

TMUX7208M 44V, Latch-Up Immune, 8:1, 1-Channel Precision Multiplexers with 1.8V Logic

1 Features

- [Latch-up immune](#)
- Dual supply range: $\pm 4.5\text{V}$ to $\pm 22\text{V}$
- Single supply range: 4.5V to 44V
- -55°C to $+125^\circ\text{C}$ operating temperature
- Low on-resistance: 4Ω
- Low charge injection: 3pC
- High current support: 300mA (maximum)
- [1.8 V logic compatible inputs](#)
- [Integrated pull-down resistor on logic pins](#)
- [Fail-safe logic](#)
- [Rail-to-rail operation](#)
- [Bidirectional signal path](#)
- Break-before-make switching

2 Applications

- [Avionics flight control unit](#)
- [Aircraft cockpit display](#)
- [Standalone avionics precision flight control](#)
- [Interconnect and distribution box](#)
- [Aerospace and defense](#)

3 Description

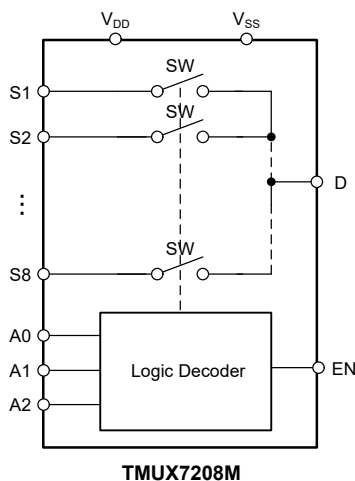

The TMUX7208M is a precision 8:1, single channel multiplexer featuring low on resistance and charge injection. The devices work with a single supply (4.5V to 44V), dual supplies ($\pm 4.5\text{V}$ to $\pm 22\text{V}$), or asymmetric supplies (such as $V_{DD} = 12\text{V}$, $V_{SS} = -5\text{V}$). The TMUX7208M support bidirectional analog and digital signals on the source (Sx) and drain (D) pins ranging from V_{SS} to V_{DD} .

The TMUX7208M is part of the precision switches and multiplexers family of devices and have very low on and off leakage currents allowing them to be used in high precision measurement applications. The TMUX72xx family provides latch-up immunity, preventing undesirable high current events between parasitic structures within the device typically caused by overvoltage events. A latch-up condition typically continues until the power supply rails are turned off and can lead to device failure. The latch-up immunity feature allows the TMUX72xx family of switches and multiplexers to be used in harsh environments. Additionally, the TMUX7208M is rated for extended temperature use down to -55°C , making it ideal for harsh industrial and aerospace applications.

Package Information

PART NUMBER	PACKAGE ⁽²⁾	PACKAGE SIZE ⁽³⁾
TMUX7208M	PW (TSSOP, 16)	5mm × 6.4mm

- (1) See [Device Comparison](#)
- (2) For more information, see [Section 12](#)
- (3) The package size (length × width) is a nominal value and includes pins, where applicable.

4 Device Comparison Table

PRODUCT	DESCRIPTION
TMUX7208M	Low-Leakage-Current, Precision, 8:1, 1-Ch. multiplexer

5 Pin Configuration and Functions

Figure 5-1. TMUX7208M: PW Package, 16-Pin TSSOP (Top View)

Table 5-1. TMUX7208M Pin Functions

NAME	PIN		TYPE ⁽¹⁾	DESCRIPTION ⁽²⁾
	PW	RUM		
A0	1	15	I	Logic control input, has internal 4MΩ pull-down resistor. Controls the switch configuration as shown in Section 8.5 .
A1	16	14	I	Logic control input, has internal 4MΩ pull-down resistor. Controls the switch configuration as shown in Section 8.5 .
A2	15	13	I	Logic control input, has internal 4MΩ pull-down resistor. Controls the switch configuration as shown in Section 8.5 .
D	8	6	I/O	Drain pin. Can be an input or output.
EN	2	16	I	Active high logic enable, has internal 4MΩ pull-down resistor. When this pin is low, all switches are turned off. When this pin is high, the Ax logic input determines which switch is turned on.
GND	14	12	P	Ground (0V) reference.
S1	4	2	I/O	Source pin 1. Can be an input or output.
S2	5	3	I/O	Source pin 2. Can be an input or output.
S3	6	4	I/O	Source pin 3. Can be an input or output.
S4	7	5	I/O	Source pin 4. Can be an input or output.
S5	12	10	I/O	Source pin 5. Can be an input or output.
S6	11	9	I/O	Source pin 6. Can be an input or output.
S7	10	8	I/O	Source pin 7. Can be an input or output.
S8	9	7	I/O	Source pin 8. Can be an input or output.
VDD	13	11	P	Positive power supply. This pin is the most positive power-supply potential. For reliable operation, connect a decoupling capacitor ranging from 0.1μF to 10μF between V _{DD} and GND.
VSS	3	1	P	Negative power supply. This pin is the most negative power-supply potential. In single-supply applications, this pin can be connected to ground. For reliable operation, connect a decoupling capacitor ranging from 0.1μF to 10μF between V _{SS} and GND.
Thermal Pad			—	The thermal pad is not connected internally. No requirement to solder this pad, if connected it is recommended that the pad be left floating or tied to GND.

(1) I = input, O = output, I/O = input and output, P = power.

(2) Refer to [Section 8.4](#) for what to do with unused pins.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾ ⁽²⁾

		MIN	MAX	UNIT
$V_{DD} - V_{SS}$	Supply voltage		48	V
V_{DD}		-0.5	48	V
V_{SS}		-48	0.5	V
$V_{ADDRESS}$ or V_{EN}	Logic control input pin voltage (EN, A0, A1, A2)	-0.5	48	V
$I_{ADDRESS}$ or I_{EN}	Logic control input pin current (EN, A0, A1, A2)	-30	30	mA
V_S or V_D	Source or drain voltage (Sx, D)	$V_{SS}-0.5$	$V_{DD}+0.5$	V
I_{IK}	Diode clamp current ⁽³⁾	-30	30	mA
I_S or I_D (CONT)	Source or drain continuous current (Sx, D)		$I_{DC} + 10\%$ ⁽⁴⁾	mA
T_A	Ambient temperature	-55	150	°C
T_{stg}	Storage temperature	-65	150	°C
T_J	Junction temperature		150	°C
P_{tot}	Total power dissipation (TSSOP package) ⁽⁵⁾		700	mW

- (1) Operation outside the *Absolute Maximum Rating* may cause permanent device damage. *Absolute Maximum Rating* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Condition*. If used outside the *Recommended Operating Condition* but within the *Absolute Maximum Rating*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltages are with respect to ground, unless otherwise specified.
- (3) Pins are diode-clamped to the power-supply rails. Over voltage signals must be voltage and current limited to maximum ratings.
- (4) Refer to *Source or Drain Continuous Current* table for I_{DC} specifications.
- (5) For QFN package: P_{tot} derates linearly above $T_A = 70^\circ\text{C}$ by $24.4\text{mW}/^\circ\text{C}$.
For TSSOP package: P_{tot} derates linearly above $T_A = 70^\circ\text{C}$ by $10.8\text{mW}/^\circ\text{C}$.

6.2 ESD Ratings

		VALUE	UNIT
TMUX7208M			
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾	±2000
		Charged device model (CDM), per JEDEC JS-002, all pins ⁽²⁾	±500

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Thermal Information

THERMAL METRIC ⁽¹⁾		TMUX7208M	UNIT
		PW (TSSOP)	
		16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	93.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	24.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	40.0	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	1.0	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	39.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{DD} - V_{SS}$ ⁽¹⁾	Power supply voltage differential	4.5		44	V
V_{DD}	Positive power supply voltage	4.5		44	V
V_S or V_D	Signal path input/output voltage (source or drain pin) (Sx, D)	V_{SS}		V_{DD}	V
$V_{ADDRESS}$ or V_{EN}	Address or enable pin voltage	0		36	V
I_S or $I_D (CONT)$	Source or drain continuous current (Sx, D)			I_{DC} ⁽²⁾	mA
T_A	Ambient temperature	-55		125	°C

(1) V_{DD} and V_{SS} can be any value as long as $4.5V \leq (V_{DD} - V_{SS}) \leq 36V$, and the minimum V_{DD} is met.

(2) Refer to *Source or Drain Continuous Current* table for I_{DC} specifications.

6.5 Source or Drain Continuous Current

at supply voltage of $V_{DD} \pm 10\%$, $V_{SS} \pm 10\%$ (unless otherwise noted)

CONTINUOUS CURRENT PER CHANNEL (I_{DC})		$T_A = 25^\circ\text{C}$	$T_A = 85^\circ\text{C}$	$T_A = 125^\circ\text{C}$	UNIT
PACKAGE	TEST CONDITIONS				
PW (TSSOP)	±15V Dual Supply	300	190	110	mA
	+36V Single Supply ⁽¹⁾	280	170	100	mA
	+12 V Single Supply	220	150	90	mA
	±5V Dual Supply	210	140	90	mA
	+5V Single Supply	170	110	70	mA

(1) Specified for nominal supply voltage only.

6.6 ±15V Dual Supply: Electrical Characteristics

$V_{DD} = +15V \pm 10\%$, $V_{SS} = -15V \pm 10\%$, GND = 0V (unless otherwise noted)

Typical at $V_{DD} = +15V$, $V_{SS} = -15V$, $T_A = 25^\circ C$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	T_A	MIN	TYP	MAX	UNIT	
ANALOG SWITCH								
R_{ON}	On-resistance	$V_S = -10V$ to $+10V$ $I_D = -10mA$ Refer to On-Resistance	25°C		4	5.9	Ω	
			-40°C to +85°C			7.4	Ω	
			-55°C to +125°C			8.7	Ω	
ΔR_{ON}	On-resistance mismatch between channels	$V_S = -10V$ to $+10V$ $I_D = -10mA$ Refer to On-Resistance	25°C		0.2	0.7	Ω	
			-40°C to +85°C			0.8	Ω	
			-55°C to +125°C			0.9	Ω	
$R_{ON\ FLAT}$	On-resistance flatness	$V_S = -10V$ to $+10V$ $I_S = -10mA$ Refer to On-Resistance	25°C		0.4	1.5	Ω	
			-40°C to +85°C			1.7	Ω	
			-55°C to +125°C			1.8	Ω	
$R_{ON\ DRIFT}$	On-resistance drift	$V_S = 0V$, $I_S = -10mA$ Refer to On-Resistance	-55°C to +125°C		0.02		$\Omega/^\circ C$	
$I_{S(OFF)}$	Source off leakage current ⁽¹⁾	$V_{DD} = 16.5V$, $V_{SS} = -16.5V$ Switch state is off $V_S = +10V / -10V$ $V_D = -10V / +10V$ Refer to Off-Leakage Current	25°C	-0.4	0.04	0.4	nA	
			-40°C to +85°C		-1		1	nA
			-55°C to +125°C		-5		5	nA
$I_{D(OFF)}$	Drain off leakage current ⁽¹⁾	$V_{DD} = 16.5V$, $V_{SS} = -16.5V$ Switch state is off $V_S = +10V / -10V$ $V_D = -10V / +10V$ Refer to Off-Leakage Current	25°C	-0.4	0.04	0.4	nA	
			-40°C to +85°C		-6		6	nA
			-55°C to +125°C		-42		42	nA
$I_{S(ON)}$ $I_{D(ON)}$	Channel on leakage current ⁽²⁾	$V_{DD} = 16.5V$, $V_{SS} = -16.5V$ Switch state is on $V_S = V_D = \pm 10V$ Refer to On-Leakage Current	25°C	-0.4	0.04	0.4	nA	
			-40°C to +85°C		-5		5	nA
			-55°C to +125°C		-40		40	nA
LOGIC INPUTS (EN, A0, A1, A2)								
V_{IH}	Logic voltage high		-55°C to +125°C	1.3		44	V	
V_{IL}	Logic voltage low		-55°C to +125°C	0		0.8	V	
I_{IH}	Input leakage current		-55°C to +125°C		0.4	1.2	μA	
I_{IL}	Input leakage current		-55°C to +125°C	-0.1	-0.005		μA	
C_{IN}	Logic input capacitance		-55°C to +125°C		3.5		pF	
POWER SUPPLY								
I_{DD}	V_{DD} supply current	$V_{DD} = 16.5V$, $V_{SS} = -16.5V$ Logic inputs = 0V, 5V, or V_{DD}	25°C		35	57	μA	
			-40°C to +85°C			60	μA	
			-55°C to +125°C			75	μA	
I_{SS}	V_{SS} supply current	$V_{DD} = 16.5V$, $V_{SS} = -16.5V$ Logic inputs = 0V, 5V, or V_{DD}	25°C		3	14	μA	
			-40°C to +85°C			15	μA	
			-55°C to +125°C			22	μA	

(1) When V_S is positive, V_D is negative, or when V_S is negative, V_D is positive.

(2) When V_S is at a voltage potential, V_D is floating, or when V_D is at a voltage potential, V_S is floating.

6.7 ±15V Dual Supply: Switching Characteristics

$V_{DD} = +15V \pm 10\%$, $V_{SS} = -15V \pm 10\%$, GND = 0V (unless otherwise noted)

Typical at $V_{DD} = +15V$, $V_{SS} = -15V$, $T_A = 25^\circ C$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	T_A	MIN	TYP	MAX	UNIT
t_{TRAN}	Transition time from control input	$V_S = 10V$ $R_L = 300\Omega$, $C_L = 35pF$ Refer to Transition Time	25°C		140	195	ns

7 Parameter Measurement Information

7.1 On-Resistance

The on-resistance of a device is the ohmic resistance between the source (Sx) and drain (D) pins of the device. The on-resistance varies with input voltage and supply voltage. The symbol R_{ON} is used to denote on-resistance. Figure 7-1 shows the measurement setup used to measure R_{ON} . Voltage (V) and current (I_{SD}) are measured using this setup, and R_{ON} is computed with $R_{ON} = V / I_{SD}$:

Figure 7-1. On-Resistance Measurement Setup

7.2 Off-Leakage Current

There are two types of leakage currents associated with a switch during the off state:

- Source off-leakage current
- Drain off-leakage current

Source leakage current is defined as the leakage current flowing into or out of the source pin when the switch is off. This current is denoted by the symbol $I_{S(OFF)}$.

Drain leakage current is defined as the leakage current flowing into or out of the drain pin when the switch is off. This current is denoted by the symbol $I_{D(OFF)}$.

Figure 7-2 shows the setup used to measure both off-leakage currents.

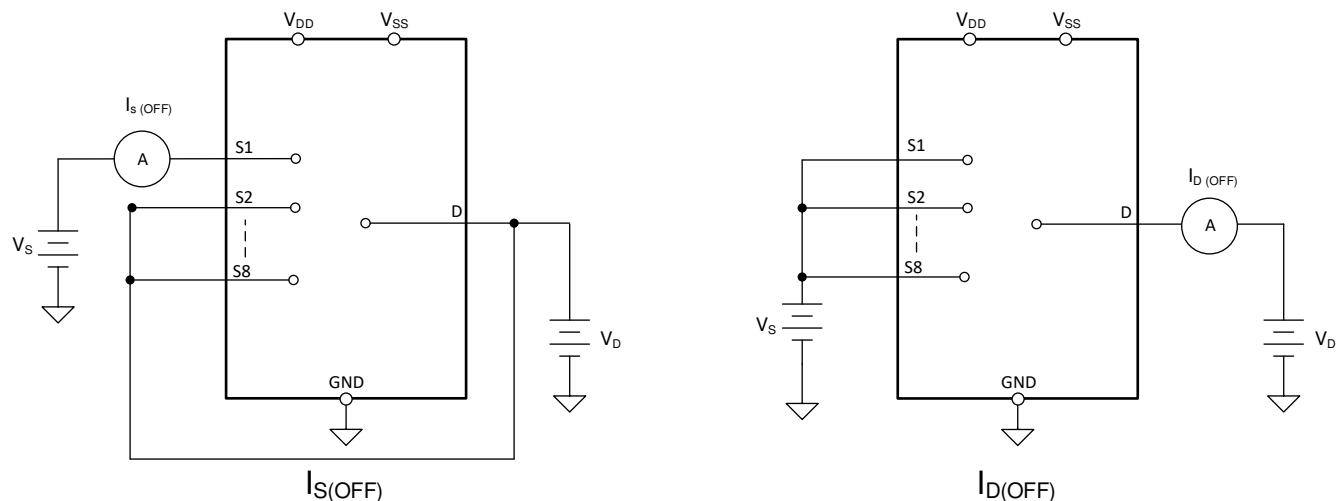

Figure 7-2. Off-Leakage Measurement Setup

7.3 On-Leakage Current

Source on-leakage current is defined as the leakage current flowing into or out of the source pin when the switch is on. This current is denoted by the symbol $I_{S(ON)}$.

Drain on-leakage current is defined as the leakage current flowing into or out of the drain pin when the switch is on. This current is denoted by the symbol $I_{D(ON)}$.

Either the source pin or drain pin is left floating during the measurement. [Figure 7-3](#) shows the circuit used for measuring the on-leakage current, denoted by $I_{S(ON)}$ or $I_{D(ON)}$.

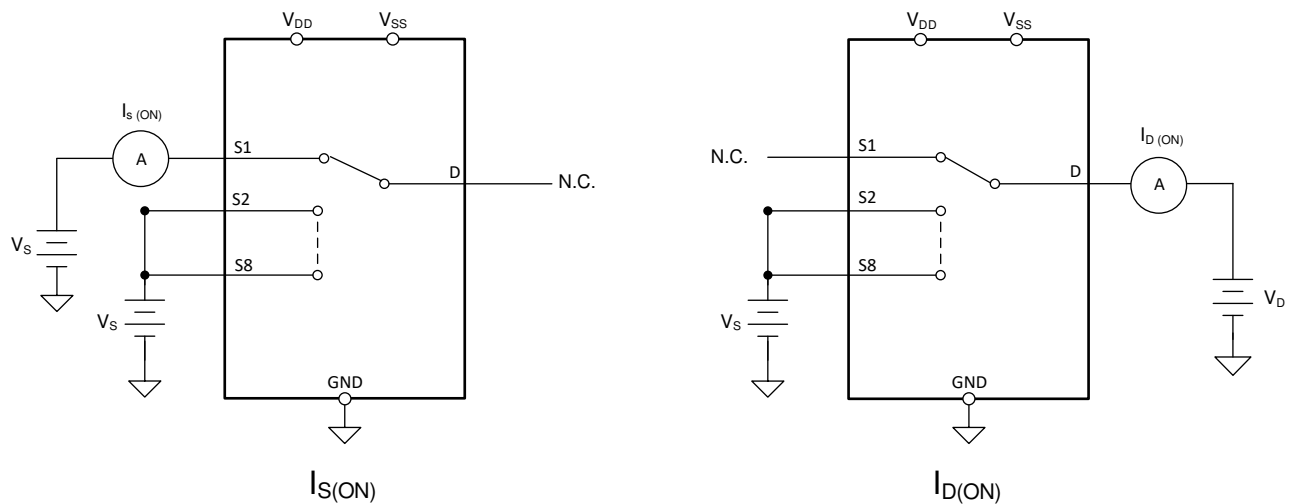

Figure 7-3. On-Leakage Measurement Setup

7.4 Transition Time

Transition time is defined as the time taken by the output of the device to rise or fall 90% after the address signal has risen or fallen past the logic threshold. The 90% transition measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. [Figure 7-4](#) shows the setup used to measure transition time, denoted by the symbol $t_{TRANSITION}$.

Figure 7-4. Transition-Time Measurement Setup

7.5 $t_{ON(EN)}$ and $t_{OFF(EN)}$

Turn-on time is defined as the time taken by the output of the device to rise to 90% after the enable has risen past the logic threshold. The 90% measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. Figure 7-7 shows the setup used to measure turn-on time, denoted by the symbol $t_{ON(EN)}$.

Turn-off time is defined as the time taken by the output of the device to fall to 10% after the enable has fallen past the logic threshold. The 10% measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. Figure 7-7 shows the setup used to measure turn-off time, denoted by the symbol $t_{OFF(EN)}$.

Figure 7-5. Turn-On and Turn-Off Time Measurement Setup

7.6 Break-Before-Make

Break-before-make delay is a safety feature that prevents two inputs from connecting when the device is switching. The output first breaks from the on-state switch before making the connection with the next on-state switch. The time delay between the *break* and the *make* is known as break-before-make delay. Figure 7-6 shows the setup used to measure break-before-make delay, denoted by the symbol $t_{OPEN(BBM)}$.

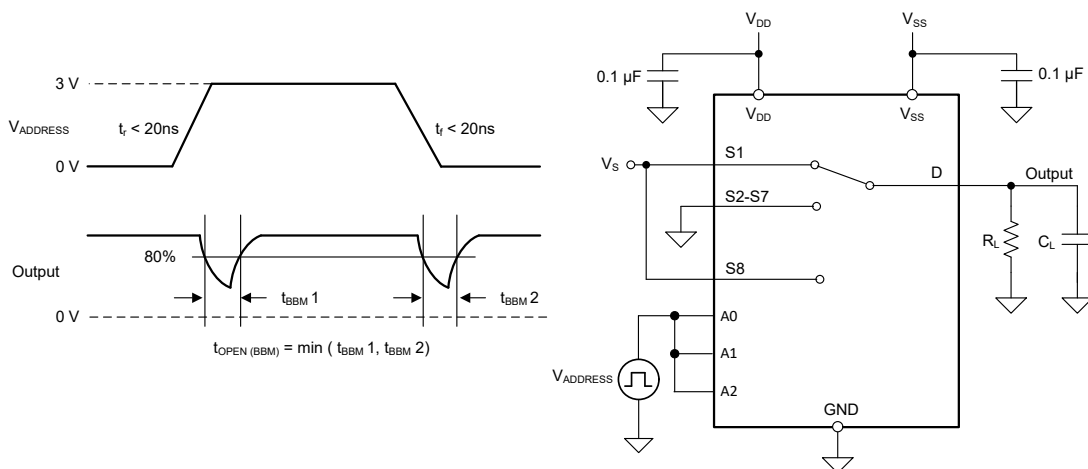

Figure 7-6. Break-Before-Make Delay Measurement Setup

7.7 $t_{ON(VDD)}$ Time

The $t_{ON(VDD)}$ time is defined as the time taken by the output of the device to rise to 90% after the supply has risen past the supply threshold. The 90% measurement is used to provide the timing of the device turning on in the system. Figure 7-7 shows the setup used to measure turn on time, denoted by the symbol $t_{ON(VDD)}$.

Figure 7-7. $t_{ON(VDD)}$ Time Measurement Setup

7.8 Propagation Delay

Propagation delay is defined as the time taken by the output of the device to rise or fall 50% after the input signal has risen or fallen past the 50% threshold. Figure 7-8 shows the setup used to measure propagation delay, denoted by the symbol t_{PD} .

Figure 7-8. Propagation Delay Measurement Setup

7.9 Charge Injection

The TMUX7208M has a transmission-gate topology. Any mismatch in capacitance between the NMOS and PMOS transistors results in a charge injected into the drain or source during the falling or rising edge of the gate signal. The amount of charge injected into the source or drain of the device is known as charge injection, and is denoted by the symbol Q_{INJ} . Figure 7-9 shows the setup used to measure charge injection from source (Sx) to drain (D).

Figure 7-9. Charge-Injection Measurement Setup

7.10 Off Isolation

Off isolation is defined as the ratio of the signal at the drain pin (D) of the device when a signal is applied to the source pin (Sx) of an off-channel. Figure 7-10 shows the setup used to measure, and the equation used to calculate off isolation.

Figure 7-10. Off Isolation Measurement Setup

7.11 Crosstalk

Crosstalk is defined as the ratio of the signal at the drain pin (D) of a different channel, when a signal is applied at the source pin (Sx) of an on-channel. Figure 7-11 shows the setup used to measure, and the equation used to calculate crosstalk.

Figure 7-11. Crosstalk Measurement Setup

7.12 Bandwidth

Bandwidth is defined as the range of frequencies that are attenuated by less than 3dB when the input is applied to the source pin (Sx) of an on-channel, and the output is measured at the drain pin (D) of the device. Figure 7-12 shows the setup used to measure bandwidth.

Figure 7-12. Bandwidth Measurement Setup

7.13 THD + Noise

The total harmonic distortion (THD) of a signal is a measurement of the harmonic distortion, and is defined as the ratio of the sum of the powers of all harmonic components to the power of the fundamental frequency at the mux output. The on-resistance of the device varies with the amplitude of the input signal and results in distortion when the drain pin is connected to a low-impedance load. Total harmonic distortion plus noise is denoted as THD+N.

Figure 7-13. THD+N Measurement Setup

7.14 Power Supply Rejection Ratio (PSRR)

PSRR measures the ability of a device to prevent noise and spurious signals that appear on the supply voltage pin from coupling to the output of the switch. The DC voltage on the device supply is modulated by a sine wave of 620 mVPP. The ratio of the amplitude of signal on the output to the amplitude of the modulated signal is the ACPSRR. A high ratio represents a high degree of tolerance to supply rail variation.

Figure 7-14 shows how the decoupling capacitors reduce high frequency noise on the supply pins. This helps stabilize the supply and immediately filter as much of the supply noise as possible.

Figure 7-14. ACPSRR Measurement Setup

8 Detailed Description

8.1 Overview

The TMUX7208M is an 8:1, 1-channel multiplexer. Each channel is turned on or turned off based on the state of the address lines and enable pin.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Bidirectional Operation

The TMUX7208M conducts equally well from source (Sx) to drain (D) or from drain (D) to source (Sx). Each channel has similar characteristics in both directions and supports both analog and digital signals.

8.3.2 Rail-to-Rail Operation

The valid signal path input or output voltage for the TMUX7208M ranges from V_{SS} to V_{DD} .

8.3.3 1.8 V Logic Compatible Inputs

TMUX7208M have 1.8V logic compatible control for all logic control inputs. 1.8 V logic level inputs allows the to interface with processors that have lower logic I/O rails and eliminates the need for an external translator, which saves both space and BOM cost. For more information on 1.8 V logic implementations refer to [Simplifying Design with 1.8 V logic Muxes and Switches](#).

8.3.4 Integrated Pull-Down Resistor on Logic Pins

The TMUX7208M has internal weak pull-down resistors to GND to ensure the logic pins are not left floating. The value of this pull-down resistor is approximately $4M\Omega$, but is clamped to about $1\mu A$ at higher voltages. This feature integrates up to four external components and reduces system size and cost.

8.3.5 Fail-Safe Logic

TMUX7208M supports fail-safe logic on the control input pins (EN and Ax) allowing it to operate up to 44V, regardless of the state of the supply pins. This feature allows voltages on the control pins to be applied before the supply pin, protecting the device from potential damage. Fail-safe logic minimizes system complexity by removing the need for power supply sequencing on the logic control pins. For example, the fail-safe logic feature allows the TMUX7208M logic input pins to ramp up to +44V while V_{DD} and $V_{SS} = 0V$. The logic control inputs are protected against positive faults of up to +44V in powered-off condition, but do not offer protection against negative overvoltage conditions.

8.3.6 Latch-Up Immune

Latch-up is a condition where a low impedance path is created between a supply pin and ground. This condition is caused by a trigger (current injection or overvoltage), but once activated, the low impedance path remains even after the trigger is no longer present. This low impedance path may cause system upset or catastrophic damage due to excessive current levels. The Latch-Up condition typically requires a power cycle to eliminate the low impedance path.

The TMUX72xx family of devices are constructed on Silicon on Insulator (SOI) based process where an oxide layer is added between the PMOS and NMOS transistor of each CMOS switch to prevent parasitic structures from forming. The oxide layer is also known as an insulating trench and prevents triggering of latch up events due to overvoltage or current injections. The latch-up immunity feature allows the TMUX72xx family of switches and multiplexers to be used in harsh environments. For more information on latch-up immunity refer to [Using Latch Up Immune Multiplexers to Help Improve System Reliability](#).

8.3.7 Ultra-Low Charge Injection

The TMUX7208M have a transmission gate topology, as shown in [Figure 8-1](#). Any mismatch in the stray capacitance associated with the NMOS and PMOS causes an output level change whenever the switch is opened or closed.

Figure 8-1. Transmission Gate Topology

The TMUX7208M contains specialized architecture to reduce charge injection on the Drain (D). To further reduce charge injection in a sensitive application, a compensation capacitor (C_p) can be added on the Source (S_x). This will ensure that excess charge from the switch transition will be pushed into the compensation capacitor on the Source (S_x) instead of the Drain (D). As a general rule of thumb, C_p should be 20x larger than the equivalent load capacitance on the Drain (D). [Figure 8-2](#) shows charge injection variation with different compensation capacitors on the Source side. This plot was captured on the TMUX7219M as part of the TMUX72xx family with a 100pF load capacitance.

Figure 8-2. Charge Injection Compensation

8.4 Device Functional Modes

When the EN pin of the TMUX7208M is pulled high, one of the switches is closed based on the state of the Ax pin. When the EN pin is pulled low, all of the switches are in an open state regardless of the state of the Ax pin. The control pins can be as high as 44V.

The TMUX7208M can operate without any external components except for the supply decoupling capacitors. The EN and Ax pins have internal pull-down resistors of 4MΩ. If unused, tie Ax and EN pins to GND to prevent the device from consuming additional current as highlighted in [Implications of Slow or Floating CMOS Inputs](#). Unused signal path inputs (Sx or D) should be connected to GND.

8.5 Truth Tables

Table 8-1 provides the truth tables for the TMUX7208M.

Table 8-1. TMUX7208M Truth Table

EN	A2	A1	A0	Selected Source Connected To Drain (D) Pin
0	X ⁽¹⁾	X	X	All sources are off (HI-Z)

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The TMUX7208M is part of the precision switches and multiplexers family of devices. These devices operate with dual supplies ($\pm 4.5\text{V}$ to $\pm 22\text{V}$), a single supply (4.5V to 44V), or asymmetric supplies (such as $V_{DD} = 12\text{V}$, $V_{SS} = -5\text{V}$), and offer true rail-to-rail input and output. The TMUX7208M offers low R_{ON} , low on and off leakage currents and ultra-low charge injection performance. These features makes the TMUX72xx a family of precision, robust, high-performance analog multiplexers for high-voltage, industrial applications.

9.2 Typical Application

One example to take advantage of performance is the implementation of multiplexed data acquisition front end for multiple input sensors. Applications such as analog input modules for programmable logic controllers (PLCs), data acquisition (DAQ), and semiconductor test systems commonly need to monitor multiple signals into a single ADC channel. The multiple inputs can come from different system voltages being monitored, or environmental sensors such as temperature or humidity. Figure 9-1 shows a simplified example of monitoring multiple inputs into a single ADC using a multiplexer.

Figure 9-1. Multiplexed Data Acquisition Front End

9.2.1 Design Requirements

Table 9-1. Design Parameters

PARAMETER	VALUE
Positive supply (VDD)	+15V
Negative supply (VSS)	-15V
Input and output signal range	-12 V to 12 V (limit of ADC)
Control logic thresholds	1.8 V compatible
Temperature range	-55°C to +125°C

9.2.2 Detailed Design Procedure

The application shown in [Figure 9-1](#) demonstrates how a multiplexer can be used to simplify the signal chain and monitor multiple input signals to a single ADC channel. In this example the ADC has software programmable input ranges up to ± 12.288 V. The ADC also has overvoltage protection up to ± 20 V, which allows for the multiplexer to be powered with wider supply voltages than the input signal range to maximize the on resistance performance of the multiplexer, while still maintaining system level overvoltage protection beyond the useable signal range. Both the multiplexer and the ADC are capable of operation in extended industrial temperature range of -55°C to $+125^{\circ}\text{C}$ allowing for use in a wider array of industrial systems.

Many SAR ADCs have an analog input structure that consists of a sampling switch and a sampling capacitor. Many signal chains will have a driver amplifier to help charge the input of the ADC to meet a fast system acquisition time. However, a driver amplifier is not always needed to drive SAR ADCs. [Figure 9-2](#) shows a typical diagram of a sensor driving the SAR ADC input directly after being passed through the multiplexer. A filter capacitor (C_{FLT}) is connected to the input of the ADC to reduce the sampling charge injection and provides a charge bucket to quickly charge the internal sample-and-hold capacitor of the ADC.

The sensor block simplifies the device into a Thevenin equivalent voltage source (V_{TH}) and resistance (R_{TH}) which can be extracted from the device data sheets. Similarly the multiplexer can be thought of as a series resistance ($R_{ON(MUX)}$) and capacitance ($C_{ON(MUX)}$). To ensure maximum precision of the signal chain, the system should be able to settle within 1/2 of an LSB within the acquisition time of the ADC. The time constant can be calculated as shown in [Figure 9-2](#). This equation highlights the importance of selecting a multiplexer with low on-resistance to further reduce the system time constant. Additionally, low charge injection performance of the multiplexer is helpful to reduce conversion errors and improve accuracy of the measurements.

$$t_{ACQ} > k \times \tau_{FLT}$$

- $\tau_{FLT} = (R_{TH} + R_{ON(MUX)}) \times (C_{FLT} + C_{ON(MUX)})$
- k is single pole time constant for N bit ADC

Figure 9-2. Driving SAR ADC

9.2.3 Application Curve

The low on and off leakage currents of TMUX7208M and ultra-low charge injection performance make this device ideal for implementing high precision industrial systems. The TMUX7208M contains specialized architecture to reduce charge injection on the drain side (D) (see Section 8.3.7 for more details). Figure 9-3 shows the plot for the charge injection versus source voltage for the TMUX7208M.

Figure 9-3. Charge Injection vs Drain Voltage

9.3 Power Supply Recommendations

The TMUX7208M operates across a wide supply range of $\pm 4.5\text{V}$ to $\pm 22\text{V}$ (4.5V to 44V in single-supply mode). The device also perform well with asymmetrical supplies such as $V_{DD} = 12\text{V}$ and $V_{SS} = -5\text{V}$.

Power-supply bypassing improves noise margin and prevents switching noise propagation from the supply rails to other components. Good power-supply decoupling is important to achieve optimum performance. For improved supply noise immunity, use a supply decoupling capacitor ranging from $0.1\mu\text{F}$ to $10\mu\text{F}$ at the V_{DD} and V_{SS} pins to ground. Place the bypass capacitors as close to the power supply pins of the device as possible using low-impedance connections. TI recommends using multi-layer ceramic chip capacitors (MLCCs) that offer low equivalent series resistance (ESR) and inductance (ESL) characteristics for power-supply decoupling purposes. For very sensitive systems, or for systems in harsh noise environments, avoiding the use of vias for connecting the capacitors to the device pins may offer superior noise immunity. The use of multiple vias in parallel lowers the overall inductance and is beneficial for connections to ground and power planes. Always ensure the ground (GND) connection is established before supplies are ramped.

9.4 Layout

9.4.1 Layout Guidelines

A reflection can occur when a PCB trace turns a corner at a 90° angle. A reflection occurs primarily because of the change of width of the trace. The trace width increases to 1.414 times the width at the apex of the turn. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self-inductance of the trace which results in the reflection. Not all PCB traces can be straight and therefore some traces must turn corners. Figure 9-4 shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

Figure 9-4. Trace Example

Route high-speed signals using a minimum of vias and corners which reduces signal reflections and impedance changes. When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points, through-hole pins are not recommended at high frequencies.

Figure 9-5 shows an example of a PCB layout with the TMUX7208M. Some key considerations are:

- Decouple the supply pins with a 0.1 μF and 1 μF capacitor, placed lowest value capacitor as close to the pin as possible.
- Keep the input lines as short as possible.
- Use a solid ground plane to help reduce electromagnetic interference (EMI) noise pickup.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when necessary.
- Using multiple vias in parallel will lower the overall inductance and is beneficial for connection to ground planes.

9.4.2 Layout Example

10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11 Revision History

DATE	REVISION	NOTES
January 2024	*	Initial Release

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMUX7208MPWR	ACTIVE	TSSOP	PW	16	2500	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-55 to 125	X208	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
