_CPR_COEF_G	GR	Gr	Cbr
	GG	Gg	Cbg
	GB	Gb	Cbb
DISPC_VP1_CPR_COEF_B	BR	Br	Crr
	BG	Bg	Crg
	BB	Bb	Crb

Figure 9-55 shows the CPR macro-architecture.

Figure 9-55. DISPC VP1 CPR Macro-Architecture

dispc-024

9.2.4.13.3 DISPC VP1 Color Space Conversion

The CPR block can be used to perform Color Space Conversion (CSC). Table 9-43 lists the associated coefficients with their respective register bit-fields. The CSC logic uses the CPR registers for the coefficients. Only the upper 10 bits of each color component are used for the CSC processing. The CSC processing is enabled by setting the DISPC_VP1_CONFIG[24] COLORCONVENABLE register bit to 0x1.

The color space conversion on the VP output can be selected in order to convert from 30-bit RGB to YUV444. The matrix is programmed through a set of nine 10-bit signed coefficients. The result is clipped to [64:940] for the luminance and [64:960] for the chrominance, when full-range equals zero (DISPC_VP1_CONFIG[25] FULLRANGE = 0).

Figure 9-56. DISPC VP1 CSC RGB to YUV Registers (FullRange=0)

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

If the programmed active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:1023], the values Y, Cb, and Cr are clipped to the range [0:1023]. The following equation gives the 11-bit coefficients of the RGB to YUV color space conversion, for full-range (DISPC_VP1_CONFIG[25] FULLRANGE = 1)

Figure 9-57. DISPC VP1 CSC RGB to YUV Registers (FullRange=1)

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

In order to provide YUV422 data to the BT-656 or BT-1120 blocks, the YUV444 format is converted to YUV422 by sub-sampling the chrominance values. The hardware does this by averaging two-by-two the chrominance samples. The conversion from YUV444 to YUV422 is performed when the color space conversion is enabled.

9.2.4.13.4 DISPC VP1 BT.656 and BT.1120 Modes

The VP1 output can be configured in BT.656 or BT.1120 mode. The following standards are not supported in BT.656 mode:

- BT.470 (Support for conventional Analog TV Systems)
- BT.803 (The avoidance of interference generated by digital television studio equipment)
- BT.1364 (Format of ancillary data signals carried in digital component studio interfaces)

Unsupported formats when BT.1120 mode is used:

- BT.1364 (Support for Ancillary Data during blanking period)

BT.656/BT.1120 modes use embedded EAV/SAV syncs.

Enabling BT.656 or BT.1120 format for VP1 output is done by setting DISPC_VP1_CONFIG[20] BT656ENABLE or [21] BT1120ENABLE register bits.

NOTE: It is not possible to enable BT.656 and BT.1120 mode simultaneously on the same output.

Figure 9-58 shows signal mapping on DISPC_VP1_DATA[23:0] data bus. Bits 9 to 0 are used in BT.656 mode (10-bit).

Figure 9-58. DISPC VP1 Data Mapping in BT.656 Mode

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Unused														BT.656									

NOTE: For compatibility with existing 8-bit interfaces, the two LSB are ignored, and only bits [9:2] are used.

Figure 9-59 shows signal mapping on DISPC_VP1_DATA[23:0] data bus for BT.1120 mode. Bits [19:10] (CbCr) and [9:0] (Y) are used in 20-bit mode. Bits [19:12] (CbCr) and [9:2] (Y) are used in 16-bit mode (YCbCr 4:2:2).

Figure 9-59. DISPC VP1 Data Mapping in BT.1120 Mode

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Unused				← BT.1120 (CbCr, 20-bit mode) →										← BT.1120 (Y, 20-bit mode) →									

dispc-049x

VP1 supports progressive output for embedded syncs interface, when it is configured in BT.656/BT.1120 modes. For more information on timings configuration, see [Section 9.2.4.13.7, DISPC VP1 Timing Generator and Panel Settings](#).

9.2.4.13.4.1 DISPC BT Mode Blanking

During the transmission of the video signal, the portion of the stream in-between active video data segments is known as the horizontal blanking interval.

Strictly speaking this entire region is the blanking interval, but this interval also includes the EAV and SAV codes. The remaining bytes of information in a digital blanking interval are filled with values corresponding to the blanking levels of the Cb, Y and Cr signals respectively, and in accordance with the standard multiplex sequence for the stream (CbYCrY..). The blanking levels are as follows:

- Cb = 80h
- Y = 10h
- Cr = 80h.

The sequence in the BLANKING region of the data stream is therefore: 80h, 10h, 80h, 10h.....80h, 10h
For more details on setting the blanking timing values for BT.1120 and/or BT.656 mode, see [Section 9.2.4.13.7, DISPC Timing Generator and Panel Settings](#).

9.2.4.13.4.2 DISPC BT Mode EAV and SAV

The End of Active Video(EAV) and Start of Active Video (SAV) parts of the stream are timing codes. Their function can be summarized as follows:

- EAV – marks the end of the active video data within the current line and therefore also the start of the subsequent line.
- SAV – heralds the start of the active video data within the current line.

These codes are embedded within the BT.656 video data stream, thereby eliminating the need for additional timing signals (HSYNC, VSYNC) to be included as part of the interface.

Both EAV and SAV codes are comprised of a sequence of four bytes (FFh – 00h – 00h - XY). The first three bytes in the sequence constitute a fixed preamble. The fourth byte, contains information about the field being transmitted (Field 1 or Field 2 in an interlaced video signal), the state of field blanking (Vertical) and the state of line blanking (Horizontal). The bit assignment for this byte of the code is shown in [Figure 9-60](#), with the function of each bit described in [Table 9-44](#).

Figure 9-60. DISPC BT Mode Bit-Assignment for the Fourth Byte of EAV/SAV Codes

Table 9-44. DISPC BT Mode Bit Function

Bit	Symbol	Function
7	1	Always set to '1'.
6	F	Field bit. 0 – Field 1 1 – Field 2
5	V	Vertical Blanking Status bit. This bit goes High during a vertical field blanking interval, otherwise it remains Low.
4	H	Horizontal Blanking Status bit. 0 – byte is part of SAV code (i.e. stream is entering an active video data region for the current line) 1 – byte is part of EAV code (i.e. stream has entered a horizontal blanking interval - start of a new line)
3	P3	Protection bit 3
2	P2	Protection bit 2
1	P1	Protection bit 1

Table 9-44. DISPC BT Mode Bit Function (continued)

Bit	Symbol	Function
0	P0	Protection bit 0

The protection bits allow for detection and correction of 1-bit errors and the detection of 2-bit errors. The status of P3, P2, P1 and P0 depend on the states of bits F, V and H. This dependency is shown in [Table 9-45](#).

Table 9-45. DISPC BT Mode Status of Protection Bits as F, V and H Vary

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

9.2.4.13.5 DISPC VP1 Spatial/Temporal Dithering

The spatial/temporal dithering logic can be selected to enhance the quality of the active matrix outputs. The dithering logic is integrated after the CPR and before the TDM. The encoded pixel values are used by spatial/temporal dithering logic to display the data in a lower color depth on the display panel. The spatial/temporal dithering algorithm is based on the (x,y) pixel position and frame rate control. The dithering logic can process the pixels over one frame, two frames, or four frames. The number of frames is selected by setting the [DISPC_VP1_CONTROL\[31:30\]](#) SPATIALTEMPORALDITHERINGFRAMES bit field. In the case of a single frame, only spatial processing is applied. In case of multiple frames, spatial and temporal processing are applied to the pixels. The spatial/temporal dithering logic is enabled by setting the [DISPC_VP1_CONTROL\[7\]](#) STDITHERENABLE bit to 0x1.

NOTE:

- If the interface data bus is smaller than the pixel format size and spatial/temporal dithering is not enabled, the MSBs of the pixel color components are output on the interface data bus.
 - If the interface data bus is larger than the pixel format size, by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus.
-

9.2.4.13.6 DISPC VP1 Multiple Cycle Output Format (TDM)

The pixels are formatted on one or multiple cycles (a maximum of three cycles). On three cycles, two pixels can concatenate and send to the panel. The cycle format is selected through the [DISPC_VP1_CONTROL\[24:23\]](#) TDMCYCLEFORMAT bit field. The number of bits for each cycle is set in the [DISPC_VP1_DATA_CYCLE_0](#) register for the first cycle, the [DISPC_VP1_DATA_CYCLE1](#) register for the second cycle, and the [DISPC_VP1_DATA_CYCLE2](#) register for the third cycle. The interface data bus width, when TDM mode is enabled ([DISPC_VP1_CONTROL\[20\]](#) TDMENABLE = 1), can be 8, 9, 12, or 16 bits, configurable through the [DISPC_VP1_CONTROL\[22:21\]](#) TDMPARALLELMODE bit field.

When the TDM is disabled ([DISPC_VP1_CONTROL\[20\]](#) TDMENABLE = 0), the DISPC outputs the pixels using the conventional formats: active matrix display monochrome/color. When TDM is disabled, the interface data bus width is configured through the [DISPC_VP1_CONTROL\[10:8\]](#) DATALINES bit field.

When using TDM mode, only up to 24-bit per pixel can be output on the interface. For higher color depth, only the upper bits are kept before converting each pixel into TDM output.

Figure 9-61 through Figure 9-64 show various examples of TDM settings in the function of pixel data formats and the interface data bus width.

9.2.4.13.7 DISPC VP1 Timing Generator and Panel Settings

The VP1 output has a dedicated timing generator supporting progressive and interlaced mode.

The size of the display panel is defined by:

- Number of lines, `DISPC_VP1_SIZE_SCREEN[27:16]` LPP bit field, with a value from 1 to 4096
- Number of pixels per line, `DISPC_VP1_SIZE_SCREEN[11:0]` PPL bit field, with a value from 1 to 4096

Standard HSYNC/VSYNC timing generation are programmable for VP1:

- Horizontal front porch is set in the [DISPC_VP1_TIMING_H\[19:8\]](#) HFP bit field.
- Horizontal back porch is set in the [DISPC_VP1_TIMING_H\[31:20\]](#) HBP bit field.
- Horizontal synchronization pulse width is set in the [DISPC_VP1_TIMING_H\[7:0\]](#) HSW bit field.
- Vertical front porch is set in the [DISPC_VP1_TIMING_V\[19:8\]](#) VFP bit field.
- Vertical back porch is set in the [DISPC_VP1_TIMING_V\[31:20\]](#) VBP bit field.
- Vertical synchronization pulse width is set in the [DISPC_VP1_TIMING_V\[7:0\]](#) VSW bit field.

When the output is in BT.1120 or BT.656 mode, the following timing constants are mapped onto the [DISPC_VP1_TIMING_H](#) and [DISPC_VP1_TIMING_V](#) registers:

- Progressive mode:
 - Horizontal blanking (12 bits) is set in the {[DISPC_VP1_TIMING_V\[3:0\]](#) VSW, [DISPC_VP1_TIMING_H\[7:0\]](#) HSW} bit fields; (up to 2048 bytes of horizontal blanking supported).
 - Vertical frame blanking No 1 is set in the [DISPC_VP1_TIMING_V\[19:8\]](#) VFP bit field.
 - Vertical frame blanking No 2 is set in the [DISPC_VP1_TIMING_V\[31:20\]](#) VBP bit field.
 - Number of lines is set in the [DISPC_VP1_SIZE_SCREEN\[27:16\]](#) LPP bit field
 - Number of pixels per line is set in the [DISPC_VP1_SIZE_SCREEN\[11:0\]](#) PPL bit field.
- Interlaced mode:
 - Horizontal blanking (12 bits) is set in the {[DISPC_VP1_TIMING_V\[3:0\]](#) VSW, [DISPC_VP1_TIMING_H\[7:0\]](#) HSW} bit fields; (up to 2048 bytes of horizontal blanking supported).
 - Vertical field blanking No 1 for Even Field is set in the [DISPC_VP1_TIMING_H\[19:8\]](#) HFP bit field.
 - Vertical field blanking No 2 for Even Field is set in the [DISPC_VP1_TIMING_H\[31:20\]](#) HBP bit field.
 - Vertical field blanking No 1 for Odd Field is set in the [DISPC_VP1_TIMING_V\[19:8\]](#) VFP bit field.
 - Vertical field blanking No 2 for Odd Field is set in the [DISPC_VP1_TIMING_V\[31:20\]](#) VBP bit field.
 - Number of lines per field (even) is set in the [DISPC_VP1_SIZE_SCREEN\[27:16\]](#) LPP bit field.
 - Delta number of odd field compared to even field (in a single line) is set in the [DISPC_VP1_SIZE_SCREEN\[15:14\]](#) DELTA_LPP bit field.
 - Number of pixels per line is set in the [DISPC_VP1_SIZE_SCREEN\[11:0\]](#) PPL bit field.

NOTE: The DELTA_LPP field only controls the output channel and not the size of the field fetched from the frame buffer in memory. This field shall be set to zero for YUV420 format.

Horizontal/vertical synchronization and output enable signals polarity are programmable by setting the [DISPC_VP1_POL_FREQ\[12\]](#) IVS, [DISPC_VP1_POL_FREQ\[13\]](#) IHS, and [DISPC_VP1_POL_FREQ\[15\]](#) IEO bits. These signals can be gated by setting the [DISPC_VP1_CONFIG\[7\]](#) VSYNCGATED and [DISPC_VP1_CONFIG\[6\]](#) HSYNCGATED bits.

The latch of data can be driven on the rising or falling edge of the pixel clock by setting the IPC bit of [DISPC_VP1_POL_FREQ\[14\]](#) IPC and [CTRL_CORE_SMA_SW_1\[\]](#) DSS_CH0_IPC (the values must match) registers. The drive of the SYNC and VSYNC signals in the function of the pixel clock is done by setting the [DISPC_VP1_POL_FREQ\[16\]](#) RF and [CTRL_CORE_SMA_SW_1\[\]](#) DSS_CH0_RF bit.

The timing generation of FID signal is defined by the [DISPC_VP1_CONFIG\[22\]](#) OUTPUTMODEENABLE bitfield. The selection can be changed only if the VP output is disabled.

- 0x0 (default): Progressive mode (FID signal is inactive: low level)
- 0x1: Interlaced mode (FID signal transition from low to high and from high to low to indicate on the VP interface the field polarity and internally the FID to be used for the registers with dual value: one for odd field and another one for even field). The FID signal toggles on the rising edge of the VSW pulse.

When in interlaced mode, the [DISPC_VP1_CONFIG\[23\]](#) FIDFIRST bit indicates which field is output first:

- 0x0: Even field first (FID = 0)
- 0x1: Odd field first (FID = 1)

Figure 9-65 shows the timing values description.

Figure 9-65. DISPC VP1 Timing Values (Display Screen)

dispc-031

The pixel clock can be gated by setting the `DISPC_VP1_CONFIG[5]` `PIXELCLOCKGATED` bit to 0x1.

9.2.4.13.8 DISPC VP1 Configuration for TV Support

Figure 9-66 shows the TV formats supported.

Figure 9-66. DISPC Example TV Timing Formats

dispc-061

The size of a frame (field, if interlaced mode) is defined by the fields:

- Number of lines, `DISPC_VP1_SIZE_SCREEN[27:16]` LPP bit field, with a value from 1 to 4096

- Number of pixels per line, [DISPC_VP1_SIZE_SCREEN](#)[11:0] PPL bit field, with a value from 1 to 4096
- Delta size between odd/even field, [DISPC_VP1_SIZE_SCREEN](#)[15:14] DELTA_LPP bit field. This bit field controls only the output channel and not the size of the data field fetched from the frame buffer in memory.

The hold time of the pixels on the data bus is determined in clock cycles by the [DISPC_VP1_CONTROL](#)[16:14] HT bit field. The default value at reset time is 0x0 (one cycle).

- When connected to external HDMI encoder, [Table 9-46](#) indicates the [DISPC_VP1_SIZE_SCREEN](#) register values for PPL and LPP for each HD standard.

Table 9-46. DISPC VP1 PPL and LLP Value for HD Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock DISPC_VP1_CONT ROL [16:14] HT = 0x0	DISPC_VP1_SIZE_SCREEN value

	1080p 3D (frame packing)	1920	2205	148.5/148.35 MHz (24/23.98 frames/s)	0x089C 077F
	1080p 3D (side-by-side half)	1920	1080	148.5 MHz (60 frames/s)	0x0437 077F

NOTE: When configuring the DISPC for outputting any supported 3D frame-packing format, the following generic details must be considered:

- As defined by the *HDMI v1.4 Specification*, 3D frame-packing is a video format structure composed of two stereoscopic pictures: left and right.
- The stereoscopic pictures can be processed through the video pipelines (VID1 and VID2). For more information about the configuration of video pipelines, see [Section 9.2.4.9, DISPC Video Pipelines](#).
- The 3D frame can be generated by setting the VP1 overlay manager to combine the outputs of the selected video pipelines that hold the pictures. VID1 pipeline must carry the top field of the 3D frame (left stereoscopic picture), and VID2 pipeline must always carry the bottom field of the frame (right stereoscopic picture). The top and bottom fields are separated by an active space area.
- The pipeline carrying each field (top and bottom) of the 3D frame must have its height and width parameters defined in the [27:16] SIZEY and [11:0] SIZEX bit fields of the [DISPC_VP1_SIZE_SCREEN](#) register, and its Y and X positions defined in the [26:16] POSY and [10:0] POSX bit fields of the [DISPC_VID_POSITION](#) register. The active space area of the 3D frame can be encoded by setting the solid background color for the VP1 output (in the [DISPC_OVR_DEFAULT_COLOR](#) and [DISPC_OVR_DEFAULT_COLOR2](#) registers). For more information about the overlay mechanism, see [Section 9.2.4.12, DISPC Overlay Managers](#).

3D frame-packing format support using a single pipeline can be achieved using the DISPC region-based feature. Refer to [Section 9.2.4.11, DISPC Region-Based Mechanism](#), for more information.

9.2.4.14 DISPC Extended 3D Support

9.2.4.14.1 DISPC Extended 3D Support - Line Alternative Format

The DISPC supports Line Alternative Format for 3D displays, as defined by the HDMI Specification 1.4a.

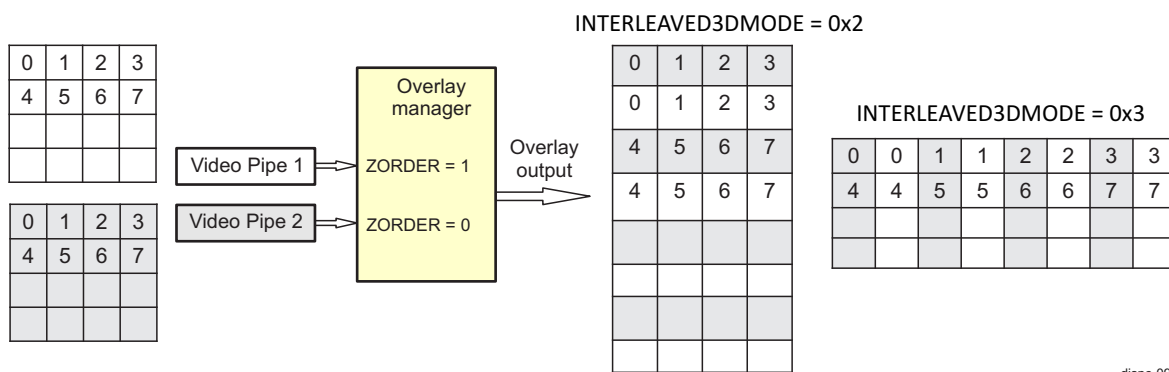

The processing is done in the overlay manager:

- The layers are grouped into two categories based on the z-order. Odd z-order may blend together and will interleave with even z-order pipes, which may blend together.
- Two types of interleaves are possible, line-based interleaving and pixel-based interleaving, to support landscape and portrait screen orientations.

The configuration is done through the `DISPC_OVR_CONFIG[9:8]` INTERLEAVED3DMODE register bitfield, which specifies the interleave pattern that needs to be added for each overlay manager:

- 0x0: No interleaving happens in the overlay manager
- 0x1: Reserved for future use
- 0x2: All even lines (all pixels) have a contribution from even z-order pipelines. All odd lines (all pixels) have a contribution from the odd z-order pipelines
- 0x3: All even pixels (for all lines) have a contribution from even z-order pipelines. All odd pixels (for all lines) have a contribution from the odd z-order pipelines

Figure 9-67. DISPC Illustration of 3D Interleaving

dispc-095

In addition, from Figure 9-67, if `DISPC_OVR_CONFIG[9:8]` INTERLEAVED3DMODE is programmed as 0x2, in this case the entire screen composited by the overlay manager (defined by PPL x LPP) gets subdivided into odd and even lines. It is possible for a 3D window created using the two pipelines to have a non-zero position (that is, POSX and POSY not equal to zero).

In such cases, depending on the oddness or evenness of the POSY setting, the first line in the window may come from VID1 or VID2 pipeline.

For instance, if the POSX = 3 and POSY = 3 (set in `DISPC_VID_POSITION` registers), then the final composited screen with PPL = 8 and LPP = 12 (set in `DISPC_VP1_SIZE_SCREEN` register) may look like in Figure 9-68:

Figure 9-68. DISPC Illustration of a Non-zero Position of 3D Window

NOTE: In this case the first line comes from the odd-zorder pipeline, that is, the VID1 pipeline.

The following limitations apply to the 3D Line alternative format:

- Software must ensure that the left/right frames are of same size.
- Software must ensure that in case of line interleaving the `DISPC_VID_SIZE[27:16]` SIZEY bitfield values is not greater than LPP/2.
- Software must ensure that in case of pixel interleaving the `DISPC_VID_SIZE[11:0]` SIZEX is not greater than PPL/2.
- Software must program POSX and POSY for both left and right frame to be the same.
- Color-keying is not available for 3D formats.
- Since each overlay manager can support 4k x 4k frames, the maximum resolution of each left/right frame must be restricted to 2k x 2k.

9.2.4.14.2 DISPC Extended 3D Support - Frame Packing Format

3D Frame Packing Format support using a single pipeline can be achieved using the region-based feature. Refer to [Section 9.2.4.11, DISPC Region-Based Mechanism](#), for more information.

9.2.4.15 DISPC Shadow Registers

Some DISPC registers are termed *shadow registers*. A shadow register change has no direct effect on the configuration of the DISPC. The registers are shadow registers in order the software to change the values of the registers at any time. When all the values for a given configuration are written into the registers, software must set 1 bit only to validate the configuration. When hardware reaches the end of the current frame and sees that the bit field has been set by software, the new configuration is now the configuration used by the hardware.

The bits enabling the hardware to use the new configuration are:

- `DISPC_VP1_CONTROL[5]` GOBIT bit for all the shadow registers of the pipeliens connected to the VP1 output

NOTE: As a general rule, all shadow registers are updated with the value of their shadow when:

- The interface is enabled, or
 - The GOBIT bit-field of the output, which the register is associated to, is set and the output sync is active
-

Address Offset	0x0000 0018		
Physical Address	0x5801 5018 + (0x4 * j)	Instance	DISPC_WB
Description	The register configures the resize accumulator init value for vertical up/down-sampling of the write-back window. It is used for Cb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the HW, any value can be used for the bit-fields. Shadow register.		
Type	RW

Table 9-119. DISPC_WB_ATTRIBUTES

Address Offset	0x0000 0020		
Physical Address	0x5801 5020	Instance	DISPC_WB
Description	The register configures the attributes of the viwrite back pipeline. Shadow register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDLENUMBER				IDLESIZE	CAPTUREMODE	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	RESERVED	WRITEBACKMODE	CHANNELIN				RESERVED	FULLRANGE	COLORCONVENABLE	RESERVED	ALPHAENABLE	RESIZEENABLE	FORMAT				ENABLE						

Bits	Field Name	Description	Type	Reset
31:28	IDLENUMBER	Determines the number of idles between requests on the L3 interconnect. It is only used when the write-back pipeline does data transfer from memory to memory. When the output of an overlay is stored in memory through the write-back pipeline in capture mode, the bit-field IDLENUMBER is ignored since a timing generator is used to time the transfer. The number of IDLE cycles is IDLENUMBER (from 0 to 15) if IDLESIZE=0. The number of IDLE cycles is IDLENUMBERx8 (from 0 to 120) if IDLESIZE=1 and BURSTSIZE=2. The number of IDLE cycles is IDLENUMBERx4 (from 0 to 60) if IDLESIZE=1 and BURSTSIZE=1. The number of IDLE cycles is IDLENUMBERx2 (from 0 to 30) if IDLESIZE=1 and BURSTSIZE=0.	RW	0x0

Bits	Field Name	Description	Type	Reset
27	IDLESIZE	Determines if the IDLENUMBER corresponds to a number of bursts or singles. 0x0: The number of idles between requests is defined by IDLENUMBER as number of cycles. 0x1: The number of idles between requests is defined by IDLENUMBER multiplied by burst size as number of cycles.	RW	0x0
26:24	CAPTUREMODE	Defines the frame rate capture. 0x6: Only one out of six frames is captured. The first one is captured then the second one is skipped and so on. 0x1: Only one frame is captured. 0x7: Only one out of seven frames is captured. The first one is captured then the second one is skipped and so on. 0x0: All frames are captures until the write-back channel is disabled or there is no more data generated by the overlay or the pipeline attached to the write-back channel. 0x2: Only one out of two frames is captured. The first one is captured then the second one is skipped and so on. 0x4: Only one out of four frames is captured. The first one is captured then the second one is skipped and so on. 0x5: Only one out of five frames is captured. The first one is captured then the second one is skipped and so on. 0x3: Only one out of three frames is captured. The first one is captured then the second one is skipped and so on.	RW	0x0
23	ARBITRATION	Determines the priority of the write-back pipeline. The write-back pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The write-back pipeline is one of the normal priority pipeline. 0x1: The write-back pipeline is one of the high priority pipeline.	RW	0x0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV420 and 2D access 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0x0
21	VERTICALTAPS	Video Vertical Resize Tap Number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. 0x1: 5 taps are used for the vertical filtering logic.	RW	0x0
20	RESERVED		R	0x0
19	WRITEBACKMODE	When connected to the overlay output of a channel the write back can operate as a simple transfer from memory to memory (composition engine) or as a capture channel. 0x0: Capture mode (default mode) 0x1: Memory to memory mode	RW	0x0

Bits	Field Name	Description	Type	Reset
18:15	CHANNELIN	WB Channel In configuration wr: immediate 0x0: OVR1 (VP1) 0x1: OVR2 0x4: GFX1SEL 0x7: VID1SEL 0x8: VID2SEL	RW	0x0
14:13	RESERVED		R	0x0
12	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0x0
11	COLORCONVENABLE	Enable the color space conversion. The HW does not enable/disable the conversion based on the pixel format. The bit-field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0x0
10	RESERVED		R	0x0
9	ALPHAENABLE	Premultiplied alpha enable 0x0: disabled. Disabled. This bit also disable the logic present in the associated channel out that compute the alpha component sent to the WB pipe 0x1: enabled.	RW	0x0
8:7	RESIZEENABLE	Resize Enable 0x0: Disable the resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0x0
30	RESERVED		R	0x0
29	RESERVED		R	0x0
28	PREMULTIPLYALPHA	The field configures the DISPC VID1 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component	RW	0x0
27:25	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is SW responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3 0x4: Z-order 4: layer above layers with z-order value of 0, 1, 2 and 3 and below layer with z-order value of 5 0x5: Z-order 5: layer above all the other layers except cursor 0x3: Z-order 3: layer above layers with z-order value of 0, 1 and 2 and below layer with z-order value of 4	RW	0x0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video1 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0x0

Bits	Field Name	Description	Type	Reset
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0x0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV420 and 2D access 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0x0
21	VERTICALTAPS	Video Vertical Resize Tap Number. The vertical poly-phase filter can be configured in 3-tap or 5-tap configuration. According to the number of taps, the maximum input picture width is double while using 3-tap compared to 5-tap. 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit-fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0x0
20	RESERVED		R	0x0
19	BUFPRELOAD	Video Preload Value 0x0: H/W prefetches pixels up to the preload value defined in the preload register 0x1: H/W prefetches pixels up to high threshold value	RW	0x0
18	RESERVED	Write 0's for future compatibility. Reads return 0.	R	0x0
17	SELFREFRESHAUTO	Automatic self refresh mode 0x0: The transition from SELFREFRESH <disabled> to <enabled> is controlled by SW. 0x1: The transition from SELFREFRESH <disabled> to <enabled> is controlled only by HW.	RW	0x0
16:14	CHANNELOUT	Video Channel Out configuration wr: immediate 0x0: OVR1 (VP1) 0x1: OVR2 0x4: WB	RW	0x0
13:12	RESERVED		R	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0x0
10	NIBBLEMODE	Video Nibble mode (only for 1-, 2- and 4-bpp) 0x0: Nibble mode is disabled 0x1: Nibble mode is enabled	RW	0x0
9	COLORCONVENABLE	Enable the color space conversion. The HW does not enable/disable the conversion based on the pixel format. The bit-field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0x0

Bits	Field Name	Description	Type	Reset
8:7	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset

Bits	Field Name	Description	Type	Reset
31:26	RESERVED		R	0x0
25	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected. 0x1: Full range selected.	RW	0x0
24	COLORCONVENABLE	Enable the color space conversion. It shall be reset when CPR bit-field is set to 0x1. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0x0
23	FIDFIRST	Selects the first field to output in case of interlace mode. In case of progressive mode, the value is not used. 0x0: First field is even. 0x1: Odd field is first.	RW	0x0
22	OUTPUTMODEENABLE	Selects between progressive and interlace mode for the VP output. 0x0: Progressive mode selected. 0x1: Interlace mode selected.	RW	0x0
21	BT1120ENABLE	Selects BT-1120 format on the VP output. It is not possible to enable BT656 and BT1120 at the same time on the same VP output. 0x0: BT-1120 is disabled. 0x1: BT-1120 is enabled.	RW	0x0
20	BT656ENABLE	Selects BT-656 format on the VP output. It is not possible to enable BT656 and BT1120 at the same time on the same VP output. 0x0: BT-656 is disabled. 0x1: BT-656 is enabled.	RW	0x0
19:17	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x0

Bits	Field Name	Description	Type	Reset
16	BUFFERHANDSHAKE	Controls the handsSHAKE between DMA buffer and STALL signal in order to prevent from underflow. The bit shall be set to 0 when the module is not in STALL mode. 0x0: Only the STALL signal (generated by RFBI or DSI2 depending on which IP uses the LCD output) is used regardless of the DMA buffer fullness information in order to provide data to the RFBI or DSI2 module. 0x1: The STALL signal (generated by RFBI or DSI2 depending on which IP uses the LCD output) is used in combination with the DMA buffer fullness information in order to provide data to the RFBI or DSI2 module only when it does not generated buffer underflow.	RW	0x0
15	CPR	Color Phase Rotation Control VP output). It shall be reset when ColorConvEnable bit-field is set to 1. Shadow bit-field. 0x0: Color Phase Rotation Disabled 0x1: Color Phase Rotation Enabled	RW	0x0
14:9	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x0
8	EXTERNALSYNCEN	Selects between external sync and internal sync mode for the VP output. 0x0: Internal sync mode selected 0x1: External sync mode selected.	RW	0x0
7	VSYNCGATED	VSYNC Gated Enabled (VP output) Shadow bit-field. 0x0: VSYNC Gated Disabled 0x1: VSYNC Gated Enabled	RW	0x0
6	HSYNCGATED	HSYNC Gated Enabled (VP output) Shadow bit-field. 0x0: HSYNC Gated Disabled 0x1: HSYNC Gated Enabled	RW	0x0
5	PIXELCLOCKGATED	Pixel Clock Gated Enabled (VP output) Shadow bit-field. 0x0: Pixel Clock Gated Disabled 0x1: Pixel Clock Gated Enabled	RW	0x0
4	PIXELDATAGATED	Pixel Data Gated Enabled (VP output) Shadow bit-field. 0x0: Pixel Data Gated Disabled 0x1: Pixel Data Gated Enabled	RW	0x0
3	HDMIMODE	Configures the timing generator in HDMI compatible mode to generate same timings as HDMI wrapper timings. 0x0: Disable HDMI mode. 0x1: Enable HDMI mode timings: - vertical FSM starts with the VFP period (instead of VSYNC) - last frame ends with the last pixel of data state.	RW	0x0
2	GAMMAENABLE	Enable the gamma Shadow bit-field. 0x0: Gamma disabled 0x1: Gamma enabled	RW	0x0
1	DATAENABLEGATED	DE Gated Enable Shadow bit-field. 0x0: DE signal is not gated 0x1: DE signal is gated.	RW	0x0
0	PIXELGATED	Pixel Gated Enable Shadow bit-field. 0x0: Pixel clock always toggles (only in TFT mode) 0x1: Pixel clock only toggles when there is valid data to display. (only in TFT mode)	RW	0x0

9.3 Video Encoder

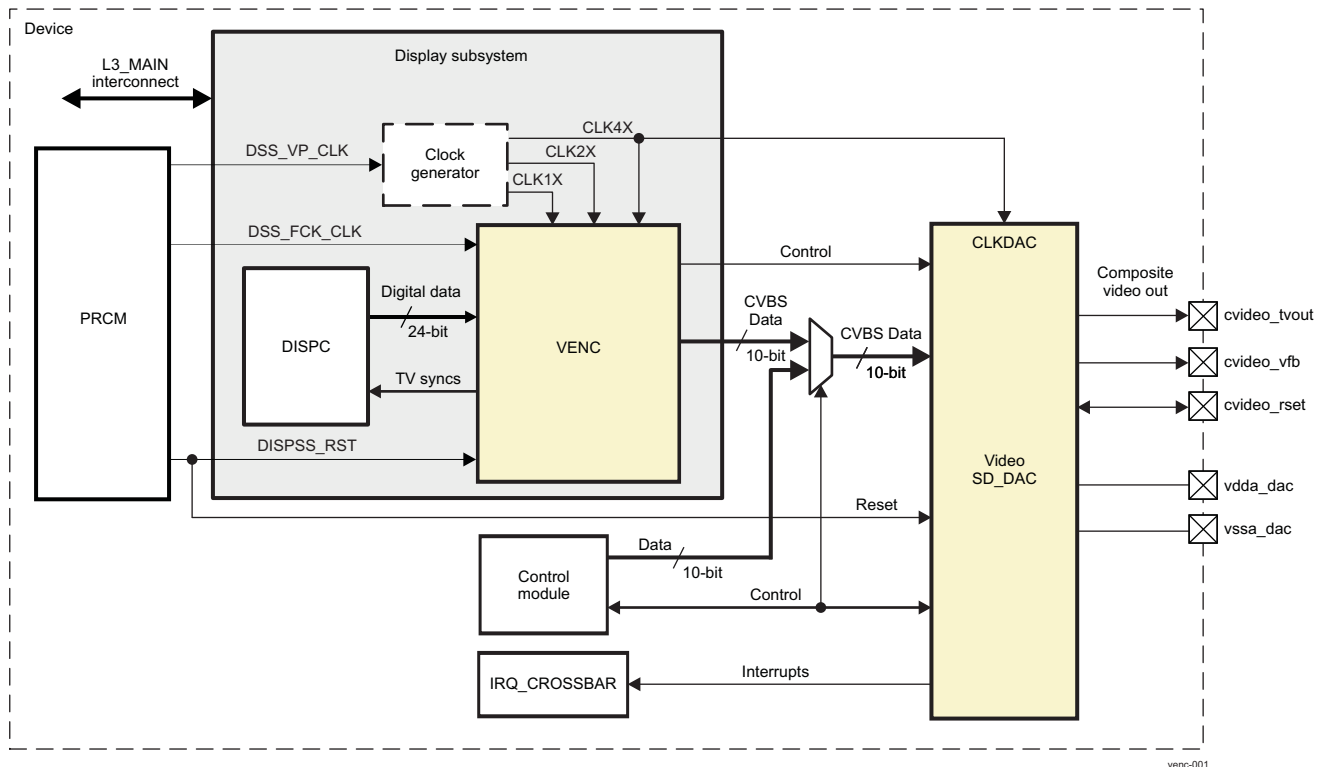

This section describes the video encoder (VENC) and associated video standard definition DAC (SD_DAC) modules for the device.

9.3.1 Video Encoder Overview

The VENC module provides the logic to display analog video on a TV set.

Figure 9-69 shows a block diagram of the video encoder and SD_DAC in the display subsystem.

Figure 9-69. Video Encoder Overview

The video encoder includes the following features:

- Supports the following standards for composite video (CVBS) :
 - NTSC-J, M
 - PAL-B, D, G, H, I
 - PAL-M
- Input data interface compatible with the following protocols:
 - 24-bit input bus compatible with external sync
 - RGB 4:4:4
- 10-bit interface for internal digital-to-analog converter (DAC) that supports:
 - 1.1V digital power supply, 1.8V analog power supply
 - 10-bit resolution
 - Sample rate of up to 60 megasamples per second (MSPS)
 - Supports Composite Video standart output
 - Supports TVOUT buffer bypass mode (DAC only mode)
 - Full-scale voltage output: 1.2 Vpp with a 75-Ω load
 - Internal TV-detect feature to detect both open and short conditions
 - Suitable for low-power wireless applications

- TV output data supports ITU-R BT 470-7 recommendation standard for consumer market
- Master clock input 13.5 MHz, 27 MHz (supports ITU-R 601 sampling for NTSC/PAL), and 54 MHz
- Programmable horizontal sync, vertical timing, and waveforms
- Programmable subcarrier frequency and SCH
- Internal test pattern generation (color bar, flat field, color burst)
- 2x/4x oversampling
- TV detection gating pulse generation
- Supports square pixel sampling (NTSC: 12.27 MHz, 24.54 MHz, 49.09 MHz PAL: 14.75 MHz, 29.5 MHz, 59 MHz)

CAUTION

In square pixel mode, an external clock generator is required to provide sampling frequencies.

9.3.2 Video Encoder Environment

To display analog video on a TV set, the path used is as follow:

- Display controller
- Video encoder
- 10-bit SD_DAC with video amplifier

The display controller module receives synchronization signals from the video encoder and synchronously sends pixel data to the video encoder with these signals. The digital output of the display controller is always a 24-bit RGB value based on a pixel request from the video encoder. For more information on the display controller settings and features, see [Section 9.2, Display Controller](#).

The video encoder converts RGB video signals to conform to the NTSC/PAL standards analog video. The video encoder includes an integrated synchronization signal generator and a video digital-to-analog converter (SD_DAC) with video amplifiers, data manager, luma stage, chroma stage, modulator, and a control interface.

The video encoder also provides the synchronization signals to the display controller: VSYNC, active VIDEo (AVID), and field ID (FID).

NOTE: To enhance the TV color display, it is highly recommended to set the DSS.DSS_VENC_CTRL[1] DAC_DEMEN register bit. See [Section 9.1.3, Display Subsystem Register Manual](#).

Figure 9-70 through Figure 9-72 show the TV display interface in composite mode.

Figure 9-70. Video Encoder Environment, Normal Mode DC-Coupling

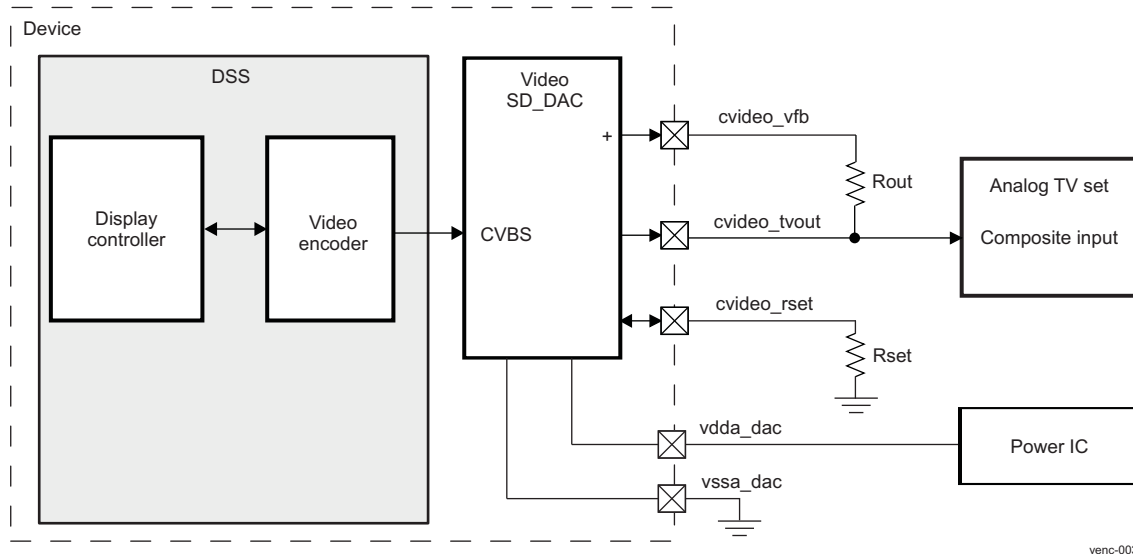

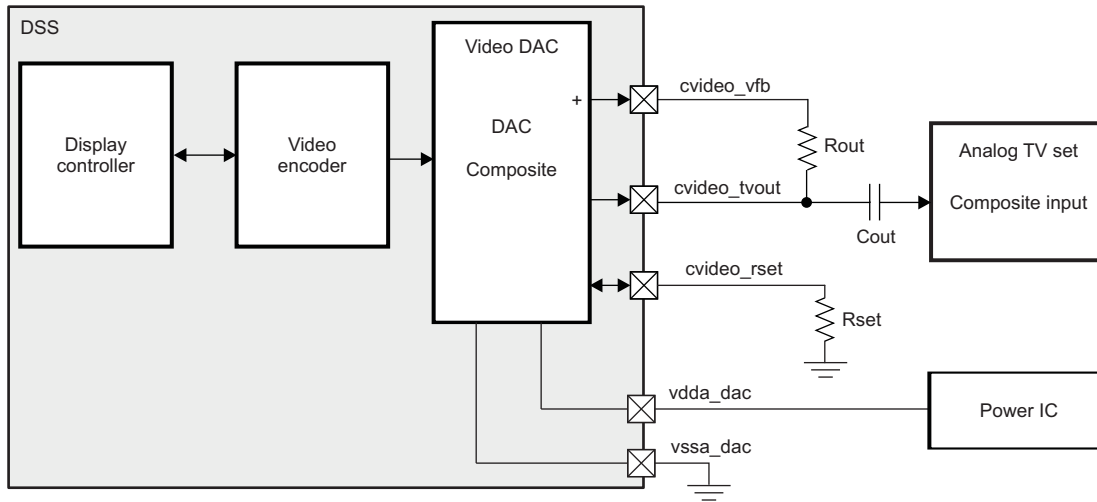

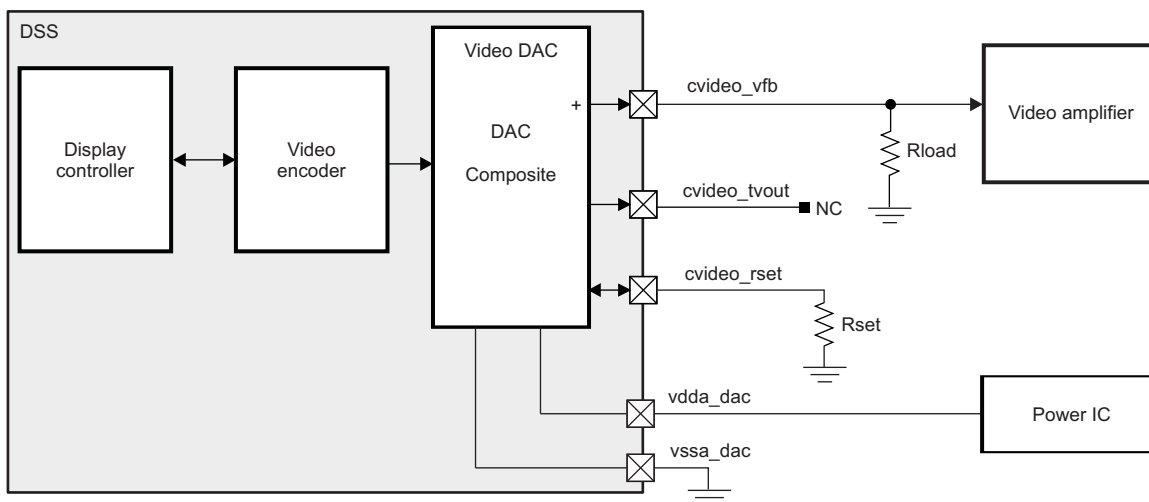

Figure 9-71. Video Encoder Environment, Normal Mode AC-Coupling

venc-015

Figure 9-72. Video Encoder Environment, Bypass Mode

venc-016

Table 9-310 describes the interface signals to/from the TV set for TV display support.

Table 9-310. TV Display Interface Pins

Pin Name	Type ⁽¹⁾	Description
cvideo_tvout	O	Composite video output. An external resistor (R_{out}) is connected between this node and the <i>cvideo_vfb</i> pin. The nominal value of R_{out} is 2700 Ω . This is the output node that drives the load (75 Ω). In AC-coupling mode, a series capacitor (C_{out}) must be connected. The nominal value for C_{out} is $\geq 200 \mu F$.
cvideo_vfb	O	In Normal mode (video DAC+Buffer), it acts as the buffer feedback node. An external resistor (R_{out}) shall be connected between this node and <i>cvideo_tvout</i> pin. In TVOUT Bypass mode, it acts as the video DAC output. A load resistor (R_{load}) shall be connected to the pin to ground. The nominal value of R_{load} is 1500 Ω .

⁽¹⁾ I = input; O = output; power = power pin

Table 9-310. TV Display Interface Pins (continued)

Pin Name	Type ⁽¹⁾	Description
cvideo_rset	I/O	External resistor (Rset) shall be connected to this pin to set the reference current of the video DAC. The value of the resistor depends on the mode of operation (Normal or TVOUT Bypass). In Normal mode, the nominal value for Rset is 4700 Ω . In TVOUT Bypass mode, the nominal value for Rset is 10000 Ω .
vdda_dac	Power	Analog supply voltage for the video DAC
vssa_dac	Power	Analog ground for the video DAC

CAUTION

- *cvideo_tvout* is a very high-frequency analog signal and must be routed with extreme care. As a result, the path of this signal must be as short as possible, and as isolated as possible from other interfering signals.
- During board design, the onboard traces and parasites must be matched for the channel. *cvideo_vfb* pin is the most sensitive pins in the TV out system. Low onboard resistance and capacitance is required for the traces that connect the Rout to the *cvideo_vfb* and *cvideo_tvout* pins. The resistance on those trace affects output impedance matching. Therefore, Rout resistor is suggested to be placed as close as possible to the device pins. The onboard traces lead to the TV OUT pin must have a characteristic impedance of 75 Ohm starting from the closest possible place to the device pin output.
- If the TV output is not used, the following configuration for the SD_DAC pins must be applied:
 - vdda_dac: Must be grounded
 - vssa_dac: Must be grounded
 - cvideo_rset: Must be floating, left unconnected
 - cvideo_tvout: Must be floating, left unconnected
 - cvideo_vfb: Must be floating, left unconnected
- To avoid current leakage, the following register bits must be set to 0:
 - DSS.DSS_VENC_CTRL[2] DAC_POWERDN_BGZ
 - DSS.VENC_OUTPUT_CONTROL[1] COMPOSITE_ENABLE
 - CONTROL.CTRL_CORE_SD_DAC_CONTROL[3] TVOUTBYPASS

Table 9-311 lists the typical values of the external components for different modes of the TV display interface.

Table 9-311. Typical Values for Rout, Rset, Rload, and Cout

	Composite, DC-Coupled	Composite, AC-Coupled	Bypass Mode	Unit
Rout	2700	2700	N/A	Ω
Rset	4700	4700	10,000	Ω
Rload	N/A	N/A	1500	Ω
Cout	N/A	≥ 220	N/A	μF

9.3.3 Video Encoder Integration

This section describes the integration of the VENC and video SD_DAC modules, and details clocks, resets, hardware requests, and power modes.

Figure 9-73 shows the integration of the VENC and SD_DAC in the device.

Figure 9-73. Video Encoder Integration

venc-004

Table 9-312 shows the interrupt requests generated by the SD_DAC.

Table 9-312. Video SD_DAC Interrupt Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
SD_DAC	SD_DAC_IRQ_TVINT	IRQ_CROSSBAR_184	-	Interrupt for TV load detection from SD_DAC
	SD_DAC_IRQ_TVSHORT	IRQ_CROSSBAR_185	-	Interrupt for TV short detection from SD_DAC

NOTE: The "Default Mapping" column in Table 9-312 shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see Section 14.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 14, *Control Module*. For more information about the device interrupt controllers, see Chapter 13, *Interrupt Controllers*.

Table 9-313 describes the various Video encoder and SD_DAC clocks.

Table 9-313. Video Encoder and SD_DAC Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Video encoder	VENC_CLK	DSS_GFCLK	PRCM	VENC interface clock
	CLK1X	VID_PIX_CLK (indirect)	PRCM	VENC functional clocks, generated on DSS level through division and gating. Refer to Section 9.1.2.2, Display Subsystem Clocks , for more details.
	CLK2X		DSS clock generator	
	CLK4X		DSS clock generator	
SD_DAC	CLKDAC	VID_PIX_CLK (indirect)	PRCM DSS clock generator	Functional clock for SD_DAC module. Gating control is available on DSS level. Refer to Section 9.1.2.2, Display Subsystem Clocks , for more details.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Video encoder SD_DAC	VENC_RESETB RESETZ	DSS_RST	PRCM	Reset signal from the PRCM module.

NOTE: For information about PRCM clock gating and management, see [Chapter 3, Power, Reset, and Clock Management](#).

- **Video encoder functional clocks:**

Three balanced clocks are provided to VENC module from DSS top level. Gating control for CLK4X clock is available through DSS.DSS_VENC_CTRL[0] VENC_CLOCK_4X_ENABLE bit (see [Section 9.1.2.2, Display Subsystem Clocks](#)).

Table 9-314. Digital Clock Division for the Video Encoder

VENC Clock Input	DSS Clock Generator Output
CLK4X	VID_PIX_CLK or 0 (gated)
CLK2X	VID_PIX_CLK/2
CLK1X	VID_PIX_CLK/4

NOTE: For proper video SD_DAC configuration, clock output CLK4X shall always be active by setting the DSS.DSS_VENC_CTRL[0] VENC_CLOCK_4X_ENABLE bit to 1 (see [Section 9.1.3, DSS Register Manual](#)).

CAUTION

DSS must be enabled first before VENC, in order the source clocks feeding VENC to be running before enabling the VENC.

VENC must be disabled before DSS, in order the source clocks feeding the VENC to be running before disabling the VENC. If DSS is disabled before VENC, the functional clocks will stop abruptly.

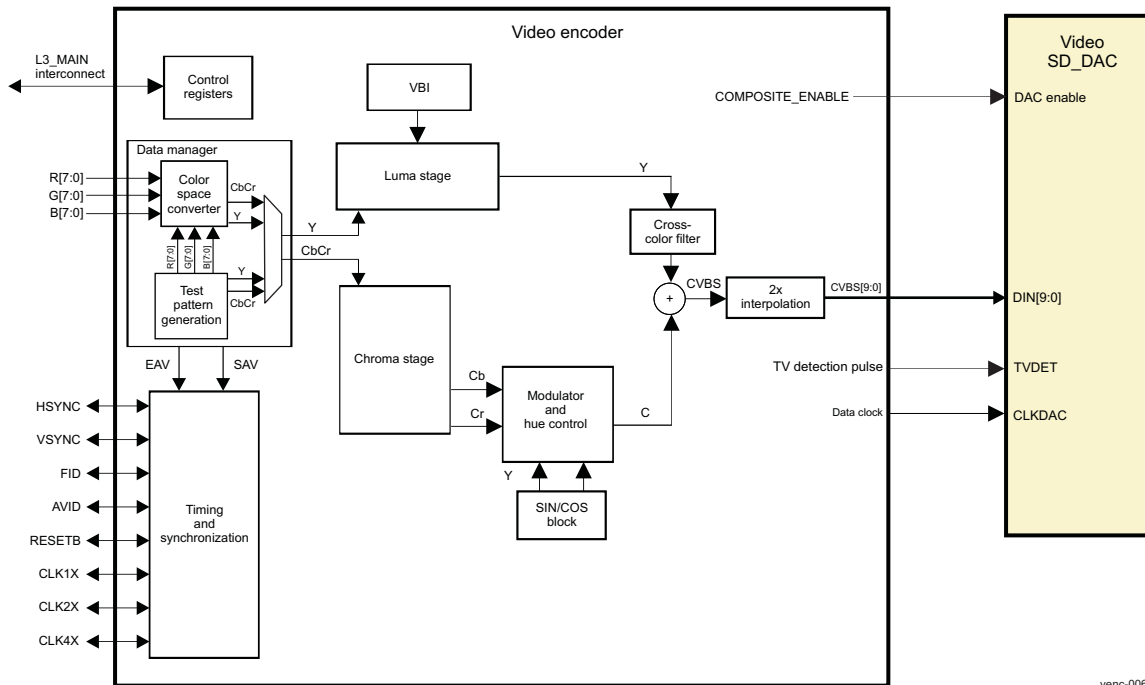

- **Video SD_DAC clock:**

The video data sent from VENC to SD_DAC is latched on the positive edge of the CLKDAC clock.

9.3.4 Video Encoder Functional Description

Figure 9-74 shows an overview of the video encoder architecture.

Figure 9-74. Video Encoder Architecture Overview

venc-006

9.3.4.1 Video Encoder Data Manager

The data manager allows user to select two sources of data inputs, by programming [VENC_F_CONTROL\[7:6\]](#) SVDS bitfield:

- Data coming from the Display Controller, when SVDS = 0x0.
- Data coming from the test pattern generation, when SVDS = 0x1 or 0x2 (default value).

The source is selected

9.3.4.1.1 Video Encoder Color Space Converter

In the display subsystem, the input format from the display controller is always 24-bit RGB coming from the display controller or the test pattern generation. The RGB-to-YCbCr color space converter converts the 24-bit RGB pixel data into 16-bit YCbCr 4:2:2 data.

9.3.4.1.2 Video Encoder Test Pattern Generation

For diagnostic purposes, the data manager can be forced to output 100/100 color bar RGB/YCbCr data. To use the test pattern generation, the [VENC_F_CONTROL\[7:6\]](#) SVDS bitfield shall be set to 0x1. If [VENC_F_CONTROL\[1:0\]](#) FMT bitfield is set to 0x0, then the 24-bits RGB test pattern data will be converted into 16-bit YCbCr 4:2:2 data by the Color Space Converter. Otherwise, if [VENC_F_CONTROL\[1:0\]](#) FMT bitfield is set to 0x2, then 16-bit YCbCr 4:2:2 test pattern data are outputted directly, the color space converted is bypassed. [Table 9-315](#) resume the test paten generator data.

Table 9-315. Video Encoder 100/100 Color Bar Table

COLOR	R	G	B	Y	Cb	Cr
White	255	255	255	235	128	128
Yellow	255	255	0	210	16	146
Cyan	0	255	255	170	166	16

Table 9-315. Video Encoder 100/100 Color Bar Table (continued)

Green	0	255	0	145	54	34
Magenta	255	0	255	106	202	222
Red	255	0	0	81	90	240
Blue	0	0	255	41	240	110
Black	0	0	0	16	128	128

9.3.4.2 Video Encoder Luma Stage

The luma stage includes a luma pipeline delay, luma shaping, 2x interpolation filter, and luma variable delay. The luma pipeline delay block is used to match luma path length to chroma path length. In the luma gain shaper, a programmable gain is first applied to the luminance data output. The luminance gain is defined by the [VENC_GAIN_Y](#) register. Horizontal sync, vertical sync, and setup insertion are then performed.

Black level and blank level are programmable through the [VENC_BLACK_LEVEL](#) and [VENC_BLANK_LEVEL](#) registers. All the transition edges of the luminance signal, such as sync edges and active video edges, are properly shaped and filtered to keep the bandwidth within the standards.

After all required components of the luminance signal are added, the resulting signal is low-passed and interpolated to 2x-pixel rate. This 2x interpolation simplifies the external analog reconstruction filter design and improves the signal-to-noise ratio.

9.3.4.3 Video Encoder Chroma Stage

The chroma stage includes a low-pass filter, first-stage 2x interpolation, chroma gain shaper, and second-stage 2x interpolation. A pair of programmable gains adjusts the time-multiplexed U/V signal. The gains for U and V are independently controlled by the [VENC_GAIN_U](#) and [VENC_GAIN_V](#) register bits.

9.3.4.4 Video Encoder Subcarrier and Burst Generation

The encoder uses a 32-bit subcarrier increment to synthesize the subcarrier. The value of the subcarrier increments required to generate the desired subcarrier frequency for NTSC and PAL format is found by:

$$S_CARR = \text{ROUND} ([F_{sc}/F_{CLK2X}] \times 2^{32})$$

where:

F_{sc} = Frequency of the subcarrier

F_{CLK2X} = Frequency of the internal video encoder

The [VENC_S_CARR](#) register controls the subcarrier frequency. The [VENC_C_PHASE](#) register controls the phase of the subcarrier. The phase of the color subcarrier is reset to [VENC_C_PHASE](#). [Table 9-316](#) presents the [VENC_S_CARR](#) register values depending the standard and pixel type used.

Table 9-316. VENC_S_CARR Register Recommended Values

Standard	Pixel Type	Subcarrier Frequency (Fsc) (MHz)	Fclkenc (MHz)	VENC_S_CARR Register Value (hexa)
NTSC-M, J	ITU-R601	3.579545	27	0x21F07C1F
PAL-M	ITU-R601	3.5756083125	27	0x21E6EFE3
PAL-B, D, G, H, I	ITU-R601	4.43361875	27	0x2A098ACB
NTSC-M, J	Square pixel	3.579545	24.5454 ⁽¹⁾	0x25555555
PAL-M	Square pixel	3.579561149	24.5454 ⁽¹⁾	0x1F15C01E
PAL-B, D, G, H, I	Square pixel	4.43361875	29.50 ⁽¹⁾	0x26798C0C

⁽¹⁾ In square pixel mode, an external clock generator is needed to provide sampling frequencies (49.09 MHz for NTSC square pixel or 59 MHz for PAL square pixel).

The color subcarrier reset has four modes:

- No reset
- Reset every two lines
- Reset every two fields
- Reset every eight fields

The [VENC_C_PHASE](#) register can be used to adjust the SCH (subcarrier to horizontal sync phase). The [VENC_BSTAMP_WSS_DATA\[6:0\]](#) BSTAP bit field sets the amplitude of the color burst.

Phase alternation line refers to the encoding scheme in which the subcarrier alternates between two phases every scan line. Setting to 0x1, the [VENC_M_CONTROL\[1\]](#) PAL bit enables phase alternation line encoding. Otherwise, a normal subcarrier is generated. Two possible alternation sequences are possible by setting the [VENC_M_CONTROL\[5\]](#) PALPHS bit.

9.3.4.5 Video Encoder Vertical Blanking Interval

9.3.4.5.1 Video Encoder Closed Caption Encoding

The encoder can be programmed to encode closed-caption (CC) data and extended data in the selected line. The data stream consists of 7-bit US-ASCII code and 1 odd-parity bit (see [Video Encoder Closed-Caption Data Format](#)).

Video Encoder Closed-Caption Data Format

MSB							LSB
Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Odd parity

The standard service encodes closed caption in both fields; the extended service encodes closed caption in even fields. When set to 1, the [VENC_L21_WC_CTL\[0\]](#) L21EN bit enables closed-caption encoding in odd fields. When set to 1, the [VENC_L21_WC_CTL\[1\]](#) L21EN bit enables closed-caption encoding in even fields.

To select the scan line where the CC data are encoded, program the [VENC_LN_SEL\[4:0\]](#) SLINE bit field.

CAUTION

The setting of the [VENC_LN_SEL\[4:0\]](#) SLINE bit field value depends on the video standard:

- PAL mode: Because there is a one-line offset, program the desired line number – 1. To activate the closed caption on line 21 (0x15), program the value $0x15 - 1 = 0x14$. The default value is $0x15 + 1 = 0x16$ (line 22).
- NTSC mode: Because there is a four-line offset, program the desired line number – 4. To activate the closed caption on line 21 (0x15), program the value $0x15 - 4 = 0x11$. The default value is $0x15 + 4 = 0x19$ (line 25).

The [VENC_LN_SEL\[25:16\]](#) LN21_RUNIN bit field should be kept at reset value (0x10B). Four closed-caption data registers contain the data to be encoded. The [VENC_LINE21\[15:8\]](#) L21O and [VENC_LINE21\[7:0\]](#) L21O bit fields contain the first and the second bytes, respectively, of closed-caption data to be encoded in the odd field. The [VENC_LINE21\[31:24\]](#) L21E and [VENC_LINE21\[23:16\]](#) L21E bit fields contain the first and the second bytes, respectively, of data to be encoded in the even field.

Immediately after the closed-caption data is written to the registers, in either the odd field or even field, the corresponding closed-caption status bit ([VENC_STATUS\[4\]](#) CCE or [VENC_STATUS\[3\]](#) CCO) is reset to 0 to indicate that the closed-caption data is available in the closed-caption data registers and yet to be encoded.

Immediately after the closed-caption data is encoded, the `VENC_STATUS[4]` CCE bit or the `VENC_STATUS[3]` CCO bit is set to 1 to indicate that the closed-caption data has been encoded and is ready to accept new data. As seen in [Figure 9-75](#), a null character is automatically inserted if the closed-caption data is not written to the closed-caption data registers in time for encoding.

The running clock frequency is controlled by the `VENC_CC_CARR_WSS_CARR[15:0]` FCC bit field which should be kept at reset value (0x2631) to get 5034960.5Hz (32xfline) for NTSC-601. The closed-caption running clock common frequencies are detailed in [Table 9-317](#).

Table 9-317. Video Encoder Closed-Caption RunClock Frequency Settings

	NTSC-601	PAL-601	NTSC Square Pixel	PAL Square Pixel
<code>VENC_CC_CARR_WSS_CARR[15:0]</code> FCC bit field value	0x2631	0x25ED	0x2A03	0x22B6

The closed-caption data is encoded in nonreturn-to-zero (NRZ) format. Additionally, the data translates to the IRE scale as follows:

- 0 = 0 IRE
- Sync pulse = -40 IRE
- 1 = 50 IRE

[Figure 9-75](#) shows the parameters of closed-caption line data implemented in different standards.

Figure 9-75. Video Encoder Closed Captioning Timing

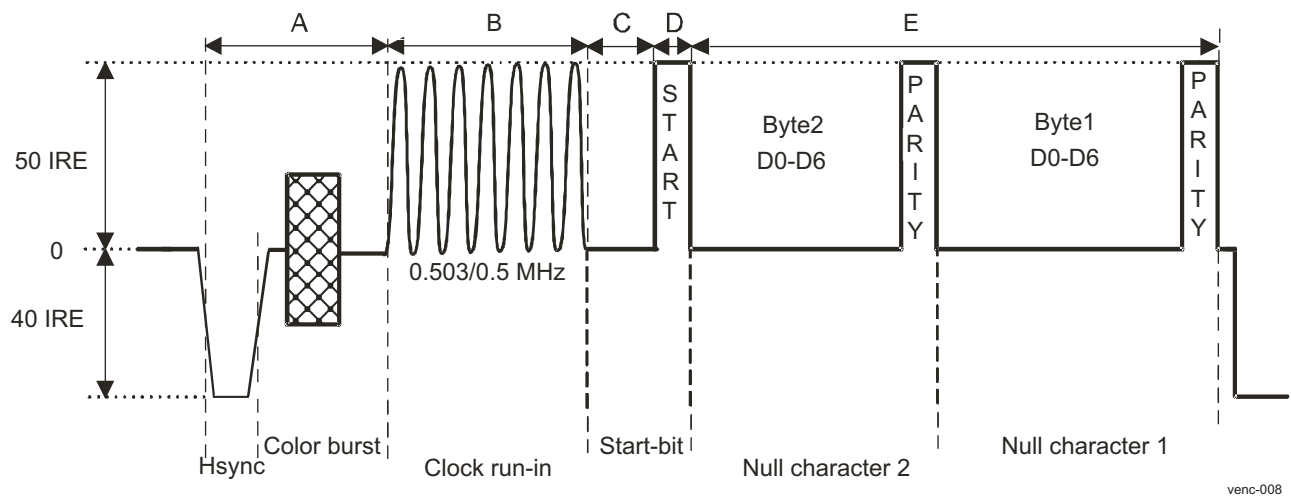

Table 9-318. Video Encoder Closed-Caption Standard Timing Values

Intervals	Description	Timing Values for Encoding			Timing Values for Decoding		
		Minimal	Nominal	Maximal	Lower Bound	Nominal	Upper Bound
A	HSYNC to clock running	10.250 μ s	10.500 μ s	10.750 μ s	10.000 μ s	10.500 μ s	11.000 μ s
B	Clock running		12.910 μ s			12.910 μ s	
C	Clock running to third start bit		3.972 μ s			3.972 μ s	
D	Start bit		1.986 μ s			1.986 μ s	
E	Data characters		31.778 μ s			31.778 μ s	

NOTE:

- The interval A is controlled by the [VENC_LN_SEL\[25:16\]](#) LN21_RUNIN bit field.
- The interval B is controlled by [VENC_CC_CARR_WSS_CARR\[15:0\]](#) FCC bit field.

All timing values listed in [Table 9-318](#) are measured from the mid-point (half amplitude) on all edges.

For a complete description of closed-caption standard including CGMS-A copy protection, see the CEA-608-x standard.

9.3.4.5.2 Video Encoder Wide-Screen Signaling (WSS) Encoding

The encoder can embed data, encoded in accordance with the IEC61880 and ITU-R 1119 data insertion standard, within the vertical blanking interval.

The encoder supports WSS data insertion on line 20 of every frame in the NTSC format. WSS data insertion is enabled by activating the [VENC_L21_WC_CTL\[14:13\]](#) EVEN_ODD_EN bit and by programming the [VENC_BSTAMP_WSS_DATA\[27:8\]](#) WSS_DATA bit field.

The running clock frequency is controlled by the [VENC_CC_CARR_WSS_CARR\[31:16\]](#) FWSS bit field. The wide-screen signaling running clock common frequencies are detailed in [Table 9-319](#)

Table 9-319. Video Encoder Wide-Screen Signaling RunClock Frequency Settings

	NTSC-601	PAL-601	NTSC Square Pixel	PAL Square Pixel
VENC_CC_CARR_WSS_CARR[31:16] FWSS bit field value	0x043F	0x2F72	0x04AC	0x2B6D

To select the line where the WSS data are encoded, program the [VENC_L21_WC_CTL\[12:8\]](#) LINE bit field.

CAUTION

The setting of the [VENC_L21_WC_CTL\[12:8\]](#) LINE bit field value depends on the video standard:

- PAL mode: Because there is a one-line offset, program the desired line number – 1. The recommended value on line 23 is $0x16 + 1 = 0x17$. The default value is $0x14 + 1 = 0x15$ (line 21).
- NTSC mode: Because there is a four-line offset, program the desired line number – 4. The recommended value on line 20 is $0x10 + 4 = 0x14$. The default value is $0x14 + 4 = 0x18$ (line 24).

The WSS encoding block assumes that a full 10-bit video range is used to determine the 70 percent of peak-white amplitude of a logic-1 bit. The encoder also supports WSS data insertion on line 23 in the PAL format. Both waveforms are shown in [Figure 9-76](#).

Figure 9-76. Video Encoder WSS Timing

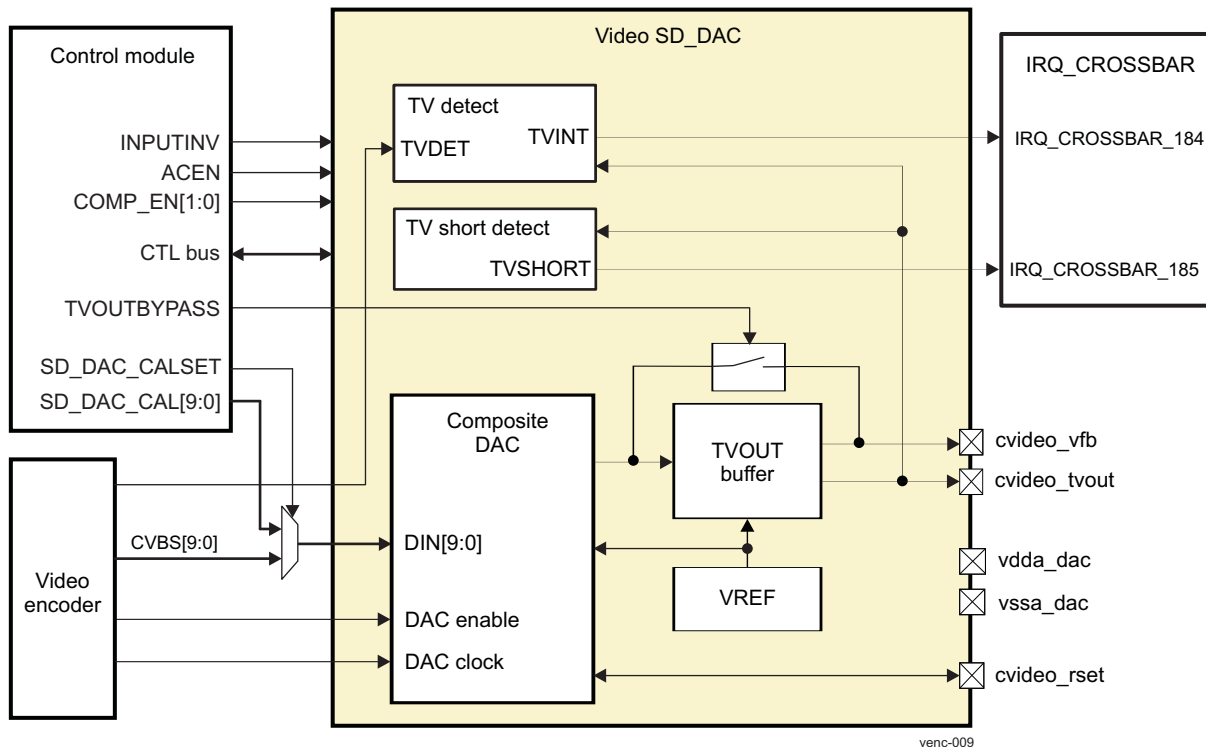

venc-007

9.3.4.6 Video Encoder SD_DAC

Figure 9-77 shows the architecture of the 10-bit video SD_DAC.

Figure 9-77. Video SD_DAC Architecture

The display subsystem provides the necessary control signals to interface the memory frame buffer directly to external displays. A 10-bit video SD_DAC is used to generate the video analog signal. The video SD_DAC also includes a TV detection/disconnection and power-down mode features.

9.3.4.6.1 Video SD_DAC DC/AC Coupled TV Load

The 10-bit video DAC supports both DC-coupled and AC-coupled TV loads. The CONTROL.CTRL_CORE_SD_DAC_CONTROL[2] ACEN bit is used to define which output coupling is used. This bit is the first one to be programmed according to the TV load on the PCB board.

NOTE: When DC coupling is used, there is a DC offset at the TVOUT output.

9.3.4.6.2 Video SD_DAC TV Detection/Disconnection Pulse Generation and Use

9.3.4.6.2.1 TV Detection/Disconnection Pulse Generation

The TV detect block is an integral part of the video SD_DAC module.

NOTE:

- The TV disconnection feature is recommended for power saving purpose. The TV detection/disconnection is only operational when video out is active. Therefore to detect cable connection automatically, it is necessary to periodically activate the video out to test for cable presence.
-

This block compares the output (*cvideo_tvout*) to reference voltage, to sense the condition of the load. To operate, the TV detect requires two digital signals, TVACEN and TVDET. The TVACEN signal indicates to both TVOUT buffer and the TV detect circuit, if the load is AC or DC coupling, to adjust accordingly. TVDET is a digital pulse at the frequency of the TV sync pulses. The operation of the circuit is based on the difference in voltage levels in the output of the buffer depending of the load status. The TV detect block compares the output against a couple of references and the result is latched at the start of every sync pulse. The status is read later in with the TVDET pulse rising edge.

The following registers are used to set the TV detection/disconnection pulse:

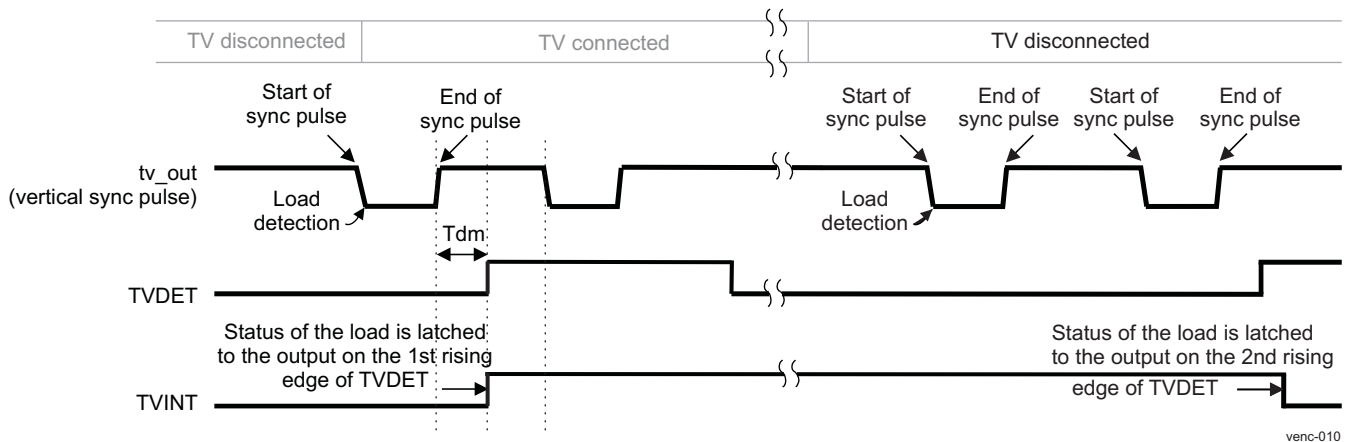

- The [VENC_TVDETGP_INT_START_STOP_X](#) register defines which pixels are used to start and stop the pulse inside their respective line.
- The [VENC_TVDETGP_INT_START_STOP_Y](#) register defines which lines are used to start and stop the pulse.
- The [VENC_GEN_CTRL\[0\]](#) EN bit enables or disables the TVDET pulse (0: Disable; 1: Enable).
- The [VENC_GEN_CTRL\[16\]](#) TVDP bit sets the TVDET pulse polarity (0: Active low; 1: Active high).

9.3.4.6.2.2 Recommended TV Detection/Disconnection Pulse Waveform

To enable the detection/disconnection of the load, the circuit requires that the TVDET pulse resembles the following waveform. By using the video encoder registers, the TVDET pulse polarity, start and stop is programmable. The only critical parameter is *Tdm*, which should be longer than the delay through the DAC and TVOUT buffer, which is at least 750 ns.

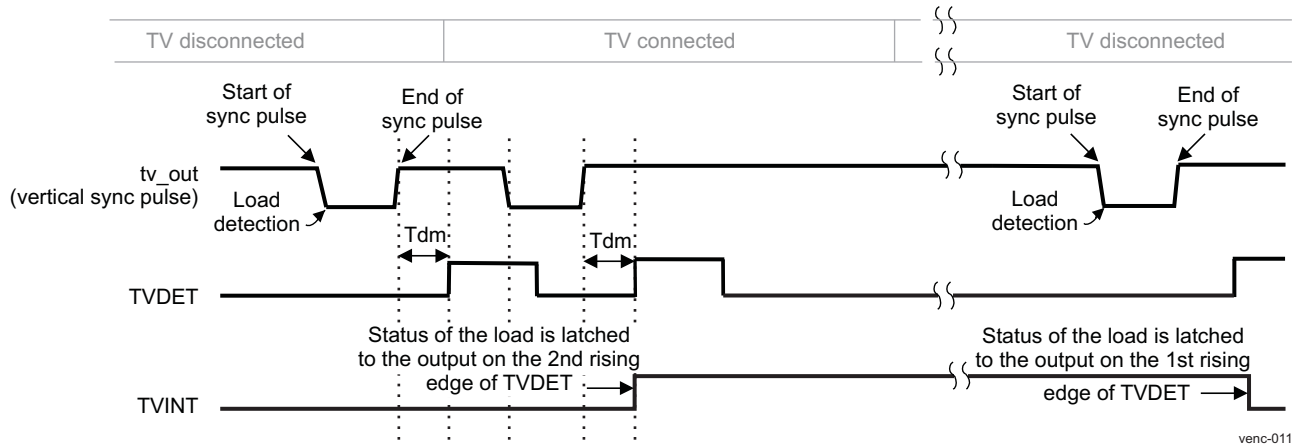

If DC-coupling is selected, the TVINT output signal for TV detection is latched at the rising edge of the first TVDET signal but the TVINT output signal for TV disconnection is latched after the next rising edge of the TVDET signal that happens during the next VSYNC timing. [Figure 9-78](#) shows the waveforms for the DC-coupling TV detect pulse (TVDET) when load is connected and disconnected.

Figure 9-78. Video SD_DAC DC-Coupling TV Detect Waveforms for TV Connected and Disconnected

If AC-coupling is selected, the TVINT output signal for TV detection is latched after the next rising edge of the TVDET signal that happens during the next VSYNC timing but the TVINT output signal for TV disconnection is latched at the rising edge of the first TVDET signal. [Figure 9-79](#) shows the waveforms for the ac-coupling TV detect pulse (TVDET) when load is connected and disconnected.

Figure 9-79. Video SD_DAC AC-Coupling TV Detect Waveforms for TV Connected and Disconnected

NOTE:

- When setting the `VENC_TVDETGPI_INT_START_STOP_X` register, software users must ensure that the TVDET signal is in the active area. To avoid any problem, the TVDET signal must not be longer than one line.
- The activation of the TVDET signal will not have a visual impact on the `cvideo_tvout` output signal.

9.3.4.6.2.3 TV Detection/Disconnection Use

The TV-detection/TV-disconnection is based on the difference in voltage levels in the output of the TV buffer depending on the load status. The operation is slightly different for AC and for DC operation.

- For DC operation, the `cvideo_tvout` voltage is compared against a voltage reference that makes the comparator trigger in each sync pulse while the load is connected. For DC-coupling mode, see [Figure 9-80](#).
- For AC operation, the `cvideo_tvout` voltage is compared against a voltage reference that makes the comparator trigger in each sync pulse while the load is disconnected. For AC-coupling mode, see [Figure 9-81](#).

In both cases, the TVINT output signal produces a logic 1 when a load is connected, and a logic 0 when a load is disconnected.

NOTE: Because the video SD_DAC and the video encoder must be awake for connection detection, consider that the video SD_DAC can take up to 10 μ s to wake up.

Figure 9-80. Video SD_DAC Signal Waveform Proposal for TV Detection/Disconnection in DC-Coupling Mode

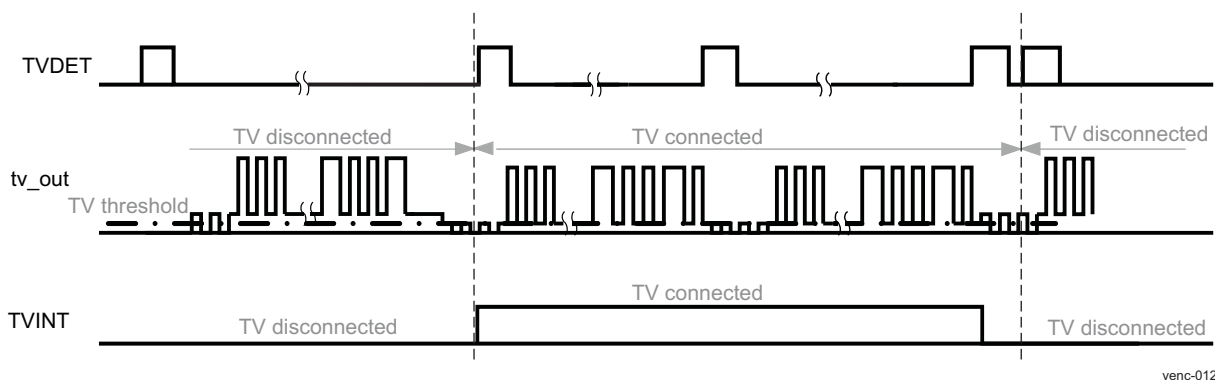

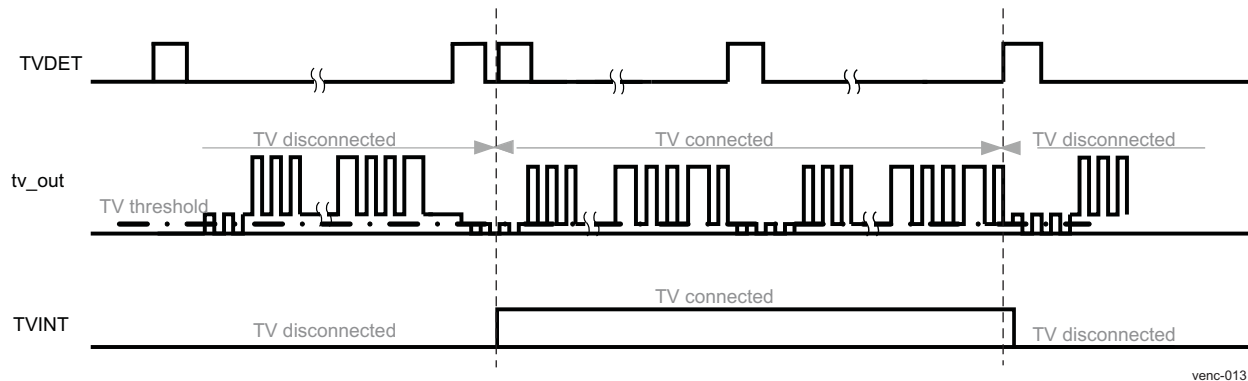

Figure 9-81. Video SD_DAC Signal Waveform Proposal for TV Detection/Disconnection in AC-Coupling Mode

9.3.4.6.3 Video SD_DAC TV Short Detection

A TV short-detection circuit, which can detect a short circuit condition at *cvideo_tvout* output during the vertical sync pulse, is integrated in the video SD_DAC module (see [Figure 9-77](#)).

When the output is shorted to ground, the TVSHORT signal turns to logic high. The TVSHORT signal is internally mapped in the device to allow interrupt generation (see [Section 9.3.3, Video Encoder Integration](#)). TV short detection is valid after two video frames pass with the short/no-short condition.

TV short detection has priority over TV load detection (see [Section 9.3.4.6.2.2, TV Detection/Disconnection Pulse Generation and Use](#)). Whenever a short is detected (with load or no-load), TVINT output is masked as long as the short remains. When released, the TV load detection resumes.

CAUTION

If TV short is detected, the video SD_DAC must be powered down by setting the DSS.DSS_VENC_CTRL[2] DAC_POWERDN_BGZ bit to 0.

9.3.4.6.4 Video SD_DAC Normal Mode

The normal mode of operation (DAC + TVOUT buffer) is the default mode of the video SD_DAC, with the CONTROL_CTRL_CORE_SD_DAC_CONTROL[3] TVOUTBYPASS bit set to 0 at device reset. The output of the DAC is internally connected to the TVOUT buffer, which can drive the composite video signal to 75 Ω load directly. For information about external connectivity, see [Section 9.3.2, Video Encoder Environment](#).

In normal mode, higher input values of the DAC code result in lower output voltage levels by default, because of the inverting configuration of the TVOUT buffer.

9.3.4.6.5 Video SD_DAC Bypass Mode

The 10-bit video SD_DAC has a TVOUT buffer bypass mode that turns off the TVOUT buffer and redirects directly the DAC output to the *cvideo_vfb* pin.

This bypass mode is activated by setting the CONTROL_CTRL_CORE_SD_DAC_CONTROL[3] TVOUTBYPASS bit to 1. The reset value of the TVOUTBYPASS bit is 0 (that is, the TVOUT buffer is not bypassed).

NOTE: In bypass mode:

- *cvideo_rset* pin requires a Rset resistor connected to the ground. The typical value of the Rset resistor is 10000 Ω .
- *cvideo_vfb* pin requires a Rload resistor connected to the ground. The typical value of the Rload resistor is 1500 Ω .

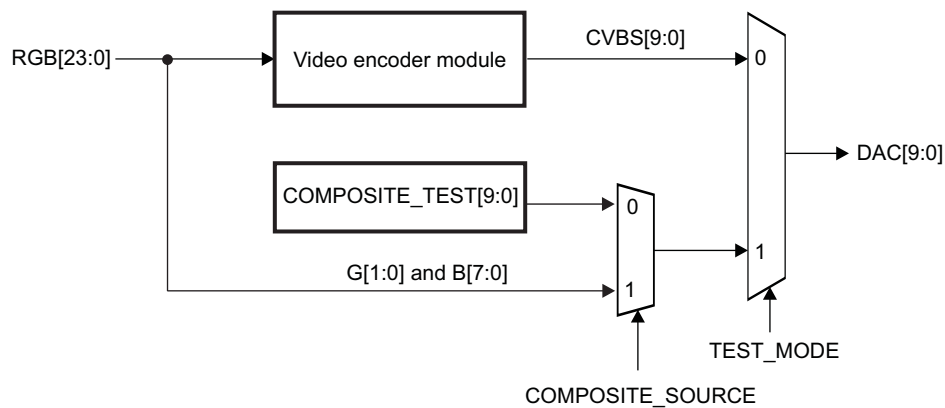

CAUTION

- The TV detect feature is not available in bypass mode.
- In bypass mode, an external video amplifier is needed on the *cvideo_vfb* pin.

9.3.4.6.6 Video SD_DAC Test Mode

10-bit external or internal datas values can be used to stimulate the DAC in debug mode, as shown in Figure 9-82.

Figure 9-82. Video SD_DAC Test Mode in Composite Video Mode

- Setting to 0x1 the [VENC_OUTPUT_CONTROL\[4\]](#) TEST_MODE bit will place the DAC under test.
- By setting the value of the [VENC_OUTPUT_CONTROL\[6\]](#) COMPOSITE_SOURCE bit to:
 - 0x0: the DAC input is coming from [VENC_OUTPUT_TEST\[9:0\]](#) COMPOSITE_TEST bit field
 - 0x1: the DAC input is coming from the display controller G[1:0], B[7:0]. To perform this configuration, the video encoder shall be configured to generate correct timing signals with the display controller, even if the video encoder is bypassed from data path perspective.

9.3.4.6.7 Video SD_DAC Power Management

After device reset, the DSS.DSS_VENC_CTRL[2] DAC_POWERDN_BGZ bit is set to 0, and the video SD_DAC is in power-down state.

[Table 9-320](#) lists the possible SD_DAC power-management configurations and the corresponding register settings.

Table 9-320. Video SD_DAC Power Management Configurations

Power Management Controls				
DSS_VENC_CTRL [2] DAC_POWERDN_BGZ bit	VENC_OUTPUT_CONT ROL [1] COMPOSITE_ENABLE bit	CTRL_CORE_SD_DAC CONTROL [3] TVOUTBYPASS bit	CTRL_CORE_SD_DAC CONTROL [2] ACEN bit	Power State
0	x	x	x	Total power down. Bandgap powered down.
1	0	x	x	Standby (analog in power down except bandgap/LDO)
1	1	0	0	Full power up in DC normal mode
1	1	0	1	Full power up in AC normal mode
1	1	1	x	Full power up in TVOUT bypass mode (DAC-only mode)

9.3.5 Video Encoder Programming Guide

9.3.5.1 Video Encoder Low-level Programming Models

9.3.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the video emodule is to be used for the first time after a device reset. This initialization of the surrounding modules is based on the integration and environment of the video encoder (for more information, see [Section 9.3.2](#) and [Section 9.3.3](#)).

CAUTION

DSS must be enabled first before VENC, in order the source clocks feeding VENC to be running before enabling the VENC.

VENC must be disabled before DSS, in order the source clocks feeding the VENC to be running before disabling the VENC. If DSS is disabled before VENC, the functional clocks will stop abruptly.

Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management
Control module	Module-specific pad muxing and configuration must be set in the control module. See Chapter 14, Control Module .
Display controller	See Section 9.2, Display Controller , for more information about the configuration.

9.3.5.1.2 Video Encoder Global Initialization

9.3.5.1.2.1 Main Sequence—Start Video Encoder

[Start Video Encoder](#) details the procedure to initialize the video encoder after a power-on or software reset.

Start Video Encoder

Step	Register/Bit Field/Programming Model	Value
Perform a video encoder reset.	See Section 9.3.5.1.2.3 .	
Save the DSS VP1 IRQ enable register value (DSS VP interrupts context).	DISPC_VP1_IRQENABLE	
Reset all DSS VP1 IRQ.	DISPC_VP1_IRQENABLE	0x00
Configure the video encoder registers for PAL 601 or NTSC 601.	See Table 9-321 .	0x--
Set the input video source and format.	VENC_F_CONTROL	See Table 9-321 .
Set the synchronization modes.	VENC_SYNC_CTRL	See Table 9-321 .
Configure the TV connection detection (optional).	See Section 9.3.5.1.2.4 .	
Enable the composite video signal output.	See Section 9.3.5.1.2.6 .	
Enable the display controller pipeline	See the display controller programming guide	
Wait until the first VSYNC pulse signal.		
Clear the SYNCLOST interrupt.	DISPC_VP1_IRQSTATUS[4] VPSYNCLOST_IRQ	0x1
Restore the DSS IRQ enable register.	DISPC_VP1_IRQENABLE	0x--

9.3.5.1.2.2 Main Sequence—Stop Video Encoder

[Start Video Encoder](#) details the procedure to stop the output of the composite signal.

Start Video Encoder

Step	Register/Bit Field/Programming Model	Value
Perform TV disconnection detection (optional).	See Section 9.3.5.1.2.5 .	
Disable the composite video signal output.	See Section 9.3.5.1.2.7 .	

9.3.5.1.2.3 Subsequence—Video Encoder Software Reset

[Reset Video Encoder](#) details the reset procedure.

Reset Video Encoder

Step	Register/Bit Field/Programming Model	Value
Activate reset.	VENC_F_CONTROL[8] RESET	0x1
Wait until reset is complete.	VENC_F_CONTROL[8] RESET	0x0

NOTE: Before changing the standard (NTSC or PAL) and related registers, a software reset is required to properly initialize the VENC module.

9.3.5.1.2.4 Subsequence—TV Connection Detection

[TV Connection Detection Subsequence](#) details the TV connection detection procedure.

TV Connection Detection Subsequence

Step	Register/Bit Field/Programming Model	Value
Set the pixel TV detection start and stop value.	VENC_TVDETP_INT_START_STOP_X	0x--
Set the line TV detection start and stop value.	VENC_TVDETP_INT_START_STOP_Y	0x--
Set the polarity of TV detection.	VENC_GEN_CTRL[16] TVDP	0x--
Enable TV detection.	VENC_GEN_CTRL[0] EN	0x1
Enable the composite video signal output.	See Section 9.3.5.1.2.6 .	
Wait until TVINT = 1.		

CAUTION

- If ac coupling is selected, two TVDET pulses are required to set high the TVINT signal. Due to the internal logic of the video SD_DAC, the TVINT signal is generated after the next positive edge of the TVDET signal that happens during the next VSYNC timing.
- If dc coupling is selected, only one TVDET pulse is required to set high the TVINT signal.

9.3.5.1.2.5 Subsequence—TV Disconnection Detection

[TV Disconnection Detection Subsequence](#) details the TV disconnection detection procedure.

TV Disconnection Detection Subsequence

Step	Register/Bit Field/Programming Model	Value
Set the pixel TV detection start and stop value.	VENC_TVDETGP_INT_START_STOP_X	0x--
Set the line TV detection start and stop value.	VENC_TVDETGP_INT_START_STOP_Y	0x--
Set the polarity of TV detection.	VENC_GEN_CTRL[16] TVDP	0x--
Enable TV disconnection.	VENC_GEN_CTRL[0] EN	0x1
Wait until TVINT = 0.		

CAUTION

- If dc coupling is selected, two TVDET pulses are required to set low the TVINT signal. Because of the internal logic of the video SD_DAC, the TVINT signal is generated after the next positive edge of the TVDET signal that happens during the next VSYNC timing.
- If ac coupling is selected, only one TVDET pulse is required to set low the TVINT signal.

9.3.5.1.2.6 Subsequence—Enable Video Composite Signal Output

[Enable Video Composite Signal Output](#) details the procedure to enable the video composite signal output.

Enable Video Composite Signal Output

Step	Register/Bit Field/Programming Model	Value
Enable the composite video signal output.	VENC_OUTPUT_CONTROL	0x0000 000A
Power up the vdda_dac voltage for SD_DAC and the TVOUT buffer.		

9.3.5.1.2.7 Subsequence—Disable Video Composite Signal Output

[Disable Video Composite Signal Output](#) details the procedure to enable the video composite signal output.

Disable Video Composite Signal Output

Step	Register/Bit Field/Programming Model	Value
Disable the composite video signal output.	VENC_OUTPUT_CONTROL	0x00000000
Power down the vdda_dac voltage for SD_DAC and the TVOUT buffer.		

9.3.6 Video Encoder Use Case and Tips

9.3.6.1 Video Encoder Register Settings

[Table 9-321](#) lists the register values to use in typical video encoder applications.

These values are validated programming values only for NTSC 601 and PAL 601 standards with a TV display resolution of 720×488 and 720×576, respectively.

Table 9-321. Video Encoder Register Programming Values

Register Name	NTSC 601	PAL 601
VENC_F_CONTROL	0x00000000	0x00000000
VENC_VIDOUT_CTRL	0x00000001	0x00000001

Table 9-321. Video Encoder Register Programming Values (continued)

Register Name	NTSC 601	PAL 601
VENC_SYNC_CTRL	0x00008040	0x00000040

VENC_OUTPUT_CONTROL	0x0000000A	0x0000000A
VENC_OUTPUT_TEST	0x00000000	0x00000000

NOTE: The following display controller fields must be programmed to the NTSC 601 video standard:

- DISPC_VP1_SIZE_SCREEN[11:0] PPL = $720 - 1 = 719 = 0x2CF$
- DISPC_VP1_SIZE_SCREEN[27:16] LPP = $(488/2) - 1 = 243 = 0xF3$

The following display controller fields must be programmed to the PAL 601 video standard:

- DISPC_VP1_SIZE_SCREEN[11:0] PPL = $720 - 1 = 719 = 0x2CF$
- DISPC_VP1_SIZE_SCREEN[27:16] LPP = $(576/2) - 1 = 287 = 0x11F$

For both standards, the base addresses should be handle as follow:

- DISPC_GFX1_BA0 or DISPC_VID_BA0 = Base address of even bit field data
- DISPC_GFX1_BA1 or DISPC_VID_BA1 = Base address of odd bit field data

SLX is an abbreviation for SonicsLX®.

Topic	Page
10.1 Interconnect Overview	3699
10.2 L3_MAIN Interconnect	3702
10.3 L4 Interconnects	3844

10.1 Interconnect Overview

10.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- **Initiator:** Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).
- **Target:** Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

NOTE: A module can have several separate ports; therefore, a module can be an initiator and a target.

- **Agent:** Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- **Interconnect:** The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it. Quality of service (QoS) is guaranteed.
- **Register target (RT):** Special TA used to access the interconnect internal configuration registers
- **Data-flow signal:** Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behaviour is defined by the protocol semantics.
- **Sideband signal:** Any signal whose behaviour is not associated to a precise transaction or data flow.
- **Out-of-band error:** Any signal whose behaviour is associated to a device error-reporting scheme, as opposed to in-band errors.

NOTE: Interrupt requests and DMA requests are not routed by the interconnect in the device.

- **Firewall:** A programmable feature integrated in a target agent or L4 interconnect to prevent unauthorized access to or from a module. A firewall can be configured using three criteria:
 - Initiator requesting access
 - Address space access
 - Type of access
- **ConnID:** Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for firewall and error-logging mechanism.
- **Firewall comparison mechanism:** A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- **MCcmd qualifier:** Command bus that indicates the type of transfer requested. [Table 10-1](#) lists the commands encoded. For information specific to L3 Interconnect error logging, see *L3 Firewall Error-Logging Registers*

Table 10-1. MCcmd Qualifier Description

MCcmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Read link
1 0 1	Write nonposted
1 1 0	Write conditional

Table 10-1. MCmd Qualifier Description (continued)

MCmd[2:0]	Transaction Type
1 1 1	Write broadcast

- MReqInfo qualifier: Three MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 10-2](#).

Table 10-2. MReqInfo Qualifier Description

Qualifiers	Description
MReqType	0: Data access 1: Opcode fetch
MReqSupervisor	0: User mode 1: Supervisor mode
MReqDebug	0: Functional access 1: Debug access

- Register that configures the combination of the MReqInfo, allowing access permission to the target module (TM) based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction, as described in [Table 10-3](#).

Table 10-3. SResp Qualifier Description

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

- MTagID: Interconnect qualifier generated by the L3_MAIN masters which purpose is to identify whether reordering is allowed or not relative to other transactions. Strong ordering is ensured by using same MTagID values between transactions. Reordering is allowed by using different MTagID values between transactions.
The MTagID values may or may not be changed by the interconnect, but the intended reordering restriction must match what came from the master. In other words, the interconnect allocates dynamically MTagID values in such a way that the intended reordering restrictions from each master are honored.

10.1.2 Architecture Overview

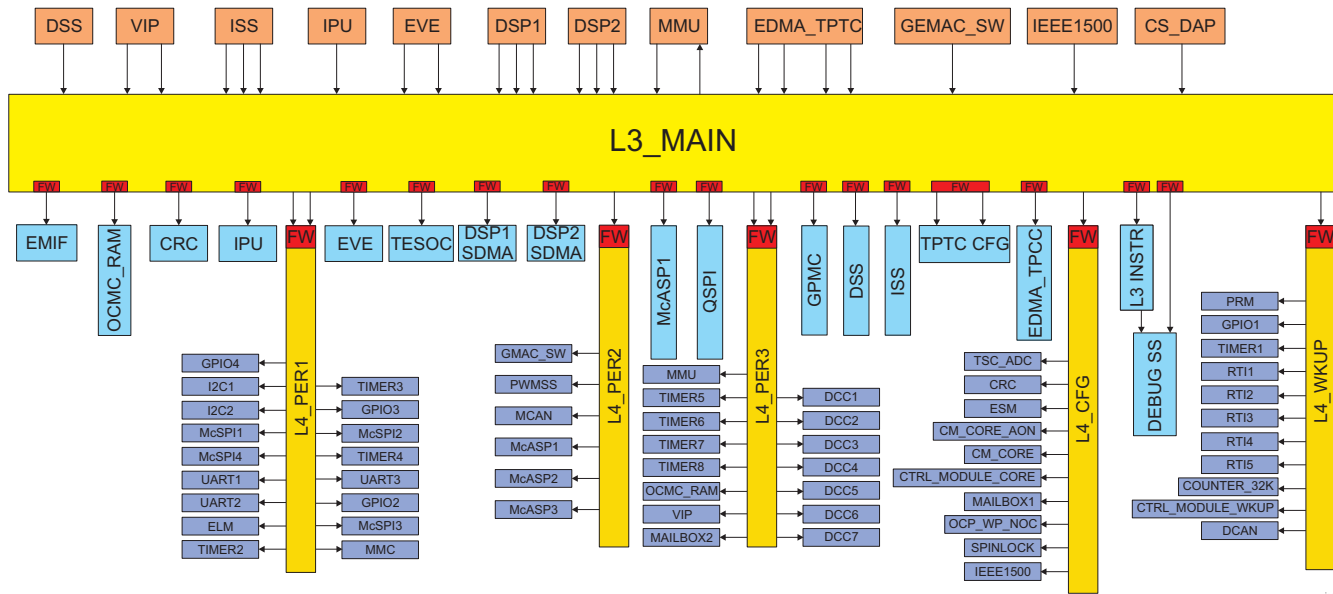

The device memory hierarchy includes four levels:

- L1 and L2 memory spaces are associated with the IPU and DSP subsystems.
- The chip-level interconnect consists of one L3 interconnect and five L4 interconnects. It enables communication among the modules and subsystems in the device.

[Figure 10-2](#) shows an overview of the L3 and L4 interconnect architecture.

NOTE: CRC, TESOC, ESM and DCC1 to DCC7 are not supported on the DM50x family of devices.

Figure 10-1. Interconnect Overview

- L3 handles many types of data transfers, especially exchanges with system-on-chip/external memories. L3 transfers data with a maximum width of 128 bits from the initiator to the target. The L3 interconnect is a little-endian platform
- The L4 is composed of the following:
 - L4_CFG: Includes the majority of the firewall configuration interface for level 3 (L3) system modules and peripheral interconnect;
 - L4_PER: Includes the main peripherals that require direct memory access access. L4_PER has three instances L4_PER1, L4_PER2 and L4_PER3. These three instances has the following ports connecting them to the L3_MAIN interconnect:
 - L4_PER1_P1, L4_PER1_P2
 - L4_PER2_P1
 - L4_PER3_P1, L4_PER3_P2
 Through the L3_MAIN interconnect, different initiators can access each of these ports. For information about which port can be accessed by each initiator, see [Figure 10-3](#).
 - L4_WKUP: Includes peripherals attached to the WKUP power domain.

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access, depending on the characteristics of the module.

To unauthorize a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default settings are fully functional; they enable all possible functional data paths and a minimal default protection setting.

10.2 L3_MAIN Interconnect

This section describes the L3_MAIN interconnect and its components. With the exception of register points, each component includes functions for the request and response networks.

10.2.1 L3_MAIN Interconnect Overview

The L3_MAIN interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

The main features of the L3_MAIN interconnects are:

- NIUs: Master NIUs for the IAs and slave NIUs for the TAs
- A partially depleted cross-bar exchange network
- A special internal slave NIU for accessing L3_MAIN interconnect configuration registers
- QoS management for real-time hardware operators, while maintaining optimal memory latency for CPU access to memory resources
- True little-endian platform
- Transaction errors tracking and logging registers
- All signaling support for chip-level power-management infrastructure
- One interrupt line signaling transaction error
- One interrupt line for reporting statistical events on the L3_MAIN interconnect

Figure 10-2 shows an overview of the L3 interconnect and the peripherals attached to it.

NOTE: CRC and TESOC are not supported on the DM50x family of devices.

Figure 10-2. L3_MAIN Interconnect Overview

10.2.2 L3_MAIN Interconnect Integration

Table 10-4 through Table 10-6 summarize the integration of the module in the device.

Table 10-4. Integration Attributes

Module Instance	Attributes
	Power Domain
L3_MAIN	PD_COREAON

Table 10-5. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3_MAIN	L3_CLK1	L3MAIN1_L3_GICKL	PRCM	Functional and interface clock
	L3_CLK2	L3INSTR_L3_GICKL	PRCM	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3_MAIN_MAIN	L3_CORE_RET_RST	CORE_PWRON_RET_RST	PRCM	Reset of L3_MAIN interconnect registers
	L3_CORE_RST	CORE_RST	PRCM	Reset of L3_MAIN interconnect

Table 10-6. Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
L3_MAIN	L3_MAIN_IRQ_DBG_ERR	IRQ_CROSSBAR_4	DSP1_IRQ_35 DSP2_IRQ_35 EVE_IRQ_3	Interrupt indicating debug error occurrence.
	L3_MAIN_IRQ_APP_ERR	IRQ_CROSSBAR_5	DSP1_IRQ_36 DSP2_IRQ_36 EVE_IRQ_4	Interrupt indicating application error occurrence.
	L3_MAIN_IRQ_STAT_ALARM	IRQ_CROSSBAR_11	DSP1_IRQ_42 DSP2_IRQ_42	Statistic collector alarm interrupt.

NOTE: The “Default Mapping” column in [Table 10-6 Hardware Requests](#) shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#).

10.2.3 L3_MAIN Interconnect Functional Description

10.2.3.1 Module Use in L3_MAIN Interconnect

The L3_MAIN interconnect network components have ConnID values for each master NIU or slave NIU. The ID uniquely identifies the master NIU or the slave NIU for an interconnect transfer. The interconnect uses ConnIDs for a number of purposes, including the following:

- Slave NIUs for error logging
- Power disconnect slave NIU for error logging
- FLAGMUXes for masking interrupts
- Statistic Collectors (STATCOLL) for configuring and monitoring: The STATCOLL components compute the traffic statistics within a user-defined window and periodically report to the user through the debug interface.
- Bandwidth regulator for configuration

10.2.3.2 Module Distribution

Master NIUs and slave NIUs provide the interface to connect the different modules to their associated interconnect.

[Table 10-7](#) and [Table 10-8](#) list all modules and subsystems with their associated agents. The agents are listed for each L3_MAIN interconnect domain.

10.2.3.2.1 L3_MAIN Interconnect Agents

Any initiator or target core is connected to the L3_MAIN interconnect through an NIU. NIUs act as entry points to the L3_MAIN interconnect, and also include various programming registers. [Table 10-7](#) lists the supported master NIU ports.

Table 10-7. Master NIUs

Master NIU	Description
DSS1_INIT	Display SubSystem initiator port. One 128b initiator port
VIP_P1_INIT	Port 1 of VIP-128b initiator port.
VIP_P2_INIT	Port 2 of VIP-128b initiator port.
ISS_RT_INIT	ISS real time (RT) initiator port. One 128b initiator port.
ISS_NRT1_INIT	ISS non real time (NRT) initiator port 1. One 128b initiator port.
ISS_NRT2_INIT	ISS non real time (NRT) initiator port 2. One 128b initiator port.
IPU_INIT	IPU initiator port. One 64b initiator port
EVE_TC0_INIT	Embedded Vision Engine 1 (EVE) initiator port 1 (P1). One 128b initiator port.
EVE_TC1_INIT	Embedded Vision Engine 1 (EVE) initiator port 1 (P2). One 128b initiator port.
DSP1_MDMA_INIT	DSP1 Initiator port. One 128b MDMA interconnect initiator port (used also for cache requests)
DSP1_EDMA_INIT	DSP1 initiator port. One 128b EDMA interconnect initiator port.
DSP1_CFG_INIT	One 32b configuration initiator port.
DSP2_MDMA_INIT	DSP2 Initiator port. One 128b MDMA interconnect initiator port (used also for cache requests)
DSP2_EDMA_INIT	DSP2 initiator port. One 128b EDMA interconnect initiator port.
DSP2_CFG_INIT	One 32b configuration initiator port.
MMU_INIT	MMU initiator port. One 128b initiator port.
TPTC1_WR_INIT	EDMA TPTC initiator write port 1. One 128b initiator port.
TPTC1_RD_INIT	EDMA TPTC initiator read port 1. One 128b initiator port.
TPTC2_WR_INIT	EDMA TPTC initiator write port 2. One 128b initiator port.
TPTC2_RD_INIT	EDMA TPTC initiator read port 2. One 128b initiator port.

Table 10-7. Master NIUs (continued)

Master NIU	Description
GMAC_SW_INIT	GMAC_SW 32b initiator port.
IEEE1500_2_OCP_INIT	IEEE1500 32b initiator port.
DEBUGSS_CS_DAP_INIT	Debug subsystem CS_DAP 32b initiator port.

Table 10-8 lists the supported slave NIU ports.

Table 10-8. Slave NIUs

Slave NIU	Description
EMIF_P1_TARG	EMIF 128b target port.
OCMC_RAM_TARG	On-chip memory controller 128b target port.
CRC_TARG	CRC 64b target port. Note: CRC is not supported on the DM50x family of devices.
IPU_TARG	IPU 64b target port.
EVE_TARG	EVE 128b target port.
TESOC_TARG	Tester-On-Chip 128b target port. Note: TESOC is not supported on the DM50x family of devices.
DSP1_SDMA_TARG	128b target port for system requests to DSP1 memory or DSP1 address space.
DSP2_SDMA_TARG	128b target port for system requests to DSP2 memory or DSP2 address space.
L4_PER1_P1_TARG (L4_PER_P0_TARG)	L4_PER1 32b target port 1 (P1).
L4_PER1_P2_TARG (L4_PER_P1_TARG)	L4_PER1 32b target port 2 (P2).
L4_PER2_P1_TARG (L4_PER_P3_TARG)	L4_PER2 32b target port 1 (P1).
L4_PER3_P1_TARG (L4_PER_P6_TARG)	L4_PER3 32b target port 1 (P1).
L4_PER3_P2_TARG (L4_PER_P7_TARG)	L4_PER3 32b target port 2 (P2).
MCASP1_TARG	McASP 32b target port.
QSPI_TARG	QSPI 32b target port.
GPMC_TARG	GPMC 32b target port.
L4_CFG_TARG	L4_CFG 32b target port.
L4_WKUP_TARG	L4_WKUP 32b target port.
ISS_TARG	ISS 32b target port.
TPTC1_TARG	EDMA TPTC 32b target port 1.
TPTC2_TARG	EDMA TPTC 32b target port 2.
EDMA_TPCC_TARG	EDMA TPCC 32b target port.
L3_INSTR_TARG	L3 instrumentation 32b target port.
DEBUGSS_CT_TBR_TARG	Debug subsystem CT_TBR 64b target port.
DSS_TARG	Display subsystem 32b target port.
MMU_TARG	Memory management unit 128b target port.

10.2.3.2.2 L3_MAIN Connectivity Matrix

The L3 interconnect is divided into two clock domains L3_CLK1 and L3_CLK2. L3_CLK1 domain is further splitted into two sub groups:

- L3_CLK1_1: Low-power domain

- L3_CLK1_2: Peripherals and multimedia

L3_CLK2 is instrumentation (debug) associated. The two clock elements (L3_CLK1 and L3_CLK2) are implemented in different clock domains.

10.2.3.2.2.1 Clock Domain Mapping of the L3_MAIN Interconnect Modules

Each clock domain (L3_CLK1 and L3_CLK2) has its own host, flag mux, slave NIUs, and bandwidth regulators. [Table 10-9](#) lists the relationships between these domains and these elements.

Table 10-9. L3_MAIN Clock Domains and Elements

Figure 10-3 shows the functional paths between the L3_MAIN master NIUs and the L3_MAIN and L4 slave NIU agents. The functional paths in L3_MAIN are indicated by the following:

- A cell contains the letter C when a functional path exists.
- A cell is empty when a functional path does not exist.

NOTE: CRC and TESOC are not supported on the DM50x family of devices.

init-002

10.2.3.2.3 Master NIU Identification

A master NIU ID (ConnID) is assigned to every module in the device. The ID uniquely identifies the master NIU for an interconnect transfer (see Table 10-10). The interconnect uses ConnID values for a number of purposes, including:

- Master source identification for the protection mechanism
- Response route generation
- Firewall error logging
- L3_MAIN interconnect error logging

All L3_MAIN firewalls use 4-bit ConnID values from several registers in the control module instead of the L3_MAIN ConnIDs. Thus appropriate grouping of initiators based on a configurable ConnID can be done. The 4-bit ConnID is equal to bits[7:4] of the L3_MAIN 8-bit ConnID. The reset values of these control module registers match the value of bits[7:4]. The registers are the following:

- CTRL_CORE_FIREWALL_CONNID_CONTROL_0

- CTRL_CORE_FIREWALL_CONNID_CONTROL_1
- CTRL_CORE_FIREWALL_CONNID_CONTROL_2
- CTRL_CORE_FIREWALL_CONNID_CONTROL_3

Table 10-10. ConnID Values

8-bit ConnID (hex)	4-bit ConnID (hex)	Master NIU
10	1	DEBUGSS_CS_DAP_INIT
14	1	IEEE1500_2_OCP_INIT
20	2	DSP1_MDMA_INIT
24	2	DSP1_CFG_INIT
28	2	DSP1_EDMA_INIT
2C	2	DSP2_EDMA_INIT
30	3	DSP2_CFG_INIT
34	3	DSP2_MDMA_INIT
42	4	EVE_TC0_INIT
60	6	IPU_INIT
70	7	TPTC1_WR_INIT
72	7	TPTC1_RD_INIT
74	7	TPTC2_WR_INIT
76	7	TPTC2_RD_INIT
80	8	DSS1_INIT
86	8	MMU_INIT
90	9	VIP_P1_INIT
92	9	VIP_P2_INIT
AC	A	GMAC_SW_INIT
C0	C	ISS_RT_INIT
C4	C	ISS_NRT1_INIT
C8	C	ISS_NRT2_INIT
D2	D	EVE_TC1_INIT
E0	E	STATCOLL1
E0	E	STATCOLL2
E0	E	STATCOLL3
E0	E	STATCOLL4

The 8-bit ConnID values are used by error decoding to distinguish the different initiators, see [Section 10.2.3.8.4, Example for Decoding Standard/Custom Errors Logged in L3_MAIN](#). They are also used by the EMIF controller. The 4-bit ConnID values are used by the firewalls to allow or not an access to a slave NIU, see [Table 10-16](#).

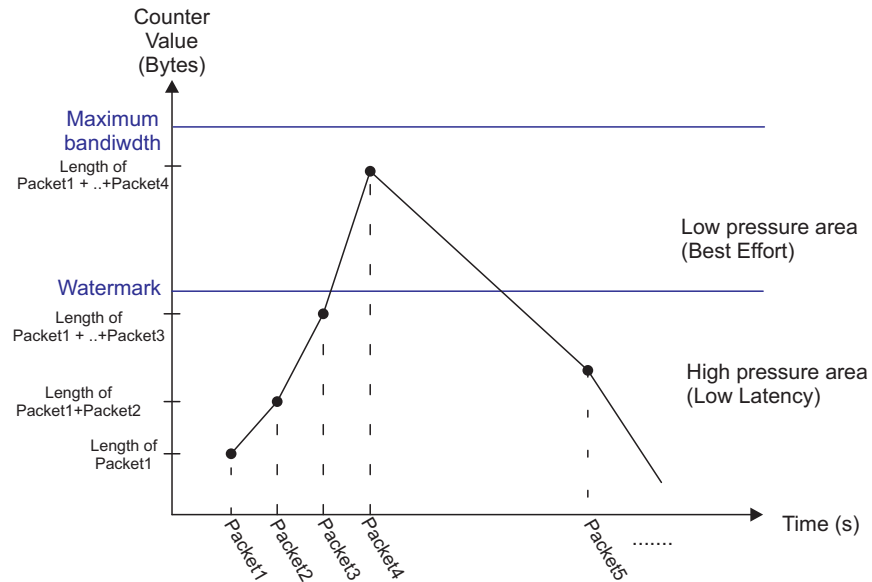

10.2.3.3 Bandwidth Regulators

The bandwidth regulators prevent master NIUs from consuming too much bandwidth of a link, or a slave NIU that is shared between several data flows: packets are then transported at a slower rate. The value of a bandwidth can be programmed in the bandwidth regulator. When the bandwidth is below the programmed value, the pressure bit is set to 1, giving priority to this master. When the bandwidth is above the programmed value, the pressure bit is set to 0 and the concerned master has the same weight as others.

A counter is used to store the sum of data lengths (in bytes) of each packet passing through the bandwidth regulator, and a value equal to the expected bandwidth is subtracted from the counter at each clock cycle. The value of the counter is compared to a programmable threshold (called Watermark), and this comparison determines whether the packet is processed with high pressure for minimum latency or low pressure for best effort processing.

The bandwidth regulator monitors the traffic using open connections between the initiators and the targets. If there is insufficient bandwidth allocated to the connection, the bandwidth regulator can increase the pressure on connections. Generally, the connection is a dataflow between master and slave NIUs. In some cases, the bandwidth regulator is attached to the master and monitors single dataflow to a target (single connection).

Figure 10-4. Bandwidth Regulator Pressure Settings

NOTE: When Counter value falls below Watermark pressure bit is assigned to 1

icnt-003

When Counter Value (bytes) falls below Watermark, the pressure bit is assigned to 1

The bandwidth regulator effective resolution is set to 8.3125 MBps. The maximum average bandwidth (max watermark value) computed in a moving window is set to up to 4096 bytes of payload. These settings are implemented by hardware.

The following is an example of bandwidth regulator settings:

Suppose the bandwidth regulator is set to run at 200 MHz and the application requires an expected bandwidth of 165.888 MBps (± 5 MBps), computed through a moving window of 5 μ s (1000 cycles). To attribute high pressure on all packet requests, the watermark could be set to the maximum bandwidth needed in the 5- μ s window.

Considering the example, the settings of the bandwidth regulator are:

- **L3_BW_REGULATOR_WATERMARK**[11:0] WATERMARK = moving window \times expected bandwidth = 829.44 bytes = 0x33D
- **L3_BW_REGULATOR_BANDWIDTH**[15:0] BANDWIDTH = $\text{ceil}(165.888/8.3125) = \text{ceil}(19.956) = 20d = 0x14$

The bandwidth registers regulate the packet flow by applying flow control on the RX port, thus ensuring that the traffic does not exceed the allocated bandwidth. The next packet is sent only when an internal timer expires. The registers in this group are:

- **L3_BW_REGULATOR_WATERMARK**: Gives the amount of data allowed to exceed the average bandwidth during a short time period
- **L3_BW_REGULATOR_PRESS**: Describes the pressure applied to outgoing packets
- **L3_BW_REGULATOR_CLEARHISTORY**: Resets the traffic counter when set to 1. This register is used after an update in the **L3_BW_REGULATOR_BANDWIDTH** and **L3_BW_REGULATOR_WATERMARK** registers (see [Section 10.2.5.1.7, L3 BW Regulator Register Summary and Description](#)).

Bandwidth regulators are mainly used to give priority to the following master NIUs:

- IPU_INIT
- EVE_TC0_INIT
- EVE_TC1_INIT
- DSP1_MDMA_INIT
- DSP2_MDMA_INIT
- GMAC_SW_INIT

Priority to the following master NIUs is given by setting their internal MFlag signals:

- DSS1_INIT
- VIP_P1_INIT
- VIP_P2_INIT
- ISS_RT_INIT

10.2.3.4 Bandwidth Limiters

Bandwidth limiters are added to control the bandwidth of:

- ISS_NRT1_INIT
- ISS_NRT2_INIT
- *IPU_INIT*
- *EVE_TC0_INIT*
- *EVE_TC1_INIT*
- *DSP1_MDMA_INIT*
- DSP1_EDMA_INIT
- *DSP2_MDMA_INIT*
- DSP2_EDMA_INIT
- MMU_INIT
- TPTC1_WR_INIT
- TPTC1_RD_INIT
- TPTC2_WR_INIT
- TPTC2_RD_INIT

This prevents a large number of RD requests being processed together, thus avoiding a large number of RD responses.

NOTE: The following initiator NIUs have also bandwidth regulators:

- *IPU_INIT*
 - *EVE_TC0_INIT*
 - *EVE_TC1_INIT*
 - *DSP1_MDMA_INIT*
 - *DSP2_MDMA_INIT*
-

The bandwidth limiter regulates the packet flow in the L3_MAIN interconnect by applying flow control when a user-defined bandwidth limit is reached. The next packet is served only after an internal timer expires, thus ensuring that traffic does not exceed the allocated bandwidth. Bandwidth limiter can be used with a watermark mechanism that allows traffic to temporarily exceeds the peak bandwidth.

The registers in this group are:

- [L3_BW_LIMITER_WATERMARK_0](#): Gives the amount of data allowed to exceed the average bandwidth during a short time period. To set the actual watermark to n bytes, the register must be set to n + 1.
- [L3_BW_LIMITER_CLEARHISTORY](#): Resets the traffic counter when set to 1.

- **L3_BW_LIMITER_BANDWIDTH_FRACTIONAL** and **L3_BW_LIMITER_BANDWIDTH_INTEGER**:
These two registers are used to set the average payload bandwidth.

Example of setting the Bandwidth Limiters:

L3_BW_LIMITER_BANDWIDTH_FRACTIONAL must be set to BandwidthConf [4 down to 0] and **L3_BW_LIMITER_BANDWIDTH_INTEGER** contains the remaining BandwidthConf bits, shifted to the right. BandwidthConf = AverageBandwidth / EffectiveResolution, where EffectiveResolution parameter is set to 5.1875 MHz at design time

AverageBandwidth is a parameter representing the value to which the payload bandwidth must be limited in average; this parameter depends on the use case and is the reason that makes the content of the registers variable. In addition the maximum packet length is 8 cells, that is 32 bytes.

Assuming that the use case requires that in average the payload bandwidth is limited to 200 MB/s, then registers must be set to the following values:

$$\text{BandwidthConf} = 200 \text{ MBps} / 5.1875 \text{ MHz} = 38 \text{ (0x26)}$$

$$\text{L3_BW_LIMITER_BANDWIDTH_FRACTIONAL} = \text{LSBs [4 down to 0] of BandwidthConf} = 0x6.$$

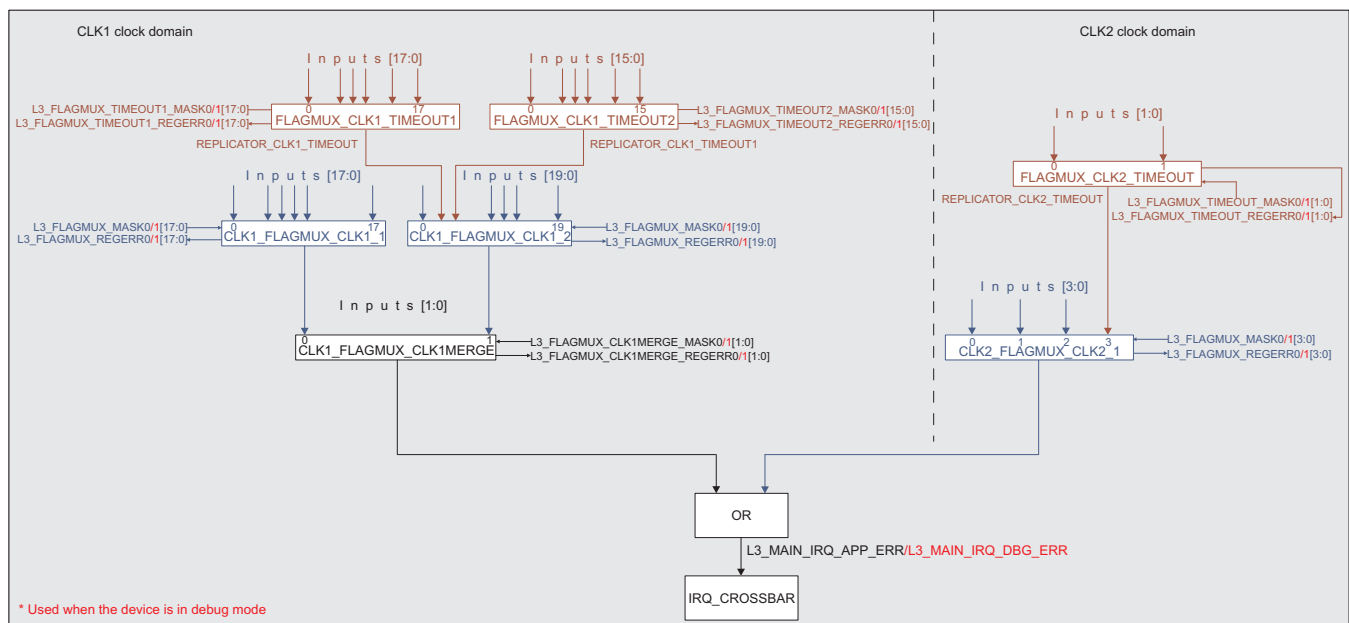

$$\text{L3_BW_LIMITER_BANDWIDTH_INTEGER} = \text{the remaining bits of BandwidthConf shifted to the right} = 0x1.$$

By setting **L3_BW_LIMITER_WATERMARK** to 65 (**L3_BW_LIMITER_WATERMARK_0** = 0x41), the bandwidth limiter is able to send three packets consecutively during peaks, therefore exceeding the peak traffic with two packets (64 bytes)

10.2.3.5 Flag Muxing

Flag muxing is used to collect information such as errors and interrupts from slave NIUs and interconnect firewalls. The result signals are then sent to the **IRQ_CROSSBAR** module without interfering with the interconnect traffic. **Figure 10-5** shows the flag muxing scheme.

Figure 10-5. Flag Muxing Scheme

The following three flag muxes collect information from targets in L3_CLK1 and L3_CLK2 clock domains:

- CLK1_FLAGMUX_CLK1_1
- CLK1_FLAGMUX_CLK1_2
- CLK2_FLAGMUX_CLK2_1

There are three [L3_FLAGMUX_MASK0](#) registers each associated with a single flag mux of the previously listed. Each bit in these registers is associated with only one source. If a bit is set to 0x0, the corresponding flag is masked which means that the input source is disabled, and if set to 0x1 the flag is unmasked. There are also three [L3_FLAGMUX_REGERR0](#) status registers for checking the source of error. A value of 0x1 indicates that the corresponding flag is set, that is, an error is generated. [Table 10-11](#) shows the mapping between the input sources and the bits in [L3_FLAGMUX_MASK0](#) and [L3_FLAGMUX_REGERR0](#) registers. The missing values are reserved and writing to these bits has no effect.

Table 10-11. Flag Mux Input Mapping

Flag Mux	Corresponding bit in registers L3_FLAGMUX_MASK0 and L3_FLAGMUX_REGERR0 (Flag Mux Input)	Flag Mux Input Sources	
CLK1_FLAGMUX_CLK1_1	1	EMIF_P1	
	2	DSP2_SDMA	
	3	TESOC <i>Note: TESOC is not supported on the DM50x family of devices.</i>	
	5	DSP1_SDMA	
	6	EVE	
	7	DSS	
	8	GPMC	
	10	L4_CFG	
	11	L4_WKUP	
	13	IPU	
	14	EDMA_TPCC	
	15	TPTC1 (EDMA)	
	16	TPTC2 (EDMA)	
	17	MMU	
	CLK1_FLAGMUX_CLK1_2	0	HOST_CLK1_1
		1	HOST_CLK1_2
		2	REPLICATOR_CLK1_TIMEOUT
4		REPLICATOR_CLK1_TIMEOUT1	
5		L4_PER2_P1 (L4_PER_P3)	
6		L4_PER1_P1 (L4_PER_P0)	
7		L4_PER1_P2 (L4_PER_P1)	
8		L4_PER3_P2 (L4_PER_P7)	
9		L4_PER3_P1 (L4_PER_P6)	
10		MCASP1	
12		OCMC_RAM	
16		QSPI	
18		CRC <i>Note: CRC is not supported on the DM50x family of devices.</i>	
19		ISS	
CLK2_FLAGMUX_CLK2_1	0	L3_INSTR	
	1	DEBUGSS_CT_TBR	
	2	HOST_CLK2_1	
	3	REPLICATOR_CLK2_TIMEOUT	

Each of the three flag muxes has also the following two registers:

- [L3_FLAGMUX_STDHOSHTDR_COREREG](#) register for identification of the attached core type
- [L3_FLAGMUX_STDHOSHTDR_VERSIONREG](#) register for identification of the characteristics of the attached core

There is also a separate mux (CLK1_FLAGMUX_CLK1MERGE) that merges the outputs of the CLK1_FLAGMUX_CLK1_1 and CLK1_FLAGMUX_CLK1_2 flag muxes. Its functionality follows the same logic as the functionality of the flag muxes previously described. The following registers are available:

- [L3_FLAGMUX_CLK1MERGE_MASK0](#) register for enabling/disabling the corresponding input sources
- [L3_FLAGMUX_CLK1MERGE_REGERR0](#) status register for checking the source of error
- [L3_FLAGMUX_CLK1MERGE_STDHOSHTDR_COREREG](#) register for identification of the attached core type
- [L3_FLAGMUX_CLK1MERGE_STDHOSHTDR_VERSIONREG](#) register for identification of the characteristics of the attached core

In addition, it must be taken into account that the following registers (already described) with suffix "0" are used when the device is in application mode:

- [L3_FLAGMUX_MASK0](#)
- [L3_FLAGMUX_REGERR0](#)
- [L3_FLAGMUX_CLK1MERGE_MASK0](#)
- [L3_FLAGMUX_CLK1MERGE_REGERR0](#)

The following registers with suffix "1" are used when the device is in debug mode:

- [L3_FLAGMUX_MASK1](#)
- [L3_FLAGMUX_REGERR1](#)
- [L3_FLAGMUX_CLK1MERGE_MASK1](#)
- [L3_FLAGMUX_CLK1MERGE_REGERR1](#)

Both register groups have identical bits and follow same logic. The only difference is that registers with suffix "0" are used in application mode and registers with suffix "1" are used in debug mode.

10.2.3.5.1 Time-out Flag Muxing

If a target does not respond after a fixed number of clock cycles, a time-out error flag is generated if enabled. There are three time-out flag muxes:

- FLAGMUX_CLK1_TIMEOUT1 with registers [L3_FLAGMUX_TIMEOUT1_MASK0](#) and [L3_FLAGMUX_TIMEOUT1_REGERR0](#)
- FLAGMUX_CLK1_TIMEOUT2 with registers [L3_FLAGMUX_TIMEOUT2_MASK0](#) and [L3_FLAGMUX_TIMEOUT2_REGERR0](#)
- FLAGMUX_CLK2_TIMEOUT with registers [L3_FLAGMUX_TIMEOUT_MASK0](#) and [L3_FLAGMUX_TIMEOUT_REGERR0](#)

Each bit in the _MASK0 registers previously listed is associated with only one time-out source. If a bit is set to 0x0, the corresponding time-out flag is masked, and if set to 0x1 the flag is unmasked. To check the source of time-out error the corresponding bit in one of the three previously listed _REGERR0 registers should be read. A value of 0x1 indicates that a time-out error has occurred.

[Table 10-12](#) shows the mapping between the time-out input sources and the bits in _MASK0 and _REGERR0 registers. The missing values are reserved and writing to these bits has no effect.

Table 10-12. L3 Time-out Flag Mapping

Time-out Flag Mux	Flag Mux Input (Corresponding bit in registers _MASK0 and _REGERR0)	Flag Mux Time-out Input Sources
FLAGMUX_CLK1_TIMEOUT1	2	DSP1_SDMA
	3	DSP2_SDMA
	4	DSS

Table 10-12. L3 Time-out Flag Mapping (continued)

Time-out Flag Mux	Flag Mux Input (Corresponding bit in registers _MASK0 and _REGERR0)	Flag Mux Time-out Input Sources
	5	EVE
	6	IPU
	7	MMU
	8	EMIF_P1
	9	TESOC <i>Note: TESOC is not supported on the DM50x family of devices.</i>
	11	L4_PER_P0
	12	L4_PER_P1
	13	L4_PER_P3
	14	L4_PER_P7
	15	L4_PER_P6
	16	L4_CFG
	17	L4_WKUP
	FLAGMUX_CLK1_TIMEOUT2	2
4		QSPI
6		EDMA_TPCC
7		TPTC1
8		TPTC2
11		MCASP1
12		OCMC_RAM
14		GPMC
15	CRC <i>Note: CRC is not supported on the DM50x family of devices.</i>	
FLAGMUX_CLK2_TIMEOUT	0	L3_INSTR
	1	DEBUGSS_CT_TBR

For example, to enable IPU time-out error the [L3_FLAGMUX_TIMEOUT1_MASK0\[6\]](#) bit must be set to 0x1. To check whether IPU time-out error has occurred the [L3_FLAGMUX_TIMEOUT1_REGERR0\[6\]](#) bit must be read.

10.2.3.6 Statistic Collectors Group

Statistic collectors are internal masters that share the same master address as the master NIUs. These components compute the traffic statistics within a defined window and periodically report through the DEBUG interface. The key features of the statistic collector are:

- Nonintrusive monitoring
- Programmable filters and counters
- Collects results at a programmable time interval

Event detectors are programmed through the [L3_STCOL_REQEVT](#) and [L3_STCOL_RSPEVT](#) configuration registers for request and response ports, respectively. The following events can be identified:

- Word transfer
- WAIT cycles
- Flow control
- Payload transfers
- Latency measurements

Performance monitoring is enabled through the [L3_STCOL_EN](#) register. The [L3_STCOL_SOFTEN](#) register enables software to monitor the performance. Event muxes are programmed through the [L3_STCOL_EVTMUX_SELO](#) configuration register, which determines which port will be monitored by a filter configured by the filter registers (see [Section 10.2.5.1.9](#)).

Filters are programmed through the [L3_STCOL_FILTER_i_GLOBALEN](#) configuration register, along with additional selection criteria programmed through the mask/match registers (see [Table 10-221](#)). A filter can be configured to accept or reject:

- Read operations
- Write operations
- Errors
- Addresses

Filter operation is programmed through the [L3_STCOL_OP](#) registers (see [Table 10-221](#)).

There are four statistic collectors used for traffic monitoring on device ports. For more detailed description regarding statistic collectors, see [L3 Target Load Monitoring](#) and [L3 Master Latency Monitoring](#) in [Chapter 26 On-Chip Debug Support](#).

10.2.3.7 L3_MAIN Protection and Firewalls

Device protection relies on L3 firewalls and their configuration.

10.2.3.7.1 L3_MAIN Firewall Reset

The values of the L3_MAIN firewall registers upon reset are tied in hardware or exported from the control module registers.

Values exported from the control module are intended to give defined rights to the firewalls at reset and thus ensure the content after going out of reset.

The L3_MAIN firewall registers are located in the CORE_AON power domain and thus no retention capability is needed. The control module registers are reset by a cold reset only, whereas the L3_MAIN firewall registers are reset by clearing the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit. When the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit comes back automatically to 1, the exported values are loaded.

CAUTION

Before reprogramming the firewall registers and/or before using the [FW_LOAD_REQ](#) mechanism, the request must be asserted by configuring the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit.

To load the exported values at run time:

1. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Clear the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit by writing 0x1 to it.
3. Wait until the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit is reset to 0x1 by hardware.
4. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

To reprogram the firewall registers at run time:

1. Write 0x1 to the [REGUPDATE_CONTROL](#) register.
2. Update the firewall registers.
3. Write 0x0 to the [REGUPDATE_CONTROL](#) register.

NOTE: While reprogramming the firewall registers at run time it must be taken into account that the [REGUPDATE_CONTROL\[1\]](#) FW_LOAD_REQ bit is written as '0' because a value of '1' reloads the firewall default values.

NOTE: At reset, exported values from the control module can modify hardware reset values.

10.2.3.7.2 Power Management

As part of the system-wide power-management scheme, the L3_MAIN interconnect goes into IDLE state after receiving a request from the power, reset, and clock management (PRCM) module after all commands are serviced. This function is handled by hardware.

To reduce power consumption, the L3_MAIN interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

L3_MAIN supports a partial retention scheme. Retention is performed on the following registers:

- Statistic collectors
- Bandwidth regulators
- Bandwidth limiters
- Firewalls
- Flag muxes

This process prevents reconfiguration after a clock domain switches off.

10.2.3.7.3 L3_MAIN Firewall Functionality

The access to the slave NIUs is granted only to master NIUs according to in-band attributes sent in each transaction crossing the L3_MAIN interconnect, such as:

- MCMD: Specifies the type of access (read or write) required by the master NIU
- ConnID: Used to determine the permission of the master NIU
- MReqInfo: Transaction attribute adding information about the access type

[Table 10-13](#) lists the MReqInfo values.

Table 10-13. MReqInfo Values

Qualifier	Access Definition	Access Description
MReqDebug	0: Functional 1: Debug	When set, indicates that the request has been issued by a master NIU in DEBUG state
MReqType	00: Processor data access 01: Processor instruction access 10: DMA access 11: Other	Indicates whether the request is for processor instruction fetch, processor data access or DMA access
MReqSupervisor	0: User 1: Privilege	When set, indicates that the request is qualified with the supervisor attribute. It can be provided by a processor running in supervisor mode or by a module that inherited this attribute from the processor (DMA channel with a supervisor attribute).

The firewall comparison mechanism enables access to a protected slave NIU only when a correct combination of three MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed 4-bit pattern that corresponds to a combination of the parameters MReqDebug, MReqType, and MReqSupervisor. See [Table 10-14](#).

Table 10-14. L3_MAIN ReqInfo Mapping

	ReqInfo Name	MReqDebug	MReqType	MReqSupervisor

10.2.3.7.3.1 Protection Regions

Each slave NIU address space is subdivided into protection regions. The regions are configurable with a size of 4-KiB granularity.

Table 10-15 lists the number of protected regions for each slave NIU.

Table 10-15. Slave NIU Firewall and Region Configuration

Firewall name	Slave NIU	Number of Firewall Regions
EMIF_FW	EMIF_P1_TARG	24
OCMC_RAM_FW	OCMC_RAM_TARG	24
CRC_FW <i>Note: CRC is not supported on the DM50x family of devices.</i>	CRC_TARG	4
IPU_FW	IPU_TARG	4
EVE_FW	EVE_TARG	1
TESOC_FW <i>Note: TESOC is not supported on the DM50x family of devices.</i>	TESOC_TARG	4
DSP1_SDMA_FW	DSP1_SDMA_TARG	1
DSP2_SDMA_FW	DSP2_SDMA_TARG	1
MCASP1_FW	MCASP1_TARG	1
QSPI_FW	QSPI_TARG	4
GPMC_FW	GPMC_TARG	8
ISS_FW	ISS_TARG	4
TPTC_FW	TPTC1_TARG and TPTC2_TARG	2
EDMA_TPCC_FW	EDMA_TPCC_TARG	1
L3_INSTR_FW	L3_INSTR_TARG	1
DEBUGSS_CT_TBR_FW	DEBUGSS_CT_TBR_TARG	2
DSS_FW	DSS_TARG	8

Two types of regions are distinguished in a slave NIU firewall:

- Default region: Available in all slave NIUs. The default region covers the entire slave NIU address range. Other firewall-configured regions must reset or overlay the default region, because it always has the lowest priority.
- Normal region: The number of normal regions varies in a slave NIU; they have identical capabilities (see Table 10-15).

Each region has the following characteristics:

- Start address: Physical slave NIU start address
- End address: Physical slave NIU end address
- Specific access rights (see Section 10.2.3.7.3.3, *Protection Mechanism per Region Examples*)
- Priority level

Depending on its priority level, a region can override the settings of another region; the access rights of the region with the highest priority apply. All regions have a fixed (not configurable) priority level that corresponds to their number: Region 0 has priority level 0 (lowest), region 1 has priority level 1, and so on.

Figure 10-6 shows the priority level with associated regions. This priority level scheme allows multiplying the flexibility and capability of the firewall. Figure 10-6 shows a 7-region firewall setting that creates 16 regions (twice the number of regions created than originally available).

Figure 10-6. L3 Interconnect Region Overlay and Priority Level Overview

icnt-005

The address range covered by the regions is defined in the [START_REGION_i](#) and [END_REGION_i](#) registers. The boundary checks are done on a minimum size of 4-KiB pages; thus, bits [11:0] of those 32-bit registers are not checked.

The address space size of the slave NIUs ([bits [31:12]]) depends on the size of the slave NIU to protect (that is, if a memory is only 48KiB, then the size is defined through bits [16:12] of the slave NIU start and end address registers of the firewall region ([START_REGION_i\[16:12\]](#) and [END_REGION_i\[16:12\]](#)).

To enable/disable regions the [END_REGION_i\[0\]](#) [END_REGION_i_ENABLE](#) bit should be set/cleared.

There is only one multiport firewall in this device. This is the TPTC_FW firewall which has two ports. The firewall configuration applies to all ports but there is one set of error logging registers per port. The [ERROR_LOG_0](#) register logs errors for traffic going to the TPTC1_TARG and the [ERROR_LOG_1](#) register logs errors for traffic going to the TPTC2_TARG.

The EMIF firewall (EMIF_FW) has 4 GiB address space and protects both the SDRAM and the EMIF configuration registers. Although the SDRAM is accessible at address space 0x8000_0000 through 0xFFFF_FFFF (total of 2GiB) the EMIF_FW sees that range in its address space at addresses 0x0000_0000 through 0x7FFF_FFFF. This means, to protect the SDRAM the start address in the [START_REGION_i](#) register should be 0x0000_0000, and not 0x8000_0000. The EMIF configuration registers are accessible through system base address 0x4C00_0000. But in the EMIF_FW address space that address is mapped to 0x8000_0000. In other words, EMIF_FW sees the EMIF configuration registers at 0x8000_0000. This means, to protect the EMIF configuration registers the start address in the [START_REGION_i](#) register should be 0x8000_0000, and not 0x4C00_0000.

10.2.3.7.3.2 L3_MAIN Firewall Registers Overview

Table 10-16 and Table 10-17 list the L3_MAIN firewall permission-setting registers.

Table 10-16. L3_MAIN Firewall Read/Write Permission-Setting Register

Register Name	Bits	Field Name	4-bit ConnID Value (hex) (see Table 10-10)	Field Modifiability
MRM_PERMISSION_REGION_HIGH_j	31	W15	ConnID = F write permission	RW
	30	R15	ConnID = F read permission	RW
	29	W14	ConnID = E write permission	RW
	28	R14	ConnID = E read permission	RW
	27	W13	ConnID = D write permission	RW
	26	R13	ConnID = D read permission	RW
	25	W12	ConnID = C write permission	RW
	24	R12	ConnID = C read permission	RW
	23	W11	ConnID = B write permission	RW
	22	R11	ConnID = B read permission	RW
	21	W10	ConnID = A write permission	RW
	20	R10	ConnID = A read permission	RW
	19	W9	ConnID = 9 write permission	RW
	18	R9	ConnID = 9 read permission	RW
	17	W8	ConnID = 8 write permission	RW
	16	R8	ConnID = 8 read permission	RW
	15	W7	ConnID = 7 write permission	RW
	14	R7	ConnID = 7 read permission	RW
	13	W6	ConnID = 6 write permission	RW
	12	R6	ConnID = 6 read permission	RW
	11	W5	ConnID = 5 write permission	RW
	10	R5	ConnID = 5 read permission	RW
	9	W4	ConnID = 4 write permission	RW
	8	R4	ConnID = 4 read permission	RW
	7	W3	ConnID = 3 write permission	RW
	6	R3	ConnID = 3 read permission	RW
	5	W2	ConnID = 2 write permission	RW
	4	R2	ConnID = 2 read permission	RW
	3	W1	ConnID = 1 write permission	RW
	2	R1	ConnID = 1 read permission	RW
	1	W0	ConnID = 0 write permission	RW
	0	R0	ConnID = 0 read permission	RW

Table 10-17. L3_MAIN Firewall Permission-Setting Register

Register name	Type of Permission	Bits	Field Name	Description	Field Modifiability
MRM_PERMISSION_REGION_LOW_j	Reserved	31:16	Reserved		
	Debug	15	PUB_PRV_DEBUG	PUBLIC PRIVILEGE DOMAIN DEBUG ALLOWED	RW
		14	PUB_USR_DEBUG	PUBLIC USER DOMAIN DEBUG ALLOWED	RW
	Reserved	13:12	Reserved		
	Access	11	PUB_PRV_READ	PUBLIC PRIVILEGE READ ACCESS ALLOWED	RW
		10	PUB_PRV_WRITE	PUBLIC PRIVILEGE WRITE ACCESS ALLOWED	RW
		9	PUB_PRV_EXE	PUBLIC PRIVILEGE EXE ACCESS ALLOWED	RW
		8	PUB_USR_READ	PUBLIC USER READ ACCESS ALLOWED	RW
		7	PUB_USR_WRITE	PUBLIC USER WRITE ACCESS ALLOWED	RW
		6	PUB_USR_EXE	PUBLIC USER EXE ACCESS ALLOWED	RW

10.2.3.7.3.3 Protection Mechanism per Region Examples

The access permission of each region is configurable and defined through the [MRM_PERMISSION_REGION_HIGH_j](#) and [MRM_PERMISSION_REGION_LOW_j](#) registers (see [Section 10.2.3.7.3.2, L3_MAIN Firewall Registers Overview](#)).

Master NIU permissions:

- To give read access to the master NIU with 4-bit ConnID = n(1), set the [MRM_PERMISSION_REGION_HIGH_j\[n × 2\]](#) Rn bit.
 - To give write access to the master NIU with 4-bit ConnID = n(1), set the [MRM_PERMISSION_REGION_HIGH_j\[n × 2 + 1\]](#) Wn bit.
- (1) - n should be first converted from hex to decimal value

Debug permissions:

- To give privilege debug access, set the [MRM_PERMISSION_REGION_LOW_j\[15\]](#) PUB_PRV_DEBUG bit.
- To give user debug access, set the [MRM_PERMISSION_REGION_LOW_j\[14\]](#) PUB_USR_DEBUG bit.

User, read, write, and executable permissions:

- To give privileged read access, set the [MRM_PERMISSION_REGION_LOW_j\[11\]](#) PUB_PRV_READ bit.
- To give privileged write access, set the [MRM_PERMISSION_REGION_LOW_j\[10\]](#) PUB_PRV_WRITE bit.
- To give privileged executable access, set the [MRM_PERMISSION_REGION_LOW_j\[9\]](#) PUB_PRV_EXE bit.
- To give user read access, set the [MRM_PERMISSION_REGION_LOW_j\[8\]](#) PUB_USR_READ bit.
- To give user write access, set the [MRM_PERMISSION_REGION_LOW_j\[7\]](#) PUB_USR_WRITE bit.
- To give user executable access, set the [MRM_PERMISSION_REGION_LOW_j\[6\]](#) PUB_USR_EXE bit.

Example: To provide debug write privilege access to the master NIU with 4-bit ConnID = 0x8, set to 0x1 the following bits:

- [MRM_PERMISSION_REGION_HIGH_j\[17\]](#) W8
- [MRM_PERMISSION_REGION_LOW_j\[15\]](#) PUB_PRV_DEBUG

10.2.3.7.3.4 L3_MAIN Firewall Error Logging

If a protection violation error is detected, the following signals are generated:

- An in-band error (SRESP = ERROR) is generated to the master NIU of the access.
- An out-band error is sent to the control module
- An interrupt is generated to the IRQ_CROSSBAR.

The L3_MAIN interconnect does not differentiate errors generated by firewalls from all other supported types of errors.

An in-band error is generated by modules each time an access is not allowed. When an in-band error is sent back into the transaction it is seen as an external prefetch or data abort by the initiator, depending on whether the transaction was an instruction fetch or a data access.

Information about in-band errors is logged into two registers:

- [ERROR_LOG_k](#): Logs the information about the start/end address of the hit region and the qualifiers of the transaction
- [LOGICAL_ADDR_ERRLOG_k\[31:12\]](#): Logs the address of the failed access

Table 10-18 lists the L3_MAIN firewall error-logging registers.

Table 10-18. L3 Firewall Error-Logging Registers

Register Name	Register Field Name	Field Modifiability	Parameter Comments
ERROR_LOG_k	RESERVED[31:24]	Read only	Reads return 0s.
	BLK_BURST_VIOLATION[23]	Read/write	Read 0x1: 2D burst not allowed or exceeds allowed size. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	RESERVED[22]	Read only	Read return 0s.
	REGION_START_ERRLOG[21:17]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	REGION_END_ERRLOG[16:12]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	REQINFO_ERRLOG[11:0]	Read/write	Mapping of the error according to the reqinfo vector: ConnID [3:0] MCMD [0] [3] MReqDebug [1] MReqSupervisor [0] MReqType

L3 firewall errors can be cleared by writing to the [ERROR_LOG_k](#) register in the firewall that recorded the error. Clearing the [ERROR_LOG_k](#) register deasserts the corresponding error if it exists.

The L3 firewall register [ERROR_LOG_k](#) must be cleared before clearing the [CTRL_CORE_SEC_ERR_STATUS_FUNC_i](#) (i = 1, 2 and 3) and [CTRL_CORE_SEC_ERR_STATUS_DEBUG_i](#) (i = 1, 2 and 3) registers in the control module.

When a protection violation occurs, an interrupt is sent to the IRQ_CROSSBAR and depending on the functional mode an error is logged in:

- the [CTRL_CORE_SEC_ERR_STATUS_FUNC_i](#) registers when the device is in application mode
- the [CTRL_CORE_SEC_ERR_STATUS_DEBUG_i](#) registers when the device is in debug mode

For more information, see [Chapter 14, Control Module](#).

10.2.3.8 L3_MAIN Interconnect Error Handling

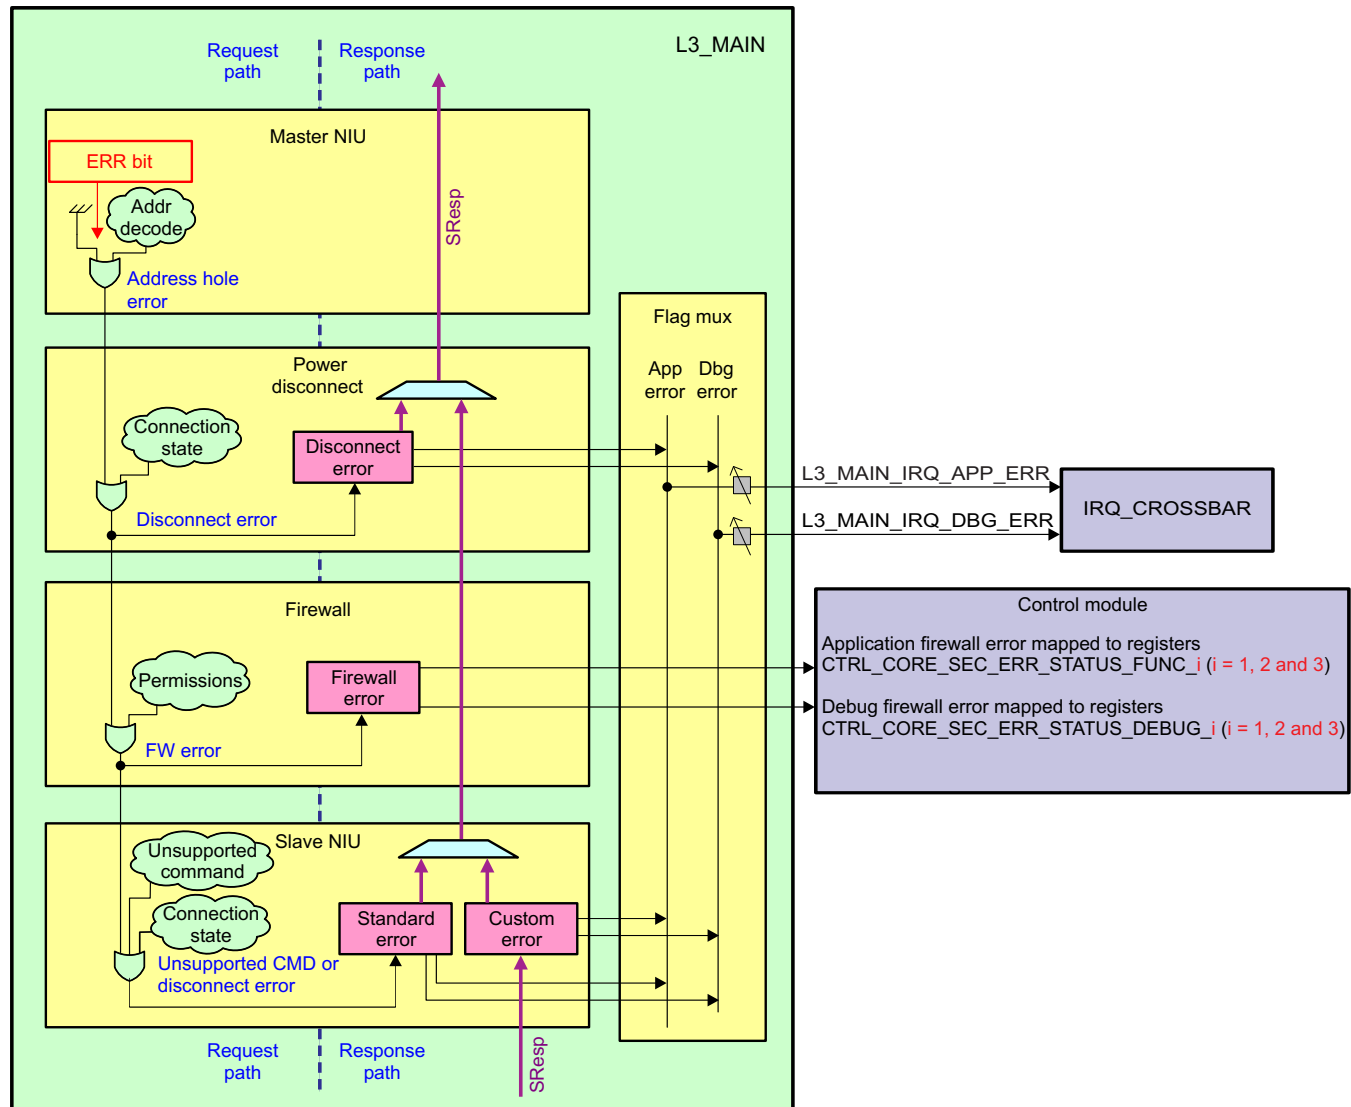

Error logging is enabled in the L3_MAIN interconnect. The three major types of errors are:

- Slave NIU errors
- Firewall errors (see Section 10.2.3.7.3.4, L3_MAIN Firewall Error Logging)
- Flag mux errors

10.2.3.8.1 Global Error-Routing Scheme

Figure 10-7 shows the L3_MAIN global error-routing scheme.

Figure 10-7. L3_MAIN Global Error-Routing Scheme

icnt-006

10.2.3.8.2 Slave NIU Error Logging

Error logging is implemented only at slave NIUs. Because the interconnect does not support master NIU error logging, an erroneous packet must be created and sent to one of the slave NIUs. The slave NIU that receives an erroneous packet is predictable but can change per master (see Table 10-19).

Table 10-19. L3_MAIN Connectivity and Holes Error Routing

Master	Connectivity and Hole Errors Logged Into Slave NIUs
All initiators	GPMC_TARG

The slave NIU can:

- be configured to report standard errors (errors generated within the interconnect):
 - Firewall error (protection violation):
this error indicates that a request was rejected by a firewall and is reported to the control module. For more information, see [Section 10.2.3.7.3.4, L3_MAIN Firewall Error Logging](#).
 - Address hole:
this error reports an unknown address for a request. The address map is local to each master NIU; therefore, an address hole error is reported each time a master NIU requests an access to a slave NIU to which it is not logically connected, even if this address exists in the global L3_MAIN address map. This error is detected only once per burst.
 - Unsupported commands:
this error reports that the master NIU sent a command that cannot be processed, because the slave NIU cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
- be configured to report custom errors: basically, when the slave answer is SResp = ERR
- be configured to report severity level, for standard error and custom errors:
 - None: error logging for this type of error is disabled.
 - Error: error is logged for this type of error.
 - Fault: error is logged and interrupt is generated for this type of error.
- generate interrupt on two IRQ lines depending on the MReqDebug qualifier:
 - Application error - on L3_MAIN_IRQ_APP_ERR line
 - Debug error - on L3_MAIN_IRQ_DBG_ERR line

By default, all slave NIUs are configured with standard and custom error levels set to Fault. The errors are reported on the flag muxes (see [Figure 10-7](#)), depending on the access type, application or debug. For more information, see [Section 10.2.3.5, Flag Muxing](#).

The slave NIU power-disconnect component also has error logging enabled, because in this case the slave NIU is in a clock domain that is switched off and therefore cannot catch the error. By nature, this component can generate only standard errors. By default, it is configured with the error level set to Fault.

Wake up on demand: If an error packet reaches a slave NIU that is set with MDiscBehave = 1 (wake up on demand), then the active signal is asserted and L3 processes the error generation when the slave is awake. Although this is inefficient, it simplifies NIU implementation and should not be a problem because errors are supposed to occur only during software debug.

10.2.3.8.3 Severity Level of Standard and Custom Errors

The slave NIU registers are important for error logging.

- The [L3_TARG_STDERRLOG_SVRTSTDLVL](#) register shows the severity level for standard errors. According to the severity level, error logging is disabled, enabled with level ERROR, or enabled with level ERROR and flag FAULT.
- The [L3_TARG_STDERRLOG_SVRTCUSTOMLVL](#) register shows the severity level for custom errors.
- The [L3_TARG_STDERRLOG_MAIN](#) register (the main register for error-logging management) shows the validity of the logged information, standard or custom.
- The [L3_TARG_STDERRLOG_HDR](#) register stores packets in case of a standard error.
- The [L3_TARG_STDERRLOG_MSTADDR](#) register returns the MSTADDR field of the logged packet.
- The [L3_TARG_STDERRLOG_SLVADDR](#) register returns the SLVADDR field of the stored packet.
- The [L3_TARG_STDERRLOG_INFO](#) register saves the information field of the logged packet.

10.2.3.8.4 Example for Decoding Standard/Custom Errors Logged in L3_MAIN

Following is a procedure that must be followed for identifying Standard/Custom errors logged in L3_MAIN:

- Read registers [L3_HOST_STDERRLOG_MAIN](#) and [L3_TARG_STDERRLOG_MAIN](#):
 - bit[0]STDERRLOG_MAIN_ERRLOGVLD = 0 -> No error
 - bit[0]STDERRLOG_MAIN_ERRLOGVLD = 1 -> Error
 - Error type is visible through:
 - bit[1]STDERRLOG_MAIN_ERRTYPE = 0 -> Standard Error (FW error, Address Hole, Unsupported command)
 - bit[1]STDERRLOG_MAIN_ERRTYPE = 1 -> Custom Error
- Standard Error:
 - Read [L3_TARG_STDERRLOG_HDR\[3:0\]](#) STDERRLOG_HDR_OPCODE
 - Read [L3_TARG_STDERRLOG_MSTADDR\[7:0\]](#) STDERRLOG_MSTADDR - > 8-bit NTP master address used to distinguish the different initiators (see [Table 10-10](#)). That master address is also referred to as ConnID or MConnID.
 - Read [L3_TARG_STDERRLOG_SLVADDR\[4:0\]](#) STDERRLOG_SLVADDR -> NTP Slave Address of the logged packet
 - Read [L3_TARG_STDERRLOG_INFO\[7:0\]](#) STDERRLOG_INFO -> see , *Terminology* for details.

The procedure for Custom error is the same, but the `*_STDERRLOG_CUSTOMINFO_*` registers should be read.

10.2.4 L3_MAIN Interconnect Programming Guide

10.2.4.1 L3_MAIN Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L3_MAIN interconnect module.

10.2.4.1.1 Global Initialization

10.2.4.1.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the L3_MAIN interconnect module is to be used for the first time after a device reset. The initialization of surrounding modules is based on the integration of the L3_MAIN interconnect. For more information, see [Section 10.2.2, L3_MAIN Interconnect Integration](#) .

Table 10-20. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see Chapter 3, Power, Reset, and Clock Management .
Control module	For information about the configuration of the control module, see Chapter 14, Control Module .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description , in Chapter 14, Control Module
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 13 Interrupt Controllers

10.2.4.2 Operational Modes Configuration

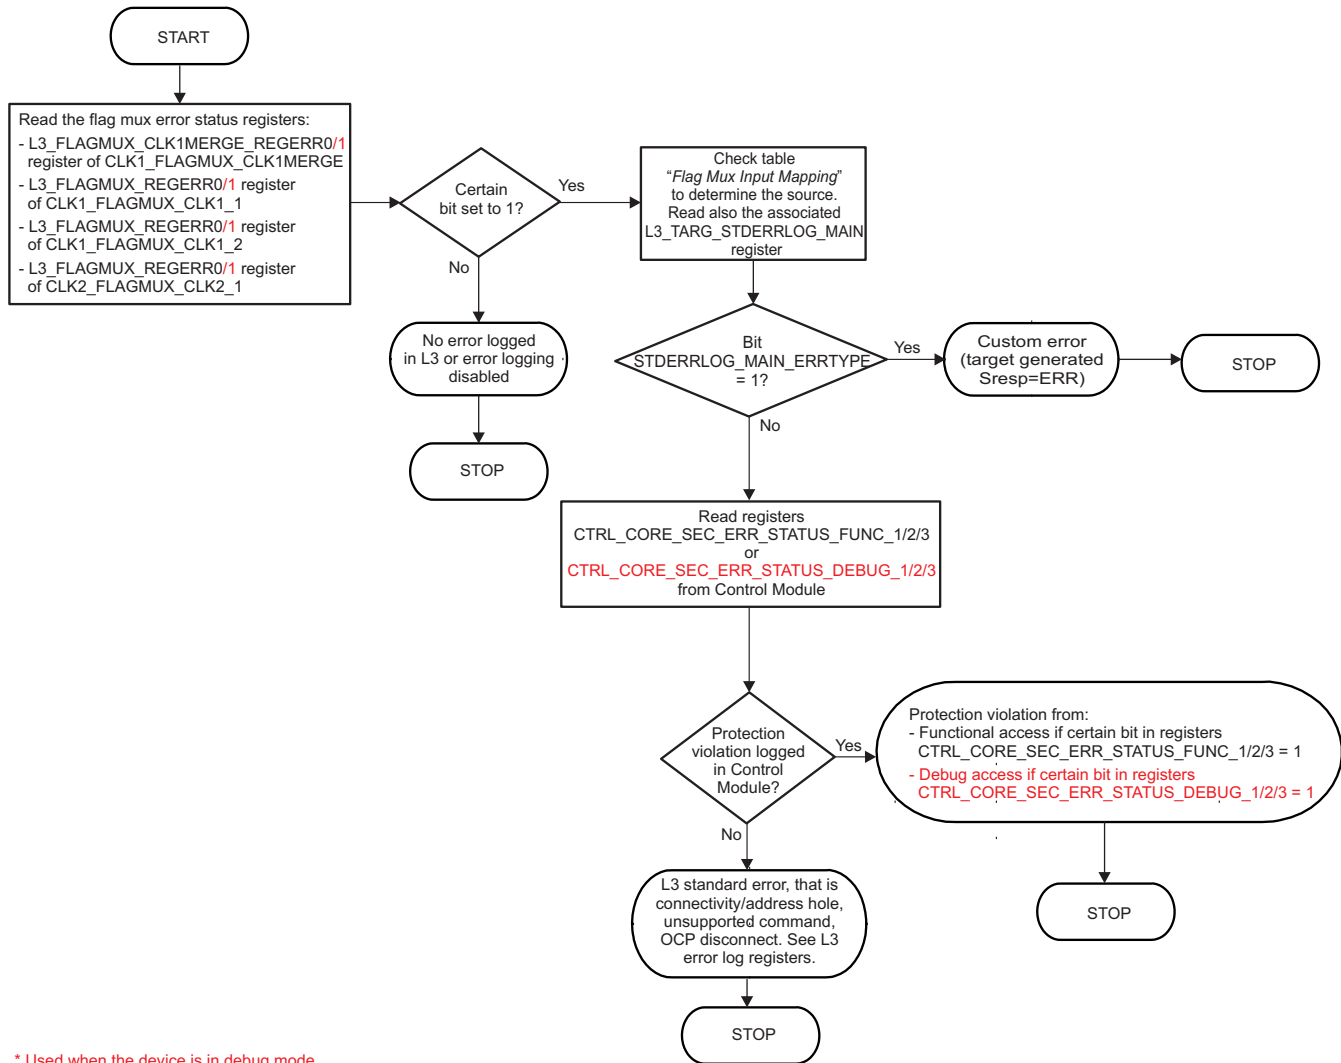

10.2.4.2.1 L3_MAIN Interconnect Error Analysis Mode

10.2.4.2.1.1 Main Sequence: L3_MAIN Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

Figure 10-8 shows the software sequence required in most cases.

Figure 10-8. Typical Error Analysis Sequence

* Used when the device is in debug mode

icnt-007

Table 10-21 lists the subprocess call summary for error analysis mode in the main sequence.

Table 10-21. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L3 interconnect error analysis	See Section 10.2.4.2.1, L3_MAIN Interconnect Error Analysis Mode.
L3_MAIN interconnect protection violation error identification	See Section 10.2.4.2.1.2, Subsequence: L3_MAIN Interconnect Protection Violation Error Identification.

Table 10-21. Subprocess Call Summary for Main Sequence – Error Analysis Mode (continued)

Subprocess	Cross-Reference
L3_MAIN interconnect unsupported command/address hole error identification	See Section 10.2.4.2.1.1.3 , <i>Subsequence: L3_MAIN Interconnect Standard Error Identification</i> .
L3_MAIN interconnect reset FLAGMUX and module	See Section 10.2.4.2.1.1.4 , <i>Subsequence: L3_MAIN Interconnect FLAGMUX Configuration</i> .

10.2.4.2.1.1.1 Subsequence: L3_MAIN Custom Error Identification

The procedure listed in [Table 10-22](#) describes custom error identification.

Table 10-22. Custom Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is custom error detected?	L3_TARG_STDERRLOG_MAIN[1] STDERRLOG_MAIN_ERRTYPE	=0x1
Read information field of the response packet.	L3_TARG_STDERRLOG_CUSTOMINFO_INFO[7:0] STDERRLOG_CUSTOMINFO_INFO	xxx
Read the address of the initiator that caused error.	L3_TARG_STDERRLOG_CUSTOMINFO_MSTADDR[7:0] STDERRLOG_CUSTOMINFO_MSTADDR	xxx
Read the type of operation (read/write).	L3_TARG_STDERRLOG_CUSTOMINFO_OPCODE[1:0] STDERRLOG_CUSTOMINFO_OPCODE	xxx
ENDIF		

10.2.4.2.1.1.2 Subsequence: L3_MAIN Interconnect Protection Violation Error Identification

The procedure listed in [Table 10-23](#) describes protection violation error identification and where it is logged in the control module registers. Two types of errors are logged: application errors and debug errors.

Table 10-23. L3_MAIN Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read the burst violation.	ERROR_LOG_k[23] BLK_BURST_VIOLATION	xxx
Read the initiator ConnID [3:0].	ERROR_LOG_k[11:8]	xxx
Read the command (MCMD [0]) that caused the error.	ERROR_LOG_k[7]	xxx
Read the address of the request that caused the error.	LOGICAL_ADDR_ERRLOG_k[31:0] SLVOFS_LOGICAL	xxx
IF: Is it an application error?	L3_FLAGMUX_REGERR0 [REGERROR0]	0x0
Read the status bits to see which module firewall has worked.	CTRL_CORE_SEC_ERR_STATUS_FUNC_i	xxx
Clear the status bits.	CTRL_CORE_SEC_ERR_STATUS_FUNC_i	xxx
Clear the status bit.	L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG	0x0
ELSE IF	L3_FLAGMUX_REGERR1[7:0] REGERROR1	= 0x1
Read the status bits to see the module.	CTRL_CORE_SEC_ERR_STATUS_DEBUG_i	xxx
Clear the status bits.	CTRL_CORE_SEC_ERR_STATUS_DEBUG_i	xxx
Clear the status bit.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_MAIN_CLRLOG	0x0
ENDIF		
Clear the burst violation.	ERROR_LOG_k[23] BLK_BURST_VIOLATION	0x0
Clear the error status.	ERROR_LOG_k[21:17] REGION_START_ERRLOG	0x00

10.2.4.2.1.1.3 Subsequence: L3_MAIN Interconnect Standard Error Identification

The procedure listed in [Table 10-24](#) describes the identification of standard errors inside the L3_MAIN interconnect. The standard errors are: unsupported command, address hole, and disconnect.

Table 10-24. L3_MAIN Standard Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is an error detected?	L3_TARG_STDERRLOG_MAIN[18] STDERRLOG_MAIN_ERRCNT	= 0x1
Read the corresponding flag.	L3_FLAGMUX_REGERR0[REGERROR0]	xxx
Read the corresponding flag.	L3_FLAGMUX_REGERR1[REGERROR1]	xxx
Localize the slave NIU that generated the error.	See Table 10-11 .	
ELSE		
Clear the error log.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_MAIN_CLRLOG	0x0
Clear the severity error status.	L3_TARG_STDERRLOG_SVRTSTDLVL[1:0] STDERRLOG_SVRTSTDLVL_0	0x2
ENDIF		

10.2.4.2.1.1.4 Subsequence: L3_MAIN Interconnect FLAGMUX Configuration

The procedures listed in [Table 10-25](#) and [Table 10-26](#) give information about the configuration of FLAGMUX masks.

Table 10-25. FLAGMUX Configuration

Step	Register/Bit Field/Programming Model	Value
Set the FLAGMUX masks to mask an event.	L3_FLAGMUX_MASK0[MASK0] L3_FLAGMUX_MASK1[MASK1]	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_REGERR0[REGERR0] L3_FLAGMUX_REGERR1[REGERR1]	xxx
Clear the slave NIU error log and the FLAGMUX error.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_SVRTSTDLVL_0	0x1

Table 10-26. FLAGMUX_CLK1_TIMEOUT1 and FLAGMUX_CLK1_TIMEOUT2 Configuration

Step	Register/Bit Field/Programming Model	Value
Enable time-out for target.	L3_FLAGMUX_TIMEOUTx_MASK0[MASK0]	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_TIMEOUTx_REGERR0[REGERR0]	xxx

Table 10-27. FLAGMUX_CLK2_TIMEOUT Configuration

Step	Register/Bit Field/Programming Model	Value
Enable time-out for target.	L3_FLAGMUX_TIMEOUT_MASK0[1:0] MASK0	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_TIMEOUT_REGERR0[1:0] REGERR0	xxx

10.2.5 L3_MAIN Interconnect Register Manual

10.2.5.1 L3_MAIN Register Group Summary

The registers in the L3 interconnect are divided into the following groups:

- Firewall registers (see [Table 10-29](#))
- HOST registers (see [Table 10-52](#))
- TARG registers (see [Table 10-88](#))
- Flag Muxing registers (see [Section 10.2.5.1.4](#) through [Section 10.2.5.1.6](#))
- Bandwidth Regulator registers (see [Table 10-186](#))
- Bandwidth Limiter registers (see [Table 10-202](#))
- STATCOLL registers (see [Table 10-221](#))

10.2.5.1.1 L3_MAIN Firewall Registers Summary and Description

NOTE: CRC and TESOC are not supported on the DM50x family of devices.

Table 10-28. L3_MAIN Firewall Instance Summary

Module Name	Base Address	Size
DEBUGSS_CT_TBR_FW	0x4A22 4000	4KiB

Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																STDHOSTHDR_MAINCTLREG_CM	STDHOSTHDR_MAINCTLREG_FLT	RESERVED	STDHOSTHDR_MAINCTLREG_EN												

Bits	Field Name	Description	Type	Reset
31:4	RESERVED	Reserved	R	0x00000000
3	STDHOSTHDR_MAINCTLREG_CM	Reserved for internal testing. Must be set to 0. Type: Control. Reset value: 0x0.	R	0
2	STDHOSTHDR_MAINCTLREG_FLT	Asserted when a Fault condition is detected: if the unit includes Error Logging, Flt is asserted when the FltCnt register field indicates a Fault, and deasserted when FltCnt is reset. If no Error Logging is implemented, this bit becomes unit-dependent. In all cases, Flt bit and Flt pin (service network) have the same logical level. Type: Status. Reset value: X.	R	0
1	RESERVED	Reserved	R	0
0	STDHOSTHDR_MAINCTLREG_EN	Sets the global core enable. Note: A disabled master does not generate any NTPP requests, and a disabled slave replies with an error packet to any request it receives. Type: Control. Reset value: 0x1.	RW	1

10.3 L4 Interconnects

This section details the device L4 interconnects.

10.3.1 L4 Interconnect Overview

The device uses three separate L4 interconnect structures to connect peripheral modules. All L4s handle transfers with peripherals but are located in distinct power domains.

Figure 10-9 is an overview of the L4 interconnects and the peripherals attached to them.

The L4 interconnect is composed of the following interconnects:

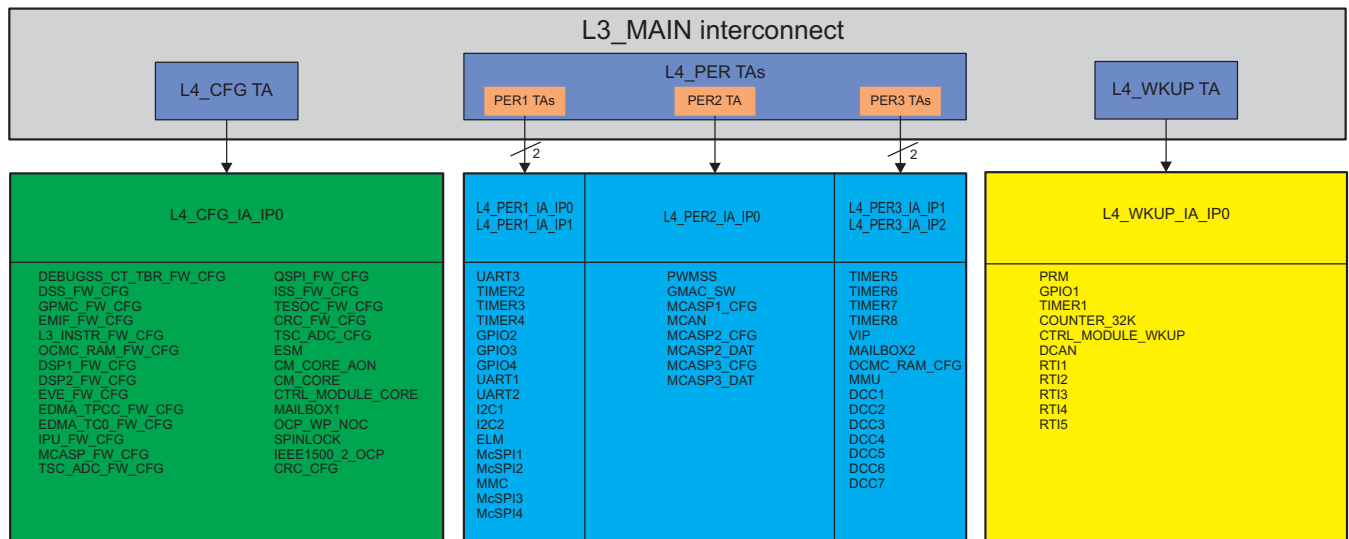

- L4_CFG: Includes the majority of the configuration interface for L3_MAIN system modules and peripheral interconnect
- L4_PER: Includes the main peripherals in the device. L4_PER is further divided into three sub-interconnects: L4_PER1, L4_PER2 and L4_PER3. Each of these L4_PERx sub-interconnects is connected to L3_MAIN initiators via the following ports:
 - L4_PER1_P1, L4_PER1_P2
 - L4_PER2_P1
 - L4_PER3_P1, L4_PER3_P2

L3_MAIN initiators access the L4_PERx peripherals through these ports. All peripherals attached to L4_PER1 and L4_PER3 are visible through the two L4_PER1 and L4_PER3 ports. For information about which initiator can access which L4_PERx port, see Figure 10-3.

- L4_WKUP: Includes peripherals attached to the WKUP power domain

NOTE: CRC, TESOC, ESM and DCC1 to DCC7 are not supported on the DM50x family of devices.

Figure 10-9. L4 Interconnect Overview

The main features of the L4 interconnects are:

- Seven ports from L3_MAIN interconnect onto 5 parallel L4 interconnects
- One or two 32-bit initiator ports for each L4 interconnect instance (7 in total)
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little-endian platform
- Non-blocking architecture with fair arbitration between masters
- Target interfaces: Fully synchronous or divided synchronous clock frequencies
- L4_CFG and L4_PER1, L4_PER2, L4_PER3 frequency equals half of L3 frequency

- Protection logic that provides user-configurable access control to targets by each initiator

10.3.2 L4 Interconnect Integration

Table 10-334 and Table 10-335 summarize the integration of the module in the device.

Table 10-334. Integration Attributes

Module Instance	Attributes
	Power Domain
L4_PER1, L4_PER2, L4_PER3	PD_COREAON
L4_CFG	PD_COREAON
L4_WKUP	PD_WKUPAON

Table 10-335. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER1	L4_PER1_CLK	L4PER_L3_GICLK	PRCM module	Functional and interface clock
L4_PER2	L4_PER2_CLK	L4PER_L3_GICLK	PRCM module	Functional and interface clock
L4_PER3	L4_PER3_CLK	L4PER_L3_GICLK	PRCM module	Functional and interface clock
L4_CFG	L4_CFG_CLK	L4CFG_L3_GICLK	PRCM module	Functional and interface clock
L4_WKUP	L4_WKUP_CLK	WKUPAON_GICLK	PRCM module	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER1, L4_PER2, L4_PER3	L4_PER_RST	L4_PER_RST	PRCM module	Reset of L4_PERx interconnect
	L4_PER_RET_RST	L4_PER_PWRON_RET_RST	PRCM module	Reset of L4_PERx interconnect retention registers. For information about retention reset, see Chapter 3, Power, Reset, and Clock Management .
L4_CFG	L4_CFG_RST	CORE_RST	PRCM module	Reset of L4_CFG interconnect.
	L4_CFG_RET_RST	CORE_PWRON_RET_RST	PRCM module	Reset of L4_CFG interconnect retention registers. For information about retention reset, see Chapter 3, Power, Reset, and Clock Management .
L4_WKUP	L4_WKUP_RST	WKUPAON_RST	PRCM module	Reset of L4_WKUP interconnect
	L4_WKUP_RET_RST	L4_WKUP_RET_RST	PRCM module	Reset of L4_WKUP interconnect. For information about retention reset, see Chapter 3, Power, Reset, and Clock Management .

10.3.3 L4 Interconnect Functional Description

10.3.3.1 Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

Table 10-336 through Table 10-345 list all the modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

10.3.3.1.1 L4_PER1 Interconnect Agents

The L4_PER1 interconnect handles transfers only to peripherals in the PER power domain. Table 10-336 lists the L4_PER1 TAs.

Table 10-336. L4_PER1 TAs

Module Target Name	Description
UART3_TARG	Universal Asynchronous Receiver/Transmitter target port
TIMER2_TARG	General Purpose Timer 2 target port
TIMER3_TARG	TIMER3 target port
TIMER4_TARG	TIMER4 target port
GPIO2_TARG	GPIO2 target port
GPIO3_TARG	GPIO3 target port
GPIO4_TARG	GPIO4 target port
UART1_TARG	UART1 target port
UART2_TARG	UART2 target port
I2C1_TARG	I2C1 target port
I2C2_TARG	I2C2 target port
ELM_TARG	Error Location Module target port
MCSP1_TARG	Multi-channel Serial Peripheral Interface 1 target port
MCSP2_TARG	MCSP2 target port
MMC_TARG	MMC target port
MCSP3_TARG	MCSP3 target port
MCSP4_TARG	MCSP4 target port

Two ports communicate between the L3_MAIN interconnect and the L4_PER1 interconnect to allow the L3_MAIN initiators to access the L4_PER1 targets. Table 10-337 lists the L4_PER1 IAs.

For the list of initiators authorized to access the L4_PER1 peripherals, see Figure 10-3.

Table 10-337. L4_PER1 IAs

Module Initiator Name	Description
L4_PER1_IA_IP0	L4_PER1 Initiator Port 0 (IP0)
L4_PER1_IA_IP1	L4_PER1 Initiator Port 1 (IP1)

10.3.3.1.2 L4_PER2 Interconnect Agents

The L4_PER2 interconnect handles transfers only to peripherals in the PER power domain. Table 10-338 lists the L4_PER2 TAs.

Table 10-338. L4_PER2 TAs

Module Target Name	Description
MCASP1_CFG_TARG	MCASP_CFG target port
PWMSS_TARG	Pulse-Width Modulation target port

Table 10-338. L4_PER2 TAs (continued)

Module Target Name	Description
MCAN_TARG	MCAN target port
GMAC_SW_TARG	Ethernet Controller target port
MCASP2_DAT_TARG	MCASP2_DAT target port
MCASP2_CFG_TARG	MCASP2_CFG target port
MCASP3_DAT_TARG	MCASP3_DAT target port
MCASP3_CFG_TARG	MCASP3_CFG target port

One port communicates between the L3_MAIN interconnect and the L4_PER2 interconnect to allow the L3_MAIN initiators to access the L4_PER2 targets. [Table 10-339](#) lists the L4_PER2 IA.

For the list of initiators authorized to access the L4_PER2 peripherals, see [Figure 10-3](#).

Table 10-339. L4_PER2 IA

Module Initiator Name	Description
L4_PER2_IA_IP0	L4_PER2 Initiator Port 0 (IP0)

10.3.3.1.3 L4_PER3 Interconnect Agents

The L4_PER3 interconnect handles transfers only to peripherals in the PER power domain. [Table 10-340](#) lists the L4_PER3 TAs.

Table 10-340. L4_PER3 TAs

Module Target Name	Description
TIMER5_TARG	TIMER5 target port
TIMER6_TARG	TIMER6 target port
TIMER7_TARG	TIMER7 target port
TIMER8_TARG	TIMER8 target port
VIP_TARG	VIP target port
MAILBOX2_TARG	Mailbox 2 target port
OCMC_RAM_CFG_TARG	OCMC_RAM target port
MMU_TARG	MMU target port
DCC1_TARG	DCC1 target port
	Note: DCC1 to DCC7 are not supported on the DM50x family of devices.
DCC2_TARG	DCC2 target port
DCC3_TARG	DCC3 target port
DCC4_TARG	DCC4 target port
DCC5_TARG	DCC5 target port
DCC6_TARG	DCC6 target port
DCC7_TARG	DCC7 target port

Two ports communicate between the L3_MAIN interconnect and the L4_PER3 interconnect to allow the L3_MAIN initiators to access the L4_PER3 targets. [Table 10-341](#) lists the L4_PER3 IAs.

For the list of initiators authorized to access the L4_PER3 peripherals, see [Figure 10-3](#).

Table 10-341. L4_PER3 IAs

Module Initiator Name	Description
L4_PER3_IA_IP1	L4_PER3 Initiator Port 1 (IP1)
L4_PER3_IA_IP2	L4_PER3 Initiator Port 2 (IP2)

10.3.3.1.4 L4_CFG Interconnect Agents

The L4_CFG interconnect handles only transfers to peripherals in the CORE power domain. [Table 10-342](#) lists the L4_CFG TAs.

Table 10-342. L4_CFG TAs

Module Target Name	Description
DEBUGSS_CT_TBR_FW_CFG_TARG	Debug subsystem firewall
DSS_FW_CFG_TARG	DSS firewall
GPMC_FW_CFG_TARG	GPMC firewall
EMIF_FW_CFG_TARG	EMIF firewall
L3_INSTR_FW_CFG_TARG	L3 Instrumentation firewall
OCMC_RAM_FW_CFG_TARG	OCMC_RAM firewall
DSP1_FW_CFG_TARG	DSP1 firewall
DSP2_FW_CFG_TARG	DSP2 firewall
EVE_FW_CFG_TARG	EVE firewall
EDMA_TPCC_FW_CFG_TARG	EDMA Channel Controller firewall
EDMA_TC0_FW_CFG_TARG	EDMA Transfer Controller firewall
IPU_FW_CFG_TARG	IPU firewall
MCASP1_FW_CFG_TARG	McASP firewall
TSC_ADC_FW_CFG_TARG	ADC firewall
QSPI_FW_CFG_TARG	QSPI firewall
ISS_FW_CFG_TARG	ISS firewall
TESOC_FW_CFG_TARG	TESOC firewall
CRC_FW_CFG_TARG	CRC firewall
TSC_ADC_CFG_TARG	ADC configuration target port
ESM_TARG	ESM target port
CM_CORE_AON_TARG	CM_CORE_AON target port
CM_CORE_TARG	CM_CORE target port
CTRL_MODULE_CORE_TARG	CTRL_MODULE_CORE target port
MAILBOX1_TARG	Mailbox1 target port
OCP_WP_NOC_TARG	OCP watchpoint target port
SPINLOCK_TARG	Spinlock target port
IEEE1500_2_OCP_TARG	IEEE1500 target port
CRC_CFG_TARG	CRC configuration target port

One port communicates between the L3_MAIN interconnect and the L4_CFG interconnect to allow the L3_MAIN initiators to access the L4_CFG targets. [Table 10-343](#) lists the L4_CFG IA.

For the list of initiators authorized to access the L4_CFG peripherals, see [Figure 10-3](#).

Table 10-343. L4_CFG IA

Module Initiator Name	Description
L4_CFG_IA_IP0	L4_CFG Initiator Port (IP0)

10.3.3.1.5 L4_WKUP Interconnect Agents

The L4-WKUP interconnect handles transfers only to peripherals in the WKUP power domain. [Table 10-344](#) lists the TAs. [Table 10-345](#) lists the L4 WKUP IA.

Table 10-344. L4_WKUP TAs

Module Target Name	Description
PRM_TARG	PRM target port
GPIO1_TARG	GPIO1 target port
TIMER1_TARG	Timer 1 target port
COUNTER_32K_TARG	Counter 32k timer
CTRL_MODULE_WKUP_TARG	CTRL_MODULE_WKUP target port
DCAN_TARG	DCAN target port
RTI1_TARG	RTI1 target port
RTI2_TARG	RTI2 target port
RTI3_TARG	RTI3 target port
RTI4_TARG	RTI4 target port
RTI5_TARG	RTI5 target port

Table 10-345. L4_WKUP IA

Module Initiator Name	Description
L4_WKUP_IA_IP0	L4_WKUP Initiator Port (IP0)

10.3.3.2 Power Management

As part of the system-wide power-management scheme, the L4 interconnects go into IDLE state after receiving a request from the PRCM module after all commands are serviced. This function is handled by hardware. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

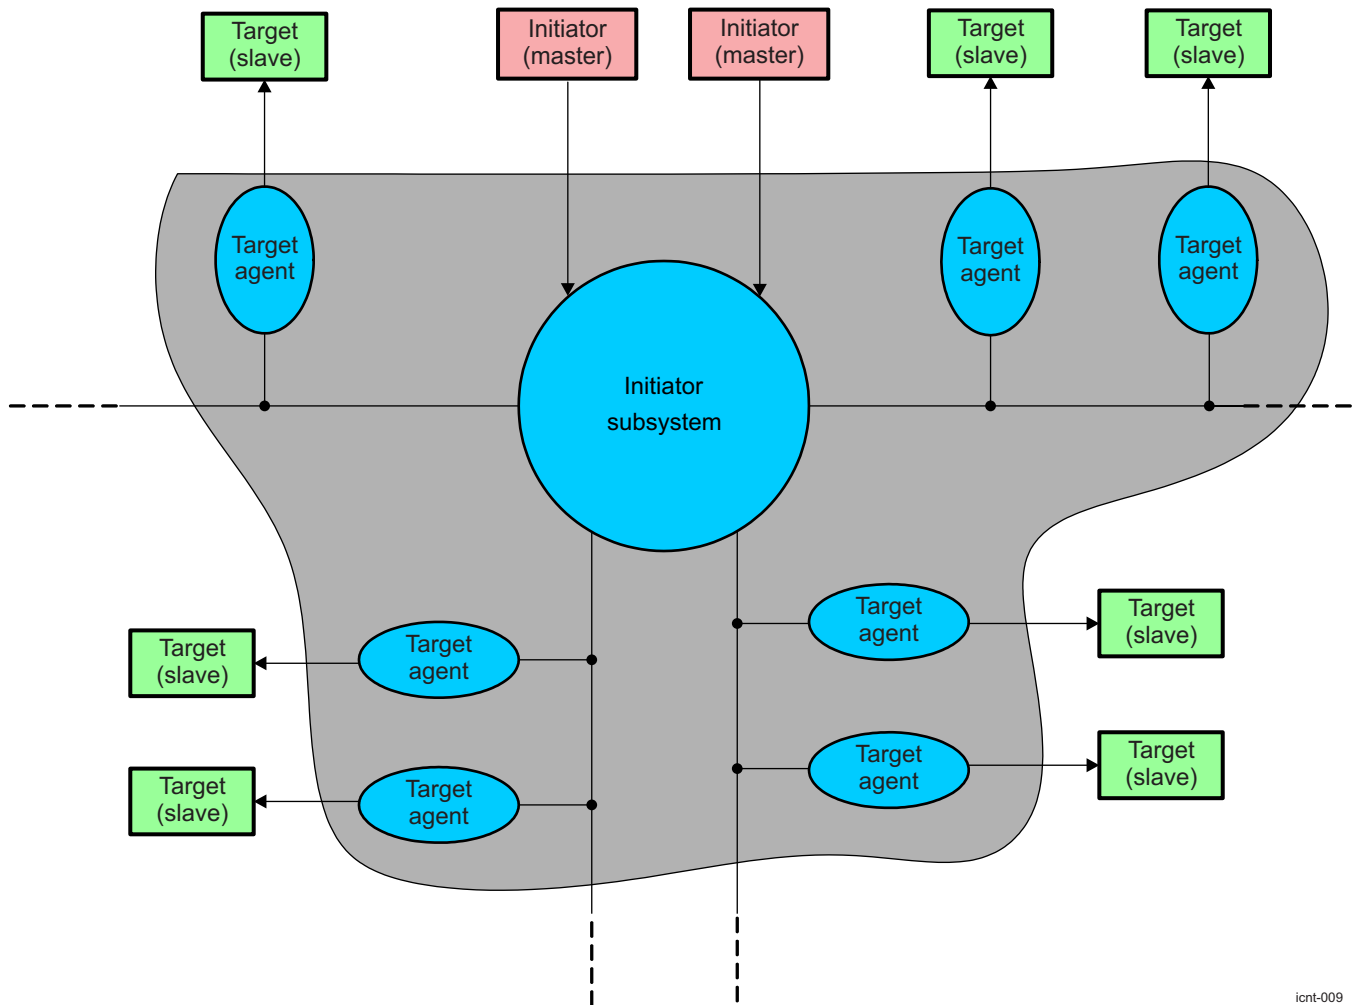

To reduce power consumption, each L4 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

L4_CFG, L4_PER1, L4_PER2, L4_PER3, and L4_WKUP are located in the always-on power domain and no retention is needed for these L4 interconnects.

10.3.3.3 L4 Firewalls

[Figure 10-10](#) is an internal view of the L4 interconnects in the overall interconnect. This architecture, with one initiator subsystem centralizing all initiator master requests and distributing them to all target modules (peripherals), enables the L4 interconnect firewall functions to be centralized at the L4 initiator subsystem level. The L4 firewall filters the accesses based on the configurable protection groups defined in the L4 address protection (AP) registers. Each module or TA is assigned to a protection group. The configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

Figure 10-10. L4 Initiator-Target Connectivity

icnt-009

NOTE: As Figure 10-10 shows, targets are attached to branches. Branches do not impact the function of the L4 interconnect but are present to simplify timing closure and reduce active power consumption.

Because of the large address spaces and the number of peripherals connected to an L4 interconnect, two parameters are used to set up access permission:

- Programmable groups for initiators:
 - Eight protection groups for the L4 interconnect
- Segments divided into regions
 - 78 regions for the L4_PER1 interconnect
 - 33 regions for the L4_PER2 interconnect
 - 93 regions for the L4_PER3 interconnect
 - 111 regions for the L4_CFG interconnect
 - 44 regions for the L4_WKUP interconnect

NOTE: There might be regions which are not used so the actual region count may not be the same as the listed above.

Protection group members are TAs with the same protection settings. A region is programmed to allow access to an unique selectable protection group. For better protection, different regions are grouped into protection group regions and associated with a protection group member.

10.3.3.3.1 Protection Group

The following registers are used to define a protection group:

- The CONNID_BIT_VECTOR field of register [L4_AP_PROT_GROUP_MEMBERS_k_L](#) defines which initiator belongs to a group. A protection group is accessible by an initiator when the bit position corresponding to its ConnID is set to 1 in the CONNID_BIT_VECTOR field. [Table 10-346](#) lists the L3 ConnIDs available at L4 level. They are 4-bit ConnIDs and are equal to bits [5:2] of the 6-bit L3_MAIN ConnIDs.
- The [L4_AP_PROT_GROUP_ROLES_k_L](#) register defines the initiator requests accepted or not by the L4 firewalls depending on the combination of MReqDebug and MReqSupervisor qualifiers. Each bit of this register corresponds to an unique combination of these two qualifiers. To accept a request with combination n, bit n of the [L4_AP_PROT_GROUP_ROLES_k_L](#) register must be set to 1. [Table 10-347](#) lists all possible combinations and the corresponding bits which have to be set to 1 for accepting particular combination.

NOTE: Permissions are identical for read and write accesses in L4 interconnect.

k indicates the protection group number.

L indicates the region number.

Table 10-346. L4 ConnID Definition

ConnID	L3 Initiator
0x1	DEBUGSS_CS_DAP_INIT, IEEE1500_2_OCP_INIT
0x2	DSP1_MDMA_INIT, DSP1_EDMA_INIT, DSP1_CFG_INIT, DSP2_EDMA_INIT
0x3	DSP2_MDMA_INIT, DSP2_CFG_INIT
0x4	EVE_TC0_INIT
0x6	IPU_INIT
0x7	TPTC1_WR_INIT, TPTC1_RD_INIT, TPTC2_WR_INIT, TPTC2_RD_INIT
0x8	DSS1_INIT, MMU_INIT
0x9	VIP_P1_INIT, VIP_P2_INIT
0xA	GMAC_SW_INIT
0xC	ISS_RT_INIT, ISS_NRT1_INIT, ISS_NRT2_INIT
0xD	EVE_TC1_INIT

Table 10-347. L4 Qualifiers Combination

MReqSupervisor	MReqDebug	Bit Positions In Register L4_AP_PROT_GROUP_ROLES_k_L Which Have To Be Set To 1
0	0	2
0	1	3
1	0	6
1	1	7

[Table 10-348](#) shows an example how to set the CONNID_BIT_VECTOR field.

Table 10-348. Example For Setting The CONNID_BIT_VECTOR Field Of Register L4_AP_PROT_GROUP_MEMBERS_k_L

Initiator	Access Allowed?	CONNID_BIT_VECTOR	Bits
Reserved	-	0	0
DEBUGSS_CS_DAP_INIT, IEEE1500_2_OCP_INIT	N	0	1
DSP1_MDMA_INIT, DSP1_EDMA_INIT, DSP1_CFG_INIT, DSP2_EDMA_INIT	N	0	2
DSP2_MDMA_INIT, DSP2_CFG_INIT	N	0	3
EVE_TC0_INIT	Y	1	4
Reserved	-	0	5
IPU_INIT	Y	1	6
TPTC1_WR_INIT, TPTC1_RD_INIT, TPTC2_WR_INIT, TPTC2_RD_INIT	N	0	7
DSS1_INIT, MMU_INIT	N	0	8
VIP_P1_INIT, VIP_P2_INIT	N	0	9
GMAC_SW_INIT	N	0	10
Reserved	-	0	11
ISS_RT_INIT, ISS_NRT1_INIT, ISS_NRT2_INIT	N	0	12
EVE_TC1_INIT	N	0	13
Reserved	-	0	14
Reserved	-	0	15

Setting to 0x1 bits 4 and 6 in the [L4_AP_PROT_GROUP_MEMBERS_k_L](#) (for example, k = 1) register defines that group 1 can be accessed by the following initiators:

- EVE_TC0_INIT
- IPU_INIT

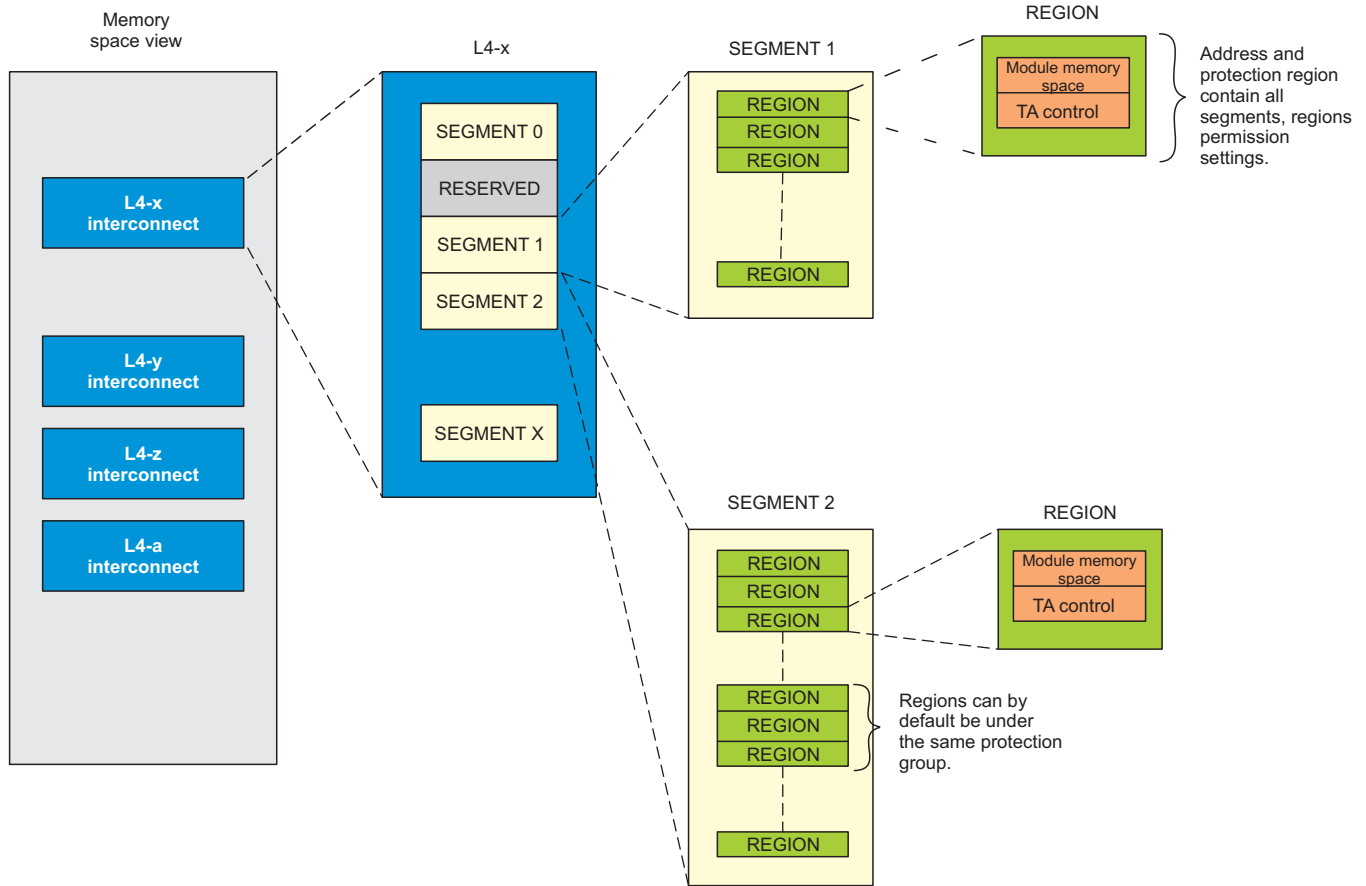

Protection group 1 can be applied to multiple protection regions with no limitation. Each protection region that is configured with protection group 1 enables permission access only to the two initiators.

The [L4_AP_REGION_I_H\[22:20\]](#) PROT_GROUP_ID bit field determines with which protection group the region I is associated.

10.3.3.3.2 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation, as shown in [Figure 10-11](#). By default, some regions are attached to specific protection group members. This specificity lets users set up the permission access to certain types of modules requiring the same access protection without managing region allocation.

Figure 10-11. L4 Segmentation

icnt-011

All interconnect address spaces are covered by regions. [Table 10-349](#) through [Table 10-353](#) list the module mapping with their addresses, region numbers, and default protection group allocated to them.

NOTE: Module refers to the configuration registers of the module.

TA (Target Agent) refers to the interconnect configuration registers of the TA associated with the module.

10.3.3.3 L4 Firewall Address and Protection Register Settings

Table 10-354 lists the settings of the AP registers relative to an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

Table 10-354. L4 Firewall Register Description Overview

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_i_L ⁽¹⁾	31:0	BASE	Segment base address
	L4_AP_SEGMENT_i_H ⁽¹⁾	5:0	SIZE	Segment size equals to 2 ^{SIZE}
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L ⁽²⁾	15:0	CONNID_BIT_VECTOR	For L4 ConnID, see Table 10-346 .
	L4_AP_PROT_GROUP_ROLES_k_L ⁽²⁾	31:0	ENABLE	Defines the initiator requests accepted or not by the L4 firewalls depending on combination of L4 qualifiers.
Region setting	L4_AP_REGION_I_L ⁽³⁾	20:0	BASE	Defines the base address of a region with respect to its segment base address
	L4_AP_REGION_I_H ⁽³⁾	31:28	MADDRSPACE	Target interconnect MAddrSpace
		26:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	Protection group member attached to the region
		18:17	BYTE_DATA_WIDTH_EXP	Determines the number of bytes in an access
		14:8	PHY_TARGET_ID	Physical target ID
		6:1	SIZE	Size of the region equals to 2 ^{SIZE}
		0	ENABLE	Enables the region protection

- ⁽¹⁾ i = 0 to 1 for L4_PER1_AP
i = 0 for L4_PER2_AP
i = 0 for L4_PER3_AP
i = 0 to 2 for L4_CFG_AP
i = 0 to 3 for L4_WKUP_AP
- ⁽²⁾ k = 0 to 7 for L4_PER1_AP
k = 0 to 7 for L4_PER2_AP
k = 0 to 7 for L4_PER3_AP
k = 0 to 7 for L4_CFG_AP
k = 0 to 7 for L4_WKUP_AP
- ⁽³⁾ l = 0 to 77 for L4_PER1_AP
l = 0 to 32 for L4_PER2_AP
l = 0 to 92 for L4_PER3_AP
l = 0 to 110 for L4_CFG_AP
l = 0 to 43 for L4_WKUP_AP

10.3.3.4 L4 Error Detection and Reporting

10.3.3.4.1 IA and TA Error Detection and Logging

The L4 interconnect provides mechanisms for handling internally detected errors or errors reported by modules attached to the L4 target ports.

NOTE: L4_IA denotes the IA for all L4 interconnects: L4_PER1, L4_PER2, L4_PER3, L4_CFG, and L4_WKUP.

L4_TA denotes the TA for all L4 interconnects: L4_PER1, L4_PER2, L4_PER3, L4_CFG, and L4_WKUP.

The L4 interconnects handle four types of errors:

- No target core found or address hole, detected and logged at IA
- Unsupported command, detected and logged at IA
- Protection violation, detected and logged at IA (see [Section 10.3.3.3, L4 Firewalls](#))
- Target does not service a request before a time-out expires. The error is detected and logged at TA (see [Section 10.3.3.4.2, Time-Out](#)).

[Table 10-355](#) lists the value of the L4_IA_ERROR_LOG_L[25:24] CODE bit field stored when an error occurs.

Table 10-355. L4 CODE Bit Field Definition

CODE (bits 1:0)	Error Type	REQ_INFO	Secondary	ConnID	CMD
0	No error				
1	Unsupported command	x	x	x	x
2	Address hole	x	x	x	x
3	Protection violation	x		x	x

- No target core found/address hole: This error indicates that a request was addressed to a hole in the L4 address map. When this error occurs, an in-band error response is returned to the L3 level. The error is also logged into the [L4_IA_AGENT_STATUS_L\[27\] INBAND_ERROR](#) bit. Additionally, an address hole error code is logged to the [L4_IA_ERROR_LOG_L\[25:24\] CODE](#) bit field.
- Unsupported command: This error indicates that the command type of the request is not supported by the accessed target register. The error is logged into the [L4_IA_AGENT_STATUS_L\[27\] INBAND_ERROR](#) bit. An unsupported command error code is written to the [L4_IA_ERROR_LOG_L\[25:24\] CODE](#) bit field for the initiator interface.
- Protection violation: This error indicates that a request is not issued from an allowed initiator member or is issued with the inappropriate ReqInfo qualifiers associated with the target region. This error is reported using an in-band error and is written to the [L4_IA_AGENT_STATUS_L\[27\] INBAND_ERROR](#) bit. A protection violation error code is saved into the [L4_IA_ERROR_LOG_L\[25:24\] CODE](#) bit field for the same initiator interface. A protection violation is also logged in the [L4_IA_AGENT_STATUS_L\[31\] PROT_ERROR_SECONDARY](#) bit when the device is in debug mode or in the [L4_IA_AGENT_STATUS_L\[30\] PROT_ERROR_PRIMARY](#) bit when the device is in application mode. The [L4_IA_ERROR_LOG_L\[30\] SECONDARY](#) bit indicates whether the error occurred in application or debug.
The [L4_IA_ERROR_LOG_H\[15:0\] REQ_INFO](#) bit field returns the type of access (MreqInfo qualifier) that has caused the error.
The [L4_IA_ERROR_LOG_L\[13:8\] CONNID](#) bit field returns the ConnID of the initiator that has caused the error.
The [L4_IA_ERROR_LOG_ADDR_L\[31:0\] ADDR](#) register logs the address for error conditions.

10.3.3.4.2 Time-Out

A time-out mechanism can be enabled at the interconnect level and on a per-target basis. If the mechanism is enabled for a TA and interconnect and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

The error is logged in the [L4_TA_AGENT_STATUS_L\[8\] REQ_TIMEOUT](#) bit. The affected TA enters an error state that causes it to send an error response to any new request targeted at it. To recover from this state, system software must reset the TA. The time-out is counted starting from the moment a command is presented to the target, regardless of the target response to this command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. The time-base circuit offers four possible sets of four time-base signals. The time-base signals are selected by programming the [L4_LA_NETWORK_CONTROL_L\[10:8\] TIMEOUT_BASE](#) bit field.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, using the [L4_TA_AGENT_CONTROL_L\[10:8\] REQ_TIMEOUT](#) bit field. These four signals are referred to as 1X time-base, 4X time-base, 16X time-base, and 64X time-base.

[Table 10-356](#) lists all values in number of L4 clock cycles.

Table 10-356. L4 Time-out Link and TA Programming

		L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT			
L4_LA_NETWORK_CON TROL_L[10:8] TIMEOUT_BASE	0	1	2	3	4
0	All L4 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16,384
3		1024	4096	16,384	65,536
4		4096	16,384	65,536	262,144

The default reset value is 0x2 for REQ_TIMEOUT and 0x4 for TIMEOUT_BASE, implying 16,384 clock cycles.

A time-out condition is detected when the command acceptance or the response is not received after a delay of from one to three time-base periods.

Example:

- L4 frequency = 65MHz, 15.3- μ s period
- TIMEOUT_BASE = 4 in the [L4_LA_NETWORK_CONTROL_L](#) register
- REQ_TIMEOUT = 2 in the [L4_TA_AGENT_CONTROL_L](#) for TA A
- REQ_TIMEOUT = 4 in the [L4_TA_AGENT_CONTROL_L](#) for TA B

At agent A, the time-base unit is 16,384 cycles. A time-out is issued when a request to the attached module is not accepted, or no response is sent after a delay of 252 μ s to 756 μ s.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 4 ms to 12 ms.

When a time-out condition is detected, the TA logs the error in the [L4_TA_AGENT_STATUS_L\[8\]](#) REQ_TIMEOUT bit, and it also reports the error to the IA, which forwards it to the L3 interconnects.

After the time-out is detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed-out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, software is assumed to first reset the faulty module and then the TA using the [L4_TA_AGENT_CONTROL_L\[0\]](#) OCP_RESET bit.

10.3.3.4.3 Error Reporting

[Figure 10-12](#) shows the error-reporting scheme used in the L4 interconnects. All L4 in-band errors are reported to their respective L3 TA, where errors are converted in an out-of band error signals (L3_MAIN_IRQ_APP_ERR and L3_MAIN_IRQ_DBG_ERR) going to the IRQ_CROSSBAR.

To enable interrupt reporting in case of error occurrence, one or all of the following bits (depending on user's desire) must be set to 0x1:

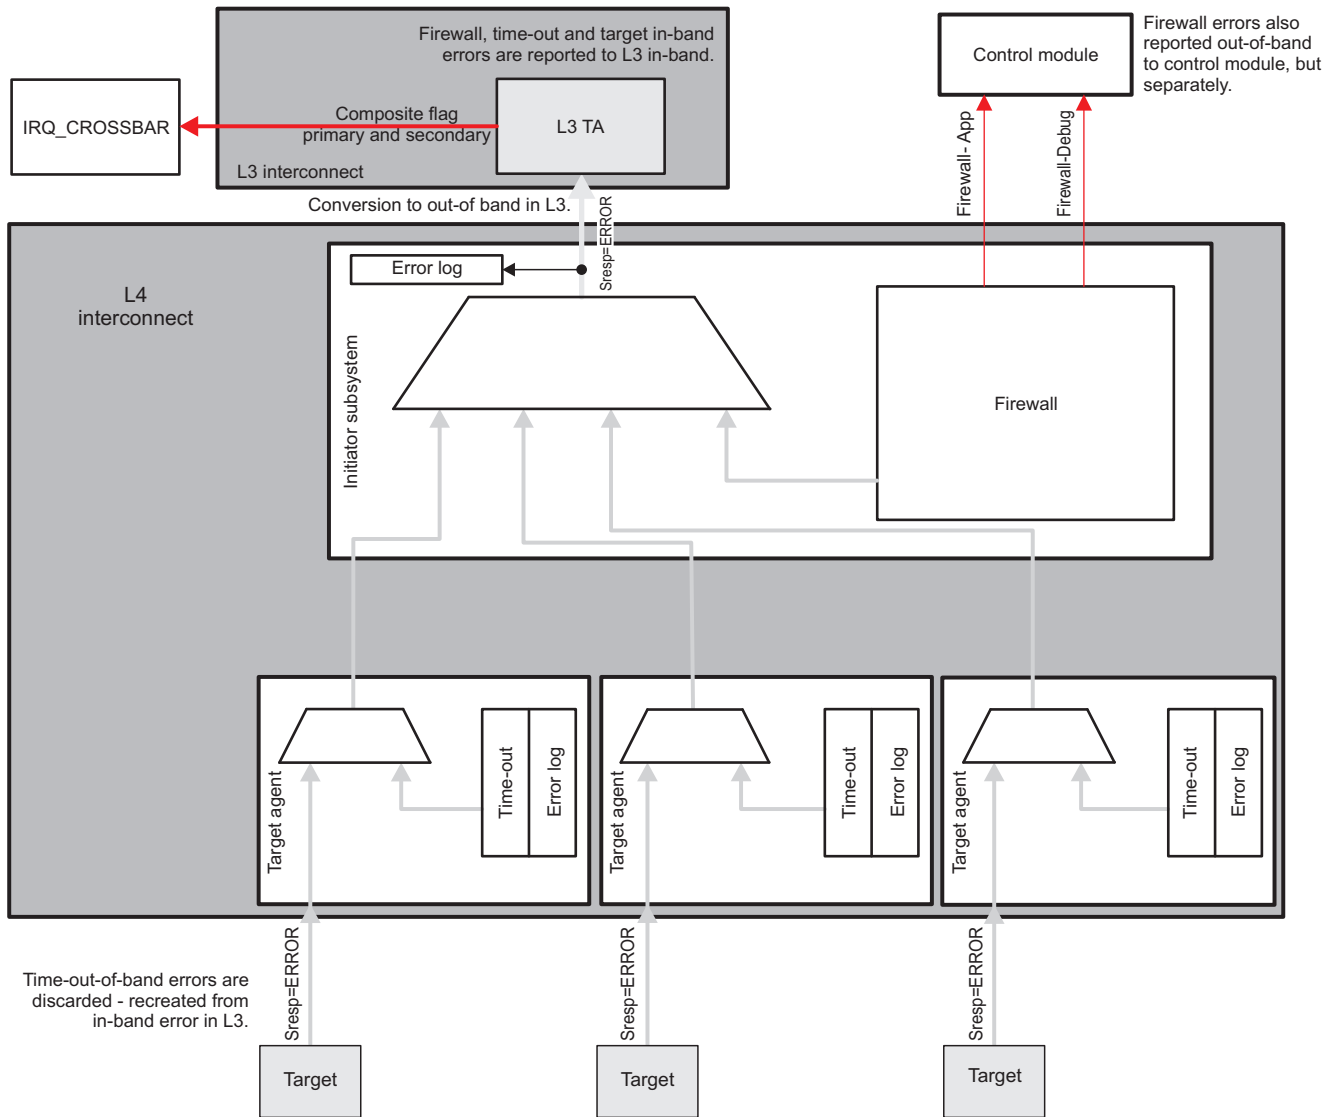

- CLK1_FLAGMUX_CLK1_1.L3_FLAGMUX_MASK0[10] for L4_CFG
- CLK1_FLAGMUX_CLK1_1.L3_FLAGMUX_MASK0[11] for L4_WKUP
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[5] for L4_PER2_P1
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[6] for L4_PER1_P1
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[7] for L4_PER1_P2
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[8] for L4_PER3_P2
- CLK1_FLAGMUX_CLK1_2.L3_FLAGMUX_MASK0[9] for L4_PER3_P1

The following bits must also be set to 0x1:

- L3_FLAGMUX_CLK1MERGE_MASK0[1]

- L3_FLAGMUX_CLK1MERGE_MASK0[0]

Figure 10-12. L4 Error Reporting

icnt-012

10.3.3.4.4 Error Recovery

Setting the [L4_TA_AGENT_CONTROL_L\[0\] OCP_RESET](#) bit to 1 initiates the software reset period. Software reset must be asserted for at least 16 cycles of the target module interface clock, which can be a divided clock with respect to the L4 clock.

During the software reset period:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to prevent unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The [L4_TA_AGENT_STATUS_L\[8\] REQ_TIMEOUT](#) status bit is cleared.

Setting the [L4_TA_AGENT_CONTROL_L\[0\] OCP_RESET](#) bit to 0 terminates the software reset period.

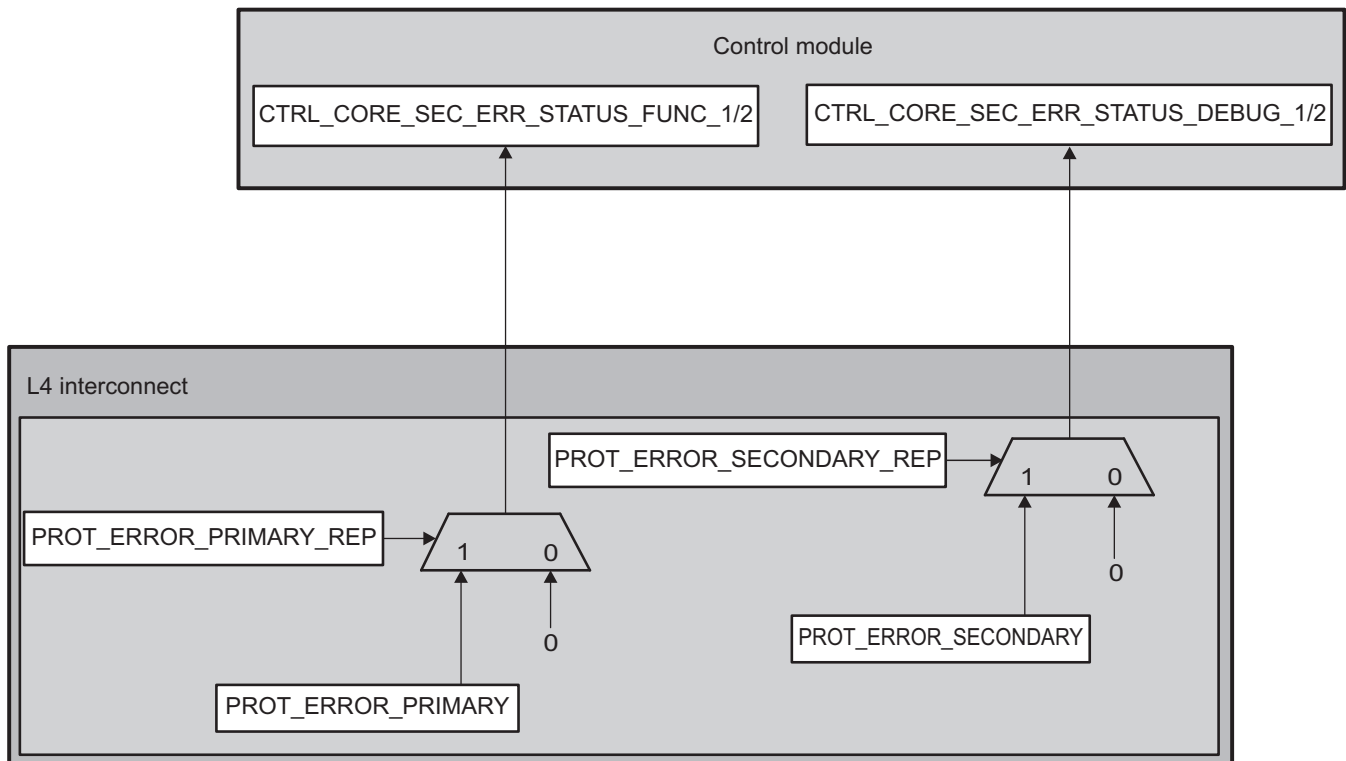

Reset the attached module to complete the recovery.

10.3.3.4.5 Firewall Error Logging in the Control Module

When a protection violation occurs, an interrupt is sent to the IRQ_CROSSBAR. An in-band error is sent back to L3 IA and an out-of-band error is logged in the CTRL_CORE_SEC_ERR_STATUS_FUNC_1/2 register (used in application mode) or in the CTRL_CORE_SEC_ERR_STATUS_DEBUG_1/2 register (used in debug mode). These out-of-band errors are enabled at the L4 IA level by setting to 0x1 the [L4_IA_AGENT_CONTROL_L\[31\] PROT_ERROR_SECONDARY_REP](#) bit when the device is in debug mode or the [L4_IA_AGENT_CONTROL_L\[30\] PROT_ERROR_PRIMARY_REP](#) bit when the device is in application mode.

Figure 10-13 shows the global protection error reporting to the control module.

Figure 10-13. Protection Violation Out-of-Band Error Reporting

10.3.4 L4 Interconnect Programming Guide

10.3.4.1 L4 Interconnect Low-level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

10.3.4.1.1 Global Initialization

10.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the L4 interconnects are used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the L4 interconnects. For more information, see [Section 10.3.2, L4 Interconnect Integration](#).

[Table 10-357](#) lists the surrounding modules.

Table 10-357. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see Chapter 3, Power, Reset, and Clock Management .
Control module	For information about the configuration of the control module, see Chapter 14, Control Module .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description , in Chapter 14, Control Module
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 13 Interrupt Controllers
L3_MAIN interconnect	For more information about the L3_MAIN interconnect configuration, see Section 10.2, L3_MAIN Interconnect .

10.3.4.1.2 Operational Modes Configuration

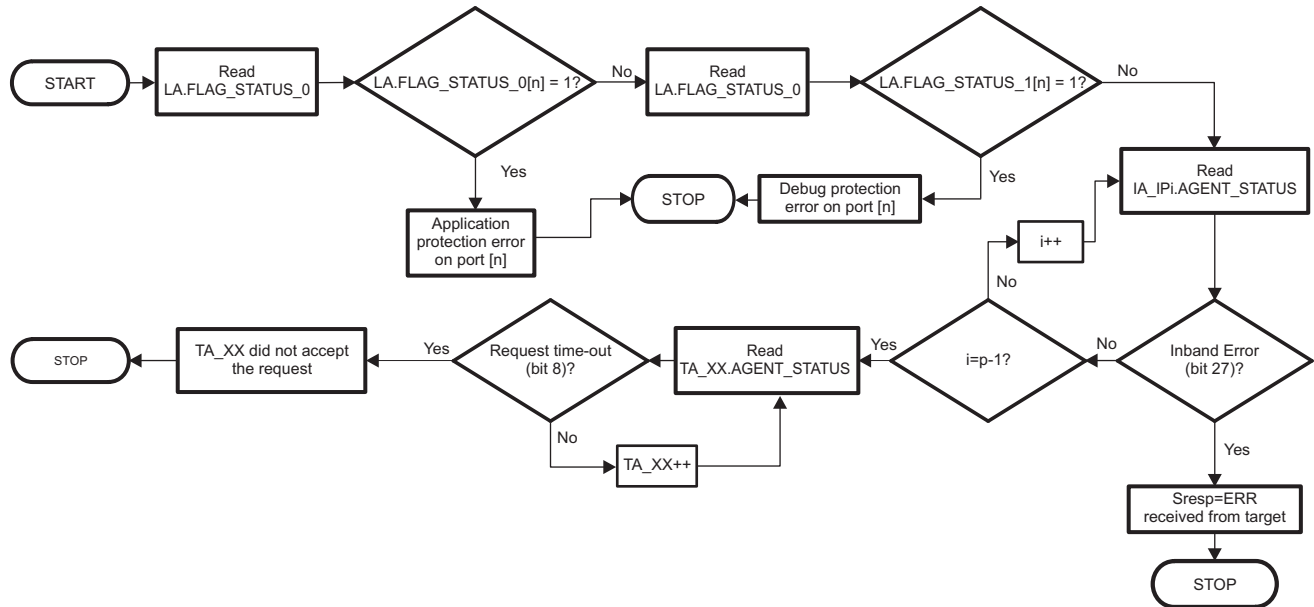

10.3.4.1.2.1 L4 Interconnect Error Analysis Mode

10.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 10-14](#) shows the software sequence required in most cases.

Figure 10-14. Typical Error Analysis Sequence

icnt-014

NOTE: L4 interconnects don't log any address or other specific information for a custom error returned from any target IP. They rather pass an error response up to the master supposed to analyze it.

In case of posted writes, the master access completes before it actually completed at the end slave level, this way no error response is sent back to the master, making it impossible to have a direct way of understanding the origin of L4 error during posted writes. However, even though no address is logged, an error flag is generated and needs to be processed.

10.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see [Table 10-358](#)).

Table 10-358. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x-
Read the initiator ConnID.	L4_IA_ERROR_LOG_L[13:8] CONNID	0x-
Read the command that has caused the error.	L4_IA_ERROR_LOG_L[2:0] CMD	0x-
Read address of request that has caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	0x-
IF: Is it a primary error?	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
Read status bits.	CTRL_CORE_SEC_ERR_STATUS_FUNC_1/2	0x-
	CTRL_CORE_SEC_ERR_STATUS_FUNC_1[16] L4_PERIPH1_FW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_FUNC_1[17] L4_CONFIG_FW_ERROR	0x1
Write 1 to clear status bits.	CTRL_CORE_SEC_ERR_STATUS_FUNC_1[22] L4_WAKEUP_FW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_FUNC_2[4] L4_PERIPH2_FW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_FUNC_2[5] L4_PERIPH3_FW_ERROR	0x1

Table 10-358. Protection Violation Error Identification (continued)

Step	Register/Bit Field/Programming Model	Value
Write 1 to clear IA status bit.	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
ELSE		
Read status bits.	CTRL_CORE_SEC_ERR_STATUS_DEBUG_1/2	0x-
	CTRL_CORE_SEC_ERR_STATUS_DEBUG_1[16] L4_PERIPH1_DBGFW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_DEBUG_1[17] L4_CONFIG_DBGFW_ERROR	0x1
Write 1 to clear status bits.	CTRL_CORE_SEC_ERR_STATUS_DEBUG_1[22] L4_WAKEUP_DBGFW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_DEBUG_2[4] L4_PERIPH2_DBGFW_ERROR	0x1
	CTRL_CORE_SEC_ERR_STATUS_DEBUG_2[5] L4_PERIPH3_DBGFW_ERROR	0x1
Write 1 to clear IA status bit	L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY	0x1
ENDIF		
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear in-band error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

10.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see [Table 10-359](#)).

Table 10-359. Unsupported Command/Address Hole Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x-
Read the initiator ConnID.	L4_IA_ERROR_LOG_L[11:8] CONNID	0x-
Read command that has caused the error.	L4_IA_ERROR_LOG_L[2:0] CMD	0x-
Read the address of the request that has caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	0x-
Read secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x-
Write 1 to clear secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x1
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear inband error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

10.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure describes the reset TA and module (see [Table 10-360](#)).

Table 10-360. Reset TA and Module

Step	Register/Bit Field/Programming Model	Value
Reset TA.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x1
Wait until target module clock = 16 cycles.		
Write 0 to clear TA time-out status.	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	0x0
Write 0 to clear TA reset.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x0
Reset the attached module.	For more information, see the respective module chapter.	

10.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

10.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see [Table 10-361](#)).

Table 10-361. Time-Out Configuration

Step	Register/Bit Field/Programming Model	Value
Disable time-out.	L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE	0x0
Clear TA time-out error status. ⁽¹⁾	L4_TA_AGENT_STATUS_L [8] REQ_TIMEOUT	0x1
Set time-out at TA level. ⁽¹⁾	L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT	0x-
Set time-out base.	L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE	0x-

⁽¹⁾ Required for each TA.

10.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

10.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see [Table 10-362](#)).

Table 10-362. Firewall Configuration

Step	Register/Bit Field/Programming Model	Value
Define the members of protection group k. In other words, define which initiators can access the protection group k. For ConnID values, see Table 10-346 .	L4_AP_PROT_GROUP_MEMBERS_k_L [15:0] CONNID_BIT_VECTOR ⁽¹⁾	0x-
For the protection group k define the initiator requests accepted or not by the L4 firewalls depending on combination of L4 qualifiers. For more details, see Table 10-347	L4_AP_PROT_GROUP_ROLES_k_L [31:0] ENABLE ⁽¹⁾	0x-
Assign the region l to a protection group.	L4_AP_REGION_l_H [22:20] PROT_GROUP_ID ⁽²⁾	0x-

⁽¹⁾ Required for each protection group.

⁽²⁾ Required for each region.

10.3.5 L4 Interconnects Register Manual

Table 10-363 through Table 10-367 list all L4 register blocks for IA, TA, AP, and LA. Each module instance is shown with the module register mapping and bit and bit field definitions.

10.3.5.1 L4 Interconnects Instance Summary

NOTE: CRC, TESOC, ESM and DCC1 to DCC7 are not supported on the DM50x family of devices.

Table 10-437. L4_TA_AGENT_CONTROL_L

Address Offset	0x0000 0020		
Physical Address	See Table 10-396 to Table 10-428	Instance	See Table 10-396 to Table 10-428
Description	Enable error reporting		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								SERROR_REP	RESERVED											REQ_TIMEOUT	RESERVED							OCP_RESET			

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	SERROR_REP	Enable logging of error	R	0x0
23:11	RESERVED	Read returns 0.	R	0x0
10:8	REQ_TIMEOUT	Time-out Bound. Values are: 0 - No time-out 1 - 1x base cycles. 2 - 4x base cycles. 3 - 16x base cycles. 4 - 64x base cycles.	RW	0x2
7:1	RESERVED	Read returns 0.	R	0x00
0	OCP_RESET	The OCP_RESET field controls the OCP reset signal to the attached core. Setting this bit clears any pending transfers and resets the OCP interface. The bit must be cleared to deassert the OCP reset signal. When the software reset feature is available on a target agent, the target agent OCP must also have a reset signal directed to the target core.	RW	0

Address Offset	0x0000 0024	Instance	L4_PER1_LA L4_PER2_LA L4_PER3_LA L4_CFG_LA L4_WKUP_LA
Physical Address	0x4800 0824 0x4840 0824 0x4880 0824 0x4A00 0824 0x4AE0 0824		
Description	Control interconnect global power control		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLOCK_GATE_DISABLE	RESERVED		THREAD0_PRI	RESERVED								EXT_CLOCK	RESERVED										

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0
23:21	RESERVED	Read returns 0.	R	0x0
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	1
19:9	RESERVED	Read returns 0.	R	0x000
8	EXT_CLOCK	Global external clock control. When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	RESERVED	Read returns 0.	R	0x00

Memory Subsystem

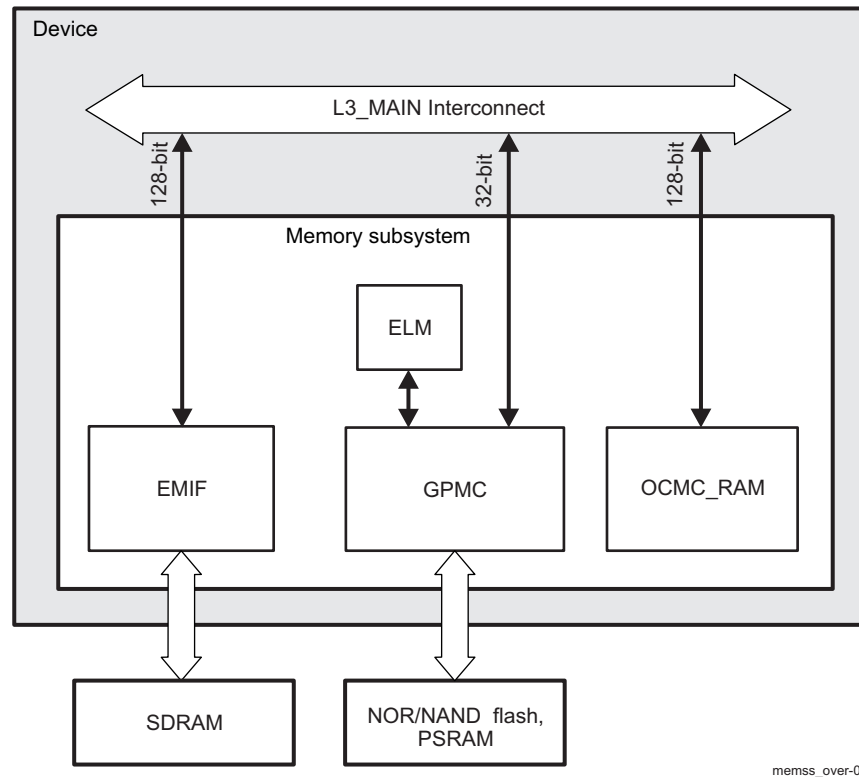

This chapter describes the Memory Subsystem for the device.

Topic	Page
11.1 Memory Subsystem Overview	3914
11.2 EMIF Controller.....	3918
11.3 General-Purpose Memory Controller	4068
11.4 Error Location Module.....	4214
11.5 On-Chip Memory (OCM) Subsystem	4243

11.1 Memory Subsystem Overview

Figure 11-1 shows a functional diagram of all memory subsystems in the device.

Figure 11-1. Memory Subsystem Functional Diagram

11.1.1 EMIF Overview

NOTE: The supported SDRAM types are device part number dependent. Refer to device Data Manual for more information.

The EMIF module provides connectivity between DDR memory types and manages data bus read/write accesses between external memory and device subsystems which have master access to the L3_MAIN interconnect and DMA capability.

The EMIF module has the following capabilities:

- Supports JEDEC standard-compliant LPDDR2/DDR2-SDRAM and DDR3/DDR3L-SDRAM memory types
- 2-GiB SDRAM address range over one chip-select.
- Supports SDRAM devices with one, two, four or eight internal banks
- Data bus widths:
 - 128-bit L3_MAIN (system) interconnect data bus width
 - 32-bit SDRAM data bus width
 - 16-bit SDRAM data bus width used in narrow mode
- Supported CAS latencies:
 - DDR3: 5, 6, 7, 8, 9, 10 and 11
 - DDR2: 2, 3, 4, 5, 6 and 7
 - LPDDR2: 3, 4, 5, 6, 7, and 8
- Supports 256-, 512-, 1024-, and 2048-word page sizes

- Supported burst length: 8
- Supports sequential burst type
- SDRAM auto initialization from reset or configuration change
- Supports self refresh and power-down modes for low power
- Partial array self-refresh mode for low power when DDR3 is used
- Output impedance (ZQ) calibration for DDR3
- Supports on-die termination (ODT) for DDR2 and DDR3
- Supports prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Programmable SDRAM timing parameters
- Write and read leveling/calibration and data eye training for DDR3.
- ECC on the SDRAM data bus:
 - 7-bit ECC over 32-bit data
 - 6-bit ECC over 16-bit data when narrow mode is used
 - 1-bit error correction and 2-bit error detection
 - Programmable address ranges to define ECC protected region
 - ECC calculated and stored on all writes to ECC protected address region
 - ECC verified on all reads from ECC protected address region
 - Statistics for 1-bit ECC and 2-bit ECC errors
 - The total width of the ECC DDR data bus is 8 bits

The EMIF module does not support:

- Burst chop for DDR3
- Interleave burst type
- Auto precharge because of better Bank Interleaving performance
- OCD calibration for DDR2
- CAS Read Latency of 2 and CAS Write Latency of 1 for DDR2
- DLL disabling from EMIF side

11.1.2 GPMC Overview

The General Purpose Memory Controller (GPMC) is an external memory controller of the device. Its data access engine provides a flexible programming model for communication with all standard memories.

The GPMC supports the following various access types:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, and 16 Word16)
- Synchronous read/write access
- Synchronous read/write burst access without wrap capability (4, 8 and 16 Word16)
- Synchronous read/write burst access with wrap capability (4, 8 and 16 Word16)
- Address-data-multiplexed (AD) access
- Address-address-data (AAD) multiplexed access
- Little- and big-endian access

The GPMC can communicate with a wide range of external devices:

- External asynchronous or synchronous 8-bit wide memory or device (non burst device)
- External asynchronous or synchronous 16-bit wide memory or device
- External 16-bit non-multiplexed NOR flash device
- External 16-bit address and data multiplexed NOR Flash device

- External 8-bit and 16-bit NAND flash device
- External 16-bit pseudo-SRAM (pSRAM) device

The main features of the GPMC are:

- 8- or 16-bit-wide data path to external memory device
- Supports up to eight CS regions of programmable size and programmable base addresses in a total address space of 1 GiB
- Supports transactions controlled by a firewall
- On-the-fly error code detection using the Bose-Chaudhuri-Hocquenghem (BCH) ($t = 4, 8, \text{ or } 16$) or Hamming code to improve the reliability of NAND with a minimum effect on software (NAND flash with 512-byte page size or greater)
- Fully pipelined operation for optimal memory bandwidth use
- The clock to the external memory is provided from GPMC functional clock divided by 1, 2, 3, or 4
- Supports programmable autoclock gating when no access is detected
- Independent and programmable control signal timing parameters for setup and hold time on a per-chip basis. Parameters are set according to the memory device timing parameters, with a timing granularity of one GPMC functional clock cycle.
- Flexible internal access time control (WAIT state) and flexible handshake mode using external WAIT pin monitoring
- Support bus keeping
- Support bus turnaround
- Prefetch and write posting engine associated with a device DMA controller to achieve full performance from the NAND device with minimum effect on NOR/SRAM concurrent access

NOTE: Page mode is available only in nonmultiplexed mode.

11.1.3 ELM Overview

In the case of NAND modules with no internal correction capability, sometimes referred to as bare NAND, the correction process can be delegated to the error location module (ELM) used in conjunction with the GPMC.

The ELM supports the following features:

- 4, 8, and 16 bits per 512-byte block error location based on BCH algorithm
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation when error location process completes:
 - When the full page has been processed in page mode
 - For each syndrome polynomial (checksum-like information) in continuous mode

11.1.4 OCM Overview

There is one on-chip memory controller (OCMC) in the device.

The OCM Controller supports the following features:

- L3_MAIN data interface:
 - Used for maximum throughput performance
 - 128-bit data bus width
 - Burst supported
- L4 interface:
 - Used for access to configuration registers
 - 32-bit data bus width

- Only single accesses supported
- The L4 associated OCMC clock is two times lower than the L3 associated OCMC clock
- Error correction and detection:
 - Single error correction and dual error detection
 - 9-bit Hamming error correction code (ECC) calculated on 128-bit data word which is concatenated with memory address bits
 - Hamming distance of 4
 - Enable/Disable mode control through a dedicated register
 - Single bit error correction on a read transaction
 - Exclusion of repeated addresses from correctable error address trace history
 - ECC valid for all write transactions to an enabled region
 - Sub-128-bit writes supported via read modify write
- ECC Error Status Reporting:
 - Trace history buffer (FIFO) with depth of 4 for corrected error address
 - Trace history buffer with depth of 4 for non correctable error address and also including double error detection
 - Interrupt generation for correctable and uncorrectable detected errors
- ECC Diagnostics Configuration:
 - Counters for single error correction (SEC), double error detection (DED) and address error events (AEE)
 - Programmable threshold registers for exceptions associated with SEC, DED and AEE counters
 - Register control for enabling and disabling of diagnostics
 - Configuration registers and ECC status accessible through L4 interconnect
- Circular buffer for sliced based VIP frame transfers:
 - Up to 12 programmable circular buffers mapped with unique virtual frame addresses
 - On the fly (with no additional latency) address translation from virtual to OCMC circular buffer memory space
 - Virtual frame size up to 8 MiB and circular buffer size up to 1 MiB
 - Error handling and reporting of illegal CBUF addressing
 - Underflow and Overflow status reporting and error handling
 - Last access read/write address history
- Two Interrupt outputs configured independently to service either ECC or CBUF interrupt events

The OCM controller does not have a memory protection logic and does not support endianism conversion.

11.2 EMIF Controller

This section describes mainly the features and functions of the external memory interface (EMIF) controller and also its associated PHYs.

11.2.1 EMIF Controller Overview

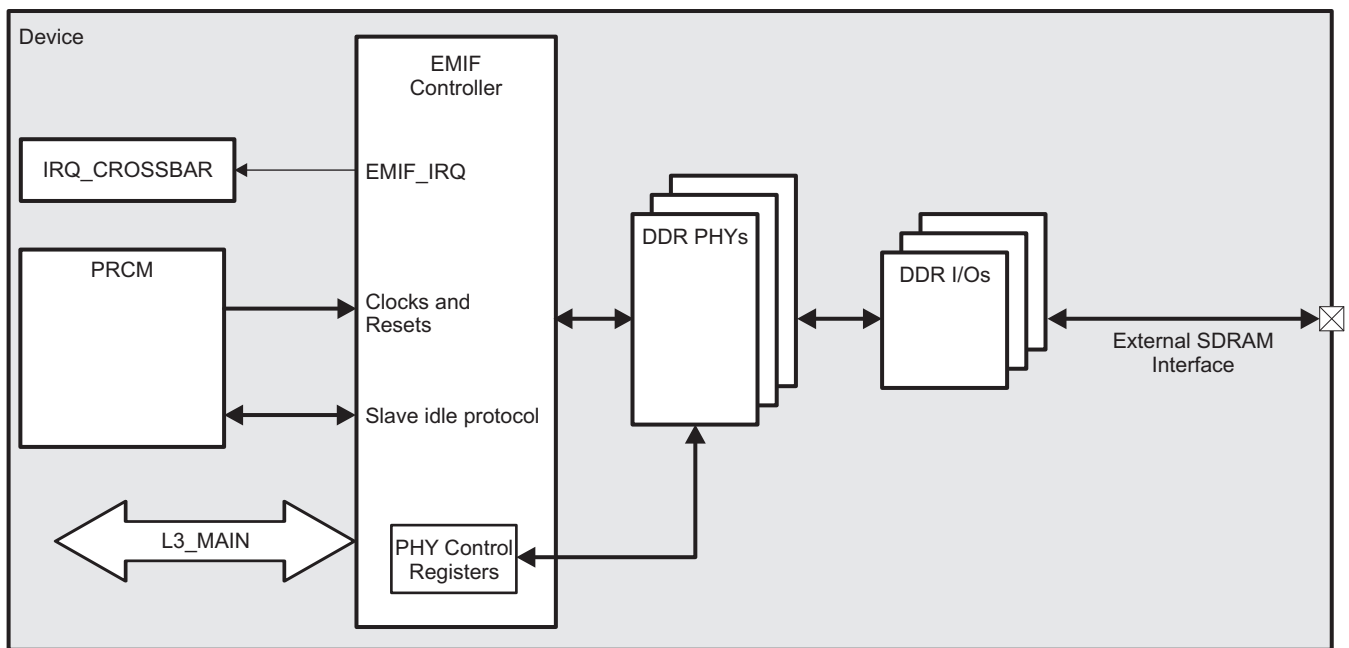

The EMIF controller provides connectivity between the device and LPDDR2/DDR2/DDR3/DDR3L types of memories and manages data bus read/write accesses between external memories and the device subsystems which have access to the L3_MAIN interconnect and DMA capability too.

NOTE: The supported SDRAM types are device part number dependent. Refer to device Data Manual for more information.

The EMIF features are introduced in [Section 11.1.1 EMIF Overview](#) of [Section 11.1 Memory Subsystem Overview](#).

The device includes one EMIF controller. [Figure 11-2](#) shows an overview of this EMIF controller and also the connections to the other surrounding modules. As can be seen on [Figure 11-2](#) the EMIF is not directly available on device pads. That is, it is not directly connected to the external SDRAM. There are DDR PHYs and then DDR I/Os between the EMIF controller and external SDRAM. The EMIF controller, the DDR PHYs and the DDR I/Os work like a single unit to manage data exchanges to and from external memories. To achieve successful data transaction between an internal device initiator and external SDRAM all these three components must be used.

Figure 11-2. EMIF Controller Overview

emif-001

11.2.2 EMIF Module Environment

This section describes the external connections of the EMIF module.

[Figure 11-3](#) shows an example EMIF DDR2/DDR3/DDR3L configuration without ECC memory connected.

[Figure 11-4](#) shows an example EMIF DDR2/DDR3/DDR3L configuration with ECC memory connected.

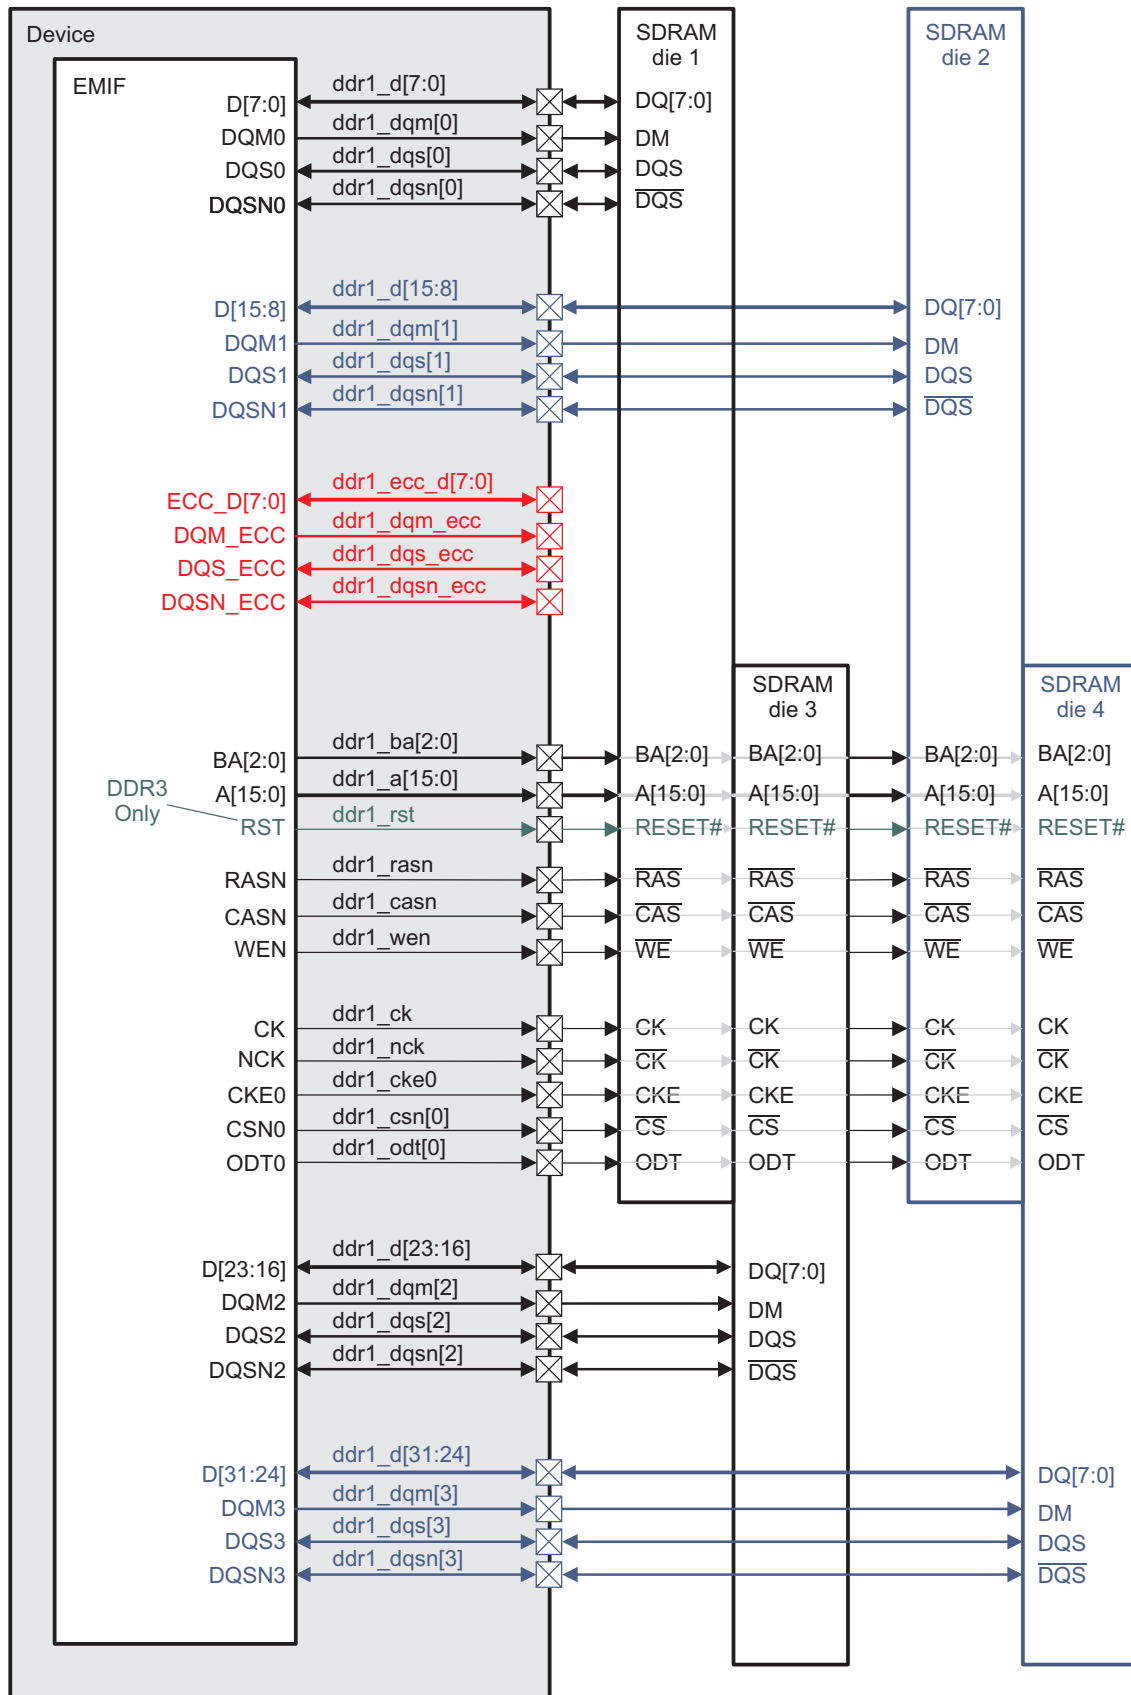

[Figure 11-5](#) shows an example EMIF LPDDR2 configuration without ECC memory connected.

[Figure 11-6](#) shows an example EMIF LPDDR2 configuration with ECC memory connected.

For simplification the DDR PHYs and DDR I/Os are not shown. Only the I/O signals and their corresponding EMIF pins are shown.

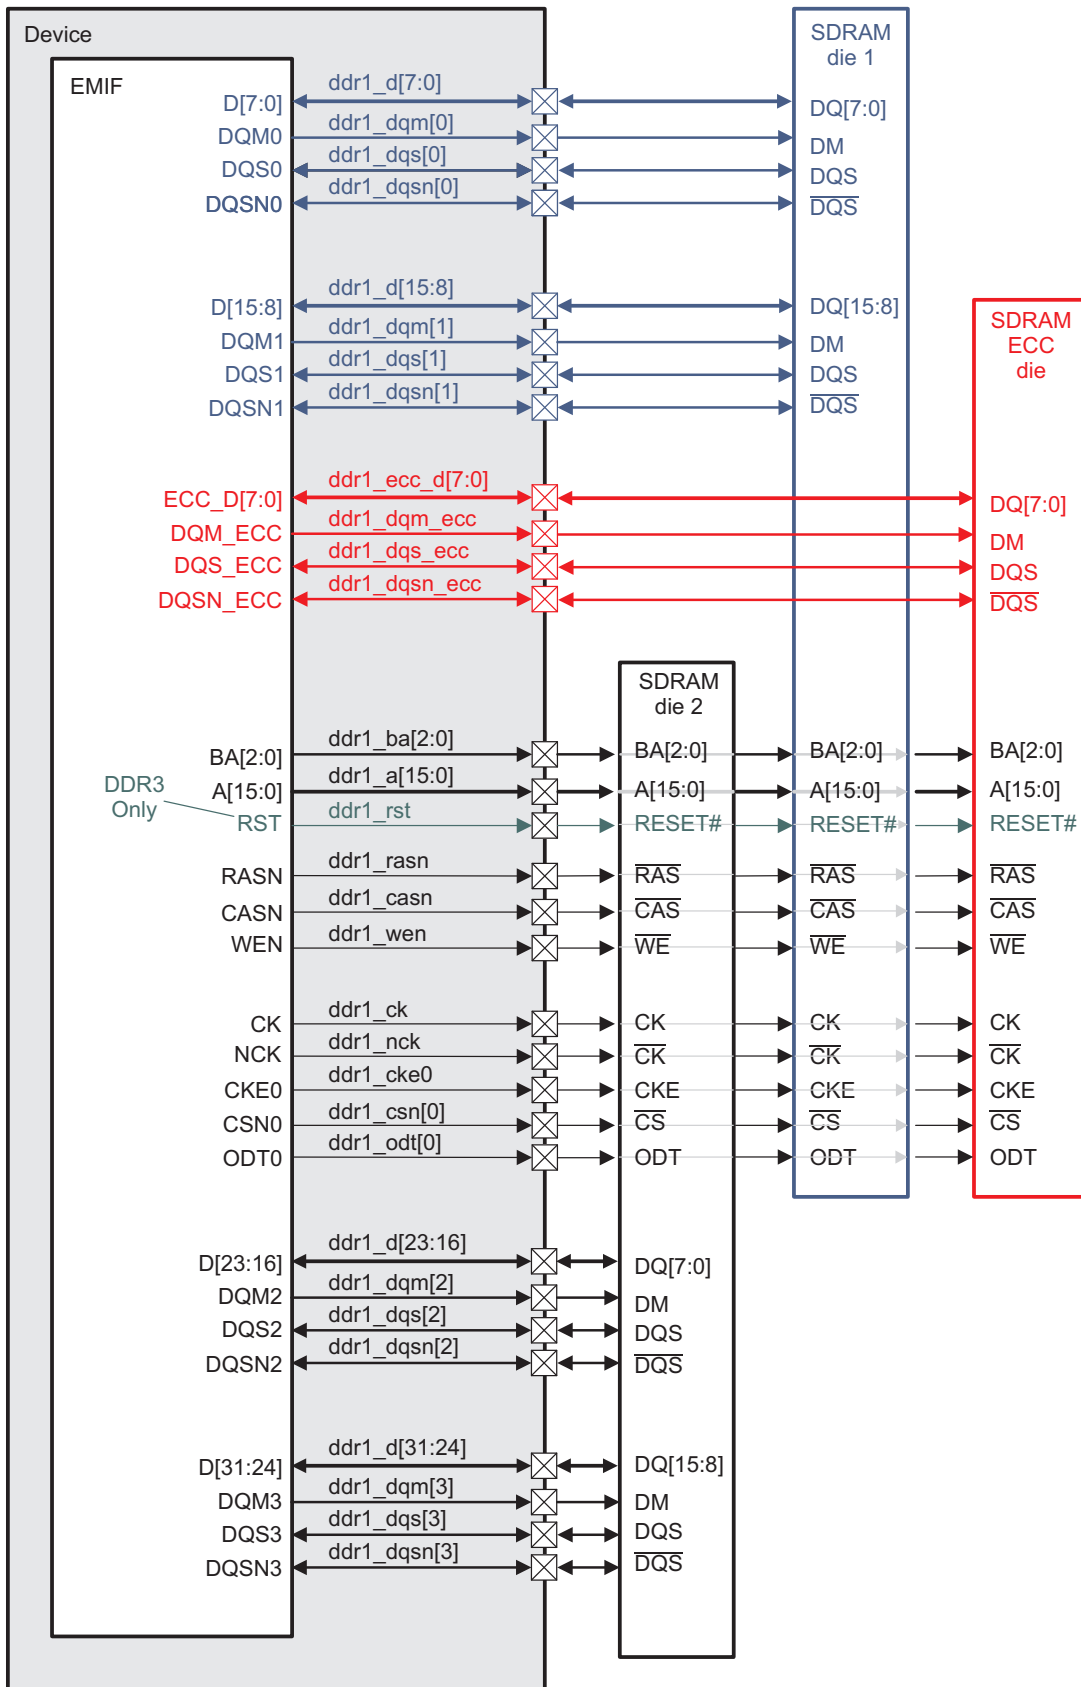

NOTE: The supported SDRAM types are device part number dependent. Refer to device Data Manual for more information.

Table 11-1 describes the EMIF module associated I/O signals used for connection to DDR2/DDR3/DDR3L memory types.

Table 11-2 describes the EMIF module associated I/O signals used for connection to LPDDR2 memory types.

Table 11-1. EMIF Module I/O Signals Used For Connection to DDR2/DDR3/DDR3L Memories

EMIF Pin Name	Device I/O Signal Names	I/O ⁽¹⁾	Description
EMIF Data PHYs			
D[31:0]	ddr1_d[31:0]	I/O	Data bus
DQM[3:0]	ddr1_dqm[3:0]	O	Data mask
DQS[3:0]	ddr1_dqs[3:0]	I/O	Data strobe
DQSN[3:0]	ddr1_dqsn[3:0]	I/O	Data strobe invert

⁽¹⁾ I = Input; O = Output

Table 11-1. EMIF Module I/O Signals Used For Connection to DDR2/DDR3/DDR3L Memories (continued)

EMIF Pin Name	Device I/O Signal Names	I/O ⁽¹⁾	Description
ECC_D	ddr1_ecc_d[7:0]	I/O	Data bus used for ECC
DQM_ECC	ddr1_dqm_ecc	O	Data mask used for ECC
DQS_ECC	ddr1_dqs_ecc	I/O	Data strobe used for ECC
DQSN_ECC	ddr1_dqsn_ecc	I/O	Data strobe invert used for ECC
EMIF Command PHYs			
A[15:0]	ddr1_a[15:0]	O	Row/column address bus
BA[2:0]	ddr1_ba[2:0]	O	Bank select
CK	ddr1_ck	O	Differential clock
NCK	ddr1_nck	O	Differential clock
CSN0	ddr1_csn[0]	O	Active low rank select signal (chip select 0)
CKE0	ddr1_cke0	O	Clock enable
CASN	ddr1_casn	O	Command
RASN	ddr1_rasn	O	Command
WEN	ddr1_wen	O	Command
RST	ddr1_rst	O	Active low asynchronous reset (DDR3/3L only)
ODT0	ddr1_odt[0]	O	On-die termination enable signal

Table 11-2. EMIF Module I/O Signals Used For Connection to LPDDR2 Memories

EMIF Pin Name	Device I/O Signal Names	I/O ⁽¹⁾	Description
EMIF Data PHYs			
D[31:0]	ddr1_d[31:0]	I/O	Data bus
DQM[3:0]	ddr1_dqm[3:0]	O	Data mask
DQS[3:0]	ddr1_dqs[3:0]	I/O	Data strobe
DQSN[3:0]	ddr1_dqsn[3:0]	I/O	Data strobe invert
ECC_D	ddr1_ecc_d[7:0]	I/O	Data bus used for ECC ⁽²⁾
DQM_ECC	ddr1_dqm_ecc	O	Data mask used for ECC ⁽²⁾
DQS_ECC	ddr1_dqs_ecc	I/O	Data strobe used for ECC ⁽²⁾
DQSN_ECC	ddr1_dqsn_ecc	I/O	Data strobe invert used for ECC ⁽²⁾
EMIF Command PHYs			
CK	ddr1_ck	O	Differential clock
NCK	ddr1_nck	O	Differential clock
CSN0	ddr1_csn[0]	O	Active low rank select signal (chip select 0)
CKE0	ddr1_cke0	O	Clock enable
CA0	ddr1_rasn	O	Command/Address bus - bit 0
CA1	ddr1_casn	O	Command/Address bus - bit 1
CA2	ddr1_wen	O	Command/Address bus - bit 2
CA3	ddr1_a[13]	O	Command/Address bus - bit 3
CA4	ddr1_a[10]	O	Command/Address bus - bit 4
CA5	ddr1_a[1]	O	Command/Address bus - bit 5
CA6	ddr1_a[2]	O	Command/Address bus - bit 6
CA7	ddr1_ba[0]	O	Command/Address bus - bit 7
CA8	ddr1_ba[1]	O	Command/Address bus - bit 8

⁽¹⁾ I = Input; O = Output

⁽²⁾ These signals are available only in non-PoP package. For more information about signal availability in PoP and non-PoP packages, see the corresponding device data manual.

Table 11-2. EMIF Module I/O Signals Used For Connection to LPDDR2 Memories (continued)

EMIF Pin Name	Device I/O Signal Names	I/O ⁽¹⁾	Description
CA9	ddr1_ba[2]	O	Command/Address bus - bit 9

The CKE0 memory pin is dynamically driven by the EMIF module according to the memory interface activity.

The ddr1_cke0 pad can also be forced to tri-state by a dedicated Control Module register. For more information, see [Section 11.2.4.18 Forcing CKE to tri-state](#).

The DDR memory connected to the DDR ECC bus does NOT need to be the same part number as the DDR memories connected to the DDR data bus. However, some constraints do apply. When selecting a memory for the DDR ECC bus, the following restrictions must be adhered to.

Compared to the DDR memories on the data bus, the DDR ECC memory must:

- Match the same DDR type (for example, DDR3) and speed grade
- Have an equal number of internal banks
- Have an equal number of columns
- Have a greater or equal number of rows

In addition,

- Unused pins should be properly tied off as described in the routing guidelines of the device data manual.
- EMIF register settings should be configured to satisfy the larger minimum timing requirements and the smaller maximum timing requirements between the two different DDR memories to ensure that all DDR memories connected to the EMIF channel are running within their specified range.

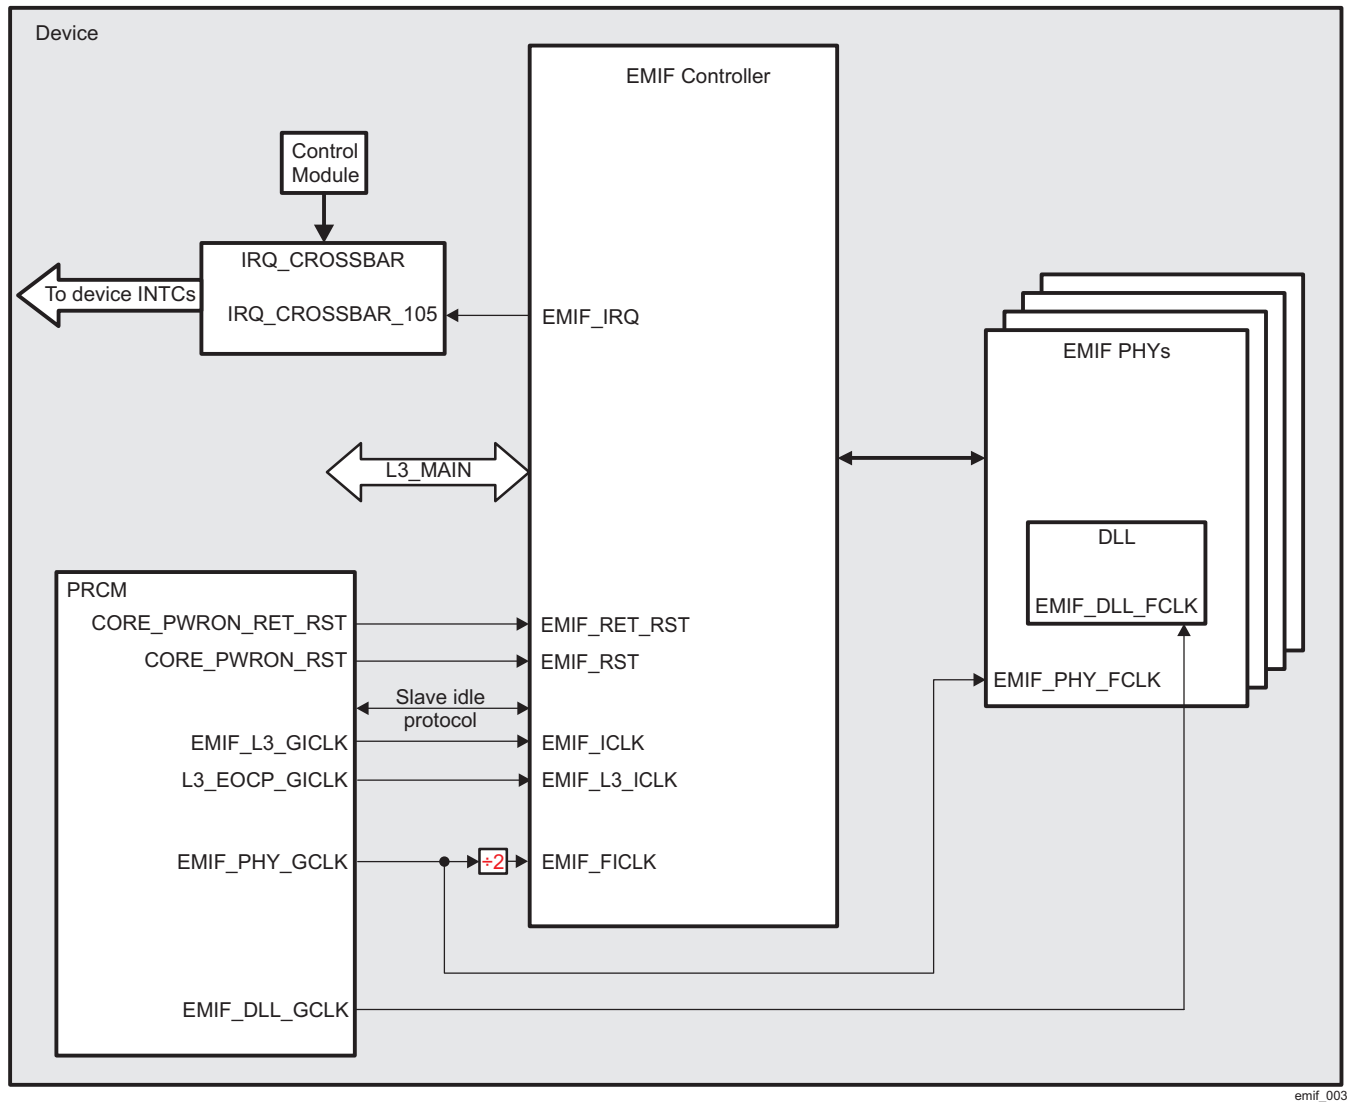

NOTE: For a full list of supported DDR device types, frequencies, and topologies, refer to the routing guidelines of the device data manual.

11.2.3 EMIF Module Integration

This section describes the integration of the EMIF module in the device and includes information about clocks, resets, and hardware requests.

Figure 11-7 shows the integration of the EMIF module in the device.

Figure 11-7. EMIF Module Integration

NOTE: For more information about the slave idle protocol, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 11-3 through Table 11-5 summarize the integration of the EMIF module in the device.

Table 11-3. EMIF Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
EMIF	PD_COREAON	No	L3_MAIN

Table 11-4. EMIF Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF	EMIF_ICLK	EMIF_L3_GICLK	PRCM	Interface clock for EMIF used for driving the L3 interface logic and for SDRAM Read Data FIFO.
	EMIF_L3_ICLK	L3_EOCP_GICLK	PRCM	Additional interface clock for EMIF which frequency is equal to EMIF_L3_GICLK interface clock. Used for command/write data pre-FIFO to Command/Write Data FIFO paths.
	EMIF_PHY_FCLK	EMIF_PHY_GCLK	PRCM	Common functional clock for the EMIF associated PHYs. This clock is equal to the DDR-SDRAM clock rate.
	EMIF_FICLK	EMIF_PHY_GCLK/2	PRCM	Functional and interface clock for the EMIF. This clock runs at half the DDR-SDRAM clock rate.
	EMIF_DLL_FCLK	EMIF_DLL_GCLK	PRCM	Common functional clock for all DLLs associated with the EMIF PHYs.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF	EMIF_RET_RST	CORE_PWRON_RET_RST	PRCM	Power-on reset
	EMIF_RST	CORE_PWRON_RST	PRCM	Power-on reset

Table 11-5. EMIF Hardware Requests

Interrupt Requests				
Module Instance	IRQ Source Name	IRQ_CROSSBAR Input	Default IRQ Source Mapping	Description
EMIF	EMIF_IRQ	IRQ_CROSSBAR_105	-	EMIF interrupt request. This IRQ source signal is not mapped by default to any device INTC.

NOTE: The “Default IRQ Source Mapping” column in [Table 11-5 EMIF Hardware Requests](#) shows the default mapping of the IRQ sources listed in column “IRQ Source Name” to a certain interrupt line of one of the device interrupt controllers. These IRQ sources can also be mapped to other interrupt lines of each device interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#).

NOTE: For the description of the interrupt source, see [Section 11.2.4.5, Interrupt Requests](#).

11.2.4 EMIF Functional Description

11.2.4.1 Block Diagram

The EMIF module provides an interface to LPDDR2, DDR2 and DDR3/DDR3L SDRAM memories.

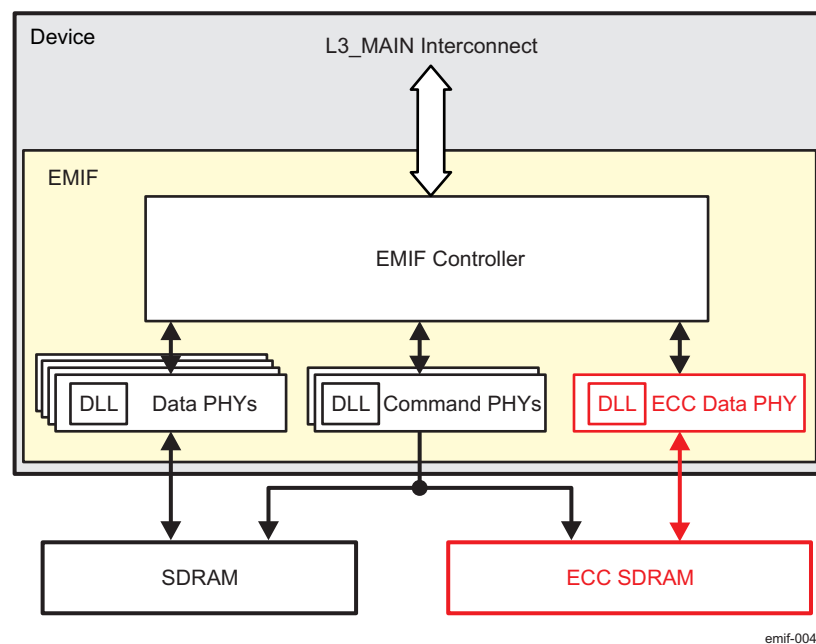

Figure 11-8 shows the interconnection between the EMIF module and the other modules.

Digital locked loops (DLLs) are used to delay the input DQS signals during reads so that these strobe signals can be used to latch incoming data on the DQ pins, as required by the DDR standard.

Physical layers (PHYs) convert single-data rate (SDR) signals to DDR signals.

NOTE: The supported SDRAM types are device part number dependent. Refer to device Data Manual for more information.

Figure 11-8. EMIF Block Diagram

11.2.4.1.1 Local Interface

The EMIF controller has only one local (on-chip) interface. It is called system interface and connects the EMIF to the L3_MAIN interconnect. The system interface is used to request all external memory device accesses, to access the EMIF registers, and to transfer all data to and from the EMIF controller.

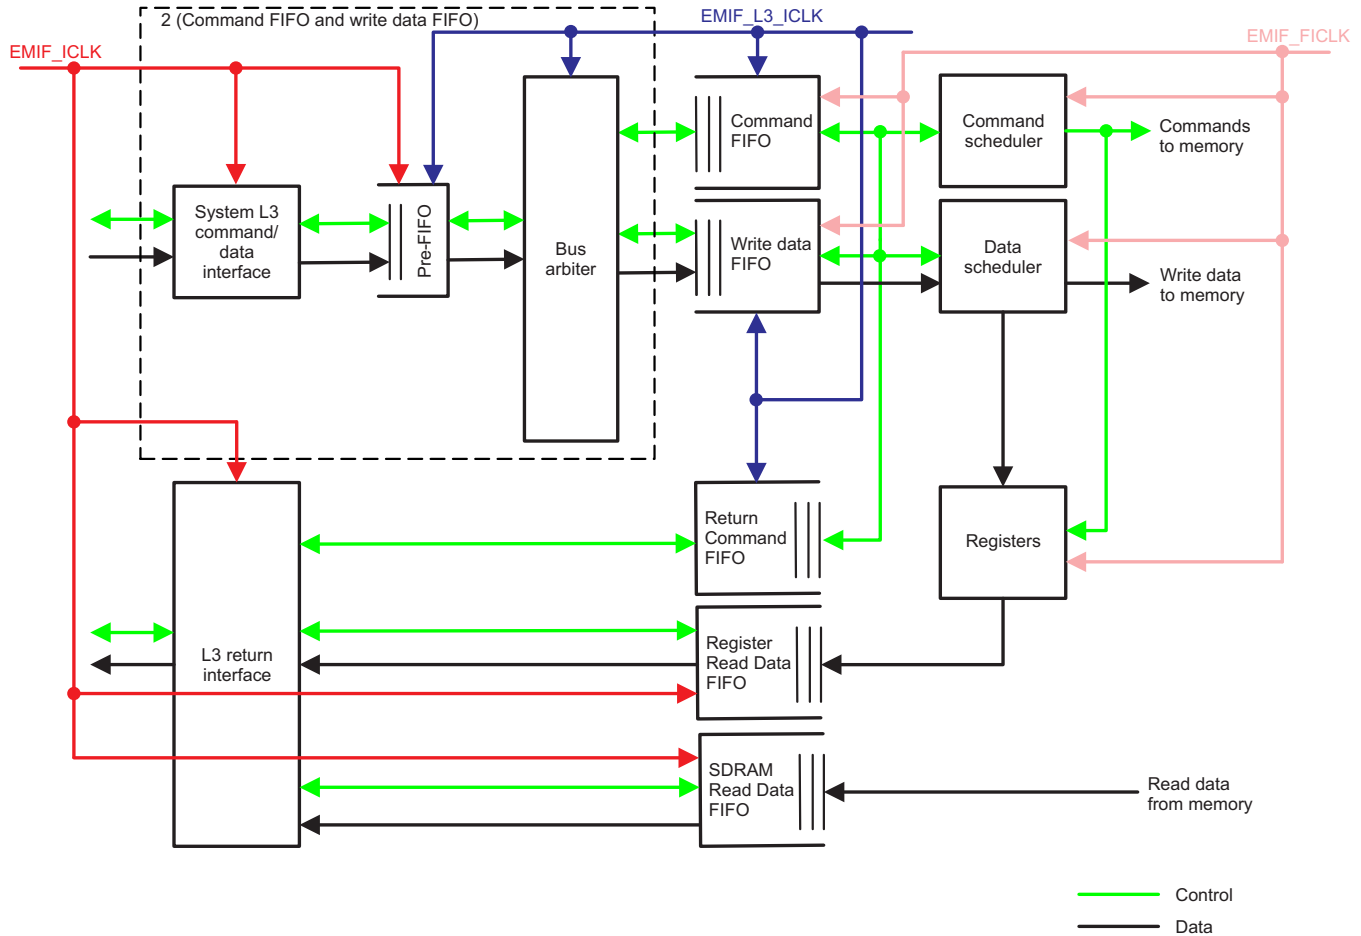

11.2.4.1.2 FIFO Description

The EMIF module contains the following FIFOs:

- Command FIFO
- Write data FIFO
- Return command FIFO
- Two read data FIFOs

Figure 11-9 shows the overall architecture of the EMIF FIFOs.

Figure 11-9. FIFO Block Diagram

emif_005

Table 11-6 lists the allocation of the entries.

Table 11-6. FIFO Allocation

Parameter	Local System Interface Entries
Pre Command FIFO	6
Command FIFO	Programmable ⁽¹⁾
Pre Write FIFO	6
Write Data FIFO (256-bit)	Up to (19 x 256 bits) + 6
Return Command FIFO	22
SDRAM Read Data FIFO	22
Register Read Data FIFO	2

⁽¹⁾ The total number of entries in the command FIFO is 10.

The command FIFO stores all the commands coming in on the local command interface. The allocation of entries in the command FIFO is programmable using the [EMIF_OCP_CONFIG\[27:24\]](#) [SYS_THRESH_MAX](#) bit field.

The write data FIFO stores the write data for all write transactions coming in on the local write data interface.

The return command FIFO stores all the return transactions that have to be issued to the local return interface. These include the write status return and the read data return commands.

Two read data FIFOs store the read data to be sent to the local return interface. One read data FIFO stores read data from the memory mapped registers. The other read data FIFO stores read data from external memory.

A write command is executed only when four local words of the corresponding data are received in the write data FIFO, or when it is the last data, and if there is space in the return command FIFO. The EMIF schedules a read-only if the results can fit into the return command FIFO and the corresponding read data FIFOs.

11.2.4.1.3 Arbitration of Commands in the Command FIFO

The EMIF looks at all the commands stored in the command FIFO to schedule commands to the external memory. All commands with the same MTagID on a particular local interface complete in order. The EMIF does not ensure ordering between commands with different MTagIDs. For information about MTagID, see [Section 10.1.1, Terminology in Chapter 10, Interconnect](#).

The EMIF must also open and close SDRAM banks and maintain the refresh counts for an SDRAM. The priority of SDRAM commands with respect to refresh levels are:

1. SDRAM refresh request when refresh-must level is reached (highest priority)
2. ZQ calibration
3. Leveling
4. local request for a read or write
5. local request for a write
6. SDRAM activate commands
7. SDRAM deactivate commands
8. SDRAM power-down request
9. SDRAM refresh request when refresh-may or release level is reached
10. SDRAM self-refresh request (lowest priority)

To avoid continuous blocking effect which can be caused by a continuous stream of high-priority commands which thus block the lower priority commands, the EMIF momentarily raises the priority of the oldest command over all other commands when the time for the oldest command configured through the [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) bit field expires.

It should be taken into account that while performing the scheduling algorithm described, the EMIF may also encounter a condition in which continuous stream of SDRAM commands to a row in an open bank can block commands to another row in the same bank.

In addition to this scheduling, the highest priority condition is a reset command. If this condition occurs, the EMIF abandons what it is currently doing and begins its start-up sequence. In this case, commands and data stored in the FIFOs are lost. The EMIF also starts its start-up sequence whenever the [EMIF_SDRAM_CONFIG](#) register is written and the [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS](#) bit is set to 0. In this case, commands and data stored in the FIFOs are not lost. The EMIF ensures that in-flight read or write transactions to the SDRAM are complete before starting the initialization sequence.

All the accesses to an SDRAM are pipelined to maximize use of the external bus. All of these are done while fulfilling the access timing requirements of an SDRAM.

11.2.4.2 Clock Management

The EMIF can gate EMIF_FICLK. There is an internal mechanism that can stop EMIF_FICLK automatically. EMIF_FICLK is stopped only after the SDRAM is put into self-refresh mode and the power-idle protocol on the local bus completes. The EMIF_FICLK frequency can be changed only after putting the external SDRAM in self-refresh mode.

The EMIF waits for the DLL lock before performing any memory access.

EMIF_FICLK frequency is equal to half of the EMIF_PHY_FCLK frequency.

11.2.4.3 Reset

The EMIF does not support a software reset.

The EMIF supports a global warm reset mode, during which the EMIF keeps the SDRAM content. Upon a request from the PRCM module indicating a need to enter global warm reset mode, the EMIF does the following:

1. During leveling operation, EMIF will immediately exit this mode and automatically perform a write to the MR1 register of DDR3 memory to disable the leveling at the memory side too.
2. EMIF completes the ongoing access, and then puts the SDRAM in self-refresh mode. If the [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS](#) field is set to 1, the EMIF does not put SDRAM in self-refresh mode.
3. EMIF clears all its FIFO contents.
4. EMIF does not wait for all interrupts to be serviced.

To exit the global warm reset:

1. If the EMIF was in Self Refresh state, it will exit Self Refresh state.
2. If leveling was enabled at the time of a global warm reset, a PHY reset must occur to bring the PHY back into a known state, as it may have been left in a leveling state upon warm reset assertion. To guarantee that the SDRAM memory clocks are off when issuing PHY reset, software can use the [EMIF_POWER_MANAGEMENT_CONTROL](#) register to enter self refresh before asserting the PHY reset.

11.2.4.4 System Power Management

11.2.4.4.1 Power-Down Mode

The EMIF supports SDRAM power-down mode for low power. The EMIF automatically puts the SDRAM into power-down mode after it is idle for [EMIF_POWER_MANAGEMENT_CONTROL\[15:12\] PD_TIM](#) number of DDR clock cycles and the [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field is set to 0x4. In power-down mode, the EMIF does not stop the clocks to the SDRAM. The EMIF maintains CKE pin low to maintain the power-down mode.

If refresh-must level is not reached before power-down entering, EMIF will not precharge all SDRAM banks before it issues the power-down command. As a result of this EMIF puts the SDRAM in active power-down mode. If refresh-must level is reached before power-down entering, EMIF will precharge all SDRAM banks and before it issues the power-down command, EMIF issues refreshes until refresh-release level is reached. As a result of this EMIF puts the SDRAM in precharge power-down mode.

When the SDRAM is in power-down mode, the EMIF services register accesses normally.

If the SDRAM is in power-down mode and one of the following occurs, the EMIF brings SDRAM out of power-down mode:

- [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field is changed from 0x4 to some other value.
- An SDRAM access is requested.
- The refresh-must level is reached.

If refresh-must level brings the SDRAM out of power-down mode, EMIF puts it in power-down again when the refreshes are complete and keeps this state until the next SDRAM request.

To exit power-down, the EMIF:

1. Drives CKE high after $t_{cke} + 1$ cycles have elapsed since the power-down command was issued. The value of t_{cke} is taken from [EMIF_SDRAM_TIMING_2\[2:0\] T_CKE](#) bit field.
2. Waits for [EMIF_SDRAM_TIMING_2\[30:28\] T_XP](#) + 1 cycles
3. Enters its idle state and can issue any commands

11.2.4.4.2 LPDDR2 Deep Power-Down Mode

For ultimate power savings, the EMIF supports deep power-down mode for LPDDR2.

The SDRAM can be forced into deep power-down mode through software by setting the [EMIF_POWER_MANAGEMENT_CONTROL\[11\] DPD_EN](#) bit to 0x1. In this case the EMIF continues normal operation until all SDRAM access requests are serviced. At this point the EMIF issues a deep power-down command. The EMIF then maintains CKE pin low to maintain deep power-down mode. In deep power-down mode, the EMIF automatically stops the clocks to the SDRAM.

Setting the [EMIF_POWER_MANAGEMENT_CONTROL\[11\] DPD_EN](#) bit to 1 overrides the setting of the [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field. Therefore, if the SDRAM is in any other power-saving mode, and the [EMIF_POWER_MANAGEMENT_CONTROL\[11\] DPD_EN](#) bit is set to 1, the EMIF exits those modes and goes into deep power-down mode.

When the SDRAM is in deep power-down mode, the EMIF services register accesses normally.

If the [EMIF_POWER_MANAGEMENT_CONTROL\[11\] DPD_EN](#) bit is set to 0x0, the EMIF brings the SDRAM out of deep power-down mode.

11.2.4.4.3 Self-Refresh Mode

The EMIF supports SDRAM self-refresh mode for low power. The EMIF automatically puts the SDRAM into self-refresh mode after the EMIF is idle for [EMIF_POWER_MANAGEMENT_CONTROL\[7:4\] SR_TIMING](#) number of DDR clock cycles and the [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field is set to 0x2. The EMIF will complete all pending refreshes before it puts the SDRAM into self-refresh. Therefore, after the expiration of [SR_TIMING](#), the EMIF will start issuing refreshes to complete the refresh backlog, and then issue a self-refresh command to the SDRAM.

In self-refresh mode, the EMIF automatically stops the SDRAM clock. The EMIF drives CKE pin low to maintain self-refresh mode.

When the SDRAM is in self-refresh mode, the EMIF services register accesses normally.

If the SDRAM is in self-refresh mode and one of the following occurs, the EMIF brings SDRAM out of self-refresh mode:

- The [EMIF_POWER_MANAGEMENT_CONTROL\[10:8\] LP_MODE](#) bit field is changed from 0x2 to some other value.
- SDRAM access is requested.
- [EMIF_SDRAM_TIMING_2\[2:0\] T_CKE](#) + 1 cycles have elapsed since the last self-refresh command.

To exit self-refresh, for LPDDR2, the EMIF:

1. Waits for [EMIF_SDRAM_TIMING_2\[2:0\] T_CKE](#) + 1 cycles have elapsed since the self-refresh command was issued and enables clocks
2. Drives CKE pin high
3. Waits for [EMIF_SDRAM_TIMING_2\[24:16\] T_XSNR](#) + 1 cycles
4. Starts an auto-refresh cycle in the next cycle. It also services all refreshes down to the refresh-release level.
5. Enters its idle state and can issue any commands

To exit self-refresh, for DDR2, the EMIF:

1. Enables the SDRAM clock
2. Drives CKE pin high
3. Waits [EMIF_SDRAM_TIMING_2\[24:16\] T_XSNR](#) + 1 cycles
4. Starts a refresh cycle in the next cycle.
5. Enters its idle state and can issue any other command except write or read command. A write or a read command is issued only after [EMIF_SDRAM_TIMING_2\[15:6\] T_XSRD](#) + 1 cycles clock cycles have elapsed since pin CKE is driven high.

To exit self-refresh, for DDR3, the EMIF does the following:

1. Enables the SDRAM clock
2. Drives CKE pin high
3. Waits [EMIF_SDRAM_TIMING_2\[24:16\] T_XSNR](#) + 1 cycles

4. Starts a refresh cycle in the next cycle. EMIF also services all refreshes down to the refresh-release level.
5. Enters its idle state and can issue any other command except write or read command. A write or a read command is issued only after [EMIF_SDRAM_TIMING_2\[15:6\]](#) T_XSRD + 1 cycles clock cycles have elapsed since pin CKE is driven high.

To use partial array self-refresh, the [EMIF_SDRAM_REFRESH_CONTROL\[26:24\]](#) PASR bits must be appropriately programmed. The EMIF performs bank interleaving when [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 0x0. Because the SDRAM is partially refreshed during partial array self-refresh, for software ease, it is recommended that the IBANK_POS bit field to be set to 0x1, 0x2, or 0x3 depending on the scheme used. If IBANK_POS is set to 0x0, software must move critical data into the banks that are going to be refreshed during partial array self-refresh.

11.2.4.5 Interrupt Requests

The EMIF controller generates one interrupt request (EMIF_IRQ) which is connected to the IRQ_CROSSBAR module. This interrupt line can be asserted by one of the interrupt events listed in [Table 11-7](#).

The EMIF controller generates an interrupt on its interrupt line only if the interrupts are enabled by setting to 0x1 the corresponding bits in the [EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET](#) register. These interrupts can be disabled by setting to 0x0 the corresponding bits in the [EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_CLEAR](#) register. After the interrupt has been serviced the corresponding status flag must be cleared by software. This is done by setting to 0x1 the corresponding bit in the [EMIF_SYSTEM_OCP_INTERRUPT_STATUS](#) register which also clears the corresponding bit in the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS](#) register. The status flags in the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS](#) register are set even if the corresponding interrupt is disabled unlike those in the [EMIF_SYSTEM_OCP_INTERRUPT_STATUS](#) register, which are set only if the corresponding interrupt is enabled. An interrupt is also generated by the EMIF controller, if certain bit in the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS](#) register is set to 0x1 and the corresponding interrupt is enabled through the [EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET](#) register. This feature is useful when user software debugging is performed. In addition, even if interrupts are not enabled, certain status bit in [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS](#) register can be cleared by setting to 0x1 the corresponding bit in the [EMIF_SYSTEM_OCP_INTERRUPT_STATUS](#) register.

The EMIF sets both the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS\[0\]](#) ERR_SYS and [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[0\]](#) ERR_SYS bits to 0x1, if access request for an unsupported command type or an unsupported addressing mode is received.

The EMIF sets both the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS\[3\]](#) WR_ECC_ERR_SYS and [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[3\]](#) WR_ECC_ERR_SYS bits to 0x1, if a write access with byte count that is not multiple of the ECC quanta or with a non ECC quanta aligned address is performed within the address range protected by the ECC.

The EMIF sets both the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS\[4\]](#) TWOBIT_ECC_ERR_SYS and [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[4\]](#) TWOBIT_ECC_ERR_SYS bits to 0x1, if 2-bit ECC error for a read access performed within the address range protected by the ECC occurs.

The EMIF sets both the [EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS\[5\]](#) ONEBIT_ECC_ERR_SYS and [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[5\]](#) ONEBIT_ECC_ERR_SYS bits to 0x1, if the threshold for 1-bit ECC error is reached. For more information about the EMIF ECC feature, see [Section 11.2.4.15, Error Correction And Detection Feature](#).

[Table 11-7](#) lists the event flags and their corresponding event mask bits of the sources which can cause module interrupts.

Table 11-7. Events

Event Flag	Event Mask	Description
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[5] ONEBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[5] ONEBIT_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[5] ONEBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[5] ONEBIT_ECC_ERR_SYS	Interrupt if one bit ECC error threshold is reached
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[4] TWOBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[4] TWOBIT_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[4] TWOBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[4] TWOBIT_ECC_ERR_SYS	Interrupt for two bit error detection
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[3] WR_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[3] WR_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[3] WR_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[3] WR_ECC_ERR_SYS	Interrupt for memory access made to a non-quanta aligned location or done with byte count not multiple of the ECC quanta
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[1] TA_SYS / EMIF_SYSTEM_OCP_INTERRUPT_STATUS[1] TA_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[1] EN_TA_SYS / EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[1] EN_TA_SYS	Interrupt for LPDDR2 temperature alert
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[0] ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[0] ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[0] EN_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[0] EN_ERR_SYS	Interrupt for command or address error

11.2.4.6 SDRAM Refresh Scheduling

The EMIF uses two counters to schedule the Refresh (REF) commands: a 13-bit decrementing refresh interval counter and a 4-bit refresh backlog counter. The interval counter is used to define the rate at which connected SDRAM devices are refreshed. It is loaded with the value of the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\] REFRESH_RATE](#) bit field at reset (only the 13 LSBs are taken). The interval counter decrements by 1 each cycle until it reaches 0x0, at which point it reloads from the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\] REFRESH_RATE](#) bit field and restarts decrementing. The counter also reloads and restarts decrementing whenever the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\] REFRESH_RATE](#) bit field is updated.

The refresh backlog counter records the number of the outstanding REF commands which the EMIF controller currently has. The backlog counter increments by 1 each time the interval counter reloads (unless it has reached its maximum value of 8). The backlog counter decrements by 1 each time the EMIF issues a REF command (unless it is already 0). For the range of values that the backlog counter can take, there are three levels of urgency with which the EMIF must perform refresh cycle in which it issues REF commands:

1. Refresh-may level is reached when the backlog count is greater than 0x0, which indicates that there is a refresh backlog and if the EMIF is not busy and there are no open SDRAM banks, the EMIF must perform refresh cycle.
2. Refresh-release level is reached when the backlog count is greater than 0x4, which indicates that the refresh backlog is getting bigger and if the EMIF is not busy it must perform refresh cycle even if there is an open SDRAM bank.
3. Refresh-must level is reached when the backlog count is greater than 0x7, which indicates that the refresh backlog is becoming excessive and the EMIF must perform refresh cycle before any new memory access request being serviced. The EMIF starts servicing new memory accesses after the refresh-release level is cleared.

The two counters do not operate when SDRAM is in self-refresh mode. They start tracking the missed refreshes (the outstanding REF commands) only after initialization is complete in case of DDR2/DDR3. For LPDDR2, the refresh counters will start tracking missed refreshes after RESET command is issued. For LPDDR2, the EMIF will also ensure that no more than 8 REF (Refresh) commands are issued in any rolling tREFBW (=4*8*tRFC) window.

The time between two REF commands is set through the [EMIF_SDRAM_TIMING_3\[12:4\] T_RFC](#) bit field.

11.2.4.7 SDRAM Initialization

NOTE: To avoid error responses from the EMIF controller the SDRAM initialization must be performed per 16-Byte blocks if [EMIF_SDRAM_CONFIG\[15:14\] NARROW_MODE = 0x0](#) or per 8-Byte blocks if [EMIF_SDRAM_CONFIG\[15:14\] NARROW_MODE = 0x1](#).

11.2.4.7.1 DDR2 SDRAM Initialization

On coming out of reset, the EMIF controller begins the DDR2 initialization sequence after a write to any one of the following three registers, providing that the corresponding listed conditions are met:

1. [EMIF_SDRAM_CONFIG](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS = 0](#) (that is, cleared before the write to [EMIF_SDRAM_CONFIG](#))
2. [EMIF_SDRAM_TIMING_1](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS = 0](#) (that is, cleared before the write to [EMIF_SDRAM_TIMING_1](#)) AND
 - b. Condition 2: The write access modifies the register bit field T_WR (bits 20:17)
3. [EMIF_SDRAM_REFRESH_CONTROL](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL\[31\] INITREF_DIS = 0](#) AND
 - b. Condition 2: The write access modifies the register bit field SRT (bit 29), ASR (bit 28), or PASR (bits 26:24).

For the first DDR2 initialization sequence, the EMIF controller performs the following actions:

1. Drives the CKE pin low.
2. After 16 SDRAM refresh rate intervals, issues a NOP command with CKE pin held high. The SDRAM refresh rate is as defined in the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\] REFRESH_RATE](#) bit field.
3. After 1 SDRAM refresh rate interval, issues Precharge all Banks command.
4. Issues EMRS command to the DDR2 EMR(2) register (bits BA[2:0] = 0x2) with bits A[15:0] = 0x0.
5. Issues EMRS command to the DDR2 EMR(3) register (bits BA[2:0] = 0x3) with bits A[15:0] = 0x0.
6. Issues EMRS command to the DDR2 EMR(1) register (bits BA[2:0] = 0x1) with bits A[15:0] set as in [Table 11-8](#).

Table 11-8. Load Value For The EMR(1) Register During DDR2 SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Output buffer enabled
A[11]	0x0	RDQS disable
A[10]	EMIF_SDRAM_CONFIG[23] DDR2_DDQS	Differential DQS enable value
A[9:7]	0x0	Exit OCD calibration mode
A[6], A[2]	EMIF_SDRAM_CONFIG[26:24] DDR_TERM	DDR2 termination resistor value. For DDR2 the EMIF_SDRAM_CONFIG[26] bit is not used.
A[5:3]	0x0	Additive latency = 0
A[1]	EMIF_SDRAM_CONFIG[19:18] SDRAM_DRIVE	SDRAM drive strength. For DDR2 the EMIF_SDRAM_CONFIG[19] bit is not used.
A[0]	EMIF_SDRAM_CONFIG[20] DDR_DISABLE_DLL = 0x0	Enable DLL

7. Issues MRS command to the DDR2 MR register (BA[2:0] = 0x0) with A[15:0] set as in [Table 11-9](#).

Table 11-9. Load Value For The MR Register During DDR2 SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Active power down exit time - fast exit
A[11:9]	EMIF_SDRAM_TIMING_1 [20:17] T_WR	Write recovery for autoprecharge
A[8]	0x1	DLL reset
A[7]	0x0	Normal mode
A[6:4]	EMIF_SDRAM_CONFIG [13:10] CL	CAS latency value. For DDR2 the EMIF_SDRAM_CONFIG [13] bit is not used.
A[3]	0x0	Sequential burst type
A[2:0]	0x3	Burst length of 8

8. After 267 clock cycles, issues Precharge all Banks command.
9. After two Refresh commands, issues MRS command to the DDR2 MR register (BA[2:0] = 0x0) with A[15:0] set as in [Table 11-10](#).

Table 11-10. Another Load Value For The MR Register During DDR2 SDRAM Initialization

Bits	Value	Description
A[15:9]	Equal to Step 7	
A[8]	0x0	No DLL reset
A[7:0]	Equal to Step 7	

10. Issues EMRS command to the DDR2 EMR(1) register (bits BA[2:0] = 0x1) with bits A[15:0] equal to Step 6.
11. The EMIF enters its IDLE state.

The EMIF updates the DDR Mode registers if the DDR2 initialization sequence is triggered again. However, the EMIF controller starts from Step 3.

The EMIF does not perform any transactions until the DDR2 initialization sequence is complete.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately $16 \times \text{REFRESH_RATE} / \text{input frequency}$.

NOTE: The values of the bit fields in the [EMIF_SDRAM_CONFIG](#) register are loaded by the control module at reset. These values must not be modified during run time, because they reflect the used hardware SDRAM memory configurations.

11.2.4.7.2 DDR3/DDR3L SDRAM Initialization

On coming out of reset, the EMIF controller begins the DDR3 initialization sequence after a write to any one of the following three registers, providing that the corresponding listed conditions are met.

1. [EMIF_SDRAM_CONFIG](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL](#)[31] INITREF_DIS = 0 (that is, cleared before the write to [EMIF_SDRAM_CONFIG](#))
2. [EMIF_SDRAM_TIMING_1](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL](#)[31] INITREF_DIS = 0 (that is, cleared before the write to [EMIF_SDRAM_TIMING_1](#)) AND
 - b. Condition 2: The write access modifies the register bit field T_WR (bits 20:17)
3. [EMIF_SDRAM_REFRESH_CONTROL](#)
 - a. Condition 1: [EMIF_SDRAM_REFRESH_CONTROL](#)[31] INITREF_DIS = 0 AND
 - b. Condition 2: The write access modifies the register bit field SRT (bit 29), ASR (bit 28), or PASR (bits 26:24).

For the first DDR3 initialization sequence, the EMIF controller performs the following actions:

1. After 7 SDRAM refresh rate intervals, de-asserts the RST pin.
2. After 16 SDRAM refresh rate intervals, issues a NOP command with CKE pin held high. The SDRAM refresh rate is as defined in the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\]](#) REFRESH_RATE bit field.
3. After 1 SDRAM refresh rate interval, issues MRS command to the DDR3/DDR3L MR2 register (bits BA[2:0] = 0x2) with bits A[15:0] set as in [Table 11-11](#)

Table 11-11. Load Value For The MR2 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:11]	0x0	Reserved
A[10:9]	EMIF_SDRAM_CONFIG[22:21] DYN_ODT	Dynamic ODT value
A[8]	0x0	Reserved
A[7]	EMIF_SDRAM_REFRESH_CONTR OL[29] SRT	Self-refresh temperature range
A[6]	EMIF_SDRAM_REFRESH_CONTR OL[28] ASR	Auto self-refresh enable
A[5]	0x0	Reserved
A[4:3]	EMIF_SDRAM_CONFIG[17:16] CWL	CAS write latency
A[2:0]	EMIF_SDRAM_REFRESH_CONTR OL[26:24] PASR	Partial array self-refresh

4. After T_{RFC} + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR3 register (bits BA[2:0] = 0x3) with A[15:0] = 0x0
5. After T_{RFC} + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR1 register (BA[2:0] = 0x1) with A[15:0] set as in [Table 11-12](#)

Table 11-12. Load Value For The MR1 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Output buffer enabled
A[11]	0x0	TDQS disable
A[10]	0x0	Reserved
A[9], A[6], A[2]	EMIF_SDRAM_CONFIG[26:24] DDR_TERM	DDR3/DDR3L termination resistor value
A[8]	0x0	Reserved
A[7]	0x0	Write leveling disabled
A[5], A[1]	EMIF_SDRAM_CONFIG[19:18] SDRAM_DRIVE	SDRAM drive strength
A[4:3]	0x0	Additive latency = 0
A[0]	EMIF_SDRAM_CONFIG[20] DDR_DISABLE_DLL = 0x0	Enable SDRAM DLL

6. After T_{RFC} + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR0 register (BA[2:0] = 0x0) with A[15:0] set as in [Table 11-13](#)

Table 11-13. Load Value For The MR0 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Slow exit. The DDR3 SDRAM DLL is "OFF" after entering precharge power-down.

Table 11-13. Load Value For The MR0 Register During DDR3/DDR3L SDRAM Initialization (continued)

Bits	Value	Description
A[11:9]	EMIF_SDRAM_TIMING_1 [20:17] T_WR	Write recovery for autoprecharge
A[8]	0x1	DLL reset
A[7]	0x0	Normal mode
A[6:4], A[2]	EMIF_SDRAM_CONFIG [13:10] CL	Value for CAS latency
A[3]	0x0	Nibble sequential read burst type
A[1:0]	0x0	Burst length of 8

- After T_{RFC} + 1 DDR clock cycles, issues a ZQCL command to start long ZQ calibration
- Waits for t_{DLLK} and t_{ZQinit} to complete
- Issues REF command
- The EMIF enters its IDLE state.

The EMIF updates the DDR Mode registers if the DDR3 initialization sequence is triggered again. However, the EMIF controller first issues a precharge command and then starts from Step 3.

The EMIF does not perform any transactions until the DDR3/DDR3L initialization sequence is complete.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately $16 \times \text{REFRESH_RATE} / \text{input frequency}$.

11.2.4.7.3 LPDDR2 SDRAM Initialization

When coming out of reset, if the [EMIF_SDRAM_CONFIG](#)[31:29] SDRAM_TYPE bit field is equal to 4, the EMIF performs an LPDDR2 initialization sequence as follows:

- Drives the CKE pin high and starts to issue NOP commands continuously
- After 16 SDRAM refresh rate intervals, issues a Precharge-All command. The SDRAM refresh rate is defined in the [EMIF_SDRAM_REFRESH_CONTROL](#)[15:0] REFRESH_RATE bit field.
- Issues a RESET command
- The EMIF enters its IDLE state.
- Software then must initialize LPDDR2 using the [EMIF_LPDDR2_MODE_REG_CONFIG](#) and [EMIF_LPDDR2_MODE_REG_DATA](#) registers. Software must enable refreshes by writing 1 in the [EMIF_LPDDR2_MODE_REG_CONFIG](#)[30] REFRESH_EN bit during the last MRW command.

The EMIF also performs the initialization sequence whenever the [EMIF_SDRAM_CONFIG](#) register is written and the LPDDR2 initialization was not performed previously because the [EMIF_SDRAM_REFRESH_CONTROL](#)[31] INITREF_DIS bit was set to 0. Once the EMIF performs initialization, rewriting to the [EMIF_SDRAM_CONFIG](#) register does not cause reinitialization.

The EMIF does not perform any transactions until the LPDDR2 initialization sequence completes.

When the EMIF comes out of reset, the delay time in step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately $16 \times \text{EMIF_SDRAM_REFRESH_CONTROL}[15:0] \text{ REFRESH_RATE} / \text{input frequency}$.

11.2.4.8 DDR3/DDR3L Read-Write Leveling

The EMIF supports one type of write/read leveling for DDR3/DDR3L memories - full leveling.

The full leveling consists of three parts:

- Write leveling
- Read data eye training
- Read DQS gate training

Write leveling

The goal of write leveling is to locate the delay between the rising edge of the write DQS signal and the rising edge of the SDRAM memory clock (CK). When this delay is identified, the system is able to accurately align the write DQS signal with the DDR3 memory clock. During Write leveling, the ODT function must be on and proper ODT values must be selected at the external memory side by setting Rtt_Nom (A9, A6, A2) bits in MR1 register of the external DDR3 memory. For more information about write leveling, see the *DDR3 SDRAM Standard*, section *Write leveling*.

Read data eye training

Through the read data eye training the delay between the rising edge of the read DQS signal and the rising and falling edges of the associated DQ data eye is determined. By identifying these delays, the midpoint between them can be calculated and thus the rising edge of the read DQS signal can be accurately centered within the DQ data eye.

Read DQS gate training

Read DQS Gate training is used for timing the internal read window during a read operation as opposed to the write leveling and read data eye training which are used for skew compensation of external signals. The goal of read DQS gate training is to locate the shortest delay that can be applied to each DQS gate such that it functions properly, then find the longest delay that can be applied to each DQS gate and keep its proper function again, and then align the midpoint of the DQS gate delay between these two.

11.2.4.8.1 Full Leveling

The EMIF does not perform full leveling after initialization upon reset. Full leveling must be triggered by software after the EMIF's registers are properly configured.

Full leveling is triggered by setting the [EMIF_READ_WRITE_LEVELING_CONTROL](#)[31] RDWRLVLFULL_START bit to 0x1. The leveling execution order is as follows:

1. Write leveling
2. Read DQS gate training
3. Read data eye training

After leveling procedure has finished the [EMIF_READ_WRITE_LEVELING_CONTROL](#)[31] RDWRLVLFULL_START bit clears itself automatically.

NOTE: SDRAM Refreshes must be disabled before triggering full leveling.

NOTE: The [EMIF_EXT_PHY_CONTROL_2](#) through [EMIF_EXT_PHY_CONTROL_21](#) registers have to be configured only in case of software leveling.

11.2.4.8.2 Software Leveling

In case of software leveling, the following registers must be configured:

- [EMIF_EXT_PHY_CONTROL_2](#) to [EMIF_EXT_PHY_CONTROL_6](#) containing the PHY_REG_FIFO_WE_SLAVE_RATIO value
- [EMIF_EXT_PHY_CONTROL_26](#) to [EMIF_EXT_PHY_CONTROL_30](#) containing the REG_PHY_GATELVL_INIT_RATIO value
- [EMIF_EXT_PHY_CONTROL_25](#) containing the DQ offset value

The bit fields of the [EMIF_EXT_PHY_CONTROL_2](#) to [EMIF_EXT_PHY_CONTROL_6](#) registers must be loaded with same values. The bit fields of the [EMIF_EXT_PHY_CONTROL_26](#) to [EMIF_EXT_PHY_CONTROL_30](#) registers must also be loaded with same values.

The REG_PHY_DQ_OFFSET fields in register [EMIF_EXT_PHY_CONTROL_25](#) must be loaded with 0x40. That value corresponds to quarter cycle shift between the DQS signals and the data to be written to the SDRAM.

To calculate the PHY_REG_FIFO_WE_SLAVE_RATIO value one of the following two formulas can be used:

- $0x80 + 2 * [(Board\ Delay\ in\ ps) * 0x100] / (Clock\ Period\ in\ ps)$. This formula is used when the [EMIF_DDR_PHY_CONTROL_1\[18\] PHY_INVERT_CLKOUT](#) bit is set to 0x1.
- $2 * [(Board\ Delay\ in\ ps) * 0x100] / (Clock\ Period\ in\ ps)$. This formula is used when the [EMIF_DDR_PHY_CONTROL_1\[18\] PHY_INVERT_CLKOUT](#) bit is set to 0x0.

The Board Delay in the previously described formulas is measured directly from the board. It depends on the trace length. When the calculated value for PHY_REG_FIFO_WE_SLAVE_RATIO is greater than 0x20, then a value of 0x27 must be used. That means, 0x27 must be loaded in registers [EMIF_EXT_PHY_CONTROL_2](#) to [EMIF_EXT_PHY_CONTROL_6](#).

To calculate the REG_PHY_GATELVL_INIT_RATIO value the following formula is used:

$$REG_PHY_GATELVL_INIT_RATIO = PHY_REG_FIFO_WE_SLAVE_RATIO - 0x20$$

When the calculated value for REG_PHY_GATELVL_INIT_RATIO is less than 0x0, then a value of 0x0 must be used. When the calculated value is greater than or equal to 0x0, then that value is used for registers [EMIF_EXT_PHY_CONTROL_26](#) to [EMIF_EXT_PHY_CONTROL_30](#).

In addition, when read DQS gate training is not performed the PHY_REG_FIFO_WE_SLAVE_RATIO value is used. When read DQS gate training is performed REG_PHY_GATELVL_INIT_RATIO is used and PHY_REG_FIFO_WE_SLAVE_RATIO is don't care.

NOTE: Software leveling is not recommended to be used. Hardware leveling must be used instead.

11.2.4.9 EMIF Access Cycles

By default, the EMIF keeps its SDRAM \overline{CS} signal high (CS is active-low). To direct a command to only one of the SDRAMs, EMIF asserts its \overline{CS} signal to the SDRAM for the duration of the command.

The EMIF always performs burst accesses to the SDRAM. Multiple SDRAM bursts may need to service a single local burst request. [Table 11-14](#) through [Table 11-19](#) show a few examples how EMIF performs SDRAM accesses for a linear incrementing transaction type. T0, T1, etc. are clock cycles. R0 is read starting at column 0, R8 is read starting at column 8, and R16 is read starting at column 16. D0-1 is the data from column 0 and 1, D2-3 is the data from column 2 and 3, and so on.

Table 11-14. 64-Byte Linear Read Starting at Address 0x0 (All DDR)

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13
R6		R8				R16							
			D6-7	Unused	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	D20-21	Unused	

The EMIF uses the unused data phases in the preceding figures by issuing successive read commands if there are reads to open banks pending in the command FIFO.

The write data conversion from SDR to DDR is done outside the EMIF.

11.2.4.10 Turnaround Time

Table 11-20 lists the turnaround time that EMIF introduces on the data bus for various back-to-back accesses. The EMIF takes advantage of the CAS latencies and packs the commands as close as possible on the control bus to introduce the following turnaround time on the data bus.

Table 11-20. Turnaround Time

Current Access	Next Access	Turnaround Time (Number of DDR Clock Cycles)
SDRAM write	SDRAM read	EMIF_SDRAM_TIMING_1 [2:0] T_WTR + 1 + CL
SDRAM read	SDRAM write	EMIF_SDRAM_TIMING_1 [31:29] T_RTW + 1

11.2.4.11 PHY DLL Calibration

When running in normal locked mode, the PHY DLL gets a reference clock (EMIF_DLL_FCLK) from the PRCM, which is used by the DLL master to lock to the right frequency and provide the control code for a full period phase shift to the slave. The slave uses this code as a control for its internal delay line to produce the required delay for the signal considered.

When working in locked mode, the delay lines only get an updated control value from the master DLLs when an explicit `dll_calib` command is issued by the EMIF controller. Failure to send such commands on a timely basis will result in inaccurate delay-line information if there is a significant voltage and temperature drift in the system. It is recommended to issue at least one command every 100 μ s. EMIF automatically sends `ctrl_update` commands for:

- Refresh Exit
- Self Refresh Exit
- `phy_ready` asserted during initialization

The PHY also internally generates a control value update upon completion of a leveling operation. Control is also added when leveling is not used and there are gradual voltage changes during frequency change. The [EMIF_DLL_CALIB_CTRL](#) register can be programmed to generate a `phy_dll_calib` for a periodic interval based on `EMIF_FICLK` cycles, so allow continued memory access as voltage is changing. A safe window of no activity will be guaranteed for this periodic generation of `phy_dll_calib`. In addition, a one shot generator for `phy_pll_calib` has also been added that will generate a single `phy_dll_calib` by setting the [EMIF_MISC_REG\[0\]](#) `DLL_CALIB_OS` bit to 1.

11.2.4.12 SDRAM Address Mapping

From the system point of view, the external SDRAM is seen as one block of SDRAM. If two external 64-MiB devices are used, a 128-MiB memory block is observed. If two external 32-MiB devices are used, a 64-MiB block is observed.

[Table 11-21](#) shows the SDRAM address space.

Table 11-21. SDRAM Addressing Space

Module Name	Base Address
EMIF-CSN0-SDRAM	0x8000 0000

When addressing SDRAM, if the [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS` bit field is set to 0, the EMIF uses the following two bit fields to determine the mapping from the source address to the SDRAM row, column and bank:

- [EMIF_SDRAM_CONFIG\[6:4\]](#) `IBANK`
- [EMIF_SDRAM_CONFIG\[2:0\]](#) `PAGESIZE`

If the [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS` bit field is set to 1, 2, or 3, the EMIF uses the following three bit fields to determine the mapping from the source address to the SDRAM row, column and bank:

- [EMIF_SDRAM_CONFIG\[6:4\]](#) `IBANK`
- [EMIF_SDRAM_CONFIG\[2:0\]](#) `PAGESIZE`
- [EMIF_SDRAM_CONFIG\[9:7\]](#) `ROWSIZE`

In all cases the EMIF considers its SDRAM address space to be a single logical block, regardless of the number of physical devices.

11.2.4.12.1 Address Mapping for `IBANK_POS = 0` and `EBANK_POS = 0`

For [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 0` and [EMIF_SDRAM_CONFIG_2\[27\]](#) `EBANK_POS = 0`, [Table 11-22](#) lists which source address bits (`MAddr`) are mapped to the SDRAM row, column and bank bits for all combinations of `IBANK` and `PAGESIZE`.

Table 11-22. Local Address to SDRAM Address Mapping for `IBANK_POS = 0` and `EBANK_POS = 0`

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
row address		bank address		column address	
ROWSIZE value	row width (bits)	IBANK value	bank[2:0] width (bits)	PAGESIZE value	col width (bits)
In this case the ROWSIZE bit field is not used	16	0	0	0	8
		1	1	1	9
		2	2	2	10
		3	3	3	11

NOTE: The ROWSIZE bit field is unused in case of `IBANK_POS = 0` and `EBANK_POS = 0`.

For [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 0`, the effect of the address-mapping scheme is that as the source address increments across the SDRAM pages, EMIF moves to page with the same number as in the previous bank. This movement across the banks continues until the same page is accessed in all banks and then EMIF moves to the next page in the first bank. The EMIF uses this movement across internal banks while remaining on the same page to maximize the number of the open SDRAM banks within the overall SDRAM space.

Thus, the EMIF can keep a maximum of 8 banks open at a time, and can interleave among all of them.

11.2.4.12.2 Address Mapping for `IBANK_POS = 1` and `EBANK_POS = 0`

[Table 11-23](#) list the local address to SDRAM address mapping when `IBANK_POS = 1` and `EBANK_POS = 0`.

Table 11-23. Local Address to SDRAM Address Mapping for `IBANK_POS = 1` and `EBANK_POS = 0`

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2]		row address		bank address[1:0]		column address	
IBANK value	bank[2] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[1:0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	0	2	11	2	2	2	10
3	1	3	12	3	2	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 1`, the EMIF interleaves banks the same as for [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 0` but the interleaving of banks is limited to four banks. Thus, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 4 of them.

11.2.4.12.3 Address Mapping for `IBANK_POS = 2` and `EBANK_POS = 0`

[Table 11-24](#) list the local address to SDRAM address mapping when `IBANK_POS = 2` and `EBANK_POS = 0`.

Table 11-24. Local Address to SDRAM Address Mapping for `IBANK_POS = 2` and `EBANK_POS = 0`

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2:1]		row address		bank address[0]		column address	
IBANK value	bank[2:1] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	1	2	11	2	1	2	10
3	2	3	12	3	1	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 2`, the EMIF interleaves banks the same as for [EMIF_SDRAM_CONFIG\[28:27\]](#) `IBANK_POS = 0` but the interleaving of banks is limited to two banks. Thus, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 2 of them.

11.2.4.12.4 Address Mapping for IBANK_POS = 3 and EBANK_POS = 0

Table 11-25 list the local address to SDRAM address mapping when IBANK_POS = 3 and EBANK_POS = 0.

Table 11-25. Local Address to SDRAM Address Mapping for IBANK_POS = 3 and EBANK_POS = 0

MAAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
bank address		row address		column address	
IBANK value	bank width (bits)	ROWSIZE value	row width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	8
1	1	1	10	1	9
2	2	2	11	2	10
3	3	3	12	3	11
		4	13		
		5	14		
		6	15		
		7	16		

If [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 3, the bank interleaving is not possible for EMIF.

11.2.4.12.5 Address Mapping for IBANK_POS = 0 and EBANK_POS = 1

Table 11-26 list the local address to SDRAM address mapping when IBANK_POS = 0 and EBANK_POS = 1.

Table 11-26. Local Address to SDRAM Address Mapping for IBANK_POS = 0 and EBANK_POS = 1

MAAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
row address		bank address		column address	
ROWSIZE value	row width (bits)	IBANK value	bank width (bits)	PAGESIZE value	col width (bits)
0	9	0	0	0	8
1	10	1	1	1	9
2	11	2	2	2	10
3	12	3	3	3	11
4	13				
5	14				
6	15				
7	16				

For [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 0, and [EMIF_SDRAM_CONFIG_2\[27\]](#) EBANK_POS = 1, the EMIF can keep a maximum of 8 banks open at a time and can interleave among all of them.

11.2.4.12.6 Address Mapping for IBANK_POS = 1 and EBANK_POS = 1

Table 11-27 list the local address to SDRAM address mapping when IBANK_POS = 1 and EBANK_POS = 1.

Table 11-27. Local Address to SDRAM Address Mapping for IBANK_POS = 1 and EBANK_POS = 1

MAAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2]		row address		bank address[1:0]		column address	
IBANK value	bank[2] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[1:0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9

Table 11-27. Local Address to SDRAM Address Mapping for IBANK_POS = 1 and EBANK_POS = 1 (continued)

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2]		row address		bank address[1:0]		column address	
IBANK value	bank[2] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[1:0] width (bits)	PAGESIZE value	col width (bits)
2	0	2	11	2	2	2	10
3	1	3	12	3	2	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 1, and [EMIF_SDRAM_CONFIG_2\[27\]](#) EBANK_POS = 1, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 4 of them.

11.2.4.12.7 Address Mapping for IBANK_POS = 2 and EBANK_POS = 1

[Table 11-28](#) list the local address to SDRAM address mapping when IBANK_POS = 2 and EBANK_POS = 1.

Table 11-28. Local Address to SDRAM Address Mapping for IBANK_POS = 2 and EBANK_POS = 1

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2:1]		row address		bank address[0]		column address	
IBANK value	bank[2:1] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	1	2	11	2	1	2	10
3	2	3	12	3	1	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 2 and [EMIF_SDRAM_CONFIG_2\[27\]](#) EBANK_POS = 1, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 2 of them.

11.2.4.12.8 Address Mapping for IBANK_POS = 3 and EBANK_POS = 1

[Table 11-29](#) list the local address to SDRAM address mapping when IBANK_POS = 3 and EBANK_POS = 1.

Table 11-29. Local Address to SDRAM Address Mapping for IBANK_POS = 3 and EBANK_POS = 1

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
bank address		row address		column address	
IBANK value	bank width (bits)	ROWSIZE value	row width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	8
1	1	1	10	1	9
2	2	2	11	2	10
3	3	3	12	3	11
		4	13		

Table 11-29. Local Address to SDRAM Address Mapping for IBANK_POS = 3 and EBANK_POS = 1 (continued)

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
bank address		row address		column address	
IBANK value	bank width (bits)	ROWSIZE value	row width (bits)	PAGESIZE value	col width (bits)
		5	14		
		6	15		
		7	16		

For [EMIF_SDRAM_CONFIG\[28:27\]](#) IBANK_POS = 3 and [EMIF_SDRAM_CONFIG_2\[27\]](#) EBANK_POS = 1, the bank interleaving is not possible for EMIF.

11.2.4.13 Output Impedance Calibration

The EMIF controller supports automatic output impedance (ZQ) calibration for LPDDR2 and DDR3/DDR3L memories. This feature is not supported by DDR2 memories. The ZQ calibration can be enabled by setting to 0x1 the [EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG\[30\]](#) ZQ_CS0EN bit. The EMIF supports three types of ZQ calibration commands:

- ZQINIT: ZQ calibration command during initialization
- ZQCL: ZQ calibration long command
- ZQCS: ZQ calibration short command

For DDR3/DDR3L, the EMIF automatically issues ZQINIT command during initialization. For LPDDR2, software must issue a ZQINIT command (MRW to mode register 10). The EMIF issues ZQCS command each time the [EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG\[15:0\]](#) ZQ_REFINTERVAL bit field expires. In other words, the ZQ_REFINTERVAL defines the interval between two ZQCS commands. When ZQCS command is issued, the EMIF waits and blocks any other command for [EMIF_SDRAM_TIMING_3\[20:15\]](#) ZQ_ZQCS + 1 number of DDR clock cycles.

If the [EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG\[28\]](#) ZQ_SFEXITEN bit field is set to 0x1, the EMIF issues ZQCL command every time it exits self-refresh, active power-down and precharge power-down modes. When ZQCL command is issued, the EMIF waits and blocks any other command for ([EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG\[17:16\]](#) ZQ_ZQCL_MULT + 1) × ([EMIF_SDRAM_TIMING_3\[20:15\]](#) ZQ_ZQCS + 1) number of DDR clock cycles.

The ZQINIT is a non periodic command issued only once during DDR initialization as opposed to the ZQCL and ZQCS calibration commands which are issued by the EMIF periodically at regular intervals.

11.2.4.14 LPDDR2 Temperature Monitoring

The EMIF supports automatic temperature monitoring to facilitate the software update of the refresh rate according to the temperature changes of the LPDDR2. Temperature monitoring can be enabled per chip select by setting the [EMIF_TEMPERATURE_ALERT_CONFIG\[31\]](#) TA_CS1EN and [EMIF_TEMPERATURE_ALERT_CONFIG\[30\]](#) TA_CS0EN bits.

The EMIF polls the temperature of the LPDDR2 (issues an MRR command to mode register 4) every time the [EMIF_TEMPERATURE_ALERT_CONFIG\[21:0\]](#) TA_REFINTERVAL bit field expires. In other words, TA_REFINTERVAL defines the interval between temperature alert polls. If the EMIF sees a 1 on bit 7 of the read data value from the MRR, which indicates the temperature has changed, the [EMIF_SYSTEM_OCP_INTERRUPT_STATUS\[1\]](#) TA_SYS bit is set and the module sends an interrupt. When the interrupt is received, software must update the [EMIF_SDRAM_REFRESH_CONTROL\[15:0\]](#) REFRESH_RATE bit field to the required value as per the temperature change.

If the [EMIF_TEMPERATURE_ALERT_CONFIG\[28\]](#) TA_SFEXITEN bit is set to 1, the EMIF polls for temperature change every time it exits self-refresh, active power-down, and precharge power-down modes.

Because the EMIF is performing a LPDDR2 mode register read, it needs information about how the LPDDR2 is connected. The [EMIF_TEMPERATURE_ALERT_CONFIG\[27:26\]](#) TA_DEVWDT and [EMIF_TEMPERATURE_ALERT_CONFIG\[25:24\]](#) TA_DEVCNT bit fields provide the necessary information to the EMIF for MRR data compare. For example, if TA_DEVWDT is set to 0, which indicates 8-bit devices are used, and if TA_DEVCNT is set to 2, which indicates four devices are used to form a 32-bit bus, the mask used for checking is 0b1111, that is, the EMIF expects data on each byte lane on a 32-bit bus.

11.2.4.15 Error Correction And Detection Feature

For data integrity, the EMIF supports ECC on the data written or read from the SDRAM and is enabled by programming the [EMIF_ECC_CTRL_REG](#) register. 7-bit ECC is calculated over 32-bit data when in 32-bit DDR mode. 6-bit ECC is calculated over 16-bit data when in 16-bit DDR mode. The ECC is calculated for all accesses that are within the address ranges protected by ECC. The address ranges are specified in the [EMIF_ECC_ADDRESS_RANGE_1](#) and [EMIF_ECC_ADDRESS_RANGE_2](#) registers. Both registers have identical bits and functionality. This provides flexibility allowing two non-overlapping memory regions to be ECC protected.

NOTE: For LPDDR2 ECC is supported only in 16-bit narrow mode.

The system must ensure that any burst access with starting address in the ECC protected region must not cross over to the un-protected region and vice-versa. The ECC is stored inside the SDRAM during writes. If a write access with byte count that is not a multiple of ECC quanta or with a non quanta aligned address is performed within the address range protected by ECC, the EMIF will send out a write ECC error interrupt. The EMIF will also report an error on the system response interface. In this case, the EMIF will perform the write to the SDRAM. However, the ECC value written to the SDRAM will be corrupted. The EMIF will also log the MConnID, MCcmd and MBurstSeq for the first error transaction in the [EMIF_OCP_ERROR_LOG](#) register.

The ECC quanta is either 32-bit or 16-bit based on the [EMIF_SDRAM_CONFIG\[15:14\]](#) NARROW_MODE bit field. For 32-bit mode (128 bits per EMIF clock cycle), an ECC quanta is 32 bits. For 16-bit narrow mode (64 bits per EMIF clock cycle), the ECC quanta is 16 bits.

Once ECC is enabled the entire protected region must be initialized with data. These writes must be quanta-sized and quanta-aligned.

The ECC is read and verified during reads. For 1-bit ECC error in the data, the EMIF will correct the data and send it on the system return interface. The EMIF will log the starting address of the SDRAM burst in an internal 4 deep address FIFO. The internal FIFO will store the first four 1-bit ECC errors. The [EMIF_1B_ECC_ERR_ADDR_LOG](#) register will display the address on top of the internal FIFO. The software must write a 0x1 to the [EMIF_1B_ECC_ERR_ADDR_LOG](#) register to pop the FIFO and display the next address stored. For subsequent reads in the ECC regions, the FIFO will be loaded with the address for the next 1-bit ECC error if it is not full. It must be noted that no address comparison will be performed, that is, if a single address has ECC errors back-to-back, that address will be logged twice.

The number of 1-bit ECC errors can be counted using the [EMIF_1B_ECC_ERR_CNT](#) register. The EMIF also supports programming a threshold and a window in the [EMIF_1B_ECC_ERR_THRSH](#) register. The window is programmed in number of refresh periods. When the programmed window value is 0x0, that is, window is disabled, and the internal error count meets the programmed threshold, the EMIF will generate a 1-bit ECC error interrupt. When the programmed window value is non-zero, that is, window is enabled, the EMIF will generate a 1-bit ECC error interrupt only if the internal error count meets the programmed threshold in that window. The internal error count is reset every time the window expires. The software can use this to gauge the degree of 1-bit ECC errors occurring in the system.

For diagnosis, the EMIF supports a 1-Bit ECC data error distribution register ([EMIF_1B_ECC_ERR_DIST_1](#)) that represent whether an error has occurred in a given data channel location. This is advantageous to detect whether the errors are random or systemic. The distribution registers will be overlay of all 1-bit ECC errors until the software clears the register. Therefore, multiple bits could be set as a result of multiple 1-bit ECC errors occurring over multiple read accesses.

For 2-bit ECC errors in the data, the EMIF will generate a 2-bit ECC error interrupt. For any bit errors in the address, the EMIF will generate an address error interrupt. It must be noted that the EMIF will neither correct the data for these uncorrectable errors. Along with generating the interrupts, the EMIF will also report an error on the system return interface. In this case the EMIF will send the resultant data from the ECC correction logic. The read data received from the memory may have further been corrupted by the ECC correction logic since it will have attempted to correct the read data but failed due to uncorrectable error.

For all uncorrectable ECC errors listed above, the EMIF will log the starting address of the SDRAM burst in the [EMIF_2B_ECC_ERR_ADDR_LOG](#) register. This register will show the address of the first uncorrectable error. After the software clears the register, it will be loaded with the address for the next uncorrectable error.

In the event that the EMIF detects a single bit ECC error, although the error is corrected on the returned data, the data in the SDRAM is not corrected. It is the responsibility of the system software to correct the ECC error at that location. To the extent possible, the system software should correct multiple bit errors with the caveat that the returned data was not corrected but corrupted by the ECC correction logic.

11.2.4.16 Class of Service

The commands in the Command FIFO can be mapped to two classes of service namely 1 and 2. The mapping of commands to a particular class of service can be done based on the priority or the master ID. The mapping based on priority can be done by setting the appropriate values in the [EMIF_PRIORITY_TO_CLASS_OF_SERVICE_MAPPING](#) register. The mapping based on master ID can be done by setting the appropriate values of master ID and the masks in the [EMIF_CONNECTION_ID_TO_CLASS_OF_SERVICE_1_MAPPING](#) and [EMIF_CONNECTION_ID_TO_CLASS_OF_SERVICE_2_MAPPING](#) registers. There are 3 master ID and mask values that can be set for each class of service. In conjunction with the masks, each class of service can have a maximum of 144 master IDs mapped to it. For example, a master ID value of 0xFF along with a mask value of 0x3 will map all master IDs from 0xF8 to 0xFF to that particular class of service.

Each class of service has an associated latency counter ([EMIF_COS_CONFIG\[23:16\] COS_COUNT_1](#) and [EMIF_COS_CONFIG\[15:8\] COS_COUNT_2](#)). When the latency counter for a command expires, that is, reaches the value programmed for the class of service that the command belongs to, that command is executed next. If there is more than one command that has expired latency counter, the command with the highest priority is executed first. One exception to this rule is, if the [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) value expires for the oldest command in the queue. That command is executed first irrespective of priority or class of service. This is done to prevent the continuous blocking effect.

The [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) value is used to identify when the oldest command in the command FIFO has timed out. At this point during the arbitration process, this oldest command is issued regardless of the priority of the other commands in the FIFO. This feature is disabled when writing 0x0 to the [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) bit field. After issuing the oldest command, the other remaining commands in the FIFO are reordered by age. The next oldest command in the FIFO is given highest priority again and issued after the [EMIF_COS_CONFIG\[7:0\] PR_OLD_COUNT](#) value expires. If a new value in the PR_OLD_COUNT bit field is written during counting, that is, before PR_OLD_COUNT expires, the counter keeps working but if this value is smaller the oldest command is issued sooner and if this value is larger the oldest command is issued later.

The master ID mapping allows the same master ID to be put in both class of service 1 and 2. Also, a transaction might belong to one class of service if viewed by master ID and might belong to another class of service if viewed by priority. In these cases, the command will belong to both class of service. The EMIF will try executing the command as soon as possible, when the smaller of the two counters ([EMIF_COS_CONFIG\[23:16\] COS_COUNT_1](#) and [EMIF_COS_CONFIG\[15:8\] COS_COUNT_2](#)) expires.

11.2.4.17 Performance Counters

The [EMIF_PERFORMANCE_COUNTER_1](#) and [EMIF_PERFORMANCE_COUNTER_2](#) registers are used to monitor or calculate the EMIF Controller bandwidth and efficiency. These counters are able to count events such as accesses made to EMIF, Activate (ACT) commands sent to SDRAM, read and write accesses made to EMIF, and other events. Each counter counts independently of the other. In addition to the ability of events counting, the counters can also filter the events from a particular master or address space. The events counting and filter enabling are configured using the [EMIF_PERFORMANCE_COUNTER_CONFIG](#) register. The filter value used is configured through the [EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT](#) register. Each counter can be configured independently.

Table 11-30 lists all the events that can be counted and whether a filter can be applied to a particular event. A filter is applied to an event if the following bits are set to 0x1 for that event:

- For Performance Counter 1: [EMIF_PERFORMANCE_COUNTER_CONFIG\[15\]](#) CNTR1_MCONNID_EN and [EMIF_PERFORMANCE_COUNTER_CONFIG\[14\]](#) CNTR1_REGION_EN;
- For Performance Counter 2: [EMIF_PERFORMANCE_COUNTER_CONFIG\[31\]](#) CNTR2_MCONNID_EN and [EMIF_PERFORMANCE_COUNTER_CONFIG\[30\]](#) CNTR2_REGION_EN.

Table 11-30. Performance Counter Filter Configuration

CNTR _n _CFG ⁽¹⁾	CNTR _n _REGION_EN	CNTR _n _MCONNID_EN	Description
0x0	0x0	0x0 or 0x1	Count the accesses made to EMIF
0x1	0x0	0x0 or 0x1	Count the Activate (ACT) commands sent to SDRAM
0x2	0x0 or 0x1	0x0 or 0x1	Count the read accesses made to EMIF
0x3	0x0 or 0x1	0x0 or 0x1	Count the write accesses made to EMIF
0x4	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Command FIFO is full
0x5	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Write Data FIFO is full
0x6	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Read Data FIFO is full
0x7	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Return Command FIFO is full
0x8	0x0 or 0x1	0x0 or 0x1	Count number of priority elevations
0x9	0x0	0x0	Count number of EMIF_FICLK clock cycles that a command was pending
0xA	0x0	0x0	Count number of EMIF_FICLK cycles used by the EMIF controller for reads and writes.
0xB - 0xF	0x0	0x0	Reserved for future use.

⁽¹⁾ n = 1 or 2

NOTE: When the MReqDebug qualifier is set to 0x1 for a particular local command, the performance counters are not incremented for that particular command if the CNTR_n_CFG values are equal to 0x0, 0x1, 0x2, 0x3, or 0xA.

NOTE: The EMIF performance counters cannot distinguish between single access and burst access. In both cases they are incremented by 1. If the actual SDRAM bandwidth of an initiator has to be measured the EMIF performance counters may not be sufficient.

11.2.4.17.1 Performance Counters General Examples

- **General Example for Counting All Write Accesses made to EMIF**
If the [EMIF_PERFORMANCE_COUNTER_1](#) register is used to count all write accesses made to EMIF from master with connection ID equal to 0x86 (this is the system MMU) the following steps should be performed:

- To enable the writes counting, the [EMIF_PERFORMANCE_COUNTER_CONFIG\[3:0\]](#) CNTR1_CFG bit field must be set to 0x3.
- The [EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT\[15:8\]](#) MCONNID1 bit field must be set to 0x86.
- To enable filtering, the [EMIF_PERFORMANCE_COUNTER_CONFIG\[15\]](#) CNTR1_MCONNID_EN bit must be set to 0x1.

With this configuration [EMIF_PERFORMANCE_COUNTER_1](#) counts every write made to the EMIF from master 0x86 to any address space. This does not include accesses from other masters and commands other than writes.

- **General Example for Counting Total Accesses made to EMIF**

If the [EMIF_PERFORMANCE_COUNTER_2](#) register is used to count total accesses made to EMIF regardless of the address space or master the following steps should be performed:

- To enable counting of all accesses to the SDRAM, the [EMIF_PERFORMANCE_COUNTER_CONFIG\[19:16\]](#) CNTR2_CFG bit field must be set to 0x0.
- To disable filtering, both the [EMIF_PERFORMANCE_COUNTER_CONFIG\[31\]](#) CNTR2_MCONNID_EN and [EMIF_PERFORMANCE_COUNTER_CONFIG\[30\]](#) CNTR2_REGION_EN bits must be set to 0x0.

With this configuration [EMIF_PERFORMANCE_COUNTER_2](#) counts every access made to the EMIF. This includes all accesses from all masters and to any address space.

- **General Example for Counting All Read Accesses made to EMIF**

If the [EMIF_PERFORMANCE_COUNTER_1](#) register is used to count all read accesses made to EMIF from master with connection ID equal to 0x86 (this is the system MMU) to address space 0x0 the following steps should be performed:

- To enable the reads counting, the [EMIF_PERFORMANCE_COUNTER_CONFIG\[3:0\]](#) CNTR1_CFG bit field must be set to 0x2.
- The [EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT\[15:8\]](#) MCONNID1 bit field must be set to 0x86
- The [EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT\[1:0\]](#) REGION_SEL1 bit field must be set to 0x0.
- To enable filtering, both the [EMIF_PERFORMANCE_COUNTER_CONFIG\[15\]](#) CNTR1_MCONNID_EN and the [EMIF_PERFORMANCE_COUNTER_CONFIG\[14\]](#) CNTR1_REGION_EN bits must be set to 0x1.

With this configuration, [EMIF_PERFORMANCE_COUNTER_1](#) counts every read made to the EMIF from master 0x86 to address space 0x0. This does not include accesses from other masters or to other address spaces and does not include commands other than reads.

11.2.4.18 Forcing CKE to tri-state

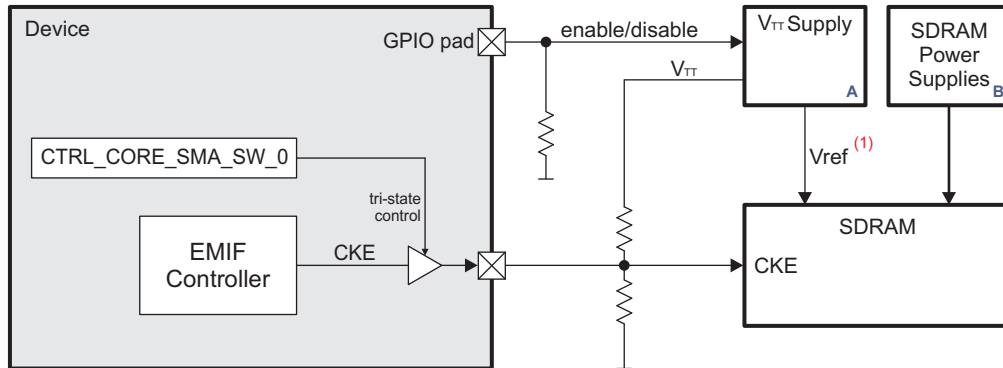

The CKE pad can be forced to tri-state when the CTRL_CORE_SMA_SW_0[0] CKE_ASSERTION bit is set to 0x1. This functionality facilitates fast resume by allowing a strong external pull-down resistor to hold the CKE memory pad low thus keeping the SDRAM in self-refresh while the device is completely powered off. [Figure 11-10](#) and the following example sequence provide more details how this functionality can be used:

- When device is running configure EMIF for self refresh. As a result it drives CKE low.
- Disable V_{TT} supply (can be controlled through a device GPIO pad).
- Ramp down all power rails to the device. When power is already off, EMIF doesn't drive CKE low. The external pull-down does this instead. Note that only V_{TT} must be off. All SDRAM supplies (including V_{REF}) must be on.
- After these three steps the device is completely powered off and the SDRAM is in self-refresh. The waking-up from this state is system specific.
- To resume from self-refresh the CKE pad must be forced to tri-state by writing 0x1 to one of the CKE_ASSERTION bits previously mentioned. Then EMIF must be configured for self-refresh so that its state becomes consistent with the actual SDRAM state.
- Write 0x0 to the corresponding CKE_ASSERTION bit to release CKE driver from tri-state. This allows

EMIF to take control over CKE which is now driven low as EMIF has already been configured for self-refresh.

- Enable V_{TT} supply.
- Access the SDRAM to bring it out of self refresh and resume application.

Figure 11-10. Example for Using the CKE Tri-state Functionality

(1) - Vref (derived either from A or B) must remain ON when V_{TT} is OFF.

emif-009

NOTE: In case the device is powered off but the SDRAM is in self-refresh (as previously described) it must be taken into account that the SDRAM RESET# signal has to be controlled externally to preserve the SDRAM contents. This is needed as ddr1_rst signal is not controlled by the CTRL_CORE_SMA_SW_0 register and therefore cannot be used.

11.2.5 EMIF Programming Guide

11.2.5.1 EMIF Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the EMIF module.

11.2.5.1.1 Global Initialization

Table 11-31. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description , in Chapter 14, Control Module
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 13 Interrupt Controllers

11.2.5.1.1.1 EMIF Configuration Sequence

[Table 11-32](#) shows all steps needed to configure and use the EMIF.

Table 11-32. EMIF Configuration Sequence

Step	Register/ Bit Field	Value
Configure DPLL_DDR to the required frequency:		
· IF DPLL_DDR is locked:	CM_IDLEST_DPLL_DDR[0] ST_DPLL_CLK	0x1
Unlock DPLL_DDR	CM_CLKMODE_DPLL_DDR[2:0] DPLL_EN	0x6
· ENDIF		
· Configure the DPLL multiplier and divider factors	CM_CLKSEL_DPLL_DDR[18:8] DPLL_MULT and CM_CLKSEL_DPLL_DDR[6:0] DPLL_DIV	0x-
· Configure the M2 post-divider factor	CM_DIV_M2_DPLL_DDR[4:0] DIVHS	0x-
· Configure the H11 post-divider factor	CM_DIV_H11_DPLL_DDR[5:0] DIVHS	0x-
· Lock the DPLL_DDR	CM_CLKMODE_DPLL_DDR[2:0] DPLL_EN	0x7
Disable DLL Override	CM_DLL_CTRL[0] DLL_OVERRIDE	0x0
Configure the output impedance, slew rate and weak pull resistors of the DDR IO cells. For more information, see <i>Software Controls for the DDR3 I/O Cells</i> .	CTRL_CORE_CONTROL_DDRCH1_0	0x-
	CTRL_CORE_CONTROL_DDRCH1_0	
	CTRL_CORE_CONTROL_DDRCH1_1	
	CTRL_CORE_CONTROL_DDRCH1_2	
If needed, configure the Vref-Generation Cells. For more information, see <i>Reference Voltage for the Device DDR3 Receivers</i> .	CTRL_CORE_CONTROL_DDRIO_0	0x-
Set the number of DQ samples required for read leveling	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT[15:14] EMIF1_REG_PHY_NUM_OF_SAMPLES	0x3
Choose SDRAM read response on only one DQ bit during read leveling	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT[12] EMIF1_REG_PHY_ALL_DQ_MPR_RD_RESP	0x0
Configure ODT for the device DDR IOs	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT [6:5] EMIF1_PHY_RD_LOCAL_ODT	0x1 for 60 Ohms
		0x2 for 80 Ohms
		0x3 for 120 Ohms

Table 11-32. EMIF Configuration Sequence (continued)

Step	Register/ Bit Field	Value
IF ECC is used:		
Enable ECC	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT[16] EMIF1_EN_ECC	0x1
ENDIF		
Based on the memory type other bits from CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT can also be configured.		
Read the EMIF_IODFT_TLGC register	EMIF_IODFT_TLGC	RD_VAL_1
Read the EMIF_TEMPERATURE_ALERT_CONFIG register	EMIF_TEMPERATURE_ALERT_CONFIG	RD_VAL_2
Read the EMIF_DDR_PHY_CONTROL_2 register	EMIF_DDR_PHY_CONTROL_2	RD_VAL_3
IF External warm reset or global warm software reset has occurred:		
	PRM_RSTST[5]EXTERNAL_WARM_RST or PRM_RSTST[1] GLOBAL_WARM_SW_RST	0x1 0x1
Reset the DDR PHY	EMIF_IODFT_TLGC[10] RESET_PHY	0x1
ENDIF		
Program the necessary ratio values to the EMIF_EXT_PHY_CONTROL_1 register	EMIF_EXT_PHY_CONTROL_1[29:20] PHY_REG_CTRL_SLAVE_RATIO2 (LPDDR2 only)	0x80 if PHY_INVERT_CLKOUT = 0x0 or 0x100 if PHY_INVERT_CLKOUT = 0x1
	EMIF_EXT_PHY_CONTROL_1[19:10] PHY_REG_CTRL_SLAVE_RATIO1 (DDR2/DDR3 only)	0x80 if PHY_INVERT_CLKOUT = 0x0 or 0x100 if PHY_INVERT_CLKOUT = 0x1
	EMIF_EXT_PHY_CONTROL_1[9:0] PHY_REG_CTRL_SLAVE_RATIO0 (DDR2/DDR3 only)	0x80 if PHY_INVERT_CLKOUT = 0x0 or 0x100 if PHY_INVERT_CLKOUT = 0x1
Program the shadow register of EMIF_EXT_PHY_CONTROL_1	EMIF_EXT_PHY_CONTROL_1_SHADOW	EMIF_EXT_PHY_CONTROL_1
If software leveling will be used, program registers EMIF_EXT_PHY_CONTROL_2 through EMIF_EXT_PHY_CONTROL_21 and their corresponding shadow registers NOTE: Software leveling is not recommended to be used. Hardware leveling must be used instead.	EMIF_EXT_PHY_CONTROL_2/EMIF_EXT_PHY_CONTROL_2_SHADOW through EMIF_EXT_PHY_CONTROL_21/EMIF_EXT_PHY_CONTROL_21_SHADOW	0x-
Program the necessary delay values to the EMIF_EXT_PHY_CONTROL_22 register	EMIF_EXT_PHY_CONTROL_22 [24:16] PHY_REG_FIFO_WE_IN_DELAY ⁽¹⁾	Recommended value is 0x0
	EMIF_EXT_PHY_CONTROL_22 [8:0] PHY_REG_CTRL_SLAVE_DELAY ⁽¹⁾	Recommended value is 0x0

⁽¹⁾ These values are only used when CM_DLL_CTRL[0] DLL_OVERRIDE is set to 0x1. This is used only for debug purposes.

Table 11-32. EMIF Configuration Sequence (continued)

Step	Register/ Bit Field	Value
Program the shadow register of EMIF_EXT_PHY_CONTROL_22	EMIF_EXT_PHY_CONTROL_22_SHADOW ⁽¹⁾	EMIF_EXT_PHY_CONT_ROL_22
Program the necessary delay values to the EMIF_EXT_PHY_CONTROL_23 register	EMIF_EXT_PHY_CONTROL_23 [24:16] PHY_REG_WR_DQS_SLAVE_DELAY ⁽¹⁾	Recommended value is 0x0
	EMIF_EXT_PHY_CONTROL_23 [8:0] PHY_REG_RD_DQS_SLAVE_DELAY ⁽¹⁾	Recommended value is 0x0
Program the shadow register of EMIF_EXT_PHY_CONTROL_23	EMIF_EXT_PHY_CONTROL_23_SHADOW ⁽¹⁾	EMIF_EXT_PHY_CONT_ROL_23
Program the EMIF_EXT_PHY_CONTROL_24 register	EMIF_EXT_PHY_CONTROL_24 [30:24] REG_PHY_DQ_OFFSET_HI	0x-
	EMIF_EXT_PHY_CONTROL_24 [16] REG_PHY_GATELVL_INIT_MODE	0x1
	EMIF_EXT_PHY_CONTROL_24 [12] REG_PHY_USE_RANK0_DELAYS	0x1
	EMIF_EXT_PHY_CONTROL_24 [8:0] REG_PHY_WR_DATA_SLAVE_DELAY ⁽¹⁾	Recommended value is 0x0
Program the shadow register of EMIF_EXT_PHY_CONTROL_24	EMIF_EXT_PHY_CONTROL_24_SHADOW	EMIF_EXT_PHY_CONT_ROL_24
Program the necessary offset ratio values to the EMIF_EXT_PHY_CONTROL_25 register	EMIF_EXT_PHY_CONTROL_25 [27:21] REG_PHY_DQ_OFFSET3	0x-
	EMIF_EXT_PHY_CONTROL_25 [20:14] REG_PHY_DQ_OFFSET2	0x-
	EMIF_EXT_PHY_CONTROL_25 [13:7] REG_PHY_DQ_OFFSET1	0x-
	EMIF_EXT_PHY_CONTROL_25 [6:0] REG_PHY_DQ_OFFSET0	0x-
Program the shadow register of EMIF_EXT_PHY_CONTROL_25	EMIF_EXT_PHY_CONTROL_25_SHADOW	EMIF_EXT_PHY_CONT_ROL_25

IF Memory type == LPDDR2:		
Initialize the LPDDR2 Mode Registers (MRs) by writing to the EMIF_LPDDR2_MODE_REG_CONFIG and EMIF_LPDDR2_MODE_REG_DATA registers:		
· Configure calibration command after initialization (write to LPDDR2 MR10)	EMIF_LPDDR2_MODE_REG_CONFIG EMIF_LPDDR2_MODE_REG_DATA	0xA 0xFF

Table 11-32. EMIF Configuration Sequence (continued)

Step	Register/ Bit Field	Value
· Configure burst parameters and nWR (write to LPDDR2 MR1)	EMIF_LPDDR2_MODE_REG_CONFIG EMIF_LPDDR2_MODE_REG_DATA	0x1 0x-
· Configure read and write latencies (write to LPDDR2 MR2)	EMIF_LPDDR2_MODE_REG_CONFIG EMIF_LPDDR2_MODE_REG_DATA	0x2 0x-
· If needed, other mode registers can also be configured.		
LPDDR2 MR0 will be read in next step.	EMIF_LPDDR2_MODE_REG_CONFIG	0x0
Wait until LPDDR2 auto initialization process completes (read LPDDR2 MR0).	EMIF_LPDDR2_MODE_REG_DATA	
If needed, other read only mode registers of the LPDDR2 memory can also be read by first writing the mode register address to EMIF_LPDDR2_MODE_REG_CONFIG and then reading EMIF_LPDDR2_MODE_REG_DATA.		
ENDIF		
IF Memory type == DDR3 AND Hardware leveling is used AND SDRAM content doesn't need to be maintained:		
IF ECC is used:		
Perform dummy ECC setup just to allow hardware leveling of ECC memories	EMIF_ECC_ADDRESS_RANGE_1	0x0
	EMIF_ECC_ADDRESS_RANGE_2	0x0
	EMIF_ECC_CTRL_REG	0xC000 0000
ENDIF		
Clear the phy_reg_fifo_we_in_misaligned_sticky status flag	EMIF_EXT_PHY_CONTROL_36[8] REG_PHY_FIFO_WE_IN_MISALIGNED_CLR	0x1
Temporarily disable SDRAM refreshes	EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS	0x1
Trigger read-write leveling	EMIF_READ_WRITE_LEVELING_CONTROL[31] RDWRLVLFULL_START	0x1
Wait 300µs		
Wait till read-write leveling completes	EMIF_READ_WRITE_LEVELING_CONTROL[31] RDWRLVLFULL_START	0x0
Enable the temporarily disabled SDRAM refreshes	EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS	0x0
Check EMIF_STATUS for leveling timeouts	EMIF_STATUS[6] RDLVLGATETO	0x1
	EMIF_STATUS[5] RDLVLTO	0x1
	EMIF_STATUS[4] WRLVLTO	0x1
IF special ⁽⁵⁾ use-cases:		
Copy EMIF_PHY_STATUS_12 through EMIF_PHY_STATUS_16 to EMIF_EXT_PHY_CONTROL_2 through EMIF_EXT_PHY_CONTROL_6		
Copy EMIF_PHY_STATUS_7 through EMIF_PHY_STATUS_11 to EMIF_EXT_PHY_CONTROL_7 through EMIF_EXT_PHY_CONTROL_11		
Copy EMIF_PHY_STATUS_17 through EMIF_PHY_STATUS_26 to EMIF_EXT_PHY_CONTROL_12 through EMIF_EXT_PHY_CONTROL_21		

⁽⁵⁾ In some special use-cases with features like suspend to RAM where EMIF may be reset but SDRAM content needs to be maintained correctly across such an event. In such cases, when EMIF is configured at first boot with hardware leveling enabled, the hardware leveling output from EMIF_PHY_STATUS_x registers is copied to the EMIF_EXT_PHY_CONTROL_x registers. When EMIF comes back from a reset state and needs to be reconfigured without losing SDRAM content, the EMIF_READ_WRITE_LEVELING_RAMP_CONTROL[31] RDWRLV_EN bit must be 0 and hardware leveling must not be triggered. In this case, the EMIF_EXT_PHY_CONTROL_2 through EMIF_EXT_PHY_CONTROL_21 registers take effect. Here it is expected that SDRAM is moved to self-refresh mode before EMIF enters reset state and SDRAM content is maintained correctly by appropriate circuitry external to the SoC.

Table 11-32. EMIF Configuration Sequence (continued)

Step	Register/ Bit Field	Value
Mask read data eye training, DQS gate training and write leveling training to disable the use of registers EMIF_PHY_STATUS_7 through EMIF_PHY_STATUS_26 registers	EMIF_DDR_PHY_CONTROL_1 [27:25]	0x7

Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Power saving mode, when EMIF is idle.	EMIF_POWER_MANAGEMENT_CONTROL [3:0] CS_TIM	0x-
Enable (enter) the Deep Power-Down mode	EMIF_POWER_MANAGEMENT_CONTROL [11] DPD_EN	0x1
Write the shadow register of EMIF_POWER_MANAGEMENT_CONTROL	EMIF_POWER_MANAGEMENT_CONTROL_SHA DOW	0x-

Table 11-39. EMIF LPDDR2-SDRAM Deep Power-Down Mode Exiting

Step	Register/ Bit Field / Programming Model	Value
Clear DPD_EN bit.	EMIF_POWER_MANAGEMENT_CONTROL [11] DPD_EN	0
Write the shadow register of EMIF_POWER_MANAGEMENT_CONTROL	EMIF_POWER_MANAGEMENT_CONTROL_SHA DOW	0x-

11.2.5.1.2.5 LPDDR2 Temperature Monitoring Mode

Table 11-40. LPDDR2 Temperature Monitoring Mode

Step	Register/ Bit Field / Programming Model	Value
Determine which chip-select (0 or 1) is used for temperature alert polling	EMIF_TEMPERATURE_ALERT_CONFIG[31] TA_CS1EN EMIF_TEMPERATURE_ALERT_CONFIG[30] TA_CS0EN	0x-
Define the interval (number of refresh periods) between temperature alert polls.	EMIF_TEMPERATURE_ALERT_CONFIG[21:0] TA_REFINTERVAL	0x-
Define the width of the physical memory device	EMIF_TEMPERATURE_ALERT_CONFIG[27:26] TA_DEVWDT	0x-
Define which external byte lanes contain a device for temperature monitoring (which devices to be polled).	EMIF_TEMPERATURE_ALERT_CONFIG[25:24] TA_DEVCNT	0x-
(Optional) Enable the issuing of a temperature alert poll on Self-Refresh exit (poll for temperature change every time EMIF exits Self-Refresh, Active Power-Down, and Precharge Power-Down modes).	EMIF_TEMPERATURE_ALERT_CONFIG[28] TA_SFEXITEN	0x1
Enable System L3 interrupt for SDRAM temperature alert.	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SE T[1] EN_TA_SYS	0x1

11.2.5.1.2.6 EMIF ECC Configuration

Table 11-41. EMIF ECC Configuration

Step	Register/ Bit Field / Programming Model	Value
Before configuring the EMIF ECC registers, the ECC must be enabled from the Control Module	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT [16] EMIF1_EN_ECC	0x1
Configure the address ranges which have to be ECC protected	EMIF_ECC_ADDRESS_RANGE_1 and EMIF_ECC_ADDRESS_RANGE_2 ⁽¹⁾	0x-
Enable the first ECC protected address range	EMIF_ECC_CTRL_REG[0] REG_ECC_ADDR_RGN_1_EN	0x1
Enable the second ECC protected address range	EMIF_ECC_CTRL_REG[1] REG_ECC_ADDR_RGN_2_EN ⁽¹⁾	0x1
Configure whether the EMIF accesses within the address ranges defined by EMIF_ECC_ADDRESS_RANGE_1 and EMIF_ECC_ADDRESS_RANGE_2 are ECC protected (=0x1) or the EMIF accesses outside these address ranges are ECC protected (=0x0).	EMIF_ECC_CTRL_REG[30] REG_ECC_ADDR_RGN_PROT	0x-
(Optional) Configure the thresholds to generate 1-bit error interrupt	EMIF_1B_ECC_ERR_THRSH	0x-
Enable ECC	EMIF_ECC_CTRL_REG[31] REG_ECC_EN	0x1
Initialize the ECC protected memory regions with quanta-sized and quanta-aligned data	EMIF_1B_ECC_ERR_CNT	Read the register value and write it back to clear
Clear the status flags and other status history	EMIF_1B_ECC_ERR_DIST_1	0xFFFF FFFF
	EMIF_2B_ECC_ERR_ADDR_LOG	0x1
	EMIF_SYSTEM_OCP_INTERRUPT_STATUS [5:3]	0x7

⁽¹⁾ It is not mandatory to enable both address ranges. This is provided for flexibility allowing two non-overlapping ECC protected regions to be created.

NOTE: The xxx_RATIO8 and xxx_RATIO9 bit fields are associated with the ECC data PHY and must be loaded with values same as in the xxx_RATIO0 through xxx_RATIO7 bit fields from registers EMIF_EXT_PHY_CONTROL_xx. This must be taken into account to avoid unexpected behavior and possible errors, if ECC is used.

11.2.6 EMIF Register Manual

Table 11-42 lists the EMIF instance.

11.2.6.1 EMIF Instance Summary

Table 11-42. EMIF Instance Summary

Module Name	Base Address	Size
EMIF	0x4C00 0000	16 MiB

11.2.6.2 EMIF Registers

Many register values are programmed with full-speed DDR clock cycles, whereas EMIF always runs at half the speed of this clock. Because EMIF is only capable of decrementing these values at half speed (taking into account the minus 1 programming model) the following model applies for data issued on a lower bus:

- REG_VALUE = 0 → 2 DDR clocks
- REG_VALUE = 1 → 2 DDR clocks
- REG_VALUE = 2 → 4 DDR clocks
- REG_VALUE = 3 → 4 DDR clocks
- REG_VALUE = 4 → 6 DDR clocks
- REG_VALUE = 5 → 6 DDR clocks
- REG_VALUE = 6 → 8 DDR clocks
- REG_VALUE = 7 → 8 DDR clocks

Activate and deactivate commands use the upper bus. Register values associated with these operations follow the general rule:

- REG_VALUE = 0 → 1 DDR clocks
- REG_VALUE = 1 → 2 DDR clocks
- REG_VALUE = 2 → 2 DDR clocks
- REG_VALUE = 3 → 4 DDR clocks
- REG_VALUE = 4 → 4 DDR clocks
- REG_VALUE = 5 → 6 DDR clocks
- REG_VALUE = 6 → 6 DDR clocks

NOTE: Shadow registers are loaded on any frequency change or SidleReq/SidleAck transition at the point where the EMIF has put SDRAM into self-refresh mode.

Table 11-43 summarizes the EMIF register mapping.

11.2.6.2.1 EMIF Register Summary

Table 11-43. EMIF Registers Mapping Summary

Register Name	Type	Register Width (Bits)	Address Offset	EMIF Physical Address

Table 11-45. Register Call Summary for Register EMIF_REVISION

EMIF Controller
• EMIF Register Summary: [0]

Table 11-46. EMIF_STATUS

Address Offset	0x0000 0004	Instance	EMIF
Physical Address	0x4C00 0004		
Description	SDRAM Status Register (STATUS)		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BE	DUAL_CLK_MODE	FAST_INIT	RESERVED													RDLVLGATETO	RDLVLTO	WRLVLTO	RESERVED	PHY_DLL_READY	RESERVED										

Bits	Field Name	Description	Type	Reset
31	BE	Big endian mode select for 8 and 16-bit devices, set to 1 for big endian or 0 for little endian operation. In current implementation, only 32-bit devices are supported - this bit is don't care.	R	0
30	DUAL_CLK_MODE	Dual Clock mode. Defines whether the EMIF_L3_ICLK and EMIF_FICLK clock are asynchronous. EMIF_L3_ICLK and EMIF_FICLK clock are asynchronous, if set to 1.	R	0
29	FAST_INIT	Fast Init. Defines whether the EMIF fast initialization mode has been enabled. Fast initialization is enabled if set to 1.	R	0
28:7	RESERVED	Reserved	R	0x00 0000
6	RDLVLGATETO	Read DQS Gate Training Timeout. Value of 1 indicates read DQS gate training has timed out because read DQS gate training done was not received from the PHY.	R	0
5	RDLVLTO	Read Data Eye Training Timeout. Value of 1 indicates read data eye training has timed out because read data eye training done was not received from the PHY.	R	0
4	WRLVLTO	Write Leveling Timeout. Value of 1 indicates write leveling has timed out because write leveling done was not received from the PHY.	R	0
3	RESERVED		R	0
2	PHY_DLL_READY	DDR PHY Ready. The DDR PHY is ready for normal operation, if set to 1.	R	0
1:0	RESERVED	Reserved	R	0x0

Table 11-48. EMIF_SDRAM_CONFIG

Address Offset	0x0000 0008	Instance	EMIF
Physical Address	0x4C00 0008		
Description	SDRAM Config Register. A write to this register will cause the EMIF to start the SDRAM initialization sequence. CAUTION: This register is loaded with values by control module at device reset.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SDRAM_TYPE			IBANK_POS			DDR_TERM			DDR2_DDQS	DYN_ODT	DDR_DISABLE_DLL	SDRAM_DRIVE		CWL		NARROW_MODE	CL				ROWSIZE			IBANK		RESERVED	PAGESIZE				

Bits	Field Name	Description	Type	Reset
31:29	SDRAM_TYPE	SDRAM Type selection. This field is loaded from e-fuse. Set to 2 for DDR2 Set to 3 for DDR3 Set to 4 for LPDDR2 All other values are reserved. Please check the device data manual for supported DDR memory types.	RW	0x0
28:27	IBANK_POS	Internal bank position. See Section 11.2.4.12, SDRAM Address Mapping .	RW	0x0
26:24	DDR_TERM	DDR3 termination resistor value. Set to 0 to disable termination. For DDR3, set to 1 for RZQ/4, set to 2 for RZQ/2, set to 3 for RZQ/6, set to 4 for RZQ/12, and set to 5 for RZQ/8. All other values are reserved.	RW	0x0
23	DDR2_DDQS	Differential DQS enable. Set to 0 for single ended DQS (Not supported). Set to 1 for differential DQS.	RW	0
22:21	DYN_ODT	DDR3 Dynamic ODT. Not supported . Set to 0 to turn off dynamic ODT.	RW	0x0
20	DDR_DISABLE_DLL	Disable DLL select. Set to 1 to disable DLL inside SDRAM.	RW	0
19:18	SDRAM_DRIVE	SDRAM drive strength. For DDR2, set to 0 for normal, and set to 1 for weak drive strength. For DDR3, set to 0 for RZQ/6 and set to 1 for RZQ/7. All other values are reserved.	RW	0x0
17:16	CWL	DDR3 CAS Write latency. Value of 0, 1, 2, and 3 (CAS write latency of 5, 6, 7, and 8) are supported. Use the lowest value supported for best performance. All other values are reserved.	RW	0x0
15:14	NARROW_MODE	SDRAM data bus width. Set to 0 for 32-bit data bus width. Set to 1 for 16-bit data bus width. All other values are reserved.	RW	0x0

Bits	Field Name	Description	Type	Reset
13:10	CL	<p>CAS Latency (referred to as read latency (RL) in some SDRAM specs). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices.</p> <p>Values of 2, 3, 4 and 5 (CAS latency of 2, 3, 4 and 5) are supported for DDR2.</p> <p>Values of 2, 4, 6, 8, 10, 12 and 14 (CAS latency of 5, 6, 7, 8, 9, 10 and 11) are supported for DDR3.</p> <p>Values of 3, 4, 5, 6, 7, and 8 (CAS latency of 3, 4, 5, 6, 7, and 8) are supported for LPDDR2-SDRAM. The write latency (WL) is tied to the RL for the LPDDR2. See the LPDDR2 SDRAM standard.</p> <p>All other values are reserved.</p>	RW	0x0
9:7	ROWSIZE	<p>Row Size. Defines the number of row address bits of connected SDRAM devices.</p> <p>Set to 0 for 9 row bits, Set to 1 for 10 row bits, Set to 2 for 11 row bits, Set to 3 for 12 row bits, Set to 4 for 13 row bits, Set to 5 for 14 row bits, Set to 6 for 15 row bits, Set to 7 for 16 row bits.</p> <p>This field is only used when EMIF_SDRAM_CONFIG[28:27] IBANK_POS field is set to 1, 2, or 3 or EBANK_POS field in EMIF_SDRAM_CONFIG_2 register is set to 1.</p>	RW	0x0
6:4	IBANK	<p>Internal Bank setup. Defines number of banks inside connected SDRAM devices.</p> <p>Set to 0 for 1 bank, Set to 1 for 2 banks, Set to 2 for 4 banks, Set to 3 for 8 banks.</p> <p>All other values are reserved.</p>	RW	0x0
3	RESERVED		R	0
2:0	PAGESIZE	<p>Page Size. Table 11-52. EMIF_SDRAM_REFRESH_CONTROL

Address Offset	0x0000 0010	Instance	EMIF
Physical Address	0x4C00 0010		
Description	SDRAM Refresh Control Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
INITREF_DIS	RESERVED	SRT	ASR	RESERVED	PASR			RESERVED								REFRESH_RATE															

Bits	Field Name	Description	Type	Reset
31	INITREF_DIS	Initialization and Refresh disable. When set to 1, EMIF will disable SDRAM initialization and refreshes, but will carry out SDRAM write/read transactions.	RW	1
30	RESERVED		R	0
29	SRT	DDR3 Self Refresh temperature range. Set to 0 for normal operating temperature range and set to 1 for extended operating temperature range when the ASR field is set to 0. This bit must be set to 0 if the ASR field is set to 1. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0
28	ASR	DDR3 Auto Self Refresh enable. Set to 1 for auto Self Refresh enable. Set to 0 for manual Self Refresh reference indicated by the SRT field. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0
27	RESERVED		R	0
26:24	PASR	Partial Array Self Refresh. These bits get loaded into the Extended Mode Register of DDR3 during initialization. For DDR3, set to 0 for full array, set to 1 or 5 for 1/2 array, set to 2 or 6 for 1/4 array, set to 3 or 7 for 1/8 array, and set to 4 for 3/4 array to be refreshed. All other values are reserved. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0x0
23:16	RESERVED		R	0x00
15:0	REFRESH_RATE	Refresh Rate. Value in this field is used to define the rate at which connected SDRAM devices will be refreshed. SDRAM refresh rate = REFRESH_RATE / EMIF_PHY_FCLK. A 533-MHz DDR clock rate system that requires a 7.8 μ s refresh rate would need $7.8 \times 533 = 4157$ or 0x103D value to be written. To avoid lock-up situations, the programmer must not program REFRESH_RATE < (6 \times EMIF_SDRAM_TIMING_3[12:4] T_RFC). NOTE: The SDRAM refresh rate can be changed on-the-fly by writing to this field. When changing the SDRAM refresh rate all timing parameters that use the refresh rate value have to be recalculated. For example, tRASmax specified in the EMIF_SDRAM_TIMING_3[3:0] T_RAS_MAX field must be recalculated.	RW	0x0000

Table 11-64. EMIF_SDRAM_TIMING_3

Address Offset	0x0000 0028	Instance	EMIF
Physical Address	0x4C00 0028		
Description	SDRAM Timing 3 Register. If this register is byte written, care must be taken that all the fields are written before performing any accesses to the SDRAM.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T_PDLL_UL		RESERVED		T_CKESR	ZQ_ZQCS				T_TDGSKMAX	T_RFC				T_RAS_MAX																	

Bits	Field Name	Description	Type	Reset
31:28	T_PDLL_UL	Minimum number of DDR clock cycles for PHY DLL to unlock. A value of N will be equal to N x 128 clocks.	RW	0x0
27:24	RESERVED		R	0x0
23:21	T_CKESR	Minimum number of DDR clock cycles for which SDRAM must remain in Self Refresh, minus one.	RW	0x0
20:15	ZQ_ZQCS	Number of DDR clock cycles for a ZQCS command, minus one.	RW	0x00
14:13	T_TDQCKMAX	Number of DDR clock that satisfies tDQCKmax for LPDDR2, minus one.	RW	0x0
12:4	T_RFC	Minimum number of DDR clock cycles from Refresh or Load Mode to Refresh or Activate, minus one.	RW	0x000
3:0	T_RAS_MAX	Maximum number of REFRESH_RATE intervals from Activate to Precharge command. This field must be equal to ((tRASmax / tREFI)-1) rounded down to the next lower integer. Value for T_RAS_MAX can be calculated as follows: If tRASmax = 120 us and tREFI = 15.7 us, then T_RAS_MAX = ((120/15.7)-1) = 6.64. Round down to the next lower integer. Therefore, the programmed value must be 6.	RW	0x0

Table 11-100. EMIF_DLL_CALIB_CTRL

Address Offset	0x0000 0098	Instance	EMIF
Physical Address	0x4C00 0098		
Description	Control register to force idle window time to generate a phy_dll_calib that can be used for updating PHY DLLs during voltage ramps. NOTE: Should always be loaded via the shadow register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED												ACK_WAIT				RESERVED				DLL_CALIB_INTERVAL											

Bits	Field Name	Description	Type	Reset
31:20	RESERVED		R	0x000
19:16	ACK_WAIT	The ack_wait determines the required wait time after a phy_dll_calib is generated before another command can be sent. Value program is in terms of EMIF_FICLK cycle count. CAUTION: 5 must be the minimum value ever programmed.	RW	0x9
15:9	RESERVED		R	0x00

Bits	Field Name	Description	Type	Reset
8:0	DLL_CALIB_INTERVAL	This field determines the interval between phy_dll_calib generation. This value is multiplied by a precounter of 16 EMIF_FICLK cycles. Program this field one less the value you are targeting; program 1 to achieve interval of 2 (minimum interval supported). Programming zero turns off function. Note the final intervals between dll_calib generation is also a function of ACK_WAIT. Final periodic interval is calculated by: $((DLL_CALIB_INTERVAL + 1) \times 16) + ACK_WAIT$	RW	0x000

Table 11-126. EMIF_DDR_PHY_CONTROL_1

Address Offset	0x0000 00E4	Instance	EMIF
Physical Address	0x4C00 00E4		
Description	PHY control register 1		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0												
RESERVED								RESERVED				PHY_HALF_DELAYS				PHY_CLK_STALL_LEVEL				PHY_DIS_CALIB_RST				PHY_INVERT_CLKOUT				PHY_DLL_LOCK_DIFF				PHY_FAST_DLL_LOCK				RESERVED				READ_LATENCY			

Bits	Field Name	Description	Type	Reset
31:28	RESERVED	Reserved	RW	0x0
27	RDLVL_MASK	Writing a 1 to this field will mask read data eye training during full leveling command, plus drives reg_phy_use_rd_data_eye_level control low to allow user to use programmed ratio values.	RW	0
26	RDLVLGATE_MASK	Writing a 1 to this field will mask dqs gate training during full leveling command, plus drives reg_phy_use_rd_dqs_level control low to allow user to use programmed ratio values.	RW	0
25	WRLVL_MASK	Writing a 1 to this field will mask write leveling training during full leveling command, plus drives reg_phy_use_wr_level control low to allow user to use programmed ratio values.	RW	0
24:22	RESERVED	Reserved	RW	0x0
21	PHY_HALF_DELAYS	Adjust slave delay line delays to support 2x mode 1: 2x mode (MDLL clock is half the rate of PHY) 0: 1x mode (MDLL clock rate is same as PHY)	RW	0

Bits	Field Name	Description	Type	Reset
20	PHY_CLK_STALL_LEVEL	Enable variable idle value for delay lines. Enable during normal operations to avoid differential aging in the delay lines.	RW	0
19	PHY_DIS_CALIB_RST	Disable the dll_calib (internally generated) signal from resetting the Read Capture FIFO pointers and portions of data PHYs. Debug only. Note: dll_calib is generated by 1. EMIF_MISC_REG[0] DLL_CALIB_OS set to 1, or 2. by the PHY when it detects that the clock frequency variation has exceeded the bounds set by PHY_DLL_LOCK_DIFF or 3. periodically throughout the leveling process.	RW	0
18	PHY_INVERT_CLKOUT	Inverts the polarity of DRAM clock. 0: core clock is passed on to DRAM 1: inverted core clock is passed on to DRAM	RW	0
17:10	PHY_DLL_LOCK_DIFF	The maximum number of delay line taps variation while maintaining the master DLL lock. When the PHY is in locked state and the variation on the clock exceeds the variation indicated by this field, the lock signal is de-asserted and a dll_calib signal is generated. To prevent the dll_calib signal from being asserted in the middle of traffic when the clock jitter exceeds the variation, this register needs to be set to a value which will ensure that the lock will not be lost. Recommended value is 16.	RW	0x02
9	PHY_FAST_DLL_LOCK	Controls master DLL to lock fast or average logic must be part of locking process. Set to 1 before OPP transition commences, and set back to 0 after OPP transition completes. 1: MDLL lock is asserted based on single sample 0: MDLL lock is asserted based on average of 16 samples.	RW	0
8:5	RESERVED	Reserved	RW	0x00
4:0	READ_LATENCY	This field defines the read latency for the read data from SDRAM in number of DDR clock cycles. This field is used by the EMIF as well as the PHY. READ_LATENCY = RL + reg_phy_rdc_we_to_re - 1. EMIF uses above equation to calculate reg_phy_rdc_we_to_re and forward it to the PHY. For DDR3, the true RL is used, not the decoded value. See JEDEC spec. The write latency (WL) is tied to the RL for the LPDDR2. See the LPDDR2 SDRAM standard.	RW	0x01E

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																REG_PHY_RDC_FIFO_RST_ERR_CNT_CLR		REG_PHY_MDLL_UNLOCK_CLR		REG_PHY_FIFO_WE_IN_MISALIGNED_CLR		REG_PHY_WRLVL_NUM_OF_DQ0				REG_PHY_GATELVL_NUM_OF_DQ0					

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x0
10	REG_PHY_RDC_FIFO_RST_ERR_CNT_CLR	Clear/reset the phy_reg_rdc_fifo_rst_err_cnt, phy_reg_rdfifo_wrptr and phy_reg_rdfifo_rdptr status flags. A value of 0x1 clears the flag. A value of 0x0 has no effect.	RW	0x0
9	REG_PHY_MDLL_UNLOCK_CLR	Clears the phy_reg_status_mdll_unlock_sticky flag. A value of 0x1 clears the flag. A value of 0x0 has no effect.	RW	0x0
8	REG_PHY_FIFO_WE_IN_MISALIGNED_CLR	Clears the phy_reg_fifo_we_in_misaligned_sticky status flag. A value of 0x1 clears the flag. A value of 0x0 has no effect.	RW	0x0
7:4	REG_PHY_WRLVL_NUM_OF_DQ0	Determines the number of samples for <i>dq0_in</i> for each ratio increment by the write leveling finite state machine (hardware leveling). The minimum value supported is 3; however, the default setting of 7 is recommended. NOTE: In this case <i>dq0_in</i> represents all 8 DQ bits OR-ed together.	RW	0x7
3:0	REG_PHY_GATELVL_NUM_OF_DQ0	Determines the number of samples for <i>dq0_in</i> for each ratio increment by the gate training finite state machine (hardware leveling). The minimum value supported is 3; however, the default setting of 7 is recommended. NOTE: In this case <i>dq0_in</i> represents the corresponding DQS signal.	RW	0x7

11.3 General-Purpose Memory Controller

This section describes the features and functions of the device GPMC controller.

11.3.1 GPMC Overview

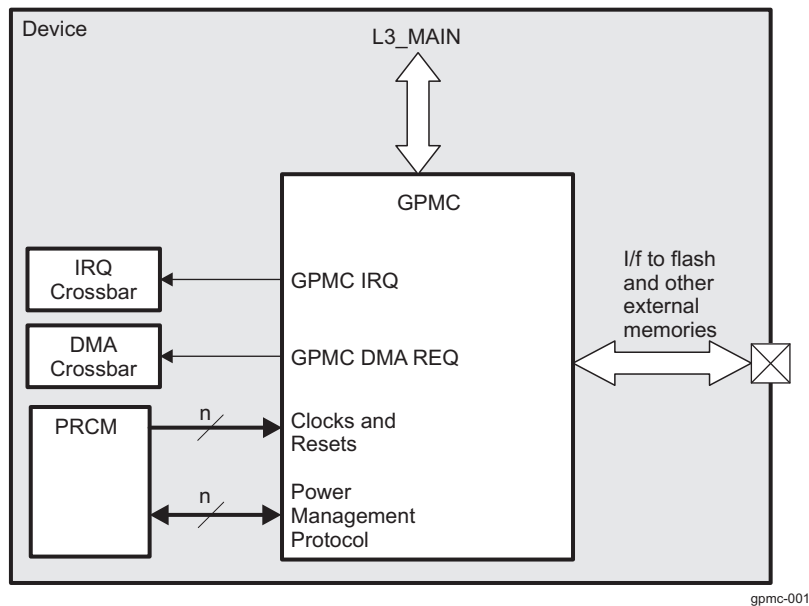

The general-purpose memory controller (GPMC) is a unified memory controller dedicated for interfacing with external memory devices like:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in nonmultiplexed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

Figure 11-11 shows the GPMC module overview.

The GPMC features are introduced in Section 11.1.2, *GPMC Overview* of Section 11.1, *Memory Subsystem Overview*.

Figure 11-11. GPMC Overview

11.3.2 GPMC Environment

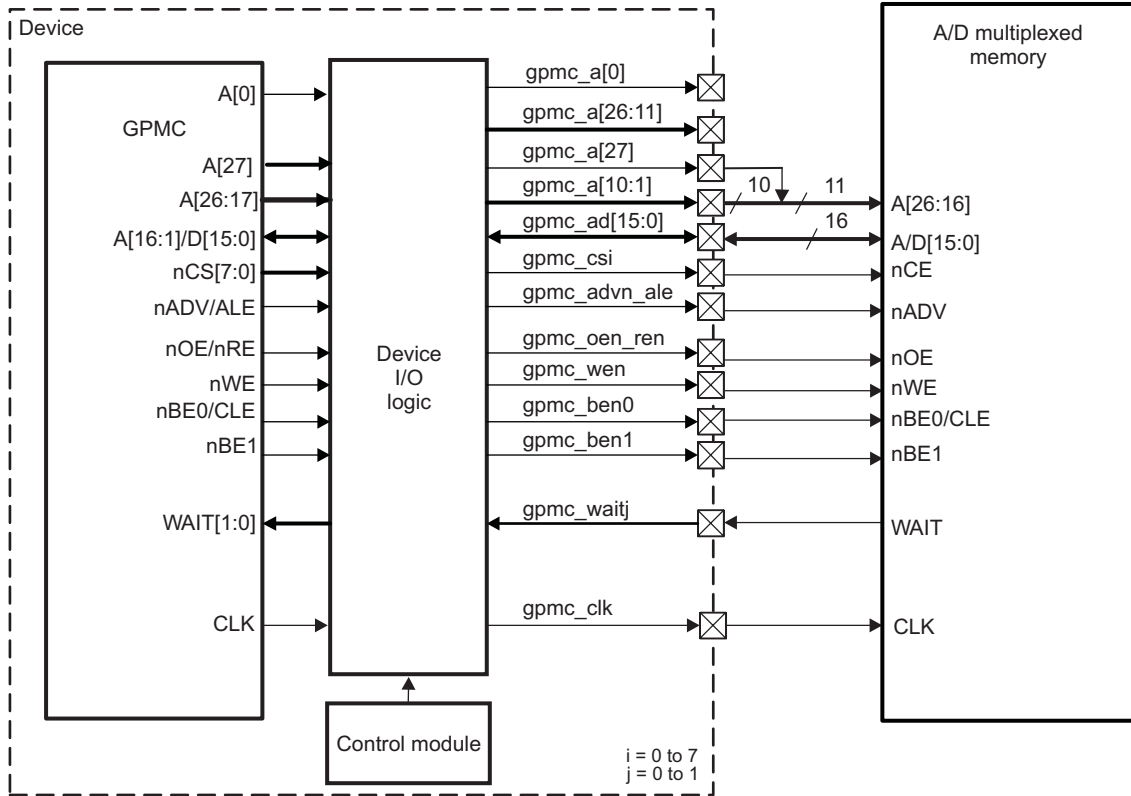

This section describes the GPMC application fields from an environment point of view (external connections). It describes GPMC connectivity options, and gives three possible interfaces.

11.3.2.1 GPMC Modes

This section shows three GPMC external connections options:

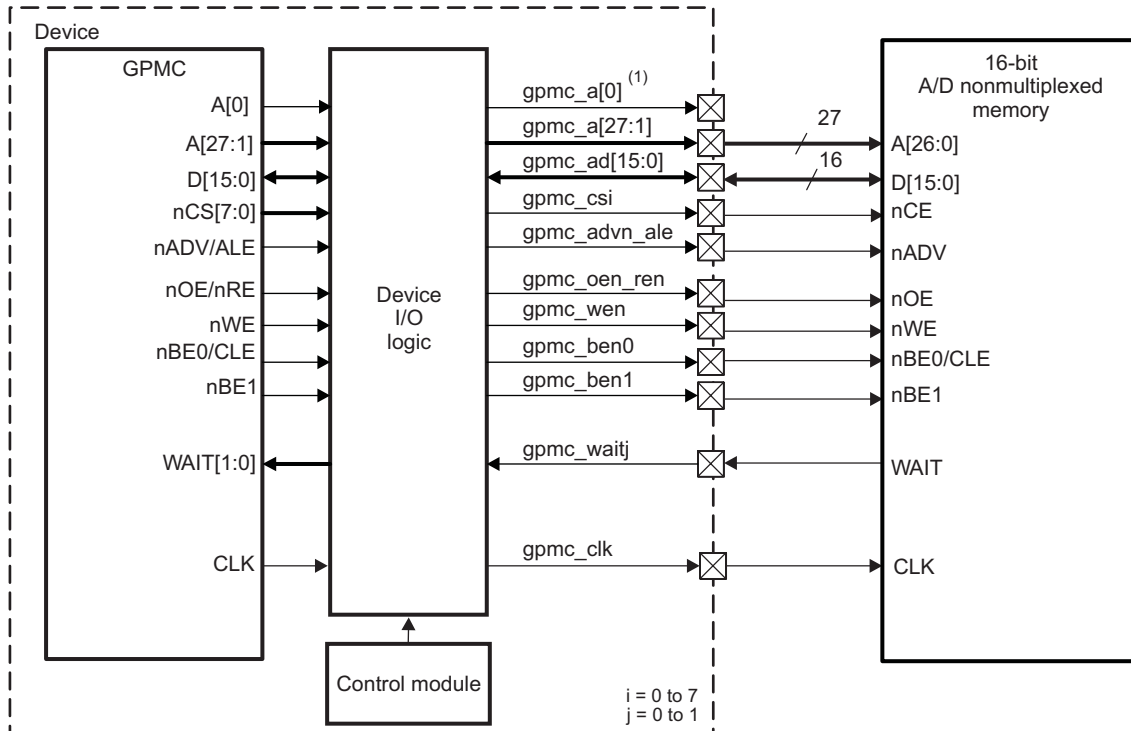

- Figure 11-12 shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol uses fewer address pins) external memory device.
- Figure 11-13 shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device.
- Figure 11-15 shows a connection between the GPMC and a 8-bit NAND device.

11.3.2.2 GPMC Signals

Table 11-358 lists the GPMC subsystem input/output (I/O) pins.

Table 11-358. GPMC I/O Description

Pin Name	Device Signal	I/O ⁽¹⁾	Description
A[27:0]	gpmc_a[27:0]	O	28-bit output address bus
A[16:1]/D[15:0]	gpmc_ad[15:0]	I/O	Multiplexed address/data
nCS[7:0]	gpmc_cs[7:0]	O	Chip-selects (active low)
CLK	gpmc_clk	O	Clock generated for the external memory or device
nADV/ALE	gpmc_advn_ale	O	Address valid (active low). Also used as address latch enable (active high) for NAND protocol memories.
nOE/nRE	gpmc_oen_ren	O	Output enable (active low). Also used as read enable (active low) for NAND protocol memories.
nWE	gpmc_wen	O	Write enable (active low)
nBE0/CLE	gpmc_ben0	O	Lower-byte enable (active low). Also used as command latch enable for NAND protocol memories.
nBE1	gpmc_ben1	O	Upper-byte enable (active low).
WAIT[1:0]	gpmc_wait[1:0]	I	External wait signal for NOR and NAND protocol memories. The wait signals can be mapped on any of the chip-select.

⁽¹⁾ I = Input; O = Output

NOTE: For the gpmc_clk signal to work properly, the INPUTENABLE bit of the appropriate CTRL_CORE_PAD_x register should be set to 0x1 because of retiming purposes.

Table 11-359 shows the use of address and data GPMC controller pins based on the type of external device.

Table 11-359. GPMC Pin Multiplexing Options

GPMC Pin	Multiplexed Address Data 16-Bit Device	Nonmultiplexed Address Data 16-Bit Device (complete 28-bit address range)	Nonmultiplexed Address Data 8-Bit Device (complete 28-bit address range)	16-Bit NAND Device	8-Bit NAND Device

gpmc_ad[0]	A1/D0	D0	D0	D0	D0

⁽¹⁾ Used to effectively address 8-bit (only) non-multiplexed memories

With all device types, the GPMC does not drive unnecessary address lines. They stay at their reset value of 0x00.

Address mapping supports address/data-multiplexed 16-bit-wide devices:

- The NOR flash memory controller still supports nonmultiplexed address and data memory devices.
- Multiplexing mode can be selected through the `GPMC_CONFIG1_i[9:8]` MUXADDDATA bit field (where $i = 0$ to 7).
- Asynchronous page mode is not supported for multiplexed address and data devices.

11.3.3 GPMC Integration

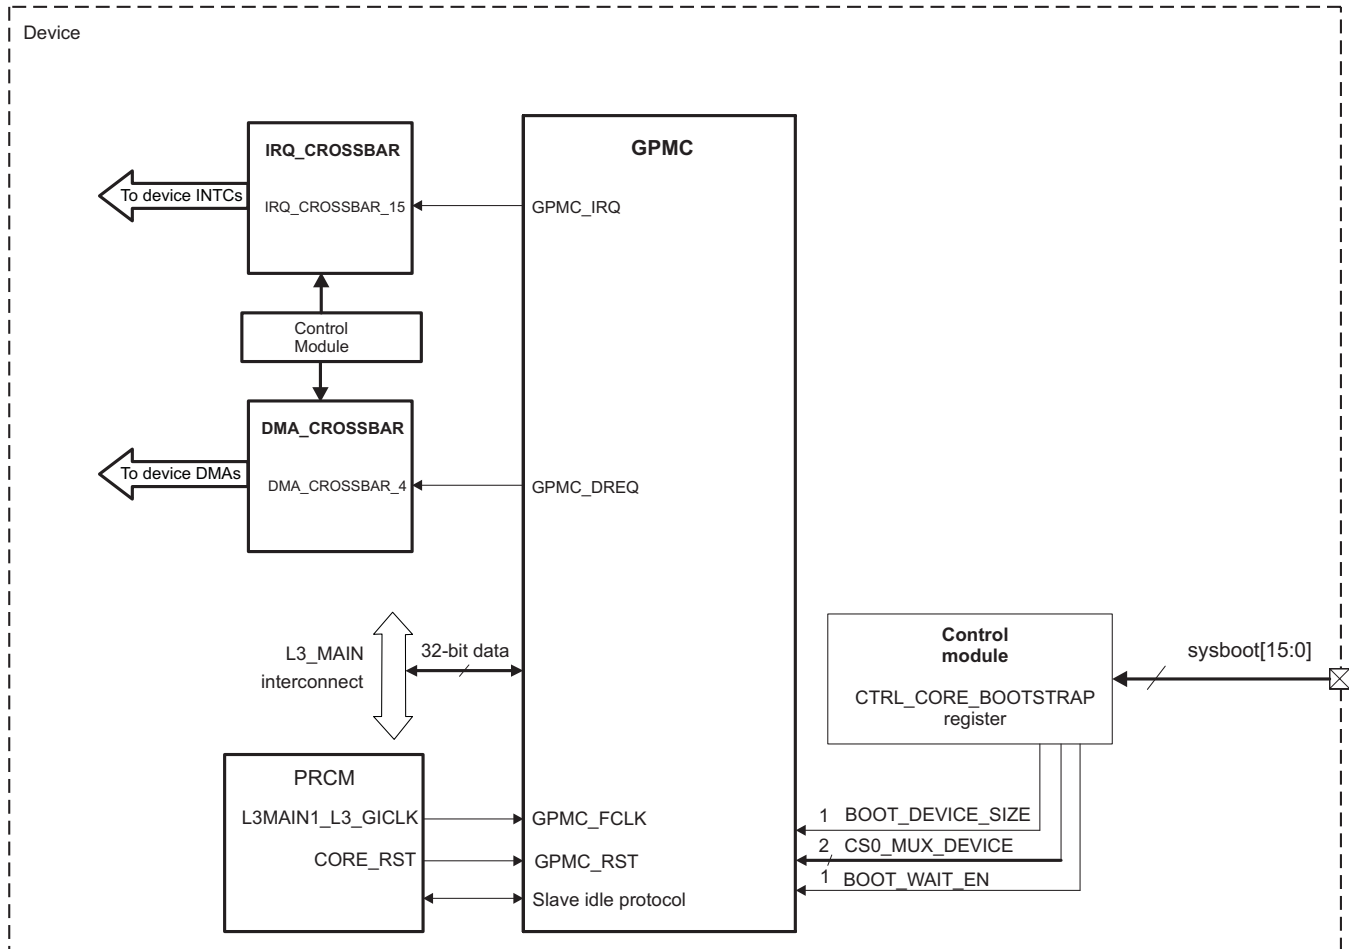

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- No master standby protocol
- Supports slave idle protocol with device PRCM
- Supports Auto Idle
- No wake-up request
- One direct memory access request mapped to the device DMA crossbar (`DMA_CROSSBAR`)

- One interrupt request mapped via the device interrupt crossbar (IRQ_CROSSBAR) to all device integrated interrupt controllers
- One clock for functional and interface domains

Figure 11-16 shows GPMC integration.

Figure 11-16. GPMC Integration

gpmc-004

Table 11-360, Table 11-361 and Table 11-362 summarize the integration of the module in the device.

Table 11-360. GPMC Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
GPMC	PD_COREAON	No	L3_MAIN

NOTE:

- For the description of the operation performance point (OPP) configuration, see [Section 3.1.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For information about frequencies associated with each OPP, see the device data manual.

Table 11-361. GPMC Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPMC	GPMC_FCLK	L3MAIN1_L3_GICLK	PRCM	Functional clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPMC	GPMC_RST	CORE_RET_RST	PRCM	GPMC reset

NOTE: For the clock description, see [Section 11.3.4.2, GPMC Clock Configuration](#).

Table 11-362. GPMC Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
GPMC	GPMC_IRQ	IRQ_CROSSBAR_15	DSP1_IRQ_46 DSP2_IRQ_46	GPMC interrupt

DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
GPMC	GPMC_DREQ	DMA_CROSSBAR_4	DMA_EDMA_DREQ_3	DMA request from GPMC prefetch engine.

NOTE: The “Default Mapping” column in [Table 11-362 GPMC Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively. For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the DMA_CROSSBAR module, see [Section 14.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#). For more information about the device EDMA module, see [Chapter 12, Enhanced DMA](#).

NOTE: For the description of the interrupt source, see [Section 11.3.4.5, GPMC Interrupt Requests](#).

11.3.4 GPMC Functional Description

The GPMC basic programming model offers maximum flexibility to support various access protocols for each of the eight configurable chip-selects. Use optimal chip-select settings, based on the characteristics of the external device:

- Different protocols can be selected to support generic asynchronous or synchronous random-access devices (NOR flash, SRAM) or to support specific NAND devices.
- The address and data bus can be multiplexed on the same external bus.
- Read and write access can be independently defined as asynchronous or synchronous.
- System requests (byte, 16-bit word, burst) are performed through single or multiple accesses. External access profiles (single, multiple with optimized burst length, native- or emulated-wrap) are based on external device characteristics (supported protocol, bus width, data buffer size, native-wrap support).
- System burst read or write requests are synchronous-burst (multiple-read or multiple-write). When neither burst nor page mode is supported by external memory or ASIC devices, system burst read or write requests are translated to successive single synchronous or asynchronous accesses (single reads or single writes). 8-bit wide devices are supported only in single synchronous or single asynchronous read or write mode.
- To simulate a programmable internal-wait-state, an external wait pin can be monitored to dynamically control external access at the beginning (initial access time) of and during a burst access.

Each control signal is controlled independently for each chip-select. The internal functional clock of the GPMC (GPMC_FCLK) is used as a time reference to specify the following:

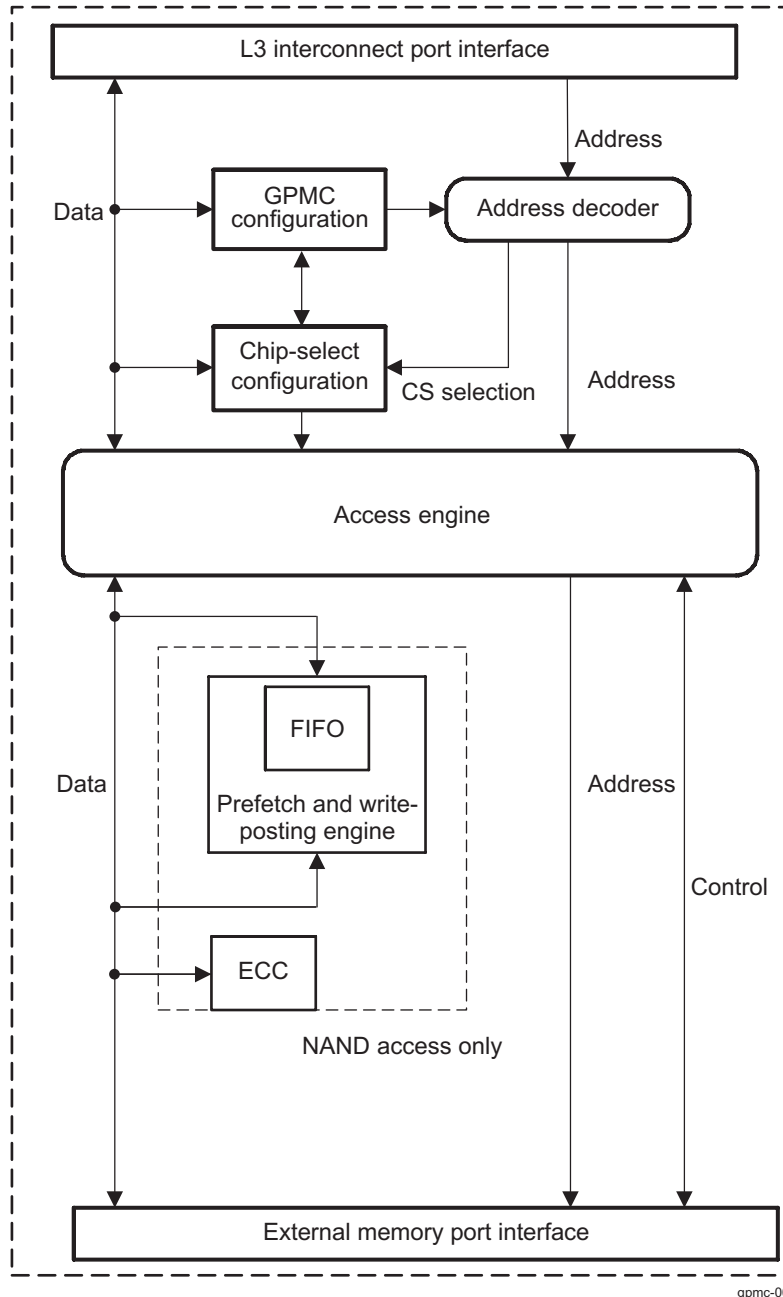

- Read- and write-access duration
- Most GPMC external interface control-signal assertion and deassertion times
- Data-capture time during read access
- External wait-pin monitoring time
- Duration of idle time between accesses, when required

11.3.4.1 GPMC Block Diagram

Figure 11-17 shows the GPMC functional block diagram. The GPMC consists of six blocks:

- L3 interconnect port interface
- Address decoder, GPMC configuration, and chip-select configuration register file
- Access engine
- Prefetch and write-posting engine
- Error correction code engine (ECC)
- External device/memory port interface

Figure 11-17. GPMC Block Diagram

The GPMC can access various external devices. The flexible programming model allows a wide range of attached device types and access schemes.

Based on the programmed configuration bit fields stored in the GPMC registers, the GPMC can generate the timing of all control signals depending on the attached device and access type.

Given the chip-select decoding and its associated configuration registers, the GPMC selects the appropriate control signal timing for the device type.

11.3.4.2 GPMC Clock Configuration

Table 11-363 describes the GPMC clocks.

Table 11-363. GPMC Clocks

Signal	I/O ⁽¹⁾	Description
GPMC_FCLK	I	Functional and interface clock
gpmc_clk	O	External clock provided to synchronous external memory devices

⁽¹⁾ I = Input; O = Output

The gpmc_clk is generated by the GPMC from the internal GPMC_FCLK clock. The source of the GPMC_FCLK is described in [Table 11-361](#). The gpmc_clk is configured using the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER bit field (where i = 0 to 7), as shown in [Table 11-364](#).

Table 11-364. gpmc_clk Configuration

Source Clock	GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER	gpmc_clk Generated Clock Provided to External Memory Device
GPMC_FCLK	00	GPMC_FCLK
	01	GPMC_FCLK/2
	10	GPMC_FCLK/3
	11	GPMC_FCLK/4

11.3.4.3 GPMC Software Reset

The GPMC can be reset by software through the [GPMC_SYSCONFIG\[1\]](#) SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Hardware and software resets initialize all GPMC registers and the finite state-machine (FSM) immediately and unconditionally. The [GPMC_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 1. Software must ensure that the software reset completes before performing GPMC operations.

11.3.4.4 GPMC Power Management

GPMC power is supplied by the CORE power domain, and GPMC power management complies with system power-management guidelines.

[Table 11-365](#) describes the power-management features available for the GPMC module.

NOTE:

- For information about source clock gating and sleep/wake-up transitions, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
 - For descriptions of the EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.6, Clock Management Functional Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).
-

Table 11-365. GPMC Local Power-Management Features

Feature	Registers	Description
Clock autogating	GPMC_SYSCONFIG[0] AUTOIDLE	This bit allows a local power optimization inside the module, by gating the GPMC_FCLK clock upon the internal activity.
Slave idle modes	GPMC_SYSCONFIG[4:3] SIDLEMODE	Force-idle, no-idle and smart-idle wake-up modes are available.
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	N/A	Feature not available

11.3.4.5 GPMC Interrupt Requests

The GPMC generates one interrupt request (see [Figure 11-16](#)).

[Table 11-366](#) lists the event flags, and their mask, that can cause module interrupts.

Table 11-366. GPMC Interrupt Events

Event Flag	Event Mask	Sensitivity	Description
GPMC_IRQSTATUS [9] WAIT1EDGE DETECTIONSTATUS	GPMC_IRQENABLE [9] WAIT1EDGE DETECTIONENABLE	Edge	Wait1 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait1 signal. The rising or falling edge detection of Wait1 is selected through the GPMC_CONFIG [9] WAIT1PINPOLARITY bit.
GPMC_IRQSTATUS [8] WAIT0EDGE DETECTIONSTATUS	GPMC_IRQENABLE [8] WAIT0EDGE DETECTIONENABLE	Edge	Wait0 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait0 signal. The rising or falling edge detection of Wait0 is selected through the GPMC_CONFIG [8] WAIT0PINPOLARITY bit.
GPMC_IRQSTATUS [1] TERMINAL COUNTSTATUS	GPMC_IRQENABLE [1] TERMINAL COUNTENABLE	Level	Terminal count event: Triggered on prefetch process completion; that is, when the number of currently remaining data to be requested reaches 0
GPMC_IRQSTATUS [0] FIFOEVENTSTATUS	GPMC_IRQENABLE [0] FIFOEVENTENABLE	Level	FIFO event interrupt: Indicates available FIFO levels for write-posting mode and prefetch mode. GPMC_PREFETCH_CONFIG1 [2] DMAMODE must be set to 0.

11.3.4.6 L3 Interconnect Interface

The GPMC L3 interconnect interface is a pipelined interface including a 16 × 32-bit word write buffer.

Any system host can issue external access requests through the GPMC.

The device system can issue the following requests through this interface:

- One 8-, 16-, or 32-bit interconnect access (read/write)
- Two incrementing 32-bit interconnect accesses (read/write)
- Two wrapped 32-bit interconnect accesses (read/write)
- Four incrementing 32-bit interconnect accesses (read/write)
- Four wrapped 32-bit interconnect accesses (read/write)
- Eight incrementing 32-bit interconnect accesses (read/write)
- Eight wrapped 32-bit interconnect accesses (read/write)

Only linear burst transactions are supported; interleaved burst transactions are not supported. Only power-of-two-length precise bursts 2 × 32, 4 × 32, 8 × 32, and 16 × 32, with the burst base address aligned on the total burst size, are supported (this limitation applies to incrementing bursts only).

This interface also provides one interrupt and one DMA request line for specific event control.

It is recommended to program the [GPMC_CONFIG1](#)_i[24:23] ATTACHEDDEVICEPAGELENGTH bit field according to the page length of the effective attached device and to enable the [GPMC_CONFIG1](#)_i[31] WRAPBURST bit if the attached device supports wrapping burst.

It is possible, however, to emulate wrapping burst on a nonwrapping memory by providing relevant addresses within the page or by splitting transactions. Bursts larger than the memory page length are chopped into multiple burst transactions. Because of the alignment requirements, a page boundary is never crossed.

11.3.4.7 GPMC Address and Data Bus

The current application supports GPMC connection to NAND devices and to address/data-multiplexed memories or devices. Connection to address/data-nonmultiplexed memories or devices is supported with an address range up to 256 MB (that is, 28 address bits in 8-bit mode or 27 address bits in 16-bit mode).

Depending on the GPMC configuration of each chip-select, address and data bus lines that are not required for a particular access protocol are not updated (changed from current value) and are not sampled when input (input data bus).

- For address/data-multiplexed and AAD-multiplexed NOR devices, the address is multiplexed on the data bus.
- 8-bit-wide NOR devices do not use GPMC I/O: gpmc_ad[15:8] for data (they are used for address if needed).
- 16-bit-wide NAND devices do not use GPMC I/O: gpmc_a[27:16].
- 8-bit-wide NAND devices do not use GPMC I/O: gpmc_a[27:16] and GPMC I/O: gpmc_ad[15:8].

11.3.4.7.1 GPMC I/O Configuration Setting

NOTE: In this section and the following sections, the *i* in GPMC_CONFIG*x*_*i* stands for the GPMC chip-select *i*, where *i* = 0 to 7.

To select a NAND device, program the following register fields:

- GPMC_CONFIG1_*i*[11:10] DEVICETYPE = 0b10
- GPMC_CONFIG1_*i*[9:8] MUXADDDATA = 0b00

To select an address/data-multiplexed device, program the following register fields:

- GPMC_CONFIG1_*i*[11:10] DEVICETYPE = 0b00
- GPMC_CONFIG1_*i*[9:8] MUXADDDATA = 0b10

To select an address/address/data-multiplexed device, program the following register fields:

- GPMC_CONFIG1_*i*[11:10] DEVICETYPE = 0b00
- GPMC_CONFIG1_*i*[9:8] MUXADDDATA = 0b01

To select an address/data-nonmultiplexed device, program the following register fields:

- GPMC_CONFIG1_*i*[11:10] DEVICETYPE = 0b00
- GPMC_CONFIG1_*i*[9:8] MUXADDDATA = 0b00

11.3.4.7.2 GPMC CS0 Default Configuration at Device Reset

To ensure a correct, fast external boot with a GPMC access on device reset, several pins are sampled:

- The "sysboot0" through "sysboot5" pins (device boundary) define the sequence of interfaces and devices to use for booting (i.e. SYSBOOT[5:0] vector). They are sampled by the control module at reset and used later by the device ROM code. For more information, see [Section 25.2.4, Sysboot Configuration](#), in [Chapter 25, Initialization](#).
- Additional pins are used to configure reset values in the GPMC_CONFIG1_*i* register (where *i* = 0) as explained in the following and in [Table 11-367](#):
 - The *bootdevicesize* input pin (at the GPMC boundary) defines the size of the attached device on chip-select 0 (CS0) and is used to configure the GPMC_CONFIG1_*i*[13:12] DEVICESIZE bit field (where *i* = 0). The BOOT_DEVICE_SIZE signal is propagated from the device Control Module. Its value 0b0 (8-bit memories) or 0b1 (16-bit memories) can be externally determined upon booting by **user hardware** via the device external input signal - "sysboot13".
 - The *cs0muxdevice* input pin (at the GPMC boundary) selects whether or not the device attached to CS0 is an address/data-multiplexed device. The input pin is used to configure the GPMC_CONFIG1_*i*[9:8] MUXADDDATA bit field (where *i* = 0). The CS0_MUX_DEVICE[1:0] signal is propagated from the Control Module. Its value 0x0 (**non-muxed memory attached**) or 0x2 (**Addr-Data Mux memory attached**) can be externally determined upon booting by **user hardware** via combining the device external input signals - "sysboot12" and "sysboot11", i.e. SYSBOOT[12:11].
 - The *bootwaiten* input pin (at the GPMC boundary) enables the monitoring on CS0 of the wait pin at device reset release time for read accesses. The input pin is used to configure the GPMC_CONFIG1_*i*[22] WAITREADMONITORING bit (where *i* = 0). The BOOT_WAIT_EN signal is

propagated from the Control Module. Its value 0x0 (**wait pin is not monitored for read accesses**) or 0x1 (**wait pin is monitored for read accesses**) can be externally determined upon booting by **user hardware** via the device external input signal - "sysboot10".

NOTE: If WAIT pin monitoring function is enabled upon booting (i.e. `BOOT_WAIT_EN="1"`), the default (power-on-reset) monitored input for CS0 is always the device `gpmc_wait0` input.

Table 11-367. Boot Control Interface Input Signals Description

Signal Name	Width	Description
BOOT_DEVICE_SIZE	1	Size of the device attached on CS0 0b00: 8-bit 0b01: 16-bit 0b10: Reserved (not used) 0b11: Reserved (not used)
CS0_MUX_DEVICE	2	Multiplexing mode of the device on CS0 0b00: Nonmultiplexed device on CS0 0b01: AAD-multiplexed device on CS0 (address-address-data) 0b10: Address/data-multiplexed device on CS0 0b11: Reserved
BOOT_WAIT_EN	1	Wait monitoring on CS0 at device reset release time for read accesses 0: Wait pin is not monitored 1: Wait pin is monitored

CAUTION

Using the internal boot code, the entire CS0 configuration can be modified before the first CS0 access. For more information, see [Section 25.8, Memory Booting](#), and [Section 25.9, Image Format](#), in [Chapter 25, Initialization](#). This modification of internal boot code is necessary for two external devices:

- NAND device attached to CS0
- Nonmultiplexed memory device attached to CS0

At reset time, the device can boot from the internal ROM.

The reset values of the timing control parameters are defined to cope with direct boot on address and data-multiplexed NOR flash devices, nonmultiplexed NOR flash devices, or any asynchronous device with large timing margins, assuming a low GPMC_FCLK frequency (for example, 19.2 MHz) at boot time.

For a multiplexed access, the address 16 low-order bits are presented onto `gpmc_ad[15:0]`, while the high-order bits are presented onto `gpmc_a[26:16]`. If the external chip interface to the memories uses a 16-bit data bus, the high-order address bits are sampled on the address bus.

The reset values of timing parameters used at boot time are:

- CSONTIME = 1
- CSRDOFFTIME = 16
- ADVONTIME = 4
- ADVRDOFFTIME = 5
- OEONTIME = 6
- OEOFFTIME = 16
- RDACCESSTIME = 15
- RDCYCLETIME = 17

For an AAD-multiplexed access, all address bits are passed onto the data bus using two nADV rising edges. The first rising edge latches the address most-significant bit (MSB) down to bit 17, while the second rising edge latches address bits 16 down to 1. This configuration is only used for 16-bit memories.

The reset values of these timing parameters used at boot time are:

- ADVAADMUXONTIME = 1
- ADVAADMUXRDOFFTIME = 2
- OEADMUXONTIME = 1
- OEADMUXRDOFFTIME = 3

11.3.4.8 Address Decoder and Chip-Select Configuration

Addresses are decoded accordingly with the address request of the chip-select and the content of the chip-select base address register file, which includes a set of global GPMC configuration registers and eight sets of chip-select configuration registers.

The GPMC configuration register file is memory-mapped and can be read or written with byte, 16-bit word, or 32-bit word accesses. The register file must be configured as a noncacheable, nonbufferable region to prevent any desynchronization between host execution (write request) and the completion of register configuration (write completed with register updated). [Section 11.3.7, GPMC Register Manual](#), provides the GPMC register locations. For the map of GPMC memory locations, see [Chapter 2, Memory Mapping](#).

After the chip-select is configured, the access engine accesses the external device, drives the external interface control signals, and applies the interface protocol based on user-defined timing parameters and settings.

11.3.4.8.1 Chip-Select Base Address and Region Size

Any external memory or ASIC device attached to the GPMC external interface can be accessed by any device system host within the GPMC 512-MiB contiguous address space. For more information, see [Chapter 2, Memory Mapping](#).

The GPMC 512-MiB address space can be divided into a maximum of eight chip-select regions with programmable base address and programmable chip-select size. The chip-select size is programmable from 16 MiB to 256 MiB (must be a power-of-two) and is defined by the mask field. Attached memory smaller than the programmed chip-select region size is accessed through the entire chip-select region (aliasing).

Each chip-select has a 6-bit base address encoding and 4-bit decoding mask, which must be programmed according to the following rules:

- The programmed chip-select region base address must be aligned on the chip-select region size address boundary and is limited to a power-of-two address value. During access decoding, the value of the register base address is used to compare the address with the address bit line mapping, as shown in [Figure 11-18](#) (with A0 as the device system byte-address line). The base address is programmed through the [GPMC_CONFIG7_i\[5:0\] BASEADDRESS](#) bit field.
- The register mask is used to exclude some address lines from the decoding. A register mask bit field set to 0 suppresses the associated address line from the address comparison (incoming address bit line is don't care). The value of the register mask must be limited to the subsequent value, based on the desired chip-select region size. Any other value has an undefined result. When multiple chip-select regions with overlapping addresses are enabled concurrently, access to these chip-select regions is cancelled and a GPMC access error is posted. The mask field is programmed through the [GPMC_CONFIG7_i\[11:8\] MASKADDRESS](#) bit field.

Figure 11-18. Chip-Select Address Mapping and Decoding Mask

gpmc-006

Chip-select configuration (base and mask address or any protocol and timing settings) must be performed while the associated chip-select is disabled through the `GPMC_CONFIG7_i[6]` CSVALID bit (where *i* stands for the GPMC chip-select value, 0 to 7). In addition, a chip-select configuration can be disabled only if there is no ongoing access to that chip-select. This requires monitoring the activity of the prefetch or write-posting engine if the engine is active on the chip-select. Also, the write buffer state must be monitored to wait for any posted write completion to the chip-select.

Any access attempted to a nonvalid GPMC address region (CSVALID disabled or address decoding outside a valid chip-select region) is not propagated to the external interface and a GPMC access error is posted. In case of overlapping chip-selects, an error is generated and no access occurs on either chip-select.

CS0 is the only chip-select region enabled after a power up or GPMC reset.

CAUTION

Although the GPMC interface can drive up to eight chip-selects, the frequency specified for this interface is for a specific load. If this load is exceeded, the maximum frequency cannot be reached. One solution is to implement a board with buffers to allow the slowest device to maintain the total load on the lines.

11.3.4.8.2 Access Protocol

11.3.4.8.2.1 Supported Devices

The access protocol of each chip-select can be independently specified through the `GPMC_CONFIG1_i[11:10]` DEVICETYPE parameter (where *i* = 0 to 7) for:

- Random-access synchronous or asynchronous memory, such as NOR flash and SRAM
- NAND flash asynchronous devices

NOTE: For more information about the NAND flash GPMC basic programming model and NAND support, see [Section 11.3.4.12, NAND Device Basic Programming Model](#), and [Section 11.3.4.12.1, NAND Memory Device in Byte or Word16 Stream Mode](#).

11.3.4.8.2.2 Access Size Adaptation and Device Width

Each chip-select can be independently configured through the [GPMC_CONFIG1_i\[13:12\]](#) DEVICESIZE bit field (where $i = 0$ to 7) to interface with a 16- or 8-bit-wide device. System requests with data width greater than the external device data bus width are split into successive accesses according to the external device data-bus width and little-endian data organization.

11.3.4.8.2.3 Address/Data-Multiplexing Interface

For random synchronous or asynchronous memory interfacing (DEVICETYPE = 0b00), an address- and data-multiplexing protocol can be selected through the [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit field (where $i = 0$ to 7). The nADV signal must be used as the external device address latch control signal. For the associated chip-select configuration, nADV assertion and deassertion time and nOE assertion time must be set to the appropriate value to meet the address latch setup/hold time requirements of the external device. See [Section 11.3.3](#), *GPMC Integration*.

NOTE: This address/data-multiplexing interface is not applicable to NAND device interfacing. NAND devices require a specific address, command, and data-multiplexing protocol. See [Section 11.3.4.12](#), *NAND Device Basic Programming Model*.

11.3.4.8.3 External Signals

NOTE: The "DIR" (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

11.3.4.8.3.1 Wait Pin Monitoring Control

GPMC access time can be dynamically controlled using an external gpmc_wait pin when the external device access time is not deterministic and cannot be defined and controlled using only the GPMC internal RDACCESSTIME, WRACCESSTIME, and PAGEBURSTACCESSTIME wait-state generator.

The GPMC features two input wait pins: gpmc_wait1, and gpmc_wait0. These pins allow control of external devices with different wait pin polarity. They also allow the overlap of wait pin assertion from different devices without affecting access to devices for which the wait pin is not asserted.

- The [GPMC_CONFIG1_i\[17:16\]](#) WAITPINSELECT bit field (where $i = 0$ to 7) selects which input gpmc_wait pin is used for the device attached to the corresponding chip-select.
- The polarity of the wait pin is defined through the WAITxPINPOLARITY bit of the [GPMC_CONFIG](#) register. A wait pin configured to be active low means that low level on the WAIT signal indicates that the data is not ready and that the data bus is invalid. When a wait pin is inactive, data is valid.

The GPMC access engine can be configured per chip-select to monitor or not the wait pin of the external memory device, based on the access type: read or write.

- The [GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bit defines whether or not the wait pin must be monitored during read accesses.
- The [GPMC_CONFIG1_i\[21\]](#) WAITWRITEMONITORING bit defines whether or not the wait pin must be monitored during write accesses.

The GPMC access engine can be configured to monitor the wait pin of the external memory device asynchronously or synchronously with the GPMC_CLK clock, depending on the access type: synchronous or asynchronous (the [GPMC_CONFIG1_i\[29\]](#) READTYPE and [GPMC_CONFIG1_i\[27\]](#) WRITETYPE bits).

11.3.4.8.3.1.1 Wait Monitoring During Asynchronous Read Access

When wait pin monitoring is enabled for read accesses (WAITREADMONITORING), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state.

During asynchronous read accesses with wait pin monitoring enabled, the wait pin must be at a valid level (asserted or deasserted) for at least two GPMC clock cycles before RDACCESSTIME completes, to ensure correct dynamic access-time control through wait pin monitoring. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

In this context, RDACCESSTIME is used as a wait invalid timing window and is set to such a value that the wait pin is at a valid state two GPMC clock cycles before RDACCESSTIME completes.

Similarly, during a multiple-access cycle (for example, asynchronous read page mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-deasserted state. Wait monitoring pipelining is also applicable to multiple accesses (access within a page).

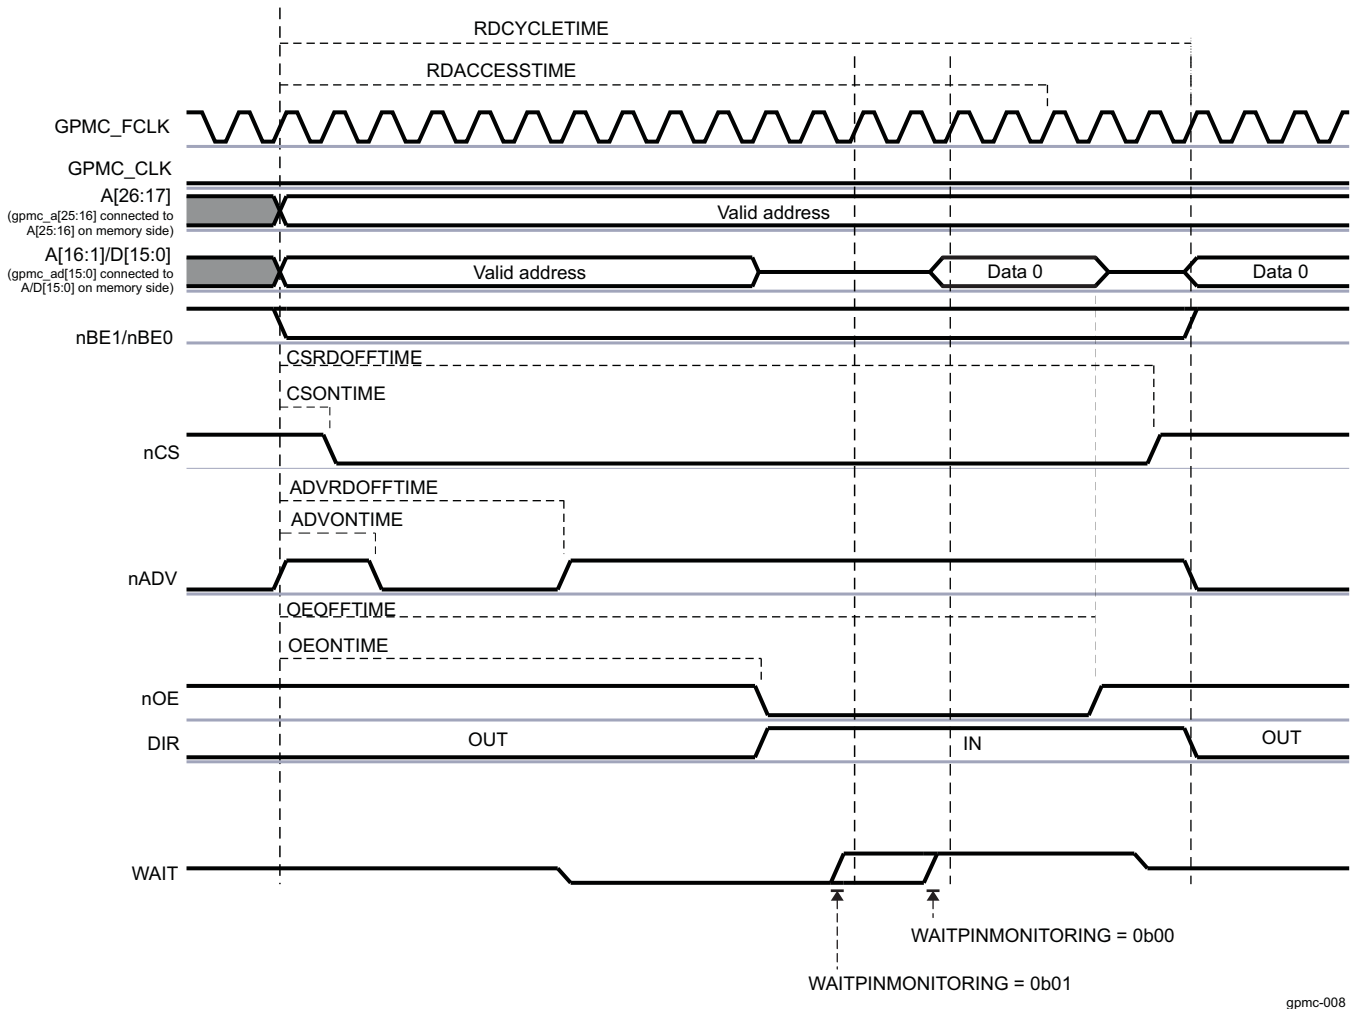

- Wait monitored as active freezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, wait monitored as asserted extends the current access time in the page. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- Wait monitored as inactive unfreezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, wait monitored as inactive completes the current access time and starts the next access phase in the page. The data bus is considered valid, and data are captured during this clock cycle. In case of a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their related control timing value and according to the CYCLETIME counter status.

When a delay larger than two GPMC clocks must be observed between wait-pin deactivation time and data valid time (including the required GPMC and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data-capture time and the effective unlock of the CYCLETIME counter. This extra delay can be programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME bit field (where i = 0 to 7).

NOTE:

- The WAITMONITORINGTIME parameter does not delay the wait pin active or inactive detection, nor does it modify the two GPMC clocks pipelined detection delay.
 - This extra delay is expressed as a number of GPMC_CLK clock cycles, even though the access is defined as asynchronous, and no GPMC_CLK clock is provided to the external device. Still, because GPMCFCLKDIVIDER is used as a divider for the GPMC clock, it must be programmed to define the correct WAITMONITORINGTIME delay.
-

[Figure 11-19](#) shows wait behavior during an asynchronous single read access.

Figure 11-19. Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1)

gpmc-008

NOTE: The WAIT signal is active low. [GPMC_CONFIG1_i\[19:18\] WAITMONITORINGTIME = 0b00](#), or [0b01](#).

11.3.4.8.3.1.2 Wait Monitoring During Asynchronous Write Access

When wait pin monitoring is enabled for write accesses ([GPMC_CONFIG1_i\[21\] WAITWRITEMONITORING](#) bit = 0x1), the wait invalid timing window is defined by the WRACCESSTIME field. WRACCESSTIME must be set so that the wait pin is at a valid state two GPMC clock cycles before WRACCESSTIME completes. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

- Wait monitored as active freezes the CYCLETIME counter. This informs the GPMC that the data bus is not captured by the external device. The control signals are kept in their current state. The data bus still drives the data.
- Wait monitored as inactive unfreezes the CYCLETIME counter. This informs that the data bus is correctly captured by the external device. All signals, including the data bus, are controlled according to their related control timing value and to the CYCLETIME counter status.

When a delay larger than two GPMC clock cycles must be observed between wait-pin deassertion time and the effective data write into the external device (including the required GPMC data setup time and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data write time into the external device and the effective unfreezing of the CYCLETIME counter. This extra delay can be programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME bit field (where $i = 0$ to 7).

NOTE:

- The WAITMONITORINGTIME parameter does not delay the wait pin assertion or deassertion detection, nor does it modify the two GPMC clock cycles pipelined detection delay.
 - This extra delay is expressed as a number of GPMC_CLK clock cycles, even though the access is defined as asynchronous, and even though no clock is provided to the external device. Still, because the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER bit field is used as a divider for the GPMC clock, it must be programmed to define the correct WAITMONITORINGTIME delay.
-

11.3.4.8.3.1.3 Wait Monitoring During Synchronous Read Access

During synchronous accesses with wait pin monitoring enabled, the wait pin is captured synchronously with GPMC_CLK, using the rising edge of this clock.

The WAIT signal can be programmed to apply to the same clock cycle in which it is captured. Alternatively, it can be sampled one or two GPMC_CLK cycles ahead of the clock cycle to which it applies. This pipelining is applicable to the entire burst access and to all data phases in the burst access. This wait pipelining depth is programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME bit field (where $i = 0$ to 7), and is expressed as a number of GPMC_CLK clock cycles.

In synchronous mode, when wait pin monitoring is enabled (the [GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bit), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state detection.

Depending on the programmed value of WAITMONITORINGTIME, the wait pin must be at a valid level, either asserted or deasserted:

- In the same clock cycle the data is valid if WAITMONITORINGTIME = 0 (at RDACCESSTIME completion)
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC_FCLK clock cycles before RDACCESSTIME completion if WAITMONITORINGTIME is not equal to 0

Similarly, during a multiple-access cycle (burst mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the WAIT-INACTIVE state. The wait pipelining-depth programming applies to the whole burst access.

- Wait monitored as active freezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in a lock state), wait monitored as active extends the current access time in the burst. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- Wait monitored as inactive unfreezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in lock state), wait monitored as inactive completes the current access time and starts the next access phase in the burst. The data bus is considered valid, and data are captured during this clock cycle. In a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their relative control timing value and the CYCLETIME counter status.

[Figure 11-20](#) shows wait behavior during a synchronous read burst access.

Figure 11-20. Wait Behavior During a Synchronous Read Burst Access

gpmc-009

NOTE: The WAIT signal is active low. WAITMONITORINGTIME = 00, 01.

11.3.4.8.3.1.4 Wait Monitoring During Synchronous Write Access

During synchronous accesses with wait pin monitoring enabled (the WAITWRITEMONITORING bit), the wait pin is captured synchronously with GPMC_CLK, using the rising edge of this clock.

If enabled, external wait pin monitoring can be used in combination with WRACCESSTIME to delay the GPMC_CLK capture edge of the effective memory device.

Wait-monitoring pipelining depth is similar to synchronous read access:

- At WRACCESSTIME completion if WAITMONITORINGTIME = 0
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC_FCLK cycles before WRACCESSTIME completion if WAITMONITORINGTIME is not equal to 0

Wait-monitoring pipelining definition applies to whole burst accesses:

- Wait monitored as active freezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, wait monitored as active indicates that the data

bus is not being captured by the external device. Control signals are kept in their current state. The data bus is kept in its current state.

- Wait monitored as inactive unfreezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, wait monitored as inactive indicates the effective data capture of the bus by the external device and starts the next access of the burst. In case of a single access or if this was the last access in a multiple access cycle, all signals, including the data bus, are controlled according to their related control timing value and the CYCLETIME counter status.

NOTE: Wait monitoring is supported for all configurations except `GPMC_CONFIG1_i[19:18]` `WAITMONITORINGTIME = 0x0` (where `i = 0` to `7`) for write bursts with a clock divider of `1` or `2` (the `GPMC_CONFIG1_i[1:0]` `GPMCFCLKDIVIDER` bit field is equal to `0x0` or `0x1`, respectively).

11.3.4.8.3.1.5 Wait With NAND Device

For information about the use of the wait pin for communication with a NAND flash external device, see [Section 11.3.4.12.2, NAND Device-Ready Pin](#).

11.3.4.8.3.1.6 Idle Cycle Control Between Successive Accesses

11.3.4.8.3.1.6.1 Bus Turnaround (BUSTURNAROUND)

To prevent data-bus contention, an access that follows a read access to a slow memory/device must be delayed (in other words, control the nCS/nOE deassertion to data bus in high-impedance delay).

The bus turnaround is a time-out counter starting after nCS or nOE deassertion time, whichever occurs first, and delays the next access start-cycle time. The counter is programmed through the `GPMC_CONFIG6_i[3:0]` `BUSTURNAROUND` bit field (where `i = 0` to `7`).

After a read access to a chip-select with a nonzero `BUSTURNAROUND`, the next access is delayed until the `BUSTURNAROUND` delay completes, if the next access is one of the following:

- A write access to any chip-select (the same or different chip-select from which the data was read)
- A read access to a different chip-select than the chip-select from which the data was read access
- A read or write access to a chip-select associated with an address/data-multiplexed device

NOTE: Bus keeping starts after bus turnaround completion so that `DIR` changes from `IN` to `OUT` after bus turnaround. The bus does not have enough time to go into high-impedance even though it can be driven with the same value before bus turnaround timing.

`BUSTURNAROUND` delay runs in parallel with `GPMC_CONFIG6_i[3:0]` `CYCLE2CYCLEDELAY` bit field delays. `BUSTURNAROUND` is a timing parameter for the ending chip-select access, while `CYCLE2CYCLEDELAY` is a timing parameter for the following chip-select access. The effective minimum delay between successive accesses is driven by these delay timing parameters and by the access type of the following access (see [Figure 11-21](#) through [Figure 11-23](#)).

Another way to prevent bus contention is to define an earlier nCS or nOE deassertion time for slow devices or to extend the value of `RDCYCLETIME`. Doing this prevents bus contention, but it also affects all accesses of this specific chip-select.

gpmc-051

11.3.4.8.3.1.6.2 Idle Cycles Between Accesses to Same Chip-Select (CYCLE2CYCLESAMECSSEN, CYCLE2CYCLEDELAY)

Some devices require a minimum chip-select signal inactive time between accesses. The [GPMC_CONFIG6_i\[7\]](#) CYCLE2CYCLESAMECSSEN bit (where $i = 0$ to 7) enables insertion of a minimum number of GPMC_FCLK cycles, defined by the [GPMC_CONFIG6_i\[11:8\]](#) CYCLE2CYCLEDELAY bit field, between successive accesses of any type (read or write) to the same chip-select.

If CYCLE2CYCLESAMECSSEN is enabled, any subsequent access to the same chip-select is delayed until its CYCLE2CYCLEDELAY completes. The CYCLE2CYCLEDELAY counter starts when CSRDOFFTIME/CSWROFFTIME completes.

The same applies to successive accesses occurring during 32-bit word or burst accesses split into successive single accesses when the single-access mode is used ([GPMC_CONFIG1_i\[30\]](#) READMULTIPLE = 0 or [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE = 0).

All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC.FCLK cycles. This prevents back-to-back accesses to the same chip-select without idle cycles between accesses.

11.3.4.8.3.1.6.3 Idle Cycles Between Accesses to Different Chip-Select (CYCLE2CYCLEDIFFCSSEN, CYCLE2CYCLEDELAY)

Because of the pipelined behavior of the system, successive accesses to different chip-selects can occur back-to-back with no idle cycles between accesses. Depending on the control signals (nCS, nADV/ALE, nBE0/CLE, nOE/RE, nWE) assertion and deassertion timing parameters and on the device timing parameters, the assertion times of some control signals may overlap between the successive accesses to a different chip-select. Similarly, some control signals (WE, OE/RE) may not respect required transition times.

To work around overlapping and to observe the required control-signal transitions, a minimum of CYCLE2CYCLEDELAY inactive cycles is inserted between the access being initiated to this chip-select and the previous access ending for a different chip-select. This applies to any type of access (read or write).

If the [GPMC_CONFIG6_i\[6\]](#) CYCLE2CYCLEDIFFCSEN bit is enabled, the chip-select access is delayed until CYCLE2CYCLEDELAY cycles have expired since the end of a previous access to a different chip-select. CYCLE2CYCLEDELAY count starts at CSRDOFFTIME/CSWROFFTIME completion. All control signals are kept inactive during the idle GPMC_FCLK cycles.

NOTE: CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDIFFCSEN must be set in the [GPMC_CONFIG6_i](#) registers to get idle cycles inserted between accesses on this chip-select and after accesses to a different chip-select, respectively.

The CYCLE2CYCLEDELAY delay runs in parallel with the BUSTURNAROUND delay. The BUSTURNAROUND is a timing parameter defined for the ending chip-select access, whereas CYCLE2CYCLEDELAY is a timing parameter defined for the starting chip-select access. The effective minimum delay between successive accesses is based on the larger delay timing parameter and on access type combination, because bus turnaround does not apply to all access types. For more information about bus turnaround, see [Section 11.3.4.8.3.1.6.1, Bus Turnaround \(BUSTURNAROUND\)](#).

[Table 11-368](#) describes the configuration required for idle cycle insertion.

Table 11-368. Idle Cycle Insertion Configuration

1st Access Type	BUSTURN AROUND Timing Parameter	Second Access Type	Chip-Select	Add/Data Multiplexed	CYCLE2 CYCLE SAMECSEN Parameter	CYCLE2 CYCLE DIFFCSEN Parameter	Idle Cycle Insertion Between the Two Accesses
R/W	= 0	R/W	Any	Any	0	x	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Same	Nonmuxed	x	0	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Different	Nonmuxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	R/W	Any	Muxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	W	Any	Any	0	0	BUSTURNAROUND cycles are inserted.
W	> 0	R/W	Any	Any	0	0	No idle cycles are inserted if the two accesses are well pipelined.
R/W	= 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted.
R/W	= 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted.
R/W	> 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is max (BUSTURNAROUND, CYCLE2CYCLEDELAY).
R/W	> 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is maximum (BUSTURNAROUND, CYCLE2CYCLEDELAY).

11.3.4.8.3.1.7 Slow Device Support (TIMEPARAGRANULARITY Parameter)

All access-timing parameters can be multiplied by 2 by setting the [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY bit (where i stands for the GPMC chip-select value, 0 to 7). Increasing all access timing parameters allows support of slow devices.

11.3.4.8.3.2 Reset

No reset signal is sent to the external memory device by the GPMC. For more information about external-device reset, see [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module provides an input pin, `global_rst_n`, to the GPMC:

- The `global_rst_n` pin is activated during device warm reset and cold reset.
- The `global_rst_n` pin initializes the internal state-machine and the internal configuration registers.

11.3.4.8.3.3 Byte Enable (`nBE1/nBE0`)

Byte enable signals (`nBE1/nBE0`) are:

- Valid (asserted or nonasserted according to the incoming system request) from access start to access completion for asynchronous and synchronous single accesses
- Asserted low from access start to access completion for asynchronous and synchronous multiple read accesses
- Valid (asserted or nonasserted, according to the incoming system request) synchronously to each written data for synchronous multiple write accesses

11.3.4.8.4 Error Handling

When an error occurs in the GPMC, the error information is stored in the [GPMC_ERR_TYPE](#) register and the address of the illegal access is stored in the [GPMC_ERR_ADDRESS](#) register. The GPMC keeps only the first error abort information until the [GPMC_ERR_TYPE](#) register is reset. Subsequent accesses that cause errors are not logged until the error is cleared by hardware with the [GPMC_ERR_TYPE\[0\]](#) `ERRORVALID` bit.

- `ERRORNOTSUPPADD` occurs when an incoming system request address decoding does not match any valid chip-select region, or if two chip-select regions are defined as overlapped, or if a register file access is tried outside the valid address range of 1KiB.
- `ERRORNOTSUPPMCMD` occurs when an unsupported command request is decoded at the L3 interconnect interface.
- `ERRORTIMEOUT`: A time-out mechanism prevents the system from hanging. The start value of the 9-bit time-out counter is defined in the [GPMC_TIMEOUT_CONTROL](#) register and enabled with the [GPMC_TIMEOUT_CONTROL\[0\]](#) `TIMEOUTENABLE` bit. When enabled, the counter starts at start-cycle time until it reaches 0 and data is not responded to from memory, and then a time-out error occurs. When data are sent from memory, this counter is reset to its start value. With multiple accesses (asynchronous page mode or synchronous burst mode), the counter is reset to its start value for each data access within the burst.

The GPMC does not generate interrupts on these errors. An interrupt generation is handled at interconnect level.

11.3.4.9 Timing Setting

The GPMC offers maximum flexibility to support various access protocols. Most of the timing parameters of the protocol access used by the GPMC to communicate with attached memories or devices are programmable on a chip-select basis. Assertion and deassertion times of control signals are defined to match the attached memory or device timing specifications and to get maximum performance during accesses. For more information about `GPMC_CLK` and `GPMC_FCLK` see [Section 11.3.4.9.6, GPMC_CLK](#).

NOTE: In the following sections, the start access time refers to the time at which the access begins.

11.3.4.9.1 Read Cycle Time and Write Cycle Time (RDCYCLETIME / WRCYCLETIME)

The `GPMC_CONFIG5_i[4:0]` RDCYCLETIME and `GPMC_CONFIG5_i[12:8]` WRCYCLETIME bit fields (where $i = 0$ to 7) define the address bus and byte-enable valid times for read and write accesses. To ensure a correct duty cycle of GPMC_CLK between accesses, RDCYCLETIME and WRCYCLETIME are expressed in GPMC_FCLK cycles and must be multiples of the GPMC_CLK cycle. The RDCYCLETIME and WRCYCLETIME bit fields can be set with a granularity of 1 or 2 through the `GPMC_CONFIG1_i[4]` TIMEPARAGRANULARITY bit.

When RDCYCLETIME or WRCYCLETIME completes, if they are not already deasserted, all control signals (`nCS`, `nADV/ALE`, `nOE/RE`, `nWE`, and `BE0/CLE`) are deasserted to their reset values, regardless of their deassertion time parameters.

An exception to this forced deassertion occurs when a pipelined request to the same chip-select or to a different chip-select is pending. In such a case, it is not necessary to deassert a control signal with deassertion time parameters equal to the cycle-time parameter. This exception to forced deassertion prevents any unnecessary glitches. This requirement also applies to BE signals, thus avoiding an unnecessary BE glitch transition when pipelining requests.

NOTE: All control signals (`CS`, `ADV#/ALE`, `BE0#/CLE`, `WE#`, and `GPMC.CLK`) are kept inactive (`ADV#/ALE`, `BE0#/CLE`, and `GPMC.CLK` at low level; and `CS`, `OE#/RE`, and `WE` at high level) during the idle GPMC_FCLK cycles.

If no inactive cycles are required between successive accesses to the same chip-select or a different chip-select (`GPMC_CONFIG6_i[7]` CYCLE2CYCLESAMECSEN = 0 or `GPMC_CONFIG6_i[6]` CYCLE2CYCLEDIFFCSEN = 0, where $i = 0$ to 7), and if assertion-time parameters associated with the pipelined access are equal to 0, asserted control signals (`nCS`, `nADV/ALE`, `nBE0/CLE`, `nWE`, and `nOE/RE`) are kept asserted. This applies to any read/write to read/write access combination.

If inactive cycles are inserted between successive accesses (that is, `CYCLE2CYCLESAMECSEN = 1` or `CYCLE2CYCLEDIFFCSEN = 1`), the control signals are forced to their respective default reset values for the number of GPMC_FCLK cycles defined in `CYCLE2CYCLEDELAY`.

11.3.4.9.2 nCS: Chip-Select Signal Control Assertion/Deassertion Time (CSONTIME / CSRDOFFTIME / CSWROFFTIME / CSEXTRADELAY)

The `GPMC_CONFIG2_i[3:0]` CSONTIME bit field (where $i = 0$ to 7) defines the nCS signal-assertion time relative to the start access time. It is common for read and write accesses.

The `GPMC_CONFIG2_i[12:8]` CSRDOFFTIME (read access) and `GPMC_CONFIG2_i[20:16]` CSWROFFTIME (write access) bit fields define the nCS signal deassertion time relative to start access time.

The CSONTIME, CSRDOFFTIME, and CSWROFFTIME parameters apply to synchronous and asynchronous modes. CSONTIME can be used to control an address and byte-enable setup time before chip-select assertion. CSRDOFFTIME and CSWROFFTIME can be used to control an address and byte-enable hold time after chip-select deassertion.

nCS signal transitions, as controlled through CSONTIME, CSRDOFFTIME, and CSWROFFTIME, can be delayed by a half-GPMC_FCLK period by enabling the `GPMC_CONFIG2_i[7]` CSEXTRADELAY bit. This half-GPMC_FCLK period provides more granularity on the nCS assertion and deassertion time to ensure proper setup and hold time relative to GPMC_CLK. CSEXTRADELAY is especially useful in configurations where GPMC_CLK and GPMC_FCLK have the same frequency, but it can also be used for all GPMC configurations. If enabled, CSEXTRADELAY applies to all parameters that control nCS transitions.

The CSEXTRADELAY bit must be used carefully to avoid control signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than the nCS signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

11.3.4.9.3 nADV/ALE: Address Valid/Address Latch Enable Signal Control Assertion/Deassertion Time (ADVONTIME / ADVRDOFFTIME / ADVWROFFTIME /

ADVEXTRADELAY/ADVAADMUXONTIME/ADVAADMUXRDOFFTIME/ADVAADMUXWROFFTIME)

The [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field (where $i = 0$ to 7) defines the nADV/ALE signal-assertion time relative to start access time. It is common to read and write accesses.

The [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME (read access) and [GPMC_CONFIG3_i\[20:16\]](#) ADVWROFFTIME (write access) bit fields define the nADV/ALE signal-deassertion time relative to start access time.

ADVONTIME can be used to control an address and byte-enable valid setup time control before nADV/ALE assertion. ADVRDOFFTIME and ADVWROFFTIME can be used to control an address and byte-enable valid hold time control after nADV/ALE deassertion. ADVRDOFFTIME and ADVWROFFTIME apply to synchronous and asynchronous modes.

The nADV/ALE signal transitions as controlled through ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME can be delayed by a half-GPMC_FCLK period by enabling the [GPMC_CONFIG3_i\[7\]](#) ADVEXTRADELAY bit. This half-GPMC_FCLK period provides more granularity on nADV/ALE assertion and deassertion time to ensure proper setup and hold time relative to GPMC_CLK. The ADVEXTRADELAY configuration parameter is especially useful in configurations where GPMC_CLK and GPMC_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, ADVEXTRADELAY applies to all parameters controlling nADV/ALE transitions.

ADVEXTRADELAY must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than nADV/ALE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

[GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME, [GPMC_CONFIG3_i\[26:24\]](#) ADVAADMUXRDOFFTIME, and [GPMC_CONFIG3_i\[30:28\]](#) ADVAADMUXWROFFTIME parameters have the same functions as ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME, but apply to the first address phase in the AAD-multiplexed protocol. The user must ensure that ADVAADMUXxxOFFTIME is programmed to a value less than or equal to ADVxxOFFTIME. Functionality in AAD-multiplexed mode is undefined if the settings do not comply with this requirement. ADVAADMUXxxOFFTIME can be programmed to the same value as ADVONTIME if no high nADV pulse is needed between the two AAD-multiplexed address phases, which is the typical case in synchronous mode. In this configuration, nADV is kept low until it reaches the correct ADVxxOFFTIME.

For more information about the use of ADVONTIME, ADVRDOFFTIME, ADVWROFFTIME, and ADVAADMUXRDOFFTIME and ADVAADMUXWROFFTIME for command latch enable (CLE) and address latch enable (ALE) use for a NAND flash interface, see [Section 11.3.4.12, NAND Access Description](#).

11.3.4.9.4 nOE/nRE: Output Enable/Read Enable Signal Control Assertion/Deassertion Time (OEONTIME / OEOFFTIME / OEEXTRADELAY / OEAADMUXONTIME / OEAADMUXOFFTIME)

The [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME bit field (where $i = 0$ to 7) defines the nOE/nRE signal assertion time relative to start access time. It applies only to read accesses.

The [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME bit field defines the nOE/nRE signal deassertion time relative to start access time. It applies only to read accesses. nOE/nRE is not asserted during a write cycle.

The OEONTIME, OEOFFTIME, OEAADMUXONTIME, and OEAADMUXOFFTIME parameters apply to synchronous and asynchronous modes. OEONTIME can be used to control an address and byte enable valid setup time control before nOE/nRE assertion. OEOFFTIME can be used to control an address and byte-enable valid hold time control after nOE/nRE assertion.

The OEAADMUXONTIME and OEAADMUXOFFTIME parameters have the same functions as OEONTIME and OEOFFTIME, but apply to the first OE assertion in the AAD-multiplexed protocol for a read phase, or to the only OE assertion for a write phase. The user must ensure that OEAADMUXOFFTIME is programmed to a value less than OEONTIME. Functionality in AAD-multiplexed mode is undefined if the settings do not comply with this requirement. OEAADMUXOFFTIME must never be equal to OEONTIME because the AAD-multiplexed protocol requires a second address phase with the nOE signal deasserted before nOE can be asserted again to define a read command.

The nOE/RE signal transitions as controlled through OEONTIME, OEOFFTIME, OEAADMUXONTIME, and OEAADMUXOFFTIME can be delayed by a half-GPMC_FCLK period by enabling the [GPMC_CONFIG4_j\[7\]](#) OEEXTRADELAY bit. This half-GPMC_FCLK period provides more granularity on the nOE/RE assertion and deassertion time to ensure proper setup and hold time relative to GPMC_CLK. If enabled, OEEXTRADELAY applies to all parameters controlling nOE/nRE transitions.

OEEXTRADELAY must be used carefully, to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program RDCYCLETIME and WRCYCLETIME to be greater than the nOE/RE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

NOTE: When the GPMC generates a read access to an address-/data-multiplexed device, it drives the address bus until nOE assertion time.

11.3.4.9.5 nWE: Write Enable Signal Control Assertion/Deassertion Time (WEONTIME / WEOFFTIME / WEEXTRADELAY)

The [GPMC_CONFIG4_i\[19:16\]](#) WEONTIME bit field (where $i = 0$ to 7) defines the nWE signal-assertion time relative to start access time. The [GPMC_CONFIG4_i\[28:24\]](#) WEOFFTIME bit field defines the nWE signal-deassertion time relative to start access time. These bit fields apply only to write accesses. nWE is not asserted during a read cycle.

WEONTIME can be used to control an address and byte-enable valid setup time control before nWE assertion. WEOFFTIME can be used to control an address and byte-enable valid hold time control after nWE assertion.

nWE signal transitions as controlled through WEONTIME, and WEOFFTIME can be delayed by a half-GPMC_FCLK period by enabling the [GPMC_CONFIG4_j\[23\]](#) WEEXTRADELAY bit. This half-GPMC_FCLK period provides more granularity on nWE assertion and deassertion time to ensure proper setup and hold time relative to GPMC_CLK. If enabled, WEEXTRADELAY applies to all parameters controlling nWE transitions.

The WEEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the WRCYCLETIME bit field to be greater than the nWE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

11.3.4.9.6 GPMC_CLK

GPMC_CLK is the external clock provided to the attached synchronous memory or device.

- The GPMC_CLK clock frequency is the GPMC_FCLK functional clock frequency divided by 1, 2, 3, or 4, depending on the [GPMC_CONFIG1_j\[1:0\]](#) GPMCFCLKDIVIDER bit field (where $i = 0$ to 7), with a guaranteed 50-percent duty cycle. For information about the duty cycle error, see the device data manual.
- The GPMC_CLK clock is activated only when the access in progress is defined as synchronous (read or write access).
- The [GPMC_CONFIG1_j\[26:25\]](#) CLKACTIVATIONTIME bit field (where $i = 0$ to 7) defines the number of GPMC_FCLK cycles from start access time to GPMC_CLK activation.
- The GPMC_CLK clock is stopped when cycle time completes and is asserted low between accesses.
- The GPMC_CLK clock is kept low when access is defined as asynchronous.

CAUTION

When the cycle time completes, the GPMC_CLK may be high because of the GPMCFCLKDIVIDER bit field. To ensure correct stoppage of the GPMC_CLK clock within the required 50-percent duty cycle, the user must extend the RDCYCLETIME or WRCYCLETIME value.

NOTE: To ensure a correct external clock cycle, the following rules must be applied:

- (RDCYCLETIME CLKACTIVATIONTIME) must be a multiple of (GPMCFCLKDIVIDER + 1).
- The PAGEBURSTACCESSTIME value must be a multiple of (GPMCFCLKDIVIDER + 1).

11.3.4.9.7 GPMC_CLK and Control Signals Setup and Hold

Control-signal transition (assertion and deassertion) setup and hold values with respect to the GPMC_CLK edge can be controlled in the following ways:

- For the GPMC_CLK signal, the [GPMC_CONFIG1_i\[26:25\]](#) CLKACTIVATIONTIME bit field (where i = 0 to 7) allows setup and hold control of control-signal assertion time.
- The use of a divided GPMC_CLK allows setup and hold control of the control-signal assertion and deassertion times.
- When GPMC_CLK runs at the GPMC_FCLK frequency so that GPMC_CLK edge and control-signal transitions refer to the same GPMC_FCLK edge, the control-signal transitions can be delayed by a half-GPMC_FCLK period to provide minimum setup and hold times. This half-GPMC_FCLK delay is enabled with the CSEXTRADelay, ADVEXTRADelay, OEXTRADelay, or WEEXTRADelay parameter. This delay must be used carefully to prevent control-signal overlap between successive accesses to different chip-selects. This implies that the RDCYCLETIME and WRCYCLETIME are greater than the last control-signal deassertion time, including the extra half-GPMC_FCLK cycle.

11.3.4.9.8 Access Time (RDACCESSTIME / WRACCESSTIME)

The read/write access time durations can be programmed independently through the [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME and [GPMC_CONFIG6_i\[28:24\]](#) WRACCESSTIME bit fields (where i = 0 to 7). This allows nOE and GPMC data-capture timing parameters to be independent of nWE and memory device data capture timing parameters. The RDACCESSTIME and WRACCESSTIME bit fields can be set with a granularity of 1 or 2 through the [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY bit.

11.3.4.9.8.1 Access Time on Read Access

In asynchronous read mode, for single and paged accesses, the [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME bit field (where i = 0 to 7) defines the number of GPMC_FCLK cycles from start access time to the GPMC_FCLK rising edge used for the first data capture. RDACCESSTIME must be programmed to the rounded greater value (in GPMC_FCLK cycles) of the read access time of the attached memory device.

In synchronous read mode, for single or burst accesses, RDACCESSTIME defines the number of GPMC_FCLK cycles from the start access time to the GPMC_FCLK rising edge corresponding to the GPMC_CLK rising edge used for the first data capture.

GPMC_CLK, which is sent to the memory device for synchronization with the GPMC controller, is internally retimed to correctly latch the returned data. The [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME bit field must be greater than RDACCESSTIME to let the GPMC latch the last return data using the internally retimed GPMC_CLK.

The external WAIT signal can be used in conjunction with RDACCESSTIME to control the effective GPMC data-capture GPMC_FCLK edge on read access in asynchronous and synchronous modes. For more information about wait monitoring, see [Section 11.3.4.8.3.1, Wait Pin Monitoring Control](#).

11.3.4.9.8.2 Access Time on Write Access

In asynchronous write mode, the [GPMC_CONFIG6_i\[28:24\]](#) WRACCESSTIME timing parameter is not used to define the effective write access time. Instead, it is used as a wait invalid timing window and must be set to a correct value so that the gpmc_wait pin is at a valid state two GPMC_CLK cycles before WRACCESSTIME completes. For more information about wait monitoring, see [Section 11.3.4.8.3.1, Wait Pin Monitoring Control](#).

In synchronous write mode, for single or burst accesses, WRACCESSTIME defines the number of GPMC_FCLK cycles from the start access time to the GPMC_CLK rising edge used by the memory device for the first data capture.

The external WAIT signal can be used in conjunction with WRACCESSTIME to control the effective memory device data-capture GPMC_CLK edge for a synchronous write access. For more information about wait monitoring, see [Section 11.3.4.8.3.1, Wait Pin Monitoring Control](#).

11.3.4.9.9 Page Burst Access Time (PAGEBURSTACCESSTIME)

The [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME bit field (where $i = 0$ to 7) can be set with a granularity of 1 or 2 through the [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY bit.

11.3.4.9.9.1 Page Burst Access Time on Read Access

In asynchronous page read mode, the delay between successive word captures in a page is controlled through the PAGEBURSTACCESSTIME bit field. The PAGEBURSTACCESSTIME parameter must be programmed to the rounded greater value (in GPMC_FCLK cycles) of the read access time of the attached device.

In synchronous burst read mode, the delay between successive word captures in a burst is controlled through the PAGEBURSTACCESSTIME bit field.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective GPMC data-capture GPMC_FCLK edge on read access. For more information about wait monitoring, see [Section 11.3.4.8.3.1, Wait Pin Monitoring Control](#).

11.3.4.9.9.2 Page Burst Access Time on Write Access

Asynchronous page write mode is not supported. PAGEBURSTACCESSTIME is irrelevant in this case.

In synchronous burst write mode, PAGEBURSTACCESSTIME controls the delay between successive memory device word captures in a burst.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective memory device data capture GPMC_CLK edge in synchronous write mode. For more information about wait monitoring, see [Section 11.3.4.8.3.1, Wait Pin Monitoring Control](#).

11.3.4.9.10 Bus Keeping Support

At the end cycle time of a read access, if no other access is pending, the GPMC drives the bus with the last data read after RDCYCLETIME completes to prevent bus floating and reduce power consumption.

After a write access, if no other access is pending, the GPMC keeps driving the data bus after WRCYCLETIME completes with the same data to prevent bus floating and power consumption.

11.3.4.10 NOR Access Description

For each chip-select configuration, the read access can be specified as asynchronous or synchronous access through the [GPMC_CONFIG1_i\[29\]](#) READTYPE bit (where $i = 0$ to 7). For each chip-select configuration, the write access can be specified as synchronous or asynchronous access through the [GPMC_CONFIG1_i\[27\]](#) WRITETYPE bit where ($i = 0$ to 7).

Asynchronous and synchronous read and write access time and related control signals are controlled through timing parameters that refer to GPMC_FCLK. The primary difference of synchronous mode is the availability of a configurable clock interface (GPMC_CLK) to control the external device. Synchronous mode also affects data-capture and wait-pin monitoring schemes in read access.

For more information about asynchronous and synchronous access, see the descriptions of GPMC_CLK, RdAccessTime, WrAccessTime, and wait pin monitoring.

For more information about timing-parameter settings, see the sample timing diagrams in this chapter.

NOTE: The address bus and nBE[1:0] are fixed for the duration of a synchronous burst read access, but they are updated for each beat of an asynchronous page-read access.

11.3.4.10.1 Asynchronous Access Description

This section describes:

- Asynchronous single-read operation on an address/data multiplexed device
- Asynchronous single write operation on an address/data-multiplexed device
- Asynchronous single read operation on an AAD-multiplexed device
- Asynchronous single write operation on an AAD-multiplexed device
- Asynchronous multiple (page) read operation on a non-multiplexed device

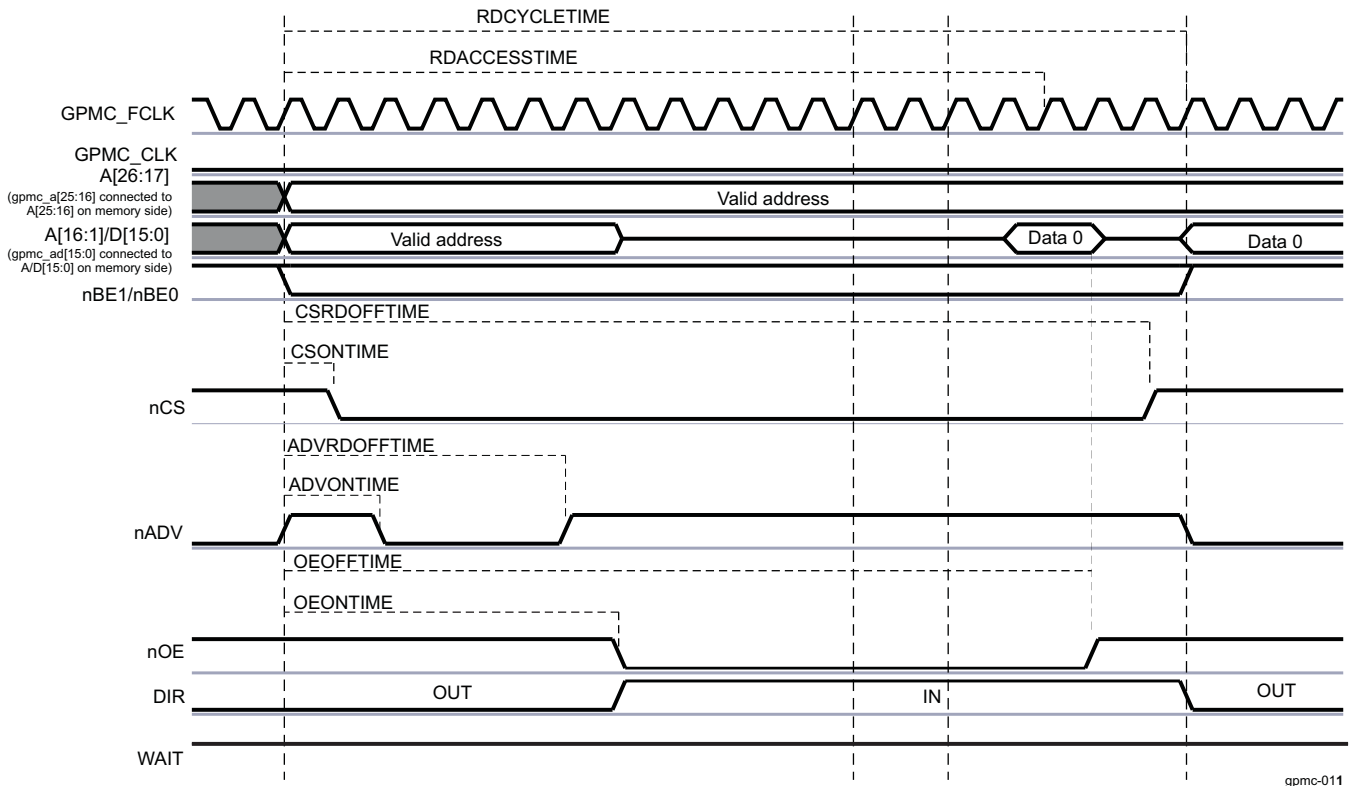

In asynchronous operations GPMC_CLK is not provided outside the GPMC and is kept low.

11.3.4.10.1.1 Access on Address/Data Multiplexed Devices

11.3.4.10.1.1.1 Asynchronous Single-Read Operation on an Address/Data Multiplexed Device

Figure 11-24 shows an asynchronous single read operation on an address/data-multiplexed device.

Figure 11-24. Asynchronous Single Read on an Address/Data-Multiplexed Device

For formulas to calculate timing parameters, see [Section 11.3.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 11-400](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single-read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For more information, see [Section 11.3.4.8.2.3, Address/Data-Multiplexing Interface](#).

Address bits (A[16:1] from a GPMC perspective, A[15:0] from an external device perspective) are placed on the address/data bus, and the remaining address bits gpmc_a[27:16] are placed on the address bus. The address phase ends at nOE assertion, when the DIR signal goes from OUT to IN.

- Chip-select signal nCS:
 - nCS assertion time is controlled by the [GPMC_CONFIG2_i\[3:0\] CSONTIME](#) bit field. It controls the address setup time to nCS assertion.
 - nCS deassertion time is controlled by the [GPMC_CONFIG2_i\[12:8\] CSRDOFFTIME](#) bit field. It controls the address hold time from nCS deassertion.
- Address valid signal nADV:
 - nADV assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\] ADVONTIME](#) bit field.
 - nADV deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\] ADVRDFFTIME](#) bit field.
- Output enable signal nOE:
 - nOE assertion indicates a read cycle.
 - nOE assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\] OEONTIME](#) bit field.
 - nOE deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\] OEOFFTIME](#) bit field.

- Read data is latched when RDACCESSTIME completes. Access time is defined in the [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME bit field.
- Direction signal DIR: DIR goes from OUT to IN at the same time that nOE is asserted.
- The end of the access is defined by the [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME parameter.

In the GPMC, when a 16-bit wide device is attached to the controller, a 32-bit word write access is split into two 16-bit word write accesses. For more information about GPMC access size and type adaptation, see [Section 11.3.4.10.5, System Burst Versus External Device Burst Support](#).

Between two successive accesses, if an nCS pulse is needed:

- The [GPMC_CONFIG6_i\[11:8\]](#) CYCLE2CYCLEDELAY bit field can be programmed with the [GPMC_CONFIG6_i\[7\]](#) CYCLE2CYCLESAMECSSEN bit enabled.
- The CSWROFFTIME and CSONTIME parameters also allow a chip-select pulse, but this affects all other types of access.

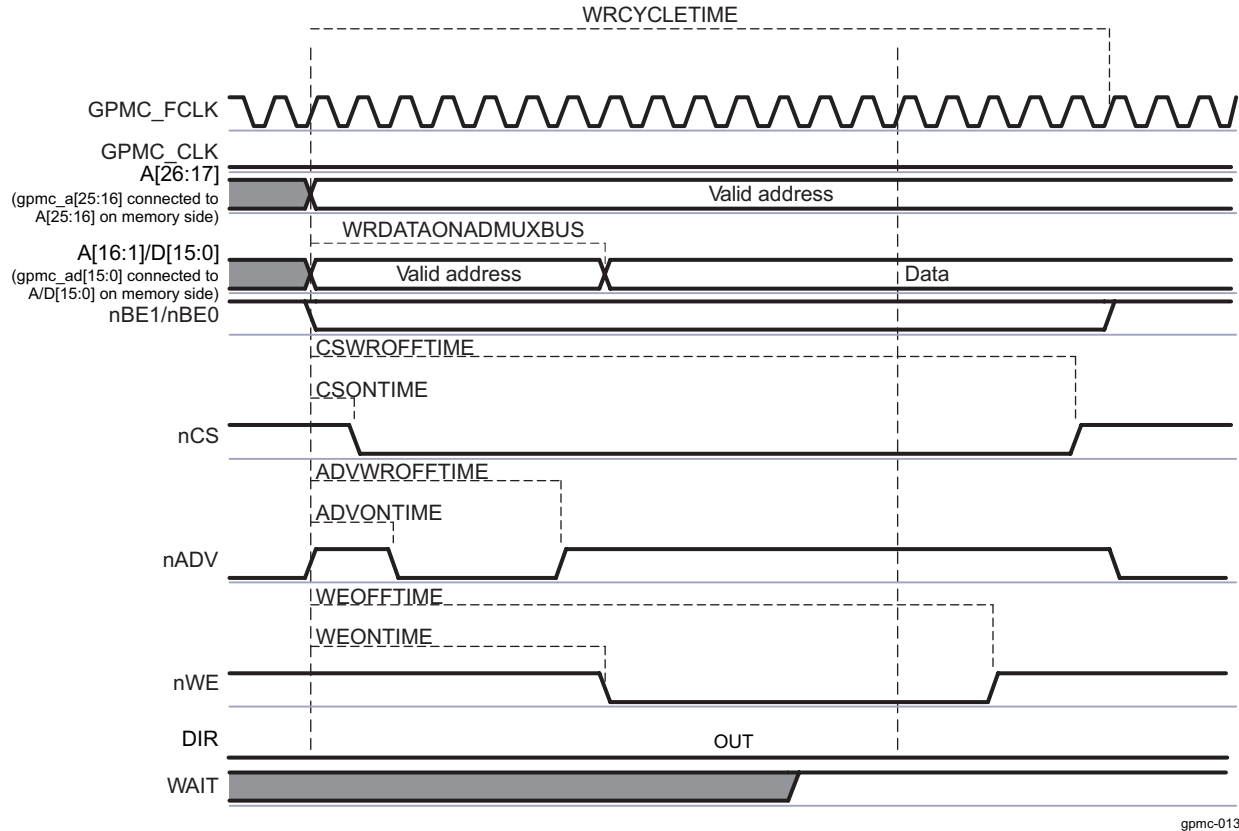

Figure 11-25. Two Asynchronous Single-Read Accesses on an Address/Data-Multiplexed Device (32-Bit Read Split Into 2 x 16-Bit Read)

gpmc-044

11.3.4.10.1.2 Asynchronous Single-Write Operation on an Address/Data-Multiplexed Device

Figure 11-26 shows an asynchronous single-write operation on an address/data-multiplexed device.

Figure 11-26. Asynchronous Single-Write on an Address/Data-Multiplexed Device

gpmc-013

For formulas to calculate timing parameters, see [Section 11.3.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 11-400](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single-write mode.

When the GPMC generates a write access to an address/data-multiplexed device, it drives the address bus until nWE assertion time. For more information, see [Section 11.3.4.8.2.3, Address/Data-Multiplexing Interface](#).

The nCS and $nADV$ signals are controlled in the same way as for a asynchronous single-read operation on an address/data-multiplexed device.

- Write enable signal nWE :
 - nWE assertion indicates a write cycle.
 - nWE assertion time is controlled by the [GPMC_CONFIG4_i\[19:16\] WEONTIME](#) bit field.
 - nWE deassertion time is controlled by the [GPMC_CONFIG4_i\[28:24\] WEOFFTIME](#) bit field.
- Direction signal DIR: DIR signal is OUT during the entire access.
- The end of the access is defined by the [GPMC_CONFIG5_i\[12:8\] WRCYCLETIME](#) parameter.

Address bits $A[16:1]$ (GPMC point of view) are placed on the address/data bus at the start of cycle time, and the remaining address bits $A[26:17]$ are placed on the address bus.

Data is driven on the address/data bus at a [GPMC_CONFIG6_i\[19:16\] WRDATAONADMUXBUS](#) time.

NOTE: Write multiple access in asynchronous mode is not supported. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

After a write operation, if no other access (read or write) is pending, the data bus keeps its previous value. See [Section 11.3.4.9.10, Bus Keeping Support](#).

11.3.4.10.1.1.3 Asynchronous Multiple (Page) Write Operation on an Address/Data-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for address/data-multiplexed devices.

If the [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE bit is enabled (0x1) with the [GPMC_CONFIG1_i\[27\]](#) WRITETYPE bit as asynchronous (0x0), the GPMC processes single asynchronous accesses.

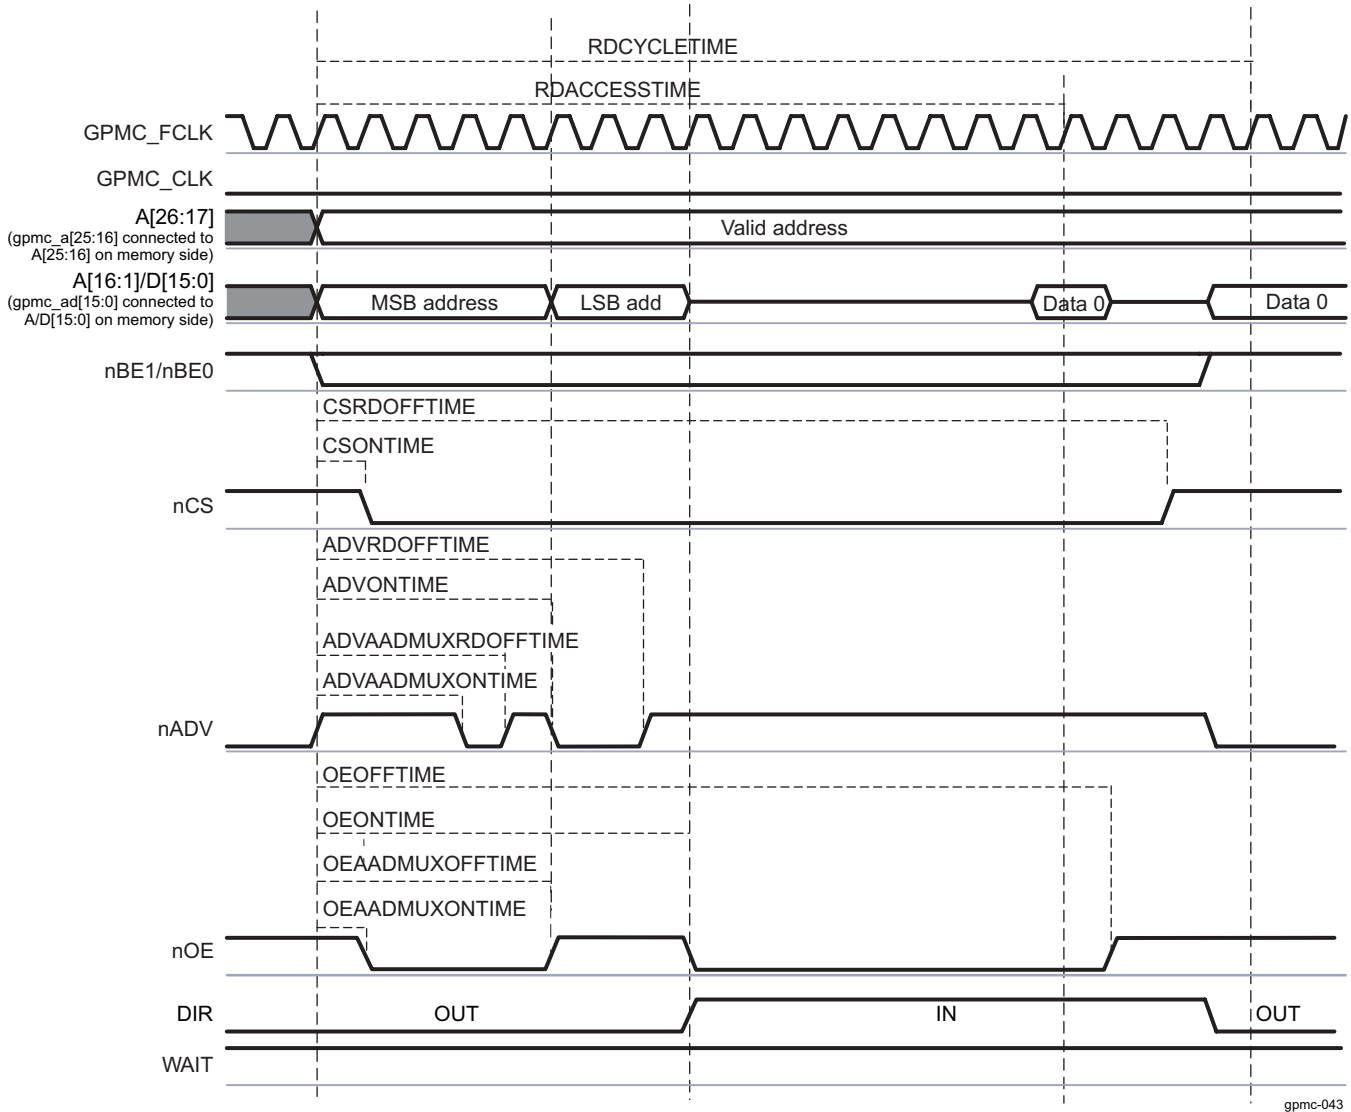

For accesses on nonmultiplexed devices, see [Section 11.3.4.10.3, Asynchronous and Synchronous Accesses in Nonmultiplexed Mode](#).

11.3.4.10.1.2 Access on Address/Address/Data-Multiplexed Devices

11.3.4.10.1.2.1 Asynchronous Single Read Operation on an AAD-Multiplexed Device

Figure 11-27 shows an asynchronous single-read operation on an AAD-multiplexed device.

Figure 11-27. Asynchronous Single Read on an AAD-Multiplexed Device

For formulas to calculate timing parameters, see [Section 11.3.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 11-400](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single write mode.

When the GPMC generates a read access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The first address phase ends at the first nOE deassertion time. The second phase for LSB address is qualified with nOE driven high. The second address phase ends at the second nOE assertion time, when the DIR signal goes from OUT to IN.

The nCS and DIR signals are controlled in the same way as for an asynchronous single-read operation on an address/data-multiplexed device.

- Address valid signal nADV. nADV is asserted and deasserted twice during a read transaction:
 - nADV first assertion time is controlled by the `GPMC_CONFIG3_i[6:4]` ADVAADMUXONTIME bit field.

- nADV first deassertion time is controlled by the GPMC_CONFIG3_i[26:24] ADVAADMUXRDOFFTIME bit field.
- nADV second assertion time is controlled by the GPMC_CONFIG3_i[3:0] ADVONTIME bit field.
- nADV second deassertion time is controlled by the GPMC_CONFIG3_i[12:8] ADVRDOFFTIME bit field.
- Output Enable signal nOE. nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
 - nOE first assertion time is controlled by the GPMC_CONFIG4_i[6:4] OEAADMUXONTIME bit field.
 - nOE first deassertion time is controlled by the GPMC_CONFIG3_i[15:13] OEAADMUXOFFTIME bit field.
 - nOE second assertion time is controlled by the GPMC_CONFIG4_i[3:0] OEONTIME bit field.
 - nOE second deassertion time is controlled by the GPMC_CONFIG4_i[12:8] OEOFFTIME bit field.

11.3.4.10.1.2.2 Asynchronous Single-Write Operation on an AAD-Multiplexed Device

Figure 11-28 shows an asynchronous single-write operation on an AAD-multiplexed device.

Figure 11-28. Asynchronous Single Write on an AAD-Multiplexed Device

gpmc-042

For formulas to calculate timing parameters, see [Section 11.3.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 11-400](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single-write mode.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, nWE, and DIR signals are controlled in the same way as for an asynchronous single-write operation on an address/data-multiplexed device. See [Table 11-391](#).

- Address valid signal nADV is asserted and deasserted twice during a write transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME bit field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[30:28\]](#) ADVAADMUXWROFFTIME bit field.
 - nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME bit field.
 - nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[20:16\]](#) ADVWROFFTIME bit field.
- Output enable signal nOE is asserted during the address phase of a write transaction:
 - nOE assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME bit field.
 - nOE deassertion time is controlled by the [GPMC_CONFIG3_i\[15:13\]](#) OEAADMUXOFFTIME bit field.

The address bits for the first address phase are driven onto the data bus until nOE deassertion. Data is driven onto the address/data bus at the clock edge defined by the [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS parameter.

11.3.4.10.1.2.3 Asynchronous Multiple (Page) Read Operation on an AAD-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for AAD-multiplexed devices.

If the [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE bit is enabled (0x1) with the [GPMC_CONFIG1_i\[27\]](#) WRITETYPE bit as asynchronous (0x0), the GPMC processes single asynchronous accesses.

For accesses on nonmultiplexed devices, see [Section 11.3.4.10.3, Asynchronous and Synchronous Accessed in Nonmultiplexed Mode](#).

11.3.4.10.2 Synchronous Access Description

This section describes read and write synchronous accesses on address/data-multiplexed devices. All information in this section can be applied to any type of memory (nonmultiplexed, address and data-multiplexed, or AAD-multiplexed) with the difference limited to the address phase. For accesses on nonmultiplexed devices, see [Section 11.3.4.10.3, Asynchronous and Synchronous Accessed in Nonmultiplexed Mode](#).

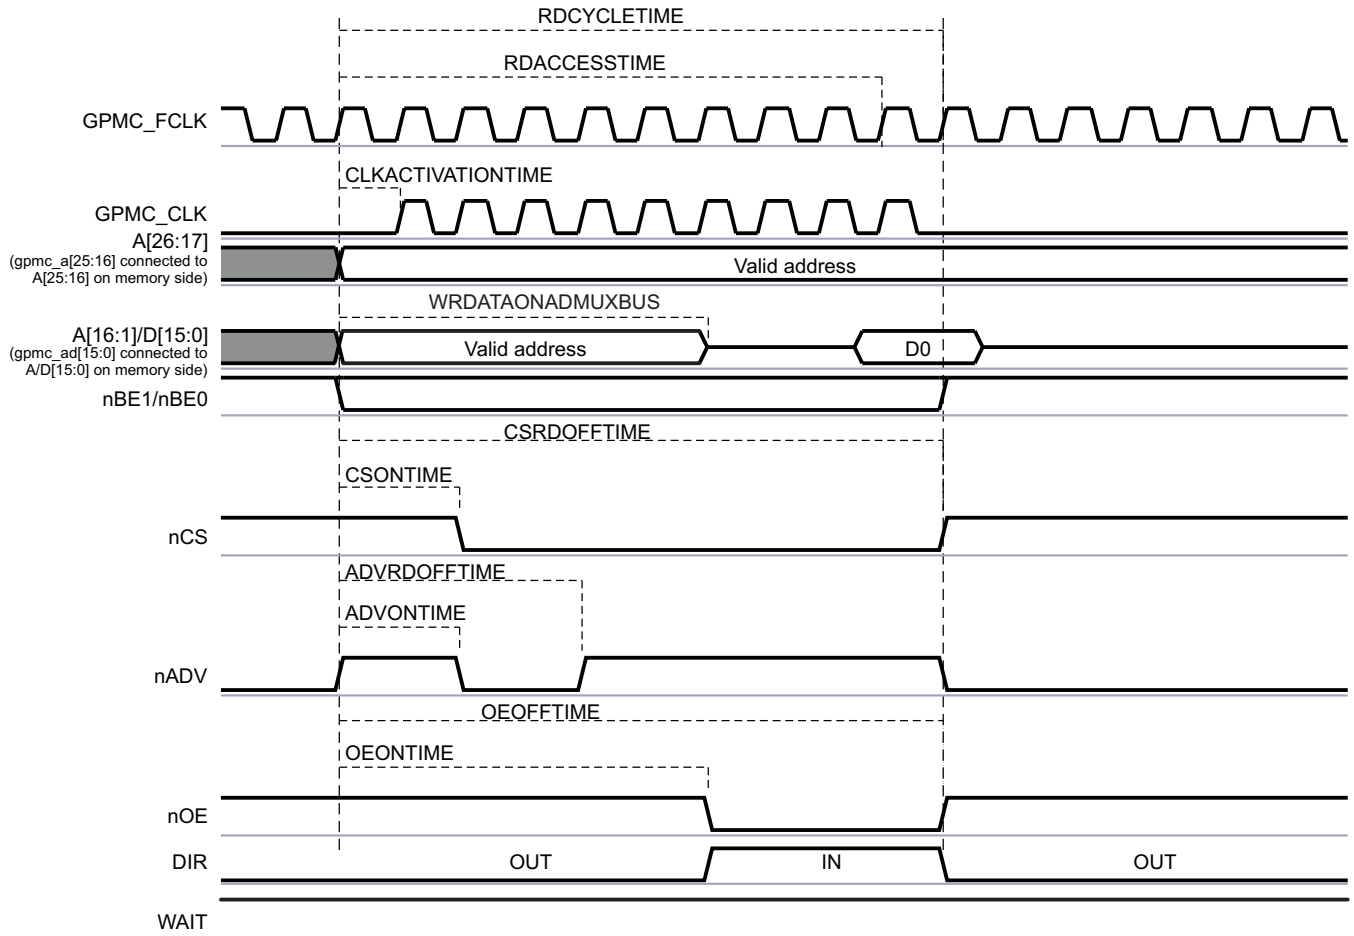

In synchronous operations:

- The GPMC_CLK clock is provided outside the GPMC when accessing the memory device.
- The GPMC_CLK clock is derived from the GPMC_FCLK clock using the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER bit field. In the following section i stands for the chip-select number, i = 0 to 7.
- The [GPMC_CONFIG1_i\[26:25\]](#) CLKACTIVATIONTIME bit field specifies that the GPMC_CLK is provided outside the GPMC for 0 to 2 GPMC_FCLK cycles after start access time until RDCYCLETIME or WRCYCLETIME completes.

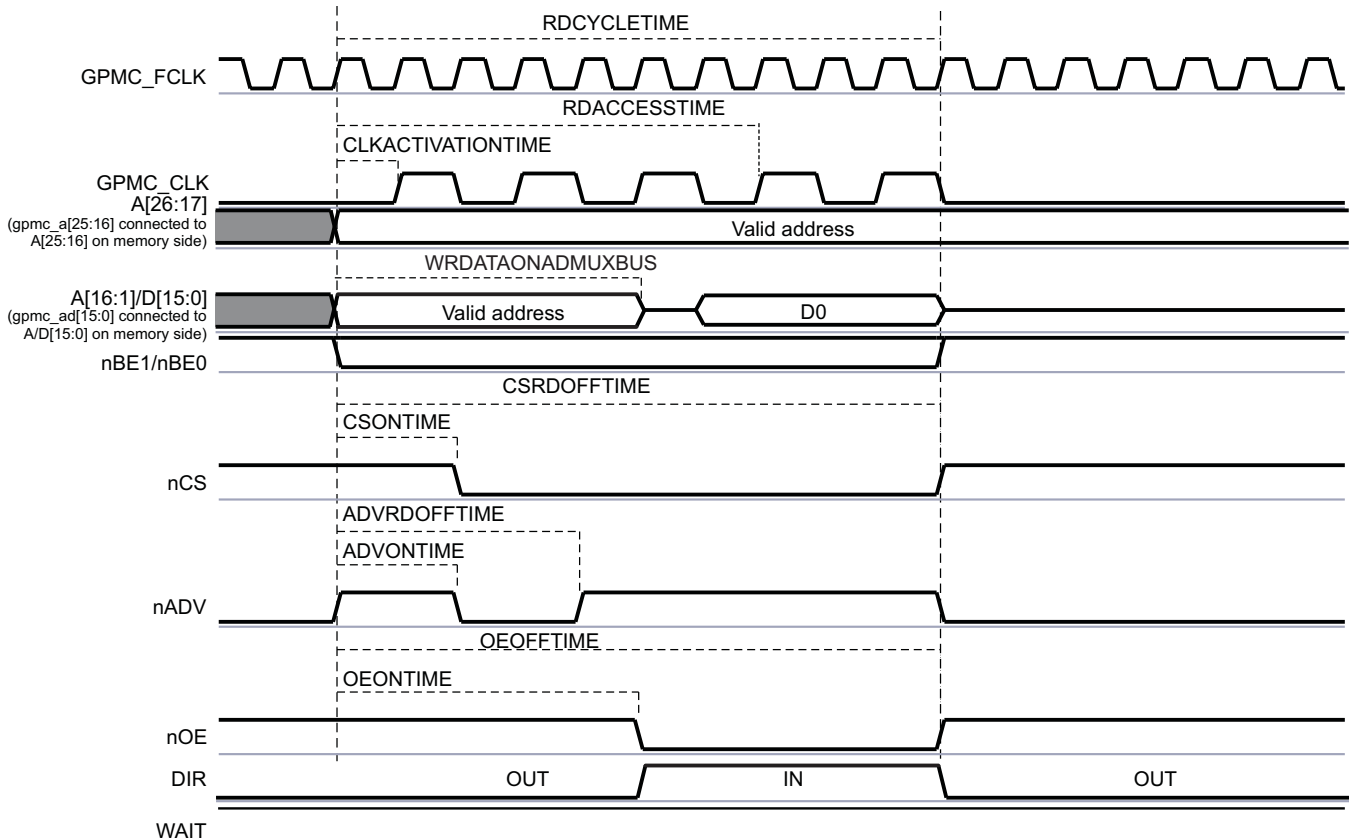

11.3.4.10.2.1 Synchronous Single Read

[Figure 11-29](#) and [Figure 11-30](#) show a synchronous single-read operation with GPMCFCLKDIVIDER equal to 0 and 1, respectively.

Figure 11-29. Synchronous Single Read (GPMCFCLKDIVIDER = 0)

gpmc-015

Figure 11-30. Synchronous Single Read (GPMCFCLKDIVIDER = 1)

gpmc-016

For formulas to calculate timing parameters, see [Section 11.3.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 11-400](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single-read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For more information, see [Section 11.3.4.8.2.3, Address/Data-Multiplexing Interface](#).

- Chip-select signal nCS:
 - nCS assertion time is controlled by the [GPMC_CONFIG2_i\[3:0\]](#) CSONTIME bit field and ensures address setup time to nCS assertion.
 - nCS deassertion time is controlled by the [GPMC_CONFIG2_i\[12:8\]](#) CSRDOFFTIME bit field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
 - nADV assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME bit field.
 - nADV deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME bit field.
- Output enable signal nOE:
 - nOE assertion indicates a read cycle.
 - nOE assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME bit field.
 - nOE deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME bit field.
- Initial latency for the first read data is controlled by [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME bit field or by monitoring the WAIT signal.
- Total access time (the [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME bit field) corresponds to RDACCESSTIME plus the address hold time from nCS deassertion, plus time from RDACCESSTIME to CSRDOFFTIME.

- Direction signal DIR: DIR goes from OUT to IN at the same time as nOE assertion.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS and DIR signals are controlled in the same way as for a synchronous single-read operation on an address/data-multiplexed device.

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME bit field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[26:24\]](#) ADVAADMUXRDOFFTIME bit field.
 - nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME bit field.
 - nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME bit field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
 - nOE first assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME bit field.
 - nOE first deassertion time is controlled by the [GPMC_CONFIG3_i\[15:13\]](#) OEAADMUXOFFTIME bit field.
 - nOE second assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME bit field.
 - nOE second deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME bit field.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 11.3.4.9.10](#), *Bus Keeping Support*.

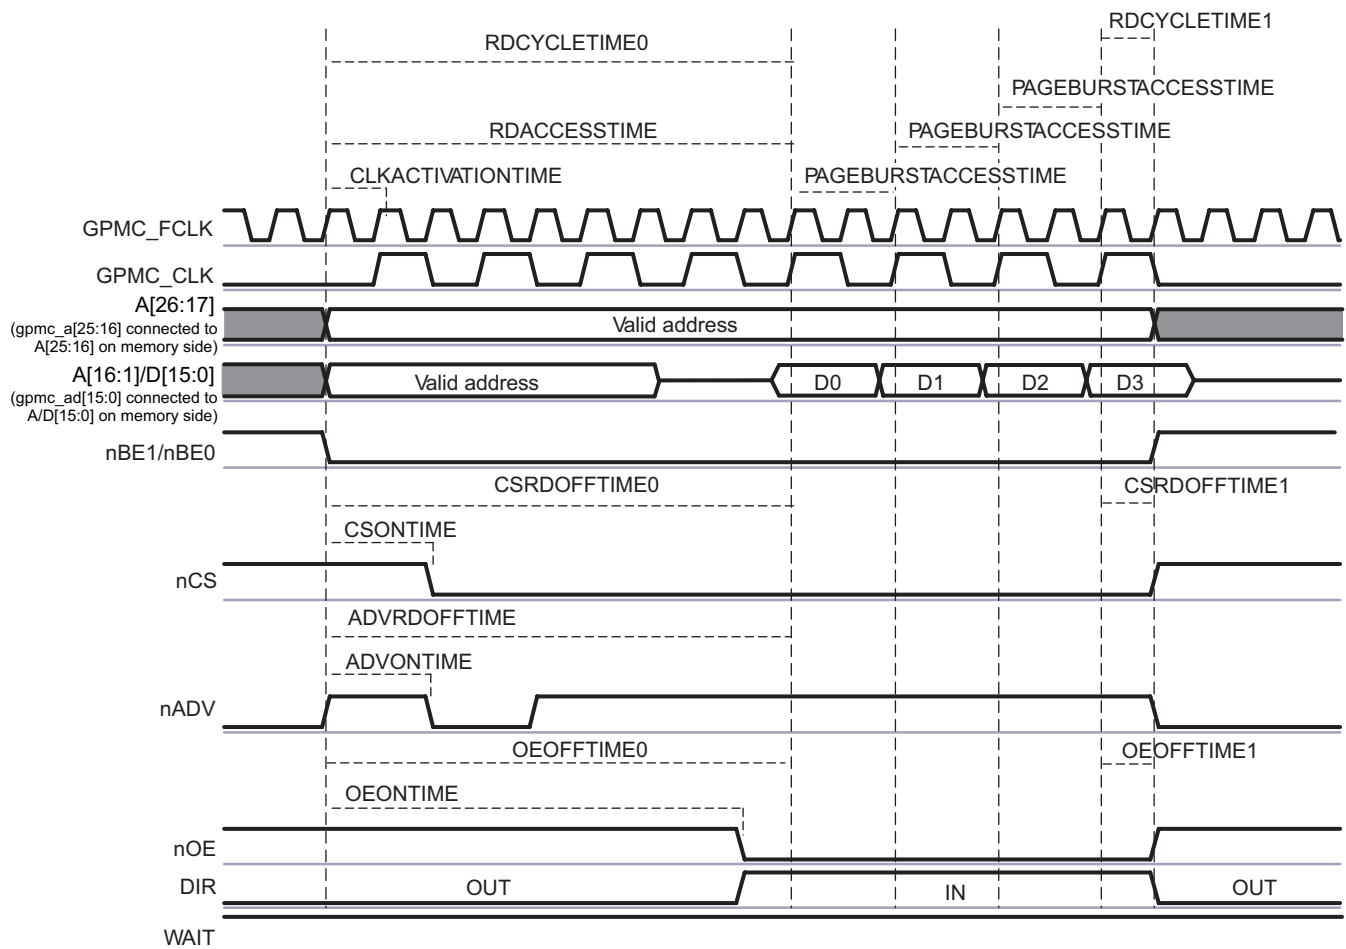

11.3.4.10.2.2 Synchronous Multiple (Burst) Read (4-, 8-, 16-Word16 Burst With Wraparound Capability)

[Figure 11-31](#) and [Figure 11-32](#) show a synchronous multiple-read operation with GPMCFCLKDivider equal to 0 and 1, respectively.

Figure 11-31. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 0)

gpmc-018

Figure 11-32. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 1)

gpmc-019

When the [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME bit field completes, control-signal timings are frozen during the multiple data transactions, corresponding to the [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME bit field multiplied by the number of remaining data transactions.

The nCS, nADV, nOE, and DIR signals are controlled in the same way as for a synchronous single-read operation. See [Table 11-386](#).

Initial latency for the first read data is controlled by RDACCESSTIME or by monitoring the WAIT signal. Successive read data are provided by the memory device every one or two GPMC_CLK cycles. The PAGEBURSTACCESSTIME parameter must be set accordingly with the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER bit field and the memory-device internal configuration. Depending on the device page length, the GPMC checks the device page crossing during a new burst request and purposely inserts initial latency (of RDACCESSTIME) when required.

Total access time [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time from nCS deassertion. In [Figure 11-32](#), the programmed value of RDCYCLETIME equals RDCYCLETIME0 + RDCYCLETIME1.

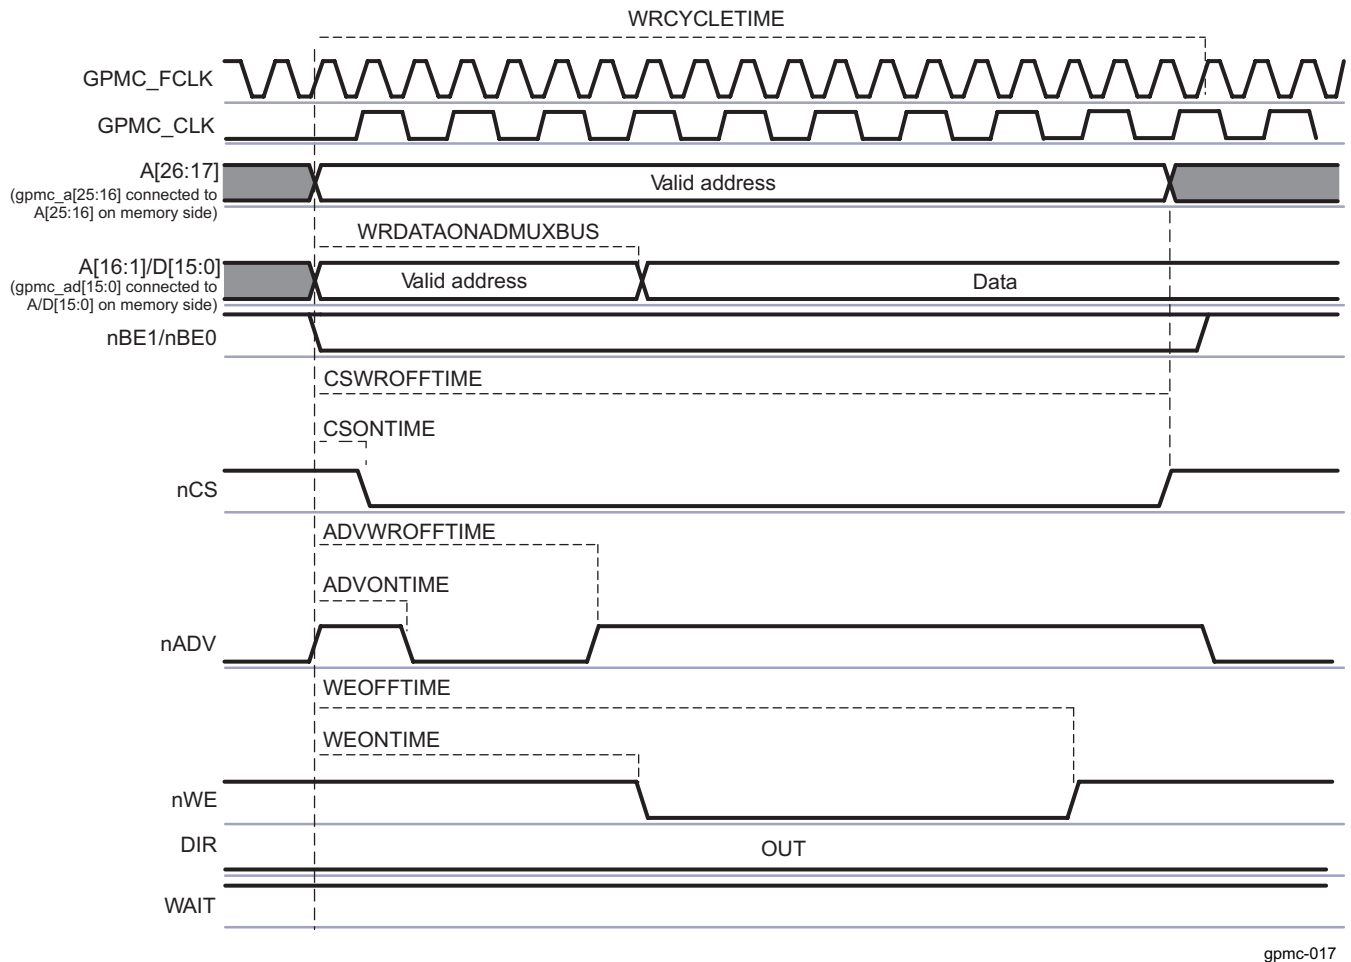

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 11.3.4.9.10, Bus Keeping Support](#).

Burst wraparound is enabled through the [GPMC_CONFIG1_i\[31\]](#) WRAPBURST bit and allows a 4-, 8-, or 16-Word16 linear burst access to wrap within its burst-length boundary through the [GPMC_CONFIG1_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH bit field.

11.3.4.10.2.3 Synchronous Single Write

Burst write mode is used for synchronous single or burst accesses.

Figure 11-33. Synchronous Single Write on an Address/Data-Multiplexed Device

When the GPMC generates a write access to an address/data-multiplexed device, it drives the data bus (with address bits A[16:1]) until the [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS bit field time. The first data of the burst is driven on the address/data bus at WRDATAONADMUXBUS time.

11.3.4.10.2.4 Synchronous Multiple (Burst) Write

Synchronous burst write mode provides synchronous single or consecutive accesses.

[Figure 11-34](#) shows a synchronous burst write access when the chip-select is configured in address/data-multiplexed mode.

Figure 11-34. Synchronous Multiple Write (Burst Write) in Address/Data-Multiplexed Mode

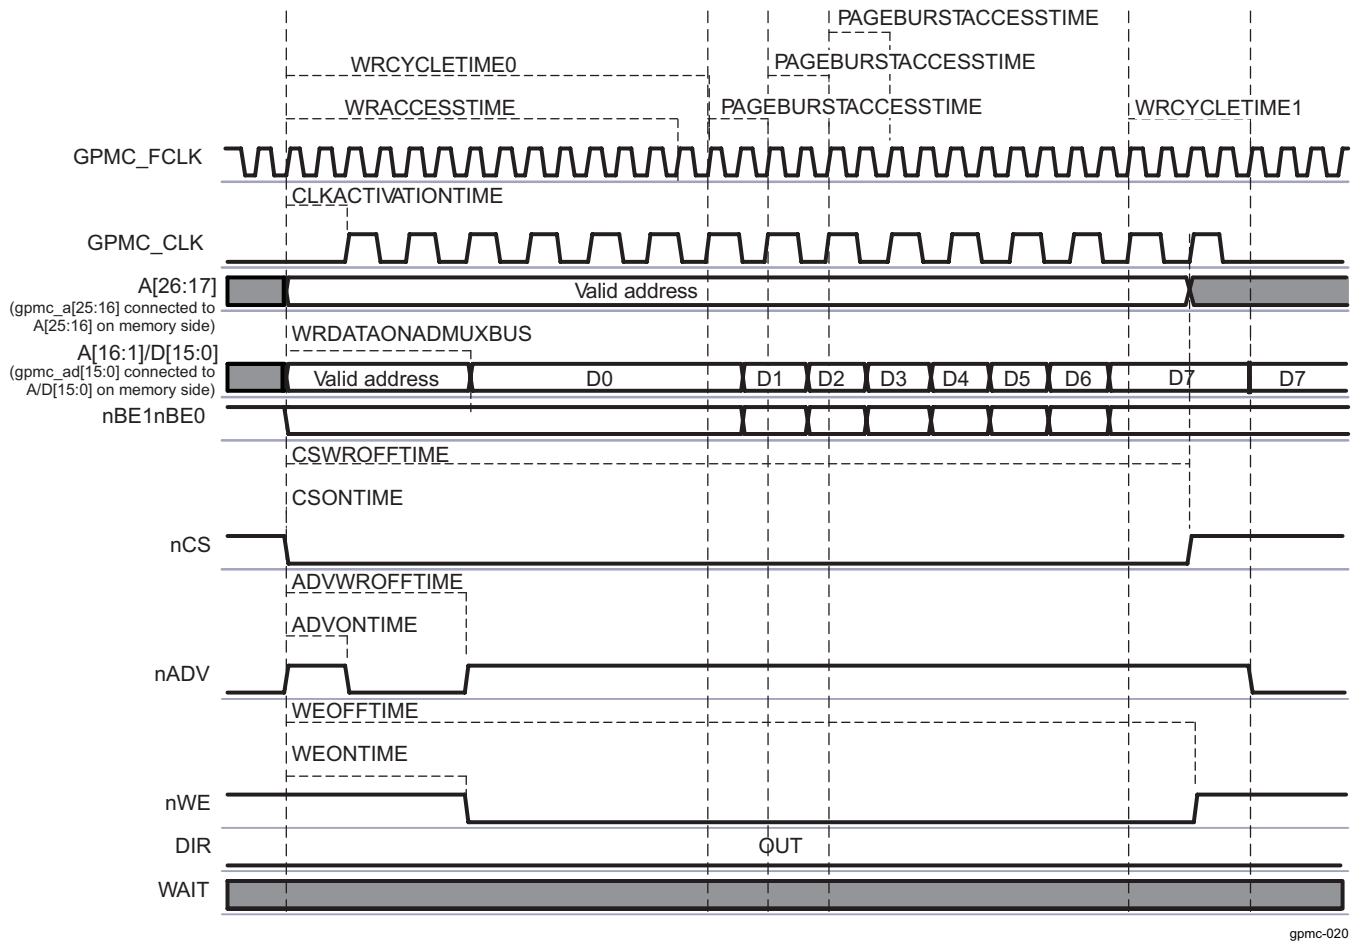

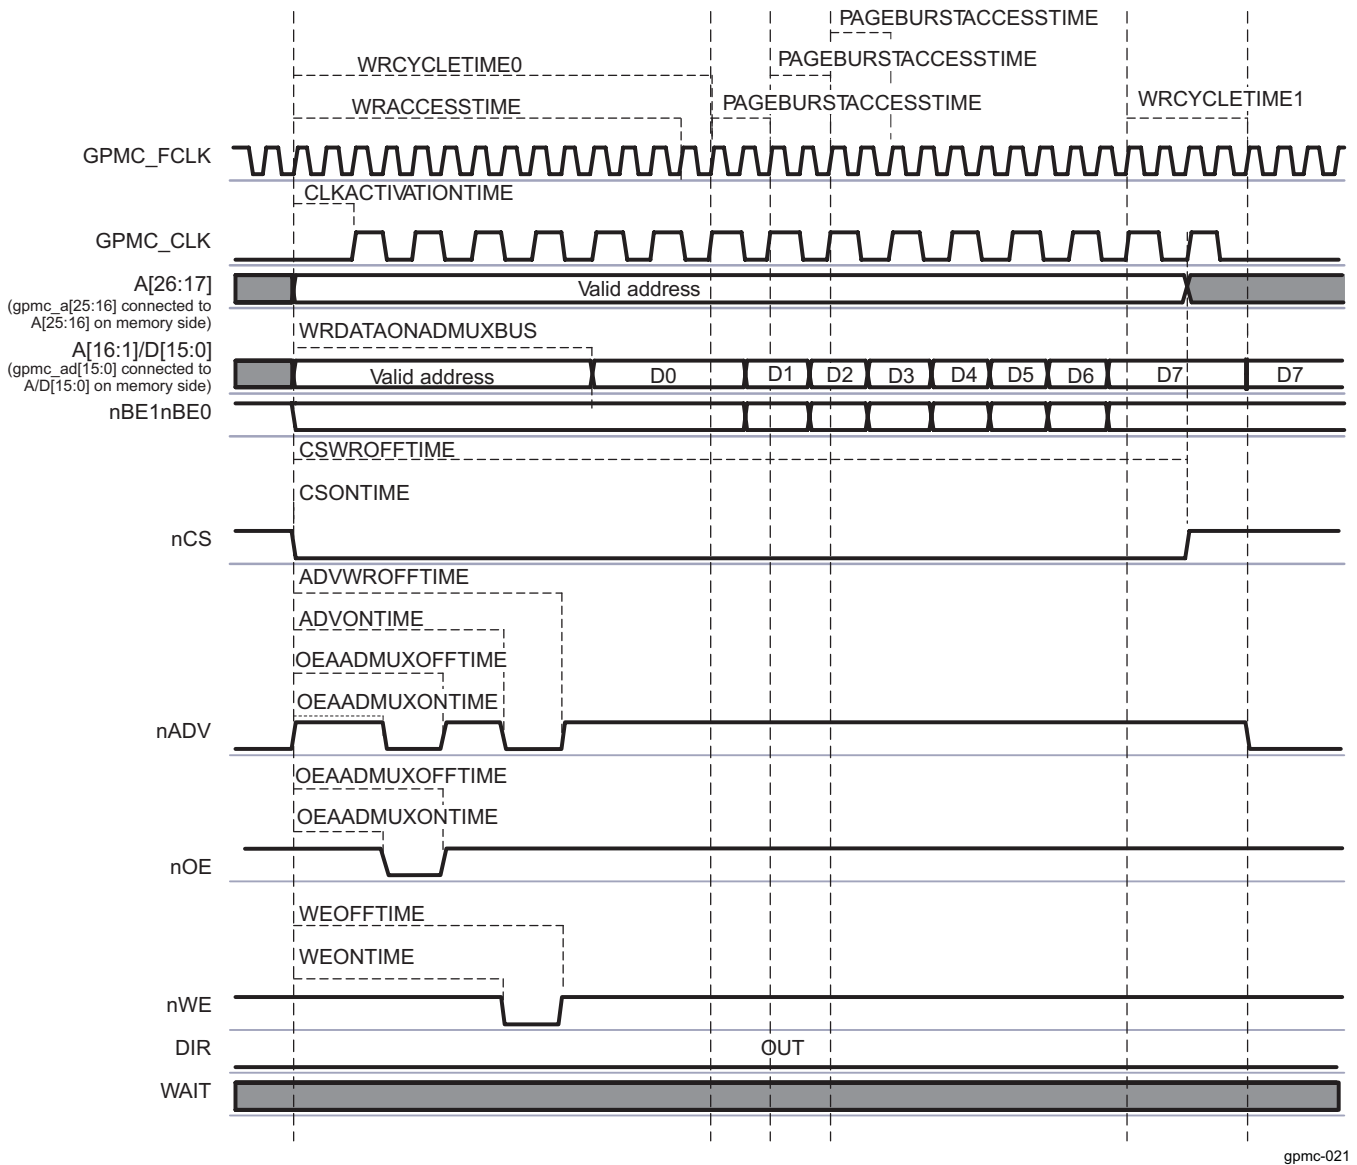

Figure 11-35 shows the same synchronous burst write access when the chip-select is configured in address/address/data-multiplexed (AAD-multiplexed) mode.

Figure 11-35. Synchronous Multiple Write (Burst Write) in Address/Address/Data-Multiplexed Mode

gpmc-021

The first data of the burst is driven on the A/D bus at the [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS bit field.

When WRACCESTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to the [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESTIME bit field multiplied by the number of remaining data transactions.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For more information, see [Section 11.3.4.8.2.3, Address/Data-Multiplexing Interface](#).

- Chip-select signal nCS:
 - nCS assertion time is controlled by the [GPMC_CONFIG2_i\[3:0\]](#) CSONTIME bit field (where $i = 0$ to 7) and ensures address setup time to nCS assertion.
 - nCS deassertion time controlled by the [GPMC_CONFIG2_i\[20:16\]](#) CSWROFFTIME bit field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
 - nADV assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME bit field.

- nADV deassertion time is controlled by the [GPMC_CONFIG3_i\[20:16\]](#) ADVWROFFTIME bit field.
- Write enable signal nWE:
 - nWE assertion indicates a read cycle.
 - nWE assertion time is controlled by the [GPMC_CONFIG4_i\[19:16\]](#) WEONTIME bit field.
 - nWE deassertion time is controlled by the [GPMC_CONFIG4_i\[28:24\]](#) WEOFFTIME bit field.

NOTE: The nWE falling edge must not be used to control the time when the burst first data is driven in the address/data bus, because some new devices require the nWE signal to be low during the address phase.

- Direction signal DIR is OUT during the entire access.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, and DIR signals are controlled as previously described..

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME bit field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[26:24\]](#) ADVAADMUXRDOFFTIME bit field.
 - nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME bit field.
 - nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME bit field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
 - nOE first assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME bit field.
 - nOE first deassertion time is controlled by the [GPMC_CONFIG4_i\[15:13\]](#) OEAADMUXOFFTIME bit field.
 - nOE second assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME bit field.
 - nOE second deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME bit field.

First write data is driven by the GPMC at [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS, when in address/data-multiplexed configuration. The next write data of the burst is driven on the bus at $WRACCESSTIME + 1$ during [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME GPMC_FCLK cycles. The last data of the synchronous burst write is driven until [GPMC_CONFIG5_i\[12:8\]](#) WRCYCLETIME completes.

- WRACCESSTIME is defined in the [GPMC_CONFIG6_i\[28:24\]](#) bit field.
- The PAGEBURSTACCESSTIME parameter must be set accordingly with GPMCFCLKDIVIDER and the memory-device internal configuration.

Total access time [GPMC_CONFIG5_i\[12:8\]](#) WRCYCLETIME corresponds to WRACCESSTIME plus the address hold time from nCS deassertion. In [Figure 11-34](#), the programmed value of WRCYCLETIME equals $WRCYCLETIME0 + WRCYCLETIME1$. WRCYCLETIME0 and WRCYCLETIME1 delays are not actual parameters and are only a graphical representation of the full WRCYCLETIME value.

After a write operation, if no other access (read or write) is pending, the data bus keeps the previous value. See [Section 11.3.4.9.10](#), *Bus Keeping Support*.

11.3.4.10.3 Asynchronous and Synchronous Accesses in Nonmultiplexed Mode

Page mode is available only in nonmultiplexed mode.

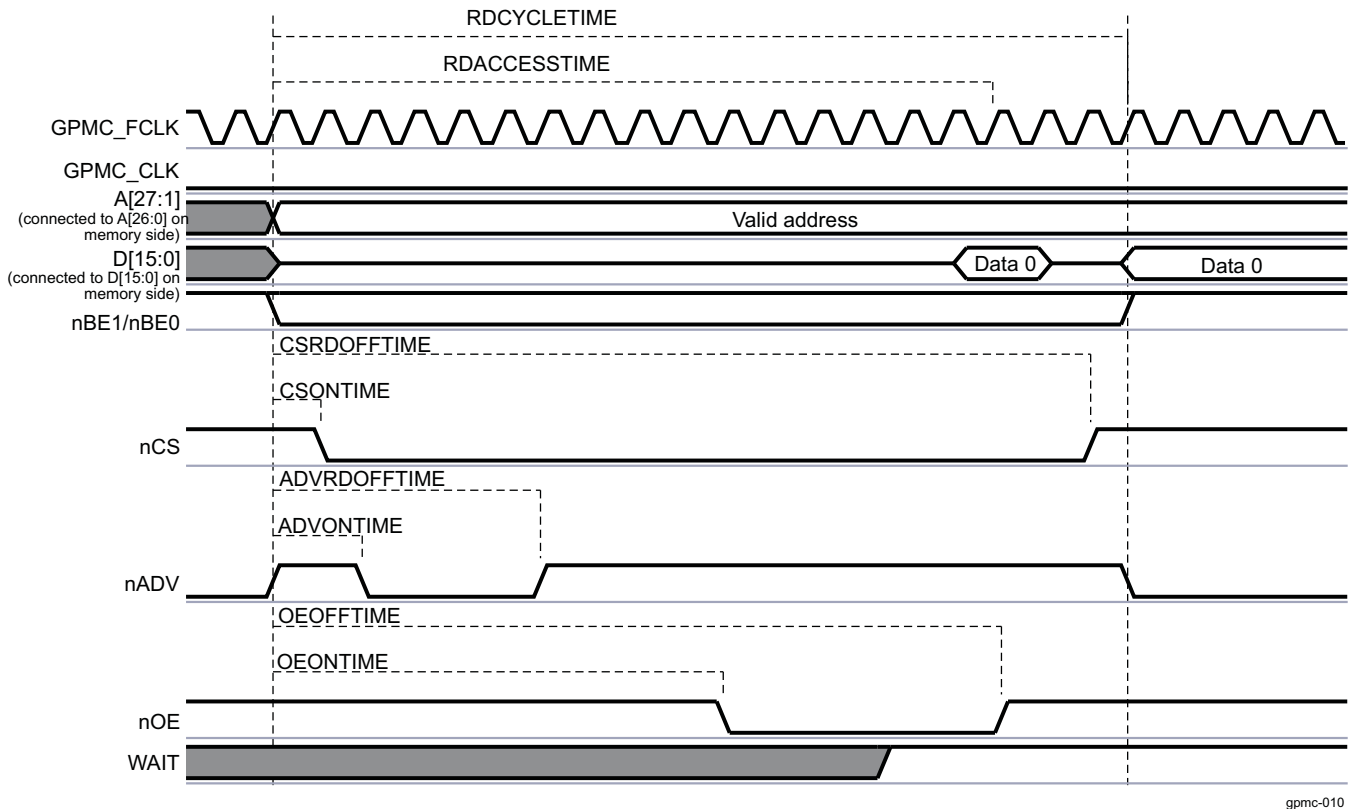

- Asynchronous single-read operation on a nonmultiplexed device
- Asynchronous single-write operation on a nonmultiplexed device
- Asynchronous multiple- (page mode) read operation on a nonmultiplexed device

- Synchronous operations on a nonmultiplexed device

11.3.4.10.3.1 Asynchronous Single-Read Operation on Nonmultiplexed Device

Figure 11-36 shows an asynchronous single-read operation on a nonmultiplexed device.

Figure 11-36. Asynchronous Single Read on an Address/Data-Nonmultiplexed Device

The 27-bit address (For a 16-bit data memory device, hence GPMC A[0] is not necessary to be output) is driven onto the address bus A[27:1] and the 16-bit data is driven onto the data bus D[15:0].

Read data is latched at `GPMC_CONFIG1_5[20:16]` RDACCESSTIME completion time. The end of the access is defined by the `GPMC_CONFIG1_5[4:0]` RDCYCLETIME parameter.

The nCS, nADV, nOE, and DIR signals are controlled in the same way as address/data-multiplexed accesses (see [Table 11-391](#)).

11.3.4.10.3.2 Asynchronous Single-Write Operation on Nonmultiplexed Device

Figure 11-37 shows an asynchronous single-write operation on a nonmultiplexed device.

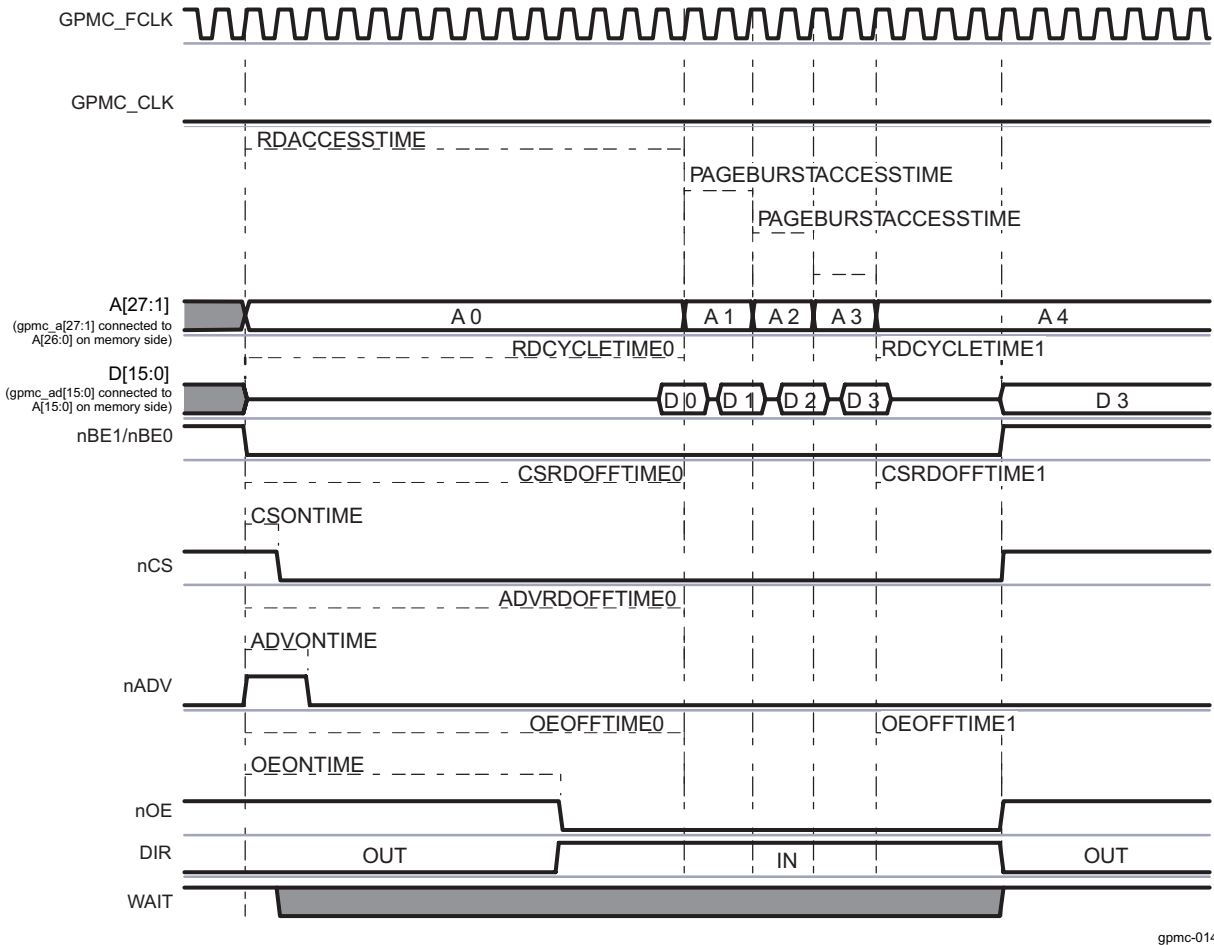

Figure 11-37. Asynchronous Single Write on an Address/Data-Nonmultiplexed Device

The nCS, nADV, nWE, and DIR signals are controlled in the same way as address/data-multiplexed accesses (see [Table 11-391](#)).

11.3.4.10.3.3 Asynchronous Multiple (Page Mode) Read Operation on Nonmultiplexed Device

Figure 11-38 shows an asynchronous multiple-read operation on a nonmultiplexed device in which two word32 host read accesses to the GPMC are split into one multiple- (page mode of 4 word16) read access to the attached device.

Figure 11-38. Asynchronous Multiple (Page Mode) Read

NOTE: The WAIT signal is active low.

The nCS, nADV, nOE, and DIR signals are controlled in the same way as address/data-multiplexed accesses (see [Table 11-391](#)).

When RDACCESSTIME completes, control signal timings are frozen during the multiple data transactions, corresponding to PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

Read data is latched at [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME completion time (where $i = 0$ to 7). The end of the access is defined by the [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME parameter.

During consecutive accesses, the GPMC increments the address after each data read completes.

Delay between successive read data in the page is controlled by the [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME parameter. Depending on the device page length, the GPMC can control device page crossing during a burst request and insert initial RDACCESSTIME latency. Page crossing is possible only with a new burst access, meaning a new initial access phase is initiated.

Total access time RDCYCLETIME corresponds to RDACCESSTIME, plus the address hold time, starting from the nCS deassertion.

- The read cycle time is defined in the [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME bit field.
- In [Figure 11-38](#), the programmed value of RDCYCLETIME equals RDCYCLETIME0 (before paged accesses) + RDCYCLETIME1 (after paged accesses).

11.3.4.10.3.4 Synchronous Operations on a Nonmultiplexed Device

All information for this section is equivalent to similar operations for address/data-multiplexed or AAD-multiplexed accesses. The only difference resides in the address phase. See [Section 11.3.5.3, GPMC Configuration in NOR Mode](#).

11.3.4.10.4 Page and Burst Support

Each chip-select can be configured to process system single or burst requests into successive single accesses or asynchronous page/synchronous burst accesses, with appropriate access size adaptation.

Depending on the external device page or burst capability, read and write accesses can be independently configured through the GPMC. The [GPMC_CONFIG1_i\[30\]](#) READMULTIPLE and [GPMC_CONFIG1_i\[28\]](#) WRITMULTIPLE bits (where $i = 0$ to 7) are associated with the READTYPE and WRITETYPE parameters.

NOTE:

- Asynchronous write page mode is not supported.
 - 8-bit-wide device support is limited to nonburstable devices (READMULTIPLE and WRITEMULTIPLE are ignored).
 - Not applicable to NAND device interfacing
-

11.3.4.10.5 System Burst vs External Device Burst Support

The device system can issue the following requests to the GPMC:

- Byte, 16-bit word, 32-bit word requests (byte-enable-controlled). This is always a single request from the interconnect point of view.
- Incrementing fixed-length bursts of two, four, and eight words
- Wrapped (critical word access first) fixed-length burst of two, four, or eight words

To process a system request with the optimal protocol, the READMULTIPLE (and READTYPE) and WRITEMULTIPLE (and WRITETYPE) parameters must be set according to the burstable capability (synchronous or asynchronous) of the attached device.

The GPMC access engine issues only fixed-length bursts. The maximum length that can be issued is defined per chip-select by the [GPMC_CONFIG1_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH bit field (where $i = 0$ to 7). When the value of ATTACHEDDEVICEPAGELENGTH is less than the length of the system burst request (including the appropriate access size adaptation according to the device width), the GPMC splits the system burst request into multiple bursts. Within the specified 4-, 8-, or 16-word value, the value of the ATTACHEDDEVICEPAGELENGTH bit field must correspond to the maximum length burst supported by the memory device configured in fixed-length burst mode (as opposed to continuous burst mode).

To get optimal performance from memory devices that natively support 16 Word16-length-wrapping burst capability (critical word access first), the ATTACHEDDEVICEPAGELENGTH parameter must be set to 16 words and the [GPMC_CONFIG1_i\[31\]](#) WRAPBURST bit (where $i = 0$ to 7) must be set to 1. Similarly DEVICEPAGELENGTH is set to 4 and 8 for memories supporting 4 and 8 Word16-length-wrapping burst, respectively.

When the memory device does not offer (or is not configured to offer) native 16 Word16-length-wrapping burst, the WRAPBURST parameter must be cleared, and the GPMC access engine emulates the wrapping burst by issuing the appropriate burst sequences according to the value of ATTACHEDDEVICEPAGELENGTH.

When the memory device does not support native-wrapping burst, there is usually no difference in behavior between a fixed-burst length mode and a continuous-burst mode configuration (except for a potential power increase from a memory-speculative data prefetch in a continuous burst read). However, even though continuous burst mode is compatible with GPMC behavior, because the GPMC access engine issues only fixed-length burst and does not benefit from continuous burst mode, it is best to configure the memory device in fixed-length burst mode.

The memory device maximum-length burst (configured in fixed-length burst wrap or nonwrap mode) usually corresponds to the memory device data buffer size. Memory devices with a minimum of 16 half-word buffers are the most appropriate (especially with wrap support), but memory devices with smaller buffer size (4 or 8) are also supported, assuming that the [GPMC_CONFIG1_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH bit field is set accordingly to 4 or 8 words.

The device system issues only requests with addresses or starting addresses for nonwrapping burst requests; that is, the request size boundary is aligned. In case of an eight-word-wrapping burst, the wrapping address always occurs on the eight-word boundary. As a consequence, all words requested must be available from the memory data buffer when the buffer size is equal to or greater than the value of ATTACHEDDEVICEPAGELENGTH. This usually means that data can be read from or written to the buffer at a constant rate (number of cycles between data) without wait-states between data accesses. If the memory does not behave this way (nonzero wait-state burstable memory), wait pin monitoring must be enabled to dynamically control data access completion within the burst.

NOTE: When the system burst request length is less than the value of ATTACHEDDEVICEPAGELENGTH, the GPMC proceeds with the required accesses.

11.3.4.11 pSRAM Access Specificities

pSRAM devices are SRAM-pin-compatible low-power memories that contain a self-refreshed DRAM memory array. The [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE bit field (where $i = 0$ to 7) must be set to 0b00.

The pSRAM device uses the NOR protocol. It supports the following operations:

- Asynchronous single read
- Asynchronous page read
- Asynchronous single write
- Synchronous single read and write
- Synchronous burst read
- Synchronous burst write (not supported by NOR flash memory)

pSRAM devices must be powered up and initialized in a predefined manner according to the specifications of the attached device.

pSRAM devices can be programmed to use either mode: fixed or variable latency. pSRAM devices can automatically schedule autorefresh operations, which force the GPMC to use its WAIT signal capability when read or write operations occur during an internal self-refresh operation, or they can automatically include the autorefresh operation in the access time. These devices do not require additional WAIT signal capability or a minimum nCS high pulse width between consecutive accesses to ensure that the correct internal refresh operation is scheduled.

11.3.4.12 NAND Access Description

NAND (8-bit and 16-bit) memory devices using a standard NAND asynchronous address/data-multiplexing scheme can be supported on any chip-select with the appropriate asynchronous configuration settings.

As for any other type of memory compatible with the GPMC interface, accesses to a chip-select allocated to a NAND device can be interleaved with accesses to chip-selects allocated to other external devices. This interleaved capability limits the system to *chip enable don't care* NAND devices, because the chip-select allocated to the NAND device must be deasserted if accesses to other chip-selects are requested.

11.3.4.12.1 NAND Memory Device in Byte or 16-bit Word Stream Mode

NAND devices require correct command and address programming before data array read or write accesses. The GPMC does not include specific hardware to translate a random address system request into a NAND-specific multiphase access. In that sense, GPMC NAND support, as opposed to random memory-map device support, is data stream-oriented (byte or 16-bit word).

The GPMC NAND programming model relies on a software driver for address and command formatting with the correct data address pointer value according to the block and page structure. Because of NAND structure and protocol interface diversity, the GPMC does not support automatic command and address phase programming, and software drivers must access the NAND device ID to ensure that correct command and address formatting are used for the identified device.

NAND device data read and write accesses are achieved through an asynchronous read or write access. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Any chip-select region can be qualified as a NAND region to constrain the nADV/ALE signal as ALE (ALE active high, default state value at low) during address program access, and the nBE0/CLE signal as CLE (CLE active high, default state value at low) during command program access. GPMC address lines are not used (the previous value is not changed) during NAND access.

11.3.4.12.1.1 Chip-Select Configuration for NAND Interfacing in Byte or Word Stream Mode

The [GPMC_CONFIG7_i](#) register (where $i = 0$ to 7) associated with a NAND device region interfaced in byte or word stream mode can be initialized with a minimum size of 16MiB, because any address location in the chip-select memory region can be used to access a NAND data array. The NAND flash protocol specifies an address sequence where address bits are passed through the data bus in a series of write accesses with the ALE pin asserted. After this address phase, all operations are streamed and the system requests address is irrelevant.

CAUTION

To allow correct command, address, and data-access controls, the [GPMC_CONFIG1_i](#) register associated with a NAND device region must be initialized in asynchronous read and write modes with the parameters listed in [Table 11-369](#). Failure to comply with these settings corrupts the NAND interface protocol.

Table 11-369. Chip-Select Configuration for NAND Interfacing

Bit Field	Register	Value	Comments
WRAPBURST	GPMC_CONFIG1_i [31] ⁽¹⁾	0	No wrap
READMULTIPLE	GPMC_CONFIG1_i [30]	0	Single access
READTYPE	GPMC_CONFIG1_i [29]	0	Asynchronous mode
WRITEMULTIPLE	GPMC_CONFIG1_i [28]	0	Single access
WRITETYPE	GPMC_CONFIG1_i [27]	0	Asynchronous mode
CLKACTIVATIONTIME	GPMC_CONFIG1_i [26:25]	0b00	
ATTACHEDDEVICEPAGELENGTH	GPMC_CONFIG1_i [24:23]	Don't care	Single-access mode
WAITREADMONITORING	GPMC_CONFIG1_i [22]	0	Wait not monitored by GPMC access engine
WAITWRITEMONITORING	GPMC_CONFIG1_i [21]	0	Wait not monitored by GPMC access engine
WAITMONITORINGTIME	GPMC_CONFIG1_i [19:18]	Don't care	Wait not monitored by GPMC access engine
WAITPINSELECT	GPMC_CONFIG1_i [17:16]		Select which wait is monitored by edge detectors
DEVICESTYPE	GPMC_CONFIG1_i [13:12]	0b00 or 0b01	8- or 16-bit interface
DEVICETYPE	GPMC_CONFIG1_i [11:10]	0b10	NAND device in stream mode
MUXADDDATA	GPMC_CONFIG1_i [9:8]	0b00	Nonmultiplexed mode

⁽¹⁾ $i = 0$ to 7

Table 11-369. Chip-Select Configuration for NAND Interfacing (continued)

Bit Field	Register	Value	Comments
TIMEPARAGRANULARITY	GPMC_CONFIG1_i[4]	0	Timing achieved with best GPMC clock granularity
GPMCFCLKDIVIDER	GPMC_CONFIG1_i[1:0]	Don't care	Asynchronous mode

The [GPMC_CONFIG1_i](#) to [GPMC_CONFIG4_i](#) registers (where $i = 0$ to 7) associated with a NAND device region must be initialized with the correct control-signal timing value according to the NAND device timing parameters.

11.3.4.12.1.2 NAND Device Command and Address Phase Control

NAND devices require multiple address programming phases. The software driver must issue the correct number of command and address program accesses, according to the device command set and the device address-mapping scheme.

NAND device-command and address-phase programming is achieved through write requests to the [GPMC_NAND_COMMAND_i](#) and [GPMC_NAND_ADDRESS_i](#) register locations (where $i = 0$ to 7) with the correct command and address values. These locations are mapped in the associated chip-select register region. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Command and address values are not latched during the access and cannot be read back at the register location.

- Only write accesses must be issued to these locations, but the GPMC does not discard any read access. Accessing a NAND device with nOE and CLE or ALE asserted (read access) can produce undefined results.
- Write accesses to the [GPMC_NAND_COMMAND_i](#) and [GPMC_NAND_ADDRESS_i](#) register locations must be posted for faster operations (where $i = 0$ to 7). The [GPMC_CONFIG\[0\]](#) NANDFORCEPOSTEDWRITE bit enables write accesses to these locations as posted, even if they are defined as nonposted.

A write buffer is used to store write transaction information before the external device is accessed:

- Up to eight consecutive posted write accesses can be accepted and stored in the write buffer.
- For nonposted write, the pipeline is one deep.
- An [GPMC_STATUS\[0\]](#) EMPTYWRITEBUFFERSTATUS bit stores the empty status of the write buffer.

The [GPMC_NAND_COMMAND_i](#) and [GPMC_NAND_ADDRESS_i](#) registers (where $i = 0$ to 7) are 32-bit word locations, which means any 32- or 16-bit word access is split into 4- or 2-byte accesses if an 8-bit-wide NAND device is attached. For multiple-command phase or multiple-address phase, the software driver can use 32- or 16-bit word access to these registers, but it must consider the splitting and little-endian ordering scheme. When only one byte command or address phase is required, only byte write access to the [GPMC_NAND_COMMAND_i](#) and [GPMC_NAND_ADDRESS_i](#) registers can be used, and any of the four byte locations of the registers is valid.

The same applies to a [GPMC_NAND_COMMAND_i](#) and a [GPMC_NAND_ADDRESS_i](#) (where $i = 0$ to 7) 32-bit word write access to a 16-bit-wide NAND device (split into two 16-bit word accesses). In the case of a 16-bit word write access, the MSByte of the 16-bit word value must be set according to the NAND device requirement (usually 0). Either 16-bit word location or any one of the four byte locations of the registers is valid.

11.3.4.12.1.3 Command Latch Cycle

Writing data at the [GPMC_NAND_COMMAND_i](#) location (where $i = 0$ to 7) places the data as the NAND command value on the bus, using a regular asynchronous write access.

- nCE is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- CLE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.

- ALE and nRE (nOE) are maintained inactive.

Figure 11-39 shows the NAND command latch cycle.

Figure 11-39. NAND Command Latch Cycle

NOTE: CLE is shared with the nBE0 output signal and has an inverted polarity from BE0. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, nBE0 (also nBE1) must not toggle, because it is shared with CLE.

NAND flash memories do not use byte-enable signals.

11.3.4.12.1.4 Address Latch Cycle

Writing data at the [GPMC_NAND_ADDRESS_i](#) location (where i = 0 to 7) places the data as the NAND partial address value on the bus, using a regular asynchronous write access.

- nCS is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- ALE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- CLE and nRE (nOE) are maintained inactive.

Figure 11-40 shows the NAND address latch cycle.

Figure 11-40. NAND Address Latch Cycle

NOTE: ALE is shared with the nADV output signal and has an inverted polarity from ADV. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, ALE is kept stable.

11.3.4.12.1.5 NAND Device Data Read and Write Phase Control in Stream Mode

NAND device data read and write accesses are achieved through a read or write request to the chip-select-associated memory region at any address location in the region or through a read or write request to the [GPMC_NAND_DATA_i](#) location (where $i = 0$ to 7) mapped in the chip-select-associated control register region. [GPMC_NAND_DATA_i](#) is not a true register, but an address location to enable nRE or nWE signal control. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Reading data from the [GPMC_NAND_DATA_i](#) location or from any location in the associated chip-select memory region activates an asynchronous read access.

- nCS is controlled by the CSONTIME and CSRDOFFTIME timing parameters.
- nRE is controlled by the OEONTIME and OEOFFTIME timing parameters.
- To take advantage of nRE high-to-data invalid minimum timing value, RDACCESSTIME can be set so that data are effectively captured after nRE deassertion. This allows optimization of NAND read access cycle time completion. For optimal timing parameter settings, see the NAND device and the device timing parameters.

ALE, CLE, and nWE are maintained inactive.

[Figure 11-41](#) shows the NAND data read cycle.

Figure 11-41. NAND Data Read Cycle

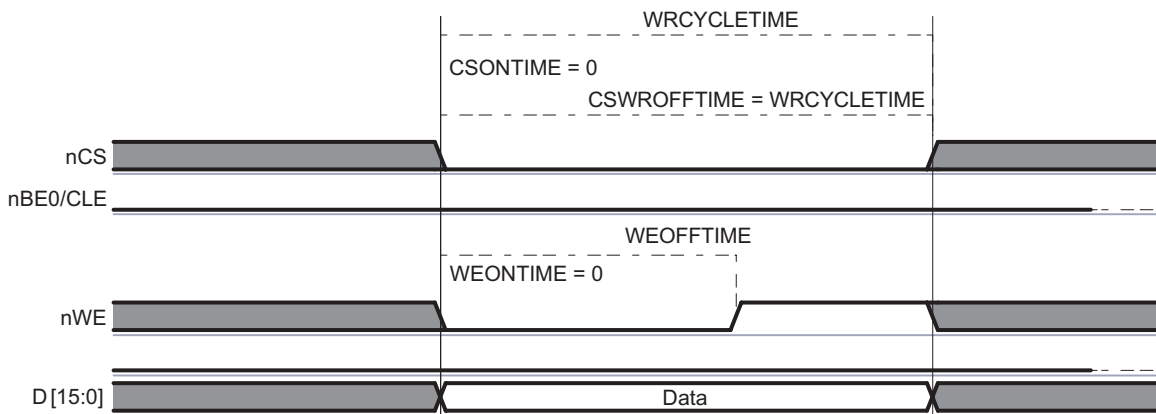

gpmc-024

Writing data to the [GPMC_NAND_DATA_i](#) location or to any location in the associated chip-select memory region activates an asynchronous write access.

- nCS is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- ALE, CLE, and nRE (nOE) are maintained inactive.

Figure 11-42 shows the NAND data write cycle.

Figure 11-42. NAND Data Write Cycle

gpmc-025

11.3.4.12.1.6 NAND Device General Chip-Select Timing Control Requirement

For most NAND devices, read data access time is dominated by nCS-to-data-valid timing and has faster nRE-to-data-valid timing. Successive accesses with nCS deassertions between accesses are affected by this timing constraint. Because accesses to a NAND device can be interleaved with other chip-select accesses, there is no certainty that nCS always stays low between two accesses to the same chip-select. Moreover, an nCS deassertion time between the same chip-select NAND accesses is likely to be required as follows: the nCS deassertion requires programming CYCLETIME and RDACCESSTIME according to the nCS-to-data-valid critical timing.

To get full performance from NAND read and write accesses, the prefetch engine can dynamically reduce the following on back-to-back NAND accesses (to the same memory) and suppress the minimum nCS high pulse width between accesses:

- RDCYCLETIME
- WRCYCLETIME
- RDACCESSTIME
- WRACCESSTIME
- CSRDOFFTIME
- CSWROFFTIME
- ADVRDOFFTIME
- ADVWROFFTIME
- OEOFFTIME
- WEOFFTIME

For more information about optimal prefetch engine access, see [Section 11.3.4.12.4](#), *Prefetch and Write-Posting Engine*.

Some NAND devices require minimum write-to-read idle time, especially for device-status read accesses following status-read command programming (write access). If such write-to-read transactions are used, a minimum nCS high pulse width must be set. For this, CYCLE2CYCLESAMEECSEN and CYCLE2CYCLEDELAY must be set according to the appropriate timing requirement to prevent any timing violation.

NAND devices usually have an important nRE high-to-data bus in three-state mode. This requires a bus turnaround setting (BUSTURNAROUND = 1) so that the next access to a different chip-select is delayed until the BUSTURNAROUND delay completes. Back-to-back NAND read accesses to the same NAND flash are not affected by the programmed bus turnaround delay.

11.3.4.12.1.7 Read and Write Access Size Adaptation

11.3.4.12.1.7.1 8-Bit-Wide NAND Device

Host 16- and 32-bit word read and write access requests to a chip-select associated with an 8-bit-wide NAND device are split into successive read and write byte accesses to the NAND memory device. Byte access is ordered according to little-endian organization. A NAND 8-bit-wide device must be interfaced on the D0D7 interface bus lane. GPMC data accesses are justified on this bus lane when the cs is associated with an 8-bit-wide NAND device.

11.3.4.12.1.7.2 16-Bit-Wide NAND Device

Host 32-bit word read and write access requests to a chip-select associated with a 16-bit-wide NAND device are split into successive read and write 16-bit word accesses to the NAND memory device. 16-bit word access is ordered according to little-endian organization.

Host byte read and write access requests to a 16-bit-wide NAND device are completed as 16-bit accesses on the device itself, because there is no byte-addressing capability on 16-bit-wide NAND devices. This means that the NAND device address pointer is incremented on a 16-bit word basis and not on a byte basis. For a read access, only the requested byte is given back to the host, but the remaining byte is not stored or saved by the GPMC, and the next byte or 16-bit word read access gets the next 16-bit word NAND location. For a write access, the invalid byte part of the 16-bit word is driven to FF, and the next byte or 16-bit word write access programs the next 16-bit word NAND location.

Generally, byte access to a 16-bit-wide NAND device must be avoided, especially when ECC calculation is enabled. 8- or 16-bit ECC-based computations are corrupted by a byte read to a 16-bit-wide NAND device, because the nonrequested byte is considered invalid on a read access (not captured on the external data bus; FF is fed to the ECC engine) and is set to FF on a write access.

Host requests (read/write) issued in the chip-select memory region are translated in successive single or split accesses (read/write) to the attached device. Therefore, incrementing 32-bit burst requests are translated in multiple 32-bit sequential accesses following the access adaptation of the 32-bit to 8- or 16-bit device.

11.3.4.12.2 NAND Device-Ready Pin

The NAND memory device provides a ready pin to indicate data availability after a block/page opening and to indicate that data programming is complete. The ready pin can be connected to one of the wait GPMC input pins; data read accesses must not be tried when the ready pin is sampled inactive (device is not ready) even if the associated chip-select WAITREADMONITORING bit field is set. The duration of the NAND device busy state after the block/page opening is so long (up to 50 micro second) that accesses occurring when the ready pin is sampled inactive can stall GPMC access and eventually cause a system time-out.

NOTE: If a read access to a NAND flash is done using wait monitoring mode, the device is blocked during a page opening, and so is the GPMC. If the correct settings are used, other chip-selects can be used while the memory processes the page opening command.

To avoid a time-out caused by a block/page opening delay in NAND flash, disable the wait pin monitoring for read and write accesses (that is, set the [GPMC_CONFIG1_i\[21\]](#) WAITWRITEMONITORING and [GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bits to 0, where $i = 0$ to 7), and use one of the following methods instead:

- Use software to poll the WAITxSTATUS bit (where $x = 0$ to 2) of the [GPMC_STATUS](#).
- Configure an interrupt that is generated on the WAIT signal change (through the [GPMC_IRQENABLE](#) register bits[11:8]).

Even if the READWAITMONITORING bit is not set, the external memory nR/B pin status is captured in the programmed wait bit in the [GPMC_STATUS](#) register.

The READWAITMONITORING bit method must be used for other memories than NAND flash, if they require the use of a WAIT signal.

11.3.4.12.2.1 Ready Pin Monitored by Software Polling

The ready signal state can be monitored through the [GPMC_STATUS](#) WAITxSTATUS bit (where $x = 0$ to 2). Software must monitor the ready pin only when the signal is declared valid. Refer to the NAND device timing parameters to set the correct software temporization to monitor ready only after the invalid window is complete from the last read command written to the NAND device.

11.3.4.12.2.2 Ready Pin Monitored by Hardware Interrupt

Each gpmc_wait input pin can generate an interrupt when a wait-to-no-wait transition is detected. Depending on whether the [GPMC_CONFIG](#) WAITxPINPOLARITY bits (where $x = 0$ to 2) is active low or active high, the wait-to-no-wait transition is a low-to-high external WAIT signal transition or a high-to-low external WAIT signal transition, respectively.

The wait transition pin detector must be cleared before any transition detection. This is done by writing 1 to the WAITxEDGEDETECTIONSTATUS bit (where $x = 0$ to 2) of the [GPMC_IRQSTATUS](#) register according to the gpmc_wait pin used for the NAND device-ready signal monitoring. To detect a wait-to-no-wait transition, the transition detector requires a wait active time detection of a minimum of two [GPMC_FCLK](#) cycles. Software must incorporate precautions to clear the wait transition pin detector before wait (busy) time completes.

A wait-to-no-wait transition detection can issue a GPMC interrupt if the WAITxEDGEDETECTIONENABLE bit in the [GPMC_IRQENABLE](#) register is set and if the WAITxEDGEDETECTIONSTATUS bit field in the [GPMC_IRQSTATUS](#) register is set.

The WAITMONITORINGTIME bit field does not affect wait-to-no-wait transition time detection.

It is also possible to poll the WAITxEDGEDETECTIONSTATUS bit field in the [GPMC_IRQSTATUS](#) register according to the gpmc_wait pin used for NAND device ready signal monitoring.

11.3.4.12.3 ECC Calculator

The GPMC includes an error code correction (ECC) calculator circuitry that enables ECC calculation on the fly during data read or data program (that is, write) operations. The page size supported by the ECC calculator in one calculation/context is 512 bytes.

The user can choose from two different algorithms with different error correction capabilities through the [GPMC_ECC_CONFIG\[16\] ECCALGORITHM](#) bit:

1. Hamming code for 1-bit error code correction on 8- or 16-bit NAND flash organized with page size greater than 512 bytes
2. Bose-Chaudhuri-Hocquenghem (BCH) code for 4- to 16-bit error correction

The GPMC does not handle the error code correction directly. During writes, the GPMC computes parity bits. During reads, the GPMC provides enough information for the processor to correct errors without reading the data buffer all over again.

The Hamming code ECC is based on a 2-dimensional (2D) (row and column) bit parity accumulation. This parity accumulation is accomplished on the programmed number of bytes or 16-bit words read from the memory device, or is written to the memory device in stream mode.

Because the ECC engine includes only one accumulation context, it can be allocated to only one chip-select at a time through the [GPMC_ECC_CONFIG\[3:1\] ECCCS](#) bit field. Even if two chip-selects use different ECC algorithms, one the Hamming code and the other a BCH code, they must define separate ECC contexts because some of the ECC registers are common to all types of algorithms.

11.3.4.12.3.1 Hamming Code

All references to ECC in this subsection refer to the 1-bit error correction Hamming code.

The ECC is based on a 2D (row and column) bit parity accumulation known as the Hamming code. The parity accumulation is done for a programmed number of bytes or 16-bit word read from the memory device or written to the memory device in stream mode.

There is no automatic error detection or correction, and the software NAND driver must read the multiple ECC calculation results, compare them to the expected code value, and take the appropriate corrective actions according to the error handling strategy (ECC storage in spare byte, error correction on read, block invalidation).

The ECC engine includes a single accumulation context. It can be allocated to a single designated chip-select at a time, and parallel computations on different chip-selects are not possible. Because it is allocated to a single chip-select, the ECC computation is not affected by interleaved GPMC accesses to other chip-selects and devices. The ECC accumulation is sequentially processed in the order of data read from or written to the memory on the designated chip-select. The ECC engine does not differentiate read accesses from write accesses and does not differentiate data from command or status information. Software must ensure that only relevant data are passed to the NAND flash memory while the ECC computation engine is active.

The starting NAND page location must be programmed first, followed by an ECC accumulation context reset with an ECC enabling, if required. The NAND device accesses discussed in the following sections must be limited to data read or write until the specified number of ECC calculations is complete.

11.3.4.12.3.1.1 ECC Result Register and ECC Computation Accumulation Size

The GPMC includes up to nine ECC result registers ([GPMC_ECCj_RESULT](#), where $j = 1$ to 9) to store ECC computation results when the specified number of bytes or 16-bit words has been computed.

The ECC result registers are used sequentially: one ECC result is stored in one ECC result register on the list, the next ECC result is stored in the next ECC result register on the list, and so forth, until the last ECC computation. The value of the [GPMC_ECCj_RESULT](#) register is valid only when the programmed number of bytes or 16-bit words has been accumulated, which means that the same number of bytes or 16-bit words has been read from or written to the NAND device in sequence.

The [GPMC_ECC_CONTROL\[3:0\]](#) ECCPOINTER bit field must be set to the correct value to select the ECC result register to be used first in the list for the incoming ECC computation process. The ECCPointer can be read to determine which ECC register is used in the next ECC result storage for the ongoing ECC computation. The value of the [GPMC_ECCj_RESULT](#) register (where j = 1 to 9) can be considered valid when ECCPOINTER equals j + 1. When the [GPMC_ECCj_RESULT](#) register (where j = 9) is updated, ECCPOINTER is frozen at 10, and ECC computing is stopped (ECCENABLE = 0).

The ECC accumulator must be reset before any ECC computation accumulation process. The [GPMC_ECC_CONTROL\[8\]](#) ECCCLEAR bit must be set to 1 (nonpersistent bit) to clear the accumulator and all ECC result registers.

For each ECC result (each [GPMC_ECCj_RESULT](#) register, where j = 1 to 9), the number of bytes or 16-bit words used for ECC computing accumulation can be selected from between two programmable values.

The ECCjRESULTSIZES bits (where j = 1 to 9) in the [GPMC_ECC_SIZE_CONFIG](#) register select which programmable size value (ECCSIZE0 or ECCSIZE1) must be used for this ECC result (stored in the [GPMC_ECCj_RESULT](#) register).

The ECCSIZE0 and ECCSIZE1 bit fields allow selection of the number of bytes or 16-bit words used for ECC computation accumulation. Any even values from 2 to 512 are allowed.

Flexibility in the number of ECCs computed and the number of bytes or 16-bit words used in the successive ECC computations enables different NAND page error-correction strategies. Usually based on 256 or 512 bytes and on 128 or 256 16-bit word, the number of ECC results required is a function of the NAND device page size. Specific ECC accumulation size can be used when computing the ECC on the NAND spare byte.

For example, with a 2-KiB data page, 8-bit-wide NAND device, eight ECCs accumulated on 256 bytes can be computed and added to one extra ECC computed on the 24 spare bytes area where the eight ECC results used for comparison and correction with the computed data page ECC are stored. The GPMC then provides nine [GPMC_ECCj_RESULT](#) registers (j = 1 to 9) to store the results. In this case, ECCSIZE0 is set to 256, and ECCSIZE1 is set to 24; the ECC[1:8] RESULTSIZES bits are set to 0, and the ECC9RESULTSIZES bit is set to 1.

11.3.4.12.3.1.2 ECC Enabling

The [GPMC_ECC_CONFIG\[3:1\]](#) ECCCS bit field selects the allocated chip-select. The [GPMC_ECC_CONFIG\[0\]](#) ECCENABLE bit enables ECC computation on the next detected read or write access to the selected chip-select.

The following fields must not be changed or cleared while an ECC computation is in progress:

- CCPOINTER
- ECCCLEAR
- ECCSIZE
- ECCjRESULTSIZES (where j = 1 to 9)
- ECC16B
- ECCCS

The ECC accumulator and ECC result register must not be changed or cleared while an ECC computation is in progress.

[Table 11-370](#) describes the ECC enable settings.

Table 11-370. ECC Enable Settings

Bit Field	Register	Value	Comments
ECCCS	GPMC_ECC_CONFIG	0–3	Selects the chip-select where ECC is computed
ECC16B	GPMC_ECC_CONFIG	0/1	Selects column number for ECC calculation
ECCCLEAR	GPMC_ECC_CONTROL	0–7	Clears all ECC result registers
ECCPOINTER	GPMC_ECC_CONTROL	0–7	A write to this bit field selects the ECC result register where the first ECC computation is stored. Set to 1 by default.

Table 11-370. ECC Enable Settings (continued)

Bit Field	Register	Value	Comments
ECCSIZE1	GPMC_ECC_SIZE_CONFIG	0x00–0xFF	Defines ECCSIZE1
ECCSIZE0	GPMC_ECC_SIZE_CONFIG	0x00–0xFF	Defines ECCSIZE0
ECCjRESULTSIZE (j from 1 to 9)	GPMC_ECC_SIZE_CONFIG	0/1	Selects the size of ECCn result register
ECCENABLE	GPMC_ECC_CONFIG	1	Enables the ECC computation

11.3.4.12.3.1.3 ECC Computation

The ECC algorithm is a multiple parity bit accumulation computed on the odd and even bit streams extracted from the byte or Word16 streams. The parity accumulation is split into row and column accumulations, as shown in Figure 11-43 and Figure 11-44. The intermediate row and column parities are used to compute the upper level row and column parities. Only the final computation of each parity bit is used for ECC comparison and correction.

P1o = bit7 XOR bit5 XOR bit3 XOR bit1 on each byte of the data stream

P1e = bit6 XOR bit4 XOR bit2 XOR bit0 on each byte of the data stream

P2o = bit7 XOR bit6 XOR bit3 XOR bit2 on each byte of the data stream

P2e = bit5 XOR bit4 XOR bit1 XOR bit0 on each byte of the data stream

P4o = bit7 XOR bit6 XOR bit5 XOR bit4 on each byte of the data stream

P4e = bit3 XOR bit2 XOR bit1 XOR bit0 on each byte of the data stream

Each column parity bit is XORed with the previous accumulated value.

Figure 11-43. Hamming Code Accumulation Algorithm (1/2)

gpmc-026

For line parities, the bits of each new data are XORed together, and line parity bits are computed as described below:

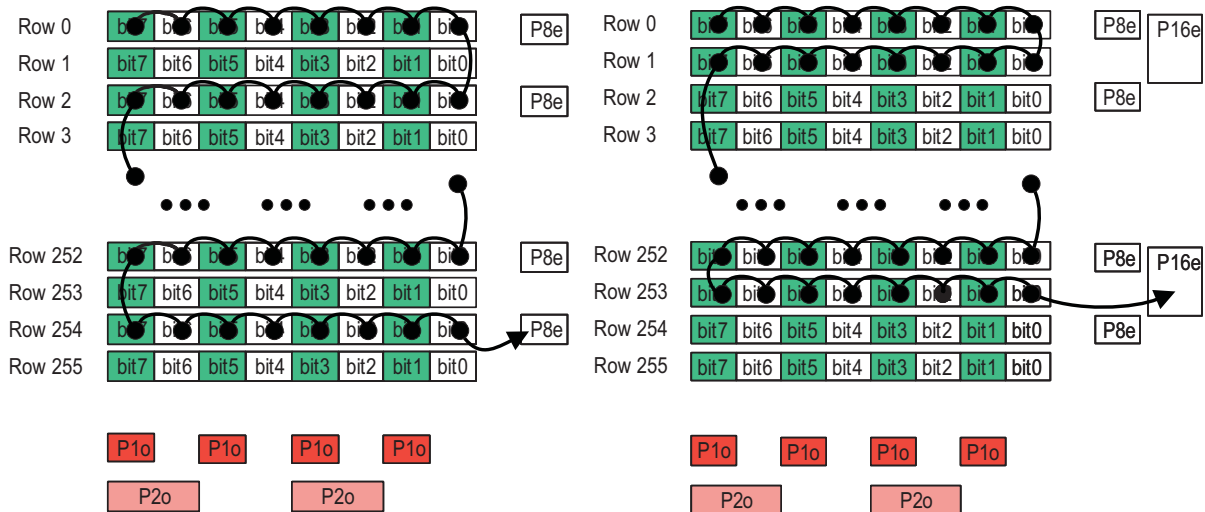

P8e = row0 XOR row2 XOR row4 XOR ... XOR row254

P8o = row1 XOR row3 XOR row5 XOR ... XOR row255

P16e = row0 XOR row1 XOR row4 XOR row5 XOR ... XOR row252 XOR row 253

P16o = row2 XOR row3 XOR row6 XOR row7 XOR ... XOR row254 XOR row 255

Figure 11-44. Hamming Code Accumulation Algorithm (2/2)

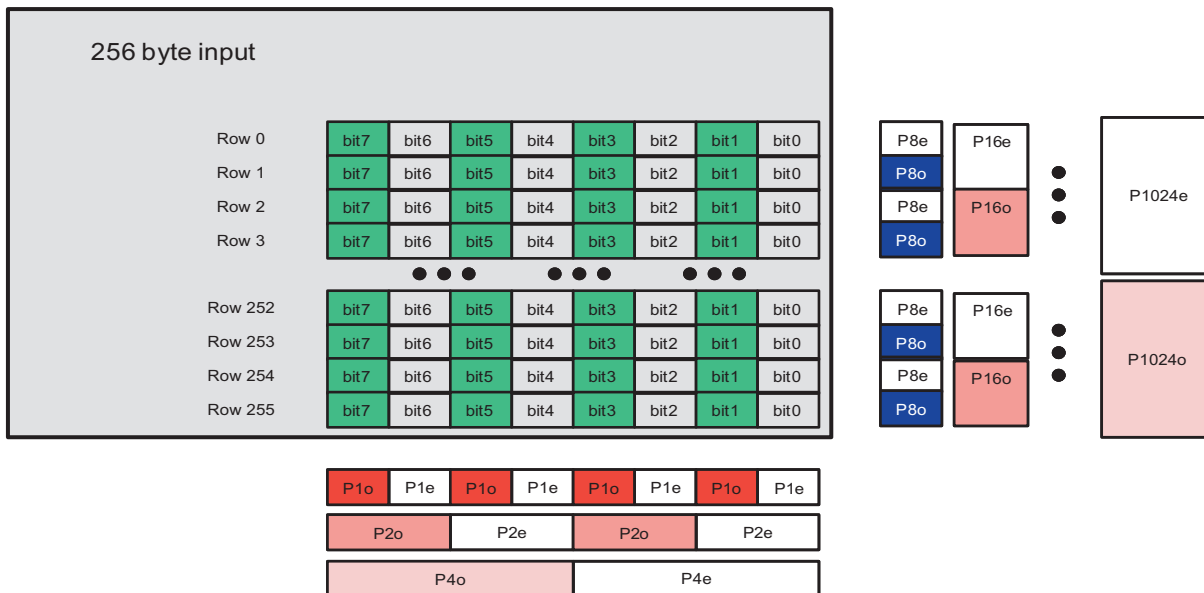

gpmc-027

Unused parity bits in the result registers are set to 0.

Figure 11-45 shows ECC computation for a 256-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and sixteen row parity bits (P8o-P16o-P32o--P1024o for odd parities, and P8e-P16e-P32e--P1024e for even parities).

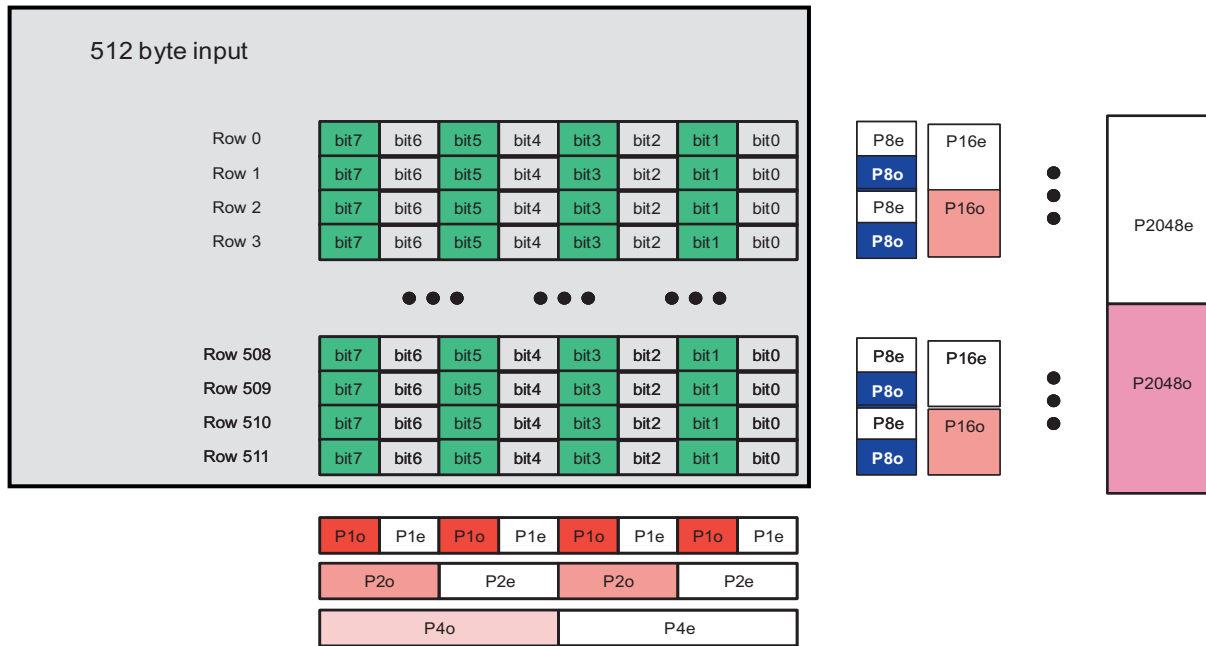

Figure 11-45. ECC Computation for a 256-Byte Data Stream (Read or Write)

gpmc-028

Figure 11-46 shows ECC computation for a 512-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and eighteen row parity bits (P8o-P16o-P32o--P1024o- - P2048o for odd parities, and P8e-P16e-P32e--P1024e- P2048e for even parities).

Figure 11-46. ECC Computation for a 512-Byte Data Stream (Read or Write)

gpmc-029

For a 2-KiB page, four 512 bytes ECC calculations plus 1 for the spare area are required. Results are stored in the [GPMC_ECCj_RESULT](#) registers (where j = 1 to 9).

11.3.4.12.3.1.4 ECC Comparison and Correction

To detect an error, the computed ECC result must be XORed with the parity value stored in the spare area of the accessed page.

- If the result of this logical XOR is all 0s, no error is detected and the read data is correct.
- If every second bit in the parity result is a 1, 1 bit is corrupted and is located at bit address (P2048o, P1024o, P512o, P256o, P128o, P64o, P32o, P16o, P8o, P4o, P2o, P1o). Software must correct the corresponding bit.
- If only 1 bit in the parity result is 1, it is an ECC error and the read data is correct.

11.3.4.12.3.1.5 ECC Calculation Based on 8-Bit Word

The 8-bit-based ECC computation is used for 8-bit-wide NAND device interfacing.

The 8-bit-based ECC computation can be used for 16-bit-wide NAND device interfacing to get backward compatibility on the error-handling strategy used with 8-bit-wide NAND devices. In this case, the 16-bit-wide data read from or written to the NAND device is fragmented into 2 bytes. According to little-endian access, the LSB of the 16-bit-wide data is ordered first in the byte stream used for 8-bit-based ECC computation.

11.3.4.12.3.1.6 ECC Calculation Based on 16-Bit Word

ECC computation based on an 16-bit word is used for 16-bit-wide NAND device interfacing. This ECC computation is not supported when interfacing an 8-bit-wide NAND device, and the [GPMC_ECC_CONFIG\[7\]](#) ECC16B bit must be set to 0 when interfacing an 8-bit-wide NAND device.

The parity computation based on 16-bit words affects the row and column parity mapping. The main difference is that the odd and even parity bits P8o and P8e are computed on rows for an 8-bit-based ECC and on columns for a 16-bit based ECC. [Figure 11-47](#) and [Figure 11-48](#) show a 128 Word16 ECC computation scheme and a 256 16-bit word ECC computation scheme.

Figure 11-47. 128 Word16 ECC Computation

gpmc-030

Figure 11-48. 256 Word16 ECC Computation

gpmc-031

11.3.4.12.3.2 BCH Code

All references to ECC in this subsection refer to the 4- to 16-bit error correction BCH code.

11.3.4.12.3.2.1 Requirements

1. Read and write accesses to a NAND flash take place by whole pages, in a predetermined sequence: first the data byte page itself, and then some spare bytes, including the BCH ECC (and other information). The NAND device can cache a full page, including spares, for read and write accesses.
 - Typical page write sequence:
 - Sequential write to NAND cache of main data plus spare data, for a page. ECC is calculated on the fly. Calculated ECC can be inserted on the fly in the spares or replaced by dummy

- accesses.
- When the calculated ECC is replaced by dummy accesses, it must be written to the cache in a second, separate phase. The ECC module is disabled during that time.
 - NAND writes its cache line (page) to the array.
- Typical page read sequence:
 - Sequential read of a page. ECC is calculated on the fly.
 - The status of the ECC module buffers determines the presence of errors.
2. Accesses to several memories can be interleaved by the GPMC, but only one of those memories at a time can be a NAND using the BCH engine; in other words, only one BCH calculation (for example, for a single page) can be ongoing at any time. The sequential nature of NAND accesses ensures that the data is always written or read out in the same order. BCH-relevant accesses are selected by the chip-selects of the GPMC.
 3. Each page can hold up to 4KiB of data, spare bytes not included. This means up to 8×512 -byte BCH messages. Because all the data is written or read out first, followed by the BCH ECC, the BCH engine must be able to hold eight 104-bit remainders or syndromes (or smaller, 52-bit ones) at the same time. The BCH module can store all remainders internally. After the page start, an internal counter is used to detect the 512-byte sector boundaries. On those boundaries, the current remainder is stored and the divider reset for the next calculation. At the end of the page, the BCH module contains all remainders.
 4. NAND access cycles hold 8 or 16 bits of data each (1 or 2 bytes); Each NAND cycle takes at least four cycles of the GPMC internal clock. This means the NAND flash timing parameters must define a RDCYCLETIME and a WRCYCLETIME of at least four clock cycles after optimization when using the BCH calculator.
 5. The spare area is assumed to be large enough to hold the BCH ECC; that is, to have a message of at least 13 bytes available per 512-byte sector of data. The zone of unused spare area by the ECC may or may not be protected by the same ECC scheme, by extending the BCH message beyond 512 bytes (the maximum codeword is 1023 bytes long, ECC included, which leaves much space to cover spare bytes).

11.3.4.12.3.2.2 Memory Mapping of BCH Codeword

BCH encoding considers a block of data to protect as a polynomial message $M(x)$. In a standard case, 512 bytes of data (that is, 2^{12} bits = 4096 bits) are seen as a polynomial of degree $2^{12} - 1 = 4095$, with parameters ranging from M_0 to M_{4095} . For 512 bytes of data, 52 bits are required for 4-bit error correction, 104 bits are required for 8-bit error correction, and 207 bits are required for 16-bit error correction. The ECC is a remainder polynomial $R(x)$ of degree 103 (or 51, depending on the selected mode). The complete codeword $C(x)$ is the concatenation of $M(x)$ and $R(x)$, as described in [Table 11-371](#).

Table 11-371. Flattened BCH Codeword Mapping (512 Bytes + 104 Bits)

Bit Number	Message $M(x)$			ECC $R(x)$		
	M_{4095}	...	M_0	R_{103}	...	R_0

If the message is extended by the addition of spare bytes to be protected by the same ECC, the principle is still valid. For example, a 3-byte extension of the message gives a polynomial message $M(x)$ of degree $((512 + 3) \times 8) - 1 = 4119$, for a total of $3 + 13 = 16$ spare bytes of spare, all protected as part of the same codeword.

The message and the ECC bits are manipulated and mapped in the GPMC byte-oriented system. The ECC bits are stored in the following registers (where $i = 0$ to 7):

- [GPMC_BCH_RESULT0_i](#)
- [GPMC_BCH_RESULT1_i](#)
- [GPMC_BCH_RESULT2_i](#)
- [GPMC_BCH_RESULT3_i](#)

11.3.4.12.3.2.1 Memory Mapping of Data Message

The data message mapping must follow the following rules:

- Bit endianness within a byte is little-endian; that is, the bytes LSB is also the lowest-degree polynomial parameter: a byte b7-b0 (with b0 the LSB) represents a segment of polynomial $b7 * x^{(7+i)} + b6 * x^{(6+i)} + \dots + b0 * x^i$
- The message is mapped in the NAND starting with the highest-order parameters, that is, in the lowest addresses of a NAND page.
- Byte endianness within the 16-bit words in the NAND is big-endian (that is, the same message mapped in 8- and 16-bit memories has the same content at the same byte address).

NOTE: The BCH module has no visibility over actual addresses. The most important point is the sequence of data words the BCH sees. However, the NAND page is always scanned incrementally in read and write accesses, which produces the mapping patterns described in the following.

Table 11-372 and Table 11-373 describe the mapping of the same 512-byte vector (typically, a BCH message) in the NAND memory space. The byte address is only an offset modulo 512 (0x200), because the same page may contain several contiguous 512-byte sectors (BCH blocks). The LSB and MSB are, respectively, the bits M0 and M(2¹²-1) of the codeword mapping discussed previously. In both cases the data vectors are aligned; that is, their boundaries coincide with the RAM data word boundaries.

Table 11-372. Aligned Message Byte Mapping in 8-Bit NAND

Byte Offset	8-Bit Word
0x000	(MSB) Byte 511 (0x1FF)
0x001	Byte 510 (0x1FE)
...	...
0x1FF	Byte 0 (0x0) (LSB)

Table 11-373. Aligned Message Byte Mapping in 16-Bit NAND

Byte Offset	16-Bit Word MSB	16-Bit Word LSB
0x000	Byte 510 (0x1FE)	(MSB) Byte 511 (0x1FF)
0x002	Byte 508 (0x1FC)	Byte 509 (0x1FD)
...
0x1FE	Byte 0 (0x0)	(LSB) Byte 1 (0x1)

Table 11-374 through list the mapping in memory of arbitrarily-sized messages, starting on access (byte or 16-bit word) boundaries for more clarity. Note that message may actually start and stop on arbitrary nibbles. A nibble is a 4-bit entity. The unused nibbles are not discarded, and they can still be used by the BCH module, but as part of the next message section (for example, on the ECC of another sector).

Table 11-374. Aligned Nibble Mapping of Message in 8-Bit NAND

Byte Offset	8-Bit Word	
	4-Bit Most Significant Nibble	4-Bit Least Significant Nibble
1	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-3	Nibble S-4
...
$S/2 - 2$	Nibble 3	Nibble 2
$S/2 - 1$	Nibble 1	Nibble 0 (LSB)

Table 11-375. Misaligned Nibble Mapping of Message in 8-Bit NAND

Byte Offset	8-Bit Word	
	4-Bit Most Significant Nibble	4-Bit Least Significant Nibble
1	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-3	Nibble S-4
...
$(S + 1) / 2 - 2$	Nibble 2	Nibble 1
$(S + 1) / 2 - 1$	Nibble 0 (LSB)	

Table 11-376. Aligned Nibble Mapping of Message in 16-Bit NAND

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Least Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...
$S/2 - 4$	Nibble 5	Nibble 4	Nibble 7	Nibble 6
$S/2 - 2$	Nibble 1	Nibble 0 (LSB)	Nibble 3	Nibble 2

Table 11-377. Misaligned Nibble Mapping of Message in 16-Bit NAND (1 Unused Nibble)

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Least Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...
$(S + 1) / 2 - 4$	Nibble 4	Nibble 3	Nibble 6	Nibble 5
$(S + 1) / 2 - 2$	Nibble 0 (LSB)		Nibble 2	Nibble 1

Table 11-378. Misaligned Nibble Mapping of Message in 16-Bit NAND (2 Unused Nibbles)

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Least Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...
$(S + 2) / 2 - 4$	Nibble 3	Nibble 2	Nibble 5	Nibble 4
$(S + 2) / 2 - 2$			Nibble 1	Nibble 0 (LSB)

Many other cases exist than those given in the previous tables; for example, where the message does not start on a word boundary.

11.3.4.12.3.2.2 Memory-Mapping of the ECC

The ECC (or remainder) is presented by the BCH module as a single 104-bit (or 52-bit), little-endian vector. Software must fetch those 13 bytes (or 6 bytes) from the module interface and then store them to the spare area (page write) in the NAND or to an intermediate buffer for comparison with the stored ECC (page read). There are no constraints on the ECC mapping inside the spare area: it is software-controlled.

It is advised, however, to maintain a coherence in the respective formats of the message or the ECC remainder once they have been read out of the NAND. The error correction algorithm works from the complete codeword (concatenated message and remainder) once an error is detected. The creation of this codeword must be made as straightforward as possible.

There are cases in which the same NAND access contains both data and the ECC protecting that data. This is the case when the data/ECC boundary (which can be on any nibble) does not coincide with an access boundary. The ECC is calculated on the fly following the write. In that case, the write must also contain part of the ECC because it is impossible to insert the ECC on the fly. Instead:

- During the initial page write (BCH encoding), the ECC is replaced by dummy bits. The BCH encoder is by definition turned OFF during the ECC section, so the BCH result is unmodified.
- During a second phase, the ECC is written to the correct location, next to the actual data.
- The completed line buffer is then written to the NAND array.

11.3.4.12.3.2.3 Wrapping Modes

For a given wrapping mode, the module automatically goes through a specific number of sections as data is being fed into the module. For each section, the BCH core can be enabled (in which case the data is fed to the BCH divider) or not (in which case the BCH simply counts to the end of the section). When enabled, the data is added to the ongoing calculation for a given sector number (for example, number 0).

Wrapping modes are described as follows. To better understand and see the real-life read and write sequences implemented with each mode, see [Section 11.3.4.12.3.2.3, Supported NAND Page Mappings and ECC Schemes](#).

For each mode:

- A sequence describes the mode in pseudo language, with, for each section, the size and the buffer used for ECC processing (if ON). The programmable lengths are size, size0, and size1.
- A checksum condition is given. If the checksum condition is not respected for a given mode, the module behavior is unpredictable. S is the number of sectors in the page; size0 and size1 are the section sizes programmed for the mode, in nibbles.

Wrapping modes 8 through 11 insert a 1-nibble padding where the BCH processing is OFF. This is intended for $t = 4$ ECC, where ECC is 6 bytes long and the ECC area is expected to include (at least) 1 unused nibble to remain byte-aligned.

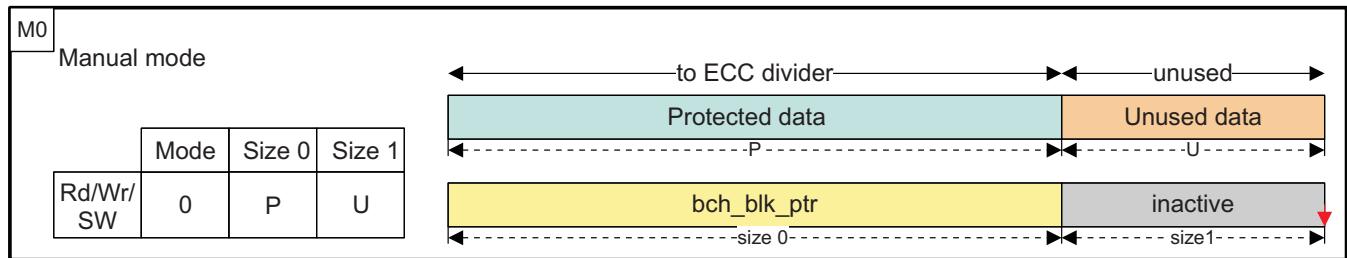

11.3.4.12.3.2.4 Manual Mode (0x0)

This mode is intended for short sequences, added manually to a given buffer through the software data port input. A complete page may be built out of several such sequences.

To process an arbitrary sequence of 4-bit nibbles, accesses to the software data port, containing the appropriate data, must be made. If the sequence end does not coincide with an access boundary (for example, to process 5 nibbles = 20 bits in 16-bit access mode) and those nibbles must be skipped, a number of unused nibbles must be programmed in `GPMC_ECC_SIZE_CONFIG[29:22] ECCSIZE1`. In the same example, 5 nibbles to process + 3 to discard = 8 nibbles = 2 × 16-bit accesses. Software must set:

- `GPMC_ECC_SIZE_CONFIG[19:12] ECCSIZE0 = 0x5`
- `GPMC_ECC_SIZE_CONFIG[29:22] ECCSIZE1 = 0x3`

NOTE: In the following figures, size and size0 are the same parameter.

Figure 11-49. Manual Mode Sequence and Mapping

gpmc-032

Section processing sequence:

- One time with buffer
 - size0 nibbles of data, processing ON
 - size1 nibbles of unused data, processing OFF

Checksum: size0 + size1 nibbles must fit in a whole number of accesses.

In the following sections, S is the number of sectors in the page.

11.3.4.12.3.2.2.5 Mode 0x1

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
 - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S – (size0 + size1)

11.3.4.12.3.2.2.6 Mode 0xA (10)

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
 - 1 nibble pad spare, processing OFF
 - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S – (size0 + 1 + size1)

11.3.4.12.3.2.2.7 Mode 0x2

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing OFF
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S – (size0 + size1)

11.3.4.12.3.2.2.8 Mode 0x3

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- One time with buffer 0
 - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S – size1)

11.3.4.12.3.2.2.9 Mode 0x7

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- One time with buffer 0
 - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
 - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = size0 + (S – size1)

11.3.4.12.3.2.2.10 Mode 0x8

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- One time with buffer 0
 - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
 - 1 nibble padding spare, processing OFF
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S – (1 + size1))

11.3.4.12.3.2.2.11 Mode 0x4

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- One time (no buffer used)
 - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S – size1)

11.3.4.12.3.2.2.12 Mode 0x9

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON

- One time (no buffer used)
 - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
 - 1 nibble padding spare, processing OFF
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S – (1 + size1))

11.3.4.12.3.2.2.13 Mode 0x5

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S – (size0 + size1)

11.3.4.12.3.2.2.14 Mode 0xB (11)

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
 - 1 nibble padding spare, processing OFF
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S – (size0 + 1 + size1)

11.3.4.12.3.2.2.15 Mode 0x6

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
 - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S – (size0 + size1)

11.3.4.12.3.2.3 Supported NAND Page Mappings and ECC Schemes

The following rules apply to the entire mapping description:

- Main data area (sectors) size is hardcoded to 512 bytes.
- Spare area size is programmable.
- All page sections (of main area data bytes, protected spare bytes, unprotected spare bytes, and ECC) are defined as explained in [Section 11.3.4.12.3.2.1, Memory Mapping of Data Message](#).

Each of the following sections gives a NAND page mapping example (per-sector spare mappings, pooled spare mapping, per-sector spare mapping, with ECC separated at the end of the page).

In the mapping diagrams, sections that belong to the same BCH codeword have the same color (blue or green); unprotected sections are not covered (orange) by the BCH scheme.

Below each mapping diagram, a write (encoding) and read (decoding: syndrome generation) sequence is given, with the number of the active buffers at each point in time (yellow). In the inactive zones (grey), no computing is taking place but the data counter is still active.

In [Figure 11-50](#) through [Figure 11-52](#), the tables on the left summarize the mode, size0, and size1 parameters to program for, respectively, write and read processing of a page, with the given mapping, where:

- P is the size of spare byte section Protected by the ECC (in nibbles)
- U is the size of spare byte section Unprotected by the ECC (in nibbles)
- E is the size of the ECC (in nibbles)
- S is the number of Sectors per page (two in the current diagrams)

Each time the processing of a BCH block is complete (ECC calculation for write/encoding, syndrome generation for read/decoding, indicated by red arrows), the update pointer is pulsed. The processing for block 0 can be the first or the last to complete, depending on the NAND page mapping and operation (read or write). All examples show a page size of 1 KiB + spares; that is, $S = 2$ sectors of 512 bytes. The same principles can be extended to larger pages by adding more sectors.

The actual BCH codeword size is used during the error location work to restrict the search range: by definition, errors can happen only in the codeword that was actually written to the NAND, not in the mathematical codeword of $n = 2^{13} - 1 = 8191$ bits; that codeword (higher-order bits) is all-zero and implicit during computations.

The actual BCH codeword size depends on the mode, the programmed sizes, and the sector number (all sizes in nibbles):

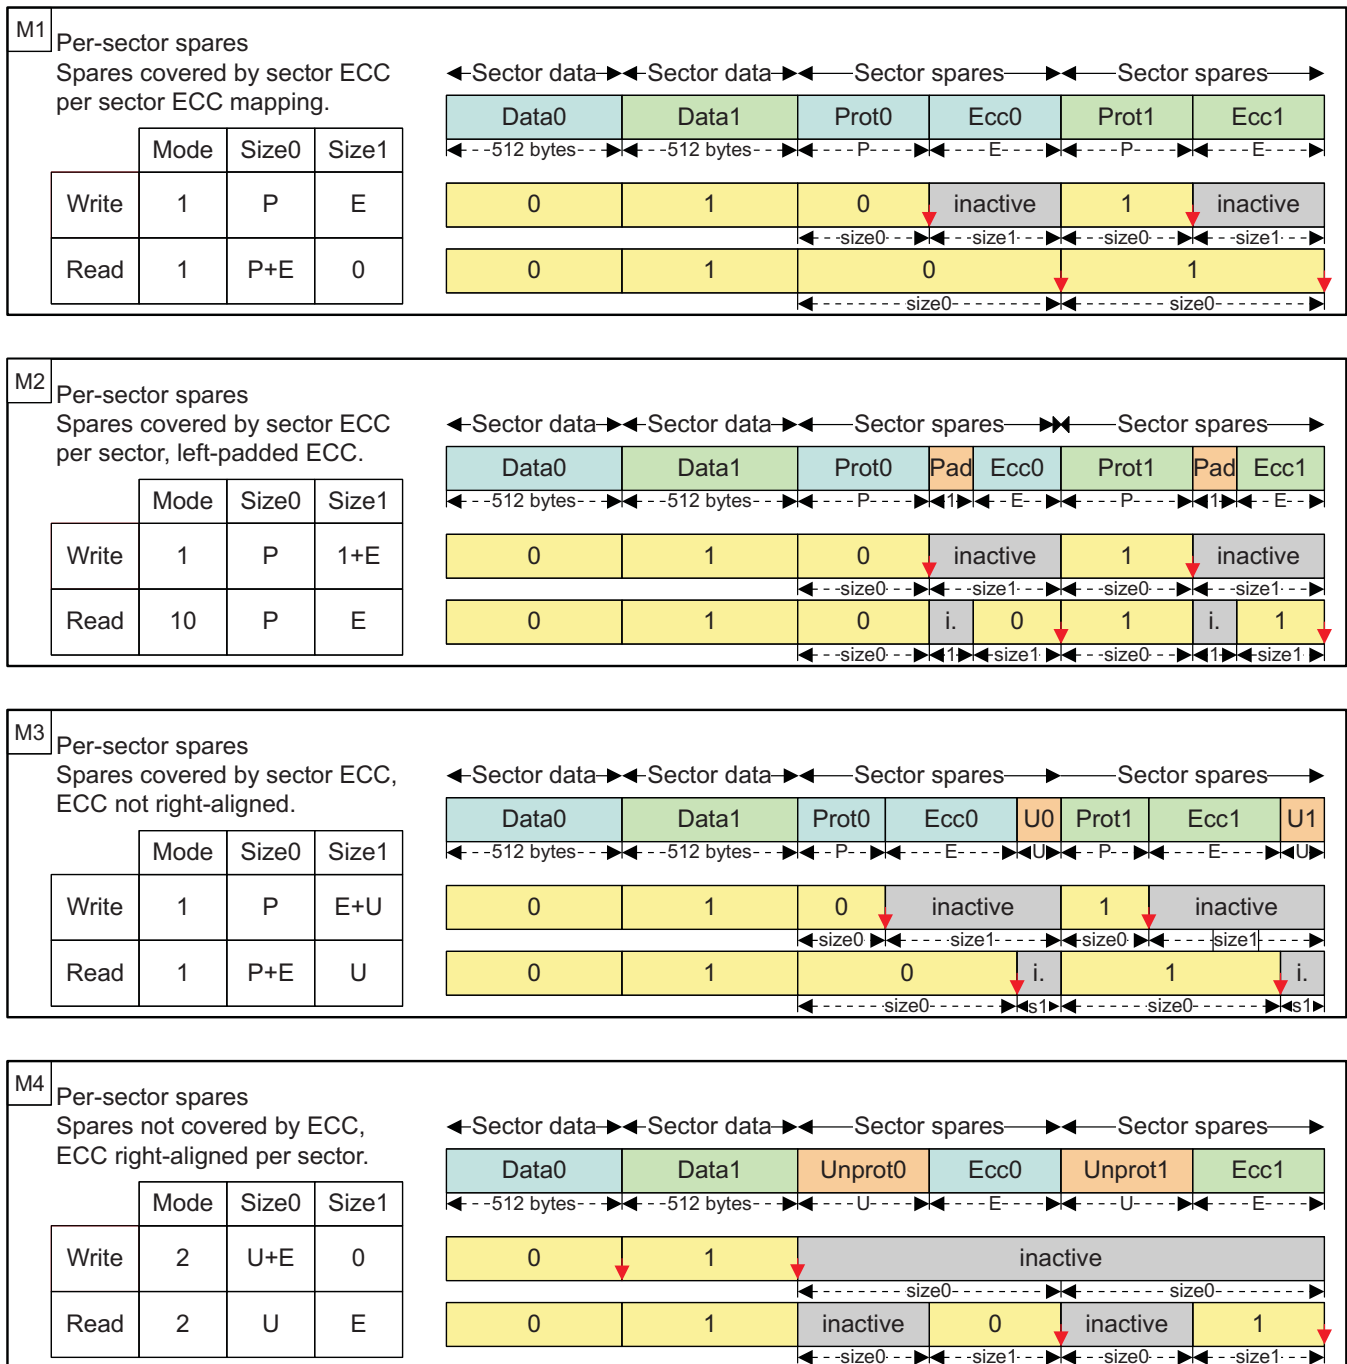

- Spares mapped and protected per sector (below: see M1-M2-M3-M9-M10):
 - All sectors: $(512) + P + E$
- Spares pooled and protected by sector 0 (below: see M5-M6):
 - Sector 0 codeword: $(512) + P + E$
 - Other sectors: $(512) + E$
- Unprotected spares (below: see M4-M7-M8-M11-M12):
 - All codewords $(512) + E$

11.3.4.12.3.2.3.1 Per-Sector Spare Mappings

In these schemes, each 512-byte sector of the main area has its own dedicated section of the spare area. The spare area of each sector is composed of:

- ECC, which must be located after the data it protects
- Other data, which may or may not be protected by the ECC for its sector.

Figure 11-50. NAND Page Mapping and ECC: Per-Sector Schemes

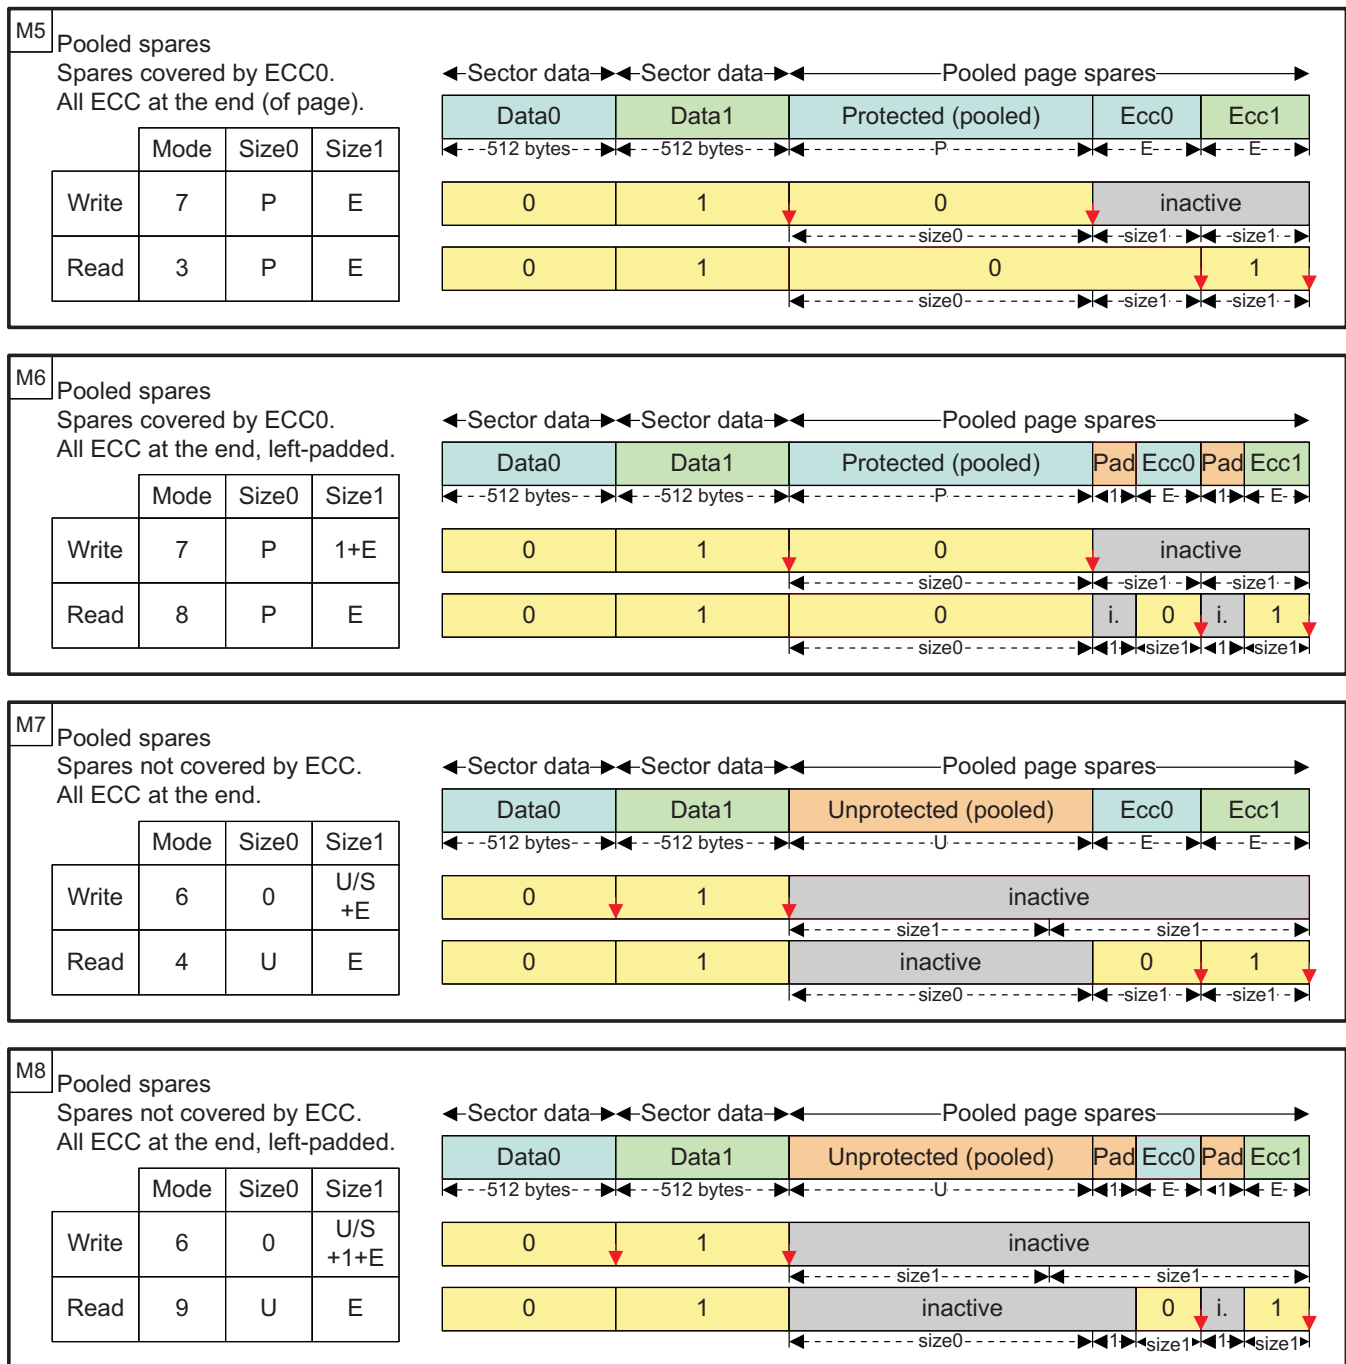

gpmc-033

11.3.4.12.3.2.3.2 Pooled Spare Mapping

In the following schemes, the spare area is pooled for the page.

- The ECC of each sector is aligned at the end of the spare area.
- The non-ECC spare data may or may not be covered by the ECC of sector 0.

Figure 11-51. NAND Page Mapping and ECC: Pooled Spare Schemes

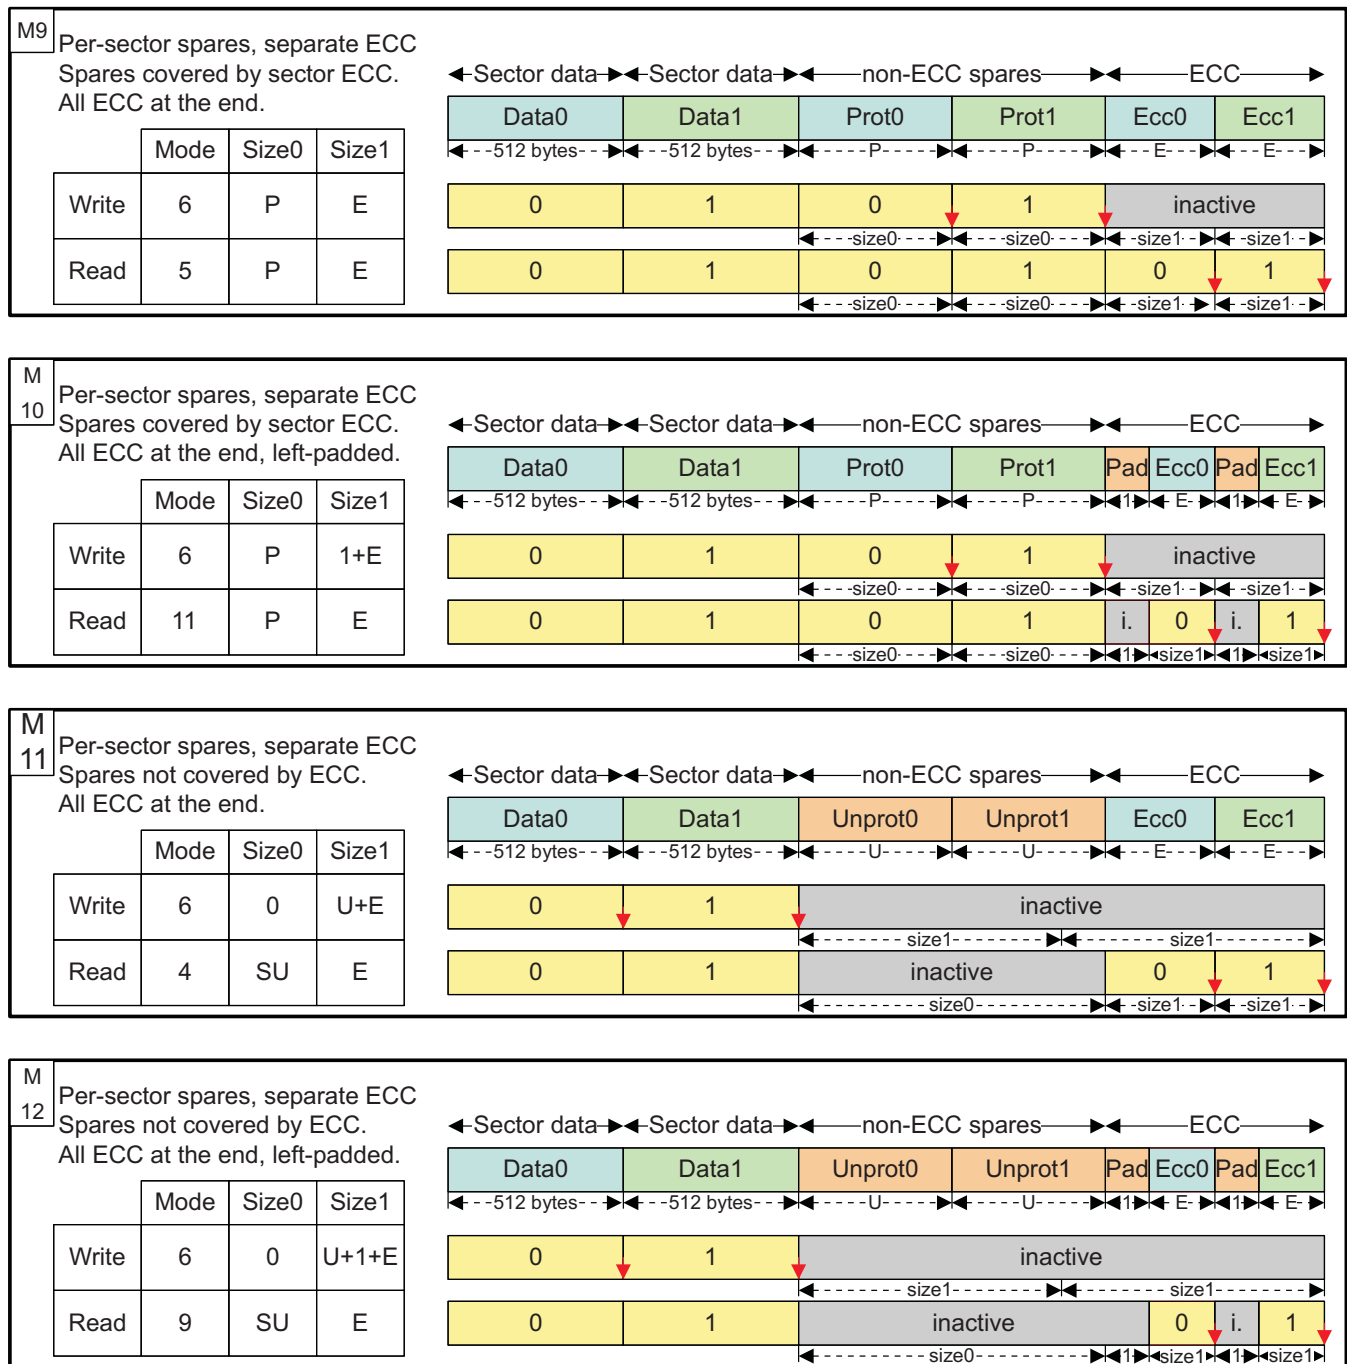

gpmc-034

11.3.4.12.3.2.3.3 Per-Sector Spare Mapping, with ECC Separated at the End of the Page

In these schemes, each 512-byte sector of the main area is associated with two sections of the spare area.

- ECC section, all aligned at the end of the page
- Other data section, aligned before the ECCs, each of which may or may not be protected by the ECC for its sector.

Figure 11-52. NAND Page Mapping and ECC: Per-Sector Schemes, With Separate ECC

gpmc_035

11.3.4.12.4 Prefetch and Write-Posting Engine

NAND device data access cycles are usually much slower than the IPU system frequency; such NAND read or write accesses issued by the processor affect the overall system performance, especially considering long read or write sequences required for NAND page loading or programming. To minimize this effect on system performance, the GPMC includes a prefetch and write-posting engine, which can be used to read from or write to any chip-select location in a buffered manner.

The prefetch and write-posting engine is a simplified embedded-access requester that presents requests to the access engine on a user-defined chip-select target. The access engine interleaves these requests with any request coming from the L3 interface; as a default, the prefetch and write-posting engine has the lowest priority.

The prefetch and write-posting engine is dedicated to data-stream access (as opposed to random data access); thus, it is primarily dedicated to NAND support. The engine does not include an address generator; the request is limited to chip-select target identification. It includes a 64-byte FIFO associated with a DMA request synchronization line, for optimal DMA-based use.

The prefetch and write-posting engine uses an embedded 64-byte (32 16-bit word) FIFO to prefetch data from the NAND device in read mode (prefetch mode) or to store host data to be programmed into the NAND device in write mode (write-posting mode). The FIFO draining and filling (read and write) can be controlled by a device host processor through interrupt synchronization (an interrupt is triggered whenever a programmable threshold is reached) or by a device DMA module through DMA request synchronization, with a programmable request byte size in prefetch or posting mode.

The prefetch and write-posting engine includes a single memory pool. Therefore, only one mode, read or write, can be used at any given time. In other words, the prefetch and write-posting engine is a single-context engine that can be allocated to only one chip-select at a time for a read prefetch or a write-posting process.

The engine does not support atomic command and address phase programming and is limited to linear memory read or write access. As a consequence, it is limited to NAND data-stream access. The engine relies on the NAND software driver to control block and page opening with the correct data address pointer initialization, before the engine can read from or write to the NAND memory device.

Once started, engine data read and write sequencing is based solely on FIFO location availability and until the total programmed number of bytes is read or written.

Any host-concurrent accesses to a different chip-select are correctly interleaved with ongoing engine accesses. The engine has the lowest priority access so that host accesses to a different chip-select do not suffer a large latency.

A round-robin arbitration scheme can be enabled to ensure minimum bandwidth to the prefetch and write-posting engine in the case of back-to-back direct memory requests to a different chip-select. If the [GPMC_PREFETCH_CONFIG1\[23\] PFPWENROUNDROBIN](#) bit is enabled, the arbitration grants the prefetch and write posting engine access to the GPMC bus for a number of requests programmed in the [GPMC_PREFETCH_CONFIG1\[19:16\] PFPWWEIGHTEDPRIO](#) bit field.

The prefetch/write-posting engine read or write request is routed to the access engine with the chip-select destination ID. After the required arbitration phase, the access engine processes the request as a single access with the data access size equal to the device size specified in the corresponding chip-select configuration.

NOTE: The destination chip-select configuration must be set to the NAND protocol-compatible configuration for which address lines are not used (the address bus is not changed from its current value). Selecting a different chip-select configuration can produce undefined behavior.

11.3.4.12.4.1 General Facts About the Engine Configuration

The engine can be configured only if the [GPMC_PREFETCH_CONTROL\[0\] STARTENGINE](#) bit is deasserted.

The engine must be correctly configured in prefetch or write-posting mode and must be linked to a NAND chip-select before it can be started. The chip-select is linked using the [GPMC_PREFETCH_CONFIG1\[26:24\] ENGINECSSELECTOR](#) bit field.

In prefetch and write-posting modes, the engine uses byte or 16-bit word access requests, respectively, for an 8- or 16-bit-wide NAND device attached to the linked chip-select. The [FIFOTHRESHOLD](#) and [TRANSFERCOUNT](#) bit fields must be programmed accordingly as a number of bytes.

When the [GPMC_PREFETCH_CONFIG1\[7\] ENABLEENGINE](#) bit is set, the FIFO entry on the L3 interconnect port side is accessible at any address in the associated chip-select memory region. When the [ENABLEENGINE](#) bit is set, any host access to this chip-select is rerouted to the FIFO input. Directly accessing the NAND device linked to this chip-select from the host is still possible through the following registers (where $i = 0$ to 7):

- [GPMC_NAND_COMMAND_i](#)
- [GPMC_NAND_ADDRESS_i](#)
- [GPMC_NAND_DATA_i](#)

The FIFO entry on the L3 interconnect port can be accessed with byte, 16-bit word, or 32-bit word access size, according to little-endian format, even though the FIFO input is 32 bits wide.

The FIFO control is made easier through the use of interrupts or DMA requests associated with the [FIFOTHRESHOLD](#) bit field. The [GPMC_PREFETCH_STATUS\[30:24\] FIFOPINTER](#) bit field monitors the number of available bytes to be read in prefetch mode or the number of free empty slots that can be written in write-posting mode. The [GPMC_PREFETCH_STATUS\[13:0\] COUNTVALUE](#) bit field monitors the number of remaining bytes to be read or written by the engine according to the value of the [TRANSFERCOUNT](#) bit field. The [FIFOPINTER](#) and [COUNTVALUE](#) bit fields are always expressed as a number of bytes even if a 16-bit-wide NAND device is attached to the linked chip-select.

In prefetch mode, when the [FIFOPINTER](#) equals 0 (that is, the FIFO is empty), a host read access receives the byte last read from the FIFO as its response. In case of 32-bit word or 16-bit word read accesses, the last byte read from the FIFO is copied the required number of times to fit the requested word size. In write-posting mode, when the [FIFOPINTER](#) equals 0 (that is, the FIFO is full), a host write overwrites the last FIFO byte location. There is no underflow or overflow error reporting in the GPMC.

11.3.4.12.4.2 Prefetch Mode

The prefetch mode is selected when the [GPMC_PREFETCH_CONFIG1\[0\] ACCESSMODE](#) bit is cleared.

The NAND software driver must issue the block and page opening (READ) command with the correct data address pointer initialization before the engine can be started to read from the NAND memory device. The engine is started by asserting the [GPMC_PREFETCH_CONTROL\[0\] STARTENGINE](#) bit. The [STARTENGINE](#) bit automatically clears when the prefetch process completes.

If required, the ECC calculator engine must be initialized (that is, reset, configured, and enabled) before the prefetch engine is started so that the ECC is computed correctly on all data read by the prefetch engine.

When the [GPMC_PREFETCH_CONFIG1\[3\] SYNCHROMODE](#) bit is cleared, the prefetch engine starts requesting data as soon as the [STARTENGINE](#) bit is set. If using this configuration, the host must monitor the NAND device-ready pin so that it sets the [STARTENGINE](#) bit only when the NAND device is in a ready state (that is, data is valid for prefetching).

When the [SYNCHROMODE](#) bit is set, the prefetch engine starts requesting data when an active-to-inactive [WAIT](#) signal transition is detected. The transition detector must be cleared before any transition detection (see [Section 11.3.4.12.2.2, Ready Pin Monitored by Hardware Interrupt](#)). The [GPMC_PREFETCH_CONFIG1\[5:4\] WAITPINSELECTOR](#) bit field selects which `gpmc_wait` pin edge detector triggers the prefetch engine in this synchronized mode.

If the [STARTENGINE](#) bit is set after the NAND address phase (page opening command), the engine is effectively started only after the actual NAND address phase completion. To prevent GPMC stall during this NAND address phase, set the [STARTENGINE](#) bit before NAND address phase completion when in synchronized mode. The prefetch engine starts when an active-to-inactive [WAIT](#) signal transition is detected. The [STARTENGINE](#) bit is automatically cleared on prefetch process completion.

The prefetch engine issues a read request to fill the FIFO with the amount of data specified by the [GPMC_PREFETCH_CONFIG2\[13:0\] TRANSFERCOUNT](#) bit field.

[Table 11-380](#) describes the prefetch mode configuration.

Table 11-380. Prefetch Mode Configuration

Bit Field	Register	Value	Comments
STARTENGINE	GPMC_PREFETCH_CONTROL [0]	0	Prefetch engine can be configured only if STARTENGINE is set to 0.
ENGINECSSELECTOR	GPMC_PREFETCH_CONFIG1 [26:24]	0 to 3	Selects the chip-select associated with a NAND device where the prefetch engine is active.
ACCESSMODE	GPMC_PREFETCH_CONFIG1 [0]	0	Selects prefetch mode
FIFOTHRESHOLD	GPMC_PREFETCH_CONFIG1 [14:8]		Selects the maximum number of bytes read or written by the host on DMA or interrupt request
TRANSFERCOUNT	GPMC_PREFETCH_CONFIG2 [13:0]		Selects the number of bytes to be read or written by the engine to the selected chip-select
SYNCHROMODE	GPMC_PREFETCH_CONFIG1 [3]	0/1	Selects when the engine starts the access to the chip-select
WAITPINSELECT	GPMC_PREFETCH_CONFIG1 [17:16]	0 to 1	Selects wait pin edge detector (if GPMC_PREFETCH_CONFIG1 [3] SYNCHROMODE = 0x1)
ENABLEOPTIMIZEDACCESS	GPMC_PREFETCH_CONFIG1 [27]	0/1	See Section 11.3.4.12.4.6, Optimizing NAND Access Using the Prefetch and Write-Posting Engine .
CYCLEOPTIMIZATION	GPMC_PREFETCH_CONFIG1 [30:28]		Number of clock cycle removed to timing parameters
ENABLEENGINE	GPMC_PREFETCH_CONFIG1 [7]	1	Engine enabled
STARTENGINE	GPMC_PREFETCH_CONTROL [0]	1	Starts the prefetch engine

11.3.4.12.4.3 FIFO Control in Prefetch Mode

The FIFO can be drained directly by a device host processor or a DMA module channel.

In draining mode, the FIFO status can be monitored through the [GPMC_PREFETCH_STATUS](#)[30:24] FIFOPointer bit field or through the [GPMC_PREFETCH_STATUS](#)[16] FIFOTHRESHOLDSTATUS bit. The FIFOPointer indicates the current number of available data to be read; FIFOTHRESHOLDSTATUS set to 1 indicates that at least FIFOTHRESHOLD bytes are available from the FIFO.

An interrupt can be triggered by the GPMC if the [GPMC_IRQENABLE](#)[0] FIFOEVENTENABLE bit is set. The FIFO interrupt event is logged, and the [GPMC_IRQSTATUS](#)[0] FIFOEVENTSTATUS bit is set. To clear the interrupt, all the available bytes must be read, or at least enough bytes to get below the programmed FIFO threshold, and the FIFOEVENTSTATUS bit must be cleared to enable further interrupt events. The FIFOEVENTSTATUS bit must always be reset before asserting the FIFOEVENTENABLE bit to clear any out-of-date logged interrupt event. This interrupt generation must be enabled after enabling the STARTENGINE bit.

Prefetch completion can be monitored through the [GPMC_PREFETCH_STATUS](#)[13:0] COUNTVALUE bit field. COUNTVALUE indicates the number of currently remaining data to be requested according to the TRANSFERCOUNT value. An interrupt can be triggered by the GPMC when the prefetch process is complete (that is, COUNTVALUE equals 0) if the [GPMC_IRQENABLE](#)[1] TERMINALCOUNTEVENTENABLE bit is set. At prefetch completion, the TERMINALCOUNT interrupt event is also logged, and the [GPMC_IRQSTATUS](#)[1] TERMINALCOUNTSTATUS bit is set. To clear the interrupt, the TERMINALCOUNTSTATUS bit must be cleared. The TERMINALCOUNTSTATUS bit must always be cleared prior to asserting the TERMINALCOUNTEVENTENABLE bit to clear any out-of-date logged interrupt event.

NOTE: The COUNTVALUE value is valid only when the prefetch engine is active (started), and an interrupt is only triggered when COUNTVALUE reaches 0, that is, when the prefetch engine automatically goes from an active to an inactive state.

The number of bytes to be prefetched (programmed in TRANSFERCOUNT) must be a multiple of the programmed FIFOTHRESHOLD to trigger the correct number of interrupts allowing a deterministic and transparent FIFO control. If this guideline is respected, the number of ISR accesses is always required and the FIFO is always empty after the last interrupt is triggered. In other cases, the TERMINALCOUNT interrupt must be used to read the remaining bytes in the FIFO (the number of remaining bytes being lower than the FIFOTHRESHOLD value).

In DMA draining mode, the [GPMC_PREFETCH_CONFIG1\[2\]](#) DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOTHRESHOLD bytes are ready to be read from the FIFO. The DMA channel that owns this DMA request must be programmed so that the number of bytes programmed in FIFOTHRESHOLD is read from the FIFO during the DMA request process. The DMA request is kept active until this number of bytes has effectively been read from the FIFO, and no other DMA request can be issued until the ongoing active request is complete.

In prefetch mode, the TERMINALCOUNT event is also a source of DMA requests if the number of bytes to be prefetched is not a multiple of FIFOTHRESHOLD, the remaining bytes in the FIFO can be read by the DMA channel using the last DMA request. This assumes that the number of remaining bytes to be read is known and controlled through the DMA channel programming model.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive-to-active prefetch (the STARTENGINE bit is set to 1). The associated DMA channel must always be enabled after setting the STARTENGINE bit so that the out-of-date active DMA request does not trigger spurious DMA transfers.

11.3.4.12.4.4 Write-Posting Mode

The write-posting mode is selected when the [GPMC_PREFETCH_CONFIG1\[0\]](#) ACCESSMODE bit is set.

The NAND software driver must issue the correct address pointer initialization command (page program) before the engine can start writing data into the NAND memory device. The engine starts when the [GPMC_PREFETCH_CONTROL\[0\]](#) STARTENGINE bit is set to 1. The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the NAND software driver must issue the second cycle program command and monitor the status for programming process completion (adding ECC handling, if required).

If used, the ECC calculator engine must be started (configured, reset, and enabled) before the posting engine is started so that the ECC parities are calculated properly on all data written by the prefetch engine to the associated chip-select.

In write-posting mode, the [GPMC_PREFETCH_CONFIG1\[3\]](#) SYNCHROMODE bit must be cleared so that posting starts as soon as the STARTENGINE bit is set and the FIFO is not empty.

If the STARTENGINE bit is set after the NAND address phase (page program command), the STARTENGINE setting is effective only after the actual NAND command completion. To prevent GPMC stall during this NAND command phase, set the STARTENGINE bit field before the NAND address completion and ensure that the associated DMA channel is enabled after the NAND address phase.

The posting engine issues a write request when valid data are available from the FIFO and until the programmed [GPMC_PREFETCH_CONFIG2\[13:0\]](#) TRANSFERCOUNT accesses are complete.

The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the NAND software driver must issue the second cycle program command and monitor the status for programming process completion. The closing program command phase must be issued only when the full NAND page has been written into the NAND flash write buffer, including the spare area data and the ECC parities, if used.

[Table 11-381](#) describes the write-posting configuration.

Table 11-381. Write-Posting Mode Configuration

Bit Field	Register	Value	Comments
STARTENGINE	GPMC_PREFETCH_CONTROL[0]	0	Write-posting engine can be configured only if STARTENGINE is set to 0.

ENGINECSSELECTOR	GPMC_PREFETCH_CONFIG1 [26:24]	0 to 3	Selects the chip-select associated with a NAND device where the prefetch engine is active
ACCESSMODE	GPMC_PREFETCH_CONFIG1 [0]	1	Selects write-posting mode
FIFOTHRESHOLD	GPMC_PREFETCH_CONFIG1 [14:8]		Selects the maximum number of bytes read or written by the host on DMA or interrupt request
TRANSFERCOUNT	GPMC_PREFETCH_CONFIG2 [13:0]		Selects the number of bytes to be read or written by the engine from/to the selected chip-select
SYNCHROMODE	GPMC_PREFETCH_CONFIG1 [3]	0	Engine starts the access to chip-select as soon as STARTENGINE is set.
ENABLEOPTIMIZEDACCESS	GPMC_PREFETCH_CONFIG1 [27]	0/1	See Section 11.3.4.12.4.6, Optimizing NAND Access Using the Prefetch and Write-Posting Engine.
CYCLOPTIMIZATION	GPMC_PREFETCH_CONFIG1 [30:28]		
ENABLEENGINE	GPMC_PREFETCH_CONFIG1 [7]	1	Engine enabled
STARTENGINE	GPMC_PREFETCH_CONTROL [0]	1	Starts the prefetch engine

11.3.4.12.4.5 FIFO Control in Write-Posting Mode

The FIFO can be filled directly by a device host processor or a DMA module channel.

In filling mode, the FIFO status can be monitored through the FIFOPOINTER or through the [GPMC_PREFETCH_STATUS](#)[16] FIFOTHRESHOLDSTATUS bit. FIFOPOINTER indicates the current number of available free byte places in the FIFO, and the FIFOTHRESHOLDSTATUS bit, when set, indicates that at least FIFOTHRESHOLD free byte places are available in the FIFO.

An interrupt can be issued by the GPMC if the [GPMC_IRQENABLE](#)[0] FIFOEVENTENABLE bit is set. When the interrupt is fired, the [GPMC_IRQSTATUS](#)[0] FIFOEVENTSTATUS bit is set. To clear the interrupt, enough bytes must be written to fill the FIFO or to get below the programmed threshold, and the FIFOEVENTSTATUS bit must be cleared to get further interrupt events. The FIFOEVENTSTATUS bit must always be cleared before asserting the FIFOEVENTENABLE bit to clear any out-of-date logged interrupt event. This interrupt must be enabled after enabling the STARTENGINE bit.

The posting completion can be monitored through the [GPMC_PREFETCH_STATUS](#)[13:0] COUNTVALUE bit field. COUNTVALUE indicates the current number of remaining data to be written based on the value of the TRANSFERCOUNT bit field. An interrupt is issued by the GPMC when the write-posting process completes (that is, COUNTVALUE equal to 0) if the [GPMC_IRQENABLE](#)[1] TERMINALCOUNTEVENTENABLE bit is set. When the interrupt is fired, the [GPMC_IRQSTATUS](#)[1] TERMINALCOUNTSTATUS bit is set. To clear the interrupt, the TERMINALCOUNTSTATUS bit must be cleared. The TERMINALCOUNTSTATUS bit must always be cleared before asserting the TERMINALCOUNTEVENTENABLE bit to clear any out-of-date logged interrupt event.

NOTE: The value of the COUNTVALUE bit field is valid only if the write-posting engine is active and started, and an interrupt is issued only when COUNTVALUE reaches 0; that is, when the posting engine automatically goes from active to inactive.

In DMA filling mode, the DMAMode bit field in the [GPMC_PREFETCH_CONFIG1](#)[2] DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOTHRESHOLD bytes-free places are available in the FIFO. The DMA channel that owns this DMA request must be programmed so that a number of bytes equal to the value programmed in the FIFOTHRESHOLD bit field are written into the FIFO during the DMA access. The DMA request remains active until the associated number of bytes has effectively been written into the FIFO, and no other DMA request can be issued until the ongoing active request completes.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive-to-active prefetch (STARTENGINE set to 1). The associated DMA channel must always be enabled after setting the STARTENGINE bit so that an out-of-date active DMA request does not trigger spurious DMA transfers.

In write-posting mode, the DMA or IPU fills the FIFO with no consideration for the associated byte enables. Any byte stored in the FIFO is written into the memory device.

11.3.4.12.4.6 Optimizing NAND Access Using the Prefetch and Write-Posting Engine

Access time to a NAND memory device can be optimized for back-to-back accesses if the associated nCS signal is not deasserted between accesses. The GPMC access engine can track prefetch engine accesses to optimize the access timing parameter programmed for the allocated chip-select, if no accesses to other chip-selects (that is, interleaved accesses) occur. Similarly, the access engine also eliminates CYCLE2CYCLEDELAY even if CYCLE2CYCLESAMECSSEN is set. This capability is limited to the prefetch and write-posting engine accesses, and accesses to a NAND memory device (through the defined chip-select memory region or through the [GPMC_NAND_DATA_i](#) location, where $i = 0$ to 7) are never optimized.

The [GPMC_PREFETCH_CONFIG1](#)[27] ENABLEOPTIMIZEDACCESS bit must be set to enable optimized accesses. To optimize access time, the [GPMC_PREFETCH_CONFIG1](#)[30:28] CYCLEOPTIMIZATION bit field defines the number of GPMC_FCLK cycles to be suppressed from the following timing parameters:

- RDCYCLETIME
- WRCYCLETIME
- RDACCESSTIME
- WRACCESSTIME
- CSOFFTIME
- ADVOFFTIME
- OEOFFTIME
- WEOFFTIME

[Figure 11-53](#) shows that in the case of back-to-back accesses to the NAND flash through the prefetch engine, CYCLE2CYCLESAMECSSEN is forced to 0 when using optimized accesses. The first access uses the regular timing settings for this chip-select. All accesses after this one use settings reduced by x clock cycles, x being defined by the [GPMC_PREFETCH_CONFIG1](#)[30:28] CYCLEOPTIMIZATION bit field.

Figure 11-53. NAND Read Cycle Optimization Timing Description

11.3.4.12.4.7 Interleaved Accesses Between Prefetch and Write-Posting Engine and Other Chip-Selects

Any on-going read or write access from the prefetch and write-posting engine is completed before an access to any other chip-select can be initiated. As a default, the arbiter uses a fixed-priority algorithm, and the prefetch and write-posting engine has the lowest priority. The maximum latency added to access starting time in this case equals the RDCYCLETIME or WRCYCLETIME (optimized or not) plus the requested BUSTURNAROUND delay for bus turnaround completion programmed for the chip-select to which the NAND device is connected.

Alternatively, a round-robin arbitration can be used to prioritize accesses to the external bus. This arbitration scheme is enabled by setting the GPMC_PREFETCH_CONFIG1[23] PFPWENROUNDROBIN bit. When a request to another chip-select is received while the prefetch and write-posting engine is active, priority is given to the new request. The request processed thereafter is the prefetch and write-posting engine request, even if another interconnect request is passed in the mean time. The engine keeps control of the bus for an additional number of requests programmed in the GPMC_PREFETCH_CONFIG1[19:16] PFPWWEIGHTEDPRIO bit field. Control is then passed to the direct interconnect request.

As an example, the round-robin arbitration scheme is selected with PFPWWEIGHTEDPRIO set to 0x2. Considering that the prefetch and write-posting engine and the interconnect interface are always requesting access to the external interface, the GPMC grants priority to the direct interconnect access for one request. The GPMC then grants priority to the engine for three requests, and finally back to the direct interconnect access, until the arbiter is reset when one of the two initiators stops initiating requests.

11.3.5 GPMC Basic Programming Model

11.3.5.1 GPMC High-Level Programming Model Overview

The goal of the basic high-level programming model is to introduce a top-down approach to users that need to configure the GPMC module.

[Figure 11-54](#) and [Table 11-382](#) through [Table 11-384](#) show a programming model top-level diagram for the GPMC, and a description of each step. Each block of the diagram is described in one of the following sections through a set of registers to configure.

Figure 11-54. Programming Model Top-Level Diagram

gpmc-uc-001

Table 11-382. GPMC Initialization

Step	Description
Enable GPMC clocks.	Module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management .
Enable GPMC pads.	Module-specific pad multiplexing and configuration must be set in the control module. See Section 14.4.6.1, Pad Configuration Registers in Chapter 14, Control Module .
Reset GPMC.	See Table 11-385 .

Table 11-383. GPMC Configuration in NOR Mode

Step	Description
NOR Memory Type	See Table 11-386 .
NOR Chip-Select Configuration	See Table 11-387 .
NOR Timings Configuration	See Table 11-388 .
Wait Pin Configuration	See Table 11-396 .
Enable Chip-Select	See Table 11-397 .

Table 11-384. GPMC Configuration in NAND Mode

Step	Description
NAND Memory Type	See Table 11-391 .
NAND Chip-Select Configuration	See Table 11-392 .
Write Operations (Asynchronous)	See Table 11-393 .
Read Operations (Asynchronous)	See Table 11-393 .
ECC Engine	See Table 11-394 .
Prefetch and Write-Posting Engine	See Table 11-395 .
Wait Pin Configuration	See Table 11-396 .
Enable Chip-Select	See Table 11-397 .

11.3.5.2 GPMC Initialization

[Table 11-413](#) describes the settings required to prepare the GPMC; that is enabling its clock and pads, and proceeding to a GPMC reset.

Table 11-385. Reset GPMC

Subprocess Name	Register/Bit Field	Value
Start a software reset.	GPMC_SYSCONFIG [1] SOFTRESET	0x1
Wait until	GPMC_SYSSTATUS [0] RESETDONE =	0x1

11.3.5.3 GPMC Configuration in NOR Mode

This section gives a generic configuration for parameters related to the NOR memory connected to the GPMC.

Table 11-386. NOR Memory Type

Subprocess Name	Register / Bit Field	Value
Set the NOR protocol.	GPMC_CONFIG1 _ <i>i</i> [11:10] DEVICETYPE	0x0
Set a device size.	GPMC_CONFIG1 _ <i>i</i> [13:12] DEVICESIZE	x
Select an address and data multiplexing protocol.	GPMC_CONFIG1 _ <i>i</i> [9] MUXADDDATA	x
Set the attached device page length.	GPMC_CONFIG1 _ <i>i</i> [24:23] ATTACHEDDEVICEPAGELENGTH	x

Table 11-386. NOR Memory Type (continued)

Subprocess Name	Register / Bit Field	Value
Set the wrapping burst capabilities.	GPMC_CONFIG1_i[31] WRAPBURST	x
Select a timing signals latencies factor.	GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY	x
Select an output clock frequency ⁽¹⁾ .	GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER	x
Choose an output clock activation time ⁽¹⁾ .	GPMC_CONFIG1_i[26:25] CLKACTIVATIONTIME	x
Set a single or multiple access for read operations ⁽¹⁾ .	GPMC_CONFIG1_i[30] READMULTIPLE	x
Set a synchronous or asynchronous mode for read operations.	GPMC_CONFIG1_i[29] READTYPE	x
Set a single or multiple access for write operations.	GPMC_CONFIG1_i[28] WRITEMULTIPLE	x
Set a synchronous or asynchronous mode for write operations.	GPMC_CONFIG1_i[27] WRITETYPE	x

⁽¹⁾ Applies only to synchronous configurations (or nonmultiplexed asynchronous for multiple access one)

Table 11-387. NOR Chip-Select Configuration

Subprocess Name	Register/Bit Field	Value
Select the chip-select base address.	GPMC_CONFIG7_i[5:0] BASEADDRESS	x
Select the chip-select mask address.	GPMC_CONFIG7_i[11:8] MASKADDRESS	x

Table 11-388. NOR Timings Configuration

Subprocess Name	Register/Bit Field	Value
Configure adequate timing parameters in various memory modes.	See Section 11.3.5.6, GPMC Timing Parameters	

Table 11-389. Wait Pin Configuration

Subprocess Name	Register/Bit Field	Value
Enable or disable wait pin monitoring for read operations.	GPMC_CONFIG1_i[22] WAITREADMONITORING	x
Enable or disable wait pin monitoring for write operations.	GPMC_CONFIG1_i[21] WAITWRITEMONITORING	x
Select a wait pin monitoring time.	GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME	x
Choose the input wait pin for the chip-select.	GPMC_CONFIG1_i[17:16] WAITPINSELECT	x

Table 11-390. Enable Chip-Select

Subprocess Name	Register/Bit Field	Value
When all parameters are configured, enable the chip-select.	GPMC_CONFIG7_i[6] CSVALID	x

11.3.5.4 GPMC Configuration in NAND Mode

This section gives a generic configuration for parameters related to the NAND memory connected to the GPMC.

Table 11-391. NAND Memory Type

Subprocess Name	Register/Bit Field	Value
Set the NAND protocol.	GPMC_CONFIG1_i[11:10] DEVICETYPE	0x2
Set a device size.	GPMC_CONFIG1_i[13:12] DEVICESIZE	x
Set the address and data multiplexing protocol to non-multiplexed attached device.	GPMC_CONFIG1_i[9] MUXADDDATA	0x0
Select a timing signals latencies factor.	GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY	x

Table 11-391. NAND Memory Type (continued)

Subprocess Name	Register/Bit Field	Value
Set a synchronous or asynchronous mode and a single or multiple access for read and write operations.	See Section 11.3.5.5, Set Memory Access.	x

Table 11-392. NAND Chip-Select Configuration

Subprocess Name	Register/Bit Field	Value
Select the chip-select base address.	GPMC_CONFIG7_i[5:0] BASEADDRESS	x
Select the chip-select minimum granularity (16MiB).	GPMC_CONFIG7_i[11:8] MASKADDRESS	x

Table 11-393. Asynchronous Read and Write Operations

Subprocess Name	Register/Bit Field	Value
Configure adequate timing parameters in asynchronous modes	See Section 11.3.5.6, GPMC Timing Parameters.	

Table 11-394. ECC Engine

Subprocess Name	Register/Bit Field	Value
Select the ECC result register where the first ECC computation is stored (applies only to Hamming).	GPMC_ECC_CONTROL[3:0] ECCPOINTER	x ⁽¹⁾
Clear all ECC result registers.	GPMC_ECC_CONTROL[8] ECCCLEAR	Write 1 to clear.
Define ECCSIZE0 and ECCSIZE1.	GPMC_ECC_SIZE_CONFIG[19:12] ECCSIZE0 and [29:22] ECCSIZE1	x ⁽²⁾
Select the size of each of the 9 result registers (size specified by ECCSIZE0 or ECCSIZE1).	GPMC_ECC_SIZE_CONFIG[j-1] ECCjRESULTSIZE where j = 1 to 9	x
Select the chip-select where ECC is computed.	GPMC_ECC_CONFIG[3:1] ECCCS	x
Select the Hamming code or BCH code ECC algorithm in use.	GPMC_ECC_CONFIG[16] ECCALGORITHM	x
Select word size for ECC calculation.	GPMC_ECC_CONFIG[7] ECC16B	x
If the BCH code is used, Set an error correction capability and Select a number of sectors to process.	GPMC_ECC_CONFIG[13:12] ECCBCHTSEL and GPMC_ECC_CONFIG[6:4] ECCTOPSECTOR	x
Enable the ECC computation.	GPMC_ECC_CONFIG[0] ECCENABLE	0x1

⁽¹⁾ This parameter depends on the numbers of sectors in a page.

⁽²⁾ Depends on the size of each sector in the NAND page

Table 11-395. Prefetch and Write-Posting Engine

Subprocess Name	Register/Bit Field	Value
Disable the engine before configuration.	GPMC_PREFETCH_CONTROL[0] STARTENGINE	0x0
Select the chip-select associated with a NAND device where the prefetch engine is active.	GPMC_PREFETCH_CONFIG1[26:24] ENGINECSSELECTOR	x
Select access direction through prefetch engine, read or write.	GPMC_PREFETCH_CONFIG1[0] ACCESSMODE	x
Select the threshold used to issue a DMA request.	GPMC_PREFETCH_CONFIG1[14:8] FIFOTHRESHOLD	x
Select DMA synchronized mode or software manual mode.	GPMC_PREFETCH_CONFIG1[2] DMAMODE	x
Select if the engine immediately starts accessing the memory upon STARTENGINE assertion or if hardware synchronization based on a WAIT signal is used.	GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE	x
Select which wait pin edge detector should start the engine in synchronized mode.	GPMC_PREFETCH_CONFIG1[5:4] WAITPINSELECTOR	x

Table 11-395. Prefetch and Write-Posting Engine (continued)

Subprocess Name	Register/Bit Field	Value
Enter a number of clock cycles removed to timing parameters (for all back-to-back accesses to the NAND flash except the first one).	GPMC_PREFETCH_CONFIG1 [30:28] CYCLOPTIMIZATION	x
Enable the prefetch postwrite engine.	GPMC_PREFETCH_CONFIG1 [7] ENABLEENGINE	0x1
Select the number of bytes to be read or written by the engine to the selected chip-select.	GPMC_PREFETCH_CONFIG2 [13:0] TRANSFERCOUNT	x
Start the prefetch engine.	GPMC_PREFETCH_CONTROL [0] STARTENGINE	0x1

Table 11-396. Wait Pin Configuration

Subprocess Name	Register/Bit Field	Value
Selects when the engine starts the access to chip-select.	GPMC_PREFETCH_CONFIG1 [3] SYNCHROMODE	x
Select which wait pin edge detector should start the engine in synchronized mode.	GPMC_PREFETCH_CONFIG1 [5:4] WAITPINSELECTOR	x

Table 11-397. Enable Chip-Select

Subprocess Name	Register/Bit Field	Value
When all parameters are configured, enable the chip-select.	GPMC_CONFIG7 _[6] CSVALID	x

11.3.5.5 Set Memory Access

This section describes the bit field to configure to set the GPMC in various memory modes. [Table 11-398](#) and [Table 11-399](#) provide check lists for mode parameters and access type parameters, respectively.

Table 11-398. Mode Parameters Check List

Register	Bit	Name	Asynchronous				Synchronous			
			Single Read Access	Single Write Access	Multiple Read (Page) Access	Multiple Write (Page) Access	Single Read Access	Single Write Access	Multiple Read (Burst) Access	Multiple Write (Burst) Access
GPMC_CONFIG1 _i	30	READMULTIPLE	0x0	–	0x1 ⁽¹⁾	N/S	0x0	–	0x1	–
GPMC_CONFIG1 _i	29	READTYPE	0x0	–	0x0 ⁽¹⁾	N/S	0x1	–	0x1	–
GPMC_CONFIG1 _i	28	WRITEMULTIPLE	–	0x0	- ⁽¹⁾	N/S	–	0x0	–	0x1
GPMC_CONFIG1 _i	27	WRITETYPE	–	0x0	- ⁽¹⁾	N/S	–	0x1	–	0x1

⁽¹⁾ Multiple read is not supported in address/data-multiplexed and AAD-multiplexed modes. Multiple read is supported in nonmultiplexed mode.

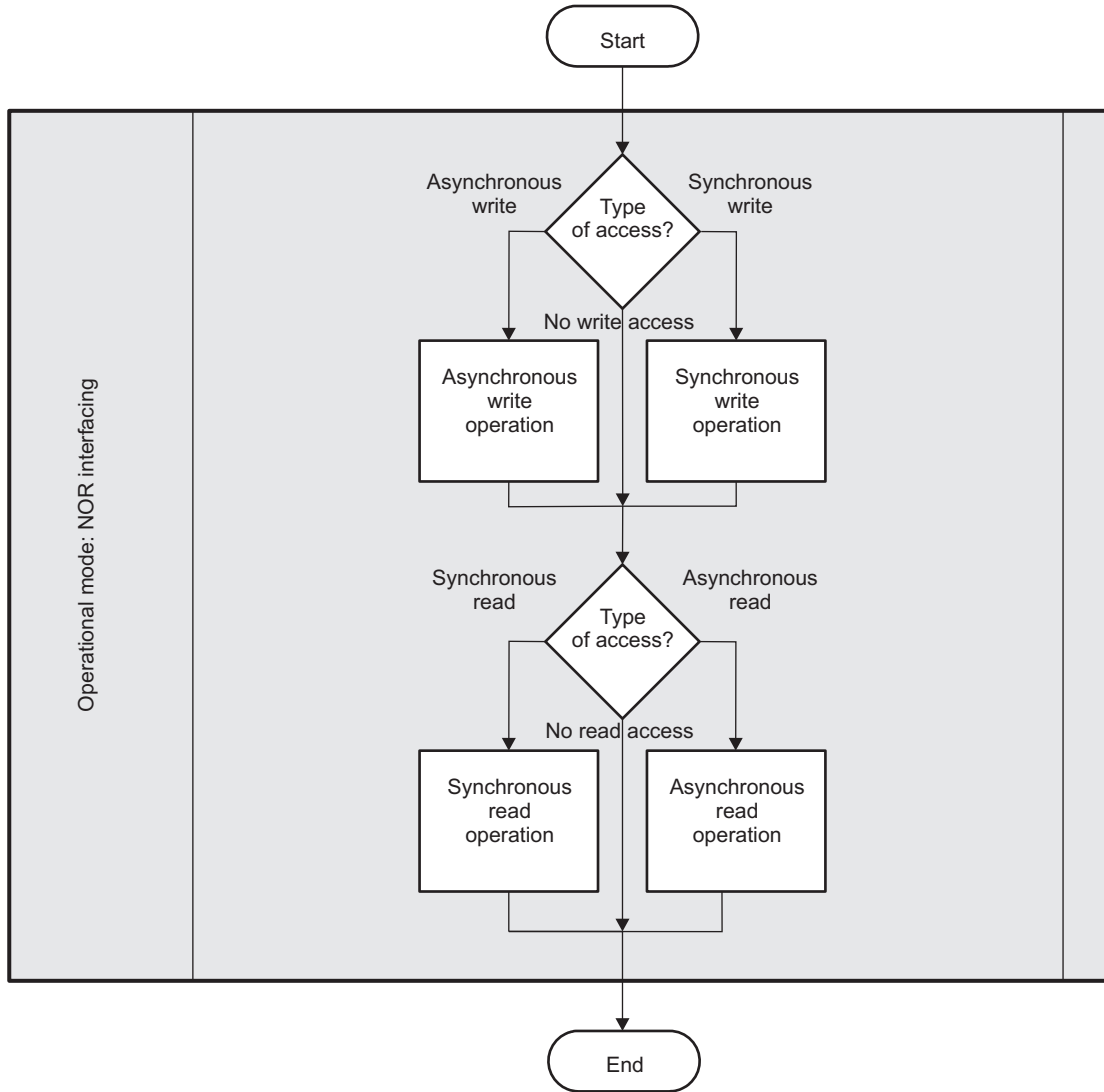

Table 11-399. Access Type Parameters Check List

Register	Bit	Name	Access Type		
			Nonmultiplexed	Address/Data-Multiplexed	AAD-Multiplexed
GPMC_CONFIG1 _i	9:8	MUXADDDATA	0x0	0x2	0x1

11.3.5.6 GPMC Timing Parameters

Figure 11-55 shows a programming model diagram for the NOR interfacing timing parameters.

Figure 11-55. NOR Interfacing Timing Parameters Diagram

gpmc-uc-002

Table 11-400 lists the bit fields to configure adequate timing parameters in various memory modes.

Table 11-400. Timing Parameters

Register	Bit	Name	Asynchronous			Synchronous				Access Type		
			Single Read Access	Single Write Access	Multiple Read (Page) access	Single Read Access	Single Write Access	Multiple Read (Burst) Access	Multiple Write (Burst) Access	Non-multiple xed	Address / Data-Multiple xed	AAD Multiple xed
GPMC_CONFIG1_i	9	MUXADDDATA	y	y	y	y	y	y	y	y	y	y
GPMC_CONFIG1_i	29	READTYPE	y		y	y		y		y	y	y

11.3.5.6.1 GPMC Timing Parameters Formulas

This section is intended to help the user calculate the GPMC timing bit field values. Formulas are not listed exhaustively.

The section describes:

- NAND flash interface timing parameters formulas
- Synchronous NOR flash timing parameters formulas
- Asynchronous NOR flash timing parameters formulas

For complete information, such as OPP and board effects on timings, see the device data manual.

11.3.5.6.1.1 NAND Flash Interface Timing Parameters Formulas

This section lists formulas to calculate NAND timing parameters. This is the case when `GPMC_CONFIG1_i[11:10] DEVICETYPE = 0x2`. [Table 11-401](#) describes the NAND timing parameters.

Table 11-401. NAND Formulas Description

Configuration Parameter	Unit	Description
A	ns	Pulse duration – gpmc_wen valid time
B	ns	Delay time – gpmc_cs valid to gpmc_wen valid
C	ns	Delay time – gpmc_ben0/gpmc_advn_ale high to gpmc_wen valid
D	ns	Delay time – gpmc_ad[15:0] valid to gpmc_wen valid
E	ns	Delay time – gpmc_wen invalid to gpmc_ad[15:0] invalid
F	ns	Delay time – gpmc_wen invalid to gpmc_ben0/gpmc_advn_ale invalid
G	ns	Delay time – gpmc_wen invalid to gpmc_cs invalid
H	ns	Cycle time – Write cycle time
I	ns	Delay time – gpmc_cs valid to gpmc_oen_ren valid
J	ns	Setup time – gpmc_ad[15:0] valid to gpmc_oen_ren invalid
K	ns	Pulse duration – gpmc_oen_ren valid time
L	ns	Cycle time – Read cycle time
M	ns	Delay time – gpmc_oen_ren invalid to gpmc_cs invalid

The configuration parameters are calculated through the following formulas. For more information, see the device data manual.

$$A = (\text{WEOffTime} - \text{WEOnTime}) * (\text{TimeParaGranularity} + 1) * \text{GPMC_FCLK period}$$

$$B = ((\text{WEOnTime} - \text{CSONTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{WEEExtraDelay} - \text{CSEExtraDelay})) * \text{GPMC_FCLK period}$$

$$C = ((\text{WEOnTime} - \text{ADVOnTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{WEEExtraDelay} - \text{ADVExtraDelay})) * \text{GPMC_FCLK period}$$

$$D = (\text{WEOnTime} * (\text{TimeParaGranularity} + 1) + 0.5 * \text{WEEExtraDelay}) * \text{GPMC_FCLK period}$$

$$E = (\text{WrCycleTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) - 0.5 * \text{WEEExtraDelay}) * \text{GPMC_FCLK period}$$

$$F = (\text{ADVWrOffTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{ADVExtraDelay} - \text{WEEExtraDelay})) * \text{GPMC_FCLK period}$$

$$G = (\text{CSWrOffTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{CSEExtraDelay} - \text{WEEExtraDelay})) * \text{GPMC_FCLK period}$$

$$H = \text{WrCycleTime} * (1 + \text{TimeParaGranularity}) * \text{GPMC_FCLK period}$$

$$I = ((\text{OEOnTime} - \text{CSONTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{OEEExtraDelay} - \text{CSEExtraDelay})) * \text{GPMC_FCLK period}$$

$$J = ((\text{RdAccessTime} - \text{OEOffTime}) * (\text{TimeParaGranularity} + 1) - 0.5 * \text{OEEExtraDelay}) * \text{GPMC_FCLK period}$$

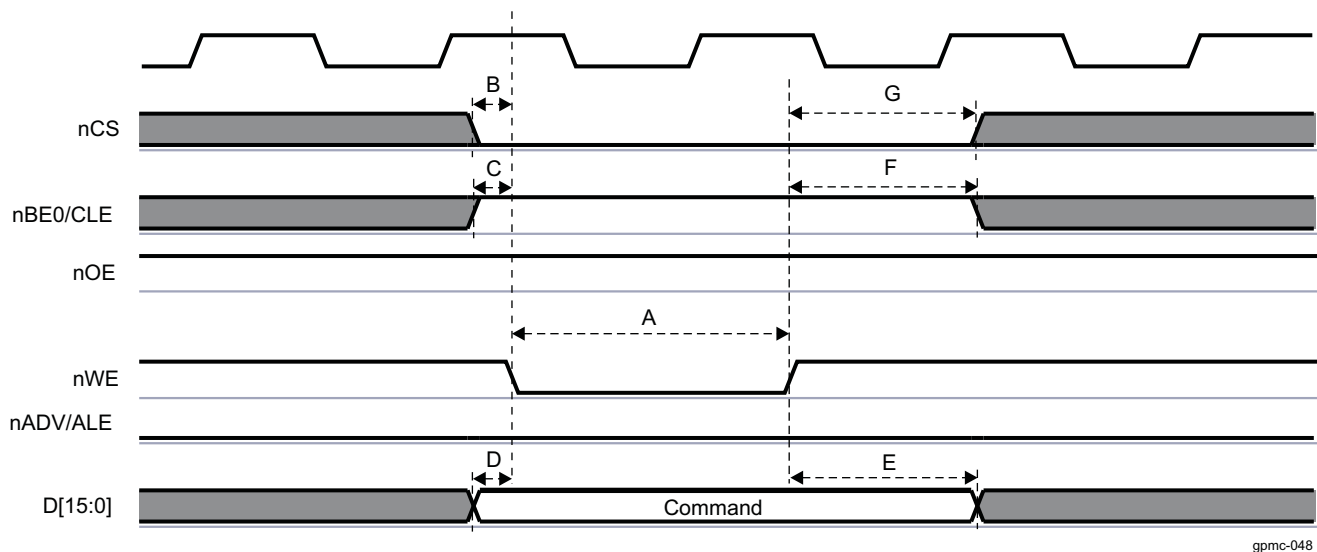

$$K = (\text{OEOffTime} - \text{OEOnTime}) * (1 + \text{TimeParaGranularity}) * \text{GPMC_FCLK period}$$

$$L = \text{RdCycleTime} * (1 + \text{TimeParaGranularity}) * \text{GPMC_FCLK period}$$

$$M = (\text{CSRdOffTime} - \text{OEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{CSEExtraDelay} - \text{OEEExtraDelay}) * \text{GPMC_FCLK period}$$

Figure 11-56 shows a simplified example of command latch cycle timing where formulas are associated with signal waves.

11.3.5.6.1.2 Synchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to calculate synchronous NOR timing parameters. This is the case when [GPMC_CONFIG1_i\[11:10\] DEVICETYPE = 0x0](#) and when READTYPE or WRITETYPE are set to synchronous mode. [Table 11-402](#) describes the synchronous NOR formulas.

Table 11-402. Synchronous NOR Formulas Description

Configuration Parameter	Unit	Description
A	ns	Pulse duration – gpmc_cs low
B	ns	Delay time – address bus valid to gpmc_clk first edge Delay time – gpmc_ben0/gpmc_ben1 valid to gpmc_clk first edge
C	ns	Pulse duration – gpmc_ben0/gpmc_ben1 low
D	ns	Delay time – gpmc_clk rising edge to gpmc_ben0/gpmc_ben1 invalid Delay time – gpmc_clk rising edge to gpmc_advn_ale invalid
E	ns	Delay time – gpmc_clk rising edge to gpmc_cs invalid Delay time – gpmc_clk rising edge to gpmc_oen_ren invalid
F	ns	Delay time – gpmc_clk rising edge to gpmc_cs transition
G	ns	Delay time – gpmc_clk rising edge to gpmc_advn_ale transition
H	ns	Delay time – gpmc_clk rising edge to gpmc_oen_ren transition
I	ns	Delay time – gpmc_clk rising edge to gpmc_wen transition
J	ns	Delay time – gpmc_clk rising edge to gpmc_ad data bus transition Delay time – gpmc_clk rising edge to gpmc_ben0/gpmc_ben1 transition
K	ns	Pulse duration – gpmc_advn_ale low
L	ns	Delay time – gpmc_wait invalid to first data latching gpmc_clk edge

The configuration parameters are calculated through the following formulas. For more information, see the device data manual.

1. For single read accesses:

$$A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$$

$$C = \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$$

$$D = (\text{RDCYCLETIME} - \text{RDACCESSTIME}) * \text{GPMC_FCLK period}$$

$$E = (\text{CSRDOFFTIME} - \text{RDACCESSTIME}) * \text{GPMC_FCLK period}$$

2. For burst read accesses (where n is the page burst access number):

$$A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$$

$$C = (\text{RDCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$$

$$D = (\text{RDCYCLETIME} - (\text{RDACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC_FCLK period}$$

$$E = (\text{CSRDOFFTIME} - (\text{RDACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC_FCLK period}$$

3. For burst write accesses (where n is the page burst access number):

$$A = (\text{CSWROFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$$

$$C = (\text{WRCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$$

$$D = (\text{WRCYCLETIME} - (\text{RDACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC_FCLK period}$$

$$E = (\text{CSWROFFTIME} - (\text{RDACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC_FCLK period}$$

4. For all accesses:

For nCS falling edge (chip-select activated):

- Case where [GPMC_CONFIG1_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:

$$F = 0.5 * \text{CSEXTRADelay} * \text{GPMC_FCLK period}$$

- Case where GPMCFCLKDIVIDER = 0x1:

F = 0.5 * CSEXTRADelay * GPMC_FCLK period, when (CLKACTIVATIONTIME and CSONTIME are odd) or (CLKACTIVATIONTIME and CSONTIME are even)

$$F = (1 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC_FCLK period otherwise.}$$

- Case where GPMCFCLKDIVIDER = 0x2:

F = 0.5 * CSEXTRADelay * GPMC_FCLK period, when (CSONTIME - CLKACTIVATIONTIME) is a multiple of 3

$$F = (1 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$$

$$F = (2 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$$

- Case where GPMCFCLKDIVIDER = 0x3:

F = 0.5 * CSEXTRADelay * GPMC_FCLK period, when (CSONTIME - CLKACTIVATIONTIME) is a multiple of 4

$$F = (1 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 1) is a multiple of 4}$$

$$F = (2 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 2) is a multiple of 4}$$

$$F = (3 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 3) is a multiple of 4}$$

For nCS rising edge (chip-select deactivated) in reading mode:

- Case where [GPMC_CONFIG1_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:

$$F = 0.5 * \text{CSEXTRADelay} * \text{GPMC_FCLK period}$$

- Case where GPMCFCLKDIVIDER = 0x1:

F = 0.5 * CSEXTRADelay * GPMC_FCLK period, when (CLKACTIVATIONTIME and CSRDOFFTIME are odd) or (CLKACTIVATIONTIME and CSRDOFFTIME are even)

$$F = (1 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC_FCLK period otherwise.}$$

- Case where GPMCFCLKDIVIDER = 0x2:
 $F = 0.5 * CSEXTRADelay * GPMC_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
 - Case where GPMCFCLKDIVIDER = 0x3:
 $F = 0.5 * CSEXTRADelay * GPMC_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 4$
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 4$
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 4$
 $F = (3 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 3) \text{ is a multiple of } 4$
- For nCS rising edge (chip-select deactivated) in writing mode:
- Case where GPMC_CONFIG1_j[1:0] GPMCFCLKDIVIDER = 0x0:
 $F = 0.5 * CSEXTRADelay * GPMC_FCLK \text{ period}$
 - Case where GPMCFCLKDIVIDER = 0x1:
 $F = 0.5 * CSEXTRADelay * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } CSWROFFTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } CSWROFFTIME \text{ are even})$
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period otherwise.}$
 - Case where GPMCFCLKDIVIDER = 0x2:
 $F = 0.5 * CSEXTRADelay * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
 - Case where GPMCFCLKDIVIDER = 0x3:
 $F = 0.5 * CSEXTRADelay * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 4$
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 4$
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 4$
 $F = (3 + 0.5 * CSEXTRADelay) * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 3) \text{ is a multiple of } 4$
- For nADV falling edge (nADV activated):
- Case where GPMC_CONFIG1_j[1:0] GPMCFCLKDIVIDER = 0x0:
 $G = 0.5 * ADVEXTRADelay * GPMC_FCLK \text{ period}$
 - Case where GPMCFCLKDIVIDER = 0x1:
 $G = 0.5 * ADVEXTRADelay * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } ADVONTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } ADVONTIME \text{ are even})$
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC_FCLK \text{ period otherwise.}$
 - Case where GPMCFCLKDIVIDER = 0x2:
 $G = 0.5 * ADVEXTRADelay * GPMC_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $G = (2 + 0.5 * ADVEXTRADelay) * GPMC_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
 - Case where GPMCFCLKDIVIDER = 0x3:
 $G = 0.5 * ADVEXTRADelay * GPMC_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 4$
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC_FCLK \text{ period, when } (ADVONTIME -$

CLKACTIVATIONTIME – 1) is a multiple of 4

$G = (2 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVONTIME – CLKACTIVATIONTIME – 2) is a multiple of 4

$G = (3 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVONTIME – CLKACTIVATIONTIME – 3) is a multiple of 4

For nADV rising edge (nADV deactivated) in reading mode:

- Case where $GPMC_CONFIG1_j[1:0]$ GPMCFCLKDIVIDER = 0x0:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK$ period
- Case where GPMCFCLKDIVIDER = 0x1:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK$ period, when (CLKACTIVATIONTIME and ADVRDOFFTIME are odd) or (CLKACTIVATIONTIME and ADVRDOFFTIME are even)
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period otherwise.
- Case where GPMCFCLKDIVIDER = 0x2:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK$ period, when (ADVRDOFFTIME - CLKACTIVATIONTIME) is a multiple of 3
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVRDOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVRDOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3
- Case where GPMCFCLKDIVIDER = 0x3:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK$ period, when (ADVRDOFFTIME – CLKACTIVATIONTIME) is a multiple of 4
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVRDOFFTIME – CLKACTIVATIONTIME – 1) is a multiple of 4
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVRDOFFTIME – CLKACTIVATIONTIME – 2) is a multiple of 4
 $G = (3 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVRDOFFTIME – CLKACTIVATIONTIME – 3) is a multiple of 4

For nADV rising edge (nADV deactivated) in writing mode:

- Case where $GPMC_CONFIG1_j[1:0]$ GPMCFCLKDIVIDER = 0x0:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK$ period
- Case where GPMCFCLKDIVIDER = 0x1:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK$ period, when (CLKACTIVATIONTIME and ADVWROFFTIME are odd) or (CLKACTIVATIONTIME and ADVWROFFTIME are even)
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period otherwise.
- Case where GPMCFCLKDIVIDER = 0x2:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK$ period, when (ADVWROFFTIME – CLKACTIVATIONTIME) is a multiple of 3
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 1) is a multiple of 3
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 2) is a multiple of 3
- Case where GPMCFCLKDIVIDER = 0x3:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK$ period, when (ADVWROFFTIME – CLKACTIVATIONTIME) is a multiple of 4
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 1) is a multiple of 4
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 2) is a multiple of 4
 $G = (3 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK$ period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 3) is a multiple of 4

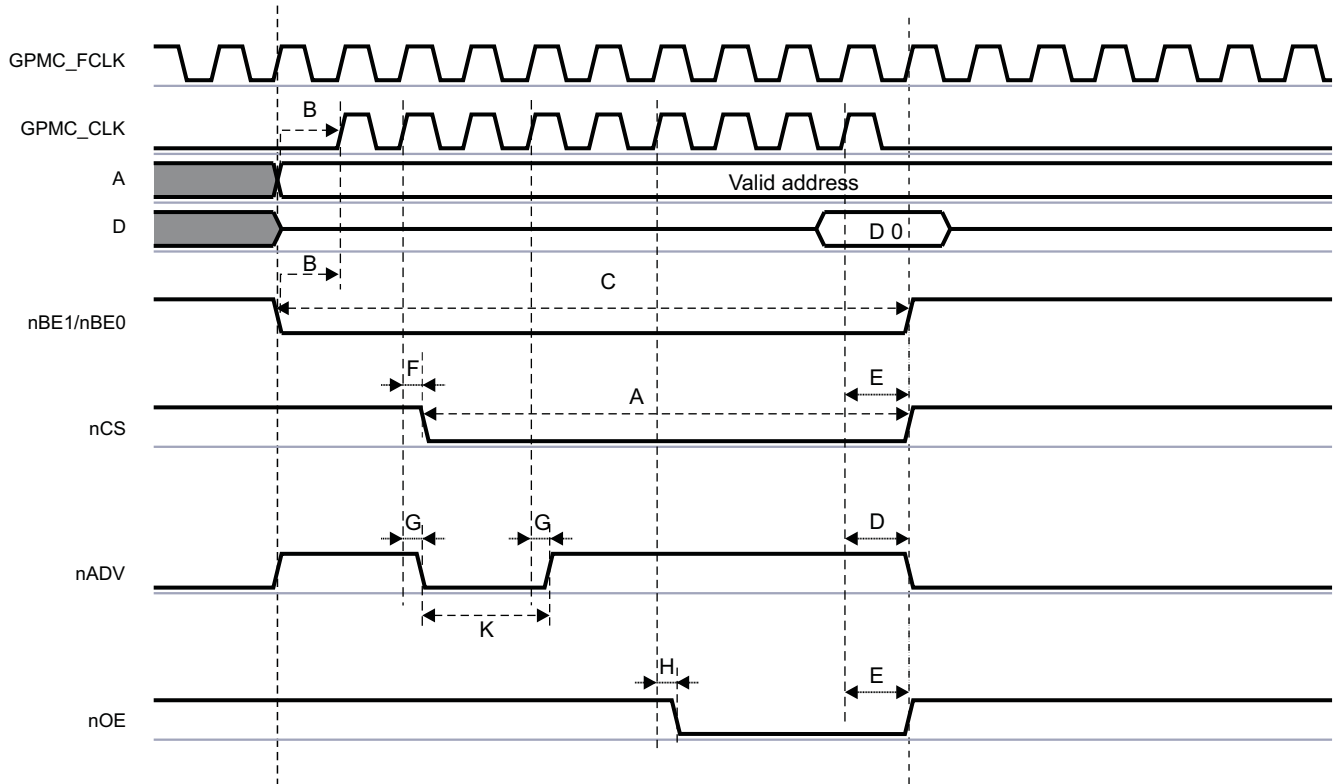

For nOE falling edge (nOE activated):

- Case where $GPMC_CONFIG1_j[1:0]$ GPMCFCLKDIVIDER = 0x0:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK$ period
- Case where GPMCFCLKDIVIDER = 0x1:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK$ period, when (CLKACTIVATIONTIME and OEONTIME are odd) or (CLKACTIVATIONTIME and OEONTIME are even)

- $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period otherwise.
- Case where $GPMCFCLKDIVIDER = 0x2$:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK$ period, when $(OEONTIME - CLKACTIVATIONTIME)$ is a multiple of 3
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEONTIME - CLKACTIVATIONTIME - 1)$ is a multiple of 3
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEONTIME - CLKACTIVATIONTIME - 2)$ is a multiple of 3
 - Case where $GPMCFCLKDIVIDER = 0x3$:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK$ period, when $(OEONTIME - CLKACTIVATIONTIME)$ is a multiple of 4
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEONTIME - CLKACTIVATIONTIME - 1)$ is a multiple of 4
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEONTIME - CLKACTIVATIONTIME - 2)$ is a multiple of 4
 $H = (3 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEONTIME - CLKACTIVATIONTIME - 3)$ is a multiple of 4
- For nOE rising edge (nOE deactivated):
- Case where $GPMC_CONFIG1_j[1:0] GPMCFCLKDIVIDER = 0x0$:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK$ period
 - Case where $GPMCFCLKDIVIDER = 0x1$:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK$ period, when $(CLKACTIVATIONTIME$ and $OEOFFTIME$ are odd) or $(CLKACTIVATIONTIME$ and $OEOFFTIME$ are even)
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period otherwise.
 - Case where $GPMCFCLKDIVIDER = 0x2$:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK$ period, when $(OEOFFTIME - CLKACTIVATIONTIME)$ is a multiple of 3
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEOFFTIME - CLKACTIVATIONTIME - 1)$ is a multiple of 3
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEOFFTIME - CLKACTIVATIONTIME - 2)$ is a multiple of 3
 - Case where $GPMCFCLKDIVIDER = 0x3$:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK$ period, when $(OEOFFTIME - CLKACTIVATIONTIME)$ is a multiple of 4
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEOFFTIME - CLKACTIVATIONTIME - 1)$ is a multiple of 4
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEOFFTIME - CLKACTIVATIONTIME - 2)$ is a multiple of 4
 $H = (3 + 0.5 * OEEXTRADELAY) * GPMC_FCLK$ period, when $(OEOFFTIME - CLKACTIVATIONTIME - 3)$ is a multiple of 4
- For nWE falling edge (nWE activated):
- Case where $GPMC_CONFIG1_j[1:0] GPMCFCLKDIVIDER = 0x0$:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK$ period
 - Case where $GPMCFCLKDIVIDER = 0x1$:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK$ period, when $(CLKACTIVATIONTIME$ and $WEONTIME$ are odd) or $(CLKACTIVATIONTIME$ and $WEONTIME$ are even)
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period otherwise.
 - Case where $GPMCFCLKDIVIDER = 0x2$:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK$ period, when $(WEONTIME - CLKACTIVATIONTIME)$ is a multiple of 3
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEONTIME - CLKACTIVATIONTIME - 1)$ is a multiple of 3
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEONTIME - CLKACTIVATIONTIME - 2)$ is a multiple of 3
 - Case where $GPMCFCLKDIVIDER = 0x3$:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK$ period, when $(WEONTIME - CLKACTIVATIONTIME)$ is a multiple of 4

- $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEONTIME - CLKACTIVATIONTIME - 1)$ is a multiple of 4
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEONTIME - CLKACTIVATIONTIME - 2)$ is a multiple of 4
 $I = (3 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEONTIME - CLKACTIVATIONTIME - 3)$ is a multiple of 4
 For nWE rising edge (nWE deactivated):
- Case where `GPMC_CONFIG1_j[1:0] GPMCFCLKDIVIDER = 0x0`:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK$ period
 - Case where `GPMCFCLKDIVIDER = 0x1`:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK$ period, when $(CLKACTIVATIONTIME$ and $WEOFFTIME$ are odd) or $(CLKACTIVATIONTIME$ and $WEOFFTIME$ are even)
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period otherwise.
 - Case where `GPMCFCLKDIVIDER = 0x2`:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK$ period, when $(WEOFFTIME - CLKACTIVATIONTIME)$ is a multiple of 3
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEOFFTIME - CLKACTIVATIONTIME - 1)$ is a multiple of 3
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEOFFTIME - CLKACTIVATIONTIME - 2)$ is a multiple of 3
 - Case where `GPMCFCLKDIVIDER = 0x3`:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK$ period, when $(WEOFFTIME - CLKACTIVATIONTIME)$ is a multiple of 4
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEOFFTIME - CLKACTIVATIONTIME - 1)$ is a multiple of 4
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEOFFTIME - CLKACTIVATIONTIME - 2)$ is a multiple of 4
 $I = (3 + 0.5 * WEEXTRADELAY) * GPMC_FCLK$ period, when $(WEOFFTIME - CLKACTIVATIONTIME - 3)$ is a multiple of 4
- For `gpmc_nadv` low pulse duration:
- Read operation:
 $K = (ADVRDOFFTIME - ADVONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC_FCLK$ period
 - Write operation:
 $K = (ADVWROFFTIME - ADVONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC_FCLK$ period
- For `gpmc_wait` invalid to first data latching `gpmc_clk` edge:
- $L = WAITMONITORINGTIME * (GPMCFCLKDIVIDER + 1) * GPMC_FCLK$ period + `GPMC_CLK` period

Figure 11-57 shows a simplified example of a synchronous NOR single read where formulas are associated with signal waves.

Figure 11-57. Synchronous NOR Single Read Simplified Example

gpmc-046

11.3.5.6.1.3 Asynchronous NOR Flash Timing Parameters Formulas

This section lists all the formulas to calculate asynchronous NOR timing parameters. This is the case when `GPMC_CONFIG1_i[11:10] DEVICETYPE = 0x0` and when `READTYPE` or `WRITETYPE` are set to asynchronous mode. Table 11-403 describes the asynchronous NOR formulas.

Table 11-403. Asynchronous NOR Formulas Description

Configuration Parameter	Unit	Description
A	ns	Pulse duration – gpmc_cs low
B	ns	Delay time – gpmc_cs valid to gpmc_advn_ale invalid
C	ns	Delay time – gpmc_cs valid to gpmc_oen_ren invalid (single read)
D	ns	Pulse duration – address bus valid - 2nd, 3rd and 4th accesses
E	ns	Delay time – gpmc_cs valid to gpmc_wen valid
F	ns	Delay time – gpmc_cs valid to gpmc_wen invalid
G	ns	Address invalid duration between two successive R/W accesses
H	ns	Setup time – read data valid before gpmc_oen_ren high
I	ns	Delay time – gpmc_cs valid to gpmc_oen_ren invalid (burst read)
J	ns	Delay time – address bus valid to gpmc_cs valid Delay time – data bus valid to gpmc_cs valid Delay time – gpmc_ben0/gpmc_ben1 valid to gpmc_cs valid
K	ns	Delay time – gpmc_cs valid to gpmc_advn_ale valid
L	ns	Delay time – gpmc_cs valid to gpmc_oen_ren valid
M	ns	Delay time – gpmc_cs valid to first data latching edge
N	ns	Pulse duration – gpmc_ben0/gpmc_ben1 valid time

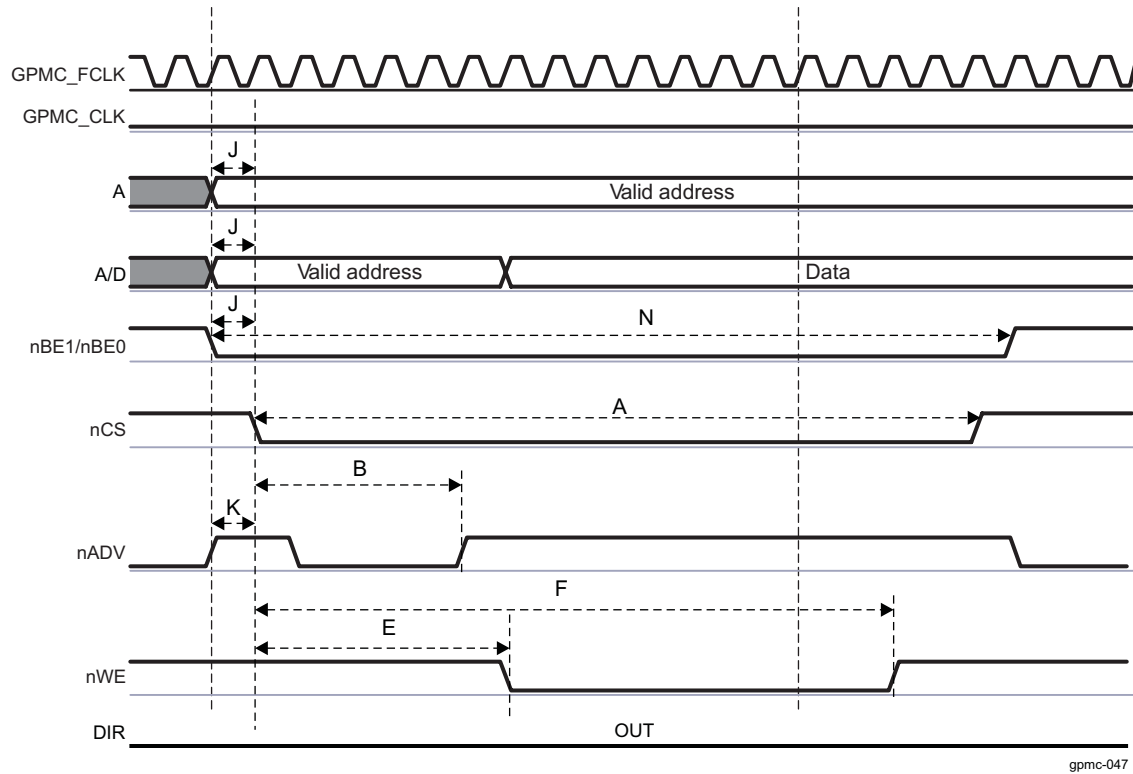

Table 11-403. Asynchronous NOR Formulas Description (continued)

Configuration Parameter	Unit	Description
O	ns	Delay time – gpmc_cs valid to gpmc_advn_ale valid

The configuration parameters are calculated through the following formulas. These formulas are not exhaustive. For more information, see the device data manual.

- gpmc_cs low pulse:
For single read: $A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
For burst read: $A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$, where N = page burst access number
For single write: $A = (\text{CSWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
For burst write: $A = (\text{CSWROFFTIME} - \text{CSONTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$, where N = page burst access number
- gpmc_cs valid to gpmc_advn_ale invalid delay:
For reading: $B = ((\text{ADVRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
For writing: $B = ((\text{ADVWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $C = ((\text{OEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $D = \text{PAGEBURSTACCESSTIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
- $E = ((\text{WEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $F = ((\text{WEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $G = \text{CYCLE2CYCLEDELAY} * \text{GPMC_FCLK period}$
- $H = ((\text{OEOFFTIME} - \text{RDACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC_FCLK period}$
- $I = ((\text{OEOFFTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$, where N = page burst access number
- $J = (\text{CSONTIME} * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$
- $K = ((\text{ADVONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $L = ((\text{OEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $M = ((\text{RDACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) - 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$
- gpmc_ben0/gpmc_ben1 pulse:
For single read: $N = \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
For burst read: $N = (\text{RDCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$, where N = page burst access number
For burst write: $N = (\text{WRCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$, where N = page burst access number
- $O = ((\text{WRCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$

Figure 11-58 shows a simplified example of an asynchronous NOR single write where formulas are associated with signal waves.

Figure 11-58. Asynchronous NOR Single Write Simplified Example

NOTE: Write multiple access is not supported in asynchronous mode. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

11.3.6 GPMC Use Cases and Tips

11.3.6.1 How to Set GPMC Timing Parameters for Typical Accesses

11.3.6.1.1 External Memory Attached to the GPMC Module

As discussed in the introduction to this chapter, the GPMC module supports the following external memory types:

- Asynchronous or synchronous, 8- or 16-bit-wide memory or device
- 16-bit address/data-multiplexed or not multiplexed NOR flash device
- 8- or 16-bit NAND flash device

The following examples describe how to calculate GPMC timing parameters by showing a typical parameter setup for the access to be performed.

The example is based on a 512-Mb multiplexed NOR flash memory with the following characteristics:

- Type: NOR flash (address/data-multiplexed mode)
- Size: 512M bits
- Data Bus: 16 bits wide
- Speed: 104-MHz clock frequency
- Read access time: 80 ns

11.3.6.1.2 Typical GPMC Setup

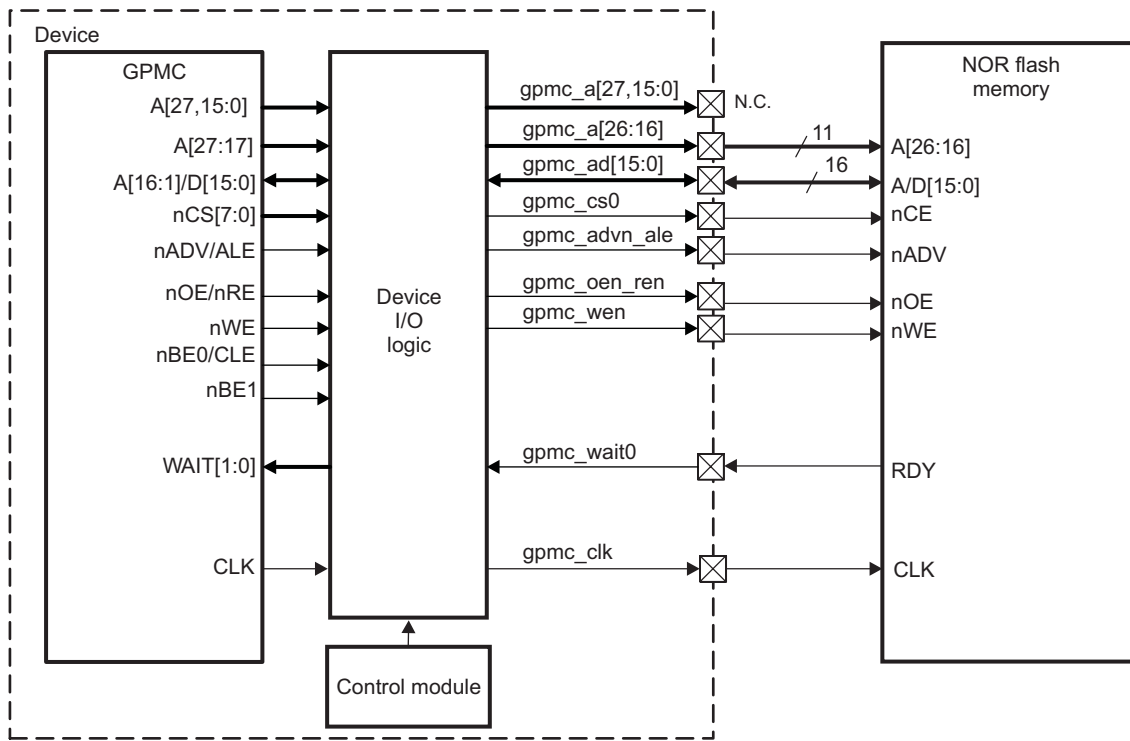

[Table 11-404](#) lists some of the I/Os of the GPMC module.

Table 11-404. GPMC Signals

Signal Name	I/O	Description
GPMC_FCLK	Internal	Functional and interface clock. Acts as the time reference.
gpmc_clk	O	External clock provided to the external device for synchronous operations
gpmc_a[26:16]	O	Address
gpmc_ad[15:0]	I/O	Data-multiplexed with addresses A[16:1] on memory side
gpmc_csx	O	Chip-select (where x = 0, or 1)
gpmc_advn_ale	O	Address valid enable
gpmc_oen_ren	O	Output enable (read access only)
gpmc_wen	O	Write enable (write access only)
gpmc_wait[1:0]	I	Ready signal from memory device. Indicates when valid burst data is ready to be read

Figure 11-59 shows the typical connection between the GPMC module and an attached NOR Flash memory.

Figure 11-59. GPMC Connection to an External NOR Flash Memory

gpmc-037

The following sections demonstrate how to calculate GPMC parameters for three access types:

- Synchronous burst read
- Asynchronous read
- Asynchronous single write

11.3.6.1.2.1 GPMC Configuration for Synchronous Burst Read Access

NOTE: The examples in Section 11.3.6.1.2.1 through Section 11.3.6.1.2.3 are based on a clock rate of 104 MHz. Refer to the device Data Manual for the maximum frequency appropriate for this device and to the memory datasheet for the maximum frequency for the particular memory device.

The clock runs at 104 MHz ($f = 104 \text{ MHz}$; $T = 9,615 \text{ ns}$).

Table 11-405 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 11-406 shows how to calculate timings for the GPMC using the memory parameters.

Figure 11-60 shows the synchronous burst read access.

Table 11-405. Useful Timing Parameters on the Memory Side

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tCES	nCS setup time to clock	0
tACS	Address setup time to clock	3
tIACC	Synchronous access time	80

Table 11-405. Useful Timing Parameters on the Memory Side (continued)

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tBACC	Burst access time valid clock to output delay	5,2
tCEZ	Chip-select to High-Z	7
tOEZ	Output enable to High-Z	7
tAVC	nADV setup time	6
tAVD	nAVD pulse	6
tACH	Address hold time from clock	3

The following terms, which describe the timing interface between the controller and its attached device, are used to calculate the timing parameters on the GPMC side:

- Read access time (GPMC side): Time required to activate the clock + read access time requested on the memory side + data setup time required for optimal capture of a burst of data
- Data setup time (GPMC side): Ensures a good capture of a burst of data (as opposed to taking a burst of data out). One word of data is processed in one clock cycle ($T = 9,615$ ns). The read access time between two bursts of data is $tBACC = 5.2$ ns. Therefore, data setup time is a clock period – $tBACC = 4,415$ ns of data setup.
- Access completion (GPMC side): (Different from page burst access time) Time required between the last burst access and access completion: nCS/nOE hold time (nCS and nOE must be released at the end of an access. These signals are held to allow the access to complete).
- Read cycle time (GPMC side): Read access time + access completion
- Write cycle time for burst access: Not supported for NOR flash memory

Table 11-406. Calculating GPMC Timing Parameters

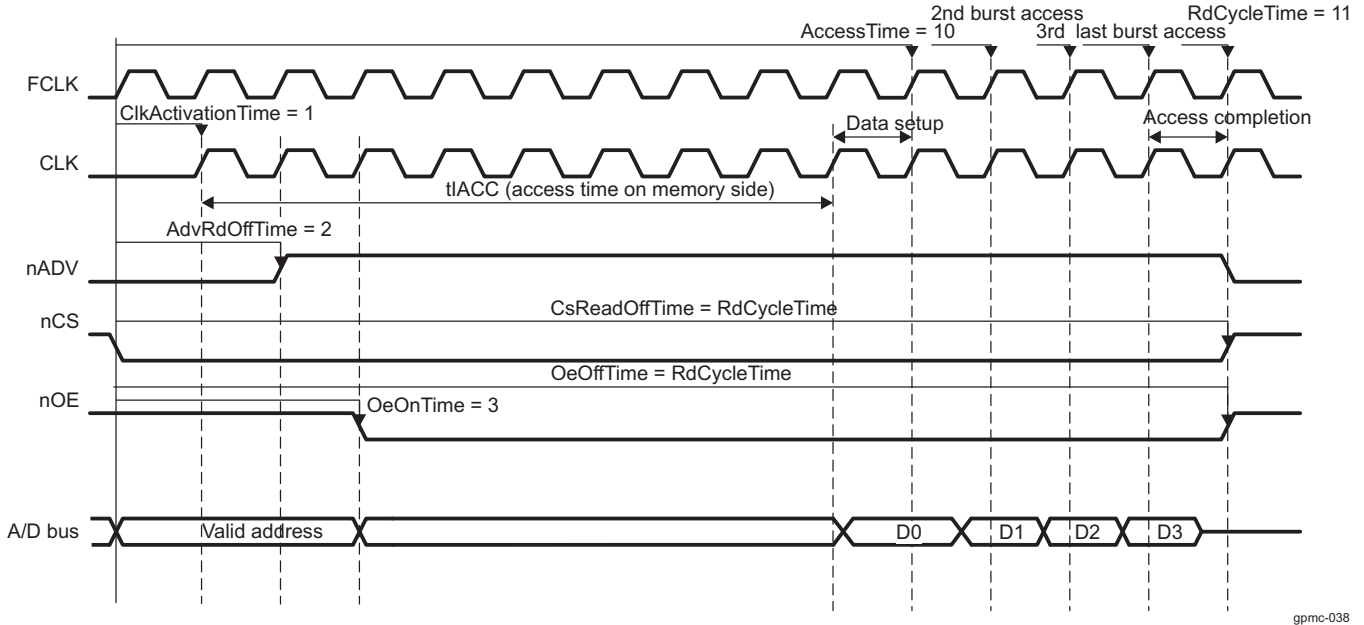

Parameter Name on GPMC Side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
GPMC FCLK Divider	–	–	–	GPMCFCLKDIVIDER = 0x0
ClkActivation Time	$\min (tCES, tACS)$	3	1	CLKACTIVATIONTIME = 0x1
RdAccessTime	$\text{roundmax} (\text{ClkActivationTime} + tIACC + \text{DataSetupTime})$	94.03: (9,615 + 80 + 4,415)	10: $\text{roundmax} (94.03 / 9,615)$	RDACCESSTIME = 0x0A
PageBurst RdAccessTime	$\text{roundmax} (tBACC)$	$\text{roundmax} (5.2)$	1	PAGEBURSTACCESSTIME = 0x1
RdCycleTime	$\text{RdAccess time} + \max (tCEZ, tOEZ)$	101.03: (94.03 + 7)	11	RDCYCLETIME = 0x0B
CsOnTime	tCES	0	0	CSONTIME = 0x0
CsReadOffTime	RdCycleTime	-	11	CSRDOFFTIME = 0x0B
AdvOnTime	tAVC ⁽¹⁾	0	0	ADVONTIME = 0x0
AdvRdOffTime	tAVD + tAVC ⁽²⁾	12	2	ADVRDOFFTIME = 0x02
OeOnTime ⁽³⁾	$(\text{ClkActivationTime} + tACH) < \text{OeOnTime} (\text{ClkActivationTime} + tIACC)$	–	3, for instance	OEONTIME = 0x3
OeOffTime	RdCycleTime	–	11	OEOFFTIME = 0x0B

⁽¹⁾ The external clock provided to the NOR flash is not yet available.

⁽²⁾ $\text{AdvRdOffTime} - \text{AdvOnTime} = tAVD$; thus, $\text{AdvRdOffTime} = tAVD + \text{AdvOnTime} = tAVD + tAVC$.

⁽³⁾ OeOnTime must ensure that addresses are available. It must not exceed the availability of the first burst of data.

Figure 11-60. Synchronous Burst Read Access (Timing Parameters in Clock Cycles)

gpmc-038

11.3.6.1.2.2 GPMC Configuration for Asynchronous Read Access

The clock runs at 104 MHz ($f = 104 \text{ MHz}$; $T = 9,615 \text{ ns}$).

Table 11-407 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 11-408 shows how to calculate timings for the GPMC using the memory parameters.

Figure 11-61 shows the asynchronous read access.

Table 11-407. AC Characteristics for Asynchronous Read Access

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tCE	Read Access time from nCS low	80
tAAVDS	Address setup time to rising edge of nADV	3
tAVDP	nADV low time	6
tCAS	nCS setup time to nADV	0
tOE	Output enable to output valid	6
tOEZ	Output enable to High-Z	7

Use the following formula to calculate the RdCycleTime parameter for this typical access:

$$\text{RdCycleTime} = \text{RdAccessTime} + \text{AccessCompletion} = \text{RdAccessTime} + 1 \text{ clock cycle} + \text{tOEZ}$$

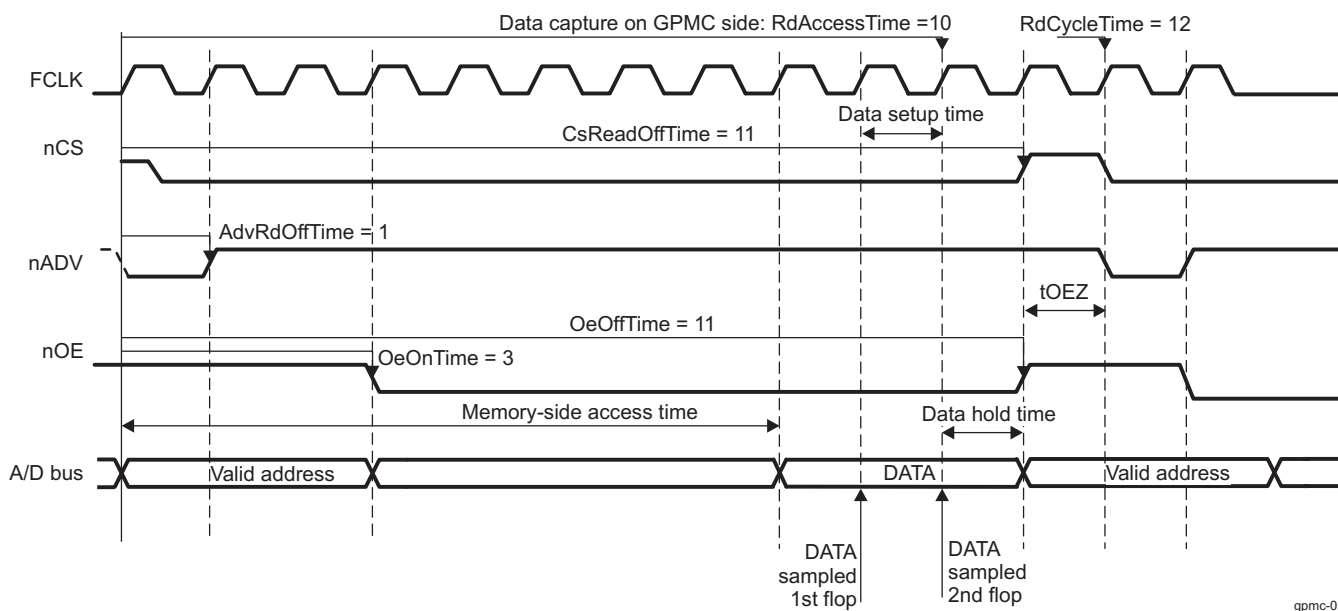

1. On the memory side, the external memory makes the data available to the output bus. This is the memory-side read access time defined in Table 11-407: the number of clock cycles between the address capture (nADV rising edge) and the data valid on the output bus.
The GPMC requires some hold time to allow the data to be captured correctly and the access to be finished.
2. To read the data correctly, the GPMC must be configured to meet the data setup time requirement of the memory; the GPMC module captures the data on the next rising edge. This is access time on the GPMC side.
3. There must also be a data hold time for correctly reading the data (checking that there is no nOE/nCS deassertion while reading the data). This data hold time is one clock cycle (that is, RdAccessTime + 1).

4. To complete the access, nOE/nCS signals are driven to High-Z. RdAccessTime + 1 + tOEZ is the read cycle time.
5. Addresses can now be relatched and a new read cycle begun.

Table 11-408. GPMC Timing Parameters for Asynchronous Read Access

Parameter Name on GPMC Side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
ClkActivationTime		n/a (asynchronous mode)		
RdAccessTime	round max (tCE)	80	10	RDACCESSTIME = 0x0A
PageBurstAccess Time	N/A (single access)			
RdCycleTime	RdAccessTime + 1cycle + tOEZ	96, 615	12	RDCYCLETIME = 0x0C
CsOnTime	tCAS	0	0	CSONTIME = 0x0
CsReadOffTime	RdAccessTime + 1 cycle	89, 615	11	CSRDOFFTIME = 0x0B
AdvOnTime	tAAVDS	3	1	ADVONTIME = 0x1
AdvRdOffTime	tAAVDS + tAVDP	9	1	ADVRDOFFTIME = 0x01
OeOnTime	OeOnTime >= AdvRdOffTime (multiplexed mode)	-	3, for instance	OEONTIME = 0x3
OeOffTime	RdAccessTime + 1cycle	89, 615	11	OEOFFTIME = 0x0B

Figure 11-61. Asynchronous Single Read Access (Timing Parameters in Clock Cycles)

gpmc-039

11.3.6.1.2.3 GPMC Configuration for Asynchronous Single Write Access

The clock runs at 104 MHz: (f = 104 MHz; T = 9, 615 ns).

Table 11-410 shows how to calculate timings for the GPMC using the memory parameters.

Table 11-409 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Figure 11-62 shows the synchronous burst write access.

Table 11-409. AC Characteristics for Asynchronous Single Write (Memory Side)

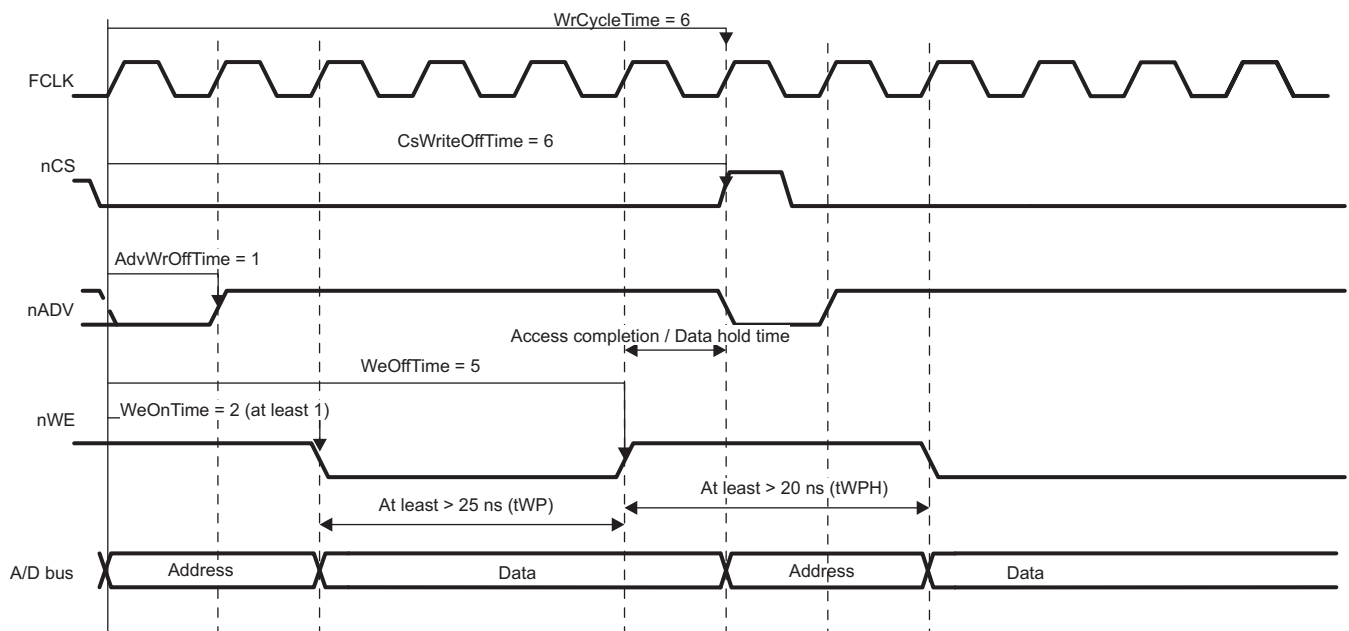

AC Characteristics on the Memory Side	Description	Duration (ns)
tWC	Write cycle time	60
tAVDP	nADV low time	6
tWP	Write pulse width	25
tWPH	Write pulse width high	20
tCS	nCS setup time to nWE	3
tCAS	nCS setup time to nADV	0
tAVSC	nADV setup time	3

For asynchronous single write access, write cycle time is $WrCycleTime = WeOffTime + AccessCompletion = WeOffTime + 1$. For the AccessCompletion, the GPMC requires one cycle of data hold time (nCS deassertion). For more information, see the device data manual.

Table 11-410. GPMC Timing Parameters for Asynchronous Single Write

Parameter Name on GPMC Side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Registers Configuration
ClkActivationTime		N/A (asynchronous mode)		
WdAccessTime	Applicable only to WAITMONITORING (the value is the same as for read access)			
PageBurstAccessTime		N/A (single access)		
WrCycleTime	$WeOffTime + AccessCompletion$	57, 615	6	WRCYCLETIME = 0x06
CsOnTime	tCAS	0	0	CSONTIME = 0x0
CsWrOffTime	$WeOffTime + 1$	57, 615	6	CSWROFFTIME = 0x06
AdvOnTime	tAVSC	3	1	ADVONTIME = 0x1
AdvWrOffTime	$tAVSC + tAVDP$	9	1	ADVWROFFTIME = 0x01
WeOnTime	tCS	3	1	WEONTIME = 0x1
WeOffTime	$tCS + tWP + tWPH$	48	5	WEOFFTIME = 0x05

11.3.6.2 How to Choose a Suitable Memory to Use With the GPMC

This section is intended to help the user select a suitable memory device to interface with the GPMC controller.

11.3.6.2.1 Supported Memories or Devices

NAND flash and NOR flash architectures are the two flash technologies. The GPMC supports various types of external memory or devices, basically any one that supports NAND or NOR protocols:

- 8- and 16-bit-wide asynchronous or synchronous memory or device (only 8-bit: nonburst device)
- 16-bit address and data-multiplexed NOR flash devices (pSRAM, OneNAND™, etc.)
- 8- and 16-bit NAND flash devices

11.3.6.2.1.1 Memory Pin Multiplexing

This section describes the interfacing differences of the GPMC supported memories.

Table 11-411. Supported Memories Interfaces

11.3.6.2.1.2 NAND Interface Protocol

NAND flash architecture, introduced in 1989, is a flash technology. NAND is a page-oriented memory device; that is, read and write accesses are done by pages. NAND achieves great density by sharing common areas of the storage transistor, which creates strings of serially connected transistors (in NOR devices, each transistor stands alone). Because of its high density NAND is best suited to devices that require high capacity data storage, such as pictures, music, and data files. NAND nonvolatility makes of it a good storage solution for many applications where mobility, low power, and speed are key factors. Low pin count and simple interface are other advantages of NAND.

Table 11-412 summarizes the NAND interface signals level applied to external device or memories.

Table 11-412. NAND Interface Bus Operations Summary

Bus Operation	CLE	ALE	nCE	nWE ⁽¹⁾	nRE ⁽¹⁾
Read (cmd input)	H	L	L	RE	H
Read (add input)	L	H	L	RE	H

⁽¹⁾ RE stands for rising edge; FE stands for falling edge

Table 11-412. NAND Interface Bus Operations Summary (continued)

Bus Operation	CLE	ALE	nCE	nWE ⁽¹⁾	nRE ⁽¹⁾
Write (cmd input)	H	L	L	RE	H
Write (add input)	L	H	L	RE	H
Data input	L	L	L	RE	H
Data output	L	L	L	H	FE
Busy (during read)	x	x	H ⁽²⁾	H ⁽²⁾	H ⁽²⁾
Busy (during program)	x	x	x	x	x
Busy (during erase)	x	x	x	x	x
Standby	x	x	H	x	x

⁽²⁾ Can be nCE high, or WE and nRE high.

11.3.6.2.1.3 NOR Interface Protocol

NOR flash architecture, introduced in 1988, is a flash technology. Unlike NAND, which is a sequential access device, NOR is directly addressable; that is, it is designed to be a random access device. NOR is best suited to devices used to store and run code or firmware, usually in small capacities. While NOR has fast read capabilities, it also has slow write and erase functions when compared to the NAND architecture.

Table 11-413 summarizes the level of the NOR interface signals applied to external devices or memories.

Table 11-413. NOR Interface Bus Operations Summary

Bus Operation	CLK	nADV	nCS	nOE	nWE	WAIT	DQ[15:0]
Read (asynchronous)	x	L	L	L	H	Asserted	Output
Read (synchronous)	Running	L	L	L	H	Driven	Output
Read (burst suspend)	Halted	x	L	H	H	Active	Output
Write	x	L	L	H	L	Asserted	Input
Output disable	x	x	L	H	H	Asserted	High-Z
Standby	x	x	H	x	x	High-Z	High-Z

11.3.6.2.1.4 Other Technologies

Other supported device types interact with the GPMC through the NOR interface protocol.

OneNAND is a high-density, low-power memory device. OneNAND is based on single- or multilevel-cell NAND core with SRAM and logic. It interfaces as a synchronous NOR flash and has synchronous write capability. It reads faster than conventional NAND and writes faster than conventional NOR flash. Hence, it is appropriate for mass storage and code storage.

pSRAM (pseudo-static random access memory) is a low-power memory device. pSRAM is based on the DRAM cell with internal refresh and address control features, and interfaces as a synchronous NOR flash. It also has synchronous write capability.

11.3.6.2.1.5 Supported Protocols

The GPMC supports the following interface protocols when communicating with external memory or external devices:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, 16 Word16)
- Synchronous read/write access
- Synchronous read burst access without wrap capability (4, 8, 16 Word16)
- Synchronous read burst access with wrap capability (4, 8, 16 Word16)

11.3.6.2.2 GPMC Features and Settings

The features and settings of the GPMC are:

- Supported device type: Up to four NAND or NOR protocol external memories or devices
- Operating voltage: 1.8 V, 3.3 V
- Maximum operating frequency provided externally: See the device data manual for precise information.
- Maximum GPMC addressing capability: 512MiB divided into eight chip-selects
- Maximum supported memory size: 256MiB (must be a power-of-two)
- Minimum supported memory size: 16MiB (must be a power-of-two). Aliasing occurs when addressing smaller memories.
- Data path to external memory or device: 8, 16 bits wide
- Burst and page access: burst of 4, 8, 16 Word16
- Supports bus keeping
- Supports bus turnaround

11.3.7 GPMC Register Manual

This section provides information about the GPMC instance in this product. [Table 11-415](#) provides a summary of the GPMC registers. The remaining parts of this section describe the registers within the module instance.

11.3.7.1 GPMC Register Summary

Table 11-414. GPMC Instance Summary

Module Name	Base Address	Size
GPMC	0x5000 0000	16 MiB

Table 11-415. GPMC Registers Mapping Summary

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address GPMC
GPMC_REVISION	R	32	0x0000 0000	0x5000 0000

⁽¹⁾ i = 0 to 7 for GPMC

⁽²⁾ j = 0 to 8 for GPMC

11.3.7.2 GPMC Register Descriptions

NOTE: All GPMC registers are aligned to 32-bit address boundaries. All register file accesses, except to [GPMC_NAND_DATA_i](#) register, are little-endian. If the [GPMC_NAND_DATA_i](#) register location is accessed, the endianness is access-dependent.

In this section *i* corresponds to the chip-select number, where *i* = 0 to 7.

Table 11-416. GPMC_REVISION

Address Offset	0x0000 0000	Instance	GPMC
Physical Address	0x5000 0000		
Description	This register contains the IP revision code.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REVISION																															

Bits	Field Name	Description	Type	Reset
31:0	REVISION	IP revision	R	T1 internal data

Table 11-418. GPMC_SYSCONFIG

Address Offset	0x0000 0010	Instance	GPMC
Physical Address	0x5000 0010		
Description	This register controls the various parameters of the interconnect.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												IDLEMODE	RESERVED	SOFTRESET	AUTOIDLE

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Write 0s for future compatibility. Read returns 0.	RW	0x00000000
4:3	IDLEMODE	0x0: Force-idle. An idle request is acknowledged unconditionally. 0x1: No-idle. An idle request is never acknowledged. 0x2: Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module. 0x3: Do not use.	RW	0x0
2	RESERVED	Write 0 for future compatibility Read returns 0.	RW	0x0
1	SOFTRESET	Software reset. Set this bit to 1 triggers a module reset. This bit is automatically reset by hardware. During reads, it always returns 0. 0x0: Normal mode 0x1: The module is reset.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	AUTOIDLE	Internal interface clock-gating strategy 0x0: Interface clock is free-running. 0x1: Automatic Interface clock gating strategy is applied, based on the interconnect activity.	RW	0x0

Table 11-422. GPMC_IRQSTATUS

Address Offset	0x0000 0018	Instance	GPMC
Physical Address	0x5000 0018		
Description	This interrupt status register regroups all the status of the module internal events that can generate an interrupt.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																WAIT1EDGEDETECTIONSTATUS		WAIT0EDGEDETECTIONSTATUS		RESERVED						TERMINALCOUNTSTATUS		FIFOEVENTSTATUS			

Bits	Field Name	Description	Type	Reset
31:10	RESERVED	Write 0s for future compatibility. Read returns 0s.	RW	0x000000
9	WAIT1EDGEDETECTIONSTATUS	Status of the Wait1 Edge Detection interrupt Read 0x0: A transition on WAIT1 input pin has not been detected. Write 0x0: WAIT1EDGEDETECTIONSTATUS bit is unchanged. Read 0x1: A transition on WAIT1 input pin has been detected. Write 0x1: WAIT1EDGEDETECTIONSTATUS bit is reset.	RW	0x0
8	WAIT0EDGEDETECTIONSTATUS	Status of the Wait0 Edge Detection interrupt Read 0x0: A transition on WAIT0 input pin has not been detected. Write 0x0: WAIT0EDGEDETECTIONSTATUS bit is unchanged. Read 0x1: A transition on WAIT0 input pin has been detected. Write 0x1: WAIT0EDGEDETECTIONSTATUS bit is reset.	RW	0x0
7:2	RESERVED	Write 0s for future compatibility. Read returns 0s.	RW	0x00
1	TERMINALCOUNTSTATUS	Status of the TerminalCountEvent interrupt Read 0x0: Indicates that CountValue is greater than 0 Write 0x0: TERMINALCOUNTSTATUS bit is unchanged. Read 0x1: Indicates that CountValue is equal to 0 Write 0x1: TERMINALCOUNTSTATUS bit is reset.	RW	0x0
0	FIFOEVENTSTATUS	Status of the FIFOEvent interrupt Read 0x0: Indicates that less than GPMC_PREFETCH_STATUS[16] FIFOTHRESHOLDSTATUS bytes are available in prefetch mode and less than FIFOTHRESHOLD bytes free places are available in write-posting mode Write 0x0: FIFOEVENTSTATUS bit is unchanged. Read 0x1: Indicates that at least GPMC_PREFETCH_STATUS[16] FIFOTHRESHOLDSTATUS bytes are available in prefetch mode and at least FIFOTHRESHOLD bytes free places are available in write-posting mode Write 0x1: FIFOEVENTSTATUS bit is reset.	RW	0x0

31	WRAPBURST	Enables the wrapping burst capability. Must be set if the attached device is configured in wrapping burst 0x0: Synchronous wrapping burst not supported 0x1: Synchronous wrapping burst supported	RW	0x0
30	READMULTIPLE	Selects the read single or multiple access 0x0: Single access 0x1: Multiple access (burst if synchronous, page if asynchronous)	RW	0x0
29	READTYPE	Selects the read mode operation 0x0: Read asynchronous 0x1: Read synchronous	RW	0x0
28	WRITEMULTIPLE	Selects the write single or multiple access 0x0: Single access 0x1: Multiple access (burst if synchronous, considered as single if asynchronous)	RW	0x0
27	WRITETYPE	Selects the write mode operation 0x0: Write asynchronous 0x1: Write synchronous	RW	0x0

Bits	Field Name	Description	Type	Reset
26:25	CLKACTIVATIONTIME	Output GPMC_CLK activation time 0x0: First rising edge of GPMC_CLK at start access time 0x1: First rising edge of GPMC_CLK one GPMC_FCLK cycle after start access time 0x2: First rising edge of GPMC_CLK two GPMC_FCLK cycles after start access time 0x3: Reserved	RW	0x0
24:23	ATTACHEDDEVICEPAGELENGTH	Specifies the attached device page (burst) length 0x0: 4 words 0x1: 8 words 0x2: 16 words 0x3: Reserved (1 word = interface size)	RW	0x0
22	WAITREADMONITORING	Selects the Wait monitoring configuration for Read accesses (Reset value is <i>bootwaiter</i> input pin sampled at device reset) 0x0: Wait pin is not monitored for read accesses. 0x1: Wait pin is monitored for read accesses.	RW	0x-
21	WAITWRITEMONITORING	Selects the Wait monitoring configuration for Write accesses 0x0: Wait pin is not monitored for write accesses. 0x1: Wait pin is monitored for write accesses.	RW	0x0
20	RESERVED	Write 0s for future compatibility. Read returns 0.	RW	0x0
19:18	WAITMONITORINGTIME	Selects input pin Wait monitoring time 0x0: Wait pin is monitored with valid data. 0x1: Wait pin is monitored one GPMC_CLK cycle before valid data. 0x2: Wait pin is monitored two GPMC_CLK cycle before valid data. 0x3: Reserved	RW	0x0
17:16	WAITPINSELECT	Selects the input wait pin for this chip-select (The reset value is HW fixed to 0x0 for CS0-CS7) 0x0: Wait input pin is WAIT0. 0x1: Wait input pin is WAIT1. 0x2, 0x3: Reserved	RW	0x0
15:14	RESERVED	Write 0s for future compatibility. Reads returns 0	RW	0x0
13:12	DEVICESTYPE	Selects the device size attached (Reset value is <i>bootdevicesize</i> input pin sampled at device reset for CS0 and 0x1 for CS1 to CS7) 0x0: 8 bit 0x1: 16 bit 0x2: Reserved 0x3: Reserved	RW	0x-
11:10	DEVICETYPE	Selects the attached device type 0x0: NOR flash-like, asynchronous and synchronous devices 0x1: Reserved 0x2: NAND flash-like devices, stream mode 0x3: Reserved	RW	0x0

Bits	Field Name	Description	Type	Reset
9:8	MUXADDDATA	Enables the address and data multiplexed protocol (Reset value is <i>cs0muxdevice</i> input pin sampled at device reset for CS0 and 0 for CS1-CS7) 0x0: Nonmultiplexed attached device 0x1: AAD-multiplexed protocol device 0x2: Address and data multiplexed attached device 0x3: Reserved	RW	0x-
7:5	RESERVED	Write 0s for future compatibility. Read returns 0s.	RW	0x0
4	TIMEPARAGRANULARITY	Signals timing latencies scalar factor (RD/WRCYCLETIME, RD/WRACCESSTIME, PAGEBURSTACCESSTIME, CSONTIME, CSRD/WROFFTIME, ADVONTIME, ADVRD/WROFFTIME, OEONTIME, OEOFFTIME, WEONTIME, WEOFFTIME, CYCLE2CYCLEDELAY, BUSTURNAROUND, TIMEOUTSTARTVALUE, WRDATAONADMUXBUS) 0x0: x1 latencies 0x1: x2 latencies	RW	0x0
3:2	RESERVED	Write 0s for future compatibility. Read returns 0s.	RW	0x0
1:0	GPMCFCLKDIVIDER	Divides the GPMC_FCLK clock 0x0: GPMC_CLK frequency = GPMC_FCLK frequency 0x1: GPMC_CLK frequency = GPMC_FCLK frequency / 2 0x2: GPMC_CLK frequency = GPMC_FCLK frequency / 3 0x3: GPMC_CLK frequency = GPMC_FCLK frequency / 4	RW	0x0

11.4 Error Location Module

11.4.1 Error Location Module Overview

When reading from NAND flash memories, some level of error-correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as *bare NANDs*, the correction process is delegated to the memory controller.

The general-purpose memory controller (GPMC) probes data read from an external NAND flash and uses this to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare-area data field, with a maximum block size of 1023 bytes. Computation is based on a Bose-Chaudhuri-Hocquenghem (BCH) algorithm. The error-location module (ELM) extracts error addresses from these syndrome polynomials.

Based on the syndrome polynomial value, the ELM can detect errors, compute the number of errors, and give the location of each error bit. The actual data is not required to complete the error-correction algorithm. Errors can be reported anywhere in the NAND flash block, including in the parity bits.

The maximum acceptable number of errors that can be corrected depends on a programmable configuration parameter. 4-, 8-, and 16-bit error-correction levels are supported. The ELM relies on a static and fixed definition of the generator polynomial for each error-correction level that corresponds to the generator polynomials defined in the GPMC (there are three fixed polynomial for the three correction error levels). A larger number of errors than the programmed error-correction level may be detected, but the ELM cannot correct them all. The offending block is then tagged as *uncorrectable* in the associated computation exit status register. If the computation is successful, that is, if the number of errors detected does not exceed the maximum value authorized for the chosen correction capability, the exit status register contains the information on the number of detected errors.

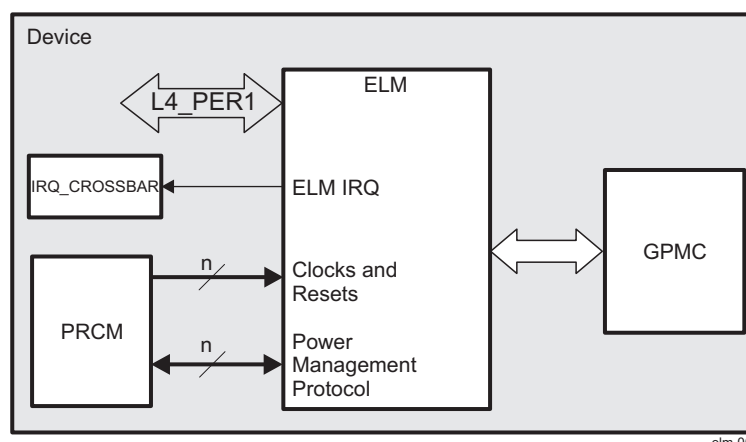

When the error-location process completes, an interrupt is triggered to inform the software that its status can be checked. The number of detected errors and their locations in the NAND block can be retrieved from the module through register accesses.

The ELM has the following features:

- 4, 8 and 16 bits per 512-byte block error-location based on BCH algorithms
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation on error-location process completion:
 - When the full page has been processed in page mode
 - For each syndrome polynomial in continuous mode

Figure 11-63 shows the ELM overview.

Figure 11-63. ELM Overview

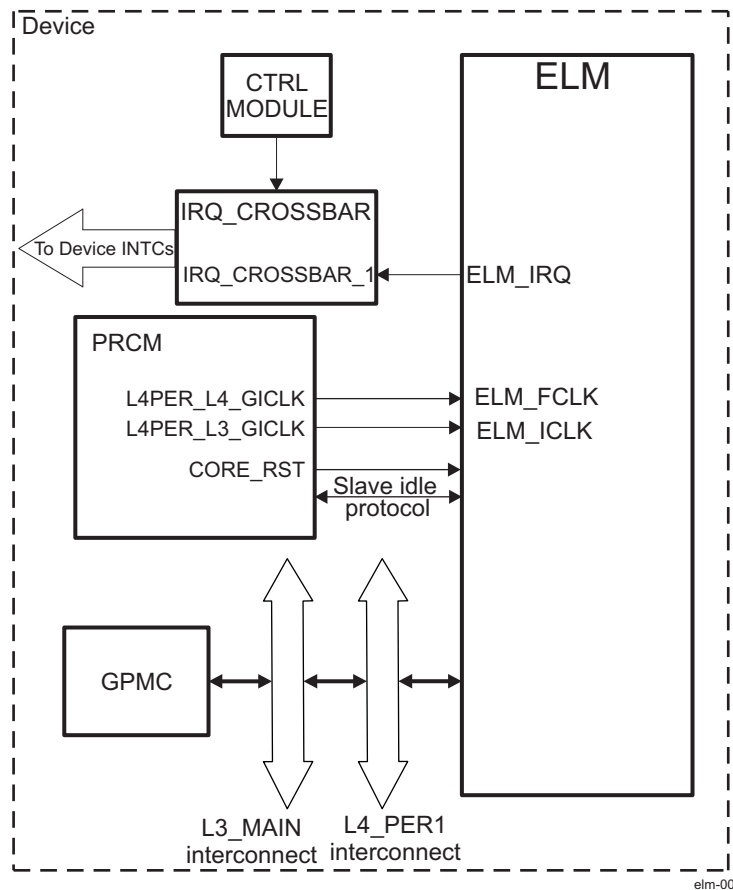

11.4.2 ELM Integration

The ELM extracts error addresses from generated syndrome polynomials.

The ELM is used with the GPMC. Syndrome polynomials generated on-the-fly when reading a NAND flash page and stored in GPMC registers are passed to the ELM. A host processor can then correct the data block by flipping the bits to which the ELM error-location outputs point.

Figure 11-64 shows the integration of the ELM subsystem in the device.

Figure 11-64. ELM Integration

elm-001

Table 11-488 through Table 11-490 summarize the integration of the module in the device.

Table 11-488. ELM Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
ELM	PD_COREAON	No	L4_PER1

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
ELM	ELM_FCLK	L4PER_L4_GICLK	PRCM	Functional clock
	ELM_ICLK	L4PER_L3_GICLK	PRCM	Interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
ELM	ELM_RST	L4PER_RST	PRCM	Module hardware reset

Table 11-490. ELM Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	IRQ_CROSSBAR	Default Mapping	Description
ELM	ELM_IRQ	IRQ_CROSSBAR_1	DSP1_IRQ_32	BCH error-location module interrupt
			DSP2_IRQ_32	
			EVE_IRQ_0	

NOTE: The “Default Mapping” column in [Table 11-490 ELM Hardware Requests](#) shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see [Section 14.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 14, Control Module](#). For more information about the device interrupt controllers, see [Chapter 13, Interrupt Controllers](#).

11.4.3 ELM Functional Description

The ELM is designed around the error-location engine, which handles the computation based on the input syndrome polynomials.

The ELM maps the error-location engine to a standard interconnect interface by using a set of registers to control inputs and outputs.

11.4.3.1 ELM Software Reset

To perform a software reset, set the [ELM_SYSCONFIG\[1\] SOFTRESET](#) bit to 1. The [ELM_SYSSTATUS\[0\] RESETDONE](#) bit indicates that the software reset is complete when its value is 1. When the software reset completes, the [ELM_SYSCONFIG\[1\] SOFTRESET](#) bit is automatically reset.

11.4.3.2 ELM Power Management

[Table 11-491](#) describes the power-management features available to the ELM.

NOTE:

- For information about source clock gating and a description of the sleep/wake-up transitions, see the [Section 3.6.4.5, CD_L4_PER1 Clock Domain](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For a general description of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.6, Clock Management Functional Description](#), in [Chapter 3, Power, Reset, and Clock Management](#)

Table 11-491. Local Power-Management Features

Feature	Registers	Description
Clock autogating	ELM_SYSCONFIG [0] AUTOGATING	This bit allows a local power optimization inside the module by gating the ELM_FCLK clock upon the interface activity.
Slave idle modes	ELM_SYSCONFIG [4:3] SIDLEMODE	Force-idle, no-idle, and smart-idle modes are available.
Clock activity	ELM_SYSCONFIG [8] CLOCKACTIVITY	The clock can be switched off or maintained during the wake-up period.
Master standby modes	N/A	
Global wake-up enable	N/A	
Wake-up sources enable	N/A	

CAUTION

The PRCM module has no hardware means of reading CLOCKACTIVITY settings. Thus, software must ensure consistent programming between the ELM CLOCKACTIVITY and ELM clock PRCM control bits. For a description of the ClockActivity feature, see [Chapter 3, Power, Reset, and Clock Management](#).

11.4.3.3 ELM Interrupt Requests

[Table 11-492](#) lists the event flags, and their masks, that can cause module interrupts.

Table 11-492. Events

Event Flag	Event Mask	Description
ELM_IRQSTATUS [8] PAGE_VALID	ELM_IRQENABLE [8] PAGE_MASK	Page interrupt
ELM_IRQSTATUS [7] LOC_VALID_7	ELM_IRQENABLE [7] LOCATION_MASK_7	Error-location interrupt for syndrome polynomial 7
ELM_IRQSTATUS [6] LOC_VALID_6	ELM_IRQENABLE [6] LOCATION_MASK_6	Error-location interrupt for syndrome polynomial 6
ELM_IRQSTATUS [5] LOC_VALID_5	ELM_IRQENABLE [5] LOCATION_MASK_5	Error-location interrupt for syndrome polynomial 5
ELM_IRQSTATUS [4] LOC_VALID_4	ELM_IRQENABLE [4] LOCATION_MASK_4	Error-location interrupt for syndrome polynomial 4
ELM_IRQSTATUS [3] LOC_VALID_3	ELM_IRQENABLE [3] LOCATION_MASK_3	Error-location interrupt for syndrome polynomial 3
ELM_IRQSTATUS [2] LOC_VALID_2	ELM_IRQENABLE [2] LOCATION_MASK_2	Error-location interrupt for syndrome polynomial 2
ELM_IRQSTATUS [1] LOC_VALID_1	ELM_IRQENABLE [1] LOCATION_MASK_1	Error-location interrupt for syndrome polynomial 1
ELM_IRQSTATUS [0] LOC_VALID_0	ELM_IRQENABLE [0] LOCATION_MASK_0	Error-location interrupt for syndrome polynomial 0

11.4.3.4 Processing Initialization

[ELM_LOCATION_CONFIG](#) global setting parameters must be set before using the error-location engine. The [ELM_LOCATION_CONFIG](#)[1:0] ECC_BCH_LEVEL bit field defines the error-correction level used (4-, 8-, or 16-bit error correction). The [ELM_LOCATION_CONFIG](#)[26:16] ECC_SIZE bit field defines the maximum buffer length beyond which the engine processing no longer looks for errors.

Software can choose to use the ELM in continuous mode or page mode. If all [ELM_PAGE_CTRL](#)[i] SECTOR_i bits (i is the syndrome polynomial number, where i = 0 to 7) are reset, continuous mode is used. In any other case, page mode is implicitly selected.

- Continuous mode: Each syndrome polynomial is processed independently. Results for a syndrome can be retrieved and acknowledged at any time, regardless of the status of the other seven processing contexts.
- Page mode: Syndrome polynomials are grouped into atomic entities: only one page can be processed at any given time, even if all eight contexts are not used for this page. Unused contexts are lost and cannot be affected to any other processing. The full page must be acknowledged and cleared before moving to the next page.

For completion interrupts to be generated correctly, all [ELM_IRQENABLE\[i\]](#) LOCATION_MASK_i bits (where i = 0 to 7) must be forced to 0 when in page mode, and set to 1 in continuous mode. Additionally, the [ELM_IRQENABLE\[8\]](#) PAGE_MASK bit must be set to 1 when in page mode.

Software initiates error-location processing by writing a syndrome polynomial into one of the eight possible register sets. Each of these register sets includes seven registers: [ELM_SYNDROME_FRAGMENT_0_i](#) to [ELM_SYNDROME_FRAGMENT_6_i](#). The first six registers can be written in any order, but [ELM_SYNDROME_FRAGMENT_6_i](#) must be written last because it includes the validity bit, which instructs the ELM that this syndrome polynomial must be processed (the [ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) SYNDROME_VALID bit).

As soon as one validity bit is asserted ([ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) SYNDROME_VALID = 0x1, where i = 0 to 7), error-location processing can start for the corresponding syndrome polynomial. The associated [ELM_LOCATION_STATUS_i](#) and [ELM_ERROR_LOCATION_0_i](#) to [ELM_ERROR_LOCATION_15_i](#) registers (where i = 0 to 7) are not reset. Software must not consider them until the corresponding [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bit is set.

11.4.3.5 Processing Sequence

While the error-location engine is busy processing one syndrome polynomial, further syndrome polynomials can be written. They are processed when the current processing completes.

The engine completes early when:

- No error is detected; that is, when the [ELM_LOCATION_STATUS_i\[8\]](#) ECC_CORRECTABLE bit is set to 1 and the [ELM_LOCATION_STATUS_i\[4:0\]](#) ECC_NB_ERRORS bit field is set to 0x0.
- Too many errors are detected; that is, when the [ELM_LOCATION_STATUS_i\[8\]](#) ECC_CORRECTABLE bit is set to 0 while the [ELM_LOCATION_STATUS_i\[4:0\]](#) ECC_NB_ERRORS bit field is set with the value output by the error-location engine. The reported number of errors is not ensured if ECC_CORRECTABLE is 0.

If the engine completes early, the associated error-location registers [ELM_ERROR_LOCATION_0_i](#) to [ELM_ERROR_LOCATION_15_i](#) (where i = 0 to 7) are not updated.

In all other cases, the engine goes through the entire error-location process. Each time an error location is found, it is logged in the associated ECC_ERROR_LOCATION bit field. The first error detected is logged in the [ELM_ERROR_LOCATION_0_i\[12:0\]](#) ECC_ERROR_LOCATION bit field; the second is logged in the [ELM_ERROR_LOCATION_1_i\[12:0\]](#) ECC_ERROR_LOCATION bit field, and so on.

Table 11-493 describes the [ELM_LOCATION_STATUS_i](#) value decoding.

Table 11-493. ELM_LOCATION_STATUS_i Value Decoding

ECC_CORRECTABLE Value	ECC_NB_ERRORS Value	Status	Number of Errors Detected	Action Required
1	0	OK	0	None
1	≠ 0	OK	ECC_NB_ERRORS	Correct the data buffer read based on the ELM_ERROR_LOCATION_0_i to ELM_ERROR_LOCATION_15_i results.
0	Any	Failed	Unknown	Software-dependent

11.4.3.6 Processing Completion

When the processing for a given syndrome polynomial completes, its [ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) SYNDROME_VALID bit is reset. It must not be set again until the exit status registers, [ELM_LOCATION_STATUS_i](#) (where $i = 0$ to 7) for this processing are checked. Failure to comply with this rule leads to potential loss of the first polynomial process data output.

The error-location engine signals the process completion to the ELM. When this event is detected, the corresponding [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bit (where $i = 0$ to 7) is set. The processing exit status is available from the associated [ELM_LOCATION_STATUS_i](#) register, and error locations are stored in order in the ECC_ERROR_LOCATION bit fields. Software must read only valid error-location registers based on the number of errors detected and located.

Immediately after the error-location engine completes, a new syndrome polynomial can be processed, if any is available, as reported by the [ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) SYNDROME_VALID bit, depending on the configured error-correction level. If several syndrome polynomials are available, a round-robin arbitration is used to select one for processing.

In continuous mode (that is, all bits in [ELM_PAGE_CTRL](#) are reset), an interrupt is triggered whenever a [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bit is asserted. Software must read the [ELM_IRQSTATUS](#) register to determine which polynomial is processed and retrieve the exit status and error locations ([ELM_LOCATION_STATUS_i](#) and [ELM_ERROR_LOCATION_0_i](#) to [ELM_ERROR_LOCATION_15_i](#)). When done, software must clear the corresponding [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bit by setting it to 1. Other status bits must be set to 0 so that other interrupts are not unintentionally cleared. When using this mode, the [ELM_IRQSTATUS\[8\]](#) PAGE_VALID interrupt is never triggered.

In page mode, the module does not trigger interrupts for the processing completion of each polynomial because the [ELM_IRQENABLE\[i\]](#) LOCATION_MASK_i bits are cleared. A page is defined using the [ELM_PAGE_CTRL](#) register. Each SECTOR_i bit set means the corresponding polynomial i is part of the page processing. A page is fully processed when all tagged polynomials have been processed, as logged in the [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bits. The module triggers an [ELM_IRQSTATUS\[8\]](#) PAGE_VALID interrupt whenever it detects that the full page has been processed. To make sure the next page can be correctly processed, all status bits in the [ELM_IRQSTATUS](#) register must be cleared by using a single atomic-write access.

NOTE: Do not modify page setting parameters in the [ELM_PAGE_CTRL](#) register unless the engine is idle, no polynomial input is valid, and all interrupts have been cleared.

Because no polynomial-level interrupt is triggered in page mode, polynomials cleared in the [ELM_PAGE_CTRL\[i\]](#) SECTOR_i bits (where $i = 0$ to 7) are processed as usual, but are essentially ignored. Software must manually poll the [ELM_IRQSTATUS](#) bits to check for their status.

11.4.4 ELM Basic Programming Model

11.4.4.1 ELM Low-Level Programming Model

11.4.4.1.1 Processing Initialization

Table 11-494. ELM Processing Initialization

Step	Register/Bit Field/Programming Model	Value
Resets the module	ELM_SYSCONFIG[1] SOFTRESET	0x1
Wait until reset is done.	ELM_SYSSTATUS[0] RESETDONE	0x1
Configure the slave interface power management.	ELM_SYSCONFIG[4:3] SIDLEMODE	Set value.
Defines the error-correction level used	ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL	Set value.
Defines the maximum buffer length	ELM_LOCATION_CONFIG[26:16] ECC_SIZE	Set value.
Sets the ELM in continuous mode or page mode	ELM_PAGE_CTRL	Set value.
If continuous mode is used	All ELM_PAGE_CTRL[i] SECTOR_i (where $i = 0$ to 7)	0x0
Enables interrupt for syndrome polynomial i	ELM_IRQENABLE[i] LOCATION_MASK_i	0x1

Table 11-494. ELM Processing Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
else (page mode is used)	One syndrome polynomial i is set ELM_PAGE_CTRL[i] SECTOR_ i (where $i = 0$ to 7)	0x1
Disable all interrupts for syndrome polynomial and enable PAGE_MASK interrupt.	All ELM_IRQENABLE[i] LOCATION_MASK_ $i = 0x0$ and ELM_IRQENABLE[8] PAGE_MASK = 0x1	Set value.
endif		Set value.
Set the input syndrome polynomial i .	ELM_SYNDROME_FRAGMENT_0_i	Set value.
	ELM_SYNDROME_FRAGMENT_1_i	Set value.
	ELM_SYNDROME_FRAGMENT_5_i	Set value.
	ELM_SYNDROME_FRAGMENT_6_i	Set value.
Initiates the computation process	ELM_SYNDROME_FRAGMENT_6_i[16] SYNDROME_VALID	0x1

11.4.4.1.2 Read Results

The engine goes through the entire error-location process and results can be read. [Table 11-495](#) and [Table 11-496](#) describe the processing completion for continuous and page modes, respectively.

Table 11-495. ELM Processing Completion for Continuous Mode

Step	Register/Bit Field/Programming Model	Value
Wait until process is complete for syndrome polynomial i : Wait until the ELM_IRQ interrupt is generated, or poll the status register.		
Read for which i the error-location process is complete.	ELM_IRQSTATUS[i] LOC_VALID_ i	0x1
if the process fails (too many errors) It is software dependant.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	0x0
else (process successful, the engine completes)	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	0x1
Read the number of errors.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS	
Read the error-location bit addresses for syndrome polynomial i of the ECC_NB_ERRORS first registers. Software must correct errors in the data buffer.	ELM_ERROR_LOCATION_0_i[12:0] ECC_ERROR_LOCATION	
	ELM_ERROR_LOCATION_1_i[12:0] ECC_ERROR_LOCATION	
	...	
	ELM_ERROR_LOCATION_15_i[12:0] ECC_ERROR_LOCATION	
endif		
Clear the corresponding i interrupt.	ELM_IRQSTATUS[i] LOC_VALID_ i	0x1

A new syndrome polynomial can be processed after the end of processing ([ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) SYNDROME_VALID = 0x0) and after the exit status register check ([ELM_LOCATION_STATUS_i](#)).

Table 11-496. ELM Processing Completion for Page Mode

Step	Register/Bit Field/Programming Model	Value
Wait until process is complete for syndrome polynomial i : Wait until the ELM_IRQ interrupt is generated, or poll the status register.		
Wait for page completed interrupt: All error locations are valid.	ELM_IRQSTATUS[8] PAGE_VALID	0x1
Repeat the following actions the necessary number of times. That is, once for each valid defined block in the page.		

Table 11-496. ELM Processing Completion for Page Mode (continued)

Step	Register/Bit Field/Programming Model	Value
Read the process exit status.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	
if the process fails (too many errors) It is software dependent.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	0x0
else (process successful, the engine completes)	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	0x1
Read the number of errors.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS	
Read the error-location bit addresses for syndrome polynomial i of the ECC_NB_ERRORS first registers.	ELM_ERROR_LOCATION_0_i[12:0] ECC_ERROR_LOCATION	
	ELM_ERROR_LOCATION_1_i[12:0] ECC_ERROR_LOCATION	
	...	
	ELM_ERROR_LOCATION_15_i[12:0] ECC_ERROR_LOCATION	
endif		
End Repeat		
Clear the ELM_IRQSTATUS register.	ELM_IRQSTATUS	0x1FF

Next page can be correctly processed after a page is fully processed, when all tagged polynomials have been processed ([ELM_IRQSTATUS\[i\]](#) LOC_VALID_i = 0x1 for all syndrome polynomials i used in the page).

11.4.4.2 Use Case: ELM Used in Continuous Mode

In this example, the ELM is programmed for an 8-bit error-correction capability in continuous mode (see [Table 11-497](#)). After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, a nonzero polynomial syndrome is reported from the GPMC (polynomial syndrome 0 is used in the ELM):

- P = 0x0A16ABE115E44F767BFB0D0980

Table 11-497. Use Case: Continuous Mode

Step	Register/Bit Field/Programming Model	Value
Resets the module	ELM_SYSCONFIG[1] SOFTRESET	0x1
Wait until reset is done.	ELM_SYSSTATUS[0] RESETDONE	0x1
Configure the slave interface power management: Smart idle is used.	ELM_SYSCONFIG[4:3] SIDLEMODE	0x2
Defines the error-correction level used: 8 bits	ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL	0x1
Defines the maximum buffer length: 528 bytes (2 × 528 = 1056)	ELM_LOCATION_CONFIG[26:16] ECC_SIZE	0x420
Sets the ELM in continuous mode	ELM_PAGE_CTRL	0
Enables interrupt for syndrome polynomial 0	ELM_IRQENABLE[0] LOCATION_MASK_0	0x1
Set the input syndrome polynomial 0.	ELM_SYNDROME_FRAGMENT_0_i (where i = 0)	0xFB0D0980
	ELM_SYNDROME_FRAGMENT_1_i (where i = 0)	0xE44F767B
	ELM_SYNDROME_FRAGMENT_2_i (where i = 0)	0x16ABE115
	ELM_SYNDROME_FRAGMENT_3_i (where i = 0)	0x0000000A
Initiates the computation process	ELM_SYNDROME_FRAGMENT_6_i[16] SYNDROME_VALID (where i = 0)	0x1
Wait until process is complete for syndrome polynomial 0: IRQ_ELM is generated or poll the status register.		
Read that error-location process is complete for syndrome polynomial 0.	ELM_IRQSTATUS[0] LOC_VALID_0	0x1
Read the process exit status: All errors were successfully located.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE (where i = 0)	0x1

Table 11-497. Use Case: Continuous Mode (continued)

Step	Register/Bit Field/Programming Model	Value
Read the number of errors: Four errors detected.	ELM_LOCATION_STATUS_i [4:0] ECC_NB_ERRORS (where i = 0)	0x4
Read the error-location bit addresses for syndrome polynomial 0 of the first four registers: Errors are located in the data buffer at decimal addresses 431, 1062, 1909, 3452.	ELM_ERROR_LOCATION_0_i (where i = 0)	0x1AF
	ELM_ERROR_LOCATION_1_i (where i = 0)	0x426
	ELM_ERROR_LOCATION_2_i (where i = 0)	0x775
	ELM_ERROR_LOCATION_3_i (where i = 0)	0xD7C
Clear the corresponding interrupt for polynomial 0.	ELM_IRQSTATUS [0] LOC_VALID_0	0x1

The NAND flash data in the sector are seen as a polynomial of degree 4223 (number of bits in a 528 byte buffer minus 1), with each data bit being a coefficient in the polynomial. When reading from a NAND flash using the GPMC module, computation of the polynomial syndrome assumes that the first NAND word read at address 0x0 contains the highest-order coefficient in the message. Furthermore, in the 16-bit NAND word, bits are ordered from bit 7 to bit 0, and then from bit 15 to bit 8. Based on this convention, an address table of the data buffer can be built. NAND memory addresses in [Table 11-498](#) are given in decimal format.

Table 11-498. 16-Bit NAND Sector Buffer Address Map

NAND Memory Address	Message Bit Addresses in Memory Word															
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	4215	4214	4213	4212	4211	4210	4209	4208	4223	4222	4221	4220	4219	4218	4217	4216

258	87	86	85	84	83	82	81	80	95	94	93	92	91	90	89	88
259	71	70	69	68	67	66	65	64	79	78	77	76	75	74	73	72
260	55	54	53	52	51	50	49	48	63	62	61	60	59	58	57	56
261	39	38	37	36	35	34	33	32	47	46	45	44	43	42	41	40
262	23	22	21	20	19	18	17	16	31	30	29	28	27	26	25	24
263	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8

The table can now be used to determine which bits in the buffer were incorrect and must be flipped. In this example, the first bit to be flipped is bit 4 from the 49th byte read from memory. It is up to the processor to correctly map this word to the copied buffer and flip this bit. The same process must be repeated for all detected errors.

11.4.4.3 Use Case: ELM Used in Page Mode

In this example, the ELM module is programmed for an 16-bit error-correction capability in page mode (see [Table 11-499](#)). After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, four non-zero polynomial syndromes are reported from the GPMC (polynomial syndrome 0, 1, 2, and 3 are used in the ELM):

- P0 = 0xE8B0 12ADDB5A318E05BE B0693DB28330B5CC A329AA05E0B718EF
- P1 = 0xBAD0 49A0D932C22E6669 0948DF08BE093336 79C6BA10E5F935EB

- P2 = 0x69D9 B86ABCD5EC3697FA A6498FEE54556EA0 1579EF7D60BA3189
- P3 = 0x0

Table 11-499. Use Case: Page Mode

Step	Register/Bit Field/Programming Model	Value	
Resets the module	ELM_SYSCONFIG[1] SOFTRESET	0x1	
Wait until reset is done.	ELM_SYSSTATUS[0] RESETDONE	0x1	
Configure the slave interface power management: Smart idle is used.	ELM_SYSCONFIG[4:3] SIDLEMODE	0x2	
Defines the error-correction level used: 16 bits	ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL	0x2	
Defines the maximum buffer length: 528 bytes	ELM_LOCATION_CONFIG[26:16] ECC_SIZE	0x420	
Sets the ELM in page mode (four blocks in a page)	ELM_PAGE_CTRL[0] SECTOR_0	0x1

Table 11-506. ELM_SYSSTATUS

Address Offset	0x0000 0014	Instance	ELM
Physical Address	0x4807 8014		
Description	Internal reset monitoring (OCP domain) Undefined since: From hardware perspective, the reset state is 0. From software user perspective, when the accessible module is 1.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												RESETDONE			

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Reserved	R	0x0000 0000
0	RESETDONE	Internal reset monitoring (OCP domain) Undefined since: From hardware perspective, the reset state is 0. From software user perspective, when the accessible module is 1. Read 0x0: Reset is ongoing. Read 0x1: Reset is done (completed).	R	1

Table 11-508. ELM_IRQSTATUS

Address Offset	0x0000 0018	Instance	ELM
Physical Address	0x4807 8018		
Description	Interrupt status. This register doubles as a status register for the error-location processes.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																PAGE_VALID	LOC_VALID_7	LOC_VALID_6	LOC_VALID_5	LOC_VALID_4	LOC_VALID_3	LOC_VALID_2	LOC_VALID_1	LOC_VALID_0							

Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Reserved	R	0x000000
8	PAGE_VALID	Error-location status for a full page, based on the mask definition Read 0x0: Error locations invalid for all polynomials enabled in the ECC_INTERRUPT_MASK register Read 0x1: All error locations valid Write 0x0: No effect Write 0x1: Clear interrupt	RW	0
7	LOC_VALID_7	Error-location status for syndrome polynomial 7 Read 0x0: No syndrome processed or process in progress Read 0x1: Error-location process completed Write 0x0: No effect Write 0x1: Clear interrupt	RW W1toClr	0
6	LOC_VALID_6	Error-location status for syndrome polynomial 6	RW W1toClr	0
5	LOC_VALID_5	Error-location status for syndrome polynomial 5	RW W1toClr	0
4	LOC_VALID_4	Error-location status for syndrome polynomial 4	RW W1toClr	0
3	LOC_VALID_3	Error-location status for syndrome polynomial 3	RW W1toClr	0
2	LOC_VALID_2	Error-location status for syndrome polynomial 2	RW W1toClr	0
1	LOC_VALID_1	Error-location status for syndrome polynomial 1	RW W1toClr	0
0	LOC_VALID_0	Error-location status for syndrome polynomial 0	RW W1toClr	0
