29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now - Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
28-25	RESERVED	R	0h	
24	MIRROR_DP	R/W	0h	Mirror Destination Port - This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the ~imirror_top port.
23-21	UPD_BW_CTRL	R/W	0h	The ~iupd_bw_ctrl field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the ~iupd_bw_ctrl can be programmed more aggressive. If the ~iupd_bw_ctrl is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0 - 350Mhz, 5M 1 - 359Mhz, 11M 2 - 367Mhz, 16M 3 - 375Mhz, 22M 4 - 384Mhz, 28M 5 - 392Mhz, 34M 6 - 400Mhz, 39M 7 - 409Mhz, 45M
20-17	RESERVED	R	0h	
16	MIRROR_TOP	R/W	0h	Mirror To Port - This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.

Table 9-660. ALE_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	UPD_STATIC	R/W	0h	Update Static Entries - A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be '0' for most switch configurations.
14	RESERVED	R	0h	
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn - This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable - This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the ~imirror_midx entry index will have that traffic also sent to the ~imirror_top port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable - This field enables the destination port mirror option. When this bit is set any traffic destined for the ~imirror_dp port will have its transmit traffic also sent to the ~imirror_top port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable - This field enables the source port mirror option. When this bit is set any port with the ~ipX_mirror_sp set in the ALE Port Control registers set will have its received traffic also sent to the ~imirror_top port.
9	RESERVED	R	0h	
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host 0 - unknown unicast packets are not sent to the host 1 - unknown unicast packets flood to host port as well as other ports
7	LEARN_NO_VLANID	R/W	0h	Learn No VID - 0 - VID is learned with the source address 1 - VID is not learned with the source address (source address is not tied to VID). Determines the entry type.
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode 0 - Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1 - Process the priority tagged packet with VID = 0.
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode - When set, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry. When cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass - When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0 - no bypass 1 - bypass the ALE
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode 0 - Broadcast and multicast rate limit counters are received port based 1 - Broadcast and multicast rate limit counters are transmit port based
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware - Determines how traffic is forwarded using VLAN rules. 0 - Simple switch rules, packets forwarded to all ports for unknown destinations. 1 - VLAN Aware rules, packets forwarded based on VLAN members

Table 9-660. ALE_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode - Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0 - The ALE is not in MAC authorization mode 1 - The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0 - Broadcast/Multicast rates not limited 1 - Broadcast/Multicast packet reception limited to the port control register rate limit fields.

9.6.629 ALE_ALE_CTRL2 Register (Offset = 0003E00Ch) [Reset = XX0XXXX0h]

ALE_ALE_CTRL2 is shown in Table 9-661.

Return to the Summary Table.

The ALE Control 2 Register is used to set the extended features used for all ports.

Table 9-661. ALE_ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address - This field enables the destination MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address - This field enables the source MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority - This field enables the VLAN Priority bits to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
28	RESERVED	R	0h	
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN - This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
26	RESERVED	R	0h	
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address - This field enables the source IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address - This field enables the destination IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the ~iALE_NXT_HDR register values.
19	RESERVED	R	0h	

Table 9-661. ALE_ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18-16	TRK_BASE	R/W	0h	Trunk Base - This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the ~itrk_en_dst, ~itrk_en_src, ~itrk_en_pri and ~itrk_en_vlan are '0', this value is used as the distribution index. That is a '0' will select the 1st bit of an 'N' link trunk, a '1' will select the second, etc. Below is the distribution across the trunk links. The first number in the ~iitalic sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0 will go to the base port (0), hash result 1 will go to the highest port of the trunk group (2), hash result 2 will go to the middle port (1), etc. 1 - ~i00000000 2 - ~i01010101 3 - ~i02102102 4 - ~i03210321
15	MULTIHOST	R/W	0h	The ~multihost allows host traffic to be sent bact to the host if the DA is market for the host port.
14-5	RESERVED	R	0h	
4-0	MIRROR_MIDX	R/W	0h	Mirror Index - This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the ~imirror_top port. That is any VLAN, ONU or address with or withou VLAN can be selected for traffic mirroring.

9.6.630 ALE_ALE_PRESCALE Register (Offset = 0003E010h) [Reset = 00000000h]

ALE_ALE_PRESCALE is shown in Table 9-662.

Return to the Summary Table.

The ALE Prescale Register is used to set the Broadcast and Multicast rate limiting prescaler value.

Table 9-662. ALE_ALE_PRESCALE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R	0h	
19-0	ALE_PRESCALE	R/W	0h	ALE Prescale - The input clock is divided by this value for use in the multicast/broadcast rate limiters. The minimum operating value is 0x10. The prescaler is off when the value is zero.

9.6.631 ALE_ALE_AGING_CTRL Register (Offset = 0003E014h) [Reset = XX000000h]

ALE_ALE_AGING_CTRL is shown in Table 9-663.

Return to the Summary Table.

The ALE Aging Control sets the aging interval which will cause periodic aging to occur. This value specifies the minimum time between aging starts.

Table 9-663. ALE_ALE_AGING_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PRESCALE_2_DISABLE	R/W	0h	ALE Prescaler 2 Disable - When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
30	PRESCALE_1_DISABLE	R/W	0h	ALE Prescaler 1 Disable - When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
29-24	RESERVED	R	0h	
23-0	ALE_AGING_TIMER	R/W	0h	ALE Aging Timer - This field specifies the number of clock cycles times 1,000,000 between aging operations.

9.6.632 ALE_ALE_NXT_HDR Register (Offset = 0003E01Ch) [Reset = 00000000h]

ALE_ALE_NXT_HDR is shown in Table 9-664.

Return to the Summary Table.

The ALE Next Header is used to limit the IPv6 Next header or IPv4 Protocol values found in the IP header. It is enabled via the ~iLmtNxtHdr bit in the VLAN entry. All four ~iip_nxt_hdr0-3 are compared when enabled, so if only one is required, set them all to the one value to be tested.

Table 9-664. ALE_ALE_NXT_HDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	IP_NXT_HDR3	R/W	0h	The ~iip_nxt_hdr3 is the forth protocol or next header compared when enabled.
23-16	IP_NXT_HDR2	R/W	0h	The ~iip_nxt_hdr2 is the third protocol or next header compared when enabled.
15-8	IP_NXT_HDR1	R/W	0h	The ~iip_nxt_hdr1 is the second protocol or next header compared when enabled.
7-0	IP_NXT_HDR0	R/W	0h	The ~iip_nxt_hdr0 is the first protocol or next header compared when enabled.

9.6.633 ALE_ALE_TBLCTL Register (Offset = 0003E020h) [Reset = XXXXXXX0h]

ALE_ALE_TBLCTL is shown in Table 9-665.

Return to the Summary Table.

The ALE table control register is used to read or write that ALE table entries. After writing to this register any read or write to any ALE register will be stalled until the read or write operation completes.

Table 9-665. ALE_ALE_TBLCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TABLEWR	R/W	0h	Table Write - This bit is used to write the table words to the lookup table. 0 - Table Read Operation is performed. The contents of the ~b TABLEIDX entry will be read into the ~b ALE_TBLWx registers 1 - Table write operation is performed. This will take the current contents from the ~b ALE_TBLWx registers and write them to the table at the specified ~b TABLEIDX.
30-5	RESERVED	R	0h	
4-0	TABLEIDX	R/W	0h	The table index is used to determine which lookup table entry is read or written.

9.6.634 ALE_ALE_TBLW2 Register (Offset = 0003E034h) [Reset = 00000000h]

ALE_ALE_TBLW2 is shown in Table 9-666.

Return to the Summary Table.

The ALE Table Word 2 is the most significant word of an ALE table entry.

Table 9-666. ALE_ALE_TBLW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6-0	TABLEWRD2	R/W	0h	Table Entry bits [71:64]

9.6.635 ALE_ALE_TBLW1 Register (Offset = 0003E038h) [Reset = 00000000h]

ALE_ALE_TBLW1 is shown in Table 9-667.

Return to the Summary Table.

The ALE Table Word 1 is the middle word of an ALE table entry.

Table 9-667. ALE_ALE_TBLW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TABLEWRD1	R/W	0h	Table Entry bits [63:32]

9.6.636 ALE_ALE_TBLW0 Register (Offset = 0003E03Ch) [Reset = 00000000h]

ALE_ALE_TBLW0 is shown in Table 9-668.

Return to the Summary Table.

The ALE Table Word 0 is the least significant word of an ALE table entry.

Table 9-668. ALE_ALE_TBLW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TABLEWRD0	R/W	0h	Table Entry bits [31:0]

9.6.637 ALE_I0_ALE_PORTCTL0_0 Register (Offset = 0003E040h) [Reset = 000000X0h]

ALE_I0_ALE_PORTCTL0_0 is shown in Table 9-669.

Return to the Summary Table.

The ALE Port Control Register sets the port specific modes of operation.

Table 9-669. ALE_I0_ALE_PORTCTL0_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	I0_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23-16	I0_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field.The ~imcast_limit is the number of Multicast packets that will be forwaded per ~iale_prescale time.
15	I0_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	I0_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.
13	I0_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with ~imaconly set.
12	I0_REG_P0_DIS_PAUTHMOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	I0_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the ~ip0_maconly bit set and the ~ip0_no_learn also set. If ~ip0_maconly bit is set and the ~ip0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	I0_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the ~ip0_trunken its set and having the same ~ip0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.

Table 9-669. ALE_I0_ALE_PORTCTL0_0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	I0_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the ~ip0_trunken is also set. Ports with the same trunk number that have the ~ip0_trunken also set will have traffic distributed within the trunk based on the result of the hash function descrived above.
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the ~imirror_top port.
6	RESERVED	R	0h	
5	I0_REG_P0_NO_SA_UPDATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
3	I0_REG_P0_VID_INGRESS_CHECK	R/W	0h	VLAN Ingress Check - When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	I0_REG_P0_DROP_UN_TAGGED	R/W	0h	If Drop Untagged - When set will drop packets without a VLAN tag.
1-0	I0_REG_P0_PORTSTATE	R/W	0h	Port State - Defins the current port state used for lookup operations. 0 - Disabled 1 - Blocked 2 - Learning 3 - Forwarding

9.6.638 ALE_I0_ALE_PORTCTL0_1 Register (Offset = 0003E044h) [Reset = 000000X0h]

ALE_I0_ALE_PORTCTL0_1 is shown in Table 9-670.

Return to the Summary Table.

The ALE Port Control Register sets the port specific modes of operation.

Table 9-670. ALE_I0_ALE_PORTCTL0_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	I0_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23-16	I0_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field.The ~imcast_limit is the number of Multicast packets that will be forwaded per ~iale_prescale time.
15	I0_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	I0_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.
13	I0_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with ~imaconly set.
12	I0_REG_P0_DIS_PAUTHMOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	I0_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the ~ip0_maconly bit set and the ~ip0_no_learn also set. If ~ip0_maconly bit is set and the ~ip0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	I0_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the ~ip0_trunken its set and having the same ~ip0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.

Table 9-670. ALE_I0_ALE_PORTCTL0_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	I0_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the ~ip0_trunken is also set. Ports with the same trunk number that have the ~ip0_trunken also set will have traffic distributed within the trunk based on the result of the hash function descrived above.
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the ~imirror_top port.
6	RESERVED	R	0h	
5	I0_REG_P0_NO_SA_UPDATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
3	I0_REG_P0_VID_INGRESS_CHECK	R/W	0h	VLAN Ingress Check - When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	I0_REG_P0_DROP_UN_TAGGED	R/W	0h	If Drop Untagged - When set will drop packets without a VLAN tag.
1-0	I0_REG_P0_PORTSTATE	R/W	0h	Port State - Defins the current port state used for lookup operations. 0 - Disabled 1 - Blocked 2 - Learning 3 - Forwarding

9.6.639 ALE_ALE_UVLAN_MEMBER Register (Offset = 0003E090h) [Reset = 00000000h]

ALE_ALE_UVLAN_MEMBER is shown in Table 9-671.

Return to the Summary Table.

The ALE Unknown VLAN Member Mask Register is used to specify the member list for unknown VLAN ID.

Table 9-671. ALE_ALE_UVLAN_MEMBER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	UVLAN_MEMBER_LIST	R/W	0h	Unknown VLAN Member List - Each bit represents the port member status for unknown VLANs.

9.6.640 ALE_ALE_UVLAN_URCAST Register (Offset = 0003E094h) [Reset = 00000000h]

ALE_ALE_UVLAN_URCAST is shown in Table 9-672.

Return to the Summary Table.

The ALE Unknown VLAN Unregistered Multicast Flood Mask Register is used to specify which egress ports unregistered multicast addresses egress for the unregistered VLAN ID.

Table 9-672. ALE_ALE_UVLAN_URCAST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	UVLAN_UNREG_MCAST_FLOOD_MASK	R/W	0h	Unknown VLAN Unregister Multicast Flood Mask - Each bit represents the port to which unregistered multicast are sent for unregistered VLANs.

9.6.641 ALE_ALE_UVLAN_RMCAST Register (Offset = 0003E098h) [Reset = 00000000h]

ALE_ALE_UVLAN_RMCAST is shown in Table 9-673.

Return to the Summary Table.

The ALE Unknown VLAN Registered Multicast Flood Mask Register is used to specify which egress ports registered multicast addresses egress for the unregistered VLAN ID.

Table 9-673. ALE_ALE_UVLAN_RMCAST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	UVLAN_REG_MCAST_FLOOD_MASK	R/W	0h	Unknown VLAN Register Multicast Flood Mask - Each bit represents the port to which registered multicast are sent for unregistered VLANs. This field is ANDed with the registered multicast mask to determine the destinations for unregistered VLANs.

9.6.642 ALE_ALE_UVLAN_UNTAG Register (Offset = 0003E09Ch) [Reset = 00000000h]

ALE_ALE_UVLAN_UNTAG is shown in Table 9-674.

Return to the Summary Table.

The ALE Unknown VLAN force Untagged Egress Mask Register is used to specify which egress ports the VLAN ID will be removed.

Table 9-674. ALE_ALE_UVLAN_UNTAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	UVLAN_FORCE_UNTAGGED_EGRESS	R/W	0h	Unknown VLAN Force Untagged Egress Mask - Each bit represents the port where the VLAN will be removed for unregistered VLANs.

9.6.643 ALE_ALE_FAST_LUT Register (Offset = 0003E0B4h) [Reset = 00000000h]

ALE_ALE_FAST_LUT is shown in Table 9-675.

Return to the Summary Table.

The Fast LUT registers allows the ports to be placed in Fast LUT mode.

Table 9-675. ALE_ALE_FAST_LUT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	FAST_LUT	R/W	0h	The ~Fast_LUT field alows any port to be Fast_LUT mode, which will cause all lookup operations to start based on DA/SA and VLAN only. That is any data beyong the first 32 are not used in the lookup process.

9.6.644 ALE_ALE_STAT_DIAG Register (Offset = 0003E0B8h) [Reset = 0000XXX0h]

ALE_ALE_STAT_DIAG is shown in Table 9-676.

Return to the Summary Table.

The ALE Statistic Output Diagnostic Register allows the output statistics to diagnose the SW counters. This register is for diagnostice only.

Table 9-676. ALE_ALE_STAT_DIAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15	PBCAST_DIAG	R/W	0h	When set and the ~iport_diag is set to zero, will allow all ports to see the same stat diagnostic increment.
14-9	RESERVED	R	0h	
8	PORT_DIAG	R/W	0h	The port selected that a received packet will cause the selected error to increment
7-4	RESERVED	R	0h	
3-0	STAT_DIAG	R/W	0h	When non-zero will cause the selected statistic to increment on the next frame received. For the selected Port. 0: Disabled 1: Destination Equal Source Drop Stat will count 2: VLAN Ingress Check Drop Stat will count 3: Source Multicast Drop Stat will count 4: Dual VLAN Drop Stat will count 5: Ether Type length error Drop Stat will count 6: Next Hop Limit Drop Stat will count 7: IPv4 Fragment Drop Stat will count 8: Classifier Hit Stat will count 9: Classifier Red Drop Stat will count 10: Classifier Yellow Drop Stat will count 11: ALE Overflow Drop Stat will count 12: Rate Limit Drop Stat will count 13: Blocked Address Drop Stat will count 14: Secure Address Drop Stat will count 15: Authorization Drop Stat will count.

9.6.645 ALE_ALE_OAM_LB_CTRL Register (Offset = 0003E0BCh) [Reset = 00000000h]

ALE_ALE_OAM_LB_CTRL is shown in Table 9-677.

Return to the Summary Table.

The ALE OAM Control allows ports to be put into OAM Loopback, only non-supervisor packet are looped back to the source port.

Table 9-677. ALE_ALE_OAM_LB_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	OAM_LB_CTRL	R/W	0h	The ~ioam_lb_ctrl allows any port to be put into OAM loopback, that is any packet received will be returned to the same port with an egressop of 0xFF which swaps the source and destination address. BPDUs will still flow through as normal so that OAM can be remotly requested and disabled.

9.6.646 ALE_ALE_MSK_MUX0 Register (Offset = 0003E0C0h) [Reset = 00000003h]

ALE_ALE_MSK_MUX0 is shown in Table 9-678.

Return to the Summary Table.

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregister mask respectively.

Table 9-678. ALE_ALE_MSK_MUX0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	VLAN_MASK_MUX_0	R	3h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

9.6.647 ALE_I1_ALE_MSK_MUX1_0 Register (Offset = 0003E0C4h) [Reset = 00000000h]

ALE_I1_ALE_MSK_MUX1_0 is shown in Table 9-679.

Return to the Summary Table.

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregister mask respectively.

Table 9-679. ALE_I1_ALE_MSK_MUX1_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	I1_REG_VLAN_MASK_MUX_1	R/W	0h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

9.6.648 ALE_I1_ALE_MSK_MUX1_1 Register (Offset = 0003E0C8h) [Reset = 00000000h]

ALE_I1_ALE_MSK_MUX1_1 is shown in Table 9-680.

Return to the Summary Table.

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregister mask respectively.

Table 9-680. ALE_I1_ALE_MSK_MUX1_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	I1_REG_VLAN_MASK_MUX_1	R/W	0h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

9.6.649 ALE_I1_ALE_MSK_MUX1_2 Register (Offset = 0003E0CCh) [Reset = 00000000h]

ALE_I1_ALE_MSK_MUX1_2 is shown in Table 9-681.

Return to the Summary Table.

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregister mask respectively.

Table 9-681. ALE_I1_ALE_MSK_MUX1_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	I1_REG_VLAN_MASK_MUX_1	R/W	0h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

9.6.650 ALE_EGRESSOP Register (Offset = 0003E0FCh) [Reset = 000XXXXXh]

ALE_EGRESSOP is shown in Table 9-682.

Return to the Summary Table.

The Egress Operation register allows enabled classifiers with any match like IPSA or IPDA match to use the CPSW Egress Packet Operations Inter VLAN Routing sub functions. If the packet was destined for the host or is destined to any port without any errors, but matches a clasifier that has a programmed egress opcode, it will be forwarded to the destination ports where the destination ports will use the thier egress opcode entry to modify the packet. InterVLAN Routing and mirroring need to be understood, they are orthogonal functions. Care must be taken not to violate VLAN rules as this can redirect packets based on classifier matches.

Table 9-682. ALE_EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0: NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. 0xff: Swap SA and DA of packet, this is intended to allow OAM diagnostics for a link.
23-21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements elclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
19-2	RESERVED	R	0h	
1-0	DEST_PORTS	R/W	0h	The Destination Ports is a list of the ports the classified packet will be set to. If a destination is a Trunk, all the port bits for that trunck must be set.

9.6.651 ALE_POLICECFG0 Register (Offset = 0003E100h) [Reset = XXX0XXX0h]

ALE_POLICECFG0 is shown in Table 9-683.

Return to the Summary Table.

The Policing Config 0 holds the port, frame priority and ONU address index as well as match enables for port, frame priority and ONU address matching.

Table 9-683. ALE_POLICECFG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PORT_MEN	R/W	0h	Port Match Enable - Enabled port match for the selected policing/ classifier entry
30	TRUNKID	R/W	0h	Trunk ID - When set indicates the port number is a trunk group.
29-26	RESERVED	R	0h	
25	PORT_NUM	R/W	0h	Port Number - Specifies the port address to match for the selected policing/classifier entry
24-20	RESERVED	R	0h	
19	PRI_MEN	R/W	0h	Priority Match Enable - Enables frame priority match for the selected policing/classifier entry
18-16	PRI_VAL	R/W	0h	Priority Value - Specifies the frame priority to match for the selected policing/classifier entry
15	ONU_MEN	R/W	0h	OUI Match Enable - Enables frame ONU address match for the selected policing/classifier entry
14-5	RESERVED	R	0h	
4-0	ONU_INDEX	R/W	0h	OUI Table Entry Index - Specifies the ALE ONU address lookup table index to match for the selected policing/classifier entry

9.6.652 ALE_POLICECFG1 Register (Offset = 0003E104h) [Reset = XXX0XXX0h]

ALE_POLICECFG1 is shown in Table 9-684.

Return to the Summary Table.

The Policing Config 1 holds the match enable/match index for the L2 Destination and L2 source addresses

Table 9-684. ALE_POLICECFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DST_MEN	R/W	0h	Destination Address Match Enable - Enables frame L2 destination address match for the selected policing/classifier entry
30-21	RESERVED	R	0h	
20-16	DST_INDEX	R/W	0h	Destination Address Table Entry Index - Specifies the ALE L2 destination address lookup table index to match for the selected policing/classifier entry
15	SRC_MEN	R/W	0h	Source Address Match Enable - Enables frame L2 source address match for the selected policing/classifier entry
14-5	RESERVED	R	0h	
4-0	SRC_INDEX	R/W	0h	Source Address Table Entry Index - Specifies the ALE L2 source address lookup table index to match for the selected policing/classifier entry

9.6.653 ALE_POLICECFG2 Register (Offset = 0003E108h) [Reset = XXX0XXX0h]

ALE_POLICECFG2 is shown in Table 9-685.

Return to the Summary Table.

The Policing Config 2 holds the match enable/match index for the Outer VLAN and Inner VLAN addresses

Table 9-685. ALE_POLICECFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	OVLAN_MEN	R/W	0h	Outer VLAN Match Enable - Enables frame Outer VLAN address match for the selected policing/classifier entry
30-21	RESERVED	R	0h	
20-16	OVLAN_INDEX	R/W	0h	Outer VLAN Table Entry Index - Specifies the ALE Outer VLAN address lookup table index to match for the selected policing/classifier entry Note this index assumes the VLANID is in the packet, it does not use the port VLAN if the packet in untagged or priority tagged.
15	IVLAN_MEN	R/W	0h	Inner VLAN Match Enable - Enables frame Inner VLAN address match for the selected policing/classifier entry
14-5	RESERVED	R	0h	
4-0	IVLAN_INDEX	R/W	0h	Inner VLAN Table Entry Index - Specifies the ALE Inner VLAN address lookup table index to match for the selected policing/classifier entry Note this index assumes the VLANID is in the packet, it does not use the port VLAN if the packet in untagged or priority tagged.

9.6.654 ALE_POLICECFG3 Register (Offset = 0003E10Ch) [Reset = XXX0XXX0h]

ALE_POLICECFG3 is shown in Table 9-686.

Return to the Summary Table.

The Policing Config 3 holds the match enable/match index for the Ether Type and IP Source address

Table 9-686. ALE_POLICECFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ETHERTYPE_MEN	R/W	0h	EtherType Match Enable - Enables frame Ether Type match for the selected policing/classifier entry
30-21	RESERVED	R	0h	
20-16	ETHERTYPE_INDEX	R/W	0h	EtherType Table Entry Index - Specifies the ALE Ether Type lookup table index to match for the selected policing/classifier entry
15	IPSRC_MEN	R/W	0h	IP Source Address Match Enable - Enables frame IP Source address match for the selected policing/classifier entry
14-5	RESERVED	R	0h	
4-0	IPSRC_INDEX	R/W	0h	IP Source Address Table Entry Index - Specifies the ALE IP Source address lookup table index to match for the selected policing/classifier entry

9.6.655 ALE_POLICECFG4 Register (Offset = 0003E110h) [Reset = XXX0XXXXh]

ALE_POLICECFG4 is shown in Table 9-687.

Return to the Summary Table.

The Policing Config 4 holds the match enable/match index for the IP Destination address

Table 9-687. ALE_POLICECFG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPDST_MEN	R/W	0h	IP Destination Address Match Enable - Enables frame IP Destination address match for the selected policing/classifier entry
30-21	RESERVED	R	0h	
20-16	IPDST_INDEX	R/W	0h	IP Destination Address Table Entry Index - Specifies the ALE IP Destination address lookup table index to match for the selected policing/classifier entry
15-0	RESERVED	R	0h	

9.6.656 ALE_POLICECFG6 Register (Offset = 0003E118h) [Reset = 00000000h]

ALE_POLICECFG6 is shown in Table 9-688.

Return to the Summary Table.

The PIR counter is a 37 bit internal counter where ~ipir_idle_inc_val is added every clock and the frame size << 18 is subtracted at EOF if not RED at LUT time. If the counter is negative the packet will be marked RED, else it can be YELLOW or GREEN based on the CIR counter. If only this counter is used (aka cir_idle_inc_val==0) Packet are marked RED or GREEN based on PIR counter only.

Table 9-688. ALE_POLICECFG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	PIR_IDLE_INC_VAL	R/W	0h	Peak Information Rate Idle Increment Value - The number added to the PIR counter every clock cycle. If zero the PIR counter is disabled and packets will never be marked or processed as RED.

9.6.657 ALE_POLICECFG7 Register (Offset = 0003E11Ch) [Reset = 00000000h]

ALE_POLICECFG7 is shown in Table 9-689.

Return to the Summary Table.

The CIR counter is a 37 bit internal counter where ~icir_idle_inc_val is added every clock and the frame size << 18 is subtracted at EOF if not RED or YELLOW at LUT time. If the counter is positive the packet will be marked GREEN, else it can be YELLOW or RED based on the PIR counter. If only this counter is used (aka pir_idle_inc_val==0) Packet are marked YELLOW or GREEN based on CIR counter only.

Table 9-689. ALE_POLICECFG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CIR_IDLE_INC_VAL	R/W	0h	Committed Information Idle Increment Value - The number added to the CIR counter every clock cycle. If zero the CIR counter is disabled and packets will never be marked or processed as YELLOW.

9.6.658 ALE_POLICETBLCTL Register (Offset = 0003E120h) [Reset = XXXXXXXXh]

ALE_POLICETBLCTL is shown in Table 9-690.

Return to the Summary Table.

The Policing Table Control is used to read or write the selected policing/classifier entry. The selected policing/classifier entry is only read or written after this register is written based on the value of the ~iwrite_enable bit.

Table 9-690. ALE_POLICETBLCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	WRITE_ENABLE	R/W	0h	Write Enable - Setting this bit will write the POLICECFG0-7 to the ~ipol_tbl_idx selected policing/classifier entry. Clearing this bit will read the ~ipol_tbl_idx selected policing/classifier entry into the POLICECFG0-7 registers.
30-2	RESERVED	R	0h	
1-0	POL_TBL_IDX	R/W	0h	Policer Entry Index - This field specifies the policing/classifier entry to be read or written. When writing to this field without setting the ~iwrite_enable=1 will cause the selected policing/classifier entry to be loaded into the POLICECFG0-7 registers. When writing to this field with setting the ~iwrite_enable=1 will cause the selected policing/classifier entry to be updated from the POLICECFG0-7 registers.

9.6.659 ALE_POLICECONTROL Register (Offset = 0003E124h) [Reset = XX0XXXXXh]

ALE_POLICECONTROL is shown in Table 9-691.

Return to the Summary Table.

The Control Enables color marking as well as internal ALE packet dropping rules.

Table 9-691. ALE_POLICECONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POLICING_EN	R/W	0h	Policing Enable - Enables the policing to color the packets, this also enables red or yellow drop capabilities.
30	RESERVED	R	0h	
29	RED_DROP_EN	R/W	0h	RED Drop Enable - Enables the ALE to drop the red colored packets.
28	YELLOW_DROP_EN	R/W	0h	WELLOW Drop Enable - Enables the ALE to drop yellow packets based on the ~iyellowthresh value. This field would normally not be used as to let the switch drop packets at a buffer threshold instead. In the event that the switch does not enable buffer threshold dropping, YELLOW packets can be dropped based on this feature.
27	RESERVED	R	0h	
26-24	YELLOWTHRESH	R/W	0h	Yellow Threshold - When set enables a portion of the yellow packets to be dropped based on the ~iyellow_drop_en enable. 0- 100% 1= 50% 2- 33% 3- 25% 4= 20% 5- 17% 6- 14% 7- 13%
23-22	POLMCHMODE	R/W	0h	Policing Match Mode - This field determines what happens to packets that fail to hit any policing/classifier entry. 0 - No Hit packets are marked GREEN 1 - No Hit packets are marked YELLOW 2 - No Hit packets are marked RED 3 - No Hit packets are marked based on policing/classifier entry=0 state.
21	PRIORITY_THREAD_EN	R/W	0h	Priority Thread Enable - This field determines if priority is OR'd to the default thread when no classifiers hit and the default thread is enabled.
20	MAC_ONLY_DEF_DIS	R/W	0h	MAC Only Default Disable - This field when set disables the default thread on MAC Only Ports. That is the default thread will be {port,priority}. If the traffic matches a classifier with a thread mapping, the classifier thread mapping still occurs.
19-0	RESERVED	R	0h	

9.6.660 ALE_POLICETESTCTL Register (Offset = 0003E128h) [Reset = 0XXXXXXXh]

ALE_POLICETESTCTL is shown in Table 9-692.

Return to the Summary Table.

The Policing Test Control enables the ability to determine which policing entry has been hit and whether they reported a red or yellow rate condition.

Table 9-692. ALE_POLICETESTCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POL_CLRALL_HIT	R/W	0h	Policer Clear - This bit clears all the policing/classifier hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit.
30	POL_CLRALL_REDHIT	R/W	0h	Policer Clear RED - This bit clears all the policing/classifier RED hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit during a RED condition.
29	POL_CLRALL_YELLOWHIT	R/W	0h	Policer Clear YELLOW - This bit clears all the policing/classifier YELLOW hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit during a YELLOW condition.
28	POL_CLRSEL_ALL	R/W	0h	Police Clear Selected - This bit clears the selected policing/classifier hit, redhit and yellowhit bits. This bit is self clearing.
27-2	RESERVED	R	0h	
1-0	POL_TEST_IDX	R/W	0h	Policer Test Index - This field selects which policing/classifier hit bits will be read or written.

9.6.661 ALE_POLICEHSTAT Register (Offset = 0003E12Ch) [Reset = XXXXXXXXh]

ALE_POLICEHSTAT is shown in Table 9-693.

Return to the Summary Table.

The policing hit status is a read only register that reads the hit bits of the selected policing/classifier.

Table 9-693. ALE_POLICEHSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POL_HIT	R	0h	Policer Hit - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit by a packet seen on any port that matches the policing/classifier entry match.
30	POL_REDHIT	R	0h	Policer Hit RED - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit during a RED condition by a packet seen on any port that matches the policing/classifier entry match.
29	POL_YELLOWHIT	R	0h	Policer Hit YELLOW - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit during a YELLOW condition by a packet seen on any port that matches the policing/classifier entry match.
28-0	RESERVED	R	0h	

9.6.662 ALE_THREADMAPDEF Register (Offset = 0003E134h) [Reset = 0000XXX0h]

ALE_THREADMAPDEF is shown in Table 9-694.

Return to the Summary Table.

The THREAD Mapping Default Value register is used to set the default thread ID when no classifier is matched,

Table 9-694. ALE_THREADMAPDEF Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15	DEFTHREAD_EN	R/W	0h	Default Tread Enable - When set the switch will use the ~idefthreadval for the host interface thread ID if no classifier is matched. If clear the switch will generate its own thread ID based on port and priority if there is no classifier match.
14-6	RESERVED	R	0h	
5-0	DEFTHREADVAL	R/W	0h	Default Thread Value - This field specifies the default thread ID value.

9.6.663 ALE_THREADMAPCTL Register (Offset = 0003E138h) [Reset = 00000000h]

ALE_THREADMAPCTL is shown in Table 9-695.

Return to the Summary Table.

The THREAD Mapping Control register allows the highest matched classifier to return a particular thread ID for traffic sent to the host. This allows particular classifier matched traffic to be placed an a particular hosts queue.

Table 9-695. ALE_THREADMAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	CLASSINDEX	R/W	0h	Classifier Index - This is the classifier index entry that the thread enable and thread value will be read or written by the ~bTHREADMAPVAL register.

9.6.664 ALE_THREADMAPVAL Register (Offset = 0003E13Ch) [Reset = 0000XXX0h]

ALE_THREADMAPVAL is shown in Table 9-696.

Return to the Summary Table.

The THREAD Mapping Value register is used to set the thread ID for a particular classifier entry.

Table 9-696. ALE_THREADMAPVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15	THREAD_EN	R/W	0h	Thread Enable - When set the switch will use the ~ithreadval for the selected classifier match. If clear the the thread ID will be determined by the ~bTHREADMAPDEF register settings.
14-6	RESERVED	R	0h	
5-0	THREADVAL	R/W	0h	Thread Value - This field is the thread ID value that is used to map a classifier hit to thread ID for host traffic.

9.6.665 rev Register (Offset = 0003F000h) [Reset = 66A03A01h]

rev is shown in Table 9-697.

Return to the Summary Table.

Revision parameters

Table 9-697. rev Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	scheme	R	1h	Scheme
29-28	bu	R	2h	bu
27-16	module_id	R	6A0h	Module ID
15-11	revrtl	R	7h	RTL version
10-8	revmaj	R	2h	Major version
7-6	custom	R	0h	Custom version
5-0	revmin	R	1h	Minor version

9.6.666 vector Register (Offset = 0003F008h) [Reset = 0000XX00h]

vector is shown in Table 9-698.

Return to the Summary Table.

ECC Vector Register

Table 9-698. vector Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R	0h	
24	rd_svbus_done	R/W1C	0h	Status to indicate if read on serial VBUS is complete, write of any value will clear this bit.
23-16	rd_svbus_address	R/W	0h	Read address
15	rd_svbus	R/W1S	0h	Write 1 to trigger a read on the serial VBUS
14-11	RESERVED	R	0h	
10-0	ecc_vector	R/W	0h	Value written to select the corresponding ECC RAM for control or status

9.6.667 stat Register (Offset = 0003F00Ch) [Reset = 00000005h]

stat is shown in Table 9-699.

Return to the Summary Table.

Misc Status

Table 9-699. stat Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	0h	
10-0	num_rams	R	5h	Indicates the number of RAMS serviced by the ECC aggregator

9.6.668 ECC_reserved_svbus_0 Register (Offset = 0003F010h) [Reset = 00000000h]

ECC_reserved_svbus_0 is shown in Table 9-700.

Return to the Summary Table.

Reference other documents that contain the ECC RAM wrapper and EDC controller serial vbus register sets.

Table 9-700. ECC_reserved_svbus_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	data	R/W	0h	Serial VBUS register data

9.6.669 ECC_reserved_svbus_1 Register (Offset = 0003F014h) [Reset = 00000000h]

ECC_reserved_svbus_1 is shown in Table 9-701.

Return to the Summary Table.

Reference other documents that contain the ECC RAM wrapper and EDC controller serial vbus register sets.

Table 9-701. ECC_reserved_svbus_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	data	R/W	0h	Serial VBUS register data

Chapter 10

Quad Serial Peripheral Interface (QSPI)

10.1 Quad Serial Peripheral Interface Overview

The quad serial peripheral interface (QSPI) module is a kind of SPI module that allows single, dual, or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. The QSPI works as a controller only.

The one QSPI in the device is primarily intended for fast booting from quad-SPI flash memories. Figure 10-1 shows the QSPI module overview.

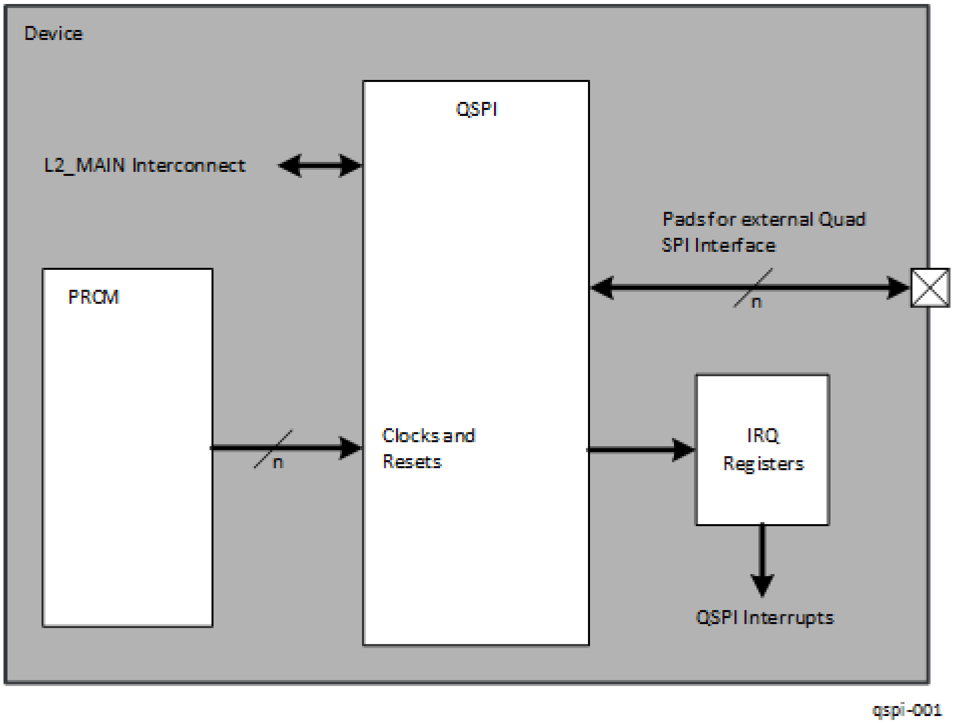

Figure 10-1. QSPI Overview

The QSPI supports the following features:

- General SPI features:
  - Programmable clock divider
  - Max four pin interface
  - Programmable length (from 1 to 128 bits) of the words transferred
  - Programmable number (from 1 to 4096) of the words transferred
  - 1 external chip-select signal
  - Support for 1 pin Write. Dual or quad writes are not supported
  - Support for 1-, 2-, or 4-pin SPI interface
  - Optional interrupt generation on word or frame (number of words) completion
  - Programmable delay between chip select activation and output data from 0 to 3 QSPI clock cycles
  - Programmable signal polarities
  - Programmable active clock edge
  - Software-controllable interface allowing for any type of SPI transfer
  - Control through L2_MAIN configuration port
- Serial flash interface (SFI) features:
  - Serial flash read/write interface
  - Additional registers for defining read and write commands to the external serial flash device
  - External flash support of up to 8 MB

  - Fast read support, where fast read requires dummy bytes after address bytes; 0 to 3 dummy bytes can be configured.
  - Dual read support
  - Quad read support
  - Little-endian support (only for memory mapped registers used to configure QSPI controller and not SPI content accesses)
  - Linear increment addressing mode only

The QSPI supports only dual and quad reads. Dual or quad writes are not supported. In addition, there is no "pass through" mode supported where the data present on the QSPI input is sent to its output.

Note

The QSPI module does not support cache line wrap mode.

10.2 QSPI Environment

Figure 10-2 shows a typical connection of the QSPI module to the external quad-SPI flash memory.

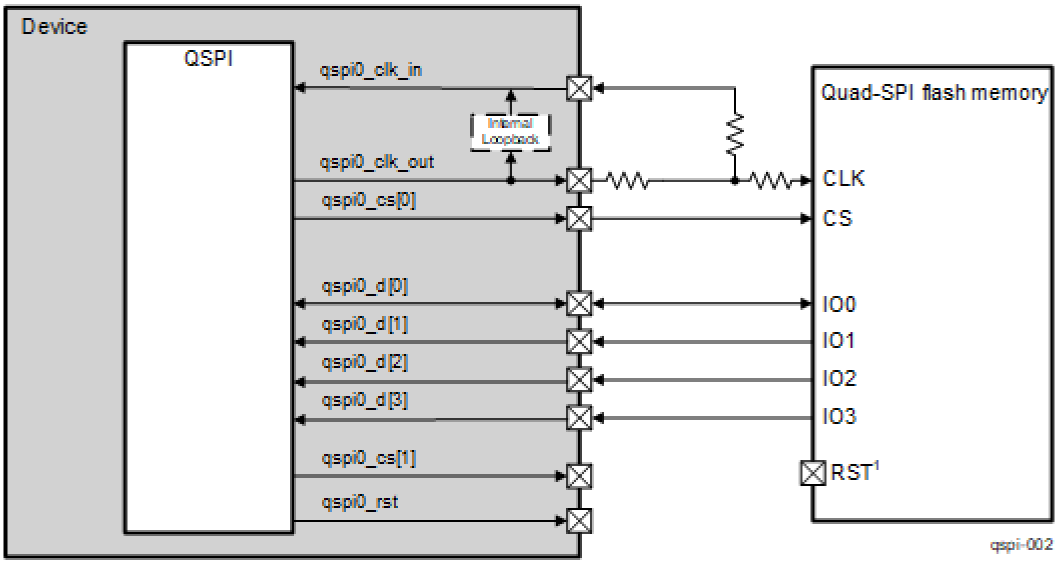

Figure 10-2. QSPI Connected to an External Quad-SPI Flash Memory

1. External flash memories that are larger than 128 Mb require an external reset pin for correct operation after SoC PORz reset. This reset must be triggered upon board reset to ensure the flash is in the correct state upon boot.

Table 10-1 lists and describes the QSPI I/O signals.

Table 10-1. QSPI I/O Signals

QSPI Signal/Pad name	I/O(1)	Description					
		3-pin(2) SPI Read (Single Read)	3-pin(2) SPI Write (Single Write)	4-pin(2) SPI Read (Single Read)	4-pin(2) SPI Write (Single Write)	4-pin(2) SPI Read (Dual Read)	6-pin(2) SPI Read (Quad Read)
qspi0_d[0]	IO	Used as SPI data input	Used as SPI data output	Not used	Used as SPI data output	Used as SPI data input 0	Used as SPI data input 0
qspi0_d[1]	I	Not used	Not used	Used as SPI data input	Not used	Used as SPI data input 1	Used as SPI data input 1
qspi0_d[2]	I	Not used	Not used	Not used	Not used	Not used	Used as SPI data input 2
qspi0_d[3]	I	Not used	Not used	Not used	Not used	Not used	Used as SPI data input 3

Table 10-1. QSPI I/O Signals (continued)

QSPI Signal/Pad name	I/O[1]	Description					
		3-pin[2] SPI Read (Single Read)	3-pin[2] SPI Write (Single Write)	4-pin[2] SPI Read (Single Read)	4-pin[2] SPI Write (Single Write)	4-pin[2] SPI Read (Dual Read)	6-pin[2] SPI Read (Quad Read)
qspi0_sclk	O	Clock for the external SPI device					
qspi0_cs[0]	O	External SPI device chip-select 0					
qspi0_rtclk	I	The qspi0_sclk output must be connected to the qspi0_rtclk input, and is used for controlling the timing of the read return data when the QSPI module operates in Mode 0. In case Mode 3 is used, there is no need to connect the qspi0_sclk to the qspi0_rtclk.					

(1) I = Input; O = Output

(2) This is the pin count at the SPI flash memory side. The pin count at the device side is increased by one because of the qspi0_rtclk signal. References to the pin count throughout this chapter consider the pin count at the SPI flash memory side.

Note

To ensure proper timing, precise layout and routing requirements must be followed. For layout and routing requirements for all QSPI signals, see section "PCB Guidelines" of the device Data Manual.

10.3 QSPI Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

10.4 QSPI Functional Description

10.4.1 QSPI Block Diagram

Initial device boot from external SPI flash memory can be accomplished through the QSPI module. The interface is a simple 4-wire SPI used for control or data transfers. The QSPI also supports a 3-wire SPI protocol where the qspi0_d[0] signal is used as a bidirectional for reads and writes. In addition, a 6-wire mode can be used to support quad read devices. Figure 10-3 shows the QSPI block diagram.

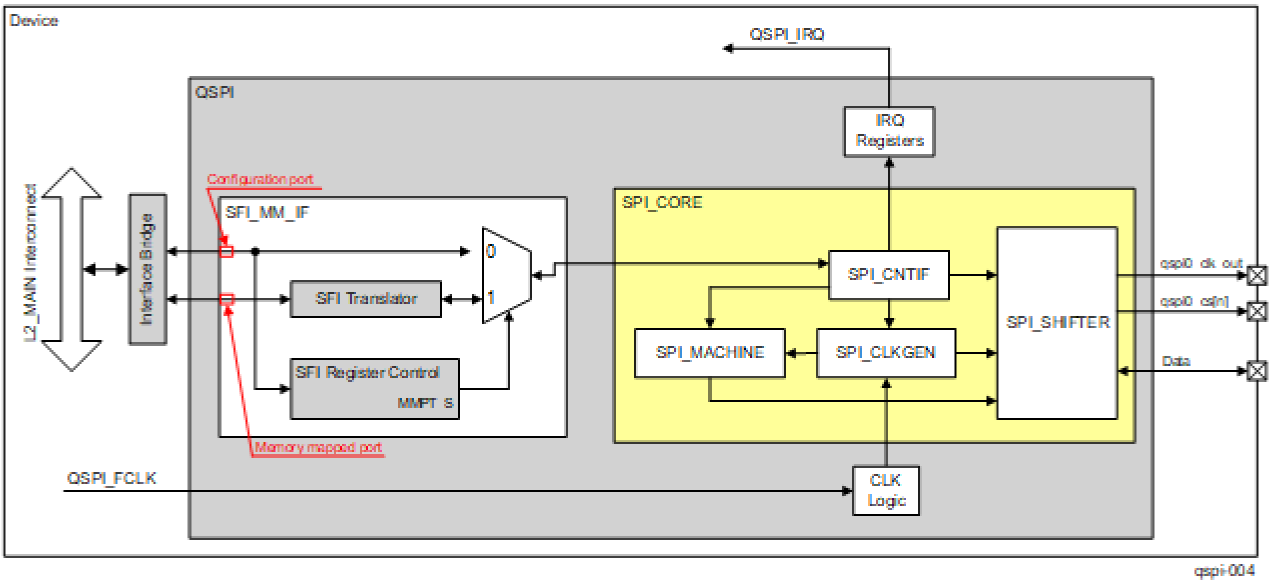

Figure 10-3. QSPI Block Diagram

The QSPI is composed of two blocks. The first one is the SFI memory-mapped interface (SFI_MM_IF) and the second one is the SPI core (SPI_CORE). The SFI_MM_IF block is associated only with SPI flash memories and is used for specifying typical for the SPI flash memories settings (read or write command, number of address and dummy bytes, and so on) unlike the SPI_CORE block, which is associated with the SPI interface itself and is used to configure typical SPI settings (chip-select polarity, serial clock inactive state, SPI clock mode, length of the words transferred, and so on).

The SFI_MM_IF comprises the following two subblocks:

- SFI register control
- SFI translator

The SPI_CORE comprises the following four subblocks:

- SPI control interface (SPI_CNTIF)
- SPI clock generator (SPI_CLKGEN)
- SPI control state machine (SPI_MACHINE)
- SPI data shifter (SPI_SHIFTER)

In addition, an interface bridge connects the two ports (configuration port and memory-mapped port) of the SFI_MM_IF block to the L2_MAIN interconnect. There are no software controls associated with this interface bridge.

The QSPI supports long transfers through a frame-style sequence. In its generic SPI use mode, a word can be defined up to 128 bits and multiple words can be transferred during a single access. For each word, a device initiator must read or write the new data and then tell the QSPI to continue the current operation. Using this sequence, a maximum of 4096 128-bit words can be transferred in a single SPI read or write operation. This allows great flexibility when connecting the QSPI to various types of devices.

As opposed to the generic SPI use mode, the communication with serial flash-type devices requires sending a byte command, followed by sending bytes of data. Commands can be sent through the SPI_CORE block to communicate with a serial flash device; however, it is easier to do this using the SFI_MM_IF block because it is intended to ease the communication with serial flash devices. If the SPI_CORE is used to communicate with a serial flash device, software must load the command into the SPI data transfer register with additional configuration fields, perform the byte transfer, then place the data to be sent (or configure for receive) along with additional configuration fields, and perform that transfer. Reads and writes to serial flash devices are more specific. First, the read or write command byte is sent, followed by 1 to 4 bytes of address (corresponding to the address to read/write), then followed by the data write/receive phase. Data is always sent byte oriented. When the address is loaded, data can be continuously read or written, and the address will automatically increment to each byte address internally to the serial flash device.

Note

The SFI_MM_IF block only allows reading and writing to an externally connected SPI flash device. The SFI_MM_IF block does not allow reads or writes to internal configuration and status registers of the SPI flash device. These registers must be accessed through the features of the SPI_CORE block.

10.4.1.1 SFI Register Control

The SFI register control block consists of the following five configuration registers:

- QSPI_SPI_SETUP0_REG
- QSPI_SPI_SETUP1_REG
- QSPI_SPI_SETUP2_REG
- QSPI_SPI_SETUP3_REG
- QSPI_SPI_SWITCH_REG

The first four registers let the user define the following:

- Byte command for a serial flash read specified by the QSPI_SPI_SETUPi_REG[7:0] RCMD bit field
- Byte command for a serial flash write specified by the QSPI_SPI_SETUPi_REG[23:16] WCMD bit field
- Number of address bytes required for the particular type of serial flash specified by the QSPI_SPI_SETUPi_REG[9:8] NUM_A_BYTES bit field
- Number of “dummy bytes” that may be needed to support the fast read mode function of some serial flash devices. The QSPI_SPI_SETUPi_REG[11:10] NUM_D_BYTES bit field specifies the number of "dummy

bits." In addition, the QSPI_SPI_SETUPi_REG[28:24] NUM_D_BITS bit field can also specify the number of "dummy bits."
- Whether the read command is single (normal), dual, or quad read mode command. This is specified by the QSPI_SPI_SETUPi_REG[13:12] READ_TYPE bit field.
- i is equal to 0, 1, 2 and 3 and means that the QSPI_SPI_SETUPi_REG registers are associated with each of the four supported chip-selects [that is, four supported output SPI flash devices])

The QSPI_SPI_SWITCH_REG register acts as a static switch which allows the configuration port (shown in Figure 10-3) to connect directly to the SPI_CORE block, or allows the memory-mapped port (also shown in Figure 10-3) to connect to the SPI_CORE block. This is done using the QSPI_SPI_SWITCH_REG[0] MMPT_S bit.

In addition, the QSPI_SPI_SWITCH_REG[1] MM_INT_EN bit is used to enable or disable the word complete interrupt during operations using the memory-mapped port.

10.4.1.2 SFI Translator

The SFI translator block represents an FSM which, based on the configuration information loaded into the SFI register control block, converts each input read/write sequence into an SPI_CORE configuration sequence for access to the external serial flash memory.

A read sequence is converted into the following actions:
1. SPI chip-select goes active.
2. Read command byte is issued.
3. 1 to 4 address bytes, which correspond to the first address supplied, are issued.
4. 0 to 3 dummy bytes are issued, if “fast read” is supported.
5. Data bytes are read from the external SPI flash memory.
6. SPI chip-select goes inactive.

For linear addressing mode, action 5 is repeated until the byte count to be transferred reaches zero.

A write sequence is identical to a read sequence, except that a write sequence does not use dummy bytes.

Another important aspect with regard to writes is that a serial flash memory location can only be written to if the bits are erased in advance. Erased means the bits are set to 1. This means that writing only changes 1 contents to 0. It is not possible with this write to change the contents of a bit from 0 to 1. An erase command must be performed to do this operation. Erase commands cannot be executed on single byte locations. Depending on device types, there are page, block, and chip erase commands. To perform an erase command, the particular command must be sent over the SPI bus, and an internal register of the serial flash device must then be polled to determine when the erase completes. The erases must be done through the configuration port by software before performing any writes through the memory-mapped port. This means that writes are passed through to the serial flash device, but if the memory locations being modified are not properly erased before the write, the contents may not result in what was sent.

Note

The input to the SFI Memory Mapped Protocol Translator is 23 address lines. Therefore, the SFI mode of operation supports external flash size of up to 8MB

10.4.1.3 SPI Control Interface

The SPI control interface contains configuration registers used to configure the SPI core functionality of the QSPI. This block maintains all configuration settings for the SPI core (that is, settings specific for the SPI interface itself but not for the SPI flash memories).

The registers defined for this block are:
- The QSPI_PID register, which is read only and contains QSPI revision associated information
- The QSPI_SPI_CLOCK_CNTRL_REG register, which is used to control external SPI clock (qspi0_sclk)

- The QSPI_SPI_DC_REG register used to define the SPI clock mode and chip-select polarity for the four external SPI devices
- The QSPI_SPI_CMD_REG register used to control the operation of the SPI command. This register is also used to configure and transfer data.
- Four data registers used for reading the data received and for writing the data to be transferred. These registers are:
  - QSPI_SPI_DATA_REG
  - QSPI_SPI_DATA_REG_1
  - QSPI_SPI_DATA_REG_2
  - QSPI_SPI_DATA_REG_3

  These four registers compose a 128-bit shift register.
- The QSPI_SPI_STATUS_REG register, which contains status information

All of these registers can only be written if the QSPI is not busy. This means that they can be written if the QSPI_SPI_STATUS_REG[0] BUSY bit is 0x0. The QSPI becomes busy when a write to the QSPI_SPI_CMD_REG[18:16] CMD bit field is performed. Writing to this bit field starts an SPI transaction and sets the QSPI_SPI_STATUS_REG[0] BUSY bit to 0x1. The CMD bit field can be written again when the BUSY bit is 0x0. In addition, the start of the SPI transaction is synchronized to the qspi0_sclk clock and clearing of the BUSY bit is synchronized to the QSPI_FCLK clock.

The register group QSPI_SPI_DATA_REG_3, QSPI_SPI_DATA_REG_2, QSPI_SPI_DATA_REG_1 and QSPI_SPI_DATA_REG is treated as a single 128-bit word for shifting data in and out. The QSPI_SPI_DATA_REG_3 register is used for the most significant bits and the QSPI_SPI_DATA_REG is used for the least significant bits.This applies for both reads and writes. For example, after reading a 128-bit word (WLEN = 0x7F) the most significant bit of the data read, that is bit 127, will be located at QSPI_SPI_DATA_REG_3[31] position and the least significant bit, that is bit 0 of the data read, will be located at the QSPI_SPI_DATA_REG[0] position.

The data written to this register group should be right justified so that a data pre-shifting is not required. The QSPI_SPI_CMD_REG[25:19] WLEN bit field determines the location of the most significant bit and the bit position that will be shifted out first during a write. In order to shift out byte data the WLEN bit field should be set to 0x7 and the data byte should be written to the lower byte of the QSPI_SPI_DATA_REG register. By setting the word length to 0x7 the QSPI_SPI_DATA_REG register will look like a pseudo 8-bit shift register. When the user wants to write 40-bit long word the WLEN bit field should be set to 0x27, the 32 least significant bits of data should be written to the QSPI_SPI_DATA_REG and the rest 8 most significant bits of data should be written to the lower byte of the QSPI_SPI_DATA_REG_1 register. By setting WLEN to 0x27 these two registers will look like a pseudo 40-bit shift register. When the word length is greater than 64 bits the QSPI_SPI_DATA_REG_2 register is also used and the previously described logic applies. The QSPI_SPI_DATA_REG_3 register is used together with the other three data registers when the word length is greater than 96 bits.

When dual or quad read mode is used the number of the words transferred must be even. This number is configured through the QSPI_SPI_CMD_REG[11:0] FLEN bit field.

Note

The QSPI module does not support a "pass through" mode where the data present on qspi0_d[1] is sent to qspi0_d[0], when 4-pin non-dual read mode is used. This means that setting the QSPI_SPI_CMD_REG[18:16] CMD bit field to 0x1 causes the QSPI only to read from an external device using the qspi0_d[1] pad as an input and if a write to the same external device is desired, the CMD bit field should be set to 0x2, which causes the qspi0_d[0] pad to be used as an output.

10.4.1.4 SPI Clock Generator

The SPI clock generator uses the QSPI_FCLK clock as an input, and generates the qspi0_sclk, which is a divided version of the QSPI_FCLK clock. The divide ratio is a 16-bit value configured through the QSPI_SPI_CLOCK_CNTRL_REG[15:0] DCLK_DIV bit field and thus provides a division factor in a range from

1 to 65536. The QSPI_FCLK clock is divided by the DCLK_DIV value + 1 to provide the qspi0_sclk clock. When DCLK_DIV = 0x0 the QSPI_FCLK clock equals the DCLK clock. The value in the DCLK_DIV bit field applies only when the QSPI_SPI_CLOCK_CNTRL_REG[31] CLKEN bit is set to 0x1. Figure 10-4 shows the SPI_CLKGEN block.

If the CLKEN bit is 0x0 the command specified in the QSPI_SPI_CMD_REG[18:16] CMD bit field is not executed and the QSPI_SPI_STATUS_REG[0] BUSY bit is not set. The command is executed only if the CLKEN bit is 0x1 before write to the CMD bit field.

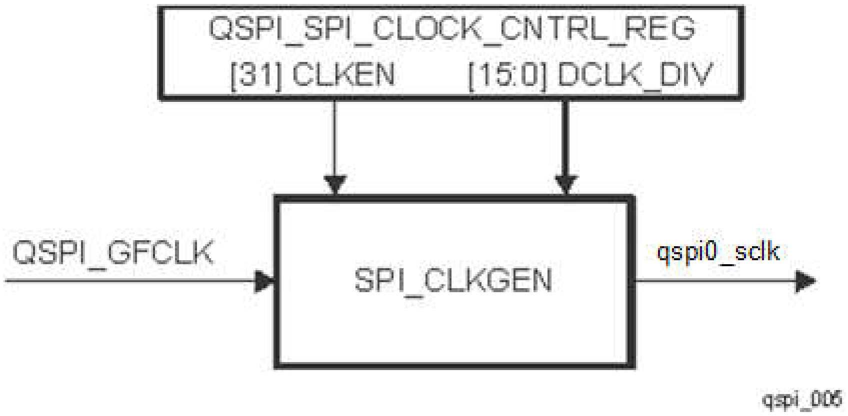

Figure 10-4. SPI_CLKGEN Block

10.4.1.5 SPI Control State-Machine

The SPI control state-machine (SPI_MACHINE) manages the operation of the SPI_CORE block. SPI_MACHINE takes control and configuration information from the registers in the SPI_CNTIF block as input and provides control information to the SPI data shifter. This information is used to control the SPI data port. The SPI_MACHINE also generates status information, which is sent back to the SPI_CNTIF block.

Writing a valid value to the QSPI_SPI_CMD_REG[18:16] CMD bit field sets immediately the QSPI_SPI_STATUS_REG[0] BUSY bit to 0x1, activates the corresponding qspi0_cs[n] (n = 0 to 1) and starts the SPI data transaction. The BUSY bit is cleared automatically when QSPI_SPI_CMD_REG[25:19] WLEN number of bits are shifted in or out. If the value of the QSPI_SPI_STATUS_REG®[27:16] WDCNT bit field is different than 0x0 and WLEN number of bits are shifted already, the SPI_MACHINE waits until another write to the CMD bit field is performed. If the command written to the CMD bit field is valid, then this increments the value of the WDCNT bit field from 0x0 and starts shifting data in or out again. This is repeated until the WDCNT bit field reaches the frame length (QSPI_SPI_CMD_REG[11:0] FLEN), that is, all words of the frame are shifted or till earlier frame termination occurs. While the SPI_MACHINE is waiting for write to the CMD bit field the corresponding qspi0_cs[n] (n = 0 to 1) remains active and the BUSY flag is set to 0x0. In addition, the bit length for each word can be changed during a frame from 1 to 128 bits using the QSPI_SPI_CMD_REG[25:19] WLEN bit field.

The SPI_MACHINE also provides a mechanism to terminate the frame earlier. This is done by writing an invalid command to the CMD bit field. An invalid command corresponds to the 0x0 and 0x4 (reserved) values of the CMD bit field. Writing one of these values when the the WDCNT bit field is not equal to 0x0 and when the BUSY flag is 0x0 terminates the frame earlier.

The corresponding qspi0_cs[n] (n = 0 to 1) becomes inactive when all words are shifted or when the frame terminates earlier.

10.4.1.6 SPI Data Shifter

The SPI data shifter handles the capture and generation of the SPI interface signals. Based on control signals from the SPI_MACHINE and SPI_CNTIF blocks, data is shifted in or out on falling or rising edge of qspi0_sclk clock depending on the SPI clock mode selected. Table 10-2 lists the four defined clock modes of operation for the QSPI.

Table 10-2. SPI Clock Modes Definition

Mode	Settings in the QSPI_SPI_DC_REG Register		Description
	Value of the CKP bits	Value of the CKPH bits	
0	0	0	Data input captured on falling edge of qspi0_sclk clock. Data output generated on falling edge of qspi0_sclk clock
1	0	1	Data input captured on rising edge of qspi0_sclk clock. Data output generated on rising edge of qspi0_sclk clock
2	1	0	Data input captured on rising edge of qspi0_sclk clock. Data output generated on rising edge of qspi0_sclk clock
3	1	1	Data input captured on falling edge of qspi0_sclk clock. Data output generated on falling edge of qspi0_sclk clock

Note

Mode 1 and Mode 2 are not supported and should not be used.

The CKPi and CKPHi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register control the clock modes. Each of these 4 bits corresponds to an output chip select.

Figure 10-5 shows all four clock modes. In addition, through the DDi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register the data can be delayed from one to three qspi0_sclk clock cycles after the corresponding qspi0_cs[n] (n = 0 to 1) goes active. The active state of each chip-select can also be controlled through the CSPi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register.

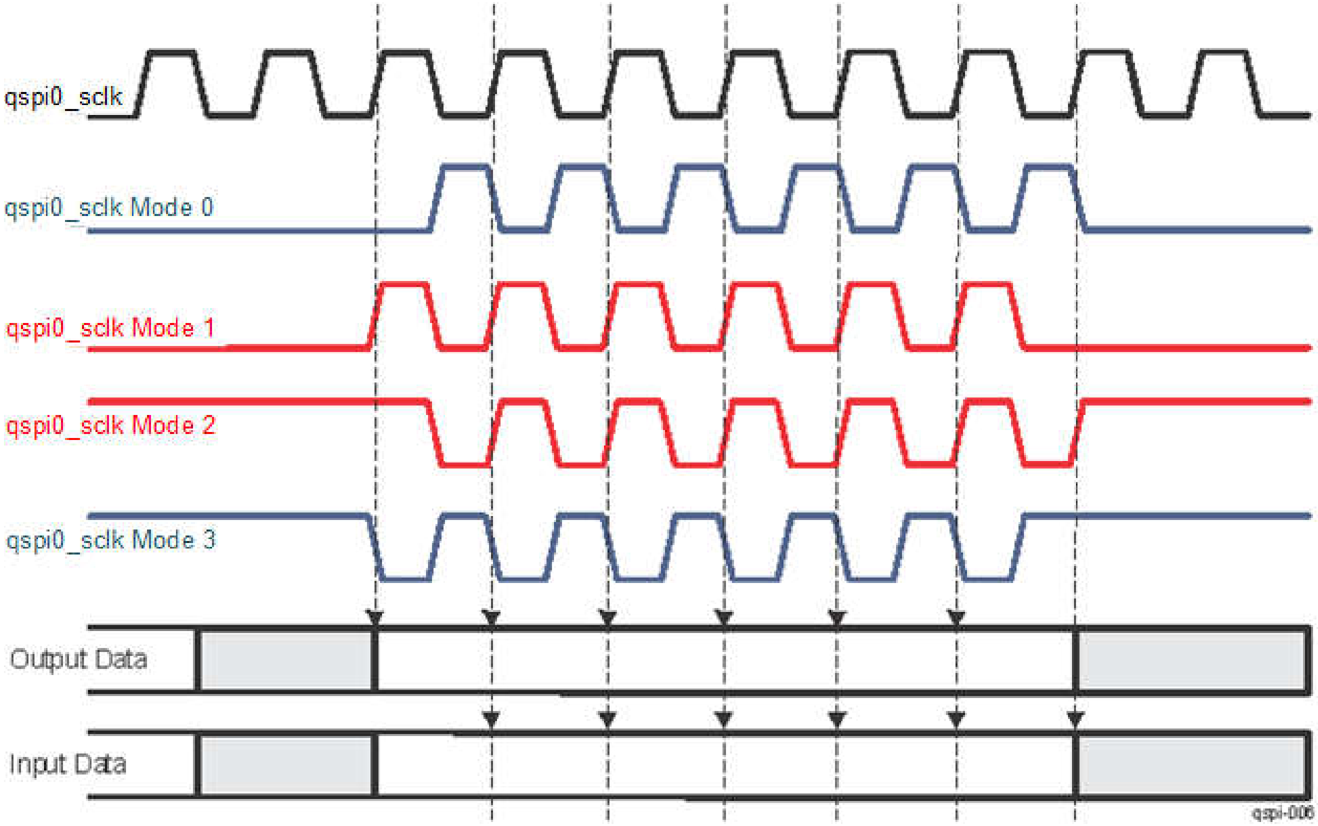

Figure 10-5. SPI Clock Modes

10.4.2 QSPI Clock Configuration

The QSPI complies with the PRCM peripheral-idle protocol. The QSPI_FCLK clock is gated based on the values loaded in the QSPI_SYSCONFIG[3:2] IDLE_MODE bit field. Three modes are supported:

- Force-idle: The QSPI_FCLK clock is gated unconditionally by the QSPI.
- No-idle: The QSPI_FCLK clock is never gated by the QSPI.
- Smart-idle: The QSPI_FCLK clock is gated by the QSPI, depending on its internal requirements.

10.4.3 QSPI Interrupt Requests

Figure 10-6 shows a logical representation of the QSPI interrupt generation scheme.

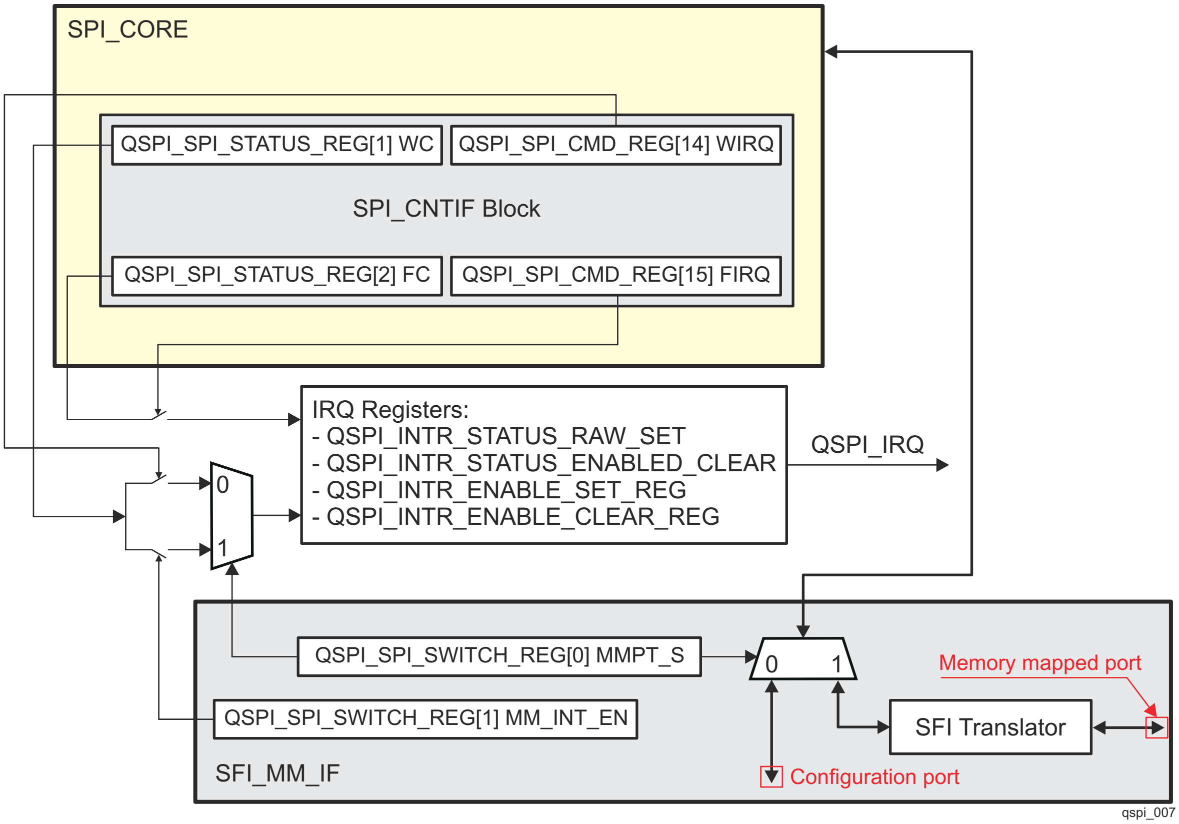

Figure 10-6. Logical Representation of the QSPI Interrupt Generation Scheme

QSPI_SPI_STATUS_REG[1] WC and QSPI_SPI_STATUS_REG[2] FC are status bits indicating whether word or frame transfer is complete. Setting the corresponding interrupt enable bit (WIRQ or FIRQ) in the QSPI_SPI_CMD_REG register allows these events (WC and FC) to generate an interrupt. The WC and FC bits are reset every time the user writes to the QSPI_SPI_CMD_REG register or reads the QSPI_SPI_STATUS_REG register. This is done to keep control parameters from changing the interface protocol signals while a transfer is in progress. Additionally, the QSPI_SPI_SWITCH_REG[1] MM_INT_EN bit is used to enable or disable the word complete interrupt during operations using the memory-mapped port.

When the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_SPI_CMD_REG[15] FIRQ bits are set to 0x1 the following applies:

- The QSPI activates its interrupt line only if the interrupts are enabled by setting to 0x1 the corresponding bits in the QSPI_INTR_ENABLE_SET_REG register. These interrupts can be disabled by setting the corresponding bits in the QSPI_INTR_ENABLE_CLEAR_REG register to 0x1.
- After an interrupt has been serviced, software must clear the corresponding status flag. This is done by setting the corresponding bit in the QSPI_INTR_STATUS_ENABLED_CLEAR register to 0x1, which

also clears the corresponding bit in the QSPI_INTR_STATUS_RAW_SET register. The status flags in the QSPI_INTR_STATUS_RAW_SET register are set even if the corresponding interrupt is disabled unlike those in the QSPI_INTR_STATUS_ENABLED_CLEAR register, which are set only if the corresponding interrupt is enabled.
- The QSPI also generates an interrupt if a certain bit in the QSPI_INTR_STATUS_RAW_SET register is set to 0x1 and the corresponding interrupt is enabled through the QSPI_INTR_ENABLE_SET_REG register. This feature is useful during user software debugging. In addition, even if interrupts are not enabled a corresponding raw flag in the QSPI_INTR_STATUS_RAW_SET register is set to 0x1 when an IRQ condition occurs.
- Even if interrupts are not enabled, a certain status bit in the QSPI_INTR_STATUS_RAW_SET register can also be cleared by setting to 0x1 the corresponding bit in the QSPI_INTR_STATUS_ENABLED_CLEAR register.

It must be considered that the previously described scenario applies if the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_SPI_CMD_REG[15] FIRQ bits are set to 0x1.

Note

The QSPI_IRQ interrupt line is activated only if at least one of the following conditions is met:
- The word complete interrupt is enabled:
  - during operations using the memory-mapped port by setting to 0x1 both the QSPI_SPI_SWITCH_REG[1] MM_INT_EN and QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET bits.
  - during operations using the configuration port by setting to 0x1 both the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET bits.
- The frame complete interrupt is enabled setting to 0x1 both the QSPI_SPI_CMD_REG[15] FIRQ and QSPI_INTR_ENABLE_SET_REG[0] FIRQ_ENA_SET bits.

The QSPI_IRQ interrupt line is also activated when both the conditions are met.

Table 10-3 lists the event flags and the corresponding mask bits of the sources which can cause interrupts.

Table 10-3. QSPI Events

Event Flag	Event Mask	Description
QSPI_INTR_STATUS_RAW_SET[1] WIRQ_RAW QSPI_INTR_STATUS_ENABLED_CLEAR[1] WIRQ_ENA QSPI_SPI_STATUS_REG[1] WC	QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET QSPI_INTR_ENABLE_CLEAR_REG[1] WIRQ_ENA_CLR QSPI_SPI_CMD_REG[14] WIRQ	Word complete interrupt event. Asserted each time after a word is transferred or received.
QSPI_INTR_STATUS_RAW_SET[0] FIRQ_RAW QSPI_INTR_STATUS_ENABLED_CLEAR[0] FIRQ_ENA QSPI_SPI_STATUS_REG[2] FC	QSPI_INTR_ENABLE_SET_REG[0] FIRQ_ENA_SET QSPI_INTR_ENABLE_CLEAR_REG[0] FIRQ_ENA_CLR QSPI_SPI_CMD_REG[15] FIRQ	Frame complete interrupt event. Asserted each time after a frame is transferred or received.

Note

QSPI_IRQ can also be used to trigger DMA events

10.4.4 QSPI Memory Regions

Two memory regions are associated with the QSPI. The first memory region is dedicated to the configuration port. Using this memory region, all internal registers can be programmed and serial transfers made from the supported external SPI devices. The L2_MAIN start address at which the configuration port is available is

0x4820 0000. The second memory region is associated mainly with the memory-mapped port and is used for communication directly with one of the two supported external SPI devices. The memory region for device 1 starts at 0x6000 0000 and the memory region for device 2 starts at 0x6200 0000

It is important to keep in mind that the configuration port provides an access to all the QSPI registers listed in the register summary. These are configuration registers and also four data registers. The configuration registers are used to configure typical SPI and serial flash memory settings and the four data registers are used for read and write operations. When communicating with an external SPI device (but not an SPI flash memory) the SPI_CORE module should be used and the data exchanged is available thorough these four data registers, which can be accessed only through the configuration port.

Chapter 11

Enhanced Direct Memory Access (EDMA)

This section describes the Enhanced Direct Memory Access (EDMA) controller. For features applicable to the EDMA instances in the device, see the device-specific Integration section. The primary purpose of the EDMA controller is to service data transfers programmed between two memory-mapped follower endpoints on the device. The EDMA controller consists of two principle blocks:

- EDMA channel controllers: EDMA_TPCC
- EDMA transfer controllers: EDMA_TPTC

Devices can have multiple instances of EDMA channel controllers, each associated with multiple EDMA transfer controllers.

The EDMA channel controller serves as the user interface for the EDMA controller. The EDMA_TPCC includes parameter RAM (PaRAM), channel control registers, and interrupt control registers. The EDMA_TPCC serves to prioritize incoming software requests or events from peripherals, and submits transfer requests (TR) to the EDMA transfer controller.

The EDMA transfer controllers are responsible for data movement. The transfer request packets (TRP) submitted by the EDMA_TPCC contain the transfer context, based on which the transfer controller issues read/write commands to the source and destination addresses programmed for a given transfer.

11.1 EDMA Module Overview

The enhanced direct memory access module, also called EDMA, performs high-performance data transfers between two target endpoints, memories and peripheral devices without microprocessor unit (MPU) or digital signal processor (DSP) support during transfer. EDMA transfer is programmed through a logical EDMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

The EDMA controller is based on two major principal blocks:

- EDMA third-party channel controller (EDMA_TPCC)
- EDMA third-party transfer controller (EDMA_TPTC)

Figure 11-1 shows an overview of the EDMA module.

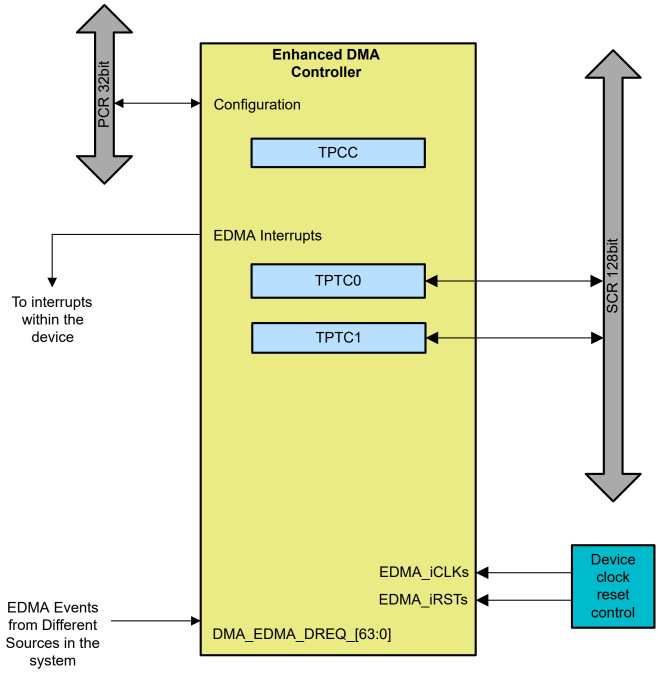

Figure 11-1. EDMA Module Overview

For EDMA instances available on the device, see the device-specific integration section.

The **TPCC** is a high flexible channel controller that serves as both a user interface and an event interface for the EDMA controller. The EDMA_TPCC serves to prioritize incoming software requests or events from peripherals, and submits transfer requests (TRs) to the transfer controller.

The **TPTC** performs read and write transfers by EDMA ports to the target peripherals, as programmed in the Active and Pending set of the registers. The transfer controllers are responsible for data movement, and issue read/write commands to the source and destination addresses programmed for a given transfer in the EDMA_TPCC.

11.1.1 EDMA Features

This section shows generic EDMA features. For features applicable to the EDMA instances in the device, see the device-specific Integration section.

The EDMA_TPCC channel controller has the following features:

- Fully orthogonal transfer description:
  - Three transfer dimensions
  - A-synchronized transfers: one dimension serviced per event
  - AB-synchronized transfers: two dimensions serviced per event
  - Independent indexes on source and destination
  - Chaining feature allowing a 3-D transfer based on a single event.
- Flexible transfer definition:
  - Increment or FIFO transfer addressing modes
  - Linking mechanism allows automatic PaRAM set update
  - Chaining allows multiple transfers to execute with one event
- Interrupt generation for the following:
  - Transfer completion
  - Error conditions
- Debug visibility:
  - Queue water marking/threshold
  - Error and status recording to facilitate debug
- 64 DMA request channels:
  - Event synchronization
  - Manual synchronization (CPUs write to event set registers EDMA_TPCC_ESR and EDMA_TPCC_ESRH).
  - Chain synchronization (completion of one transfer triggers another transfer).
- Eight QDMA channels:
  - QDMA channels trigger automatically upon writing to a parameter RAM (PaRAM) set entry.
  - Support for programmable QDMA channel to PaRAM mapping.
- Each PaRAM set can be used for a DMA channel, QDMA channel, or link set.
- Multiple transfer controllers/event queues.
- 16 event entries per event queue.

The **EDMA_TPTC** transfer controller has the following features:

- 64-bit wide read and write ports per TC
- Supports two-dimensional transfers with independent indexes on source and destination (EDMA_TPCC manages the third dimension)
- Support for increment or constant addressing mode transfers
- Interrupt and error support
- Memory-Mapped Register (MMR) bit fields are fixed position in 32-bit MMR regardless of endianness

11.2 EDMA Integration

This section describes modules integration in the device, including information about clocks, resets, and hardware requests.

11.2.1 EDMA Integration

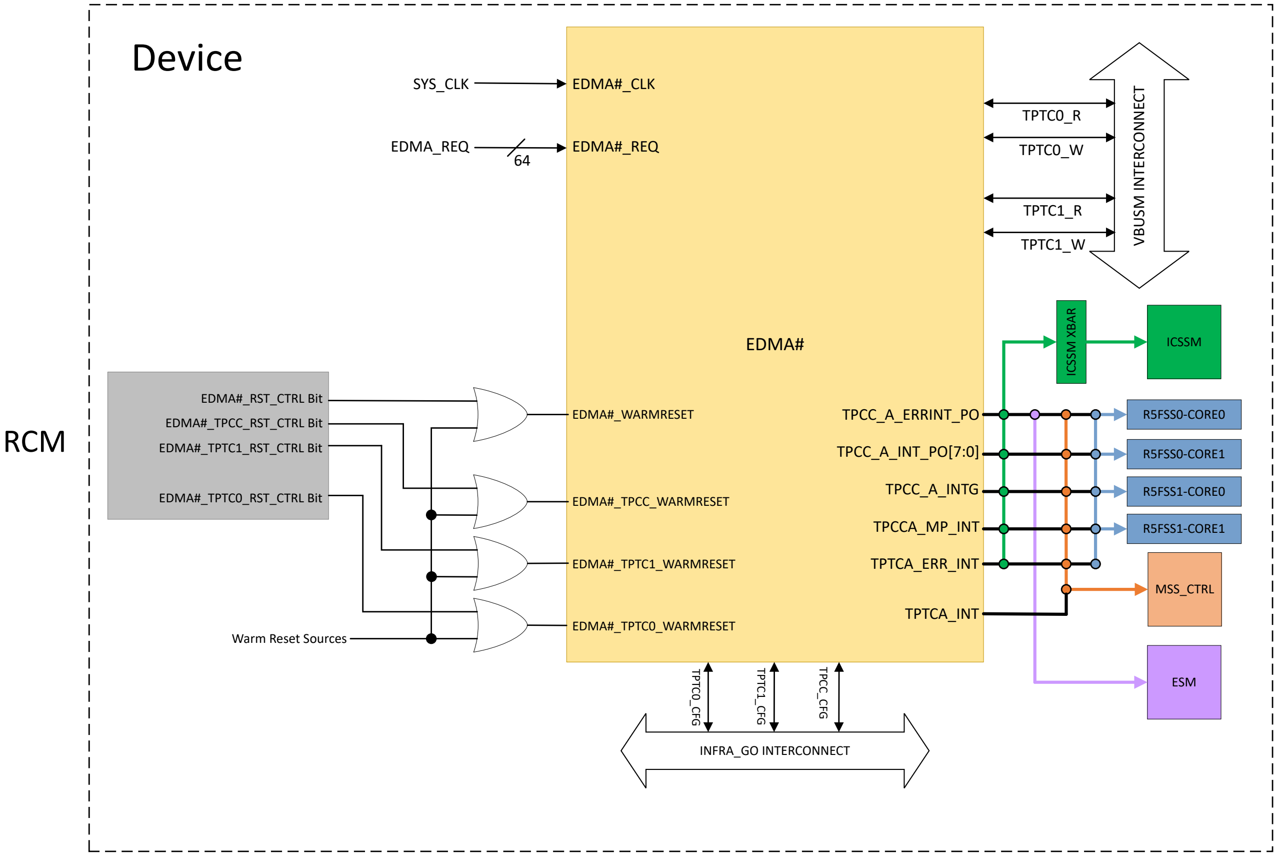

Figure 11-2. EDMA Integration Block Diagram

Note

For more information on the interconnects, see the System Interconnect chapter.

For more information on power, reset, and clock management, see the corresponding sections within the Device Configuration chapter.

For more information on the device interrupt controllers, see the Interrupt Controllers chapter.

11.2.2 EDMA Integration in MSS

The MSS has 2 TPCCs and 3 TPTCs, as shown in Figure 11-3.

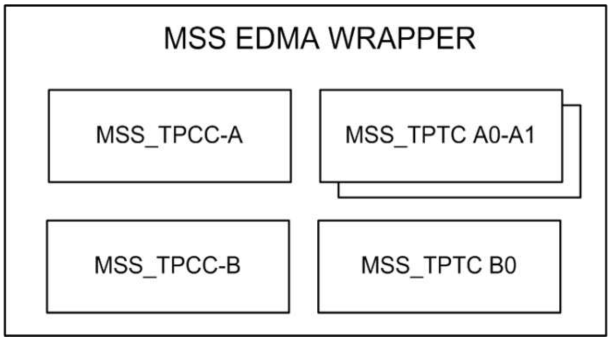

Figure 11-3. MSS EDMA Wrapper

Table 11-1 and Table 11-2 list the configuration for the TPCCs and TPTCs in the MSS.

Table 11-1. MSS TPCC Configuration

Parameters	TPCC_A	TPCC_B

11.2.4 EDMA Functional Interrupt Aggregator

The following EDMA interrupts are aggregated and sent to the processor:

- TPCC Completion Interrupt
- TPCC Completion Region Interrupts
- TPTCs Completion Interrupt

Table 11-5 lists the associated interrupt and registers for each TPCC instance. This section refers to TPCC and TPTC related interrupts, so refer to EDMA XBAR INTRTR0 for EDMA XBAR interrupts.

Table 11-5. TPCC Interrupt Aggregators

TPCC	Interrupt	Registers Space
MSS_TPCC_A	MSS_TPCC_A_INTAGG	MSS_CTRL::MSS_TPCC_A_INTAGG_MASK MSS_CTRL::MSS_TPCC_A_INTAGG_STATUS MSS_CTRL::MSS_TPCC_A_INTAGG_STATUS_RAW
MSS_TPCC_B	MSS_TPCC_B_INTAGG	MSS_CTRL::MSS_TPCC_B_INTAGG_MASK MSS_CTRL::MSS_TPCC_B_INTAGG_STATUS MSS_CTRL::MSS_TPCC_B_INTAGG_STATUS_RAW
DSS_TPCC_A	DSS_TPCC_A_INTAGG	DSS_CTRL::DSS_TPCC_A_INTAGG_MASK DSS_CTRL::DSS_TPCC_A_INTAGG_STATUS DSS_CTRL::DSS_TPCC_A_INTAGG_STATUS_RAW
DSS_TPCC_B	DSS_TPCC_B_INTAGG	DSS_CTRL::DSS_TPCC_B_INTAGG_MASK DSS_CTRL::DSS_TPCC_B_INTAGG_STATUS DSS_CTRL::DSS_TPCC_B_INTAGG_STATUS_RAW
DSS_TPCC_C	DSS_TPCC_C_INTAGG	DSS_CTRL::DSS_TPCC_C_INTAGG_MASK DSS_CTRL::DSS_TPCC_C_INTAGG_STATUS DSS_CTRL::DSS_TPCC_C_INTAGG_STATUS_RAW
RSS_TPCC_A	RSS_TPCC_A_INTAGG	RSS_CTRL::RSS_TPCC_A_INTAGG_MASK RSS_CTRL::RSS_TPCC_A_INTAGG_STATUS RSS_CTRL::RSS_TPCC_A_INTAGG_STATUS_RAW
RSS_TPCC_B	RSS_TPCC_B_INTAGG	RSS_CTRL::RSS_TPCC_B_INTAGG_MASK RSS_CTRL::RSS_TPCC_B_INTAGG_STATUS RSS_CTRL::RSS_TPCC_B_INTAGG_STATUS_RAW
HSM_TPCC_A	HSM_TPCC_A_INTAGG	HSM_CTRL::HSM_TPCC_A_INTAGG_MASK HSM_CTRL::HSM_TPCC_A_INTAGG_STATUS HSM_CTRL::HSM_TPCC_A_INTAGG_STATUS_RAW

For an event to generate an interrupt to the processor, the corresponding bit field must be unmasked in TPCC_x_INTAGG_MASK.

An interrupt processor can read the TPCC_x_INTAGG_STATUS register to detect which event triggered the interrupt.

The interrupt can be cleared by writing 0x1 to the corresponding bit in TPCC_x_INTAGG_STATUS. The software must verify that all the aggregated interrupts are cleared so that the level interrupt is deserted before exiting the ISR. This makes sure that a new pulse interrupt is generated to the processor. Thus, after clearing software, the user can read the register to confirm a value of 0x0.

The register TPCC_x_INTAGG_STATUS_RAW is set on an event irrespective of the value in TPCC_x_INTAGG_MASK. This field can be cleared by writing 0x1 to the corresponding bit in TPCC_x_INTAGG_STATUS_RAW.

11.2.5 EDMA Error Interrupt Aggregator

The following interrupts are aggregated and sent to the processor:

- TPCC Error
- TPCC MPU Error
- TPTCs Error
- TPCC Read and Write Config Space Access error
- TPTCs Read and Write Config Space Access error

Table 11-6. TPCC Error Interrupt Aggregators

TPCC	Interrupt	Registers Space
MSS_TPCC_A	MSS_TPCC_A_ERRAGG	MSS_CTRL::MSS_TPCC_A_ERRAGG_MASK MSS_CTRL::MSS_TPCC_A_ERRAGG_STATUS MSS_CTRL::MSS_TPCC_A_ERRAGG_STATUS_RAW
MSS_TPCC_B	MSS_TPCC_B_ERRAGG	MSS_CTRL::MSS_TPCC_B_ERRAGG_MASK MSS_CTRL::MSS_TPCC_B_ERRAGG_STATUS MSS_CTRL::MSS_TPCC_B_ERRAGG_STATUS_RAW
DSS_TPCC_A	DSS_TPCC_A_ERRAGG	DSS_CTRL::DSS_TPCC_A_ERRAGG_MASK DSS_CTRL::DSS_TPCC_A_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_A_ERRAGG_STATUS_RAW
DSS_TPCC_B	DSS_TPCC_B_ERRAGG	DSS_CTRL::DSS_TPCC_B_ERRAGG_MASK DSS_CTRL::DSS_TPCC_B_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_B_ERRAGG_STATUS_RAW
DSS_TPCC_C	DSS_TPCC_C_ERRAGG	DSS_CTRL::DSS_TPCC_C_ERRAGG_MASK DSS_CTRL::DSS_TPCC_C_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_C_ERRAGG_STATUS_RAW
RSS_TPCC_A	RSS_TPCC_A_ERRAGG	RSS_CTRL::RSS_TPCC_A_ERRAGG_MASK RSS_CTRL::RSS_TPCC_A_ERRAGG_STATUS RSS_CTRL::RSS_TPCC_A_ERRAGG_STATUS_RAW
HSM_TPCC_A	HSM_TPCC_A_ERRAGG	HSM_CTRL::HSM_TPCC_A_ERRAGG_MASK HSM_CTRL::HSM_TPCC_A_ERRAGG_STATUS HSM_CTRL::HSM_TPCC_A_ERRAGG_STATUS_RAW

For an event to generate an interrupt to the processor, the corresponding bit field must be unmasked in TPCC_x_ERRAGG_MASK.

An interrupt processor can read the TPCC_x_ERRAGG_STATUS register to detect which event triggered the interrupt.

The interrupt can be cleared by writing 0x1 to the corresponding bit in TPCC_x_ERRAGG_STATUS. The software must ensure that all the aggregated interrupts are cleared so that the level interrupt is deserted before exiting the ISR. Only then is it ensured that a new pulse interrupt is generated to the processor. Thus, after clearing the software, the user should read the register to confirm a value of 0x0.

The register TPCC_x_ERRAGG_STATUS_RAW is set on an event irrespective of the value in TPCC_x_ERRAGG_MASK. This field can be cleared by writing 0x1 to the corresponding bit in TPCC_x_ERRAGG_STATUS_RAW.

11.2.6 EDMA Configuration

- The MSS has 2 channel controllers: MSS_TPCC-A and MSS_TPCC-B. MSS_TPCC-A has two transfer controllers: MSS_TPTC-A0 and MSS_TPTC-A1. MSS_TPCC-B has one transfer controller MSS_TPTC-B0.
- The DSS has 3 channel controllers: DSS_TPCC-A, DSS_TPCC-B and DSS_TPCC-C. Each channel controller has 2 transfer controllers.
- RSS has 1 channel controller: RCSS_TPCC-A, it has two transfer controllers: RCSS_TPTC-A0 and RCSS_TPTC-A1.

Table 11-7. EDMA3 Channel Controller Configuration

Parameters	MSS_TPCC_A	MSS_TPCC_B	DSS_TPCC_A	DSS_TPCC_B	DSS_TPCC_C	RCSS_TPCC_A

11.3 EDMA Controller Functional Description

This chapter discusses the architecture of the EDMA controller. The description contained in this section is generic to the EDMA module, and not all features mentioned here are supported by the device. See the EDMA integration section of the device to determine the applicability of these features.

11.3.1 Block Diagram

Figure 11-5 shows the functional block diagram of the EDMA controller.

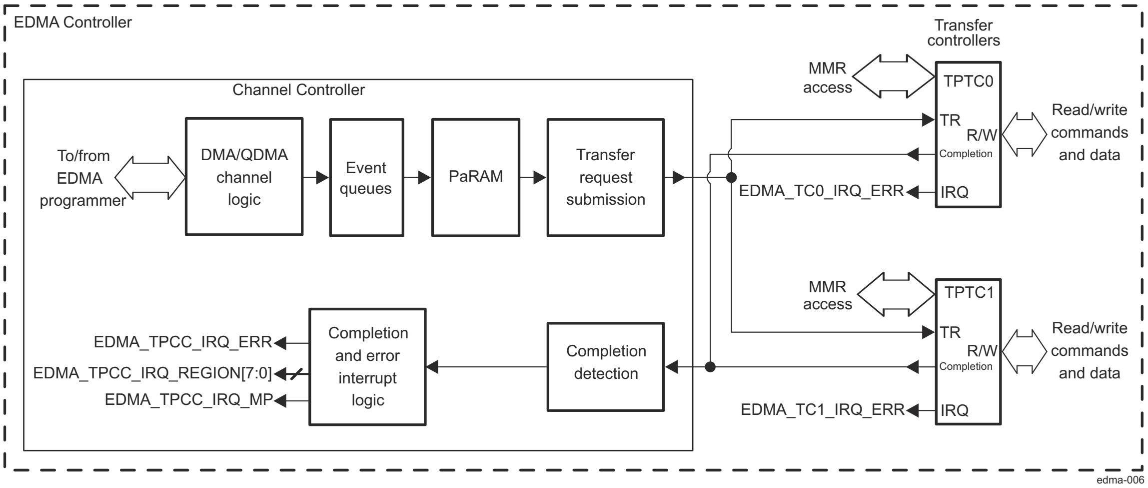

Figure 11-5. EDMA Controller Block Diagram

11.3.1.1 Third-Party Channel Controller

The TPCC is the EDMA transfer scheduler responsible for scheduling, arbitrating, and issuing user programmed transfers to the two TPTCs.

The functional block diagram below describes EDMA channel controller (EDMA_TPCC).

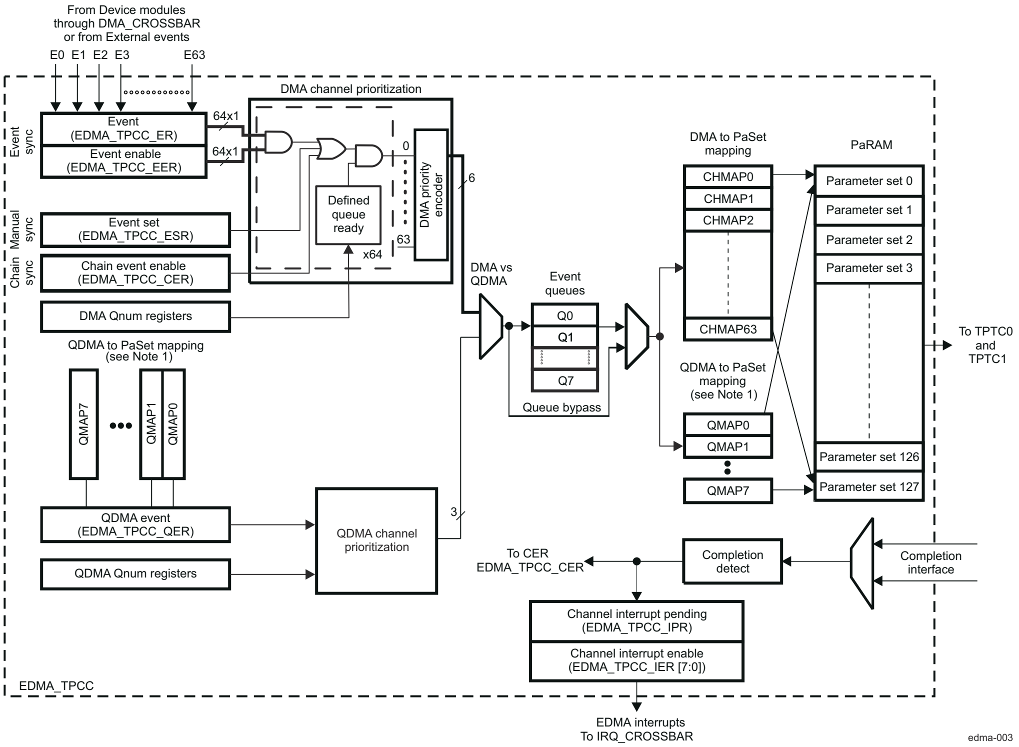

Figure 11-6. EDMA Channel Controller Block Diagram

A. Although the block is depicted twice in EDMA Channel Controller Block Diagram, there is only one physical register set for the QDMA to PaRAM set mapping block.

The main blocks of the EDMA_TPCC are as follows:

- Parameter RAM (PaRAM): The PaRAM maintains parameter sets for channel and reload parameter sets. The PaRAM must be written with the transfer context for the desired channels and link parameter sets. EDMA_TPCC processes and sets based on a trigger event and submits a transfer request (TR) to the transfer controllers.
- EDMA event and interrupt processing registers: Allows mapping of events to parameter sets, enable/disable events, enable/disable interrupt conditions, and clearing interrupts.
- Completion detection: The completion detect block detects completion of transfers by the EDMA_TPTCs or follower peripherals. The completion of transfers can be used optionally to chain trigger new transfers or to assert interrupts.
- Event queues: Event queues form the interface between the event detection logic and the transfer request submission logic.
- Memory protection registers: Memory protection registers define the accesses (privilege level and requestor(s)) that are allowed to access the DMA channel shadow region view(s) and regions of PaRAM.

Other functions include the following:

- Region registers: Region registers allow DMA resources (DMA channels and interrupts) to be assigned to unique regions that different EDMA programmers own (for example, DSPs).
- Debug registers: Debug registers allow debug visibility by providing registers to read the queue status, controller status, and missed event status.

The EDMA_TPCC includes two channel types: DMA channels (64 channels) and QDMA channels (8 channels).

Each channel is associated with a given event queue/transfer controller and with a given PaRAM set. These channels are identical. The main difference between a DMA channel and a QDMA channel is the method that the system uses to trigger transfers.

- DMA channels are triggered by external events by the event set registers EDMA_TPCC_ESR and EDMA_TPCC_ESRH, or through chaining register EDMA_TPCC_CER.
- QDMA channels are triggered automatically (auto-triggered) by the CPU. QDMAs allow a minimum number of linear writes to be issued to the TPCC to force a series of transfers to occur.

The TPCC arbitrates among pending DMA and QDMA events with a fixed [64:1] and [8:1] priority encoder for these events, respectively (a low channel number corresponds to a high priority).

DMA events are always higher priority than QDMA events. The higher-priority event is placed in the event queue to await submission to the transfer controllers, which occurs at the earliest opportunity. Each event queue is serviced in FIFO order, with a maximum of 16 queued events per event queue. If more than one TPTC is ready to be programmed with a transmission request (TR), the event queues are serviced with fixed priority: Q0 is higher than Q1. When an event is ready to be queued and the event queue and the TC channel are empty, the event bypasses the event queue and goes directly to the PaRAM processing logic for submission to the appropriate TC. If the transfer request TR bus or PaRAM processing are busy, the bypass path is not used. The bypass is not used to dequeue for a higher-priority event.

Events are extracted from the event queue when the EDMA_TPTC is available for a new TR to be programmed into the EDMA_TPTC (signaled with the empty signal, indicating an empty program register set). As an event is extracted from the event queue, the associated PaRAM entry is processed and submitted to the TPTC as a TR. The TPCC updates the appropriate counts and addresses in the PaRAM entry in anticipation of the next trigger event for that PaRAM entry.

The EDMA_TPCC also has an error detection logic that causes an error interrupt generation on various error conditions (for example: missed events EDMA_TPCC_EMR and EDMA_TPCC_EMRH registers, exceeding event queue thresholds in EDMA_TPCC_CCERR register, etc.).

11.3.1.2 Third-Party Transfer Controller

The TPTC module is the EDMA transfer engine that generates transfers as programmed in dedicated working registers, using two dedicated controller ports: a read-only port and a write-only port.

Figure 11-7 shows a functional block diagram and of the EDMA transfer controller (EDMA_TPTC) and its connection to the EDMA_TPCC.

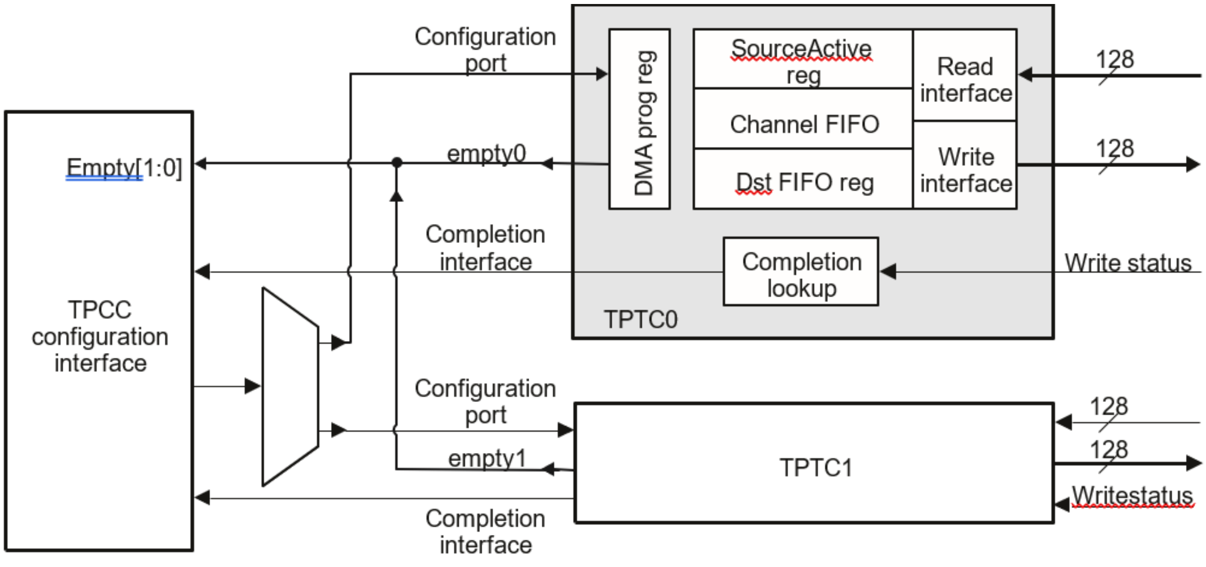

Figure 11-7. TPTC Block Diagram

Note

The port data bus width of the instances of the TPTC is fixed at 64 bits.

Two instances of the EDMA_TPTC generate concurrent traffic on the L3_VBUSM interconnect. Each TC controller consists of the following components:

- DMA Program Register Set: Stores the context for the DMA transfer that is loaded into the active register set when the current active register set completes. The CPU or TPCC programs the Program Register Set, not the active register set. For typical standalone operation, the CPU programs the Program Register while the TC services the Active register set. The Program Register set includes ownership control such that CPU software and the EDMA stay synchronized relative to one another.
- Source Active Register Set : Stores the context (src/dst/cnt/etc) for the DMA Transfer Request (TR) in progress in the Read Controller. The Active register set is split into independent Source and Destination, because the source interconnect controller and the destination interconnect controller operate independently of one another.
- Destination FIFO Register Set: Stores the context (src/dst/cnt/etc) for the DMA Transfer Request (TR) in progress, or pending, in the Write Controller. The pending register must allow the source controller to begin processing a new TR while the destination register set processes the previous TR.
- Channel FIFO: Temporary holding buffer for in-flight data. The read return data of the source peripheral is stored in the Data FIFO, and then is written to the destination peripheral by the write command/data bus.
- Read Controller/Interconnect Read Interface: The Interconnect read interface issues optimally sized read commands to the source peripheral, based on a burst size of 32 bytes and available landing space in the channel FIFO.
- Write controller/Interconnect Write interface: The local interconnect write interface issues optimally sized write commands to the destination peripheral, based on a burst size of 32 bytes and available data in the channel FIFO.
- Completion interface: sends completion codes to the EDMA_TPCC when a transfer completes and generates interrupts and chained events in the TPCC module.
- Configuration port: Target interface that provides read/write access to program registers and read access to all memory-mapped TPTC registers.

When one EDMA_TPTC module is idle and receive its first TR, DMA program register set receives the TR, where it transitions to the DMA source active set and the destination FIFO register set immediately. The second TR (if pending from EDMA_TPCC) is loaded into the DMA program set, ensuring it can start as soon as possible when the active transfer completes. As soon as the current active set is exhausted, the TR is loaded from the DMA program register set into the DMA source active register set as well as to the appropriate entry in the destination FIFO register set.

The read controller issues read commands controlled by the rules of command fragmentation and optimization. These are issued only when the data FIFO has space available for the data read. When sufficient data is in the data FIFO, the write controller starts issuing a write command again following the rules for command fragmentation and optimization.

Depending on the number of entries, the read controller can process up to two or four transfer requests ahead of the destination subject to the amount of free data FIFO.

11.3.2 Types of EDMA Controller Transfers

An EDMA transfer is always defined in terms of three dimensions. Figure 11-8 shows the three dimensions used by EDMA controller transfers. These three dimensions are defined as:

- 1st Dimension or Array (A): The 1st dimension in a transfer consists of EDMA_TPCC_ABCNT_n[15:0] ACNT contiguous bytes.
- 2nd Dimension or Frame (B): The 2nd dimension in a transfer consists of EDMA_TPCC_ABCNT_n[31:16] BCNT arrays of ACNT bytes. Each array transfer in the 2nd dimension is separated from each other by an index programmed using bit-fields EDMA_TPCC_BIDX_n[15:0] SBIDX or EDMA_TPCC_BIDX_n[31:16] DBIDX.

- 3rd Dimension or Block (C): The 3rd dimension in a transfer consists of CCNT frames of BCNT arrays of ACNT bytes. The Count for 3rd Dimension is defined in PaRAM memory EDMA_TPCC_CCNT_n[15:0] CCNT. Each transfer in the 3rd dimension is separated from the previous by an index programmed using EDMA_TPCC_CIDX_n[15:0] SCIDX or EDMA_TPCC_CIDX_n[31:16] DCIDX.

Note

The reference point for the index depends on the synchronization type. The amount of data transferred upon receipt of a trigger/synchronization event is controlled by the synchronization types (EDMA_TPCC_OPT_n[2] SYNCDIM bit). For these three dimensions, only two synchronization types are supported: A-synchronized transfers and AB-synchronized transfers.

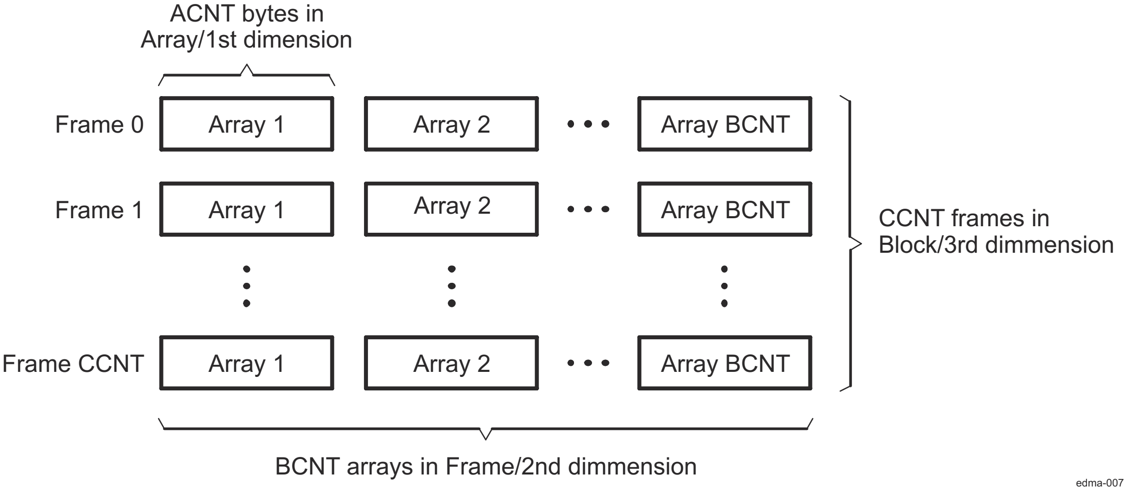

Figure 11-8. Definition of ACNT, BCNT, and CCNT

11.3.2.1 A-Synchronized Transfers

In an A-synchronized transfer, each EDMA sync event initiates the transfer of the 1st dimension of EDMA_TPCC_ABCNT_n[15:0] ACNT bytes, or one array of ACNT bytes. Each event/TR packet conveys the transfer information for one array only. Thus, BCNT × CCNT events are needed to completely service a PaRAM set.

Arrays are always separated by EDMA_TPCC_BIDX_n[15:0]SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX, as shown in Figure 11-9, where the start address of Array N is equal to the start address of Array N – 1 plus source (SRC) or destination (DST) in EDMA_TPCC_BIDX_n register.

Frames are always separated by EDMA_TPCC_CIDX_n[15:0] SCIDX and EDMA_TPCC_CIDX_n[31:16] DCIDX. For A-synchronized transfers, after the frame is exhausted, the address is updated by adding SRCCIDX/ DSTCIDX to the beginning address of the last array in the frame. As in Figure 11-9, SRCCIDX / DSTCIDX is the difference between the start of Frame 0 Array 3 to the start of Frame 1 Array 0.

Figure 11-9 shows an A-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of n (ACNT) bytes. In this example, a total of 12 sync events (BCNT × CCNT) exhaust a PaRAM set. See Figure 11-9 for details on parameter set updates.

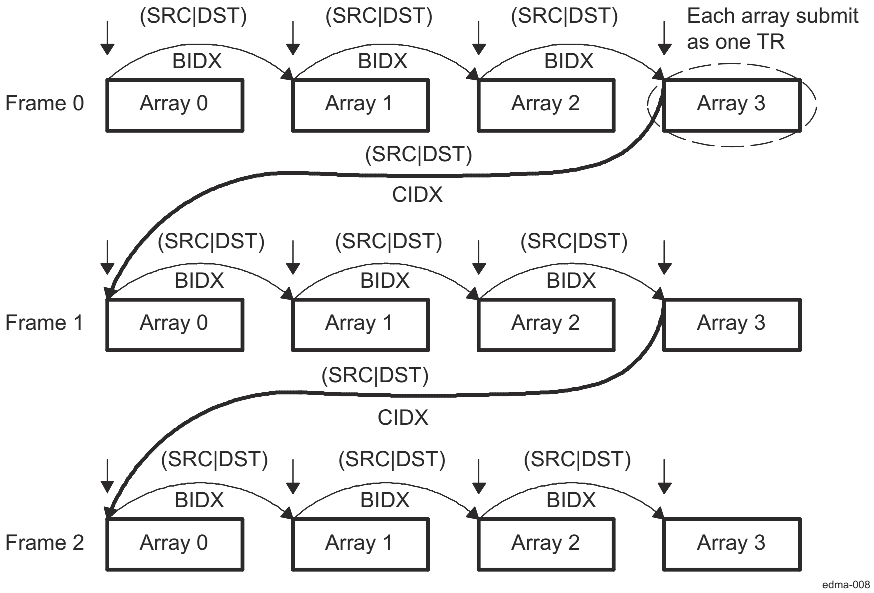

Figure 11-9. A-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)

11.3.2.2 AB-Synchronized Transfers

In a AB-synchronized transfer, each EDMA sync event initiates the transfer of 2 dimensions or one frame. Each event/TR packet conveys information for one entire frame of BCNT_n arrays of ACNT_n bytes. Thus, EDMA_TPCC_CCNT_n events are needed to completely service a PaRAM set.

Arrays are always separated by EDMA_TPCC_BIDX_n[15:0] SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX as shown in Figure 11-10. Frames are always separated by SRCCIDX and DSTCIDX.

Note that for AB-synchronized transfers, after a TR for the frame is submitted, the address update is to add EDMA_TPCC_CIDX_n[15:0] SCIDX / EDMA_TPCC_CIDX_n[31:16] DCIDX to the beginning address of the beginning array in the frame. This is different from A-synchronized transfers where the address is updated by adding SRCCIDX/DSTCIDX to the start address of the last array in the frame. See Section 11.3.3.6 for details on parameter set updates.

Figure 11-10 shows an AB-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of *n* (ACNT) bytes. In this example, a total of 3 sync events (CCNT) exhaust a PaRAM set; that is, a total of 3 transfers of 4 arrays each completes the transfer.

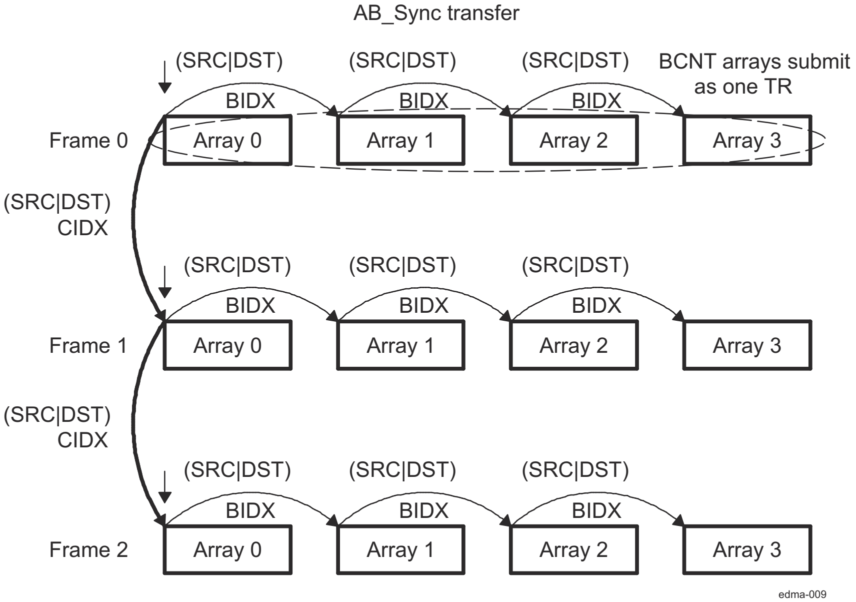

Figure 11-10. AB-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)

Note

ABC-synchronized transfers are not directly supported. It can be logically achieved by chaining between multiple AB-synchronized transfers.

11.3.3 Parameter RAM (PaRAM)

The EDMA controller is a RAM-based architecture. The transfer context (source/destination addresses, count, indexes, etc.) for DMA or QDMA channels is programmed in a parameter RAM table in EDMA_TPCC. The PaRAM table is segmented into multiple PaRAM sets. Each PaRAM set includes eight four-byte PaRAM set entries (32-bytes total per PaRAM set), which includes typical DMA transfer parameters such as source address, destination address, transfer counts, indexes, options, etc.

The PaRAM structure supports flexible ping-pong, circular buffering, channel chaining, and auto-reloading (linking).

The contents of the PaRAM include the following:

- PaRAM sets
- 64 channels that are direct mapped and can be used as link or QDMA sets if not used for DMA channels
- 8 channels remain for link or QDMA sets

By default, all channels map to PaRAM set to 0 and should be remapped before use by EDMA_TPCC_DCHMAPN_m and EDMA_TPCC_QCHMAPN_j registers.

Table 11-11. EDMA Parameter RAM Contents

PaRAM Set Number	Base Address	Parameters[1]
0	EDMA Base Address + 4000h to EDMA Base Address + 401Fh	PaRAM set 0
1	EDMA Base Address + 4020h to EDMA Base Address + 403Fh	PaRAM set 1
2	EDMA Base Address + 4040h to EDMA Base Address + 405Fh	PaRAM set 2
3	EDMA Base Address + 4060h to EDMA Base Address + 407Fh	PaRAM set 3
4	EDMA Base Address + 4080h to EDMA Base Address + 409Fh	PaRAM set 4
5	EDMA Base Address + 40A0h to EDMA Base Address + 40BFh	PaRAM set 5
6	EDMA Base Address + 40C0h to EDMA Base Address + 40DFh	PaRAM set 6
7	EDMA Base Address + 40E0h to EDMA Base Address + 40FFh	PaRAM set 7
8	EDMA Base Address + 4100h to EDMA Base Address + 411Fh	PaRAM set 8
9	EDMA Base Address + 4120h to EDMA Base Address + 413Fh	PaRAM set 9
...	...	...
63	EDMA Base Address + 47E0h to EDMA Base Address + 47FFh	PaRAM set 63
64	EDMA Base Address + 4800h to EDMA Base Address + 481Fh	PaRAM set 64
65	EDMA Base Address + 4820h to EDMA Base Address + 483Fh	PaRAM set 65
...	...	...
127	EDMA Base Address + 5000h to EDMA Base Address + 4FE0h	PaRAM set 127

(1) The device has 8 QDMA channels that can be mapped to any parameter set number from 0 to .

Note

11.3.3.1 PaRAM

Each parameter set of PaRAM is organized into eight 32-bit words or 32 bytes, as shown in Figure 11-11 and described in Table 11-12. Each PaRAM set consists of 16-bit and 32-bit parameters.

Table 11-12. EDMA Channel Parameter Description

Offset Address (bytes)	Acronym	Parameter	Description
0h	OPT	Channel Options EDMA_TPCC_OPT_n register	Transfer configuration options
4h	SRC	Channel Source Address EDMA_TPCC_SRC_n register	The byte address from which data is transferred
8h(1)	ACNT	Count for 1st Dimension EDMA_TPCC_ABCNT_n[15:0] ACNT bit-field.	Unsigned value specifying the number of contiguous bytes within an array (first dimension of the transfer). Valid values range from 1 to 65 535.
	BCNT	Count for 2nd Dimension EDMA_TPCC_ABCNT_n[31:16] BCNT bit-field.	Unsigned value specifying the number of arrays in a frame, where an array is ACNT bytes. Valid values range from 1 to 65 535.
Ch	DST	Channel Destination Address EDMA_TPCC_DST_n register	The byte address to which data is transferred
10h(1)	SBIDX	Source BCNT Index EDMA_TPCC_BIDX_n[15:0] SBIDX bit-field.	Signed value specifying the byte address offset between source arrays within a frame (2nd dimension). Valid values range from –32 768 and 32 767.
	DBIDX	Destination BCNT Index EDMA_TPCC_BIDX_n[31:16] DBIDX bit-field.	Signed value specifying the byte address offset between destination arrays within a frame (2nd dimension). Valid values range from –32 768 and 32 767.
14h(1)	LINK	Link Address EDMA_TPCC_LNK_n[15:0] LINK bit-field	The PaRAM address containing the PaRAM set to be linked (copied from) when the current PaRAM set is exhausted. A value of FFFFh specifies a null link.
	BCNTRLD	BCNT Reload EDMA_TPCC_LNK_n[31:16] BCNTRLD bit-field	The count value used to reload BCNT when BCNT decrements to 0 (TR is submitted for the last array in 2nd dimension). Only relevant in A-synchronized transfers.
18h(1)	SCIDX	Source CCNT index. EDMA_TPCC_CIDX_n[15:0] SCIDX bit-field.	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from –32 768 and 32 767. A-synchronized transfers: The byte address offset from the beginning of the last source array in a frame to the beginning of the first source array in the next frame. AB-synchronized transfers: The byte address offset from the beginning of the first source array in a frame to the beginning of the first source array in the next frame.
	DCIDX	Destination CCNT index. EDMA_TPCC_CIDX_n[31:16] DCIDX bit-field.	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from –32 768 and 32 767. A-synchronized transfers: The byte address offset from the beginning of the last destination array in a frame to the beginning of the first destination array in the next frame. AB-synchronized transfers: The byte address offset from the beginning of the first destination array in a frame to the beginning of the first destination array in the next frame.
1Ch	CCNT	Count for 3rd Dimension. EDMA_TPCC_CCNT_n[15:0] CCNT bit-field.	Unsigned value specifying the number of frames in a block, where a frame is BCNT arrays of ACNT bytes. Valid values range from 1 to 65 535.
	Reserved	Reserved	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts cam result in undefined behavior.

(1) If OPT, SRC, or DST is the trigger word for a QDMA transfer, then it is required to do a 32-bit access to that field. Furthermore, it is recommended to perform only 32-bit accesses on the parameter RAM for best code compatibility. For example, switching the endianness of the processor swaps addresses of the 16-bit fields, but 32-bit accesses avoid the issue entirely.

11.3.3.2 EDMA Channel PaRAM Set Entry Fields

11.3.3.2.1 Channel Options Parameter (OPT)

This is the control register for TPCC channel configuration options. Refer to the EDMA_TPCC_OPT_n register bitfield description in the for additional details.

11.3.3.2.2 Channel Source Address (SRC)

The 32-bit source address parameter specifies the starting byte address of the source. For SAM in increment mode, there are no alignment restrictions imposed by EDMA. For SAM in FIFO addressing mode, it must program the source address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). If this rule is not observed, the EDMA_TPTC returns an error. Refer to Section 11.3.12.3 *Error Generation* for additional details.

11.3.3.2.3 Channel Destination Address (DST)

The 32-bit destination address parameter specifies the starting byte address of the destination. For DAM in increment mode, there are no alignment restrictions imposed by EDMA. For DAM in FIFO addressing mode, it must program the destination address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). If this rule is not observed, the EDMA_TPTC returns an error. Refer to *Error Generation* for additional details.

11.3.3.2.4 Count for 1st Dimension (ACNT)

EDMA_TPCC_ABCNT_n[15:0] ACNT represents the number of bytes within the 1st dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 1 and 65535. Therefore, the maximum number of bytes in an array is 65 535 bytes (64K – 1 bytes). ACNT must be greater than or equal to 1 for a TR to be submitted to EDMA_TPTC. A transfer with ACNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

Refer to Section 11.3.3.5 *Dummy Versus Null Transfer Comparison* and Section 11.3.5.3 *Dummy or Null Completion* for details on dummy/null completion conditions.

11.3.3.2.5 Count for 2nd Dimension (BCNT)

EDMA_TPCC_ABCNT_n[15:0] BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation, valid values for BCNT are between 1 and 65 535. Therefore, the maximum number of arrays in a frame is 65 535 (64K – 1 arrays). A transfer with BCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

Refer to Section 11.3.3.5 *Dummy Versus Null Transfer Comparison* and Section 11.3.5.3 *Dummy or Null Completion* for details on dummy/null completion conditions.

11.3.3.2.6 Count for 3rd Dimension (CCNT)

EDMA_TPCC_CCNT_n[15:0] CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT are between 1 and 65 535. Therefore, the maximum number of frames in a block is 65 535 (64K – 1 frames). A transfer with CCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

A CCNT value of 0 is considered either a null or dummy transfer.

Refer to Section 11.3.3.5 *Dummy Versus Null Transfer Comparison* and Section 11.3.5.3 *Dummy or Null Completion* for details on dummy/null completion conditions.

11.3.3.2.7 BCNT Reload (BCNTRLD)

EDMA_TPCC_LNK_n[31:16] BCNTRLD is a 16-bit unsigned value used to reload the EDMA_TPCC_ABCNT_n[15:0] BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-synchronized transfers. In this case, the EDMA_TPCC decrements the BCNT value by 1 on each TR submission. When BCNT reaches 0, the EDMA_TPCC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value.

For AB-synchronized transfers, the EDMA_TPCC submits the BCNT in the TR and the EDMA_TPTC decrements BCNT appropriately. For AB-synchronized transfers, BCNTRLD is not used.

11.3.3.2.8 Source B Index (SBIDX)

EDMA_TPCC_BIDX_n[15:0] SBIDX is a 16-bit signed value (2s complement) used for source address modification between each array in the 2nd dimension. Valid values for EDMA_TPCC_BIDX_n[15:0] SBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-synchronized and AB-synchronized transfers. Some examples:

- EDMA_TPCC_BIDX_n[15:0] SBIDX = 0000h (0): no address offset from the beginning of an array to the beginning of the next array. All arrays are fixed to the same beginning address.
- EDMA_TPCC_BIDX_n[15:0] SBIDX = 0003h (+3): the address offset from the beginning of an array to the beginning of the next array in a frame is 3 bytes. For example, if the current array begins at address 1000h, the next array begins at 1003h.
- EDMA_TPCC_BIDX_n[15:0] SBIDX = FFFFh (–1): the address offset from the beginning of an array to the beginning of the next array in a frame is –1 byte. For example, if the current array begins at address 5054h, the next array begins at 5053h.

11.3.3.2.9 Destination B Index (DBIDX)

EDMA_TPCC_BIDX_n[31:16] DBIDX is a 16-bit signed value (2s complement) used for destination address modification between each array in the 2nd dimension. Valid values for EDMA_TPCC_BIDX_n[31:16] DBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-synchronized and AB-synchronized transfers. Refer to Section 11.3.3.2.8 *Source B Index (SBIDX)* for examples.

11.3.3.2.10 Source C Index (SCIDX)

EDMA_TPCC_CIDX_n[15:0] SCIDX is a 16-bit signed value (2s complement) used for source address modification in the 3rd dimension. Valid values for EDMA_TPCC_CIDX_n[15:0] SCIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-synchronized and AB-synchronized transfers.

Note

When SCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame (Figure 11-9), while the current array in an AB-synchronized transfer is the first array in the frame (Figure 11-10).

11.3.3.2.11 Destination C Index (DCIDX)

EDMA_TPCC_CIDX_n[31:16] DCIDX is a 16-bit signed value (2s complement) used for destination address modification in the 3rd dimension. Valid values are between –32 768 and 32 767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array TR in the next frame. It applies to both A-synchronized and AB-synchronized transfers.

Note

When DCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame (Figure 11-9), while the current array in a AB-synchronized transfer is the first array in the frame (Figure 11-10).

11.3.3.2.12 Link Address (LINK)

The EDMA_TPCC provides a mechanism, called linking, to reload the current PaRAM set upon its natural termination (that is, after the count fields are decremented to 0) with a new PaRAM set. The 16-bit parameter EDMA_TPCC_LNK_n[15:0] LINK specifies the byte address offset in the PaRAM from which the EDMA_TPCC loads/reloads the next PaRAM set during linking.

It must program the link address to point to a valid aligned 32-byte PaRAM set. The 5 LSBs of the LINK field should be cleared to 0.

The EDMA_TPCC ignores the upper 2 bits of the LINK entry, allowing the flexibility of programming the link address as either an absolute/literal byte address or use the PaRAM-base-relative offset address. Therefore, if it use the literal address with a range from 4000h to 7FFFh, it will be treated as a PaRAM-base-relative value of 0000h to 3FFFh.

It should check that the programed value in the EDMA_TPCC_LNK_n[15:0] LINK field is correctly, so that link update is requested from a PaRAM address that falls in the range of the available PaRAM addresses on the device.

Value of FFFFh in EDMA_TPCC_LNK_n[15:0] LINK bit-field is referred to as a NULL link that should cause the EDMA_TPCC to perform an internal write of 0 to all entries of the current PaRAM set, except for the EDMA_TPCC_LNK_n[15:0] LINK field is set to FFFFh. Also, see Section 11.3.5 *Completion of a DMA Transfer* for details on terminating a transfer.

11.3.3.3 Null PaRAM Set

A null PaRAM set is defined as a PaRAM set where all count fields (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, and EDMA_TPCC_CCNT_n[15:0] CCNT) are cleared to 0. If a PaRAM set associated with a channel is a NULL set, then when serviced by the EDMA_TPCC, the bit corresponding to the channel is set in the associated event missed register (EDMA_TPCC_EMR, EDMA_TPCC_EMRH, or EDMA_TPCC_QEMR). This bit remains set in the associated secondary event register (EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER).
This implies that any future events on the same channel are ignored by the EDMA_TPCC and it is required to clear the bit in EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER for the channel. This is considered an error condition, since events are not expected on a channel that is configured as a null transfer.

11.3.3.4 Dummy PaRAM Set

A dummy PaRAM set is defined as a PaRAM set where at least one of the count fields (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, or EDMA_TPCC_CCNT_n[15:0] CCNT) is cleared to 0 and at least one of the count fields is nonzero.

If a PaRAM set associated with a channel is a dummy set, then when serviced by the EDMA_TPCC, it will not set the bit corresponding to the channel (DMA/QDMA) in the event missed register (EDMA_TPCC_EMR, EDMA_TPCC_EMRH, or EDMA_TPCC_QEMR) and the secondary event register (EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER) bit gets cleared similar to a normal transfer. Future events on that channel are serviced. A dummy transfer is a legal transfer of 0 bytes.

11.3.3.5 Dummy Versus Null Transfer Comparison

There are some differences in the way the EDMA_TPCC logic treats a dummy versus a null transfer request. A null transfer request is an error condition, but a dummy transfer is a legal transfer of 0 bytes. A null transfer causes an error bit (E*n*) in EDMA_TPCC_EMR to get set and the E*n* bit in EDMA_TPCC_SER remains set, essentially preventing any further transfers on that channel without clearing the associated error registers.

Table 11-13 summarizes the conditions and effects of null and dummy transfer requests.

Table 11-13. Dummy and Null Transfer Request

Feature	Null TR	Dummy TR
EDMA_TPCC_EMR / EDMA_TPCC_EMRH / EDMA_TPCC_QEMR is set	Yes	No
EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER remains set	Yes	No

Table 11-13. Dummy and Null Transfer Request (continued)

Feature	Null TR	Dummy TR
Link update (STATIC = 0 in EDMA_TPCC_OPT_n)	Yes	Yes
EDMA_TPCC_QER is set	Yes	Yes
EDMA_TPCC_IPR / EDMA_TPCC_IPRH, EDMA_TPCC_CER / EDMA_TPCC_CERH is set using early completion	Yes	Yes

11.3.3.6 Parameter Set Updates

When a TR is submitted for a given DMA/QDMA channel and its corresponding PaRAM set, the EDMA_TPCC is responsible for updating the PaRAM set in anticipation of the next trigger event. For events that are not final, this includes address and count updates; for final events, this includes the link update.

The specific PaRAM set entries that are updated depend on the channel's synchronization type (A-synchronized or AB-synchronized) and the current state of the PaRAM set. A B-update refers to the decrementing of EDMA_TPCC_ABCNT_n[31:16] BCNT in the case of A-synchronized transfers after the submission of successive TRs. A C-update refers to the decrementing of CCNT in the case of A-synchronized transfers after BCNT TRs for EDMA_TPCC_ABCNT_n[15:0] ACNT byte transfers have submitted. For AB-synchronized transfers, a C-update refers to the decrementing of EDMA_TPCC_CCNT_n[15:0] CCNT after submission of every transfer request.

Refer to Table 11-14 for details and conditions on the parameter updates. A link update occurs when the PaRAM set is exhausted, as described in Section 11.3.3.7 *Linking Transfers*.

After the TR is read from the PaRAM (and is in process of being submitted to EDMA_TPTC), the following fields are updated if needed:

- A-synchronized: BCNT, CCNT, SRC, DST.
- AB-synchronized: CCNT, SRC, DST.

The following fields are not updated (except for during linking, where all fields are overwritten by the link PaRAM set):

- A-synchronized: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_LNK_n[31:16] BCNTRLD, EDMA_TPCC_BIDX_n[15:0] SBIDX, EDMA_TPCC_BIDX_n[31:16] DBIDX, EDMA_TPCC_CIDX_n[15:0] SCIDX, EDMA_TPCC_CIDX_n[31:16] DCIDX, EDMA_TPCC_OPT_n, EDMA_TPCC_LNK_n[15:0]LINK.
- AB-synchronized: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, EDMA_TPCC_LNK_n[31:16] BCNTRLD, EDMA_TPCC_BIDX_n[15:0] SBIDX, EDMA_TPCC_BIDX_n[31:16] DBIDX, EDMA_TPCC_CIDX_n[15:0] SCIDX, EDMA_TPCC_CIDX_n[31:16] DCIDX, EDMA_TPCC_OPT_n, EDMA_TPCC_LNK_n[15:0]LINK.

Note

PaRAM updates only pertain to the information that is needed to properly submit the next transfer request to the EDMA_TPTC. Updates that occur while data is moved within a transfer request are tracked within the transfer controller, and is detailed in Section 11.3.12 *EDMA Transfer Controller (EDMA_TPTC)*. For A-synchronized transfers, the EDMA_TPCC always submits a TRP for EDMA_TPCC_ABCNT_n[15:0] ACNT bytes (EDMA_TPCC_ABCNT_n[31:16] BCNT = 1 and EDMA_TPCC_CCNT_n[15:0] CCNT = 1). For AB-synchronized transfers, the EDMA_TPCC always submits a TRP for EDMA_TPCC_ABCNT_n[15:0] ACNT bytes of BCNT arrays (EDMA_TPCC_CCNT_n[15:0] CCNT = 1). The EDMA_TPTC is responsible for updating source and destination addresses within the array based on EDMA_TPCC_ABCNT_n[15:0] ACNT and EDMA_TPCC_OPT_n[10:8] FWID. For AB-synchronized transfers, the EDMA_TPTC is also responsible to update source and destination addresses between arrays based on EDMA_TPCC_BIDX_n[15:0] SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX.

Table 11-14 shows the details of parameter updates that occur within EDMA_TPCC for A-synchronized and AB-synchronized transfers.

Table 11-14. Parameter Updates in EDMA_TPCC (for Non-Null, Non-Dummy PaRAM Set)

	A-Synchronized Transfer			**AB-Synchronized Transfer**		
	B-Update	**C-Update**	**Link Update**	**B-Update**	**C-Update**	**Link Update**
Condition:	**BCNT > 1**	**BCNT == 1 && CCNT > 1**	**BCNT == 1 && CCNT == 1**	**N/A**	**EDMA_TPCC_CCNT_n[15:0] CCNT > 1**	**EDMA_TPCC_CCNT_n[15:0] CCNT == 1**
SRC	+= SBIDX	+= SCIDX	= Link.EDMA_TPCC_SRC_n	in EDMA_TPTC	+= SCIDX	= Link.EDMA_TPCC_SRC_n
DST	+= DBIDX	+= DCIDX	= Link.EDMA_TPCC_DST_n	in EDMA_TPTC	+= DCIDX	= Link.EDMA_TPCC_DST_n
ACNT	None	None	= Link.EDMA_TPCC_ABCNT_n[15:0] ACNT	None	None	= Link.EDMA_TPCC_ABCNT_n[15:0] ACNT
BCNT	–= 1	= BCNTRLD	= Link.EDMA_TPCC_ABCNT_n[31:16] BCNT	in EDMA_TPTC	N/A	= Link.EDMA_TPCC_ABCNT_n[31:16] BCNT
CCNT	None	–= 1	= Link.EDMA_TPCC_CCNT_n[15:0] CCNT	in EDMA_TPTC	-=1	= Link.EDMA_TPCC_CCNT_n[15:0] CCNT

DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX
SCIDX	None	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX	in EDMA_TPTC	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX
DCIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX
LINK	None	None	= Link.EDMA_TPCC_LNK_n[15:0]LINK	None	None	= Link.EDMA_TPCC_LNK_n[15:0]LINK
BCNTRLD	None	None	= Link.EDMA_TPCC_LNK_n[31:16] BCNTRLD	None	None	= Link.EDMA_TPCC_LNK_n[31:16] BCNTRLD
OPT(1)	None	None	= LINK.EDMA_TPCC_OPT_n	None	None	= LINK.EDMA_TPCC_OPT_n

(1) In all cases, no updates occur if EDMA_TPCC_OPT_n[3] STATIC == 1 for the current PaRAM set.

Note

The EDMA_TPCC includes no special hardware to detect when an indexed address update calculation overflows/underflows. The address update will wrap across boundaries as programmed by the user. It should ensure that no transfer is allowed to cross internal port boundaries between peripherals. A single TR must target a single source/destination peripheral endpoint.

11.3.3.7 Linking Transfers

The EDMA_TPCC provides a mechanism known as linking, which allows the entire PaRAM set to be reloaded from a location within the PaRAM memory map (for both DMA and QDMA channels). Linking is especially useful for maintaining ping-pong buffers, circular buffering, and repetitive/continuous transfers with no CPU intervention. Upon completion of a transfer, the current transfer parameters are reloaded with the parameter set pointed that the 16-bit link address field of the current parameter set points to. Linking only occurs when the EDMA_TPCC_OPT_n[3] STATIC bit is cleared.

Note

It should always link a transfer (EDMA or QDMA) to another useful transfer. If it must terminate a transfer, then link the transfer to a NULL parameter set. Refer to Section 11.3.3.3 *Null PaRAM Set*.

The link update occurs after the current PaRAM set event parameters have been exhausted. An event's parameters are exhausted when the EDMA channel controller has submitted all of the transfers that are associated with the PaRAM set.

A link update occurs for null and dummy transfers depending on the state of the EDMA_TPCC_OPT_n[3] STATIC bit and the EDMA_TPCC_LNK_n[15:0] LINK field. In both cases (null or dummy), if the value of EDMA_TPCC_LNK_n[15:0] LINK is FFFFh, then a null PaRAM set (with all 0s and EDMA_TPCC_LNK_n[15:0] LINK set to FFFFh) is written to the current PaRAM set.
Similarly, if EDMA_TPCC_LNK_n[15:0] LINK is set to a value other than FFFFh, then the appropriate PaRAM location that EDMA_TPCC_LNK_n[15:0] LINK points to is copied to the current PaRAM set.

Once the channel completion conditions are met for an event, the transfer parameters that are located at the link address are loaded into the current DMA or QDMA channel’s associated parameter set. This indicates that the EDMA_TPCC reads the entire set (eight words) from the PaRAM set specified by EDMA_TPCC_LNK_n[15:0] LINK and writes all eight words to the PaRAM set that is associated with the current channel. Figure 11-12 shows an example of a linked transfer.

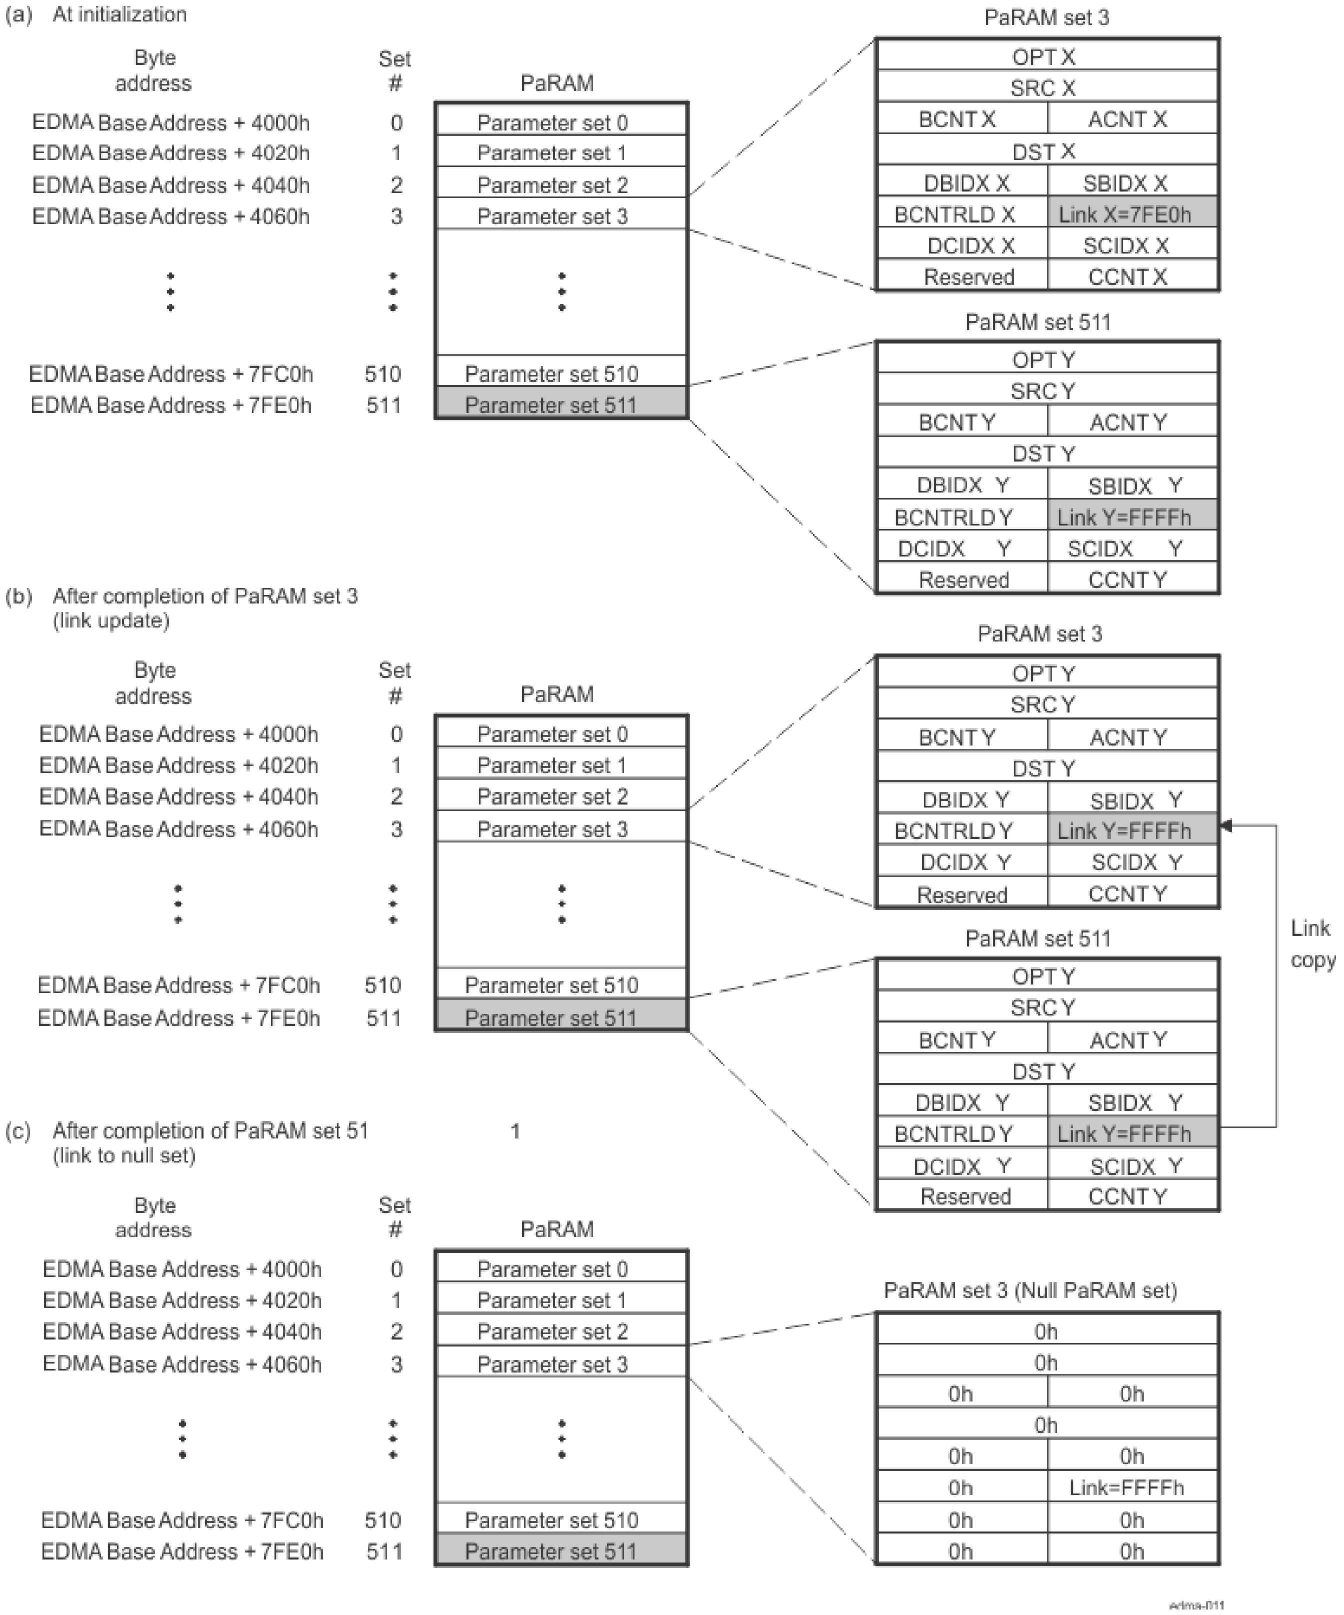

Figure 11-12. Linked Transfer

Any PaRAM set in the PaRAM can be used as a link/reload parameter set. The PaRAM sets associated with peripheral synchronization events (refer to Section 11.3.6 *Event, Channel, and PaRAM Mapping*) only use for linking if the corresponding events are disabled.

If a PaRAM set location is defined as a QDMA channel PaRAM set (by EDMA_TPCC_QCHMAPN_j register), then copying the link PaRAM set into the current QDMA channel PaRAM set is recognized as a trigger event. It is latched in EDMA_TPCC_QER because a write to the trigger word was performed. This feature is used to create a linked list of transfers using a single QDMA channel and multiple PaRAM sets. Refer to Section 11.3.4.2 *QDMA Channels*.

Linking to itself replicates the behavior of auto-initialization, thus facilitating the use of circular buffering and repetitive transfers. After an EDMA channel exhausts its current PaRAM set, it reloads all of the parameter set entries from another PaRAM set, which is initialized with values that are identical to the original PaRAM set. Figure 11-13 shows an example of a linked to self transfer. Here, the PaRAM set 511 has the link field pointing to the address of parameter set 511 (linked to self).

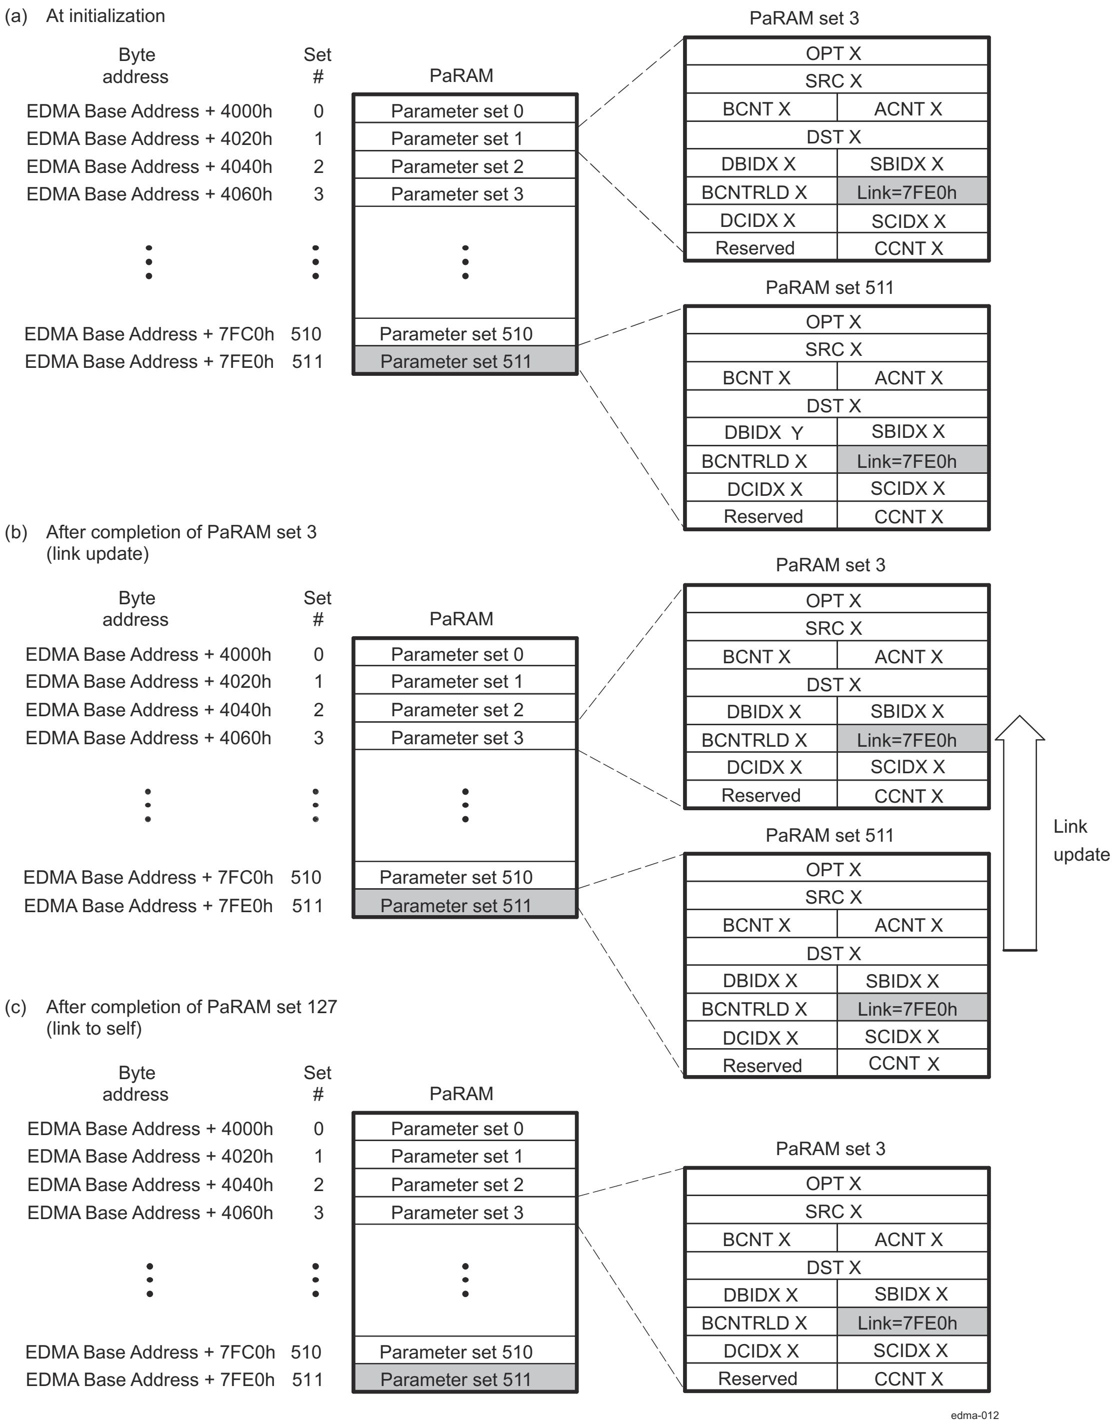

Figure 11-13. Link-to-Self Transfer

Note

If the in EDMA_TPCC_OPT_n[3] STATIC bit is set for a PaRAM set, then link updates are not performed.

11.3.3.8 Constant Addressing Mode Transfers/Alignment Issues

If either EDMA_TPCC_OPT_n[0] SAM or EDMA_TPCC_OPT_n[1] DAM is set (constant addressing mode), then the source or destination address must be aligned to a 256-bit aligned address, respectively, and the corresponding EDMA_TPCC_BIDX_n is an even multiple of 32 bytes (256 bits). The EDMA_TPCC does not recognize errors here, but the EDMA_TPTC asserts an error if this is not true. Refer to Section 11.3.12.3 *Error Generation*.

Note

The constant addressing (CONST) mode has limited applicability. The EDMA is configured for the constant addressing mode (EDMA_TPCC_OPT_n[0] SAM / EDMA_TPCC_OPT_n[1] DAM = 1) only if the transfer source or destination (on-chip memory, off-chip memory controllers, target peripherals) support the constant addressing mode. If the constant addressing mode is not supported, the similar logical transfer can be achieved using the increment (INCR) mode (EDMA_TPCC_OPT_n[0] SAM / EDMA_TPCC_OPT_n[1] DAM =0) by appropriately programming the count and indices values.

11.3.3.9 Element Size

The EDMA controller does not use element-size and element-indexing. Instead, all transfers are defined in terms of all three dimensions: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, and EDMA_TPCC_CCNT_n[15:0] CCNT. An element-indexed transfer is logically achieved by programming EDMA_TPCC_ABCNT_n[15:0] ACNT to the size of the element and EDMA_TPCC_ABCNT_n[31:16] BCNT to the number of elements that need to be transferred. For example: If there are 16-bit audio data and 256 audio samples that must be transferred to a serial port, therefore the EDMA_TPCC_ABCNT_n[15:0] ACNT = 2 (2 bytes) and EDMA_TPCC_ABCNT_n[31:16] BCNT = 256.

11.3.4 Initiating a DMA Transfer

There are multiple ways to initiate a programmed data transfer using the EDMA_TPCC channel controller. Transfers on DMA channels are initiated by three sources.

They are listed as follows:
- **Event-triggered transfer request** (this is the typical usage of EDMA controller): A peripheral, system, or externally-generated event triggers a transfer request.
- **Manually-triggered transfer request:**The CPU manually triggers a transfer by writing a 1 to the corresponding bit in the event set registers (EDMA_TPCC_ESR / EDMA_TPCC_ESRH).
- **Chain-triggered transfer request:** A transfer is triggered on the completion of another transfer or sub-transfer.

Transfers on QDMA channels are initiated by two sources. They are as follows:
- **Auto-triggered transfer request:** Writing to the programmed trigger word triggers a transfer.
- **Link-triggered transfer requests:** Writing to the trigger word triggers the transfer when linking occurs.

11.3.4.1 DMA Channels

11.3.4.1.1 Event-Triggered Transfer Request

When an event is asserted from a peripheral or device pins, it gets latched in the corresponding bit of the event register (EDMA_TPCC_ER[31:0] E*n* = 1). For more information about peripheral events to EDMA events mapping, refer to *the device data manual*.
If the corresponding event in the event enable register (EDMA_TPCC_EER) is enabled (EDMA_TPCC_EER[31:0] E*n* = 1), then the EDMA_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

If the PaRAM set is valid (not a NULL set), then a transfer request packet (TRP) is submitted to the EDMA_TPTC and the EDMA_TPCC_ER[31:0] E*n* bit is cleared. At this point, a new event can be safely received by the EDMA_TPCC.

If the PaRAM set associated with the channel is a NULL set (see Section 11.3.3.3 *Null PaRAM Set*), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_ER[31:0] E*n* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register (EDMA_TPCC_EMR[31:0] E*n* = 1) to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include cleaning the event missed error before re-triggering the DMA channel.

When an event is received, the corresponding event bit in the event register is set (EDMA_TPCC_ER[31:0] E*n* = 1), regardless of the state of EDMA_TPCC_EER[31:0] E*n*. If the event is disabled when an external event is received (EDMA_TPCC_ER[31:0] E*n* = 1 and EDMA_TPCC_EER[31:0] E*n* = 0), the EDMA_TPCC_ER[31:0] E*n* bit remains set. If the event is subsequently enabled (EDMA_TPCC_EER[31:0] E*n* = 1), then the pending event is processed by the EDMA_TPCC and the TR is processed/submitted, after which the EDMA_TPCC_ER[31:0] E*n* bit is cleared.

If an event is being processed (prioritized or is in the event queue) and another sync event is received for the same channel prior to the original being cleared (EDMA_TPCC_ER[31:0] E*n* != 0), then the second event is registered as a missed event in the corresponding bit of the event missed register (EDMA_TPCC_EMR[31:0] E*n* = 1).

11.3.4.1.2 Manually-Triggered Transfer Request

The CPU or any peripheral device module initiates a DMA transfer by writing to the event set register EDMA_TPCC_ESR. Writing a 1 to an event bit in the EDMA_TPCC_ESR results in the event being prioritized/ queued in the appropriate event queue, regardless of the state of the EDMA_TPCC_EER[31:0] E*n* bit. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA_TPTC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see Section 11.3.3.3 *Null PaRAM Set*), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_ER[31:0] E*n* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register EDMA_TPCC_EMR[31:0] E*n* = 1 to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include clearing the event missed error before re-triggering the DMA channel.

If an event is being processed (prioritized or is in the event queue) and the same channel is manually set by a write to the corresponding channel bit of the event set register EDMA_TPCC_ESR[31:0] E*n* = 1 prior to the original being cleared EDMA_TPCC_ESR[31:0] E*n* = 0, then the second event is registered as a missed event in the corresponding bit of the event missed register EDMA_TPCC_EMR[31:0] E*n* = 1.

11.3.4.1.3 Chain-Triggered Transfer Request

Chaining is a mechanism by which the completion of one transfer automatically sets the event for another channel. When a chained completion code is detected, the value of which is dictated by the transfer completion code EDMA_TPCC_OPT_n[17:12] TCC of the PaRAM set associated with the channel, it results in the corresponding bit in the chained event register EDMA_TPCC_CER to be set EDMA_TPCC_CER[31:0] E[TCC] = 1).

Once a bit is set in EDMA_TPCC_CER, the EDMA_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA_TPTC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see Section 11.3.3.3 *Null PaRAM Set*), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_CER[31:0] E*n* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register EDMA_TPCC_EMR[31:0] E*n* = 1 to indicate that the event was discarded due to a null TR being serviced. In this case, the error condition must be cleared before the DMA channel can be re-triggered. Good programming practices might include clearing the event missed error before re-triggering the DMA channel.

If a chaining event is being processed (prioritized or queued) and another chained event is received for the same channel prior to the original being cleared EDMA_TPCC_CER[31:0] E*n* != 0), then the second chained event is registered as a missed event in the corresponding channel bit of the event missed register EDMA_TPCC_EMR[31:0] E*n* = 1.

Note

Chained event registers EDMA_TPCC_CER, event registers EDMA_TPCC_ER, and event set registers EDMA_TPCC_ESR operate independently. An event E*n* can be triggered by any of the trigger sources (event-triggered, manually-triggered, or chain-triggered).

11.3.4.2 QDMA Channels

11.3.4.2.1 Auto-Triggered and Link-Triggered Transfer Request

QDMA-based transfer requests are issued when a QDMA event gets latched in the QDMA event register EDMA_TPCC_QER[31:0] E*n* = 1. A bit corresponding to a QDMA channel is set in the QDMA event register EDMA_TPCC_QER when the following occurs:

- A CPU (or any device module) write occurs to a PaRAM address that is defined as a QDMA channel trigger word (programmed in the QDMA channel mapping register EDMA_TPCC_QCHMAPN_j for the particular QDMA channel and the QDMA channel is enabled via the QDMA event enable register EDMA_TPCC_QEER[31:0] E*n* = 1.
- EDMA_TPCC performs a link update on a PaRAM set address that is configured as a QDMA channel matches EDMA_TPCC_QCHMAPN_j settings and the corresponding channel is enabled via the QDMA event enable register EDMA_TPCC_QEER[31:0] E*n* = 1.

Once a bit is set in EDMA_TPCC_QER, the EDMA_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA_TPTC and the channel can be triggered again.

If a bit is already set in EDMA_TPCC_QER[31:0] E*n* = 1 and a second QDMA event for the same QDMA channel occurs prior to the original being cleared, the second QDMA event gets captured in the QDMA event miss register EDMA_TPCC_QEMR[7:0] E*n* = 1.

11.3.4.3 Comparison Between DMA and QDMA Channels

The primary difference between DMA and QDMA channels is the event/channel synchronization.

QDMA events are either auto-triggered or link triggered. Auto-triggering allows QDMA channels to be triggered by CPU(s) with a minimum number of linear writes to PaRAM. Link triggering allows a linked list of transfers to be executed, using a single QDMA PaRAM set and multiple link PaRAM sets.

A QDMA transfer is triggered when a CPU (or other device modules) writes to the trigger word of the QDMA channel parameter set (auto-triggered) or when the EDMA_TPCC performs a link update on a PaRAM set that has been mapped to a QDMA channel (link triggered).

Note

The CPUs triggered (manually triggered) DMA channels, in addition to writing to the PaRAM set, it is required to write to the event set register EDMA_TPCC_ESR to kick-off the transfer.

QDMA channels are typically for cases where a single event accomplishes a complete transfer since the CPU (or other device modules) must reprogram some portion of the QDMA PaRAM set in order to re-trigger the channel. QDMA transfers are programmed with EDMA_TPCC_ABCNT_n[31:0] BCNT =1 and

EDMA_TPCC_CCNT_n[15:0] CCNT = 1 for A-synchronized transfers, and EDMA_TPCC_CCNT_n[15:0] CCNT = 1 for AB-synchronized transfers.

Additionally, since linking is also supported (if EDMA_TPCC_OPT_n[3] STATIC = 0) for QDMA transfers, it allows to initiate a linked list of QDMAs, so when EDMA_TPCC copies over a link PaRAM set (including the write to the trigger word), the current PaRAM set mapped to the QDMA channel automatically recognizes as a valid QDMA event and initiate another set of transfers as specified by the linked set.

11.3.5 Completion of a DMA Transfer

A parameter set for a given channel is complete when the required number of transfer requests is submitted (based on receiving the number of synchronization events). The expected number of TRs for a non-null/non-dummy transfer is shown in Table 11-15 for both synchronization types along with state of the PaRAM set prior to the final TR being submitted. When the counts (EDMA_TPCC_ABCNT_n[31:0] BCNT and/or EDMA_TPCC_CCNT_n[15:0] CCNT) are this value, the next TR results in:

- Final chaining or interrupt codes sent by the transfer controllers (instead of intermediate).
- Link updates (linking to either null or another valid link set).

Table 11-15. Expected Number of Transfers for Non-Null Transfer

Sync Mode	Counts at time 0	Total # Transfers	Counts prior to final TR
A-synchronized	ACNT BCNT CCNT	(BCNT × CCNT) TRs of ACNT bytes each	EDMA_TPCC_ABCNT_n[31:0] BCNT == 1 && EDMA_TPCC_CCNT_n[15:0] CCNT == 1
AB-synchronized	ACNT BCNT CCNT	CCNT TRs for ACNT × BCNT bytes each	EDMA_TPCC_CCNT_n[15:0] CCNT == 1

The PaRAM OPT field must program with a specific transfer completion code TCC or EDMA_TPCC_OPT_n[17:12] TCC along with the other EDMA_TPCC_OPT_n fields ([22] TCCHEN, [20] TCINTEN, [23] ITCCHEN, and [21] ITCINTEN bits) to indicate whether the completion code is to be used for generating a chained event or/and for generating an interrupt upon completion of a transfer.

The specific EDMA_TPCC_OPT_n[17:12] TCC value (6-bit binary value) programmed dictates which of the 64-bits in the chain event register EDMA_TPCC_CER [TCC] and/or interrupt pending register EDMA_TPCC_IPR [TCC] is set.

It can selectively program whether the transfer controller sends back completion codes on completion of the final transfer request (TR) of a parameter set EDMA_TPCC_OPT_n[22] TCCHEN or EDMA_TPCC_OPT_n[20] TCINTEN, for all but the final transfer request (TR) of a parameter set EDMA_TPCC_OPT_n[23] ITCCHEN or EDMA_TPCC_OPT_n[21] ITCINTEN), or for all TRs of a parameter set (both). Refer to Section 11.3.8 *Chaining EDMA Channels* for details on chaining (intermediate/final chaining) and Section 11.3.9 *EDMA Interrupts* for details on intermediate/final interrupt completion.

A completion detection interface exists between the EDMA channel controller and transfer controller(s). This interface sends back information from the transfer controller to the channel controller to indicate that a specific transfer is completed. Completion of a transfer is used for generating chained events and/or generating interrupts to the CPU(s).

All DMA/QDMA PaRAM sets must also specify a link address value. For repetitive transfers such as ping-pong buffers, the link address value must point to another predefined PaRAM set. Alternatively, a non-repetitive transfer must set the link address value to the null link value. The null link value is defined as FFFFh. Refer to Section 11.3.3.7 *Linking Transfers* for more details.

Note

Any incoming events that are mapped to a null PaRAM set results in an error condition. The error condition must clear before the corresponding channel is used again. Refer to Section 11.3.3.5 *Dummy Versus Null Transfer Comparison*.

There are three ways the EDMA_TPCC gets updated/informed about a transfer completion: normal completion, early completion, and dummy/null completion. This applies to both chained events and completion interrupt generation.

11.3.5.1 Normal Completion

In normal completion mode EDMA_TPCC_OPT_n[11] TCCMODE = 0, the transfer or sub-transfer is considered to be complete when the EDMA channel controller receives the completion codes from the EDMA transfer controller. In this mode, the completion code to the channel controller is posted by the transfer controller after it receives a signal from the destination peripheral. Normal completion is typically used to generate an interrupt to inform the CPU that a set of data is ready for processing.

11.3.5.2 Early Completion

In early completion mode EDMA_TPCC_OPT_n[11] TCCMODE = 1, the transfer is considered to be complete when the EDMA channel controller submits the transfer request (TR) to the EDMA transfer controller. In this mode, the channel controller generates the completion code internally. Early completion is typically useful for chaining, as it allows subsequent transfers to be chained-triggered while the previous transfer is still in progress within the transfer controller, maximizing the overall throughput of the set of the transfers.

11.3.5.3 Dummy or Null Completion

This is a variation of early completion. Dummy or null completion is associated with a dummy set Section 11.3.3.4 or null set Section 11.3.3.3. In both cases, the EDMA channel controller does not submit the associated transfer request to the EDMA transfer controller(s). However, if the set (dummy/null) has the OPT field programmed to return completion code (intermediate/final interrupt/chaining completion), then it sets the appropriate bits in the interrupt pending registers EDMA_TPCC_IPR and EDMA_TPCC_IPRH or chained event register EDMA_TPCC_CER and EDMA_TPCC_CERH. The internal early completion path is used by the channel controller to return the completion codes internally (that is, EDMA_TPCC generates the completion code).

11.3.6 Event, Channel, and PaRAM Mapping

Several of the 64 DMA channels are tied to a specific hardware event, thus allowing events from device peripherals or external hardware (via the dma_evt[3:0] pins) to trigger transfers. A DMA channel typically requests a data transfer when it receives its event (apart from manually-triggered, chain-triggered, and other transfers). The amount of data transferred per synchronization event depends on the channel's configuration (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, EDMA_TPCC_CCNT_n[15:0] CCNT, etc.) and the synchronization type (A-synchronized or AB-synchronized).

The association of an event to a channel is fixed within the EDMA Channel Controller, that is, each DMA channel has one specific event associated with it.

In an application, if a channel does not use the associated synchronization event or if it does not have an associated synchronization event (unused), that channel can be used for manually-triggered or chained-triggered transfers, for linking/reloading, or as a QDMA channel.

11.3.6.1 DMA Channel to PaRAM Mapping

The mapping between the DMA channel numbers and the PaRAM sets is programmable (see). The DMA channel mapping registers EDMA_TPCC_DCHMAPN_m in the EDMA_TPCC provide programmability that allows the DMA channels to be mapped to any of the PaRAM sets in the PaRAM memory map. Figure 11-14 illustrates the use of EDMA_TPCC_DCHMAPN_m. There is one EDMA_TPCC_DCHMAPN_m register per channel.

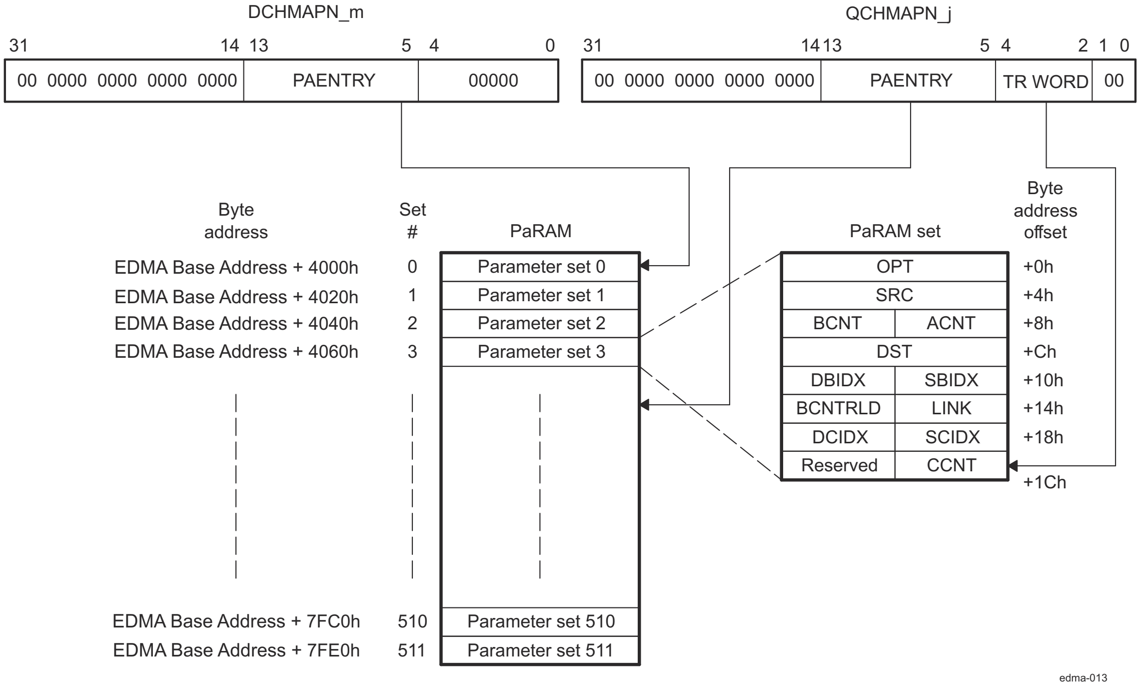

Figure 11-14. DMA Channel and QDMA Channel to PaRAM Mapping

Note

11.3.6.2 QDMA Channel to PaRAM Mapping

The mapping between the QDMA channels and the PaRAM sets is programmable. The QDMA channel mapping register EDMA_TPCC_QCHMAPN_j in the EDMA_TPCC allows to map the QDMA channels to any of the PaRAM sets in the PaRAM memory map. Figure 11-15 illustrates the use of EDMA_TPCC_QCHMAPN_j.

EDMA_TPCC_QCHMAPN_j[4:2] TRWORD bit-field allows to program the trigger word in the PaRAM set for the QDMA channel. A trigger word is one of the eight words in the PaRAM set. For a QDMA transfer to occur, a valid TR synchronization event for EDMA_TPCC is a write to the trigger word in the PaRAM set pointed to by EDMA_TPCC_QCHMAPN_j for a particular QDMA channel. By default, QDMA channels are mapped to PaRAM set 0.

It must appropriately re-map PaRAM set 0 before use.

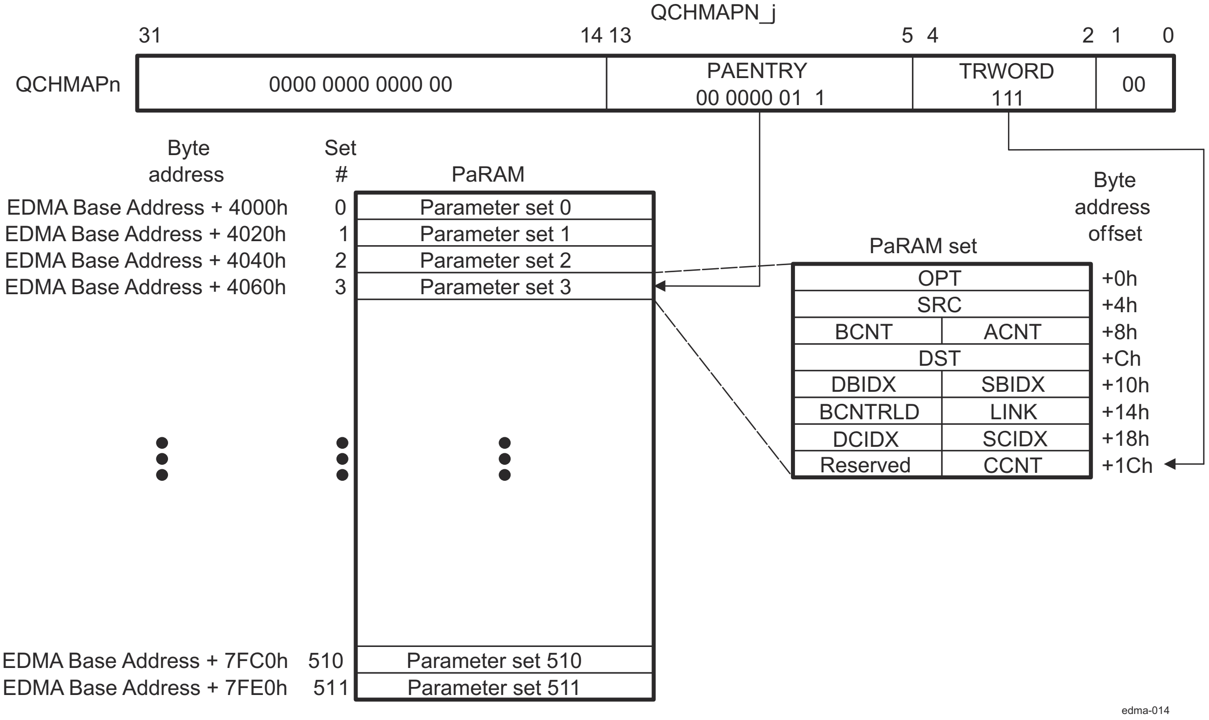

Figure 11-15. QDMA Channel to PaRAM Mapping

11.3.7 EDMA Channel Controller Regions

The EDMA channel controller divides its address space into eight regions. Individual channel resources are assigned to a specific region, where each region is typically assigned to a specific device module uses the EDMA controller.

Application software can use regions or to ignore them altogether. It can be used active memory protection in conjunction with regions so that only a specific device module which uses the EDMA (for example, privilege identification) or privilege level (for example, user vs. supervisor) is allowed access to a given region, and thus to a given DMA or QDMA channel. This allows robust system-level DMA code where each EDMA initiator only modifies the state of the assigned resources. Memory protection is described in Section 11.3.10 *Memory Protection*.

11.3.7.1 Region Overview

The EDMA channel controller memory-mapped registers are divided in three main categories:

1. Global registers
2. Global region channel registers
3. Shadow region channel registers

The global registers are located at a single/fixed location in the EDMA_TPCC memory map. These registers control EDMA resource mapping and provide debug visibility and error tracking information.

The channel registers (including DMA, QDMA, and interrupt registers) are accessible via the global channel region address range, or in the shadow *n* channel region address range(s). For example, the event enable register EDMA_TPCC_EER is visible at the global address of EDMA Base Address + 1020h or region addresses of EDMA Base Address + 2020h for region 0, EDMA Base Address + 2220h for region 1, … EDMA Base Address + 2E20h for region 7.

The DMA region access enable registers EDMA_TPCC_DRAEM_k and the QDMA region access enable registers EDMA_TPCC_QRAEN_k control the underlying control register bits that are accessible via the shadow region address space (except for EDMA_TPCC_IEVAL and EDMA_TPCC_IEVAL_RN_k registers). Table 11-16 lists the registers in the shadow region memory map. Refer to *EDMA_TPCC register mapping summary* for the complete global and shadow region memory maps.

Table 11-16. Shadow Region Registers

EDMA_TPCC_DRAEM_k	**EDMA_TPCC_DRAEHM_k**	**EDMA_TPCC_QRAEN_k**

Figure 11-16 illustrates the conceptual view of the regions.

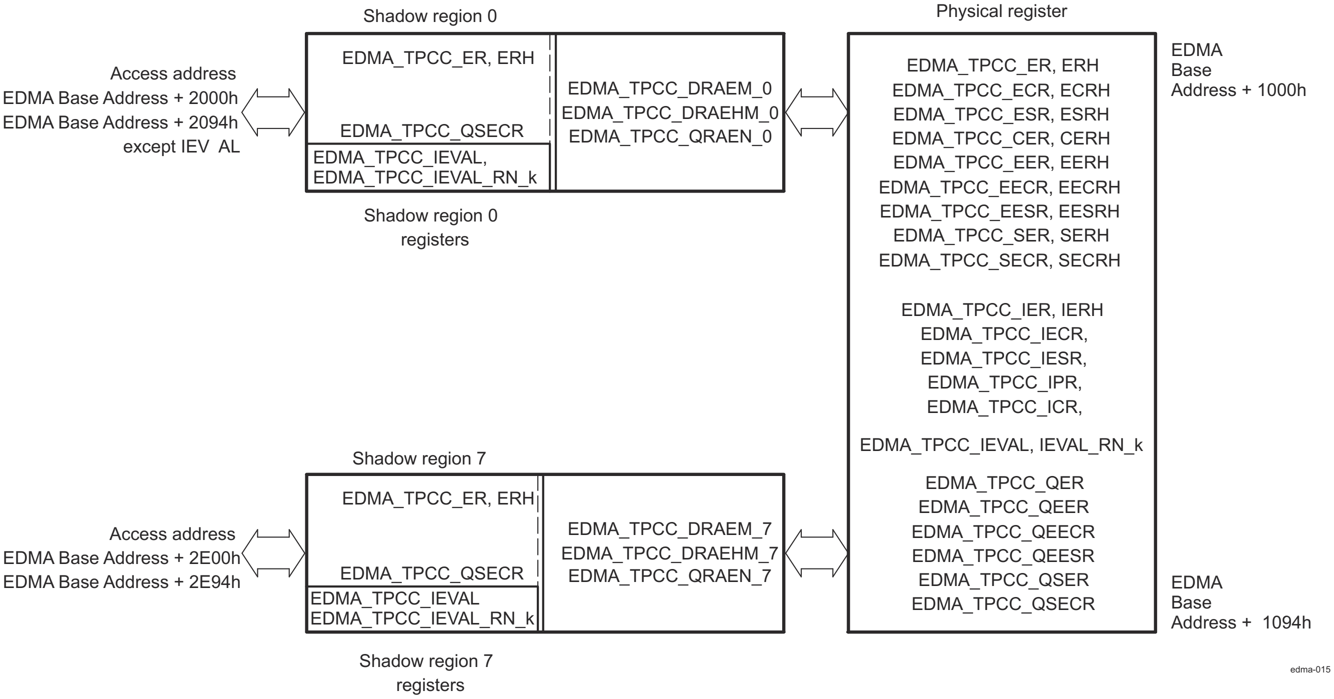

Figure 11-16. Shadow Region Registers

11.3.7.2 Channel Controller Regions

There are eight EDMA shadow regions (and associated memory maps). Associated with each shadow region are a set of registers defining which channels and interrupt completion codes belong to that region. These registers are user-programmed per region to assign ownership of the DMA/QDMA channels to a region.

- EDMA_TPCC_DRAEM_k and EDMA_TPCC_DRAEHM_k: One register pair exists for each of the shadow regions. The number of bits in each register pair matches the number of DMA channels (64 DMA channels). These registers need to be programmed to assign ownership of DMA channels and interrupt (or EDMA_TPCC_OPT_n[17:12] TCC codes) to the respective region. Accesses to DMA and interrupt registers via the shadow region address view are filtered through the DRAEM/DRAEHM pair. A value of 1 in the corresponding EDMA_TPCC_DRAEM_k[31:0] / EDMA_TPCC_DRAEHM_k[31:0] bit implies that the corresponding DMA interrupt channel is accessible; a value of 0 in the corresponding EDMA_TPCC_DRAEM_k[31:0] / EDMA_TPCC_DRAEHM_k[31:0] bit forces writes to be discarded and returns a value of 0 for reads.
- EDMA_TPCC_QRAEN_k: One register exists for every region. The number of bits in each register matches the number of QDMA channels (8 QDMA channels). These registers must be programmed to assign ownership of QDMA channels to the respective region. To enable a channel in a shadow region using shadow region 0 EDMA_TPCC_QEER, the corresponding bits in QRAE must be set or writing into EDMA_TPCC_QEESR there will be no the desired effect.
- EDMA_TPCC_MPPAN_k and EDMA_TPCC_MPPAG: One register exists for every region. This register defines the privilege level, requestor, and types of accesses allowed to a region's memory-mapped registers.

It is typical for an application to have a unique assignment of QDMA/DMA channels (and, therefore, a given bit position) to a given region.

The use of shadow regions allows restricted access to EDMA resources (DMA channels, QDMA channels, TCC, interrupts) by tasks in a system by setting or clearing bits in the EDMA_TPCC_DRAEM_k / EDMA_TPCC_QRAEN_k registers.

If exclusive access to any given channel / TCC code is required for a region, then only that region's EDMA_TPCC_DRAEM_k / EDMA_TPCC_QRAEN_k have the associated bit set.

Example 11-1. Resource Pool Division Across Two Regions

This example illustrates a resource pool division across two regions, assuming region 0 must be allocated 16 DMA channels (0-15) and 1 QDMA channel (0) and 32 TCC codes (0-15 and 48-63).

Region 1 needs to be allocated 16 DMA channels (16-32) and the remaining 7 QDMA channels (1-7) and TCC codes (16-47).

EDMA_TPCC_DRAEM_k should be equal to the OR of the bits that are required for the DMA channels and the TCC codes:

```
Region 0: DRAEHM, DRAEM = 0xFFFF0000, 0x0000FFFF QRAEN = 0x0000001
Region 1: DRAEHM, DRAEM = 0x0000FFFF, 0xFFFF0000 QRAEN = 0x00000FE
```

11.3.7.3 Region Interrupts

In addition to the EDMA_TPCC global completion interrupt, there is an additional completion interrupt line that is associated with every shadow region. Along with the interrupt enable register EDMA_TPCC_IER, DRAEM acts as a secondary interrupt enable for the respective shadow region interrupts. Refer to *Hardware Request* for more information about EDMA Interrupts.

11.3.8 Chaining EDMA Channels

The channel chaining capability for the EDMA allows the completion of an EDMA channel transfer to trigger another EDMA channel transfer. The purpose is to allow the ability to chain several events through one event occurrence.

Chaining is different from linking (Section 11.3.3.7 *Linking Transfers*). The EDMA link feature reloads the current channel parameter set with the linked parameter set. The EDMA chaining feature does not modify or update any channel parameter set. It provides a synchronization event to the chained channel (see Section 11.3.4.1.3 *Chain-Triggered Transfer Request*).

Chaining is achieved at either final transfer completion or intermediate transfer completion, or both, of the current channel. Consider a channel *m* (DMA/QDMA) required to chain to channel *n*. Channel number *n* (0-63) needs to be programmed into the EDMA_TPCC_OPT_n[17:12] TCC bit-field of channel *m* channel options parameter (OPT) set.

- If final transfer completion chaining EDMA_TPCC_OPT_n[22] TCCHEN = 1 is enabled, the chain-triggered event occurs after the submission of the last transfer request of channel *m* is either submitted or completed (depending on early or normal completion).

- If intermediate transfer completion chaining EDMA_TPCC_OPT_n[23] ITCCHEN = 1 is enabled, the chain-triggered event occurs after every transfer request, except the last of channel *m* is either submitted or completed (depending on early or normal completion).
- If both final and intermediate transfer completion chaining (EDMA_TPCC_OPT_n[22] TCCHEN = 1 and EDMA_TPCC_OPT_n[23] ITCCHEN = 1) are enabled, then the chain-trigger event occurs after every transfer request is submitted or completed (depending on early or normal completion).

Table 11-17 illustrates the number of chain event triggers occurring in different synchronized scenarios. Consider channel 31 programmed with EDMA_TPCC_ABCNT_n[15:0] ACNT = 3, EDMA_TPCC_ABCNT_n[31:16] BCNT = 4, EDMA_TPCC_CCNT_n[15:0] CCNT = 5, and EDMA_TPCC_OPT_n[17:12] TCC = 30.

Table 11-17. Chain Event Triggers

	(Number of chained event triggers on channel 30)	
Options	**A-Synchronized**	**AB-Synchronized**
EDMA_TPCC_OPT_n[22] TCCHEN = 1, EDMA_TPCC_OPT_n[23] ITCCHEN = 0	1 (Owing to the last TR)	1 (Owing to the last TR)
EDMA_TPCC_OPT_n[22] TCCHEN = 0, EDMA_TPCC_OPT_n[23] ITCCHEN = 1	19 (Owing to all but the last TR)	4 (Owing to all but the last TR)
EDMA_TPCC_OPT_n[22] TCCHEN = 1, EDMA_TPCC_OPT_n[23] ITCCHEN = 1	20 (Owing to a total of 20 TRs)	5 (Owing to a total of 5 TRs)

11.3.9 EDMA Interrupts

The EDMA interrupts are divided into 2 categories: transfer completion interrupts and error interrupts.

There are nine region interrupts, eight shadow regions and one global region. The transfer completion interrupts are listed in Table 11-18. The transfer completion interrupts and the error interrupts from the transfer controllers are all routed to the device interrupt controllers INTCs.

Table 11-18. EDMA Transfer Completion Interrupts

Name	**Description**
EDMA_TPCC_INT0	EDMA_TPCC Transfer Completion Interrupt Shadow Region 0
EDMA_TPCC_INT1	EDMA_TPCC Transfer Completion Interrupt Shadow Region 1
EDMA_TPCC_INT2	EDMA_TPCC Transfer Completion Interrupt Shadow Region 2
EDMA_TPCC_INT3	EDMA_TPCC Transfer Completion Interrupt Shadow Region 3
EDMA_TPCC_INT4	EDMA_TPCC Transfer Completion Interrupt Shadow Region 4
EDMA_TPCC_INT5	EDMA_TPCC Transfer Completion Interrupt Shadow Region 5
EDMA_TPCC_INT6	EDMA_TPCC Transfer Completion Interrupt Shadow Region 6
EDMA_TPCC_INT7	EDMA_TPCC Transfer Completion Interrupt Shadow Region 7

Table 11-19. EDMA Error Interrupts

Name	**Description**
EDMA_TPCC_ERRINT	EDMA_TPCC Error Interrupt
EDMA_TPCC_MPINT	EDMA_TPCC Memory Protection Interrupt
EDMA_TC0_ERRINT	TC0 Error Interrupt
EDMA_TC1_ERRINT	TC1 Error Interrupt

11.3.9.1 Transfer Completion Interrupts

The EDMA_TPCC is responsible for generating transfer completion interrupts to the CPU(s) (and other EDMA controllers). The EDMA generates a single completion interrupt per shadow region, as well as one for the global region on behalf of all 64 channels. The various control registers and bit fields facilitate EDMA interrupt generation.

The software architecture must either use the global interrupt or the shadow interrupts, but not both.

The transfer completion code EDMA_TPCC_OPT_n[17:12] TCC value is directly mapped to the bits of the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH.

For example, if EDMA_TPCC_OPT_n[17:12] TCC = 10 0001b, EDMA_TPCC_IPRH[1] is set after transfer completion, and results in interrupt generation to the CPU(s) if the completion interrupt is enabled for the CPU. See Section 11.3.9.1.1 *Enabling Transfer Completion Interrupts* for details about enabling EDMA transfer completion interrupts.

When a completion code is returned (as a result of early or normal completions), the corresponding bit in EDMA_TPCC_IPR / EDMA_TPCC_IPRH registers is set if transfer completion interrupt (final/intermediate) is enabled in the channel options parameter (OPT) for a PaRAM set associated with the transfer.

Table 11-20. Transfer Complete Code (TCC) to EDMA_TPCC Interrupt Mapping

TCC values in EDMA_TPCC_OPT_n[17:12] TCC (EDMA_TPCC_OPT_n[20] TCINTEN / EDMA_TPCC_OPT_n[21] ITCINTEN = 1)	EDMA_TPCC_IPR Bit Set	TCC values in EDMA_TPCC_OPT_n[17:12] TCC (EDMA_TPCC_OPT_n[20] TCINTEN / EDMA_TPCC_OPT_n[21] ITCINTEN = 1)	EDMA_TPCC_IPRH Bit Set[1]
0	EDMA_TPCC_IPR[0]	20h	EDMA_TPCC_IPR[32] / EDMA_TPCC_IPRH[0]
1	EDMA_TPCC_IPR[1]	21h	EDMA_TPCC_IPR[33] / EDMA_TPCC_IPRH[1]
2h	EDMA_TPCC_IPR[2]	22h	EDMA_TPCC_IPR[34] / EDMA_TPCC_IPRH[2]
3h	EDMA_TPCC_IPR[3]	23h	EDMA_TPCC_IPR[35] / EDMA_TPCC_IPRH[3]
4h	EDMA_TPCC_IPR[4]	24h	EDMA_TPCC_IPR[36] / EDMA_TPCC_IPRH[4]
...	...	...	...
1Eh	EDMA_TPCC_IPR[30]	3Eh	EDMA_TPCC_IPR[62] / EDMA_TPCC_IPRH[30]
1Fh	EDMA_TPCC_IPR[31]	3Fh	EDMA_TPCC_IPR[63] / EDMA_TPCC_IPRH[31]

(1) Bit fields EDMA_TPCC_IPR [32-63] correspond to bits 0 to 31 in EDMA_TPCC_IPRH, respectively.

The transfer completion code (TCC) can program to any value for a DMA/QDMA channel. A direct relation between the channel number and the transfer completion code value does not need to exist. This allows multiple channels having the same transfer completion code value to cause a CPU to execute the same interrupt service routine (ISR) for different channels.

If the channel is used in the context of a shadow region and it intends for the shadow region interrupt to be asserted, then ensure that the bit corresponding to the TCC code is enabled in EDMA_TPCC_IER / EDMA_TPCC_IERH and in the corresponding shadow region's DMA region access registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k).

Interrupt generation can be enabled at either final transfer completion or intermediate transfer completion, or both. Consider channel *m* as an example.

- If the final transfer interrupt (EDMA_TPCC_OPT_n[20] TCINTEN = 1) is enabled, the interrupt occurs after the last transfer request of channel *m* is either submitted or completed (depending on early or normal completion).
- If the intermediate transfer interrupt (EDMA_TPCC_OPT_n[21] ITCINTEN = 1) is enabled, the interrupt occurs after every transfer request, except the last TR of channel *m* is either submitted or completed (depending on early or normal completion).

- If both final and intermediate transfer completion interrupts (EDMA_TPCC_OPT_n[20] TCINTEN = 1, and EDMA_TPCC_OPT_n[21] ITCINTEN = 1) are enabled, then the interrupt occurs after every transfer request is submitted or completed (depending on early or normal completion).

Table 11-21 shows the number of interrupts that occur in different synchronized scenarios. Consider channel 31, programmed with ABCNT_n[15:0] ACNT = 3, EDMA_TPCC_ABCNT_n[31:16] BCNT = 4, EDMA_TPCC_CCNT_n[15:0]CCNT = 5, and EDMA_TPCC_OPT_n[17:12] TCC = 30.

Table 11-21. Number of Interrupts

Options	A-Synchronized	AB-Synchronized
EDMA_TPCC_OPT_n[20] TCINTEN = 1, EDMA_TPCC_OPT_n[21] ITCINTEN = 0	1 (Last TR)	1 (Last TR)
EDMA_TPCC_OPT_n[20] TCINTEN = 0, EDMA_TPCC_OPT_n[21] ITCINTEN = 1	19 (All but the last TR)	4 (All but the last TR)
EDMA_TPCC_OPT_n[20] TCINTEN = 1, EDMA_TPCC_OPT_n[21] ITCINTEN = 1	20 (All TRs)	5 (All TRs)

11.3.9.1.1 Enabling Transfer Completion Interrupts

For the EDMA channel controller to assert a transfer completion to the external environment, the interrupts must be enabled in the EDMA_TPCC. This is in addition to setting up the EDMA_TPCC_OPT_n[20] TCINTEN and EDMA_TPCC_OPT_n[21] ITCINTEN bits of the associated PaRAM set.

The EDMA channel controller has interrupt enable registers EDMA_TPCC_IER / EDMA_TPCC_IERH and each bit location in EDMA_TPCC_IER / EDMA_TPCC_IERH serves as a primary enable for the corresponding interrupt pending registers EDMA_TPCC_IPR / EDMA_TPCC_IPRH.

All of the interrupt registers (EDMA_TPCC_IER, EDMA_TPCC_IESR, EDMA_TPCC_IECR, and EDMA_TPCC_IPR) are either manipulated from the global DMA channel region, or by the DMA channel shadow regions. The shadow regions provide a view to the same set of physical registers that are in the global region.

The EDMA channel controller has a hierarchical completion interrupt scheme that uses a single set of interrupt pending registers EDMA_TPCC_IPR / EDMA_TPCC_IPRH and single set of interrupt enable registers EDMA_TPCC_IER / EDMA_TPCC_IERH. The programmable DMA region access enable registers EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k provides a second level of interrupt masking. The global region interrupt output is gated based on the enable mask that is provided by EDMA_TPCC_IER / EDMA_TPCC_IERH, see Figure 11-17

The region interrupt outputs are gated by EDMA_TPCC_IER and the specific EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k associated with the region.

Figure 11-17 shows the Interrupt diagram of the EDMA controller.

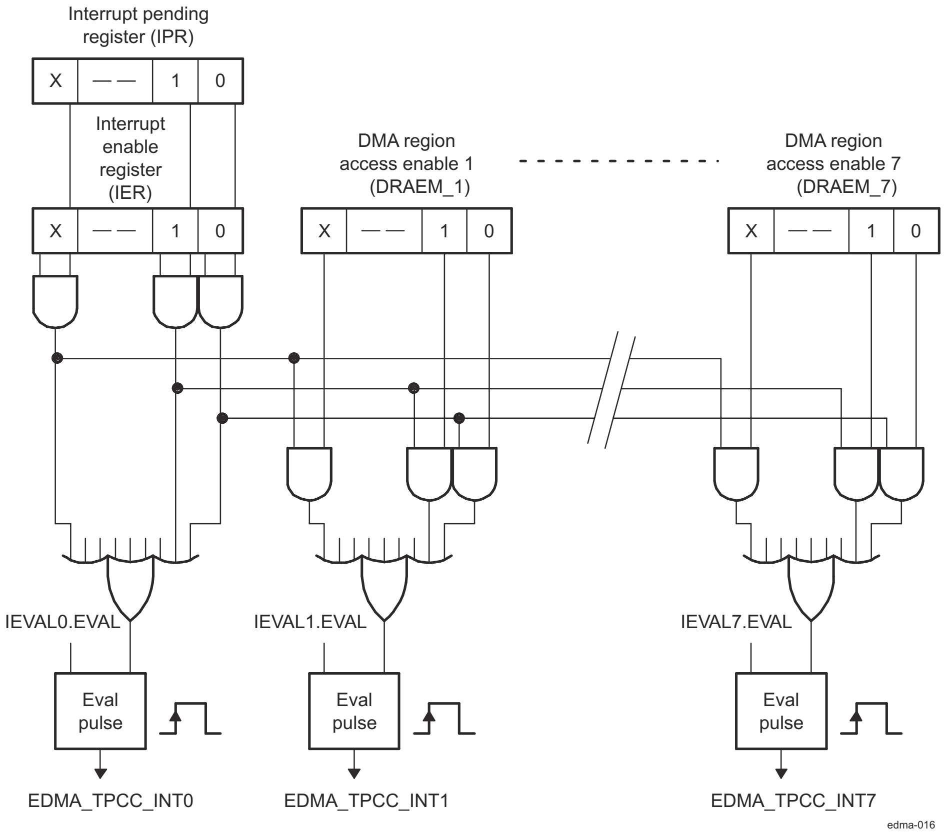

Figure 11-17. Interrupt Diagram

The EDMA_TPCC generates the transfer completion interrupts that are associated with each shadow region, the following conditions must be true:

- EDMA_TPCC_INT0: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_0[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_0[1] E1) | …|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_0[31] E63)
- EDMA_TPCC_INT1: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_1[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_1[1] E1) | …| (EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_1[31] E63)
- EDMA_TPCC_INT2: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_2[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_2[1] E1) | …|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_2[31] E63)....
- Up to EDMA_TPCC_INT7: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_7[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_7[1] E1) | …|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_7[31] E63)

Note

The EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k for all regions are expected to be set up at system initialization and to remain static for an extended period of time. The interrupt enable registers are used for dynamic enable/disable of individual interrupts.

Because there is no relation between the EDMA_TPCC_OPT_n[17:12] TCC value and the DMA/QDMA channel, it is possible, the DMA channel 0 to have the EDMA_TPCC_OPT_n[17:12] TCC = 63 in its associated PaRAM set. This mean that if a transfer completion interrupt is enabled (EDMA_TPCC_OPT_n[20] TCINTEN or EDMA_TPCC_OPT_n[21] ITCINTEN is set), then based on the TCC value, EDMA_TPCC_IPRH[31] E63 is set up on completion. For proper channel operations and interrupt generation using the shadow region map - program the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k that is associated with the shadow region to have read/write access to both bit 0 (corresponding to channel 0) and bit 63 (corresponding to EDMA_TPCC_IPRH bit that is set upon completion).

11.3.9.1.2 Clearing Transfer Completion Interrupts

Transfer completion interrupts that are latched to the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH) are cleared by writing a 1 to the corresponding bit in the interrupt pending clear register (EDMA_TPCC_ICR / EDMA_TPCC_ICRH). For example, a write of 1 to EDMA_TPCC_ICR[0] E0 clears a pending interrupt in EDMA_TPCC_IPR[0] E0.

If an incoming transfer completion code TCC (EDMA_TPCC_OPT_n[17:12] TCC) gets latched to a bit in EDMA_TPCC_IPR / EDMA_TPCC_IPRH, then additional bits that get set due to a subsequent transfer completion does not result in asserting the EDMA_TPCC completion interrupt. In order for the completion interrupt to be pulsed, the required transition is from a state where no enabled interrupts are set to a state where at least one enabled interrupt is set.

11.3.9.2 EDMA Interrupt Servicing

Upon completion of a transfer (early or normal completion), the EDMA channel controller sets the appropriate bit in the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH), as the transfer completion codes specify. If the completion interrupts are appropriately enabled, then the CPU enters the interrupt service routine (ISR) when the completion interrupt is asserted.

After servicing the interrupt, the ISR should clear the corresponding bit in EDMA_TPCC_IPR/ EDMA_TPCC_IPRH, thereby enabling recognition of future interrupts. The EDMA_TPCC only asserts additional completion interrupts when all EDMA_TPCC_IPR / EDMA_TPCC_IPRH bits clear.

When one interrupt is serviced many other transfer completions may result in additional bits being set in EDMA_TPCC_IPR / EDMA_TPCC_IPRH, thereby resulting in additional interrupts. Each of the bits in EDMA_TPCC_IPR / EDMA_TPCC_IPRH may need different types of service therefore, the ISR must check all pending interrupts and continue until all of the posted interrupts are serviced appropriately.

Examples of pseudo code for a CPU interrupt service routine for an EDMA_TPCC completion interrupt are shown in Example 11-2 and Example 11-3.

The ISR routine in Example 11-2 is more exhaustive and incurs a higher latency.

Example 11-2. Interrupt Servicing

The pseudo code:

1. Reads the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH.
2. Performs the operations needed.
3. Writes to the interrupt pending clear register EDMA_TPCC_ICR / EDMA_TPCC_ICRH to clear the corresponding EDMA_TPCC_IPR / EDMA_TPCC_IPRH bit(s).
4. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH again:

   a. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is not equal to 0, repeat from step 2 (implies occurrence of new event between step 2 to step 4).
   b. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is equal to 0, assure that all of the enabled interrupts are inactive.

Note

An event may occur during step 4 while the EDMA_TPCC_IPR / EDMA_TPCC_IPRH bits are read as 0 and the application is still in the interrupt service routine. If this happens, a new interrupt is recorded in the device interrupt controller and a new interrupt generates as soon as the application exits in the interrupt service routine.

11.3.9.3

Example 11-3 is less rigorous, with less burden on the software in polling for set interrupt bits, but can occasionally cause a race condition as mentioned above.

Example 11-3. Interrupt Servicing

If any enabled and pending (possibly lower priority) interrupts are left, force the interrupt logic to reassert the interrupt pulse by setting the EDMA_TPCC_IEVAL[0] EVAL bit in the interrupt evaluation register.

The pseudo code is as follows:

1. Enters ISR.
2. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH.
3. For the condition that is set in EDMA_TPCC_IPR / EDMA_TPCC_IPRH:
   a. Service interrupt as the application requires.
   b. Clear the bit for serviced conditions (others may still be set, and other transfers may have resulted in returning the TCC to EDMA_TPCC after step 2).
4. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH prior to exiting the ISR:
   a. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is equal to 0, then exit the ISR.
   b. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is not equal to 0, then set EDMA_TPCC_IEVAL so that upon exit of ISR, a new interrupt triggers if any enabled interrupts are still pending.

11.3.9.4 Interrupt Evaluation Operations

The EDMA_TPCC has interrupt evaluate registers EDMA_TPCC_IEVAL that exist in the global region and in each shadow region. The registers in the shadow region are the only registers in the DMA channel shadow region memory map that are not affected by the settings for the DMA region access enable registers EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k. Writing a 1 to the EDMA_TPCC_IEVAL[0] EVAL bit in the registers that are associated with a particular shadow region results in pulsing the associated region interrupt (global or shadow), if any enabled interrupt (via EDMA_TPCC_IER / EDMA_TPCC_IERH) is still pending EDMA_TPCC_IPR / EDMA_TPCC_IPRH. This register assures that the CPU does not miss the interrupts (or the EDMA controller associated with the shadow region) if the software architecture chooses not to use all interrupts. Refer to Example 11-3 about the use of EDMA_TPCC_IEVAL in the EDMA interrupt service routine (ISR).

Similarly an error evaluation register EDMA_TPCC_EEVAL exists in the global region. Writing a 1 to the EDMA_TPCC_EEVAL[0] EVAL bit causes the pulsing of the error interrupt if any pending errors are in EDMA_TPCC_EMR / EDMA_TPCC_EMRH, EDMA_TPCC_QEMR, or EDMA_TPCC_CCERR. See Section 11.3.9.5 *Error Interrupts* for additional information regarding error interrupts.

Note

While using EDMA_TPCC_IEVAL for shadow region completion interrupts, check that the EDMA_TPCC_IEVAL operated upon is from that particular shadow region memory map.

11.3.9.5 Error Interrupts

The EDMA_TPCC error registers provide the capability to differentiate error conditions (event missed, threshold exceed, etc.). Additionally, setting the error bits in these registers results in asserting the EDMA_TPCC error interrupt. If the EDMA_TPCC error interrupt is enabled in the device interrupt controller(s), then it allows the CPU(s) to handle the error conditions.

The EDMA_TPCC has a single error interrupt (EDMA_TPCC_ERRINT) that is asserted for all EDMA_TPCC error conditions. There are four conditions that cause the error interrupt:

- DMA missed events: for all 64 DMA channels. DMA missed events are latched in the event missed registers EDMA_TPCC_EMR / EDMA_TPCC_EMRH.
- QDMA missed events: for all 8 QDMA channels. QDMA missed events are latched in the QDMA event missed register EDMA_TPCC_QEMR.
- Threshold exceed: for all event queues. These are latched in EDMA_TPCC error register EDMA_TPCC_CCERR.
- TCC error: for outstanding transfer requests that are expected to return completion code EDMA_TPCC_OPT_n[22] TCCHEN or EDMA_TPCC_OPT_n[23] TCINTEN bit is set to 1, exceeding the maximum limit of 63. This is also latched in the EDMA_TPCC error register EDMA_TPCC_CCERR.

Figure 11-18 illustrates the EDMA_TPCC error interrupt generation operation.

If any of the bits are set in the error registers due to any error condition, the EDMA_TPCC_ERRINT is always asserted, as there are no enables for masking these error events. Similar to transfer completion interrupts (EDMA_TPCC_INT), the error interrupt also only pulses when the error interrupt condition transitions from no errors being set to at least one error being set. If additional error events are latched prior to the original error bits clearing, the EDMA_TPCC does not generate additional interrupt.

To reduce the burden on the software, there is an error evaluate register EDMA_TPCC_EEVAL that allows re-evaluation of pending set error events/bits, similar to the interrupt evaluate register EDMA_TPCC_IEVAL. Unlike the EDMA_TPCC_IEVAL functionality, the EDMA_TPCC_EEVAL register must be written with ‘1’ after any error interrupts are serviced (even when all pending errors are cleared) in order for subsequent errors to trigger a new interrupt.

Note

It is good practice to enable the error interrupt in the device interrupt controller and to associate an interrupt service routine with it to address the various error conditions appropriately. Doing so puts less burden on the software (polling for error status), it provides a good debug mechanism for unexpected error conditions.

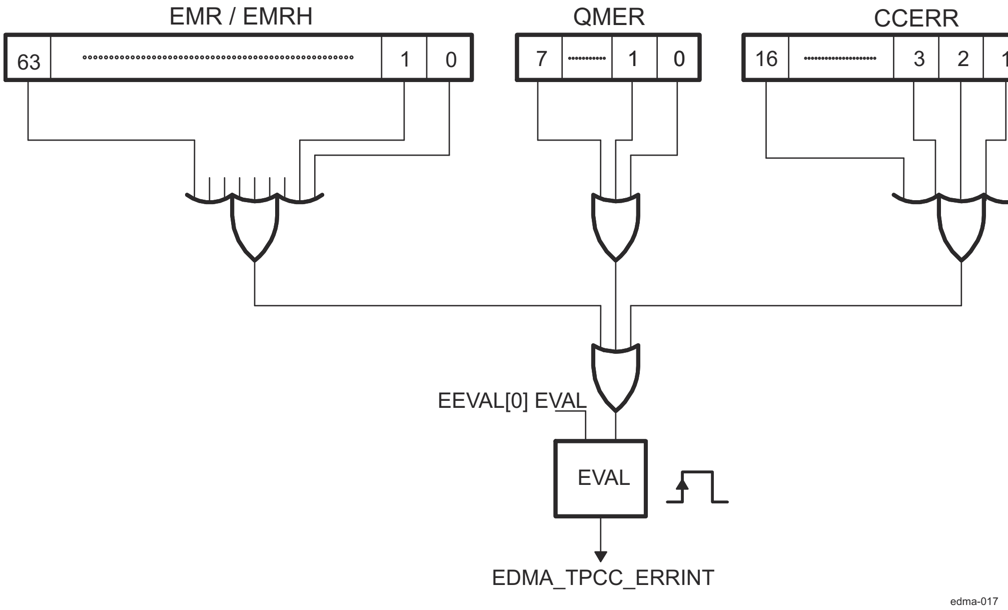

Figure 11-18. Error Interrupt Operation

11.3.10 Memory Protection

The EDMA channel controller supports two kinds of memory protection: active and proxy.

11.3.10.1 Active Memory Protection

Active memory protection is a feature that allows or prevents read and write accesses to the EDMA_TPCC registers. Active memory protection is achieved by a set of memory protection permissions attribute EDMA_TPCC_MPPAN_k registers.

The EDMA_TPCC register map is divided into three categories:

- a global region.
- a global channel region.
- eight shadow regions.

Each shadow region consists of the respective shadow region registers and the associated PaRAM. For more detailed information regarding the contents of a shadow region, refer to the associated Register Addendum.

Each of the eight shadow regions has an associated EDMA_TPCC_MPPAN_k registers that defines the specific requestor(s) and types of requests that are allowed to the regions resources.

The global channel region is also protected with a memory-mapped register EDMA_TPCC_MPPAG. The EDMA_TPCC_MPPAG applies to the global region and to the global channel region, except the other EDMA_TPCC_MPPAN_k registers themselves.

Table 11-22 shows the accesses that are allowed or not allowed to the EDMA_TPCC_MPPAG and EDMA_TPCC_MPPAN_k. The active memory protection uses the EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID attributes of the EDMA peripheral modules. TheEDMA_TPCC_OPT_n[31] PRIV is the privilege level (i.e., user vs. supervisor).

The EDMA_TPCC_OPT_n[27:24] PRIVID refers to a privilege ID with a number that is associated with an EDMA peripheral modules.

Table 11-22. Allowed Accesses

Access	Supervisor	User
Read	Yes	Yes
Write	Yes	No

Table 11-23 describes the EDMA_TPCC_MPPAN_k register mapping for the shadow regions (which includes shadow region registers and PaRAM addresses).

The region-based EDMA_TPCC_MPPAN_k registers are used to protect accesses to the DMA shadow regions and the associated region PaRAM. Because there are eight regions, there are eight EDMA_TPCC_MPPAN_k region registers (MPPA[0-7]).

Table 11-23. MPPA Registers to Region Assignment

Register	Registers Protect	Address Range	PaRAM Protect(1)	Address Range
EDMA_TPCC_MPPAG	Global Range	0000h-1FFCh	N/A	N/A
EDMA_TPCC_MPPAN_k. MPPAN_0	DMA Shadow 0	2000h-21FCh	1st octant	4000h-47FCh
MPPAN_1	DMA Shadow 1	2200h-23FCh	2nd octant	4800h-4FFCh
MPPAN_2	DMA Shadow 2	2400h-25FCh	3rd octant	5000h-57FCh
MPPAN_3	DMA Shadow 3	2600h-27FCh	4th octant	5800h-5FFCh
MPPAN_4	DMA Shadow 4	2800h-29FCh	5th octant	6000h-67FCh
MPPAN_5	DMA Shadow 5	2A00h-2BFCh	6th octant	6800h-6FFCh
MPPAN_6	DMA Shadow 6	2C00h-2DFCh	7th octant	7000h-77FCh
MPPAN_7	DMA Shadow 7	2E00h-2FFCh	8th octant	7800h-7FFCh

(1) The PARAM region is divided into 8 regions referred to as an octant.

Example *Access denied.*

Write access to shadow region 7's event enable set register EDMA_TPCC_EESR:

1. The original value of the event enable register EDMA_TPCC_EER at address offset 0x1020 is 0x0.
2. The EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[7] NS is set to prevent user level accesses (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[1] UW = 0, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[2] UR = 0), but it allows supervisor level accesses (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[4] SW = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[5] SR = 1) with a privilege ID of 0. (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[10] AID0 = 1).
3. EDMA peripheral modules with a privilege ID of 0 attempts to perform a user-level write of a value of 0xFF00FF00 to shadow region 7's event enable set register EDMA_TPCC_EESR at address offset 0x2E30.

Note

The EDMA_TPCC_EER is a read-only register and the only way that write to it is by writing to the EDMA_TPCC_EESR. There is only one physical register for EDMA_TPCC_EER, EDMA_TPCC_EESR, etc. and that the shadow regions only provide to the same physical set.

---

4. Since the EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[1] UW = 0, though the privilege ID of the write access is set to 0, the access is not allowed and the EDMA_TPCC_EER is not written too.

Example *Access Allowed*

Write access to shadow region 7's event enable set register EDMA_TPCC_EESR:

1. The original value of the event enable register EDMA_TPCC_EER at address offset 0x1020 is 0x0.
2. The EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7 is set to allow user-level accesses (EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[1] UW = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[2] UR = 1) and supervisor-level accesses (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[4] SW = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[5] SR = 1) with a privilege ID of 0. (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[10] AID0 = 1).
3. EDMA peripheral modules with a privilege ID of 0, attempts to perform a user-level write of a value of 0xABCD0123 to shadow region 7's event enable set register EDMA_TPCC_EESR at address offset 0x2E30.

Note

The EDMA_TPCC_EER is a read-only register and the only way that write to it is by writing to the EDMA_TPCC_EESR. There is only one physical register for EDMA_TPCC_EER, EDMA_TPCC_EESR, etc. and that the shadow regions only provide to the same physical set.

---

4. Since the EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[1] UW = 1 and EDMA_TPCC_MPPAN_k. MPPAN_7[10] AID0 = 1, the user-level write access is allowed.
5. The accesse to shadow region registers are masked by their respective EDMA_TPCC_DRAEM_k register. In this example, the EDMA_TPCC_DRAEM_k. EDMA_TPCC_DRAEM_7 is set of 0x9FF00FC2.
6. The value finally written to EDMA_TPCC_EER is 0x8BC00102.

11.3.10.2 Proxy Memory Protection

Proxy memory protection allows an EDMA transfer programmed by a given peripheral module connected to EDMA, to have its permissions travel with the transfer through the EDMA_TPTC. The permissions travel along with the read transactions to the source and the write transactions to the destination endpoints. The EDMA_TPCC_OPT_n[31] PRIV bit and EDMA_TPCC_OPT_n[27:24] PRIVID bit is set with the peripheral module's PRIV value and PRIVID values, respectively, when any part of the PaRAM set is written.

The EDMA_TPCC_OPT_n[31] PRIV is the privilege level (i.e., user vs. supervisor). The EDMA_TPCC_OPT_n[27:24] PRIVID refers to a privilege ID with a number that is associated with an peripheral module connected to EDMA.

These options are part of the TR that are submitted to the transfer controller. The transfer controller uses the above values on their respective read and write command bus so that the target endpoints can perform memory protection checks based on these values.

Consider a parameter set that is programmed by a CPU in user privilege level for a simple transfer with the source buffer on an L2 page and the destination buffer on an L1D page. The EDMA_TPCC_OPT_n[31] PRIV is 0 for user-level and the CPU has a EDMA_TPCC_OPT_n[27:24] PRIVID to 0.

The PaRAM set is shown in Figure 11-19.

Figure 11-19. PaRAM Set Content for Proxy Memory Protection Example

(a) EDMA Parameters

Parameter Contents		Parameter	
0010 0007h		Channel Options Parameter (OPT)	
009F 0000h		Channel Source Address (SRC)	
0001h	0004h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
00F0 7800h		Channel Destination Address (DST)	
0001h	0001h	Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0001h	1000h	Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h	Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT_n) Content

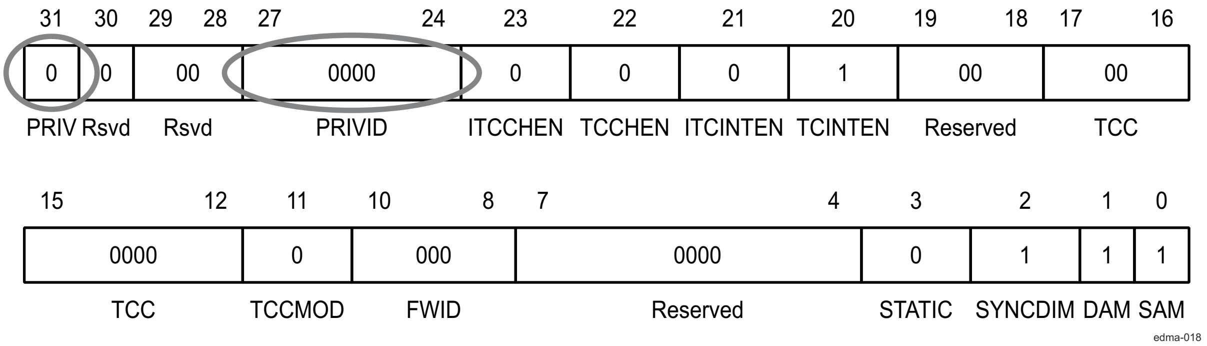

Figure 11-20. Channel Options Parameter (OPT) Example

The EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID information travels along with the read and write requests that are issued to the source and destination memories.

For example, if the access attributes that are associated with the L2 page with the source buffer only allow supervisor read, write accesses (EDMA_TPCC_MPPAN_k[4] SW and EDMA_TPCC_MPPAN_k[5] SR), the user-level read request above is refused. Similarly, if the access attributes that are associated with the L1D page with the destination buffer only allow supervisor read and write accesses (EDMA_TPCC_MPPAN_k[4] SW, EDMA_TPCC_MPPAN_k[5] SR), the user-level write request above is refused. For the transfer to succeed, the source and destination pages must have user-read and user-write permissions, respectively, along with allowing accesses from a PRIVID = 0.

Because the privilege level and privilege identification travel with the read and write requests, EDMA acts as a proxy.

Figure 11-21 illustrates the propagation of EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID at the boundaries of all the interacting entities (CPU, EDMA_TPCC, EDMA_TPTCs, and target memories).

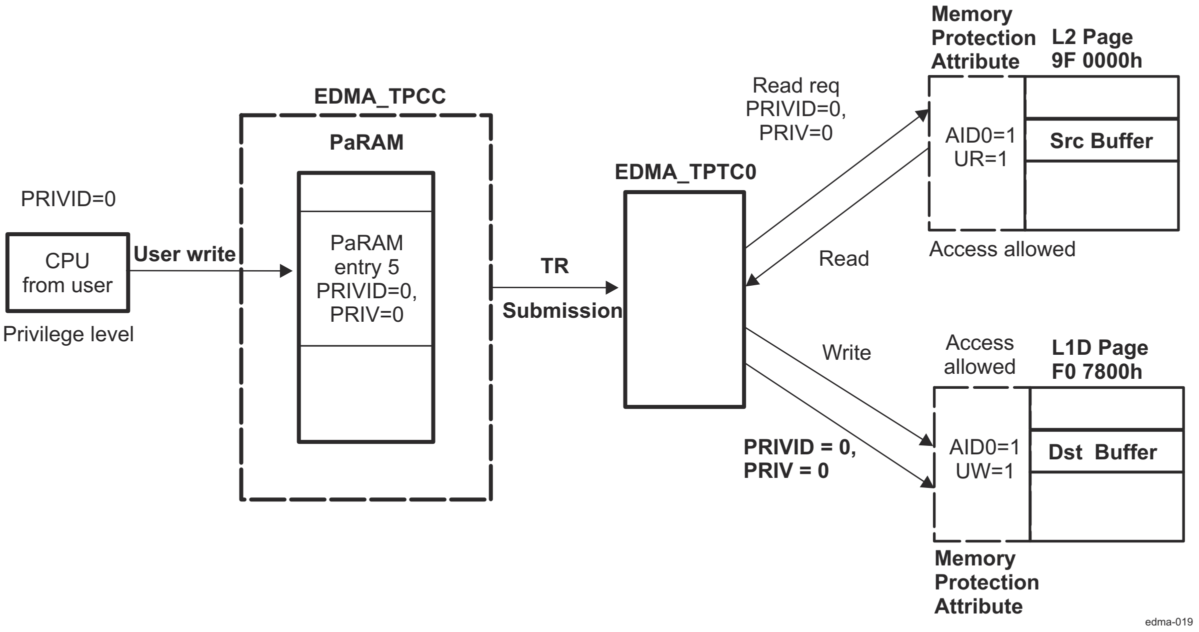

Figure 11-21. Proxy Memory Protection Example

11.3.11 Event Queue(s)

Event queues are a part of the EDMA channel controller. Event queues form the interface between the event detection logic in the EDMA_TPCC and the transfer request (TR) submission logic of the EDMA_TPCC. Each queue is 16 entries deep. Each event queue can queue a maximum of 16 events. If there are more than 16 events, then the events that cannot find a place in the event queue remain set in the associated event register and the CPU does not stall.

There are two event queues for the device: Queue0, Queue1. Events in Queue0 result in submission of its associated transfer requests (TRs) to TC0. The transfer requests that are associated with events in Queue1 are submitted to TC1.

An event that wins prioritization against other DMA and/or QDMA pending events is placed at the tail of the appropriate event queue. Each event queue is serviced in FIFO order. Once the event reaches the head of its queue and the corresponding transfer controller is ready to receive another TR, the event is de-queued and the PaRAM set corresponding to the de-queued event is processed and submitted as a transfer request packet (TRP) to the associated EDMA transfer controller.

Queue0 has highest priority and Queue1 has the lowest priority, if Queue0 and Queue1 both have at least one event entry and if both TC0 and TC1 can accept transfer requests, then the event in Queue0 is de-queued first and its associated PaRAM set is processed and submitted as a transfer request (TR) to TC0.

Refer to *Performance Considerations* for system-level performance considerations. All of the event entries in all of the event queues are software readable (not writeable) by accessing the event entry registers EDMA_TPCC_Q0E_p and EDMA_TPCC_Q1E_p. Each event entry register characterizes the queued event in terms of the type of event (manual, event, chained or auto-triggered) and the event number. Refer to the associated Register Addendum for EDMA_TPCC_Q0E_p / EDMA_TPCC_Q1E_p descriptions of the bit fields.

11.3.11.1 DMA/QDMA Channel to Event Queue Mapping

Each of the 64 DMA channels and eight QDMA channels are programmed independently to map to a specific queue, using the DMA queue number register EDMA_TPCC_DMAQNUMN_k and the QDMA queue number register EDMA_TPCC_QDMAQNUM. The mapping of DMA/QDMA channels is critical to achieving the desired performance level for the EDMA and most importantly, in meeting real-time deadlines. Refer to *System-level Performance Considerations*.

Note

If an event is ready to be queued and both the event queue and the EDMA transfer controller that is associated to the event queue are empty, then the event bypasses the event queue, and moves the PaRAM processing logic, and eventually to the transfer request submission logic for submission to the EDMA_TPTC. In this case, the event is not logged in the event queue status registers.

11.3.11.2 Queue RAM Debug Visibility

There are two event queues and each queue has 16 entries. These 16 entries are managed in a circular FIFO. There is a queue status register EDMA_TPCC_QSTATN_i associated with each queue. These along with all of the 16 entries per queue can be read via registers EDMA_TPCC_QSTATN_i and Q0E_p / Q1E_p, respectively.

These registers provide user visibility.

The event queue entry register (Q*x*E*y* Q0E_p / Q1E_p) uniquely identifies the specific event type (event-triggered, manually-triggered, chain-triggered, and QDMA events) along with the event number (for all DMA/ QDMA event channels) that are in the queue or have been de-queued (passed through the queue).

Each of the 16 entries in the event queue are read using the EDMA_TPCC memory-mapped register. To see the history of the last 16 TRs that have been processed by the EDMA on a given queue, read the event queue registers. This provides user/software visibility and is helpful for debugging real-time issues (typically post-mortem), involving multiple events and event sources.

The queue status register (QSTAT*n* EDMA_TPCC_QSTATN_i) includes fields for the start pointer EDMA_TPCC_QSTATN_i[3:0] STRTPTR which provides the offset to the head entry of an event. It also includes a field called EDMA_TPCC_QSTATN_i[12:8] NUMVAL that provides the total number of valid entries residing in the event queue at a given instance of time. The EDMA_TPCC_QSTATN_i[3:0] STRTPTR is used to index appropriately into the 16 event entries. EDMA_TPCC_QSTATN_i[12:8] NUMVAL number of entries starting from STRTPTR are indicative of events still queued in the respective queue. The remaining entry must be read to determine what's already de-queued and submitted to the associated transfer controller.

11.3.11.3 Queue Resource Tracking

The EDMA_TPCC event queue includes watermarking/threshold logic that allows to keep track of maximum usage of all event queues. This is useful for debugging real-time deadline violations that may result from head-of-line blocking on a given EDMA event queue.

The maximum number of events are programed that the queue up in an event queue by programming the threshold value (between 0 to 15) in the queue watermark threshold A register EDMA_TPCC_QWMTHRA. The maximum queue usage is recorded actively in the watermark EDMA_TPCC_QSTATN_i[20:16] WM field of the queue status register, that keeps getting updated based on a comparison of number of valid entries, which is also visible in the EDMA_TPCC_QSTATN_i[12:8] NUMVAL bit and the maximum number of entries.

If the queue usage is exceeded, this status is visible in the EDMA_TPCC registers: the QTHRXCD*n* bits in the channel controller error register EDMA_TPCC_CCERR[7:0] and the EDMA_TPCC_QSTATN_i[24] THRXCD bit, where *n* stands for the event queue number. Any bits that are set in EDMA_TPCC_CCERR also generate an EDMA_TPCC error interrupt.

11.3.11.4 Performance Considerations

The device system bus infrastructure arbitrates bus requests from all of the controllers (TCs, CPU(S), and other bus controllers) to the shared target resources (peripherals and memories).

The priorities of transfer requests (read and write commands) from the EDMA transfer controllers with respect to other controllers within the device IRQ_CROSSBAR are programmed using the Control Module registers. The EDMA_TPCC_QUEPRI register has no affect.

Therefore, the priority of unloading queues has a secondary affect compared to the priority of the transfers as they are executed by the EDMA_TPTC.

11.3.12 EDMA Transfer Controller (EDMA_TPTC)

The EDMA channel controller is the user-interface of the EDMA and the EDMA transfer controller (EDMA_TPTC) is the data movement engine of the EDMA controller. The EDMA_TPCC submits transfer requests (TR) to the EDMA_TPTC and the EDMA_TPTC performs the data transfers dictated by the TR, so the EDMA_TPTC is a target to the EDMA_TPCC.

11.3.12.1 Architecture Details

11.3.12.1.1 Command Fragmentation

The TC read and write controllers in conjunction with the source and destination register sets are responsible for issuing optimally-sized reads and writes to the target endpoints. An optimally-sized command is defined by the transfer controller default burst size (DBS), which is defined in the *TPTC DBS Configuration registers*.

The EDMA_TPTC attempts to issue the largest possible command size as limited by the DBS value or the EDMA_TPCC_ABCNT_n[15:0] ACNT and EDMA_TPCC_ABCNT_n[31:16] BCNT value of the TR. EDMA_TPTC obeys the following rules:

- The read/write controllers always issue commands less than or equal to the DBS value.
- The first command of a 1D transfer command always aligns the address of subsequent commands to the DBS value.

Table 11-24 lists the TR segmentation rules that are followed by the EDMA_TPTC. In summary, if the EDMA_TPCC_ABCNT_n[15:0] ACNT value is larger than the DBS value, then the EDMA_TPTC breaks the EDMA_TPCC_ABCNT_n[15:0] ACNT array into DBS-sized commands to the source/destination addresses. Each EDMA_TPCC_ABCNT_n[31:16] BCNT number of arrays are then serviced in succession.

For BCNT arrays of ACNT bytes (that is, a 2D transfer), if the EDMA_TPCC_ABCNT_n[15:0] ACNT value is less than or equal to the DBS value, then the TR may be optimized into a 1D-transfer in order to maximize efficiency. The optimization takes place if the EDMA_TPTC recognizes that the 2D-transfer is organized as a single dimension (EDMA_TPCC_ABCNT_n[15:0] ACNT == EDMA_TPCC_BIDX_n) and the ACNT value is a power of 2.

Table 11-24 lists conditions in which the optimizations are performed.

Table 11-24. Read/Write Command Optimization Rules

ACNT ≤ DBS	ACNT is power of 2	BIDX = ACNT	BCNT ≤ 1023	SAM/DAM = Increment	Description
Yes	Yes	Yes	Yes	Yes	Optimized
No	x	x	x	x	Not Optimized
x	No	x	x	x	Not Optimized
x	x	No	x	x	Not Optimized
x	x	x	No	x	Not Optimized
x	x	x	x	No	Not Optimized

11.3.12.1.2 TR Pipelining

TR pipelining refers to the ability of the source active set to proceed ahead of the destination active set. Essentially, the reads for a given TR may already be in progress while the writes of a previous TR may not have completed.

The number of outstanding TRs is limited by the number of destination FIFO register entries.

TR pipelining is useful for maintaining throughput on back-to-back small TRs. It minimizes the startup overhead because reads start in the background of a previous TR writes.

Example 11-4. Command Fragmentation (DBS = 64)

The pseudo code:

1. EDMA_TPTCn_PCNT[15:0] ACNT = 8, EDMA_TPTCn_PCNT[31:16] BCNT = 8, EDMA_TPTCn_PBIDX[15:0] SBIDX = 8, EDMA_TPTCn_PBIDX[31:16] DBIDX = 10, EDMA_TPTCn_PSRC[31:0] SADDR = 64, EDMA_TPTCn_SADST[31:0] DADDR = 191

   Read Controller: This is optimized from a 2D-transfer to a 1D-transfer such that the read side is equivalent to EDMA_TPTCn_PCNT[15:0] ACNT = 64, EDMA_TPTCn_PCNT[31:16] BCNT = 1.

   Cmd0 = 64 byte

   Write Controller: Because DBIDX != ACNT, it is not optimized.

   Cmd0 = 8 byte, Cmd1 = 8 byte, Cmd2 = 8 byte, Cmd3 = 8 byte, Cmd4 = 8 byte, Cmd5 = 8 byte, Cmd6 = 8 byte, Cmd7 = 8 byte.
2. EDMA_TPTCn_PCNT[15:0] ACNT=128, EDMA_TPTCn_PCNT[31:16] BCNT = 1, EDMA_TPTCn_PSRC[31:0] SADDR = 63, EDMA_TPTCn_SADST[31:0] DADDR = 513

   Read Controller: Read address is not aligned.

   Cmd0 = 1 byte, (now the SADDR is aligned to 64 for the next command)

   Cmd1 = 64 bytes

   Cmd2 = 63 bytes

   Write Controller: The write address is also not aligned.

   Cmd0 = 63 bytes, (now the DADDR is aligned to 64 for the next command)

   Cmd1 = 64 bytes

   Cmd2 = 1 byte

11.3.12.1.3 Performance Tuning

By default, reads are as issued as fast as possible. In some cases, the reads issued by the EDMA_TPTC could fill the available command buffering for a target, delaying other (potentially higher priority) controllers from successfully submitting commands to that target. The rate at which read commands are issued by the EDMA_TPTC is controlled by the EDMA_TPTCn_RDRATE register. The EDMA_TPTCn_RDRATE register defines the number of cycles that the EDMA_TPTC read controller waits before issuing subsequent commands for a given TR, thus minimizing the chance of the EDMA_TPTC consuming all available target resources. The EDMA_TPTCn_RDRATE[2:0] RDRATE value must be set to a relatively small value if the transfer controller is targeted for high priority transfers and to a higher value if the transfer controller is targeted for low priority transfers.

In contrast, the Write Interface does not have any performance turning knobs because writes always have an interval between commands as write commands are submitted along with the associated write data.

11.3.12.2 Memory Protection

The transfer controller plays an important role in handling proxy memory protection. There are two access properties associated with a transfer: for instance, the privilege id (system-wide identification assigned to a controller) of the controller initiating the transfer, and the privilege level (user versus supervisor) used to program the transfer. This information is maintained in the PaRAM set when it is programmed in the channel controller. When a TR is submitted to the transfer controller, this information is made available to the EDMA_TPTC and used by the EDMA_TPTC while issuing read and write commands. The read or write commands have the same privilege identification, and privilege level as that programmed in the EDMA transfer in the channel controller.

11.3.12.3 Error Generation

Errors are generated if enabled under three conditions:

- EDMA_TPTC detection of an error signaled by the source or destination address.
- Attempt to read or write to an invalid address in the configuration memory map.
- Detection of a constant addressing mode TR violating the constant addressing mode transfer rules (the source/destination addresses and source/destination indexes must be aligned to 32 bytes).

Either or all error types may be disabled. If an error bit is set and enabled, the error interrupt for the concerned transfer controller is generated.

11.3.12.4 Debug Features

The DMA program register set, DMA source active register set, and the destination FIFO register set are used to derive a brief history of TRs serviced through the transfer controller.

Additionally, the EDMA_TPTC status register EDMA_TPTCn_TCSTAT has dedicated bit fields to indicate the ongoing activity within different parts of the transfer controller:

- The EDMA_TPTCn_TCSTAT[1] SRCACTV bit indicates whether the source active set is active.
- The EDMA_TPTCn_TCSTAT[6:4] DSTACTV bit indicates the number of TRs resident in the destination register active set at a given instance.
- The EDMA_TPTCn_TCSTAT[0] PROGBUSY bit indicates whether a valid TR is present in the DMA program set.

Note

If the TRs are in progression, it must realize that there is a chance that the values read from the EDMA_TPTC status registers will be inconsistent since the EDMA_TPTC changes the values of these registers due to ongoing activities.

It is recommended that to ensure no additional submission of TRs to the EDMA_TPTC in order to facilitate ease of debug.

11.3.12.4.1 Destination FIFO Register Pointer

The destination FIFO register pointer is implemented as a circular buffer with the start pointer being EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR and a buffer depth of usually 2 or 4. The EDMA_TPTC maintains two important status details in EDMA_TPTCn_TCSTAT that are used during advanced debugging, if necessary. The EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR is a start pointer, the index to the head of the destination FIFO register. The EDMA_TPTCn_TCSTAT[6:4] DSTACTV is a counter for the number of valid (occupied) entries. These registers are used to get a brief history of transfers.

Examples of some register field values and their interpretation:

- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x0 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x0 implies that no TRs are stored in the destination FIFO register.
- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x1 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x2 implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 1 and the second pending TR is read from the destination FIFO register entry 2.
- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x3 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x2 implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 3 and the second pending TR is read from the destination FIFO register entry 0.

11.3.13 Event Dataflow

This section summarizes the data flow of a single event, from the time the event is latched to the channel controller to the time the transfer completion code is returned. The following steps list the sequence of EDMA_TPCC activity:

1. Event is asserted from an external source (peripheral or external interrupt). This also is similar for a manually-triggered, chained-triggered, or QDMA-triggered event. The event is latched into the EDMA_TPCC_ER[31:0]E*n* / EDMA_TPCC_ERH[31:0] E*n* (or EDMA_TPCC_CER[31:0] E*n* / EDMA_TPCC_CERH[31:0] E*n*, EDMA_TPCC_ESR[31:0] E*n* / EDMA_TPCC_ESRH[31:0] E*n*, EDMA_TPCC_QER[7:0] E*n*) bit.
2. Once an event is prioritized and queued into the appropriate event queue, the EDMA_TPCC_SER[31:0] E*n* \ EDMA_TPCC_SERH[31:0] E*n* (or EDMA_TPCC_QSER[7:0] E*n*) bit is set to inform the event prioritization / processing logic to disregard this event since it is already in the queue. Alternatively, if the transfer controller and the event queue are empty, then the event bypasses the queue.
3. The EDMA_TPCC processing and the submission logic evaluates the appropriate PaRAM set and determines whether it is a non-null and non-dummy transfer request (TR).
4. The EDMA_TPCC clears the EDMA_TPCC_ER[31:0] E*n*/ EDMA_TPCC_ERH[31:0] E*n* (or EDMA_TPCC_CER[31:0] E*n* / EDMA_TPCC_CERH[31:0] E*n*, EDMA_TPCC_ESR[31:0]E*n* / EDMA_TPCC_ESRH[31:0] E*n*, EDMA_TPCC_QER[31:0] E*n*) bit and the EDMA_TPCC_SER[31:0] E*n*/ EDMA_TPCC_SERH[31:0] E*n* bit as soon as it determines the TR is non-null. In the case of a null set, the EDMA_TPCC_SER[31:0] E*n*/ EDMA_TPCC_SERH[31:0] E*n* bit remains set. It submits the non-null/non-dummy TR to the associated transfer controller. If the TR was programmed for early completion, the EDMA_TPCC immediately sets the interrupt pending register (EDMA_TPCC_IPR[31:0] I[TCC] / EDMA_TPCC_IPRH[31:0] I[TCC] - 32).
5. If the TR was programmed for normal completion, the EDMA_TPCC sets the interrupt pending register (EDMA_TPCC_IPR[31:0] I[TCC] / EDMA_TPCC_IPRH[31:0] I[TCC]) when the EDMA_TPTC informs the EDMA_TPCC about completion of the transfer (returns transfer completion codes).
6. The EDMA_TPCC programs the associated EDMA_TPTC's Program Register Set with the TR.
7. The TR is then passed to the Source Active set and the DST FIFO Register Set, if both the register sets are available.
8. The Read Controller processes the TR by issuing read commands to the source peripheral endpoint. The Read Data lands in the Data FIFO of the EDMA_TPTC*n*.
9. As soon as sufficient data is available, the Write Controller begins processing the TR by issuing write commands to the destination peripheral endpoint.
10. This continues until the TR completes and the EDMA_TPTC*n* then signals completion status to the EDMA_TPCC.

11.3.14 EDMA Controller Prioritization

The EDMA controller has many implementation rules to deal with concurrent events/channels, transfers, etc. The following subsections detail various arbitration details whenever there might be occurrence of concurrent activity. Figure 11-22 shows the different places EDMA priorities come into play.

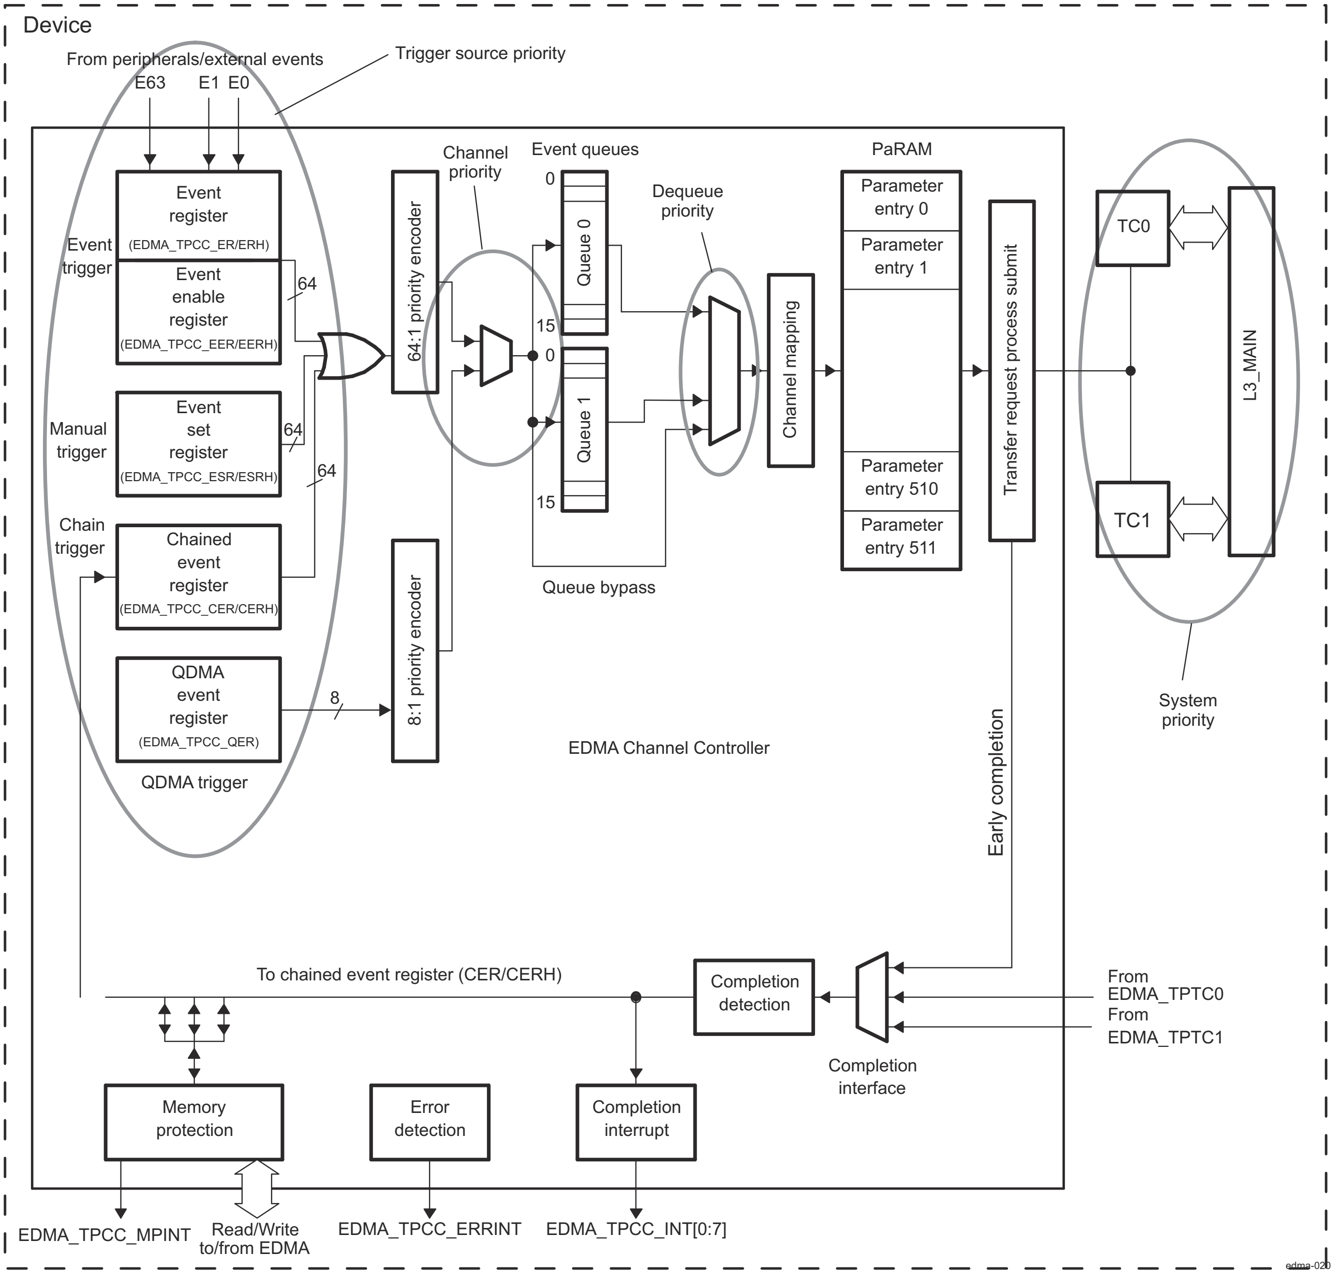

Figure 11-22. EDMA Prioritization

11.3.14.1 Channel Priority

The EDMA event registers EDMA_TPCC_ER and EDMA_TPCC_ERH capture up to 64 events, the QDMA event register EDMA_TPCC_QER captures QDMA events for all QDMA channels therefore, it is possible for events to occur simultaneously on the DMA/QDMA event inputs. For events arriving simultaneously, the event associated with the lowest channel number is prioritized for submission to the event queues (for DMA events, channel 0 has the highest priority and channel 63 has the lowest priority, for QDMA events, channel 0 has the highest priority and channel 7 has the lowest priority). This mechanism only sorts simultaneous events for submission to the event queues.

If a DMA and QDMA event occurs simultaneously, the DMA event always has prioritization against the QDMA event for submission to the event queues.

11.3.14.2 Trigger Source Priority

If a EDMA channel is associated with more than one trigger source (event trigger, manual trigger, and chain trigger), and if multiple events are set simultaneously for the same channel (EDMA_TPCC_ER[31:0] E*n* = 1, EDMA_TPCC_ESR[31:0] E*n* = 1 , EDMA_TPCC_CER[31:0] E*n* = 1) , then the EDMA_TPCC always services these events in the following priority order: event trigger (via EDMA_TPCC_ER) is higher priority than chain trigger (via EDMA_TPCC_CER) and chain trigger is higher priority than manual trigger (via EDMA_TPCC_ESR).

This implies that if for channel 0, both EDMA_TPCC_ER[0] E0 = 1 and EDMA_TPCC_CER[0] E0 = 1 at the same time, then the EDMA_TPCC_ER[0] E0 event is always queued before the EDMA_TPCC_CER[0] E0 event.

11.3.14.3 Dequeue Priority

The priority of the associated transfer request (TR) is further mitigated by which event queue is being used for event submission (dictated by EDMA_TPCC_DMAQNUMN_k and EDMA_TPCC_QDMAQNUM). For submission of a TR to the transfer request, events need to be de-queued from the event queues. Queue 0 has the highest dequeue priority and queue 1 the lowest.

11.3.15 Emulation Considerations

During debug when using the emulator, the CPU(s) may be halted on an execute packet boundary for single-stepping, benchmarking, profiling, or other debug purposes. During an emulation halt, the EDMA channel controller and transfer controller operations continue. Events continue to be latched and processed and transfer requests continue to be submitted and serviced.

Since EDMA is involved in servicing multiple controller and target peripherals, it is not feasible to have an independent behavior of the EDMA for emulation halts. EDMA functionality would be coupled with the peripherals it is servicing, which might have different behavior during emulation halts.

11.4 EDMA Transfer Examples

The EDMA channel controller performs a variety of transfers depending on the parameter configuration. The following sections provide a description and PaRAM configuration for some typical use case scenarios.

11.4.1 Block Move Example

The most basic transfer performed by the EDMA is a block move. During device operation it is often necessary to transfer a block of data from one location to another, usually between on-chip and off-chip memory.

In this example, a section of data is to be copied from external memory to internal L2 SRAM as shown in Figure 11-23.

The source address for the transfer is set to the start of the data block in external memory, and the destination address is set to the start of the data block in L2. If the data block is less than 64K bytes, the PaRAM configuration shown in Figure 11-24 holds true with the synchronization type set to A-synchronized and indexes cleared to 0. If the amount of data is greater than or equal to 64K bytes, EDMA_TPCC_ABCNT_n[31:16] BCNT and the B-indexes need to be set appropriately with the synchronization type set to AB-synchronized. The EDMA_TPCC_OPT_n[3] STATIC bit is set to prevent linking.

This transfer example may also be set up using QDMA. For successive transfer submissions, of a similar nature, the number of cycles used to submit the transfer are fewer depending on the number of changing transfer parameters. The QDMA trigger word must be programed to be the highest numbered offset in the PaRAM set that undergoes change.

Figure 11-24 shows the parameters Block Move transfer.

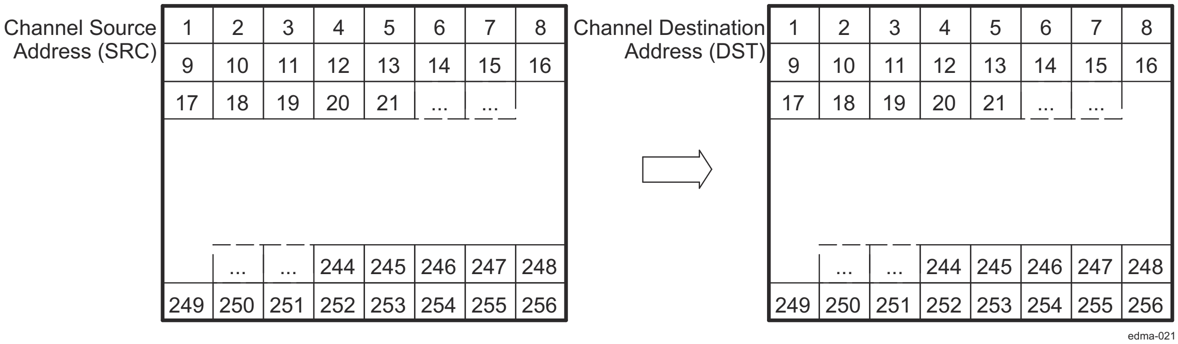

Figure 11-23. Block Move Example

Figure 11-24. Block Move Example PaRAM Configuration

(a) EDMA Parameters

Parameter Contents		Parameter	
0010 0008h		Channel Options Parameter (OPT)	
Channel Source Address (SRC)		Channel Source Address (SRC)	
0001h	FFFFh	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)		Channel Destination Address (DST)	
0000h	0000h	Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0000h	0000h	Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h	Reserved	Count for 3rd Dimension (CCNT)

(b)Channel Options Parameter (OPT) Content

- EDMA_TPCC_OPT_n[3] STATIC = 0x1
- EDMA_TPCC_OPT_n[20] TCINTEN = 0x1

11.4.2 Subframe Extraction Example

The EDMA can efficiently extract a small frame of data from a larger frame of data. By performing a 2D-to-1D transfer, the EDMA retrieves a portion of data for the CPU to process. In this example, a 640 × 480-pixel frame of video data is stored in external memory. Each pixel is represented by a 16-bit halfword. The CPU extracts a 16 × 12-pixel subframe of the image for processing. To facilitate more efficient processing time by the CPU, the EDMA places the subframe in internal L2 SRAM. Figure 11-25 shows the transfer of a subframe from external memory to L2.

The same PaRAM entry options are used for QDMA channels, as well as DMA channels. The EDMA_TPCC_OPT_n[3] STATIC bit is set to prevent linking. For successive transfers, only changed parameters need to be programmed before triggering the channel.

Figure 11-26 shows the parameters for Subframe Extraction transfer.

11.4.3 Data Sorting Example

Many applications require the use of multiple data arrays, it is often desirable to have the arrays arranged such that the first elements of each array are adjacent, the second elements are adjacent, and so on. Often this is not how the data is presented to the device. Either data is transferred via a peripheral with the data arrays arriving one after the other or the arrays are located in memory with each array occupying a portion of contiguous memory spaces. For these instances, the EDMA can reorganize the data into the desired format.

To determine the parameter set values, the following need to be considered:

- ACNT - Program this to be the size in bytes of an element.
- BCNT - Program this to be the number of elements in a frame.
- CCNT - Program this to be the number of frames.
- SBIDX - Program this to be the size of the element or ACNT.
- DBIDX - CCNT × ACNT
- SCIDX - ACNT × BCNT
- DCIDX - ACNT

The synchronization type needs to be AB-synchronized and the EDMA_TPCC_OPT_n[3] STATIC bit is 0 to allow updates to the parameter set. It is advised to use normal EDMA channels for sorting.

It is not possible to sort this with a single trigger event. Instead, the channel can be programmed to be chained to itself. After BCNT elements get sorted, intermediate chaining could be used to trigger the channel again causing the transfer of the next BCNT elements and so on. Figure 11-28 shows the parameter set programming for this transfer, assuming channel 0 and an element size of 4 bytes.

Figure 11-27 shows the Data Sorting transfer

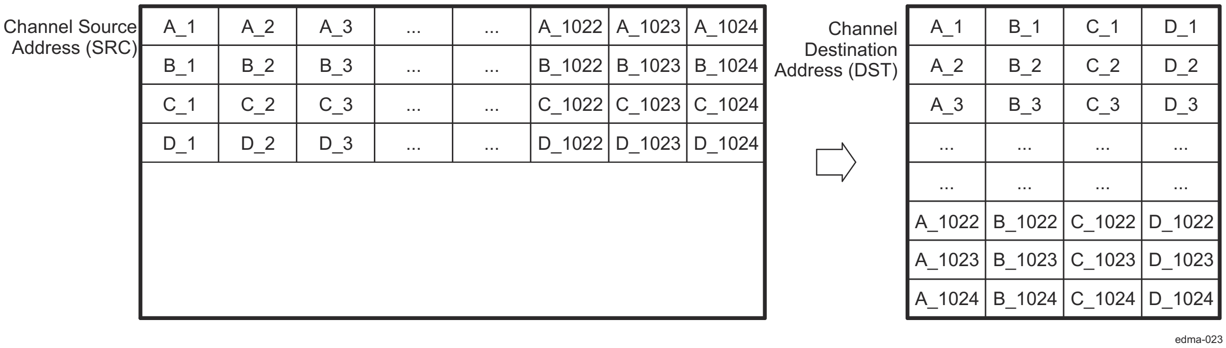

Figure 11-27. Data Sorting Example

Figure 11-28. Data Sorting Example PaRAM Configuration

(a) EDMA Parameters

Parameter Contents		Parameter	
0090 0004h		Channel Options Parameter (OPT)	
Channel Source Address (SRC)		Channel Source Address (SRC)	
0400h	0004h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)		Channel Destination Address (DST)	
0010h	0001h	Destination BCNT Index (DSTBIDX)	Source BCNT Index (SRCBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0001h	1000h	Destination CCNT Index (DSTCIDX)	Source CCNT Index (SRCCIDX)
0000h	0004h	Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

- EDMA_TPCC_OPT_n[2] SYNCDIM = 0x1
- EDMA_TPCC_OPT_n[20] TCINTEN = 0x1
- EDMA_TPCC_OPT_n[23] ITCCHEN = 0x1

11.4.4 Setting Up an EDMA Transfer

The following list provides a quick guide for the typical steps involved in setting up a transfer.

1. Initiating a DMA/QDMA channel
    a. Determine the type of channel (QDMA or DMA) to be used.
    b. Channel mapping
        i. If using a QDMA channel, program the EDMA_TPCC_QCHMAPN_j with the parameter set number to which the channel maps and the trigger word.
        ii. If using a DMA channel, program the EDMA_TPCC_DCHMAPN_m with the parameter set number to which the channel maps.
    c. If the channel is being used in the context of a shadow region, ensure the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k for the region is properly set up to allow read write accesses to bits in the event registers and interrupt registers in the Shadow region memory map. The subsequent steps in this process should be done using the respective shadow region registers. (Shadow region descriptions and usage are provided in Section 11.3.7.1.)
    d. Determine the type of triggering used.
        i. If external events are used for triggering (DMA channels), enable the respective event in EDMA_TPCC_EER / EDMA_TPCC_EERH by writing into EDMA_TPCC_EESR / EDMA_TPCC_EESRH.
        ii. If QDMA Channel is used, enable the channel in EDMA_TPCC_QEER by writing into EDMA_TPCC_QEESR.
    e. Queue setup
        i. If a QDMA channel is used, set up the EDMA_TPCC_QDMAQNUM to map the channel to the respective event queue.
        ii. If a DMA channel is used, set up the EDMA_TPCC_DMAQNUMN_k to map the event to the respective event queue.
2. Parameter set setup
    a. Program the PaRAM set number associated with the channel. Note that

Note

If it is a QDMA channel, the PaRAM entry that is configured as trigger word is written to last. Alternatively, enable the QDMA channel (step 1-d-ii above) just before the write to the trigger word.

3. Interrupt setup
    a. Enable the interrupt in the EDMA_TPCC_IER / EDMA_TPCC_IERH by writing into EDMA_TPCC_IESR / EDMA_TPCC_IESRH.
    b. Ensure the EDMA_TPCC completion interrupt (this refers to either the Global interrupt or the shadow region interrupt) is enabled properly in the Device Interrupt controller.
    c. Set up the interrupt controller properly to receive the expected EDMA interrupt.
4. Initiate transfer
    a. This step is highly dependent on the event trigger source:
        i. If the source is an external event coming from a peripheral, the peripheral will be enabled to start generating relevant EDMA events that can be latched to the EDMA_TPCC_ER transfer.
        ii. For QDMA events, writes to the trigger word (step 2-a above) will initiate the transfer.
        iii. Manually triggered transfers will be initiated by writes to the Event Set Registers EDMA_TPCC_ESR / EDMA_TPCC_ESRH.
        iv. Chained-trigger events initiate when a previous transfer returns a transfer completion code equal to the chained channel number.
5. Wait for completion
    a. If the interrupts are enabled as mentioned in step 3 above, then the EDMA_TPCC will generate a completion interrupt to the CPU whenever transfer completion results in setting the corresponding bits in the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH. The set bits must be cleared in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH by writing to corresponding bit in EDMA_TPCC_ICR / EDMA_TPCC_ICRH.

b. If polling for completion (interrupts not enabled in the device controller), then the application code can wait on the expected bits to be set in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH. Again, the set bits in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH must be manually cleared via EDMA_TPCC_ICR / EDMA_TPCC_ICRH before the next set of transfers is performed for the same transfer completion code values.

11.5 EDMA Debug Checklist and Programming Tips

This section lists some tips to keep in mind while debugging applications using the EDMA controller.

11.5.1 EDMA Debug Checklist

Table 11-25 provides some common issues and their probable causes and resolutions.

Table 11-25. Debug Checklist

Issue	Description/Solution
The transfer associated with the channel does not happen. The channel does not get serviced.	The EDMA_TPCC may not service a transfer request, even though the associated PaRAM set is programmed appropriately. Check for the following: 1) Verify that events are enabled, i.e., if an external/peripheral event is latched in Event Registers EDMA_TPCC_ER / EDMA_TPCC_ERH, check that the event is enabled in the Event Enable Registers EDMA_TPCC_EER / EDMA_TPCC_EERH. Similarly, for QDMA channels, check that QDMA events are appropriately enabled in the QDMA Event Enable Register EDMA_TPCC_QEER. 2) Verify that the DMA or QDMA Secondary Event Register EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER bits corresponding to the particular event or channel are not set.
The Secondary Event Registers bits are set, not allowing additional transfers to occur on a channel.	It is possible that a trigger event was received when the parameter set associated with the channel/event was a NULL set for a previous transfer on the channel. This is typical in two cases: 1) QDMA channels: Typically if the parameter set is non-static and expected to be terminated by a NULL set (i.e., EDMA_TPCC_OPT_n[3] STATIC = 0x0, EDMA_TPCC_LNK_n[15:0] LINK = 0xFFFF), the parameter set is updated with a NULL set after submission of the last TR. Because QDMA channels are auto-triggered, this update caused the generation of an event. An event generated for a NULL set causes an error condition and results in setting the bits corresponding to the QDMA channel in the EDMA_TPCC_QEMR and EDMA_TPCC_QSER. This will disable further prioritization of the channel. 2) DMA channels used in a continuous mode: The peripheral may be set up to continuously generate infinite events . The parameter set may be programmed to expect only a finite number of events and to be terminated by a NULL link. After the expected number of events, the parameter set is reloaded with a NULL parameter set. Because the peripheral will generate additional events, an error condition is set in the EDMA_TPCC_SER[31:0] E*n* and EDMA_TPCC_EMR[31:0] E*n* set, preventing further event prioritization. Check the number of events received is limited to the expected number of events for which the parameter set is programmed, or check the bits corresponding to particular channel or event are not set in the Secondary event registers (EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER) and Event Missed Registers (EDMA_TPCC_EMR / EDMA_TPCC_EMRH / EDMA_TPCC_QEMR) before trying to perform subsequent transfers for the event/channel.

Table 11-25. Debug Checklist (continued)

Issue	Description/Solution
Completion interrupts are not asserted, or no further interrupts are received after the first completion interrupt.	Check the following: 1) The interrupt generation is enabled in the EDMA_TPCC_OPT_n of the associated PaRAM set (EDMA_TPCC_OPT_n[20] TCINTEN = 0x1 and/or EDMA_TPCC_OPT_n[20] ITCINTEN = 0x1). 2) The interrupts are enabled in the EDMA Channel Controller, via the Interrupt Enable Registers (EDMA_TPCC_IER / EDMA_TPCC_IERH). 3) The corresponding interrupts are enabled in the device interrupt controller. 4) The set interrupts are cleared in the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH) before exiting the transfer completion interrupt service routine (ISR). See Section 11.3.9.1.2 *Clearing Transfer Complerion Interrupts* for details on writing EDMA ISRs. 5) If working with shadow region interrupts, make sure that the DMA Region Access registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k) are set up properly, because the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k registers act as secondary enables for shadow region completion interrupts, along with the EDMA_TPCC_IER / EDMA_TPCC_IERH registers. If working with shadow region interrupts, make sure that the bits corresponding to the transfer completion code EDMA_TPCC_OPT_n[17:12] TCC value are also enabled in the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k registers. For instance, if the PaRAM set associated with Channel 0 returns a completion code of 63 EDMA_TPCC_OPT_n[17:12] TCC = 63, ensure that EDMA_TPCC_DRAEHM_k[31] E63 is also set for a shadow region completion interrupt because the interrupt pending register bit set will be EDMA_TPCC_IPRH[31] I63 (not EDMA_TPCC_IPR[0] I0).

11.5.2 EDMA Programming Tips

1. For several registers, the setting and clearing of bits needs to be done via separate dedicated registers. For example, the Event Register (EDMA_TPCC_ER / EDMA_TPCC_ERH) can only be cleared by writing a 1 to the corresponding bits in the Event Clear Registers (EDMA_TPCC_ECR / EDMA_TPCC_ECRH). Similarly, the Event Enable Register (EDMA_TPCC_EER / EDMA_TPCC_EERH) bits can only be set with writing of 0x1 to the Event Enable Set Registers (EDMA_TPCC_EESR / EDMA_TPCC_EESRH) and cleared with writing of 0x1 to the corresponding bits in the Event Enable Clear Register (EDMA_TPCC_EECR / EDMA_TPCC_EECRH).
2. Writes to the shadow region memory maps are governed by region access registers (EDMA_TPCC_DRAE / EDMA_TPCC_DRAEHM_k / EDMA_TPCC_QRAEN_k). If the appropriate channels are not enabled in these registers, read/write access to the shadow region memory map is not enabled.
3. When working with shadow region completion interrupts, ensure that the DMA Region Access Registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k) for every region are set in a mutually exclusive way (unless it is a requirement for an application). If there is an overlap in the allocated channels and transfer completion codes (setting of Interrupt Pending Register bits) in the region resource allocation, it results in multiple shadow region completion interrupts.
   For example, if EDMA_TPCC_DRAEM_k.DRAEM_0[0] E0 and EDMA_TPCC_DRAEM_k.DRAEM_1[0] E0 are both set, then on completion of a transfer that returns a TCC = 0x0, they will generate both shadow region 0 and 1 completion interrupts.
4. While programming a non-dummy parameter set, ensure the EDMA_TPCC_CCNT_n[15:0] CCNT is not left to zero.
5. Enable the EDMA_TPCC error interrupt in the device controller and attach an interrupt service routine (ISR) to ensure that error conditions are not missed in an application and are appropriately addressed with the ISR.
6. Depending on the application, it can want to break large transfers into smaller transfers and use self-chaining to prevent starvation of other events in an event queue.
7. In applications where a large transfer is broken into sets of small transfers using chaining or other methods, it chooses to use the early chaining option to reduce the time between the sets of transfers and increase the throughput.
   However, keep in mind that with early completion, all data might have not been received at the end point when completion is reported because the EDMA_TPCC internally signals completion when the TR is submitted to the EDMA_TPTC, potentially before any data has been transferred.
8. The event queue entries can be observed to determine the last few events if there is a system failure (provided the entries were not bypassed).

31-14	RES10	R	0h	RESERVE FIELD
13-5	PAENTRY	R/W	0h	PaRAM Entry number for QDMA Channel N.
4-2	TRWORD	R/W	0h	TRWORD points to the specific trigger word of the PaRAM Entry defined by PAENTRY. A write to the trigger word results in a QDMA Event being recognized.
1-0	RESERVED	R	0h	

11.8.1.1.4 DMAQNUMN Register (Offset = 240h) [reset = 0h]

DMAQNUMN is shown in Figure 11-32 and described in Table 11-35.

Return to the Table 11-31.

DMA Queue Number Register n Contains the Event queue number to be used for the corresponding DMA Channel.

31-7	RES29	R	0h	RESERVE FIELD
6-4	PRIQ1	R/W	0h	Priority Level for Queue 1 Dictates the priority level used for the OPTIONS field programmation for Qn TRs. Sets the priority used for TC read and write commands.
3	RES30	R	0h	RESERVE FIELD
2-0	PRIQ0	R/W	0h	Priority Level for Queue 0 Dictates the priority level used for the OPTIONS field programmation for Qn TRs. Sets the priority used for TC read and write commands.

11.8.1.1.8 EMR Register (Offset = 300h) [reset = 0h]

EMR is shown in Figure 11-36 and described in Table 11-39.

Return to the Table 11-31.

Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

Table 11-45. CCERR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES33	R	0h	RESERVE FIELD
16	TCERR	R	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors were previously clear) then an error will be signaled with TPCC error interrupt.
15-8	RES34	R	0h	RESERVE FIELD
7	QTHRXCD7	R	0h	Queue Threshold Error for Q7: QTHRXCD7 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD7 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD7 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
6	QTHRXCD6	R	0h	Queue Threshold Error for Q6: QTHRXCD6 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD6 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD6 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

Table 11-45. CCERR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	QTHRXCD5	R	0h	Queue Threshold Error for Q5: QTHRXCD5 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD5 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD5 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
4	QTHRXCD4	R	0h	Queue Threshold Error for Q4: QTHRXCD4 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD4 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD4 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
3	QTHRXCD3	R	0h	Queue Threshold Error for Q3: QTHRXCD3 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD3 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD3 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
2	QTHRXCD2	R	0h	Queue Threshold Error for Q2: QTHRXCD2 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD2 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD2 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
1	QTHRXCD1	R	0h	Queue Threshold Error for Q1: QTHRXCD1 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD1 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD1 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
0	QTHRXCD0	R	0h	Queue Threshold Error for Q0: QTHRXCD0 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD0 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD0 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

11.8.1.1.15 CCERRCLR Register (Offset = 31Ch) [reset = 0h]

CCERRCLR is shown in Figure 11-43 and described in Table 11-46.

Return to the Table 11-31.

Table 11-67. QSTATN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RES55	R	0h	RESERVE FIELD
24	THRXCD	R	0h	Threshold Exceeded: THRXCD = 0 : Threshold specified by QWMTHR(A B).Qn has not been exceeded. THRXCD = 1 : Threshold specified by QWMTHR(A B).Qn has been exceeded. QSTATn.THRXCD is cleared via CCERR.WMCLRn bit.
23-21	RES56	R	0h	RESERVE FIELD
20-16	WM	R	0h	Watermark for Maximum Queue Usage: Watermark tracks the most entries that have been in QueueN since reset or since the last time that the watermark (WM) was cleared. QSTATn.WM is cleared via CCERR.WMCLRn bit. Legal values = 0x0 (empty) to 0x10 (full)
15-13	RES57	R	0h	RESERVE FIELD
12-8	NUMVAL	R	0h	Number of Valid Entries in QueueN: Represents the total number of entries residing in the Queue Manager FIFO at a given instant. Always enabled. Legal values = 0x0 (empty) to 0x10 (full)
7-4	RES58	R	0h	RESERVE FIELD
3-0	STRTPTR	R	0h	Start Pointer: Represents the offset to the head entry of QueueN in units of entries. Always enabled. Legal values = 0x0 (0th entry) to 0xF (15th entry)

11.8.1.1.37 QWMTHRA Register (Offset = 620h) [reset = 1010h]

QWMTHRA is shown in Figure 11-65 and described in Table 11-68.

Return to the Table 11-31.

Queue Threshold A for Q[3:0]: CCERR.QTHRXCDn and QSTATn.THRXCD error bit is set when the number of Events in QueueN at an instant in time (visible via QSTATn.NUMVAL) equals or exceeds the value specified by QWMTHRA.Qn. Legal values = 0x0 (ever used?) to 0x10 (ever full?) A value of 0x11 disables threshold errors.

15-14	RES62	R	0h	RESERVE FIELD

Table 11-69. CCSTAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13-8	COMPACTV	R	0h	Completion Request Active: Counter that tracks the total number of completion requests submitted to the TC. The counter increments when a TR is submitted with TCINTEN or TCCHEN set to '1'. The counter decrements for every valid completion code received from any of the external TCs. The CC will not service new TRs if COMPACTV count is already at the limit. COMPACTV = 0 : No completion requests outstanding. COMPACTV = 1: Total of '1' completion request outstanding. ... COMPACTV = 63 : Total of 63 completion requests are outstanding. No additional TRs will be submitted until count is less than 63.
7-5	RES63	R	0h	RESERVE FIELD
4	ACTV	R	0h	Channel Controller Active: Channel Controller Active is a logical-OR of each of the ACTV signals. The ACTV bit must remain high through the life of a TR. ACTV = 0 : Channel is idle. ACTV = 1 : Channel is busy.
3	RES64	R	0h	RESERVE FIELD
2	TRACTV	R	0h	Transfer Request Active: TRACTV = 0 : Transfer Request processing/submission logic is inactive. TRACTV = 1 : Transfer Request processing/submission logic is active.
1	QEVTACTV	R	0h	QDMA Event Active: QEVTACTV = 0 : No enabled QDMA Events are active within the CC. QEVTACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.
0	EVTACTV	R	0h	DMA Event Active: EVTACTV = 0 : No enabled DMA Events are active within the CC. EVTACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.

11.8.1.1.39 AETCTL Register (Offset = 700h) [reset = 0h]

AETCTL is shown in Figure 11-67 and described in Table 11-70.

Return to the Table 11-31.

0	CLR	W	0h	AET Clear command: CPU write of '1' to the CLR bit causes the tpcc_aet output signal and AETSTAT.STAT register to be cleared. CPU write of '0' has no effect..

11.8.1.1.42 ER Register (Offset = 1000h) [reset = 0h]

ER is shown in Figure 11-70 and described in Table 11-73.

Return to the Table 11-31.

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

11.8.1.1.48 CER Register (Offset = 1018h) [reset = 0h]

CER is shown in Figure 11-76 and described in Table 11-79.

Return to the Table 11-31.

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

11.8.1.1.50 EER Register (Offset = 1020h) [reset = 0h]

EER is shown in Figure 11-78 and described in Table 11-81.

Return to the Table 11-31.

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

11.8.1.1.56 SER Register (Offset = 1038h) [reset = 0h]

SER is shown in Figure 11-84 and described in Table 11-87.

Return to the Table 11-31.

Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

11.8.1.1.60 IER Register (Offset = 1050h) [reset = 0h]

IER is shown in Figure 11-88 and described in Table 11-91.

Return to the Table 11-31.

Int Enable Register: IER.In is not directly writeable. Interrupts can be enabled via writes to IESR and can be disabled via writes to IECR register. IER.In = 0: IPR.In is NOT enabled for interrupts. IER.In = 1: IPR.In IS enabled for interrupts.

1	I33	W	0h	Interrupt associated with TCC #33
0	I32	W	0h	Interrupt associated with TCC #32

11.8.1.1.66 IPR Register (Offset = 1068h) [reset = 0h]

IPR is shown in Figure 11-94 and described in Table 11-97.

Return to the Table 11-31.

Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.

11.8.1.1.67 IPRH Register (Offset = 106Ch) [reset = 0h]

IPRH is shown in Figure 11-95 and described in Table 11-98.

Return to the Table 11-31.

Interrupt Pending Register (High Part): IPRH.In bit is set when a interrupt completion code with TCC of N is detected. IPRH.In bit is cleared via software by writing a '1' to ICRH.In bit.

0	I32	R	0h	Interrupt associated with TCC #32

11.8.1.1.68 ICR Register (Offset = 1070h) [reset = 0h]

ICR is shown in Figure 11-96 and described in Table 11-99.

Return to the Table 11-31.

Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.

RES69						SET	EVAL
R-0h						W-0h	W-0h

Table 11-101. IEVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RES69	R	0h	RESERVE FIELD
1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

11.8.1.1.71 QER Register (Offset = 1080h) [reset = 0h]

QER is shown in Figure 11-99 and described in Table 11-102.

Return to the Table 11-31.

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

11.8.1.1.72 QEER Register (Offset = 1084h) [reset = 0h]

QEER is shown in Figure 11-100 and described in Table 11-103.

Return to the Table 11-31.

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

11.8.1.1.76 QSECR Register (Offset = 1094h) [reset = 0h]

QSECR is shown in Figure 11-104 and described in Table 11-107.

Return to the Table 11-31.

QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

11.8.1.1.77 ER_RN Register (Offset = 2000h) [reset = 0h]

ER_RN is shown in Figure 11-105 and described in Table 11-108.

Return to the Table 11-31.

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

11.8.1.1.83 CER_RN Register (Offset = 2018h) [reset = 0h]

CER_RN is shown in Figure 11-111 and described in Table 11-114.

Return to the Table 11-31.

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

Figure 11-111. CER_RN Register

11.8.1.1.84 CERH_RN Register (Offset = 201Ch) [reset = 0h]

CERH_RN is shown in Figure 11-112 and described in Table 11-115.

Return to the Table 11-31.

Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.

11.8.1.1.85 EER_RN Register (Offset = 2020h) [reset = 0h]

EER_RN is shown in Figure 11-113 and described in Table 11-116.

Return to the Table 11-31.

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

11.8.1.1.91 SER_RN Register (Offset = 2038h) [reset = 0h]

SER_RN is shown in Figure 11-119 and described in Table 11-122.

Return to the Table 11-31.

Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Table 11-136. IEVAL_RN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RES76	R	0h	RESERVE FIELD
1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

11.8.1.1.106 QER_RN Register (Offset = 2080h) [reset = 0h]

QER_RN is shown in Figure 11-134 and described in Table 11-137.

Return to the Table 11-31.

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Figure 11-134. QER_RN Register

11.8.1.1.107 QEER_RN Register (Offset = 2084h) [reset = 0h]

QEER_RN is shown in Figure 11-135 and described in Table 11-138.

Return to the Table 11-31.

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

Table 11-143. OPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PRIV	R	0h	Privilege level: privilege level (supervisor vs. user) for the host/cpu/dma that programmed this PaRAM Entry. Value is set with the vbus priv value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus. PRIV = 0 : User level privilege PRIV = 1 : Supervisor level privilege
30-28	RES83	R	0h	RESERVE FIELD
27-24	PRIVID	R	0h	Privilege ID: Privilege ID for the external host/cpu/dma that programmed this PaRAM Entry. This value is set with the vbus privid value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus.
23	ITCCHEN	R/W	0h	Intermediate transfer completion chaining enable: 0: Intermediate transfer complete chaining is disabled. 1: Intermediate transfer complete chaining is enabled.
22	TCCHEN	R/W	0h	Transfer complete chaining enable: 0: Transfer complete chaining is disabled. 1: Transfer complete chaining is enabled.
21	ITCINTEN	R/W	0h	Intermediate transfer completion interrupt enable: 0: Intermediate transfer complete interrupt is disabled. 1: Intermediate transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
20	TCINTEN	R/W	0h	Transfer complete interrupt enable: 0: Transfer complete interrupt is disabled. 1: Transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)

Table 11-143. OPT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	WIMODE	R/W	0h	Backward compatibility mode: 0: Normal operation 1 : WI Backwards Compatibility mode forces BCNT to be adjusted by '1' upon TR submission (0 means 1 1 means 2 ...) and forces ACNT to be treated as a word-count (left shifted by 2 by hardware to create byte cnt for TR submission)
18	RES84	R	0h	RESERVE FIELD
17-12	TCC	R/W	0h	Transfer Complete Code: The 6-bit code is used to set the relevant bit in CER (bit CER[TCC]) for chaining or in IER (bit IER[TCC]) for interrupts.
11	TCCMODE	R/W	0h	Transfer complete code mode: Indicates the point at which a transfer is considered completed. Applies to both chaining and interrupt. 0: Normal Completion A transfer is considered completed after the transfer parameters are returned to the CC from the TC (which was returned from the peripheral). 1: Early Completion A transfer is considered completed after the CC submits a TR to the TC. CC generates completion code internally .
10-8	FWID	R/W	0h	FIFO width: Applies if either SAM or DAM is set to FIFO mode. Pass-thru to TC.
7-4	RES85	R	0h	RESERVE FIELD
3	STATIC	R/W	0h	Static Entry: 0: Entry is updated as normal 1: Entry is static Count and Address updates are not updated after TRP is submitted. Linking is not performed.
2	SYNCDIM	R/W	0h	Transfer Synchronization Dimension: 0: A-Sync Each event triggers the transfer of ACNT elements. 1: AB-Sync Each event triggers the transfer of BCNT arrays of ACNT elements
1	DAM	R/W	0h	Destination Address Mode: Destination Address Mode within an array. Pass-thru to TC. 0: INCR Dst addressing within an array increments. Dst is not a FIFO. 1: FIFO Dst addressing within an array wraps around upon reaching FIFO width.
0	SAM	R/W	0h	Source Address Mode: Source Address Mode within an array. Pass-thru to TC. 0: INCR Src addressing within an array increments. Source is not a FIFO. 1: FIFO Src addressing within an array wraps around upon reaching FIFO width.

11.8.1.1.113 SRC Register (Offset = 4004h) [reset = 0h]

SRC is shown in Figure 11-141 and described in Table 11-144.

Return to the Table 11-31.

Source Address

Figure 11-141. SRC Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W-0h																															

Table 11-144. SRC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SRC	R/W	0h	Source Address: The 32-bit source address parameters specify the starting byte address of the source . If SAM is set to FIFO mode then the user should program the Source address to be aligned to the value specified by the OPT.FWID field. No errors are recognized here but TC will assert error if this is not true.

11.8.1.1.114 ABCNT Register (Offset = 4008h) [reset = 0h]

ABCNT is shown in Figure 11-142 and described in Table 11-145.

Return to the Table 11-31.

A and B byte count

Figure 11-142. ABCNT Register

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="16">BCNT</td><td colspan="16">ACNT</td></tr>
<tr><td colspan="16">R/W-0h</td><td colspan="16">R/W-0h</td></tr>
</table>

Table 11-145. ABCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	BCNT	R/W	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 (64K-1 arrays). BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ...
15-0	ACNT	R/W	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes (64K-1 bytes). ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation (to translate between a word count and a byte count) will drop the 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT.

11.8.1.1.115 DST Register (Offset = 400Ch) [reset = 0h]

DST is shown in Figure 11-143 and described in Table 11-146.

Return to the Table 11-31.

Destination Address

Figure 11-143. DST Register

</table>

Table 11-147. BIDX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	DBIDX	R/W	0h	Destination 2nd Dimension Index: DBIDX is a 16-bit signed value (2's complement) used for destination address modification in between each array in the 2nd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-Sync and AB-Sync transfers.
15-0	SBIDX	R/W	0h	Source 2nd Dimension Index: SBIDX is a 16-bit signed value (2's complement) used for source address modification in between each array in the 2nd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-sync and AB-sync transfers.

11.8.1.1.117 LNK Register (Offset = 4014h) [reset = 0h]

LNK is shown in Figure 11-145 and described in Table 11-148.

Return to the Table 11-31.

Link and Reload parameters

Figure 11-145. LNK Register

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="16">BCNTRLD</td><td colspan="16">LINK</td></tr>
<tr><td colspan="16">R/W-0h</td><td colspan="16">R/W-0h</td></tr>
</table>

Table 11-148. LNK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	BCNTRLD	R/W	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT (conceptually) reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field.
15-0	LINK	R/W	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination (i.e. after count fields are decremented to '0') with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case (5-lsbs) behavior is undefined for the user (i.e. don't have to test it). In the former case (2 msbs) user should be able to take advantage of this feature (i.e. do have to test it). If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.

11.8.1.1.118 CIDX Register (Offset = 4018h) [reset = 0h]

CIDX is shown in Figure 11-146 and described in Table 11-149.

Return to the Table 11-31.

Register description is not available

Figure 11-146. CIDX Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DCIDX																SCIDX															
R/W-0h																R/W-0h															

Table 11-149. CIDX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	DCIDX	R/W	0h	Destination Frame Index: DCIDX is a 16-bit signed value (2's complement) used for destination address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when DCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a ABsync transfer is the first array in the frame.
15-0	SCIDX	R/W	0h	Source Frame Index: SCIDX is a 16-bit signed value (2's complement) used for source address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when SCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a AB-sync transfer is the first array in the frame.

11.8.1.1.119 CCNT Register (Offset = 401Ch) [reset = 0h]

CCNT is shown in Figure 11-147 and described in Table 11-150.

Return to the Table 11-31.

C byte count

Figure 11-147. CCNT Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES86																CCNT															
R-0h																R/W-0h															

Table 11-150. CCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RES86	R	0h	RESERVE FIELD
15-0	CCNT	R/W	0h	CCNT : Count for 3rd Dimension: CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT can be anywhere between 1 and 65535. Therefore the maximum number of frames in a block is 65535 (64K-1 frames). CCNT of '1' means '1' frame in the block and CCNT of '0' means '0' frames in the block. A CCNT value of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. WIMODE has no affect on CCNT operation.

11.8.1.2 TPTC Registers

Table 11-151 lists the TPTC registers. All register offset addresses not listed in Table 11-151 should be considered as reserved locations and the register contents should not be modified.

Table 11-162. ERRDET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R	X	
17	TCCHEN	R	0h	Contains the OPT.TCCHEN value programmed by the user for the Read or Write transaction that resulted in an error.
16	TCINTEN	R	0h	Contains the OPT.TCINTEN value programmed by the user for the Read or Write transaction that resulted in an error.
15-14	RESERVED	R	X	
13-8	TCC	R	0h	Transfer Complete Code: Contains the OPT.TCC value programmed by the user for the Read or Write transaction that resulted in an error.
7-4	RESERVED	R	X	
3-0	STAT	R	0h	Transaction Status: Stores the non-zero status/error code that was detected on the read status or write status bus. MS-bit effectively serves as the read vs. write error code. If read status and write status are returned on the same cycle then the TC chooses non-zero version. If both are non-zero then write status is treated as higher priority. Encoding of errors matches the CBA spec.

11.8.1.2.12 ERRCMD Register (Offset = 130h) [reset = X]

Table 11-196. DFBCNT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	X	
15-0	BCNT	R	0h	B-Count Remaining for Dst Register Set: Number of arrays to be transferred where each array is ACNT in length. Represents the amount of data remaining to be written. Initial value is copied from PCNT. TC decrements ACNT and BCNT as necessary after each write dataphase is issued. Final value should be 0 when TR is complete.

Chapter 12
CANFD

This chapter describes the Modular Controller Area Network (MCAN) module.

12.1 MCAN Overview

The Controller Area Network (CAN) is a serial communications protocol which efficiently supports distributed real-time control with a high level of security. CAN has high immunity to electrical interference and the ability to self-diagnose and repair data errors. In a CAN network, many short messages are broadcast to the entire network, which provides for data consistency in every node of the system.

The MCAN modules support both classic CAN and CAN FD (CAN with Flexible Data-Rate) specifications. CAN FD feature allows high throughput and increased payload per data frame. The classic CAN and CAN FD devices can coexist on the same network without any conflict.

The device supports up to two MCAN modules connecting to the CAN network through external (for the device) transceiver for connection to the physical layer. Each MCAN module supports up to 5 Mbit/s data rate and is compliant to ISO 11898-1:2015.

Note

The availabilty of CAN FD feature is device part number dependent. Refer to device Data Manual for more information.

Figure 12-1 shows the MCAN module overview.

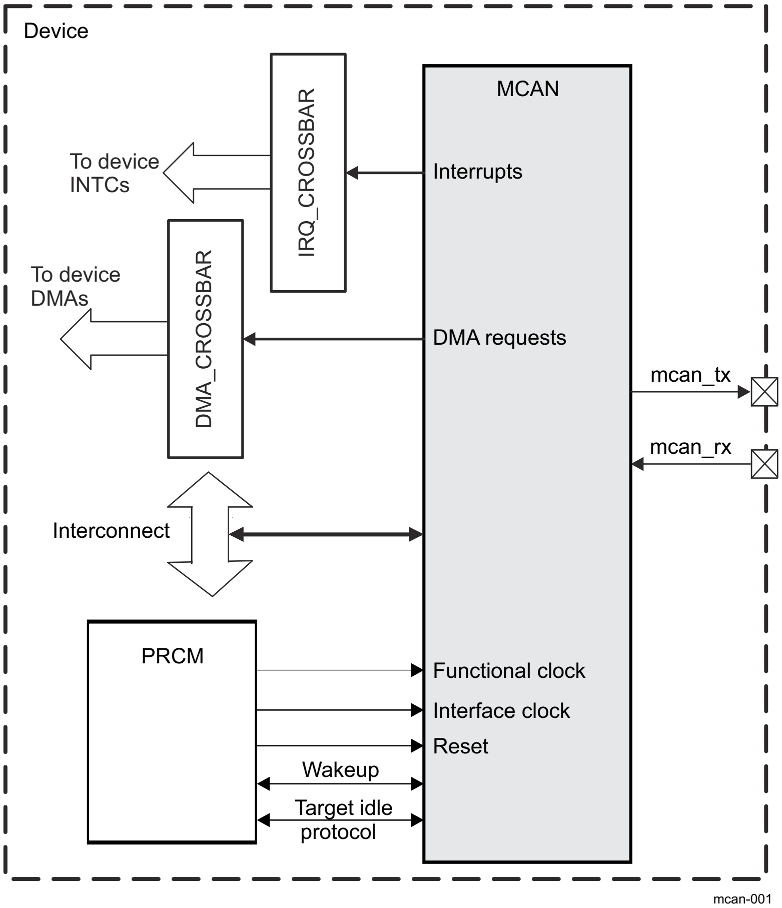

Figure 12-1. MCAN Module Overview

12.1.1 Features

Each MCAN module implements the following features:

- Conforms with ISO 11898-1:2015

- Full CAN FD support (up to 64 data bytes)
- AUTOSAR and SAE J1939 support
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO, up to 32 elements
- Configurable Transmit Queue, up to 32 elements
- Configurable Transmit Event FIFO, up to 32 elements
- Up to 64 dedicated Receive Buffers
- Two configurable Receive FIFOs, up to 64 elements each
- Up to 128 filter elements
- Internal Loopback mode for self-test
- Maskable interrupts, two interrupt lines
- Two clock domains (CAN clock/Host clock)
- Parity/ECC support - Message RAM single error correction and double error detection (SECDED) mechanism
- Local power-down and wakeup support
- Timestamp Counter
- Full Message Memory capacity (4352 words).

Not supported features:

- Debug on CAN (Debug DMA)
- Host bus read and write bursts
- Host bus firewall
- GPIO mode
- External (IO) Loopback mode
- Device clock domains monitoring (using DCC module)

12.2 MCAN Environment

A CAN network physical layer consists of two-wire differential bus, usually twisted pair, and provides high level of interference immunity. External CAN transceiver IC is needed to access a CAN bus by the MCAN.

Figure 12-2 shows an overview of a typical MCAN application.

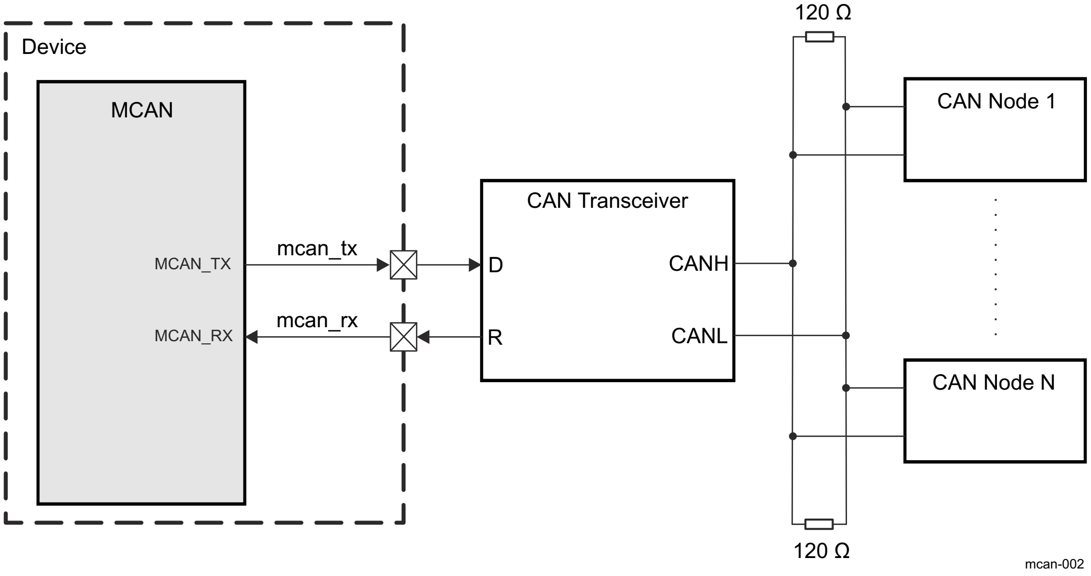

Figure 12-2. MCAN Typical Application

Table 12-1 describes the external signals of the MCAN module.

Table 12-1. MCAN I/O Description

Module Signal	Device Signal	I/O[1]	Description	Value at Reset
MCAN_RX	mcan_rx	I	Serial data input from external CAN tranceiver	HiZ
MCAN_TX	mcan_tx	O	Serial data output to external CAN tranceiver	1

(1) I = Input; O = Output

Note

The path from a module pin to device pad(s) is defined at the device I/O logic level. The control module registers assign the specific function to the device pads. For more information on control module settings, see *Pad Configuration Registers* of *Control Module*.

12.2.1 CAN Network Basics

- A CAN bus is a 2-wire differential bus using Non-Return-to-Zero (NRZ) encoding and has two states:
  - Recessive state (logical 1)
  - Dominant state (logical 0)
- The network is multicontroller. When two or more nodes (ECUs) attempt to transmit at the same time, a non-destructive arbitration technique guarantees messages are sent in order of priority and no messages are lost.
- The message transmission is multicast. Data messages transmitted are identifier based, not address based.
- Content of message is labeled by the identifier that is unique throughout the network (for example: rpm, temperature, position, pressure, and so forth).
- All nodes on network receive the message and each performs an acceptance test on the identifier. If message is relevant, it is processed, otherwise it is ignored.

- The unique identifier also determines the priority of the message (the lower the numerical value of the identifier, the higher the priority is).
- Data is transmitted and received using message frames, consisting of the following basic fields:
  - Arbitration field
  - Control field
  - Data field (up to 8 bytes for Classical CAN and up to 64 bytes for CAN FD)
  - CRC field
  - ACK field

For more information, see *ISO 11898-1:2015: CAN data link layer and physical signalling*.

12.3 MCAN Integration

MCAN Integration shows the integration of the MCAN module in the device.

Table 12-2 through Table 12-4 summarize the integration of the MCAN module in the device.

Table 12-2. MCAN Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
MCAN	PD_L4PER	Yes	L4_PER2

Table 12-3. MCAN Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
MCAN	MCAN_ICLK	L4PER2_L3_GICLK/2	PRCM	Interface clock for the MCAN module
	MCAN_FCLK	MCAN_CLK	PRCM	Functional clock for the MCAN core
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
MCAN	MCAN_RST	L4PER_RST	PRCM	Asynchronous reset signal to the MCAN module

Table 12-4. MCAN Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	IRQ_CROSSBAR Input	Default Mapping	Description
MCAN	MCAN_IRQ_INT0	IRQ_CROSSBAR_225	-	MCAN interrupt 0
	MCAN_IRQ_INT1	IRQ_CROSSBAR_226	-	MCAN interrupt 1
	MCAN_IRQ_ECC	IRQ_CROSSBAR_227	-	MCAN ECC interrupt
	MCAN_IRQ_TS	IRQ_CROSSBAR_457	-	MCAN timestamp interrupt
DMA Requests				
Module Instance	Source Signal Name	DMA_CROSSBAR Input	Default Mapping	Description
MCAN	MCAN_DREQ_TX	DMA_CROSSBAR_161	-	MCAN TX DMA Event
	MCAN_DREQ_RX_FE1	DMA_CROSSBAR_162	-	MCAN RX Filter Event 1
	MCAN_DREQ_RX_FE2	DMA_CROSSBAR_163	-	MCAN RX Filter Event 2

Note

The MCAN module has no default IRQ mappings through the IRQ_CROSSBAR. For the MCAN module, the IRQ_CROSSBAR module must be configured prior to unmask interrupts in the interrupt controller(s).

For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description* in *Control Module*.

For more information about the device interrupt controllers, see *Interrupt Controllers*.

Note

For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description* in *Control Module*.

Note

For the description of the interrupt source, see Section 12.4.2, *Interrupt and DMA Requests*.

12.4 MCAN Functional Description

Each MCAN module performs CAN protocol communication according to ISO 11898-1:2015. The bit rate can be programmed to values up to 5 Mbit/s. Additional transceiver hardware is required for the connection to the physical layer (CAN bus).

For communication on a CAN network, individual message frames can be configured. The message frames and identifier masks are stored in the Message RAM.

All functions concerning the handling of messages are implemented in the Message Handler.

The register set of each MCAN module can be accessed directly via the module interface. These registers are used to control and configure the CAN core and the Message Handler, and to access the Message RAM.

Figure 12-3 shows a CAN module block diagram.

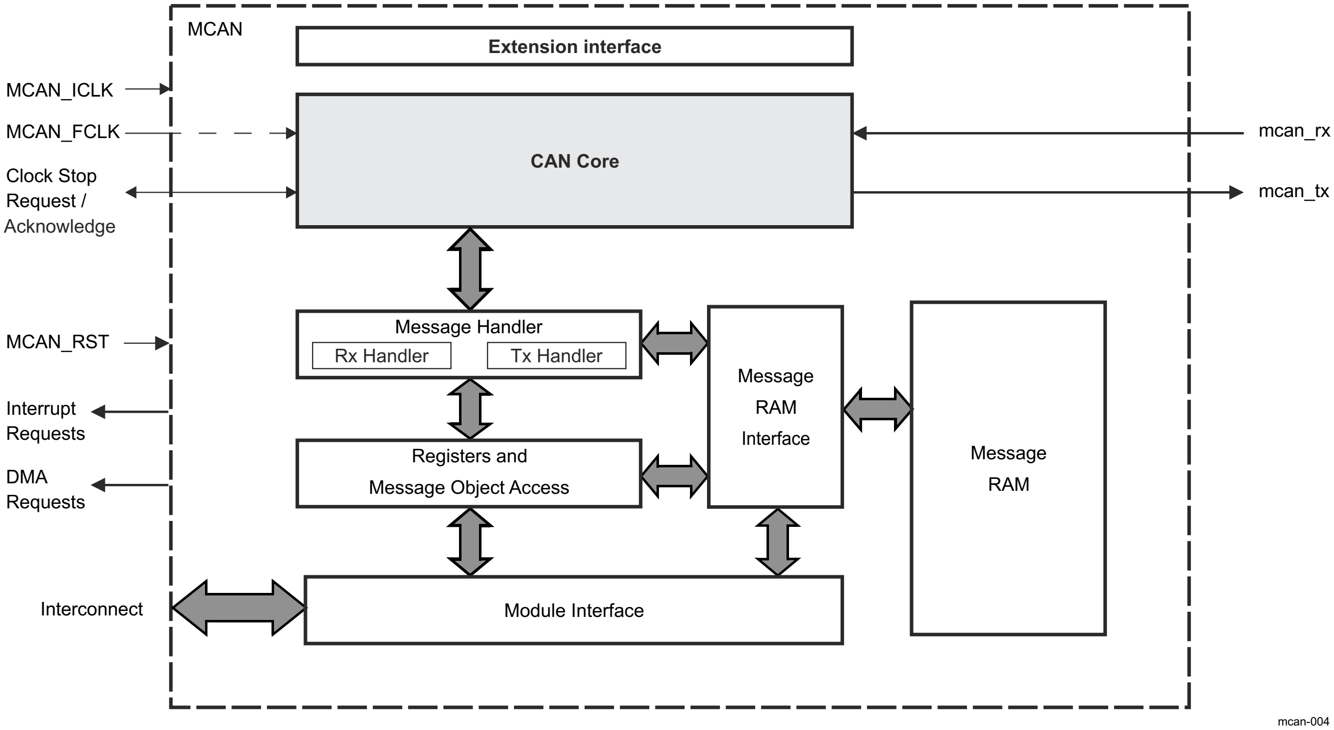

Figure 12-3. MCAN Block Diagram

The MCAN module blocks description:

- **CAN Core**: The CAN core consists of the CAN protocol controller and the Rx/Tx shift register. It handles all ISO 11898-1:2015 protocol functions and supports 11-bit and 29-bit identifiers.
- **Message Handler**: the Message Handler (Rx Handler and Tx Handler) is a state machine that controls the data transfer between the single-ported Message RAM and the CAN core's Rx/Tx shift register. It also handles the acceptance filtering and the Interrupt/DMA request generation as programmed in the control registers.
- **Message RAM**: the main purpose of the Message RAM is to store Rx/Tx messages, Tx Event elements, and Message ID Filter elements (for more information, see Section 12.4.11, *Message RAM*).
- **Message RAM Interface**: enables connection between the Message RAM and the other blocks in the MCAN module.
- **Registers and Message Object Access**: Data consistency is ensured by indirect accesses to the message objects. During normal operation, all software and DMA accesses to the Message RAM are done through interface registers. The interface registers have the same word-length as the Message RAM.
- **Module Interface**: The MCAN module registers are accessed by the user software through a 32-bit peripheral bus interface.

- **Clocking**: Two clocks are provided to the MCAN module: the peripheral synchronous clock (interface clock - MCAN_ICLK) and the peripheral asynchronous clock (functional clock - MCAN_FCLK).
- **Extension Interface**: All flags from the Interrupt Register (MCAN_IR) as well as selected internal status and control signals are routed to this interface.

12.4.1 Module Clocking Requirements

Two clocks are provided to each MCAN module:

- the peripheral synchronous clock (MCAN_ICLK) as the general module clock source
- and the peripheral asynchronous clock (MCAN_FCLK) provided to the CAN core for generating the CAN bit timing.

Within each MCAN module there is a synchronization mechanism implemented to ensure safe data transfer between the two clock domains. There are synchronization between the signals from the Host clock domain to the CAN clock domain and vice versa and between the reset signal (MCAN_RST) to the Host clock domain and to the CAN clock domain.

Note

MCAN_ICLK must always be higher or equal to MCAN_FCLK, in order to achieve a stable functionality of the MCAN module. Here, also the frequency shift of the modulated MCAN_ICLK has to be considered:

$f_{0,\mathrm{ICLK}}(\mathrm{OCP}) \pm \Delta f_{\mathrm{FM,ICLK}}(\mathrm{OCP}) \geq f_{\mathrm{FCLK}}$

CAN-FD supports higher speeds of operation and as such has more stringent timing requirements than Classic CAN. For optimal performance, TI recommends using the lowest N-divider value that maintains a working PLL REF_CLK (GMAC_DSP_DPLL_CLK) for the system. Lower N-divider values increase the loop bandwidth of the PLL which in turn improves timing margins for CAN-FD.

For CAN-FD operations > 2 Mbps:

- For 20 MHz input clocks, N = 0 is the preferred configuration.

For CAN-FD operations < 2 Mbps:

- For 20 MHz input clocks, N = 0 is the preferred configuration.
- For 19.2 MHz input clocks, N = 11 is the preferred configuration.

For more information on how to configure the relevant clock source registers, see *PRCM* and the device data manual.

12.4.2 Interrupt and DMA Requests

Each MCAN module provides interrupt and DMA requests. They are configured via the Host CPU. The Suspend Mode prevents the interrupt and DMA requests from propagating to the Host CPU (for more information, see Section 12.4.4.8.2, *Suspend Mode*).

12.4.2.1 Interrupt Requests

Each MCAN module has two interrupt lines. The first interrupt line (INT0) is associated with the MCAN core. There are 30 internal interrupt sources. The interrupts are 'level high' interrupts.

For more information, see the following registers:

- Interrupt Register (MCAN_IR)
- Interrupt Enable (MCAN_IE)
- Interrupt Line Select (MCAN_ILS)
- Interrupt Line Enable (MCAN_ILE)

Each MCAN module is capable of issuing an ECC interrupt. After clearing the ECC interrupt source, the application software must also write 1 to MCANSS_ECC_EOI[8] ECC_EOI bit (for more information, see Section 12.4.7.2, *ECC Aggregator*).

The second interrupt line (INT1) is associated with the External Timestamp Counter. When the External Timestamp Counter rolls over it produces an interrupt (see Section 12.4.5.1, *External Timestamp Counter*).

For more information, see the following registers:

- Interrupt Clear Shadow Register (MCANSS_ICS)
- Interrupt Raw Status Register (MCANSS_IRS)
- Interrupt Enable Clear Shadow Register (MCANSS_IECS)
- Interrupt Enable Register (MCANSS_IE)
- Interrupt Enable Status (MCANSS_IES)
- End Of Interrupt (MCANSS_EOI)
- External Timestamp Prescaler (MCANSS_EXT_TS_PRESCALER)
- External Timestamp Unserviced Interrupts Counter (MCANSS_EXT_TS_UNSERVICED_INTR_CNTR)

12.4.2.2 DMA Requests

Functional transmit and Filter DMA requests are generated by each MCAN module based on the signaling in the Extention Interface. The DMA signaling uses a simple DMA request active high pulse. Only one Tx DMA event is provided by each MCAN module.

Standard and Extended message filters can be set to issue a pulse when a filter match occurs. These "Filter Events" can be used to DMA messages from the Rx FIFO. The events are high level single clock cycle (MCAN_ICLK) pulses. Only two Filter DMA events are provided by the MCAN module.

For more information about available Interrupt and DMA Requests, see Section 12.3, *MCAN Integration*.

12.4.2.3

For more information about available Interrupt and DMA Requests, see Section 12.3, *MCAN Integration*.

12.4.3 Fuseable CAN FD Operation Enable

The Flexible Datarate feature of each MCAN module can be enabled by writing 1 to MCAN_CCCR[8] FDOE bit. A value of 0 on the primary configuration port (mcanss_enable_fdoe) will force the MCAN_CCCR[8] FDOE bit during write to the MCAN_CCCR register which will prevent the device from enabling and using the CAN FD mode.

12.4.4 Operating Modes

12.4.4.1 Software Initialization

Setting the MCAN_CCCR[0] INIT bit to 1 starts a software initialization. This is done either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off state. While the MCAN_CCCR[0] INIT bit is set, the message transfer is stopped and the status of the output MCAN_TX pin is recessive (high). The counters of the Error Management Logic (EML) are unchanged. Setting the MCAN_CCCR[0] INIT bit does not change any configuration register. Resetting the MCAN_CCCR[0] INIT bit finishes the software initialization. After waiting for the occurrence of a sequence of 11 consecutive recessive bits (indication for Bus_Idle state) the message transfer starts.

Access to the MCAN configuration registers is only enabled when both MCAN_CCCR[0] INIT and MCAN_CCCR[1] CCE bits are set (write protection).

The MCAN_CCCR[1] CCE bit can only be set/reset while the MCAN_CCCR[0] INIT = 1. The MCAN_CCCR[1] CCE bit is automatically reset when the MCAN_CCCR[0] INIT bit is reset.

The following registers are reset when the MCAN_CCCR[1] CCE bit is set:

- MCAN_HPMS - High Priority Message Status
- MCAN_RXF0S - Rx FIFO 0 Status
- MCAN_RXF1S - Rx FIFO 1 Status
- MCAN_TXFQS - Tx FIFO/Queue Status
- MCAN_TXBRP - Tx Buffer Request Pending
- MCAN_TXBTO - Tx Buffer Transmission Occurred

- MCAN_TXBCF - Tx Buffer Cancellation Finished
- MCAN_TXEFS - Tx Event FIFO Status

The Timeout Counter value MCAN_TOCV[15:0] TOC field is preset to the value configured by the MCAN_TOCC[31:16] TOP field when the MCAN_CCCR[1] CCE bit is set.

In addition the Tx Handler and Rx Handler are held in idle state while MCAN_CCCR[1] CCE = 1.

The following registers are only writeable while MCAN_CCCR[1] CCE = 0

- MCAN_TXBAR - Tx Buffer Add Request
- MCAN_TXBCR - Tx Buffer Cancellation Request

MCAN_CCCR[7] TEST and MCAN_CCCR[5] MON bits can only be set by the Host CPU while MCAN_CCCR[0] INIT = 1 and MCAN_CCCR[1] CCE = 1. Both bits may be reset at any time. The MCAN_CCCR[6] DAR bit can only be set/reset while MCAN_CCCR[0] INIT = 1 and MCAN_CCCR[1] CCE = 1.

12.4.4.2 Normal Operation

Once an MCAN module is initialized and the MCAN_CCCR[0] INIT bit is reset to zero, the MCAN module synchronizes itself to the CAN bus and is ready for communication. After passing the acceptance filtering, received messages including Message Identifier (ID) and Data Length Code (DLC) are stored into a dedicated Rx Buffer or into Rx FIFO 0/Rx FIFO 1.

For messages to be transmitted dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated.

Note

Automated transmission on reception of remote frames is not supported.

12.4.4.3 CAN FD Operation

There are two variants of CAN FD frame transmission:

- CAN FD frame transmission without bit rate switching
- CAN FD frame transmission where control field, data field, and CRC field are transmitted with a higher bit rate than the beginning and the end of the frame

In the CAN frames FDF = recessive (logical 1) signifies a CAN FD frame, FDF = dominant (logical 0) signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF - res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. Note that the coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN module receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting the MCAN_PSR[14] EXE bit. When Protocol Exception Handling is enabled (MCAN_CCCR[12] PXHD = 0), this causes the operation state to change from Receiver (MCAN_PSR[4:3] ACT = 10) to Integrating (MCAN_PSR[4:3] ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN_CCCR[12] PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming the MCAN_CCCR[8] FDOE bit. In case MCAN_CCCR[8] FDOE = 1, transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via the FDF bit in the respective Tx Buffer element.

With MCAN_CCCR[8] FDOE = 0, received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if the FDF bit of a Tx Buffer element is set. The MCAN_CCCR[8] FDOE and MCAN_CCCR[9] BRSE bits can only be changed while the MCAN_CCCR[0] INIT and MCAN_CCCR[1] CCE bits are both set. With MCAN_CCCR[8] FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format.

With MCAN_CCCR[8] FDOE = 1 and MCAN_CCCR[9] BRSE = 0, only FDF bit of a Tx Buffer element is evaluated. With MCAN_CCCR[8] FDOE = 1 and MCAN_CCCR[9] BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting Classic CAN messages until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wakeup messages in CAN Partial Networking have to be transmitted in Classic CAN format.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in Silent mode until programming has completed. Then all nodes switch back to Classic CAN communication.

In the CAN FD format, the DLC coding differs from the standard CAN format (see Table 12-5).

Table 12-5. DLC Coding

DLC	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Number of Data Bytes in Standard CAN	0	1	2	3	4	5	6	7	8	8	8	8	8	8	8	8
Number of Data Bytes in CAN FD	0	1	2	3	4	5	6	7	8	12	16	20	24	32	48	64

For CAN FD frames with bit rate switching, the bit timing will be switched inside the frame after the BRS (Bit Rate Switch) bit in case this bit is recessive. In the CAN FD arbitration phase, before the BRS bit, the nominal CAN bit timing (see Figure 12-4) is used as configured by the Nominal Bit Timing and Prescaler Register, MCAN_NBTP. In the following CAN FD data phase, the data phase bit timing is used as configured by the Data Bit Timing and Prescaler Register, MCAN_DBTP. The bit timing is switched back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

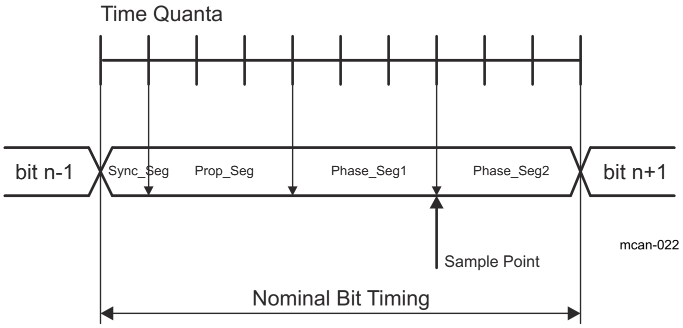

Figure 12-4. CAN Bit Timing

The maximum configurable data phase bit timing depends on the CAN clock frequency (MCAN_FCLK). Example: with MCAN_FCLK = 20 MHz and the shortest configurable bit time of 4 t_q (time quanta), the bit rate in the data phase is 5 Mbit/s.

For CAN FD with or without bit rate switching, the value of the ESI (Error Status Indicator) bit depends on the transmitter's error state (see MCAN_PSR[11] RESI bit) monitored at the start of the transmission. If the transmitter has an error passive flag, the ESI bit is transmitted recessive. Otherwise, it is transmitted dominant.

12.4.4.4 Transmitter Delay Compensation

12.4.4.4.1 Description

When only one CAN FD node is transmitting and all others are receivers the length of the bus line has no impact. When transmitting via the MCAN_TX pin, the MCAN module receives the transmitted data from its local

CAN transceiver via the MCAN_RX pin. The received data is delayed. If the transmitter delay is greater than TSEG1 (time segment before sample point), a bit error is detected.

The MCAN module provides a delay compensation mechanism to compensate the transmitter delay. The compensation mechanism enables transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver. Without transmitter delay compensation, the bit rate in the data phase is limited by the transmitter delay.

The mechanism enables configurations where the data bit time is shorter than the transmitter delay (described in detail in ISO 11898-1:2015). The transmitter delay compensation is enabled by setting the MCAN_DBTP[23] TDC bit to 1.

The delayed transmit data is compared against the received data at the Secondary Sample Point (SSP) in order to check for bit errors during the data phase of transmitting nodes. If a bit error is detected, the transmitter will react on this bit error at the next following regular sample point. During the arbitration phase, the delay compensation is always disabled.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output MCAN_TX pin through the transceiver to the receive input MCAN_RX pin plus the transmitter delay compensation offset configured by the MCAN_TDCR[14:8] TDCO field (see Figure 12-5). The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (example: half of the bit time in the data phase). The position of the SSP is rounded down to the next integer number of mtq (minimum time quantum).

The actual transmitter delay compensation value can be checked by reading the MCAN_PSR[22:16] TDCV field. This filed is cleared when the MCAN_CCCR[0] INIT bit is set and is updated at each transmission of CAN FD frame while the MCAN_DBTP[23] TDC bit is set.

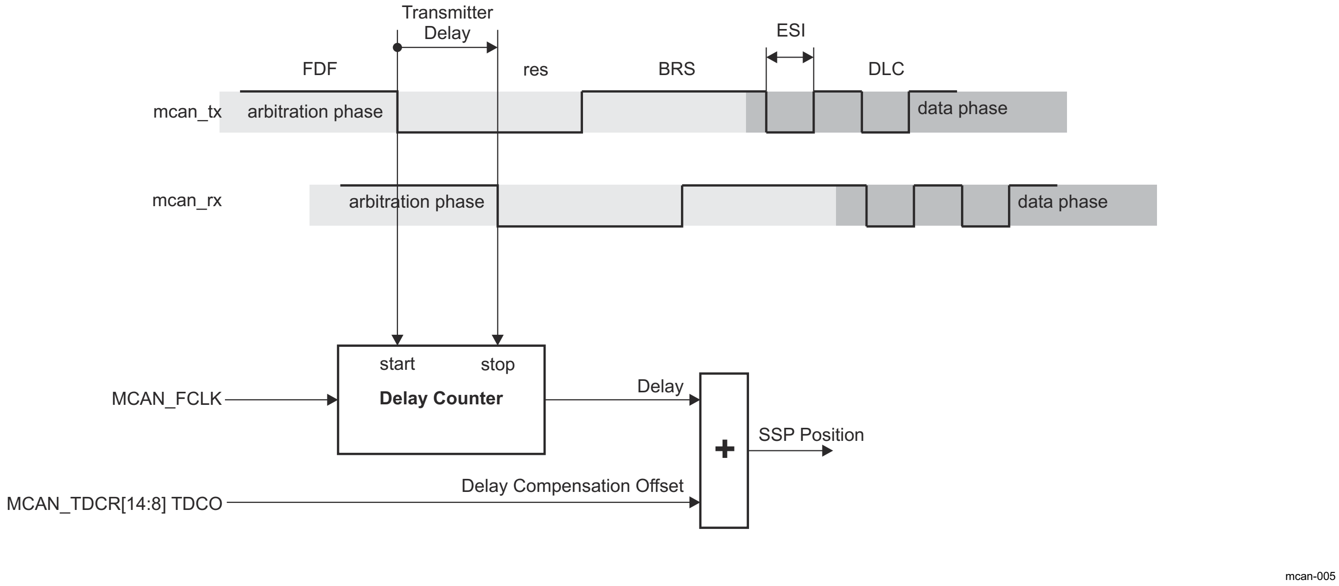

Figure 12-5. Transmitter Delay Measurement

12.4.4.4.2 Transmitter Delay Compensation Measurement

When transmitter delay compensation is enabled (by programming MCAN_DBTP[23] TDC = 1), the measurement is started within each transmitted CAN FD frame at the falling edge of FDF bit to bit res. The measurement is stopped when this edge is seen at the receive input MCAN_RX pin of the transmitter. The resolution of this measurement is one mtq (see Figure 12-5). The mtq (minimum time quantum) dimension is equal to the CAN clock period (MCAN_FCLK).

The use of a transmitter delay compensation filter window can be enabled by programming MCAN_TDCR[6:0] TDCF field. This filter feature defines a minimum value for the SSP position to avoid the case in which a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in an early taken SSP position. Dominant edges on the MCAN_RX pin that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN_TDCR[6:0] TDCF field and the MCAN_RX pin is low.

The following boundary conditions have to be considered:

- The sum of the measured delay from the MCAN_TX pin to the MCAN_RX pin and the configured transmitter delay compensation offset (MCAN_TDCR[14:8] TDCO field) has to be less than 6 bit times in the data phase.
- The sum of the measured delay from the MCAN_TX pin to the MCAN_RX pin and the configured transmitter delay compensation offset (MCAN_TDCR[14:8] TDCO) field has to be less or equal 127 mtq. In case this sum exceeds 127 mtq, the maximum value of 127 mtq is used for transmitter delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

12.4.4.5 Restricted Operation Mode

In Restricted Operation Mode, the CAN node is able to receive data and remote frames and acknowledge valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The receive and transmit error counters (MCAN_ECR[14:8] REC and MCAN_ECR[7:0] TEC) are frozen while CAN error logging (MCAN_ECR[23:16] CEL) is active. The Host CPU can set the MCAN module into Restricted Operation Mode by setting MCAN_CCCR[2] ASM bit. The bit can only be set by the Host CPU at any time when both MCAN_CCCR[2] CCE and MCAN_CCCR[1] INIT bits are set to 1.

The Restricted Operation Mode is automatically entered when the Tx Handler is not able to read data from the Message RAM in time. To leave Restricted Operation Mode, the Host CPU has to reset MCAN_CCCR[2] ASM bit. This mode can be used in applications that adapt themselves to different CAN bit rates. In this case, the application tests different bit rates and leaves the Restricted Operation Mode after it has received a valid frame.

Note

The Restricted Operation Mode must not be combined with the Loop Back Mode.

12.4.4.6 Bus Monitoring Mode

Entering Bus Monitoring Mode is done by setting the MCAN_CCCR[5] MON bit to 1. In this mode (see ISO 11898-1:2015, *Bus Monitoring* section), the MCAN module is able to receive valid data and remote frames but cannot start a transmission. The MCAN module sends only recessive bits on the CAN bus. If the MCAN module is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the MCAN module monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring Mode, the MCAN_TXBRP register is held in reset state. The Bus Monitoring Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. Figure 12-6 shows the connection of the MCAN_TX and MCAN_RX signals to the MCAN module in Bus Monitoring Mode.

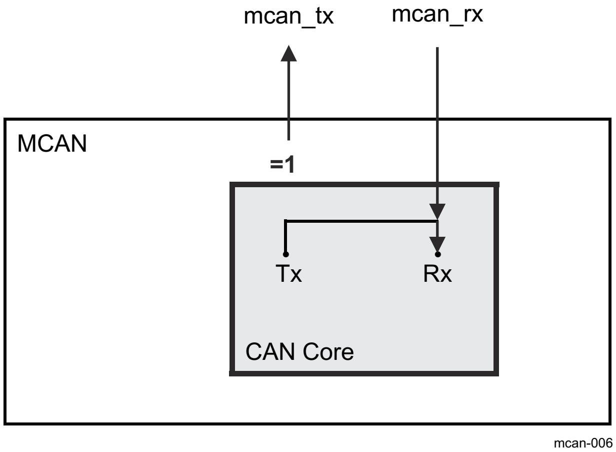

Figure 12-6. Connection of Signals in Bus Monitoring Mode

12.4.4.7 Disabled Automatic Retransmission (DAR) Mode

According to the CAN Specification (see ISO11898-1:2015, *Recovery Management* section), the MCAN module provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default, automatic retransmission is enabled (see the MCAN_CCCR[6] DAR bit).

12.4.4.7.1 Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they started on the CAN bus. A Tx Buffer's Tx Request Pending MCAN_TXBRP TRPx bit is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

Successful transmission:

- Corresponding Tx Buffer Transmission Occurred MCAN_TXBTO TOx bit is set
- Corresponding Tx Buffer Cancellation Finished MCAN_TXBCF CFx bit is not set

Successful transmission in spite of cancellation:

- Corresponding Tx Buffer Transmission Occurred MCAN_TXBTO TOx bit is set
- Corresponding Tx Buffer Cancellation Finished MCAN_TXBCF CFx bit is set

Arbitration lost or frame transmission disturbed:

- Corresponding Tx Buffer Transmission Occurred MCAN_TXBTO TOx bit is not set
- Corresponding Tx Buffer Cancellation Finished MCAN_TXBCF CFx bit is set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = 10 (transmission in spite of cancellation).

12.4.4.8 Power Down (Sleep) Mode

Entering Power Down mode is controlled via the input clock stop request signal (mcanss_clkstp_clkstop_req) or MCAN_CCCR[4] CSR bit. As long as the clock stop request signal is active, the MCAN_CCCR[4] CSR bit is read as 1. When all pending transmission requests have completed, the MCAN module waits until bus idle state is detected. Then the MCAN module sets the MCAN_CCCR[1] INIT to 1 to prevent any further CAN transfers. The MCAN module acknowledges that it is ready for power down by setting the output clock stop acknowledge signal (mcanss_clkstop_clkstop_ack) to 1 and the MCAN_CCCR[3] CSA bit to 1. In this state, before the clocks are switched off, further register accesses can be made except to the MCAN_CCCR[1] INIT bit which is held at one. Now, the module clock inputs MCAN_ICLK and MCAN_FCLK may be switched off.

To leave power down mode, the application has to turn on the module clocks before resetting the input clock stop request signal respectively the MCAN_CCCR[4] CSR flag bit. The MCAN will acknowledge this by resetting the output clock stop acknowledge signal respectively the MCAN_CCCR[3] CSA flag bit. Afterwards, the application can restart CAN communication by resetting MCAN_CCCR[1] INIT bit.

12.4.4.8.1 External Clock Stop Mode

The MCAN module supports two external clock stop modes:

- Immediate
- Graceful

In graceful clock stop mode, when the clock stop request is asserted, the MCAN core will respond with clock stop acknowledge when all pending Tx messages have been processed and an Idle line had been detected. The MCAN_CCCR[0] INIT bit will be set, the MCAN core will go and stay Idle.

The automatic wakeup feature is enabled by setting the MCANSS_CTRL[5] AUTOWAKEUP and MCANSS_CTRL[4] WAKEUPREQEN bits to 1 (for more information, see Section 12.4.4.8.3, *Wakeup request*). When external clock stop request is removed and no suspend request is active, a read-modify-write to the MCAN_CCCR[0] INIT bit is performed to clear it.

12.4.4.8.2 Suspend Mode

The MCAN module supports two suspend modes:

- Immediate
- Graceful

In graceful suspend mode (see the MCANSS_CTRL[3] FREE and MCANSS_CTRL[2] SOFT bits), when the suspend request is asserted, a clock stop request to the MCAN core is performed. The MCAN core will respond with clock stop acknowledge when all pending Tx messages have been processed and an Idle line had been detected. At that point, the MCAN_CCCR[0] INIT bit will be set, the MCAN core will go and stay Idle. The suspend state can be verified by reading MCAN_CCCR[0] INIT bit.

The automatic wakeup feature is enabled by setting the MCANSS_CTRL[5] AUTOWAKEUP and MCANSS_CTRL[4] WAKEUPREQEN bits to 1 (for more information, see Section 12.4.4.8.3, *Wakeup request*). When suspend request is removed, if no external clock stop request is active, a read-modify-write to the MCAN_CCCR[0] INIT bit is performed to clear it.

During suspend mode, the auto-clear feature is disabled. The following register fields have an auto-clear feature:

- MCAN_ECR[23:16] CEL
- MCAN_PSR[2:0] LEC
- MCAN_PSR[10:8] DLEC
- MCAN_PSR[11] RESI
- MCAN_PSR[12] RBRS
- MCAN_PSR[13] RFDF
- MCAN_PSR[14] PXE

12.4.4.8.3 Wakeup Request

Issuing a clock stop request puts the MCAN module into Power Down mode (Sleep Mode). During transition from IDLE to ACTIVE, if the MCANSS_CTRL[5] AUTOWAKEUP and MCANSS_CTRL[4] WAKEUPREQEN bits are enabled, after the MCAN Core respond to the removal of the clock stop request with removing the clock stop acknowledge, a read-modify-write will be issued to clear the MCAN_CCCR[0] INIT bit and the MCAN core will resume operation.

If the MCANSS_CTRL[4] WAKEUPREQEN bit is set, the MCAN module provides a wakeup request (SWakeup) on any of the following wakeup events:

- The receive MCAN_RX pin is dominant (logical 0)
- OCP access is performed

To clear the SWakeup in case any of these events is active, the MCANSS_CTRL[4] WAKEUPREQEN bit should be cleared. The MCAN module adds a third wakeup event source - interrupt line 0 (INT0). In this case the SWakeup is cleared by clearing the interrupt source.

12.4.4.9 Test Mode

The MCAN_TEST register write access is enabled by setting the test mode enable MCAN_CCCR[7] TEST bit to 1. The MCAN_TEST register allows the configuration of the test modes and test functions.

The CAN transmit MCAN_TX pin has four output functions. One of those functions can be selected by programming the MCAN_TEST[6:5] TX filed. Additionally to its default function (the serial data output) it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values.

The actual value of the CAN receive MCAN_RX pin can be monitored from MCAN_TEST[7] RX bit. Both functions can be used to check the CAN bus physical layer. Due to the synchronization mechanism between CAN clock (MCAN_FCLK) and Host clock (MCAN_ICLK) domain, there may be a delay of several Host clock periods between writing to the MCAN_TEST[6:5] TX filed until the new configuration is visible at the output MCAN_TX pin. This applies also when reading input MCAN_RX pin via the MCAN_TEST[7] RX bit.

Note

Test modes should be used for self test only. The software control for MCAN_TX pin interferes with all CAN protocol functions. It is not recommended to use test modes for application.

12.4.4.9.1 Internal Loop Back Mode

The MCAN module can be set into Internal Loop Back Mode by programming MCAN_TEST[4] LBCK and MCAN_CCCR[5] MON bits to 1. The Internal Loop Back Mode is used for a 'Hot Selftest'. The 'Hot Selftest' allows the MCAN module to be tested without affecting a running CAN system connected to the MCAN_TX and MCAN_RX pins. In this mode MCAN_RX pin is disconnected from the MCAN module and MCAN_TX pin is held recessive. Figure 12-7 shows the connection of the MCAN_TX and MCAN_RX pins to the MCAN module in case of Internal Loop Back Mode.

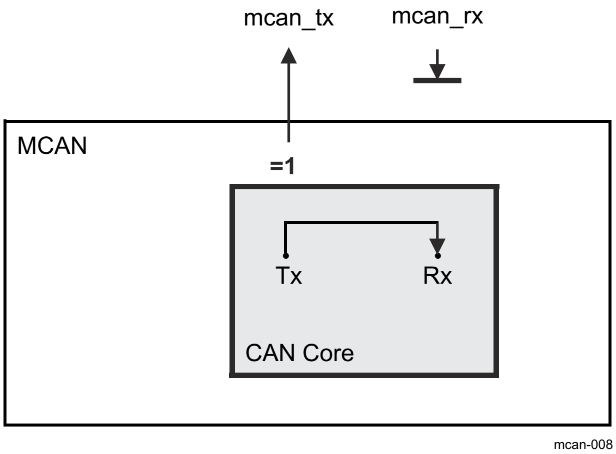

Figure 12-7. Internal Loop Back Mode

12.4.5 Timestamp Generation

The MCAN module has integrated a 16-bit wrap-around counter for timestamp generation. The timestamp counter prescaler MCAN_TSCC[19:16] TCP field can be configured to clock the counter in multiples of CAN bit times (1-16). The counter is readable via the MCAN_TSCV[15:0] TSC field. A write access to the MCAN_TSCV register resets the counter to zero. When the timestamp counter wraps around the interrupt MCAN_IR[16] TSW flag is set. On start of a frame reception/transmission the counter value is captured and stored into the timestamp section of an Rx Buffer/Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element. For more information, see Section 12.4.11, *Message RAM*.

12.4.5.1 External Timestamp Counter

For CAN FD operation mode the MCAN core requires an External Timestamp Counter. An externally generated 16-bit vector may substitute the integrated 16-bit CAN bit time counter (internal timestamp counter) for receive and transmit timestamp generation. An external 16-bit timestamp counter can be used by programming the MCAN_TSCC[1:0] TSS field.

The External Timestamp Counter uses the interface clock (MCAN_ICLK) as a reference clock. The MCAN Core accepts a 16-bit timestamp. A 24-bit prescaler provides a programmable resolution for the timestamp (see MCANSS_EXT_TS_PRESCALER[23:0] PRESCALER field). When disabled the counter is reset back to zero. While enabled the counter keeps incrementing. When the timestamp rolls over the MCAN_IRQ_TS interrupt is generated. The MCAN module provides both pulse and level interrupt type for this interrupt.

When the timestamp rolls over the MCANSS_IRS register is set (see Figure 12-8). The MCANSS_IE register can be affected by writing to the MCAN_IESS register to set or to the MCANSS_IECS register to clear. The level interrupt is a reflection of both MCANSS_IRS and MCANSS_IE being set. The MCANSS_IES register reflects the level interrupt. When an rollover event occurs the interrupt counter is incremented. Writing to the MCANSS_ICS register to clear the MCANSS_IRS register will also decrement the interrupt counter. Writing to the MCANSS_EOI register will issue another pulse if the interrupt counter is not zero.

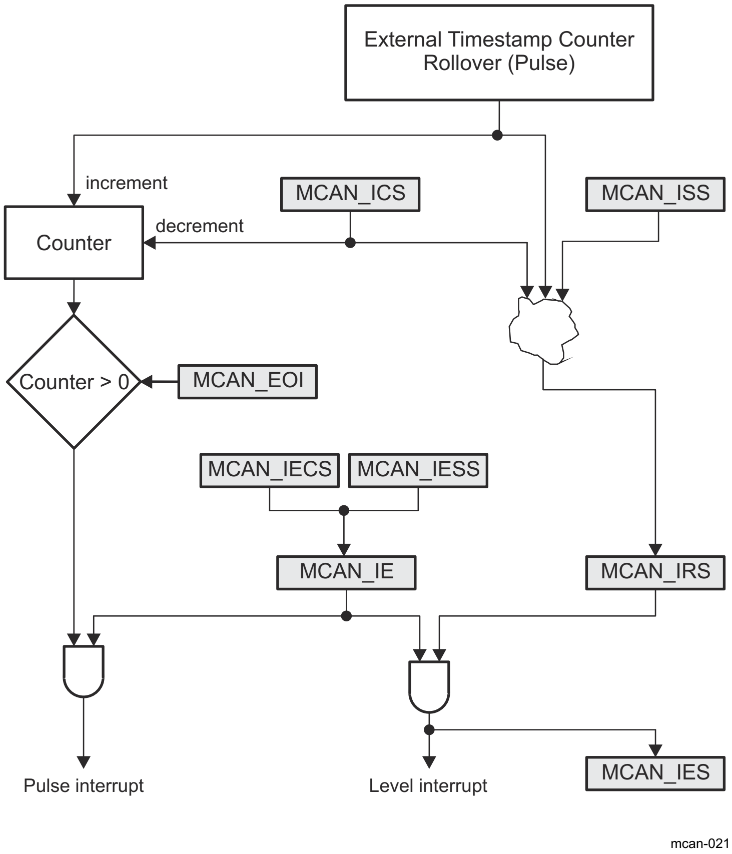

Figure 12-8. External Timestamp Counter Interrupt

12.4.6 Timeout Counter

The MCAN module has integrated a 16-bit Timeout Counter. It is used to signal timeout conditions for the Rx FIFO 0, Rx FIFO 1, and Tx Event FIFO Message RAM elements. The Timeout Counter is configured via the MCAN_TOCC register. It is enabled via the MCAN_TOCC[0] ETOC bit. The Timeout Counter operates as down-counter and uses the same prescaler programmed by the MCAN_TSCC[19:16] TCP field as the Timestamp Counter. The actual counter value can be monitored from the MCAN_TOCV[15:0] TOC field. The Timeout Counter can be started only when MCAN_CCCR[1] INIT = 0 and stopped when MCAN_CCCR[1] INIT = 1 (example: when the MCAN enters Bus_Off state). The operation mode is selected by the MCAN_TOCC[2:1] TOS field. When Continuous Mode is selected, the counter starts when MCAN_CCCR[1] INIT = 0, a write to the MCAN_TOCV register presets the counter to the value configured by the MCAN_TOCC[31:16] TOP field and continues down-counting.

In case the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by the MCAN_TOCC[31:16] TOP field. Down-counting is started when the first FIFO element is stored. Writing to the MCAN_TOCV register has no effect. When the counter reaches zero, the interrupt MCAN_IR[18] TOO flag is set.

In Continuous Mode, the counter is immediately restarted at the value configured by the MCAN_TOCC[31:16] TOP field.

12.4.7 Safety

The Message Memory is wrapped in an ECC wrapper provididing SECDED parity functionalilty. The ECC wrapper is controlled by an ECC Aggregator.

12.4.7.1 ECC Wrapper

The ECC wrapper provides Single Error Correction (SEC) and Double Error Detection (DED) parity to the Message Memory content. It has side band signals for error notification. The ECC Wrapper implements an error injection test mode.

The error correction is done using a lazy write back. When an error is detected, it is noted in a FIFO Queue which waits for an access gap to write the data back and refresh the memory. If a transaction writes new data to the compromised entry before the lazy write back completes, the write back is discarded.

12.4.7.2 ECC Aggregator

This section describes the functional details of the ECC Aggregator module.

12.4.7.2.1 ECC Aggregator Overview

The ECC Aggregator module supports the following general features:

- Provides a mechanism to control and monitor the ECC RAM in the MCAN module.
- Provides software access to all the ECC related registers.
- Supports software readable status of ECC single/double-bit errors and associated info such as RAM address and data bit(s) that are in error.
- Aggregates level pending status from the ECC RAM into a single interrupt to the Host CPU.

The following feature is not supported:

- Statistics such as tracking the number of single and double-bit errors. If needed, these operations can be handled by software.

12.4.7.2.2 ECC Aggregator Registers

There are 3 groups of registers in the ECC aggregator module:

- Global registers - Aggregator Revision Register (MCANSS_ECC_AGGR_REVISION), ECC Vector Register (MCANSS_ECC_VECTOR), Misc Status Register (MCANSS_ECC_MISC_STATUS), ECC Control Register (MCANSS_ECC_CONTROL), and ECC Wrapper Revision Register (MCANSS_ECC_WRAP_REVISION).
- Control and status registers - ECC Error Control Registers (MCANSS_ECC_ERR_CTRL1 and MCANSS_ECC_ERR_CTRL2) and ECC Error Status Registers (MCANSS_ECC_ERR_STAT1 and MCANSS_ECC_ERR_STAT2).
- Interrupt registers - interrupt status, interrupt enable set, interrupt enable clear and EOI (End Of Interrupt) registers that are part of a standard interrupt module. For more information, see the following registers:
  - MCANSS_ECC_SEC_EOI_REG

  - MCANSS_ECC_SEC_STATUS_REG0
  - MCANSS_ECC_SEC_ENABLE_SET_REG0
  - MCANSS_ECC_SEC_ENABLE_CLR_REG0
  - MCANSS_ECC_DED_EOI_REG
  - MCANSS_ECC_DED_STATUS_REG0
  - MCANSS_ECC_DED_ENABLE_SET_REG0
  - MCANSS_ECC_DED_ENABLE_CLR_REG0

12.4.7.2.3 Reads to ECC Control and Status Registers

The reads to the ECC control and status registers are triggered by writing a 'read message' to the ECC Vector Register as described below:

- Software writes value (the ECC RAM ID) to the MCANSS_ECC_VECTOR[10-0] ECC_VECTOR field to select the ECC RAM for control or status.
- Software writes 1 to the MCANSS_ECC_VECTOR[15] RD_SVBUS bit to trigger a read.
- Software writes read address to the MCANSS_ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field.
- Software then polls the MCANSS_ECC_VECTOR[24] RD_SVBUS_DONE bit to check if it is 1. This bit indicates that the read operation has completed.
- Software reads the data from the ECC control or status register. The following clock cycle (MCAN_ICLK) returns the read data.

12.4.7.2.4 ECC Interrupts

The ECC aggregator module aggregates the level pending status from the ECC RAM into a single EOI-handshake based interrupt to the Host CPU. Software is expected to follow the sequence described below:

- Software enables the interrupts for the ECC RAM by writing to the MCANSS_ECC_SEC_ENABLE_SET_REG0/MCANSS_ECC_DED_ENABLE_SET_REG0 register.
- Software writes the ECC RAM ID in the MCANSS_ECC_VECTOR[10-0] ECC_VECTOR.
- Software writes the MCANSS_ECC_VECTOR[15] RD_SVBUS bit to trigger the read.
- Software writes the MCANSS_ECC_ERR_STAT1 register address to the MCANSS_ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field. Software will need to load the 'read message' in the MCANSS_ECC_VECTOR register again if it needs to read the MCANSS_ECC_ERR_STAT2 register.
- Software polls the MCANSS_ECC_VECTOR[24] RD_SVBUS_DONE bit. When this bit is set, a read of the MCANSS_ECC_ERR_STAT1/MCANSS_ECC_ERR_STAT2 register is performed.
- After the interrupt has been serviced, software will clear the interrupt status by writing to the MCANSS_ECC_ERR_STAT1[8] CLR_ECC_SEC or MCANSS_ECC_ERR_STAT1[9] CLR_ECC_DED bit depending on the type of the ECC error.
- Software has to poll the MCANSS_ECC_ERR_STAT1 register to guarantee that the status bit has been cleared.
- Software will write to the MCANSS_ECC_SEC_EOI_REG/MCANSS_ECC_DED_EOI_REG register to clear the interrupt.
- After clearing the ECC interrupt source, the application software must also write 1 to the MCANSS_ECC_EOI[8] ECC_EOI bit.

12.4.8 Rx Handling

The Rx Handler controls the following operations:

- Acceptance filtering
- The transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs (Rx FIFO 0 or Rx FIFO 1)
- Rx FIFO Put and Get Index operations

12.4.8.1 Acceptance Filtering

The MCAN module is capable to configure two sets of acceptance filters - one set for standard and one set for extended identifiers. These filters can be assigned to an Rx Buffer or to one of the two Rx FIFOs.

The main features of the filter elements are:

- Each filter element can be configured as:
  - Range Filter (from - to)
  - Filter for specific IDs (for one or two dedicated IDs)
  - Classic Bit Mask Filter
- Each filter element can be enabled/disabled individually
- Each filter element can be configured for acceptance or rejection filtering
- Filters are checked sequentially and execution (acceptance filtering procedure) stops at the first matching filter element or when the end of the filter list is reached

Related configuration registers are:

- Global Filter Configuration (MCAN_GFC) register
- Standard ID Filter Configuration (MCAN_SIDFC) register
- Extended ID Filter Configuration (MCAN_XIDFC) register
- Extended ID AND Mask (MCAN_XIDAM) register

Depending on the configuration of the filter element (see SFEC/EFEC in Section 12.4.11, *Message RAM*) if filter matches, one of the following actions is performed:

- Received frame is stored in FIFO 0 or FIFO 1
- Received frame is stored in Rx Buffer
- Received frame is stored in Rx Buffer and generation of pulse at filter event pin is performed. This is high level single MCAN_ICLK pulse. For more information, see Section 12.4.2.1, *DMA Requests*.
- Received frame is rejected
- Set High Priority Message interrupt flag MCAN_IR[8] HPM
- Set High Priority Message interrupt flag MCAN_IR[8] HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering starts when complete Message ID is received. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If a filter element matches - the Rx Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If an error condition occurs (for example: CRC error), this message is rejected with the following impact on the affected Rx Buffer or Rx FIFO:

- Rx Buffer:
  New Data flag (MCAN_NDAT1/MCAN_NDAT2) of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data (for error type see MCAN_PSR[2:0] LEC respectively MCAN_PSR[10:8] DLEC fields).
- Rx FIFO:
  Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data (for error type see MCAN_PSR[2:0] LEC respectively MCAN_PSR[10:8] DLEC fields). If matching Rx FIFO is configured to operate in overwrite mode, the boundary conditions described in Section 12.4.8.2.2 have to be considered.

12.4.8.1.1 Range Filter

Each filter element can be configured to operate as Range Filter (Standard Filter Type SFT = 00/Extended Filter Type EFT = 00). The filter matches for all received message frames with IDs in the range from SFID1 to SFID2 (SFID2 ≥ SFID1) respectively in the range from EFID1 to EFID2 (EFID2 ≥ EFID1). For more information see Section 12.4.11.5, *Standard Message ID Filter Element* and Section 12.4.11.6, *Extended Message ID Filter Element*.

There are two options for range filtering of extended frames:

- Extended Filter Type EFT = 00: The Extended ID AND Mask (MCAN_XIDAM) is used for Range Filtering. The Message ID of received frames is ANDed with the Extended ID AND Mask (MCAN_XIDAM) before the range filter is applied.
- Extended Filter Type EFT = 11: The Extended ID AND Mask (MCAN_XIDAM) is not used for Range Filtering.

12.4.8.1.2 Filter for specific IDs

Each filter element can be configured to filter one or two dedicated Message IDs (Standard Filter Type SFT =01/Extended Filter Type EFT =01). To filter only one specific Message ID, the filter element has to be configured with SFID1 = SFID2 respectively EFID1 = EFID2. For more information see Section 12.4.11.5, *Standard Message ID Filter Element* and Section 12.4.11.6, *Extended Message ID Filter Element*.

12.4.8.1.3 Classic Bit Mask Filter

Classic bit mask filtering can filter groups of Message IDs (Standard Filter Type SFT =10/Extended Filter Type EFT =10). This is done by masking single bits of a received Message ID. In this case SFID1/EFID1 element is used as Message ID filter, while SFID2/EFID2 element is used as filter mask.

A 0 bit at the filter mask (SFID2/EFID2) will mask out the corresponding bit position of the configured Message ID filter (SFID1/EFID1) and the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are 1 are relevant for acceptance filtering.

There are two interesting cases:

- All mask bits are 1: a match occurs only when the received Message ID and the configured Message ID filter are identical.
- All mask bits are 0: all Message IDs match.

12.4.8.1.4 Standard Message ID Filtering

The standard Message ID (11-bit ID) filtering flow is shown in Figure 12-9. Section 12.4.11.5, *Standard Message ID Filter Element* describes the standard Message ID filter element.

The Remote Transmission Request (RTR) and Extended Identifier (XTD) bits of the received frames are compared against the list of configured filter elements. This is controlled by the following registers:

- Global Filter Configuration (MCAN_GFC) register
- Standard ID Filter Configuration (MCAN_SIDFC) register

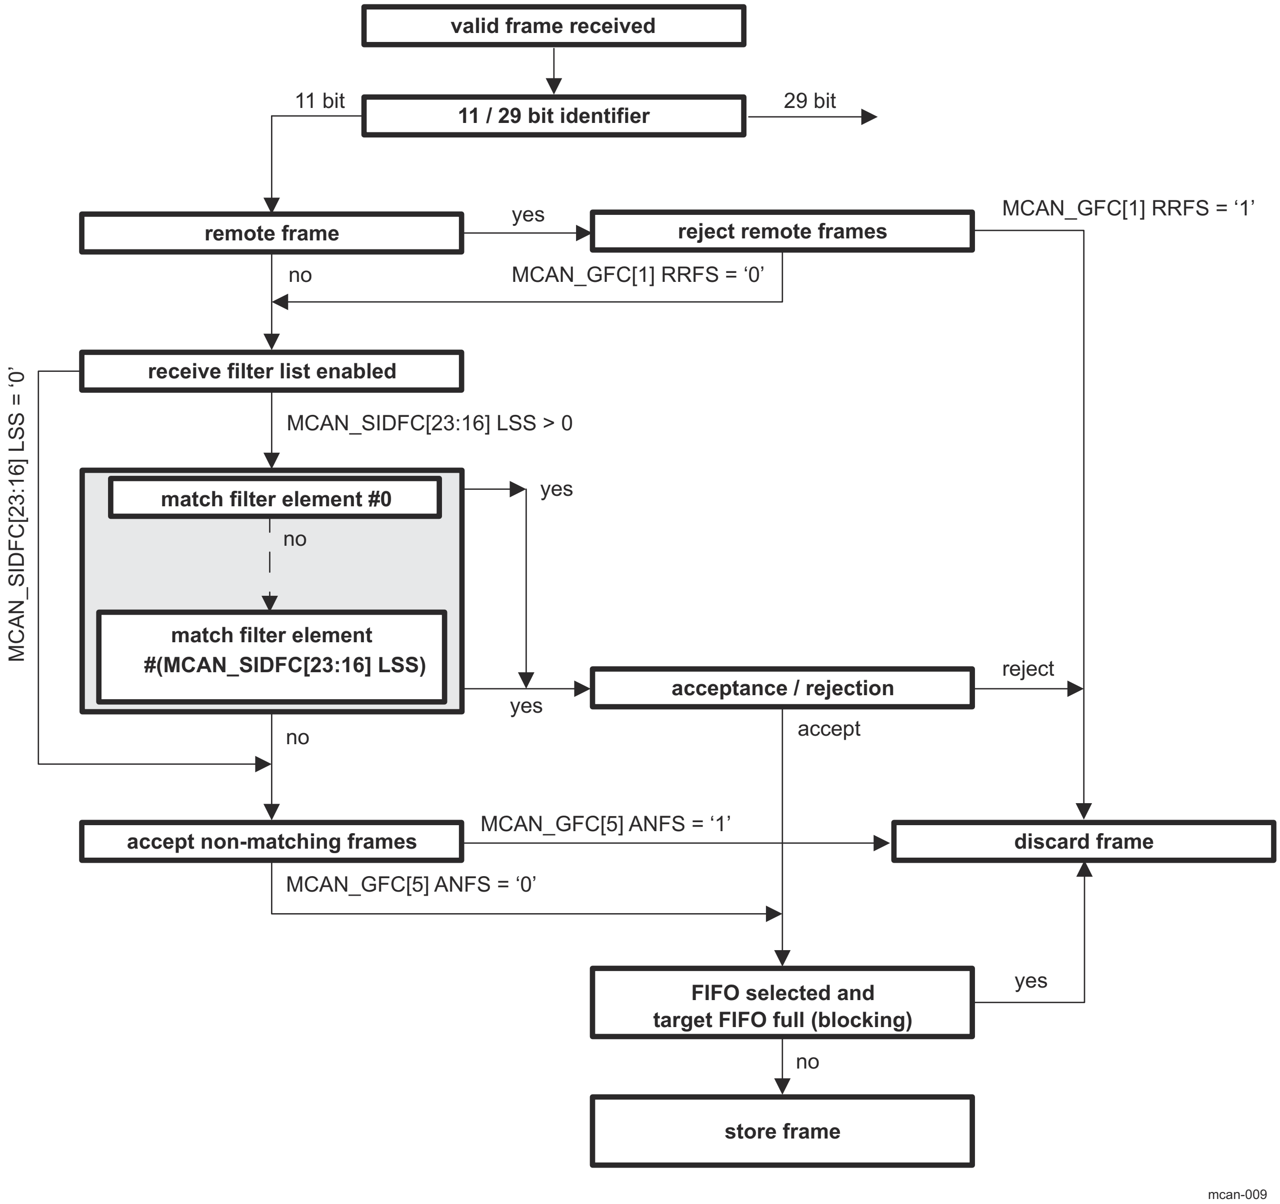

Figure 12-9. Standard Message ID Filter Path

12.4.8.1.5 Extended Message ID Filtering

The extended Message ID (29-bit ID) filtering flow is shown in Figure 12-10. Section 12.4.11.6, *Extended Message ID Filter Element* describes the extended Message ID filter element.

The Remote Transmission Request (RTR) and Extended Identifier (XTD) bits of the received frames are compared against the list of configured filter elements. This is controlled by the following registers:

- Global Filter Configuration (MCAN_GFC) register
- Extended ID Filter Configuration (MCAN_XIDFC) register

Note that before the filter list is executed the received identifier is ANDed with the Extended ID AND Mask (MCAN_XIDAM).

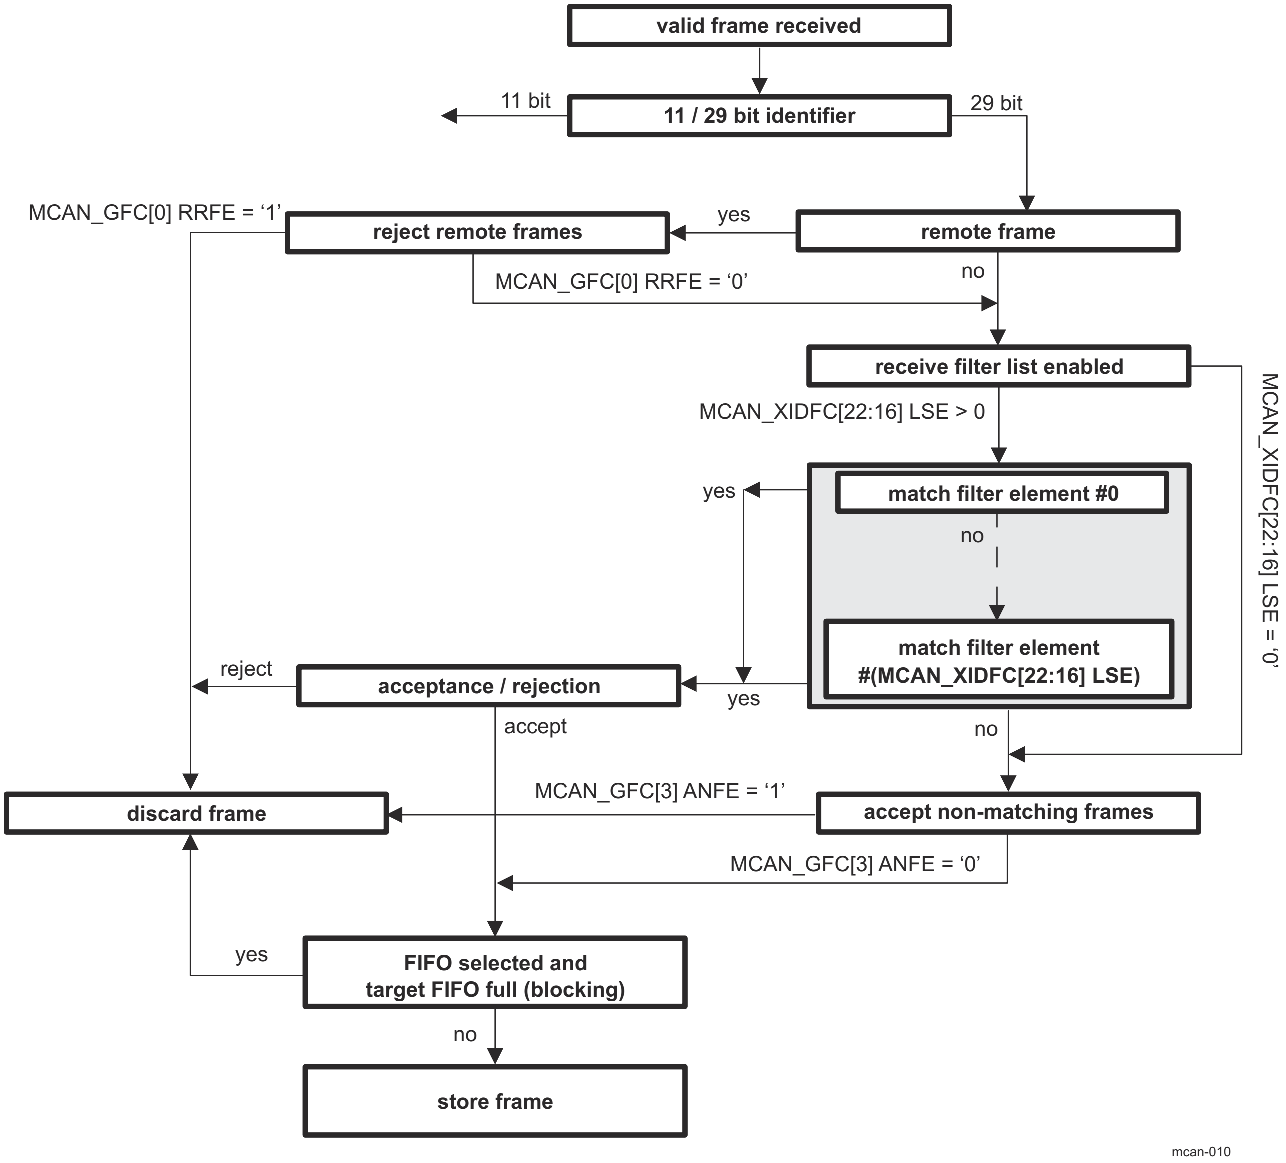

Figure 12-10. Extended Message ID Filter Path

12.4.8.2 Rx FIFOs

The configuration of the Rx FIFOs (Rx FIFO 0 and Rx FIFO 1) can be done via the MCAN_RXF0C and MCAN_RXF1C registers. Each Rx FIFO can be configured to store up to 64 received messages.

After acceptance filtering the received messages that passed are transferred to the Rx FIFO. The filter mechanisms available for the Rx FIFO 0 and Rx FIFO 1 is described in Section 12.4.8.1, *Acceptance Filtering*. Section 12.4.11.2, *Rx Buffer and FIFO Element* describes the Rx FIFO element.

The Rx FIFO watermark can be used to prevent an Rx FIFO overflow. If the Rx FIFO fill level reaches the Rx FIFO watermark configured by the MCAN_RXFnC[30:24] FnWM filed (where: n = 0 or 1) an interrupt flag MCAN_IR[1] RF0W/MCAN_IR[5] RF1W is set.

When the Rx FIFO Put Index reaches the Rx FIFO Get Index (MCAN_RXFnS[21:16] FnPI = MCAN_RXFnS[13:8] FnGI) an Rx FIFO Full condition is signalled by the MCAN_RXFnS[24] FnF status bit and interrupt flag MCAN_IR[2] RF0F/MCAN_IR[6] RF1F is set. Figure 12-11 shows Rx FIFO Status. The FIFOs fill level is presented in the MCAN_RXFnS[6:0] FnFL field (the number of elements stored in Rx FIFO).

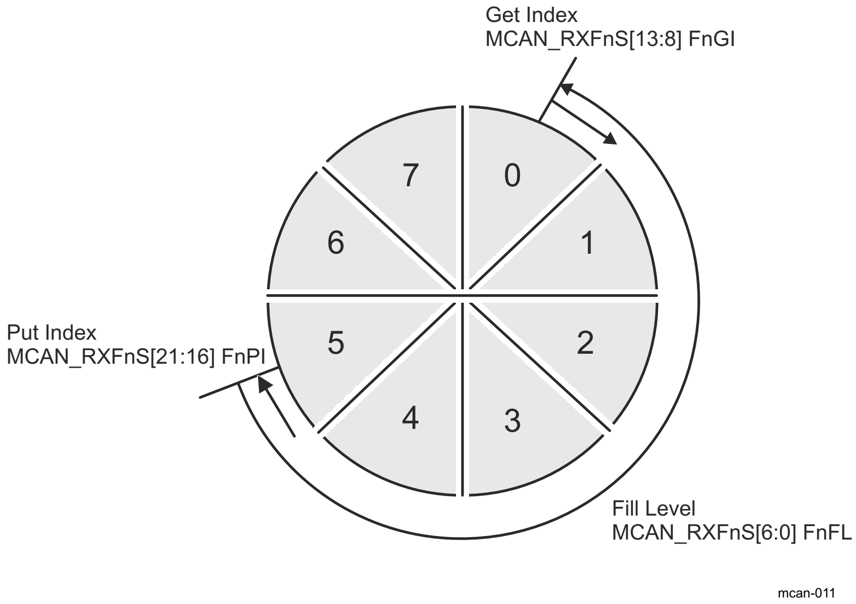

Figure 12-11. Rx FIFO Status

Rx FIFOs start address in the Message RAM (MCAN_RXFnC[15:2]FnSA field) have to be configured when reading from an Rx FIFO (Rx FIFO Get Index - MCAN_RXFnS[13:8] FnGI). Table 12-6 presents Rx Buffer/Rx FIFO Element Size for different Rx Buffer / Rx FIFO Data Field Size which is configured via the MCAN_RXESC register.

Table 12-6. Rx Buffer/Rx FIFO Element Size

MCAN_RXESC[10:8] RBDS MCAN_RXESC[2:0] F0DS/ MCAN_RXESC[6:4] F1DS	Data Field [bytes]	FIFO Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

12.4.8.2.1 Rx FIFO Blocking Mode

The Rx FIFO blocking mode is the default operation mode for the Rx FIFOs. It is configured by the MCAN_RXFnC[31] FnOM = 0.

If an Rx FIFO full condition is reached (MCAN_RXFnS[21:16] FnPI = MCAN_RXFnS[13:8] FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by the MCAN_RXFnS[24] FnF = 1 and interrupt flag MCAN_IR[2] RF0F/MCAN_IR[6] RF1F is set.

In case a message is received while the corresponding Rx FIFO is full, this message is rejected and the message lost condition is signalled by MCAN_RXFnS[25] RFnL = 1 and interrupt flag MCAN_IR[3] RFnL/ MCAN_IR[25] RFnL is set.

12.4.8.2.2 Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by the MCAN_RXFnC[31] FnOM = 1. When an Rx FIFO full condition is reached (MCAN_RXFnS[21:16] FnPI = MCAN_RXFnS[13:8] FnGI) signalled by MCAN_RXFnS[24] FnF = 1, the next accepted message for the FIFO will overwrite the oldest FIFO message. Put index/Get index are both incremented by one.

In overwrite mode if an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (Put index) while the Host CPU is reading from the Message RAM (Get index). In this case inconsistent data may be read from the respective Rx FIFO element. The problem is solved by adding an offset to the Get index when reading from the Rx FIFO. The offset depends on how fast the Host CPU accesses the Rx FIFO. Figure 12-12 shows an offset of two with respect to the Get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

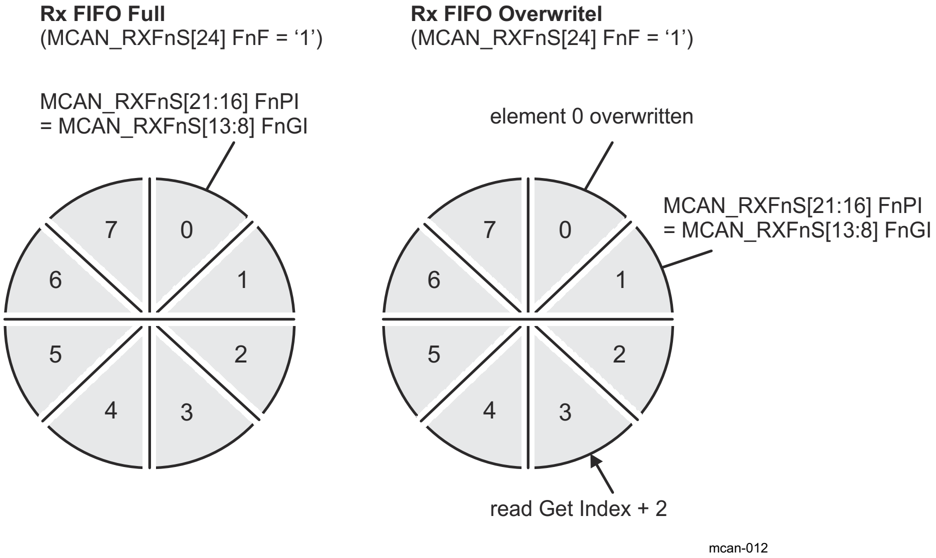

Figure 12-12. Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index MCAN_RXFnA[5:0] FnAI. This increments the get index to that element number. In case the Put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (MCAN_RXFnS[24] FnF = 0).

12.4.8.3 Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the Rx Buffers section in the Message RAM is configured via MCAN_RXBC[15:2] RBSA field. To store in an Rx Buffer a Standard or Extended Message ID Filter Element with SFEC/EFEC = 111 and SFID2/EFID2[10:9] = 00 has to be configured (see Section 12.4.11.5, *Standard Message ID Filter Element* and Section 12.4.11.6, *Extended Message ID Filter Element*).

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element (the format is the same as for an Rx FIFO element). In addition the flag MCAN_IR[19] DRX (Message stored in Dedicated Rx Buffer) is set.

Table 12-7 shows Example Filter Configuration for Rx Buffers.

Table 12-7. Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	00	00 0000

Table 12-7. Example Filter Configuration for Rx Buffers (continued)

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
1	ID message 2	00	00 0001
2	ID message 3	00	00 0010

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register MCAN_NDAT1/MCAN_NDAT2 is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the Host CPU by writing a 1 to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

12.4.8.3.1 Rx Buffer Handling

Rx Buffer Handling include the following steps:

- Reset interrupt flag MCAN_IR[19] DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

12.4.9 Tx Handling

The Tx Handler is used to handle the Tx requests. It controls the transfer of transmit messages from the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue to the CAN Core, the Tx Event FIFO, and the Put and Get Index operations. The MCAN module supports up to 32 Tx Buffers. These Tx Buffers can be configured as dedicated Tx Buffers, Tx FIFO, or Tx Queue and as combination of dedicated Tx Buffers/Tx FIFO or dedicated Tx Buffers/Tx Queue. For each Tx Buffer element Classical CAN or CAN FD transmission mode can be configured. Section 12.4.11.3 describes the Tx Buffer Element. Table 12-8 shows the possible configurations for message transmission.

Table 12-8. Possible Configurations for Message Transmission

MCAN_CCCR		Tx Buffer Element		Frame Transmission
MCAN_CCCR[9] BRSE	MCAN_CCCR[8] FDOE	FDF	BRS	
ignored	0	ignored	ignored	Classic CAN
0	1	0	ignored	Classic CAN
0	1	1	ignored	CAN FD without bit rate switching
1	1	0	ignored	Classic CAN
1	1	1	0	CAN FD without bit rate switching
1	1	1	1	CAN FD with bit rate switching

When the Tx Buffer Request Pending MCAN_TXBRP register is updated, or when a transmission has been started the Tx Handler starts scanning to check for the highest priority pending Tx request. The Tx Buffer with lowest Message ID has highest priority.

Note

AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

12.4.9.1 Transmit Pause

The transmit pause feature is intended for use in CAN networks where the CAN Message IDs are specific and cannot easily be changed. These Message IDs may have a higher priority than other defined Message IDs, while in a specific application their relative priority should be inverse. This allows for a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed (paused).

The transmit pause feature is enabled by the MCAN_CCCR[14] TXP bit. By default this bit is disabled (MCAN_CCCR[14] TXP = 0). Each time after successfully transmitted message, a pause for two CAN bit times occurs before the start of the next transmission. This allows the other CAN nodes in the network to transmit messages even if their Message IDs have lower priority.

12.4.9.2 Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the Host CPU.

There are two options:

- Each dedicated Tx Buffer is configured with a specific Message ID.
- Two or more dedicated Tx Buffers are configured with the same Message ID. In this case the Tx Buffer with the lowest buffer number is transmitted first.

After the data section has been updated, a transmission is requested by an Add Request. This is done via the MCAN_TXBAR[x]ARn bit (where x = 0 - 31). The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

Table 12-9 shows Tx Buffer/Tx FIFO/Tx Queue Element Size. A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM. The start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index from 0 to 31 (MCAN_TXFQS[20:16] TFQPI) × Element Size to the Tx Buffer Start Address MCAN_TXBC[15:2] TBSA field.

Table 12-9. Tx Buffer/Tx FIFO/Tx Queue Element Size

MCAN_TXESC[2:0] TBDS	Data Field [bytes]	Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

12.4.9.3 Tx FIFO

Tx FIFO mode is configured by setting bit MCAN_TXBC[30] TFQM = 0. The stored in the Tx FIFO messages are transmitted starting with the message referenced by the Get Index MCAN_TXFQS[12:8] TFGI field. After each transmission the Get Index is incremented until the Tx FIFO is empty. The Tx FIFO Free Level MCAN_TXFQS[5:0] TFFL field indicates the number of the available free Tx FIFO elements. The Tx FIFO allows transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN_TXFQS[20:16] TFQPI field. After each Add Request (MCAN_TXBAR[x] ARn = 1) the Put Index is incemented to the next free Tx FIFO element. When the Put Index reaches the Get Index (MCAN_TXFQS[20:16] TFQPI = MCAN_TXFQS[12:8] TFGI), Tx FIFO Full condition is signalled by bit MCAN_TXFQS[21] TFQF = 1. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level MCAN_TXFQS[5:0] TFFL field.

In case a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level MCAN_TXFQS[5:0] TFFL field is recalculated. In case transmission cancellation is applied to any other Tx Buffer - the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see Table 12-9). The start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS[20:16] TFQPI (from 0 to 31) × Element Size to the Tx Buffer Start Address MCAN_TXBC[15:2] TBSA field.

12.4.9.4 Tx Queue

Tx Queue mode is configured by setting bit MCAN_TXBC[30] TFQM = 1. The stored in the Tx Queue messages are transmitted starting with the highest priority message (lowest Message ID). In case two or more Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN_TXFQS[20:16] TFQPI field. Each Add Request cyclically increments the Put Index to the next free Tx Buffer. In case of Tx Queue Full condition (MCAN_TXFQS[21] TFQF = 1), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use the MCAN_TXBRP register instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see Table 12-9). The start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS[20:16] TFQPI (from 0 to 31) × Element Size to the Tx Buffer Start Address MCAN_TXBC[15:2] TBSA field.

12.4.9.5 Mixed Dedicated Tx Buffers/Tx FIFO

For this combination the Tx Buffers section in the Message RAM is separated in two parts:

- Dedicated Tx Buffers: the number of Dedicated Tx Buffers is configured by the MCAN_TXBC[21:16] NDTB field
- Tx FIFO: the number of Tx Buffers assigned to the Tx FIFO is configured by the MCAN_TXBC[29:24] TFQS field

If the MCAN_TXBC[29:24] TFQS field is empty (zero) - only Dedicated Tx Buffers are used.

Tx prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by the MCAN_TXFQS[12:8] TFGI field)
- Buffer with lowest Message ID gets highest priority and is transmitted next

Figure 12-13 shows Mixed Dedicated Tx Buffers/Tx FIFO example.

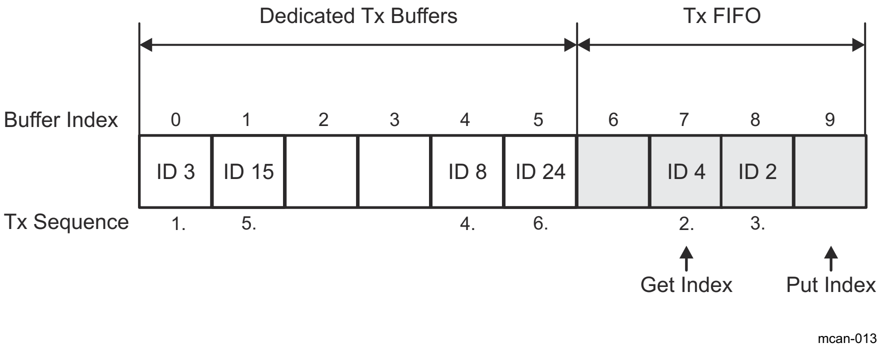

Figure 12-13. Mixed Dedicated Tx Buffers /Tx FIFO (example)

12.4.9.6 Mixed Dedicated Tx Buffers/Tx Queue

For this combination the Tx Buffers section in the Message RAM is separated in two parts:

- Dedicated Tx Buffers: the number of Dedicated Tx Buffers is configured by the MCAN_TXBC[21:16] NDTB field
- Tx Queue: the number of Tx Buffers assigned to the Tx Queue is configured by the MCAN_TXBC[29:24] TFQS field

If MCAN_TXBC[29:24] TFQS field is empty (zero) - only Dedicated Tx Buffers are used.

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

Figure 12-14 shows Mixed Dedicated Tx Buffers/Tx Queue example.

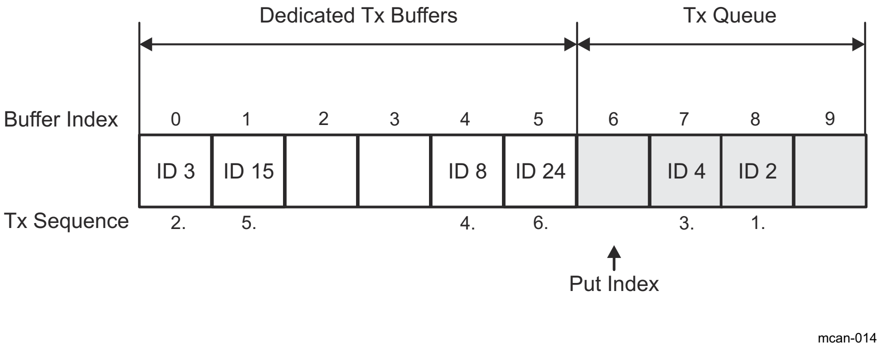

Figure 12-14. Mixed Dedicated Tx Buffers /Tx Queue (example)

12.4.9.7 Transmit Cancellation

This feature is especially intended for gateway and AUTOSAR based applications. The Host CPU can cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer by setting bit MCAN_TXBCR[n] CRn = 1 (where n = 0 - 31). The corresponding bit position n is equivalent to the number of the Tx Buffer.

Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of the MCAN_TXBCF register (MCAN_TXBCF[n] CFn = 1).

If transmission from a Tx Buffer is already ongoing and a transmit cancellation is requested, the corresponding MCAN_TXBRP[n] TRPn bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN_TXBTO[n] TOn and MCAN_TXBCF[n] CFn bits are set. If the transmission was not successful, only the corresponding bit MCAN_TXBCF[n] CFn = 1.

Note

If pending transmission is cancelled immediately before this transmission could have been started, a short time window occurs where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

12.4.9.8 Tx Event Handling

To support Tx Event Handling the Message RAM has implemented a Tx Event FIFO section. Up to 32 Tx Event FIFO elements can be configured. Section 12.4.11.4 describes the Tx Event FIFO element. After message transmission on the CAN bus, Message ID and Timestamp are stored in a Tx Event FIFO element. To link a Tx Event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

A Tx Event FIFO full condition is signalled by the MCAN_IR[14] TEFF bit. In this case no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented (MCAN_TXEFS[12:8] EFGI). In case a Tx Event occurs while the Tx Event FIFO is full, this event is rejected and interrupt flag MCAN_IR[15] TEFL bit is set.

The Tx Event FIFO watermark can be configured to avoid a Tx Event FIFO overflow. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by the MCAN_TXEFC[29:24] EFWM field, interrupt flag MCAN_IR[13] TEFW is set. When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN_TXEFS[12:8] EFGI field has to be added to the Tx Event FIFO start address MCAN_TXEFC[15:2] EFSA field.

12.4.10 FIFO Acknowledge Handling

The Get Indices of the two Rx FIFOs (Rx FIFO 0 or Rx FIFO 1) and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index (see MCAN_RXF0A, MCAN_RXF1A, and MCAN_TXEFA). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level.

There are two use cases:

- A single element has been read from the FIFO: the Get Index value is written to the FIFO Acknowledge Index.
- A sequence of elements has been read from the FIFO: the Get Index value (Index of the last element read) is written to the FIFO Acknowledge Index at the end of that read sequence.

The Host CPU has free access to the Message RAM. The special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This can be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also changes the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

Note

The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN module does not check for erroneous values.

12.4.11 Message RAM

The MCAN module has implemented Message RAM. The main purpose of the Message RAM is to store:

- Receive Messages
- Transmit Messages
- Tx Event Elements
- Message ID Filter Elements

12.4.11.1 Message RAM Configuration

The MCAN module is configured to allocate 4352 words in the Message RAM. The Message RAM has a width of 32 bits.

Refer :Section 2.1 for the address range of the Message RAM.

The Message RAM is capable to include each of the sections listed in Figure 12-15. It is not necessary to configure each of the sections (a section in the Message RAM may be 0) and there is not restriction with respect to the sequence of the sections. For parity checking or ECC a respective number of bits has to be added to each word.

When the MCAN module addresses the Message RAM it addresses 32-bit words. The start addresses are configurable and they are 32-bit word addresses.

The element size can be configured for

- Rx FIFO 0 via the MCAN_RXESC[2:0] F0DS field
- Rx FIFO 1 via the MCAN_RXESC[6:4] F1DS field
- Rx Buffers via the MCAN_RXESC[10:8] RBDS field
- Tx Buffers via the MCAN_TXESC[2:0] TBDS field

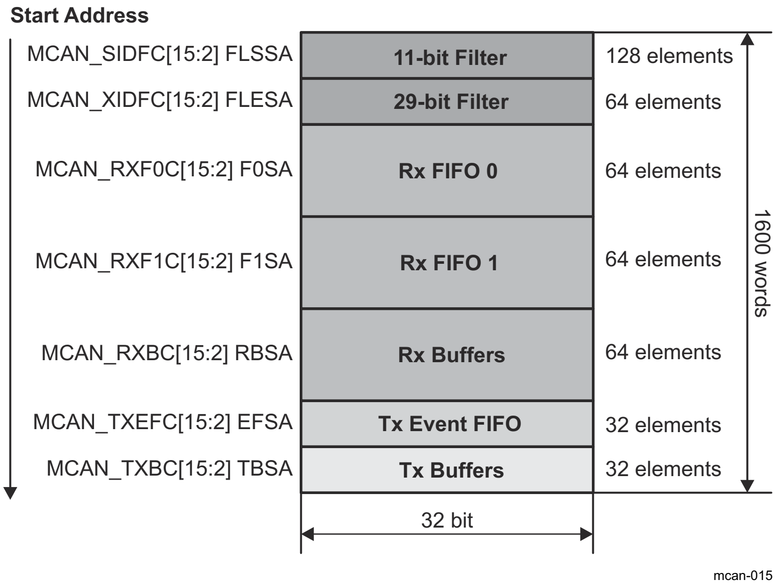

Figure 12-15. Message RAM Configuration

The Host CPU configures the following information in the Message RAM:

- Start addresses of the memory sections
- Number of elements in each section
- The size of the elements in some sections

Note

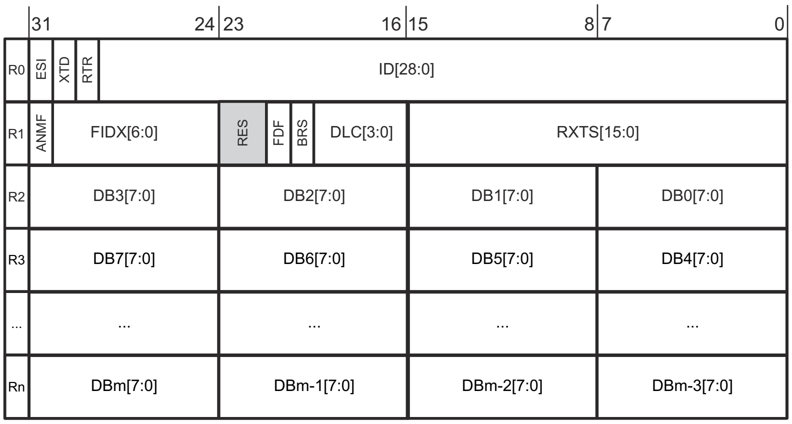
Above image is meant to allocate memory for 4352 words (max supported).

The MCAN module does not check for errors in the Message RAM configuration. The configuration of the start addresses of the different sections and the number of elements of each section has to be done carefully. This will prevent falsification or loss of data.

12.4.11.2 Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via the MCAN_RXESC register.

Figure 12-16 shows Rx Buffer/Rx FIFO element structure.



mcan-016

Figure 12-16. Rx Buffer/Rx FIFO Element Structure

Table 12-10 shows Rx Buffer/Rx FIFO element field descriptions.

Table 12-10. Rx Buffer/Rx FIFO Element Field Descriptions

Word	Bits	Field Name	Description
R0	31	ESI	Error State Indicator • 0x0: Transmitting node is error active • 0x1: Transmitting node is error passive
	30	XTD	Extended Identifier Signals to the Host CPU whether the received frame has a standard or extended identifier. • 0x0: 11-bit standard identifier • 0x1: 29-bit extended identifier
	29	RTR	Remote Transmission Request Signals to the Host CPU whether the received frame is a data frame or a remote frame. • 0x0: Received frame is a data frame • 0x1: Received frame is a remote frame **Note:** There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDF = 1), RTR bit reflects the state of the reserved r1 bit (RES[23]).
	28:0	ID[28:0]	Identifier Standard or extended identifier depending on XTD bit. A standard identifier is stored into ID[28:18].

Table 12-10. Rx Buffer/Rx FIFO Element Field Descriptions (continued)

Word	Bits	Field Name	Description
R1	31	ANMF	Accepted Non-matching Frame Acceptance of non-matching frames may be enabled via the MCAN_GFC[5:4] ANFS and MCAN_GFC[3:2] ANFE fields. • 0x0: Received frame matching filter index FIDX field • 0x1: Received frame did not match any Rx filter element
	30:24	FIDX[6:0]	Filter Index 0x0-0x7F (0-127): Index of matching Rx acceptance filter element (invalid if ANMF = 1). Range is 0 to MCAN_SIDFC[23:16] LSS - 1 respectively MCAN_XIDFC[22:16] LSE - 1.
	23:22	RES	Reserved
	21	FDF	FD Format • 0x0: Standard frame format • 0x1: CAN FD frame format (new DLC-coding and CRC)
	20	BRS	Bit Rate Switch • 0x0: Frame received without bit rate switching • 0x1: Frame received with bit rate switching
	19:16	DLC[3:0]	Data Length Code • 0x0-0x8 (0-8): CAN + CAN FD: received frame has 0-8 data bytes • 0x9-0xF (9-15): CAN: received frame has 8 data bytes • 0x9-0xF (9-15): CAN FD: received frame has 12/16/20/24/32/48/64 data bytes
	15:0	RXTS[15:0]	Rx Timestamp Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC[19:16] TCP.
R2	31:24	DB3[7:0]	Data Byte 3
	23:16	DB2[7:0]	Data Byte 2
	15:8	DB1[7:0]	Data Byte 1
	7:0	DB0[7:0]	Data Byte 0
R3	31:24	DB7[7:0]	Data Byte 7
	23:16	DB6[7:0]	Data Byte 6
	15:8	DB5[7:0]	Data Byte 5
	7:0	DB4[7:0]	Data Byte 4
...	...	...	...
Rn	31:24	DBm[7:0]	Data Byte m
	23:16	DBm-1[7:0]	Data Byte m-1
	15:8	DBm-2[7:0]	Data Byte m-2
	7:0	DBm-3[7:0]	Data Byte m-3

Note: Depending on the configuration of the element size (MCAN_RXESC), between two and sixteen 32-bit words (Rn = 3-17) are used for storage of a CAN message's data field.

12.4.11.3 Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO/Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO/Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler makes difference between dedicated Tx Buffers and Tx FIFO/Tx Queue via the MCAN_TXBC[29:24] TFQS and MCAN_TXBC[21:16] NDTB fields. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via the MCAN_TXESC register.

Figure 12-17 shows Tx Buffer element structure.

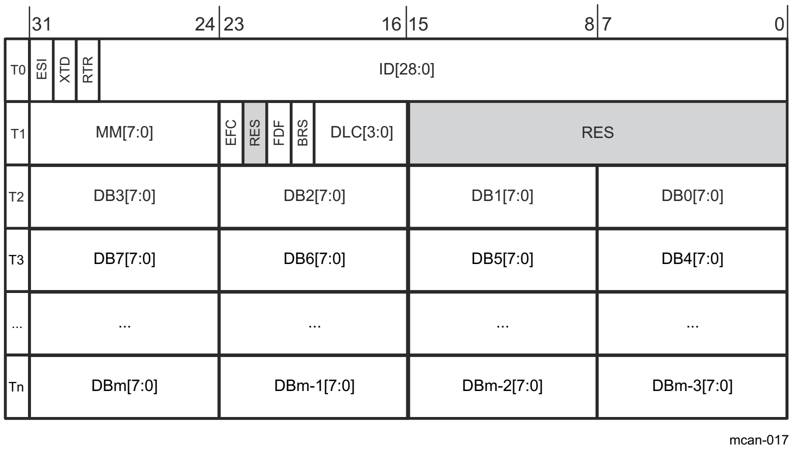


Figure 12-17. Tx Buffer Element Structure

Table 12-11 shows Tx Buffer element field descriptions.

Table 12-11. Tx Buffer Element Field Descriptions

Word	Bits	Field Name	Description
T0	31	ESI	Error State Indicator • 0x0: ESI bit in CAN FD format depends only on error passive flag • 0x1: ESI bit in CAN FD format transmitted recessive **Note:** The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted CAN FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive.
	30	XTD	Extended Identifier • 0x0: 11-bit standard identifier • 0x1: 29-bit extended identifier
	29	RTR	Remote Transmission Request • 0x0: Transmit data frame • 0x1: Transmit remote frame **Note:** When RTR = 1, the MCAN module transmits a remote frame according to ISO11898-1:2015, even if the MCAN_CCCR[8] FDOE bit enables the transmission in CAN FD format.
	28:0	ID[28:0]	Identifier Standard or extended identifier depending on XTD bit. A standard identifier has to be written to ID[28:18].

Table 12-11. Tx Buffer Element Field Descriptions (continued)

Word	Bits	Field Name	Description
T1	31:24	MM[7:0]	Message Marker Written by Host CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status (see also MM[7:0] field in Table 12-12).
	23	EFC	Event FIFO Control • 0x0: Don't store Tx events • 0x1: Store Tx events
	22	RES	Reserved
	21	FDF	FD Format • 0x0: Frame transmitted in Classic CAN format • 0x1: Frame transmitted in CAN FD format
	20	BRS	Bit Rate Switch • 0x0: CAN FD frames transmitted without bit rate switching • 0x1: CAN FD frames transmitted with bit rate switching **Note:** ESI, FDF, and BRS bits are only evaluated when CAN FD operation is enabled vie the MCAN_CCCR[8] FDOE bit. BRS bit is only evaluated when in addition the MCAN_CCCR[9] BRSE = 1.
	19:16	DLC[3:0]	Data Length Code • 0x0-0x8 (0-8): CAN + CAN FD: transmit frame has 0-8 data bytes • 0x9-0xF (9-15): CAN: transmit frame has 8 data bytes • 0x9-0xF (9-15): CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes
	15:0	RES	Reserved
T2	31:24	DB3[7:0]	Data Byte 3
	23:16	DB2[7:0]	Data Byte 2
	15:8	DB1[7:0]	Data Byte 1
	7:0	DB0[7:0]	Data Byte 0
T3	31:24	DB7[7:0]	Data Byte 7
	23:16	DB6[7:0]	Data Byte 6
	15:8	DB5[7:0]	Data Byte 5
	7:0	DB4[7:0]	Data Byte 4
...	...	...	...
Tn	31:24	DBm[7:0]	Data Byte m
	23:16	DBm-1[7:0]	Data Byte m-1
	15:8	DBm-2[7:0]	Data Byte m-2
	7:0	DBm-3[7:0]	Data Byte m-3

Note: Depending on the configuration of the element size (MCAN_TXESC), between two and sixteen 32-bit words (Tn = 3-17) are used for storage of a CAN message's data field.

12.4.11.4 Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the Host CPU gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from the MCAN_TXEFS register.

Figure 12-18 shows Tx Event FIFO element structure.

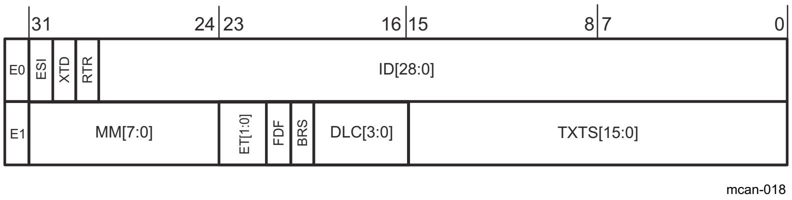

Figure 12-18. Tx Event FIFO Element Structure

Table 12-12 shows Tx Event FIFO element field descriptions.

Table 12-12. Tx Event FIFO Element Field Descriptions

Word	Bits	Field Name	Description
E0	31	ESI	Error State Indicator • 0x0: Transmitting node is error active • 0x1: Transmitting node is error passive
	30	XTD	Extended Identifier • 0x0: 11-bit standard identifier • 0x1: 29-bit extended identifier
	29	RTR	Remote Transmission Request • 0x0: Data frame transmitted • 0x1: Remote frame transmitted
	28:0	ID[28:0]	Identifier Standard or extended identifier depending on XTD bit. A standard identifier has to be written to ID[28:18].

Table 12-12. Tx Event FIFO Element Field Descriptions (continued)

Word	Bits	Field Name	Description
E1	31:24	MM[7:0]	Message Marker Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status (see also MM[7:0] field in Table 12-11).
	23:22	ET[1:0]	Event Type • 0x0: Reserved • 0x1: Tx event • 0x2: Transmission in spite of cancellation (always set for transmissions in DAR mode) • 0x3: Reserved
	21	FDF	FD Format • 0x0: Standard frame format • 0x1: CAN FD frame format (new DLC-coding and CRC)
	20	BRS	Bit Rate Switch • 0x0: Frame transmitted without bit rate switching • 0x1: Frame transmitted with bit rate switching
	19:16	DLC[3:0]	Data Length Code • 0x0-0x8 (0-8): CAN + CAN FD: frame with 0-8 data bytes transmitted • 0x9-0xF (9-15): CAN: frame with 8 data bytes transmitted • 0x9-0xF (9-15): CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted
	15:0	TXTS[15:0]	Tx Timestamp Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC[19:16] TCP filed.

12.4.11.5 Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN_SIDFC[15:2] FLSSA field plus the index of the filter element (0-127).

Figure 12-19 shows Standard Message ID Filter element structure.

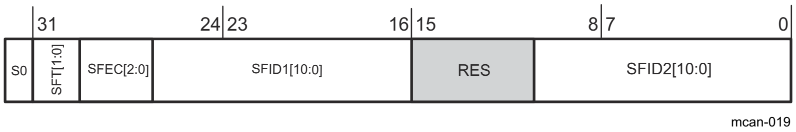

Figure 12-19. Standard Message ID Filter Element Structure

Table 12-13 shows Standard Message ID Filter element field descriptions.

Table 12-13. Standard Message ID Filter Element Field Descriptions

Word	Bits	Field Name	Description
S0	31:30	SFT[1:0]	Standard Filter Type • 0x0: Range filter from SFID1 to SFID2 (SFID2 ≥ SFID1) • 0x1: Dual ID filter for SFID1 or SFID2 • 0x2: Classic filter: SFID1 = filter; SFID2 = mask • 0x3: Filter element disabled **Note:** With SFT = 11 the filter element is disabled and the acceptance filtering continues (same behaviour as with SFEC = 000)
	29:27	SFEC[2:0]	Standard Filter Element Configuration All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = 100, 101, or 110 a match sets interrupt flag MCAN_IR[8]HPM and, if enabled, an interrupt is generated. In this case the MCAN_HPMS register is updated with the status of the priority match. • 0x0: Disable filter element • 0x1: Store in Rx FIFO 0 if filter matches • 0x2: Store in Rx FIFO 1 if filter matches • 0x3: Reject ID if filter matches • 0x4: Set priority if filter matches • 0x5: Set priority and store in FIFO 0 if filter matches • 0x6: Set priority and store in FIFO 1 if filter matches • 0x7: Store into Rx Buffer, configuration of SFT[1:0] ignored
	26:16	SFID1[10:0]	Standard Filter ID 1 When filtering for Rx Buffers this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.
	15:11	RES	Reserved
	10:0	SFID2[10:0]	Standard Filter ID 2 This bit field has a different meaning depending on the configuration of SFEC: • 1) SFEC = 001 - 110 Second ID of standard ID filter element • 2) SFEC = 111 Filter for Rx Buffers
		SFID2[10:9]	This filed is decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence. • 0x0: Store message into an Rx Buffer • 0x1: Debug Message A • 0x2: Debug Message B • 0x3: Debug Message C **Note:** Debug feature is not supported.
		SFID2[8:6]	This field is used to control the filter event pins at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one MCAN_ICKL period in case the filter matches. **Note:** Only two filter event pins are supported.
		SFID2[5:0]	This field defines the offset to the Rx Buffer Start Address MCAN_RXBC[15:2] RBSA field for storage of a matching message.

12.4.11.6 Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN_XIDFC[15:2] FLESA field plus two times the index of the filter element (0-63).

Figure 12-20 shows Extended Message ID Filter element structure.

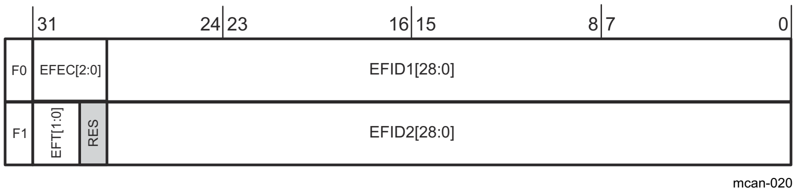

Figure 12-20. Extended Message ID Filter Element Structure

Table 12-14 shows Extended Message ID Filter element field descriptions.

Table 12-14. Extended Message ID Filter Element Field Descriptions

Word	Bits	Field Name	Description
F0	31:29	EFEC[2:0]	Extended Filter Element Configuration All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = 100, 101, or 110 a match sets interrupt flag MCAN_IR[8]HPM and, if enabled, an interrupt is generated. In this case the MCAN_HPMS register is updated with the status of the priority match. • 0x0: Disable filter element • 0x1: Store in Rx FIFO 0 if filter matches • 0x2: Store in Rx FIFO 1 if filter matches • 0x3: Reject ID if filter matches • 0x4: Set priority if filter matches • 0x5: Set priority and store in FIFO 0 if filter matches • 0x6: Set priority and store in FIFO 1 if filter matches • 0x7: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored
	28:0	EFID1[28:0]	Extended Filter ID 1 First ID of extended ID filter element. When filtering for Rx Buffers this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only XIDAM masking mechanism (see Section 12.4.8.1.5, *Extended Message ID Filtering*) is used.

Table 12-14. Extended Message ID Filter Element Field Descriptions (continued)

Word	Bits	Field Name	Description
F1	31:30	EFT[1:0]	Extended Filter Type • 0x0: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1) • 0x1: Dual ID filter for EFID1 or EFID2 • 0x2: Classic filter: EFID1 = filter, EFID2 = mask • 0x3: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1), XIDAM mask not applied
	29	RES	Reserved
	28:0	EFID2[28:0]	Extended Filter ID 2 This bit field has a different meaning depending on the configuration of EFEC: • 1) EFEC = 001 - 110 Second ID of extended ID filter element • 2) EFEC = 111 Filter for Rx Buffers
		EFID2[10:9]	This field decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence. • 0x0: Store message into an Rx Buffer • 0x1: Debug Message A • 0x2: Debug Message B • 0x3: Debug Message C **Note:** Debug feature is not supported.
		EFID2[8:6]	This field is used to control the filter event pins at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one MCAN_ICKL period in case the filter matches. **Note:** Only two filter event pins are supported.
		EFID2[5:0]	This field defines the offset to the Rx Buffer Start Address MCAN_RXBC[15:2] RBSA field for storage of a matching message.

12.5 MCAN Register Manual

Note

After hardware reset, the registers of the MCAN module hold the values shown in the register descriptions.

Additionally, the Bus_Off state is reset and the MCAN_TX pin is set to recessive (high). The MCAN_CCCR[0] INIT bit is set to enable the software initialization. The MCAN module will not influence the CAN bus until the software resets the MCAN_CCCR[0] INIT bit.

12.5.1 MSS_MCAN_CFG Registers

Table 12-16 lists the memory-mapped registers for the MSS_MCAN_CFG registers. All register offset addresses not listed in Table 12-16 should be considered as reserved locations and the register contents should not be modified.

Table 12-16. MSS_MCAN_CFG Registers

Complex bit access types are encoded to fit into small table cells. Table 12-17 shows the codes that are used for access types in this section.

Table 12-17. MSS_MCAN_CFG Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write

Table 12-17. MSS_MCAN_CFG Access Type Codes (continued)

Access Type	Code	Description
W0C	W 0C	Write 0 to clear
Reset or Default Value		
-*n*		Value after reset or the default value

12.5.1.1 SS_PID Register (Offset = 0h) [Reset = 00000000h]

SS_PID is shown in Table 12-18.

Return to the Summary Table.

SS_PID

Table 12-18. SS_PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	0h	PID register scheme
29-28	BU	R	0h	Business Unit: 10 = Processors
27-16	MODULE_ID	R	0h	Module ID
15-11	RTL	R	0h	RTL revision. Will vary depending on release.
10-8	MAJOR	R	0h	Major revision
7-6	CUSTOM	R	0x0	Custom
5-0	MINOR	R	0h	Minor revision

12.5.1.2 SS_CTRL Register (Offset = 4h) [Reset = 00000000h]

SS_CTRL is shown in Table 12-19.

Return to the Summary Table.

SS_CTRL

Table 12-19. SS_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	NU0	R	0x0	Reserved
6	EXT_TS_CNTR_EN	R/W	0x0	External TimeStamp Counter Enable
5	AUTOWAKEUP	R/W	0x0	Automatic Wakeup Enable
4	WAKEUPREGEN	R/W	0x0	Wakeup Request Enable
3	DBGSUSP_FREE	R/W	0h	0-Honor Debug Suspend, 1-Disregard debug suspend
2-0	NU	R	0x0	Reserved

12.5.1.3 SS_STAT Register (Offset = 8h) [Reset = 00000000h]

SS_STAT is shown in Table 12-20.

Return to the Summary Table.

SS_STAT

Table 12-20. SS_STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	NU1	R	0x0	Reserved
2	EN_FDOE	R	0h	Reflects the value of mcanss_enable_fdoe configuration port x=mcanss_enable_fdoe
1	MMI_DONE	R	0h	0:Memory Initialization is in progress, 1:Memory Intialization Done
0	NU	R	0x0	Reserved

12.5.1.4 SS_ICS Register (Offset = Ch) [Reset = 00000000h]

SS_ICS is shown in Table 12-21.

Return to the Summary Table.

SS_ICS

Table 12-21. SS_ICS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU2	R	0x0	Reserved
0	ICS	W	0x0	This bit contains the External TimeStamp Counter Overflow Interrupt status. Write '1' to clear bits. (ICS - Interrupt Clear Shadow Register)

12.5.1.5 SS_IRS Register (Offset = 10h) [Reset = 00000000h]

SS_IRS is shown in Table 12-22.

Return to the Summary Table.

SS_IRS

Table 12-22. SS_IRS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU3	R	0x0	Reserved
0	IRS	R	0x0	External TimeStamp Counter Overflow Interrupt status. Read raw interrupt status. (IRS - Interrupt Raw Status Register)

12.5.1.6 SS_IECS Register (Offset = 14h) [Reset = 00000000h]

SS_IECS is shown in Table 12-23.

Return to the Summary Table.

SS_IECS

Table 12-23. SS_IECS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU4	R	0x0	Reserved
0	IECS	W	0x0	External TimeStamp Counter Overflow Interrupt. Write '1' to clear bits. (IECS - Interrupt Enable Clear Shadow Register)

12.5.1.7 SS_IE Register (Offset = 18h) [Reset = 00000000h]

SS_IE is shown in Table 12-24.

Return to the Summary Table.

SS_IE

Table 12-24. SS_IE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU5	R	0x0	Reserved
0	IE	R/W	0x0	External TimeStamp Counter Overflow Interrupt. Write '1' to set interrupt enable. Read returns interrupt enable. (IE - Interrupt Enable Register)

12.5.1.8 SS_IES Register (Offset = 1Ch) [Reset = 00000000h]

SS_IES is shown in Table 12-25.

Return to the Summary Table.

SS_IES

Table 12-25. SS_IES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU6	R	0x0	Reserved
0	IES	R	0x0	External TimeStamp Counter Overflow Interrupt. Read Enabled Interrupts. (IES - Interrupt Enable Status)

12.5.1.9 SS_EOI Register (Offset = 20h) [Reset = 00000000h]

SS_EOI is shown in Table 12-26.

Return to the Summary Table.

SS_EOI

Table 12-26. SS_EOI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU7	R	0x0	Reserved
7-0	EOI	W	0x0	Write with bit position of targeted interrupt. (E.g. Ext TS is bit 0). Upon write, level interrupt will clear and if unserviced interrupt counter > 1 will issue another pulse interrupt. Field values: ext_ts_eoi(0): EOI value for External TS interrupt mcan_0_eoi(1): EOI value for mcan[0] interrupt mcan_1_eoi(2): EOI value for mcan[1] interrupt (EOI - End Of Interrupt)

12.5.1.10 SS_EXT_TS_PS Register (Offset = 24h) [Reset = 00000000h]

SS_EXT_TS_PS is shown in Table 12-27.

Return to the Summary Table.

SS_EXT_TS_PS

Table 12-27. SS_EXT_TS_PS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU8	R	0x0	Reserved
23-0	PRESCALE	R/W	0x0	External Timestamp Prescaler reload value. External Timestamp count rate is host clock rate divided by this value with one exception: a value of 0 has the same effect as 1 .

12.5.1.11 SS_EXT_TS_USIC Register (Offset = 28h) [Reset = 00000000h]

SS_EXT_TS_USIC is shown in Table 12-28.

Return to the Summary Table.

SS_EXT_TS_USIC

Table 12-28. SS_EXT_TS_USIC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	NU9	R	0x0	Reserved
4-0	EXT_TS_INTR_CNTR	R	0x0	Number of unserviced rollover interrupts. If >1 an EOI write will issue another pulse interrupt (EXT_TS_USIC - External TImeStamp Unserviced Interrupts Counter)

12.5.1.12 CREL Register (Offset = 200h) [Reset = 00000000h]

CREL is shown in Table 12-29.

Return to the Summary Table.

CREL

Table 12-29. CREL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	REL	R	0h	Core Release
27-24	STEP	R	0h	Step of Core Release
23-20	SUBSTEP	R	0h	Sub-Step of Core Release
19-16	YEAR	R	0h	Time Stamp Year
15-8	MON	R	0h	Time Stamp Month
7-0	DAY	R	0h	Time Stamp Day

12.5.1.13 ENDN Register (Offset = 204h) [Reset = 00000000h]

ENDN is shown in Table 12-30.

Return to the Summary Table.

ENDN

Table 12-30. ENDN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ETV	R	0h	Endianess test value

12.5.1.14 CUST Register (Offset = 208h) [Reset = 00000000h]

CUST is shown in Table 12-31.

Return to the Summary Table.

CUST

Table 12-31. CUST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CUST	R	0x0	Custom

12.5.1.15 DBTP Register (Offset = 20Ch) [Reset = 00000000h]

DBTP is shown in Table 12-32.

Return to the Summary Table.

DBTP

Table 12-32. DBTP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU13	R	0x0	Reserved
23	TDC	R/W	0x0	Transmitter Delay Compensation
22-21	NU12	R	0x0	Reserved
20-16	DBRP	R/W	0x0	Data Baud Rate Prescaler
15-13	NU11	R	0x0	Reserved
12-8	DTSEG1	R/W	0h	Data time segment before smaple point
7-4	DTSEG2	R/W	0h	Data time segment after sample point
3-0	DSJW	R/W	0h	Data resynchronization Jump Width

12.5.1.16 TEST Register (Offset = 210h) [Reset = 00000000h]

TEST is shown in Table 12-33.

Return to the Summary Table.

TEST

Table 12-33. TEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU15	R	0x0	Reserved
7	RX	R	0x0	Receive Pin
6-5	TX	R/W	0x0	Control of Transmit Pin
4	LBCK	R/W	0x0	Loop Back Mode
3-0	NU14	R	0x0	Reserved

12.5.1.17 RWD Register (Offset = 214h) [Reset = 00000000h]

RWD is shown in Table 12-34.

Return to the Summary Table.

RWD

Table 12-34. RWD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU16	R	0x0	Reserved
15-8	WDV	R	0x0	Watchdog Value
7-0	WDC	R/W	0x0	Watchdog Counter Value

12.5.1.18 CCCR Register (Offset = 218h) [Reset = 00000000h]

CCCR is shown in Table 12-35.

Return to the Summary Table.

CCCR

Table 12-35. CCCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	NU18	R/W	0x0	Reserved
14	TXP	R/W	0x0	Transmit Pause
13	EFBI	R/W	0x0	Edge Filtering durign Bus Integration
12	PXHD	R/W	0x0	Protocol Exception Handling Disable
11-10	NU17	R	0x0	Reserved
9	BRSE	R/W	0x0	Bit Rate Switch Enable
8	FDOE	R/W	0x0	FD Operation Enable
7	TEST	R/W	0x0	Test Mode enable
6	DAR	R/W	0x0	Disable Automatic Regransmission
5	MON	R/W	0x0	Bus Monitoring Mode
4	CSR	R/W	0x0	Clock Stop Request
3	CSA	R	0x0	Clock Stop Acknowledge
2	ASM	R/W	0x0	Restriced Operation Mode
1	CCE	R/W	0x0	Configuration Change Enable
0	INIT	R/W	0h	Initialization

12.5.1.19 NBTP Register (Offset = 21Ch) [Reset = 00000000h]

NBTP is shown in .

Return to the Summary Table.

NBTP

Table 12-36. NBTP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	NSJW	R/W	0h	Valid values are 0 to 127. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
24-16	NBRP	R/W	0x0	The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 511. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15-8	NTSEG1	R/W	0h	Valid values are 1 to 255. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
7	NU19	R	0x0	Reserved
6-0	NTSEG2	R/W	0h	Valid values are 1 to 127. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

12.5.1.20 TSCC Register (Offset = 220h) [Reset = 00000000h]

TSCC is shown in Table 12-37.

Return to the Summary Table.

TSCC

Table 12-37. TSCC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU21	R	0x0	Reserved
19-16	TCP	R/W	0x0	Timestamp Counter Prescaler
15-2	NU20	R	0x0	Reserved
1-0	TSS	R/W	0x0	Timestamp Select

12.5.1.21 TSCV Register (Offset = 224h) [Reset = 00000000h]

TSCV is shown in Table 12-38.

Return to the Summary Table.

TSCV

Table 12-38. TSCV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU22	R	0x0	Reserved
15-0	TSC	R/W	0x0	Timestamp Counter

12.5.1.22 TOCC Register (Offset = 228h) [Reset = 00000000h]

TOCC is shown in Table 12-39.

Return to the Summary Table.

TOCC

Table 12-39. TOCC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TOP	R/W	0h	Timeout Period
15-3	NU23	R	0x0	Reserved
2-1	TOS	R/W	0x0	Timeout Select
0	ETOC	R/W	0x0	Enable Timeout Counter

12.5.1.23 TOCV Register (Offset = 22Ch) [Reset = 00000000h]

TOCV is shown in Table 12-40.

Return to the Summary Table.

TOCV

Table 12-40. TOCV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU24	R	0x0	Reserved
15-0	TOC	R/W	0h	Timeout Counter

12.5.1.24 RES00 Register (Offset = 230h) [Reset = 00000000h]

RES00 is shown in Table 12-41.

Return to the Summary Table.

RES00

Table 12-41. RES00 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES00	R	0x0	Reserved

12.5.1.25 RES01 Register (Offset = 234h) [Reset = 00000000h]

RES01 is shown in Table 12-42.

Return to the Summary Table.

RES01

Table 12-42. RES01 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES01	R	0x0	Reserved

12.5.1.26 RES02 Register (Offset = 238h) [Reset = 00000000h]

RES02 is shown in Table 12-43.

Return to the Summary Table.

RES02

Table 12-43. RES02 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES02	R	0x0	Reserved

12.5.1.27 RES03 Register (Offset = 23Ch) [Reset = 00000000h]

RES03 is shown in Table 12-44.

Return to the Summary Table.

RES03

Table 12-44. RES03 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES03	R	0x0	Reserved

12.5.1.28 ECR Register (Offset = 240h) [Reset = 00000000h]

ECR is shown in Table 12-45.

Return to the Summary Table.

ECR

Table 12-45. ECR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU25	R	0x0	Reserved
23-16	CEL	R	0x0	CAN Error Logging
15	RP	R	0x0	Recieve Error Passive
14-8	REC	R	0x0	Recieve Error Counter
7-0	TEC	R	0x0	Transmit Error Counter

12.5.1.29 PSR Register (Offset = 244h) [Reset = 00000000h]

PSR is shown in Table 12-46.

Return to the Summary Table.

PSR

Table 12-46. PSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	NU27	R	0x0	Reserved
22-16	TDCV	R	0x0	Transmitter Delay Compensation Value
15	NU26	R	0x0	Reserved
14	PXE	R	0x0	Protocol Exception Event
13	RFDF	R	0x0	Recieved a CAN FD Message
12	RBRS	R	0x0	BRS flag of last recieved CAN FD Message
11	RESI	R	0x0	ESI flag of last recieved CAN FD Message
10-8	DLEC	R	0h	Data Phase Last Error Code
7	BO	R	0x0	Bus_Off status
6	EW	R	0x0	Warning Status
5	EP	R	0x0	Error Passive
4-3	ACT	R	0x0	Activity
2-0	LEC	R	0h	Last Error Code

12.5.1.30 TDCR Register (Offset = 248h) [Reset = 00000000h]

TDCR is shown in Table 12-47.

Return to the Summary Table.

TDCR

Table 12-47. TDCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	NU29	R	0x0	Reserved
14-8	TDCO	R/W	0x0	Transmitter Delay Compensation Offset
7	NU28	R	0x0	Reserved
6-0	TDCF	R/W	0x0	Transmitter Delay Compensation Filter Window Length

12.5.1.31 RES04 Register (Offset = 24Ch) [Reset = 00000000h]

RES04 is shown in Table 12-48.

Return to the Summary Table.

RES04

Table 12-48. RES04 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES04	R	0x0	Reserved

12.5.1.32 IR Register (Offset = 250h) [Reset = 00000000h]

IR is shown in Table 12-49.

Return to the Summary Table.

IR

Table 12-49. IR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	NU30	R	0x0	Reserved
29	ARA	R/W	0x0	Access to Reserved Address
28	PED	R/W	0x0	Protocol Error in data Phase
27	PEA	R/W	0x0	Protocol Error in Arbitration Phase
26	WDI	R/W	0x0	Watchdog Interrupt
25	BO	R/W	0x0	Bus_Off Status
24	EW	R/W	0x0	Warning Status
23	EP	R/W	0x0	Error Passive
22	ELO	R/W	0x0	Error Logging Overflow
21	BEU	R/W	0x0	Bit Error Uncorrected
20	BEC	R/W	0x0	Bit Error Corrected
19	DRX	R/W	0x0	Message stored to Dedicated Rx Buffer
18	TOO	R/W	0x0	Timeout Occurred
17	MRAF	R/W	0x0	Message RAM Access Failure
16	TSW	R/W	0x0	Timestamp Wraparound
15	TEFL	R/W	0x0	Tx Event FIFO Element Lost
14	TEFF	R/W	0x0	Tx Event FIFO Full
13	TEFW	R/W	0x0	Tx Event FIFO Watermark Reached
12	TEFN	R/W	0x0	Tx Event FIFO New Entry
11	TFE	R/W	0x0	Tx FIFO Empty
10	TCF	R/W	0x0	Transmission Cancellation Finished
9	TC	R/W	0x0	Transmission Complete
8	HPM	R/W	0x0	High Priority Message
7	RF1L	R/W	0x0	Rx FIFO 1 Message Lost
6	RF1F	R/W	0x0	Rx FIFO 1 Full
5	RF1W	R/W	0x0	Rx FIFO 1 Watermark Reached
4	RF1N	R/W	0x0	Rx FIFO 1 New Message
3	RF0L	R/W	0x0	Rx FIFO 0 Message Lost
2	RF0F	R/W	0x0	Rx FIFO 0 Full
1	RF0W	R/W	0x0	Rx FIFO 0 Watermark Reached
0	RF0N	R/W	0x0	Rx FIFO 0 New Message

12.5.1.33 IE Register (Offset = 254h) [Reset = 00000000h]

IE is shown in Table 12-50.

Return to the Summary Table.

IE

Table 12-50. IE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	NU31	R	0x0	Reserved
29	ARAE	R/W	0x0	Acces to Reserve Address Interrupt Enable
28	PEDE	R/W	0x0	Protocol Error in Data Phase Interrupt Enable
27	PEAE	R/W	0x0	Protocol Error in Arbitration Phase Interrupt Enable
26	WDIE	R/W	0x0	Watchdog Interrupt Enable
25	BOE	R/W	0x0	Bus_Off Status Interrupt Enable
24	EWE	R/W	0x0	Warning Status Interrupt Enable
23	EPE	R/W	0x0	Error Passive Interrupt Enable
22	ELOE	R/W	0x0	Error Logging Overflow Interrupt Enable
21	BEUE	R/W	0x0	Bit Error Uncorrected Interrupt Enable
20	BECE	R/W	0x0	Bit Error Corrected Interrupt Enable
19	DRX	R/W	0x0	Message stored to Dedicated Rx Buffer Interrupt Enable
18	TOOE	R/W	0x0	Timeout Occurred Interrupt Enable
17	MRAFE	R/W	0x0	Message RAM Access Failure Interrupt Enable
16	TSWE	R/W	0x0	Timestamp Wraparound Interrupt Enable
15	TEFLE	R/W	0x0	Tx Event FIFO Event Lost Interrupt Enable
14	TEFFE	R/W	0x0	Tx Event FIFO Full Interrupt Enable
13	TEFWE	R/W	0x0	Tx Event FIFO Watermark Reached Interrupt enable
12	TEFNE	R/W	0x0	Tx Event FIFO New Entry Interrupt Enable
11	TFEE	R/W	0x0	Tx FIFO Empty Interrupt Enable
10	TCFE	R/W	0x0	Transmission Cancellation Finishied Interrupt Enable
9	TCE	R/W	0x0	Transmission Completed Interrupt Enable
8	HPME	R/W	0x0	High Priority message Interrupt Enable
7	RF1LE	R/W	0x0	rx FIFO 1 Message Lost Interrupt Enable
6	RF1FE	R/W	0x0	Rx FIFO 1 Full Interrupt Enable
5	RF1WE	R/W	0x0	Rx FIFO 1 Watermark Reached Interrupt Enable
4	RF1NE	R/W	0x0	Rx FIFO 1 New Message Interrupt Enable
3	RF0LE	R/W	0x0	Rx FIFO 0 Message Lost Interrupt Enable
2	RF0FE	R/W	0x0	Rx FIFO 0 Full Interrupt Enable
1	RF0WE	R/W	0x0	Rx FIFO 0 Watermark Reached Interrupt Enable
0	RF0NE	R/W	0x0	Rx FIFO 0 New Message Interrupt Enable

12.5.1.34 ILS Register (Offset = 258h) [Reset = 00000000h]

ILS is shown in Table 12-51.

Return to the Summary Table.

ILS

Table 12-51. ILS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	NU32	R	0x0	Reserved
29	ARAL	R/W	0x0	Accees to Reserve Address Interrupt Line
28	PEDL	R/W	0x0	Protocol Error in Data Phase Interrupt Line
27	PEAL	R/W	0x0	Protocol Error in Arbitration Phase Interrupt Line
26	WDIL	R/W	0x0	Watchdog Interrupt Line
25	BOL	R/W	0x0	Bus_Off Status Interrupt Line
24	EWL	R/W	0x0	Warning Status Interrupt Line
23	EPL	R/W	0x0	Error Passive Interrupt Line
22	ELOL	R/W	0x0	Error Logging Overflow Interrupt Line
21	BEUL	R/W	0x0	Bit Error Uncorrected Interrupt Line
20	BECL	R/W	0x0	Bit Error Corrected Interrupt Line
19	DRXL	R/W	0x0	Message stored to Dedicated Rx Buffer Interrupt Line
18	TOOL	R/W	0x0	Timeout Occurred Interrupt Line
17	MRAFL	R/W	0x0	Message RAM Access Failure Interrupt Line
16	TSWL	R/W	0x0	Timestamp Wraparound Interrupt Line
15	TEFLL	R/W	0x0	Tx Event FIFO Event Lost Interrupt Line
14	TEFFL	R/W	0x0	Tx Event FIFO Full Interrupt Line
13	TEFWL	R/W	0x0	Tx Event FIFO Watermark Reached Interrupt Line
12	TEFNL	R/W	0x0	Tx Event FIFO New Entry Interrupt Line
11	TFEL	R/W	0x0	Tx FIFO Empty Interrupt Line
10	TCFL	R/W	0x0	Transmission Cancellation Finishied Interrupt Line
9	TCL	R/W	0x0	Transmission Completed Interrupt Line
8	HPML	R/W	0x0	High Priority message Interrupt Line
7	RF1LL	R/W	0x0	rx FIFO 1 Message Lost Interrupt Line
6	RF1FL	R/W	0x0	Rx FIFO 1 Full Interrupt Line
5	RF1WL	R/W	0x0	Rx FIFO 1 Watermark Reached Interrupt Line
4	RF1NL	R/W	0x0	Rx FIFO 1 New Message Interrupt Line
3	RF0LL	R/W	0x0	Rx FIFO 0 Message Lost Interrupt Line
2	RF0FL	R/W	0x0	Rx FIFO 0 Full Interrupt Line
1	RF0WL	R/W	0x0	Rx FIFO 0 Watermark Reached Interrupt Line
0	RF0NL	R/W	0x0	Rx FIFO 0 New Message Interrupt Line

12.5.1.35 ILE Register (Offset = 25Ch) [Reset = 00000000h]

ILE is shown in Table 12-52.

Return to the Summary Table.

ILE

Table 12-52. ILE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU33	R	0x0	Reserved
1	EINT1	R/W	0x0	Enable Interrupt Line 1
0	EINT0	R/W	0x0	Enable Interrupt Line 0

12.5.1.36 RES05 Register (Offset = 260h) [Reset = 00000000h]

RES05 is shown in Table 12-53.

Return to the Summary Table.

RES05

Table 12-53. RES05 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES05	R	0x0	Reserved

12.5.1.37 RES06 Register (Offset = 264h) [Reset = 00000000h]

RES06 is shown in Table 12-54.

Return to the Summary Table.

RES06

Table 12-54. RES06 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES06	R	0x0	Reserved

12.5.1.38 RES07 Register (Offset = 268h) [Reset = 00000000h]

RES07 is shown in Table 12-55.

Return to the Summary Table.

RES07

Table 12-55. RES07 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES07	R	0x0	Reserved

12.5.1.39 RES08 Register (Offset = 26Ch) [Reset = 00000000h]

RES08 is shown in Table 12-56.

Return to the Summary Table.

RES08

Table 12-56. RES08 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES08	R	0x0	Reserved

12.5.1.40 RES09 Register (Offset = 270h) [Reset = 00000000h]

RES09 is shown in Table 12-57.

Return to the Summary Table.

RES09

Table 12-57. RES09 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES09	R	0x0	Reserved

12.5.1.41 RES10 Register (Offset = 274h) [Reset = 00000000h]

RES10 is shown in Table 12-58.

Return to the Summary Table.

RES10

Table 12-58. RES10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES10	R	0x0	Reserved

12.5.1.42 RES11 Register (Offset = 278h) [Reset = 00000000h]

RES11 is shown in Table 12-59.

Return to the Summary Table.

RES11

Table 12-59. RES11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES11	R	0x0	Reserved

12.5.1.43 RES12 Register (Offset = 27Ch) [Reset = 00000000h]

RES12 is shown in Table 12-60.

Return to the Summary Table.

RES12

Table 12-60. RES12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES12	R	0x0	Reserved

12.5.1.44 GFC Register (Offset = 280h) [Reset = 00000000h]

GFC is shown in Table 12-61.

Return to the Summary Table.

GFC

Table 12-61. GFC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU34	R	0x0	Reserved
5-4	ANFS	R/W	0x0	Accept Non-matching Frames Standard
3-2	ANFE	R/W	0x0	Accept Non-matching Frames Extended
1	RRFS	R/W	0x0	reject Remote Frames Standard
0	RRFE	R/W	0x0	reject Remote Frames Extended

12.5.1.45 SIDFC Register (Offset = 284h) [Reset = 00000000h]

SIDFC is shown in Table 12-62.

Return to the Summary Table.

SIDFC

Table 12-62. SIDFC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU36	R	0x0	Reserved
23-16	LSS_S	R/W	0x0	List Size Standard
15-2	FLSSA_S	R/W	0x0	Filter List Standard Start Address
1-0	NU35	R	0x0	Reserved

12.5.1.46 XIDFC Register (Offset = 288h) [Reset = 00000000h]

XIDFC is shown in Table 12-63.

Return to the Summary Table.

XIDFC

Table 12-63. XIDFC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU38	R	0x0	Reserved
23-16	LSS_X	R/W	0x0	List Size Standard
15-2	FLSSA_X	R/W	0x0	Filter List Standard Start Address
1-0	NU37	R	0x0	Reserved

12.5.1.47 RES13 Register (Offset = 28Ch) [Reset = 00000000h]

RES13 is shown in Table 12-64.

Return to the Summary Table.

RES13

Table 12-64. RES13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES13	R	0x0	Reserved

12.5.1.48 XIDAM Register (Offset = 290h) [Reset = 00000000h]

XIDAM is shown in Table 12-65.

Return to the Summary Table.

XIDAM

Table 12-65. XIDAM Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	NU39	R	0x0	Reserved
28-0	EIDM	R/W	0h	Extended ID Mask

12.5.1.49 HPMS Register (Offset = 294h) [Reset = 00000000h]

HPMS is shown in Table 12-66.

Return to the Summary Table.

HPMS

Table 12-66. HPMS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU40	R	0x0	Reserved
15	FLST	R	0x0	Filter List
14-8	FIDX	R	0x0	Filter Index
7-6	MSI	R	0x0	Message Storeage Indicator
5-0	BIDX	R	0x0	Buffer Index

12.5.1.50 NDAT1 Register (Offset = 298h) [Reset = 00000000h]

NDAT1 is shown in Table 12-67.

Return to the Summary Table.

NDAT1

Table 12-67. NDAT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ND0_31	R/W	0x0	New Data 0-31

12.5.1.51 NDAT2 Register (Offset = 29Ch) [Reset = 00000000h]

NDAT2 is shown in Table 12-68.

Return to the Summary Table.

NDAT2

Table 12-68. NDAT2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ND32_63	R/W	0x0	New Data 32-63

12.5.1.52 RXF0C Register (Offset = 2A0h) [Reset = 00000000h]

RXF0C is shown in Table 12-69.

Return to the Summary Table.

RXF0C

Table 12-69. RXF0C Register Field Descriptions

Bit	Field	Type	Reset	Description
31	F0OM	R/W	0x0	Rx FIFO 0 Operation Mode
30-24	F0WM	R/W	0x0	Rx FIFO 0 Watermark
23	NU42_1	R	0x0	Reserved
22-16	F0S	R/W	0x0	Rx FIFO 0 Size
15	NU42	R	0x0	Reserved
14-2	F0SA	R/W	0x0	Rx FIFO 0 Start Address
1-0	NU41	R	0x0	Reserved

12.5.1.53 RXF0S Register (Offset = 2A4h) [Reset = 00000000h]

RXF0S is shown in Table 12-70.

Return to the Summary Table.

RXF0S

Table 12-70. RXF0S Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	NU46	R	0x0	Reserved
25	RF0L	R	0x0	Rx FIFO 0 Message Lost
24	F0F	R	0x0	Rx FIFO 0 Full
23-22	NU45	R	0x0	Reserved
21-16	F0PI	R	0x0	Rx FIFO 0 Put Index
15-14	NU44	R	0x0	Reserved

1-0	NU499	R	0x0	Reserved

12.5.1.57 RXF1S Register (Offset = 2B4h) [Reset = 00000000h]

RXF1S is shown in Table 12-74.

Return to the Summary Table.

RXF1S

Table 12-74. RXF1S Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	NU54	R	0x0	Reserved
25	RF1L	R	0x0	Rx FIFO 0 Message Lost
24	F1F	R	0x0	Rx FIFO 0 Full
23-22	NU53	R	0x0	Reserved
21-16	F1PI	R	0x0	Rx FIFO 0 Put Index
15-14	NU52	R	0x0	Reserved
13-8	F1GI	R	0x0	Rx FIFO 0 Get Index
7	NU51	R	0x0	Reserved
6-0	F1FL	R	0x0	Rx FIFO 0 Fill Level

12.5.1.58 RXF1A Register (Offset = 2B8h) [Reset = 00000000h]

RXF1A is shown in Table 12-75.

Return to the Summary Table.

RXF1A

Table 12-75. RXF1A Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU55	R	0x0	Reserved
5-0	F1AI	R/W	0x0	Rx FIFO 0 Acknowledge Index

12.5.1.59 RXESC Register (Offset = 2BCh) [Reset = 00000000h]

RXESC is shown in Table 12-76.

Return to the Summary Table.

RXESC

Table 12-76. RXESC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU58	R	0x0	Reserved
10-8	RBDS	R/W	0x0	Rx Buffer data Field Size
7	NU57	R	0x0	Reserved
6-4	F1DS	R/W	0x0	Rx FIFO 1 Data Field Size
3	NU56	R	0x0	Reserved
2-0	F0DS	R/W	0x0	Rx FIFO 0 Data Field Size

12.5.1.60 TXBC Register (Offset = 2C0h) [Reset = 00000000h]

TXBC is shown in Table 12-77.

Return to the Summary Table.

TXBC

Table 12-77. TXBC Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NU61	R	0x0	Reserved
30	TFQM	R	0x0	Tx FIFO/Queue Mode
29-24	TFQS	R	0x0	Transmit FIFO/Queue Size
23-22	NU60	R	0x0	Reserved
21-16	NDTB	R	0x0	Number of Dedicated Transmit Buffers
15-2	TBSA	R	0x0	Tx Buffers Start Address
1-0	NU59	R	0x0	Reserved

12.5.1.61 TXFQS Register (Offset = 2C4h) [Reset = 00000000h]

TXFQS is shown in Table 12-78.

Return to the Summary Table.

TXFQS

Table 12-78. TXFQS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	NU64	R	0x0	Reserved
21	TFQF	R	0x0	Tx FIFO/Queue Full
20-16	TFQPI	R	0x0	Tx FIFO/Queue Put Index
15-13	NU63	R	0x0	Reserved
12-8	TFGI	R	0x0	Tx Queue Get Index
7-6	NU62	R	0x0	Reserved
5-0	TFFL	R	0x0	Tx FIFO Free Level

12.5.1.62 TXESC Register (Offset = 2C8h) [Reset = 00000000h]

TXESC is shown in Table 12-79.

Return to the Summary Table.

TXESC

Table 12-79. TXESC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	NU65	R	0x0	Reserved
2-0	TBDS	R/W	0x0	Tx Buffer Data Field Size

12.5.1.63 TXBRP Register (Offset = 2CCh) [Reset = 00000000h]

TXBRP is shown in Table 12-80.

Return to the Summary Table.

TXBRP

Table 12-80. TXBRP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TRP	R	0x0	Transmission Request Pending

12.5.1.64 TXBAR Register (Offset = 2D0h) [Reset = 00000000h]

TXBAR is shown in Table 12-81.

Return to the Summary Table.

TXBAR

Table 12-81. TXBAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	AR	R/W0C	0x0	Add request

12.5.1.65 TXBCR Register (Offset = 2D4h) [Reset = 00000000h]

TXBCR is shown in Table 12-82.

Return to the Summary Table.

TXBCR

Table 12-82. TXBCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CR	R/W0C	0x0	Cancellation Request

12.5.1.66 TXBTO Register (Offset = 2D8h) [Reset = 00000000h]

TXBTO is shown in Table 12-83.

Return to the Summary Table.

TXBTO

Table 12-83. TXBTO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TO	R	0x0	Transmission Occurred

12.5.1.67 TXBCF Register (Offset = 2DCh) [Reset = 00000000h]

TXBCF is shown in Table 12-84.

Return to the Summary Table.

TXBCF

Table 12-84. TXBCF Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CF	R	0x0	Cancellation Finished

12.5.1.68 TXBTIE Register (Offset = 2E0h) [Reset = 00000000h]

TXBTIE is shown in Table 12-85.

Return to the Summary Table.

TXBTIE

Table 12-85. TXBTIE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TIE	R/W	0x0	Transmission Interrupt Enable

12.5.1.69 TXBCIE Register (Offset = 2E4h) [Reset = 00000000h]

TXBCIE is shown in Table 12-86.

Return to the Summary Table.

TXBCIE

Table 12-86. TXBCIE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFIE	R/W	0x0	Cancellation Finished Interrupt Enable

12.5.1.70 RES14 Register (Offset = 2E8h) [Reset = 00000000h]

RES14 is shown in Table 12-87.

Return to the Summary Table.

RES14

Table 12-87. RES14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES14	R	0x0	Reserved

12.5.1.71 RES15 Register (Offset = 2ECh) [Reset = 00000000h]

RES15 is shown in Table 12-88.

Return to the Summary Table.

RES15

Table 12-88. RES15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES15	R	0x0	Reserved

12.5.1.72 TXEFC Register (Offset = 2F0h) [Reset = 00000000h]

TXEFC is shown in Table 12-89.

Return to the Summary Table.

TXEFC

Table 12-89. TXEFC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	NU68	R/W	0x0	Reserved
29-24	EFWM	R/W	0x0	Event FIFO Watermark
23-22	NU67	R/W	0x0	Reserved
21-16	EFS	R/W	0x0	Event FIFO Size
15-2	EFSA	R/W	0x0	Event FIFO Start Address
1-0	NU66	R/W	0x0	Reserved

12.5.1.73 TXEFS Register (Offset = 2F4h) [Reset = 00000000h]

TXEFS is shown in Table 12-90.

Return to the Summary Table.

TXEFS

Table 12-90. TXEFS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	NU72	R	0x0	Reserved
25	TEFL	R	0x0	Tx Event FIFO Element Lost
24	EFF	R	0x0	Event FIFO Full
23-21	NU71	R	0x0	Reserved
20-16	EFPI	R	0x0	Event FIFO Put Index
15-13	NU70	R	0x0	Reserved
12-8	EFGI	R	0x0	Event FIFO Get Index
7-6	NU69	R	0x0	Reserved
5-0	EFFL	R	0x0	Event FIFO FIll Level

12.5.1.74 TXEFA Register (Offset = 2F8h) [Reset = 00000000h]

TXEFA is shown in Table 12-91.

Return to the Summary Table.

TXEFA

Table 12-91. TXEFA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	NU73	R	0x0	Reserved
4-0	EFAI	R	0x0	Event FIFO Acknowledge Index

12.5.1.75 RES16 Register (Offset = 2FCh) [Reset = 00000000h]

RES16 is shown in Table 12-92.

Return to the Summary Table.

RES16

Table 12-92. RES16 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES16	R	0x0	Reserved

12.5.2 MSS_MCAN_ECC Registers

Table 12-93 lists the memory-mapped registers for the MSS_MCAN_ECC registers. All register offset addresses not listed in Table 12-93 should be considered as reserved locations and the register contents should not be modified.

Table 12-93. MSS_MCAN_ECC Registers

Offset	Acronym	Register Name	Section
0h	REV	REV	Go
8h	VECTOR	VECTOR	Go
Ch	STAT	STAT	Go
14h	CTRL	CTRL	Go
18h	ERR_CTRL1	ERR_CTRL1	Go
1Ch	ERR_CTRL2	ERR_CTRL2	Go
20h	ERR_STAT1	ERR_STAT1	Go
24h	ERR_STAT2	ERR_STAT2	Go
28h	ERR_STAT3	ERR_STAT3	Go
3Ch	SEC_EOI_REG	SEC_EOI_REG	Go
40h	SEC_STATUS_REG0	SEC_STATUS_REG0	Go
80h	SEC_ENABLE_SET_REG0	SEC_ENABLE_SET_REG0	Go
C0h	SEC_ENABLE_CLR_REG0	SEC_ENABLE_CLR_REG0	Go
13Ch	DED_EOI_REG	DED_EOI_REG	Go
140h	DED_STATUS_REG0	DED_STATUS_REG0	Go
180h	DED_ENABLE_SET_REG0	DED_ENABLE_SET_REG0	Go
1C0h	DED_ENABLE_CLR_REG0	DED_ENABLE_CLR_REG0	Go
200h	AGGR_ENABLE_SET	AGGR_ENABLE_SET	Go
204h	AGGR_ENABLE_CLR	AGGR_ENABLE_CLR	Go
208h	AGGR_STATUS_SET	AGGR_STATUS_SET	Go
20Ch	AGGR_STATUS_CLR	AGGR_STATUS_CLR	Go

Complex bit access types are encoded to fit into small table cells. Table 12-94 shows the codes that are used for access types in this section.

Table 12-94. MSS_MCAN_ECC Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-*n*		Value after reset or the default value

12.5.2.1 REV Register (Offset = 0h) [Reset = 66A03A01h]

REV is shown in Table 12-95.

Return to the Summary Table.

Aggregator Revision Register

Table 12-95. REV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	1h	Scheme
29-28	BU	R	2h	bu
27-16	MODULE_ID	R	6A0h	Module ID
15-11	REVRTL	R	7h	RTL version
10-8	REVMAJ	R	2h	Major version
7-6	CUSTOM	R	0h	Custom version
5-0	REVMIN	R	1h	Minor version

12.5.2.2 VECTOR Register (Offset = 8h) [Reset = 00000000h]

VECTOR is shown in Table 12-96.

Return to the Summary Table.

ECC Vector Register

Table 12-96. VECTOR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	NU1	R	0h	Reserved
24	RD_SVBUS_DONE	R/W	0h	Status to indicate if read on serial VBUS is complete, write of any value will clear this bit. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field.
23-16	RD_SVBUS_ADDR	R/W	0h	Read address
15	RD_SVBUS	R/W	0h	Write 1 to trigger a read on the serial VBUS. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.
14-11	NU0	R	0h	Reserved
10-0	ECC_VEC	R/W	0h	Value written to select the corresponding ECC RAM for control or status

12.5.2.3 STAT Register (Offset = Ch) [Reset = 00000002h]

STAT is shown in Table 12-97.

Return to the Summary Table.

Misc Status

Table 12-97. STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU2	R	0h	Reserved
10-0	NUM_RAMS	R	2h	Indicates the number of RAMS serviced by the ECC aggregator

12.5.2.4 CTRL Register (Offset = 14h) [Reset = 00000187h]

CTRL is shown in Table 12-98.

Return to the Summary Table.

CTRL

Table 12-98. CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	NU3	R	0h	TI Internal : Reserved
8	CHECK TIMEOUT	W	1h	TI Internal : Check timeout
7	CHECK PARITY	W	1h	TI Internal : Check Parity
6	ERROR_ONCE	W	0h	TI Internal : Force Error only once
5	FORCE_N_ROW	W	0h	TI Internal : Force Error on any RAM read
4	FORCE_DED	W	0h	TI Internal : Force Double Bit Error
3	FORCE_SEC	W	0h	TI Internal : Force Single Bit Error
2	EN_RMW	W	1h	TI Internal : Enable rmw
1	ECC_CHK	W	1h	TI Internal : Enable ECC check
0	ECC_EN	W	1h	TI Internal : Enable ECC

12.5.2.5 ERR_CTRL1 Register (Offset = 18h) [Reset = 00000000h]

ERR_CTRL1 is shown in Table 12-99.

Return to the Summary Table.

ERR_CTRL1

Table 12-99. ERR_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ECC_ROW	R/W	0h	TI Internal : Row address where single or double-bit error needs to be applied. This is ignored if force_n_row is set

12.5.2.6 ERR_CTRL2 Register (Offset = 1Ch) [Reset = 00000000h]

ERR_CTRL2 is shown in Table 12-100.

Return to the Summary Table.

ERR_CTRL2

Table 12-100. ERR_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ECC_BIT2	R/W	0h	TI Internal : Data bit that needs to be flipped if double bit error needs to be forced
15-0	ECC_BIT1	R/W	0h	TI Internal : Data bit that needs to be flipped when force_sec is set

12.5.2.7 ERR_STAT1 Register (Offset = 20h) [Reset = 00000000h]

ERR_STAT1 is shown in Table 12-101.

Return to the Summary Table.

ERR_STAT1

Table 12-101. ERR_STAT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ECC_BIT1_STS	R	0h	TI Internal : Data bit that corresponds to the single-bit error
15	CLR_ECC_CTRL_REG	W	0h	TI Internal : Clear Ctrl Reg Error Status. Write 1 to clear. This bit is self clearing.
14-13	CLR_ECC_PAR	W	0h	TI Internal : Clear Parity Error Status. Write 1 to clear. This bit is self clearing.
12	CLR_ECC_OTHER	W	0h	TI Internal : Clear Other Error Status. Write 1 to clear. This bit is self clearing.
11-10	CLR_ECC_DED	W	0h	TI Internal : Clear Double Bit Error Status. Write 1 to clear. This bit is self clearing.
9-8	CLR_ECC_SEC	W	0h	TI Internal : Clear Single Bit Error Status. Write 1 to clear. This bit is self clearing.
7	ECC_CTRL_REG	W	0h	TI Internal : Force ctrl reg pending interrupt. Write 1 to set. This bit is self clearing.
6-5	ECC_PAR	W	0h	TI Internal : Force ECC parity pending interrupt. Write 1 to set. This bit is self clearing.
4	ECC_OTHER	W	0h	TI Internal : Force ECC other pending interrupt. Write 1 to set. This bit is self clearing.
3-2	ECC_DED	W	0h	TI Internal : Force ECC DED pending interrupt. Write 1 to set. This bit is self clearing.
1-0	ECC_SEC	W	0h	TI Internal : Force ECC SEC pending interrupt. Write 1 to set. This bit is self clearing.

12.5.2.8 ERR_STAT2 Register (Offset = 24h) [Reset = 00000000h]

ERR_STAT2 is shown in Table 12-102.

Return to the Summary Table.

ERR_STAT2

Table 12-102. ERR_STAT2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ECC_ROW	R	0h	TI Internal : Row address where the single or double-bit error has occurred

12.5.2.9 ERR_STAT3 Register (Offset = 28h) [Reset = 00000000h]

ERR_STAT3 is shown in Table 12-103.

Return to the Summary Table.

ERR_STAT3

Table 12-103. ERR_STAT3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU6	R	0h	TI Internal : Reserved
9	CLR_TIMEOUT_PEND	W	0h	TI Internal : Clear timeout pending
8-2	NU5	R	0h	TI Internal : Reserved
1	TIMEOUT_PEND	W	0h	TI Internal : Timeout pending
0	NU4	R	0h	TI Internal : Reserved

12.5.2.10 SEC_EOI_REG Register (Offset = 3Ch) [Reset = 00000000h]

SEC_EOI_REG is shown in Table 12-104.

Return to the Summary Table.

EOI Register

Table 12-104. SEC_EOI_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU7	R	0h	Reserved
0	SEC_EOI_WR	R/W	0h	EOI Register. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field. This bit is self clearing, reading this bit will return 0.

12.5.2.11 SEC_STATUS_REG0 Register (Offset = 40h) [Reset = 00000000h]

SEC_STATUS_REG0 is shown in Table 12-105.

Return to the Summary Table.

Interrupt Status Register 0

Table 12-105. SEC_STATUS_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU8	R	0h	Reserved
1	CTRL_EDC_VBUSS_PEND	R	0h	Interrupt Pending Status for ctrl_edc_vbuss_pend.
0	SEC_PEND	R	0h	Interrupt Pending Status for msgmem_pend.

12.5.2.12 SEC_ENABLE_SET_REG0 Register (Offset = 80h) [Reset = 00000000h]

SEC_ENABLE_SET_REG0 is shown in Table 12-106.

Return to the Summary Table.

Interrupt Enable Set Register 0

Table 12-106. SEC_ENABLE_SET_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU9	R	0h	Reserved
1	CTRL_EDC_VBUSS_ENABLE_SET	R/W	0h	Interrupt Enable Set Register for ctrl_edc_vbuss_pend. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.
0	SEC_EN_SET	R/W	0h	Interrupt Enable Set Register for msgmem_pend. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.

12.5.2.13 SEC_ENABLE_CLR_REG0 Register (Offset = C0h) [Reset = 00000000h]

SEC_ENABLE_CLR_REG0 is shown in Table 12-107.

Return to the Summary Table.

Interrupt Enable Clear Register 0

Table 12-107. SEC_ENABLE_CLR_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU10	R	0h	Reserved
1	CTRL_EDC_VBUSS_ENABLE_CLR	R/W	0h	Interrupt Enable Clear Register for ctrl_edc_vbuss_pend. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.
0	SEC_EN_CLR	R/W	0h	Interrupt Enable Clear Register for msgmem_pend. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.

12.5.2.14 DED_EOI_REG Register (Offset = 13Ch) [Reset = 00000000h]

DED_EOI_REG is shown in Table 12-108.

Return to the Summary Table.

EOI Register

Table 12-108. DED_EOI_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU11	R	0h	Reserved
0	DED_EOI_WR	R/W	0h	EOI Register. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field. This bit is self clearing, reading this bit will return 0.

12.5.2.15 DED_STATUS_REG0 Register (Offset = 140h) [Reset = 00000000h]

DED_STATUS_REG0 is shown in Table 12-109.

Return to the Summary Table.

Interrupt Status Register 0

Table 12-109. DED_STATUS_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU12	R	0h	Reserved
1	CTRL_EDC_VBUSS_PEND	R	0h	Interrupt Pending Status for ctrl_edc_vbuss_pend.
0	DED_PEND	R	0h	Interrupt Pending Status for msgmem_pend.

12.5.2.16 DED_ENABLE_SET_REG0 Register (Offset = 180h) [Reset = 00000000h]

DED_ENABLE_SET_REG0 is shown in Table 12-110.

Return to the Summary Table.

Interrupt Enable Set Register 0

Table 12-110. DED_ENABLE_SET_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU13	R	0h	Reserved
1	CTRL_EDC_VBUSS_ENABLE_SET	R/W	0h	Interrupt Enable Set Register for ctrl_edc_vbuss_pend. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.
0	DED_EN_SET	R/W	0h	Interrupt Enable Set Register for msgmem_pend. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.

12.5.2.17 DED_ENABLE_CLR_REG0 Register (Offset = 1C0h) [Reset = 00000000h]

DED_ENABLE_CLR_REG0 is shown in Table 12-111.

Return to the Summary Table.

Interrupt Enable Clear Register 0

Table 12-111. DED_ENABLE_CLR_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU14	R	0h	Reserved
1	CTRL_EDC_VBUSS_ENABLE_CLR	R/W	0h	Interrupt Enable Clear Register for ctrl_edc_vbuss_pend. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.
0	DED_EN_CLR	R/W	0h	Interrupt Enable Clear Register for msgmem_pend. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.

12.5.2.18 AGGR_ENABLE_SET Register (Offset = 200h) [Reset = 00000000h]

AGGR_ENABLE_SET is shown in Table 12-112.

Return to the Summary Table.

AGGR interrupt enable set Register

Table 12-112. AGGR_ENABLE_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU15	R	0h	Reserved
1	TIMEOUT	R/W	0h	Interrupt Enable Set Register for svbus timeout errors. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.
0	PARITY	R/W	0h	Interrupt Enable Set Register for parity errors. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.

12.5.2.19 AGGR_ENABLE_CLR Register (Offset = 204h) [Reset = 00000000h]

AGGR_ENABLE_CLR is shown in Table 12-113.

Return to the Summary Table.

AGGR interrupt enable clear Register

Table 12-113. AGGR_ENABLE_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU16	R	0h	Reserved
1	TIMEOUT	R/W	0h	Interrupt Enable Clear for svbus timeout errors. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.
0	PARITY	R/W	0h	Interrupt Enable Clear for parity errors. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.

12.5.2.20 AGGR_STATUS_SET Register (Offset = 208h) [Reset = 00000000h]

AGGR_STATUS_SET is shown in Table 12-114.

Return to the Summary Table.

AGGR interrupt status set Register

Table 12-114. AGGR_STATUS_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	NU17	R	0h	Reserved
3-2	TIMEOUT	R/W	0h	Interrupt status set for svbus timeout errors. A write to increment field. Writing a value to this field increment the field value by the value written. Reads do not alter the value of the field.
1-0	PARITY	R/W	0h	Interrupt status set for parity errors. A write to increment field. Writing a value to this field increment the field value by the value written. Reads do not alter the value of the field.

12.5.2.21 AGGR_STATUS_CLR Register (Offset = 20Ch) [Reset = 00000000h]

AGGR_STATUS_CLR is shown in Table 12-115.

Return to the Summary Table.

AGGR interrupt status clear Register

Table 12-115. AGGR_STATUS_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	NU18	R	0h	Reserved
3-2	TIMEOUT	R/W	0h	Interrupt status clear for svbus timeout errors. A write to decrement field. Writing a value to this field decrements the field value by the value written. Reads do not alter the value of the field.
1-0	PARITY	R/W	0h	Interrupt status clear for parity errors. A write to decrement field. Writing a value to this field decrements the field value by the value written. Reads do not alter the value of the field.

Chapter 13

Multi-Buffered Serial Peripheral Interface Module (MibSPI) with Parallel Pin Option (MibSPIP)

This chapter provides the specifications for a 16-bit configurable synchronous multi-buffered multi-pin serial peripheral interface (MibSPI). This chapter also provides the specifications for MibSPI with Parallel Pin Option (MibSPIP). The MibSPI is a programmable-length shift register used for high-speed communication between external peripherals or other microcontrollers.

Throughout this chapter, all references to SPI also apply to MibSPI/MibSPIP, unless otherwise noted.

Note

This chapter describes a superset implementation of the MibSPI/SPI modules that includes features and functionality that may not be available on some devices. Device-specific content that should be determined by referencing the datasheet includes DMA functionality, MibSPI RAM size, number of transfer groups, number of chip selects, parallel mode support, and availability of 5-pin operation ($\overline{\text{SPIENA}}$).

13.1 Overview

The MibSPI/MibSPIP is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (2 to 16 bits) to be shifted in and out of the device at a programmed bit-transfer rate. Typical applications for the SPI include interfacing to external peripherals, such as I/Os, memories, display drivers, and analog-to-digital converters.

The SPI has the following attributes:

- 16-bit shift register
- Receive buffer register
- 11-bit baud clock generator
- Serial clock (SPICLK) pin
- 1 SPIPOCI/SPIPICO pin for data transfer, with programmable pin direction
- SPI enable ($\overline{\text{SPIENA}}$) pin
- Up to 6 peripheral chip select ($\overline{\text{SPICS}}$) pins
- SPICLK can be internally-generated (and driven) or received from an external clock source
- Each word transferred can have a unique format
- SPI pins can be used as functional or digital Input/Output pins (GIOs)

Note

PICO - Peripheral In Controller Out Pin

POCI - Peripheral Out Controller In Pin

SPICS - SPI Chip Select Pin

SPIENA - SPI Enable Pin

13.1.1 Word Format Options

Each word transferred can have a unique format. Several format characteristics are programmable for each word transferred:

- SPICLK frequency
- Character length (2 to 16 bits)
- Phase (with and without delay)
- Polarity (high or low)
- Parity enabled/disabled
- Chip Select(CS) timers for setup and hold
- Shift direction (Most-Significant Bit (MSB) first or Least-Significant Bit (LSB) first)
- Multi-pin parallel modes

13.1.2 Multi-buffering (Mib) Support

The MibSPI has a programmable buffer memory that enables programmed transmission to be completed without CPU intervention. The buffers are combined in different Transfer Groups (TGs) that can be triggered by external events (timers, Input/Output activity, and so on) or by the internal tick counter. The internal tick counter supports periodic trigger events. Each buffer of the MibSPI can be associated with different DMA channels in different TGs, allowing the user to move data between internal memory and an external controller with minimal CPU interaction.

13.1.2.1 Multi-buffer Mode

Multi-buffer Mode is an extension to the SPI. In multi-buffer mode, many extended features are configurable:

- Number of buffers for each peripheral (or data source/destination, up to 128 buffers supported) or group (up to 8 groupings)
- Triggers for each group, trigger types, trigger sources for individual groups (14 external trigger sources and 1 internal trigger source supported)
- Memory fault detection via an internal parity circuit
- Number of DMA-controlled buffers and number of DMA request channels (up to 8 for each of transmit and receive)
- Number of DMA transfers for each buffer (up to 65536 words for up to 8 buffers)
- Uninterrupted DMA buffer transfer (NOBREAK buffer)

13.1.2.2 Compatibility Mode

Compatibility Mode of the MibSPI makes it behave exactly like a standard platform SPI module and ensures full compatibility with other SPIs. All features in compatibility mode of the MibSPI are directly applicable to a SPI. Multi-buffer Mode features are not available in Compatibility Mode.

Note

The SPIDAT0 register is not accessible in the multi-buffer mode of MibSPI. It is only accessible in compatibility mode.

13.1.3 Transmission Lock (Multi-Buffer Mode Controller Only)

Some peripheral devices require transmission of a command followed by data. In this case the SPI transaction should not be interrupted by another group transfer. The LOCK bit within each buffer allows a consecutive transfer to happen without being interrupted by another higher-priority group transfer.

13.2 Operating Modes

The SPI can be configured via software to operate as either a controller or a peripheral. The CONTROLLER bit (SPIGCR1[0]) selects the configuration of the SPIPICO and SPIPOCI pins. CLKMOD bit (SPIGCR1[1]) determines whether an internal or external clock source will be used.

The chip select ($\overline{\text{SPICS}}$) pins are used when communicating with multiple peripheral devices or, with a single peripheral device, to delimit messages containing a leading register address. When a write occurs to SPIDAT1 in controller mode, the $\overline{\text{SPICS}}$ pins are automatically driven to select the specified peripheral device.

Handshaking mechanism, provided by the $\overline{\text{SPIENA}}$ pin, enables a peripheral SPI to delay the generation of the clock signal supplied by the controller if it is not prepared for the next exchange of data.

Note

If in the peripheral mode of operation and configured in either 3-pin or 4-pin (without $\overline{\text{SPIENA}}$) modes, there must be a minimum of 8 VCLK cycles of delay between the last SPICLK and the start of the SPICLK for the next buffer transmit. In general, this equates to a VCLK/SPICLK ratio of ≤16 requiring a minimum of 1 SPICLK delay between transmissions.

13.2.1 Pin Configurations

The SPI supports data connections as shown in Table 13-1.

Note

1. When the SPICS signals are disabled, the chip select field in the transmit data is not used.
2. When the $\overline{\text{SPIENA}}$ signal is disabled, the $\overline{\text{SPIENA}}$ pin is ignored in controller mode, and not driven as part of the SPI transaction in peripheral mode.

Table 13-1. Pin Configurations

Pin	Controller Mode		Peripheral Mode	
SPICLK	Drives the clock to external devices		Receives the clock from the external controller	
SPIPSOCI	Receives data from the external peripheral		Sends data to the external controller	
SPIPICO	Transmits data to the external peripheral		Receives data from the external controller	
$\overline{\text{SPIENA}}$	**$\overline{\text{SPIENA}}$ disabled:** GIO	**$\overline{\text{SPIENA}}$ enabled:** Receives ENA signal from the external peripheral	**$\overline{\text{SPIENA}}$ disabled:** GIO	**$\overline{\text{SPIENA}}$ enabled:** Drives ENA signal from the external controller
$\overline{\text{SPICS}}$	**$\overline{\text{SPICS}}$ disabled:** GIO	**$\overline{\text{SPICS}}$ enabled:** Selects one or more peripheral devices	**$\overline{\text{SPICS}}$ disabled:** GIO	**$\overline{\text{SPICS}}$ enabled:** Receives the CS signal from the external controller

13.2.2 Data Handling

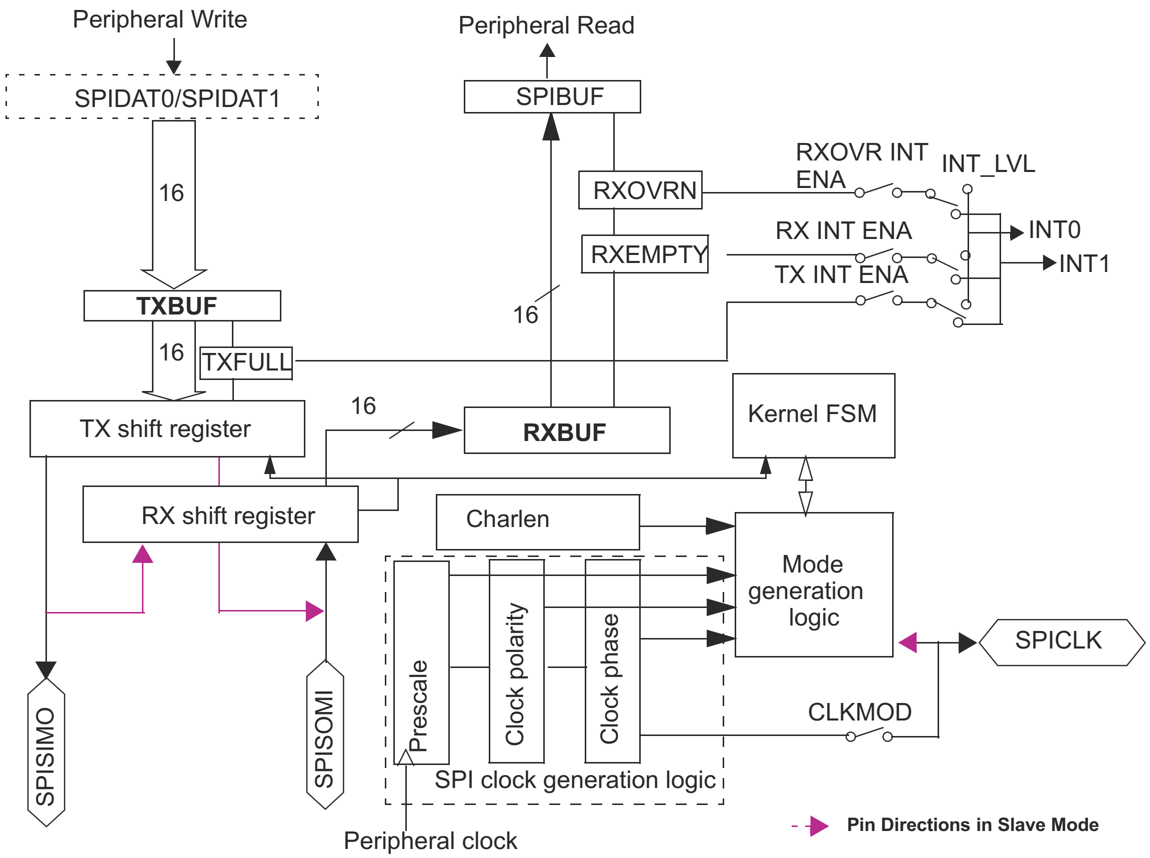
Figure 13-1 shows the SPI transaction hardware. TXBUF and RXBUF are internal buffers that are intended to improve the overall throughput of data transfer. TXBUF is a transmit buffer, while RXBUF is a receive buffer.

13.2.2.1 Data Sequencing when SPIDAT0 or SPIDAT1 is Written

- If both the TX shift register and TXBUF are empty, then the data is directly copied to the TX shift register. For devices with DMA, if DMA is enabled, a transmit DMA request (TX_DMA_REQ) is generated to cause the next word to be fetched. If transmit interrupts are enabled, a transmitter-empty interrupt is generated.
- If the TX shift register is already full or is in the process of shifting and if TXBUF is empty then the data written to SPIDAT0 / SPIDAT1 is copied to TXBUF and TXFULL flag is set to 1 at the same time.
- When a shift operation is complete, data from the TXBUF (if it is full) is copied into TX shift register and the TXFULL flag is cleared to 0 to indicate that next data can be fetched. A transmit DMA request (if enabled) or a transmitter-empty interrupt (if enabled) is generated at the same time.

13.2.2.2 Data Sequencing when All Bits Shifted into RXSHIFT Register

- If both SPIBUF and RXBUF are empty, the received data in RX shift register is directly copied into SPIBUF and the receive DMA request (if enabled) is generated and the receive-interrupt (if enabled) is generated. The RXEMPTY flag in SPIBUF is cleared at the same time.
- If SPIBUF is already full at the end of receive completion, the RX shift register contents is copied to RXBUF. A receive DMA request is generated, if enabled. The receive complete interrupt line remains high.
- If SPIBUF is read by the CPU or DMA and if RXBUF is full, then the contents of RXBUF are copied to SPIBUF as soon as SPIBUF is read. RXEMPTY flag remains cleared, indicating that SPIBUF is still full.
- If both SPIBUF and RXBUF are full, then RXBUF will be overwritten and the RXOVR interrupt flag is set and an interrupt is generated, if enabled.



1 This is a representative diagram, which shows three-pin mode hardware.
2 TXBUF, RXBUF, and SHIFT_REGISTER are user-invisible registers.
3 SPIDAT0 and SPIDAT1 are user-visible, and are physically mapped to the contents of TXBUF.
4 SPISIMO, SPISOMI, SPICLK pin directions depend on the Master or Slave Mode.

Figure 13-1. SPI Functional Logic Diagram

13.2.2.3 Three-Pin Mode

In controller mode configuration (MASTER = 1 and CLKMOD = 1), the SPI provides the serial clock on the SPICLK pin. Data is transmitted on the SPISIMO pin and received on the SPISOMI pin (see Figure 13-2).

Data written to the shift register (SPIDAT0 / SPIDAT1) initiates data transmission on the SPISIMO pin, MSB first. Simultaneously, received data is shifted through the SPISOMI pin into the LSB of the SPIDAT0 register. When the selected number of bits have been transmitted, the received data in the shift register is transferred to the SPIBUF register for the CPU to read. Data is stored right-justified in SPIBUF.

See Section 13.2.2.1 and Section 13.2.2.2 for details about the data handling for transmit and receive operations.

In peripheral mode configuration (MASTER = 0 and CLKMOD = 0), data shifts out on the SPIPOCI pin and in on the SPIPICO pin. The SPICLK pin is used as the input for the serial shift clock, which is supplied from the external network controller. The transfer rate is defined by this clock.

Data written to the SPIDAT0 or SPIDAT1 register is transmitted to the network when the SPICLK signal is received from the network controller. To receive data, the SPI waits for the network controller to send the SPICLK signal and then shifts data on the SPISIMO pin into the RX shift register. If data is to be transmitted by the peripheral simultaneously, it must be written to the SPIDAT0 or SPIDAT1 register before the beginning of the SPICLK signal.

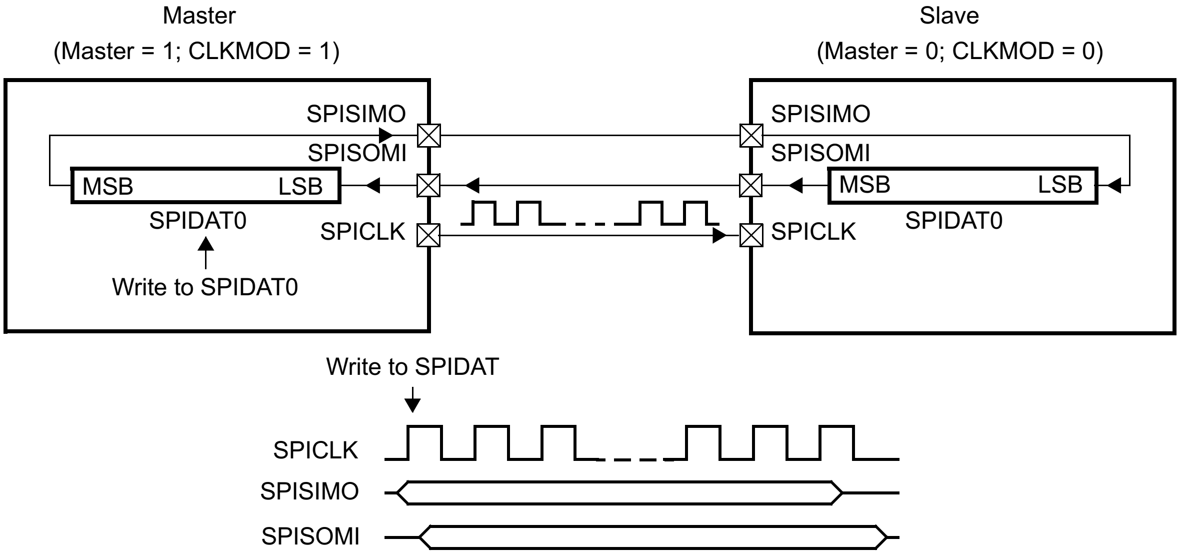


Figure 13-2. SPI Three-Pin Operation

13.2.3 Operation with $\overline{\text{SPICS}}$

In controller mode, each chip select signal is used to select a specific peripheral. In peripheral mode, the chip select signal is used to enable and disable the transfer. Chip-select functionality is enabled by setting one of the $\overline{\text{SPICS}}$ pins as a chip select. It is disabled by setting all $\overline{\text{SPICS}}$ pins as GIOs in SPIPC0.

13.2.3.1 Multiple Chip Selects

The $\overline{\text{SPICS}}$ pins that are used must be configured as functional pins in the SPIPC0 register. The default pattern to be put on the $\overline{\text{SPICS}}$ when all the peripherals are deactivated is set in the SPIDEF register. This pattern allows different peripherals with different chip-select polarity to be activated by the SPI.

The controller-mode SPI is capable of driving either 0 or 1 as the active value for any $\overline{\text{SPICS}}$ output pin. The drive state for the $\overline{\text{SPICS}}$ pins is controlled by the CSNR field of SPIDAT1. The pattern that is driven will select the peripheral to which the transmission is dedicated.

In peripheral mode, the SPI can only be selected by an active value of 0 on any of its selected $\overline{\text{SPICS}}$ input pins.

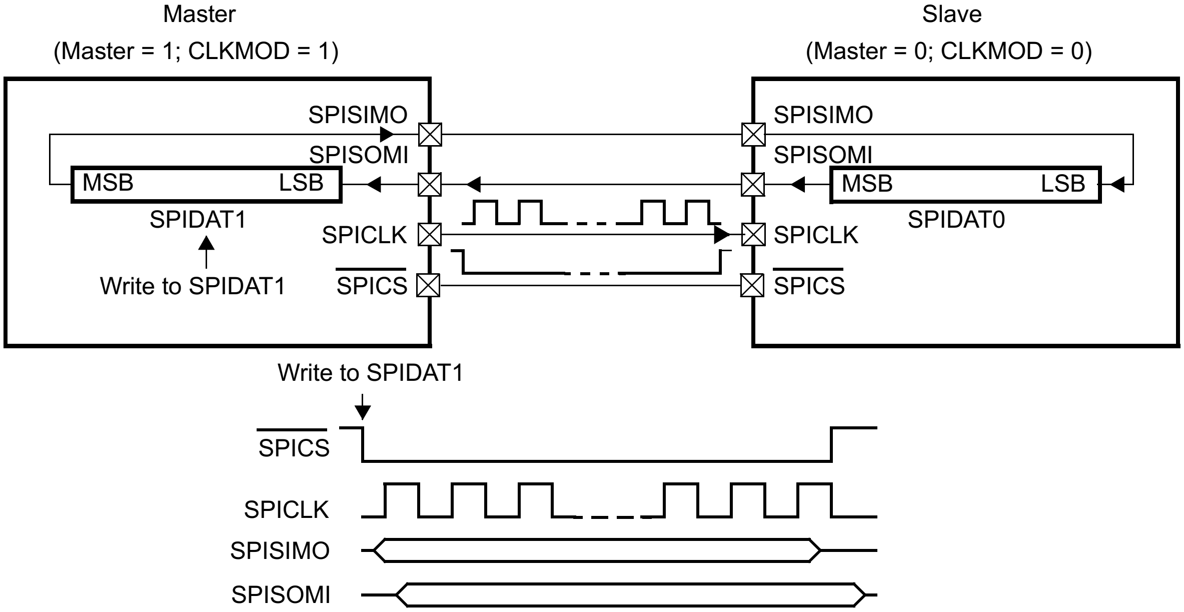

Figure 13-3. Operation with $\overline{\text{SPICS}}$

13.2.4 Operation with SPIENA

The SPIENA operates as a WAIT signal pin. For both the peripheral and the controller, the SPIENA pin must be configured to be functional (SPIPC0[8] = 1). In this mode, an active-low signal from the peripheral on the SPIENA pin allows the controller SPI to drive the clock pulse stream. A high signal tells the controller to hold the clock signal (and delay SPI activity).

If the SPIENA pin is in high-impedance mode (ENABLE_HIGHZ = 1), the peripheral will put SPIENA into the high-impedance once it completes receiving a new character. If the SPIENA pin is in push-pull mode (ENABLE_HIGHZ = 0), the peripheral will drive SPIENA to 1 once it completes receiving a new character. The peripheral will drive SPIENA low again for the next word to transfer, after new data is written to the peripheral TX shift register.

In controller mode (CLKMOD = 1), if the SPIENA pin is configured as functional, then the pin acts as an input pin. If configured as a peripheral SPI and as functional, the SPIENA pin acts as an output pin.

Note

During a transfer, if a peripheral-mode SPI detects a deassertion of its chip select before its internal character length counter overflows, then it places SPISOMI and SPIENA (if ENABLE_HIGHZ bit is set to 1) in high-impedance mode. Once this condition has occurred, if a SPICLK edge is detected while the chip select is deasserted, then the SPI stops that transfer and sets an DLENERR error flag and generates an interrupt (if enabled).

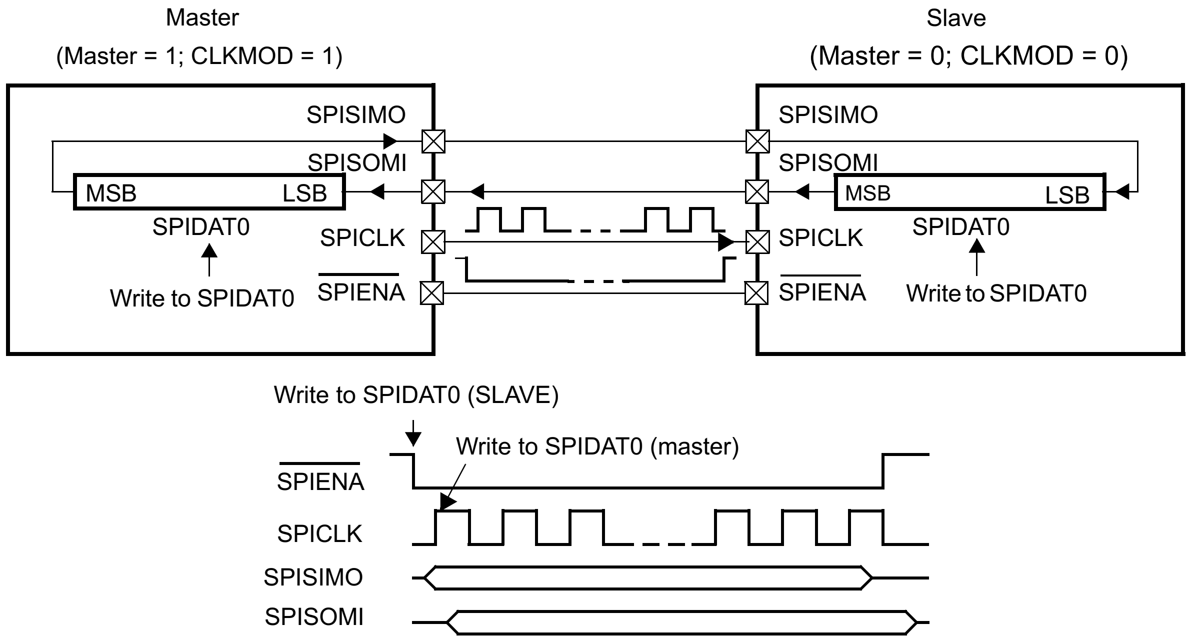

Figure 13-4. Operation with SPIENA

13.2.5 Five-Pin Operation (Hardware Handshaking)

Five-pin operation combines the functionality of three-pin mode, plus the enable pin and one or more chip select pins. The result is full hardware handshaking. To use this mode, both the $\overline{\text{SPIENA}}$ pin and the required number of $\overline{\text{SPICS}}$ pins must be configured as functional pins.

If the $\overline{\text{SPIENA}}$ pin is in high-impedance mode (ENABLE_HIGHZ = 1), the peripheral SPI will put this signal into the high-impedance state by default. The peripheral will drive the signal $\overline{\text{SPIENA}}$ low when new data is written to the peripheral shift register and the peripheral has been selected by the controller ($\overline{\text{SPICS}}$ is low).

If the $\overline{\text{SPIENA}}$ pin is in push-pull mode (ENABLE_HIGHZ = 0), the peripheral SPI drives this pin high by default when it is in functional mode. The peripheral SPI will drive the $\overline{\text{SPIENA}}$ signal low when new data is written to the peripheral shift register (SPIDAT0/SPIDAT1) and the peripheral is selected by the controller ($\overline{\text{SPICS}}$ is low). If the peripheral is deselected by the controller ($\overline{\text{SPICS}}$ goes high), the peripheral $\overline{\text{SPIENA}}$ signal is driven high.

Note

Push-pull mode of the $\overline{\text{SPIENA}}$ pin can be used only when there is a single peripheral in the system. When multiple SPI peripheral devices are connected to the common $\overline{\text{SPIENA}}$ pin, all of the peripherals should configure their $\overline{\text{SPIENA}}$ pins in high-impedance mode.

In controller mode, if the $\overline{\text{SPICS}}$ pins are configured as functional pins, then the pins will be in output mode. A write to the controller's SPIDAT1/SPIDAT0 register will automatically drive the $\overline{\text{SPICS}}$ signals low. The controller will drive the $\overline{\text{SPICS}}$ signals high again after completing the transfer of the bits of the data.

In peripheral mode (CLKMOD = 0), the $\overline{\text{SPICS}}$ pins act as SPI functional inputs.

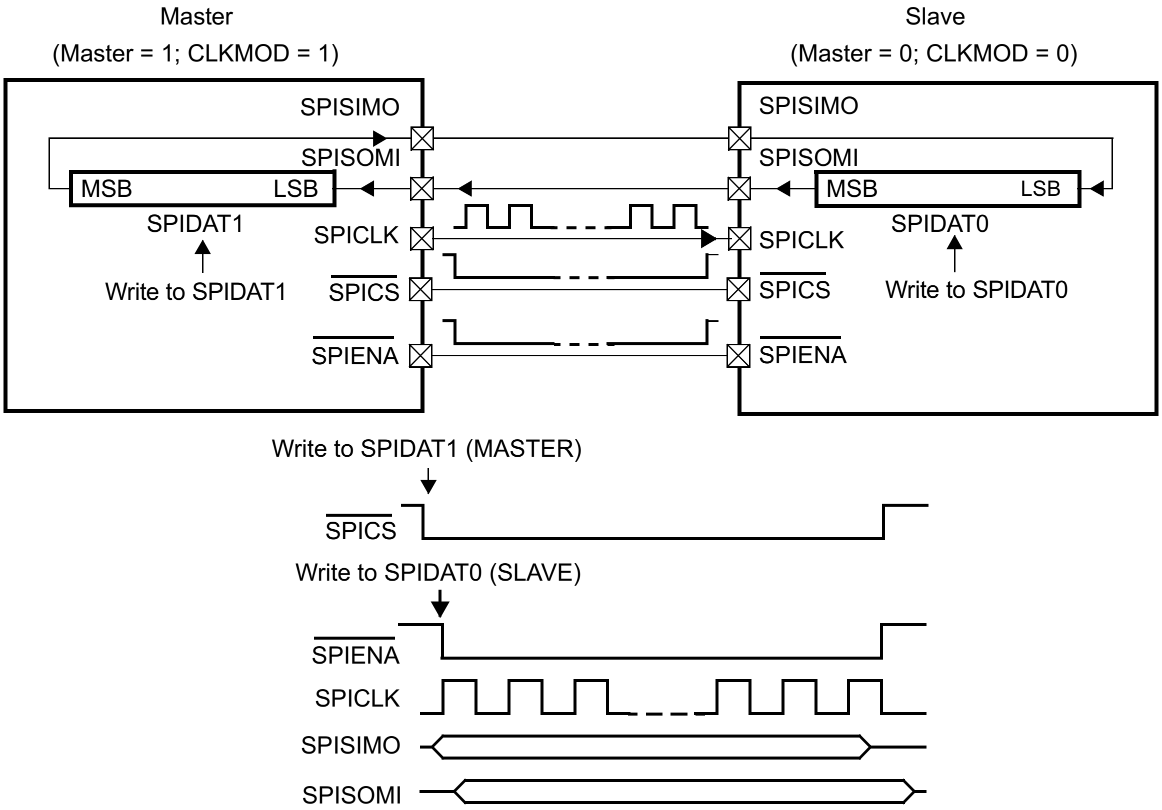

Figure 13-5. SPI Five-Pin Option with $\overline{\text{SPIENA}}$ and $\overline{\text{SPICS}}$

13.2.6 Data Formats

To support multiple different types of peripherals in one SPI network, four independent data word formats are implemented that allow configuration of individual data word length, polarity, phase, and bit rate. Each word transmitted can select which data format to use via the bits DFSEL[1:0] in its control field from one of the four data word formats. Same data format can be supported on multiple chip selects.

Data formats 0, 1, 2, and 3 can be configured through SPIFMTx control registers.

Each SPI data format includes the standard SPI data format with enhanced features:

- Individually-configurable shift direction can be used to select MSB first or LSB first, whereas the position of the MSB depends on the configured data word length.
- Receive data is automatically right-aligned, independent of shift direction and data word length. Transmit data has to be written right-aligned into the SPI and the internal shift register will transmit according to the selected shift direction and data word length for correct transfer.
- To increase fault detection of data transmission and reception, an odd or even parity bit can be added at the end of a data word. The parity generator can be enabled or disabled individually for each data format. If a received parity bit does not match with the locally calculated parity bit, the parity error flag (PARITYERR) is set and an interrupt is asserted (if enabled).

Since the controller-mode SPI can drive two consecutive accesses to the same peripheral, an 8-bit delay counter is available to satisfy the delay time for data to be refreshed in the accessed peripheral. The delay counter can be programmed as part of the data format.

CHARLEN[4:0] specifies the number of bits (2 to 16) in the data word. The CHARLEN[4:0] value directs the state control logic to count the number of bits received or transmitted to determine when a complete word is transferred.

Data word length **must** be programmed to the same length for both the **controller** and the **peripheral**. However, when chip selects are used, there may be multiple targets with different lengths in the system.

Note

Data must be right-justified when it is written to the SPI for transmission irrespective of its character length or word length.

Figure 13-6 shows how a 12-bit word (0xEC9) needs to be written to the transmit buffer to be transmitted correctly.

Figure 13-6. Format for Transmitting an 12-Bit Word

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
x	x	x	x	1	1	1	0	1	1	0	0	1	0	0	1

Note

The received data is always stored right-justified regardless of the character length or direction of shifting and is padded with leading 0s when the character length is less than 16 bits.

Figure 13-7 shows how a 10-bit word (0x0A2) is stored in the buffer once it is received.

Figure 13-7. Format for Receiving an 10-Bit Word

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	0	1	0	1	0	0	0	1	0

13.2.7 Clocking Modes

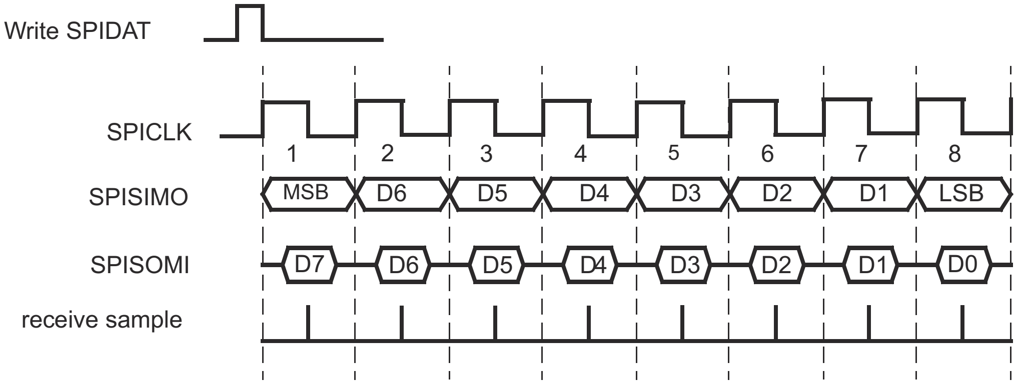
SPICLK may operate in four different modes, depending on the choice of phase (delay/no delay) and the polarity (rising edge/falling edge) of the clock.

The data input and output edges depend on the values of both POLARITY and PHASE as shown in Table 13-2.

Table 13-2. Clocking Modes

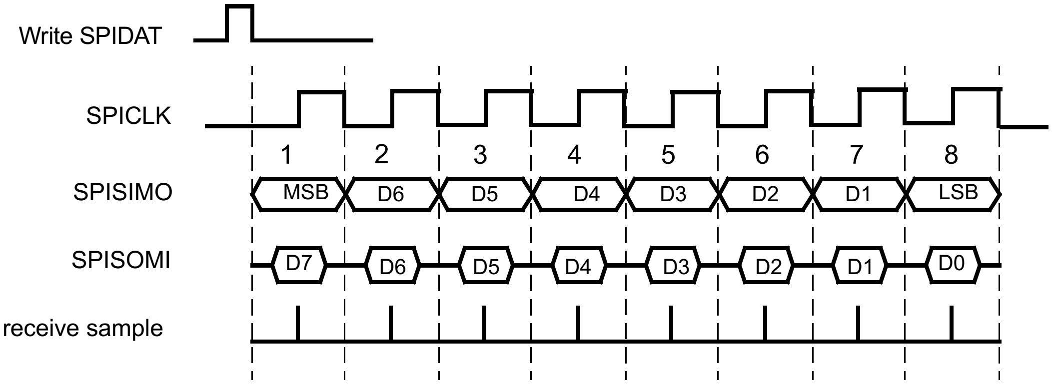
POLARITY	PHASE	Action
0	0	Data is output on the rising edge of SPICLK. Input data is latched on the falling edge.
0	1	Data is output one half-cycle before the first rising edge of SPICLK and on subsequent falling edges. Input data is latched on the rising edge of SPICLK.
1	0	Data is output on the falling edge of SPICLK. Input data is latched on the rising edge.
1	1	Data is output one half-cycle before the first falling edge of SPICLK and on subsequent rising edges. Input data is latched on the falling edge of SPICLK.

Figure 13-8 to Figure 13-11 illustrate the four possible configurations of **SPICLK** corresponding to each mode. Having four signal options allows the SPI to interface with many different types of serial devices.



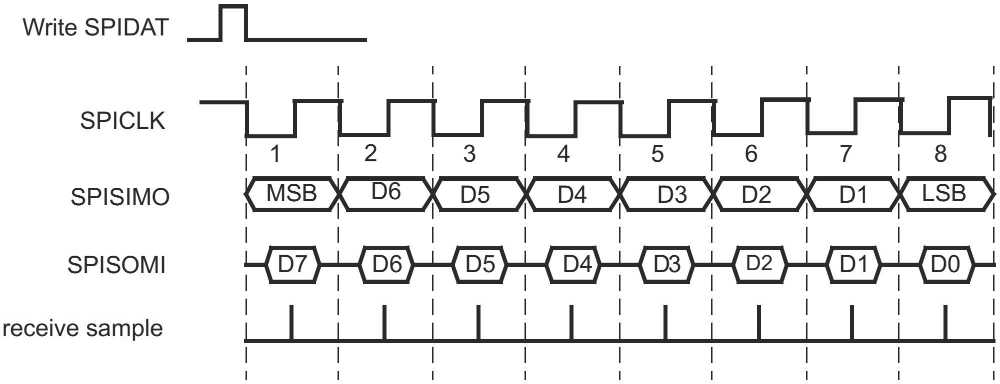
Data is output on the rising edge of SPICLK.
Input data is latched on the falling edge of SPICLK.

Figure 13-8. Clock Mode with Polarity = 0 and Phase = 0



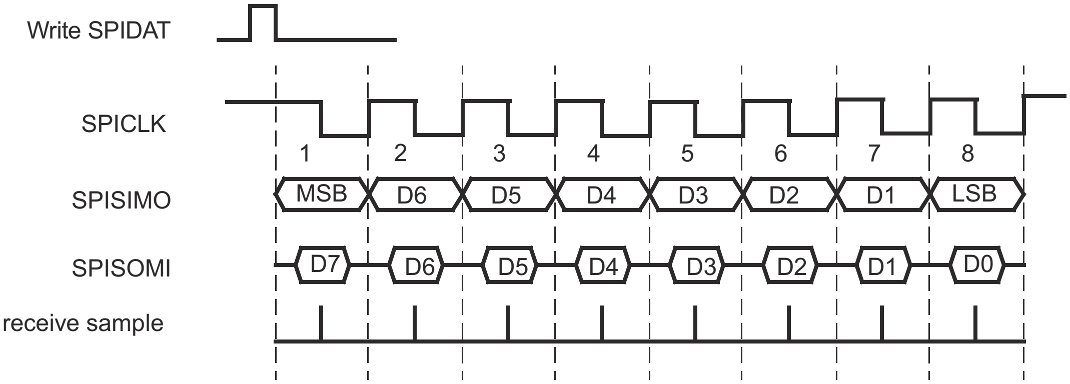
Data is output one-half cycle before the first rising edge of SPICLK and on subsequent falling edges of SPICLK
Input data is latched on the rising edge of SPICLK

Figure 13-9. Clock Mode with Polarity = 0 and Phase = 1



Data is output on the falling edge of SPICLK.
Input data is latched on the rising edge of SPICLK.

Figure 13-10. Clock Mode with Polarity = 1 and Phase = 0



Data is output one-half cycle before the first falling edge of SPICLK and on the subsequent rising edges of SPICLK.
Input data is latched on the falling edge of SPICLK.

Figure 13-11. Clock Mode with Polarity = 1 and Phase = 1

13.2.8 Data Transfer Example

Figure 13-12 illustrates a SPI data transfer between two devices using a character length of five bits.

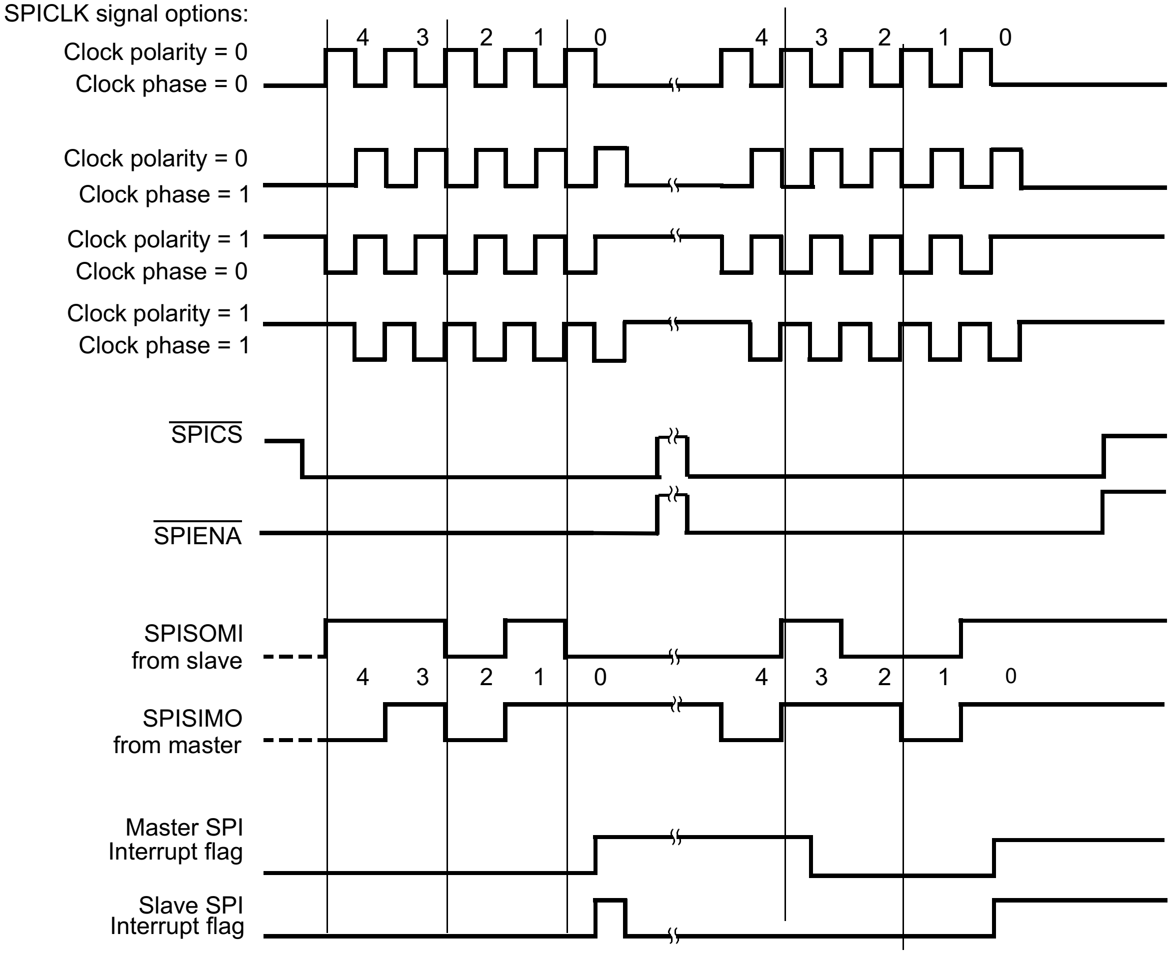


Figure 13-12. Five Bits per Character (5-Pin Option)

13.2.9 Decoded and Encoded Chip Select (Controller Only)

In this device, the SPI can connect to up to 6 individual peripheral devices using chip-selects by routing one wire to each peripheral. The 6 chip selects in the control field are directly connected to the 6 pins. The default value of each chip select (not active) can be configured via the register CSDEF. During a transmission, the value of the chip select control field (CSNR) of the SPIDAT1 register (SPIDAT1) is driven on the $\overline{\text{SPICS}}$ pins. When the transmission finishes, the default chip-select value (defined by the CSDEF register) is put on the $\overline{\text{SPICS}}$ pins.

The SPI can support more than 6 slaves by using encoded chip selects. To connect the SPI with encoded slaves devices, the CSNR field allows multiple active $\overline{\text{SPICS}}$ pins at the same time, which enables encoded chip selects from 0 to 16. To use encoded chip selects, all 6 chip select lines have to be connected to each peripheral device and each peripheral needs to have a unique chip-select address. The CSDEF register is used to provide the address at which slaves devices are all de-selected.

Users can combine decoded and encoded chip selects. For example, *n* $\overline{\text{SPICS}}$ pins can be used for encoding an *n*-bit address and the remaining pins can be connected to decoded-mode slaves.

13.2.10 Variable Chip Select Setup and Hold Timing (Controller Only)

In order to support slow peripheral devices, a delay counter can be configured to delay data transmission after the chip select is activated. A second delay counter can be configured to delay the chip select deactivation after the last data bit is transferred. Both delay counters are clocked with the peripheral clock (VCLK).

If a particular data format specifically does not require these additional set-up or hold times for the chip select pins, then they can be disabled in the corresponding SPIFMTx register.

13.2.11 Hold Chip-Select Active

Some peripheral devices require the chip select signal to be held continuously active during several consecutive data word transfers. Other peripheral devices require the chip select signal to be deactivated between consecutive data word transfers.

CSHOLD is programmable in both controller and peripheral modes of the multi-buffer mode of SPI. However, the meaning of CSHOLD in controller mode and peripheral mode are different.

Note

If the CSHOLD bit is set within the current data control field, the programmed hold time and the following programmed set-up time will not be applied between transactions.

13.2.11.1 CSHOLD Bit in Controller Mode

Each word in a controller-mode SPI can be individually initialized for one of the two modes via the CSHOLD bit in its control field.

If the CSHOLD bit is set in the control field of a word, the chip select signal will not be deactivated until the next control field is loaded with new chip select information. Since the chip-select is maintained active between two transfers, the chip-select hold delay (T2CDELAY) is not applied at the end of the current transaction, and the chip-select set-up time delay (C2TDELAY) is not applied as well at the beginning of the following transaction. However, the wait delay (WDELAY) will be still applied between the two transactions, if the WDEL bit is set within the control field.

Figure 13-13 shows the SPI pins when a controller-mode SPI transfers a word that has its CSHOLD bit set. The chip-select pins will not be deasserted after the completion of this word. If the next word to transmit has the same chip-select number (CSNR) value, the chip select pins will be maintained until the completion of the second word, regardless of whether the CSHOLD bit is set or not.

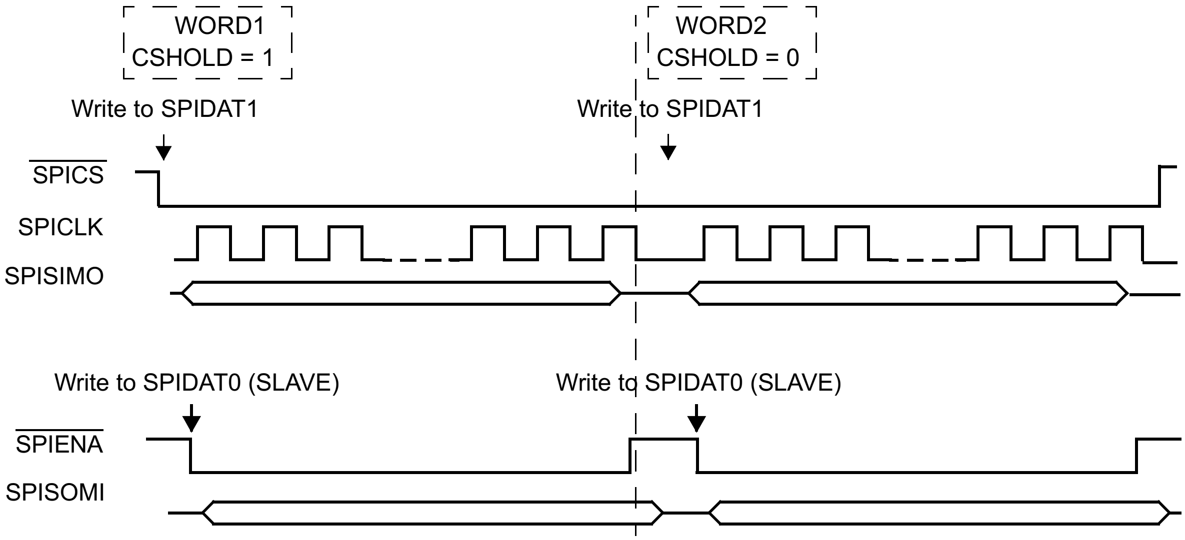

Figure 13-13. Typical Diagram when a Buffer in controller is in CSHOLD Mode (SPI-SPI)

13.2.11.2 CSHOLD Bit in Peripheral Mode (Multi-buffered Mode)

If the CSHOLD bit in a buffer is set to 1, then the MibSPI does not wait for the SPICS pins to be de-activated at the end of the shift operation to copy the received data to the receive RAM. With this feature, it is possible for a peripheral in multi-buffer mode to do multiple data transfers without requiring the SPICS pins to be deasserted between two buffer transfers.

If the CSHOLD bit in a buffer is cleared to 0 in a peripheral MibSPI, even after the shift operation is done, the MibSPI waits until the SPICS pin (if functional) is deasserted to copy the received data to the RXRAM.

If the CSHOLD bit is maintained as 0 across all the buffers, then the peripheral in multi-buffer mode requires its SPICS pins to be deasserted between any two buffer transfers; otherwise, the peripheral SPI will be unable to respond to the next data transfer.

Note

In compatibility mode, the peripheral does not require the SPICS pin to be deasserted between two buffer transfers. The CSHOLD bit of the peripheral will be ignored in compatibility mode.

13.2.12 Detection of Peripheral Desynchronization (Controller Only)

When a peripheral supports generation of an enable signal (ENA), desynchronization can be detected. With the enable signal a peripheral indicates to the controller that it is ready to exchange data. A desynchronization can occur if one or more clock edges are missed by the peripheral. In this case, the peripheral may block the SOMI line until it detects clock edges corresponding to the next data word. This would corrupt the data word of the desynchronized peripheral and the consecutive data word. A configurable 8-bit time-out counter (T2EDELAY), which is clocked with SPICLK, is implemented to detect this peripheral malfunction. After the transmission has finished (end of last bit transferred: either last data bit or parity bit) the counter is started. If the ENA signal generated by the peripheral does not become inactive before the counter overflows, the DESYNC flag is set and an interrupt is asserted (if enabled).

Note

Inconsistency of Desynchronization Flag in Compatibility Mode MibSPI

Because of the nature of this error, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is due to the fact that receive completion flag/interrupt will be generated when the buffer transfer is completed. But desync will be detected after the buffer transfer is completed. So, if VBUS controller reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. This inconsistency in the desync flag is valid only in compatibility mode of MibSPI. In multi-buffer mode, the desync flag is always assured to be for the current buffer.

13.2.13 ENA Signal Time-Out (Controller Only)

The SPI in controller mode waits for the hardware handshake signal (ENA) coming from the addressed peripheral before performing a data transfer. To avoid stalling the SPI by a non-responsive peripheral device, a time-out value can be configured using C2EDELAY. If the time-out counter overflows before an active ENA signal is sampled, the TIMEOUT flag in the status register SPIFLG is set and the TIMEOUT flag in the status field of the corresponding buffer is set.

Note

When the chip select signal becomes active, no breaks in transmission are allowed. The next arbitration is performed while waiting for the time-out to occur.

13.2.14 Data-Length Error

A SPI can generate an error flag by detecting any mismatch in length of received or transmitted data and the programmed character length under certain conditions.

Data-Length Error in Controller Mode: During a data transfer, if the SPI detects a de-assertion of the $\overline{\text{SPIENA}}$ pin (by the peripheral) while the character counter is not overflowed, then an error flag is set to indicate a data-length error. This can be caused by a peripheral receiving extra clocks (for example, due to noise on the SPICLK line).

Note

In a controller mode SPI, the data length error will be generated only if the $\overline{\text{SPIENA}}$ pin is enabled as a functional pin.

Data-Length Error in peripheral Mode: During a transfer, if the SPI detects a de-assertion of the $\overline{\text{SPICS}}$ pin before its character length counter overflows, then an error flag is set to indicate a data-length error. This situation can arise If the peripheral SPI misses one or more SPICLK pulses from the controller. This error in peripheral mode implies that both the transmitted and received data were not complete.

Note

In a peripheral mode SPI, the data-length error flag will be generated only if at least one of the $\overline{\text{SPICS}}$ pins are configured as functional, and are being used for selecting the peripheral.

13.2.15 Parallel Mode (Multiple PICO/POCI Support, not available on all devices)

In order to increase throughput, the parallel mode of the SPI enables the module to send data over more than one data line (parallel 2, 4, or 8). When parallel mode is used, the data length must be set as 16 bits. Only module MIBSPIP5 supports Parallel Mode.

This feature increases throughput by 2 for 2 pins, by 4 for 4 pins, or by 8 for 8 pins.

Parallel mode supports the following features:

- Scalable data lines (1, 2, 4, 8) per direction. (POCI and PICO lines)
- All clock schemes are supported (clock phase and polarity)
- Parity is supported. The parity bit will be transmitted on bit0 of the PICO/POCI lines. The receive parity is expected on bit0 of the POCI/PICO pins.

Parallel mode can be programmed using the PMODEx bits of SPIPMCTRL register. See Section 13.9.26 for details about this register.

After reset the parallel mode selection bits are cleared (single PICO/POCI lines).

13.2.15.1 Parallel Mode Block Diagram

Figure 13-14 and Figure 13-15 show the parallel connections to the SPI shift register.

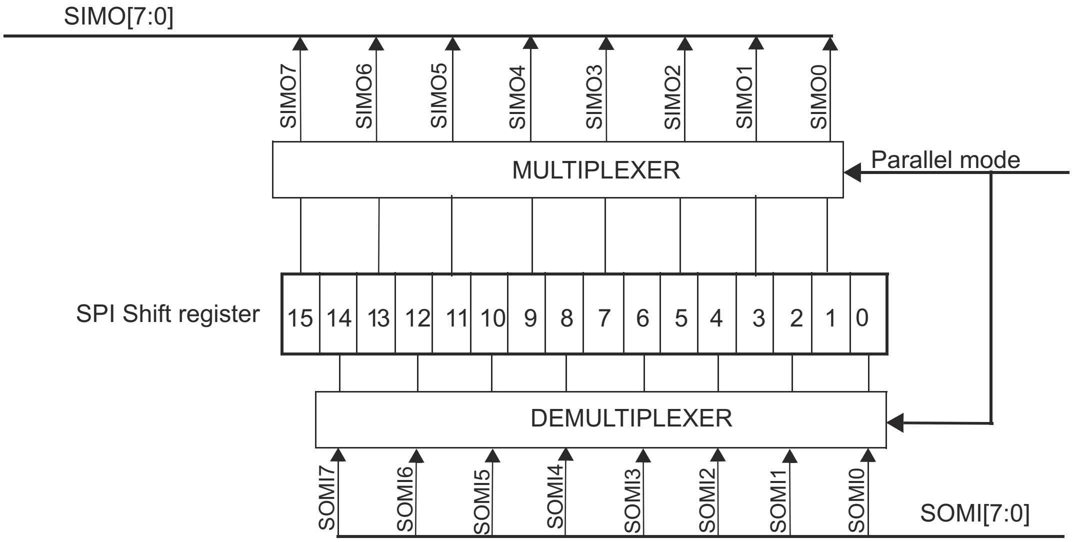

Figure 13-14. Block Diagram Shift Register, MSB First

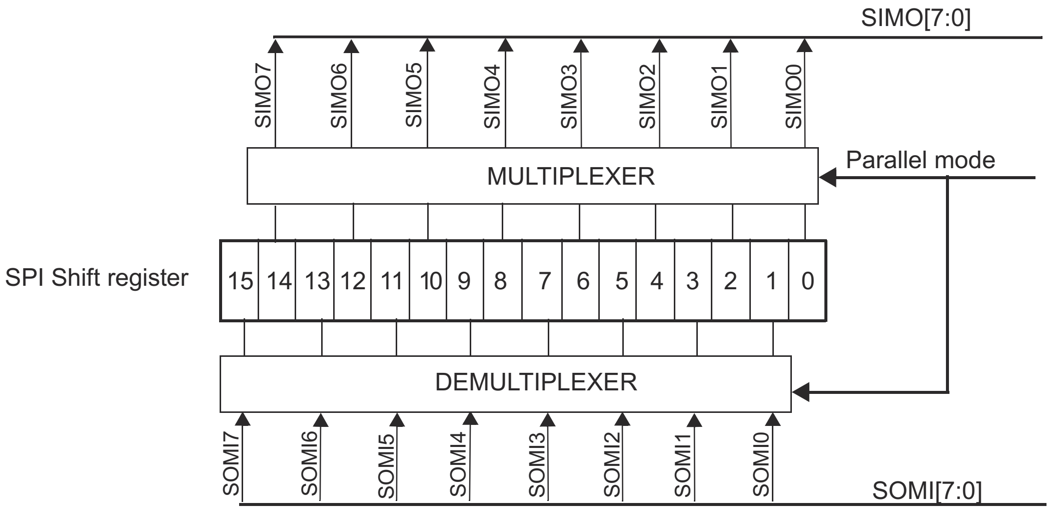

Figure 13-15. Block Diagram Shift Register, LSB First

13.2.15.2 Parallel Mode Pin Mapping, MSB First

Table 13-3 and Table 13-4 describe the POCI and PICO pin mapping when the SPI is used in parallel mode (1, 2, 4, 8) pin mode, MSB first.

Note

MSB-first or LSB-first can be configured using the SHIFTDIRx bit of the SPIFMTx registers.

Table 13-3. Pin Mapping for PICO Pin with MSB First

Parallel Mode	Shift Register Bit	PICO[7:0]
1	15	0
2	15	1

13.2.15.4 2-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 2-data line mode (controller mode) the shift register bits 15 and 7 will be connected to the pins PICO[1] and PICO[0], and the shift register bits 8 and 0 will be connected to the pins POCI[1] and POCI[0] or vice versa in peripheral mode. After writing to the SPIDAT0/SPIDAT1 register, the bits 15 and 7 will be output on PICO[1] and PICO[0] on the rising edge if SPICLK. With the falling clock edge of the SPICLK, the received data on POCI[1] and POCI[0] will be latched to the shift register bits 8 and 0. The subsequent rising edge of SPICLK will shift the data in the shift register by 1 bit to the left. (PICO[1] will shift the data out from bit 15 to 8, PICO[0] will shift the data out from bit 7 to 0). After eight SPICLK cycles, when the full data word is transferred, the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set. Figure 13-16 shows the clock/data diagram of the 2-data line mode. Figure 13-17 shows the timing of a two-pin parallel transfer.

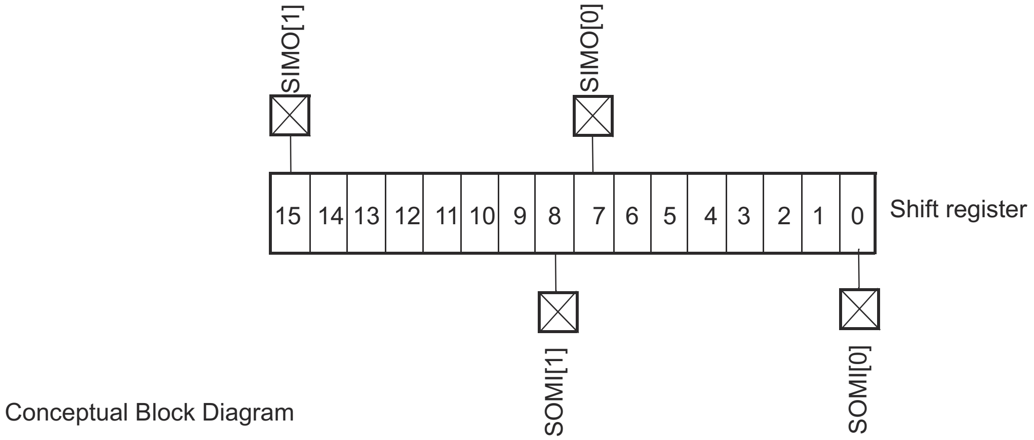

Figure 13-16. 2-data Line Mode (Phase 0, Polarity 0)

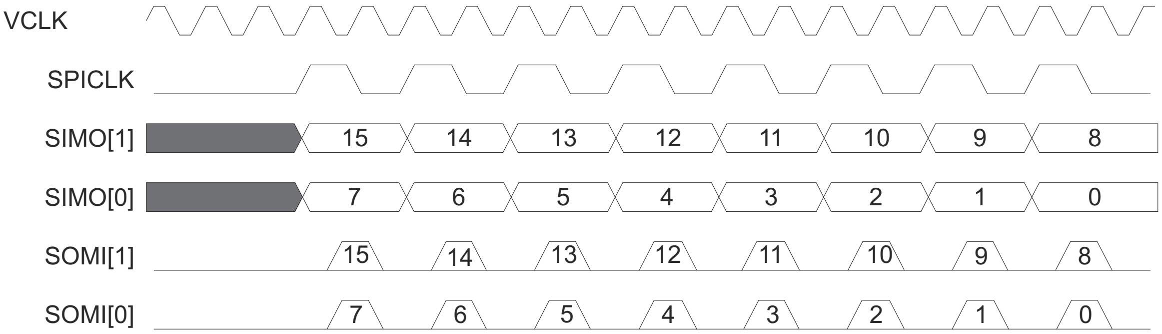

Figure 13-17. Two-Pin Parallel Mode Timing Diagram (Phase 0, Polarity 0)

13.2.15.5 4-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 4-data line mode (controller mode) the shift register bits 15, 11, 7, and 3 will be connected to the pins SIMO[3], SIMO[2], SIMO[1], and SIMO[0], and the shift register bits 12, 8, 4, and 0 will be connected to the pins SOMI[3], SOMI[2], SOMI[1], and SOMI[0] (or vice versa in peripheral mode). After writing to SPIDAT1/SPIDAT0, the bits 15, 11, 7, and 3 will be output on SIMO[3], SIMO[2], SIMO[1], and SIMO[0] on the rising edge of SPICLK. With the falling clock edge of the SPICLK, the received data on SOMI[3], SOMI[2], SOMI[1] and SOMI[0] will be latched to shift register bits 12, 8, 4, and 0. The subsequent rising edge of SPICLK will shift data in the shift register by 1 bit to the left (SIMO[3] will shift the data out from bit 15 to 12, SIMO[2] will shift the data out from bit 11 to 8, SIMO[1] will shift the data out from bit 7 to 4, SIMO[0] will shift the data out from bit 3 to 0). After four SPICLK cycles, when the full data word is transferred, the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set.

Figure 13-18 shows the clock/data diagram of the four-data line mode. Figure 13-19, shows the timing diagram for four-data line mode.

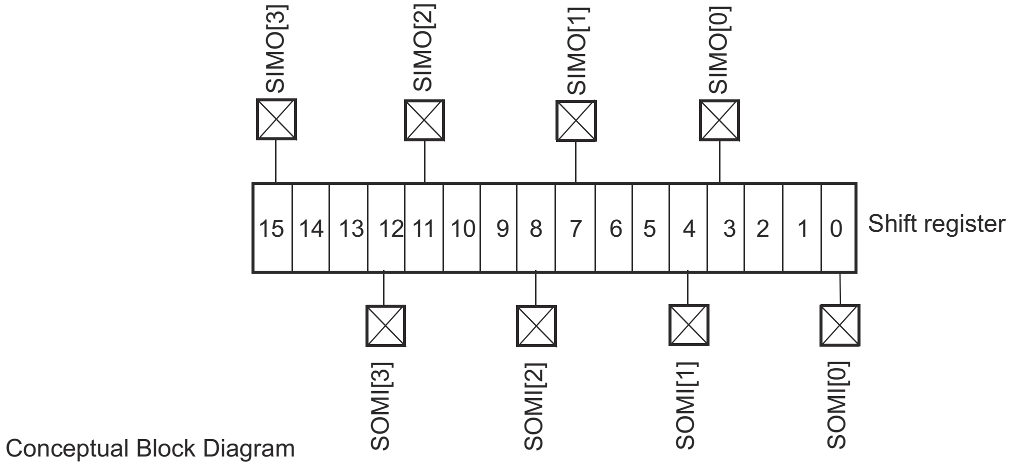

Figure 13-18. 4-Data Line Mode (Phase 0, Polarity 0)

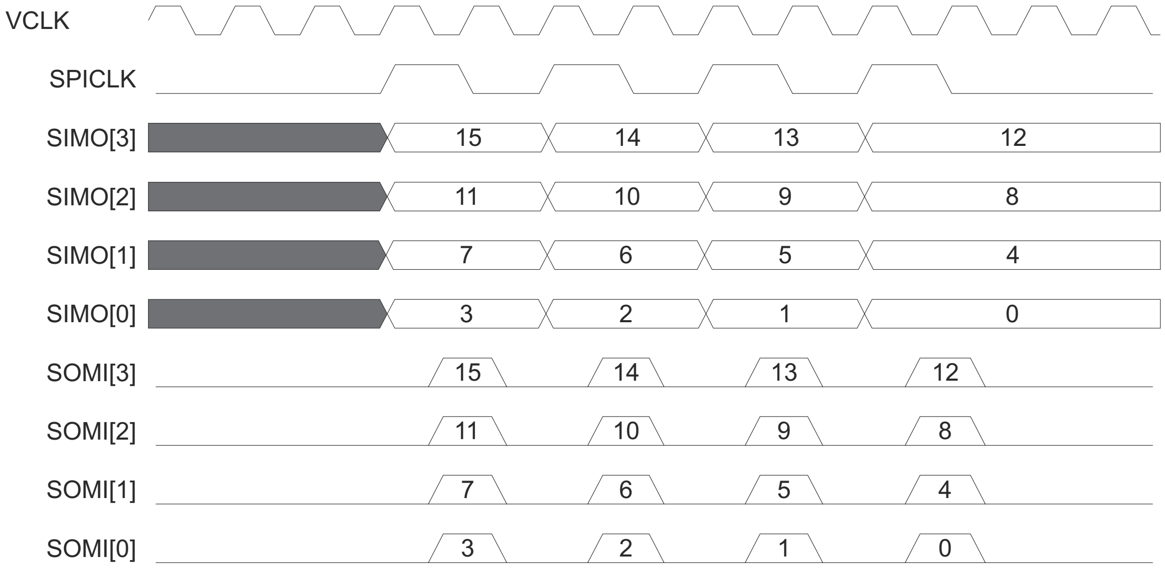

Figure 13-19. 4 Pins Parallel Mode Timing Diagram (Phase 0, Polarity 0)

13.2.15.6 8-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 8-data line mode (controller mode) the shift register bits 15, 13, 11, 9, 7, 5 and 3 will be connected to the pins PICO[7], PICO[6], PICO[5], PICO[4], PICO[3], PICO[2], PICO[1], and PICO[0], and the shift-register bits 14, 12, 10, 8, 6, 4, and 0 will be connected to the pins POCI[7], POCI[6], POCI[5], POCI[4], POCI[3], POCI[2], POCI[1], and POCI[0] (or vice versa in peripheral mode).

After writing to SPIDAT0/SPIDAT1, the bits 15, 13, 11, 9, 7, 5, 3, and 1 will be output on PICO[7], PICO[6], PICO[5], PICO[4], PICO[3], PICO[2], PICO[1], and PICO[0], on the rising edge of SPICLK. On the falling clock edge of the SPICLK, the received data on POCI[8], POCI[7], POCI[6],POCI[5], POCI[4], POCI[3], POCI[2], POCI[1], and POCI[0] will be latched to the shift register bits 14, 12, 10, 8, 6, 4, 2, and 0.

The subsequent rising edge of SPICLK will shift the data in the shift register by 1 bit to the left. After two SPICLK cycles, when the full data word is transferred the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set. Figure 13-20 shows the clock/data diagram of the 8-data line mode. Figure 13-21 shows the pin timings for 8-data line mode.

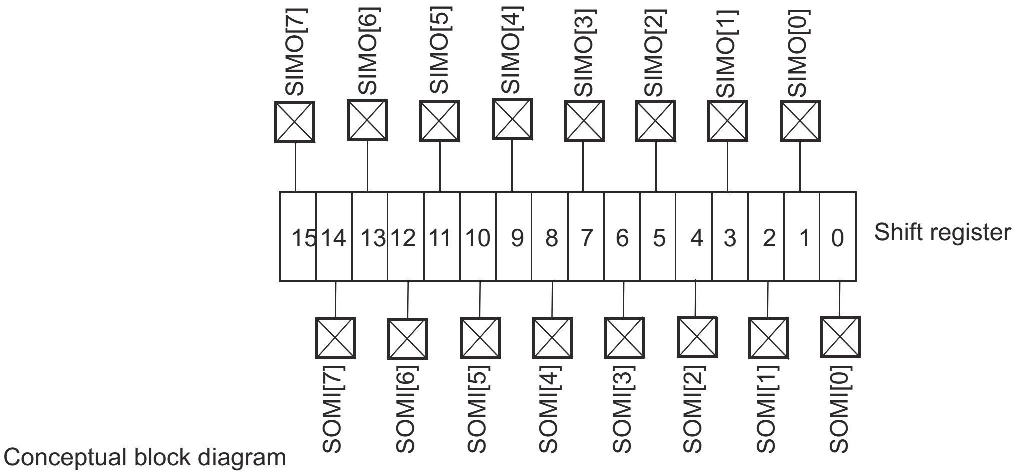

Figure 13-20. 8-data Line Mode (Phase 0, Polarity 0)

Note

Parity Support

Using the parity support in parallel mode may seriously affect throughput. For an eight-line mode to transfer 16 bits of data, only two SPICLK pulses are enough. If parity is enabled, one extra SPICLK pulse will be used to transfer and receive the parity bit. Parity will be transmitted and received on the 0th line regardless of 1/2/4/8-line modes. During the parity bit transfer, other data bits are not valid.

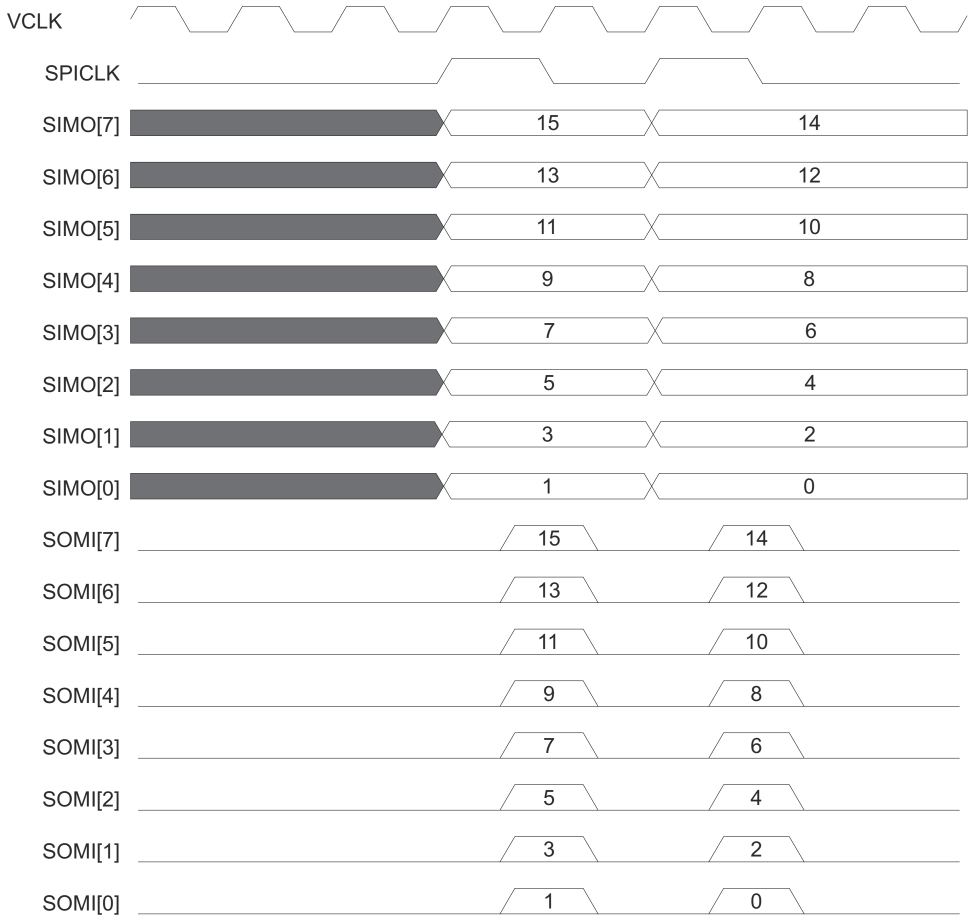

Figure 13-21. 8 Pins Parallel Mode Timing Diagram (Phase 0, Polarity 0)

Note

Modulo Count Parallel Mode is not supported in this device.

13.2.16 Continuous Self-Test (Controller/Peripheral)

During data transfer, the SPI compares its own internal transmit data with its transmit data on the bus. The sample point for the compare is at one-half SPI clock after transmit point. If the data on the bus does not match the expected value, the bit-error (BITERR) flag is set and an interrupt is asserted if enabled.

Note

The compare is made from the output pin using its input buffer.

13.2.17 Half Duplex Mode

SPI by protocol is Full Duplex in nature, which means simultaneous TX and RX operations happen on two separate data pins, SIMO and SOMI. However, it is possible to use SPI/MibSPI to do the TX-only operation (ignoring the RX data) and the RX-only operation (using dummy TX data and ignoring the TX pin). But this requires that both SOMI and SIMO lines are bonded out in a chip to be able to support both TX-only or RX-only features.

13.2.17.1 Half Duplex Mode in Master

The Half Duplex Mode gives an additional flexibility to use the SIMO pin, which is normally used as a TX pin in Controller mode, to work like an RX pin while the HDUPLEX_ENAx bit in SPIFMTx register is set to 1. In Half Duplex Controller mode, the SIMO pin acts as an RX pin. Switching between Full Duplex and Half Duplex can be achieved using the SPIFMTx register being selected using the DFSEL bit of SPIDAT1 register or TXRAM locations.

13.2.17.2 Half Duplex Mode in Peripheral

In Half Duplex Peripheral mode, the SIMO pin, which is normally an RX pin, acts as a TX pin while the HDUPLEX_ENAx bit in SPIFMTx register is set to 1. In Half Duplex Peripheral mode, the SIMO pin acts as a TX pin. Switching between Full Duplex and Half Duplex can be achieved using the SPIFMTx register being selected using the DFSEL bit of SPIDAT1 register or TXRAM locations.

13.3 Test Features

13.3.1 Internal Loop-Back Test Mode (Controller Only)

The internal loop-back self-test mode can be utilized to test the SPI transmit and receive paths, including the shift registers, the SPI buffer registers, and the parity generator. In this mode the transmit signal is internally feedback to the receiver, whereas the SIMO, SOMI, and CLK pin are disconnected; that is, the transmitted data is internally transferred to the corresponding receive buffer while external signals remain unchanged.

This mode allows the CPU to write into the transmit buffer, and check that the receive buffer contains the correct transmit data. If an error occurs the corresponding error is set within the status field.

Note

This mode cannot be changed during transmission.

13.3.2 Input/Output Loopback Test Mode

Input/Output Loopback Test mode supports the testing of all Input/Output pins without the aid of an external interface. Loopback can be configured as either analog-loopback (loopback through the pin-level input/output buffers) or digital loopback (internal to the SPI module). With Input/Output Loopback, all functional features of the SPI can be tested. Transmit data is fed back through the receive-data line(s). See Figure 13-22 for a diagram of the types of feedback available. The IOLPBKTSTCR register defines all of the available control fields.

In loopback mode, it is also possible to induce various error conditions. See Section 13.9.44 for details of the register field controlling these features.

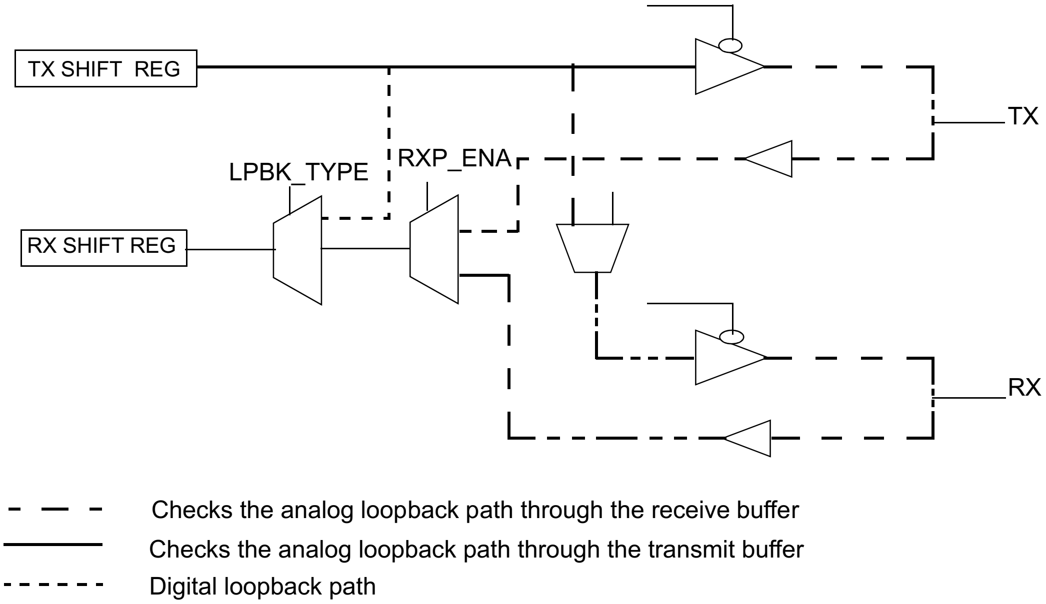
In Input/Output loopback test modes, even when the module is in slave mode, the SPICLK is generated internally. This SPICLK is used for all loopback-mode SPI transactions. Peripheral-mode features can be tested without the help of another controller SPI, using the internally-generated SPICLK. Chip selects are also generated by the slave itself while it is in Input/Output loopback mode.

In Input/Output loopback test modes, if the module is in controller mode, the $\overline{\text{ENA}}$ signal is also generated by internal logic so that an external interface is not required.

Note

Usage Guideline for Input/Output Loopback

Input/Output Loopback mode should be used with caution because, in some configurations, even the receive pins will be driven with transmit data. During testing, it should be ensured that none of the SPI pins are driven by any other device connected to them. Otherwise, if analog loopback is selected in I/O Loopback mode, then testing may damage the device.



This diagram is intended to illustrate loopback paths and therefore may omit some normal-mode paths.

Figure 13-22. I/O Paths during I/O Loopback Modes

13.3.2.1 Input/Output Loopback Mode Operation in Peripheral Mode

In multi-buffer slave mode, there are some additional requirements for using I/O loopback mode (IOLPBK). In multi-buffer peripheral mode, the chip-select pins are the triggers for various TGs. Enabling the IOLPBK mode by writing 0xA to the IOLPBTSTENA bits of the IOLPBKTSTCR register triggers TG0 by driving $\overline{\text{SPICS}}$ to 0. The actual number of chip selects can be programmed to have any or all of the $\overline{\text{SPICS}}$ pins as functional. All other configurations should be completed before enabling the IOLPBK mode in multi-buffer peripheral mode since it triggers TG0.

After the first buffer transfer is completed, the CSNR field of the current buffer is used to trigger the next buffer. So, if multiple TGs are desired to be tested, then the CSNR field of the final buffer in each TG should hold the number of the next TG to be triggered. As long as TG boundaries are well defined and are enabled, the completion of one TG will trigger the next TG.

To stop the transfer in multi-buffer peripheral mode in I/O Loopback configuration, either IOLPBK mode can be disabled by writing 0x5 to the IOLPBTSTENA bits or all of the TGs can be disabled.

13.4 General-Purpose I/O

All of the SPI pins may be programmed via the SPIPCx control registers to be either functional or general-purpose I/O pins.

If the SPI function is to be used, application software must ensure that at least the SPICLK pin and the SOMI and/or SIMO pins are configured as SPI functional pins, and not as GIO pins, or else the SPI state machine will be held in reset, preventing SPI transactions.

SPI pins support:

- internal pull-up resistors
- internal pull-down resistors
- open-drain or push-pull mode

13.5 Low-Power Mode

The SPI can be put into either local or global low-power mode. Global low-power mode is asserted by the system and is not controlled by the SPI. During global low-power mode, all clocks to the SPI are turned off, making the module completely inactive.

Local low-power mode is asserted by setting the POWERDOWN (SPIGCR1[8]) bit; setting this bit stops the clocks to the SPI internal logic and registers. Setting the POWERDOWN bit causes the SPI to enter local low-power mode and clearing the POWERDOWN bit causes SPI to exit from local low-power mode. All registers remain accessible during local power-down mode, since the clock to the SPI registers is temporarily re-enabled for each access. RAM buffers are also accessible during low power mode.

Note

Since entering a low-power mode has the effect of suspending all state-machine activities, care must be taken when entering such modes to ensure that a valid state is entered when low-power mode is active. Application software must ensure that a low power mode is not entered during a data transfer.

13.6 Interrupts

There are two levels of vectorized interrupts supported by the SPI. These interrupts can be caused under the following circumstances:

- Transmission error
- Receive overrun
- Receive complete (receive buffer full)
- Transmit buffer empty

These interrupts may be enabled or disabled via the SPIINT0 register.

During transmission, if one of the following errors occurs: BITERR, DESYNC, DLENERR, PARITYERR, or TIMEOUT, the corresponding bit in the SPIFLG register is set. If the corresponding enable bit is set, then an interrupt is generated. The level of all the above interrupts is set by the bit fields in the SPILVL register.

The error interrupts are enabled and prioritized independently from each other, but the interrupt generated will be the same if multiple errors are enabled on the same level. The SPIFLG register should be used to determine the actual cause of an error.

Note

Since there are two interrupt lines, one each for Level 0 and Level 1, it is possible for a programmer to separate out the interrupts for receive buffer full and transmit buffer empty. By programming one to Level 0 and the other to Level 1, it is possible to avoid a check on whether an interrupt occurred for transmit or for receive. A programmer can also choose to group all of the error interrupts into one interrupt line and both TX-empty and RX-full interrupts into another interrupt line using the LVL control register. In this way, it is possible to separate error-checking from normal data handling.

13.6.1 Interrupts in Multi-Buffer Mode

In multi-buffer mode, the SPI can generate interrupts on two levels.

In normal multi-buffer operation, the receive and transmit are not used and therefore the enable bits of SPIINT0 are not used.

The interrupts available in multi-buffer mode are:

- Transmission error interrupt
- Receive overrun interrupt
- TG suspended interrupt
- TG completed interrupt

When a TG has finished and the corresponding enable bit in the TGINTENA register is set, a transfer-finished interrupt is generated. The level of priority of the interrupt is determined by the corresponding bit in the TGINTLVL register.

When a TG is suspended by a buffer that has been set as suspend to wait until TXFULL flag or/and RXEMPTY flag are set, and if the corresponding bit in the TGINTENA register is set, an transfer-suspended interrupt is generated. The level of priority of the interrupt is determined by the corresponding bit in the TGINTLVL register.

Figure 13-23 illustrates the TG interrupts.

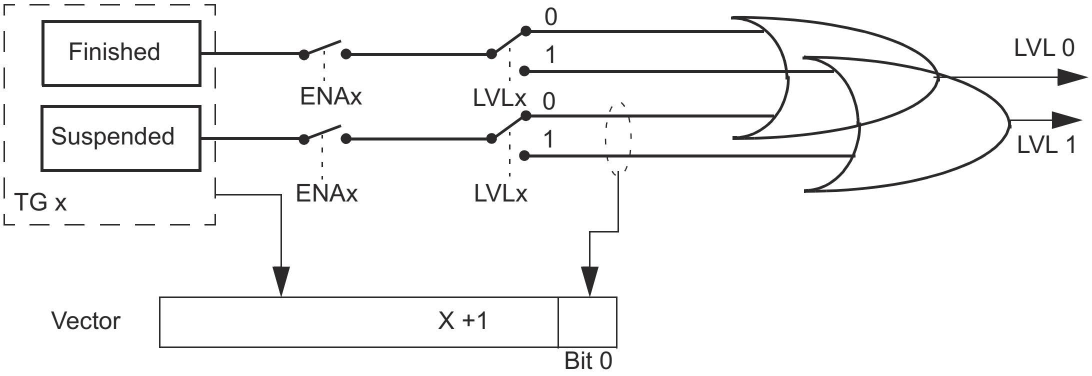


Figure 13-23. TG Interrupt Structure

During transmission, if one of the following errors occurs, BITERR, DESYNC, PARITYERR, TIMEOUT, DLENERR, the corresponding flag in the SPIFLG register is set. If the enable bit is set, then an interrupt is generated. The level of the interrupts could be generated according to the bit field in SPILVL register.

The RXOVRN interrupt is generated when a buffer in the RXRAM is overwritten by a new received word. While writing newly received data to a RXRAM location, if the RXEMPTY bit of the corresponding location is 0, then the RXOVR bit will be set to 1 during the write operation, so that the buffer starts to indicate an overrun. This RXOVR flag is also reflected in SPIFLG register as RXOVRNINTFLG and the corresponding vector number is updated in TGINTVECT0/TGINTVECT1 register. If an overrun interrupt is enabled, then an interrupt will be generated indicating an overrun condition.

The error interrupts are enabled and prioritized independently from each other, but the vector generated by the SPI will be the same if multiple errors are enabled on the same level.

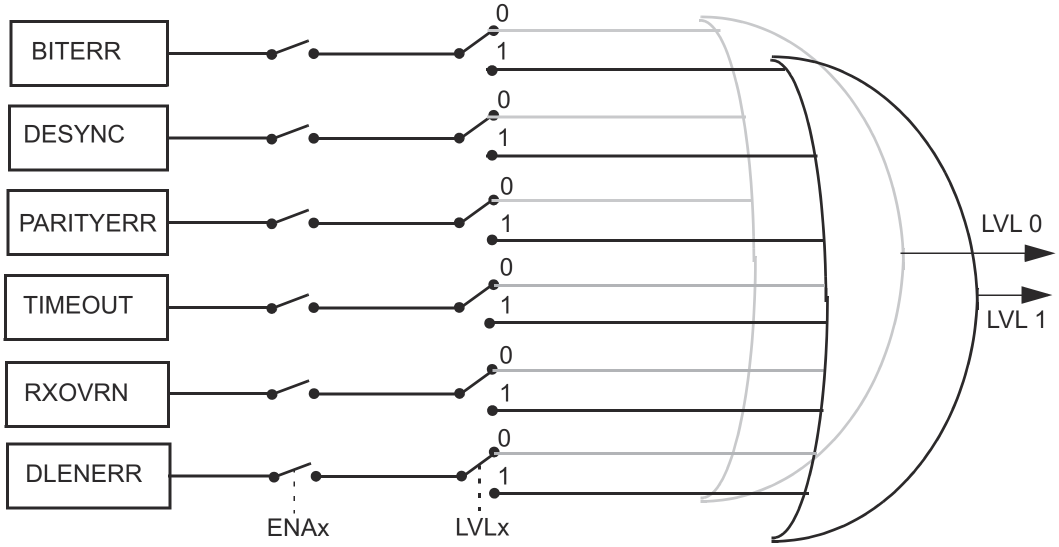

Figure 13-24. SPIFLG Interrupt Structure

Since the priority of an error interrupt is lower than a completion/suspend interrupt for a TG, the interrupts can be split into two levels. By programming all the error interrupts into Level 0 and TG-complete / TG-suspend interrupts into Level 1, it is possible to get a clear indication of the source of error interrupts. However, when a vector register shows an error interrupt, the actual buffer for which the error has occurred is not readily identifiable. Since each buffer in the multi-buffer RAM is stored along with its individual status flags, each buffer should be read until a buffer with any error flag set is found.

A separate interrupt line is provided to indicate the uncorrectable error condition in the MibSPI. This line is available (and valid) only in the multi-buffer mode of the MibSPI module and if the parity error detection feature for multi-buffer RAM is enabled.

13.7 DMA Interface

In order to reduce CPU overhead in handling SPI message traffic on a character-by-character basis, SPI can use the DMA controller to transfer the data. The DMA request enable bit (DMA REQ EN) controls the assertion of requests to the DMA controller module. When a character is being transmitted or received, the SPI will signal the DMA via the DMA request signals, TX_DMA_REQ and RX_DMA_REQ. The DMA controller will then perform the required data transfer.

For efficient behavior during DMA operations, the transmitter empty and receive-buffer full interrupts can be disabled. For specific DMA features, see the DMA controller specification.

The SPI generates a request on the TX_DMA_REQ line each time the TX data is copied to the TX shift register either from the TXBUF or from peripheral data bus (when TXBUF is empty).

The first TX_DMA_REQ pulse is generated when either of the following is true:

- DMAREQEN (SPIINT0[16]) is set to 1 while SPIEN (SPIGCR1[24]) is already 1.
- SPIEN (SPIGCR1[24]) is set to 1 while DMAREQEN (SPIINT0[16]) is already 1.

The SPI generates a request on the RX_DMA_REQ line each time the received data is copied to the SPIBUF.

13.7.1 DMA in Multi-Buffer Mode

The MibSPI provides sophisticated programmable DMA control logic that completely eliminates the necessity of CPU intervention for data transfers, once programmed. When the multi-buffer mode is used, the DMA enable bit in the SPIINT0 register is ignored. DMA source or destination should be only the multi-buffer RAM and not SPIDAT0 / SPIDAT1 or SPIBUF register as in case of compatibility mode DMA.

The MibSPI offers up to eight DMA channels (for SEND and RECEIVE). All of the DMA channels are programmable individually and can be hooked to any buffer. The MibSPI provides up to 16 DMA request lines, and DMA requests from any channel can be programmed to be routed through any of these 16 lines. A DMA transfer can trigger both transmit and receive.

Each DMA channel has the capability to transfer a block of up to 32 data words without interruption using only one buffer of the array by configuring the DMAxCTRL register. Using the DMAxCOUNT and DMACTNTLEN register, up to 65535 (64K) words of data can be transferred without any interruption using just one buffer of the array. This enables the transfer of memory blocks from or into an external SPI memory.

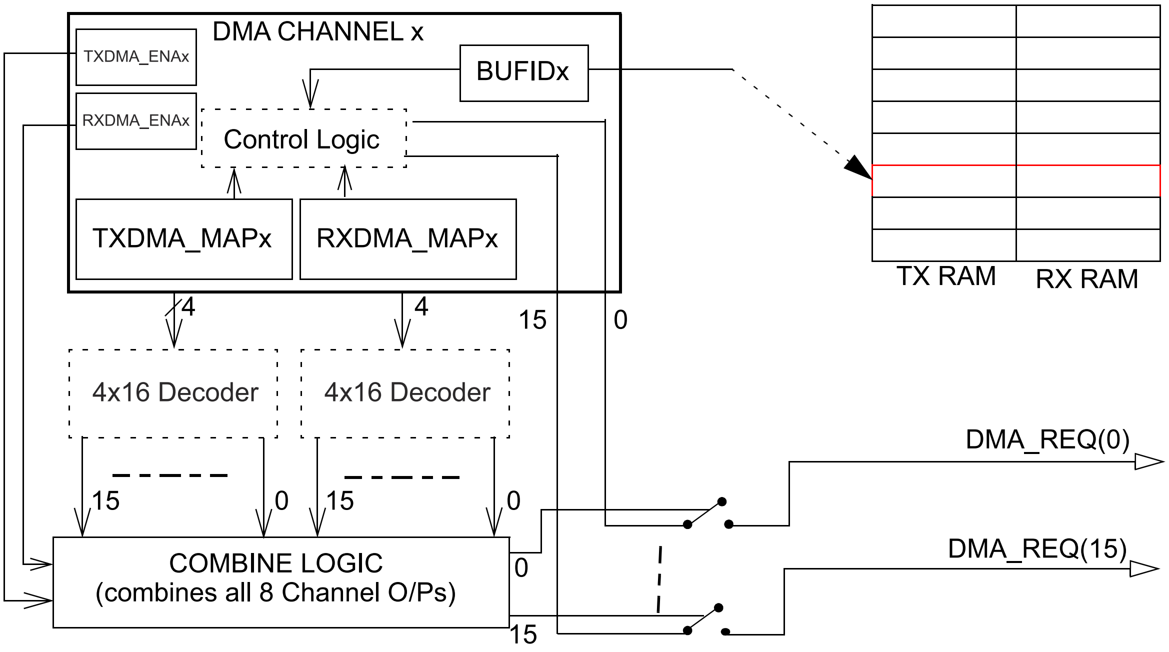

Figure 13-25. DMA Channel and Request Line (Logical) Structure in Multi-buffer Mode

13.8 Module Configuration

MibSPI/MibSPIP can be configured to function as Normal SPI and Multi-buffered SPI. Upon power-up or a system-level reset, each bit in the module registers is set to a default state. The registers are writable only after the RESET bit is set to 1.

13.8.1 Compatibility (SPI) Mode Configuration

The following list details the configuration steps that software should perform prior to the transmission or reception of data. As long as the SPIEN bit in the Global Control Register 1 (SPIGCR1) is cleared to 0 the entire time that the SPI is being configured, the order in which the registers are programmed is not important.

- Enable SPI by setting RESET bit.
- Configure the SIMO, SOMI, SPICLK, and optional $\overline{\text{SPICS}}$ and $\overline{\text{SPIENA}}$ pins for SPI functionality by setting the corresponding bit in SPIPC0 register.
- Configure the module to function as Controller or Peripheral using CLKMOD and MASTER bits.
- Configure the required SPI data format using SPIFMTx register.
- If the module is selected to function as Controller, the delay parameters can be configured using SPIDELAY register.
- Enable the Interrupts using SPIINT0 register if required.
- Select the chip select to be used by setting CSNR bits in SPIDAT1 register.
- Configure CSHOLD and WDEL bits in SPIDAT1 register if required.
- Select the Data word format by setting DFSEL bits. Select the Number of the configured SPIFMTx register (0 to 3) to used for the communication.
- Set LOOPBACK bit to connect the transmitter to the receiver internally. (This feature is used to perform a self-test. Do not configure for normal communication to external devices).
- Set SPIEN bit to 1 after the SPI is configured.
- Perform Transmit and receive data, using SPIDAT1 and SPIBUF register.
- You must wait for TXFULL to reset or TXINT before writing next data to SPIDAT1 register.
- You must wait for RXEMPTY to reset or RXINT before reading the data from SPIBUF register.

13.8.2 MibSPI Mode Configuration

The following list details the configuration steps that software should perform prior to the transmission or reception of data in MIBSPI mode. As long as the SPIEN bit in the Global Control Register 1 (SPIGCR1) is cleared to 0 the entire time that the SPI is being configured, the order in which the registers are programmed is not important.

- Enable SPI by setting RESET bit.
- Set MSPIENA bit to 1 to get access to multi-buffer mode registers.
- Configure the SIMO, SOMI, SPICLK, and optional $\overline{\text{SPICS}}$ and $\overline{\text{SPIENA}}$ pins for SPI functionality by setting the corresponding bit in SPIPC0 register.
- Configure the module to function as Controller or Peripheral using CLKMOD and MASTER bits.
- Configure the required SPI data format using SPIFMTx register.
- If the module is selected to function as Controller, the delay parameters can be configured using SPIDELAY register.
- Check for BUFINITACTIVE bit to be active before configuring MIBSPI RAM. (From Device Power On it take Number of Buffers × Peripheral clock period to initialize complete RAM.)
- Enable the Transfer Group interrupts using TGITENST register if required.
- Enable error interrupts using SPIINT0 register if required.
- Set SPIEN bit to 1 after the SPI is configured.
- The Trigger Source, Trigger Event, Transfer Group start address for the corresponding Transfer groups can be configured using the corresponding TGxCTRL register.
- Configure LPEND to specify the end address of the last TG.
- Similar to SPIDAT1 register, the 16 bit control fields in every TXRAM buffer in the TG have to be configured.
- Configure one of the eight BUFMODE available for each buffer.
- Fill the data to be transmitted in TXDATA field in TXRAM buffers.
- Configure TGENA bit to enable the required Transfer groups. (In case of Trigger event always setting TGENA will trigger the transfer group).
- At the occurrence of the correct trigger event, the Transfer group will be triggered and data gets transmitted and received one after the other with out any CPU intervention.
- You can poll Transfer Group interrupt flag or wait for a transfer-completed interrupt to read and write new data to the buffers.

13.9 Control Registers

This section describes the SPI control, data, and pin registers. The registers support 8-bit, 16-bit and 32-bit writes. The offset is relative to the associated base address of this module in a system.

Note

TI highly recommends that write values corresponding to the reserved locations of registers be maintained as 0 consistently. This allows future enhancements to use these reserved bits as control bits without affecting the functionality of the module with any older versions of software.

13.9.1 SPI Global Control Register 0 (SPIGCR0)

Table 13-8. SPI Global Control Register 0 (SPIGCR0) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reads return 0. Writes have no effect.
0	nRESET		This is the local reset control for the module. This bit needs to be set to 1 before any operation on SPI / MibSPI can be done. Only after setting this bit to 1, the Auto Initialization of Multi-buffer RAM starts. Clearing this bit to 0 will result in all of the control and status register values to return to their default values..
		0	SPI is in the reset state.
		1	SPI is out of the reset state.

13.9.2 SPI Global Control Register 1 (SPIGCR1)

Table 13-9. SPI Global Control Register 1 (SPIGCR1) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	SPIEN		SPI enable. This bit enables SPI transfers. This bit must be set to 1 after all other SPI configuration bits have been written. When the SPIEN bit is 0 or cleared to 0, the following SPI registers get forced to their default states: • Both TX and RX shift registers • The TXDATA fields of the SPI Transmit Data Register 0 (SPIDAT0) and the SPI Transmit Data Register 1 (SPIDAT1) • All the fields of the SPI Flag Register (SPIFLG) • Contents of SPIBUF and the internal RXBUF registers
		0	The SPI is not activated for transfers.
		1	Activates SPI.
23-17	Reserved	0	Reads return 0. Writes have no effect.
16	LOOPBACK		Internal loop-back test mode. The internal self-test option can be enabled by setting this bit. If the SPISIMO and SPISOMI pins are configured with SPI functionality, then the SPISIMO[7:0] pins are internally connected to the SPISOMI[7:0] pins (transmit data is looped back as receive data). GIO mode for these pins is not supported in loopback mode. Externally, during loop-back operation, the SPICLK pin outputs an inactive value and SPISOMI[7:0] remains in the high-impedance state. If the SPI is initialized in slave mode or a data transfer is ongoing, errors may result. **Note: This loopback mode can only be used in master mode. Master mode must be selected before setting LOOPBACK. When this mode is selected, the CLKMOD bit should be set to 1, meaning that SPICLK is internally generated.**
		0	Internal loop-back test mode is disabled.
		1	Internal loop-back test mode is enabled.
15-9	Reserved	0	Reads return 0. Writes have no effect.
8	POWERDOWN		When active, the SPI state machine enters a power-down state.
		0	The SPI is in active mode.
		1	The SPI is in power-down mode.
7-2	Reserved	0	Reads return 0. Writes have no effect.

Table 13-9. SPI Global Control Register 1 (SPIGCR1) Field Descriptions (continued)

Bit	Field	Value	Description
1	CLKMOD		Clock mode. This bit selects either an internal or external clock source. This bit also determines the I/O direction of the $\overline{\text{SPIENA}}$ and $\overline{\text{SPICS}}$ pins in functional mode.
		0	Clock is external. • $\overline{\text{SPIENA}}$ is an output. • $\overline{\text{SPICS}}$ are inputs.
		1	Clock is internally-generated. • $\overline{\text{SPIENA}}$ is an input. • $\overline{\text{SPICS}}$ are outputs.
0	MASTER		SPISIMO/SPISOMI pin direction determination. Sets the direction of the SPISIMO and SPISOMI pins. **Note: For master-mode operation of the SPI, MASTER bit should be set to 1 and CLKMOD bit can be set either 1 or 0. The master-mode SPI can run on an external clock on SPICLK.** **For slave mode operation, both the MASTER and CLKMOD bits should be cleared to 0. Any other combinations may result in unpredictable behavior of the SPI. In slave mode. SPICLK will not be generated internally in slave mode.**
		0	SPISIMO[7:0] pins are inputs, SPISOMI[7:0] pins are outputs.
		1	SPISOMI[7:0] pins are inputs, SPISIMO[7:0] pins are outputs.

13.9.3 SPI Interrupt Register (SPIINT0)

R-0	R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 13-10. SPI Interrupt Register (SPIINT0) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	ENABLEHIGHZ		$\overline{\text{SPIENA}}$ pin high-impedance enable. When active, the $\overline{\text{SPIENA}}$ pin (when it is configured as a WAIT functional output signal in a slave SPI) is forced to high-impedance when not driving a low signal. If inactive, then the pin will output both a high and a low signal.
		0	$\overline{\text{SPIENA}}$ pin is pulled high when not active.
		1	$\overline{\text{SPIENA}}$ pin remains high-impedance when not active.
23-17	Reserved	0	Reads return 0. Writes have no effect.
16	DMAREQEN		DMA request enable. Enables the DMA request signal to be generated for both receive and transmit channels. Enable DMA REQ only after setting the SPIEN bit to 1.
		0	DMA is not used.
		1	DMA requests will be generated.
			Note: A DMA request will be generated on the TX DMA REQ line each time a word is copied to the shift register either from TXBUF or directly from SPIDAT0/SPIDAT1 writes.
			Note: A DMA request will be generated on the RX DMA REQ line each time a word is copied to the SPIBUF register either from RXBUF or directly from the shift register.
15-10	Reserved	0	Reads return 0. Writes have no effect.
9	TXINTENA		Causes an interrupt to be generated every time data is written to the shift register, so that the next word can be written to TXBUF. Setting this bit will generate an interrupt if the TXINTFLG bit (SPI Flag Register (SPIFLG)[9]) is set to 1.
		0	No interrupt will be generated upon TXINTFLG being set to 1.
		1	An interrupt will be generated upon TXINTFLG being set to 1.
			The transmitter empty interrupt is valid in compatibility mode of SPI only. In multi-buffered mode, this interrupts will not be generated, even if it is enabled.
			Note: An interrupt request will be generated as soon as this bit is set to 1. By default it will be generated on the INT0 line. The SPILVL register can be programmed to change the interrupt line.
8	RXINTENA		Causes an interrupt to be generated when the RXINTFLAG bit (SPI Flag Register (SPIFLG)[8]) is set by hardware.
		0	Interrupt will not be generated.
		1	Interrupt will be generated.
			The receiver full interrupt is valid in compatibility mode of SPI only. In multi-buffered mode, this interrupts will not be generated, even if it is enabled.
7	Reserved	0	Reads return 0. Writes have no effect.
6	RXOVRNINTENA		Overrun interrupt enable.
		0	Overrun interrupt will not be generated.
		1	Overrun interrupt will be generated.
5	Reserved	0	Reads return 0. Writes have no effect.
4	BITERRENA		Enables interrupt on bit error.
		0	No interrupt asserted upon bit error.
		1	Enables interrupt on bit error.
3	DESYNCENA		Enables interrupt on desynchronized slave. DESYNCENA is used in master mode only.
		0	No interrupt asserted upon desynchronization error.
		1	An interrupt is asserted on desynchronization of the slave (DESYNC = 1).
2	PARERRENA		Enables interrupt-on-parity-error.
		0	No interrupt asserted on parity error.
		1	An interrupt is asserted on a parity error.

Table 13-10. SPI Interrupt Register (SPIINT0) Field Descriptions (continued)

Bit	Field	Value	Description
1	TIMEOUTENA		Enables interrupt on ENA signal time-out.
		0	No interrupt asserted upon ENA signal time-out.
		1	An interrupt is asserted on a time-out of the ENA signal.
0	DLENERRENA		Data length error interrupt enable. A data length error occurs under the following conditions. **Master:** When $\overline{\text{SPIENA}}$ is used, if the $\overline{\text{SPIENA}}$ pin from the slave is deasserted before the master has completed its transfer, the data length error is set. That is, if the character length counter has not overflowed while $\overline{\text{SPIENA}}$ deassertion is detected, then it means that the slave has neither received full data from the master nor has it transmitted complete data. **Slave:** When $\overline{\text{SPICS}}$ pins are used, if the incoming valid $\overline{\text{SPICS}}$ pin is deactivated before the character length counter overflows, then the data length error is set.
		0	No interrupt is generated upon data length error.
		1	An interrupt is asserted when a data-length error occurs.

LEGEND: R/W = Read/Write; R = Read only; W1C = Write 1 to clear; -*n* = value after reset

Table 13-12. SPI Flag Register (SPIFLG) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	BUFINITACTIVE		Indicates the status of multi-buffer initialization process. Software can poll for this bit to determine if it can proceed with the register configuration of multi-buffer mode registers or buffer handling. **Note: If the SPIFLG register is read while the multi-buffer RAM is being initialized, the BUFINITACTIVE bit will be read as 1. If SPIFLG is read after the internal automatic buffer initialization is complete, this bit will be read as 0. This bit will show a value of 1 as long as the nRESET bit is 0, but does not really indicate that buffer initialization is underway. Buffer initialization starts only when the nRESET bit is set to 1.**
		0	Multi-buffer RAM initialization is complete.
		1	Multi-buffer RAM is still being initialized. Do not attempt to write to either multi-buffer RAM or any multi-buffer mode registers.
23-10	Reserved	0	Reads return 0. Writes have no effect.
9	TXINTFLG		Transmitter-empty interrupt flag. Serves as an interrupt flag indicating that the transmit buffer (TXBUF) is empty and a new word can be written to it. This flag is set when a word is copied to the shift register either directly from SPIDAT0/SPIDAT1 or from the TXBUF register. This bit is cleared by one of following methods: • Writing a new data to either SPIDAT0 or SPIDAT1 • Writing a 0 to SPIEN (SPIGCR1[24])
		0	Transmit buffer is now full. No interrupt pending for transmitter empty.
		1	Transmit buffer is empty. An interrupt is pending to fill the transmitter.

Table 13-12. SPI Flag Register (SPIFLG) Field Descriptions (continued)

Bit	Field	Value	Description
8	RXINTFLG		Receiver-full interrupt flag. This flag is set when a word is received and copied into the buffer register (SPIBUF). If RXINTEN is enabled, an interrupt is also generated. This bit is cleared under the following methods: • Reading the SPIBUF register • Reading TGINTVECT0 or TGINTVECT1 register when there is a receive buffer full interrupt • Writing a 1 to this bit • Writing a 0 to SPIEN (SPIGCR1[24]) • System reset During emulation mode, however, a read to the emulation register (SPIEMU) does not clear this flag bit.
		0	No new received data pending. Receive buffer is empty.
		1	A newly received data is ready to be read. Receive buffer is full.
			Note: Clearing RXINTFLG bit by writing a 1 before reading the SPIBUF sets the RXEMPTY bit of the SPIBUF register too. In this way, one can ignore a received word. However, if the internal RXBUF is already full, the data from RXBUF will be copied to SPIBUF and the RXEMPTY bit will be cleared again. The SPIBUF contents should be read first if this situation needs to be avoided.
7	Reserved	0	Reads return 0. Writes have no effect.
6	RXOVRNINTFLG		Receiver overrun flag. The SPI hardware sets this bit when a receive operation completes before the previous character has been read from the receive buffer. The bit indicates that the last received character has been overwritten and therefore lost. The SPI will generate an interrupt request if this bit is set and the RXOVRN INTEN bit (SPIINT0.6) is set high. This bit is cleared under the following conditions in compatibility mode of MibSPI: • Reading TGINTVECT0 or TGINTVECT1 register when there is a receive-buffer-overrun interrupt • Writing a 1 to RXOVRNINTFLG in the SPI Flag Register (SPIFLG) itself • Writing a 0 to SPIEN • Reading the data field of the SPIBUF register **Note: Reading the SPIBUF register does not clear this RXOVRNINTFLG bit. If an RXOVRN interrupt is detected, then the SPIBUF may need to be read twice to get to the overrun buffer. This is due to the fact that the overrun will always occur to the internal RXBUF. Each read to the SPIBUF will result in RXBUF contents (if it is full) getting copied to SPIBUF.** **Note: There is a special condition under which the RXOVRNINTFLG flag gets set. If both SPIBUF and RXBUF are already full and while another reception is underway, if any errors (TIMEOUT, BITERR, and DLEN_ERR) occur, then RXOVR in RXBUF and RXOVRNINTFLG in SPIFLG registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a receive overrun.** In multi-buffer mode of MibSPI, this bit is cleared under the following conditions: • Reading the RXOVRN_BUF_ADDR register • Writing a 1 to RXOVRNINTFLG in the SPI Flag Register (SPIFLG) itself In multi-buffer mode, if RXOVRNINTFLG is set, then the address of the buffer which experienced the overrun is available in RXOVRN_BUF_ADDR.
		0	Overrun condition did not occur.
		1	Overrun condition has occurred.
5	Reserved	0	Reads return 0. Writes have no effect.

Table 13-12. SPI Flag Register (SPIFLG) Field Descriptions (continued)

Bit	Field	Value	Description
4	BITERRFLG		Mismatch of internal transmit data and transmitted data. This flag can be cleared by one of the following methods. • Write a 1 to this bit • Clear the SPIEN bit to 0
		0	No bit error occurred.
		1	A bit error occurred. The SPI samples the signal of the transmit pin (master: SIMO, slave: SOMI) at the receive point (half clock cycle after transmit point). If the sampled value differs from the transmitted value a bit error is detected and the flag BITERRFLG is set. If BITERRENA is set an interrupt is asserted. Possible reasons for a bit error can be an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.
3	DESYNCFLG		Desynchronization of slave device. Desynchronization monitor is active in master mode only. This flag can be cleared by one of the following methods: • Write a 1 to this bit • Clear the SPIEN bit to 0
		0	No slave desynchronization is detected.
		1	A slave device is desynchronized. The master monitors the ENAble signal coming from the slave device and sets the DESYNC flag after the last bit is transmitted plus $t_{T2EDELAY}$. If DESYNCENA is set an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master.
2	PARERRFLG		Calculated parity differs from received parity bit. If the parity generator is enabled (can be selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word the parity generator calculates the reference parity and compares it to the received parity bit. In the event of a mismatch the PARITYERR flag is set and an interrupt is asserted if PARERRENA is set. This flag can be cleared by one of the following methods: • Write a 1 to this bit • Clear the SPIEN bit to 0
		0	No parity error is detected.
		1	A parity error occurred.
1	TIMEOUTFLG		Time-out caused by nonactivation of ENA signal. This flag can be cleared by one of the following methods: • Write a 1 to this bit • Clear the SPIEN bit to 0
		0	No ENA-signal time-out occurred.
		1	An ENA signal time-out occurred. The SPI generates a time-out because the slave hasn't responded in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition the TIMEOUT flag in the status field of the corresponding buffer is set. The transmit request of the concerned buffer is cleared, that is, the SPI does not re-start a data transfer from this buffer.
0	DLENERRFLG		Data-length error flag. This flag can be cleared by one of the following methods: • Write a 1 to this bit • Clear the SPIEN bit to 0 **Note: Whenever any transmission errors (TIMEOUT, BITERR, DLEN_ERR, PARITY_ERR, DESYNC) are detected and the error flags are cleared by writing to the error bit in the SPIFLG register, the corresponding error flag in SPIBUF does not get cleared. Software needs to read the SPIBUF until it becomes empty before proceeding. This ensures that all of the old status bits in SPIBUF are cleared before starting the next transfer.**
		0	No data length error has occurred.
		1	A data length error has occurred.

13.9.6 SPI Pin Control Register 0 (SPIPC0)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of SPIPC0 to SPIPC9 reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Table 13-13. SPI Pin Control (SPIPC0) Field Descriptions

Bit	Field	Value	Description
31-24	SOMIFUN		Slave out, master in function. Determines whether each SPISOMI[x] pin is to be used as a general-purpose I/O pin or as a SPI functional pin. **Note: Duplicate Control Bits for SPISOMI[0]. Bit 24 is not physically implemented. It is a mirror of Bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPISOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.**
		0	The SPISOMI[x] pin is a GIO pin.
		1	The SPISOMI[x] pin is a SPI functional pin.
23-16	SIMOFUN		Slave in, master out function. Determines whether each SPISIMO[x] pin is to be used as a general-purpose I/O pin or as a SPI functional pin. **Note: Duplicate Control Bits for SPISIMO[0]. Bit 16 is not physically implemented. It is a mirror of Bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPISIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.**
		0	The SPISIMO[x] pin is a GIO pin.
		1	The SPISIMO[x] pin is a SPI functional pin.
15-12	Reserved	0	Reads return 0. Writes have no effect.

Table 13-13. SPI Pin Control (SPIPC0) Field Descriptions (continued)

Bit	Field	Value	Description
11	SOMIFUN0		Slave out, master in function. This bit determines whether the SPISOMI[0] pin is to be used as a general-purpose I/O pin or as a SPI functional pin.
		0	The SPISOMI[0] pin is a GIO pin.
		1	The SPISOMI[0] pin is a SPI functional pin.
			Note: Regardless of the number of parallel pins used, the SPISOMI[0] pin will always have to be programmed as functional pins for any SPI transfers.
10	SIMOFUN0		Slave in, master out function. This bits determine whether each SPISIMO[0] pin is to be used as a general-purpose I/O pin or as a SPI functional pin.
		0	The SPISIMO[0] pin is a GIO pin.
		1	The SPISIMO[0] pin is a SPI functional pin.
			Note: Regardless of the number of parallel pins used, the SPISIMO[0] pin will always have to be programmed as functional pins for any SPI transfers.
9	CLKFUN		SPI clock function. This bit determines whether the SPICLK pin is to be used as a general-purpose I/O pin, or as a SPI functional pin.
		0	The SPICLK pin is a GIO pin.
		1	The SPICLK pin is a SPI functional pin.
8	ENAFUN		SPIENA function. This bit determines whether the SPIENA pin is to be used as a general-purpose I/O pin or as a SPI functional pin.
		0	The SPIENA pin is a GIO pin.
		1	The SPIENA pin is a SPI functional pin.
7-0	SCSFUN		SPICS function. Determines whether each SPICS pin is to be used as a general-purpose I/O pin or as a SPI functional pin. If the slave SPICS pins are in functional mode and receive an inactive high signal, the slave SPI will place its output in a high-impedance state and disable shifting.
		0	The SPICS pin is a GIO pin.
		1	The SPICS pin is a SPI functional pin.

13.9.7 SPI Pin Control Register 1 (SPIPC1)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Table 13-14. SPI Pin Control Register (SPIPC1) Field Descriptions

Bit	Field	Value	Description
31-24	SOMIDIR		SPISOMI[x] direction. Controls the direction of each SPISOMI[x] pin when used for general-purpose I/O. If SPISOMI[x] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register. **Note: Duplicate Control Bits for SPISOMI[0]. Bit 24 is not physically implemented. It is a mirror of Bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPISOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.**
		0	The SPISOMI[x] pin is an input.
		1	The SPISOMI[x] pin is an output.
23-16	SIMODIR		SPISIMO[x] direction. Controls the direction of each SPISIMO[x] pin when used for general-purpose I/O. If SPISIMO[x] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register. **Note: Duplicate Control Bits for SPISIMO[0]. Bit 16 is not physically implemented. It is a mirror of Bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPISIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.**
		0	The SPISIMO[x] pin is an input.
		1	The SPISIMO[x] pin is an output.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMIDIR0		SPISOMI[0] direction. This bit controls the direction of the SPISOMI[0] pin when it is used as a general-purpose I/O pin. If the SPISOMI[0] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register.
		0	The SPISOMI[0] pin is an input.
		1	The SPISOMI[0] pin is an output.
10	SIMODIR0		SPISIMO[0] direction. This bit controls the direction of the SPISIMO[0] pin when it is used as a general-purpose I/O pin. If the SPISIMO[0] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register.
		0	The SPISIMO[0] pin is an input.
		1	The SPISIMO[0] pin is an output.
9	CLKDIR		SPICLK direction. This bit controls the direction of the SPICLK pin when it is used as a general-purpose I/O pin. In functional mode, the I/O direction is determined by the CLKMOD bit.
		0	The SPICLK pin is an input.
		1	The SPICLK pin is an output.
8	ENADIR		$\overline{\text{SPIENA}}$ direction. This bit controls the direction of the $\overline{\text{SPIENA}}$ pin when it is used as a general-purpose I/O. If the $\overline{\text{SPIENA}}$ pin is used as a functional pin, then the I/O direction is determined by the CLKMOD bit (SPIGCR1[1]).
		0	The $\overline{\text{SPIENA}}$ pin is an input.
		1	The $\overline{\text{SPIENA}}$ pin is an output.
7-0	SCSDIR		$\overline{\text{SPICS}}$ direction. These bits control the direction of each $\overline{\text{SPICS}}$ pin when it is used as a general-purpose I/O pin. Each pin could be configured independently from the others if the $\overline{\text{SPICS}}$ is used as a SPI functional pin. The I/O direction is determined by the CLKMOD bit (SPIGCR1[1]).
		0	The $\overline{\text{SPICS}}$ pin is an input.
		1	The $\overline{\text{SPICS}}$ pin is an output.

13.9.8 SPI Pin Control Register 2 (SPIPC2)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

		0	Pull control on the $\overline{\text{SPIENA}}$ pin is enabled.
		1	Pull control on the $\overline{\text{SPIENA}}$ pin is disabled.
7-0	SCSPDIS		$\overline{\text{SPICS}}$ pull control disable. This bit disables pull control capability for each $\overline{\text{SPICS}}$ pin if it is in input mode, regardless of whether it is in functional or GIO mode.
		0	Pull control on the $\overline{\text{SPICS}}$ pin is enabled.
		1	Pull control on the $\overline{\text{SPICS}}$ pin is disabled.

13.9.14 SPI Pin Control Register 8 (SPIPC8)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Note

Default Register Value

The default values of these register bits vary by device. See your device datasheet for information about default pin states, which correspond to the register reset values (see the pin-list table).

Table 13-21. SPI Pin Control Register 8 (SPIPC8) Field Descriptions

Bit	Field	Value	Description
31-24	SOMIPSEL		SPISOMI[x] pull select. This bit selects the type of pull logic for each SPISOMI[x] pin. **Note: Bit 11 or bit 24 can be used to set pull-select for SPISOMI[0]. If a 32-bit write is performed, bit 11 will have priority over bit 24.**
		0	Pull down on the SPISOMI[x] pin.
		1	Pull up on the SPISOMI[x] pin.
23-16	SIMOPSEL		SPISIMO[x] pull select. This bit selects the type of pull logic for each SPISIMO[x] pin. **Note: Bit 10 or bit 16 can be used to set pull-select for SPISIMO[0]. If a 32-bit write is performed, bit 10 will have priority over bit 16.**
		0	Pull down on the SPISIMO[x] pin.
		1	Pull up on the SPISIMO[x] pin.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMIPSEL0		SPISOMI[0] pull select. This bit selects the type of pull logic at the SPISOMI[0] pin.
		0	Pull down on the SPISOMI[0] pin.
		1	Pull up on the SPISOMI[0] pin.
10	SIMOPSEL0		SPISIMO[0] pull select. This bit selects the type of pull logic at the SPISIMO[0] pin.
		0	Pull down on the SPISIMO[0] pin.
		1	Pull up on the SPISIMO[0] pin.
9	CLKPSEL		SPICLK pull select. This bit selects the type of pull logic at the SPICLK pin.
		0	Pull down on the SPICLK pin.
		1	Pull up on the SPICLK pin.
8	ENAPSEL		$\overline{\text{SPIENA}}$ pull select. This bit selects the type of pull logic at the $\overline{\text{SPIENA}}$ pin.
		0	Pull down on the $\overline{\text{SPIENA}}$ pin.
		1	Pull up on the $\overline{\text{SPIENA}}$ pin.
7-0	SCSPSEL		$\overline{\text{SPICS}}$ pull select. This bit selects the type of pull logic for each $\overline{\text{SPICS}}$ pin.
		0	Pull down on the $\overline{\text{SPICS}}$ pin.
		1	Pull up on the $\overline{\text{SPICS}}$ pin.

Table 13-22. SPI Transmit Data Register 0 (SPIDAT0) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved	0	Reads return 0. Writes have no effect.
15-0	TXDATA	0-FFFFh	SPI transmit data. When written, these bits will be copied to the shift register if it is empty. If the shift register is not empty, TXBUF holds the written data. SPIEN (SPICGR1[24]) must be set to 1 before this register can be written to. Writing a 0 to the SPIEN register forces the lower 16 bits of the SPIDAT0 to 0x00. **Note: When this register is read, the contents TXBUF, which holds the latest written data, will be returned.** **Note: Regardless of character length, the transmit word should be right-justified before writing to the SPIDAT1 register.** **Note: The default data format control register for SPIDAT0 is SPIFMT0. However, it is possible to reprogram the DFSEL[1:0] fields of SPIDAT1 before using SPIDAT0, to select a different SPIFMTx register.** **Note: It is highly recommended to use SPIDAT1 register, SPIDAT0 is supported for compatibility reasons.**

13.9.16 SPI Transmit Data Register 1 (SPIDAT1)

Note

Writing to only the control fields, bits 28 through 16, does not initiate any SPI transfer in master mode. This feature can be used to set up SPICLK phase or polarity before actually starting the transfer by only updating the DFSEL bit field to select the required phase and polarity combination.

R/W-0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 13-23. SPI Transmit Data Register 1 (SPIDAT1) Field Descriptions

Bit	Field	Value	Description
31-29	Reserved	0	Reads return 0. Writes have no effect.
28	CSHOLD		Chip select hold mode. The CSHOLD bit is supported in master mode only in compatibility-mode of SPI, (it is ignored in slave mode). CSHOLD defines the behavior of the chip select line at the end of a data transfer.
		0	The chip select signal is deactivated at the end of a transfer after the T2CDELAY time has passed. If two consecutive transfers are dedicated to the same chip select this chip select signal will be deactivated for at least 2VCLK cycles before it is activated again.
		1	The chip select signal is held active at the end of a transfer until a control field with new data and control information is loaded into SPIDAT1. If the new chip select number equals the previous one, the active chip select signal is extended until the end of transfer with CSHOLD cleared, or until the chip-select number changes.
27	Reserved	0	Reads return 0. Writes have no effect.
26	WDEL		Enable the delay counter at the end of the current transaction. **Note: The WDEL bit is supported in master mode only. In slave mode, this bit will be ignored.**
		0	No delay will be inserted. However, the $\overline{\text{SPICS}}$ pins will still be de-activated for at least for 2VCLK cycles if CSHOLD = 0. **Note: The duration for which the $\overline{\text{SPICS}}$ pin remains deactivated depends upon the time taken to supply a new word after completing the shift operation. If TXBUF is already full, then the $\overline{\text{SPICS}}$ pin will be deasserted for at least two VCLK cycles (if WDEL = 0).**
		1	After a transaction, WDELAY of the corresponding data format will be loaded into the delay counter. No transaction will be performed until the WDELAY counter overflows. The $\overline{\text{SPICS}}$ pins will be de-activated for at least (WDELAY + 2) × VCLK_Period duration.
25-24	DFSEL		Data word format select.
		0	Data word format 0 is selected.
		1h	Data word format 1 is selected.
		2h	Data word format 2 is selected.
		3h	Data word format 3 is selected.

Table 13-23. SPI Transmit Data Register 1 (SPIDAT1) Field Descriptions (continued)

Bit	Field	Value	Description
23-16	CSNR	0-FFh	Chip select (CS) number. CSNR defines the chip select pins that will be activated during the data transfer. CSNR is a bit-mask that controls all chip select pins. See Table 13-24. **Note: If your MibSPI has less than 8 chip select pins, all unused upper bits will be 0. For example, MiBSPI3 has 6 chip select pins, if you write FFh to CSNR, the actual number stored in CSNR is 3Fh.**
15-0	TXDATA	0-FFFFh	Transfer data. When written, these bits are copied to the shift register if it is empty. If the shift register is not empty, then they are held in TXBUF. SPIEN must be set to 1 before this register can be written to. Writing a 0 to SPIEN forces the lower 16 bits of SPIDAT1 to 0x0000. A write to this register (or to the TXDATA field only) drives the contents of the CSNR field on the $\overline{\text{SPICS}}$ pins, if the pins are configured as functional pins (automatic chip select, see Section 13.2). When this register is read, the contents of TXBUF, which holds the latest data written, will be returned. **Note: Regardless of the character length, the transmit data should be right-justified before writing to the SPIDAT1 register.**

R-0

LEGEND: R = Read only; -*n* = value after reset

Table 13-25. SPI Receive Buffer Register (SPIBUF) Field Descriptions

Bit	Field	Value	Description
31	RXEMPTY		Receive data buffer empty. When the host reads the RXDATA field or the entire SPIBUF register, it automatically sets the RXEMPTY flag. When a data transfer is completed, the received data is copied into RXDATA and the RXEMPTY flag is cleared.
		0	New data has been received and copied into RXDATA.
		1	No data has been received since the last read of RXDATA.
			This flag gets set to 1 under the following conditions: • Reading the RXDATA field of the SPIBUF register • Writing a 1 to clear the RXINTFLG bit in the SPI Flag Register (SPIFLG) Write-clearing the RXINTFLG bit before reading the SPIBUF indicates the received data is being ignored. Conversely, RXINTFLG can be cleared by reading the RXDATA field of SPIBUF (or the entire register).
30	RXOVR		Receive data buffer overrun. When a data transfer is completed and the received data is copied into RXBUF while it is already full, RXOVR is set. Overruns always occur to RXBUF, not to SPIBUF; the contents of SPIBUF are overwritten only after it is read by the Peripheral (VBUSP) master (CPU, DMA, or other host processor). If enabled, the RXOVRN interrupt is generated when RXBUF is overwritten, and reading either SPI Flag Register (SPIFLG) or SPIVECTx shows the RXOVRN condition. Two read operations from the SPIBUF register are required to reach the overwritten buffer word (one to read SPIBUF, which then transfers RXDATA into SPIBUF for the second read). **Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.** **Note: A special condition under which RXOVR flag gets set. If both SPIBUF and RXBUF are already full and while another buffer receive is underway, if any errors such as TIMEOUT, BITERR, and DLEN_ERR occur, then RXOVR in RXBUF and SPI Flag Register (SPIFLG) registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a normal receive overrun.**
		0	No receive data overrun condition occurred since last read of the data field.
		1	A receive data overrun condition occurred since last read of the data field.

Table 13-25. SPI Receive Buffer Register (SPIBUF) Field Descriptions (continued)

Bit	Field	Value	Description
29	TXFULL		Transmit data buffer full. This flag is a read-only flag. Writing into the SPIDAT0 or SPIDAT1 field while the TX shift register is full will automatically set the TXFULL flag. Once the word is copied to the shift register, the TXFULL flag will be cleared. Writing to SPIDAT0 or SPIDAT1 when both TXBUF and the TX shift register are empty does not set the TXFULL flag.
		0	The transmit buffer is empty; SPIDAT0/SPIDAT1 is ready to accept a new data.
		1	The transmit buffer is full; SPIDAT0/SPIDAT1 is not ready to accept new data.
28	BITERR		Bit error. There was a mismatch of internal transmit data and transmitted data. **Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.**
		0	No bit error occurred.
		1	A bit error occurred. The SPI samples the signal of the transmit pins (master: SIMOx, slave: SOMIx) at the receive point (one-half clock cycle after the transmit point). If the sampled value differs from the transmitted value, a bit error is detected and the BITERR flag is set. Possible reasons for a bit error include noise, an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.
27	DESYNC		Desynchronization of slave device. This bit is valid in master mode only. The master monitors the ENA signal coming from the slave device and sets the DESYNC flag if ENA is deactivated before the last reception point or after the last bit is transmitted plus $t_{T2EDELAY}$. If DESYNCENA is set, an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master. **Note: In the Compatibility Mode MibSPI, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is because the receive completion flag/interrupt is generated when the buffer transfer is completed. But desynchronization is detected after the buffer transfer is completed. So, if the VBUS master reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. In multi-buffer mode, the desync flag is always assured to be for the current buffer.** **Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.**
		0	No slave desynchronization is detected.
		1	A slave device is desynchronized.
26	PARITYERR		Parity error. The calculated parity differs from the received parity bit. If the parity generator is enabled (selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word, the parity generator calculates the reference parity and compares it to the received parity bit. If a mismatch is detected, the PARITYERR flag is set. **Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.**
		0	No parity error is detected.
		1	A parity error occurred.
25	TIMEOUT		Time-out because of non-activation of $\overline{\text{SPIENA}}$ pin. The SPI generates a time-out when the slave does not respond in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected, the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition, the TIMEOUT flag in the status field of the corresponding buffer and in the SPI Flag Register (SPIFLG) is set. **Note: This bit is valid only in master mode.** **Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.**
		0	No $\overline{\text{SPIENA}}$ pin time-out occurred.
		1	An $\overline{\text{SPIENA}}$ signal time-out occurred.
24	DLENERR		Data length error flag. **Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.**
		0	No data-length error occurred.
		1	A data length error occurred.
23-16	LCSNR	0-FFh	Last chip select number. LCSNR in the status field is a copy of CSNR in the corresponding control field. It contains the chip select number that was activated during the last word transfer.

Table 13-25. SPI Receive Buffer Register (SPIBUF) Field Descriptions (continued)

Bit	Field	Value	Description
15-0	RXDATA	0-FFFFh	SPI receive data. This is the received word, transferred from the receive shift-register at the end of a transfer. Regardless of the programmed character length and the direction of shifting, the received data is stored right-justified in the register.

13.9.18 SPI Emulation Register (SPIEMU)

LEGEND: R/W = Read/Write; -*n* = value after reset

Table 13-27. SPI Delay Register (SPIDELAY) Field Descriptions

Bit	Field	Value	Description
31-24	C2TDELAY	0-FFh	Chip-select-active to transmit-start delay. See Figure 13-45 for an example. C2TDELAY is used only in master mode. It defines a setup time (for the slave device) that delays the data transmission from the chip select active edge by a multiple of VCLK cycles. The setup time value is calculated as follows. $t_{C2TDELAY}$ = (C2TDELAY + 2) × VCLK Period Example: VCLK = 25 MHz -> VCLK Period = 40ns; C2TDELAY = 07h; > $t_{C2TDELAY}$ = 360 ns When the chip select signal becomes active, the slave has to prepare data transfer within 360 ns. **Note: If phase = 1, the delay between SPICS falling edge to the first edge of SPICLK will have an additional 0.5 SPICLK period delay. This delay is as per the SPI protocol.**

Table 13-27. SPI Delay Register (SPIDELAY) Field Descriptions (continued)

Bit	Field	Value	Description
23-16	T2CDELAY	0-FFh	Transmit-end-to-chip-select-inactive-delay. See Figure 13-46 for an example. T2CDELAY is used only in master mode. It defines a hold time for the slave device that delays the chip select deactivation by a multiple of VCLK cycles after the last bit is transferred. The hold time value is calculated as follows: $t_{T2CDELAY}$ = (T2CDELAY +1) × VCLK Period Example: VCLK = 25 MHz -> VCLK Period = 40ns; T2CDELAY = 03h; > $t_{T2CDELAY}$ = 160 ns After the last data bit (or parity bit) is being transferred the chip select signal is held active for 160 ns. **Note: If phase = 0, then between the last edge of SPICLK and rise-edge of SPICS there will be an additional delay of 0.5 SPICLK period. This is as per the SPI protocol.** Both C2TDELAY and T2CDELAY counters do not have any dependency on the $\overline{\text{SPIENA}}$ pin value. Even if the $\overline{\text{SPIENA}}$ pin is asserted by the slave, the master will continue to delay the start of SPICLK until the C2TDELAY counter overflows. Similarly, even if the $\overline{\text{SPIENA}}$ pin is deasserted by the slave, the master will continue to hold the $\overline{\text{SPICS}}$ pins active until the T2CDELAY counter overflows. In this way, it is assured that the setup and hold times of the $\overline{\text{SPICS}}$ pins are determined by the delay timers alone. To achieve better throughput, it should be ensured that these two timers are kept at the minimum possible values.
15-8	T2EDELAY	0-FFh	Transmit-data-finished to ENA-pin-inactive time-out. T2EDELAY is used in master mode only. It defines a time-out value as a multiple of SPI clock before $\overline{\text{SPIENA}}$ signal has to become inactive and after $\overline{\text{SPICS}}$ becomes inactive. SPICLK depends on which data format is selected. If the slave device is missing one or more clock edges, it becomes de-synchronized. In this case, although the master has finished the data transfer, the slave is still waiting for the missed clock pulses and the ENA signal is not disabled. The T2EDELAY defines a time-out value that triggers the DESYNC flag, if the $\overline{\text{SPIENA}}$ signal is not deactivated in time. The DESYNC flag is set to indicate that the slave device did not de-assert its $\overline{\text{SPIENA}}$ pin in time to acknowledge that it received all bits of the sent word. See Figure 13-47 for an example of this condition. **Note: DESYNC is also set if the SPI detects a de-assertion of $\overline{\text{SPIENA}}$ before the end of the transmission.** The time-out value is calculated as follows: $t_{T2EDELAY}$ = T2EDELAY/SPIclock Example: SPIclock = 8 Mbit/s; T2EDELAY = 10h; > $t_{T2EDELAY}$ = 2 µs The slave device has to disable the ENA signal within 2 µs, otherwise DESYNC is set and an interrupt is asserted (if enabled).
7-0	C2EDELAY	0-FFh	Chip-select-active to ENA-signal-active time-out. C2EDELAY is used only in master mode and it applies only if the addressed slave generates an ENA signal as a hardware handshake response. C2EDELAY defines the maximum time between when the SPI activates the chip-select signal and the addressed slave has to respond by activating the ENA signal. C2EDELAY defines a time-out value as a multiple of SPI clocks. The SPI clock depends on whether data format 0 or data format 1 is selected. See Figure 13-48 for an example of this condition. **Note: If the slave device does not respond with the ENA signal before the time-out value is reached, the TIMEOUT flag in the SPIFLG register is set and a interrupt is asserted (if enabled).** If a time-out occurs, the SPI clears the transmit request of the timed-out buffer, sets the TIMEOUT flag for the current buffer, and continues with the transfer of the next buffer in the sequence that is enabled. The timeout value is calculated as follows: $t_{C2EDELAY}$ = C2EDELAY/SPIclock Example: SPIclock = 8 Mbit/s; C2EDELAY = 30h; > $t_{C2EDELAY}$ = 6 ms The slave device has to activate the ENA signal within 6 ms after the SPI has activated the chip select signal ($\overline{\text{SPICS}}$), otherwise the TIMEOUT flag is set and an interrupt is asserted (if enabled).

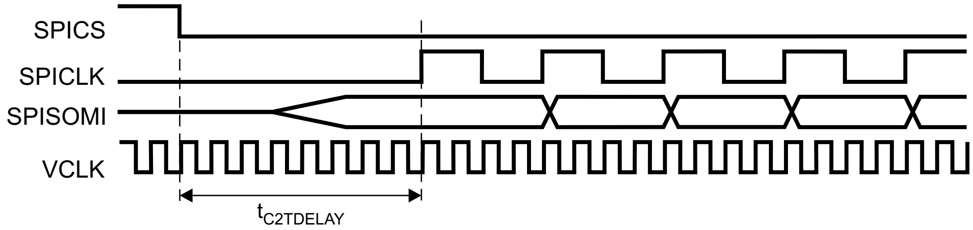

Figure 13-45. Example: $t_{C2TDELAY}$= 8 VCLK Cycles

Table 13-29. SPI Data Format Registers (SPIFMT) Field Descriptions

Bit	Field	Value	Description
31-24	WDELAY	0-FFh	Delay in between transmissions for data format x (x= 0,1,2,3).Idle time that will be applied at the end of the current transmission if the bit WDEL is set in the current buffer. The delay to be applied is equal to: WDELAY × P_{VCLK} + 2 × P_{VCLK} P_{VCLK} -> Period of VCLK.
23	PARPOL		Parity polarity: even or odd. PARPOLx can be modified in privilege mode only. It can be used for data format x (x= 0,1,2,3).
		0	An even parity flag is added at the end of the transmit data stream.
		1	An odd parity flag is added at the end of the transmit data stream.
22	PARITYENA		Parity enable for data format x.
			No parity generation/ verification is performed for this data format.
		0	A parity bit is transmitted at the end of each transmitted word. At the end of a transfer the parity generator compares the received parity bit with the locally-calculated parity flag. If the parity bits do not match, the RXERR flag is set in the corresponding control field. The parity type (even or odd) can be selected via the PARPOL bit.
		1	**Note: If an uncorrectable error flag is set in a slave-mode SPI, then the wrong parity bit will be transmitted to indicate to the master that there has been some issue with the data parity. The SPISOMI pins will be forced to transmit all 0s, and the parity bit will be transmitted as 1 if even parity is selected and as 0 if odd parity is selected (using the PARPOLx bit of this register). This behavior occurs regardless of an uncorrectable parity error on either TXRAM or RXRAM.**

Table 13-29. SPI Data Format Registers (SPIFMT) Field Descriptions (continued)

Bit	Field	Value	Description
21	WAITENA		The master waits for the ENA signal from slave for data format x. WAITENA is valid in master mode only. WAITENA enables a flexible SPI network where slaves with ENA signal and slaves without ENA signal can be mixed. WAITENA defines, for each transferred word, whether the addressed slave generates the ENA signal or not.
		0	The SPI does not wait for the ENA signal from the slave and directly starts the transfer.
		1	Before the SPI starts the data transfer it waits for the ENA signal to become low. If the ENA signal is not pulled down by the addressed slave before the internal time-out counter (C2EDELAY) overflows, then the master aborts the transfer and sets the TIMEOUT error flag.
20	SHIFTDIR		Shift direction for data format x. With bit SHIFTDIRx, the shift direction for data format x (x=0,1,2,3) can be selected.
		0	MSB is shifted out first.
		1	LSB is shifted out first.
19	HDUPLEX_ENAx		Half Duplex transfer mode enable for Data Format x. This bit controls the I/O function of SOMI/SIMO lines for a specific requirement where in the case of Master mode, TX pin - SIMO will act as an RX pin, and in the case of Slave mode, RX pin - SIMO will act as a TX pin.
		0	Normal Full Duplex transfer.
		1	If MASTER = 1, SPISIMO pin will act as an RX pin (No TX possible) If MASTER = 0, SPISIMO pin will act as a TX pin (No RX possible). For all normal operations, HDUPLEX_ENAx bits should always remain 0. It is intended for the usage when the SPISIMO pin is used for both TX and RX operations at different times.
18	DIS CS TIMERS		Disable chip-select timers for this format. The C2TDELAY and T2CDELAY timers are by default enabled for all the data format registers. Using this bit, these timers can be disabled for a particular data format, if they are not required. When a master is handling multiple slaves, with varied set-up hold requirement, the application can selectively choose to include or not include the chip-select delay timers for any slaves.
		0	Both C2TDELAY and T2CDELAY counts are inserted for the chip selects.
		1	No C2TDELAY or T2CDELAY is inserted in the chip select timings.
17	POLARITY		SPI data format x clock polarity. POLARITYx defines the clock polarity of data format x. The following restrictions apply when switching clock phase and/or polarity: • In 3-pin/4-pin with $\overline{\text{SPIENA}}$ pin configuration of a slave SPI, the clock phase and polarity cannot be changed on-the-fly between two transfers. The slave should be reset and reconfigured if clock phase/polarity needs to be switched. In summary, SPI format switching is not fully supported in slave mode. • Even while using chip select pins, the polarity of SPICLK can be switched only while the slave is not selected by a valid chip select. The master SPI should ensure that while switching SPICLK polarity, it has deselected all of its slaves. Otherwise, the switching of SPICLK polarity may be incorrectly treated as a clock edge by some slaves.
		0	If POLARITYx is cleared to 0, the SPI clock signal is low-inactive, that is, before and after data transfer the clock signal is low.
		1	If POLARITYx is set to 1, the SPI clock signal is high-inactive, that is, before and after data transfer the clock signal is high.
16	PHASE		SPI data format x clock delay. PHASEx defines the clock delay of data format x.
		0	If PHASEx is cleared to 0, the SPI clock signal is not delayed versus the transmit/receive data stream. The first data bit is transmitted with the first clock edge and the first bit is received with the second (inverse) clock edge.
		1	If PHASEx is set to 1, the SPI clock signal is delayed by a half SPI clock cycle versus the transmit/receive data stream. The first transmit bit has to output prior to the first clock edge. The master and slave receive the first bit with the first edge.

Table 13-29. SPI Data Format Registers (SPIFMT) Field Descriptions (continued)

Bit	Field	Value	Description
15-8	PRESCALE		SPI data format x prescaler. PRESCALEx determines the bit transfer rate of data format x if the SPI is the network master. PRESCALEx is use to derive SPICLK from VCLK. If the SPI is configured as slave, PRESCALEx **does not need** to be configured. The clock rate for data format x can be calculated as: $BR_{Formatx}$ = VCLK / (PRESCALEx + 1) **Note: When PRESCALEx is cleared to 0, the SPI clock rate defaults to VCLK/2.**
7-5	Reserved	0	Reads return 0. Writes have no effect.
4-0	CHARLEN	0-1Fh	SPI data format x data-word length. CHARLENx defines the word length of data format x. Legal values are 0x02 (data word length = 2 bit) to 10h (data word length = 16). Illegal values, such as 00 or 1Fh are not allowed; their effect is indeterminate.

13.9.22 Interrupt Vector 0 (INTVECT0)

Note

The TG interrupt is not available in MibSPI in compatibility mode. Therefore, there is no possibility to access this register in compatibility mode.

Figure 13-51. Interrupt Vector 0 (NTVECT0) [offset = 60h]

31 – 16
Reserved
R-0

15 – 6	5 – 1	0
Reserved	INTVECT0	SUSPEND0
R-0	R-0	R-0

LEGEND: R = Read only; -*n* = value after reset

Table 13-30. Transfer Group Interrupt Vector 0 (INTVECT0)

Bit	Field	Value	Description
31-6	Reserved	0	Reads return 0. Writes have no effect.
5-1	INTVECT0		INTVECT0. Interrupt vector for interrupt line INT0. Returns the vector of the pending interrupt at interrupt line INT0. If more than one interrupt is pending, INTVECT0 always references the highest prior interrupt source first. **Note: This field reflects the status of the SPIFLG register in vector format. Any updates to the SPIFLG register will automatically cause updates to this field.**
		0	There is no pending interrupt.
		1h + x	Transfer group x (x = 0 to 15) has a pending interrupt. SUSPEND0 reflects the type of interrupt (*suspend* or *finished*).
		11h	Error Interrupt pending. The lower half of SPIFLG contains more details about the type of error.
		13h	The pending interrupt is a Receive Buffer Overrun interrupt.
		12h	**SPI mode:** The pending interrupt is a Receive Buffer Full interrupt. **Mib mode:** Reserved. This bit combination should not occur.
		14h	**SPI mode:** The pending interrupt is a Transmit Buffer Empty interrupt. **Mib mode:** Reserved. This bit combination should not occur.
		All Other Combinations	**SPI mode:** Reserved. These bit combinations should not occur.
0	SUSPEND0		Transfer suspended / Transfer finished interrupt flag. Every time INTVECT0 is read by the host, the corresponding interrupt flag of the referenced transfer group is cleared and INTVECT0 is updated with the vector coming next in the priority chain.
		0	The interrupt type is a transfer finished interrupt. In other words, the buffer array referenced by INTVECT0 has asserted an interrupt because all of data from the transfer group has been transferred.
		1	The interrupt type is a transfer suspended interrupt. In other words, the transfer group referenced by INTVECT0 has asserted an interrupt because the buffer to be transferred next is in suspend-to-wait mode.

Note

Reading from the INTVECT0 register when Transmit Empty is indicated does not clear the TXINTFLG flag in the SPI Flag Register (SPIFLG). Writing a new word to the SPIDATx register clears the Transmit Empty interrupt.

Note

In multi-buffer mode, INTVECT0 contains the interrupt for the highest priority transfer group. A read from INTVECT0 automatically causes the next-highest priority transfer group's interrupt status to get loaded into INTVECT0 and its corresponding SUSPEND flag to get loaded into SUSPEND0. The transfer group with the lowest number has the highest priority, and the transfer group with the highest number has the lowest priority.

Reading the INTVECT0 register when the RXOVRN interrupt is indicated in multi-buffer mode does not clear the RXOVRN flag and hence does not clear the vector. The RXOVRN interrupt vector may be cleared in multi-buffer mode either by write-clearing the RXOVRN flag in the SPI Flag Register (SPIFLG) or by reading the RXRAM Overrun Buffer Address Register (RXOVRN_BUF_ADDR).

13.9.23

13.9.24 Interrupt Vector 1 (INTVECT1)

Note

The TG interrupt is not available in SPI in compatibility mode compatibility mode. Therefore, there is no possibility to access this register in compatibility mode.

LEGEND: R = Read only; -*n* = value after reset

Table 13-31. Transfer Group Interrupt Vector 1 (INTVECT1)

Bit	Field	Value	Description
31-6	Reserved	0	Reads return 0. Writes have no effect.

Table 13-31. Transfer Group Interrupt Vector 1 (INTVECT1) (continued)

Bit	Field	Value	Description
5-1	INTVECT1		INTVECT1. Interrupt vector for interrupt line INT1. Returns the vector of the pending interrupt at interrupt line INT1. If more than one interrupt is pending, INTVECT1 always references the highest prior interrupt source first. **Note: This field reflects the status of the SPIFLG register in vector format. Any updates to the SPIFLG register will automatically cause updates to this field.**
		0	There is no pending interrupt. **SPI mode only.**
		11h	Error Interrupt pending. The lower half of SPIINT1 contains more details about the type of error. **SPI mode only.**
		13h	The pending interrupt is a Receive Buffer Overrun interrupt. **SPI mode only.**
		12h	The pending interrupt is a Receive Buffer Full interrupt. **SPI mode only.**
		14h	The pending interrupt is a Transmit Buffer Empty interrupt. **SPI mode only.**
		All Other Combinations	Reserved. These bit combinations should not occur. **SPI mode only.**
0	SUSPEND1		Transfer suspended / Transfer finished interrupt flag. Every time INTVECT1 is read by the host, the corresponding interrupt flag of the referenced transfer group is cleared and INTVECT1 is updated with the vector coming next in the priority chain.
		0	The interrupt type is a transfer finished interrupt. In other words, the buffer array referenced by INTVECT1 has asserted an interrupt because all of data from the transfer group has been transferred.
		1	The interrupt type is a transfer suspended interrupt. In other words, the transfer group referenced by INTVECT1 has asserted an interrupt because the buffer to be transferred next is in suspend-to-wait mode.

Note

Reading from the INTVECT1 register when Transmit Empty is indicated does not clear the TXINTFLG flag in the SPI Flag Register (SPIFLG). Writing a new word to the SPIDATx register clears the Transmit Empty interrupt.

Note

In multi-buffer mode, INTVECT1 contains the interrupt for the highest priority transfer group. A read from INTVECT1 automatically causes the next-highest priority transfer group's interrupt status to get loaded into INTVECT1 and its corresponding SUSPEND flag to get loaded into SUSPEND1. The transfer group with the lowest number has the highest priority, and the transfer group with the highest number has the lowest priority.

Reading the INTVECT1 register when the RXOVRN interrupt is indicated in multi-buffer mode does not clear the RXOVRN flag and hence does not clear the vector. The RXOVRN interrupt vector may be cleared in multi-buffer mode either by write-clearing the RXOVRN flag in the SPI Flag Register (SPIFLG) or by reading the RXOVERN_BUF_ADDR register.

13.9.25 SPI Pin Control Register 9 (SPIPC9)

SPIPC9 only applies to SPI2.

Figure 13-53. SPI Pin Control Register 9 (SPIPC9) [offset = 68h]

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 13-32. SPI Pin Control Register 9 (SPIPC9) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return the value that was last written. Writes have no effect.
24	SOMISRS0		SPI2 SOMI[0] slew control. This bit controls between the fast or slow slew mode.
			Note: Duplicate Control Bits for SPI2 SOMI[0]. Bit 24 is not physically implemented. It is a mirror of bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPI2 SOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
23-17	Reserved	0	Reads return the value that was last written. Writes have no effect.
16	SIMOSRS0		SPI2 SIMO[0] slew control. This bit controls between the fast or slow slew mode.
			Note: Duplicate Control Bits for SPI2 SIMO[0]. Bit 16 is not physically implemented. It is a mirror of bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPI2 SIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMISRS0		SPI2 SOMI[0] slew control. This bit controls between the fast or slow slew mode.
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
10	SIMOSRS0		SPI2 SIMO[0] slew control. This bit controls between the fast or slow slew mode.
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
9	CLKSRS		SPI2 CLK slew control. This bit controls between the fast or slow slew mode.
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
8-0	Reserved	0	Reads return the value that was last written. Writes have no effect.

13.9.26 Parallel/Modulo Mode Control Register (SPIPMCTRL)

Note

Do not configure MODCLKPOLx and MMODEx bits since this device does not support modulo mode.

Note

The bits of this register are used in conjunction with the SPIFMTx registers. Each byte of this register corresponds to one of the SPIFMTx registers.

1. Byte0 (Bits 7:0) are used when SPIFMT0 register is selected by DFSEL[1:0] = 00 in the control field of a buffer.
2. Byte1 (Bits 15:8) are used when SPIFMT1 register is selected by DFSEL[1:0] = 01 in the control field of a buffer.
3. Byte2 (Bits 23:16) are used when SPIFMT2 register is selected by DFSEL[1:0] = 10 in the control field of a buffer.
4. Byte3 (Bits 31:24) are used when SPIFMT3 register is selected by DFSEL[1:0] = 11 in the control field of a buffer.

		3h	8-data line mode (MMODE0 should be set to 000)

13.9.27 Multi-buffer Mode Enable Register (MIBSPIE)

Note

Accessibility of Multi-Buffer RAM

The multi-buffer RAM is not accessible unless the MSPIENA bit set to 1. The only exception to this is in test mode, where, by setting RXRAMACCESS to 1, the multi-buffer RAM can be fully accessed for both read and write.

Figure 13-55. Multi-buffer Mode Enable Register (MIBSPIE) [offset = 70h]

31–17	16
Reserved	RXRAM_ACCESS
R-0	R/WP-0

15–1	0
Reserved	MSPIENA
R-0	R/WP-0

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -*n* = value after reset

Table 13-34. Multi-buffer Mode Enable Register (MIBSPIE) Field Descriptions

Bit	Field	Value	Description
31-17	Reserved	0	Reads return 0. Writes have no effect.
16	RXRAM ACCESS		Receive-RAM access control. During normal operating mode of SPI, the receive data/status portion of multi-buffer RAM is read-only. To enable testing of receive RAM, direct read/write access is enabled by setting this bit.
		0	The RX portion of multi-buffer RAM is not writable by the CPU.
		1	The whole of multi-buffer RAM is fully accessible for read/write by the CPU.
			Note: The RX RAM ACCESS bit remains 0 after reset and it should remain cleared to 0 at all times, except when testing the RAM. SPI should be given a local reset by using the nRESET (SPIGCR0[0]) bit after RAM testing is performed so that the multi-buffer RAM gets re-initialized.
15-1	Reserved	0	Reads return 0. Writes have no effect.
0	MSPIENA		Multi-buffer mode enable. After power-up or reset, MSPIENA remains cleared, which means that the SPI runs in compatibility mode by default. If multi-buffer mode is desired, this register should be configured first after configuring the SPIGCR0 register. If MSPIENA is not set to 1, the multi-buffer mode registers are not writable.
		0	The SPI runs in compatibility mode, that is, in this mode the MibSPI is fully code-compliant to the standard device SPI. No multi-buffered-mode features are supported.
		1	The SPI is configured to run in multi-buffer mode.

Note

Accessibility of Registers

Registers from this offset address onwards are not accessible in SPI compatibility mode. They are accessible only in the multi-buffer mode.

13.9.28 TG Interrupt Enable Set Register (TGITENST)

The register TGITENST contains the TG interrupt enable flags for transfer-finished and for transfer-suspended events. Each of the enable bits in the higher half-word and the lower half-word of TGITENST belongs to one TG.

The register map shown in Figure 13-56 and Table 13-35 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Figure 13-56. TG Interrupt Enable Set Register (TGITENST) [offset = 74h]

Table 13-35. TG Interrupt Enable Set Register (TGITENST) Field Descriptions

Bit	Field	Value	Description
31-16	SETINTENRDY[*n*]		TG interrupt set (enable) when transfer finished. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx completes. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx completes. Write: Enable the TGx-completed interrupt. The interrupt gets generated when TGx completes.
15-0	SETINTENSUS[*n*]		TG interrupt set (enabled) when transfer suspended. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx is suspended. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx is suspended. Write: Enable the TGx-completed interrupt. The interrupt gets generated when TGx is suspended.

13.9.29 TG Interrupt Enable Clear Register (TGITENCR)

The register TGITENCR is used to clear the interrupt enables for the TG-completed interrupt and the TG-suspended interrupts.

The register map shown in Figure 13-57 and Table 13-36 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Table 13-36. TG Interrupt Enable Clear Register (TGITENCR) Field Descriptions

Bit	Field	Value	Description
31-16	CLRINTENRDY[*n*]		TG interrupt clear (disabled) when transfer finished. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx completes. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx completes. Write: Disable the TGx-completed interrupt. The interrupt does not get generated when TGx completes.
15-0	CLRINTENSUS[*n*]		TG interrupt clear (disabled) when transfer suspended. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx is suspended. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx is suspended. Write: Disable the TGx-completed interrupt. The interrupt does not get generated when TGx is suspended.

13.9.30 Transfer Group Interrupt Level Set Register (TGITLVST)

The register TGITLVST sets the level of interrupts for transfer completed interrupt and for transfer suspended interrupt to level 1.

The register map shown in Figure 13-58 andTable 13-37 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Bit	Field	Value	Description
31-16	SETINTLVLRDY[*n*]		Transfer-group completed interrupt level set. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is set to INT1. Write: Set the TGx-completed interrupt to INT1.
15-0	SETINTLVLSUS[*n*]		Transfer-group suspended interrupt level set. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.
		0	Read: The TGx-suspended interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-suspended interrupt is set to INT1. Write: Set the TGx-suspended interrupt to INT1.

13.9.31 Transfer Group Interrupt Level Clear Register (TGITLVCR)

The register TGITLVCR clears the level of interrupts for transfer completed interrupt and for transfer suspended interrupt to level 0.

The register map shown in Figure 13-59 and Table 13-38 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Bit	Field	Value	Description
31-16	CLRINTLVLRDY[*n*]		Transfer-group completed interrupt level clear. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is set to INT1. Write: Clear the TGx-completed interrupt to INT0.
15-0	CLRINTLVLSUS[*n*]		Transfer group suspended interrupt level clear. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.
		0	Read: The TGx-suspended interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-suspended interrupt is set to INT1. Write: Clear the TGx-suspended interrupt to INT0.

13.9.32 Transfer Group Interrupt Flag Register (TGINTFLG)

The TGINTFLG register comprises the transfer group interrupt flags for transfer-completed interrupts (INTFLGRDYx) and for transfer-suspended interrupts (INTFLGSUSx). Each of the interrupt flags in the higher half-word and the lower half-word of TGINTFLG belongs to one TG.

The register map shown in Figure 13-60 and Table 13-39 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Table 13-39. Transfer Group Interrupt Flag Register (TGINTFLG) Field Descriptions

Bit	Field	Value	Description
31-16	INTFLGRDY[*n*]		Transfer-group interrupt flag for a transfer-completed interrupt. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on. **Note: Read Clear Behavior. Reading the interrupt vector registers TGINTVECT0 or TGINTVECT1 automatically clears the interrupt flag bit INTFLGRDYx referenced by the vector number given by INTVECT0/INTVECT1 bits, if the SUSPEND[0:1] bit in the vector registers is 0.**
		0	Read: No transfer-completed interrupt occurred since last clearing of the INTFLGRDYx flag. Write: A write of 0 to this bit has no effect.
		1	Read: A transfer finished interrupt from transfer group x occurred. No matter whether the interrupt is enabled or disabled (INTENRDYx = don't care) or whether the interrupt is mapped to INT0 or INT1, INTFLGRDYx is set right after the transfer from TGx is finished. Write: The corresponding bit flag is cleared.
15-0	INTFLGSUS[*n*]		Transfer-group interrupt flag for a transfer-suspend interrupt. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on. **Note: Read Clear Behavior. Reading the interrupt vector registers TGINTVECT0 or TGINTVECT1 automatically clears the interrupt flag bit INTFLGSUSx referenced by the vector number given by INTVECT0/INTVECT1 bits, if the SUSPEND[0:1] bit in the corresponding vector registers is 1.**
		0	Read: No transfer-suspended interrupt occurred since the last clearing of the INTFLGSUSx flag. Write: A write of 0 to this bit has no effect.
		1	Read: A transfer-suspended interrupt from TGx occurred. No matter whether the interrupt is enabled or disabled (INTENSUSx = don't care) or whether the interrupt is mapped to INT0 or INT1, INTFLGSUSx is set right after the transfer from transfer group x is suspended. Write: The corresponding bit flag is cleared.

13.9.33 Tick Count Register (TICKCNT)

One of the trigger sources for TGs is an internal periodic time trigger. This time trigger is called a tick counter and is basically a down-counter with a preload/reload value. Every time the tick counter detects an underflow it reloads the initial value and toggles the trigger signal provided to the TGs.

The trigger signal, shown in Figure 13-61 as a square wave, illustrates the different trigger event types for the TGs (for example, rising edge, falling edge, and both edges).

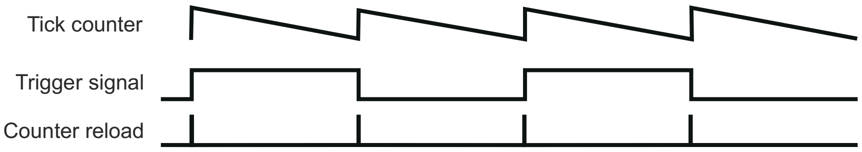

Figure 13-61. Tick Counter Operation

This register is shown in Figure 13-62 and described in Table 13-40.

Figure 13-62. Tick Count Register (TICKCNT) [offset = 90h]

31	30	29-28	27-16

15-0
TICKVALUE
R/W-0

LEGEND: R/W = Read/Write; R = Read only; S = Set; -*n* = value after reset

Table 13-40. Tick Count Register (TICKCNT) Field Descriptions

Bit	Field	Value	Description
31	TICKENA		Tick counter enable.
		0	The internal tick counter is disabled. The counter value remains unchanged.
			Note: When the tick counter is disabled, the trigger signal is forced low.
		1	The internal tick counter is enabled and is clocked by the clock source selected by CLKCTRL. When TICKENA goes from 0 to 1, the tick counter is automatically loaded with the contents of TICKVALUE.
30	RELOAD		Pre-load the tick counter. RELOAD is a set-only bit; writing a 1 to it reloads the tick counter with the value stored in TICKVALUE. Reading RELOAD always returns a 0.
			Note: When the tick counter is reloaded by the RELOAD bit, the trigger signal is not toggled.
29-28	CLKCTRL		Tick counter clock source control. CLKCTRL defines the clock source that is used to clock the internal tick counter.
		0	SPICLK of data word format 0 is selected as the clock source of the tick counter.
		1h	SPICLK of data word format 1 is selected as the clock source of the tick counter.
		2h	SPICLK of data word format 2 is selected as the clock source of the tick counter.
		3h	SPICLK of data word format 3 is selected as the clock source of the tick counter.
27-16	Reserved	0	Reads return 0. Writes have no effect.

Table 13-40. Tick Count Register (TICKCNT) Field Descriptions (continued)

Bit	Field	Value	Description
15-0	TICKVALUE	0-FFFFh	Initial value for the tick counter. TICKVALUE stores the initial value for the tick counter. The tick counter is loaded with the contents of TICKVALUE every time an underflow condition occurs and every time the RELOAD flag is set by the host.

13.9.34 Last TG End Pointer (LTGPEND)

Figure 13-63. Last TG End Pointer (LTGPEND) [offset = 94h]

Rsvd	LPEND	Reserved
R-0	R/W-0	R-0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 13-41. Last TG End Pointer (LTGPEND) Field Descriptions

Bit	Field	Value	Description
31-29	Reserved	0	Reads return 0. Writes have no effect.
28-24	TG_IN_SERVICE		The TG number currently being serviced by the sequencer. These bits indicate the current TG that is being serviced. This field can generally be used for code debugging.
		0	No TG is being serviced by the sequencer.
		1h	TG0 is being serviced by the sequencer.
		:	:
		10h	TG15 is being serviced by the sequencer.
			Note: The number of transfer groups varies by device.
		11h-1Fh	Invalid values.
23-15	Reserved	0	Reads return 0. Writes have no effect.
14-8	LPEND	0-7Fh	Last TG end pointer. Usually the TG end address (PEND) is inherently defined by the start value of the starting pointer of the subsequent TG (PSTART). The TG ends one word before the next TG starts (PEND[x] = PSTART[x+1] - 1). For a full configuration of MibSPI, the last TG has no subsequent TG, that is, no end address is defined. Therefore, LPEND has to be programmed to specify explicitly the end address of the last TG. **Note: When using all 8 transfer groups, program the LPEND bits to define the end of the last transfer group. When using less than 8 transfer groups, leave the LPEND bits programmed to point to the end of the buffer and create a dummy transfer group that defines the end of your last intentional transfer group and occupies all the remaining buffer space.**
7-0	Reserved	0	Reads return 0. Writes have no effect.

13.9.35 TGx Control Registers (TGxCTRL)

Each TG can be configured via one dedicated control register. The register description shows one control register (x) that is identical for all TGs. For example, the control register for TG2 is named TG2CTRL and is located at *base address* + *98h* + *4* × *2*. The actual number of available control registers varies by device.

Figure 13-64. MibSPI TG Control Registers (TGxCTRL) [offsets = 98h-D4h]

Rsvd	PSTART	Rsvd	PCURRENT
R-0	R/W-0	R-0	R-0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 13-42. TG Control Registers (TGxCTRL) Field Descriptions

Bit	Field	Value	Description
31	TGENA		TGx enable. If the correct event (TRIGEVTx) occurs at the selected source (TRIGSRCx), a group transfer is initiated if no higher-priority TG is in active-transfer mode or if one or more higher-priority TGs are in transfer-suspend mode. Disabling a TG while a transfer is ongoing will finish the ongoing word transfer but not the whole group transfer.
		0	TGx is disabled.
		1	TGx is enabled.
30	ONESHOTx		Single transfer for TGx.
		0	TGx initiates a transfer every time a trigger event occurs and TGENA is set.
		1	A transfer from TGx will be performed only once (one shot) after a valid trigger event at the selected trigger source. After the transfer is finished the TGENAx control bit will be cleared and therefore no additional transfer can be triggered before the host enables the TG again. This one shot mode ensures that after one group transfer the host has enough time to read the received data and to provide new transmit data.

Table 13-42. TG Control Registers (TGxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
29	PRSTx		TGx pointer reset mode. Configures the way to resolve trigger events during an ongoing transfer. This bit is meaningful only for level-triggered TGs. Edge-triggered TGs cannot be restarted before their completion by another edge. The PRST bit will have no effect on this behavior. **Note: When the PRST bit is set, if the buffer being transferred at the time of a new trigger event is a LOCK, CSHOLD or NOBRK buffer, then only after finishing those transfers, the TG will be restarted. This means that even if the TG is retriggered, the TG will only be restarted after finishing the transfer of the first non-LOCK or non-CSHOLD buffer. In the case of the NOBRK buffer, after completing the ICOUNT number of transfers, the TG will be restarted from its PSTART.** This means that TX control fields such as LOCK and CSHOLD, and DMA control fields such as NOBRK have higher priority over anything else. They have the capability to delay the restart of the TG even if it is retriggered when PRST is 1.
		0	If a trigger event occurs during a transfer from TGx, the event is ignored and is not stored internally. The TGx transfer has priority over additional trigger events.
		1	The TGx pointer (PCURRENTx) will be reset to the start address (PSTARTx) when a valid trigger event occurs at the selected trigger source while a transfer from the same TG is ongoing. Every trigger event resets PCURRENTx no matter whether the concerned TG is in transfer mode or not. The trigger events have priority over the ongoing transfer.
28	TGTDx		TG triggered.
		0	TGx has not been triggered or is no longer waiting for service.
		1	TGx has been triggered and is either currently being serviced or waiting for servicing.
27-24	Reserved	0	Reads return 0. Writes have no effect.

Table 13-42. TG Control Registers (TGxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description	
23-20	TRIGEVTx		Type of trigger event. A level-triggered TG can be stopped by de-activating the level trigger. However, the following restrictions apply. • Deactivating the level trigger for a TG during a NOBRK transfer does not stop the transfers until all of the ICOUNT number of buffers are transferred for the NOBRK buffer. Once a NOBRK buffer is prefetched, the trigger event loses control over the TG until the NOBRK buffer transfer is completed. • Once the transfer of a buffer with CSHOLD or LOCK bit set starts, deactivating the trigger level does not stop the transfer until the sequencer completes the transfer of the next non-CSHOLD or non-LOCK buffer in the same TG. • Once the last buffer in a TG is pre-fetched, de-activating the trigger level does not stop the transfer group until the last buffer transfer is completed. This means even if the trigger level is deactivated at the beginning of the penultimate (one-before-last) buffer transfer, the sequencer continues with the same TG until it is completed.	
		0	never	Never trigger TGx. This is the default value after reset.
		1h	rising edge	A rising edge (0 to 1) at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		2h	falling edge	A falling edge (1 to 0) at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		3h	both edges	Rising and falling edges at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		4h	Rsvd	Reserved
		5h	high-active	While the selected trigger source (TRIGSRCx) is at a logic-high level (1), the group transfer is continued and at the end of one group, transfer is restarted at the beginning. If the logic level changes to low (0) during an ongoing group transfer, the whole group transfer will be stopped. **Note: If ONESHOTx is set, the transfer is performed only once.**
		6h	low-active	While the selected trigger source (TRIGSRCx) is at a logic-low level (0), the group transfer is continued and at the end of one group, transfer is restarted at the beginning. If the logic level changes to high (1) during an ongoing group transfer, the whole group transfer will be stopped. **Note: If ONESHOTx is set, the transfer is performed only once.**
		7h	always	A repetitive group transfer will be performed. **Note: By setting the TRIGSRC to 0, the TRIGEVT to 7h (ALWAYS), and the ONESHOTx bit to 1, software can trigger this TG. Upon setting the TGENA bit, the TG is immediately triggered.** **Note: If ONESHOTx is set, the transfer is performed only once.**
		8h-Fh	Rsvd	Reserved

Table 13-42. TG Control Registers (TGxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description	
19-16	TRIGSRCx		Trigger source. After reset, the trigger sources of all TGs are disabled.	
		0	Disabled	
		1h	EXT0	External trigger source 0. The actual source varies per device (for example, HET I/O channel, event pin).
		2h	EXT1	External trigger source 1. The actual source varies per device (for example, HET I/O channel, event pin).
		3h	EXT2	External trigger source 2. The actual source varies per device (for example, HET I/O channel, event pin).
		4h	EXT3	External trigger source 3. The actual source varies per device (for example, HET I/O channel, event pin).
		5h	EXT4	External trigger source 4. The actual source varies per device (for example, HET I/O channel, event pin).
		6h	EXT5	External trigger source 5. The actual source varies per device (for example, HET I/O channel, event pin).
		7h	EXT6	External trigger source 6. The actual source varies per device (for example, HET I/O channel, event pin).
		8h	EXT7	External trigger source 7. The actual source varies per device (for example, HET I/O channel, event pin).
		9h	EXT8	External trigger source 8. The actual source varies per device (for example, HET I/O channel, event pin).
		Ah	EXT9	External trigger source 9. The actual source varies per device (for example, HET I/O channel, event pin).
		Bh	EXT10	External trigger source 10. The actual source varies per device (for example, HET I/O channel, event pin).
		Ch	EXT11	External trigger source 11. The actual source varies per device (for example, HET I/O channel, event pin).
		Dh	EXT12	External trigger source 12. The actual source varies per device (for example, HET I/O channel, event pin).
		Eh	EXT13	External trigger source 13. The actual source varies per device (for example, HET I/O channel, event pin).
		Fh	TICK	Internal periodic event trigger. The tick counter can initiate periodic group transfers.
15	Reserved	0	Reads return 0. Writes have no effect.	
14-8	PSTARTx	0-7Fh	TG start address. PSTARTx stores the start address of the corresponding TG. The corresponding end address is inherently defined by the subsequent TG start address minus 1 (PENDx[TGx] = PSTARTx[TGx+1]-1). PSTARTx is copied into PCURRENTx when: • The TG is enabled • The end of the TG is reached during a transfer • A trigger event occurs while PRST is set to 1	
7	Reserved	0	Reads return 0. Writes have no effect.	
6-0	PCURRENTx	0-7Fh	Pointer to current buffer. PCURRENT is read-only. PCURRENTx stores the address (0...127) of the buffer that corresponds to this TG. If the TG switches from active-transfer mode to suspend-to-wait mode, PCURRENTx contains the address of the currently suspended word. After the TG resumes from suspend-to-wait mode, the next buffer will be transferred; that is, no buffer data is transferred because of suspend-to-wait mode.	

Note

Register bits vary by device

TG0 has the highest priority and TG15 has the lowest priority. Under the following conditions, a lower-priority TG cannot be interrupted by a higher-priority TG:

1. When there is a CSHOLD or LOCK buffer, until the completion of the next buffer transfer that is a non-CSHOLD or non-LOCK buffer.
2. An entire sequence of words transferred for a NOBRK DMA buffer.
3. Once the last word in a TG is pre-fetched.

13.9.36 DMA Channel Control Register (DMAxCTRL)

Each DMA channel can be configured via one dedicated control register. The register description below shows one exemplary control register that is identical for all DMA channels; for example, the control register for DMA channel 0 is named DMA0CTRL. The MibSPI supports up to 8 bidirectional DMA channels.

The number of bidirectional DMA channels varies by device. The number of DMA channels and hence the number of DMA channel control registers may vary.

Figure 13-65. DMA Channel Control Register (DMAxCTRL) [offset = D8h-F4h]

31	30 - 24	23 - 20	19 - 16
ONESHOT	BUFID	RXDMA_MAP	TXDMA_MAP

R-0	R-0	R-0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 13-43. DMA Channel Control Register (DMAxCTRL) Field Descriptions

Bit	Field	Value	Description
31	ONESHOT		Auto-disable of DMA channel after ICOUNT + 1 transfers. **Note: This ONESHOT applies to the DMA channel identified by x and will autodisable based on ICOUNTx.**
		0	The length of the block transfer is fully controlled by the DMA controller. The enable bits RXDMAENAx and TXDMAENAx are not modified by the MibSPI.
		1	ONESHOT allows a block transfer of defined length (ICOUNTx + 1), mainly controlled by the MibSPI and not by the DMA controller. After ICOUNTx + 1 transfers, the enable bits RXDMAENAx and TXDMAENAx are automatically cleared by the MibSPI, hence no more DMA requests are generated. In conjunction with NOBRKx, a burst transfer can be initiated without any other transfer through another buffer.
30-24	BUFIDx	0-7Fh	Buffer utilized for DMA transfer. BUFIDx defines the buffer that is utilized for the DMA transfer. In order to synchronize the transfer with the DMA controller with the NOBRK condition the "suspend to wait until..." modes must be used.
23-20	RXDMA_MAPx	0-Fh	Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. RXDMA_MAPx defines the number of the physical DMA Request line that is connected to the receive path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set to 1, then RXDMA_MAPx shall differ from TXDMA_MAPx and shall differ from any other used physical DMA Request line. Otherwise, unexpected interference may occur.

Table 13-43. DMA Channel Control Register (DMAxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
19-16	TXDMA_MAPx	0-Fh	Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. TXDMA_MAPx defines the number of the physical DMA Request line that is connected to the transmit path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set to 1, then TXDMA_MAPx shall differ from RXDMA_MAPx and shall differ from any other used physical DMA Request line. Otherwise, unexpected interference may occur.
15	RXDMAENAx		Receive data DMA channel enable.
		0	No DMA request upon new receive data.
		1	The physical DMA channel for the receive path is enabled. The first DMA request pulse is generated after the first transfer from the referenced buffer (BUFIDx) is finished. The buffer should be configured in as "skip until RXEMPTY is set" or "suspend to wait until RXEMPTY is set" in order to ensure synchronization between the DMA controller and the MibSPI sequencer.
14	TXDMAENAx		Transmit data DMA channel enable.
		0	No DMA request upon new transmit data.
		1	The physical DMA channel for the transmit path is enabled. The first DMA request pulse is generated right after setting TXDMAENAx to load the first transmit data. The buffer should be configured in the as "skip until TXFULL is set" or "suspend to wait until TXFULL is set" in order to ensure synchronization between the DMA controller and the MibSPI sequencer.
13	NOBRKx		Non-interleaved DMA block transfer. This bit is available in master mode only. **Note: Special Conditions during a NOBRK Buffer Transfer. If a NOBRK DMA buffer is currently being serviced by the sequencer, then it is not allowed to be disabled prematurely.** During a NOBRK transfer, the following operations are not allowed: • Clearing the NOBRKx bit to 0 • Clearing the RXDMAENAx to 0 (if it is already 1) • Clearing the TXDMAENAx to 0 (if it is already 1) • Clearing the BUFMODE[2:0] bits in TXRAM to 000 **Note: Any attempts to perform these actions during a NOBRK transfer will produce unpredictable results.**
		0	DMA transfers through the buffer referenced by BUFIDx are interleaved by data transfers from other active buffers or TGs. Every time the sequencer checks the DMA buffer, it performs one transfer and then steps to the next buffer.
		1	NOBRKx ensures that ICOUNTx + 1 data transfers are performed from the buffer referenced by BUFIDx without a data transfer from any other buffer. The sequencer remains at the DMA buffer until ICOUNTx + 1 transfers have been processed. For example, this can be used to generate a burst transfer to one device without disabling the chip select signal in-between (the concerned buffer has to be configured with CSHOLD = 1). Another example would be to have a defined block data transfer in slave mode, synchronous to the master SPI. **Note: Triggering of higher priority TGs or enabling of higher priority DMA channels will not interrupt a NOBRK block transfer.**
12-8	ICOUNTx	0-1Fh	Initial count of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits 0, it is reloaded with ICOUNTx. The real number of transfers equals ICOUNTx plus 1. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer. If ONESHOTx and NOBRKx are not set, ICOUNTx should be 0. **Note: See Section 13.9.37 (ICOUNT) and Section 13.9.38 (DMACNTLEN) about how to increase the ICOUNT to a 16-bit value. With this extended capability, MibSPI can transfer a block of up to 65535 (65K) words without interleaving (if NOBRK is used) or without deasserting the chip select between the buffers (if CSHOLD is used).**
7	Reserved	0	Reads return 0. Writes have no effect.
6	COUNT_BIT17x		The 17th bit of the COUNT field of DMAxCOUNT register.

Table 13-43. DMA Channel Control Register (DMAxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
5-0	COUNTx	0-3Fh	Actual number of remaining DMA transfers. This field contains the actual number of DMA transfers that remain, until the DMA channel is disabled, if ONESHOTx is set. **Note: If the TX and RX DMA requests are enabled, the COUNT register will be decremented when the RX has been serviced.**

13.9.37 DMAxCOUNT Register (ICOUNT)

Note

These registers are used only if the LARGE COUNT bit in the DMACNTLEN register is set.

The number of bidirectional DMA channels varies by device. The number of DMA channels and hence the number of DMA registers varies by device.

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 13-44. MibSPI DMAxCOUNT Register (ICOUNT) Field Descriptions

Bit	Field	Value	Description
31-16	ICOUNTx	0-FFFFh	Initial number of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits 0, it is reloaded with ICOUNTx. The real number of transfer equals ICOUNTx plus 1. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the corresponding DMA channel. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer.
15-0	COUNTx	0-FFFFh	Actual number of remaining DMA transfers. COUNTx Contains the actual number of DMA transfers that remain, until the DMA channel is disabled, if ONESHOTx is set. Since the real counter value is always ICOUNTx +1, the 17th bit of COUNTx is available on DMACTRLx[6] bit. **Note: Usage Tip for Block Transfer Using a Single DMA Request. It is possible to use the multi-buffer RAM to transfer chunks of data to/from an external SPI. A DMA Controller can be used to handle the data in bursts. Suppose a chunk of 64 bytes of data needs to be transferred and a single DMA request needs to be generated at the end of transferring the 64 bytes. This can be easily achieved by configuring a TG register for the 64 buffer locations and using the DMAxCTRL/DMAxCOUNT registers to configure the last buffer (64th) of the TG as the BUFID and enable RXDMA (NOBRK = 0). At the end of the transfer of the 64th buffer, a DMA request will be generated on the selected DMA request channel. The DMA controller can do a burst read of all 64 bytes from RXRAM and/or then do a burst write to all 64 bytes to the TXRAM for the next chunk.**

Table 13-45. MibSPI DMA Large Count Register (DMACNTLEN) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reads return 0. Writes have no effect.
0	LARGE_COUNT		Select either the 16-bit DMAxCOUNT counters or the smaller counters in DMAxCTRL.
		0	Select the DMAxCTRL counters. Writes to the DMAxCTRL register will modify the ICOUNT value. Reading ICOUNT and COUNT can be done from the DMAxCTRL register. The DMAxCOUNT register should not be used since any write to this register will be overwritten by a subsequent write to the DMAxCTRL register to set the TXDMAENA or RXDMAENA bits.
		1	Select the DMAxCOUNT counters. Writes to the DMAxCTRL register will not modify the ICOUNT value. The ICOUNT value must be written to in the DMAxCOUNT register before the RXDMAENA or TXDMAENA bits are set in the DMAxCTRL register. The DMAxCOUNT register should be used for reading COUNT or ICOUNT.

13.9.39 Multi-buffer RAM Uncorrectable Parity Error Control Register (UERRCTRL)

31-9	Reserved	0	Reads return 0. Writes have no effect.

Table 13-46. Multi-buffer RAM Uncorrectable Parity Error Control Register (UERRCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
8	PTESTEN		Parity memory test enable. This bit maps the parity bits corresponding to multi-buffer RAM locations into the peripheral RAM frame to make them accessible by the CPU. See Section 13.11 for further details about parity memory testing.
		0	Parity bits are not memory-mapped.
		1	Parity bits are memory-mapped.
7-4	Reserved	0	Reads return 0. Writes have no effect.
3-0	EDEN		Error detection enable. These bits enable parity error detection.
		5h	Parity error detection logic (default) is disabled.
		All Other Values	Parity error detection logic is enabled.
			Note: It is recommended to write a 1010 to enable error detection, to guard against a soft error from disabling parity error detect

13.9.40 Multi-buffer RAM Uncorrectable Parity Error Status Register (UERRSTAT)

Bit	Field	Value	Description
31-10	Reserved	0	Reads return 0. Writes have no effect.
9-0	OVERADDR1	200h-3FFh	Uncorrectable parity error address for RXRAM. This register holds the address where a parity error is generated while reading RXRAM. Only the CPU or DMA can read from RXRAM locations. The address captured is byte-aligned. This error address is frozen from being updated until it is read by the CPU. The offset address of RXRAM varies from 200h-3FFh. The register does not clear its contents during or after module-level reset, system-level reset or even power-on reset. A read operation to this register clears its contents to the default value 200h. After a power-on reset the contents will be unpredictable. A read operation can be performed after power-up to keep the register at its default value, if required. However, the contents of this register are meaningful only when EDFLG1 is set to 1. **Note: A read of the UERRADDR1 register will clear EDFLG1 in the UERRSTAT register. However, in emulation mode when the SUSPEND signal is high, a read from the UERRADDR1 register does not clear EDFLG1.**

13.9.42 TXRAM Uncorrectable Parity Error Address Register (UERRADDR0)

Bit	Field	Value	Description
31-9	Reserved	0	Reads return 0. Writes have no effect.
8-0	UERRADDR0	0-1FFh	Uncorrectable parity error address for TXRAM. This register holds the address where a parity error is generated while reading from TXRAM. The TXRAM can be read either by CPU or by the MibSPI sequencer logic for transmission. The address captured is byte-aligned. This error address is frozen from being updated until it is read by the CPU. The offset address of TXRAM varies from 0-1FFh. The register does not clear its contents during or after module-level reset, system-level reset, or even power-on reset. A read operation to this register clears its contents to all 0s. After a power-on reset, the contents of this register will be unpredictable. A read operation can be performed after power-up to clear the this register's contents, if required. However, the contents of this register are meaningful only when EDFLG0 is set to 1. **Note: A read from the UERRADDR0 register will clear EDFLG0 in the UERRSTAT register. However, in emulation mode when the SUSPEND signal is high, a read from the UERRADDR0 register does not clear EDFLG0.**

13.9.43 RXRAM Overrun Buffer Address Register (RXOVRN_BUF_ADDR)

In multi-buffer mode, if a particular RXRAM location is written by the MibSPI sequencer logic after the completion of a new transfer when that location already contains valid data, the RX_OVR bit will be set to 1 while the data is being written. The RXOVRN_BUF_ADDR register captures the address of the RXRAM location for which a receiver overrun condition occurred.

Table 13-50. RXRAM Overrun Buffer Address Register (RXOVRN_BUF_ADDR) Field Descriptions

Bit	Field	Value	Description
31-10	Reserved	0	Reads return 0. Writes have no effect.
9-0	RXOVRN_BUF_ADDR	200h-3FCh	Address in RXRAM at which an overwrite occurred. This address value will show only the offset address of the RAM location in the multi-buffer RAM address space. Refer to the device-specific data sheet for the actual absolute address of RXRAM. This word-aligned address can vary from 200h-3FCh. Contents of this register are valid only when any of the INTVECT0 or INTVECT1 and SPIFLG registers show an RXOVRN error vector while in multi-buffer mode. If there are multiple overrun errors, then this register holds the address of first overrun address until it is read. **Note: Reading this register clears the RXOVRN interrupt flag in the SPIFLG register and the TGINTVECTx.** **Note: Receiver overrun errors in multi-buffer mode can be completely avoided by using the SUSPEND until RXEMPTY feature, which can be programmed into each buffer of any TG. However, using the SUSPEND until RXEMPTY feature will make the sequencer wait until the current RXRAM location is read by the VBUS master before it can start the transfer for the same buffer location again. This may affect the overall throughput of the SPI transfer. By enabling the interrupt on RXOVRN in multi-buffer mode, the user can rely on interrupts to know if a receiver overrun has occurred. The address of the overrun in RXRAM is indicated in this RXOVRN_BUF_ADDR register.**

13.9.44 I/O-Loopback Test Control Register (IOLPBKTSTCR)

This register controls test mode for I/O pins. It also controls whether loop-back should be digital or analog. In addition, it contains control bits to induce error conditions into the module. These are to be used only for module testing.

All of the control/status bits in this register are valid only when the IOLPBKTSTENA field is set to Ah.

Table 13-51. I/O-Loopback Test Control Register (IOLPBKTSTCR) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	SCS FAIL FLG		Bit indicating a failure on $\overline{\text{SPICS}}$ pin compare during analog loopback.
		0	Read: No miscompares occurred on any of the eight chip select pins (vs. the internal chip select number CSNR during transfers). Write: Writing a 0 to this bit has no effect.
		1	Read: A comparison between the internal CSNR field and the analog looped-back value of one or more of the $\overline{\text{SPICS}}$ pins failed. A stuck-at fault is detected on one of the $\overline{\text{SPICS}}$ pins. Comparison is done only on the pins that are configured as functional and during transfer operation. Write: This flag bit is cleared.
23-21	Reserved	0	Reads return 0. Writes have no effect.
20	CTRL BITERR		Controls inducing of BITERR during I/O loopback test mode.
		0	Do not interfere with looped-back data.
		1	Induces bit errors by inverting the value of the incoming data during loopback.

Table 13-51. I/O-Loopback Test Control Register (IOLPBKTSTCR) Field Descriptions (continued)

Bit	Field	Value	Description
19	CTRL DESYNC		Controls inducing of the desync error during I/O loopback test mode.
		0	Do not cause a desync error.
		1	Induce a desync error by forcing the incoming SPIENA pin (if functional) to remain 0 even after the transfer is complete. This forcing will be retained until the kernel reaches the idle state.
18	CTRL PARERR		Controls inducing of the parity errors during I/O loopback test mode.
		0	Do not cause a parity error.
		1	Induce a parity error by inverting the polarity of the parity bit.
17	CTRL TIMEOUT		Controls inducing of the timeout error during I/O loopback test mode.
		0	Do not cause a timeout error.
		1	Induce a timeout error by forcing the incoming SPIENA pin (if functional) to remain 1 when transmission is initiated. The forcing will be retained until the kernel reaches the idle state.
16	CTRL DLENERR		Controls inducing of the data length error during I/O loopback test mode.
		0	Do not cause a data-length error.
		1	Induce a data-length error. *Master mode:* The SPIENA pin (if functional) is forced to 1 when the module starts shifting data. *Slave mode:* The incoming SPICS pin (if functional) is forced to 1 when the module starts shifting data.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11-8	IOLPBKSTENA		Module I/O loopback test enable key.
		Ah	Enable I/O loopback test mode.
		All Other Values	Disable I/O loopback test mode.
7-6	Reserved	0	Reads return 0. Writes have no effect.
5-3	ERR SCS PIN		Inject error on chip-select pin number x. The value in this field is decoded as the number of the chip select pin on which to inject an error. During analog loopback, if CTRL SCS PIN ERR bit is set to 1, then the chip select pin selected by this field is forced to the opposite of its value in the CSNR.
		0	Select SPICS[0] for injecting error.
		1h	Select SPICS[1] for injecting error.
		:	:
		7h	Select SPICS[7] for injecting error.
2	CTRL SCS PIN ERR		Enable/disable the injection of an error on the SPICS pins. The individual SPICS pins can be chosen using the ERR SCS PIN field.
		0	Disable the SPICS error-inducing logic.
		1	Enable the SPICS error-inducing logic.
1	LPBK TYPE		Module I/O loopback type (analog/digital). See Figure 13-22 for the different types of loopback modes.
		0	Enable Digital loopback when IOLPBKTSTENA = 1010.
		1	Enable Analog loopback when IOLPBKTSTENA = 1010.
0	RXPENA		Enable analog loopback through the receive pin. **Note: This bit is valid only when LPBK TYPE = 1, which chooses analog loopback mode.**
		0	Analog loopback is through the transmit pin.
		1	Analog loopback is through the receive pin.

13.9.45 SPI Extended Prescale Register 1 (EXTENDED_PRESCALE1 for SPIFMT0 and SPIFMT1)

This register provides an extended Prescale values for SPICLK generation to be able to interface with much slower SPI Slaves. This is an extension of SPIFMT0 and SPIFMT1 registers. For example, EPRESCALE_FMT1[7:0] of EXTENDED_PRESCALE1 and PRESCALE1 of SPIFMT1 register will always reflect the same contents. Similarly, EPRESCALE_FMT0[7:0] and PRESCALE0 of SPIFMT0 reflect the same contents.

Figure 13-74. SPI Extended Prescale Register 1 (EXTENDED_PRESCALE1 for SPIFMT0 and SPIFMT1) [offset = 138h]

R-0	R/WP-0

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -*n* = value after reset

Table 13-52. SPI Extended Prescale Register 1 (EXTENDED_PRESCALE1) Field Descriptions

Bit	Field	Value	Description
31-27	Reserved	0	Reads return 0. Writes have no effect.
26-16	EPRESCALE_FMT1	0-7FFh	EPRESCALE_FMT1. Extended Prescale value for SPIFMT1. EPRESCALE_FMT1 determines the bit transfer rate of data format 1 if the SPI/MibSPI is the network master. EPRESCALE_FMT1 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT1 **does not need** to be configured. These EPRESCALE_FMT1[7:0] bits and PRESCALE1 bits of SPIFMT1 register will point to the same physically implemented register. The clock rate for data format 1 can be calculated as: $BR_{Format1}$ = VCLK / (EPRESCALE_FMT1 + 1) Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE1 bits of SPIFMT1 register. Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE1[26:16] or SPIFMT1[15:8] register. **Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE1 register is programmed after SPIFMT1 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE1 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE1 field of SPIFMT1 will automatically clear EPRESCALE_FMT1[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.**
15-11	Reserved	0	Reads return 0. Writes have no effect.

Table 13-52. SPI Extended Prescale Register 1 (EXTENDED_PRESCALE1) Field Descriptions (continued)

Bit	Field	Value	Description
10-0	EPRESCALE_FMT0	0-7FFh	EPRESCALE_FMT0. Extended Prescale value for SPIFMT0. EPRESCALE_FMT0 determines the bit transfer rate of data format 0 if the SPI/MibSPI is the network master. EPRESCALE_FMT0 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT0 **does not need** to be configured. These EPRESCALE_FMT0[7:0] bits and PRESCALE0 bits of SPIFMT0 register will point to the same physically implemented register. The clock rate for data format 0 can be calculated as: $BR_{Format0}$ = VCLK / (EPRESCALE_FMT0 + 1) Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE0 bits of SPIFMT0 register. Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE0[10:0] or SPIFMT0[15:8] register. **Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE1 register is programmed after SPIFMT0 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE1 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE0 field of SPIFMT0 will automatically clear EPRESCALE_FMT0[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.**

13.9.46 SPI Extended Prescale Register 2 (EXTENDED_PRESCALE2 for SPIFMT2 and SPIFMT3)

This register provides an extended Prescale values for SPICLK generation to be able to interface with much slower SPI Slaves. This is an extension of SPIFMT2 and SPIFMT3 registers. For example, EPRESCALE_FMT3[7:0] of EXTENDED_PRESCALE2 and PRESCALE3 of SPIFMT3 register will always reflect the same contents. Similarly, EPRESCALE_FMT2[7:0] and PRESCALE2 of SPIFMT2 reflect the same contents.

Complex bit access types are encoded to fit into small table cells. Table 13-55 shows the codes that are used for access types in this section.

Table 13-55. MSS_SPI Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

13.9.47.1 SPIGCR0 Register (Offset = 0h) [Reset = 00000000h]

SPIGCR0 is shown in Table 13-56.

Return to the Summary Table.

SPI / MibSPI Global Control Register 0

Table 13-56. SPIGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU	R	0h	Reserved, Reads return ‘0’ and writes have no effect.
0	nRESET	R/W	0h	This is the local reset control for the module. This bit needs to be set to ‘1’ before any operation on SPI / MibSPI can be done. Only after setting this bit to ‘1’, the Auto Initialization of Multibuffer RAM starts. Clearing this bit to ‘0’ will result in all of the control and status register values to return to their default values. 0 = SPI / MibSPI is in reset state 1 = SPI / MibSPI is out of reset state.

13.9.47.2 SPIGCR1 Register (Offset = 4h) [Reset = 00000000h]

SPIGCR1 is shown in Table 13-57.

Return to the Summary Table.

SPI / MibSPI Global control register 1

Table 13-57. SPIGCR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	NU4	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
24	SPIEN	R/W	0h	SPI enable. This bit enables the SPI/MibSPI transfers. This bit must be set to 1 after all other SPI / MibSPI configuration bits have been written. When SPIEN bit is 0 or cleared to 0, the following SPI/MibSPI registers get forced to their default states (to ‘0’s except for RXEMPTY bit in SPIBUF): - Both TX & RX Shift Registers - The TXDATA fields of SPIDAT0 and SPIDAT1 registers - All the fields of SPIFLG register - Contents of SPIBUF & the internal RXBUF registers 0=SPI / MibSPI is not activated for transfers. 1=Activates SPI / MibSPI
23-17	NU3	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
16	LOOPBACK	R/W	0h	LOOP BACK. Internal loop-back test mode. The internal self-test option can be enabled by setting this bit. If the SPISIMO and SPISOMI pins are configured with SPI functionality, then the SPISIMO pin is internally connected to the SPISOMI pin. The transmit data is looped back as receive data and is stored in the receive field of the concerned buffer. Externally, during loop-back operation, the SPICLK pin outputs an inactive value and SPISOMI remains in high-impedance state. The SPI / MibSPI has to be initialized in master mode before the loop-back can be selected. If the SPI / MibSPI is initialized in slave mode or a data transfer is ongoing, errors may result. 1 =Internal loop-back test mode enabled. 0 =Internal loop-back test mode disabled. This loopback mode can be used only in Master mode. This automatically selects digital loopback path. When this Loopback mode is selected, CLKMOD bit should be set to ‘1’, meaning that SPICLK can only be internal.
15-9	NU2	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
8	POWERDOWN	R/W	0h	POWERDOWN. When active, the SPI / MibSPI state machines enter a powerdown state. 0=MibSPI in active mode 1=MibSPI in powerdown mode
7-2	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
1	CLKMOD	R/W	0h	CLKMOD. Clock mode Selects either an internal or external clock source. This bit also determines the I/O direction of the SPIENA and SPISCS [7:0] pins in functional mode. 0=Clock is external 1=Clock is internal

Table 13-57. SPIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	MASTER	R/W	0h	MASTER: SPISIMO/SPISOMI pin direction determination. Determines the direction of the SPISIMO and SPISOMI pins. This bit determines whether the SPI/MibSPI is in Master mode or Slave mode. This bit also controls the Master-only features like the C2T/T2C counters, C2E/T2E timers, most of the Error conditions specific to Master mode. 0=SPISIMO pin an input, SPISOMI pin an output 1=SPISOMI pin an input, SPISIMO pin an output Note: Although there are two different bits which control the Master/Slave mode functions, only two of their combinations are valid. For compatibility reasons both the bits are retained. For Master mode of operation: MASTER = ‘1’, CLKMOD = ‘1’ For Slave mode of operation: MASTER = ‘0’, CLKMOD = ‘0’ Any other combinations of these two bits may not yield any desirable operation of the module.

13.9.47.3 SPIINT0 Register (Offset = 8h) [Reset = 00000000h]

SPIINT0 is shown in Table 13-58.

Return to the Summary Table.

SPI / MibSPI Interrupt Enable Register

Table 13-58. SPIINT0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	NU5	R	0h	Reserved. Reads return '0' and writes have no effect.
24	ENABLEHIGHZ	R/W	0h	SPIENA pin high-z enable. When active, the SPIENA pin (when it is configured as a WAIT functional output signal in a slave SPI) is forced to place it is output in high-z when not driving a low signal. If inactive, then the pin will output both a high and a low signal. 0=SPIENA pin is pulled high when not active. 1=SPIENA pin remains in high-z when not active.
23-17	NU4	R	0h	Reserved. Reads return '0' and writes have no effect.
16	DMAREQEN	R/W	0h	DMA request enable. Enables the DMA request signal to be generated for both receive and transmit channels. Enable DMA REQ only after setting the SPIEN bit to '1'. 0=DMA is not used 1=DMA Requests will be generated. A DMA request will be generated on TX DMA REQ line each time a transmit data is copied to the Shift Register either from TXBUF or directly from SPIDAT0/SPIDAT1 writes. A DMA request will be generated on RX DMA REQ line each time a received data is copied to SPIBUF register either from RXBUF or directly from the Shift Register.
15-10	NU3	R	0h	Reserved. Reads return '0' and writes have no effect.
9	TXINTENA	R/W	0h	An interrupt is to be generated everytime data is written to the "Shift Register", so that a new data can be written to TXBUF. Setting this bit will generate an interrupt if TXINTFLG bit (SPIFLG.9) is set to '1'. 0=No interrupt will be generated upon TXINTFLG getting set to '1'. 1=Interrupt will be generated upon TXINTFLG getting set to '1'. An interrupt request will be generated as soon as this bit is set to '1'. By default it will be generated on INT0 line. SPILVL register can be programmed before-hand to change this default.
8	RXINTENA	R/W	0h	An interrupt is to be generated when the RXINTFLAG bit (SPIFLG.8) is set by hardware. Otherwise, no interrupt will be generated. 0=Interrupt will not be generated 1=Interrupt will be generated Both Transmitter Empty & Receiver Full interrupts are valid in SPI or Compatibility mode of MibSPI only. In Multibuffered mode these interrupts will not be generated even if enabled.
7	NU2	R	0h	Reserved. Reads return '0' and writes have no effect.
6	OVRNINTENA	R/W	0h	Overrun interrupt enable. An interrupt is to be generated when the RCVR OVRN flag bit (SPIFLG.6) is set by hardware. Otherwise, no interrupt will be generated. 0=Overrun interrupt will not be generated 1=Overrun interrupt will be generated
5	NU1	R	0h	Reserved. Reads return '0' and writes have no effect.

Table 13-58. SPIINT0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	BITERRENA	R/W	0h	Enables interrupt on bit error. 1 =Enables an interrupt on a bit error (BITERR = 1). 0 =No interrupt asserted upon bit error.
3	DESYNCENA	R/W	0h	Enables interrupt on de-synchronized slave. DESYNCENA is used in master mode only. 1 =Enables an interrupt on de-synchronization of the slave (DESYNC = 1). 0 =No interrupt asserted upon de-synchronization error.
2	PARERRENA	R/W	0h	Enables interrupt on parity error. 1 =Enables an interrupt on a parity error (PARITYERR = 1). 0 =No interrupt asserted upon parity error.
1	TIMEOUTENA	R/W	0h	Enables interrupt on ENA signal time-out. 1 =Enables an interrupt on a time-out of the ENA signal (TIMEOUT = 1). 0 =No interrupt asserted upon ENA signal time-out.
0	DLENERRENA	R/W	0h	Data Length Error interrupt Enable. 1 = Enables an interrupt when Data Length Error occurs. 0 = No interrupt is generated upon Data Length Error. A Data Length Error occurs under the following conditions. Master: In a 4-pin with SPIENA mode or 5-pin mode, if the SPIENA pin from the slave is deasserted before the Master has completed its transfer, the Data Length Error is set. That is, if the Character Length counter has not completed counting while SPIENA deassertion is detected, then it means that the Slave has neither received full data from the Master nor has it transmitted complete data. Slave: In a 4-pin with ChipSelects mode or 5-pin mode, if the incoming valid SPISCS pin is de-activated before the Character Length counter completes counting, then Data Length Error is set.

13.9.47.4 SPILVL Register (Offset = Ch) [Reset = 00000000h]

SPILVL is shown in Table 13-59.

Return to the Summary Table.

SPI / MibSPI Interrupt Level Register

Table 13-59. SPILVL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU3	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
9	TXINTLVL	R/W	0h	Transmit Interrupt Level. 1 =Transmit interrupt is mapped to interrupt line INT1. 0 =Transmit interrupt is mapped to interrupt line INT0.
8	RXINTLVL	R/W	0h	Receive interrupt level. 1 =Receive interrupt is mapped to interrupt line INT1. 0 =Receive interrupt is mapped to interrupt line INT0.
7	NU2	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
6	OVRNINTLVL	R/W	0h	Receive Overrun interrupt level. 1 =Receive Overrun interrupt is mapped to interrupt line INT1. 0 =Receive Overrun interrupt is mapped to interrupt line INT0.
5	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
4	BITERRLVL	R/W	0h	Bit error interrupt level. 1 =bit error interrupt is mapped to interrupt line INT1. 0 =bit error interrupt is mapped to interrupt line INT0.
3	DESYNCLVL	R/W	0h	De-synchronized slave interrupt level. DESYNCLVL is used in master mode only. 1 =An interrupt due to de-synchronization of the slave (DESYNC = 1) is mapped to interrupt line INT1. 0 =An interrupt due to de-synchronization of the slave (DESYNC = 1) is mapped to interrupt line INT0.
2	PARERRLVL	R/W	0h	Parity error interrupt level. 1 =A parity error interrupt (PARITYERR = 1) is mapped to interrupt line INT1. 0 =A parity error interrupt (PARITYERR = 1) is mapped to interrupt line INT0.
1	TIMEOUTLVL	R/W	0h	SPIENA pin Time-out interrupt level. 1 =An interrupt on a time-out of the ENA signal (TIMEOUT = 1) is mapped to interrupt line INT1. 0 =An interrupt on a time-out of the ENA signal (TIMEOUT = 1) is mapped to interrupt line INT0.
0	DLENERRLVL	R/W	0h	Data Length Error interrupt Enable Level. 1 = An interrupt on Data Length Error is mapped to interrupt line INT1. 0 = An interrupt on Data Length Error is mapped to interrupt line INT0.

13.9.47.5 SPIFLG Register (Offset = 10h) [Reset = 00000000h]

SPIFLG is shown in Table 13-60.

Return to the Summary Table.

SPI / MibSPI Flag Register

Table 13-60. SPIFLG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	NU4	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
24	BUFINITACTIVE	R	0h	Indicates the status of Multibuffer initialization process. Software should poll this bit to determine if it can proceed with the configuration of Multibuffer mode registers or Multibuffer RAM handling. Refer to Section 3.10.7 for details on Initialization of Multibuffer RAM. 1 = Multibuffer RAM is still being initialized. Do not attempt to write to either Multibuffer RAM or any Multibuffer mode registers. Refer to Section 3.3 for a classification of registers into compatibility mode and Multibuffer mode. 0 = Multibuffer RAM initialization is complete. This bit will show a value of ‘1’ as long as the nRESET bit is ‘0’, but does not really indicate that Buffer initialization is underway. Internal automatic buffer initialization starts only when the nRESET bit is set to ‘1’. For SPI, this bit reads ‘1’ always. For MibSPI, BUF INIT ACTIVE bit will show up as ‘1’ for a maximum of 128/256 (will vary depending upon the actual size of the Multibuffer RAM implemented) VCLK cycles after the nRESET bit in GCR0 is set to ‘1’ and then settle to ‘0’. If Auto Memory Initialization is triggered through System (MEM_AUTO_INIT pulse), then BUF INIT ACTIVE bit will show up as ‘1’ for a maximum of 128/256 (will vary depending upon the actual size of the Multibuffer RAM implemented) VCLK cycles and then settle to ‘0’.
23-10	NU3	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
9	TXINTFLG	R	0h	Transmitter Empty Interrupt Flag. Serves as an interrupt flag indicating that Transmit Buffer (TXBUF) is empty and a new data can be written to it. This flag is set when a data is copied to the “Shift Register” either directly or from the TXBUF register. This bit is cleared by one of following ways: Writing a new data to either SPIDAT0 or SPIDAT1 Writing a ‘0’ to SPIEN (SPIGCR1.24) 0= Transmit Buffer is now full. No interrupt pending for Transmitter Empty 1= Transmit Buffer is empty. An interrupt is pending to fill the transmitter.

Table 13-60. SPIFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	RXINTFLG		0h	Receiver Full Interrupt Flag. This flag is set when a word is received and copied into the buffer register (SPIBUF). If RXINTEN is enabled, an interrupt is also generated. During emulation mode, however, a read to the emulation register (SPIEMU) does not clear this flag bit. This bit is cleared under the following ways: Reading the SPIBUF register Reading TGINTVECT0 or TGINTVECT1 register when there is a “Receive Buffer Full” interrupt Writing a ‘1’ to this bit Writing a ‘0’ to SPIEN (SPIGCR1.24) System reset 0= No new received data pending. Receive buffer is Empty. 1= A newly received data is ready to be read. Receive buffer is full. Note: Exception for clearing of RXINT If both SPIBUF and RXBUF (internal buffer) are full, then, reading TGINTVECT0 or TGINTVECT1 register (while it shows 10010) does not clear the RXINTFLG in SPIFLG register. In this case, only way to clear the Interrupt is to read the SPIBUF (twice) and clear all the received data. Note: Side effects of Write Clear to RXINTFLG Clearing RXINTFLG bit by writing a ‘1’ before reading the SPIBUF sets the RXEMPTY bit of the SPIBUF register too. This way, one can ignore a received data. However, if the internal RXBUF is already full, the data from RXBUF will be copied to SPIBUF and RXEMPTY bit will be cleared again. SPIBUF contents should be read first if this situation needs to be avoided.
7	NU2	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
6	OVRNINTFLG		0h	Receiver overrun flag. The SPI / MibSPI hardware sets this bit when a receive operation completes before the previous character has been read from the receive buffer. The bit indicates that the last received character has been overwritten and therefore lost. The SPI / MibSPI will generate an interrupt request if this bit is set and the OVRN INTEN bit (SPIINT0.6) is set high. 0 = Overrun condition did not occur 1 = Overrun condition has occurred In SPI or Compatibility mode of MibSPI, this bit is cleared under the following conditions: Reading TGINTVECT0 or TGINTVECT1 register when there is a “Receive Buffer Overrun” interrupt Writing a ‘1’ to OVRNINTFLG in SPIFLG register itself Reading SPIBUF register does not clear this OVRNINTFLG bit. If an RXOVRN interrupt is detected, then the SPIBUF may need to be read twice to get to the Overrun buffer. This is due to the fact that the Overrun will always occur to the internal RXBUF. Each read to the SPIBUF will result in RXBUF contents (if it is full) getting copied to SPIBUF. Note: A special condition under which OVRNINTFLG flag gets set. If both SPIBUF & RXBUF are already full and while another buffer receive is underway, if any errors like TIMEOUT, BITERR & DLEN_ERR occur, then RXOVR in RXBUF & OVRNINTFLG in SPIFLG registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a normal Receiver Overrun. In Multibuffer mode of MibSPI, this bit is cleared under the following conditions. Reading the RXOVRN_BUF_ADDR register Writing a ‘1’ to OVRNINTFLG in SPIFLG register itself In Multibuffer mode, if OVRNINTFLG is set, then the address of the buffer which experienced the Overrun is available in RXOVRN_BUF_ADDR.

Table 13-60. SPIFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
4	BITERRFLG		0h	Mismatch of internal transmit data and transmitted data. 1 =A bit error occurred. The SPI / MibSPI samples the signal of the transmit pin (master: SIMO, slave: SOMI) at the receive point (half clock cycle after transmit point). If the sampled value differs from the transmitted value a bit error is detected and the Flag BITERR is set. If BITERRENA is set an interrupt is asserted. A possible reason for a bit error can be a to high bit rate / capacitive load or another master/slave trying to transmit at the same time. 0 =No bit error occurred. This flag can be cleared by one of the following ways. Write a ‘1’ to this bit. Set SPIEN bit to ‘0’.
3	DESYNCFLG		0h	De-synchronization of slave device. De-synchronization monitor is active in master mode only. 1 = A slave device is de-synchronized. The master monitors the ENAble signal coming from the slave device and sets the DESYNC flag after the last bit is transmitted plus tT2EDELAY (see Section 8.21). If DESYNCENA is set an interrupt is asserted. De-synchronization can occur if a slave device misses a clock edge coming from the master. 0 =No slave de-synchronization detected. This flag can be cleared by one of the following ways. Write a ‘1’ to this bit. Set SPIEN bit to ‘0’. Note: Inconsistency of Desync flag in SPI/Compatibility mode MibSPI Due to the nature of this Error, under some circumstances it is possible for Desync error detected for the previous buffer to be visible in the current buffer. This is due to the fact that Receive Completion flag/interrupt will be generated when the buffer transfer is completed. But Desync will be detected after the buffer transfer is completed. So, if VBUS master reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct Desync condition. This inconsistency in Desync flag is valid only in SPI or Compatibility mode of MibSPI. In Multibuffer mode, Desync flag is always guaranteed to be for the current buffer.
2	PARERRFLG		0h	Calculated parity differs from received parity bit. 1 =A parity error occurred. If the parity generator is enabled (can be selected individually for each buffer) an even or odd parity bit is added at the end of a data word (see Section 8.23). During reception of the data word the parity generator calculates the reference parity and compares it to the received parity bit. In the event of a mismatch the PARITYERR flag is set and an interrupt is asserted if PARERRENA is set. 0 =No parity error detected. This flag can be cleared by one of the following ways. Write a ‘1’ to this bit. Set SPIEN bit to ‘0’.

Table 13-60. SPIFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	TIMEOUTFLG		0h	Time-out due to non-activation of ENA signal. 1 =An ENA signal time-out occurred. The SPI / MibSPI generates a time-out because the slave hasn't responded in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition the TIMOUT flag in the status field of the corresponding buffer is set. The transmit request of the concerned buffer is cleared, i.e. the SPI / MibSPI doesn't re-start a data transfer from this buffer. 0 =No ENA-signal time-out occurred. This flag can be cleared by one of the following ways. Write a '1' to this bit. Set SPIEN bit to '0'.
0	DLENERRFLG		0h	Data Length Error Flag. 1 = A Data Length Error has occured. 0 = No Data Length Error has occured. This flag can be cleared by one of the following ways. Write a '1' to this bit. Set SPIEN bit to '0'. A Data Length Error occurs under the following conditions. Master: In a 4-pin with SPIENA mode or 5-pin mode, if the SPIENA pin from the slave is deasserted before the Master has completed its transfer, the Data Length Error is set. That is, if the Character Length counter has not completed counting while SPIENA pin deassertion is detected, then it means that the Slave has neither received full data from the Master nor has it transmitted complete data. Slave: In a 4-pin with ChipSelects mode or 5-pin mode, if the incoming valid SPISCS pin is de-activated before the Character Length counter completes counting, then Data Length Error is set. Note: Clearing of Transmission Error Flags in SPIBUF during Error conditions Whenever any Transmission Errors (TIMEOUT, BITERR, DLEN_ERR, PARITY_ERR, DESYNC) are detected, and the Error Flag are cleared by writing to the Error bit in SPIFLG register, the corresponding Error flag in SPIBUF does not get cleared. Software needs to read the SPIBUF until it becomes empty before proceeding. This ensures that all the older status bits in SPIBUF are cleared before starting the next transfer.

13.9.47.6 SPIPC0 Register (Offset = 14h) [Reset = 00000000h]

SPIPC0 is shown in Table 13-61.

Return to the Summary Table.

SPI / MibSPI Pin Control Register 0 (SPIPC0) - SPIFUN Note: Duplicate Control Bits for SIMO0 & SOMI0 Bit 24 is not physically implemented. it is a mirror of Bit11. Any write to Bit 24 will be reflected on Bit11 and when Bit 24 & Bit 11 simultaneously written, the value of Bit11 will control the SOMI pin. Read value of Bit 24 always reflects the Bit 11 value. This is true for the Bit 24 & Bit 11 of all of SPIPC0 to SPIPC9 registers. Same is true for SIMO pin with Bit16 & Bit 10 of SPIPC0 to SPIPC9 registers.

Table 13-61. SPIPC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SOMIFUN	R/W	0h	Slave out, master in function. Determines whether the SPISOMIx pins are to be used as a general-purpose I/O pin or as a SPI / MibSPI functional pin. 0=SPISOMIx pin is a GPIO 1=SPISOMIx pin is a SPI / MibSPI functional pin
23-16	SIMOFUN	R/W	0h	Slave in, master out function. Determines whether the SPISIMOx pin is to be used as a general-purpose I/O pin or as a SPI / MibSPI functional pin. 0=SPISIMOx pin is a GPIO 1=SPISIMOx pin is a SPI / MibSPI functional pin Note: Generic based bit implementation Register bits 31 to 24 and 23 to 16 of SPIPC0 to SPIPC9 are implemented depending upon the generic parameter NUM_PARLL_PINS which determines the number of SIMO/SOMI data lines to be supported. Only if 8 dataline support is selected at the time of logic synthesis, bits 31 to 16 are implemented. Un-implemented bits return ‘0’ upon read and are not writable.
15-12	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11	SOMIFUN0	R/W	0h	Slave out, master in function. Determines whether the SPISOMI0 pin is to be used as a general-purpose I/O pin or as a SPI / MibSPI functional pin. 0=SPISOMI0 pin is a GPIO 1=SPISOMI0 pin is a SPI / MibSPI functional pin Note: Bit 11 or bit 24 can be used to set the function mode for pin SOMI0. If a 32 bit write is performed, bit 11 will have priority over bit 24.
10	SIMOFUN0	R/W	0h	Slave in, master out function. Determines whether the SPISIMO0 pin is to be used as a general-purpose I/O pin, or as a SPI / MibSPI functional pin. 0=SPISIMO0 pin is a GPIO 1=SPISIMO0 pin is a SPI / MibSPI functional pin Note: Bit 10 or bit 16 can be used to set the function mode for pin SIMO0. If a 32 bit write is performed, bit 10 will have priority over bit 16.
9	CLKFUN	R/W	0h	SPI / MibSPI clock function. Determines whether the SPICLK pin is to be used as a general-purpose I/O pin, or as a SPI / MibSPI functional pin. 0=SPICLK pin is a GPIO 1=SPICLK pin is a SPI / MibSPI functional pin
8	ENAFUN	R/W	0h	SPIENA function. Determines whether the SPIENA pin is to be used as a general-purpose I/O pin, or as a SPI / MibSPI functional pin. 0=SPIENA pin is a GPIO 1=SPIENA pin is a SPI / MibSPI functional pin

Table 13-61. SPIPC0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-0	SCSFUN	R/W	0h	SPISCS [7:0] function. Determines whether the SPISCSx pins are to be used as a general-purpose I/O pins or as SPI functional pins. If the slave SPISCSx pins are in functional mode and receive an inactive high signal, the slave SPI will place it is output in high-z and disable shifting. 0=SPISCSx pin is a GPIO 1=SPISCSx pin is a SPI functional pin Note: Effect of NUM_CS_PINS generic on ChipSelect bits. Actual number of bits implemented in SCSFUN [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be read-only and will read ‘0’ always.

13.9.47.7 SPIPC1 Register (Offset = 18h) [Reset = 00000000h]

SPIPC1 is shown in Table 13-62.

Return to the Summary Table.

SPI / MibSPI Pin Control Register 1 (SPIPC1) - SPIDIR

Table 13-62. SPIPC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SOMIDIR	R/W	0h	SPISOMIx direction. Controls the direction of the SPISOMIx pin when it is used as a general-purpose I/O pin. If the SPISOMIx pin is used as a SPI / MibSPI functional pin, the I/O direction is determined by the MASTER bit. 0=SPISOMIx pin is an input 1=SPISOMIx pin is an output
23-16	SIMODIR	R/W	0h	SPISIMOx direction. Controls the direction of the SPISIMOx pin when it is used as a general-purpose I/O pin. If the SPISIMOx pin is used as a SPI / MibSPI functional pin, the I/O direction is determined by the MASTER bit. 0=SPISIMOx pin is an input 1=SPISIMOx pin is an output
15-12	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11	SOMIDIR0	R/W	0h	SPISOMI0 direction. Controls the direction of the SPISOMI0 pin when it is used as a general-purpose I/O pin. If the SPISOMI0 pin is used as a SPI / MibSPI functional pin, the I/O direction is determined by the MASTER bit. 0=SPISOMI0 pin is an input 1=SPISOMI0 pin is an output Note: Bit 11 or bit 24 can be used to set the direction for pin SOMI0. If a 32 bit write is performed, bit 11 will have priority over bit 24.
10	SIMODIR0	R/W	0h	SPISIMO0 direction. Controls the direction of the SPISIMO0 pin when it is used as a general-purpose I/O pin. If the SPISIMO0 pin is used as a SPI / MibSPI functional pin, the I/O direction is determined by the MASTER bit. 0=SPISIMO0 pin is an input 1=SPISIMO0 pin is an output Note: Bit 10 or bit 16 can be used to set the direction for pin SIMO0. If a 32 bit write is performed, bit 10 will have priority over bit 16.
9	CLKDIR	R/W	0h	SPICLK direction. Controls the direction of the SPICLK pin when it is used as a general-purpose I/O pin. In functional mode, the I/O direction is determined by the CLKMOD bit. 0=SPICLK pin is an input 1=SPICLK pin is an output
8	ENADIR	R/W	0h	SPIENA direction. Controls the direction of the SPIENA pin when it is used as a general-purpose I/O. If the SPIENA pin is used as a functional pin, then the I/O direction is determined by the CLKMOD bit (SPIGCR1.1). 0=SPIENA pin is an input 1=SPIENA pin is an output

Table 13-62. SPIPC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-0	SCSDIR	R/W	0h	SPISCS [7:0] direction. Controls the direction of the SPISCSx pins when they are used as a general-purpose I/O pin. Each pins could be configured independently from the others If the SPISCSx is used as a SPI functional pin, the I/O direction is determined by the CLKMOD bit (SPIGCR1.1). 0=SPISCSx pin is an input 1=SPISCSx pin is an output Note: Effect of NUM_CS_PINS generic on ChipSelect bits. Actual number of bits implemented in SCSDIR [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be read-only and will read ‘0’ always.

13.9.47.8 SPIPC2 Register (Offset = 1Ch) [Reset = 00000000h]

SPIPC2 is shown in Table 13-63.

Return to the Summary Table.

SPI / MibSPI Pin Control Register 2 (SPIPC2) - SPIDIN

Table 13-63. SPIPC2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SOMIDIN	R	0h	SPISOMIx data in. Reflects the value of the SPISOMIx pin. 0=Current value on SPISOMIx pin is logic 0. 1=Current value on SPISOMIx pin is logic 1
23-16	SIMODIN	R	0h	SPISIMOx data in. Reflects the value of the SPISIMOx pin. 0=Current value on SPISIMOx pin is logic 0. 1=Current value on SPISIMOx pin is logic 1
15-12	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11	SOMIDIN0	R	0h	SPISOMI0 data in. Reflects the value of the SPISOMI0 pin. 0=Current value on SPISOMI0 pin is logic 0. 1=Current value on SPISOMI0 pin is logic 1 Note: Bit 11 or bit 24 can be used to set the direction for pin SOMI0. If a 32 bit write is performed, bit 11 will have priority over bit 24.
10	SIMODIN0	R	0h	SPISIMO0 data in. Reflects the value of the SPISIMO0 pin. 0=Current value on SPISIMO0 pin is logic 0. 1=Current value on SPISIMO0 pin is logic 1. Note: Bit 10 or bit 16 can be used to set the direction for pin SIMO0. If a 32 bit write is performed, bit 10 will have priority over bit 16.
9	CLKDIN	R	0h	Clock data in. Reflects the value of the SPICLK pin. 0=Current value on SPICLK pin is logic 0. 1=Current value on SPICLK pin is logic 1
8	ENADIN	R	0h	SPIENA data in. Reflects the value of the SPIENA pin. 0=Current value on SPIENA pin is logic 0. 1=Current value on SPIENA pin is logic 1
7-0	SCSDIN	R	0h	SPISCS [7:0] data in. Reflects the value of the SPISCSx pins. 0=Current value on SPISCSx pin is logic 0. 1=Current value on SPISCSx pin is logic 1 Note: Effect of NUM_CS_PINS generic on ChipSelect bits. Actual number of bits implemented in SCSDIN [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will read ‘0’ always.

13.9.47.9 SPIPC3 Register (Offset = 20h) [Reset = 00000000h]

SPIPC3 is shown in Table 13-64.

Return to the Summary Table.

SPI / MibSPI Pin Control Register 3 (SPIPC3) - SPIDOUT

Table 13-64. SPIPC3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SOMIDOUT	R/W	0h	SPISOMIx dataout write. Only active when the SPISOMIx pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. 0=Current value on SPISOMIx pin is logic 0. 1=Current value on SPISOMIx pin is logic 1
23-16	SIMODOUT	R/W	0h	SPISIMOx dataout write. Only active when the SPISIMOx pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. 0=Current value on SPISIMOx pin is logic 0. 1=Current value on SPISIMOx pin is logic 1
15-12	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11	SOMIDOUT0	R/W	0h	SPISOMI0 dataout write. Only active when the SPISOMI0 pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. 0=Current value on SPISOMI0 pin is logic 0. 1=Current value on SPISOMI0 pin is logic 1. Note: Bit 11 or bit 24 can be used to set the direction for pin SOMI0. If a 32 bit write is performed, bit 11 will have priority over bit 24.
10	SIMODOUT0	R/W	0h	SPISIMO0 dataout write. Only active when the SPISIMO0 pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. 0=Current value on SPISIMO0 pin is logic 0. 1=Current value on SPISIMO0 pin is logic 1. Note: Bit 10 or bit 16 can be used to set the direction for pin SIMO0. If a 32 bit write is performed, bit 10 will have priority over bit 16.
9	CLKDOUT	R/W	0h	SPICLK dataout write. Only active when the SPICLK pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. 0=Current value on SPICLK pin is logic 0. 1=Current value on SPICLK pin is logic 1
8	ENADOUT	R/W	0h	SPIENA dataout write. Only active when the SPIENA pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. 0=Current value on SPIENA pin is logic 0. 1=Current value on SPIENA pin is logic 1

Table 13-64. SPIPC3 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-0	SCSDOUT	R/W	0h	SPISCS [7:0] dataout write. Only active when the SPISCSx pins are configured as a general-purpose I/O pins and configured as an output pins. The value of these bit indicates the value sent to the pins. 0=Current value on SPISCSx pin is logic 0. 1=Current value on SPISCSx pin is logic 1 Note: Effect of NUM_CS_PINS generic on ChipSelect bits. Actual number of bits implemented in SCSDOUT [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be read-only and will read ‘0’ always.

13.9.47.10 SPIPC4 Register (Offset = 24h) [Reset = 00000000h]

SPIPC4 is shown in Table 13-65.

Return to the Summary Table.

SPI / MibSPI Pin Control Register 4 (SPIPC4) - SPIDSET

Table 13-65. SPIPC4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SOMISET	R/W	0h	SPISOMIx dataout set. Only active when the SPISOMIx pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit sets the corresponding SPISOMIDOUTx bit to ‘1’. Write: 0= Has no effect 1= Logic 1 placed on SPISOMIx pin if it is in General Purpose O/P mode Read: 0= Current value on SIMODOUTx is 0. 1= Current value on SOMIDOUTx is 1.
23-16	SIMOSET	R/W	0h	SPISIMOx dataout set. Only active when the SPISIMOx pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit sets the corresponding SPISIMODOUTx bit to ‘1’. Write: 0= Has no effect 1= Logic 1 placed on SPISIMOx pin if it is in General Purpose O/P mode Read: 0= Current value on SIMODOUTx is 0. 1= Current value on SIMODOUTx is 1
15-12	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11	SOMISET0	R/W	0h	SPISOMI0 dataout set. Only active when the SPISOMI0 pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit sets the corresponding SPISOMIDOUT bit to ‘1’. Write: 0= Has no effect 1= Logic 1 placed on SPISOMI0 pin if it is in General Purpose O/P mode Read: 0= Current value on SOMIDOUT0 is 0. 1= Current value on SOMIDOUT0 is 1. Note: Bit 11 or bit 24 can be used to set the direction for pin SOMI0. If a 32 bit write is performed, bit 11 will have priority over bit 24.
10	SIMOSET0	R/W	0h	SPISIMO0 dataout set. Only active when the SPISIMO0 pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit sets the corresponding SPISIMODOUT bit to ‘1’. Write: 0= Has no effect 1= Logic 1 placed on SPISIMO0 pin if it is in General Purpose O/P mode Read: 0= Current value on SIMODOUT0 is 0. 1= Current value on SIMODOUT0 is 1. Note: Bit 10 or bit 16 can be used to set the direction for pin SIMO0. If a 32 bit write is performed, bit 10 will have priority over bit 16.

Table 13-65. SPIPC4 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	CLKSET	R/W	0h	SPICLK dataout set. Only active when the SPICLK pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit sets the corresponding CLKDOUT bit to ‘1’. Write: 0= Has no effect 1= Logic 1 placed on SPICLK pin if it is in General Purpose O/P mode Read: 0= Current value on CLKDOUT pin is logic 0. 1= Current value on CLKDOUT pin is logic 1
8	ENASET	R/W	0h	SPIENA dataout set. Only active when the SPIENA pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit sets the corresponding ENABLEDOUT bit to ‘1’. Write: 0= Has no effect 1= Logic 1 placed on SPIENA pin if it is in General Purpose O/P mode Read: 0= Current value on ENADOUT is 0. 1= Current value on ENADOUT is 1
7-0	SCSSET	R/W	0h	SPISCS [7:0] dataout set. Only active when the SPISCSx pins are configured as a general-purpose output pins. A value of ‘1’ written to these bits set the corresponding SCSDOUT bit to ‘1’. Write: 0= Has no effect 1= Logic 1 placed on SPISCSx pin if it is in General Purpose O/P mode Read: 0= Current value on SCSDOUTx is 0. 1= Current value on SCSDOUTx is 1. Note: Effect of NUM_CS_PINS generic on ChipSelect bits. Actual number of bits implemented in SCSSET [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be read-only and will read ‘0’ always. Note: Register Read Read of SPIPC4 register gives out contents of the SPIPC3 register.

13.9.47.11 SPIPC5 Register (Offset = 28h) [Reset = 00000000h]

SPIPC5 is shown in Table 13-66.

Return to the Summary Table.

SPI / MibSPI Pin Control Register 5 (SPIPC5) - SPIDCLR

Table 13-66. SPIPC5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SOMICLR	R/W	0h	SPISOMIx dataout clear. Only active when the SPISOMIx pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit clears the corresponding SPISOMIDOUTx bit to ‘0’. Write: 0= Has no effect 1= Logic 0 placed on SPISOMIx pin if it is in General Purpose O/P mode Read: 0= Current value on SOMIDOUTx is 0. 1= Current value on SOMIDOUTx is 1.
23-16	SIMOCLR	R/W	0h	SPISIMOx dataout clear. Only active when the SPISIMOx pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit clears the corresponding SPISIMODOUTx bit to ‘0’. Write: 0= Has no effect 1= Logic 0 placed on SPISIMOx pin if it is in General Purpose O/P mode Read: 0=Current value on SIMODOUTx is 0. 1=Current value on SIMODOUTx is 1.
15-12	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11	SOMICLR0	R/W	0h	SPISOMI0 dataout clear. Only active when the SPISOMI0 pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit clears the corresponding SPISOMIDOUT bit to ‘0’. Write: 0= Has no effect 1= Logic 0 placed on SPISOMI0 pin if it is in General Purpose O/P mode Read: 0= Current value on SOMIDOUT0 is 0. 1= Current value on SOMIDOUT0 is 1. Note: Bit 11 or bit 24 can be used to set the direction for pin SOMI0. If a 32 bit write is performed, bit 11 will have priority over bit 24.
10	SIMOCLR0	R/W	0h	SPISIMO0 dataout clear. Only active when the SPISIMO0 pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit clears the corresponding SIMODOUT0 bit to ‘0’. Write: 0= Has no effect 1= Logic 0 placed on SPISIMO0 pin if it is in General Purpose O/P mode Read: 0= Current value on SIMODOUT0 is 0. 1= Current value on SIMODOUT0 is 1. Note: Bit 10 or bit 16 can be used to set the direction for pin SIMO0. If a 32 bit write is performed, bit 10 will have priority over bit 16.

Table 13-66. SPIPC5 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	CLKCLR	R/W	0h	SPICLK dataout clear. Only active when the SPICLK pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit clears the corresponding CLKDOUT bit to ‘0’. Write: 0= Has no effect 1= Logic 0 placed on SPICLK pin if it is in General Purpose O/P mode Read: 0= Current value on CLKDOUT is 0. 1= Current value on CLKDOUT is 1.
8	ENACLR	R/W	0h	SPIENA dataout clear. Only active when the SPIENA pin is configured as a general-purpose output pin. A value of ‘1’ written to this bit clears the corresponding ENABLEDOUT bit to ‘0’. Write: 0= Has no effect 1= Logic 0 placed on SPIENA pin if it is in General Purpose O/P mode Read: 0= Current value on ENADOUT is 0. 1= Current value on ENADOUT is 1.
7-0	SCSCLR	R/W	0h	SPISCS [7:0] dataout clear. Only active when the SPISCSx pins are configured as a general-purpose output pins. A value of ‘1’ written to this bit clears the corresponding SCSDOUT bit to ‘0.. Write: 0= Has no effect 1= Logic 0 placed on SPISCSx pin if it is in General Purpose O/P mode Read: 0= Current value on SCSDOUTx is 0. 1= Current value on SCSDOUTx is 1 Note: Effect of NUM_CS_PINS generic on ChipSelect bits. Actual number of bits implemented in SCSCLR [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be read-only and will read ‘0’ always. Note: Register Read Read of SPIPC5 register gives out contents of the SPIPC3 register.

13.9.47.12 SPIPC6 Register (Offset = 2Ch) [Reset = 00000000h]

SPIPC6 is shown in Table 13-67.

Return to the Summary Table.

SPI / MibSPI Pin Control Register 6 (SPIPC6) - SPIPDR

Table 13-67. SPIPC6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SOMIPDR	R/W	0h	SPISOMIx Open drain enable Enables Open drain capability for the pin SOMIx if the following conditions are met. SOMIDIRx = 1 (SPISOMI0 pin configured in GPIO mode as output pin) SOMIDOUTx = 1 0 = Output value on SPISOMIx pin is logic ‘1’ 1 = Output pin SPISOMIx is Tri-stated
23-16	SIMOPDR	R/W	0h	SPISIMOx Open drain enable Enables Open drain capability for the pin SPISIMOx if the following conditions are met. SIMODIRx = 1 (SPISIMOx pin configured in GPIO mode as output pin) SIMODOUTx = 1 0 = Output value on SPISIMOx pin is logic ‘1’ 1 = Output pin SPISIMOx is Tri-stated
15-12	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11	SOMIPDR0	R/W	0h	SPISOMI0 Open drain enable Enables Open drain capability for the pin SPISOMI if the following conditions are met. SOMIDIR 0 = 1 (SPISOMI0 pin configured in GPIO mode as output pin) SOMIDOUT 0 = 1 0 = Output value on SPISOMI0 pin is logic ‘1’ 1 = Output pin SPISOMI0 is Tri-stated Note: Bit 11 or bit 24 can be used to set the direction for pin SPISOMI0. If a 32 bit write is performed, bit 11 will have priority over bit 24.
10	SIMOPDR0	R/W	0h	SPISIMO0 Open drain enable Enables Open drain capability for the pin SPISIMO0 if the following conditions are met. SIMODIR 0 = 1 (SPISIMO pin configured in GPIO mode as output pin) SIMODOUT 0 = 1 0 = Output value on SPISIMO0 pin is logic ‘1’ 1 = Output pin SPISIMO0 is Tri-stated Note: Bit 10 or bit 16 can be used to set the direction for pin SPISIMO0. If a 32 bit write is performed, bit 10 will have priority over bit 16.
9	CLKPDR	R/W	0h	SPICLK Open drain enable Enables Open drain capability for the pin CLK if the following conditions are met. CLKDIR = 1 (SPICLK pin configured in GPIO mode as output pin) CLKDOUT = 1 0 = Output value on SPICLK pin is logic ‘1’ 1 = Output pin SPICLK is Tri-stated
8	ENAPDR	R/W	0h	SPIENA Open drain enable Enables Open drain capability for the pin SPIENA if the following conditions are met. ENABLEDIR = 1 (SPIENA pin configured in GPIO mode as output pin) ENABLEDOUT = 1 0 = Output value on SPIENA pin is logic ‘1’ 1 = Output pin SPIENA is Tri-stated

Table 13-67. SPIPC6 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-0	SCSPDR	R/W	0h	SPISCSx Open drain enable Enables Open drain capability for the pin SPISCSx if the following conditions are met. SCSDIRx = 1 (SPISCS pin configured in GPIO mode as output pin) SCSDOUTx = 1 0 = Output value on SPISCSx pin is logic ‘1’ 1 = Output pin SPISCSx is Tri-stated Note: Effect of NUM_CS_PINS generic on ChipSelect bits. Actual number of bits implemented in SCSPDR [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be read-only and will read ‘0’ always.

13.9.47.13 SPIDAT0 Register (Offset = 38h) [Reset = 00000000h]

SPIDAT0 is shown in Table 13-68.

Return to the Summary Table.

SPI / MibSPI Transmit Data Register 0 Note: Accessibility of SPIDAT0 The SPIDAT0 register is not accessible in Multibuffer Mode of MibSPI. It is only accessible in compatibility mode.

Table 13-68. SPIDAT0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
15-0	TXDATA	R/W	0h	SPI / MibSPI Transmit Data. When written, these bits will be copied to the Shift Register if it is empty. If the Shift Register is not empty, the TXBUF will hold the written values. SPIEN (SPICGR1.24) must be set to 1 before this register can be written to. Writing a 0 to the SPIEN register forces the lower 16 bits of the SPIDAT0 register to 0x00. When this register is read, contents of internal buffer register TXBUF which holds the latest written data will be returned. As the data is shifted out from either the MSB or the LSB of Transmit Shift Register depending upon SHIFTDIR bit (SPIFMTx.20). Simultaneously, the received bit will be shifted into the Receive Shift Register either through LSB or MSB depending upon SHIFTDIR bit. This allows the concurrent transmission and reception of data. Note: Irrespective of the character length, the Transmit data should be right justified before writing to SPIDAT0 register. The default Data Format Control register for SPIDAT0 is SPIFMT0. However it is possible to reprogram the DFSEL [1:0] fields of SPIDAT1 prior to using SPIDAT0, to select a different SPIFMTx register.

13.9.47.14 SPIDAT1 Register (Offset = 3Ch) [Reset = 00000000h]

SPIDAT1 is shown in Table 13-69.

Return to the Summary Table.

SPI / MibSPI Transmit Data Register 1 When this register is read, contents of internal buffer register TXBUF which holds the latest written data will be returned.

Table 13-69. SPIDAT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	NU2	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
28	CSHOLD	R/W	0h	Chip select hold mode. In SPI or compatibility mode MibSPI, the CSHOLD bit is supported in master mode only. In slave mode, this bit is ignored. CSHOLD defines the behavior of the chip select line at the end of a data transfer. 1 =The chip select signal is held active at the end of a transfer until a control field with new data and control information is loaded into SPIDAT1. If the new chip select information equals the previous one, the active chip select signal is extended until the end of transfer with CSHOLD cleared or until the chip select information changes. 0 =The chip select signal is deactivated at the end of a transfer after the T2CDELAY time has passed. If two consecutive transfers are dedicated to the same chip select this chip select signal will be deactivated for atleast 2VCLK cycles before it is activated again.
27	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
26	WDEL	R/W	0h	Enable the delay counter at the end of the current transaction. WDELAY bit is supported in Master mode only. In Slave mode, this bit will be ignored. 1 = After a transaction, WDELAY of the corresponding data format will be loaded into the delay counter. No transaction will be performed until the WDELAY counter overflows. The SPISCS pins will be de-activated for atleast (WDELAY + 2) * VCLK_Period duration. 0 = No delay will be inserted. However, SPISCS pins will still be de-activated for atleast for 2VCLK cycles if CSHOLD = ‘0’. In SPI or Compatibility mode of MibSPI, the duration for which the SPISCS pin remaining de-activated will also depend upon time taken to supply a new data after completing the shifting operation. If the internal buffer - TXBUF is already full, then the SPISCS will be deasserted for atleast 2 VCLK cycles(if WDEL = ‘0’).
25-24	DFSEL	R/W	0h	DFSEL1 DFSEL0 Description 0 0 Data word format 0 is selected 0 1 Data word format 1 is selected 1 0 Data word format 2 is selected 1 1 Data word format 3 is selected

Table 13-69. SPIDAT1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23-16	CSNR	R/W	0h	Chip select number. CSNR defines the chip select that shall be activated during the data transfer. The value of CSNR [7:0] will be driven on SPISCS [7:0] lines during the transfer. Note: Effect of NUM_CS_PINS generic on CSNR bits. Actual number of bits implemented in CSNR [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be read-only and will read ‘0’ always. Note: Preselecting a Format Register. Writing to just the Control Field (using byte writes) does not initiate any SPI transfer in Master mode. This feature can be used to setup SPICLK Phase or Polarity before actually starting the transfer by just updating the DFSEL fields in the control field to select the required Phase/Polarity combination.
15-0	TXDATA	R/W	0h	SPI / MibSPI Transmit Data. When written, these bits will be copied to the Shift Register if it is empty. If the Shift Register is not empty, the TXBUF will hold the written values. SPIEN must be set to 1 before this register can be written to. Writing a 0 to the SPIEN register forces the lower 16 bits of the SPIDAT1 register to 0x00. Write to this register ONLY when using the automatic Slave Chip Select feature. See section 3, Operation Modes, on page 14. A write to this register will drive the contents of CSNR [7:0] into the respective pins in SPISCS [7:0] if those are configured as functional pins. When this register is read, contents of internal buffer register TXBUF which holds the latest written data will be returned. Irrespective of the character length, the Transmit data should be right justified before writing to SPIDAT1 register.

13.9.47.15 SPIBUF Register (Offset = 40h) [Reset = 80000000h]

SPIBUF is shown in Table 13-70.

Return to the Summary Table.

SPI / MibSPI Receive Buffer Register

Table 13-70. SPIBUF Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RXEMPTY		1h	Receive data buffer empty. When host reads the SPIBUF field or the whole SPIBUF register this will automatically set the RXEMPTY flag. When a data transfer is completed, the received data is copied into SPIBUF, the RXEMPTY flag is cleared. 1 =No data received since last reading of SPIBUF register. 0 =A new Data is received and copied into SPIBUF field. This flag gets set to ‘1’ under following conditions: oReading RXDATA portion of the SPIBUF register. oWriting ‘1’ to clear the RXINTFLG bit in SPIFLG register. Write-Clearing the RXINTFLG bit before reading the SPIBUF indicates the received data is being ignored. Conversely, RXINTFLG can be cleared by reading the RXDATA portion of the SPIBUF register. So, reading the full of SPIBUF register itself clears the Receiver Full Interrupt Flag.
30	RXOVR		0h	Receive data buffer overrun. When a data transfer is completed and the received data is copied into the RXBUF while it is already full, RXOVR is set. Refer to Figure 1 for a view of internal logic diagram. An Overrun always occurs to the RXBUF, and SPIBUF contents never get Overwritten until after it is read by the VBUSP Master. If enabled, RXOVRN interrupt gets generated when RXBUF is Overwritten, and reading SPIFLG or SPIVECTx register shows the RXOVRN condition. However, two read operations to the SPIBUF register are required to reach the Overrun buffer. 1 =A receive data overrun condition occurred since last time reading the data field. 0 =No receive data overrun condition occurred since last time reading the data field. This bit is cleared to ‘0’ under the following conditions: o RXDATA portion of the SPIBUF register is read. o OVRNINTFLG bit in SPIFLG register is write-cleared. When an Overrun occurs, the SPIBUF contents will not be overwritten. Only the RXBUF contents are overwritten. When the SPIBUF is read out , the RXBUF contents get copied to the SPIBUF if RXBUF is full. So, the first data read out will be intact when an Overrun occurs. Note: A special condition under which RXOVR flag gets set. If both SPIBUF & RXBUF are already full and while another buffer receive is underway, if any errors like TIMEOUT, BITERR & DLEN_ERR occur, then RXOVR in RXBUF & SPIFLG registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a normal Receiver Overrun.

Table 13-70. SPIBUF Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	TXFULL	R	0h	Transmit data buffer full. This flag is a read-only flag. Writing into SPIDAT0 or SPIDAT1 field while TX Shift Register is full will automatically set the TXFULL flag. Once the data is copied to the Shift Register the TXFULL flag will be cleared. Writing to SPIDAT0/SPIDAT1 register when both TXBUF & the TX Shift Register are empty does not set the TXFULL flag. 1 =Transmit buffer is full, SPIDAT0/SPIDAT1 is not ready to accept a new data. 0 =Transmit buffer is empty, SPIDAT0/SPIDAT1 is ready to accept a new data.
28	BITERR		0h	Mismatch of internal transmit data and transmitted data. 1 =A bit error occurred. The SPI / MibSPI samples the signal of the transmit pin (master: SIMO, slave: SOMI) at the receive point (half clock cycle after transmit point). If the sampled value differs from the transmitted value a bit error is detected and the flag BITERR is set. A possible reason for a bit error can be noise, a to high bit rate / capacitive load or another master/slave trying to transmit at the same time. 0 =No bit error occurred. This flag is cleared to ‘0’ when RXDATA portion of the SPIBUF register is read.
27	DESYNC		0h	De-synchronization of slave device. De-synchronization monitor is active in master mode only. 1 =A slave device is de-synchronized. The master monitors the ENA signal coming from the slave device and sets the DESYNC flag if ENA is deactivated before the last reception point or after the last bit is transmitted plus tT2EDELAY (see Section 8.21). If DESYNCENA is set an interrupt is asserted. De-synchronization can occur if a slave device misses a clock edge coming from the master. 0 =No slave de-synchronization detected. This bit is valid in Master mode only. This flag is cleared to ‘0’ when RXDATA portion of the SPIBUF register is read. Note: Possible inconsistency of Desync flag in SPI/Compatibility mode MibSPI Due to the nature of this Error, under some circumstances it is possible for Desync error detected for the previous buffer to be visible in the current buffer. This is due to the fact that Receive Completion flag/interrupt will be generated when the buffer transfer is completed. But Desync will be detected after the buffer transfer is completed. So, if VBUS master reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct Desync condition. This inconsistency in Desync flag is valid only in SPI or Compatibility mode of MibSPI. In Multibuffer mode, Desync flag is always guaranteed to be for the current buffer.
26	PARITYERR		0h	Calculated parity differs from received parity bit. 1 =A parity error occurred. If the parity generator is enabled (can be selected individually for each buffer) an even or odd parity bit is added at the end of a data word (see Section 8.23). During reception of the data word the parity generator calculates the reference parity and compares it to the received parity bit. In the event of a mismatch the PARITYERR flag is set. 0 =No parity error detected. This flag is cleared to ‘0’ when RXDATA portion of the SPIBUF register is read.

Table 13-70. SPIBUF Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	TIMEOUT		0h	Time-out due to non-activation of ENA pin. 1 =An ENA signal time-out occurred. The SPI / MibSPI generates a time-out because the slave hasn't responded in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition the TIMOUT flag in the status field of the corresponding buffer and in the SPIFLG register is set. 0 =No ENA-pin time-out occurred. This flag is cleared to '0' when RXDATA portion of the SPIBUF register is read. This bit is valid in Master mode only.
24	DLENERR		0h	Data Length Error flag. 1 = A Data Length Error has occured. 0 = No Data Length Error has occured. This flag is cleared to '0' when RXDATA portion of the SPIBUF register is read.
23-16	LCSNR	R	0h	Last Chip select number. LCSNR in the status field is a copy of CSNR in the corresponding control field. It defines the chip select that has been activated during the last data transfer from the corresponding buffer. This is the copy of CSNR bits from SPIDAT1 latched at the end of a transfer. Note: Effect of NUM_CS_PINS generic on LCSNR bits. Actual number of bits implemented in LCSNR [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will read '0' always
15-0	RXDATA	R	0h	SPI Receive Data. This is the received data, transferred from the Receive Shift-Register at the end of a transfer completion. Irrespective of the programmed character length & the direction of shifting, the received data is stored right-justified in the register.

13.9.47.16 SPIEMU Register (Offset = 44h) [Reset = 80000000h]

SPIEMU is shown in Table 13-71.

Return to the Summary Table.

SPI / MibSPI Emulation Register Note: All the fields ot SPIEMU register are Read-Only. Read operation on this register under any mode will not have any impact on the status of this or any other registers.

Table 13-71. SPIEMU Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RXEMPTY	R	1h	Receive data buffer empty. 1 = No data received since last reading of SPIBUF register. 0 = A new Data is received and copied into SPIBUF field.
30	RXOVR	R	0h	Receive data buffer overrun. 1 =A receive data overrun condition occurred since last time reading the data field. 0 =No receive data overrun condition occurred since last time reading the data field.
29	TXFULL	R	0h	Transmit data buffer full. 1 =Transmit buffer is full, SPIDAT0/SPIDAT1 is not ready to accept a new data. 0 =Transmit buffer is empty, SPIDAT0/SPIDAT1 is ready to accept a new data.
28	BITERR	R	0h	Mismatch of internal transmit data and transmitted data. 1 =A bit error occurred. The SPI / MibSPI samples the signal of the transmit pin (master: SIMO, slave: SOMI) at the receive point (half clock cycle after transmit point). If the sampled value differs from the transmitted value a bit error is detected and the flag BITERR is set. A possible reason for a bit error can be noise, a to high bit rate / capacitive load or another master/slave trying to transmit at the same time. 0 =No bit error occurred.
27	DESYNC	R	0h	De-synchronization of slave device. De-synchronization monitor is active in master mode only. 1 =A slave device is de-synchronized. The master monitors the ENA signal coming from the slave device and sets the DESYNC flag if ENA is deactivated before the last reception point or after the last bit is transmitted plus tT2EDELAY (see Section 8.21). If DESYNCENA is set an interrupt is asserted. De-synchronization can occur if a slave device misses a clock edge coming from the master. 0 =No slave de-synchronization detected. This bit is valid in Master mode only.
26	PARITYERR	R	0h	Calculated parity differs from received parity bit. 1 =A parity error occurred. If the parity generator is enabled (can be selected individually for each buffer) an even or odd parity bit is added at the end of a data word (see Section 8.23). During reception of the data word the parity generator calculates the reference parity and compares it to the received parity bit. In the event of a mismatch the PARITYERR flag is set. 0 =No parity error detected.

Table 13-71. SPIEMU Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	TIMEOUT	R	0h	Time-out due to non-activation of ENA pin. 1 =An ENA signal time-out occurred. The SPI / MibSPI generates a time-out because the slave hasn't responded in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition the TIMOUT flag in the status field of the corresponding buffer and in the SPIFLG register is set. 0 =No ENA-pin time-out occurred. This bit is valid in Master mode only.
24	DLENERR	R	0h	Data Length Error flag. 1 = A Data Length Error has occured. 0 = No Data Length Error has occured.
23-16	LCSNR	R	0h	Last Chip select number. LCSNR in the status field is a copy of CSNR in the corresponding control field. It defines the chip select that has been activated during the last data transfer from the corresponding buffer. This is the copy of CSNR bits from SPIDAT1 latched at the end of a transfer. Note: Effect of NUM_CS_PINS generic on LCSNR bits. Actual number of bits implemented in LCSNR [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will read '0' always.
15-0	RXDATA	R	0h	SPI Receive Data. SPI / MibSPI emulation is a mirror of the SPIBUF register. The only difference between SPIEMU and SPIBUF is that a read from SPIEMU does not clear any of the status flags.

13.9.47.17 SPIDELAY Register (Offset = 48h) [Reset = 00000000h]

SPIDELAY is shown in Table 13-72.

Return to the Summary Table.

SPI / MibSPI Delay Register

Table 13-72. SPIDELAY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	C2TDELAY	R/W	0h	Chip-select-active-to-transmit-start-delay. C2TDELAY is used in master mode only. It defines a setup time for the slave device that delays the data transmission from the chip select active edge by a multiple of VBUSPCLK cycles. ChipSelect-active-to-transmission delays between 2 to 257 VBUSPCLK cycles can be achieved. If Phase = ‘1’, the delay between SCS fall-edge to the first edge of SPICLK will have an additional 0.5 SPICLK Period delay. This delay is as per the SPI protocol.
23-16	T2CDELAY	R/W	0h	Transmit-end-to-chip-select-inactive-delay. T2CDELAY is used in master mode only. It defines a hold time for the slave device that delays the chip select deactivation by a multiple of VBUSPCLK cycles after the last bit is transferred. T2CDELAY can be configured between 2 and 256 VBUSPCLK cycles. If Phase = ‘0’, then between the last edge of SPICLK and rise-edge of SCS, there will be an additional delay of 0.5 SPICLK period. This is as per the SPI protocol Both C2TDELAY and T2CDELAY counters do not have any dependancy on SPIENA pin value. Even if the SPIENA pin is asserted by the Slave, Master will continue to delay the start of SPICLK until the C2TDELAY counter overflows. Similarly, even if the SPIENA pin is deasserted by the Slave, Master will continue to hold the SPISCS pins active until the T2CDELAY counter overflows. This way, it is guaranteed that the setup/hold times of the SPISCS pins is determined by the Delay timers alone. To achieve better throughput, it should be ensured that these two timers are kept at the minimum possible values.
15-8	T2EDELAY	R/W	0h	Transmit-data-finished-to-ENA-pin-inactive-time-out. T2EDELAY is used in master mode only. It defines a time-out value as a multiple of SPI clock before the ENAble signal has to become inactive and after the CS becomes inactive. The SPI clock depends on which data format is selected. If the slave device is missing one or more clock edges, it is becoming de-synchronized. Although the master has finished the data transfer the slave is still waiting for the missed clock pulses and the ENA signal isn’t disabled. The T2EDELAY defines a time-out value that triggers the DESYNC flag, if the ENA signal isn’t deactivated in time. DESYNC flag is set to indicate that the Slave device did not deassert its SPIENA pin in time to acknowledge that it has received all the bits of the sent character. If T2CDELAY is programmed a non-zero value, then T2EDELAY will start only after the T2CDELAY completes. This should be taken into consideration to determine an optimum value of T2EDELAY. Note: Zero T2EDELAY If T2EDELAY is not programmed or programmed to ‘0’, then the Master SPI/MibSPI does not wait for SPIENA pin to be deasserted. It ignores the state of the SPIENA pin after the transmission is completed.

Table 13-72. SPIDELAY Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-0	C2EDELAY	R/W	0h	Chip-select-active-to-ENA-signal-active-time-out C2EDELAY is utilized only in master mode and it applies only if the addressed slave generates an ENA signal as a hardware handshake response. C2EDELAY defines the maximum time between the SPI / MibSPI activating the chip select signal and the addressed slave responding by activating the ENA signal. C2EDELAY defines a time-out value as a multiple of SPI clocks. The SPI clock depends on whether data format 0 or data format 1 is selected. If the slave device is not responding with the ENA signal before the time-out value is reached, the TIMEOUT flag in SPIFLG register is set and an interrupt is asserted if enabled. If a time-out occurs the MibSPI clears the transmit request of the timed-out buffer, sets the TIMEOUT flag for the current buffer and continues with the transfer of the next buffer in the sequence that is enabled. If C2TDELAY is programmed a non-zero value, then C2EDELAY will start only after the C2TDELAY completes. This should be taken into consideration to determine an optimum value of C2EDELAY. Note: Zero C2EDELAY If C2EDELAY is not programmed or programmed to ‘0’, then the Master SPI/MibSPI waits until the SPIENA pin to asserted before it can start the transfer. If the SPIENA pin is not asserted due to a malfunctioning Slave, the Master will wait forever. This might cause hang-up situation. it is recommended to program to C2EDELAY to a suitable value whenever SPIENA pin is used as functional.

13.9.47.18 SPIDEF Register (Offset = 4Ch) [Reset = 00000001h]

SPIDEF is shown in Table 13-73.

Return to the Summary Table.

SPI / MibSPI Default Chip select Register

Table 13-73. SPIDEF Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
7-0	CSDEF0	R/W	1h	Chip select default pattern. Master mode behavior. The CSDEFx bits are output to the chip select pins when no transmission are currently performed. It allows the user to set a chip select pattern which deselects all the SPI slaves. 1 =If CSDEFx is set to “1” the corresponding chip select is set to “1” while SPI/MibSPI is IDLE. 0 =If CSDEFx is set to “0” the corresponding chip select is set to “0” while SPI/MibSPI is IDLE. Note: Effect of NUM_CS_PINS generic on CSDEF bits. Actual number of bits implemented in CSDEF [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be treated as reserved, read-only and will read ‘0’ always.

13.9.47.19 SPIFMT0 Register (Offset = 50h) [Reset = 00000000h]

SPIFMT0 is shown in Table 13-74.

Return to the Summary Table.

SPI / MibSPI Data Format Register 0

Table 13-74. SPIFMT0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	WDELAY	R/W	0h	Delay in between transmissions for data format x (x= 0,1,2,3). Idle time that will be applied at the end of the current transmission if the bit WDEL is set in the current buffer. The delay to be applied is equal to: WDELAY * PVBUSPCLK + 2 * PVBUSPCLK. PVBUSPCLK -> Period of VBUSPCLK.
23	PARPOL	R/W	0h	Parity polarity: even or odd. PARPOLx can be modified in privilege mode only. It can be used for data format x (x= 0,1,2,3). 1 =An odd parity flag is added at the end of the transmit data stream. 0 =An even parity flag is added at the end of the transmit data stream.
22	PARITYENA	R/W	0h	Parity enable for data format x. 1= A parity is transmitted at the end of each transmit data stream. At the end of a transfer the parity generator compares the received parity bit with the locally calculated parity flag. If the parity bits do not match the RXERR flag is set in the corresponding control field. The parity type (even or odd) can be selected via the PARPOL bit. 0= No parity generation/ verification is performed for this data format. If an Uncorrectable Error Flag is set in a Slave mode MibSPI, then wrong parity bit will be transmitted to indicate to the master that there has been some issue with the data parity. The SOMI pin will be forced to transmit all ‘0’s. And parity bit will be transmitted as ‘1’ if even parity is selected and as ‘0’ if odd parity is selected(using the PARPOLx bit of this register). This behavior will be irrespective of an UPE on either TXRAM or RXRAM.
21	WAITENA	R/W	0h	Master waits for ENA signal from slave for data format x. WAITENA is considered in master mode only. In slave mode this bit has no meaning. WAITENA enables a flexible SPI network where slaves with ENA signal and slaves without ENA signal can be mixed. WAITENA defines for each buffer whether the addressed slave generates the ENA signal or does not. 1= Before the SPI / MibSPI starts the data transfer it waits for the ENA signal to become low. If the ENA signal is not pulled down by the addressed slave before the internal time-out counter (C2EDELAY) overflows, then the Master aborts the transfer and sets the TIMEOUT error flag. 0= The SPI / MibSPI does not wait for the ENA signal from the slaves and directly starts the transfer.
20	SHIFTDIR	R/W	0h	Shift direction for data format x. With bit SHIFTDIRx the shift direction for data format x (x=0,1,2,3) can be selected. 1 =Data format x shift direction: Least significant bit is shifted out first. 0 =Data format x shift direction: Most significant bit is shifted out first.

Table 13-74. SPIFMT0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	HDUPLEX_ENA	R/W	0h	Half Duplex transfer mode enable for Data Format x. This bit controls the I/O function of SOMI/SIMO lines for a specific requirement where in the case of Master mode, TX pin - SIMO will act as an RX pin, and in the case of Slave mode, RX pin - SIMO will act as a TX pin. 0 = Normal Full Duplex transfer. 1 = If MASTER = ‘1’, SIMO pin will act as an RX pin (No TX possible) If MASTER = ‘0’, SIMO pin will act as a TX pin (No RX possible). For all normal operations, HDUPLEX_ENAx bits should always remain ‘0’. It is intended for the usage when the SIMO pin is used for both TX & RX operations at different times.
18	DISCSTIMERS	R/W	0h	Disable Chipselect Timers for this format register. The C2TDELAY & T2CDELAY timers are by default enabled for all the Data Format registers. Using this bit, these timers can be disabled for particular Data Format if not required. When a Master is handling multiple Slaves, with varied set-up hold requirement, the application can selectively choose to include or not include the ChipSelect Delay timers for any Slaves. 0 = Both C2TDELAY & T2CDELAY counts are inserted for the ChipSelects. 1 = No C2TDELAY or T2CDELAY is inserted in the ChipSelect timings.
17	POLARITY	R/W	0h	SPI data format x clock polarity. POLARITYx defines the clock polarity of data format x. POLARITYx can be modified in privilege mode only. 1 =If POLARITYx is set to “1” the SPI clock signal is high-inactive, i.e. before and after data transfer the clock signal is high. 0 =If POLARITYx is set to “0” the SPI clock signal is low-inactive, i.e. before and after data transfer the clock signal is low.
16	PHASE	R/W	0h	SPI Data format x clock delay. PHASEx defines the clock delay of data format x. PHASEx can be modified in privilege mode only. 1 =If PHASEx is set to “1” the SPI clock signal is delayed by a half SPI clock cycle versus the transmit / receive data stream. The first transmit bit has to output prior to the first clock edge. Master and slave receive the first bit with the first edge 0 =If PHASEx is set to “0” the SPI clock signal is not delayed versus the transmit / receive data stream. The first data bit is transmitted with the first clock edge and the first bit is received with the second (inverse) clock edge Note: Restriction on SPICLK Phase/Polarity change in Slave Mode In Slave mode if Phase and/or Polarity of SPICLK has to be changed, the following sequence should be used. oClear the GCR1.SPIEN bit to ‘0’. oSet the required Phase/Polarity values in SPIFMTx registers. oSet the GCR1.SPIEN bit back to ‘1’. The setting of GCR1.SPIEN bit in Slave SPI/MibSPI to ‘1’ should be done only after the Polarity of the incoming SPICLK signal changes (if POLARITYx bit was changed in the configuration).

Table 13-74. SPIFMT0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	PRESCALE	R/W	0h	SPI data format x prescaler. PRESCALEx can be modified in privilege mode only. PRESCALEx determines the bit transfer rate of data format x if the SPI is the network master. PRESCALEx is directly derived from VBUSPCLK. If the SPI / MibSPI is configured as slave, PRESCALEx DOES NOT NEED to be configured. The clock rate for data format x can be calculated as BRFormat = VBUSPCLCK/(PRESCALEx+1) When PRESCALEx is set to zero (0), the SPI clock rate defaults to VBUSPCLK/2. Any write to this field will update EPRESCALE_FMTx field of EPRESCALEy (y=1,2) registers with EPRESCALE_FMTx(11:8) bits rounded off to ‘000’. Any write to EPRESCALE_FMTx field of the EXTENDED_PRESCALEy (y=1,2) register will cause its lower 8bits to be reflected in this field as well.
7-5	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
4-0	CHARLEN	R/W	0h	SPI data format x data word length. CHARLENx defines the word length of data format x. Legal values are 0x02 (data word length = 2 bit) to 0x10 (data word length = 16). Illegal values, such as 0x00 or 0x1F are not detected and their effect is indeterminate.

13.9.47.20 SPIFMT1 Register (Offset = 54h) [Reset = 00000000h]

SPIFMT1 is shown in Table 13-75.

Return to the Summary Table.

SPI / MibSPI Data Format Register 1

Table 13-75. SPIFMT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	WDELAY	R/W	0h	Delay in between transmissions for data format x (x= 0,1,2,3). Idle time that will be applied at the end of the current transmission if the bit WDEL is set in the current buffer. The delay to be applied is equal to: WDELAY * PVBUSPCLK + 2 * PVBUSPCLK. PVBUSPCLK -> Period of VBUSPCLK.
23	PARPOL	R/W	0h	Parity polarity: even or odd. PARPOLx can be modified in privilege mode only. It can be used for data format x (x= 0,1,2,3). 1 =An odd parity flag is added at the end of the transmit data stream. 0 =An even parity flag is added at the end of the transmit data stream.
22	PARITYENA	R/W	0h	Parity enable for data format x. 1= A parity is transmitted at the end of each transmit data stream. At the end of a transfer the parity generator compares the received parity bit with the locally calculated parity flag. If the parity bits do not match the RXERR flag is set in the corresponding control field. The parity type (even or odd) can be selected via the PARPOL bit. 0= No parity generation/ verification is performed for this data format. If an Uncorrectable Error Flag is set in a Slave mode MibSPI, then wrong parity bit will be transmitted to indicate to the master that there has been some issue with the data parity. The SOMI pin will be forced to transmit all ‘0’s. And parity bit will be transmitted as ‘1’ if even parity is selected and as ‘0’ if odd parity is selected(using the PARPOLx bit of this register). This behavior will be irrespective of an UPE on either TXRAM or RXRAM.
21	WAITENA	R/W	0h	Master waits for ENA signal from slave for data format x. WAITENA is considered in master mode only. In slave mode this bit has no meaning. WAITENA enables a flexible SPI network where slaves with ENA signal and slaves without ENA signal can be mixed. WAITENA defines for each buffer whether the addressed slave generates the ENA signal or does not. 1= Before the SPI / MibSPI starts the data transfer it waits for the ENA signal to become low. If the ENA signal is not pulled down by the addressed slave before the internal time-out counter (C2EDELAY) overflows, then the Master aborts the transfer and sets the TIMEOUT error flag. 0= The SPI / MibSPI does not wait for the ENA signal from the slaves and directly starts the transfer.
20	SHIFTDIR	R/W	0h	Shift direction for data format x. With bit SHIFTDIRx the shift direction for data format x (x=0,1,2,3) can be selected. 1 =Data format x shift direction: Least significant bit is shifted out first. 0 =Data format x shift direction: Most significant bit is shifted out first.

Table 13-75. SPIFMT1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	HDUPLEX_ENA	R/W	0h	Half Duplex transfer mode enable for Data Format x. This bit controls the I/O function of SOMI/SIMO lines for a specific requirement where in the case of Master mode, TX pin - SIMO will act as an RX pin, and in the case of Slave mode, RX pin - SIMO will act as a TX pin. 0 = Normal Full Duplex transfer. 1 = If MASTER = ‘1’, SIMO pin will act as an RX pin (No TX possible) If MASTER = ‘0’, SIMO pin will act as a TX pin (No RX possible). For all normal operations, HDUPLEX_ENAx bits should always remain ‘0’. It is intended for the usage when the SIMO pin is used for both TX & RX operations at different times.
18	DISCSTIMERS	R/W	0h	Disable Chipselect Timers for this format register. The C2TDELAY & T2CDELAY timers are by default enabled for all the Data Format registers. Using this bit, these timers can be disabled for particular Data Format if not required. When a Master is handling multiple Slaves, with varied set-up hold requirement, the application can selectively choose to include or not include the ChipSelect Delay timers for any Slaves. 0 = Both C2TDELAY & T2CDELAY counts are inserted for the ChipSelects. 1 = No C2TDELAY or T2CDELAY is inserted in the ChipSelect timings.
17	POLARITY	R/W	0h	SPI data format x clock polarity. POLARITYx defines the clock polarity of data format x. POLARITYx can be modified in privilege mode only. 1 =If POLARITYx is set to “1” the SPI clock signal is high-inactive, i.e. before and after data transfer the clock signal is high. 0 =If POLARITYx is set to “0” the SPI clock signal is low-inactive, i.e. before and after data transfer the clock signal is low.
16	PHASE	R/W	0h	SPI Data format x clock delay. PHASEx defines the clock delay of data format x. PHASEx can be modified in privilege mode only. 1 =If PHASEx is set to “1” the SPI clock signal is delayed by a half SPI clock cycle versus the transmit / receive data stream. The first transmit bit has to output prior to the first clock edge. Master and slave receive the first bit with the first edge 0 =If PHASEx is set to “0” the SPI clock signal is not delayed versus the transmit / receive data stream. The first data bit is transmitted with the first clock edge and the first bit is received with the second (inverse) clock edge Note: Restriction on SPICLK Phase/Polarity change in Slave Mode In Slave mode if Phase and/or Polarity of SPICLK has to be changed, the following sequence should be used. oClear the GCR1.SPIEN bit to ‘0’. oSet the required Phase/Polarity values in SPIFMTx registers. oSet the GCR1.SPIEN bit back to ‘1’. The setting of GCR1.SPIEN bit in Slave SPI/MibSPI to ‘1’ should be done only after the Polarity of the incoming SPICLK signal changes (if POLARITYx bit was changed in the configuration).

Table 13-75. SPIFMT1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	PRESCALE	R/W	0h	SPI data format x prescaler. PRESCALEx can be modified in privilege mode only. PRESCALEx determines the bit transfer rate of data format x if the SPI is the network master. PRESCALEx is directly derived from VBUSPCLK. If the SPI / MibSPI is configured as slave, PRESCALEx DOES NOT NEED to be configured. The clock rate for data format x can be calculated as BRFormat = VBUSPCLCK/(PRESCALEx+1) When PRESCALEx is set to zero (0), the SPI clock rate defaults to VBUSPCLK/2. Any write to this field will update EPRESCALE_FMTx field of EPRESCALEy (y=1,2) registers with EPRESCALE_FMTx(11:8) bits rounded off to ‘000’. Any write to EPRESCALE_FMTx field of the EXTENDED_PRESCALEy (y=1,2) register will cause its lower 8bits to be reflected in this field as well.
7-5	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
4-0	CHARLEN	R/W	0h	SPI data format x data word length. CHARLENx defines the word length of data format x. Legal values are 0x02 (data word length = 2 bit) to 0x10 (data word length = 16). Illegal values, such as 0x00 or 0x1F are not detected and their effect is indeterminate.

13.9.47.21 SPIFMT2 Register (Offset = 58h) [Reset = 00000000h]

SPIFMT2 is shown in Table 13-76.

Return to the Summary Table.

SPI / MibSPI Data Format Register 2

Table 13-76. SPIFMT2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	WDELAY	R/W	0h	Delay in between transmissions for data format x (x= 0,1,2,3). Idle time that will be applied at the end of the current transmission if the bit WDEL is set in the current buffer. The delay to be applied is equal to: WDELAY * PVBUSPCLK + 2 * PVBUSPCLK. PVBUSPCLK -> Period of VBUSPCLK.
23	PARPOL	R/W	0h	Parity polarity: even or odd. PARPOLx can be modified in privilege mode only. It can be used for data format x (x= 0,1,2,3). 1 =An odd parity flag is added at the end of the transmit data stream. 0 =An even parity flag is added at the end of the transmit data stream.
22	PARITYENA	R/W	0h	Parity enable for data format x. 1= A parity is transmitted at the end of each transmit data stream. At the end of a transfer the parity generator compares the received parity bit with the locally calculated parity flag. If the parity bits do not match the RXERR flag is set in the corresponding control field. The parity type (even or odd) can be selected via the PARPOL bit. 0= No parity generation/ verification is performed for this data format. If an Uncorrectable Error Flag is set in a Slave mode MibSPI, then wrong parity bit will be transmitted to indicate to the master that there has been some issue with the data parity. The SOMI pin will be forced to transmit all ‘0’s. And parity bit will be transmitted as ‘1’ if even parity is selected and as ‘0’ if odd parity is selected(using the PARPOLx bit of this register). This behavior will be irrespective of an UPE on either TXRAM or RXRAM.
21	WAITENA	R/W	0h	Master waits for ENA signal from slave for data format x. WAITENA is considered in master mode only. In slave mode this bit has no meaning. WAITENA enables a flexible SPI network where slaves with ENA signal and slaves without ENA signal can be mixed. WAITENA defines for each buffer whether the addressed slave generates the ENA signal or does not. 1= Before the SPI / MibSPI starts the data transfer it waits for the ENA signal to become low. If the ENA signal is not pulled down by the addressed slave before the internal time-out counter (C2EDELAY) overflows, then the Master aborts the transfer and sets the TIMEOUT error flag. 0= The SPI / MibSPI does not wait for the ENA signal from the slaves and directly starts the transfer.
20	SHIFTDIR	R/W	0h	Shift direction for data format x. With bit SHIFTDIRx the shift direction for data format x (x=0,1,2,3) can be selected. 1 =Data format x shift direction: Least significant bit is shifted out first. 0 =Data format x shift direction: Most significant bit is shifted out first.

Table 13-76. SPIFMT2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	HDUPLEX_ENA	R/W	0h	Half Duplex transfer mode enable for Data Format x. This bit controls the I/O function of SOMI/SIMO lines for a specific requirement where in the case of Master mode, TX pin - SIMO will act as an RX pin, and in the case of Slave mode, RX pin - SIMO will act as a TX pin. 0 = Normal Full Duplex transfer. 1 = If MASTER = ‘1’, SIMO pin will act as an RX pin (No TX possible) If MASTER = ‘0’, SIMO pin will act as a TX pin (No RX possible). For all normal operations, HDUPLEX_ENAx bits should always remain ‘0’. It is intended for the usage when the SIMO pin is used for both TX & RX operations at different times.
18	DISCSTIMERS	R/W	0h	Disable Chipselect Timers for this format register. The C2TDELAY & T2CDELAY timers are by default enabled for all the Data Format registers. 13.9.47.23 TGINTVECT0 Register (Offset = 60h) [Reset = 00000000h]

TGINTVECT0 is shown in Table 13-78.

Return to the Summary Table.

SPI Interrupt Vector Register 0 / MibSPI Transfer Group Interrupt Vector Register 0

Table 13-78. TGINTVECT0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
5-1	INTVECT0	R	0h	Interrupt vector for interrupt line INT0. INTVECT0 returns the vector of the pending interrupt at interrupt line INT0. If more than one interrupts are pending, INTVECT0 always references the highest priority interrupt source first. The vectors generated are different for SPI / Compatibility mode of MibSPI and Multibuffer mode of MibSPI. INTVECT0 field just reflects the status of SPIFLG register in a vectorized format. So, any updates to SPIFLG will automatically reflect in the Vector value in this register. SPI / Compatibility mode - MibSPI The interrupts available for SPI or Compatibility mode - MibSPI, in the descending order of their priorities are as given below. Transmission Error Interrupt Receive Buffer Overrun Interrupt Receive Buffer Full Interrupt Transmit Buffer Empty Interrupt Vectors for each of these interrupts will be reflected on the INTVECT0 bits, when they occur. Reading the vectors for the “Receive Buffer Overrun” & “Receive Buffer Full” interrupts will automatically clear the respective flags in the SPIFLG register. On reading the INTVECT0 bits, the vector of the next highest priority interrupt (if any) will be then reflected on the INTVECT0 bits. If two or more interrupts occur simultaneously, the vector for the higest priority interrupt will be reflected on the INTVECT0 bits. Reading the Vector register when “Transmitter Empty” is indicated does not clear the TXINTFLG in SPIFLG register. Writing a new data to SPIDATx register clears the “Transmitter Empty” interrupt. INTVECT0 [4:0] Description 00000b no interrupt pending 10001b Error interrupt pending. Refer to Least Significant (LS) Byte of SPIFLG to determine more details about the type of error. 10011b Pending interrupt is “Receive Buffer Overrun Interrupt” 10010b Pending interrupt is “Receive Buffer Full Interrupt” 10100b Pending interrupt is “Transmit Buffer Empty Interrupt” All other bit combinations Reserved Note: Exception for clearing of RXINT If both SPIBUF and RXBUF (internal buffer) are full, then, reading TGINTVECT0 register (while it shows 10010) does not clear the RXINTFLG in SPIFLG register. In this case, only way to clear the Interrupt is to read the SPIBUF again until there’s no more unread RX data.

Table 13-78. TGINTVECT0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	SUSPEND0	R	0h	“Transfer suspended” or “transfer finished” interrupt.(MibSPI only) The SUSPEND0 flag is updated depending on the type of interrupt reflected by the VECTOR value field. 1 =The interrupt type is a “transfer suspended” interrupt. I.e. the transfer group referenced by INTVECT0 has asserted an interrupt, because the buffer to be transferred next is in “suspend to wait” mode. 0 =The interrupt type is a “transfer finished” interrupt. I.e. the buffer array referenced by INTVECT0 has asserted an interrupt, because all of the data from the whole transfer group has been transferred. Note: Special case for SUSPEND interrupt When there’s a “transfer suspended” interrupt (SUSPEND0 bit is set to ‘1’), reading the TGINTVECT0 register does not clear the “TG Suspended” interrupt. The SUSPEND condition should be resolved first before the interrupt can be cleared. The SUSPEND condition can be cleared by writing a new data to that TXRAM location and/or reading the data from that RXRAM location depending upon the SUSPEND criteria programmed in the “BUFMODE” field of that TXRAM location. The SUSPEND0 bit always returns value ‘0’ in SPI / Compatibility mode MibSPI. When there is an RXOVRN or any Error interrupt in Multibuffer mode, SUSPEND0 bit stays ‘0’. Refer to Section 6.2 on page 77 & Section 6.3 on page 77 for more details and notes on better handling of interrupts. Note: Reading Error Vector Reading an Error Vector in the TGINTVECT0 register will NOT clear the Error flags in the SPIFLG register. The Error Flags in SPIFLG need to be write-cleared after servicing them suitably. If “TG Completed” interrupt occurs for a TG and after a while “TG Suspended” flag too gets set for the same TG, then the TGINTVECT0 register will show “TG Completed” interrupt giving it higher priority than the “TG Suspended” interrrupt.

13.9.47.24 TGINTVECT1 Register (Offset = 64h) [Reset = 00000000h]

TGINTVECT1 is shown in Table 13-79.

Return to the Summary Table.

SPI Interrupt Vector Register 1 / MibSPI Transfer Group Interrupt Vector Register 1

Table 13-79. TGINTVECT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
5-1	INTVECT1	R	0h	Interrupt vector for interrupt line INT1. INTVECT1 returns the vector of the pending interrupt at interrupt line INT0. If more than one interrupt is pending, INTVECT1 always references the highest priority interrupt source first. The vectors generated are different for SPI / Compatibility mode of MibSPI and Multibuffer mode of MibSPI. INTVECT1 field just reflects the status of SPIFLG register in a vectorized format. So, any updates to SPIFLG will automatically reflect in the Vector value in this register. SPI / Compatibility mode - MibSPI The interrupts available for SPI / Compatibility mode - MibSPI, in the descending order of their priorities are as given below. Transmission Error Interrupt Receive Buffer Overrun Interrupt Receive Buffer Full Interrupt Transmit Buffer Empty Interrupt Vectors for each of these interrupts will be reflected on the INTVECT1 bits, when they occur. Reading the vectors for the “Receive Buffer Overrun” & “Receive Buffer Full” interrupts will automatically clear the respective flags in the SPIFLG register. On reading the INTVECT1 bits, the vector of the next highest priority interrupt (if any) will then be reflected on the INTVECT1 bits. If two or more interrupts occur simultaneously, the vector for the higest priority interrupt will be reflected on the INTVECT1 bits. Reading the Vector register when “Transmitter Empty” is indicated does not clear the TXINTFLG in SPIFLG register. Writing a new data to SPIDATx register clears the “Transmitter Empty” interrupt. 00000b no interrupt pending 10001b Error interrupt pending. Refer to LS Byte of SPIFLG to determine more details about the type of error. 10011b Pending interrupt is “Receive Buffer Overrun Interrupt” 10010b Pending interrupt is “Receive Buiffer Full Interrupt” 10100b Pending interrupt is “Transmit Buffer Empty Interrupt” All other bit combinations Reserved Note: Exception for clearing of RXINT If both SPIBUF and RXBUF (internal buffer) are full, then, reading TGINTVECT1 register (while it shows 10010) does not clear the RXINTFLG in SPIFLG register. In this case, only way to clear the Interrupt is to read out the SPIBUF again until there’s no more unread RX data.

Table 13-79. TGINTVECT1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	SUSPEND1	R	0h	"Transfer suspended" or "transfer finished" interrupt.(MibSPI Only) The SUSPEND1 flag is updated depending on the type of interrupt reflected by the VECTOR value field. 1 =The interrupt type is a "transfer suspended" interrupt. I.e. the transfer group referenced by INTVECT1 has asserted an interrupt, because the buffer to be transferred next is in "suspend to wait" mode. 0 =The interrupt type is a "transfer finished" interrupt. I.e. the buffer array referenced by INTVECT1 has asserted an interrupt, because all data from the whole transfer group has been transferred. Note: Special case for SUSPEND interrupt When there's a "transfer suspended" interrupt(SUSPEND1 bit is set to '1'), reading the TGINTVECT1 register does not clear the "TG Suspended" interrupt. The SUSPEND condition should be resolved first before the interrupt can be cleared. This condition can be cleared by writing a new data to that TXRAM location and/or reading the data from that RXRAM location depending upon the SUSPEND criteria programmed in the "BUFMODE" field of that TXRAM location. The SUSPEND1 bit always returns value '0' in SPI / Compatibility mode MibSPI. Even while there is an RXOVRN or any Error interrupt in Multibuffer mode, SUSPEND1 bit stays '0'. Refer to Section 6.2 on page 77 & Section 6.3 on page 77 for more details and notes on better handling of interrupts. Note: Reading Error Vector Reading an Error Vector in the TGINTVECT1 register will NOT clear the Error flags in the SPIFLG register. The Error Flags in SPIFLG need to be write-cleared after servicing them suitably. If "TG Completed" interrupt occurs for a TG and after a while "TG Suspended" flag too gets set for the same TG, then the TGINTVECT1 register will show "TG Completed" interrupt giving it higher priority than the "TG Suspended" interrrupt.

13.9.47.25 SPIPC9 Register (Offset = 68h) [Reset = 00000000h]

SPIPC9 is shown in Table 13-80.

Return to the Summary Table.

SPI/MibSPI Pin Control Register 9 (SPIPC9) - SPISRSEL

Table 13-80. SPIPC9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	SOMISRS7	R/W	0h	Each of these 7 bits controls the slew rate for the corresponding SPISOMIx pin. 0 =Normal Buffer Select. 1 =Slow Buffer Select.
23-16	SIMOSRS7	R/W	0h	Each of these 7 bits controls the slew rate for the corresponding SPISIMOx pin. 0 =Normal Buffer Select. 1 =Slow Buffer Select.
15-12	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11	SOMISRS0	R/W	0h	This bit controls the slew rate for SPISOMI0 pin. 0 =Normal Buffer Select. 1 =Slow Buffer Select. Note: Bit 11 or bit 24 can be used to control the slew rate for SPISOMI0. If a 32 bit write is performed, bit 11 will have priority over bit 24.
10	SIMOSRS0	R/W	0h	This bit controls the slew rate for SPISIMO0 pin. 0 =Normal Buffer Select. 1 =Slow Buffer Select. Note: Bit 10 or bit 16 can be used to control the slew rate for SPISIMO0. If a 32 bit write is performed, bit 10 will have priority over bit 16.
9	CLKSRS	R/W	0h	This bit controls the slew rate for SPICLK pin. 0 =Normal Buffer Select. 1 =Slow Buffer Select.
8	ENASRS	R/W	0h	This bit controls the slew rate for SPIENA pin. 0 =Fast Buffer Select. 1 =Slow Buffer Select.
7-0	SCSSRS	R/W	0h	Each of these 7 bits controls the slew rate for the corresponding SPISCSx pin. 0 =Normal Buffer Select. 1 =Slow Buffer Select. Note: Effect of NUM_CS_PINS generic on ChipSelect bits. Actual number of bits implemented in SCSSRS [7:0] will depend upon the NUM_CS_PINS generic set during synthesis. Unimplemented bits will be read-only and will read ‘0’ always.

13.9.47.26 SPIPMCTRL Register (Offset = 6Ch) [Reset = 00000000h]

SPIPMCTRL is shown in Table 13-81.

Return to the Summary Table.

SPI/MibSPI Parallel/Modulo Mode Control Register

Table 13-81. SPIPMCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NU4	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
30	HSM_MODE3	R/W	0h	High Speed Modulo Mode control bit for Data Format 3. Controls whether the PMODE3 bits will result in Modulo Format data transfer or not. Refer to Section 3.26 for details about the HSM Mode. 0 = Normal mode - Normal Parallel mode if PMODE3 bits are non-zero. 1 = High Speed Modulo Mode. Data transfer will happen in Modulo Format if PMODE3 bits are non-zero
29	MODCLKPOL3	R/W	0h	Modulo mode SPICLK Polarity for Data Format 3 Determines the Polarity of the SPICLK in Modulo mode only. If MODULO MODE [2:0] bits are “000”, this bit will be ignored. 0 = Normal SPICLK in all the modes. 1 = Polarity of the SPICLK will be inverted if Modulo mode is selected
28-26	MMODE3	R/W	0h	These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if Modulo Option is supported by the module) for Data Format 3. 000 = Normal single dataline mode - Default (PMODE should be set to “00”) 001 = 2-data line Mode (PMODE should be set to “00”) 010 = 3-data line mode (PMODE should be set to “00”) 011 = 4-data line mode (PMODE should be set to “00”) 100 = 5-data line mode (PMODE should be set to “00”) 101 = 6-data line mode (PMODE should be set to “01”) 110 = Reserved 111 = Reserved
25-24	PMODE3	R/W	0h	Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2 ,4 or 8 data lines for Data Format 3. 00 = normal operation / 1-data line (MMODE should be set to “000”) 01 = 2-data line mode (MMODE should be set to “000”) 10 = 4-data line mode (MMODE should be set to “000”) 11 = 8-data line mode (MMODE should be set to “000”)
23	NU3	R	0h	Reserved. Reads return ‘0’ and writes have no effect.

Table 13-81. SPIPMCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	HSM_MODE2	R/W	0h	High Speed Modulo Mode control bit for Data Format 2. Controls whether the PMODE2 bits will result in Modulo Format data transfer or not. Refer to Section 3.26 for details about the HSM Mode. 0 = Normal mode - Normal Parallel mode if PMODE2 bits are non-zero. 1 = High Speed Modulo Mode. Data transfer will happen in Modulo Format if PMODE2 bits are non-zero
21	MODCLKPOL2	R/W	0h	Modulo mode SPICLK Polarity for Data Format 2. Determines the Polarity of the SPICLK in Modulo mode only. If MMODE [2:0] bits are “000”, this bit will be ignored. 0 = Normal SPICLK in all the modes. 1 = Polarity of the SPICLK will be inverted if Modulo mode is selected
20-18	MMODE2	R/W	0h	These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if Modulo Option is supported by the module) for Data Format 2. 000 = 1-data line Mode - Default (PMODE should be set to “00”) 001 = 2-data line Mode (PMODE should be set to “00”) 010 = 3-data line mode (PMODE should be set to “00”) 011 = 4-data line mode (PMODE should be set to “00”) 100 = 5-data line mode (PMODE should be set to “00”) 101 = 6-data line mode (PMODE should be set to “01”) 110 = Reserved 111 = Reserved
17-16	PMODE2	R/W	0h	Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2 ,4 or 8 data lines for Data Format 2. 00 = normal operation / 1-data line (MMODE should be set to “000”) 01 = 2-data line mode (MMODE should be set to “000”) 10 = 4-data line mode (MMODE should be set to “000”) 11 = 8-data line mode (MMODE should be set to “000”)
15	NU2	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
14	HSM_MODE1	R/W	0h	High Speed Modulo Mode control bit for Data Format 1. Controls whether the PMODE1 bits will result in Modulo Format data transfer or not. Refer to Section 3.26 for details about the HSM Mode. 0 = Normal mode - Normal Parallel mode if PMODE1 bits are non-zero. 1 = High Speed Modulo Mode. Data transfer will happen in Modulo Format if PMODE1 bits are non-zero.
13	MODCLKPOL1	R/W	0h	Modulo mode SPICLK Polarity for Data Format 1. Determines the Polarity of the SPICLK in Modulo mode only. If MMODE [2:0] bits are “000”, this bit will be ignored. 0 = Normal SPICLK in all the modes. 1 = Polarity of the SPICLK will be inverted if Modulo mode is selected.

Table 13-81. SPIPMCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12-10	MMODE1	R/W	0h	These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if Modulo Option is supported by the module) for Data Format 1. 000 = 1-data line Mode - Default (PMODE should be set to “00”) 001 = 2-data line Mode (PMODE should be set to “00”) 010 = 3-data line mode (PMODE should be set to “00”) 011 = 4-data line mode (PMODE should be set to “00”) 100 = 5-data line mode (PMODE should be set to “00”) 101 = 6-data line mode (PMODE should be set to “01”) 110 = Reserved 111 = Reserved
9-8	PMODE1	R/W	0h	Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2 ,4 or 8 data lines for Data Format 1. 00 = normal operation / 1-data line (MMODE should be set to “000”) 01 = 2-data line mode (MMODE should be set to “000”) 10 = 4-data line mode (MMODE should be set to “000”) 11 = 8-data line mode (MMODE should be set to “000”)
7	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
6	HSM_MODE0	R/W	0h	High Speed Modulo Mode control bit for Data Format 0. Controls whether the PMODE0 bits will result in Modulo Format data transfer or not. Refer to Section 3.26 for details about the HSM Mode. 0 = Normal mode - Normal Parallel mode if PMODE0 bits are non-zero. 1 = High Speed Modulo Mode. Data transfer will happen in Modulo Format if PMODE0 bits are non-zero.
5	MODCLKPOL0	R/W	0h	Modulo mode SPICLK Polarity for Data Format 0. Determines the Polarity of the SPICLK in Modulo mode only. If MMODE [2:0] bits are “000”, this bit will be ignored. 0 = Normal SPICLK in all the modes. 1 = Polarity of the SPICLK will be inverted if Modulo mode is selected.
4-2	MMODE0	R/W	0h	These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if Modulo Option is supported by the module) for Data Format 0. 000 = 1-data line Mode - Default (PMODE should be set to “00”) 001 = 2-data line Mode (PMODE should be set to “00”) 010 = 3-data line mode (PMODE should be set to “00”) 011 = 4-data line mode (PMODE should be set to “00”) 100 = 5-data line mode (PMODE should be set to “00”) 101 = 6-data line mode (PMODE should be set to “01”) 110 = Reserved 111 = Reserved

Table 13-81. SPIPMCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1-0	PMODE0	R/W	0h	Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2 ,4 or 8 data lines for Data Format 0. 00 = normal operation / 1-data line (MMODE should be set to “000”) 01 = 2-data line mode (MMODE should be set to “000”) 10 = 4-data line mode (MMODE should be set to “000”) 11 = 8-data line mode (MMODE should be set to “000”)

13.9.47.27 MIBSPIE Register (Offset = 70h) [Reset = 00000500h]

MIBSPIE is shown in Table 13-82.

Return to the Summary Table.

MibSPI Enable Register

Table 13-82. MIBSPIE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	NU3	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
16	RXRAMACCESS	R/W	0h	Receive RAM Access control Bit. During normal operating mode of MibSPI, the Receive Data/Status portion of Multibuffer RAM is read-only. To enable testing of Data Integrity checks of Receive RAM, a special read/write access control is provided through this bit. 0 = The RX portion of Multibuffer RAM is not writable by the CPU. That is, portion of Multibuffer RAM, addressed by an offset of 0x 200-0x3FF is write protected. 1 = The whole of Multibuffer RAM is fully accessible for read/write by the CPU.
15-12	NU2	R	0h	Reserved.Reads return ‘0’ and writes have no effect
11-8	EXTENDED_BUF_ENA	R/W	5h	Enables the support for 256 buffers. By default MibSPI supports up to 128 buffers for both TX and RX. It is also possible to extend the support to 256 buffers as a parameterized implementation. This field can be used to enable/disable the support for Extended Buffers. This Enable field is implemented only if “EXTENDED_BUF” parameter is set to ‘1’. If the parameter is set to ‘0’, this field is read-only and reads the disable value. Write (Privilege mode only) 1010 - Enable the Extended Buffer mode - up to 256 buffers can be used 0101 - Disable the Extended Buffer mode - MibSPI supports only 128 buffers All other values - writes are ignored and the values are not updated into this field. The state of the feature remains unchanged. Read (both privilege and user modes) 1010 - Extended Buffer mode is enabled - up to 256 buffers can be used 0101 - Extended Buffer mode is disabled - MibSPI supports only 128 buffers
7-1	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
0	MSPIENA	R/W	0h	Multibuffer mode Enable. After power-up or reset MSPIENA remains cleared, which means that the MibSPI runs in compatibility mode by default. If Multibuffer mode is desired, this register should be configured first after configuring the SPIGCR0 register. Unless MSPIENA is set to ‘1’, the Multibuffer mode registers are not writable. Refer to Section 3.3 for the grouping of registers into Compatibility mode and Multibuffer mode. 1 =The MibSPI is configured to run in MibSPI mode (Multibuffer mode). In this mode the additional features are available. 0 =The MibSPI runs in compatibility mode, i.e. in this mode the MibSPI is fully code compliant to the standard TMS470 Platform SPI. No Multibuffer feature is supported

13.9.47.28 TGITENST Register (Offset = 74h) [Reset = 00000000h]

TGITENST is shown in Table 13-83.

Return to the Summary Table.

MibSPI Transfer Group Interrupt Enable Set Register

Table 13-83. TGITENST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	SETINTENRDY	R/W	0h	Transfer group interrupt set (enable) when transfer finished. Write: 1 = Enables the “The Transfer group x completed “ interrupt Interrupt gets generated when Transfer Group x gets completed. 0 = Has no effect. Read: 1 = “The Transfer group x completed “ interrupt is enabled Interrupt gets generated when Transfer Group x gets completed. 0 = “The Transfer group x completed” interrupt is disabled Interrupt does not get generated when Transfer Group x gets completed
15-0	SETINTENSUS	R/W	0h	Transfer group interrupt set (enable) when transfer suspended Write: 1 = Enables the “The Transfer group x suspended “ interrupt Interrupt gets generated when Transfer Group x gets suspended. 0 = Has no effect. Read: 1 = “The Transfer group x suspended “ interrupt is enabled Interrupt gets generated when Transfer Group x gets suspended. 0 = “The Transfer group x suspended” interrupt is disabled Interrupt does not get generated when Transfer Group x gets suspended

13.9.47.29 TGITENCR Register (Offset = 78h) [Reset = 00000000h]

TGITENCR is shown in Table 13-84.

Return to the Summary Table.

MibSPI Transfer Group Interrupt Enable Clear Register

Table 13-84. TGITENCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	CLRINTENRDY	R/W	0h	Transfer group interrupt clear (disable) when transfer finished. Write: 1 = Disables the “The Transfer group x completed “ interrupt Interrupt does not get generated when Transfer Group x gets completed. 0 = Has no effect. Read: 1 = “The Transfer group x completed “ interrupt is enabled Interrupt gets generated when Transfer Group x gets completed. 0 = “The Transfer group x completed” interrupt is disabled Interrupt does not get generated when Transfer Group x gets completed
15-0	CLRINTENSUS	R/W	0h	Transfer group interrupt clear (disable) when transfer suspended Write: 1 = Disables the “The Transfer group x suspended “ interrupt Interrupt does not get generated when Transfer Group x gets suspended. 0 = Has no effect. Read: 1 = “The Transfer group x suspended “ interrupt is enabled Interrupt gets generated when Transfer Group x gets suspended. 0 = “The Transfer group x suspended” interrupt is disabled Interrupt does not get generated when Transfer Group x gets suspended

13.9.47.30 TGITLVST Register (Offset = 7Ch) [Reset = 00000000h]

TGITLVST is shown in Table 13-85.

Return to the Summary Table.

MibSPI Transfer Group Interrupt Level Set Register

Table 13-85. TGITLVST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	SETINTLVLRDY	R/W	0h	Transfer group completed” Interrupt Level set register Write: 1 = Sets the “The Transfer group x completed “ interrupt to line INT1 0 = Has no effect. Read: 1 = “The Transfer group x completed “ interrupt is set to line INT1 0 = “The Transfer group x completed “ interrupt is set to line INT0
15-0	SETINTLVLSUS	R/W	0h	Transfer group suspended” interrupt Level set rigester Write: 1 = Sets the “The Transfer group x suspended “ interrupt to line INT1 0 = Has no effect. Read: 1 = “The Transfer group x suspended “ interrupt is set to line INT1 0 = “The Transfer group x suspended “ interrupt is set to line INT0

13.9.47.31 TGITLVCR Register (Offset = 80h) [Reset = 00000000h]

TGITLVCR is shown in Table 13-86.

Return to the Summary Table.

MibSPI Transfer Group Interrupt Level Clear Register

Table 13-86. TGITLVCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	CLRINTLVLRDY	R/W	0h	Transfer group completed” Interrupt Level clear register Write: 1 = Sets the “The Transfer group x completed “ interrupt to line INT0 0 = Has no effect. Read: 1 = “The Transfer group x completed “ interrupt is set to line INT1 0 = “The Transfer group x completed “ interrupt is set to line INT0
15-0	CLRINTLVLSUS	R/W	0h	Transfer group suspended” interrupt Level clear register Write: 1 = Sets the “The Transfer group x suspended “ interrupt to line INT0 0 = Has no effect. Read: 1 = “The Transfer group x suspended “ interrupt is set to line INT1 0 = “The Transfer group x suspended “ interrupt is set to line INT0

13.9.47.32 TGINTFLAG Register (Offset = 84h) [Reset = 00000000h]

TGINTFLAG is shown in Table 13-87.

Return to the Summary Table.

Transfer Group Interrupt Flag Register

Table 13-87. TGINTFLAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	INTFLGRDY	R	0h	Transfer group interrupt flag for “transfer finished” interrupt. Read: 1 =A “transfer finished” interrupt from transfer group x occurred. No matter whether the interrupt is enabled or disabled (INTENRDYx = don’t care) or whether the interrupt is mapped to line INT0 or INT1, INTFLGRDYx is set right after the transfer from transfer group x is finished. 0 =No “transfer finished” interrupt occurred since last clearing of the flag INTFLGRDYx. Write: 1 = Clears the corresponding bit flag. 0 = Has no effect.
15-0	INTFLGSUS	R	0h	Transfer group interrupt flag for “transfer suspend” interrupt. Read: 1 =A “transfer suspended” interrupt from transfer group x occurred. No matter whether the interrupt is enabled or disabled (INTENSUSx = don’t care) or whether the interrupt is mapped to line INT0 or INT1, INTFLGSUSx is set right after the transfer from transfer group x is suspended. 0 =No ”transfer suspended” interrupt occurred since last clearing of the flag INTFLGSUSx. Note: Read Clear Behavior Reading the interrupt vector registers TGINTVECT0 or TGINTVECT1 automatically clears the interrupt flag bit INTFLGRDYx referenced by the vector number given by INTVECT0/INTVECT1 bits, if SUSPEND0/SUPEND1 bit in the Vector registers is ‘0’.

13.9.47.33 TICKCNT Register (Offset = 90h) [Reset = 00000000h]

TICKCNT is shown in Table 13-88.

Return to the Summary Table.

Tick Count Register

Table 13-88. TICKCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TICKENA	R/W	0h	Tick counter enable. 1 =The MibSPI internal tick counter is enabled and is clocked by the clock source selected by CLKCTRL [1:0]. When the tick counter is enabled it starts down-counting from its current value. When TICKENA goes from “0” to “1” the tick counter is automatically loaded with the TICKVALUE. 0 =The MibSPI internal tick counter is disabled. The counter value remains unchanged. Note: When the tick counter is disabled the trigger signal is forced low.
30	RELOAD	R-0/W	0h	Re-load tick counter. RELOAD is a set-only bit, i.e. writing a “1” to it automatically reloads the Tick Counter with the value stored in TICKVALUE. Reading RELOAD always returns a “0”. Note: When the tick counter is reloaded by the RELOAD bit, the trigger signal is not toggled.
29-28	CLKCTRL	R/W	0h	Tick counter clock source control. CLKCTRL [1:0] defines the clock source that is used to clock the MibSPI internal tick counter.CLKCTRL [1:0] Description 00b SPICLK of Data word format 0 is selected as clock source of tick counter 01b SPICLK of Data word format 1 is selected as clock source of tick counter 10b SPICLK of Data word format 2 is selected as clock source of tick counter 11b SPICLK of Data word format 3 is selected as clock source of tick counter
27-16	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect
15-0	TICKVALUE	R/W	0h	Initial value for tick counter. TICKVALUE stores the initial value for the tick counter. The tick counter is loaded with TICKVALUE every time an under-flow condition occurs and every time the RELOAD flag is set by the host

13.9.47.34 LTGPEND Register (Offset = 94h) [Reset = 00000000h]

LTGPEND is shown in Table 13-89.

Return to the Summary Table.

Last Transfer Group End Pointer

Table 13-89. LTGPEND Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	NU3	R	0h	Reserved.Reads return ‘0’ and writes have no effect
28-24	TGINSERVICE	R	0h	Transfer Group currently being serviced by the Sequencer. Read-Only field indicating the current Transfer Group that is being serviced. This field can generally be used for code debug purpose. Read Value:TG IN SERVICE [4:0] Description 00000b No Transfer Group is being serviced by the Sequencer 00001b Transfer Group0 is being serviced by the Sequencer ... ... 10000b Transfer Group15 is being serviced by the Sequencer 10001b - 11111b Invalid values
23-16	NU2	R	0h	Reserved.Reads return ‘0’ and writes have no effect
15-8	LPEND	R/W	0h	Last Transfer Group End Pointer Usually the transfer group end address (PEND) is inherently defined by the start value of the starting pointer of the subsequent transfer group (PSTART). The transfer group ends at the buffer one before the next transfer group starts (PEND[x]=PSTART[x+1] - 1). For a full configuration of MibSPI, the 15th transfer group has no subsequent transfer group, i.e. no end address is inherently defined. Therefore LPEND has to be programmed to specify explicitly the end address of the 15th transfer group. Number of Transfer Groups implemented in a MibSPI can vary from one MibSPI to another since it is a generic parameter based implementation. If in a MibSPI, only 4 Transfer Groups are implemented, then the PEND of the 4th TG is defined by LPEND values defined in this LTGPEND register.
7-0	NU1	R	0h	Reserved.Reads return ‘0’ and writes have no effect

13.9.47.35 TG0CTRL Register (Offset = 98h) [Reset = 00000000h]

TG0CTRL is shown in Table 13-90.

Return to the Summary Table.

MibSPI Transfer Group Control Register The number of transfer groups is scalable by design up to a maximum of 16. Depending on the implementation the number of transfer groups and hence the number of transfer group control register may vary. Each transfer group can be configured via one dedicated control register. The register description below shows one exemplary control register(x) which is identical for all transfer groups. E.g. the control register for transfer group 2 is named “TG2CTRL” and is located at address base0+98h+4*2.

Table 13-90. TG0CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TGENA	R/W	0h	Transfer Group Enable. 1 =The corresponding transfer group is enabled. If the correct event (TRIGEVTx) occurs at the selected source (TRIGSRCx) a group transfer is initiated if no higher priority transfer group is in active transfer mode or if one or more higher priority Transfer Groups are in transfer suspend mode. If higher priority Transfer Groups (TG) are in transfer mode, then the newly enabled TG will wait till all of the higher priority TG transfers are completed. 0 =The corresponding transfer group is disabled. Disabling a transfer group while a transfer is ongoing, will finish the ongoing buffer transfer but not the whole group transfer
30	ONESHOT	R/W	0h	Single transfer for this Transfer Group group. 1 =A transfer from the corresponding transfer group will be performed only once (= one shot) after a valid trigger event at the selected trigger source. After the transfer is finished the TGENAx control bit will be cleared by the MibSPI and therefore no additional transfer can be triggered before the host enables the transfer group again. This oneshot mode ensures that after one group transfer the host has enough time to read the received data and to provide new transmit data. 0 =The corresponding transfer group initiates a transfer every time a trigger event occurs and TGENA is set.
29	PRST	R/W	0h	transfer group Pointer Reset mode. With PRST, the way of resolving trigger events during an ongoing transfer from the concerned transfer group can be configured. This bit is meaningful only for Level Triggered Transfer Groups. Edge triggered TGs cannot be re-started before their completion by another edge. PRST bit will have no effect on this behavior. 1 =The corresponding transfer group pointer (PCURRENTx) will be reset to the start address (PSTARTx) when a valid trigger event occurs at the selected trigger source while a transfer from the same transfer group is ongoing. I.e. every trigger event resets PCURRENTx no matter whether the concerned transfer group is in transfer mode or not. The trigger events have priority over the ongoing transfer. 0 =If a trigger event occurs during a transfer from the concerned transfer group, the event is ignored and is not stored internally. The transfer group transfer has priority over additional trigger events.
28	TGTD	R	0h	Transfer group triggered. This bit is read-only. 1 =The transfer group has been triggered and is either currently in service or waiting for servicing. 0 =The corresponding transfer group has not been triggered or is no more waiting for service. Use the “TG IN SERVICE” field in LTGPEND register to determine the exact Transfer Group being currently serviced
27-24	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect

Table 13-90. TG0CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23-20	TRIGEVT	R/W	0h	Type of trigger event. After reset, the trigger event types of all transfer groups are set to inactive TypesTRIGEVTx [3:0] Type Description 0000b never 0001b rising edge A rising edge (0 to 1) at the selected trigger source (TRIGSRCx) initiates a transfer from the corresponding transfer group 0010b falling edge A falling edge (1 to 0) at the selected trigger source (TRIGSRCx) initiates a transfer from the corresponding transfer group 0011b both edges Rising and falling edges at the selected trigger source (TRIGSRCx) initiates a transfer from the corresponding transfer group 0100b reserved 0101b high-active Repetitive group transfer while trigger is high: While the selected trigger source (TRIGSRCx) is at a logic high level (1) the group transfer is continued and at the end of one group transfer restarted at the beginning. If ONESHOTx is set the transfer is performed only once. If the logic level changes to low (0) during an ongoing group transfer, the whole group transfer will be stopped. 0110b low-active Repetitive group transfer while trigger is low: While the selected trigger source (TRIGSRCx) is at a logic low level (0) the group transfer is continued and at the end of one restarted at the beginning. If ONESHOTx is set the transfer is performed only once. If the logic level changes to high (1) during an ongoing group transfer, the whole group transfer will be stopped. 0111b always A repetitive group transfer will be performed. Setting ONESHOTx allows a software controlled single transfer modea a. By setting the TRIGSRC to 0000b, the TRIGEVT to ALWAYS (0111b) the ONESHOT bit to 1. This allows a software control trigger on this Transfer Group. Then by setting the TGENA bit, the Transfer Group is immediately triggered. . If ONESHOTx is cleared a continuous mode for this Transfer Group is selected.1xxxb reserved
19-16	TRIGSRC	R/W	0h	Trigger source. After reset the trigger sources of all transfer groups are disabled. Table 22. Trigger SourcesTRIGSRCx [3:0] Type Description 0000b disabled 0001b EXT0 MibSPI external trigger source 0. Source has to be defined individually for each Microcontroller derivative (e.g. HET I/O channel, event pin, etc.). 0010b EXT1 MibSPI external trigger source 1. Source has to be defined individually for each Microcontroller derivative (e.g. HET I/O channel, event pin, etc.). 0011b EXT2 MibSPI external trigger source 2. Source has to be defined individually for each Microcontroller derivative (e.g. HET I/O channel, event pin, etc.). 0100b EXT3 MibSPI external trigger source 3. Source has to be defined individually for each Microcontroller derivative (e.g. HET I/O channel, event pin, etc.). ... ... 1110b EXT13 MibSPI external trigger source 13. Source has to be defined individually for each Microcontroller derivative (e.g. HET I/O channel, event pin, etc.). 1111b TICK MibSPI internal periodic event trigger. The tick counter can initiate periodic group transfers.

Table 13-90. TG0CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	PSTART	R/W	0h	transfer group start address. PSTARTx stores the start address of the corresponding transfer group. The corresponding end address is inherently defined by the subsequent transfer groups start address minus one (PENDx[TGx] = PSTARTx[TGx+1]-1). PSTARTx is copied into PCURRENTx when: o the transfer group is enabled o the end of the transfer group is reached during a transfer o a trigger event occurs while PRST is set to 1
7-0	PCURRENT	R	0h	transfer group pointer to current buffer. PCURRENT is read-only. PCURRENTx stores the address (0...127/255) of the buffer that is currently transferred or that will be transferred after a trigger event occurs (if PRSTx=0) or after the transfer group resumes from suspend to wait mode. If the transfer group switches mode from active transfer mode to “suspend to wait”, PCURRENTx keeps the address of the currently Suspended buffer. After the transfer group resumes from “suspend to wait” mode the next buffer will be transferred. I.e. no buffer data is multiply transferred or not at all transferred due to “suspend to wait” mode.

13.9.47.36 TG1CTRL Register (Offset = 9Ch) [Reset = 00000000h]

TG1CTRL is shown in Table 13-91.

Return to the Summary Table.

MibSPI Transfer Group Control Register

Table 13-91. TG1CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TGENA	R/W	0h	Transfer Group Enable. 1 =The corresponding transfer group is enabled. If the correct event (TRIGEVTx) occurs at the selected source (TRIGSRCx) a group transfer is initiated if no higher priority transfer group is in active transfer mode or if one or more higher priority Transfer Groups are in transfer suspend mode. If higher priority Transfer Groups (TG) are in transfer mode, then the newly enabled TG will wait till all of the higher priority TG transfers are completed. 0 =The corresponding transfer group is disabled. Disabling a transfer group while a transfer is ongoing, will finish the ongoing buffer transfer but not the whole group transfer
30	ONESHOT	R/W	0h	Single transfer for this Transfer Group group. 1 =A transfer from the corresponding transfer group will be performed only once (= one shot) after a valid trigger event at the selected trigger source. After the transfer is finished the TGENAx control bit will be cleared by the MibSPI and therefore no additional transfer can be triggered before the host enables the transfer group again. This oneshot mode ensures that after one group transfer the host has enough time to read the received data and to provide new transmit data. 0 =The corresponding transfer group initiates a transfer every time a trigger event occurs and TGENA is set.
29	PRST	R/W	0h	transfer group Pointer Reset mode. With PRST, the way of resolving trigger events during an ongoing transfer from the concerned transfer group can be configured. This bit is meaningful only for Level Triggered Transfer Groups. Edge triggered TGs cannot be re-started before their completion by another edge. PRST bit will have no effect on this behavior. 1 =The corresponding transfer group pointer (PCURRENTx) will be reset to the start address (PSTARTx) when a valid trigger event occurs at the selected trigger source while a transfer from the same transfer group is ongoing. I.e. every trigger event resets PCURRENTx no matter whether the concerned transfer group is in transfer mode or not. The trigger events have priority over the ongoing transfer. 0 =If a trigger event occurs during a transfer from the concerned transfer group, the event is ignored and is not stored internally. The transfer group transfer has priority over additional trigger events.
28	TGTD	R	0h	Transfer group triggered. This bit is read-only. 1 =The transfer group has been triggered and is either currently in service or waiting for servicing. 0 =The corresponding transfer group has not been triggered or is no more waiting for service. Use the “TG IN SERVICE” field in LTGPEND register to determine the exact Transfer Group being currently serviced
27-24	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect

Table 13-91. TG1CTRL Register Field Descriptions (continued)

30	ONESHOT	R/W	0h	Single transfer for this Transfer Group group. 1 =A transfer from the corresponding transfer group will be performed only once (= one shot) after a valid trigger event at the selected trigger source. After the transfer is finished the TGENAx control bit will be cleared by the MibSPI and therefore no additional transfer can be triggered before the host enables the transfer group again. This oneshot mode ensures that after one group transfer the host has enough time to read the received data and to provide new transmit data. 0 =The corresponding transfer group initiates a transfer every time a trigger event occurs and TGENA is set.
29	PRST	R/W	0h	transfer group Pointer Reset mode. With PRST, the way of resolving trigger events during an ongoing transfer from the concerned transfer group can be configured. This bit is meaningful only for Level Triggered Transfer Groups. Edge triggered TGs cannot be re-started before their completion by another edge. PRST bit will have no effect on this behavior. 1 =The corresponding transfer group pointer (PCURRENTx) will be reset to the start address (PSTARTx) when a valid trigger event occurs at the selected trigger source while a transfer from the same transfer group is ongoing. I.e. every trigger event resets PCURRENTx no matter whether the concerned transfer group is in transfer mode or not. The trigger events have priority over the ongoing transfer. 0 =If a trigger event occurs during a transfer from the concerned transfer group, the event is ignored and is not stored internally. The transfer group transfer has priority over additional trigger events.
28	TGTD	R	0h	Transfer group triggered. This bit is read-only. 1 =The transfer group has been triggered and is either currently in service or waiting for servicing. 0 =The corresponding transfer group has not been triggered or is no more waiting for service. Use the “TG IN SERVICE” field in LTGPEND register to determine the exact Transfer Group being currently serviced
27-24	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect

Table 13-95. TG5CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description

13.9.47.43 DMA0CTRL Register (Offset = D8h) [Reset = 00000000h]

DMA0CTRL is shown in Table 13-98.

Return to the Summary Table.

MibSPI DMA Channel Control Register

Table 13-98. DMA0CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ONESHOT	R/W	0h	Auto-disable of DMA channel after ICOUNT+1 transfers. 1 =ONESHOTx allows a block transfer of defined length (ICOUNTx+1) mainly controlled by the MibSPI and not by the DMA controller. After ICOUNTx +1 transfers the enable bits RXDMAENAx and TXDMAENAx are automatically cleared by the MibSPI, hence no more DMA requests are generated. In conjunction with NOBRKx, a burst transfer can be initiated without any other transfer through another buffer. 0 =The length of the block transfer is fully controlled by the DMA controller. The enable bits RXDMAENAx and TXDMAENAx are not modified by the MibSPI.
30-24	BUFID	R/W	0h	Buffer utilized for DMA transfer. BUFIDx defines the buffer that is utilized for the DMA transfer. In order to synchronize the transfer with the DMA controller with the NOBRK condition the “suspend to wait until...” modes must be used (for more details refer to Section 8.53.1).
23-20	RXDMA_MAP	R/W	0h	Receive data DMA Request Map Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. RXDMA_MAPx [3:0] defines the number of the physical DMA Request line that is connected to the receive path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set to ‘1’, then RXDMA_MAPx [3:0] shall differ from TXDMA_MAPx [3:0] and shall differ from any other used physical DMA Request line. Otherwise unexpected interference may occur.
19-16	TXDMA_MAP	R/W	0h	Transmit data DMA channel Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. ne request line for receive data and the other for request line for transmit data. TXDMA_MAPx [3:0] defines the number of the physical DMA Request line that is connected to the transmit path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set then TXDMA_MAPx [3:0] shall differ from RXDMA_MAPx [3:0] and shall differ from any other used physical DMA Request line. Otherwise unexpected interference may occur.
15	RXDMAENA	R/W	0h	Receive data DMA channel enable. 1 =The physical DMA Request line for the receive path is enabled. The first DMA request pulse is generated after the first transfer from the referenced buffer (BUFIDx) is finished. The concerned buffer should be configured in the mode “skip until RXEMPTY is set” or “suspend to wait until RXEMPTY is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new receive data.

Table 13-98. DMA0CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	TXDMAENA	R/W	0h	Transmit data DMA channel enable. 1 =The physical DMA Request line for the transmit path is enabled. The first DMA request pulse is generated right after setting TXDMAENAx to load the first transmit data. The concerned buffer should be configured in the mode “skip until TXFULL is set” or “suspend to wait until TXFULL is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new transmit data
13	NOBRK	R/W	0h	Non-interleaved DMA block transfer(Master mode only). 1 =NOBRKx ensures that ICOUNTx+1 data transfers are performed from the buffer referenced by BUFIDx without a data transfer from any other buffer. The sequencer remains at the DMA buffer until ICOUNTx+1 transfers have been processed. E.g: this can be used to generate a burst transfer to one device without disabling the chip select signal in-between (the concerned buffer has to be configured with CSHOLD=1). Another example would be to have a defined block data transfer in slave mode, synchronous to the master SPI. Triggering of higher priority transfer groups or enabling of higher priority DMA channels will not interrupt NOBRK block transfer. 0 =The DMA transfers through the buffer referenced by BUFIDx are interleaved by data transfers from other active buffers or transfer groups. Every time the sequencer checks the DMA buffer, it performs one transfer and then steps to the next buffer
12-8	ICOUNT	R/W	0h	Initial Count of DMA transfers ICOUNTx [4:0] is used to preset the transfer counter COUNTx [4:0]. Every time COUNTx [4:0] hits zero it is reloaded with ICOUNTx [4:0]. The real number of transfer equals ICOUNTx [4:0] plus one. If ONESHOTx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
7	BUFID7	R/W	0h	Extended bit of BUFIDx field when Extended Buffer feature is implemented. This bit represents the 8th bit of BUFID field such that any buffers between 127-255 can be configured as DMA capable buffers
6	COUNTBIT17	R	0h	The 17th bit of COUNT field of DMAxCOUNT register. This bit is useful only when ICOUNTx in DMAxCOUNT register is programmed to be 0xFFFF. During all other values, this bit remains to be ‘0’.
5-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx [5:0] is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set.

13.9.47.44 DMA1CTRL Register (Offset = DCh) [Reset = 00000000h]

DMA1CTRL is shown in Table 13-99.

Return to the Summary Table.

MibSPI DMA Channel Control Register

Table 13-99. DMA1CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ONESHOT	R/W	0h	Auto-disable of DMA channel after ICOUNT+1 transfers. 1 =ONESHOTx allows a block transfer of defined length (ICOUNTx+1) mainly controlled by the MibSPI and not by the DMA controller. After ICOUNTx +1 transfers the enable bits RXDMAENAx and TXDMAENAx are automatically cleared by the MibSPI, hence no more DMA requests are generated. In conjunction with NOBRKx, a burst transfer can be initiated without any other transfer through another buffer. 0 =The length of the block transfer is fully controlled by the DMA controller. The enable bits RXDMAENAx and TXDMAENAx are not modified by the MibSPI.
30-24	BUFID	R/W	0h	Buffer utilized for DMA transfer. BUFIDx defines the buffer that is utilized for the DMA transfer. In order to synchronize the transfer with the DMA controller with the NOBRK condition the “suspend to wait until...” modes must be used (for more details refer to Section 8.53.1).
23-20	RXDMA_MAP	R/W	0h	Receive data DMA Request Map Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. RXDMA_MAPx [3:0] defines the number of the physical DMA Request line that is connected to the receive path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set to ‘1’, then RXDMA_MAPx [3:0] shall differ from TXDMA_MAPx [3:0] and shall differ from any other used physical DMA Request line. Otherwise unexpected interference may occur.
19-16	TXDMA_MAP	R/W	0h	Transmit data DMA channel Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. ne request line for receive data and the other for request line for transmit data. TXDMA_MAPx [3:0] defines the number of the physical DMA Request line that is connected to the transmit path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set then TXDMA_MAPx [3:0] shall differ from RXDMA_MAPx [3:0] and shall differ from any other used physical DMA Request line. Otherwise unexpected interference may occur.
15	RXDMAENA	R/W	0h	Receive data DMA channel enable. 1 =The physical DMA Request line for the receive path is enabled. The first DMA request pulse is generated after the first transfer from the referenced buffer (BUFIDx) is finished. The concerned buffer should be configured in the mode “skip until RXEMPTY is set” or “suspend to wait until RXEMPTY is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new receive data.

Table 13-99. DMA1CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	TXDMAENA	R/W	0h	Transmit data DMA channel enable. 1 =The physical DMA Request line for the transmit path is enabled. The first DMA request pulse is generated right after setting TXDMAENAx to load the first transmit data. The concerned buffer should be configured in the mode “skip until TXFULL is set” or “suspend to wait until TXFULL is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new transmit data
13	NOBRK	R/W	0h	Non-interleaved DMA block transfer(Master mode only). 1 =NOBRKx ensures that ICOUNTx+1 data transfers are performed from the buffer referenced by BUFIDx without a data transfer from any other buffer. The sequencer remains at the DMA buffer until ICOUNTx+1 transfers have been processed. E.g: this can be used to generate a burst transfer to one device without disabling the chip select signal in-between (the concerned buffer has to be configured with CSHOLD=1). Another example would be to have a defined block data transfer in slave mode, synchronous to the master SPI. Triggering of higher priority transfer groups or enabling of higher priority DMA channels will not interrupt NOBRK block transfer. 0 =The DMA transfers through the buffer referenced by BUFIDx are interleaved by data transfers from other active buffers or transfer groups. Every time the sequencer checks the DMA buffer, it performs one transfer and then steps to the next buffer
12-8	ICOUNT	R/W	0h	Initial Count of DMA transfers ICOUNTx [4:0] is used to preset the transfer counter COUNTx [4:0]. Every time COUNTx [4:0] hits zero it is reloaded with ICOUNTx [4:0]. The real number of transfer equals ICOUNTx [4:0] plus one. If ONESHOTx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
7	BUFID7	R/W	0h	Extended bit of BUFIDx field when Extended Buffer feature is implemented. This bit represents the 8th bit of BUFID field such that any buffers between 127-255 can be configured as DMA capable buffers
6	COUNTBIT17	R	0h	The 17th bit of COUNT field of DMAxCOUNT register. This bit is useful only when ICOUNTx in DMAxCOUNT register is programmed to be 0xFFFF. During all other values, this bit remains to be ‘0’.
5-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx [5:0] is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set.

13.9.47.45 DMA2CTRL Register (Offset = E0h) [Reset = 00000000h]

DMA2CTRL is shown in Table 13-100.

Return to the Summary Table.

MibSPI DMA Channel Control Register

Table 13-100. DMA2CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ONESHOT	R/W	0h	Auto-disable of DMA channel after ICOUNT+1 transfers. 1 =ONESHOTx allows a block transfer of defined length (ICOUNTx+1) mainly controlled by the MibSPI and not by the DMA controller. After ICOUNTx +1 transfers the enable bits RXDMAENAx and TXDMAENAx are automatically cleared by the MibSPI, hence no more DMA requests are generated. In conjunction with NOBRKx, a burst transfer can be initiated without any other transfer through another buffer. 0 =The length of the block transfer is fully controlled by the DMA controller. The enable bits RXDMAENAx and TXDMAENAx are not modified by the MibSPI.
30-24	BUFID	R/W	0h	Buffer utilized for DMA transfer. BUFIDx defines the buffer that is utilized for the DMA transfer. In order to synchronize the transfer with the DMA controller with the NOBRK condition the “suspend to wait until...” modes must be used (for more details refer to Section 8.53.1).
23-20	RXDMA_MAP	R/W	0h	Receive data DMA Request Map Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. RXDMA_MAPx [3:0] defines the number of the physical DMA Request line that is connected to the receive path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set to ‘1’, then RXDMA_MAPx [3:0] shall differ from TXDMA_MAPx [3:0] and shall differ from any other used physical DMA Request line. Otherwise unexpected interference may occur.
19-16	TXDMA_MAP	R/W	0h	Transmit data DMA channel Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. ne request line for receive data and the other for request line for transmit data. TXDMA_MAPx [3:0] defines the number of the physical DMA Request line that is connected to the transmit path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set then TXDMA_MAPx [3:0] shall differ from RXDMA_MAPx [3:0] and shall differ from any other used physical DMA Request line. Otherwise unexpected interference may occur.
15	RXDMAENA	R/W	0h	Receive data DMA channel enable. 1 =The physical DMA Request line for the receive path is enabled. The first DMA request pulse is generated after the first transfer from the referenced buffer (BUFIDx) is finished. The concerned buffer should be configured in the mode “skip until RXEMPTY is set” or “suspend to wait until RXEMPTY is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new receive data.

Table 13-100. DMA2CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	TXDMAENA	R/W	0h	Transmit data DMA channel enable. 1 =The physical DMA Request line for the transmit path is enabled. The first DMA request pulse is generated right after setting TXDMAENAx to load the first transmit data. The concerned buffer should be configured in the mode “skip until TXFULL is set” or “suspend to wait until TXFULL is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new transmit data
13	NOBRK	R/W	0h	Non-interleaved DMA block transfer(Master mode only). 1 =NOBRKx ensures that ICOUNTx+1 data transfers are performed from the buffer referenced by BUFIDx without a data transfer from any other buffer. The sequencer remains at the DMA buffer until ICOUNTx+1 transfers have been processed. E.g: this can be used to generate a burst transfer to one device without disabling the chip select signal in-between (the concerned buffer has to be configured with CSHOLD=1). Another example would be to have a defined block data transfer in slave mode, synchronous to the master SPI. Triggering of higher priority transfer groups or enabling of higher priority DMA channels will not interrupt NOBRK block transfer. 0 =The DMA transfers through the buffer referenced by BUFIDx are interleaved by data transfers from other active buffers or transfer groups. Every time the sequencer checks the DMA buffer, it performs one transfer and then steps to the next buffer
12-8	ICOUNT	R/W	0h	Initial Count of DMA transfers ICOUNTx [4:0] is used to preset the transfer counter COUNTx [4:0]. Every time COUNTx [4:0] hits zero it is reloaded with ICOUNTx [4:0]. The real number of transfer equals ICOUNTx [4:0] plus one. If ONESHOTx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
7	BUFID7	R/W	0h	Extended bit of BUFIDx field when Extended Buffer feature is implemented. This bit represents the 8th bit of BUFID field such that any buffers between 127-255 can be configured as DMA capable buffers
6	COUNTBIT17	R	0h	The 17th bit of COUNT field of DMAxCOUNT register. This bit is useful only when ICOUNTx in DMAxCOUNT register is programmed to be 0xFFFF. During all other values, this bit remains to be ‘0’.
5-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx [5:0] is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set.

13.9.47.46 DMA3CTRL Register (Offset = E4h) [Reset = 00000000h]

DMA3CTRL is shown in Table 13-101.

Return to the Summary Table.

MibSPI DMA Channel Control Register

Table 13-101. DMA3CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ONESHOT	R/W	0h	Auto-disable of DMA channel after ICOUNT+1 transfers. 1 =ONESHOTx allows a block transfer of defined length (ICOUNTx+1) mainly controlled by the MibSPI and not by the DMA controller. After ICOUNTx +1 transfers the enable bits RXDMAENAx and TXDMAENAx are automatically cleared by the MibSPI, hence no more DMA requests are generated. In conjunction with NOBRKx, a burst transfer can be initiated without any other transfer through another buffer. 0 =The length of the block transfer is fully controlled by the DMA controller. The enable bits RXDMAENAx and TXDMAENAx are not modified by the MibSPI.
30-24	BUFID	R/W	0h	Buffer utilized for DMA transfer. BUFIDx defines the buffer that is utilized for the DMA transfer. In order to synchronize the transfer with the DMA controller with the NOBRK condition the “suspend to wait until...” modes must be used (for more details refer to Section 8.53.1).
23-20	RXDMA_MAP	R/W	0h	Receive data DMA Request Map Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. RXDMA_MAPx [3:0] defines the number of the physical DMA Request line that is connected to the receive path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set to ‘1’, then RXDMA_MAPx [3:0] shall differ from TXDMA_MAPx [3:0] and shall differ from any other used physical DMA Request line. Otherwise unexpected interference may occur.
19-16	TXDMA_MAP	R/W	0h	Transmit data DMA channel Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. ne request line for receive data and the other for request line for transmit data. TXDMA_MAPx [3:0] defines the number of the physical DMA Request line that is connected to the transmit path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set then TXDMA_MAPx [3:0] shall differ from RXDMA_MAPx [3:0] and shall differ from any other used physical DMA Request line. Otherwise unexpected interference may occur.
15	RXDMAENA	R/W	0h	Receive data DMA channel enable. 1 =The physical DMA Request line for the receive path is enabled. The first DMA request pulse is generated after the first transfer from the referenced buffer (BUFIDx) is finished. The concerned buffer should be configured in the mode “skip until RXEMPTY is set” or “suspend to wait until RXEMPTY is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new receive data.

Table 13-101. DMA3CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	TXDMAENA	R/W	0h	Transmit data DMA channel enable. 1 =The physical DMA Request line for the transmit path is enabled. The first DMA request pulse is generated right after setting TXDMAENAx to load the first transmit data. The concerned buffer should be configured in the mode “skip until TXFULL is set” or “suspend to wait until TXFULL is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new transmit data
13	NOBRK	R/W	0h	Non-interleaved DMA block transfer(Master mode only). 1 =NOBRKx ensures that ICOUNTx+1 data transfers are performed from the buffer referenced by BUFIDx without a data transfer from any other buffer. The sequencer remains at the DMA buffer until ICOUNTx+1 transfers have been processed. E.g: this can be used to generate a burst transfer to one device without disabling the chip select signal in-between (the concerned buffer has to be configured with CSHOLD=1). Another example would be to have a defined block data transfer in slave mode, synchronous to the master SPI. Triggering of higher priority transfer groups or enabling of higher priority DMA channels will not interrupt NOBRK block transfer. 0 =The DMA transfers through the buffer referenced by BUFIDx are interleaved by data transfers from other active buffers or transfer groups. Every time the sequencer checks the DMA buffer, it performs one transfer and then steps to the next buffer
12-8	ICOUNT	R/W	0h	Initial Count of DMA transfers ICOUNTx [4:0] is used to preset the transfer counter COUNTx [4:0]. Every time COUNTx [4:0] hits zero it is reloaded with ICOUNTx [4:0]. The real number of transfer equals ICOUNTx [4:0] plus one. If ONESHOTx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
7	BUFID7	R/W	0h	Extended bit of BUFIDx field when Extended Buffer feature is implemented. This bit represents the 8th bit of BUFID field such that any buffers between 127-255 can be configured as DMA capable buffers
6	COUNTBIT17	R	0h	The 17th bit of COUNT field of DMAxCOUNT register. This bit is useful only when ICOUNTx in DMAxCOUNT register is programmed to be 0xFFFF. During all other values, this bit remains to be ‘0’.
5-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx [5:0] is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set.

13.9.47.47 DMA4CTRL Register (Offset = E8h) [Reset = 00000000h]

DMA4CTRL is shown in Table 13-102.

Return to the Summary Table.

MibSPI DMA Channel Control Register

Table 13-102. DMA4CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ONESHOT	R/W	0h	Auto-disable of DMA channel after ICOUNT+1 transfers. 1 =ONESHOTx allows a block transfer of defined length (ICOUNTx+1) mainly controlled by the MibSPI and not by the DMA controller. After ICOUNTx +1 transfers the enable bits RXDMAENAx and TXDMAENAx are automatically cleared by the MibSPI, hence no more DMA requests are generated. In conjunction with NOBRKx, a burst transfer can be initiated without any other transfer through another buffer. 0 =The length of the block transfer is fully controlled by the DMA controller. The enable bits RXDMAENAx and TXDMAENAx are not modified by the MibSPI.
30-24	BUFID	R/W	0h	Buffer utilized for DMA transfer. BUFIDx defines the buffer that is utilized for the DMA transfer. In order to synchronize the transfer with the DMA controller with the NOBRK condition the “suspend to wait until...” modes must be used (for more details refer to Section 8.53.1).
23-20	RXDMA_MAP	R/W	0h	Receive data DMA Request Map Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. Otherwise unexpected interference may occur.
15	RXDMAENA	R/W	0h	Receive data DMA channel enable. 1 =The physical DMA Request line for the receive path is enabled. The first DMA request pulse is generated after the first transfer from the referenced buffer (BUFIDx) is finished. The concerned buffer should be configured in the mode “skip until RXEMPTY is set” or “suspend to wait until RXEMPTY is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new receive data.

Table 13-102. DMA4CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	TXDMAENA	R/W	0h	Transmit data DMA channel enable. 1 =The physical DMA Request line for the transmit path is enabled. The first DMA request pulse is generated right after setting TXDMAENAx to load the first transmit data. The concerned buffer should be configured in the mode “skip until TXFULL is set” or “suspend to wait until TXFULL is set” in order to ensure synchronization between DMA controller and MibSPI sequencer. 0 =No DMA request upon new transmit data
13	NOBRK	R/W	0h	Non-interleaved DMA block transfer(Master mode only). 1 =NOBRKx ensures that ICOUNTx+1 data transfers are performed from the buffer referenced by BUFIDx without a data transfer from any other buffer. The sequencer remains at the DMA buffer until ICOUNTx+1 transfers have been processed. E.g: this can be used to generate a burst transfer to one device without disabling the chip select signal in-between (the concerned buffer has to be configured with CSHOLD=1). Another example would be to have a defined block data transfer in slave mode, synchronous to the master SPI. Triggering of higher priority transfer groups or enabling of higher priority DMA channels will not interrupt NOBRK block transfer. 0 =The DMA transfers through the buffer referenced by BUFIDx are interleaved by data transfers from other active buffers or transfer groups. Every time the sequencer checks the DMA buffer, it performs one transfer and then steps to the next buffer
12-8	ICOUNT	R/W	0h	Initial Count of DMA transfers ICOUNTx [4:0] is used to preset the transfer counter COUNTx [4:0]. Every time COUNTx [4:0] hits zero it is reloaded with ICOUNTx [4:0]. The real number of transfer equals ICOUNTx [4:0] plus one. If ONESHOTx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx [4:0] defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
7	BUFID7	R/W	0h	Extended bit of BUFIDx field when Extended Buffer feature is implemented. This bit represents the 8th bit of BUFID field such that any buffers between 127-255 can be configured as DMA capable buffers
6	COUNTBIT17	R	0h	The 17th bit of COUNT field of DMAxCOUNT register. This bit is useful only when ICOUNTx in DMAxCOUNT register is programmed to be 0xFFFF. During all other values, this bit remains to be ‘0’.
5-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx [5:0] is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set.

13.9.47.48 ICOUNT0 Register (Offset = F8h) [Reset = 00000000h]

ICOUNT0 is shown in Table 13-103.

Return to the Summary Table.

MibSPI DMAxCOUNT

Table 13-103. ICOUNT0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ICOUNT	R/W	0h	Initial Number of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits zero it is reloaded with ICOUNTx. The real number of transfer equals ICOUNTx plus one. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
15-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set. Since the real COUNTx is always ICLOUNTx +1, the 17th bit of COUNTx is available on DMAxCTRL(6) bit.

13.9.47.49 ICOUNT1 Register (Offset = FCh) [Reset = 00000000h]

ICOUNT1 is shown in Table 13-104.

Return to the Summary Table.

MibSPI DMAxCOUNT

Table 13-104. ICOUNT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ICOUNT	R/W	0h	Initial Number of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits zero it is reloaded with ICOUNTx. The real number of transfer equals ICOUNTx plus one. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
15-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set. Since the real COUNTx is always ICLOUNTx +1, the 17th bit of COUNTx is available on DMAxCTRL(6) bit.

13.9.47.50 ICOUNT2 Register (Offset = 100h) [Reset = 0000h]

ICOUNT2 is shown in Table 13-105.

Return to the Summary Table.

MibSPI DMAxCOUNT

Table 13-105. ICOUNT2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set. Since the real COUNTx is always ICLOUNTx +1, the 17th bit of COUNTx is available on DMAxCTRL(6) bit.

13.9.47.51 ICOUNT3 Register (Offset = 104h) [Reset = 00000000h]

ICOUNT3 is shown in Table 13-106.

Return to the Summary Table.

MibSPI DMAxCOUNT

Table 13-106. ICOUNT3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ICOUNT	R/W	0h	Initial Number of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits zero it is reloaded with ICOUNTx. The real number of transfer equals ICOUNTx plus one. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
15-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set. Since the real COUNTx is always ICLOUNTx +1, the 17th bit of COUNTx is available on DMAxCTRL(6) bit.

13.9.47.52 ICOUNT4 Register (Offset = 108h) [Reset = 00000000h]

ICOUNT4 is shown in Table 13-107.

Return to the Summary Table.

MibSPI DMAxCOUNT

Table 13-107. ICOUNT4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ICOUNT	R/W	0h	Initial Number of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits zero it is reloaded with ICOUNTx. The real number of transfer equals ICOUNTx plus one. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer
15-0	COUNT	R	0h	Actual number of remaining DMA transfer COUNTx is a read-only bit field. It comprises the actual number of DMA transfers that remain, until the DMA channel is disabled if ONESHOTx is set. Since the real COUNTx is always ICLOUNTx +1, the 17th bit of COUNTx is available on DMAxCTRL(6) bit.

13.9.47.53 DMACNTLEN Register (Offset = 118h) [Reset = 00000000h]

DMACNTLEN is shown in Table 13-108.

Return to the Summary Table.

DMA LARGE COUNT register

Table 13-108. DMACNTLEN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
0	LARGE_COUNT	R/W	0h	0: Writes to the DMAxCTRL register will modify the ICOUNT value. Reading ICOUNT and COUNT can be done from the DMAxCTRL register. The DMAxCOUNT register should not be used since any write to this register will be overwritten by a subsequent write to DMAxCTRL register to set the TXDMAENA or RXDMAENA bits. 1: Writes to the DMAxCTRL register will not modify the ICOUNT value. The ICOUNT value must be written to in the DMAxCOUNT register before the RXDMAENA or TXDMAENA bits are set in the DMAxCTRL register. The DMAxCOUNT register should be used for reading COUNT or ICOUNT.

13.9.47.54 PAR_ECC_CTRL Register (Offset = 120h) [Reset = 050A0005h]

PAR_ECC_CTRL is shown in Table 13-109.

Return to the Summary Table.

Parity/ECC Control Register

Table 13-109. PAR_ECC_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	NU4	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
27-24	SBE_EVT_EN	R/W	5h	Single Bit Error Event Enable This bit controls the generation of Error signaling (on MIBSPI_SBERR port) whenever a Single Bit Errors (SBE) is detected on TXRAM/RXRAM. This signal can be used to generate interrupt if required. Write: 0101 - Disable Error Event indication upon detection of SBE on TXRAM/RXRAM 1010 - Enable Error Event upon detection of SBE on TXRAM/ RXRAM All other values - writes are ignored and the values are not updated into this field. The state of the feature remains unchanged. Read: Returns the current value of the field
23-20	NU3	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
19-16	EDAC_MODE	R/W	Ah	Error Detection And Correction Mode These bits determine whether Single Bit Errors (SBE) detected by the SECDED block will be corrected or not. Write: 0101 - Disable correction of SBE detected by the SECDED block 1010 - Enable correction of SBE detected by the SECDED block All other values - writes are ignored and the values are not updated into this field. The state of the feature remains unchanged. Read: Returns the current value of the field
15-9	NU2	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
8	PTESTEN	R/W	0h	Parity/ECC memory Test Enable. This bit, maps the parity/ecc bits corresponding to Multibuffer RAM locations into the peripheral RAM frame to make them accessible by the CPU. User and privilege mode (read): 0 = parity/ecc bits are not memory mapped 1 = parity/ecc bits are memory mapped Privilege mode (write): 0 = disable memory mapping of Parity/ECC locations 1 = enable memory mapping of Parity/ECC locations
7-4	NU1	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
3-0	EDEN	R/W	5h	Error Detection Enable These bits enable Parity/ECC Error Detection. Write: 0101: Disables Parity/ECC Error Detection Logic(default) Others : Enables Parity/ECC Error Detection Logic. Read: Returns the current value of this field

13.9.47.55 PAR_ECC_STAT Register (Offset = 124h) [Reset = 00000000h]

PAR_ECC_STAT is shown in Table 13-110.

Return to the Summary Table.

Parity/ECC Status Register

Table 13-110. PAR_ECC_STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU2	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
9	SBE_FLG1	R	0h	Single Bit Error in RXRAM. This flag indicates if a single bit ECC Error ocurred on reading RXRAM Read: 0 = No error occured. 1 = Single bit error is detected in RXRAM and the address is captured in SBERRADDR1 register. Write: 0 = No effect. 1 = Clears the bit.
8	SBE_FLG0	R	0h	Single Bit Error in TXRAM. This flag indicates if a single bit ECC Error ocurred on reading TXRAM Read: 0 = No error occured. 1 = Single bit error is detected in TXRAM and the address is captured in SBERRADDR0 register. Write: 0 = No effect. 1 = Clears the bit.
7-2	NU1	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
1	UERR_FLG1	R	0h	Uncorrectable Parity or double bit ECC error detection flag This flag indicates if a Parity or double bit ECC error ocurred on reading RXRAM When this bit is read: 0 = No error occured. 1 = Error detected and the address is captured in UERRADDR1 register. When write to this bit with: 0 = No effect. 1 = Clears the bit
0	UERR_FLG0	R	0h	Uncorrectable Parity or double bit ECC error detection flag This flag indicates if a Parity or ECC error ocurred on reading TXRAM When this bit is read: 0 = No error occured. 1 = Error detected and the address is captured in UERRADDR0 register. When write to this bit with: 0 = No effect. 1 = Clears the bit.

13.9.47.56 UERRADDR1 Register (Offset = 128h) [Reset = 00000000h]

UERRADDR1 is shown in Table 13-111.

Return to the Summary Table.

Uncorrectable Parity or double bit ECC error Address Register - RXRAM

Table 13-111. UERRADDR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
10-0	UERRADDR1	R	0h	Uncorrectable Parity or double bit ECC error address This register holds the address of the RAM location if a parity or double bit ECC error is detected when reading the MibSPI (Receive) RXRAM. The address captured is byte alligned when RAM Parity Check is supported. This error address is frozen from being updated until it is read by the VBUS host. Reading this register clears its contents to the default value The default value is 0x400 if Extended Buffer feature is enabled, else it is 0x200 Writes to this register are ignored

13.9.47.57 UERRADDR0 Register (Offset = 12Ch) [Reset = 00000000h]

UERRADDR0 is shown in Table 13-112.

Return to the Summary Table.

Uncorrectable Parity or double bit ECC error address register - TXRAM

Table 13-112. UERRADDR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
10-0	UERRADDR0	R	0h	Uncorrectable Parity or double bit ECC error address This register holds the address when a parity error is generated while reading the MibSPI (Transmit) TXRAM. The TXRAM can be read either by CPU or by the MibSPI Sequencer FSM logic for transmission. The address captured is byte alligned. This error address is frozen from being updated until it is read by the VBUSP host. Reading this register clears its contents to the default value of 0x000. Writes to this register are ignored.

13.9.47.58 RXOVRN_BUF_ADDR Register (Offset = 130h) [Reset = 00000200h]

RXOVRN_BUF_ADDR is shown in Table 13-113.

Return to the Summary Table.

Receive RAM Overrun Buffer Address Register

Table 13-113. RXOVRN_BUF_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
10-0	RXOVRN_BUF_ADDR	R	200h	Address of the RAM location of RXRAM for which an Overwrite occured. This address value will show only the offset address of the RAM location in the Multibuffer RAM address space. Refer to the device Spec for the actual absolute address of RXRAM. Content of this register are valid only when any of the TGINTVECT0 or TGINTVECT1 and SPIFLG registers show an RXOVRN error vector while in Multibuffer mode. If there are multiple Overrun errors, then this register holds address of first overrun address until it is read.

13.9.47.59 IOLPBKTSTCR Register (Offset = 134h) [Reset = 00000000h]

IOLPBKTSTCR is shown in Table 13-114.

Return to the Summary Table.

SPI/MibSPI IO Loopback Test Control Register This register controls test mode for I/O pins. It also controls whether loop-back should be digital or analog ones in this test mode. In addition it contains control bits to induce some of the error condition into the module. These are to be used for test purpose only. All the control/status bits in this register are valid only when IO LPBK TST ENA field is set to “1010”.

Table 13-114. IOLPBKTSTCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	NU4	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
24	SCSFAILFLG		0h	Bit indicating a failure on SPISCS pin compare during analog loopback during IO Loopback Test mode. Read 1 = A comparison between the internal CSNR field and the analog looped back value of SPISCS[7:0] pins failed. A stuck-at fault is detected on one of the SPISCS[7:0]. Comparison is done only on the pins which are configured as functional and during transfer operation. 0 = No miscompares on any of the 8 chipselect pin value comparison with the internal Chipselect number CSNR during transfers. Write 1 = Clear this Flag bit. 0 = No effect.
23-21	NU3	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
20	CTRLBITERR	R/W	0h	Controls inducing of BITERR during IO Loopback Test mode. 1 = The value of incoming data from the loopback Transmit pin is flipped. 0 = No affect on BIT ERROR.
19	CTRLDESYNC	R/W	0h	Controls inducing of DESYNC Error during IO Loopback Test mode. 1 = Forces the incoming SPIENA pin (if functional) to remain ‘0’ even after the transfer complete. This forcing will be retained until the Kernel reaches IDLE state. 0 = No affect on DESYNC Error.
18	CTRLPARERR	R/W	0h	Controls inducing of Parity Error during IO Loopback Test mode. 1 = Flips the Parity Polarity signal being used for transmit parity generation logic 0 = No affect on Parity Error
17	CTRLTIMEOUT	R/W	0h	Controls inducing of TIMEOUT Error during IO LoopbacK Test mode. 1 = Forces the incoming SPIENA pin (if functional) to remain ‘1’ when transmission is initiated. The forcing will be retained until the Kernel reaches IDLE state. 0 = No affect on TIMEOUT Error.
16	CTRLDLENERR	R/W	0h	Controls inducing of Data Length Error during IO Loopback Test mode. 1 = When in Master mode, forces the SPIENA pin(if functional) to ‘1’ when the module starts Shifting the data. When in Slave mode, forces the incoming SPISCS pin(if functional) to ‘1’ when the module starts shifting the data.. 0 = No affect on Data Length Error.
15-12	NU2	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
11-8	IOLPBKTSTENA	R/W	0h	Module I/O Loopback Test Enable Key User and Privileged mode reads. Write access only in Privileged mode. Write: 1010 = I/O DFT is enabled All other values = I/O DFT is disabled Read: 1010 = I/O DFT is enabled All other values = I/O DFT is disabled

Table 13-114. IOLPBKTSTCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
5-3	ERRSCSPIN	R/W	0h	Inject Error on ChipSelect Pin. The value in this field is decoded to find out the ChipSelect pin on which to inject an error. During the analog loopback of IO Loopback Test mode if CTRL SCS PIN ERR bit is set to ‘1’, then the chipselect pin selected by this field is forced to the opposite of its original CSNR bit. 000 - Select SPISCS[0] for injecting error 001 - Select SPISCS[1] for injecting error . 111 - Select SPISCS[7] for injecting error
2	CTRLSCSPINERR	R/W	0h	Control bit to enable the injection of an error on SPISCS [7:0] pins. Individual pins of SPISCS [7:0] can be choosen using ERR SCS PIN. 1 = Enable the error inducing logic to the SPISCS pins. 0 = Disable the error inducing logic.
1	LPBKTYPE	R/W	0h	Module IO Loopback Type (Analog/Digital). User and Privileged mode reads. Write access only in Privileged mode. Write/Read : 1 = Analog loopback is enabled in module I/O DFT mode when IOLPBKTSTENA = 1010) 0 = Digital loopback is enabled in module I/O DFT mode when IOLPBKTSTENA = 1010
0	RXPENA	R/W	0h	Module Analog loopback through Receive Pin Enable. User and Privileged mode reads. Write only in privileged mode: Write/Read : 1 = Analog loopback through receive pin 0 = Analog loopback through transmit pin. This bit is valid only when LPBK TYPE = ‘1’ which chooses Analog loopback mode.

13.9.47.60 EXTENDED_PRESCALE1 Register (Offset = 138h) [Reset = 00000000h]

EXTENDED_PRESCALE1 is shown in Table 13-115.

Return to the Summary Table.

SPI/MibSPI Extended Prescale Register 1 (EXTENDED_PRESCALE1 for SPIFMT0 and SPIFMT1) This register provides an extended Prescale values for SPICLK generation to be able to interface with much slower SPI Slaves. This is an extension of SPIFMT0 and SPIFMT1 registers. For example, EPRESCALE_FMT1(7:0) of EXTENDED_PRESCALE1 and PRESCALE1(7:0) of SPIFMT1 register will always reflect the same contents. Similarly EPRESCALE_FMT0(7:0) and PRESCALE0(7:0) of SPIFMT0 reflect the same contents.

Table 13-115. EXTENDED_PRESCALE1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	NU2	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
26-16	EPRESCLAE_FMT1	R/W	0h	Extended Prescale value for SPIFMT1. EPRESCALE_FMT1 can be modified in privilege mode only. EPRESCALE_FMT1 determines the bit transfer rate of Data Format 1 if the SPI/MibSPI is the network master. If the SPI / MibSPI is configured as slave, this field DOES NOT NEED to be configured. These EPRESCALE_FMT1(7:0) bits and PRESCALE1(7:0) bits of SPIFMT1 register will point to the same physically implemented register. Refer to Figure 56 for a graphical representation of the implementation. Write : This register field should be written if a SPICLK prescaler of more VBUSPCLK/256 is required. This field provides a prescaler of up to VBUSPCLK/2048 for SPICLK. Writing to this register field will also get reflected in SPIFMT1(15:8). Read : Reading this field will reflect the PRESCALE value based on the last written register field i.e., EXTENDED_PRESCALE1(26:16) or SPIFMT1(15:8) register. Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE1 register is programmed after SPIFMT1 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE1 register when a prescale of more 256 is intended on SPICLK. BRFormatx = VBUSPCLK/(EXTENDEDPRESCALEy+1) When EPRESCALE_FMTy (y=1,2) is set to zero(0), the SPI clock rate defaults to VBUSPCLK/2.
15-11	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.

Table 13-115. EXTENDED_PRESCALE1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10-0	EPRESCLAE_FMT0	R/W	0h	EPRESCALE_FMT0 can be modified in privilege mode only. EPRESCALE_FMT0 determines the bit transfer rate of Data Format 0 if the SPI is the network master. If the SPI / MibSPI is configured as slave, this field DOES NOT NEED to be configured. These EPRESCALE_FMT0(7:0) bits and PRESCALE0(7:0) bits of SPIFMT0 register will point to the same physically implemented register. Refer to Figure 56 for a graphical representation of the implementation. Write : This register field should be written if a SPICLK prescaler of more VBUSPCLK/256 is required. This field provides a prescaler of up to VBUSPCLK/2048 for SPICLK. Writing to this register field will also get reflected in SPIFMT0(15:8). Read : Reading this field will reflect the PRESCALE value based on the last written register field i.e., EPRESCALE0(26:16) or SPIFMT0(15:8) register. Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE1 register is programmed after SPIFMT0 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE1 register when a prescale of more 256 is intended on SPICLK.

13.9.47.61 EXTENDED_PRESCALE2 Register (Offset = 13Ch) [Reset = 00000000h]

EXTENDED_PRESCALE2 is shown in Table 13-116.

Return to the Summary Table.

SPI/MibSPI Extended Prescale Register 2 (EXTENDED_PRESCALE2 for SPIFMT2 and SPIFMT3) This register provides an extended Prescale values for SPICLK generation to be able to interface with much slower SPI Slaves. This register is an extension of SPIFMT2 and SPIFMT3 registers. For example, EPRESCALE_FMT2(7:0) of EXTENDED_PRESCALE2 and PRESCALE2(7:0) of SPIFMT2 register will always reflect the same contents. Similarly EPRESCALE_FMT3(7:0) and PRESCALE3(7:0) of SPIFMT3 reflect the same contents.

Table 13-116. EXTENDED_PRESCALE2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	NU4	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
26-16	EPRESCLAE_FMT3	R/W	0h	EPRESCALE_FMT3 can be modified in privilege mode only. EPRESCALE_FMT3 determines the bit transfer rate of Data Format 3 if the SPI is the network master. If the SPI / MibSPI is configured as slave, this field DOES NOT NEED to be configured. These EPRESCALE_FMT3(7:0) bits and PRESCALE3(7:0) bits of SPIFMT3 register will point to the same physically implemented register. Refer to Figure 56 for a graphical representation of the implementation. Write : This register field should be written if a SPICLK prescaler of more VBUSPCLK/256 is required. This field provides a prescaler of up to VBUSPCLK/2048 for SPICLK. Writing to this register field will also get reflected in SPIFMT3(15:8). Read : Reading this field will reflect the PRESCALE value based on the last written register field i.e., EPRESCALE3(26:16) or SPIFMT3(15:8) register. Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE2 register is programmed after SPIFMT3 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE2 register when a prescale of more 256 is intended on SPICLK.
15-11	NU3	R	0h	Reserved. Reads return ‘0’ and writes have no effect.

Table 13-116. EXTENDED_PRESCALE2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10-0	EPRESCLAE_FMT2	R/W	0h	EPRESCALE_FMT2 can be modified in privilege mode only. EPRESCALE_FMT2 determines the bit transfer rate of Data Format 2 if the SPI is the network master. If the SPI / MibSPI is configured as slave, this field DOES NOT NEED to be configured. These EPRESCALE_FMT2(7:0) bits and PRESCALE2(7:0) bits of SPIFMT2 register will point to the same physically implemented register. Refer to Figure 56 for a graphical representation of the implementation. Write : This register field should be written if a SPICLK prescaler of more VBUSPCLK/256 is required. This field provides a prescaler of up to VBUSPCLK/2048 for SPICLK. Writing to this register field will also get reflected in SPIFMT3(15:8). Read : Reading this field will reflect the PRESCALE value based on the last written register field i.e., EXTENDED_PRESCALE2(26:16) or SPIFMT2(15:8) register. Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE2 register is programmed after SPIFMT2 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE2 register when a prescale of more 256 is intended on SPICLK.

13.9.47.62 ECCDIAG_CTRL Register (Offset = 140h) [Reset = 0000000Ah]

ECCDIAG_CTRL is shown in Table 13-117.

Return to the Summary Table.

ECC Diagnostic Control register

Table 13-117. ECCDIAG_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	NU	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
3-0	ECCDIAG_EN	R/W	Ah	ECC Diagnostic mode Enable Key bits. 0101 : Diagnostic mode is enabled. Writes and reads from ECC bits allowed from the ECC address space. Refer to Section 9 for details on ECC/Parity address space. Others : Diagnostic mode is disabled. No writes to ECC bits are ignored, reads return ‘0’.

13.9.47.63 ECCDIAG_STAT Register (Offset = 144h) [Reset = 00000000h]

ECCDIAG_STAT is shown in Table 13-118.

Return to the Summary Table.

ECC Diagnostic Status register

Table 13-118. ECCDIAG_STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	NU2	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
17	DEFLG1	R	0h	Double bit error flag for RXRAM 1 - A double bit Error is detected for RXRAM bank during diagnostic mode tests. 0 - No error. A write ‘1’ to this bit will clear the bit.
16	DEFLG0	R	0h	Double bit error flag for TXRAM 1 - A double bit Error is detected for TXRAM bank during diagnostic mode tests. 0 - No error. A write ‘1’ to this bit will clear the bit.
15-2	NU1	R	0h	Reserved. Reads return ‘0’ and writes have no effect.
1	SEFLG1	R	0h	Single bit error flag for RXRAM 1 - A Single bit Error is detected for RXRAM bank during diagnostic mode tests. 0 - No error. A write ‘1’ to this bit will clear the bit.
0	SEFLG0	R	0h	Single bit error flag for TXRAM 1 - A Single bit Error is detected for TXRAM bank during diagnostic mode tests. 0 - No error. A write ‘1’ to this bit will clear the bit.

13.9.47.64 SBERRADDR1 Register (Offset = 148h) [Reset = 00000000h]

SBERRADDR1 is shown in Table 13-119.

Return to the Summary Table.

Single Bit Error Address Register - RXRAM

Table 13-119. SBERRADDR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU1	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
10-0	SBERRADDR1	R	0h	Single Bit ECC Error Address This register holds the address of the RAM location when a single bit error is generated by SECDED block while reading the MibSPI (Receive) RXRAM. This error address is frozen from being updated until it is read by the VBUS host. Reading this register clears its contents to the default value The default value is 0x400 if Extended Buffer feature is enabled, else it is 0x200 Writes to this register are ignored.

13.9.47.65 SBERRADDR0 Register (Offset = 14Ch) [Reset = 00000000h]

SBERRADDR0 is shown in Table 13-120.

Return to the Summary Table.

Single Bit ECC Error Address Register - TXRAM

Table 13-120. SBERRADDR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU2	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
10-0	SBERRADDR0	R	0h	Single Bit ECC Error Address This register holds the address when a single bit error is generated from SECDED block while reading the MibSPI (Transmit) TXRAM. The TXRAM can be read either by CPU or by the MibSPI Sequencer logic for transmission. This error address is frozen from being updated until it is read by the VBUSP host. Reading this register clears its contents to the default value of 0x000. Writes to this register are ignored.

13.9.47.66 SPIREV Register (Offset = 1FCh) [Reset = 4A050308h]

SPIREV is shown in Table 13-121.

Return to the Summary Table.

SPI / MibSPI Revision ID Register

Table 13-121. SPIREV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	1h	Identification Scheme Used to distinguish different ID schemes. Reads 0x01
29-28	NU	R	0h	Reserved.Reads return ‘0’ and writes have no effect.
27-16	FUNC	R	A05h	Indicates functionally equivalent module family Reads 0xA05
15-11	RTL	R	0h	RTL version number Read value will provide an approximate RTL revision number. The design release version can be obtained from the device specification
10-8	MAJOR	R	3h	Major Revision number Reads 0x3
7-6	CUSTOM	R	0h	Indicates device specific implementation Reads 0x0
5-0	MINOR	R	8h	Minor Revision number Reads 0x8

13.10 Multi-Buffer RAM

The multi-buffer RAM is used for holding transmit and received data, control and status information. The multi-buffer RAM contains two banks of up to 128 32-bit words for a maximum configuration. One bank (TXRAM) contains entries for transmit data (replicating the SPIDAT1 register). The other bank (RXRAM) contains received data (replicating the SPIBUF register). The buffers can be partitioned into multiple TGs, each containing a programmable number of buffers. Each of the buffers can be subdivided into 16-bit transmit field, 16-bit receive field, 16-bit control field, and 16-bit status field, as displayed in Figure 13-76. A 4-bit parity field per word is also included in each bank of RAM.

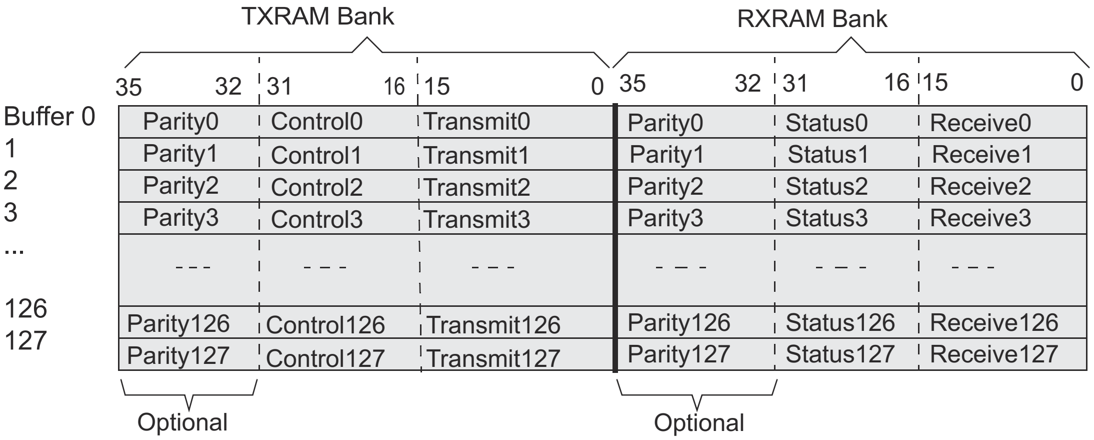

Figure 13-76. Multi-Buffer RAM Configuration

All fields can be read and written with 8-bit, 16-bit, or 32-bit accesses.

The transmit fields can be written and read in the address range 000h to 1FFh. The transmit words contain data and control fields.

The receive RAM fields are read-only and can be accessed through the address range 200h to 3FCh. The receive words contain data and status fields.

The chip select number (CSNR) bit field of the control field for a given word is mirrored into the corresponding receive-buffer status field after transmission.

The Parity is automatically calculated and copied to Parity location

Note

Please refer to the specific device datasheet for the actual number of transmit and receive buffers.

Write to unimplemented buffer is overwriting the corresponding implemented buffer. In MIBSPI, if the RAM SIZE specified is 32 buffers, write to 33rd buffer overwrites 1st buffer, write to 34th buffer overwrites 2st buffer and so on.

13.10.1 Multi-Buffer RAM Auto Initialization

When the MIBSPI is out of reset mode, auto initialization of multi-buffer RAM starts. The application code must check for BUFINITACTIVE bit to be 0 (Multi-buffer RAM initialization is complete) before configuring multi-buffer RAM.

Besides the default auto initialization after reset, the auto-initialization sequence can also be done by:

1. Enable the global hardware memory initialization key by programming a value of 1010b to the bits [3:0] of the MINITGCR register of the System module.
2. Set the control bit for the multi-buffer RAM in the MSINENA System module register. This bit is device-specific for each memory that support auto-initialization. Please refer to the device datasheet to identify the control bit for the multi-buffer RAM. This starts the initialization process. The BUFINITACTIVE bit will get set to reflect that the initialization is ongoing.
3. When the memory initialization is completed, the corresponding status bit in the MINISTAT register will be set. Also, the BUFINITACTIVE bit will get cleared.
4. Disable the global hardware memory initialization key by programming a value of 0101 to the bits [3:0] of the MINITGCR register of the System module.

Please refer to the *Architecture* chapter for more details on the memory auto-initialization process.

Note

During Auto Initialization process, all the Multi-buffer mode registers (except MIBSPIE) will be reset to their default values. So, it should be ensured that Auto Initialization is completed before configuring the Multi-buffer mode registers.

13.10.2 Multi-Buffer RAM Register Summary

This section describes the multi-buffer RAM control and transmit-data fields of each word of TXRAM, and the status and receive-data fields of each word of RXRAM. The base address for multi-buffer RAM is FF0E 0000h for MibSPI1 RAM, FF0C 000h for MibSPI3 RAM, and FF0A 0000h for MibSPI5 RAM.

Table 13-122. Multi-Buffer RAM Register Summary

Offset	Acronym	Register Description	Section
Base + 0h-1FFh	TXRAM	Multi-Buffer RAM Transmit Data Register	Section 13.10.3
Base + 200h-3FFh	RXRAM	Multi-Buffer RAM Receive Buffer Register	Section 13.10.4

13.10.3 Multi-Buffer RAM Transmit Data Register (TXRAM)

Each word of TXRAM is a transmit-buffer register.

Note

Writing to only the control fields, bits 28 through 16, does not initiate any SPI transfer in master mode. This feature can be used to set up SPICLK phase or polarity before actually starting the transfer by only updating the DFSEL bit field to select the required phase and polarity combination.

LEGEND: R/W = Read/Write; -*n* = value after reset

Table 13-123. Multi-Buffer RAM Transmit Data Register (TXRAM) Field Descriptions

Bit	Field	Value	Description
31-29	BUFMODE		Specify conditions that are recognized by the sequencer to initiate transfers of each buffer word. When one of the "skip" modes is selected, the sequencer checks the buffer status every time it reads from this buffer. If the current buffer status (TXFULL, RXEMPTY) does not match, the buffer is skipped without a data transfer. When one of the "suspend" modes is selected, the sequencer checks the buffer status when it reads from this buffer. If TXFULL and/or RXEMPTY do not match, the sequencer waits until a match occurs. No data transfer is initiated until the status condition of this buffer changes.
		0	**disabled.** The buffer is disabled.
		1h	**skip single-transfer mode.** Skip this buffer until the corresponding TXFULL flag is set (new transmit data is available).
		2h	**skip overwrite-protect mode.** Skip this buffer until the corresponding RXEMPTY flag is set (new receive data can be stored in RXDATA without data loss).
		3h	**skip single-transfer overwrite-protect mode**. Skip this buffer until both of the corresponding TXFULL and RXEMPTY flags are set. (new transmit data available and previous data received by the host).
		4h	**continuous mode.** Initiate a transfer each time the sequencer checks this buffer. Data words are retransmitted if the buffer has not been updated. Receive data is overwritten, even if it has not been read.
		5h	**suspend single-transfer mode.** Suspend-to-wait until the corresponding TXFULL flag is set (the sequencer stops at the current buffer until new transmit data is written in the TXDATA field).
		6h	**suspend overwrite-protect mode.** Suspend-to-wait until the corresponding RXEMPTY flag is set (the sequencer stops at the current buffer until the previously-received data is read by the host.
		7h	**suspend single-transfer overwrite-protect mode.** Suspend-to-wait until the corresponding TXFULL and RXEMPTY flags are set (the sequencer stops at the current buffer until new transmit data is written into the TXDATA field and the previously-received data is read by the host).

Table 13-123. Multi-Buffer RAM Transmit Data Register (TXRAM) Field Descriptions (continued)

Bit	Field	Value	Description
28	CSHOLD		Chip select hold mode. The CSHOLD bit is supported in master mode only, it is ignored in slave mode. CSHOLD defines the behavior of the chip select line at the end of a data transfer.
		0	The chip select signal is deactivated at the end of a transfer after the T2CDELAY time has passed. If two consecutive transfers are dedicated to the same chip select this chip select signal will be deactivated for at least 2VCLK cycles before it is activated again.
		1	The chip select signal is held active at the end of a transfer until a control field with new data and control information is loaded into SPIDAT1. If the new chip select number equals the previous one, the active chip select signal is extended until the end of transfer with CSHOLD cleared, or until the chip-select number changes.
27	LOCK		Lock two consecutive buffer words. Do not allow interruption by TGs with higher priority.
		0	Any higher-priority TG can begin at the end of the current transaction.
		1	A higher-priority TG cannot occur until after the next unlocked buffer word is transferred.
26	WDEL		Enable the delay counter at the end of the current transaction. **Note: The WDEL bit is supported in master mode only. In slave mode, this bit is ignored.**
		0	No delay will be inserted. However, $\overline{\text{SPICS}}$ pins will still be de-activated for at least for 2VCLK cycles if CSHOLD = 0. **Note: The duration for which the $\overline{\text{SPICS}}$ pin remains deactivated also depends upon the time taken to supply a new word after completing the shift operation (in compatibility mode). If TXBUF is already full, then the $\overline{\text{SPICS}}$ pin will be deasserted for at least two VCLK cycles (if WDEL = 0).**
		1	After a transaction, WDELAY of the corresponding data format will be loaded into the delay counter. No transaction will be performed until the WDELAY counter overflows. The $\overline{\text{SPICS}}$ pins will be de-activated for at least (WDELAY + 2) × VCLK_Period duration.
25-24	DFSEL		Data word format select.
		0	Data word format 0 is selected.
		1h	Data word format 1 is selected.
		2h	Data word format 2 is selected.
		3h	Data word format 3 is selected.
23-16	CSNR	0-FFh	Chip select (CS) number. CSNR defines the chip select pins that will be activated during the data transfer. CSNR is a bit-mask that controls all chip select pins. See Table 13-124. **Note: If your MibSPI has less than 8 chip select pins, all unused upper bits will be 0. For example, MiBSPI3 has 6 chip select pins, if you write FFh to CSNR, the actual number stored in CSNR is 3Fh.**
15-0	TXDATA	0-7FFFh	Transfer data. When written, these bits are copied to the shift register if it is empty. If the shift register is not empty, then they are held in TXBUF. SPIEN must be set to 1 before this register can be written to. Writing a 0 to SPIEN forces the lower 16 bits of TXDATA to 0. A write to this register (or to the TXDATA field only) drives the contents of the CSNR field on the $\overline{\text{SPICS}}$ pins, if the pins are configured as functional pins (automatic chip select, see Section 13.2). When this register is read, the contents of TXBUF, which holds the latest data written, will be returned. **Note: Regardless of the character length, the transmit data should be right-justified before writing to the SPIDAT1 register.**

Table 13-124. Chip Select Number Active

CSNR Value	Chip Select Active:							CSNR Value	Chip Select Active:					
	CS[5](1)	CS[4](1)	CS[3](1)	CS[2](1)	CS[1](1)	CS[0]			CS[5](1)	CS[4](1)	CS[3](1)	CS[2](1)	CS[1](1)	CS[0]

1Eh		x	x	x	x			3Eh	x	x	x	x	x	
1Fh		x	x	x	x	x		3Fh	x	x	x	x	x	x

(1) If your MibSPI does not have this chip select pin, this bit is 0.

13.10.4 Multi-Buffer RAM Receive Buffer Register (RXRAM)

Each word of RXRAM is a receive-buffer register.

Table 13-125. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions

Bit	Field	Value	Description
31	RXEMPTY		Receive data buffer empty. When the host reads the RXDATA field or the entire RXRAM register, it automatically sets the RXEMPTY flag. When a data transfer is completed, the received data is copied into RXDATA, and the RXEMPTY flag is cleared.
		0	New data has been received and copied into RXDATA.
		1	No data has been received since the last read of RXDATA. This flag gets set to 1 under the following conditions: • Reading the RXDATA field of the RXRAM register • Writing a 1 to clear the RXINTFLG bit in the SPI Flag Register (SPIFLG) Write-clearing the RXINTFLG bit before reading RXDATA indicates the received data is being ignored. Conversely, RXINTFLG can be cleared by reading the RXDATA field of RXRAM (or the entire register).
30	RXOVR		Receive data buffer overrun. When a data transfer is completed and the received data is copied into RXBUF while it is already full, RXOVR is set. Overruns always occur to RXBUF, not to RXRAM; the contents of RXRAM are overwritten only after it is read by the Peripheral (VBUSP) master (CPU, DMA, or other host processor). If enabled, the RXOVRN interrupt is generated when RXBUF is overwritten, and reading either SPI Flag Register (SPIFLG) or SPIVECTx shows the RXOVRN condition. Two read operations from the RXRAM register are required to reach the overwritten buffer word (one to read RXRAM, which then transfers RXDATA into RXRAM for the second read). **Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.** **Note: A special condition under which RXOVR flag gets set. If both RXRAM and RXBUF are already full and while another buffer receive is underway, if any errors such as TIMEOUT, BITERR, and DLEN_ERR occur, then RXOVR in RXBUF and SPI Flag Register (SPIFLG) registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a normal receive overrun.**
		0	No receive data overrun condition occurred since last read of the data field.
		1	A receive data overrun condition occurred since last read of the data field.

Table 13-125. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions (continued)

Bit	Field	Value	Description
29	TXFULL		Transmit data buffer full. This flag is a read-only flag. Writing into the SPIDAT0 or SPIDAT1 field while the TX shift register is full will automatically set the TXFULL flag. Once the word is copied to the shift register, the TXFULL flag will be cleared. Writing to SPIDAT0 or SPIDAT1 when both TXBUF and the TX shift register are empty does not set the TXFULL flag.
		0	The transmit buffer is empty; SPIDAT0/SPIDAT1 is ready to accept a new data.
		1	The transmit buffer is full; SPIDAT0/SPIDAT1 is not ready to accept new data.
28	BITERR		Bit error. There was a mismatch of internal transmit data and transmitted data. **Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.**
		0	No bit error occurred.
		1	A bit error occurred. The SPI samples the signal of the transmit pins (master: SIMOx, slave: SOMIx) at the receive point (one-half clock cycle after the transmit point). If the sampled value differs from the transmitted value, a bit error is detected and the BITERR flag is set. Possible reasons for a bit error include noise, an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.
27	DESYNC		Desynchronization of slave device. This bit is valid in master mode only. The master monitors the ENA signal coming from the slave device and sets the DESYNC flag if ENA is deactivated before the last reception point or after the last bit is transmitted plus $t_{T2EDELAY}$. If DESYNCENA is set, an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master. **Note: In the Compatibility Mode MibSPI, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is because the receive completion flag/interrupt is generated when the buffer transfer is completed. But desynchronization is detected after the buffer transfer is completed. So, if the VBUS master reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. In multi-buffer mode, the desync flag is always guaranteed to be for the current buffer.** **Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.**
		0	No slave desynchronization is detected.
		1	A slave device is desynchronized.
26	PARITYERR		Parity error. The calculated parity differs from the received parity bit. If the parity generator is enabled (selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word, the parity generator calculates the reference parity and compares it to the received parity bit. If a mismatch is detected, the PARITYERR flag is set. **Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.**
		0	No parity error is detected.
		1	A parity error occurred.
25	TIMEOUT		Time-out because of non-activation of $\overline{\text{SPIENA}}$ pin. The SPI generates a time-out when the slave does not respond in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected, the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition, the TIMEOUT flag in the status field of the corresponding buffer and in the SPI Flag Register (SPIFLG) is set. **Note: This bit is valid only in master mode.** **Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.**
		0	No $\overline{\text{SPIENA}}$ pin time-out occurred.
		1	An $\overline{\text{SPIENA}}$ signal time-out occurred.
24	DLENERR		Data length error flag. **Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.**
		0	No data-length error occurred.
		1	A data length error occurred.
23-16	LCSNR	0-FFh	Last chip select number. LCSNR in the status field is a copy of CSNR in the corresponding control field. It contains the chip select number that was activated during the last word transfer.

Table 13-125. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions (continued)

Bit	Field	Value	Description
15-0	RXDATA	0-FFFFh	SPI receive data. This is the received word, transferred from the receive shift-register at the end of a transfer. Regardless of the programmed character length and the direction of shifting, the received data is stored right-justified in the register.

13.11 Parity Memory

The parity portion of multi-buffer RAM is not accessible by the CPU during normal operating modes. However, each read or write operation to the control/data/status portion of the multi-buffer RAM causes reads/writes to the parity portion as well.

- Each write to the multi-buffer RAM (either from the Peripheral interface or by the MibSPI itself) causes a write operation to the parity portion of RAM simultaneously to update the equivalent parity bits.
- Each read operation from the multi-buffer RAM (either from the Peripheral interface or by the MibSPI itself) causes a read operation from the parity portion of the RAM for parity comparison purpose.
- Reads/Writes to multi-buffer RAM can either be caused by any CPU/DMA accesses or by the sequencer logic of MibSPI itself.
- Incase of Parity error ESM module is notified to generate MIBSPI Parity ESM interrupt. User can check the error status and address location captured in the UERRSTAT and UERRADDRx registers respectively.

For testing the parity portion of the multi-buffer RAM, which is a 4-bit field per word address (1 bit per byte), a separate parity memory test mode is available. Parity memory test mode can be enabled and disabled by the PTESTEN bit in the UERRCTRL register.

During the parity test mode, the parity locations are addressable at the address between RAM_BASE_ADDR + 0x400h and RAM_BASE_ADDR + 0x7FFh. Each location corresponds, sequentially, to each TXRAM word, then to each RXRAM word. See Figure 13-79 for a diagram of the memory map of parity memory during normal operating mode and during parity test mode.

During parity test mode, after writing the data/control portion of the RAM, the parity locations can be written with incorrect parity bits to intentionally cause parity errors.

See the device-specific data sheet to get the actual base address of the multi-buffer RAM.

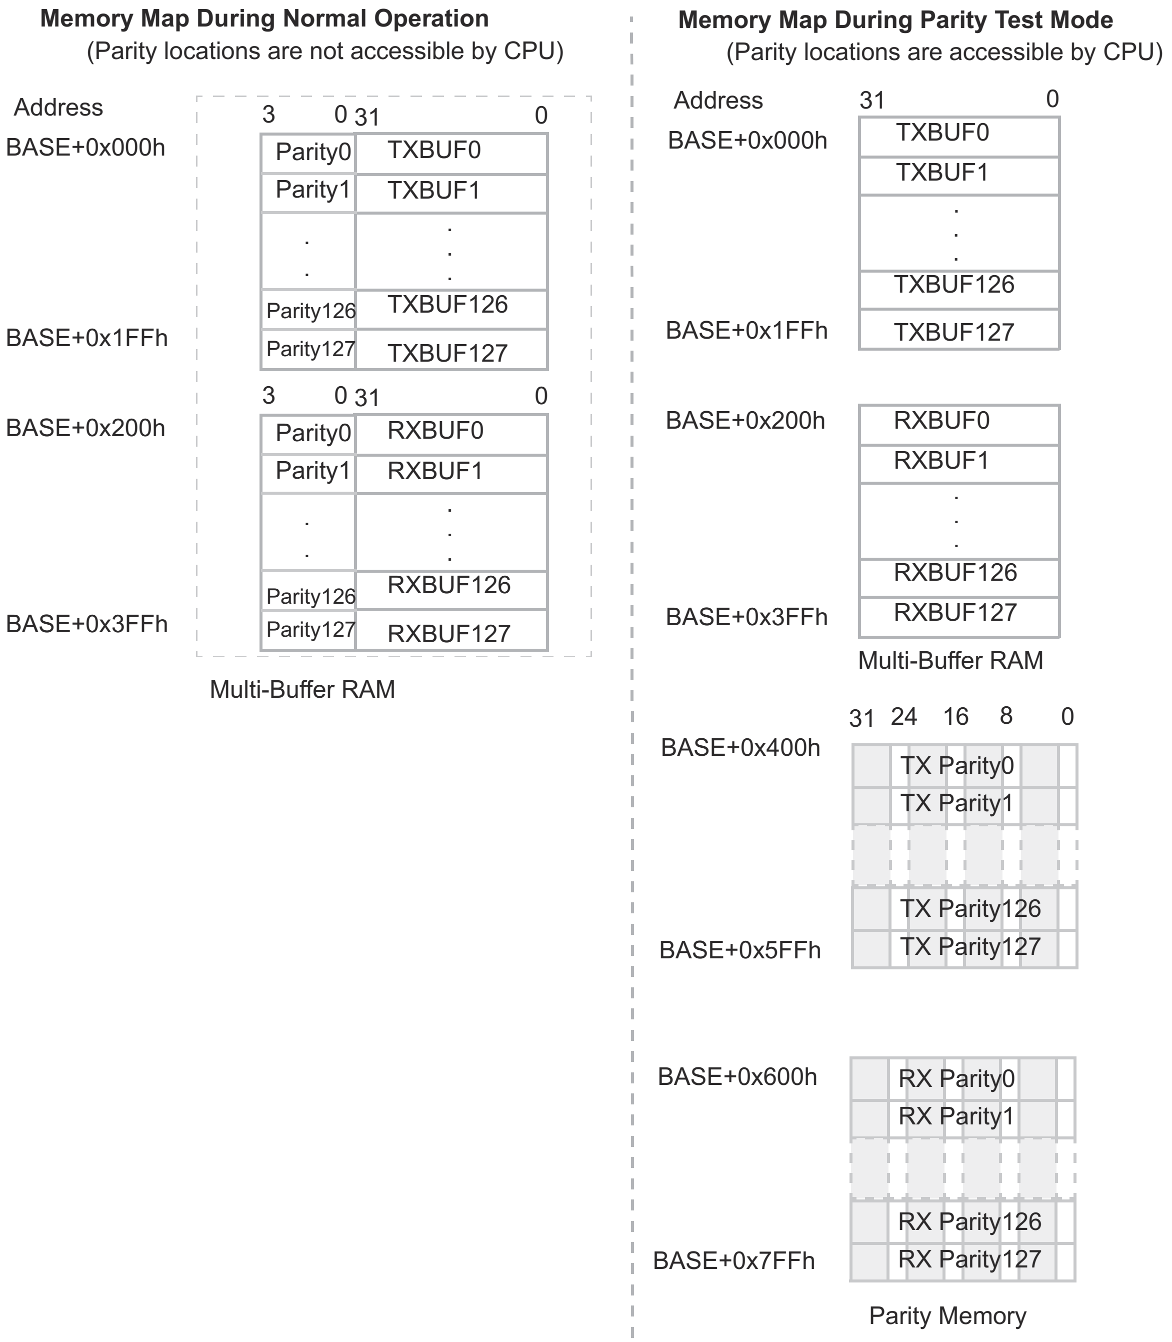
Note

The RX_RAM_ACCESS bit can also be set to 1 during the parity test mode to be enable writes to RXRAM locations. Both parity RAM testing and RXRAM testing can be done together.

There are 4 bits of parity corresponding to each of the 32-bit multi-buffer locations. Individual bits in the parity memory are byte-addressable in parity test mode. See the example in Figure 13-80 for further details.

Note

Polarity of the parity (odd/even) varies by device. In some devices, a control register in the system module can be used to select odd or even parity.



Memory Map During Normal Operation

(Parity locations are not accessible by CPU)

Memory Map During Parity Test Mode

(Parity locations are accessible by CPU)

* BASE - Base Address of Multi-Buffer RAM

Refer to specific Device Data sheet for the actual value of BASE.

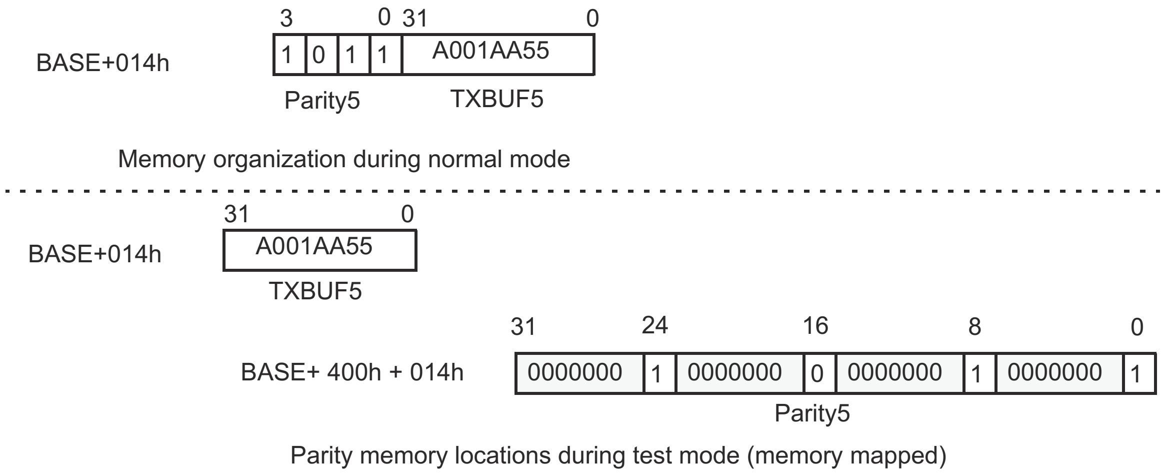
* Shaded areas indicate they are physically not present.

Figure 13-79. Memory Map for Parity Locations During Normal and Test Mode

13.11.1 Example of Parity Memory Organization

Suppose TXBUF5 (6th location in TXRAM) in the multi-buffer RAM is written with a value of A001_AA55. If the polarity of the parity is set to odd, the corresponding parity location parity5 will get updated with equivalent parity of 1011 in its field.

During parity-memory test mode, these bits can be individually byte addressed. The return data will be a byte adjusted with actual parity bit in the LSB of the byte. If a word is read from the word-boundary address of parity locations, then each bit of the 4-bit parity is byte-adjusted and a 32-bit word is returned. 0s will be padded into the parity bits to get each byte. See Figure 13-80 for a diagram.



1 Shaded areas indicate reads return 0, writes have no effect. These registers are not physically present.

Figure 13-80. Example of Memory-Mapped Parity Locations During Test Mode

---

Note

Read Access to Parity Memory Locations

Parity memory locations can be read even without entering into parity memory test mode. Their address remains as in memory test mode. It is only to enter parity-memory test mode to enable write access to the parity memory locations.

13.12 MibSPI Pin Timing Parameters

The pin timings of SPI can be classified based on its mode of operation. In each mode, different configurations like Phase and Polarity affect the pin timings.

The pin directions are based on the mode of operation.

Controller mode SPI:

- SPICLK (SPI Clock) - Output
- SPISIMO (SPI Peripheral In Controller Out) - Output
- $\overline{\text{SPICS}}$ (SPI Peripheral Chip Selects) - Output
- SPISOMI (SPI Peripheral Out Controller In) - Input
- $\overline{\text{SPIENA}}$ (SPI Peripheral ready Enable) - Input

Peripheral mode SPI:

- SPICLK - Input
- SPISIMO - Input
- $\overline{\text{SPICS}}$ - Input
- SPISOMI - Output
- $\overline{\text{SPIENA}}$ - Output

Note

All the timing diagrams given below are with Phase = 0 and Polarity = 0. unless explicitly stated otherwise.

13.12.3 Controller Timing Parameter Details

In case of Controller the module drives out SPICLK. It also drives out the Transmit data on SPISIMO with respect to its internal SPICLK. In case of Controller mode, the RX data on the SPISOMI pin is registered with respect to SPICLK received through the input buffer from the I/O pad.

If the chip select pin is functional, then the Controller will drive out the $\overline{\text{SPICS}}$ pins before starting the SPICLK. If the $\overline{\text{SPIENA}}$ pin is functional, then Controller will wait for an active low from the Peripheral on the input pin to start the SPICLK.

13.12.4 Peripheral Mode Timing Parameter Details

In case of Peripheral mode, the module will drive only the SPISOMI and $\overline{\text{SPIENA}}$ pins. All other pins are inputs to it. The RX data on the SPISIMO pin will be registered with respect to the SPICLK pin. The Peripheral will use the $\overline{\text{SPICS}}$ pin to drive out the $\overline{\text{SPIENA}}$ pin if both are functional. If 4-pin with $\overline{\text{SPIENA}}$ is configured, then the Peripheral will drive out an active-low signal on the $\overline{\text{SPIENA}}$ pin when new data is written to the TX Shift Register. Irrespective of 4-pin with $\overline{\text{SPIENA}}$ or 5-pin configuration, the Peripheral will deassert the $\overline{\text{SPIENA}}$ pin after the last bit is received. If ENABLE_HIGHZ (SPIINT0.24) bit is 0, the deasserted value of the $\overline{\text{SPIENA}}$ pin will be 1. Otherwise, it will depend upon the internal pull up or pull down resistor (if implemented) depending upon the Specification of the Chip.

Chapter 14

Vectored Interrupt Manager (VIM) Module

This chapter describes the behavior of the vectored interrupt manager (VIM) module of the device family.

14.1 VIM Overview

The VIM aggregates device interrupts and sends them to the R5F CPU(s). It can be used in either split or lockstep configuration. In split, it has two independent interrupt cores, one per CPU. In lockstep, CPU1 acts as a diagnostic on CPU0; only CPU0's outputs are used but all outputs are compared to CPU1 to provide diagnostic coverage.

The VIM module supports the following features:

- 256 interrupt inputs per R5F core
- Each interrupt has its own 4-bit programmable priority
  - Defined via the INTPRIORITY_j register
  - The VIM provides support for priority interruption of interrupts
- Each interrupt has its own enable mask
  - Interrupt enable is done via the INTR_EN_SET_j register
  - Interrupt disable is done via the INTR_EN_CLR_j register
- Each interrupt can be programmed as either an IRQ or FIQ
  - Defined via the INTMAP_j register
- Each interrupt has its own programmable 32-bit vector address associated with it
  - Defined via the INTVECTOR_j register
  - Protected with SECDED
- One IRQn and one FIQn output per core
- Vectored interrupt interface
  - Compatible with R5F VIC port
- Default vector provided when a double-bit error is detected
- Split or lockstep capable
  - In lockstep mode, only interrupts connected to VIM interrupt core 0 are available
- Software interrupt generation

14.2 VIM Interrupt Inputs

The VIM supports 256 interrupt inputs per core. Each interrupt can be either a level or a pulse (both active-high). The interrupt mapping for the two R5F cores can be found in Chapter 7, *Interrupts*.

14.3 VIM Interrupt Outputs

The VIM has two interrupt outputs per core:

- *CoreN_IRQn*: This is a normal interrupt for core *N* (active-low level). It can be serviced via the VIC interface or through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an IRQ (via the INTMAP_j register) and is enabled (via the INTR_EN_SET_j register), then it will cause an IRQ to assert
- *CoreN_FIQn*: This is a fast (or non-maskable) interrupt for core *N* (active-low level). FIQs always have priority over IRQs. An FIQ can be serviced through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an FIQ and is enabled, then it will cause an FIQ to assert

14.4 VIM Interrupt Vector Table (VIM RAM)

For each VIM interrupt core, there is an associated interrupt vector table (VIM RAM) that is used to store the address of ISRs. During register vectored interrupt and hardware vectored interrupt, VIM accesses the interrupt vector table using the vector value to fetch the address of the corresponding ISR. Note that both interrupt vector tables are identical in their memory organization.

The VIM RAM is basically comprised of a set of interrupt vector registers (INTVECTOR_j). Hence, the interrupt vector table is organized in 256 words of 30 bits, with a base address corresponding to the physical address of the first register in the group.

Note

The lower two bits of the 32-bit interrupt vector are always 0s.

Figure 14-1 shows the VIM RAM interrupt vector map.

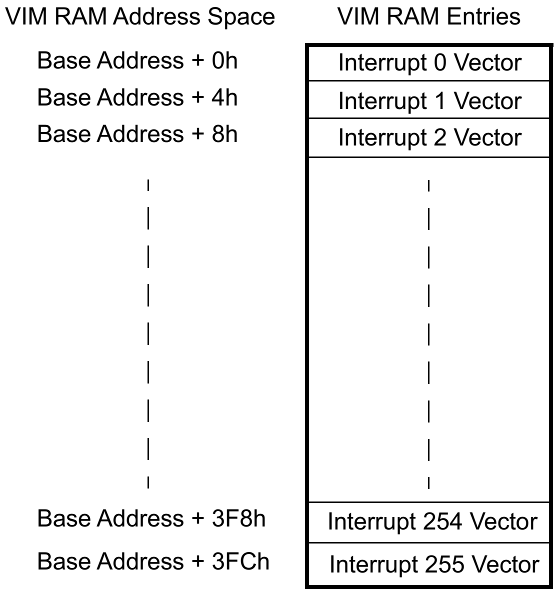

Figure 14-1. VIM RAM Interrupt Vector Map

The interrupt vector table has protection by ECC to indicate corruption due to soft errors. The ECC logic inside VIM supports SECDED. Refer to the ECC aggregator map for the VIM RAM ID.

14.5 VIM Interrupt Prioritization

The VIM supports the interruption of the currently active interrupt by one with a higher priority. FIQs and IRQs are completely separate but both use the same mechanism.

When an interrupt goes from pending to active (FIQ: reading the FIQVEC register; IRQ: reading the IRQVEC register, then the interrupt is loaded into the corresponding active register (ACTFIQ / ACTIRQ), and all interrupts of an equal or lesser priority are masked (discarded). If prior to this interrupt being cleared (by writing to theFIQVEC register, or IRQVEC register) another interrupt of higher priority arrives, then the FIQn/IRQn will be asserted and that interrupt made pending as normal. If the CPU switches this interrupt to active (by reading the FIQVEC / IRQVEC register), then the currently active interrupt will be pushed onto a stack. When an interrupt is cleared by reading the FIQVEC / IRQVEC register, if there are any interrupts on the stack, the first entry is popped off and put back into the ACTFIQ / ACTIRQ register, so that software may continue where it left off.

14.6 VIM ECC Support

The memory that holds the interrupt vector for each interrupt is protected by SECDED ECC. Single-bit errors are corrected and written back. Double-bit errors are not corrected. If a double-bit error occurs while trying to load a vector, then the DEDVEC register is used to provide the default vector for the *coreN_IRQADDRV* signal, the IRQVEC register, and the FIQVEC register. The DEDVEC should point to an ISR that handles the fact that there was an uncorrectable error in the interrupt handling.

Some possible remediating actions would be to:

1. Reconstruct the vector table and re-start the application
    a. Potentially switch to a completely software interrupt handler in the mean time
2. Restart the application from scratch
3. Reset the device

4. Sit in a loop (or WFI) while something external (for example, the ESM) responds to the DED interrupt that will be generated

It is up to the user and the application to determine the appropriate action.

Note

An interrupt that has an uncorrectable vector error (and thus uses the DED vector) will still have the priority of the original interrupt . This makes it possible for a higher priority interrupt to supercede the handling of the error.

Control and reporting are done by the ECC aggregator.

14.7 VIM Lockstep Mode

In lockstep mode, CPU1 is used as a diagnostic for CPU0. In this mode, only the interrupt inputs for CPU0 are used. Besides to CPU0, these interrupt inputs are also internally routed to CPU1 (through the level-sync / edge-detect logic dedicated to CPU1, and additionally through some delay circuits). The outputs from both VIM interrupt cores are then sent to the MSS CCMR5 module through dedicated compare buses (with CPU0's outputs delayed). The CCMR5 module is responsible for comparing the two sets of output signals and for reporting any mismatches by generating an interrupt (MSS_CCMR5_ERR).

Note

In lockstep mode, only the RAM dedicated to CPU0 is used, so software *must not* do anything with the ECC interface on the RAM dedicated to CPU1.

14.8 VIM IDLE State

The VIM will indicate IDLE when there are no pending unmasked interrupts or MMR accesses. The VIM does not have a clock stop interface.

14.9 VIM Interrupt Handling

There are multiple ways to service an interrupt depending on how much of the hardware assistance offered by the VIM the software wants to take advantage of.

For IRQs, it is recommended to use the procedure in Section 14.9.1, but the procedures in Section 14.9.2 or Section 14.9.3 (if a user wants to implement a fully software prioritization scheme) may be used as alternatives.

For FIQs, it is recommended to use the procedure in Section 14.9.4, but the procedure in Section 14.9.5 may be used as an alternative.

Note

These descriptions do not include steps such as stack pushes and state retention that software must take in order to return from the ISR. It is assumed that the programmer is aware of these steps.

14.9.1 Servicing IRQ Through Vector Interface

If the associated CPU has the vector (VIC) interface enabled, then the following method is used for servicing IRQs:

1. Hardware handshake
    a. CPU asserts *coreN_IRQACK* high
    b. VIM asserts *coreN_IRQADDRV* to indicate that the *coreN_IRQADDR* bus is stable with the correct vector address
    c. CPU reads *coreN_IRQADDR*, jumps to that address, and de-asserts *coreN_IRQACK* low
    d. VIM de-asserts *coreN_IRQn* and *coreN_IRQADDRV*, VIM masks (discards) all IRQs with the same or lower priority

    e. VIM loads the value from the PRIIRQ[9:0] NUM bit field (which corresponds to the vector address) into the ACTIRQ[9:0] NUM bit field, which causes the ACTIRQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTIRQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE_j register to determine type)
    a. Pulse
        i. Clear the status by writing a '1' to the appropriate bit in the IRQSTS_j register, or STS_j register
        ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
    b. Level
        i. Clear the interrupt at the source
        ii. Clear the status by writing a '1' to the appropriate bit in the IRQSTS_j register, or STS_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the IRQVEC register
    a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
    b. This will also clear the ACTIRQ[31] VALID bit

14.9.2 Servicing IRQ Through MMR Interface

When an IRQ interrupt is received, the CPU should follow these steps if not using the vector interface:

1. Read the IRQVEC register and jump to that address to service the ISR
    a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN_IRQn* output. If another interrupt of a higher priority becomes available, the *coreN_IRQn* will re-assert, allowing priority interruption of an interrupt
    b. Reading this register will cause the value from the PRIIRQ[9:0] NUM bit field to be loaded into the ACTIRQ[9:0] NUM bit field, and the ACTIRQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
    a. Pulse
        i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
        ii. Clear the interrupt at the source
    b. Level
        i. Clear the interrupt at the source
        ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
4. Write any value to the IRQVEC register
    a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
    b. This will also clear the ACTIRQ[31] VALID bit

14.9.3 Servicing IRQ Through MMR Interface (Alternative)

If a user does not want to use the IRQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the IRQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
    a. Read the PRIIRQ register to determine which interrupt is the highest priority IRQ currently asserted, OR
    b. Optionally read the IRQGSTS register to determine which groups have IRQs pending, then read the IRQSTS_j register and use a software prioritization scheme to determine which IRQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
    a. Pulse

        i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register
        ii. Clear the interrupt at the source.
    b. Level
        i. Clear the interrupt at the source
        ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or IRQSTS_j register

14.9.4 Servicing FIQ

When an FIQ interrupt is received, the CPU should follow these steps:

1. Read the FIQVEC register and jump to that address to service the ISR
    a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN_FIQn* output. If another interrupt of a higher priority becomes available, the *coreN_FIQn* will re-assert, allowing priority interruption of an interrupt.
    b. Reading this register will cause the value from the PRIFIQ[9:0] NUM bit field to be loaded into the ACTFIQ[9:0] NUM bit field, and the ACTFIQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTFIQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE_j register to determine type)
    a. Pulse
        i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register
        ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
    b. Level
        i. Clear the interrupt at the source
        ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the FIQVEC register
    a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
    b. This will also clear the ACTFIQ[31] VALID bit

14.9.5 Servicing FIQ (Alternative)

If a user does not want to use the FIQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the FIQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
    a. Read the PRIFIQ register to determine which interrupt is the highest priority FIQ currently asserted, OR
    b. Optionally read the FIQGSTS register to determine which groups have IRQs pending, then read the FIQSTS_j register and use a software prioritization scheme to determine which FIQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
    a. Pulse
        i. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register
        ii. Clear the interrupt at the source.
    b. Level
        i. Clear the interrupt at the source
        ii. Clear the status by writing a '1' to the appropriate bit in the STS_j register, or FIQSTS_j register.

14.10 MSS_VIM Registers

Table 14-1 lists the memory-mapped registers for the MSS_VIM registers. All register offset addresses not listed in Table 14-1 should be considered as reserved locations and the register contents should not be modified.

Complex bit access types are encoded to fit into small table cells. Table 14-2 shows the codes that are used for access types in this section.

Table 14-2. MSS_VIM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

14.10.1 PID Register (Offset = 0h) [Reset = 00000000h]

PID is shown in Table 14-3.

Return to the Summary Table.

The Revision Register contains the major and minor revisions for the module.

Table 14-3. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	0h	PID register scheme
29-28	BU	R	0h	Business Unit: 10 = Processors
27-16	FUNC	R	0h	Module ID
15-11	RTL	R	0h	RTL revision. Will vary depending on release.
10-8	MAJOR	R	0h	Major revision
7-6	CUSTOM	R	0h	Custom
5-0	MINOR	R	0h	Minor revision

14.10.2 INFO Register (Offset = 4h) [Reset = 00000000h]

INFO is shown in Table 14-4.

Return to the Summary Table.

The Info Register gives the configuration Inforrmation of this VIM.

Table 14-4. INFO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RES1	R	0h	RESERVE FIELD
10-0	INTERRUPTS	R	0h	Total number of Interrupts

14.10.3 PRIIRQ Register (Offset = 8h) [Reset = 00000000h]

PRIIRQ is shown in Table 14-5.

Return to the Summary Table.

The Prioritized IRQ Register shows the number of the highest priority pending IRQ.

Table 14-5. PRIIRQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid.
30-20	RES2	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES3	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the highest priority pending IRQ. valid only if the valid flag is set.

14.10.4 PRIFIQ Register (Offset = Ch) [Reset = 00000000h]

PRIFIQ is shown in Table 14-6.

Return to the Summary Table.

The Prioritized FIQ Register shows the number of the highest priority pending FIQ.

Table 14-6. PRIFIQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid.
30-20	RES4	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending FIQ. valid only if the valid flag is set.
15-10	RES5	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the highest priority pending FIQ. valid only if the valid flag is set.

14.10.5 IRQGSTS Register (Offset = 10h) [Reset = 00000000h]

IRQGSTS is shown in Table 14-7.

Return to the Summary Table.

The IRQ Group Status Register indicates which groups have pending IRQ interrupts.

Table 14-7. IRQGSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R	0h	Indicates that the num field is valid.

14.10.6 FIQGSTS Register (Offset = 14h) [Reset = 00000000h]

FIQGSTS is shown in Table 14-8.

Return to the Summary Table.

The FIQ Group Status Register indicates which groups have pending FIQ interrupts.

Table 14-8. FIQGSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R	0h	Indicates that the num field is valid.

14.10.7 IRQVEC Register (Offset = 18h) [Reset = 00000000h]

IRQVEC is shown in Table 14-9.

Return to the Summary Table.

The IRQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pendind IRQ.

Table 14-9. IRQVEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address. Only valid if the Prioritized IRQ Register valid flag is true.
1-0	RES21	R	0h	RESERVE FIELD

14.10.8 FIQVEC Register (Offset = 1Ch) [Reset = 00000000h]

FIQVEC is shown in Table 14-10.

Return to the Summary Table.

The FIQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pendind FIQ.

Table 14-10. FIQVEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address. Only valid if the Prioritized FIQ Register valid flag is true.
1-0	RES22	R	0h	RESERVE FIELD

14.10.9 ACTIRQ Register (Offset = 20h) [Reset = 00000000h]

ACTIRQ is shown in Table 14-11.

Return to the Summary Table.

The Active IRQ Register shows the number of the currently active IRQ.

Table 14-11. ACTIRQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid. Set when the IRQ Vector Address Register is read and cleared whenever the IRQ Vector Address Register is written.
30-20	RES6	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES7	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the currently active IRQ. Loaded from teh Prioritized IRQ Register whenever the IRQ Vector Address is read. Valid only if the valid flag is set.

14.10.10 ACTFIQ Register (Offset = 24h) [Reset = 00000000h]

ACTFIQ is shown in Table 14-12.

Return to the Summary Table.

The Active FIQ Register shows the number of the currently active FIQ.

Table 14-12. ACTFIQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid. Set when the FIQ Vector Address Register is read and cleared whenever the FIQ Vector Address Register is written.
30-20	RES8	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES9	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the currently active FIQ. Loaded from teh Prioritized FIQ Register whenever the FIQ Vector Address is read. Valid only if the valid flag is set.

14.10.11 DEDVEC Register (Offset = 30h) [Reset = 00000000h]

DEDVEC is shown in Table 14-13.

Return to the Summary Table.

The DED Vector Address contains a default vector address for when an uncorrectable error is detected for an active IRQ or FIQ.

Table 14-13. DEDVEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address.
1-0	RES23	R	0h	RESERVE FIELD

14.10.12 RAW Register (Offset = 400h) [Reset = 00000000h]

RAW is shown in Table 14-14.

Return to the Summary Table.

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 14-14. RAW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

14.10.13 STS Register (Offset = 404h) [Reset = 00000000h]

STS is shown in Table 14-15.

Return to the Summary Table.

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 14-15. STS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

14.10.14 INTR_EN_SET Register (Offset = 408h) [Reset = 00000000h]

INTR_EN_SET is shown in Table 14-16.

Return to the Summary Table.

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 14-16. INTR_EN_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

14.10.15 INTER_EN_CLR Register (Offset = 40Ch) [Reset = 00000000h]

INTER_EN_CLR is shown in Table 14-17.

Return to the Summary Table.

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 14-17. INTER_EN_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

14.10.16 IRQSTS Register (Offset = 410h) [Reset = 00000000h]

IRQSTS is shown in Table 14-18.

Return to the Summary Table.

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 14-18. IRQSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an IRQ Read 1 Active/Pending, Enabled, and IRQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if IRQ)

14.10.17 FIQSTS Register (Offset = 414h) [Reset = 00000000h]

FIQSTS is shown in Table 14-19.

Return to the Summary Table.

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 14-19. FIQSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

14.10.18 INTMAP Register (Offset = 418h) [Reset = 00000000h]

INTMAP is shown in Table 14-20.

Return to the Summary Table.

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 14-20. INTMAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

14.10.19 INTTYPE Register (Offset = 41Ch) [Reset = 00000000h]

INTTYPE is shown in Table 14-21.

Return to the Summary Table.

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

Table 14-21. INTTYPE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

14.10.20 RAW_1 Register (Offset = 420h) [Reset = 00000000h]

RAW_1 is shown in Table 14-22.

Return to the Summary Table.

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 14-22. RAW_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

14.10.21 STS_1 Register (Offset = 424h) [Reset = 00000000h]

STS_1 is shown in Table 14-23.

Return to the Summary Table.

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 14-23. STS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

14.10.22 INTR_EN_SET_1 Register (Offset = 428h) [Reset = 00000000h]

INTR_EN_SET_1 is shown in Table 14-24.

Return to the Summary Table.

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 14-24. INTR_EN_SET_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

14.10.23 INTER_EN_CLR_1 Register (Offset = 42Ch) [Reset = 00000000h]

INTER_EN_CLR_1 is shown in Table 14-25.

Return to the Summary Table.

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 14-25. INTER_EN_CLR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

14.10.24 IRQSTS_1 Register (Offset = 430h) [Reset = 00000000h]

IRQSTS_1 is shown in Table 14-26.

Return to the Summary Table.

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 14-26. IRQSTS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an IRQ Read 1 Active/Pending, Enabled, and IRQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if IRQ)

14.10.25 FIQSTS_1 Register (Offset = 434h) [Reset = 00000000h]

FIQSTS_1 is shown in Table 14-27.

Return to the Summary Table.

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 14-27. FIQSTS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

14.10.26 INTMAP_1 Register (Offset = 438h) [Reset = 00000000h]

INTMAP_1 is shown in Table 14-28.

Return to the Summary Table.

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 14-28. INTMAP_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

14.10.27 INTTYPE_1 Register (Offset = 43Ch) [Reset = 00000000h]

INTTYPE_1 is shown in Table 14-29.

Return to the Summary Table.

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

Table 14-29. INTTYPE_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

14.10.28 RAW_2 Register (Offset = 440h) [Reset = 00000000h]

RAW_2 is shown in Table 14-30.

Return to the Summary Table.

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 14-30. RAW_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

14.10.29 STS_2 Register (Offset = 444h) [Reset = 00000000h]

STS_2 is shown in Table 14-31.

Return to the Summary Table.

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 14-31. STS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

14.10.30 INTR_EN_SET_2 Register (Offset = 448h) [Reset = 00000000h]

INTR_EN_SET_2 is shown in Table 14-32.

Return to the Summary Table.

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 14-32. INTR_EN_SET_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

14.10.31 INTER_EN_CLR_2 Register (Offset = 44Ch) [Reset = 00000000h]

INTER_EN_CLR_2 is shown in Table 14-33.

Return to the Summary Table.

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 14-33. INTER_EN_CLR_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

14.10.32 IRQSTS_2 Register (Offset = 450h) [Reset = 00000000h]

IRQSTS_2 is shown in Table 14-34.

Return to the Summary Table.

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 14-34. IRQSTS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an IRQ Read 1 Active/Pending, Enabled, and IRQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if IRQ)

14.10.33 FIQSTS_2 Register (Offset = 454h) [Reset = 00000000h]

FIQSTS_2 is shown in Table 14-35.

Return to the Summary Table.

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 14-35. FIQSTS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

14.10.34 INTMAP_2 Register (Offset = 458h) [Reset = 00000000h]

INTMAP_2 is shown in Table 14-36.

Return to the Summary Table.

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 14-36. INTMAP_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

14.10.35 INTTYPE_2 Register (Offset = 45Ch) [Reset = 00000000h]

INTTYPE_2 is shown in Table 14-37.

Return to the Summary Table.

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

Table 14-37. INTTYPE_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

14.10.36 RAW_3 Register (Offset = 460h) [Reset = 00000000h]

RAW_3 is shown in Table 14-38.

Return to the Summary Table.

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 14-38. RAW_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

14.10.37 STS_3 Register (Offset = 464h) [Reset = 00000000h]

STS_3 is shown in Table 14-39.

Return to the Summary Table.

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 14-39. STS_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

14.10.38 INTR_EN_SET_3 Register (Offset = 468h) [Reset = 00000000h]

INTR_EN_SET_3 is shown in Table 14-40.

Return to the Summary Table.

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 14-40. INTR_EN_SET_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

14.10.39 INTER_EN_CLR_3 Register (Offset = 46Ch) [Reset = 00000000h]

INTER_EN_CLR_3 is shown in Table 14-41.

Return to the Summary Table.

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 14-41. INTER_EN_CLR_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

14.10.40 IRQSTS_3 Register (Offset = 470h) [Reset = 00000000h]

IRQSTS_3 is shown in Table 14-42.

Return to the Summary Table.

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 14-42. IRQSTS_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an IRQ Read 1 Active/Pending, Enabled, and IRQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if IRQ)

14.10.41 FIQSTS_3 Register (Offset = 474h) [Reset = 00000000h]

FIQSTS_3 is shown in Table 14-43.

Return to the Summary Table.

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 14-43. FIQSTS_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

14.10.42 INTMAP_3 Register (Offset = 478h) [Reset = 00000000h]

INTMAP_3 is shown in Table 14-44.

Return to the Summary Table.

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 14-44. INTMAP_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

14.10.43 INTTYPE_3 Register (Offset = 47Ch) [Reset = 00000000h]

INTTYPE_3 is shown in Table 14-45.

Return to the Summary Table.

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

Table 14-45. INTTYPE_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

14.10.44 RAW_4 Register (Offset = 480h) [Reset = 00000000h]

RAW_4 is shown in Table 14-46.

Return to the Summary Table.

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 14-46. RAW_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

14.10.45 STS_4 Register (Offset = 484h) [Reset = 00000000h]

STS_4 is shown in Table 14-47.

Return to the Summary Table.

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 14-47. STS_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

14.10.46 INTR_EN_SET_4 Register (Offset = 488h) [Reset = 00000000h]

INTR_EN_SET_4 is shown in Table 14-48.

Return to the Summary Table.

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 14-48. INTR_EN_SET_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

14.10.47 INTER_EN_CLR_4 Register (Offset = 48Ch) [Reset = 00000000h]

INTER_EN_CLR_4 is shown in Table 14-49.

Return to the Summary Table.

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 14-49. INTER_EN_CLR_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

14.10.48 IRQSTS_4 Register (Offset = 490h) [Reset = 00000000h]

IRQSTS_4 is shown in Table 14-50.

Return to the Summary Table.

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 14-50. IRQSTS_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an IRQ Read 1 Active/Pending, Enabled, and IRQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if IRQ)

14.10.49 FIQSTS_4 Register (Offset = 494h) [Reset = 00000000h]

FIQSTS_4 is shown in Table 14-51.

Return to the Summary Table.

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 14-51. FIQSTS_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

14.10.50 INTMAP_4 Register (Offset = 498h) [Reset = 00000000h]

INTMAP_4 is shown in Table 14-52.

Return to the Summary Table.

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 14-52. INTMAP_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

14.10.51 INTTYPE_4 Register (Offset = 49Ch) [Reset = 00000000h]

INTTYPE_4 is shown in Table 14-53.

Return to the Summary Table.

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

Table 14-53. INTTYPE_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

14.10.52 RAW_5 Register (Offset = 4A0h) [Reset = 00000000h]

RAW_5 is shown in Table 14-54.

Return to the Summary Table.

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 14-54. RAW_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

14.10.53 STS_5 Register (Offset = 4A4h) [Reset = 00000000h]

STS_5 is shown in Table 14-55.

Return to the Summary Table.

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 14-55. STS_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

14.10.54 INTR_EN_SET_5 Register (Offset = 4A8h) [Reset = 00000000h]

INTR_EN_SET_5 is shown in Table 14-56.

Return to the Summary Table.

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 14-56. INTR_EN_SET_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

14.10.55 INTER_EN_CLR_5 Register (Offset = 4ACh) [Reset = 00000000h]

INTER_EN_CLR_5 is shown in Table 14-57.

Return to the Summary Table.

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 14-57. INTER_EN_CLR_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

14.10.56 IRQSTS_5 Register (Offset = 4B0h) [Reset = 00000000h]

IRQSTS_5 is shown in Table 14-58.

Return to the Summary Table.

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 14-58. IRQSTS_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an IRQ Read 1 Active/Pending, Enabled, and IRQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if IRQ)

14.10.57 FIQSTS_5 Register (Offset = 4B4h) [Reset = 00000000h]

FIQSTS_5 is shown in Table 14-59.

Return to the Summary Table.

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 14-59. FIQSTS_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

14.10.58 INTMAP_5 Register (Offset = 4B8h) [Reset = 00000000h]

INTMAP_5 is shown in Table 14-60.

Return to the Summary Table.

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 14-60. INTMAP_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

14.10.59 INTTYPE_5 Register (Offset = 4BCh) [Reset = 00000000h]

INTTYPE_5 is shown in Table 14-61.

Return to the Summary Table.

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

Table 14-61. INTTYPE_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

14.10.60 RAW_6 Register (Offset = 4C0h) [Reset = 00000000h]

RAW_6 is shown in Table 14-62.

Return to the Summary Table.

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 14-62. RAW_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

14.10.61 STS_6 Register (Offset = 4C4h) [Reset = 00000000h]

STS_6 is shown in Table 14-63.

Return to the Summary Table.

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 14-63. STS_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

14.10.62 INTR_EN_SET_6 Register (Offset = 4C8h) [Reset = 00000000h]

INTR_EN_SET_6 is shown in Table 14-64.

Return to the Summary Table.

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 14-64. INTR_EN_SET_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

14.10.63 INTER_EN_CLR_6 Register (Offset = 4CCh) [Reset = 00000000h]

INTER_EN_CLR_6 is shown in Table 14-65.

Return to the Summary Table.

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 14-65. INTER_EN_CLR_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

14.10.64 IRQSTS_6 Register (Offset = 4D0h) [Reset = 00000000h]

IRQSTS_6 is shown in Table 14-66.

Return to the Summary Table.

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 14-66. IRQSTS_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an IRQ Read 1 Active/Pending, Enabled, and IRQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if IRQ)

14.10.65 FIQSTS_6 Register (Offset = 4D4h) [Reset = 00000000h]

FIQSTS_6 is shown in Table 14-67.

Return to the Summary Table.

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 14-67. FIQSTS_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

14.10.66 INTMAP_6 Register (Offset = 4D8h) [Reset = 00000000h]

INTMAP_6 is shown in Table 14-68.

Return to the Summary Table.

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 14-68. INTMAP_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

14.10.67 INTTYPE_6 Register (Offset = 4DCh) [Reset = 00000000h]

INTTYPE_6 is shown in Table 14-69.

Return to the Summary Table.

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

Table 14-69. INTTYPE_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

14.10.68 RAW_7 Register (Offset = 4E0h) [Reset = 00000000h]

RAW_7 is shown in Table 14-70.

Return to the Summary Table.

Group M Interrupt Raw Status/Set Register (M is 0 to 7) h400 + M x h20 + h00

Table 14-70. RAW_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

14.10.69 STS_7 Register (Offset = 4E4h) [Reset = 00000000h]

STS_7 is shown in Table 14-71.

Return to the Summary Table.

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

Table 14-71. STS_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

14.10.70 INTR_EN_SET_7 Register (Offset = 4E8h) [Reset = 00000000h]

INTR_EN_SET_7 is shown in Table 14-72.

Return to the Summary Table.

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

Table 14-72. INTR_EN_SET_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

14.10.71 INTER_EN_CLR_7 Register (Offset = 4ECh) [Reset = 00000000h]

INTER_EN_CLR_7 is shown in Table 14-73.

Return to the Summary Table.

Group M Interrupt Enabled Clear Register (M is 0 to 7) h400 + M x h20 + h0C

Table 14-73. INTER_EN_CLR_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

14.10.72 IRQSTS_7 Register (Offset = 4F0h) [Reset = 00000000h]

IRQSTS_7 is shown in Table 14-74.

Return to the Summary Table.

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

Table 14-74. IRQSTS_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an IRQ Read 1 Active/Pending, Enabled, and IRQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if IRQ)

14.10.73 FIQSTS_7 Register (Offset = 4F4h) [Reset = 00000000h]

FIQSTS_7 is shown in Table 14-75.

Return to the Summary Table.

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

Table 14-75. FIQSTS_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

14.10.74 INTMAP_7 Register (Offset = 4F8h) [Reset = 00000000h]

INTMAP_7 is shown in Table 14-76.

Return to the Summary Table.

Group M Interrupt Map Register (M is 0 to 7) h400 + M x h20 + h18

Table 14-76. INTMAP_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where Q = Mx32+Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt

14.10.75 INTTYPE_7 Register (Offset = 4FCh) [Reset = 00000000h]

INTTYPE_7 is shown in Table 14-77.

Return to the Summary Table.

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

Table 14-77. INTTYPE_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling). The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse

14.10.76 INTPRIORITY Register (Offset = 1000h) [Reset = 00000000h]

INTPRIORITY is shown in Table 14-78.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h4

Table 14-78. INTPRIORITY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.77 INTPRIORITY_1 Register (Offset = 1004h) [Reset = 00000000h]

INTPRIORITY_1 is shown in Table 14-79.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h5

Table 14-79. INTPRIORITY_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.78 INTPRIORITY_2 Register (Offset = 1008h) [Reset = 00000000h]

INTPRIORITY_2 is shown in Table 14-80.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h6

Table 14-80. INTPRIORITY_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.79 INTPRIORITY_3 Register (Offset = 100Ch) [Reset = 00000000h]

INTPRIORITY_3 is shown in Table 14-81.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h7

Table 14-81. INTPRIORITY_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.80 INTPRIORITY_4 Register (Offset = 1010h) [Reset = 00000000h]

INTPRIORITY_4 is shown in Table 14-82.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h8

Table 14-82. INTPRIORITY_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.81 INTPRIORITY_5 Register (Offset = 1014h) [Reset = 00000000h]

INTPRIORITY_5 is shown in Table 14-83.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h9

Table 14-83. INTPRIORITY_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.82 INTPRIORITY_6 Register (Offset = 1018h) [Reset = 00000000h]

INTPRIORITY_6 is shown in Table 14-84.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h10

Table 14-84. INTPRIORITY_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.83 INTPRIORITY_7 Register (Offset = 101Ch) [Reset = 00000000h]

INTPRIORITY_7 is shown in Table 14-85.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h11

Table 14-85. INTPRIORITY_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.84 INTPRIORITY_8 Register (Offset = 1020h) [Reset = 00000000h]

INTPRIORITY_8 is shown in Table 14-86.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h12

Table 14-86. INTPRIORITY_8 Register Field Descriptions

Bit	Field	Type	Reset	Description

3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.99 INTPRIORITY_23 Register (Offset = 105Ch) [Reset = 00000000h]

INTPRIORITY_23 is shown in Table 14-101.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h27

Table 14-101. INTPRIORITY_23 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.100 INTPRIORITY_24 Register (Offset = 1060h) [Reset = 00000000h]

INTPRIORITY_24 is shown in Table 14-102.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h28

Table 14-102. INTPRIORITY_24 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.101 INTPRIORITY_25 Register (Offset = 1064h) [Reset = 00000000h]

INTPRIORITY_25 is shown in Table 14-103.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h29

Table 14-103. INTPRIORITY_25 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.102 INTPRIORITY_26 Register (Offset = 1068h) [Reset = 00000000h]

INTPRIORITY_26 is shown in Table 14-104.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h30

Table 14-104. INTPRIORITY_26 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.103 INTPRIORITY_27 Register (Offset = 106Ch) [Reset = 00000000h]

INTPRIORITY_27 is shown in Table 14-105.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h31

Table 14-105. INTPRIORITY_27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.104 INTPRIORITY_28 Register (Offset = 1070h) [Reset = 00000000h]

INTPRIORITY_28 is shown in Table 14-106.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h32

Table 14-106. INTPRIORITY_28 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.105 INTPRIORITY_29 Register (Offset = 1074h) [Reset = 00000000h]

INTPRIORITY_29 is shown in Table 14-107.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h33

Table 14-107. INTPRIORITY_29 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.106 INTPRIORITY_30 Register (Offset = 1078h) [Reset = 00000000h]

INTPRIORITY_30 is shown in Table 14-108.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h34

Table 14-108. INTPRIORITY_30 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.107 INTPRIORITY_31 Register (Offset = 107Ch) [Reset = 00000000h]

INTPRIORITY_31 is shown in Table 14-109.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h35

Table 14-109. INTPRIORITY_31 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.108 INTPRIORITY_32 Register (Offset = 1080h) [Reset = 00000000h]

INTPRIORITY_32 is shown in Table 14-110.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h36

Table 14-110. INTPRIORITY_32 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.109 INTPRIORITY_33 Register (Offset = 1084h) [Reset = 00000000h]

INTPRIORITY_33 is shown in Table 14-111.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h37

Table 14-111. INTPRIORITY_33 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.110 INTPRIORITY_34 Register (Offset = 1088h) [Reset = 00000000h]

INTPRIORITY_34 is shown in Table 14-112.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h38

Table 14-112. INTPRIORITY_34 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.111 INTPRIORITY_35 Register (Offset = 108Ch) [Reset = 00000000h]

INTPRIORITY_35 is shown in Table 14-113.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h39

Table 14-113. INTPRIORITY_35 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.112 INTPRIORITY_36 Register (Offset = 1090h) [Reset = 00000000h]

INTPRIORITY_36 is shown in Table 14-114.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h40

Table 14-114. INTPRIORITY_36 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.113 INTPRIORITY_37 Register (Offset = 1094h) [Reset = 00000000h]

INTPRIORITY_37 is shown in Table 14-115.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h41

Table 14-115. INTPRIORITY_37 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.114 INTPRIORITY_38 Register (Offset = 1098h) [Reset = 00000000h]

INTPRIORITY_38 is shown in Table 14-116.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h42

Table 14-116. INTPRIORITY_38 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.115 INTPRIORITY_39 Register (Offset = 109Ch) [Reset = 00000000h]

INTPRIORITY_39 is shown in Table 14-117.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h43

Table 14-117. INTPRIORITY_39 Register Field Descriptions

Bit	Field	Type	Reset	Description

INTPRIORITY_61 is shown in Table 14-139.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h65

Table 14-139. INTPRIORITY_61 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.138 INTPRIORITY_62 Register (Offset = 10F8h) [Reset = 00000000h]

INTPRIORITY_62 is shown in Table 14-140.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h66

Table 14-140. INTPRIORITY_62 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.139 INTPRIORITY_63 Register (Offset = 10FCh) [Reset = 00000000h]

INTPRIORITY_63 is shown in Table 14-141.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h67

Table 14-141. INTPRIORITY_63 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.140 INTPRIORITY_64 Register (Offset = 1100h) [Reset = 00000000h]

INTPRIORITY_64 is shown in Table 14-142.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h68

Table 14-142. INTPRIORITY_64 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.141 INTPRIORITY_65 Register (Offset = 1104h) [Reset = 00000000h]

INTPRIORITY_65 is shown in Table 14-143.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h69

Table 14-143. INTPRIORITY_65 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.142 INTPRIORITY_66 Register (Offset = 1108h) [Reset = 00000000h]

INTPRIORITY_66 is shown in Table 14-144.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h70

Table 14-144. INTPRIORITY_66 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.143 INTPRIORITY_67 Register (Offset = 110Ch) [Reset = 00000000h]

INTPRIORITY_67 is shown in Table 14-145.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h71

Table 14-145. INTPRIORITY_67 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.144 INTPRIORITY_68 Register (Offset = 1110h) [Reset = 00000000h]

INTPRIORITY_68 is shown in Table 14-146.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h72

Table 14-146. INTPRIORITY_68 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.145 INTPRIORITY_69 Register (Offset = 1114h) [Reset = 00000000h]

INTPRIORITY_69 is shown in Table 14-147.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h73

Table 14-147. INTPRIORITY_69 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.146 INTPRIORITY_70 Register (Offset = 1118h) [Reset = 00000000h]

INTPRIORITY_70 is shown in Table 14-148.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h74

Table 14-148. INTPRIORITY_70 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.147 INTPRIORITY_71 Register (Offset = 111Ch) [Reset = 00000000h]

INTPRIORITY_71 is shown in Table 14-149.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h75

Table 14-149. INTPRIORITY_71 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.148 INTPRIORITY_72 Register (Offset = 1120h) [Reset = 00000000h]

INTPRIORITY_72 is shown in Table 14-150.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h76

Table 14-150. INTPRIORITY_72 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.149 INTPRIORITY_73 Register (Offset = 1124h) [Reset = 00000000h]

INTPRIORITY_73 is shown in Table 14-151.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h77

Table 14-151. INTPRIORITY_73 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.150 INTPRIORITY_74 Register (Offset = 1128h) [Reset = 00000000h]

INTPRIORITY_74 is shown in Table 14-152.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h78

Table 14-152. INTPRIORITY_74 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.151 INTPRIORITY_75 Register (Offset = 112Ch) [Reset = 00000000h]

INTPRIORITY_75 is shown in Table 14-153.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h79

Table 14-153. INTPRIORITY_75 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.152 INTPRIORITY_76 Register (Offset = 1130h) [Reset = 00000000h]

INTPRIORITY_76 is shown in Table 14-154.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h80

Table 14-154. INTPRIORITY_76 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.153 INTPRIORITY_77 Register (Offset = 1134h) [Reset = 00000000h]

INTPRIORITY_77 is shown in Table 14-155.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h81

Table 14-155. INTPRIORITY_77 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.154 INTPRIORITY_78 Register (Offset = 1138h) [Reset = 00000000h]

INTPRIORITY_78 is shown in Table 14-156.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h82

Table 14-156. INTPRIORITY_78 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.155 INTPRIORITY_79 Register (Offset = 113Ch) [Reset = 00000000h]

INTPRIORITY_79 is shown in Table 14-157.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h83

Table 14-157. INTPRIORITY_79 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.156 INTPRIORITY_80 Register (Offset = 1140h) [Reset = 00000000h]

INTPRIORITY_80 is shown in Table 14-158.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h84

Table 14-158. INTPRIORITY_80 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.157 INTPRIORITY_81 Register (Offset = 1144h) [Reset = 00000000h]

INTPRIORITY_81 is shown in Table 14-159.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h85

Table 14-159. INTPRIORITY_81 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.158 INTPRIORITY_82 Register (Offset = 1148h) [Reset = 00000000h]

INTPRIORITY_82 is shown in Table 14-160.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h86

Table 14-160. INTPRIORITY_82 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.159 INTPRIORITY_83 Register (Offset = 114Ch) [Reset = 00000000h]

INTPRIORITY_83 is shown in Table 14-161.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h87

Table 14-161. INTPRIORITY_83 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.160 INTPRIORITY_84 Register (Offset = 1150h) [Reset = 00000000h]

INTPRIORITY_84 is shown in Table 14-162.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h88

Table 14-162. INTPRIORITY_84 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.161 INTPRIORITY_85 Register (Offset = 1154h) [Reset = 00000000h]

INTPRIORITY_85 is shown in Table 14-163.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h89

Table 14-163. INTPRIORITY_85 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.162 INTPRIORITY_86 Register (Offset = 1158h) [Reset = 00000000h]

INTPRIORITY_86 is shown in Table 14-164.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h90

Table 14-164. INTPRIORITY_86 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.163 INTPRIORITY_87 Register (Offset = 115Ch) [Reset = 00000000h]

INTPRIORITY_87 is shown in Table 14-165.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h91

Table 14-165. INTPRIORITY_87 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.164 INTPRIORITY_88 Register (Offset = 1160h) [Reset = 00000000h]

INTPRIORITY_88 is shown in Table 14-166.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h92

Table 14-166. INTPRIORITY_88 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.165 INTPRIORITY_89 Register (Offset = 1164h) [Reset = 00000000h]

INTPRIORITY_89 is shown in Table 14-167.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h93

Table 14-167. INTPRIORITY_89 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.166 INTPRIORITY_90 Register (Offset = 1168h) [Reset = 00000000h]

INTPRIORITY_90 is shown in Table 14-168.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h94

Table 14-168. INTPRIORITY_90 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.167 INTPRIORITY_91 Register (Offset = 116Ch) [Reset = 00000000h]

INTPRIORITY_91 is shown in Table 14-169.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h95

Table 14-169. INTPRIORITY_91 Register Field Descriptions

31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.176 INTPRIORITY_100 Register (Offset = 1190h) [Reset = 00000000h]

INTPRIORITY_100 is shown in Table 14-178.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h104

Table 14-178. INTPRIORITY_100 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.177 INTPRIORITY_101 Register (Offset = 1194h) [Reset = 00000000h]

INTPRIORITY_101 is shown in Table 14-179.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h105

Table 14-179. INTPRIORITY_101 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.178 INTPRIORITY_102 Register (Offset = 1198h) [Reset = 00000000h]

INTPRIORITY_102 is shown in Table 14-180.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h106

Table 14-180. INTPRIORITY_102 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.179 INTPRIORITY_103 Register (Offset = 119Ch) [Reset = 00000000h]

INTPRIORITY_103 is shown in Table 14-181.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h107

Table 14-181. INTPRIORITY_103 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.180 INTPRIORITY_104 Register (Offset = 11A0h) [Reset = 00000000h]

INTPRIORITY_104 is shown in Table 14-182.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h108

Table 14-182. INTPRIORITY_104 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.181 INTPRIORITY_105 Register (Offset = 11A4h) [Reset = 00000000h]

INTPRIORITY_105 is shown in Table 14-183.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h109

Table 14-183. INTPRIORITY_105 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.182 INTPRIORITY_106 Register (Offset = 11A8h) [Reset = 00000000h]

INTPRIORITY_106 is shown in Table 14-184.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h110

Table 14-184. INTPRIORITY_106 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.214 INTPRIORITY_138 Register (Offset = 1228h) [Reset = 00000000h]

INTPRIORITY_138 is shown in Table 14-216.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h142

Table 14-216. INTPRIORITY_138 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.215 INTPRIORITY_139 Register (Offset = 122Ch) [Reset = 00000000h]

INTPRIORITY_139 is shown in Table 14-217.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h143

Table 14-217. INTPRIORITY_139 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.216 INTPRIORITY_140 Register (Offset = 1230h) [Reset = 00000000h]

INTPRIORITY_140 is shown in Table 14-218.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h144

Table 14-218. INTPRIORITY_140 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.217 INTPRIORITY_141 Register (Offset = 1234h) [Reset = 00000000h]

INTPRIORITY_141 is shown in Table 14-219.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h145

Table 14-219. INTPRIORITY_141 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.218 INTPRIORITY_142 Register (Offset = 1238h) [Reset = 00000000h]

INTPRIORITY_142 is shown in Table 14-220.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h146

Table 14-220. INTPRIORITY_142 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.219 INTPRIORITY_143 Register (Offset = 123Ch) [Reset = 00000000h]

INTPRIORITY_143 is shown in Table 14-221.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h147

Table 14-221. INTPRIORITY_143 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.220 INTPRIORITY_144 Register (Offset = 1240h) [Reset = 00000000h]

INTPRIORITY_144 is shown in Table 14-222.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h148

Table 14-222. INTPRIORITY_144 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.221 INTPRIORITY_145 Register (Offset = 1244h) [Reset = 00000000h]

INTPRIORITY_145 is shown in Table 14-223.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h149

Table 14-223. INTPRIORITY_145 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.222 INTPRIORITY_146 Register (Offset = 1248h) [Reset = 00000000h]

INTPRIORITY_146 is shown in Table 14-224.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h150

Table 14-224. INTPRIORITY_146 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.223 INTPRIORITY_147 Register (Offset = 124Ch) [Reset = 00000000h]

INTPRIORITY_147 is shown in Table 14-225.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h151

Table 14-225. INTPRIORITY_147 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.224 INTPRIORITY_148 Register (Offset = 1250h) [Reset = 00000000h]

INTPRIORITY_148 is shown in Table 14-226.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h152

Table 14-226. INTPRIORITY_148 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.225 INTPRIORITY_149 Register (Offset = 1254h) [Reset = 00000000h]

INTPRIORITY_149 is shown in Table 14-227.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h153

Table 14-227. INTPRIORITY_149 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.226 INTPRIORITY_150 Register (Offset = 1258h) [Reset = 00000000h]

INTPRIORITY_150 is shown in Table 14-228.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h154

Table 14-228. INTPRIORITY_150 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.227 INTPRIORITY_151 Register (Offset = 125Ch) [Reset = 00000000h]

INTPRIORITY_151 is shown in Table 14-229.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h155

Table 14-229. INTPRIORITY_151 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.228 INTPRIORITY_152 Register (Offset = 1260h) [Reset = 00000000h]

INTPRIORITY_152 is shown in Table 14-230.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h156

Table 14-230. INTPRIORITY_152 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.229 INTPRIORITY_153 Register (Offset = 1264h) [Reset = 00000000h]

INTPRIORITY_153 is shown in Table 14-231.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h157

Table 14-231. INTPRIORITY_153 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.230 INTPRIORITY_154 Register (Offset = 1268h) [Reset = 00000000h]

INTPRIORITY_154 is shown in Table 14-232.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h158

Table 14-232. INTPRIORITY_154 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.231 INTPRIORITY_155 Register (Offset = 126Ch) [Reset = 00000000h]

INTPRIORITY_155 is shown in Table 14-233.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h159

Table 14-233. INTPRIORITY_155 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.232 INTPRIORITY_156 Register (Offset = 1270h) [Reset = 00000000h]

INTPRIORITY_156 is shown in Table 14-234.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h160

Table 14-234. INTPRIORITY_156 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.233 INTPRIORITY_157 Register (Offset = 1274h) [Reset = 00000000h]

INTPRIORITY_157 is shown in Table 14-235.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h161

Table 14-235. INTPRIORITY_157 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.234 INTPRIORITY_158 Register (Offset = 1278h) [Reset = 00000000h]

INTPRIORITY_158 is shown in Table 14-236.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h162

Table 14-236. INTPRIORITY_158 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.235 INTPRIORITY_159 Register (Offset = 127Ch) [Reset = 00000000h]

INTPRIORITY_159 is shown in Table 14-237.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h163

Table 14-237. INTPRIORITY_159 Register Field Descriptions

Bit	Field	Type	Reset	Description

Table 14-253. INTPRIORITY_175 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.252 INTPRIORITY_176 Register (Offset = 12C0h) [Reset = 00000000h]

INTPRIORITY_176 is shown in Table 14-254.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h180

Table 14-254. INTPRIORITY_176 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.253 INTPRIORITY_177 Register (Offset = 12C4h) [Reset = 00000000h]

INTPRIORITY_177 is shown in Table 14-255.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h181

Table 14-255. INTPRIORITY_177 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.254 INTPRIORITY_178 Register (Offset = 12C8h) [Reset = 00000000h]

INTPRIORITY_178 is shown in Table 14-256.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h182

Table 14-256. INTPRIORITY_178 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.255 INTPRIORITY_179 Register (Offset = 12CCh) [Reset = 00000000h]

INTPRIORITY_179 is shown in Table 14-257.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h183

Table 14-257. INTPRIORITY_179 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.256 INTPRIORITY_180 Register (Offset = 12D0h) [Reset = 00000000h]

INTPRIORITY_180 is shown in Table 14-258.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h184

Table 14-258. INTPRIORITY_180 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.257 INTPRIORITY_181 Register (Offset = 12D4h) [Reset = 00000000h]

INTPRIORITY_181 is shown in Table 14-259.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h185

Table 14-259. INTPRIORITY_181 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.258 INTPRIORITY_182 Register (Offset = 12D8h) [Reset = 00000000h]

INTPRIORITY_182 is shown in Table 14-260.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h186

Table 14-260. INTPRIORITY_182 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.259 INTPRIORITY_183 Register (Offset = 12DCh) [Reset = 00000000h]

INTPRIORITY_183 is shown in Table 14-261.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h187

Table 14-261. INTPRIORITY_183 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.260 INTPRIORITY_184 Register (Offset = 12E0h) [Reset = 00000000h]

INTPRIORITY_184 is shown in Table 14-262.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h188

Table 14-262. INTPRIORITY_184 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.261 INTPRIORITY_185 Register (Offset = 12E4h) [Reset = 00000000h]

INTPRIORITY_185 is shown in Table 14-263.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h189

Table 14-263. INTPRIORITY_185 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.262 INTPRIORITY_186 Register (Offset = 12E8h) [Reset = 00000000h]

INTPRIORITY_186 is shown in Table 14-264.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h190

Table 14-264. INTPRIORITY_186 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.263 INTPRIORITY_187 Register (Offset = 12ECh) [Reset = 00000000h]

INTPRIORITY_187 is shown in Table 14-265.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h191

Table 14-265. INTPRIORITY_187 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.264 INTPRIORITY_188 Register (Offset = 12F0h) [Reset = 00000000h]

INTPRIORITY_188 is shown in Table 14-266.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h192

Table 14-266. INTPRIORITY_188 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.265 INTPRIORITY_189 Register (Offset = 12F4h) [Reset = 00000000h]

INTPRIORITY_189 is shown in Table 14-267.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h193

Table 14-267. INTPRIORITY_189 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.266 INTPRIORITY_190 Register (Offset = 12F8h) [Reset = 00000000h]

INTPRIORITY_190 is shown in Table 14-268.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h194

Table 14-268. INTPRIORITY_190 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.267 INTPRIORITY_191 Register (Offset = 12FCh) [Reset = 00000000h]

INTPRIORITY_191 is shown in Table 14-269.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h195

Table 14-269. INTPRIORITY_191 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.268 INTPRIORITY_192 Register (Offset = 1300h) [Reset = 00000000h]

INTPRIORITY_192 is shown in Table 14-270.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h196

Table 14-270. INTPRIORITY_192 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.269 INTPRIORITY_193 Register (Offset = 1304h) [Reset = 00000000h]

INTPRIORITY_193 is shown in Table 14-271.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h197

Table 14-271. INTPRIORITY_193 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.270 INTPRIORITY_194 Register (Offset = 1308h) [Reset = 00000000h]

INTPRIORITY_194 is shown in Table 14-272.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h198

Table 14-272. INTPRIORITY_194 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.271 INTPRIORITY_195 Register (Offset = 130Ch) [Reset = 00000000h]

INTPRIORITY_195 is shown in Table 14-273.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h199

Table 14-273. INTPRIORITY_195 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.272 INTPRIORITY_196 Register (Offset = 1310h) [Reset = 00000000h]

INTPRIORITY_196 is shown in Table 14-274.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h200

Table 14-274. INTPRIORITY_196 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.273 INTPRIORITY_197 Register (Offset = 1314h) [Reset = 00000000h]

INTPRIORITY_197 is shown in Table 14-275.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h201

Table 14-275. INTPRIORITY_197 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.274 INTPRIORITY_198 Register (Offset = 1318h) [Reset = 00000000h]

INTPRIORITY_198 is shown in Table 14-276.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h202

Table 14-276. INTPRIORITY_198 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.275 INTPRIORITY_199 Register (Offset = 131Ch) [Reset = 00000000h]

INTPRIORITY_199 is shown in Table 14-277.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h203

Table 14-277. INTPRIORITY_199 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.276 INTPRIORITY_200 Register (Offset = 1320h) [Reset = 00000000h]

INTPRIORITY_200 is shown in Table 14-278.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h204

Table 14-278. INTPRIORITY_200 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.277 INTPRIORITY_201 Register (Offset = 1324h) [Reset = 00000000h]

INTPRIORITY_201 is shown in Table 14-279.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h205

Table 14-279. INTPRIORITY_201 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.278 INTPRIORITY_202 Register (Offset = 1328h) [Reset = 00000000h]

INTPRIORITY_202 is shown in Table 14-280.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h206

Table 14-280. INTPRIORITY_202 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.279 INTPRIORITY_203 Register (Offset = 132Ch) [Reset = 00000000h]

INTPRIORITY_203 is shown in Table 14-281.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h207

Table 14-281. INTPRIORITY_203 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.280 INTPRIORITY_204 Register (Offset = 1330h) [Reset = 00000000h]

INTPRIORITY_204 is shown in Table 14-282.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h208

Table 14-282. INTPRIORITY_204 Register Field Descriptions

Bit	Field	Type	Reset	Description

14.10.289 INTPRIORITY_213 Register (Offset = 1354h) [Reset = 00000000h]

INTPRIORITY_213 is shown in Table 14-291.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h217

Table 14-291. INTPRIORITY_213 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.290 INTPRIORITY_214 Register (Offset = 1358h) [Reset = 00000000h]

INTPRIORITY_214 is shown in Table 14-292.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h218

Table 14-292. INTPRIORITY_214 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.291 INTPRIORITY_215 Register (Offset = 135Ch) [Reset = 00000000h]

INTPRIORITY_215 is shown in Table 14-293.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h219

Table 14-293. INTPRIORITY_215 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.292 INTPRIORITY_216 Register (Offset = 1360h) [Reset = 00000000h]

INTPRIORITY_216 is shown in Table 14-294.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h220

Table 14-294. INTPRIORITY_216 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.293 INTPRIORITY_217 Register (Offset = 1364h) [Reset = 00000000h]

INTPRIORITY_217 is shown in Table 14-295.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h221

Table 14-295. INTPRIORITY_217 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.294 INTPRIORITY_218 Register (Offset = 1368h) [Reset = 00000000h]

INTPRIORITY_218 is shown in Table 14-296.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h222

Table 14-296. INTPRIORITY_218 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.295 INTPRIORITY_219 Register (Offset = 136Ch) [Reset = 00000000h]

INTPRIORITY_219 is shown in Table 14-297.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h223

Table 14-297. INTPRIORITY_219 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.296 INTPRIORITY_220 Register (Offset = 1370h) [Reset = 00000000h]

INTPRIORITY_220 is shown in Table 14-298.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h224

Table 14-298. INTPRIORITY_220 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.297 INTPRIORITY_221 Register (Offset = 1374h) [Reset = 00000000h]

INTPRIORITY_221 is shown in Table 14-299.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h225

Table 14-299. INTPRIORITY_221 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.298 INTPRIORITY_222 Register (Offset = 1378h) [Reset = 00000000h]

INTPRIORITY_222 is shown in Table 14-300.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h226

Table 14-300. INTPRIORITY_222 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.299 INTPRIORITY_223 Register (Offset = 137Ch) [Reset = 00000000h]

INTPRIORITY_223 is shown in Table 14-301.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h227

Table 14-301. INTPRIORITY_223 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.300 INTPRIORITY_224 Register (Offset = 1380h) [Reset = 00000000h]

INTPRIORITY_224 is shown in Table 14-302.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h228

Table 14-302. INTPRIORITY_224 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.301 INTPRIORITY_225 Register (Offset = 1384h) [Reset = 00000000h]

INTPRIORITY_225 is shown in Table 14-303.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h229

Table 14-303. INTPRIORITY_225 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.302 INTPRIORITY_226 Register (Offset = 1388h) [Reset = 00000000h]

INTPRIORITY_226 is shown in Table 14-304.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h230

Table 14-304. INTPRIORITY_226 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.303 INTPRIORITY_227 Register (Offset = 138Ch) [Reset = 00000000h]

INTPRIORITY_227 is shown in Table 14-305.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h231

Table 14-305. INTPRIORITY_227 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.304 INTPRIORITY_228 Register (Offset = 1390h) [Reset = 00000000h]

INTPRIORITY_228 is shown in Table 14-306.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h232

Table 14-306. INTPRIORITY_228 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.305 INTPRIORITY_229 Register (Offset = 1394h) [Reset = 00000000h]

INTPRIORITY_229 is shown in Table 14-307.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h233

Table 14-307. INTPRIORITY_229 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.306 INTPRIORITY_230 Register (Offset = 1398h) [Reset = 00000000h]

INTPRIORITY_230 is shown in Table 14-308.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h234

Table 14-308. INTPRIORITY_230 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.307 INTPRIORITY_231 Register (Offset = 139Ch) [Reset = 00000000h]

INTPRIORITY_231 is shown in Table 14-309.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h235

Table 14-309. INTPRIORITY_231 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.308 INTPRIORITY_232 Register (Offset = 13A0h) [Reset = 00000000h]

INTPRIORITY_232 is shown in Table 14-310.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h236

Table 14-310. INTPRIORITY_232 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.309 INTPRIORITY_233 Register (Offset = 13A4h) [Reset = 00000000h]

INTPRIORITY_233 is shown in Table 14-311.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h237

Table 14-311. INTPRIORITY_233 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.310 INTPRIORITY_234 Register (Offset = 13A8h) [Reset = 00000000h]

INTPRIORITY_234 is shown in Table 14-312.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h238

Table 14-312. INTPRIORITY_234 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.311 INTPRIORITY_235 Register (Offset = 13ACh) [Reset = 00000000h]

INTPRIORITY_235 is shown in Table 14-313.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h239

Table 14-313. INTPRIORITY_235 Register Field Descriptions

Bit	Field	Type	Reset	Description

14.10.327 INTPRIORITY_251 Register (Offset = 13ECh) [Reset = 00000000h]

INTPRIORITY_251 is shown in Table 14-329.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h255

Table 14-329. INTPRIORITY_251 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.328 INTPRIORITY_252 Register (Offset = 13F0h) [Reset = 00000000h]

INTPRIORITY_252 is shown in Table 14-330.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h256

Table 14-330. INTPRIORITY_252 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.329 INTPRIORITY_253 Register (Offset = 13F4h) [Reset = 00000000h]

INTPRIORITY_253 is shown in Table 14-331.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h257

Table 14-331. INTPRIORITY_253 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.330 INTPRIORITY_254 Register (Offset = 13F8h) [Reset = 00000000h]

INTPRIORITY_254 is shown in Table 14-332.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h258

Table 14-332. INTPRIORITY_254 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.331 INTPRIORITY_255 Register (Offset = 13FCh) [Reset = 00000000h]

INTPRIORITY_255 is shown in Table 14-333.

Return to the Summary Table.

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h259

Table 14-333. INTPRIORITY_255 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	0h	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

14.10.332 INTVECTOR Register (Offset = 2000h) [Reset = 00000000h]

INTVECTOR is shown in Table 14-334.

Return to the Summary Table.

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h4

Table 14-334. INTVECTOR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

14.10.333 INTVECTOR_1 Register (Offset = 2004h) [Reset = 00000000h]

INTVECTOR_1 is shown in Table 14-335.

Return to the Summary Table.

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h5

Table 14-335. INTVECTOR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

14.10.334 INTVECTOR_2 Register (Offset = 2008h) [Reset = 00000000h]

INTVECTOR_2 is shown in Table 14-336.

Return to the Summary Table.

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h6

Table 14-336. INTVECTOR_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

14.10.350 INTVECTOR_18 Register (Offset = 2048h) [Reset = 00000000h]

INTVECTOR_18 is shown in Table 14-352.

Return to the Summary Table.

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h41

Table 14-371. INTVECTOR_37 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

14.10.370 INTVECTOR_38 Register (Offset = 2098h) [Reset = 00000000h]

INTVECTOR_38 is shown in Table 14-372.

Return to the Summary Table.

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h42

Table 14-372. INTVECTOR_38 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

14.10.429 INTVECTOR_97 Register (Offset = 2184h) [Reset = 00000000h]

INTVECTOR_97 is shown in Table 14-431.

Return to the Summary Table.

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

14.10.468 INTVECTOR_136 Register (Offset = 2220h) [Reset = 00000000h]

INTVECTOR_136 is shown in Table 14-470.

Return to the Summary Table.

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

14.10.507 INTVECTOR_175 Register (Offset = 22BCh) [Reset = 00000000h]

INTVECTOR_175 is shown in Table 14-509.

Return to the Summary Table.

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1-0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

14.10.546 INTVECTOR_214 Register (Offset = 2358h) [Reset = 00000000h]

INTVECTOR_214 is shown in Table 14-548.

Return to the Summary Table.

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h218

Chapter 15

Real-Time Interrupt (RTI) and Watchdog Module

This chapter describes the functionality of the real-time interrupt (RTI) module. The RTI is designed as an operating system timer to support a real time operating system (RTOS).

Note

This chapter describes a superset implementation of the RTI module that includes features and functionality related to DMA and Timebase control. These features are dependent on the device-specific feature content. Consult your device-specific datasheet to determine the applicability of these features to your device being used.

15.1 Overview

The real-time interrupt (RTI) module provides timer functionality for operating systems and for benchmarking code. The RTI module can incorporate several counters that define the time bases needed for scheduling in the operating system.

The timers also allow you to benchmark certain areas of code by reading the values of the counters at the beginning and the end of the desired code range and calculating the difference between the values.

There are two instances of the RTI and Watchdog modules: One in the APPSS, and one in the HWASS.

15.1.1 Features

The RTI module has the following features:

- Two independent 64 bit counter blocks
- Windowed Watchdog Timer (WWDT) Feature
- Four configurable compares for generating operating system ticks or DMA requests. Each event can be driven by either counter block 0 or counter block 1.
- Fast enabling/disabling of events
- Two time stamp (capture) functions for system or peripheral interrupts, one for each counter block
- Digital windowed watchdog

The RTI does not support the following features:

- External clock supervising circuit to switch to internal prescale counter 0, if external clock source fails to increment in a predefined window.
- Capture events to capture timestamps through recording of timer status.
- Two time-stamp (capture) functions for system or peripheral interrupts, one for each counter block.
- Analog Watchdog via external RC Network to prevent for runaway code.

15.1.2 Industry Standard Compliance Statement

This module is specifically designed to fulfill the requirements for OSEK (**O**ffene **S**ysteme und deren **S**chnittstellen für die **E**lektronik im **K**raftfahrzeug, or Open Systems and the Corresponding Interfaces for Automotive Electronics) as well as OSEK/time-compliant operating systems, but is not limited to it.

15.2 Module Operation

Figure 15-1 illustrates the high level block diagram of the RTI module.

The RTI module has two independent counter blocks for generating different timebases: counter block 0 and counter block 1. The two counter blocks provide the same basic functionality.

A compare unit compares the counters with programmable values and generates four independent interrupt or DMA requests on compare matches. Each of the compare registers can be programmed to be compared to either counter block 0 or counter block 1.

The following sections describe the individual functions in more detail.

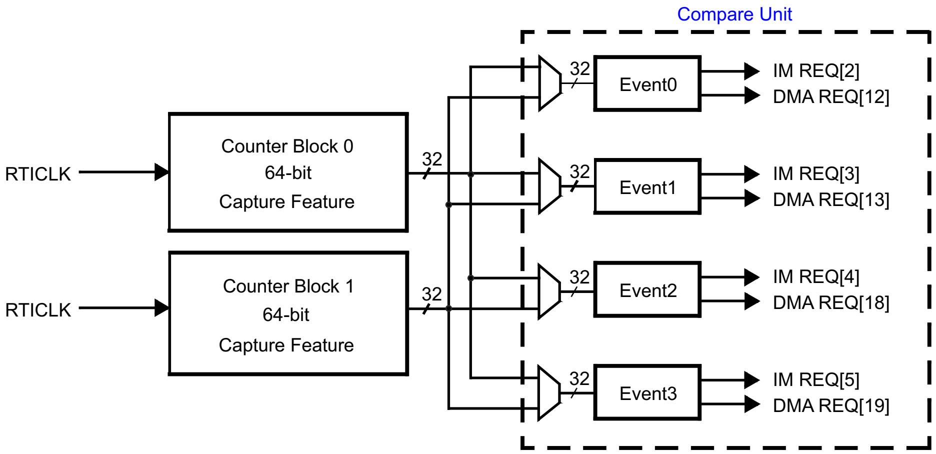

Figure 15-1. RTI Block Diagram

Note

During deep sleep entry, there is a need to disable the WDT warm reset propagation.

The WDT does **not** provide coverage in deep sleep mode. Thus, proper care must be taken by the application to ensure the WDT is not enabled when entering this mode. TOP_PRCM:RST_WDT_RESET_EN[0] must be set to 0.

15.2.1 Counter Operation

Each counter block consists of the following (see Figure 15-2):

- One 32-bit prescale counter (RTIUC0 or RTIUC1)
- One 32-bit free running counter (RTIFRC0 or RTIFRC1)

The RTIUC0/1 is driven by the RTICLK and counts up until the compare value in the compare up counter register (RTICPUC0 or RTICPUC1) is reached. When the compare matches, RTIFRC0/1 is incremented and RTIUC0/1 is reset to 0. If RTIFRC0/1 overflows, an interrupt is generated to the interrupt manager (NVIC/IM). The overflow interrupt is not intended to generate the timebase for the operating system. See Section 15.2.2 for the timebase generation. The up counter together with the compare up counter value prescale the RTI clock. The resulting formula for the frequency of the free running counter (RTIFRC0/1) is:

$$f_{RTIFRCx} = \begin{cases} \dfrac{f_{RTICLK}}{RTICPUCx + 1} & \text{when RTICPUCx} \neq 0 \\ \dfrac{f_{RTICLK}}{2^{32}+1} & \text{when RTICPUCx} = 0 \end{cases} \qquad (1)$$

Note

Setting RTICPUCx equal to zero is not recommended. Doing so will hold the Up Counter at zero for two RTICLK cycles after it overflows from 0xFFFFFFFF to zero.

The counter values can be determined by reading the respective counter registers or by generating a hardware event which captures the counter value into the respective capture register. Both functions are described in the following sections.

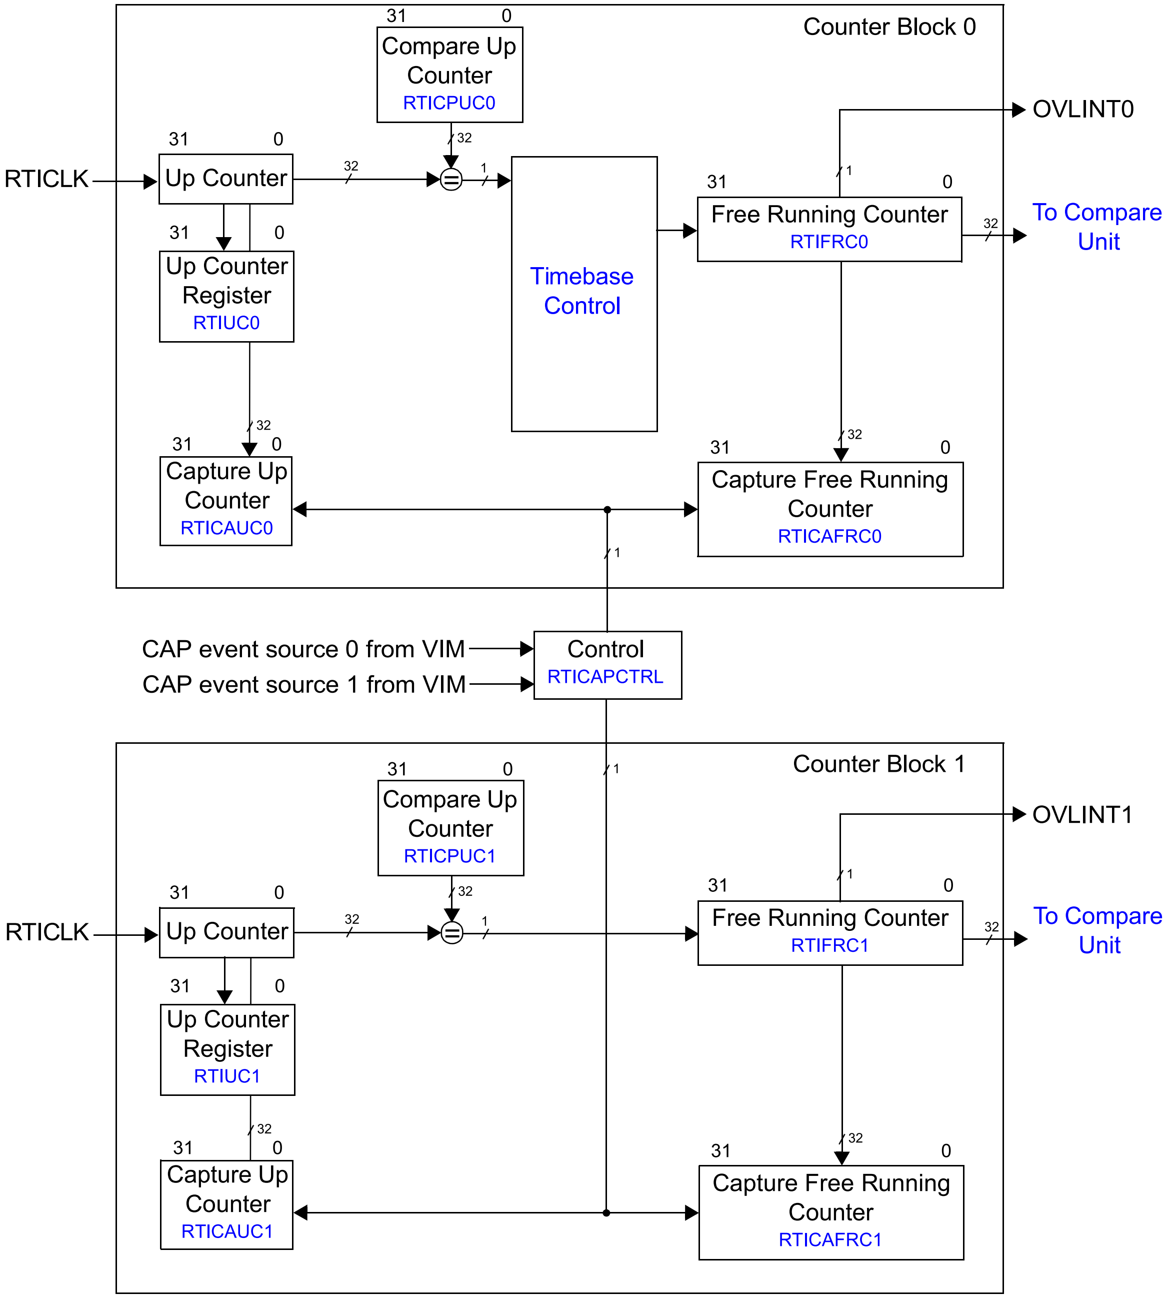

Figure 15-2. Counter Block Diagram

15.2.1.1 Counter and Capture Read Consistency

Portions of the device internal databus are 32-bits wide. If the application wants to read the 64-bit counters or the 64-bit capture values, a certain order of 32-bit read operations needs to be followed. This is to prevent one counter incrementing in between the two separate read operations to both counters.

Reading the Counters

The free running counter (RTIFRCx) must be read first. This priority will ensure that in the cycle when the CPU reads RTIFRCx, the up counter value is stored in its counter register (RTIUCx). The second read has to access the up counter register (RTIUCx), which then holds the value which corresponds to the number of RTICLK cycles that have elapsed at the time reading the free running counter register (RTIFRCx).

Note

The up counters are implemented as shadow registers. Reading RTIUCx without having read RTIFRCx first will return always the same value. RTIUCx will only be updated when RTIFRCx is read.

Reading the Capture Values

The free running counter capture register (RTICAFRCx) must be read first. This priority will ensure that in the cycle when the CPU reads RTICAFRCx, the up counter value is stored in its counter register (RTICAUCx). The second read has to access the up counter register (RTICAUCx), which then holds the value captured at the time when reading the capture free running counter register (RTICAFRCx).

Note

The capture up counter registers are implemented as shadow registers. Reading RTICAUCx without having read RTICAFRCx first will return always the same value. RTICAUCx will only be updated when RTICAFRCx is read.

15.2.1.2 Capture Feature

Both counter blocks also provide a capture feature on external events. Two capture sources can trigger the capture event. The source triggering the block is configurable (RTICAPCTRL). The sources originate from the Interrupt Manager (NVIC/IM) and allow the generation of capture events when a peripheral modules has generated an interrupt. Any of the peripheral interrupts can be selected as the capture event in the NVIC/IM.

When an event is detected, RTIUCx and RTIFRCx are stored in the capture up counter (RTICAUCx) and capture free running counter (RTICAFRCx) registers. The read order of the captured values must be the same as the read order of the actual counters (see Section 15.2.1.1).

15.2.2 Interrupt/DMA Requests

There are four compare registers (RTICOMPy) to generate interrupt requests to the NVIC/IM or DMA requests to the DMA controller. The interrupts can be used to generate different timebases for the operating system. Each of the compare registers can be configured to be compared to either RTIFRC0 or RTIFRC1. When the counter value matches the compare value, an interrupt is generated. To allow periodic interrupts, a certain value can be added to the compare value in RTICOMPy automatically. This value is stored in the update compare register (RTIUDCPy) and will be added after a compare is matched. The period of the generated interrupt/DMA request can be calculated with:

$$t_{COMPx} = t_{RTICLK} \times (RTICPUCy + 1) \times RTIUDCPy$$

if RTICPUCy ≠ 0,

$$t_{COMPx} = t_{RTICLK} \times (2^{32}+1) \times RTIUDCPy$$

if RTIUDCPy = 0,

$$t_{COMPx} = t_{RTICLK} \times (RTICPUCy + 1) \times 2^{32} \qquad (2)$$

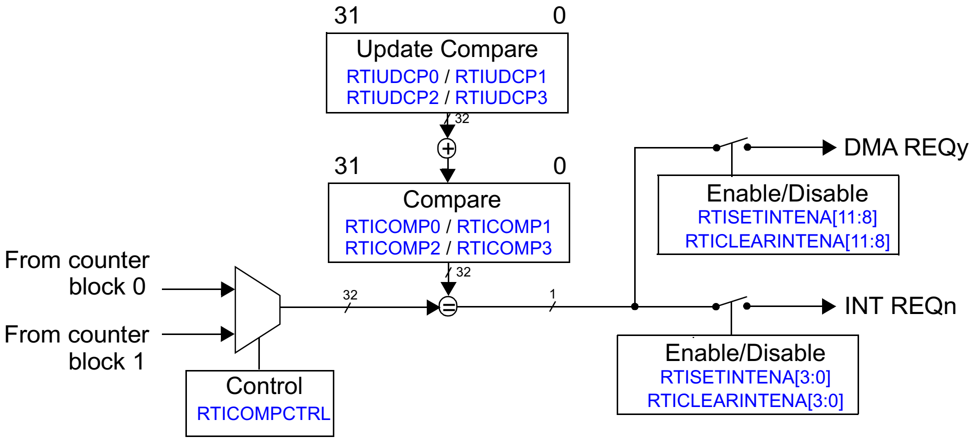

Figure 15-3. Compare Unit Block Diagram (shows only 1 of 4 blocks for simplification)

Another interrupt that can be generated is the overflow interrupt (OVLINTx) in case the RTIFRCx counter overflows.

The interrupts/DMA requests can be enabled in the RTISETINTENA register and disabled in the RTICLEARINTENA register. The RTIINTFLAG register shows the pending interrupts.

15.2.3 RTI Clocking

The counter blocks are clocked with RTICLK.

A clock supervision for the NTUx clocking scheme is implemented to avoid missing operating system ticks.

15.2.4 Digital Watchdog (DWD)

The digital watchdog (DWD) is an optional safety diagnostic which can detect a runaway CPU and generate either a reset or NMI (non-maskable interrupt) response. It generates resets or NMIs after a programmable period, and generates a reset if no correct key sequence was written to the RTIWDKEY register. Figure 15-4 illustrates the DWD.

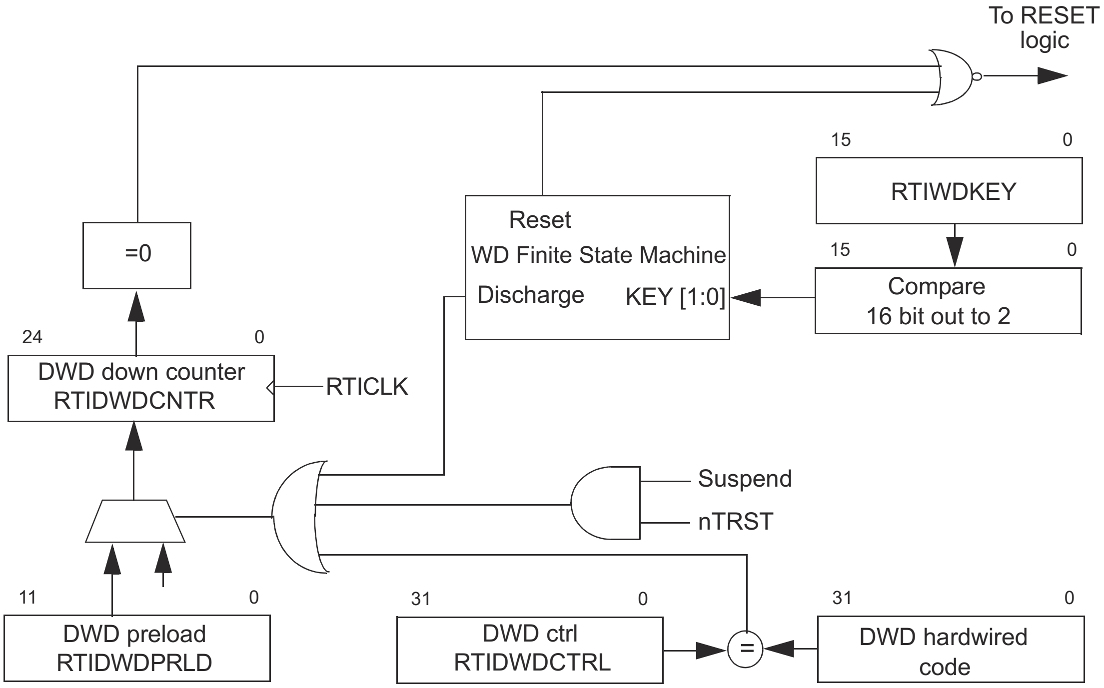

Figure 15-4. Digital Watchdog

15.2.4.1 Digital Watchdog (DWD)

The DWD is disabled by default. If it should be used, it must be enabled by writing a 32-bit value to the RTIDWDCTRL register.

Note

Once the DWD is enabled, it cannot be disabled except by system reset or power on reset.

If the correct key sequence is written to the RTIWDKEY register (0xE51A followed by 0xA35C), the 25-bit DWD down counter is reloaded with the left justified 12-bit preload value stored in RTIDWDPRLD. If an incorrect value is written, a watchdog reset will occur immediately. Also a reset or NMI will be generated when the DWD down counter is decremented to 0.

While the device is in suspend mode (halting debug mode), the DWD down counter keeps the value it had when entering suspend mode.

The DWD down counter will be decremented with the RTICLK frequency.

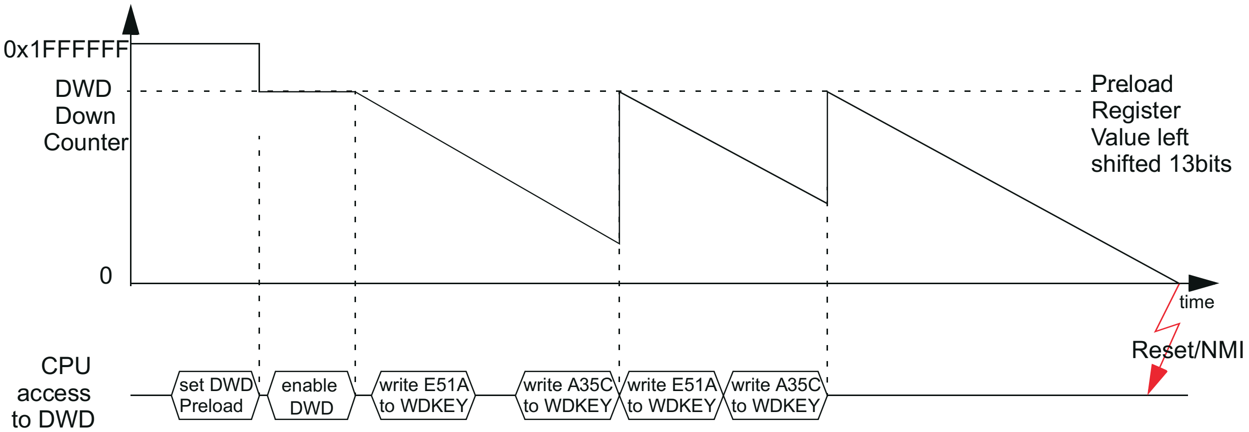

Figure 15-5. DWD Operation

The expiration time of the DWD down counter can be determined with the following equation:

$texp = (DWDPRLD + 1) \times 2^{13}/RTICLK$

where

DWDPRLD = 0...4095

Note

Care should be taken to ensure that the CPU write to the watchdog register is made allowing time for the write to propagate to the RTI.

15.2.4.2 Digital Windowed Watchdog (DWWD)

In addition to the time-out boundary configurable via the digital watchdog discussed in Section 15.2.4.1, for enhanced safety metrics it is desirable to check for a watchdog "pet" within a time window rather than using a single time threshold. This is enabled by the digital windowed watchdog (DWWD) feature.

- Functional Behavior

The DWWD opens a configurable time window in which the watchdog must be serviced. Any attempt to service the watchdog outside this time window, or a failure to service the watchdog in this time window, will cause the watchdog to generate either a reset to the CPU. This is controlled by configuring the RTIWWDRXNCTRL register. As with the DWD, the DWWD is disabled after power on reset. When the DWWD is configured to generate a non-maskable interrupt on a window violation, the watchdog counter continues to count down. The NMI handler needs to clear the watchdog violation status flag(s) and then service the watchdog by writing the correct sequence in the watchdog key register. This service will cause the watchdog counter to get reloaded from the preload value and start counting down. If the NMI handler does not service the watchdog in time, it could count down all the way to zero and wrap around. If the NMI Handler does not service the watchdog in time, the NMI gets generated continuously, each time the counter counts to '0'.

The DWWD uses the Digital Watchdog (DWD) preload register (RTIDWDPRLD) setting to define the end-time of the window. The start-time of the window is defined by a window size configuration register(RTIWWDSIZECTRL).

The default window size is set to 100%, which corresponds to the DWD functionality of a time-out-only watchdog. The window size can be selected (through register RTIWWDSIZECTRL) from among 100%, 50%, 25%, 12.5%, 6.25% and 3.125% as shown in Figure 15-6. The window with the respective size will be opened before the end of the DWD expiration. The user has to serve the watchdog in the window. Otherwise, a reset or NMI will generate. Figure 15-7 shows an DWWD operation example (25% window).

- Configuration of DWWD

The DWWD preload value (same as DWD preload) can only be configured when the DWWD counter is disabled. The window size and watchdog reaction to a violation can be configured even after the watchdog has been enabled. Any changes to the window size and watchdog reaction configurations will only take effect after the next servicing of the DWWD. This feature can be utilized to dynamically set windows of different sizes based on task execution time, adding a program sequence element to the diagnostic which can improve fault coverage.

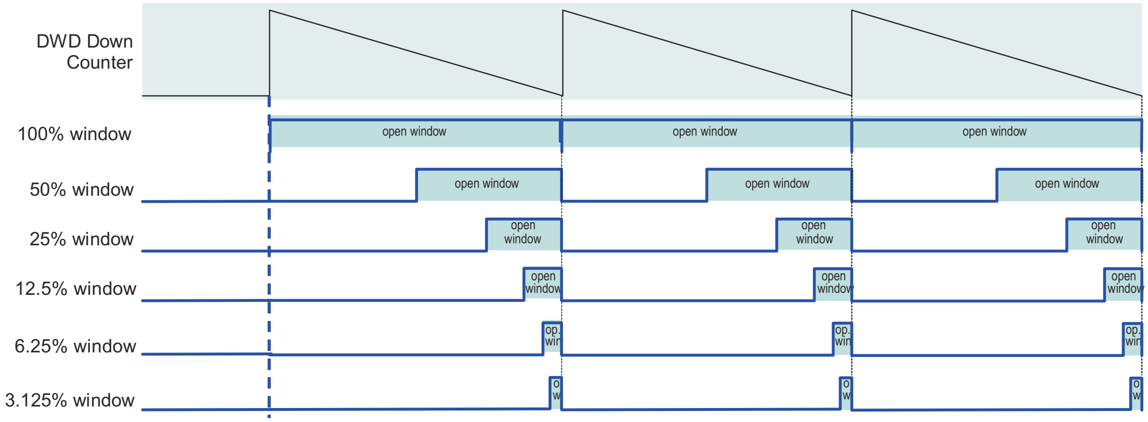

Figure 15-6. Digital Windowed Watchdog Timing Example

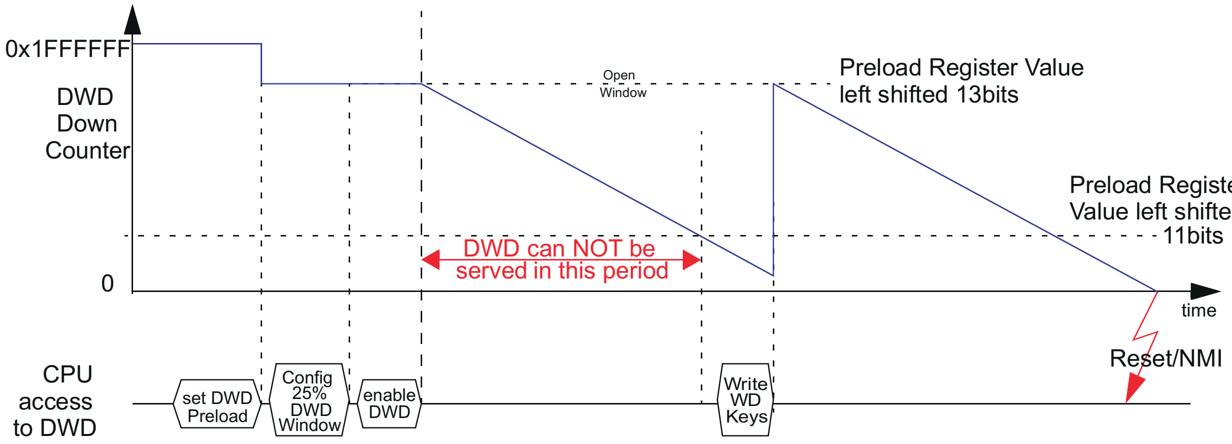

Figure 15-7. Digital Windowed Watchdog Operation Example (25% Window)

15.2.5 Halting Debug Mode Behaviour

Once the system enters halting debug mode, the behavior of the RTI depends on the COS (continue on suspend) bit. If the bit is cleared and halting debug mode is active, all counters will stop operation. If the bit is set to one, all counters will be clocked normally and the RTI will work like in normal mode. However, if the external timebase (NTU) is used and the system is in halting debug mode, the timebase control circuit will switch to internal timebase once it detects the missing NTU signal of the suspended communication controller. This will be signaled with an TBINT interrupt so that software can resynchronize after the device exits halting debug mode.

15.3 MSS_RTI Registers

Table 15-1 lists the memory-mapped registers for the MSS_RTI registers. All register offset addresses not listed in Table 15-1 should be considered as reserved locations and the register contents should not be modified.

-*n*		Value after reset or the default value

15.3.1 RTIGCTRL Register (Offset = 0h) [Reset = 00000000h]

RTIGCTRL is shown in Table 15-3.

Return to the Summary Table.

Global Control Register starts / stops the counters

Table 15-3. RTIGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
19-16	NTUSEL	R/W	0h	NTUSEL: Select NTU signal. These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL. User and privilege mode (read): 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to ‘0’ Privilege mode (write): 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to ‘0’
15	COS	R/W	0h	COS: Continue On Suspend. This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting. User and privilege mode (read): 0 = counters are stopped while in debug mode 1 = counters are running while in debug mode Privilege mode (write): 0 = stop counters in debug mode 1 = continue counting in debug mode
14-2	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CNT1EN	R/W	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 (UC1 and FRC1). User and privilege mode (read): 0 = counters are stopped 1 = counters are running Privilege mode (write): 0 = stop counters 1 = start counters Gives the absolute 32 bit destination address (physical).
0	CNT0EN	R/W	0h	CNT0EN: Counter 0 Enable.The CNT0EN bit starts and stops the operation of counter block 0 (UC0 and FRC0). User and privilege mode (read): 0 = counters are stopped 1 = counters are running Privilege mode (write): 0 = stop counters 1 = start counters Gives the absolute 32 bits source address (physical).

15.3.2 RTITBCTRL Register (Offset = 4h) [Reset = 00000000h]

RTITBCTRL is shown in Table 15-4.

Return to the Summary Table.

Timebase Control selection which source triggers free running counter 0

Table 15-4. RTITBCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	0h	Reserved
1	INC	R/W	0h	INC: Increment Free Running Counter 0. This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected. User and privilege mode (read): 0 = FRC0 will not be incremented 1 = FRC0 will be incremented Privilege mode (write): 0 = Do not increment FRC0 on failing external clock 1 = Increment FRC0 on failing external clock
0	TBEXT	R/W	0h	TBEXT: Timebase External. The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx. When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset. The selection if the external signal should be used, can only be done by software. User and privilege mode (read): 0 = UC0 clocks FRC0 1 = NTUx clocks FRC0 Privilege mode (write): 0 = MUX is switched to internal UC0 clocking scheme 1 = MUX is switched to external NTUx clocking scheme

15.3.3 RTICAPCTRL Register (Offset = 8h) [Reset = 00000000h]

RTICAPCTRL is shown in Table 15-5.

Return to the Summary Table.

Capture Control controls the capture source for the counters

Table 15-5. RTICAPCTRL Register Field Descriptions

15.3.5 RTIFRC0 Register (Offset = 10h) [Reset = 00000000h]

RTIFRC0 is shown in Table 15-7.

Return to the Summary Table.

Free Running Counter 0 current value of free running counter 0

Table 15-7. RTIFRC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	FRC0	R/W	0h	FRC0: Free Running Counter 0. This registers holds the current value of the Free Running Counter 0 and will be updated continuously. User and privilege mode (read): current value of the counter Privilege mode (write): The counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0.

15.3.6 RTIUC0 Register (Offset = 14h) [Reset = 00000000h]

RTIUC0 is shown in Table 15-8.

Return to the Summary Table.

Up Counter 0 current value of prescale counter 0

Table 15-8. RTIUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UC0	R/W	0h	UC0: Up Counter 0. This registers holds the current value of the Up Counter 0 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 0. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 0 and Free Running Counter 0. User and privilege mode (read): value of the counter when the Free Running Counter 0 was read Privilege mode (write): the counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC0 then it can take a long time until a compare matches, since RTIUC0 has to count up until it overflows.

15.3.7 RTICPUC0 Register (Offset = 18h) [Reset = 00000000h]

RTICPUC0 is shown in Table 15-9.

Return to the Summary Table.

Compare Up Counter 0 compare value compared with prescale counter 0

Table 15-9. RTICPUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPUC0	R/W	0h	This registers holds the compare value, which is compared with the Up Counter 0. When the compare matches, Free Running counter 0 is incremented. The Up Counter is set to zero when the counter value matches the CPUC0 value. The value set in this prescales the RTI clock. If CPUC 0 = 0: then, frequency = RTICLK/ (2^{32}) If CPUC0 ≠ 0: then , frequency = RTICLK/(CPUC0 + 1) User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed

15.3.8 RTICAFRC0 Register (Offset = 20h) [Reset = 00000000h]

RTICAFRC0 is shown in Table 15-10.

Return to the Summary Table.

Capture Free Running Counter 0 current value of free running counter 0 on external event

Table 15-10. RTICAFRC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAFRC0	R/W	0h	CAFRC0: Capture Free Running Counter 0. This registers captures the current value of the Free Running Counter 0 when a event occurs, controlled by the external capture control block. User and privilege mode (read): value of Free Running Counter 0 on a capture event

15.3.9 RTICAUC0 Register (Offset = 24h) [Reset = 00000000h]

RTICAUC0 is shown in Table 15-11.

Return to the Summary Table.

Capture Up Counter 0 current value of prescale counter 0 on external event

Table 15-11. RTICAUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAUC0	R/W	0h	CAUC0: Capture Up Counter 0. This registers captures the current value of the Up Counter 0 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 0 and Free Running Counter 0. So the RTICAFRC0 register has to be read first, before the RTICAUC0 register is read. This sequence ensures that the value of the RTICAUC0 register is the corresponding value to the RTICAFRC0 register, even if another capture event happens in between the two reads. User and privilege mode (read): value of Up Counter 0 on a capture event

15.3.10 RTIFRC1 Register (Offset = 30h) [Reset = 00000000h]

RTIFRC1 is shown in Table 15-12.

Return to the Summary Table.

Free Running Counter 1 current value of free running counter 1

Table 15-12. RTIFRC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	FRC1	R/W	0h	FRC1: Free Running Counter 1. This registers holds the current value of the Free Running Counter 1 and will be updated continuously. User and privilege mode (read): current value of the counter Privilege mode (write): The counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1.

15.3.11 RTIUC1 Register (Offset = 34h) [Reset = 00000000h]

RTIUC1 is shown in Table 15-13.

Return to the Summary Table.

Up Counter 1 current value of prescale counter 1

Table 15-13. RTIUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UC1	R/W	0h	UC1: Up Counter 1. This registers holds the current value of the Up Counter 1 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 1. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 1 and Free Running Counter 1. User and privilege mode (read): value of the counter when the Free Running Counter 1 was read Privilege mode (write): the counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC1 then it can take a long time until a compare matches, since RTIUC1 has to count up until it overflows.

15.3.12 RTICPUC1 Register (Offset = 38h) [Reset = 00000000h]

RTICPUC1 is shown in Table 15-14.

Return to the Summary Table.

Compare Up Counter 1 compare value compared with prescale counter 1

Table 15-14. RTICPUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPUC1	R/W	0h	This registers holds the compare value, which is compared with the Up Counter 1. When the compare matches, Free Running Counter 1 is incremented. The Up Counter is set to zero when the counter value matches the CPUC1 value. The value set in this prescales the RTI clock. If CPUC 1 = 0: then, frequency = RTICLK/ (2^{32}) If CPUC1 ≠ 0: then , frequency = RTICLK/(CPUC1 + 1) User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed

15.3.13 RTICAFRC1 Register (Offset = 40h) [Reset = 00000000h]

RTICAFRC1 is shown in Table 15-15.

Return to the Summary Table.

Capture Free Running Counter 1 current value of free running counter 1 on external event

Table 15-15. RTICAFRC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAFRC1	R/W	0h	CAFRC1: Capture Free Running Counter 1. This registers captures the current value of the Free Running Counter 1 when a event occurs, controlled by the external capture control block. User and privilege mode (read): value of Free Running Counter 1 on a capture event

15.3.14 RTICAUC1 Register (Offset = 44h) [Reset = 00000000h]

RTICAUC1 is shown in Table 15-16.

Return to the Summary Table.

Capture Up Counter 1 current value of prescale counter 1 on external event

Table 15-16. RTICAUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAUC1	R/W	0h	CAUC1: Capture Up Counter 1. This registers captures the current value of the Up Counter 1 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 1 and Free Running Counter 1. So the RTICAFRC1 register has to be read first, before the RTICAUC1 register is read. This sequence ensures that the value of the RTICAUC1 register is the corresponding value to the RTICAFRC1 register, even if another capture event happens in between the two reads. User and privilege mode (read): value of Up Counter 1 on a capture event

15.3.15 RTICOMP0 Register (Offset = 50h) [Reset = 00000000h]

RTICOMP0 is shown in Table 15-17.

Return to the Summary Table.

Compare 0 compare value to be compared with the counters

Table 15-17. RTICOMP0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP0	R/W	0h	COMP0: Compare 0. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

15.3.16 RTIUDCP0 Register (Offset = 54h) [Reset = 00000000h]

RTIUDCP0 is shown in Table 15-18.

Return to the Summary Table.

Update Compare 0 value to be added to the compare register 0 value on compare match

Table 15-18. RTIUDCP0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UDCP0	R/W	0h	UDCP0: Update Compare 0 Register. This registers holds a value, which is added to the value in the compare 0 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 0 register on the next compare match Privilege mode (write): new update value

15.3.17 RTICOMP1 Register (Offset = 58h) [Reset = 00000000h]

RTICOMP1 is shown in Table 15-19.

Return to the Summary Table.

Compare 1 compare value to be compared with the counters

Table 15-19. RTICOMP1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP1	R/W	0h	COMP1: compare1. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

15.3.18 RTIUDCP1 Register (Offset = 5Ch) [Reset = 00000000h]

RTIUDCP1 is shown in Table 15-20.

Return to the Summary Table.

Update Compare 1 value to be added to the compare register 1 value on compare match

Table 15-20. RTIUDCP1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UDCP1	R/W	0h	UDCP1: Update compare1 Register. This registers holds a value, which is added to the value in the compare1 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare1 register on the next compare match Privilege mode (write): new update value

15.3.19 RTICOMP2 Register (Offset = 60h) [Reset = 00000000h]

RTICOMP2 is shown in Table 15-21.

Return to the Summary Table.

Compare 2 compare value to be compared with the counters

Table 15-21. RTICOMP2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP2	R/W	0h	COMP2: compare 2. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

15.3.20 RTIUDCP2 Register (Offset = 64h) [Reset = 00000000h]

RTIUDCP2 is shown in Table 15-22.

Return to the Summary Table.

Update Compare 2 value to be added to the compare register 2 value on compare match

Table 15-22. RTIUDCP2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UDCP2	R/W	0h	UDCP2: Update compare 2 Register. This registers holds a value, which is added to the value in the compare 2 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 2 register on the next compare match Privilege mode (write): new update value

15.3.21 RTICOMP3 Register (Offset = 68h) [Reset = 00000000h]

RTICOMP3 is shown in Table 15-23.

Return to the Summary Table.

Compare 3 compare value to be compared with the counters

Table 15-23. RTICOMP3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP3	R/W	0h	COMP3: compare 3. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

15.3.22 RTIUDCP3 Register (Offset = 6Ch) [Reset = 00000000h]

RTIUDCP3 is shown in Table 15-24.

Return to the Summary Table.

Update Compare 3 value to be added to the compare register 3 value on compare match

Table 15-24. RTIUDCP3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UDCP3	R/W	0h	UDCP3: Update compare 3 Register. This registers holds a value, which is added to the value in the compare 3 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 3 register on the next compare match Privilege mode (write): new update value

15.3.23 RTITBLCOMP Register (Offset = 70h) [Reset = 00000000h]

RTITBLCOMP is shown in Table 15-25.

Return to the Summary Table.

Timebase Low Compare compare value to activate edge detection circuit

Table 15-25. RTITBLCOMP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TBLCOMP	R/W	0h	TBLCOMP: Timebase Low Compare Value. This value determines when the edge detection circuit starts monitoring the NTUx signal. It will be compared with Up Counter 0. User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed Note: Reset behavior A reset does not generate a compare match.

15.3.24 RTITBHCOMP Register (Offset = 74h) [Reset = 00000000h]

RTITBHCOMP is shown in Table 15-26.

Return to the Summary Table.

Timebase High Compare compare value to deactivate edge detection circuit

Table 15-26. RTITBHCOMP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TBHCOMP	R/W	0h	TBHCOMP: Timebase High Compare Value. This value determines when the edge detection circuit will stop monitoring the NTUx signal. It will be compared with Up Counter 0. RTITBHCOMP has to be less than RTICPUC0, since RTIUC0 will be reset when RTICPUC0 is reached. Example: The NTUx edge detection circuit should be active +/- 10 RTICLK cycles around RTICPUC0. RTICPUC 0 = 0x00000050 RTITBLCOMP = 0x000046 RTITBHCOMP = 0x00000009 User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed Note: Reset behavior A reset does not generate a compare match.

15.3.25 RTISETINT Register (Offset = 80h) [Reset = 00000000h]

RTISETINT is shown in Table 15-27.

Return to the Summary Table.

Set Interrupt Enable sets interrupt enable bits int RTIINTCTRL without having to do a read-modify-write operation

Table 15-27. RTISETINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	SETOVL1INT	R/W	0h	SETOVL1INT: Set Free Running Counter 1 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
17	SETOVL0INT	R/W	0h	SETOVL0INT: Set Free Running Counter 0 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
16	SETTBINT	R/W	0h	SETTBINT: Set Timebase Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11	SETDMA3	R/W	0h	SETDMA 3: Set Compare DMA Request 3. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
10	SETDMA2	R/W	0h	SETDMA 2: Set Compare DMA Request 2. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
9	SETDMA1	R/W	0h	SETDMA 1: Set Compare DMA Request 1. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
8	SETDMA0	R/W	0h	SETDMA 0: Set Compare DMA Request 0. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect

Table 15-27. RTISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	SETINT3	R/W	0h	SETINT 3: Set Compare Interrupt 3. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged
2	SETINT2	R/W	0h	SETINT 2: Set Compare Interrupt 2. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
1	SETINT1	R/W	0h	SETINT 1: Set Compare Interrupt 1. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
0	SETINT0	R/W	0h	SETINT 0: Set Compare Interrupt 0. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt

15.3.26 RTICLEARINT Register (Offset = 84h) [Reset = 00000000h]

RTICLEARINT is shown in Table 15-28.

Return to the Summary Table.

Clear Interrupt Enable clears interrupt enable bits int RTIINTCTRL without having to do a read-modify-write operation

Table 15-28. RTICLEARINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	CLEAROVL1INT	R/W	0h	CLEAROVL1INT: CLEAR Free Running Counter 1 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
17	CLEAROVL0INT	R/W	0h	CLEAROVL0INT: CLEAR Free Running Counter 0 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
16	CLEARTBINT	R/W	0h	CLEARTBINT: CLEAR Timebase Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11	CLEARDMA3	R/W	0h	CLEARDMA 3: CLEAR Compare DMA Request 3. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
10	CLEARDMA2	R/W	0h	CLEARDMA 2: CLEAR Compare DMA Request 2. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
9	CLEARDMA1	R/W	0h	CLEARDMA 1: CLEAR Compare DMA Request 1. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
8	CLEARDMA0	R/W	0h	CLEARDMA 0: CLEAR Compare DMA Request 0. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request

Table 15-28. RTICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3	CLEARINT3	R/W	0h	CLEARINT 3: CLEAR Compare Interrupt 3. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
2	CLEARINT2	R/W	0h	CLEARINT 2: CLEAR Compare Interrupt 2. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
1	CLEARINT1	R/W	0h	CLEARINT 1: CLEAR Compare Interrupt 1. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
0	CLEARINT0	R/W	0h	CLEARINT 0: CLEAR Compare Interrupt 0. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt

15.3.27 RTIINTFLAG Register (Offset = 88h) [Reset = 00000000h]

RTIINTFLAG is shown in Table 15-29.

Return to the Summary Table.

Interrupt Flags interrupt pending bits

Table 15-29. RTIINTFLAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	OVL1INT	R/W	0h	OVL1INT: Free Running Counter 1 Overflow Interrupt Flag. User and privilege mode (read): determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
17	OVL0INT	R/W	0h	OVL0INT: Free Running Counter 0 Overflow Interrupt Flag. User and privilege mode (read): determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
16	TBINT	R/W	0h	User and privilege mode (read): this flag is set when the TBEXT bit is cleared by detection of a missing external clockedge. It will not be set by clearing TBEXT by software. determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
15-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3	INT3	R/W	0h	INT 3: Interrupt Flag 3. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
2	INT2	R/W	0h	INT 2: Interrupt Flag 2. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
1	INT1	R/W	0h	INT 1: Interrupt Flag 1. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
0	INT0	R/W	0h	INT 0: Interrupt Flag 0. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0

15.3.28 RTIDWDCTRL Register (Offset = 90h) [Reset = 00000000h]

RTIDWDCTRL is shown in Table 15-30.

Return to the Summary Table.

Digital Watchdog Control Enables the Digital Watchdog

Table 15-30. RTIDWDCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DWDCTRL	R/W	0h	DWDCTRL: Digital Watchdog Control. User and priviledge mode (read): 0x5312ACED = DWD counter is disabled. This is the default value. 0xA98559DA = DWD counter is enabled Any other value = DWD counter state is unchanged (enabled or disabled) Priviledge mode (write): 0xA98559DA = DWD counter is enabled Any other value = State of DWD counter is unchanged (stays enabled or disabled) Note: One-Write Functionality of DWDCTRL Register The RTIDWDCTRL register implements a one-write functionality, such that the application cannot write to this registermore than once. Writing the default value will not enable the watchdog as described above. Writing the enable value will start the watchdog counters. A write to RTIDWDCTRL will only be enabled after a system reset again.

15.3.29 RTIDWDPRLD Register (Offset = 94h) [Reset = 00000000h]

RTIDWDPRLD is shown in Table 15-31.

Return to the Summary Table.

Digital Watchdog Preload sets the experation time of the Digital Watchdog

Table 15-31. RTIDWDPRLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11-0	DWDPRLD	R/W	0h	DWDPRLD: Digital Watchdog Preload Value. User and priviledge mode (read): A read from this register in any CPU mode returns the current preload value. Priviledge mode (write): If the DWD is always enabled after reset is released: The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires. When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value. If the DWD is implemented such that the down counter is enabled by software: The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter. The expiration time of the DWD Down Counter can be determined with following equation: texp = (RTIDWDPRLD+1) x 2^{13} / RTICLK1 where: RTIDWDPRLD = 0...4095

15.3.30 RTIWDSTATUS Register (Offset = 98h) [Reset = 00000000h]

RTIWDSTATUS is shown in Table 15-32.

Return to the Summary Table.

Watchdog Status reflects the status of Analog and Digital Watchdog

Table 15-32. RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and priviledge mode (read): 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Priviledge mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and priviledge mode (read): 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Priviledge mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0.
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and priviledge mode (read): 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Priviledge mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and priviledge mode (read): 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Priviledge mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0

Table 15-32. RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and priviledge mode (read): 0 = DWD timeout period not expired 1 = DWD timeout period has expired Priviledge mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and priviledge mode (read): 0 = AWD pin 0 –> 1 threshold not exceeded 1 = AWD pin 0 –> 1 threshold exceeded Priviledge mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0

15.3.31 RTIWDKEY Register (Offset = 9Ch) [Reset = 00000000h]

RTIWDKEY is shown in Table 15-33.

Return to the Summary Table.

Watchdog Key correct written key values discharge the external capacitor

Table 15-33. RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
15-0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode (write): A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1’s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3. Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

15.3.32 RTIDWDCNTR Register (Offset = A0h) [Reset = 00000000h]

RTIDWDCNTR is shown in Table 15-34.

Return to the Summary Table.

Digital Watchdog Down Counter current value of DWD down counter

Table 15-34. RTIDWDCNTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
24-0	DWDCNTR	R/W	0h	DWDCNTR: Digital Watchdog Down Counter. The value of the DWDCNTR after a system reset is 0x002D_FFFF. When the DWD is enabled and the DWD counter starts counting down from this value with an RTICLK1 time base of 3MHz, a watchdog reset will be generated in 1 second. User and privilege mode (read): Reads return the current counter value. Privilege mode (write): Writes don't have an effect.

15.3.33 RTIWWDRXNCTRL Register (Offset = A4h) [Reset = 00000000h]

RTIWWDRXNCTRL is shown in Table 15-35.

Return to the Summary Table.

Windowed Watchdog Reaction Control configures the windowed watchdog to either generate a non-maskable interrupt to the CPU or to generate a system reset

Table 15-35. RTIWWDRXNCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3-0	WWDRXN	R/W	0h	WWDRXN: Digital Windowed Watchdog Reaction. User and privilege mode (read), privileged mode (write): 0x 5 = This is the default value. The windowed watchdog will cause a reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. 0xA = The windowed watchdog will generate a non-maskable interrupt to the CPU if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Writing any other value will cause a system reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Note: Configuration of DWWD Reaction The DWWD reaction can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDRXN is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDRXN is made when the watchdog service window is already open, then the change in configuration takes effect only after the watchdog is serviced.

15.3.34 RTIWWDSIZECTRL Register (Offset = A8h) [Reset = 00000000h]

RTIWWDSIZECTRL is shown in Table 15-36.

Return to the Summary Table.

Windowed Watchdog Size Control configures the size of the window for the digital windowed watchdog

Table 15-36. RTIWWDSIZECTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	WWDSIZE	R/W	0h	WWDSIZE: Digital Windowed Watchdog Window Size. User and privilege mode (read), privileged mode (write): Value written to WWDSIZE Window Size 0x00000005 100% (Functionality same as the time-out digital watchdog.) 0x00000050 50% 0x00000500 25% 0x00005000 12.5% 0x00050000 6.25% 0x00500000 3.125% Any other value 3.125% Note: Incorrect value being written to watchdog window size control register If an incorerct value is written to the WWDSIZE field, or if a system disturbance causes the WWDSIZE field to have a value other than 0x5, 0x50, 0x500, 0x5000, 0x50000, or 0x500000, then the window size will be configured to be 3.125%. This increases the chances of getting a reset due to the windowed watchdog, which enables the system to handle the cause for the incorrect configuration. Note: Configuration of DWWD Window Size The DWWD window size can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDSIZE is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDSIZE is made when the watchdog service window is already open, then

15.3.35 RTIINTCLRENABLE Register (Offset = ACh) [Reset = 00000000h]

RTIINTCLRENABLE is shown in Table 15-37.

Return to the Summary Table.

RTI Compare Interrupt Clear Enable enable the auto clear functionality for each of the compare interrupts

Table 15-37. RTIINTCLRENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
27-24	INTCLRENABLE3	R/W	0h	INTCLRENABLE3. Enables the auto-clear functionality on the compare 3 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 3 interrupt is disabled. Any other value = Auto-clear for compare 3 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 3 interrupt. Any other value = Enables the auto-clear functionality on the compare 3 interrupt.
23-20	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
19-16	INTCLRENABLE2	R/W	0h	INTCLRENABLE2. Enables the auto-clear functionality on the compare 2 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 2 interrupt is disabled. Any other value = Auto-clear for compare 2 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 2 interrupt. Any other value = Enables the auto-clear functionality on the compare 2 interrupt.
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11-8	INTCLRENABLE1	R/W	0h	INTCLRENABLE1. Enables the auto-clear functionality on the compare 1 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 1 interrupt is disabled. Any other value = Auto-clear for compare 1 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 1 interrupt. Any other value = Enables the auto-clear functionality on the compare 1 interrupt.
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3-0	INTCLRENABLE0	R/W	0h	INTCLRENABLE0. Enables the auto-clear functionality on the compare 0 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 0 interrupt is disabled. Any other value = Auto-clear for compare 0 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 0 interrupt. Any other value = Enables the auto-clear functionality on the compare 0 interrupt.

15.3.36 RTICOMP0CLR Register (Offset = B0h) [Reset = 00000000h]

RTICOMP0CLR is shown in Table 15-38.

Return to the Summary Table.

Compare 0 Clear compare value to be compared with the counter to clear the compare0 interrupt line

Table 15-38. RTICOMP0CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP0CLR	R/W	0h	COMP0CLR: Compare 0 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the compare 0 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

15.3.37 RTICOMP1CLR Register (Offset = B4h) [Reset = 00000000h]

RTICOMP1CLR is shown in Table 15-39.

Return to the Summary Table.

Compare 1 Clear compare value to be compared with the counter to clear the compare1 interrupt line

Table 15-39. RTICOMP1CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP1CLR	R/W	0h	COMP1CLR: Compare 1 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 1 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

15.3.38 RTICOMP2CLR Register (Offset = B8h) [Reset = 00000000h]

RTICOMP2CLR is shown in Table 15-40.

Return to the Summary Table.

Compare 2 Clear compare value to be compared with the counter to clear the compare2 interrupt line

Table 15-40. RTICOMP2CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP2CLR	R/W	0h	COMP2CLR: Compare 2 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 2 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

15.3.39 RTICOMP3CLR Register (Offset = BCh) [Reset = 00000000h]

RTICOMP3CLR is shown in Table 15-41.

Return to the Summary Table.

Compare 3 Clear compare value to be compared with the counter to clear the compare3 interrupt line

Table 15-41. RTICOMP3CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP3CLR	R/W	0h	COMP3CLR: Compare 3 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 3 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

UART/SCI

This chapter contains the description of the serial communication interface (SCI) module.

16.1 Introduction

The SCI module is a universal asynchronous receiver-transmitter that implements the standard nonreturn to zero format. The SCI can be used to communicate, for example, through an RS-232 port or over a K-line.

16.1.1 SCI Features

The following are the features of the SCI module:

- Standard universal asynchronous receiver-transmitter (UART) communication
- Supports full- or half-duplex operation
- Standard nonreturn to zero (NRZ) format
- Double-buffered receive and transmit functions
- Supports two individually enabled interrupt lines: level 0 and level 1
- Configurable frame format of 3 to 13 bits per character based on the following:
  - Data word length programmable from one to eight bits
  - Additional address bit in address-bit mode
  - Parity programmable for zero or one parity bit, odd or even parity
  - Stop programmable for one or two stop bits
- Asynchronous communication mode with no CLK pin
- Two multiprocessor communication formats allow communication between more than two devices
- Sleep mode is available to free CPU resources during multiprocessor communication and then wake up to receive an incoming message
- The 24-bit programmable baud rate supports 2^{24} different baud rates provide high accuracy baud rate selection
- Capability to use Direct Memory Access (DMA) for transmit and receive data
- Four error flags and Five status flags provide detailed information regarding SCI events
- Two external pins: SCIRX and SCITX

Note

SCI module does not support UART Hardware Flow Control. This feature can be implemented in Software using a General Purpose I/O pin.

16.1.2 Block Diagram

Three Major components of the SCI Module are:

- Transmitter
- Baud Clock Generator
- Receiver

Transmitter (TX) contains two major registers to perform double buffering:

- The transmitter data buffer register (SCITD) contains data loaded by the CPU to be transferred to the shift register for transmission.

- The transmitter shift register (SCITXSHF) loads data from the data buffer (SCITD) and shifts data onto the SCITX pin, one bit at a time.

Baud Clock Generator

- A programmable baud generator produces a baud clock scaled from VCLK.

Receiver (RX) contains two major registers to perform double buffering:

- The receiver shift register (SCIRXSHF) shifts data in from the SCIRX pin one bit at a time and transfers completed data into the receive data buffer.
- The receiver data buffer register (SCIRD) contains received data transferred from the receiver shift register

The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. The receiver and transmitter can each be operated independently or simultaneously in full duplex mode.

To ensure data integrity, the SCI checks the data it receives for breaks, parity, overrun, and framing errors. The bit rate (baud) is programmable to over 16 million different rates through a 24-bit baud-select register. Figure 16-1 shows the detailed SCI block diagram.

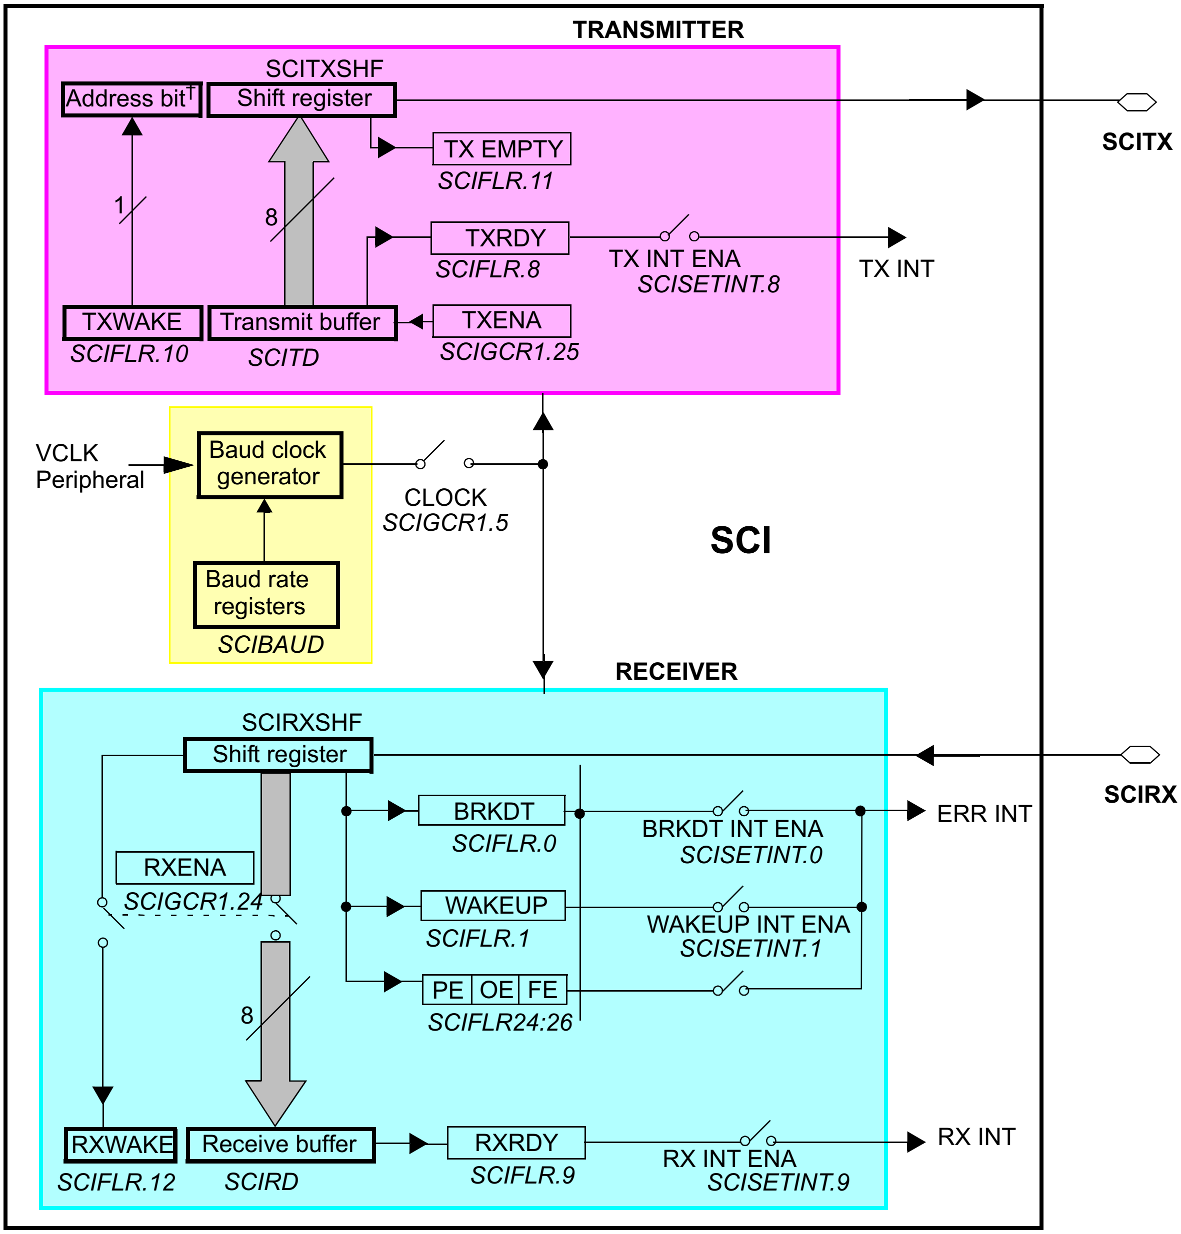

Figure 16-1. Detailed SCI Block Diagram

16.2 SCI Communication Formats

The SCI module can be configured to meet the requirements of many applications. Because communication formats vary depending on the specific application, many attributes of the SCI are user configurable. The list below describes these configuration options:

- SCI Frame format
- SCI Timing modes
- SCI Baud rate
- SCI Multiprocessor modes

16.2.1 SCI Frame Formats

The SCI uses a programmable frame format. All frames consist of the following:

- One start bit
- One to eight data bits
- Zero or one address bit
- Zero or one parity bit
- One or two stop bits

The frame format for both the transmitter and receiver is programmable through the bits in the SCIGCR1 register. Both receive and transmit data is in nonreturn to zero (NRZ) format, which means that the transmit and receive lines are at logic high when idle. Each frame transmission begins with a start bit, in which the transmitter pulls the SCI line low (logic low). Following the start bit, the frame data is sent and received least significant bit first (LSB).

An address bit is present in each frame if the SCI is configured to be in address-bit mode but is not present in any frame if the SCI is configured for idle-line mode. The format of frames with and without the address bit is illustrated in Figure 16-2.

A parity bit is present in every frame when the PARITY ENA bit is set. The value of the parity bit depends on the number of one bits in the frame and whether odd or even parity has been selected via the PARITY ENA bit. Both examples in Figure 16-2 have parity enabled.

All frames include one stop bit, which is always a high level. This high level at the end of each frame is used to indicate the end of a frame to ensure synchronization between communicating devices. Two stop bits are transmitted if the STOP bit in SCIGCR1 register is set. The examples shown in Figure 16-2 use one stop bit per frame.

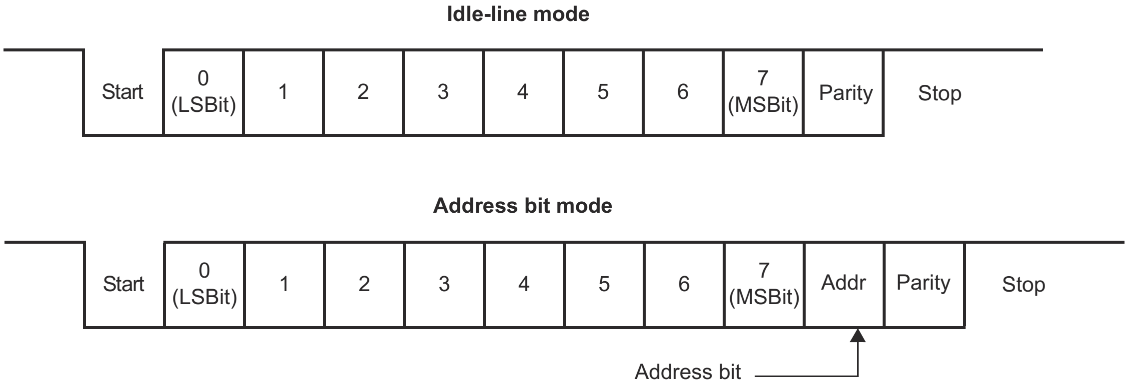

Figure 16-2. Typical SCI Data Frame Formats

16.2.2 SCI Timing Mode

The SCI can be configured to use asynchronous or isosynchronous timing using TIMING MODE bit in SCIGCR1 register.

16.2.2.1 Asynchronous Timing Mode

The asynchronous timing mode uses only the receive and transmit data lines to interface with devices using the standard universal asynchronous receiver- transmitter (UART) protocol.

In the asynchronous timing mode, each bit in a frame has a duration of 16 SCI baud clock periods. Each bit therefore consists of 16 samples (one for each clock period). When the SCI is using asynchronous mode, the baud rates of all communicating devices must match as closely as possible. Receive errors result from devices communicating at different baud rates.

With the receiver in the asynchronous timing mode, the SCI detects a valid start bit if the first four samples after a falling edge on the SCIRX pin are of logic level 0. As soon as a falling edge is detected on SCIRX, the SCI assumes that a frame is being received and synchronizes itself to the bus.

To prevent interpreting noise as Start bit SCI expects SCIRX line to be low for at least four contiguous SCI baud clock periods to detect a valid start bit. The bus is considered idle if this condition is not met. When a valid start bit is detected, the SCI determines the value of each bit by sampling the SCIRX line value during the seventh, eighth, and ninth SCI baud clock periods. A majority vote of these three samples is used to determine the value stored in the SCI receiver shift register. By sampling in the middle of the bit, the SCI reduces errors caused by propagation delays and rise and fall times and data line noises. Figure 16-3 illustrates how the receiver samples a start bit and a data bit in asynchronous timing mode.

The transmitter transmits each bit for a duration of 16 SCI baud clock periods. During the first clock period for a bit, the transmitter shifts the value of that bit onto the SCITX pin. The transmitter then holds the current bit value on SCITX for 16 SCI baud clock periods.

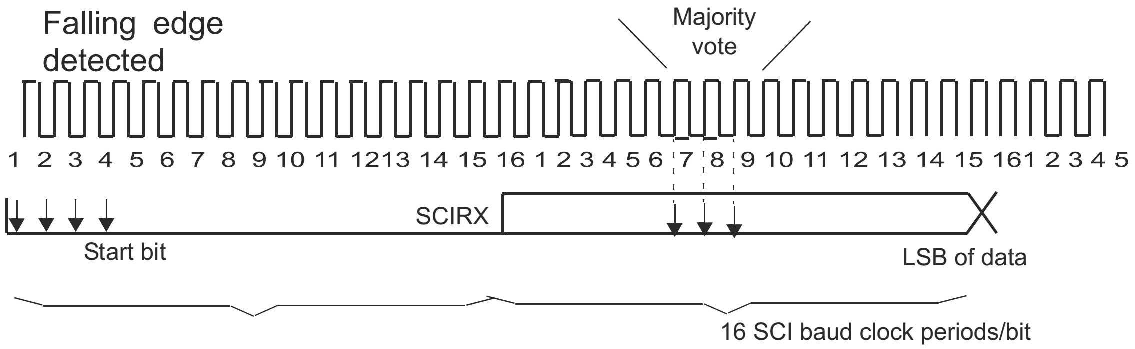

Figure 16-3. Asynchronous Communication Bit Timing

16.2.2.2 Isosynchronous Timing Mode

In isosynchronous timing mode, each bit in a frame has a duration of exactly 1 baud clock period and therefore consists of a single sample. With this timing configuration, the transmitter and receiver are required to make use of the SCICLK pin to synchronize communication with other SCI. **This mode is not fully supported on this device because SCICLK pin is not available.**

16.2.3 SCI Baud Rate

The SCI has an internally generated serial clock determined by the peripheral VCLK and the prescalers BAUD. The SCI uses the 24-bit integer prescaler BAUD value of the BRS register to select the required baud rates.

In asynchronous timing mode, the SCI generates a baud clock according to the following formula:

$$\textit{Asynchronous baud value} = \frac{\text{VCLK Frequency}}{16 * (\text{BAUD} + 1)}$$

For BAUD = 0,

$$\textit{Asynchronous baud value} = \frac{\text{VCLK Frequency}}{32} \tag{3}$$

In isosynchronous timing mode, the SCI generates a baud clock according to the following formula:

$$\textit{Isosynchronous baud value} = \frac{\text{VCLK Frequency}}{\text{BAUD} + 1}$$

For BAUD = 0,

$$\textit{Isosynchronous baud value} = \frac{\text{VCLK Frequency}}{32} \tag{4}$$

16.2.4 SCI Multiprocessor Communication Modes

In some applications, the SCI may be connected to more than one serial communication device. In such a multiprocessor configuration, several frames of data may be sent to all connected devices or to an individual device. In the case of data sent to an individual device, the receiving devices must determine when they are being addressed. When a message is not intended for them, the devices can ignore the following data. When only two devices make up the SCI network, addressing is not needed, so multiprocessor communication schemes are not required.

SCI supports two multiprocessor Communication Modes which can be selected using COMM MODE bit:

- Idle-Line Mode
- Address Bit Mode

When the SCI is not used in a multiprocessor environment, software can consider all frames as data frames. In this case, the only distinction between the idle-line and address-bit modes is the presence of an extra bit (the address bit) in each frame sent with the address-bit protocol.

The SCI allows full-duplex communication where data can be sent and received via the transmit and receive pins simultaneously. However, the protocol used by the SCI assumes that only one device transmits data on the same bus line at any one time. No arbitration is done by the SCI.

Note

Avoid Transmitting Simultaneously on the Same Serial Bus

The system designer must ensure that devices connected to the same serial bus line do not attempt to transmit simultaneously. If two devices are transmitting different data, the resulting bus conflict could damage the device..

16.2.4.1 Idle-Line Multiprocessor Modes

In idle-line multiprocessor mode, a frame that is preceded by an idle period (10 or more idle bits) is an address frame. A frame that is preceded by fewer than 10 idle bits is a data frame. Figure 16-4 illustrates the format of several blocks and frames with idle-line mode.

There are two ways to transmit an address frame using idle-line mode:

Method 1: In software, deliberately leave an idle period between the transmission of the last data frame of the previous block and the address frame of the new block.

Method 2: Configure the SCI to automatically send an idle period between the last data frame of the previous block and the address frame of the new block.

Although Method 1 is only accomplished by a delay loop in software, Method 2 can be implemented by using the transmit buffer and the TXWAKE bit in the following manner:

Step 1 : Write a 1 to the TXWAKE bit.

Step 2 : Write a dummy data value to the SCITD register. This triggers the SCI to begin the idle period as soon as the transmitter shift register is empty.

Step 3 : Wait for the SCI to clear the TXWAKE flag.

Step 4 : Write the address value to SCITD.

As indicated by Step 3, software should wait for the SCI to clear the TXWAKE bit. However, the SCI clears the TXWAKE bit at the same time it sets TXRDY (that is, transfers data from SCITD into SCITXSHF). Therefore, if the TX INT ENA bit is set, the transfer of data from SCITD to SCITXSHF causes an interrupt to be generated at the same time that the SCI clears the TXWAKE bit. If this interrupt method is used, software is not required to poll the TXWAKE bit waiting for the SCI to clear it.

When idle-line multiprocessor communications are used, software must ensure that the idle time exceeds 10 bit periods before addresses (using one of the methods mentioned above), and software must also ensure that data frames are written to the transmitter quickly enough to be sent without a delay of 10 bit periods between frames. Failure to comply with these conditions will result in data interpretation errors by other devices receiving the transmission.

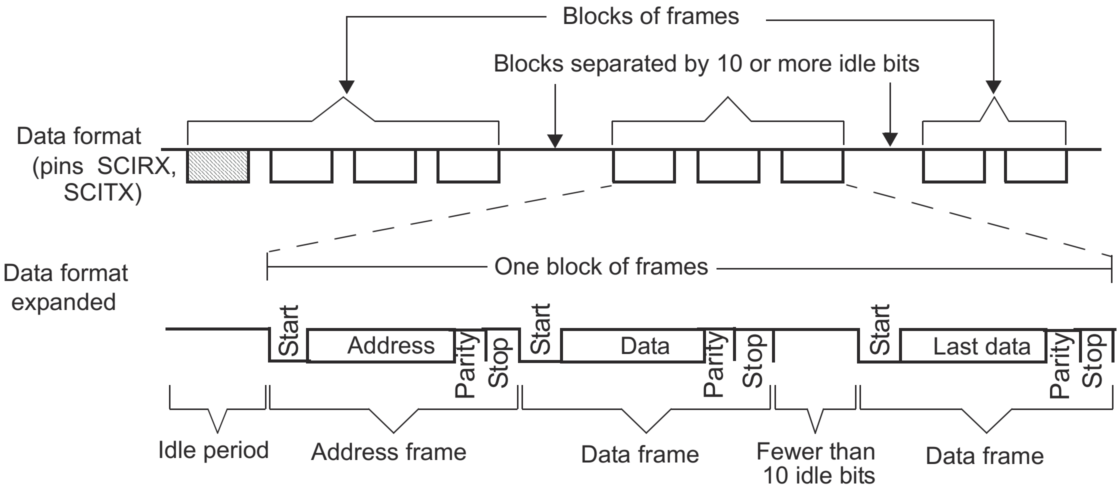

Figure 16-4. Idle-Line Multiprocessor Communication Format

16.2.4.2 Address-Bit Multiprocessor Mode

In the address-bit protocol, each frame has an extra bit immediately following the data field called an address bit. A frame with the address bit set to 1 is an address frame; a frame with the address bit set to 0 is a data frame. The idle period timing is irrelevant in this mode. Figure 16-5 illustrates the format of several blocks and frames with the address-bit mode.

When address-bit mode is used, the value of the TXWAKE bit is the value sent as the address bit. To send an address frame, software must set the TXWAKE bit. This bit is cleared as the contents of the SCITD are shifted from the TXWAKE register so that all frames sent are data except when the TXWAKE bit is written as a 1.

No dummy write to SCITD is required before an address frame is sent in address-bit mode. The first byte written to SCITD after the TXWAKE bit is written to 1 is transmitted with the address bit set when address-bit mode is used.

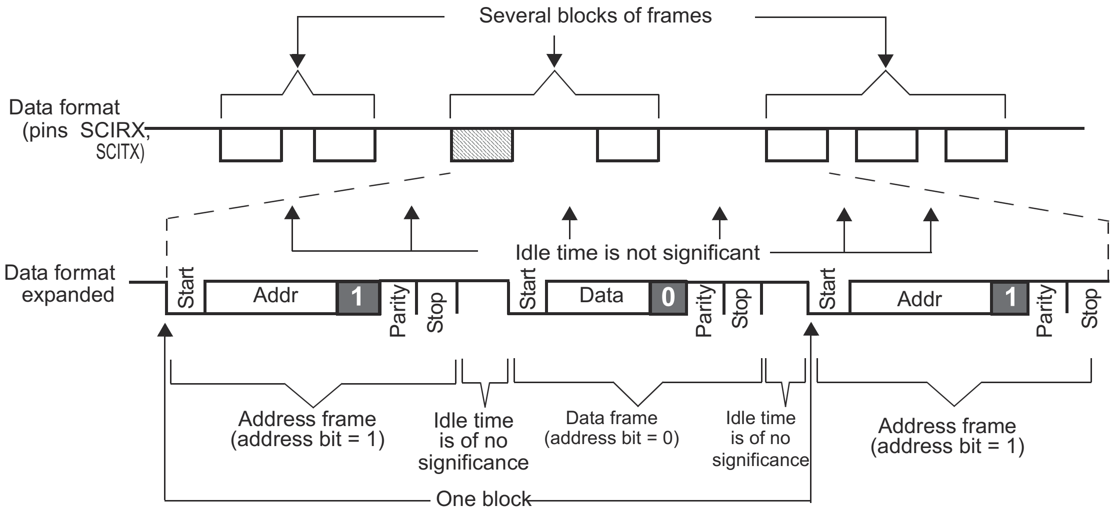

Figure 16-5. Address-Bit Multiprocessor Communication Format

16.3 SCI Interrupts

The SCI module has two interrupt lines, level 0 and level 1, to the interrupt manager (NVIC/IM) module (see Figure 16-6). Two offset registers SCIINTVECT0 and SCIINTVECT1 determine which flag triggered the interrupt according to the respective priority encoders. Each interrupt condition has a bit to enable and disable the interrupt in the SCISETINT and SCICLRINT registers, respectively.

Each interrupt also has a bit that can be set as interrupt level 0 (INT0) or as interrupt level 1 (INT1). By default, interrupts are in interrupt level 0. SCISETINTLVL sets a given interrupt to level1. SCICLEARINTLVL resets a given interrupt level to the default level 0.

The interrupt vector registers SCIINTVECT0 and SCIINTVECT1 return the vector of the pending interrupt line INT0 or INT1. If more than one interrupt is pending, the interrupt vector register holds the highest priority interrupt.

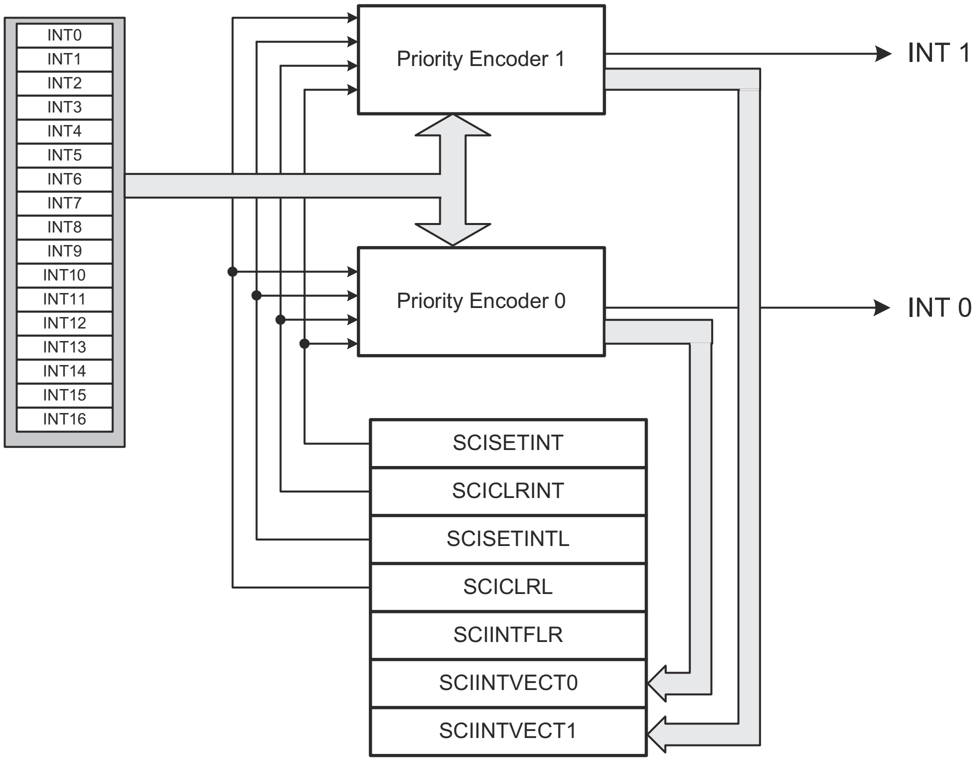

Figure 16-6. General Interrupt Scheme

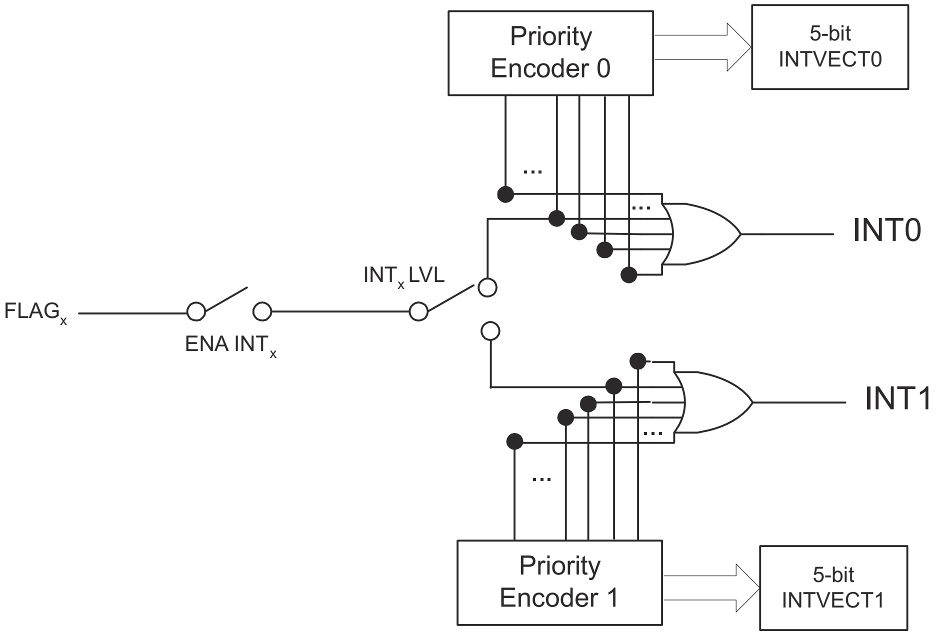

Figure 16-7. Interrupt Generation for Given Flags

16.3.1 Transmit Interrupt

To use transmit interrupt functionality, SET TX INT bit must be enabled and SET TX DMA bit must be cleared. The transmit ready (TXRDY) flag is set when the SCI transfers the contents of SCITD to the shift register, SCITXSHF. The TXRDY flag indicates that SCITD is ready to be loaded with more data. In addition, the SCI sets the TX EMPTY bit if both the SCITD and SCITXSHF registers are empty. If the SET TX INT bit is set, then a transmit interrupt is generated when the TXRDY flag goes high. Transmit Interrupt is not generated immediately after setting the SET TX INT bit unlike transmit DMA request. Transmit Interrupt is generated only after the first transfer from SCITD to SCITXSHF, that is first data has to be written to SCITD by the User before any interrupt gets generated. To transmit further data the user can write data to SCITD in the transmit Interrupt service routine.

Writing data to the SCITD register clears the TXRDY bit. When this data has been moved to the SCITXSHF register, the TXRDY bit is set again. The interrupt request can be suspended by setting the CLR TX INT bit; however, when the SET TX INT bit is again set to 1, the TXRDY interrupt is asserted again. The transmit interrupt request can be eliminated until the next series of values is written to SCITD, by disabling the transmitter via the TXENA bit, by a software reset SWnRST, or by a device hardware reset.

16.3.2 Receive Interrupt

The receive ready (RXRDY) flag is set when the SCI transfers newly received data from SCIRXSHF to SCIRD. The RXRDY flag therefore indicates that the SCI has new data to be read. Receive interrupts are enabled by the SET RX INT bit. If the SET RX INT is set when the SCI sets the RXRDY flag, then a receive interrupt is generated. The received data can be read in the Interrupt Service routine.

On a device with both SCI and a DMA controller, the bits SET RX DMA ALL and SET RX DMA must be cleared to select interrupt functionality.

16.3.3 WakeUp Interrupt

SCI sets the WAKEUP flag if bus activity on the RX line either prevents power-down mode from being entered, or RX line activity causes an exit from power-down mode. If enabled (SET WAKEUP INT), wakeup interrupt is triggered once WAKEUP flag is set.

16.3.4 Error Interrupts

The following error detection features are supported with Interrupt by the SCI module:

- Parity errors (PE)
- Frame errors (FE)
- Break Detect errors (BRKDT)
- Overrun errors (OE)

If any of these errors (PE, FE, BRKDT, OE) is flagged, an interrupt for the flagged errors will be generated if enabled. A message is valid for both the transmitter and the receiver if there is no error detected until the end of the frame. Each of these flags is located in the receiver status (SCIFLR) register. Further details on these flags are explained in SCIFLR register description.

The SCI module supports the following 7 interrupts as listed in Table 16-1.

Table 16-1. SCI Interrupts

Offset (1)	Interrupt
0	Reserved
1	Wakeup
2	Reserved
3	Parity error

16.4 SCI DMA Interface

DMA requests for receive (RXDMA request) and transmit (TXDMA request) are available for the SCI module. Refer to the DMA module chapter for DMA module configurations.

16.4.1 Receive DMA Requests

This DMA functionality is enabled/disabled by the CPU using the SET RX DMA/CLR RX DMA bits, respectively.

The receiver DMA request is set when a frame is received successfully and DMA functionality has been previously enabled. The RXRDY flag is set when the SCI transfers newly received data from the SCIRXSHF register to the SCIRD buffer. The RXRDY flag therefore indicates that the SCI has new data to be read. Receive DMA requests are enabled by the SET RX INT bit.

Parity, overrun, break detect, wakeup, and framing errors generate an error interrupt request immediately upon detection, if enabled, even if the device is in the process of a DMA data transfer. The DMA transfer is postponed until the error interrupt is served. The error interrupt can delete this particular DMA request by reading the receive buffer.

In multiprocessor mode, the SCI can generate receiver interrupts for address frames and DMA requests for data frames. This is controlled by an extra select bit SET RX DMA ALL.

If the SET RX DMA ALL bit is set and the SET RX DMA bit is set when the SCI sets the RXRDY flag, then a receive DMA request is generated for address and data frames.

If the SET RX DMA ALL bit is cleared and the SET RX DMA bit is set when the SCI sets the RXRDY flag upon receipt of a data frame, then a receive DMA request is generated. Receive interrupt requests are generated for address frames.

In multiprocessor mode with the SLEEP bit set, no DMA is generated for received data frames. The software must clear the SLEEP bit before data frames can be received. Table 16-2 specifies the bit values for DMA requests in multiprocessor modes.

Table 16-2. DMA and Interrupt Requests in Multiprocessor Modes

SET RX INT	SET RX DMA	SET RX DMA ALL	ADDR FRAME INT	ADDR FRAME DMA	DATA FRAME INT	DATA FRAME DMA
0	0	x	N	N	N	N
0	1	0	Y	N	N	Y
0	1	1	N	Y	N	Y
1	0	x	Y	N	Y	N
1	1	0	Y	N	Y	Y
1	1	1	Y	Y	Y	Y

In multiprocessor mode, the SCI can generate receiver interrupts for address frames and DMA requests for data frames or DMA requests for both. This is controlled by the SET RX DMA ALL bit.

In multiprocessor mode with the SLEEP bit set, no DMA is generated for received data frames. The software must clear the SLEEP bit before data frames can be received.

16.4.2 Transmit DMA Requests

DMA functionality is enabled and disabled by the CPU with the SET TX DMA and CLR TX DMA bits, respectively.

The TXRDY flag is set when the SCI transfers the contents of SCITD to SCITXSHF. The TXRDY flag indicates that SCITD is ready to be loaded with more data. In addition, the SCI sets the TX EMPTY bit if both the SCITD and SCITXSHF registers are empty.

Transmit DMA requests are enabled by the setting SET TX DMA and SET TX INT bits. If the SET TX DMA bit is set, then a TX DMA request is sent to the DMA when data is written to SCITD and TXRDY is set. The DMA will write the first byte to the transmit buffer.

16.5 SCI Configurations

Before the SCI sends or receives data, its registers should be properly configured. Upon power-up or a system-level reset, each bit in the SCI registers is set to a default state. The registers are writable only after the RESET bit in the SCIGCR0 register is set to 1. Of particular importance is the SWnRST bit in the SCIGCR1 register. The SWnRST is an active-low bit initialized to 0 and keeps the SCI in a reset state until it is programmed to 1. Therefore, all SCI configuration should be completed before a 1 is written to the SWnRST bit.

The following list details the configuration steps that software should perform prior to the transmission or reception of data. As long as the SWnRST bit is cleared to 0 the entire time that the SCI is being configured, the order in which the registers are programmed is not important.

- Enable SCI by setting the RESET bit to 1.
- Clear the SWnRST bit to 0 before SCI is configured.
- Select the desired frame format by programming the SCIGCR1 register.
- Set both the RX FUNC and TX FUNC bits in SCIPIO0 to 1 to configure the SCIRX and SCITX pins for SCI functionality.
- Select the baud rate to be used for communication by programming the BRS register.
- Set the CLOCK bit in SCIGCR1 to 1 to select the internal clock.
- Set the CONT bit in SCIGCR1 to 1 to make SCI not halt for an emulation breakpoint until its current reception or transmission is complete (this bit is used only in an emulation environment).
- Set LOOP BACK bit in SCIGCR1 to 1 to connect the transmitter to the receiver internally (this feature is used to perform a self-test).
- Set the RXENA bit in SCIGCR1 to 1, if data is to be received.
- Set the TXENA bitin SCIGCR1 to 1, if data is to be transmitted.
- Set the SWnRST bit to 1 after SCI is configured.
- Perform receiving or transmitting data (see Section 16.5.1 and Section 16.5.2).

16.5.1 Receiving Data

The SCI receiver is enabled to receive messages if both the RX FUNC bit and the RXENA bit are set to 1. If the RX FUNC bit is not set, the SCIRX pin functions as a general-purpose I/O pin rather than as an SCI function pin. After a valid idle period is detected, data is automatically received as it arrives on the SCIRX pin.

SCI sets the RXRDY bit when it transfers newly received data from SCIRXSHF to SCIRD. The SCI clears the RXRDY bit after the new data in SCIRD has been read. Also, as data is transferred from SCIRXSHF to SCIRD, the SCI sets the FE, OE, or PE flags if any of these error conditions were detected in the received data. These error conditions are supported with configurable interrupt capability. The wakeup and break-detect status bits are also set if one of these errors occurs, but they do not necessarily occur at the same time that new data is being loaded into SCIRD.

You can receive data by:

1. Polling Receive Ready Flag
2. Receive Interrupt
3. DMA

In polling method, software can poll for the RXRDY bit and read the data from SCIRD register once RXRDY is set high. The CPU is unnecessarily overloaded by selecting the polling method. To avoid this, you can use either the interrupt or DMA method. To use the interrupt method, the SET RX INT bit is set. To use the DMA method, the SET RX DMA bit is set. Either an interrupt or a DMA request is generated the moment the RXRDY bit is set.

16.5.2 Transmitting Data

The SCI transmitter is enabled if both the TX FUNC bit and the TXENA bit are set to 1. If the TX FUNC bit is not set, the SCITX pin functions as a general-purpose I/O pin rather than as an SCI function pin. Any value written to the SCITD before TXENA is set to 1 is not transmitted. Both of these control bits allow for the SCI transmitter to be held inactive independently of the receiver.

SCI waits for data to be written to SCITD, transfers it to SCITXSHF, and transmits the data. The TXRDY and TX EMPTY bits indicate the status of the transmit buffers. That is, when the transmitter is ready for data to be written to SCITD, the TXRDY bit is set. Additionally, if both SCITD and SCITXSHF are empty, then the TX EMPTY bit is also set.

You can transmit data by:

1. Polling Transmit Ready Flag
2. Transmit Interrupt
3. DMA

In polling method, software can poll for the TXRDY bit to go high before writing the data to the SCITD register. The CPU is unnecessarily overloaded by selecting the polling method. To avoid this, you can use either the interrupt or DMA method. To use the interrupt method, the SET TX INT bit is set. To use the DMA method, the SET TX DMA bit is set. Either an interrupt or a DMA request is generated the moment the TXRDY bit is set. When the SCI has completed transmission of all pending frames, the SCITXSHF register and SCITD are empty, the TXRDY bit is set, and an interrupt/DMA request is generated, if enabled. Because all data has been transmitted, the interrupt/DMA request should be halted. This can either be done by disabling the transmit interrupt (CLR TX INT) / DMA request (CLR TX DMA bit) or by disabling the transmitter (clear TXENA bit).

Note

The TXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0 or SCIINTVECT1 register.

16.6 MSS_SCI Registers

Table 16-3 lists the memory-mapped registers for the MSS_SCI registers. All register offset addresses not listed in Table 16-3 should be considered as reserved locations and the register contents should not be modified.

16.6.8 SCIFLR Register (Offset = 1Ch) [Reset = 00000904h]

SCIFLR is shown in Table 16-12.

Return to the Summary Table.

SCI Flags Register

Table 16-12. SCIFLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	FE	R/W	0h	SCI framing error flag Read: 0=No framing error detected 1=Framing error detected Write: 0=No effect 1=Clears this bit to 0
25	OE	R	0h	SCI overrun error flag This bit is set when the transfer of data from SCIRXSHF to SCIRD overwrites unread data already in SCIRD
24	PE	R	0h	SCI parity error flag. This bit is set when a parity error is detected in the received data
23-13	RESERVED	R	0h	Reserved
12	RXWAKE	R	0h	Receiver wake-up detect flag. The SCI sets this bit to indicate that the data currently in SCIRD is an address
11	TX_EMPTY	R	1h	Transmitter empty flag. The value of this flag indicates the contents of the transmitter's buffer register (SCITD) and shift register (SCITXSHF)
10	TXWAKE	R/W	0h	SCI transmitter wake-up method select. The TXWAKE bit controls whether the data in SCITD should be sent as an address or data frame using multiprocessor communication format
9	RXRDY	R	0h	SCI receiver ready flag. The receiver sets this bit to indicate that the SCIRD contains new data and is ready to be read by the CPU or DMA.
8	TXRDY	R	1h	Transmitter buffer register ready flag. When set, this bit indicates that the transmit buffer register (SCITD) is ready to receive another character.
7-4	RESERVED	R	0h	Reserved
3	Bus_busy_flag	R	0h	This bit indicates whether the receiver is in the process of receiving a frame.
2	IDLE	R	1h	SCI receiver in idle state. While this bit is set, the SCI looks for an idle period to resynchronize itself with the bit stream.
1	WAKEUP	R	0h	Wake-up flag. This bit is set by the SCI when receiver or transmitter activity has taken the module out of power-down mode.
0	BRKDT	R	0h	SCI break-detect flag. This bit is set when the SCI detects a break condition on the SCIRX pin.

16.6.9 SCIINTVECT0 Register (Offset = 20h) [Reset = 00000000h]

SCIINTVECT0 is shown in Table 16-13.

Return to the Summary Table.

SCI Interrupt Offset Vector 0 Register

Table 16-13. SCIINTVECT0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	INTVECT0	R	0h	Interrupt vector offset for INT0

16.6.10 SCIINTVECT1 Register (Offset = 24h) [Reset = 00000000h]

SCIINTVECT1 is shown in Table 16-14.

Return to the Summary Table.

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	0h	Reserved
23-0	BAUD	R/W	0h	SCI 24-bit baud selection

16.6.13 SCIED Register (Offset = 30h) [Reset = 00000000h]

SCIED is shown in Table 16-17.

Return to the Summary Table.

Receiver Emulation Data Buffer

Table 16-17. SCIED Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	ED	R	0h	Receiver Emulation Data Buffer

16.6.14 SCIRD Register (Offset = 34h) [Reset = 00000000h]

SCIRD is shown in Table 16-18.

Return to the Summary Table.

Receiver Data Buffer

Table 16-18. SCIRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	RD	R	0h	Contains received data.

16.6.15 SCITD Register (Offset = 38h) [Reset = 00000000h]

SCITD is shown in Table 16-19.

Return to the Summary Table.

Transmit Data Buffer Register

Table 16-19. SCITD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	TD	R/W	0h	Contains Data to be transmitted. This is pushed to SCITXSHF(shift register) when TXENA bit is set in SCRGCR1 register.

16.6.16 SCIPIO0 Register (Offset = 3Ch) [Reset = 00000000h]

SCIPIO0 is shown in Table 16-20.

Return to the Summary Table.

SCI Pin I/O Control Register 0

Table 16-20. SCIPIO0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_FUNC	R/W	0h	Defines the function of pin SCITX. 0=SCITX is a general-purpose digital I/O pin. 1=SCITX is the SCI transmit pin. 0=SCIRX is a general-purpose digital I/O pin. 1=SCIRX is the SCI receive pin.
1	RX_FUNC	R/W	0h	Determines the data direction on the SCIRX pin if it is configured with general-purpose I/O functionality (RX FUNC = 0). See Table 12 for bit values. 0=SCIRX is a general-purpose input pin. 1=SCIRX is a general-purpose output pin
0	CLK_FUNC	R/W	0h	Clock function. Defines the function of pin SCICLK. 0=SCICLK is a general-purpose digital I/O pin. 1=SCICLK is the SCI serial clock pin. Determines the data direction on the SCICLK pin. The direction is defined differently depending upon the value of the CLK FUNC bit

16.6.17 SCIPIO1 Register (Offset = 40h) [Reset = 00000000h]

SCIPIO1 is shown in Table 16-21.

Return to the Summary Table.

SCI Pin I/O Control Register 1

Table 16-21. SCIPIO1 Register Field Descriptions

Bit	Field	Type	Reset	Description

SCIIODCTRL is shown in Table 16-38.

Return to the Summary Table.

SCI IO DFT Control

Table 16-38. SCIIODCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	FEN	R/W	0h	Frame Error Enable. User and Privileged Mode Reads and Writes: 1 = This bit is used to create a Frame Error. The stop bit received is ANDed with ’0’ and passed to the stop bit check circuitry. 0 = No effect.
25	PEN	R/W	0h	Parity Error Enable. User and Privileged Mode Reads and Writes: 1 = This bit is used to create a Parity Error. The parity bit received is toggled so that a parity error occurs. 0 = No effect
24	BRKDT_ENA	R/W	0h	Break Detect Error Enable. User and Privileged Mode Reads and Writes: 1 = This bit is used to create BRKDT Error. The stop bit of the frame is ANDed with ‘0’ and passed to the RSM so that a frame error occurs. Then the RX pin is forced to continuous low for 10 TBITS so that a BRKDT error occurs. 0 = No effect.
23-21	RESERVED	R	0h	Reserved
20-19	PIN_SAMPLE_MASK	R/W	0h	PIN SAMPLE MASK These bits define the sample number at which the TX Pin value that is being transmitted will be inverted to verify the receive pin samples majority detection circuitry. PIN SAMPLE MASK: 00 -- No Mask, 01 -- Invert the TX Pin value at 7th SCLK, 10 -- Invert the TX Pin value at 8th SCLK, 11 -- Invert the TX Pin value at 9th SCLK.
18-16	TX_SHIFT	R/W	0h	These bits define the delay by which the value on TX pin is delayed so that the value on RX Pin is asynchronous. (Not applicable to Start Bit) TX SHIFT: 000 -- No Delay, 001 -- Delay by 1 SCLK, 010 -- Delay by 2 SCLKs, 011 -- Delay by 3 SCLKs, 100 -- Delay by 4 SCLKs, 101 -- Delay by 5 SCLKs, 110 -- Delay by 6 SCLKs, 111 -- No Delay.
15-12	RESERVED	R	0h	Reserved
11-8	IODFTENA	R/W	0h	These bits define the delay by which the value on TX pin is delayed so that the value on RX Pin is asynchronous. (Not applicable to Start Bit) TX SHIFT: 000 -- No Delay, 001 -- Delay by 1 SCLK, 010 -- Delay by 2 SCLKs, 011 -- Delay by 3 SCLKs, 100 -- Delay by 4 SCLKs, 101 -- Delay by 5 SCLKs, 110 -- Delay by 6 SCLKs, 111 -- No Delay.
7-2	RESERVED	R	0h	Reserved

Table 16-38. SCIIODCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	LBP_ENA	R/W	0h	Module loopback enable. user and privileged mode reads: Write only in privileged mode: write/ read : 1=Analog loopback is enabled in module I/O DFT mode(when IODFTENA = 1010) 0=Digital loopback is enabled.
0	RXP_ENA	R/W	0h	Module Analog loopback through receive pin enable. user and privileged mode reads: Write only in privileged mode: write/ read : 1=Analog loopback through receive pin. 0=Analog loopback through transmit pin.

16.7 SCI GPIO Functionality

The following sections apply to all device pins that can be configured as functional or general-purpose I/O pins.

16.7.1 GPIO Functionality

Figure 16-8 illustrates the GPIO functionality.

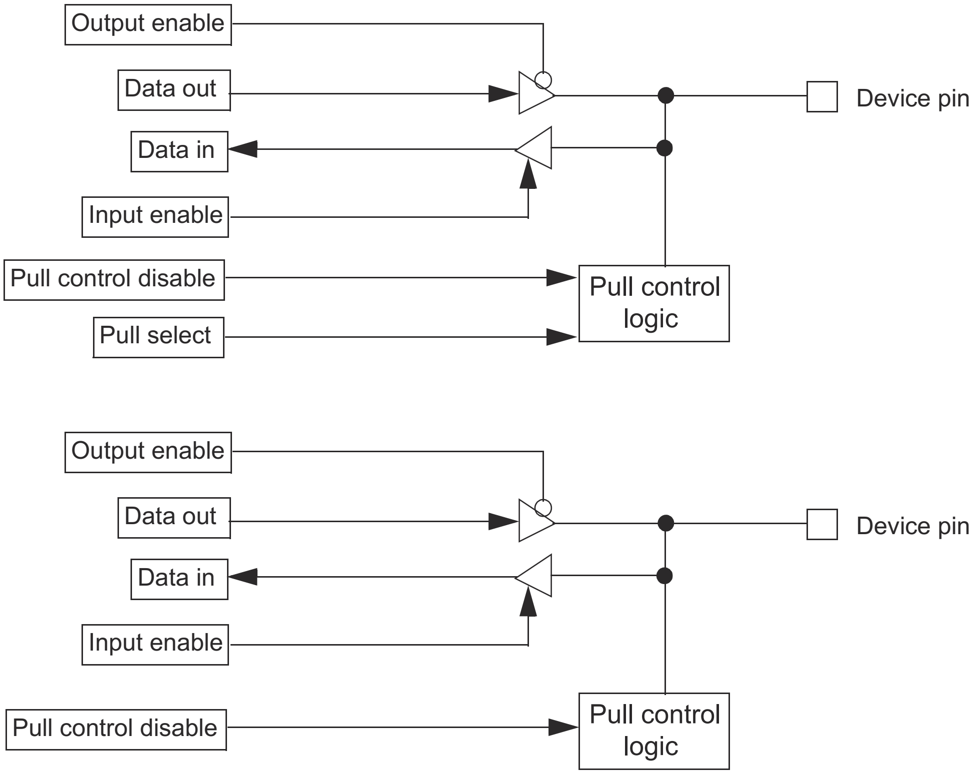

Figure 16-8. GPIO Functionality

16.7.2 Under Reset

The following apply if a device is under reset:

- Pull control. The reset pull control on the pins is enabled.
- Input buffer. The input buffer is enabled.
- Output buffer. The output buffer is disabled.

16.7.3 Out of Reset

The following apply if the device is out of reset:

- Pull control. The pull control is enabled by clearing the PD (pull control disable) bit in the SCIPIO7 register (SCIPIO7 Register (Offset = 58h) [Reset = 00000000h]). In this case, if the PSL (pull select) bit in the SCIPIO8 register (Section 16.6.24) is set, the pin will have a pull-up. If the PSL bit is cleared, the pin will have a pull-down. If the PD bit is set in the control register, there is no pull-up or pull-down on the pin.
- Input buffer. The input buffer is always enabled in functional mode.

Note

The pull-disable logic depends on the pin direction. It is independent of whether the device is in I/O or functional mode. If the pin is configured as output or transmit, then the pulls are disabled automatically. If the pin is configured as input or receive, the pulls are enabled or disabled depending on bit PD in the pull disable register SCIPIO7 (Section 16.6.23).

- Output buffer. A pin can be driven as an output pin if the TX DIR bit is set in the pin direction control register (SCIPIO1; Section 16.6.17) AND the open-drain feature is not enabled in the SCIPIO6 register (Section 16.6.22).

16.7.4 Open-Drain Feature Enabled on a Pin

The following apply if the open-drain feature is enabled on a pin:

- The output buffer is enabled, if a low signal is being driven on to the pin.
- The output buffer is disabled (the direction control signal DIR is internally forced low), if a high signal is being driven on to the pin.

Note

The open-drain feature is available only in I/O mode (SCIPIO0; Section 16.6.16).

16.7.5 Summary

The behavior of the input buffer, output buffer, and the pull control is summarized in Table 16-39.

Table 16-39. Input Buffer, Output Buffer, and Pull Control Behavior as GPIO Pins

Device under Reset?	Pin Direction (DIR) (1) (2)	Pull Disable (PULDIS) (1) (3)	Pull Select (PULSEL) (1) (4)	Pull Control	Output Buffer	Input Buffer
Yes	X	X	X	Enabled	Disabled	Enabled
No	0	0	0	Pull down	Disabled	Enabled
No	0	0	1	Pull up	Disabled	Enabled
No	0	1	0	Disabled	Disabled	Enabled
No	0	1	1	Disabled	Disabled	Enabled
No	1	X	X	Disabled	Enabled	Enabled

(1) X = Don't care
(2) DIR = 0 for input, = 1 for output
(3) PULDIS = 0 for enabling pull control
= 1 for disabling pull control
(4) PULSEL= 0 for pull-down functionality
= 1 for pull-up functionality

Chapter 17
Inter-Integrated Circuit (I2C) Module

This chapter describes the inter-integrated circuit (I2C or I^{2}C) module. The I2C is a multi-Target communication module providing an interface between the Texas Instruments (TI) microcontroller and devices compliant with Philips Semiconductor I^{2}C-bus specification version 2.1 and connected by an I2C-bus. This module will support any Controller or Target I2C compatible device.

17.1 Overview

The I2C has the following features:

- Compliance to the Philips (now NXP Semiconductors) I^{2}C bus specification, v2.1 (*The I 2 C Specification,* Philips document number 9398 393 40011)
  - Bit/Byte format transfer
  - 7-bit and 10-bit device addressing modes
  - General call
  - START byte
  - Multi-controller transmitter/target receiver mode
  - Multi-controller receiver/target transmitter mode
  - Combined controller transmit/receive and receive/transmit mode
  - Transfer rates of 10 kbps up to 400 kbps (Fast mode transfer rate)
- Free data format
- Two DMA events (transmit and receive)
- DMA event enable/disable capability
- Seven interrupts that can be used by the CPU
- Operates with VBUS frequency from 6.7 MHz up
- Operates with module frequency between 6.7 MHz and 13.3 MHz
- Module enable/disable capability
- The SDA and SCL are optionally configurable as general purpose I/O
- Slew rate control of the outputs
- Open drain control of the outputs
- Programmable pullup/pulldown capability on the inputs
- Supports Ignore NACK mode

The device has three instances of I2C called:

- MSS_I2CA
- RCSS_I2CA
- RCSS_I2CB

Note

This I2C module does **not** support:

- High-speed (HS) mode (only supports up to 400 kbps (Fast mode))
- C-bus compatibility mode
- The combined format in 10-bit address mode (the I2C sends the target address second byte every time it sends the target address first byte)

17.1.1 Introduction to the I2C Module

The I2C module supports any target or controller I2C-compatible device. Figure 17-1 shows an example of multiple I2C serial ports connected for a two-way transfer from one device to another device.

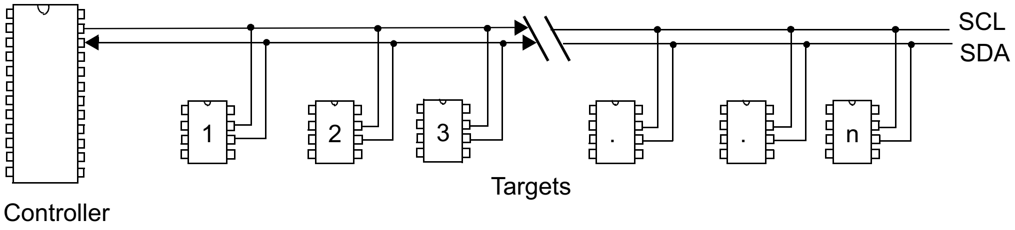

Figure 17-1. Multiple I2C Modules Connection Diagram

17.1.2 Functional Overview

The I2C module is a serial bus that supports multiple Controller devices. In multi Controller mode, one or more devices can be connected to the same bus and are capable of controlling the bus. Each I2C device on the bus is recognized by a unique address and can operate as either a transmitter or a receiver, depending on the function of the device. In addition to being a transmitter or receiver, a device connected to the I2C bus can also be considered a Controller or a Target when performing data transfers.

Note

A Controller device is the device that initiates the data transfer on a bus and generates the clock signal that permits the transfer. During the transmission, any device addressed by the Controller is considered the Target.

Data is communicated to devices interfacing to the I2C module using the serial data pin (SDA) and the serial clock pin (SCL) as shown in Figure 17-2. These two wires carry information between the device and the other devices connected to the I2C bus. Both SDA and SCL pins on the device are bidirectional. They must be connected to a positive supply voltage through a pull-up resistor. When the bus is free, both pins are high. The driver of these two pins has an open-drain configuration to perform the wired-AND function.

The device has a special mode that can be entered to ignore a NACK generated from non-compliant I2C devices that are incapable of generating an ACK.

The I2C module consists of the following Controller blocks:

- A serial Interface: one data pin (SDA) and one clock pin (SCL)
- The device register interface
  - Data registers to temporarily hold received data and transmitted data traveling between the SDA pin and the CPU or the DMA
  - Control and status registers
- A prescaler to divide down the input clock that is driven to the I2C module
- A peripheral bus interface to enable the CPU and DMA to access the I2C module registers
- An arbitrator to handle arbitration between the I2C module (when configured as a Controller) and another Controller
- Interrupt generation logic (interrupts can be sent to the CPU)
- A clock synchronizer that synchronizes the I2C input clock (from the system module) and the clock on the SCL pin, and synchronizes data transfers with controllers of different clock speeds.
- A noise filter on each of the two serial pins
- DMA event generation logic that synchronizes data reception and data transmission in the I2C module for DMA transmission

In Figure 17-2, the CPU or the DMA writes data for transmission to I2CDXR and reads received data from I2CDRR. When the I2C module is configured as a transmitter, data written to I2CDXR is copied to I2CXSR and shifted out one bit at a time. When the I2C module is configured as a receiver, received data is shifted into I2CRSR and then copied to I2CDRR.

When the I2C function is not needed, the pins may be controlled as general-purpose input/output (GPIO) pins. The I/O structure of each pin includes:

- programmable slew rate control of the outputs
- open drain mode
- programmable pull enable/disable on the input
- programmable pull up/pull down function on the input

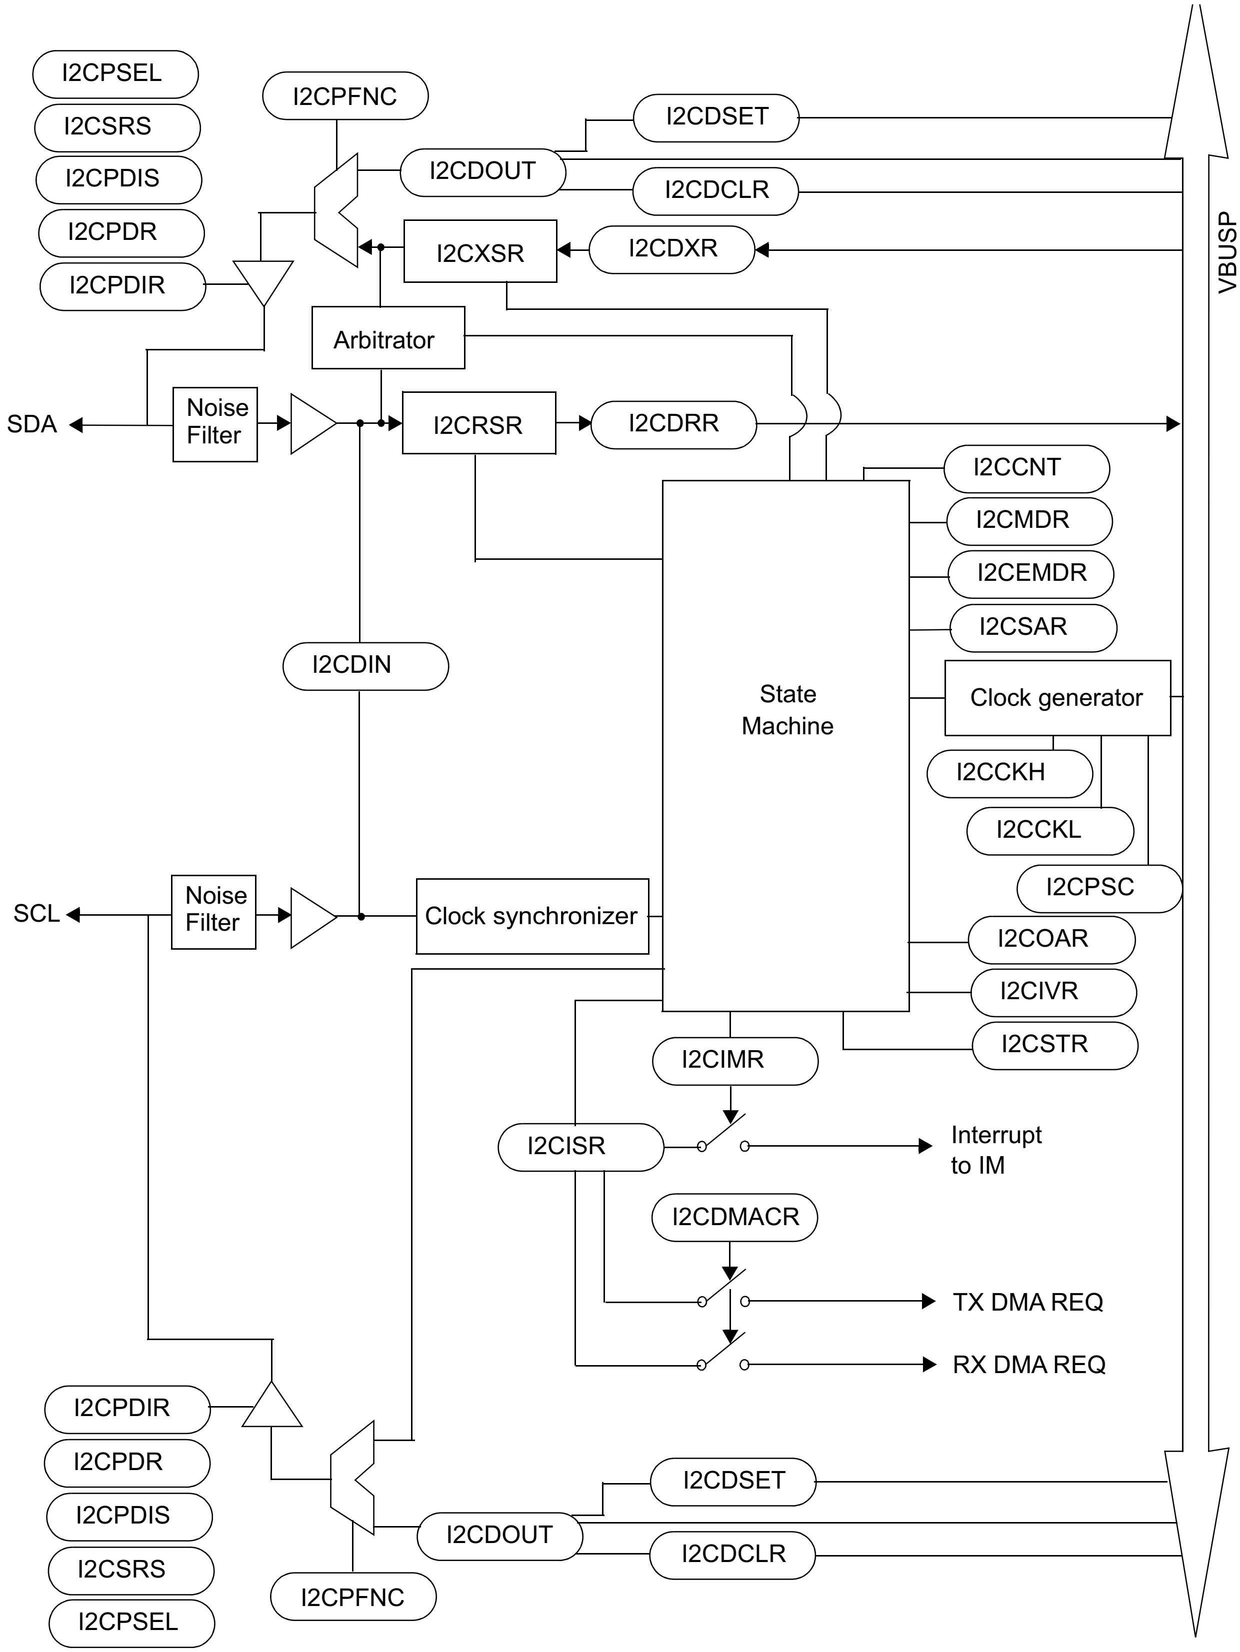

Figure 17-2. Simple I2C Block Diagram

17.1.3 Clock Generation

As shown in Figure 17-3, the I2C module uses the input clock generated from the device clock generator to generate the module clock and Controller clock. The I2C input clock is the device peripheral clock (VBUS_CLK). The clock is then divided twice more inside the I2C module to produce the module clock and the Controller clock.

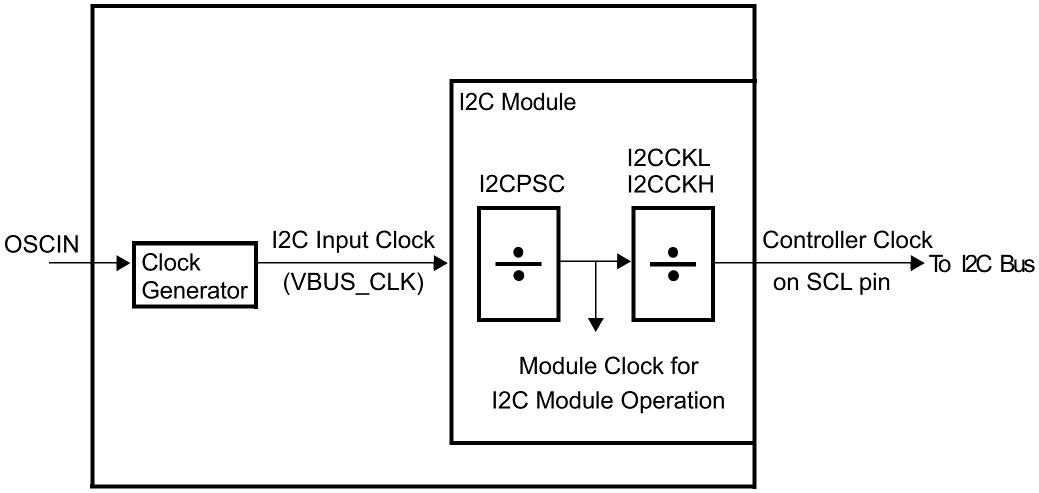

Figure 17-3. Clocking Diagram for the I2C Module

The module clock determines the frequency at which the I2C module operates. A programmable prescaler in the I2C module divides down the input clock to produce the module clock. To specify the divide-down value, initialize the I2CPSC field of the prescaler register, I2CPSC. The resulting frequency is:

$$ModuleClockFrequency - \frac{I2CInputClockFrequency}{(ICPSC + 1)} \tag{5}$$

The module clock frequency must be between 6.7MHz and 13.3MHz. The prescaler can only be initialized while the I2C module is in the reset state (IRS = 0 in I2CMDR). The prescaled frequency takes effect only when IRS is changed to 1. Changing the I2CPSC value while IRS = 1 has no effect.

The Controller clock appears on the SCL pin when the I2C module is configured to be a Controller on the I2C bus. This clock controls the timing of the communication between the I2C module and a secondary. As shown in Figure 17-3, a second clock divider in the I2C module divides down the module clock to produce the Controller clock. The clock divider uses the I2CCKL to divide down the low portion of the module clock signal and uses the I2CCKH to divide down the high portion of the module clock signal.

The resulting frequency is:

$$ControllerClockFrequency = \frac{ModuleClockFrequency}{(ICCLKL + d) + (ICCLKH + d)} \tag{6}$$

$$ControllerClockFrequency = \frac{I2CInputClockFrequency}{(ICPSC + 1)((ICCLKL + d) + (ICCLKH + d))} \tag{7}$$

where *d* depends on the value of I2CPSC:

I2CPSC	d
0	7
1	6

I2CPSC	d
Greater than 1	5

Note

The Controller clock frequency defined above does not include rise/fall time and latency of the synchronizer inside the module. The actual transfer rate will be slower than the value calculated from the formula above. Also, due to the nature of SCL synchronization, the SCL clock period could change if SCL synchronization is taking place.

17.2 I2C Module Operation

The following section discusses how the I2C module operates.

17.2.1 Input and Output Voltage Levels

One clock pulse is generated by the Controller device for each data bit transferred. Because of a variety of different technology devices that can be connected to the I2C-bus, the levels of logic 0 (low) and logic 1 (high) are not fixed and depend on the associated level of V_{CCIO}. For details, see the device specific data sheet.

17.2.2 I2C Module Reset Conditions

The I2C module can be reset in the following two ways:

- Through the global peripheral reset. A device reset causes a global peripheral reset.
- By clearing the $\overline{\text{IRS}}$ bit in the I2C mode register (I2CMDR). When the global peripheral reset is removed, the $\overline{\text{IRS}}$ bit is cleared to 0, keeping the I2C module in the reset state.

17.2.3 I2C Module Data Validity

The data on the SDA must be stable during the high period of the clock. See Figure 17-4. The high and low state of the data line, the SDA, can only change when the clock signal on the serial clock line (SCL) is low.

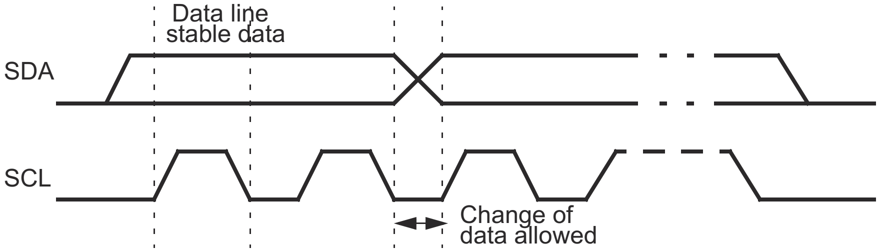

Figure 17-4. Bit Transfer on the I2C Bus

17.2.4 I2C Module Start and Stop Conditions

START and STOP conditions are generated by a primary I2C module.

- The START condition is defined as a high-to-low transition on the SDA line while SCL is high. A primary drives this condition to indicate the start of data transfer. The bus is considered to be busy after the START condition, and the bus busy bit (BB) in I2CSR is set to 1.
- The STOP condition is defined as a low-to-high transition on the SDA line while SCL is high. A primary drives this condition to indicate the end of data transfer. The bus is considered to be free after the STOP condition, therefore the BB bit in I2CSR is cleared to 0.

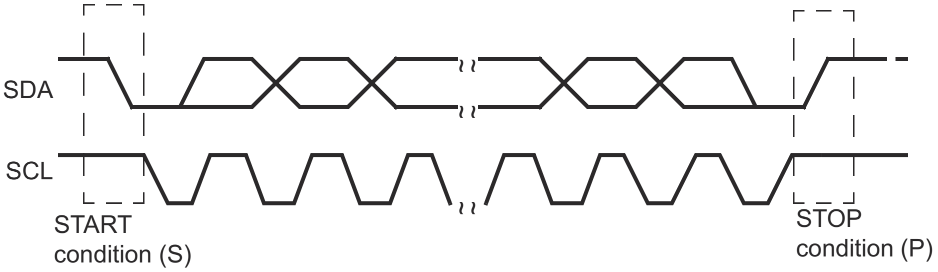

Figure 17-5. I2C Module START and STOP Conditions

For the I2C module to start a data transfer with a START condition, the primary mode bit (MST) and the START condition bit (STT) in the I2CMDR must both be set to 1. For the I2C module to end a data transfer with a STOP condition, the STOP condition bit (STP) must be set to 1. When the BB bit is set to 1 and the STT bit is set to 1, a repeated START condition is generated.

17.2.5 Serial Data Formats

The I2C module operates in byte data format. Each message put on the SDA line is 2 to 8-bits long. The number of messages that can be transmitted or received is unrestricted. The data is transferred with the most significant bit (MSB) first (Figure 17-6). Each message is followed by an acknowledge bit from the I2C if it is in receiver mode. The I2C module does not support little endian systems.

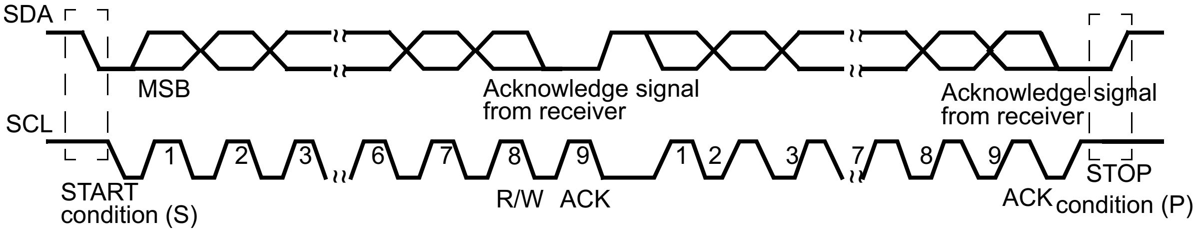

Figure 17-6. I2C Module Data Transfer

The first byte after a START condition (S) always consists of 8 bits that comprise either a 7-bit address plus the R/ $\overline{W}$ bit, or 8 data bits. The eighth bit, R/W, in the first byte determines the direction of the data. When the R/ $\overline{W}$ bit is 0, the Controller writes (transmits) data to a selected Target device; when the R/ $\overline{W}$ bit is 1, the Controller reads (receives) data from the Target device. In acknowledge mode, an extra bit dedicated for the acknowledgment (ACK) bit is inserted after each message.

The I2C module supports the following formats:

- 7-bit addressing format (Figure 17-7)
- 10-bit addressing format (Figure 17-8)
- 7-bit/10-bit addressing format with repeated START condition (Figure 17-9)
- Free-data format (Figure 17-10)

17.2.5.1 7-Bit Addressing Format

In the 7-bit addressing format (Figure 17-7), the first byte after the START condition consists of a 7-bit secondary address followed by the R/ $\overline{W}$ bit (in the LSB). The R/ $\overline{W}$ bit determines the direction of the data transfer:

- R/ $\overline{W}$ = 0: The primary writes (transmits) data to the addressed secondary.
- R/ $\overline{W}$ = 1: The primary reads (receives) data from the secondary.

An extra clock cycle dedicated for acknowledgement (ACK) is inserted after each byte. If the ACK is inserted by the secondary after the first byte from the primary, it is followed by n bits of data from the transmitter (primary or secondary, depending on the R/ $\overline{W}$ bit). The device I2C allows n to be a number between 2 to 8, programmable by the bit count (BC) field of I2CMDR. After the data bits have been transferred, the receiver inserts an ACK bit.

To select the 7-bit addressing format, write 0 to the expanded address enable (XA) bit of I2CMDR and make sure the free data format mode is off (FDF = 0 in I2CMDR).

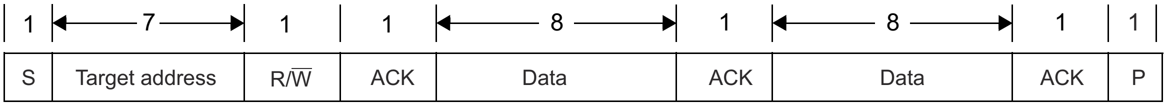

Figure 17-7. I2C Module 7-Bit Addressing Format

17.2.5.2 10-Bit Addressing Format

The 10-bit addressing format is similar to the 7-bit addressing format, but the primary sends the secondary address in two separate byte transfers. In the 10-bit addressing format (Figure 17-8), the first byte is 11110b, the two MSBs of the 10-bit secondary address, and the R/ $\overline{W}$ bit. The ACK bit is inserted after each byte. The second byte is the remaining 8 bits of the 10-bit secondary address. The secondary must send an acknowledgment after each of the two byte transfers. Once the primary has written the second byte to the secondary, the primary can either write data or use repeated a START condition to change the data direction.

To select the 10-bit addressing format, write 1 to the expanded address enable (XA) bit of I2CMDR and make sure the free data format mode is off (FDF = 0 in I2CMDR).

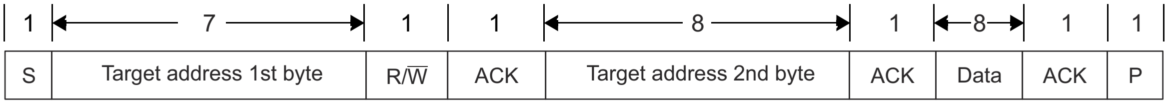

Figure 17-8. I2C Module 10-bit Addressing Format

17.2.5.3 Using the Repeated START Condition

At the end of each byte, the primary can drive another START condition (Figure 17-9). Using this capability, a primary can transmit/receive any number of data bytes before generating a STOP condition. The length of a data byte can be from 2 to 8 bits. The repeated START condition can be used with the 7-bit addressing, 10-bit addressing, or the free data formats.

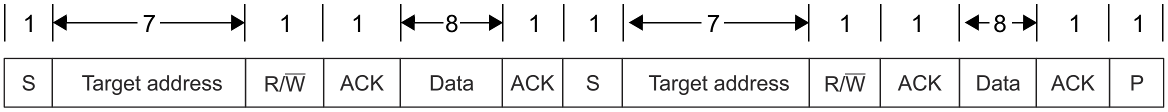

Figure 17-9. I2C Module 7-Bit Addressing Format with Repeated START

17.2.5.4 Free Data Format

In this format (Figure 17-10), the first byte after a START condition is a data byte. The ACK bit is inserted after each byte, followed by another 8 bits of data. No address or data direction bit is sent. Therefore, the transmitter and receiver must both support the free data format. The direction of data transmission (transmit or receive) remains constant throughout the transfer.

To select the free data format, write a 1 to the free data format (FDF) bit of the I2CMDR. The free data format is not supported in the digital loop back mode.

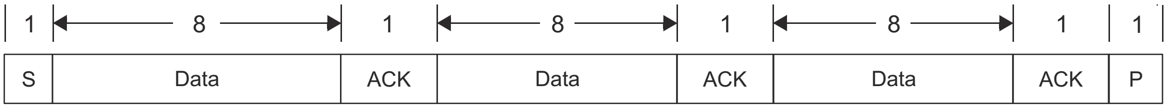

Figure 17-10. I2C Module in Free Data Format

17.2.6 NACK Bit Generation

When the I2C module is a receiver (Controller or Target), it can acknowledge or ignore bits sent by the transmitter. To ignore any new bits, the I2C module must send a no-acknowledge (NACK) bit during the acknowledge cycle on the bus. Table 17-1 summarizes the various ways a NACK can be generated.

Table 17-1. Ways to Generate a NACK Bit

I2C Module Condition	Basic NACK Bit Generation Options	Additional Option
Target receiver mode	Disable data transfers (STT = 0) Allow an overrun condition (RSFULL = 1) Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.
Controller receiver mode and repeat mode (RM = 1)	Generate a STOP condition (STP = 1) Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.
Controller receiver mode with non-repeat mode (RM = 0)	If STP = 1, allow the internal data counter to count down to 0 and thus force a STOP condition. If STP = 0, make STP = 1 to generate a STOP condition. Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.

In some applications, the Target cannot generate the ACK signal. If the IGNACK bit is set in the I2CEMDR register, the resulting NACK will be ignored and the I2C block will continue the data transfer.

17.3 I2C Operation Modes

17.3.1 Controller Transmitter Mode

All primaries begin in this mode. The I2C module is a Controller and transmits control information and data to a Target. In this mode, data assembled in any of the addressing formats shown in Figure 17-7, Figure 17-8, or Figure 17-9 is shifted out onto the SDA pin and synchronized with the self-generated clock pulses on the SCL pin. The clock pulses are inhibited and the SCL pin is held low when the intervention of the device is required ($\overline{\text{XSMT}}$ = 0) after a byte has been transmitted.

Note

If the I2C is configured for two simultaneous Controller transmissions, wait until the MST and BB have been reset before performing the second Controller transmission.

Failure to wait for the MST and BB to reset will prevent the start condition on the second transfer from being issued and the bus BB will not be set. Typically the end of the first transfer is handled by polling BB. However, the MST bit is not reset at the same instant as the BB bit. As a result, when the second Controller transmission is initiated before the resetting of the MST, the MST bit for the second transfer is reset. This prevents the I2C from recognizing itself as the Controller, thus failing to occupy the bus.

17.3.2 Controller Receiver Mode

In this mode, the I2C module is a Controller and receives data from a Target. This mode can only be entered from the Controller transmitter mode (the I2C module must first transmit a command to the Target). In any of the addressing formats shown in Figure 17-7, Figure 17-8, or Figure 17-9, the Controller receiver mode is entered after the Target address byte and the R/ $\overline{\text{W}}$ bit have been transmitted (if the R/ $\overline{\text{W}}$ bit is 1). Serial data bits received on the SDA pin are shifted in with the self-generated clock pulses on the SCL pin. The clock pulses are inhibited and the SCL is held low when the intervention of the device is required (RSFULL = 1) after a byte has been received. At the end of the transfer, the Controller-receiver signals the end of data to the Target-transmitter by not generating an acknowledge on the last byte that was clocked out of the Target. The Target-transmitter then releases the data line allowing the Controller-receiver to generate a STOP condition or a repeated START condition.

In many applications, the size of the message is in the initial bytes of the message itself. Since the size of the message is not known to the Controller before the transmission/reception starts, the Controller must use the repeat mode to force the stop condition when the reception is completed. The repeat mode is enabled by setting the RM bit to 1. Due to the double buffer implementation on the receive side, the Controller must generate the stop condition (STP =1) after reading the (message size - 1)th data.

17.3.3 Target Transmitter Mode

In this mode, the I2C module is a Target and transmits data to a Controller. This mode can only be entered from the Target receiver mode (The I2C module must first receive a command from the Controller). In any of the addressing formats shown in Figure 17-7, Figure 17-8, or Figure 17-9, the Target transmitter mode is entered if the Target address byte is the same as its own address and the R/ $\overline{\text{W}}$ bit has been transmitted (if the R/ $\overline{\text{W}}$ bit is set to 1). The Target transmitter shifts the serial data out on the SDA pin with the clock pulses that are generated by the Controller device. The Target device does not generate the clock, but it can hold the SCL pin low when intervention of the device is required ($\overline{\text{XSMT}}$ = 0) after a byte has been transmitted.

17.3.4 Target Receiver Mode

In this mode, the I2C module is a Target and receives data from a Controller. All Target begin in this mode. Serial data bits received on the SDA pin are shifted in with the clock pulses that are generated by the Controller device. The Target device does not generate the clock, but it can hold the SCL pin low while intervention of the device is required (RSFULL = 1) after a byte has been received.

17.3.5 Low Power Mode

The I2C module can be placed in low-power mode by a global low-power mode initiated by the system (by writing to the Peripheral Power-Down Set Register in the Peripheral Central Resource (PCR) module.

In effect, low-power mode shuts down all the clocks to the module. In global low-power mode, no registers are visible to the software; nothing can be written to or read from any register.

17.3.6 Free Run Mode

The I2C module can be placed in free run mode when the FREE bit (I2CMDR.14) is set to 1. This bit is primarily used on an emulator when encountering a break point while debugging software. When the FREE bit is set to 0, the I2C responds differently depending on whether the SCL is high or low. If the SCL is low, the I2C stops immediately and keeps driving the SCL low whether the I2C is the Controller transmitter or receiver. If the SCL is high, the I2C waits until the SCL becomes a low and then stops. If the I2C is a Target, it stops when the transmission/reception completes.

17.3.7 Ignore NACK Mode

The I2C module can be placed in the ignore NACK mode by setting the IGNACK bit in the I2CEMDR register. This mode allows an I2C module that is configured as a Controller transmitter to ignore a NACK from a Target device that is not capable of generating a proper ACK signal.

17.4 I2C Module Integrity

The following section discusses how the I2C module maintains priorities and order among signals and commands.

17.4.1 Arbitration

If two or more Controller transmitters simultaneously start a transmission on the same bus, an arbitration procedure is invoked. Figure 17-11 illustrates the arbitration procedure between two devices. The arbitration procedure uses the data presented on the SDA bus by the competing transmitters. The first Controller transmitter that generates a high is overruled by the other Controller that generates a low. The arbitration procedure gives priority to the device that transmits the serial data stream with the lowest binary value. The Controller transmitter that loses the arbitration switches to the Target receiver mode, sets the arbitration lost (AL) flag, and generates the arbitration-lost interrupt. The data transmitted by the other Controller module is salvaged, and the I2C continues to receive data from the Controller module. Should two or more devices send identical first bytes, arbitration continues on the subsequent bytes.

If, during a serial transfer, the arbitration procedure is still in progress when a repeated START condition or STOP condition is transmitted to I2C bus, the Controller transmitters involved must send the repeated START condition or STOP condition at the same position in the format frame. In other words, arbitration is not allowed between:

- A repeated START condition and a data bit
- A STOP condition and a data bit
- A repeated START condition and a STOP condition

Secondarys are not involved in the arbitration procedure.

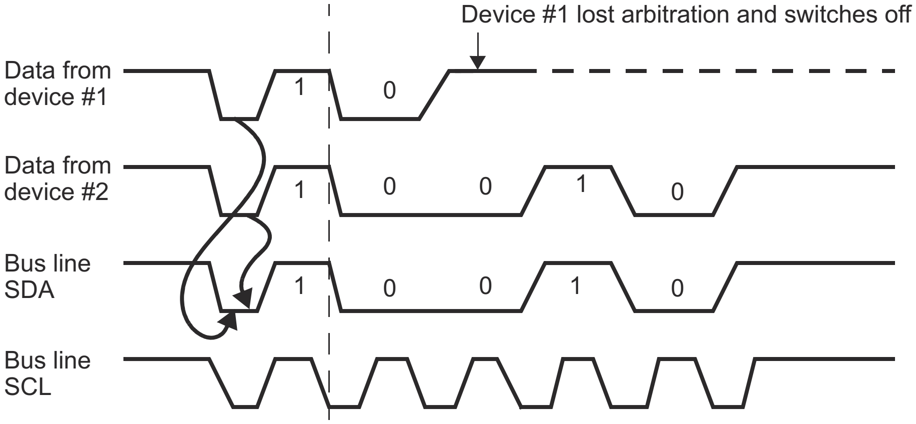

Figure 17-11. Arbitration Procedure Between Two Controller Transmitters

17.4.2 I2C Clock Generation and Synchronization

Under normal conditions only one Controller device generates the clock signal; the SCL. During the arbitration procedure, however, there are two or more Controller devices and the clock must be synchronized so that the data output can be compared. Figure 17-12 illustrates clock synchronization. The wired-AND property of the SCL line means that a device that first generates a low period on the SCL overrules the other devices. At this high-to-low transition, the clock generators of the other devices are forced to start their own low period. The SCL line is held low by the device with the longest low period. The other devices that finish their low periods must wait for the SCL line to be released before starting their high periods. A synchronized signal on the SCL is obtained where the slowest device determines the length of the low period and the fastest device determines the length of the high period.

If a device pulls down the clock line for a longer time, the result is that all clock generators must enter the wait state. In this way, a Target slows down a fast Controller and the slow device creates enough time to store a received byte or to prepare a byte to be transmitted.

Note

I2C Protocol Fault

The following conditions violate the clock spec as defined in the Philips I^{2}C bus specification, v2.1 (*The I 2 C Specification,* Philips document number 9398 393 40011), and will result in an I2C protocol fault: I2CCLKH = 2 I2CCLKL = 2I2CPSC = 2. This will cause the SDA data transition to occur while the SCL is high.

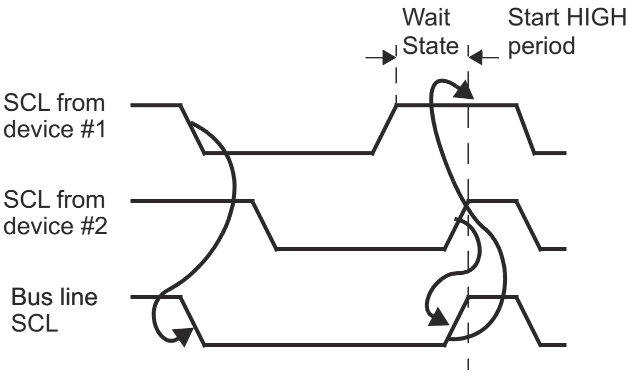

Figure 17-12. Synchronization of Two I2C Clock Generators During Arbitration

17.4.3 Prescaler

The I2C module is operated by the module clock. This clock is generated by way of the I2C prescaler block. The prescaler block consists of a 8-bit register, I2CPSC, used for dividing down the device peripheral clock (VBUS_CLK) to obtain a module clock between 6.7 MHz and 13.3 MHz.

17.4.4 Noise Filter

The noise filter is used to suppress any noises that are 50ns or less. It is designed to suppress noise with one module clock, assuming the lower and upper limits of the module clock are 6.7MHz and 13.3MHz, respectively.

17.5 Operational Information

The following section provides specific information about how the I2C module operates.

17.5.1 I2C Module Interrupts

The I2C module generates seven types of interrupts. These seven interrupts are accompanied with seven interrupt mask bits in the interrupt mask register (I2CIMR) and with seven interrupt flag bits in the status register (I2CSR).

17.5.1.1 I2C Interrupt Requests

The I2C module generates the interrupt requests described below. All requests are multiplexed through an arbiter into a single I2C interrupt request to the CPU. Each interrupt request has a flag bit and an enable bit. Interrupts must be enabled prior to the occurrence of the expected interrupt condition. When one of the specified events occurs, the flag bit is set. If the corresponding enable bit is 0, the interrupt request is blocked. If the enable bit is 1, the interrupt request is forwarded to the CPU as an I2C interrupt request. As an alternative, the CPU can poll all of the bits shown in Table 17-2.

Table 17-2. Interrupt Requests Generated by I2C Module

Flag	Name	Generated
AL	Arbitration-lost interrupt	Generated when the I2C module has lost an arbitration contest with another Controller-transmitter
NACK	No-acknowledge interrupt	Generated when the Controller I2C does not receive an acknowledge from the receiver
ARDY	Register-access-ready interrupt	Generated when the previously programmed address, data and command have been performed and the status bits have been updated. The interrupt is used to notify the device that the I2C registers are ready to be accessed.
RXRDY	Receive-data-ready interrupt	Generated when the received data in the receive-shift register (I2CSR) has been copied into the data receive register (I2CDRR). The RXRDY bit can also be polled by the device to determine when to read the received data in the I2CDRR.
TXRDY	Transmit-data-ready interrupt	Generated when the transmitted data has been copied from the data transmit register (I2CDXR) into the transmit-shift register (I2CXSR). The TXRDY bit can also be polled by the device to determine when to write the next data into I2CDXR.
SCD	Stop-condition-detect interrupt	Generated when a STOP condition has been detected.
AAS	Address-as-Target interrupt	Generated when the I2C has recognized its own Target address or an address of all zeroes.

17.5.2 DMA Controller Events

The I2C module has two events that use the DMA controller to synchronously read received data (I2CREVNT) from I2CDRR, and synchronously write data (I2CWEVNT) to the transmit buffer, I2CDXR. The read and write events have the same timing as I2CRRDY (I2CRINT) and I2CXRDY (I2CXINT), respectively.

The CPU or the DMA controller reads the received data from I2CDRR and writes the data to be transmitted to I2CDXR. The RXRDY bit is automatically cleared when the DMA controller reads the I2CDRR register, and the TXRDY bit is automatically cleared when the DMA controller writes to the I2CDXR register.

Data written to I2CDXR is copied to I2CXSR and shifted out from the SDA pin when the I2C module is configured as a transmitter. When the I2C module is configured as a receiver, received data is shifted into ICRSR and copied to I2CDRR, which can be read by the CPU or the DMA controller.

A transmit event (I2CWEVNT) is generated after a START condition in Controller transmitter mode. This ensures that the DMA gets an event even if no Target returns an ACK to the Target address following the START condition.

Note

Unexpected DMA transmit and receive event

An unexpected DMA transmit event (ICXEVT) and a DMA receive event (ICXRDY) are generated in 10-bit, Controller transmit, repeat mode. This event occurs soon after the start condition but before the first bit of the address is transmitted. In this event, no DMA activity should be initiated without the Target ACK being received.

17.5.3 I2C Enable/Disable

The I2C module can be enabled or disabled with the I2C reset enable bit (IRS) in the I2C module register (I2CMDR). This occurs in one of two ways:

- Write 0 to the I2C reset bit (IRS) in I2CMDR. All status bits are forced to the default values and the I2C mode remains disabled until IRS is changed to 1. The SDA and SCL pins are in the high impedance state.
- Initiate a device reset by driving the $\overline{\text{PORRST}}$ pin low. The entire device is reset and is held in the reset state until the pin is released and is driven high. When $\overline{\text{PORRST}}$ is released, all I2C module registers are reset to their default values. The IRS bit is forced to 0, which resets the I2C module. The I2C module stays in the reset state until a 1 is written to the IRS bit.

IRS must be 0 while the I2C module is being configured. Forcing IRS to 0 can be used to save power and also clear error conditions.

17.5.4 General Purpose I/O

Both of the I2C pins can be programmed to be general-purpose I/O pins via the I2C pin control registers (I2CPFNC, I2CDIR, I2CDOUT, and I2CDIN).

When the I2C module is not used, the I2C pins may be programmed to be either general purpose input or general-purpose output pins. This function is controlled in the I2CDIR and I2CPFNC registers. Note that each pin can be programmed to be either an I2C pin or a GIO pin.

If the I2C function is to be used, the application software must ensure that each pin is configured as an I2C pin and not a GIO pin, or else unexpected behavior may result.

17.5.5 Pull Up/Pull Down Function

I2C module pins can have either an active pull up or active pull down that makes it possible to leave the pins unconnected externally. The pins can be programmed to have the active pull function enabled or disabled by writing to the corresponding bit in the I2CPDIS register. Please see the device-specific data sheet for the default internal pull (pull-up, pull-down or no pull) on the pins.

The pull on the pins is programmable to a setting other than the default internal pull as specified in the data sheet. The pins can be programmed to have either an active pull up or an active pull down function by writing to the corresponding bit in I2CPSEL register. The pull up/pull down function is active on the pin only when the pull enabled is programmed in the I2CPDIS register.

The pull up/pull down functions are deactivated when a bidirectional pin is configured as an output. At system reset, the pull up function of all the pins is enabled. Please see the device-specific data sheet for the current supplied by the pull up/pull down.

17.5.6 Open Drain Function

The I2C pins can be programmed to include an open drain function when they are configured as output pins. This is done by writing to the corresponding bit of the I2CPDR register. When the open drain function is enabled, a low value (0) written to the data output register forces the pin to a low output voltage (V_{OL} or lower), whereas a high value (1) written to the data output register forces the pin to a high-impedance state. The open drain function is disabled when the pin is configured as an input pin.

17.6 MSS_I2C Registers

Table 17-3 lists the memory-mapped registers for the MSS_I2C registers. All register offset addresses not listed in Table 17-3 should be considered as reserved locations and the register contents should not be modified.

Table 17-3. MSS_I2C Registers

Offset	Acronym	Register Name	Section
0h	ICOAR	ICOAR	Go
4h	ICIMR	ICIMR	Go
8h	ICSTR	ICSTR	Go
Ch	ICCLKL	ICCLKL	Go
10h	ICCLKH	ICCLKH	Go
14h	ICCNT	ICCNT	Go

Complex bit access types are encoded to fit into small table cells. Table 17-4 shows the codes that are used for access types in this section.

Table 17-4. MSS_I2C Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

17.6.1 ICOAR Register (Offset = 0h) [Reset = 00000000h]

ICOAR is shown in Table 17-5.

Return to the Summary Table.

I2C Own Address register

Table 17-5. ICOAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU	R/W	0h	Reserved
9-0	A9_A0	R/W	0h	Own address. Use in both 7- and 10-bit address mode. Note that usercan program the I2C own address to any value as long as it does notconflict with other components in the system.

17.6.2 ICIMR Register (Offset = 4h) [Reset = 00000000h]

ICIMR is shown in Table 17-6.

Return to the Summary Table.

I2C Interrupt Mask/Status register

Table 17-6. ICIMR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	NU	R/W	0h	Reserved
6	AAS	R/W	0h	Address As Slave interrupt mask bit. Setting a"1" to this bit unmasks the Address As Slave interrupt. Setting a"0" to this bit masks the Address As Slave interrupt.
5	SCD	R/W	0h	Stop Condition Detection mask bit. Setting a"1" to this bit unmasks the Stop Condition Detection interrupt. Setting a "0" to this bit masks the Stop Condition Detection interrupt.
4	ICXRDY	R/W	0h	Transmit Data Ready interrupt mask bit. Setting a"1" to this bit unmasks the Transmit Data Ready interrupt. Setting a"0" to this bit masks the Transmit Data Ready interrupt.
3	ICRRDY	R/W	0h	Receive Data Ready interrupt mask bit. Setting a"1" to this bit unmasks the Receive Data Ready interrupt. Setting a"0" to this bit masks the Receive Data Ready interrupt.
2	ARDY	R/W	0h	Register access ready interrupt mask bit. Setting a"1" to this bit unmasks the Register access ready interrupt. Setting a"0" to this bit masks the Register access ready interrupt.
1	NACK	R/W	0h	No Acknowledgement interrupt mask bit. Setting a"1" to this bit unmasks the No Acknowledgement interrupt. Setting a"0" to this bit masks the No Acknowledgement interrupt.
0	AL	R/W	0h	Arbitration Lost interrupt mask bit. Setting a"1" to this bit unmasks the Arbitration Lost interrupt. Setting a"0" to this bit masks the Arbitration Lost interrupt.

17.6.3 ICSTR Register (Offset = 8h) [Reset = 00000000h]

ICSTR is shown in Table 17-7.

Return to the Summary Table.

I2C Interrupt Status register

Table 17-7. ICSTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	NU2	R/W	0h	Reserved
14	SDIR	R/W	0h	Slave Direction. This bit is clear to '0' indicating the I2C is a master transmitter/ receiver or a slave receiver. This bit is also clear by STOP condition or START condition. It is set to '1' when the I2C slave is a transmitter. In DLB mode (which the configuration should be master-transmitter slave-receiver) this bit is clear to '0'. Writing a"1" to this bit to clear it.
13	NACKSNT	R/W	0h	A No Acknowledge is sent due to NACKMOD is set to a"1". NACKSNT = 0: A No Acknowledge is not sent. NACKSNT = 1: A No Acknowledge is sent. Writing a"1" to this bit to clear it.
12	BB	R/W	0h	Bus Busy. This bit indicates the state of the serial bus. BB= 0: The bus is free. BB= 1: The bus is occupied. On reception of a"start" condition the device sets BB to 1. This bit is also set if the I2C detects SCL low state. BB is clear to 0 after reception of a"stop" condition. BB is kept to"0" regardless SCL state when the I2C is in reset (IRS_=0). If the IRS_ is set to"1" during transaction between other I2C devices the BB bit is set at the first falling edge of SCL or START condition. - (RW)
11	RSFULL	R/W	0h	Receive shift full. This bit indicates whether the receiver has experienced overrun. Overrun occurs when the receive shift register (ICRSR) is full and ICDRR has not been read since the ICRSR-to-ICDRR transfer. The FSM is holding for ICDRR read access. RSFULL is clear when reading the ICDRR. RSFULL is set to"1" when the I2C has recognized an overrun. The contents of ICDRR are NOT lost in this case. In repeat mode since double buffer (ICRSR and ICDRR) behaves like a single buffer RSFULL is set to"1" every time the data is received. RSFULL is clear as a result of reading the ICDRR. - (RW)
10	XSMT	R/W	0h	Transmit shift empty not. This bit indicates whether the transmitter has experienced underflow. Underflow occurs when the transmit shift register (ICXSR) is empty and ICDXR has not been loaded. The FSM is holding for ICDXR write access. XSMT_ is cleared when underflow has occurred. XSMT_ is set to"1" as a result of writing to ICDXR. In repeat mode if the I2C in master transmitter mode is holding transfer with XSMT_=0 (i.e. waiting for further action) and the STT or STP bit is set XSMT_ is set to"1" by hardware.

Table 17-7. ICSTR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	AAS	R/W	0h	Address As Slave. This bit is set to 1 by the device when it has recognized its own slave address or an address of all (8) zeros. The AAS bit is reset by stop condition or detection of any address byte that does not match ICOAR. - (RW)
8	AD0	R/W	0h	Address Zero Status: This bit is set to 1 by device if it detects the address of all (8) zeros (i.e. general call). The AD0 bit is reset to 0 (default value) when a"start" or"stop" condition is detected. - (RW)
7-6	NU1	R/W	0h	Reserved
5	SCD	R/W	0h	Stop Condition Detection bit SCD is set when the I2C sends or receives STOP condition. This bit is cleared by reading ICIVR (as 110) or writing '1' to itself.
4	ICXRDY	R/W	0h	Transmit Data Ready interrupt flag bit. ICXRDY is set to"1" is generated when the transmitted data has been copied from ICDXR to the transmit-shift register (ICXSR). ICRXDY is clear to"0" when the ICDXR is written. This bit can also be polled by the CPU to write a new transmitted data into the ICDXR. Write '1' to this bit will set it and DXR Write will clear it.
3	ICRRDY	R/W	0h	Receive Data Ready interrupt flag bit. ICRRDY is set to"1" when the received data has been copied from ICRSR into the ICDRR. ICRRDY is cleared to"0" when the ICDRR is read. This bit can also be polled by the CPU to read the received data in the ICDRR. Write '1' or DRR Read will clear it.
2	ARDY	R/W	0h	Register-access-ready interrupt flag bit. ARDY is generated by the hardware if the I2C is in the master mode when the previously programmed data and command has been performed and status bit has been updated. This flag is used by the CPU to let it knows that the I2C registers are ready to be accessed again. When RM=0 ARDY is set when the internal data count is passed 0 if STP register bit has not been set. When RM=1 ARDY is set at each byte end. If the I2C is in FDF mode(FDF=1) ARDY is set just after Start condition. This bit is automatically cleared by hardware when writing data to ICDXR in transmit mode reading data from ICDRR in receive mode or setting STT or STP bit. Write '1' will clear it.
1	NACK	R/W	0h	No-Acknowledgement interrupt flag bit. The No Acknowledge flag bit is set when the hardware in "master" mode detects no acknowledge has been received. This bit is NOT set by no-acknowledgement after Start byte Write '1' or Read the ICIVR (as 010) will clear it.
0	AL	R/W	0h	Arbitration-Lost interrupt flag bit. The Arbitration Lost flag bit is set to 1 when the device in the "master" mode senses it has lost an arbitration when two or more transmitters start a transmission almost simultaneously or when the I2C attempts to start a transfer while BB (bus busy) is 1. When this is set to 1 due to arbitration lost the MST/STT/STP bits are clear the I2C becomes a slave. Write '1' or Read the ICIVR (as 001) will clear it.

17.6.4 ICCLKL Register (Offset = Ch) [Reset = 00000000h]

ICCLKL is shown in Table 17-8.

Return to the Summary Table.

I2C Clock Divider Low register

Table 17-8. ICCLKL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICCL15_ICCL0	R/W	0h	Low time I 2 C SCL Clock Division Factor. They are used to divide down the master clock to create the SCL low time transition frequency. This register must be configured while the I2C is still in reset (IRS_=0).

17.6.5 ICCLKH Register (Offset = 10h) [Reset = 00000000h]

ICCLKH is shown in Table 17-9.

Return to the Summary Table.

I2C Clock Divider High register

Table 17-9. ICCLKH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICCH15_ICCLH0	R/W	0h	High time I 2 C SCL Clock Division Factor. They are used to divide down the master clock to create the SCL high time transition frequency. This register must be configured while the I2C is still in reset (IRS_=0).

17.6.6 ICCNT Register (Offset = 14h) [Reset = 00000000h]

ICCNT is shown in Table 17-10.

Return to the Summary Table.

I2C Data Count register

Table 17-10. ICCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICDC15_ICDC0	R/W	0h	Data count. This data count register is used to generate a Stop condition if a Stop condition is specified (STP=1). . ICCNT=1 data count is 1 ::: ::: ICCNT=0FFFFh data count is 65535 ICCNT=0data counter is 65536 Note that ICCNT is a don"t care when RM is set to 1.

17.6.7 ICDRR Register (Offset = 18h) [Reset = 00000000h]

ICDRR is shown in Table 17-11.

Return to the Summary Table.

I2C Data Receive register

Table 17-11. ICDRR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved
7-0	D7_D0	R/W	0h	Receive data

17.6.8 ICSAR Register (Offset = 1Ch) [Reset = 00000000h]

ICSAR is shown in Table 17-12.

Return to the Summary Table.

I2C Slave Address register

Table 17-12. ICSAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU	R/W	0h	Reserved
9-0	A9_A0	R/W	0h	Slave address. Use in both 7- and 10-bit address mode.

17.6.9 ICDXR Register (Offset = 20h) [Reset = 00000000h]

ICDXR is shown in Table 17-13.

Return to the Summary Table.

I2C Data Transmit register

Table 17-13. ICDXR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved
7-0	D7_D0	R/W	0h	Transmit data

17.6.10 ICMDR Register (Offset = 24h) [Reset = 00000000h]

ICMDR is shown in Table 17-14.

Return to the Summary Table.

I2C Mode register

Table 17-14. ICMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU2	R/W	0h	Reserved
15	NACKMOD	R/W	0h	No Acknowledge (NACK) mode. This bit is used to send an Acknowledge (ACK) or a No Acknowledge (NACK) to the transmitter. This bit is only applicable when the I2C is in receiver mode. In master receiver mode when the internal data count counter decrements to zero the I2C sends a NACK. The master receiver I2C finishes a transfer when it sends a NACK. The I2C ignores ICCNT when NACKMOD is '1'. The NACKMOD bit should be set before the rising edge of the last data bit (bit 8) if a NACK must be sent and this bit is cleared once a NACK has been sent. NACKMOD=0 the I2C sends an ACK to the transmitter during the acknowledge cycle. NACKMOD=1 the I2C sends a NACK to the transmitter during the acknowledge cycle.
14	FREE	R/W	0h	Free Running. This bit is used to determine the state of the I2C when a breakpoint is encountered in the HLL debugger. FREE= 0: (default) Stops immediately if SCL is low and keep driving SCL low whether I2C is master transmitter/receiver. If SCL is high I2C waits until SCL becomes low and then stops. If the I2C is a slave it will stop when the transmission/receiving completes. FREE= 1: The I2C runs free.
13	STT	R/W	0h	Start Condition (Master only mode). This bit can be set to a"1" by the CPU to generate a Start condition. In master mode when setting Start to"1" generates a Start condition. It is reset to "0" by the hardware after the Start condition has been generated. The Start/Stop bits can be configured to generate different transfer formats. Note that the STT and STP can be used to terminate the repeat mode. ____ STT___STP____Conditions_______________Bus Activities _1_____0________Start___________________S-A-D _0_____1________Stop_____________________P _1_____1________Start-Stop (ICCNT= n)______S-A-D..(n)..D-P _1_____0________Start (ICCNT= n)__________S-A-D..(n)..D ____
12	NU1	R/W	0h	Reserved for IDLEEN (IDLE Enable on 5509). - (RW)
11	STP	R/W	0h	Stop Condition (Master mode only). This bit can be set to a"1" by the CPU to generate a Stop condition. It is reset to "0" by the hardware after the Stop condition has been generated. The Stop condition is generated when ICCNT passes 0 when the I2C is in non-repeat mode(RM=0).

Table 17-14. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	MST	R/W	0h	Master. MST= 0: The I 2 C peripheral is in the"slave" mode and clock is received from the"master" device. MST= 1: The I 2 C peripheral is in the"master" mode and it generates the clock. This bit is clear when the transfer completed.
9	TRX	R/W	0h	Transmitter. TRX= 0: The I 2 C is in the"receiver" mode and data on data line SDA is shifted into the data register ICDRR. TRX= 1: The I 2 C is in the"transmitter" mode and the data in ICDXR is shifted out on data line SDA. The operating modes (not in FDF mode) are defined as follows. In FDF mode TRX must be configured even if the I2C is in slave mode because there is no address/direction byte in FDF mode. ________________________________ MST___TRX___Operating Modes _0______x_____"slave receiver" _0______x_____"slave transmitter" _1______0_____"master receiver" _1______1_____"master transmitter" ________________________________
8	XA	R/W	0h	Expanded Address. XA= 0: (default) 7-bit address mode (normal address mode). XA= 1: 10-bit address mode (expanded address mode) Please note that XA needs to be configured even if the I2C is in slave mode.
7	RM	R/W	0h	Repeat Mode. This bit is set to a"1" by the CPU to put the I2C in the repeat mode. In this mode data is continuously transmitted out of the ICDXR until the STP bit is set to"1" regardless of ICCNT value. This bit is don"t care if the I2C is configured in slave mode. ____ __ RM___STT___STP___Conditions_____Bus Activities_______Mode _0_____0_____0_______Idle___________None___________NA _0_____0_____1_______Stop____________P____________NA _0_____1_____0_____(Re)Start_______S-A-D..(n)..D____Repeat n _0_____1_____1_____(Re)Start-Stop___S-A-D..(n)..D-P__Repeat n _1_____0_____0_______Idle___________none___________NA _1_____0_____1_______Stop____________P ___________NA _1_____1_____0_____(Re)Start_______S-A-D-D-D.._____Continuous _1_____1_____1_____Reserved________None___________NA ____ __
6	DLB	R/W	0h	Digital Loop Back (in master transmit mode only). This bit is set to a"1" by the CPU to put the I2C in the loop back mode. In this mode data transmitted out of the ICDXR will be received in the ICDRR after ((CPU freq/I2C freq)8) CPU cycles via an internal path. The address of the ICOAR is output on SDA.
5	IRS	R/W	0h	I2C Reset Not. This can be set to a"0" by the CPU to put the I2C in reset or to a"1" to take the I2C out of reset. When this bit is reset to 0 all status bits in ICSTR and ICIVR are set to default values. Note that if this bit is reset during a transfer it can cause the I2C bus hang (SDA and SCL are tri-stated).

Table 17-14. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	STB	R/W	0h	Start Byte (Master only mode). The Start Byte mode bit is set to 1 by the CPU to configure the I2C in Start byte mode the I2C sends "00000001"� regardless ICSAR value. Refer to the Philip I2C spec for more details.
3	FDF	R/W	0h	Free Data Format. This bit can be set to"1" by the CPU to configure the I2C in Free Data Format mode. ____ FDF___MST___TRX______Operating mode _0______0_____ x____Slave in non FDF mode _0______1_____0____Master receive in non FDF mode _0______1_____1____Master transmit in non FDF mode _1______0_____0____Slave receiver in FDF mode _1______0_____1____Slave transmitter in FDF mode _1______1_____0____Master receiver in FDF mode _1______1_____1____Master transmitter in FDF mode ____
2-0	BC2_BC1_BC0	R/W	0h	Bit Count : Bit Count 2, Bit Count 1 and Bit Count 0 define the number of bits starting from the lsb (excluding the acknowledge bit) of the next byte which are yet to be received or transmitted. ____ BC2_BC1_BC0__Bits/byte in FDF__Bits/byte w/ ACK _0___0___1_____NA (reserved)____ NA (reserved) _0___1___0________2______________3_______ _0___1___1________3______________4_______ _1___0___0________4______________5_______ _1___0___1________5______________6_______ _1___1___0________6______________7_______ _1___1___1________7______________8_______ _0___0___0________8______________9_______ ____

17.6.11 ICIVR Register (Offset = 28h) [Reset = 00000000h]

ICIVR is shown in Table 17-15.

Return to the Summary Table.

I2C Interrupt Vector register

Table 17-15. ICIVR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	NU2	R/W	0h	Reserved.
11-8	TESTMD	R/W	0h	Reserved for internal testing.
7-3	NU1	R/W	0h	Reserved.
2-0	INTCODE	R/W	0h	Interrupt code. The binary-coded-interrupt vector indicates which interrupt has occurred. Reading the ICIVR clears the interrupt code except ARDY(011) RRDY(100) and XRDY(101). Interrupt code for ARDY RRDY and XRDY is cleared when ARDY ICRRDY and ICXRDY bits in the ICSTR is cleared to default value respectively. If other interrupts are pending a new interrupt is generated. If there are more than one interrupt flag reading the ICIVR clears the highest priority interrupt code. Reading the ICIVR also clears corresponding status bit in the ICSTR except ARDY ICRRDY ICXRDY and AAS. Note that users must read (clear) the ICIVR before doing another start otherwise the ICIVR could contain incorrect (old interrupt flags) value. ____ Interrupt Code____________Interrupt Occurred__________ _000_(default)_________________None _001_(highest priority)____Arbitration Lost interrupt _010__________________No Acknowledgement interrupt _011__________________Register Access Ready interrupt _100__________________Receive Data Ready interrupt _101__________________Transmit Data Ready interrupt _110__________________Stop Condition Detection _111_(lowest priority)_____Address As Slave - (RW) ____

17.6.12 ICEMDR Register (Offset = 2Ch) [Reset = 00000000h]

ICEMDR is shown in Table 17-16.

Return to the Summary Table.

I2C Extended Mode register

Table 17-16. ICEMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved. - (RW)
1	IGNACK	R/W	0h	Ignore NACK mode IGNACK=0 The master transmitter will operate normally discontinue the data transfer and set the ARDY and NACK status bits when a NACK signal is received from the slave. IGNACK=1 The master transmitter will ignore a NACK received from the slave.
0	BCM	R/W	0h	Backward Compatibility Mode. This bit affects the I2C interrupt behavior. Refer to appendix A for details.

17.6.13 ICPSC Register (Offset = 30h) [Reset = 00000000h]

ICPSC is shown in Table 17-17.

Return to the Summary Table.

I2C Prescaler register

Table 17-17. ICPSC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved.
7-0	IPSC7_IPSC0	R/W	0h	8-bit prescaler to divide the system clock down to 4/8/12Mhz clock and used by the I2C module. This register must be initialized while the I2C is still in reset (IRS_=0). The value takes effect on the rising edge of IRS_.

17.6.14 ICPID1 Register (Offset = 34h) [Reset = 00000000h]

ICPID1 is shown in Table 17-18.

Return to the Summary Table.

I2C Peripheral ID register 1

Table 17-18. ICPID1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved.
15-8	CLASS	R/W	0h	Identifies the class of peripheral. This value should be 0x 01 - (RW)
7-0	REVISION	R/W	0h	Identifies the revision level of the I2C. This value should be incremented each time the design is revised. - (RW)

17.6.15 ICPID2 Register (Offset = 38h) [Reset = 00000000h]

ICPID2 is shown in Table 17-19.

Return to the Summary Table.

I2C Peripheral ID register 2

Table 17-19. ICPID2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved.
7-0	TYPE	R/W	0h	Identifies the type of peripheral. This value should be 0x 05 - (RW)

17.6.16 ICDMAC Register (Offset = 3Ch) [Reset = 00000000h]

ICDMAC is shown in Table 17-20.

Return to the Summary Table.

I2C DMA Control Register

Table 17-20. ICDMAC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved. - (RW)
1	TXDMAEN	R/W	0h	Transmit DMA enable. This bit controls the receive DMA event pin to the system. When this bit is 1 the DMA event is enabled and ICTEVT_POR pin is asserted when the DMA transfer is required. When this bit is 0 the ICTEVT_POR pin is never asserted. RXDMAEN= 0: DMA transmit event is disabled. RXDMAEN= 1: DMA transmit event is enabled. (Default)
0	RXDMAEN	R/W	0h	Receive DMA enable. This bit controls the receive DMA event pin to the system. When this bit is 1 the DMA event is enabled and ICREVT_POR pin is asserted when the DMA transfer is required. When this bit is 0 the ICREVT_POR pin is never asserted. RXDMAEN= 0: DMA receive event is disabled. RXDMAEN= 1: DMA receive event is enabled. (Default)

17.6.17 I2C_RESERVED1 Register (Offset = 40h) [Reset = 00000000h]

I2C_RESERVED1 is shown in Table 17-21.

Return to the Summary Table.

Reserved

Table 17-21. I2C_RESERVED1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	NU	R/W	0h	Reserved.

17.6.18 I2C_RESERVED2 Register (Offset = 44h) [Reset = 00000000h]

I2C_RESERVED2 is shown in Table 17-22.

Return to the Summary Table.

Reserved

Table 17-22. I2C_RESERVED2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	NU	R/W	0h	Reserved.

17.6.19 ICPFUNC Register (Offset = 48h) [Reset = 00000000h]

ICPFUNC is shown in Table 17-23.

Return to the Summary Table.

I2C Pin Function register

Table 17-23. ICPFUNC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU	R/W	0h	Reserved.
0	PFUNC0	R/W	0h	Controls the function of the I2C SCL and SDA pins. 0 = Pins function as SCL and SDA 1 = Pins functions as GPIO Note: No hardware protection is required to disable I2C function when the PFUNC[0] and IRS_ bits are both set to one. When PFUNC[0] is"1" (GPIO mode) the sub-module which controls the I2C function receives the value"1" for SCL and SDA. IRS_ can be set to"1" regardless of PFUNC[0] and the I2C function works whenever the IRS_ bit is"1". The user is expected to hold I2C in reset via IRS_ bit when changing to/from GPIO mode via the PFUNC[0] bit.

17.6.20 ICPDIR Register (Offset = 4Ch) [Reset = 00000000h]

ICPDIR is shown in Table 17-24.

Return to the Summary Table.

I2C Pin Direction register

Table 17-24. ICPDIR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDIR1	R/W	0h	Controls the direction of the I2C SDA pin when configured as GPIO. 0 = SDA pin functions as input 1 = SDA pin functions as output
0	PDIR0	R/W	0h	Controls the direction of the I2C SCL pin when configured as GPIO. 0 = SCL pin functions as input 1 = SCL pin functions as output

17.6.21 ICPDIN Register (Offset = 50h) [Reset = 00000000h]

ICPDIN is shown in Table 17-25.

Return to the Summary Table.

I2C Pin Data In register

Table 17-25. ICPDIN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDIN1	R/W	0h	Indicates the logic level present on the SDA pin. Reads: 0 = Logic low present at SDA pin regardless of PFUNC setting. 1 = Logic high present at SDA pin regardless of PFUNC setting. Writes: Writes have no effect. - (RW)
0	PDIN0	R/W	0h	Indicates the logic level present on the SCL pin. Reads: 0 = Logic low present at SCL pin regardless of PFUNC setting. 1 = Logic high present at SCL pin regardless of PFUNC setting. Writes: Writes have no effect - (RW)

17.6.22 ICPDOUT Register (Offset = 54h) [Reset = 00000000h]

ICPDOUT is shown in Table 17-26.

Return to the Summary Table.

I2C Pin Data Out register

Table 17-26. ICPDOUT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDOUT1	R/W	0h	Controls the level driven on the SDA pin when configured as GPIO output. Reads: Reads return register values not GPIO pin levels. Writes: 0 = SDA pin driven low 1 = SDA pin driven high. Note: If SDA is connected to an open-drain buffer at the chiplevel the I2C cannot drive SDA to high.
0	PDOUT0	R/W	0h	Controls the level driven on the SCL pin when configured as GPIO output. Reads: Reads return register values not GPIO pin levels. Writes: 0 = SCL pin driven low 1 = SCL pin driven high Note: If SCL is connected to an open-drain buffer at the chiplevel the I2C cannot drive SCL to high.

17.6.23 ICPDSET Register (Offset = 58h) [Reset = 00000000h]

ICPDSET is shown in Table 17-27.

Return to the Summary Table.

I2C Pin Data Set register

Table 17-27. ICPDSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDSET1	R/W	0h	Used to set PDOUT[1] bit which corresponds to the SDA GPIO pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[1] bit is set to logic high.
0	PDSET0	R/W	0h	Used to set PDOUT[0] bit which corresponds to the SCL GPIO pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[0] bit is set to logic high.

17.6.24 ICPDCLR Register (Offset = 5Ch) [Reset = 00000000h]

ICPDCLR is shown in Table 17-28.

Return to the Summary Table.

I2C Pin Data Clear register

Table 17-28. ICPDCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDCLR1	R/W	0h	Used to clear PDOUT[1] bit which corresponds to the SDA pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[1] bit is cleared to logic low.
0	PDCLR0	R/W	0h	Used to clear PDOUT[0] bit which corresponds to the SCL pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[0] bit is cleared to logic low.

17.6.25 ICPDRV Register (Offset = 60h) [Reset = 00000000h]

ICPDRV is shown in Table 17-29.

Return to the Summary Table.

I2C Pin Driver Mode Register

Table 17-29. ICPDRV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDRV1	R/W	0h	Used to select driver mode of output buffer for SDA pin. 0 = I2C mode. 1 = GPIO mode. Note: Value of this register is reflected on the PDRV_SDA_POR port. Actual function depends on I/O buffer and chip implementation.
0	PDRV0	R/W	0h	Used to select driver mode of output buffer for SCL pin. 0 = I2C mode. 1 = GPIO mode. Note: Value of this register is reflected on the PDRV_SCL_POR port. Actual function depends on I/O buffer and chip implementation.

17.7 Sample Waveforms

Figure 17-13 provides waveforms to illustrate the difference between normal operation and backward compatibility mode.

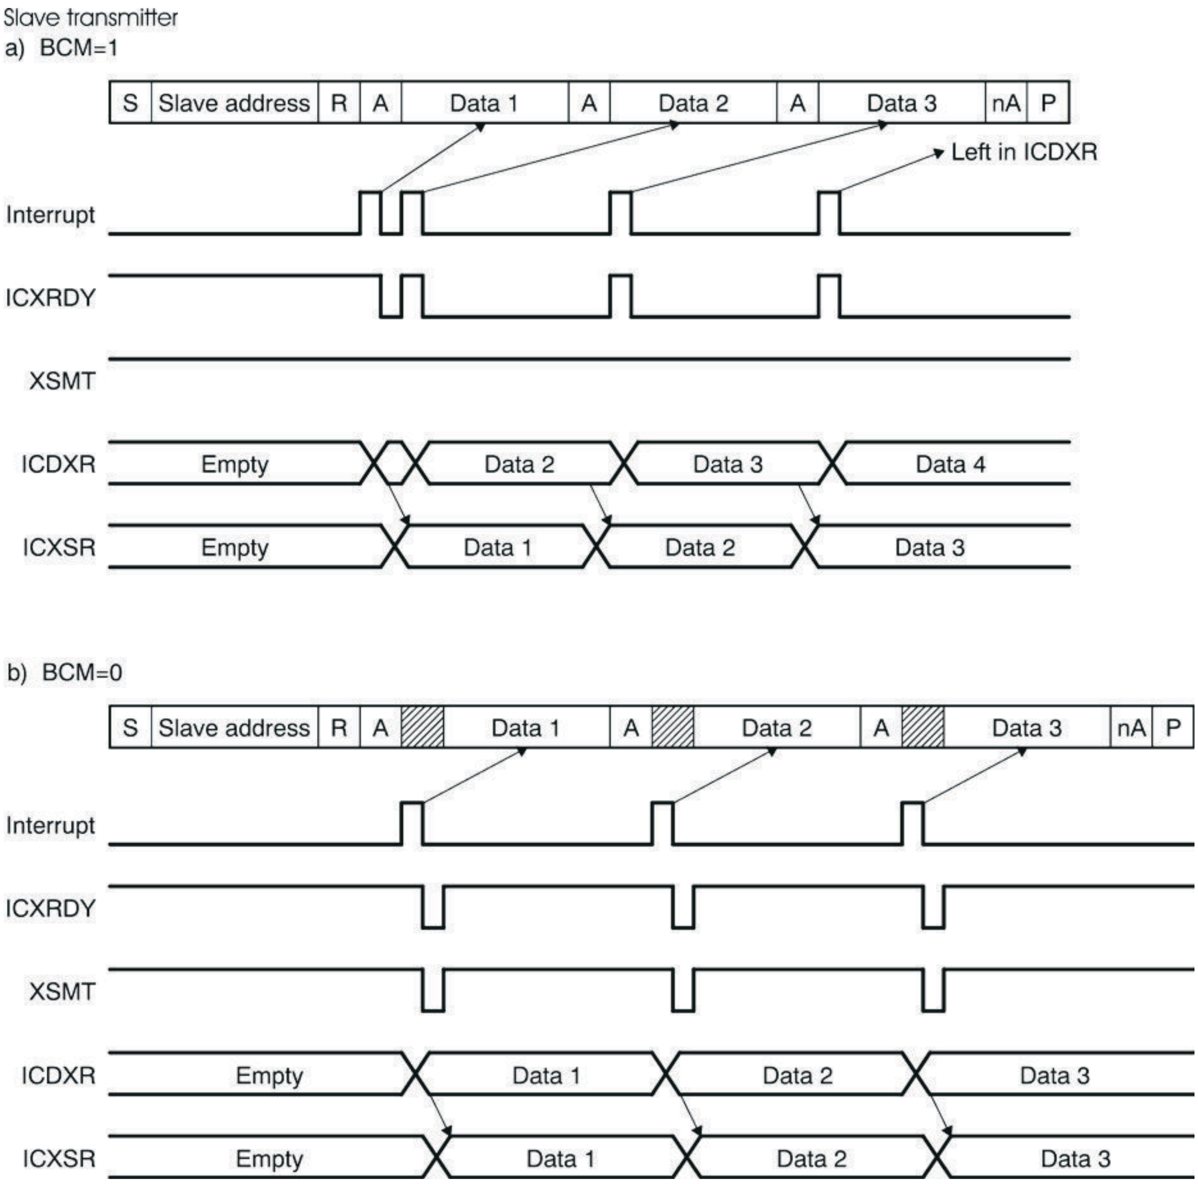

Figure 17-13. Difference between Normal Operation and Backward Compatibility Mode

Chapter 18

General-Purpose Input/Output (GIO) Module

This chapter describes the general-purpose input/output (GIO) module. The GIO module provides the family of devices with input/output (I/O) capability. The I/O pins are bidirectional and bit-programmable. The GIO module also supports external interrupt capability.

Note

The "GIO" module is also known as the "GPIO" module in other TI MCU and MPU devices. The two terms are used interchangeably and represent the general use I/O module of the device.

18.1 Overview

The The GIO module offers general-purpose input and output capability. It supports up to eight 8-bit ports for a total of up to 64 GIO terminals. Each of these 64 terminals can be independently configured as input or output and configured as required by the application. The GIO module also supports generation of interrupts whenever a rising edge or falling edge or any toggle is detected on up to 32 of these GIO terminals. Refer to the device datasheet for identifying the number of GIO ports supported and the GIO terminals capable of generating an interrupt.

The main features of the GIO module are summarized as follows:

- Allows each GIO terminal to be configured for general-purpose input or output functions
- Supports programmable pull directions on each input GIO terminal
- Supports GIO output in push/pull or open-drain modes
- Allows up to 32 GIO terminals to be used for generating interrupt requests

18.2 Quick Start Guide

The GIO module comprises two separate components: an input/output (I/O) block and an interrupt generation block. Figure 18-1 and Figure 18-2 show what you should do after reset to configure the GIO module as I/O or for generating interrupts.

In GIO interrupt service routine, you shall read the GIO offset register (GIOOFF1 or GIOOFF2, depending on high-/low-level interrupt) to clear the flag and find the pending interrupt GIO channel.

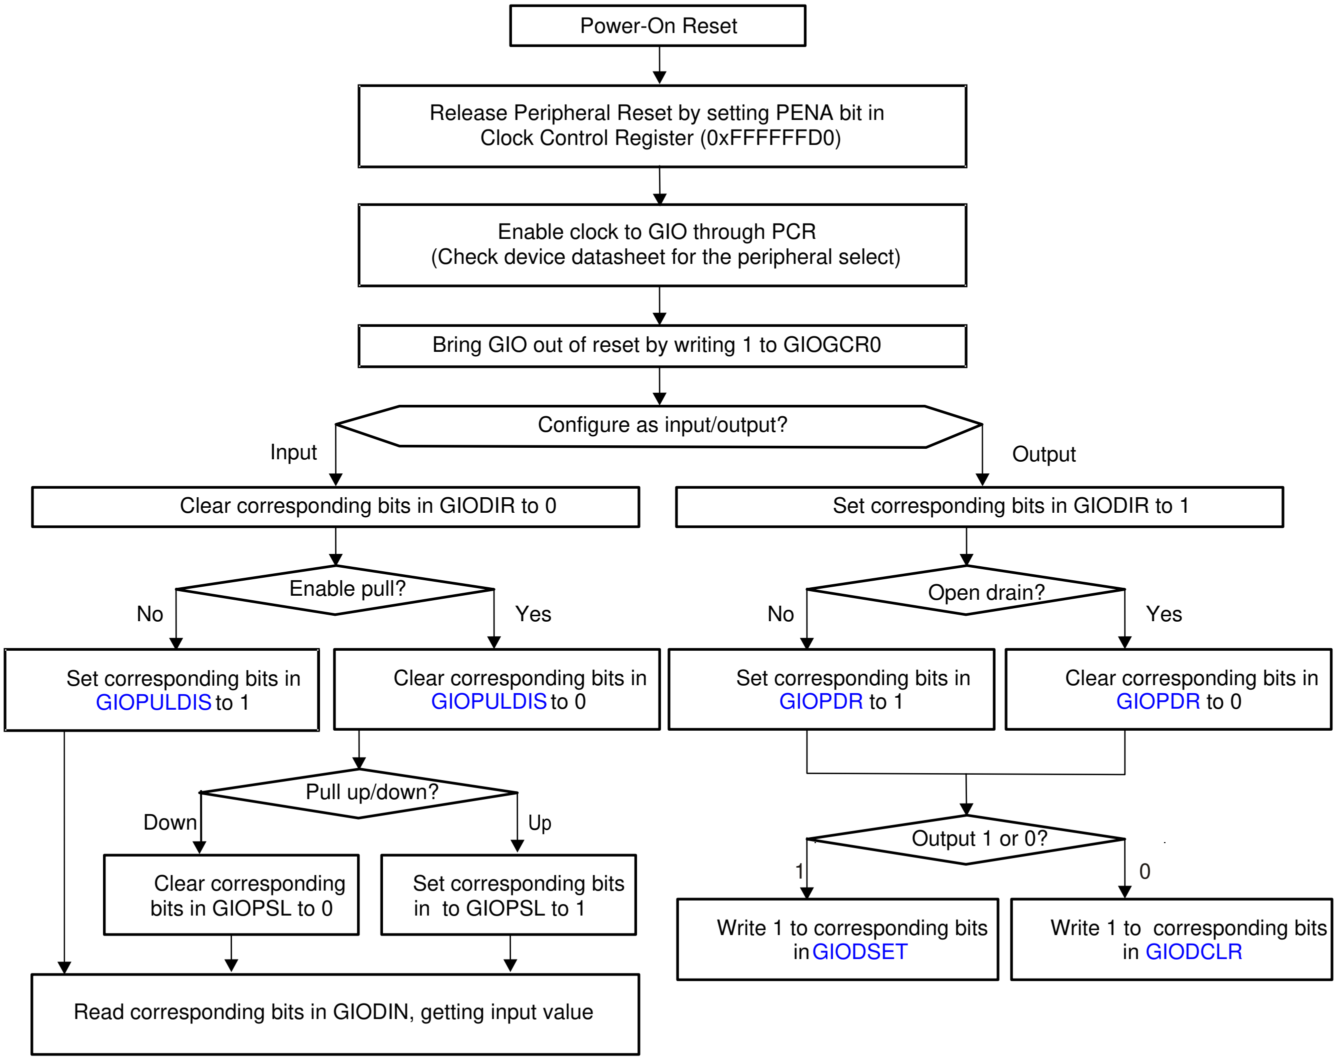

Figure 18-1. I/O Function Quick Start Flow Chart

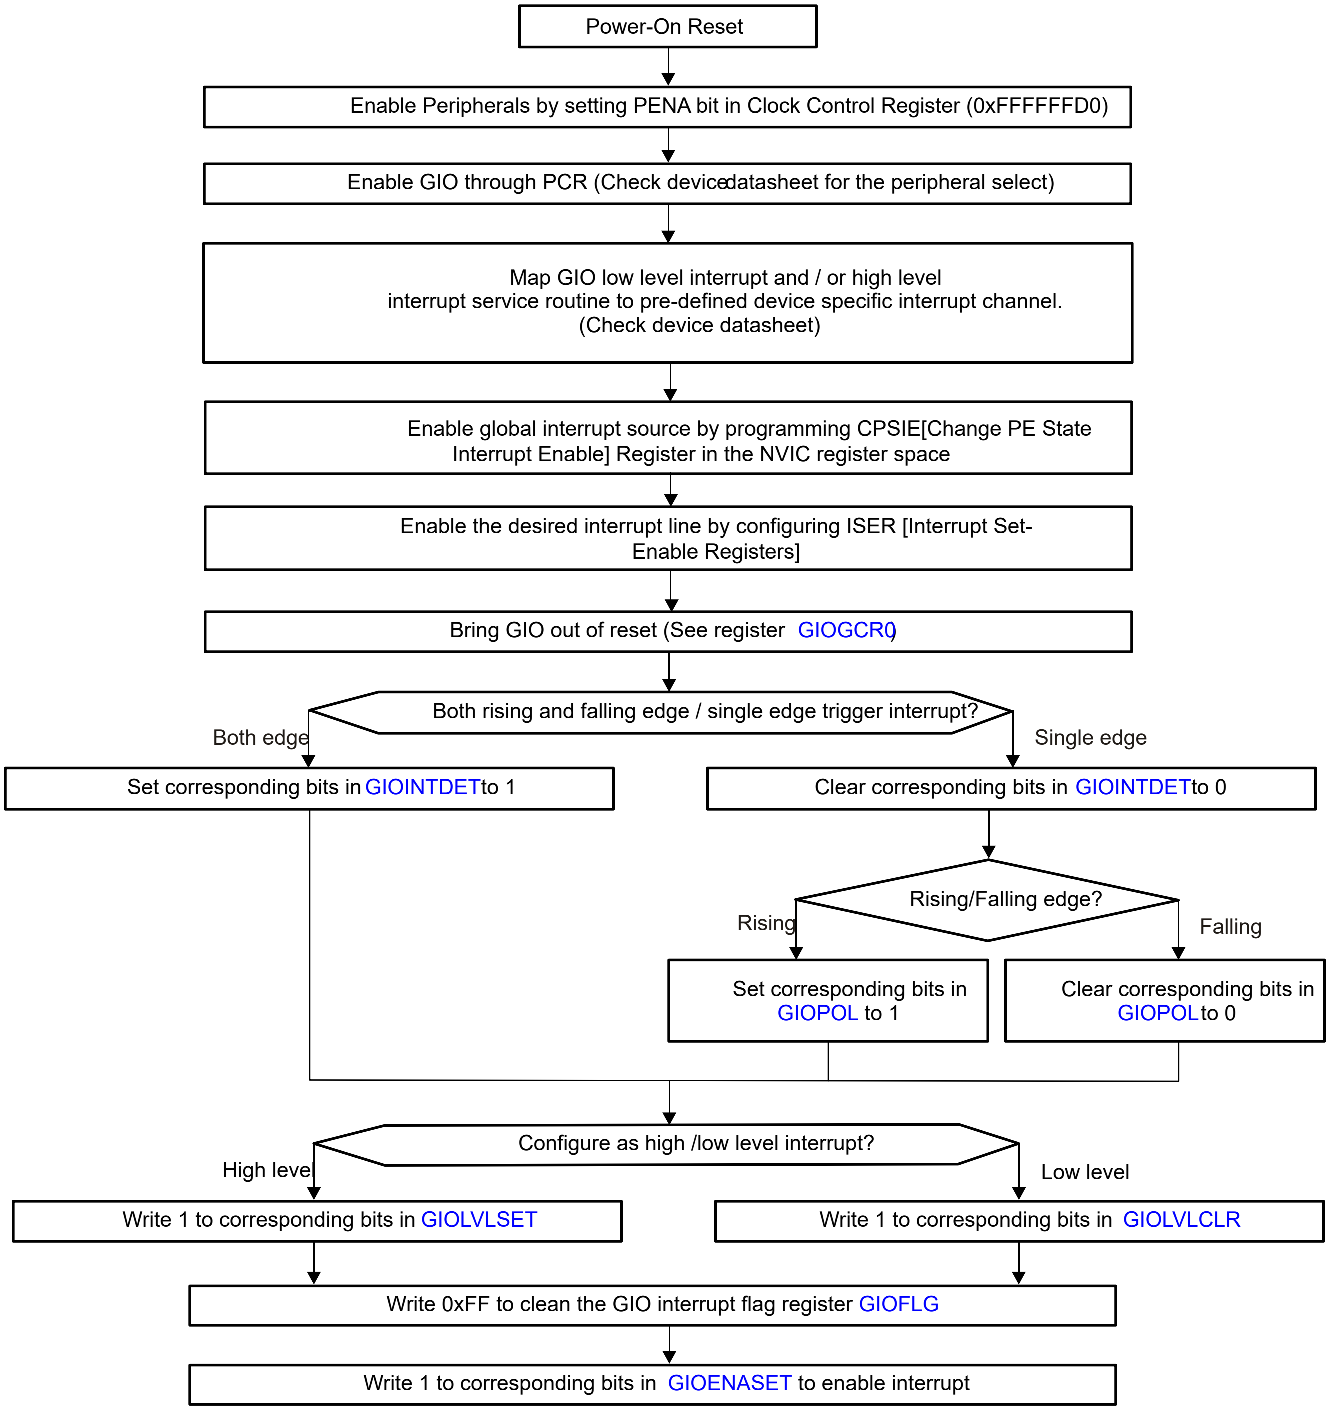

Figure 18-2. Interrupt Generation Function Quick Start Flow Chart

18.3 Functional Description of GIO Module

As shown in Figure 18-3, the GIO module comprises of two separate components: an input/output (I/O) block and an interrupt block.

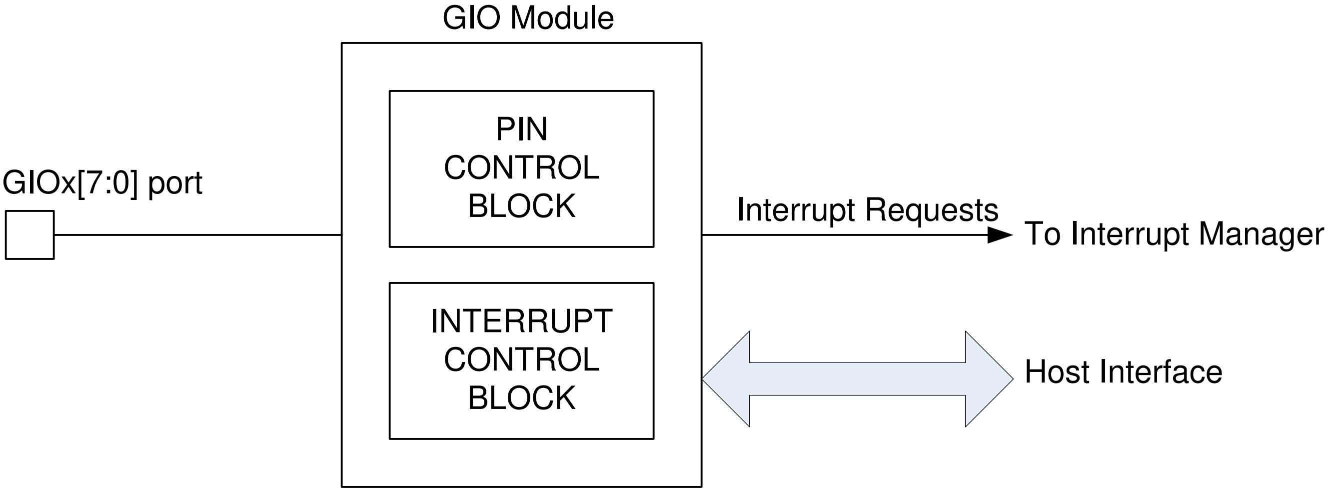

Figure 18-3. GIO Module Diagram

18.3.1 I/O Functions

The I/O block allows each GIO terminal to be configured for use as a general-purpose input or output in the application. The GIO module supports multiple registers to control the various aspects of the input and output functions. These are described as follows.

- Data direction (GIODIR)

  Configures GIO terminal(s) as input (default) or output through the GIODIRx registers.
- Data input (GIODIN)

  Reflects the logic level on GIO terminals in the GIODINx registers. A high voltage (V_{IH} or greater) applied to the pin causes a high value (1) in the data input register (GIODIN[7:0]). When a low voltage (V_{IL} or less) is applied to the pin, the data input register reads a low value (0). The V_{IH} and V_{IL} values are device specific and can be found in the device datasheet.
- Data output (GIODOUT)

  Configures the logic level to be output on GIO terminal(s) configured as outputs. A low value (0) written to the data output register forces the pin to a low output voltage (V_{OL} or lower). A high value (1) written to the data output register (GIODOUTx) forces the pin to a high output voltage (V_{OH} or higher) if the open drain functionality is disabled (GIOPDRx[7:0]). If open drain functionality is enabled, a high value (1) written to the data output register forces the pin to a high-impedance state (Z).
- Data set (GIODSET)

  Allows logic HIGH to be output on GIO terminal(s) configured as outputs by writing 1's to the required bits in the GIODSETx registers. If open drain functionality is enabled, a high value (1) written to the data output register forces the pin to a high-impedance state (Z). The GIODSETx registers eliminate the need for the application to perform a read-modify-write operation when it needs to set one or more GIO pin(s).
- Data clear (GIODCLR)

  Allows logic LOW to be output on GIO terminal(s) configured as outputs by writing 1s to the required bits in the GIODCLRx registers. The GIODCLRx registers eliminate the need for the application to perform a read-modify-write operation when it needs to clear one or more GIO pin(s).
- Open drain (GIOPDR)

Open drain functionality is enabled or disabled (default) using the open drain register GIOPDR[7:0] register. If open-drain mode output is enabled on a pin, a high value (1) written to the data output register (GIODOUTx[7:0]) forces the pin to a high impedance state (Z).

- Pull disable (GIOPULDIS)

  Disables the internal pull on GIO terminal(s) configured as inputs by writing to the GIOPULDISx registers.
- Pull select (GIOPSL)

  Selects internal pull down (default) or pull up on GIO terminal(s) configured as inputs by writing to the GIOPULSELx registers.

Refer to the specific device's datasheet to identify the number of GIO ports as well as the input and output functions supported. Some devices may not support the programmable pull controls. In that case, the pull disable and the pull select register controls will not work.

18.3.2 Interrupt Function

The GIO module supports up to 32 terminals to be configured for generating an interrupt to the host processor through the Interrupt Manager (NVIC/IM). The main functions of the interrupt block are:

- Select the GIO pin(s) that is/are used to generate interrupt(s)

  This is done via the interrupt enable set and clear registers, GIOENASET and GIOENACLR.
- Select the edge on the selected GIO pin(s) that is/are used to generate interrupt(s): rising/falling/both

  Rising or falling edge can be selected via the GIOPOL register. If interrupt is required to be generated on both rising and falling edges, this can be configured via the GIOINTDET register.
- Select the interrupt priority

  Low- or high-level interrupt can be selected through the GIOLVLSET and GIOLVLCLR registers.
- Individual interrupt flags are set in the GIOFLG register

The terminals on GIO ports A through D are all interrupt-capable and can be used to handle either general I/O functions or interrupt requests. Each interrupt request can be connected to the NVIC/IM at one of two different levels – High (or A) and Low (or B), depending on the NVIC/IM channel number. The NVIC/IM has an inherent priority scheme so that a request on a lower number channel has a higher priority than a request on a higher number channel. Refer the device datasheet to identify the NVIC/IM channel numbers for the GIO level A and level B interrupt requests. Also note that the interrupt priority of level A and level B interrupt handling blocks can be re-programmed in the NVIC/IM.

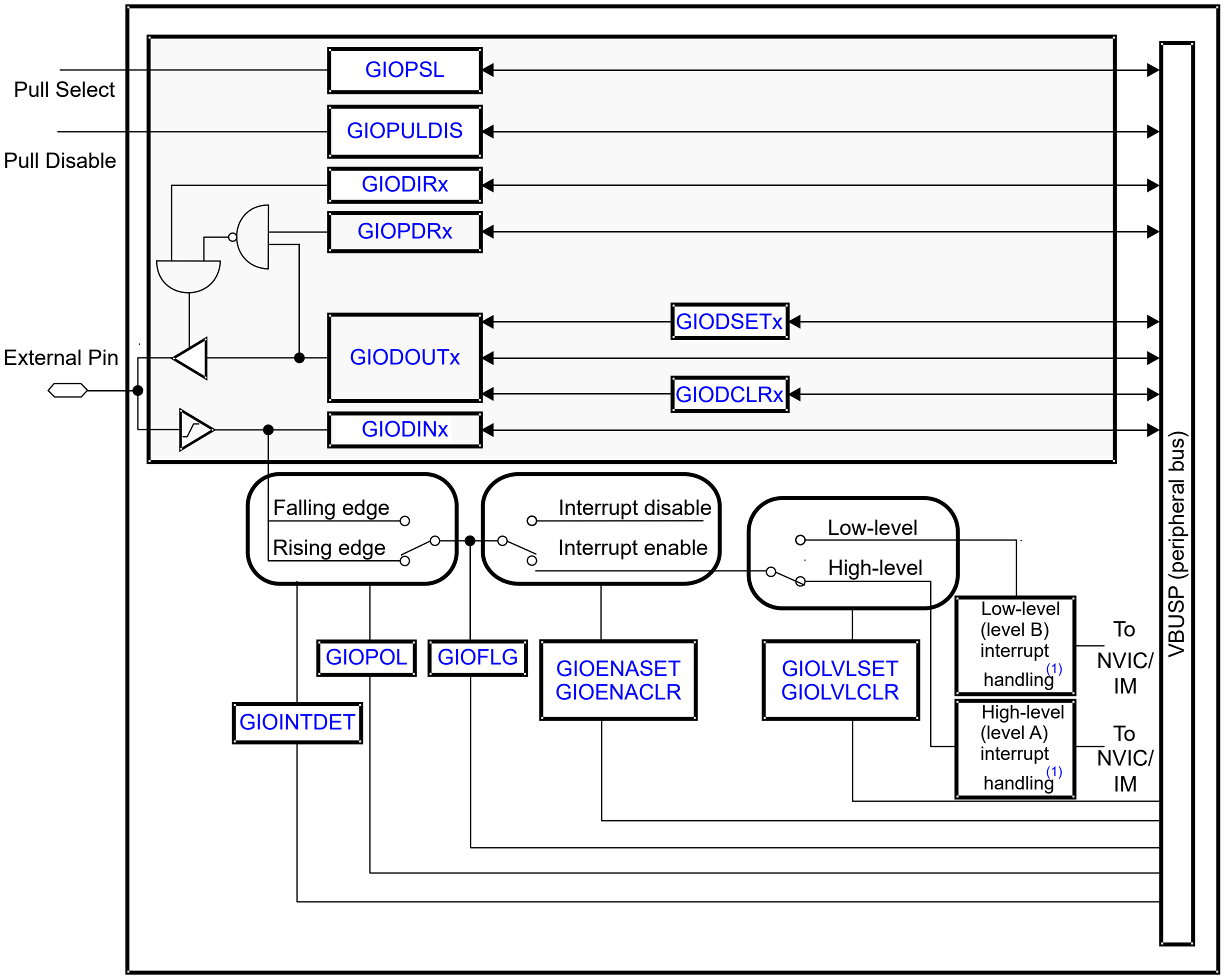
18.3.3 GIO Block Diagram

The GIO block diagram (Figure 18-4) represents the flow of information through a pin. The shaded area corresponds to the I/O block; the unshaded area corresponds to the interrupt block.

Figure 18-4. GIO Block Diagram

A. A single low-level-interrupt-handling block and a single high-level-interrupt-handling block service all of the interrupt-capable external pins, but only one pin can be serviced by an interrupt block at a time.

Figure 18-5.



18.4 Device Modes of Operation

The GIO module behaves differently in different modes of operation. There are two main modes:

- Emulation mode
- Power-down mode (low-power mode)

18.4.1 Emulation Mode

Emulation mode is used by debugger tools to stop the CPU at breakpoints to read registers.

Note

Emulation Mode and Emulation Registers

Emulation mode is a mode of operation of the device and is separate from the GIO emulation registers (GIOEMU1 and GIOEMU2). The contents of these emulation registers are identical to the contents of GIO offset registers (GIOOFF1 and GIOOFF2). Both emulation registers and GIO offset registers are NOT cleared when they are read in emulation mode. GIO offset registers are cleared when they are read in normal mode (other than emulation mode). The emulation registers are NOT cleared when they are read in normal mode. The intention for the emulation registers is that software can use them without clearing the flags.

During emulation mode:

- External interrupts are not captured because the NVIC/IM is unable to service interrupts.
- Any register can be read without affecting the state of the system.
- A write to a register still does affect the state of the system.

18.4.2 Power-Down Mode (Low-Power Mode)

In power-down mode, the clock signal to the GIO module is disabled. Thus, there is no switching and the only current draw comes from leakage current. In power-down mode, interrupt pins become level-sensitive rather than edge-sensitive. The polarity bit changes function from falling-edge-triggered to low-level-triggered and rising-edge-triggered to high-level-triggered. A corresponding level on an interrupt pin pulls the module out of low-power mode, if the interrupt is also enabled to wake up the device out of a low-power mode.

18.4.3 Interrupts

GIO generates aggregated interrupts for all inputs from PAD. Some of the interrupts to MSS_R5F are directly taken from GPIO-PAD.

MSS_GIO_INT0/1

MSS_GIO_PAD_INT0 from GPIO[0]

MSS_GIO_PAD_INT1 from GPIO[1]

MSS_GIO_PAD_INT2 from GPIO[2]

MSS_CTRL:: MSS_GIO_CFG_GIO:: MSS_GIO_CFG_GIO_CONFIG is used for selecting the edge that can give a trigger.

18.5 TOP_GIO Registers

Table 18-1 lists the memory-mapped registers for the TOP_GIO registers. All register offset addresses not listed in Table 18-1 should be considered as reserved locations and the register contents should not be modified.

Table 18-1. TOP_GIO Registers

18.6 I/O Control Summary

The behavior of the output buffer and the pull control is summarized in Table 18-88.

Table 18-88. Output Buffer and Pull Control Behavior for GIO Pins

Module under Reset?	Pin Direction (GIODIR)(1) (2)	Open Drain Enable (GIOPDR)(1)	Pull Disable (GIOPULDIS)(1) (3)	Pull Select (GIOPSL)(1) (4)	Pull Control	Output Buffer(5)
Yes	X	X	X	X	Enabled	Disabled
No	0	X	0	0	Pull down	Disabled
No	0	X	0	1	Pull up	Disabled
No	0	X	1	0	Disabled	Disabled
No	0	X	1	1	Disabled	Disabled
No	1	0	X	X	Disabled	Enabled
No	1	1	X	X	Disabled	Enabled

(1) X = Don't care
(2) GIODIR = 0 for input; = 1 for output
(3) GIOPULDIS = 0 for enabling pull control; = 1 for disabling pull control
(4) GIOPSL= 0 for pull-down functionality; = 1 for pull-up functionality
(5) If open drain is enabled, output buffer will be disabled if a high level (1) is being output.

Chapter 19

Enhanced Pulse Width Modulator (ePWM) Module

The enhanced pulse width modulator (ePWM) peripheral is a key element in controlling many of the power electronic systems found in both commercial and industrial equipments. The features supported by the ePWM make it especially suitable for digital motor control.

19.1 Introduction

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It needs to be highly programmable and very flexible while being easy to understand and use. The ePWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the ePWM is built up from smaller single channel modules with separate resources that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand its operation quickly.

In this document the letter x within a signal or module name is used to indicate a generic ePWM instance on a device. For example, output signals EPWMxA and EPWMxB refer to the output signals from the ePWMx instance. Thus, EPWM1A and EPWM1B belong to ePWM1 and likewise EPWM4A and EPWM4B belong to ePWM4.

19.1.1 Submodule Overview

The ePWM module represents one complete PWM channel composed of two PWM outputs: EPWMxA and EPWMxB. Multiple ePWM modules are instanced within a device as shown in Figure 19-1. Each ePWM instance is identical and is indicated by a numerical value starting with 1. For example, ePWM1 is the first instance and ePWM3 is the third instance in the system and ePWMx indicates any instance.

The ePWM modules are chained together via a clock synchronization scheme that allows them to operate as a single system when required. Additionally, this synchronization scheme can be extended to the capture peripheral modules (eCAP). Modules can also operate stand-alone.

Each ePWM module supports the following features:

- Dedicated 16-bit time-base counter with period and frequency control
- Two PWM outputs (EPWMxA and EPWMxB) that can be used in the following configurations:
  - Two independent PWM outputs with single-edge operation
  - Two independent PWM outputs with dual-edge symmetric operation
  - One independent PWM output with dual-edge asymmetric operation
- Asynchronous override control of PWM signals through software.
- Programmable phase-control support for lag or lead operation relative to other ePWM modules.
- Hardware-locked (synchronized) phase relationship on a cycle-by-cycle basis.
- Dead-band generation with independent rising and falling edge delay control.
- Programmable trip zone allocation of both cycle-by-cycle trip and one-shot trip on fault conditions.
- A trip condition can force either high, low, or high-impedance state logic levels at PWM outputs.
- All events can trigger both CPU interrupts and ADC start of conversion (SOC)
- Programmable event prescaling minimizes CPU overhead on interrupts.
- PWM chopping by high-frequency carrier signal, useful for pulse transformer gate drives.

Each ePWM module is connected to the input/output signals shown in Figure 19-1. The signals are described in detail in subsequent sections.

Each ePWM module consists of eight submodules and is connected within a system via the signals shown in Figure 19-2.

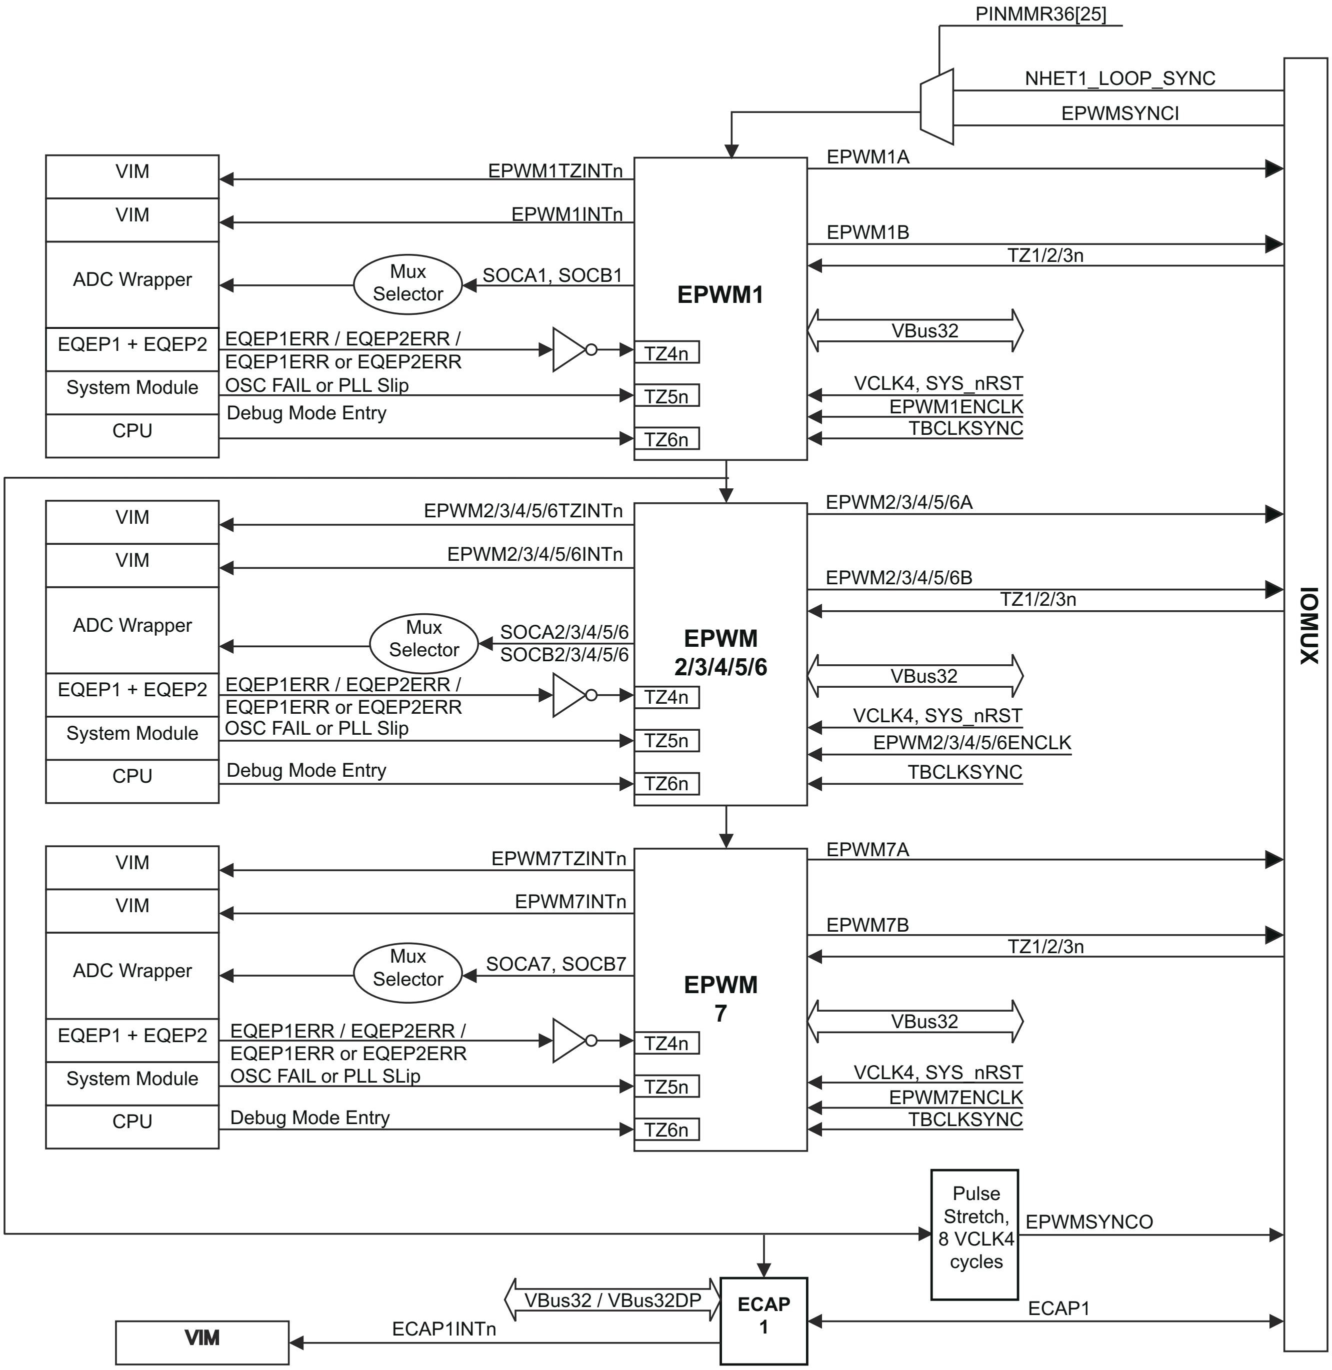

Figure 19-1. Multiple ePWM Modules

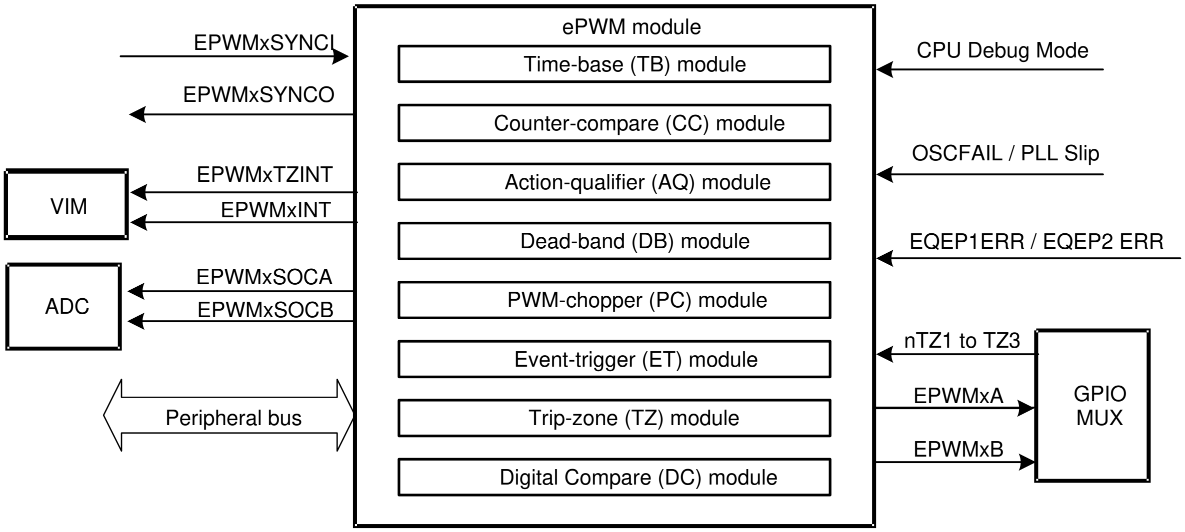

Figure 19-2. Submodules and Signal Connections for an ePWM Module

The main signals used by the ePWM module are:

- **PWM output signals (EPWMxA and EPWMxB).**

  The PWM output signals are made available external to the device through the Pinmux.
- **Trip-zone signals ($\overline{\text{TZ1}}$ to $\overline{\text{TZ6}}$).**

  These input signals alert the ePWM module of fault conditions external to the ePWM module. Each ePWM module can be configured to either use or ignore any of the trip-zone signals. The $\overline{\text{TZ1}}$ to $\overline{\text{TZ3}}$ trip-zone signals can be configured as asynchronous inputs, or double-synchronized using VCLK4, or double-synchronized and filtered through a 6-VCLK4-cycle counter before connecting to the ePWM modules. This selection is done by configuring registers in the Pinmux. $\overline{\text{TZ4}}$ is connected to an inverted eQEP1 error signal (EQEP1ERR), or to an inverted eQEP2 error signal (EQEP2ERR), or an OR-combination of EQEP1ERR and EQEP2ERR. This selection is also done via the Pinmux registers . $\overline{\text{TZ5}}$ is connected to the system clock fail status. This is asserted whenever an oscillator failure is detected, or a PLL slip is detected. $\overline{\text{TZ6}}$ is connected to the debug mode entry indicator output from the CPU. This allows you to configure a trip action when the CPU halts.
- **Time-base synchronization input (EPWMxSYNCI) and output (EPWMxSYNCO) signals**.

  The synchronization signals daisy chain the ePWM modules together. Each module can be configured to either use or ignore its synchronization input. The clock synchronization input and output signal are brought out to pins only for ePWM1 (ePWM module #1). The synchronization output for ePWM1 (EPWM1SYNCO) is also connected to the SYNCI of the first enhanced capture module (eCAP1).
- **ADC start-of-conversion signals (EPWMxSOCA and EPWMxSOCB).**

  Each ePWM module has two ADC start of conversion signals. Any ePWM module can trigger a start of conversion. Which event triggers the start of conversion is configured in the Event-Trigger submodule of the ePWM.
- **Peripheral Bus**

  The peripheral bus is 32-bits wide and allows both 16-bit and 32-bit writes to the ePWM register file.

19.1.2 Register Mapping

The complete ePWM module control and status register set is grouped by submodule as shown in Table 19-1. Each register set is duplicated for each instance of the ePWM module. The start address for each ePWM register file instance on a device is specified in the specific part's datasheet.

Table 19-1. ePWM Module Control and Status Register Set Grouped by Submodule

19.2 ePWM Submodules

Eight submodules are included in every ePWM peripheral. Each of these submodules performs specific tasks that can be configured by software.

19.2.1 Overview

Table 19-2 lists the eight key submodules together with a list of their main configuration parameters. For example, if you need to adjust or control the duty cycle of a PWM waveform, then you should see the counter-compare submodule in Section 19.2.3 for relevant details.

Table 19-2. Submodule Configuration Parameters

Submodule	Configuration Parameter or Option
Time-base (TB)	• Scale the time-base clock (TBCLK) relative to the system clock (VCLK4). • Configure the PWM time-base counter (TBCTR) frequency or period. • Set the mode for the time-base counter: – count-up mode: used for asymmetric PWM – count-down mode: used for asymmetric PWM – count-up-and-down mode: used for symmetric PWM • Configure the time-base phase relative to another ePWM module. • Synchronize the time-base counter between modules through hardware or software. • Configure the direction (up or down) of the time-base counter after a synchronization event. • Configure how the time-base counter will behave when the device is halted by an emulator. • Specify the source for the synchronization output of the ePWM module: – Synchronization input signal – Time-base counter equal to zero – Time-base counter equal to counter-compare B (CMPB) – No output synchronization signal generated.
Counter-compare (CC)	• Specify the PWM duty cycle for output EPWMxA and/or output EPWMxB • Specify the time at which switching events occur on the EPWMxA or EPWMxB output

Table 19-2. Submodule Configuration Parameters (continued)

Submodule	Configuration Parameter or Option
Action-qualifier (AQ)	• Specify the type of action taken when a time-base or counter-compare submodule event occurs: – No action taken – Output EPWMxA and/or EPWMxB switched high – Output EPWMxA and/or EPWMxB switched low – Output EPWMxA and/or EPWMxB toggled • Force the PWM output state through software control • Configure and control the PWM dead-band through software
Dead-band (DB)	• Control of traditional complementary dead-band relationship between upper and lower switches • Specify the output rising-edge-delay value • Specify the output falling-edge delay value • Bypass the dead-band module entirely. In this case the PWM waveform is passed through without modification. • Option to enable half-cycle clocking for double resolution.
PWM-chopper (PC)	• Create a chopping (carrier) frequency. • Pulse width of the first pulse in the chopped pulse train. • Duty cycle of the second and subsequent pulses. • Bypass the PWM-chopper module entirely. In this case the PWM waveform is passed through without modification.
Trip-zone (TZ)	• Configure the ePWM module to react to one, all, or none of the trip-zone signals or digital compare events. • Specify the tripping action taken when a fault occurs: – Force EPWMxA and/or EPWMxB high – Force EPWMxA and/or EPWMxB low – Force EPWMxA and/or EPWMxB to a high-impedance state – Configure EPWMxA and/or EPWMxB to ignore any trip condition. • Configure how often the ePWM will react to each trip-zone signal: – One-shot – Cycle-by-cycle • Enable the trip-zone to initiate an interrupt. • Bypass the trip-zone module entirely.
Event-trigger (ET)	• Enable the ePWM events that will trigger an interrupt. • Enable ePWM events that will trigger an ADC start-of-conversion event. • Specify the rate at which events cause triggers (every occurrence or every second or third occurrence) • Poll, set, or clear event flags
Digital-compare (DC)	• Enables trip zone signals to create events and filtered events • Specify event-filtering options to capture TBCTR counter or generate blanking window

Code examples are provided in the remainder of this document that show how to implement various ePWM module configurations. These examples use the constant definitions in the device *EPwm_defines.h* file in the device-specific header file and peripheral examples software package.

19.2.2 Time-Base (TB) Submodule

Each ePWM module has its own time-base submodule that determines all of the event timing for the ePWM module. Built-in synchronization logic allows the time-base of multiple ePWM modules to work together as a single system. Figure 19-3 illustrates the time-base module's place within the ePWM.

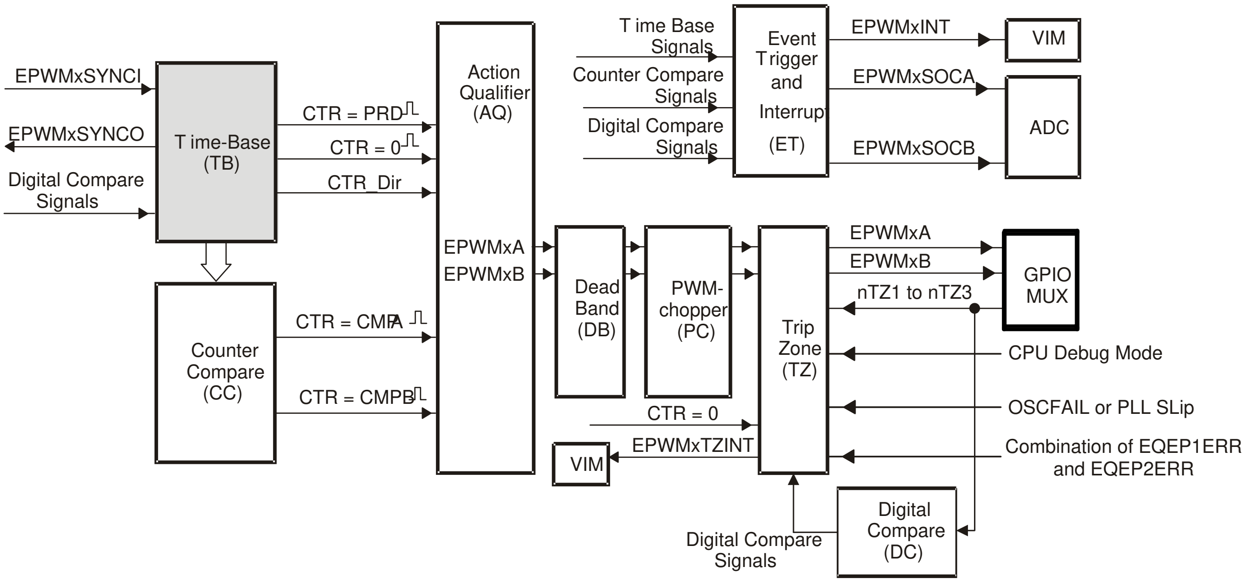

Figure 19-3. Time-Base Submodule Block Diagram

19.2.2.1 Purpose of the Time-Base Submodule

You can configure the time-base submodule for the following:

- Specify the ePWM time-base counter (TBCTR) frequency or period to control how often events occur.
- Manage time-base synchronization with other ePWM modules.
- Maintain a phase relationship with other ePWM modules.
- Set the time-base counter to count-up, count-down, or count-up-and-down mode.
- Generate the following events:
  - CTR = PRD: Time-base counter equal to the specified period (TBCTR = TBPRD) .
  - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000).
- Configure the rate of the time-base clock; a prescaled version of the device peripheral clock domain (VCLK4). This allows the time-base counter to increment/decrement at a slower rate.

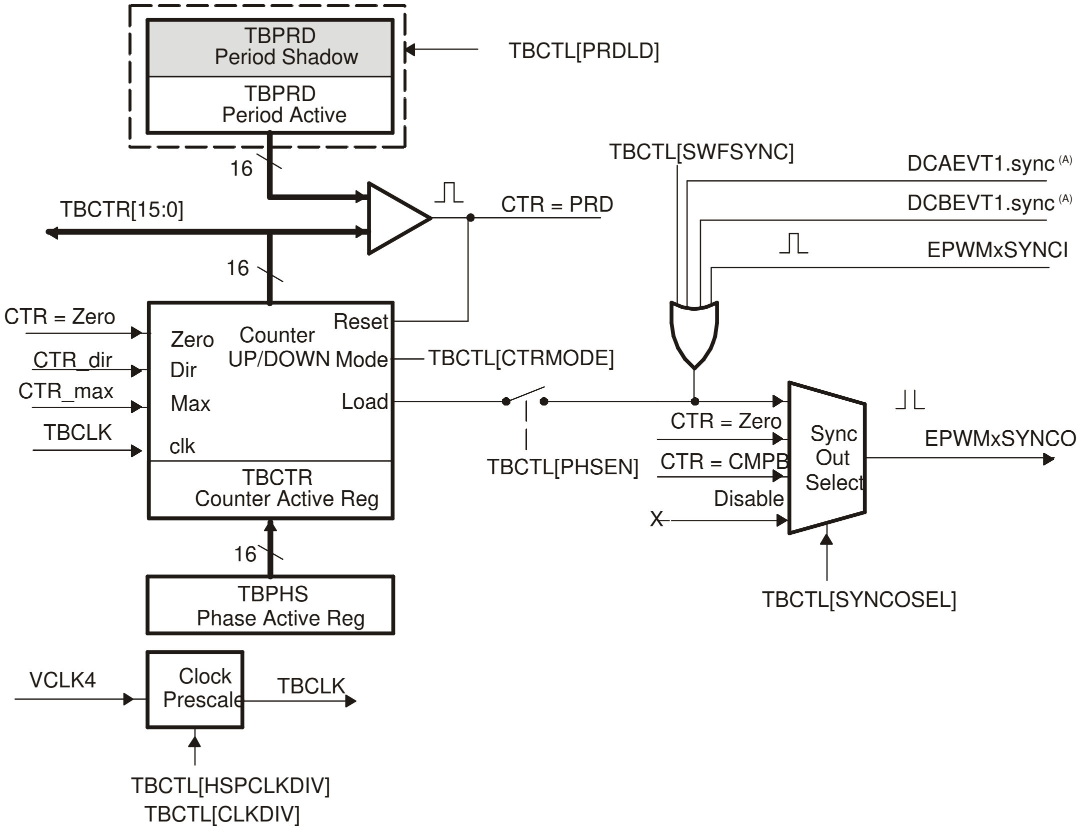
19.2.2.2 Controlling and Monitoring the Time-base Submodule

Table 19-3 shows the registers used to control and monitor the time-base submodule.

Table 19-3. Time-Base Submodule Registers

Register Name	Address Offset	Shadowed	Description
TBCTL	0x0002	No	Time-Base Control Register
TBSTS	0x0000	No	Time-Base Status Register
TBPHS	0x0004	No	Time-Base Phase Register
TBCTR	0x000A	No	Time-Base Counter Register
TBPRD	0x0008	Yes	Time-Base Period Register

The block diagram in Figure 19-4 shows the critical signals and registers of the time-base submodule. Table 19-4 provides descriptions of the key signals associated with the time-base submodule.



A. These signals are generated by the digital compare (DC) submodule.

Figure 19-4. Time-Base Submodule Signals and Registers

Table 19-4. Key Time-Base Signals

Signal	Description
EPWMxSYNCI	Time-base synchronization input. Input pulse used to synchronize the time-base counter with the counter of ePWM module earlier in the synchronization chain. An ePWM peripheral can be configured to use or ignore this signal. For the first ePWM module (EPWM1), this signal comes from a device pin or from the N2HET1 module. For subsequent ePWM modules, this signal is passed from another ePWM peripheral. For example, EPWM2SYNCI is generated by the ePWM1 peripheral, EPWM3SYNCI is generated by ePWM2 and so forth. See Section 19.2.2.3.3 for information on the synchronization order of a particular device.
EPWMxSYNCO	Time-base synchronization output. This output pulse is used to synchronize the counter of an ePWM module later in the synchronization chain. The ePWM module generates this signal from one of three event sources: 1. EPWMxSYNCI (Synchronization input pulse) 2. CTR = Zero: The time-base counter equal to zero (TBCTR = 0x0000). 3. CTR = CMPB: The time-base counter equal to the counter-compare B (TBCTR = CMPB) register.
CTR = PRD	Time-base counter equal to the specified period. This signal is generated whenever the counter value is equal to the active period register value. That is when TBCTR = TBPRD.
CTR = Zero	Time-base counter equal to zero This signal is generated whenever the counter value is zero. That is when TBCTR equals 0x0000.
CTR = CMPB	Time-base counter equal to active counter-compare B register (TBCTR = CMPB). This event is generated by the counter-compare submodule and used by the synchronization out logic
CTR_dir	Time-base counter direction. Indicates the current direction of the ePWM's time-base counter. This signal is high when the counter is increasing and low when it is decreasing.
CTR_max	Time-base counter equal max value. (TBCTR = 0xFFFF) Generated event when the TBCTR value reaches its maximum value. This signal is only used only as a status bit
TBCLK	Time-base clock. This is a prescaled version of the system clock (VCLK4) and is used by all submodules within the ePWM. This clock determines the rate at which time-base counter increments or decrements.

19.2.2.3 Calculating PWM Period and Frequency

The frequency of PWM events is controlled by the time-base period (TBPRD) register and the mode of the time-base counter. Figure 19-5 shows the period (T_{pwm}) and frequency (F_{pwm}) relationships for the up-count, down-count, and up-down-count time-base counter modes when the period is set to 4 (TBPRD = 4). The time increment for each step is defined by the time-base clock (TBCLK) which is a prescaled version of the system clock (VCLK4).

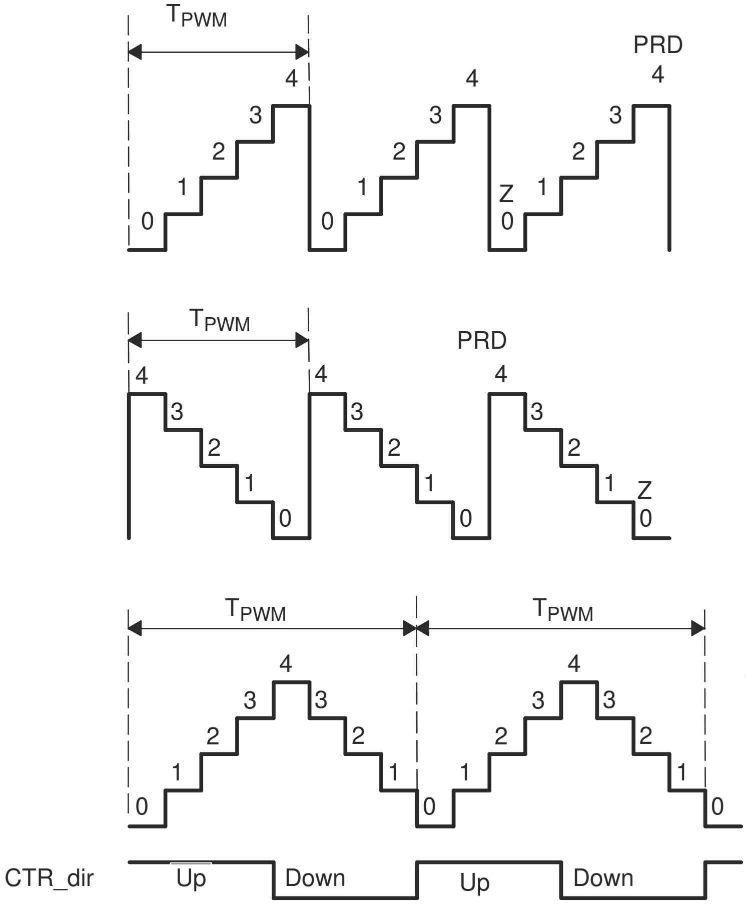
The time-base counter has three modes of operation selected by the time-base control register (TBCTL):

- **Up-Down-Count Mode:**

  In up-down-count mode, the time-base counter starts from zero and increments until the period (TBPRD) value is reached. When the period value is reached, the time-base counter then decrements until it reaches zero. At this point the counter repeats the pattern and begins to increment.
- **Up-Count Mode:**

  In this mode, the time-base counter starts from zero and increments until it reaches the value in the period register (TBPRD). When the period value is reached, the time-base counter resets to zero and begins to increment once again.
- **Down-Count Mode:**

  In down-count mode, the time-base counter starts from the period (TBPRD) value and decrements until it reaches zero. When it reaches zero, the time-base counter is reset to the period value and it begins to decrement once again.



For Up Count and Down Count

$T_{PWM} = (TBPRD + 1) \times T_{TBCLK}$

$F_{PWM} = 1/ (T_{PWM})$

For Up and Down Count

$T_{PWM} = 2 \times TBPRD \times T_{TBCLK}$

$F_{PWM} = 1 / (T_{PWM})$

Figure 19-5. Time-Base Frequency and Period

19.2.2.3.1 Time-Base Period Shadow Register

The time-base period register (TBPRD) has a shadow register. Shadowing allows the register update to be synchronized with the hardware. The following definitions are used to describe all shadow registers in the ePWM module:

- **Active Register**

  The active register controls the hardware and is responsible for actions that the hardware causes or invokes.
- **Shadow Register**

  The shadow register buffers or provides a temporary holding location for the active register. It has no direct effect on any control hardware. At a strategic point in time the shadow register's content is transferred to the active register. This prevents corruption or spurious operation due to the register being asynchronously modified by software.

The memory address of the shadow period register is the same as the active register. Which register is written to or read from is determined by the TBCTL[PRDLD] bit. This bit enables and disables the TBPRD shadow register as follows:

- **Time-Base Period Shadow Mode:**

  The TBPRD shadow register is enabled when TBCTL[PRDLD] = 0. Reads from and writes to the TBPRD memory address go to the shadow register. The shadow register contents are transferred to the active register (TBPRD (Active) ← TBPRD (shadow)) when the time-base counter equals zero (TBCTR = 0x0000). By default the TBPRD shadow register is enabled.
- **Time-Base Period Immediate Load Mode:**

  If immediate load mode is selected (TBCTL[PRDLD] = 1), then a read from or a write to the TBPRD memory address goes directly to the active register.

19.2.2.3.2 Time-Base Clock Synchronization

Bit 1 of the device-level multiplexing control module (Pinmux) register PINMMR37 is defined as the TBCLKSYNC bit. The TBCLKSYNC bit allows users to globally synchronize all enabled ePWM modules to the time-base clock (TBCLK). When set, all enabled ePWM module clocks are started with the first rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescalers for each ePWM module must be set identically.

The proper procedure for enabling ePWM clocks is as follows:

1. Enable ePWM module clocks using the Pinmux control registers for each ePWM module instance
2. Set TBCLKSYNC = 0. This will stop the time-base clock within any enabled ePWM module.
3. Configure ePWM modules: prescaler values and ePWM modes.
4. Set TBCLKSYNC = 1.

19.2.2.3.3 Time-Base Counter Synchronization

A time-base synchronization scheme connects all of the ePWM modules on a device. Each ePWM module has a synchronization input (EPWMxSYNCI) and a synchronization output (EPWMxSYNCO). The input synchronization for the first instance (ePWM1) comes from an external pin. The synchronization connections for the remaining ePWM modules are shown in Figure 19-6.

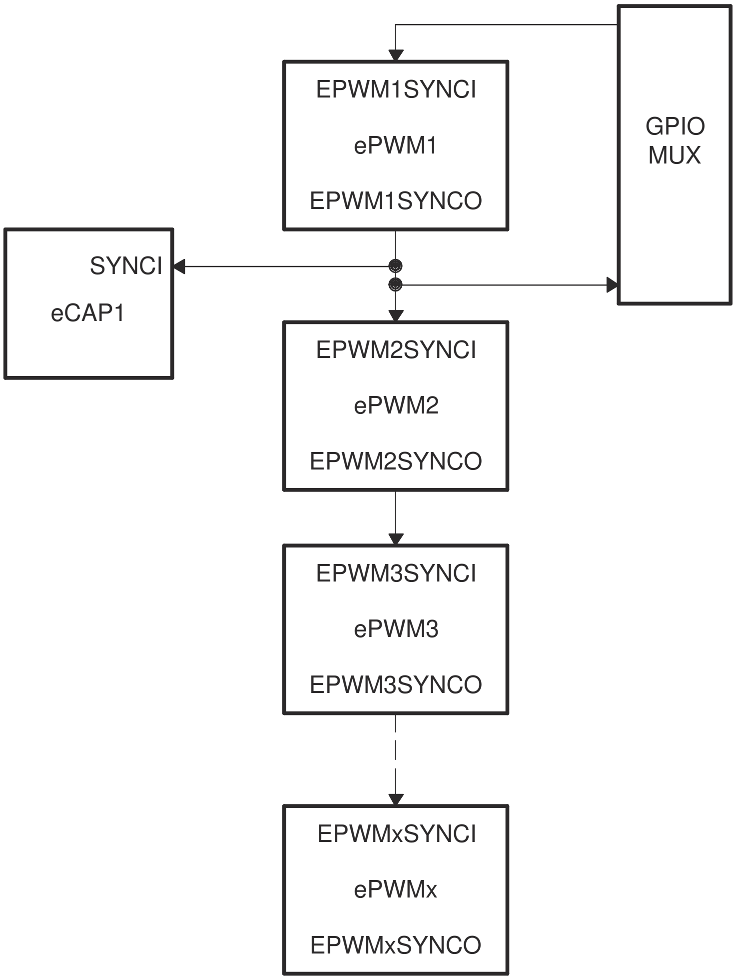


Figure 19-6. Time-Base Counter Synchronization Scheme

Each ePWM module can be configured to use or ignore the synchronization input. If the TBCTL[PHSEN] bit is set, then the time-base counter (TBCTR) of the ePWM module will be automatically loaded with the phase register (TBPHS) contents when one of the following conditions occur:

- **EPWMxSYNCI: Synchronization Input Pulse:**

  The value of the phase register is loaded into the counter register when an input synchronization pulse is detected (TBPHS → TBCTR). This operation occurs on the next valid time-base clock (TBCLK) edge.

  The delay from internal controller module to target modules is given by:
  - if (TBCLK = VCLK4): 2 × VCLK4
  - if (TBCLK != VCLK4): 1 TBCLK
- **Software Forced Synchronization Pulse:**

  Writing a 1 to the TBCTL[SWFSYNC] control bit invokes a software forced synchronization. This pulse is ORed with the synchronization input signal, and therefore has the same effect as a pulse on EPWMxSYNCI.
- **Digital Compare Event Synchronization Pulse:**

  DCAEVT1 and DCBEVT1 digital compare events can be configured to generate synchronization pulses which have the same affect as EPWMxSYNCI.

This feature enables the ePWM module to be automatically synchronized to the time base of another ePWM module. Lead or lag phase control can be added to the waveforms generated by different ePWM modules to synchronize them. In up-down-count mode, the TBCTL[PSHDIR] bit configures the direction of the time-base counter immediately after a synchronization event. The new direction is independent of the direction prior to the synchronization event. The PHSDIR bit is ignored in count-up or count-down modes. See Figure 19-7 through Figure 19-10 for examples.

Clearing the TBCTL[PHSEN] bit configures the ePWM to ignore the synchronization input pulse. The synchronization pulse can still be allowed to flow-through to the EPWMxSYNCO and be used to synchronize other ePWM modules. In this way, you can set up a controller time-base (for example, ePWM1) and downstream modules (ePWM2 - ePWMx) may elect to run in synchronization with the controller.

19.2.2.4 Phase Locking the Time-Base Clocks of Multiple ePWM Modules

The TBCLKSYNC bit can be used to globally synchronize the time-base clocks of all enabled ePWM modules on a device. When TBCLKSYNC = 0, the time-base clock of all ePWM modules is stopped (default). When TBCLKSYNC = 1, all ePWM time-base clocks are started with the rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescaler bits in the TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is as follows:

1. Enable ePWM module clocks using the IOMM control registers for each ePWM module instance
2. Set TBCLKSYNC = 0. This will stop the time-base clock within any enabled ePWM module.
3. Configure ePWM modules: prescaler values and ePWM modes.
4. Set TBCLKSYNC = 1.

19.2.2.5 Time-Base Counter Modes and Timing Waveforms

The time-base counter operates in one of four modes:

- Up-count mode which is asymmetrical.
- Down-count mode which is asymmetrical.
- Up-down-count which is symmetrical
- Frozen where the time-base counter is held constant at the current value

To illustrate the operation of the first three modes, the following timing diagrams show when events are generated and how the time-base responds to an EPWMxSYNCI signal.

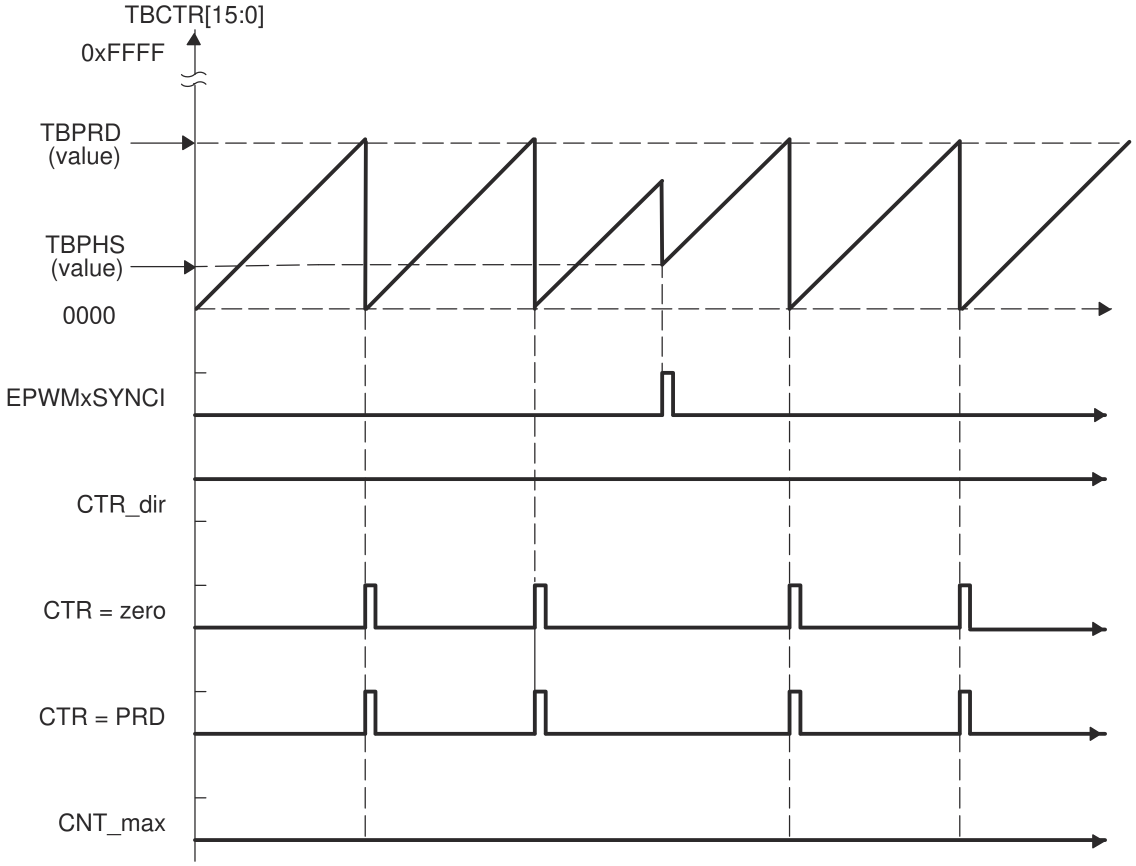

Figure 19-7. Time-Base Up-Count Mode Waveforms

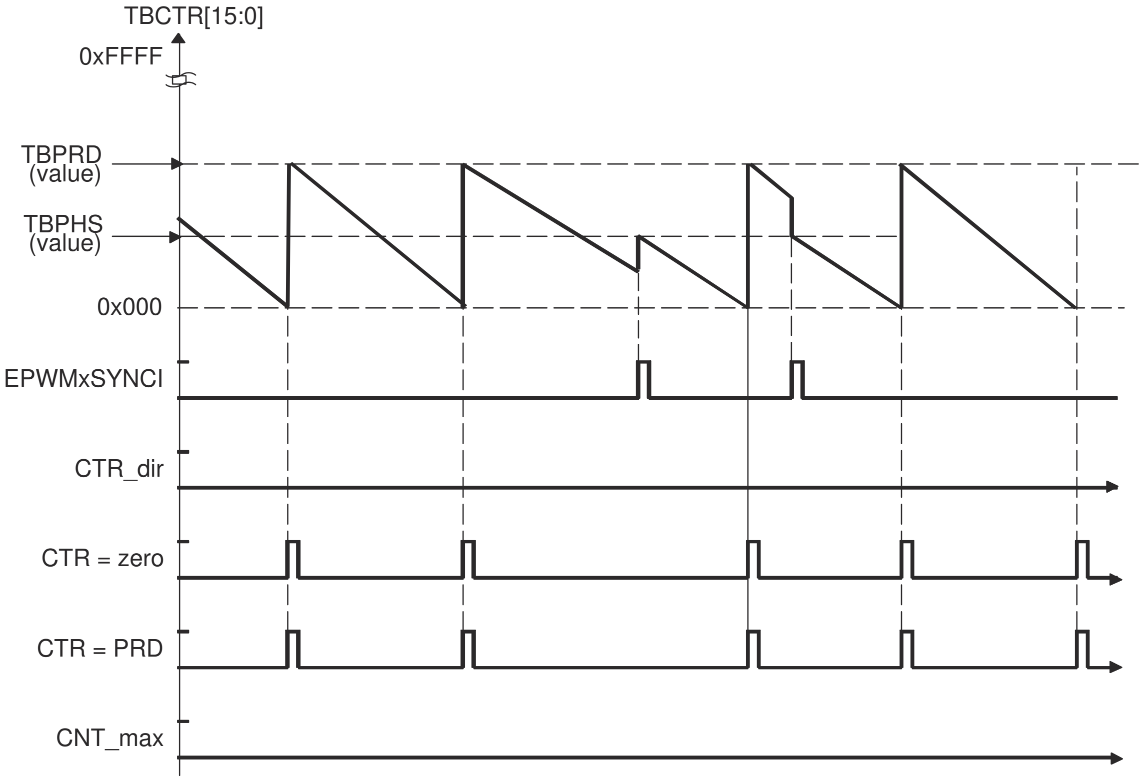

Figure 19-8. Time-Base Down-Count Mode Waveforms

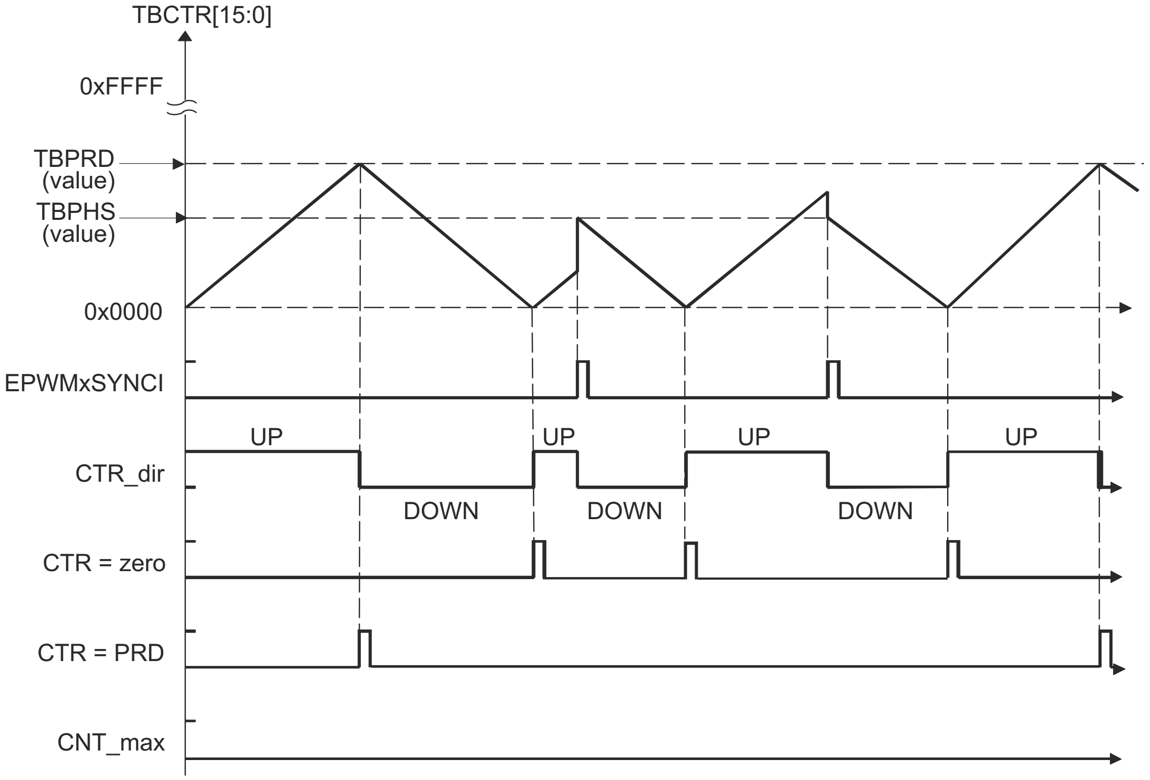

Figure 19-9. Time-Base Up-Down-Count Waveforms, TBCTL[PHSDIR = 0] Count Down On Synchronization Event

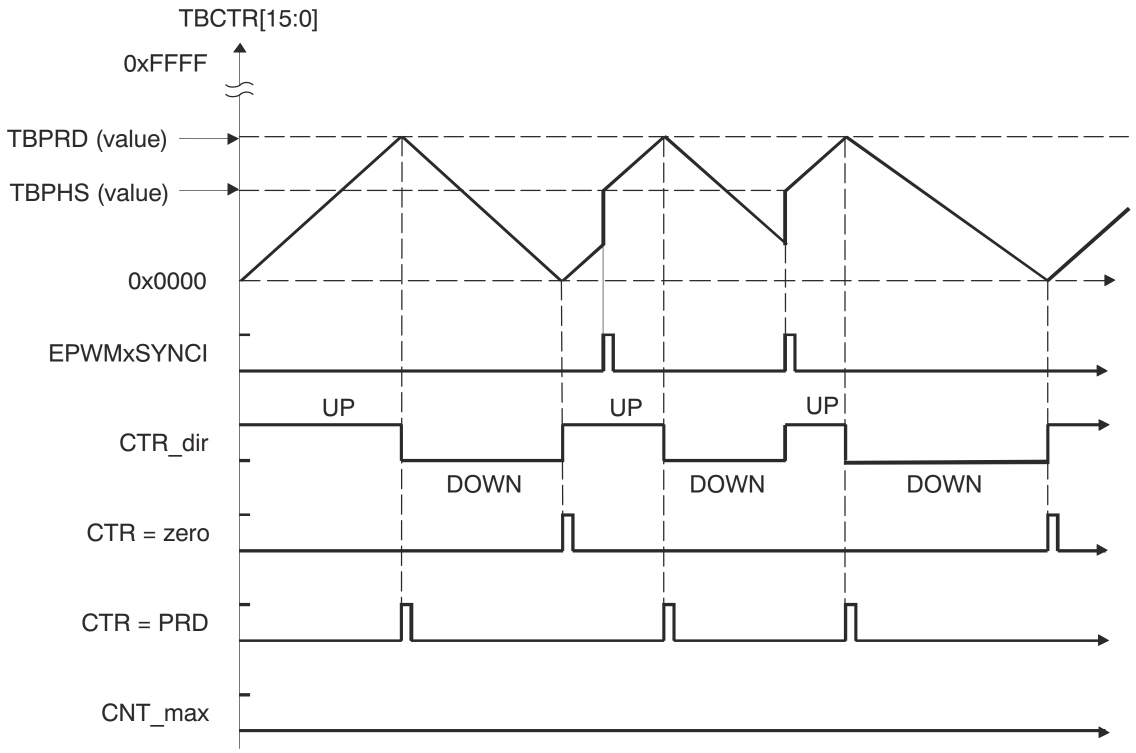

Figure 19-10. Time-Base Up-Down Count Waveforms, TBCTL[PHSDIR = 1] Count Up On Synchronization Event

19.2.3 Counter-Compare (CC) Submodule

Figure 19-11 illustrates the counter-compare submodule within the ePWM.

Figure 19-12 shows the basic structure of the counter-compare submodule.

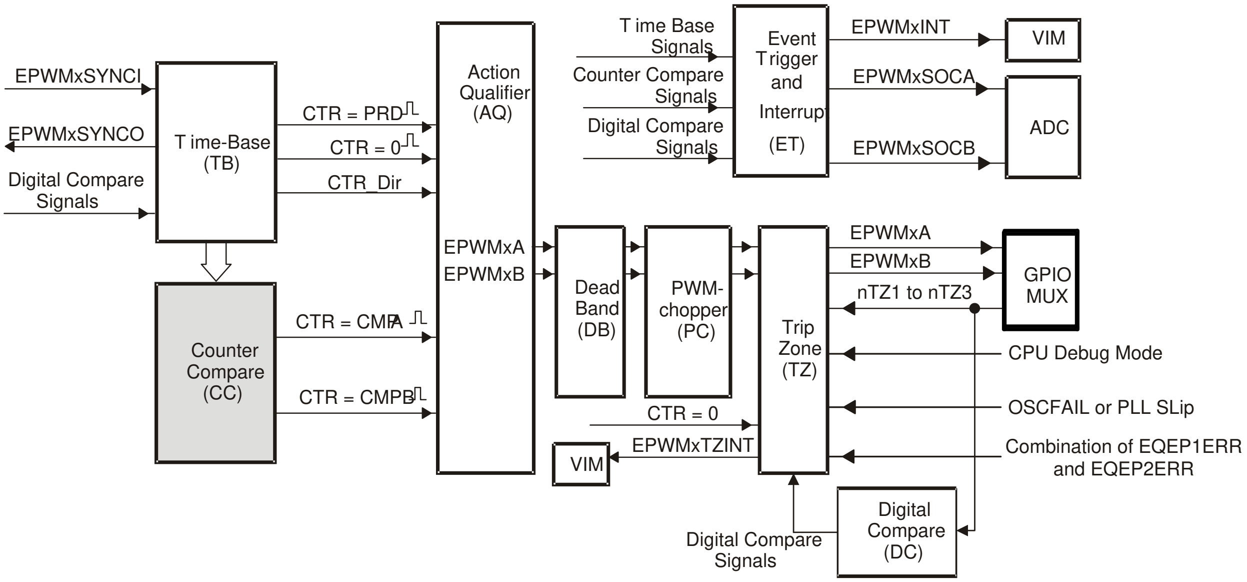

Figure 19-11. Counter-Compare Submodule

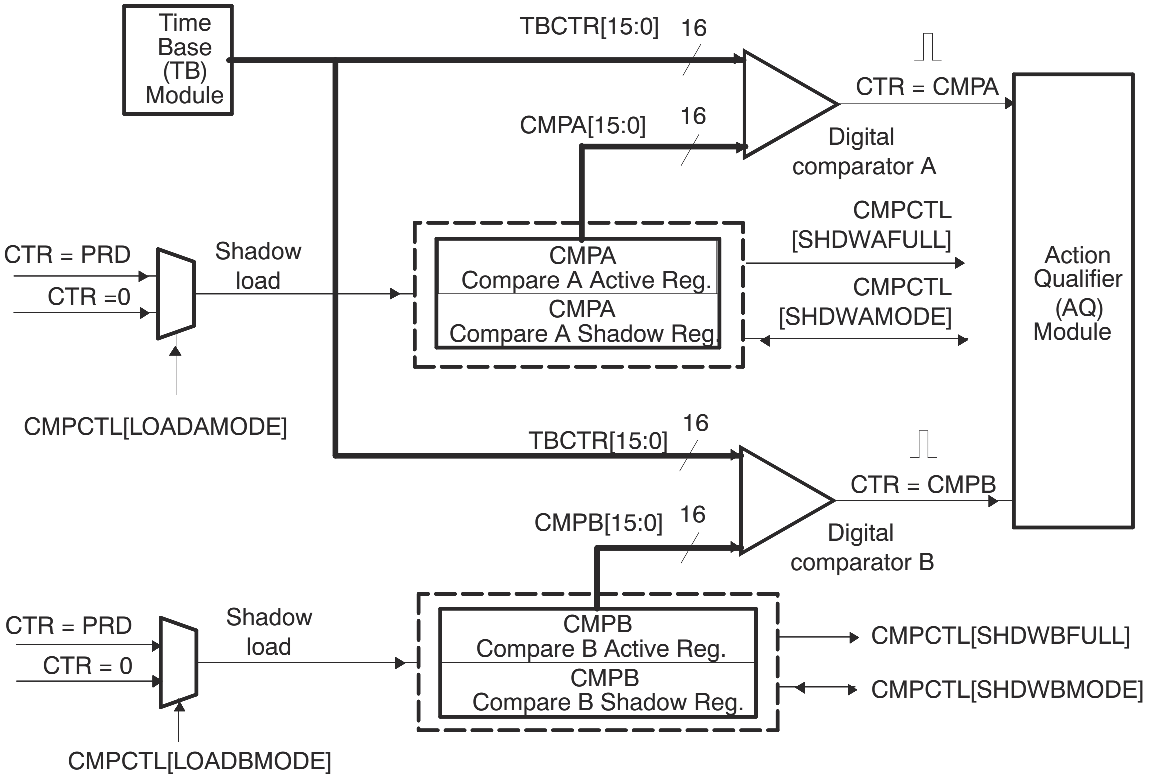

Figure 19-12. Detailed View of the Counter-Compare Submodule

19.2.3.1 Purpose of the Counter-Compare Submodule

The counter-compare submodule takes as input the time-base counter value. This value is continuously compared to the counter-compare A (CMPA) and counter-compare B (CMPB) registers. When the time-base counter is equal to one of the compare registers, the counter-compare unit generates an appropriate event.

The counter-compare:

- Generates events based on programmable time stamps using the CMPA and CMPB registers
  - CTR = CMPA: Time-base counter equals counter-compare A register (TBCTR = CMPA).
  - CTR = CMPB: Time-base counter equals counter-compare B register (TBCTR = CMPB)
- Controls the PWM duty cycle if the action-qualifier submodule is configured appropriately
- Shadows new compare values to prevent corruption or glitches during the active PWM cycle

19.2.3.2 Controlling and Monitoring the Counter-Compare Submodule

The counter-compare submodule operation is controlled and monitored by the registers shown in Table 19-5:

Table 19-5. Counter-Compare Submodule Registers

Register Name	Address Offset	Shadowed	Description
CMPCTL	0x000C	No	Counter-Compare Control Register.
CMPA	0x0010	Yes	Counter-Compare A Register
CMPB	0x0016	Yes	Counter-Compare B Register

The key signals associated with the counter-compare submodule are described in Table 19-6.

Table 19-6. Counter-Compare Submodule Key Signals

Signal	Description of Event	Registers Compared
CTR = CMPA	Time-base counter equal to the active counter-compare A value	TBCTR = CMPA
CTR = CMPB	Time-base counter equal to the active counter-compare B value	TBCTR = CMPB
CTR = PRD	Time-base counter equal to the active period. Used to load active counter-compare A and B registers from the shadow register	TBCTR = TBPRD
CTR = ZERO	Time-base counter equal to zero. Used to load active counter-compare A and B registers from the shadow register	TBCTR = 0x0000

19.2.3.3 Operational Highlights for the Counter-Compare Submodule
