The counter-compare submodule is responsible for generating two independent compare events based on two compare registers:

1. CTR = CMPA: Time-base counter equal to counter-compare A register (TBCTR = CMPA).
2. CTR = CMPB: Time-base counter equal to counter-compare B register (TBCTR = CMPB).

For up-count or down-count mode, each event occurs only once per cycle. For up-down-count mode each event occurs twice per cycle if the compare value is between 0x0000-TBPRD and once per cycle if the compare value is equal to 0x0000 or equal to TBPRD. These events are fed into the action-qualifier submodule where they are qualified by the counter direction and converted into actions if enabled. Refer to Section 19.2.4.1 for more details.

The counter-compare registers CMPA and CMPB each have an associated shadow register. Shadowing provides a way to keep updates to the registers synchronized with the hardware. When shadowing is used, updates to the active registers only occur at strategic points. This prevents corruption or spurious operation due to the register being asynchronously modified by software. The memory address of the active register and the shadow register is identical. Which register is written to or read from is determined by the CMPCTL[SHDWAMODE] and CMPCTL[SHDWBMODE] bits. These bits enable and disable the CMPA shadow register and CMPB shadow register respectively. The behavior of the two load modes is as described:

Shadow Mode:

The shadow mode for the CMPA is enabled by clearing the CMPCTL[SHDWAMODE] bit and the shadow register for CMPB is enabled by clearing the CMPCTL[SHDWBMODE] bit. Shadow mode is enabled by default for both CMPA and CMPB.

If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the CMPCTL[LOADAMODE] and CMPCTL[LOADBMODE] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000)
- Both CTR = PRD and CTR = Zero

Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.

Immediate Load Mode:

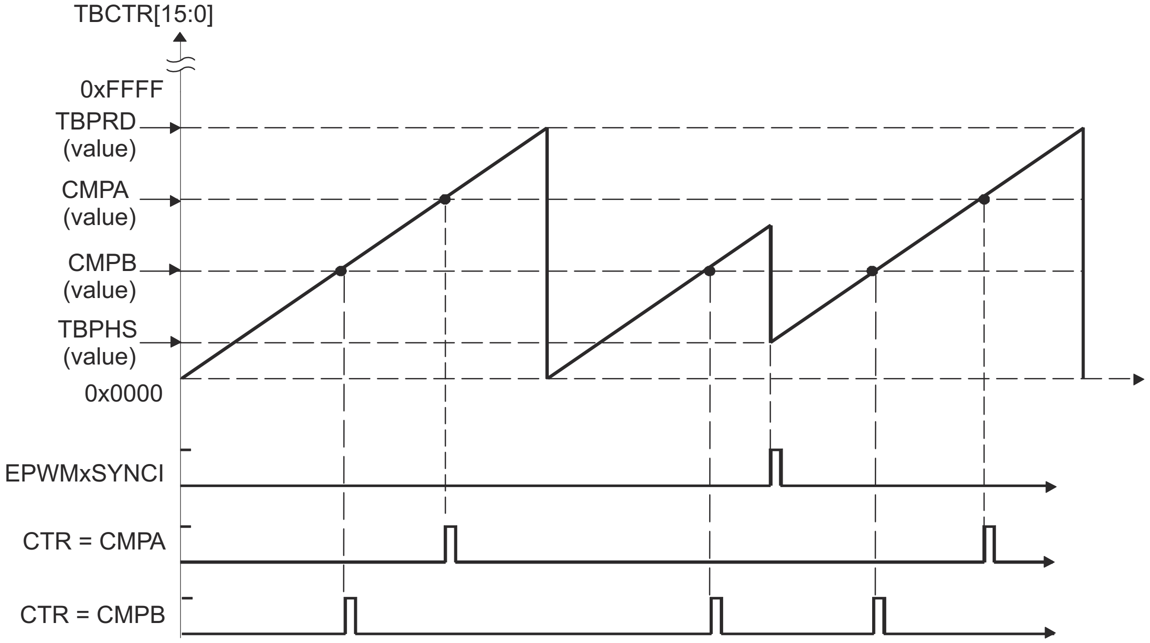
If immediate load mode is selected (that is, TBCTL[SHADWAMODE] = 1 or TBCTL[SHADWBMODE] = 1), then a read from or a write to the register will go directly to the active register.

19.2.3.4 Count Mode Timing Waveforms

The counter-compare module can generate compare events in all three count modes:

- Up-count mode: used to generate an asymmetrical PWM waveform.
- Down-count mode: used to generate an asymmetrical PWM waveform.
- Up-down-count mode: used to generate a symmetrical PWM waveform.

To best illustrate the operation of the first three modes, the timing diagrams in Figure 19-13 through Figure 19-16 show when events are generated and how the EPWMxSYNCI signal interacts.



An EPWMxSYNCI external synchronization event can cause a discontinuity in the TBCTR count sequence. This can lead to a compare event being skipped. This skipping is considered normal operation and must be taken into account.

Figure 19-13. Counter-Compare Event Waveforms in Up-Count Mode

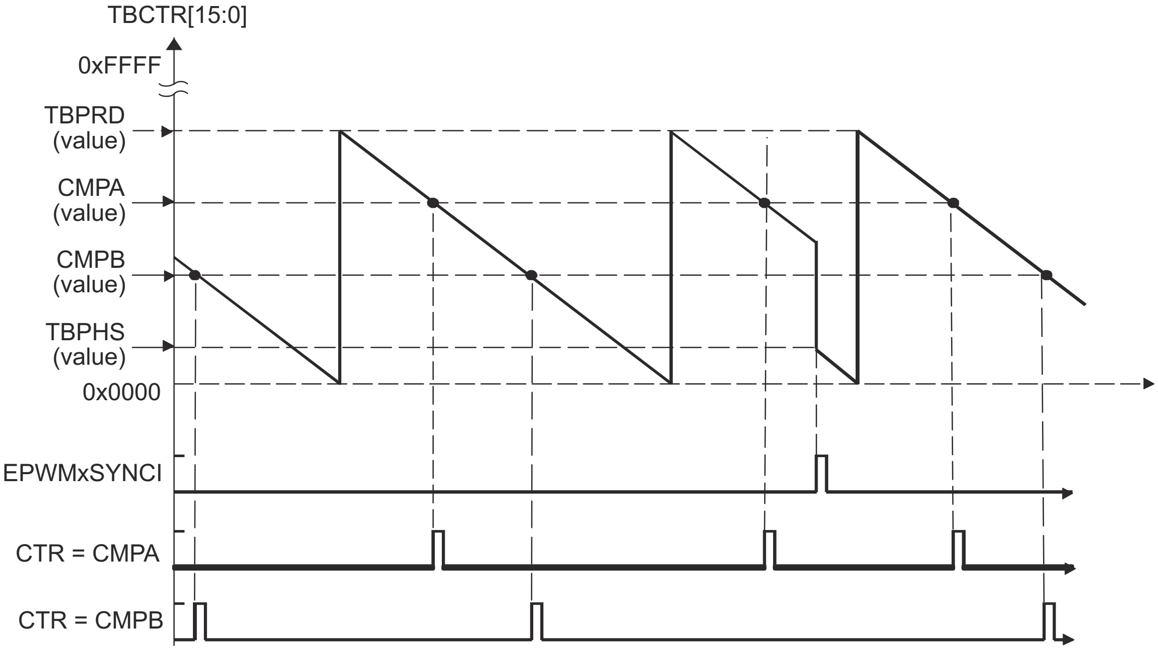


Figure 19-14. Counter-Compare Events in Down-Count Mode

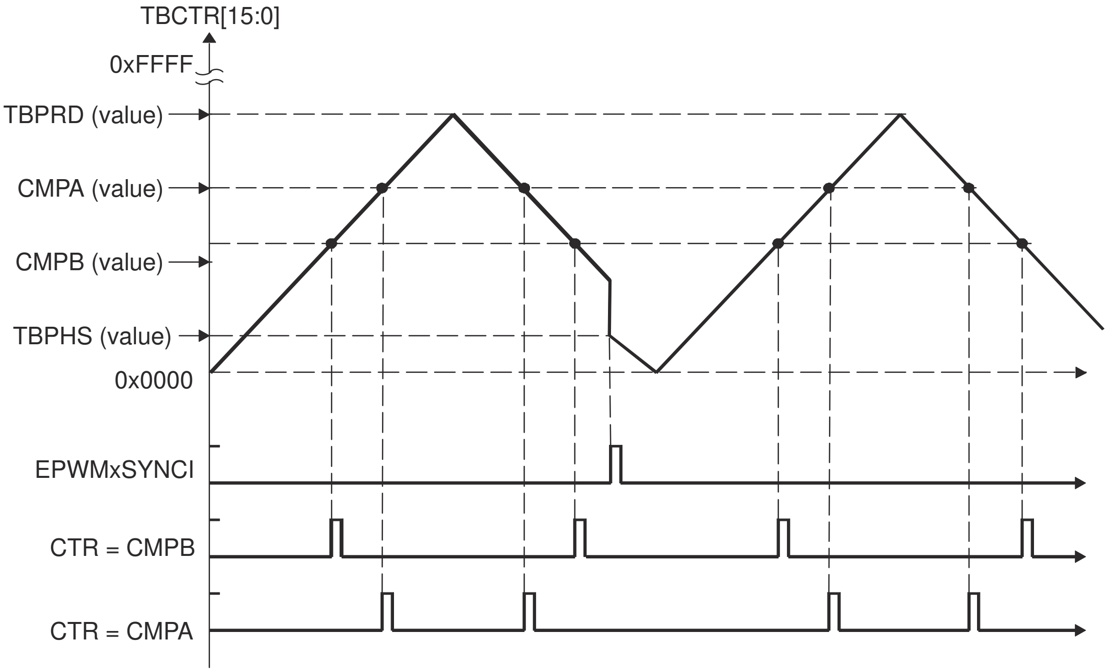

Figure 19-15. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 0] Count Down On Synchronization Event

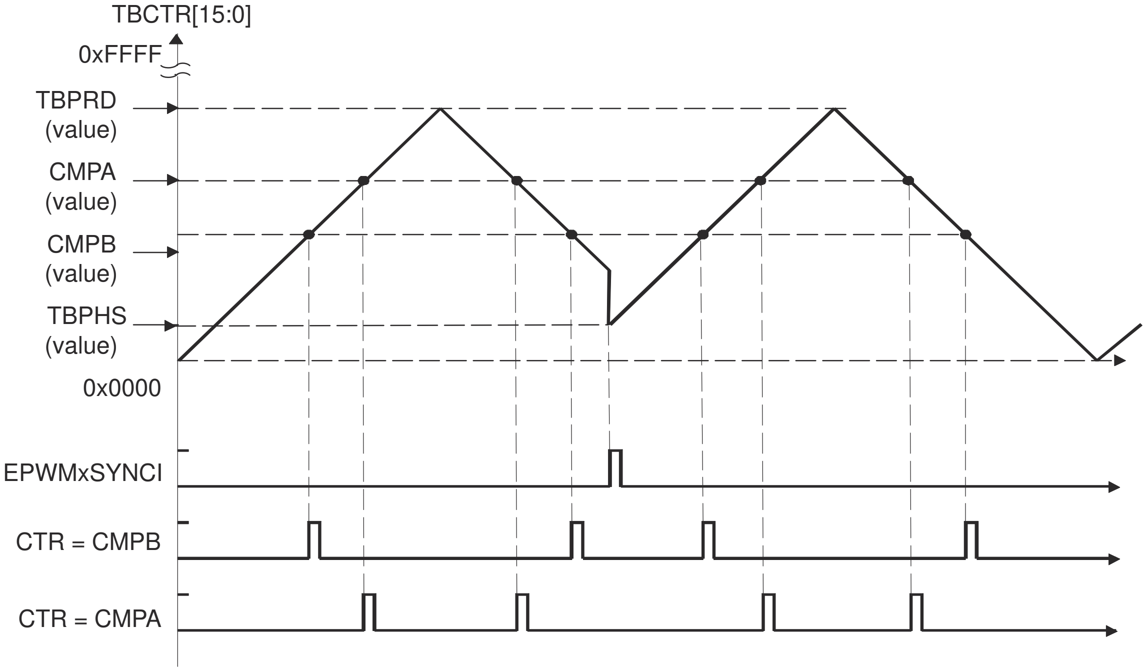

Figure 19-16. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 1] Count Up On Synchronization Event

19.2.4 Action-Qualifier (AQ) Submodule

Figure 19-17 shows the action-qualifier (AQ) submodule (see shaded block) in the ePWM system.

The action-qualifier submodule has the most important role in waveform construction and PWM generation. It decides which events are converted into various action types, thereby producing the required switched waveforms at the EPWMxA and EPWMxB outputs.

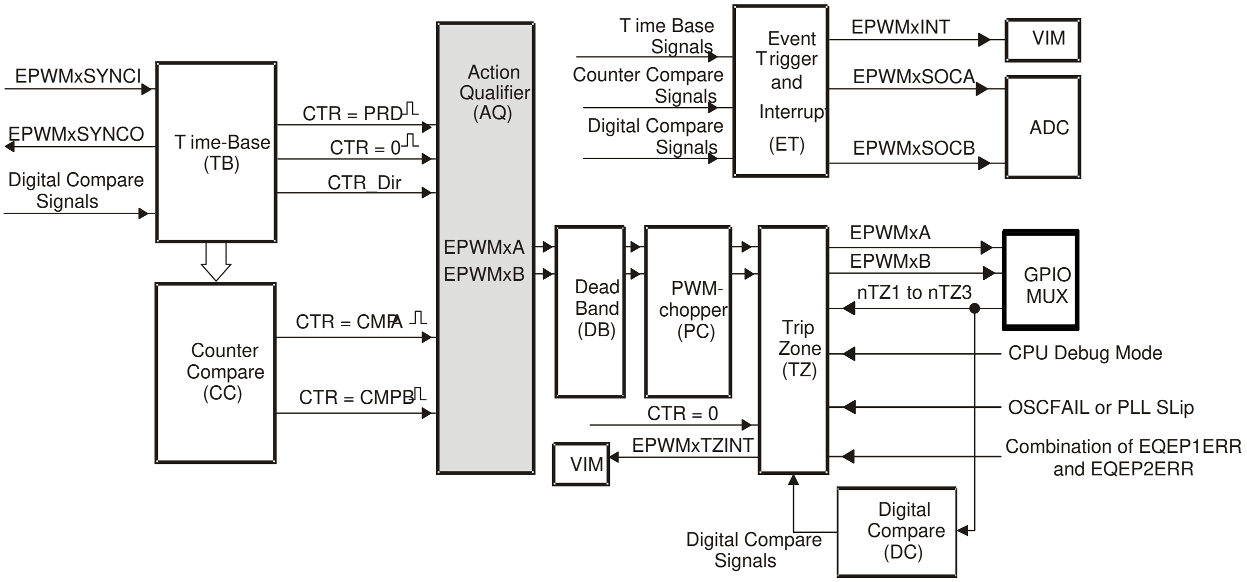

Figure 19-17. Action-Qualifier Submodule

19.2.4.1 Purpose of the Action-Qualifier Submodule

The action-qualifier submodule is responsible for the following:

- Qualifying and generating actions (set, clear, toggle) based on the following events:
  - CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD)
  - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000)
  - CTR = CMPA: Time-base counter equal to the counter-compare A register (TBCTR = CMPA)
  - CTR = CMPB: Time-base counter equal to the counter-compare B register (TBCTR = CMPB)
- Managing priority when these events occur concurrently
- Providing independent control of events when the time-base counter is increasing and when it is decreasing

19.2.4.2 Action-Qualifier Submodule Control and Status Register Definitions

The action-qualifier submodule operation is controlled and monitored via the registers in Table 19-7.

Table 19-7. Action-Qualifier Submodule Registers

Register Name	Address Offset	Shadowed	Description
AQCTLA	0x0014	No	Action-Qualifier Control Register For Output A (EPWMxA)
AQCTLB	0x001A	No	Action-Qualifier Control Register For Output B (EPWMxB)
AQSFRC	0x0018	No	Action-Qualifier Software Force Register
AQCSFRC	0x001E	Yes	Action-Qualifier Continuous Software Force

The action-qualifier submodule is based on event-driven logic. It can be thought of as a programmable cross switch with events at the input and actions at the output, all of which are software controlled via the set of registers shown in Table 19-7.

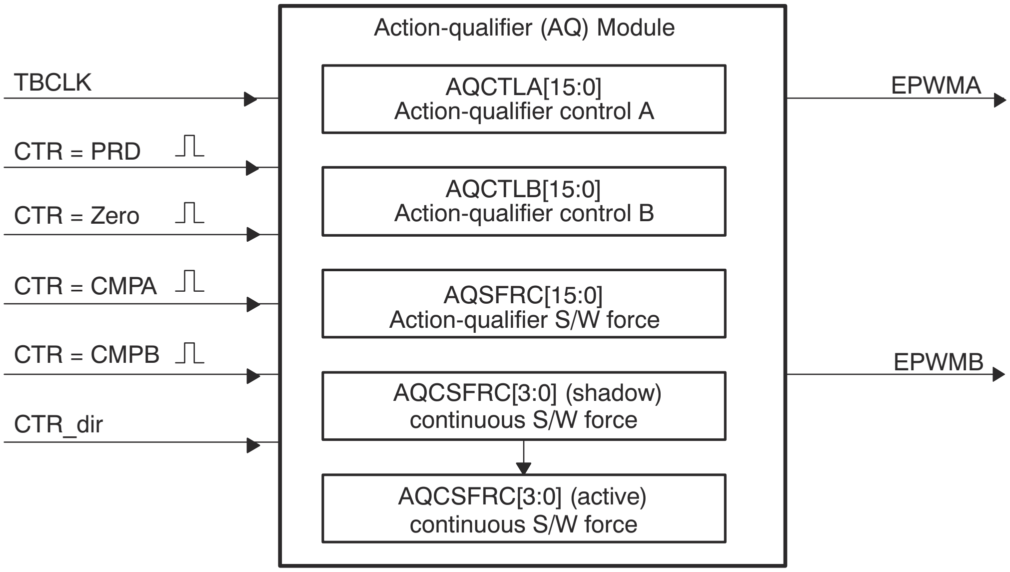

Figure 19-18. Action-Qualifier Submodule Inputs and Outputs

For convenience, the possible input events are summarized again in Table 19-8.

Table 19-8. Action-Qualifier Submodule Possible Input Events

Signal	Description	Registers Compared
CTR = PRD	Time-base counter equal to the period value	TBCTR = TBPRD
CTR = Zero	Time-base counter equal to zero	TBCTR = 0x0000
CTR = CMPA	Time-base counter equal to the counter-compare A	TBCTR = CMPA
CTR = CMPB	Time-base counter equal to the counter-compare B	TBCTR = CMPB
Software forced event	Asynchronous event initiated by software	

The software forced action is a useful asynchronous event. This control is handled by registers AQSFRC and AQCSFRC.

The action-qualifier submodule controls how the two outputs EPWMxA and EPWMxB behave when a particular event occurs. The event inputs to the action-qualifier submodule are further qualified by the counter direction (up or down). This allows for independent action on outputs on both the count-up and count-down phases.

The possible actions imposed on outputs EPWMxA and EPWMxB are:

- **Set High:**

  Set output EPWMxA or EPWMxB to a high level.
- **Clear Low:**

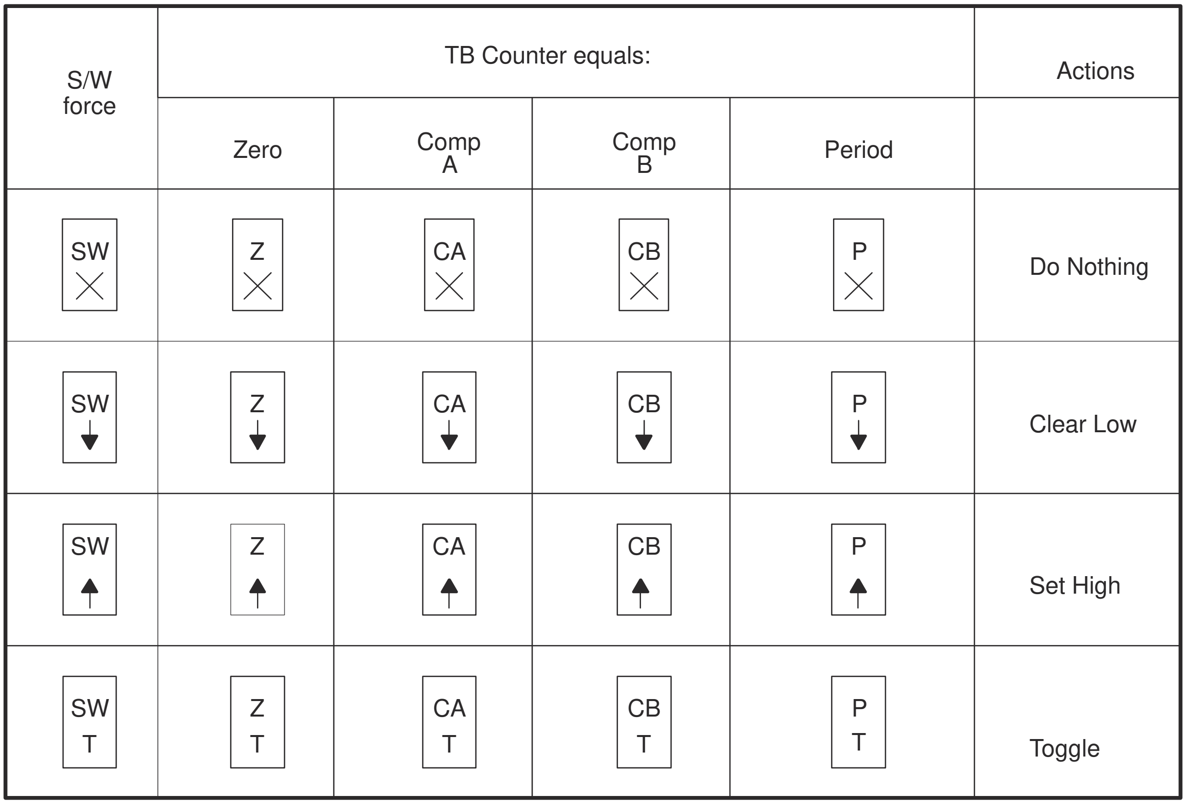
  Set output EPWMxA or EPWMxB to a low level.
- **Toggle:**

  If EPWMxA or EPWMxB is currently pulled high, then pull the output low. If EPWMxA or EPWMxB is currently pulled low, then pull the output high.
- **Do Nothing:**

  Keep outputs EPWMxA and EPWMxB at same level as currently set. Although the "Do Nothing" option prevents an event from causing an action on the EPWMxA and EPWMxB outputs, this event can still trigger interrupts and ADC start of conversion. See the Event-trigger Submodule description in Section 19.2.8 for details.

Actions are specified independently for either output (EPWMxA or EPWMxB). Any or all events can be configured to generate actions on a given output. For example, both CTR = CMPA and CTR = CMPB can operate on output EPWMxA. All qualifier actions are configured via the control registers found at the end of this section.

For clarity, the drawings in this document use a set of symbolic actions. These symbols are summarized in Figure 19-19. Each symbol represents an action as a marker in time. Some actions are fixed in time (zero and period) while the CMPA and CMPB actions are moveable and their time positions are programmed via the counter-compare A and B registers, respectively. To turn off or disable an action, use the "Do Nothing option"; it is the default at reset.



S/W force	TB Counter equals:				Actions
	Zero	Comp A	Comp B	Period	
SW ✕	Z ✕	CA ✕	CB ✕	P ✕	Do Nothing
SW ↓	Z ↓	CA ↓	CB ↓	P ↓	Clear Low
SW ↑	Z ↑	CA ↑	CB ↑	P ↑	Set High
SW T	Z T	CA T	CB T	P T	Toggle

Figure 19-19. Possible Action-Qualifier Actions for EPWMxA and EPWMxB Outputs

19.2.4.3 Action-Qualifier Event Priority

It is possible for the ePWM action qualifier to receive more than one event at the same time. In this case events are assigned a priority by the hardware. The general rule is events occurring later in time have a higher priority and software forced events always have the highest priority. The event priority levels for up-down-count mode are shown in Table 19-9. A priority level of 1 is the highest priority and level 7 is the lowest. The priority changes slightly depending on the direction of TBCTR.

Table 19-9. Action-Qualifier Event Priority for Up-Down-Count Mode

Priority Level	Event If TBCTR is Incrementing TBCTR = Zero up to TBCTR = TBPRD	Event If TBCTR is Decrementing TBCTR = TBPRD down to TBCTR = 1
1 (Highest)	Software forced event	Software forced event
2	Counter equals CMPB on up-count (CBU)	Counter equals CMPB on down-count (CBD)
3	Counter equals CMPA on up-count (CAU)	Counter equals CMPA on down-count (CAD)
4	Counter equals zero	Counter equals period (TBPRD)
5	Counter equals CMPB on down-count (CBD)	Counter equals CMPB on up-count (CBU)
6 (Lowest)	Counter equals CMPA on down-count (CAD)	Counter equals CMPA on up-count (CBU)

Table 19-10 shows the action-qualifier priority for up-count mode. In this case, the counter direction is always defined as up and thus down-count events will never be taken.

Table 19-10. Action-Qualifier Event Priority for Up-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to period (TBPRD)
3	Counter equal to CMPB on up-count (CBU)
4	Counter equal to CMPA on up-count (CAU)
5 (Lowest)	Counter equal to Zero

Table 19-11 shows the action-qualifier priority for down-count mode. In this case, the counter direction is always defined as down and thus up-count events will never be taken.

Table 19-11. Action-Qualifier Event Priority for Down-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to Zero
3	Counter equal to CMPB on down-count (CBD)
4	Counter equal to CMPA on down-count (CAD)
5 (Lowest)	Counter equal to period (TBPRD)

It is possible to set the compare value greater than the period. In this case the action will take place as shown in Table 19-12.

Table 19-12. Behavior if CMPA/CMPB is Greater than the Period

Counter Mode	Compare on Up-Count Event CAD/CBD	Compare on Down-Count Event CAD/CBD
Up-Count Mode	If CMPA/CMPB ≤ TBPRD period, then the event occurs on a compare match (TBCTR=CMPA or CMPB). If CMPA/CMPB > TBPRD, then the event will not occur.	Never occurs.
Down-Count Mode	Never occurs.	If CMPA/CMPB < TBPRD, the event will occur on a compare match (TBCTR=CMPA or CMPB). If CMPA/CMPB ≥ TBPRD, the event will occur on a period match (TBCTR=TBPRD).
Up-Down-Count Mode	If CMPA/CMPB < TBPRD and the counter is incrementing, the event occurs on a compare match (TBCTR=CMPA or CMPB). If CMPA/CMPB is ≥ TBPRD, the event will occur on a period match (TBCTR = TBPRD).	If CMPA/CMPB < TBPRD and the counter is decrementing, the event occurs on a compare match (TBCTR=CMPA or CMPB). If CMPA/CMPB ≥ TBPRD, the event occurs on a period match (TBCTR=TBPRD).

19.2.4.4 Waveforms for Common Configurations

Note

The waveforms in this document show the ePWMs behavior for a static compare register value. In a running system, the active compare registers (CMPA and CMPB) are typically updated from their respective shadow registers once every period. The user specifies when the update will take place; either when the time-base counter reaches zero or when the time-base counter reaches period. There are some cases when the action based on the new value can be delayed by one period or the action based on the old value can take effect for an extra period. Some PWM configurations avoid this situation. These include, but are not limited to, the following:

Use up-down-count mode to generate a symmetric PWM:

- If you load CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1.
- If you load CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD - 1.

  This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

Use up-down-count mode to generate an asymmetric PWM:

- To achieve 50%-0% asymmetric PWM use the following configuration: Load CMPA/CMPB on period and use the period action to clear the PWM and a compare-up action to set the PWM. Modulate the compare value from 0 to TBPRD to achieve 50%-0% PWM duty.

When using up-count mode to generate an asymmetric PWM:

- To achieve 0-100% asymmetric PWM use the following configuration: Load CMPA/CMPB on TBPRD. Use the Zero action to set the PWM and a compare-up action to clear the PWM. Modulate the compare value from 0 to TBPRD + 1 to achieve 0-100% PWM duty.

See the *Using Enhanced Pulse Width Modulator (ePWM) Module for 0-100% Duty Cycle Control* Application Report (SPRAAI1)

Figure 19-20 shows how a symmetric PWM waveform can be generated using the up-down-count mode of the TBCTR. In this mode 0%-100% DC modulation is achieved by using equal compare matches on the up count and down count portions of the waveform. In the example shown, CMPA is used to make the comparison. When the counter is incrementing the CMPA match will pull the PWM output high. Likewise, when the counter is decrementing the compare match will pull the PWM signal low. When CMPA = 0, the PWM signal is low for the entire period giving the 0% duty waveform. When CMPA = TBPRD, the PWM signal is high achieving 100% duty.

When using this configuration in practice, if you load CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1. If you load CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD - 1. This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

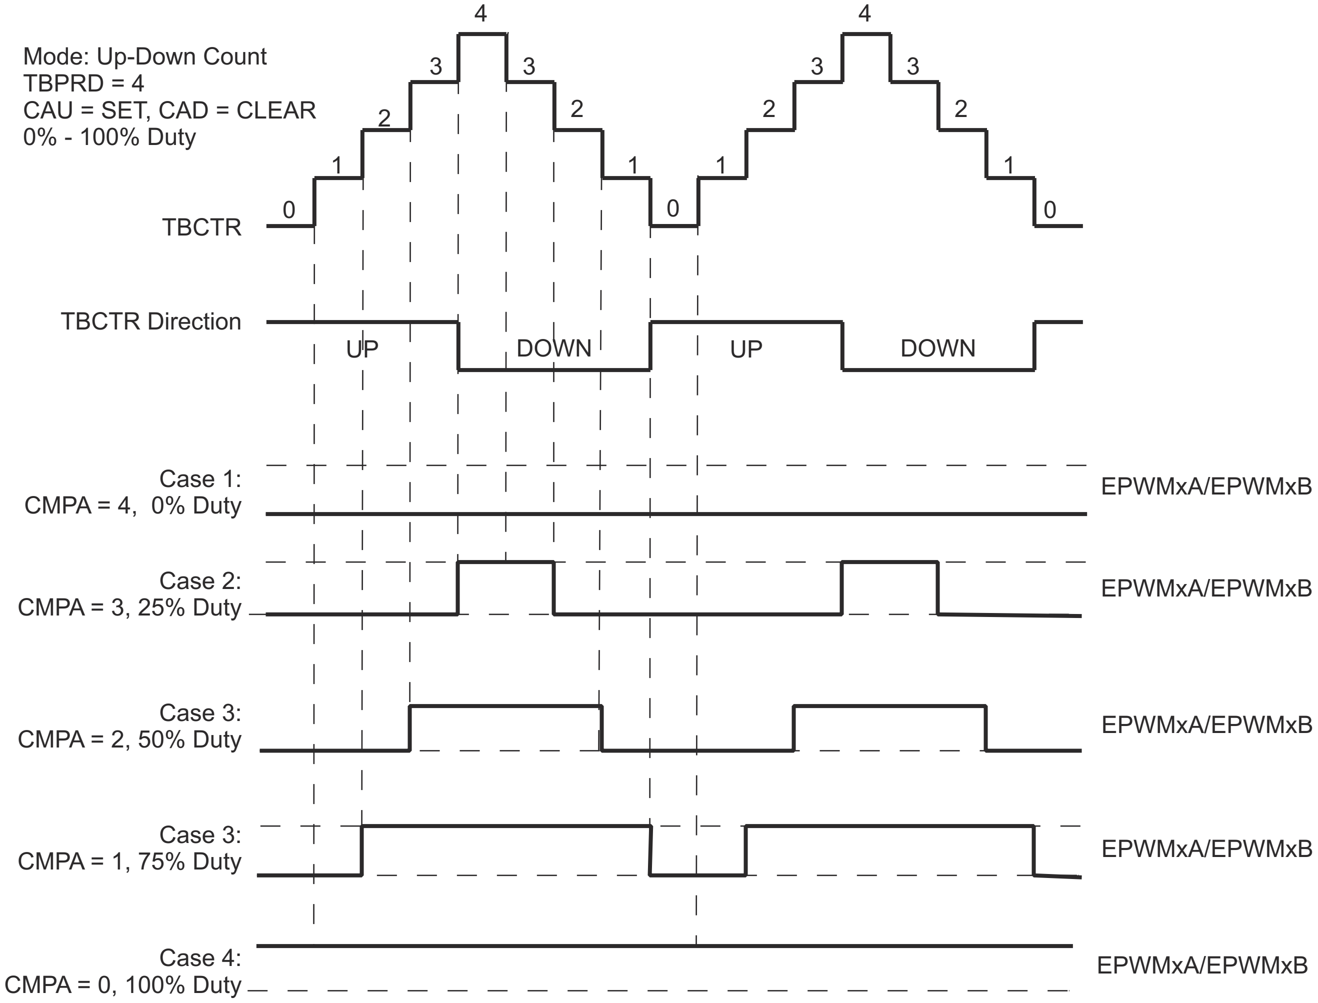


Figure 19-20. Up-Down-Count Mode Symmetrical Waveform

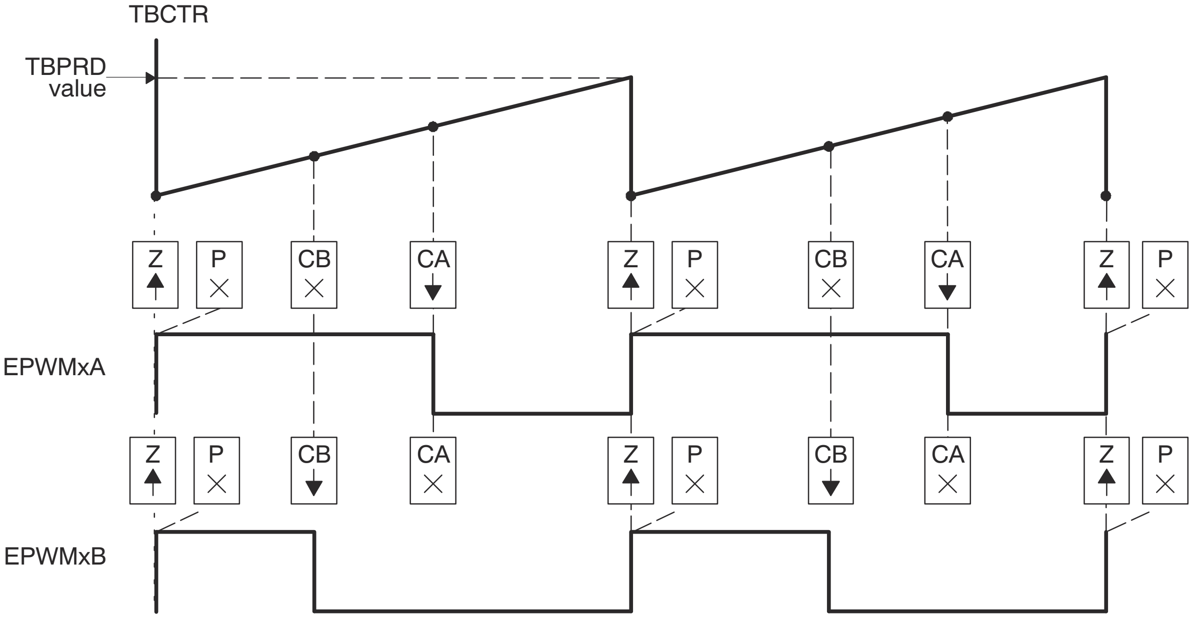
The PWM waveforms in Figure 19-21 through Figure 19-26 show some common action-qualifier configurations. The C-code samples in Example 19-1 through Example 19-6 shows how to configure an ePWM module for each case. Some conventions used in the figures and examples are as follows:

- TBPRD, CMPA, and CMPB refer to the value written in their respective registers. The active register, not the shadow register, is used by the hardware.
- CMPx, refers to either CMPA or CMPB
- EPWMxA and EPWMxB refer to the output signals from ePWMx
- Up-Down means Count-up-and-down mode, Up means up-count mode and Dwn means down-count mode
- Sym = Symmetric, Asym = Asymmetric



A. PWM period = (TBPRD + 1) × T_{TBCLK}

B. Duty modulation for EPWMxA is set by CMPA, and is active high (that is, high time duty proportional to CMPA).

C. Duty modulation for EPWMxB is set by CMPB and is active high (that is, high time duty proportional to CMPB).

D. The "Do Nothing" actions (X) are shown for completeness, but will not be shown on subsequent diagrams.

E. Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

Figure 19-21. Up, Single Edge Asymmetric Waveform, With Independent Modulation on EPWMxA and EPWMxB—Active High

Example 19-1 contains a code sample showing initialization and run time for the waveforms in Figure 19-21.

Example 19-1. Code Sample for Figure 19-21

```
// Initialization Time
// = = = = = = = = = = = = = = = = = = = = = = = = =
EPwm1Regs.TBPRD = 600;                         // Period = 601 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 350;                // Compare A = 350 TBCLK counts
EPwm1Regs.CMPB = 200;                          // Compare B = 200 TBCLK counts
EPwm1Regs.TBPHS = 0;                           // Set Phase register to zero
EPwm1Regs.TBCTR = 0;                           // clear TB counter
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;        // Phase loading disabled
EPwm1Regs.TBCTL.bit.PRDLD = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCOSEL = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1;       // TBCLK = SYSCLK
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR = Zero

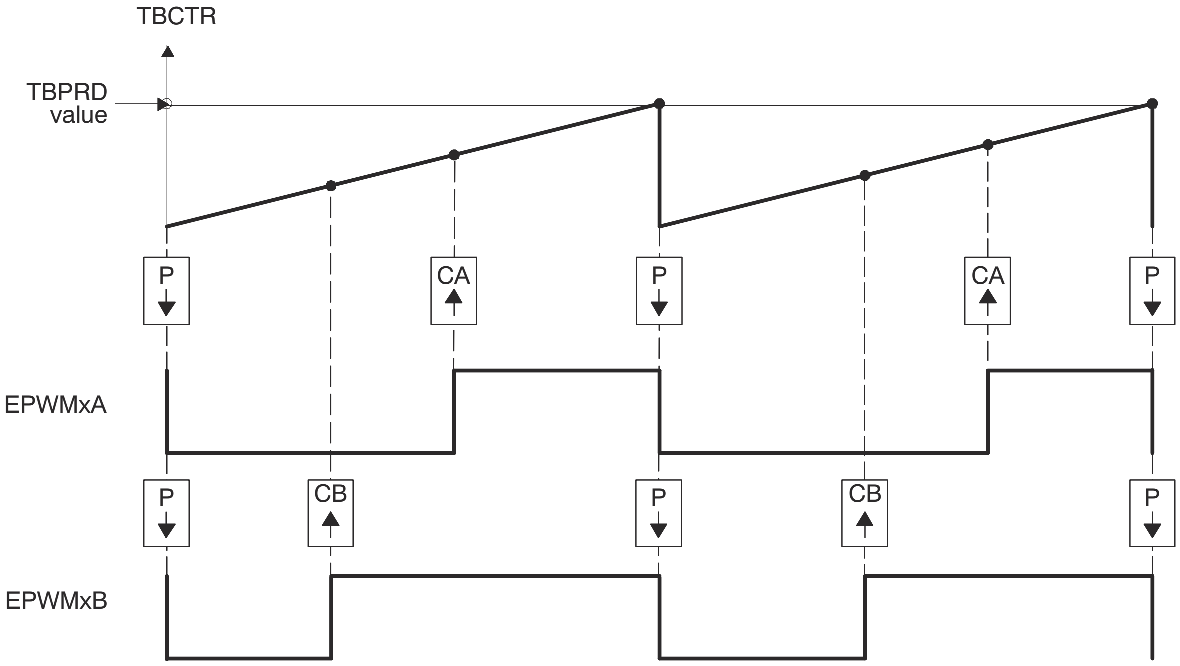
EPwm1Regs.AQCTLA.bit.CAU = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.ZRO = AQ_SET;
EPwm1Regs.AQCTLB.bit.CBU = AQ_CLEAR;
//
// Run Time
// = = = = = = = = = = = = = = = = = = = = = = = = =
EPwm1Regs.CMPA.half.CMPA = Duty1A;             // adjust duty for output EPWM1A
EPwm1Regs.CMPB = Duty1B;                       // adjust duty for output EPWM1B
```

19.2.4.5



A. PWM period = (TBPRD + 1) × T_{TBCLK}

B. Duty modulation for EPWMxA is set by CMPA, and is active low (that is, the low time duty is proportional to CMPA).

C. Duty modulation for EPWMxB is set by CMPB and is active low (that is, the low time duty is proportional to CMPB).

D. Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

Figure 19-22. Up, Single Edge Asymmetric Waveform With Independent Modulation on EPWMxA and EPWMxB—Active Low

Example 19-2 contains a code sample showing initialization and run time for the waveforms in Figure 19-22.

Example 19-2. Code Sample for Figure 19-22

```
// Initialization Time
// = = = = = = = = = = = = = = = = = = = = = = = =
EPwm1Regs.TBPRD = 600;                         // Period = 601 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 350;                // Compare A = 350 TBCLK counts
EPwm1Regs.CMPB = 200;                          // Compare B = 200 TBCLK counts

// Run Time
// = = = = = = = = = = = = = = = = = = = = = = = =
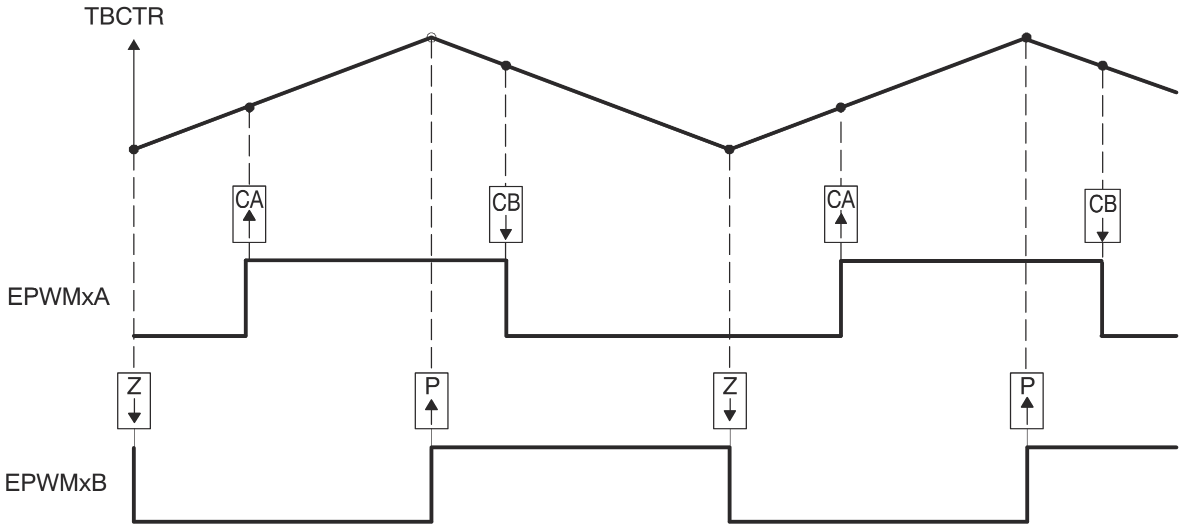
EPwm1Regs.CMPA.half.CMPA = Duty1A;          // adjust duty for output EPWM1A
EPwm1Regs.CMPB = Duty1B;                    // adjust duty for output EPWM1B
```

19.2.4.9



A. PWM period = 2 × TBPRD × TBCLK

B. Rising edge and falling edge can be asymmetrically positioned within a PWM cycle. This allows for pulse placement techniques.

C. Duty modulation for EPWMxA is set by CMPA and CMPB.

D. Low time duty for EPWMxA is proportional to (CMPA + CMPB).

E. To change this example to active high, CMPA and CMPB actions need to be inverted (that is, Set ! Clear and Clear Set).

F. Duty modulation for EPWMxB is fixed at 50% (utilizes spare action resources for EPWMxB)

Figure 19-26. Up-Down-Count, Dual Edge Asymmetric Waveform, With Independent Modulation on EPWMxA—Active Low

Example 19-6 contains a code sample showing initialization and run time for the waveforms in Figure 19-26.

```

19.2.5 Dead-Band Generator (DB) Submodule

Figure 19-27 illustrates the dead-band submodule within the ePWM module.

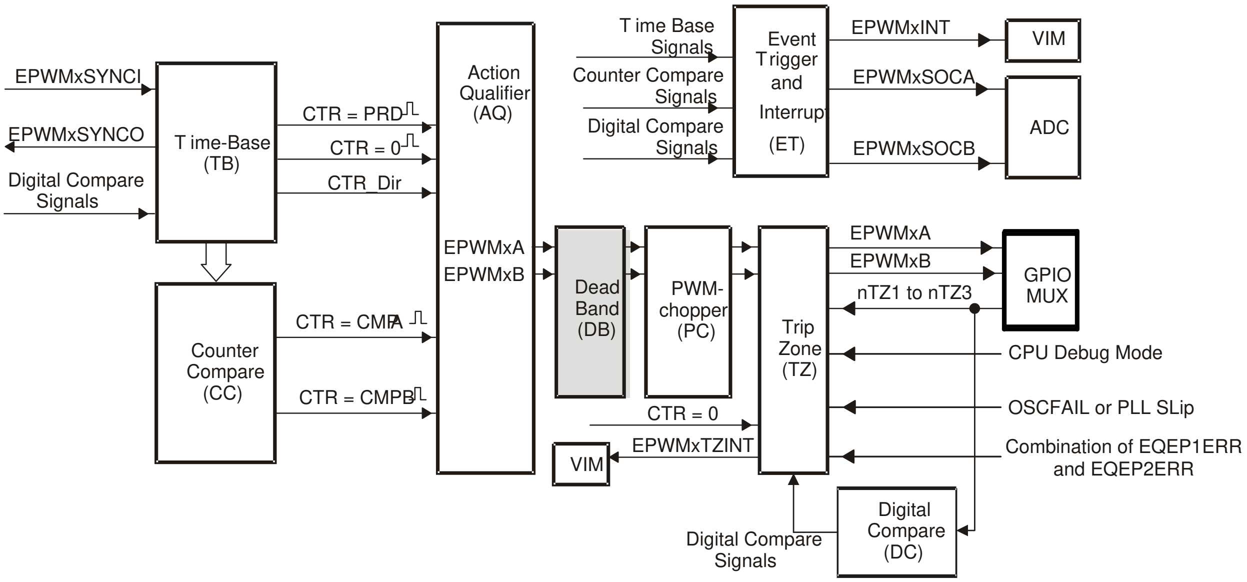

Figure 19-27. Dead_Band Submodule

19.2.5.1 Purpose of the Dead-Band Submodule

Section 19.2.4 discussed how it is possible to generate the required dead-band by having full control over edge placement using both the CMPA and CMPB resources of the ePWM module. However, if the more classical edge delay-based dead-band with polarity control is required, then the dead-band submodule described here should be used.

The key functions of the dead-band module are:

- Generating appropriate signal pairs (EPWMxA and EPWMxB) with dead-band relationship from a single EPWMxA input
- Programming signal pairs for:
  - Active high (AH)
  - Active low (AL)
  - Active high complementary (AHC)
  - Active low complementary (ALC)
- Adding programmable delay to rising edges (RED)
- Adding programmable delay to falling edges (FED)
- Can be totally bypassed from the signal path (note dotted lines in diagram)

19.2.5.2 Controlling and Monitoring the Dead-Band Submodule

The dead-band submodule operation is controlled and monitored via the following registers:

Table 19-13. Dead-Band Generator Submodule Registers

Register Name	Address Offset	Shadowed	Description
DBCTL	0x001C	No	Dead-Band Control Register
DBRED	0x0022	No	Dead-Band Rising Edge Delay Count Register
DBFED	0x0020	No	Dead-Band Falling Edge Delay Count Register

19.2.5.3 Operational Highlights for the Dead-Band Submodule

The following sections provide the operational highlights.

The dead-band submodule has two groups of independent selection options as shown in Figure 19-28.

- **Input Source Selection:**

  The input signals to the dead-band module are the EPWMxA and EPWMxB output signals from the action-qualifier. In this section they will be referred to as EPWMxA In and EPWMxB In. Using the DBCTL[IN_MODE) control bits, the signal source for each delay, falling-edge or rising-edge, can be selected:
  - EPWMxA In is the source for both falling-edge and rising-edge delay. This is the default mode.
  - EPWMxA In is the source for falling-edge delay, EPWMxB In is the source for rising-edge delay.
  - EPWMxA In is the source for rising edge delay, EPWMxB In is the source for falling-edge delay.
  - EPWMxB In is the source for both falling-edge and rising-edge delay.
- **Half Cycle Clocking:**

  The dead-band submodule can be clocked using half cycle clocking to double the resolution (that is, counter clocked at 2× TBCLK)
- **Output Mode Control:**

  The output mode is configured by way of the DBCTL[OUT_MODE] bits. These bits determine if the falling-edge delay, rising-edge delay, neither, or both are applied to the input signals.
- **Polarity Control:**

  The polarity control (DBCTL[POLSEL]) allows you to specify whether the rising-edge delayed signal and/or the falling-edge delayed signal is to be inverted before being sent out of the dead-band submodule.

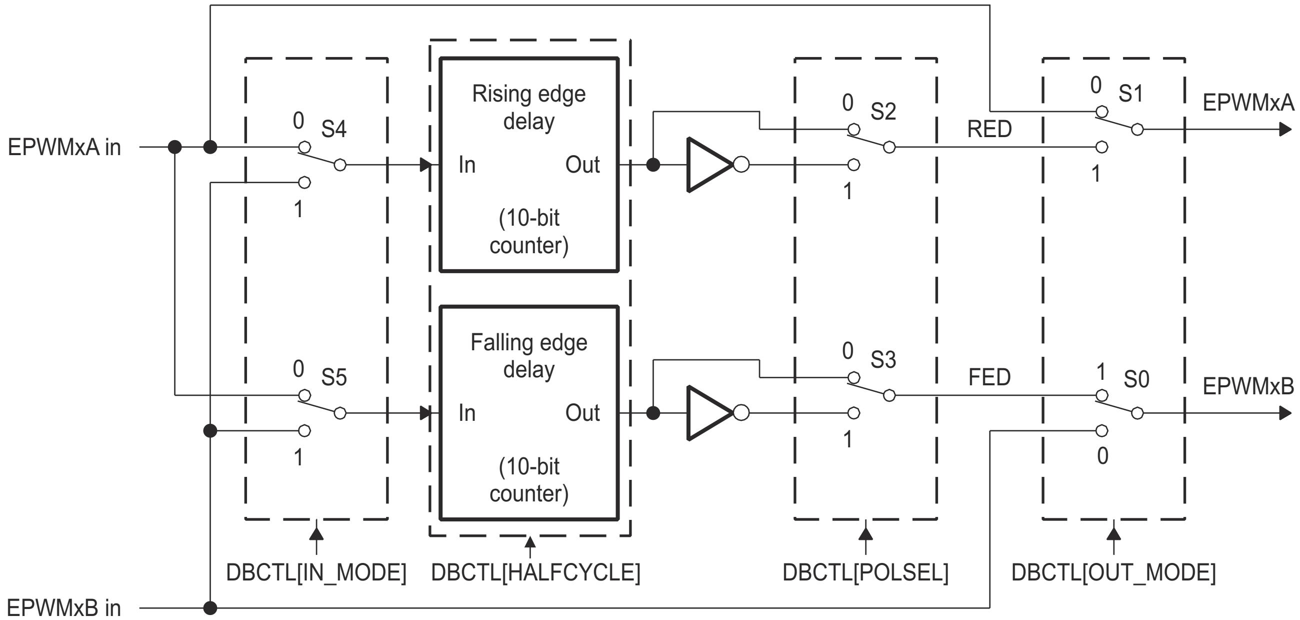

Figure 19-28. Configuration Options for the Dead-Band Submodule

Although all combinations are supported, not all are typical usage modes. Table 19-14 documents some classical dead-band configurations. These modes assume that the DBCTL[IN_MODE] is configured such that EPWMxA In is the source for both falling-edge and rising-edge delay. Enhanced, or non-traditional modes can be achieved by changing the input signal source. The modes shown in Table 19-14 fall into the following categories:

- **Mode 1: Bypass both falling-edge delay (FED) and rising-edge delay (RED)**

  Allows you to fully disable the dead-band submodule from the PWM signal path.
- **Mode 2-5: Classical Dead-Band Polarity Settings:**

  These represent typical polarity configurations that should address all the active high/low modes required by available industry power switch gate drivers. The waveforms for these typical cases are shown in Figure 19-29. Note that to generate equivalent waveforms to Figure 19-29, configure the action-qualifier submodule to generate the signal as shown for EPWMxA.
- **Mode 6: Bypass rising-edge-delay and Mode 7: Bypass falling-edge-delay**

  Finally the last two entries in Table 19-14 show combinations where either the falling-edge-delay (FED) or rising-edge-delay (RED) blocks are bypassed.

Table 19-14. Classical Dead-Band Operating Modes

		DBCTL[POLSEL]		DBCTL[OUT_MODE]	
Mode	**Mode Description**	**S3**	**S2**	**S1**	**S0**
1	EPWMxA and EPWMxB Passed Through (No Delay)	X	X	0	0
2	Active High Complementary (AHC)	1	0	1	1
3	Active Low Complementary (ALC)	0	1	1	1
4	Active High (AH)	0	0	1	1
5	Active Low (AL)	1	1	1	1
6	EPWMxA Out = EPWMxA In (No Delay) EPWMxB Out = EPWMxA In with Falling Edge Delay	0 or 1	0 or 1	0	1
7	EPWMxA Out = EPWMxA In with Rising Edge Delay EPWMxB Out = EPWMxB In with No Delay	0 or 1	0 or 1	1	0

Figure 19-29 shows waveforms for typical cases where 0% < duty < 100%.

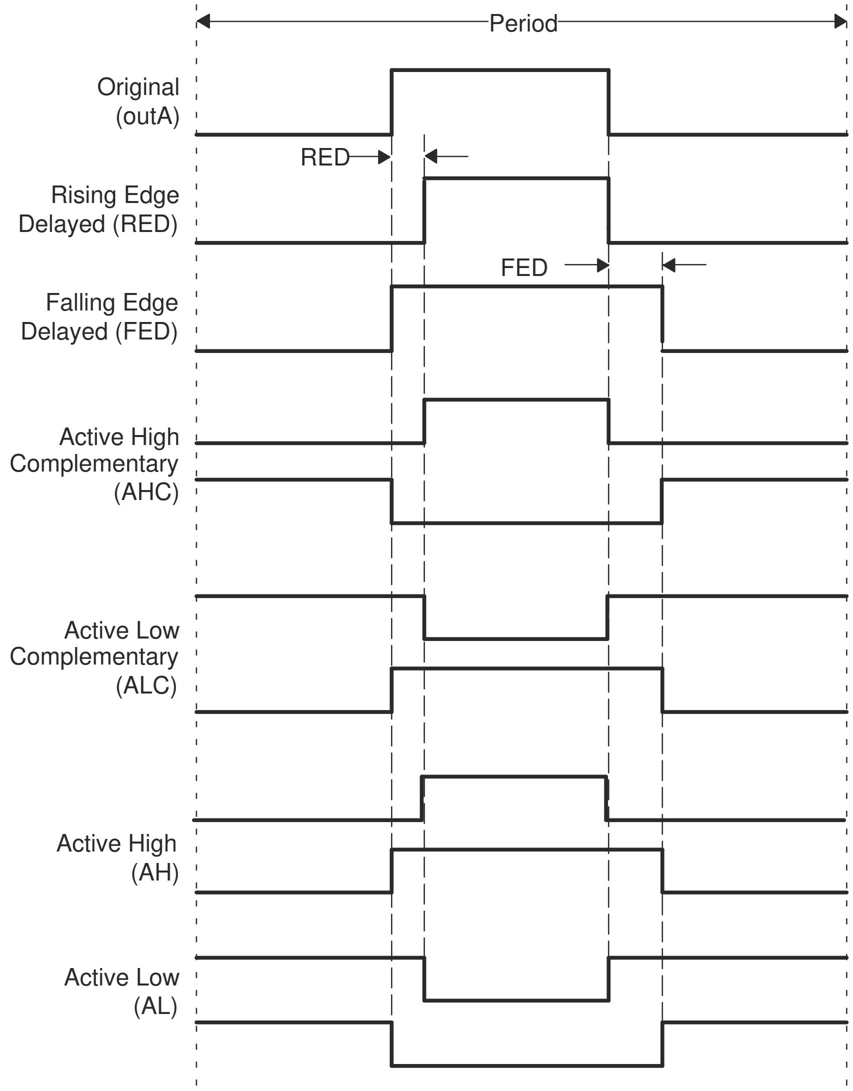

Figure 19-29. Dead-Band Waveforms for Typical Cases (0% < Duty < 100%)

The dead-band submodule supports independent values for rising-edge (RED) and falling-edge (FED) delays. The amount of delay is programmed using the DBRED and DBFED registers. These are 10-bit registers and their value represents the number of time-base clock, TBCLK, periods a signal edge is delayed by. For example, the formula to calculate falling-edge-delay and rising-edge-delay are:

$\mathrm{FED} = \mathrm{DBFED} \times T_{\mathrm{TBCLK}}$

$\mathrm{RED} = \mathrm{DBRED} \times T_{\mathrm{TBCLK}}$

Where T_{TBCLK} is the period of TBCLK, the prescaled version of VCLK4.

For convenience, delay values for various TBCLK options are shown in Table 19-15.

Table 19-15. Dead-Band Delay Values in μS as a Function of DBFED and DBRED

Dead-Band Value	Dead-Band Delay in μS		
DBFED, DBRED	**TBCLK = VCLK4/1**	**TBCLK = VCLK4 /2**	**TBCLK = VCLK4/4**
1	0.02 μS	0.03 μS	0.07 μS
5	0.08 μS	0.17 μS	0.33 μS
10	0.17 μS	0.33 μS	0.67 μS
100	1.67 μS	3.33 μS	6.67 μS
200	3.33 μS	6.67 μS	13.33 μS
400	6.67 μS	13.33 μS	26.67 μS
500	8.33 μS	16.67 μS	33.33 μS
600	10.00 μS	20.00 μS	40.00 μS
700	11.67 μS	23.33 μS	46.67 μS
800	13.33 μS	26.67 μS	53.33 μS
900	15.00 μS	30.00 μS	60.00 μS
1000	16.67 μS	33.33μS	66.67 μS

When half-cycle clocking is enabled, the formula to calculate the falling-edge-delay and rising-edge-delay becomes:

$\mathrm{FED} = \mathrm{DBFED} \times T_{\mathrm{TBCLK}}/2$

$\mathrm{RED} = \mathrm{DBRED} \times T_{\mathrm{TBCLK}}/2$

19.2.6 PWM-Chopper (PC) Submodule

Figure 19-30 illustrates the PWM-chopper (PC) submodule within the ePWM module.

The PWM-chopper submodule allows a high-frequency carrier signal to modulate the PWM waveform generated by the action-qualifier and dead-band submodules. This capability is important if you need pulse transformer-based gate drivers to control the power switching elements.

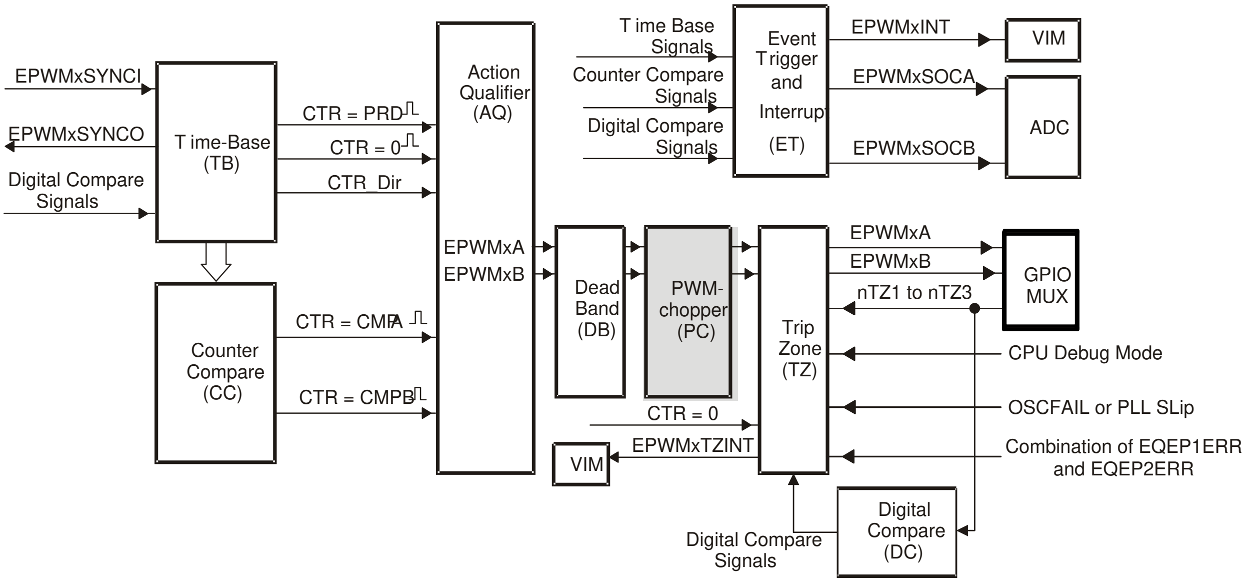

Figure 19-30. PWM-Chopper Submodule

19.2.6.1 Purpose of the PWM-Chopper Submodule

The key functions of the PWM-chopper submodule are:

- Programmable chopping (carrier) frequency
- Programmable pulse width of first pulse
- Programmable duty cycle of second and subsequent pulses
- Can be fully bypassed if not required

19.2.6.2 Controlling the PWM-Chopper Submodule

The PWM-chopper submodule operation is controlled via the registers in Table 19-16.

Table 19-16. PWM-Chopper Submodule Registers

Register Name	Address Offset	Shadowed	Description
PCCTL	0x003E	No	PWM-chopper Control Register

19.2.6.3 Operational Highlights for the PWM-Chopper Submodule

Figure 19-31 shows the operational details of the PWM-chopper submodule. The carrier clock is derived from VCLK4. Its frequency and duty cycle are controlled via the CHPFREQ and CHPDUTY bits in the PCCTL register. The one-shot block is a feature that provides a high energy first pulse to ensure hard and fast power switch turn on, while the subsequent pulses sustain pulses, ensuring the power switch remains on. The one-shot width is programmed via the OSHTWTH bits. The PWM-chopper submodule can be fully disabled (bypassed) via the CHPEN bit.

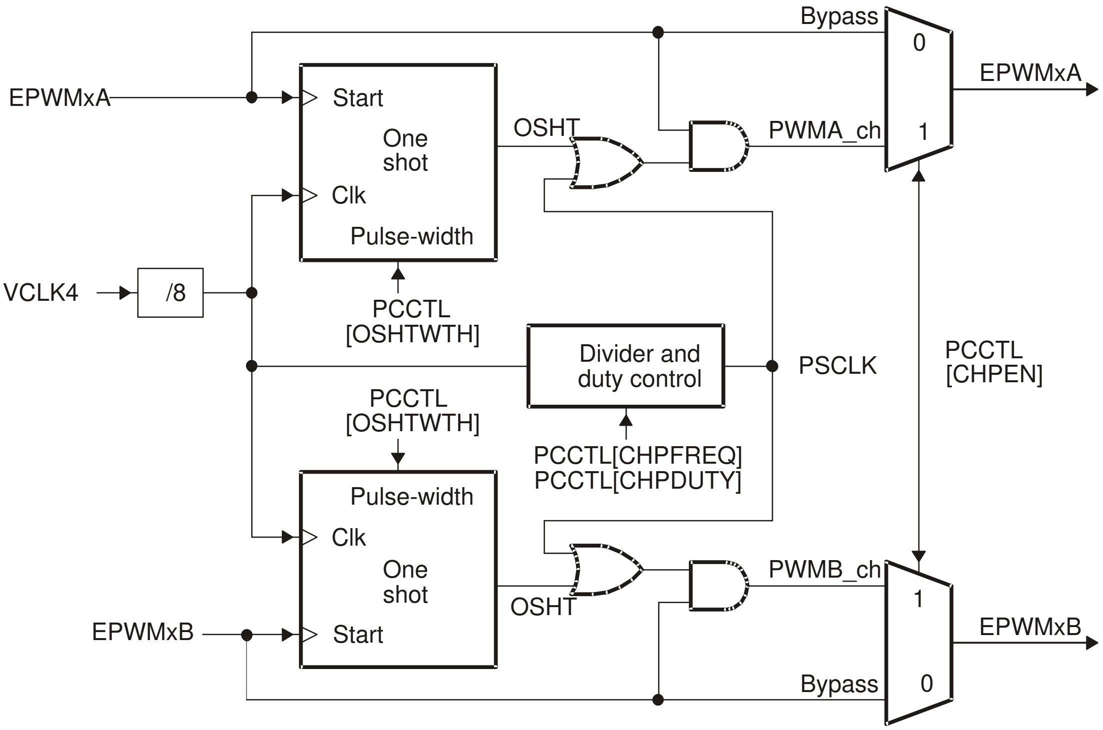

Figure 19-31. PWM-Chopper Submodule Operational Details

19.2.6.4 Waveforms

Figure 19-32 shows simplified waveforms of the chopping action only; one-shot and duty-cycle control are not shown. Details of the one-shot and duty-cycle control are discussed in the following sections.

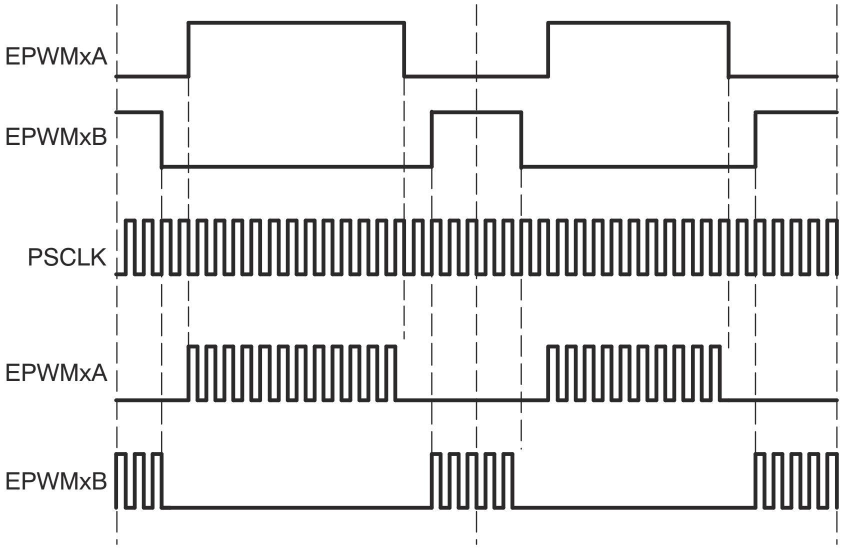

Figure 19-32. Simple PWM-Chopper Submodule Waveforms Showing Chopping Action Only

19.2.6.4.1 One-Shot Pulse

The width of the first pulse can be programmed to any of 16 possible pulse width values. The width or period of the first pulse is given by:

$T_{1stpulse} = T_{VCLK4} \times 8 \times OSHTWTH$

Where T_{VCLK4} is the period of the system clock (VCLK4) and OSHTWTH is the four control bits (value from 1 to 16)

Figure 19-33 shows the first and subsequent sustaining pulses and Table 19-17 gives the possible pulse width values for a VCLK4 = 100 MHz.

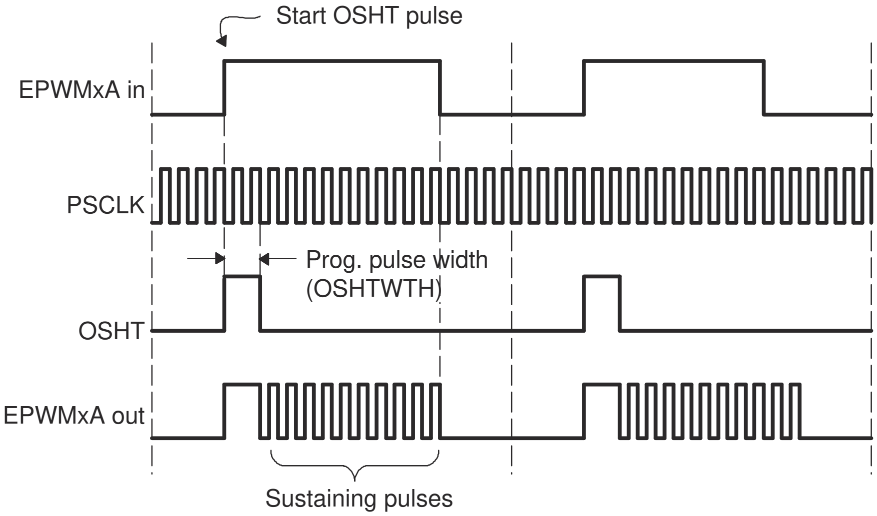

Figure 19-33. PWM-Chopper Submodule Waveforms Showing the First Pulse and Subsequent Sustaining Pulses

Table 19-17. Possible Pulse Width Values for VCLK4 = 100 MHz

OSHTWTHz (hex)	Pulse Width (nS)
0	100
1	200
2	300
3	400
4	500
5	600
6	700
7	800
8	900
9	1000
A	1100
B	1200
C	1300
D	1400
E	1500

Table 19-17. Possible Pulse Width Values for VCLK4 = 100 MHz (continued)

OSHTWTHz (hex)	Pulse Width (nS)
F	1600

19.2.6.4.2 Duty Cycle Control

Pulse transformer-based gate drive designs need to comprehend the magnetic properties or characteristics of the transformer and associated circuitry. Saturation is one such consideration. To assist the gate drive designer, the duty cycles of the second and subsequent pulses have been made programmable. These sustaining pulses ensure the correct drive strength and polarity is maintained on the power switch gate during the on period, and hence a programmable duty cycle allows a design to be tuned or optimized via software control.

Figure 19-34 shows the duty cycle control that is possible by programming the CHPDUTY bits. One of seven possible duty ratios can be selected ranging from 12.5% to 87.5%.

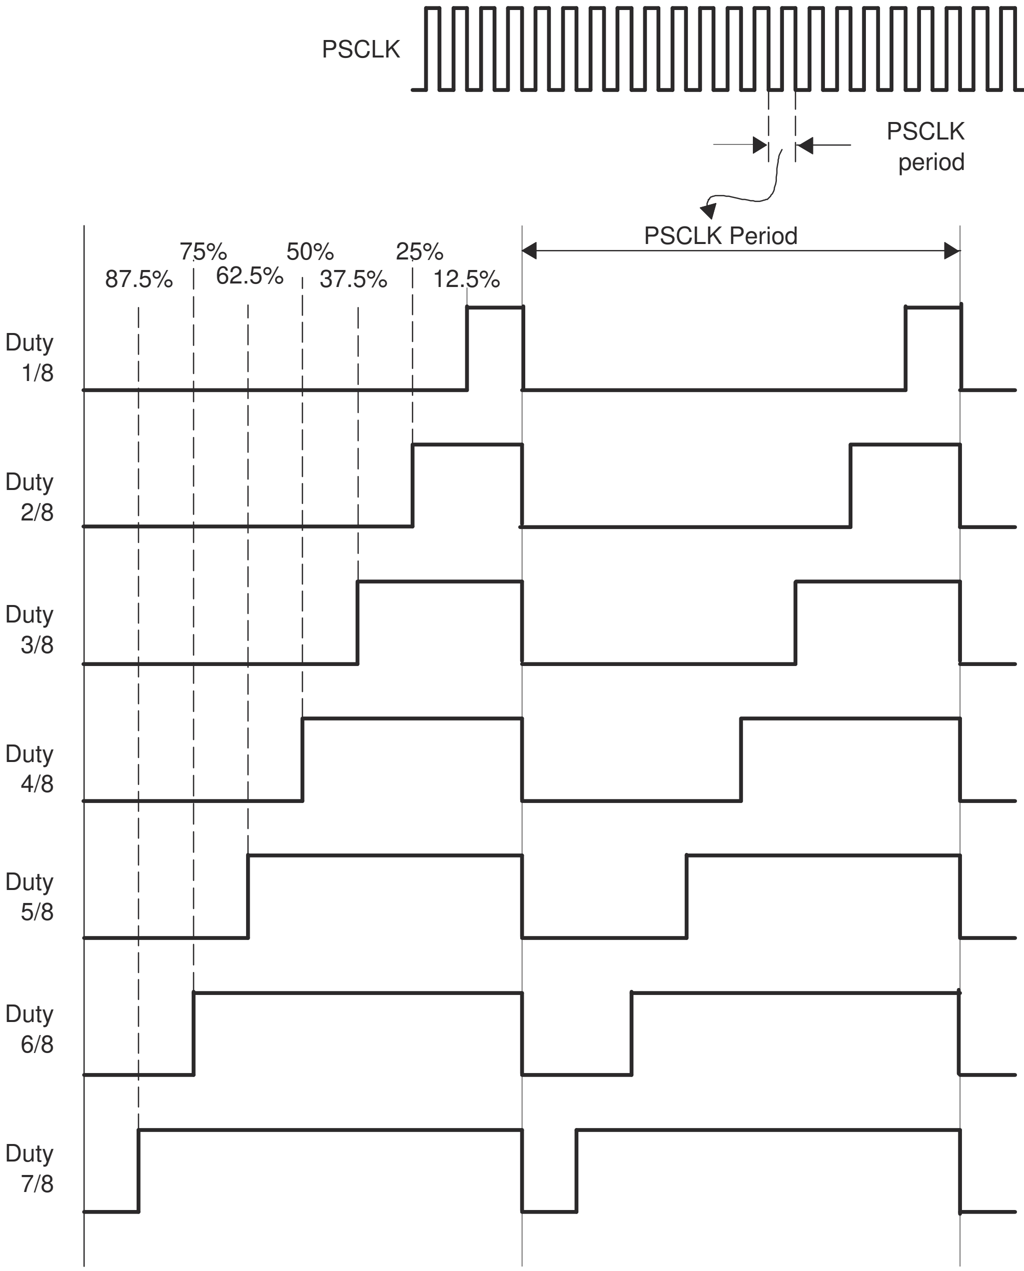

Figure 19-34. PWM-Chopper Submodule Waveforms Showing the Pulse Width (Duty Cycle) Control of Sustaining Pulses

19.2.7 Trip-Zone (TZ) Submodule

Figure 19-35 shows how the trip-zone (TZ) submodule fits within the ePWM module.

Each ePWM module is connected to six $\overline{\text{TZn}}$ signals ($\overline{\text{TZ1}}$ to $\overline{\text{TZ6}}$). $\overline{\text{TZ1}}$ to $\overline{\text{TZ3}}$ are sourced from the GPIO mux. $\overline{\text{TZ4}}$ is sourced from a combination of EQEP1ERR and EQEP2ERR signals. $\overline{\text{TZ5}}$ is connected to the system oscillator or PLL clock fail logic, and $\overline{\text{TZ6}}$ is sourced from the debug mode halt indication output from the CPU. These signals indicate fault or trip conditions, and the ePWM outputs can be programmed to respond accordingly when faults occur.

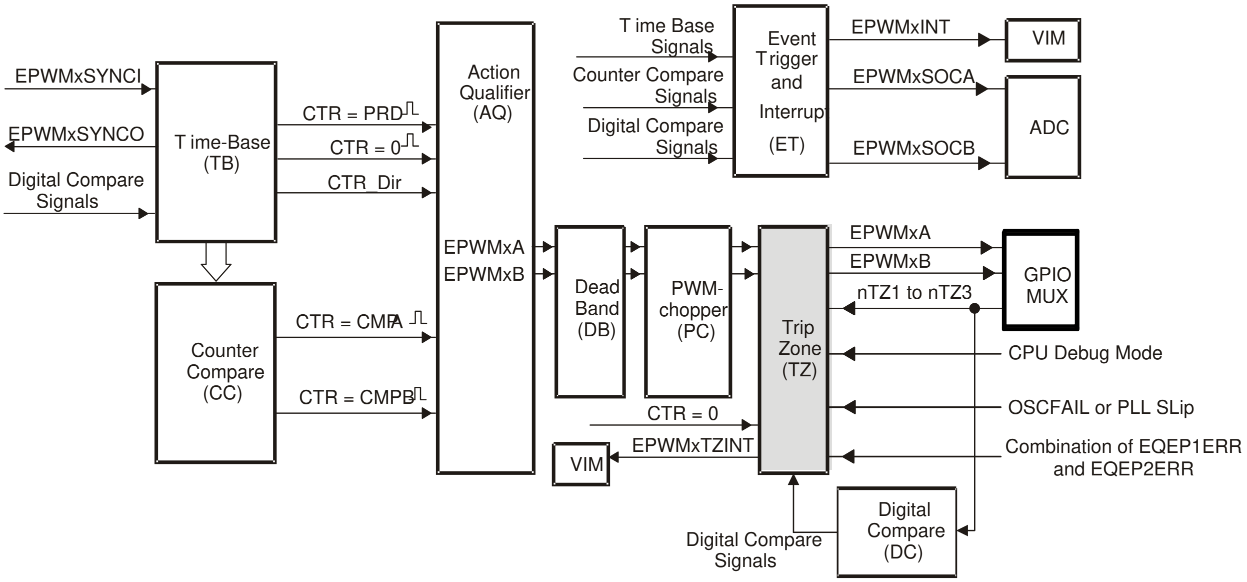

Figure 19-35. Trip-Zone Submodule

19.2.7.1 Purpose of the Trip-Zone Submodule

The key functions of the Trip-Zone submodule are:

- Trip inputs $\overline{TZ1}$ to $\overline{TZ6}$ are mapped to all ePWM modules.
- Upon a fault indication, either no action is taken or the ePWM outputs EPWMxA and EPWMxB can be forced to one of the following:
  - High
  - Low
  - High-impedance
- Support for one-shot trip (OSHT) for major short circuits or over-current conditions.
- Support for cycle-by-cycle tripping (CBC) for current limiting operation.
- Support for digital compare tripping (DC) based on state of on-chip analog comparator module outputs and/or $\overline{TZ1}$ to $\overline{TZ3}$ signals.
- Each trip-zone input and digital compare (DC) submodule DCAEVT1/2 or DCBEVT1/2 force event can be allocated to either one-shot or cycle-by-cycle operation.
- Interrupt generation is possible on any trip-zone input.
- Software-forced tripping is also supported.
- The trip-zone submodule can be fully bypassed if it is not required.

19.2.7.2 Controlling and Monitoring the Trip-Zone Submodule

The trip-zone submodule operation is controlled and monitored through the following registers:

Table 19-18. Trip-Zone Submodule Registers

Register Name	Address Offset	Shadowed	Description (2)
TZSEL	0x0026	No	Trip-Zone Select Register
TZDCSEL	0x0024	No	Trip-zone Digital Compare Select Register (1)
TZCTL	0x002A	No	Trip-Zone Control Register
TZEINT	0x0028	No	Trip-Zone Enable Interrupt Register
TZFLG	0x002E	No	Trip-Zone Flag Register
TZCLR	0x002C	No	Trip-Zone Clear Register
TZFRC	0x0032	No	Trip-Zone Force Register

(1) This register is discussed in more detail in Section 19.2.9.

(2) All trip-zone registers are writable only in privileged mode.

19.2.7.3 Operational Highlights for the Trip-Zone Submodule

The following sections describe the operational highlights and configuration options for the trip-zone submodule.

The trip-zone signals $\overline{\text{TZ1}}$ to $\overline{\text{TZ6}}$ (also collectively referred to as $\overline{\text{TZn}}$) are active low input signals. When one of these signals goes low, or when a DCAEVT1/2 or DCBEVT1/2 force happens based on the TZDCSEL register event selection, it indicates that a trip event has occurred. Each ePWM module can be individually configured to ignore or use each of the trip-zone signals or DC events. Which trip-zone signals or DC events are used by a particular ePWM module is determined by the TZSEL register for that specific ePWM module. The trip-zone signals may or may not be synchronized to the system clock (VCLK4) and digitally filtered within the GPIO MUX block. A minimum of 3*TBCLK low pulse width on $\overline{\text{TZn}}$ inputs is sufficient to trigger a fault condition on the ePWM module. If the pulse width is less than this, the trip condition may not be latched. The asynchronous trip makes sure that if clocks are missing for any reason, the outputs can still be tripped by a valid event present on $\overline{\text{TZn}}$ inputs. The GPIOs or peripherals must be appropriately configured. For more information, see the IOMM chapter of the device technical reference manual.

Each $\overline{\text{TZn}}$ input can be individually configured to provide either a cycle-by-cycle or one-shot trip event for an ePWM module. DCAEVT1 and DCBEVT1 events can be configured to directly trip an ePWM module or provide a one-shot trip event to the module. Likewise, DCAVET2 and DCBEVT2 events can also be configured to directly trip an ePWM module or provide a cycle-by-cycle trip event to the module. This configuration is determined by the TZSEL[DCAEVT1/2], TZSEL[DCBEVT1/2], TZSEL[CBCn], and TZSEL[OSHTn] control bits (where n corresponds to the trip input) respectively.

- **Cycle-by-Cycle (CBC):**

  When a cycle-by-cycle trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and/or EPWMxB output. Table 19-19 lists the possible actions. In addition, the cycle-by-cycle trip event flag (TZFLG[CBC]) is set and a EPWMx_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral.

  If the CBC interrupt is enabled via the TZEINT register, and DCAEVT2 or DCBEVT2 are selected as CBC trip sources via the TZSEL register, it is not necessary to also enable the DCAEVT2 or DCBEVT2 interrupts in the TZEINT register, as the DC events trigger interrupts through the CBC mechanism.

  The specified condition on the inputs is automatically cleared when the ePWM time-base counter reaches zero (TBCTR = 0x0000) if the trip event is no longer present. Therefore, in this mode, the trip event is cleared or reset every PWM cycle. The TZFLG[CBC] flag bit will remain set until it is manually cleared by writing to the TZCLR[CBC] bit. If the cycle-by-cycle trip event is still present when the TZFLG[CBC] bit is cleared, then it will again be immediately set.

- **One-Shot (OSHT):**

  When a one-shot trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and/or EPWMxB output. Table 19-19 lists the possible actions. In addition, the one-shot trip event flag (TZFLG[OST]) is set and a EPWMx_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral. The one-shot trip condition must be cleared manually by writing to the TZCLR[OST] bit.

  If the one-shot interrupt is enabled via the TZEINT register, and DCAEVT1 or DCBEVT1 are selected as OSHT trip sources via the TZSEL register, it is not necessary to also enable the DCAEVT1 or DCBEVT1 interrupts in the TZEINT register, as the DC events trigger interrupts through the OSHT mechanism.
- **Digital Compare Events (DCAEVT1/2 and DCBEVT1/2):**

  A digital compare DCAEVT1/2 or DCBEVT1/2 event is generated based on a combination of the DCAH/DCAL and DCBH/DCBL signals as selected by the TZDCSEL register. The signals which source the DCAH/DCAL and DCBH/DCBL signals are selected via the DCTRIPSEL register and can be either trip zone input pins. For more information on the digital compare submodule signals, see Section 19.2.9.

  When a digital compare event occurs, the action specified in the TZCTL[DCAEVT1/2] and TZCTL[DCBEVT1/2] bits is carried out immediately on the EPWMxA and/or EPWMxB output. Table 19-19 lists the possible actions. In addition, the relevant DC trip event flag (TZFLG[DCAEVT1/2] / TZFLG[DCBEVT1/2]) is set and a EPWMx_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral.

  The specified condition on the pins is automatically cleared when the DC trip event is no longer present. The TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag bit will remain set until it is manually cleared by writing to the TZCLR[DCAEVT1/2] or TZCLR[DCBEVT1/2] bit. If the DC trip event is still present when the TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag is cleared, then it will again be immediately set.

The action taken when a trip event occurs can be configured individually for each of the ePWM output pins by way of the TZCTL register bit fields. One of four possible actions, shown in Table 19-19, can be taken on a trip event.

Table 19-19. Possible Actions On a Trip Event

TZCTL Register bit-field Settings	EPWMxA and/or EPWMxB	Comment
0,0	High-Impedance	Tripped
0,1	Force to High State	Tripped
1,0	Force to Low State	Tripped
1,1	No Change	Do Nothing. No change is made to the output.

Example 19-7. Trip-Zone Configurations

Scenario A:

A one-shot trip event on $\overline{\text{TZ1}}$ pulls both EPWM1A, EPWM1B low and also forces EPWM2A and EPWM2B high.

- Configure the ePWM1 registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{\text{TZ1}}$ as a one-shot event source for ePWM1
  - TZCTL[TZA] = 2: EPWM1A will be forced low on a trip event.
  - TZCTL[TZB] = 2: EPWM1B will be forced low on a trip event.
- Configure the ePWM2 registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{\text{TZ1}}$ as a one-shot event source for ePWM2
  - TZCTL[TZA] = 1: EPWM2A will be forced high on a trip event.
  - TZCTL[TZB] = 1: EPWM2B will be forced high on a trip event.

Scenario B:

A cycle-by-cycle event on $\overline{\text{TZ5}}$ pulls both EPWM1A, EPWM1B low.
A one-shot event on $\overline{\text{TZ1}}$ or $\overline{\text{TZ6}}$ puts EPWM2A into a high impedance state.

- Configure the ePWM1 registers as follows:
  - TZSEL[CBC5] = 1: enables $\overline{\text{TZ5}}$ as a one-shot event source for ePWM1
  - TZCTL[TZA] = 2: EPWM1A will be forced low on a trip event.
  - TZCTL[TZB] = 2: EPWM1B will be forced low on a trip event.
- Configure the ePWM2 registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{\text{TZ1}}$ as a one-shot event source for ePWM2
  - TZSEL[OSHT6] = 1: enables $\overline{\text{TZ6}}$ as a one-shot event source for ePWM2
  - TZCTL[TZA] = 0: EPWM2A will be put into a high-impedance state on a trip event.
  - TZCTL[TZB] = 3: EPWM2B will ignore the trip event.

19.2.7.4 Generating Trip Event Interrupts

Figure 19-36 and Figure 19-37 illustrate the trip-zone submodule control and interrupt logic, respectively. DCAEVT1/2 and DCBEVT1/2 signals are described in further detail in Section 19.2.9.

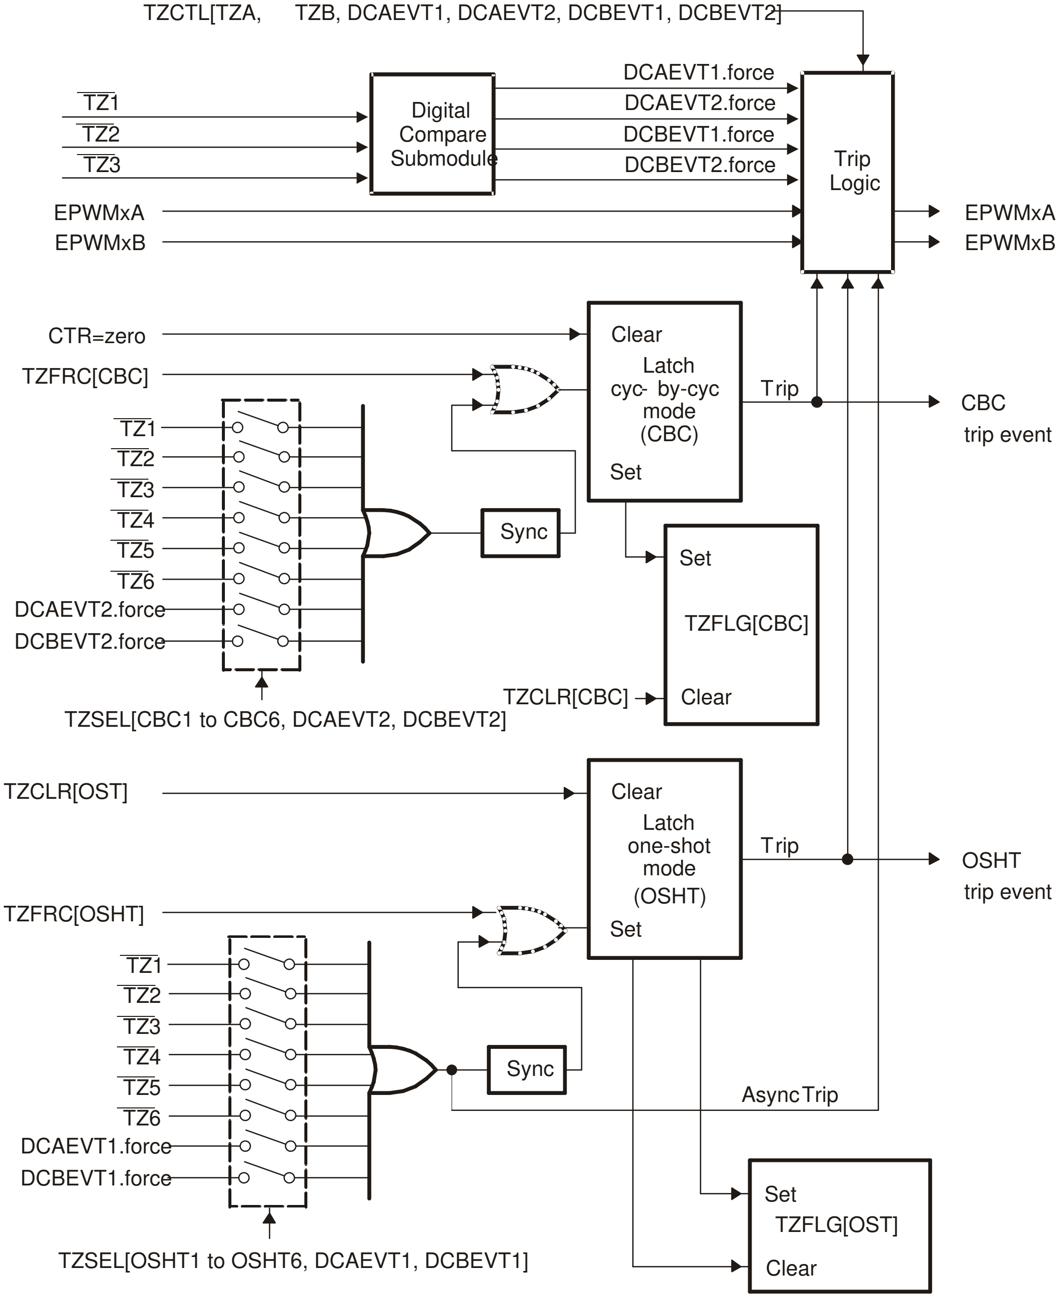

Figure 19-36. Trip-Zone Submodule Mode Control Logic

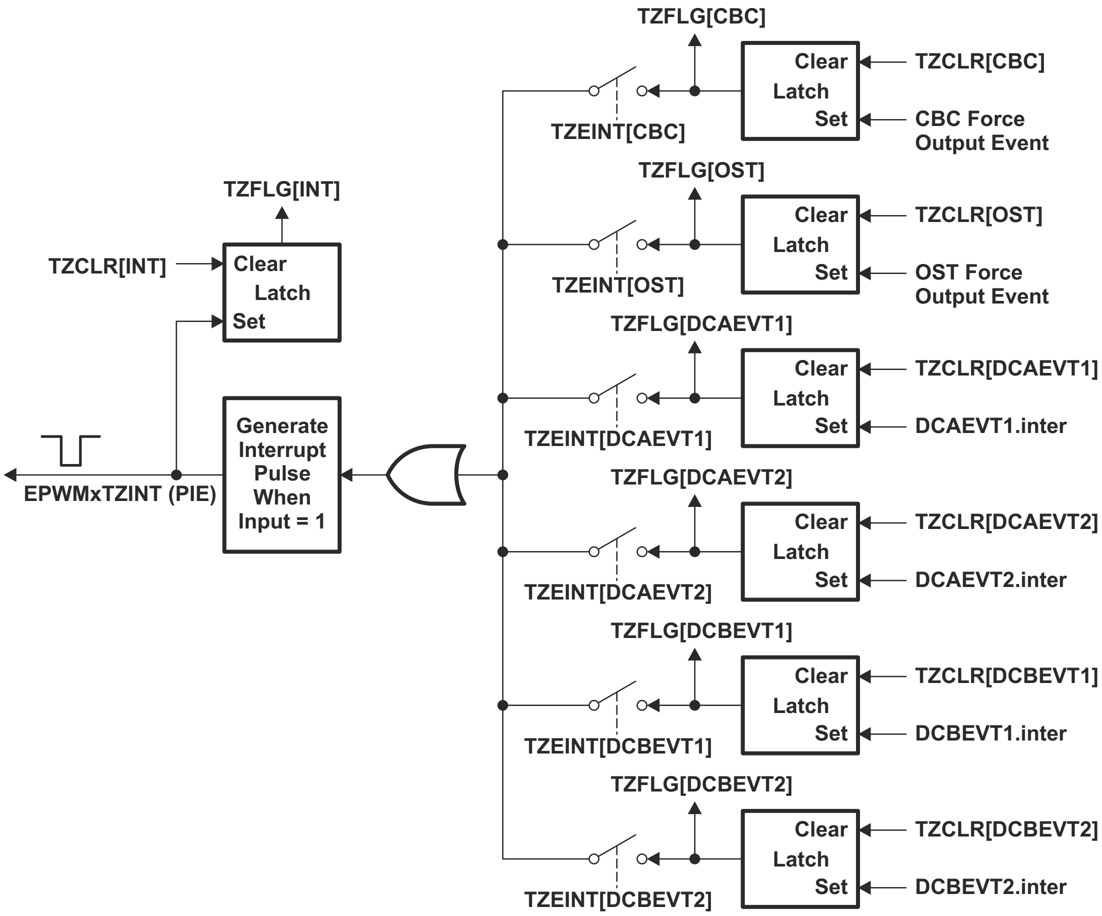

Figure 19-37. Trip-Zone Submodule Interrupt Logic

19.2.8 Event-Trigger (ET) Submodule

The key functions of the event-trigger submodule are:

- Receives event inputs generated by the time-base, counter-compare and digital-compare submodules
- Uses the time-base direction information for up/down event qualification
- Uses prescaling logic to issue interrupt requests and ADC start of conversion at:
  - Every event
  - Every second event
  - Every third event
- Provides full visibility of event generation via event counters and flags
- Allows software forcing of Interrupts and ADC start of conversion

The event-trigger submodule manages the events generated by the time-base submodule, the counter-compare submodule, and the digital-compare submodule to generate an interrupt to the CPU and/or a start of conversion pulse to the ADC when a selected event occurs. Figure 19-38 illustrates where the event-trigger submodule fits within the ePWM system.

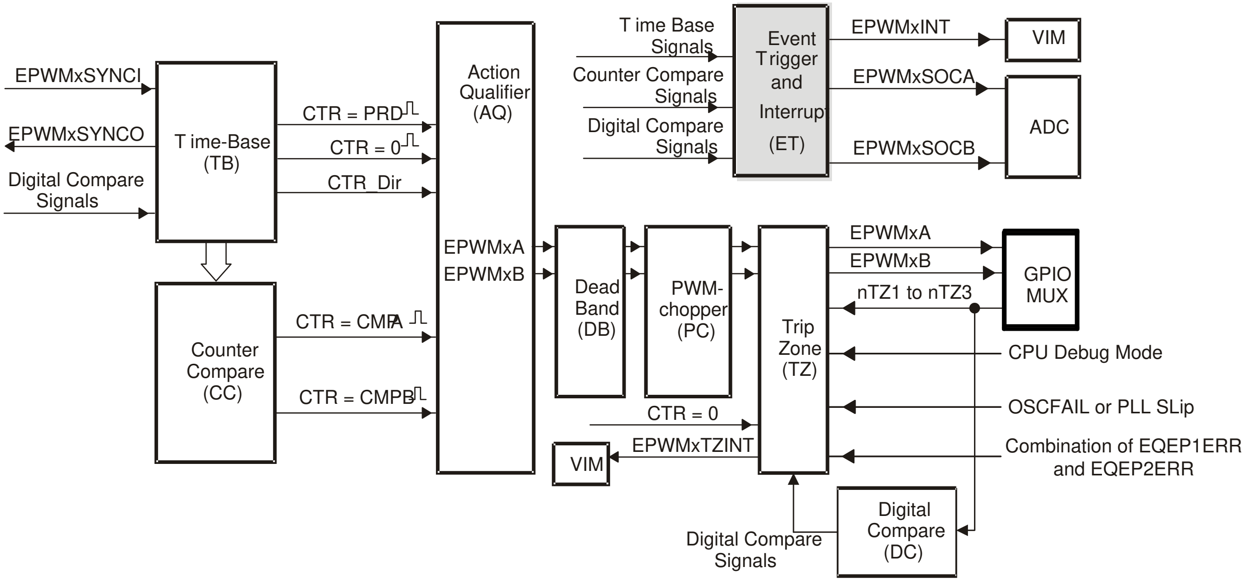

Figure 19-38. Event-Trigger Submodule

19.2.8.1 Operational Overview of the Event-Trigger Submodule

The following sections describe the event-trigger submodule's operational highlights.

Each ePWM module has one interrupt request line connected to the VIM and two start of conversion signals connected to the ADC module. As shown in Figure 19-39, the ePWMxSOCA and ePWMxSOCB signals are combined to generate four special signals that can be used to trigger an ADC start of conversion, and hence multiple modules can initiate an ADC start of conversion via the ADC trigger inputs.

The event-trigger submodule monitors various event conditions (the left side inputs to event-trigger submodule shown in Figure 19-40) and can be configured to prescale these events before issuing an Interrupt request or an ADC start of conversion. The event-trigger prescaling logic can issue Interrupt requests and ADC start of conversion at:

- Every event
- Every second event
- Every third event

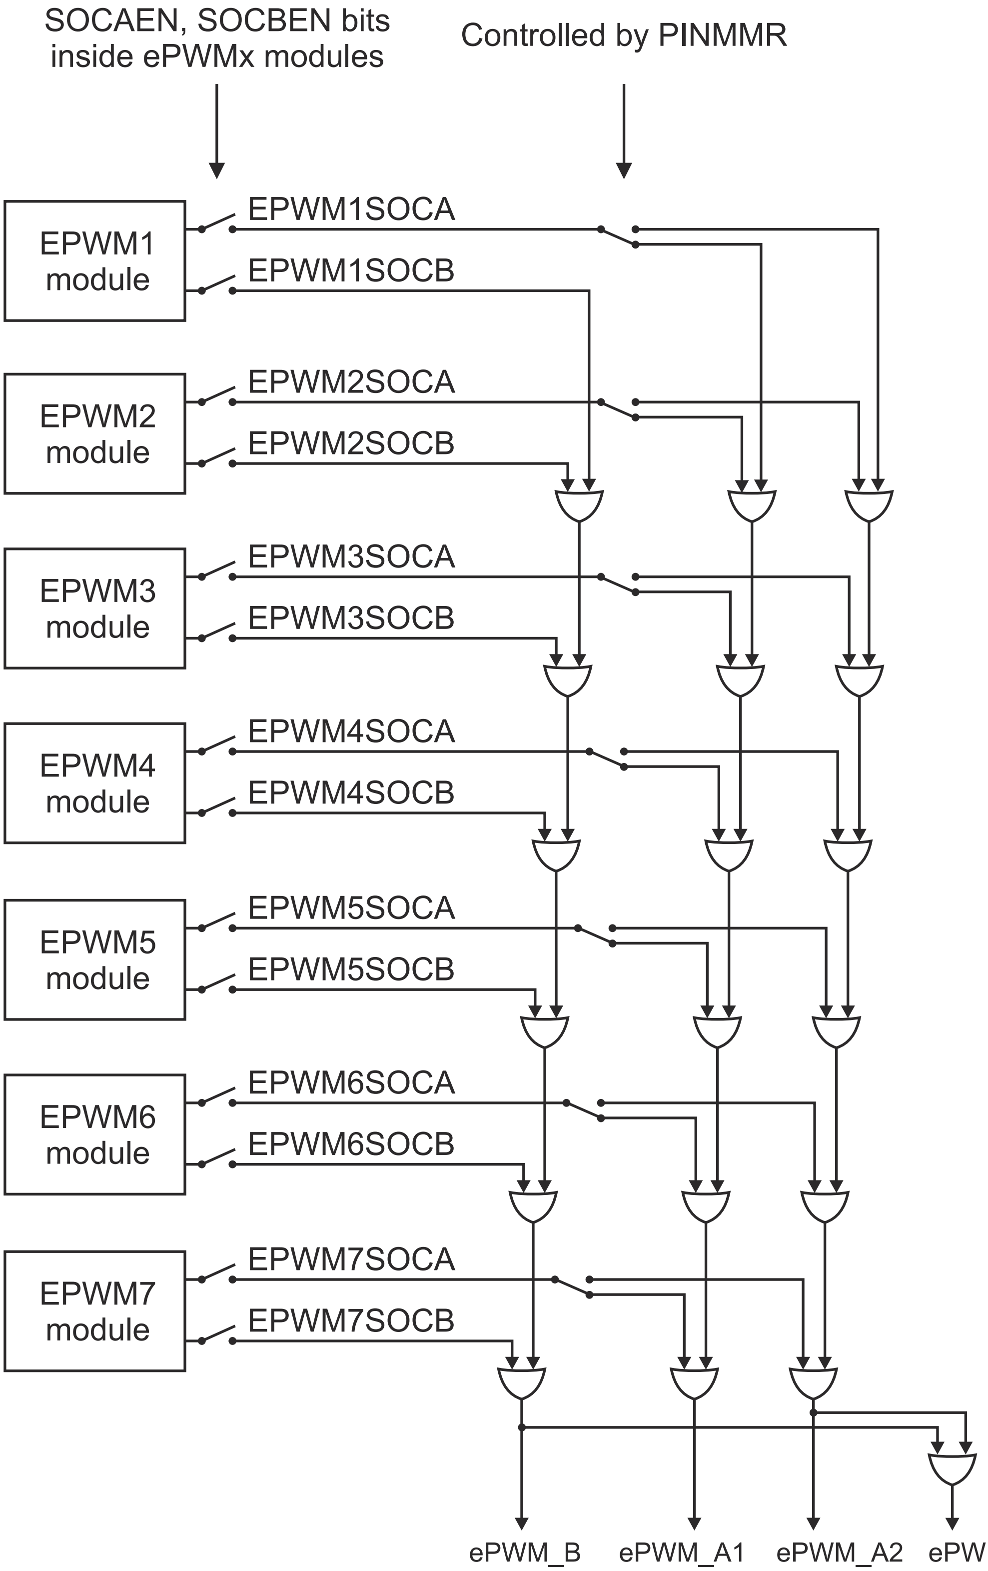

Figure 19-39. Event-Trigger Submodule Inter-Connectivity of ADC Start of Conversion

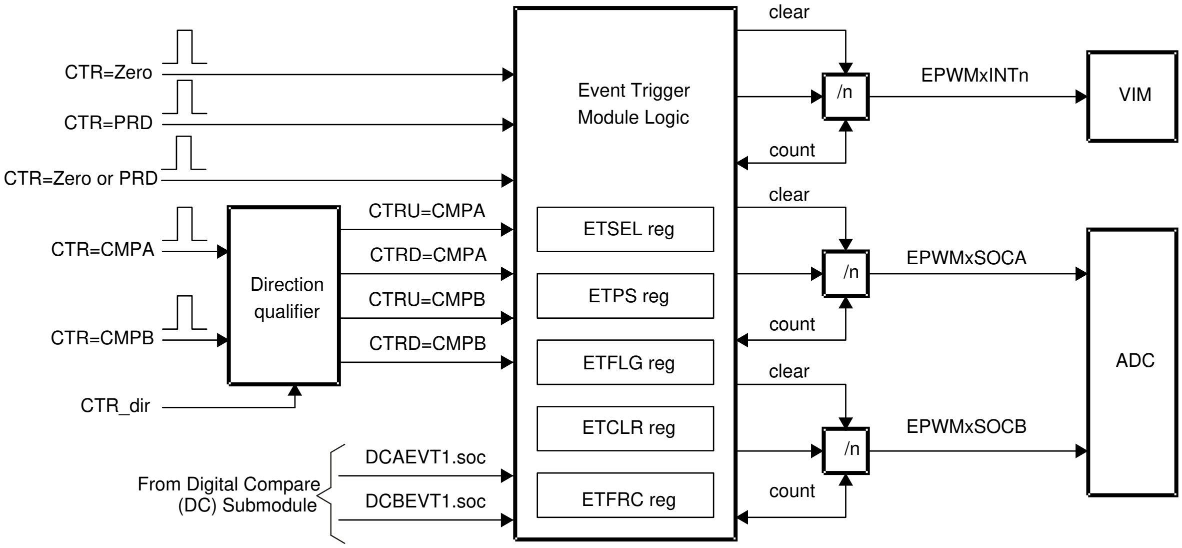

Figure 19-40. Event-Trigger Submodule Showing Event Inputs and Prescaled Outputs

The key registers used to configure the event-trigger submodule are shown in Table 19-20.

Table 19-20. Event-Trigger Submodule Registers

Register Name	Address Offset	Shadowed	Description
ETSEL	0x0030	No	Event-trigger Selection Register
ETPS	0x0036	No	Event-trigger Prescale Register
ETFLG	0x0034	No	Event-trigger Flag Register
ETCLR	0x003A	No	Event-trigger Clear Register
ETFRC	0x0038	No	Event-trigger Force Register

- ETSEL—This selects which of the possible events will trigger an interrupt or start an ADC conversion
- ETPS—This programs the event prescaling options mentioned above.
- ETFLG—These are flag bits indicating status of the selected and prescaled events.
- ETCLR—These bits allow you to clear the flag bits in the ETFLG register via software.
- ETFRC—These bits allow software forcing of an event. Useful for debugging or s/w intervention.

A more detailed look at how the various register bits interact with the Interrupt and ADC start of conversion logic are shown in Figure 19-41, Figure 19-42, and Figure 19-43.

Figure 19-41 shows the event-trigger's interrupt generation logic. The interrupt-period (ETPS[INTPRD]) bits specify the number of events required to cause an interrupt pulse to be generated. The choices available are:

- Do not generate an interrupt.
- Generate an interrupt on every event
- Generate an interrupt on every second event
- Generate an interrupt on every third event

Which event can cause an interrupt is configured by the interrupt selection (ETSEL[INTSEL]) bits. The event can be one of the following:

- Time-base counter equal to zero (TBCTR = 0x0000).
- Time-base counter equal to period (TBCTR = TBPRD).
- Time-base counter equal to zero or period (TBCTR = 0x0000 || TBCTR = TBPRD)
- Time-base counter equal to the compare A register (CMPA) when the timer is incrementing.
- Time-base counter equal to the compare A register (CMPA) when the timer is decrementing.

- Time-base counter equal to the compare B register (CMPB) when the timer is incrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is decrementing.

The number of events that have occurred can be read from the interrupt event counter (ETPS[INTCNT]) register bits. That is, when the specified event occurs the ETPS[INTCNT] bits are incremented until they reach the value specified by ETPS[INTPRD]. When ETPS[INTCNT] = ETPS[INTPRD] the counter stops counting and its output is set. The counter is only cleared when an interrupt is sent to the VIM.

When ETPS[INTCNT] reaches ETPS[INTPRD] the following behaviors will occur:

- If interrupts are enabled, ETSEL[INTEN] = 1 and the interrupt flag is clear, ETFLG[INT] = 0, then an interrupt pulse is generated and the interrupt flag is set, ETFLG[INT] = 1, and the event counter is cleared ETPS[INTCNT] = 0. The counter will begin counting events again.
- If interrupts are disabled, ETSEL[INTEN] = 0, or the interrupt flag is set, ETFLG[INT] = 1, the counter stops counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD].
- If interrupts are enabled, but the interrupt flag is already set, then the counter will hold its output high until the ENTFLG[INT] flag is cleared. This allows for one interrupt to be pending while one is serviced.

Writing to the INTPRD bits will automatically clear the counter INTCNT = 0 and the counter output will be reset (so no interrupts are generated). Writing a 1 to the ETFRC[INT] bit will increment the event counter INTCNT. The counter will behave as described above when INTCNT = INTPRD. When INTPRD = 0, the counter is disabled and hence no events will be detected and the ETFRC[INT] bit is also ignored.

The above definition means that you can generate an interrupt on every event, on every second event, or on every third event. An interrupt cannot be generated on every fourth or more events.

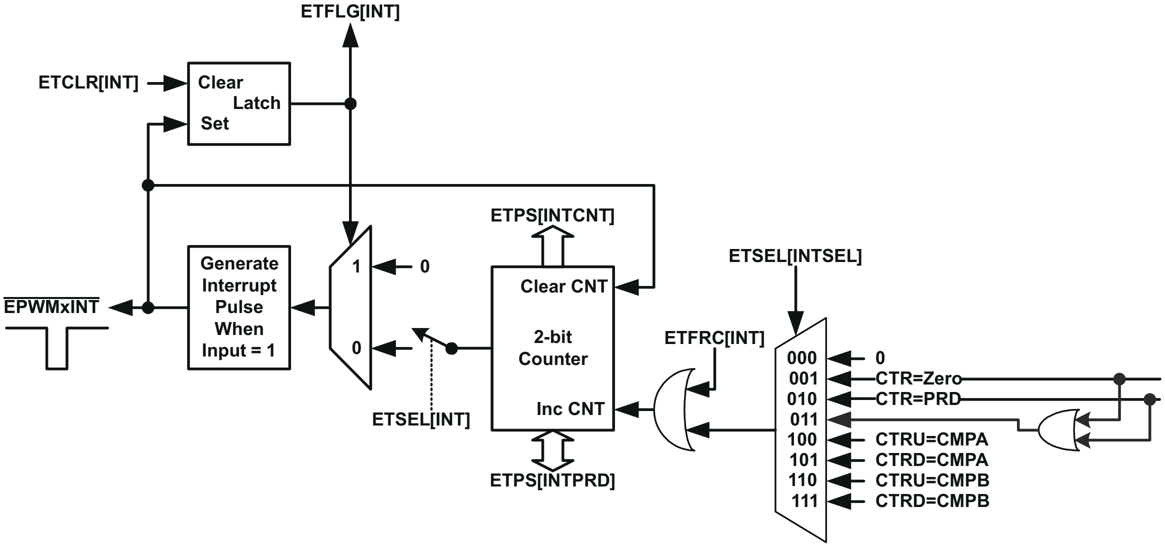

Figure 19-41. Event-Trigger Interrupt Generator

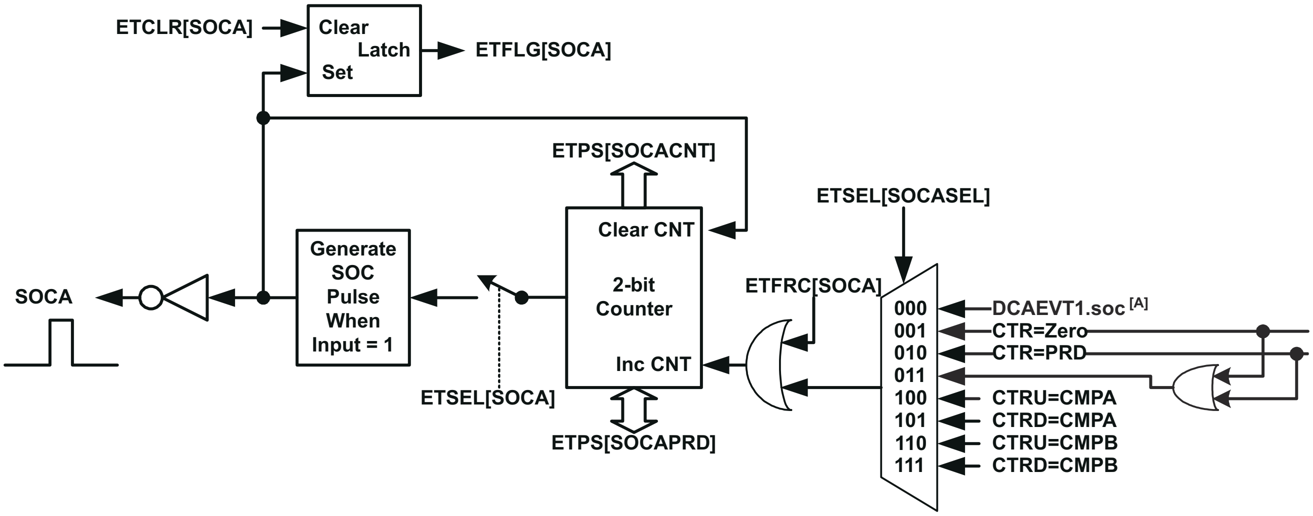
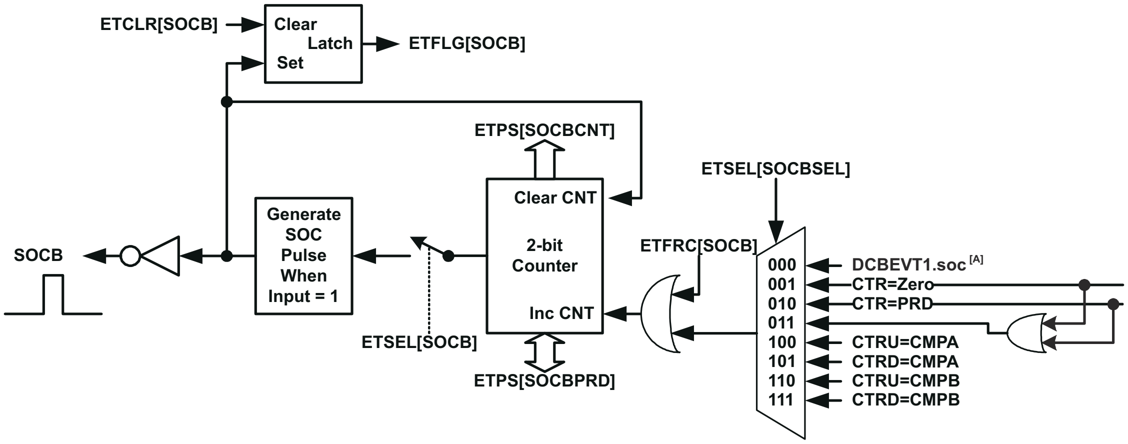
Figure 19-42 shows the operation of the event-trigger's start-of-conversion-A (SOCA) pulse generator. The ETPS[SOCACNT] counter and ETPS[SOCAPRD] period values behave similarly to the interrupt generator except that the pulses are continuously generated. That is, the pulse flag ETFLG[SOCA] is latched when a pulse is generated, but it does not stop further pulse generation. The enable/disable bit ETSEL[SOCAEN] stops pulse generation, but input events can still be counted until the period value is reached as with the interrupt generation logic. The event that will trigger an SOCA and SOCB pulse can be configured separately in the ETSEL[SOCASEL] and ETSEL[SOCBSEL] bits. The possible events are the same events that can be specified for the interrupt generation logic with the addition of the DCAEVT1.soc and DCBEVT1.soc event signals from the digital compare (DC) submodule.



A. The DCAEVT1.soc signals are signals generated by the Digital compare (DC) submodule described later in Section 19.2.9.

Figure 19-42. Event-Trigger SOCA Pulse Generator

Figure 19-43 shows the operation of the event-trigger's start-of-conversion-B (SOCB) pulse generator. The event-trigger's SOCB pulse generator operates the same way as the SOCA.



A. The DCBEVT1.soc signals are signals generated by the Digital compare (DC) submodule described later in Section 19.2.9.

Figure 19-43. Event-Trigger SOCB Pulse Generator

19.2.9 Digital Compare (DC) Submodule

Figure 19-44 illustrates where the digital compare (DC) submodule signals interface to other submodules in the ePWM system.

The digital compare (DC) submodule compares signals external to the ePWM module to directly generate PWM events/actions that then feed to the event-trigger, trip-zone, and time-base submodules. Additionally, blanking window functionality is supported to filter noise or unwanted pulses from the DC event signals.

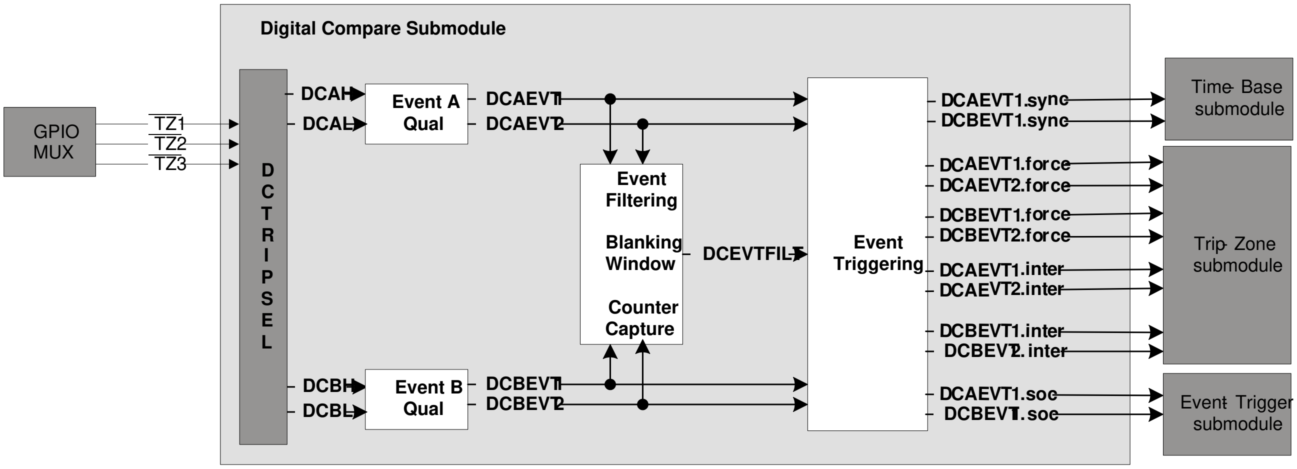


Figure 19-44. Digital-Compare Submodule High-Level Block Diagram

19.2.9.1 Purpose of the Digital Compare Submodule

The key functions of the digital compare submodule are:

- $\overline{TZ1}$, $\overline{TZ2}$, and $\overline{TZ3}$ inputs generate Digital Compare A High/Low (DCAH, DCAL) and Digital Compare B High/Low (DCBH, DCBL) signals.
- DCAH/L and DCBH/L signals trigger events which can then either be filtered or fed directly to the trip-zone, event-trigger, and time-base submodules to:
  - generate a trip zone interrupt
  - generate an ADC start of conversion
  - force an event
  - generate a synchronization event for synchronizing the ePWM module TBCTR.
- Event filtering (blanking window logic) can optionally blank the input signal to remove noise.

19.2.9.2 Controlling and Monitoring the Digital Compare Submodule

The digital compare submodule operation is controlled and monitored through the following registers:

Table 19-21. Digital Compare Submodule Registers

Register Name	Address Offset	Shadowed	Description
TZDCSEL(1) (2)	0x0024	No	Trip Zone Digital Compare Select Register
DCTRIPSEL(1)	0x0062	No	Digital Compare Trip Select Register
DCACTL(1)	0x0060	No	Digital Compare A Control Register
DCBCTL(1)	0x0066	No	Digital Compare B Control Register
DCFCTL(1)	0x0064	No	Digital Compare Filter Control Register
DCCAPCTL(1)	0x006A	No	Digital Compare Capture Control Register
DCFOFFSET	0x0068	Writes	Digital Compare Filter Offset Register
DCFOFFSETCNT	0x006E	No	Digital Compare Filter Offset Counter Register
DCFWINDOW	0x006C	No	Digital Compare Filter Window Register
DCFWINDOWCNT	0x0072	No	Digital Compare Filter Window Counter Register
DCCAP	0x0070	Yes	Digital Compare Counter Capture Register

(1) These registers are writable only in privileged mode.
(2) The TZDCSEL register is part of the trip-zone submodule but is mentioned again here because of its functional significance to the digital compare submodule.

19.2.9.3 Operation Highlights of the Digital Compare Submodule

The following sections describe the operational highlights and configuration options for the digital compare submodule.

19.2.9.3.1 Digital Compare Events

As illustrated in Figure 19-44, trip zone inputs ($\overline{TZ1}$, $\overline{TZ2}$, and $\overline{TZ3}$) can be selected via the DCTRIPSEL bits to generate the Digital Compare A High and Low (DCAH/L) and Digital Compare B High and Low (DCBH/L) signals. Then, the configuration of the TZDCSEL register qualifies the actions on the selected DCAH/L and DCBH/L signals, which generate the DCAEVT1/2 and DCBEVT1/2 events (Event Qualification A and B).

Note

The $\overline{TZn}$ signals, when used as a DCEVT tripping functions, are treated as a normal input signal and can be defined to be active high or active low inputs. EPWM outputs are asynchronously tripped when either the $\overline{TZn}$, DCAEVTx.force, or DCBEVTx.force signals are active. For the condition to remain latched, a minimum of 3 × TBCLK sync pulse width is required. If pulse width is < 3 × TBCLK sync pulse width, the trip condition may or may not get latched by CBC or OST latches.

The DCAEVT1/2 and DCBEVT1/2 events can then be filtered to provide a filtered version of the event signals (DCEVTFILT) or the filtering can be bypassed. Filtering is discussed further in Section 19.2.9.3.2. Either the DCAEVT1/2 and DCBEVT1/2 event signals or the filtered DCEVTFILT event signals can generate a force to the trip zone module, a TZ interrupt, an ADC SOC, or a PWM sync signal.

- **force signal:**

  DCAEVT1/2.force signals force trip zone conditions which either directly influence the output on the EPWMxA pin (via TZCTL[DCAEVT1 or DCAEVT2] configurations) or, if the DCAEVT1/2 signals are selected as one-shot or cycle-by-cycle trip sources (via the TZSEL register), the DCAEVT1/2.force signals can effect the trip action via the TZCTL[TZA] configuration. The DCBEVT1/2.force signals behaves similarly, but affect the EPWMxB output pin instead of the EPWMxA output pin.

  The priority of conflicting actions on the TZCTL register is as follows (highest priority overrides lower priority):

  Output EPWMxA: TZA (highest) -> DCAEVT1 -> DCAEVT2 (lowest)

  Output EPWMxB: TZB (highest) -> DCBEVT1 -> DCBEVT2 (lowest)
- **interrupt signal:**

  DCAEVT1/2.interrupt signals generate trip zone interrupts to the VIM. To enable the interrupt, the user must set the DCAEVT1, DCAEVT2, DCBEVT1, or DCBEVT2 bits in the TZEINT register. Once one of these events occurs, an EPWMxTZINT interrupt is triggered, and the corresponding bit in the TZCLR register must be set in order to clear the interrupt.
- **soc signal:**

  The DCAEVT1.soc signal interfaces with the event-trigger submodule and can be selected as an event which generates an ADC start-of-conversion-A (SOCA) pulse via the ETSEL[SOCASEL] bit. Likewise, the DCBEVT1.soc signal can be selected as an event which generates an ADC start-of-conversion-B (SOCB) pulse via the ETSEL[SOCBSEL] bit.
- **sync signal:**

  The DCAEVT1.sync and DCBEVT1.sync events are ORed with the EPWMxSYNCI input signal and the TBCTL[SWFSYNC] signal to generate a synchronization pulse to the time-base counter.

Figure 19-45 and Figure 19-46 show how the DCAEVT1, DCAEVT2, or DCEVTFLT signals are processed to generate the digital compare A event force, interrupt, soc and sync signals.

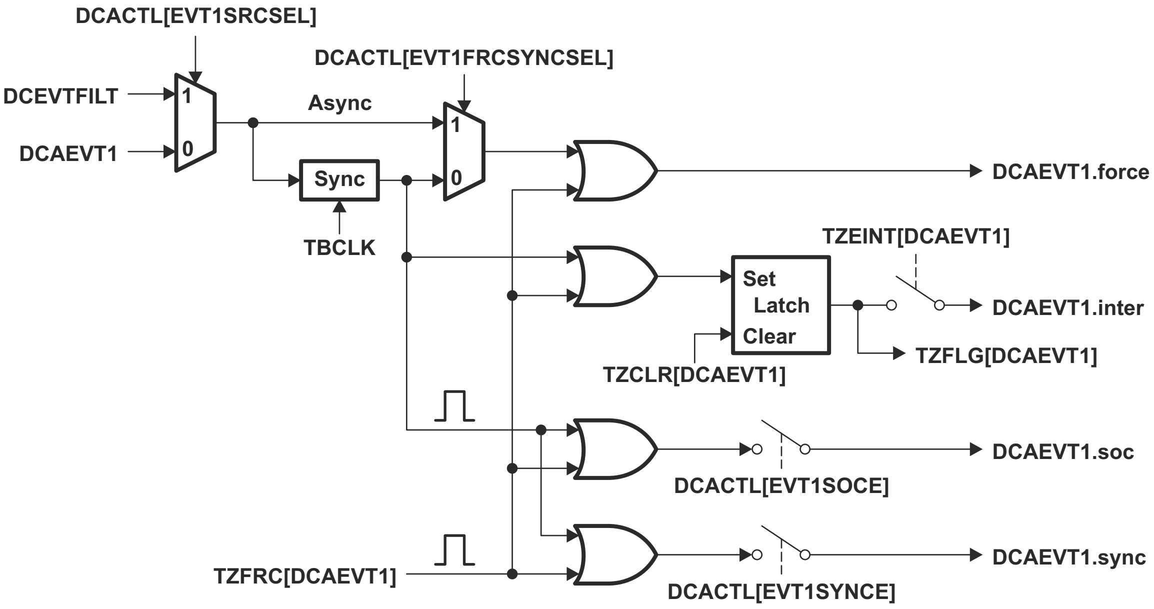

Figure 19-45. DCAEVT1 Event Triggering

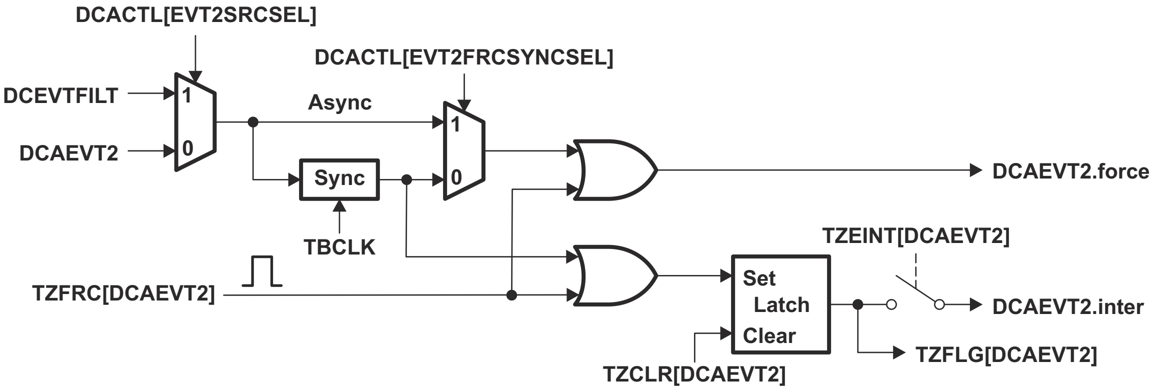

Figure 19-46. DCAEVT2 Event Triggering

Figure 19-47 and Figure 19-48 show how the DCBEVT1, DCBEVT2, or DCEVTFLT signals are processed to generate the digital compare B event force, interrupt, soc, and sync signals.

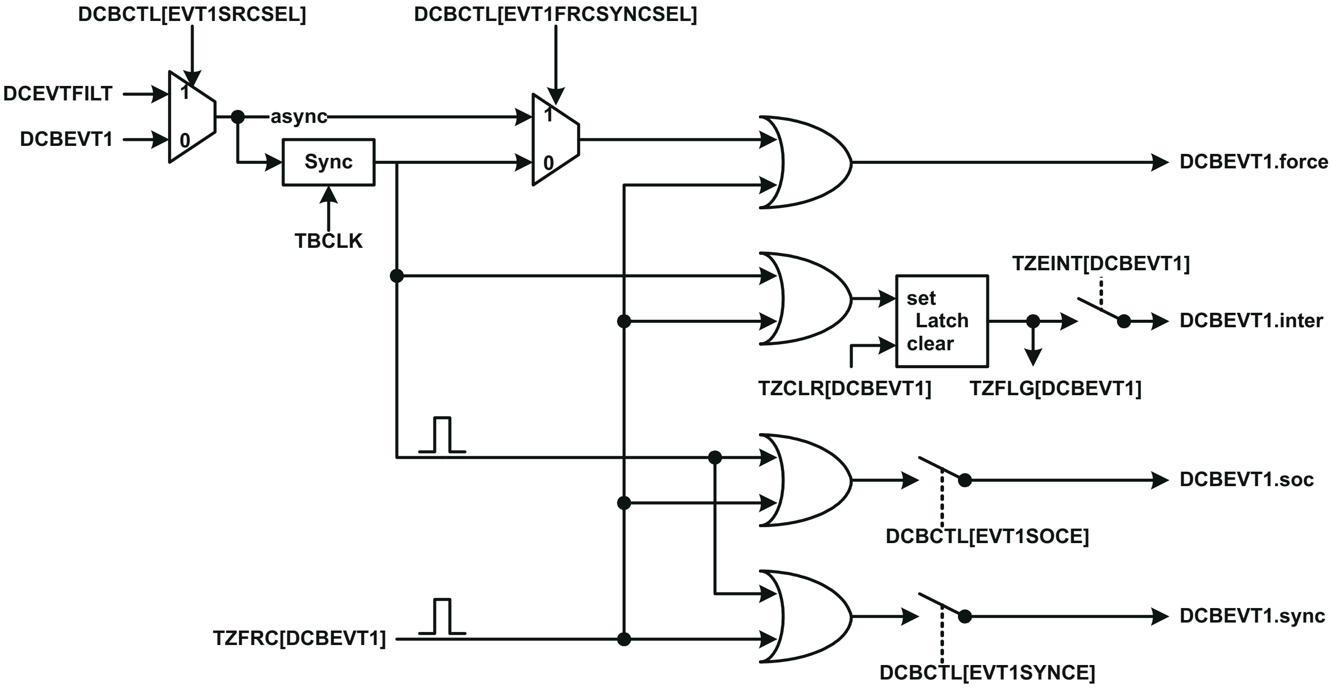

Figure 19-47. DCBEVT1 Event Triggering

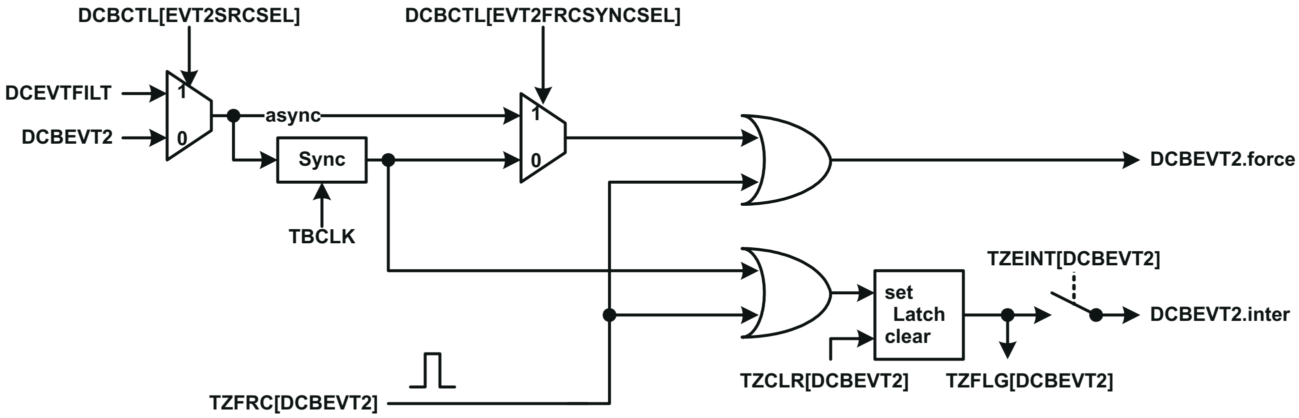

Figure 19-48. DCBEVT2 Event Triggering

19.2.9.3.2 Event Filtering

The DCAEVT1/2 and DCBEVT1/2 events can be filtered via event filtering logic to remove noise by optionally blanking events for a certain period of time. This is useful for cases where the analog comparator outputs may be selected to trigger DCAEVT1/2 and DCBEVT1/2 events, and the blanking logic is used to filter out potential noise on the signal prior to tripping the PWM outputs or generating an interrupt or ADC start-of-conversion. The event filtering can also capture the TBCTR value of the trip event. Figure 19-49 shows the details of the event filtering logic.

If the blanking logic is enabled, one of the digital compare events – DCAEVT1, DCAEVT2, DCBEVT1, DCBEVT2 – is selected for filtering. The blanking window, which filters out all event occurrences on the signal while it is active, will be aligned to either a CTR = PRD pulse or a CTR = 0 pulse (configured by the DCFCTL[PULSESEL] bits). An offset value in TBCLK counts is programmed into the DCFOFFSET register, which determines at what point after the CTR = PRD or CTR = 0 pulse the blanking window starts. The duration of the blanking window, in number of TBCLK counts after the offset counter expires, is written to the DCFWINDOW register by the application. During the blanking window, all events are ignored. Before and after the blanking window ends, events can generate soc, sync, interrupt, and force signals as before.

Figure 19-50 illustrates several timing conditions for the offset and blanking window within an ePWM period. Notice that if the blanking window crosses the CTR = 0 or CTR = PRD boundary, the next window still starts at the same offset value after the CTR = 0 or CTR = PRD pulse.

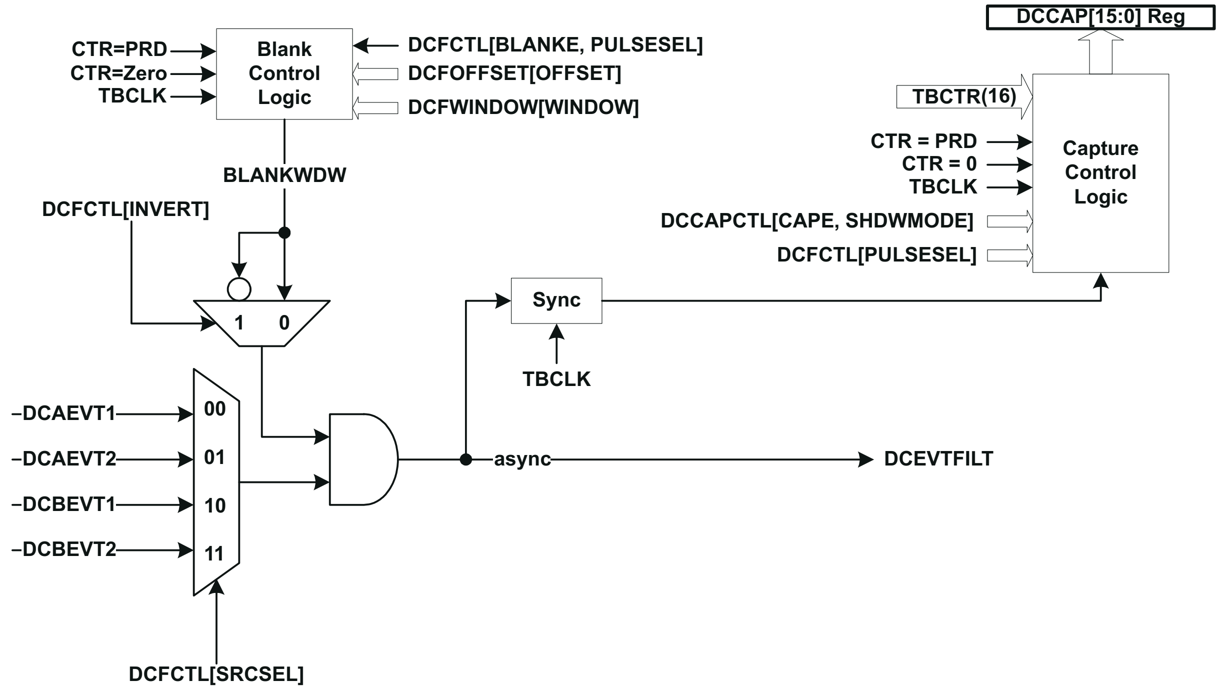

Figure 19-49. Event Filtering

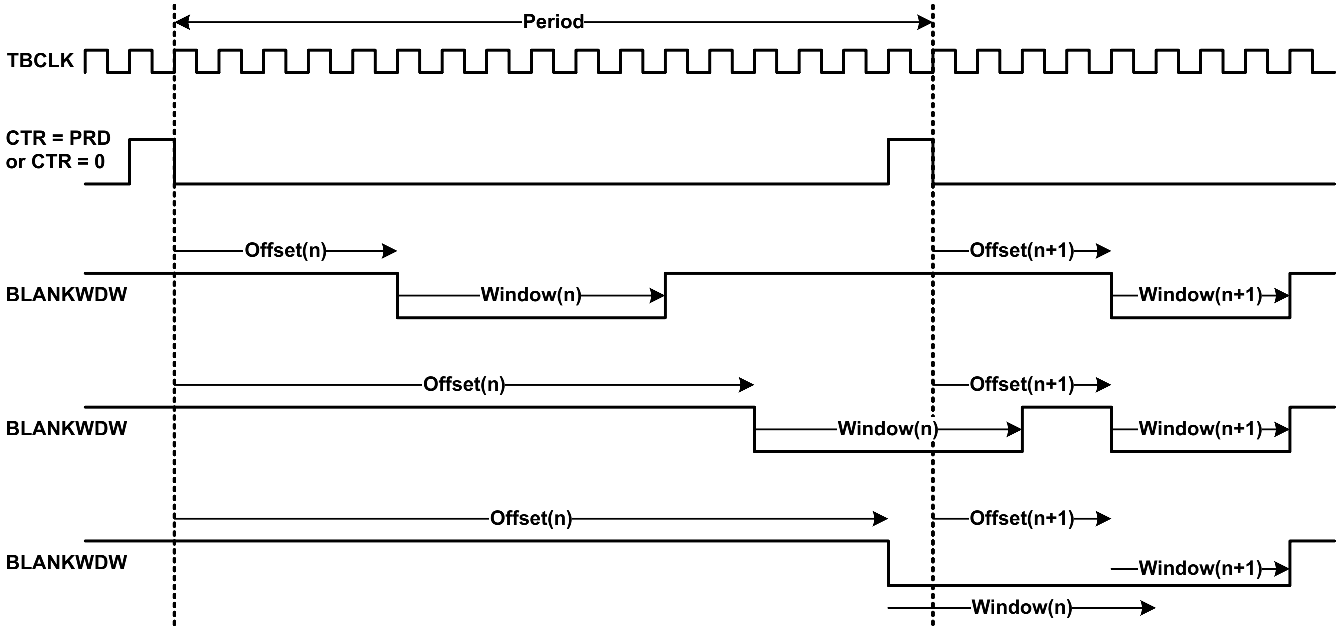

Figure 19-50. Blanking Window Timing Diagram

19.2.10 Proper Interrupt Initialization Procedure

When the ePWM peripheral clock is enabled it may be possible that interrupt flags may be set due to spurious events due to the ePWM registers not being properly initialized. The proper procedure for initializing the ePWM peripheral is as follows:

1. Disable global interrupts (CPU INTM flag)
2. Disable ePWM interrupts
3. Set TBCLKSYNC = 0
4. Initialize peripheral registers
5. Set TBCLKSYNC = 1
6. Clear any spurious ePWM flags (including interrupt flags)
7. Enable ePWM interrupts
8. Enable global interrupts

19.2.11

19.3 Application Examples

An ePWM module has all the local resources necessary to operate completely as a standalone module or to operate in synchronization with other identical ePWM modules.

19.3.1 Overview of Multiple Modules

Previously in this chapter, all discussions have described the operation of a single module. To facilitate the understanding of multiple modules working together in a system, the ePWM module described in reference is represented by the more simplified block diagram shown in Figure 19-51. This simplified ePWM block shows only the key resources needed to explain how a multiswitch power topology is controlled with multiple ePWM modules working together.

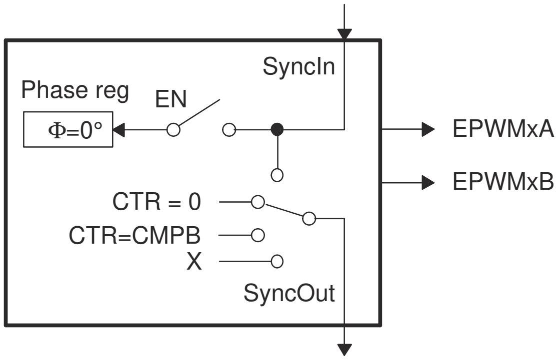

Figure 19-51. Simplified ePWM Module

19.3.2 Key Configuration Capabilities

The key configuration choices available to each module are as follows:

- Options for SyncIn
  - Load own counter with phase register on an incoming sync strobe—enable (EN) switch closed
  - Do nothing or ignore incoming sync strobe—enable switch open
  - Sync flow-through - SyncOut connected to SyncIn
  - Controller mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Controller mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides No sync to other modules—SyncOut connected to X (disabled)
- Options for SyncOut
  - Sync flow-through - SyncOut connected to SyncIn
  - Controller mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Controller mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides No sync to other modules—SyncOut connected to X (disabled)

For each choice of SyncOut, a module may also choose to load its own counter with a new phase value on a SyncIn strobe input or choose to ignore it, that is, via the enable switch. Although various combinations are possible, the two most common—controller module and target module modes—are shown in Figure 19-52.

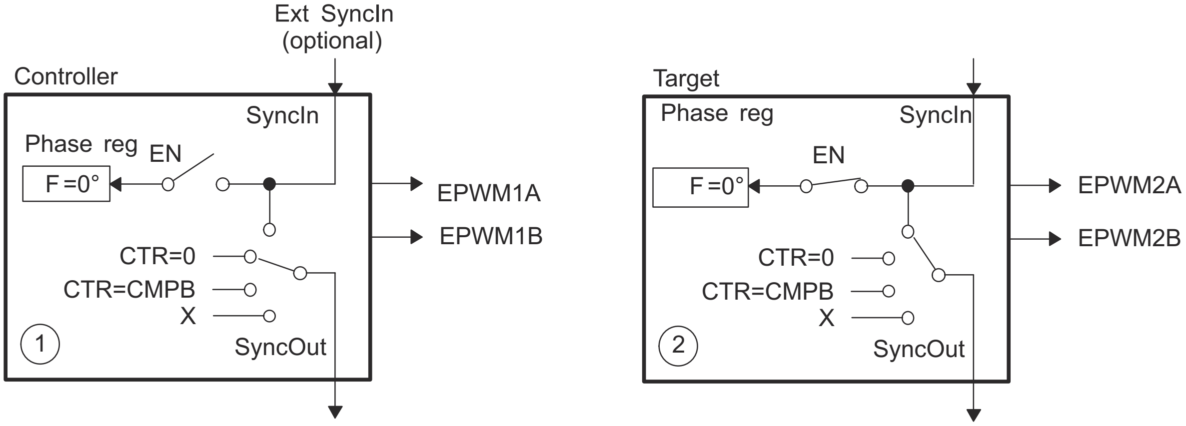

Figure 19-52. EPWM1 Configured as a Typical Controller, EPWM2 Configured as a Target

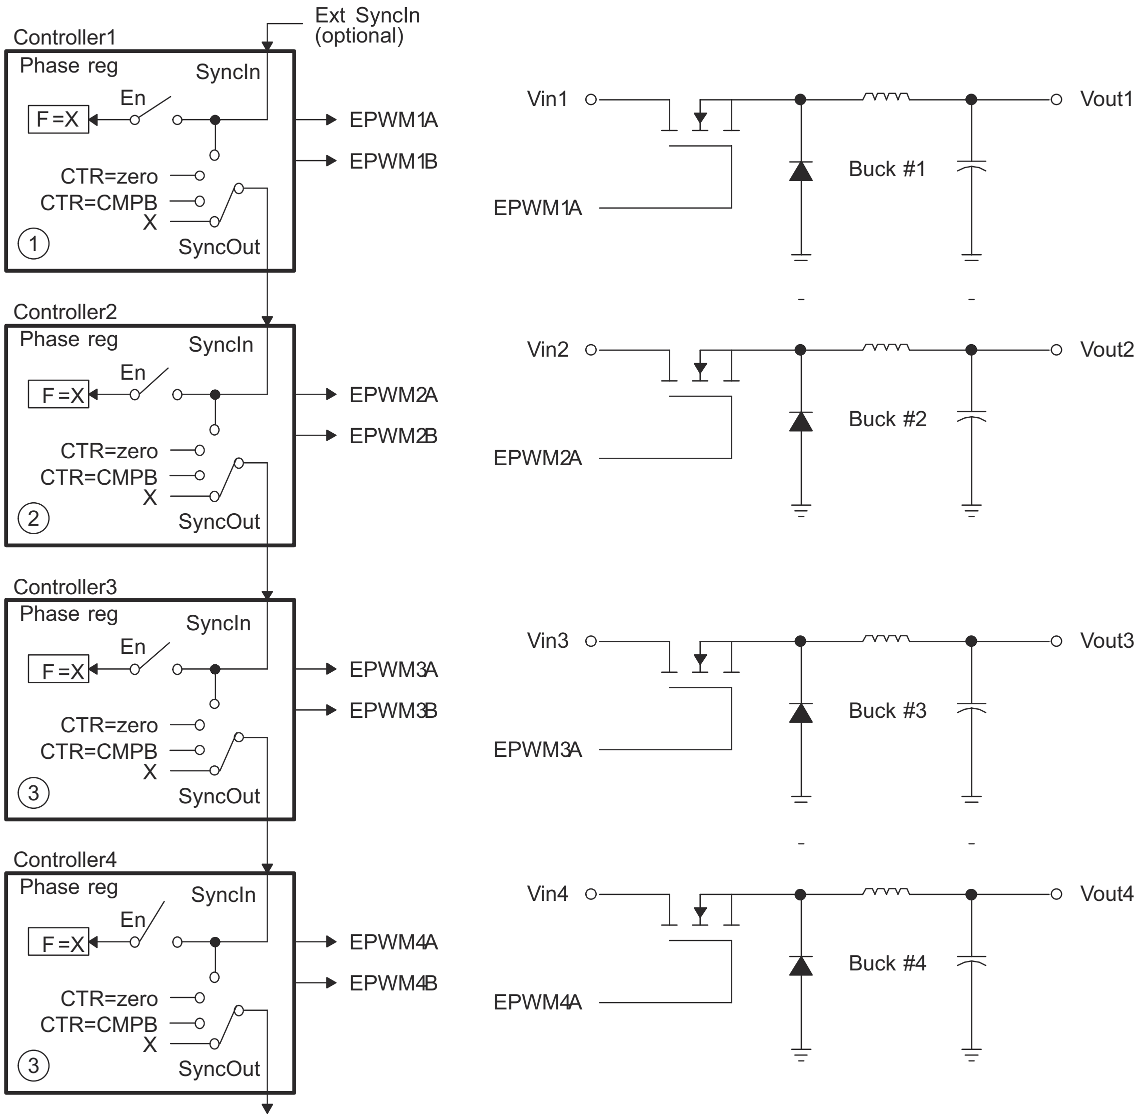
19.3.3 Controlling Multiple Buck Converters With Independent Frequencies

One of the simplest power converter topologies is the buck. A single ePWM module configured as a controller can control two buck stages with the same PWM frequency. If independent frequency control is required for each buck converter, then one ePWM module must be allocated for each converter stage. Figure 19-53 shows four buck stages, each running at independent frequencies. In this case, all four ePWM modules are configured as Controllers and no synchronization is used. Figure 19-54 shows the waveforms generated by the setup shown in Figure 19-53; note that only three waveforms are shown, although there are four stages.



A. Θ = X indicates value in phase register is a "don't care"

Figure 19-53. Control of Four Buck Stages. Here $F_{PWM1} \neq F_{PWM2} \neq F_{PWM3} \neq F_{PWM4}$

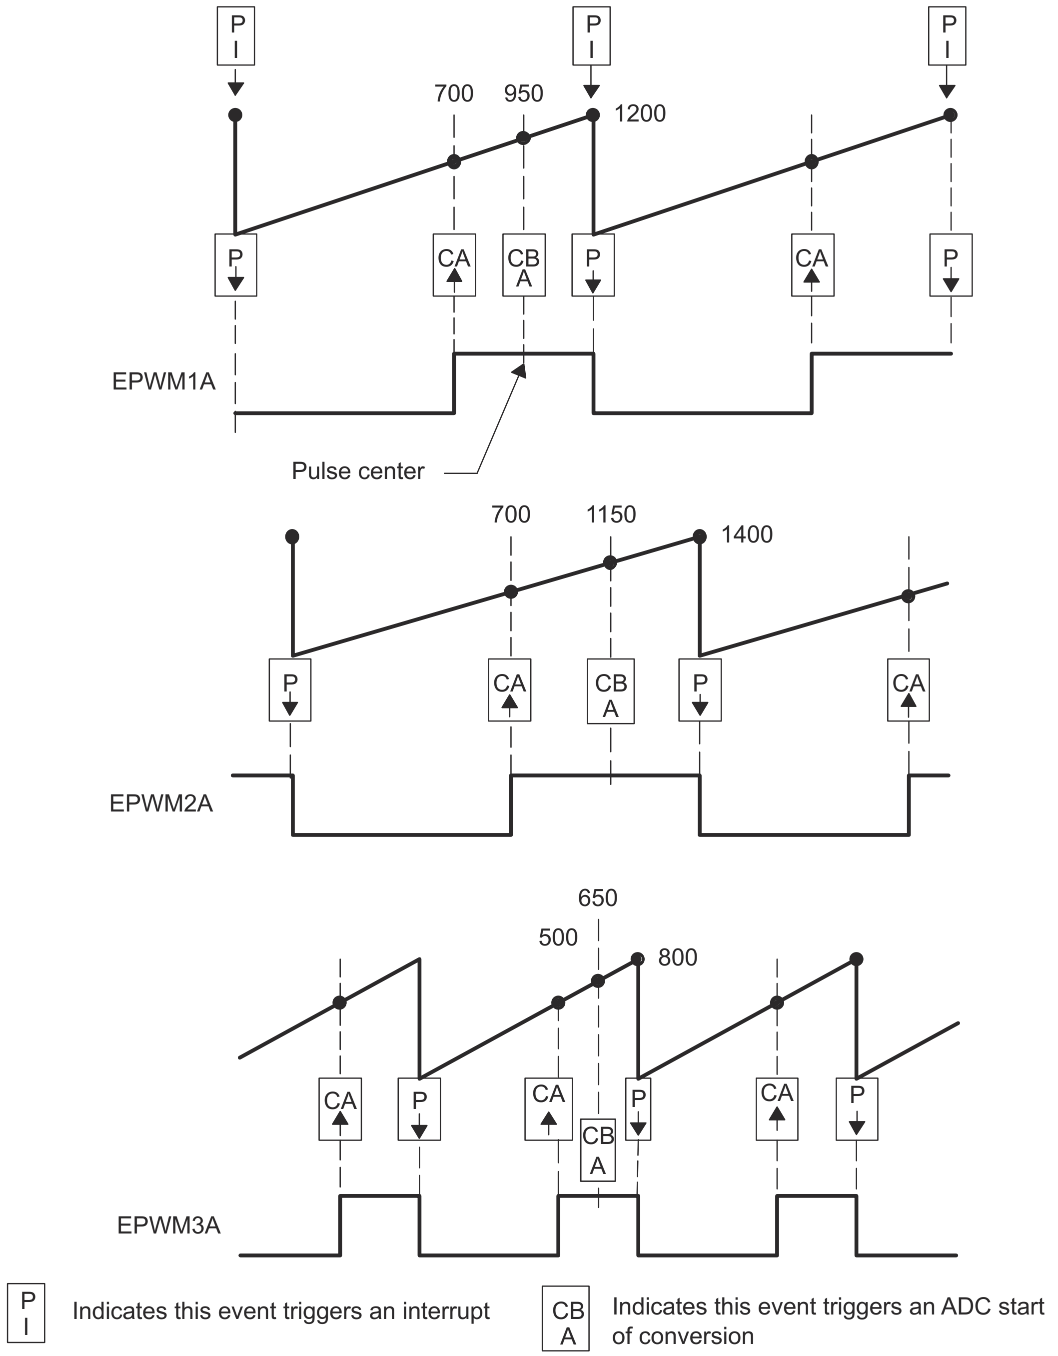


Figure 19-54. Buck Waveforms for Figure 19-53 (Note: Only three bucks shown here)

Example 19-8. Configuration for Example in Figure 19-54

```
//=====================================================================
// (Note: code for only 3 modules shown)
// Initialization Time
//========================
// EPWM Module 1 config
   EPwm1Regs.TBPRD = 1200;                         // Period = 1201 TBCLK counts
   EPwm1Regs.TBPHS.half.TBPHS = 0;                 // Set Phase register to zero
   EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;      // Asymmetrical mode
   EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;         // Phase loading disabled
   EPwm1Regs.TBCTL.bit.PRDLD = TB_SHADOW;
   EPwm1Regs.TBCTL.bit.SYNCOSEL = TB_SYNC_DISABLE;
   EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
   EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
   EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;   // load on CTR=Zero
   EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;   // load on CTR=Zero
   EPwm1Regs.AQCTLA.bit.PRD = AQ_CLEAR;
   EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;
// EPWM Module 2 config
   EPwm2Regs.TBPRD = 1400;                         // Period = 1401 TBCLK counts
   EPwm2Regs.TBPHS.half.TBPHS = 0;                 // Set Phase register to zero
   EPwm2Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;      // Asymmetrical mode
   EPwm2Regs.TBCTL.bit.PHSEN = TB_DISABLE;         // Phase loading disabled
   EPwm2Regs.TBCTL.bit.PRDLD = TB_SHADOW;
   EPwm2Regs.TBCTL.bit.SYNCOSEL = TB_SYNC_DISABLE;
   EPwm2Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
   EPwm2Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
   EPwm2Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;   // load on CTR=Zero
   EPwm2Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;   // load on CTR=Zero
   EPwm2Regs.AQCTLA.bit.PRD = AQ_CLEAR;
   EPwm2Regs.AQCTLA.bit.CAU = AQ_SET;
// EPWM Module 3 config
   EPwm3Regs.TBPRD = 800;                           // Period = 801 TBCLK counts
   EPwm3Regs.TBPHS.half.TBPHS = 0;                  // Set Phase register to zero
   EPwm3Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
   EPwm3Regs.TBCTL.bit.PHSEN = TB_DISABLE;          // Phase loading disabled
   EPwm3Regs.TBCTL.bit.PRDLD = TB_SHADOW;
   EPwm3Regs.TBCTL.bit.SYNCOSEL = TB_SYNC_DISABLE;
   EPwm3Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
   EPwm3Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
   EPwm3Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;    // load on CTR=Zero
   EPwm3Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;    // load on CTR=Zero
   EPwm3Regs.AQCTLA.bit.PRD = AQ_CLEAR;
   EPwm3Regs.AQCTLA.bit.CAU = AQ_SET;
//
// Run Time (Note: Example execution of one run-time instant)
//=========================================================
   EPwm1Regs.CMPA.half.CMPA = 700;                 // adjust duty for output EPWM1A
   EPwm2Regs.CMPA.half.CMPA = 700;                 // adjust duty for output EPWM2A
   EPwm3Regs.CMPA.half.CMPA = 500;                 // adjust duty for output EPWM3A
```

19.3.4 Controlling Multiple Buck Converters With Same Frequencies

If synchronization is a requirement, ePWM module 2 can be configured as a target and can operate at integer multiple (N) frequencies of module 1. The sync signal from controller to target ensures these modules remain locked. Figure 19-55 shows such a configuration; Figure 19-56 shows the waveforms generated by the configuration.

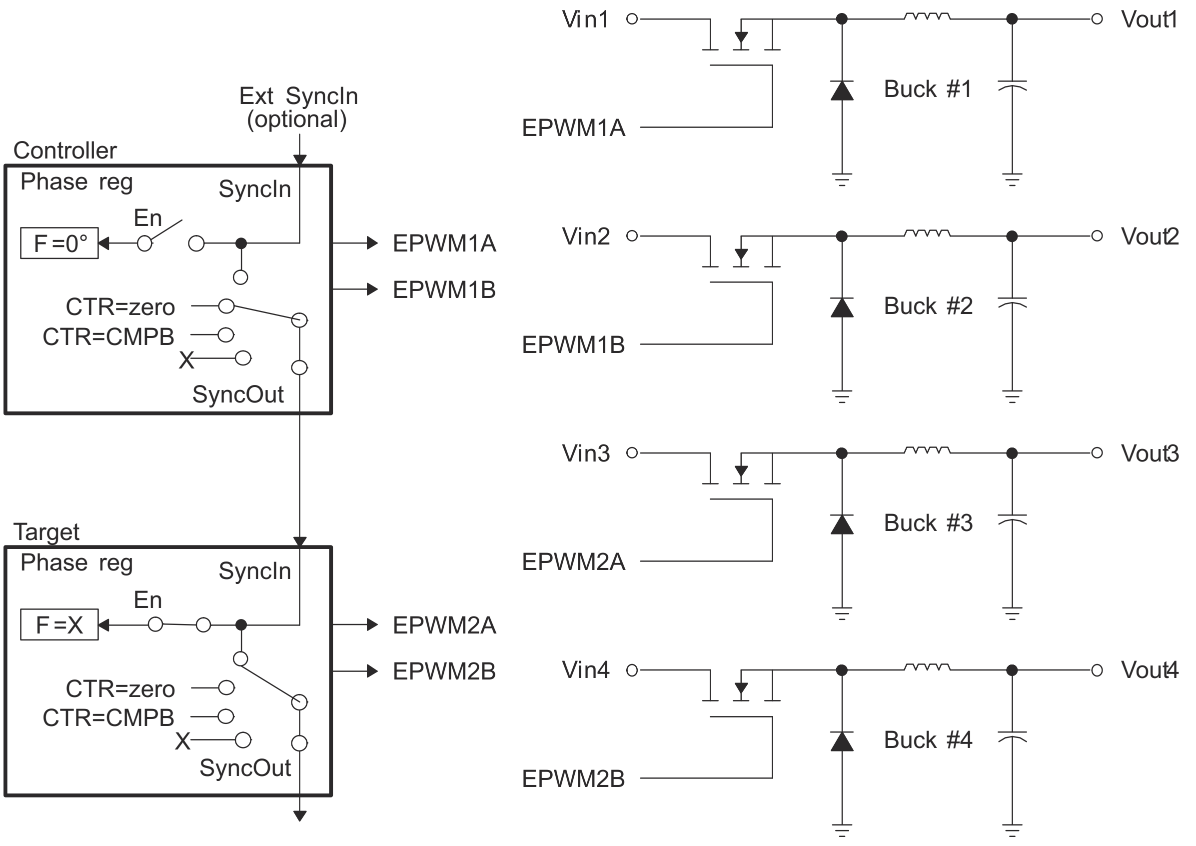

Figure 19-55. Control of Four Buck Stages. (Note: $F_{PWM2} = N \times F_{PWM1}$)

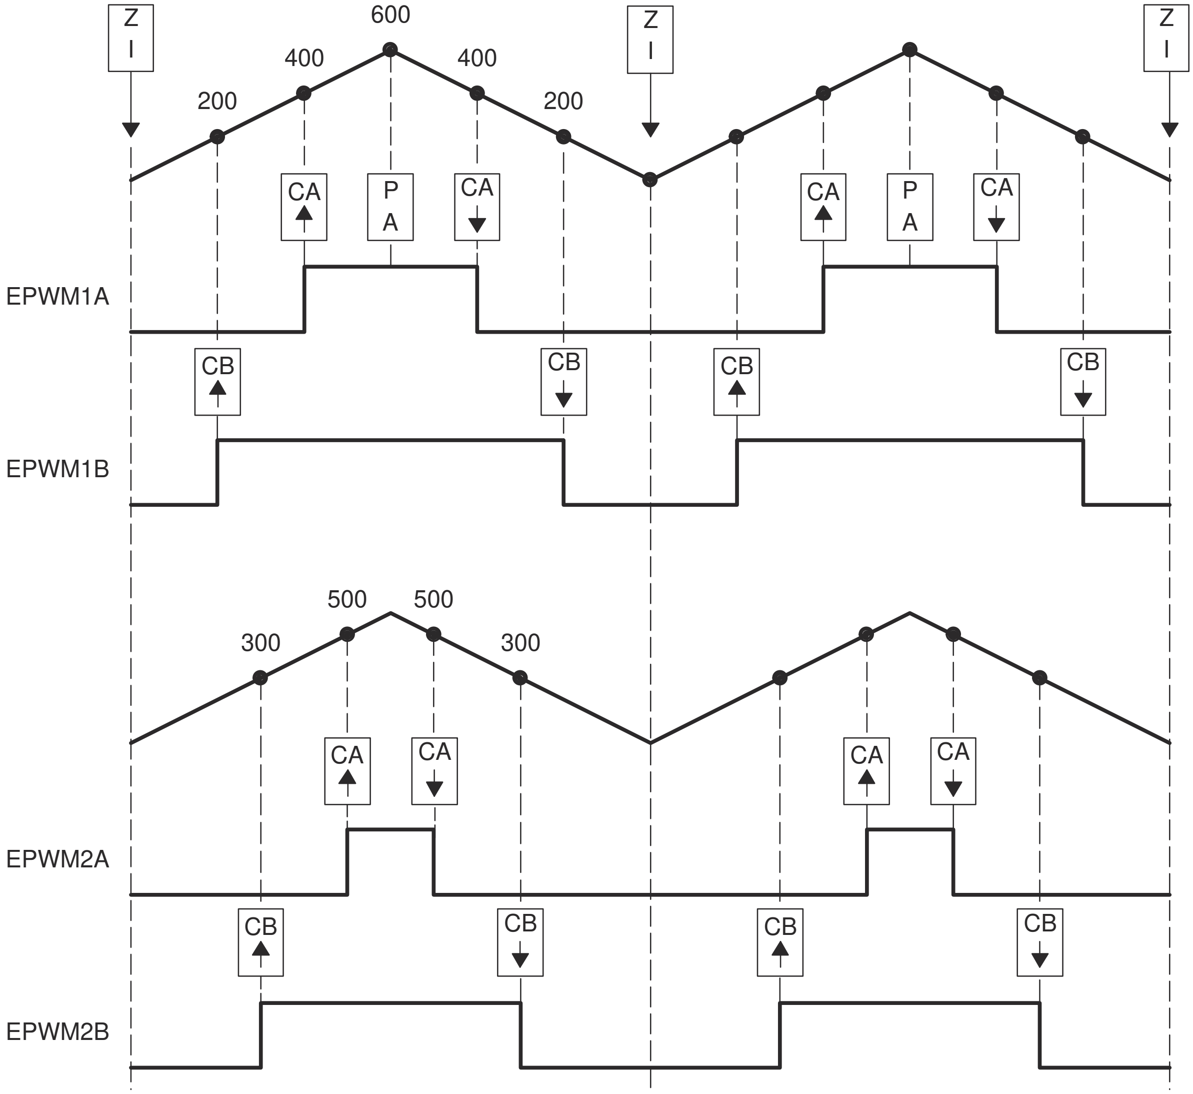

Figure 19-56. Buck Waveforms for Figure 19-55 (Note: $F_{PWM2} = F_{PWM1}$)

Example 19-9. Code Snippet for Configuration in Figure 19-55

```
//========================
// EPWM Module 1 config
     EPwm1Regs.TBPRD = 600;                         // Period = 1200 TBCLK counts
     EPwm1Regs.TBPHS.half.TBPHS = 0;                // Set Phase register to zero
     EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetrical mode
     EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;        // Controller module
     EPwm1Regs.TBCTL.bit.PRDLD = TB_SHADOW;
     EPwm1Regs.TBCTL.bit.SYNCOSEL = TB_CTR_ZERO;    // Sync down-stream module
     EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
     EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
     EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;             // set actions for EPWM1A
     EPwm1Regs.AQCTLA.bit.CAD = AQ_CLEAR;
     EPwm1Regs.AQCTLB.bit.CBU = AQ_SET;             // set actions for EPWM1B
     EPwm1Regs.AQCTLB.bit.CBD = AQ_CLEAR;
// EPWM Module 2 config
     EPwm2Regs.TBPRD = 600;                         // Period = 1200 TBCLK counts
     EPwm2Regs.TBPHS.half.TBPHS = 0;                // Set Phase register to zero
     EPwm2Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetrical mode
     EPwm2Regs.TBCTL.bit.PHSEN = TB_ENABLE;         // Target module
     EPwm2Regs.TBCTL.bit.PRDLD = TB_SHADOW;
     EPwm2Regs.TBCTL.bit.SYNCOSEL = TB_SYNC_IN;     // sync flow-through
     EPwm2Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
     EPwm2Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
     EPwm2Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm2Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm2Regs.AQCTLA.bit.CAU = AQ_SET;             // set actions for EPWM2A
     EPwm2Regs.AQCTLA.bit.CAD = AQ_CLEAR;
     EPwm2Regs.AQCTLB.bit.CBU = AQ_SET;             // set actions for EPWM2B
     EPwm2Regs.AQCTLB.bit.CBD = AQ_CLEAR;
//
// Run Time (Note: Example execution of one run-time instance)
//===========================================================
    EPwm1Regs.CMPA.half.CMPA = 400;                // adjust duty for output EPWM1A
    EPwm1Regs.CMPB = 200;                          // adjust duty for output EPWM1B
    EPwm2Regs.CMPA.half.CMPA = 500;                // adjust duty for output EPWM2A
    EPwm2Regs.CMPB = 300;                          // adjust duty for output EPWM2B
```

19.3.5 Controlling Multiple Half H-Bridge (HHB) Converters

Topologies that require control of multiple switching elements can also be addressed with these same ePWM modules. It is possible to control a Half-H bridge stage with a single ePWM module. This control can be extended to multiple stages. Figure 19-57 shows control of two synchronized Half-H bridge stages where stage 2 can operate at integer multiple (N) frequencies of stage 1. Figure 19-58 shows the waveforms generated by the configuration shown in Figure 19-57.

Module 2 (target) is configured for Sync flow-through; if required, this configuration allows for a third Half-H bridge to be controlled by PWM module 3 and also, most importantly, to remain in synchronization with controller module 1.

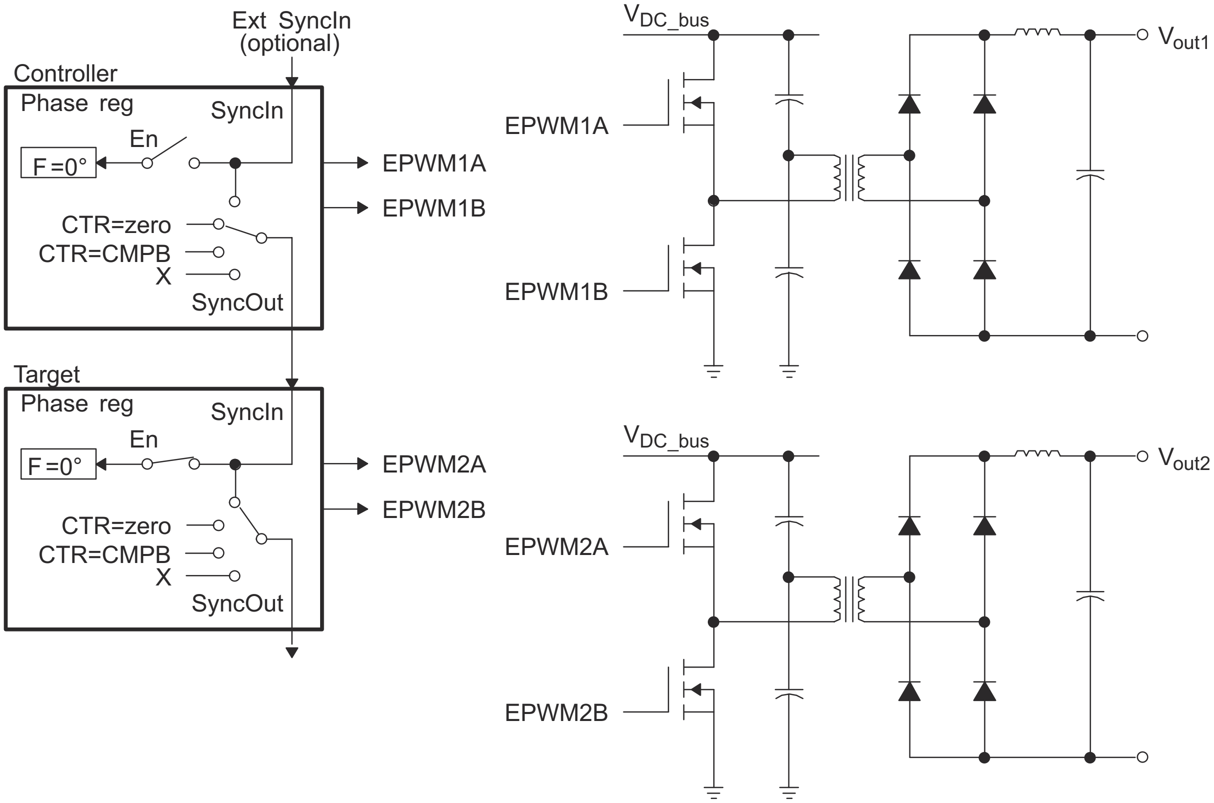

Figure 19-57. Control of Two Half-H Bridge Stages (F_{PWM2} = N x F_{PWM1})

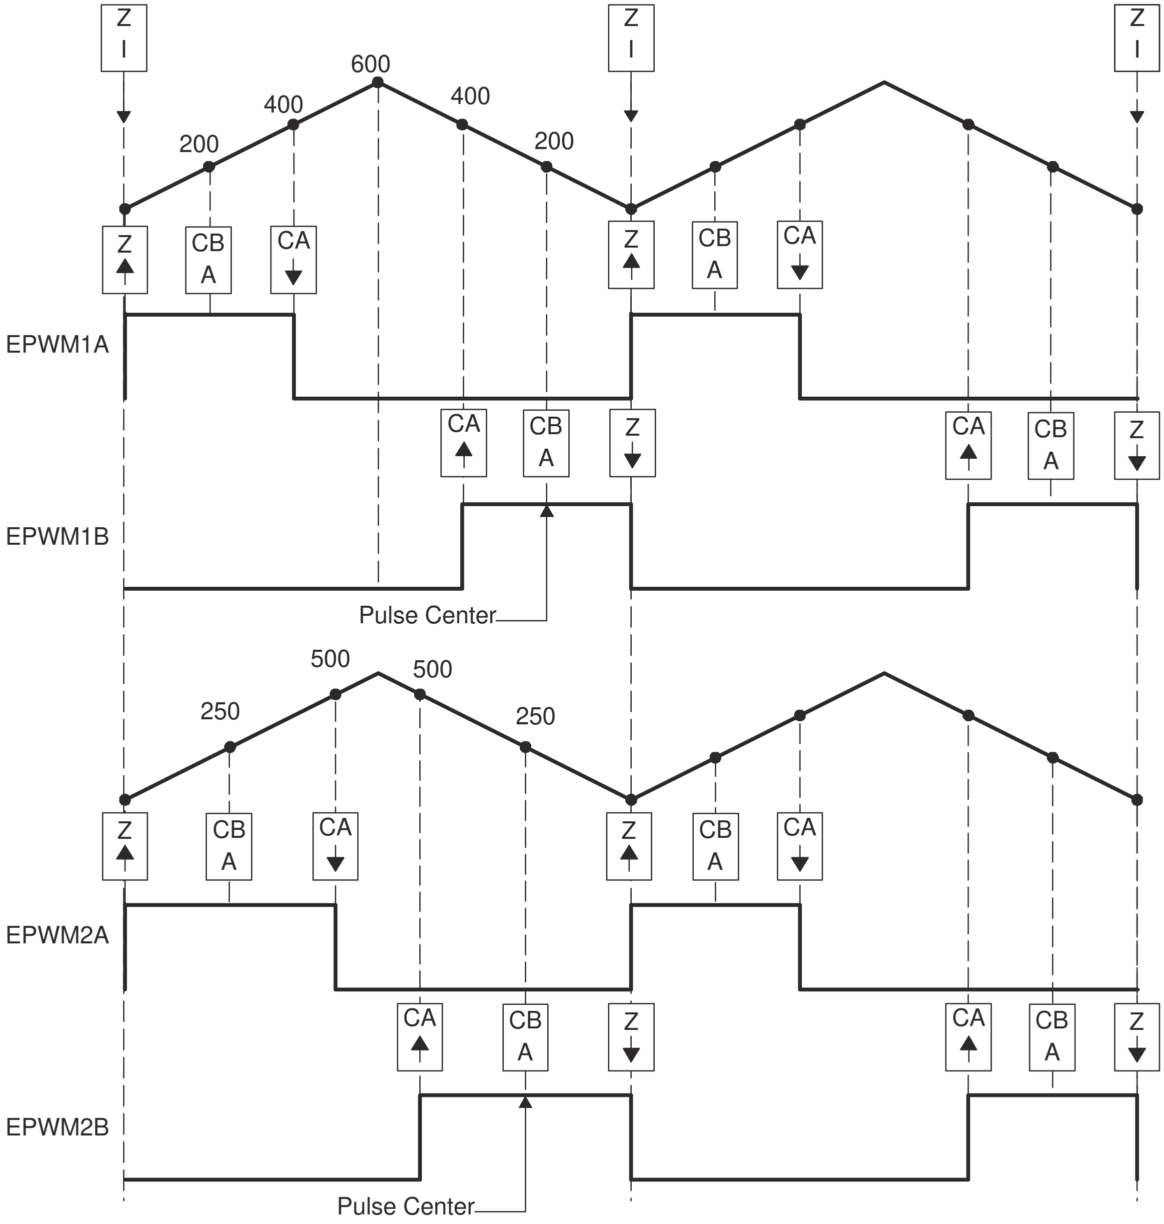

Figure 19-58. Half-H Bridge Waveforms for Figure 19-57 (Note: Here F_{PWM2} = F_{PWM1})

Example 19-10. Code Snippet for Configuration in Figure 19-57

```
//=====================================================================
// Config
//=====================================================================
// Initialization Time
//========================
// EPWM Module 1 config
     EPwm1Regs.TBPRD = 600;                         // Period = 1200 TBCLK counts
     EPwm1Regs.TBPHS.half.TBPHS = 0;                // Set Phase register to zero
     EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetrical mode
     EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;        // Controller module
     EPwm1Regs.TBCTL.bit.PRDLD = TB_SHADOW;
     EPwm1Regs.TBCTL.bit.SYNCOSEL = TB_CTR_ZERO;    // Sync down-stream module
     EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
     EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
     EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;  // load on CTR=Zero

```

19.3.5.1

19.3.6 Controlling Dual 3-Phase Inverters for Motors (ACI and PMSM)

The idea of multiple modules controlling a single power stage can be extended to the 3-phase Inverter case. In such a case, six switching elements can be controlled using three PWM modules, one for each leg of the inverter. Each leg must switch at the same frequency and all legs must be synchronized. A controller + two targets configuration can easily address this requirement. Figure 19-59 shows how six PWM modules can control two independent 3-phase inverters; each running a motor.

As in the cases shown in the previous sections, we have a choice of running each inverter at a different frequency (module 1 and module 4 are controllers as in Figure 19-59), or both inverters can be synchronized by using one controller (module 1) and five targets. In this case, the frequency of modules 4, 5, and 6 (all equal) can be integer multiples of the frequency for modules 1, 2, 3 (also all equal).

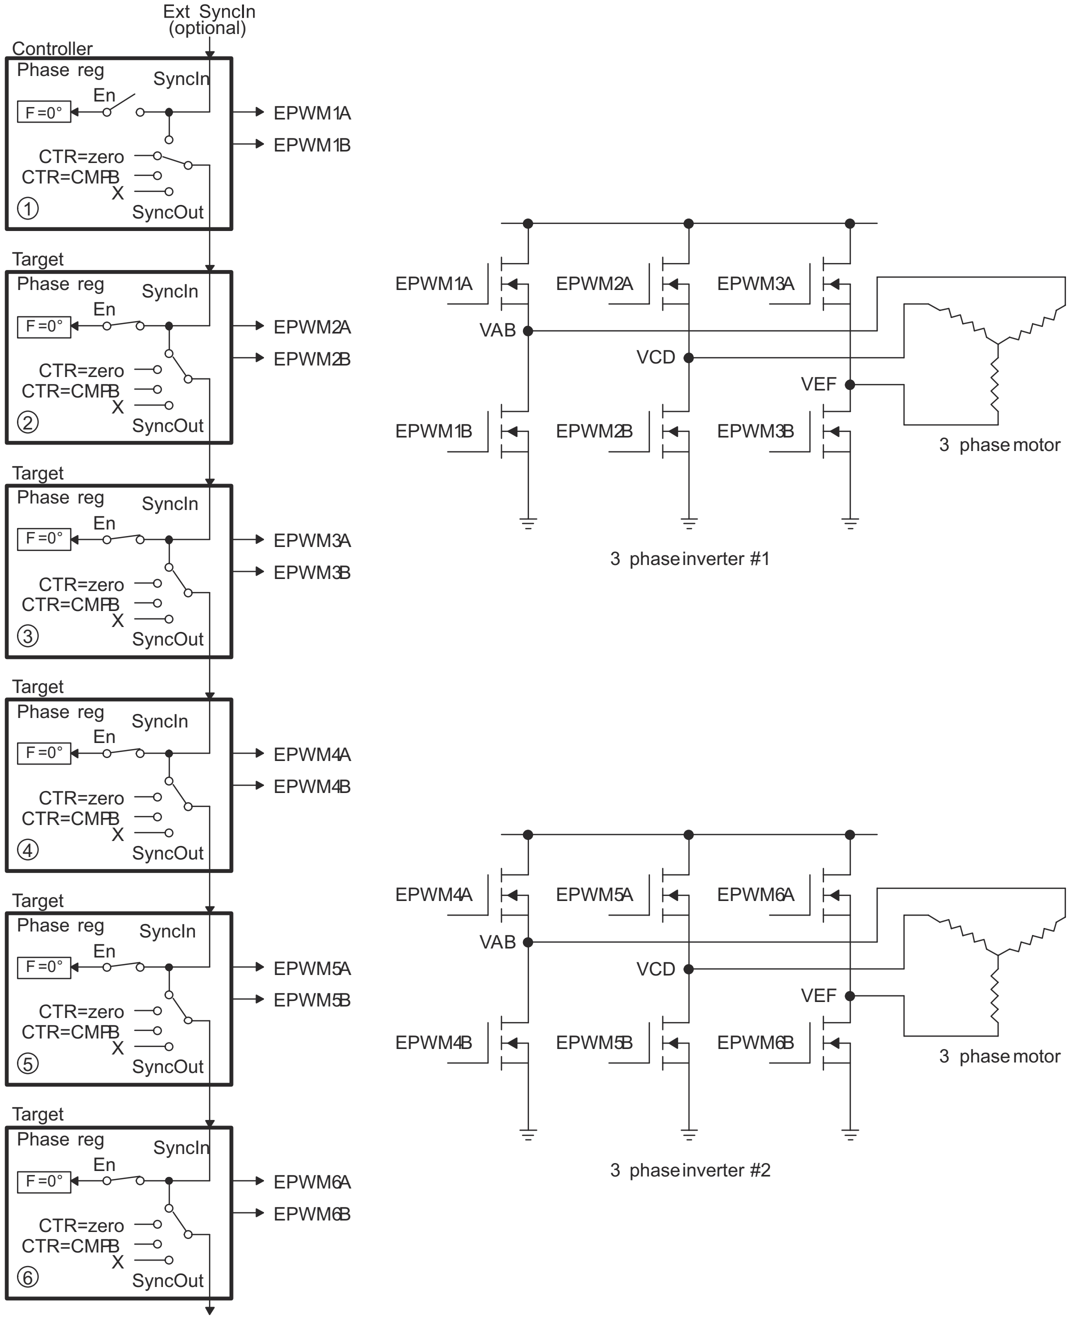

Figure 19-59. Control of Dual 3-Phase Inverter Stages as Is Commonly Used in Motor Control

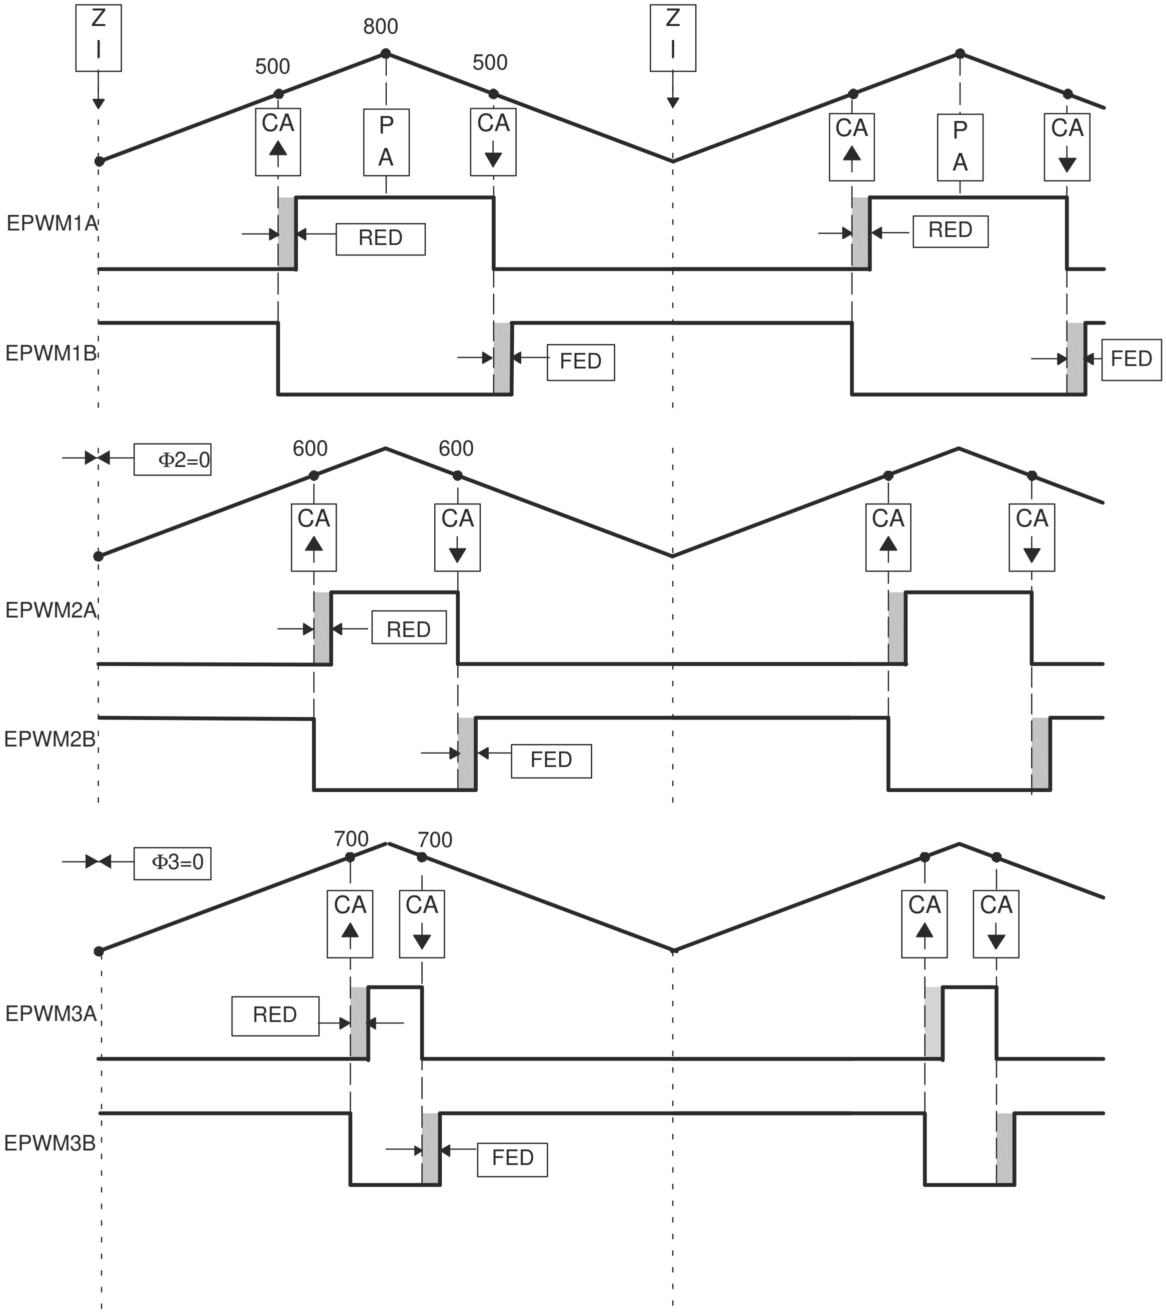

Figure 19-60. 3-Phase Inverter Waveforms for Figure 19-59 (Only One Inverter Shown)

19.3.7 Practical Applications Using Phase Control Between PWM Modules

So far, none of the examples have made use of the phase register (TBPHS). It has either been set to zero or its value has been a don't care. However, by programming appropriate values into TBPHS, multiple PWM modules can address another class of applications that rely on phase relationship between stages for correct operation. As described in the TB module section, a PWM module can be configured to allow a SyncIn pulse to cause the TBPHS register to be loaded into the TBCTR register. To illustrate this concept, Figure 19-61 shows a controller and target module with a phase relationship of 120°, that is, the target leads the controller.

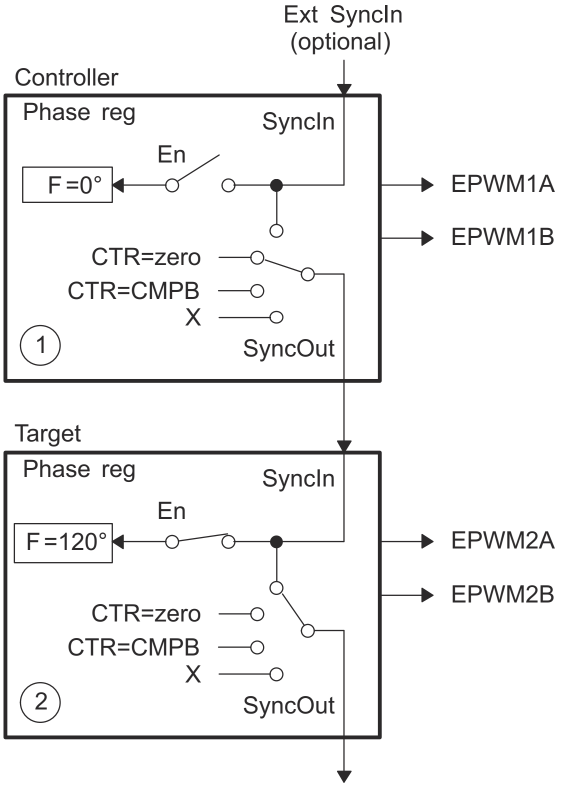

Figure 19-61. Configuring Two PWM Modules for Phase Control

Figure 19-62 shows the associated timing waveforms for this configuration. Here, TBPRD = 600 for both controller and target. For the target, TBPHS = 200 (that is, 200/600 X 360° = 120°). Whenever the controller generates a SyncIn pulse (CTR = PRD), the value of TBPHS = 200 is loaded into the target TBCTR register so the target time-base is always leading the controller's time-base by 120°.

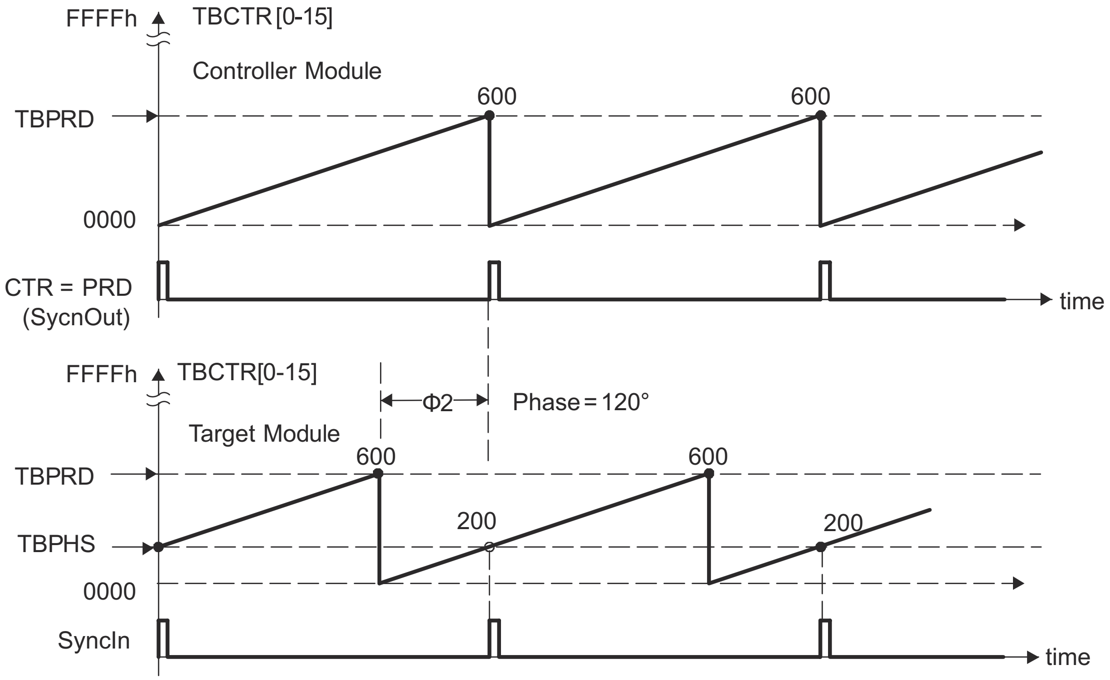

Figure 19-62. Timing Waveforms Associated With Phase Control Between 2 Modules

19.4 ePWM Module Control and Status Registers

Table 19-22 lists the memory-mapped registers for the ePWM Module Control and Status Registers. All register offset addresses not listed in Table 19-22 should be considered as reserved locations and the register contents should not be modified.

Table 19-22. ePWM Module Control and Status Registers

<tr><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="5">RESERVED</td><td>CTRMAX</td><td>SYNCI</td><td>CTRDIR</td></tr>
<tr><td colspan="5">R-0h</td><td>R-0h</td><td>R/W-0h</td><td>R-1h</td></tr>
</table>

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 19-23. TBSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-3	RESERVED	R	0h	Reserved
2	CTRMAX	R	0h	Time-Base Counter Max Latched Status Bit 0h = Reading a 0 indicates the time-base counter never reached its maximum value. Writing a 0 will have no effect. 1h = Reading a 1 on this bit indicates that the time-base counter reached the max value 0xFFFF. Writing a 1 to this bit will clear the latched event.
1	SYNCI	R/W	0h	Input Synchronization Latched Status Bit 0h = Writing a 0 will have no effect. Reading a 0 indicates no external synchronization event has occurred. 1h = Reading a 1 on this bit indicates that an external synchronization event has occurred (EPWMxSYNCI). Writing a 1 to this bit will clear the latched event.
0	CTRDIR	R	1h	Time-Base Counter Direction Status Bit. At reset, the counter is frozen, therefore, this bit has no meaning. To make this bit meaningful, you must first set the appropriate mode via TBCTL[CTRMODE]. 0h = Time-Base Counter is currently counting down. 1h = Time-Base Counter is currently counting up.

19.4.2 TBCTL Register (Offset = 2h) [reset = 83h]

TBCTL is shown in Figure 19-64 and described in Table 19-24.

Figure 19-64. TBCTL Register

15	14	13	12	11	10	9	8
FREE_SOFT		PHSDIR	CLKDIV			HSPCLKDIV

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 19-24. TBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events: 0h = Stop after the next time-base counter increment or decrement. 1h = Stop when counter completes a whole cycle. In up-count mode, stop when the time-base counter = period (TBCTR = TBPRD). In down-count mode, stop when the time-base counter = 0x0000 (TBCTR = 0x0000). In up-down-count mode, stop when the time-base counter = 0x0000 (TBCTR = 0x0000). 2h = Free run 3h = Free run
13	PHSDIR	R/W	0h	Phase Direction Bit. This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter (TBCTR) will count after a synchronization event occurs and a new phase value is loaded from the phase (TBPHS) register. This is irrespective of the direction of the counter before the synchronization event. In the up-count and down-count modes this bit is ignored. 0h = Count down after the synchronization event. 1h = Count up after the synchronization event.
12-10	CLKDIV	R/W	0h	Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value. TBCLK = VCLK4 / (HSPCLKDIV x CLKDIV) 0h = /1 (default on reset) 1h = /2 2h = /4 3h = /8 4h = /16 5h = /32 6h = /64 7h = /128

Table 19-24. TBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-7	HSPCLKDIV	R/W	1h	High Speed Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value. TBCLK = VCLK4 / (HSPCLKDIV x CLKDIV) 0h = /1 1h = /2 (default on reset) 2h = /4 3h = /6 4h = /8 5h = /10 6h = /12 7h = /14
6	SWFSYNC	R/W	0h	Software Forced Synchronization Pulse. This event is ORed with the EPWMxSYNCI input of the ePWM module. SWFSYNC is valid (operates) only when EPWMxSYNCI is selected by SYNCOSEL = 0. 0h = Writing a 0 has no effect and reads always return a 0. 1h = Writing a 1 forces a one-time synchronization pulse to be generated.
5-4	SYNCOSEL	R/W	0h	Synchronization Output Select. These bits select the source of the EPWMxSYNCO signal. 0h = EPWMxSYNC 1h = CTR = zero: Time-base counter equal to zero (TBCTR = 0x0000) 2h = CTR = CMPB : Time-base counter equal to counter-compare B (TBCTR = CMPB) 3h = Disable EPWMxSYNCO signal
3	PRDLD	R/W	0h	Active Period Register Load From Shadow Register Select 0h = The period register (TBPRD) is loaded from its shadow register when the time-base counter, TBCTR, is equal to 0. A write or read to the TBPRD register accesses the shadow register. 1h = Load the TBPRD register immediately without using a shadow register. A write or read to the TBPRD register directly accesses the active register.
2	PHSEN	R/W	0h	Counter Register Load From Phase Register Enable 0h = Do not load the time-base counter (TBCTR) from the time-base phase register (TBPHS) 1h = Load the time-base counter with the phase register when an EPWMxSYNCI input signal occurs or when a software synchronization is forced by the SWFSYNC bit, or when a digital compare sync event occurs.
1-0	CTRMODE	R/W	3h	Counter Mode. The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 0h = Up-count mode 1h = Down-count mode 2h = Up-down-count mode 3h = Stop-freeze counter operation (default on reset)

19.4.3 TBPHS Register (Offset = 4h) [reset = 0h]

TBPHS is shown in Figure 19-65 and described in Table 19-25.

Figure 19-65. TBPHS Register

<table>
<tr><th>15</th><th>14</th><th>13</th><th>12</th><th>11</th><th>10</th><th>9</th><th>8</th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td colspan="16">TBPHS</td></tr>
<tr><td colspan="16">R/W-0h</td></tr>
</table>

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 19-25. TBPHS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TBPHS	R/W	0h	These bits set time-base counter phase of the selected ePWM relative to the time-base that is supplying the synchronization input signal. Valid values: 0-FFFFh If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase. If TBCTL[PHSEN] = 1, then the time-base counter (TBCTR) will be loaded with the phase (TBPHS) when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal (EPWMxSYNCI) or by a software forced synchronization.

19.4.4 TBPRD Register (Offset = 8h) [reset = 0h]

TBPRD is shown in Figure 19-66 and described in Table 19-26.

Figure 19-66. TBPRD Register

Table 19-26. TBPRD Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TBPRD	R/W	0h	These bits determine the period of the time-base counter. This sets the PWM frequency. Valid values: 0-FFFFh Shadowing of this register is enabled and disabled by the TBCTL[PRDLD] bit. By default this register is shadowed. If TBCTL[PRDLD] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the active register will be loaded from the shadow register when the time-base counter equals 0. If TBCTL[PRDLD] = 1, then the shadow is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. The active and shadow registers share the same memory map address.

19.4.5 TBCTR Register (Offset = Ah) [reset = 0h]

TBCTR is shown in Figure 19-67 and described in Table 19-27.

Figure 19-67. TBCTR Register

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 19-28. CMPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-10	RESERVED	R	0h	Reserved
9	SHDWBFULL	R	0h	Counter-compare B (CMPB) Shadow Register Full Status Flag. This bit self clears once a load-strobe occurs. 0h = CMPB shadow FIFO not full yet 1h = Indicates the CMPB shadow FIFO is full a CPU write will overwrite current shadow value.
8	SHDWAFULL	R	0h	Counter-compare A (CMPA) Shadow Register Full Status Flag. The flag bit is set when a 32-bit write to CMPA:CMPAHR register or a 16-bit write to CMPA register is made. A 16-bit write to CMPAHR register will not affect the flag. This bit self clears once a load-strobe occurs. 0h = CMPA shadow FIFO not full yet 1h = Indicates the CMPA shadow FIFO is full, a CPU write will overwrite the current shadow value.
7	RESERVED	R	0h	Reserved
6	SHDWBMODE	R/W	0h	Counter-compare B (CMPB) Register Operating Mode. 0h = Shadow mode. Operates as a double buffer. All writes via the CPU access the shadow register. 1h = Immediate mode. Only the active compare B register is used. All writes and reads directly access the active register for immediate compare action.
5	RESERVED	R	0h	Reserved
4	SHDWAMODE	R/W	0h	Counter-compare A (CMPA) Register Operating Mode. 0h = Shadow mode. Operates as a double buffer. All writes via the CPU access the shadow register. 1h = Immediate mode. Only the active compare register is used. All writes and reads directly access the active register for immediate compare action.

Table 19-28. CMPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-2	LOADBMODE	R/W	0h	Active Counter-Compare B (CMPB) Load From Shadow Select Mode. This bit has no effect in immediate mode (CMPCTL[SHDWBMODE] = 1). 0h = Load on CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000) 1h = Load on CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 2h = Load on either CTR = Zero or CTR = PRD 3h = Freeze (no loads possible)
1-0	LOADAMODE	R/W	0h	Active Counter-Compare A (CMPA) Load From Shadow Select Mode. This bit has no effect in immediate mode (CMPCTL[SHDWAMODE] = 1). 0h = Load on CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000) 1h = Load on CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 2h = Load on either CTR = Zero or CTR = PRD 3h = Freeze (no loads possible)

19.4.7 CMPA Register (Offset = 10h) [reset = 0h]

CMPA is shown in Figure 19-69 and described in Table 19-29.

Figure 19-69. CMPA Register

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMPA															
R/W-0h															

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 19-29. CMPA Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	CMPA	R/W	0h	The value in the active CMPA register is continuously compared to the time-base counter (TBCTR). When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include: Do nothing, the event is ignored. Clear: Pull the EPWMxA and/or EPWMxB signal low Set: Pull the EPWMxA and/or EPWMxB signal high Toggle the EPWMxA and/or EPWMxB signal Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed. If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register. Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full. If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. In either mode, the active and shadow registers share the same memory map address.

19.4.8 AQCTLA Register (Offset = 14h) [reset = 0h]

AQCTLA is shown in Figure 19-70 and described in Table 19-30.

Table 19-31. CMPB Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	CMPB	R/W	0h	The value in the active CMPB register is continuously compared to the time-base counter (TBCTR). When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare B" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include: Do nothing, event is ignored. Clear: Pull the EPWMxA and/or EPWMxB signal low Set: Pull the EPWMxA and/or EPWMxB signal high Toggle the EPWMxA and/or EPWMxB signal Shadowing of this register is enabled and disabled by the CMPCTL[SHDWBMODE] bit. By default this register is shadowed. If CMPCTL[SHDWBMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADBMODE] bit field determines which event will load the active register from the shadow register. Before a write, the CMPCTL[SHDWBFULL] bit can be read to determine if the shadow register is currently full. If CMPCTL[SHDWBMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. In either mode, the active and shadow registers share the same memory map address.

19.4.10 AQSFRC Register (Offset = 18h) [reset = 0h]

AQSFRC is shown in Figure 19-72 and described in Table 19-32.

</table>

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 19-34. DBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit: 0h = Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1h = Half cycle clocking enabled. The dead-band counters are clocked at TBCLK x 2.
14-6	RESERVED	R	0h	Reserved
5-4	IN_MODE	R/W	0h	Dead Band Input Mode Control. Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown in . This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays. 0h = EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay. 1h = EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal. 2h = EPWMxA In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal. 3h = EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal.

Table 19-34. DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-2	POLSEL	R/W	0h	Polarity Select Control. Bit 3 controls the S3 switch and bit 2 controls the S2 switch shown in . This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 1,1 and DBCTL[IN_MODE] = 0,0. Other enhanced modes are also possible, but not regarded as typical usage modes. 0h = Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default). 1h = Active low complementary (ALC) mode. EPWMxA is inverted. 2h = Active high complementary (AHC). EPWMxB is inverted. 3h = Active low (AL) mode. Both EPWMxA and EPWMxB are inverted.
1-0	OUT_MODE	R/W	0h	Dead-band Output Mode Control. Bit 1 controls the S1 switch and bit 0 controls the S0 switch shown in . This allows you to selectively enable or bypass the dead-band generation for the falling-edge and rising-edge delay. 0h = Dead-band generation is bypassed for both output signals. In this mode, both the EPWMxA and EPWMxB output signals from the action-qualifier are passed directly to the PWM-chopper submodule. In this mode, the POLSEL and IN_MODE bits have no effect. 1h = Disable rising-edge delay. The EPWMxA signal from the action-qualifier is passed straight through to the EPWMxA input of the PWM-chopper submodule. The falling-edge delayed signal is seen on output EPWMxB. The input signal for the delay is determined by DBCTL[IN_MODE]. 2h = The rising-edge delayed signal is seen on output EPWMxA. The input signal for the delay is determined by DBCTL[IN_MODE]. Disable falling-edge delay. The EPWMxB signal from the action-qualifier is passed straight through to the EPWMxB input of the PWM-chopper submodule. 3h = Dead-band is fully enabled for both rising-edge delay on output EPWMxA and falling-edge delay on output EPWMxB. The input signal for the delay is determined by DBCTL[IN_MODE].

19.4.13 AQCSFRC Register (Offset = 1Eh) [reset = 0h]

AQCSFRC is shown in Figure 19-75 and described in Table 19-35.

19.4.17 TZSEL Register (Offset = 26h) [reset = 0h]

TZSEL is shown in Figure 19-79 and described in Table 19-39.

One-Shot (OSHT) Trip-zone enable/disable (bits 15-8). When any of the enabled pins go low, a one-shot trip event occurs for this ePWM module. When the event occurs, the action defined in the TZCTL register is taken on the EPWMxA and EPWMxB outputs. The one-shot trip condition remains latched until the user clears the condition via the TZCLR register. Cycle-by-Cycle (CBC) Trip-zone enable/disable (bits 7-0). When any of the enabled pins go low, a cycle-by-cycle trip event occurs for this ePWM module. When the event occurs, the action defined in the TZCTL register is taken on the EPWMxA and EPWMxB outputs. A cycle-by-cycle trip condition is automatically cleared when the time-base counter reaches zero.

Table 19-43. TZFLG Register Field Descriptions

Bit	Field	Type	Reset	Description
15-7	RESERVED	R	0h	Reserved
6	DCBEVT2	R	0h	Latched Status Flag for Digital Compare Output B Event 2 0h = Indicates no trip event has occurred on DCBEVT2 1h = Indicates a trip event has occurred for the event defined for DCBEVT2
5	DCBEVT1	R	0h	Latched Status Flag for Digital Compare Output B Event 1 0h = Indicates no trip event has occurred on DCBEVT1 1h = Indicates a trip event has occurred for the event defined for DCBEVT1
4	DCAEVT2	R	0h	Latched Status Flag for Digital Compare Output A Event 2 0h = Indicates no trip event has occurred on DCAEVT2 1h = Indicates a trip event has occurred for the event defined for DCAEVT2
3	DCAEVT1	R	0h	Latched Status Flag for Digital Compare Output A Event 1 0h = Indicates no trip event has occurred on DCAEVT1 1h = Indicates a trip event has occurred for the event defined for DCAEVT1
2	OST	R	0h	Latched Status Flag for A One-Shot Trip Event. This bit is cleared by writing the appropriate value to the TZCLR register. 0h = No one-shot trip event has occurred. 1h = Indicates a trip event has occurred on a pin selected as a one-shot trip source.
1	CBC	R	0h	Latched Status Flag for Cycle-By-Cycle Trip Event. This bit is cleared by writing the appropriate value to the TZCLR register. 0h = No cycle-by-cycle trip event has occurred. 1h = Indicates a trip event has occurred on a signal selected as a cycle-by-cycle trip source. The TZFLG.CBC bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the signal is automatically cleared when the ePWM time-base counter reaches zero (TBCTR = 0x0000) if the trip condition is no longer present. The condition on the signal is only cleared when the TBCTR = 0x0000 no matter where in the cycle the CBC flag is cleared.

Table 19-43. TZFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	INT	R	0h	Latched Trip Interrupt Status Flag. No further EPWMx_TZINT VIM interrupts will be generated until this flag is cleared. If the interrupt flag is cleared when either CBC or OST is set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts. This bit is cleared by writing the appropriate value to the TZCLR register. 0h = Indicates no interrupt has been generated. 1h = Indicates an EPWMx_TZINT VIM interrupt was generated because of a trip condition.

19.4.22 ETSEL Register (Offset = 30h) [reset = 0h]

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 19-47. ETPS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	SOCBCNT	R	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Counter Register. These bits indicate how many selected ETSEL[SOCBSEL] events have occurred: 0h = No events have occurred. 1h = 1 event has occurred. 2h = 2 events have occurred. 3h = 3 events have occurred.
13-12	SOCBPRD	R/W	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Period Select. These bits determine how many selected ETSEL[SOCBSEL] events need to occur before an EPWMxSOCB pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCBEN] = 1). The SOCB pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCB] = 1). Once the SOCB pulse is generated, the ETPS[SOCBCNT] bits will automatically be cleared. 0h = Disable the SOCB event counter. No EPWMxSOCB pulse will be generated 1h = Generate the EPWMxSOCB pulse on the first event: ETPS[SOCBCNT] = 0,1 2h = Generate the EPWMxSOCB pulse on the second event: ETPS[SOCBCNT] = 1,0 3h = Generate the EPWMxSOCB pulse on the third event: ETPS[SOCBCNT] = 1,1
11-10	SOCACNT	R	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Counter Register. These bits indicate how many selected ETSEL[SOCASEL] events have occurred: 0h = No events have occurred. 1h = 1 event has occurred. 2h = 2 events have occurred. 3h = 3 events have occurred.

Table 19-47. ETPS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	SOCAPRD	R/W	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Period Select. These bits determine how many selected ETSEL[SOCASEL] events need to occur before an EPWMxSOCA pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCAEN] = 1). The SOCA pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCA] = 1). Once the SOCA pulse is generated, the ETPS[SOCACNT] bits will automatically be cleared. 0h = Disable the SOCA event counter. No EPWMxSOCA pulse will be generated 1h = Generate the EPWMxSOCA pulse on the first event: ETPS[SOCACNT] = 0,1 2h = Generate the EPWMxSOCA pulse on the second event: ETPS[SOCACNT] = 1,0 3h = Generate the EPWMxSOCA pulse on the third event: ETPS[SOCACNT] = 1,1
7-4	RESERVED	R	0h	Reserved
3-2	INTCNT	R	0h	ePWM Interrupt Event (EPWMx_INT) Counter Register. These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD]. 0h = No events have occurred. 1h = 1 event has occurred. 2h = 2 events have occurred. 3h = 3 events have occurred.
1-0	INTPRD	R/W	0h	ePWM Interrupt (EPWMx_INT) Period Select. These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled (ETSEL[INT] = 1). If the interrupt status flag is set from a previous interrupt (ETFLG[INT] = 1) then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared. Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear. Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented. 0h = Disable the interrupt event counter. No interrupt will be generated and ETFRC[INT] is ignored. 1h = Generate an interrupt on the first event INTCNT = 01 (first event) 2h = Generate interrupt on ETPS[INTCNT] = 1,0 (second event) 3h = Generate interrupt on ETPS[INTCNT] = 1,1 (third event)

19.4.26 ETFRC Register (Offset = 38h) [reset = 0h]

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 19-55. DCFOFFSET Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	OFFSET	R	0h	Blanking Window Offset. Valid values: 0-FFFFh These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted.

19.4.34 DCCAPCTL Register (Offset = 6Ah) [reset = 0h]

DCCAPCTL is shown in Figure 19-96 and described in Table 19-56.

Figure 19-96. DCCAPCTL Register

Table 19-56. DCCAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-2	RESERVED	R	0h	Reserved
1	SHDWMODE	R/W	0h	TBCTR Counter Capture Shadow Select Mode 0h = Enable shadow mode. The DCCAP active register is copied to shadow register on a TBCTR = TBPRD or TBCTR = zero event as defined by the DCFCTL[PULSESEL] bit. CPU reads of the DCCAP register will return the shadow register contents. 1h = Active Mode. In this mode the shadow register is disabled. CPU reads from the DCCAP register will always return the active register contents.
0	CAPE	R/W	0h	TBCTR Counter Capture Enable/Disable 0h = Disable the time-base counter capture. 1h = Enable the time-base counter capture.

19.4.35 DCFWINDOW Register (Offset = 6Ch) [reset = 0h]

DCFWINDOW is shown in Figure 19-97 and described in Table 19-57.

Figure 19-97. DCFWINDOW Register

15	14	13	12	11	10	9	8

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 19-57. DCFWINDOW Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	RESERVED	R	0h	Reserved
7-0	WINDOW	R/W	0h	Blanking Window Width. Valid values: 0-FFh specifies the width of the blanking window in TBCLK cycles. The blanking window begins when the offset counter expires. When this occurs, the window counter is loaded and begins to count down. If the blanking window is currently active and the offset counter expires, the blanking window counter is restarted. The blanking window can cross a PWM period boundary. 0h = No blanking window is generated.

19.4.36 DCFOFFSETCNT Register (Offset = 6Eh) [reset = 0h]

DCFOFFSETCNT is shown in Figure 19-98 and described in Table 19-58.

Figure 19-98. DCFOFFSETCNT Register

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OFFSETCNT

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 19-58. DCFOFFSETCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	OFFSETCNT	R	0h	Blanking Offset Counter. Valid values: 0-FFFFh These 16-bits are read only and indicate the current value of the offset counter. The counter counts down to zero and then stops until it is re-loaded on the next period or zero event as defined by the DCFCTL[PULSESEL] bit. The offset counter is not affected by the free/soft emulation bits. That is, it will always continue to count down if the device is halted by a emulation stop.

19.4.37 DCCAP Register (Offset = 70h) [reset = 0h]

DCCAP is shown in Figure 19-99 and described in Table 19-59.

Figure 19-99. DCCAP Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 19-59. DCCAP Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	DCCAP	R	0h	Digital Compare Time-Base Counter Capture. Valid values: 0-FFFFh To enable time-base counter capture, set the DCCAPCLT[CAPE] bit to 1. If enabled, reflects the value of the time-base counter (TBCTR) on the low to high edge transition of a filtered (DCEVTFLT) event. Further capture events are ignored until the next period or zero as selected by the DCFCTL[PULSESEL] bit. Shadowing of DCCAP is enabled and disabled by the DCCAPCTL[SHDWMODE] bit. By default this register is shadowed. If DCCAPCTL[SHDWMODE] = 0, then the shadow is enabled. In this mode, the active register is copied to the shadow register on the TBCTR = TBPRD or TBCTR = zero as defined by the DCFCTL[PULSESEL] bit. CPU reads of this register will return the shadow register value. If DCCAPCTL[SHDWMODE] = 1, then the shadow register is disabled. In this mode, CPU reads will return the active register value. The active and shadow registers share the same memory map address.

19.4.38 DCFWINDOWCNT Register (Offset = 72h) [reset = 0h]

DCFWINDOWCNT is shown in Figure 19-100 and described in Table 19-60.

Figure 19-100. DCFWINDOWCNT Register

Table 19-60. DCFWINDOWCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	RESERVED	R	0h	Any writes to these bit(s) must always have a value of 0.
7-0	WINDOWCNT	R	0h	Blanking Window Counter. Valid value: 0-FFh These 8 bits are read only and indicate the current value of the window counter. The counter counts down to zero and then stops until it is re-loaded when the offset counter reaches zero again.

Chapter 20

On-chip Debug

The debug subsystem contains one MCUDebugss at its core that allows the JTAG interface access to device components. The debug subsystem is designed to provide the following debug features:

- JTAG debug access to debug resources, mapped through an ARM SWJ-DP and TI ICEPickM scan module
- System memory access without halting the processor
- Trace for C66x DSP
- ETM-based trace for ARM R5F
- Cross trigger to halt and restart MSS and DSP, based on events such as watchdog, timers, DMA, and time-stamp events
- Capability to read the device ID

20.1 AWR294x DebugSS Architecture

20.1.1 DebugSS Overview

The OneMCU Debug Subsystem (OneMCUDebugSS) is used in the AWR294x platform. An overview of the interconnectivity of the debug ports and trace ports are shown in Figure 20-1.

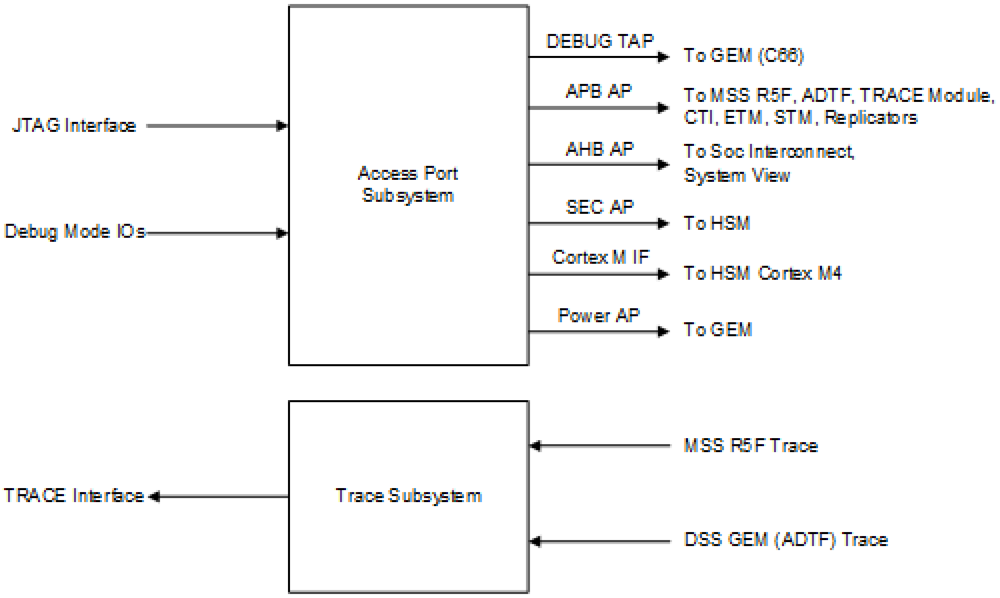

Figure 20-1. Debug SS Overview

20.1.2 DebugSS Architecture

The DebugSSarchitecture and the connectivity of the various debug components are shown in Figure 20-2.

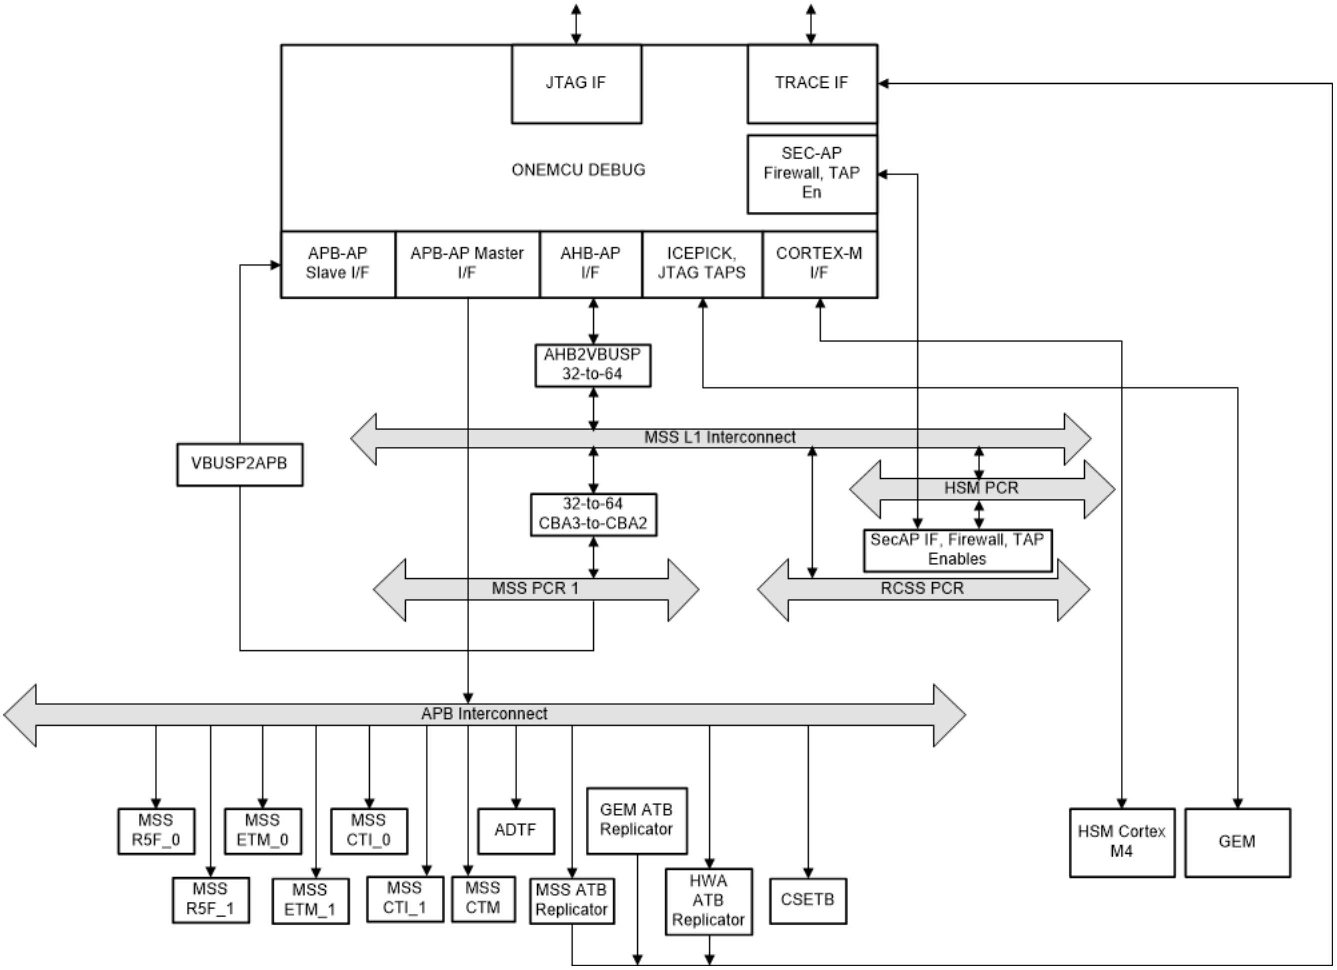

Figure 20-2. AWR294x DebugSS Architecture

20.1.3 Debug Subsystem Address Map

The memory map view for RS232 and DAP AHB is the same as MSS CortexR5. Table 20-1 shows the APB Port Address Map for the AWR294x .

Table 20-1. Debug Subsystem Address Map

20.1.4 Trace Subsystem

20.1.4.1 Trace Infrastructure

The trace infrastructure is shown in Figure 20-3. Trace data from the MSS CR5 cores, C66x DSP core, and HSM Cortex M4 cores may be routed to the external trace lines over the TPIU-Trace interface. Alternately, there is an 8KB trace memory to store the configured (filtered) trace data onto the memory.

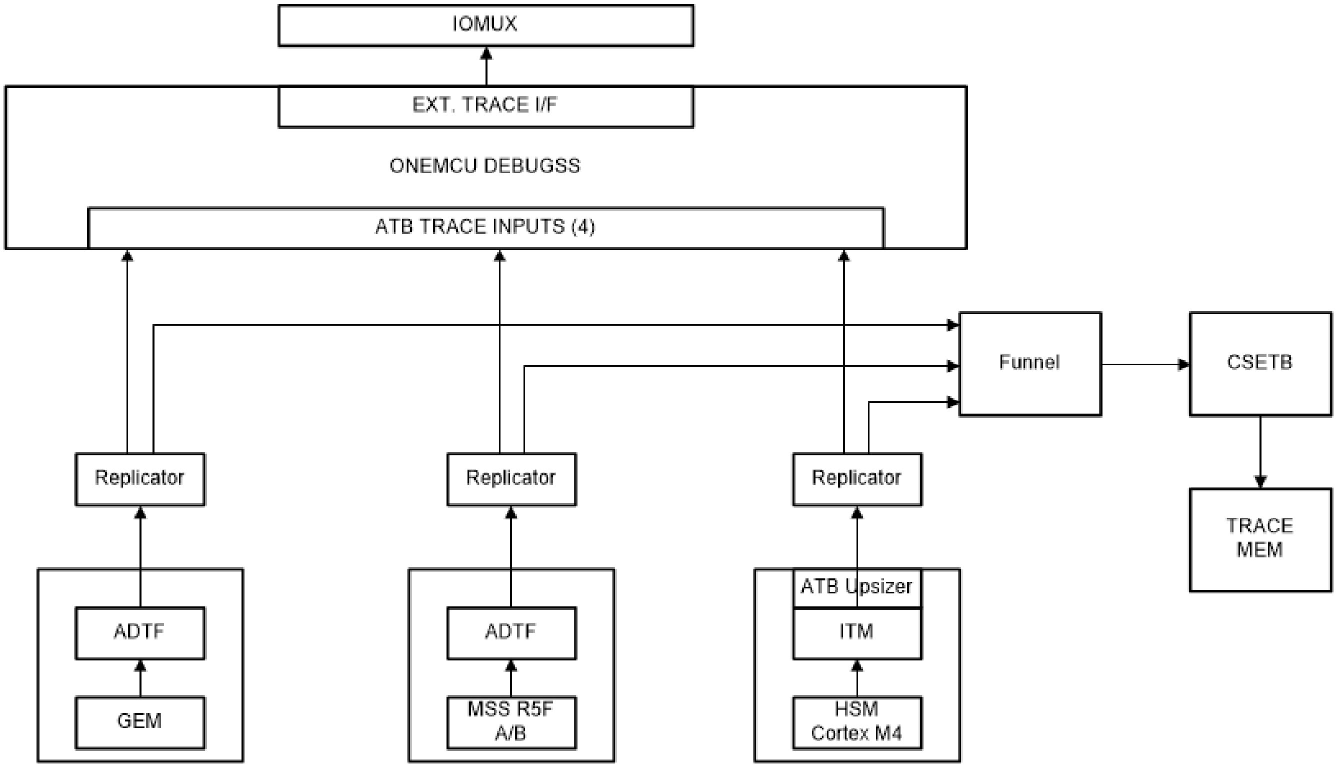

Figure 20-3. Trace Infrastructure

The CortexM4 ITM output requries an 8-bit to 32-bit ATB upsizer in the path to convert the signals to be compatible as input to the upstream layers/modules.

The maximum support frequency for the external interface trace clock is 125 MHz.

20.1.4.2 Cross Triggering

20.1.4.2.1 Cross Triggering Infrastructure

The cross triggering infrastructure is shown in Figure 20-4. The host processors involved in the cross triggering sequence are:

- MSS Cortex R5F cores, ETB
- C66x DSP cores, ADTF
- Host as suspend peripherals
  - HWA Accelerator

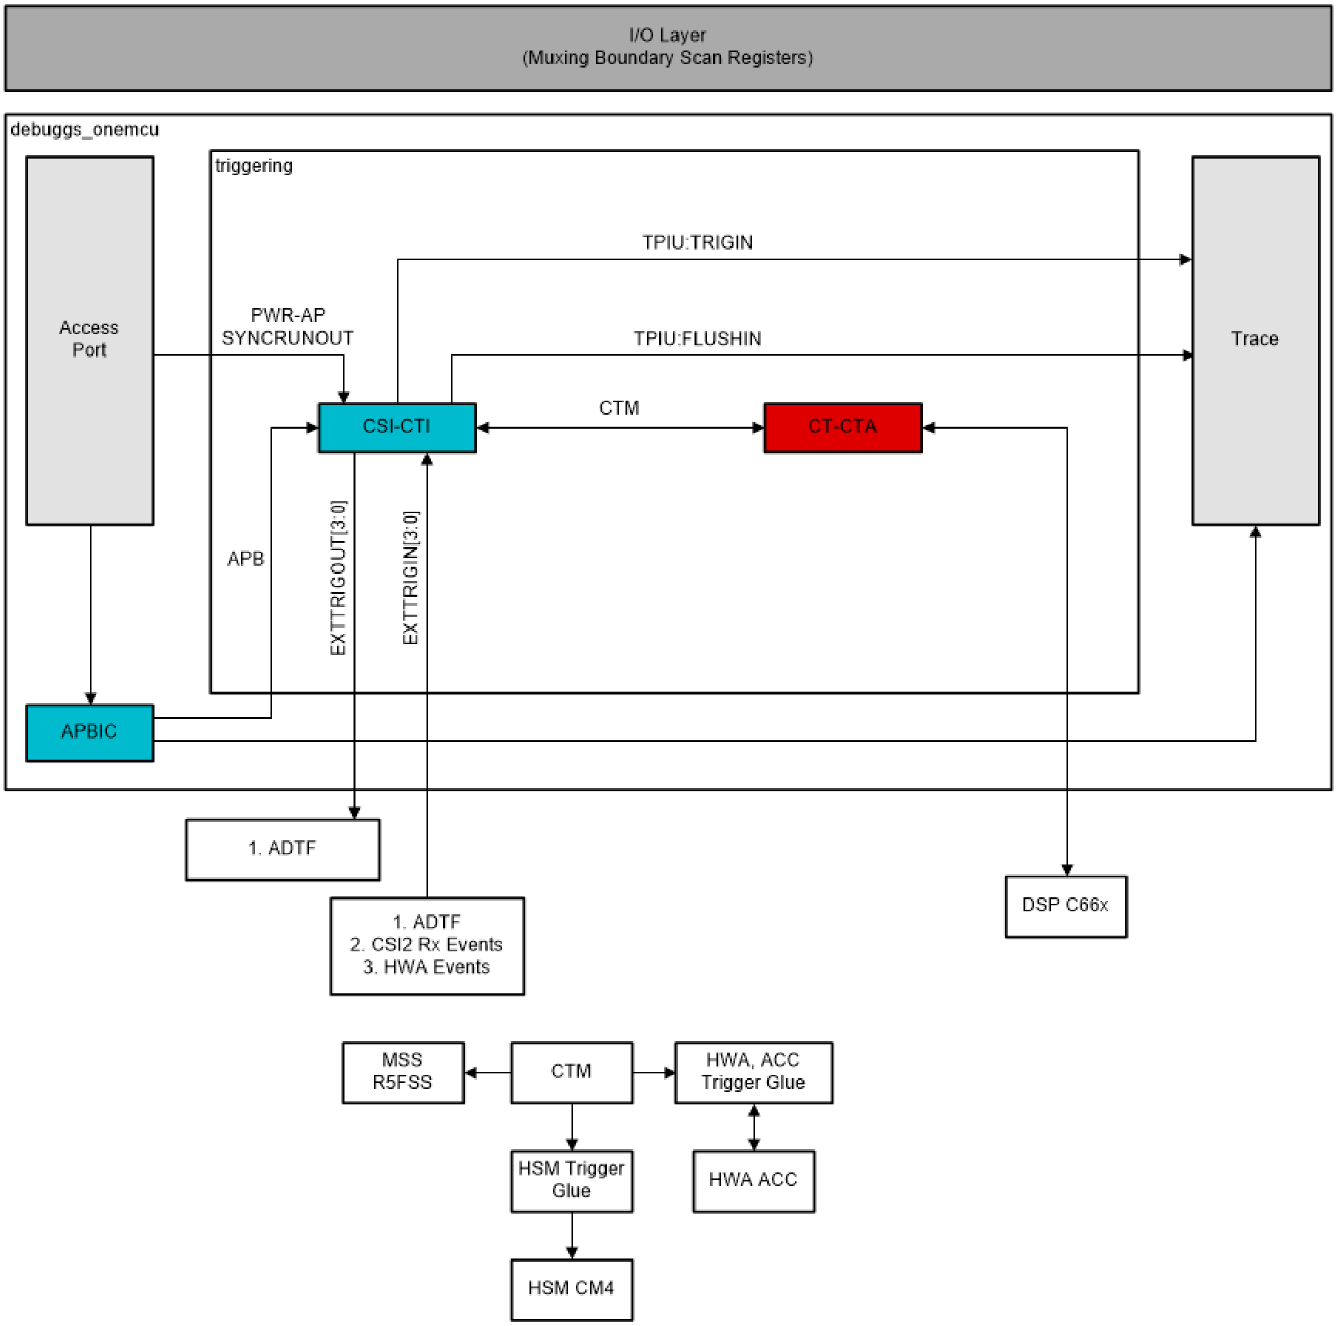

Figure 20-4. Cross Triggering Infrastructure

20.1.5 Suspend Peripherals

The device supports a suspend feature, which provides a way to stop a "closely coupled" hardware process running on a peripheral-IP when the host processor enters a debug state. The suspend mechanism is important for debug to ensure that peripheral-IPs operate in a lock-step manner with a host controller processor.

Table 20-6. Suspend Peripherals

Subsystems Peripherals	CPU Suspend	Peripherals	Peripheral Control Register

Chapter 21

Safety Modules

21.1 Core Clock Comparator (CCC)

21.1.1 Description

Core Clock Comparator (CCC) supports single-shot and continuous mode of operation, such as DCC. In continuous mode, the programmed values are reloaded after every successful comparison.

The module accepts 7 clock inputs for clock 0 and clock 1. One of these input clocks is selected to counter 0 and counter 1. Counter 0 is a down counter and is preloaded with a value before enabling the module. Counter 1 is an up counter which operates on Clock 1.

At the expiry of counter 0, value in the counter 1 is compared against the programmed expected value of the counter. After a successful comparison, a Done signal is asserted in single-shot mode, whereas in continuous mode, counter 0 is reloaded for the next comparison. Margin value programmed provides the tolerance for the comparison. An error signal is asserted when the counter 1 value differs from the expected value beyond the tolerance range.

When an error occurs, the module stops comparison in both single-shot and continuous mode.

There is a timeout counter functioning on Clock 1. A timeout value must be loaded into the timeout counter before enabling the module. If the timeout counter expires before the expiry of counter 0, an error condition is indicated. In continuous mode, after the successful comparison, the timeout value is also reloaded along with Counter 0.

21.1.2 Block Diagram

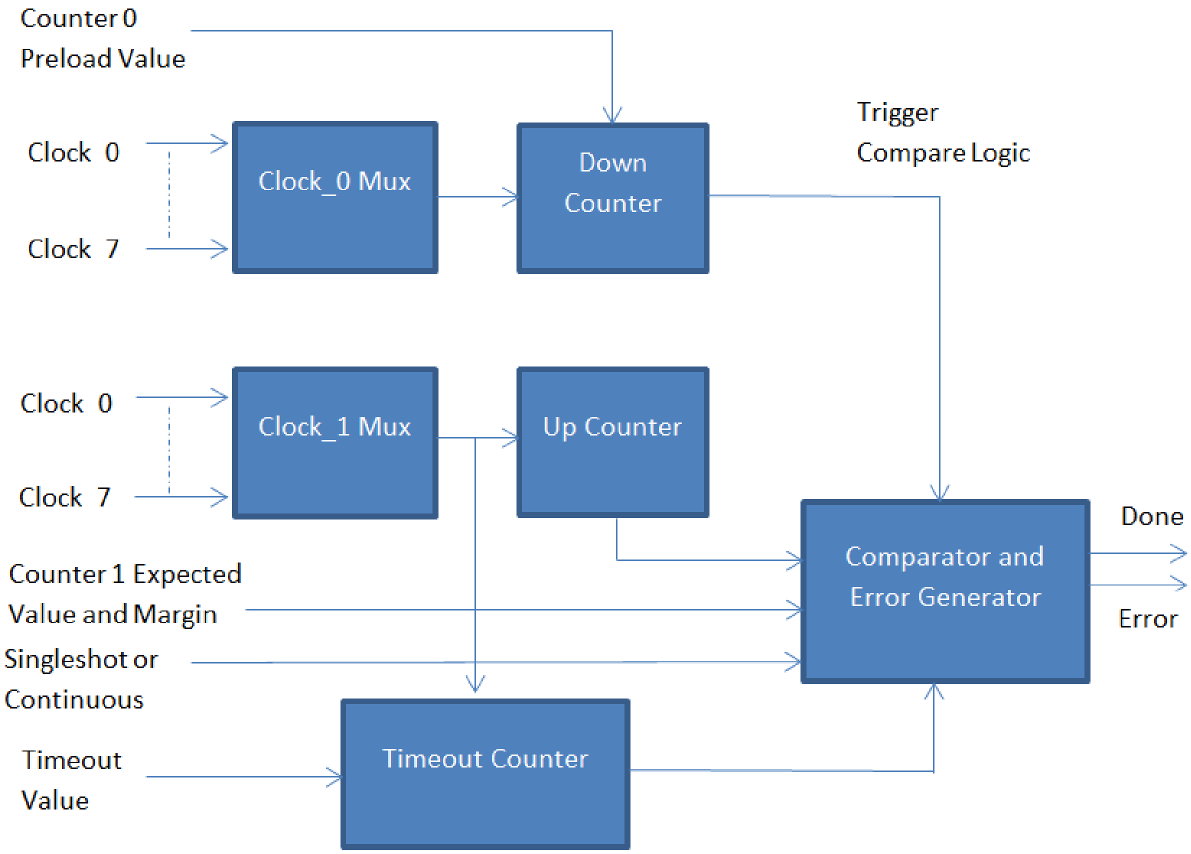

Figure 21-1. CCC Block Diagram

21.1.3 Perform Clock Comparison

The following are the steps to perform clock comparison.

1. Select Clock 0.
2. Select Clock 1.
3. Load value for down counting in counter 0.
4. Load expected value of counter 1.
5. Load Margin value for tolerance.
6. Set singleshot or continuous mode.
7. Load timeout value.
8. Enable Module.
9. Wait for Done or Error indication.

21.1.4 I/O Table

Table 21-1. I/O Table

Signal	Input/Output	Description
async_rst_n	Input	Module Reset
vbusp_clk	Input	Clock
clock0_src	Input	Input clocks for Counter 0
clock1_src	Input	Input clocks for Counter 1
clock0_sel	Input	Clock Selector for Counter 0
clock1_sel	Input	Clock Selector for Counter 1
count0_expiry_val	Input	Preload Value for Counter 0
count1_expected_val	Input	Expected value of Counter 1
disable_clk_output	Input	Cutoff clocks for the module
enable_module	Input	Enable for Clock comparator
margin_count	Input	Tolerance value for Comparator
singleshot_mode	Input	0->Continuous mode, 1-> Singleshot mode
count1_val_out	Output	Counter 1 value
counter_error	Output	Error Indicator
counter_done	Output	Successful comparison Indicator
mod_status	Output	Internal Status Indicator
async_error_indicator	Output	Error indicator without the synchronizer
timeout_err_count	Input	Preload value for Timeout Counter
atpg_reset_bypass	Input	DFT reset
atpg_clk	Input	DFT clock
icg_te	Input	Control for ICG
atpg_clk_bypass	Input	Control for ATPG clock

21.1.5 Recommended Programmation

- Clock source 1 must be faster than Clock source 0 for successful comparison of clocks.
- The timeout value must always be loaded for successful comparison. The timeout value must be greater than the duration of the comparison operation.

21.2 Dual Clock Comparator (DCC)

This section describes the dual-clock comparator (DCC) module.

21.2.1 Introduction

The primary purpose of a DCC module is to measure the frequency of a clock signal using a second known clock signal as a reference. Specifically, DCC is designed to detect drifts from the expected clock frequency. This capability can be used to ensure the correct frequency range for several different device clock sources, thereby enhancing the system safety metrics.

21.2.1.1 Main Features

The main features of each of the DCC modules are:

- Allows application to ensure that a fixed ratio is maintained between frequencies of two clock signals
- Supports the definition of a programmable tolerance window in terms of number of reference clock cycles
- Supports continuous monitoring without requiring application intervention
- Also supports a single-sequence mode for spot measurements
- Allows selection of clock source for each of the counters resulting in several specific use cases

21.2.1.2 Block Diagram

Figure 21-2 illustrates the main concept of the DCC module.

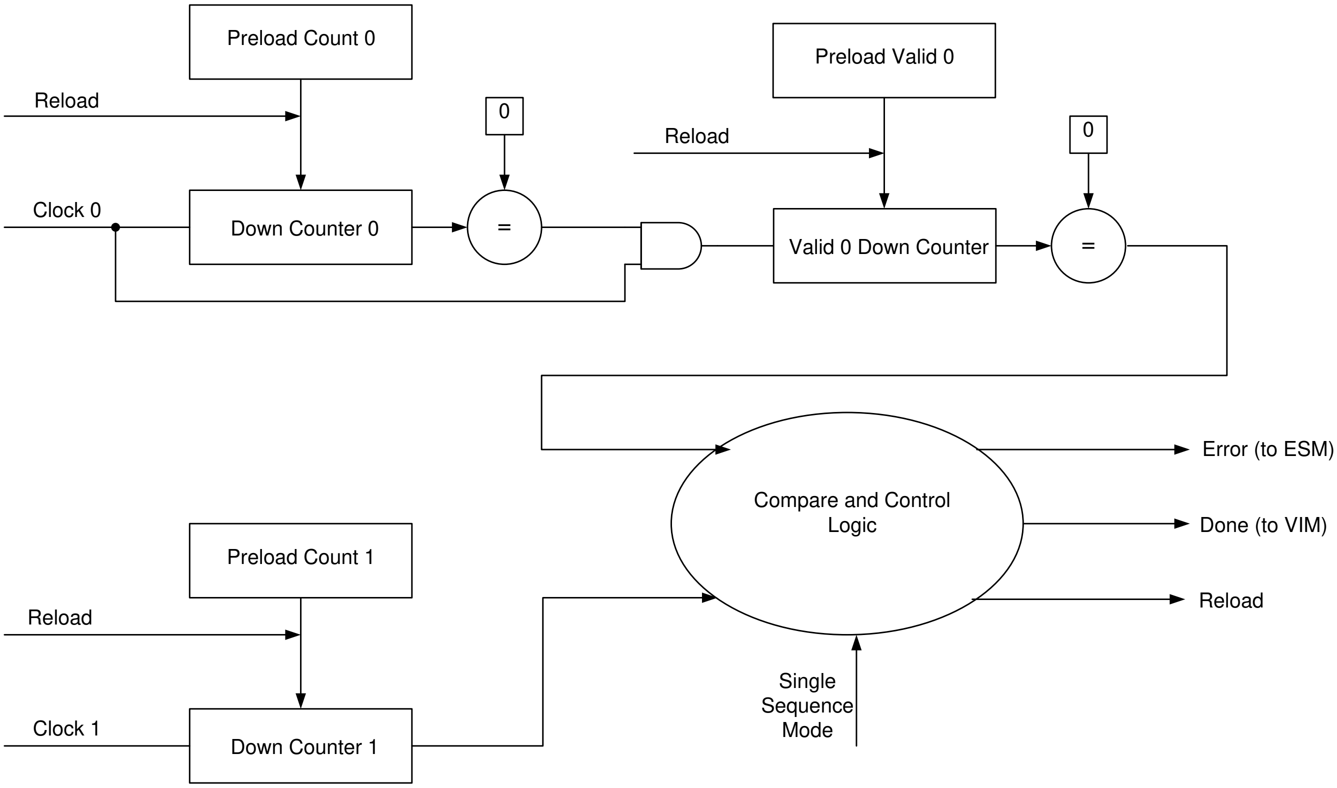

Figure 21-2. Block Diagram

21.2.2 Module Operation

As shown in Figure 21-2, the DCC contains two counters – counter0 and counter1, which are driven by two signals – clock0 and clock1. The application programs the seed values for both these counters. The application also configures the tolerance window time by configuring the valid counter for clock0.

Counter0 and counter1 both start counting simultaneously once the DCC is enabled. When counter0 counts down to zero, this automatically triggers the count down of the tolerance window counter (valid0).

The DCC module can be used in two different operating modes:

21.2.2.1 Continuous Monitoring Mode

In this mode, the DCC is used by the application to ensure that two clock signals maintain the correct frequency ratio. Suppose the application wants to ensure that the PLL output signal (clock source # 1) always maintains a fixed frequency relationship with the main oscillator (clock source # 0).

- In this case, the application can use the main oscillator as the clock0 signal (for counter0 and valid0) and the PLL output as the clock1 (for counter1).
- The seed values of counter0, valid0 and counter1 are selected such that if the actual frequencies of clock0 and clock1 are equal to their expected frequencies, then the counter1 will reach zero either at the same time as counter0 or during the count down of the valid0 counter.
- If the counter1 reaches zero during the count down of the valid0 counter, then all the counters (counter0, valid0, counter1) are reloaded with their initial seed values once valid0 has also counted down to zero.
- This sequence of counting down and checking then continues as long as there is no error, or until the DCC module is disabled.
- The counters also all get reloaded if the application resets and restarts the DCC module.

Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that clock1 is faster than expected, or clock0 is slower than expected. It includes the case when clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that clock1 is slower than expected. It includes the case when clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

21.2.2.1.1 Error Conditions

While operating in continuous mode, the counters get reloaded with the seed values and continue counting down under the following conditions:

- The module is reset or restarted by the application, OR
- Counter0, Valid 0 and Counter1 all reach 0 without any error

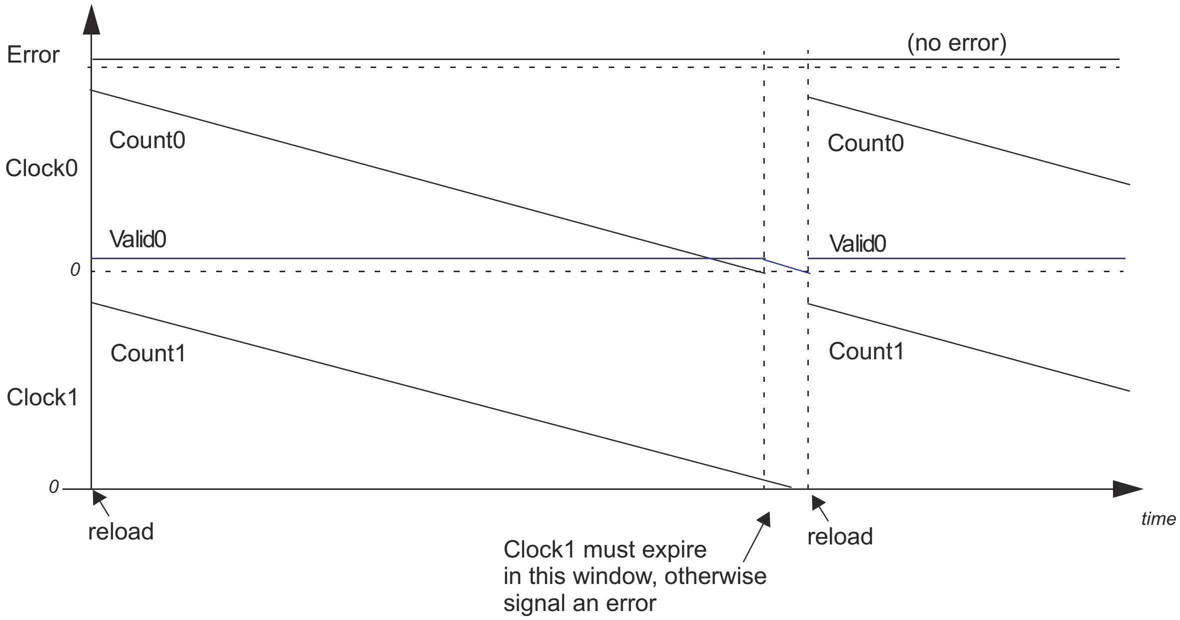

Figure 21-3. Counter Relationship

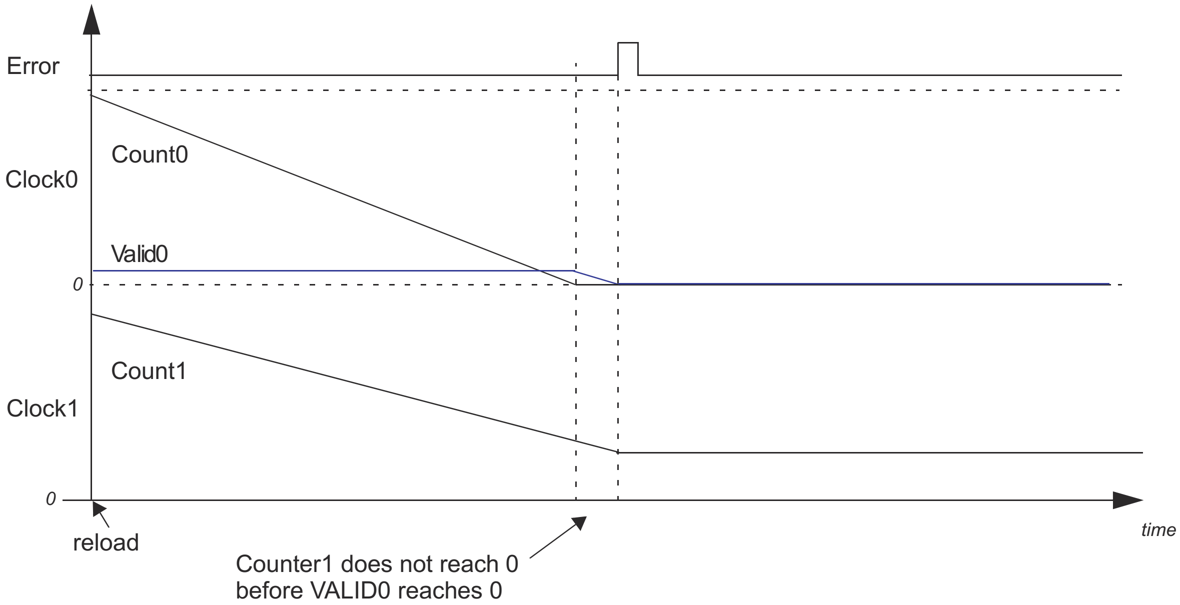

Figure 21-4. Clock1 Slower Than Clock0 - Results in an Error and Stops Counting

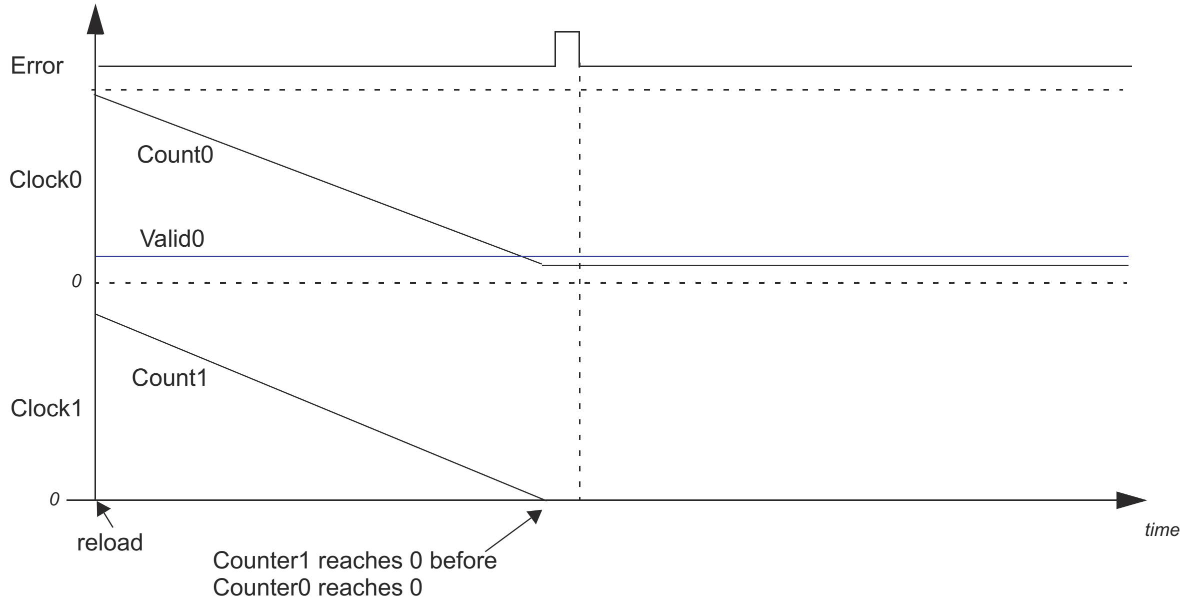

Figure 21-5. Clock1 Faster Than Clock0 - Results in an Error and Stops Counting

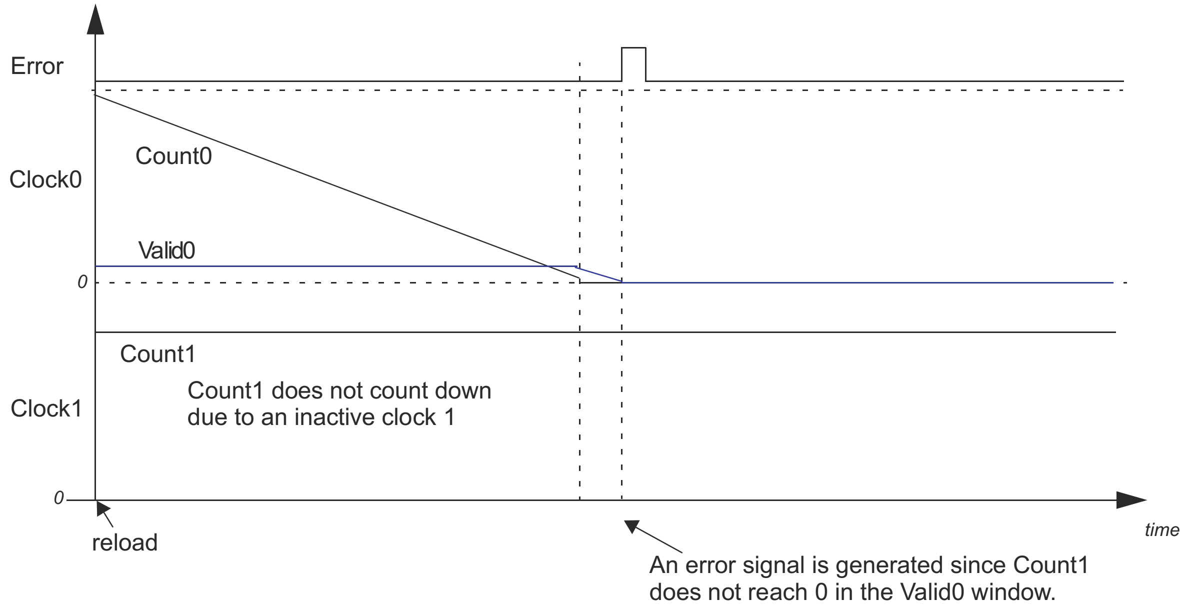

Figure 21-6. Clock1 Not Present - Results in an Error and Stops Counting

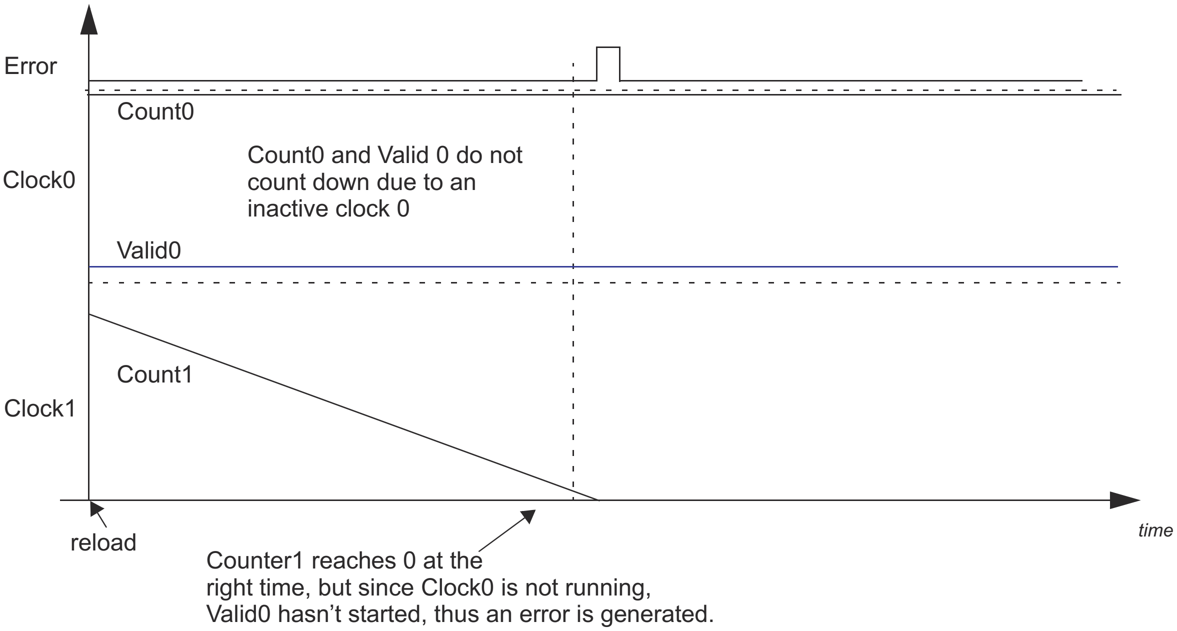

Figure 21-7. Clock0 Not Present - Results in an Error and Stops Counting

21.2.2.2 Single-Shot Measurement Mode

The DCC module can be programmed to count down one time by enabling the single-shot mode. In this mode, the DCC stops operating when the down counter0 and the valid counter0 reach 0. Alternatively, the DCC can be programmed to stop counting when the down counter1 reaches 0.

At the end of one sequence of counting down in this single-shot mode, the DCC gets disabled automatically, which prevents further counting. This mode is typically used for spot measurements of the frequency of a signal. This frequency could be an unknown for the application before the measurement.

Example Usage of Single-Shot Measurement Mode: Trimming the High-Frequency Low-Power Oscillator

A practical example of the usage of the spot measurement mode is in trimming the HF LPO (clock source # 5) using the main oscillator as a reference. This measurement sequence would proceed as follows:

- The application sets up the seed values for counter0 and valid0 for the duration of the measurement. Suppose the main oscillator frequency is 10 MHz and the intended duration of the measurement is 500 μs. The application needs to configure a seed value of 5000.
- These 5000 counts need to be divided between the counter0 and the valid0 counters. The minimum value for the valid0 seed is 4, so the application can configure counter0 seed value as 4996 and the valid0 seed value as 4.
- Suppose the HF LPO frequency is truly unknown. In this case the application can choose the maximum allowed seed value for counter1. This increases the probability of counter0 and valid0 counting down while the counter1 has still not fully counted down to zero. The maximum allowed seed value for counter1 is 1048575.
- Once the DCC is enabled, the counters counter0 and counter1 both start counting down from their seed values.
- When counter0 reaches zero, it automatically triggers the valid0 counter.
- When valid0 reaches zero, if counter1 is not zero as well, an ERROR status flag is set and a "DCC error" is sent to the ESM. Counter1 is also frozen so that it stops counting down any further. The application can enable an interrupt to be generated from the ESM whenever this DCC error is indicated. Refer the device datasheet to identify the ESM group and channel where the DCC error is connected.
- The DCC error interrupt service routine can then check the value of counter1 when the error was generated. Suppose that the counter1 now reads 1044575. This means that counter1 has counted 1048575 - 1044575,

or 4000 cycles within the 500-µs measurement period. This means that the average frequency of the HF LPO over this 500-µs period was 4000 cycles / 500 µs, or 8 MHz.
- The application then needs to clear the ERROR status flag and restart the DCC module so that it is ready for the next spot measurement.

If there is no error generated at the end of the sequence, then the DONE status flag is set and a DONE interrupt is generated. The application must clear the DONE flag before restarting the DCC.

The conditions that cause a DCC error are identical between the continuous monitoring mode and the single-shot measurement mode.

Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that clock1 is faster than expected, or clock0 is slower than expected. It includes the case when clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that clock1 is slower than expected. It includes the case when clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

Freezing Counters when Counter1 Reaches Zero:

The DCC module also allows the counters to be frozen when the counter1 reaches zero. This allows one of the clock sources for counter1 to be used as a reference for measuring one of the clock sources for counter0. The error conditions are the same as those where (counter0=0 and valid0=0) define the condition when the DCC counters are frozen. That is, an error is indicated if coutner0 and valid0 become zero while counter1 is still non-zero. In this case, however, the application would typically set up the seed values such that the counter1 will become zero before counter0. Essentially the measurement period is defined by the seed value of the counter1. Note that this is also an error condition, and the interrupt service routine can use the measurement period and the actual cycles counted by counter1 to determine the frequency of the clock0 signal.

21.2.3 MSS DCC Integration

4-DCC modules have been instantiated in the SOC as part of MSS. Clocks to the module are mentioned in the following sections.

21.2.3.1 Input Clock sources

DCC_CLKSRC5_CLK	Counter 1 Clock Source	RSS_CLK	0x5
DSS_CLKSRC7_CLK	Counter 1 Clock Source	PLL_PER_HSDIV0_CLKOUT1	0x7

Refer to the interrupt and DMA tables for mapping of the IPs interrupts and DMA requests.

21.2.5 Clock Source Selection for Counter0 and Counter1

Refer the device datasheet to identify the available options for selecting the clock sources for both counters of the DCC module. Some microcontrollers may include multiple instances of the DCC module. This will also be identified in the device datasheet.

The selection of the clock sources for counter0 and coutner1 is done by a combination of the KEY, CNT0 CLKSRC and CNT1 CLKSRC control fields of the CNT0CLKSRC and CNT1CLKSRC registers.

21.2.6 DCC Registers

Table 21-8 lists the DCC memory-mapped registers. All register offset addresses not listed in Table 21-8 should be considered as reserved locations and the register contents should not be modified.

Table 21-8. DCC Registers

Offset	Acronym	Register Name	Section
0h	DCCGCTRL	DCCGCTRL	Section 21.2.6.1

Complex bit access types are encoded to fit into small table cells. Table 21-9 shows the codes that are used for access types in this section.

Table 21-9. DCC Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

21.2.6.1 DCCGCTRL Register (Offset = 0h) [reset = 5555h]

DCCGCTRL is shown in Figure 21-8 and described in Table 21-10.

Return to Table 21-8.

Starts / stops the counters clears the error signal

21.3 ECC_AGGREGATOR

This section describes the common ECC aggregator functionality.

21.3.1 ECC Aggregator Overview

To increase functional safety and system reliability the memories (for example, FIFOs, queues, SRAMs and others) in many device modules and subsystems are protected by error correcting code (ECC). This is accomplished through an ECC aggregator and ECC wrapper. The ECC aggregator is connected to these memories (hereinafter ECC RAMs) and involved in the ECC process. Each memory is surrounded by an ECC wrapper which performs the ECC detection and correction. The wrapper communicates via serial interface with the aggregator which has memory mapped configuration interface

21.3.2 Integration Details

In AWR294x design, there are five ECC aggregators.

- MSS_ECC_AGG_R5A
- MSS_ECC_AGG_R5B
- MSS_ECC_AGG_MSS
- DSS_ECC_AGG
- HSM_ECC_AGGR (details will be available in HSM document)

This aggregator is used to fault inject all memory ecc_controllers and aggregate the errors to generate a single error to ESM.

21.3.3 ECC Aggregator Features

The ECC aggregator has the following features:

- Reduces memory software errors via single error correction (SEC) and double error detection (DED)
- Provides a mechanism to control and monitor the ECC protected memories in a module or subsystem
- SEC and DED over the system interconnect data bus and parity and redundancy for the system interconnect command and address buses

- Generates an interrupt for correctable error
- Generates an interrupt for non-correctable error
- Supports inject only mode for diagnostic purposes
- Supports software readable status for single and double-bit ECC errors and associated information such as row address where error has occurred and data bits that have been flipped
- An ECC endpoint can be ECC RAM component.
- Detects single bit error via parity checking on:
  1. Memory mapped configuration interface FIFO
  2. Serial interface FIFO
- Single bit error detection via parity checking results in a non-correctable error interrupt
- Supports timeout mechanism on transactions over the ECC serial interface. Timeout occurrence results in a non-correctable error interrupt.
- Certain control bits have redundancy and if a bit flips an interrupt is generated

21.3.4 ECC Aggregator Integration

This section describes ECC aggregator integration in the device, including information about clocks, resets, and hardware requests.

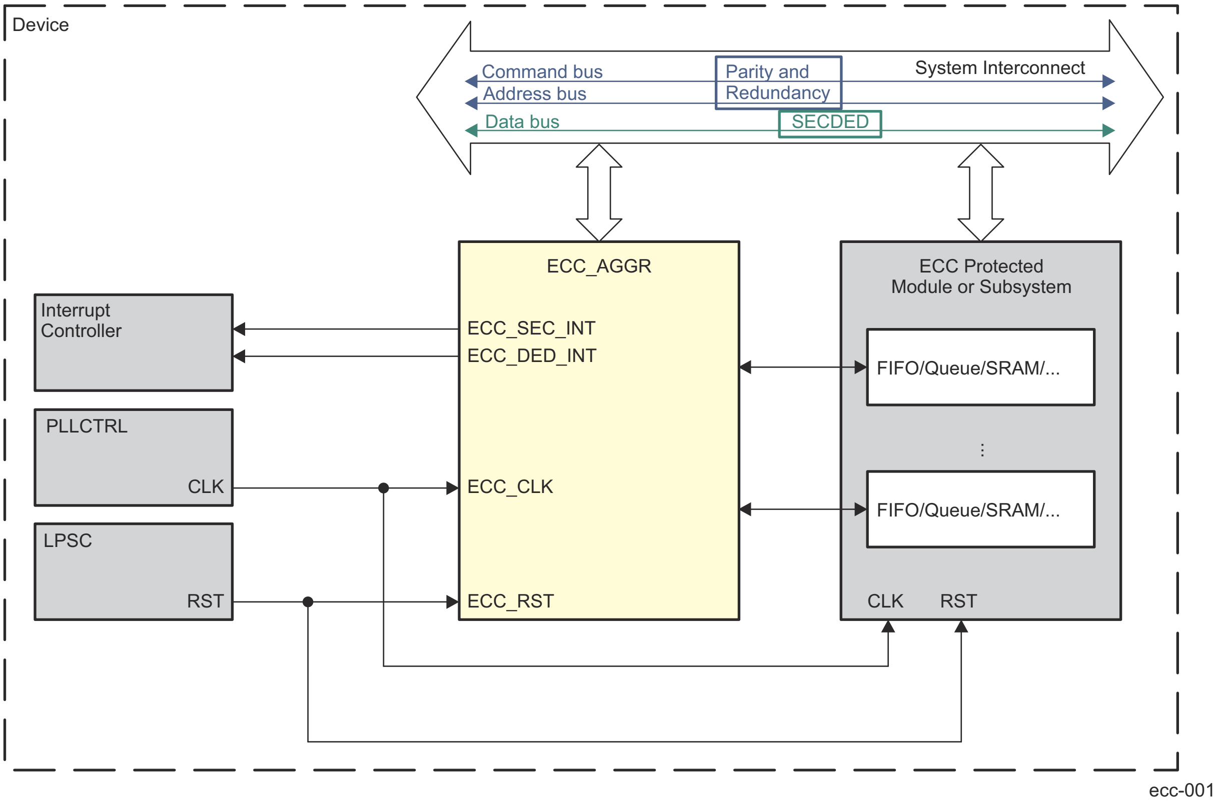

Figure 21-19. ECC Aggregator Integration

Table 21-21. ECC Aggregator Clocks and Resets

Clock				
Module Instance	Module Clock Input	Source Clock Signal	Source	Description

DMA Events					
Module Instance	Module DMA Input	Destination DMA Event Input	Destination	Description	Type
ECC_AGGR	-	-	-	-	-

Note

For more information on the interrupts, see Section 21.3.9.

For more information on the interconnects, see .

For more information on the power, reset and clock management, see the corresponding sections in .

For more information on the device interrupt controllers, see *Interrupt Controllers*.

21.3.5 ECC Aggregator Function Description

This section describes the architecture and functional details of the ECC aggregator.

21.3.5.1 ECC Aggregator Block Diagram

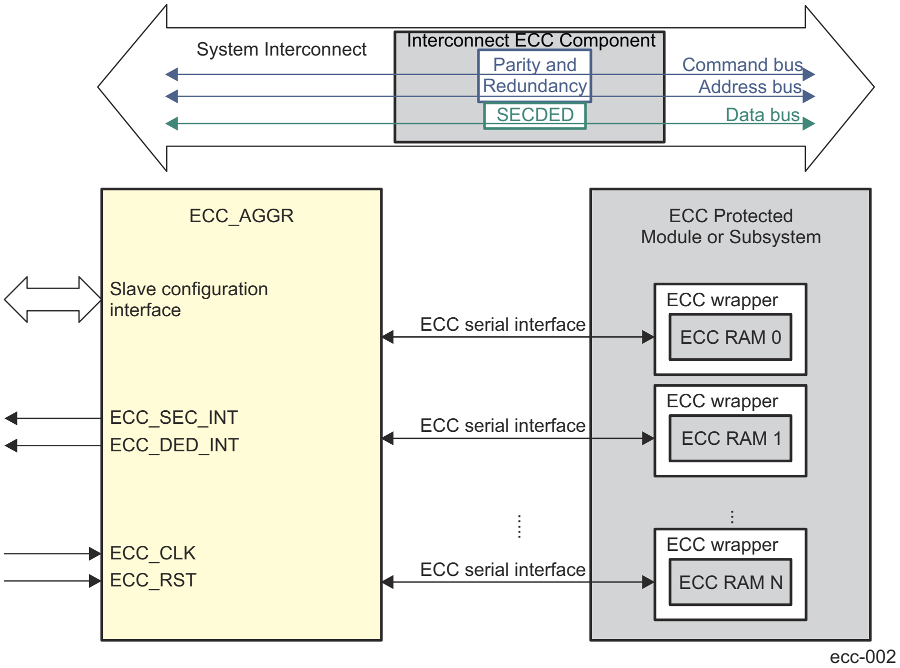

Figure 21-20. ECC Aggregator Block Diagram

The ECC aggregator is connected to one or more ECC endpoints each of which has assigned a unique ID used when the endpoint is accessed for status information or configuration. The ECC aggregator provides software access to all ECC related registers through its memory mapped slave configuration interface while the serial interface is used to communicate with the ECC endpoints. Upon detection of single or double-bit error the corresponding interrupt line is asserted.

21.3.6 ECC Aggregator Register Groups

The ECC aggregator has ECC control, status and interrupt registers for each ECC endpoint in a module or subsystem. These registers are memory mapped and occupy 1 KB address space although part of it may contain reserved locations. The registers are split in the following types:

- **Global registers**. They are common to all ECC endpoints associated with the ECC aggregator and include the ECC_VECTOR and ECC_REV registers. Each ECC endpoint has assigned a unique ID.

  When this ID is written to the ECC_VECTOR[10-0] ECC_VECTOR field the corresponding endpoint is selected either for control or for status reading.
- **ECC control and status registers**. These registers are specific to each ECC endpoint and reside in the range from address offset 0x10 to 0x28, if the endpoint is ECC RAM or from 0x10 to 0x24, if the endpoint is interconnect ECC component. They are memory mapped but are accessed through the ECC serial interface. They are also selected by the ECC endpoint ID written to the ECC_VECTOR[10-0] ECC_VECTOR field. Because of latency on the serial interface the ECC control and status registers are read by performing special sequence as described in Section 12.9.4.3.3. These registers have also different functionality for both types of endpoints - ECC RAM and interconnect ECC component.
- **Interrupt registers**. They include interrupt status, interrupt enable, interrupt disable, and EOI registers.

21.3.7 Read Access to the ECC Control and Status Registers

Read accesses to the ECC control and status registers for each ECC endpoint represent read operations over the ECC serial interface and are triggered by performing the following sequence:

1. Software writes the following in the ECC_VECTOR register:
   - The ECC endpoint ID in the ECC_VECTOR[10-0] ECC_VECTOR field to select particular ECC endpoint.
   - The register read address in the ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field to select which register has to be read through the ECC serial interface.
   - A value of 0x1 in the ECC_VECTOR[15] RD_SVBUS bit to trigger read operation through the ECC serial interface.
2. Software polls the ECC_VECTOR[24] RD_SVBUS_DONE bit to check if it is 0x1. This indicates that the read operation on the ECC serial interface has completed.
3. Software reads the data from the register previously selected by the ECC_VECTOR[23-16]RD_SVBUS_ADDRESS field.

21.3.8 Serial Write Operation

Write operations over the ECC serial interface are performed as follows:

1. Software specifies the ECC endpoint ID in the ECC_VECTOR[10-0] ECC_VECTOR field. The ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field is a don't care but the ECC_VECTOR[15] RD_SVBUS bit must be set to 0x0.
2. Software performs regular write operation to the desired address. If the ECC endpoint ID has already been specified, step 1 can be skipped. Unlike serial read operations it is not necessary to always specify the endpoint ID before performing serial write operation.

The following is an example for serial write operation:

1. Write 0x0000 0008 to the ECC_VECTOR register.
2. Write 0x0000 000F to the ECC_CTRL register. This sends write request with data 0x0000 000F to the ECC_CTRL register associated with ECC RAM with ID = 8.

21.3.9 Interrupts

The ECC aggregator generates the following interrupts:

- Correctable interrupt (ECC_SEC_INT) where hardware can correct the error but notifies the system in case of SEC.
- Non-correctable interrupt (ECC_DED_INT) where hardware cannot correct the error in cases of DED, parity check, redundancy check or timeout occurrence.

The following is the sequence for servicing interrupts:

- Software enables the interrupts for an ECC endpoint by writing 0x1 to the corresponding bit of the following interrupt enable registers:
  - ECC_SEC_ENABLE_SET_REG0 for the correctable interrupt
  - ECC_DED_ENABLE_SET_REG0 for the noncorrectable interrupt
- On receiving an interrupt, software checks which ECC endpoint has caused the error by reading the following interrupt status registers:
  - ECC_SEC_STATUS_REG0 for the correctable interrupt ECC_DED_STATUS_REG0 for the non-correctable interrupt
- Software performs serial read operations as described in Section 12.9.4.3.3 to read the following status registers that contain details about the error:
  - If the endpoint is ECC RAM:
    - ECC_ERR_STAT1
    - ECC_ERR_STAT2
    - ECC_ERR_STAT3
- If the endpoint is interconnect ECC component:
  - ECC_CBASS_ERR_STAT1
  - ECC_CBASS_ERR_STAT2
- After the interrupt has been serviced, depending on the error type, software should clear the corresponding status bits in the ECC_ERR_STAT1 and ECC_ERR_STAT3 registers or in the ECC_CBASS_ERR_STAT1 register. Software has to poll these registers to guarantee that status bits are cleared as there is no other indication for write completion over the ECC serial interface.

The value of the *_PEND_CLR fields in the ECC_CBASS_ERR_STAT1 register must be read and then written back to decrement the count of each field back to 0x0. A further error capture into the ECC_CBASS_ERR_STAT1 register does not occur unless all its fields are 0x0. The decrement value should not be larger than the read value. If a field in the ECC_CBASS_ERR_STAT1 register should not be modified, write a value of 0x0 to that field.

- Software writes 0x1 to the corresponding end of interrupt register to clear the interrupt:
  - ECC_SEC_EOI_REG for the correctable interrupt
  - ECC_DED_EOI_REG for the non-correctable interrupt

Note

For AWR294x device the ECC aggregator is used only for the memories and not on interconnects. Hence any register set and text for the interconnect ECC will not be appliacble to the AWR294x device and can be ignored.

21.3.10 Inject Only Mode

There are modules that already perform the ECC generation and checking as part of their data path. In this case, the ECC wrapper may be configured in inject only mode, if needed. In this mode the ECC wrapper does not perform ECC detection and correction. The inject only mode allows users to inject single or double-bit errors so that the module logic can be tested for diagnostic purposes.

Note

There is no software control to enable inject only mode. It is configured via tie-off value. Inject only and ECC modes are mutually exclusive.

The interconnect ECC component also supports error injection mode. There is error injection logic for testing of the error checking logic (checkers). The injection logic can be configured to inject either single or double bit error and what data pattern to be used for injection (ECC_CBASS_CTRL[11-8] ECC_PATTERN). The ECC_CBASS_ERR_CTRL1 and ECC_CBASS_ERR_CTRL2 registers should be written first to setup the injection. Then, either the ECC_CBASS_CTRL[3] FORCE_SE or the ECC_CBASS_CTRL[4] FORCE_DE bit must be set to 0x1 to start the injection. Both bits must not be set at the same time. If the injection should continue in incrementing mode, then the ECC_CBASS_CTRL[5] FORCE_N_BIT bit should be set to 0x1. Once the FORCE_N_BIT is set, then each successive injection can simply write the ECC_CBASS_CTRL register to set the FORCE_SE or FORCE_DE again. Reading 0x0 from either the FORCE_SE or the FORCE_DE bit indicates that the injection has completed, as these bits automatically clear when the checker indicates that it has performed the injection. The time for an injection to complete is not guaranteed, so some delay is needed between successive injections.

Note

For AWR294x device the ECC aggregator is used only for the memories and not on interconnects. Hence any register set and text for the interconnect ECC will not be appliacble to the AWR294x device and can be ignored.

21.3.11 Errors

Each aggregator generates two errors which drive the ESM.

- <modulename>_SERR module names are mentioned in the below section
- <modulename>_SERR module names are mentioned in the below section

Group1 and Group2 mappings are found the ESM interrupt sections.

Misc Status

Table 21-31. stat Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	X	
10-0	num_rams	R	17h	Indicates the number of RAMS serviced by the ECC aggregator

21.4.1.4 wrap_rev Register (Offset = 10h) [Reset = 66A40202h]

wrap_rev is shown in Table 21-32.

Return to the Summary Table.

Revision parameters

Table 21-32. wrap_rev Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	scheme	R	1h	Scheme
29-28	bu	R	2h	bu
27-16	module_id	R	6A4h	Module ID
15-11	revrtl	R	0h	RTL version
10-8	revmaj	R	2h	Major version
7-6	custom	R	0h	Custom version
5-0	revmin	R	2h	Minor version

21.4.1.5 ctrl Register (Offset = 14h) [Reset = X]

ctrl is shown in Table 21-33.

Return to the Summary Table.

ECC Control Register

Table 21-33. ctrl Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R/W	X	
8	check_svbus_timeout	R/W	1h	check for svbus timeout errors
7	check_parity	R/W	1h	check for parity errors
6	error_once	R/W	0h	Force Error only once
5	force_n_row	R/W	0h	Force Error on any RAM read
4	force_ded	R/W	0h	Force Double Bit Error
3	force_sec	R/W	0h	Force Single Bit Error
2	enable_rmw	R/W	1h	Enable rmw
1	ecc_check	R/W	1h	Enable ECC check
0	ecc_enable	R/W	1h	Enable ECC

21.4.1.6 err_ctrl1 Register (Offset = 18h) [Reset = 00000000h]

err_ctrl1 is shown in Table 21-34.

Return to the Summary Table.

ECC Error Control1 Register

Table 21-34. err_ctrl1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ecc_row	R/W	0h	Row address where single or double-bit error needs to be applied. This is ignored if force_n_row is set

21.4.1.7 err_ctrl2 Register (Offset = 1Ch) [Reset = 00000000h]

err_ctrl2 is shown in Table 21-35.

Return to the Summary Table.

ECC Error Control2 Register

Table 21-35. err_ctrl2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ecc_bit2	R/W	0h	Data bit that needs to be flipped if double bit error needs to be forced
15-0	ecc_bit1	R/W	0h	Data bit that needs to be flipped when force_sec is set

21.4.1.8 err_stat1 Register (Offset = 20h) [Reset = 00000000h]

err_stat1 is shown in Table 21-36.

Return to the Summary Table.

ECC Error Status1 Register

Table 21-36. err_stat1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ecc_bit1	R	0h	Data bit that corresponds to the single-bit error
15	clr_ctrl_reg_err	R/W1C	0h	Clear control reg error Error Status, you must also re write the contorl ergister itself to clear this
14-13	clr_parity_err	R/Wdecr	0h	Clear parity Error Status
12	clr_ecc_other	R/W1C	0h	Clear other Error Status
11-10	clr_ecc_ded	R/Wdecr	0h	Clear Double Bit Error Status
9-8	clr_ecc_sec	R/Wdecr	0h	Clear Single Bit Error Status
7	ctr_reg_err	R/W1S	0h	control register error pending, Level interrupt
6-5	parity_err	R/W1S	0h	Level parity error Error Status
4	ecc_other	R/W1S	0h	successive single-bit errors have occurred while a writeback is still pending, Level interrupt
3-2	ecc_ded	R/Wincr	0h	Level Double Bit Error Status
1-0	ecc_sec	R/Wincr	0h	Level Single Bit Error Status

21.4.1.9 err_stat2 Register (Offset = 24h) [Reset = 00000000h]

err_stat2 is shown in Table 21-37.

Return to the Summary Table.

ECC Error Status2 Register

Table 21-37. err_stat2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ecc_row	R	0h	Row address where the single or double-bit error has occurred

21.4.1.10 err_stat3 Register (Offset = 28h) [Reset = X]

err_stat3 is shown in Table 21-38.

Return to the Summary Table.

ECC Error Status3 Register

Table 21-38. err_stat3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9	clr_svbus_timeout_err	R/W1C	0h	Clear svbus timeout Error Status
8-2	RESERVED	R/W	X	
1	svbus_timeout_err	R/W1S	0h	Level svbus timeout error Error Status
0	wb_pend	R	0h	delayed write back pending Status

21.4.1.11 sec_eoi_reg Register (Offset = 3Ch) [Reset = X]

sec_eoi_reg is shown in Table 21-39.

Return to the Summary Table.

EOI Register

Table 21-39. sec_eoi_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	eoi_wr	R/W1S	0h	EOI Register

21.4.1.12 sec_status_reg0 Register (Offset = 40h) [Reset = X]

sec_status_reg0 is shown in Table 21-40.

Return to the Summary Table.

Interrupt Status Register 0

Table 21-40. sec_status_reg0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	RESERVED	R/W	X	
22	rcss_tptc_b1_pend	R/W1S	0h	Interrupt Pending Status for rcss_tptc_b1_pend
21	rcss_tptc_b0_pend	R/W1S	0h	Interrupt Pending Status for rcss_tptc_b0_pend
20	rcss_tptc_a1_pend	R/W1S	0h	Interrupt Pending Status for rcss_tptc_a1_pend
19	rcss_tptc_a0_pend	R/W1S	0h	Interrupt Pending Status for rcss_tptc_a0_pend
18	dss_tptc_c5_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c5_pend
17	dss_tptc_c4_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c4_pend
16	dss_tptc_c3_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c3_pend
15	dss_tptc_c2_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c2_pend
14	dss_tptc_c1_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c1_pend
13	dss_tptc_c0_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c0_pend
12	dss_tptc_b1_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_b1_pend
11	dss_tptc_b0_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_b0_pend
10	dss_tptc_a1_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_a1_pend
9	dss_tptc_a0_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_a0_pend
8-5	RESERVED	R/W	0h	
4	dss_mailbox_pend	R/W1S	0h	Interrupt Pending Status for dss_mailbox_pend
3	dss_l3ram3_pend	R/W1S	0h	Interrupt Pending Status for dss_l3ram3_pend
2	dss_l3ram2_pend	R/W1S	0h	Interrupt Pending Status for dss_l3ram2_pend
1	dss_l3ram1_pend	R/W1S	0h	Interrupt Pending Status for dss_l3ram1_pend
0	dss_l3ram0_pend	R/W1S	0h	Interrupt Pending Status for dss_l3ram0_pend

21.4.1.13 sec_enable_set_reg0 Register (Offset = 80h) [Reset = X]

sec_enable_set_reg0 is shown in Table 21-41.

Return to the Summary Table.

Interrupt Enable Set Register 0

Table 21-41. sec_enable_set_reg0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	RESERVED	R/W	X	
22	rcss_tptc_b1_enable_set	R/W1S	0h	Interrupt Enable Set Register for rcss_tptc_b1_pend
21	rcss_tptc_b0_enable_set	R/W1S	0h	Interrupt Enable Set Register for rcss_tptc_b0_pend
20	rcss_tptc_a1_enable_set	R/W1S	0h	Interrupt Enable Set Register for rcss_tptc_a1_pend
19	rcss_tptc_a0_enable_set	R/W1S	0h	Interrupt Enable Set Register for rcss_tptc_a0_pend
18	dss_tptc_c5_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_c5_pend
17	dss_tptc_c4_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_c4_pend
16	dss_tptc_c3_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_c3_pend
15	dss_tptc_c2_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_c2_pend
14	dss_tptc_c1_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_c1_pend
13	dss_tptc_c0_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_c0_pend
12	dss_tptc_b1_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_b1_pend
11	dss_tptc_b0_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_b0_pend
10	dss_tptc_a1_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_a1_pend
9	dss_tptc_a0_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_tptc_a0_pend
8-5	RESERVED	R/W	0h	
4	dss_mailbox_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_mailbox_pend
3	dss_l3ram3_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_l3ram3_pend
2	dss_l3ram2_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_l3ram2_pend
1	dss_l3ram1_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_l3ram1_pend
0	dss_l3ram0_enable_set	R/W1S	0h	Interrupt Enable Set Register for dss_l3ram0_pend

21.4.1.14 sec_enable_clr_reg0 Register (Offset = C0h) [Reset = X]

sec_enable_clr_reg0 is shown in Table 21-42.

Return to the Summary Table.

Interrupt Enable Clear Register 0

Table 21-42. sec_enable_clr_reg0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	RESERVED	R/W	X	
22	rcss_tptc_b1_enable_clr	R/W1C	0h	Interrupt Enable Clear Register for rcss_tptc_b1_pend
21	rcss_tptc_b0_enable_clr	R/W1C	0h	Interrupt Enable Clear Register for rcss_tptc_b0_pend

21.5 Error Signaling Module (ESM)

This section provides the details of the error signaling module (ESM) that aggregates device errors and provides internal and external error response based on error severity.

21.5.1 Overview

The Error Signaling Module (ESM) collects and reports the various error conditions on the microcontroller. The error condition is categorized based on a severity level. Error response is then generated based on the category of the error. Possible error responses include a low priority interrupt, high priority interrupt, and an external pin action.

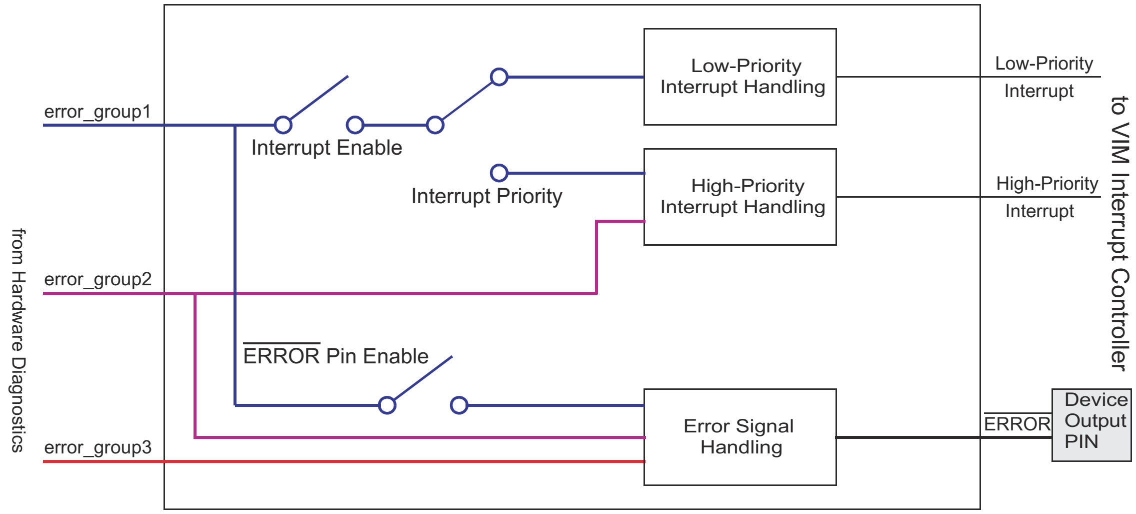
21.5.2 Feature List

- Up to 192 error channels (MSS/DSS) are supported, divided into 3 different groups:
  - 128 Group1 (low severity) channels with configurable interrupt generation and configurable $\overline{\text{ERROR}}$ pin behavior
  - 32 Group2 (high severity) channels with predefined interrupt generation and predefined $\overline{\text{ERROR}}$ pin behavior
  - 32 Group3 (high severity) channels with no interrupt generation and predefined $\overline{\text{ERROR}}$ pin behavior. These channels have no interrupt response as they are reserved for CPU based diagnostics that generate aborts directly to the CPU.
- Dedicated device $\overline{\text{ERROR}}$ pin to signal an external observer
- Configurable timebase for $\overline{\text{ERROR}}$ pin output
- Error forcing capability for latent fault testing

21.5.3 Block Diagram

As shown in Figure 21-87, the ESM channels are divided into three groups. Group1 channels are considered to be low severity. Group1 errors have a configurable interrupt response and configurable $\overline{\text{ERROR}}$ pin behavior. Note that the ESM Status Register 1 (ESMSR1) for error group 1 gets updated, regardless if the interrupt enable is active or not. Group2 channels are $\overline{\text{ERROR}}$ high severity. Group2 errors always generate a high priority interrupt and an output on the $\overline{\text{ERROR}}$ pin. Group3 errors are reserved for high severity errors generated by diagnostics which have already generated a CPU abort response. Because an abort response is generated, there is no need to generate an interrupt response. Group3 errors always generate an $\overline{\text{ERROR}}$ pin output.

The ESM interrupt and $\overline{\text{ERROR}}$ pin behavior are also summarized in Table 21-120.



Note that the ESM Status Register 1 (ESMSR1) for error_group1 gets updated, regardless if the interrupt enable is active or not.

Figure 21-87. Block Diagram

Table 21-120. ESM Interrupt and $\overline{\text{ERROR}}$ Pin Behavior

Error Group	Interrupt Generated	Interrupt Priority	$\overline{\text{ERROR}}$ Pin Response Generated
1	configurable interrupt	configurable priority	configurable output generation
2	interrupt generated	high priority	output generated
3	no interrupt	NA	output generated

Figure 21-88 and Figure 21-89 show the interrupt response handling and $\overline{\text{ERROR}}$ pin response handling with register configuration. The total active time of the $\overline{\text{ERROR}}$ pin is controlled by the Low-Time Counter Preload register (LTCP) and the key register (ESMEPSR) as shown in Figure 21-89. See for details.

21.5.5 Module Operation

This This device has 192 error channels (MSS & DSS), divided into 3 different error groups. Please refer to the device datasheet for ESM channel assignment details.

The ESM module has error flags for each error channel. The error status registers ESMSR1, ESMSR4, ESMSR2, ESMSR3 provide status information on a pending error of Group1 (Channel 0-31), Group1 (Channel 32-63), Group1 (Channel 64-95), Group2, and Group3, respectively. The ESMEPSR register provides the current ERROR status. The module also provides a status shadow register, ESMSSR2, which maintains the error flags of Group2 until power-on reset (PORRST) is asserted. See for details of their behavior during power on reset and warm reset.

Once an error occurs, the ESM module will set the corresponding error flags. In addition, it can trigger an interrupt, ERROR pin outputs low depending on the ESM settings. Once the ERROR pin outputs low, a power on reset or a write of 0x5 to ESMEKR is required to release the ESM error pin back to normal state. The application can read the error status registers (ESMSR1, ESMSR4, ESMSR7, ESMSR2, and ESMSR3) to debug the error. If an RST is triggered or the error interrupt has been served, the error flag of Group2 should be read from ESMSSR2 because the error flag in ESMSR2 will be cleared by RST.You can also test the functionality of the ERROR pin by forcing an error.

You can also test the functionality of the ERROR pin by forcing an error.

21.5.5.1 Reset Behavior

Power on reset:

- ERROR pin behavior

  When nPORRST is active, the ERROR pin is in a high impedance state (output drivers disabled).
- Register behavior

  After PORRST, all registers in ESM module will be re-initialized to the default value. All the error status registers are cleared to zero.

Warm reset (RST):

- ERROR pin behavior

  During RST, the ERROR pin is in “output active” state with pull-down disabled. The ERROR pin remains unchanged after RST.
- Register behavior

  After RST, ESMSR1, ESMSR4, ESMSR7, ESMSSR2, ESMSR3 and ESMEPSR register values remains un-changed. Since RST does not clear the critical failure registers, the user can read those registers to debug the failures after RST pin goes back to high.

After RST, if one of the flags in ESMSR1, ESMSR4 and ESMSR7 is set, the interrupt service routine will be called once the corresponding interrupt is enabled.

-

Note

ESMSR2 is cleared after RST. The flag in ESMSR2 gets cleared when reading the appropriate vector in the ESMIOFFHR offset register. Reading ESMIOFFHR will not clear the ESMSR1, ESMSR4, ESMSR7 and the shadow register ESMSSR2. Reading ESMIOFFLR will also not clear the ESMSR1, ESMSR4 and ESMSR7.

21.5.5.2 $\overline{\text{ERROR}}$ Pin Timing

The $\overline{\text{ERROR}}$ pin is an active low function. The state of the pin is also readable from $\overline{\text{ERROR}}$ Pin Status Register (ESMEPSR). A warm reset ($\overline{\text{RST}}$) does not affect the state of the pin. The pin is in a high-impedance state during power-on reset. Once the ESM module drives the $\overline{\text{ERROR}}$ pin low, it remains in this state for the time specified by the Low-Time Counter Preload register (LTCPR). Based on the time period of the peripheral clock (VCLK), the total active time of the $\overline{\text{ERROR}}$ pin can be calculated as:

$$t_{\overline{ERROR}\_low} = t_{VCLK} \times (LTCP + 1) \tag{8}$$

Once this period expires, the $\overline{\text{ERROR}}$ pin is set to high in case the reset of the $\overline{\text{ERROR}}$ pin was requested. This request is done by writing an appropriate key (0x5) to the key register (ESMEKR) during the $\overline{\text{ERROR}}$ pin low time. Here are a few examples:

Example 1: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. No $\overline{\text{ERROR}}$ pin reset is requested. The $\overline{\text{ERROR}}$ pin continues outputting low until power on reset occurs.

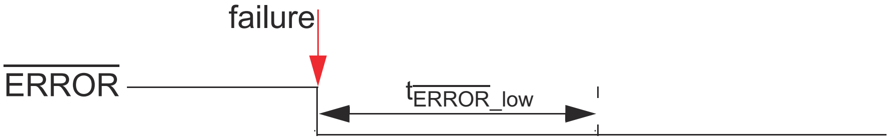

Figure 21-91. $\overline{\text{ERROR}}$ Pin Timing - Example 1

Example 2: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. An $\overline{\text{ERROR}}$ pin reset request is received before $t_{\overline{\text{ERROR}}\_low}$ expires. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after $t_{\overline{\text{ERROR}}\_low}$ expires.

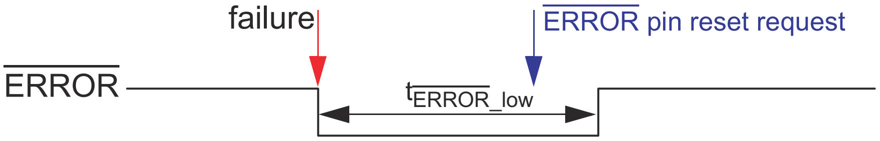

Figure 21-92. $\overline{\text{ERROR}}$ Pin Timing - Example 2

Example 3: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. An $\overline{\text{ERROR}}$ pin reset request is received after $t_{\overline{\text{ERROR}}\_low}$ expires. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after $\overline{\text{ERROR}}$ pin reset request is received.

Figure 21-93. $\overline{\text{ERROR}}$ Pin Timing - Example 3

Example 4: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. Another failure occurs within the time the pin stays low. In this case, the low time counter will be reset when the other failure occurs. In other words, $t_{\overline{\text{ERROR}}\text{\_low}}$ should be counted from whenever the most recent failure occurs.

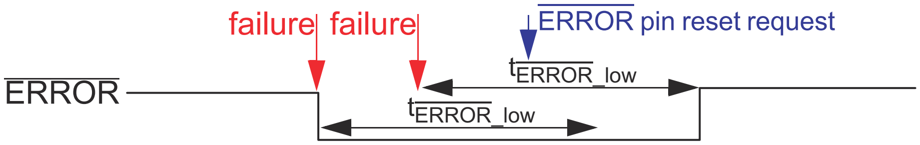

Figure 21-94. $\overline{\text{ERROR}}$ Pin Timing - Example 4

Example 5: The reset of the $\overline{\text{ERROR}}$ pin was requested by the software even before the failure occurs. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after $t_{\overline{\text{ERROR}}\text{\_low}}$ expires. This case is not recommended and should be avoided by the application.

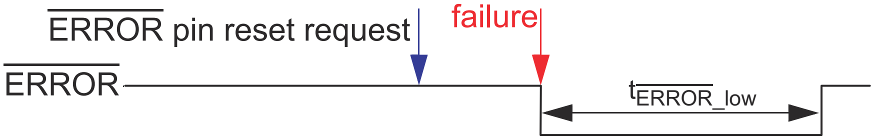

Figure 21-95. $\overline{\text{ERROR}}$ Pin Timing - Example 5

21.5.5.3 Forcing an Error Condition

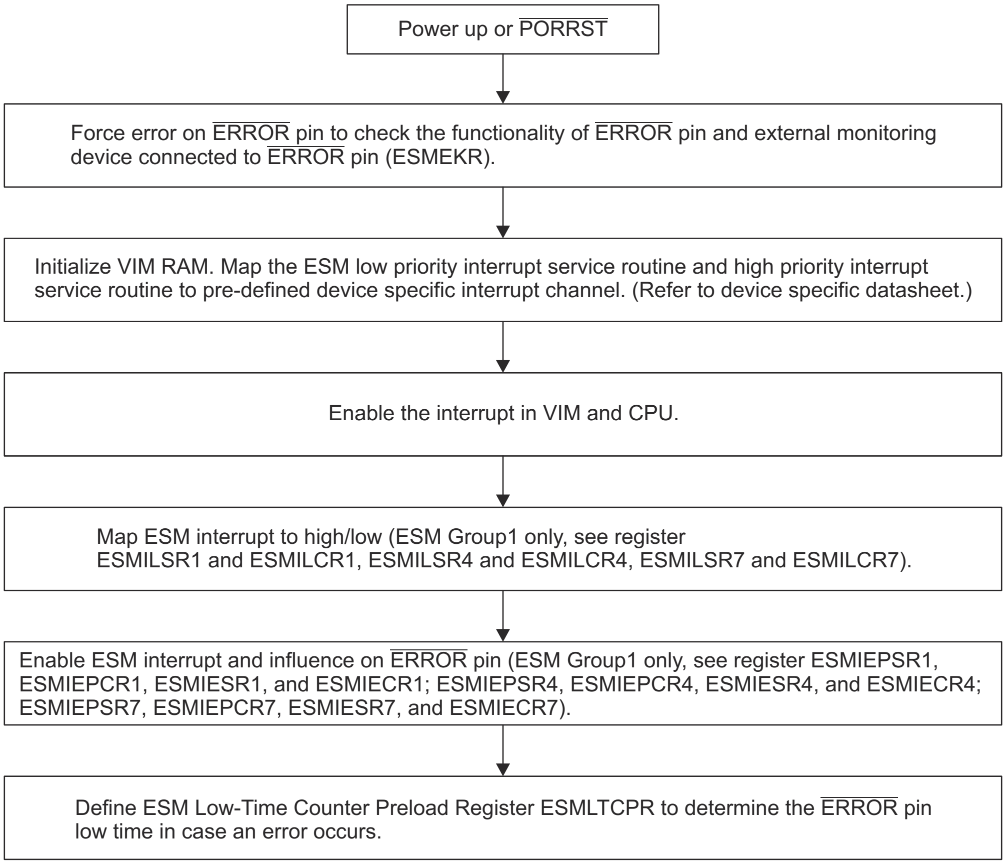
The error response generation mechanism is testable by software by forcing an error condition. This allows testing the $\overline{\text{ERROR}}$ pin functionality. By writing a dedicated key to the error forcing key register (ESMEKR), the $\overline{\text{ERROR}}$ pin is set to low for the specified time. The following steps describe how to force an error condition:

1. Check $\overline{\text{ERROR}}$ Pin Status Register (ESMEPSR). This register must be 1 to switch into the error forcing mode. The ESM module cannot be switched into the error forcing mode if a failure has already been detected in functional mode. The application command to switch to error forcing mode is ignored.
2. Write “1010b” to the error forcing key register (ESMEKR). After that, the $\overline{\text{ERROR}}$ pin should output low (error force mode). Once the application puts the ESM module in the error forcing mode, the $\overline{\text{ERROR}}$ pin cannot indicate the normal error functionality. If a failure occurs during this time, it gets still latched and the LTC is reset and stopped. The error output pin is already driven low on account of the error forcing mode. When the ESM is forced back to normal functional mode, the LTC becomes active and forces the $\overline{\text{ERROR}}$ pin low until the expiration of the LTC.
3. Write “0000” to the error forcing key register (ESMEKR) back to the active normal mode. If there are no errors detected while the ESM module is in the error forcing mode, the $\overline{\text{ERROR}}$ pin goes high immediately after exiting the error forcing mode.

21.5.6 Recommended Programming Procedure

During the initialization stage, the application code should follow the recommendations in Figure 21-96 to initialize the ESM.

Once an error occurs, it can trigger an interrupt, $\overline{\text{ERROR}}$ pin outputs low depending on the ESM settings. Once the $\overline{\text{ERROR}}$ pin outputs low, a power on reset or a write of 0x5 to ESMEKR is required to release the ESM back to normal state. The application can read the error status registers (ESMSR1, ESMSR4, ESMSR7, ESMSR2, and ESMSR3) to debug the error. If an $\overline{\text{RST}}$ is triggered or the error interrupt has been served, the error flag of Group2 should be read from ESMSSR2 because the error flag in ESMSR2 will be cleared by $\overline{\text{RST}}$.



Power up or $\overline{\text{PORRST}}$

Force error on $\overline{\text{ERROR}}$ pin to check the functionality of $\overline{\text{ERROR}}$ pin and external monitoring device connected to $\overline{\text{ERROR}}$ pin (ESMEKR).

Initialize VIM RAM. Map the ESM low priority interrupt service routine and high priority interrupt service routine to pre-defined device specific interrupt channel. (Refer to device specific datasheet.)

Enable the interrupt in VIM and CPU.

Map ESM interrupt to high/low (ESM Group1 only, see register ESMILSR1 and ESMILCR1, ESMILSR4 and ESMILCR4, ESMILSR7 and ESMILCR7).

Enable ESM interrupt and influence on $\overline{\text{ERROR}}$ pin (ESM Group1 only, see register ESMIEPSR1, ESMIEPCR1, ESMIESR1, and ESMIECR1; ESMIEPSR4, ESMIEPCR4, ESMIESR4, and ESMIECR4; ESMIEPSR7, ESMIEPCR7, ESMIESR7, and ESMIECR7).

Define ESM Low-Time Counter Preload Register ESMLTCPR to determine the $\overline{\text{ERROR}}$ pin low time in case an error occurs.

Figure 21-96. ESM Initialization

21.5.7 MSS_ESM Registers

Table 21-121 lists the memory-mapped registers for the MSS_ESM. To determine the base address, refer to the device-specific memory map. The address locations not listed are reserved.

21.6 Cyclic Redudancy Check (CRC)

This section describes the cyclic redundancy check (CRC) controller module. Presently two CRC modules have been instantiated in the AWR2944 one for MSS and another for DSS.

Note

AWR2944LC has only instance of CRC located in the MSS.

21.6.1 Overview

The CRC controller is a module that is used to perform CRC (Cyclic Redundancy Check) to verify the integrity of memory system. A signature representing the contents of the memory is obtained when the contents of the memory are read into CRC controller. The responsibility of CRC controller is to calculate the signature for a set of data and then compare the calculated signature value against a pre-determined good signature value. CRC controller supports two channels to perform CRC calculation on multiple memories in parallel and can be used on any memory system.

21.6.2 Features

The CRC controller offers:

- Two channels to perform background signature verification on any memory sub-system.
- Data compression on 8, 16, 32, and 64-bit data size.
- Maximum-length PSA (Parallel Signature Analysis) register constructed based on 64-bit primitive polynomial.
- Each channel has a CRC Value Register that contains the pre-determined CRC value.
- Use timed base event trigger from timer to initiate DMA data transfer.
- Programmable 20-bit pattern counter per channel to count the number of data patterns for compression.
- Three modes of operation. Auto, Semi-CPU and Full-CPU.
- For each channel, CRC can be performed either by CRC Controller or by CPU.
- Automatically perform signature verification without CPU intervention in AUTO mode.
- Generate interrupt to CPU in Semi-CPU mode to allow CPU to perform signature verification itself.
- Generate CRC fail interrupt in AUTO mode if signature verification fails.
- Generate Timeout interrupt if CRC is not performed within the time limit.
- Generate DMA request per channel to initiate CRC value transfer.

21.6.3 Block Diagram

Figure 21-127 shows a block diagram of the CRC controller.

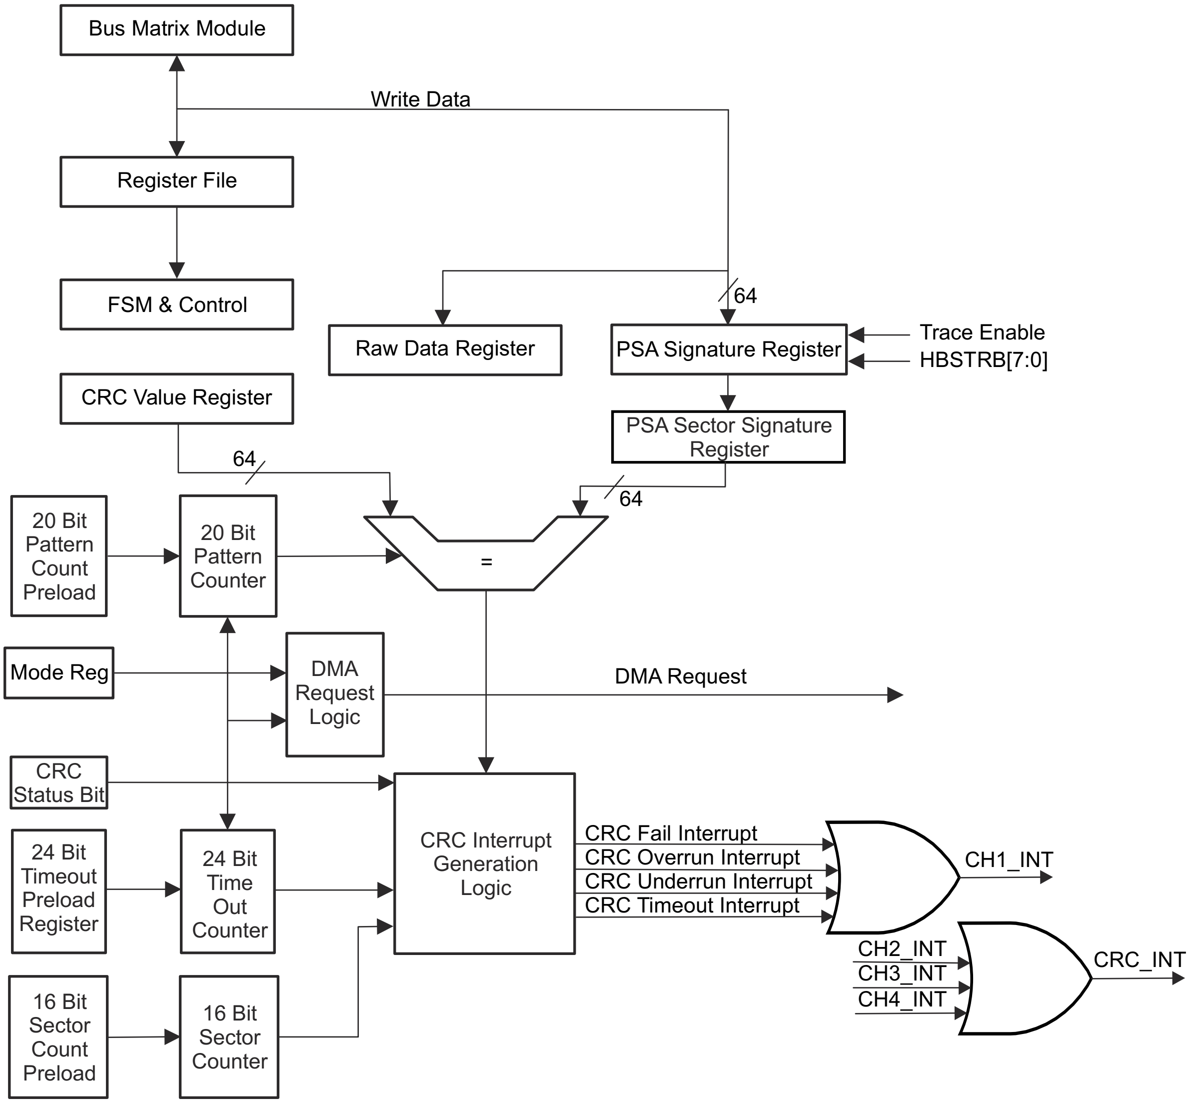

Figure 21-127. CRC Controller Block Diagram For One Channel

21.6.4 Module Operation

21.6.4.1 General Operation

There are two channels in CRC controller, and for each channel there is a memory-mapped PSA (Parallel Signature Analysis) Signature Register and a memory-mapped CRC (Cyclic Redundancy Check) Value Register. A memory can be organized into multiple sectors with each sector consisting of multiple data patterns. A data pattern can be 8-, 16-, 32-, or 64-bit data. CRC module performs the signature calculation and compares the signature to a pre-determined value. The PSA Signature Register compresses an incoming data pattern into a signature when it is written. When one sector of data patterns are written into PSA Signature Register, a final signature corresponding to the sector is obtained. CRC Value Register stores the pre-determined signature corresponding to one sector of data patterns. The calculated signature and the pre-determined signature are then compared to each other for signature verification. To minimize CPU’s involvement, data patterns transfer can be carried out at the background of CPU using DMA controller. DMA is setup to transfer data from memory from which the contents to be verified to the memory mapped PSA Signature Register. When DMA transfers data to the memory mapped PSA Signature Register, a signature is generated. A programmable 20-bit data pattern counter is used for each channel to define the number of data patterns to calculate for each sector. Signature verification can be performed automatically by CRC controller in AUTO mode or by CPU itself in Semi-CPU or Full-CPU mode. In AUTO mode, a self sustained CRC signature calculation can be achieved without any CPU intervention.

21.6.4.2 CRC Modes of Operation

CRC Controller can operate in AUTO, Semi-CPU, and Full-CPU modes.

21.6.4.2.1 AUTO Mode

In AUTO mode, CRC Controller in conjunction with DMA controller can perform CRC without CPU intervention. A sustained transfer of data to both the PSA Signature Register and CRC Value Register are performed in the background of CPU. When a mismatch is detected, an interrupt is generated to CPU. A 16-bit current sector ID register is provided to identify which sector causes a CRC failure.

21.6.4.2.2 Semi-CPU Mode

In Semi-CPU mode, DMA controller is also utilized to perform data patterns transfer to PSA Signature Register. Instead of performing signature verification automatically, the CRC controller generates an compression complete interrupt to CPU after each sector is compressed. Upon responding to the interrupt the CPU performs the signature verification by reading the calculated signature stored at the PSA Sector Signature Register, and compares it to a pre-determined CRC value.

21.6.4.2.3 Full CPU Mode

In Full-CPU mode, the CPU does the data patterns transfer and signature verification all by itself. When CPU has enough throughput, it can perform data patterns transfer by reading data from the memory system to the PSA Signature Register. After certain number of data patterns are compressed, the CPU can read from the PSA Signature Register and compare the calculated signature to the pre-determined CRC signature value. In Full-CPU mode, neither interrupt nor DMA request is generated. All counters are also disabled.

21.6.4.3 PSA Signature Register

The 64-bit PSA Signature Register is based on the primitive polynomial (as in the following equation) to produce the maximum length LFSR (Linear Feedback Shift Register), as shown in Figure 21-128.

$$f(x) = x^{64} + x^4 + x^3 + x + 1 \qquad (9)$$

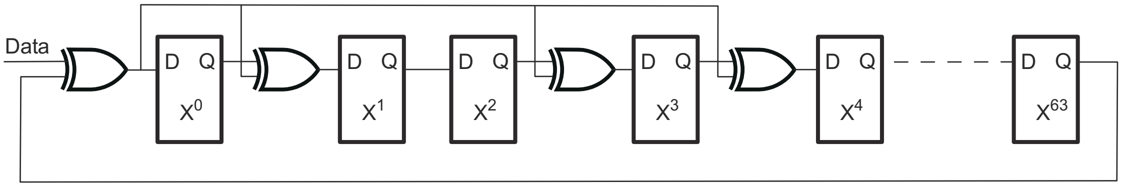

Figure 21-128. Linear Feedback Shift Register (LFSR)

The serial implementation of LFSF has a limitation that, it requires ‘n’ clock cycles to calculate the CRC values for an ‘n’ bit data stream. The idea is to produce the same CRC value operating on a multi-bit data stream, as would occur if the CRC were computed one bit at a time over the whole data stream. The algorithm involves looping to simulate the shifting, and concatenating strings to build the equations after ‘n’ shift.

The parallel CRC calculation based on the polynomial can be illustrated in the following HDL code:

```
for i in 63 to 0 loop
   NEXT_CRC_VAL(0) := CRC_VAL(63) xor DATA(i);
     for j in 1 to 63 loop
       case j is
          when 1|3|4 =>
               NEXT_CRC_VAL(j) :=
                   CRC_VAL(j - 1) xor CRC_VAL(63) xor DATA(i);
          when others =>
               NEXT_CRC_VAL(j) := CRC_VAL(j - 1);
       end case;
     end loop;
   CRC_VAL := NEXT_CRC_VAL;
end loop;
```

Note

1) The inner loop is to calculate the next value of each shift register bit after one cycle

2) The outer loop is to simulate 64 cycles of shifting. The equation for each shift register bit is thus built before it is compressed into the shift register.

3) MSB of the DATA is shifted in first

There is one PSA Signature Register per CRC channel. PSA Signature Register can be both read and written. When it is written, it can either compress the data or just capture the data depending on the state of CHx_MODE bits. If CHx_MODE=Data Capture, a seed value can be planted in the PSA Signature Register without compression. Other modes other than Data Capture will result with the data compressed by PSA Signature Register when it is written. Each channel can be planted with different seed value before compression starts. When PSA Signature Register is read, it gives the calculated signature.

CRC Controller should be used in conjunction with the on chip DMA controller to produce optimal system performance. The incoming data pattern to PSA Signature Register is typically initiated by the DMA controller. When DMA is properly setup, it would read data from the pre-determined memory system and write them to the memory mapped PSA Signature Register. Each time PSA Signature Register is written a signature is generated.

CPU itself can also perform data transfer by reading from the memory system and perform write operation to PSA Signature Register if CPU has enough throughput to handle data patterns transfer.

After system reset and when AUTO mode is enabled, CRC Controller automatically generates a DMA request to request the pre-determined CRC value corresponding to the first sector of memory to be checked.

In AUTO mode, when one sector of data patterns is compressed, the signature stored at the PSA Signature Register is first copied to the PSA Sector Signature Register and PSA Signature Register is then cleared out to all zeros. An automatic signature verification is then performed by comparing the signature stored at the PSA Sector Signature Register to the CRC Value Register. After the comparison the CRC Controller can generate a DMA request. Upon receiving the DMA request the DMA controller will update the CRC Value Register by transferring the next pre-determined signature value associated with the next sector of memory system. If the signature verification fails then CRC Controller can generate a CRC fail interrupt.

In Full-CPU mode, no DMA request and interrupt are generated at all. The number of data patterns to be compressed is determined by CPU itself. Full-CPU mode is useful when DMA controller is not available to perform background data patterns transfer. The OS can periodically generate a software interrupt to CPU and use CPU to accomplish data transfer and signature verification.

CRC Controller supports doubleword, word, half word and byte access to the PSA Signature Register. During a non-doubleword write access, all unwritten byte lanes are padded with zero’s before compression. Note that comparison between PSA Sector Signature Register and CRC Value Register is always in 64 bit because a compressed value is always expressed in 64 bit.

There is a software reset per channel for PSA Signature Register. When set, the PSA Signature Register is reset to all zeros.

PSA Signature Register is reset to zero under the following conditions:

- System reset
- PSA Software reset
- One sector of data patterns are compressed

21.6.4.4 PSA Sector Signature Register

After one sector of data is compressed, the final resulting signature calculated by PSA Signature Register is transferred to the PSA Sector Signature Register. PSA Signature Register is a read only register. During Semi-CPU mode, the host CPU should read from the PSA Sector Signature Register instead of reading from PSA Signature Register for signature verification to avoid data coherency issue. The PSA Signature Register can be updated with new signature before the host CPU is able to retrieve it.

In Semi-CPU mode, no DMA request is generated. When one sector of data patterns is compressed, CRC controller first generates a compression complete interrupt. Responding to the interrupt, CPU will in the ISR read the PSA Sector Signature Register and compare it to the known good signature or write the signature value to another memory location to build a signature file. In Semi-CPU mode, CPU must perform the signature verification in a manner to prevent any overrun condition. The overrun condition occurs when the compression complete interrupt is generated after one sector of data patterns is compressed and CPU has not read from the PSA Sector Signature Register to perform necessary signature verification before PSA Sector Signature Register is overridden with a new value. An overrun interrupt can be enable to generate when overrun condition occurs. During Semi-CPU mode, the host CPU should read from the PSA Sector Signature Register instead of reading from PSA Signature Register for signature verification to avoid data coherency issue. The PSA Signature Register can be updated with new signature before the host CPU is able to retrieve it.

21.6.4.5 CRC Value Register

Associated with each channel there is a CRC Value Register. The CRC Value Register stores the pre-determined CRC value. After one sector of data patterns is compressed by PSA Signature Register, CRC Controller can automatically compare the resulting signature stored at the PSA Sector Signature Register with the pre-determined value stored at the CRC Value Register if AUTO mode is enabled. If the signature verification fails, CRC Controller can be enabled to generate an CRC fail interrupt. When the channel is set up for Semi-CPU mode, CRC controller first generates a compression complete interrupt to CPU. Upon servicing the interrupt, CPU will then read the PSA Sector Signature Register and then read the corresponding CRC value stored at another location and compare them. CPU should not read from the CRC Value Register during Semi-CPU or Full-CPU mode because the CRC Value Register is not updated during these two modes.

In AUTO mode, for first sector's signature, DMA request is generated when mode is programmed to AUTO. For subsequent sectors, DMA request is generated after each sector is compressed. Responding to the DMA request, DMA controller reloads the CRC Value Register for the next sector of memory system to be checked.

When CRC Value Register is updated with a new CRC value, an internal flag is set to indicate that CRC Value Register contains the most current value. This flag is cleared when CRC comparison is performed. Each time at the end of the final data pattern compression of a sector, CRC Controller first checks to see if the corresponding CRC Value Register has the most current CRC value stored in it by polling the flag. If the flag is set then the CRC comparison can be performed. If the flag is not set then it means the CRC Value Register contains stale information. A CRC underrun interrupt is generated. When an underrun condition is detected, signature verification is not performed.

CRC Controller supports doubleword, word, half word and byte access to the CRC Value Register. As noted before comparison between PSA Sector Signature Register and CRC Value Register during AUTO mode is carried out in 64 bit.

21.6.4.6 Raw Data Register

The raw or un-compressed data written to the PSA Signature Register is also saved in the Raw Data Register. This register is read only.

21.6.4.7 Example DMA Controller Setup

DMA controller needs to be setup properly in either either AUTO or Semi-CPU mode as DMA controller is used to transfer data patterns. Hardware or a combination of hardware and software DMA triggering are supported.

21.6.4.7.1 AUTO Mode Using Hardware Timer Trigger

There are two DMA channels associated with each CRC channel when in AUTO mode. One DMA channel is setup to transfer data patterns from the source memory to the PSA Signature Register. The second DMA channel is setup to transfer the pre-determined signature to the CRC Value Register. The trigger source for the first DMA channel can be either by hardware or by software. As illustrated in Figure 21-129 a timer can be used to trigger a DMA request to initiate transfer from the source memory system to PSA Signature Register. In AUTO mode, CRC Controller also generates DMA request after one sector of data patterns is compressed to initiate transfer of the next CRC value corresponding to the next sector of memory. Thus a new CRC value is always updated in the CRC Value Register by DMA synchronized to each sector of memory.

A block of memory system is usually divided into many sectors. All sectors are the same size. The sector size is programmed in the CRC_PCOUNT_REGx and the number of sectors in one block is programmed in the CRC_SCOUNT_REGx of the respective channel. CRC_PCOUNT_REGx multiplies CRC_SCOUNT_REGx and multiplies transfer size of each data pattern should give the total block size in number of bytes.

The total size of the memory system to be examined is also programmed in the respective transfer count register inside DMA module. The DMA transfer count register is divided into two parts. They are element count and frame count. Note that an HW DMA request can be programmed to trigger either one frame or one entire block transfer. In Figure 21-129, an HW DMA request from a timer is used as a trigger source to initiate DMA transfer. If all two CRC channels are active in AUTO mode then a total of two DMA requests would be generated by CRC Controller.

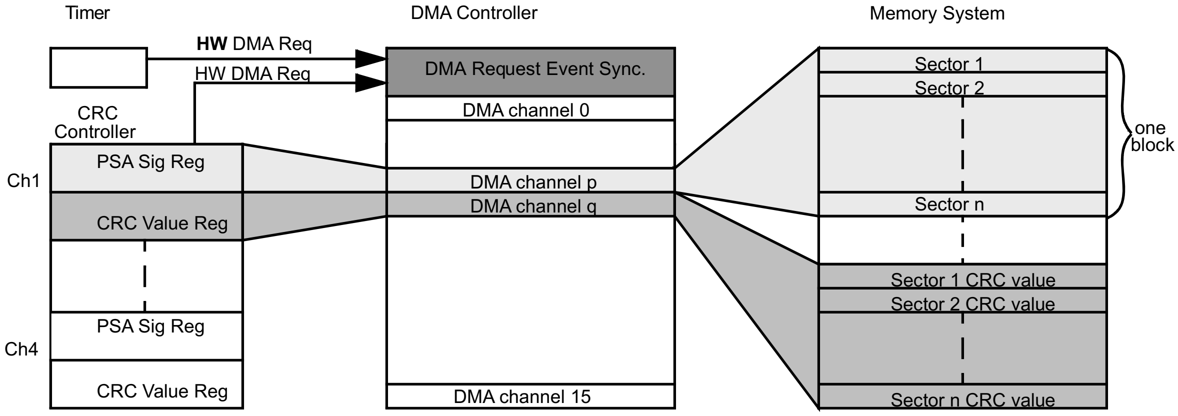

Figure 21-129. AUTO Mode Using Hardware Timer Trigger

21.6.4.7.2 AUTO Mode Using Software Trigger

The data patterns transfer can also be initiated by software. CPU can generate a software DMA request to activate the DMA channel to transfer data patterns from source memory system to the PSA Signature Register. To generate a software DMA request CPU needs to set the corresponding DMA channel in the DMA software trigger register. Note that just one software DMA request from CPU is enough to complete the entire data patterns transfer for all sectors. See Figure 21-130 for an illustration.

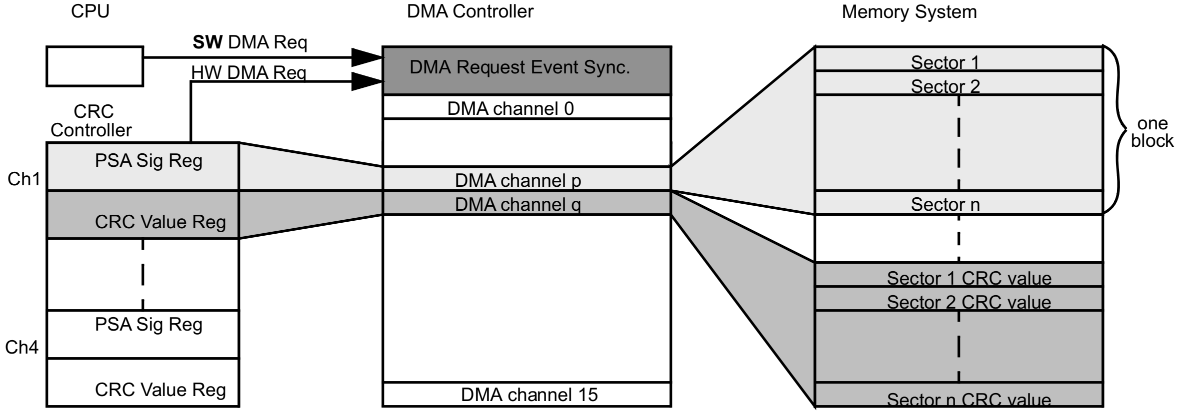

Figure 21-130. AUTO Mode With Software CPU Trigger

21.6.4.7.3 Semi-CPU Mode Using Hardware Timer Trigger

During semi-CPU mode, no DMA request is generated by CRC controller. Therefore, no DMA channel is allocated to update CRC Value Register. CPU should not read from CRC Value Register in semi-CPU mode as it contains stale value. Note that no signature verification is performed at all during this mode. Similar to AUTO mode, either by hardware or by software DMA request can be used as a trigger for data patterns transfer. Figure 21-131 illustrates the DMA setup using semi-CPU mode with hardware timer trigger.

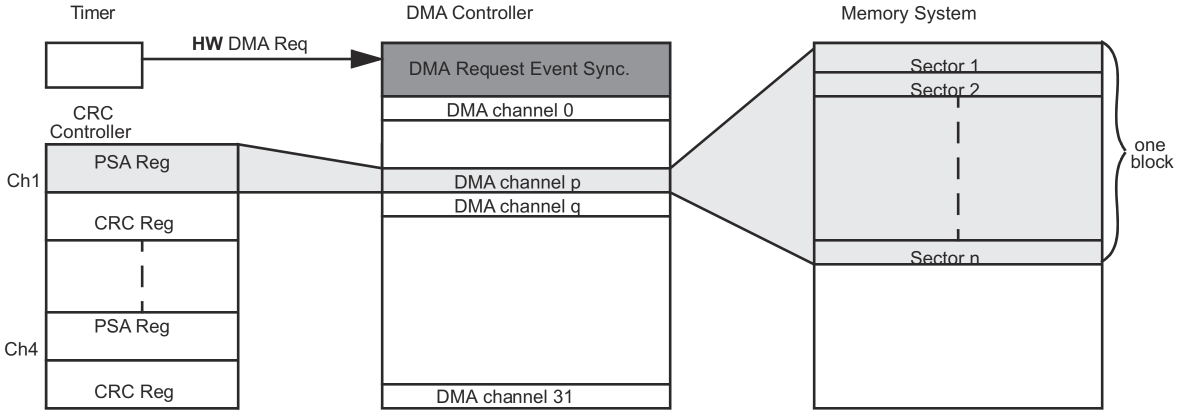

Figure 21-131. Semi-CPU Mode With Hardware Timer Trigger

Table 21-153. CRC Modes in Which DMA Request and Counter Logic are Active or Inactive

Mode	DMA Request	Pattern Counter	Sector Counter	Timeout Counter
AUTO	Active	Active	Active	Active
Semi-CPU	Inactive	Active	Active	Active
Full-CPU	Inactive	Inactive	Inactive	Inactive

21.6.4.8 Pattern Count Register

There is a 20-bit data pattern counter for every CRC channel. The data pattern counter is a down counter and can be pre-loaded with a programmable value stored in the Pattern Count Register. When the data pattern counter reaches zero, a compression complete interrupt is generated in Semi-CPU mode and an automatic signature verification is performed in AUTO mode. In AUTO only, DMA request is generated to trigger the DMA controller to update the CRC Value Register.

Note

The data pattern count should be divisible by the total transfer count as programmed in DMA controller. The total transfer count is the product of element count and frame count.

21.6.4.9 Sector Count Register/Current Sector Register

Each channel contains a 16 bit sector counter. The sector count register stores the number of sectors. Sector counter is a free running counter and is incremented by one each time when one sector of data patterns is compressed. When the signature verification fails, the current value stored in the sector counter is saved into current sector register. If signature verification fails, CPU can read from the current sector register to identify the sector which causes the CRC mismatch. To aid and facilitate the CPU in determining the cause of a CRC failure, it is advisable to use the following equation during CRC and DMA setup:

$$\text{CRC Pattern Count} \times \text{CRC Sector Count} = \text{DMA Element Count} \times \text{DMA Frame Count}$$

The current sector register is frozen from being updated until both the current sector register is read and CRC fail status bit is cleared by CPU. If CPU does not respond to the CRC failure in a timely manner before another sector produces a signature verification failure, the current sector register is not updated with the new sector number. An overrun interrupt is generate instead. If current sector register is already frozen with an erroneous sector and emulation is entered with SUSPEND signal goes to high then the register still remains frozen even it is read.

In Semi-CPU mode, the current sector register is used to indicate the sector for which the compression complete has last happened.

The current sector register is reset when the PSA software reset is enabled.

Note

Both data pattern count and sector count registers must be greater than or equal to one for the counters to count. After reset, pattern count and sector count registers default to zero and the associated counters are inactive.

21.6.4.10 Interrupt

The CRC controller generates several types of interrupts per channel. Associated with each interrupt, there is an interrupt enable bit. No interrupt is generated in Full-CPU mode.

- Compression complete interrupt
- CRC fail interrupt
- Overrun interrupt
- Underrun interrupt
- Timeout interrupt

Table 21-154. Modes in Which Interrupt Condition Can Occur

	AUTO	Semi-CPU	Full-CPU
Compression Complete	no	yes	no
CRC Fail	yes	no	no
Overrun	yes	yes	no
Underrun	yes	no	no
Timeout	yes	yes	no

21.6.4.10.1 Compression Complete Interrupt

Compression complete interrupt is generated in Semi-CPU mode only. When the data pattern counter reaches zero, the compression complete flag is set and the interrupt is generated.

21.6.4.10.2 CRC Fail Interrupt

CRC fail interrupt is generated in AUTO mode only. When the signature verification fails, the CRC fail flag is set,. CPU should take action to address the fail condition and clear the CRC fail flag after it resolves the CRC mismatch.

21.6.4.10.3 Overrun Interrupt

Overrun interrupt is generated in either AUTO or Semi-CPU mode. During AUTO mode, if a CRC fail is detected then the current sector number is recorded in the current sector register. If CRC fail status bit is not cleared and current sector register is not read by the host CPU before another CRC fail is detected for another sector then an overrun interrupt is generated. During Semi-CPU mode, when the data pattern counter finishes counting, it generates a compression complete interrupt. At the same time the signature is copied into the PSA Sector Signature Register. If the host CPU does not read the signature from PSA Sector Signature Register before it is updated again with a new signature value then an overrun interrupt is generated.

21.6.4.10.4 Underrun Interrupt

Underrun interrupt only occurs in AUTO mode. The interrupt is generated when the CRC Value Register is not updated with the corresponding signature when the data pattern counter finishes counting. During AUTO mode, CRC Controller generates DMA request to update CRC Value Register in synchronization to the corresponding sector of the memory. Signature verification is also performed if underrun condition is detected. And CRC fail interrupt is generated at the same time as the underrun interrupt.

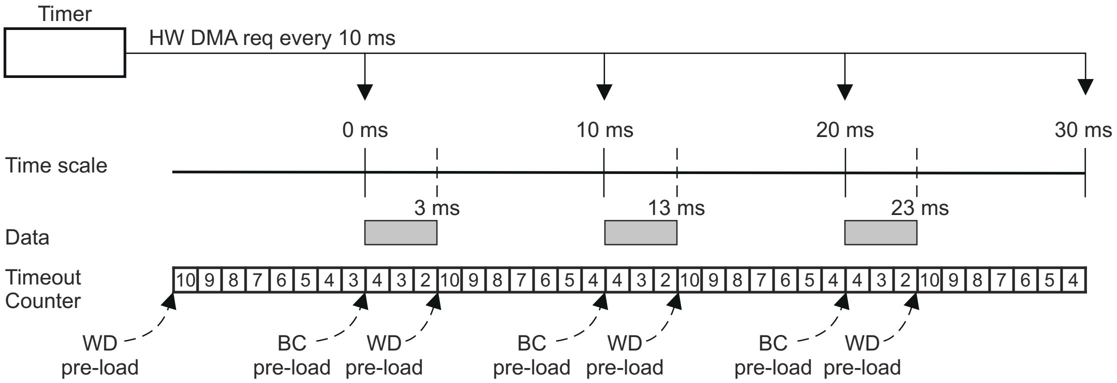
21.6.4.10.5 Timeout Interrupt

To ensure that the memory system is examined within a pre-defined time frame and no loss of incoming data there is a 24 bit timeout counter per CRC channel. The 24 bit timeout down counter can be pre-loaded with two different pre-load values, watchdog timeout pre-load value (CRC_WDTOPLDx) and block complete timeout pre-load value (CRC_BCTOPLDx). The timeout counter is clocked by a prescaler clock which is permanently running at division 64 of HCLK clock.

First pattern of data must be transferred by the DMA before the timeout counter expires, Watchdog timeout pre-load register (CRC_WDTOPLDx) is used as timeout counter. Block complete timeout pre-load register (CRC_BCTOPLDx) is used to check if one complete block of data patterns are compressed within a specific time frame. The timeout counter is first pre-loaded with CRC_WDTOPLDx after either AUTO or Semi-CPU mode is selected and starts to down count. If the timeout counter expires before DMA transfers any data pattern to PSA Signature Register then a timeout interrupt is generated. An incoming data pattern before the timeout counter expires will automatically pre-load the timeout counter with CRC_BCTOPLDx the block complete timeout pre-load value.

Block complete timeout pre-load value is used to check it one block of data patterns are compressed within a given time limit. If the timeout counter pre-loaded with CRC_BCTOPLDx value expires before one block of data patterns are compressed a timeout interrupt is generated. When one block (pattern count x sector count) of data patterns are compressed before the counter has expired, the counter is pre-loaded with CRC_WDTOPLDx value again. If the timeout counter is pre-loaded with zero then the counter is disable and no timeout interrupt is generated.

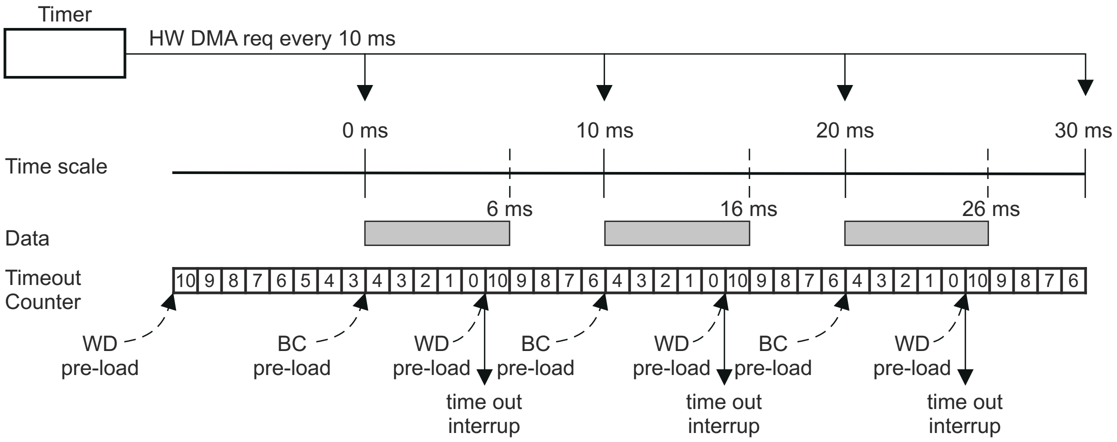
In Figure 21-132, a timer generates DMA request every 10ms to trigger one block (pattern count x sector count) transfer. Since we want to make sure that DMA does start to transfer a block every 10 ms we would set the first pre-load value to 10ms in CRC_WDTOPLDx. We also want to make sure that one block of data patterns are compressed within 4ms. With such a requirement, we would set the second pre-load value to 4ms in CRC_BCTOPLDx register.



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: No timeout interrupt is generated in this example since each block of data patterns are compressed in 3 ms and DMA does initiate a block transfer every 10 ms.

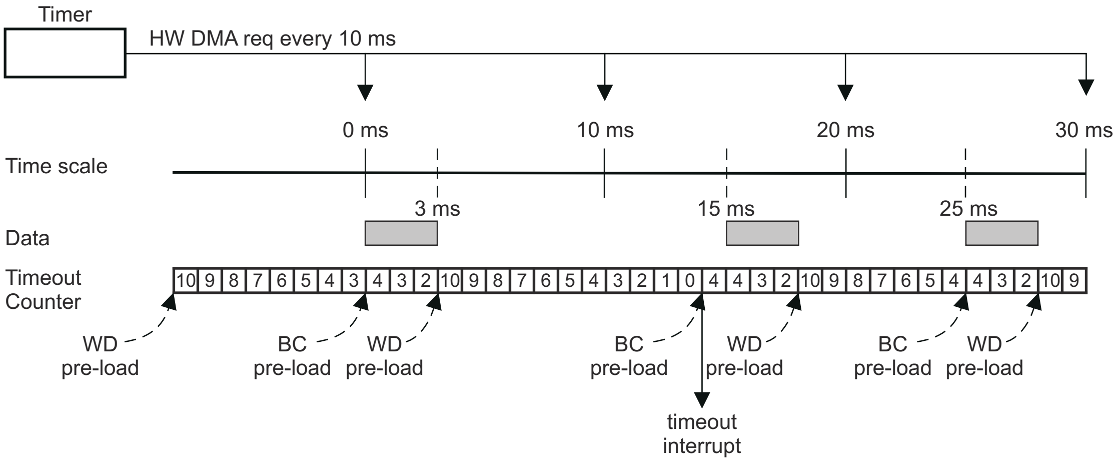
Figure 21-132. Timeout Example 1



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: Timeout interrupt is generated in this example since each block of data patterns are compressed in 6 ms and this is out of the 4ms time frame.

Figure 21-133. Timeout Example 2



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: Timeout interrupt is generated in this example since DMA can not transfer the second block of data within 10ms time limit and the reason may be that DMA is set up in fixed priority scheme and DMA is serving other higher priority channels at the time before it can service the timer request.

Figure 21-134. Timeout Example 3

21.6.4.10.6 Interrupt Offset Register

CRC Controller only generates one interrupt request to interrupt manager. A interrupt offset register is provided to indicate the source of the pending interrupt with highest priority. Table 21-155 shows the offset interrupt vector address of each interrupt condition in an ascending order of priority.

Table 21-155. Interrupt Offset Mapping

Offset Value	Interrupt Condition
0	Phantom
1h	Ch1 CRC Fail
2h	Ch2 CRC Fail
3h-8h	Reserved
9h	Ch1 Compression Complete
Ah	Ch2 Compression Complete
Bh-10h	Reserved
11h	Ch1 Overrun
12h	Ch2 Overrun
13h-18h	Reserved
19h	Ch1 Underrun
1Ah	Ch2 Underrun
1Bh-20h	Reserved
21h	Ch1 Timeout
22h	Ch2 Timeout
23h-24h	Reserved

21.6.4.10.7 Error Handling

When an interrupt is generated, host CPU should take appropriate actions to identify the source of error and restart the respective channel in DMA and CRC module. To restart a CRC channel, the user should perform the following steps in the ISR:

1. Write to software reset bit in CRC_CTRL register to reset the respective PSA Signature Register.
2. Reset the CHx_MODE bits to 00 in CRC_CTRL register as Data capture mode.
3. Set the CHx_MODE bits in CRC_CTRL register to desired new mode again.
4. Release software reset.

The host CPU should use byte write to restart each individual channel.

21.6.4.11 Power Down Mode

CRC module can be put into power down mode when the power down control bit PWDN is set. The module wakes up when the PWDN bit is cleared.

21.6.4.12 Emulation

A read access from a register in functional mode can sometimes trigger a certain internal event to follow. For example, reading an interrupt offset register triggers an event to clear the corresponding interrupt status flag. During emulation when SUSPEND signal is high, a read access from any register should only return the register contents to the bus and should not trigger or mask any event as it would have in functional mode. This is to prevent debugger from reading the interrupt offset register during refreshing screen and cause the corresponding interrupt status flag to get cleared. Timeout counters are stopped to generate timeout interrupts in emulation mode. No Peripheral Controller bus error should be generated if reading from the unimplemented locations.

21.6.4.13 Peripheral Bus Interface

CRC is a Peripheral target module. The register interface is similar to other peripheral modules. CRC supports following features:

- Different sizes of burst operation.
- Aligned and unaligned accesses.
- Abort is generated for any illegal address accesses.

21.6.5 Example

This section illustrates several of the ways in which the CRC Controller can be utilized to perform CRC.

21.6.5.1 Example: Auto Mode Using Time Based Event Triggering

A large memory area with 2Mbyte (256k doubleword) is to be checked in the background of CPU. CRC is to be performed every 1K byte (128 doubleword). Therefore there should be 2048 pre-recorded CRC values. For illustration purpose, we map channel 1 CRC Value Register to DMA channel 1 and channel 1 PSA Signature Register to DMA channel 2. Assume all DMA transfers are carried out in 64-bit transfer size.

21.6.5.1.1 DMA Setup

- Set up DMA channel 1 with the starting address from which the pre-determined CRC values are stored. Set up the destination address to the memory mapped channel 1 CRC Value Register. Put the source address at post increment addressing mode and put the destination address at constant addressing mode. Use ***hardware*** DMA request for channel 1 to trigger a ***frame*** transfer.
- Set up DMA channel 2 with the source address from which the contents of memory to be verified. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Program the element transfer count to 128 and the frame transfer count to 2048. Put the source address at post increment addressing mode and put the destination address at constant address mode. Use ***hardware*** DMA request for channel 2 to trigger an entire ***block*** transfer.

21.6.5.1.2 Timer Setup

The timer can be any general purpose timer which is capable of generating a time-based DMA request.

- Set up timer to generate DMA request associated with DMA channel 2. For example, an OS can set up the timer to generate a DMA request every 10ms.

21.6.5.1.3 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 2048.
- Enable AUTO mode and all interrupts.

After AUTO mode is selected, CRC Controller automatically generates a DMA request on channel 1. Around the same time the timer module also generates a DMA request on DMA channel 2. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After some time, the DMA controller would update the CRC Value Register with a pre-determined value matching the calculated signature for the first sector of 128 64 bit data patterns. After one sector of data patterns are compressed, the CRC Controller generate a CRC fail interrupt if signature stored at the PSA Sector Signature Register does not match the CRC Value Register. CRC Controller generates a DMA request on DMA channel 1 when one sector of data patterns are compressed. This routine will continue until the entire 2Mbyte are consumed. If the timeout counter reached zero before the entire 2Mbytes are compressed a timeout interrupt is generated. After 2MBytes are transferred, the DMA can generate an interrupt to CPU. The entire operation will continue again when DMA responds to the DMA request from both the timer and CRC Controller. The CRC is performed totally without any CPU intervention.

21.6.5.2 Example: Auto Mode Without Using Time Based Triggering

A small but highly secured memory area with 1kbytes is to be checked in the background of CPU. CRC is to be performed every 1Kbytes. Therefore there is only one pre-recorded CRC value. For illustration purpose, we map channel 1 CRC Value Register to DMA channel 1 and channel 1 PSA Signature Register to DMA channel 2. Assume all transfers carried out by DMA are in 64 bit transfer size.

21.6.5.2.1 DMA Setup

- Set up DMA channel 1 with the source address from which the pre-determined CRC value is stored. Set up the destination address to the memory mapped channel 1 CRC Value Register. Put the source address at constant addressing mode and put the destination address at constant addressing mode. Use ***hardware*** DMA request for channel 1.
- Set up DMA channel 2 with the source address from which the memory area to be verified. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Program the element transfer count to 128 and the frame transfer count to 1. Put the source address at post increment addressing mode and put the destination address at constant address mode. Generate a ***software*** DMA request on channel 2 after CRC has completed its setup. Enable autoinitiation for DMA channel 2.

21.6.5.2.2 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 1.
- Leaving the timeout count register with the reset value of zero means no timeout interrupt is generated.
- Enable AUTO mode and all interrupts.

After AUTO mode is selected, the CRC Controller automatically generates a DMA request on channel 1. At the same time the CPU generates a ***software*** DMA request on DMA channel 2. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After some time, the DMA controller would update the CRC Value Register with a pre-determined value matching the calculated signature for the first sector of 128 64 bit data patterns. After one sector of data patterns are compressed, the CRC Controller generates a CRC fail interrupt if signature stored at the PSA Sector Signature Register does not match the CRC Value Register. CRC Controller generates a DMA request on DMA channel 1 again after one sector is compressed. After 1kbytes are transferred, the DMA can generate an interrupt to CPU. Responding to the DMA interrupt CPU can restart the CRC routine by generating a software DMA request onto channel 2 again.

21.6.5.3 Example: Semi-CPU Mode

If DMA controller is available in a system, the CRC module can also operate in semi-CPU mode. This means that CPU can still make use of the DMA to perform data patterns transfer to CRC controller in the background. The difference between semi-CPU mode and AUTO mode is that CRC controller does not automatically perform the signature verification. CRC controllers generates a compression complete interrupt to CPU when the one sector of data patterns are compressed. CPU needs to perform the signature verification itself.

A memory area with 2Mbyte is to be verified with the help of the CPU. CRC operation is to be performed every 1K byte. Since there are 2Mbyte (256k doublewords) of memory to be check and we want to perform a CRC every 1Kbyte (128 doublewords) and therefore there should be 2048 pre-recorded CRC values. In Semi-CPU mode, the CRC Value Register is not updated and contains indeterminate data.

21.6.5.3.1 DMA Setup

Set up DMA channel 1 with the source address from which the memory area to be verified are mapped. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Put the starting address at post increment addressing mode and put the destination address at constant address mode. Use hardware DMA request to trigger an entire block transfer for channel 1. Disable autoinitiation for DMA channel 1.

21.6.5.3.2 Timer Setup

The timer can be any general purpose timer which is capable of generating a time based DMA request.

Set up timer to generate DMA request associated with DMA channel 1. For example, an OS can set up the timer to generate a DMA request every 10ms.

21.6.5.3.3 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 2048.
- Enable Semi-CPU mode and enable all interrupts.

The timer module first generates a DMA request on DMA channel 1 when it is enabled. When the first incoming data pattern arrives at the PSA Signature Register, the CRC controller will compress it. After one sector of data patterns are compressed, the CRC controller generate a compression complete interrupt. Upon responding to the interrupt the CPU would read from the PSA Sector Signature Register. It is up to the CPU on how to deal with the PSA value just read. It can compare it to a known signature value or it can write it to another memory location to build a signature file or even transfer the signature out of the device via SCI or SPI. This routine will continue until the entire 2Mbyte are consumed. The latency of the interrupt response from CPU can cause overrun condition. If CPU does not read from PSA Sector Signature Register before the PSA value is overridden with the signature of the next sector of memory, an overrun interrupt will be generated by CRC controller.

21.6.5.4 Example: Full-CPU Mode

In a system without the availability of DMA controller, the CRC routine can be operated by CPU provided the CPU has enough throughput. CPU needs to read from the memory area from which CRC is to be performed.

A memory area with 2Mbyte is to be checked with the help of the CPU. CRC verification is to be performed every 1K byte. In CPU mode, the CRC Value Register is not updated and contains indeterminate data.

21.6.5.4.1 CRC Setup

- All control registers can be left in their reset state. Only enable Full-CPU mode.

CPU itself reads from the memory and write the data to the PSA Signature Register inside CRC Controller. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After ***2MBytes*** data patterns are compressed, CPU can read from the PSA Signature Register. It is up to the CPU on how to deal with the PSA signature value just read. It can compare it to a known signature value stored at another memory location.

21.6.6 MSS_MCRC Registers

Table 21-156 lists the PCR_generated_memory_map registers. All register offset addresses not listed in Table 21-156 should be considered as reserved locations and the register contents should not be modified.

</table>

Table 21-167. CRC_CURSEC_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	CRC_CURSEC1	R/W	0h	Channel 1 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erro- neous sector number.

21.6.6.12 CRC_WDTOPLD1 Register (Offset = 4Ch) [reset = 0h]

CRC_WDTOPLD1 is shown in Figure 21-146 and described in Table 21-168.

Table 21-180. CRC_CURSEC_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	CRC_CURSEC2	R/W	0h	Channel 2 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erro- neous sector number.

21.6.6.25 CRC_WDTOPLD2 Register (Offset = 8Ch) [reset = 0h]

CRC_WDTOPLD2 is shown in Figure 21-159 and described in Table 21-181.

- MSS_STC.STC_CLKDIV clock division features

21.7.2 STC Overview

The enhanced Self-Test Controller (STC) is used to test logic cores based on the On-Product Multiple Input Signature Register (OPMISR) scan compression architecture.

Software-based self-test programs for the cores are available, but offer less test coverage. Due to the complexity of the soft cores, the coverage required can be difficult to achieve and will result in a larger program size.

For these complex cores, on-chip logic BIST support for the self-test is preferred.

The main features of the STC include:

- Implements the OPMISR controller, along with the on-chip self-test controller for the synthesizable module logic, which enables high test coverage.
- The self-test controller facilitates complete isolation of the logical segment under the test from the rest of the system during the self-test run. Configure critical control signals in the initiator and target ports of the logical segment under the test to a safe state.
- The self-tested CPU core initiator bus transaction signals are configured to be in idle mode during the self-test run.
- Time-out counter for the self-test run as a fail-safe feature.

- Can capture power reduction using dead cycles before and after the capture pulse.
- Coverage improvements technique – ROM inverse access mode. In this, the patterns are read in a reverse order from ROM and applied to the UUT. Pattern randomization due to this approach results in coverage improvement, without an increase in the number of patterns. Corresponding INV_MISR is also stored in the ROM.

A self test segment corresponds to a portion of discreet safety-critical logic which can be tested in isolation from the rest of the system by the self test controller and OPMISR logic.

21.7.2.1 OPMISR Concept

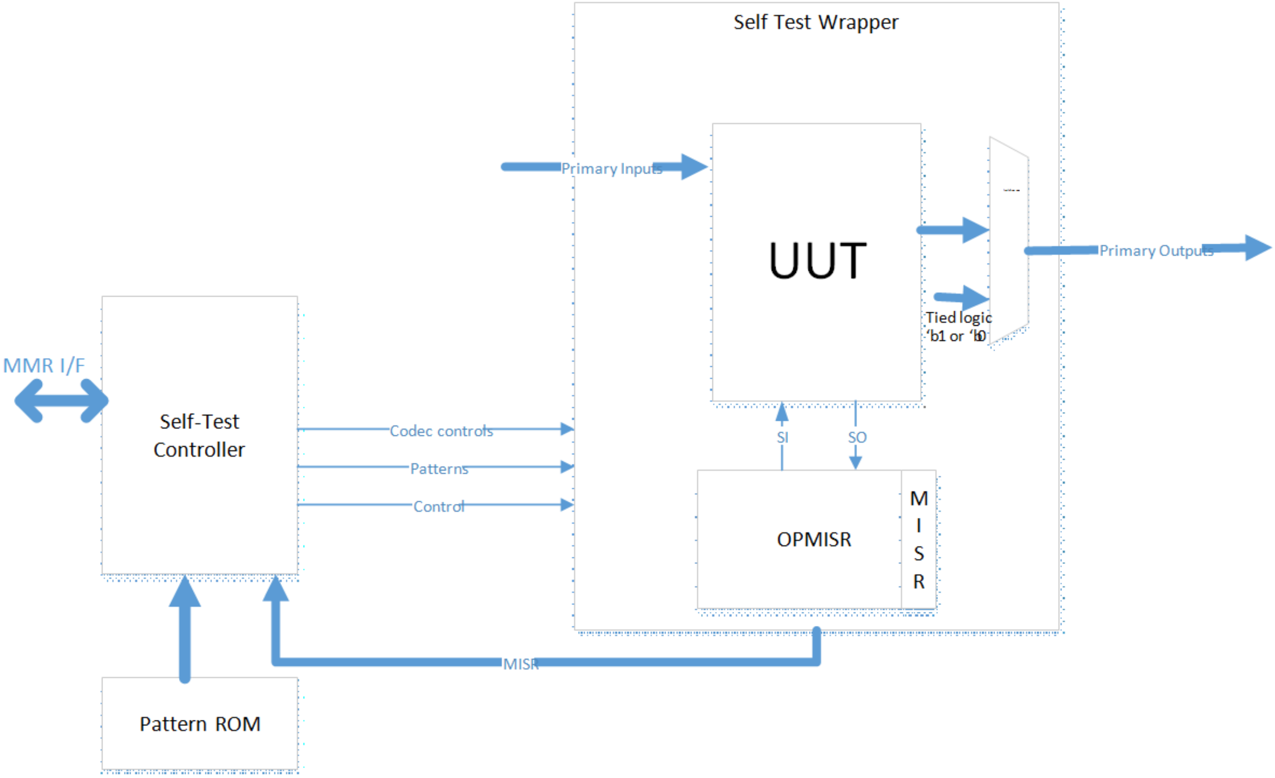

Figure 21-197. OPMISR Conceptual Diagram

The On-Product Multiple-Input Signature Register (OPMISR) is a methodology which moves the test pattern generation on-chip. Logic BIST is implemented on functional partitions (BIST'ed COREs) that are speed-critical and have high gate count. A conceptual diagram of OPMISR implementation is shown in Figure 21-197.

The MISR test structure modifies the typical fullscan scan chain such that each scan data input internally drives many chains. These chains feed to the inserted MISR structure. The chain's values are captured into the MISR during shift, generating a resulting signature that can be shifted out.

A given Unit Under Test (UUT) is scan-inserted, and the scan chains are hooked to the OPMISR logic. The self-test wrapper created around the UUT and the OPMISR logic includes the isolation muxes for the output ports of the core, to ensure that the core and UUT are isolated from the rest of the system during the self-test.

21.7.3 Block Diagram

The STC module is composed of following blocks:

- ROM interface
- FSM and sequence control

- Register file
- STC bypass / ATE interface
- Peripheral bus interface (VBUSP interface)

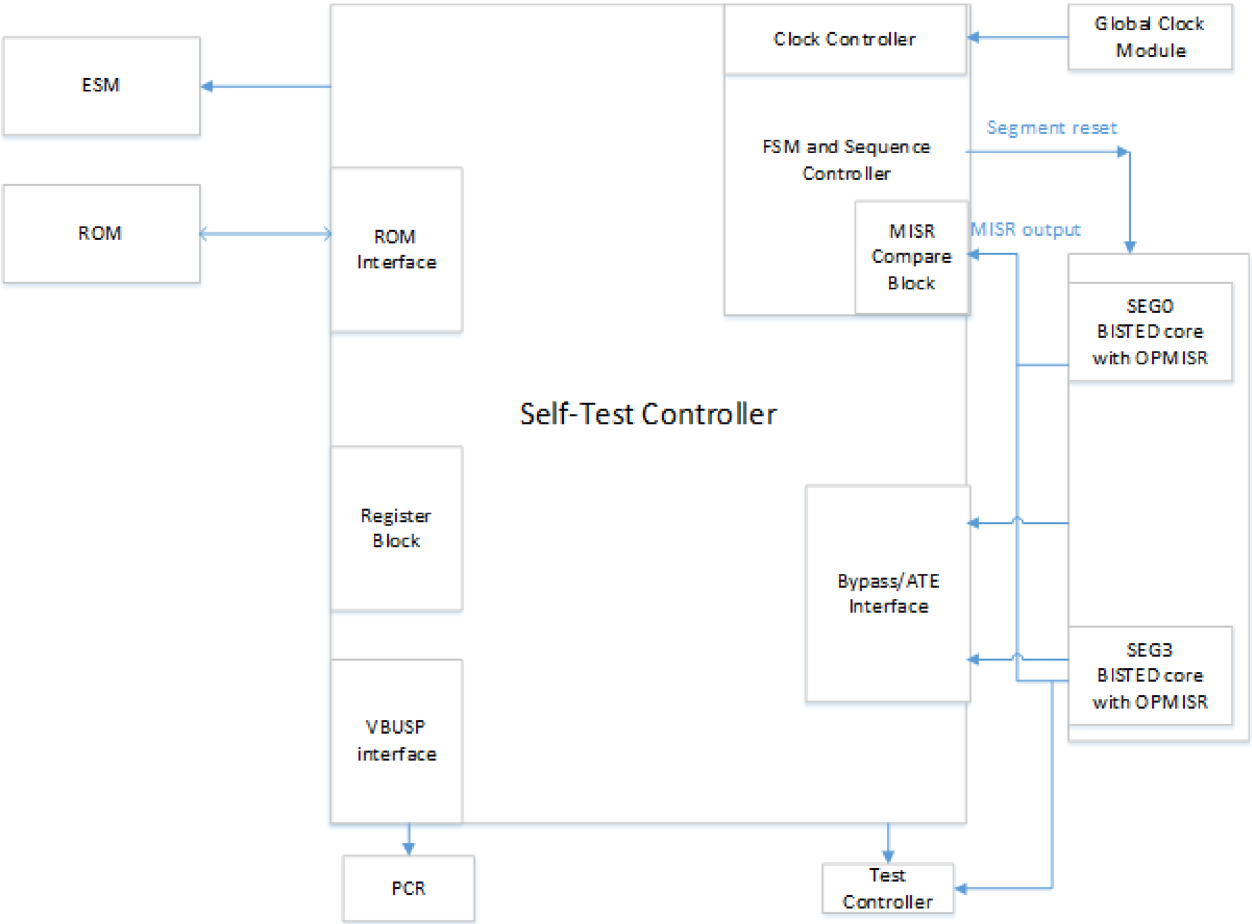

Figure 21-198. Block Diagram for STC With Multiple Segments

21.7.4 Module Description

21.7.4.1 ROM Interface

This block handles the ROM address and control signal generation to read the self-test microcode from the ROM. The test microcode, patterns, and golden signature value for each interval is stored in ROM.

Detailed information of the ROM microcode is available at ROM.

21.7.4.2 FSM and Sequence Control

This block generates the signals and data to OPMISR controller based on the test type and scan chain depth. The sequence of operation per interval is defined in Section 21.7.4.6.

21.7.4.2.1 Clock Control

The CLOCK CNTRL sub-block handles the clock selection and clock generation for ROM, OPMISR controller, and BIST'ed CORE clocks.

21.7.4.2.2 MISR Compare Block

At the end of the each self-test interval, an 896-bit MISR value from the OPMISR controller is shifted into NSTC. This is compared with the MISR_GOLDEN value, which is copied into a buffered register before the start of the interval. The result is updated into the status registers.

21.7.4.3 Register Block

This block implements the user-programmable control registers that determine when to start a self test, at what clock frequency the scan test should be performed, which segment to be selected for the test, how many pattern intervals to be completed before stopping, and so forth.

The register block also captures various status information of the self test for the user.

21.7.4.4 STC Bypass / ATE Interface

This is a production test interface. This section bypasses the self-test FSM. The OPMISR signal interface is brought out directly to the module ports, and these are accessible to the ATE (tester) at the device level using the test controller module. The intent of the block is to provide capability for fault isolation for parts failing the logic self test run.

This block receives two sets of signals; one from the device test controller, and another similar set from the self-test FSM (test sequencer). The bypass indicator signal is used to select one of the two sets of signals to be routed to the OPMISR controller.

21.7.4.5 VBUSP Interface

The control and the status registers of the STC module can be accessed through the VBUSP interface. During application programming, configuration registers are programmed through the peripheral interface, to enable and run the self-test controller.

21.7.4.6 STC Flow

The ROM contains the data to be processed by STC for the self-test run. This includes the control fields such as Segment ID, Pattern Count, and Golden MISR value for the STC, and the pattern scan data for the OPMISR controller.

The ROM space is divided into chunks, with each chunk containing the data corresponding to one OPMISR interval. The size required for an interval varies depending on the number patterns packed into the interval and the length of internal scan chains required.

Because each interval requires 64 rows of ROM for storing control and Golden MISR values, minimizing the number of intervals by packing more patterns into each interval provides the best ROM size. This works best if the self-test must be run only as a part of the boot-up sequence. However, if the self-test is performed during application IDLE time, the number of patterns that can be packed into each interval will be dictated by the IDLE time available for the self-test, because an interval is the smallest granularity of a self-test run.

Details of the ROM image micro-code fields are given in the following sections.

21.7.4.7.1 TR_T: Transition Delay Methodology Type

This specifies the transition delay methodology for the current transition delay interval.

0	Launch-on-System-Clock

21.7.4.7.2 FT: Fault Model for the BIST Run

This specifies the fault model for the current interval of the test.

0	Stuck-at

21.7.4.7.3 SEG_ID[1:0]

This indicates which logical segment is selected for the associated interval during the self-test run.

SEG_SEL[1:0]	Segment Under Test
00	Segment 0
01	Segment 1
10	Segment 2
11	Segment 3

21.7.4.7.4 Pattern Count (patt_count[9:0])

This specifies the number of scan data patterns within a self-test interval. The pattern counts can vary from a minimum of 2 to a maximum of 1024.

patt_count[9:0]	Patterns per Interval
00_0000_0000	Not a valid interval [defaults to 2 patterns per interval]
00_0000_0001	2 patterns per interval
00_0000_0010	3 patterns per interval
...	...
11_1111_1110	1023 patterns per interval
11_1111_1111	1024 patterns per interval

21.7.4.7.5 MISR_GOLDEN[895:0]: Golden Signature Data Bits

This part of ROM contains the golden signature data of the current interval. This value is used to compare with the actual MISR value, when ST_GCR1.ROM_ACCESS_INV=0 and ST_GCR1.LP_SCAN_MODE=0, to generate the pass/fail information of the interval.

21.7.4.7.6 LP_MISR_GOLDEN[895:0]: Low Power Mode Golden Signature Data Bits

This part of ROM contains the LP golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM_ACCESS_INV=0 and STCGCR1.LP_SCAN_MODE=1, to generate the pass/fail information of the interval.

21.7.4.7.7 INV_MISR_GOLDEN[895:0]: Inverse Mode Golden Signature Data Bits

This part of ROM contains the inverse mode golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM_ACCESS_INV=1 and STCGCR1.LP_SCAN_MODE=0, to generate the pass/fail information of the interval.

21.7.4.7.8 LP_INV_MISR_GOLDEN[895:0]: Low Power Inverse Mode Golden Signature Data Bits

This part of ROM contains the low-power inverse mode golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM_ACCESS_INV=1 and STCGCR1.LP_SCAN_MODE=1, to generate the pass/fail information of the interval.

21.7.4.7.9 Pn_SDm[7:0] (n - no. of patterns, m - scan chain length): OP-MISR Scan Data

This part of the ROM contains the scan data corresponding to each pattern. Each interval can have n number of scan patterns, as defined in the patt_count field. The number of 7bits of scan data in a pattern is equal to the length of the scan chain formed inside the UUT.

21.7.5 STC Registers

Table 21-221 lists the memory-mapped registers for the STC registers. These registers are applicable for the R5F_STC, DSP_STC, and HSM_STC. All register offset addresses not listed in Table 21-221 should be considered as reserved locations and the register contents should not be modified.

Complex bit access types are encoded to fit into small table cells. Table 21-222 shows the codes that are used for access types in this section.

Table 21-222. STC Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

21.7.5.1 STCGCR0 Register (Offset = 0h) [Reset = 00000000h]

STCGCR0 is shown in Table 21-223.

Return to the Summary Table.

Self test Global control Reg0. *NOT BYTE ACCESSIBLE

Table 21-223. STCGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	INTCOUNT_B16	R/W	0h	Number of intervals of the self test run (RWP - Read, Priviledge Mode Write only) Count of intervals that need to be covered for a specific selftest run. The selftest controller sends out “complete” indication once it runs all of the intervals programmed in this field. INTCOUNT_B 16= 0 is an invalid configuration for a selftest.
15-11	NU0	R	0h	Reserved bits
10-8	CAP_IDLE_CYCLE	R/W	0h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only) Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7-5	SCANEN_HIGH_CAP_IDLE_CYCLE	R/W	0h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only). *NOT BYTE ACCESSIBLE Idle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock (scan_en going high to func_clk_en generation) and misr_log_clk (scan_en going high to misr_log_en generation) generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
4-2	NU1	R	0h	Reserved bits
1-0	RS_CNT_B1	R/W	0h	Restart/Continue or preload (RWP - Read, Priviledge Mode Write only) This bit specifies the selftest controller whether to continue the run from next interval onwards, restart from ROM address 0 or preload from a prescribed interval. This bit gets reset after the completion of selftest run. 00 = Continue NSTC run from previous interval 01 = Restart NSTC run from ROM address 0 1X = Start from segment number specified in STC_SEGPLR register

21.7.5.2 STCGCR1 Register (Offset = 4h) [Reset = 00000000h]

STCGCR1 is shown in Table 21-224.

Return to the Summary Table.

Self test Global control Reg1

Table 21-224. STCGCR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	NU2	R	0h	Reserved bits
11-8	SEG0_CORE_SEL	R/W	0h	Selects the Segment 0 CORE for self test (RWP - Read, Priviledge Mode Write only) Select the Segment 0 CORE for Self -Test 0001 = Select CORE for selftest Other = CORE not selected.
7	NU3	R	0h	Reserved bits
6	CODEC_SPREAD_MODE	R/W	0h	Codec Spread Mode control signal (RWP - Read, Priviledge Mode Write only) This bit is used to configure the codec in spread / X-OR mode. 1 = Spread mode 0 = XOR mode
5	LP_SCAN_MODE	R/W	0h	LP scan mode (RWP - Read, Priviledge Mode Write only) This bit is used to decide the scan configuration: 1 = Operates in Low Power Scan Mode. 0 = Operates in Normal Scan Mode.
4	ROM_ACCESS_INV	R/W	0h	Rom access inversion mode (RWP - Read, Priviledge Mode Write only) - NOT SUPPORTED
3-0	ST_ENA_B4	R/W	0h	Self test enable key (RWP - Read, Priviledge Mode Write only) 1010 = Self test run enabled All values other than 1010 = Self test run disabled

21.7.5.3 STCTPR Register (Offset = 8h) [Reset = 00000000h]

STCTPR is shown in Table 21-225.

Return to the Summary Table.

Time out counter preload register

Table 21-225. STCTPR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TO_PRELOAD	R/W	0h	Self test time out preload (RWP - Read, Priviledge Mode Write only) This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run. This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective. This register value (preload count value) gets loaded into the self test timeout down counter whenever a self test run is initiated (ST_ENA is enabled). and gets disabled on completion of a self test run.

21.7.5.4 STC_CADDR Register (Offset = Ch) [Reset = 00000000h]

STC_CADDR is shown in Table 21-226.

Return to the Summary Table.

Current Address register for CORE1

Table 21-226. STC_CADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADDR	R	0h	Current ROM Address for CORE1 This register reflects the current ROM address (for micro code load) accessed during selftest for CORE1 in of case segment0 and all the remaining segmentsn where n = 1 to 3).

21.7.5.5 STCCICR Register (Offset = 10h) [Reset = 00000000h]

STCCICR is shown in Table 21-227.

Return to the Summary Table.

Current Interval count register

Table 21-227. STCCICR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	CORE2_ICOUNT	R	0h	Specifies the last interval number for CORE2 This specifies the Last executed Interval number for CORE2 of Segment0 if self test is being executed for secondary core as well. This field is applicable only for Segment 0.
15-0	CORE1_ICOUNT	R	0h	Specifies the last interval number for CORE1 This specifies the Last executed Interval number of a self-test run.

21.7.5.6 STCGSTAT Register (Offset = 14h) [Reset = 00000000h]

STCGSTAT is shown in Table 21-228.

Return to the Summary Table.

Global Status Register

Table 21-228. STCGSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	NU4	R	0h	Reserved bits
11-8	ST_ACTIVE	R	0h	Tells whether self test is currently active or not. 1010 = Self test is active Others = SelfTest is not active Once the self-test completes and ST_ENA_B 4 key is cleared, this field will reflect the inactive value.
7-2	NU5	R	0h	Reserved bits
1	TEST_FAIL	R	0h	Test_fail flag (RCP - Read, Clear on Writing in Priviledge Mode) 0 = Self test run has not failed 1 = SelfTest run has failed. Write Clear.
0	TEST_DONE	R	0h	Test_done_flag (RCP - Read, Clear on Writing in Priviledge Mode) 0 = Not completed 1 = SelfTest run Completed

21.7.5.7 STCFSTAT Register (Offset = 18h) [Reset = 00000000h]

STCFSTAT is shown in Table 21-229.

Return to the Summary Table.

Fail Status Register

Table 21-229. STCFSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	NU6	R	0h	Reserved bits
4-3	FSEG_ID	R	0h	Failed Segment ID (RCP - Read, Clear on Writing in Priviledge Mode) This field captures the Segment number for which any of the failures like TO_ER_B 1, CPU 1_FAIL_B 1 and CPU 2_FAIL_B 1 occur. 00 = Failure on Segment 0 01 = Failure on Segment 1 10 = Failure on Segment 2 11 = Failure on Segment 3
2	TO_ER_B1	R	0h	Tells whether self test failed because of time out error (RCP - Read, Clear on Writing in Priviledge Mode) 0 = No time out error occurred 1 = SelfTest run failed due to a timeout error
1	CPU2_FAIL_B1	R	0h	Tells whether MISR mismatch happenned in CORE 2 when in Segment 0 mode (RCP - Read, Clear on Writing in Priviledge Mode) 0 = No MISR mismatch for CORE 2 1 = Self test run failed due to MISR mismatch for CORE 2
0	CPU1_FAIL_B1	R	0h	Tells whether MISR mismatch happenned in CORE 1 (RCP - Read, Clear on Writing in Priviledge Mode) Applicable to all segments. 0 = No MISR mismatch for CORE 1 1 = Self test run failed due to MISR mismatch for CORE 1

21.7.5.8 STCSCSCR Register (Offset = 1Ch) [Reset = 00000000h]

STCSCSCR is shown in Table 21-230.

Return to the Summary Table.

Signature compare Self Check Register

Table 21-230. STCSCSCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	NU7	R	0h	Reserved bits
4	FAULT_INS_B1	R/W	0h	Fault Insertion bit (RWP - Read, Priviledge Mode Write only) 0 = No fault insertion. 1 = Inserts fault in the logic unedr test which will make signature compare fail. This feature is used as diagnostic check of the STC IP.
3-0	SELF_CHECK_KEY_B4	R/W	0h	Signature compare logic self check key enable/disable (RWP - Read, Priviledge Mode Write only) 1010 = Signature compare logic Self Check is enabled All values other than 1010 = Signature compare logic Self Check is disabled

21.7.5.9 STC_CADDR2 Register (Offset = 20h) [Reset = 00000000h]

STC_CADDR2 is shown in Table 21-231.

Return to the Summary Table.

Current Address register for CORE2

Table 21-231. STC_CADDR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADDR	R	0h	Current ROM Address for CORE2 This register reflects the current ROM address(for micro code load) accessed during selftest for CORE2 in of case segment0.

21.7.5.10 STC_CLKDIV Register (Offset = 24h) [Reset = 00000000h]

STC_CLKDIV is shown in Table 21-232.

Return to the Summary Table.

Clock Divider Register

Table 21-232. STC_CLKDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	NU8	R	0h	Reserved bits
26-24	CLKDIV0	R/W	0h	Clock division for Seg0 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 0
23-19	NU9	R	0h	Reserved bits
18-16	CLKDIV1	R/W	0h	Clock division for Seg1 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 1
15-11	NU10	R	0h	Reserved bits
10-8	CLKDIV2	R/W	0h	Clock division for Seg2 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 2
7-3	NU11	R	0h	Reserved bits
2-0	CLKDIV3	R/W	0h	Clock division for Seg3 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 3

21.7.5.11 STC_SEGPLR Register (Offset = 28h) [Reset = 00000000h]

STC_SEGPLR is shown in Table 21-233.

Return to the Summary Table.

Segment 1st interval Preload Register

Table 21-233. STC_SEGPLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU12	R	0h	Reserved bits
1-0	SEGID_PLOAD	R/W	0h	Segment number for which preload is to be started (RWP - Read, Priviledge Mode Write only) This specifies the segment for which the address of its First interval will be pre-loaded into the NSTC ROM address counter. The 1st address of each segment are defined in SEGx_START_ADDR register.The address of the 1st interval of the selected segment is loaded into the NSTC ROM address counter when the RS_CNT_B 1 bits of STC_GCR 0 are set to 1X 00 = Preload the address of the 1st interval of segment 0. 01 = Preload the address of the 1st interval of segment 1. 10 = Preload the address of the 1st interval of segment 2. 11 = Preload the address of the 1st interval of segment 3.

21.7.5.12 SEG0_START_ADDR Register (Offset = 2Ch) [Reset = 00000000h]

SEG0_START_ADDR is shown in Table 21-234.

Return to the Summary Table.

ROM Start address for Segment0

Table 21-234. SEG0_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU13	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 0 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) “PRELOAD” option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR

21.7.5.13 SEG1_START_ADDR Register (Offset = 30h) [Reset = 00000000h]

SEG1_START_ADDR is shown in Table 21-235.

Return to the Summary Table.

ROM Start address for Segment1

Table 21-235. SEG1_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU14	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 1 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) “PRELOAD” option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR. This register is present only when RTL parameter NUM_SEG = 1.

21.7.5.14 SEG2_START_ADDR Register (Offset = 34h) [Reset = 00000000h]

SEG2_START_ADDR is shown in Table 21-236.

Return to the Summary Table.

ROM Start address for Segment2

Table 21-236. SEG2_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU15	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 2 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) “PRELOAD” option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR. This register is present only when RTL parameter NUM_SEG = 2.

21.7.5.15 SEG3_START_ADDR Register (Offset = 38h) [Reset = 00000000h]

SEG3_START_ADDR is shown in Table 21-237.

Return to the Summary Table.

ROM Start address for Segment3

Table 21-237. SEG3_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU16	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 3 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) “PRELOAD” option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR. This register is present only when RTL parameter NUM_SEG = 3.

21.7.5.16 CORE1_CURMISR_0 Register (Offset = 3Ch) [Reset = 00000000h]

CORE1_CURMISR_0 is shown in Table 21-238.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-238. CORE1_CURMISR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR0	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.17 CORE1_CURMISR_1 Register (Offset = 40h) [Reset = 00000000h]

CORE1_CURMISR_1 is shown in Table 21-239.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-239. CORE1_CURMISR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR1	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.18 CORE1_CURMISR_2 Register (Offset = 44h) [Reset = 00000000h]

CORE1_CURMISR_2 is shown in Table 21-240.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-240. CORE1_CURMISR_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR2	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.19 CORE1_CURMISR_3 Register (Offset = 48h) [Reset = 00000000h]

CORE1_CURMISR_3 is shown in Table 21-241.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-241. CORE1_CURMISR_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR3	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.20 CORE1_CURMISR_4 Register (Offset = 4Ch) [Reset = 00000000h]

CORE1_CURMISR_4 is shown in Table 21-242.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-242. CORE1_CURMISR_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR4	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.21 CORE1_CURMISR_5 Register (Offset = 50h) [Reset = 00000000h]

CORE1_CURMISR_5 is shown in Table 21-243.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-243. CORE1_CURMISR_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR5	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.22 CORE1_CURMISR_6 Register (Offset = 54h) [Reset = 00000000h]

CORE1_CURMISR_6 is shown in Table 21-244.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-244. CORE1_CURMISR_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR6	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.23 CORE1_CURMISR_7 Register (Offset = 58h) [Reset = 00000000h]

CORE1_CURMISR_7 is shown in Table 21-245.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-245. CORE1_CURMISR_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR7	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.24 CORE1_CURMISR_8 Register (Offset = 5Ch) [Reset = 00000000h]

CORE1_CURMISR_8 is shown in Table 21-246.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-246. CORE1_CURMISR_8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR8	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.25 CORE1_CURMISR_9 Register (Offset = 60h) [Reset = 00000000h]

CORE1_CURMISR_9 is shown in Table 21-247.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-247. CORE1_CURMISR_9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR9	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.26 CORE1_CURMISR_10 Register (Offset = 64h) [Reset = 00000000h]

CORE1_CURMISR_10 is shown in Table 21-248.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-248. CORE1_CURMISR_10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR10	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.27 CORE1_CURMISR_11 Register (Offset = 68h) [Reset = 00000000h]

CORE1_CURMISR_11 is shown in Table 21-249.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-249. CORE1_CURMISR_11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR11	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.28 CORE1_CURMISR_12 Register (Offset = 6Ch) [Reset = 00000000h]

CORE1_CURMISR_12 is shown in Table 21-250.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-250. CORE1_CURMISR_12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR12	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.29 CORE1_CURMISR_13 Register (Offset = 70h) [Reset = 00000000h]

CORE1_CURMISR_13 is shown in Table 21-251.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-251. CORE1_CURMISR_13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR13	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.30 CORE1_CURMISR_14 Register (Offset = 74h) [Reset = 00000000h]

CORE1_CURMISR_14 is shown in Table 21-252.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-252. CORE1_CURMISR_14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR14	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.31 CORE1_CURMISR_15 Register (Offset = 78h) [Reset = 00000000h]

CORE1_CURMISR_15 is shown in Table 21-253.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-253. CORE1_CURMISR_15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR15	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.32 CORE1_CURMISR_16 Register (Offset = 7Ch) [Reset = 00000000h]

CORE1_CURMISR_16 is shown in Table 21-254.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-254. CORE1_CURMISR_16 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR16	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.33 CORE1_CURMISR_17 Register (Offset = 80h) [Reset = 00000000h]

CORE1_CURMISR_17 is shown in Table 21-255.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-255. CORE1_CURMISR_17 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR17	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.34 CORE1_CURMISR_18 Register (Offset = 84h) [Reset = 00000000h]

CORE1_CURMISR_18 is shown in Table 21-256.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-256. CORE1_CURMISR_18 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR18	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.35 CORE1_CURMISR_19 Register (Offset = 88h) [Reset = 00000000h]

CORE1_CURMISR_19 is shown in Table 21-257.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-257. CORE1_CURMISR_19 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR19	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.36 CORE1_CURMISR_20 Register (Offset = 8Ch) [Reset = 00000000h]

CORE1_CURMISR_20 is shown in Table 21-258.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-258. CORE1_CURMISR_20 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR20	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.37 CORE1_CURMISR_21 Register (Offset = 90h) [Reset = 00000000h]

CORE1_CURMISR_21 is shown in Table 21-259.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-259. CORE1_CURMISR_21 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR21	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.38 CORE1_CURMISR_22 Register (Offset = 94h) [Reset = 00000000h]

CORE1_CURMISR_22 is shown in Table 21-260.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-260. CORE1_CURMISR_22 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR22	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.39 CORE1_CURMISR_23 Register (Offset = 98h) [Reset = 00000000h]

CORE1_CURMISR_23 is shown in Table 21-261.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-261. CORE1_CURMISR_23 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR23	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.40 CORE1_CURMISR_24 Register (Offset = 9Ch) [Reset = 00000000h]

CORE1_CURMISR_24 is shown in Table 21-262.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-262. CORE1_CURMISR_24 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR24	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.41 CORE1_CURMISR_25 Register (Offset = A0h) [Reset = 00000000h]

CORE1_CURMISR_25 is shown in Table 21-263.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-263. CORE1_CURMISR_25 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR25	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.42 CORE1_CURMISR_26 Register (Offset = A4h) [Reset = 00000000h]

CORE1_CURMISR_26 is shown in Table 21-264.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-264. CORE1_CURMISR_26 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR26	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.43 CORE1_CURMISR_27 Register (Offset = A8h) [Reset = 00000000h]

CORE1_CURMISR_27 is shown in Table 21-265.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 21-265. CORE1_CURMISR_27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR27	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.44 CORE2_CURMISR_0 Register (Offset = ACh) [Reset = 00000000h]

CORE2_CURMISR_0 is shown in Table 21-266.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-266. CORE2_CURMISR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR0	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.45 CORE2_CURMISR_1 Register (Offset = B0h) [Reset = 00000000h]

CORE2_CURMISR_1 is shown in Table 21-267.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-267. CORE2_CURMISR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR1	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.46 CORE2_CURMISR_2 Register (Offset = B4h) [Reset = 00000000h]

CORE2_CURMISR_2 is shown in Table 21-268.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-268. CORE2_CURMISR_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR2	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.47 CORE2_CURMISR_3 Register (Offset = B8h) [Reset = 00000000h]

CORE2_CURMISR_3 is shown in Table 21-269.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-269. CORE2_CURMISR_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR3	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.48 CORE2_CURMISR_4 Register (Offset = BCh) [Reset = 00000000h]

CORE2_CURMISR_4 is shown in Table 21-270.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-270. CORE2_CURMISR_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR4	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.49 CORE2_CURMISR_5 Register (Offset = C0h) [Reset = 00000000h]

CORE2_CURMISR_5 is shown in Table 21-271.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-271. CORE2_CURMISR_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR5	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.50 CORE2_CURMISR_6 Register (Offset = C4h) [Reset = 00000000h]

CORE2_CURMISR_6 is shown in Table 21-272.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-272. CORE2_CURMISR_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR6	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.51 CORE2_CURMISR_7 Register (Offset = C8h) [Reset = 00000000h]

CORE2_CURMISR_7 is shown in Table 21-273.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-273. CORE2_CURMISR_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR7	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.52 CORE2_CURMISR_8 Register (Offset = CCh) [Reset = 00000000h]

CORE2_CURMISR_8 is shown in Table 21-274.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-274. CORE2_CURMISR_8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR8	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.53 CORE2_CURMISR_9 Register (Offset = D0h) [Reset = 00000000h]

CORE2_CURMISR_9 is shown in Table 21-275.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-275. CORE2_CURMISR_9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR9	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.54 CORE2_CURMISR_10 Register (Offset = D4h) [Reset = 00000000h]

CORE2_CURMISR_10 is shown in Table 21-276.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-276. CORE2_CURMISR_10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR10	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.55 CORE2_CURMISR_11 Register (Offset = D8h) [Reset = 00000000h]

CORE2_CURMISR_11 is shown in Table 21-277.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-277. CORE2_CURMISR_11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR11	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.56 CORE2_CURMISR_12 Register (Offset = DCh) [Reset = 00000000h]

CORE2_CURMISR_12 is shown in Table 21-278.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-278. CORE2_CURMISR_12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR12	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.57 CORE2_CURMISR_13 Register (Offset = E0h) [Reset = 00000000h]

CORE2_CURMISR_13 is shown in Table 21-279.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-279. CORE2_CURMISR_13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR13	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.58 CORE2_CURMISR_14 Register (Offset = E4h) [Reset = 00000000h]

CORE2_CURMISR_14 is shown in Table 21-280.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-280. CORE2_CURMISR_14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR14	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.59 CORE2_CURMISR_15 Register (Offset = E8h) [Reset = 00000000h]

CORE2_CURMISR_15 is shown in Table 21-281.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-281. CORE2_CURMISR_15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR15	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.60 CORE2_CURMISR_16 Register (Offset = ECh) [Reset = 00000000h]

CORE2_CURMISR_16 is shown in Table 21-282.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-282. CORE2_CURMISR_16 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR16	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.61 CORE2_CURMISR_17 Register (Offset = F0h) [Reset = 00000000h]

CORE2_CURMISR_17 is shown in Table 21-283.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-283. CORE2_CURMISR_17 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR17	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.62 CORE2_CURMISR_18 Register (Offset = F4h) [Reset = 00000000h]

CORE2_CURMISR_18 is shown in Table 21-284.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-284. CORE2_CURMISR_18 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR18	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.63 CORE2_CURMISR_19 Register (Offset = F8h) [Reset = 00000000h]

CORE2_CURMISR_19 is shown in Table 21-285.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-285. CORE2_CURMISR_19 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR19	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.64 CORE2_CURMISR_20 Register (Offset = FCh) [Reset = 00000000h]

CORE2_CURMISR_20 is shown in Table 21-286.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-286. CORE2_CURMISR_20 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR20	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.65 CORE2_CURMISR_21 Register (Offset = 100h) [Reset = 00000000h]

CORE2_CURMISR_21 is shown in Table 21-287.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-287. CORE2_CURMISR_21 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR21	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.66 CORE2_CURMISR_22 Register (Offset = 104h) [Reset = 00000000h]

CORE2_CURMISR_22 is shown in Table 21-288.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-288. CORE2_CURMISR_22 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR22	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.67 CORE2_CURMISR_23 Register (Offset = 108h) [Reset = 00000000h]

CORE2_CURMISR_23 is shown in Table 21-289.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-289. CORE2_CURMISR_23 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR23	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.68 CORE2_CURMISR_24 Register (Offset = 10Ch) [Reset = 00000000h]

CORE2_CURMISR_24 is shown in Table 21-290.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-290. CORE2_CURMISR_24 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR24	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.69 CORE2_CURMISR_25 Register (Offset = 110h) [Reset = 00000000h]

CORE2_CURMISR_25 is shown in Table 21-291.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-291. CORE2_CURMISR_25 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR25	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.70 CORE2_CURMISR_26 Register (Offset = 114h) [Reset = 00000000h]

CORE2_CURMISR_26 is shown in Table 21-292.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-292. CORE2_CURMISR_26 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR26	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.7.5.71 CORE2_CURMISR_27 Register (Offset = 118h) [Reset = 00000000h]

CORE2_CURMISR_27 is shown in Table 21-293.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 21-293. CORE2_CURMISR_27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR27	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

21.8 Programmable Built-In Self-Test (PBIST)

This section describes the programmable built-in self-test (PBIST) controller module used for testing the on-chip memories.

21.8.1 Overview

The PBIST (Programmable Built-In Self-Test) controller architecture provides a run-time-programmable memory BIST engine for varying levels of coverage across many embedded memory instances.

Name	Frame Address (Hex) Start	Frame Address (Hex) End	Size	Description
TOP_PBIST	0x02F7_9400	0x02F7_95CC	464Bytes	PBIST module configuration registers. This IP covers memory test for all memories excluding DSP L1P, L1D and associated TAG memories
DSS_DSP_PBIST	0x06F7_9000	0x06F7_91CC	464Bytes	PBIST module configuration registers. This IP covers memory test for all memories excluding DSP L1P, L1D and associated TAG memories

21.8.1.1 PBIST vs. Application Software-Based Testing

The PBIST architecture consists of a small coprocessor with a dedicated instruction set targeted specifically toward testing memories. This coprocessor executes test routines stored in the PBIST ROM and runs them on multiple on-chip memory instances. The on-chip memory configuration information is also stored in the PBIST ROM.

The PBIST Controller architecture offers significant advantages over tests running on the main processor (application software-based testing):

- Embedded CPUs have a long access path to memories outside the tightly-couple memory sub-system, while the PBIST controller has a dedicated path to the memories specifically for the self-test
- Embedded CPUs are designed for their targeted use and are often not easily programmed for memory test algorithms.
- The memory test algorithm code on embedded CPUs is typically significantly larger than that needed for PBIST.

- The embedded CPU is significantly larger than the PBIST controller.

21.8.1.2 PBIST Block Diagram

Figure 21-201 illustrates the basic PBIST blocks and its wrapper logic for the device.

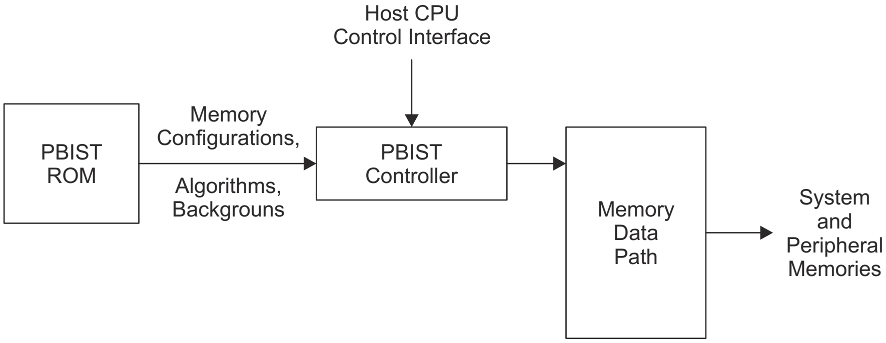

Figure 21-201. PBIST Block Diagram

21.8.1.2.1 On-chip ROM

The on-chip ROM contains the information regarding the algorithms and memories to be tested.

21.8.1.2.2 Host Processor Interface to the PBIST Controller Registers

The CPU can select the algorithm and RAM groups for the memories' self-test from the onchip ROM based on the application requirements. Once the self-test has executed, the CPU can query the PBIST controller registers to identify any memories that failed the self-test and to then take appropriate next steps as required by the application's author.

21.8.1.2.3 Memory Data Path

This is the read and write data path logic between different system and peripheral memories tightly coupled to the PBIST memory interface. The PBIST controller executes each selected algorithm on each valid memory group sequentially until all the algorithms are executed.

Note

NOTE: Not all algorithms are designed to run on all RAM groups. If an algorithm is selected to run on an incompatible memory, this will result in a failure. Refer to and for RAM grouping and algorithm information.

21.8.2 RAM/ROM Grouping and Algorithm

21.8.2.1 RAM Algorithm: March13N

This section provides a brief description for some of the test algorithms used for memory self-test.

-

- **March13N**:

– March13N is the baseline test algorithm for SRAM testing. It provides the highest overall coverage.

The other algorithms provide additional coverage of otherwise missed boundary conditions of the SRAM operation.

– The concept behind the general march algorithm is to indicate:

- The bits around the bit cell do not affect the bit cell.
- The bit cell can be written and read as both a 1 and a 0.

– The basic operation of the march is to initialize the array to a know pattern, then march a different pattern through the memory.

– Type of faults detected by this algorithm:

- Address decoder faults
- Stuck-At faults
- Coupled faults
- State coupling faults
- Parametric faults
- Write recovery faults
- Read/write logic faults

21.8.2.2 Read/write logic faults

The triple read reads the array, all the way through, three times while summing the reads to compare the sums for all three read formats. The algorithm checks if there is enough margin in both the erasure and programmation to operate at full speed with the CPU. This can be addressed with the XOR Read (Memory Contents XOR Memory Address). An error in the XOR Read indicates that the interaction between adjacent bit cells, being a different polarity, may be causing speed issues when the CPU exercises worstcase instruction sequencing. Each read can be performed on any memory block, and an associated checksum is calculated to determine PASS or FAIL.

Type of faults detected by this algorithm:

- Address decoder faults
- Stuck-At faults
- Coupled faults
- State coupling faults
- Parametric faults
- Read logic faults

21.8.2.3

Note

March13N is the most recommended algorithm for the memory self-test

---

21.8.3 PBIST Registers

Table 21-294 lists the memory-mapped registers for the PBIST registers. All register offset addresses not listed in Table 21-294 should be considered as reserved locations and the register contents should not be modified.

Table 21-294. PBIST Registers

Offset	Acronym	Register Name	Section
0h	RESERVED	Reserved	Go
164h	PBIST_DLR	Datalogger 0	Go
16Ch	PBIST_PC	Program Control	Go
180h	PBIST_PACT	Pbist Active	Go
188h	PBIST_OVR	PBIST Overrides	Go
190h	PBIST_FSFR0	Fail status fail - port 0	Go
194h	PBIST_FSFR1	Fail status fail - port 1	Go
1C0h	PBIST_ROM	Rom Mask	Go
1C4h	PBIST_ALGO	ROM Algorithm Mask 0	Go
1C8h	PBIST_RINFOL	RAM Info Mask Lower 0	Go
1CCh	PBIST_RINFOU	RAM Info Mask Upper 0	Go

Complex bit access types are encoded to fit into small table cells. Table 21-295 shows the codes that are used for access types in this section.

Table 21-295. PBIST Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

21.8.3.1 RESERVED Register (Offset = 0h) [Reset = 00000000h]

RESERVED is shown in Table 21-296.

Return to the Summary Table.

Reserved

Table 21-296. RESERVED Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R	0h	Reserved

21.8.3.2 PBIST_DLR Register (Offset = 164h) [Reset = 0208h]

PBIST_DLR is shown in Table 21-297.

Return to the Summary Table.

Datalogger 0

Table 21-297. PBIST_DLR Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	DLR1	R/W	2h	Datalogger Register [8] : Reserevd [9] : Default Testing Mode. When in this mode, ROM-based testing is kicked off. If the intention is to perform go/no-go testing via config, write to both this bit and bit [2] of the Datalogger Register simultaneously [15:10] : Reserevd
7-0	DLR0	R/W	8h	Datalogger Register [1:0] : Reserved [2] : ROM-based testing mode. Setting this bit to 1 enables the PBIST controller to execute test algorithms that are stored in the PBIST ROM [3] : Do not change this bit from its default value of 1 [4] : Config access mode. Setting this bit allows the host processor to configure the PBIST controller registers [7:5] : Reserved

21.8.3.3 PBIST_PC Register (Offset = 16Ch) [Reset = 00h]

PBIST_PC is shown in Table 21-298.

Return to the Summary Table.

Program Control

Table 21-298. PBIST_PC Register Field Descriptions

Bit	Field	Type	Reset	Description
4-0	PBIST_PC	R/W	0h	TI Internal Register.Reserved for HW RnD

21.8.3.4 PBIST_PACT Register (Offset = 180h) [Reset = 0h]

PBIST_PACT is shown in Table 21-299.

Return to the Summary Table.

Pbist Active

Table 21-299. PBIST_PACT Register Field Descriptions

Bit	Field	Type	Reset	Description
0	PBIST_PACT	R/W	0h	Pbist Active/ROM Clock Enable Register [0]: This bit must be set to turn on internal PBIST clocks. Setting this bit asserts an internal signal that is used as the clock gate enable. As long as this bit is 0, any access to PBIST will not go through, and PBIST will remain in an almost zero-power mode. Value 0 = Disable internal PBIST clocks Value 1 = Enable internal PBIST clocks

21.8.3.5 PBIST_OVR Register (Offset = 188h) [Reset = 0h]

PBIST_OVR is shown in Table 21-300.

Return to the Summary Table.

PBIST Overrides

Table 21-300. PBIST_OVR Register Field Descriptions

Bit	Field	Type	Reset	Description
3-0	PBIST_OVR	R/W	0h	TI Internal Register.Reserved for HW RnD

21.8.3.6 PBIST_FSFR0 Register (Offset = 190h) [Reset = 00000000h]

PBIST_FSFR0 is shown in Table 21-301.

Return to the Summary Table.

Fail status fail - port 0

Table 21-301. PBIST_FSFR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	TI Internal Register.Reserved for HW RnD
0	PBIST_FSFR0	R	0h	Fail Status Fail Register- Port 0 This register indicates if a failure occurred during a memory self-test. Value 0 = No failure occurred Value 1 = Indicates a failure

21.8.3.7 PBIST_FSFR1 Register (Offset = 194h) [Reset = 00000000h]

PBIST_FSFR1 is shown in Table 21-302.

Return to the Summary Table.

Fail status fail - port 1

Table 21-302. PBIST_FSFR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	TI Internal Register.Reserved for HW RnD
0	PBIST_FSFR1	R	0h	Fail Status Fail Register- Port 1 This register indicates if a failure occurred during a memory self-test. Value 0 = No failure occurred Value 1 = Indicates a failure

21.8.3.8 PBIST_ROM Register (Offset = 1C0h) [Reset = 3h]

PBIST_ROM is shown in Table 21-303.

Return to the Summary Table.

Rom Mask

Table 21-303. PBIST_ROM Register Field Descriptions

Bit	Field	Type	Reset	Description
1-0	PBIST_ROM	R/W	3h	Rom Mask . This two-bit register sets appropriate ROM access modes for the PBIST controller. Value 0h = No information is used from ROM Value 1h = Only RAM Group information from ROM Vaule 2h = Only Algorithm information from ROM Value 3h = Both Algorithm and RAM information from ROM. This option should be selected for application self-test.

21.8.3.9 PBIST_ALGO Register (Offset = 1C4h) [Reset = FFFFFFFFh]

PBIST_ALGO is shown in Table 21-304.

Return to the Summary Table.

ROM Algorithm Mask 0

Table 21-304. PBIST_ALGO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	ALGO3	R/W	FFh	This register is used to indicate the algorithm(s) to be used for the memory self-test routine. Each bit corresponds to a specific algorithm. Writing a value 1 to the particular bit, enables the corresponding algorithm. Writing a value 0 to the particular bit, disables the corresponding algorithm.
23-16	ALGO2	R/W	FFh	This register is used to indicate the algorithm(s) to be used for the memory self-test routine. Each bit corresponds to a specific algorithm. Writing a value 1 to the particular bit, enables the corresponding algorithm. Writing a value 0 to the particular bit, disables the corresponding algorithm.
15-8	ALGO1	R/W	FFh	This register is used to indicate the algorithm(s) to be used for the memory self-test routine. Each bit corresponds to a specific algorithm. Writing a value 1 to the particular bit, enables the corresponding algorithm. Writing a value 0 to the particular bit, disables the corresponding algorithm.
7-0	ALGO0	R/W	FFh	This register is used to indicate the algorithm(s) to be used for the memory self-test routine. Each bit corresponds to a specific algorithm. Writing a value 1 to the particular bit, enables the corresponding algorithm. Writing a value 0 to the particular bit, disables the corresponding algorithm.

21.8.3.10 PBIST_RINFOL Register (Offset = 1C8h) [Reset = FFFFFFFFh]

PBIST_RINFOL is shown in Table 21-305.

Return to the Summary Table.

RAM Info Mask Lower 0

Table 21-305. PBIST_RINFOL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RINFOL3	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
23-16	RINFOL2	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
15-8	RINFOL1	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
7-0	RINFOL0	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.

21.8.3.11 PBIST_RINFOU Register (Offset = 1CCh) [Reset = FFFFFFFFh]

PBIST_RINFOU is shown in Table 21-306.

Return to the Summary Table.

RAM Info Mask Upper 0

Table 21-306. PBIST_RINFOU Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RINFOU3	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
23-16	RINFOU2	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
15-8	RINFOU1	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
7-0	RINFOU0	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.

Chapter 22

GPADC

22.1 GPADC Overview

The AWR294x device implements a GPADC module on MainSS for safety monitoring the inputs, such as the temp sensor, voltage regulators, and so forth; both external and internal to the device. Features supported by the ADC module include:

- 10-bit ENOB 625Ksps ADC
- Full-scale range of GPADC input between 0 V and 1.8 V
- 9 external I/Os and internal components -temperature sensors (3), supplies, bias reference, LDO output mapped to GPADC input
- Total capacitance, including parasitic and sampling cap, for each of GPADC pins be less than 14pf
- Single conversion mode
- Event pin and software command mechanism to trigger the conversion
  - Event signal from either of the GPIO (provides options with pinmuxing) as well as from RTI timer module
- Data RAM to store the conversion results (1K results)
- Storage of min, max, and sum of the samples captured per channel
- Mechanism to skip initial M samples and program the number of samples N to be collected every channel
- Instruction PARAMs RAM to program the channels is monitored
- Mechanism to execute the instruction PARAMs in a circular manner without any CPU intervention
- DMA trigger when conversion is completed or data RAM threshold is achieved
- Self-test logic support for input channel failure detection (open / short to power / short to ground)
- Calibration logic using BGAP, for offset error correction
- Separate operating supply and ground pins on package
- Capability to have an external reference voltage for GPADC

Note

1. It is recommended to gate of the MSS_GPADC_CLK when not in operation. This gating will reduce the standard-cell activity around the transmitter and reduces the chance of interference.
2. Write 3b'111 to MSS_RCM:MSS_GPADC_CLK_GATE:MSS_GPADC_CLK_GATE_GATED gates the MSS_GPADC_CLK.

22.2 Functional Description Modes of Operation

22.2.1 IFM Mode (Inter Frame Monitoring Mode)

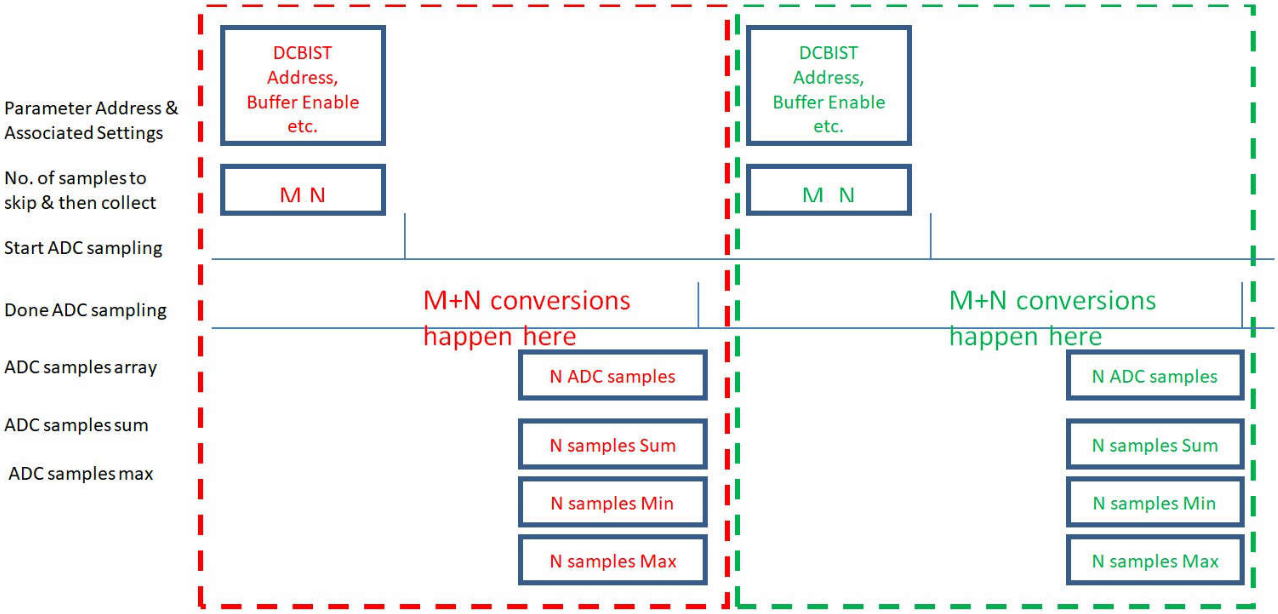

Figure 22-1. IFM Mode

Firmware writes the following register bit fields:

- Param_val_ifm
- Config_value_ifm
- Skip_samples_ifm(M)
- Collect_samples_ifm(N)
- Config settings in Analog
- ADC Reset =0
- ADC Enable =1
- ADC Start =1
- Firmware issues GPADC Trigger (self clearing bit)

Hardware skips M samples, collects N samples. Hardware outputs the sum, min, max of those samples in a register. Hardware outputs the actual array of samples in Data RAM (debug, if enabled). Each entry in the data RAM (256 deep) contains 4 ADC data samples, i.e. 1K ADC samples can be stored in the data RAM. Hardware issues a done interrupt.

22.3 Interrupts

The following interrupt is generated by GPADC:

- MSS_GPADC_IFM_DONE

22.4 GPADC Trigger Sources

22.4.1 IFM Mode

Writing 1’b1 to MSS_GPADC_REG::REG1:: GPADC_TRIGGER generates a trigger for IFM Mode to start.

22.5 MSS GPADC Register Specification

22.5.1 MSS_GPADC_REG Registers

Table 22-1 lists the MSS_GPADC_REG registers. All register offset addresses not listed in Table 22-1 should be considered as reserved locations and the register contents should not be modified.

Table 22-1. MSS_GPADC_REG Registers

Offset	Acronym	Register Name	Section

Chapter 23

LVDS

23.1 LVDS Overview

The LVDS interface includes the following signals:

- LVDS bit clock
- LVDS data lanes (the HSI integration chapter specific to the device lists the number of available lanes specific to the device)
- LVDS frame clock
- LVDS data_valid signal

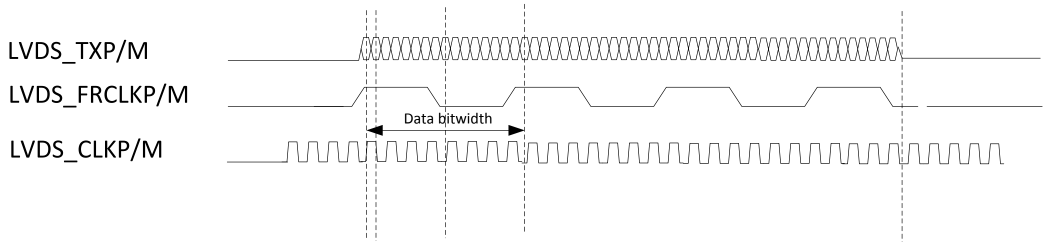

Figure 23-1. LVDS Interface Timings

The LVDS interface supports the following data rates(only DDR mode is supported):

- 900 Mbps (450-MHz DDR Clock)
- 600 Mbps (300-MHz DDR Clock)
- 450 Mbps (225-MHz DDR Clock)
- 400 Mbps (200-MHz DDR Clock)
- 300 Mbps (150-MHz DDR Clock)
- 225 Mbps (112.5-MHz DDR Clock)
- 150 Mbps (75-MHz DDR Clock)

Refer to the device data sheet for more details.

23.2 LVDS Programming Sequence

The following sections show the programming sequence needed before the hardware triggers are generated to initiate the high-speed LVDS data transmission.

23.2.1 LVDS Global Initialization

Table 23-1. Main Sequence – TOP_CTRL and Global Configuration

Steps	Register/Bit Field/Programming	Value
Power on the LVDS I/Os	MSS_TOP_CTRL. LVDS_PAD_CTRL0 MSS_TOP_CTRL. LVDS_PAD_CTRL1	0x0 0x0
Power off the LVDS I/Os	MSS_TOP_CTRL. LVDS_PAD_CTRL0 MSS_TOP_CTRL. LVDS_PAD_CTRL1	0x39393939 0x01003939
Power on the LVDS I/Os	MSS_TOP_CTRL. LVDS_PAD_CTRL0 MSS_TOP_CTRL. LVDS_PAD_CTRL1	0x0 0x0

23.2.2 CBUFF Configuration

Table 23-2. Main Sequence – CBUFF LVDS Static Configuration

Steps	Register/Bit Field/Programming	Value
Assert the CBUFF soft reset	CONFIG_REG_0.CSWCRST	0x1
Configure CBUFF for LVDS data transfer	CONFIG_REG_0.CFG_1LVDS_0CSI	0x1

Table 23-2. Main Sequence – CBUFF LVDS Static Configuration (continued)

Steps	Register/Bit Field/Programming	Value
Configure static values for LVDS	CONFIG_REG_0.CVC0EN	
	CFG_SPHDR_ADDRESS	0x55555555
	CFG_CMD_VSVAL	0x55555555
	CFG_CMD_VEVAL	0xAAAAAAAA
	CFG_LPHDR_ADDRESS	0xAAAAAAAA
	CFG_LVDS_GEN_0.CCSMEN	0x1
Configure the number of chirps in a frame	CFG_CHIRPS_PER_FRAME	X
Configure static values for LVDS based on LVDS CRC enabled or disabled	CFG_LVDS_GEN_0.CBCRCEN CFG_CMD_HEVAL CFG_CMD_HSVAL	X
Enable the LVDS lanes	CFG_LVDS_GEN_0.CFG_LVDS_LANE[X]_EN	0x1
Configure the alignment for start of samples	CFG_LVDS_GEN_0.CPOSSEL	0x-
Configure the LVDS FIFO initial threshold	CFG_LVDS_GEN_0.CFDLY	0x8
Set the 3C3L mode if the system configuration is interleaved 3 channel – 3 lane	CFG_LVDS_GEN_1.C3C3L	0x-
Configure the lane-mapping format registers	CFG_LVDS_MAPPING_LANE[X]_FMT_0 CFG_LVDS_MAPPING_LANE[X]_FMT_1	X
Release the CBUFF from soft reset	CONFIG_REG_0.CSWCRST	0x0

The configuration in should be performed for each linklist entry required to transmit the LVDS packet.

Table 23-3. Main Sequence – CBUFF Linklist

Steps	Register/Bit Field/Programming	Value
Set the valid for the linklist	CFG_DATA_LL[X].LL[X]_VALID	0x1
If the linklist is the start of a new LVDS packet	CFG_DATA_LL[X].LL[X]_LPHDR_EN CFG_DATA_LL[X].LL[X]_HS	0x-
Configure the long packet header to static value for LVDS	CFG_DATA_LL[X]_LPHDR_VAL	0xBBBBBBBB
If the linklist is the end of a LVDS packet	CFG_DATA_LL[X].LL[X]_HE	0x-
Configure the size in CBUFF units	CFG_DATA_LL[X].LL[X]_SIZE	X
Configure the format of the CSI2 packet to which the linklist belongs	CFG_DATA_LL[X].LL[X]_FMT	X
Select the LVDS format-mapping register for the LVDS packet	CFG_DATA_LL[X].LL[X]_FMT_MAP	0x-
Set the input format	CFG_DATA_LL[X].LL[X]_FMT_IN	X
Set the Linklist write threshold	CFG_DATA_LL[X]_THRESHOLD.LL[X]_WR_THRESHOLD	X
Set the Linklist read threshold	CFG_DATA_LL[X]_THRESHOLD.LL[X]_WR_THRESHOLD	X

23.3 CBUFF and LVDS Registers

23.3.1 DSS_CBUFF Registers

Table 23-4 lists the memory-mapped registers for the DSS_CBUFF registers. All register offset addresses not listed in Table 23-4 should be considered as reserved locations and the register contents should not be modified.

Table 23-4. DSS_CBUFF Registers

Offset	Acronym	Register Name	Section
0h	CONFIG_REG_0	CONFIG_REG_0	Go
4h	CFG_SPHDR_ADDRESS	CFG_SPHDR_ADDRESS	Go
8h	CFG_CMD_HSVAL	CFG_CMD_HSVAL	Go
Ch	CFG_CMD_HEVAL	CFG_CMD_HEVAL	Go
10h	CFG_CMD_VSVAL	CFG_CMD_VSVAL	Go
14h	CFG_CMD_VEVAL	CFG_CMD_VEVAL	Go

Complex bit access types are encoded to fit into small table cells. Table 23-5 shows the codes that are used for access types in this section.

Table 23-5. DSS_CBUFF Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

23.3.1.1 CONFIG_REG_0 Register (Offset = 0h) [Reset = 00000000h]

CONFIG_REG_0 is shown in Table 23-6.

Return to the Summary Table.

Basic Config register

Table 23-6. CONFIG_REG_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	dbussel	R/W	0h	TI Internal feature. 1 : This selects the debug bus mode transmission on LVDS
27	cswcrst	R/W	0h	CBUFF controller SW Reset 1 => RESET the CBUFF Controller 0 => RELEASE RESET for CBUFF Controller
26	cswlrst	R/W	0h	TI Internal Feature. LVDS logic SW Reset. Debug feature. 1 => RESET the FSM 0 => RELEASE RESET
25	CFG_FRAME_START_TRIG	SW Trigger generation : Write 1 to this bit to generate a Frame Start SW Trigger		
24	CFG_CHIRP_AVAIL_TRIG	SW Trigger generation : Write 1 to this bit to generate a Chirp Available SW Trigger		
23-20	CFG_VBUSP_BURST_EN	R/W	0h	TI Internal Feature. Only required for 900 Mbps 4 lane trasnmission CSI2 only Programming : 0xA : Burst Enable. Set this only for transmission at 900 Mbps Others : Burst disable.
19	dbusen	R/W	0h	TC2 Mode selection. TI Internal feature. 0 : Normal 1 : When in TC2 mode, setting this bit will enable debug bus to sent via LVDS
18	ccfwpen	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_CSI2_FIFO_WORDS_PROCESSING_EN 0 : Use the fifo_free_words directly from CSI2 by vbusp_mstr to decide how many more words to send. 1 : Process the fifo_free_words and use it by vbusp_mstr to decide how many more words to send.
17-16	cvc3en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 3 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 3 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 3 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 3 is generated at end of Frame

Table 23-6. CONFIG_REG_0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-14	cvc2en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 2 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 2 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 2 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 2 is generated at end of Frame
13-12	cvc1en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 1 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 1 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 1 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 1 is generated at end of Frame
11-10	cvc0en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 0 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 0 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 0 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 0 is generated at end of Frame
9	crdthsel	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_RDTHRESHOLD_SEL . This is a Debug feature. Not requred in Programming model 0 : The read threshold is selected based on the Write Side parsing engine 1 : The read threshold is selected based on the Read Side parsing engine.
8	ccfwlen	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_CSI2_FIFO_WORDS_LOAD_SW_EN. This is a Debug feature. Not requred in Programming model When CFG_CSI2_FIFO_WORDS_PROCESSING_EN==1 and CFG_CSI2_FIFO_WORDS_LOAD_SW_EN==1, then a fixed fifo_free_words from CSI2 is not used. Program the CFG_FIFO_FREE_THRESHOLD0 to 0x4
7-4	NU1	R	0h	
3	CFG_SW_TRIG_EN	R/W	0h	Select Chirp Available Trigger Source 0 : Chirp Available trigger will be generated by HW 1 : Chirp Available trigger will be generated by SW
2	cftrigen	R/W	0h	Select Frame Start Trigger Source 0 : Frame trigger will be generated by HW 1 : Frame trigger will be generated by SW
1	CFG_ECC_EN	R/W	0h	0 : Disable ECC on the CBUF FIFO 1 : Enable ECC on the CBUF FIFO
0	CFG_1LVDS_0CSI	R/W	0h	0 : Send data over CSI-2 1 : Send data over LVDS

23.3.1.2 CFG_SPHDR_ADDRESS Register (Offset = 4h) [Reset = 00000000h]

CFG_SPHDR_ADDRESS is shown in Table 23-7.

Return to the Summary Table.

Short Packet Header Address

Table 23-7. CFG_SPHDR_ADDRESS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_SPHDR_ADDRESS	R/W	0h	CSI2 Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_SHORT_PACKET_HEADER Address in the CSI Protocol Engine LVDS Programming : Configure with the static value : 0x55555555

23.3.1.3 CFG_CMD_HSVAL Register (Offset = 8h) [Reset = 00000000h]

CFG_CMD_HSVAL is shown in Table 23-8.

Return to the Summary Table.

HSYNC Value

Table 23-8. CFG_CMD_HSVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_HSVAL	R/W	0h	CSI2 Programming : Configure the HSync Start Short Packet Value LVDS Programming : If LVDS CRC is enabled : Configure with the static value : 0x55555555 If LVDS CRC is disbaled : Configure with the static value : 0xAAAAAAAA

23.3.1.4 CFG_CMD_HEVAL Register (Offset = Ch) [Reset = 00000000h]

CFG_CMD_HEVAL is shown in Table 23-9.

Return to the Summary Table.

HEND Value

Table 23-9. CFG_CMD_HEVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_HEVAL	R/W	0h	CSI2 Programming : Configure the HSync End Short Packet Value LVDS Programming : If LVDS CRC is enabled : Configure with the static value : 0x33333333 If LVDS CRC is disbaled : Configure with the static value : 0xAAAAAAAA

23.3.1.5 CFG_CMD_VSVAL Register (Offset = 10h) [Reset = 00000000h]

CFG_CMD_VSVAL is shown in Table 23-10.

Return to the Summary Table.

VSYNC Value

Table 23-10. CFG_CMD_VSVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_VSVAL	R/W	0h	CSI2 Programming : Configure the VSync Start Short Packet Value LVDS Programming : Configure with the static value : 0xAAAAAAAA

23.3.1.6 CFG_CMD_VEVAL Register (Offset = 14h) [Reset = 00000000h]

CFG_CMD_VEVAL is shown in Table 23-11.

Return to the Summary Table.

VEND Value

Table 23-11. CFG_CMD_VEVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_VEVAL	R/W	0h	CSI2 Programming : Configure the VSync End Short Packet Value LVDS Programming : Configure with the static value : 0xAAAAAAAA

23.3.1.7 CFG_LPHDR_ADDRESS Register (Offset = 18h) [Reset = 00000000h]

CFG_LPHDR_ADDRESS is shown in Table 23-12.

Return to the Summary Table.

Long Packet Address

Table 23-12. CFG_LPHDR_ADDRESS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_LPHDR_ADDRESS	R/W	0h	CSI2 Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_LONG_PACKET_HEADER Address in the CSI Protocol Engine LVDS Programming : Configure with the static value : 0x55555555

23.3.1.8 CFG_CHIRPS_PER_FRAME Register (Offset = 20h) [Reset = 00000000h]

CFG_CHIRPS_PER_FRAME is shown in Table 23-13.

Return to the Summary Table.

Number of Chirps per Frame

Table 23-13. CFG_CHIRPS_PER_FRAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CHIRPS_PER_FRAME	R/W	0h	Configure the number of Chirps in a Frame

23.3.1.9 CFG_FIFO_FREE_THRESHOLD Register (Offset = 24h) [Reset = 00000000h]

CFG_FIFO_FREE_THRESHOLD is shown in Table 23-14.

Return to the Summary Table.

CSI2 FIFO threshold for transferring data from CBUFF to CSI2

Table 23-14. CFG_FIFO_FREE_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	CFG_FIFO_FREE_THRESHOLD3	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO3 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
23-16	CFG_FIFO_FREE_THRESHOLD2	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO2 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
15-8	CFG_FIFO_FREE_THRESHOLD1	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO1 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
7-0	CFG_FIFO_FREE_THRESHOLD0	R/W	0h	CSI2 only Programming : Configure the threshold used to fill the FIFO0 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register

23.3.1.10 CFG_LPPYLD_ADDRESS Register (Offset = 28h) [Reset = 00000000h]

CFG_LPPYLD_ADDRESS is shown in Table 23-15.

Return to the Summary Table.

Long payload Address

Table 23-15. CFG_LPPYLD_ADDRESS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_LPPYLD_ADDRESS	R/W	0h	CSI2 only Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_LONG_PACKET_PAYLOAD Address in the CSI Protocol Engine

23.3.1.11 CFG_DELAY_CONFIG Register (Offset = 2Ch) [Reset = 00000000h]

CFG_DELAY_CONFIG is shown in Table 23-16.

Return to the Summary Table.

Delay Config Registers

Table 23-16. CFG_DELAY_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU	R	0h	
23-16	CFG_DATA_WR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Long packet Payload. This is a Debug feature. Not requred in Programming model
15-8	CFG_LPHDR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Long packet Header. This is a Debug feature. Not requred in Programming model
7-0	CFG_SPHDR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Short packet. This is a Debug feature. Not requred in Programming model

23.3.1.12 CFG_DATA_LL0 Register (Offset = 30h) [Reset = 00000000h]

CFG_DATA_LL0 is shown in Table 23-17.

Return to the Summary Table.

Payload Description : Linked list entry 0

Table 23-17. CFG_DATA_LL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL0_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL0_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL0_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL0_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL0_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL0_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL0_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL0_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL0_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL0_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL0_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL0_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL0_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL0_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL0_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.13 CFG_DATA_LL0_LPHDR_VAL Register (Offset = 34h) [Reset = 00000000h]

CFG_DATA_LL0_LPHDR_VAL is shown in Table 23-18.

Return to the Summary Table.

Payload Description : Linked list entry 0

Table 23-18. CFG_DATA_LL0_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL0_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.14 CFG_DATA_LL0_THRESHOLD Register (Offset = 38h) [Reset = 0000X0X0h]

CFG_DATA_LL0_THRESHOLD is shown in Table 23-19.

Return to the Summary Table.

Table 23-19. CFG_DATA_LL0_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll0dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL0_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL0_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.15 CFG_DATA_LL1 Register (Offset = 3Ch) [Reset = 00000000h]

CFG_DATA_LL1 is shown in Table 23-20.

Return to the Summary Table.

Table 23-20. CFG_DATA_LL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL1_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL1_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL1_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL1_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL1_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL1_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL1_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL1_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL1_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL1_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL1_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL1_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL1_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL1_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL1_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.16 CFG_DATA_LL1_LPHDR_VAL Register (Offset = 40h) [Reset = 00000000h]

CFG_DATA_LL1_LPHDR_VAL is shown in Table 23-21.

Return to the Summary Table.

Table 23-21. CFG_DATA_LL1_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL1_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.17 CFG_DATA_LL1_THRESHOLD Register (Offset = 44h) [Reset = 0000X0X0h]

CFG_DATA_LL1_THRESHOLD is shown in Table 23-22.

Return to the Summary Table.

Table 23-22. CFG_DATA_LL1_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll1dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL1_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL1_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.18 CFG_DATA_LL2 Register (Offset = 48h) [Reset = 00000000h]

CFG_DATA_LL2 is shown in Table 23-23.

Return to the Summary Table.

Table 23-23. CFG_DATA_LL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL2_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL2_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL2_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL2_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL2_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL2_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL2_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL2_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL2_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL2_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL2_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL2_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL2_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL2_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL2_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.19 CFG_DATA_LL2_LPHDR_VAL Register (Offset = 4Ch) [Reset = 00000000h]

CFG_DATA_LL2_LPHDR_VAL is shown in Table 23-24.

Return to the Summary Table.

Table 23-24. CFG_DATA_LL2_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL2_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.20 CFG_DATA_LL2_THRESHOLD Register (Offset = 50h) [Reset = 0000X0X0h]

CFG_DATA_LL2_THRESHOLD is shown in Table 23-25.

Return to the Summary Table.

Table 23-25. CFG_DATA_LL2_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll2dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL2_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL2_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.21 CFG_DATA_LL3 Register (Offset = 54h) [Reset = 00000000h]

CFG_DATA_LL3 is shown in Table 23-26.

Return to the Summary Table.

Table 23-26. CFG_DATA_LL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL3_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL3_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL3_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL3_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL3_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL3_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL3_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL3_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL3_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL3_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL3_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit

2	LL3_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL3_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL3_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.22 CFG_DATA_LL3_LPHDR_VAL Register (Offset = 58h) [Reset = 00000000h]

CFG_DATA_LL3_LPHDR_VAL is shown in Table 23-27.

Return to the Summary Table.

Table 23-27. CFG_DATA_LL3_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL3_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.23 CFG_DATA_LL3_THRESHOLD Register (Offset = 5Ch) [Reset = 0000X0X0h]

CFG_DATA_LL3_THRESHOLD is shown in Table 23-28.

Return to the Summary Table.

Table 23-28. CFG_DATA_LL3_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll3dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL3_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL3_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.24 CFG_DATA_LL4 Register (Offset = 60h) [Reset = 00000000h]

CFG_DATA_LL4 is shown in Table 23-29.

Return to the Summary Table.

Table 23-29. CFG_DATA_LL4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL4_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL4_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL4_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL4_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL4_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL4_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL4_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL4_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL4_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL4_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL4_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL4_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL4_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL4_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL4_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.25 CFG_DATA_LL4_LPHDR_VAL Register (Offset = 64h) [Reset = 00000000h]

CFG_DATA_LL4_LPHDR_VAL is shown in Table 23-30.

Return to the Summary Table.

Table 23-30. CFG_DATA_LL4_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL4_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.26 CFG_DATA_LL4_THRESHOLD Register (Offset = 68h) [Reset = 0000X0X0h]

CFG_DATA_LL4_THRESHOLD is shown in Table 23-31.

Return to the Summary Table.

Table 23-31. CFG_DATA_LL4_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll4dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL4_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL4_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.27 CFG_DATA_LL5 Register (Offset = 6Ch) [Reset = 00000000h]

CFG_DATA_LL5 is shown in Table 23-32.

Return to the Summary Table.

Table 23-32. CFG_DATA_LL5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL5_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model

29	LL5_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL5_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL5_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL5_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL5_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL5_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL5_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL5_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL5_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL5_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL5_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL5_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL5_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.28 CFG_DATA_LL5_LPHDR_VAL Register (Offset = 70h) [Reset = 00000000h]

CFG_DATA_LL5_LPHDR_VAL is shown in Table 23-33.

Return to the Summary Table.

Table 23-33. CFG_DATA_LL5_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL5_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.29 CFG_DATA_LL5_THRESHOLD Register (Offset = 74h) [Reset = 0000X0X0h]

CFG_DATA_LL5_THRESHOLD is shown in Table 23-34.

Return to the Summary Table.

Table 23-34. CFG_DATA_LL5_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll5dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL5_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL5_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.30 CFG_DATA_LL6 Register (Offset = 78h) [Reset = 00000000h]

CFG_DATA_LL6 is shown in Table 23-35.

Return to the Summary Table.

Table 23-35. CFG_DATA_LL6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL6_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL6_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL6_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL6_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL6_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL6_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL6_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL6_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL6_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL6_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL6_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL6_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL6_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL6_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL6_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.31 CFG_DATA_LL6_LPHDR_VAL Register (Offset = 7Ch) [Reset = 00000000h]

CFG_DATA_LL6_LPHDR_VAL is shown in Table 23-36.

Return to the Summary Table.

Table 23-36. CFG_DATA_LL6_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL6_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.32 CFG_DATA_LL6_THRESHOLD Register (Offset = 80h) [Reset = 0000X0X0h]

CFG_DATA_LL6_THRESHOLD is shown in Table 23-37.

Return to the Summary Table.

Table 23-37. CFG_DATA_LL6_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll6dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL6_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL6_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.33 CFG_DATA_LL7 Register (Offset = 84h) [Reset = 00000000h]

CFG_DATA_LL7 is shown in Table 23-38.

Return to the Summary Table.

Table 23-38. CFG_DATA_LL7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL7_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL7_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL7_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL7_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL7_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL7_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL7_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL7_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL7_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL7_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL7_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL7_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL7_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL7_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL7_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.34 CFG_DATA_LL7_LPHDR_VAL Register (Offset = 88h) [Reset = 00000000h]

CFG_DATA_LL7_LPHDR_VAL is shown in Table 23-39.

Return to the Summary Table.

Table 23-39. CFG_DATA_LL7_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL7_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.35 CFG_DATA_LL7_THRESHOLD Register (Offset = 8Ch) [Reset = 0000X0X0h]

CFG_DATA_LL7_THRESHOLD is shown in Table 23-40.

Return to the Summary Table.

Table 23-40. CFG_DATA_LL7_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll7dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL7_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL7_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.36 CFG_DATA_LL8 Register (Offset = 90h) [Reset = 00000000h]

CFG_DATA_LL8 is shown in Table 23-41.

Return to the Summary Table.

Table 23-41. CFG_DATA_LL8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL8_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL8_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL8_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL8_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL8_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL8_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL8_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL8_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL8_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL8_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL8_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL8_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL8_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL8_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL8_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.37 CFG_DATA_LL8_LPHDR_VAL Register (Offset = 94h) [Reset = 00000000h]

CFG_DATA_LL8_LPHDR_VAL is shown in Table 23-42.

Return to the Summary Table.

Table 23-42. CFG_DATA_LL8_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL8_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.38 CFG_DATA_LL8_THRESHOLD Register (Offset = 98h) [Reset = 0000X0X0h]

CFG_DATA_LL8_THRESHOLD is shown in Table 23-43.

Return to the Summary Table.

Table 23-43. CFG_DATA_LL8_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll8dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL8_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL8_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.39 CFG_DATA_LL9 Register (Offset = 9Ch) [Reset = 00000000h]

CFG_DATA_LL9 is shown in Table 23-44.

Return to the Summary Table.

Table 23-44. CFG_DATA_LL9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL9_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL9_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL9_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL9_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL9_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL9_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL9_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL9_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL9_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL9_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL9_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL9_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL9_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL9_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL9_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.40 CFG_DATA_LL9_LPHDR_VAL Register (Offset = A0h) [Reset = 00000000h]

CFG_DATA_LL9_LPHDR_VAL is shown in Table 23-45.

Return to the Summary Table.

Table 23-45. CFG_DATA_LL9_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL9_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.41 CFG_DATA_LL9_THRESHOLD Register (Offset = A4h) [Reset = 0000X0X0h]

CFG_DATA_LL9_THRESHOLD is shown in Table 23-46.

Return to the Summary Table.

Table 23-46. CFG_DATA_LL9_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll9dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL9_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL9_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.42 CFG_DATA_LL10 Register (Offset = A8h) [Reset = 00000000h]

CFG_DATA_LL10 is shown in Table 23-47.

Return to the Summary Table.

Table 23-47. CFG_DATA_LL10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL10_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model

29	LL10_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL10_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL10_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL10_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL10_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL10_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL10_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL10_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL10_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL10_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL10_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL10_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL10_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.43 CFG_DATA_LL10_LPHDR_VAL Register (Offset = ACh) [Reset = 00000000h]

CFG_DATA_LL10_LPHDR_VAL is shown in Table 23-48.

Return to the Summary Table.

Table 23-48. CFG_DATA_LL10_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL10_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.44 CFG_DATA_LL10_THRESHOLD Register (Offset = B0h) [Reset = 0000X0X0h]

CFG_DATA_LL10_THRESHOLD is shown in Table 23-49.

Return to the Summary Table.

Table 23-49. CFG_DATA_LL10_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll10dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL10_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL10_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.45 CFG_DATA_LL11 Register (Offset = B4h) [Reset = 00000000h]

CFG_DATA_LL11 is shown in Table 23-50.

Return to the Summary Table.

Table 23-50. CFG_DATA_LL11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL11_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL11_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL11_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL11_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL11_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL11_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL11_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL11_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL11_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL11_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL11_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL11_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL11_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL11_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL11_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.46 CFG_DATA_LL11_LPHDR_VAL Register (Offset = B8h) [Reset = 00000000h]

CFG_DATA_LL11_LPHDR_VAL is shown in Table 23-51.

Return to the Summary Table.

Table 23-51. CFG_DATA_LL11_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL11_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.47 CFG_DATA_LL11_THRESHOLD Register (Offset = BCh) [Reset = 0000X0X0h]

CFG_DATA_LL11_THRESHOLD is shown in Table 23-52.

Return to the Summary Table.

Table 23-52. CFG_DATA_LL11_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll11dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL11_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL11_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.48 CFG_DATA_LL12 Register (Offset = C0h) [Reset = 00000000h]

CFG_DATA_LL12 is shown in Table 23-53.

Return to the Summary Table.

Table 23-53. CFG_DATA_LL12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL12_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL12_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL12_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL12_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL12_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL12_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL12_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL12_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL12_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL12_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL12_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL12_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL12_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL12_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL12_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.49 CFG_DATA_LL12_LPHDR_VAL Register (Offset = C4h) [Reset = 00000000h]

CFG_DATA_LL12_LPHDR_VAL is shown in Table 23-54.

Return to the Summary Table.

Table 23-54. CFG_DATA_LL12_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL12_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.50 CFG_DATA_LL12_THRESHOLD Register (Offset = C8h) [Reset = 0000X0X0h]

CFG_DATA_LL12_THRESHOLD is shown in Table 23-55.

Return to the Summary Table.

Table 23-55. CFG_DATA_LL12_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll12dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL12_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL12_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.51 CFG_DATA_LL13 Register (Offset = CCh) [Reset = 00000000h]

CFG_DATA_LL13 is shown in Table 23-56.

Return to the Summary Table.

Table 23-56. CFG_DATA_LL13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL13_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model

29	LL15_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL15_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL15_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL15_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL15_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL15_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL15_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL15_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL15_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL15_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL15_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL15_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL15_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.58 CFG_DATA_LL15_LPHDR_VAL Register (Offset = E8h) [Reset = 00000000h]

CFG_DATA_LL15_LPHDR_VAL is shown in Table 23-63.

Return to the Summary Table.

Table 23-63. CFG_DATA_LL15_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL15_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.59 CFG_DATA_LL15_THRESHOLD Register (Offset = ECh) [Reset = 0000X0X0h]

CFG_DATA_LL15_THRESHOLD is shown in Table 23-64.

Return to the Summary Table.

Table 23-64. CFG_DATA_LL15_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll15dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL15_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL15_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.60 CFG_DATA_LL16 Register (Offset = F0h) [Reset = 00000000h]

CFG_DATA_LL16 is shown in Table 23-65.

Return to the Summary Table.

Table 23-65. CFG_DATA_LL16 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL16_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL16_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL16_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL16_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL16_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL16_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL16_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL16_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL16_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL16_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL16_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL16_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL16_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL16_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL16_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.61 CFG_DATA_LL16_LPHDR_VAL Register (Offset = F4h) [Reset = 00000000h]

CFG_DATA_LL16_LPHDR_VAL is shown in Table 23-66.

Return to the Summary Table.

Table 23-66. CFG_DATA_LL16_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL16_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.62 CFG_DATA_LL16_THRESHOLD Register (Offset = F8h) [Reset = 0000X0X0h]

CFG_DATA_LL16_THRESHOLD is shown in Table 23-67.

Return to the Summary Table.

Table 23-67. CFG_DATA_LL16_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll16dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL16_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL16_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.63 CFG_DATA_LL17 Register (Offset = FCh) [Reset = 00000000h]

CFG_DATA_LL17 is shown in Table 23-68.

Return to the Summary Table.

Table 23-68. CFG_DATA_LL17 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL17_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL17_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL17_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL17_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL17_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL17_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL17_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL17_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL17_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL17_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL17_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL17_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL17_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL17_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL17_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.64 CFG_DATA_LL17_LPHDR_VAL Register (Offset = 100h) [Reset = 00000000h]

CFG_DATA_LL17_LPHDR_VAL is shown in Table 23-69.

Return to the Summary Table.

Table 23-69. CFG_DATA_LL17_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL17_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.65 CFG_DATA_LL17_THRESHOLD Register (Offset = 104h) [Reset = 0000X0X0h]

CFG_DATA_LL17_THRESHOLD is shown in Table 23-70.

Return to the Summary Table.

Table 23-70. CFG_DATA_LL17_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll17dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL17_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL17_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.66 CFG_DATA_LL18 Register (Offset = 108h) [Reset = 00000000h]

CFG_DATA_LL18 is shown in Table 23-71.

Return to the Summary Table.

Table 23-71. CFG_DATA_LL18 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL18_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL18_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL18_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL18_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL18_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL18_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL18_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL18_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL18_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL18_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL18_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL18_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL18_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL18_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL18_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.67 CFG_DATA_LL18_LPHDR_VAL Register (Offset = 10Ch) [Reset = 00000000h]

CFG_DATA_LL18_LPHDR_VAL is shown in Table 23-72.

Return to the Summary Table.

Table 23-72. CFG_DATA_LL18_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL18_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.68 CFG_DATA_LL18_THRESHOLD Register (Offset = 110h) [Reset = 0000X0X0h]

CFG_DATA_LL18_THRESHOLD is shown in Table 23-73.

Return to the Summary Table.

Table 23-73. CFG_DATA_LL18_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll18dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL18_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL18_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.69 CFG_DATA_LL19 Register (Offset = 114h) [Reset = 00000000h]

CFG_DATA_LL19 is shown in Table 23-74.

Return to the Summary Table.

Table 23-74. CFG_DATA_LL19 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL19_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL19_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL19_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL19_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL19_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL19_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL19_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL19_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL19_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL19_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL19_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL19_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL19_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL19_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL19_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.70 CFG_DATA_LL19_LPHDR_VAL Register (Offset = 118h) [Reset = 00000000h]

CFG_DATA_LL19_LPHDR_VAL is shown in Table 23-75.

Return to the Summary Table.

Table 23-75. CFG_DATA_LL19_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL19_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.71 CFG_DATA_LL19_THRESHOLD Register (Offset = 11Ch) [Reset = 0000X0X0h]

CFG_DATA_LL19_THRESHOLD is shown in Table 23-76.

Return to the Summary Table.

Table 23-76. CFG_DATA_LL19_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll19dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL19_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL19_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.72 CFG_DATA_LL20 Register (Offset = 120h) [Reset = 00000000h]

CFG_DATA_LL20 is shown in Table 23-77.

Return to the Summary Table.

Table 23-77. CFG_DATA_LL20 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL20_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL20_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL20_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL20_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL20_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL20_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL20_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL20_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL20_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL20_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL20_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL20_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL20_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL20_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL20_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.73 CFG_DATA_LL20_LPHDR_VAL Register (Offset = 124h) [Reset = 00000000h]

CFG_DATA_LL20_LPHDR_VAL is shown in Table 23-78.

Return to the Summary Table.

Table 23-78. CFG_DATA_LL20_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL20_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.74 CFG_DATA_LL20_THRESHOLD Register (Offset = 128h) [Reset = 0000X0X0h]

CFG_DATA_LL20_THRESHOLD is shown in Table 23-79.

Return to the Summary Table.

Table 23-79. CFG_DATA_LL20_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll20dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL20_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL20_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.75 CFG_DATA_LL21 Register (Offset = 12Ch) [Reset = 00000000h]

CFG_DATA_LL21 is shown in Table 23-80.

Return to the Summary Table.

Table 23-80. CFG_DATA_LL21 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL21_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL21_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL21_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL21_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL21_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL21_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL21_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL21_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL21_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL21_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL21_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL21_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL21_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL21_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL21_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.76 CFG_DATA_LL21_LPHDR_VAL Register (Offset = 130h) [Reset = 00000000h]

CFG_DATA_LL21_LPHDR_VAL is shown in Table 23-81.

Return to the Summary Table.

Table 23-81. CFG_DATA_LL21_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL21_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.77 CFG_DATA_LL21_THRESHOLD Register (Offset = 134h) [Reset = 0000X0X0h]

CFG_DATA_LL21_THRESHOLD is shown in Table 23-82.

Return to the Summary Table.

Table 23-82. CFG_DATA_LL21_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll21dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL21_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL21_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.78 CFG_DATA_LL22 Register (Offset = 138h) [Reset = 00000000h]

CFG_DATA_LL22 is shown in Table 23-83.

Return to the Summary Table.

Table 23-83. CFG_DATA_LL22 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL22_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL22_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL22_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL22_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL22_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL22_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL22_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL22_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL22_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL22_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL22_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL22_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL22_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL22_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL22_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.79 CFG_DATA_LL22_LPHDR_VAL Register (Offset = 13Ch) [Reset = 00000000h]

CFG_DATA_LL22_LPHDR_VAL is shown in Table 23-84.

Return to the Summary Table.

Table 23-84. CFG_DATA_LL22_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL22_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.80 CFG_DATA_LL22_THRESHOLD Register (Offset = 140h) [Reset = 0000X0X0h]

CFG_DATA_LL22_THRESHOLD is shown in Table 23-85.

Return to the Summary Table.

Table 23-85. CFG_DATA_LL22_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll22dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL22_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL22_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.81 CFG_DATA_LL23 Register (Offset = 144h) [Reset = 00000000h]

CFG_DATA_LL23 is shown in Table 23-86.

Return to the Summary Table.

Table 23-86. CFG_DATA_LL23 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL23_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL23_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL23_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL23_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL23_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL23_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL23_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL23_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL23_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL23_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL23_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL23_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL23_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL23_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL23_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.82 CFG_DATA_LL23_LPHDR_VAL Register (Offset = 148h) [Reset = 00000000h]

CFG_DATA_LL23_LPHDR_VAL is shown in Table 23-87.

Return to the Summary Table.

Table 23-87. CFG_DATA_LL23_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL23_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.83 CFG_DATA_LL23_THRESHOLD Register (Offset = 14Ch) [Reset = 0000X0X0h]

CFG_DATA_LL23_THRESHOLD is shown in Table 23-88.

Return to the Summary Table.

Table 23-88. CFG_DATA_LL23_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll23dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL23_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL23_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.84 CFG_DATA_LL24 Register (Offset = 150h) [Reset = 00000000h]

CFG_DATA_LL24 is shown in Table 23-89.

Return to the Summary Table.

Table 23-89. CFG_DATA_LL24 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL24_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL24_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL24_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL24_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL24_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL24_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL24_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL24_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL24_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL24_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL24_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL24_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL24_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL24_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL24_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.85 CFG_DATA_LL24_LPHDR_VAL Register (Offset = 154h) [Reset = 00000000h]

CFG_DATA_LL24_LPHDR_VAL is shown in Table 23-90.

Return to the Summary Table.

Table 23-90. CFG_DATA_LL24_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL24_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.86 CFG_DATA_LL24_THRESHOLD Register (Offset = 158h) [Reset = 0000X0X0h]

CFG_DATA_LL24_THRESHOLD is shown in Table 23-91.

Return to the Summary Table.

Table 23-91. CFG_DATA_LL24_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll24dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL24_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL24_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.87 CFG_DATA_LL25 Register (Offset = 15Ch) [Reset = 00000000h]

CFG_DATA_LL25 is shown in Table 23-92.

Return to the Summary Table.

Table 23-92. CFG_DATA_LL25 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL25_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL25_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL25_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL25_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL25_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL25_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL25_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL25_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL25_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL25_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL25_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL25_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL25_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL25_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL25_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.88 CFG_DATA_LL25_LPHDR_VAL Register (Offset = 160h) [Reset = 00000000h]

CFG_DATA_LL25_LPHDR_VAL is shown in Table 23-93.

Return to the Summary Table.

Table 23-93. CFG_DATA_LL25_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL25_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.89 CFG_DATA_LL25_THRESHOLD Register (Offset = 164h) [Reset = 0000X0X0h]

CFG_DATA_LL25_THRESHOLD is shown in Table 23-94.

Return to the Summary Table.

Table 23-94. CFG_DATA_LL25_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll25dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL25_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL25_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.90 CFG_DATA_LL26 Register (Offset = 168h) [Reset = 00000000h]

CFG_DATA_LL26 is shown in Table 23-95.

Return to the Summary Table.

Table 23-95. CFG_DATA_LL26 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL26_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL26_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL26_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL26_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL26_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL26_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL26_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL26_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL26_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL26_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL26_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL26_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL26_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL26_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL26_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.91 CFG_DATA_LL26_LPHDR_VAL Register (Offset = 16Ch) [Reset = 00000000h]

CFG_DATA_LL26_LPHDR_VAL is shown in Table 23-96.

Return to the Summary Table.

Table 23-96. CFG_DATA_LL26_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL26_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.92 CFG_DATA_LL26_THRESHOLD Register (Offset = 170h) [Reset = 0000X0X0h]

CFG_DATA_LL26_THRESHOLD is shown in Table 23-97.

Return to the Summary Table.

Table 23-97. CFG_DATA_LL26_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll26dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL26_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL26_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.93 CFG_DATA_LL27 Register (Offset = 174h) [Reset = 00000000h]

CFG_DATA_LL27 is shown in Table 23-98.

Return to the Summary Table.

Table 23-98. CFG_DATA_LL27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL27_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL27_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL27_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL27_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL27_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL27_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL27_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL27_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL27_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL27_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL27_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL27_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL27_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL27_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL27_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.94 CFG_DATA_LL27_LPHDR_VAL Register (Offset = 178h) [Reset = 00000000h]

CFG_DATA_LL27_LPHDR_VAL is shown in Table 23-99.

Return to the Summary Table.

Table 23-99. CFG_DATA_LL27_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL27_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.95 CFG_DATA_LL27_THRESHOLD Register (Offset = 17Ch) [Reset = 0000X0X0h]

CFG_DATA_LL27_THRESHOLD is shown in Table 23-100.

Return to the Summary Table.

Table 23-100. CFG_DATA_LL27_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll27dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL27_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL27_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.96 CFG_DATA_LL28 Register (Offset = 180h) [Reset = 00000000h]

CFG_DATA_LL28 is shown in Table 23-101.

Return to the Summary Table.

Table 23-101. CFG_DATA_LL28 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL28_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL28_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL28_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL28_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL28_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL28_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL28_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL28_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL28_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL28_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL28_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL28_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL28_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL28_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL28_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.97 CFG_DATA_LL28_LPHDR_VAL Register (Offset = 184h) [Reset = 00000000h]

CFG_DATA_LL28_LPHDR_VAL is shown in Table 23-102.

Return to the Summary Table.

Table 23-102. CFG_DATA_LL28_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL28_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.98 CFG_DATA_LL28_THRESHOLD Register (Offset = 188h) [Reset = 0000X0X0h]

CFG_DATA_LL28_THRESHOLD is shown in Table 23-103.

Return to the Summary Table.

Table 23-103. CFG_DATA_LL28_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll28dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL28_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL28_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.99 CFG_DATA_LL29 Register (Offset = 18Ch) [Reset = 00000000h]

CFG_DATA_LL29 is shown in Table 23-104.

Return to the Summary Table.

Table 23-104. CFG_DATA_LL29 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL29_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL29_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL29_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL29_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL29_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL29_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL29_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL29_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL29_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL29_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL29_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL29_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL29_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL29_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL29_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.100 CFG_DATA_LL29_LPHDR_VAL Register (Offset = 190h) [Reset = 00000000h]

CFG_DATA_LL29_LPHDR_VAL is shown in Table 23-105.

Return to the Summary Table.

Table 23-105. CFG_DATA_LL29_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL29_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.101 CFG_DATA_LL29_THRESHOLD Register (Offset = 194h) [Reset = 0000X0X0h]

CFG_DATA_LL29_THRESHOLD is shown in Table 23-106.

Return to the Summary Table.

Table 23-106. CFG_DATA_LL29_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll29dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL29_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL29_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.102 CFG_DATA_LL30 Register (Offset = 198h) [Reset = 00000000h]

CFG_DATA_LL30 is shown in Table 23-107.

Return to the Summary Table.

Table 23-107. CFG_DATA_LL30 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL30_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL30_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL30_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL30_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL30_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL30_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL30_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL30_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL30_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL30_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL30_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL30_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL30_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL30_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL30_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.103 CFG_DATA_LL30_LPHDR_VAL Register (Offset = 19Ch) [Reset = 00000000h]

CFG_DATA_LL30_LPHDR_VAL is shown in Table 23-108.

Return to the Summary Table.

Table 23-108. CFG_DATA_LL30_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL30_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.104 CFG_DATA_LL30_THRESHOLD Register (Offset = 1A0h) [Reset = 0000X0X0h]

CFG_DATA_LL30_THRESHOLD is shown in Table 23-109.

Return to the Summary Table.

Table 23-109. CFG_DATA_LL30_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll30dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL30_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL30_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.105 CFG_DATA_LL31 Register (Offset = 1A4h) [Reset = 00000000h]

CFG_DATA_LL31 is shown in Table 23-110.

Return to the Summary Table.

Table 23-110. CFG_DATA_LL31 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL31_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL31_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL31_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL31_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL31_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL31_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL31_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL31_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL31_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL31_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL31_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL31_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL31_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL31_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL31_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

23.3.1.106 CFG_DATA_LL31_LPHDR_VAL Register (Offset = 1A8h) [Reset = 00000000h]

CFG_DATA_LL31_LPHDR_VAL is shown in Table 23-111.

Return to the Summary Table.

Table 23-111. CFG_DATA_LL31_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL31_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

23.3.1.107 CFG_DATA_LL31_THRESHOLD Register (Offset = 1ACh) [Reset = 0000X0X0h]

CFG_DATA_LL31_THRESHOLD is shown in Table 23-112.

Return to the Summary Table.

Table 23-112. CFG_DATA_LL31_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll31dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL31_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL31_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

23.3.1.108 CFG_LVDS_MAPPING_LANE0_FMT_0 Register (Offset = 1B0h) [Reset = 00000000h]

CFG_LVDS_MAPPING_LANE0_FMT_0 is shown in Table 23-113.

Return to the Summary Table.

Table 23-113. CFG_LVDS_MAPPING_LANE0_FMT_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE0_FMT_0_H	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
27-24	CFG_LVDS_MAPPING_LANE0_FMT_0_G	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
23-20	CFG_LVDS_MAPPING_LANE0_FMT_0_F	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
19-16	CFG_LVDS_MAPPING_LANE0_FMT_0_E	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
15-12	CFG_LVDS_MAPPING_LANE0_FMT_0_D	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
11-8	CFG_LVDS_MAPPING_LANE0_FMT_0_C	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
7-4	CFG_LVDS_MAPPING_LANE0_FMT_0_B	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
3-0	CFG_LVDS_MAPPING_LANE0_FMT_0_A	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details

23.3.1.109 CFG_LVDS_MAPPING_LANE1_FMT_0 Register (Offset = 1B4h) [Reset = 00000000h]

CFG_LVDS_MAPPING_LANE1_FMT_0 is shown in Table 23-114.

Return to the Summary Table.

Table 23-114. CFG_LVDS_MAPPING_LANE1_FMT_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE1_FMT_0_H	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
27-24	CFG_LVDS_MAPPING_LANE1_FMT_0_G	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
23-20	CFG_LVDS_MAPPING_LANE1_FMT_0_F	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
19-16	CFG_LVDS_MAPPING_LANE1_FMT_0_E	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
15-12	CFG_LVDS_MAPPING_LANE1_FMT_0_D	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
11-8	CFG_LVDS_MAPPING_LANE1_FMT_0_C	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
7-4	CFG_LVDS_MAPPING_LANE1_FMT_0_B	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
3-0	CFG_LVDS_MAPPING_LANE1_FMT_0_A	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details

23.3.1.110 CFG_LVDS_MAPPING_LANE2_FMT_0 Register (Offset = 1B8h) [Reset = 00000000h]

CFG_LVDS_MAPPING_LANE2_FMT_0 is shown in Table 23-115.

Return to the Summary Table.

Table 23-115. CFG_LVDS_MAPPING_LANE2_FMT_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE2_FMT_0_H	R/W	0h	Please refer to LVDS Mapping Format section for confiuration details
27-24	CFG_LVDS_MAPPING_LANE2_FMT_0_G	R/W	0h	Please refer to LVDS Mapping Format section for confiuration details
23-20	CFG_LVDS_MAPPING_LANE2_FMT_0_F	R/W	0h	Please refer to LVDS Mapping Format section for confiuration details
19-16	CFG_LVDS_MAPPING_LANE2_FMT_0_E	R/W	0h	Please refer to LVDS Mapping Format section for confiuration details

Chapter 24
CSI2-RX

24.1 CSI2 Interface

24.1.1 CSI Overview

AWR294x integrates one two-lane CSI2 receiver interfaces (1 x DHPYv1.2 + CSI-RX) in Radar processing subsystem. The prime functionality of these interfaces is Hardware in loop (HIL) functionality- playback data from the storage/playback device. In HIL mode it is expected that specific configuration registers can be programmable through this interface. To achieve this, the DMM IP would be connected as a slave interface to the DSPSS/MSS Interconnect and CSI2 Virtual channel along with associated DMA context can be used to write into DMM IP which can further write into specific address space through its master port.

24.1.1.1 CSI2 Interface Features

- One CSI2 Rx interface: CSI2-A
- Transfer raw ADC data and user data received by the CSI2 digital physical layer receiver to the system memory.
- Use unidirectional data link
- CSI2 supports two configurable data links in addition to the clock signaling.
- Maximum data rate of 900Mbpsper data lane
- Data merger for 2-data lane configuration
- Error detection and correction by the protocol engine
- Direct memory access (DMA) engine integrated with dedicated first in first out (FIFO)
- Linear addressing mode
- Line/Chirp wise Ping-pong mode
- Eight contexts to support eight dedicated configurations of virtual channel ID and data types
- Ping-pong mode support after N (N being programmable) number of lines.
- All primary and secondary MIPI-defined formats are supported.
- Support for User Defined data types
- Configuration of the complex input/output (I/O) physical layer (PHY) (MIPI D-PHY-compliant receiver PHY solution [D-PHY mode]
- Data skip (beginning of line) and Crop (end of line) mode
- Interrupt generation on reception of end of line or/and end of frame
- Support for Data reception for Variable size lines

In addition to the above features, the CSI IP has been enhanced to support the following additional features.

- Support for 8/10/12/14/16-bits RAW data mode with capability of sign extension to align with 16-bit memory addressing for RAW10/12/14 modes
  - The CSI2 IP supports sign-extension in “EXP16” data modes. The below MMR bits are provided to enable sign extension instead of zero padding while writing into the CSI2 internal FIFO.
    - RCSS_CTRL: RCSS_CSI2A_CFG_SIGN_EXT_EN
- Interrupts for each of the DMA contexts (RCSS_CSI2A_EOL_CNTX0_INT… RCSS_CSI2A_EOL_CNTX7_INT)
  - 8 line end interrupts are generated corresponding to the 8 CSI2 contexts. These interrupts are generated after the last word of N line data (N= RCSS_CSI2A_CTX[0-7]_LINE_PING_PONG_NUM_LINES) for that particular context is written into the destination address by the CSI2 DMA.
  - These interrupts are connected to the following interrupt and DMA lines:
    - MSS CR5 A/B
    - DSS DSP
    - DSS_TPCC_B (CSI2A interrupts)
    - RCSS_TPCC_A
  - These context based interrupts are also connected to HWA and can be configured to be used as HWA triggers.
- Frame start interrupts (RCSS_CSI2A_SOF_INT0 , RCSS_CSI2A_SOF_INT1)

  - Can be independently configured to select any of the 8 CSI2 context based frame start interrupts using below MMR register
    - RCSS_CSI2A_CFG_SOF_INTR1_SEL / RCSS_CSI2A_CFG_SOF_INTR0_SEL
  - These interrupts are connected to the following interrupt and DMA lines
    - MSS CR5 A/B
    - DSS DSP
    - DSS_TPCC_B(CSI2A interrupts)
    - RCSS_TPCC_A
  - These context based interrupts are also connected to HWA and can be configured to be used as HWA triggers.
- N Line wise Ping-pong mode
  - Legacy CSI2 IP supports only Frame based ping pong DMA trasfers. In AWR294x , support is provided to support ping-pong switch at line level and also after “N”(N being programmable) number of lines.These can be enabled using below MMR registers
    - RCSS_CTRL: RCSS_CSI2A_CTX[0-7]_LINE_PING_PONG_ENABLE Enable line ping/pong feature instead of frame ping/pong
    - RCSS_CTRL: RCSS_CSI2A_CTX[0-7]_LINE_PING_PONG_NUM_LINES Number of lines after which the CSI2 DMA writes switch between ping and pong
  - At the start of a frame, the CSI2 DMA writes always starts from the PING start address for all contexts
- Parity for CSI2 memories
  - Byte-wise parity support is provided for FIFO RAM and CTX RAM
  - The parity enable for the RAMs are provided below
    - RCSS_CTRL:RCSS_CSI2A_PARITY_CTRL_FIFO_PARITY_EN
    - RCSS_CTRL: RCSS_CSI2A_PARITY_CTRL_CTX_PARITY_EN
  - The parity error status for the RAMs are available in below configuration registers
    - RCSS_CTRL: RCSS_CSI2A_PARITY_STATUS_FIFO_PARITY_ADDR
    - RCSS_CTRL: RCSS_CSI2A_PARITY_STATUS_FIFO_PARITY_ADDR
- ECC on Memories and PBIST of data buffers/Local Memories.

Note

Chirp/Frame connects to end-of-line for CSI2. For AWR294x, camera term is related to radar interface in this section.

24.1.2 CSI2 PHY

24.1.2.1 CSI2 PHY Overview

One MIPI D-PHY-compliant CSIRX PHY receivers act as a physical connection and configuration of clock/data lanes with external sensors. CSIRX PHY supports up to four configurations, depending on the required number of D-PHY data lane external sensors. The receivers are compatible with the *MIPI D-PHY Specification v0.92*.

The PHY is controlled and must be configured first from the control module for pad configuration. The differential data/clock lanes coming into the CSI2-A is explained in the CSI2 PHY control registers CSI2_PHY_CFG.

As mentioned previously, two PHYs are integrated in the device. Both the CSI2-A CSIRX contains two data lanes, as shown in Figure 24-1.

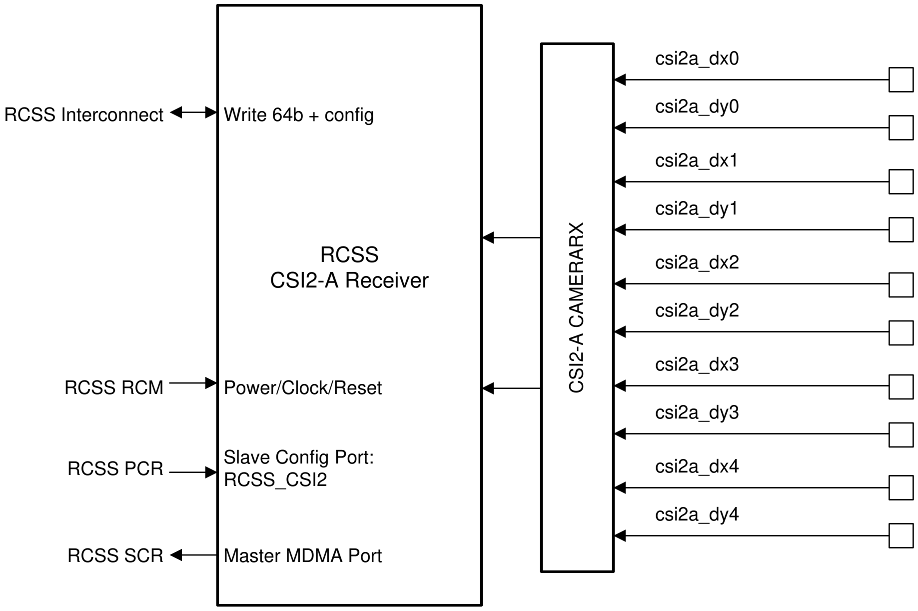

Figure 24-1. Interfaces CSI2-A PHY Diagram Four D-PHY Data Lane Configuration

CSI2-A CSIRX represent the overall PHY solution for connecting external sensors to feed the CSI interface. The MIPI D-PHY function can support up to four data lane modules and one clock lane module. Reverse direction escape mode is not supported. The lane module polarity and positions are configurable; that is, any lane module can be chosen as the clock lane module, and the DX/DY data pad for each lane module can be configured as DP or DN pins defined.

24.1.2.2 CSI2 PHY Functional Description

24.1.2.2.1 CSI2 PHY Functional Configuration

The CSI2 PHY converts the bitstream, divided into 1 to 2 serial data lanes, into a bitstream compatible with the CSI2 receiver and one clock lane.

The register logs complex I/O events of the following types:

- Line power-state change (all lanes in ultralow-power mode [ULPM], at least one lane exits ULPM, etc.)
- Error on one lane

The CSI2 receiver embeds two registers to configure/read some complex I/O parameters:

- The register detects clock miss with respect to the *MIPI D-PHY Specification v0.92* and control timing.
- The register reports completion of reset on the different parts of the module and configures the timing parameters.
- The registers contain the PWR_AUTO and PWR_CMD bit fields, which affect the power management of the two complex I/Os.

The complex I/O has three power modes: on, off, and ultralow power (ULP). These modes can reflect the ON or ULP states of the five differential lines if the CSI2_COMPLEXIO_CFG[24] PWR_AUTO bit is set to 1. If the PWR_AUTO bit is at reset value (0), the complex I/O power state is controlled by the CSI2_COMPLEXIO_CFG[28:27] PWR_CMD bit field, which directly defines the power state. Figure 24-2 shows the complex I/O power finite state-machine (FSM).

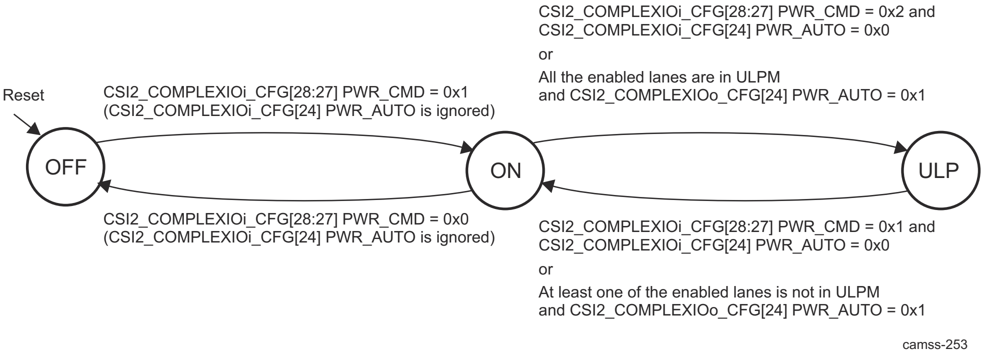

Figure 24-2. CSI2 Complex I/O Power FSM

Another register, , is used to control the power state of the complex I/O modules with regard to the differential line state. This register controls the mode of the two complex I/Os (RxMode and NoRxMode) and the delay between the differential lanes in STOP state and the complex I/O on NoRxMode. The CSI2_TIMING[15] FORCE_RX_MODE_IO1 bit sets the complex I/O in RxMode or NoRxMode (stopped mode). The FORCE_RX_MODE_IO bit is automatically reset to 0 by hardware when the counter ends and the FSM returns to NoRxMode. Three bits (CSI2_TIMING[14] STOP_STATE_X16_IO1, CSI2_TIMING[13] STOP_STATE_X4_IO1, and the CSI2_TIMING[12:0] STOP_STATE_COUNTER_IO1 bit field) configure the delay between line stop mode and complex I/O stop mode. The delay represents the number of functional clock cycles and can be calculated as follows:

Total delay in clock cycle = CSI2_TIMING.STOP_STATE_COUNTER_IO x (1+CSI2_TIMING.STOP_STATE_X16_IO x 15) x (1+CSI2_TIMING.STOP_STATE_X4_IO x 3).

Table 24-1 lists the possible values of the delay, in terms of the clock cycles, depending on the values of the STOP_STATE_X16_IO and STOP_STATE_X4_IO bits.

Table 24-1. CSI2 Possible Time-Out Value for RxMode Counter

STOP_STATE_X16_IO	STOP_STATE_X4_IO	Possible Delay Value (in Functional Clock Cycles)
0x0	0x0	8191 (with step of 1)
0x0	0x1	32764 (with step of 4)
0x1	0x0	131056 (with step of 16)
0x1	0x1	524224 (with step of 64)

The FORCERXMODE signal is used at initialization time (complex I/O). Figure 24-3 describes the ForceRxMode and StopState FSM to assert and deassert the FORCERXMODE signal and to monitor STOPSTATE from the complex I/O.

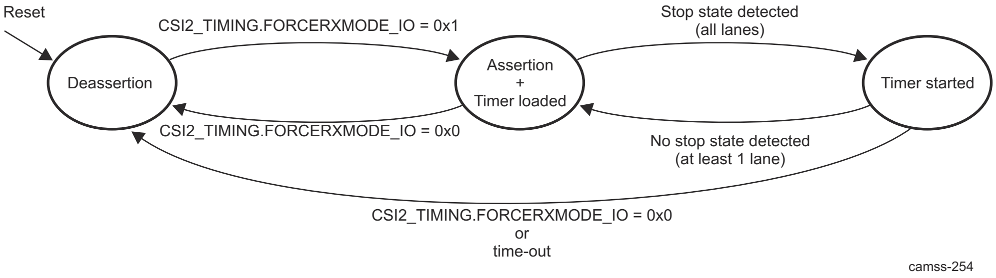

Figure 24-3. CSI2 RxMode and StopState FSM

24.1.2.2.2 CSI2 PHY and Link Initialization Sequence

The MIPI D-PHY initialization sequence is not implemented within CSIRX. The CSI2 receiver is expected to coordinate the PHY initialization. The controller must ensure that the PHY is held in RESET/WAIT for RX mode until the D-PHY transmitter is powered up and the link comes to the defined state. The controller can use the STOPSTATE and FORCERXMODE signals of CSIRX for this purpose. STOPSTATE indicates the line states, while FORCERXMODE forces the receiver state-machine into "wait for stop state." One possible initialization sequence is:

To fully initialize the CSIPHY, perform the following steps:

1. Configure all CSI2 receiver registers to be ready to receive signals/data from the CSIPHY:
   a. Configure all needed CSI2 registers:
      i. Set [10:8] DATA2_POSITION.
      ii. Set [6:4] DATA1_POSITION.
      iii. Set [2:0] CLOCK_POSITION.
      iv. **CAUTION**

         This must be done before the CSIPHY is active.
2. CSIPHY and link initialization sequence:
   a. Deassert the CSIPHY reset.
      i. Set [30] RESET_CTRL to 0x1.

      CAUTION

      For the [29] RESET_DONE bit to be set to 0x1 (reset completed), the external sensor must to be active and sending the MIPI HS BYTECLK.

      The following registers can be set only after deasserting the CSIPHY reset and before asserting the FORCERXMODE signal:

      -
      -
      -
   b. Assert the FORCERXMODE signal:
      i. Set [15] FORCE_RX_MODE_IO1 to 0x1.
   c. Connect pulldown on link (DP/DN) by asserting the respective PIPD* signals (PIPD* = 0):

      For CSI2-A CSIRX pulldown on signals using the RCSS_CTRL: RCSS_CSI2A_LANE_CFG registers for each lane:

      - RCSS_CSI2A_LANEn_CFG_DX/Yn_IE=0x1
      -
   d. Power up the CSIPHY:
      i. Set [28:27] PWR_CMD to 0x1.
   e. Check whether the state status reaches the ON state:

        - [26:25] PWR_STATUS = 0x1
    f. Wait for STOPSTATE = 1 (for all enabled lane modules):
        i. The timer is set through the [14:0] bit field. The reset value can be kept.
        ii. Wait until [15] FORCE_RX_MODE_IO1 = 0x0. It is automatically put at 0 when all enabled lanes are in STOPSTATE and the timer is finished.
    g. Release PIPD* (= 1).

        For CSI2-A CSIRX pullup on signals using the RCSS_CTRL: RCSS_CSI2A_LANE_CFG registers for each lane:

        - RCSS_CSI2A_LANEn_CFG_DX/Yn_ENBPU = 0x1
3. The CSIPHY is initialized and ready/active in CSI2 mode.

24.1.2.2.3 CSI PHY Error Signals

In D-PHY mode, the CSIPHY supports the following error detection and signaling to the associated receiver:

- ERRSOTHS: Flags 1-bit errors in the HS start of transmission synchronization pattern. In this error scenario, the CSIPHY continues to receive the data and pass it to the receiver, but confidence in the data may be low, because of the 1-bit error seen in sync. This signal, if asserted, is high for one cycle of RXBYTECLKHS.
- ERRSOTSYNCHS: Flags multiple bit errors in the HS start of transmission synchronization pattern. In this case, the CSIPHY cannot achieve proper synchronization and does not pass the received data to the receiver. This signal, if asserted, is high for one cycle of RXBYTECLKHS.
- ERRCONTROL: Flags the control sequence error; that is, when the LP sequence observed on line is not recognized as a valid control sequence. This signal, if asserted, is high until the next change in the state of the LP line.
- ERRESC: Flags the escape entry error; that is, when the escape entry sequence is unrecognized. This signal, if asserted, is high until the next change in the state of the LP line.

24.1.3 CSI2

24.1.3.1 CSI2 Environment

24.1.3.1.1 CSI2 Protocol and Data Format

The CSI2 supports MIPI CSI2 multiple data type formats. This section describes MIPI CSI2 protocol and data formats. The CSI2 is compatible with the *MIPI CSI2 Specification v1.0-01-00 r0.03*. Table 24-2 lists the MIPI CSI2 supported by CSI2 formats . Shading in the primary and secondary MIPI CSI2-defined formats indicates special format extensions of the CSI2 receiver.

Table 24-2 summarizes the pixel formats supported by the CSI2 receiver interface.

Table 24-2. CSI2 Pixel Format Modes

CSI2_CTX_CTRL2_i[9:0] Format	CSI2 Data Format	Bits per Pixel (BPP)	Data Size Increases in Memory	2D Mode Availability	Comments
0x29	RAW7	7	0%	Yes	
0x2A	RAW8	8	8%	Yes	
0x2B	RAW10	10	0%	Yes	
0x2C	RAW12	12	0%	Yes	
0x2D	RAW14	14	0%	Yes	
0x2A8	RAW6 + DPCM10 + EXP16	16	166%	Yes	DPCM decompression
0x229	RAW7 + DPCM10 + EXP16	16	128%	Yes	DPCM decompression
0x2AA	RAW8 + DPCM10 + EXP16	16	100%	Yes	DPCM decompression
0x369	RAW7 + DPCM12 + EXP16	16	128%	Yes	DPCM decompression
0x36A	RAW8 + DPCM12 + EXP16	16	100%	Yes	DPCM decompression
0x3A8	RAW6 + DPCM12 + EXP16	16	166%	Yes	DPCM decompression

For more information about how the data formats are transmitted and how the data are stored in memory, see Section 24.1.3.1.4, *CSI2 Operating Modes*.

24.1.3.1.1.1 CSI2 Physical Layer

The CSI2-A/CSI2-B receivers are tightly connected to a PHY layer (for more information about the PHY, see Section 24.1.2, *CSI2 PHY*). Table 24-3 lists the CSI2-A receiver I/O . The CSI2_RECEIVER provides access to the complex I/O configuration from the CSI2_COMPLEXIO_CFG register.

Table 24-3. CSI2-A I/O Description

Signal Name		I/O(1)	Description
csi2a_dx0	lane 0 (position 1)	I	Serial data/clock input
csi2a_dy0			
csi2a_dx1	lane 1 (position 2)	I	Serial data/clock input
csi2a_dy1			
csi2a_dx2	lane 2 (position 3)	I	Serial data/clock input
csi2a_dy2			

(1) I = Input

Note

The serial lane can be used as clock lane or data lane . The MIPI CSI2 protocol requires one clock lane (others are data lane or unused lane).

Lanes support the two operating modes:

- HS mode: High-speed transmit mode
- Off mode: Lane is off.

24.1.3.1.1.2 CSI2 Lane Merger

The layer consists of lane merger logic to merge the incoming serial stream into a byte stream. The lane merger can merge up to four lanes (CSI2-A) into a single byte stream. The bits are sent with the LSB first. The order of the lanes at the CSI2-A, CSI2-B receiver core depends on the lane configuration. The merger is not used for a single lane.

The number of lanes and their configuration can be changed only in ULPM or when all data lanes are in off mode.

Below figures show the byte position into each serial link for one to four data lane configurations. The byte stream always starts from lane 1. It finishes on one of the lanes, depending on the number of bytes to receive and the number of lanes.

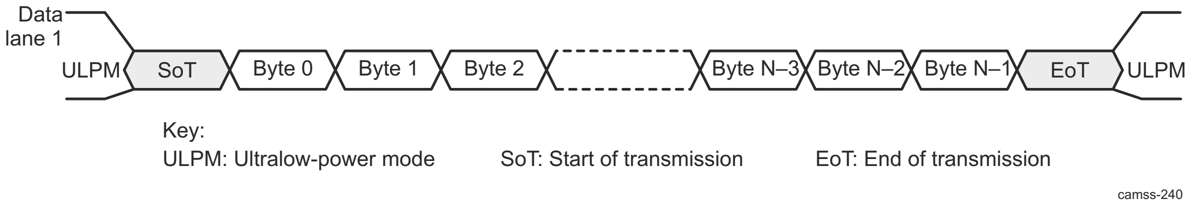

Figure 24-4. CSI2 One Data-Lane Configuration

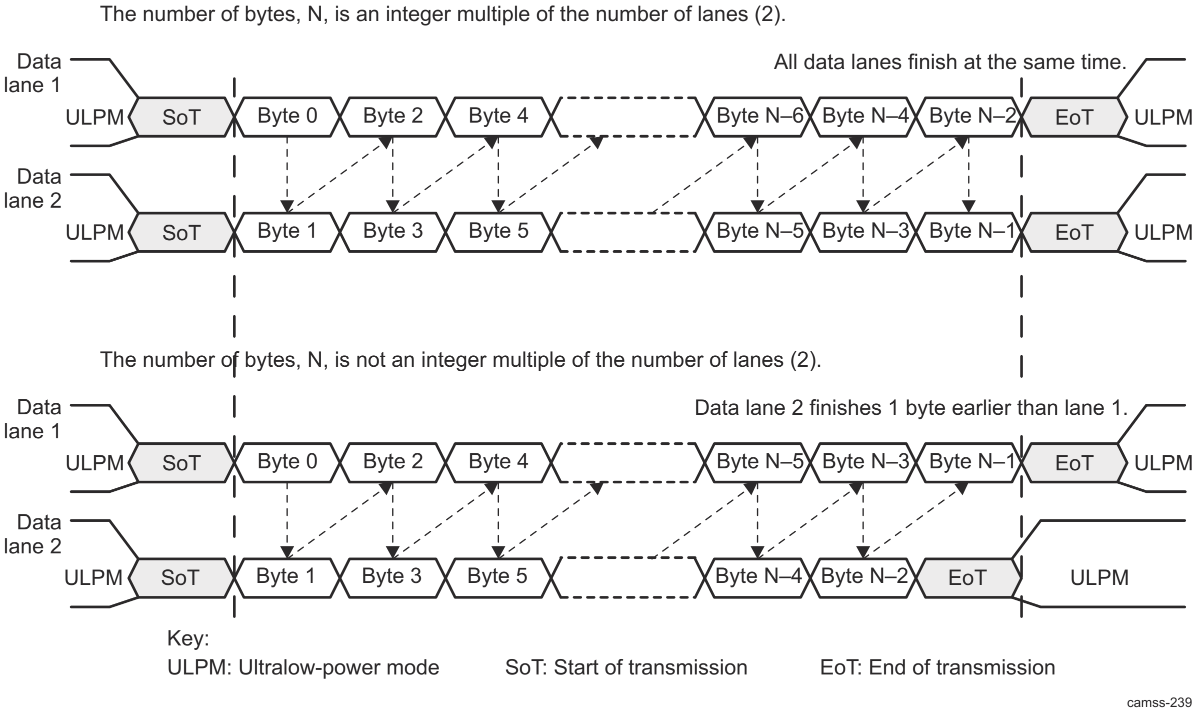

Figure 24-5. CSI2 Two Data-Lane Merger Configuration

24.1.3.1.1.3 CSI2 Protocol Layer

The low-level protocol (LLP) is a byte-oriented protocol from the lane merger layer. It supports short and long packet formats.

The CSI2 protocol layer defines how image-sensor data is transported onto the physical layer.

The feature set of the protocol layer implemented by the CSI2 receiver is:

- Transport of arbitrary data (payload-independent)
- 8-bit word size
- Support for up to four interleaved virtual channels on the same link
- Special packets for frame-start, frame-end, line-start, and line-end information
- Descriptor for the type, pixel depth, and format of application-specific payload data
- Error-correction code (ECC) for 1-bit error correction or 2-bit error detection in the header
- 16-bit checksum code for payload error detection

Figure 24-6 shows the CSI2 protocol layer with short and long packets.

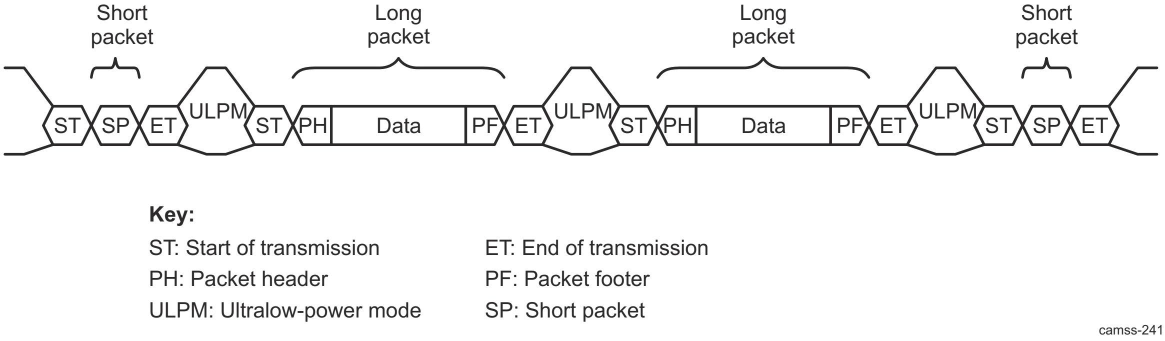

Figure 24-6. CSI2 Protocol Layer With Short and Long Packets

Two packets are always separated from each other with a sequence of ET, ULPM, and ST.

24.1.3.1.1.3.1 CSI2 Short Packet

A short packet is identified by data types 0x00 to 0x0F. A short packet can be used for frame or line synchronization or for generic data. Figure 24-7 shows the structure of a short packet.

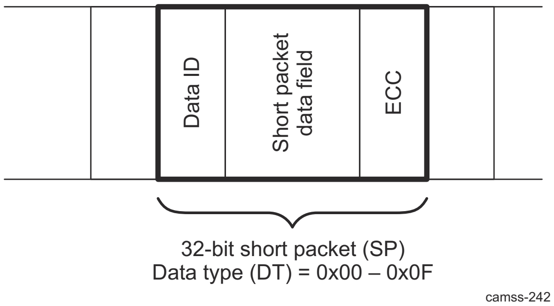

Figure 24-7. CSI2 Short Packet Structure

For frame-synchronization data types, the short packet data field is the frame number. For line-synchronization data types, the short packet data field is the line number. For generic short packet data types, the content of the short packet data field is user-defined.

The 16-bit frame number, when used, is always nonzero to distinguish it from the use case where the frame number is inoperative and remains set to 0. The behavior of the 16-bit frame number is one of the following:

- The frame number is always 0 and is inoperative.

- The frame number increments by 1 for every FS packet within the same virtual channel and is periodically reset to 1 (1, 2, 1, 2, 1, 2, 1, 2 or 1, 2, 3, 4, 1, 2, 3, 4).

For LSC and LEC synchronization packets, the short packet data field contains a 16-bit line number. This line number is the same for the LS and LE packets corresponding to a given line. Line numbers are logical line numbers and do not necessarily equal physical line numbers. The 16-bit line number, when used, is always nonzero to distinguish it from the use case where the line number is inoperative and remains set to 0.

The behavior of the 16-bit line number is one of the following:

- The line number is always 0 and is inoperative.
- The line number increments by 1 for every LS packet within the same virtual channel and the same data type. The line number is periodically reset to 1 for the first LS packet after an FS packet. The intended use is for progressive scan (noninterlaced) video data streams. The line number must be a nonzero value.
- The line number increments by the same arbitrary step value greater than 1 for every LS packet within the same virtual channel and the same data type. The line number is periodically reset to a nonzero arbitrary start value for the first LS packet after an FS packet. The arbitrary start value can be different between successive frames. The intended use is for interlaced video data streams.

The ECC byte allows single-bit errors to be corrected and 2-bit errors to be detected in the short packet.

Short packets apply to all contexts using the same virtual channel ID (up to eight contexts support eight dedicated configurations of virtual channel ID and data types). The data type associated with the context is not used to distinguish which context is used when receiving short packets.

24.1.3.1.1.3.2 CSI2 Long Packet

A long packet is identified by data types 0x10 to 0x37. A long packet consists of three elements:

- A 32-bit packet header (PH)
- An application-specific data payload with a variable number of 8-bit data words
- A 16-bit packet footer (PF)

The packet header is composed of three elements:

- An 8-bit data identifier
- A 16-bit word count field
- An 8-bit ECC

The packet footer has one element, a 16-bit checksum.

Figure 24-8 and Table 24-4 show the structure of a long packet.

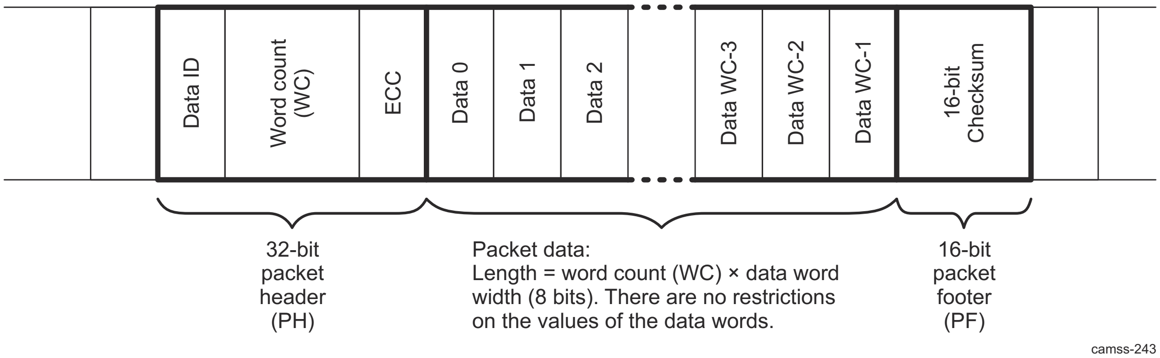

Figure 24-8. CSI2 Long Packet Structure

Table 24-4. CSI2 Long Packet Structure Description

Packet Part	Field Name	Size (Bits)	Description
Header	Data ID	8	Contains the virtual channel identifier and the data-type information
	Word count	16	Number of data words in the packet data. A word is 8 bits.
	ECC	8	ECC for data ID and WC field. Allows 1-bit error recovery and 2-bit error detection.
Data	Data	WC-8	Application-specific payload (WC words of 8 bits)
Footer	Checksum	16	16-bit CRC for packet data

There are no restrictions on the size of the packet data, but each data format can impose additional restrictions on the length of the payload data (for example, a multiple of 4 bytes).

24.1.3.1.1.3.3 CSI2 Data Identifier

The data identifier byte contains the virtual channel (VC) value and the data-type (DT) value, as shown in Figure 24-9. The VC value is in the 2 MSBs of the data identifier byte. The DT value is in the 6 LSBs of the data identifier byte.

Figure 24-9 shows the data identifier structure.

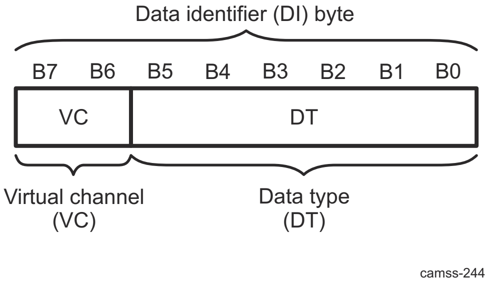

Figure 24-9. CSI2 Data Identifier Structure

Virtual Channel

The CSI2 protocol layer transports virtual channels. Virtual channels are built of frames. A frame can comprise embedded data and image-sensor data. Two contexts are used to send the two types of data separately. Each frame is identified by unique mandatory synchronization codes: frame start and frame end. Line start and line end synchronization codes are optional for the transmitter. A set of registers is associated with each context defined by the virtual channel ID and the data type. Figure 24-10 shows a virtual channel.

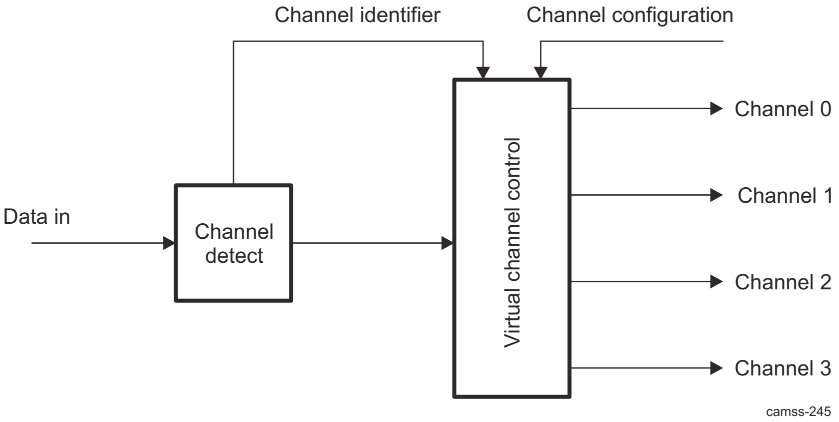

Figure 24-10. CSI2 Virtual Channel

Pixel Formats

24.1.3.1.1.3.4 CSI2 Synchronization Codes

Data reception from the image-sensor module uses four synchronization codes embedded in the serial bitstream:

- FSC: Identifies the start of a new frame
- LSC: Identifies the start of a new line; received for every line
- LEC: Identifies the end of a line; received for every line
- FEC: Identifies the end of the last line and the end of the current frame

Table 24-5 summarizes the synchronization code values.

Table 24-5. CSI2 Synchronization Codes

Synchronization Code	Value	Comments
FSC	0x0	Mandatory
FEC	0x1	Mandatory
LSC	0x2	Optional
LEC	0x3	Optional
Reserved	0x4 to 0x7	Not used

24.1.3.1.1.3.5 CSI2 Generic Short Packet Codes

When the synchronization code value is from 0x8 to 0xF, the short packet is called a generic short packet. Short packets are not processed by the radar interface hardware. A generic short packet is stored in a register without the ECC and an interrupt can be generated. Therefore, generic short packets must be handled by software.

24.1.3.1.1.3.6 CSI2 Generic Long Packet Codes

The code value 0x10 indicates null packets, which can be received at any time. They are discarded by the protocol engine.

The code value 0x11 indicates blanking packets, which can be received at any time. They are discarded by the protocol engine.

The code value 0x12 indicates embedded 8-bit nonimage data typically used for JPEG.

Code values from 0x13 to 0x17 are reserved.

24.1.3.1.1.3.7 CSI2 Frame Structure

Each frame consists of short packets to indicate SOF and EOF. Optional short packets for start of line and end of line can be sent by the image sensor.

Some information before and after the picture data can be sent as SOF and EOF information by the image sensor to the memory through the L3 port.

For each frame, the pixel data (arbitrary data or user-defined byte data) are valid only after an SOF short packet. If the data are invalid, they are discarded by the protocol engine.

A frame contains embedded data and image-sensor data. Figure 24-11 shows where the embedded data and image-sensor data are in the frame. The frame is scanned in raster order starting from the top-left corner, as shown in Figure 24-11 and Figure 24-12. The following definitions for a frame apply:

- Zero or more SOF status lines (SOF lines) can be embedded at the beginning of a CSI2 frame.
- The image embedded data is carried using separate data types and virtual channels (see Section 24.1.3.3.2.4, *CSI2 Virtual Channel and Context*).
- Zero or more EOF status lines (EOF lines) can be embedded at the end of a CSI2 frame.
- The SOF lines, pixel data, and EOF lines do not overlap.

The CSI2 receiver does not use the information in the status lines. However, it extracts it and stores it in memory for use by software.

Because the data types are different, the data is carried using separate data types called virtual channels. Those must be mapped to the adequate context. The CSI2 receiver uses a different context for embedded data and image-sensor data. See Section 24.1.3.3.2.4, *CSI2 Virtual Channel and Context*.

Embedded data is supported as a context by the CSI2 receiver; therefore, there is no specific hardware support for embedded data.

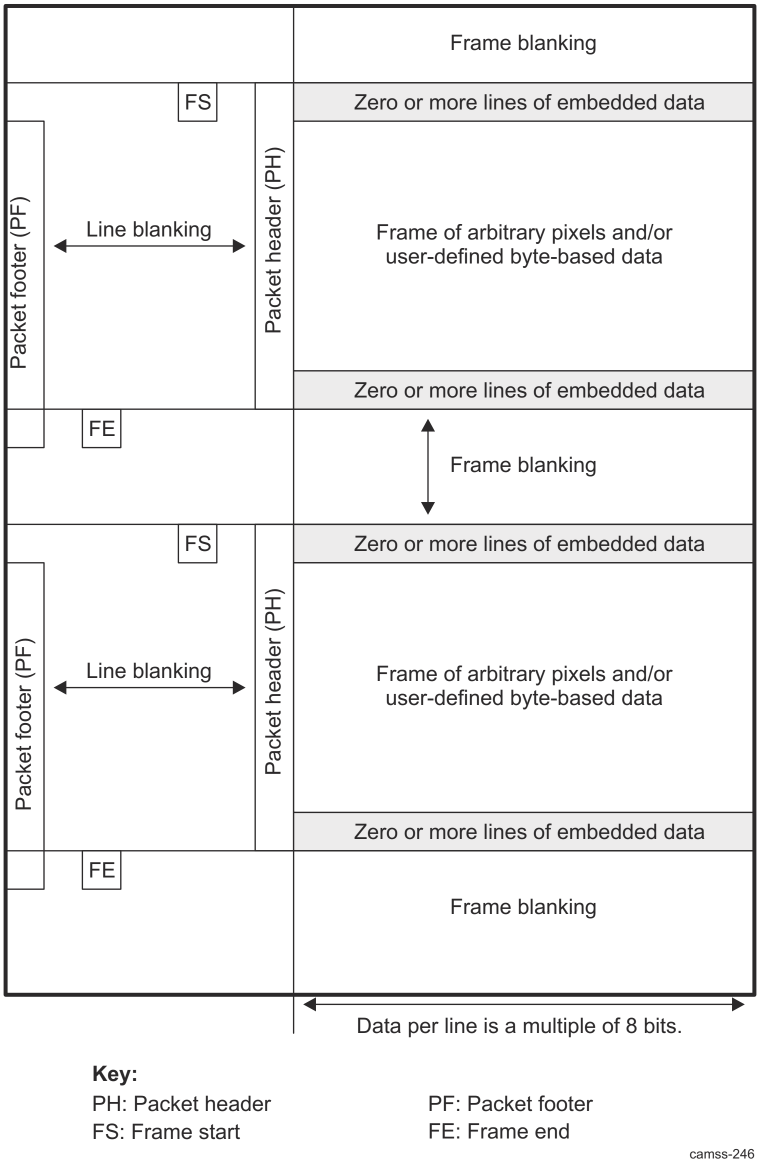

Figure 24-11. CSI2 General Frame Structure (Informative)

Figure 24-12 shows the frame structure of a YUV4:2:2 interlaced video frame without embedded data.

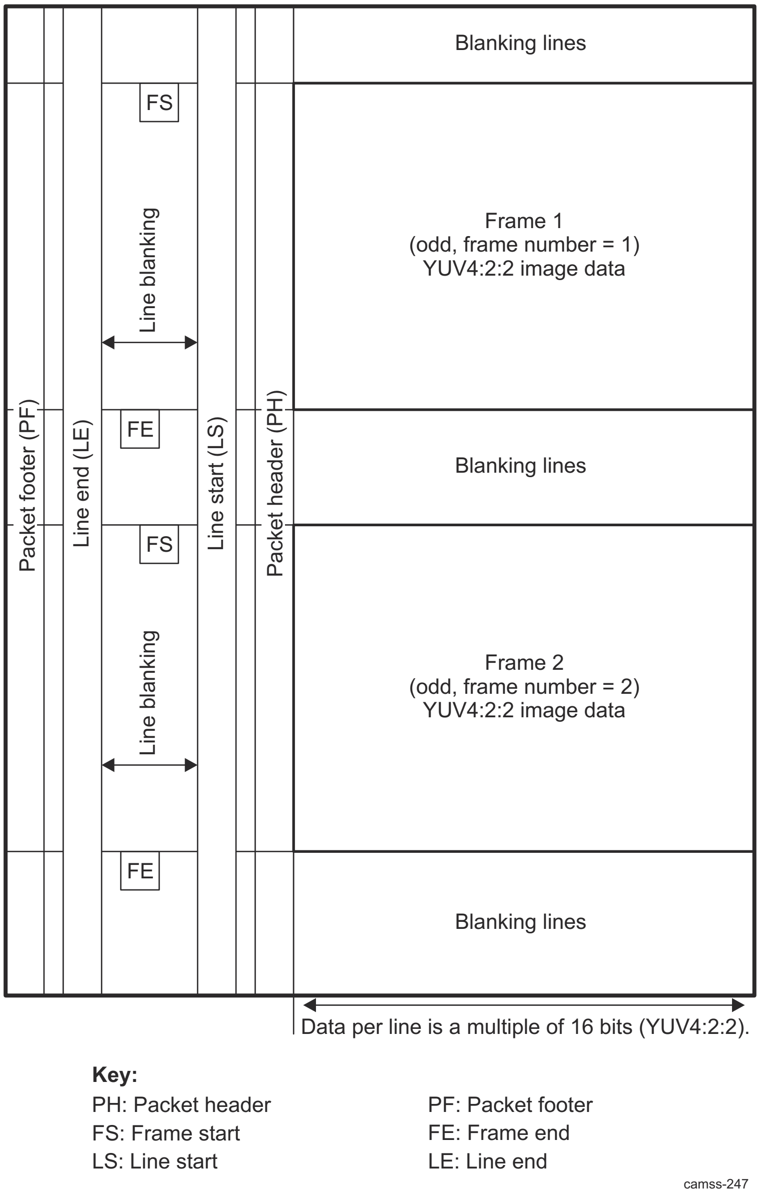

Figure 24-12. CSI2 Digital Interlaced Video Frame (Informative)

The period between the LEC and the new LSC is the line blanking period. The time between the FEC and the new FSC is the frame blanking period. The receiver works with the line blanking period set to 0. The image data is stored in memory by selecting one of the various operating modes. Section 24.1.3.1.1.4, *CSI2 Operating Modes*, explains storing image data frames into memory.

24.1.3.1.1.4 CSI2 Operating Modes

24.1.3.1.1.4.1 CSI2 RAW Bayer RGB Operating Modes

24.1.3.1.1.4.1.1 CSI2 RAW6

RAW6 data can be output to memory with or without data expansion. The line length sent through the CSI2 physical layer is a multiple of 8 bits (6-bit image data + 2-bit expansion). Furthermore, the line length is a multiple of 3 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 6 is 24, so 3 × 8 bits). Figure 24-13 shows the storage format for RAW6 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x28 to select RAW6 mode

- To 0x68 for RAW6 + 8-bit expansion
- To 0x2A8 for RAW6 + DPCM decompression to 10-bit expanded to 16-bit
- To 0x3A8 for RAW6 + DPCM decompression to 12-bit expanded to 16-bit

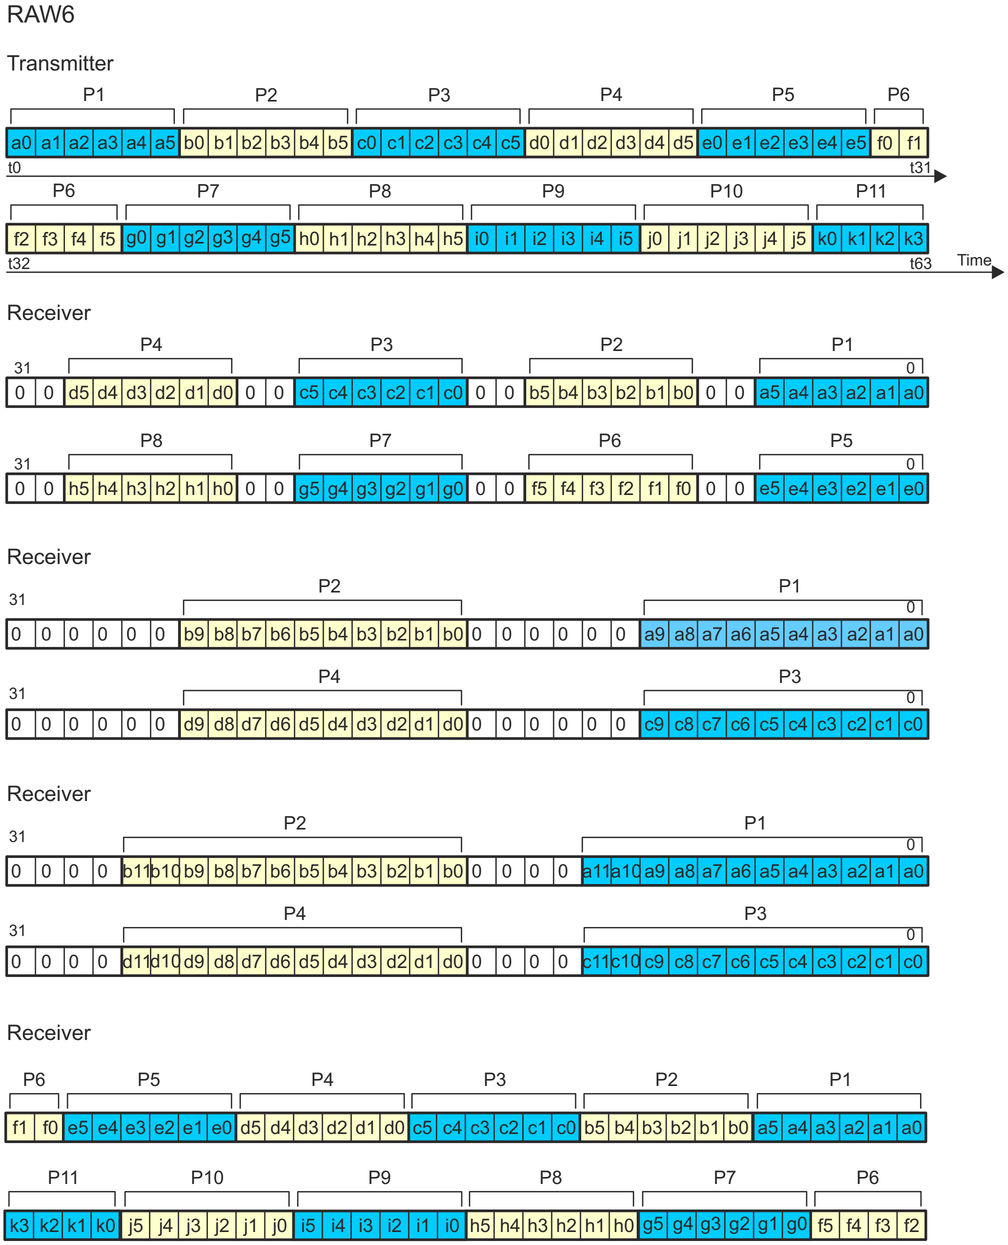

Figure 24-13. CSI2 RAW6

24.1.3.1.1.4.1.2 CSI2 RAW7

RAW7 data can be output to memory with or without data expansion. The line length sent through the CSI2 physical layer is a multiple of 8 bits. Furthermore, the line length is a multiple of 7 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 7 is 56, so 7 × 8 bits). Figure 24-14 shows the storage format for RAW7 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x29 to select RAW7 mode
- To 0x69 for RAW7 + 8-bit expansion
- To 0x229 for RAW7 + DPCM decompression to 10-bit expanded to 16-bit
- To 0x369 for RAW7 + DPCM decompression to 12-bit expanded to 16-bit

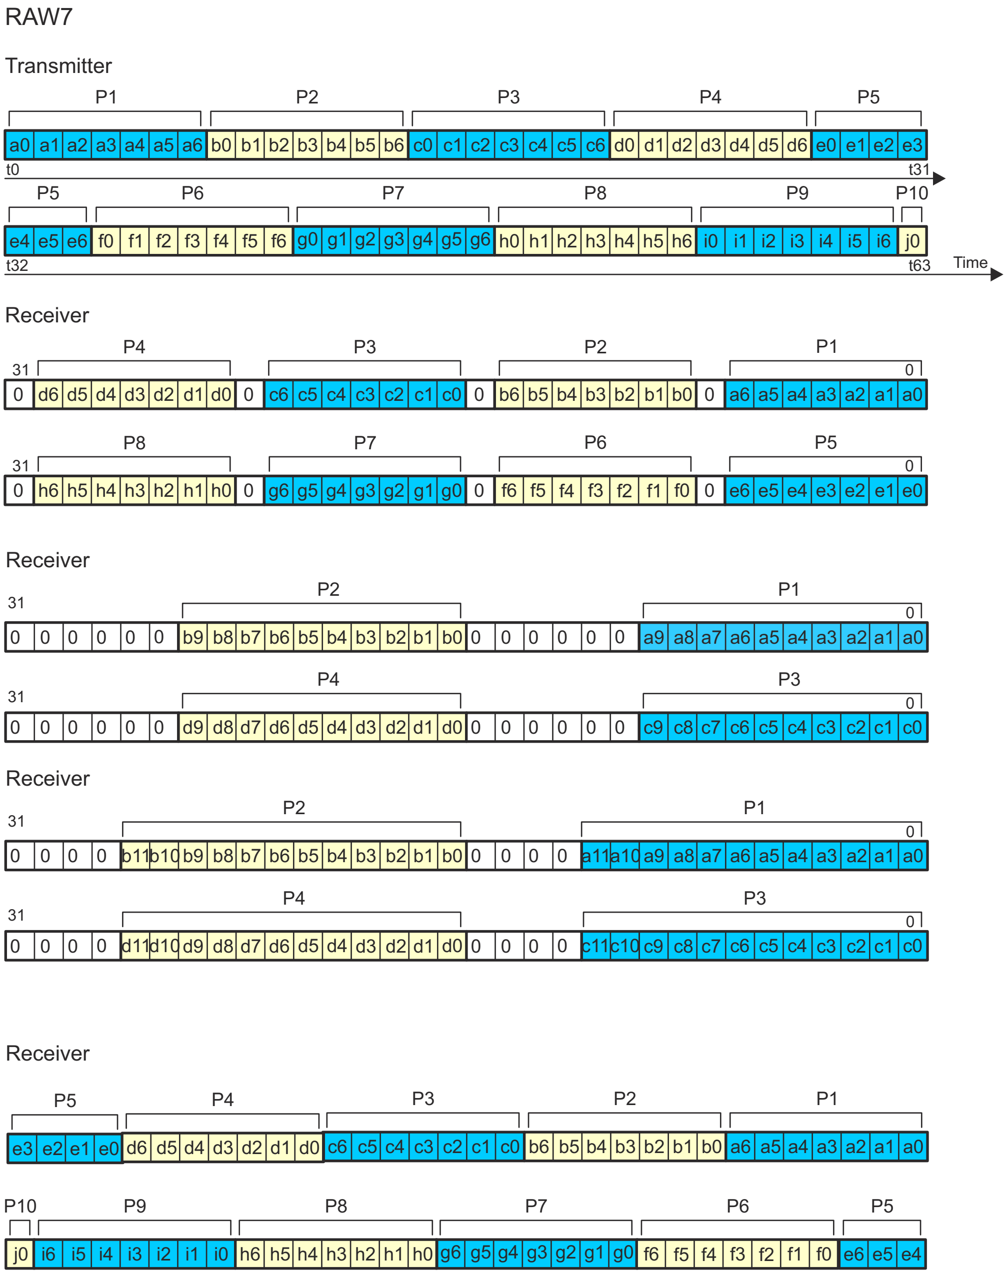

Figure 24-14. CSI2 RAW7

24.1.3.1.1.4.1.3 CSI2 RAW8

RAW8 data can be output to memory with or without data expansion. The line length sent through the CSI2 physical layer is always a multiple of 8 bits. Figure 24-15 shows the storage format for RAW8 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x2A to select RAW8 mode
- To 0x2AA for RAW8 + DPCM decompression to 10-bit expanded to 16-bit
- To 0x36A for RAW8 + DPCM decompression to 12-bit expanded to 16-bit

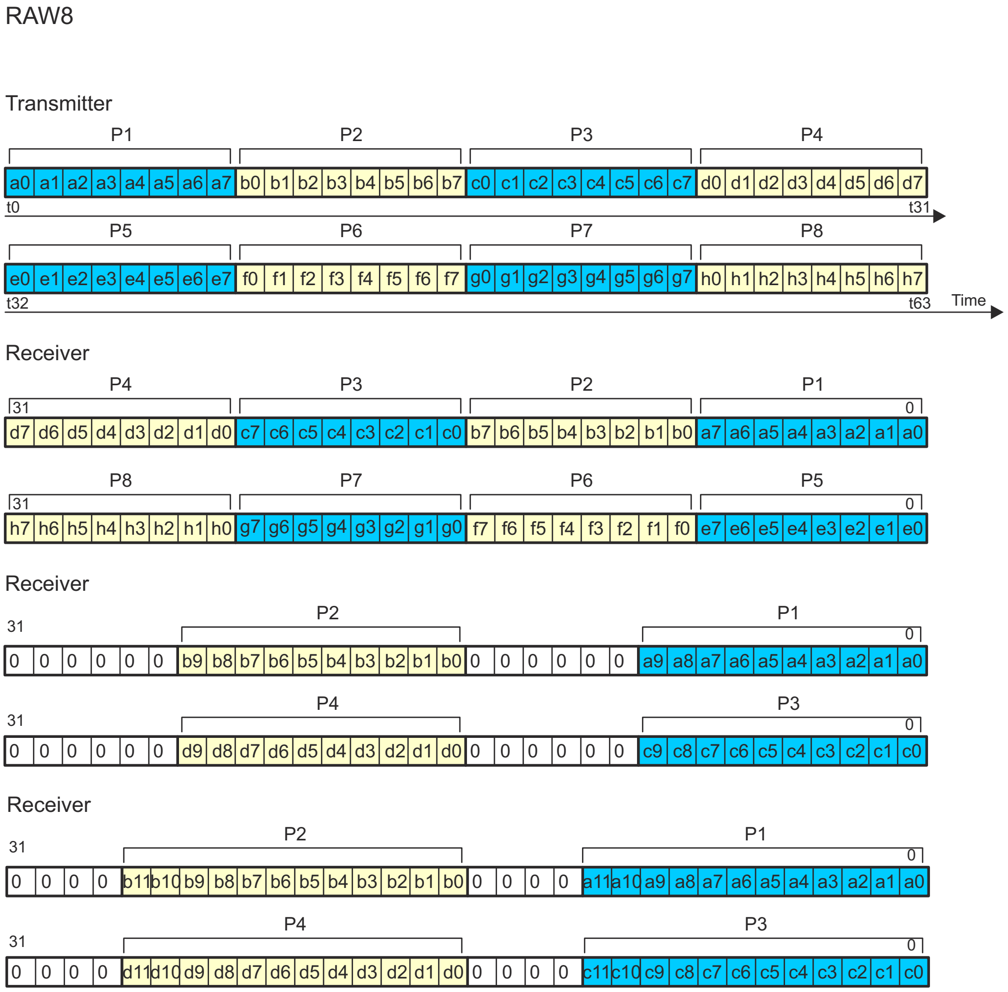

Figure 24-15. CSI2 RAW8

24.1.3.1.1.4.1.4 CSI2 RAW10

RAW10 data can be output memory in two formats: with or without data expansion. If data expansion is used, the 10-bit data are padded with 0s on a 16-bit word. The line length sent through the CSI2 physical layer is a multiple of 8 bits. Furthermore, the line length is a multiple of 5 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 10 is 40, so 5 × 8 bits). Figure 24-16 shows the storage format for RAW10 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x2B to select RAW10 mode
- To 0xAB for RAW10 + 16-bit expansion

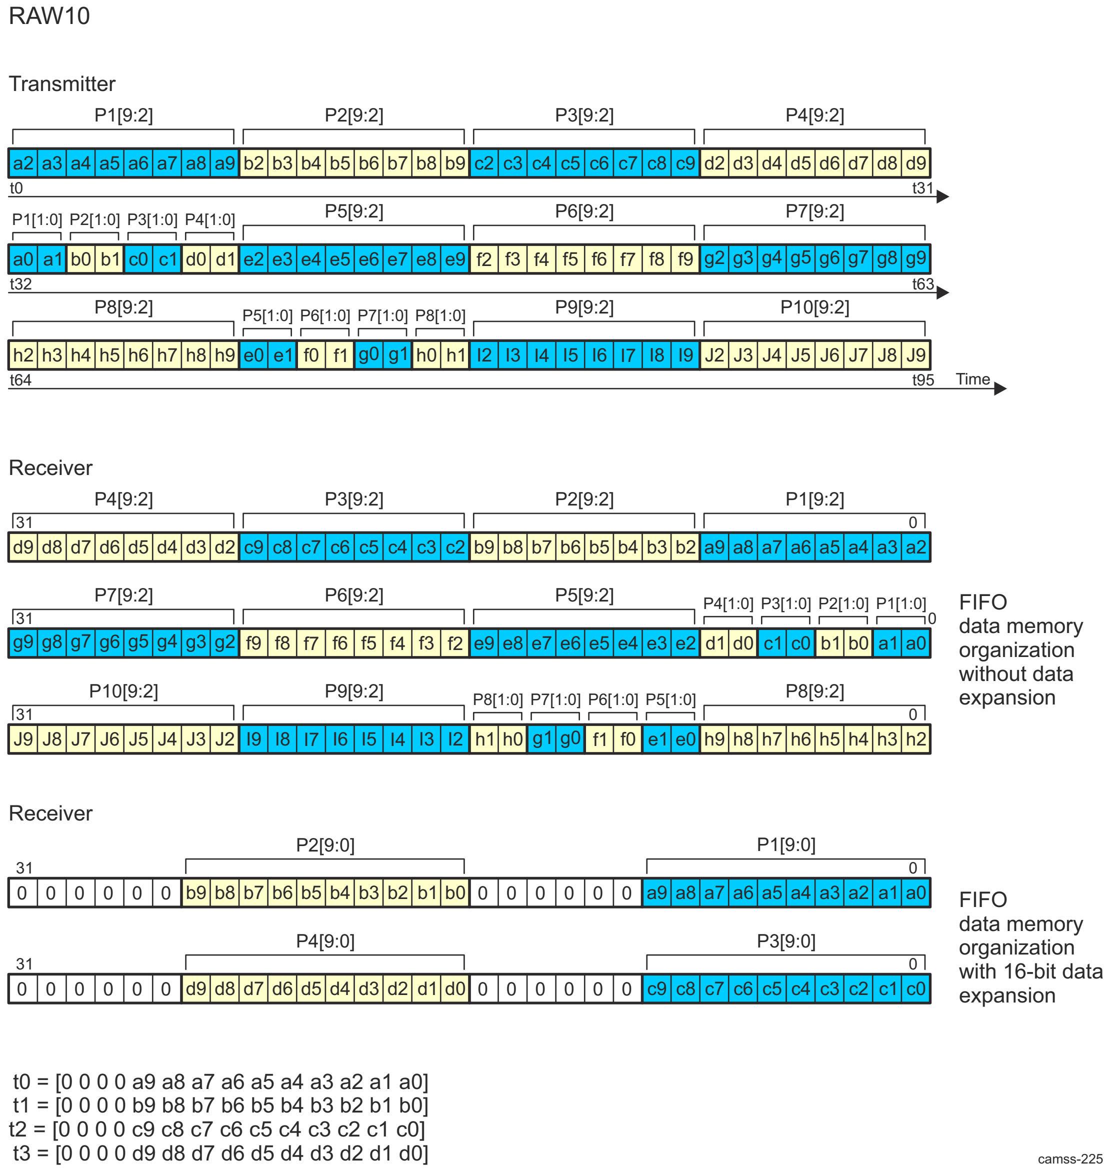

Figure 24-16. CSI2 RAW10

24.1.3.1.1.4.1.5 CSI2 RAW12

RAW12 data can be output to memory in two formats: with or without data expansion. If data expansion is used, the 12-bit data are padded with 0s on a 16-bit word. The line length sent through the CSI2 physical layer is a multiple of 8 bits. Furthermore, the line length is a multiple of 3 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 12 is 24, so 3 × 8 bits). Figure 24-17 shows the storage format for RAW12 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x2C to select RAW12 mode
- To 0xAC for RAW12 + 16-bit expansion

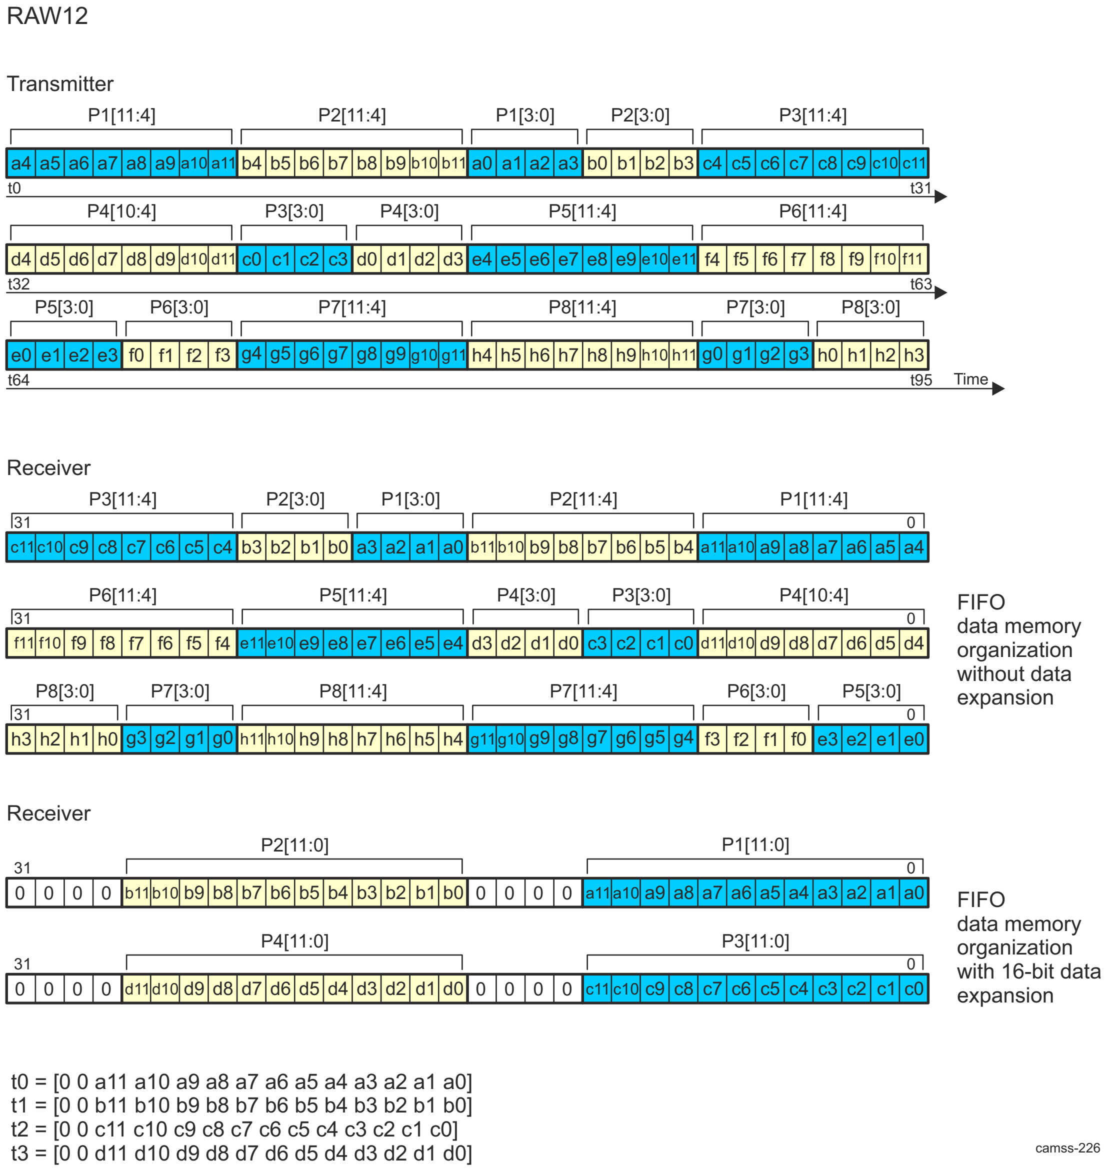

Figure 24-17. CSI2 RAW12

24.1.3.1.1.4.1.6 CSI2 RAW14

RAW14 data can be output to memory in two formats: with or without data expansion. If data expansion is used, the 14-bit data are padded with 0s on a 16-bit word. The line length sent through the CSI2 physical layer is a multiple of 8 bits. Furthermore, the line length is a multiple of 7 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 14 is 56, so 7 × 8 bits). Figure 24-18 shows the storage format for RAW14 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x2D to select RAW14 mode
- To 0xAD for RAW14 + 16-bit expansion

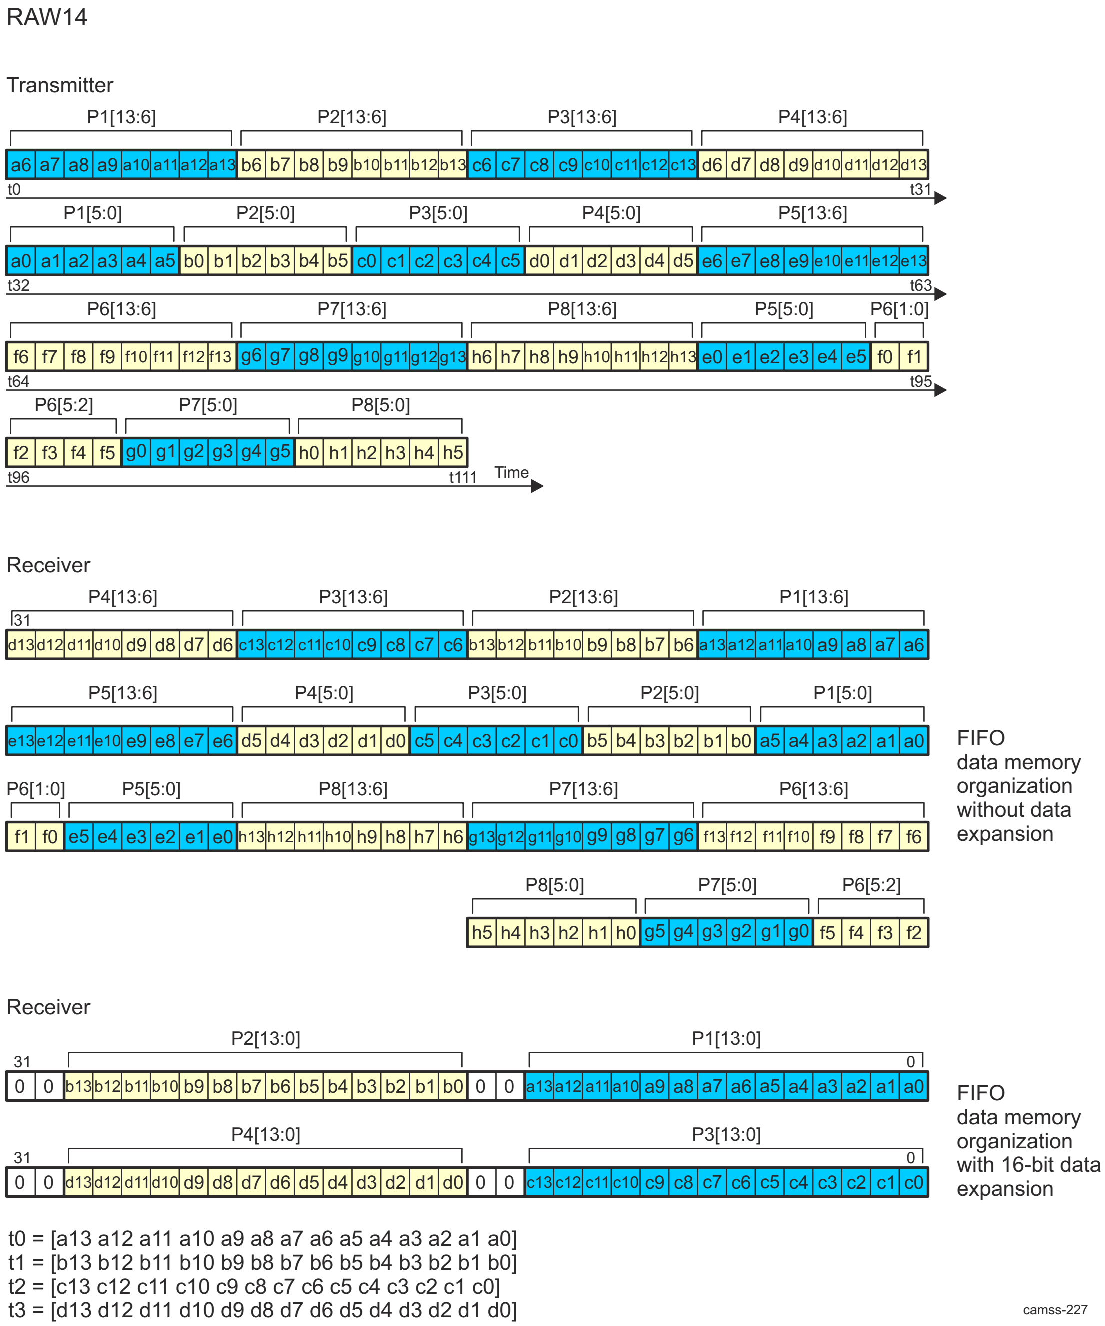

Figure 24-18. CSI2 RAW14

24.1.3.1.1.4.2 CSI2 Generic Format

The CSI2 receiver supports a generic format to send data to memory. The generic mode is entered by setting the CSI2_CTX_CTRL1_i[30] GENERIC bit. The CSI2_CTX_CTRL2_i[9:0] FORMAT bit field defines how the data stream is decoded. When generic mode is enabled (GENERIC = 1), the MIPI data type code is ignored and data is decoded using the FORMAT bit. Whatever the MIPI data type code, it is ignored (the data stream is processed even if the FORMAT bit does not match the MIPI data type code.) When generic mode is not used (GENERIC = 0), the data stream is processed only when the MIPI data type code matches the FORMAT setting of the enabled context. If not matched, the data stream is not processed by the CSI2 engine. Only the virtual channel information is used to map a received data stream to a context. Software must ensure that a MIPI virtual channel used in generic mode is mapped only to a single context.

Figure 24-19 shows the CSI2 generic format.

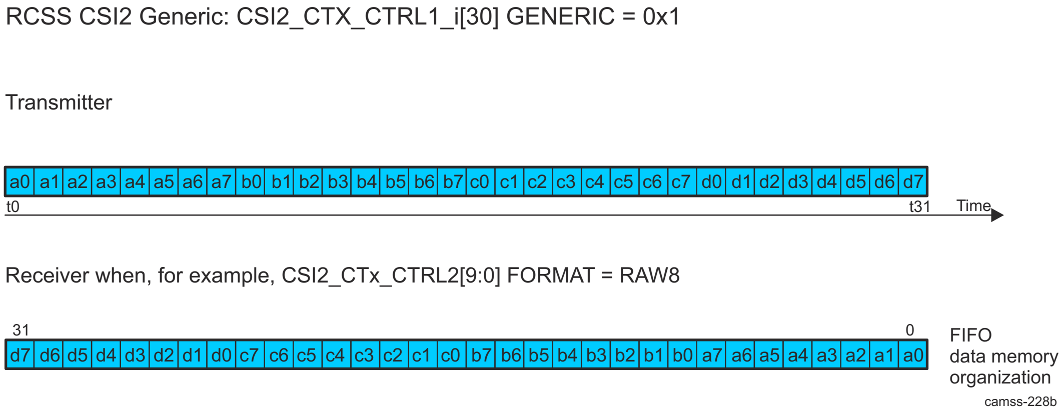

Figure 24-19. CSI2 Generic Format

24.1.3.1.1.4.3 CSI2 MIPI Format Supported Summary

Table 24-6 summarizes the CSI2 MIPI-supported formats and their output category. By setting the CSI2_CTX_CTRL2_i register format, the CSI2 outputs certain types of pixel packet data.

Table 24-6. CSI2 MIPI Format Supported by the Protocol Engine

(1) To understand synchronization codes and short packets, see Section 24.1.3.3.2.3, *CSI2 Short Packet*.

(2) To understand synchronization codes and long packets, see Section 24.1.3.1.1.3.2, *CSI2 Long Packet*.

24.1.3.2 CSI2 Integration

Figure 24-20 is an overview of the integration of the CSI2-A interface in the device. The figure is the top-level block diagram of the CSI2-A receiver. The CSI2-A receiver receives the serial data coming from a CSI2 compatible image sensor, converts it to parallel data, extracts the logical channels, detects and extracts the synchronization codes, reformats the data, and outputs it through the RSS interconnect interface.

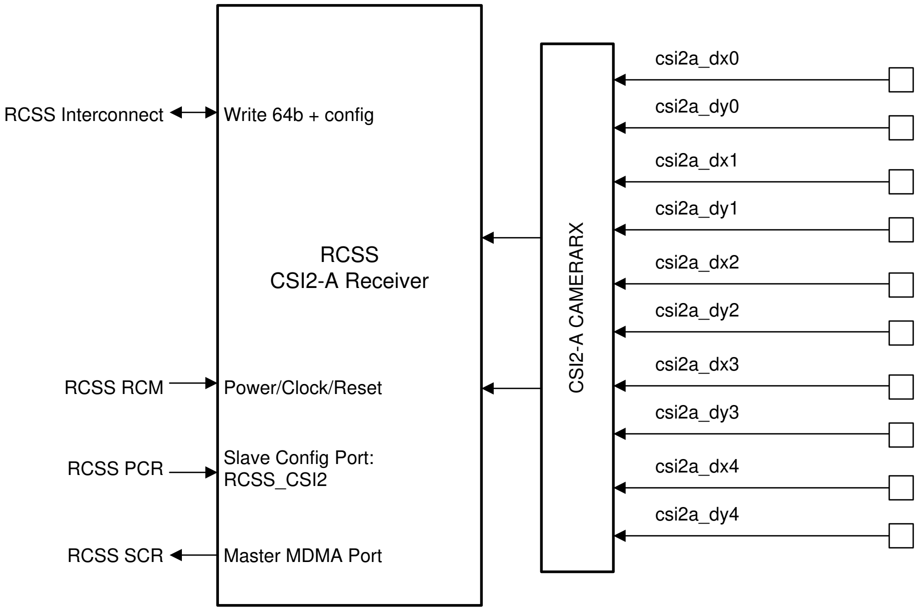

Figure 24-20. CSI2-A Integration

The CSI2-A receiver can send data directly to system memory using the master port.

For power domain, clocks, reset, and hardware requests, see Section 5.5.

24.1.3.3 CSI2 Functional Description

24.1.3.3.1 CSI2 Overview

Figure 24-21 is the CSI2-A receiver block diagram (it assumes there are four CSI2 image sensor data lines). The CSI2 receiver receives the byte data coming from a CSI2 D-PHY receiver (up to four data pairs), converts it to byte stream, detects and corrects errors, extracts the virtual channel ID, detects and extracts the synchronization codes, reformats the data, and outputs it through the RSS interconnect interface.

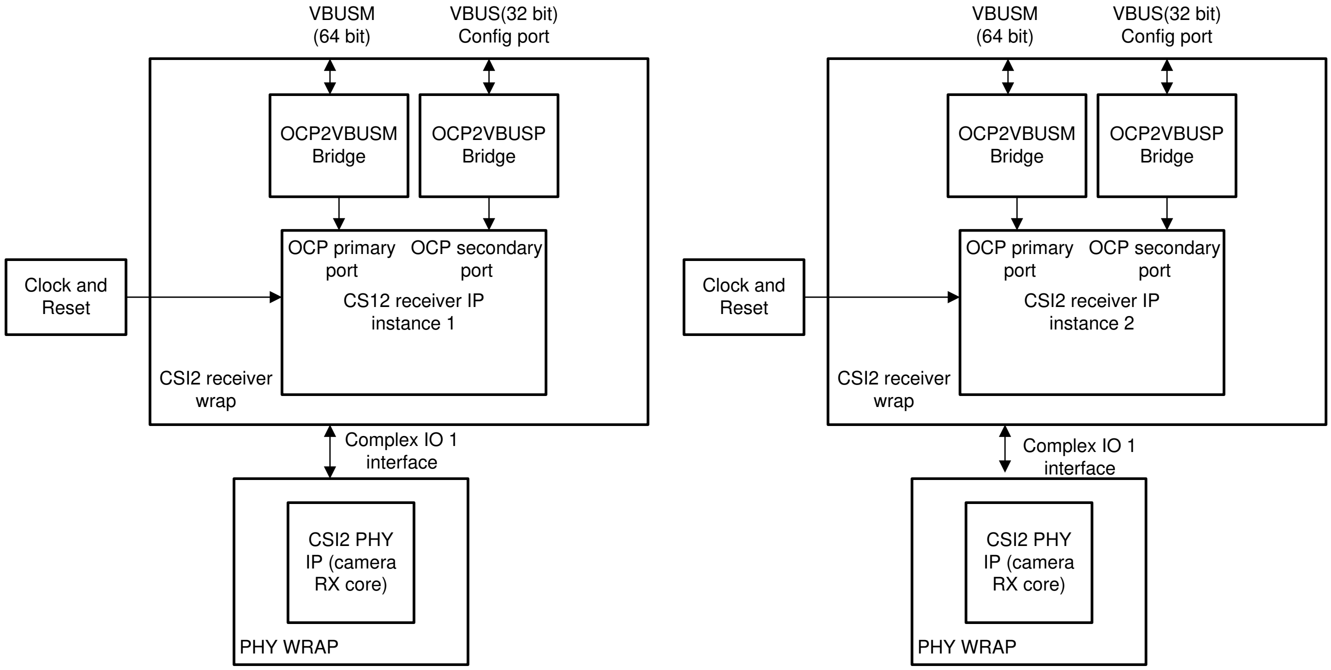

Figure 24-21. CSI2-A Receiver Block Diagram

24.1.3.3.2 CSI2 Functional Description

24.1.3.3.2.1 CSI2 Physical Layer Lane Configuration

The CSI2 serial interface is a unidirectional differential serial interface with data/clock for the physical layer.

The maximum CSI2 receiver data transfer capacity is 900 Mbps per data lane.

Data-clock signaling consists of two to five differential signal pairs: from one to four data lanes and one clock lane:

- The data signal carries the bit-serial data. The CSI2 transmitter in the image sensor sends the data in-quadrature with the dual-data rate (DDR) clock in HS mode; otherwise, the clock is extracted from the received data in LS mode. Data is transmitted byte-wise, LSB first. The CSI2 complex I/O receives the data and sends the byte stream to the CSI2 receiver.
- The clock signal carries the DDR clock signal.

Each physical lane can be a data or clock lane with a restriction to the fourth line, which can only be data (see Section 24.1.2.1, *CSI2 PHY Overview*). The clock/data lane must be configured before transmission to indicate the byte order, while merging the received bytes into a byte stream shows the reachable speed per data lane function of data lane numbers.

Lanes are configured through the CSI2_COMPLEXIO_CFG registers for CSI2-A PHY, respectively. The [2:0] CLOCK_POSITION bit field and the [3] CLOCK_POL bit configure which lane transmits the clock and define its polarity. DATAI_POSITION and DATAI_POL configure the data lanes and their polarity, where I is the number of the data lane (I = 1 to 2). When the DATAI_POSITION field is set to 0, data lane I is not used.

24.1.3.3.2.2 CSI2 ECC and Checksum Generation

The CSI2 receiver includes an ECC in the packet header and a checksum in the packet footer for long-packet transmission. These two fields can be used to detect and/or correct errors in the received packet.

24.1.3.3.2.2.1 CSI2 ECC

To detect and correct transmission errors of the header of short and long packets, an 8-bit ECC is included in the header of packets (short and long packet).

The ECC concerns all the fields for a short packet (data ID and short-packet data field) and the packet header for a long packet (data ID and word count). The ECC can only correct one error. Additional errors cannot be repaired, but they are flagged.

The CSI2 receiver ECC is compared against the CSI2 transmitter ECC embedded in the bitstream. If the ECC does not match, an interrupt is triggered to the host central processing unit (CPU).

For long and short packets, the correction is always done if there is only one error per packet header.

An ECC error with or without correction can be reported at two levels, depending on the type of packet. Table 24-7 describes the field in which events are logged. Logging cannot be disabled, but users can set the corresponding bit in the and registers to prevent event generation at a higher level.

Table 24-7. CSI2 ECC Event Logging

	Short Packet	**Long Packet**
With correction	Global CSI2_IRQSTATUS[12] ECC_CORRECTION_IRQ	Context CSI2_CTX_IRQENABLE_i[8] ECC_CORRECTION_IRQ
Without correction	Global CSI2_IRQSTATUS[11] ECC_NO_CORRECTION_IRQ	Global CSI2_IRQSTATUS[11] ECC_NO_CORRECTION_IRQ

The ECC check can be disabled (short and long packet) by setting the [2] ECC_EN bit to 0. Setting the bit to 1 enables the ECC check.

24.1.3.3.2.2.2 CSI2 Checksum

To detect errors in transmission of the payload of long packets, a 16-bit CRC checksum is computed on the payload of the long packets in the transmitter. This CRC is stored in the packet footer. A CRC is also computed in the CSI2 receiver. If the checksums do not match, an interrupt is triggered to the host CPU.

CRC errors are logged in the CS_IRQ field of the corresponding context register, . Logging cannot be disabled, but users can set the corresponding bit in the register to prevent event generation at a higher level.

The CRC can be disabled for a specific context by setting the [5] CS_EN bit to 0. Seeting the bit to 1 enables the CRC.

24.1.3.3.2.3 CSI2 Short Packet

There are two types of short packets in the CSI2 receiver:

- Synchronization short packet: Used by the protocol engine to synchronize frame and line (data ID from 0x0 to 0x7)
- Generic short packet: User-dependent; not treated by the protocol engine (data ID from 0x8 to 0xF)

When a generic short packet is received by the CSI2 receiver, the ECC check is performed if it is enabled. Then, the short packet is written in the [23:0] SHORT_PACKET bit field. The ECC field is deleted from the short packet. Figure 24-22 shows the SHORT_PACKET bit field format.

Figure 24-22. CSI2 SHORT_PACKET Bit Field Format

When a short packet is stored, an event is logged in the [13] SHORT_PACKET_IRQ bit. Logging cannot be disabled, but users can set the corresponding bit in the register to prevent event generation at a higher level.

The application reads the register before the next short packet with a code from 0x8 to 0xF. There is a single register for capturing the generic short packet, because no data type in it is associated with context.

24.1.3.3.2.4 CSI2 Virtual Channel and Context

The CSI2 protocol layer transports virtual channels. The virtual channels separate different data flows interleaved in the same data stream. Each virtual channel is identified by a unique channel identification number in the packet header. This channel identification number is encoded in the 2-bit code.

The CSI2 receiver monitors the channel identifier number and demultiplexes the interleaved data streams. The CSI2 receiver supports up to four concurrent virtual channels.

The CSI2 receiver supports eight contexts with their events to control the four possible virtual channels and the different data transmitted through them. A context is linked to a specific data type transported by a given virtual channel. The following bit fields permit configuration of a context:

- [12:11] VIRTUAL_ID: Configures the virtual ID linked to the current context
- [9:0] FORMAT: Configures the data format linked to the current context

Figure 24-23 shows the relationships between virtual channels and contexts.

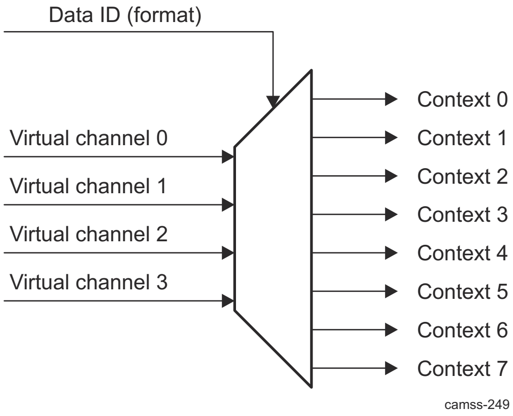

Figure 24-23. CSI2 Virtual Channel to Context

Each context consists of eight registers: six registers to control the corresponding context and two to log and enable events from the context. All registers in a context can be modified at any time; however, modifications apply only from the start of the following frame.

A context can be enabled independently by setting the [0] CTX_EN bit to 1; setting this bit to 0 disables the corresponding context.

When acquiring frames on a context, users can write the number of frames to capture in the [15:8] COUNT bit field. Acceptable values are 0 to 255; 0 stands for infinite capture (no count). After each frame is acquired, the count value is decremented by 1. When the count value reaches 0, the [6] FRAME_NUMBER_IRQ event is set and the CTX_EN bit is set to 0. To write a value in the COUNT bit field, the [4] COUNT_UNLOCK bit must be set to 1. If the value of the COUNT_UNLOCK bit is 0, a write in the COUNT bit field has no effect.

The CSI2_CTX_CTRL3_i[15:0] LINE_NUMBER bit field configures the generation of the [7] LINE_NUMBER_IRQ event. The [1] LINE_MODULO bit configures how the LINE_NUMBER event is generated:

- 0: The event is generated one time by frame.
- 1: The event is generated modulo LINE_NUMBER (the event can be generated more than once in a frame).

During a frame capture, the [31:16] FRAME_NUMBER bit field shows the number that identifies the frame received.

24.1.3.3.2.5 CSI2 DMA Engine

The CSI2 receiver integrates its own DMA engine with dedicated FIFO.

Global DMA configuration is common to the eight channels and is defined in the register. Configuration of the ping-pong address and the offset between lines is specific for a given context; therefore, each context has its own DMA configuration registers.

The DMA engine supports:

- 1D addressing mode (no address line offset, CSI2_CTX_DAT_OFST_i = 0)
- 2D addressing mode (address line offset different than 0, CSI2_CTX_DAT_OFST_i != 0)

The burst size is defined in the [6:5] BURST_SIZE bit field and the [16] BURST_SIZE_EXPAND bit. The DMA uses the burst size or smaller sizes down to single open-core protocol (OCP) writes depending on the alignment at the end of lines. The DMA engine can handle burst requests. When the burst requests can be used, as soon as one burst of data is present in the FIFO, the DMA engine initiates a burst write.

Note

Unless there are specific requirements, CSI2 (also applies to all other initiators) must be configured to use only a burst size of 128 bytes and nonposted writes.

When single requests must be used, as soon as one element (the size depends on the data type and the post-processing: DPCM, EXT, etc.) is present in the FIFO, the DMA engine initiates a single write.

Interleave mode is dedicated by the CSI2 receiver only when the line numbers are received (short packets). The line number is used to calculate the start address of the line.

The DMA starts to write in memory using the [31:5] ADDR bit field for the first frame to be transferred, and then uses the [31:5] ADDR bit field and the ping address alternately. Thus, the first frame uses the ping address, the second frame uses the pong address, the third frame uses the ping address, and so on.

The [3] PING_PONG status bit indicates whether the ping address () or the pong address () was used to store the pixel data of the last frame. After reset or after a 0-to-1 edge transition in the [0] IF_EN bit, the pixel data is written in the ping buffer and the [3] PING_PONG bit = PONG. When the number of FECs received equals the value programmed in the [23:16] FEC_NUMBER bit field, the pixel data are written in the pong buffer and [3] PING_PONG = PING. [3] PING_PONG toggles after the [23:16] FEC_NUMBER FEC sync code with the virtual channel ID defined is received in the [12:11] VIRTUAL_ID bit field.

The [23:16] FEC_NUMBER bit field must be set as follows:

- In progressive mode, set to 1.
- In interlaced mode, set to the number of interlaced frames to recreate a progressive image in the PING_PONG buffer.

24.1.3.3.2.5.1 CSI2 Progressive Frame to Progressive Storage

After each line, a new start line address is computed, depending on the value of the [31:5] OFST bit field:

- If OFST = 0, the new line starts immediately after the last pixel (data are written contiguously in memory).
- Otherwise, the value of OFST sets the offset between the first pixel of the previous line and the first pixel of the current line in memory.

For the ping frame:

```
@Line0 = CSI2_CTX_DAT_PING_ADDR_i@Line1 = @Line0 + CSI2_CTX_DAT_OFST_i@Line2 = @Line1 +
CSI2_CTX_DAT_OFST_i
```

For the pong frame:

```
@Line0 = CSI2_CTX_DAT_PONG_ADDR_i@Line1 = @Line0 + CSI2_CTX_DAT_OFST_i@Line2 = @Line1 +
CSI2_CTX_DAT_OFST_i
```

24.1.3.3.2.5.2 CSI2 Interlaced Frame to Progressive Storage

The mode is functional only when the line numbers are transmitted. It is automatically enabled without setting.

For the ping frame:

```
@LineX = CSI2_CTX_DAT_PING_ADDR_i + CSI2_CTX_DAT_OFST_i * Line_Number
```

For the pong frame:

```
@LineX = CSI2_CTX_DAT_PONG_ADDR_i + CSI2_CTX_DAT_OFST_i * Line_Number
```

Figure 24-24 shows how data are stored in memory regarding the DMA configuration.

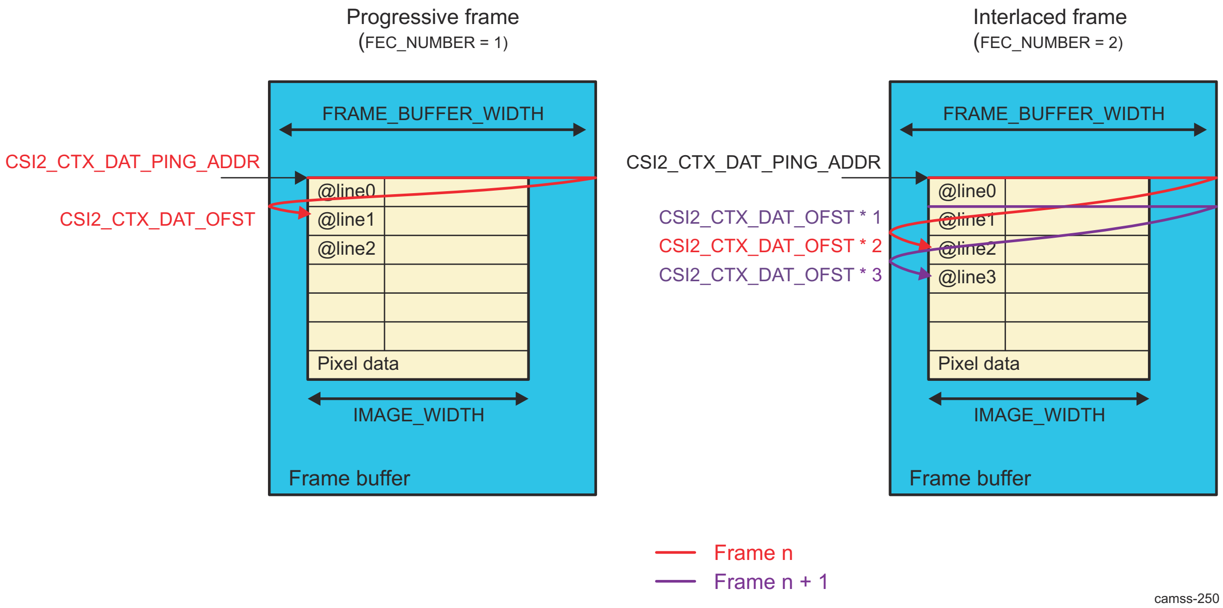

Figure 24-24. CSI2 Data Destination Setting in Progressive and Interlaced Mode

The burst size is defined in the CSI2_CTRL[6:5] BURST_SIZE bit field for bursts up to 16 × 64 bits or the CSI2_CTRL[16] BURST_SIZE_EXPAND bit for 16 × 128-bit bursts. It can be changed only while the CSI2_CTRL[0] IF_EN bit is reset to 0. The recommended value is the CSI2_CTRL[16] BURST_SIZE_EXPAND bit set to 1, which defines a burst of 16 × 64 bits (the maximum value); otherwise, by default it is set to 8 × 64 bits. When the BURST_SIZE_EXPAND bit is set, the BURST_SIZE setting has no effect. The DMA uses nonposted writes by default. The CSI2_CTRL[13] NON_POSTED_WRITE bit must be set to 1 to match DMA default configuration. It can be changed only while the CSI2_CTRL[0] IF_EN bit is reset to 0.

24.1.3.3.2.6 CSI2 MFLAG Mechanism and Arbitration

The MFLAG mechanism allows a dynamic increase of the priority of CSI2 real-time traffic, when required, based on the fullness of the CSI2 DMA read and write buffers. Programmable buffer thresholds indicate when the local MFLAG signal is generated. The MFLAG signal is then provided to the L3 interconnect for granting or prioritizing OCP requests. The out band CSI2 MFLAG signal is asynchronous to any on-going OCP transaction. The threshold corresponds to the fullness of DMA buffer, and is defined by the following threshold parameters:

- High threshold – When the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted). The value is set in the [22:20] MFLAG_LEVH register.
- Low threshold – When the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted). The value is set in the [19:17] MFLAG_LEVL register.

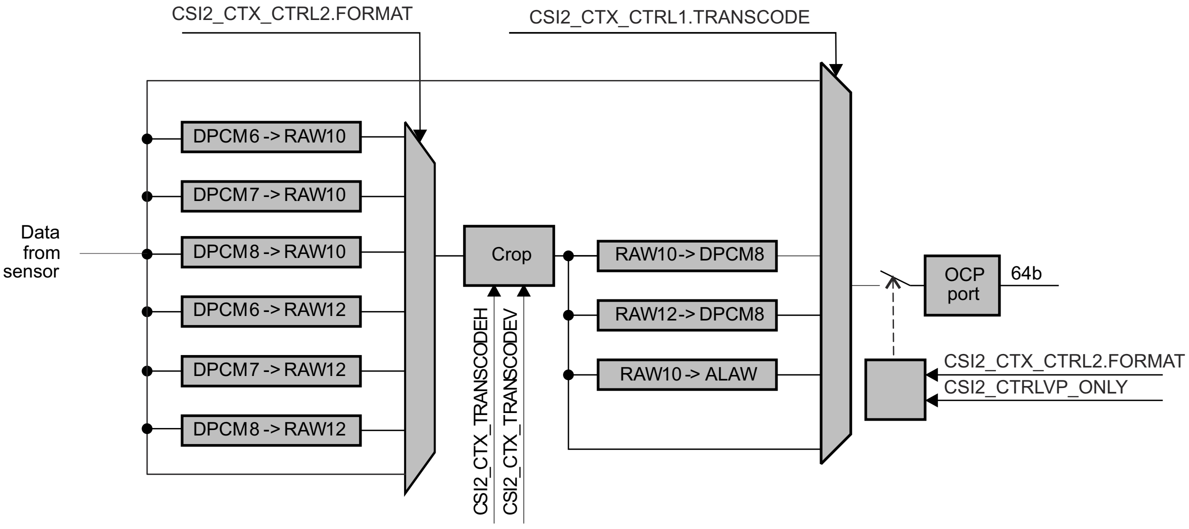
24.1.3.3.2.7 CSI2 Transcoding

Image transcoding is used mainly to reduce memory footprint and bandwidth when:

- The sensor does not support DPCM compression. In fact, A-Law and DPCM compressed pixels occupy only 6, 7, or 8 BPP of storage.
- Digital zoom is used
  - Data that is not going to be used by further processing does not need to the stored in system memory.
  - Pixels cannot be accessed from random locations in a DPCM-compressed frame. Transcoding avoids memory-to-memory processing of unused pixels.

Figure 24-25 shows the logical representation of the image transcoding operation.

- Data is extracted from the CSI2 stream by the protocol engine.
- It is DPCM decompressed if necessary. That is the case when the received stream is DPCM-compressed and transcoding has been enabled using the [27:24] TRANSCODE bit field.
- Internal data are aligned on MSB when they enter the cropping stage. For example:
  - 4 LSBs are 0s when RAW10 data are handled.
  - 2 LSBs are 0s when RAW12 data are handled.



camss-255

Figure 24-25. CSI2 Frame Processing

Table 24-8 shows the input format provided to the cropping engine for a given pixel format provided by the sensor. Formats not listed in the table are not supported for transcoding. The FORMAT and Corresponding Setting Value column corresponds to the value set in the [9:0] FORMAT register.

Table 24-8. CSI2 Supported Transcoding Input Formats

CSI2_CTX_CTRL2_i[9:0] FORMAT and Corresponding Setting Value		Cropping Engine Input Format	DPCM Decomposition Enabled	Video Port Enabled
0x028	RAW6	RAW6		
0x068	RAW6 + EXP8			
0x029	RAW7	RAW7		
0x069	RAW7 + EXP8			
0x02A	RAW8	RAW8		
0x02B	RAW10	RAW10		
0x0AB	RAW10 + EXP16			

Table 24-8. CSI2 Supported Transcoding Input Formats (continued)

CSI2_CTX_CTRL2_i[9:0] FORMAT and Corresponding Setting Value		Cropping Engine Input Format	DPCM Decomposition Enabled	Video Port Enabled
0x229	RAW7 + DPCM10 + EXP16	RAW12	Yes	
0x2A8	RAW6 + DPCM10 + EXP16		Yes	
0x2AA	RAW8 + DPCM10 + EXP16		Yes	
0x2Cn	USER_DEFINED_BYTE_DATA + DPCM10 + EXP16		Yes	
0x02C	RAW12			
0x0AC	RAW12 + EXP16			
0x35A	RAW8 DPCM12 + EXP16		Yes	
0x1Cn	USER_DEFINED_BYTE_DATA + DPCM12 + EXP16		Yes	
0x3A8	RAW6 + DPCM12 + EXP16		Yes	
0x369	RAW7 + DPCM12 + EXP16		Yes	
0x02D	RAW14	RAW14		
0x0AD	RAW14 + EXP16			

Image cropping parameters are controlled by software. Figure 24-26 shows the cropping operation.

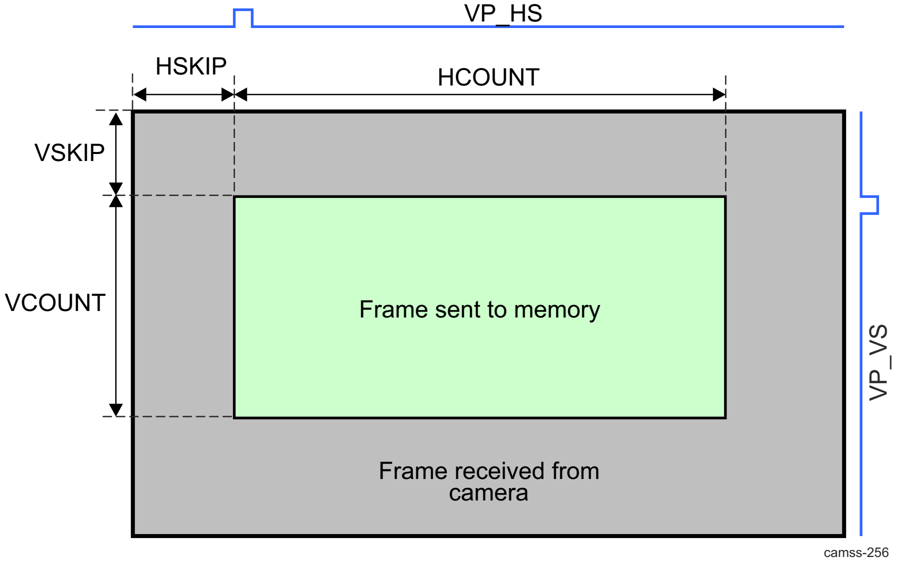


Figure 24-26. CSI2 Frame Cropping

CAUTION

Hardware does not check for validity of the settings. The following rules must be respected:

- [12:0] HSKIP + CSI2_CTX_TRANSCODEH_i[28:16] HCOUNT <= image width
- [12:0] VSKIP + CSI2_CTX_TRANSCODEV_i[28:16] VCOUNT <= image height

Furthermore, the [28:16] HCOUNT bit field must comply with the following alignment constraints; otherwise, undefined behavior occurs. Table 24-9 shows the transcode alignment constraints

Table 24-9. CSI2 Transcode Alignment Constraints

CSI2_CTX_CTRLi[27:24] TRANSCODE Value	Transcode	HCOUNT Must Be Multiple of
0x0	Disabled	1
0x1	DPCM10 RAW8	1

Table 24-9. CSI2 Transcode Alignment Constraints (continued)

CSI2_CTX_CTRLi[27:24] TRANSCODE Value	Transcode	HCOUNT Must Be Multiple of
0x2	DPCM12 RAW8	1
0x3	ALAW10 RAW8	1
0x4	RAW8	1
0x5	RAW10 + EXP16	1
0x6	RAW10	4
0x7	RAW12 + EXP16	1
0x8	RAW12	2
0x9	RAW10 + EXP16	4

The CSI2_CTX_CTRL1_i[28] HSCALE configuration register enables horizontal downscaling of RAW data. It reduces the horizontal size and pixel clock by a factor of 2. The scaler uses a 2-tap horizontal filter operating on samples of the same color plane. The coefficients are: [1/2 ; 0 ; 1/2]

Figure 24-27 shows the scaler operation.

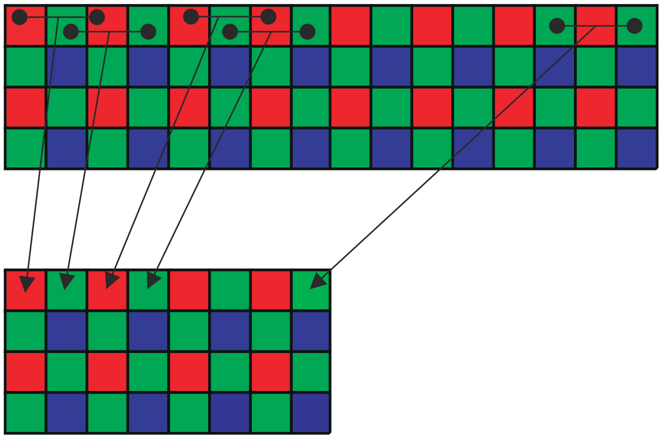

Figure 24-27. CSI2 Horizontal Scaler

When data goes to the interface port, HCOUNT/2 must comply with the constraints from Table 24-9 (for example, for RAW10, HCOUNT must be a multiple of 8).

Table 24-10 lists possible combinations of input and output formats supported by the transcoding engine. The Transcode column corresponds to the CSI2_CTX_CTRL1_i[27:24] TRANSCODE bit field of a context.

Table 24-10. CSI2-Supported Transcoding Output Formats

Cropping Engine Output	Transcode		Supported	Cropping Engine Output	Transcode		Supported
RAW6	0	Disabled	Yes	RAW10	0	Disabled	Yes
	1	DPCM10 RAW8			1	DPCM10 RAW8	Yes
	2	DPCM12 RAW8			2	DPCM12 RAW8	
	3	ALAW10 RAW8			3	ALAW10 RAW8	Yes
	4	RAW8			4	RAW8

	8	RAW12			8	RAW12	
	9	RAW14			9	RAW14	Yes

RAW pixels are packed into 64-bit words sent to the OCP master port, as defined in:

- Section 24.1.3.1.1.4.1.3, *CSI2 RAW8*
- Section 24.1.3.1.1.4.1.4, *CSI2 RAW10*
- Section 24.1.3.1.1.4.1.5, *CSI2 RAW12*
- Section 24.1.3.1.1.4.1.6, *CSI2 RAW14*

For RAW10 and RAW12, software can choose among packed and nonpacked storage. A-Law and DPCM-compressed pixels are stored as RAW8 data: each RAW8 container holds a compressed data point.

Enabling of the OCP is controlled by the [9:0] FORMAT bit field and the [11] VP_ONLY_EN and CSI2_CTX_CTRL1_i[2] VP_FORCE bits.

To enable transcoding, software configures the context normally and also configures the framing using the and registers. Software defines the after transcoding with the CSI2_CTX_CTRL1_i[27:24] TRANSCODE bit field.

24.1.3.3.2.8 CSI2 EndOfFrame and EndOfLine (EOF and EOL) Pulses

The CSI2 receiver generates two signals to qualify the last pixel of a frame and the last pixel of a line to the TCTRL. It is active during or after the adequate interface bridge transaction and becomes inactive before the first transaction of the next line. Software can enable/disable generation of those signals for each context using the [7] EOF_EN and [6] EOL_EN bits.

24.1.3.3.2.9 CSI2 Data Decompression

The data compression technique used is DPCM and PCM.

To select the DPCM decompression predictor for the CSI2 Interface, set the [10] DPCM_PRED bit to 1 for simple predictor or to 0 for advanced predictor.

24.1.3.4 CSI2 Programming Model

24.1.3.4.1 CSI2 Programming Reset Management

The CSI2 receiver accepts a general software reset, propagated throughout the hierarchy. This reset can be done to initialize the CSI2 receiver and the complex I/O (A) and has the same effect as a hardware reset. Figure 24-28 shows how to reset CSI2 globally.

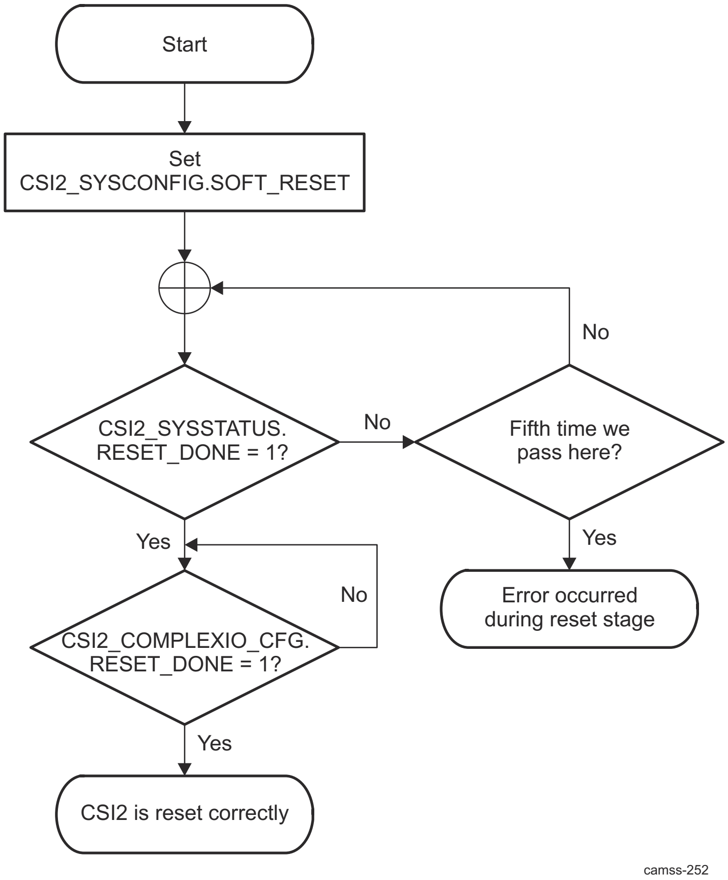

Figure 24-28. CSI2 Receiver Global Reset Flow Chart

Note

Before setting the software reset bit to 1 in the CSI2_SYSCONFIG register, the user must have access to a CSI2 receiver register.

Note

The CSI2_COMPLEXIO_CFG[29] RESET_DONE bit is set to 1 only after the initialization of the CSI2 receiver, CSI2 complex I/O.

24.1.3.4.2 CSI2 Programming Enable Data Acquisition

Before using the receiver, a CSIPHY initialization in CSI2 mode must be made for CSI2-A CSIRX, which is associated with the CSI2 receiver. See Section 24.1.2.2.2, *CSI2 PHY and Link Initialization Sequence.* To start a video/picture acquisition, perform the steps listed in Table 24-11.

Table 24-11. CSI2 Global Initialization

Step	Register/Bit Field/Programming Model	Value
Reset the CSI2 receiver.	See Section 24.1.3.4.1, *Reset Management.*	

Table 24-11. CSI2 Global Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
Configure the module power management. The module tries to enter smart-standby mode during the vertical blanking period. The CSI2_SYSCONFIG[0] AUTO_IDLE bit keeps its reset value; by default, an automatic port clock gating strategy is applied based on port interface activity.	CSI2_SYSCONFIG[13:12] MSTANDBY_MODE	0x2
Configure the interrupt generation as required. To enable context and/or complex I/O event reporting, enable the corresponding bit field in the CSI2_IRQENABLE register. If the enable bit is at 0, logging is still effective if an event occurs, but is not reported to a higher level.	CSI2_IRQENABLE and CSI2_IRQENABLE	
Configure the complex I/O interrupt generation as required. If the enable bit is at 0, logging is still effective if an event occurs, but is not reported to a higher level.	CSI2_COMPLEXIO_IRQSTATUS and CSI2_COMPLEXIO_IRQENABLE)	
Start complex I/O: Set the CSI2_COMPLEXIO_CFG[28:27] PWR_CMD bit field to 0x1 to pass the complex I/O to the ON state, and then check that the state status reaches the ON state (CSI2_COMPLEXIO_CFG[26:25] PWR_STATUS = 0x1) (for complex I/O A).	CSI2_COMPLEXIO_CFG[28:27] PWR_CMD	0x1
Configure the complex I/O: • The complex I/O is fully functional with CSI2_COMPLEX_CFG set at its reset value. • CSI2_COMPLEX_CFG must be changed according to the data rate being used.	CSI2_COMPLEXIO_CFG	
Set RXMODE and STOPSTATE FSM to RXMODE state. Users can also configure the delay for the FSM to return from RXMODE to NORXMODE when all lines reach STOPSTATE.	CSI2_TIMING[15] FORCE_RX_MODE_IO1	0x1
Activate ECC correction and error detection on short packets and packet headers. The ECC check corrects the packet if there is one error and generates an error if there is more than one error (unrecoverable error).	CSI2_CTRL[2] ECC_EN	0x1
Start the CSI2 receiver.	CSI2_CTRL[0] IF_EN	0x1
Configure the different contexts to be used.		
Link the context to a virtual channel and a data type.	See Section 24.1.3.4.6, *Linking a Context to a Virtual Channel and a Data Type*.	
Set the FEC_NUMBER bit field to 0x1 for a progressive video and to 0x2 for an interlaced video. For more information, see Section 24.1.3.3.2.5, *DMA Engine*.	CSI2_CTX_CTRL1_i[26:23] FEC_NUMBER	0x1 or 0x2
Capture an infinite number of frames (until the interface or the context is disabled).	CSI2_CTX_CTRL1_i[15:8] COUNT and CSI2_CTX_CTRL1_i[4] COUNT_UNLOCK	0x0
Enable the CRC checksum on long packet payload. This allows detection of errors, but cannot correct errors like the ECC for header and short packet. On error detection, an event is triggered (the CSI2_CTX_IRQSTATUS_i[5] CS_IRQ bit).	CSI2_CTX_CTRL1_i[5] CS_EN	
Configure the DMA engine for the current channel: Configure the ping and pong addresses.	CSI2_CTX_DAT_PING_ADDR_i[31:5] ADDR and CSI2_CTX_DAT_PING_ADDR_i[31:5] ADDR	
Set the CSI2_CTx_DAT_OFST_i[15:5] OFST bit field to 0x0 so consecutive lines are stored consecutively in memory (image width and frame-buffer width are equal).	CSI2_CTX_DAT_OFST_i[15:5] OFST	

Table 24-11. CSI2 Global Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
Keep the ALPHA setting at its reset value (0x0) for RGB padding.	CSI2_CTX_CTRL3_i[29:16] ALPHA	
Enable the contexts.	CSI2_CTX_CTRL1_i[0] CTX_EN	0x1

24.1.3.4.3 CSI2 Programming Disable Data Acquisition

There are two ways to end picture acquisition:

- Disable the corresponding context by setting the [0] CTX_EN bit to 0. This stops the acquisition for the current context. Other enabled contexts are still capturing frames and writing them in memory.
- Disable the CSI2 receiver interface by setting the [0] IF_EN bit to 0. This can have an immediate effect if the [3] FRAME bit is set to 0, or it can be effective after all the enabled contexts receive the FEC if the [3] FRAME bit is set to 1.

24.1.3.4.4 CSI2 Programming Capture a Finite Number of Frames

The CSI2 receiver can be configured to capture a finite number of frames. To configure the CSI2 receiver in this mode, perform the steps listed in Table 24-12.

Table 24-12. CSI2 Capture a Finite Number of Frames

Step	Bit Field	Value
Enable a write to the COUNT bit field.	CSI2_CTX_CTRL1_i[4] COUNT_UNLOCK	0x1
Set the bit field to the number of frames the CSI2 receiver must capture.	CSI2_CTX_CTRL1_i[15:8] COUNT	Valid values are 0 to 255; 0 is infinite capture and 1 to 255 defines the number of frames to capture.
Disable a write to the COUNT bit field.	CSI2_CTX_CTRL1_i[4] COUNT_UNLOCK	0x0

During frame capture, the COUNT bit field is decremented by 1 at each frame capture. Software reads the COUNT bit field to know how many frames must still be captured.

The COUNT bit can be updated during capture if the COUNT_UNLOCK bit is set to 1.

24.1.3.4.5 CSI2 Programming a Periodic Event During Frame Acquisition

The CSI2 receiver can generate a periodic event. This line number is defined in the [15:0] LINE_NUMBER bit field. The event can be generated once or multiple times per frame, depending on the value of the [1] LINE_MODULO bit:

- If the LINE_MODULO bit = 0, the event is generated when the line number corresponding to the LINE_NUMBER bit field is received.
- If the LINE_MODULO bit = 1, the event is generated when the line number received corresponds to a multiple of the LINE_NUMBER value (LINE_NUMBER is used as a modulo).

24.1.3.4.6 CSI2 Programming a Context to a Virtual Channel and a Data Type

The CSI2 receiver supports eight contexts and the CSI2 protocol defines four virtual channels. Therefore, a CSI2 receiver context can be associated with a virtual channel and a data type. Virtual channels are defined by a 2-bit field. Valid data types for the CSI2 receiver with their associated values are described in the [9:0] FORMAT bit field.

For each context, a register defines with which channel and data type the context is associated:

- The VIRTUAL_ID bit field defines the associated virtual ID transported by the CSI2 protocol from the radar sensor.
- The FORMAT bit field defines the associated data type. The data type is a combination of the data type transported by the CSI2 protocol and the type of storage in memory. A given data type (RGB888) can be stored in memory in different ways (RGB888 or RGB888 + EXP32). Therefore, the FORMAT bit field also defines how DMA stores data in memory.

- **CSI2_CTXn_DAT_PING_ADDR** and **CSI2_CTX0_DAT_PONG_ADDR** need to be set in order to store the received data (ping or pong manner) from CSI2RX. Same set of registers would be used during HIL mode to write data to device's internal memory.

For example, for the current context to capture a frame from virtual channel 2 and data type RAW12 with data expansion (RAW12 + EXP16), write the value 0x10AC (0x2 11 + 0xAC) in the 16 LSBs of the register.

24.1.3.4.7 CSI2 Programming Progressive and Interleaved Frame Configuration

The CSI2 receiver can treat progressive and interlaced frames. There is no progressive or interleaved mode, but the [23:16] FEC_NUMBER bit field controls the number of FECs before swapping to the other (ping or pong) buffer. Therefore, two modes are possible:

- FEC_NUMBER = 1: This is equivalent to progressive mode. After a FEC on the context, the current buffer is switched (ping to pong or pong to ping). The data in the memory buffer consists of one transmitted frame.
- FEC_NUMBER = 2: The current buffer is switched (ping to pong or pong to ping) after the FEC_NUMBER FEC is received for the context. The data in the memory buffer consists of the FEC_NUMBER transmitted frame.

For more information about how data is stored in memory through the DMA, see Section 24.1.3.3.2.5, *DMA Engine*.

Note

If FEC_NUMBER 1, the external sensor must send the line number information with the current line. Otherwise, the CSI2 receiver cannot calculate each line address.

24.1.3.4.8 CSI2 Programming Debug Mode

Table 24-13 lists the procedure to enable debug mode.

Table 24-13. CSI2 Enable Debug Mode

Step	Bit	Value
Enable debug mode.	CSI2_CTRL[7] DBG_EN	0x1

- During debug mode the input does not come from the CSI2 receiver interface but from the CSI2_DBG_H and CSI2_DBG_P registers. The full CSI2 receiver function can be debugged in debug mode. Full 32-bit values must always be written to the CSI2_DBG_H register. The CSI2_CTRL[0] IF_EN bit has no affect during debug mode. To reset the FIFO in case of overflow, the CSI2_CTRL[7] DBG_EN bit must be reset to 0, and the interface must be enabled by setting the CSI2_CTRL[0] IF_EN bit to 0x1.
- The CSI2_DBG_H register is used to provide short packet and long packet headers.
- The CSI2_DBG_P register is used to provide long packet payload.

The following examples apply to the CSI2_DBG_H register:

- The sync codes for virtual channel 0 are written as CSI2_DBG_H = 0xFF00 0000 or 0xFF00 0001, or 0xFF00 0002 or 0xFF00 0003. To send the RAW12 pixels 0x673, 0x452, 0x01d, 0xefc, 0xab0, 0x891, 0x326, 0x547, write CSI2_DBG_H = 0x0123 4567, followed by CSI2_DBG_H = 0x89abcdef, and CSI2_DBG_H = 0x7654 3210.

24.1.3.5 CSI2 Register Manual

24.1.3.5.1 CSI2 Instance Summary

Table 24-14 summarizes the CSI2 instance.

Table 24-14. CSI2 Instance Summary

Reset or Default Value		
-n		Value after reset or the default value

24.1.3.5.2.1 CSI2_REVISION Register (Offset = 0h) [Reset = 00000030h]

CSI2_REVISION is shown in Table 24-17.

Return to the Summary Table.

MODULE REVISION This register contains the IP revision code in binary coded digital. For example we have: 0x01 = revision 0.1 and 0x21 = revision 2.1

Table 24-17. CSI2_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RES1	R	0h	RESERVE FIELD
7-0	REV	R	30h	IP revision [7:4] Major revision [3:0] Minor revision

24.1.3.5.2.2 CSI2_SYSCONFIG Register (Offset = 10h) [Reset = 00000001h]

CSI2_SYSCONFIG is shown in Table 24-18.

Return to the Summary Table.

SYSTEM CONFIGURATION REGISTER This register is the OCP-socket system configuration register.

Table 24-18. CSI2_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-14	RES2	R	0h	RESERVE FIELD
13-12	MSTANDBY_MODE	R/W	0h	RESERVE FIELD
11-2	RES3	R	0h	RESERVE FIELD
1	SOFT_RESET	R/W	0h	Software reset. Set the bit to 1 to trigger a module reset. The bit is automatically reset by the hw. During reads return 0. 0: Normal mode. 1: The module is reset
0	AUTO_IDLE	R/W	1h	Internal OCP gating strategy 0: OCP clock is free-running. 1: Automatic OCP clock gating strategy is applied based on the OCP interface activity.

24.1.3.5.2.3 CSI2_SYSSTATUS Register (Offset = 14h) [Reset = 00000001h]

CSI2_SYSSTATUS is shown in Table 24-19.

Return to the Summary Table.

SYSTEM STATUS REGISTER This register provides status information about the module excluding the interrupt status register.

Table 24-19. CSI2_SYSSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RES4	R	0h	RESERVE FIELD
0	RESET_DONE	R	1h	Internal reset monitoring Read 0x1: Reset completed. Read 0x0: Internal module reset is on going.

24.1.3.5.2.4 CSI2_IRQSTATUS Register (Offset = 18h) [Reset = 00000000h]

CSI2_IRQSTATUS is shown in Table 24-20.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - All contexts This register associates one bit for each context in order to determine which context has generated the interrupt. The context shall be enabled for events to be generated on that context. If the

Bit	Field	Type	Reset	Description
31-15	RES5	R	0h	RESERVE FIELD
14	OCP_ERR_IRQ	R/W	0h	OCP Error Interrupt 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. (RW W1toClr)
13	SHORT_PACKET_IRQ	R/W	0h	Short packet reception status (other than synch events: Line Start, Line End, Frame Start, and Frame End: data type between 0x8 and x0F only shall be considered). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. (RW W1toClr)
12	ECC_CORRECTION_IRQ	R/W	0h	ECC has been used to do the correction of the only 1-bit error status (short packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
11	ECC_NO_CORRECTION_IRQ	R/W	0h	ECC error status (short and long packets). No correction of the header because of more than 1-bit error. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
10	COMPLEXIO2_ERR_IRQ	R	0h	RESERVE FIELD
9	COMPLEXIO1_ERR_IRQ	R	0h	Error signaling from Complex IO #1: status of the PHY errors received from the complex IO #1 (events are defined in CSI2_COMPLEXIO1_IRQSTATUS for the 1st complex IO). Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
8	FIFO_OVF_IRQ	R/W	0h	FIFO overflow error status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
7	CONTEXT7	R	0h	Context 7 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
6	CONTEXT6	R	0h	Context 6 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
5	CONTEXT5	R	0h	Context 5 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).

Table 24-20. CSI2_IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	CONTEXT4	R	0h	Context 4 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
3	CONTEXT3	R	0h	Context 3 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
2	CONTEXT2	R	0h	Context 2 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
1	CONTEXT1	R	0h	Context 1 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
0	CONTEXT0	R	0h	Context 0 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).

24.1.3.5.2.5 CSI2_IRQENABLE Register (Offset = 1Ch) [Reset = 00000000h]

CSI2_IRQENABLE is shown in Table 24-21.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - All contexts This register associates one bit for each context in order to enable/disable each context individually.

Table 24-21. CSI2_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RES6	R	0h	RESERVE FIELD
14	OCP_ERR_IRQ	R/W	0h	OCP Error Interrupt 0: Event is masked 1: Event generates an interrupt when it occurs
13	SHORT_PACKET_IRQ	R/W	0h	Short packet reception (other than synch events: Line Start, Line End, Frame Start, and Frame End: data type between 0x8 and x0F only shall be considered). 0: Event is masked 1: Event generates an interrupt when it occurs
12	ECC_CORRECTION_IRQ	R/W	0h	ECC has been used to correct the only 1-bit error (short packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
11	ECC_NO_CORRECTION_IRQ	R/W	0h	ECC error (short and long packets). No correction of the header because of more than 1-bit error. 0: Event is masked 1: Event generates an interrupt when it occurs
10	COMPLEXIO2_ERR_IRQ	R/W	0h	RESERVED
9	COMPLEXIO1_ERR_IRQ	R/W	0h	Error signaling from Complex IO # 1: the interrupt is triggered when any error is received from the complex IO #1 (events are defined in CSI2_COMPLEXIO1_IRQSTATUS for the 1st complex IO). 0: Event is masked 1: Event generates an interrupt when it occurs
8	FIFO_OVF_IRQ	R/W	0h	FIFO overflow enable 0: Event is masked 1: Event generates an interrupt when it occurs
7	CONTEXT7	R/W	0h	Context 7 0: Event is masked 1: Event generates an interrupt when it occurs
6	CONTEXT6	R/W	0h	Context 6 0: Event is masked 1: Event generates an interrupt when it occurs
5	CONTEXT5	R/W	0h	Context 5 0: Event is masked 1: Event generates an interrupt when it occurs
4	CONTEXT4	R/W	0h	Context 4 0: Event is masked 1: Event generates an interrupt when it occurs
3	CONTEXT3	R/W	0h	Context 3 0: Event is masked 1: Event generates an interrupt when it occurs
2	CONTEXT2	R/W	0h	Context 2 0: Event is masked 1: Event generates an interrupt when it occurs
1	CONTEXT1	R/W	0h	Context 1 0: Event is masked 1: Event generates an interrupt when it occurs

Table 24-21. CSI2_IRQENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	CONTEXT0	R/W	0h	Context 0 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.6 CSI2_CTRL Register (Offset = 40h) [Reset = 00000000h]

CSI2_CTRL is shown in Table 24-22.

Return to the Summary Table.

GLOBAL CONTROL REGISTER This register controls the CSI2 RECEIVER module. This register shall not be modified dynamically (except IF_EN bit field).

Table 24-22. CSI2_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	RES7	R	0h	RESERVE FIELD
22-20	MFLAG_LEVH	R/W	0h	RESERVE FIELD
19-17	MFLAG_LEVL	R/W	0h	RESERVE FIELD
16	BURST_SIZE_EXPAND	R/W	0h	Sets the DMA burst size on the L3 interconnect. 0: Use the burst size defined in the BURST_SIZE register 1: Allow generation of 16x 64-bit bursts
15	VP_CLK_EN	R/W	0h	RESERVE FIELD
14	STREAMING	R/W	0h	Streaming mode 0: Disable 1: Enable
13	NON_POSTED_WRITE	R/W	0h	Not Posted Writes 0: Disable 1: Enable
12	RES8	R	0h	RESERVE FIELD
11	VP_ONLY_EN	R/W	0h	RESERVE FIELD
10	STREAMING_32_BIT	R/W	0h	Indicates if 64-bit or 32-bit streaming burst is used. Valid only if CSI2_CTRL.STREAMING=1 0: 64-bit streaming burst is used byte enable pattern is 0xFF 1: 32-bit streaming burst is used byte enable pattern is 0x0F
9-8	VP_OUT_CTRL	R/W	0h	RESERVE FIELD
7	DBG_EN	R/W	0h	Enables the debug mode. 0: Disable 1: Enable
6-5	BURST_SIZE	R/W	0h	Sets the DMA burst size on the L3 interconnect. 0x 0: 1x64 OCP writes 0x 1: 2x64 OCP writes 0x 2: 4x64 OCP writes 0x 3: 8x64 OCP writes
4	ENDIANNESS	R/W	0h	Select endianness for YUV422 8 bit and YUV420 legacy formats. 0: Use native MIPI CSI2 endianness: Little endian for all formats except for YUV422 8b and YUV420 Legacy which a big endian. 1: Store all pixel formats little endian.
3	FRAME	R/W	0h	Set the modality in which IF_EN works. 0: If IF_EN = 0 the interface is disabled immediately. 1: If IF_EN = 1 the interface is disabled after all FEC sync code have been received for the active contexts.
2	ECC_EN	R/W	0h	Enables the Error Correction Code check for the received header (short and long packets for all virtual channel ids). 0: Disabled 1: Enabled
1	SECURE	R/W	0h	RESERVE FIELD

Table 24-22. CSI2_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	IF_EN	R/W	0h	Enables the physical interface to the module. 0: The interface is disabled. If FRAME = 0, it is disabled immediately. If FRAME = 1, it is disabled when each context has received the FEC sync code. 1: The interface is enabled immediately, the data acquisition starts on the next FSC sync code. Writing '1' to this register when the current value is '0' has the effect to clear the output FIFO. The pixel data of the following frame will be written in the PING buffer, i.e., the CSI2_CTX_CTRL.PING_PONG bits are reset to '0' as well.

24.1.3.5.2.7 CSI2_DBG_H Register (Offset = 44h) [Reset = 00000000h]

CSI2_DBG_H is shown in Table 24-23.

Return to the Summary Table.

DEBUG REGISTER (Header) This register provides a way to debug the CSI2 RECEIVER module with no image sensor connected to the module. The debug mode is enabled by CSI2_CTRL.DBG_EN. Only full 32-bit values shall be written. The register is

Table 24-23. CSI2_DBG_H Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DBG	W	0h	32-bit input value.

24.1.3.5.2.8 CSI2_GNQ Register (Offset = 48h) [Reset = 0000001Bh]

CSI2_GNQ is shown in Table 24-24.

Return to the Summary Table.

GENERIC PARAMETER REGISTER This register provide a way to read the generic parameters used in the design.

Table 24-24. CSI2_GNQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RES9	R	0h	RESERVE FIELD
5-2	FIFODEPTH	R	6h	Output FIFO size in multiple of 68 bits. Read 0x2: 8x 68 bits Read 0x3: 16x 68 bits Read 0x4: 32x 68 bits Read 0x5: 64x 68 bits Read 0x6: 128 x 68 bits Read 0x7: 256 x 68 bits
1-0	NBCONTEXTS	R	3h	Number of contexts supported by the module. Read 0x0: 1 Context Read 0x1: 2 Contexts Read 0x2: 4 Contexts Read 0x3: 8 Contexts

24.1.3.5.2.9 CSI2_COMPLEXIO_CFG2 Register (Offset = 4Ch) [Reset = 00000000h]

CSI2_COMPLEXIO_CFG2 is shown in Table 24-25.

Return to the Summary Table.

COMPLEX IO CONFIGURATION REGISTER for the complex IO #2 This register contains the lane configuration for the order and position of the lanes (clock and data) and the polarity order for the control of the PHY differential signals in addit

Table 24-25. CSI2_COMPLEXIO_CFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RES10	R	0h	RESERVE FIELD
30	RESET_CTRL	R/W	0h	RESERVE FIELD
29	RESET_DONE	R	0h	RESERVE FIELD
28-27	PWR_CMD	R/W	0h	RESERVE FIELD
26-25	PWR_STATUS	R	0h	RESERVE FIELD
24	PWR_AUTO	R/W	0h	RESERVE FIELD
23-20	RES11	R	0h	RESERVE FIELD
19	DATA4_POL	R/W	0h	RESERVE FIELD
18-16	DATA4_POSITION	R/W	0h	RESERVE FIELD
15	DATA3_POL	R/W	0h	RESERVE FIELD
14-12	DATA3_POSITION	R/W	0h	RESERVE FIELD
11	DATA2_POL	R/W	0h	RESERVE FIELD
10-8	DATA2_POSITION	R/W	0h	RESERVE FIELD
7	DATA1_POL	R/W	0h	RESERVE FIELD
6-4	DATA1_POSITION	R/W	0h	RESERVE FIELD
3	CLOCK_POL	R/W	0h	RESERVE FIELD
2-0	CLOCK_POSITION	R/W	0h	RESERVE FIELD

24.1.3.5.2.10 CSI2_COMPLEXIO_CFG1 Register (Offset = 50h) [Reset = 00000000h]

CSI2_COMPLEXIO_CFG1 is shown in Table 24-26.

Return to the Summary Table.

COMPLEXIO CONFIGURATION REGISTER for the complex IO #1 This register contains the lane configuration for the order and position of the lanes (clock and data) and the polarity order for the control of the PHY differential signals in additi

Table 24-26. CSI2_COMPLEXIO_CFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RES12	R	0h	RESERVE FIELD
30	RESET_CTRL	R/W	0h	Controls the reset of the complex IO 0: Complex IO reset active. 1: Complex IO reset de-asserted.
29	RESET_DONE	R	0h	Internal reset monitoring of the power domain using the PPI byte clock from the complex io Read 0: Internal module reset is on going. Read 1: Reset completed.
28-27	PWR_CMD	R/W	0h	Command for power control of the complex io 0x 0: Command to change to OFF state 0x 1: Command to change to ON state 0x 2: Command to change to Ultra Low Power state
26-25	PWR_STATUS	R	0h	Status of the power control of the complex io Read 0x0: Complex IO in OFF state Read 0x1: Complex IO in ON state Read 0x2: Complex IO in Ultra Low Power state
24	PWR_AUTO	R/W	0h	Automatic switch between ULP and ON states based on ULPM signals from complex iO 0: Disable 1: Enable
23-20	RES13	R	0h	RESERVE FIELD
19	DATA4_POL	R/W	0h	+/- differential pin order of DATA lane 4. 0: +/- pin order 1: -/+ pin order
18-16	DATA4_POSITION	R/W	0h	Position and order of the DATA lane 4. The values 6 and 7 are reserved. 0x 0: Not used/connected 0x 1: Data lane 4 is at the position 1. 0x 2: Data lane 4 is at the position 2. 0x 3: Data lane 4 is at the position 3. 0x 4: Data lane 4 is at the position 4. 0x 5: Data lane 4 is at the position 5.
15	DATA3_POL	R/W	0h	+/- differential pin order of DATA lane 3. 0: +/- pin order 1: -/+ pin order

Table 24-26. CSI2_COMPLEXIO_CFG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14-12	DATA3_POSITION	R/W	0h	Position and order of the DATA lane 3. The values 6 and 7 are reserved. 0x 0: Not used/connected 0x 1: Data lane 3 is at the position 1. 0x 2: Data lane 3 is at the position 2. 0x 3: Data lane 3 is at the position 3. 0x 4: Data lane 3 is at the position 4. 0x 5: Data lane 3 is at the position 5.
11	DATA2_POL	R/W	0h	+/- differential pin order of DATA lane 2. 0: +/- pin order 1: -/+ pin order
10-8	DATA2_POSITION	R/W	0h	Position and order of the DATA lane 2. The values 6 and 7 are reserved. 0x 0: Not used/connected 0x 1: Data lane 2 is at the position 1. 0x 2: Data lane 2 is at the position 2. 0x 3: Data lane 2 is at the position 3. 0x 4: Data lane 2 is at the position 4. 0x 5: Data lane 2 is at the position 5.
7	DATA1_POL	R/W	0h	+/- differential pin order of DATA lane 1. 0: +/- pin order 1: -/+ pin order
6-4	DATA1_POSITION	R/W	0h	Position and order of the DATA lane 1. 0, 6 and 7 are reserved. The data lane 1 is always present. 0x 1: Data lane 1 is at the position 1. 0x 2: Data lane 1 is at the position 2. 0x 3: Data lane 1 is at the position 3. 0x 4: Data lane 1 is at the position 4. 0x 5: Data lane 1 is at the position 5.
3	CLOCK_POL	R/W	0h	+/- differential pin order of CLOCK lane. 0: +/- pin order 1: -/+ pin order
2-0	CLOCK_POSITION	R/W	0h	Position and order of the CLOCK lane. 0, 6 and 7 are reserved. The clock lane is always present. 0x 1: Clock lane is at the position 1. 0x 2: Clock lane is at the position 2. 0x 3: Clock lane is at the position 3. 0x 4: Clock lane is at the position 4. 0x 5: Clock lane is at the position 5.

24.1.3.5.2.11 CSI2_COMPLEXIO1_IRQSTATUS Register (Offset = 54h) [Reset = 00000000h]

CSI2_COMPLEXIO1_IRQSTATUS is shown in Table 24-27.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - All errors from complex IO #1

Table 24-27. CSI2_COMPLEXIO1_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RES14	R	0h	RESERVE FIELD
26	STATEALLULPMEXIT	R/W	0h	At least one of the active lanes has exit the ULPM 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
25	STATEALLULPMENTER	R/W	0h	All active lanes are entering in ULPM. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
24	STATEULPM5	R/W	0h	Lane #5 in Ultra Low Power Mode 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
23	STATEULPM4	R/W	0h	Lane #4 in Ultra Low Power Mode 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
22	STATEULPM3	R/W	0h	Lane #3 in Ultra Low Power Mode 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
21	STATEULPM2	R/W	0h	Lane #2 in Ultra Low Power Mode 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
20	STATEULPM1	R/W	0h	Lane #1 in Ultra Low Power Mode 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
19	ERRCONTROL5	R/W	0h	Control error for lane #5 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

Table 24-27. CSI2_COMPLEXIO1_IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ERRCONTROL4	R/W	0h	Control error for lane #4 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
17	ERRCONTROL3	R/W	0h	Control error for lane #3 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
16	ERRCONTROL2	R/W	0h	Control error for lane #2 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
15	ERRCONTROL1	R/W	0h	Control error for lane #1 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
14	ERRESC5	R/W	0h	Escape entry error for lane #5 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
13	ERRESC4	R/W	0h	Escape entry error for lane #4 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
12	ERRESC3	R/W	0h	Escape entry error for lane #3 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
11	ERRESC2	R/W	0h	Escape entry error for lane #2 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
10	ERRESC1	R/W	0h	Escape entry error for lane #1 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
9	ERRSOTSYNCHS5	R/W	0h	Start of transmission sync error for lane #5 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

Table 24-27. CSI2_COMPLEXIO1_IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	ERRSOTSYNCHS4	R/W	0h	Start of transmission sync error for lane #4 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
7	ERRSOTSYNCHS3	R/W	0h	Start of transmission sync error for lane #3 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	ERRSOTSYNCHS2	R/W	0h	Start of transmission sync error for lane #2 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	ERRSOTSYNCHS1	R/W	0h	Start of transmission sync error for lane #1 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	ERRSOTHS5	R/W	0h	Start of transmission error for lane #5 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
3	ERRSOTHS4	R/W	0h	Start of transmission error for lane #4 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
2	ERRSOTHS3	R/W	0h	Start of transmission error for lane #3 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	ERRSOTHS2	R/W	0h	Start of transmission error for lane #2 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	ERRSOTHS1	R/W	0h	Start of transmission error for lane #1 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.12 CSI2_COMPLEXIO2_IRQSTATUS Register (Offset = 58h) [Reset = 00000000h]

CSI2_COMPLEXIO2_IRQSTATUS is shown in Table 24-28.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - All errors from complex IO #2

Table 24-28. CSI2_COMPLEXIO2_IRQSTATUS Register Field Descriptions

24.1.3.5.2.13 CSI2_SHORT_PACKET Register (Offset = 5Ch) [Reset = 00000000h]

CSI2_SHORT_PACKET is shown in Table 24-29.

Return to the Summary Table.

SHORT PACKET INFORMATION - This register sets the 24-bit DATA_ID + Short Packet Data Field when the data type is between 0x8 and x0F

Table 24-29. CSI2_SHORT_PACKET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RES16	R	0h	RESERVE FIELD
23-0	SHORT_PACKET	R	0h	Short Packet information: DATA ID + DATA FIELD

24.1.3.5.2.14 CSI2_COMPLEXIO1_IRQENABLE Register (Offset = 60h) [Reset = 00000000h]

CSI2_COMPLEXIO1_IRQENABLE is shown in Table 24-30.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - All errors from complex IO #1

Table 24-30. CSI2_COMPLEXIO1_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RES17	R	0h	RESERVE FIELD
26	STATEALLULPMEXIT	R/W	0h	At least one of the active lanes has exit the ULPM 0: Event is masked 1: Event generates an interrupt when it occurs
25	STATEALLULPMENTER	R/W	0h	All active lanes are entering in ULPM. 0: Event is masked 1: Event generates an interrupt when it occurs
24	STATEULPM5	R/W	0h	Lane #5 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
23	STATEULPM4	R/W	0h	Lane #4 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
22	STATEULPM3	R/W	0h	Lane #3 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
21	STATEULPM2	R/W	0h	Lane #2 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
20	STATEULPM1	R/W	0h	Lane #1 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
19	ERRCONTROL5	R/W	0h	Control error for lane #5 0: Event is masked 1: Event generates an interrupt when it occurs
18	ERRCONTROL4	R/W	0h	Control error for lane #4 0: Event is masked 1: Event generates an interrupt when it occurs
17	ERRCONTROL3	R/W	0h	Control error for lane #3 0: Event is masked 1: Event generates an interrupt when it occurs
16	ERRCONTROL2	R/W	0h	Control error for lane #2 0: Event is masked 1: Event generates an interrupt when it occurs
15	ERRCONTROL1	R/W	0h	Control error for lane #1 0: Event is masked 1: Event generates an interrupt when it occurs
14	ERRESC5	R/W	0h	Escape entry error for lane #5 0: Event is masked 1: Event generates an interrupt when it occurs
13	ERRESC4	R/W	0h	Escape entry error for lane #4 0: Event is masked 1: Event generates an interrupt when it occurs
12	ERRESC3	R/W	0h	Escape entry error for lane #3 0: Event is masked 1: Event generates an interrupt when it occurs
11	ERRESC2	R/W	0h	Escape entry error for lane #2 0: Event is masked 1: Event generates an interrupt when it occurs

Table 24-30. CSI2_COMPLEXIO1_IRQENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	ERRESC1	R/W	0h	Escape entry error for lane #1 0: Event is masked 1: Event generates an interrupt when it occurs
9	ERRSOTSYNCHS5	R/W	0h	Start of transmission sync error for lane #5 0: Event is masked 1: Event generates an interrupt when it occurs
8	ERRSOTSYNCHS4	R/W	0h	Start of transmission sync error for lane #4 0: Event is masked 1: Event generates an interrupt when it occurs
7	ERRSOTSYNCHS3	R/W	0h	Start of transmission sync error for lane #3 0: Event is masked 1: Event generates an interrupt when it occurs
6	ERRSOTSYNCHS2	R/W	0h	Start of transmission sync error for lane #2 0: Event is masked 1: Event generates an interrupt when it occurs
5	ERRSOTSYNCHS1	R/W	0h	Start of transmission sync error for lane #1 0: Event is masked 1: Event generates an interrupt when it occurs
4	ERRSOTHS5	R/W	0h	Start of transmission error for lane #5 0: Event is masked 1: Event generates an interrupt when it occurs
3	ERRSOTHS4	R/W	0h	Start of transmission error for lane #4 0: Event is masked 1: Event generates an interrupt when it occurs
2	ERRSOTHS3	R/W	0h	Start of transmission error for lane #3 0: Event is masked 1: Event generates an interrupt when it occurs
1	ERRSOTHS2	R/W	0h	Start of transmission error for lane #2 0: Event is masked 1: Event generates an interrupt when it occurs
0	ERRSOTHS1	R/W	0h	Start of transmission error for lane #1 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.15 CSI2_COMPLEXIO2_IRQENABLE Register (Offset = 64h) [Reset = 00000000h]

CSI2_COMPLEXIO2_IRQENABLE is shown in Table 24-31.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - All errors from complex IO #2

24.1.3.5.2.16 CSI2_DBG_P Register (Offset = 68h) [Reset = 00000000h]

CSI2_DBG_P is shown in Table 24-32.

Return to the Summary Table.

DEBUG REGISTER (Payload) This register provides a way to debug the CSI2 RECEIVER module with no image sensor connected to the module. The debug mode is enabled by CSI2_CTRL.DBG_EN. Only full 32-bit values shall be written. The register is

Table 24-32. CSI2_DBG_P Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DBG	W	0h	32-bit input value.

24.1.3.5.2.17 CSI2_TIMING Register (Offset = 6Ch) [Reset = 7FFF7FFFh]

CSI2_TIMING is shown in Table 24-33.

Return to the Summary Table.

TIMING REGISTER This register controls the CSI2 RECEIVER module. This register shall not be modified while CSI2_CTRL.IF_EN is set to '1'. It is used to indicate the number of L3 cycles for the Stop State monitoring.

Table 24-33. CSI2_TIMING Register Field Descriptions

Bit	Field	Type	Reset	Description
31	FORCE_RX_MODE_IO2	R/W	0h	RESERVE FIELD
30	STOP_STATE_X16_IO2	R/W	1h	RESERVE FIELD
29	STOP_STATE_X4_IO2	R/W	1h	RESERVE FIELD
28-16	STOP_STATE_COUNTER_IO2	R/W	1FFFh	RESERVE FIELD
15	FORCE_RX_MODE_IO1	R/W	0h	Control of ForceRxMode signal 0: De-assertion of ForceRxMode. The HW reset the bit at the end of the Force RX Mode assertion. The SW can reset the bit in order to stop the assertion of the ForceRXMode signal prior to the completion of the period. 1: Assertion of ForceRxMode
14	STOP_STATE_X16_IO1	R/W	1h	Multiplication factor for the number of L3 cycles defined in STOP_STATE_COUNTER bit-field 0: The number of L3 cycles defined in STOP_STATE _COUNTER is multiplied by 1x 1: The number of L3 cycles defined in STOP_STATE _COUNTER is multiplied by 16x
13	STOP_STATE_X4_IO1	R/W	1h	Multiplication factor for the number of L3 cycles defined in STOP_STATE_COUNTER bit-field 0: The number of L3 cycles defined in STOP_STATE _COUNTER is multiplied by 1x 1: The number of L3 cycles defined in STOP_STATE _COUNTER is multiplied by 4x
12-0	STOP_STATE_COUNTER_IO1	R/W	1FFFh	Stop State counter for monitoring. It indicates the number of L3 to monitor for Stop State before de-asserting ForceRxMode (Complex IO #1). The value is from 0 to 8191.

24.1.3.5.2.18 CSI2_CTX0_CTRL1 Register (Offset = 70h) [Reset = 00010008h]

CSI2_CTX0_CTRL1 is shown in Table 24-34.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-34. CSI2_CTX0_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 24-34. CSI2_CTX0_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

24.1.3.5.2.19 CSI2_CTX0_CTRL2 Register (Offset = 74h) [Reset = 00000000h]

CSI2_CTX0_CTRL2 is shown in Table 24-35.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 24-35. CSI2_CTX0_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 24-35. CSI2_CTX0_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 24.1.3.5.2.20 CSI2_CTX0_DAT_OFST Register (Offset = 78h) [Reset = 00000000h]

CSI2_CTX0_DAT_OFST is shown in Table 24-36.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 24-36. CSI2_CTX0_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ $(2^{17}-1)$
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.21 CSI2_CTX0_DAT_PING_ADDR Register (Offset = 7Ch) [Reset = 00000000h]

CSI2_CTX0_DAT_PING_ADDR is shown in Table 24-37.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 24-37. CSI2_CTX0_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.22 CSI2_CTX0_DAT_PONG_ADDR Register (Offset = 80h) [Reset = 00000000h]

CSI2_CTX0_DAT_PONG_ADDR is shown in Table 24-38.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 24-38. CSI2_CTX0_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.23 CSI2_CTX0_IRQENABLE Register (Offset = 84h) [Reset = 00000000h]

CSI2_CTX0_IRQENABLE is shown in Table 24-39.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 24-39. CSI2_CTX0_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.24 CSI2_CTX0_IRQSTATUS Register (Offset = 88h) [Reset = 00000000h]

CSI2_CTX0_IRQSTATUS is shown in Table 24-40.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 24-40. CSI2_CTX0_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.25 CSI2_CTX0_CTRL3 Register (Offset = 8Ch) [Reset = 00000000h]

CSI2_CTX0_CTRL3 is shown in Table 24-41.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-41. CSI2_CTX0_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

24.1.3.5.2.26 CSI2_CTX1_CTRL1 Register (Offset = 90h) [Reset = 00010008h]

CSI2_CTX1_CTRL1 is shown in Table 24-42.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-42. CSI2_CTX1_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 24-42. CSI2_CTX1_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

24.1.3.5.2.27 CSI2_CTX1_CTRL2 Register (Offset = 94h) [Reset = 00000000h]

CSI2_CTX1_CTRL2 is shown in Table 24-43.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 24-43. CSI2_CTX1_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 24-43. CSI2_CTX1_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 24.1.3.5.2.28 CSI2_CTX1_DAT_OFST Register (Offset = 98h) [Reset = 00000000h]

CSI2_CTX1_DAT_OFST is shown in Table 24-44.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 24-44. CSI2_CTX1_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ $(2^{17}-1)$
4-0	RESERVED	R	0h	

24.1.3.5.2.29 CSI2_CTX1_DAT_PING_ADDR Register (Offset = 9Ch) [Reset = 00000000h]

CSI2_CTX1_DAT_PING_ADDR is shown in Table 24-45.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 24-45. CSI2_CTX1_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.30 CSI2_CTX1_DAT_PONG_ADDR Register (Offset = A0h) [Reset = 00000000h]

CSI2_CTX1_DAT_PONG_ADDR is shown in Table 24-46.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 24-46. CSI2_CTX1_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.31 CSI2_CTX1_IRQENABLE Register (Offset = A4h) [Reset = 00000000h]

CSI2_CTX1_IRQENABLE is shown in Table 24-47.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 24-47. CSI2_CTX1_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.32 CSI2_CTX1_IRQSTATUS Register (Offset = A8h) [Reset = 00000000h]

CSI2_CTX1_IRQSTATUS is shown in Table 24-48.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 24-48. CSI2_CTX1_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.33 CSI2_CTX1_CTRL3 Register (Offset = ACh) [Reset = 00000000h]

CSI2_CTX1_CTRL3 is shown in Table 24-49.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-49. CSI2_CTX1_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

24.1.3.5.2.34 CSI2_CTX2_CTRL1 Register (Offset = B0h) [Reset = 00010008h]

CSI2_CTX2_CTRL1 is shown in Table 24-50.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-50. CSI2_CTX2_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 24-50. CSI2_CTX2_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

24.1.3.5.2.35 CSI2_CTX2_CTRL2 Register (Offset = B4h) [Reset = 00000000h]

CSI2_CTX2_CTRL2 is shown in Table 24-51.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 24-51. CSI2_CTX2_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 24-51. CSI2_CTX2_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 24.1.3.5.2.36 CSI2_CTX2_DAT_OFST Register (Offset = B8h) [Reset = 00000000h]

CSI2_CTX2_DAT_OFST is shown in Table 24-52.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 24-52. CSI2_CTX2_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ $(2^{17}-1)$
4-0	RESERVED	R	0h	

24.1.3.5.2.37 CSI2_CTX2_DAT_PING_ADDR Register (Offset = BCh) [Reset = 00000000h]

CSI2_CTX2_DAT_PING_ADDR is shown in Table 24-53.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 24-53. CSI2_CTX2_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.38 CSI2_CTX2_DAT_PONG_ADDR Register (Offset = C0h) [Reset = 00000000h]

CSI2_CTX2_DAT_PONG_ADDR is shown in Table 24-54.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 24-54. CSI2_CTX2_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.39 CSI2_CTX2_IRQENABLE Register (Offset = C4h) [Reset = 00000000h]

CSI2_CTX2_IRQENABLE is shown in Table 24-55.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 24-55. CSI2_CTX2_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.40 CSI2_CTX2_IRQSTATUS Register (Offset = C8h) [Reset = 00000000h]

CSI2_CTX2_IRQSTATUS is shown in Table 24-56.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 24-56. CSI2_CTX2_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.41 CSI2_CTX2_CTRL3 Register (Offset = CCh) [Reset = 00000000h]

CSI2_CTX2_CTRL3 is shown in Table 24-57.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-57. CSI2_CTX2_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

24.1.3.5.2.42 CSI2_CTX3_CTRL1 Register (Offset = D0h) [Reset = 00010008h]

CSI2_CTX3_CTRL1 is shown in Table 24-58.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-58. CSI2_CTX3_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 24-58. CSI2_CTX3_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

24.1.3.5.2.43 CSI2_CTX3_CTRL2 Register (Offset = D4h) [Reset = 00000000h]

CSI2_CTX3_CTRL2 is shown in Table 24-59.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 24-59. CSI2_CTX3_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)

24.1.3.5.2.44 CSI2_CTX3_DAT_OFST Register (Offset = D8h) [Reset = 00000000h]

CSI2_CTX3_DAT_OFST is shown in Table 24-60.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 24-60. CSI2_CTX3_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ $(2^{17}-1)$
4-0	RESERVED	R	0h	

24.1.3.5.2.45 CSI2_CTX3_DAT_PING_ADDR Register (Offset = DCh) [Reset = 00000000h]

CSI2_CTX3_DAT_PING_ADDR is shown in Table 24-61.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 24-61. CSI2_CTX3_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.46 CSI2_CTX3_DAT_PONG_ADDR Register (Offset = E0h) [Reset = 00000000h]

CSI2_CTX3_DAT_PONG_ADDR is shown in Table 24-62.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 24-62. CSI2_CTX3_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.47 CSI2_CTX3_IRQENABLE Register (Offset = E4h) [Reset = 00000000h]

CSI2_CTX3_IRQENABLE is shown in Table 24-63.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 24-63. CSI2_CTX3_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.48 CSI2_CTX3_IRQSTATUS Register (Offset = E8h) [Reset = 00000000h]

CSI2_CTX3_IRQSTATUS is shown in Table 24-64.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 24-64. CSI2_CTX3_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.49 CSI2_CTX3_CTRL3 Register (Offset = ECh) [Reset = 00000000h]

CSI2_CTX3_CTRL3 is shown in Table 24-65.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-65. CSI2_CTX3_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

24.1.3.5.2.50 CSI2_CTX4_CTRL1 Register (Offset = F0h) [Reset = 00010008h]

CSI2_CTX4_CTRL1 is shown in Table 24-66.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-66. CSI2_CTX4_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 24-66. CSI2_CTX4_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

24.1.3.5.2.51 CSI2_CTX4_CTRL2 Register (Offset = F4h) [Reset = 00000000h]

CSI2_CTX4_CTRL2 is shown in Table 24-67.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 24-67. CSI2_CTX4_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 24-67. CSI2_CTX4_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description

Table 24-67. CSI2_CTX4_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
				0: USER_DEFINED_8_BIT_DATA_TYPE_1 + DPCM10 + EXP16 0x2C 1: USER_DEFINED_8_BIT_DATA_TYPE_2 + DPCM10 + EXP16 0x2C 2: USER_DEFINED_8_BIT_DATA_TYPE_3 + DPCM10 + EXP16 0x2C 3: USER_DEFINED_8_BIT_DATA_TYPE_4 + DPCM10 + EXP16 0x2C 4: USER_DEFINED_8_BIT_DATA_TYPE_5 + DPCM10 + EXP16 0x2C 5: USER_DEFINED_8_BIT_DATA_TYPE_6 + DPCM10 + EXP16 0x2C 6: USER_DEFINED_8_BIT_DATA_TYPE_7 + DPCM10 + EXP16 0x2C 7: USER_DEFINED_8_BIT_DATA_TYPE_8 + DPCM10 + EXP16 0x 329: RAW7 + DPCM10 + VP 0x32A: RAW8 + DPCM10 + VP 0x 340: USER_DEFINED_8_BIT_DATA_TYPE_1 + DPCM10 + VP 0x 341: USER_DEFINED_8_BIT_DATA_TYPE_2 + DPCM10 + VP 0x 342: USER_DEFINED_8_BIT_DATA_TYPE_3 + DPCM10 + VP 0x 343: USER_DEFINED_8_BIT_DATA_TYPE_4 + DPCM10 + VP 0x 344: USER_DEFINED_8_BIT_DATA_TYPE_5 + DPCM10 + VP 0x 345: USER_DEFINED_8_BIT_DATA_TYPE_6 + DPCM10 + VP 0x 346: USER_DEFINED_8_BIT_DATA_TYPE_7 + DPCM10 + VP 0x 347: USER_DEFINED_8_BIT_DATA_TYPE_8 + DPCM10 + VP 0x 368: RAW6 DPCM12 + VP 0x 369: RAW7 DPCM12 + EXP16 0x36A: RAW8 DPCM12 + EXP16 0x3A 8: RAW6 DPCM12 + EXP16 0x3A 9: RAW7 DPCM12 + VP 0x3AA: RAW8 DPCM12 + VP

24.1.3.5.2.52 CSI2_CTX4_DAT_OFST Register (Offset = F8h) [Reset = 00000000h]

CSI2_CTX4_DAT_OFST is shown in Table 24-68.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 24-68. CSI2_CTX4_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ $(2^{17}-1)$
4-0	RESERVED	R	0h	

24.1.3.5.2.53 CSI2_CTX4_DAT_PING_ADDR Register (Offset = FCh) [Reset = 00000000h]

CSI2_CTX4_DAT_PING_ADDR is shown in Table 24-69.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 24-69. CSI2_CTX4_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.54 CSI2_CTX4_DAT_PONG_ADDR Register (Offset = 100h) [Reset = 00000000h]

CSI2_CTX4_DAT_PONG_ADDR is shown in Table 24-70.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 24-70. CSI2_CTX4_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.55 CSI2_CTX4_IRQENABLE Register (Offset = 104h) [Reset = 00000000h]

CSI2_CTX4_IRQENABLE is shown in Table 24-71.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 24-71. CSI2_CTX4_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.56 CSI2_CTX4_IRQSTATUS Register (Offset = 108h) [Reset = 00000000h]

CSI2_CTX4_IRQSTATUS is shown in Table 24-72.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 24-72. CSI2_CTX4_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.57 CSI2_CTX4_CTRL3 Register (Offset = 10Ch) [Reset = 00000000h]

CSI2_CTX4_CTRL3 is shown in Table 24-73.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-73. CSI2_CTX4_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

24.1.3.5.2.58 CSI2_CTX5_CTRL1 Register (Offset = 110h) [Reset = 00010008h]

CSI2_CTX5_CTRL1 is shown in Table 24-74.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-74. CSI2_CTX5_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 24-74. CSI2_CTX5_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

24.1.3.5.2.59 CSI2_CTX5_CTRL2 Register (Offset = 114h) [Reset = 00000000h]

CSI2_CTX5_CTRL2 is shown in Table 24-75.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 24-75. CSI2_CTX5_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 24-75. CSI2_CTX5_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 24.1.3.5.2.60 CSI2_CTX5_DAT_OFST Register (Offset = 118h) [Reset = 00000000h]

CSI2_CTX5_DAT_OFST is shown in Table 24-76.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 24-76. CSI2_CTX5_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ $(2^{17}-1)$
4-0	RESERVED	R	0h	

24.1.3.5.2.61 CSI2_CTX5_DAT_PING_ADDR Register (Offset = 11Ch) [Reset = 00000000h]

CSI2_CTX5_DAT_PING_ADDR is shown in Table 24-77.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 24-77. CSI2_CTX5_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.62 CSI2_CTX5_DAT_PONG_ADDR Register (Offset = 120h) [Reset = 00000000h]

CSI2_CTX5_DAT_PONG_ADDR is shown in Table 24-78.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 24-78. CSI2_CTX5_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.63 CSI2_CTX5_IRQENABLE Register (Offset = 124h) [Reset = 00000000h]

CSI2_CTX5_IRQENABLE is shown in Table 24-79.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 24-79. CSI2_CTX5_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.64 CSI2_CTX5_IRQSTATUS Register (Offset = 128h) [Reset = 00000000h]

CSI2_CTX5_IRQSTATUS is shown in Table 24-80.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 24-80. CSI2_CTX5_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.65 CSI2_CTX5_CTRL3 Register (Offset = 12Ch) [Reset = 00000000h]

CSI2_CTX5_CTRL3 is shown in Table 24-81.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-81. CSI2_CTX5_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

24.1.3.5.2.66 CSI2_CTX6_CTRL1 Register (Offset = 130h) [Reset = 00010008h]

CSI2_CTX6_CTRL1 is shown in Table 24-82.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-82. CSI2_CTX6_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 24-82. CSI2_CTX6_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

24.1.3.5.2.67 CSI2_CTX6_CTRL2 Register (Offset = 134h) [Reset = 00000000h]

CSI2_CTX6_CTRL2 is shown in Table 24-83.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 24-83. CSI2_CTX6_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 24-83. CSI2_CTX6_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 24.1.3.5.2.68 CSI2_CTX6_DAT_OFST Register (Offset = 138h) [Reset = 00000000h]

CSI2_CTX6_DAT_OFST is shown in Table 24-84.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 24-84. CSI2_CTX6_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ $(2^{17}-1)$
4-0	RESERVED	R	0h	

24.1.3.5.2.69 CSI2_CTX6_DAT_PING_ADDR Register (Offset = 13Ch) [Reset = 00000000h]

CSI2_CTX6_DAT_PING_ADDR is shown in Table 24-85.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 24-85. CSI2_CTX6_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.70 CSI2_CTX6_DAT_PONG_ADDR Register (Offset = 140h) [Reset = 00000000h]

CSI2_CTX6_DAT_PONG_ADDR is shown in Table 24-86.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 24-86. CSI2_CTX6_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.71 CSI2_CTX6_IRQENABLE Register (Offset = 144h) [Reset = 00000000h]

CSI2_CTX6_IRQENABLE is shown in Table 24-87.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 24-87. CSI2_CTX6_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.72 CSI2_CTX6_IRQSTATUS Register (Offset = 148h) [Reset = 00000000h]

CSI2_CTX6_IRQSTATUS is shown in Table 24-88.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 24-88. CSI2_CTX6_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.73 CSI2_CTX6_CTRL3 Register (Offset = 14Ch) [Reset = 00000000h]

CSI2_CTX6_CTRL3 is shown in Table 24-89.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-89. CSI2_CTX6_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

24.1.3.5.2.74 CSI2_CTX7_CTRL1 Register (Offset = 150h) [Reset = 00010008h]

CSI2_CTX7_CTRL1 is shown in Table 24-90.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-90. CSI2_CTX7_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. 23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 24-90. CSI2_CTX7_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

24.1.3.5.2.75 CSI2_CTX7_CTRL2 Register (Offset = 154h) [Reset = 00000000h]

CSI2_CTX7_CTRL2 is shown in Table 24-91.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 24-91. CSI2_CTX7_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 24-91. CSI2_CTX7_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 24.1.3.5.2.76 CSI2_CTX7_DAT_OFST Register (Offset = 158h) [Reset = 00000000h]

CSI2_CTX7_DAT_OFST is shown in Table 24-92.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 24-92. CSI2_CTX7_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ $(2^{17}-1)$
4-0	RESERVED	R	0h	

24.1.3.5.2.77 CSI2_CTX7_DAT_PING_ADDR Register (Offset = 15Ch) [Reset = 00000000h]

CSI2_CTX7_DAT_PING_ADDR is shown in Table 24-93.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 24-93. CSI2_CTX7_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.78 CSI2_CTX7_DAT_PONG_ADDR Register (Offset = 160h) [Reset = 00000000h]

CSI2_CTX7_DAT_PONG_ADDR is shown in Table 24-94.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 24-94. CSI2_CTX7_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

24.1.3.5.2.79 CSI2_CTX7_IRQENABLE Register (Offset = 164h) [Reset = 00000000h]

CSI2_CTX7_IRQENABLE is shown in Table 24-95.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 24-95. CSI2_CTX7_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

24.1.3.5.2.80 CSI2_CTX7_IRQSTATUS Register (Offset = 168h) [Reset = 00000000h]

CSI2_CTX7_IRQSTATUS is shown in Table 24-96.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 24-96. CSI2_CTX7_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

24.1.3.5.2.81 CSI2_CTX7_CTRL3 Register (Offset = 16Ch) [Reset = 00000000h]

CSI2_CTX7_CTRL3 is shown in Table 24-97.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 24-97. CSI2_CTX7_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

24.1.3.5.2.82 CSI2_PHY_CFG_REG0 Register (Offset = 170h) [Reset = 00000427h]

CSI2_PHY_CFG_REG0 is shown in Table 24-98.

Return to the Summary Table.

Table 24-98. CSI2_PHY_CFG_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	HS_CLK_CONFIG	R/W	0h	Disable clock missing detector
23-16	RESERVED	R	0h	RESERVED
15-8	THS_TERM	R/W	4h	Ths-term timing parameter in multiples of DDR clock. Effective time for enabling of termination= synchronizer delay + timer delay + LPRX delay + combinational routing delay ~ (1-2)* DDRCLK + THS-TERM + ~ (1-15) ns Programmed value = ceil(12.5 / DDR clock period) –1
7-0	THS_SETTLE	R/W	27h	THS-SETTLE timing parameter in multiples on DDR clock frequency. Effective Ths-settle seen on line (starting to look for sync pattern) = synchronizer delay + timer delay + LPRX delay + combinational routing delay – pipeline delay in HS data path. ~ (1-2)* DDRCLK + THS-SETTLE + ~ (1-15) ns -1*DDRCLK Programmed value = ceil(90 ns / DDR clock period) + 3

24.1.3.5.2.83 CSI2_PHY_CFG_REG1 Register (Offset = 174h) [Reset = 0002E10Eh]

CSI2_PHY_CFG_REG1 is shown in Table 24-99.

Return to the Summary Table.

Table 24-99. CSI2_PHY_CFG_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RSVD2	R/W	0h	Reserved
29	RESETDONECTRLCLK	R	0h	RESETDONECTRLCLK
28	RESETDONERXBYTECLK	R	0h	RESETDONERXBYTECLK
27-26	RSVD1	R/W	0h	Reserved
25	CLK_MISS_DET	R	0h	1: Error in clock missing detector 0: Clock missing detector successful.
24-18	TCLK_TERM	R/W	0h	TCLK_TERM timing parameter in multiples of CTRLCLK Effective time for enabling of termination = synchronizer delay + timer delay + LPRX delay + combinational routing delay ~ (1–2)* CTRLCLK + TCLK_TERM + ~ (1–15) ns Programmed value = ceil(9.5 / CTRLCLK period) – 1
17-10	D_PHY_HS_SYNC_PAT	R/W	B8h	DPHY mode HS sync pattern in byte order (reverse of RW 0xB8 received order) D-PHY mode sync pattern. Default : “10111000”
9-8	CTRLCLK_DIV_FACT	R/W	1h	Divide factor for CTRLCLK for CLKMISS detector
7-0	TCLK_SETTLE	R/W	Eh	TCLK_SETTLE timing parameter in multiples of CTRLCLK Clock Effective TCLK_SETTLE = synchronizer delay + timer delay + LPRX delay + combinational routing delay ~(1–2)* CTRLCLK + Tclk-settle + ~ (1 –15) ns Programmed value = max[3, ceil(155 ns/CTRLCLK period) –1]

24.1.3.5.2.84 CSI2_PHY_CFG_REG2 Register (Offset = 178h) [Reset = 000000FFh]

CSI2_PHY_CFG_REG2 is shown in Table 24-100.

Return to the Summary Table.

Table 24-100. CSI2_PHY_CFG_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RXTRIGGERESC0	R/W	0h	Mapping of Trigger escape entry command to PPI output RXTRIGGERESC0
29-28	RXTRIGGERESC1	R/W	0h	Mapping of Trigger escape entry command to PPI output RXTRIGGERESC1
27-26	RXTRIGGERESC2	R/W	0h	Mapping of Trigger escape entry command to PPI output RXTRIGGERESC2.
25-24	RXTRIGGERESC3	R/W	0h	Mapping of Trigger escape entry command to PPI output RXTRIGGERESC3
23-0	CCP2_SYNC_PAT	R/W	FFh	CCP2 mode sync pattern in byte order (reverse of received order)

24.1.3.5.2.85 CSI2_PHY_CFG_REG3 Register (Offset = 17Ch) [Reset = 00000000h]

CSI2_PHY_CFG_REG3 is shown in Table 24-101.

Return to the Summary Table.

Table 24-101. CSI2_PHY_CFG_REG3 Register Field Descriptions

Chapter 25

MDO/Aurora

25.1 Measurement Data Output Infrastructure

25.1.1 MDO Infra Design Overview

MDO is used to capture the transactions on the bus connected from different interfaces of the AWR294x device and transmitted outside over LVDS (4-data lanes). MDO is comprised of a sniffer, FIFO, and aggregator, which are explained in following sections.

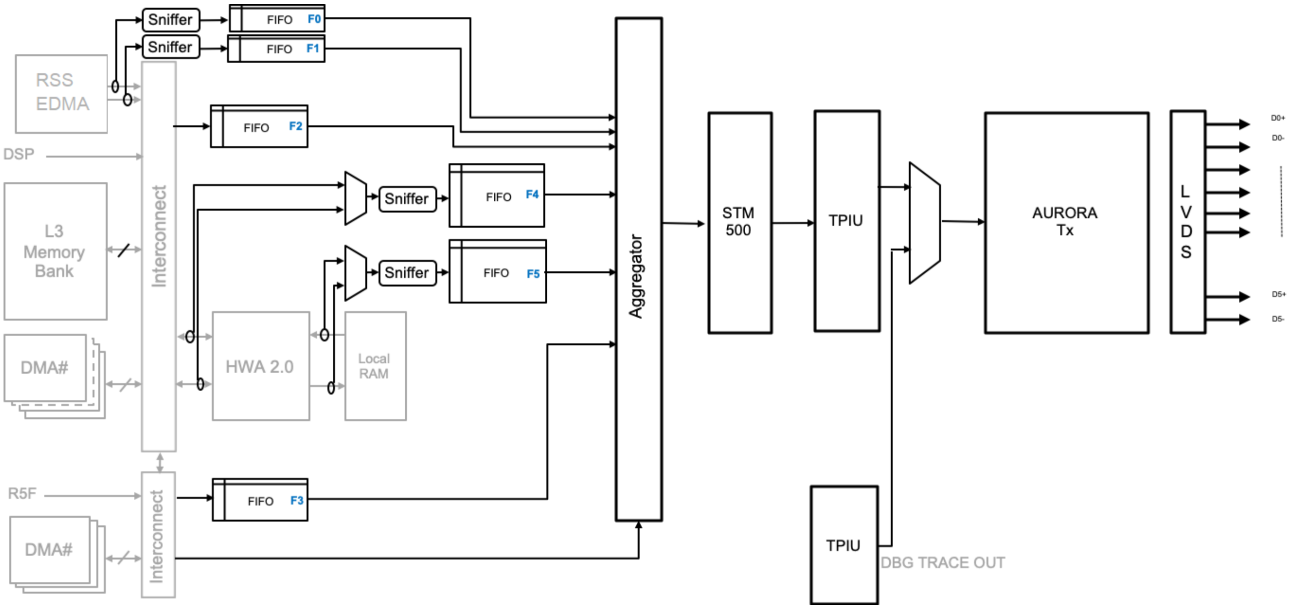

Figure 25-1. MDO Diagram

As depicted in above figure, the sniffer can access the data from the the RSS EDMA, L3 memory, DMA, HWA, and from local RAM, which are then sent to the aggregator.

25.1.2 MDO Sniffer

25.1.2.1 Overview

The MDO sniffer module is responsible for monitoring the hardware interfaces in the SoC and capturing the transactions on the bus which are within the configured addressing region of interest, and writing the transaction details into a FIFO.

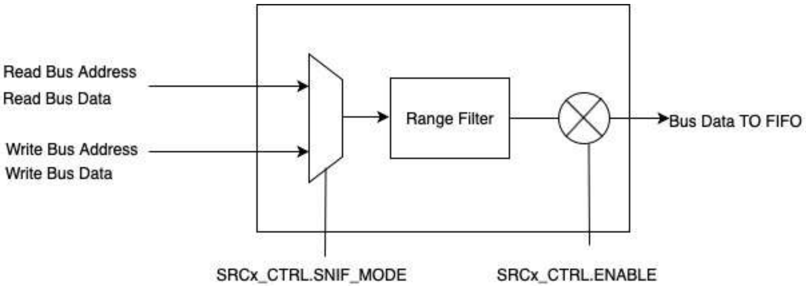

Figure 25-2. MDO Sniffer

The sniffer module can sniff a bus interface and filter transfers to be sent to the MDO FIFO.

Table 25-1. MDO Source Address Range Selection

Start Address	End Address	Range Enable
TOP_MDO_INFRA:SRCx_RANGE_START0	TOP_MDO_INFRA:SRCx_RANGE_END0	TOP_MDO_INFRA:SRCx_CTRL.RANGE_EN[0]
TOP_MDO_INFRA:SRCx_RANGE_START1	TOP_MDO_INFRA:SRCx_RANGE_END1	TOP_MDO_INFRA:SRCx_CTRL.RANGE_EN[1]
TOP_MDO_INFRA:SRCx_RANGE_START2	TOP_MDO_INFRA:SRCx_RANGE_END2	TOP_MDO_INFRA:SRCx_CTRL.RANGE_EN[2]
TOP_MDO_INFRA:SRCx_RANGE_START3	TOP_MDO_INFRA:SRCx_RANGE_END3	TOP_MDO_INFRA:SRCx_CTRL.RANGE_EN[3]

- Read OR Write interface can be selected based on the configuration TOP_MDO_INFRA.SRCx_CTRL.SNIF_MODE
- The address/paramset is used to filter transactions.
- Only the data bus is captured. Range is not sent to the FIFO.
- On completion of configuration, the sniffer can be enabled by writing 0x1 to TOP_MDO_INFRA:SRCx_CTRL.ENABLE.
- If TOP_MDO_INFRA:SRCx_CTRL.CROP_EN is set to 0x1, then for every 32 bits of DATA[31:0], DATA[27:16], and DATA[11:0] is written to the FIFO (24 bits).

25.1.3 MDO FIFO Master

25.1.3.1 Overview

The data from MDO sniffer accumulates in the FIFO. When a threshold is reached, the data is sent out to the aggregator as a burst transfer.

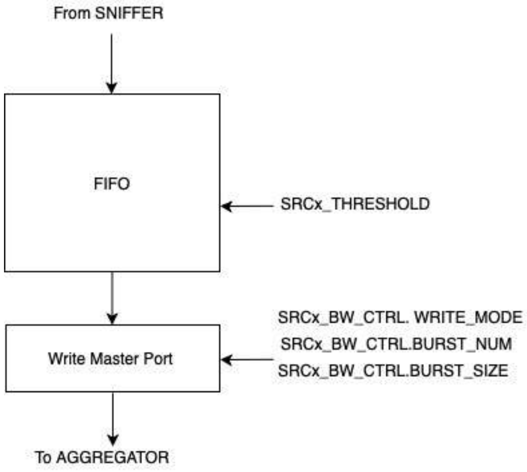

Figure 25-3. MDO FIFO Master

- When SRC0_BW_CTRL Register (Offset = 40h) [Reset = X] .WRITE_MODE is 0x0, then the data is sent out as a burst where the burst size is the THRESHOLD.
- When SRC0_BW_CTRL Register (Offset = 40h) [Reset = X] .WRITE_MODE is 0x1, then the data is sent out as a series of bursts of count BURST_NUM each of size BURST_SIZE.

25.1.3.2 Sniffer Marker Generation

An MDO source can inject a marker indicator along with its data. A marker indicator is sent to the STM module to generate a FLAG or FLAG_TS.

A marker indicator can be injected into the source stream by:

- A hardware event when register field SRC0_CTRL Register (Offset = 14h) [Reset = X] :HW_MARKER_EN is 0x1
- Software writing to the register field SRC0_SW_TRIGGER Register (Offset = 38h) [Reset = X] :MARKER

If SRCx_CHANNEL_CFG_NONDATA_TIMESTAMPED is set, then the STM is written to generate a FLAG_TS packet; else, a FLAG packet is generated.

An MDO source can inject a flush indicator in its data stream. A flush causes all the previous data in the FIFO to be sent to the STM irrespective of the threshold.

A flush indicator can be injected into the source stream by:

- A hardware event when register field SRC0_CTRL Register (Offset = 14h) [Reset = X] :HW_FLUSH_EN is 0x1
- Software writing to the register field SRC0_SW_TRIGGER Register (Offset = 38h) [Reset = X] :FLUSH

25.1.3.3 Sniffer Flush Operation

On a flush request, the MDO FIFO Master empties the FIFO, irrespective of the threshold. Any new data in the FIFO is not drained and is sent out only when the threshold is reached or a new flush request is received.

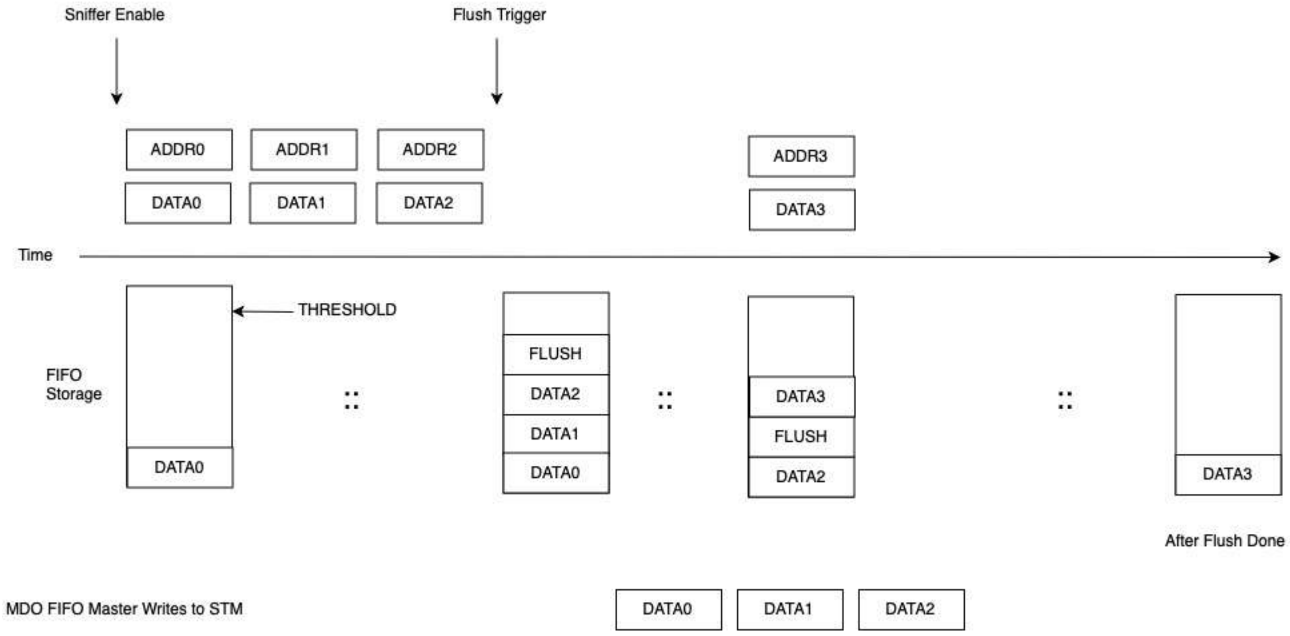

Figure 25-4. Sniffer Flush Operation

25.1.4 MDO Aggregator

25.1.4.1 Overview

The aggregator module merges the streams of data from the various MDO sources (SRCx) and sends it to the CS-STM Block.

- If there are multiple active SRC streams, it uses round robin arbitration to arbitrate which SRC should be sent.
- When an SRC wins arbitration, it has access for the entire duration of its burst transfer.
- The aggregator module also provides the correct address for the STM channel.

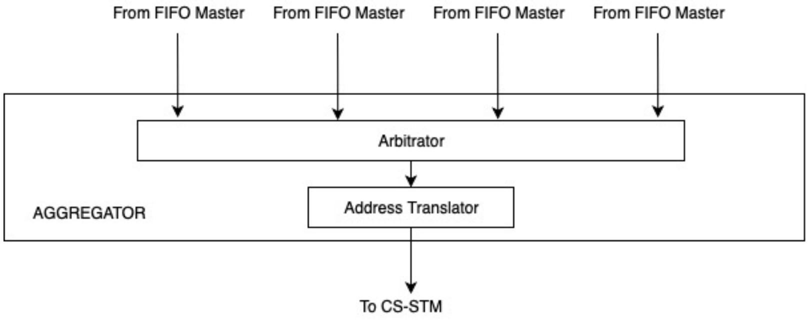

Figure 25-5. MDO Aggregator

25.1.4.2 Address Translator - CS_STM Mapping

The address provided to the CS-STM for each of the sources is derived as shown in Table 25-2 and Table 25-3.

Table 25-2. Address Mapping for Data Access

CS-STM Address	Mapping
[31:8]	SRCx_CHANNEL_ADDR[31:8]
[7]	!SRCx_CHANNEL_CFG_DATA_GUARANTEED
[6:5]	Tie Low
[4]	!SRCx_CHANNEL_CFG_DATA_MARKED
[3]	!SRCx_CHANNEL_CFG_DATA_TIMESTAMPED
[2:0]	Tie Low

Table 25-3. Address Mapping for Non Data Access

CS-STM Address	Mapping
[31:8]	SRCx_CHANNEL_ADDR[31:8]
[7]	!SRCx_CHANNEL_CFG_NONDATA_GUARANTEED
[6:5]	Tie High
[4]	Tie Low
[3]	!SRCx_CHANNEL_CFG_NONDATA_TIMESTAMPED
[2:0]	Tie Low

25.1.5 MDO Transmission Example

Table 25-4. MDO Transmission Example

SRC	Data	Size	Threshold
SRC2	DSP Processor Variables	2 KB	256 Bytes
SRC3	MSS SPI Data	2 KB	256 Bytes
SRC4	HWA 1D FFT Output 256 16 bit complex samples for 4 channels	4 KB	512 Bytes

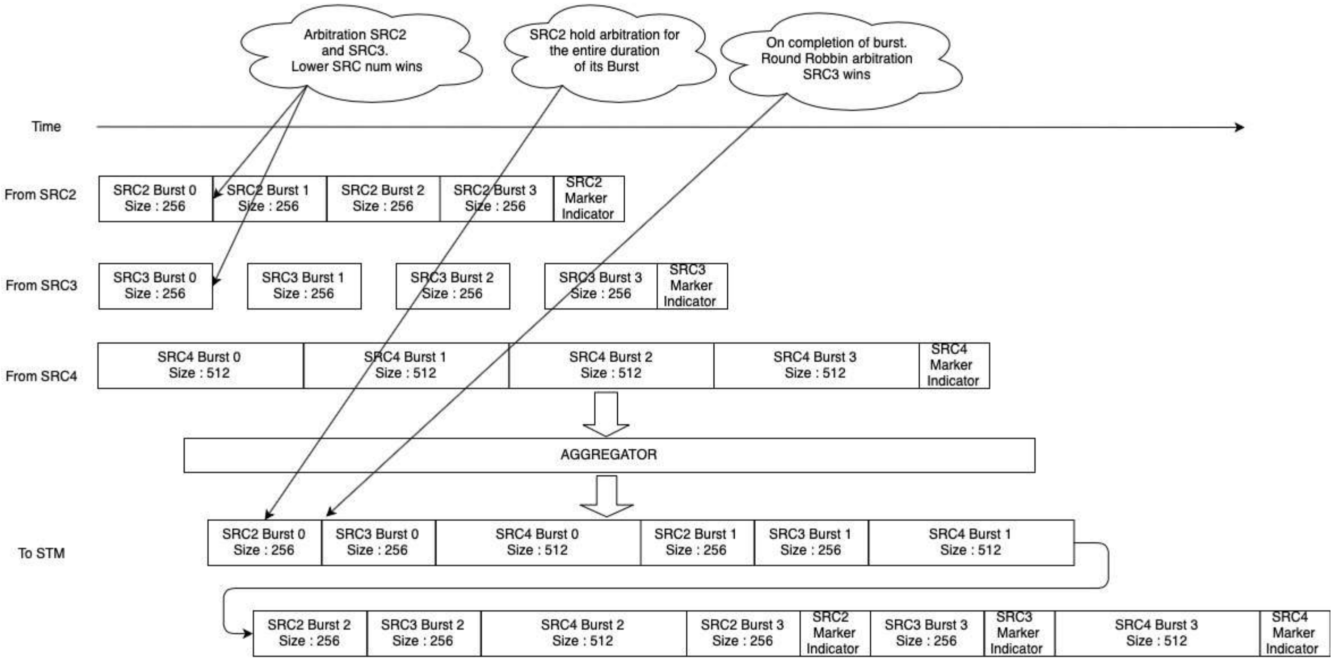

Figure 25-6. MDO Transmission

25.1.6 MDO Source Attributes

Table 25-5. MDO Source Attributes

SRC Num	SRC Name	Read/Write	Bus Matrix Stall Capability	HW Marker Event	Range Selection Parameter
0	RCSS_CSI2A_MDMA	Write	No	0 : RCSS_CSI2A_SOF_INT0 1 : RCSS_CSI2A_SOF_INT1 2 : RCSS_CSI2A_EOF_INT0 3 : RCSS_CSI2A_EOF_INT1	Address
1	RCSS_CSI2B_MDMA	Write	No	0 : RCSS_CSI2B_SOF_INT0 1 : RCSS_CSI2B_SOF_INT1 2 : RCSS_CSI2B_EOF_INT0 3 : RCSS_CSI2B_EOF_INT1	Address
2	DSS_MDO_FIFO	Write	Yes		Address
3	MSS_MDO_FIFO	Write	Yes		Address
4	DSS_HWA_DMA0 OR DSS_HWA_DMA1	Read OR Write	No	No	HWA Param Set Num
5	DSS_HWA_ENGINE	Read OR Write	No		HWA Param Set Num

Note

Because the DSS_MDO_FIFO (Address 0x83400000:0x83403FFC) and MSS_MDO_FIFO (Address 0xCA000000:0xCA00FFFC) have stall capability as they are hooked up to the bus matrix, these sources do not overflow.

25.1.7 References

Table 25-6 shows the ARM Coresight components that are part of the MDO Datapath.

101Ch	intr_enable_clear	Interrupt Enable Clear register	Go
1020h	eoi	EOI register	Go
1024h	fault_address	Fault Address register	Go
1028h	fault_type_status	Fault Type Status register	Go
102Ch	fault_attr_status	Fault Attribute Status register	Go
1030h	fault_clear	Fault Clear register	Go

Complex bit access types are encoded to fit into small table cells. Table 25-8 shows the codes that are used for access types in this section.

Table 25-8. TOP_MDO_INFRA Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set

Table 25-8. TOP_MDO_INFRA Access Type Codes (continued)

Access Type	Code	Description
Reset or Default Value		
-n		Value after reset or the default value

25.1.8.1 PID Register (Offset = 0h) [Reset = 61800213h]

PID is shown in Table 25-9.

Return to the Summary Table.

PID register

Table 25-9. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	13h	

25.1.8.2 HW_REG0 Register (Offset = 4h) [Reset = 00000000h]

HW_REG0 is shown in Table 25-10.

Return to the Summary Table.

Table 25-10. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

25.1.8.3 HW_REG1 Register (Offset = 8h) [Reset = 00000000h]

HW_REG1 is shown in Table 25-11.

Return to the Summary Table.

Table 25-11. HW_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

25.1.8.4 PREVIOUS_NAME Register (Offset = Ch) [Reset = 00000000h]

PREVIOUS_NAME is shown in Table 25-12.

Return to the Summary Table.

Table 25-12. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

25.1.8.5 HW_REG3 Register (Offset = 10h) [Reset = 00000000h]

HW_REG3 is shown in Table 25-13.

Return to the Summary Table.

Table 25-13. HW_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

25.1.8.6 SRC0_CTRL Register (Offset = 14h) [Reset = X]

SRC0_CTRL is shown in Table 25-14.

Return to the Summary Table.

Table 25-14. SRC0_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

25.1.8.7 SRC0_RANGE_START0 Register (Offset = 18h) [Reset = 00000000h]

SRC0_RANGE_START0 is shown in Table 25-15.

Return to the Summary Table.

Table 25-15. SRC0_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

25.1.8.8 SRC0_RANGE_END0 Register (Offset = 1Ch) [Reset = 00000000h]

SRC0_RANGE_END0 is shown in Table 25-16.

Return to the Summary Table.

Table 25-16. SRC0_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

25.1.8.9 SRC0_RANGE_START1 Register (Offset = 20h) [Reset = 00000000h]

SRC0_RANGE_START1 is shown in Table 25-17.

Return to the Summary Table.

Table 25-17. SRC0_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

25.1.8.10 SRC0_RANGE_END1 Register (Offset = 24h) [Reset = 00000000h]

SRC0_RANGE_END1 is shown in Table 25-18.

Return to the Summary Table.

Table 25-18. SRC0_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

25.1.8.11 SRC0_RANGE_START2 Register (Offset = 28h) [Reset = 00000000h]

SRC0_RANGE_START2 is shown in Table 25-19.

Return to the Summary Table.

Table 25-19. SRC0_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

25.1.8.12 SRC0_RANGE_END2 Register (Offset = 2Ch) [Reset = 00000000h]

SRC0_RANGE_END2 is shown in Table 25-20.

Return to the Summary Table.

Table 25-20. SRC0_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

25.1.8.13 SRC0_RANGE_START3 Register (Offset = 30h) [Reset = 00000000h]

SRC0_RANGE_START3 is shown in Table 25-21.

Return to the Summary Table.

Table 25-21. SRC0_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

25.1.8.14 SRC0_RANGE_END3 Register (Offset = 34h) [Reset = 00000000h]

SRC0_RANGE_END3 is shown in Table 25-22.

Return to the Summary Table.

Table 25-22. SRC0_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

25.1.8.15 SRC0_SW_TRIGGER Register (Offset = 38h) [Reset = X]

SRC0_SW_TRIGGER is shown in Table 25-23.

Return to the Summary Table.

Table 25-23. SRC0_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

25.1.8.16 SRC0_THRESHOLD Register (Offset = 3Ch) [Reset = X]

SRC0_THRESHOLD is shown in Table 25-24.

Return to the Summary Table.

Table 25-24. SRC0_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

25.1.8.17 SRC0_BW_CTRL Register (Offset = 40h) [Reset = X]

SRC0_BW_CTRL is shown in Table 25-25.

Return to the Summary Table.

Table 25-25. SRC0_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

25.1.8.18 SRC0_CHANNEL Register (Offset = 44h) [Reset = 00000000h]

SRC0_CHANNEL is shown in Table 25-26.

Return to the Summary Table.

Table 25-26. SRC0_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

25.1.8.19 SRC0_CHANNEL_CFG Register (Offset = 48h) [Reset = X]

SRC0_CHANNEL_CFG is shown in Table 25-27.

Return to the Summary Table.

Table 25-27. SRC0_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

25.1.8.20 SRC1_CTRL Register (Offset = 4Ch) [Reset = X]

SRC1_CTRL is shown in Table 25-28.

Return to the Summary Table.

Table 25-28. SRC1_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

25.1.8.21 SRC1_RANGE_START0 Register (Offset = 50h) [Reset = 00000000h]

SRC1_RANGE_START0 is shown in Table 25-29.

Return to the Summary Table.

Table 25-29. SRC1_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

25.1.8.22 SRC1_RANGE_END0 Register (Offset = 54h) [Reset = 00000000h]

SRC1_RANGE_END0 is shown in Table 25-30.

Return to the Summary Table.

Table 25-30. SRC1_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

25.1.8.23 SRC1_RANGE_START1 Register (Offset = 58h) [Reset = 00000000h]

SRC1_RANGE_START1 is shown in Table 25-31.

Return to the Summary Table.

Table 25-31. SRC1_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

25.1.8.24 SRC1_RANGE_END1 Register (Offset = 5Ch) [Reset = 00000000h]

SRC1_RANGE_END1 is shown in Table 25-32.

Return to the Summary Table.

Table 25-32. SRC1_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

25.1.8.25 SRC1_RANGE_START2 Register (Offset = 60h) [Reset = 00000000h]

SRC1_RANGE_START2 is shown in Table 25-33.

Return to the Summary Table.

Table 25-33. SRC1_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

25.1.8.26 SRC1_RANGE_END2 Register (Offset = 64h) [Reset = 00000000h]

SRC1_RANGE_END2 is shown in Table 25-34.

Return to the Summary Table.

Table 25-34. SRC1_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

25.1.8.27 SRC1_RANGE_START3 Register (Offset = 68h) [Reset = 00000000h]

SRC1_RANGE_START3 is shown in Table 25-35.

Return to the Summary Table.

Table 25-35. SRC1_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

25.1.8.28 SRC1_RANGE_END3 Register (Offset = 6Ch) [Reset = 00000000h]

SRC1_RANGE_END3 is shown in Table 25-36.

Return to the Summary Table.

Table 25-36. SRC1_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

25.1.8.29 SRC1_SW_TRIGGER Register (Offset = 70h) [Reset = X]

SRC1_SW_TRIGGER is shown in Table 25-37.

Return to the Summary Table.

Table 25-37. SRC1_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

25.1.8.30 SRC1_THRESHOLD Register (Offset = 74h) [Reset = X]

SRC1_THRESHOLD is shown in Table 25-38.

Return to the Summary Table.

Table 25-38. SRC1_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

25.1.8.31 SRC1_BW_CTRL Register (Offset = 78h) [Reset = X]

SRC1_BW_CTRL is shown in Table 25-39.

Return to the Summary Table.

Table 25-39. SRC1_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

25.1.8.32 SRC1_CHANNEL Register (Offset = 7Ch) [Reset = 00000000h]

SRC1_CHANNEL is shown in Table 25-40.

Return to the Summary Table.

Table 25-40. SRC1_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

25.1.8.33 SRC1_CHANNEL_CFG Register (Offset = 80h) [Reset = X]

SRC1_CHANNEL_CFG is shown in Table 25-41.

Return to the Summary Table.

Table 25-41. SRC1_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

25.1.8.34 SRC2_CTRL Register (Offset = 84h) [Reset = X]

SRC2_CTRL is shown in Table 25-42.

Return to the Summary Table.

Table 25-42. SRC2_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

25.1.8.35 SRC2_RANGE_START0 Register (Offset = 88h) [Reset = 00000000h]

SRC2_RANGE_START0 is shown in Table 25-43.

Return to the Summary Table.

Table 25-43. SRC2_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

25.1.8.36 SRC2_RANGE_END0 Register (Offset = 8Ch) [Reset = 00000000h]

SRC2_RANGE_END0 is shown in Table 25-44.

Return to the Summary Table.

Table 25-44. SRC2_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

25.1.8.37 SRC2_RANGE_START1 Register (Offset = 90h) [Reset = 00000000h]

SRC2_RANGE_START1 is shown in Table 25-45.

Return to the Summary Table.

Table 25-45. SRC2_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

25.1.8.38 SRC2_RANGE_END1 Register (Offset = 94h) [Reset = 00000000h]

SRC2_RANGE_END1 is shown in Table 25-46.

Return to the Summary Table.

Table 25-46. SRC2_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

25.1.8.39 SRC2_RANGE_START2 Register (Offset = 98h) [Reset = 00000000h]

SRC2_RANGE_START2 is shown in Table 25-47.

Return to the Summary Table.

Table 25-47. SRC2_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

25.1.8.40 SRC2_RANGE_END2 Register (Offset = 9Ch) [Reset = 00000000h]

SRC2_RANGE_END2 is shown in Table 25-48.

Return to the Summary Table.

Table 25-48. SRC2_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

25.1.8.41 SRC2_RANGE_START3 Register (Offset = A0h) [Reset = 00000000h]

SRC2_RANGE_START3 is shown in Table 25-49.

Return to the Summary Table.

Table 25-49. SRC2_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

25.1.8.42 SRC2_RANGE_END3 Register (Offset = A4h) [Reset = 00000000h]

SRC2_RANGE_END3 is shown in Table 25-50.

Return to the Summary Table.

Table 25-50. SRC2_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

25.1.8.43 SRC2_SW_TRIGGER Register (Offset = A8h) [Reset = X]

SRC2_SW_TRIGGER is shown in Table 25-51.

Return to the Summary Table.

Table 25-51. SRC2_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush.
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

25.1.8.44 SRC2_THRESHOLD Register (Offset = ACh) [Reset = X]

SRC2_THRESHOLD is shown in Table 25-52.

Return to the Summary Table.

Table 25-52. SRC2_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

25.1.8.45 SRC2_BW_CTRL Register (Offset = B0h) [Reset = X]

SRC2_BW_CTRL is shown in Table 25-53.

Return to the Summary Table.

Table 25-53. SRC2_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

25.1.8.46 SRC2_CHANNEL Register (Offset = B4h) [Reset = 00000000h]

SRC2_CHANNEL is shown in Table 25-54.

Return to the Summary Table.

Table 25-54. SRC2_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

25.1.8.47 SRC2_CHANNEL_CFG Register (Offset = B8h) [Reset = X]

SRC2_CHANNEL_CFG is shown in Table 25-55.

Return to the Summary Table.

Table 25-55. SRC2_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

25.1.8.48 SRC3_CTRL Register (Offset = BCh) [Reset = X]

SRC3_CTRL is shown in Table 25-56.

Return to the Summary Table.

Table 25-56. SRC3_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

25.1.8.49 SRC3_RANGE_START0 Register (Offset = C0h) [Reset = 00000000h]

SRC3_RANGE_START0 is shown in Table 25-57.

Return to the Summary Table.

Table 25-57. SRC3_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

25.1.8.50 SRC3_RANGE_END0 Register (Offset = C4h) [Reset = 00000000h]

SRC3_RANGE_END0 is shown in Table 25-58.

Return to the Summary Table.

Table 25-58. SRC3_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

25.1.8.51 SRC3_RANGE_START1 Register (Offset = C8h) [Reset = 00000000h]

SRC3_RANGE_START1 is shown in Table 25-59.

Return to the Summary Table.

Table 25-59. SRC3_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

25.1.8.52 SRC3_RANGE_END1 Register (Offset = CCh) [Reset = 00000000h]

SRC3_RANGE_END1 is shown in Table 25-60.

Return to the Summary Table.

Table 25-60. SRC3_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

25.1.8.53 SRC3_RANGE_START2 Register (Offset = D0h) [Reset = 00000000h]

SRC3_RANGE_START2 is shown in Table 25-61.

Return to the Summary Table.

Table 25-61. SRC3_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

25.1.8.54 SRC3_RANGE_END2 Register (Offset = D4h) [Reset = 00000000h]

SRC3_RANGE_END2 is shown in Table 25-62.

Return to the Summary Table.

Table 25-62. SRC3_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

25.1.8.55 SRC3_RANGE_START3 Register (Offset = D8h) [Reset = 00000000h]

SRC3_RANGE_START3 is shown in Table 25-63.

Return to the Summary Table.

Table 25-63. SRC3_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

25.1.8.56 SRC3_RANGE_END3 Register (Offset = DCh) [Reset = 00000000h]

SRC3_RANGE_END3 is shown in Table 25-64.

Return to the Summary Table.

Table 25-64. SRC3_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

25.1.8.57 SRC3_SW_TRIGGER Register (Offset = E0h) [Reset = X]

SRC3_SW_TRIGGER is shown in Table 25-65.

Return to the Summary Table.

Table 25-65. SRC3_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

25.1.8.58 SRC3_THRESHOLD Register (Offset = E4h) [Reset = X]

SRC3_THRESHOLD is shown in Table 25-66.

Return to the Summary Table.

Table 25-66. SRC3_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

25.1.8.59 SRC3_BW_CTRL Register (Offset = E8h) [Reset = X]

SRC3_BW_CTRL is shown in Table 25-67.

Return to the Summary Table.

Table 25-67. SRC3_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

25.1.8.60 SRC3_CHANNEL Register (Offset = ECh) [Reset = 00000000h]

SRC3_CHANNEL is shown in Table 25-68.

Return to the Summary Table.

Table 25-68. SRC3_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

25.1.8.61 SRC3_CHANNEL_CFG Register (Offset = F0h) [Reset = X]

SRC3_CHANNEL_CFG is shown in Table 25-69.

Return to the Summary Table.

Table 25-69. SRC3_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

25.1.8.62 SRC4_CTRL Register (Offset = F4h) [Reset = X]

SRC4_CTRL is shown in Table 25-70.

Return to the Summary Table.

Table 25-70. SRC4_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-5	RESERVED	R/W	X	
4	port_sel	R/W	0h	Select which bus to capture. 0 : DSS_HWA_DMA0 1 : DSS_HWA_DMA1
3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

25.1.8.63 SRC4_RANGE_START0 Register (Offset = F8h) [Reset = 00000000h]

SRC4_RANGE_START0 is shown in Table 25-71.

Return to the Summary Table.

Table 25-71. SRC4_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

25.1.8.64 SRC4_RANGE_END0 Register (Offset = FCh) [Reset = 00000000h]

SRC4_RANGE_END0 is shown in Table 25-72.

Return to the Summary Table.

Table 25-72. SRC4_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

25.1.8.65 SRC4_RANGE_START1 Register (Offset = 100h) [Reset = 00000000h]

SRC4_RANGE_START1 is shown in Table 25-73.

Return to the Summary Table.

Table 25-73. SRC4_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

25.1.8.66 SRC4_RANGE_END1 Register (Offset = 104h) [Reset = 00000000h]

SRC4_RANGE_END1 is shown in Table 25-74.

Return to the Summary Table.

Table 25-74. SRC4_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

25.1.8.67 SRC4_RANGE_START2 Register (Offset = 108h) [Reset = 00000000h]

SRC4_RANGE_START2 is shown in Table 25-75.

Return to the Summary Table.

Table 25-75. SRC4_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

25.1.8.68 SRC4_RANGE_END2 Register (Offset = 10Ch) [Reset = 00000000h]

SRC4_RANGE_END2 is shown in Table 25-76.

Return to the Summary Table.

Table 25-76. SRC4_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

25.1.8.69 SRC4_RANGE_START3 Register (Offset = 110h) [Reset = 00000000h]

SRC4_RANGE_START3 is shown in Table 25-77.

Return to the Summary Table.

Table 25-77. SRC4_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

25.1.8.70 SRC4_RANGE_END3 Register (Offset = 114h) [Reset = 00000000h]

SRC4_RANGE_END3 is shown in Table 25-78.

Return to the Summary Table.

Table 25-78. SRC4_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

25.1.8.71 SRC4_SW_TRIGGER Register (Offset = 118h) [Reset = X]

SRC4_SW_TRIGGER is shown in Table 25-79.

Return to the Summary Table.

Table 25-79. SRC4_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

25.1.8.72 SRC4_THRESHOLD Register (Offset = 11Ch) [Reset = X]

SRC4_THRESHOLD is shown in Table 25-80.

Return to the Summary Table.

Table 25-80. SRC4_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

25.1.8.73 SRC4_BW_CTRL Register (Offset = 120h) [Reset = X]

SRC4_BW_CTRL is shown in Table 25-81.

Return to the Summary Table.

Table 25-81. SRC4_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

25.1.8.74 SRC4_CHANNEL Register (Offset = 124h) [Reset = 00000000h]

SRC4_CHANNEL is shown in Table 25-82.

Return to the Summary Table.

Table 25-82. SRC4_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

25.1.8.75 SRC4_CHANNEL_CFG Register (Offset = 128h) [Reset = X]

SRC4_CHANNEL_CFG is shown in Table 25-83.

Return to the Summary Table.

Table 25-83. SRC4_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

25.1.8.76 SRC5_CTRL Register (Offset = 12Ch) [Reset = X]

SRC5_CTRL is shown in Table 25-84.

Return to the Summary Table.

Table 25-84. SRC5_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

25.1.8.77 SRC5_RANGE_START0 Register (Offset = 130h) [Reset = 00000000h]

SRC5_RANGE_START0 is shown in Table 25-85.

Return to the Summary Table.

Table 25-85. SRC5_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

25.1.8.78 SRC5_RANGE_END0 Register (Offset = 134h) [Reset = 00000000h]

SRC5_RANGE_END0 is shown in Table 25-86.

Return to the Summary Table.

Table 25-86. SRC5_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

25.1.8.79 SRC5_RANGE_START1 Register (Offset = 138h) [Reset = 00000000h]

SRC5_RANGE_START1 is shown in Table 25-87.

Return to the Summary Table.

Table 25-87. SRC5_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

25.1.8.80 SRC5_RANGE_END1 Register (Offset = 13Ch) [Reset = 00000000h]

SRC5_RANGE_END1 is shown in Table 25-88.

Return to the Summary Table.

Table 25-88. SRC5_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

25.1.8.81 SRC5_RANGE_START2 Register (Offset = 140h) [Reset = 00000000h]

SRC5_RANGE_START2 is shown in Table 25-89.

Return to the Summary Table.

Table 25-89. SRC5_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

25.1.8.82 SRC5_RANGE_END2 Register (Offset = 144h) [Reset = 00000000h]

SRC5_RANGE_END2 is shown in Table 25-90.

Return to the Summary Table.

Table 25-90. SRC5_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

25.1.8.83 SRC5_RANGE_START3 Register (Offset = 148h) [Reset = 00000000h]

SRC5_RANGE_START3 is shown in Table 25-91.

Return to the Summary Table.

Table 25-91. SRC5_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

25.1.8.84 SRC5_RANGE_END3 Register (Offset = 14Ch) [Reset = 00000000h]

SRC5_RANGE_END3 is shown in Table 25-92.

Return to the Summary Table.

Table 25-92. SRC5_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

25.1.8.85 SRC5_SW_TRIGGER Register (Offset = 150h) [Reset = X]

SRC5_SW_TRIGGER is shown in Table 25-93.

Return to the Summary Table.

Table 25-93. SRC5_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

25.1.8.86 SRC5_THRESHOLD Register (Offset = 154h) [Reset = X]

SRC5_THRESHOLD is shown in Table 25-94.

Return to the Summary Table.

Table 25-94. SRC5_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

25.1.8.87 SRC5_BW_CTRL Register (Offset = 158h) [Reset = X]

SRC5_BW_CTRL is shown in Table 25-95.

Return to the Summary Table.

Table 25-95. SRC5_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X

25.1.8.88 SRC5_CHANNEL Register (Offset = 15Ch) [Reset = 00000000h]

SRC5_CHANNEL is shown in Table 25-96.

Return to the Summary Table.

Table 25-96. SRC5_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

25.1.8.89 SRC5_CHANNEL_CFG Register (Offset = 160h) [Reset = X]

SRC5_CHANNEL_CFG is shown in Table 25-97.

Return to the Summary Table.

Table 25-97. SRC5_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

25.1.8.90 SRC0_STATUS Register (Offset = 1D4h) [Reset = X]

SRC0_STATUS is shown in Table 25-98.

Return to the Summary Table.

Table 25-98. SRC0_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 0
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

25.1.8.91 SRC1_STATUS Register (Offset = 1D8h) [Reset = X]

SRC1_STATUS is shown in Table 25-99.

Return to the Summary Table.

Table 25-99. SRC1_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 1
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

25.1.8.92 SRC2_STATUS Register (Offset = 1DCh) [Reset = X]

SRC2_STATUS is shown in Table 25-100.

Return to the Summary Table.

Table 25-100. SRC2_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 2
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

25.1.8.93 SRC3_STATUS Register (Offset = 1E0h) [Reset = X]

SRC3_STATUS is shown in Table 25-101.

Return to the Summary Table.

Table 25-101. SRC3_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 3
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

25.1.8.94 SRC4_STATUS Register (Offset = 1E4h) [Reset = X]

SRC4_STATUS is shown in Table 25-102.

Return to the Summary Table.

Table 25-102. SRC4_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 4
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

25.1.8.95 SRC5_STATUS Register (Offset = 1E8h) [Reset = X]

SRC5_STATUS is shown in Table 25-103.

Return to the Summary Table.

Table 25-103. SRC5_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 5
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

25.1.8.96 INTERRUPT_MASK Register (Offset = 1ECh) [Reset = FFFFFFFFh]

INTERRUPT_MASK is shown in Table 25-104.

Return to the Summary Table.

Table 25-104. INTERRUPT_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	mask	R/W	FFFFFFFFh	MDO Infra Interrupt Mask

25.1.8.97 HW_SPARE_RW0 Register (Offset = FD0h) [Reset = 00000000h]

HW_SPARE_RW0 is shown in Table 25-105.

Return to the Summary Table.

Table 25-105. HW_SPARE_RW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw0	R/W	0h	Reserved for HW R&D

25.1.8.98 HW_SPARE_RW1 Register (Offset = FD4h) [Reset = 00000000h]

HW_SPARE_RW1 is shown in Table 25-106.

Return to the Summary Table.

25.1.8.107 LOCK0_KICK0 Register (Offset = 1008h) [Reset = 00000000h]

LOCK0_KICK0 is shown in Table 25-115.

Return to the Summary Table.

- KICK0 component

Table 25-115. LOCK0_KICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick0	R/W	0h	RESERVED, write has no impact

25.1.8.108 LOCK0_KICK1 Register (Offset = 100Ch) [Reset = 00000000h]

LOCK0_KICK1 is shown in Table 25-116.

Return to the Summary Table.

- KICK1 component

Table 25-116. LOCK0_KICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick1	R/W	0h	RESERVED, write has no impact

25.1.8.109 intr_raw_status Register (Offset = 1010h) [Reset = X]

intr_raw_status is shown in Table 25-117.

Return to the Summary Table.

Interrupt Raw Status/Set Register

Table 25-117. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

25.1.8.110 intr_enabled_status_clear Register (Offset = 1014h) [Reset = X]

intr_enabled_status_clear is shown in Table 25-118.

Return to the Summary Table.

Interrupt Enabled Status/Clear register

Table 25-118. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

25.1.8.111 intr_enable Register (Offset = 1018h) [Reset = X]

intr_enable is shown in Table 25-119.

Return to the Summary Table.

Interrupt Enable register

Table 25-119. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

25.1.8.112 intr_enable_clear Register (Offset = 101Ch) [Reset = X]

intr_enable_clear is shown in Table 25-120.

Return to the Summary Table.

Interrupt Enable Clear register

Table 25-120. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

25.1.8.113 eoi Register (Offset = 1020h) [Reset = X]

eoi is shown in Table 25-121.

Return to the Summary Table.

EOI register

Table 25-121. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

25.1.8.114 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in Table 25-122.

Return to the Summary Table.

Fault Address register

Table 25-122. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

25.1.8.115 fault_type_status Register (Offset = 1028h) [Reset = X]

fault_type_status is shown in Table 25-123.

Return to the Summary Table.

Fault Type Status register

Table 25-123. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	X	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_0000 = Supervisor read fault - priv = 1 dir = 1 dtype != 1 01_0000 = Supervisor write fault - priv = 1 dir = 0 00_1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_0010 = User write fault - priv = 0 dir = 0 00_0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_0000 = No fault

25.1.8.116 fault_attr_status Register (Offset = 102Ch) [Reset = 00000000h]

fault_attr_status is shown in Table 25-124.

Return to the Summary Table.

Fault Attribute Status register

Table 25-124. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

25.1.8.117 fault_clear Register (Offset = 1030h) [Reset = X]

fault_clear is shown in Table 25-125.

Return to the Summary Table.

Fault Clear register

Table 25-125. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	X	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

25.2 Aurora TX IP

25.2.1 Features Supported

The Aurora Tx IP has the following features:

- Configurable 4/2/1 lane of operation
- Transmit data compliant to Aurora 8B/10B Serial Simplex Operation
- Transmit data compliant to Aurora 64B/66B Serial Simplex Operation
- Only Tx support. No Rx support
- Supports input format for Trace Wrapper Protocol (TWP) from ARM Coresight CS-TPIU IP
- Support for packing TWP packets as an Aurora User PDU
- Configurable option to append CRC for TWP data
- Configurable option to drop TWP padding packets
- Support for transmission of user-defined flow control packet for overflow condition

Note

In AWR294x Aurora/LVDS can support max data rate of 900Mbps.

25.2.2 Block Diagram

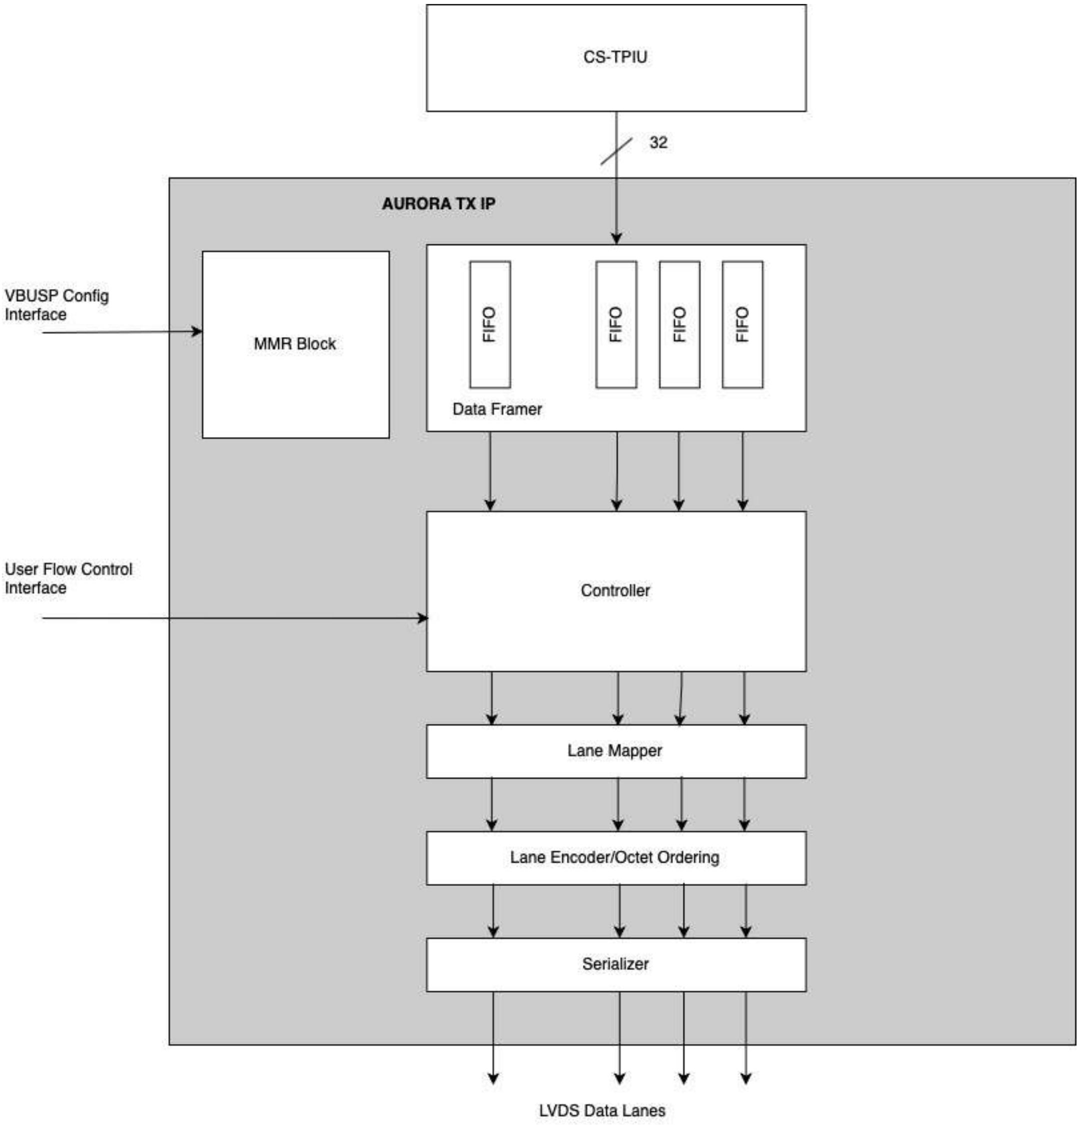

Figure 25-7. Block Diagram

25.2.2.1 Aurora UDP Packet Format

The following is the structure of a user data packet.

Figure 25-8. UDP Packet for 8b10b

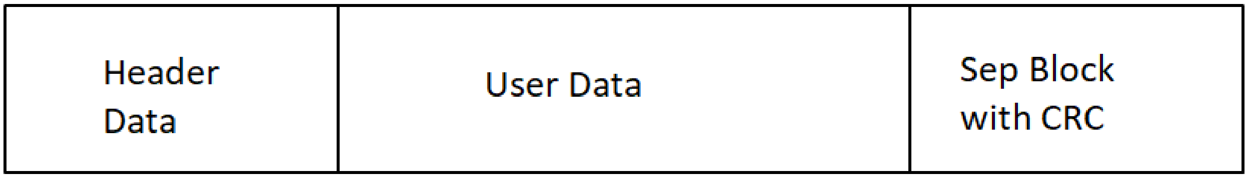

Figure 25-9. UDP Packet for 64b66b

25.2.2.1.1 Header Data (Optional)

An optional 64-byte frame header is inserted at the start of every aurora packet. The header data should be written to the AURORA_TX_UDP_FRAME_HEADERn registers. AURORA_UDP_FRAME_HEADERn is an array of 32-bit registers numbered from 0 to 15.

The AURORA_TX_UDP_CONFIG_FRAME_HEADER_EN of AURORA_TX_UDP_CONFIG register specifies the amount of header data to be sent with the aurora packets in multiples of 4 bytes.

For example, if AURORA_TX_UDP_CONFIG_FRAME_HEADER_EN = 4, a 128-bit header is sent.

25.2.2.1.2 Packet Completion

The incoming TWP data is packetized to an aurora packet based on the AURORA_TX_UDP_CONFIG:AURORA_TX_UDP_CONFIG_PACK_MODE_SEL register. The available options are:

- Number of bytes transferred. This enables the delineation of aurora packets based on the number of received bytes through the TPIU interface. Configuring the AURORA_TX_UDP_SIZE register specifies the number of bytes. This register value should be a multiple of 4 bytes, as the input TPIU data-width is 32 bits. A write to the AURORA_TX_EOP_REQ_TRIGGER ends the packet abruptly without waiting for the AURORA_TX_UDP_SIZE to be completed. AURORA_TX_UDP_SIZE should be programmed to a value greater than 4.
- Number of TWP packets. This enables the delineation of aurora packets based on the number of TWP packets. Configuring the AURORA_TX_UDP_SIZE register specifies the number of packets. A write to the AURORA_TX_EOP_REQ_TRIGGER ends the packet abruptly without waiting for the AURORA_TX_UDP_SIZE to be completed.
- Software End of Packet signal. The third option enables only the AURORA_TX_EOP_REQ_TRIGGER to end the packet. An aurora packet without an ECP or SEP block is possible if this value is not asserted.

25.2.2.1.3 Idle Filtering

The idle filter removes all the padding packets from the input TWP stream for transmission through the aurora interface.

The TWP idle filter can be enabled by writing a value of 1 to the AURORA_TX_UDP_CONFIG:TWP_IDLE_FILTER_EN register.

25.2.2.1.4 Frame Sync Compression

The frame sync compression transmits N consecutive frame syncs and ignores all subsequent consecutive frame syncs. It can be used to avoid sending long frame sync packets when data is not available.

25.2.2.1.5 CRC

A CRC is computed on 32 bits of input data in a single clock cycle. The computed CRC is inserted at the end of an aurora packet. The CRC insertion is an optional feature which can be enabled by writing a value of 1 to the register AURORA_TX_UDP_CONFIG:CRC_EN.

- A 16-bit CRC is appended in 8b10b mode: $X^{16} + X^{15} + X^2 + 1$
- A 32-bit CRC is appended in 64b66b mode: $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$

25.2.2.1.6 TEST PATTERN ENABLE

When test mode is enabled, a linear feedback shift register (LSFR) is used to generate a test pattern which is transmitted as user data. Only CRC and pattern data is transmitted in a frame. The polynomial used for the LSFR is $x^{65} + x^{47} + 1$ with initial seed 0x1_6B61A3B5_EF91F65A.

A Ramp pattern is also possible. This generates data in increments of 0x1. To enable this pattern, set the AURORA_TX_TESTPATTERN_CTRL:RAMP_EN bit to 0x1.

25.2.2.1.7 BYPASS AURORA

Aurora protocol can be disabled by writing a value of 1 to the register AURORA_TX_UDP_CONFIG.BYPASS_EN.

In this mode, the unencoded 8b/10b User Data Packets are transmitted.

The LVDS Pad : LVDS Bit Clk is available.

An additional LVDS Pad is available : LVDS Frame Clock signal to indicate that atleast 1 lane has a Start of Packet/End of Packet.

No Initialization/Clock Compensation/UFC etc is sent. Only UDP.

When the receiver sees Frame Clock high, it indicates one of the following:

- Lane 0 is transmitting an SCP pair (unencoded). This is the “Start of a new packet”.
- One of the lanes is transmitting an ECP pair (unencoded) and subsequent higher lanes are transmitting an Idle packet. This is “End of packet”.

Because the uer has the qualifier of Frame Clock for SCP/ECP, there is no mistaking data as control.

LVDS Clock, Frame Clock, and data timing relationship are the same in CBUFF LVDS transmission as in AWR294x and mmWave Gen1 Devices. The protocol relationship is as mentioned above.

25.2.3 Flow Control

25.2.3.1 Stall and Overflow Mechanism

Data loss due to overflow can occur only at the sniffer. There is no data loss at any other point in the chain. Overflow information is sent as an interrupt to the CPU and the Aurora Tx IP.

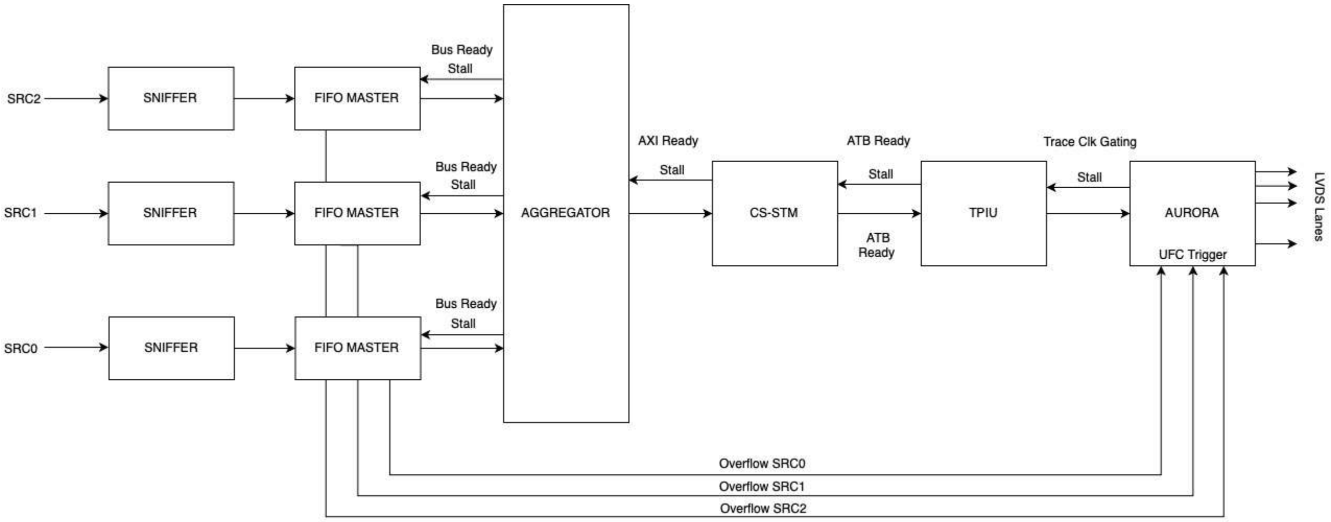

Figure 25-10. Stall and Overflow Mechanism

25.2.3.2 Aurora User Flow Control Packet

The Aurora Tx IP on receiving an overflow from a source can generate as User Flow Control Packet.

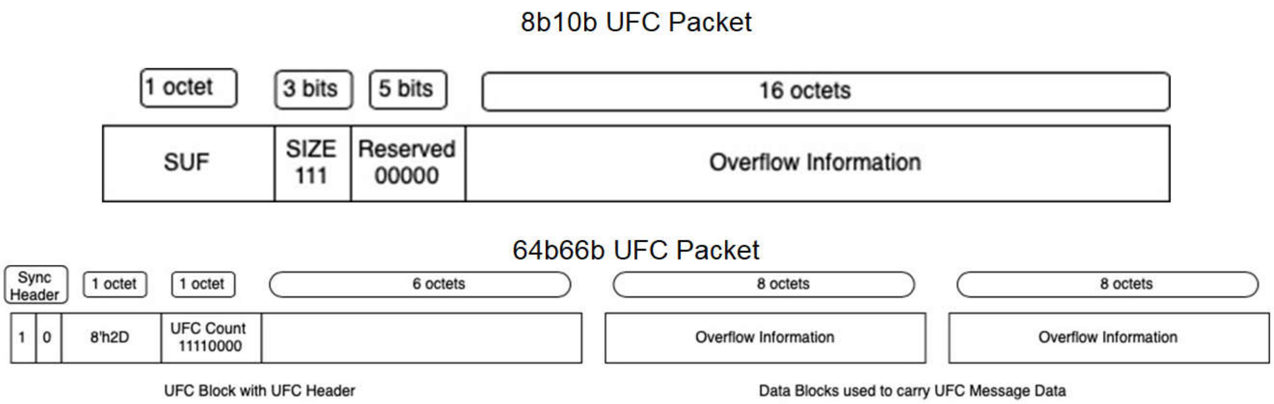

Figure 25-11. Aurora User Flow Control Packet

25.2.3.3 Aurora User Flow Control Packet Overflow Information Mapping

The following is the contents of the UFC packet.

SW_MSG0 is the data in register AURORA_TX_UFC_MESSAGE0

SW_MSG1 is the data in register AURORA_TX_UFC_MESSAGE1

Table 25-126 shows the mapping for the hardware message.

Table 25-126. HW_MSG Mapping

HW_MSG[63:0] Mapping	Integration
Bit [0]	Indicates SRC0 Overflow
Bit [1]	Indicates SRC1 Overflow
Bit [2]	Indicates SRC2 Overflow
Bit [3]	Indicates SRC3 Overflow
Bit [4]	Indicates SRC4 Overflow
Bit [5]	Indicates SRC5 Overflow
Bit [63:6]	Reserved. Tied Low

25.2.5 Global Flush

25.2.5.1 Architecture

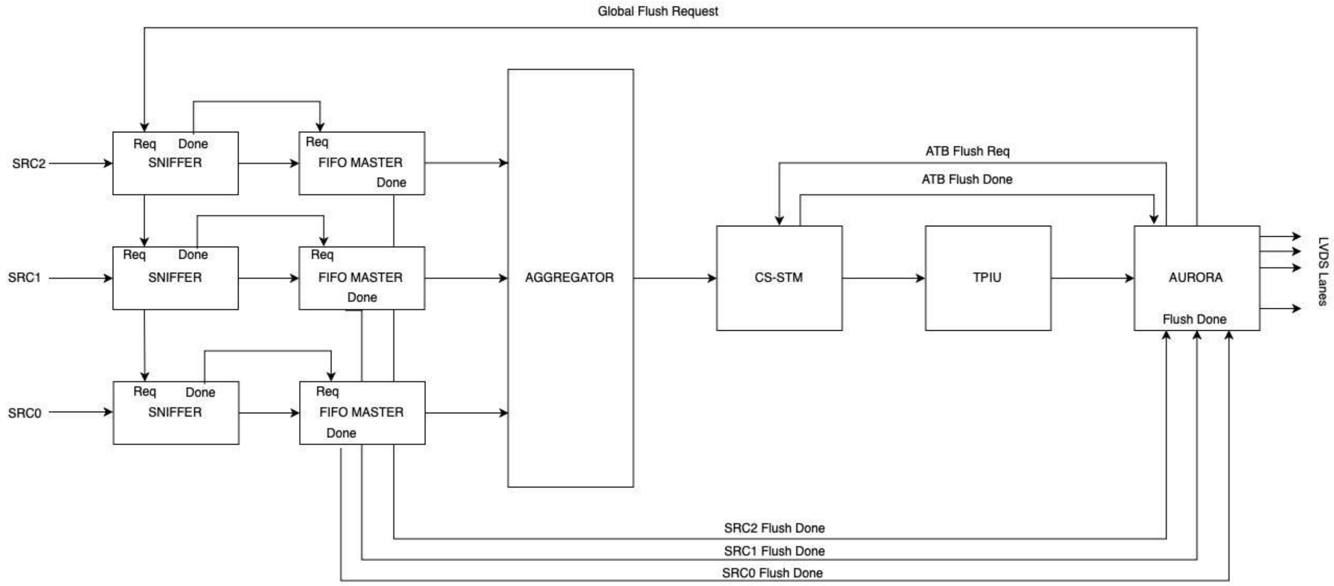

Figure 25-18. Global Flush Architecture

25.2.5.2 Sequence

Refer to Section 25.2.7 for more details on the software sequence.

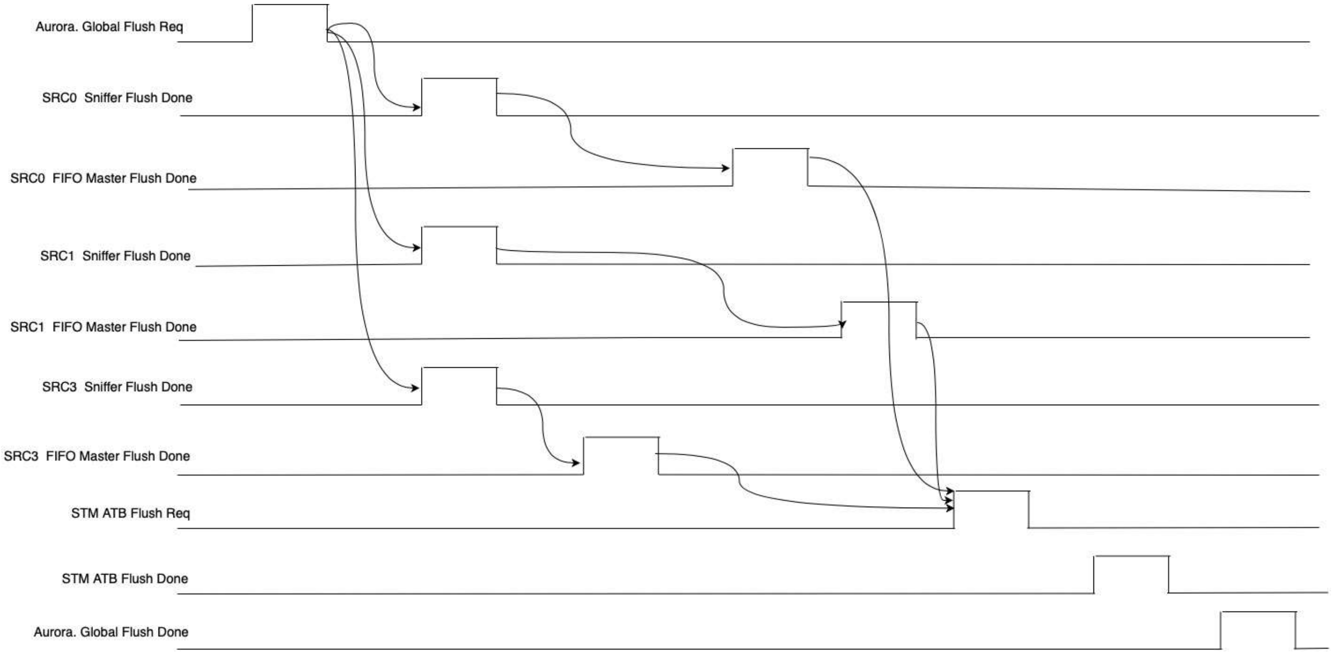

Figure 25-19. Global Flush Sequence

25.2.6 Interrupts

The IP generates two interrupt output lines. Each line has the following aggregated interrupts.

25.2.6.1 AURORA_TX_INTAGG

Table 25-127 shows the bit aggregation to generate the interrupt. The register AURORA_TX_INTAGG_MASK is used to mask some of the aggregated events from generating an interrupt. On receiving an interrupt, the processor must read the AURORA_TX_INTAGG_STATUS register to analyze the event that caused the interrupt. Writing 0x1 to the corresponding bit set clears the interrupt. Only unmasked events generate an interrupt and their status latched in the AURORA_TX_INTAGG_STATUS register. AURORA_TX_INTAGG_STATUS_RAW latches any event assertion irrespective of the mask register.

Table 25-127. AURORA_TX_INTAGG Bit Aggregation

Interrupt Number	Interrupt	Description
0	AURORA_TX_INIT_DONE	Indicates completion of Aurora Initialization sequence
1	AURORA_TX_FLUSH_DONE	Indicates that the Aurora IP has completed flush operation on its Data FIFO
2	AURORA_TX_EXT_FLUSH_DONE	Indicates that the MDO infrastructure has completed flushing its components
3	AURORA_TX_UFC_SENT	Indicates that a UFC packet has been generated as sent
4	AURORA_TX_CC_DONE	Indicate completion of Clock compensation sequence transmission
5	DATA_STOP_DONE	
6	AURORA_TX_EOP_DONE	Indicates completion of UDP packets
7	AURORA_TX_HEADER_DONE	Indicates completion of Frame Header transmission

25.2.6.2 AURORA_TX_ERRAGG

Table 25-128 shows the bit aggregation to generate the interrupt. The register AURORA_TX_ERRAGG_MASK is used to mask some of the aggregated events from generating an interrupt. On receiving an interrupt, the processor must read the AURORA_TX_ERRAGG_STATUS register to analyze the event that caused the interrupt. Writing 0x1 to the corresponding bit set clears the interrupt. Only unmasked events generate an interrupt and their status latched in the AURORA_TX_ERRAGG_STATUS register. AURORA_TX_ERRAGG_STATUS_RAW latches any event assertion irrespective of the mask register.

Table 25-128. AURORA_TX_ERRAGG Bit Aggregation

Interrupt Number	Interrupt	Description
0	AURORA_TX_UFC_ERR	Indicates that another UFC generation request was received with the IP was in the progress of transmitting the previous request

25.2.7 Programming Sequence

25.2.7.1 Programming Sequence for Typical Data Flow

1. Enable lvds PADS from TOP_RCM:
    - LVDS_PAD_CTRL0 Register (Offset = 208h) [Reset = 01010101h]
    - LVDS_PAD_CTRL1 Register (Offset = 20Ch) [Reset = 00000101h]
2. Program Aurora config registers:
    - AURORA_TX_CONFIG.AURORA_TX_CONFIG_ENABLE = 1
    - AURORA_TX_CONFIG.AURORA_TX_CONFIG_NUM_LANES = 1 (2 lanes active)
    - AURORA_TX_CONFIG.AURORA_TX_CONFIG_PROTOCOL_SEL = 1 (For Aurora 64b/66b)
    - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_PACK_MODE_SEL = 1 (TWP packets)
    - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_CRC_EN = 1
    - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_TWP_SYNC_COMPRESSION_EN = 1
    - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_TEST_PATTERN_EN = 0
    - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_BYPASS_EN = 0
    - Configuring for an 8-byte Frame Header: AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_FRAME_HEADER_EN = 2 (Optional)
    - If FRAME_HEADER_EN > 0: AURORA_TX_UDP_FRAME_HEADER0 = 0x900
    - If FRAME_HEADER_EN > 1: AURORA_TX_UDP_FRAME_HEADER1 = 0xA00

- AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_TWP_IDLE_FILTER_EN = 1
- Mapping Logical Lane 0 and 1 to physical lanes 0 and 1, respectively: AURORA_TX_LANE_MAP= 0x98
- AURORA_TX_TWP_SYNC_CNT.AURORA_TX_TWP_SYNC_CNT_SYNC_CNT = 2
- AURORA_TX_UDP_SIZE.AURORA_TX_UDP_SIZE = 0x18
- AURORA_TX_CC_CNT.AURORA_TX_CC_CNT_SYNC_COUNT = 0x199C

3. For Aurora 64b66b only:
    - AURORA_TX_CB_CNT.AURORA_TX_CB_CNT_CB_COUNT = 0x199C
4. Lane initialization sequence count:
    - AURORA_TX_INIT_CNT_LRC.AURORA_TX_INIT_CNT_LRC = 0x3E8
    - AURORA_TX_INIT_CNT_ALIGN.AURORA_TX_INIT_CNT_ALIGN_ALIGN_LEN = 0x10
    - AURORA_TX_INIT_CNT_ALIGN.AURORA_TX_INIT_CNT_ALIGN_ALIGN_MUL = 0x7
5. Channel bonding sequence count:
    - AURORA_TX_INIT_CNT_BONDING.AURORA_TX_INIT_CNT_BONDING_BOND_LEN = 0x11
    - AURORA_TX_INIT_CNT_BONDING.AURORA_TX_INIT_CNT_BONDING_BOND_MUL = 0x5
    - AURORA_TX_INIT_CNT_BONDING.AURORA_TX_INIT_CNT_BONDING_NO_OF_IDLES = 0x4
6. For Aurora 8b10b only: Channel verification sequence count:
    - AURORA_TX_INIT_CNT_VERIFY.AURORA_TX_INIT_CNT_VERIFY_VERIFY_LEN = 0x6
    - AURORA_TX_INIT_CNT_VERIFY.AURORA_TX_INIT_CNT_VERIFY_VERIFY_MUL = 0x4
7. Assert init req:
    - AURORA_TX_INITIALIZE_REQ.AURORA_TX_INITIALIZE_REQ_TX_INIT = 1
8. Poll for init to get over:
    - AURORA_TX_INIT_STATUS.AURORA_TX_INIT_STATUS_TX_CH_RDY (to 1).
9. For a test pattern, follow this step. Else, skip to Step 11. At this stage, the test pattern can also be enabled so that Aurora starts sending test data generated internally within the Aurora module. This part is optional, and the user can skip this step to directly jump to next step:
    - AURORA_TX_TESTPATTERN_START_REQ = 1
    - Wait as long as needed to receive test pattern
    - AURORA_TX_TESTPATTERN_STOP_REQ = 1
10. Clock source selection
    - TOP_AURORA_TX.AURORA_TX_RESET_REQ.AURORA_TX_RESET_REQ_TX_RESET = 1
    - MSS_TOPRCM.HSI_CLK_GATE.HSI_CLK_GATE_GATED =0
    - HSI_CLK_SRC_SEL Register (Offset = 14h) [Reset = 00000000h]
11. For MDO Data, follow these steps. Programming MDO registers; example scenario: Sniffer 2 , STM channel 3, threshold of 1024 bytes, write mode=0
    - SRC2_BW_CTRL Register (Offset = B0h) [Reset = X]
    - SRC2_CTRL Register (Offset = 84h) [Reset = X]
    - SRC2_THRESHOLD Register (Offset = ACh) [Reset = X]
    - SRC2_RANGE_START0 Register (Offset = 88h) [Reset = 00000000h]
    - SRC2_RANGE_END0 Register (Offset = 8Ch) [Reset = 00000000h]
    - SRC2_CHANNEL Register (Offset = B4h) [Reset = 00000000h] = 0x300 (For STM channel=3, set bits[31:8]=3)
    - Ensure guaranteed access: SRC2_CHANNEL Register (Offset = B4h) [Reset = 00000000h]
    - Enable the sniffer: TOP_MDO_INFRA.SRC2_CTRL_UN.SRC2_CTRL_ENABLE = 0x1
12. Programming STM regs; scenario: sniffer 2 , STM schannel 3, threshold of 1024 bytes, write mode=0 (SRC2_BW_CTRL Register (Offset = B0h) [Reset = X])
    - TOP_DEBUGSS.STMTCSR = 0x0 (Initializing to 0)
    - TOP_DEBUGSS.STMTCSR.EN = 0x1 (Global STM enable)
    - TOP_DEBUGSS.STMTCSR.TRACEID = 0x1 (Set trace ID to a nonzero value)
    - TOP_DEBUGSS.STMSPER.STMSPER = 0x8 (Enabling stimulus port:STM channel 3 - bit[3])
13. Assert data start:
    - AURORA_TX_DATA_START_REQ. DATA_START = 1
14. Trigger the transfer on the subsystem which the user wants to sniff.

25.2.7.2 To Stop Data Transmission with Flush of Data

1. Disable the sniffer when the user must stop sniffing:
    - SRC2_BW_CTRL Register (Offset = B0h) [Reset = X]
2. Flush MDO-Aurora modules:
    - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_PACK_MODE_SEL = 0x3
    - AURORA_TX_FLUSH_REQ.AURORA_TX_FLUSH_REQ_TRIGGER = 1
3. Poll for flush done:
    - AURORA_TX_INTAGG_STATUS_RAW.AURORA_TX_INTAGG_STATUS_RAW_INT1

25.2.7.3 To Stop Data Transmission Without Flush of Data

1. Stop Data:
    - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_PACK_MODE_SEL = 0x3
    - AURORA_TX_DATA_STOP_REQ.AURORA_TX_DATA_STOP_REQ_DATA_STOP = 1
2. Poll for Data Stop:
    - AURORA_TX_INTAGG_STATUS_RAW.AURORA_TX_INTAGG_STATUS_RAW_INT5

25.2.7.4 Aurora Programming Care-abouts

- Test patterns support a minimum transfer size of 16 bytes.
- Header-only transmission is not supported.
- Synch compression supports minimum 2 sync packets; less than this cannot be programmed in the AURORA_TX_TWP_SYNC_CNT register.
- For the header to be sent out before updating for next header, ensure the header done interrupt has occurred.

LVDS Aurora Muxing

Below table specifies all muxing modes for different functionality:

Register Details: TOP_CTRL:: MDO_CTRL_SRC:: MDO_CTRL_SRC_SELECT

4-Lane LVDS Packaging:

PAD NAME	Legacy Mode (Select = 2’b01)	Aurora Full data (Select = 2’b00)	Aurora bypass (Select = 2’b10)	Aurora (LOP) (Select = 2’b11)
LVDS_TXM1_CLKM **LVDS_TXP1_CLKP**	Bit clock from cbuff	Data[2] from aurora	Bit clk from aurora	This mode is specific for 3-Lane LVDS packaging
LVDS_TXM2_FRCLKM **LVDS_TXP2_FRCLKP**	Frame clk from cbuff	Data[3] from aurora	Frame clk from aurora	
LVDS_TXM0_ARCLKM **LVDS_TXM0_ARCLKP**	Data[0] from cbuff	Data[0] from aurora	Data[0] from aurora	
LVDS_TXM3_ARFRCLKM **LVDS_TXP3_ARFRCLKP**	Data[1] from cbuff	Data[1] from aurora	Data[1] from aurora	

3-Lane LVDS Packaging:

PAD NAME	Legacy Mode (Select = 2’b01)	Aurora Full data (Select = 2’b00)	Aurora bypass (Select = 2’b10)	Aurora (LOP) (Select = 2’b11)
LVDS_TXM1_CLKM **LVDS_TXP1_CLKP**	Bit clock from cbuff	Data[2] from aurora	Bit clk from aurora	Bit clk from aurora
LVDS_TXM2_FRCLKM **LVDS_TXP2_FRCLKP**	Frame clk from cbuff	Data[3] from aurora	Frame clk from aurora	Data[3] from aurora

LVDS_TXM0_ARCLKM **LVDS_TXM0_ARCLKP**	Data[0] from cbuff	Data[0] from aurora	Data[0] from aurora	Data[0] from aurora
LVDS_TXM3_ARFRCLKM **LVDS_TXP3_ARFRCLKP**	**Not used**	**Not used**	**Not used**	**Not used**

2-Lane LVDS Packaging

PAD NAME	**Legacy Mode (Select = 2'b01)**	**Aurora Full data (Select = 2'b00)**	**Aurora bypass (Select = 2'b10)**	**Aurora (LOP) (Select = 2'b11)**
LVDS_TXM1_CLKM **LVDS_TXP1_CLKP**	This mode cannot be supported in 2-Lane LVDS	Data[2] from aurora	Bit clk from aurora	Bit clk from aurora
LVDS_TXM2_FRCLKM **LVDS_TXP2_FRCLKP**		**Not used**	**Not used**	**Not used**
LVDS_TXM0_ARCLKM **LVDS_TXM0_ARCLKP**		Data[0] from aurora	Data[0] from aurora	Data[0] from aurora
LVDS_TXM3_ARFRCLK **LVDS_TXP3_ARFRCLKP**		**Not used**	**Not used**	**Not used**

25.3 TOP_AURORA_TX Registers

This section provides information on the TOP_AURORA_TX Module Instance within this product. Each of the registers within the Module Instance is described separately below.

25.3.1 TOP_AURORA_TX Registers Mapping Summary

Table 25-129. TOP_AURORA_TX Register Summary

Register Name	Type	Register Width (Bits)	Register Reset	Address Offset	Physical Address

25.3.2 TOP_AURORA_TX Register Descriptions

25.3.2.1 TOP_AURORA_TX:PID

Address offset: 0x0000 0000

Physical address: 0x0306 0000

Instance: TOP_AURORA_TX

Description: PID register

Type: RO

Table 25-130. TOP_AURORA_TX:PID

Bits	Field Name	Type	Reset	Description
31:16:00	PID_MSB16	RO	0x6180	
15:11	PID_MISC	RO	0x00	
10:08	PID_MAJOR	RO	0x2	
7:06	PID_CUSTOM	RO	0x0	
5:00	PID_MINOR	RO	0x13	

25.3.2.2 TOP_AURORA_TX:AURORA_TX_CONFIG

Address offset: 0x0000 0014

Physical address: 0x0306 0014

Instance: TOP_AURORA_TX

Type: RW

Table 25-131. TOP_AURORA_TX:AURORA_TX_CONFIG

Bits	Field Name	Type	Reset	Description
18:16	AURORA_TX_CONFIG_NUM_LANES	RW	0x0	Selects the number of lanes for transmission 0 : 1 Lane 1 : 2 Lanes 2 : 3 Lanes 3 : 4 Lanes
2	AURORA_TX_CONFIG_STRICT_ALIGN	RW	1	Reserved for HW RnD. Do not modify
1	AURORA_TX_CONFIG_PROTOCOL_SEL	RW	0	Selects if the IP is in 8b/10b OR 64b/66b mode. 0 : 8b/10b 1 : 64b/66b
0	AURORA_TX_CONFIG_ENABLE	RW	0	Select to Enable or Disable IP. 0 : Disable 1 : Enable

25.3.2.3 TOP_AURORA_TX:AURORA_TX_LANE_MAP

Address offset: 0x0000 0018

Physical address: 0x0306 0018

Instance: TOP_AURORA_TX

Type: RO

Table 25-132. TOP_AURORA_TX:AURORA_TX_LANE_MAP

Bits	Field Name	Type	Reset	Description
31:28:00	AURORA_TX_LANE_MAP_LANE7_MAP	RW	0x0	Reserved for HW RnD. Do not modify
27:24:00	AURORA_TX_LANE_MAP_LANE6_MAP	RW	0x0	Reserved for HW RnD. Do not modify
23:20	AURORA_TX_LANE_MAP_LANE5_MAP	RW	0x0	Reserved for HW RnD. Do not modify
19:16	AURORA_TX_LANE_MAP_LANE4_MAP	RW	0x0	Reserved for HW RnD. Do not modify

Table 25-132. TOP_AURORA_TX:AURORA_TX_LANE_MAP (continued)

Bits	Field Name	Type	Reset	Description
15:12	AURORA_TX_LANE_MAP_LANE3_MAP	RW	0x0	Bits [2:0] bits determine the logical lane that is transported over the physical lane 3. 000 : Logical lane 0 is transported over physical lane 3 001 : Logical lane 1 is transported over physical lane 3. ... 111 : Logical lane 7 is transported over physical lane 3. Bit 3 determines if the entry is valid
11:08	AURORA_TX_LANE_MAP_LANE2_MAP	RW	0x0	Bits [2:0] determine the logical lane that is transported over the physical lane 2. 000 : Logical lane 0 is transported over physical lane 2 001 : Logical lane 1 is transported over physical lane 2. ... 111 : Logical lane 7 is transported over physical lane 2. Bit 3 determines if the entry is valid
7:04	AURORA_TX_LANE_MAP_LANE1_MAP	RW	0x0	Bits [2:0] determine the logical lane that is transported over the physical lane 1. 000 : Logical lane 0 is transported over physical lane 1 001 : Logical lane 1 is transported over physical lane 1. ... 111 : Logical lane 7 is transported over physical lane 1. Bit 3 determines if the entry is valid
3:00	AURORA_TX_LANE_MAP_LANE0_MAP	RW	0x0	Bits [2:0] determine the logical lane that is transported over the physical lane 0. 000 : Logical lane 0 is transported over physical lane 0 001 : Logical lane 1 is transported over physical lane 0. ... 111 : Logical lane 7 is transported over physical lane 0. Bit 3 determines if the entry is valid

25.3.2.4 TOP_AURORA_TX:AURORA_TX_UDP_CONFIG

Address offset: 0x0000 001C

Physical address: 0x0306 001C

Instance: TOP_AURORA_TX

Type: RW

Table 25-133. TOP_AURORA_TX:AURORA_TX_UDP_CONFIG

Bits	Field Name	Type	Reset	Description
20:16	AURORA_TX_UDP_CONFIG_FRAME_HEADER_EN	RW	0x00	Header Enable configuration 0x0 : Disable Header transmission 0x1 - 0x10 : Number of 32 bit Header to be transmitted
8	AURORA_TX_UDP_CONFIG_BYPASS_EN	RW	0	Writing a value of 1'b1 : Bypass the aurora protocol. - No aurora framing is done 1'b0 : Normal Mode - Framing is done as per aurora protocol
7	AURORA_TX_UDP_CONFIG_TEST_PATTERN_EN	RW	0	Writing a value of 1'b1: Enable the test pattern generation when the aurora transmitter is in IDLE state.

Table 25-133. TOP_AURORA_TX:AURORA_TX_UDP_CONFIG (continued)

Bits	Field Name	Type	Reset	Description
6	AURORA_TX_UDP_CONFIG_TWP_SYNC_COMPRESSION_EN	RW	0	Writing a value of 1'b1 : Enables the compression of incoming synchronisation packets. This allows only a configurable number of TWP synchronization packets define by AURORA_TX_TWP_SYNC_CNT::AURORA_TX_TWP_SYNC_CNT_SYNC_CNT to be send through aurora interface. 1'b0 : Disable the TWP padding packet filter.
5	AURORA_TX_UDP_CONFIG_CRC_EN	RW	0	Writing a value of 1'b1 : Enable the UDP CRC calculation 1'b0 : Disable UDP CRC calculation
4	AURORA_TX_UDP_CONFIG_TWP_IDLE_FILTER_EN	RW	0	Writing a value of 1'b1 : Filters out the incoming TWP Padding Packet from being send via aurora interface. 1'b0 : Disable the TWP padding packet filter.
1:00	AURORA_TX_UDP_CONFIG_PACK_MODE_SEL	RW	0x0	Configure to select AURORATX_UDP_SIZE format 0: Number of TWP Packets 1 : Number of Bytes 3: SW only

25.3.2.5 TOP_AURORA_TX:AURORA_TX_UDP_SIZE

Address offset: 0x0000 0020

Physical address: 0x0306 0020

Instance: TOP_AURORA_TX

Type: RW

Table 25-134. TOP_AURORA_TX:AURORA_TX_UDP_SIZE

Bits	Field Name	Type	Reset	Description
31:00:00	AURORA_TX_UDP_SIZE_SIZE	RW	0x0000 0000	Configure the number of TWP packets or data bytes to be sent as one packet based on AURORATX_CTRL::PACK_MODE. If PACK_MODE=1 Value configure should be multiple of 4 Bytes.

25.3.2.6 TOP_AURORA_TX:AURORA_TX_UDP_FRAME_HEADER0

Address offset: 0x0000 0024

Physical address: 0x0306 0024

Instance: TOP_AURORA_TX

Bits	Field Name	Type	Reset	Description
16	AURORA_TX_EOP_DELAY_ENABLE	RW	0	Write 0x1 to this fiel to enable the delay configured in AURORA_TX_EOP_DEALY::DELAY
15:00	AURORA_TX_EOP_DELAY_DELAY	RW	0x0000	Internal Delay between the Data Framer and the Controller Block to stall data to the controller and force IDLES to be inserted by the controller after an ECP of a UDP. This is a feature added for Debug Purposes only and has not been tested

25.3.2.63 TOP_AURORA_TX:AURORA_TX_FLUSH_DELAY

Address offset: 0x0000 0178

Physical address: 0x0306 0178

Instance: TOP_AURORA_TX

Type: RW

Table 25-192. TOP_AURORA_TX:AURORA_TX_FLUSH_DELAY

Bits	Field Name	Type	Reset	Description
7:00	AURORA_TX_FLUSH_DELAY_DELAY	RW	0x10	Write 0x1 to this field to enable the delay configured in AURORA_TX_EOP_DEALY::DELAY

25.3.2.64 TOP_AURORA_TX:AURORA_TX_STATUS

Address offset: 0x0000 0200

Physical address: 0x0306 0200

Instance: TOP_AURORA_TX

Type: RO

Table 25-193. TOP_AURORA_TX:AURORA_TX_STATUS

Bits	Field Name	Type	Reset	Description
31:16:00	AURORA_TX_STATUS_DATAFRAMER	RO	0x0000	Dataframer Status fields Bit 16 : Write on Full FIFO Bit 17 : Read on Empty FIFO Bits [20:18] : Run State 000 : OFF 001 : INIT DONE 010 : TEST MODE 011 : DATA MODE 100 : WAITING FOR GLOBAL FLUSH DONE 101 : FLUSH IN PROGRESS Bits [26:21] : Data Available in Internal FIFO
3:00	AURORA_TX_STATUS_TX_STATE	RO	0x0	These read only bits indicate the state of the transmitter in 8B/10B and 64B/66B. 0000 : Reset, no transmission. 0001 : Initialization 0010 : Clock Compensation 0011 : Idle 0100 : UFC 0101 : Run (data) 0110 : Test (data) 0111 : Reserved 1111 : Reserved The user must note that these bits reflect the controller state and that the actual octets on the PHY lines may differ due to internal data path latencies.

25.3.2.65 TOP_AURORA_TX:AURORA_TX_INIT_STATUS

Address offset: 0x0000 0204

Physical address: 0x0306 0204

Instance: TOP_AURORA_TX

Type: RO

Table 25-194. TOP_AURORA_TX:AURORA_TX_INIT_STATUS

Bits	Field Name	Type	Reset	Description
4	AURORA_TX_INIT_STATUS_TX_CH_RDY	RO	0	The status bit that indicates that the channel ready state has been reached. This bit is reset with the device reset and when the TX_RESET bit is set.
3	AURORA_TX_INIT_STATUS_TX_TXCB0	RO	0	The status bit that indicates that the TX_ TXCB0 state has been completed. This bit is reset with the device reset and when the TX_RESET bit is set.
2	AURORA_TX_INIT_STATUS_TX_INIT0	RO	0	The status bit that indicates that the TX_INIT0 state has been completed. This bit is reset with the device reset and when the TX_RESET bit is set.
1	AURORA_TX_INIT_STATUS_TX_RESET1	RO	0	The status bit that indicates that the TX_RESET1 state has been completed. This bit is reset with the device reset and when the TX_RESET bit is set.
0	AURORA_TX_INIT_STATUS_TX_RESET0	RO	0	The status bit that indicates that the TX_RESET0 state has been completed. This bit is reset with the device reset and when the TX_RESET bit is set.

25.3.2.66 TOP_AURORA_TX:AURORA_TX_CC_STATUS

Address offset: 0x0000 0208

Physical address: 0x0306 0208

Instance: TOP_AURORA_TX

Type: RW

Table 25-195. TOP_AURORA_TX:AURORA_TX_CC_STATUS

Bits	Field Name	Type	Reset	Description
0	AURORA_TX_CC_STATUS_CC_COMP	RW	0	This bit reflects the state of the CC FSM. Read 0 : CC sequence is not complete. Read 1 : CC sequence is complete. Write 0 : No effect. Write 1 : Clears the bit. Setting the SEND_CC bit also clears this bit.

25.3.2.67 TOP_AURORA_TX:AURORA_TX_IDLE_STATUS

Address offset: 0x0000 020C

Physical address: 0x0306 020C

Instance: TOP_AURORA_TX

Type: RW

8	AURORA_TX_INTAGG_STATUS_INT8	RW	0	Reserved for HW RnD. Do not modify
7	AURORA_TX_INTAGG_STATUS_INT7	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_HEADER_DONE.
6	AURORA_TX_INTAGG_STATUS_INT6	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_EOP_DONE.

Table 25-198. TOP_AURORA_TX:AURORA_TX_INTAGG_STATUS (continued)

Bits	Field Name	Type	Reset	Description
5	AURORA_TX_INTAGG_STATUS_INT5	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of DATA_STOP_DONE.
4	AURORA_TX_INTAGG_STATUS_INT4	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_CC_DONE
3	AURORA_TX_INTAGG_STATUS_INT3	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_UFC_SENT.
2	AURORA_TX_INTAGG_STATUS_INT2	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_EXT_FLUSH_DONE
1	AURORA_TX_INTAGG_STATUS_INT1	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_FLUSH_DONE
0	AURORA_TX_INTAGG_STATUS_INT0	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_INIT_DONE

25.3.2.70 TOP_AURORA_TX:AURORA_TX_INTAGG_STATUS_RAW

Address offset: 0x0000 0218

Physical address: 0x0306 0218

Instance: TOP_AURORA_TX

Type: RW

Table 25-199. TOP_AURORA_TX:AURORA_TX_INTAGG_STATUS_RAW

Bits	Field Name	Type	Reset	Description
15	AURORA_TX_INTAGG_STATUS_RAW_INT15	RW	0	Reserved for HW RnD. Do not modify
14	AURORA_TX_INTAGG_STATUS_RAW_INT14	RW	0	Reserved for HW RnD. Do not modify
13	AURORA_TX_INTAGG_STATUS_RAW_INT13	RW	0	Reserved for HW RnD. Do not modify
12	AURORA_TX_INTAGG_STATUS_RAW_INT12	RW	0	Reserved for HW RnD. Do not modify
11	AURORA_TX_INTAGG_STATUS_RAW_INT11	RW	0	Reserved for HW RnD. Do not modify
10	AURORA_TX_INTAGG_STATUS_RAW_INT10	RW	0	Reserved for HW RnD. Do not modify
9	AURORA_TX_INTAGG_STATUS_RAW_INT9	RW	0	Reserved for HW RnD. Do not modify
8	AURORA_TX_INTAGG_STATUS_RAW_INT8	RW	0	Reserved for HW RnD. Do not modify
7	AURORA_TX_INTAGG_STATUS_RAW_INT7	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_HEADER_DONE- Indicates completion of Frame Header transmission.

Table 25-199. TOP_AURORA_TX:AURORA_TX_INTAGG_STATUS_RAW (continued)

Bits	Field Name	Type	Reset	Description
6	AURORA_TX_INTAGG_STATUS_RAW_INT6	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_EOP_DONE-Indicates completion of UDP packets.
5	AURORA_TX_INTAGG_STATUS_RAW_INT5	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of DATA_STOP_DONE.
4	AURORA_TX_INTAGG_STATUS_RAW_INT4	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_CC_DONE-Indicate completion of Clock compensation sequence transmission.
3	AURORA_TX_INTAGG_STATUS_RAW_INT3	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_UFC_SENT-Indicates that a UFC packet has been generated as sent.
2	AURORA_TX_INTAGG_STATUS_RAW_INT2	RW	1	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_EXT_FLUSH_DONE-Indicates that the MDO infrastructure has completed flushing is components
1	AURORA_TX_INTAGG_STATUS_RAW_INT1	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_FLUSH_DONE -Indicates that the Aurora IP has completed flush operation on its Data FIFO
0	AURORA_TX_INTAGG_STATUS_RAW_INT0	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_INIT_DONE - Indicates completion of Aurora Initilization sequence

Chapter 26
Mailbox

The device provides a mailbox mechanism to asynchronously exchange the messages between any two processors.

Each processor has a mailbox memory space, and registers designated to be used by other processor that wishes to communicate.

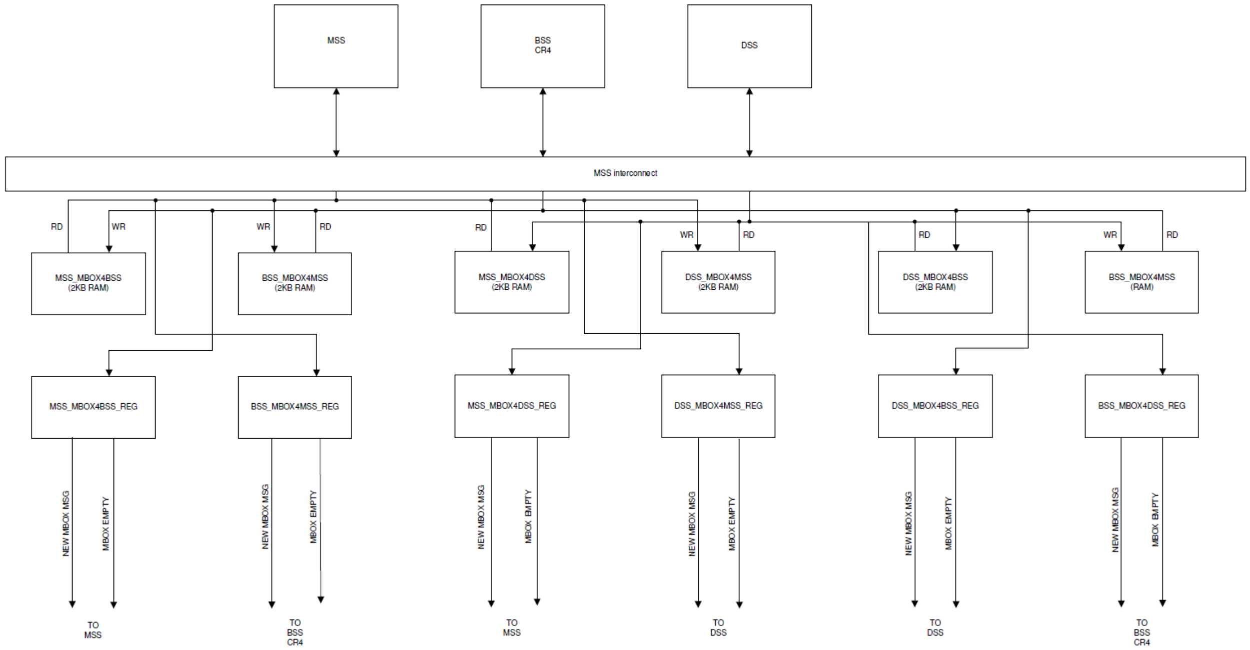

Figure 26-1. Mailbox Block Diagram

Table 26-1. Mailbox Allocation for different Sub-System

Sub-System Name	**Size**	**Start Address (Same across sub-systems)**	Mailbox Memory Breakup (*_OFFSET depends on driver implementation)
MSS CR5-A	8 kB	0xC5000000	RSS_TO_CR5A_MBX: 0xC5000000, DSS_TO_CR5A_MBX: 0xC5000000 + CR5A_MBX_DSS_OFFSET,
RSS CR4	8 kB	0xA4030000	CR5A_TO_RSS_MBX: 0xA4030000, DSS_TO_RSS_MBX: 0xA4030000 + RSS_MBX_DSS_OFFSET,

Table 26-1. Mailbox Allocation for different Sub-System (continued)

DSS DSP	4 kB	0x83100000	RSS_TO_DSS_MBX: 0x83100000, CR5A_TO_DSS_MBX: 0x83100000 + DSS_MBX_CR5A_OFFSET,

Table 26-2. Mailbox Allocation for different Sub-System for AWR2944LC

Sub-System Name	**Size**	**Start Address (Same across sub-systems)**	Mailbox Memory Breakup (*_OFFSET depends on driver implementation)
MSS CR5-A	8 kB	0xC5000000	RSS_TO_CR5A_MBX: 0xC5000000, CM4_TO_CR5A_MBX: 0xC5000000 + CR5A_MBX_CM4_OFFSET
RSS CR4	8 kB	0xA4030000	CR5A_TO_RSS_MBX: 0xA4030000, CM4_TO_RSS_MBX: 0xA4030000 + RSS_MBX_CM4_OFFSET
HWA CM4	4 kB	0x48000000	RSS_TO_CM4_MBX: 0x48000000, CR5A_TO_CM4_MBX: 0x48000000 + CM4_MBX_CR5A_OFFSET

Note

There is an MPU at every Mailbox that can be used to partition the mailbox memory between the Controllers/cores. This gives some flexibility over a fixed allocation scheme.

26.1 Maibox Message Scheme

The mailbox architecture is a distributed architecture with the Mailbox memory present in the Receiving processors Subsystem. The following is the processor numbering for AWR294x

Table 26-3. Mailbox Processor ID

Processor	ID
MSS_CR5A	0
HSM_CM4	2
RSS_CR4	3
DSS_DSP	4
HWA_CM4	5

Note

HWA_CM4 is applicable only for AWR2944LC and not AWR294x devices. DSS_DSP is not applicable for AWR2944LC.

The processor which wishes to send a message to another processor writes the message to the mailbox memory space, then interrupts the receiver processor. The receiver processor acknowledges the interrupt, then reads the message from the mailbox memory space. The receiver informs the sender that the message is read by an interrupt, which is acknowledged back by the sender. The sender must not initiate another message to the same receiver until the previously initiated mailbox interaction with the same receiver is complete.

1. SENDER writes the message in the RECEIVER mailbox.
2. SENDER triggers an interrupt to RECEIVER by writing 1 to <SENDER_SS>_CTRL: <SENDER>_MBOX_WRITE_DONE [RECEIVER]. Note: It is writing to its own CTRL space.
3. SENDER polls <RECEIVER_SS>_CTRL: <RECEIVER>_MBOX_READ_REQ[SENDER] and keeps writing 1'b1 to <SENDER_SS>_CTRL: <SENDER>_MBOX_WRITE_DONE [RECEIVER] until the read value is 1'b1.
4. RECEIVER gets a single interrupt for all interprocessor communication, which is an aggregated interrupt. RECEIVER reads the register <RECEIVER_SS>_CTRL::<RECEIVER>_MBOX_READ_REQ and sees bit [SENDER] is 0x1.
5. RECEIVER waits for some 60-70 clock cycles before going to next step.
6. RECEIVER writes to 0x1 to <RECEIVER_SS>>_CTRL::<RECEIVER>_MBOX_READ_REQ [SENDER] to clear the interrupt.
7. RECEIVER reads the message.
8. RECEIVER writes to 0x1 to <RECEIVER_SS>>_CTRL::<RECEIVER>_MBOX_READ_DONE_ACK[SENDER] to generate an acknowledgment interrupt to SENDER. SENDER gets a single interrupt for all interprocessor communication, which is an aggregated ACK interrupt.
9. RECEIVER polls the <SENDER_SS>_CTRL: <SENDER>_MBOX_READ_DONE and keeps writing 1'b1 to <RECEIVER_SS>_CTRL: <RECEIVER>_MBOX_READ_DONE_ACK [SENDER] until the read value is 1'b1.
10. SENDER reads the register <SENDER_SS>_CTRL:<SENDER>_MBOX_READ_DONE and sees bit [RECEIVER] is 0x1.
11. SENDER waits for some 60-70 clock cycles before going to next step.
12. SENDER writes 0x1 to <SENDER_SS>_CTRL:<SENDER>_MBOX_READ_DONE [RECEIVER] to clear the interrupt.

Mailbox message example (message from MSS CR5 C0 to RSS):

1. MSS CR5_C0 writes the message in the RSS mailbox.
2. MSS triggers an interrupt to RSS by writing 1 to MSS_CTRL: MSS_CR5A_MBOX_WRITE_DONE [3]. Note: It is writing to its own CTRL space.

3. MSS CR5_C0 polls the RSS_PROC_CTRL:RSS_MBOX_READ_REQ[0] and keeps writing 1 to MSS_CTRL: MSS_CR5A_MBOX_WRITE_DONE [3] until the read value is 1.
4. RSS gets a single interrupt for all interprocessor communication, which is an aggregated interrupt. RSS reads the register RSS_PROC_CTRL::RSS_MBOX_READ_REQ and sees bit [0] is 0x1.
5. RSS waits for some 60-70 clock cycles.
6. RSS writes to 0x1 to RSS_PROC_CTRL::RSS_MBOX_READ_REQ [0] to clear the interrupt.
7. RSS reads the message.
8. RSS writes to 0x1 to RSS_PROC_CTRL::RSS_MBOX_READ_DONE_ACK [0] to generate an acknowledgment interrupt to MSS CR5 C0.
9. RSS polls the MSS_CTRL:: MSS_CR5A_MBOX_READ_DONE[3] and keeps writing 1 to RSS_PROC_CTRL::RSS_MBOX_READ_DONE_ACK [0] until the read value is 1.
10. MSS CR5 C0 gets a single interrupt for all interprocessor communication, which is an aggregated ACK interrupt. MSS CR5 C0 reads the register MSS_CTRL:: MSS_CR5A_MBOX_READ_DONE and sees bit [3] is 0x1.
11. MSS CR5 C0 waits for some 60-70 clock cycles.
12. MSS CR5 C0 writes 0x1 to MSS_CTRL:: MSS_CR5A_MBOX_READ_DONE [3] to clear the interrupt.

Every processor is always writing to its own control space.

Each processor has only 2 interrupts (aggregated): <PROC>MBOX_READ_REQ and <PROC>MBOX_READ_ACK to its interrupt controller.

Scheme ensures the number of mailbox interrupts to a processor is always only 2, regardless of the number of procs in the SoC.

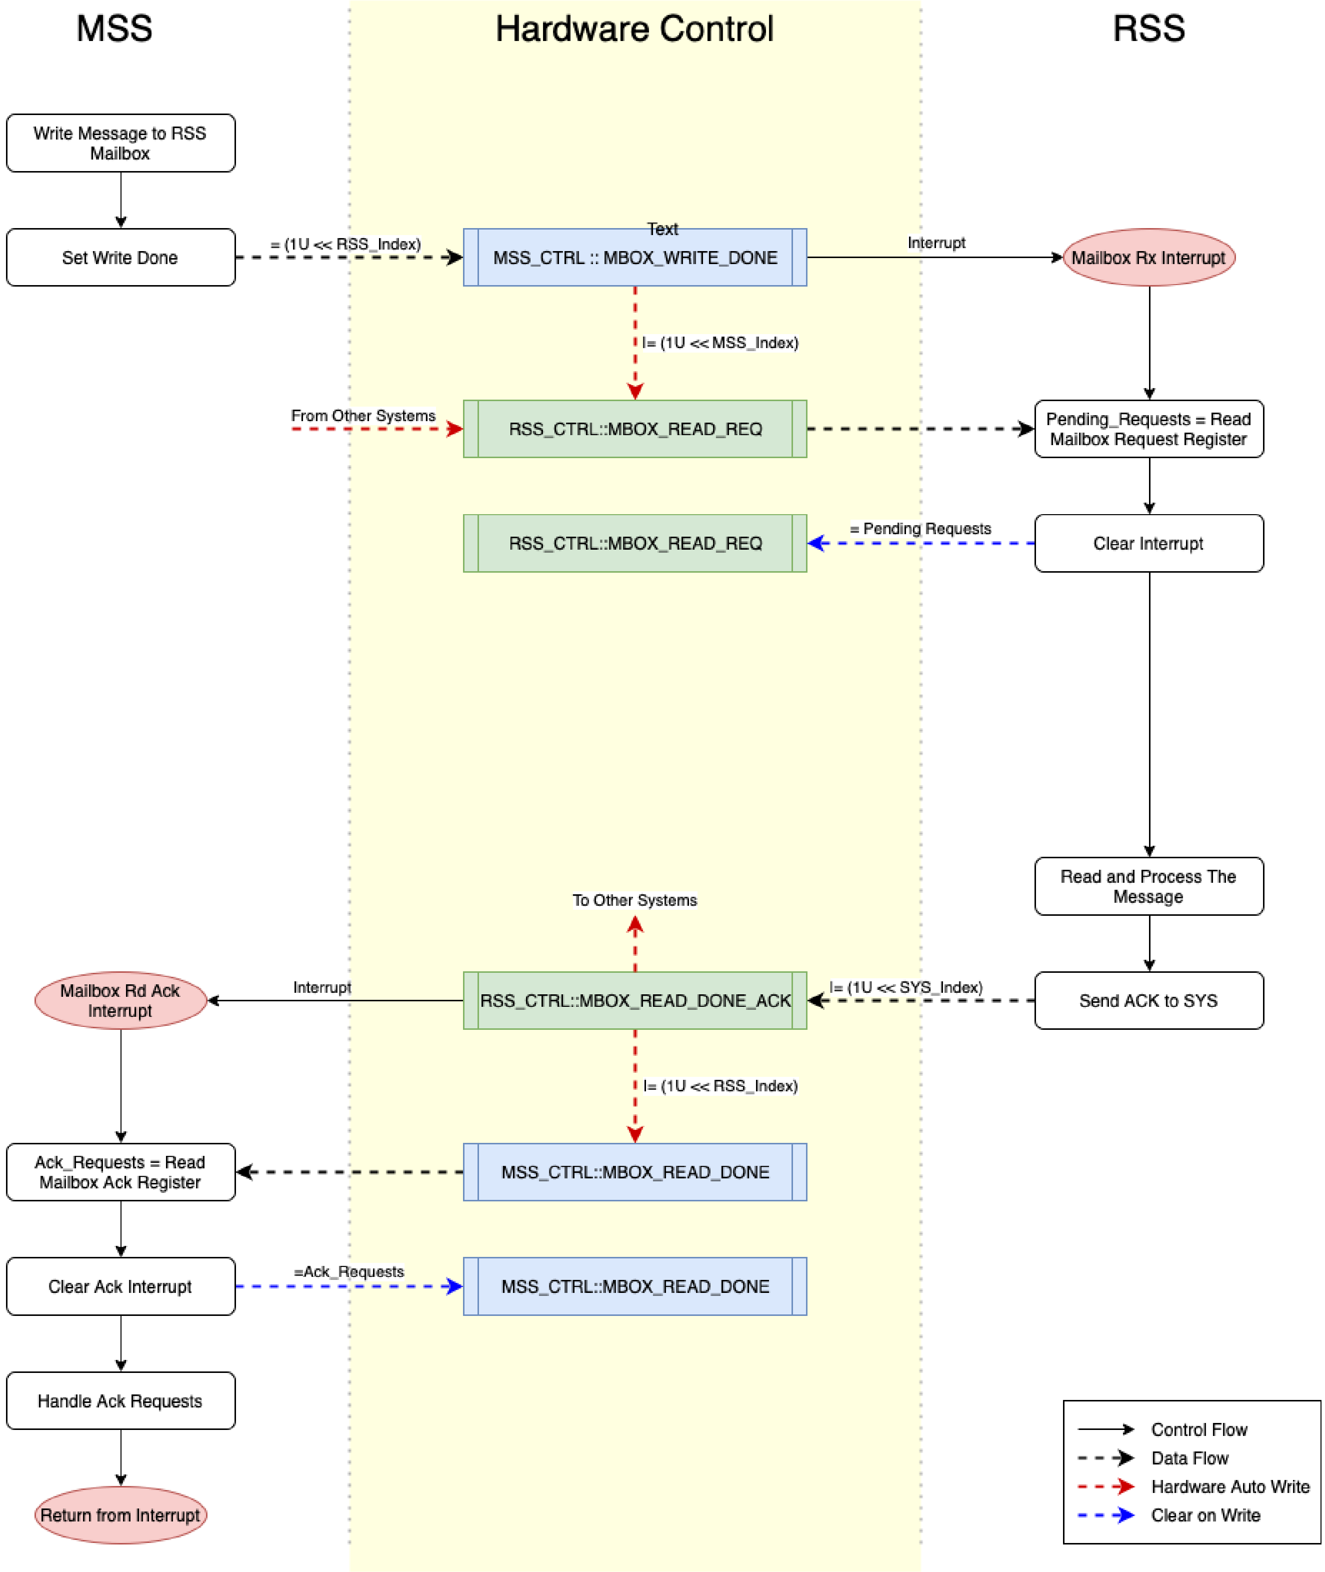

Figure 26-2. Mailbox Message Scheme between Cores

Refer to Section 5.2.7 for registers details related to mailbox. For mailbox interrupt to cores, refer Section 7.1 and Section 7.2.

Chapter 27

Data Modification Module (DMM)

A Data Modification Module (DMM) gives the ability to write external data into the device memory.

This chapter describes the functionality of the Data Modification Module (DMM), which provides the capability to modify data in the entire 4 GB address space of the device from an external peripheral, with minimal interruption of the application. A DMM gives the ability to write external data into the device memory. For HIL (playback), DMM can be used in I/O Mode and CSI mode (trace only mode).

27.1 Overview

27.1.1 Features

The DMM module has the following features:

- Acts as a bus master, thus enabling direct writes to the 4GB address space without CPU intervention
- Writes to memory locations specified in the received packet (leverages packets defined by trace mode of the RAM trace port (RTP) module
- Writes received data to consecutive addresses, which are specified by the DMM module (leverages packets defined by direct data mode of RTP module)
- Configurable port width (1, 2, 4, 8, 16 pins)
- Up to 65 Mbit/s pin data rate
- Unused pins configurable as GIO pins

27.1.2 Block Diagram

Figure 27-1 shows the block diagram for the DMM.

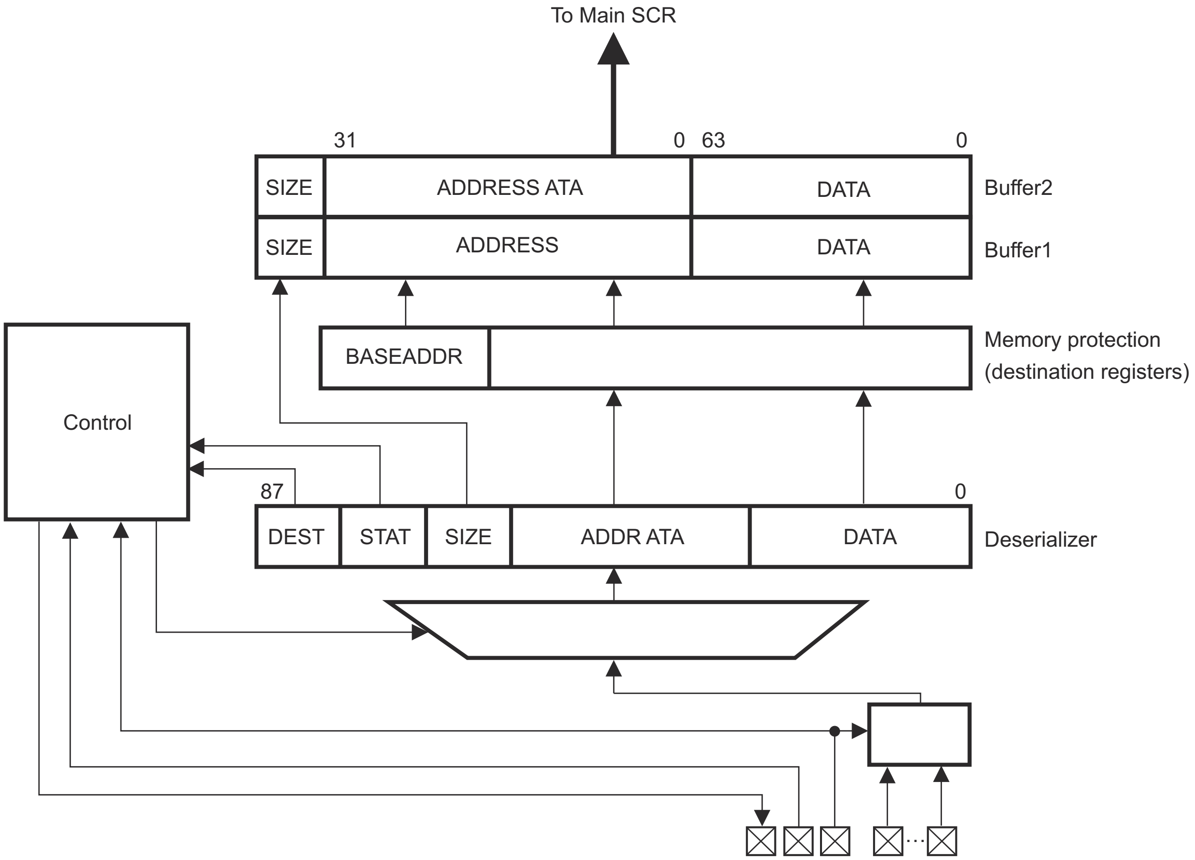

Figure 27-1. DMM Block Diagram

27.2 Module Operation

The DMM receives data over the DMM pins from external systems and writes the received data directly to the base address programmed in the module plus offset address given in the packet or into a buffer specified by start address and length. It leverages the protocol defined by the RAM Trace Port (RTP) module to have a common interface definition for external systems. It can also be used to connect an RTP and DMM module together for fast processor intercommunication.

The DMM module provides two modes of operation:

- **Trace Mode:** In this mode, the DMM writes the received data directly to an address that is calculated from the base address programmed into the destination register (DEST0REG1 Register (Offset = 2Ch) [Reset = 00000000h] ; DEST0REG2 Register (Offset = 34h) [Reset = 00000000h]) plus the offset address contained in the received packet. An interrupt can be generated when data is written the lowest address of a programmed region. This capability enables the sender to raise an interrupt at the receiver while sending specific information.
- **Direct Data Mode:** In this mode, the DMM writes the received data into an address range of the 4GB address space. The buffer start address (DDMDEST Register (Offset = 1Ch) [Reset = 00000000h]) and blocksize (DDMBL Register (Offset = 20h) [Reset = 00000000h]) is programmable in the DMM module. When the buffer reaches its end address, the buffer pointer wraps around and points to the beginning of the buffer again. The EO_BUFF flag (INTFLAG Register (Offset = 10h) [Reset = 00000000h]) will be set and if enabled, an interrupt will be generated to indicate a buffer-full condition. Another interrupt, can be configured to indicate different buffer fill levels. This can be accomplished by programming a certain fill level into the DMMINTPT register (INTPT Register (Offset = 28h) [Reset = 00000000h]). The PROG_BUFF flag (INTFLAG Register (Offset = 10h) [Reset = 00000000h]) indicates that this level has been reached.

Data will be captured by the input buffer and moved to the appropriate bit field in the deseralizer. When the deseralizer is completely full, the data will be moved to the output buffer register. A two-level buffer is implemented to avoid overflow conditions if the internal bus is occupied by other transactions. In addition the $\overline{\text{DMMENA}}$ signal can be used to signal the external hardware that an overflow might occur if more data is sent. The automatic generation of the $\overline{\text{DMMENA}}$ signal can be configured by setting the ENAFUNC bit (DMMPC0 Register (Offset = 6Ch) [Reset = 00000000h]). While the $\overline{\text{DMMENA}}$ signal is active, the DMM module will not receive any new data.

The DMM is a bus master and forwards the received data to the bus system. The write operation will be minimally intrusive to the program flow, because the CPU/DMA access will only be blocked if the CPU/DMA accesses the same resource as the DMM.

To prevent an external system from overwriting critical data in the memory while configured in Trace Mode, a memory protection mechanism is implemented via a programmable start address and block size of a region. A maximum of four destinations with two regions each are supported.

For proper operation, at least DMMCLK, DMMSYNC and DMMDATA[0] need to be programmed in functional mode (DMMPC0 Register (Offset = 6Ch) [Reset = 00000000h]). If a large amount of data should be transmitted in a short time, more data pins should be used in functional mode. The module supports 1, 2, 4, 8, or 16-pin configurations.

The module can be configured to handle a free running clock provided on DMMCLK (GLBCTRL Register (Offset = 0h) [Reset = 00000005h]). Clock pulses between two DMMSYNC pulses that exceed the number of valid clock pulses for a packet will be ignored.

27.2.1 Data Format

Below is a description of the packet and frame format.

27.2.1.1 Clocking Scheme

The DMM supports both continuous and noncontinuous clocking. The clock received on DMMCLK in the continuous clocking scheme is a free-running clock. In noncontinuous clocking scheme, the clock will stop after each packet and will start with the reception of a DMMSYNC signal.

27.2.1.2 Trace Mode Packet

Figure 27-2 illustrates the trace mode packet format. One packet consists of 2 bits (DEST) denoting the destination in which the data is stored, 2 status bits (STAT), the 2-bit SIZE of the data, the 18-bit address of where the data should be written to, and a variable data field.

The DEST bits (Table 27-1) will be used to determine which destination register applies to the transmitted data and the received address determines if the packet falls into a valid region of the destination area. If the address is valid, the base address, programmed in one of the destination registers (DEST1REG1 Register (Offset = 3Ch) [Reset = 00000000h] ; DEST1REG2 Register (Offset = 44h) [Reset = 00000000h]) of this particular region will be applied to create the complete 32-bit address for the destination. The DMM module only takes action on a "11" setting of the STAT bits (Table 27-2). This signals that an overflow in the transmitting hardware module has occurred. If this is the case the SRC_OVF flag (INTFLAG Register (Offset = 10h) [Reset = 00000000h]) will be set and the received data will be written to the address specified in the packet. The size information of the data transmitted in the packet is denoted in the SIZE bits (Table 27-3) of the packet. Depending on the SIZE information, the module expects to receive only this amount of data.

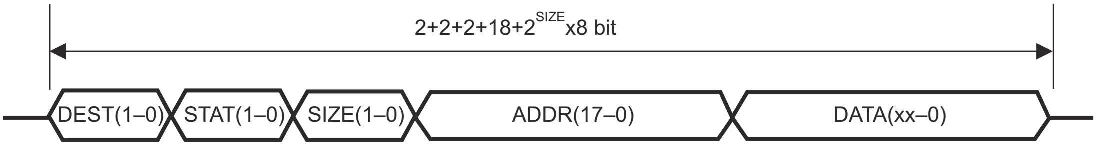

Figure 27-2. Trace Mode Packet Format

Table 27-1 through Table 27-3 illustrate the encoding of packet format in trace mode.

Table 27-1. Encoding of Destination Bits in Trace Mode Packet Format

DEST[1:0]	Destination
00	Dest 0
01	Dest 1
10	Dest 2
11	Dest 3

Table 27-2. Encoding of Status Bits in Trace Mode Packet Format

STAT[1:0]	Status
00	don't care
01	don't care
10	don't care
11	overflow

Table 27-3. Encoding of Write Size in Packet Format

SIZE[1:0]	Write Size
00	8 bit
01	16 bit
10	32 bit
11	64 bit

27.2.1.3 Direct Data Mode Packet

Figure 27-3 illustrates the direct data mode packet format.

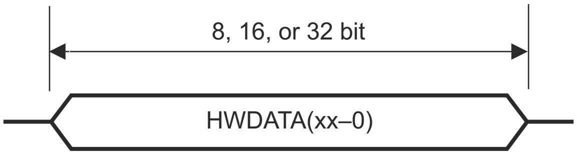

Figure 27-3. Direct Data Mode Packet Format

The packet consists only of data bits and no header information. It can be 8-, 16- or 32-bit wide. A variable packet width is not supported because the DMM module will check the number of incoming bits (DMMCLK cycles) for error detection. The DMM will write the received data to the destination once the programmed number of bits has been received.

If the programmed word width does not correspond to the received data, the following actions will be taken:

- If the received data is greater than the programmed width, only the configured number of bits are transferred into the RAM buffer, the additional bits are discarded.
- If the received number of bits is smaller than the programmed width, no data will be written to the buffer, because a new DMMSYNC signal has been received before the expected number of bits.

27.2.2 Data Port

The packet will be received in several subpackets, depending on the width of the external data bus (DMMDATA[y:0]) and the amount of data to be transmitted. Table 27-4 illustrates the number of clock cycles required for a complete packet.

Table 27-4. Number of Clock Cycles per Packet

Port Width/ Pins	Write Size in Bits			
	8	16	32	64
1	32	40	56	88
2	16	20	28	44
4	8	10	14	22
8	4	5	7	11
16	2	3	4	6

The user can program the port width in the DMMPC0 register (DMMPC0 Register (Offset = 6Ch) [Reset = 00000000h]). This feature allows pins that are not used for DMM functionality to be used as GIO pins. Only the pins shown in Table 27-5 can be used for a desired port width.

Table 27-5. Pins Used for Data Communication

Port Width	Pins Used
1	DMMDATA[0]
2	DMMDATA[1:0]
4	DMMDATA[3:0]
8	DMMDATA[7:0]
16	DMMDATA[15:0]

Note

If pins other than the ones specified in Table 27-5 are programmed as functional pins for a desired port width, the received data will be corrupted and will not be transferred to the deserializer.

Note

If DMMCLK or DMMSYNC are programmed as nonfunctional pins, functional operation will not occur.

27.2.2.1 Signal Description

DMMSYNC	This signal has to be provided by external hardware. It signals the start of a new packet. It has to be active (high) for one full DMMCLK cycle, starting with the rising edge of DMMCLK. If the DMMSYNC pulse is longer than a single DMMCLK cycle and two falling edges of DMMCLK see a high pulse on DMMSYNC, the module will treat the second DMMSYNC pulse as the start of a packet and will flag a PACKET_ERR_INT (INTFLAG Register (Offset = 10h) [Reset = 00000000h]).
DMMCLK	The clock is externally generated and can be suspended between two packets. For this feature, CONTCLK must be set to 0 (GLBCTRL Register (Offset = 0h) [Reset = 00000005h]). If the clock is not stopped between two packets, CONTCLK must be set to 1. Data will be latched on the falling edge of the DMMCLK signal.
$\overline{\text{DMMENA}}$	This signal is pulled high if no new data should be received via the data pins, because of a potential overflow situation.
DMMDATA[15:0]	These pins receive the packet information transmitted by the external hardware. Data is latched on the falling edge of DMMCLK.

Figure 27-4 shows an example of multiple packets received during trace mode, in noncontinuous clock configuration.

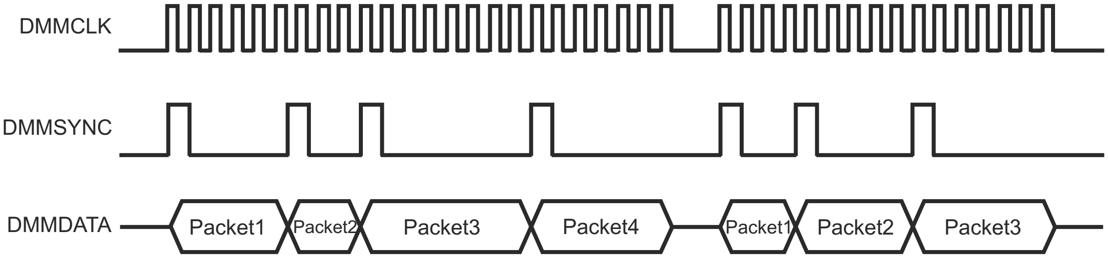

Figure 27-4. Packet Sync Signal Example

Figure 27-5 shows an example of a 4-bit data port with 8-bit receive data (A5h) to be written into DEST1 (address 0001 2345h) on a trace mode packet.

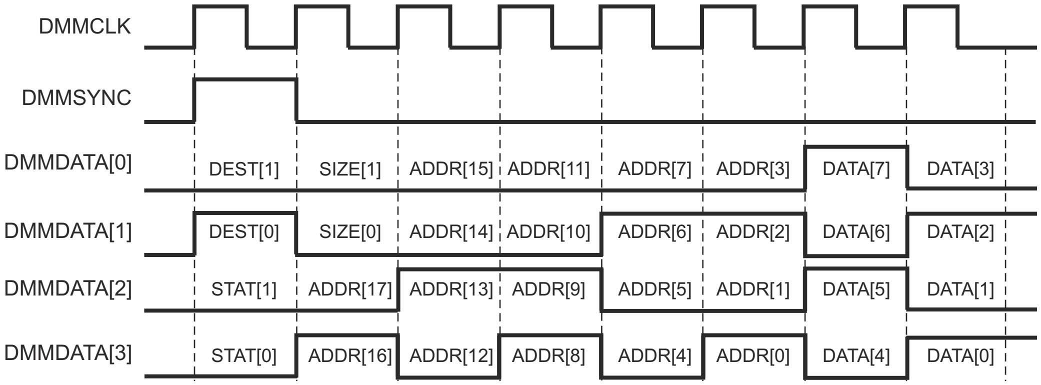

Figure 27-5. Example Single Packet Transmission

27.2.3 Error Handling

The module will generate two different kind of errors. Once an error condition is recognized, an interrupt will be generated if enabled.

27.2.3.1 Overflow Error

This error is signaled when the module has received new data before the previous data was written to the destination address. If the internal buffers are full, the $\overline{\text{DMMENA}}$ signal will go high. If the sending module does not evaluate the $\overline{\text{DMMENA}}$ signal and keeps on sending new frames, the data that was previously received might be overwritten, thus resulting in setting the BUFF_OVF flag (INTFLAG Register (Offset = 10h) [Reset = 00000000h]).

27.2.3.2 Packet Error

Noncontinuous Clock Mode

The size of the incoming packet is defined by the SIZE information of a trace mode packet or the programmed size of a direct data mode packet. If too many or less than the number of bits are received before the next sync signal, the PACKET_ERR_INT flag will be set (INTFLAG Register (Offset = 10h) [Reset = 00000000h]). In case of receiving a DMMCLK signal without a corresponding DMMSYNC signal, a packet error will also be generated.

Continuous Clock Mode

If less than the expected number of bits are received, the PACKET_ERR_INT flag will be set (INTFLAG Register (Offset = 10h) [Reset = 00000000h]) when the next DMMSYNC signal is received. Packets with more than the expected number of bits cannot be detected.

The check for packet error is done only after the detection of the first DMMSYNC signal after the DMM is turned on or comes out of suspend mode (with COS = 0; GLBCTRL Register Field Descriptions), that is, before the reception of first DMMSYNC, the toggling of DMMCLK would be ignored.

27.2.3.3 Bus Error

If an error occurs on the microcontroller internal bus system while transferring the data from the DMM to the destination, the BUSERROR flag will be set.

27.2.4 Interrupts

The module provides different interrupts. These can be programmed to different interrupt levels independently using DMMINTLVL (INTLVL Register (Offset = Ch) [Reset = 00000000h]).

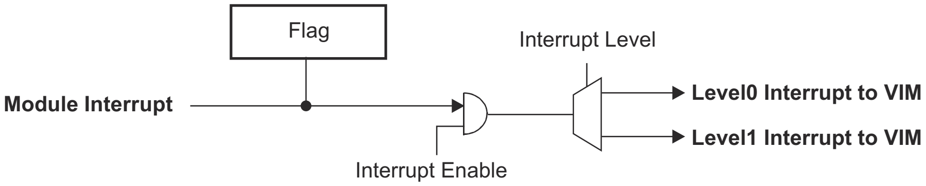

Figure 27-6. Interrupt Structure

Interrupts can be divided into error interrupts and functional interrupts. The error handling is described in Section 27.2.3. Functional interrupts depend on the mode (Trace Mode, Direct Data Mode) the DMM module is used in.

Trace Mode: An interrupt can be enabled whenever an access to the lowest address of a defined region is performed. This address is the starting address programmed in the DMMDESTxREGy register. An interrupt for each of the region can be generated by setting the individual interrupt enable bits.

Direct Data Mode: There are two interrupts that can be individually controlled. One is generated when the buffer pointer reaches the end of the defined buffer and wraps around (EO_BUFF; INTSET Register (Offset = 4h) [Reset = 00000000h]). The other one is generated when the buffer pointer matches the programmed interrupt threshold (PROG_BUFF; INTSET Register (Offset = 4h) [Reset = 00000000h]). The buffer pointer points to the next address to be written, therefor there are (interrupt threshold - 1) values stored in the buffer. The interrupt threshold can be programmed in the DMMINTPT register (INTPT Register (Offset = 28h) [Reset = 00000000h]).

27.3 MSS_DMM Registers

Table 27-6 lists the memory-mapped registers for the MSS_DMM registers. All register offset addresses not listed in Table 27-6 should be considered as reserved locations and the register contents should not be modified.

Table 27-6. MSS_DMM Registers

Offset	Acronym	Register Name	Section
0h	GLBCTRL	DMM Global Control Register	Go

Complex bit access types are encoded to fit into small table cells. Table 27-7 shows the codes that are used for access types in this section.

Table 27-7. MSS_DMM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-*n*		Value after reset or the default value

27.3.1 GLBCTRL Register (Offset = 0h) [Reset = 00000005h]

GLBCTRL is shown in Table 27-8.

Return to the Summary Table.

Sets the global configuration of the module

Table 27-8. GLBCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R	0h	Reserved
24	BUSY	R/W	0h	BUSY User and privilege mode (read): 0 = the DMM does not currently receive data and has no data in its internal buffers, which need to be transfered. 1 = the module is currently receiving data, or has data in its internal buffers Privilege mode (write): Writes have no effect
23-19	RESERVED	R	0h	Reserved
18	CONTCLK	R/W	0h	CONTCLK. Continous RTPCLK output User and privilege mode (read): 0 = RTPCLK will be suspended between two packets 1 = free running RTPCLK Privilege mode (write): 0 = suspend RTPCLK between packets 1 = enable free running clock between packets
17	COS	R/W	0h	COS. Continue On Suspend Influences behaviour of module while in suspend mode. In all cases the corresponding interrupt will be set. User and privilege mode (read): 0 = before entering suspend mode, the ongoing reception (if started 1 HCLK cycle before SUSPEND goes high) of a packet will be finished and the value will be written to the destination. 2 HCLK cycles after SUSPEND goes low, the reception of packets is enabled again. 1 = continue receiving packets and update destination, while in suspend mode Privilege mode (write): 0 = disable data reception while in suspend mode 1 = enable data reception while in suspend mode
16	RESET	R/W	0h	RESET This bit resets the statemachine and the registers to its reset value, except the RESET bit itself. It has to be cleared by writing to it. User and privilege mode (read): 0 = no reset of DMM module 1 = reset of DMM module Privilege mode (write): 0 = no reset of DMM module 1 = reset DMM module to its reset state
15-11	RESERVED	R	0h	Reserved
10-9	DDM_WIDTH	R/W	0h	DDM_WIDTH: Packet Width in Direct Data Mode User and privilege mode read and write operation: Bit Encoding Transfer Size 00 8 bit 01 16 bit 10 32 bit 11 Reserved
8	TM_DMM	R/W	0h	TM_DMM: Packet Format If this bit is set, the DMM module assumes to receive packets by the Direct Data Mode. User and privilege mode (read): 0 = the DMM module assumes packets in Trace Mode definition 1 = the DMM module assumes packets in Direct Data Mode definition Privilege mode (write): 0 = enable Trace Mode 1 = enable Direct Data Mode
7-4	RESERVED	R	0h	Reserved

Table 27-8. GLBCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-0	ONOFF	R/W	5h	ON/OFF User and privilege mode (read): 1010 = the DMM module receives data and writes it to the buffer all other = the DMM module does not receive data Privilege mode (write): 1010 = enable receive/write operations. Packets will be received 1 HCLK cycle after enabling the module all other = disable receive/write operations. Packets in reception will be finished. NOTE: It is recommended to write 0101 to avoid having a soft error inadvertently enabling the module. NOTE: Registers which affect the operation of the module, should be only programmed when the BUSY bit is 0 and the ON/OFF bits are not 1010. NOTE: If the module was turned off (ON/OFF != 1010) and then turned on (ON/OFF = 1010) again, it is recommended to perform a reset (RESET = 1) of the module before switching it on. This avoids that the state machine is held in an unrecoverable state.

27.3.2 INTSET Register (Offset = 4h) [Reset = 00000000h]

INTSET is shown in Table 27-9.

Return to the Summary Table.

Enables interrupts

Table 27-9. INTSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R/W	0h	Reserved
17	PROG_BUFF	R/W	0h	PROG_BUFF: Programmable Buffer Interrupt Set This enables the interrupt generation in case the buffer pointer equals the programmed value in the DMMINTPT register. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
16	EO_BUFF	R/W	0h	EO_BUFF: End of Buffer Interrupt Set This enables the interrupt generation in case data was written to the last entry in the buffer and the pointer wrapped around. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
15	DEST3REG2	R/W	0h	DEST3REG 2: Destination 3 Region 2 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 3 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
14	DEST3REG1	R/W	0h	DEST3REG 1: Destination 3 Region 1 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 3 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
13	DEST2REG2	R/W	0h	DEST2REG 2: Destination 2 Region 2 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 2 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
12	DEST2REG1	R/W	0h	DEST2REG 1: Destination 2 Region 1 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 2 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)

Table 27-9. INTSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	DEST1REG2	R/W	0h	DEST1REG 2: Destination 1 Region 2 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 1 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
10	DEST1REG1	R/W	0h	DEST1REG 1: Destination 1 Region 1 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 1 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
9	DEST0REG2	R/W	0h	DEST0REG 2: Destination 0 Region 2 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 0 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
8	DEST0REG1	R/W	0h	DEST0REG 1: Destination 0 Region 1 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 0 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
7	BUSERROR	R/W	0h	BUSERROR: BMM Bus Error Response User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated on BMM HRESP = Error Privilege mode (write): 0 = no influence on bit 1 = enable interrupt when BMM HRESP = Error
6	BUFF_OVF	R/W	0h	BUFF_OVF: Write Buffer Overflow Interrupt Set This enables the interrupt generation in case new data is received, while the previous data is still in the deserializer. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
5	SRC_OVF	R/W	0h	SRC_OVF: Source Overflow Interrupt Set This enables the interrupt generation in case a overflow was denoted in the STAT bits of the received packet. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)

Table 27-9. INTSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DEST3_ERRENA	R/W	0h	DEST3_ERRENA: Destination 3 Error Interrupt Set This enables the interrupt generation in case data should be written into a address not specified by DMMDEST3REG1/DMMDEST3BL1 or DMMDEST3REG2/DMMDEST3BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt
3	DEST2_ERRENA	R/W	0h	DEST2_ERRENA: Destination 2 Error Interrupt Set This enables the interrupt generation in case data should be written into a address not specified by DMMDEST2REG1/DMMDEST2BL1 or DMMDEST2REG2/DMMDEST2BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
2	DEST1_ERRENA	R/W	0h	DEST1_ERRENA: Destination 1 Error Interrupt Set This enables the interrupt generation in case data should be written into a address not specified by DMMDEST1REG1/DMMDEST1BL1 or DMMDEST1REG2/DMMDEST1BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
1	DEST0_ERRENA	R/W	0h	DEST0_ERRENA: Destination 0 Error Interrupt Set This enables the interrupt generation in case data should be written into a address not specified by DMMDEST0REG1/DMMDEST0BL1 or DMMDEST0REG2/DMMDEST0BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
0	PACKET_ERR_INT	R/W	0h	PACKET_ERR_INT: Packet Error Interrupt Set This enables the interrupt generation in case of an error condition. Either the number of bits received on a Trace Mode packet doesn’t correspond to the size specified in the SIZE field or the number of bits received on a Direct Data Mode packet doesn’t equal the number of programmed bits in DMMGLBCTRL [10:9]. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated in case of an overflow or packet error. Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)

27.3.3 INTCLR Register (Offset = 8h) [Reset = 00000000h]

INTCLR is shown in Table 27-10.

Return to the Summary Table.

Disables interrupts

Table 27-10. INTCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R	0h	Reserved

27.3.6 OFF1 Register (Offset = 14h) [Reset = 00000000h]

OFF1 is shown in Table 27-13.

Return to the Summary Table.

Interrupt offset for high priority level

Table 27-13. OFF1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	Reserved
4-0	OFFSET	R	0h	OFFSET User and privilege mode (read): Bit Encoding Interrupt 00000 Phantom 00001 Packet Error 00010 Destination 0 Error 00011 Destination 1 Error 00100 Destination 2 Error 00101 Destination 3 Error 00110 Source Overflow 00111 Buffer Overflow 01000 Bus Error 01001 Destination 0 Region 1 01010 Destination 0 Region 2 01011 Destination 1 Region 1 01100 Destination 1 Region 2 01101 Destination 2 Region 1 01110 Destination 2 Region 2 01111 Destination 3 Region 1 10000 Destination 3 Region 2 10001 End of Buffer 10010 Programmable Buffer 10011 - 11111 Reserved Reading the offset will clear the corresponding flag in DMMINTFLAG. Privilege and user mode (write): writes have no effect

27.3.7 OFF2 Register (Offset = 18h) [Reset = 00000000h]

OFF2 is shown in Table 27-14.

Return to the Summary Table.

Interrupt offset for low priority level

Table 27-14. OFF2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	Reserved
4-0	OFFSET	R	0h	OFFSET User and privilege mode (read): Bit Encoding Interrupt 00000 Phantom 00001 Packet Error 00010 Destination 0 Error 00011 Destination 1 Error 00100 Destination 2 Error 00101 Destination 3 Error 00110 Source Overflow 00111 Buffer Overflow 01000 Bus Error 01001 Destination 0 Region 1 01010 Destination 0 Region 2 01011 Destination 1 Region 1 01100 Destination 1 Region 2 01101 Destination 2 Region 1 01110 Destination 2 Region 2 01111 Destination 3 Region 1 10000 Destination 3 Region 2 10001 End of Buffer 10010 Programmable Buffer 10011 - 11111 Reserved Reading the offset will clear the corresponding flag in DMMINTFLAG. Privilege and user mode (write): writes have no effect

27.3.8 DDMDEST Register (Offset = 1Ch) [Reset = 00000000h]

DDMDEST is shown in Table 27-15.

Return to the Summary Table.

Configuration of Buffer for Direct Data Mode

Table 27-15. DDMDEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STARTADDR	R/W	0h	STARTADDR[31:0] These bits define the starting address of the buffer. The starting address has to be a multiple of the blocksize chosen in DMMDDMBL. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

27.3.9 DDMBL Register (Offset = 20h) [Reset = 00000000h]

DDMBL is shown in Table 27-16.

Return to the Summary Table.

Defines the blocksize for the buffer in Direct Data Mode

Table 27-16. DDMBL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current start address Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0 0001 32 0010 64 0011 128 0100 256 0101 512 0110 1k 0111 2k 1000 4k 1001 8k 1010 16k 1011 32k 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

27.3.10 DDMPT Register (Offset = 24h) [Reset = 00000000h]

DDMPT is shown in Table 27-17.

Return to the Summary Table.

Pointer to the last written entry in the buffer

Table 27-17. DDMPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R	0h	Reserved
14-0	POINTER	R	0h	POINTER These bits hold the pointer to the next entry to be written in the buffer. The pointer points to the byte aligned address. If in 16-bit DDM mode, bit 0 will be discarded. If in 32-bit DDM mode, bit 0 and 1 will be discarded. User and privilege mode (read): next pointer entry Privilege mode (write): writes have no effect

27.3.11 INTPT Register (Offset = 28h) [Reset = 00000000h]

INTPT is shown in Table 27-18.

Return to the Summary Table.

Programmable Interrupt Pointer

Table 27-18. INTPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R	0h	Reserved
14-0	INTPT	R/W	0h	INTPT: Interrupt Pointer When the buffer pointer (DMMDDMPT) matches the programmed value in DMMINTPT and the PROG_BUF interrupt is set, a interrupt is generated. User and privilege mode (read): current interrupt pointer Privilege mode (write): new interrupt pointer

27.3.12 DEST0REG1 Register (Offset = 2Ch) [Reset = 00000000h]

DEST0REG1 is shown in Table 27-19.

Return to the Summary Table.

Defines Region 1 for Destination 0

Table 27-19. DEST0REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST0BL1. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

27.3.13 DEST0BL1 Register (Offset = 30h) [Reset = 00000000h]

DEST0BL1 is shown in Table 27-20.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 0 Region 1

Table 27-20. DEST0BL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current block size Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0k 0001 1k 0010 2k 0011 4k 0100 8k 0101 16k 0110 32k 0111 64k 1000 128k 1001 256k 1010 Reserved 1011 Reserved 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

27.3.14 DEST0REG2 Register (Offset = 34h) [Reset = 00000000h]

DEST0REG2 is shown in Table 27-21.

Return to the Summary Table.

Defines Region 2 for Destination 0

Table 27-21. DEST0REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST0BL2. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

27.3.15 DEST0BL2 Register (Offset = 38h) [Reset = 00000000h]

DEST0BL2 is shown in Table 27-22.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 0 Region 2

Table 27-22. DEST0BL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current block size Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0k 0001 1k 0010 2k 0011 4k 0100 8k 0101 16k 0110 32k 0111 64k 1000 128k 1001 256k 1010 Reserved 1011 Reserved 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

27.3.16 DEST1REG1 Register (Offset = 3Ch) [Reset = 00000000h]

DEST1REG1 is shown in Table 27-23.

Return to the Summary Table.

Defines Region 1 for Destination1

Table 27-23. DEST1REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST1BL1. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

27.3.17 DEST1BL1 Register (Offset = 40h) [Reset = 00000000h]

DEST1BL1 is shown in Table 27-24.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 1 Region 1

Table 27-24. DEST1BL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current block size Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0k 0001 1k 0010 2k 0011 4k 0100 8k 0101 16k 0110 32k 0111 64k 1000 128k 1001 256k 1010 Reserved 1011 Reserved 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

27.3.18 DEST1REG2 Register (Offset = 44h) [Reset = 00000000h]

DEST1REG2 is shown in Table 27-25.

Return to the Summary Table.

Defines Region 2 for Destination 1

Table 27-25. DEST1REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST1BL2. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

27.3.19 DEST1BL2 Register (Offset = 48h) [Reset = 00000000h]

DEST1BL2 is shown in Table 27-26.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 1 Region 2

Table 27-26. DEST1BL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. Chapter 28

Radar Hardware Accelerator 2.1

This chapter describes the Radar Hardware Accelerator architecture, features, and operation of various blocks and their register descriptions. The purpose is to enable the user to understand the capabilities offered by the Radar Hardware Accelerator and to program it appropriately to achieve the desired functionality.

This chapter provides an overview of the overall architecture and features available in the Radar Hardware Accelerator. The main features, such as, windowing, FFT, and log-magnitude are covered in this chapter.

The chapter also covers additional features like CFAR and other advanced usage possibilities, which can be skipped if the user is interested only in the FFT computation capability.

This chapter covers the introduction and high-level architecture, the state machine, trigger mechanisms, input/output formatting, and general framework for using the accelerator. Later sections describe the primary computational unit features, namely, windowing, FFT, and log-magnitude.

28.1 Radar Hardware Accelerator – Overview

This section provides an overview of the Radar Hardware Accelerator 2.02.1. The section covers the key features of the accelerator and overall architecture.

28.1.1 Introduction

The Radar Hardware Accelerator 2.1 is a hardware IP that enables off-loading the burden of certain frequently used computations in FMCW radar signal processing from the main processor. It is well known that FMCW radar signal processing involves the use of FFT and log-magnitude computations to obtain a radar image across the range, velocity, and angle dimensions. Some of the frequently used functions in FMCW radar signal processing can be done within the Radar Hardware Accelerator, while still retaining the flexibility of implementing other proprietary algorithms in the main processor.

28.1.2 Key Features

The main features of the Radar Hardware Accelerator 2.1 are as follows.

- Fast FFT computation, with programmable FFT sizes (2, 4, 8…, 2048-pt, and 3, 6, 12, …, 1536-pt) complex FFT.
- Internal FFT bit width of 24 bits (for each I and Q) for good SQNR performance, with fully programmable butterfly scaling at every stage for user flexibility.
- Built-in capabilities for pre-FFT processing – specifically DC estimation and removal, interference localization and mitigation, channel equalization, channel combination, zero insertion, and programmable windowing.
- Magnitude (absolute value) and log-magnitude computation capability.
- Flexible data flow and data sample arrangement to support efficient multidimensional FFT operations and transpose accesses as required.
- Chaining, looping and context switching mechanisms to sequence a set of accelerator operations one-after-another with minimal intervention from the main processor
- CFAR-CA and CFAR-OS detector support (linear and logarithmic), Local Maxima engine
- Statistics including 2D maxima, Histogram and CDF
- Radar data compression / decompression capability
- Miscellaneous other capabilities of the accelerator:
  - Stitching two or four 2K-point FFTs to get the equivalent of 4096-point or 8192-point FFT for industrial level sensing applications where large FFT sizes are required
  - Slow DFT mode, with resolution equivalent to 16K size FFT, for FFT peak interpolation purposes (for example, range interpolation)
  - Complex vector multiplication and Dot product capability for vectors up to 1024 in size

This chapter covers the high-level architecture and key features such as windowing, FFT, and log-magnitude. It also covers additional features such as CFAR, complex multiplication, advanced statistics, radar data compression engine, and so forth.

28.1.3 High Level Architecture

The Radar Hardware Accelerator module is loosely coupled to the main processor (eg. C6x DSP). The accelerator is connected to a 128-bit bus that is present in the main processor system, as shown in Figure 28-1.

The Radar Hardware Accelerator module comprises an accelerator engine and four memories, each of 16KB size, which are used to send input data to and pull output data from the accelerator engine. These memories are referred to as *local memories* of the Radar Accelerator (ACCEL_MEM). For convenience, these eight local memories are referred to as ACCEL_MEM0, ACCEL_MEM1, ACCEL_MEM2, ACCEL_MEM3, ACCEL_MEM4, ACCEL_MEM5, ACCEL_MEM6 and ACCEL_MEM7.

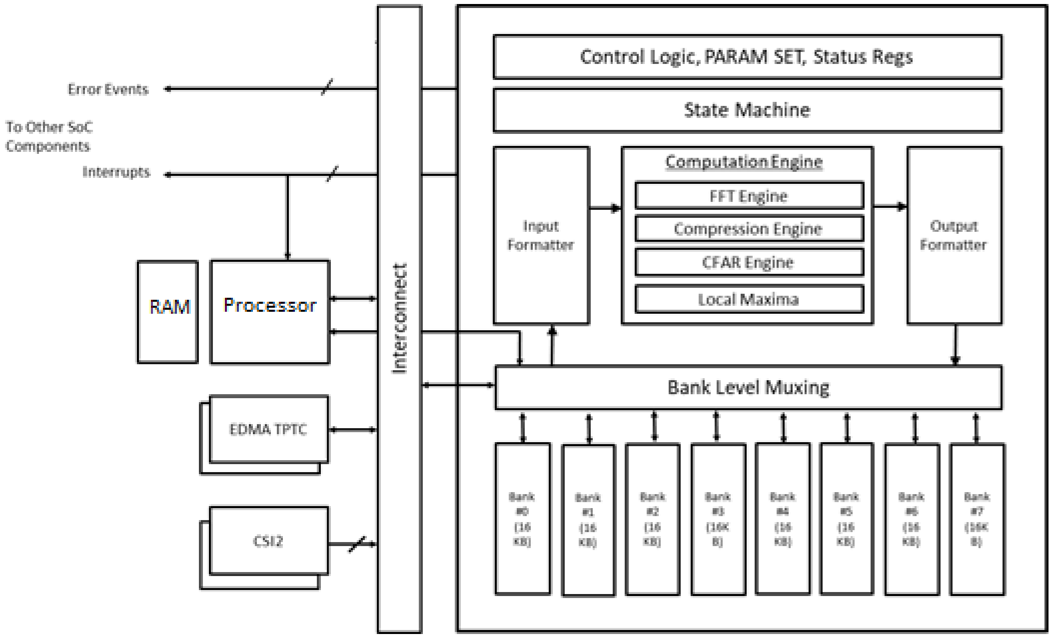

Figure 28-1. Radar Hardware Accelerator

Note

Only one CSI2 interface instance is applicable for AWR294x device.

28.1.3.1 High-Level Data Flow

The typical data flow is that the DMA module is used to bring samples (for example, FFT input samples) into the local memories of the Radar Hardware Accelerator, so that the main accelerator engine can access and process these samples. Once the accelerator processing is done, the DMA module reads the output samples from the local memories of the Radar Hardware Accelerator and stores them back in the Radar data memory for further processing by the main processor.

The purpose behind the eight separate local memories (16KB each) inside the Radar Hardware Accelerator is to enable the *ping-pong* mechanism, for both the input and output, such that the DMA write (and read) operations can happen in parallel to the main computational processing of the accelerator. The presence of four memories enables such parallelism. For example, the DMA can be configured to write FFT input samples (ping) into ACCEL_MEM0 and read FFT output samples (ping) from ACCEL_MEM2. At the same time, the accelerator engine can be working on FFT input samples (pong) from ACCEL_MEM1 and writing FFT output samples (pong) into ACCEL_MEM3. However, both the DMA and the accelerator cannot access the same 16KB memory at the same time. This would lead to an error (referto the MEM_ACCESS_ERR_STATUS register description in TBD-Table 3). As will be explained in later sections, the accelerator engine can perform multiple computational steps one after another autonomously. In each step, the input samples are read from one of the eight local memories and the output samples are written into another one of the eight local memories.

The Radar Hardware Accelerator operates on a single clock domain and the operating clock frequency is 300MHz.

The accelerator local memories are 128-bits wide, for example, each of the 16KB banks is implemented as 1024 words of 128 bits each. This allows the DMA to bring data into the accelerator local memories efficiently (up to a maximum throughput of 128 bits per clock cycle, depending upon the DMA configuration). Two ports for accessing the HWA local memories are available and these map the same 128KB into two different address spaces, thus allowing simultaneous efficient to and from DMA transfers.

It is important to note that any of the eight local memories can be the *source* of the input samples to the accelerator engine and any of the eight local memories can be the *destination* for the output samples from the accelerator engine – with the important restriction that the source and destination memories cannot be the same 16KB bank. Note also that the accelerator local memories do not necessarily need to be used in ping-pong mode and can instead be used as larger 32KB input and output memories, if the use case requires. The address space for the four 16KB memories is contiguous (including a wrap-around form the end of ACCEL_MEM7 to the start of ACCEL_MEM0). Therefore the source as well as destination memory addresses can span beyond 16KB.

28.1.3.2 Configuration

The operations of the Radar Hardware Accelerator are configured using registers, which are of two types – *parameter sets* and *common* (common for all parameter sets) registers. The purpose of the parameter sets is to enable a complete sequence of various accelerator operations to be preprogrammed (with appropriate source and destination memory addresses and other configurations specified for each operation in that sequence), such that the accelerator can perform them one after the other, with minimal intervention from the main processor.

The parameter-set register configurations are programmed into a separate 4KB *parameter-set configuration memory*. A state machine built into the accelerator handles the loading of one parameter-set configuration at a time and sequences the preprogrammed operations one after another. This process is further explained in later sections of this user's guide.

28.1.4 Accelerator Engine Block Diagram

As previously mentioned, the Radar Hardware Accelerator module consists of eight local memories of 16KB each (ACCEL_MEM) and the main accelerator engine. The accelerator engine has the following five components (as shown in Figure 28-2) – a state machine, input formatter block, output formatter block, core computational unit, and the 4KB parameter-set configuration memory.

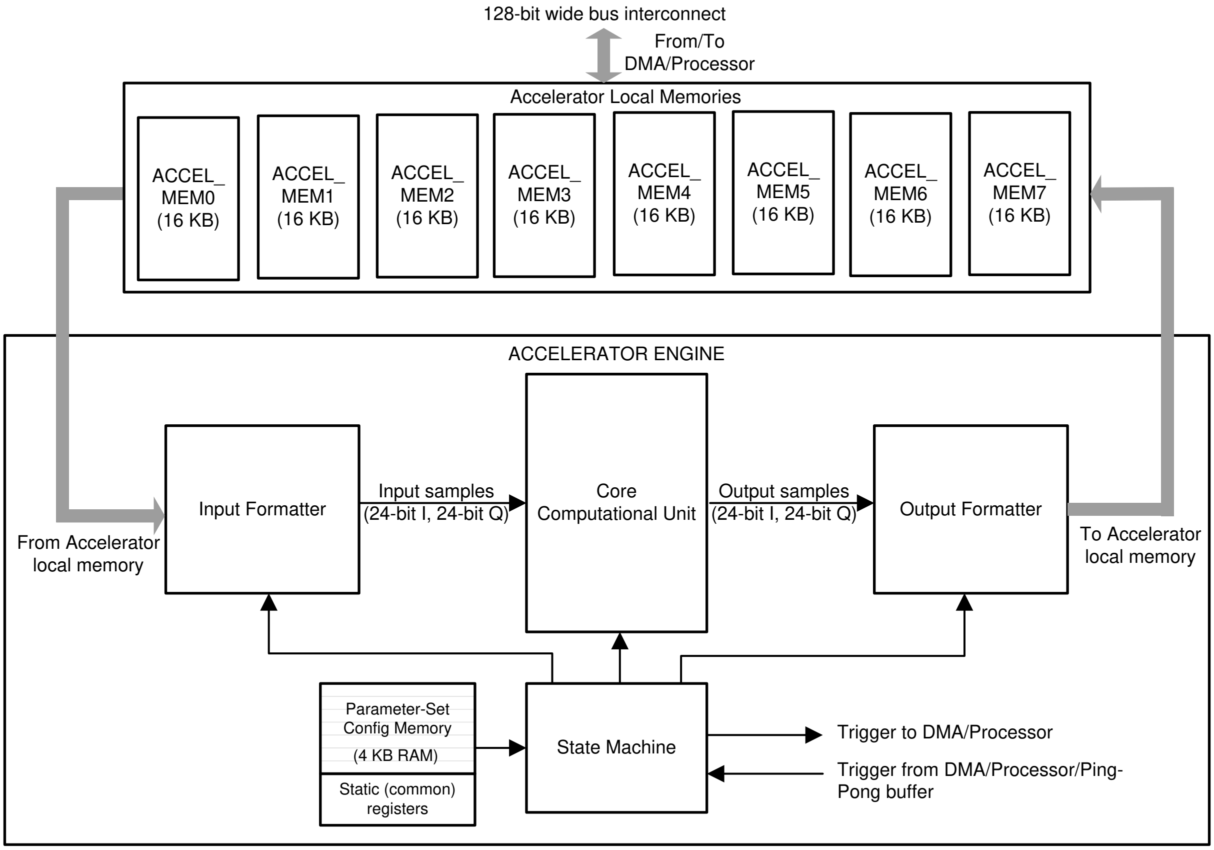

Figure 28-2. Accelerator Engine Block Diagram

The purpose of these components is as follows.

- State machine: the state machine is responsible for controlling the overall operation of the accelerator – specifically, the starting, looping, stopping, as well as triggering and handshake mechanisms between the accelerator, DMA, and main processor. The state machine is also closely connected to the parameter-set configuration memory and takes care of sequencing and chaining a sequence of multiple accelerator operations as programmed in the parameter-set configuration memory.
- Input formatter: the input formatter block is responsible for reading the input samples from any one of the local memories and feeding them into the core computational unit. In this process, this block provides flexible ways of accessing the input samples, in terms of 16-bit versus 32-bit aligned input samples, transpose read-out, flexible scaling, and sign extension to generate internal bit-width of 24 bits, and so on. Lastly the input formatter block provides 24-bit complex samples as input to the core computational unit. The local memory (memories) from which the input formatter reads the input samples is called the *source* memory.
- Output formatter: the output formatter block is responsible for writing the output samples from the core computational unit into the local memories. This block also provides flexible ways of formatting the output samples, in terms of 16-bit versus 32-bit aligned output samples, transpose write, flexible scaling from internal bit-width of 24 bits, to 16-bit or 32-bit aligned output samples, sign-extension, and so on. The local memory (memories) to which the output formatter writes the output samples is called the *destination* memory.
- Core computational unit: the core computational unit contains the main computational logic for various operations, such as windowing, FFT, magnitude, log2, and CFAR calculations. The unit accepts a streaming input from the input formatter block (at the rate of one input sample per clock cycle), performs computations, and produces a streaming output to the output formatter block (typically at the rate of one output sample per clock cycle), with some initial latency depending on the nature of the computations involved.
- Parameter-set configuration memory: this is a 4096-byte RAM that is used to preconfigure the sets of parameters (register settings) for a chained sequence of accelerator operations, which can then be executed

by the state machine in a loop. This allows the accelerator to perform a preprogrammed sequence of operations in a loop without frequent intervention from the main processor.

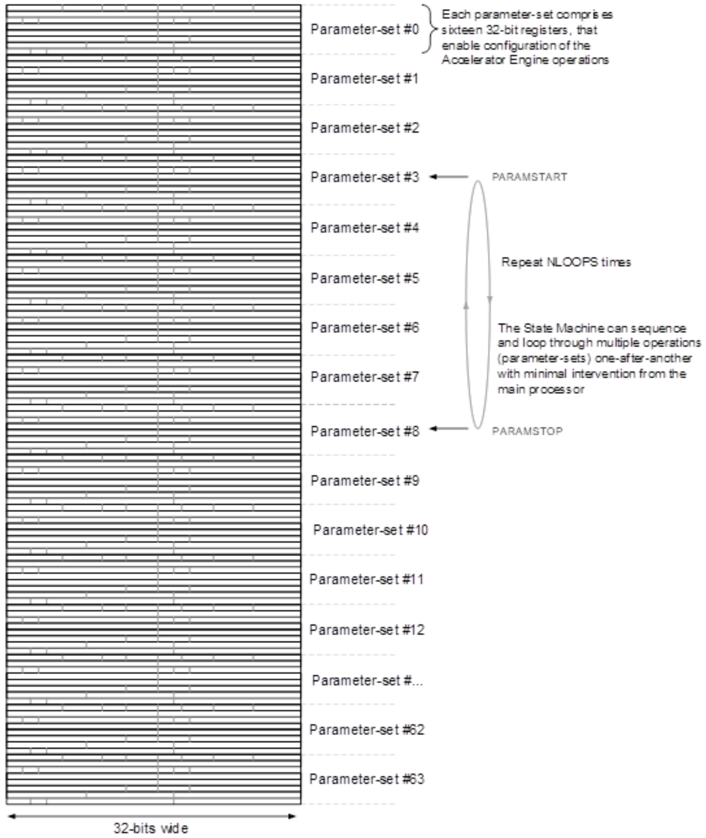

Figure 28-3. Parameter-Set Configuration Memory (4KB)

The number of parameter sets that can be preconfigured and sequenced (chained) is 64. This means that up to 64 accelerator operations can be chained together and these can then be looped as well, with minimal intervention from the main processor. For example, operations like FFT, log-magnitude, and CFAR detection can be preconfigured in the parameter-set configuration memory and the state machine can be made to sequence them one after another and run them in a loop for specified number of times. There is a provision available to interrupt the main processor and/or trigger a DMA channel at the end of each parameter set if required. This allows various ways by which the accelerator, DMA, and the main processor can work together to establish a data and processing flow. As shown in Figure 28-3, each parameter set contains the equivalent of sixteen 32-bit registers, which corresponds to total RAM size of 64 ×16 × 32 bits = 4KB for the parameter-set configuration memory.

The layout of the parameter-set register map is provided in Section 28.6. Note that the parameter-set RAM must be programmed using 32-bit word writes only (i.e., byte-writes and half-word writes are not supported). The detailed descriptions of the registers is provided in the various sections, as and when the functionality of each component is presented.

Typically, all necessary parameter sets can be pre-configured before triggering execution by the accelerator. If needed, the parameter sets can be modified on-the-fly but without modifying the parameter set being executed at that time. If parameter sets are being overwritten after execution, it is recommended to re-program all the fields for particular set, i.e., avoid partial over-writing.

28.1.5 Accelerator Engine Operation

The accelerator engine and the local memories run on a single clock domain. The overall operation of the accelerator can be summarized as follows. The accelerator engine is configured by the main processor through common configuration registers (common for all parameter sets), as well as the parameter-set configuration memory. As explained earlier, the former comprises common register settings for overall control of the accelerator engine, and the latter comprises the 64 parameter-set specific settings which control the functioning of the accelerator for each of its *chained* sequence of operations.

When the accelerator engine is enabled, the state machine kicks off and controls the overall operation of the accelerator, which involves loading the parameter sets one at a time from the parameter-set configuration memory into various internal registers of the accelerator engine and running the accelerator as per the programmed configuration for each parameter set one after another. The entire procedure then repeats in a loop for a programmed number of times (NUMLOOPS described later).

Each parameter set includes various configuration details such as the accelerator mode of operation (FFT, Log2, and so on), the source memory address, number of samples, the destination memory address, input formatting, output formatting, trigger mode for controlling the start of computations to ensure proper handshake with the DMA, and so on.

28.1.5.1 Data Throughput

Once the state machine has loaded the registers corresponding to the current parameter set to be executed, the data flow happens as follows: at each clock cycle, one sample from the source memory is read by the input formatter and fed into the core computational unit with appropriate scaling and formatting as configured. The data interface between the input formatter and the core computational unit is a 24-bit complex bus (24-bit for each I and Q) which streams one input sample every clock cycle. The core computational unit processes this streaming sequence of input samples and in general, produces a streaming output also at one sample every clock cycle, after an initial latency period. Thus for most operations (FFT, log-magnitude, CFAR, and so on), in steady state the core computational unit maintains a streaming data rate of one sample per clock cycle. The data interface between the core computational unit and the output formatter is also a 24-bit complex bus (24-bit for each I and Q) and the output formatter is responsible for writing into the destination memory, with appropriate scaling and formatting as configured.

The next section provides more details regarding the state machine, including its detailed operation, registers, trigger mechanisms, and so on.

28.2 Accelerator Engine – State Machine

This section describes the state machine block present in the accelerator engine (see Figure 28-4). This block, together with the input formatter and output formatter blocks described in the next two sections, provides the overall framework for establishing the data flow and using the accelerator for various computations.

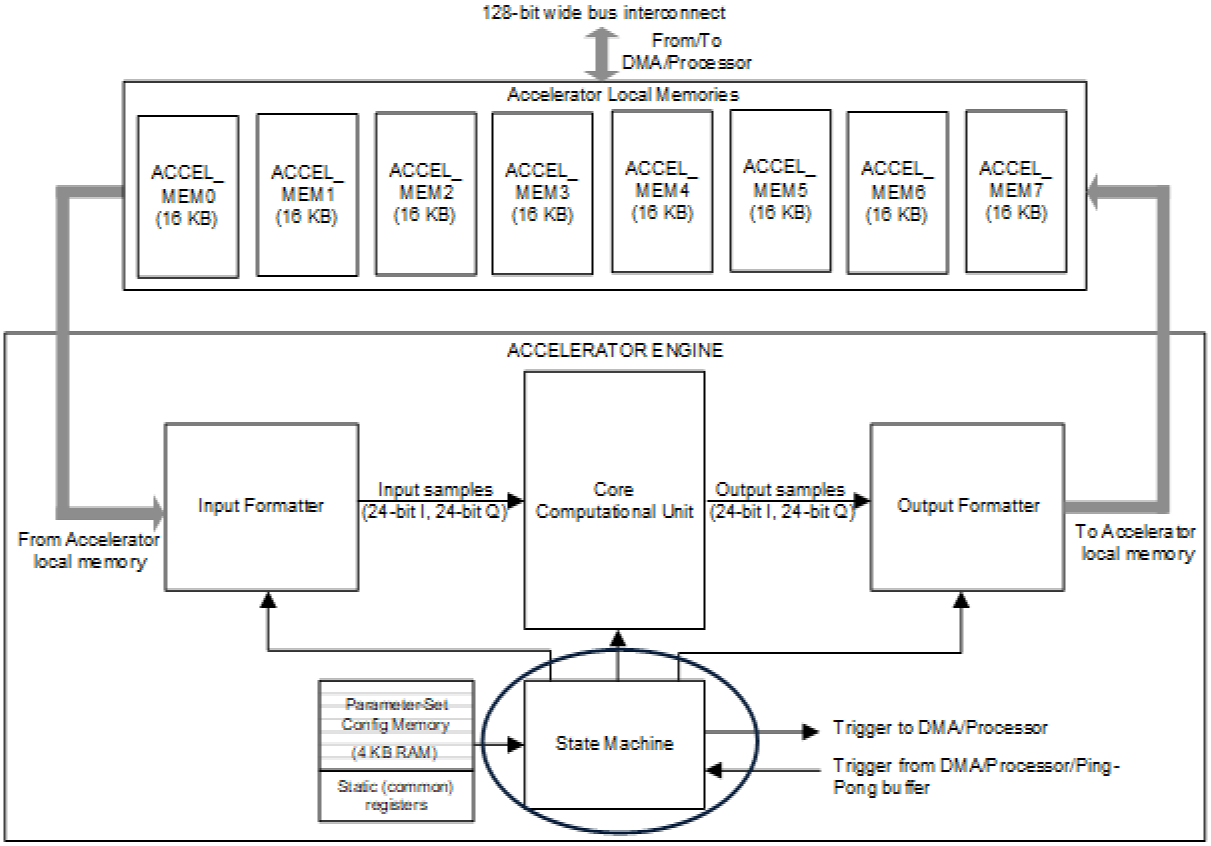

Figure 28-4. State Machine

28.2.1 State Machine

The state machine controls the overall functioning of the Radar Hardware Accelerator. The state machine controls the enabling and disabling of the accelerator, as well as supports sequencing an entire set of operations (configured using parameter-set configuration memory), and looping through those operations one after another without needing frequent intervention from the main processor.

28.2.1.1 State Machine – Operation

The state machine block and the entire accelerator remain in reset and disabled state by default. The state machine (and hence the accelerator in general) is enabled by setting the HWA_CLK_EN register bit, followed by writing 111b into the HWA_EN register.

Note that a complete list of registers pertaining to the state machine is provided in Section 28.2.1.4. Some of the registers are common (common for all parameter sets) registers, whereas some other registers are parameter-set registers, which as explained in the previous section means that they can be uniquely programmed for each of the 64 parameter sets. For each register, Table 28-1 lists whether it is part of the parameter set or not. Table 28-1 also provides a brief description of each register.

When enabled, the state machine steps through (one after another) the parameter sets programmed in the parameter-set configuration memory and executes the computations as per the configuration of each parameter set. The registers PARAM_START_IDX andPARAM_END_IDX define the starting index and ending index within the 64 parameter sets, so that only those parameter sets between the start and end indices are executed by the accelerator, as shown in TBD. The state machine also loops through these parameter sets for a total of NUMLOOPS times (unless NUMLOOPS is programmed as 0 or 4095, in which case the loop does not run or runs infinite times respectively). As an example, if the state machine needs to be configured to run the first four parameter sets in a loop 64 times, then the registers should be programmed as follows: PARAM_START_IDX =0, PARAM_END_IDX = 3, and NUMLOOPS = 64.

For each parameter set, there is a TRIGMODE register, which is used to control when the state machine starts executing the computations for that parameter set. This control is useful, for example, to ensure that the input data is ready in the accelerator local memory (source memory) before the computations are started. Specifically, it is possible to trigger the start of computations after completion of a DMA transfer, or after a CSI2 line is received, and so on. The TRIGMODE register setting thus controls when the accelerator operation is triggered for the current parameter set and there are four trigger mechanisms supported as listed in the next subsection. Once triggered, the state machine loads all the registers from the parameter-set configuration memory for the current parameter set into corresponding internal registers of the accelerator and starts the actual computations for that parameter set. After completion of computations of the current parameter set, it moves to the next parameter set. . In general, once the parameter set registers are configured and the state machine is enabled, it is recommended to avoid dynamically changing any of the register values. In particular, note that the loading of parameter set (N+1)’s registers happens soon after the completion of parameter set N’s execution, and this loading can happen even while the state machine is waiting for the parameter set (N+1)'s trigger to arrive. This means that parameter set configuration registers of parameter set (N+1) cannot be reliably changed while parameter set N is already executing.

After a sequence of operations as programmed in the parameter set(s) for the specified number of loops is complete, the accelerator provides a completion interrupt (DSS_HWA_THREAD1_LOOP_INT) to the processor. The accelerator can be reconfigured as desired. For reconfiguration, the following procedure must be followed. The accelerator must be disabled by writing 000b to the HWA_EN register. Then, a reset must be asserted by writing 111b followed by 000b to the HWA_RESET register. The new configurations can now be written in to the accelerator, and then the accelerator can be enabled again by writing 111b to HWA_EN. Note that any spare/reserved bits should be kept as 0.

28.2.1.2 State Machine – Trigger Mechanisms (Incoming)

As mentioned in the previous subsection, for each parameter set, the start of the computations can be triggered based on specific events. Four trigger mechanisms are supported as follows.

- Immediate trigger (TRIGMODE = 000b): In this case, the state machine does not wait for any trigger and starts the accelerator computations immediately for the current parameter set. This mode is applicable when chaining (sequencing) a set of operations one after another in the accelerator without any need for control handshake or data exchange outside the accelerator (for example, when chaining FFT and log-magnitude operations) with no need to wait for a trigger in between.
- Wait for processor-based software trigger (TRIGMODE = 001b, TRIGMODE = 111b): This is a software-triggered mode that is useful when the main processor must directly control the data flow and start or stop of accelerator computations. In this trigger mode, the state machine waits for a software-based trigger, which involves the main processor setting a separate self-clearing bit in a FW2HWA_TRIGGER_0 or FW2HWA_TRIGGER_1 register (single-bit register). The state machine keeps monitoring that register bit and waits as long as the value is zero. When the value becomes 1 (set), the state machine gets triggered to start the accelerator operations for the current parameter set. FW2HWA_TRIGGER_0 register bit corresponds to TRIGMODE = 001b and FW2HWA_TRG_1 corresponds to TRIGMODE = 111b.
- TRIGMODE= 010b : mode is reserved.
- Wait for the DMA-based trigger (TRIGMODE = 011b): This trigger mode is useful when a DMA transfer completion must be used to trigger the start of the accelerator computations for the current parameter set. The primary purpose of this trigger mode is as follows; when performing second dimension FFT, the DMA is used to bring the FFT input samples from the Radar data memory to the local memory of the accelerator. Upon completion of each DMA transfer, it is useful to automatically trigger the accelerator to perform the FFT.

To achieve this, the state machine of the accelerator has a 32-bit register called the DMA2HWA_TRIGGER register, where each register bit maps to one of 32 DMA channels that are associated with the accelerator. To use the DMA-based trigger mode, the HWA_TRIGSRCregister in the current parameter set must be programmed to the DMA channel whose completion we wish to monitor. The state machine then monitors the corresponding register bit in the DMA2HWA_TRIGGER register, and triggers the execution of the current parameter set only when that register bit gets set. For e.g. if HWA_TRIGSRC is programmed to 5, then the current parameter set will execute only once the register bit #5 gets set in DMA2HWA_TRIGGER.

The user may utilize the EDMA's linking capability to set the appropriate register bit in DMA2HWA_TRIGGER. Linking is a programmable feature of the EDMA, where the completion of a DMA transfer can automatically trigger a second DMA transfer. In the present context, the DMA transfer that moves data to the local memory of the accelerator can be linked to a second DMA whose purpose is to write a one-hot signature into DMA2HWA_TRIGGER to set a specific register bit and trigger the accelerator. Note that there are 32 read-only, one-hot, signature registers (SIG_DMACH1_DONE, SIG_DMACH2_DONE, and more) that are available. These registers are simply read-only registers which contain hard-coded values (each register is a one-hot signature – 0x0001, 0x0002, 0x0004, 0x0008, and so on). For convenience, these hard-coded 32 read-only signatures can be used, so that the second DMA can simply copy from one of these SIG_DMACHx_DONE registers into the DMA2HWA_TRIGGER register to set the appropriate register bit.

In case of multiple DMA triggers waiting on multiple HWA paramset operation, each time the DMA transfer is completed, the corresponding one-hot signature is copied to DMA2HWA_TRIGGER (self-clearing bit) register and this value gets internally latched and is serviced only on DMA transfer completion. For example, assume there are two parallel DMA's (DMA-0 and DMA-1) which are about to trigger paramset-0 and paramset-1 respectively. So in this case even if DMA-1 completes transfer first, the HWA will only start execution once DMA-0 is over and also note that DMA2HWA_TRIGGER register is not overwritten but the values get internally latched as mentioned above.

- Wait for hardware trigger (TRIGMODE = 0b100): These trigger modes are useful when a hardware signal such as CSI interrupt needs to be used to trigger the start of the accelerator computations for the current parameter set. The hardware trigger sources can be either CSI #1 frame start, CSI #1 lineend, or CSI #2 frame start, or CSI #2 line end. The HWA_TRIG_SRC register in the parameter-set decides which of these trigger sources is selected. . The valid range for HWA_TRIG_SRC register is 0 to 19, and these values correspond to different trigger sources – specifically, a value of 0 selects the right most trigger and 19 selects left most trigger in the following trigger sources: RCSS_CSI2A_SOF_INT[0,1] RCSS_CSI2A_EOL_CNTX[0..7]_INT, RCSS_CSI2B_SOF_INT[0,1], RCSS_CSI2B_EOL_CNTX[0..7]_INT. Please refer to the device TRM for more details.

Note

CSI2 interrupt based trigger is not relevant in the context of AWR294x device.

28.2.1.3 State Machine – Trigger Mechanisms (Outgoing)

After the accelerator computations for the current parameter set are triggered (using one of the four incoming trigger mechanisms mentioned in the previous subsection), it performs the actual computation operations for that parameter set. These computations typically take several tens or hundreds of clock cycles, depending on the nature of the configuration programmed. Once the accelerator completes its computation operations for the current parameter set, the state machine advances to the next parameter set and repeats the same process. But before advancing to the next parameter set, it can interrupt the main processor and/or trigger a DMA channel. This provision is useful if the main processor is required to read or write registers or memory locations at the end of the current parameter set. Also, this provision is useful for triggering a DMA channel, so that the output of the accelerator can be copied out of the accelerator local memories.

There are two trigger mechanisms provided as follows:

- Interrupt(s) to main processor (CPU_INTR1_EN = 1, CPU_INTR2_EN = 1): The accelerator interrupts the main processor(s) at the end of completion of computations for the current parameter set, if the register bit CPU_INTR1_EN or CPU_INTR2_EN is set. Two interrupt signals are available and they are enabled or disabled for each parameter-set by these two register bits. Setting CPU_INTR1_EN in a parameter-set enables DSS_HWA_PARAM_DONE_INTR1 interrupt to be generated at the end of that parameter-set.

Setting CPU_INTR2_EN in a parameter-set enables DSS_HWA_PARAM_DONE_INTR2 interrupt to be generated at the end of that parameter-set.

- Trigger to DMA (DMATRIG_DMATRIG_ENEN = 1): The accelerator gives a trigger to a DMA channel at the end of completion of computations for the current parameter set, if the register bit DMATRIG_EN is set. If DMATRIG_EN is set, then the particular DMA channel as specified in a separate HWA2DMA_TRIGDST register (valid values are 0 to 31, for the 32 DMA channels dedicated for the accelerator) is triggered. Thus, it is possible to preconfigure up to 32 DMA channels and trigger the appropriate one at the end of the computations of the current parameter set. The trigger from accelerator to the DMA channels can also be emulated by the processor, by writing to a FW2DMA_TRIGGER register. This can be used by the processor to kick-start a full/repetitive chain of operations, that are then subsequently managed between the DMA and the accelerator without further processor involvement – for example, the processor writes to the FW2DMA_TRIGGER register to trigger a DMA channel for the first time, and this kicks off a series of back-to-back data transfers and accelerator computations, with the DMA and accelerator hand-shaking with each other.

28.2.1.4 State Machine – Register Descriptions

Table 28-1 lists all the registers of the state machine block. As explained previously, some of the registers are common (common for all parameter sets) registers, whereas some others are *part of each parameter set*. For each register, this distinction is captured as part of the register description in Table 28-1.

Table 28-1. State Machine Registers

Register.Field	Width	Parameter Set	Description
HWA_ENABLE.hwa_en	3	No	Enable and Disable Control: This register enables or disables the entire Radar Hardware Accelerator. The reason for a 3-bit register (instead of 1-bit) is to avoid an accidental bit-flip (for example, transient error caused by a neutron strike) from unintentionally turning on the accelerator engine. A value of HWA_EN = 111b enables the Radar Hardware Accelerator and any other value of the register keeps the accelerator engine in disabled state.
HWA_ENABLE.hwa_clk_en	3	No	Clock-gating Control: This register bit controls the enable/disable for the clock of the Radar Accelerator. This register bit can be set to 0 to clock-gate the accelerator when not using the accelerator. Before enabling the accelerator or before configuring the accelerator's registers, this register bit should be set first, so that the clock is available.
HWA_ENABLE.hwa_reset	3	No	Software Reset Control: This register provides software reset control for the Radar Hardware Accelerator. The assertion of these register bits by the main processor will bring the accelerator engine to a known reset state. This is mostly applicable for resetting the accelerator in case of unexpected behavior. Under normal circumstances, it is expected that whenever the accelerator is enabled (from disabled state), it always comes up in a known reset state automatically. The recommended sequence to be followed in case software reset is desired is to write 111b to this register and then a 000b, before the clock is enabled to the accelerator.
PARAM_RAM_LOOP.numloops	12	No	Number of loops: This register controls the number of times the state machine will loop through the parameter sets (from a programmed start index till a programmed end index) and run them. The maximum number of times the loop can be made is run is 4094. A value of 4095 (0xFFF) programmed in this register should be considered as a special case and it should be interpreted as an infinite loop mode, for example, keep looping and never stop the accelerator engine unless reset by the main processor. A value of zero programmed in this register means that the looping mechanism is disabled. In this case, the accelerator engine can still be used under direct control of the main processor (without the state machine looping provision coming into the picture).

Table 28-1. State Machine Registers (continued)

PARAM_RAM_IDX. param_start_idx	4	No	Parameter-set Start Index: These registers are used to control the start and stop index of the parameter set through which the state machine loops through. The state machine starts at the parameter set specified by PARAM_START_IDX and loads each parameter set one after another and runs the accelerator as per that configuration. When the state machine reaches the parameter set specified by PARAM_END_IDX, it loops back to the start index as specified by PARAM_START_IDX.
PARAM_RAM_IDX. param_end_idx	4	No	Parameter-set Stop Index: Refer register description for PARAM_START_IDX
HWA_ENABLE. hwa_dyn_clk_en	1	No	Dynamic Clock-gating Control: Setting this register bit to '1' enables the capability to clock gate the unused computation engines (i.e., from the four computation engines, namely FFT, CFAR, Memory compression, Local Maxima) to save power consumption, based on the specific parameter-set being executed.
TRIGMODE	4	Yes	Trigger mode select: 0000b – Immediate trigger 0001b – Software trigger 0010b – Reserved 0011b – DMA-based trigger 0100b – Hardware based trigger 0101b – Reserved 0110b – Reserved
FW2HWA_TRIG_0.fw2hwa_trigger_0	1	No	Software trigger bit: This register bit is relevant whenever software triggered mode is used (TRIGMODE = 001b). Whenever this software triggered mode is configured for a parameter set, the state machine keeps monitoring this register bit and waits as long as the value is zero. The main processor software can set this register bit, so that the state machine gets triggered and starts the accelerator operations for that parameter set.
FW2HWA_TRIG_1.fw2hwa_trigger_1	1	No	Software trigger bit: This register bit is similar to FW2HWA_TRIGGER_0, except that this register bit corresponds to TRIGMODE = 111b.
DMA2HWA_TRIG.dma2hwa_trigger	32	No	DMA trigger register: This register is relevant whenever DMA triggered mode is used (for example, TRIGMODE = 011b). Whenever a DMA channel has finished copying input samples into the local memory of the accelerator and wants to trigger the accelerator, the procedure to follow is to use a second linked DMA channel to write a 32-bit one-hot signature into this register to trigger the accelerator. In DMA triggered mode, the state machine keeps monitoring this 32-bit register and waits as long as a specific bit (see DMA2HWA_TRIGSRC) in this register is zero. The second linked DMA channel writes a one-hot signature that sets the specific bit, so that the state machine gets triggered and starts the accelerator operations for that parameter set.
DMA2HWA_TRIGSRC	5	Yes	DMA channel select for DMA completion trigger: This parameter-set register is relevant whenever DMA triggered mode is used (for example, TRIGMODE = 011b). This register selects the bit number in DMA2HWA_TRIGGER for the state machine to monitor to trigger the operation for that parameter set.

Table 28-1. State Machine Registers (continued)

CPU_INTR1_EN	1	Yes	Completion interrupt to main processor: This parameter-set register is used to enable/disable interrupt to the main processor upon completion of the accelerator operation for that parameter set. If enabled, the main processor receives an interrupt from the Radar Hardware Accelerator at the end of operations for that parameter set, so that the main processor can take any necessary action. Two interrupts are available, and this register bit enables or disables the first interrupt.
CPU_INTR2_EN	1	Yes	Completion interrupt to main processor: Similar to CPU_INTR1_EN. This register bit enables or disables the second interrupt to the main processor.
PARAM_DONE_SET_STATUS_0 . param_done_set_status_0 PARAM_DONE_SET_STATUS_1. param_done_set_status_1	32	No	Parameter-set done status: These read-only status registers can be used by the main processor to see which parameter sets are complete that led to the interrupt to the main processor. The individual bits in these 32-bit status register indicate which of the 64 parameter sets have completed. These status bits are not automatically cleared, but they can be individually cleared by writing to another set of 32-bit registers (PARAM_DONE_STATUS_CLR)
PARAM_DONE_STATUS_CLR_0 PARAM_DONE_STATUS_CLR_1	32	No	Refer register description for PARAM_DONE_SET_STATUS
DMATRIG_EN	1	Yes	Completion trigger to DMA: This parameter-set register is used to enable DMA channel trigger upon completion of the accelerator operation for that parameter set. This trigger mechanism enables the accelerator to hand-shake with the DMA so that output data samples are copied out of the accelerator local memory. If enabled, the accelerator triggers a specified DMA channel, so that the output samples can be shipped from the local memory to Radar data memory.
HWA2DMA_TRIGDST	5	Yes	DMA channel select for accelerator completion trigger: This parameter-set register is used to select which of the 32 DMA channels allocated to the accelerator should be triggered upon completion of the accelerator operation for that parameter set. This register is to be used in conjunction with DMATRIG_EN.
FW2DMA_TRIGGER. fw2dma_trigger	32	No	Trigger from processor to DMA: This register can be used by the processor to trigger a DMA channel for the first time, so that a full sequence of repeated operations between the DMA and the accelerator gets kick-started.
PARAMADDR.paramaddr	6	No	Debug register for current parameter-set index: This read-only status register indicates the index of the current parameter set that is under execution. This is useful for debug, where parameter sets can be executed in single-step manner (one-by-one) using SW trigger mode for each of them. In such a debug, this register indicates which parameter set is currently waiting for the SW trigger.
LOOP_CNT.loop_cnt	12	No	Debug register for current loop count: This read-only status register indicates what is the loop count that is presently running. When the state machine is programmed for NUMLOOPS loops, this register shows the current loop count that is running.
TRIGGER_SET_STATUS_0. Trigger_set_status_0	32	No	Debug register for trigger status: This is a read-only status register, which indicates the trigger status of the accelerator, for example, whether a DMA trigger was ever received (refer TRIGMODE). The 32 bits in this register correspond to the 32 DMA trigger bits (refer DMA2HWA_TRIGGER).
TRIGGER_SET_STATUS_1. Trigger_set_status_1	32	No	Debug register for trigger status: This is a read-only status register, which indicates the trigger status of the accelerator, for example, whether a specific hardware trigger or software trigger or context switch trigger has even been received.

Table 28-1. State Machine Registers (continued)

TRIGGER_SET_IN_CLR_0. Trigger_set_in_clr_0	1	No	Clear trigger status read-only register: This register-bit when set clears the trigger status register TRIGGER_SET_STATUS_0 described above.
TRIGGER_SET_IN_CLR_1 Trigger_set_in_clr_1	1	No	Clear trigger status read-only register: This register-bit when set clears the trigger status register TRIGGER_SET_STATUS_1 described above.
FORCED_CONTEXTSW_EN	**1**	Yes	Force context switch: This register bit is useful in Context Switching. If this bit is set, the state machine switches the context to other thread after the completion of the current parameter-set. Refer the Context Switching section 28.11 of TRM for details.
CONTEXTSW_EN	1	Yes	Enable context switch: This register bit is useful in Context Switching. If this bit is set, the state machine is allowed to switch context at the end of execution of this parameter-set. Refer the Context Switching section 28.11 of TRM for details
PARAM_RAM_IDX_ALT.param_start_idx	10	No	Refer Context Switching section in section 28.11 of TRM
PARAM_RAM_IDX_ALT.param_end_idx	10	No	Refer Context Switching section in section 28.11 of TRM
PARAM_RAM_IDX_ALT.numloops	12	No	Refer Context Switching section in section 28.11 of TRM

The next two sections cover the Input Formatter and Output Formatter blocks, including their detailed operation, registers and usage procedure.

28.3 Accelerator Engine – Input Formatter

This section describes the input formatter block present in the accelerator engine (see Figure 28-5).

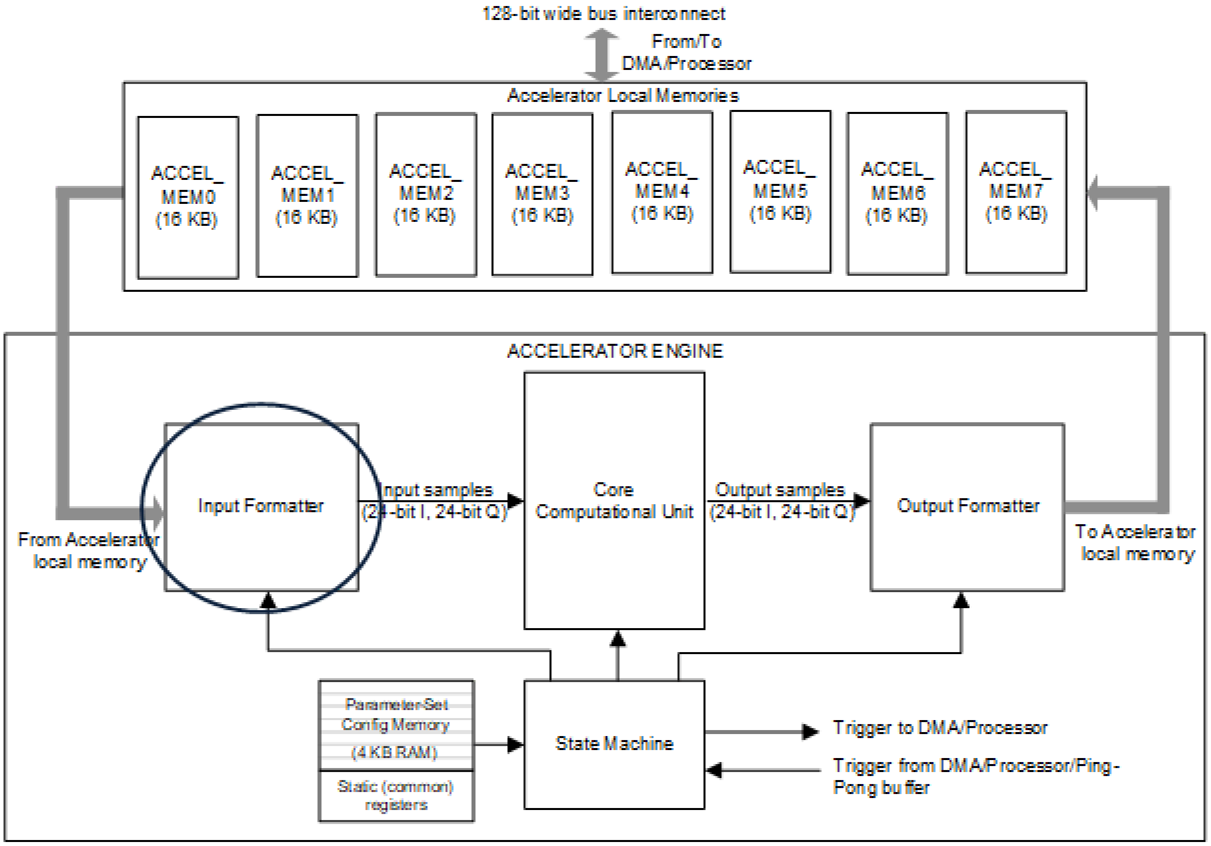

Figure 28-5. Input Formatter

28.3.1 Input Formatter

The input formatter is used to access, format, and feed the data from the local memories of the accelerator as 24-bit I and 24-bit Q samples into the core computational unit. The input formatter provides various capabilities to access and format the samples from the local memories – especially, various multidimensional access patterns (for example transpose access), 16-bit or 32-bit aligned word access, scaling using bit-shifts to generate 24-bit wide samples from 16-bit or 32-bit words, real versus complex input, sign extension, conjugation, and more.

28.3.1.1 Input Formatter – Operation

The input formatter block is responsible for reading the input samples from the accelerator local memory and feeding them into the core computational unit (see Figure 28-5). The data flow from the input formatter, through the core computational unit, to the output formatter is designed to sustain a steady-state throughput of one complex sample per clock cycle. The input formatter thus feeds one sample (24-bit I and 24-bit Q) into the core computational unit every clock cycle.

To make the best use of the capabilities of the core computational unit and to allow meaningful chaining of radar signal processing operations with minimal intervention from the processor, the input formatter supports flexibility in how the input samples are accessed from the memory and how they are formatted and fed into the core computational unit.

The memory from which the input formatter picks up the data is referred to as *source memory*. Note that any of the eight accelerator local memories can be the source memory. However, as will be described in a subsequent section, there is an important restriction which explains that the source memory cannot be the same as the destination memory (which is the memory to which the output formatter writes the output data).

28.3.1.2 Input Formatter – 2D Indexed Addressing for Source Memory Access

The parameter-set register SRCADDR specifies the start address at which the input samples must be accessed. This register is a byte-address, and a value of 0x00000 corresponds to the first memory location of ACCEL_MEM0 memory. The SRCADDR register maps to the entire 128 KB address space of the eight accelerator local memories (8x16KB). Note that even though SRCADDR register is a 20-bit register, only the 17 LSB bits are used. The 3 MSB bits are reserved for future extension purpose.

The input data can be read from the memory as either 16-bit wide samples or 32-bit wide samples. Also, they can be read as real samples or complex samples. These two aspects are configured using register bits SRC16b32b and SRCREAL. See Section 28.3.1.5 for a description of these and other registers pertaining to the input formatter block. As an example, if SRC16b32b = 0 and SRCREAL = 0, then the input samples are read from the memory as 16-bit complex samples (16-bit I and 16-bit Q), shown in Figure 28-6.

An important feature of the input formatter block is that it supports flexible access pattern to fetch data from the source memory, which makes it convenient when the data corresponding to multiple RX channels are interleaved or when performing multi-dimensional (FFT) processing. This feature is facilitated through the SRCAINDX, SRCACNT, SRCBINDX, and BCNT registers, which are part of each parameter-set configuration.

The register SRCAINDX specifies how many bytes separate successive samples to be fetched from the source memory and the register SRCACNT specifies how many samples need to be fetched per iteration. An iteration is typically one computational routine, such as one FFT operation. It is possible to perform multiple iterations back-to-back – for example, four FFT operations corresponding to four RX channels. The register SRCBINDX specifies how many bytes separate the start of input samples for successive iterations and BCNT specifies how many iterations to perform back-to-back. These registers can be better understood using the example given in Figure 28-6.

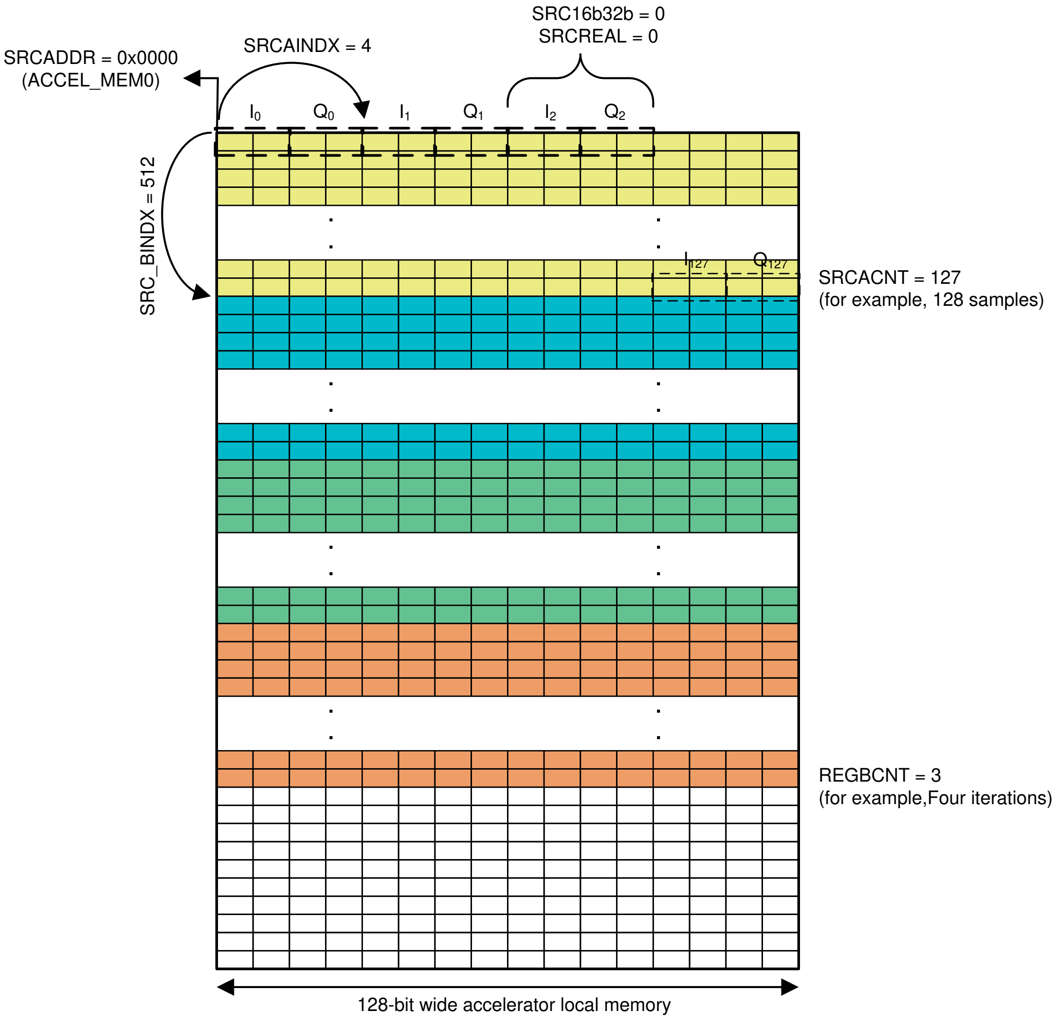

Figure 28-6. Input Formatter Source Memory Access Pattern (Example)

In Figure 28-6, the input data consists of complex data (16-bit I and 16-bit Q) that is contiguously present in ACCEL_MEM0. The data in memory consists of four sets of 128 samples each (say, corresponding to four RX antennas) and these are shown in four different colors. Because each sample occupies 4 bytes and the samples are contiguously placed in the memory starting at the beginning of ACCEL_MEM0, values of SRCADDR = 0x0000 and SRCAINDX = 4 are used to fetch these samples.

In each clock cycle, the input formatter fetches one complex sample from the memory and feeds it into the core computational unit (with appropriate scaling, as described later). Because there are 128 samples to be fed for the first iteration (computational routine), a value of SRCACNT = 127 is used. For the second iteration, the samples are fetched starting from a memory location that is SRCBINDX (=128 × 4 = 512) bytes away from SRCADDR.

This process repeats for the programmed number of iterations as per the BCNT register. For example, the value of BCNT = 3 used in this example corresponds to four iterations. Note that the registers shown here are part of parameter-set configuration registers and the four iterations described here can be performed using a single parameter set. Thus, A-dimension is used to run through samples of a given vector, and B-dimension is used to repeat (iterate) the same operation for multiple vectors.

In addition to A and B dimensions, the Input Formatter also includes a provision for C-dimension. The C-dimension is only available in a certain restricted mode of operation called the Local Maxima Engine and its usage is explained in the section 28.10 of the TRM.

An important restriction in programming the registers related to source memory access pattern is that the input formatter can only read data from one memory row (128-bit memory location) in a clock cycle. Therefore, if a sample is placed in memory such that the real-part (I value) is at the end of one memory location and the imaginary part (Q value) is at the beginning of the next memory location, then that would be an invalid configuration (see Figure 28-7). Further, although the accelerator supports byte-addresses, only even values are allowed for SRCADDR, SRCAINDX, SRCBINDX and SRCCINDX.

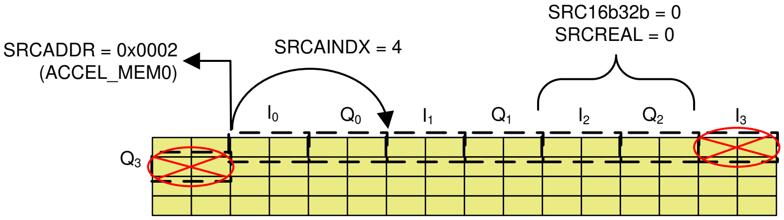

Figure 28-7. Invalid Configuration Example

28.3.1.3 Input Formatter – Circular and Shuffled Addressing

The input formatter additionally supports circular addressing in each of the A, B and C dimensions. For the A dimension, the register, SRCA_CIRCSHIFT controls the initial offset, while the registers, SRCA_CIRCSHIFTWRAP and SRC_CIRCSHIFTWRAP3X (bit 0) indicate the circular modulus at which the wrap-around happens.

For example, if SRCA_CIRCSHIFT is programmed as 7, then the input formatter skips sample indices 0 to 6 and reads samples from the source memory starting directly from index 7 (i.e., the 8th sample). Then, for wrap-around, if SRCA_CIRCSHIFTWRAP is programmed with a non-zero value and the LSB bit (bit 0) of SRC_CIRCSHIFTWRAP3X is 0, then the sample index wraps around (i.e., resets to 0) at 2^SRCA_CIRCSHIFTWRAP. Continuing the previous example, if SRCA_CIRCSHIFT = 7, SRCA_CIRCSHIFTWRAP = 9, and the LSB bit of SRC_CIRCSHIFTWRAP3X = 0, then the sample indices will be in the following order: 7, 8, 9, 10, 11, …, 510, 511, 0, 1, 2, 3, 4, 5, 6. On the other hand, in the same example, if the LSB bit (bit 0) of SRC_CIRCSHIFTWRAP3X is set equal to 1, then the sample index wraps around at 3*2^SRCA_CIRCSHIFTWRAP, and then the sample indices will be in the following order: 7, 8, 9, 10, 11, …, 1534, 1535, 0, 1, 2, 3, 4, 5, 6. Circular shifting is generally useful in CFAR and Local Maxima engines. Its usage is explained in more detail in the CFAR engine section in the scetion 28.10 of the TRM.

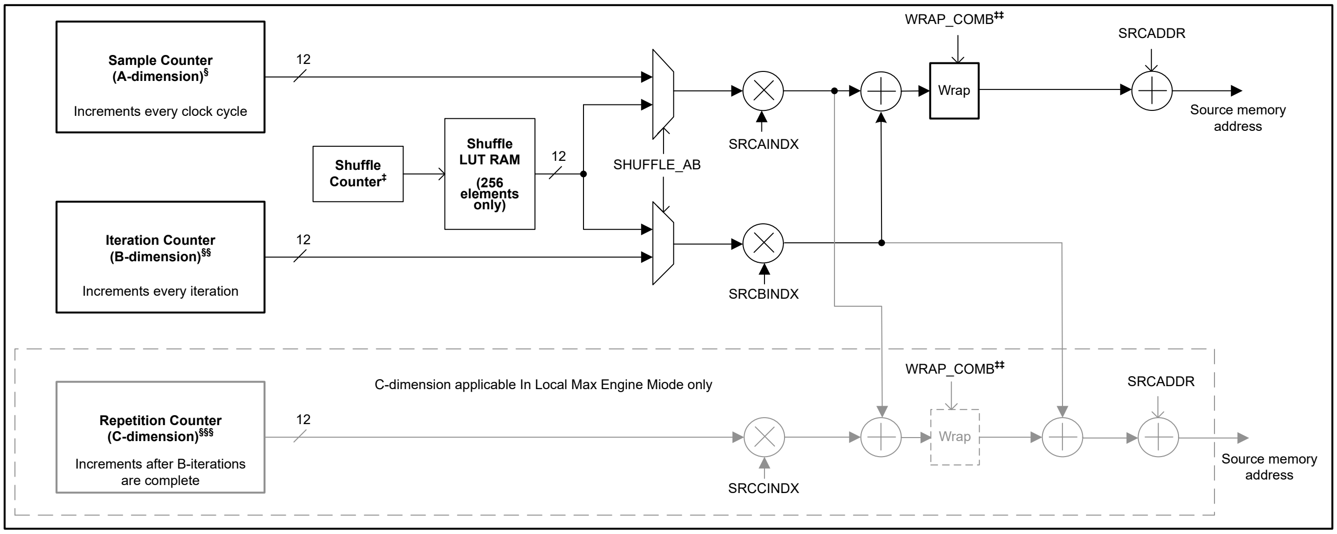
Circular shifting is also supported in B-dimension with registers SRCB_CIRCSHIFT, SRC_CIRCSHIFTWRAP and SRC_CIRCSHIFTWRAP3X (bit 1).

In addition to linear and circular addressing, the input formatter allows a shuffled access, in either the A-dimension or the B-dimension (selectable through the register SHUFFLE_AB). When engaged in A-dimension, the A-dimension’s sample index is remapped (or shuffled) through a programmable look up table, Shuffle LUT. The Shuffle LUT is a 256 element vector (RAM) storing 12-bit numbers and this LUT can be programmed by the user with the shuffled index pattern that is desired. This feature is useful in rearranging angle dimension input samples for FFT. Note that the Shuffle LUT can hold only 256 elements atmost, and therefore the shuffled access is only supported for a maximum count of 256 (eg. SRCACNT of 255). Since Angle dimension FFT is usually small in size, this limitation is acceptable.

The start index within the Shuffle LUT (RAM) is also configurable in the parameter-set using the 4-bit register SHUFFLE_INDX_START_OFFSET. This 4-bit register value along with 4 LSBs padded as zeros becomes the 8-bit start index for the 256-element look-up table RAM. This feature allows multiple small shuffle patterns to be pre-stored in the Shuffle LUT, so that any of those patterns can be selected by appropriately setting this start index register in the parameter-set. For example, if SHUFFLE_INDX_START_OFFSET = 0010b, then the shuffled indices are picked up starting from index 32 (i.e., 00100000b) of the Shuffle LUT, and these shuffled indices in turn are used to pick up appropriate input samples from the source memory.

While A- and B-dimension have independent circular wrap around capabilities through the registers explained above, some use cases may need a combined (A, B) wrap around capability. A limited wrap around capability in the combined (A, B) dimension is provided through the register WRAP_COMB (see Figure 28-8). If shuffling is enabled, it is possible that after combining (A, B) dimension, the combined value attempts to access an address outside the valid range. The register WRAP_COMB can be programmed to overcome this, and the input formatter wraps back any access outside the range [0, WRAP_COMB) to fall within this range.

Figure 28-8 shows how the sample count value (A-dimension sample index) and the iteration count value (B-dimension count) are used to calculate the address of the input sample to be fetched from the source memory. The exact addressing calculation is indicated in the schematic of the below figure. The bottom section of the figure showing C-dimension is only applicable in the case of a Local Max Engine mode of operation, which will be introduced later.



§ Starts at SRCA_CIRCSHIFT. If SRCA_CIRCSHIFTWRAP is non-zero, then wraps around at $2^{\text{SRCA\_CIRCSHIFTWRAP}}$, or at $3*2^{\text{SRCA\_CIRCSHIFTWRAP}}$

§§ Starts at SRCB_CIRCSHIFT. If SRCB_CIRCSHIFTWRAP is non-zero, then wraps around at $2^{\text{SRCB\_CIRCSHIFTWRAP}}$, or at $3*2^{\text{SRCA\_CIRCSHIFTWRAP}}$

§§§ Starts at SRCC_CIRCSHIFT. If SRCC_CIRCSHIFTWRAP is non-zero, then wraps around at $2^{\text{SRCC\_CIRCSHIFTWRAP}}$, or at $3*2^{\text{SRCA\_CIRCSHIFTWRAP}}$. Only applicable for Local Maxima Engine.

‡ Starts at SHUFFLE_INDX_START_OFFSET * 16. Increments every clock cycle if engaged in A-dim, or every iteration if engaged in B-dim.

‡‡ Wrap around based on WRAP_COMB register applies after combining A and B dimension address offsets. In local maxima engine mode, the WRAP_COMB register applies after combining A and C dimension address offsets.

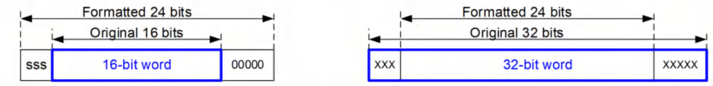
Figure 28-8. Input Formatter's Source Memory Address Generation

28.3.1.4 Input Formatter – Scaling and Formatting

The input formatter allows the input samples read from the source memory to be scaled and formatted before feeding them as 24-bit complex samples into the core computational unit.

Even though the data read from the source memory is initially 16-bits or 32-bits wide (for each I and Q), the samples expected by the core computational unit are 24-bit complex samples (24-bits each for I and Q). There is a SRCSCAL register which provides scaling options using bit-shift to generate 24-bit samples from the original 16- or 32-bit data (see Figure 28-9).

For the 16-bit case, the 24-bit sample is generated by padding (8-SRCSCAL) zeros at the LSB and SRCSCAL redundant MSBs. For the 32-bit case, the 24-bit sample is generated by dropping SRCSCAL bits at the LSB and clipping (8-SRCSCAL) bits at the MSB. Note that the register bit SRCSIGNED is used to indicate whether the input samples are signed or unsigned. When this register bit is set, the input samples are treated as signed numbers and hence any extra MSB bits are sign- extended and any clipping of MSB bits takes care of signed saturation. In most cases of interest in this TRM (for example, when performing FFT operation), the input samples would be signed and hence SRCSIGNED should be set (i.e., equal to 1).



For 16-bit case, if SRC_SCAL = 3, then 5 zeros are padded at the LSB, and 3 redundant (extension) bits are padded at the MSB

For 32-bit case, if SRC_SCAL = 5, then 5 bits are dropped at the LSB, and 3 bits are clipped (with saturation) at the MSB

A. 16- or 32-bit words to 24-bit samples

Figure 28-9. Input Formatter Data Scaling

When the input samples are complex (for example, SRCREAL = 0), there is a provision to conjugate the input samples. Setting the register bit SRCCONJ conjugates the input samples before feeding them to the core computational unit. This feature (together with a corresponding DSTCONJ register bit in the output formatter block) enables an IFFT mode from the FFT engine. Note that conjugating the input and output of an FFT block is equivalent to an IFFT function.

There is also provision for swapping I and Q samples read from memory. This can be controlled using SRCIQSWAP register bit. If SRCIQSWAP = 0, then the I sample is located at the LSB bits, and the Q sample is located at the MSB bits.

There are other registers in the input formatter, such as BPM_EN, BPMPATTERNLSB and BPMPATTERNMSB, BPMRATE, and so on, which are beyond the scope of part one of this user's guide and these registers are described section 28.7.10 of the TRM. For the immediate purpose, of the first part of the TRM, it is important to note that BPM_EN and unused dimension (C) registers must be kept 0.

28.3.1.5 Input Formatter – Register Descriptions

Table 28-2 lists all the registers of the input formatter block.

Table 28-2. Input Formatter Registers

Register	Width	Parameter Set	Description
SRCADDR	20	Yes	Source start address: This register specifies the starting address of the input samples, for example, it specifies the source memory start address from which input samples have to be fetched by the input formatter. This is a byte-address but only even values are valid. This register covers the entire address space of the eight local memories (8 × 16KB = 128 KB). Only the 17 LSB bits of this register are relevant for this device, and the 3 MSB bits are reserved for future use. The eight accelerator local memories are contiguous in the memory address space and any of them can act as the source memory (as long as the same memory bank is not configured to be used as destination memory at the same time).
SRCACNT	12	Yes	Source sample count: This register specifies the number of samples (minus 1) from the source memory to process for every iteration. The sample count is in number of samples, not number of bytes. For example, the sample count can be specified as 255 (SRCACNT = 0x0FF) in a case where a 256-point FFT is required to be performed. Note however that the sample count register does not always match the FFT size. This can happen when zero-padding of input samples is required. For example, a sample count of 192 could be used with an FFT size of 256, in which case, the input formatter will automatically append 64 zeros.
SRCAINDX	20	Yes	Source sample index increment: This register specifies the number of bytes separating successive samples in the source memory. For example, a value of SRCAINDX = 16 means that successive samples are separated by 16 bytes in memory. Only even values are allowed for this register. The maximum value allowed for this register is 65534.

Table 28-2. Input Formatter Registers (continued)

BCNT	12	Yes	Number of iterations: This register specifies the number of times (minus 1) the processing should be repeated. This register can be used to process the four RX chains back-to-back – for example, a value of BCNT = 3 means that the processing (say first dimension FFT processing) is repeated four times. Note the distinction between the NUMLOOPS register of the state machine block and the BCNT register of the input formatter block. The NUMLOOPS register specifies how many times the state machine loops through all the configured parameter sets (with each time possibly awaiting a trigger), whereas the register BCNT specifies how many times the input formatter and the computational processing of the accelerator is iterated back-to-back for the current parameter set (without any intermediate triggers). Non-zero BCNT should be used only with non-zero ACNT.
SRCBINDX	20	Yes	Source offset per iteration: This register specifies the number of bytes separating the starting address of input samples for successive iterations. For example, when using four iterations to process the four RX chains, this register can be used to specify the offset in the starting address between the successive RX chains. Note the distinction that SRCAINDX specifies the number of bytes separating successive samples for a particular iteration, whereas SRCBINDX specifies the number of bytes separating the starting address of the first sample for successive iterations. Only even values are allowed for this register. The maximum value allowed for this register is 65534.
CCNT	12	Yes	C-dimension count – i.e., Number of times (minus 1) that the B dimension iterations are performed. This register specifies the C-dimension count. C-dimension is applicable only to Local Maxima Engine. Non-zero CCNT should be used only with non-zero BCNT.
SRCCINDX	20	Yes	Source offset in C-dimension: This register specifies the number of bytes separating the starting address of input samples for successive sets of B-dimension iterations. Only even values are allowed for this register. Refer to the description section for details on the address generation logic.
SRCREAL	1	Yes	Complex or Real Input: This register-bit specifies whether the input samples are real or complex. A value of SRCREAL = 0 implies complex input and a value of SRCREAL = 1 implies real input. When real input is selected, the input formatter block automatically feeds zero for the imaginary part into the core computational unit.
SRCA_CIRCSHIFT	12	Yes	Start index for circular shift in A-dimension. Input Formatter reads samples from the source memory with this start offset to the sample index.
SRCB_CIRCSHIFT	12	Yes	Start index for circular shift in B-dimension (similar to A-dimension circular shift).
SRCA_CIRCSHIFTWRAP	4	Yes	Circular shift wrap-around point for A-dimension: This register, when set to a non-zero value, specifies the wrap-around point for A-dimension sample counter. If SRC_CIRCSHIFTWRAP3X (A-dimension bit) is set to 0, the A-dimension sample index counter wraps around (i.e., resets to 0) when the counter exceeds (2^SRCA_CIRCSHIFTWRAP-1). When that bit is 1, the A-dimension sample index counter wraps around when the counter exceeds (3*2^SRCA_CIRCSHIFTWRAP-1).

Table 28-2. Input Formatter Registers (continued)

SRCB_CIRCSHIFTWRAP	4	Yes	Circular shift wrap-around point for B-dimension: This register, when set to a non-zero value, specifies the wrap-around point for B-dimension iteration counter. Functionality is similar to SRCA_CIRCSHIFTWRAP.
SRC_CIRCSHIFTWRAP3X	2	Yes	3X enable for circular shift wrap-around: This register is used in conjunction with SRCA_CIRCSHIFTWRAP and SRCB_CIRCSHIFTWRAP to specify the wrap-around point when circular shift is used. Bit 0 of this register corresponds to A-dimension, and bit 1 corresponds to B-dimension. Refer description of SRCA_CIRCSHIFTWRAP for details.
SHUFFLE_AB	2	Yes	Shuffled addressing: If this register is set to 0b01, the Shuffle LUT is used for sample index re-ordering in A-dimension. If it is set to 0b10, it is used in B-dimension. If this register is set to 0b00, the Shuffle LUT is bypassed / ignored.
SHUFFLE LUT RAM[256] DSS_HWA_SHUFFLE_RAM	12	No	This RAM stores the Shuffle LUT contents
SHUFFLE_INDX_START_OFFSET	4	Yes	Start index for the Shuffle LUT: This register together with 4 zeros padded at the LSB becomes the 8-bit starting index for the 256-element Shuffle LUT (RAM).
WRAP_COMB	20	*Yes*	Combined wrap around for A and B dimension: This is applicable in Shuffled addressing mode. The combined A & B dimension based address offset is wrapped around this number.
SRC16b32b	1	Yes	16-bit or 32-bit input word alignment: This register-bit specifies whether the input samples fetched from source memory are to be read as 16-bits or 32-bits wide. A value of SRC16b32b = 0 implies that the input samples are 16-bits wide each (in case of complex input, real and imaginary parts are each 16 bits wide). A value of SRC16b32b = 1 implies that the input samples are 32-bits wide each.
SRCSIGNED	1	Yes	Input sign-extension mode: This register-bit, when set, specifies that the input samples are signed numbers and hence, sign-extension or signed-saturation at the MSB is required when converting 16- bit or 32-bit input words to the 24-bit wide samples to be fed into the core computational unit.
SRCCONJ	1	Yes	Input conjugation: This register-bit specifies whether the input samples should be conjugated before feeding them into the core computational unit. If SRCCONJ is set, then the input samples are conjugated. Setting this register-bit only makes sense if the samples are complex numbers (for example, SRCREAL = 0). This register, together with its counterpart in the output formatter block, enable an IFFT mode for the FFT engine. Note that conjugating the input and output of an FFT block is equivalent to an IFFT function.
SRCSCAL	4	Yes	Input scaling: This register specifies a programmable scaling using bit-shift, when converting the 16-bit or 32-bit wide input data to 24-bit wide samples before feeding into the core computational unit. See Figure 8 and its description for more details regarding this register.
SRCIQSWAP	1	Yes	Swap the I & Q samples drawn from memory. LSB bits drawn from memory is used as I, and the MSB bits are used a Q of input
IP_OP_FORMATTER_CLIP_STATUS. ip_formatter_clip_status	1	No	Read-only register that indicates clip status for input formatter (during scaling).

Table 28-2. Input Formatter Registers (continued)

CLR_CLIP_MISC.clr_clip_status	1	No	Below clip status read-registers will be cleared upon writing to this self-clearing register bit: channel_comb_clip_status, dc_acc_clip_status, dc_est_clip_status, intf_stats_mag_accumulator_clip_status, intf_stats_magdiff_accumulator_clip_status, intf_stats_thresh_mag_clip_status, intf_stats_thresh_magdiff_clip_status, twid_incr_delta_frac_clip_status, ip_formatter_clip_status, op_formatter_clip_status
BPM_PATTERN_0, BPMPATTERN_1, … BPMPATTERN_7	–	–	Described in part two of this user's guide. For the immediate purposes relevant to part one of this user's guide, all of these registers must be kept as 0.
BPMRATE	–	–	Described in section 28.7.7 of the TRM.
BPMPHASE	–	–	Described in section 28.7.7 of the TRM.

28.4 Accelerator Engine – Output Formatter

This section describes the output formatter block present in the accelerator engine (see Figure 28-10).

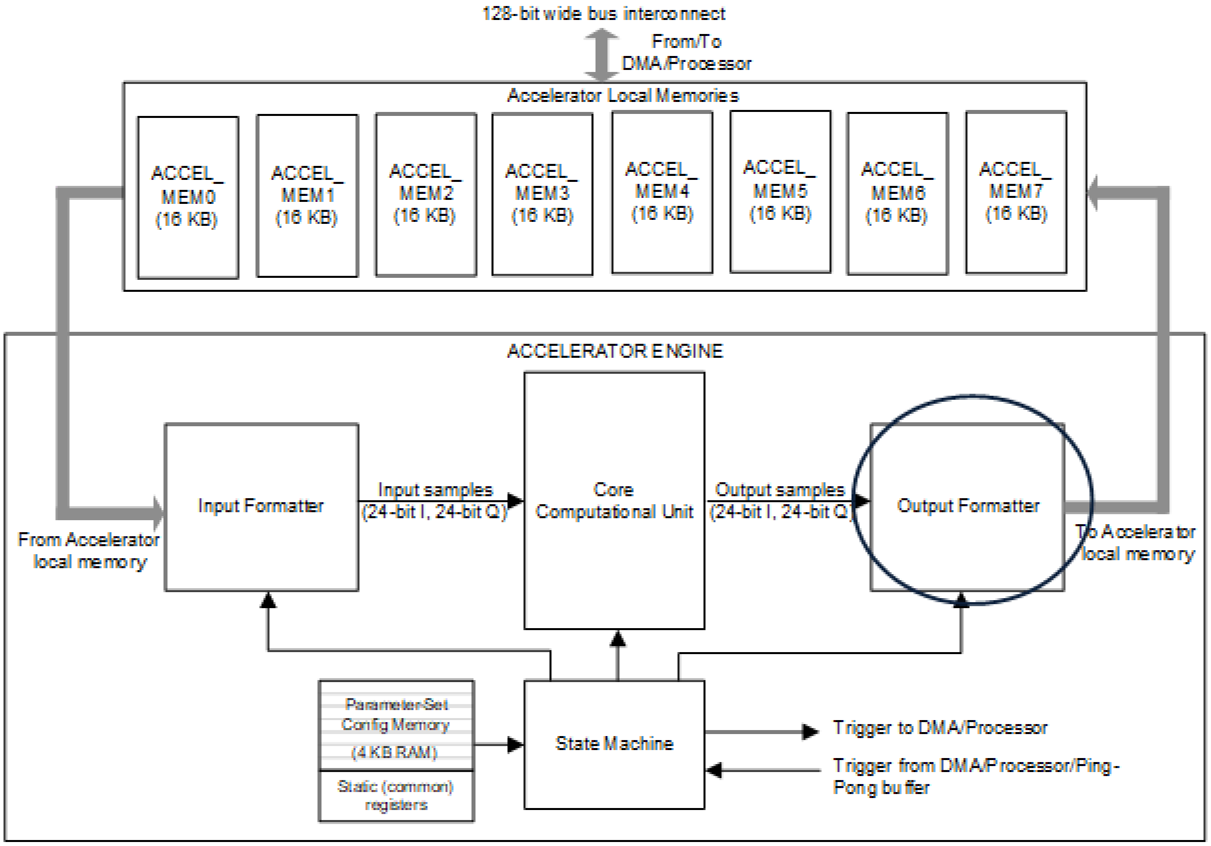


Figure 28-10. Output Formatter

28.4.1 Output Formatter

The output formatter is used to format and write the data coming out of the core computational unit into the accelerator local memory. Similar to the input formatter block discussed in the previous section, the output formatter block also provides various capabilities to format and write the samples written to the local memory – especially, various multidimensional access patterns (for example, transpose writes), 16-bit or 32-bit aligned word writes, scaling using bit-shifts to generate 16-bit or 32-bit words from 24-bit wide samples, real versus complex output write, and more.

28.4.1.1 Output Formatter – Operation

The output formatter block is responsible for storing the samples coming out of the core computation unit into the accelerator local memory (see Figure 28-10). As mentioned in the previous section, the data flow from the input formatter, through the core computational unit, to the output formatter, is designed to sustain a steady-state throughput of one complex sample per clock cycle. Thus, typically, the output formatter accepts one sample (24-bit I and 24-bit Q) from the core computational unit every clock cycle and writes it to the accelerator local memory. Just like the input formatter, the output formatter also supports lot of flexibility in how the samples are formatted and written into the memory.

The memory into which the output formatter writes the data is referred to as *destination memory*. Note that any of the four accelerator local memories can be the destination memory, with the important restriction that the source memory cannot be same as the destination memory. In other words, each of the eight 16KB memory banks can either function as source memory, or as destination memory at any time (for example, in any given parameter set).

28.4.1.2 Output Formatter – 2-D Indexed Addressing for Destination Memory Access

The parameter-set register DSTADDR specifies the start address at which the output samples must be written into the accelerator local memory. Similar to the SRCADDR register of the input formatter, the DSTADDR register of the output formatter is a byte-address and a value of 0x0 corresponds to the first memory location of ACCEL_MEM0 memory. The DSTADDR register maps to the entire 128KB address space of the eight accelerator local memories (each 16KB). As mentioned in the previous paragraph, in a given parameter set, SRCADDR and DSTADDR cannot be configured such that the input samples being fetched and the output samples being written out are accessing the same memory bank.

Even though the core computational unit produces a 24-bit complex output stream, this output data can be written to the memory as either 16-bit wide samples or 32-bit wide samples. Also, they can be written out as complex samples or real samples (for example, drop imaginary part – applicable when performing log-magnitude computation). These two aspects are configured using register bits DST16b32b and DSTREAL. See Section 28.4.1.4 for a description of these and other registers pertaining to the output formatter block. As an example, if DST16b32b = 0 and DSTREAL = 0, then the output samples are written to the memory as 16-bit complex samples (16-bit I and 16-bit Q), shown in Figure 28-11.

Similar to the input formatter block, the output formatter block also supports flexible patterns to write multidimensional data to the destination memory and this makes it convenient when the data corresponding to multiple RX channels must be interleaved, or when performing multidimensional (FFT) processing. This feature is facilitated through the DSTAINDX, DSTACNT, DSTBINDX, and BCNT registers, which are part of each parameter-set configuration.

The register DSTAINDX specifies how many bytes separate successive samples to be written to the destination memory and the register DSTACNT specifies how many samples must be written per iteration. Note that DSTACNT can be different from SRCACNT – this is useful when only a subset of the output samples need to be stored in the output memory (for example, if some FFT output bins must be discarded). The register DSTBINDX specifies how many bytes separate the start of output samples for successive iterations and BCNT specifies the number of iterations. The BCNT register is common for input formatter and output formatter. These registers can be better understood using the example given in Figure 28-11.

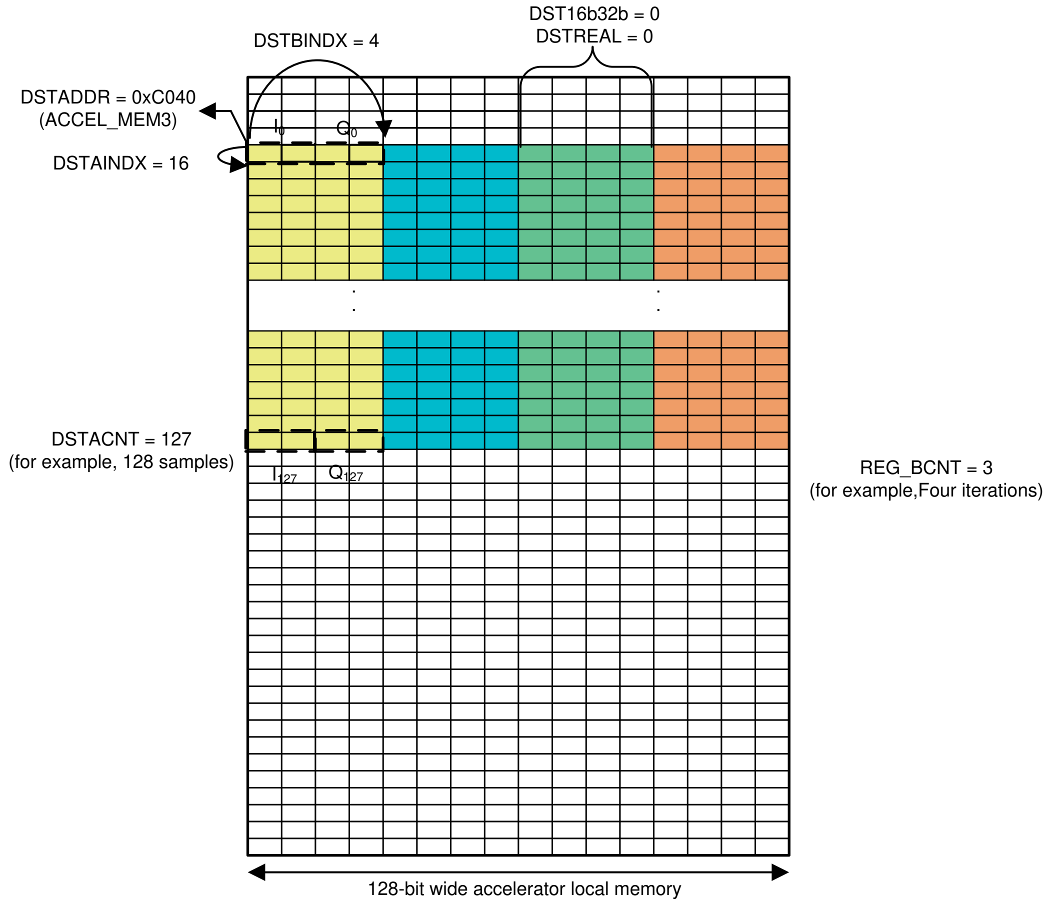

Figure 28-11. Output Formatter Destination Memory Access Pattern (Example)

In the example shown in Figure 28-11, the output data consists of complex data (16-bit I and 16-bit Q) that is written to ACCEL_MEM3. The output data consists of four sets of 128 samples each (say, corresponding to FFT output of four RX antennas) and these are shown in four different colors. Each sample occupies 4 bytes and the samples are written to the output memory at a specific start address inside ACCEL_MEM3, as shown in Figure 28-11. The samples for the four RX antennas are written to the memory in an interleaved manner. Thus, for this example, a value of DSTADDR = 0xC040, DSTAINDX = 16, DSTACNT = 127, and DSTBINDX = 4 are used. The register BCNT (common for input formatter and output formatter) is configured with a value of 3, corresponding to the four iterations required (for the four RX antennas). In steady state, for each clock cycle, the output formatter accepts one complex sample from the core computational unit and writes it into the memory as per the 2-D indexed addressing pattern programmed.

The register DSTACNT, which corresponds to the number of samples written to the destination memory for each iteration does not need to be equal to SRCACNT. This is useful in cases where some of the output samples (for example, some FFT bins at the end) can be dropped and do not need to be written into the destination memory. Another register, DST_SKIP_INIT is also available, which can be used to skip some samples in the beginning as well. The number of samples written to the destination memory for each iteration is equal to (DSTACNT + 1) – DST_SKIP_INIT.

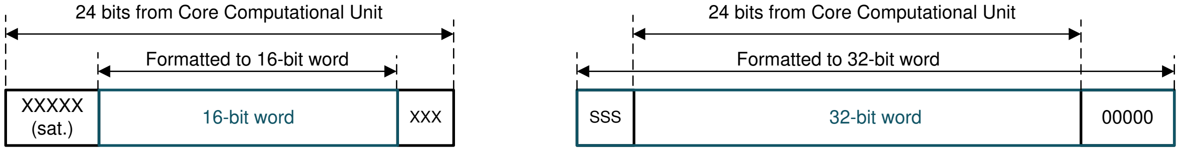
Note that when performing FFT operations, internally the core computational unit sends out FFT output data in bit-reversed addressing order, but this is automatically handled in the output formatter, such that when the FFT output samples are written into the destination memory, they are written out in the correct normal order. Therefore, no special procedure is required on the part of the main processor to read the FFT output samples in the right sequence.

Similar to the input formatter, the output formatter can write data into only one memory row (128-bit memory location) in a clock cycle. Therefore DSTADDR, DSTAINDX, and DSTBINDX should be programmed such that no sample needs to be partially written in one memory row and the next (e.g. if DST16b32b=1). Also, these address parameters should be restricted to even values.

28.4.1.3 Output Formatter – Scaling and Formatting

The output formatter allows the 24-bit output samples from the core computational unit to be scaled and formatted before writing them to the destination memory as 16-bit or 32-bit words. There is a DSTSCAL register which provides scaling options using bit-shift, to take the 24-bit samples and convert them to 16-bit or 32-bit data.

For the 16-bit case (see Figure 28-12), the 24-bit sample (24-bits for each I and Q) is converted to 16-bit word by dropping DSTSCAL bits at the LSB and by clipping with saturation (8-DSTSCAL) bits at the MSB. For the 32-bit case, the 24-bit sample is padded with DSTSCAL extra bits at the MSB and with (8-DSTSCAL) extra zeros at the LSB. Note that the register bit DSTSIGNED is used to indicate whether the output samples are signed or unsigned. When this register bit is set, the output samples are treated as signed numbers and therefore any extra MSB bits are sign-extended and any clipping of MSB bits handles signed saturation. In most cases of interest in the TRM (for example, when performing FFT operation), the output samples would be signed and therefore DSTSIGNED should be set (for example, equal to 1). However, if the log-magnitude operation in the core computational unit is enabled, then the output samples are unsigned and therefore DSTSIGNED is cleared (for example, equal to zero).



For 16-bit case, if REG_DSTCAL = 3, then 3 btis are dropped at the LSB, and 5 bits are clipped (saturated) at the LSB

For 32-bit case, if REG_DSTCAL = 3, then 5 zeros are padded at the LSB, and 3 bits are extended at the MSB

Figure 28-12. Output Formatter Data Scaling

When the output samples are complex (for example, DSTREAL = 0), there is a provision to conjugate the output samples. Setting the register bit DSTCONJ conjugates the output samples before writing them to the destination memory. This feature (together with a corresponding SRCCONJ register bit in the input formatter block) enables an IFFT mode from the FFT engine.

In addition, there is provision for swapping I and Q samples written into the destination memory. This is controlled using DSTIQSWAP register bit.

28.4.1.4 Output Formatter – Register Descriptions

Table 28-3 lists all the registers of the output formatter block.

Table 28-3. Output Formatter Registers

Register	Width	Parameter Set	Description

Table 28-3. Output Formatter Registers (continued)

DSTADDR	20	Yes	Destination start address: This register specifies the starting address of the output samples, for example, it specifies the destination memory start address at which the output samples have to be written by the output formatter. This is a byte-address but only even values are valid. This register covers the entire address space of the eight local memories (8 × 16KB = 128 KB). Only the 17 LSB bits of this register are relevant for this device, and the 3 MSB bits are reserved for future use. The eight accelerator local memories are contiguous in the memory address space and any of them can act as the destination memory (as long as the same memory bank is not configured to be used as source memory at the same time).
DSTACNT	12	Yes	Destination sample count: This register specifies the number of samples (minus 1) to be written to the destination memory for every iteration. The sample count is in number of samples, not number of bytes. For example, the sample count can be specified as 191 (DSTACNT = 0x0BF) in a case where 192 samples must be written. Note that the DSTACNT register can be different from SRCACNT or even the FFT size. This is useful when only a part of the FFT bins must be written to memory and the remaining (far-end FFT bins) can be discarded. This register description is true when the DST_SKIP_INIT register value is zero (see further for more information related to DST_SKIP_INIT).
DSTAINDX	20	Yes	Destination sample index increment: This register specifies the number of bytes separating successive samples to be written to the destination memory. For example, a value of DSTAINDX = 16 means that successive samples written to the destination memory should be separated by 16 bytes. Only even values are allowed for this register. The maximum value allowed for this register is 65534.
DSTBINDX	20	Yes	Destination offset per iteration: This register specifies the number of bytes separating the starting address of output samples for successive iterations. For example, when using four iterations to process four RX chains, this register can be used to specify the offset in the starting address between the successive RX chains. Note the distinction that DSTAINDX specifies the number of bytes separating successive samples for a particular iteration, whereas SRCBINDX specifies the number of bytes separating the starting address of the first sample for successive iterations. Only even values are allowed for this register. The maximum value allowed for this register is 65534.
DST_SKIP_ INIT	10	Yes	Destination skip sample count: This register specifies how many output samples should be skipped in the beginning, before starting to write to the destination memory. This is useful if only a certain part of the FFT output (skipping the first several bins) need to be stored in memory. The total number of samples written to destination memory is equal to DSTACNT+1-DST_SKIP_INIT.

Table 28-3. Output Formatter Registers (continued)

DSTREAL	1	Yes	Complex or real output: This register-bit specifies whether the output samples are real or complex. A value of DSTREAL = 0 implies complex output and a value of DSTREAL = 1 implies real output. When real output is selected, the output formatter block automatically stores only the real part into the destination memory. This is useful when the core computational unit is configured to output magnitude or log-magnitude values.
DST16b32b	1	Yes	16-bit or 32-bit output word alignment: This register-bit specifies whether the output samples are to be written as 16-bits or 32- bits wide in the destination memory. A value of DST16b32b = 0 implies that the output samples are to be written as 16-bit words (in case of complex output, real and imaginary parts are each 16 bits wide). A value of DST16b32b = 1 implies that the output samples are 32-bits wide each.
DSTSIGNED	1	Yes	Output sign-extension mode: This register-bit, when set, specifies that the output samples are signed numbers and therefore, sign-extension or signed-saturation at the MSB is required when converting the 24-bit wide samples coming from the core computational unit into 16-bit or 32-bit output words to be written to the destination memory.
DSTCONJ	1	Yes	Output conjugation: This register-bit specifies whether the output samples must be conjugated before writing them into the destination memory. If DSTCONJ is set, then the output samples are conjugated. Setting this register-bit only makes sense if the samples are complex numbers (for example, DSTREAL = 0). This register, together with its counterpart in the output formatter block, enables an IFFT mode for the FFT engine.
DSTSCAL	4	Yes	Output scaling: This register specifies a programmable scaling using bit-shift, when converting the 24-bit samples coming from the core computational unit into 16-bit or 32-bit wide words to be written to the destination memory. See Figure 11and its description for more details regarding this register.
DSTIQSWAP	1	Yes	IQ Swapping : Swap the I & Q samples written out to memory.
IP_OP_FORMATTER_CLIP_STATUS. op_formatter_clip_status	1	No	Read-only register that indicates clip status for output formatter (during scaling).
MEM_INIT_START. MEM_INIT_START_PARAM_RAM	1	No	Writing 1'b1 would start the memory initialization for the Param memory. Self-clearing bit.
MEM_INIT_START.MEM_INIT_START_DMEM7, MEM_INIT_START_DMEM6, .. MEM_INIT_START_DMEM0	1	No	Writing 1'b1 would start the memory initialization for the DMEM7, DMEM6.. DMEM0. Self-clearing bit
DMEM0, DMEM1… DMEM7 (MEM_ACCESS_ERR_STATUS) MEM_ACCESS_ERR_STATUS.dmem0..7	1	No	Memory access error: This set of 8 1-bit read-only registers indicates if there is a memory access error caused by incorrect configuration or usage of the accelerator, where both the DMA and the accelerator are attempting to access the same 16KB memory at the same time. The composite 8- bit register indicates the error status for the 8 16KB memories (DMEM0 bit corresponds to ACCEL_MEM0).

28.5 Accelerator Engine – Core Computational Unit

This section describes the core computational unit present in the accelerator engine (see Figure 28-13).

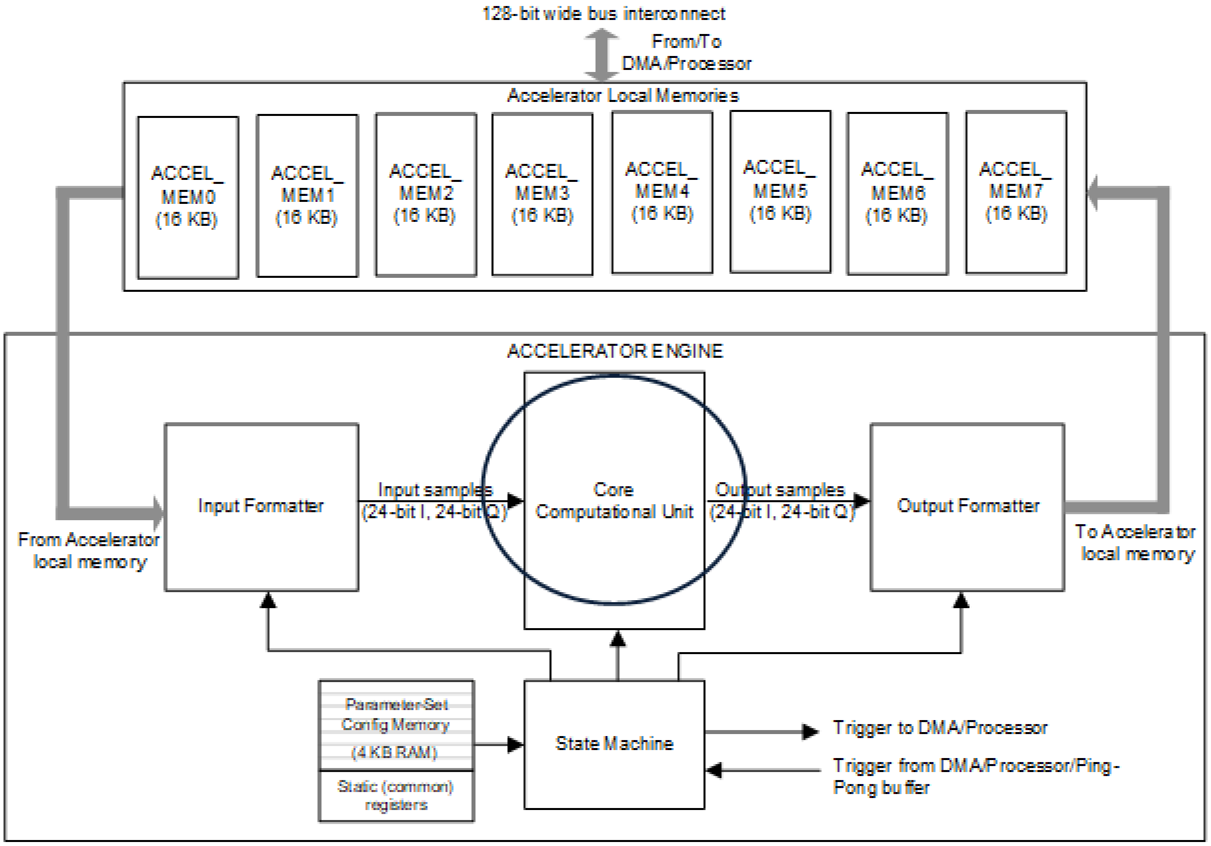


Figure 28-13. Core Computational Unit

28.5.1 Core Computational Unit

The core computational unit performs the mathematical operations required for the key functions, such as FFT, log-magnitude, CFAR detection, and so on. The core computational unit accepts a streaming 24-bit complex input (24 bits for each I and Q) from the input formatter block and it outputs a streaming 24-bit complex output (24 bits for each I and Q) to the output formatter block.

Figure 28-14 shows the block diagram of the core computational unit. The core computational unit has four main computation engines, namely:

- FFT Engine: Performs Pre-processing, Windowing, FFT and Log-magnitude.
- CFAR Engine: Performs CFAR detection using CFAR-CA or CFAR-OS method.
- Local Maxima Engine: Performs threshold and local maxima based peak identification.
- Compression Engine: Used for compression and decompression of radar data.

Only one of these four engines can be operational at any given instant. However, in separate parameter sets, different engines can be configured and used, so that multiple parameter sets executing one after another can accomplish a sequence of computational operations as desired. The register ACCEL_MODE controls which engine gets used in a given parameter set.

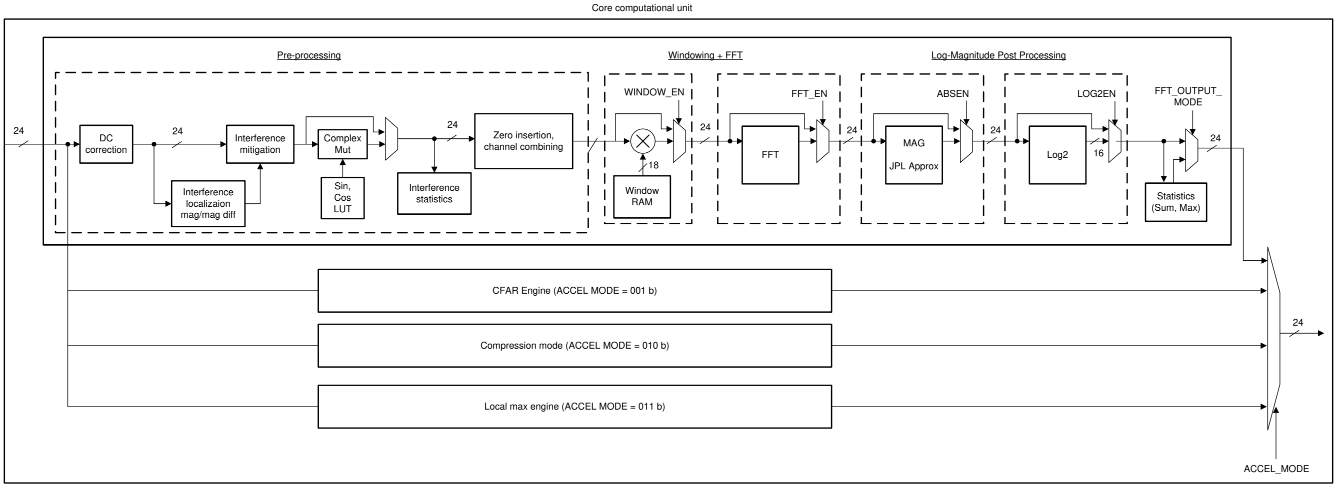

Figure 28-14. Core Computational Unit Block Diagram

28.5.1.1 Core Computational Unit – FFT Engine – Operation

The core computational unit operates on the streaming input of samples coming from the input formatter block, and in general outputs a stream of samples (after an initial latency in some cases) to the output formatter block. In general, at steady-state, one input sample is processed and one output sample is produced every clock.

The FFT Engine in the core computational unit has the ability to perform pre-processing, windowing, FFT, and log-magnitude computations. Each of these computational subblocks operate on a streaming input and produce a streaming output at the throughput of one sample per clock. These computational subblocks are stitched together one after the other in a series, as shown in Figure 28-14. This architecture allows multiple operations to be done in a streaming manner (for example, windowing and FFT can be done together), while at the same time, providing the user flexibility to choose one operation at a time.

The parameter-set registers WINDOW_EN, FFT_EN, ABS_EN, and LOG2_EN control the multiplexers (see Figure 28-14), which decide what operations are performed on the input samples for that parameter set.

Note that for the purpose of FFT engine operation in this section, the registers ACCEL_MODE and FFTOUT_MODE must be kept at zero. The purpose of these registers is covered in following sections of the TRM.

28.5.1.2 Core Computational Unit – FFT Engine – Windowing

The incoming samples from the input formatter to the core computational unit are passed through the (optional) windowing operation (see Figure 28-15). Windowing operation is often required prior to performing FFT, to mitigate the sinc roll-off leakage from one strong FFT bin to the adjacent bins.

As the incoming samples from the input formatter stream in, each sample is multiplied by the appropriate window coefficient read from a Window RAM. Because the incoming samples are complex 24-bits wide (24-bits for each I and Q), the windowing operation involves multiplying the 24-bit I and 24-bit Q of the incoming sample with the window coefficient (see Figure 28-15). The output of this multiplication is rounded back to 24-bit I and 24-bit Q by dropping excess LSBs. Note that windowing can be enabled by setting the register bit WINDOW_EN to 1.

The window RAM can hold up to 2048 32-bit words. The window coefficients can be stored in these words in one of the following three formats:

1. 18-bit real coefficients: If WINDOW_MODE = 0b00, the window coefficients are assumed to be 18-bit signed real values. Up to 2048 real coefficients can be stored in the window RAM in this mode (one 32-bit word in the RAM stores one 18-bit coefficient).
2. 16-bit real coefficients: If WINDOW_MODE = 0b01, the window coefficients are assumed to be 16-bit signed real values. Up to 4096 real coefficients can be stored in the window RAM in this mode (one 32-bit word in the RAM stores two successive 16-bit coefficients: the 16LSBs store coefficients 0, 2, 4, etc. and 16MSBs store coefficients 1, 3, 5, etc.).
3. 16-bit complex coefficients: If WINDOW_MODE = 0b10, the window coefficients are assumed to be 16-bit I and 16-bit Q complex values. Up to 2048 complex coefficients can be stored in the window RAM in this mode (one 32-bit word in the RAM stores the real part of the coefficient in the 16 LSBs of the word and the imaginary part in the 16 MSBs of the word).

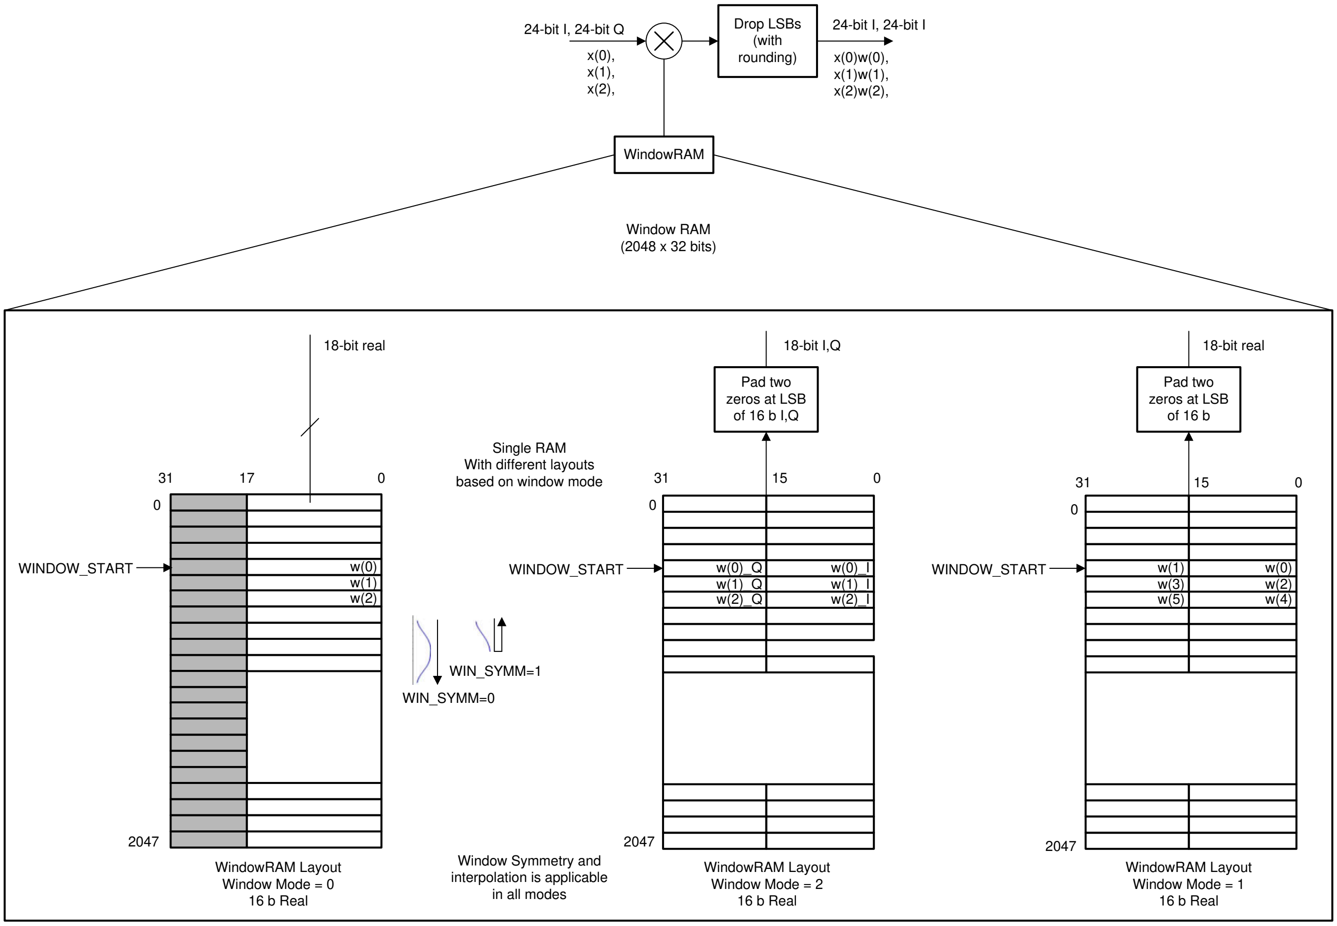

Figure 28-15. Window RAM Layout for 18b Real, 16b Complex and 16b Real Modes

The start location (32-bit word index) in the window RAM is programmed in a 11-bit register WINDOW_START as part of the parameter set, so that the windowing computation can pick the appropriate window coefficients starting from that index. For each incoming sample, the index keeps incrementing, so that each successive sample is multiplied by the successive window coefficient. At the end of each iteration (for example, when SRCACNT number of samples have been processed), the index resets back to the starting coefficient index programmed for the parameter set, so that the next iteration can be performed. At the end of all the iterations of the current parameter set, the next parameter set can use a different window if desired. For example, when performing second- and third-dimension FFTs one after another (in two parameter sets), the window functions for both these FFTs can be pre-stored in the Window RAM and appropriate start index can be provided for each of the FFT operation dimensions.

If the window function is symmetric, the user may store only one half of the window coefficients in the Window RAM. The register bit WINSYMM, when set, indicates that after SRCACNT / 2 samples (or, if SRCACNT is odd, (SRCACNT + 1) / 2 samples) are processed, the window coefficients read-indexing must be reversed, so that the same set of coefficients used for the first SRCACNT / 2 samples are reused in the reverse order for the next SRCACNT / 2 samples. (See Figure 28-15). If SRCACNT is odd, then the last window coefficient is read only once, when the direction is reversed. If SRCACNT is even, then the last window coefficients is read twice, when the direction is reversed. In the dynamic window mode, the coefficients are read from the corresponding bank only.

The output of the windowing computation is 24-bit I and 24-bit Q, which is streamed into the FFT subblock.

28.5.1.3 Core Computational Unit – FFT Engine – FFT

The FFT subblock performs FFT on the incoming 24-bit I and 24-bit Q data stream. The FFT size is programmable, in the range, 2 to 2048. FFTs of length 2N for N = 0 to 11, and 3x2N for N = 0 to 9 are supported. Advanced features such as direct computation of two-dimensional FFTs, as well as an FFT *stitching* feature that realizes FFTs of larger lengths using a two-step process, are also supported. But their description is deferred to section 28.7.6 of the TRM.

The lowest FFT size of 2 is mostly useful as a *complexadd-subtract* feature or while using the *FFT*stitchingfeature. FFT sizes of 4, 8, 16, and 32 can be used for third dimension (angle estimation) FFT.

The FFT operation can be enabled or disabled by using the register bit FFT_EN. When enabled, the FFT subblock computes the FFT of the input data stream and produces a 24-bit I and 24-bit Q output stream. This output stream is initially in bit-reversed order, but the output formatter handles appropriately writing the output to the destination memory in the correct order.

The FFT implementation comprises a series of butterfly stages. Depending on the FFT size needed, an appropriate number of butterfly stages are employed.The FFT size is programmed using the registers, FFTSIZE and FFTSIZE_3X_EN.

For power-of-2 FFT sizes, the register bit FFTSIZE_3X_EN should be kept 0. The FFT size is configured using the register FFTSIZE and the actual FFT size in this case is 2^FFTSIZE. When an FFT size of the form (3 * power-of-2) is needed, then the register bit FFTSIZE_3X_EN should be set to 1. In this case, the actual FFT size is 3 * 2^FFTSIZE.

For example, if FFTSIZE_3X_EN is 0, then FFTSIZE = 5 means 32-point FFT, FFTSIZE = 7 means 128-point FFT, and so on. In this case, the FFT is realized using a series of FFTSIZE number of radix-2 butterfly stages. On the other hand, if FFTSIZE_3X_EN is set to 1, then FFTSIZE = 5 means a 96-point FFT, FFTSIZE = 7 means 384-point FFT. In these cases, an additional radix 3 butterfly stage is engaged before feeding to the original series of radix-2 butterfly stages.

Note that the FFT size must be equal to or larger than SRCACNT, and the input formatter block automatically zero-pads extra samples to account for the difference between FFT size and SRCACNT.

28.5.1.4 Core Computational Unit – FFT Engine – FFT – Zero Padding

The FFT engine has provision for *zeropadding*, which is important when performing FFT of a set of samples whose length doesn’t match a supported FFT size. The FFT engine automatically feeds the required number of zeros into the core computational unit, whenever the FFT size (as programmed using the FFTSIZE register, which is described in a later section) does not match the SRCACNT setting.

For example, if the number of input samples read by the input formatter is 56 (for example, SRCACNT = 55) and the FFT size is programmed to be 64 (FFTSIZE = 6, FFTSIZE_3X_EN = 0), then the FFT engine feeds 8 zeros at the end of each iteration, before starting to read the input samples for the next iteration from the source memory. This zero-padding provision enables the core computational unit to perform 64-point FFT with the correct set of zero-padded input samples.

The zero padding is effective only when performing FFT operation in the core computational unit (i.e., when FFT_EN = 1) and not otherwise. Advanced features such as zero insertion (at programmable locations) and channel combining are described in section 28.7.9 of the TRM.

28.5.1.5 Core Computational Unit – FFT Quantization and Speed Performance

As is well known, a butterfly stage typically consists of add-subtract and twiddle multiplication operations. At the output of each add-subtract structure, the bit-width would increase by 1 bit (for example, 24-bit input would grow to 25-bit output). To handle this one-bit growth due to add-subtract operation, there is a provision at the output of each butterfly add-subtract stage to scale the result back to 24 bits, by either dividing the output by 2 (round off one LSB) or by saturating one MSB, shown in Figure 28-16.

The multi-bit register BFLY_SCALING is used to control this divide-by-2 scaling operation at each stage, so that the user has full flexibility to control the signal level through the different butterfly stages. If BFLY_SCALING = 0 for a particular stage, then the 25-bit output is saturated at the MSB to get back to 24 bits. Otherwise, it is convergent-rounded at the LSB to get back to 24 bits. The user can thus control the scaling at each of the butterfly stages. The LSB of this multi-bit register corresponds to the last stage and the MSB of this register corresponds to the first stage. For an FFT size of 64, only the LSB 6 bits are relevant. Similarly, for an FFT size of 3*64, the LSB 6 bits are relevant. Additionally the register, BFLY_SCALING_FFT3X indicates the scaling option for the single radix-3 stage (i.e., it supports removing 0 or 1 or 2 LSBs).

There is a multi-bit read-only register FFTCLIP which indicates whether there was any clipping in any of the butterfly stages. This register is a sticky register that gets set when a clipping event occurs and remains set until it is cleared using the CLR_FFTCLIP register bit. See the register description of FFTCLIP in Section 28.5.1.9.

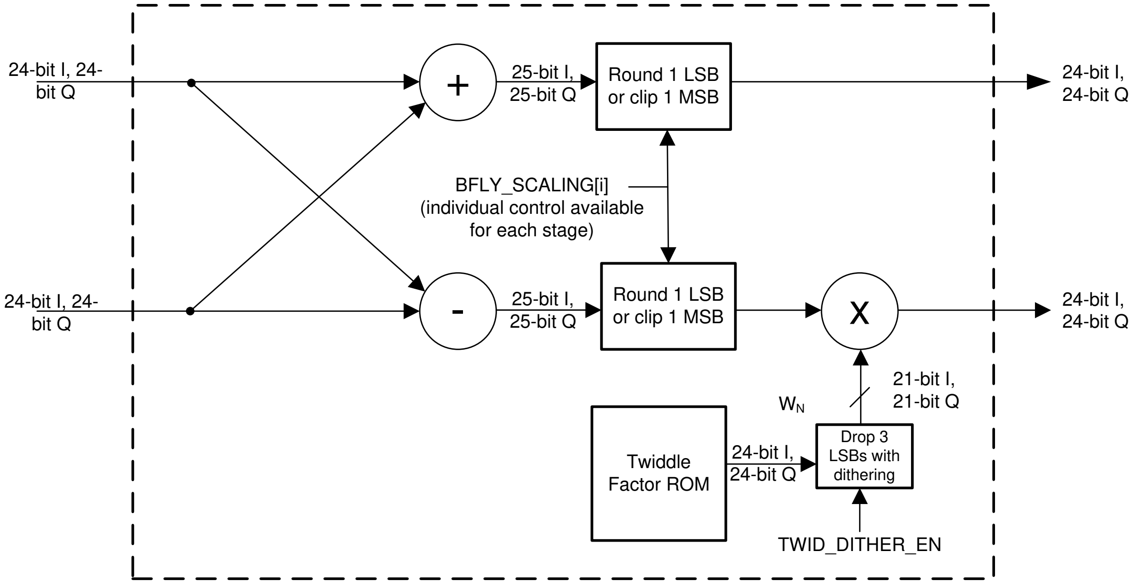

Figure 28-16. Butterfly Stage Fixed-Point

The twiddle factors are stored as 24-bit I and 24-bit Q coefficients. Prior to twiddle factor multiplication, the coefficients are reduced to 21-bit I and 21-bit Q by dropping three LSBs (with optional dithering). The purpose of dithering is to eliminate any repetitive quantization noise patterns from degrading the SFDR of the FFT. The use of dithering here is optional. For dithering, an LFSR is used to generate a random pattern, for which the LFSR seed must be loaded with a non-zero value (see LFSRSEED in the register descriptions).

The SFDR performance of the FFT, with dithering enabled, is better than –140 dBc, as shown in Figure 28-17.

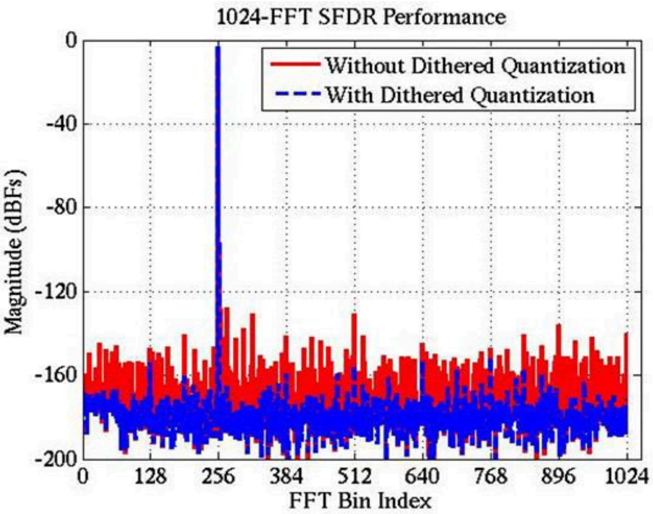

Figure 28-17. FFT SFDR Performance With and Without Dithering

The architecture of the FFT is such that it can take a streaming input (one sample per clock) and produce a streaming FFT output (one sample per clock), in steady-state. There is an initial latency of approximately *FFT size* number of clocks. This latency only comes into picture once for a given parameter set. Within a parameter set, multiple FFT iterations can be performed back-to-back (for example, for four RX) with no additional latency between iterations.

Because the implementation uses 300MHz clock in the device, a 256-point complex FFT for four RX chains would take 256 + 256 × 4 clock cycles to complete, which corresponds to 3.2 µs (plus a few clocks of implementation latencies, which are not accounted here since it is negligible). Table 28-4 lists the approximate computation time needed for various FFT sizes.

Table 28-4. FFT Computation Time

Example	FFT Size	Number of Back-to-Back Iterations	Number of Clock Cycles (Initial latency + Computation)	Total Duration
1	256	4	256 + (256 × 4)	3.2 µs
2	128	4	128 + (128 × 4)	1.6 µs
3	8	64	8 + (64 × 8)	1.3 µs

The output of the FFT can be fed to the output formatter or it can be sent to the magnitude/log-magnitude computation subblock.

Note

The FFT is a complex FFT implementation. If the input samples are real-only, then the SRCREAL register bit can be set, such that the imaginary part (Q-part) will be forced to zero by the input formatter block.

28.5.1.6 Advanced FFT Features – FFT Stitching

FFT Engine additionally allows the computation of 4096 & 8192-point FFTs by using FFT stitching. This is done in two-passes. In the first pass, 2 or 4 sets of 2048-point FFT are computed. In the next pass, 2048 sets of 2-point or 4-point FFTs are computed with appropriate twiddle pre-multiplications using the complex multiplier in mode 3 (described in part 2 of user guide) yielding the final 4096 or 8192-point FFT. The relevant register (CMULT_MODE, TWIDINCR, WINDOW_INTERP) settings are indicated in table below A detailed example of FFT stitching along with window interpolation is provided in HWA2.1 Examples document.

Table 28-5. FFT Stitching Registers

FFT Size	CMULT_MODE	TWIDINCR	WINDOW_INTERP
4096	3	1	2
8192	3	2	1

28.5.1.7 Advanced FFT Features – 2D FFT

The traditional approach for realizing an M×N point 2-D FFT involves two passes: first pass computing M number of N-point FFTs on the input arrays, and then a second pass computing N number of M-point FFTs on the result of the first pass. HWA instead supports a direct and faster computation of M×N 2-D FFT, for small M×N sizes (M×N≤2048, N being a power of 2).

The following illustrates the necessary programming for an example with M=16 and N=4. The register FFT_SIZE should be set to , and the register FFT_SIZE_DIM2 should be set to . Further the M×N samples of input data should be placed in the memory and fed sequentially to the FFT engine in an interleaved manner as follows. If A is the 2-D 16×4 size input array for the 2-D FFT, then the data placement should ensure that the FFT engine's input order is $A_{0,0}$, $A_{0,1}$, $A_{0,2}$, $A_{0,3}$, $A_{1,0}$, $A_{1,1}$, $A_{1,2}$, $A_{1,3}$, $A_{2,0}$, $A_{2,1}$, …, $A_{15,0}$, $A_{15,1}$, $A_{15,2}$, $A_{15,3}$. The FFT engine computes the 2-D FFT results, and automatically stores them in the destination memory in the right order. The output memory contents would be linear order: $B_{0,0}$, $B_{0,1}$, $B_{0,2}$, $B_{0,3}$, $B_{1,0}$, $B_{1,1}$, $B_{1,2}$, $B_{1,3}$, $B_{2,0}$, $B_{2,1}$, …, $B_{15,0}$, $B_{15,1}$, $B_{15,2}$, $B_{15,3}$, where B represents the 2D FFT of A.

If zero padding is required in one or both dimensions, it can be achieved through the accelerator's zero insertion feature. It can be done by adding zeros at right locations in the M×N long linear array streaming into the FFT engine (subject to the 256 element limit in zero insertion feature). If 2-D windowing is required before the 2-D FFT, then the 2-D M×N window coefficients can be unrolled into one long linear array and placed in the window RAM. This is illustrated in the below figure for a 32×16 2-D FFT case. If 2-D FFT feature is enabled in any parameter set, it is recommended that the advanced 2D statistics feature be disabled in that parameter set.

This 2-D FFT feature can be used in performing small sized 2-D FFTs, repeatedly over several iterations (e.g. Azimuth × Elevation 2-D FFTs using A dimension, performed for multiple Doppler or Range bins using B dimension). The computation time for B iterations of M×N 2-D FFTs would be (B+1)×(MN) = BMN+MN. In comparison, the traditional two pass approach mentioned earlier, uses (BM+1)×N cycles for first pass (if first passes of all B iterations are performed together) and (BN+1)×M cycles for second pass, in total 2BMN+M+N.

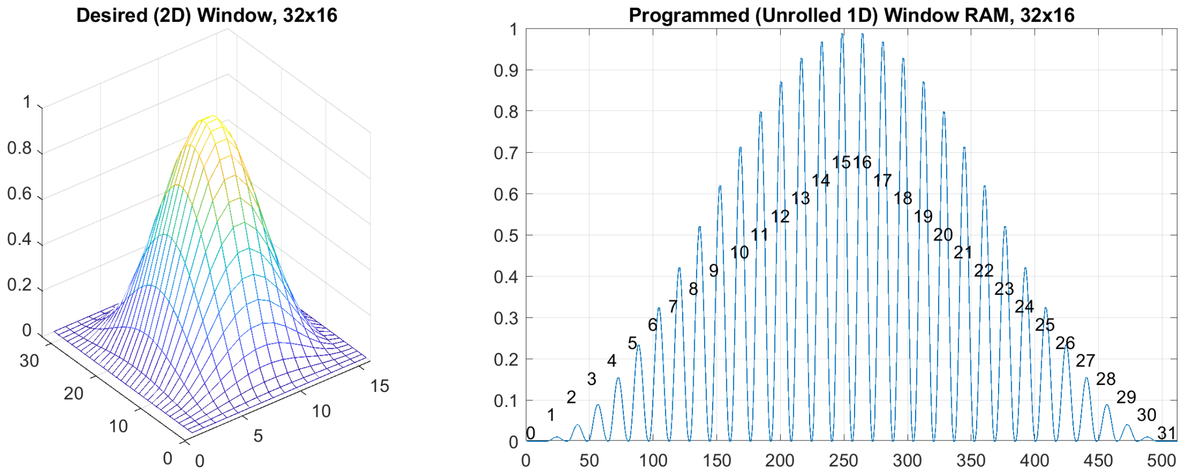

Figure 28-18. Unrolling 32x16 2D Array Window Coefficients to a 512 1D Vector for Placement in Window RAM

28.5.1.8 Core Computational Unit – FFT Engine – Magnitude and Log-Magnitude Post-Processing

The magnitude and log-magnitude post-processing block computes absolute value or log2 of the absolute value of its input. Because this block is connected to the output of the FFT engine, the computation of absolute value (and log2) can be directly performed on the streaming FFT output. Alternately, the FFT block can be bypassed and only the magnitude and log-magnitude block can be employed.

The processing in this block first involves computation of magnitude (absolute value) of the input samples in the magnitude subblock (using JPL approximation in HWA 2.0 and a modified approximation in HWA 2.1).). The result of the magnitude computation is fed into a Log2 computation subblock, which uses a look-up table-based approximation to compute logarithm- base-2 of the magnitude.

As shown in Figure 28-14, if the register-bit ABS_EN is set, the magnitude computation subblock is enabled. In addition, if the register-bit LOG2_EN is set, then the Log2 computation subblock is also enabled. Note that setting LOG2_EN makes sense only when ABSEN is also set.

In HWA 2.0, the magnitude computation uses JPL (Levitt and Morris) approximation. This approximation for magnitude of a complex number (I + jQ) is defined as follows, let $U = \max(|I|, |Q|)$ and $V = \min(|I|, |Q|)$. Then, the magnitude can be approximated as follows in Figure 28-19.

$$\text{Magnitude} \approx \max(U + V/8,\ 7U/8 + V/2) \tag{10}$$

Figure 28-19.

In HWA 2.1, the above expression is modified by having a better approximation based on which segment the input belongs (the quadrant is divided into 3 segments) and per-segment there is a better approximation, which improves the overall accuracy of the magnitude computation. Please note that this is done for FFT path only, the CFAR path still uses JPL approximation.

The magnitude output is 24-bits wide (real number).

Next, the log2 computation of the magnitude value is achieved as follows. Any unsigned input number N can be written as N = 2k(1 + f) and the log2(N) can then be written as follows in Figure 28-20.

$$\log2(N) = k + \log2(1+f) \tag{11}$$

Figure 28-20.

The implementation of log2 computation uses the previous formula, where a look-up table approximation is used to generate the second term, for example, log2(1 + f). The accuracy of the log2 computation for HWA 2.0 is shown in Table 28-6. In HWA 2.1, the LUT provides a better approximation and overall accuracy of magnitude and log2 approximation is +/- 0.02 dB (refer table below for overall accuracy comparison between HWA2.0 and HWA2.1).The log2 output is 16-bits wide. The 16-bit logarithm output consists of 5 bits of integer part and 11 bits of fractional part.

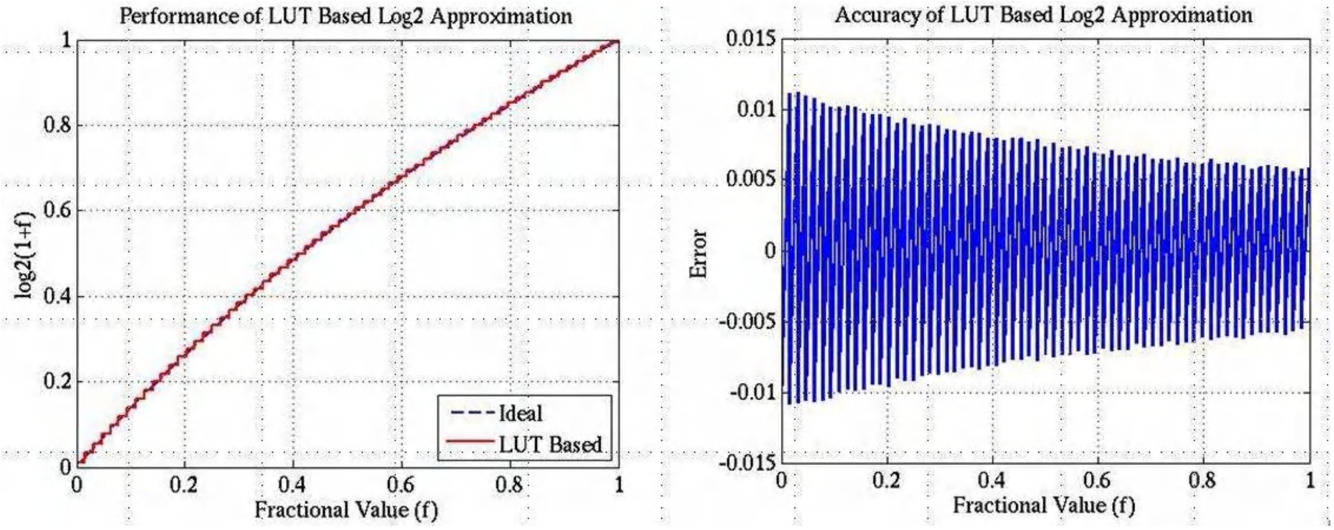

Figure 28-21. Accuracy of Log2 Computation for HWA 2.0

Table 28-6. Magnitude and Log-magnitude Error in HWA 2.0 and 2.1

	Magnitude error (dB)	Log-Mag error (dB)
HWA2.0	(-0.24, +0.06)	(-0.31, +0.13)
HWA2.1	(-0.017, +0.016)	(-0.02, +0.02)

Depending on the settings of ABS_EN and LOG2_EN, either the magnitude or the log-magnitude is sent as the final output of the core computational unit. The final output of the core computational unit going to the output formatter is 24-bits I and 24-bits Q. Thus, if either magnitude or log-magnitude is enabled, the Q- values are just made zeros. Similarly, when log2 is enabled, because the output is 16-bits, 8 MSBs are filled as zero.

The outputformatter handles writing the samples to the destination memory as per the configured destination memory access pattern described in a previous section.

28.5.1.9 Core Computational Unit – FFT Engine – Register Descriptions

Table 28-7 lists all the registers of the FFT Engine within the core computational unit.

Table 28-7. FFT Engine Registers

Register	Width	Parameter Set	Description
WINDOW_EN	1	Yes	Windowing Enable: This register-bit enables or disables the pre-FFT windowing operation. If this register is set to 1, then the windowing is enabled, otherwise, it is disabled. The exact window function (coefficients) to be applied is specified in a dedicated Window RAM, which is 2048 × 32 bits in size.
FFT_EN	1	Yes	FFT Enable: This register-bit is used to enable the FFT computation. If FFT_EN = 1, then the FFT computation is enabled. Otherwise, it is disabled (bypassed).
ABS_EN	1	Yes	Magnitude Enable: This register-bit is used to enable the magnitude calculation. If this register bit is set, then the magnitude calculation is enabled, else it is bypassed. When enabled, the magnitude (absolute value) of the input complex samples are calculated using JPL approximation and the resulting magnitude value is sent on the I-arm of the output. The Q-arm is made zeros.

Table 28-7. FFT Engine Registers (continued)

Register	Width	Parameter Set	Description
LOG2_EN	1	Yes	Log2 Enable: This register-bit is used to enable the Log2 computation. If this register bit is set, then the Log2 computation is enabled, else it is bypassed. Note that setting this register bit only makes sense if the inputs to the Log2 computation are unsigned real numbers, such as when the Magnitude Enable bit (ABS_EN) is also set. When enabled, the Log2 of the magnitude of the input samples is calculated and sent out on the I-arm of the output. The Q-arm is made zeros.
WINDOW_START	11	Yes	Windowing coefficients start location in Window RAM: This register specifies the starting location (32-bit word index) of the window coefficients within the Window RAM. The purpose of this register is to allow multiple windows (for example, one window of 512 coefficients and another window of 256 coefficients) to be stored in the Window RAM and one of these windows can be used by programming this start location register appropriately in the current parameter set.
WINSYMM	1	Yes	Window symmetry: This register-bit indicates whether the complete set of window coefficients are stored in the Window RAM or whether one half of the coefficients are stored. If this register bit is set, it means that the window function is symmetric and therefore, only one half of the window function coefficients are stored in the Window RAM. See the description section related to Windowing computation for more details.
WINDOW_MODE	2	Yes	Window Mode: 00b : 18-bit signed real coefficients, 01b: 16-bit signed real coefficients, 10b: 16-bit I, 16-bit Q complex coefficients
FFTSIZE	4	Yes	FFT size: This register indicates the number of FFT radix-2 butterfly stages employed. Refer detailed description section for more details on this register.
FFTSIZE3X_EN	1	Yes	FFT size 3X enable: This register indicates whether to engage the additional FFT radix-3 butterfly stage. Together with FFTSIZE, this register specifies the FFT size. This can be used to realize FFTs of length 3x2N point FFTs..
FFTSIZE_DIM2	4	Yes	2D FFT dimension specification: This register can be used to realize 2 dimensional FFTs. If this register is set to 0 (default), the FFT engine computes the usual one dimensional FFT. Otherwise, it computes a two dimensional FFT of size 2^(FFTSIZE–FFTSIZE_DIM2) x 2^FFTSIZE_DIM2.
BFLY_SCALING	12	Yes	Butterfly scaling for radix-2 stages: This register is used to control the butterfly scaling at each of the radix-2 butterfly stages. If the Nth bit in this register is set to 0, then the 25-bit output of the Nth radix-2 stage from the last is saturated to 24-bit. Otherwise it is scaled down by 2 and rounded to produce a 24-bit output.
BFLY_SCALING_FFT3X	2	Yes	Butterfly scaling for radix-3 stage: This register is applicable only if FFTSIZE3X_EN is set to 1. This register is used to control the butterfly scaling in the 3-point FFT structure that precedes the powers-of-2 FFT structure. If this register is set to 0, then that 26-bit output after radix-3 stage is saturated at the MSB to get back to 24 bits. If it is 2, it is rounded to remove 2 LSBs to get back to 24 bits. A middle option exists by setting this to 1. In this case, the 26 bit temporary output is convergent-rounded to remove 1 LSB and the 25-bit output thus obtained is saturated to 24 bits.
DITHER_TWID_EN. dither_twid_en	1	No	Twiddle factor dithering enable: This register-bit is used to enable and disable dithering of twiddle factors in the FFT. The twiddle factors are 24-bits wide (24-bits for each I and Q), but they are quantized to 21-bits before twiddle factor multiplication. This quantization is implemented with dithering on the LSB, to avoid periodic quantization pattern affecting SFDR performance of the FFT. It is recommended to keep this register bit set to 1 (dithering enabled), with appropriate LSFR seed loaded.

Table 28-7. FFT Engine Registers (continued)

Register	Width	Parameter Set	Description
LFSR_SEED. lfsr_seed	29	No	Seed for LFSR (random pattern): For twiddle factor dithering, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit LFSRSEED register. The LFSRSEED register should be set to any non-zero value, say 0x1234567. To load the LFSR seed, a pulse signal needs to be provided, by writing a 1 followed by a 0 (i.e., by setting and clearing) the LFSRLOAD register-bit.
LFSR_LOAD. lfsr_load	1	No	For twiddle factor dithering, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit LFSRSEED register. The LFSRSEED register should be set to any non-zero value, say 0x1234567. To load the LFSR seed, a pulse signal needs to be provided, by writing a 1 followed by a 0 (i.e., by setting and clearing) the LFSRLOAD register-bit.
FFT_CLIP.fft_clip	13	No	FFT Clip Status (read-only): This is a read-only status register, which indicates any saturation/clipping events that have happened in the FFT butterfly stages. Note that each of the individual butterfly stages in the FFT can be programmed to either saturate the MSB or round the LSB. Whenever saturation of MSB is used in any stage, there is a possibility that that stage can saturate or clip samples. In that case, this saturation event is indicated in the corresponding bit in this status register, so that the processor can read it. If multiple FFTs are performed, this status register includes any saturation events happening in any of them. This status register can only be cleared by any processor, by setting another single-bit register CLR_FFTCLIP, so that the saturation status indication gets cleared back to 0 and any subsequent saturation events can be freshly monitored. The MSB of this register indicates clip status corresponding to the radix 3 butterfly (note: it is the MSB, independent of the number of radix-2 stages engaged).
CLR_FFTCLIP.clr_fftclip	1	No	Clear FFT Clip Status register: This register bit, when set, clears the FFTCLIP register.
WINDOW_RAM[2048] DSS_HWA_WINDOW_RAM	32b each	No	This RAM stores the window co-efficients. Note that there is only one RAM and based on WINDOW_MODE, the samples are accordingly chosen as illustrated in Fig. 15
MEM_INIT_START. MEM_INIT_START_WINDOW_RAM	1	N	Writing 1'b1 would start the memory initialization for the window memory. This bit is self-clearing.
ACCEL_MODE	3	Yes	Select Core Computational Unit Data Path: This register selects the data-path of the accelerator’s core computational unit – for example, it selects which of the paths: the FFT engine path, or the CFAR engine path, or the compression/decompression path, or the local maxima engine path, or none is active. Value = 0b000: FFT engine path Value = 0b001: CFAR engine path Value = 0b010: Compression / decompression engine path Value = 0b011: Local Maxima engine path Value = 0b111: No Operation. The No Operation setting can be used together with an appropriate trigger mode to cause the state machine to wait for an event before moving to the next parameter-set.
WINDOW_INTERP_FRACTION CMULT_MODE TWIDINCR FFT_OUTPUT_MODE FFTSUMDIV MAX<n>_VALUE ISUM<n>, QSUM<n>	–	–	Described in sections starting from 28.7 of the TRM. For the immediate purposes relevant to this ection and above sections of HWA chapter, all of these registers should be kept as 0.

28.6 Parameter Set Layouts

The parameter-set register layout is provided below for all the accelerator modes. Note that the parameter-set RAM must be written using 32-bit word writes only (i.e., byte-writes and half-word writes are NOT supported).

28.7 FFT Engine – Pre-Processing

As explained in Part 1 of this chapter, the FFT Engine comprises pre-processing, windowing, FFT and Log-magnitude subblocks and these are stitched together one after the other in series (refer to Figure 28-27). This architecture allows multiple operations to be done in a streaming manner (for example, windowing and FFT can be done together), while at the same time, providing the user flexibility to choose one operation at a time. This section provides an overview of the pre-processing subblock inside the FFT engine of the core computational unit.

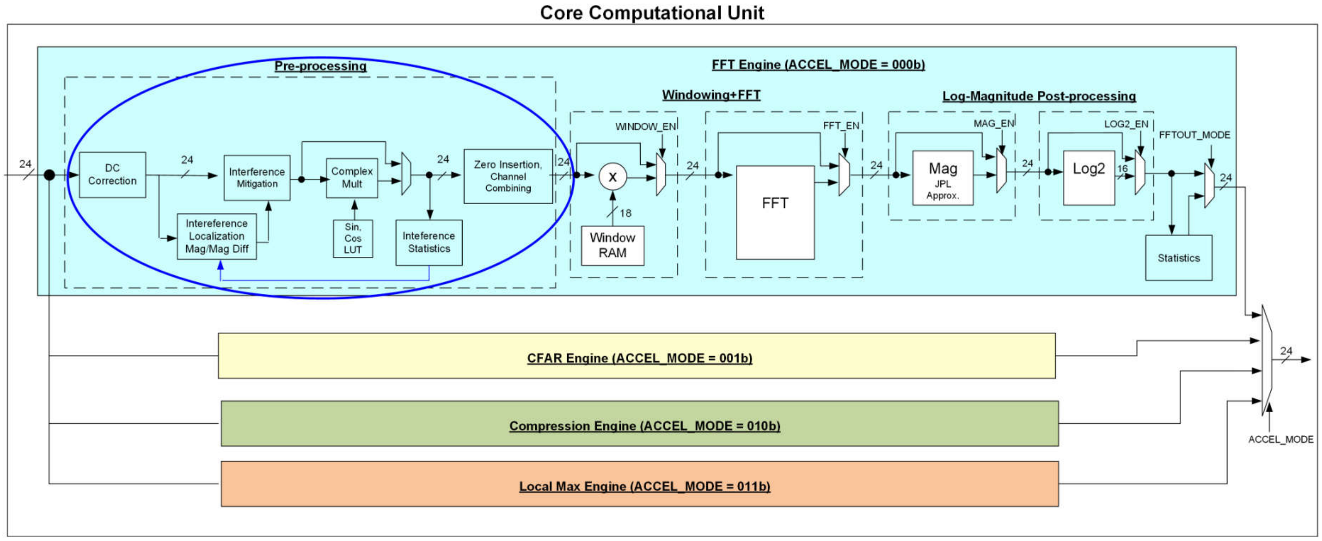

Figure 28-27. Core Computational Unit

The pre-processing subblock provides capability for DC estimation and correction, Interference localization and mitigation, complex multiplication, channel combining and zero-insertion.

28.7.1 DC Estimation

The DC estimation block estimates the time-domain average of the stream of samples along the A dimension. The stream can be one chirp, or set of chirps, i.e., frame. The DC is estimated on a per-iteration basis (i.e., along A dimension for each B iteration) for I & Q samples. Up-to 12 estimates corresponding to up to 12 iterations are available.

DC estimation is based on accumulation followed by a fine scaling and a programmable right shift. The fine scaling is configured as 1.8 value, via the 9-bit DCEST_SCALE register. The subsequent programmable right shift is configurable from 6 to 20 bits. Therefore, the DC estimation is well suited for cases where the number of samples per iteration is between 2^6 and 2^20. The fixed point details are captured in Figure 28-28. The internal accumulator reset supports several modes as shown in Table 28-8. For example, when DCEST_RESET_MODE = 2, the internal DC accumulators are reset at the beginning of the current parameter-set execution. Therefore, this mode estimates DC value for each set of SRCACNT samples along the A-dimension for up to 12 iterations along B-dimension within the current parameter-set. This mode is useful for per-chirp DC estimation. In this mode, the estimated DC values per iteration are latched at the end of current param-set and the accumulators are reset at the start. On the other hand, when DCEST_RESET_MODE = 3, the internal DC accumulators are reset only when the state machine executes the first loop of the parameter-set. As the state machine loops through various parameter-sets multiple times as programmed via NLOOPS register, the DC accumulators are not reset in between these loops. This mode is useful for per-frame DC estimation, where each loop corresponds to one chirp and the NLOOPS loops (chirps) correspond to a complete frame. The estimated DC values per iteration are latched at the end of last execution of the param-set.

The processor can read the DC estimates through the read-only registers – DCESTI_0VAL, .., DCESTI_11VAL & DCESTQ_0VAL, .., DCESTQ_11VAL. The DC estimates can also be used for DC subtraction described next.

Table 28-8. DC Estimation – Reset Modes

DCEST_RESET_MODE	Comments
0	Hold the DC internal accumulators without updating (bypass DC estimation).
1	DC estimation enabled, but free-running without automatic reset (i.e., not reset at the start of this parameter-set). In this mode, the software can reset the DC accumulators by writing to DC_EST_RESET_SW register bit.
2	Reset the DC internal accumulators at the start of this parameter-set. This mode is applicable for per-chirp DC estimation.
3	Reset the DC internal accumulators at the start of this parameter-set only if the loop-counter is 0. This mode is applicable for per-frame DC estimation.

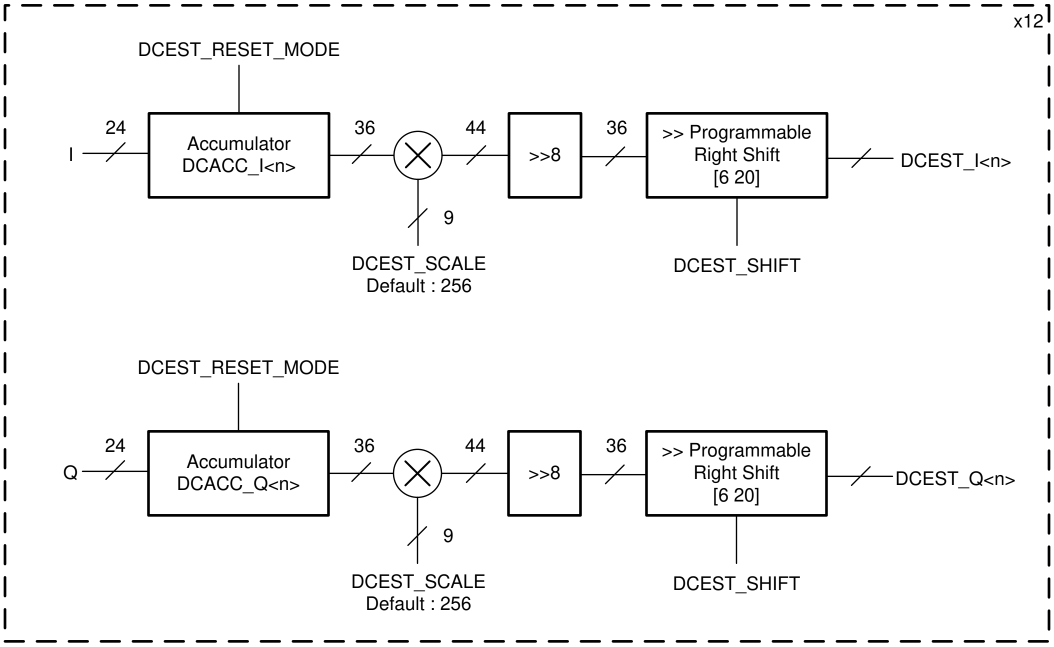

Figure 28-28. DC Estimation

28.7.2 DC Subtraction

The DC subtraction feature is enabled if the register DCSUB_EN is set to 1.

DC subtraction (see Figure 28-29) can use the output from the built-in DC estimation accumulators, or a user-programmed value, based on the register bit, DCSUB_SELECT. If DCSUB_SELECT is 1, the DC estimation based on the internal accumulators is used. If DCSUB_SELECT is 0, the software override values are used (they are given by DC_SW_I_<n> and DC_SW_Q_<n> for the nth iteration).

When using the built-in DC estimation accumulators, DC subtraction is performed on 12 individual streams corresponding to 12 RX on a per-iteration basis. Note that in a typical usage, for performing per-chirp DC estimation and DC subtraction, a two-pass approach is needed, where the first pass is configured for DC estimation via one parameter-set, and the second pass is configured for DC subtraction in the next parameter-set. Alternately, if a previous DC estimate (eg. From the previous chirp) is desired to be used for DC subtraction for the current chirp, then DC subtraction can be directly accomplished in one pass.

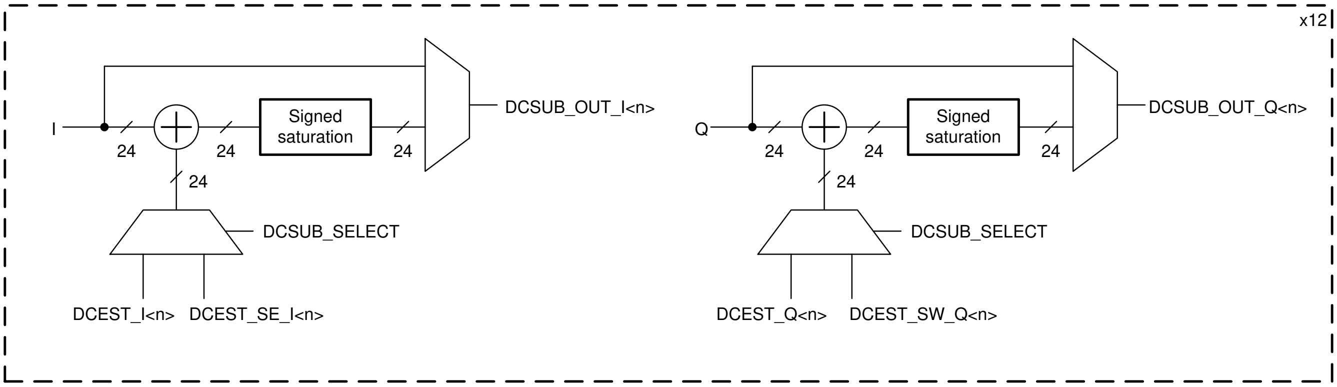

Figure 28-29. DC Subtraction

28.7.3 Interference Localization

In an FMCW radar transceiver, interference from another radar typically manifests itself as a time-domain spike in a few samples. This spike corresponds to the time duration when the chirping frequency of both radars overlap with each other. Such a time-domain spike caused by interference can lead to degradation in the noise floor at the FFT output, causing degradation in detection performance.

In order to mitigate the impact of interference, the pre-processing block provides capability to perform interference localization to identify samples corrupted by interference, followed by interference mitigation to repair those samples.

The INTF_LOC_THRESH_EN register is provided as part of the parameter-set to control when the interference localization should be enabled. When enabled, the input samples are fed through a magnitude calculation (based on JPL approximation), which computes a 24-bit magnitude of the 24-bit input complex sample. For definition of this approximation, see 28.5.1.8 of the TRM. Similarly, magnitude of the backward difference between adjacent samples is also computed, which is another useful metric for interference (glitch) detection.

Any sample whose magnitude and/or magnitude of backward difference exceeds thresholds THRESH_MAG<n> and THRESH_MAGDIFF<n> is considered as affected by interference and is marked by a corresponding Interference indicator Bit (IIB). This is supported individually for up to 12 iterations. Note that the IIB bit is just an internal signal that is set by the interference localization module, in order to mark samples for the interference mitigation module (described later). The register, INTF_LOC_THRESH_MODE determines the logic to set the IIB bit using the magnitude and/or magnitude of difference estimates. Based on this register, samples are marked with IIB if they exceed the THRESH_MAG<n>, or THRESH_MAGDIFF<n>, a logical AND of both, a logical OR of both as shown in Figure 28-30.

This applies across all iterations.

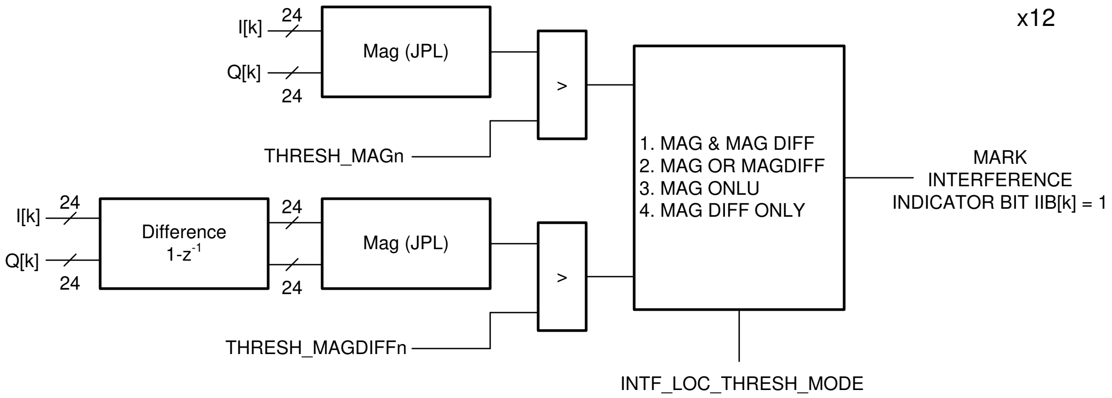

Figure 28-30. Interference Localization

The threshold values of THRESH_MAG<n> and THRESH_MAGDIFF<n> applied on a per-channel basis can derived from SW – INTF_LOC_THRESH_MAG<n>_SW, INTF_LOC_THRESH_MAGDIFF<n>_SW or from a built-in Interference statistics block – INTF_LOC_THRESH_MAG<n>, INTF_LOC_THRESH_MAGDIFF<n> as described in the next section. The user can also choose to sum the built-in interference statistics estimates across all channels to derive a common interference threshold across all iterations– INTF_STATS_SUM_MAG, INTF_STATS_SUM_MAGDIFF. The register, INTF_LOC_THRESH_SELECT is used to select these threshold options.

The number of samples marked with IIB across the iterations is recorded in the read-only registers, INTF_LOC_COUNT_ALL_CHIRP and INTF_LOC_COUNT_ALL_FRAME. This can be read after every chirp or after the completion of a frame (when the state machine completes all the programmed parameter-set loops and enters idle state).

28.7.4 Interference Statistics

This block (see Figure 28-31) provides the thresholds for interference localization. In order to obtain the interference statistics and derive the thresholds, the magnitude and magnitude of backward difference of the incoming samples are accumulated per iteration and up to 12 such independent accumulations are supported. These registers can be reset on a per-chirp or per-frame basis, and the behavior can be controlled using the register INTF_STATS_RESET_MODE. These reset modes are similar to DCEST_RESET_MODE previously explained (refer to Table 28-8). The interference statistics accumulators can be reset by software via writing the INTF_STATS_RESET_SW register bit. This reset also clears the INTF_LOC_COUNTS.

The determination of interference threshold for interference localization is based on taking the above accumulator values and applying a programmable fine scaling, followed by a programmable right shift. The fine scaling is configured via 8-bit registers, INTF_STATS_MAG_SCALE and INTF_STATS_MAGDIFF_SCALE in 5.3 format. The fine scaling value is interpreted as an unsigned 8-bit number with 5 integer bits and 3 fractional bits giving a scale in range [0 to 31.875]. The default value of this register is 8, applying a scaling of 1.0. The programmable right-shift in the range of 6 to 12 is applied via the registers, INTF_STATS_MAG_SHIFT and INTF_STATS_MAGDIFF_SHIFT respectively. Note that if the sum mode of threshold selection is made, then the shift values have to include the extra division based on number of iterations being summed.

The resulting values INTF_LOC_THRESH_MAGn and INTF_LOC_THRESH_MAGDIFFn are used as thresholds in the interference localization block as described in the previous section.

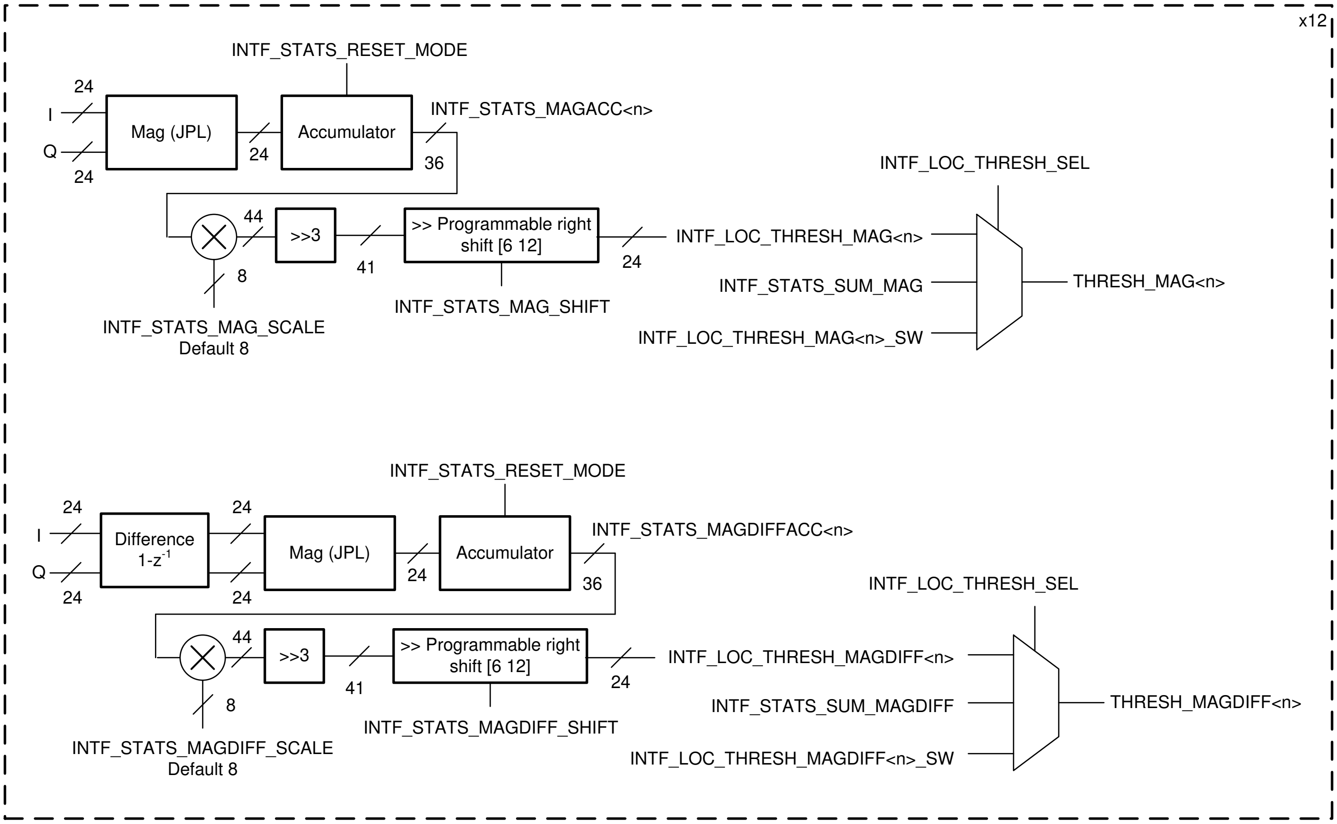

Figure 28-31. Interference Statistics

28.7.5 Interference Mitigation

Interference mitigation block (Figure 28-32) uses the results of Interference Localization block and mitigates the interference affecting the input samples which are marked as interference-corrupted through the Interference Indicator Bit. Interference mitigation is applicable for max. 12 iterations

The interference mitigation feature can be enabled by setting the INTF_MITG_EN bit in the parameter-set.

The first sub-module of the Interference Mitigation Block is a hysteresis module, which provides de-bouncing logic. For each incoming sample, its own IIB bit, as well as INTF_MITG_RIGHT_HYST_ORD number of right IIB bits and INTF_MITG_LEFT_HYST_ORD number of left IIB bits are considered in order to decide whether that particular sample is actually affected by interference. If the number of IIB bits in that interval is greater than or equal to INTF_MITG_CNTTHRESH, then that sample is assumed to be affected by interference. Thus, the hysteresis module outputs a filtered version of the IIB bit stream, which is then used for interference mitigation.

There are three different options (Figure 28-33) for interference mitigation and one of these can be selected using the INTF_MITG_PATH_SEL register. If INTF_MITG_PATH_SEL = 0, then the interference mitigation block simply zeros out samples that are marked with the IIB bit. This is a simple form of interference mitigation.

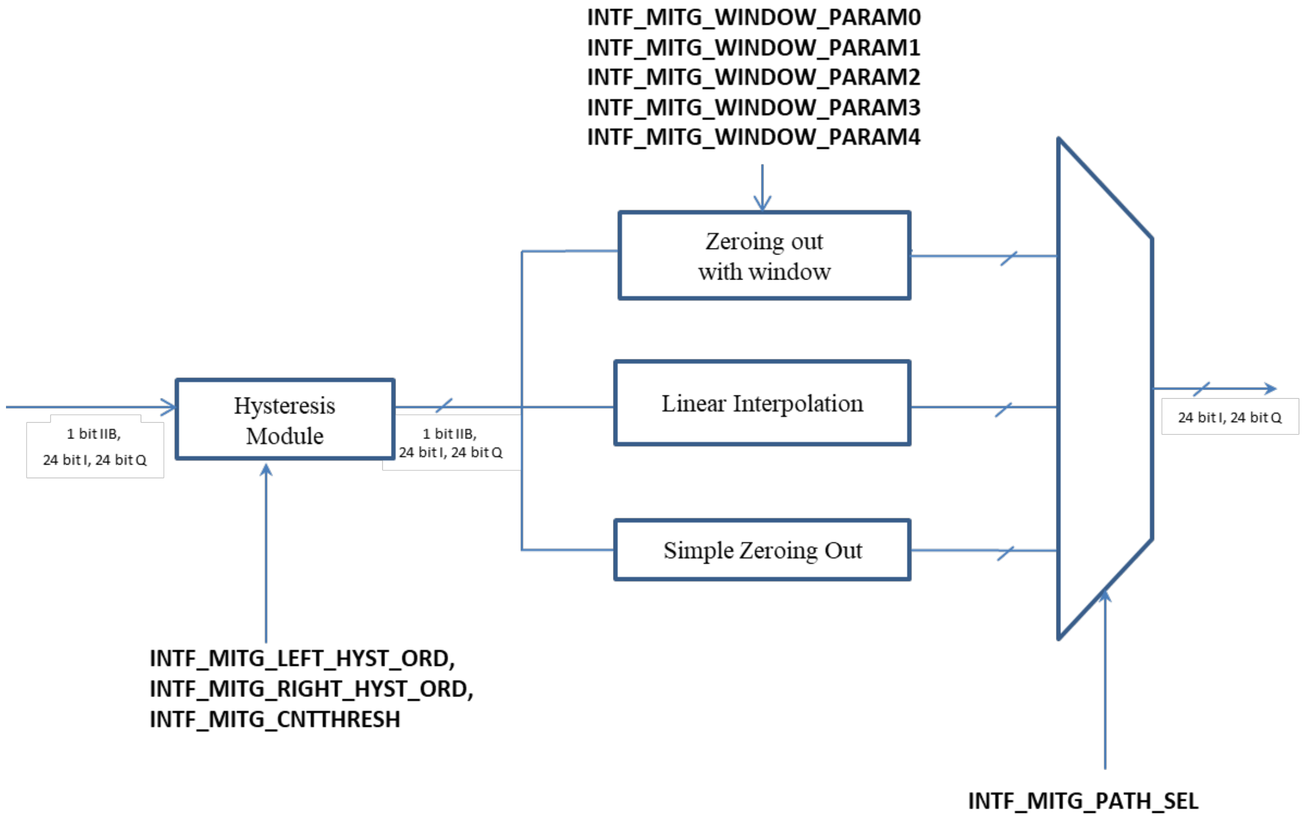

Figure 28-32. Interference Mitigation Block

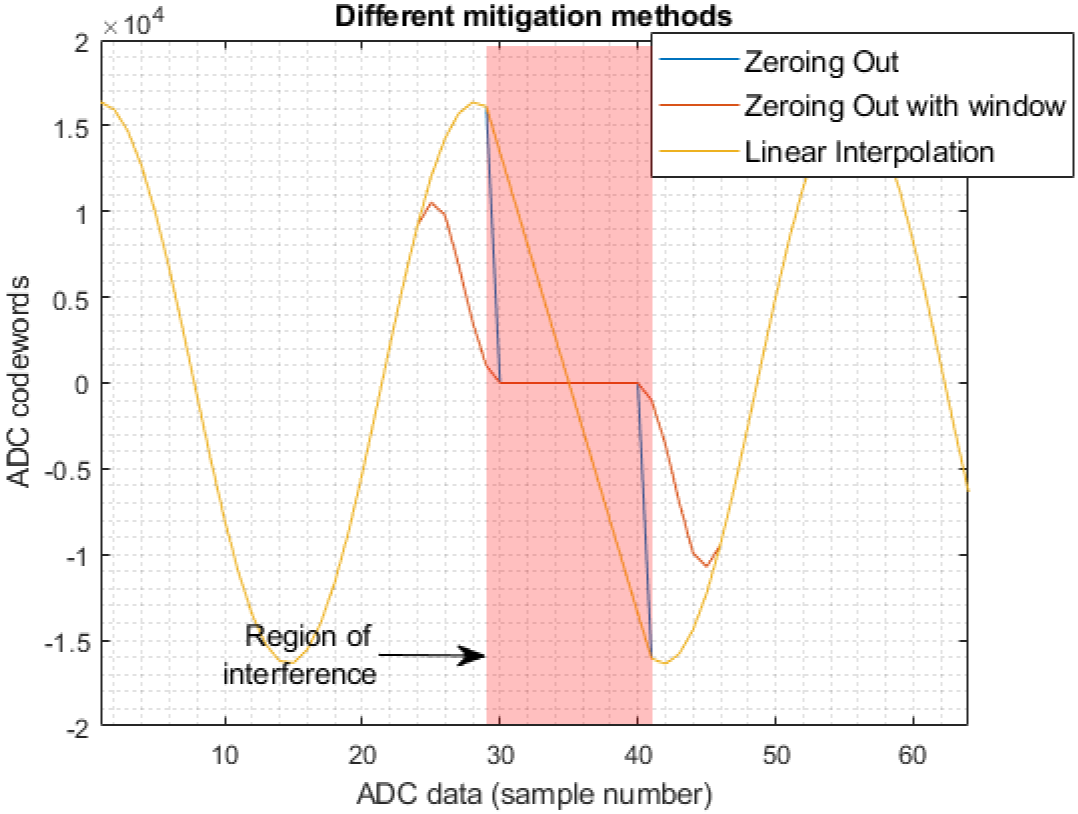

Figure 28-33. Interference Mitigation Methods

If INTF_MITG_PATH_SEL = 1, then the interference mitigation block performs a windowed zero-out, where a smoothing window is applied to the edge samples of the interference-affected set of samples, in order to reduce the side-lobe increase that can happen with abrupt windowing. The windowing function that is applied is programmable via the INTF_MITG_WINDOW_PARAM <n> registers. The manner in which this smoothing window is applied is as follows.

Assume that the input sample array is: [x[0], x[1], x[2], x[3], x[4], x[5], x[6], x[7], x[8], x[9], x[10]]. Assume that the IIB array input is of the form [0, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0]. (In other words, the 6th and 7th samples are corrupted by interference.) Then, the output of the windowed zero-out module would be:

[x[0]w[4], x[1]w[3], x[2]w[2], x[3]w[1], x[4]w[0], 0, 0, x[7]w[0], x[8]w[1], x[9]w[2], x[10]w[3]].

Where w[n] = INTF_MITG_WINDOW_PARAM<n>.

Note that the samples that are affected by interference are always zeroed out. The window is applied on the neighbours of these samples, so as to smoothen the transition to zero.

If INTF_MITG_PATH_SEL = 2, then the interference mitigation block performs a linear interpolation between the two good (i.e., non-interference-affected) samples at the start and end of the interference affected set of samples and this linear interpolation procedure is used to replace the interference affected samples themselves. The number of interference affected samples between these good samples can be any number. However, if it exceeds 32, then the ‘last good sample’ is pushed out in the place of affected samples until a new good sample arrives. Then linear interpolation will be performed across the 32 remaining affected samples.

28.7.6 Complex Multiplication

In addition to interference zero-out, the pre-processing block contains a complex multiplication sub-block. The purpose of this sub-block (Figure 28-34) is to enable several assorted capabilities that require complex multiplication of the input samples. The CMULT_MODE register is used to enable and configure the complex multiplication functionality. The complex multiplication sub-block can be disabled (bypassed) by the setting CMULT_MODE to 0b0000.

There are nine modes of the complex multiplier supported as follows. They are frequency shifter mode, frequency shifter with auto-increment mode (a slow DFT mode), FFT stitching mode, magnitude squared mode, scalar multiplication mode, vector multiplication modes-1 & 2, recursive windowing and LUT based frequency shifter modes.

Inall the nine modes of the complex multiplier, one complex multiplication is performed every clock cycle.

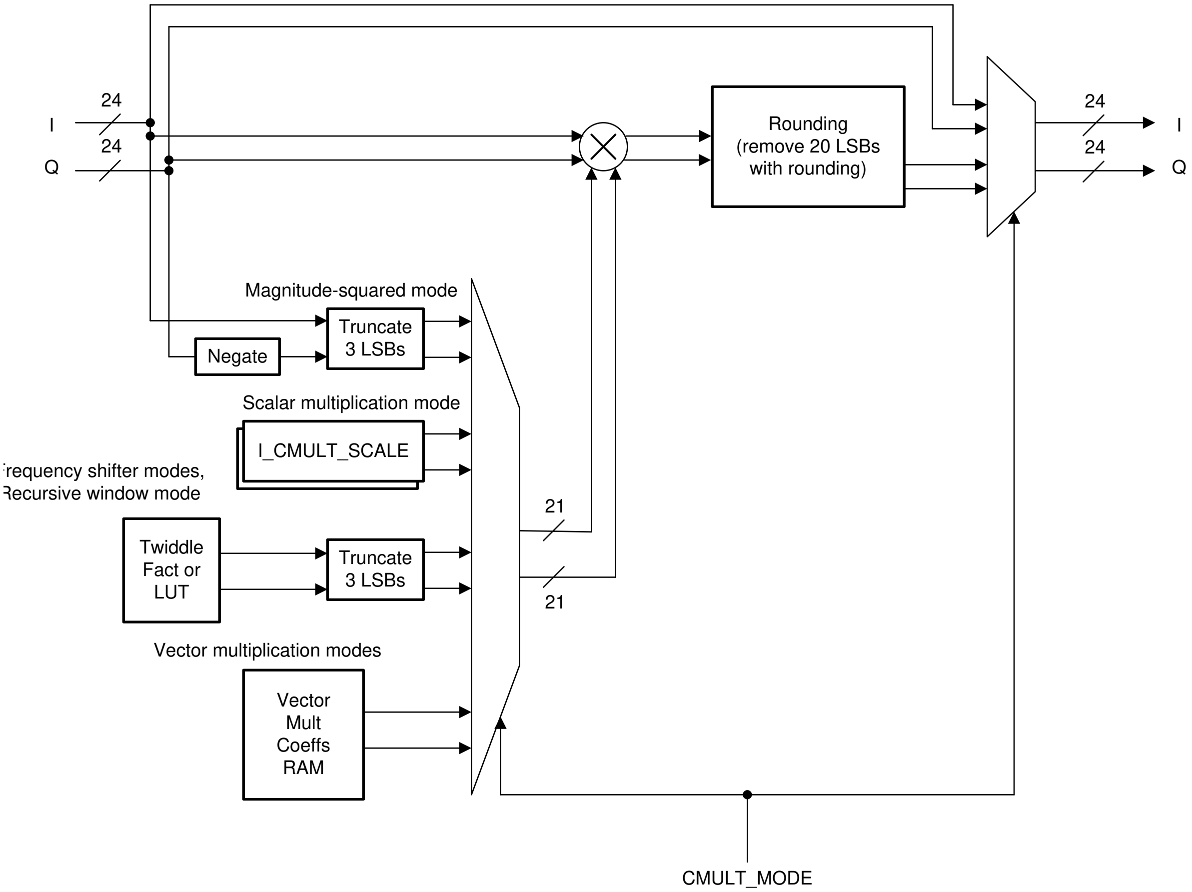

Figure 28-34. Complex Multiplication Capability in Pre-Processing Block

- **Frequency shifter mode**: If the register value is CMULT_MODE = 0001b, then the complex multiplier functions as a frequency shifter, which can be used to de-rotate the input samples by a certain frequency. This de-rotation is accomplished using cos, sin values from a twiddle factor look-up table (LUT). This LUT contains the (compressed) equivalent of the cos, sin values corresponding to the 16384 long sequence exp(–j*2*pi*(0:16383)/16384). TWIDINCR is used to specify the de-rotation frequency, by specifying how much the phase should change for each successive input sample (that register controls how much the LUT read index increments every sample) as shown in (Figure 9). The starting phase in this mode is always zero, since the 20-bit accumulator always starts at zero for each iteration.

  Note that although the figure shows another TWIDINCR_DELTA_FRAC register (portions shown in the red dotted box), that functionality is only applicable for CMULT_MODE = 1010b described later and it is not applicable in the present complex multiplier mode (0001b).

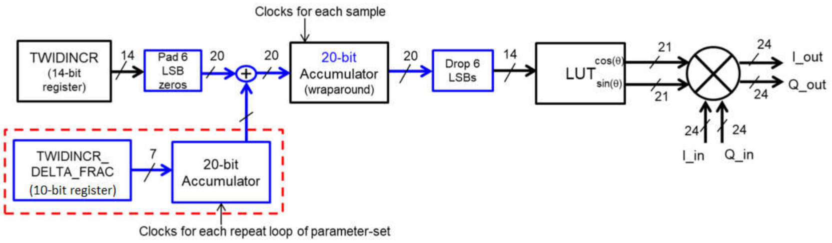

Figure 28-35. Frequency Shifter Mode

- **Frequency shifter with auto-increment mode (a slow DFT mode)**: If the register value is CMULT_MODE = 0010b, then the complex multiplier functions in a mode which enables Discrete Fourier Transform (DFT) computation. In this case, the complex multiplier performs a function that is very similar to frequency shifter mode, except that, at the end of each iteration, the de-rotation frequency is automatically incremented for the next iteration. Note that DFT computation for a given set of input samples involves de-rotating the samples by one frequency at a time, and computing a sum of the de-rotated samples for each such frequency. To achieve DFT computation, the Input Formatter should be configured to send the same set of input samples to the complex multiplier for multiple iterations (as many as the number of DFT bins required) and the complex multiplier de-rotates the samples by one frequency at a time and auto-increments to the next frequency for the next iteration. Also, the statistics block (explained in a later section) is used to compute the sum of the de-rotated samples corresponding to each iteration, which then becomes the final DFT value.

  The DFT computation is 'slow' in the sense that in each clock cycle, only one complex multiplication is performed. For example, for a 512-point input sample set, it would take 512 clock cycles per DFT bin. However, since the DFT mode is typically only used for FFT peak interpolation (very few bins), it is acceptable. The starting frequency for the DFT computation is specified in the TWIDINCR register (similar to the frequency shifter mode). The increment value by which the frequency increments every iteration is obtained from FFTSIZE register – Note that the DFT mode cannot be used simultaneously with FFT enabled, hence the FFTSIZE register has been over-loaded for providing the increment value in this mode. The increment value is calculated as 2^(14 – FFTSIZE) and hence the DFT resolution is 16384/2^(14 – FFTSIZE) = 2^FFTSIZE. As an example, if FFTSIZE = 1011b, then the DFT resolution is 2048. This is equivalent to computing DFT points corresponding to 2K size FFT grid. The highest resolution for the DFT would be obtained when FFTSIZE = 1110b (max allowed value), in which case the DFT resolution is 16384 (corresponding to 16K size FFT grid). In effect, for the kth iteration (with k starting from 0), the input samples x(n) for n = 0 to SRCACNT-1 are multiplied by the sequence, exp(–j*2*pi*(TWIDINCR+2^(14-FFTSIZE)*k)*(0:SRCACNT-1)/16384).
- **FFT Stitching mode**: If the register value is CMULT_MODE = 0011b, then the complex multiplier functions in FFT stitching mode. This mode is useful when large size FFTs (4K and 8K) are required. Since the FFT block natively supports only up to 2048 size, for 4096 and 8192 point FFT, an FFT Stitching procedure using two steps (two parameter-sets) can be used. As an example, when an 8K size FFT is needed, it is achieved in two steps as follows. In the first step, every 4th input sample is passed through a 2K size FFT (four 2K point FFTs are performed on decimated input samples). Then, in the next step, the resulting 4x2048 FFT outputs are sent through four-point "stitching" FFTs (2048 four- point FFTs), with an additional pre-multiplication by the complex multiplier block to achieve FFT stitching. This pre-multiplication uses the twiddle factor LUT in a specific pattern, for which additional configuration information is available in 2 LSBs of TWID_INCR register. Value '01' is for 4K (2x2048) size FFT stitching. If '10', then the twiddle factor pattern will correspond to what is required for 8K (4x2048) size FFT stitching. In the FFT stitching mode of operation, the 12 MSBs of TWID_INCR must be kept as 0.

  The last section includes a more detailed explanation and configuration information for the FFT stitching example for 4K and 8K FFT, including the use of WINDOW_INTERP_FRACTION register for extending the window RAM using linear interpolation to more than 2048 coefficients. Note that Window Symmetry and Interpolation modes can't be used simultaneously.
- **Magnitude squared mode**: If the register value is CULT_MODE = 0100b, then the complex multiplier functions in magnitude squared mode. In this case, the complex multiplier takes a complex input and

produces the magnitude squared as the output. This can be used together with the statistics block (explained in Section 3) to compute the mean squared sum of the input samples.

- **Scalar multiplication mode**: This mode is selected by setting CMULT_MODE = 0101b. It supports two options – multiplication by a complex scalar that remains constant across all iterations or by a complex scalar that changes per iteration.

  If the register bit CMULT_SCALE_EN = 0, then the complex multiplier functions in constant scalar multiplication mode. This feature is useful if the input samples need to be scaled by some constant factor. In this case, the complex multiplier will multiply each input sample with a 21-bit scalar complex number that is programmed in ICMULT_SCALE0 and QCMULT_SCALE0 registers (for I and Q value, each having 21 bits). The ICMULT_SCALE0 and QCMULT_SCALE0 registers are common registers and not part of parameter-set.

  To multiply the input samples for different iterations (channels) with different complex scalars, set CMULT_SCALE_EN = 1. In this mode, upto 12 different complex scalars are supported, viz. from ICMULT_SCALE0, QMULT_SCALE0 to ICMULT_SCALE11, QMULT_SCALE11 that are used for multiplication per iteration. TWID_INCR Register has no implication in this mode.
- **Vector multiplication mode 1**: If the register value is CMULT_MODE = 0110b, then the complex multiplier functions in vector multiplication mode 1. The purpose of this mode is to enable element-wise multiplication of two complex vectors, as well as dot-product capability (using statistics block to sum the element-wise multiplication output). The samples from the Input Formatter block constitute one of the two vectors, whereas the other vector is taken from a pre-loaded 'Vector Multiplication Coefficient RAM' inside the core computational unit. This Vector Multiplication Coefficient RAM can store 1024-complex samples and hence the vector multiplication can support a maximum of 1024 elements of multiplication. The Vector multiplication is not a highly parallelized operation, in the sense that only one complex multiplication is done per clock cycle. Note that the vector multiplication coefficient RAM should ideally be pre-programmed once upfront, and should not normally be re-programmed dynamically when the hardware accelerator is in active execution. If such a dynamic re-programming is required, then it can only be done when CMULT_MODE is set to 0b0000. For any other value of the CMULT_MODE register, the Vector multiplication coefficient RAM access is locked and hence cannot be re-programmed.

  The operation of the vector multiplication mode 1 is as follows. The streaming set of samples from the Input Formatter block is element-wise multiplied with successive samples from the Vector Multiplication Coefficient RAM. The statistics block (described in a later section) can be used to compute the sum for every iteration, which enables a dot-product implementation if desired. At the end of every iteration, the addressing from the Vector Multiplication Coefficient RAM is reset, so that for the next iteration, the samples are picked up from the start index of the Vector Multiplication Coefficient RAM. It is possible to choose a non-zero start address for the Vector Multiplication Coefficient RAM, by programming the TWID_INCR register. The top 12 MSBs of the TWID_INCR register functions as a sample address offset for the RAM. The 2 LSBs must be kept zero. For example, if TWID_INCR = 20, then the vector multiplication happens starting from the 5th coefficient in the RAM (zero-based count).

  When the size of vectors is small (<=12 coefficients), this mode can also be realized by setting the bit CMULT_SCALE_EN = 1 and programming ICMULT_SCALE0, QCMULT_SCALE0 to ICMULT_SCALE11, QCMULT_SCALE11 registers to store the successive coefficients. This mode can be used for example in RX channel gain and phase mismatch equalization. Because these ICMULT_SCALE<n> and QCMULT_SCALE<n> registers are independent of the Vector Multiplication Coefficients RAM, the user can use the RAM approach for some parameter-set which may need vector multiplication coefficients up to 1024, while another parameter-set of the processing chain uses the registers approach.
- **Vector multiplication mode 2**: If the register value is CMULT_MODE = 0111b, then the complex multiplier functions in vector multiplication mode 2, which is slightly different from the earlier Vector multiplication mode 1. The only difference in this case is that at the end of every iteration, the addressing of the Vector Multiplication Coefficient RAM is not reset, so that for the next iteration, the samples from the Vector Multiplication Coefficient RAM are picked up with an address that continues from where it left off at the end of the previous iteration. This mode can be used when a given set of input samples needs to be element-wise multiplied with multiple vectors. In this case, the input formatter block can be configured to repeat the same set of samples for multiple iterations, and the Vector Multiplication Coefficient RAM can be loaded with all the

vectors, such that for successive iterations, the input samples are multiplied with successive vectors. As in previous mode, TWID_INCR functions as an address offset for the RAM.

- **Recursive windowing mode** (next Figure) is supported using CMULT_MODE = 1000b. In this mode, a set of possibly random phase values θ(n) is stored in an internal RAM. This internal RAM is shared with the Vector Multiplication Coefficient RAM, in the sense that each of the *θ(n) values takes up one coefficient location in the Vector Multiplication Coefficients RAM, and therefore use of Recursive Windowing mode comes at the expense of reduced number of coefficients storage for the other vector multiplication modes. For the purpose of recursive windowing the vector multiplication RAM must be programmed with appropriate values and it is as shown below:
  - If θ is in degrees, the corresponding code to be programmed in the RAM is (θ/360) *2^16
  - If θ is in radians, the corresponding code to be programmed in the RAM is (θ /(2*pi)) *2^16

  The operation of Recursive Windowing mode is explained as follows.

  Assuming that the Window RAM (which is separate) contains the window coefficients w0(n), the final window function is computed as: Wk(n) = W0(n) * exp(– j*K*θ(n)*2*pi/16384). This computed window function Wk(n) is used for the windowing prior to FFT operation. Here K is either the iteration count (zero-based count corresponding to B-dimension iterations) within the parameter-set, or the current execution count of the parameter-set where CMULT_MODE = 0b1000. This selection can be made using the register bit, RECWIN_MODE_SEL. A value of RECWIN_MODE_SEL = 0 indicates k is based on iteration count, and RECWIN_MODE_SEL = 1 indicates it is based on the said execution count. When REC_WIN_MODE_SEL = 0, the value of K resets to zero at the end of all iterations of the current parameter-set. On the other hand, when REC_WIN_MODE_SEL = 1, the value of k persists (and increments) across multiple loops of the parameter-set and it can be reset via software by writing to the register bit RECWIN_RESET_SW.

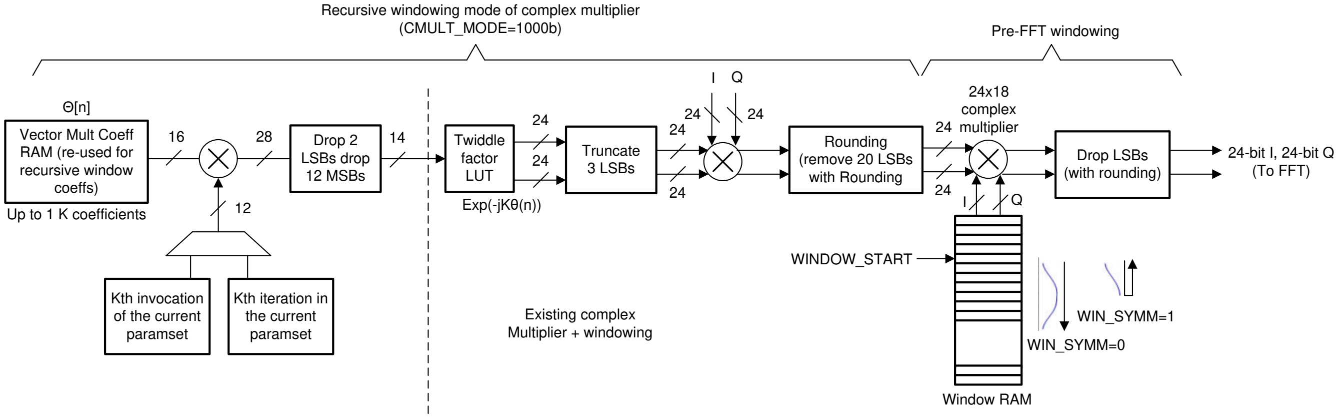

Figure 28-36. Recursive Windowing using the Complex Multiplier

- **LUT based frequency and phase de-rotation mode**: This mode is enabled using CMULT_MODE = 1001b. This mode is similar to Frequency shifter mode (previously explained, where CMULT_MODE = 0001b), except that it supports both frequency de-rotation and phase de-rotation based on a programmable RAM, TWID_ANGLE_RAM. Up to store 64 different frequency de-rotation and starting phase values can be programmed. Each entry in the RAM is 32 bits wide. The 16 MSBs contain starting phase word – TWID_PHA and in remaining 16 LSB, the top-most two bits are don't cares, the next 14 LSBs contain the de-rotation frequency word. The 6 LSBs of TWIDINCR register are used as a start address index to the TWID_ANGLE_RAM.

  There are two sub-modes of this feature, selectable by bit 13 of TWIDINCR register. If this bit set to 1 (Auto-increment mode), then the RAM index is incremented automatically after each iteration (i.e., B dimension), else (Non-increment mode), the RAM index is constant for all iterations, based on the 6 LSBs of TWIDINCR register. Further, bit 12 of TWIDINCR controls whether the RAM index saturates at 63 (behavior when the bit is set to 1) or wraps around (behavior when the bit is 0) in the Auto-increment mode.
- **Frequency shifter mode with fine frequency increment**: This mode is enabled using CMULT_MODE = 1010b. This mode is an extension of the Frequency shifter mode (previously explained, where CMULT_MODE = 0001b). In this mode, in addition to the previously explained frequency shifter functionality,

there is another signed 10-bit offset TWIDINCR_DELTA_FRAC that can be added to the de-rotation frequency, such that the de-rotation frequency changes incrementally after every “execution count”. The TWIDINCR_DELTA_FRAC value is automatically accumulated to the de-rotation frequency at the end of the current execution of the current parameter-set with CMULT_MODE = 1010b. The fixed-point design of this datapath is illustrated in Figure 9). In effect, the input samples x(n) for n = 0 to SRCACNT-1 are multiplied by the sequence: exp(–j * 2*pi * ((TWIDINCR + 2^(-6) * TWIDINCR_DELTA_FRAC * execution_count) * (0:SRCACNT-1) / 16384)). The execution_count here refers to the current execution count of the parameter-set with CMULT_MODE = 1010b. The TWIDINCR_DELTA_FRAC accumulator is reset only via software by writing to the TWID_INCR_DELTA_FRAC_RESET_SW register bit. Note that the TWIDINCR_DELTA_FRAC register is applicable only in this mode of the complex multiplier and is ignored in all other modes.

The memory layouts for different modes are illustrated in Figure 28-37.

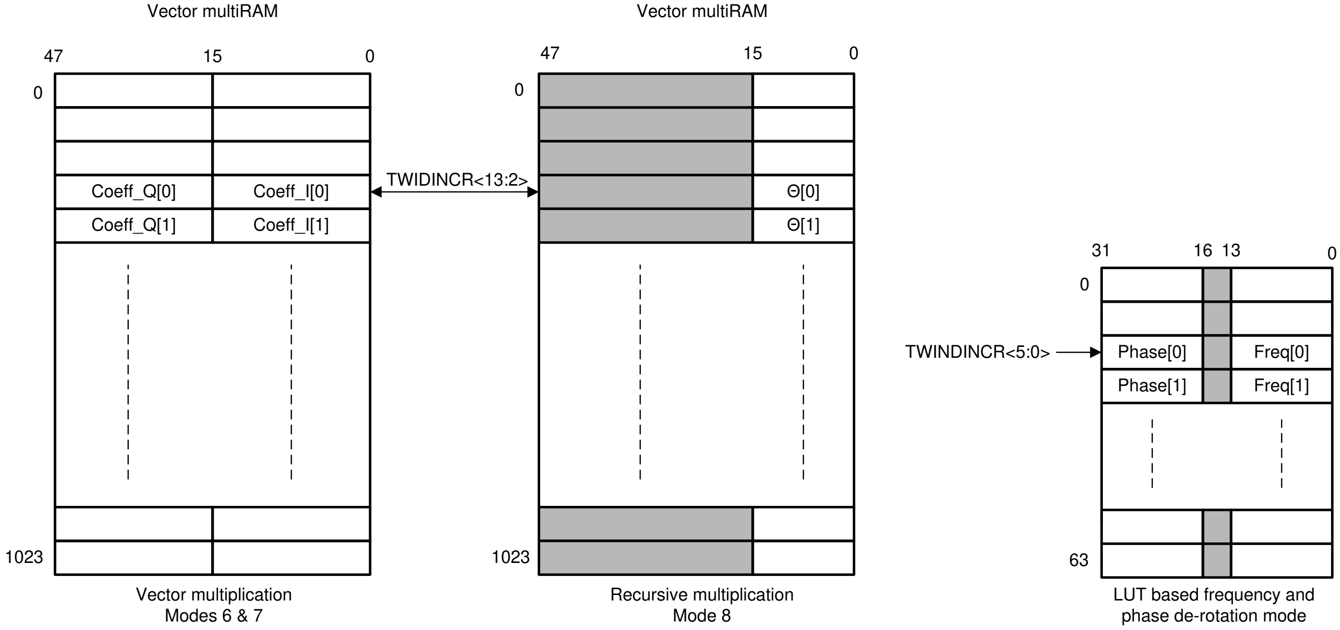

Figure 28-37. Memory Layout for Different Multiplication Modes

28.7.7 BPM Removal

Although not explicitly shown in Figure 1-1, it is possible to multiply the input samples going from the input formatter into the core computational unit with a +1/-1 programmable binary sequence (of length up to 256). This feature is enabled by setting the register bit BPM_EN in the parameter-set.

This feature may be useful when Binary Phase Modulation (BPM) is used during transmission of chirps. The BPM pattern is generally a pseudo-random sequence (chipping sequence) of 1’s and -1’s, which have already been applied to the radar transmit signal. Therefore, the radar signal processing of the resultant analog-to-digital converter (ADC) samples prior to FFT needs to undo the modulation. For instance, if each chirp is transmitted with a +1 or -1 polarity, then it is necessary to undo this sequence prior to the second dimension FFT processing across chirps. The BPM removal feature can be used to achieve this.

Note that an alternate way to achieve this is to pre-multiply the window coefficients, which are signed numbers, in the window RAM, so that the process of windowing prior to FFT takes care of undoing the BPM sequence.

When BPM removal is enabled, each input sample is multiplied by a +1 or -1, based on the bit sequence present in the eight 32-bit registers, BPMPATTERN0, BPMPATTERN1, … BPMPATTERN7. A bit value of 0 (1) multiplies the input sample with 1 (–1). The register BPMRATE is used to control for how many consecutive samples the same BPM bit is applied. For example, if BPMRATE = 4, then the same BPM bit is applied for 4 consecutive samples. Similarly, if BPMRATE = 1, then the BPM bit is changed for every sample.

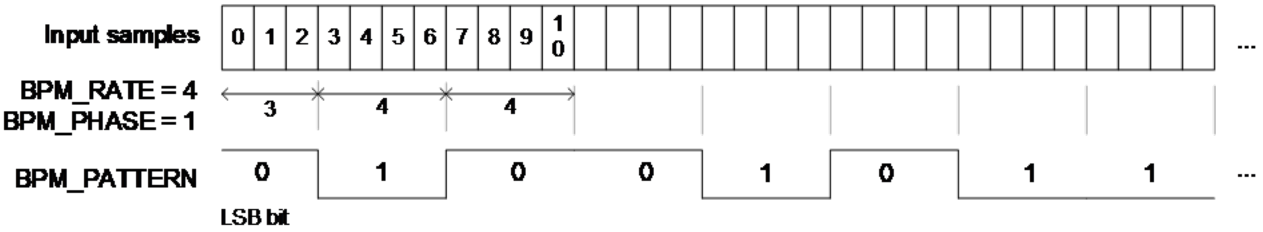

Figure 28-38. BPM Removal Capability

There is another register BPMPHASE that specifies the number of consecutive samples for which the first BPM bit is applied. Note that this is applicable only for the first BPM bit. If BPMPHASE = 0, then the first BPM bit is applied for BPMRATE number of samples. Otherwise, the first BPM bit is applied for BPMRATE – BPMPHASE number of samples. For example, if BPMPHASE = 1 and BPMRATE = 4, then the first BPM bit is applied for 4-1 = 3 samples, and then subsequent BPM bits are applied with periodicity of 4 samples for each bit. This is shown in Figure 28-38. If multiple iterations (for example, four back-to-back FFTs in a single parameter-set using BCNT=3) are done, then the same BPM pattern gets applied to the input samples in each iteration.

Notethe limitation that the BPM pattern register is 256 bits long, hence, the maximum BPM sequence length that is supported is 256. For higher BPM sequence length, the alternate approach of pre-multiplying the window coefficients stored in the window RAM may be considered.

28.7.8 Channel Combining

The accelerator allows combining of data samples from multiple channels into one effective channel. This is done via an accumulator that sums a set of successive samples along the A dimension. The samples to combine are indicated by a 256-length bit-vector, CHAN_COMB_VEC. A string of ‘1’ or a string of ‘0’ sums the samples corresponding to the indices. A ‘10’ or ‘01’ transition demarcates the groups. This results in a variable rate output based on the length of 1s-string & 0s-string. The down-stream processing stalls during the grouping. The LSB of this bit-vector corresponds to the first input sample. An additional register, CHAN_COMB_SIZE needs to be programmed to indicate the number of samples after this combination in A dimension. The combination pattern is the same across all iterations. The channel combining is feature is enabled only if CHAN_COMB_EN is set to 1. The bit-vector CHAN_COMB_VEC is specified through eight 32-bit registers, CHAN_COMB_VEC0, CHAN_COMB_VEC1, … CHAN_COMB_VEC7.

Channel combination is illustrated with an example here: if CHAN_COMB_VEC0 = 0x008C (and CHAN_COMB_VEC1-7 are 0s), SRCACNT = 11 (i.e. 12 samples), and CHAN_COMB_SIZE = 5, then the first 2 samples are combined into one output sample, the next 2 samples are combined into one output sample, and the next 3 samples are combined into one output sample, the next sample is output as another output sample, and the last 4 samples are combined into one output sample. Note that the 1s and 0s in CHAN_COMB_VEC can be flipped to achieve the same effect.

28.7.9 Zero Insertion

In addition to traditional zero padding before FFT, the accelerator includes a Zero Insertion feature. This feature allows filling of zeros at arbitrary locations in the A dimension, prior to windowing and FFT. Zero insertion is typically meant for angle-dimension FFT to account for missing antenna positions. The Zero Insertion capability is applicable to FFT sizes up to 256 in HWA2.0 and up to 2048 size in HWA2.1.

In HWA2.0, ZERO_INSERT_MASK is a 256-bit vector (split in eight 32-bit registers) that holds the positions of zero-insertion. A bit value of ‘0’ inserts a zero and a value of ‘1’ means the input is passed through. Input streaming is stalled during the zero insertion. The register ZERO_INSERT_NUM is used indicate the number of zeros to be inserted. The register ZERO_INSERT_EN, if set to 1, enables this feature.

In HWA 2.1, the ZERO_INSERT_MASK is of length 2048 and is stored in DSS_HWA_DEROT_RAM (TWID ANGLE RAM) as 64x32 bit pattern. In HWA 2.1, the complex multiplication mode 9 and zero insertion feature cannot be simultaneously activated in same parameter-set due to the sharing of DSS_HWA_DEROT_RAM for both these features.

Zeros insert locations directly refer to FFT's input sample indices. For example in HWA2.0, if FFT size is 16, SRCANT is 11, ZERO_INSERT_MASK0 = 0xFF0F means that the first 4 samples are passed through, 4 zeros are inserted, and the next 8 samples are passed through. As with channel combination, the zero insertion pattern remains same across iterations.

This mode is not to be confused with zero padding mode where zeros are appended to an input stream. The number of zeros padded at the end depends on FFTsize, zero insertion and channel combination. It is recommended to avoid zero insertion for the last sample in the iteration (the last sample should come through input formatter).

Note

There is a known observation with the behavior in the readback values of the DSS_HWA_DEROT_RAM when using it as the zero-insertion mask register space. The RAM was designed to hold data up to 14-bits within 16-bit words (0x0000 to 0x3FFF) for frequency shifter phase values in CMULT_MODE = 1001 and the topmost 2 MSBs were not to be cared for. When using the zero-insertion feature in HWA 2.1, the RAM can be programmed with full range of 16-bit values (0x0000 to 0xFFFF) and the complete zero insertion for 2048 samples can be achieved as intended. The only thing to note would be that the readback value of the same which will read the top 2 MSBs as 0 (Eg : RAM programmed with 0xFFFF would have a readback value of 0x3FFF). This however does not represent the actual contents of the RAM nor will it affect the functionality of the zero-insertion feature. It is suggested that the user refer to the value programmed via software and treat it as the actual contents of the RAM. It can also be noted that in the HWA2.1, the ZERO_INSERT_MASK_<n> registers are obsolete.

28.7.10 Pre-Processing Block – Register Descriptions

Table 28-9 lists all the registers of the pre-processing block. As explained in the first part of this chapter, some of the registers are common (common for all parameter-sets) registers, whereas, some others are "part of each parameter-set". For each register, this distinction is captured as part of the register description in Table 28-9.

Table 28-9. Pre-Processing Registers

Register.field	Width	Parameter-Set? (Y/N)	Description
DCEST_RESET_MODE	2	Y	2-bit field that controls the reset behavior for all 12 DC accumulators 00 : Hold Accumulator state without updating 01 : Reserved 10 : Reset at start of param-set (i.e., per-chirp DC estimation). 11 : Reset at start of param-set only if loop counter is 0 (i.e., per-frame DC estimation)
DC_EST_CTRL.dc_est_scale	9	N	Programmable fine scaling for DC estimation: 9-bit scale applied to all 12 DC accumulators. This is followed by right shift and truncation. Multiplies the accumulator output by DC_EST_SCALE/256. Default value is 256 giving a scale of 1.0. Setting it to 128, gives a scale of 0.5.
DC_EST_CTRL.dc_est_shift	4	N	Programmable right shift for DC estimation: Right bit-shift applied to all 12 DC accumulator outputs. Cannot be bypassed. Accumulator outputs are scaled by 2^(8 + 6 + DC_EST_SHIFT). Valid range for this register is 0 to 14 (i.e., scaling of 2^14 to 2^28). Note that DC_EST_SHIFT = 15 is not supported.
DC_ACC_I_<n>_VAL_LSB. Dc_acc_i_<n>_val_lsb n=0,1,..11	32	N	These read-only registers provide the lower 32 bits of 36b DC estimation accumulator values –I&Q for 12 streams for processor read-out.

Table 28-9. Pre-Processing Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
DC_ACC_I_<n>_VAL_MSB. Dc_acc_i_<n>_val_msb n=0,1,..11	4	N	These read-only registers provide the upper 4 bits of 36b DC estimation accumulator values –I&Q for 12 streams for processor read-out.
DC_EST_RESET_SW.dc_est_reset_sw	1	N	Software reset for DC accumulators: Setting this register bit to 1 resets all 12 DC estimation accumulators. This is a self-clearing reset bit.
DC_EST_I_<n>_VAL.dc_est_i_<n>_val DC_EST_Q_<n>_VAL.dc_est_q_<n>_val n=0,1,..11	24	N	These read-only registers provide the DC estimates – I&Q for 12 streams – for the processor to read.
DC_ACC_CLIP_STATUS.dc_acc_clip_status	12	N	Clip status indication (read-register) for the 12 DC accumulators (both I and Q combined). Value of 1 indicates a clipping event occurred.
DC_EST_CLIP_STATUS.dc_est_clip_status	12	N	Clip status indication (read-register) for the 12 DC estimates (both I and Q combined). Value of 1 indicates a clipping event occurred.
DCSUB_EN	1	Y	Enable or Disable DC subtraction. If this register bit is set to 1, DC subtraction is enabled. Else, it is disabled.
DCSUB_SELECT	1	Y	Source select for DC subtraction: 0 : Value comes from processor via DC_SW_I<n> & DC_SW_Q<n> 1: Value comes from built-in DC estimation hardware, i.e., DCEST_I<n> & DCEST_Q<n>
DC_I<n>_SW.dc_i<n>_sw DC_Q<n>_SW.dc_q<n>_sw n=0,1,..11	24	N	User-programmed DC values used for DC subtraction. These registers are relevant only when DCSUB_SELECT is 0.
DC_SUB_CLIP.dc_sub_clip	1	N	Clip status indication (read-register) for DC subtraction node (both I and Q combined). Value of 1 indicates a clipping event occurred.
INTF_LOC_THRESH_EN	1	Y	Enable/Disable for Interference localization (marking out): This registerbit controls the enable/disable for the interference marking (setting Interference Indicator Bit) feature. The feature is enabled if this register bit is set to 1.
INTF_LOC_THRESH_MAG<n>_SW.intf_loc_thresh_mag<n>_sw n=0..11	24	N	Software Interference threshold for Magnitude These registersare used to specify the user-programmed threshold for marking out samples affected by interference in the Interference localization block. The magnitude of each incoming samples is compared with this threshold to decide whether it is corrupted by interference or not.
INTF_LOC_THRESH_MAGDIFF<n>_SW.intf_loc_thresh_magdiff<n>_sw n=0…11	24	N	Software Interference threshold for Magnitude of backward difference These registersare used to specify the user-programmed threshold for marking out samples affected by interference in the Interference localization block. The magnitude of backward difference of incoming samples is compared with this threshold to decide whether it is corrupted by interference or not.
INTF_LOC_THRESH_MODE	2	Y	Interference detection mode selection: This register is used to control the mode for interference detection in the Interference localization block. 00 : Magnitude OR Magnitude difference 01: Only Magnitude difference 10: Only Magnitude 11 : Magnitude AND Magnitude difference

Table 28-9. Pre-Processing Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
INTF_LOC_THRESH_SEL	2	Y	Select the source of interference threshold 0 : User-defined threshold via INTERFTHRESH_MAG_SW and INTERFTHRESH_MAGDIFF_SW 1 : Single threshold based on built-in interference statistics outputs using sum value across collected interference statistics 2 : Threshold based on built-in interference statistics outputs, with each statistic being used for corresponding iteration (RX channel)
INTF_STATS_RESET_MODE	2	Y	Reset mode control for Interference statistics accumulators: Controls the reset behavior for all 12 magnitude and magdiff accumulators. 00 : Hold Accumulator state without updating 01 : Free-running accumulator mode 10 : Reset at start of parameter-set (i.e.,per-chirp accumulation). 11 : Reset at start of parameter-set only if loop counter is 0 (i.e., per-frame)
INTF_STATS_CTRL.intf_stats_mag_scale	8	N	Programmable fine scaling for Interference statistics Magnitude: Scaling applied to INTF_STATS_MAGACC<n> from interference statistics block.
INTF_STATS_CTRL.intf_stats_mag_shift	3	N	Programmable right shift for Interference statistics Magnitude: Right bit-shift applied to the interference magnitude accumulator. Total right shift of the accumulator is 2^(3+6+INTF_STATS_MAG_SHIFT). Valid range for this register is 0 to 6 (i.e., the total right shift can't be more than 2^15).
INTF_STATS_CTRL.intf_stats_magdiff_scale	8	N	Programmable fine scaling for Interference statistics MagDiff: Scaling applied to INTF_STATS_MAGDIFFACC<n> from interference statistics block.
INTF_STATS_CTRL.intf_stats_magdiff_shift	3	N	Programmable right shift for Interference statistics MagDiff: Right bit-shift applied to the interference magdiff accumulator. Total right shift of the accumulator is 2^(3+6+INTF_STATS_MAGDIFF_SHIFT). Valid range for this register is 0 to 6 (i.e., the right shift can't be more than 2^15).
INTF_STATS_MAG_ACC_<n>_LSB.intf_stats_mag_acc_<n>_lsb	32	N	These read-only registers provide the lower 32 bits of 36b magnitude accumulator values –I&Q 12 streams for processor read-out.
INTF_STATS_MAG_ACC_<n>_MSB.intf_stats_mag_acc_<n>_msb	4	N	These read-only registers provide the upper 4 bits of 36b magnitude accumulator values –I&Q 12 streams for processor read-out.
INTF_STATS_MAGDIFF_ACC_<n>_LSB.intf_stats_magdiff_acc_<n>_lsb	32	N	These read-only registers provide the lower 32 bits of 36b magnitude difference accumulator values –I&Q 12 streams for processor read-out.
INTF_STATS_MAG_ACC_<n>_MSB.intf_stats_mag_acc_<n>_msb	4	N	These read-only registers provide the upper 4 bits of 36b magnitude difference accumulator values –I&Q 12 streams for processor read-out.
INTF_STATS_RESET_SW.intf_stats_reset_sw	1	N	Software reset bit for all the interference statistics accumulators. This is a self-clearing reset bit.
INTF_LOC_THRESH_MAG<n>_VAL.intf_loc_thresh_mag<n>_val	24	N	Read-only thresholds – scaled and shifted INTF_STATS_MAGACC<n> of interference statistics block

Table 28-9. Pre-Processing Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
INTF_STATS_SUM_MAG_VAL.intf_stats_sum_mag_val	24	N	Sum of INTF_LOC_THRESH_MAG<n>_VAL, based on number of iterations. Useful as single magnitude threshold value across all iterations
INTF_LOC_THRESH_MAGDIFF<n>_VAL.intf_loc_thresh_magdiff<n>_val	24	N	Read-only thresholds – scaled and shifted INTF_STATS_MAGACCDIFF<n> of interference statistics block
INTF_STATS_SUM_MAGDIFF_VAL.intf_stats_sum_magdiff_val	24	N	Sum of INTF_LOC_THRESH_MAGDIFF<n>_VAL, based on number of iterations. Useful as single magnitude difference threshold value across all iterations
INTF_STATS_SUM_MAG_VAL_CLIP_STATUS.intf_stats_sum_mag_val_clip_status	1	N	Read-only clip status indication register for 12 interference statistics magnitude accumulators INTF_STATS_MAGACC<n>. Value of 1 indicates a clipping event occurred in atleast one accumulator
INTF_STATS_SUM_MAGDIFF_VAL_CLIP_STATUS.intf_stats_sum_magdiff_val_clip_status	1	N	Read-only clip status indication register for 12 interference statistics magnitude-difference accumulators INTF_STATS_MAGACCDIFF<n>. Value of 1 indicates a clipping event occurred in atleast one accumulator
INTF_STATS_ACC_CLIP_STATUS.intf_stats_mag_accumulator_clip_status	12	N	Read-only clip status indication register for 12 magnitude based interference threshold. INTF_LOC_THRESH_MAG<n>_VAL. Value of 1 indicates a clipping event occurred in atleast one estimate
INTF_STATS_ACC_CLIP_STATUS.intf_stats_magdiff_accumulator_clip_status	12	N	Read-only clip status indication register for magnitude-difference based interference threshold. INTF_LOC_THRESH_MAGDIFF<n>_VAL. Value of 1 indicates a clipping event occurred in atleast one estimate
INTF_STATS_THRESH_CLIP_STATUS.intf_stats_thresh_mag_clip_status	12	N	Read-only clip status for sum of all magnitude thresholds computed by the statistics block. Value of 1 indicates that the sum clipped.
INTF_STATS_THRESH_CLIP_STATUS.intf_stats_thresh_magdiff_clip_status	12	N	Read-only clip status for sum of all magnitude difference thresholds computed by statistics block. Value of 1 indicates that the sum clipped.
INTF_LOC_COUNT_ALL_CHIRP.intf_loc_count_all_chirp	12	N	Read-only register indicating the number of samples that exceeded the threshold in a given param-set. The count is saturated to 2^12 – 1.
INTF_LOC_COUNT_ALL_FRAME.intf_loc_count_all_frame	20	N	Read-only register indicating the number of samples that exceeded the threshold across multiple executions of same param-set. The count is saturated to 2^20 – 1.
INTF_MITG_EN	1	Y	If this bit is set, the interference mitigation path is activated, else it is bypassed.
INTF_MITG_PATH_SEL	2	Y	Based on the value of this register, one of the three paths is activated. 00b: Simple Zeroing out 01b: Windowed Zeroing out 10b: Linear Interpolation 11b: Reserved
INTF_MITG_WINDOW_PARAM_<n>.intf_mitg_window_param_<n> n=0..4	5 (each)	N	This is a programmable array of window parameters. Each window parameter is an unsigned 5 bit integer. The length of the array is 5. The parameters of the window are assumed to be monotonically ascending. For example : val = floor(hanning(14)*32) INTF_MITG_WINDOW_PARAM = val(2:6); If a shorter window (of length less than 5) is desired, some of the earlier window parameters can be set to 31. This sets the window parameter to 31/32 (or ~1).

Table 28-9. Pre-Processing Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
INTF_MITG_CNTTHRESH	5	Y	The (total) number of non-zero IIB within the 'Hysteresis window' should exceed this threshold for the sample-under-test to be considered to be affected by interference. Range : 0 to 31.
INTF_MITG_RIGHT_HYST_ORD	4	Y	The length of the IIB array considered on the right side of (i.e. after) the sample under test. Range : 0 to 15.
INTF_MITG_LEFT_HYST_ORD	4	Y	The length of the IIB array considered on the left side of (i.e. before) the sample under test. Range : 0 to 15.
CMULT_MODE	4	Y	Complexmultiplication mode selection: This registeris used to configure the mode of the complex multiplication sub-block. A value of 0000b disables/bypasses the complex multiplication. Any other value chooses one of nine available modes of operation . Detailed description of the nine modes in the main description section.
CMULT_SCALE_EN	1	Y	Complex multiplier iteration enable : This register bit is applicable in certain modes of the complex multiplication pre-processing to enable per-iteration change of the complex scalar coefficient. When using scalar multiplication mode of the complex multiplier (CMULT_MODE = 0101b), if CMULT_SCALE_EN is set to 1, then the input samples are multiplied by a different complex scalar (i.e., ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11) for each iteration. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all samples across all iterations. When using vector multiplication mode (CMULT_MODE = 0110b), if CMULT_SCALE_EN is set to 1, then instead of pulling the coefficients for vector multiplication from the Vector Multiplication Coefficients RAM, the input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 registers.
ICMULT_SCALE<n>.icmult_scale<n> QCMULT_SCALE<n>.qcmult_scale<n> n = 0 ..11	21	N	Coefficients for Complex multiplication: Refer the description for CMULT_SCALE_EN register.
VEC_MULT_RAM[1024]	32	N	Vector multiplication RAM : Stores the complex vector multiplication coefficients used in modes 6, 7 and 8. Layout shown in Fig. 28-34

Table 28-9. Pre-Processing Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
TWIDINCR	14	Y	Frequency shifter configuration: When the complex multiplication sub-block is programmed in one of the frequency shifter modes (CMULT_MODE = 0001b or 0010b), this register is used to indicate the amount of frequency shift. When the complex multiplication sub-block is programmed in FFT stitching mode (CMULT_MODE = 0011b), the last two bits of this register specify whether it is 4K or 8K FFT stitching. Specifically, if the last two bits are 01b, then it is 4K FFT stitching and if the last two bits are 10b, then it is 8K FFT stitching. Values of 00b and 11b are reserved. Also, the 12 MSB bits of this register must be kept zero in the FFT stitching mode. In all other modes of the complex multiplication sub-block, this 14-bit register must be kept as 0. When the complex multiplication sub-block is programmed with CMULT_MODE = 0110b, 0111b or 1000b, then the 12 MSBs of this register are used as an address offset for the Vector Multiplication Coefficients RAM (the 2 LSBs must be kept 0). When the complex multiplication sub-block is programmed with CMULT_MODE = 1001b, then the 6 LSBs of this register are used an address offset for TWID_ANGLE_RAM, with bit 13 enabling auto-address increment over iterations and bit 12 enabling address saturation or address roll-over after 63.
TWID_INCR_DELTA_FRAC.twid_incr_delta_frac	10	N	Fractional frequency increment per execution of the parameter-set: Frequency shift value to be accumulated at the end of current parameter-set. Refer main description for more details.
DSS_HWA_DEROT_RAM	32	N	HWA 2.0:-Frequency and Phase values for generic frequency shifter mode. This is only applicable when CMULT_MODE = 1001b. In this mode, these 64 registers represent the starting phase and frequency values used. Layout is shown in Fig. 28-34
RECWIN_MODE	1	Y	Recursive window mode select bit.(0) –the K value increments with iteration. (1) –the K value increments with paramset execution count. K always starts from 0
RECWIN_RESET_SW.recwin_reset_sw	1	N	Software reset bit for recursive window K value. This is a self-clearing reset bit.
RECWIN_INIT_KVAL.recwin_init_kval	12	N	RESERVED. This is a reserved register and should be always kept 0.
TWID_INCR_DELTA_FRAC_RESET_SW.twid_incr_delta_frac_reset_sw	1	N	Software reset bit for fine frequency increment accumulator (in CMULT_MODE = 1010b). This is a self-clearing reset bit.
TWID_INCR_DELTA_FRAC_CLIP_STATUS.twid_incr_delta_frac_clip_status	1	N	Read-only register bit that indicates clip status for the fine-frequency increment accumulator (in CMULT_MODE = 1010b).
BPM_EN	1	Y	Enable/Disable BPM removal: This registerbit specifies whether the BPM removal needs to be enabled or not. If this register is set, then BPM removal is enabled prior to feeding samples from the input formatter into the core computational unit.

Table 28-9. Pre-Processing Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
BPM_PATTERN<n>. bpm_pattern_<n> n=0..7	256	N	BPM pattern: Specifies the BPM patternto be used to multiply the input samples if BPM removal is enabled. The 256-bit word is split into 8 32-bit words as [BPM_PATTERN_7, BPM_PATTERN_6, BPM_PATTERN_5, BPM_PATTERN_4, BPM_PATTERN_3, BPM_PATTERN_2, BPM_PATTERN_1, BPM_PATTERN_0]
BPM_RATE.bpm_rate	10	N	BPM rate: Specifies the numberof input samples corresponding to each BPM bit. Minimum valid value for this register is 1.
BPMPHASE	4	Y	BPM startingphase: Specifies the startingphase of the BPM pattern periodicity. For more information, see the detailed description.
CHAN_COMB_EN	1	Y	Enable/Disable channel combining: If this register bit is set to 1, then the channel combining feature is enabled.
CHAN_COMB_VEC_<n>.chan_comb_vec_<n> n=0..7	256	N	Sample index indicator for Channel combining : This register indicates the sample indices that need to be combined in the Channel combiner block. A '01' or '10' transition demarcates the groups. The 256-bit word is split into 8 32-bit words as [CHAN_COMB_VEC_7,CHAN_COMB_VEC_6, CHAN_COMB_VEC_5, CHAN_COMB_VEC_4, CHAN_COMB_VEC_3, CHAN_COMB_VEC_2 CHAN_COMB_VEC_1, CHAN_COMB_VEC_0]
CHAN_COMB_SIZE.chan_comb_size	8	N	This register indicates the number of samples after channel combination in each iteration.
CHANNEL_COMB_CLIP_STATUS.channel_comb_clip_status	1	N	Clip status indication (read-register) during channel combining. Value of 1 indicates a clipping event occurred.
ZERO_INSERT_EN	1	Y	Enable/Disable zero-insertion: If this register bit is set to 1, then the zero-insertion feature is enabled.
ZERO_INSERT_NUM.zero_insert_num	8(HWA2.0)	N	This register indicates the number of zeros to be inserted in each iteration.
ZERO_INSERT_MASK_<n>. zero_insert_mask_<n> n=0..7	256	N	Sample index indicator for Zero Insertion: This is a 256-bit register that holds the positions of zero-insertion. A bit value of '0' inserts a zero at the corresponding index location. A bit value of '1' means the input is passed through. The input sample stream from Input formatter is stalled during the zero insertion. The 256-bit word is split into 8 32-bit words as [ZERO_INSERT_MASK_7, ZERO_INSERT_MASK_6 ZERO_INSERT_MASK_5, ZERO_INSERT_MASK_4 ZERO_INSERT_MASK_3, ZERO_INSERT_MASK_2 ZERO_INSERT_MASK_1, ZERO_INSERT_MASK_0]

28.8 Core Computational Unit - CFAR Engine

This section describes the CFAR engine block present in the core computational unit.

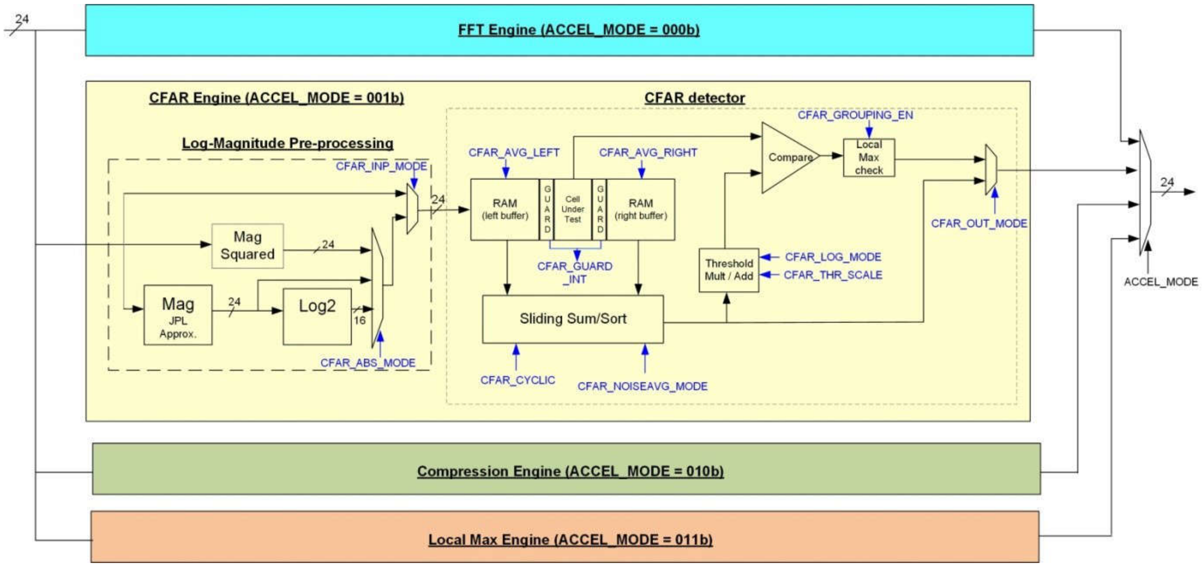

Figure 28-39. CFAR Engine

28.8.1 CFAR Engine

The CFAR engine (Figure 28-39) is a module that enables detection of objects, by identifying peaks in the FFT output. Although there are several detection algorithms, the accelerator supports CFAR-CA and CFAR-OS algorithms. CFAR-CA stands for constant false alarm rate – Cell Averaging. CFAR-OS stands for constant false alarm rate – Ordered Statistic.

As shown in figure, the CFAR engine path is selected by setting the accelerator mode ACCEL_MODE = 001b. In this mode, the FFT path is not usable simultaneously and the input 24-bit samples from the input formatter block will be routed into the CFAR engine. The CFAR engine has capability to perform CFAR- detection processing (both linear and logarithmic CFAR modes are available) and generate a peak list.

In CFAR, the processing steps involve computing a threshold for each sample under test (cell under test) and deciding whether a peak is detected or not based on whether the cell under test crosses that threshold. Additionally, peak grouping may be done, where a peak is declared only if the cell under test is greater than or equal to its most immediate neighboring cells to its left and right. One thing to note here is that for peak grouping, the left and right neighboring cells themselves are not required to be CFAR qualified.

In CFAR-CA case, for each cell under test, the computation of threshold is done by averaging the magnitude (or magnitude- squared or log-magnitude) of a specified number of noise samples to the left and right of the cell under test to determine a ‘surrounding noise level’ and then applying a scale factor (or addition factor in case log-magnitude is used) on that surrounding noise average to determine the threshold. Thus, the CFAR-CA detector takes one cell at a time, computes the threshold and decides whether a valid peak is present at that cell. In the case of CFAR-OS, for each cell under test, the computation of threshold is done by sorting the magnitude (or magnitude-squared or log-magnitude) of a specified number of noise samples to the left and right of the cell under test and selecting a specific “K-th” lowest value from the sorted list as representative of the surrounding noise level, and then applying a scale factor on that value to determine the threshold.

28.8.1.1 CFAR Engine – Operation

The CFAR engine receives 24-bit input samples from the Input Formatter block. Typically, these are real samples, representing the magnitude or magnitude-squared or log-magnitude of the FFT output. However, the input to CFAR engine can instead be complex samples, in which case, either magnitude or magnitude-squared or log-magnitude of the complex samples can be computed inside the CFAR engine itself. This is done by the log-magnitude pre-processing sub-block inside the CFAR engine (see Figure 28-39). The real unsigned result from this pre-processing operation is sent to CFAR detection processing. The registers CFAR_INP_MODE and CFAR_ABS_MODE are used to configure real vs. complex input, as well as the nature of pre-processing required. The log-magnitude computation uses the same JPL approximation for magnitude calculation and the same look-up table (LUT) approximation for log2 computation as described in the section 28.5.1.8 for FFT engine post-processing. Note that for the case of real input (i.e., CFAR_INP_MODE = 1), the input samples must be unsigned. In this case, CFAR_ABS_MODE register has no effect.

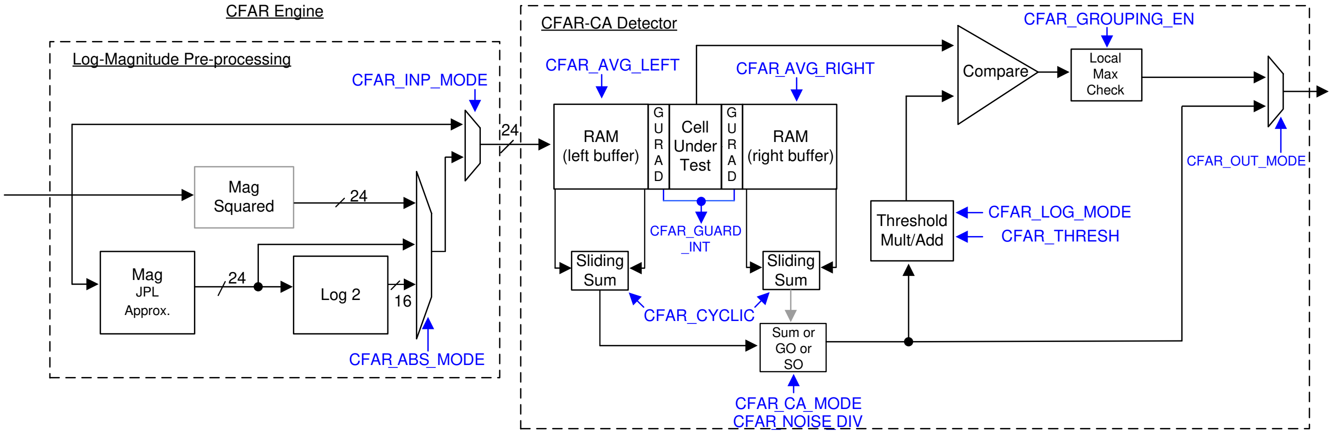

Figure 28-40. CFAR Engine Block Diagram

As described earlier, the CFAR detection processing involves finding a “surrounding noise average” for each cell under test and then determining a threshold that is a function of the surrounding noise average. The cell under test is compared against this threshold to decide whether a peak is present or not in that cell. To calculate the threshold, the surrounding noise average is multiplied with (or added to) a threshold scaling factor specified in CFAR_THRESH register.

There are two modes in which the CFAR detector can be used – in non-logarithmic mode (a.k.a linear CFAR), the threshold scale factor is multiplied, and in logarithmic mode (a.k.a logarithmic CFAR), the threshold scale factor is added. This is decided based on CFAR_LOG_MODE register.

Note: The linear and logarithmic modes are available for CFAR-CA and its variants. Their detection cores are built with 24-bit datapath width. Only the logarithmic mode is available for CFAR-OS. The CFAR-OS detection core is built with 16-bit datapath width, which is sufficient in logarithmic mode.

The final detection threshold that is so obtained is used to compare against the cell under test to determine whether a peak is detected in that cell.

Table 28-10 summarizes the register settings for the different CFAR modes of operation.

Table 28-10. CFAR Modes and Register Settings

Desired CFAR Mode	Input Real or Complex	Desired Pre-Processing	Register Values to Use		
			CFAR_INP_MODE	CFAR_ABS_MODE	CFAR_LOG_MODE
Linear CFAR	Real	N/A	1	00	0
	Complex	Magnitude	0	10	0
		Mag-squared	0	00	0
		Log2-Mag	0	11	0
Log CFAR	Real	N/A	1	00	1
	Complex	Log2-Mag	0	11	1

Desired CFAR-CA Algorithm	CFAR_CA_MODE Register Setting
CFAR-CA	00
CFAR-CAGO	01
CFAR-CASO	10

Desired CFAR-CA Algorithm	CFAR_CA_MODE Register Setting
CFAR-OS	11

The surrounding noise level computation has multiple options – cell averaging (CFAR-CA), cell averaging with greater-of selection (CFAR-CAGO), cell averaging with smaller-of selection (CFAR- CASO) and ordered statistic (CFAR-OS). The register CFAR_CA_MODE is used to select one among CFAR-CA, CFAR-CAGO, CFAR-CASO and CFAR-OS modes. In CFAR-CA, the noise samples on the left side and right side of the cell under test (after ignoring some guard cells on either side) are simply averaged to determine the surrounding noise level. In CFAR-CAGO, the noise samples on the left side and right side are averaged independently and the greater of the two is used to determine the threshold. In CFAR-CASO, the lesser of the two is used. In CFAR-OS, the noise samples on the left side and right side of the cell under test (after ignoring some guard cells on either side) are sorted and the “K-th” lowest value from the sorted list is selected as the surrounding noise level. The selection of “K-th value” from the sorted list is based on the register CFAR_OS_KVALUE (see table of registers for more details on this register).

The number of samples on the left side and right side used for computing the noise average is configured using CFAR_AVG_LEFT and CFAR_AVG_RIGHT registers and the number of guard cells is configured using CFAR_GUARD_INT register (Figure 28-40). The number of samples used for left side noise averaging is given by 2*CFAR_AVG_LEFT. The number of samples used for right side noise averaging is given by 2*CFAR_AVG_RIGHT. The number of guard cells that are ignored on each side of the cell under test is given by CFAR_GUARD_INT. For example as shown in Figure 28-41, if CFAR_AVG_LEFT = CFAR_AVG_RIGHT = 16, and CFAR_GUARD_INT = 3, then it means that the most immediate three samples each to the left and right of the cell under test are skipped and then, 32 samples on the left and 32 samples on the right side are used for noise averaging. Note that even though the term noise averaging is used here, the actual implementation simply adds the noise samples first and the “averaging” is done as a divide by a power-of- 2 as specified in a separate register, CFAR_NOISE_DIV. These registers are described in Section 7.1.

Note: The CFAR engine also supports a special “constant threshold mode” of CFAR detection. In this special mode, the detection threshold value to compare with each cell-under-test is based on a user configurable constant – CFAR_DET_THR. This detection threshold value is independent of “surrounding noise level”, and the detection comparison depends only CFAR_DET_THR, CFAR_THR_SCALE, and CFAR_LOG_MODE. This mode of operation can be achieved by setting the engine in CFAR-CA mode and additionally setting CFAR_AVG_LEFT = CFAR_AVG_RIGHT = 0. In this constant threshold mode, CFAR_THRESH scalefactor is multiplied with CFAR_DET_THR in the linear mode, and in the logarithmic mode the threshold scale factor is added.

In case of CFAR-CA, the valid values for CFAR_AVG_LEFT and CFAR_AVG_RIGHT is any number between 0 and 63 (except 1), which means that the number of samples each on the left side and right side used for noise averaging can be one of 0, 4, 6, 8, 10, 12, 14, … 124, 126. The values of CFAR_AVG_LEFT and CFAR_AVG_RIGHT can be different in cyclic mode of CFAR and need to be equal in non-cyclic mode (both are described in a later section).

However, in the case of CFAR-OS, the valid values for CFAR_AVG_LEFT and CFAR_AVG_RIGHT are highly restricted. They need to be equal (i.e., same window size on left and right sides) and further, the only values supported for these registers in CFAR-OS mode are: 0, 4, 6, 8, 12, 16, 24 and 32 (which corresponds to number of samples being 0, 8, 12, 16, 24, 32, 48 and 64 on either side). Note that the register CFAR_NOISE_DIV, which is used in CFAR-CA for noise “averaging”, is not applicable in case of CFAR-OS.

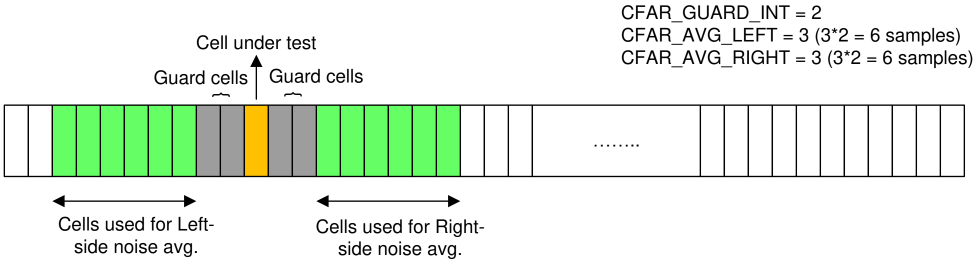

Figure 28-41. CFAR-CA: Cells Used for Surrounding Noise Average

As mentioned earlier, the CFAR_THRESH register specifies the threshold scaling factor. This is an 18-bit register whose value is used to either multiply or add to the ‘surrounding noise average’ to determine the threshold used for detection of the present cell under test. If logarithmic mode is disabled (in magnitude or magnitude-squared mode), then the register value is multiplied with the surrounding noise average to determine the threshold, else it is added to the surrounding noise average. In the former case, this 18-bit register is interpreted as a 14.4 value and supports a range of values from 1/16 to 2^14-1. In the latter case (logarithmic mode), the 18-bit register is interpreted as a 7.11 value.

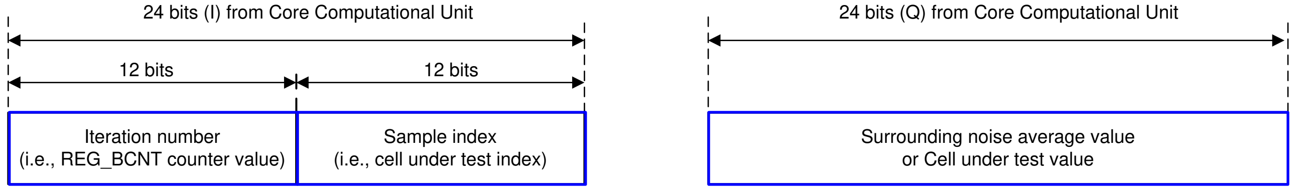
The CFAR engine supports a few output formats that are described next.

28.8.1.2 CFAR Engine – Output Formats

As part of CFAR detection, the cells that exceed the threshold are noted and this ‘Detected Peaks list’ is sent to the destination memory. Since the output format of the core computational unit is 24-bits I and 24-bits Q, the detected peaks list is formatted into ‘I’ and ‘Q’ channels as shown in Figure 28-42 below. The 24-bit I channel contains the index at which the peak is detected, with the MSB 12 bits containing the iteration number (corresponding to BCNT counter value) and the LSB 12 bits containing the sample index number (corresponding to SRCACNT counter value). The 24-bit Q channel contains the surrounding noise level value or the cell under test value of that detected peak. This is chosen based on CFAR_OUT_MODE register setting. Instead of ‘Detected Peaks list’, it is also possible for the CFAR engine to send out the raw ‘surrounding noise level’ value for each cell. This is called ‘Raw output mode’.

Figure 28-42 and Table 28-11 show the different output formats available.

Output format of CFAR Engine in ‘Detected Peaks list’ mode



Output format of CFAR Engine in ‘Raw output’ mode

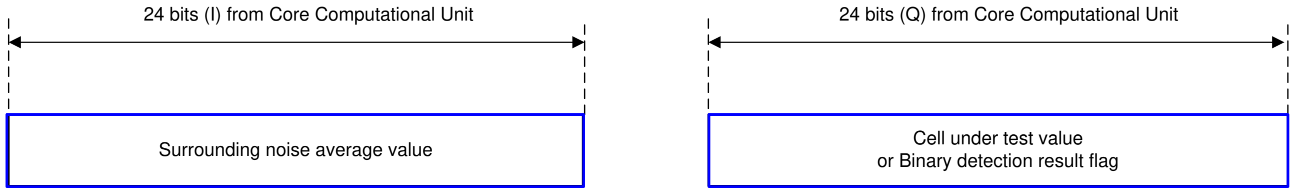


Figure 28-42. CFAR Engine Output Format

In detected peaks list mode, only the detected peaks are output to the destination memory. In this case, the read-only register CFARPEAKCNT indicates how many peaks have been totally detected, so that the main processor can read that many locations from the destination memory. In this mode, the number of peaks stored in the destination memory is limited to a maximum of 4095, or DSTACNT, whichever is smaller. If more peaks are detected beyond this number, they wrap around and circularly overwrite the same locations in the destination memory. Also, in this mode, the register DSTBINDX is not applicable and is ignored.

While detecting peaks, if ‘peak grouping’ is required, then it can be enabled using CFAR_GROUPING_EN register. In this case, a peak is declared as detected only if it the cell under test exceeds the threshold, as well as, if the cell under test exceeds the two neighboring cells to its immediate left and right (the peak is a local maximum).

Further, there is a special mode of the CFAR Engine called “Dominant peaks mode”. This mode can be used to create a modified copy of the range FFT output, where the range FFT bins corresponding to large objects are kept as is, and the range FFT bins which do not correspond to large objects are masked (zeroed out). In this special mode of the CFAR engine, the CFAR engine takes complex (I & Q) input samples and the CFAR engine outputs values that are simply equal to its input values at the sample indices corresponding to the detected peaks, and outputs zeros at all other sample indices. This thereby gives an output array which is the same as the input array AND’ed with the binary CFAR peak detection flags. Note that this special mode is only meaningful when the CFAR input is complex , i.e., when CFAR_INP_MODE = 0. The purpose of this “Dominant Peaks mode” is to re-construct interference affected samples, where this mode can be used to extract the FFT output bins corresponding to large peaks and later, doing an IFFT on this output to re-construct the time domain signal corresponding only to dominant peaks.

Output format of CFAR Engine in the special ‘Dominant peaks’ mode

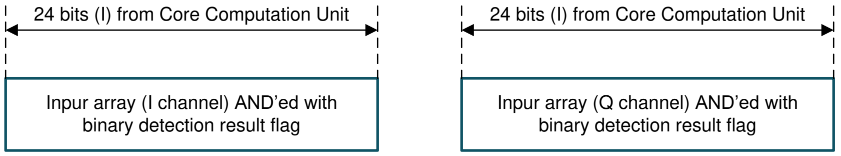

Figure 28-43. CFAR Engine Output Format in Dominant Peaks Mode

Table 28-11. CFAR Output Modes and Register Settings

CFAROutput Mode	IChannel Output	QChannel Output	Register Settings (CFAR_ADV_OUT_MODE, CFAR_OUT_MODE)
Rawoutput mode (all cells are output)	Surrounding noiselevel	Cellunder test value	(0,00)
	Surrounding noiselevel	Binary detectionresult flag (0 or 1)	(0,01)
Detectedpeaks list mode (only detected peaks are output)	Peak index	Surrounding noiselevel value	(0,10)
	Peak index	Cellunder test value	(0,11)
Dominant peaks mode	Reserved	Reserved	(1,00)
	Input array (I channel) AND'ed with binary detection result flag	Input array (Q channel) AND'ed with binary detection result flag	(1,01)

28.8.1.3 CFAR Engine – Cyclic vs. Non-Cyclic

The register CFAR_CYCLIC specifies whether the CFAR detector needs to work in cyclic mode or in non-cyclic mode. In general, the programmed number of samples for noise level computation (specified by CFAR_AVG_RIGHT and CFAR_AVG_LEFT) are available fully only for the cells under test which are in the middle of the input array (Figure 28-44). For first several cells under test, the available number of samples to the left is lesser than the programmed number. Similarly, for the last several cells under test, the available number of samples to the right is lesser than programmed.

In cyclic mode (Figure 28-45), this is handled by wrapping around the edges in a circular manner. For a cell under test near the left edge, some samples from the right edge (circular wrap around the edge) are fetched to collect the programmed CFAR_AVG_LEFT number of left side samples for noise level computation. Similarly, for a cell under test near the right edge, an appropriate number of samples from the left edge are used (again, circular wrap around the edge).

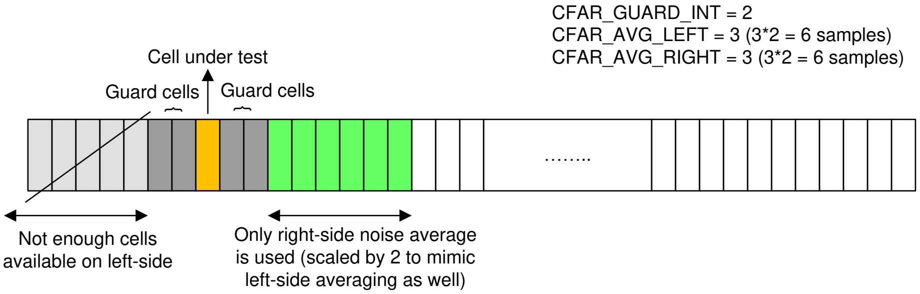

Figure 28-44. Handling of Samples Near the Edge in Non-Cyclic Mode

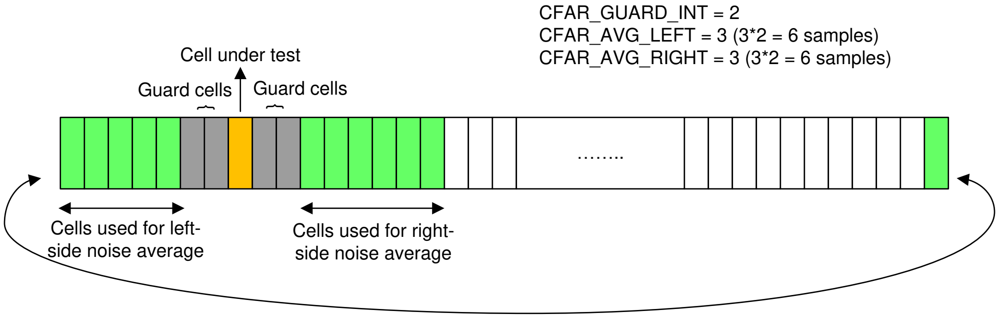

Figure 28-45. Handling of Samples Near the Edge in Cyclic Mode

This cyclic CFAR implementation is accomplished through a combination of a few register settings within the CFAR engine, as well as in the input and output formatter blocks. Specifically, the input formatter is configured to send additional samples (repeat samples) in a circular manner wrapping around the left and right edges. This is achieved by using the A-dimension circular shift (SRCA_CIRCSHIFT) and wrap-around (SRCA_CIRCSHIFTWRAP) registers in the input formatter, such that the required number of extra samples at both edges are streamed into the CFAR engine. The cyclic CFAR mode only works when the number of cells under test is a power of 2.

For example, if the number of cells under test is 256, the average number of left and right noise samples is 32 each and the number of guard cells is 3 on either side. Then, the registers need to be programmed as shown in Table 28-12.

Table 28-12. Configuration Example for CFAR Cyclic Mode

Module	RegisterSetting	Comments
CFAREngine	CFAR_GUARD_INT= 3	3guard cells on either side
	CFAR_AVG_LEFT= 16 CFAR_AVG_RIGHT= 16	32samples on left side and 32 samples on right side for noise averaging
Input Formatter	SRCACNT =325	255+ (32+3) + (32+3), where 255 is the usually configured value of SRCACNT for a 256 sample vector, plus 32+3 additional samples for circular repeat at either end
	SRCA_CIRCSHIFT= 221	256– (32+3), which is the starting offset for the circular shift, so that samples are streamed into CFAR engine start from this point
	SRCA_CIRCSHIFTWRAP= 8 SRC_CIRCSHIFTWRAP3X = 0	The circularwrap-around happens when SRCACNT counter value reaches 2^SRCA_CIRCSHIFTWRAP = 256
Output Formatter	REG_DST_SKIP_INIT= 0	Noneed to skip any samples at Output Formatter even though extra samples are fed into CFAR engine, because CFAR engine automatically strips out the extra samples
	DSTACNT= 255	256outputs corresponding to 256 cells

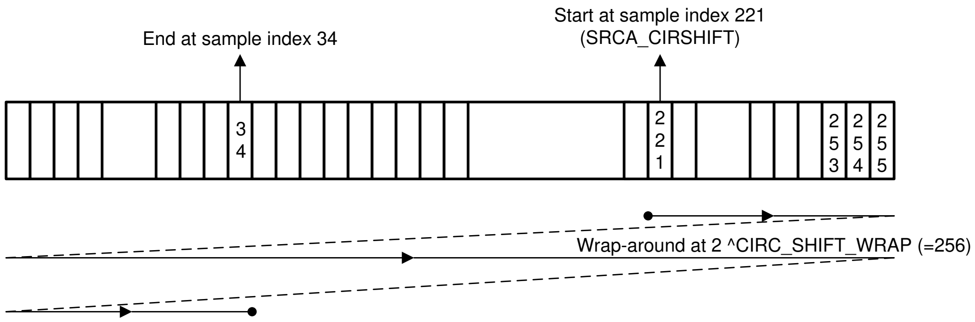

Figure 28-46. Input Formatter Sample Streaming for the Cyclic CFAR Example

However, the handling of edge samples in non-cyclic mode of CFAR is different. It is explained below – first for CFAR-CA and then for CFAR-OS versions.

In non-cyclic mode of CFAR-CA, if the number of available samples on the left for any cell under test is lesser than CFAR_AVG_LEFT, then the noise average is computed solely from the right side. This is done by calculating the noise sum as twice the right side noise sum. Similarly, if the number of available samples on the right is lesser than CFAR_AVG_RIGHT, then the noise average is computed solely from the left side. This is done by calculating the noise sum as twice the left side noise sum. It is required that the CFAR_AVG_LEFT and CFAR_AVG_RIGHT be programmed equally in non-cyclic mode – otherwise, the noise computation for the edge samples is not ideal.

In non-cyclic mode of CFAR-OS, the edge samples are handled as follows. For the cells under test that are near the edges, the number of available surrounding samples for sorting is lesser than programmed (CFAR_AVG_LEFT or CFAR_AVG_RIGHT). These available samples are first sorted and the Kth lowest value is selected as the noise level. It should be noted that this Kth lowest sample in the available samples may result in a sub-optimal noise level for edge samples than non-edge samples because the number of available samples is lesser for edge samples than for non-edge samples. A minor variant for better handling this edge sample case can be enabled by setting the register CFAR_OS_NONCYC_VARIANT_EN to 1. In that case, available samples are first sorted. But instead of using the programmed K value directly for noise sample selection from the sorted array, a proportionally scaled down value is used based on the number of available surrounding samples for each cell under test. This is illustrated in Table 28-13 below, where, L represents the programmed

CFAR_AVG_LEFT (same as CFAR_AVG_RIGHT) and K represents the programmed CFAR_OS_KVAL. It is required that the CFAR_AVG_LEFT and CFAR_AVG_RIGHT be programmed equally in non-cyclic mode.

Table 28-13. Internal K Value used in CFAR-OS Non-Cyclic Mode

No. of available samples on one side (excluding guard)	No. of available samples on the other side (excluding guard)	Internal K value used for noise sample selection (CFAR_OS_NON_CYC_ VARIANT_EN = 0)	Internal K value used for noise sample selection (CFAR_OS_NON_CYC_ VARIANT_EN = 1)
L	0 to floor(L/4)-1	K	floor (4K/8)
L	floor(L/4) to floor(2L/4)-1	K	floor (5K/8)
L	floor(2L/4) to floor(3L/4)-1	K	floor (6K/8)
L	floor(3L/4) to floor(4L/4)-1	K	floor (7K/8)
L	L	K	K

In general, it is expected that CFAR Engine will be used for arrays much larger than the configured left and right window and guard lengths. Specifically, the ACNT should exceed the sum of configured left and right window and guard lengths.

28.8.2 CFAR Engine – Register Descriptions

Table 28-14 lists all the registers of the CFAR engine block.

Table 28-14. CFAR Engine Registers

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_AVG_LEFT	6	Y	Number of left-side samples for noise level computation: This register is used to specify the number of samples used for noise level computation to the left of the cell under test. The number of samples used for noise level computation is equal to the value of this register multiplied by 2. For example, if this register value is 15, then the number of left- side samples used for averaging is 30. The maximum number that is possible is 126. A value of zero in this register means that the noise samples on the left side are not used for noise level computation. The valid values for this register are different for CFAR-CA and CFAR-OS modes: In CFAR-CA (and its variants CFAR-CAGO and CFAR-CASO), valid values for this register are 0, 2, 3, 4, …63 (Note that avalue of 1 is not supported). This corresponds to number of samples equal to 0, 4, 6, 8, 10, 12, 14, … 124, or 126. In CFAR-OS mode, valid values for this register are restricted to 0, 4, 6, 8, 12, 16, 24, 32 only (which corresponds to number of samples equal to 0, 8, 12, 16, 24, 32, 48 or 64).
CFAR_AVG_RIGHT	6	Y	Numberof right-side samples for noise level computation: This registeris very similar to the above, except that this register specifies the averaging to the right of the cell under test. In most cases, it is expected that CFAR_AVG_RIGHT has the same value as CFAR_AVG_LEFT. In non-cyclic modes of CFAR, CFAR_AVG_RIGHT must be programmed equal to CFAR_AVG_LEFT.

Table 28-14. CFAR Engine Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_GUARD_INT	3	Y	Numberof guard cells: This registerspecifies the number of guard cells to ignore on either side of the cell under test. If this register value is 3, then three guard cells on the left side and three guard cells on the right side are ignored. Only the noise samples beyond this guard region are used for calculating the surrounding noise level.
CFAR_OS_KVALUE	7	Y	K-th value for ordered statistic: This register is useful only in CFAR-OS mode, where it indicates the parameter K. From the sorted list of left and right noise samples, the K’th lowest value is used as the noise sample. This is a zero-based count – for instance, if this register value is 27, then the 28th lowest element in the sorted array is selected. Note that since CFAR-OS supports a maximum of 64 samples each on left and right side, the maximum size of the vector to sort is 128, and hence the maximum valid value of CFAR_OS_KVALUE register is 127.
CFAR_OS_NON_CYC_VARIANT_EN	1	Y	Enable scaling of K value for edge samples in non-cyclic CFAR-OS: This is useful only in CFAR-OS in non-cyclic mode. Setting this to 1 enables a variant where the K value used for noise sample selection for edge samples is scaled down proportional to the number of available neighboring samples at edges.
CFAR_THRESH .cfar_thresh	18	N	Threshold scalefactor: This registeris used to specify the threshold scale factor. This value is used to either multiply or add to the ‘surrounding noise level’ to determine the threshold used for detection of the present cell under test. If logarithmic CFAR mode is disabled (in magnitude or magnitude-squared mode), then the register value is multiplied with the surrounding noise level to determine the threshold, else it is added to the surrounding noise level. In the former case, this 18-bit register is interpreted as a 14.4 value. In the latter case (logarithmic mode), the 18-bit register is interpreted as a 7.11 value.
CFAR_DET_THRESH.cfar_det_thresh	24	N	Constant detection threshold value in constant threshold mode: This register is applicable only in constant threshold mode of CFAR (i.e. only in CFAR-CA mode and only if CFAR_AVG_LEFT = CFAR_AVG_RIGHT = 0). In this special mode, this register specifies the detection threshold value used to compare with cell under test. The detection threshold value is held constant, and scaled by CFAR_THRESH linearly or logarithmically

Table 28-14. CFAR Engine Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_LOG_MODE	1	Y	CFARlinear or logarithmic mode: This registeris one of the registers used to specify whether the CFAR detector operates in linear or logarithmic mode. If this register bit is set, then the CFAR detector operates in logarithmic mode, which means that the threshold scale factor is added to (instead of multiplied with) the surrounding noise level value to determine the threshold. Note that this mode is meaningful only when the input samples to the CFAR detector are log- magnitude samples (see CFAR_INP_MODE as well). If this register bit is 0, then the logarithmic mode is disabled, in which case, the threshold scale factor is multiplied with (instead of added to) the surrounding noise level to determine the threshold. This mode is meaningful when magnitude or magnitude-squared samples are fed to the CFAR detector.
CFAR_INP_MODE	1	Y	CFARengine input mode: This registerbit specifies whether the inputs to the CFAR engine are complex samples or real values (the real values are already magnitude, magnitude-squared or log-magnitude numbers that can be directly sent to CFAR detection process). If this register bit is 1, then the input samples are real values and are directly sent to CFAR detection. If this register bit is 0, then the inputs are complex samples and hence either magnitude or magnitude- squared or log-magnitude computation is required prior to CFAR detection. Which of the three, viz., magnitude or magnitude-squared or log-magnitude is done, is selected by CFAR_ABS_MODE register described below.
CFAR_ABS_MODE	2	Y	CFARmagnitude, mag-squared or log-mag mode: This registeris used to specify which of the three computations, namely Magnitude, Mag- squared or Log-Magnitude, is enabled inside the CFAR engine prior to CFAR detection. This register is only relevant when CFAR_INP_MODE is 0 (complex samples are fed to CFAR engine). 00b– Magnitude-squared 01b – Not valid 10b– Magnitude (using JPL approximation) 11b– Log2-Magnitude (using LUT approximation)

Table 28-14. CFAR Engine Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_OUT_MODE	2	Y	CFARengine output mode: The MSBbit of this register selects whether the CFAR Engine outputs all the noise average values for all the cells (‘Raw output’ mode), or whether the CFAR Engine outputs only the detected peaks (‘Detected Peaks List’ mode). The LSB bit specifies the content of the 24-bit ‘I’ and ‘Q’ channel outputs logged in destination memory. If CFAR_ADV_OUT_MODE is set to 1 (special mode called “Dominant peaks”), this register should be set to 1. Refermain description section for details.
CFAR_ADV_OUT_MODE	1	Y	CFARengine special output mode (Dominant peaks mode): This register bit enables the special “Dominant peaks” mode of the CFAR engine. In this mode, the CFAR engine outputs the input array (I and Q) samples corresponding detected peak locations as is and suppresses the non-detected peak locations (sends zeros).
CFAR_GROUPING_ EN	1	Y	CFARpeak grouping enable: This registerbit specifies whether peak grouping should be enabled. When this register bit is 0, peak grouping is disabled, which means that a peak is declared as detected as long as the cell under test exceeds the threshold. On the other hand, if this register bit is 1, then a peak is declared as detected only if it the cell under test exceeds the threshold, as well as, if the cell under test exceeds the two neighboring cells to its immediate left and right (local maximum).
CFAR_NOISE_DIV	4	Y	CFARnoise average division factor: This parameter is applicable only in CFAR-CA modes and it is not applicable in CFAR-OS mode. This registerspecifies the division factor with which the noise sum calculated from the left and right noise windows are divided, in order to get the final surrounding noise average value. The division factor is equal to 2^ CFAR_NOISE_DIV. Therefore, only powers-of-2 division are possible, even though the number of samples specified in CFAR_AVG_LEFT and CFAR_AVG_RIGHT are not restricted to powers of 2. The surrounding noise average value obtained after the division is multiplied or added with CFAR_THRESH to determine the final threshold used to compare the cell under test for detection. The maximum allowed value for this register is 8, which gives a division factor of 256.

Table 28-14. CFAR Engine Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_CA_MODE	2	Y	CFARnoise averaging mode: This registerconfigures the noise averaging mode in the CFAR detector from one of these options – CFAR-CA, CFAR-CAGO, CFAR-CASO, CFAR-OS. 00b– CFAR-CA 01b– CFAR-CAGO 10b– CFAR-CASO 11b– CFAR-OS
CFAR_CYCLIC	1	Y	CFARcyclic vs. non-cyclic mode: This registerbit specifies whether the CFAR detector needs to work in cyclic mode or in non-cyclic mode. When this register bit is 0, the CFAR detector works in non-cyclic mode and when it is 1, it works in cyclic mode. Refer main description section for details on how to configure and use cyclic mode.
CFAR_PEAKCNT.cfar_peakcnt	12	N	CFARdetected peak count: This isa read-only register that contains the number of detected peaks that are logged in the destination memory, when CFAR Engine is configured in 'Detected Peaks List' mode. In the Detected Peaks List mode, since only the detected peaks are logged in the destination memory, this read-only register provides the number of detected peaks that are logged to the main processor, so that the main processor can determine how many entries to read from the destination memory.

28.9 Core Computational Unit – Statistics

This section describes the statistics block present in the core computational unit.

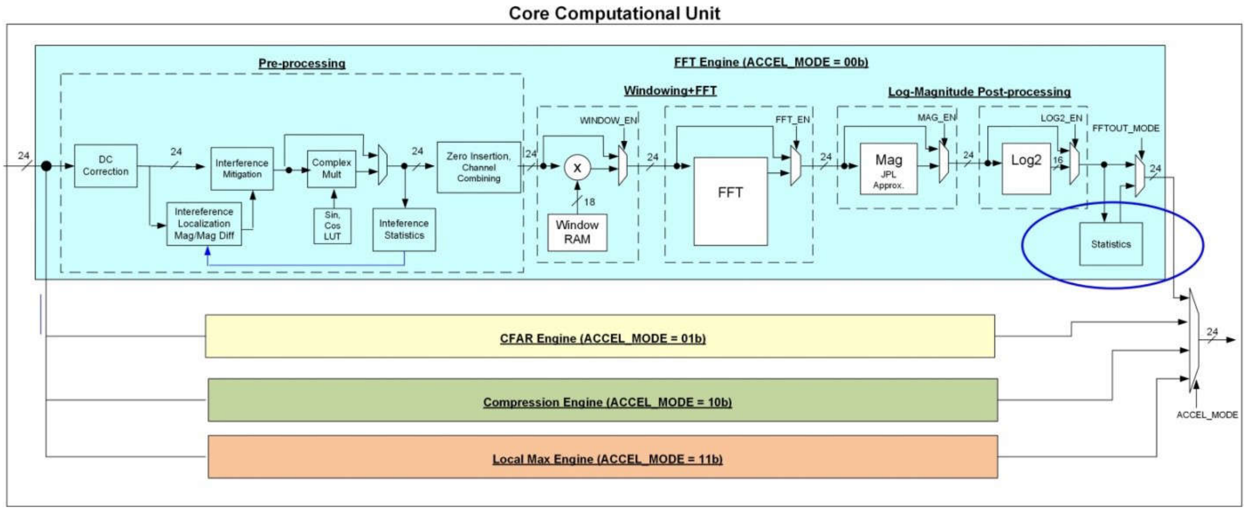

Figure 28-47. Statistics Block

28.9.1 Statistics Block

The corecomputational unit has a statistics computation block at the end of the FFT Engine path as shown in Figure 28-47. It can be used to compute a few simple statistics of the samples output by the core computational unit. It supports computing statistics on 1- and 2-dimensional array inputs.

With 1-dimensional array input, it can compute sum and maximum of samples. It also supports a few advanced features, with 2-dimensional array inputs. It can compute 2 arrays of maxima (one in each dimension) and multiple histograms or cumulative distribution functions (CDFs) of the input samples (one histogram for each sample index).

The simple basic mode of operation is described first. The advanced features are described in separate later sub-sections.

28.9.1.1 Basic Statistics Block – Operation

The 24-bit I and 24-bit Q output of the core computational unit goes to a statistics computation block. The purpose of this block is to find the maximum and sum (average) of the output samples

The sum and max statistics are computed on a ‘per-iteration’ basis (the sum and max values are logged at the end of each iteration) and the computation is reset for the next iteration. The sum and max values are logged in register-sets (see MAXn_VALUE, MAXn_INDEX, ISUMn, QSUMn register-sets), which can be read by the main processor. However, only four such registers are provided for each statistic and therefore, the sum and max values can be logged in these registers only for up to a maximum of four iterations.

The max statistics register-set comprises four read-only registers of 24 bits each, named MAXn_VALUE, for recording max values, and four read-only registers each 12 bits unsigned, named MAXn_INDEX, for recording the max indices. The sum statistics register-set contains four registers of 36 bits each, named ISUMn, for I-sum statistics, and 4 registers of 36 bits each, named QSUMn, for Q-sum statistics.

For larger number (>4) of iterations, either the sum or the max value can be sent to the destination memory for each iteration, which allows the statistic to be available even for cases with more than four iterations. The logging of the statistic into the destination memory is enabled using FFT_OUTPUT_MODE register described below.

The MSB bit of the FFT_OUTPUT_MODE (Table 8) register selects whether the default (main) output of the core computational unit goes to the destination memory, or the statistics block output. If the MSB of this 2-bit register is 0, then it selects the default mode of operation, where the main output (FFT or Log-Mag result) is sent to the destination memory. If the MSB is 1, then it selects the statistics output mode, where either the sum or max statistic is sent to the destination memory (one value per iteration). Whether the sum or max is sent to memory is dependent on the LSB bit. If the LSB bit is 0, then the statistic value that is sent is the max value (useful in conjunction with Log-Mag enabled to find the biggest peak and peak index per iteration). Here, the I output is the maximum value itself and the Q output is the index (location) of the maximum value. If the LSB bit is 1, then the statistic value that is sent is the sum value (useful for DFT mode, as well as for mean squared or mean of absolute values computation).

Table 28-15. Statistics Output Modes

FFT_OUTPUT_MODE Register	IChannel Output	QChannel Output
00b– Default output mode	Main output of core computational unit	
10b– Max statistics output (One output per iteration)	MaxValue	MaxIndex
11b– Sum statistics output (One output per iteration)	Sum ofI values	Sum ofQ values

The max statistic records the maximum value (and its index) of the magnitude or log-magnitude samples corresponding to every iteration. The sum statistic records the sum of the magnitude or log-magnitude or the complex output samples corresponding to each iteration. If the main output of the core computational unit is the complex FFT output (ABS EN=0 and LOG2EN=0), then the sum statistics is the complex sum.

The complex sum statistics mode is useful when used in conjunction with the complex multiplier block in DFT mode or vector multiplication mode. For example, the sum statistic computed here, together with the DFT mode of the complex multiplier block, enable DFT computation for the desired number of bins (iterations). When the desired number of bins is more than 4, the sum statistic can be sent to destination memory (instead of the main data output that is normally sent to the destination memory).

Notethat when the sum statistics is logged into the destination memory, it goes through the Output Formatter block as only 24-bits each for I and Q (same bit-width as the primary FFT outputs). Hence, the computed sum statistics value of 36-bits width, needs to be scaled down by right-shifting the appropriate number of LSBs (using FFTSUMDIV register) before sending to output formatter. Thus, when logging the statistics in destination memory, the sum statistics is to be used as an “average” value, rather than a “sum” value itself.

The FFTSUMDIV register specifies the number of bits to right-shift the sum statistic before it is written to destination memory. The internal sum statistic register is 36-bits wide (allowing 12 bits of MSB growth of the 24-bit data path), but this statistics value needs to be scaled down to 24 bits to match the data path width going to the Output Formatter. This register specifies how many LSBs to drop to convert the sum statistics to 24-bit value. Note that when ABS_EN = 1, unsigned saturation is implemented, else the saturation is signed. The FFTSUMDIV register specifies how many LSBs to drop to convert the sum statistics to 24-bit value. Therefore, it is recommended that this register is configured to drop an appropriate number of LSBs such that incorrect saturation in case of magnitude sum is avoided.

Notethat in statistics output mode, the registers DSTACNT, DSTAINDX, DSTBINDX, DST16b32b and DSTREAL are not meant to be used, since it is known that there is only one value to be written to destination memory for every iteration in a specific format. It is recommended that in this mode, DSTACNT be programmed to a value of 0, DSTAINDX and DSTBINDX are both programmed to a value of 8 bytes, DST16b32b is set to 1 and DSTREAL is reset to 0. The statistics is then always logged in the destination memory as consecutive 32-bit I and Q samples, irrespective of whether sum statistic or max statistic is being logged.

28.9.1.2 Statistics Block – Register Descriptions

Table 28-16 lists all the registers of the statistics block.

Table 28-16. Statistics Block Registers

Register.field	Width	Parameter-Set? (Y/N)	Description
MAX<n>_VALUE.max<n>_value n=1..4	24	N	Max value: These registers contain the max value on a per-iteration basis. These registers are meaningful only when Magnitude or Log-Magnitude is enabled. Only the max values for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE below).
MAX<n>_INDEX.max<n>_index n=1..4	12	N	Maxindex: These registerscontain the max index on a per-iteration basis, corresponding to each max value in the MAXn_VALUE registers.

Table 28-16. Statistics Block Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
I_SUM<n>_LSB. I_sum<n>_lsb I_SUM<n>_MSB.i_sum<n>_msb Q_SUM<n>_LSB. Q_sum<n>_lsb Q_SUM<n>_MSB. Q_sum<n>_msb	32 4 32 4		Sum statistics: These registerscontain the sum of the I outputs and Q outputs on a per-iteration basis. Only the statistics for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE below). Note that both for sum and max the results of last iteration are placed in <n=1> register, the penultimate in <n=2> and so on.
FFT_OUTPUT_ MODE	2	Y	FFT Path outputmode: This registerspecifies the output mode of the FFT path. Instead of the default mode where the main output of the core computational unit is sent to the destination memory, this register can be configured such that either the max or sum statistics can be sent to the destination memory. 00b– Default mode (main output) 10b – Max statistics output mode 11b – Sum statistics output mode
FFTSUMDIV.fftsumdiv	5	N	Right-shiftingfor Sum statistic: This registerspecifies the number of bits to right-shift the sum statistic before it is written to destination memory. The internal sum statistic register is 36-bits wide (allowing 12 bits of MSB growth of the 24-bit data path), but this statistics value needs to be scaled down to 24 bits to match the data path width going to the Output Formatter. This register specifies how many LSBs to drop to convert the sum statistics to 24-bit value.

28.9.1.3 Advanced Statistics – 2-Dimensional Maxima

The Statistics block can be used to compute 2 arrays (one in each dimension) of maxima on the input samples. This feature can be enabled by setting the register, MAX2D_EN to 1.

For each iteration, the maximum value observed and the corresponding sample index are stored in per-iteration RAMs. Similarly, for each sample index, the maximum value observed over all the iterations and the corresponding iteration index are stored in per-sample RAMs. Thus, as shown in Figure 28-48 the results include (value, location) pairs stored on a per-iteration basis and per-sample index basis. These RAMs are a part of the

Advanced Statisitics Memories. This feature supports SRCACNT (samples) in the range of 1 to 255 and BCNT (iteration) in the range of 0 to 1023.

The processor as well as the local maxima computation engine can access the Advanced Statistics Memories. This allows the 2D maxima to be used as thresholds in the local maxima computation steps.

Local Maxima peak detector can be configured to use the max value RAMs as arrays of thresholds. The max value and max index RAMs can also be read and modified by the CPU/DSP. This allows flexible and application specific control on the peak detection thresholds. The data read/write format for the 2Dmax output RAMs are described in the table of Advanced Statistics Memories (Table 28-19).

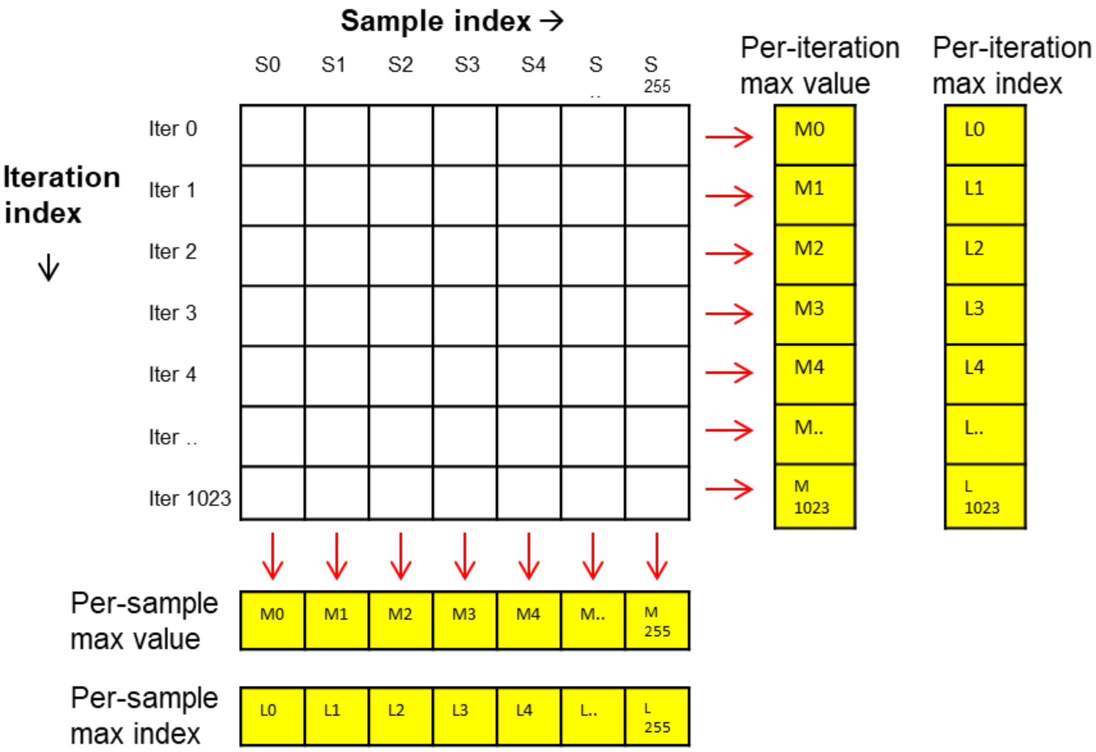

Figure 28-48. 2D Max Advanced Statistics Computation

28.9.1.4 Advanced Statistics – Histograms, CDF, and CDF Count Threshold

The Statistics block can compute the histograms or CDFs of the input samples. The statistics block can also be used to calculate a detection threshold based on the CDF.

The histogram function operates on a 2-D matrix of input samples. The ACNT (or 2^FFT_SIZE) number of samples received in a single iteration constitute the “sample” dimension. BCNT+1 iterations of the sample dimension data are received, which constitutes the “iteration” dimension. One histogram is computed for each sample index using values received across all iterations corresponding to that sample index as shown in figure below.

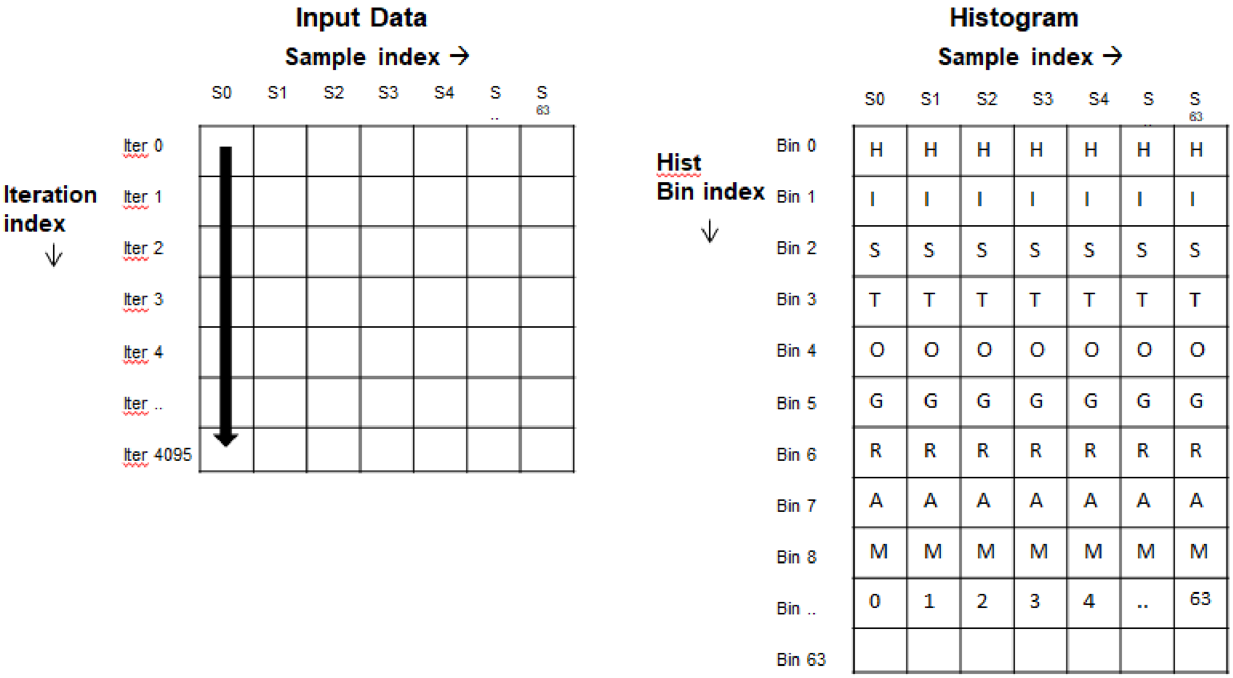

Figure 28-49. Advanced Statistics Histogram Computation

The results are stored in corresponding RAMs which are part of the Advanced Statistics Memories. The register HIST_MODE can be used to enable this feature and select the exact operation mode as mentioned in the table below. MEM_INIT_START bit 13 & 14 should be set to start the Histogram Memory initialization. MEM_INIT_DONE bit 13 & 14 indicates the histogram Memory initialization completion. If 2-D FFT feature is enabled in any parameter set, it is recommended that the advanced 2D statistics feature be disabled in that parameter set.

Table 28-17. Histogram Operating Modes

HIST_MODE	Histogram Statistics Computation
00	Disabled: In this mode, the histogram computation is totally bypassed and the Histogram RAM is retained in its existing state.
01	Histogram computation mode: In this mode, histograms are computed, one histogram per sample index. The histograms are stored in the Histogram RAM.
10	CDF count computation mode: In this mode, CDF counts are computed, one CDF per sample index. The CDF count range (0, number of iterations programmed) maps to the CDF range (0, 1). The CDFs are stored in the Histogram RAM. The CDF count computation needs additional computation time over and above the histogram computation mode. The number of histogram bins times the number of histograms is the number of additional cycles..

Table 28-17. Histogram Operating Modes (continued)

HIST_MODE	Histogram Statistics Computation
11	CDF threshold computation mode: In this mode, histograms are computed similar to the histogram computation mode. Additionally, for the purpose of computing a detection threshold, information about the histogram bin at which the corresponding CDF would just exceed the programmed register, CDF_CNT_THRESH, is calculated and reported through CDF_CNT_BINNUM. The corresponding CDF and histogram values at that bin are reported through CDF_CNT_CDFVAL and CDF_CNT_HISTVAL.

The histograms are computed on a per-sample-index basis. Up to 64 histograms can be computed. The valid range of SRCACNT for this feature is 1 to 63. The histogram size (number of bins) is programmable (from 8 to 64, in powers of 2) using the register HIST_SIZE_SEL. The bins are uniformly spaced. It should be noted that histogram resolution is optimal if input is in log-magnitude mode rather than linear-magnitude. Since the log-magnitude mode gives outputs with high precision (in 5.11u format, i.e. 5 integer bits, 11 fractional bits, unsigned), they can be scaled down through a programmable right shift before histogram computation, using the register HIST_SCALE_SEL. Valid values for HIST_SCALE_SEL are 7, 8, 9, 10, 11, 12 and 13. The HIST_SIZE_SEL and the HIST_SCALE_SEL registers are explained in Figure 28-50.

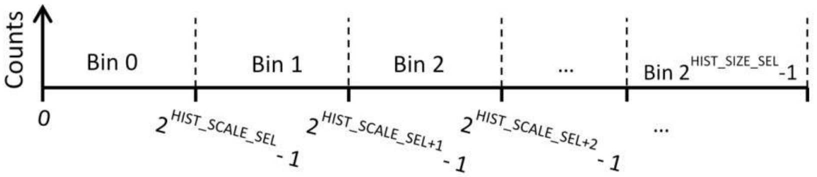

Figure 28-50. HIST_SCALE_SEL and HIST_SCALE_VAL Configuration

It should be noted that the input samples that exceed the highest bin are counted in the histogram's highest bin index. Also, if any bin's count (i.e. the number of occurrences) exceeds the bit-width allocated in the histogram output memory, then the count is clipped to the maximum level.

As an illustration, if SRCACNT = 31, BCNT = 767, HIST_SIZE_SEL = 4, HIST_SCALE_SEL = 10, and HIST_MODE = 0b01, then 32 histograms, each with 16 bins are computed and stored in the Histogram RAM. The bins correspond to the input ranges, [0 to 1023], [1024 to 2047], …, [14*1024 to 15*1024 -1], [>/= 15*1024]. In each of the 32 histograms, the sum of all bin values will match 768. This example assumes that the pre-processing block's channel combining and zero insertion features are not enabled. If they are enabled, then the number of histograms will match the resultant number of samples in A-dimension after the channel combining and zero insertion operations.

The contents of the Histogram RAM can be read by the CPU/DSP and may be utilized to update the threshold arrays for Local Maxima peak detection. The Histogram RAM can be read with the format explained in table of the Advanced Statistics Memories (Table 28-20).Histogram RAMs needs to be initialized before enabling histogram/CDF/Threshold operations in any parameter set. This can be done by setting the MEM_INIT_START_HIST_ODD_RAM and MEM_INIT_START_HIST_EVEN_RAM self-clearing bits described in register description below.

In HIST_MODE = 0b11, the CDF_CNT_BINNUM (bin number where CDF just exceeds the programmed CDF_CNT_THRESH) for each sample is stored along with the corresponding CDF_CNT_CDFVAL and CDF_CNT_HISTVAL. These values are stored in the CDF Threshold RAM which can be read with the format as explained in the Advanced Statistics Memories (Table 28-20).

28.9.1.5 Advanced Statistics Block – Register Descriptions

Table 28-18 lists all the registers of the statistics block.

Table 28-18. Advanced Statistics – Control Registers

Register	Width	Parameter Set	Description
MAX2D_EN	1	Yes	2-Dimensional Maxima Computation Enable: If this bit is set to 1, one maxima (and corresponding index) array for A dimension and another for B dimension are computed and stored in the per-sample and per-iteration RAMs.
HIST_MODE	2	Yes	Histogram Computation Mode: 00: Disable 01: Histogram computation mode 10: CDF computation mode 11: CDF threshold computation mode Refer to the earlier section for details.
HIST_SCALE_SEL	4	Yes	Histogram Input Scale Select: This register isused to select the input scaling before histogram computation. It provides a way to control the resolution of the histogram bins by right-shifting the input sample values before histogram computation. If this register is set to X (and Y=2^X), then the histogram bin ranges are [0, Y-1], [Y, 2Y–1] and so on. Valid values for this register are X=7, 8, 9, 10, 11, 12, and 13.
HIST_SIZE_SEL	4	Yes	Histogram Size Select: This register is used to select the histogram size (number of bins). The size is configurable in powers of 2. The number of histogram bins is 2^HIST_SIZE_SEL. Valid values of this register are 3, 4, 5, and 6. They correspond to histogram sizes of 8, 16, 32, and 64.
CDF_CNT_THRESH.cdf_cnt_thresh	12	No	This register is applicable in CDF count threshold mode of operation. CDF is computed over the histogram till the value of the CDF just exceeds the CDF_CNT_THRESH specified by the user. This register can take values from 0 to BCNT. CDF count threshold value is same for all samples indices (histograms). Value of '0' is not valid.

Table 28-18. Advanced Statistics – Control Registers (continued)

Register	Width	Parameter Set	Description
MEM_INIT_START	32	No	Writing 1’b1 to bit locations – 13 & 14 would start the memory initialization for the Histogram Memory. These are self-clearing bits Bit 13 : MEM_INIT_START_HIST_ODD_RAM Bit 14 : MEM_INIT_START_HIST_EVEN_RAM
MEM_INIT_DONE	32	No	When the memory initialization is complete, then bit locations 13 & 14 shall be 1b’1 Bit 13 : MEM_INIT_DONE_HIST_ODD_RAM Bit 14 : MEM_INIT_DONE_HIST_EVEN_RAM

Table 28-19 lists the contents of the Advanced Statistics Memory.

Table 28-19. Contents of Advanced Statistics Memory Output

RAM content	Width	Description
MAXVAL_ARRAY_DIM1 [1024] DSS_HWA_2DSTAT_ITER_VAL_RAM	24 bits each	2-D Maxima Array – maximum values of each iteration: The maximum value across samples in each iteration is recorded here (one value per iteration, first address corresponding to first iteration).
MAXLOC_ARRAY_DIM1 [1024] DSS_HWA_2DSTAT_SMPL_VAL_RAM	10 bits each	2-D Maxima Array – maximum locations corresponding to each iteration: The sample index at which the maximum value occurred in each iteration is recorded here (one value per iteration, first address corresponding to first iteration).
MAXVAL_ARRAY_DIM2 [256] DSS_HWA_2DSTAT_ITER_IDX_RAM	24 bits each	2-D Maxima Array – maximum values corresponding to each sample index: The maximum value across the iterations for each sample index is recorded here (one value per sample index, first address corresponding to first sample index).
MAXLOC_ARRAY_DIM2[256] DSS_HWA_2DSTAT_SMPL_VAL_RAM	10 bits each	2-D Maxima Array – maximum locations corresponding to each sample:: The iteration count at which the maximum value occurred corresponding to each sample is recorded here (one value per sample index, first address corresponding to first sample index).
DSS_HWA_HIST_RAM HIST_OUT_ARRAY[64][64]	12 bits each	Histogram Output Corresponding to each Sample Index: The number of occurrences in each histogram bin is recorded here for different sample indices.

Table 28-19. Contents of Advanced Statistics Memory Output (continued)

RAM content	Width	Description
DSS_HWA_HIST_THRESH_RAM CDF_CNT_BINNUM [64]	6 bits each	If CDF count threshold mode is enabled: the bin number at which the specified count (CDF_CNT_THRESH) is just exceeded is stored in this register for all the sample indices.
DSS_HWA_HIST_THRESH_RAM CDF_CNT_CDFVAL [64]	12 bits each	Valid when CDF count threshold mode is enabled. This stores the CDF count at CDF_CNT_BINNUM bin for all the sample indices.
CDF_CNT_HISTVAL [64] DSS_HWA_HIST_THRESH_RAM	12 bits each	Valid when CDF count threshold mode is enabled. This stores the Histogram count at CDF_CNT_BINNUM bin for all the sample indices.

Table 28-20 lists the read/write format for Advanced Statistics Memories.

28.10 Core Computational Unit – Local Maxima Engine

The Core Computation Unit includes a Local Maxima Engine, which can be enabled by setting ACCEL_MODE = 011b.

In context of Radar signal processing, Local Maxima Engine is useful in a peak detection step where each sample/bin (Cell Under Test (CUT)) is compared against detection threshold(s), and also compared against the neighboring samples and the CUT is declared as a valid local peak if the sample amplitude exceeds the detection threshold and is “more than or equal to” the neighboring cells. Local maxima computations are done on a 2D matrix. Typically, local maxima are computed after the Angle FFT, on the Doppler-Beam/angle “2D” plane (2D Local Maxima).

The output of the local maxima computations is stored into the destination memory as a bit pattern, where each bit indicates whether the specific sample/CUT was detected as a valid local peak or not. More details on this are given in the later section of the document. The detection thresholds can either be configured into the configuration registers or in the Advanced Statistics Memory (borrowed from the Statistics module), in case there are individual thresholds for the different rows and columns of the 2D matrix.

28.10.1 Local Maxima Engine – Operation

Figure 28-51 shows an example of 2D plane (eg. Dopplers-Beams plane) used for Local maxima computations. A 3x3 matrix (CUT and all its neighboring samples) is needed to compute the local maxima. To keep the scheme simple and efficient from memory access perspective (as the input samples for local maxima computations are fetched from the memory), a 3x4 matrix (shown as red box in Figure) is fetched.

Every cycle, four consecutive samples (16-bit x 4 = 64bits) are picked from the memory and this is repeated three times across three row vectors (doppler bins) to fetch the 3x4 matrix data. This box keeps on moving to the right (computation wise) till the last group of four samples are fetched. By the end of this process, we get a bit-pattern of size (bits) equivalent to the number of columns (i.e., beams), with each bit indicating whether the specific bin was a local peak or not. This scheme is repeated for each doppler vector to get the bit-pattern output for the complete 2D plane.

Samples are fetched using the three-dimension addressing scheme built-in to the Input Formatter (the dimensions denoted by A, B and C) by configuring the configuration registers accordingly. For Local Maxima operation, there are restrictions on the maximum sizes of these dimensions. The number of columns (achieved through dimension B) has to be one of these supported values: 8, 12, 16, 24, 32, 48, 64, 96, 128, 192, 256. The number of rows (achieved through dimension C) can be any value between 3 and 1024.

Typically, for CUT processing at the edges, wrap-around around these dimensions would be required (cyclic mode of operation). This is achieved using the configuration registers SRCB_CIRCSHIFTWRAP, SRC_CIRCSHIFTWRAP3X and WRAP_COMB. If non-cyclic mode of operation is desired (i.e., for the edge samples, the neighboring cells should not be wrapped around), then LM_DIMB_NONCYCLIC and LM_DIMC_NONCYCLIC register bits can be set. In this case, the unavailable neighbouring samples will be considered as masked out.

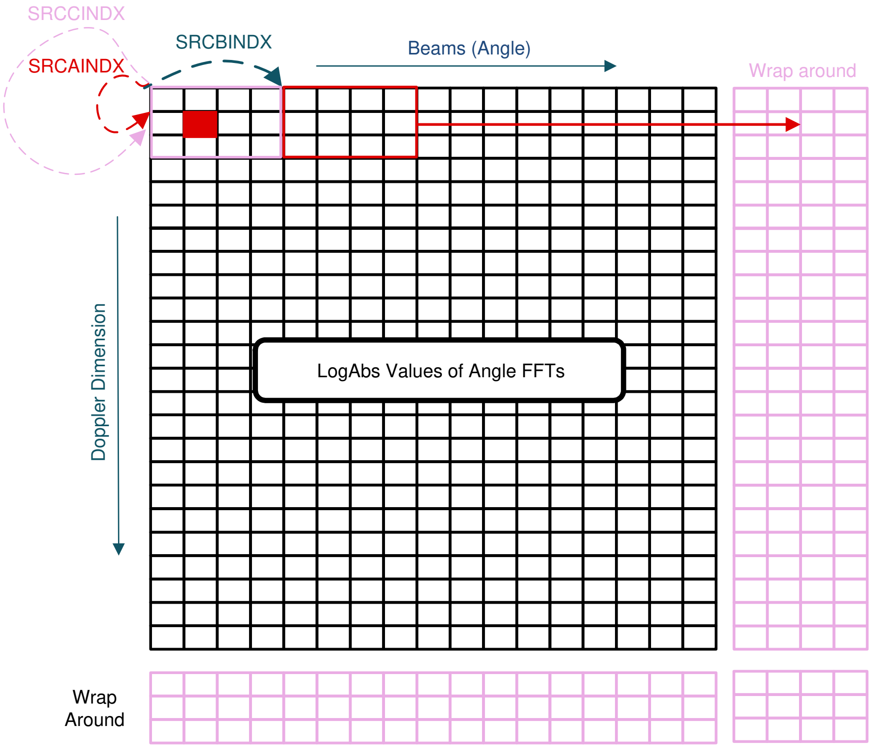

Figure 28-51. Local Maxima Engine A, B and C-Dimension Usage

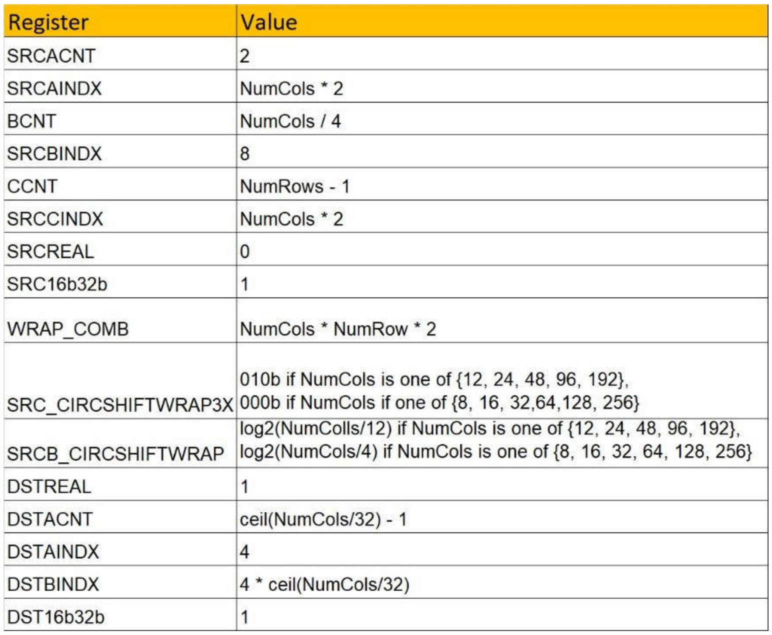
Below is the example of the configuration values of each of these registers accessing the samples from the source memory for Local maxima computations for a 256x12 matrix. Note that though SRCACNT and SRCBINDX values are part of configuration registers, for the local maxima functionality, the values shall always be fixed to the values of 2 and 8 respectively, as shown below in Figure 28-52. The other registers are calculated easily as a function of the number of beams (number of columns) and number of Doppler (number of rows) as shown in the figure. Note that these configurations are irrespective of whether cyclic or non-cyclic mode of operation. It is important that in Local Maxima Engine mode of operation, the registers of Input Formatter and Output Formatter listed in figure below are programmed exactly as per the calculations shown.



Register	Value
SRCACNT	2
SRCAINDX	NumCols * 2
BCNT	NumCols / 4
SRCBINDX	8
CCNT	NumRows - 1
SRCCINDX	NumCols * 2
SRCREAL	0
SRC16b32b	1
WRAP_COMB	NumCols * NumRow * 2
SRC_CIRCSHIFTWRAP3X	010b if NumCols is one of {12, 24, 48, 96, 192}, 000b if NumCols if one of {8, 16, 32,64,128, 256}
SRCB_CIRCSHIFTWRAP	log2(NumColls/12) if NumCols is one of {12, 24, 48, 96, 192}, log2(NumCols/4) if NumCols is one of {8, 16, 32, 64, 128, 256}
DSTREAL	1
DSTACNT	ceil(NumCols/32) - 1
DSTAINDX	4
DSTBINDX	4 * ceil(NumCols/32)
DST16b32b	1

Figure 28-52. Local Maxima Engine Configuration

28.10.2 Local Maxima Engine – Operating Mode Configurations

Local maxima computations involve comparing each CUT with several values. The values that can be compared with are the 8 neighboring (adjacent right/left/top/bottom/diagonal) samples in the 2D matrix, row-threshold and a column-threshold. Each of these comparisons can be enabled or disabled through the configuration registers LM_NEIGH_BITMASK (8-bit) and LM_THRESH_BITMASK (2-bit).

The row- and column-thresholds can be selected from software configurable registers DIMB_THRESH_VALUE and DIMC_THRESH_VALUE or Maxima Arrays from Advanced Statistics RAM. This selection can be made through the register LM_THRESH_MODE. Further, if the Maxima Arrays from Advanced Statistics RAM are selected for determining thresholds, then the Local Maxima engine has provision for adding 24-bit signed offsets (one in each dimension). This can be useful in log-mode of operation, to convert the maxima arrays to row- and column-thresholds for peak detection. The offsets are programmable through the registers, MAX2D_OFFSET_DIM1 and MAX2D_OFFSET_DIM2. As these offsets are *added* to the Maxima Arrays from Advanced Statistics RAM to derive the detection thresholds, typically, these registers are expected to be set to negative values.

Figure 28-53 and Figure 28-54 illustrate the thresholding and comparisons in Local Maxima. The result of the Local Maxima comparisons is a 2D bit pattern. Each bit in it indicates whether the corresponding (row, column) CUT either exceeded *or equaled* each of the values it was compared against. A value of 0 in the result bit indicates that at least one of these values exceeded the CUT and 1 indicates otherwise.

Figure 28-54. Local Maxima – Bitmask Configuration

28.10.3 Local Maxima Engine – Output Write Pattern

The output of the local maxima computations is first shifted to a local shift register of 256 bits. The output is pushed on to the local memory in HWA only once the computations worth one full row is completed. So, 256 puts a restriction on the maximum number of bins can be used in a particular row.

The output bit pattern is stored in the destination memory packed as 32-bit words, with the LSB bit corresponding to B-dimension (column) count of 0. In case when the output of a vector is not a multiple of 32 bits, the remaining bits in the last 32-bit word would be irrelevant bits and shall be ignored (set to ‘0’). If the number of bits per Doppler row is less than 32, for example 16, then 16 LSB of a 32b word are populated with bitmask and the remaining 16b are set to ‘0’.

This mechanism is described in the below diagrams Figure 28-55 and Figure 28-56.

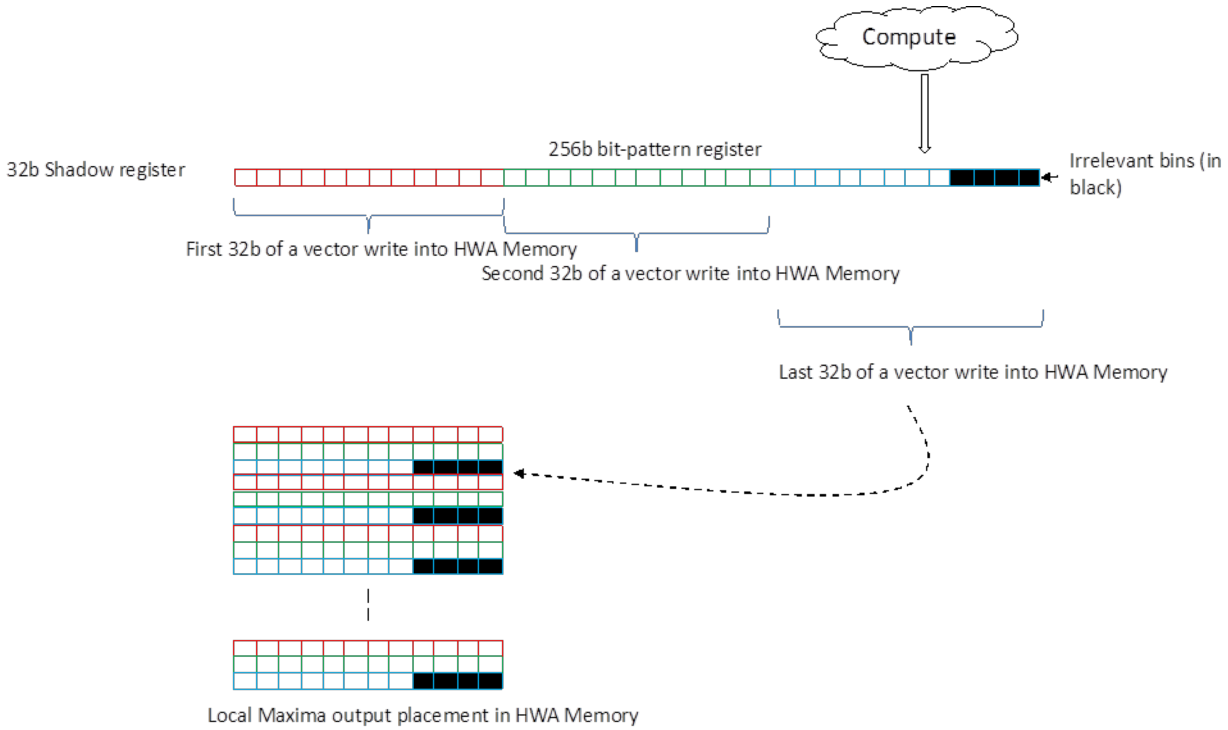

Figure 28-55. Local Maxima Output Write Pattern

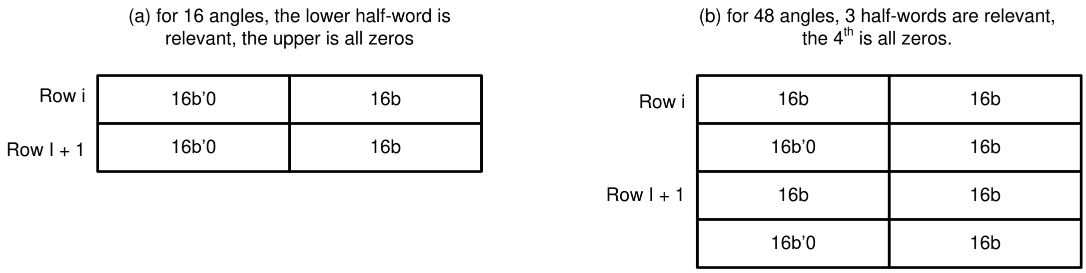

(a) for 16 angles, the lower half-word is relevant, the upper is all zeros

Row i	16b'0	16b
Row I + 1	16b'0	16b

(b) for 48 angles, 3 half-words are relevant, the 4th is all zeros.

Row i	16b	16b
	16b'0	16b
Row I + 1	16b	16b
	16b'0	16b

28.10.4 Local Maxima Engine – Register Descriptions

Table 28-21. Local Maxima Engine – Registers

Register	Width	Parameter Set	Description
LM_NEIGH_BITMASK	8	Y	Neighbour bitmask for CUT comparison: Bit mask for the 8 neighbouring cells (adjacent left/right/top/left/diagonal) to enable or disable the comparison with cell under test. Starting from left top corner and moving in a clock-wise direction. If a bit is set to 1, then the corresponding comparison is disabled.

Table 28-21. Local Maxima Engine – Registers (continued)

Register	Width	Parameter Set	Description
LM_THRESH_BITMASK	2	Y	Enable/Disable for detection threshold comparison: 00b: Enable CUT comparison with detection threshold in both dimensions 01b: Enable CUT comparison with detection threshold in column dimension only (B-dimension threshold) 10b: Enable CUT comparison with detection threshold in row dimension only (C-dimension threshold) 11b: Disable CUT comparison with detection thresholds in both dimensions
LM_THRESH_MODE	2	Y	Threshold source selection: This 2-bit register is used to indicate whether the detection threshold is provided by a software register, or derived from the built-in Advanced Statistics RAM. The LSB of this register corresponds to column dimension (B-dimension), and the MSB corresponds to row dimension (C-dimension). If the register bit is 0, then the threshold is taken from software configured register (DIMB_THRESH_VALUE, DIMC_THRESH_VALUE), whereas if the register bit is 1, then the threshold is taken from the built-in Advanced Statistics RAM, with an offset addition (see registers MAX2D_OFFSET_DIM1, MAX2D_OFFSET_DIM2). .
LM_THRESH_VAL.dimb_thresh_val	16	N	SW configurable column threshold register: Refer description of LM_THRESH_MODE for more details.
LM_THRESH_VAL.dimc_thresh_val	16	N	SW configurable row threshold register: Refer description of LM_THRESH_MODE for more details.

Table 28-21. Local Maxima Engine – Registers (continued)

Register	Width	Parameter Set	Description
MAX2D_OFFSET_DIM1.max2d_offset_dim1	24	N	Offset for row thresholds from Advanced Statistics RAM: Offset to be added to dimension 1 Maxima results (from Advanced Statistics) to derive row thresholds for Local Maxima computation.
MAX2D_OFFSET_DIM2.max2d_offset_dim2	24	N	Offset for column thresholds from Advanced Statistics RAM: Offset to be added to dimension 2 Maxima results (from Advanced Statistics) to derive column thresholds for Local Maxima computation.
LM_DIMB_NONCYCLIC	1	Y	Dimension B Non Cyclic: 1: Non-cyclic mode of Local Maxima detection (i.e., for the edge samples, the neighboring cells will not be wrapped around) 0: Cyclic mode of Local Maxima detection (i.e., for the edge samples, the neighboring cells will be wrapped around)
LM_DIMC_NONCYCLIC	1	Y	Dimension C Non Cyclic: 1: Non-cyclic mode of Local Maxima detection (i.e., for the edge samples, the neighboring cells will not be wrapped around) 0: Cyclic mode of Local Maxima detection (i.e., for the edge samples, the neighboring cells will be wrapped around)

28.11 Context Switching

The state machine supports an advanced feature called ”Context Switching” that allows a sequence of operations running in the hardware accelerator to be interrupted, in order to run a different (higher priority) sequence of operations, before returning back to resume execution of the original sequence. This state machine feature is useful when Doppler FFT, detection and angle FFT processing of a radar frame is still running, while the chirps for the subsequent frame have already started. In such a case, it is possible for the hardware accelerator to perform the Doppler FFT, detection and angle FFT processing in one context (a.k.a the background context), while permitting “context switching” to an alternate context (a.k.a the high priority context) to perform inline range FFT processing as and when new chirp ADC data samples are received.

28.11.1 Context Switching – Operation

The context switching feature of the state machine can be enabled by setting the CS_ENABLE register bit. This register is a common (static) register that controls the overall enabling/disabling of the feature.

The background context execution is programmed and configured using PARAM_START_IDX, PARAM_END_IDX, and NUMLOOPS registers as before. The high priority context is programmed using additional parameter-sets that are configured using PARAM_START_IDX_ALT, PARAM_END_IDX_ALT and

ALT_NUMLOOPS registers (refer to Table 28-17). Normally, the state machine executes the parameter-sets in the background (low-priority) context by looping through the parameter-sets between PARAM_START_IDX and PARAM_END_IDX, until a context switch is triggered. Whenever a context switch from background context to high priority context happens, the state machine jumps to PARAM_START_IDX_ALT and executes the parameter-sets from PARAM_START_IDX_ALT to PARAM_END_IDX_ALT for ALT_NUMLOOPS number of times and returns back to resume execution of the background context from where it left off.

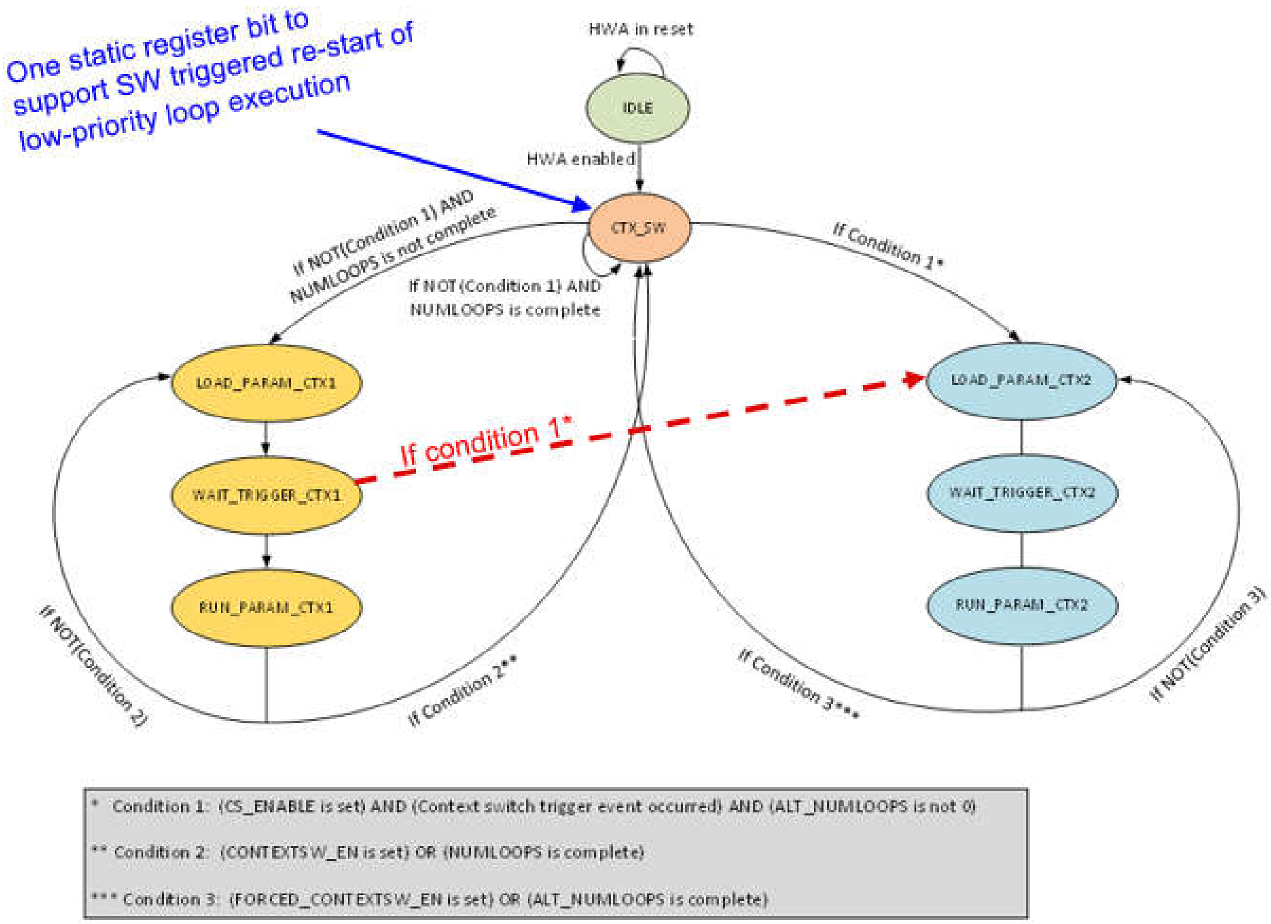
The context switch from background context to high priority context is triggered based on the settings of CS_TRIGMODE and CS_TRIGSRC registers. Specifically, CS_TRIGMODE can be configured to trigger context switch based on a DMA completion, or based on a CSI2 line/frame end event. Refer the register description section for details of these registers.

It is important to note that the context switch only happens at the end of execution of a parameter-set and never in the middle of execution of a parameter-set. Also, the context switch is allowed to happen at the end of a parameter-set only if CONTEXTSW_EN register bit in the parameter-set is set. If this register is not set, then context switch will not happen at the end of that parameter-set. CONTEXTSW_EN should only be set in the parameter-sets corresponding to background context. In HWA 2.0, while a Low-priority thread is waiting for SW trigger or DMA trigger, the context switch to high-priority is withheld till such time the low-priority trigger is received. In HWA 2.1, the context switch to high-priority is immediately serviced as soon as it receives the trigger for high priority context. Care has to be taken to enable CONTEXTSW_EN in previous paramsets (to switch to high priority) before this can be serviced immediately.

Context switch from the high priority context back to the background context typically occurs after the completion of all parameter-sets in the high priority context. But if an early exit is needed, i.e. after the execution of a certain high priority parameter-set, the register FORCED_CONTEXTSW_EN in that parameter-set can be set. This forces a context switch to the background context, without the need for any explicit context switch trigger. In such a case, when the next context switch trigger occurs, the high priority context execution resumes from where it left off. FORCED_CONTEXTSW_EN should be set only in the parameter-sets corresponding to the high priority context, and can be used for debug purposes. It can also be used when a large time gap is expected between execution of one high priority parameter-set and the next (e.g. due to the timing of the associated trigger sources), and it is desired that this time gap be used for some background context execution.[SK1]

Generally, for most computations, there is no ‘state information’ that carries forward across parameter-sets – i.e., each parameter-set is independent of the other. However, there are four specific items – namely, DC estimation accumulators, Interference statistics accumulators, TWID_INCR_DELTA_FRAC execution count and Recursive window execution count, which have state information in the form of accumulator value or execution count value that is applicable across parameter-sets. Therefore, while using the context switching feature, appropriate care has to be taken by the user to ensure that these features do not conflict when used in both the background context and high-priority context at the same time. The solution to this is to use these features only in one context at a time (eg. DC estimation and compensation can be used only in range FFT context), or to avoid jumping context between certain back-to-back parameter-sets (eg. Avoid jumping context between Interference statistics estimation and Interference mitigation steps), or to use the processor to save and restore state information (where possible). Also, care should be taken by the user to ensure that the usage of source and destination (ACCEL_MEMx) memories is mutually exclusive between the two contexts, so that there is no unintentional overwriting of the memory bank that is still under use by the background context by some computations of the high-priority context.

The operation of the state machine featuring the context switch capability is shown in Figure 28-57. In the figure, Context1 and Thread1 indicate the background context (states shown in left side of the figure) and Context2 and Thread2 indicate the high-priority thread (states shown in right side of the figure). FSM_STATE indicates which state the HWA is currently in and is detailed in register description table below.



* Condition 1: (CS_ENABLE is set) AND (Context switch trigger event occurred) AND (ALT_NUMLOOPS is not 0)

** Condition 2: (CONTEXTSW_EN is set) OR (NUMLOOPS is complete)

*** Condition 3: (FORCED_CONTEXTSW_EN is set) OR (ALT_NUMLOOPS is complete)

Figure 28-57. Context Switching State Machine

Whenever the NUMLOOPS of the background context completes, the state machine raises a loop complete interrupt (DSS_HWA_THREAD1_LOOP_INT). For every time the ALT_NUMLOOPS of the high-priority context completes, the state machine raises a different loop complete interrupt (DSS_HWA_THREAD2_LOOP_INT).

The accelerator's execution always begins with the background thread and proceeds to the high priority context upon receiving context switch trigger. If the application needs the operations to begin directly with the high priority context, then the user can define a "No Operation" parameter set in the background context and set CONTEXT_SW_EN in it, to indirectly achieve this.

Note that when the background context completes (i.e., NUMLOOPS is done), the state machine does not automatically move to IDLE state and remains in the CTX_SW state. This state means that the high-priority context switch can still happen even after all the operations for the background context are complete. The only way to make the state machine go back to IDLE state is by disabling the hardware accelerator completely. In typical frame-by-frame processing applications, the host may disable the accelerator after the background context is completed and the necessary number of calls of the high priority context have been completed for one frame (counted by the host), and if necessary reconfigure the accelerator and trigger it again to restart the process. The reconfiguration of low-priority context without disabling the accelerator is possible in HWA 2.1 and is described below.

In HWA 2.0, the Context Switching state machine is such that Background Processing (low-priority) context can be triggered only from IDLE state, while High Priority context can be re-triggered multiple times without going back to IDLE state. Registers such as PARAM_START/STOP_ALT, NUMLOOPS_ALT can be modified before/after the High Priority context starts/completes, whereas PARAM_START/STOP and NUMLOOPS may not be modified after accelerator starts executing. In HWA 2.1, it is possible to re-trigger the low-priority context through the use of SW_RESTART_LOOP register bit. When the accelerator has finished all on-going low-priority execution and is servicing only high-priority triggers in CTX_SW state, it is possible to re-configure PARAM_START/STOP and NUMLOOPS of low-priority and by writing SW_RESTART_LOOP = 1. This will restart the low-priority context execution with possibly new configuration values without having to disable and restart the accelerator again. Note that high-priority can be re-configured without the use of this bit in CTX_SW state.

28.11.2 State Machine – Context Switching – Register Descriptions

Table 28-22. Context Switching – Registers

Register	Width	Parameter Set	Description
CS_CONFIG.cs_enable	1	N	Context Switching Enable: 0: Disable context switching feature. 1: Enable context switching feature.
PARAM_RAM_IDX_ALT.param_start_idx	10	N	Parameter-set start index for high-priority context: When context switch from background context to high-priority context happens, the state machine starts execution of high-priority context at the parameter-set indicated by this register. Valid range: 0-63
PARAM_RAM_IDX_ALT.param_end_idx	10	N	Parameter-set stop index for high-priority context: When running the high-priority context, this register indicates the last parameter-set in the sequence, before looping back to PARAM_START_IDX_ALT. Valid range: 0-63
PARAM_RAM_LOOP_ALT.numloops	12	N	Number of loops for high-priority context: This register specifies how many times (loops) for which the parameter-sets corresponding to the high-priority context are executed before returning back to resume the background context.
CS_CONFIG.cs_trigmode	4	N	Trigger mode selection for context switch: 0000b: Reserved 0001b: Reserved 0010b: Reserved 0011b: DMA-based trigger (used in conjunction with CS_TRIGSRC) 0100b: Hardware trigger (used in conjunction with CS_TRIGSRC) 0101b: Software trigger (used in conjunction with CS_FW2ACC_TRIG) Other values : Reserved

Table 28-22. Context Switching – Registers (continued)

Register	Width	Parameter Set	Description
CS_CONFIG.cs_trgsrc	4	N	Trigger source for context switch: When CS_TRIGMODE = 0011b (i.e., in case of DMA-based trigger mode), this register specifies which DMA channel (i.e., which bit in DMA2CS_TRIG register) to wait for being set in order to perform context switch to high-priority context. When CS_TRIGMODE = 0100b (i.e., in case of hardware trigger mode), this register specifies which CSI2 trigger signal (out of the 20 possible trigger signals) to wait for in order to switch to high-priority context. The 20 signals are listed below, with CS_TRIGSRC = 0 corresponding to the last signal in the list: {CSI2A_FRAME_START[1:0], CSI2A_LINE_END[7:0], CSI2B_FRAME_START[1:0], CSI2B_LINE_END[7:0]}
CONTEXTSW_EN	1	Y	Context switch enable register: This register is used in the background context. If this register is set to 1 in a parameter-set, then the state machine checks for a context switch trigger at the end of that parameter-set execution. If a trigger is found, the higher priority parameter-sets start executing. On returning from the higher priority context the next background parameter-set is run.
FORCED_CONTEXTSW_EN	1	Y	Forced context switch enable register: This register can be used in the higher priority context. If this register is set to 1 in a parameter-set, then the higher priority execution is interrupted after this parameter-set. And the execution switches to the next background parameter-set. Later when a context switch trigger is received the higher priority thread resumes from the parameter-set after the parameter-set having FORCED_CONTEXTSW_EN set.
CS_FW2ACC_TRIG.fw2hwa_trigger_cs	1	N	Software context switch trigger: When CS_TRIGMODE = 0101b, this register bit can be set by software to trigger a context switch.
SW_RESTART_LOOP (only in HWA 2.1)	1	N	This is a self clearing sofware trigger bit for low priority thread . When SW_RESTART_LOOP is 1 , low priority thread is re-configured with param_start_idx, param_end_idx, num_loops
FSM_STATE.FSM_STATE	3	N	3'b000: State Machine is in IDLE state 3'b111: State machine is in context switch state 3'b001: State machine is in thread 1 Load params state 3'b010: State machine is in thread 1 wait trigger state 3'b011: State machine is in thread 1 run state 3'b100: State machine is in thread 2 Load params state 3'b101: State machine is in thread 2 wait trigger state 3'b110: State machine is in thread 2 run state

28.12 Compression Engine

The accelerator includes a Compression Engine, which can compress or uncompress data in order to reduce storage RAM size requirements. For example, after range dimension FFT of the received RX data, the FFT results can be input to the Compression Engine and its output can be stored in a relatively smaller RAM in the device (e.g. L3 RAM). And before performing any Doppler FFT processing, the data can be retrieved from the RAM, input to the Compression Engine for uncompression, and then fed to any further Doppler FFT processing steps.

28.12.1 Compression/Decompression Engine Overview

The Compression and Decompression Engine (referred henceforth simply as the ‘compression engine’) consists of:

- A compression engine which takes a fixed number of samples and returns a ‘block of bits’ such that the block’s size (in bits occupied) is a fraction of the size of the input samples.
- A decompression engine which when provided with the same compressed block of bits, regenerates the original samples (with the possibility of some quantization error).

The features of the compression engine are:

- The compression engine is designed to achieve arbitrary compression ratio. (‘compression ratio’ is defined as the ratio of ‘average bit-width per sample’ after compression and ‘the original bit-width’ before compression. In other words, a 33 % compression-ratio, results in the average bitwidth after compression being 1/3rd of the bitwidth before compression.)
- It has two configurable algorithms for compression and decompression.
  - Block Floating Point (BFP)
  - Exponential-Golomb Encoding (EGE)
- It implements a ‘block’ based compression scheme - i.e. it takes a fixed number of samples (called a block) and creates a ‘compressed block of bits’ of fixed size. During the Doppler processing operation, when radar data has to be accessed or written in transpose, having each block as a fixed size simplifies the EDMA programming. The EDMA can simply access a full block (across Doppler) in much the same manner as a single range gate.
- It is a part of the HWA as one of the programmable ‘paths’ in the accelerator (in addition to the FFT, CFAR and ‘local-max’ paths). It can therefore use existing capabilities/resources of the HWA (input/output formatters, state machine, looping, etc).

Note

Low compression ratios can result in ‘high quantization noise’. Designers should select the appropriate ‘compression ratio’ after confirming that it meets the dynamic range necessary for their application.

28.12.2 Algorithms

The following section is a brief introduction to the two algorithms used in the compression engine.

28.12.2.1 Block Floating Point (BFP)

The block floating point compression algorithm is a simple method by which a block of N samples are given a common exponent (referred to as scalefactor with b_{bw} bits) based on the largest sample in the block. Each sample in the block is also assigned a fixed number of mantissa bits (with $mantissa_{bw}$ bits). The size of the compressed block is then simply b_{bw} + N x $mantissa_{bw}$. The compression ratio can be tweaked by varying $mantissa_{bw}$. Smaller $mantissa_{bw}$ have better compression ratios but higher quantization noise.

As an example, consider a block of 2 samples, where each sample is a 32-bit long complex number (i.e. 16 bit I, 16 bit Q), it is possible to compress the block by giving it a common scale factor, b (of width b_{bw} = 4 bits) and then encoding the remaining data as 7 bit mantissas (i.e. 14 bits for complex number). The total compressed block size is 32 bits (2*14+4 = 32 bits). This configuration thus enables compression scenario of 50%. Also, with 7 bits of mantissa, the dynamic-range preserved per block of samples is 7 x 6 dB (or 42 dB).

The decompression engine takes a compressed block of data and regenerates the original samples (with some quantization error). It extracts the scalefactor (*b*), scales the mantissa and place it in an output buffer. Put simply, the sample is reconstructed as ‘*mantissa* x 2^{b}’

,

28.12.2.1.1 The BFP Format

The block starts with an optional header holding the scalefactor. The rest of the block is filled with the mantissa of each sample directly in twos-complement format (since the input samples are signed numbers). The scalefactor and the mantissa have known bitwidths.

There may be empty space (for padding) at the end of the compressed block, in case the compressed block size is not a multiple of a byte/word. The exact number of padding bits that are present would depend on the desired compression, based on the size of the mantissa and the size of the header and the number of samples per block.

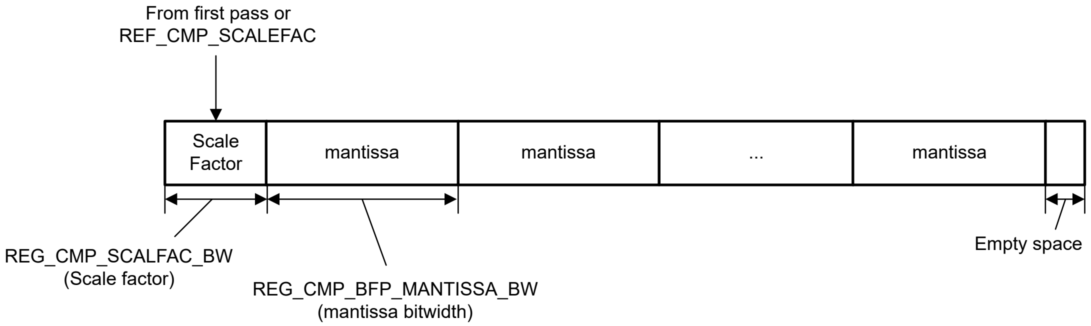


Figure 28-58. BFP – Format

28.12.2.2 Exponential Golomb Encoder (EGE)

Radar data (after the range FFT) is expected to be sparse in the range dimension. The term ‘sparse array’ is defined as an array where most of the samples are very small, and a few samples are large. There are typically a few large samples corresponding to target reflections, the remaining samples are either the noise-floor or clutter or weak reflectors and are comparatively small. Most importantly, in a sparse array, the “average” bit-width (where bit-width is defined as the number of bits up to the most-significant 1) will be small.

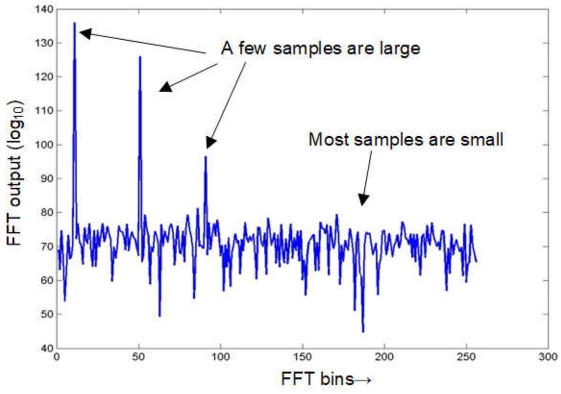

Figure 28-59. An Example of Sparse Data

The “Order-k exponential Golomb encoder” (henceforth EGE) encodes each sample such that it occupies a space approximately proportional to its bit-width. A description of the algorithm is given in ‘https://en.wikipedia.org/wiki/Exponential-Golomb_coding’. Order-k Exponential Golomb codes are parameterized by the Golomb-parameter ‘*k*’. This parameter represents the most common bitwidth in the input vector and is required to determine the boundary line between the variable-bitwidth quotient part (that is stored by having its length encoded in unary and the actual bits in binary form) and the fixed-bitwidth remainder part (that is stored in the usual binary form).

For example, if a number, say 23 were to be Exponential-Golomb encoded, then the process would look as follows.

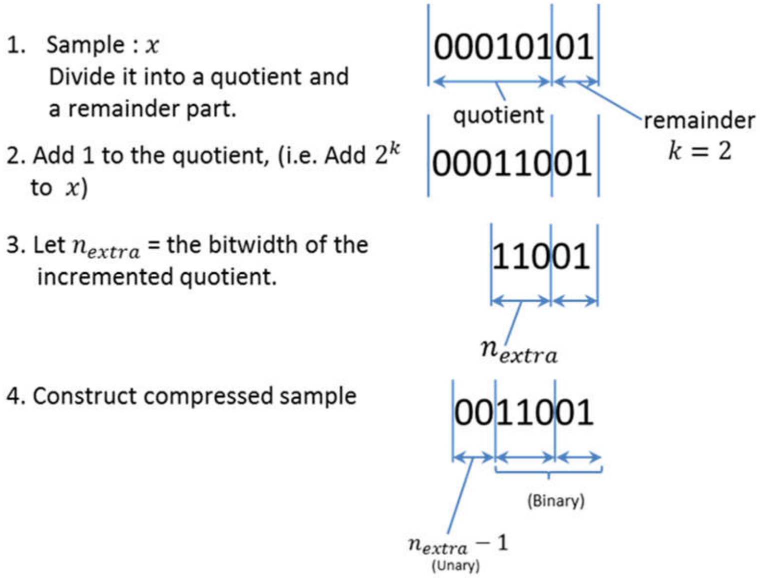

Figure 28-60. Exp-Golomb Encoding Example

One distinction in the compression engine is that the order *k* of the EGE (i.e., Golomb parameter k) is automatically selected from a list of possible values (stored in an array called the ‘Golomb parameter array’) to optimize the Golomb parameter based on the input samples.

28.12.2.2.1 The EGE Format

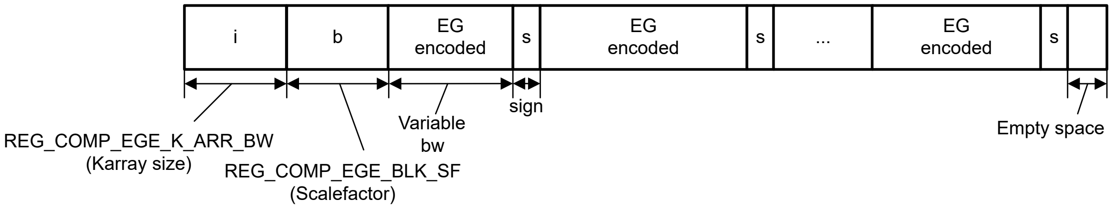

Figure 28-61. EGE Format

The block starts with a header, holding the scalefactor ’b’, and the index to the Golomb parameter array ‘i’. The rest of the block is filled with EGE words that take a variable number of bit-widths. Since the encoding is done only on the absolute value of each sample (i.e., without sign bit), the sign bit is taken separately, after each EG-E word.

28.12.3 Operation

The compression/decompression operation is intended to be fairly invisible in operation. In order to use the compression/decompression engine the following steps are necessary.

1. One ‘param-set’ of the HWA is configured to use the compression path. This configuration includes the number of samples per block, the access pattern, the number of blocks to be compressed, and some additional parameters for the compression engine.

2. Before the compression engine is run, samples (real/complex) are to be placed in an input buffer of the HWA either as part of the operation of a previous param-set by the HWA or by the EDMA. Likewise before the decompression engine is run, compressed blocks are to be placed in an input buffer.
3. The HWA is then executed. When the param-set corresponding to compression is reached the samples in the input buffer are read and compressed and then written to an output buffer as contiguous blocks. When the param-set corresponding to decompression is reached the samples in the output buffer are read, decompressed and then written to the output buffer.

Note

Internally, compression is accomplished via a two-pass operation. In the first pass, the samples are analyzed and the optimal parameters are selected. In the second pass, the samples are compressed to generate the compressed block of bits.

28.12.3.1 Configuring Compression

To configure compression:

1. To configure the ‘compression engine’, set the compression path in the HWA by setting the ACCEL_MODE to 2, and then set the register CMP_DCMP to 0 to select the compression engine.
2. Enable dither (CMP_DITHER_ENABLE = 1), enable both first and second pass (CMP_PASS_SEL = 3), and enable the header (CMP_HEADER_EN = 1).
3. Configure the ‘scale factor bitwidth’. For most cases, it should be set to the logarithm (in base 2) of number of bits per real sample. I.e. for e.g. CMP_SCALEFAC_BW = 4, if the sample bitwidth is 16bits (because 2^4 = 16), and CMP_SCALEFAC_BW = 5, if the sample bitwidth is 32 bits.
4. Configure BCNT to be ‘number of blocks to be compressed’-1. For example, if there are 256 samples and the number of samples per block is 2, there would be 128 blocks. The BCNT register would then be configured to 127.
5. Setup the input formatter. In particular registers like SRCACNT, SRC_REAL, SRC_16b32b, and SRC_AINDX. SRCACNT should be set to the ‘number of samples per block’ – 1 (The ‘-1’ in the previous equation comes from the fact that SRCACNT is zero based). SRC_AINDX would correspond to address increment after SRCACNT samples. For example, for compression of 4 complex 16 bit samples, the following configuration should be used.
   - SRCACNT = 3 (4 samples)
   - SRC_REAL = 0 (complex data)
   - SRC_16b23b = 0 (16-bit samples)
6. Setup the output formatter. In particular registers like DSTACNT, DST_REAL, DST_16b32b, and DST_AINDX. DSTACNT should be set to the ‘compressed data size (in samples)’ – 1. (The ‘-1’ in the previous equation comes from the fact that SRCACNT is zero based). For example, if a 50 % compression is required, DSTACNT can be set to ½ (SRCACNT+1)-1. To compress the previous example by 50 %, the following configuration should be used.
   - DSTACNT = 1 (2 compressed samples)
   - DST_REAL=1 (real data)
   - DST_16b23b = 1 (32-bit samples)
7. Select/Configure the compression method. As of now, there is only a single method (EGE). (OR) As of now there are two compression algorithms (EGE and BFP).
   a. To configure EGE:
      i. Set the compression method (CMP_METHOD) to 0.
      ii. Program CMP_EGE_K_ARR_LEN which holds the length (in log2) of the list of golomb parameters and also CMP_EGE_K_ARR_<n> which holds the actual parameters.

      Note : The golomb parameter should correspond to the most common bit-width in the input array. Since radar data has a wide dynamic range, we typically set the golomb parameter list (for 16 bit numbers) to [0 2 4 6 8 10 12 15]. In the worst-case, the most common bitwidth can be as large as bitwidth of the input rhence the 15 at the end. In the case of 32-bit input, we set the list to [0 4 8 12 16 20 24 31]. CMP_EGE_K_ARR_LEN is normally set 3 (the list length is 8).

b. To configure BFP:
   i. Set the compression method (CMP_METHOD) to 1.
   ii. Set the mantissa bitwidth - CMP_BFP_MANTISSA_BW

      The total compressed size of each block (in bits) is given by the following equation.

      if SRC_REAL == 1

      Compressed Size = CMP_SCALEFAC_BW + \ (CMP_BFP_MANTISSA_BW x SRCACNT)

      elseif SRC_REAL == 0

      Compressed Size = CMP_SCALEFAC_BW + \ (CMP_BFP_MANTISSA_BW x SRCACNT x 2)

      For example, for 50 % compression of 4 16-bit complex samples, the CMP_BFP_MANTISSA_BW should be set to 7, CMP_SCALEFAC_BW to 4. This is because there are 8 16-bit numbers in the input (128 bits), and the compressed output should be less than 64 bits (including the header) i.e

      64 ≥ CMP_SCALEFAC_BW + (CMP_BFP_MANTISSA_BW x SRCACNT x 2)

      Since CMP_SCALEFAC_BW = 4 and SRCACNT = 4, implies that

      CMP_BFP_MANTISSA_BW ≤ 7.

Note

Configuring the input and output formatters: The sample size for the input formatter is dependent on SRC_REAL, and SRC_16b32b. If SRC_16b32b is set to 1 (i.e. 32 bits), then the per-real-sample bit-width is assumed to be 32bit (and 16bit otherwise). In each cycle, it will read 32 bits of data.

The sample size of the output formatter is likewise dependent on DST_REAL and DST_16b32b. For example if DST_REAL=1, and DST_16b32b=1, then in each clock cycle the compression engine will write 32-bits to the output. If DST_REAL=0, and DST_16b32b=1, then in each cycle (subject to data availability) the compression engine will write 64 bits to the output buffer.

The reason to care about the sample size in this case is that it directly limits the granularity of compression ratio. For example, consider the following scenario, assume 62.5 % compression is desired. In other words if the input is 128 bits (in total), the compressed output should be 80 bits (which is only divisible by 16 – and not by 32 or 64). So the output per-sample bit-width has to be configured to 16 which needs the destination to be configured to DST_REAL = 1, and DST_16b32b = 0.

Note

Computing the actual compression Ratio.

```
bits_per_src_sample = 16
if SRC_16b32b == 1
    bits_per_src_sample = 32
end
if SRC_REAL == 0
    bits_per_src_sample = 2* bits_per_src_sample
end
Input_Block_Size = bits_per_src_sample * (SRC_ACNT + 1)
bits_per_dst_sample = 16
if DST_16b32b == 1
    bits_per_dst_sample = 32
end
if DST_REAL == 0
    bits_per_dst_sample = 2* bits_per_dst_sample
end
Output_Block_Size = bits_per_dst_sample * (DST_ACNT + 1)
```

The compression ratio is then Output_Block_Size/Input_Block_Size.

28.12.3.2 Configuring Decompression

Decompression is configured almost exactly the same was as compression, except for the following differences.

- The only difference is that the register CMP_DCMP should be set to 1 to select the decompression engine, and
- The ‘input formatter configuration’ and the ‘output format configuration’ used in ‘the compression stage’ should be interchanged. For instance,
    - The SRCACNT used in compression would become the DSTACNT (and vice versa).
    - SRC_AINDX should be configured so as to jump to the next sample in the compressed block, whereas DST_AINDX should be configured to be the size of a sample.

28.12.3.3 Speed

When using either the BFP or EGE with 32-bit complex numbers, Compression and Decompression of one complex sample takes one cycle in steady state. If the sample consists of 64-bit complex numbers (i.e. 32-bit I, 32-bit Q), then EGE takes two cycles per sample in steady state, whereas BFP takes only a single cycle per complex number.

The initial delay (per paramSet) includes the cycles corresponding to the reading of the paramSet registers (~40 cycles) and an additional delay corresponding to the ‘number of samples in a block’.

28.13 Radar Hardware Accelerator Registers

28.13.1 Register Descriptions

28.13.1.1 Basic Configuration

<table>
<tr><th>Register</th><th>Width</th><th>Parameter-Set? (Y/N)</th><th>Description</th></tr>
<tr><td>ACCEL_MODE</td><td>3</td><td>Y</td><td>The accelerator core is essentially a parallel set of paths. Each path performs a certain core operation, either FFT, CFAR-CA, compression/decompression, etc. To select the Compression/Decompression Engine set to 2.</td></tr>
<tr><td>CMP_DCMP</td><td>1</td><td>Y</td><td>This register controls the compression mode, i.e. whether the operation to be performed is compression (when CMP_DCMP = 0) or decompression (when CMP_DCMP = 1).</td></tr>
<tr><td>CMP_METHOD</td><td>3</td><td>Y</td><td>3 bit register that selects one of the two compression algorithms. The only valid value of the register is:
<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td>0</td><td>EGE</td></tr>
<tr><td>1</td><td>BFP</td></tr>
</table>
All other values are to be considered invalid</td></tr>
</table>

28.13.1.2 Compression/Decompression Configuration

<table>
<tr><th>Register</th><th>Width</th><th>Parameter-Set?(Y/N)</th><th>Description</th></tr>
<tr><td>CMP_DITHER_ENABLE</td><td>1</td><td>Y</td><td>The register enables dithering. Dithering prevents periodic quantization patterns from resulting in spurs. The dither source provides 3 bits of dither for every sample. Valid dither generation requires that the LFSR seed be programmed to any non-zero number.
Note :
• This register has to be set to 1 for proper operation of the hardware. accelerator.
• HWA 2.0 While a separate LFSR is available to generate dither for compression, the same seed parameter is used by both FFT (when DITHER_TWID_EN is enabled) and compression. Hence, both LFSR_SEED and LFSR_LOAD have to be populated for the LFSR to generate valid dither.
• HWA 2.1 There are two LFSRs (0 and 1) , both of which have independent seed and load registers (CMP_LFSRSEED_0 and CMP_LFSR_LOAD_0 for LFSR 0, and CMP_LFSRSEED_1 and CMP_LFSR_LOAD_1 for LFSR 1). The LFSR that is used is selected by CMP_SEL_LFSR.</td></tr>
<tr><td>CMP_PASS_SEL</td><td>2</td><td>Y</td><td>This register optionally bypasses the first pass (i.e. optimization of parameters) or the 2nd pass (actual compression). Note that if the first pass is bypassed, the programmed scale-factor is used.
<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td>11</td><td>Both first pass and second pass are enabled.</td></tr>
<tr><td>01</td><td>First pass is disabled.</td></tr>
</table></td></tr>
</table>

Register	Width	Parameter-Set?(Y/N)	Description
CMP_HEADER_EN	1	Y	Optionally populate the header in the compressed stream. In most normal use-cases, this is set to 1, as the header is necessary for decompressing a block. However, if the first-pass is bypassed and all blocks are configured to use a specific customer-chosen scale-factor value, the header wouldn't be necessary.
CMP_SCALEFAC_BW	4	Y	The number of bits to be used in the header for the ‘common scale-factor´ per block. If the input is 16-bit (real or complex) set the common scale-factor to 4 (since the scale factor can vary from 0 to 15). If the input is 32-bit (real or complex), set the complex scale-factor to 5 (since the scale factor can vary from 0 to 31).

Source/Destination configuration. Some of the Registers from the input and output formatters are reused internally to compute the compression ratio (with some additional description).

Register	Width	Parameter-Set?(Y/N)	Description
SRCACNT	12	Y	This register (plus 1) denotes the number of samples in a block. This is a zero-based count and therefore a register value of 15 indicates that there are 16 samples in a block. Note that we also rely on SRC_REAL and SRC_16b32b to denote the size of each sample, and they have to be correctly programmed for SRCACNT to select the necessary samples. Also, the maximum number of samples has to fit in the input buffer of the compression engine (< 2Kb).
DSTACNT	12	Y	This register (plus 1) denotes the desired output size in samples. To get the true compressed size in bits, DST_REAL, and DST_16b32b should be taken into consideration. When using the EG algorithm, the compression engine will compress all data so that it fits within this DSTACNT. (OR) When using the BFP algorithm, the programming of the mantissa bit-width, the header size and SRCACNT (i.e. the number of input samples) should be such that the compressed size is less than the DSTACNT.
BCNT	12	Y	This register (plus 1) denotes the number of blocks in the input buffer (ping and pong).
SRC_16b32b	1	Y	Specifies the number of bits samples per real sample. This register along with SRC_REAL, allows one to compute the number of bits per sample. Value: 0 = 16 bit. Value: 1 = 32 bit. Note : While BFP supports both 16 bit and 32 bit modes at the full rate, EGE only supports 16 bit at the full rate. 32 bit inputs will be processed at half rate.

SRC_16b32b values:

Value	Description
0	16 bit.
1	32 bit.

<table>
<tr><th>Register</th><th>Width</th><th>Parameter-Set?(Y/N)</th><th>Description</th></tr>
<tr><td>SRC_REAL</td><td>1</td><td>Y</td><td>Specifies the format of the input samples
<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td>0</td><td>REAL</td></tr>
<tr><td>1</td><td>COMPLEX</td></tr>
</table>
Note: The compression engine uses this register to process either 1 real sample per cycle or 1 complex sample per cycle. It is recommended that the COMPLEX mode is used to get the best throughput from the compression engine.</td></tr>
</table>

28.13.1.3 BFP Specific Registers

Register	Width	Parameter-Set?(Y/N)	Description
CMP_BFP_MANTISSA_BW	5	Y	The number of bits in the mantissa.
CMP_SCALEFAC	5	Y	Hardcoded scalefactor. This is used only if first pass is disabled (i.e. CMP_PASS_SEL = 01b

28.13.1.4 EGE Specific Registers

Register	Width	Parameter-Set?(Y/N)	Description
CMP_EGE_K_ARR_LEN	4	Y	This register value encodes the length of the 'list of Golomb parameters' to optimize over. The actual length of this list is 2^(Register Value). The valid range for this register is from 1 to 3. In effect the valid length of the list of parameters is 2, 4, 8.
CMP_EGE_K_ARR_<n>	5bits per element (upto 8 elements in total)	N	These set of registers hold the list of golomb parameters to optimize over. The number of valid elements is determined by the CMP_EGE_K_ARR_LSSSEN (see register).

28.13.1.5 Additional Registers for HWA 2.1 (For AWR2944 PG 2.0 only)

Register	Width	Parameter-Set?(Y/N)	Description
CMP_BFP_DECR_IMAG_BITW	1	Y	This register value reduces the bit-width of the mantissa of the imaginary part of a complex number when set. Note: SRC_REAL must be set to 0 for compression, and DST_REAL must be set to 0 for decompression.
CMP_ROUND_EN	1	Y	This register implements rounding instead of dithered rounding. Note: CMP_DITHER_ENABLE should be set for the rounding to take effect.
CMP_SEL_LFSR	1	Y	There are two LFSRs that are available to generate dither used for dithered rounding. Based on this register one of the two LFSRs will be selected for generating dither. The selected LFSR will also be updated per valid sample. Note: See

Register	Width	Parameter-Set?(Y/N)	Description
CMP_LFSR_SEED_0 .	29	N	Seed for compression LFSR 0: For dithered rounding, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit register. This register should be set to any non-zero value, say 0x1234567. To load the LFSR seed, a pulse signal needs to be provided, by writing a 1 followed by a 0 (i.e., by setting and clearing) the CMP_LFSR_LOAD_0 register-bit.
CMP_LFSR_LOAD_0	1	N	The LFSR load register corresponding to CMP_LFSRSEED_0.
CMP_LFSR_SEED_1	29	N	Seed for compression LFSR 1: For dithered rounding, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit register. This register should be set to any non-zero value, say 0x1234567. To load the LFSR seed, a pulse signal needs to be provided, by writing a 1 followed by a 0 (i.e., by setting and clearing) the CMP_LFSR_LOAD_0 register-bit.
CMP_LFSR_LOAD_1	1	N	The LFSR load register corresponding to CMP_LFSRSEED_1.

28.13.2 DSS_HWA_CFG Registers

Table 28-23 lists the memory-mapped registers for the DSS_HWA_CFG registers. All register offset addresses not listed in Table 28-23 should be considered as reserved locations and the register contents should not be modified.

Complex bit access types are encoded to fit into small table cells. Table 28-24 shows the codes that are used for access types in this section.

Table 28-24. DSS_HWA_CFG Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-*n*		Value after reset or the default value

28.13.2.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in Table 28-25.

Return to the Summary Table.

PID register

Table 28-25. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

28.13.2.2 PARAM_RAM_IDX Register (Offset = 4h) [Reset = X]

PARAM_RAM_IDX is shown in Table 28-26.

Return to the Summary Table.

Table 28-26. PARAM_RAM_IDX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25-16	param_end_idx	R/W	0h	The state machine starts at the parameter-set specified by PARAM_START_IDX and loads each parameter-set one after another and runs the accelerator as per that configuration. When the state machine reaches the parameter-set specified by PARAM_ENS_IDX, it loops back to the start index as specified by PARAM_START_IDX.Valid range : 0-63
15-10	RESERVED	R/W	X	
9-0	param_start_idx	R/W	0h	The state machine starts at the parameter-set specified by PARAM_START_IDX and loads each parameter-set one after another and runs the accelerator as per that configuration. When the state machine reaches the parameter-set specified by PARAM_ENS_IDX, it loops back to the start index as specified by PARAM_START_IDX..Valid range : 0-63

28.13.2.3 PARAM_RAM_LOOP Register (Offset = 8h) [Reset = X]

PARAM_RAM_LOOP is shown in Table 28-27.

Return to the Summary Table.

Table 28-27. PARAM_RAM_LOOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	X	
11-0	numloops	R/W	0h	Number of loops: This register controls the number of times the State Machine will loop through the parameter-sets (from a programmed start index till a programmed end index) and run them. The maximum number of times the loop can be made is run is 4094. A value of zero programmed in this register means that the looping mechanism is disabled.

28.13.2.4 PARAM_RAM_IDX_ALT Register (Offset = Ch) [Reset = X]

PARAM_RAM_IDX_ALT is shown in Table 28-28.

Return to the Summary Table.

Table 28-28. PARAM_RAM_IDX_ALT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25-16	param_end_idx	R/W	0h	PARAM_END_IDX for alternate thread
15-10	RESERVED	R/W	X	
9-0	param_start_idx	R/W	0h	PARAM_START_IDX for alternate thread

28.13.2.5 PARAM_RAM_LOOP_ALT Register (Offset = 10h) [Reset = X]

PARAM_RAM_LOOP_ALT is shown in Table 28-29.

Return to the Summary Table.

Table 28-29. PARAM_RAM_LOOP_ALT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	X	
11-0	numloops	R/W	0h	NUMLOOPS for alternate thread

28.13.2.6 PREVIOUS_NAME Register (Offset = 14h) [Reset = X]

PREVIOUS_NAME is shown in Table 28-30.

Return to the Summary Table.

Table 28-30. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	X	
24	hwa_dyn_clk_en	R/W	0h	Dynamic Clock-gating Control: Setting this register bit to '1' enables the capability to clock gate the 4 Radar Accelerator core IPs (FFT datapath,CFAR,Memory compression,Local Maxima) based on the ParamSet being executed.
23-19	RESERVED	R/W	X	
18-16	hwa_reset	R/W	0h	Software Reset Control: This register provides software reset control for the Radar Hardware Accelerator. The assertion of these register bits by the main processor will bring the Accelerator Engine to a known reset state. This is mostly applicable for resetting the accelerator in case of unexpected behavior. The sequence to be followed in case software reset is to write 111b to this register and then a 000b
15-11	RESERVED	R/W	X	
10-8	hwa_clk_en	R/W	0h	Clock-gating Control: This register controls the enable/disable for the clock of the Radar Accelerator. This register bit can be set to 0 to clock-gate the accelerator when not using the accelerator. Before enabling the accelerator or before configuring the accelerator s registers, this register bit should be set first to 111b, so that the clock is available
7-3	RESERVED	R/W	X	
2-0	hwa_en	R/W	0h	Enable/Disable Control: A value of ACC_ENABLE = 111b enables the Radar Hardware Accelerator and any other value of the register keeps the Accelerator Engine in disabled state. A 000b to 111b transition is expected to trigger a new Paramset execution

28.13.2.7 CS_CONFIG Register (Offset = 18h) [Reset = X]

CS_CONFIG is shown in Table 28-31.

Return to the Summary Table.

Table 28-31. CS_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-16	cs_trgsrc	R/W	0h	In case of DMA trigger, this specifies which DMA channel (which bit in DMA2HWA_TRIG register) to wait for In case of HW-based trigger, this specifies which CSI2 trigger signal (out of the 20 possible trigger signals) to wait for
15-12	RESERVED	R/W	X	
11-8	cs_trigmode	R/W	5h	Trigger mode for context switching 0011b: DMA-based trigger (used in conjunction with DMA2HWA_TRIGGER and CS_TRIGSRC registers described below) 0100b: Hardware based trigger (used in conjunction with CS_TRIGSRC) Valid programmation 0-19, where 0 selct right most trigger and 19 selects left most trigger below {CSI2A_FRAME_START [1:0],CSI2A_LINE_END [7:0],CSI2B_FRAME_START [1:0],CSI2B_LINE_END [7:0]} 0101b: Software trigger (used in conjunction with CS_FW2ACC_TRIG register described below)
7-1	RESERVED	R/W	X	
0	cs_enable	R/W	0h	Master enable for the Conxtext switching feature.Setting this bit will allow context switching to ALT thread if it is enabled in the Param set

28.13.2.8 FW2DMA_TRIG Register (Offset = 1Ch) [Reset = 00000000h]

FW2DMA_TRIG is shown in Table 28-32.

Return to the Summary Table.

Table 28-32. FW2DMA_TRIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fw2dma_trigger	R/W	0h	SW Override for HWA Trigger to DMA by the CPU It s a Self clearing bit

28.13.2.9 DMA2HWA_TRIG Register (Offset = 20h) [Reset = 00000000h]

DMA2HWA_TRIG is shown in Table 28-33.

Return to the Summary Table.

Table 28-33. DMA2HWA_TRIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dma2hwa_trigger	R/W	0h	DMA trigger register: This register is relevant whenever DMA triggered mode is used (i.e., TRIGMODE = 011b). Whenever a DMA channel has finished copying input samples into the local memory of the accelerator and wants to trigger the accelerator, the procedure to follow is to use a second linked DMA channel to write a 16-bit one-hot signature into this register to trigger the accelerator. In DMA triggered mode, the State Machine keeps monitoring this 32-bit register and waits as long as a specific bit (see DMA2ACC_CHANNEL_TRIGSRC) in this register is zero. The second linked DMA channel writes a one-hot signature that sets the specific bit, so that the State Machine gets triggered and starts the accelerator operations for that parameter-set. It s a Self clearing bit

28.13.2.10 SIGDMACH0DONE Register (Offset = 24h) [Reset = 00000001h]

SIGDMACH0DONE is shown in Table 28-34.

Return to the Summary Table.

Table 28-34. SIGDMACH0DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH0DONE	R	1h	Signature for DMA channel 0 completion : 0x0000_0001 Linked DMA can copy from one of these SIG_DMACHx_DONE registers into DMA2HWA_TRIGGER register to set the appropriate register bit to signal the completion of DMA and trigger the accelerator

28.13.2.11 SIGDMACH1DONE Register (Offset = 28h) [Reset = 00000002h]

SIGDMACH1DONE is shown in Table 28-35.

Return to the Summary Table.

Table 28-35. SIGDMACH1DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH1DONE	R	2h	Signature for DMA channel 1 completion : 0x0000_0002

28.13.2.12 SIGDMACH2DONE Register (Offset = 2Ch) [Reset = 00000004h]

SIGDMACH2DONE is shown in Table 28-36.

Return to the Summary Table.

Table 28-36. SIGDMACH2DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH2DONE	R	4h	Signature for DMA channel 2 completion : 0x0000_0004

28.13.2.13 SIGDMACH3DONE Register (Offset = 30h) [Reset = 00000008h]

SIGDMACH3DONE is shown in Table 28-37.

Return to the Summary Table.

Table 28-37. SIGDMACH3DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH3DONE	R	8h	Signature for DMA channel 3 completion : 0x0000_0008

28.13.2.14 SIGDMACH4DONE Register (Offset = 34h) [Reset = 00000010h]

SIGDMACH4DONE is shown in Table 28-38.

Return to the Summary Table.

Table 28-38. SIGDMACH4DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH4DONE	R	10h	Signature for DMA channel 4 completion : 0x0000_0010

28.13.2.15 SIGDMACH5DONE Register (Offset = 38h) [Reset = 00000020h]

SIGDMACH5DONE is shown in Table 28-39.

Return to the Summary Table.

Table 28-39. SIGDMACH5DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH5DONE	R	20h	Signature for DMA channel 5 completion : 0x0000_0020

28.13.2.16 SIGDMACH6DONE Register (Offset = 3Ch) [Reset = 00000040h]

SIGDMACH6DONE is shown in Table 28-40.

Return to the Summary Table.

Table 28-40. SIGDMACH6DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH6DONE	R	40h	Signature for DMA channel 6 completion : 0x0000_0040

28.13.2.17 SIGDMACH7DONE Register (Offset = 40h) [Reset = 00000080h]

SIGDMACH7DONE is shown in Table 28-41.

Return to the Summary Table.

Table 28-41. SIGDMACH7DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH7DONE	R	80h	Signature for DMA channel 7 completion : 0x0000_0080

28.13.2.18 SIGDMACH8DONE Register (Offset = 44h) [Reset = 00000100h]

SIGDMACH8DONE is shown in Table 28-42.

Return to the Summary Table.

Table 28-42. SIGDMACH8DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH8DONE	R	100h	Signature for DMA channel 8 completion : 0x0000_0100

28.13.2.19 SIGDMACH9DONE Register (Offset = 48h) [Reset = 00000200h]

SIGDMACH9DONE is shown in Table 28-43.

Return to the Summary Table.

Table 28-43. SIGDMACH9DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH9DONE	R	200h	Signature for DMA channel 9 completion : 0x0000_0200

28.13.2.20 SIGDMACH10DONE Register (Offset = 4Ch) [Reset = 00000400h]

SIGDMACH10DONE is shown in Table 28-44.

Return to the Summary Table.

Table 28-44. SIGDMACH10DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH10DONE	R	400h	Signature for DMA channel 10 completion : 0x0000_0400

28.13.2.21 SIGDMACH11DONE Register (Offset = 50h) [Reset = 00000800h]

SIGDMACH11DONE is shown in Table 28-45.

Return to the Summary Table.

Table 28-45. SIGDMACH11DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH11DONE	R	800h	Signature for DMA channel 11 completion : 0x0000_0800

28.13.2.22 SIGDMACH12DONE Register (Offset = 54h) [Reset = 00001000h]

SIGDMACH12DONE is shown in Table 28-46.

Return to the Summary Table.

Table 28-46. SIGDMACH12DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH12DONE	R	1000h	Signature for DMA channel 12 completion : 0x0000_1000

28.13.2.23 SIGDMACH13DONE Register (Offset = 58h) [Reset = 00002000h]

SIGDMACH13DONE is shown in Table 28-47.

Return to the Summary Table.

Table 28-47. SIGDMACH13DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH13DONE	R	2000h	Signature for DMA channel 13 completion : 0x0000_2000

28.13.2.24 SIGDMACH14DONE Register (Offset = 5Ch) [Reset = 00004000h]

SIGDMACH14DONE is shown in Table 28-48.

Return to the Summary Table.

Table 28-48. SIGDMACH14DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH14DONE	R	4000h	Signature for DMA channel 14 completion : 0x0000_4000

28.13.2.25 SIGDMACH15DONE Register (Offset = 60h) [Reset = 00008000h]

SIGDMACH15DONE is shown in Table 28-49.

Return to the Summary Table.

Table 28-49. SIGDMACH15DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH15DONE	R	8000h	Signature for DMA channel 15 completion : 0x0000_8000

28.13.2.26 SIGDMACH16DONE Register (Offset = 64h) [Reset = 00010000h]

SIGDMACH16DONE is shown in Table 28-50.

Return to the Summary Table.

Table 28-50. SIGDMACH16DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH16DONE	R	00010000h	Signature for DMA channel 16 completion : 0x0001_0000

28.13.2.27 SIGDMACH17DONE Register (Offset = 68h) [Reset = 00020000h]

SIGDMACH17DONE is shown in Table 28-51.

Return to the Summary Table.

Table 28-51. SIGDMACH17DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH17DONE	R	00020000h	Signature for DMA channel 17 completion : 0x0002_0000

28.13.2.28 SIGDMACH18DONE Register (Offset = 6Ch) [Reset = 00040000h]

SIGDMACH18DONE is shown in Table 28-52.

Return to the Summary Table.

Table 28-52. SIGDMACH18DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH18DONE	R	00040000h	Signature for DMA channel 18 completion : 0x0004_0000

28.13.2.29 SIGDMACH19DONE Register (Offset = 70h) [Reset = 00080000h]

SIGDMACH19DONE is shown in Table 28-53.

Return to the Summary Table.

Table 28-53. SIGDMACH19DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH19DONE	R	00080000h	Signature for DMA channel 19 completion : 0x0008_0000

28.13.2.30 SIGDMACH20DONE Register (Offset = 74h) [Reset = 00100000h]

SIGDMACH20DONE is shown in Table 28-54.

Return to the Summary Table.

Table 28-54. SIGDMACH20DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH20DONE	R	00100000h	Signature for DMA channel 20 completion : 0x0010_0000

28.13.2.31 SIGDMACH21DONE Register (Offset = 78h) [Reset = 00200000h]

SIGDMACH21DONE is shown in Table 28-55.

Return to the Summary Table.

Table 28-55. SIGDMACH21DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH21DONE	R	00200000h	Signature for DMA channel 21 completion : 0x0020_0000

28.13.2.32 SIGDMACH22DONE Register (Offset = 7Ch) [Reset = 00400000h]

SIGDMACH22DONE is shown in Table 28-56.

Return to the Summary Table.

Table 28-56. SIGDMACH22DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH22DONE	R	00400000h	Signature for DMA channel 22 completion : 0x0040_0000

28.13.2.33 SIGDMACH23DONE Register (Offset = 80h) [Reset = 00800000h]

SIGDMACH23DONE is shown in Table 28-57.

Return to the Summary Table.

Table 28-57. SIGDMACH23DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH23DONE	R	00800000h	Signature for DMA channel 23 completion : 0x0080_0000

28.13.2.34 SIGDMACH24DONE Register (Offset = 84h) [Reset = 01000000h]

SIGDMACH24DONE is shown in Table 28-58.

Return to the Summary Table.

Table 28-58. SIGDMACH24DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH24DONE	R	01000000h	Signature for DMA channel 24 completion : 0x0100_0000

28.13.2.35 SIGDMACH25DONE Register (Offset = 88h) [Reset = 02000000h]

SIGDMACH25DONE is shown in Table 28-59.

Return to the Summary Table.

Table 28-59. SIGDMACH25DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH25DONE	R	02000000h	Signature for DMA channel 25 completion : 0x0200_0000

28.13.2.36 SIGDMACH26DONE Register (Offset = 8Ch) [Reset = 04000000h]

SIGDMACH26DONE is shown in Table 28-60.

Return to the Summary Table.

Table 28-60. SIGDMACH26DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH26DONE	R	04000000h	Signature for DMA channel 26 completion : 0x0400_0000

28.13.2.37 SIGDMACH27DONE Register (Offset = 90h) [Reset = 08000000h]

SIGDMACH27DONE is shown in Table 28-61.

Return to the Summary Table.

Table 28-61. SIGDMACH27DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH27DONE	R	08000000h	Signature for DMA channel 27 completion : 0x0800_0000

28.13.2.38 SIGDMACH28DONE Register (Offset = 94h) [Reset = 10000000h]

SIGDMACH28DONE is shown in Table 28-62.

Return to the Summary Table.

Table 28-62. SIGDMACH28DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH28DONE	R	10000000h	Signature for DMA channel 28 completion : 0x1000_0000

28.13.2.39 SIGDMACH29DONE Register (Offset = 98h) [Reset = 20000000h]

SIGDMACH29DONE is shown in Table 28-63.

Return to the Summary Table.

Table 28-63. SIGDMACH29DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH29DONE	R	20000000h	Signature for DMA channel 29 completion : 0x2000_0000

28.13.2.40 SIGDMACH30DONE Register (Offset = 9Ch) [Reset = 40000000h]

SIGDMACH30DONE is shown in Table 28-64.

Return to the Summary Table.

Table 28-64. SIGDMACH30DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH30DONE	R	40000000h	Signature for DMA channel 30 completion : 0x4000_0000

28.13.2.41 SIGDMACH31DONE Register (Offset = A0h) [Reset = 80000000h]

SIGDMACH31DONE is shown in Table 28-65.

Return to the Summary Table.

Table 28-65. SIGDMACH31DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SIGDMACH31DONE	R	80000000h	Signature for DMA channel 31 completion : 0x8000_0000

28.13.2.42 FW2HWA_TRIG_0 Register (Offset = A4h) [Reset = X]

FW2HWA_TRIG_0 is shown in Table 28-66.

Return to the Summary Table.

Table 28-66. FW2HWA_TRIG_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	fw2hwa_trigger_0	R/W	0h	Software trigger bit 0: This register bit is relevant whenever software triggered mode is used (i.e., TRIGMODE = 001b). The main processor software can set this register bit, so that the State Machine gets triggered and starts the accelerator operations for that parameter-set. It s a Self clearing bit

28.13.2.43 FW2HWA_TRIG_1 Register (Offset = A8h) [Reset = X]

FW2HWA_TRIG_1 is shown in Table 28-67.

Return to the Summary Table.

Table 28-67. FW2HWA_TRIG_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	fw2hwa_trigger_1	R/W	0h	Software trigger bit 1: This register bit is relevant whenever software triggered mode is used (i.e., TRIGMODE = 111b). The main processor software can set this register bit, so that the State Machine gets triggered and starts the accelerator operations for that parameter-set. It s a Self clearing bit

28.13.2.44 CS_FW2ACC_TRIG Register (Offset = ACh) [Reset = X]

CS_FW2ACC_TRIG is shown in Table 28-68.

Return to the Summary Table.

Table 28-68. CS_FW2ACC_TRIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	fw2hwa_trigger_cs	R/W	0h	CPU can set this register bit to trigger a context switch when CS_TRIGMODE = 101b It s a Self clearing bit

28.13.2.45 BPM_PATTERN_0 Register (Offset = B0h) [Reset = 00000000h]

BPM_PATTERN_0 is shown in Table 28-69.

Return to the Summary Table.

Table 28-69. BPM_PATTERN_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bpm_pattern_0	R/W	0h	BPM pattern [31:0]: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled

28.13.2.46 BPM_PATTERN_1 Register (Offset = B4h) [Reset = 00000000h]

BPM_PATTERN_1 is shown in Table 28-70.

Return to the Summary Table.

Table 28-70. BPM_PATTERN_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bpm_pattern_1	R/W	0h	BPM pattern [63:32]: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled

28.13.2.47 BPM_PATTERN_2 Register (Offset = B8h) [Reset = 00000000h]

BPM_PATTERN_2 is shown in Table 28-71.

Return to the Summary Table.

Table 28-71. BPM_PATTERN_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bpm_pattern_2	R/W	0h	BPM pattern [95:64]: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled

28.13.2.48 BPM_PATTERN_3 Register (Offset = BCh) [Reset = 00000000h]

BPM_PATTERN_3 is shown in Table 28-72.

Return to the Summary Table.

Table 28-72. BPM_PATTERN_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bpm_pattern_3	R/W	0h	BPM pattern [127:96]: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled

28.13.2.49 BPM_PATTERN_4 Register (Offset = C0h) [Reset = 00000000h]

BPM_PATTERN_4 is shown in Table 28-73.

Return to the Summary Table.

Table 28-73. BPM_PATTERN_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bpm_pattern_4	R/W	0h	BPM pattern [159:128]: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled

28.13.2.50 BPM_PATTERN_5 Register (Offset = C4h) [Reset = 00000000h]

BPM_PATTERN_5 is shown in Table 28-74.

Return to the Summary Table.

Table 28-74. BPM_PATTERN_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bpm_pattern_5	R/W	0h	BPM pattern [191:160]: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled

28.13.2.51 BPM_PATTERN_6 Register (Offset = C8h) [Reset = 00000000h]

BPM_PATTERN_6 is shown in Table 28-75.

Return to the Summary Table.

Table 28-75. BPM_PATTERN_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bpm_pattern_6	R/W	0h	BPM pattern [223:192]: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled

28.13.2.52 BPM_PATTERN_7 Register (Offset = CCh) [Reset = 00000000h]

BPM_PATTERN_7 is shown in Table 28-76.

Return to the Summary Table.

Table 28-76. BPM_PATTERN_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bpm_pattern_7	R/W	0h	BPM pattern[255:224]: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled

28.13.2.53 BPM_RATE Register (Offset = D0h) [Reset = X]

BPM_RATE is shown in Table 28-77.

Return to the Summary Table.

Table 28-77. BPM_RATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	bpm_rate	R/W	0h	BPM rate: Specifies the number of input samples corresponding to each BPM bit. Minimum valid value for this register is 1.

28.13.2.54 PARAM_DONE_SET_STATUS_0 Register (Offset = D4h) [Reset = 00000000h]

PARAM_DONE_SET_STATUS_0 is shown in Table 28-78.

Return to the Summary Table.

Table 28-78. PARAM_DONE_SET_STATUS_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	param_done_set_status_0	R	0h	Parameter-set done status[31:0]: This read-only status register can be used by the main processor to see which parameter-sets are complete that led to the interrupt to the main processor. The individual bits in this 64-bit status register indicate which of the 64 parameter-sets have completed.

28.13.2.55 PARAM_DONE_SET_STATUS_1 Register (Offset = D8h) [Reset = 00000000h]

PARAM_DONE_SET_STATUS_1 is shown in Table 28-79.

Return to the Summary Table.

Table 28-79. PARAM_DONE_SET_STATUS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	param_done_set_status_1	R	0h	Parameter-set done status[63:32]: This read-only status register can be used by the main processor to see which parameter-sets are complete that led to the interrupt to the main processor. The individual bits in this 64-bit status register indicate which of the 64 parameter-sets have completed.

28.13.2.56 PARAM_DONE_CLR_0 Register (Offset = DCh) [Reset = 00000000h]

PARAM_DONE_CLR_0 is shown in Table 28-80.

Return to the Summary Table.

Table 28-80. PARAM_DONE_CLR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	param_done_status_clr_0	R/W	0h	Status bits in PARAM_DONE_SET_STATUS are not automatically cleared, but they can be individually cleared by writing to 64-bit register PARAM_DONE_CLR. It s a Self clearing bit

28.13.2.57 PARAM_DONE_CLR_1 Register (Offset = E0h) [Reset = 00000000h]

PARAM_DONE_CLR_1 is shown in Table 28-81.

Return to the Summary Table.

Table 28-81. PARAM_DONE_CLR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	param_done_status_clr_1	R/W	0h	Status bits in PARAM_DONE_SET_STATUS are not automatically cleared, but they can be individually cleared by writing to 64-bit register PARAM_DONE_CLR. It s a Self clearing bit

28.13.2.58 TRIGGER_SET_STATUS_0 Register (Offset = E4h) [Reset = 00000000h]

TRIGGER_SET_STATUS_0 is shown in Table 28-82.

Return to the Summary Table.

Table 28-82. TRIGGER_SET_STATUS_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	trigger_set_status_0	R	0h	Debug register for trigger status[31:0]: This is a read-only status register, which indicates the trigger status of the accelerator, i.e., whether a specific DMA trigger or a CSI or a SW trigger was ever received (refer TRIGMODE in HW_ACC_PARAM register set). The mapping for 32 bits is as given below: {DMA2HWA_TRIGGER[31:0]}

28.13.2.59 TRIGGER_SET_STATUS_1 Register (Offset = E8h) [Reset = 00000000h]

TRIGGER_SET_STATUS_1 is shown in Table 28-83.

Return to the Summary Table.

Table 28-83. TRIGGER_SET_STATUS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	trigger_set_status_1	R	0h	Debug register for trigger status[63:32]: This is a read-only status register, which indicates the trigger status of the accelerator, i.e., whether a specific DMA trigger or a CSI or a SW trigger was ever received (refer TRIGMODE in HW_ACC_PARAM register set). The mapping for 32 bits is as given below: {4'b0,CSI2A_FRAME_START[1:0],CSI2A_LINE_END[7:0],CSI2B_FRAME_START[1:0],CSI2B_LINE_END[7:0],FW2HWA_TRIGGER_CS,FW2HWA_TRIGGER_1,3'b0,FW2HWA_TRIGGER_0,1'b1}

28.13.2.60 TRIGGER_SET_IN_CLR_0 Register (Offset = ECh) [Reset = X]

TRIGGER_SET_IN_CLR_0 is shown in Table 28-84.

Return to the Summary Table.

Table 28-84. TRIGGER_SET_IN_CLR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	trigger_set_in_clr_0	R/W	0h	Clear trigger_set_status : This register-bit when set clears the trigger status register TRIGGER_SET_STATUS_0 described above It s a Self clearing bit

28.13.2.61 TRIGGER_SET_IN_CLR_1 Register (Offset = F0h) [Reset = X]

TRIGGER_SET_IN_CLR_1 is shown in Table 28-85.

Return to the Summary Table.

Table 28-85. TRIGGER_SET_IN_CLR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	trigger_set_in_clr_1	R/W	0h	Clear trigger_set_status : This register-bit when set clears the trigger status register TRIGGER_SET_STATUS_1 described above It s a Self clearing bit

28.13.2.62 DC_EST_RESET_SW Register (Offset = F4h) [Reset = X]

DC_EST_RESET_SW is shown in Table 28-86.

Return to the Summary Table.

Table 28-86. DC_EST_RESET_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	dc_est_reset_sw	R/W	0h	Reset for all 12 DC estimation accumulators It s a Self clearing bit

28.13.2.63 DC_EST_CTRL Register (Offset = F8h) [Reset = X]

DC_EST_CTRL is shown in Table 28-87.

Return to the Summary Table.

Table 28-87. DC_EST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R/W	X	
19-16	dc_est_shift	R/W	0h	Programmable shift applied to all 12 accumulator outputs. Cannot be bypassed. Output shifted by $2^{8\ +\ 6+\mathrm{DCEST\_SHIFT}}$. For DCEST_SHIFT = 15 also gives 2^{28} and not 29 (saturate at 28)
15-9	RESERVED	R/W	X	
8-0	dc_est_scale	R/W	100h	9-bit scale applied to all 12 accumulators. Multiplies the accumulator output by DCEST_SCALE/256.This is followed by right shift and truncation. Default value is 256 giving a scale of 1.0. Setting it to 128, gives a scale of 0.5

28.13.2.64 DC_EST_I_0_VAL Register (Offset = FCh) [Reset = X]

DC_EST_I_0_VAL is shown in Table 28-88.

Return to the Summary Table.

Table 28-88. DC_EST_I_0_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_0_val	R	0h	This read only register provide the DC estimates I for bcnt= 0

28.13.2.65 DC_EST_I_1_VAL Register (Offset = 100h) [Reset = X]

DC_EST_I_1_VAL is shown in Table 28-89.

Return to the Summary Table.

Table 28-89. DC_EST_I_1_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_1_val	R	0h	This read only register provide the DC estimates I for bcnt= 1

28.13.2.66 DC_EST_I_2_VAL Register (Offset = 104h) [Reset = X]

DC_EST_I_2_VAL is shown in Table 28-90.

Return to the Summary Table.

Table 28-90. DC_EST_I_2_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_2_val	R	0h	This read only register provide the DC estimates I for bcnt= 2

28.13.2.67 DC_EST_I_3_VAL Register (Offset = 108h) [Reset = X]

DC_EST_I_3_VAL is shown in Table 28-91.

Return to the Summary Table.

Table 28-91. DC_EST_I_3_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_3_val	R	0h	This read only register provide the DC estimates I for bcnt= 3

28.13.2.68 DC_EST_I_4_VAL Register (Offset = 10Ch) [Reset = X]

DC_EST_I_4_VAL is shown in Table 28-92.

Return to the Summary Table.

Table 28-92. DC_EST_I_4_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_4_val	R	0h	This read only register provide the DC estimates I for bcnt= 4

28.13.2.69 DC_EST_I_5_VAL Register (Offset = 110h) [Reset = X]

DC_EST_I_5_VAL is shown in Table 28-93.

Return to the Summary Table.

Table 28-93. DC_EST_I_5_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_5_val	R	0h	This read only register provide the DC estimates I for bcnt= 5

28.13.2.70 DC_EST_I_6_VAL Register (Offset = 114h) [Reset = X]

DC_EST_I_6_VAL is shown in Table 28-94.

Return to the Summary Table.

Table 28-94. DC_EST_I_6_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_6_val	R	0h	This read only register provide the DC estimates I for bcnt= 6

28.13.2.71 DC_EST_I_7_VAL Register (Offset = 118h) [Reset = X]

DC_EST_I_7_VAL is shown in Table 28-95.

Return to the Summary Table.

Table 28-95. DC_EST_I_7_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_7_val	R	0h	This read only register provide the DC estimates I for bcnt= 7

28.13.2.72 DC_EST_I_8_VAL Register (Offset = 11Ch) [Reset = X]

DC_EST_I_8_VAL is shown in Table 28-96.

Return to the Summary Table.

Table 28-96. DC_EST_I_8_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_8_val	R	0h	This read only register provide the DC estimates I for bcnt= 8

28.13.2.73 DC_EST_I_9_VAL Register (Offset = 120h) [Reset = X]

DC_EST_I_9_VAL is shown in Table 28-97.

Return to the Summary Table.

Table 28-97. DC_EST_I_9_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_9_val	R	0h	This read only register provide the DC estimates I for bcnt= 9

28.13.2.74 DC_EST_I_10_VAL Register (Offset = 124h) [Reset = X]

DC_EST_I_10_VAL is shown in Table 28-98.

Return to the Summary Table.

Table 28-98. DC_EST_I_10_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_10_val	R	0h	This read only register provide the DC estimates I for bcnt= 10

28.13.2.75 DC_EST_I_11_VAL Register (Offset = 128h) [Reset = X]

DC_EST_I_11_VAL is shown in Table 28-99.

Return to the Summary Table.

Table 28-99. DC_EST_I_11_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_i_11_val	R	0h	This read only register provide the DC estimates I for bcnt= 11

28.13.2.76 DC_EST_Q_0_VAL Register (Offset = 12Ch) [Reset = X]

DC_EST_Q_0_VAL is shown in Table 28-100.

Return to the Summary Table.

Table 28-100. DC_EST_Q_0_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_q_0_val	R	0h	This read only register provide the DC estimates Q for bcnt= 0

28.13.2.77 DC_EST_Q_1_VAL Register (Offset = 130h) [Reset = X]

DC_EST_Q_1_VAL is shown in Table 28-101.

Return to the Summary Table.

Table 28-101. DC_EST_Q_1_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_q_1_val	R	0h	This read only register provide the DC estimates Q for bcnt= 1

28.13.2.78 DC_EST_Q_2_VAL Register (Offset = 134h) [Reset = X]

DC_EST_Q_2_VAL is shown in Table 28-102.

Return to the Summary Table.

Table 28-102. DC_EST_Q_2_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	dc_est_q_2_val	R	0h	This read only register provide the DC estimates Q for bcnt= 2

28.13.2.79 DC_EST_Q_3_VAL Register (Offset = 138h) [Reset = X]

DC_EST_Q_3_VAL is shown in Table 28-103.

Return to the Summary Table.

DC_ACC_I_9_VAL_LSB is shown in Table 28-130.

Return to the Summary Table.

Table 28-130. DC_ACC_I_9_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_i_9_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator I channel value for bcnt=9

28.13.2.107 DC_ACC_I_9_VAL_MSB Register (Offset = 1A8h) [Reset = X]

DC_ACC_I_9_VAL_MSB is shown in Table 28-131.

Return to the Summary Table.

Table 28-131. DC_ACC_I_9_VAL_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	dc_acc_i_9_val_msb	R	0h	This read only register provide the MSB 4 bits value of DC accumulator I channel value for bcnt=9

28.13.2.108 DC_ACC_I_10_VAL_LSB Register (Offset = 1ACh) [Reset = 00000000h]

DC_ACC_I_10_VAL_LSB is shown in Table 28-132.

Return to the Summary Table.

Table 28-132. DC_ACC_I_10_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_i_10_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator I channel value for bcnt=10

28.13.2.109 DC_ACC_I_10_VAL_MSB Register (Offset = 1B0h) [Reset = X]

DC_ACC_I_10_VAL_MSB is shown in Table 28-133.

Return to the Summary Table.

Table 28-133. DC_ACC_I_10_VAL_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	dc_acc_i_10_val_msb	R	0h	This read only register provide the MSB 4 bits value of DC accumulator I channel value for bcnt=10

28.13.2.110 DC_ACC_I_11_VAL_LSB Register (Offset = 1B4h) [Reset = 00000000h]

DC_ACC_I_11_VAL_LSB is shown in Table 28-134.

Return to the Summary Table.

Table 28-134. DC_ACC_I_11_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_i_11_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator I channel value for bcnt=11

28.13.2.111 DC_ACC_I_11_VAL_MSB Register (Offset = 1B8h) [Reset = X]

DC_ACC_I_11_VAL_MSB is shown in Table 28-135.

Return to the Summary Table.

Table 28-135. DC_ACC_I_11_VAL_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	dc_acc_i_11_val_msb	R	0h	This read only register provide the MSB 4 bits value of DC accumulator I channel value for bcnt=11

28.13.2.112 DC_ACC_Q_0_VAL_LSB Register (Offset = 1BCh) [Reset = 00000000h]

DC_ACC_Q_0_VAL_LSB is shown in Table 28-136.

Return to the Summary Table.

Table 28-136. DC_ACC_Q_0_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_q_0_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator Q channel value for bcnt=0

28.13.2.113 DC_ACC_Q_0_VAL_MSB Register (Offset = 1C0h) [Reset = X]

DC_ACC_Q_0_VAL_MSB is shown in Table 28-137.

Return to the Summary Table.

Table 28-137. DC_ACC_Q_0_VAL_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	dc_acc_q_0_val_msb	R	0h	This read only register provide the MSB 4 bits value of DC accumulator Q channel value for bcnt=0

28.13.2.114 DC_ACC_Q_1_VAL_LSB Register (Offset = 1C4h) [Reset = 00000000h]

DC_ACC_Q_1_VAL_LSB is shown in Table 28-138.

Return to the Summary Table.

Table 28-138. DC_ACC_Q_1_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_q_1_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator Q channel value for bcnt=1

28.13.2.115 DC_ACC_Q_1_VAL_MSB Register (Offset = 1C8h) [Reset = X]

DC_ACC_Q_1_VAL_MSB is shown in Table 28-139.

Return to the Summary Table.

Table 28-139. DC_ACC_Q_1_VAL_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	dc_acc_q_1_val_msb	R	0h	This read only register provide the MSB 4 bits value of DC accumulator Q channel value for bcnt=1

28.13.2.116 DC_ACC_Q_2_VAL_LSB Register (Offset = 1CCh) [Reset = 00000000h]

DC_ACC_Q_2_VAL_LSB is shown in Table 28-140.

Return to the Summary Table.

Table 28-140. DC_ACC_Q_2_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_q_2_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator Q channel value for bcnt=2

28.13.2.117 DC_ACC_Q_2_VAL_MSB Register (Offset = 1D0h) [Reset = X]

DC_ACC_Q_2_VAL_MSB is shown in Table 28-141.

Return to the Summary Table.

Table 28-141. DC_ACC_Q_2_VAL_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	dc_acc_q_2_val_msb	R	0h	This read only register provide the MSB 4 bits value of DC accumulator Q channel value for bcnt=2

28.13.2.118 DC_ACC_Q_3_VAL_LSB Register (Offset = 1D4h) [Reset = 00000000h]

DC_ACC_Q_3_VAL_LSB is shown in Table 28-142.

Return to the Summary Table.

Table 28-142. DC_ACC_Q_3_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_q_3_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator Q channel value for bcnt=3

28.13.2.119 DC_ACC_Q_3_VAL_MSB Register (Offset = 1D8h) [Reset = X]

DC_ACC_Q_3_VAL_MSB is shown in Table 28-143.

Return to the Summary Table.

Table 28-143. DC_ACC_Q_3_VAL_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	dc_acc_q_3_val_msb	R	0h	This read only register provide the MSB 4 bits value of DC accumulator Q channel value for bcnt=3

28.13.2.120 DC_ACC_Q_4_VAL_LSB Register (Offset = 1DCh) [Reset = 00000000h]

DC_ACC_Q_4_VAL_LSB is shown in Table 28-144.

Return to the Summary Table.

Table 28-144. DC_ACC_Q_4_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_q_4_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator Q channel value for bcnt=4

28.13.2.121 DC_ACC_Q_4_VAL_MSB Register (Offset = 1E0h) [Reset = X]

DC_ACC_Q_4_VAL_MSB is shown in Table 28-145.

Return to the Summary Table.

Table 28-145. DC_ACC_Q_4_VAL_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	dc_acc_q_4_val_msb	R	0h	This read only register provide the MSB 4 bits value of DC accumulator Q channel value for bcnt=4

28.13.2.122 DC_ACC_Q_5_VAL_LSB Register (Offset = 1E4h) [Reset = 00000000h]

DC_ACC_Q_5_VAL_LSB is shown in Table 28-146.

Return to the Summary Table.

Table 28-146. DC_ACC_Q_5_VAL_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dc_acc_q_5_val_lsb	R	0h	This read only register provide the LSB 32 bits value of DC accumulator Q channel value for bcnt=5

28.13.2.123 DC_ACC_Q_5_VAL_MSB Register (Offset = 1E8h) [Reset = X]

DC_ACC_Q_5_VAL_MSB is shown in Table 28-147.

Return to the Summary Table.

31-24	RESERVED	R/W	X	
23-0	dc_q6_sw	R/W	0h	SW programmed DC Q value(for bcnt =6) used in DC subtraction

28.13.2.157 DC_Q7_SW Register (Offset = 270h) [Reset = X]

DC_Q7_SW is shown in Table 28-181.

Return to the Summary Table.

Table 28-181. DC_Q7_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	dc_q7_sw	R/W	0h	SW programmed DC Q value(for bcnt =7) used in DC subtraction

28.13.2.158 DC_Q8_SW Register (Offset = 274h) [Reset = X]

DC_Q8_SW is shown in Table 28-182.

Return to the Summary Table.

Table 28-182. DC_Q8_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	dc_q8_sw	R/W	0h	SW programmed DC Q value(for bcnt =8) used in DC subtraction

28.13.2.159 DC_Q9_SW Register (Offset = 278h) [Reset = X]

DC_Q9_SW is shown in Table 28-183.

Return to the Summary Table.

Table 28-183. DC_Q9_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	dc_q9_sw	R/W	0h	SW programmed DC Q value(for bcnt =9) used in DC subtraction

28.13.2.160 DC_Q10_SW Register (Offset = 27Ch) [Reset = X]

DC_Q10_SW is shown in Table 28-184.

Return to the Summary Table.

Table 28-184. DC_Q10_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	dc_q10_sw	R/W	0h	SW programmed DC Q value(for bcnt =10) used in DC subtraction

28.13.2.161 DC_Q11_SW Register (Offset = 280h) [Reset = X]

DC_Q11_SW is shown in Table 28-185.

Return to the Summary Table.

Table 28-185. DC_Q11_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	dc_q11_sw	R/W	0h	SW programmed DC Q value(for bcnt =11) used in DC subtraction

28.13.2.162 DC_SUB_CLIP Register (Offset = 284h) [Reset = X]

DC_SUB_CLIP is shown in Table 28-186.

Return to the Summary Table.

Table 28-186. DC_SUB_CLIP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	DC_SUB_CLIP	R	0h	Indicates the DC subtraction clip status

28.13.2.163 DC_RESERVED_2 Register (Offset = 288h) [Reset = 00000000h]

DC_RESERVED_2 is shown in Table 28-187.

Return to the Summary Table.

Table 28-187. DC_RESERVED_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.164 DC_RESERVED_3 Register (Offset = 28Ch) [Reset = 00000000h]

DC_RESERVED_3 is shown in Table 28-188.

Return to the Summary Table.

Table 28-188. DC_RESERVED_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.165 DC_RESERVED_4 Register (Offset = 290h) [Reset = 00000000h]

DC_RESERVED_4 is shown in Table 28-189.

Return to the Summary Table.

Table 28-189. DC_RESERVED_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.166 DC_RESERVED_5 Register (Offset = 294h) [Reset = 00000000h]

DC_RESERVED_5 is shown in Table 28-190.

Return to the Summary Table.

Table 28-190. DC_RESERVED_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.167 INTF_STATS_RESET_SW Register (Offset = 298h) [Reset = X]

INTF_STATS_RESET_SW is shown in Table 28-191.

Return to the Summary Table.

Table 28-191. INTF_STATS_RESET_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	intf_stats_reset_sw	R/W	0h	SW reset for Interference stats module. It s a self clearing bit.

28.13.2.168 INTF_STATS_CTRL Register (Offset = 29Ch) [Reset = X]

INTF_STATS_CTRL is shown in Table 28-192.

Return to the Summary Table.

Table 28-192. INTF_STATS_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	intf_stats_magdiff_scale	R/W	8h	Unsigned scaler (5.3) applied to INTERFSUM_MAGDIFFn from interference statistics block. Default 8= scale of 1.0
23-16	intf_stats_mag_scale	R/W	8h	Unsigned scaler (5.3) applied to INTERFSUM_MAGn from interference statistics block. Default 8= scale of 1.0
15-7	RESERVED	R/W	X	
6-4	intf_stats_magdiff_shift	R/W	0h	Right shift applied after scaling - $2^{6+INTERFSUM\_MAGDIFF\_SHIFT}$. Can t be more than 2^{12}.
3	RESERVED	R/W	X	
2-0	intf_stats_mag_shift	R/W	0h	Right shift applied after scaling - $2^{6+INTERSUM\_MAGS\_SHIFT}$. Can t be more than 2^{12}.

28.13.2.169 INTF_LOC_THRESH_MAG0_VAL Register (Offset = 2A0h) [Reset = X]

INTF_LOC_THRESH_MAG0_VAL is shown in Table 28-193.

Return to the Summary Table.

Table 28-193. INTF_LOC_THRESH_MAG0_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag0_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =0

28.13.2.170 INTF_LOC_THRESH_MAG1_VAL Register (Offset = 2A4h) [Reset = X]

INTF_LOC_THRESH_MAG1_VAL is shown in Table 28-194.

Return to the Summary Table.

Table 28-194. INTF_LOC_THRESH_MAG1_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag1_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =1

28.13.2.171 INTF_LOC_THRESH_MAG2_VAL Register (Offset = 2A8h) [Reset = X]

INTF_LOC_THRESH_MAG2_VAL is shown in Table 28-195.

Return to the Summary Table.

Table 28-195. INTF_LOC_THRESH_MAG2_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag2_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =2

28.13.2.172 INTF_LOC_THRESH_MAG3_VAL Register (Offset = 2ACh) [Reset = X]

INTF_LOC_THRESH_MAG3_VAL is shown in Table 28-196.

Return to the Summary Table.

Table 28-196. INTF_LOC_THRESH_MAG3_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag3_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =3

28.13.2.173 INTF_LOC_THRESH_MAG4_VAL Register (Offset = 2B0h) [Reset = X]

INTF_LOC_THRESH_MAG4_VAL is shown in Table 28-197.

Return to the Summary Table.

Table 28-197. INTF_LOC_THRESH_MAG4_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag4_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =4

28.13.2.174 INTF_LOC_THRESH_MAG5_VAL Register (Offset = 2B4h) [Reset = X]

INTF_LOC_THRESH_MAG5_VAL is shown in Table 28-198.

Return to the Summary Table.

Table 28-198. INTF_LOC_THRESH_MAG5_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag5_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =5

28.13.2.175 INTF_LOC_THRESH_MAG6_VAL Register (Offset = 2B8h) [Reset = X]

INTF_LOC_THRESH_MAG6_VAL is shown in Table 28-199.

Return to the Summary Table.

Table 28-199. INTF_LOC_THRESH_MAG6_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag6_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =6

28.13.2.176 INTF_LOC_THRESH_MAG7_VAL Register (Offset = 2BCh) [Reset = X]

INTF_LOC_THRESH_MAG7_VAL is shown in Table 28-200.

Return to the Summary Table.

Table 28-200. INTF_LOC_THRESH_MAG7_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag7_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =7

28.13.2.177 INTF_LOC_THRESH_MAG8_VAL Register (Offset = 2C0h) [Reset = X]

INTF_LOC_THRESH_MAG8_VAL is shown in Table 28-201.

Return to the Summary Table.

Table 28-201. INTF_LOC_THRESH_MAG8_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag8_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =8

28.13.2.178 INTF_LOC_THRESH_MAG9_VAL Register (Offset = 2C4h) [Reset = X]

INTF_LOC_THRESH_MAG9_VAL is shown in Table 28-202.

Return to the Summary Table.

Table 28-202. INTF_LOC_THRESH_MAG9_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag9_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =9

28.13.2.179 INTF_LOC_THRESH_MAG10_VAL Register (Offset = 2C8h) [Reset = X]

INTF_LOC_THRESH_MAG10_VAL is shown in Table 28-203.

Return to the Summary Table.

Table 28-203. INTF_LOC_THRESH_MAG10_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	intf_loc_thresh_mag10_val	R	0h	Interference magnitude threshold value from Interference stats module (read only) for bcnt =10

28.13.2.180 INTF_LOC_THRESH_MAG11_VAL Register (Offset = 2CCh) [Reset = X]

INTF_LOC_THRESH_MAG11_VAL is shown in Table 28-204.

Return to the Summary Table.

28.13.2.205 INTF_STATS_MAG_ACC_5_LSB Register (Offset = 330h) [Reset = 00000000h]

INTF_STATS_MAG_ACC_5_LSB is shown in Table 28-229.

Return to the Summary Table.

Table 28-229. INTF_STATS_MAG_ACC_5_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	intf_stats_mag_acc_5_lsb	R	0h	This read only register contains the accumulator value of the interference magnitude (LSB 32 bits) for bcnt = 5

28.13.2.206 INTF_STATS_MAG_ACC_5_MSB Register (Offset = 334h) [Reset = X]

INTF_STATS_MAG_ACC_5_MSB is shown in Table 28-230.

Return to the Summary Table.

Table 28-230. INTF_STATS_MAG_ACC_5_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	intf_stats_mag_acc_5_msb	R	0h	This read only register contains the accumulator value of the interference magnitude (MSB 4 bits)for bcnt = 5

28.13.2.207 INTF_STATS_MAG_ACC_6_LSB Register (Offset = 338h) [Reset = 00000000h]

INTF_STATS_MAG_ACC_6_LSB is shown in Table 28-231.

Return to the Summary Table.

Table 28-231. INTF_STATS_MAG_ACC_6_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	intf_stats_mag_acc_6_lsb	R	0h	This read only register contains the accumulator value of the interference magnitude (LSB 32 bits) for bcnt = 6

28.13.2.208 INTF_STATS_MAG_ACC_6_MSB Register (Offset = 33Ch) [Reset = X]

INTF_STATS_MAG_ACC_6_MSB is shown in Table 28-232.

Return to the Summary Table.

Table 28-232. INTF_STATS_MAG_ACC_6_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	intf_stats_mag_acc_6_msb	R	0h	This read only register contains the accumulator value of the interference magnitude (MSB 4 bits)for bcnt = 6

28.13.2.209 INTF_STATS_MAG_ACC_7_LSB Register (Offset = 340h) [Reset = 00000000h]

INTF_STATS_MAG_ACC_7_LSB is shown in Table 28-233.

Return to the Summary Table.

Table 28-233. INTF_STATS_MAG_ACC_7_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	intf_stats_mag_acc_7_lsb	R	0h	This read only register contains the accumulator value of the interference magnitude (LSB 32 bits) for bcnt = 7

28.13.2.210 INTF_STATS_MAG_ACC_7_MSB Register (Offset = 344h) [Reset = X]

INTF_STATS_MAG_ACC_7_MSB is shown in Table 28-234.

Return to the Summary Table.

Table 28-234. INTF_STATS_MAG_ACC_7_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	intf_stats_mag_acc_7_msb	R	0h	This read only register contains the accumulator value of the interference magnitude (MSB4 bits)for bcnt = 7

28.13.2.211 INTF_STATS_MAG_ACC_8_LSB Register (Offset = 348h) [Reset = 00000000h]

INTF_STATS_MAG_ACC_8_LSB is shown in Table 28-235.

Return to the Summary Table.

Table 28-235. INTF_STATS_MAG_ACC_8_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	intf_stats_mag_acc_8_lsb	R	0h	This read only register contains the accumulator value of the interference magnitude (LSB 32 bits) for bcnt = 8

28.13.2.212 INTF_STATS_MAG_ACC_8_MSB Register (Offset = 34Ch) [Reset = X]

INTF_STATS_MAG_ACC_8_MSB is shown in Table 28-236.

Return to the Summary Table.

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	icmult_scale11	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.291 QCMULT_SCALE0 Register (Offset = 488h) [Reset = X]

QCMULT_SCALE0 is shown in Table 28-315.

Return to the Summary Table.

Table 28-315. QCMULT_SCALE0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale0	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.292 QCMULT_SCALE1 Register (Offset = 48Ch) [Reset = X]

QCMULT_SCALE1 is shown in Table 28-316.

Return to the Summary Table.

Table 28-316. QCMULT_SCALE1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale1	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.293 QCMULT_SCALE2 Register (Offset = 490h) [Reset = X]

QCMULT_SCALE2 is shown in Table 28-317.

Return to the Summary Table.

Table 28-317. QCMULT_SCALE2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale2	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.294 QCMULT_SCALE3 Register (Offset = 494h) [Reset = X]

QCMULT_SCALE3 is shown in Table 28-318.

Return to the Summary Table.

Table 28-318. QCMULT_SCALE3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale3	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.295 QCMULT_SCALE4 Register (Offset = 498h) [Reset = X]

QCMULT_SCALE4 is shown in Table 28-319.

Return to the Summary Table.

Table 28-319. QCMULT_SCALE4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale4	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.296 QCMULT_SCALE5 Register (Offset = 49Ch) [Reset = X]

QCMULT_SCALE5 is shown in Table 28-320.

Return to the Summary Table.

Table 28-320. QCMULT_SCALE5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale5	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.297 QCMULT_SCALE6 Register (Offset = 4A0h) [Reset = X]

QCMULT_SCALE6 is shown in Table 28-321.

Return to the Summary Table.

Table 28-321. QCMULT_SCALE6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale6	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.298 QCMULT_SCALE7 Register (Offset = 4A4h) [Reset = X]

QCMULT_SCALE7 is shown in Table 28-322.

Return to the Summary Table.

Table 28-322. QCMULT_SCALE7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale7	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.299 QCMULT_SCALE8 Register (Offset = 4A8h) [Reset = X]

QCMULT_SCALE8 is shown in Table 28-323.

Return to the Summary Table.

Table 28-323. QCMULT_SCALE8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale8	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.300 QCMULT_SCALE9 Register (Offset = 4ACh) [Reset = X]

QCMULT_SCALE9 is shown in Table 28-324.

Return to the Summary Table.

Table 28-324. QCMULT_SCALE9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale9	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.301 QCMULT_SCALE10 Register (Offset = 4B0h) [Reset = X]

QCMULT_SCALE10 is shown in Table 28-325.

Return to the Summary Table.

Table 28-325. QCMULT_SCALE10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale10	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.302 QCMULT_SCALE11 Register (Offset = 4B4h) [Reset = X]

QCMULT_SCALE11 is shown in Table 28-326.

Return to the Summary Table.

Table 28-326. QCMULT_SCALE11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-0	qcmult_scale11	R/W	0h	Complex scalars used in CMULT_MODE = 0101, 0110 & 0111 In CMULT_MODE : 0101 , If set CMULT_SCALE_EN is 1, the input samples are multiplied by a different complex scalar ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per-iteration based on REG_BCNT. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all sample across all iterations. In CMULT_MODE : 0110 or 0111, if CMULT_SCALE_EN is 1, then input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 per iteration. Complex scalar to be multiplier is ACNT modulo 12.

28.13.2.303 TWID_INCR_DELTA_FRAC Register (Offset = 4B8h) [Reset = X]

TWID_INCR_DELTA_FRAC is shown in Table 28-327.

Return to the Summary Table.

Table 28-327. TWID_INCR_DELTA_FRAC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	twid_incr_delta_frac	R/W	0h	Used in complex multiplier mode 10 Delta Fractional frequency increment per param-set looping Instantaneous frequency is (TWIDINCR << 10) +TWID_INCR_DELTA_ FRAC*c, c is current execution count of the parameter set.

28.13.2.304 RECWIN_RESET_SW Register (Offset = 4BCh) [Reset = X]

RECWIN_RESET_SW is shown in Table 28-328.

Return to the Summary Table.

Table 28-328. RECWIN_RESET_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	recwin_reset_sw	R/W	0h	This resets the param set counter / execution counter used in Complex multiplier mode 8 . It s a self clearing bit.

28.13.2.305 TWID_INCR_DELTA_FRAC_RESET_SW Register (Offset = 4C0h) [Reset = X]

TWID_INCR_DELTA_FRAC_RESET_SW is shown in Table 28-329.

Return to the Summary Table.

Table 28-329. TWID_INCR_DELTA_FRAC_RESET_SW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	twid_incr_delta_frac_reset_sw	R/W	0h	This resets the param set counter used in Complex multiplier mode 10 . It s a Self clearing bit

28.13.2.306 TWID_INCR_DELTA_FRAC_CLIP_STATUS Register (Offset = 4C4h) [Reset = X]

TWID_INCR_DELTA_FRAC_CLIP_STATUS is shown in Table 28-330.

Return to the Summary Table.

Table 28-330. TWID_INCR_DELTA_FRAC_CLIP_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	twid_incr_delta_frac_clip_status	R	0h	Indicates the clip status for TWID_INCR_DELTA_FRAC accumulator

28.13.2.307 RECWIN_INIT_KVAL Register (Offset = 4C8h) [Reset = X]

RECWIN_INIT_KVAL is shown in Table 28-331.

Return to the Summary Table.

Table 28-331. RECWIN_INIT_KVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	X	
11-0	recwin_init_kval	R/W	0h	Indicates the initialization value of execution counter in recursive window mode . Execution counter value is initialized when recwin_reset_sw is 1'b1

28.13.2.308 CMULT_RESERVED_2 Register (Offset = 4CCh) [Reset = 00000000h]

CMULT_RESERVED_2 is shown in Table 28-332.

Return to the Summary Table.

Table 28-332. CMULT_RESERVED_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.309 CHAN_COMB_SIZE Register (Offset = 4D0h) [Reset = X]

CHAN_COMB_SIZE is shown in Table 28-333.

Return to the Summary Table.

Table 28-333. CHAN_COMB_SIZE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	chan_comb_size	R/W	0h	Number of samples after combination

28.13.2.310 CHAN_COMB_VEC_0 Register (Offset = 4D4h) [Reset = 00000000h]

CHAN_COMB_VEC_0 is shown in Table 28-334.

Return to the Summary Table.

Table 28-334. CHAN_COMB_VEC_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	chan_comb_vec_0	R/W	0h	Channel combination MASK for 0 to 31 samples Vector indicating the samples indices that need to be combined. A 01 or 10 transition demarcates the groups. if CHAN_COMB_VEC = 0xF030000000000000 sums the first 4 samples and outputs one sample, sums 5th-9th samples and passes one sample, combines 10th-12th samples, outputs one sample and then streams the rest of the input

28.13.2.311 CHAN_COMB_VEC_1 Register (Offset = 4D8h) [Reset = 00000000h]

CHAN_COMB_VEC_1 is shown in Table 28-335.

Return to the Summary Table.

Table 28-335. CHAN_COMB_VEC_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	chan_comb_vec_1	R/W	0h	Channel combination MASK for 32 to 63 samples Vector indicating the samples indices that need to be combined. A 01 or 10 transition demarcates the groups. if CHAN_COMB_VEC = 0xF030000000000000 sums the first 4 samples and outputs one sample, sums 5th-9th samples and passes one sample, combines 10th-12th samples, outputs one sample and then streams the rest of the input

28.13.2.312 CHAN_COMB_VEC_2 Register (Offset = 4DCh) [Reset = 00000000h]

CHAN_COMB_VEC_2 is shown in Table 28-336.

Return to the Summary Table.

Table 28-336. CHAN_COMB_VEC_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	chan_comb_vec_2	R/W	0h	Channel combination MASK for 64 to 95 samples Vector indicating the samples indices that need to be combined. A 01 or 10 transition demarcates the groups. if CHAN_COMB_VEC = 0xF030000000000000 sums the first 4 samples and outputs one sample, sums 5th-9th samples and passes one sample, combines 10th-12th samples, outputs one sample and then streams the rest of the input

28.13.2.313 CHAN_COMB_VEC_3 Register (Offset = 4E0h) [Reset = 00000000h]

CHAN_COMB_VEC_3 is shown in Table 28-337.

Return to the Summary Table.

Table 28-337. CHAN_COMB_VEC_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	chan_comb_vec_3	R/W	0h	Channel combination MASK for 96 to 127 samples Vector indicating the samples indices that need to be combined. A 01 or 10 transition demarcates the groups. if CHAN_COMB_VEC = 0xF030000000000000 sums the first 4 samples and outputs one sample, sums 5th-9th samples and passes one sample, combines 10th-12th samples, outputs one sample and then streams the rest of the input

28.13.2.314 CHAN_COMB_VEC_4 Register (Offset = 4E4h) [Reset = 00000000h]

CHAN_COMB_VEC_4 is shown in Table 28-338.

Return to the Summary Table.

Table 28-338. CHAN_COMB_VEC_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	chan_comb_vec_4	R/W	0h	Channel combination MASK for 128 to 159 samples Vector indicating the samples indices that need to be combined. A 01 or 10 transition demarcates the groups. if CHAN_COMB_VEC = 0xF030000000000000 sums the first 4 samples and outputs one sample, sums 5th-9th samples and passes one sample, combines 10th-12th samples, outputs one sample and then streams the rest of the input

28.13.2.315 CHAN_COMB_VEC_5 Register (Offset = 4E8h) [Reset = 00000000h]

CHAN_COMB_VEC_5 is shown in Table 28-339.

Return to the Summary Table.

Table 28-339. CHAN_COMB_VEC_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	chan_comb_vec_5	R/W	0h	Channel combination MASK for 160 to 191 samples Vector indicating the samples indices that need to be combined. A 01 or 10 transition demarcates the groups. if CHAN_COMB_VEC = 0xF030000000000000 sums the first 4 samples and outputs one sample, sums 5th-9th samples and passes one sample, combines 10th-12th samples, outputs one sample and then streams the rest of the input

28.13.2.316 CHAN_COMB_VEC_6 Register (Offset = 4ECh) [Reset = 00000000h]

CHAN_COMB_VEC_6 is shown in Table 28-340.

Return to the Summary Table.

Table 28-340. CHAN_COMB_VEC_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	chan_comb_vec_6	R/W	0h	Channel combination MASK for 192 to 223 samples Vector indicating the samples indices that need to be combined. A 01 or 10 transition demarcates the groups. if CHAN_COMB_VEC = 0xF030000000000000 sums the first 4 samples and outputs one sample, sums 5th-9th samples and passes one sample, combines 10th-12th samples, outputs one sample and then streams the rest of the input

28.13.2.317 CHAN_COMB_VEC_7 Register (Offset = 4F0h) [Reset = 00000000h]

CHAN_COMB_VEC_7 is shown in Table 28-341.

Return to the Summary Table.

Table 28-341. CHAN_COMB_VEC_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	chan_comb_vec_7	R/W	0h	Channel combination MASK for 224 to 255 samples Vector indicating the samples indices that need to be combined. A 01 or 10 transition demarcates the groups. if CHAN_COMB_VEC = 0xF030000000000000 sums the first 4 samples and outputs one sample, sums 5th-9th samples and passes one sample, combines 10th-12th samples, outputs one sample and then streams the rest of the input

28.13.2.318 CHANNEL_COMB_CLIP_STATUS Register (Offset = 4F4h) [Reset = X]

CHANNEL_COMB_CLIP_STATUS is shown in Table 28-342.

Return to the Summary Table.

Table 28-342. CHANNEL_COMB_CLIP_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	channel_comb_clip_status	R	0h	Indicates the clip status of the channel combination

28.13.2.319 ZERO_INSERT_NUM Register (Offset = 4F8h) [Reset = X]

ZERO_INSERT_NUM is shown in Table 28-343.

Return to the Summary Table.

Table 28-343. ZERO_INSERT_NUM Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	zero_insert_num	R/W	0h	Number of zeros to be inserted in an iteration

28.13.2.320 ZERO_INSERT_MASK_0 Register (Offset = 4FCh) [Reset = 00000000h]

ZERO_INSERT_MASK_0 is shown in Table 28-344.

Return to the Summary Table.

Table 28-344. ZERO_INSERT_MASK_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	zero_insert_mask_0	R/W	0h	Zero insert mask for samples 0 to 31 A bit-field of 0 inserts a zero at location based on bit-field index. 1 means the input is passed through. Up-stream and down-stream processing is stalled during the zero insertion

28.13.2.321 ZERO_INSERT_MASK_1 Register (Offset = 500h) [Reset = 00000000h]

ZERO_INSERT_MASK_1 is shown in Table 28-345.

Return to the Summary Table.

Table 28-345. ZERO_INSERT_MASK_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	zero_insert_mask_1	R/W	0h	Zero insert mask for samples 32 to 63 A bit-field of 0 inserts a zero at location based on bit-field index. 1 means the input is passed through. Up-stream and down-stream processing is stalled during the zero insertion

28.13.2.322 ZERO_INSERT_MASK_2 Register (Offset = 504h) [Reset = 00000000h]

ZERO_INSERT_MASK_2 is shown in Table 28-346.

Return to the Summary Table.

Table 28-346. ZERO_INSERT_MASK_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	zero_insert_mask_2	R/W	0h	Zero insert mask for samples 64 to 95 A bit-field of 0 inserts a zero at location based on bit-field index. 1 means the input is passed through. Up-stream and down-stream processing is stalled during the zero insertion

28.13.2.323 ZERO_INSERT_MASK_3 Register (Offset = 508h) [Reset = 00000000h]

ZERO_INSERT_MASK_3 is shown in Table 28-347.

Return to the Summary Table.

Table 28-347. ZERO_INSERT_MASK_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	zero_insert_mask_3	R/W	0h	Zero insert mask for samples 96 to 127 A bit-field of 0 inserts a zero at location based on bit-field index. 1 means the input is passed through. Up-stream and down-stream processing is stalled during the zero insertion

28.13.2.324 ZERO_INSERT_MASK_4 Register (Offset = 50Ch) [Reset = 00000000h]

ZERO_INSERT_MASK_4 is shown in Table 28-348.

Return to the Summary Table.

Table 28-348. ZERO_INSERT_MASK_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	zero_insert_mask_4	R/W	0h	Zero insert mask for samples 128 to 159 A bit-field of 0 inserts a zero at location based on bit-field index. 1 means the input is passed through. Up-stream and down-stream processing is stalled during the zero insertion

28.13.2.325 ZERO_INSERT_MASK_5 Register (Offset = 510h) [Reset = 00000000h]

ZERO_INSERT_MASK_5 is shown in Table 28-349.

Return to the Summary Table.

Table 28-349. ZERO_INSERT_MASK_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	zero_insert_mask_5	R/W	0h	Zero insert mask for samples 160 to 191 A bit-field of 0 inserts a zero at location based on bit-field index. 1 means the input is passed through. Up-stream and down-stream processing is stalled during the zero insertion

28.13.2.326 ZERO_INSERT_MASK_6 Register (Offset = 514h) [Reset = 00000000h]

ZERO_INSERT_MASK_6 is shown in Table 28-350.

Return to the Summary Table.

Table 28-350. ZERO_INSERT_MASK_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	zero_insert_mask_6	R/W	0h	Zero insert mask for samples 192 to 223 A bit field of 0 inserts a zero at location based on bit-field index. 1 means the input is passed through. Up-stream and down-stream processing is stalled during the zero insertion

28.13.2.327 ZERO_INSERT_MASK_7 Register (Offset = 518h) [Reset = 00000000h]

ZERO_INSERT_MASK_7 is shown in Table 28-351.

Return to the Summary Table.

Table 28-351. ZERO_INSERT_MASK_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	zero_insert_mask_7	R/W	0h	Zero insert mask for samples 224 to 255 A bit-field of 0 inserts a zero at location based on bit-field index. 1 means the input is passed through. Up-stream and down-stream processing is stalled during the zero insertion

28.13.2.328 ZERO_INSERT_RESERVED_1 Register (Offset = 51Ch) [Reset = 00000000h]

ZERO_INSERT_RESERVED_1 is shown in Table 28-352.

Return to the Summary Table.

Table 28-352. ZERO_INSERT_RESERVED_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.329 ZERO_INSERT_RESERVED_2 Register (Offset = 520h) [Reset = 00000000h]

ZERO_INSERT_RESERVED_2 is shown in Table 28-353.

Return to the Summary Table.

Table 28-353. ZERO_INSERT_RESERVED_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.330 ZERO_INSERT_RESERVED_3 Register (Offset = 524h) [Reset = 00000000h]

ZERO_INSERT_RESERVED_3 is shown in Table 28-354.

Return to the Summary Table.

Table 28-354. ZERO_INSERT_RESERVED_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.331 ZERO_INSERT_RESERVED_4 Register (Offset = 528h) [Reset = 00000000h]

ZERO_INSERT_RESERVED_4 is shown in Table 28-355.

Return to the Summary Table.

Table 28-355. ZERO_INSERT_RESERVED_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.332 LFSR_SEED Register (Offset = 52Ch) [Reset = X]

LFSR_SEED is shown in Table 28-356.

Return to the Summary Table.

Table 28-356. LFSR_SEED Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	X	
28-0	lfsr_seed	R/W	0h	Seed for LFSR (random pattern): For twiddle factor dithering, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit LFSRSEED register. The LFSRSEED register should be set to any non-zero value, say 0x1234567

28.13.2.333 LFSR_LOAD Register (Offset = 530h) [Reset = X]

LFSR_LOAD is shown in Table 28-357.

Return to the Summary Table.

Table 28-357. LFSR_LOAD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	lfsr_load	R/W	0h	Its self clearing bit . It should be set for loading the LFSR_SEED. It s a self clearing bit

28.13.2.334 DITHER_TWID_EN Register (Offset = 534h) [Reset = X]

DITHER_TWID_EN is shown in Table 28-358.

Return to the Summary Table.

Table 28-358. DITHER_TWID_EN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	dither_twid_en	R/W	0h	Twiddle factor dithering enable: This register-bit is used to enable and disable dithering of twiddle factors in the FFT. The twiddle factors are 24-bits wide (24-bits for each I and Q), but they are quantized to 21-bits before twiddle factor multiplication. This quantization is implemented with dithering on the LSB, to avoid periodic quantization pattern affecting SFDR performance of the FFT. TI recommends keeping this register bit set to 1 (for example, dithering enabled), with appropriate LSFR seed loaded (see the following).

28.13.2.335 FFT_CLIP Register (Offset = 538h) [Reset = X]

FFT_CLIP is shown in Table 28-359.

Return to the Summary Table.

Table 28-359. FFT_CLIP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	RESERVED	R	X	
12-0	fft_clip	R	0h	FFT Clip Status (read-only): This is a read-only status register, which indicates any saturation/clipping events that have happened in the FFT butterfly stages. Note that each of the individual butterfly stages in the FFT can be programmed to either saturate the MSB or round the LSB. Whenever saturation of MSB is used in any stage, there is a possibility that that stage can saturate or clip samples. In that case, this saturation event is indicated in the corresponding bit in this status register, so that the Cortex-R4F processor can read it. If multiple FFTs are performed, this status register includes any saturation events happening in any of them. This status register can only be cleared by the R4F, by setting another single-bit register CLR_FFTCLIP, so that the saturation status indication gets cleared back to 0 and any subsequent saturation events can be freshly monitored. The MSB of this register indicates clip status corresponding to the radix 3 butterfly.

28.13.2.336 CLR_FFTCLIP Register (Offset = 53Ch) [Reset = X]

CLR_FFTCLIP is shown in Table 28-360.

Return to the Summary Table.

Table 28-360. CLR_FFTCLIP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	clr_fftclip	R/W	0h	Clear FFT Clip Status register: This register bit, when set, clears the FFTCLIP register. It s a self clearing bit

28.13.2.337 CLR_CLIP_MISC Register (Offset = 540h) [Reset = X]

CLR_CLIP_MISC is shown in Table 28-361.

Return to the Summary Table.

Table 28-361. CLR_CLIP_MISC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	clr_clip_status	R/W	0h	This clears the following clip register channel_comb_clip_status dc_acc_clip_status dc_est_clip_status intf_stats_mag_accumulator_clip_status intf_stats_magdiff_accumulator_clip_status intf_stats_thresh_mag_clip_status intf_stats_thresh_magdiff_clip_status twid_incr_delta_frac_clip_status ip_formatter_clip_status op_formatter_clip_status intf_stats_sum_mag_val_clip_status intf_stats_sum_magdiff_val_clip_status dc_sub_clip Its a self clearing bit

28.13.2.338 IP_OP_FORMATTER_CLIP_STATUS Register (Offset = 544h) [Reset = X]

IP_OP_FORMATTER_CLIP_STATUS is shown in Table 28-362.

Return to the Summary Table.

Table 28-362. IP_OP_FORMATTER_CLIP_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RESERVED	R	X	
16	op_formatter_clip_status	R	0h	Indicates the output formatter clip status
15-1	RESERVED	R	X	
0	ip_formatter_clip_status	R	0h	Indicates the input formatter clip status

28.13.2.339 FFT_RESERVED_1 Register (Offset = 548h) [Reset = 00000000h]

FFT_RESERVED_1 is shown in Table 28-363.

Return to the Summary Table.

Table 28-363. FFT_RESERVED_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.340 FFT_RESERVED_2 Register (Offset = 54Ch) [Reset = 00000000h]

FFT_RESERVED_2 is shown in Table 28-364.

Return to the Summary Table.

Table 28-364. FFT_RESERVED_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.341 FFT_RESERVED_3 Register (Offset = 550h) [Reset = 00000000h]

FFT_RESERVED_3 is shown in Table 28-365.

Return to the Summary Table.

Table 28-365. FFT_RESERVED_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Reserved for future addition

28.13.2.342 MAX1_VALUE Register (Offset = 554h) [Reset = X]

MAX1_VALUE is shown in Table 28-366.

Return to the Summary Table.

Table 28-366. MAX1_VALUE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	max1_value	R	0h	These registers contain the max value on a per-iteration basis. These registers are meaningful only when Magnitude or Log-Magnitude is enabled. Only the max values for up to four iterations are recorded in these registers. For larger number of iterations, max values are wriiten into destination memory by configuring FFT_OUTPUT_MODE

28.13.2.343 MAX2_VALUE Register (Offset = 558h) [Reset = X]

MAX2_VALUE is shown in Table 28-367.

Return to the Summary Table.

Table 28-367. MAX2_VALUE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	max2_value	R	0h	These registers contain the max value on a per-iteration basis. These registers are meaningful only when Magnitude or Log-Magnitude is enabled. Only the max values for up to four iterations are recorded in these registers. For larger number of iterations, max values are wriiten into destination memory by configuring FFT_OUTPUT_MODE

28.13.2.344 MAX3_VALUE Register (Offset = 55Ch) [Reset = X]

MAX3_VALUE is shown in Table 28-368.

Return to the Summary Table.

Table 28-368. MAX3_VALUE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	max3_value	R	0h	These registers contain the max value on a per-iteration basis. These registers are meaningful only when Magnitude or Log-Magnitude is enabled. Only the max values for up to four iterations are recorded in these registers. For larger number of iterations, max values are wriiten into destination memory by configuring FFT_OUTPUT_MODE

28.13.2.345 MAX4_VALUE Register (Offset = 560h) [Reset = X]

MAX4_VALUE is shown in Table 28-369.

Return to the Summary Table.

Table 28-369. MAX4_VALUE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-0	max4_value	R	0h	These registers contain the max value on a per-iteration basis. These registers are meaningful only when Magnitude or Log-Magnitude is enabled. Only the max values for up to four iterations are recorded in these registers. For larger number of iterations, max values are wriiten into destination memory by configuring FFT_OUTPUT_MODE

28.13.2.346 MAX1_INDEX Register (Offset = 564h) [Reset = X]

MAX1_INDEX is shown in Table 28-370.

Return to the Summary Table.

Table 28-370. MAX1_INDEX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	X	
11-0	max1_index	R	0h	These registers contain the max index on a per-iteration basis, corresponding to each max value in the MAXn_VALUE registers.

28.13.2.347 MAX2_INDEX Register (Offset = 568h) [Reset = X]

MAX2_INDEX is shown in Table 28-371.

Return to the Summary Table.

Table 28-371. MAX2_INDEX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	X	
11-0	max2_index	R	0h	These registers contain the max index on a per-iteration basis, corresponding to each max value in the MAXn_VALUE registers.

28.13.2.348 MAX3_INDEX Register (Offset = 56Ch) [Reset = X]

MAX3_INDEX is shown in Table 28-372.

Return to the Summary Table.

Table 28-372. MAX3_INDEX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	X	
11-0	max3_index	R	0h	These registers contain the max index on a per-iteration basis, corresponding to each max value in the MAXn_VALUE registers.

28.13.2.349 MAX4_INDEX Register (Offset = 570h) [Reset = X]

MAX4_INDEX is shown in Table 28-373.

Return to the Summary Table.

Table 28-373. MAX4_INDEX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	X	
11-0	max4_index	R	0h	These registers contain the max index on a per-iteration basis, corresponding to each max value in the MAXn_VALUE registers.

28.13.2.350 I_SUM1_LSB Register (Offset = 574h) [Reset = 00000000h]

I_SUM1_LSB is shown in Table 28-374.

Return to the Summary Table.

Table 28-374. I_SUM1_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	i_sum1_lsb	R	0h	I Sum value 1 LSB 32 bits These registers contain the sum of the I outputs and Q outputs on a per-iteration basis. Only the statistics for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE) to write to destination memory

28.13.2.351 I_SUM1_MSB Register (Offset = 578h) [Reset = X]

I_SUM1_MSB is shown in Table 28-375.

Return to the Summary Table.

Table 28-375. I_SUM1_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	i_sum1_msb	R	0h	I Sum value 1 MSB 4 bits These registers contain the sum of the I outputs and Q outputs on a per-iteration basis. Only the statistics for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE) to write to destination memory

28.13.2.352 I_SUM2_LSB Register (Offset = 57Ch) [Reset = 00000000h]

I_SUM2_LSB is shown in Table 28-376.

Return to the Summary Table.

Table 28-376. I_SUM2_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	i_sum2_lsb	R	0h	I Sum value 2 LSB 32 bits These registers contain the sum of the I outputs and Q outputs on a per-iteration basis. Only the statistics for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE) to write to destination memory

28.13.2.353 I_SUM2_MSB Register (Offset = 580h) [Reset = X]

I_SUM2_MSB is shown in Table 28-377.

Return to the Summary Table.

Table 28-377. I_SUM2_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3-0	i_sum2_msb	R	0h	I Sum value 2 MSB 4 bits These registers contain the sum of the I outputs and Q outputs on a per-iteration basis. Only the statistics for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE) to write to destination memory

28.13.2.354 I_SUM3_LSB Register (Offset = 584h) [Reset = 00000000h]

I_SUM3_LSB is shown in Table 28-378.

Return to the Summary Table.

Table 28-378. I_SUM3_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	i_sum3_lsb	R	0h	I Sum value 3 LSB 32 bits These registers contain the sum of the I outputs and Q outputs on a per-iteration basis. Only the statistics for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE) to write to destination memory

28.13.2.355 I_SUM3_MSB Register (Offset = 588h) [Reset = X]

I_SUM3_MSB is shown in Table 28-379.

Return to the Summary Table.

Table 28-379. I_SUM3_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X

31-4	RESERVED	R	X	
3-0	q_sum4_msb	R	0h	Q Sum value 4 MSB 4 bits These registers contain the sum of the I outputs and Q outputs on a per-iteration basis. Only the statistics for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE) to write to destination memory

28.13.2.366 FFTSUMDIV Register (Offset = 5B4h) [Reset = X]

FFTSUMDIV is shown in Table 28-390.

Return to the Summary Table.

Table 28-390. FFTSUMDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4-0	fftsumdiv	R/W	0h	Right-shifting for Sum statistic: This register specifies the number of bits to right-shift the sum statistic before it is written to destination memory. The internal sum statistic register is 36-bits wide (allowing 12 bits of MSB growth of the 24-bit data path), but this statistics value needs to be scaled down to 24 bits to match the data path width going to the Output Formatter. This register specifies how many LSBs to drop to convert the sum statistics to 24-bit value.

28.13.2.367 MAX2D_OFFSET_DIM1 Register (Offset = 5B8h) [Reset = X]

MAX2D_OFFSET_DIM1 is shown in Table 28-391.

Return to the Summary Table.

Table 28-391. MAX2D_OFFSET_DIM1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	max2d_offset_dim1	R/W	0h	Offset to be added to dimension 1 Maxima results. This offset will be applied to all the maxima results in the iteration dimension. Needs to be configured to 0 in case no offset is required.

28.13.2.368 MAX2D_OFFSET_DIM2 Register (Offset = 5BCh) [Reset = X]

MAX2D_OFFSET_DIM2 is shown in Table 28-392.

Return to the Summary Table.

Table 28-392. MAX2D_OFFSET_DIM2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	max2d_offset_dim2	R/W	0h	Offset to be added to dimension 2 Maxima results. This offset will be applied to all the maxima results in the sample dimension. Needs to be configured to 0 in case no offset is required.

28.13.2.369 CDF_CNT_THRESH Register (Offset = 5C0h) [Reset = X]

CDF_CNT_THRESH is shown in Table 28-393.

Return to the Summary Table.

Table 28-393. CDF_CNT_THRESH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	X	
11-0	cdf_cnt_thresh	R/W	0h	This register is applicable in CDF_CNT_THRESH mode of operation. CDF is computed over the histogram till the value of the CDF just exceeds the CDF_CNT_THRESH specified by the user. This register can take values from 0 to 1023.

28.13.2.370 STATS_RESERVED_1 Register (Offset = 5C4h) [Reset = 00000000h]

STATS_RESERVED_1 is shown in Table 28-394.

Return to the Summary Table.

Table 28-394. STATS_RESERVED_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.371 STATS_RESERVED_2 Register (Offset = 5C8h) [Reset = 00000000h]

STATS_RESERVED_2 is shown in Table 28-395.

Return to the Summary Table.

Table 28-395. STATS_RESERVED_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.372 STATS_RESERVED_3 Register (Offset = 5CCh) [Reset = 00000000h]

STATS_RESERVED_3 is shown in Table 28-396.

Return to the Summary Table.

Table 28-396. STATS_RESERVED_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.373 STATS_RESERVED_4 Register (Offset = 5D0h) [Reset = 00000000h]

STATS_RESERVED_4 is shown in Table 28-397.

Return to the Summary Table.

Table 28-397. STATS_RESERVED_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.374 STATS_RESERVED_5 Register (Offset = 5D4h) [Reset = 00000000h]

STATS_RESERVED_5 is shown in Table 28-398.

Return to the Summary Table.

Table 28-398. STATS_RESERVED_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.375 CFAR_PEAKCNT Register (Offset = 5D8h) [Reset = X]

CFAR_PEAKCNT is shown in Table 28-399.

Return to the Summary Table.

Table 28-399. CFAR_PEAKCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	X	
11-0	cfar_peakcnt	R	0h	CFAR detected peak count: This is a read-only register that contains the number of detected peaks that are logged in the destination memory, when CFAR Engine is configured in Detected Peaks List mode. In the Detected Peaks List mode, since only the detected peaks are logged in the destination memory, this read-only register provides the number of detected peaks that are logged to the main processor, so that the main processor can determine how many entries to read from the destination memory.

28.13.2.376 CFAR_DET_THR Register (Offset = 5DCh) [Reset = X]

CFAR_DET_THR is shown in Table 28-400.

Return to the Summary Table.

Table 28-400. CFAR_DET_THR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	cfar_det_thr	R/W	0h	To be added

28.13.2.377 CFAR_TEST_REG Register (Offset = 5E0h) [Reset = X]

CFAR_TEST_REG is shown in Table 28-401.

Return to the Summary Table.

Table 28-401. CFAR_TEST_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-0	cfar_test_reg	R/W	0h	To be added

28.13.2.378 CFAR_THRESH Register (Offset = 5E4h) [Reset = X]

CFAR_THRESH is shown in Table 28-402.

Return to the Summary Table.

Table 28-402. CFAR_THRESH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R/W	X	
17-0	cfar_thresh	R/W	0h	Threshold scale factor: This register is used to specify the threshold scale factor. This value is used to either multiply or add to the surrounding noise average to determine the threshold used for detection of the present cell under test. If logarithmic CFAR mode is disabled (in magnitude or magnitude-squared mode), then the register value is multiplied with the surrounding noise average to determine the threshold, else it is added to the surrounding noise average. In the former case, this 18-bit register is interpreted as a 14.4 value. In the latter case (logarithmic mode), the 18-bit register is interpreted as a 7.11 value.

28.13.2.379 CFAR_RESERVED_1 Register (Offset = 5E8h) [Reset = 00000000h]

CFAR_RESERVED_1 is shown in Table 28-403.

Return to the Summary Table.

Table 28-403. CFAR_RESERVED_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.380 CFAR_RESERVED_2 Register (Offset = 5ECh) [Reset = 00000000h]

CFAR_RESERVED_2 is shown in Table 28-404.

Return to the Summary Table.

Table 28-404. CFAR_RESERVED_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.381 CFAR_RESERVED_3 Register (Offset = 5F0h) [Reset = 00000000h]

CFAR_RESERVED_3 is shown in Table 28-405.

Return to the Summary Table.

Table 28-405. CFAR_RESERVED_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.382 CFAR_RESERVED_4 Register (Offset = 5F4h) [Reset = 00000000h]

CFAR_RESERVED_4 is shown in Table 28-406.

Return to the Summary Table.

Table 28-406. CFAR_RESERVED_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R/W	0h	Future use

28.13.2.383 CMP_EGE_K0123 Register (Offset = 5F8h) [Reset = X]

CMP_EGE_K0123 is shown in Table 28-407.

Return to the Summary Table.

Table 28-407. CMP_EGE_K0123 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	X	
28-24	cmp_ege_k3	R/W	0h	3th K-param value should be loaded here which would be used in the First-pass of EGE Compression
23-21	RESERVED	R/W	X	
20-16	cmp_ege_k2	R/W	0h	2th K-param value should be loaded here which would be used in the First-pass of EGE Compression
15-13	RESERVED	R/W	X	
12-8	cmp_ege_k1	R/W	0h	1th K-param value should be loaded here which would be used in the First-pass of EGE Compression
7-5	RESERVED	R/W	X	
4-0	cmp_ege_k0	R/W	0h	0th K-param value should be loaded here which would be used in the First-pass of EGE Compression

28.13.2.384 CMP_EGE_K4567 Register (Offset = 5FCh) [Reset = X]

CMP_EGE_K4567 is shown in Table 28-408.

Return to the Summary Table.

Table 28-408. CMP_EGE_K4567 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	X	
28-24	cmp_ege_k7	R/W	0h	7th K-param value should be loaded here which would be used in the First-pass of EGE Compression
23-21	RESERVED	R/W	X	
20-16	cmp_ege_k6	R/W	0h	6th K-param value should be loaded here which would be used in the First-pass of EGE Compression
15-13	RESERVED	R/W	X	
12-8	cmp_ege_k5	R/W	0h	5th K-param value should be loaded here which would be used in the First-pass of EGE Compression
7-5	RESERVED	R/W	X	
4-0	cmp_ege_k4	R/W	0h	4th K-param value should be loaded here which would be used in the First-pass of EGE Compression

28.13.2.385 MEM_INIT_START Register (Offset = 600h) [Reset = X]

MEM_INIT_START is shown in Table 28-409.

Return to the Summary Table.

Table 28-409. MEM_INIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R/W	X	
14	hist_odd_ram	R/W	0h	writing 1'b1 would start the memory initialization for the Histogram memory 2 It s a self clearing bit
13	hist_even_ram	R/W	0h	writing 1'b1 would start the memory initialization for the Histogram memory 1 It s a self clearing bit
12	per_iter_max_val_ram	R/W	0h	writing 1'b1 would start the memory initialization for the 2D MAX per iteration RAM It s a self clearing bit
11	per_sample_max_val_odd_ram	R/W	0h	writing 1'b1 would start the memory initialization for the 2D MAX per sample RAM 2 It s a self clearing bit
10	per_sample_max_val_even_ram	R/W	0h	writing 1'b1 would start the memory initialization for the 2D MAX per sample RAM 1 It s a self clearing bit
9	window_ram	R/W	0h	writing 1'b1 would start the memory initialization for the window memory It s a self clearing bit
8	param_ram	R/W	0h	writing 1'b1 would start the memory initialization for the Param memory It s a self clearing bit
7	dmem7	R/W	0h	writing 1'b1 would start the memory initialization for the DMEM7 It s a self clearing bit
6	dmem6	R/W	0h	writing 1'b1 would start the memory initialization for the DMEM6 It s a self clearing bit
5	dmem5	R/W	0h	writing 1'b1 would start the memory initialization for the DMEM5 It s a self clearing bit
4	dmem4	R/W	0h	writing 1'b1 would start the memory initialization for the DMEM4 It s a self clearing bit
3	dmem3	R/W	0h	writing 1'b1 would start the memory initialization for the DMEM3 It s a self clearing bit
2	dmem2	R/W	0h	writing 1'b1 would start the memory initialization for the DMEM2 It s a self clearing bit
1	dmem1	R/W	0h	writing 1'b1 would start the memory initialization for the DMEM1. It s a self clearing bit
0	dmem0	R/W	0h	writing 1'b1 would start the memory initialization for the DMEM0 It s a self clearing bit

28.13.2.386 MEM_INIT_DONE Register (Offset = 604h) [Reset = X]

MEM_INIT_DONE is shown in Table 28-410.

Return to the Summary Table.

Table 28-410. MEM_INIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R/W	X	
14	hist_odd_ram	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for hist_odd_ram
13	hist_even_ram	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for hist_even_ram
12	per_iteration_max_val_ram	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for per_iteration_max_val_ram
11	per_sample_max_val_odd_ram	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for per_sample_max_val_odd_ram
10	per_sample_max_val_even_ram	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for per_sample_max_val_even_ram
9	window_ram	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for window_ram
8	param_ram	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for param_ram
7	dmem7	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for dmem7
6	dmem6	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for dmem6
5	dmem5	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for dmem5
4	dmem4	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for dmem4
3	dmem3	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for dmem3
2	dmem2	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for dmem2
1	dmem1	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for dmem1
0	dmem0	R/W	0h	Will be 1'b1 after cmpletion of memory initialization for dmem0

28.13.2.387 MEM_INIT_STATUS Register (Offset = 608h) [Reset = X]

MEM_INIT_STATUS is shown in Table 28-411.

Return to the Summary Table.

Table 28-411. MEM_INIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R	X	
14	hist_odd_ram	R	0h	Will be 1'b1 during memory initialization for hist_odd_ram
13	hist_even_ram	R	0h	Will be 1'b1 during memory initialization for hist_even_ram
12	per_iteration_max_val_ram	R	0h	Will be 1'b1 during memory initialization for per_iteration_max_val_ram
11	per_sample_max_val_odd_ram	R	0h	Will be 1'b1 during memory initialization for per_sample_max_val_odd_ram
10	per_sample_max_val_even_ram	R	0h	Will be 1'b1 during memory initialization for per_sample_max_val_even_ram
9	window_ram	R	0h	Will be 1'b1 during memory initialization for window_ram
8	param_ram	R	0h	Will be 1'b1 during memory initialization for param_ram
7	dmem7	R	0h	Will be 1'b1 during memory initialization for dmem7
6	dmem6	R	0h	Will be 1'b1 during memory initialization for dmem6
5	dmem5	R	0h	Will be 1'b1 during memory initialization for dmem5
4	dmem4	R	0h	Will be 1'b1 during memory initialization for dmem4
3	dmem3	R	0h	Will be 1'b1 during memory initialization for dmem3
2	dmem2	R	0h	Will be 1'b1 during memory initialization for dmem2
1	dmem1	R	0h	Will be 1'b1 during memory initialization for dmem1
0	dmem0	R	0h	Will be 1'b1 during memory initialization for dmem0

28.13.2.388 LM_THRESH_VAL Register (Offset = 60Ch) [Reset = 00000000h]

LM_THRESH_VAL is shown in Table 28-412.

Return to the Summary Table.

Table 28-412. LM_THRESH_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	dimc_thresh_val	R/W	0h	Threshold value configured for Dimension C
15-0	dimb_thresh_val	R/W	0h	Threshold value configured for Dimension B

28.13.2.389 LM_2DSTATS_BASE_ADDR Register (Offset = 610h) [Reset = X]

LM_2DSTATS_BASE_ADDR is shown in Table 28-413.

Return to the Summary Table.

Table 28-413. LM_2DSTATS_BASE_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	X	
27-16	base_addr_dimc	R/W	0h	Base Address in Stats RAM for the Threshold values corresponding to dimension C
15-12	RESERVED	R/W	X	
11-0	base_addr_dimb	R/W	0h	Base Address in Stats RAM for the Threshold values corresponding to dimension B

28.13.2.390 HWA_SAFETY_EN Register (Offset = 614h) [Reset = X]

HWA_SAFETY_EN is shown in Table 28-414.

Return to the Summary Table.

Table 28-414. HWA_SAFETY_EN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	cfg_dmem_parity_en	R/W	0h	Writing 1'b1 would enable the parity chekcer for the 8 DMEM memories
2	cfg_window_ram_parity_en	R/W	0h	Writing 1'b1 enables parity for windowing RAM
1	cfg_fsm_lockstep_inv_en	R/W	0h	Writing 1'b1 will invert the redundant FSM outputs. This can be used for selftest of FSM lockstep error interrupt. This bit is self clearing bit
0	cfg_fsm_lockstep_en	R/W	0h	Writing 1'b1 would enable the lockstep logic for FSM

28.13.2.391 HWA_SAFETY_ERR_MASK Register (Offset = 618h) [Reset = X]

HWA_SAFETY_ERR_MASK is shown in Table 28-415.

Return to the Summary Table.

Table 28-415. HWA_SAFETY_ERR_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9	fsm_lockstep	R/W	0h	When 1'b 1 : FSM lockstep error is masked 1'b 0 : FSM lockstep error is not masked
8	window_ram	R/W	0h	When 1'b 1 : window RAM parity error is masked 1'b 0 : window RAM parity error is not masked
7	dmem7	R/W	0h	When 1'b 1 : DMEM7 parity error is masked 1'b 0 : DMEM7 parity error is not masked
6	dmem6	R/W	0h	When 1'b 1 : DMEM6 parity error is masked 1'b 0 : DMEM6 parity error is not masked
5	dmem5	R/W	0h	When 1'b 1 : DMEM5 parity error is masked 1'b 0 : DMEM5 parity error is not masked
4	dmem4	R/W	0h	When 1'b 1 : DMEM4 parity error is masked 1'b 0 : DMEM4 parity error is not masked
3	dmem3	R/W	0h	When 1'b 1 : DMEM3 parity error is masked 1'b 0 : DMEM3 parity error is not masked
2	dmem2	R/W	0h	When 1'b 1 : DMEM2 parity error is masked 1'b 0 : DMEM2 parity error is not masked
1	dmem1	R/W	0h	When 1'b 1 : DMEM1 parity error is masked 1'b 0 : DMEM1 parity error is not masked
0	dmem0	R/W	0h	When 1'b 1 : DMEM0 parity error is masked 1'b 0 : DMEM0 parity error is not masked

28.13.2.392 HWA_SAFETY_ERR_STATUS Register (Offset = 61Ch) [Reset = X]

HWA_SAFETY_ERR_STATUS is shown in Table 28-416.

Return to the Summary Table.

Table 28-416. HWA_SAFETY_ERR_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9	fsm_lockstep	R/W	0h	Indicates the FSM lockstep error (Masked status)
8	window_ram	R/W	0h	Indicates the parity error in window RAM (Masked status)
7	dmem7	R/W	0h	Indicates the parity error in dmem7 (Masked status)
6	dmem6	R/W	0h	Indicates the parity error in dmem6 (Masked status)
5	dmem5	R/W	0h	Indicates the parity error in dmem5 (Masked status)
4	dmem4	R/W	0h	Indicates the parity error in dmem4 (Masked status)
3	dmem3	R/W	0h	Indicates the parity error in dmem3 (Masked status)
2	dmem2	R/W	0h	Indicates the parity error in dmem2 (Masked status)
1	dmem1	R/W	0h	Indicates the parity error in dmem1 (Masked status)
0	dmem0	R/W	0h	Indicates the parity error in dmem0 (Masked status)

28.13.2.393 HWA_SAFETY_ERR_STATUS_RAW Register (Offset = 620h) [Reset = X]

HWA_SAFETY_ERR_STATUS_RAW is shown in Table 28-417.

Return to the Summary Table.

Table 28-417. HWA_SAFETY_ERR_STATUS_RAW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9	fsm_lockstep	R/W	0h	Indicates the FSM lockstep error (raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 9
8	window_ram	R/W	0h	Indicates the parity error in window RAM(raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 8
7	dmem7	R/W	0h	Indicates the parity error in dmem7(raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 7
6	dmem6	R/W	0h	Indicates the parity error in dmem6(raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 6
5	dmem5	R/W	0h	Indicates the parity error in dmem5(raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 5
4	dmem4	R/W	0h	Indicates the parity error in dmem4(raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 4
3	dmem3	R/W	0h	Indicates the parity error in dmem3(raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 3
2	dmem2	R/W	0h	Indicates the parity error in dmem2(raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 2
1	dmem1	R/W	0h	Indicates the parity error in dmem1(raw status) Set irrespective of HWA_SAFETY_ERR_MASK bit 1
0	dmem0	R/W	0h	Indicates the parity error in dmem0(raw status). Set irrespective of HWA_SAFETY_ERR_MASK bit 0

28.13.2.394 HWA_SAFETY_DMEM0_ERR_ADDR Register (Offset = 624h) [Reset = X]

HWA_SAFETY_DMEM0_ERR_ADDR is shown in Table 28-418.

Return to the Summary Table.

Table 28-418. HWA_SAFETY_DMEM0_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	X	
9-0	dmem0_err_addr	R	0h	Captures the address where parity error occured for dmem0

28.13.2.395 HWA_SAFETY_DMEM1_ERR_ADDR Register (Offset = 628h) [Reset = X]

HWA_SAFETY_DMEM1_ERR_ADDR is shown in Table 28-419.

Return to the Summary Table.

Table 28-419. HWA_SAFETY_DMEM1_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	X	
9-0	dmem1_err_addr	R	0h	Captures the address where parity error occured for dmem1

28.13.2.396 HWA_SAFETY_DMEM2_ERR_ADDR Register (Offset = 62Ch) [Reset = X]

HWA_SAFETY_DMEM2_ERR_ADDR is shown in Table 28-420.

Return to the Summary Table.

Table 28-420. HWA_SAFETY_DMEM2_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	X	
9-0	dmem2_err_addr	R	0h	Captures the address where parity error occured for dmem2

28.13.2.397 HWA_SAFETY_DMEM3_ERR_ADDR Register (Offset = 630h) [Reset = X]

HWA_SAFETY_DMEM3_ERR_ADDR is shown in Table 28-421.

Return to the Summary Table.

Table 28-421. HWA_SAFETY_DMEM3_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	X	
9-0	dmem3_err_addr	R	0h	Captures the address where parity error occured for dmem3

28.13.2.398 HWA_SAFETY_DMEM4_ERR_ADDR Register (Offset = 634h) [Reset = X]

HWA_SAFETY_DMEM4_ERR_ADDR is shown in Table 28-422.

Return to the Summary Table.

Table 28-422. HWA_SAFETY_DMEM4_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	X	
9-0	dmem4_err_addr	R	0h	Captures the address where parity error occured for dmem4

28.13.2.399 HWA_SAFETY_DMEM5_ERR_ADDR Register (Offset = 638h) [Reset = X]

HWA_SAFETY_DMEM5_ERR_ADDR is shown in Table 28-423.

Return to the Summary Table.

Table 28-423. HWA_SAFETY_DMEM5_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	X	
9-0	dmem5_err_addr	R	0h	Captures the address where parity error occured for dmem5

28.13.2.400 HWA_SAFETY_DMEM6_ERR_ADDR Register (Offset = 63Ch) [Reset = X]

HWA_SAFETY_DMEM6_ERR_ADDR is shown in Table 28-424.

Return to the Summary Table.

Table 28-424. HWA_SAFETY_DMEM6_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	X	
9-0	dmem6_err_addr	R	0h	Captures the address where parity error occured for dmem6

28.13.2.401 HWA_SAFETY_DMEM7_ERR_ADDR Register (Offset = 640h) [Reset = X]

HWA_SAFETY_DMEM7_ERR_ADDR is shown in Table 28-425.

Return to the Summary Table.

Table 28-425. HWA_SAFETY_DMEM7_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	X	
9-0	dmem7_err_addr	R	0h	Captures the address where parity error occured for dmem7

28.13.2.402 HWA_SAFETY_WINDOW_RAM_ERR_ADDR Register (Offset = 644h) [Reset = X]

HWA_SAFETY_WINDOW_RAM_ERR_ADDR is shown in Table 28-426.

Return to the Summary Table.

Table 28-426. HWA_SAFETY_WINDOW_RAM_ERR_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	X	
10-0	window_ram_err_addr	R	0h	Captures the address where parity error occured for window RAM

28.13.2.403 MEM_ACCESS_ERR_STATUS Register (Offset = 648h) [Reset = X]

MEM_ACCESS_ERR_STATUS is shown in Table 28-427.

Return to the Summary Table.

Table 28-427. MEM_ACCESS_ERR_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7	dmem7	R/W	0h	Indicates if more than 1 master (DMA,Accelerator) are trying to access the dmem7 at the same time
6	dmem6	R/W	0h	Indicates if more than 1 master (DMA,Accelerator) are trying to access the dmem6 at the same time
5	dmem5	R/W	0h	Indicates if more than 1 master (DMA,Accelerator) are trying to access the dmem5 at the same time
4	dmem4	R/W	0h	Indicates if more than 1 master (DMA,Accelerator) are trying to access the dmem4 at the same time
3	dmem3	R/W	0h	Indicates if more than 1 master (DMA,Accelerator) are trying to access the dmem3 at the same time
2	dmem2	R/W	0h	Indicates if more than 1 master (DMA,Accelerator) are trying to access the dmem2 at the same time
1	dmem1	R/W	0h	Indicates if more than 1 master (DMA,Accelerator) are trying to access the dmem1 at the same time
0	dmem0	R/W	0h	Indicates if more than 1 master (DMA,Accelerator) are trying to access the dmem0 at the same time

28.13.2.404 LOOP_CNT Register (Offset = 64Ch) [Reset = X]

LOOP_CNT is shown in Table 28-428.

Return to the Summary Table.

Table 28-428. LOOP_CNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R	X	
27-16	loop_cnt_alt	R	0h	Loop count for alternate thread
15-12	RESERVED	R	X	
11-0	loop_cnt	R	0h	Loop count

28.13.2.405 PARAMADDR Register (Offset = 650h) [Reset = X]

PARAMADDR is shown in Table 28-429.

Return to the Summary Table.

Table 28-429. PARAMADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	X	
5-0	paramaddr	R	0h	Index of the current parameter set being executed from PARAM RAM .

28.13.2.406 PARAMADDR_CPUINTR0 Register (Offset = 654h) [Reset = X]

PARAMADDR_CPUINTR0 is shown in Table 28-430.

Return to the Summary Table.

Table 28-430. PARAMADDR_CPUINTR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	X	
5-0	paramaddr	R	0h	Index of the parameter set when PARAM_DONE_INTR0 is generated

28.13.2.407 PARAMADDR_CPUINTR1 Register (Offset = 658h) [Reset = X]

PARAMADDR_CPUINTR1 is shown in Table 28-431.

Return to the Summary Table.

Table 28-431. PARAMADDR_CPUINTR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	X	
5-0	paramaddr	R	0h	Index of the parameter set when PARAM_DONE_INTR1 is generated

28.13.2.408 FSM_STATE Register (Offset = 65Ch) [Reset = X]

FSM_STATE is shown in Table 28-432.

Return to the Summary Table.

Table 28-432. FSM_STATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	X	
2-0	fsm_state	R	0h	Current state of the state machine

28.13.2.409 SINGLE_STEP_EN Register (Offset = 660h) [Reset = X]

SINGLE_STEP_EN is shown in Table 28-433.

Return to the Summary Table.

Table 28-433. SINGLE_STEP_EN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	single_step_en	R/W	0h	Single step enable 1'b 1 : the state machine executes one parameter-set at a time and wait for the single step trigger every time

28.13.2.410 SINGLE_STEP_TRIG Register (Offset = 664h) [Reset = X]

SINGLE_STEP_TRIG is shown in Table 28-434.

Return to the Summary Table.

Table 28-434. SINGLE_STEP_TRIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	single_step_trig	R/W	0h	This is a self clearing sofware trigger bit . When single_step_en is 1 , the state machine executes one parameter-set at a time and wait for the single step trigger every time

28.13.2.411 HWA_DMEM_A_BUS_SAFETY_CTRL Register (Offset = 668h) [Reset = X]

HWA_DMEM_A_BUS_SAFETY_CTRL is shown in Table 28-435.

Return to the Summary Table.

Table 28-435. HWA_DMEM_A_BUS_SAFETY_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-16	type	R	Fh	Refer to Safety Manual and Safety Diagnostic Library for more details
15-9	RESERVED	R/W	X	
8	err_clear	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
7-3	RESERVED	R/W	X	
2-0	enable	R/W	7h	Refer to Safety Manual and Safety Diagnostic Library for more details

28.13.2.412 HWA_DMEM_A_BUS_SAFETY_FI Register (Offset = 66Ch) [Reset = X]

HWA_DMEM_A_BUS_SAFETY_FI is shown in Table 28-436.

Return to the Summary Table.

Table 28-436. HWA_DMEM_A_BUS_SAFETY_FI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	safe	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
23-16	main	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
15-8	data	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
7-6	RESERVED	R/W	X	
5	ded	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
4	sec	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
3	global_safe_req	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
2	global_main_req	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
1	global_safe	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
0	global_main	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details

28.13.2.413 HWA_DMEM_A_BUS_SAFETY_ERR Register (Offset = 670h) [Reset = 00000000h]

HWA_DMEM_A_BUS_SAFETY_ERR is shown in Table 28-437.

Return to the Summary Table.

Table 28-437. HWA_DMEM_A_BUS_SAFETY_ERR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	ded	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
23-16	sec	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
15-8	comp_check	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
7-0	comp_err	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details

28.13.2.414 HWA_DMEM_A_BUS_SAFETY_ERR_STAT_DATA0 Register (Offset = 678h) [Reset = X]

HWA_DMEM_A_BUS_SAFETY_ERR_STAT_DATA0 is shown in Table 28-438.

Return to the Summary Table.

Table 28-438. HWA_DMEM_A_BUS_SAFETY_ERR_STAT_DATA0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	X	
15-8	d1	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
7-0	d0	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details

28.13.2.415 HWA_DMEM_B_BUS_SAFETY_CTRL Register (Offset = 67Ch) [Reset = X]

HWA_DMEM_B_BUS_SAFETY_CTRL is shown in Table 28-439.

Return to the Summary Table.

Table 28-439. HWA_DMEM_B_BUS_SAFETY_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-16	type	R	Fh	Refer to Safety Manual and Safety Diagnostic Library for more details
15-9	RESERVED	R/W	X	
8	err_clear	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
7-3	RESERVED	R/W	X	
2-0	enable	R/W	7h	Refer to Safety Manual and Safety Diagnostic Library for more details

28.13.2.416 HWA_DMEM_B_BUS_SAFETY_FI Register (Offset = 680h) [Reset = X]

HWA_DMEM_B_BUS_SAFETY_FI is shown in Table 28-440.

Return to the Summary Table.

Table 28-440. HWA_DMEM_B_BUS_SAFETY_FI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	safe	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
23-16	main	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
15-8	data	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
7-6	RESERVED	R/W	X	
5	ded	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
4	sec	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
3	global_safe_req	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
2	global_main_req	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
1	global_safe	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
0	global_main	R/W	0h	Refer to Safety Manual and Safety Diagnostic Library for more details

28.13.2.417 HWA_DMEM_B_BUS_SAFETY_ERR Register (Offset = 684h) [Reset = 00000000h]

HWA_DMEM_B_BUS_SAFETY_ERR is shown in Table 28-441.

Return to the Summary Table.

Table 28-441. HWA_DMEM_B_BUS_SAFETY_ERR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	ded	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
23-16	sec	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
15-8	comp_check	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
7-0	comp_err	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details

28.13.2.418 HWA_DMEM_B_BUS_SAFETY_ERR_STAT_DATA0 Register (Offset = 68Ch) [Reset = X]

HWA_DMEM_B_BUS_SAFETY_ERR_STAT_DATA0 is shown in Table 28-442.

Return to the Summary Table.

Table 28-442. HWA_DMEM_B_BUS_SAFETY_ERR_STAT_DATA0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	X	
15-8	d1	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details
7-0	d0	R	0h	Refer to Safety Manual and Safety Diagnostic Library for more details

28.13.2.419 SW_RESTART_LOOP Register (Offset = 690h) [Reset = X]

SW_RESTART_LOOP is shown in Table 28-443.

Return to the Summary Table.

Table 28-443. SW_RESTART_LOOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	sw_restart_loop	R/W	0h	This is a self clearing sofware trigger bit for low priority thread . When sw_restart_loop is 1 , low priority thread is reconfigured with param_start_idx,param_end_idx,num_loops

28.13.2.420 REG_CMP_LFSRSEED_0 Register (Offset = 694h) [Reset = X]

REG_CMP_LFSRSEED_0 is shown in Table 28-444.

Return to the Summary Table.

Table 28-444. REG_CMP_LFSRSEED_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	X	
28-0	REG_CMP_LFSRSEED_0	R/W	0h	This register is the first seed for the 29-bit LFSR used for compression

28.13.2.421 REG_CMP_LFSRSEED_1 Register (Offset = 698h) [Reset = X]

REG_CMP_LFSRSEED_1 is shown in Table 28-445.

Return to the Summary Table.

Table 28-445. REG_CMP_LFSRSEED_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	X	
28-0	REG_CMP_LFSRSEED_1	R/W	0h	This register is the second seed for the 29-bit LFSR used for compression

28.13.2.422 REG_CMP_LFSRLOAD_0 Register (Offset = 69Ch) [Reset = X]

REG_CMP_LFSRLOAD_0 is shown in Table 28-446.

Return to the Summary Table.

Table 28-446. REG_CMP_LFSRLOAD_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	REG_CMP_LFSRLOAD_0	R/W	0h	Resets CMP LFSR 0 with the programmed value. This is a self clearing bit

28.13.2.423 REG_CMP_LFSRLOAD_1 Register (Offset = 6A0h) [Reset = X]

REG_CMP_LFSRLOAD_1 is shown in Table 28-447.

Return to the Summary Table.

Table 28-447. REG_CMP_LFSRLOAD_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	REG_CMP_LFSRLOAD_1	R/W	0h	Resets CMP LFSR 1 with the programmed value. This is a self clearing bit

28.13.2.424 HW_SPARE_RW0 Register (Offset = FD0h) [Reset = 00000000h]

HW_SPARE_RW0 is shown in Table 28-448.

Return to the Summary Table.

Table 28-448. HW_SPARE_RW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw0	R/W	0h	Reserved for HW R&D

28.13.2.425 HW_SPARE_RW1 Register (Offset = FD4h) [Reset = 00000000h]

HW_SPARE_RW1 is shown in Table 28-449.

Return to the Summary Table.

Table 28-449. HW_SPARE_RW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw1	R/W	0h	Reserved for HW R&D

28.13.2.426 HW_SPARE_RW2 Register (Offset = FD8h) [Reset = 00000000h]

HW_SPARE_RW2 is shown in Table 28-450.

Return to the Summary Table.

Table 28-450. HW_SPARE_RW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw2	R/W	0h	Reserved for HW R&D

28.13.2.427 HW_SPARE_RW3 Register (Offset = FDCh) [Reset = 00000000h]

HW_SPARE_RW3 is shown in Table 28-451.

Return to the Summary Table.

Table 28-451. HW_SPARE_RW3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw3	R/W	0h	Reserved for HW R&D

28.13.2.428 HW_SPARE_RO0 Register (Offset = FE0h) [Reset = 00000000h]

HW_SPARE_RO0 is shown in Table 28-452.

Return to the Summary Table.

Table 28-452. HW_SPARE_RO0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro0	R	0h	Reserved for HW R&D

28.13.2.429 HW_SPARE_RO1 Register (Offset = FE4h) [Reset = 00000000h]

HW_SPARE_RO1 is shown in Table 28-453.

Return to the Summary Table.

Table 28-453. HW_SPARE_RO1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro1	R	0h	Reserved for HW R&D

28.13.2.430 HW_SPARE_RO2 Register (Offset = FE8h) [Reset = 00000000h]

HW_SPARE_RO2 is shown in Table 28-454.

Return to the Summary Table.

Table 28-454. HW_SPARE_RO2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro2	R	0h	Reserved for HW R&D

28.13.2.431 HW_SPARE_RO3 Register (Offset = FECh) [Reset = 00000000h]

HW_SPARE_RO3 is shown in Table 28-455.

Return to the Summary Table.

Table 28-455. HW_SPARE_RO3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro3	R	0h	Reserved for HW R&D

28.13.2.432 HW_SPARE_WPH Register (Offset = FF0h) [Reset = 00000000h]

HW_SPARE_WPH is shown in Table 28-456.

Return to the Summary Table.

Table 28-456. HW_SPARE_WPH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_wph	R/W	0h	Reserved for HW R&D

28.13.2.433 HW_SPARE_REC Register (Offset = FF4h) [Reset = 00000000h]

HW_SPARE_REC is shown in Table 28-457.

Return to the Summary Table.

Table 28-457. HW_SPARE_REC Register Field Descriptions

Bit	Field	Type	Reset	Description
31	hw_spare_rec31	R/W	0h	Reserved for HW R&D
30	hw_spare_rec30	R/W	0h	Reserved for HW R&D
29	hw_spare_rec29	R/W	0h	Reserved for HW R&D
28	hw_spare_rec28	R/W	0h	Reserved for HW R&D
27	hw_spare_rec27	R/W	0h	Reserved for HW R&D
26	hw_spare_rec26	R/W	0h	Reserved for HW R&D
25	hw_spare_rec25	R/W	0h	Reserved for HW R&D
24	hw_spare_rec24	R/W	0h	Reserved for HW R&D
23	hw_spare_rec23	R/W	0h	Reserved for HW R&D
22	hw_spare_rec22	R/W	0h	Reserved for HW R&D
21	hw_spare_rec21	R/W	0h	Reserved for HW R&D
20	hw_spare_rec20	R/W	0h	Reserved for HW R&D
19	hw_spare_rec19	R/W	0h	Reserved for HW R&D
18	hw_spare_rec18	R/W	0h	Reserved for HW R&D
17	hw_spare_rec17	R/W	0h	Reserved for HW R&D
16	hw_spare_rec16	R/W	0h	Reserved for HW R&D
15	hw_spare_rec15	R/W	0h	Reserved for HW R&D
14	hw_spare_rec14	R/W	0h	Reserved for HW R&D
13	hw_spare_rec13	R/W	0h	Reserved for HW R&D
12	hw_spare_rec12	R/W	0h	Reserved for HW R&D
11	hw_spare_rec11	R/W	0h	Reserved for HW R&D
10	hw_spare_rec10	R/W	0h	Reserved for HW R&D
9	hw_spare_rec9	R/W	0h	Reserved for HW R&D
8	hw_spare_rec8	R/W	0h	Reserved for HW R&D
7	hw_spare_rec7	R/W	0h	Reserved for HW R&D
6	hw_spare_rec6	R/W	0h	Reserved for HW R&D
5	hw_spare_rec5	R/W	0h	Reserved for HW R&D
4	hw_spare_rec4	R/W	0h	Reserved for HW R&D
3	hw_spare_rec3	R/W	0h	Reserved for HW R&D
2	hw_spare_rec2	R/W	0h	Reserved for HW R&D
1	hw_spare_rec1	R/W	0h	Reserved for HW R&D
0	hw_spare_rec0	R/W	0h	Reserved for HW R&D

28.13.2.434 LOCK0_KICK0 Register (Offset = 1008h) [Reset = 00000000h]

LOCK0_KICK0 is shown in Table 28-458.

Return to the Summary Table.

- KICK0 component

Table 28-458. LOCK0_KICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick0	R/W	0h	- KICK0 component

28.13.2.435 LOCK0_KICK1 Register (Offset = 100Ch) [Reset = 00000000h]

LOCK0_KICK1 is shown in Table 28-459.

Return to the Summary Table.

- KICK1 component

Table 28-459. LOCK0_KICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick1	R/W	0h	- KICK1 component

28.13.2.436 intr_raw_status Register (Offset = 1010h) [Reset = X]

intr_raw_status is shown in Table 28-460.

Return to the Summary Table.

Interrupt Raw Status/Set Register

Table 28-460. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

28.13.2.437 intr_enabled_status_clear Register (Offset = 1014h) [Reset = X]

intr_enabled_status_clear is shown in Table 28-461.

Return to the Summary Table.

Interrupt Enabled Status/Clear register

Table 28-461. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

28.13.2.438 intr_enable Register (Offset = 1018h) [Reset = X]

intr_enable is shown in Table 28-462.

Return to the Summary Table.

Interrupt Enable register

Table 28-462. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

28.13.2.439 intr_enable_clear Register (Offset = 101Ch) [Reset = X]

intr_enable_clear is shown in Table 28-463.

Return to the Summary Table.

Interrupt Enable Clear register

Table 28-463. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

28.13.2.440 eoi Register (Offset = 1020h) [Reset = X]

eoi is shown in Table 28-464.

Return to the Summary Table.

EOI register

Table 28-464. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

28.13.2.441 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in Table 28-465.

Return to the Summary Table.

Fault Address register

Table 28-465. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

28.13.2.442 fault_type_status Register (Offset = 1028h) [Reset = X]

fault_type_status is shown in Table 28-466.

Return to the Summary Table.

Fault Type Status register

Table 28-466. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	X	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_ 0000 = Supervisor read fault - priv = 1 dir = 1 dtype != 1 01_ 0000 = Supervisor write fault - priv = 1 dir = 0 00_ 1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_ 0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_ 0010 = User write fault - priv = 0 dir = 0 00_ 0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_ 0000 = No fault

28.13.2.443 fault_attr_status Register (Offset = 102Ch) [Reset = 00000000h]

fault_attr_status is shown in Table 28-467.

Return to the Summary Table.

Fault Attribute Status register

Table 28-467. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

28.13.2.444 fault_clear Register (Offset = 1030h) [Reset = X]

fault_clear is shown in Table 28-468.

Return to the Summary Table.

Fault Clear register

Table 28-468. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	X	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

28.13.3 DSS_HWA_PARAM Registers

Table 28-469 lists the memory-mapped registers for the DSS_HWA_PARAM registers. All register offset addresses not listed in Table 28-469 should be considered as reserved locations and the register contents should not be modified.

Table 28-469. DSS_HWA_PARAM Registers

Offset	Acronym	Register Name	Section
0h	START		Go
FFCh	END		Go

Complex bit access types are encoded to fit into small table cells. Table 28-470 shows the codes that are used for access types in this section.

Table 28-470. DSS_HWA_PARAM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

28.13.3.1 START Register (Offset = 0h) [Reset = 00000000h]

START is shown in Table 28-471.

Return to the Summary Table.

Table 28-471. START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Start address

28.13.3.2 END Register (Offset = FFCh) [Reset = 00000000h]

END is shown in Table 28-472.

Return to the Summary Table.

Table 28-472. END Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	End address

28.13.4 DSS_HWA_WINDOW_RAM Registers

Table 28-473 lists the memory-mapped registers for the DSS_HWA_WINDOW_RAM registers. All register offset addresses not listed in Table 28-473 should be considered as reserved locations and the register contents should not be modified.

Table 28-473. DSS_HWA_WINDOW_RAM Registers

Offset	Acronym	Register Name	Section
0h	START		Go
1FFCh	END		Go

Complex bit access types are encoded to fit into small table cells. Table 28-474 shows the codes that are used for access types in this section.

Table 28-474. DSS_HWA_WINDOW_RAM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

28.13.4.1 START Register (Offset = 0h) [Reset = 00000000h]

START is shown in Table 28-475.

Return to the Summary Table.

Table 28-475. START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Start address

28.13.4.2 END Register (Offset = 1FFCh) [Reset = 00000000h]

END is shown in Table 28-476.

Return to the Summary Table.

Table 28-476. END Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	End address

28.13.5 DSS_HWA_MULT_RAM Registers

Table 28-477 lists the memory-mapped registers for the DSS_HWA_MULT_RAM registers. All register offset addresses not listed in Table 28-477 should be considered as reserved locations and the register contents should not be modified.

Table 28-477. DSS_HWA_MULT_RAM Registers

Offset	Acronym	Register Name	Section
0h	START		Go
1FFCh	END		Go

Complex bit access types are encoded to fit into small table cells. Table 28-478 shows the codes that are used for access types in this section.

Table 28-478. DSS_HWA_MULT_RAM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-*n*		Value after reset or the default value

28.13.5.1 START Register (Offset = 0h) [Reset = 00000000h]

START is shown in Table 28-479.

Return to the Summary Table.

Table 28-479. START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Start address

28.13.5.2 END Register (Offset = 1FFCh) [Reset = 00000000h]

END is shown in Table 28-480.

Return to the Summary Table.

Table 28-480. END Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	End address

28.13.6 DSS_HWA_DEROT_RAM Registers

Table 28-481 lists the memory-mapped registers for the DSS_HWA_DEROT_RAM registers. All register offset addresses not listed in Table 28-481 should be considered as reserved locations and the register contents should not be modified.

Table 28-481. DSS_HWA_DEROT_RAM Registers

Offset	Acronym	Register Name	Section
0h	START		Go
FCh	END		Go

Complex bit access types are encoded to fit into small table cells. Table 28-482 shows the codes that are used for access types in this section.

Table 28-482. DSS_HWA_DEROT_RAM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read

Glossary

- RBL - ROM Bootloader
- SBL - Secondary Bootloader
- ROM - Read only Memory
- SFlash - Serial Flash
- SDF - Software Defined Flash
- HWA – Hardware Accelerator
- SOP - Sense on Power
- MSS - Main SubSystem (R5F)
- DSS - DSP SubSystem
- RSS - Radar SubSystem
- BSS - BIST SubSystem
- DSP – Digital Signal Processors
- DFE – Digital Front End
- HSM - High Secure Module
- MPU - Memory Protection Unit
- QSPI – Quad Serial Peripheral Interface
- EDMA – Enhanced Direct Memory Access
- RTI – Real Time Interrupt
- UART – Universal Asynchronous Receiver/Transmitter
- GPIO – General-Purpose Input/Output
- MiBSPI – Multi Buffered Serial Peripheral Interfaces
- GIO – General Purpose Input/Output
- I2C – Inter-Integrated Circuit
- EPWM – Enhanced Pulse Width Modulation
- DMM – Data Modification Module
- CPSW – Common Platform Ethernet Switch
- HSDIV – High Speed Clock Division
- PBIST – Programmable Built-In Self-Test
- LBIST – Logic Built-In Self-Test
- PLL- Phase-Locked Loop
- MCU – Microcontroller Unit
- ESM – Error State Machine
- MCRC – Memory Cyclic Redundancy Check
- DCC – Dual Clock Comparator
- GPADC – General-Purpose Analog Digital Converter
- TCMA/TCMB – Tightly Coupled Memory
- R5FA/R5FB – ARM Real Time processor with floating point Unit
- MDO – Measurement Data Output
- CBUFF - Clock Buffer
- PCR – Peripheral Central Resource
- SCR - Switched Central Resource
- TPTC - Third Party Transfer Controller
- TPCC - Third Party Channel Controller
- PRCM - Power, Reset and Clock Management

- STC – Self-Test Controller
- IPC – Interprocessor Communication
- WDT – Watchdog Timer
- WWDT – Windowed Watchdog Timer
- VIM – Vectored Interrupt Manager
- IRQ – Interrupt Request
- FIQ – Fast Interrupt Request
- SECDEC - Single Error Correction Double Error Code
- ECC – Error Correction Code
- ADC – Analog to Digital Converter
- CQ – Chirp Quality
- CP – Chirp Parameter
- ICD - Interface Control Document
- MCAN – Controlled Area Network
- JTAG - Joint Test Action Group
- TPIU - Trace Port Interface Unit.
- CTI - Cross Trigger Interface
- EMIF - External Memory Interface

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from November 30, 2023 to August 1, 2024 (from Revision C (November 2023) to Revision D (August 2024))	**Page**
• Removed dual core support for R5F	15
• Added HSM CLock Frequency	15
• Added Introduction to AWR2944LC device	15
• Changed the device block diagram. HWA2.0 was changed to 2.1	18
• Added the AWR2944LC Block Diagram and added AWR2944LC in the module allocation table	18
• Added the applicable sections for for AWR2944 and AWR2944LC	21
• Multiple entries added to the DSP Subsystem C66x Memory map	26
• Added the memory map for AWR2944LC	29
• Added the HWA CM4 Infrastructure for AWR2944LC	41
• Added description for PCR	43
• Added DSP_ICFG register set	987
• Added text on clock sources	2713
• Added LC clock Tree	2713
• Added Root clocks section	2716
• Added Clock Register Details section in the clock chapter	2731
• Added Ethernet Clock Section	2733
• Added a section for the AWR2944LC M4	2772
• Changed Interrupt number 138 to reserved.	2783
• [EDMA - Third Party Transfer Controller] updated interconnect naming to L3_VBUSM. Fixed typos (distant->destination register). Updated read/write data bus to 64 bits in TPTC Block Diagram and in note below diagram	3668
• [Types of EDMA Controller Transfers] changed 3rd dimension count definition space naming from register to PaRAM memory	3669
• [Channel Options Parameter] added references to RAs for AM26x devices	3677
• [Channel Source Address (SRC)] updated addressing mode to FIFO for SAM	3677
• [Channel Destination Address (DST)] updated addressing mode to FIFO for DAM	3677
• [Count for 1st Dimension (ACNT)] updated ACNT valid values to range of 1 to 65535/	3677
• [Parameter Set Updates] Changed 'slave' to 'peripheral'	3680
• [Constant Addressing Mode Transfers/Alignment Issues] changed 'slave' to 'target'	3686
• [Active Memory Protection] removed Example Access Denied register table, Example Access Allowed table since they are also in the RA	3705
• [Proxy Memory Protection] changed 'slave' to 'target'	3706
• [EDMA Transfer Controller (EDMA_TPTC)] Updated for inclusive terminology	3710
• [Event Dataflow] Updated for inclusive terminology	3712
• [Block Move Example] changed 'greater than 64K bytes' to 'greater than or equal to'	3716
• [Setting Up an EDMA Transfer] edited note under step 2 to reference step 1-d-ii instead of 1-b-ii	3721
• [EDMA Debug Checklist] filtered McASP example in Table 11-23 for AM273x only	3723
• Made edits to the fist para for DWD	4976
• Made edits to DWD module operation	4978

- Made edits to DWWD module operation. 4978
- I2C: Added list of I2C instance names... 5083
- ePWM: Removed outdated terms for pinmux..5226
- MCRC: Add bit details relating to Semi-CPU mode... 5552
- STC General Description: Removed unsupported features (Interval Testing)..5621
- Fixed TOP_PBIST base address and appended the DSS_DSP_PBIST row. 5705
- Updated the mailbox block diagram and remove CR4 form MSS...6250
- Added the Mailbox allocation summary for AWR2944LC...6250
- Added HWA_CM4 for AWR2944LC and added note for the same.. 6252
- Edited the width field for a couple of registers 6368
