Description	QDMA Region Access enable for bit N in Region M: En = 0 : Accesses via Region M address space to Bit N in any QDMA Channel Register are not allowed. Reads will return 'b0 on Bit N and writes will not modify the state of bit N. Enabled interrupt bits for bit N do not contribute to the generation of the TPCC region M interrupt. En = 1 : Accesses via Region M address space to Bit N in any QDMA Channel Register are allowed. Reads will return the value from Bit N and writes will modify the state of bit N. Enabled interrupt bits for bit N do contribute to the generation of the TPCC region n interrupt.

Table 16-126. EDMA_TPCC_ER

Address Offset	0x0000 1000		
Physical Address	0x4330 1000 0x40D1 1000 0x4151 1000 0x01D1 1000 0x420A 1000 0x421A 1000	**Instance**	SYS_EDMA_TPCC DSP1_EDMA_TPCC DSP2_EDMA_TPCC DSP_EDMA_TPCC EVE1_EDMA_TPCC EVE2_EDMA_TPCC
Description	Event Register: If EDMA_TPCC_ER.En bit is set and the EDMA_TPCC_EER.En bit is also set, then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. EDMA_TPCC_ER.En bit is set when the input event #n transitions from inactive (low) to active (high), regardless of the state of EDMA_TPCC_EER.En bit. EDMA_TPCC_ER.En bit is cleared when the corresponding event is prioritized and serviced. If the EDMA_TPCC_ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EDMA_TPCC_EER register is set, then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the EDMA_TPCC_ECR pseudo-register.

Table 16-132. EDMA_TPCC_CER

Address Offset	0x0000 1018		
Physical Address	0x4330 1018 0x40D1 1018 0x4151 1018 0x01D1 1018 0x420A 1018 0x421A 1018	**Instance**	SYS_EDMA_TPCC DSP1_EDMA_TPCC DSP2_EDMA_TPCC DSP_EDMA_TPCC EVE1_EDMA_TPCC EVE2_EDMA_TPCC
Description	Chained Event Register: If EDMA_TPCC_CER.En bit is set (regardless of state of EDMA_TPCC_EER.En), then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. EDMA_TPCC_CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface, or is generated internally via Early Completion path. EDMA_TPCC_CER.En bit is cleared when the corresponding event is prioritized and serviced. If the EDMA_TPCC_CER.En bit is already set and the corresponding chaining completion code is returned from the TC, then the corresponding bit in the Event Missed Register is set. EDMA_TPCC_CER.En cannot be set or cleared via software.

Table 16-134. EDMA_TPCC_EER

Address Offset	0x0000 1020		
Physical Address	0x4330 1020 0x40D1 1020 0x4151 1020 0x01D1 1020 0x420A 1020 0x421A 1020	**Instance**	SYS_EDMA_TPCC DSP1_EDMA_TPCC DSP2_EDMA_TPCC DSP_EDMA_TPCC EVE1_EDMA_TPCC EVE2_EDMA_TPCC
Description	Event Enable Register: Enables DMA transfers for EDMA_TPCC_ER.En pending events. EDMA_TPCC_ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (EDMA_TPCC_CER) or Event Set Register (EDMA_TPCC_ESR). Note that if a bit is set in EDMA_TPCC_ER.En while EDMA_TPCC_EER.En is disabled, no action is taken. If EDMA_TPCC_EER.En is enabled at a later point (and EDMA_TPCC_ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EDMA_TPCC_EER.En is not directly writeable. Events can be enabled via writes to EDMA_TPCC_EESR and can be disabled via writes to EDMA_TPCC_EECR register. EDMA_TPCC_EER.En = 0: EDMA_TPCC_ER.En is not enabled to trigger DMA transfers. EDMA_TPCC_EER.En = 1: EDMA_TPCC_ER.En is enabled to trigger DMA transfers.

31:2	RESERVED	Reserved	R	0x0

Bits	Field Name	Description	Type	Reset
1	SET	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (EDMA_TPCC_IPRn). CPU write of '0' has no effect.	W	0x0
0	EVAL	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (EDMA_TPCC_IPRn). CPU write of '0' has no effect.	W	0x0

Table 16-155. EDMA_TPCC_QER

Address Offset	0x0000 1080		
Physical Address	0x4330 1080 0x40D1 1080 0x4151 1080 0x01D1 1080 0x420A 1080 0x421A 1080	**Instance**	SYS_EDMA_TPCC DSP1_EDMA_TPCC DSP2_EDMA_TPCC DSP_EDMA_TPCC EVE1_EDMA_TPCC EVE2_EDMA_TPCC
Description	QDMA Event Register: If EDMA_TPCC_QER.En bit is set, then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. EDMA_TPCC_QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. EDMA_TPCC_QER.En bit is cleared when the corresponding event is prioritized and serviced. EDMA_TPCC_QER.En is also cleared when user writes a '1' to the EDMA_TPCC_QSECR.En bit. If the EDMA_TPCC_QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and EDMA_TPCC_QEER register is set, then the corresponding bit in the QDMA Event Missed Register is set.

Description	Chained Event Register If EDMA_TPCC_CER.En bit is set (regardless of state of EDMA_TPCC_EER.En), then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. EDMA_TPCC_CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface, or is generated internally via Early Completion path. EDMA_TPCC_CER.En bit is cleared when the corresponding event is prioritized and serviced. If the EDMA_TPCC_CER.En bit is already set and the corresponding chaining completion code is returned from the TC, then the corresponding bit in the Event Missed Register is set. EDMA_TPCC_CER.En cannot be set or cleared via software.

Table 16-169. EDMA_TPCC_EER_RN_k

Address Offset	0x0000 2020 + (0x200 * k)		
Physical Address	0x4330 2020 + (0x200 * k) 0x40D1 2020 + (0x200 * k) 0x4151 2020 + (0x200 * k) 0x01D1 2020 + (0x200 * k) 0x420A 2020 + (0x200 * k) 0x421A 2020 + (0x200 * k)	**Instance**	SYS_EDMA_TPCC DSP1_EDMA_TPCC DSP2_EDMA_TPCC DSP_EDMA_TPCC EVE1_EDMA_TPCC EVE2_EDMA_TPCC
Description	Event Enable Register Enables DMA transfers for EDMA_TPCC_ER.En pending events. EDMA_TPCC_ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (EDMA_TPCC_CER) or Event Set Register (EDMA_TPCC_ESR). **NOTE: If a bit is set in EDMA_TPCC_ER.En while EDMA_TPCC_EER.En is disabled, no action is taken.** If EDMA_TPCC_EER.En is enabled at a later point (and EDMA_TPCC_ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EDMA_TPCC_EER.En is not directly writeable. Events can be enabled via writes to EDMA_TPCC_EESR and can be disabled via writes to EDMA_TPCC_EECR register. EDMA_TPCC_EER.En = 0: EDMA_TPCC_ER.En is not enabled to trigger DMA transfers. EDMA_TPCC_EER.En = 1: EDMA_TPCC_ER.En is enabled to trigger DMA transfers.

Address Offset	0x0000 2024 + (0x200 * k)		
Physical Address	0x4330 2024 + (0x200 * k) 0x40D1 2024 + (0x200 * k) 0x4151 2024 + (0x200 * k) 0x01D1 2024 + (0x200 * k) 0x420A 2024 + (0x200 * k) 0x421A 2024 + (0x200 * k)	**Instance**	SYS_EDMA_TPCC DSP1_EDMA_TPCC DSP2_EDMA_TPCC DSP_EDMA_TPCC EVE1_EDMA_TPCC EVE2_EDMA_TPCC
Description	Event Enable Register (High Part) Enables DMA transfers for EDMA_TPCC_ERH.En pending events. EDMA_TPCC_ERH.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (EDMA_TPCC_CERH) or Event Set Register (EDMA_TPCC_ESRH). **NOTE: If a bit is set in EDMA_TPCC_ERH.En while EDMA_TPCC_EERH.En is disabled, no action is taken.** If EDMA_TPCC_EERH.En is enabled at a later point (and EDMA_TPCC_ERH.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EDMA_TPCC_EERH.En is not directly writeable. Events can be enabled via writes to EDMA_TPCC_EESRH and can be disabled via writes to EDMA_TPCC_EECRH register. EDMA_TPCC_EERH.En = 0: EDMA_TPCC_ER.En is not enabled to trigger DMA transfers. EDMA_TPCC_EERH.En = 1: EDMA_TPCC_ER.En is enabled to trigger DMA transfers.

Description	Interrupt Eval Register		
Type	W		

31–2	1	0
RESERVED	SET	EVAL

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Reserved	R	0x0
1	SET	Interrupt Set CPU writes 0x0 has no effect. CPU writes 0x1 to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (EDMA_TPCC_IPRn).	W	0x0
0	EVAL	Interrupt Evaluate CPU writes 0x0 has no effect. CPU writes 0x1 to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (EDMA_TPCC_IPRn).	W	0x0

Table 16-190. EDMA_TPCC_QER_RN_k

Address Offset	0x0000 2080 + (0x200 * k)		
Physical Address	0x4330 2080 + (0x200 * k) 0x40D1 2080 + (0x200 * k) 0x4151 2080 + (0x200 * k) 0x01D1 2080 + (0x200 * k) 0x420A 2080 + (0x200 * k) 0x421A 2080 + (0x200 * k)	**Instance**	SYS_EDMA_TPCC DSP1_EDMA_TPCC DSP2_EDMA_TPCC DSP_EDMA_TPCC EVE1_EDMA_TPCC EVE2_EDMA_TPCC

Table 16-190. EDMA_TPCC_QER_RN_k (continued)

Description	QDMA Event Register If EDMA_TPCC_QER.En bit is set, then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. EDMA_TPCC_QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. EDMA_TPCC_QER.En bit is cleared when the corresponding event is prioritized and serviced. EDMA_TPCC_QER.En is also cleared when user writes a '1' to the EDMA_TPCC_QSECR.En bit. If the EDMA_TPCC_QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and EDMA_TPCC_QEER register is set, then the corresponding bit in the QDMA Event Missed Register is set.

BCNT																ACNT															

Bits	Field Name	Description	Type	Reset
31:16	BCNT	BCNT: Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation, valid values for BCNT can be anywhere between 1 and 65535. Therefore, the maximum number of arrays in a frame is 65535 (64K-1 arrays). BCNT=1 means 1 array in the frame, and BCNT=0 means 0 arrays in the frame. In normal mode, a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the EDMA_TPCC_OPT_n.WIMODE bit is set, then the programmed BCNT value will be incremented by '1' before submission to TC. I.e., 0 means 1, 1 means 2, 2 means 3, ..., 0xFFFE means 0xFFFF. A value of 0xFFFF is an illegal value that will be treated as a Null TR.	RW	0x0
15:0	ACNT	ACNT: number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore, the maximum number of bytes in an array is 65535 bytes (64K-1 bytes). ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the EDMA_TPCC_OPT_n.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0, it will still be treated as 0 since the multiply-by-4 operation (to translate between a word count and a byte count) will drop the 2 msbits. For dummy and null transfer definition, the ACNT definition will disregard the 2 msbits. I.e., a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer, resulting in null or dummy operation dependent on the state of BCNT and CCNT.	RW	0x0

Description	Link and Reload parameters		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BCNTRLD																LINK															

Bits	Field Name	Description	Type	Reset
31:16	BCNTRLD	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case, the CC decrements the BCNT value by one on each TR submission. When BCNT (conceptually) reaches zero, then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers, the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT, not thus BCNTRLD is a don't care field.	RW	0x0
15:0	LINK	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination (i.e., after count fields are decremented to '0') with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore, if the user uses the literal address with a range from 0x4000 to 0x7FFF, it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000, thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case (5-lsbs), behavior is undefined for the user (i.e., don't have to test it). In the former case (2 msbs), user should be able to take advantage of this feature (i.e., do have to test it). If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM, then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e., a value of 0x3FFE is a non-NULL PaRAM link field.	RW	0x0

DCIDX																SCIDX															

Bits	Field Name	Description	Type	Reset
31:16	DCIDX	Destination Frame Index: DCIDX is a 16-bit signed value (2's complement) used for destination address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when DCIDX is applied, the current array in an A-sync transfer is the last array in the frame, while the current array in a ABsync transfer is the first array in the frame.	RW	0x0
15:0	SCIDX	Source Frame Index: SCIDX is a 16-bit signed value (2's complement) used for source address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when SCIDX is applied, the current array in an A-sync transfer is the last array in the frame, while the current array in a AB-sync transfer is the first array in the frame.	RW	0x0

RESERVED																CCNT															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Reserved	RW	0x0
15:0	CCNT	CCNT: Count for 3rd Dimension: CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT can be anywhere between 1 and 65535. Therefore, the maximum number of frames in a block is 65535 (64K-1 frames). CCNT of '1' means '1' frame in the block, and CCNT of '0' means '0' frames in the block. A CCNT value of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. WIMODE has no affect on CCNT operation.	RW	0x0

Bits	Field Name	Description	Type	Reset
31:13	RESERVED	Reserved	R Return 0's	0x0
12:11	DFSTRTPTR	Dst FIFO Start Pointer Represents the offset to the head entry of Dst Register FIFO, in units of *entries*. Legal values = 0x0 to 0x3	R	0x0
10:9	RESERVED	Reserved	R Return 0's	0x0
8	ACTV	Channel Active Channel Active is a logical-OR of each of the *BUSY/ACTV signals. The ACTV bit must remain high through the life of a TR. 0x0: Channel is idle 0x1: Channel is busy	R	0x1
7	RESERVED	Reserved	R Return 0's	0x0
6:4	DSTACTV	Destination Active State Specifies the number of TRs that are resident in the Dst Register FIFO at a given instant. Legal values are constrained by the DSTREGDEPTH parameter.	R	0x0
3	RESERVED	Reserved	R Return 0's	0x0

Bits	Field Name	Description	Type	Reset
2	WSACTV	Write Status Active 0x0: Write status is not pending. Write status has been received for all previously issued write commands. 0x1: Write Status is pending. Write status has not been received for all previously issued write commands.	R	0x0
1	SRCACTV	Source Active State 0x0: Source Active set is idle. Any TR written to Prog Set will immediately transition to Source Active set as long as the Dst FIFO Set is not full (DSTFULL == 1). 0x1: Source Active set is busy either performing read transfers or waiting to perform read transfers for current Transfer Request.	R	0x0
0	PROGBUSY	Program Register Set Busy 0x0: Program set idle and is available for programming. 0x1: Program set busy. User should poll for PROGBUSY equal to '0' prior to re-programming the Program Register set.	R	0x0

7:4	RESERVED	Reserved	R Return 0's	0x0
3:0	STAT	Transaction Status: Stores the non-zero status/error code that was detected on the read status or write status bus. MS-bit effectively serves as the read vs. write error code. If read status and write status are returned on the same cycle, then the TC chooses non-zero version. If both are non-zero then write status is treated as higher priority. Encoding of errors matches the CBA spec and is summarized here: 0xF =	R	0x0

Chapter 17

Interrupt Controllers

This chapter describes the interrupt controllers (INTCs) in the device.

17.1 Interrupt Controllers Overview 3968
17.2 Interrupt Controllers Environment 3970
17.3 Interrupt Controllers Integration 3972
17.4 Interrupt Controllers Functional Description 4014

17.1 Interrupt Controllers Overview

The device has a large number of interrupts to service the needs of its many peripherals and subsystems. The MPU, DSP (x2), IPU (x2), and EVE (x2) subsystems are capable of servicing these interrupts via their integrated interrupt controllers. In addition, each processor's interrupt controller is preceded by an Interrupt Controller Crossbar (IRQ_CROSSBAR) that provides flexibility in mapping the device interrupts to processor interrupt inputs. For more information about IRQ crossbar, see Chapter 18, *Control Module*.

Dual Cortex®-A15 MPU Subsystem Interrupt Controller (MPU_INTC)

The MPU_INTC module (also called Generalized Interrupt Controller [GIC]) is a single functional unit that is integrated in the Arm® Cortex-A15 multiprocessor core (MPCore) alongside Cortex-A15 processors. It provides:

- 160 hardware interrupt inputs
- Generation of interrupts by software
- Prioritization of interrupts
- Masking of any interrupts
- Distribution of the interrupts to the target Cortex-A15 processor(s)
- Tracking the status of interrupts

Each Cortex-A15 processor supports three main groups of interrupt sources, with each interrupt source having a unique ID:

- *Software Generated Interrupts (SGIs):* SGIs are generated by writing to the Cortex-A15 Software Generated Interrupt Register (GICD_SGIR). A maximum of 16 SGIs (ID0–ID15) can be generated for each CPU interface. An SGI has edge-triggered properties. The software triggering of the interrupt is equivalent to the edge transition of the interrupt signal on a peripheral input.
- *Private Peripheral Interrupts (PPIs):* A PPI is an interrupt generated by a peripheral that is specific to a single processor. Although interrupts ID16–ID31 are dedicated to PPIs in general, only seven PPIs are actually used for each CPU interface (ID25–ID31). Interrupts ID16–ID24 are reserved (not used).
- *Shared Peripheral Interrupts (SPIs):* SPIs are triggered by events generated on associated interrupt input lines. In this device, the GIC is configured to support 160 SPIs corresponding to its external IRQS[159:0] signals. SPIs start at ID32 and their mapping is presented in Section 17.3.1.

For detailed information about this module and description of SGIs and PPIs, see the Arm *Cortex-A15 MPCore Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).

C66x DSP Subsystem Interrupt Controller (DSPx_INTC, where x = 1, 2)

There are two Digital Signal Processing (DSP) subsystems in the device - DSP1, and DSP2. Each DSP subsystem integrates an interrupt controller - DSPx_INTC, which interfaces the system events to the C66x core interrupt and exceptions inputs. It combines up to 128 interrupts into 12 prioritized interrupts presented to the C66x CPU.

For detailed information about this module, see Chapter 5, *DSP Subsystem*.

Dual Cortex-M4 IPU Subsystem Interrupt Controller (IPUx_Cx_INTC, where x = 1, 2)

There are two Image Processing Unit (IPU) subsystems in the device - IPU1, and IPU2. Each IPU subsystem integrates two Arm Cortex-M4 cores.

A Nested Vectored Interrupt Controller (NVIC) is integrated within each Cortex-M4. The interrupt mapping is the same (per IPU) for the two cores to facilitate parallel processing. The NVIC supports:

- 64 external interrupts (in addition to 16 Cortex-M4 internal interrupts), which are dynamically prioritized with 16 levels of priority defined for each core
- Low-latency exception and interrupt handling
- Prioritization and handling of exceptions
- Control of the local power management
- Debug accesses to the processor core

For detailed information about this module, refer to Arm *Cortex-M4 Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).

Note

IPUx_Cx_INTC is a unified name for the following interrupt controllers:

- IPU1_C0_INTC - NVIC in first Cortex-M4 core of IPU1
- IPU1_C1_INTC - NVIC in second Cortex-M4 core of IPU1
- IPU2_C0_INTC - NVIC in first Cortex-M4 core of IPU2
- IPU2_C1_INTC - NVIC in second Cortex-M4 core of IPU2

EVE Subsystem Interrupt Controller (EVEx_INTC, where x = 1 to 2)

There are two Embedded Video Engine (EVE) subsystems in the device - EVE1, and EVE2. Each EVE subsystem integrates an interrupt controller - EVEx_INTC, which handles incoming interrupts, merging them with internal interrupt sources to drive ARP32's interrupt inputs. It also allows ARP32 to generate outgoing interrupts or events to synchronize with other system processors and EDMA.

The EVEx_INTC supports up to 32 active-high level interrupt inputs. Its architecture allows both hardware and software prioritization.

For detailed information about this module, see Section 8.1, *Embedded Vision Engine*.

Figure 17-1 shows the top-level block diagram of the interrupt controllers in this device.

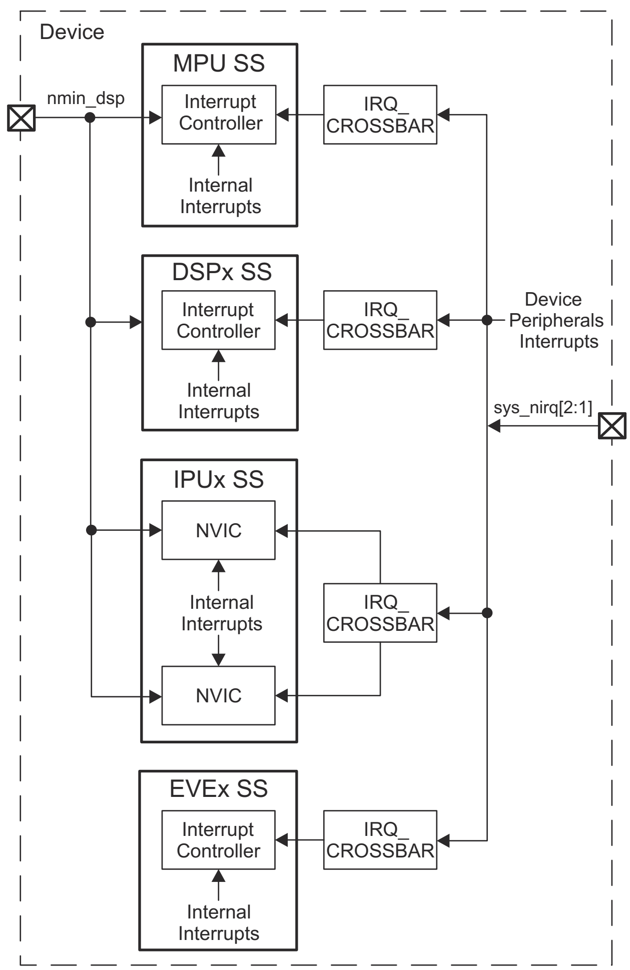

Figure 17-1. Interrupt Controllers in the Device

17.2 Interrupt Controllers Environment

Figure 17-2 shows the relationship between the device INTCs and external interrupts.

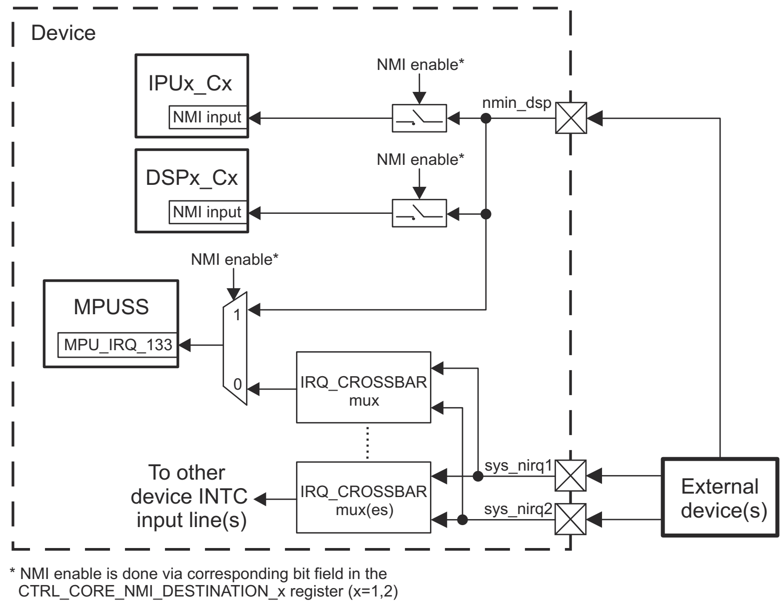

Figure 17-2. Interrupts From External Devices

Table 17-1 describes the signals that can be used by external devices to generate interrupts to the device INTCs.

Table 17-1. Interrupts From External Devices

Device Pin	I/O[(1)]	Description
sys_nirq1	I	External devices can use these pins to generate a system wake-up interrupt event to any device INTC. The user must take care to configure the corresponding IRQ_CROSSBAR properly (via Control Module).
sys_nirq2	I	

Table 17-1. Interrupts From External Devices (continued)

Device Pin	I/O[(1)]	Description
nmin_dsp	I	External device can use this pin to generate a non-maskable interrupt (NMI) event to the following device processors: - IPU1_C0, IPU1_C1. Upon enable (via Control Module), the NMI is routed directly to the NMI input of Cortex M4 core. Note that NMI can be enabled separately for IPU1_C0 and IPU1_C1. - IPU2_C0, IPU2_C1. Upon enable (via Control Module), the NMI is routed directly to the NMI input of Cortex M4 core. Note that NMI can be enabled separately for IPU2_C0 and IPU2_C1. - DSP1, DSP2. Upon enable (via Control Module), the NMI is routed directly to the NMI input of C66x CPU. The signal from the **nmin_dsp** pin can also be mapped to the MPU_INTC (MPU_IRQ_133 input) but it would be treated by Cortex-A15 as a general interrupt and not as a non-maskable interrupt. The Cortex-A15 processor does not provide NMI input. The Control Module registers CTRL_CORE_NMI_DESTINATION_1 and CTRL_CORE_NMI_DESTINATION_2 are used to route the **NMI** signal to the corresponding device processor subsystems as follows: • Writing 0x1 to CTRL_CORE_NMI_DESTINATION_1[23:16] IPU2_C1 enables NMI mapping to IPU2_C1; • Writing 0x1 to CTRL_CORE_NMI_DESTINATION_1[15:8] IPU2_C0 enables NMI mapping to IPU2_C0; • Writing 0x1 to CTRL_CORE_NMI_DESTINATION_1[7:0] IPU1_C1 enables NMI mapping to IPU1_C1; • Writing 0x1 to CTRL_CORE_NMI_DESTINATION_2[31:24] IPU1_C0 enables NMI mapping to IPU1_C0; • Writing 0x1 to CTRL_CORE_NMI_DESTINATION_2[23:16] DSP2 enables NMI mapping to DSP2; • Writing 0x1 to CTRL_CORE_NMI_DESTINATION_2[15:8] DSP1 enables NMI mapping to DSP1; • Writing 0x1 to CTRL_CORE_NMI_DESTINATION_2[7:0] MPU enables NMI mapping to MPU_IRQ_133 interrupt line of MPU_INTC; writing 0x0 to this bit field disables the NMI mapping and IRQ_CROSSBAR mux is mapped to MPU_IRQ_133 instead. For more information about CTRL_CORE_NMI_DESTINATION_1 and CTRL_CORE_NMI_DESTINATION_2 registers, see Chapter 18, *Control Module*.

(1) I = Input, O = Output

Note

External devices can also use the GPIO modules to generate an interrupt to the device INTCs. For more information, see Chapter 27, *General-Purpose Interface*.

17.3 Interrupt Controllers Integration

Table 17-2 through Table 17-8 present the default interrupt mapping of the device INTCs. The mapping of device interrupts to IRQ_CROSSBAR inputs is presented in Table 17-9.

Note

All device interrupts (external to the MPU, DSP [x2], IPU [x2], and EVE [x2] subsystems) are active-high, level-sensitive.

CAUTION

A single interrupt source can be physically mapped to multiple INTCs. With multiple-mapped interrupts, it is strongly recommended to unmask each interrupt source in only one INTC at a time.

17.3.1 Interrupt Requests to MPU_INTC

Table 17-2 lists the default interrupt sources for the MPU_INTC. In addition, interrupts MPU_IRQ_4, MPU_IRQ_[130:7], MPU_IRQ_[138:133], and MPU_IRQ_[159:141] can alternatively be sourced through the MPU's IRQ_CROSSBAR from one of the 420 multiplexed device interrupts listed in Table 17-9. The CTRL_CORE_MPU_IRQ_y_z registers (where *y* and *z* are indexes of INTC input lines) in the Control Module are used to select between the default interrupts and the multiplexed interrupts.

Note

The interrupts listed in Table 17-2 are also called Shared Peripheral Interrupts (SPIs) in Arm Cortex-A15 terminology. That is, the MPU_IRQ_[159:0] interrupt inputs correspond to the **IRQS[N:0]** GIC signals (N = 159 for this device), described in the Arm *Cortex-A15 MPCore Processor Technical Reference Manual*.

The association between the Shared Peripheral Interrupts (MPU_IRQ_0 – MPU_IRQ_159) and the GIC inputs (ID32 – ID191) is shown in the first column of this table.

Table 17-2. MPU_INTC Default Interrupt Mapping

IRQ Input Line (GIC ID Number) (1)	IRQ_CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
MPU_IRQ_0 (ID32)	N/A	N/A	N/A	MPU_CLUSTER_IRQ_INTERR	Illegal writes to interrupt controller memory map region
MPU_IRQ_1 (ID33)	N/A	N/A	N/A	CS_CTI_MPU_C0_IRQ	TRIGOUT[6] of Cross Trigger Interface 0 (CTI0)
MPU_IRQ_2 (ID34)	N/A	N/A	N/A	CS_CTI_MPU_C1_IRQ	TRIGOUT[6] of Cross Trigger Interface 1 (CTI1)
MPU_IRQ_3 (ID35)	N/A	N/A	N/A	MPU_CLUSTER_IRQ_AXIERR	Error indication for AXI write transactions with a BRESP error condition
MPU_IRQ_4 (ID36)	1	CTRL_CORE_MPU_IRQ_4_7[8:0]	1	ELM_IRQ	Error location process completion interrupt
MPU_IRQ_5 (ID37)	N/A	N/A	N/A	WD_TIMER_MPU_C0_IRQ_WARN	MPU_WD_TIMER channel 0 warning interrupt
MPU_IRQ_6 (ID38)	N/A	N/A	N/A	WD_TIMER_MPU_C1_IRQ_WARN	MPU_WD_TIMER channel 1 warning interrupt
MPU_IRQ_7 (ID39)	2	CTRL_CORE_MPU_IRQ_4_7[24:16]	2	EXT_SYS_IRQ_1	External interrupt (active low) via sys_nirq1 pin

Table 17-2. MPU_INTC Default Interrupt Mapping (continued)

IRQ Input Line (GIC ID Number) (1)	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
MPU_IRQ_8 (ID40)	3	CTRL_CORE_MPU_IRQ_8_9[8:0]	3	CTRL_MODULE_CORE_IRQ_SEC_EVTS	Combined firewall error interrupt. For more information, see Section 18.4.6.14.3.
MPU_IRQ_9 (ID41)	4	CTRL_CORE_MPU_IRQ_8_9[24:16]	4	L3_MAIN_IRQ_DBG_ERR	L3_MAIN debug error
MPU_IRQ_10 (ID42)	5	CTRL_CORE_MPU_IRQ_10_11[8:0] (not functional)	5	L3_MAIN_IRQ_APP_ERR	L3_MAIN application or non-attributable error(2)
MPU_IRQ_11 (ID43)	6	CTRL_CORE_MPU_IRQ_10_11[24:16]	6	PRM_IRQ_MPU	PRCM interrupt to MPU
MPU_IRQ_12 (ID44)	7	CTRL_CORE_MPU_IRQ_12_13[8:0]	7	DMA_SYSTEM_IRQ_0	System DMA interrupt 0
MPU_IRQ_13 (ID45)	8	CTRL_CORE_MPU_IRQ_12_13[24:16]	8	DMA_SYSTEM_IRQ_1	System DMA interrupt 1
MPU_IRQ_14 (ID46)	9	CTRL_CORE_MPU_IRQ_14_15[8:0]	9	DMA_SYSTEM_IRQ_2	System DMA interrupt 2
MPU_IRQ_15 (ID47)	10	CTRL_CORE_MPU_IRQ_14_15[24:16]	10	DMA_SYSTEM_IRQ_3	System DMA interrupt 3
MPU_IRQ_16 (ID48)	11	CTRL_CORE_MPU_IRQ_16_17[8:0]	11	L3_MAIN_IRQ_STAT_ALARM	L3_MAIN statistic collector alarm interrupt
MPU_IRQ_17 (ID49)	12	CTRL_CORE_MPU_IRQ_16_17[24:16]	12	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_18 (ID50)	13	CTRL_CORE_MPU_IRQ_18_19[8:0]	13	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_19 (ID51)	14	CTRL_CORE_MPU_IRQ_18_19[24:16]	14	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_20 (ID52)	15	CTRL_CORE_MPU_IRQ_20_21[8:0]	15	GPMC_IRQ	GPMC interrupt
MPU_IRQ_21 (ID53)	16	CTRL_CORE_MPU_IRQ_20_21[24:16]	16	GPU_IRQ	GPU interrupt
MPU_IRQ_22 (ID54)	17	CTRL_CORE_MPU_IRQ_22_23[8:0]	17	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_23 (ID55)	18	CTRL_CORE_MPU_IRQ_22_23[24:16]	18	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_24 (ID56)	19	CTRL_CORE_MPU_IRQ_24_25[8:0]	19	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_25 (ID57)	20	CTRL_CORE_MPU_IRQ_24_25[24:16]	20	DISPC_IRQ	Display controller interrupt
MPU_IRQ_26 (ID58)	21	CTRL_CORE_MPU_IRQ_26_27[8:0]	21	MAILBOX1_IRQ_USER0	Mailbox 1 user 0 interrupt
MPU_IRQ_27 (ID59)	22	CTRL_CORE_MPU_IRQ_26_27[24:16]	22	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_28 (ID60)	23	CTRL_CORE_MPU_IRQ_28_29[8:0]	23	DSP1_IRQ_MMU0	DSP1 MMU0 interrupt

Table 17-2. MPU_INTC Default Interrupt Mapping (continued)

IRQ Input Line (GIC ID Number) (1)	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description

MPU_IRQ_132 (ID164)	N/A	N/A	N/A	MPU_CLUSTER_IRQ_PMU_C1	MPU core 1 PMU interrupt

Table 17-2. MPU_INTC Default Interrupt Mapping (continued)

IRQ Input Line (GIC ID Number) (1)	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
MPU_IRQ_133 (ID165)	126	CTRL_CORE_MPU_IRQ_130_133[24:16]	0	Reserved	Reserved by default but can be remapped to: • a valid interrupt source (through CTRL_CORE_MPU_IRQ_130_133[24:16] • the nmin_dsp pin (through CTRL_MOD_CTRL_CORE_NMI_DESTINATION_2[7:0] MPU). See Section 17.2, *Interrupt Controllers Environment* for details.
MPU_IRQ_134 (ID166)	127	CTRL_CORE_MPU_IRQ_134_135[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_135 (ID167)	128	CTRL_CORE_MPU_IRQ_134_135[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_136 (ID168)	129	CTRL_CORE_MPU_IRQ_136_137[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_137 (ID169)	130	CTRL_CORE_MPU_IRQ_136_137[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_138 (ID170)	131	CTRL_CORE_MPU_IRQ_138_139[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_139 (ID171)	N/A	N/A	N/A	WD_TIMER_MPU_C0_IRQ	MPU_WD_TIMER channel 0 timeout interrupt (watchdog reset)
MPU_IRQ_140 (ID172)	N/A	N/A	N/A	WD_TIMER_MPU_C1_IRQ	MPU_WD_TIMER channel 1 timeout interrupt (watchdog reset)
MPU_IRQ_141 (ID173)	134	CTRL_CORE_MPU_IRQ_140_141[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_142 (ID174)	135	CTRL_CORE_MPU_IRQ_142_143[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_143 (ID175)	136	CTRL_CORE_MPU_IRQ_142_143[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_144 (ID176)	137	CTRL_CORE_MPU_IRQ_144_145[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_145 (ID177)	138	CTRL_CORE_MPU_IRQ_144_145[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_146 (ID178)	139	CTRL_CORE_MPU_IRQ_146_147[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source

Table 17-2. MPU_INTC Default Interrupt Mapping (continued)

IRQ Input Line (GIC ID Number) (1)	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
MPU_IRQ_147 (ID179)	140	CTRL_CORE_MPU_IRQ_146_147[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_148 (ID180)	141	CTRL_CORE_MPU_IRQ_148_149[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_149 (ID181)	142	CTRL_CORE_MPU_IRQ_148_149[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_150 (ID182)	143	CTRL_CORE_MPU_IRQ_150_151[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_151 (ID183)	144	CTRL_CORE_MPU_IRQ_150_151[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_152 (ID184)	145	CTRL_CORE_MPU_IRQ_152_153[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_153 (ID185)	146	CTRL_CORE_MPU_IRQ_152_153[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_154 (ID186)	147	CTRL_CORE_MPU_IRQ_154_155[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_155 (ID187)	148	CTRL_CORE_MPU_IRQ_154_155[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_156 (ID188)	149	CTRL_CORE_MPU_IRQ_156_157[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_157 (ID189)	150	CTRL_CORE_MPU_IRQ_156_157[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_158 (ID190)	151	CTRL_CORE_MPU_IRQ_158_159[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
MPU_IRQ_159 (ID191)	152	CTRL_CORE_MPU_IRQ_158_159[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source

(1) This column shows the association between the Shared Peripheral Interrupts (MPU_IRQ_0 – MPU_IRQ_159) and the GIC inputs (ID32 – ID191).
(2) The L3_MAIN_IRQ_APP_ERR interrupt is directly mapped to the MPU_IRQ_10 line, bypassing the crossbar instance dedicated to this line. No other interrupt source can be mapped to MPU_IRQ_10.

Note

The "**IRQ_CROSSBAR Default Input Index**" column of Table 17-2 shows which input of the corresponding IRQ_CROSSBAR instance is mapped to its output (and then routed to the corresponding MPU_INTC input) by default. In other words, this column specifies the default (reset) values (in decimal) of the CTRL_CORE_MPU_IRQ_y_z register bit fields that are used to control the mapping of device interrupts to MPU_INTC inputs. For example, the MPU_IRQ_4_7[8:0] bit field is used to configure which device interrupt would be mapped to the MPU_IRQ_4 line. The reset value of this bit field is 0x1, meaning that ELM_IRQ would be mapped to MPU_IRQ_4 by default because it is connected to the IRQ_CROSSBAR_1 input.

'N/A' in this column means that the corresponding interrupt is internal to the MPU subsystem. There is no IRQ_CROSSBAR dedicated to the associated MPU_INTC input line and therefore, the user cannot change its default mapping.

17.3.2 Interrupt Requests to DSP1_INTC

Table 17-3 lists the default interrupt sources for the DSP1_INTC. In addition, interrupts DSP1_IRQ_32 through DSP1_IRQ_95 can alternatively be sourced through the DSP1's IRQ_CROSSBAR from one of the 420 multiplexed device interrupts listed in Table 17-9. The CTRL_CORE_DSP1_IRQ_y_z registers in the Control Module are used to select between the default interrupts and the multiplexed interrupts.

Table 17-3. DSP1_INTC Default Interrupt Mapping

IRQ Input Line	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
DSP1_IRQ_0	N/A	N/A	N/A	CGEM_IRQ_0	CGEM Internal Interrupt
DSP1_IRQ_1	N/A	N/A	N/A	CGEM_IRQ_1	CGEM Internal Interrupt
DSP1_IRQ_2	N/A	N/A	N/A	CGEM_IRQ_2	CGEM Internal Interrupt
DSP1_IRQ_3	N/A	N/A	N/A	CGEM_IRQ_3	CGEM Internal Interrupt
DSP1_IRQ_4	N/A	N/A	N/A	CGEM_IRQ_4	CGEM Internal Interrupt
DSP1_IRQ_5	N/A	N/A	N/A	CGEM_IRQ_5	CGEM Internal Interrupt
DSP1_IRQ_6	N/A	N/A	N/A	CGEM_IRQ_6	CGEM Internal Interrupt
DSP1_IRQ_7	N/A	N/A	N/A	CGEM_IRQ_7	CGEM Internal Interrupt
DSP1_IRQ_8	N/A	N/A	N/A	CGEM_IRQ_8	CGEM Internal Interrupt
DSP1_IRQ_9	N/A	N/A	N/A	CGEM_IRQ_9	CGEM Internal Interrupt
DSP1_IRQ_10	N/A	N/A	N/A	CGEM_IRQ_10	CGEM Internal Interrupt
DSP1_IRQ_11	N/A	N/A	N/A	CGEM_IRQ_11	CGEM Internal Interrupt
DSP1_IRQ_12	N/A	N/A	N/A	CGEM_IRQ_12	CGEM Internal Interrupt
DSP1_IRQ_13	N/A	N/A	N/A	CGEM_IRQ_13	CGEM Internal Interrupt

Table 17-3. DSP1_INTC Default Interrupt Mapping (continued)

IRQ Input Line	IRQ_CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
DSP1_IRQ_14	N/A	N/A	N/A	CGEM_IRQ_14	CGEM Internal Interrupt
DSP1_IRQ_15	N/A	N/A	N/A	CGEM_IRQ_15	CGEM Internal Interrupt
DSP1_IRQ_16	N/A	N/A	N/A	TPCC_INTG	EDMA CC global interrupt

DSP1_IRQ_127	N/A	N/A	N/A	CGEM_IRQ_47	CGEM Internal Interrupt

Note

The "**IRQ_CROSSBAR Default Input Index**" column of Table 17-3 shows which input of the corresponding IRQ_CROSSBAR instance is mapped to its output (and then routed to the corresponding DSP1_INTC input) by default. In other words, this column specifies the default (reset) values (in decimal) of the CTRL_CORE_DSP1_IRQ_y_z register bit fields that are used to control the mapping of device interrupts to DSP1_INTC inputs. For example, the DSP1_IRQ_32_33[8:0] bit field is used to configure which device interrupt would be mapped to the DSP1_IRQ_32 line. The reset value of this bit field is 0x1, meaning that ELM_IRQ would be mapped to DSP1_IRQ_32 by default because it is connected to the IRQ_CROSSBAR_1 input.

'N/A' in this column means that the corresponding interrupt is internal to the DSP1 subsystem. There is no IRQ_CROSSBAR dedicated to the associated DSP1_INTC input line and therefore, the user cannot change its default mapping.

17.3.3 Interrupt Requests to DSP2_INTC

Table 17-4 lists the default interrupt sources for the DSP2_INTC. In addition, interrupts DSP2_IRQ_32 through DSP2_IRQ_95 can alternatively be sourced through the DSP2's IRQ_CROSSBAR from one of the 420 multiplexed device interrupts listed in Table 17-9. The CTRL_CORE_DSP2_IRQ_y_z registers in the Control Module are used to select between the default interrupts and the multiplexed interrupts.

Table 17-4. DSP2_INTC Default Interrupt Mapping

IRQ Input Line	IRQ_CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
DSP2_IRQ_0	N/A	N/A	N/A	CGEM_IRQ_0	CGEM Internal Interrupt
DSP2_IRQ_1	N/A	N/A	N/A	CGEM_IRQ_1	CGEM Internal Interrupt
DSP2_IRQ_2	N/A	N/A	N/A	CGEM_IRQ_2	CGEM Internal Interrupt
DSP2_IRQ_3	N/A	N/A	N/A	CGEM_IRQ_3	CGEM Internal Interrupt

DSP2_IRQ_ 122	N/A	N/A	N/A	CGEM_IRQ_42	CGEM Internal Interrupt
DSP2_IRQ_ 123	N/A	N/A	N/A	CGEM_IRQ_43	CGEM Internal Interrupt
DSP2_IRQ_ 124	N/A	N/A	N/A	CGEM_IRQ_44	CGEM Internal Interrupt
DSP2_IRQ_ 125	N/A	N/A	N/A	CGEM_IRQ_45	CGEM Internal Interrupt
DSP2_IRQ_ 126	N/A	N/A	N/A	CGEM_IRQ_46	CGEM Internal Interrupt
DSP2_IRQ_ 127	N/A	N/A	N/A	CGEM_IRQ_47	CGEM Internal Interrupt

Note

The "**IRQ_CROSSBAR Default Input Index**" column of Table 17-4 shows which input of the corresponding IRQ_CROSSBAR instance is mapped to its output (and then routed to the corresponding DSP2_INTC input) by default. In other words, this column specifies the default (reset) values (in decimal) of the CTRL_CORE_DSP2_IRQ_y_z register bit fields that are used to control the mapping of device interrupts to DSP2_INTC inputs. For example, the DSP2_IRQ_32_33[8:0] bit field is used to configure which device interrupt would be mapped to the DSP2_IRQ_32 line. The reset value of this bit field is 0x1, meaning that ELM_IRQ would be mapped to DSP2_IRQ_32 by default because it is connected to the IRQ_CROSSBAR_1 input.

'N/A' in this column means that the corresponding interrupt is internal to the DSP2 subsystem. There is no IRQ_CROSSBAR dedicated to the associated DSP2_INTC input line and therefore, the user cannot change its default mapping.

17.3.4 Interrupt Requests to IPU1_Cx_INTC

Table 17-5 lists the default interrupt sources for the IPU1_Cx_INTC. In addition, device interrupts IPU1_IRQ_23 through IPU1_IRQ_79 can alternatively be sourced through the IPU1's IRQ_CROSSBAR from one of the 420 multiplexed device interrupts listed in Table 17-9. The CTRL_CORE_IPU1_IRQ_y_z registers in the Control Module are used to select between the default interrupts and the multiplexed interrupts.

Table 17-5. IPU1_Cx_INTC Default Interrupt Mapping

IRQ Input Line[(1)]	IRQ_CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
IPU1_IRQ_0	N/A	N/A	N/A	Reserved	MSP initial value in exception vector table
IPU1_IRQ_1	N/A	N/A	N/A	RESET_IRQ	Reset
IPU1_IRQ_2	N/A	N/A	N/A	NMI_IRQ	External NMI input (interrupt from **nmin_dsp** device pad)
IPU1_IRQ_3	N/A	N/A	N/A	HARD_FAULT_IRQ	All fault conditions, if the fault handle is not enabled
IPU1_IRQ_4	N/A	N/A	N/A	MEM_MANAGE_FAULT_IRQ	Memory management fault; access to illegal locations
IPU1_IRQ_5	N/A	N/A	N/A	BUS_FAULT_IRQ	Bus error (on AHB intf)
IPU1_IRQ_6	N/A	N/A	N/A	USAGE_FAULT_IRQ	Program error
IPU1_IRQ_7	N/A	N/A	N/A	Reserved	Reserved
IPU1_IRQ_8	N/A	N/A	N/A	Reserved	Reserved
IPU1_IRQ_9	NA	N/A	N/A	Reserved	Reserved
IPU1_IRQ_10	N/A	N/A	N/A	Reserved	Reserved
IPU1_IRQ_11	N/A	N/A	N/A	SV_CALL_IRQ	Service system Call
IPU1_IRQ_12	N/A	N/A	N/A	DEBUG_MON_IRQ	BP, WP or external debug req.
IPU1_IRQ_13	N/A	N/A	N/A	Reserved	Reserved

Table 17-5. IPU1_Cx_INTC Default Interrupt Mapping (continued)

IRQ Input Line(1)	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description

IPU1_IRQ_78	56	CTRL_CORE_IPU1_IRQ_77_78[24:16]	62	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU1_IRQ_79	57	CTRL_CORE_IPU1_IRQ_79_80[8:0]	63	Reserved	Reserved by default but can be remapped to a valid interrupt source

(1) This column shows the number of the corresponding exception type.

Note

Exceptions/interrupts IPU1_IRQ_[15:0] are all internal to the Cortex-M4 core.

Exceptions/interrupts IPU1_IRQ_[79:16] are all external to the Cortex-M4 core – that is, the first Cortex-M4 external interrupt is mapped to IPU1_IRQ_16 (exception #16), and the last (sixty-fourth) Cortex-M4 external interrupt is mapped to IPU1_IRQ_79 (exception #79).

For more information about Cortex-M4 exception types, refer to Arm *Cortex®-M4 Devices Generic User Guide* (available at http://infocenter.arm.com/help/index.jsp).

Note

The "**IRQ_CROSSBAR Default Input Index**" column of Table 17-5 shows which input of the corresponding IRQ_CROSSBAR instance is mapped to its output (and then routed to the corresponding IPU1_Cx_INTC input) by default. In other words, this column specifies the default (reset) values (in decimal) of the CTRL_CORE_IPU1_IRQ_y_z register bit fields that are used to control the mapping of device interrupts to IPU1_Cx_INTC inputs. For example, the IPU1_IRQ_23_24[8:0] bit field is used to configure which device interrupt would be mapped to the IPU1_IRQ_23 line. The reset value of this bit field is 0x14, meaning that DISPC_IRQ would be mapped to IPU1_IRQ_23 by default because it is connected to the IRQ_CROSSBAR_20 input.

'N/A' in this column means that the corresponding interrupt is internal to the IPU1 subsystem. There is no IRQ_CROSSBAR dedicated to the associated IPU1_Cx_INTC input line and therefore, the user cannot change its default mapping.

The CTRL_CORE_IPU1_IRQ_y_z registers control the IRQ_CROSSBAR settings for both NVICs in the IPU1 subsystem. That is, it is not possible to map different interrupts to the same interrupt input of the NVICs in IPU1.

17.3.5 Interrupt Requests to IPU2_Cx_INTC

Table 17-6 lists the default interrupt sources for the IPU2_Cx_INTC. In addition, device interrupts IPU2_IRQ_23 through IPU2_IRQ_79 can alternatively be sourced through the IPU2's IRQ_CROSSBAR from one of the 420 multiplexed device interrupts listed in Table 17-9. The CTRL_CORE_IPU2_IRQ_y_z registers in the Control Module are used to select between the default interrupts and the multiplexed interrupts.

Table 17-6. IPU2_Cx_INTC Default Interrupt Mapping

IRQ Input Line[(1)]	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
IPU2_IRQ_ 0	N/A	N/A	N/A	Reserved	MSP initial value in exception vector table
IPU2_IRQ_ 1	N/A	N/A	N/A	RESET_IRQ	Reset
IPU2_IRQ_ 2	N/A	N/A	N/A	NMI_IRQ	External NMI input (interrupt from **nmin_dsp** device pad)
IPU2_IRQ_ 3	N/A	N/A	N/A	HARD_FAULT_IRQ	All fault conditions, if the fault handle is not enabled
IPU2_IRQ_ 4	N/A	N/A	N/A	MEM_MANAGE_FAULT _IRQ	Memory management fault; access to illegal locations
IPU2_IRQ_ 5	N/A	N/A	N/A	BUS_FAULT_IRQ	Bus error (on AHB intf)
IPU2_IRQ_ 6	N/A	N/A	N/A	USAGE_FAULT_IRQ	Program error
IPU2_IRQ_ 7	N/A	N/A	N/A	Reserved	Reserved
IPU2_IRQ_ 8	N/A	N/A	N/A	Reserved	Reserved
IPU2_IRQ_ 9	NA	N/A	N/A	Reserved	Reserved
IPU2_IRQ_ 10	N/A	N/A	N/A	Reserved	Reserved
IPU2_IRQ_ 11	N/A	N/A	N/A	SV_CALL_IRQ	Service system Call
IPU2_IRQ_ 12	N/A	N/A	N/A	DEBUG_MON_IRQ	BP, WP or external debug req.

IPU2_IRQ_59	37	CTRL_CORE_IPU2_IRQ_59_60[8:0]	50	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_60	38	CTRL_CORE_IPU2_IRQ_59_60[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_61	39	CTRL_CORE_IPU2_IRQ_61_62[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_62	40	CTRL_CORE_IPU2_IRQ_61_62[24:16]	22	Reserved	Reserved by default but can be remapped to a valid interrupt source

Table 17-6. IPU2_Cx_INTC Default Interrupt Mapping (continued)

IRQ Input Line[(1)]	IRQ_CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
IPU2_IRQ_63	41	CTRL_CORE_IPU2_IRQ_63_64[8:0]	83	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_64	42	CTRL_CORE_IPU2_IRQ_63_64[24:16]	108	DMM_IRQ	DMM interrupt
IPU2_IRQ_65	43	CTRL_CORE_IPU2_IRQ_65_66[8:0]	120	BB2D_IRQ	BB2D interrupt
IPU2_IRQ_66	44	CTRL_CORE_IPU2_IRQ_65_66[24:16]	78	MMC1_IRQ	MMC1 interrupt
IPU2_IRQ_67	45	CTRL_CORE_IPU2_IRQ_67_68[8:0]	81	MMC2_IRQ	MMC2 interrupt
IPU2_IRQ_68	46	CTRL_CORE_IPU2_IRQ_67_68[24:16]	89	MMC3_IRQ	MMC3 interrupt
IPU2_IRQ_69	47	CTRL_CORE_IPU2_IRQ_69_70[8:0]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_70	48	CTRL_CORE_IPU2_IRQ_69_70[24:16]	0	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_71	49	CTRL_CORE_IPU2_IRQ_71_72[8:0]	119	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_72	50	CTRL_CORE_IPU2_IRQ_71_72[24:16]	118	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_73	51	CTRL_CORE_IPU2_IRQ_73_74[8:0]	72	USB1_IRQ_INTR1	USB1 interrupt 1
IPU2_IRQ_74	52	CTRL_CORE_IPU2_IRQ_73_74[24:16]	73	USB2_IRQ_INTR0	USB2 interrupt 0
IPU2_IRQ_75	53	CTRL_CORE_IPU2_IRQ_75_76[8:0]	117	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_76	54	CTRL_CORE_IPU2_IRQ_75_76[24:16]	87	USB2_IRQ_INTR1	USB2 interrupt 1
IPU2_IRQ_77	55	CTRL_CORE_IPU2_IRQ_77_78[8:0]	88	USB3_IRQ_INTR0	USB3 interrupt 0
IPU2_IRQ_78	56	CTRL_CORE_IPU2_IRQ_77_78[24:16]	62	Reserved	Reserved by default but can be remapped to a valid interrupt source
IPU2_IRQ_79	57	CTRL_CORE_IPU2_IRQ_79_80[8:0]	63	Reserved	Reserved by default but can be remapped to a valid interrupt source

(1) This column shows the number of the corresponding exception type.

Note

Exceptions/interrupts IPU2_IRQ_[15:0] are all internal to the Cortex-M4 core.

Exceptions/interrupts IPU2_IRQ_[79:16] are all external to the Cortex-M4 core – that is, the first Cortex-M4 external interrupt is mapped to IPU2_IRQ_16 (exception #16), and the last (sixty-fourth) Cortex-M4 external interrupt is mapped to IPU2_IRQ_79 (exception #79).

For more information about Cortex-M4 exception types, refer to Arm *Cortex®-M4 Devices Generic User Guide* (available at http://infocenter.arm.com/help/index.jsp).

Note

The "**IRQ_CROSSBAR Default Input Index**" column of Table 17-6 shows which input of the corresponding IRQ_CROSSBAR instance is mapped to its output (and then routed to the corresponding IPU2_Cx_INTC input) by default. In other words, this column specifies the default (reset) values (in decimal) of the CTRL_CORE_IPU2_IRQ_y_z register bit fields that are used to control the mapping of device interrupts to IPU2_Cx_INTC inputs. For example, the IPU2_IRQ_23_24[8:0] bit field is used to configure which device interrupt would be mapped to the IPU2_IRQ_23 line. The reset value of this bit field is 0x14, meaning that DISPC_IRQ would be mapped to IPU2_IRQ_23 by default because it is connected to the IRQ_CROSSBAR_20 input.

'N/A' in this column means that the corresponding interrupt is internal to the IPU2 subsystem. There is no IRQ_CROSSBAR dedicated to the associated IPU2_Cx_INTC input line and therefore, the user cannot change its default mapping.

The CTRL_CORE_IPU2_IRQ_y_z registers control the IRQ_CROSSBAR settings for both NVICs in the IPU2 subsystem. That is, it is not possible to map different interrupts to the same interrupt input of the NVICs in IPU2.

17.3.6 Interrupt Requests to EVE1_INTC1

Table 17-7 lists the default interrupt sources for the EVE1_INTC1. In addition, device interrupts EVE1_IRQ_0 through EVE1_IRQ_7 can alternatively be sourced through the EVE1's IRQ_CROSSBAR from one of the 420 multiplexed device interrupts listed in Table 17-9. The CTRL_CORE_EVE1_IRQ_y_z registers in the Control Module are used to select between the default interrupts and the multiplexed interrupts.

Table 17-7. EVE1_INTC1 Default Interrupt Mapping

IRQ Input Line	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
EVE1_IRQ_0	1	CTRL_CORE_EVE1_IRQ_0_1[8:0]	1	ELM_IRQ	Error location process completion interrupt
EVE1_IRQ_1	2	CTRL_CORE_EVE1_IRQ_0_1[24:16]	2	EXT_SYS_IRQ_1	External interrupt (active low) via sys_nirq1 pin
EVE1_IRQ_2	3	CTRL_CORE_EVE1_IRQ_2_3[8:0]	3	CTRL_MODULE_CORE_IRQ_SEC_EVTS	Combined firewall error interrupt. For more information, see Section 18.4.6.14.3.
EVE1_IRQ_3	4	CTRL_CORE_EVE1_IRQ_2_3[24:16]	4	L3_MAIN_IRQ_DBG_ERR	L3_MAIN debug error
EVE1_IRQ_4	5	CTRL_CORE_EVE1_IRQ_4_5[8:0]	5	L3_MAIN_IRQ_APP_ERR	L3_MAIN application or non-attributable error
EVE1_IRQ_5	6	CTRL_CORE_EVE1_IRQ_4_5[24:16]	6	PRM_IRQ_MPU	PRCM interrupt to MPU
EVE1_IRQ_6	7	CTRL_CORE_EVE1_IRQ_6_7[8:0]	7	DMA_SYSTEM_IRQ_0	System DMA interrupt 0
EVE1_IRQ_7	8	CTRL_CORE_EVE1_IRQ_6_7[24:16]	8	DMA_SYSTEM_IRQ_1	System DMA interrupt 1
EVE1_IRQ_8	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_9	N/A	N/A	N/A	EVE2_GP8	EVE2 GP8 interrupt
EVE1_IRQ_10	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_11	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source

Table 17-7. EVE1_INTC1 Default Interrupt Mapping (continued)

IRQ Input Line	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
EVE1_IRQ_12	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_13	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_14	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_15	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_16	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_17	N/A	N/A	N/A	EVE2_MBX2_INT1	EVE2 Mailbox 2 Interrupt 1
EVE1_IRQ_18	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_19	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_20	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_21	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_22	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_23	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_24	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_25	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_26	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_27	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_28	N/A	N/A	N/A	EVE1_MBX2_INT0	EVE1 Mailbox 2 Interrupt 0
EVE1_IRQ_29	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_30	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE1_IRQ_31	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source

Note

The "**IRQ_CROSSBAR Default Input Index**" column of Table 17-7 shows which input of the corresponding IRQ_CROSSBAR instance is mapped to its output (and then routed to the corresponding EVE1_INTC input) by default. In other words, this column specifies the default (reset) values (in decimal) of the CTRL_CORE_EVE1_IRQ_y_z register bit fields that are used to control the mapping of device interrupts to EVE1_INTC inputs. For example, the EVE1_IRQ_0_1[8:0] bit field is used to configure which device interrupt would be mapped to the EVE1_IRQ_0 line. The reset value of this bit field is 0x1, meaning that ELM_IRQ would be mapped to EVE1_IRQ_0 by default because it is connected to the IRQ_CROSSBAR_1 input.

'N/A' in this column means that the corresponding interrupt is internal to the EVE1 subsystem. There is no IRQ_CROSSBAR dedicated to the associated EVE1_INTC input line and therefore, the user cannot change its default mapping.

17.3.7 Interrupt Requests to EVE2_INTC1

Table 17-8 lists the default interrupt sources for the EVE2_INTC1. In addition, device interrupts EVE2_IRQ_0 through EVE2_IRQ_7 can alternatively be sourced through the EVE2's IRQ_CROSSBAR from one of the 420 multiplexed device interrupts listed in Table 17-9. The CTRL_CORE_EVE2_IRQ_y_z registers in the Control Module are used to select between the default interrupts and the multiplexed interrupts.

Table 17-8. EVE2_INTC1 Default Interrupt Mapping

IRQ Input Line	IRQ_CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
EVE2_IRQ_0	1	CTRL_CORE_EVE2_IRQ_0_1[8:0]	1	ELM_IRQ	Error location process completion interrupt
EVE2_IRQ_1	2	CTRL_CORE_EVE2_IRQ_0_1[24:16]	2	EXT_SYS_IRQ_1	External interrupt (active low) via sys_nirq1 pin
EVE2_IRQ_2	3	CTRL_CORE_EVE2_IRQ_2_3[8:0]	3	CTRL_MODULE_CORE_IRQ_SEC_EVTS	Combined firewall error interrupt. For more information, see Section 18.4.6.14.3.
EVE2_IRQ_3	4	CTRL_CORE_EVE2_IRQ_2_3[24:16]	4	L3_MAIN_IRQ_DBG_ERR	L3_MAIN debug error
EVE2_IRQ_4	5	CTRL_CORE_EVE2_IRQ_4_5[8:0]	5	L3_MAIN_IRQ_APP_ERR	L3_MAIN application or non-attributable error
EVE2_IRQ_5	6	CTRL_CORE_EVE2_IRQ_4_5[24:16]	6	PRM_IRQ_MPU	PRCM interrupt to MPU
EVE2_IRQ_6	7	CTRL_CORE_EVE2_IRQ_6_7[8:0]	7	DMA_SYSTEM_IRQ_0	System DMA interrupt 0
EVE2_IRQ_7	8	CTRL_CORE_EVE2_IRQ_6_7[24:16]	8	DMA_SYSTEM_IRQ_1	System DMA interrupt 1
EVE2_IRQ_8	N/A	N/A	N/A	EVE1_GP1	EVE1 GP1 interrupt
EVE2_IRQ_9	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_10	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_11	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_12	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source

Table 17-8. EVE2_INTC1 Default Interrupt Mapping (continued)

IRQ Input Line	IRQ_ CROSSBAR Instance Number	IRQ_CROSSBAR Configuration Register	IRQ_ CROSSBAR Default Input Index	Default Interrupt Name	Default Interrupt Source Description
EVE2_IRQ_13	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_14	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_15	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_16	N/A	N/A	N/A	EVE1_MBX2_INT1	EVE1 Mailbox 2 Interrupt 1
EVE2_IRQ_17	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_18	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_19	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_20	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_21	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_22	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_23	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_24	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_25	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_26	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_27	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_28	N/A	N/A	N/A	EVE2_MBX2_INT0	EVE2 Mailbox 2 Interrupt 0
EVE2_IRQ_29	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_30	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source
EVE2_IRQ_31	N/A	N/A	N/A	Reserved	Reserved by default but can be remapped to a valid interrupt source

Note

The "**IRQ_CROSSBAR Default Input Index**" column of Table 17-8 shows which input of the corresponding IRQ_CROSSBAR instance is mapped to its output (and then routed to the corresponding EVE2_INTC input) by default. In other words, this column specifies the default (reset) values (in decimal) of the CTRL_CORE_EVE2_IRQ_y_z register bit fields that are used to control the mapping of device interrupts to EVE2_INTC inputs. For example, the EVE2_IRQ_0_1[8:0] bit field is used to configure which device interrupt would be mapped to the EVE2_IRQ_0 line. The reset value of this bit field is 0x1, meaning that ELM_IRQ would be mapped to EVE2_IRQ_0 by default because it is connected to the IRQ_CROSSBAR_1 input.

'N/A' in this column means that the corresponding interrupt is internal to the EVE2 subsystem. There is no IRQ_CROSSBAR dedicated to the associated EVE2_INTC input line and therefore, the user cannot change its default mapping.

17.3.8 Mapping of Device Interrupts to IRQ_CROSSBAR Inputs

Table 17-9 shows the individual connection between all module IRQs and all IRQ_CROSSBAR inputs.

Table 17-9. Connection of Device IRQs to IRQ_CROSSBAR Inputs

IRQ_CROSSBAR Input	Interrupt Name	Interrupt Source	Description
IRQ_CROSSBAR_0	Reserved	Reserved	Reserved
IRQ_CROSSBAR_1	ELM_IRQ	ELM	Error location process completion interrupt
IRQ_CROSSBAR_2	EXT_SYS_IRQ_1	External system	External interrupt (active low) via sys_nirq1 pin
IRQ_CROSSBAR_3	CTRL_MODULE_CORE_IRQ_SEC_EVTS	CTRL_MODULE_CORE	Combined firewall error interrupt. For more information, see *Firewall Error Status Registers*
IRQ_CROSSBAR_4	L3_MAIN_IRQ_DBG_ERR	L3_MAIN	L3_MAIN debug error
IRQ_CROSSBAR_5	L3_MAIN_IRQ_APP_ERR	L3_MAIN	L3_MAIN application or non-attributable error
IRQ_CROSSBAR_6	PRM_IRQ_MPU	PRM	PRCM interrupt to MPU
IRQ_CROSSBAR_7	DMA_SYSTEM_IRQ_0	DMA_SYSTEM	System DMA interrupt 0
IRQ_CROSSBAR_8	DMA_SYSTEM_IRQ_1	DMA_SYSTEM	System DMA interrupt 1
IRQ_CROSSBAR_9	DMA_SYSTEM_IRQ_2	DMA_SYSTEM	System DMA interrupt 2
IRQ_CROSSBAR_10	DMA_SYSTEM_IRQ_3	DMA_SYSTEM	System DMA interrupt 3
IRQ_CROSSBAR_11	L3_MAIN_IRQ_STAT_ALARM	L3_MAIN	L3_MAIN statistic collector alarm interrupt
IRQ_CROSSBAR_12	Reserved	Reserved	Reserved
IRQ_CROSSBAR_13	Reserved	Reserved	Reserved
IRQ_CROSSBAR_14	Reserved	Reserved	Reserved
IRQ_CROSSBAR_15	GPMC_IRQ	GPMC	GPMC interrupt

17.4 Interrupt Controllers Functional Description

For detailed information about each device INTC (including functional description and registers descriptions), see the TRM chapters and Arm documents referenced in Section 17.1, *Interrupt Controllers Overview*.

Chapter 18

Control Module

This chapter describes the system control module for the device.

18.1 Control Module Overview 4016
18.2 Control Module Environment 4018
18.3 Control Module Integration 4019
18.4 Control Module Functional Description 4021
18.5 Control Module Register Manual 4059
18.6 IODELAYCONFIG Module Integration 4671
18.7 IODELAYCONFIG Module Register Manual 4672

18.1 Control Module Overview

The control module allows software control of the various operation modes supported by the device. It is composed of two submodules. The CTRL_MODULE_CORE submodule which resides in the COREAON power domain and the CTRL_MODULE_WKUP submodule which resides in the WKUPAON power domain. These two submodules represent a set of registers which are used to control the device I/O ports and also various kinds of settings related to the different device operation modes and also to its internal modules.

The CTRL_MODULE_CORE submodule has registers for the following features:

- Pad configuration with following controls:
  - Pad I/O multiplexing
  - Pad pullup and pulldown configuration
  - Pad wake-up detection enabling
  - Pad wake-up event status
  - Pad input buffer enable
  - Pad slew rate control
- Device thermal management control and status registers
- PBIAS cell and MMC1 I/O cells control
- IRQ_CROSSBAR and DMA_CROSSBAR control
- Control the priority of initiator accesses to the external SDRAM
- Control the priority of initiators connected to L3_MAIN interconnect
- Memory region lock registers
- Mapping of the device non-maskable interrupt (NMI) to respective cores
- Controls for the DDR2/DDR3 I/O Cells
- Controls for the DDR2/DDR3 associated vref-generation cells
- AVS Class 0 associated registers
- ABB associated registers
- PCIe related registers
- Standard eFuse logic
- Other miscellaneous functions:
  - Status of the system boot settings
  - DSP1 and DSP2 reset vector address
  - Settings assoaciated with USB, SATA, and HDMI PHYs
  - DSS PLLs multiplexing and enabling
  - Force MPU write nonposted transactions
  - Firewalls error status
  - Settings related to different peripheral modules
  - Others

The CTRL_MODULE_WKUP submodule has registers for the following features:

- Basic EMIF configuration settings
- XTAL Oscilator control
- Efuse I/O compensation
- Other functions

Figure 18-1 represents an overview block diagram of the control module.

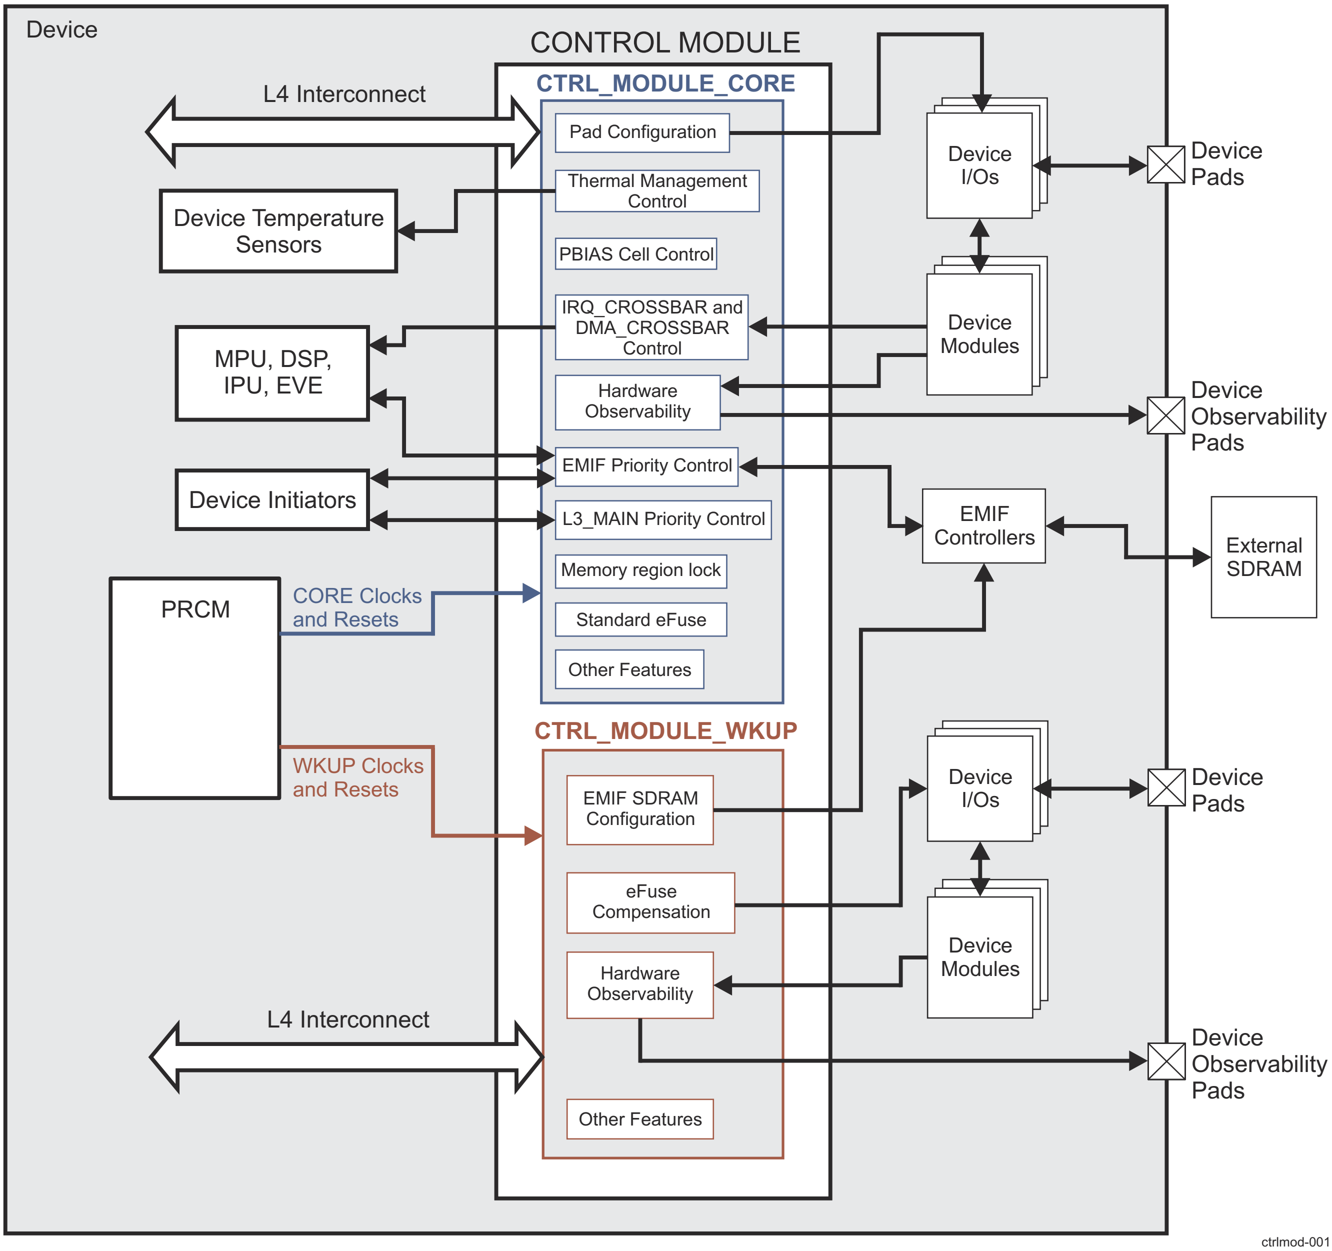

Figure 18-1. Control Module Overview Block Diagram

18.2 Control Module Environment

One of the control module functions is to control the multiplexing of certain signals from the device internal modules. Using the correct pad configuration settings, the control module maps these observability lines to the device boundary and a set of user selected internal module signals are available to be observed on the device pads. In addition, there are also two lines intended for observation of any of the device interrupt requests connected to the inputs of the IRQ_CROSSBAR module and two lines intended for observation of any of the DMA requests connected to the inputs of the DMA_CROSSBAR module. For more information, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description* and Section 18.4.6.5, *DMA_CROSSBAR Module Functional Description*.

An external non-maskable interrupt signal is also present. Using the appropriate registers the NMI can be mapped to different device cores. For more information, see Section 18.4.6.9, *NMI Mapping to respective cores*.

Figure 18-2 is an overview of the control module environment.

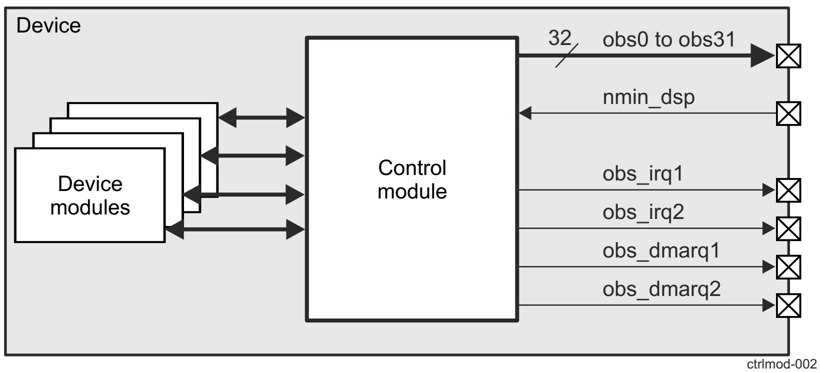

Figure 18-2. Control Module Environment

Table 18-1 shows the NMI input signal and observability outputs used to observe different signals of the device modules.

Table 18-1. Control Module I/O Description

Signal	I/O(1)	Description
obs[31:0]	O	32 internal hardware observability signals
nmin_dsp	I	External non-maskable interrupt signal
obs_irq1	O	Two signals intended for IRQ observation
obs_irq2	O	
obs_dmarq1	O	Two signals intended for DREQ observation
obs_dmarq2	O	

(1) I = Input; O = Output; I/O = Bidirectional

18.3 Control Module Integration

Figure 18-3 shows the integration of the control module in the device.

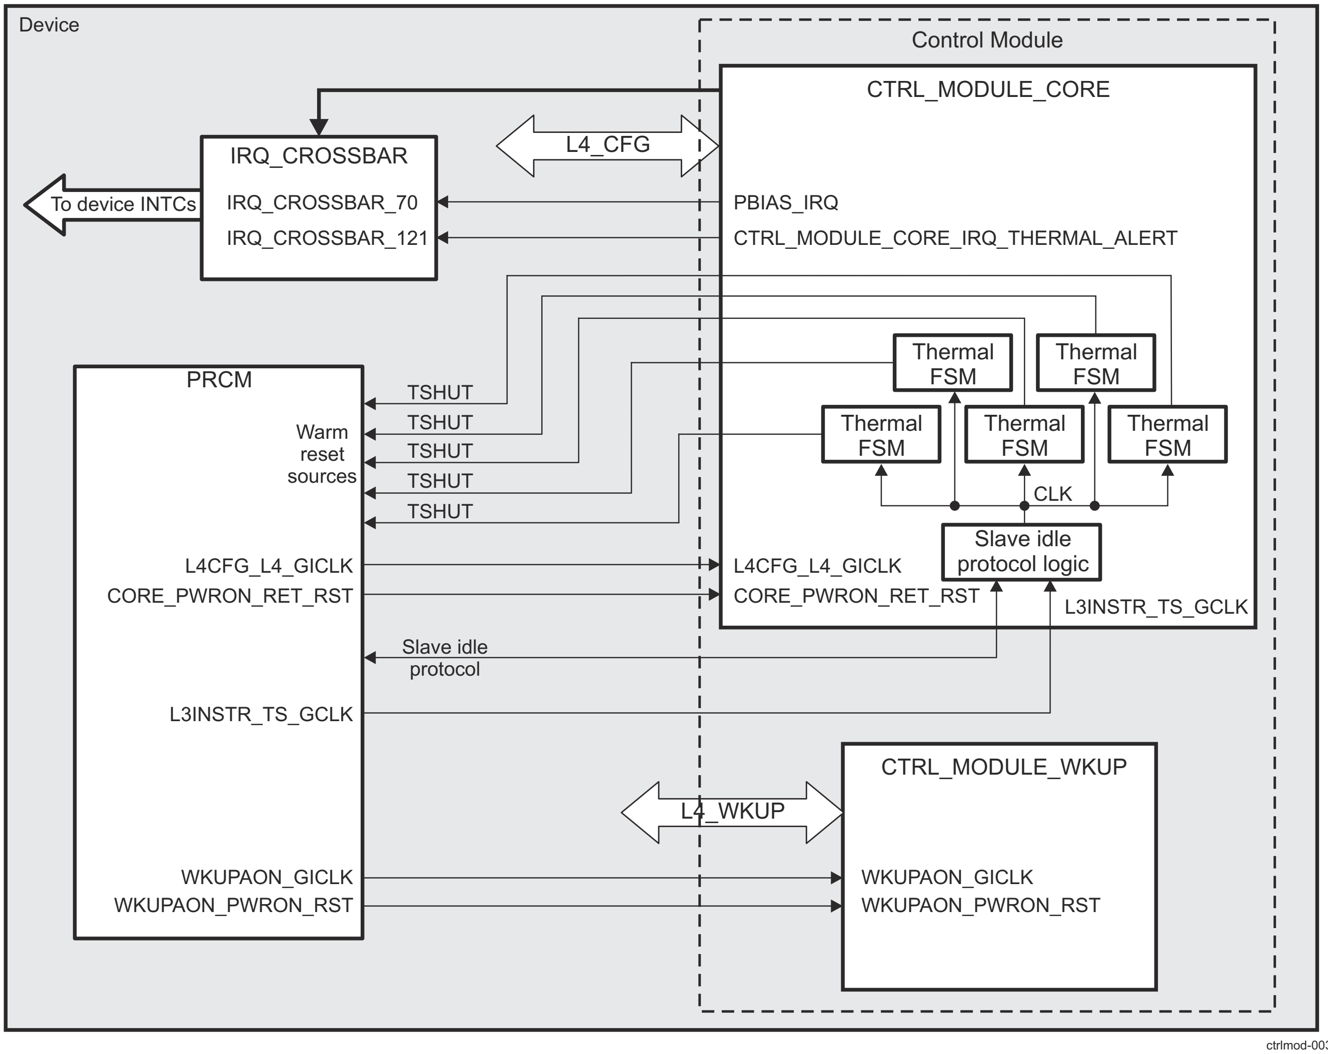

Figure 18-3. Control Module Integration

Table 18-2 through Table 18-4 summarize the integration of the Control Module in the device.

Table 18-2. Control Module Integration Attributes

Submodule	Attributes	
	Power Domain	Interconnect
CTRL_MODULE_CORE	PD_COREAON	L4_CFG
CTRL_MODULE_WKUP	PD_WKUPAON	L4_WKUP

Table 18-3. Control Module Clocks and Resets

Clocks				
Submodule	Destination Signal Name	Source Signal Name	Source	Description

Table 18-3. Control Module Clocks and Resets (continued)

CTRL_MODULE_CORE	L4CFG_L4_GICLK	L4CFG_L4_GICLK	PRCM	Interface clock to the CTRL_MODULE_CORE submodule
	L3INSTR_TS_GCLK	L3INSTR_TS_GCLK	PRCM	Common functional clock for the five thermal FSMs instantiated in the CTRL_MODULE_CORE submodule
CTRL_MODULE_WKUP	WKUPAON_GICLK	WKUPAON_GICLK	PRCM	Interface clock to the CTRL_MODULE_WKUP submodule
		Resets		
CTRL_MODULE_CORE	CORE_PWRON_RET_RST	CORE_PWRON_RET_RST	PRCM	Internal power-on reset (POR) affecting the CTRL_MODULE_CORE submodule
CTRL_MODULE_WKUP	WKUPAON_PWRON_RST	WKUPAON_PWRON_RST	PRCM	Internal POR affecting the CTRL_MODULE_WKUP submodule

Table 18-4. Control Module Hardware Requests

Interrupt Requests				
Submodule	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
CTRL_MODULE_CORE	PBIAS_IRQ	IRQ_CROSSBAR_70	MPU_IRQ_75	Interrupt signal generated by the PBIAS cell when the MMC1 I/Os supply voltage is not equal to the bias voltage generated by the PBIAS cell
	CTRL_MODULE_CORE_IRQ_THERMAL_ALERT	IRQ_CROSSBAR_121	MPU_IRQ_126	Thermal alert interrupt signal generated when one of the five thermal sensors goes over the tepmerature threshold value

Note

The “**Default Mapping**” column in Table 18-4 *Control Module Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module.
For more information about the IRQ_CROSSBAR module, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*.
For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.

The integration of the control module is the following:

- No wake-up request generation
- No DMA request generation
- No master standby protocol with the PRCM
- Slave idle protocol, between the CTRL_MODULE_CORE submodule and the PRCM, related only to the L3INSTR_TS_GCLK
- One interrupt request to the IRQ_CROSSBAR module
- Five (thermal shutdown) TSHUT signals used as PRCM warm reset sources
- Two clocks and one reset signal to the CTRL_MODULE_CORE submodule
- One clock and one reset signal to the CTRL_MODULE_WKUP submodule

18.4 Control Module Functional Description

18.4.1 Control Module Clock Configuration

There is no software control over the L4CFG_L4_GICLK and WKUPAON_GICLK clocks neither in the control module nor in the PRCM module. The L4CFG_L4_GICLK clock is automatically gated when there is no access to the CTRL_MODULE_CORE registers and the WKUPAON_GICLK is automatically gated when there is no access to the CTRL_MODULE_WKUP registers. There are clock activity status bits for these two clocks in the PRCM module.

The L3INSTR_TS_GCLK is controlled by the CTRL_CORE_BANDGAP_MASK_1[31:30] SIDLEMODE bit field. For more information, see Section 18.4.6.2.5.

The L3INSTR_TS_GCLK has also the following software controls located in the PRCM module:
- Status: see Chapter 3, *Power, Reset, and Clock Management*
- Divider ratio: see Chapter 3, *Power, Reset, and Clock Management*

18.4.2 Control Module Resets

The control module is not sensitive to software reset. It does not respond to global warm reset too. The control module is reset only by the internal POR (global cold reset).

Despite the previously stated that control module is not sensitive to global warm reset all CTRL_CORE_PAD_x registers are exception of this rule and are sensitive to global warm reset. All other control module registers are sensitive only to global cold reset.

The PRCM provides the CORE_PWRON_RET_RST POR signal to the CTRL_MODULE_CORE and the WKUPAON_PWRON_RST POR signal to the CTRL_MODULE_WKUP. For more information, see Section 3.5.5, *Reset Domains*, in Chapter 3, *Power, Reset, and Clock Management*.

18.4.3 Control Module Power Management

18.4.3.1 Power Management Protocols

The control module, which is slave on the L4 interconnect, does not support master standby or slave idle protocols for handshaking with the PRCM. Only the five thermal FSMs support slave idle protocol used to control their common functional clock, that is the L3INSTR_TS_GCLK clock.

18.4.4 Hardware Requests

The control module does not generate DMA and wake-up requests. The CTRL_MODULE_CORE submodule generates only two IRQs to the IRQ_CROSSBAR module. The first one is the PBIAS_IRQ and the second one is the CTRL_MODULE_CORE_IRQ_THERMAL_ALERT. For more information, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*.

18.4.5 Control Module Initialization

The control module responds to the internal POR. During device initialization, only modules used at boot time are associated with the pads. Other module inputs are internally tied and output buffers are turned off. After POR, software must set the pad configuration registers to appropriate values according to the desired device configuration.

The CTRL_CORE_BOOTSTRAP[15:0] bit field reflects the state of the sysboot[15:0] pads captured at POR in the PRCM module.

18.4.6 Functional Description Of The Various Register Types In CTRL_MODULE_CORE Submodule

The following sections describe in detail the purpose of the various kinds of registers and register groups which reside in the CTRL_MODULE_CORE submodule.

18.4.6.1 Pad Configuration

18.4.6.1.1 Pad Configuration Registers

The pad configuration registers are used to configure most of the device pads. Each pad configuration register is assotiated only with one pad. The name of each register is formed by the corresponding pad name and the prefix "CTRL_CORE_PAD_". Almost all pad configuration registers have same bits. In some of these registers certain bits cannot be present. Figure 18-4 shows the general case in which all the pad configuration register bits are present. Table 18-5 describes these bits.

After POR, software must set the pad configuration registers to appropriate values depending on the desired device configuration. Configuration of the pad configuration registers is normally done as part of the IO delay recalibration sequence described in Section 18.4.6.1.8, *IO Delay Recalibration*.

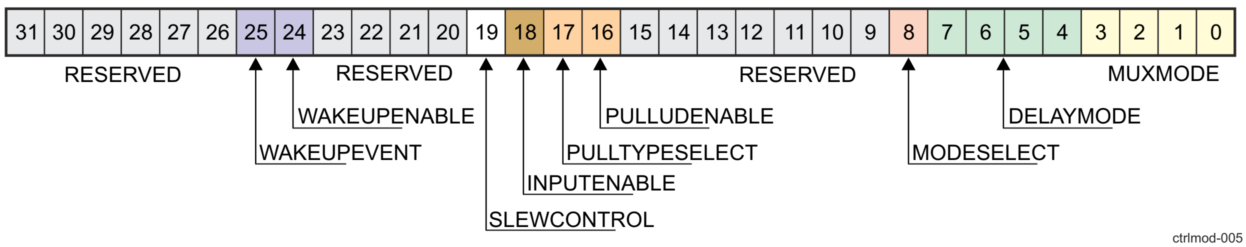

Figure 18-4. Pad Configuration Register Bits

Table 18-5. Description Of The Pad Configuration Register Bits

Bit/Bit Field	Bit Meaning		Description
	0b0	0b1	
WAKEUPEVENT	Wake-up event is not detected	Wake-up event is detected	Wake-up event status for a given pad. Indicates whenever the pad state is changed (0->1 or 1->0). In addition, when a wake-up event from a given I/O cell is received, the PRCM will wake up the MPU by switching-on its power domain and clocks and then generating an interrupt.
WAKEUPENABLE	Disable I/O wake-up function	Enable I/O wake-up function	Enables wake-up detection on input
SLEWCONTROL	Fast slew is selected	Slow slew is selected	Selects the slew rate for a given pad. The slew rate should be set to the value specified in the device Data Manual for a given mode of operation.
INPUTENABLE[1]	Receive mode is disabled. The pad is configured in output mode only.	Receive mode is enabled. The pad is configured in bidirectional mode.	Enables the input buffer of a given I/O
PULLTYPESELECT	Weak pull-down resistor is selected	Weak pull-up resistor is selected	Weak pull-up or weak pull-down resistor selection for a given pad
PULLUDENABLE	Weak pull-up/pull-down resistor is enabled	Weak pull-up/pull-down resistor is disabled	Enables weak pull-up/pull-down feature of a given pad
MODESELECT	Default IO Timing Mode is used	A Virtual or Manual IO Timing Mode is used.	Selects between the Default IO Timing Mode and a Virtual or Manual IO Timing Mode. Refer to the device Data Manual for definition of the required settings for a given mode of operation. When this bit is 0b1, a Virtual IO Timing Mode can be selected via the DELAYMODE field of this register, as described in Section 18.4.6.1.5, *Virtual IO Timing Modes*. Manual IO Timing Modes are selected via the procedure described in Section 18.4.6.1.6, *Manual IO Timing Modes*.

Table 18-5. Description Of The Pad Configuration Register Bits (continued)

Bit/Bit Field	Bit Meaning		Description
	0b0	0b1	
DELAYMODE	This bit field selects the Virtual Timing Mode used when the MODESELECT bit is set to 0b1. See Section 18.4.6.1.5, *Virtual IO Timing Modes* for details.		
MUXMODE	This bit field selects the desired Multiplexing Mode for the pad. See section "*Multiplexing Characteristics*" of the Data Manual for a list of available functions for each pad.		

(1) To enable/disable the input buffers of the mmc1_* pads the ACTIVE bits of the corresponding CTRL_CORE_PAD_x registers are used. These registers have ACTIVE bits instead of INPUTENABLE bits.

Note

The default SLEWCONTROL settings in each pad configuration register must be used to guarantee timings, unless specific instructions otherwise are given in the individual timing sub-sections of the device Data Manual. The only exception is when the MUXMODE is configured to select a vout*_* signal. In this case the corresponding SLEWCONTROL bit is recommended to be set to slow slew instead of the default fast slew. FAST slew setting is allowed, but results in faster edge rates on the VOUTn bus, higher power/ground noise, and higher EMI emissions compared to SLOW slew rate.

Note

It must be taken into account that when an external pull resistor is desired, the internal pull resistors must be disabled by software because they are enabled by default.

Note

GPIO pins can directly snoop device pads even if those are configured in the other modes. For GPIO output user needs to set pad mux.

The following signals require CTRL_CORE_PAD_x to be programmed with INPUTENABLE=1 for retiming purposes:

- mmc2_clk, mmc3_clk, and mmc4_clk
- gpmc_clk
- i2cj_scl where j=1-5
- spim_sclk where m=1-4
- mcaspi_aclkx, mcaspi_ahclkx and mcaspi_aclkr signals where i=1-8

18.4.6.1.1.1 Permanent PU/PD disabling (SR 2.0 only)

This section applies only to SR2.0.

The internal pull resistors of pads gpmc_a[27:24, 22:19] can be permanently disabled by pulling sysboot15 high during power-on-reset deassertion. When sysboot15 = 1, the corresponding PULLUDENABLE bit does not apply anymore. In this case it is a don't care bit whatever value set. This functionality is intended to be used when mmc2_dat* signals are configured on the gpmc_a[27:24, 22:19] pads. In this case, if sysboot15 = 1, external pull-up resistors with values as per JEDEC eMMC specification (JESD84-B451) must be connected to these pads. If gpmc_a[27:24, 22:19] are connected to non-multiplexed NOR flash used for booting and sysboot15 = 1, external pull-down resistors are mandatory on these pads otherwise boot is not possible. During NOR flash run-time accesses the external pull-down resistors are not needed.

18.4.6.1.2 Pull Selection

There is no automatic gating control to ensure that internal weak pull-up or pull-down resistors on a pad are disconnected whenever pad is configured as output. If a pad is always configured in output mode, it is recommended for user software to disable any internal pull resistor tied to it to avoid unnecessary consumption.

Table 18-6 describes the software controls available for pad internal pull-up and pull-down resistors in the control module pad configuration registers.

Table 18-6. Pull Selection

PULL		Pad Behavior
PULLTYPESELECT	PULLUDENABLE	
0	1	Pull-down selected but not activated
0	0	Pull-down selected and activated
1	1	Pull-up selected but not activated
1	0	Pull-up selected and activated

18.4.6.1.3 Pad multiplexing

Many of the Device pads support pad multiplexing. This means that their function can be independently chosen from two or more options. The selection of functions available on each pad is enumerated in the "*Multiplexing Characteristics*" section of the Data Manual. The desired function is selected via the MUXMODE field of the associated pad configuration register.

By default, the MUXMODE field of most device pads is set to 0xF, which means the pads are in Hi-Z. Only MUXMODE values which correspond to defined functions should be used.

Note

When setting the MUXMODE of any mmc1_* pad, the following register fields should also be programmed:

- CTRL_CORE_CONTROL_PBIAS[27] SDCARD_BIAS_PWRDNZ = 1
- CTRL_CORE_CONTROL_PBIAS[26] SDCARD_IO_PWRDNZ = 1
- If MUXMODE=0 is not selected, configure CTRL_CORE_CONTROL_PBIAS[21] SDCARD_BIAS_VMODE
  – Clear to 0 if vddshv8 = 1.8V
  – Set to 1 if vddshv8 = 3.3V

18.4.6.1.4 IOSETs

An IO signal may have multiplexing options across two or more device pads. In many cases, the user is allowed to select any combination of IO signal multiplexing options to use for an interface. But in some cases, specific combinations of multiplexing options must be selected to guarantee the Timing and Switching Characteristics in the *Data Manual*. These specific combinations are called IOSETs, and they generally represent layout-friendly groups of pads that are pinned-out in close proximity to each other. IOSETs are defined in the Data Manual for interfaces that require them.

18.4.6.1.5 Virtual IO Timing Modes

When operating a pad in certain modes, a Virtual IO Timing Mode must be selected to ensure that IO timings are met. The modes requiring Virtual IO Timing Modes are described in *Virtual Functions Mapping* tables within the "*Timing Requirements and Switching Characteristics*" section of the Data Manual. These tables list each pad associated with a specific Virtual IO Timing Mode, along with the DELAYMODE setting required for that pad.

To select a Virtual IO Timing Mode, both the MODESELECT field of each associated pad configuration register must be set to 0b1 and DELAYMODE field of each associated pad configuration register must be set to match the *Virtual Function Mapping* tables in the Data Manual.

Selection of all Virtual IO Timings Modes should be done as part of the IO Delay Recalibration Sequence described in Section 18.4.6.1.8, *IO Delay Recalibration*.

18.4.6.1.6 Manual IO Timing Modes

When operating a pad in certain modes, a Manual IO Timing Mode must be configured to ensure that IO timings are met. The modes requiring Manual IO Timing Modes are described in *Manual Functions Mapping* tables within the "*Timing Requirements and Switching Characteristics*" section of the Data Manual. These tables list each pad associated with a specific Manual IO Timing Mode, along with the required A_DELAY and G_DELAY values that should be used to calculate the correct values to be set in the CFG_x_IN, CFG_x_OEN, and CFG_x_OUT registers associated with that pad. For more information regarding these registers, see Section 18.7, *IODELAYCONFIG Module Register Manual*

To select a Manual IO Timing Mode, the MODESELECT field of each associated pad configuration register must be set to 0b1 and the associated CFG_x_IN, CFG_x_OEN, and CFG_x_OUT registers should be set via the following sequence:

1. Compute CDPE and FPDE based on the following equations using values from the IODELAYCONFIG module registers (the register values must be converted to decimal before calculating):

$$\text{CDPE} = \frac{10^*(\text{CONFIG\_REG\_3[15:0] COARSE\_REF\_COUNT}^*\text{CONFIG\_REG\_2[15:0] REFCLK\_PERIOD})}{(2^*(\text{CONFIG\_REG\_3[31:16] COARSE\_DELAY\_COUNT}^*88))}$$

$$\text{FDPE} = \frac{10^*(\text{CONFIG\_REG\_4[15:0] FINE\_REF\_COUNT}^*\text{CONFIG\_REG\_2[15:0] REFCLK\_PERIOD})}{(2^*(\text{CONFIG\_REG\_4[31:16] FINE\_DELAY\_COUNT}^*264))}$$

ctrlmod-014

2. For each pad that requires a Manual IO Timing Mode, perform the following setups to calculate the values required to be programmed into each of the associated CFG_x_IN, CFG_x_OEN, and CFG_x_OUT IODELAYCONFIG module registers:
   a. Calculate the Coarse Values and Fine Values corresponding to the A_DELAY and G_DELAY values listed in the Data Manual for the associated Manual IO Timing Mode as follows:

$$\text{G\_DELAY\_COARSE} = \text{floor}\left(\frac{\text{G\_DELAY}}{920}\right)$$

$$\text{G\_DELAY\_FINE} = \frac{\text{floor(G\_DELAY mod 920)}^*10}{60}$$

$$\text{A\_DELAY\_COARSE} = \text{floor}\left(\frac{\text{A\_DELAY}}{\text{CDPE}}\right)$$

$$\text{A\_DELAY\_FINE} = \frac{\text{floor(A\_DELAY mod CDPE)}^*10}{\text{FDPE}}$$

ctrlmod-015

   b. Calculate the required number of Coarse Elements and Fine Elements:

$$\text{COARSE\_ELEMENTS} = \text{G\_DELAY\_COARSE} + \text{A\_DELAY\_COARSE}$$

$$\text{FINE\_ELEMENTS} = \frac{\text{G\_DELAY\_FINE} + \text{A\_DELAY\_FINE}}{10}$$

ctrlmod-016

   c. If FINE_ELEMENTS > 22, recalculate COARSE_ELEMENTS and FINE_ELEMENTS as follows:

$$\text{COARSE\_ELEMENTS} = \frac{\text{TOTAL\_DELAY}}{\text{CDPE}}$$

$$\text{FINE\_ELEMENTS} = \frac{\text{TOTAL\_DELAY mod CDPE}}{\text{FDPE}}$$

Where TOTAL_DELAY = (Original COARSE_ELEMENTS * CDPE) + (Original FINE_ELEMENTS * FDPE)

ctrlmod-017

   d. Convert COARSE_ELEMENTS and FINE_ELEMENTS to 5-bit binary values COARSE_ELEMENTS_5b and FINE_ELEMENETS_5b
   e. Write associated CFG_x register with 0x29400 + COARSE_ELEMENTS_5b<<5 + FINE_ELEMENETs_5b

Selection of all Manual IO Timing Modes should be done as part of the IO Delay Recalibration Sequence described in Section 18.4.6.1.8, *IO Delay Recalibration*.

18.4.6.1.7 Isolation Requirements

When reprogramming the MUXMODE, DELAYMODE, and MODESELECT fields of a pad configuration register or the CFG_x_IN, CFG_x_OEN, and CFG_x_OUT registers in the IODELAYCONFIG Module, there is potential for a glitch on the corresponding IO. Therefore, the device IOs should be isolated when writing to any of these fields. Isolating the IOs forces them to tri-state output with internal pulls holding their previous levels. De-isolating the IOs returns their control to the selected peripheral modules.

Note

While the IOs are Isolated, code must execute only from internal RAM and the isolated IO interfaces should not be actively used.

Isolation is a global event that affects all LVCMOS IOs except for the following:

- JTAG IOs
- on_off
- rstoutn

Isolation/De-isolation of the device IOs is accomplished via the following sequences:

Isolation Sequence:

1. Ensure that the CTRL_CORE_CONTROL_PBIAS[27] SDCARD_BIAS_PWRDNZ and CTRL_CORE_CONTROL_PBIAS[26] SDCARD_IO_PWRDNZ bits are set to 1
2. Write 1 to the PRM_IO_PMCTRL[0] ISOCLK_OVERRIDE bit
3. Poll the PRM_IO_PMCTRL[1] ISOCLK_STATUS bit until it reads 1
4. Write 1 to the CTRL_CORE_SMA_SW_0[2] ISOLATE bit
5. Read the CTRL_CORE_SMA_SW_0[2] ISOLATE bit for timing purposes only
6. Write the PRM_IO_PMCTRL[0] ISOCLK_OVERRIDE bit to 0
7. Poll the PRM_IO_PMCTRL[1] ISOCLK_STATUS bit until it reads 0

De-isolation Sequence:

1. Write 1 to the PRM_IO_PMCTRL[0] ISOCLK_OVERRIDE bit
2. Poll the PRM_IO_PMCTRL[1] ISOCLK_STATUS bit until it reads 1
3. Write 0 to the CTRL_CORE_SMA_SW_0[2] ISOLATE bit
4. Read the CTRL_CORE_SMA_SW_0[2] ISOLATE bit for timing purposes only
5. Write the PRM_IO_PMCTRL[0] ISOCLK_OVERRIDE bit to 0
6. Poll the PRM_IO_PMCTRL[1] ISOCLK_STATUS bit until it reads 0

Configuration of the pad configuration registers is normally done as part of the IO Delay Recalibration Sequence described in Section 18.4.6.1.8, *IO Delay Recalibration*, which references the above Isolation/De-isolation sequences.

18.4.6.1.8 IO Delay Recalibration

After adjusting the AVS voltage for VDD_CORE_L voltage domain, an IO Delay Recalibration Sequence must be followed to ensure device IO timings are met. The IO Delay Recalibration Sequence is as follows:

IO Delay Recalibration Sequence:

1. Complete the AVS voltage change on the VDD_CORE_L voltage domain and ensure voltage has stabilized to the new AVS target voltage
2. Unlock the registers used by this sequence as follows:
   a. Write 0x2FF1AC2B to register CTRL_CORE_MMR_LOCK_1 of the Control Module
   b. Write 0x6F361E05 to register CTRL_CORE_MMR_LOCK_5 of the Control Module
   c. Write 0x0000AAAA to register CONFIG_REG_8 of the IODELAYCONFIG Module
3. Perform IO Delay Calibration

a. Write register field CONFIG_REG_2[15:0] REFCLK_PERIOD of the IODELAYCONFIG Module with the L4_ICLK clock period in ps divided by 10 (or, equivalently, L3_ICLK clock period in ps divided by 5), then rounded down to the closest integer
   i. L4_ICLK = 133MHz requires a value of 0x2EF
b. Write 1 to register field CONFIG_REG_0[0] CALIBRATION_START of the IODELAYCONFIG module to initiate the calibration.
c. Poll register field CONFIG_REG_0[0] CALIBRATION_START for 0, indicating calibration is complete.

4. Isolate the device IOs via the Isolation Sequence described in Section 18.4.6.1.7 *Isolation Requirements*
5. Update the delay mechanism for each IO with new calibrated values:
   a. Write 1 to register field CONFIG_REG_0[1] ROM_READ of the IODELAYCONFIG module to initiate a reload of calibrated delay values for all IOs.
   b. Poll register field CONFIG_REG_0[1] ROM_READ for 0, indicating reload is complete.
6. Configure the pad configuration register (CTRL_CORE_PAD_x) for each IO with the desired MUXMODE, DELAYMODE, and MODESELECT settings.
7. Configure all required Manual IO Timing Modes as described in Section 18.4.6.1.6, *Manual IO Timing Modes*
8. De-isolate the device IOs via the de-isolation sequence described in Section 18.4.6.1.7 *Isolation Requirements*
9. Relock the registers used by this sequence:
   a. Write 0x1A1C8144 to register CTRL_CORE_MMR_LOCK_1
   b. Write 0x143F832C to register CTRL_CORE_MMR_LOCK_5
   c. Write 0x0000AAAB to register CONFIG_REG_8

18.4.6.2 Thermal Management Related Registers

There are five temperature sensors on the device die. Each sensor is associated only with one voltage domain and is also a part of a VBGAPTS cell. This cell has a 10-bit ADC. The ADC converts the temperature values into digital output values proportional to the temperature measured. Each VBGAPTS cell is controlled by a dedicated FSM referred to as thermal FSM. The registers associated with each FSM reside in the CTRL_MODULE_CORE submodule. All FSMs are clocked by the L3INSTR_TS_GCLK clock. The PRCM module controlls this clock through the slave idle protocol.

The device thermal management related registers can be split into the following classes:

- Temperature sensors control registers
- Registers for the thermal alert comparators
- Temperature timestamp registers
- Other registers used for:
  – controlling the FIFOs
  – controlling the clock provided to the five FSMs

Figure 18-5 shows the block diagram of the device thermal management.

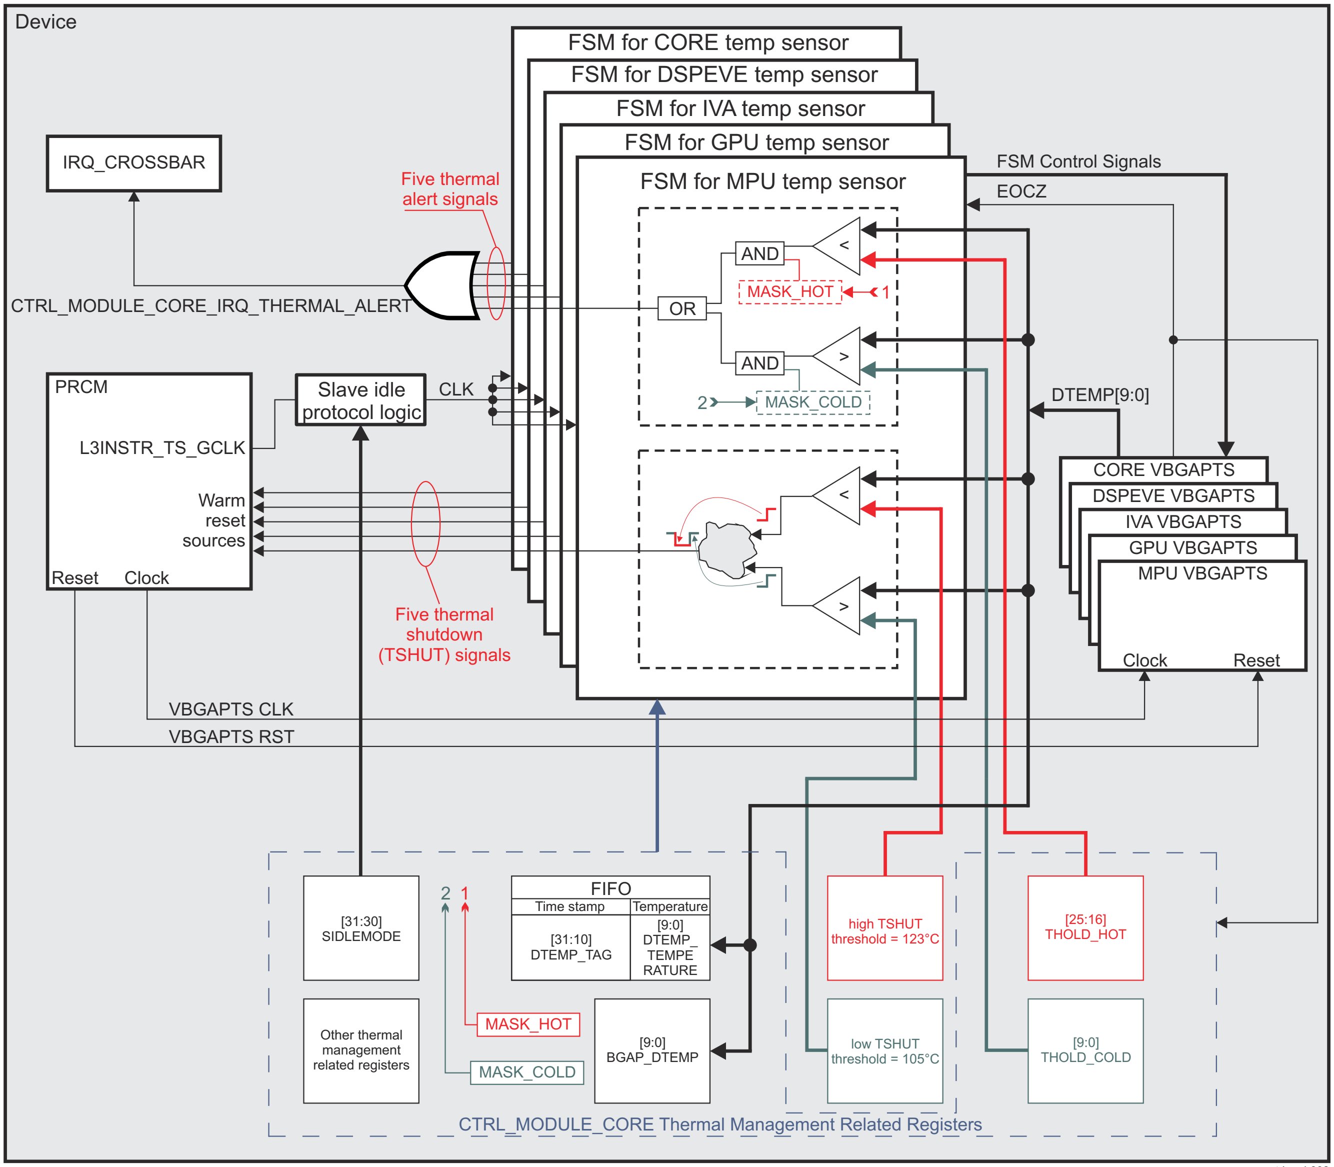

Figure 18-5. Thermal Management Functional Block Diagram

Table 18-7 describes the signals related to the device thermal management logic.

Table 18-7. Thermal Management Signals Description

Signal	I/O[(1)]	Description
EOCZ	O	End of conversion signal. When low, this signal indicates that the value of DTEMP[9:0] is valid.
DTEMP[9:0]	O	Temperature data from the temperature sensor. This value is valid when EOCZ is low.
VBGAPTS CLK	I	Functional clock from the WKUPAON power domain used by the temperature sensor during temperature conversion.
THERMAL ALERT	O	The five thermal alert outputs from each thermal FSM are ORed and then mapped as an interrupt request to the IRQ_CROSSBAR module. Software uses this interrupt to implement the device thermal management policy.

Table 18-7. Thermal Management Signals Description (continued)

Signal	I/O(1)	Description
TSHUT	O	Each of the five thermal shutdown signals is mapped to the PRCM and is used as a warm reset signal. These overheat protection signals are high during normal operation and go low during thermal shutdown event.

(1) I = Input; O = Output

The ADC values which correspond to the current temperature are listed in Table 18-10.

18.4.6.2.1 Temperature Sensors Control Registers

Each VBGAPTS cell works in continuous conversion mode controlled by the corresponding FSM. This means that the temperature is measured at regular time intervals. The start of temperature measurement is initiated automatically by each FSM after it goes out of reset state. To control the main delay between two measurements the CTRL_CORE_BANDGAP_MASK_1[29:27] COUNTER_DELAY bit field is used. After this delay expires the five FSMs automatically start a temperature conversion.

The conversion is complete when the CTRL_CORE_TEMP_SENSOR_x[10] BGAP_EOCZ_x status bits are set to 0x0. After this the valid temperature is written automatically by each FSM in the CTRL_CORE_TEMP_SENSOR_x[9:0] BGAP_DTEMP_x bit fields, and then software is able to read it from the corresponding register. After writing the valid temperature values the five FSMs wait one clock cycle and start another conversion cycle.

For details regarding the CTRL_CORE_TEMP_SENSOR_x registers, see Table 18-9.

18.4.6.2.2 Registers For The Thermal Alert Comparators

There is a comparator block responsible for the thermal alert function of the CTRL_MODULE_CORE thermal management logic. This comparator block is composed of two comparators. One dedicated to low temperature threshold and the other one to high temperature threshold. Because of the five temperature sensors there are also five comparator blocks. Software can configure the low temperature threshold through the CTRL_CORE_BANDGAP_THRESHOLD_x[9:0] THOLD_COLD_x bit fields and high temperature threshold through the CTRL_CORE_BANDGAP_THRESHOLD_x[25:16] THOLD_HOT_x bit fields. The values which have to be loaded in these bit fields are the same as those listed in Table 18-10. For example, to set the high temperature threshold value to 120°C, the THOLD_HOT filed must be loaded with value of 931 (0x3A3).

The thermal alert logic provides also a capability to mask the outputs of the comparators associated with low and high temperature thresholds. The low temperature threshold comparator outputs are masked by setting to 0x0 the corresponding MASK_COLD_x bits in the CTRL_CORE_BANDGAP_MASK_1 and CTRL_CORE_BANDGAP_MASK_2 registers. The high temperature threshold comparator outputs are masked by setting to 0x0 the corresponding MASK_HOT_x bits in CTRL_CORE_BANDGAP_MASK_1 and CTRL_CORE_BANDGAP_MASK_2 registers.

The masked low and high temperature threshold outputs are ORed once and as a result a single thermal alert signal is produced. As there are five temperature sensors there are also five thermal alert output signals produced. These five signals are then ORed (see Figure 18-5) in the CTRL_MODULE_CORE_IRQ_THERMAL_ALERT signal, which delivers an interrupt to the IRQ_CROSSBAR_121 input line of the IRQ_CROSSBAR module. Software can use this interrupt to implement the device thermal management policy. The CTRL_MODULE_CORE_IRQ_THERMAL_ALERT signal is also routed to the CTRL_CORE_BANDGAP_STATUS_1[31] ALERT bit. Value of 0x1 indicates that the CTRL_MODULE_CORE_IRQ_THERMAL_ALERT signal is asserted.

The non masked (raw) comparator outputs are available for reading through the corresponding bits in the CTRL_CORE_BANDGAP_STATUS_1 and CTRL_CORE_BANDGAP_STATUS_2 registers. The low temperature threshold comparator outputs are read through the COLD_x bits and the high temperature threshold comparator outputs through the HOT_x bits.

Figure 18-6 shows the behavior of the thermal alert logic.

For details regarding the CTRL_CORE_BANDGAP_THRESHOLD_x registers, see Table 18-9.

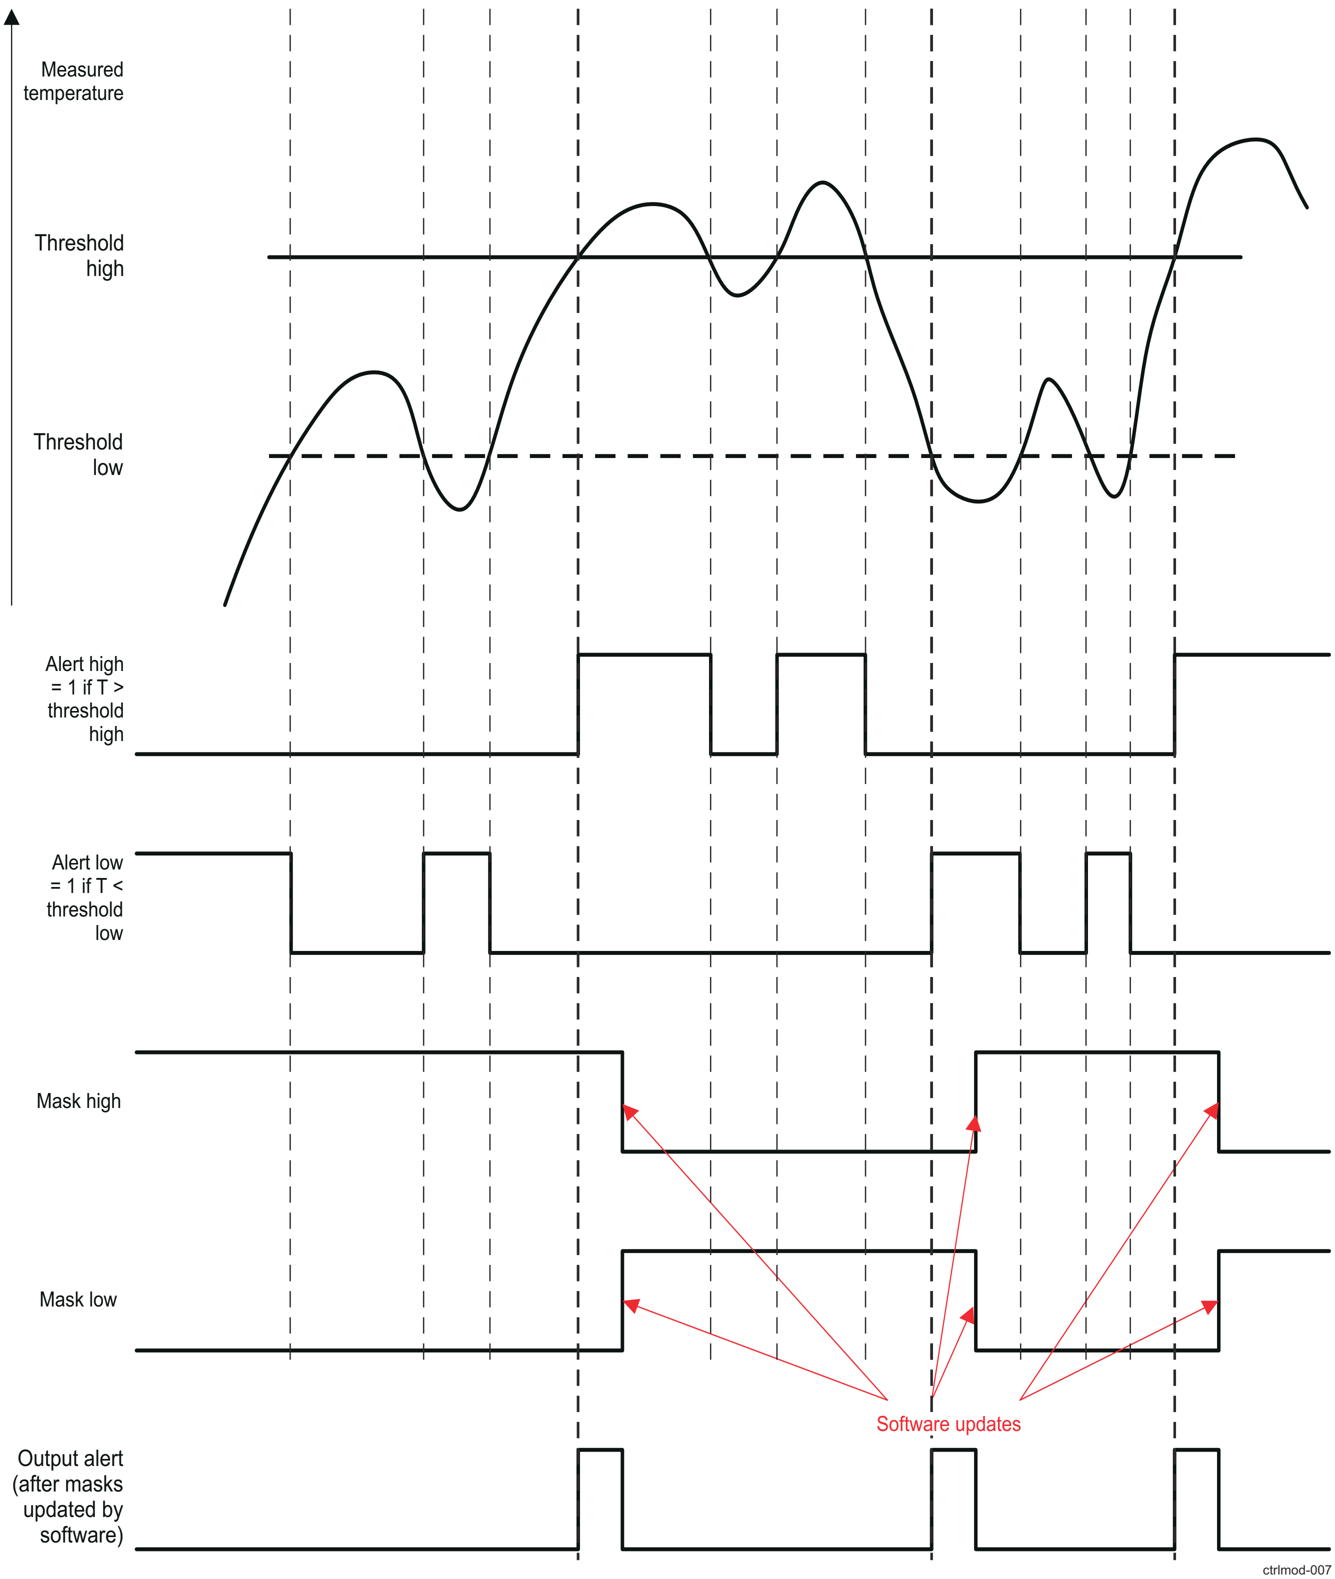

Figure 18-6. Behavior Of The Thermal Alert Logic

18.4.6.2.3 Thermal Shutdown Comparators

There is also a comparator block responsible for the thermal shutdown (TSHUT) function of the CTRL_MODULE_CORE thermal management logic. This comparator block is also composed of two comparators. One dedicated to low TSHUT threshold and the other one to high TSHUT threshold. Because of the five temperature sensors there are also five comparator blocks. The comparator outputs for the low and high TSHUT thresholds of each comparator block are connected to a logic which then generates a single TSHUT signal. All five TSHUT signals are tied to the PRCM and used as warm reset sources. For details, see Figure 18-5.

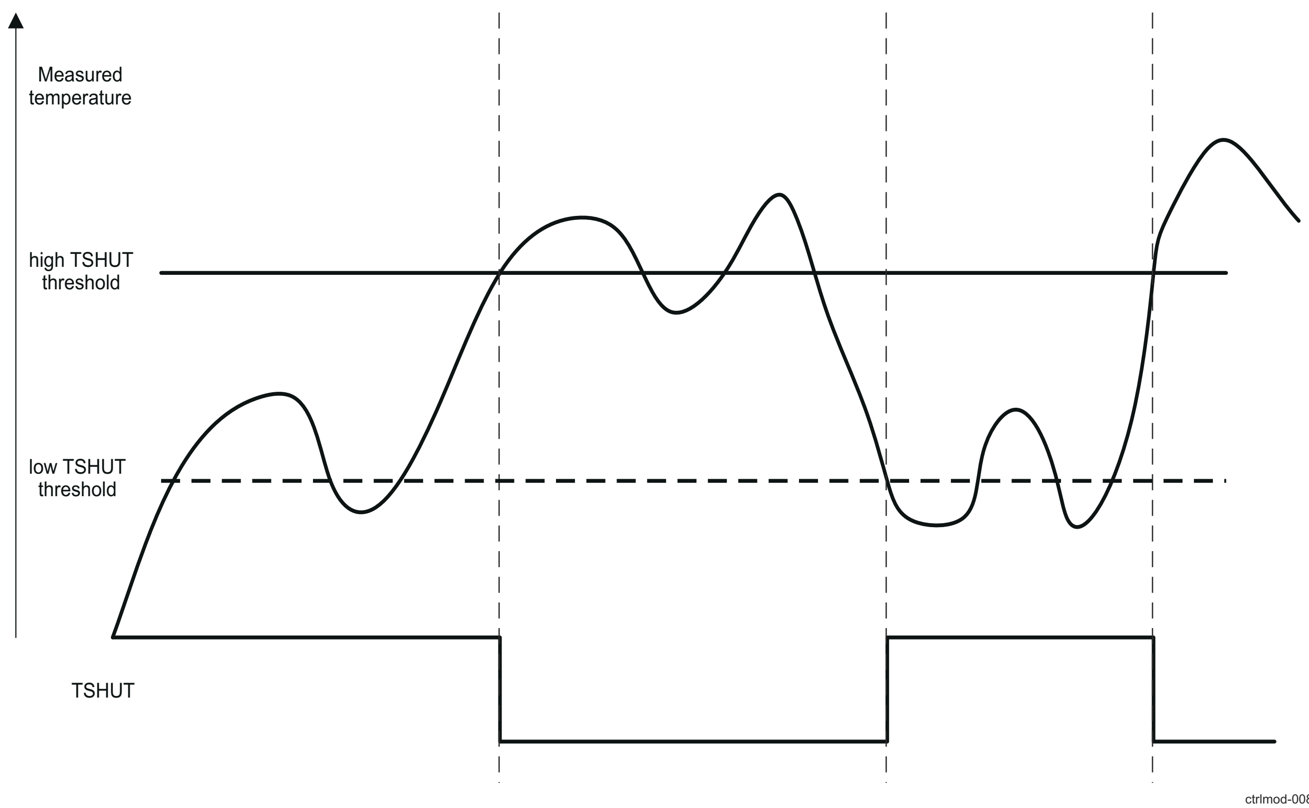
The values of the five low and high TSHUT thresholds are fixed and can be neither overridden nor read by software. The value for the high TSHUT threshold is 123°C (assuming ±2°C temperature sensor accuracy), and the low TSHUT threshold is 105°C.

When the high TSHUT threshold is reached, the TSHUT output is activated. To deactivate each TSHUT output, the temperature must go below the value of each low TSHUT threshold.

Each of the five TSHUT signals is used as an overheat protection.

Figure 18-7 shows the behavior of the TSHUT logic.

Figure 18-7. Behavior Of The Thermal Shutdown Logic



18.4.6.2.4 Temperature Timestamp Registers

Each time one of the CTRL_CORE_TEMP_SENSOR_x[9:0] BGAP_DTEMP_x bit fields is updated with new temperature value, this value is also automatically stored into a 5-level deep FIFO and a timestamp is registered too. There are five FIFOs used to store a brief history for the last few temperature measurements and are also dedicated to temperature timestamping feature. Each FIFO has two fields. The first one is 10 bits wide, 5 levels deep, and is intended to store the temperature values for the last five measurements. The second field is 22 bits wide, 5 levels deep, and acts like a counter for the number of temperature measurements. Each FIFO is composed of the following registers:

- CTRL_CORE_DTEMP_x_0
- CTRL_CORE_DTEMP_x_1
- CTRL_CORE_DTEMP_x_2
- CTRL_CORE_DTEMP_x_3
- CTRL_CORE_DTEMP_x_4

Table 18-8 shows a generic description of the five FIFOs.

For details regarding the five CTRL_CORE_DTEMP_x registers, see Table 18-9.

Table 18-8. FIFOs Generic Description

FIFO Levels	Second FIFO Field (22 Bits) – Timestamp	Description	First FIFO field (10 Bits) – Temperature	Description
	Bits [31:10]		Bits [9:0]	
Level 1	DTEMP_TAG_x_0	Indicates the number of temperature measurements	DTEMP_TEMPERATURE_x_0	Indicates the last measured temperature value (the most recent sample)
Level 2	DTEMP_TAG_x_1	Indicates the number of temperature measurements minus one (DTEMP_TEMPERATURE_x_0 – 1)	DTEMP_TEMPERATURE_x_1	Indicates the penultimate measured temperature value
Level 3	DTEMP_TAG_x_2	Indicates the number of temperature measurements minus two (DTEMP_TEMPERATURE_x_0 – 2)	DTEMP_TEMPERATURE_x_2	Indicates temperature value measured before DTEMP_TEMPERATURE_x_1
Level 4	DTEMP_TAG_x_3	Indicates the number of temperature measurements minus three (DTEMP_TEMPERATURE_x_0 – 3)	DTEMP_TEMPERATURE_x_3	Indicates temperature value measured before DTEMP_TEMPERATURE_x_2
Level 5	DTEMP_TAG_x_4	Indicates the number of temperature measurements minus four (DTEMP_TEMPERATURE_x_0 – 4)	DTEMP_TEMPERATURE_x_4	Indicates temperature value measured before DTEMP_TEMPERATURE_x_3 (the oldest sample)

Note

DTEMP_TAG_x_4 increments its value with one after each fifth temperature measurement.

DTEMP_TAG_x_3 increments its value with one after each fourth temperature measurement.

DTEMP_TAG_x_2 increments its value with one after each third temperature measurement.

DTEMP_TAG_x_1 increments its value with one after each second temperature measurement.

DTEMP_TAG_x_0 increments its value with one after each temperature measurement.

18.4.6.2.5 Other Thermal Management Related Registers

- **Controlling the FIFOs:**

  Software can stop a certain FIFO to update with new temperature and timestamp values when setting to 0x1 one of the FREEZE_x bits in the CTRL_CORE_BANDGAP_MASK_1 and CTRL_CORE_BANDGAP_MASK_2 registers. These 5 bits are automatically cleared by hardware after the FIFOs are cleared.

Each FIFO is cleared by setting to 0x1 one of the CLEAR_x bits in the CTRL_CORE_BANDGAP_MASK_1 and CTRL_CORE_BANDGAP_MASK_2 registers. These 5 bits are also automatically set by hardware to 0x0 after the FIFOs clearing procedure completes.

- **Controlling the clock provided to the five FSMs:**

  The five FSMs comply with the PRCM slave idle protocol. They share common functional clock (L3INSTR_TS_GCLK), which is automatically gated by PRCM depending on the value of the CTRL_CORE_BANDGAP_MASK_1[31:30] SIDLEMODE bit field. L3INSTR_TS_GCLK clock is also enabled automatically by the PRCM module.

18.4.6.2.6 Summary of the Thermal Management Related Registers

Table 18-9 summarizes all the thermal management related registers.

Table 18-9. Summary of the Thermal Management Related Registers

Register Name	Description	Access
CTRL_CORE_TEMP_SENSOR_MPU CTRL_CORE_TEMP_SENSOR_GPU CTRL_CORE_TEMP_SENSOR_CORE CTRL_CORE_TEMP_SENSOR_IVA CTRL_CORE_TEMP_SENSOR_DSPEVE	Temperature sensor control registers	RW
CTRL_CORE_BANDGAP_THRESHOLD_MPU CTRL_CORE_BANDGAP_THRESHOLD_GPU CTRL_CORE_BANDGAP_THRESHOLD_CORE CTRL_CORE_BANDGAP_THRESHOLD_IVA CTRL_CORE_BANDGAP_THRESHOLD_DSPEVE	Registers for the thermal alert comparators	RW
CTRL_CORE_BANDGAP_TSHUT_MPU CTRL_CORE_BANDGAP_TSHUT_GPU CTRL_CORE_BANDGAP_TSHUT_CORE CTRL_CORE_BANDGAP_TSHUT_IVA CTRL_CORE_BANDGAP_TSHUT_DSPEVE	Registers for the thermal shutdown comparators	RW

Table 18-9. Summary of the Thermal Management Related Registers (continued)

Register Name	Description	Access
CTRL_CORE_DTEMP_MPU_0 CTRL_CORE_DTEMP_MPU_1 CTRL_CORE_DTEMP_MPU_2 CTRL_CORE_DTEMP_MPU_3 CTRL_CORE_DTEMP_MPU_4	Temperature timestamp registers	RO
CTRL_CORE_DTEMP_GPU_0 CTRL_CORE_DTEMP_GPU_1 CTRL_CORE_DTEMP_GPU_2 CTRL_CORE_DTEMP_GPU_3 CTRL_CORE_DTEMP_GPU_4		
CTRL_CORE_DTEMP_CORE_0 CTRL_CORE_DTEMP_CORE_1 CTRL_CORE_DTEMP_CORE_2 CTRL_CORE_DTEMP_CORE_3 CTRL_CORE_DTEMP_CORE_4		
CTRL_CORE_DTEMP_IVA_0 CTRL_CORE_DTEMP_IVA_1 CTRL_CORE_DTEMP_IVA_2 CTRL_CORE_DTEMP_IVA_3 CTRL_CORE_DTEMP_IVA_4		
CTRL_CORE_DTEMP_DSPEVE_0 CTRL_CORE_DTEMP_DSPEVE_1 CTRL_CORE_DTEMP_DSPEVE_2 CTRL_CORE_DTEMP_DSPEVE_3 CTRL_CORE_DTEMP_DSPEVE_4		
CTRL_CORE_BANDGAP_STATUS_1 CTRL_CORE_BANDGAP_STATUS_2	Registers with status bits for the non masked comparator outputs and the thermal alert signal.	RO
CTRL_CORE_BANDGAP_MASK_1 CTRL_CORE_BANDGAP_MASK_2	Registers used to mask the comparator outputs for the low and high thermal alert thresholds. These registers are also used to control the FIFOs and the clock provided to the five FSMs.	RW

18.4.6.2.7 ADC Values Versus Temperature

Table 18-10 provides all the valid ADC values which correspond to the temperature measured which is read from the CTRL_CORE_TEMP_SENSOR_x[9:0] BGAP_DTEMP_x bit fields. Table 18-10 also provides the values for the low and high temperature thresholds which are configurable through the CTRL_CORE_BANDGAP_THRESHOLD_x[9:0] THOLD_COLD_x and CTRL_CORE_BANDGAP_THRESHOLD_x[25:16] THOLD_HOT_x bit fields.

Table 18-10. ADC Values Versus Temperature

ADC Code	Temperature		ADC Code	Temperature		ADC Code	Temperature		ADC Code	Temperature

18.4.6.3 PBIAS Cell And MMC1 I/O Cells Control Registers

The PBIAS cell is associated with device MMC1 interface and used together with the MMC1 I/O cells. Its purpose is to provide bias voltage to the MMC1 I/O cells. Without this bias voltage these I/O cells can not function properly.

The PBIAS cell is controlled by software using the CTRL_CORE_CONTROL_PBIAS register. The CTRL_CORE_CONTROL_HYST_1 register is used for hysteresis and drive strength control of the MMC1 I/O cells.

Figure 18-8 shows the PBIAS cell with the control bits and connections between it, the control module and the MMC1 I/O cells.

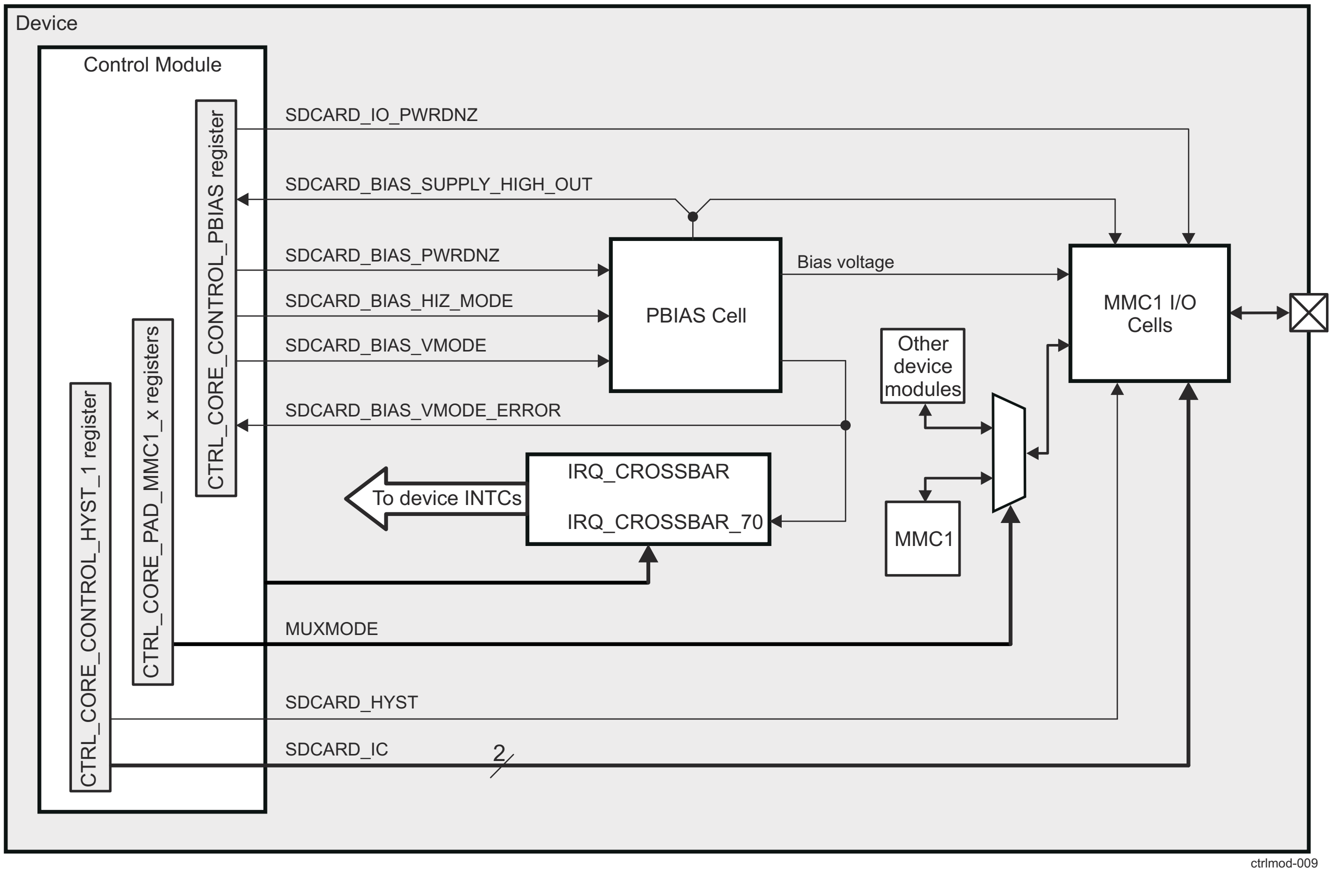

Figure 18-8. PBIAS Cell And Its Connections

Table 18-11 describes PBIAS cell and MMC1 I/O cells control bits.

Table 18-11. Control Bits For the PBIAS and MMC1 I/O Cells

Control bits for PBIAS cell and MMC1 I/O cells	Reset Value	Description
CTRL_CORE_CONTROL_PBIAS[27] SDCARD_BIAS_PWRDNZ	0x0	This bit turns ON and OFF the PBIAS cell. Software must keep it to 0x0 whenever the PBIAS cell supply voltage is ramping up/down or changing. Thus the PBIAS cell is protected. This bit should be set to 0x1 only after the PBIAS cell supply voltage is stable. This action power up the PBIAS cell.
CTRL_CORE_CONTROL_PBIAS[26] SDCARD_IO_PWRDNZ	0x0	This bit turns ON and OFF the MMC1 I/O cells. Software must keep it to 0x0 whenever the MMC1 IOs supply voltage is ramping up/down or changing. Thus the MMC1 I/O cells are protected. When this bit is set to 0x0, the MMC1 pads are floating. This bit should be set to 0x1 only after the MMC1 IOs supply voltage is stable. This action powers up the MMC1 I/O cells.
CTRL_CORE_CONTROL_PBIAS[25] SDCARD_BIAS_HIZ_MODE	0x0	When this bit is set to 0x1, the PBIAS cell output is in high impedance state and the SDCARD_BIAS_VMODE_ERROR bit sets automatically to 0x1. When SDCARD_BIAS_HIZ_MODE is set to 0x0, the PBIAS cell is in normal operation mode.
CTRL_CORE_CONTROL_PBIAS[24] SDCARD_BIAS_SUPPLY_HI_OUT	0x0	This is status bit indicating whether the MMC1 I/O cells supply voltage is equal to 1,8V or 3,3V.

Table 18-11. Control Bits For the PBIAS and MMC1 I/O Cells (continued)

Control bits for PBIAS cell and MMC1 I/O cells	Reset Value	Description
CTRL_CORE_CONTROL_PBIAS[23] SDCARD_BIAS_VMODE_ERROR	0x0	Status bit which indicates, during PBIAS cell normal operation mode, whether the voltage defined by the SDCARD_BIAS_VMODE bit is equal to the MMC1 I/Os supply voltage or not. If not, this bit is automatically set to 0x1 4µs after the voltage detection. It is also mapped to the IRQ_CROSSBAR_70 input line and is used as an interrupt source. If both voltage values are not equal an interrupt is generated.
CTRL_CORE_CONTROL_PBIAS[21] SDCARD_BIAS_VMODE	0x1	By controlling this bit software tells the PBIAS cell whether the MMC1 I/O cells supply voltage is equal to 1,8V or 3,3V. Its reset value indicates that the MMC1 I/Os voltage level is 3,3V.
CTRL_CORE_CONTROL_HYST_1[31] SDCARD_HYST	0x1	Hysteresis enabling/disabling for the MMC1 I/Os input buffer.
CTRL_CORE_CONTROL_HYST_1[30:29] SDCARD_IC	0x0	Impedance control (drive strength) for the MMC1 I/Os output buffer.

When the MMC1 signals are not used, that is MUXMODE different than 0x0 selected, the PBIAS cell must also be configured for proper work of the other interface signals multiplexed on the MMC1 I/O cells. For example, if MUXMODE = 0xE (gpio6_21 to gpio6_26 signals selected) the PBIAS cell and MMC1 I/O cells must be configured. This means that both the cells must be powerd and the appropriate PBAIS cell control bits must also be configured.

The MMC1 interface pads are the following:

- mmc1_clk
- mmc1_cmd
- mmc1_dat[3:0]
- mmc1_sdcd
- mmc1_sdwp

All of these pads except the mmc1_sdcd and mmc1_sdwp pads are associated with the PBIAS cell and the CTRL_CORE_CONTROL_PBIAS register and are also controlled by the CTRL_CORE_CONTROL_HYST_1 register.

The PBIAS cell and the MMC1 I/O cells are powered externally through the vddshv8 ball.

The PBIAS cell must be programmed according to the MMC1 I/O cells supply voltage. For details, see Table 18-12.

Table 18-12. PBIAS Cell Voltage Configuration

CTRL_CORE_CONTROL_PBIAS[21] SDCARD_BIAS_VMODE Bit Configuration(1)	PBIAS Cell and MMC1 I/O Cells Supply Voltage	Type of Operation
1.8V (0x0)	1.8V	Normal 1.8V operation
1.8V (0x0)	3.3V	Damaging configuration(2)
3.3V (0x1)	1.8V	Damaging configuration(2)
3.3V (0x1)	3.3V	Normal 3.3V operation

(1) For damaging configuration, hardware system protection is provided to prevent deterioration of the associated MMC1 I/Os.
(2) These modes must not be used.

Table 18-13 summarizes the generation of the CTRL_CORE_CONTROL_PBIAS[23] SDCARD_BIAS_VMODE_ERROR status flag, which depends on the various combinations of bits in the CTRL_CORE_CONTROL_PBIAS register. When this flag sets to 0x1, it is recommended the MMC1 I/O cells to be powered down by setting to 0x0 the CTRL_CORE_CONTROL_PBIAS[26] SDCARD_IO_PWRDNZ bit.

Table 18-13. PBIAS Cell Error Signal Truth Table

Programmed Voltage Level (SDCARD_BIAS_VMODE)	SDCARD_BIAS_SUPPLY_HI_OUT	SDCARD_BIAS_HIZ_MODE	PWRDNZ Bits	SDCARD_BIAS_VMODE_ERROR
0	0	X	0	0
0	0	0	1	0
0	1	0	1	1
X	X	1	1	1
1	0	X	0	0
1	0	0	1	1
1	1	0	1	0

SDCARD_BIAS_VMODE_ERROR = 0x1 shows that the programmed voltage level is not the same as the voltage indicated by the SDCARD_BIAS_SUPPLY_HI_OUT bit or high impedance mode is selected.

SDCARD_BIAS_VMODE_ERROR = 0x0 shows that the programmed voltage level is the same as the voltage indicated by the SDCARD_BIAS_SUPPLY_HI_OUT bit or it is not considered because SDCARD_PWRDNZ = 0x0.

18.4.6.4 IRQ_CROSSBAR Module Functional Description

There is an IRQ_CROSSBAR module in the device, which is controlled by registers in the CTRL_MODULE_CORE submodule. The IRQ_CROSSBAR is able to map any of its input signals to any of its outputs. This module is associated with the device interrupt sources. The IRQs from all the device modules are connected to the IRQ_CROSSBAR inputs. Each module IRQ is connected only to one cross-bar input. Each output of the IRQ_CROSSBAR module is connected only to one interrupt line of certain interrupt controller (INTC). Thus, the device IRQs are mapped to the device INTCs through the IRQ_CROSSBAR. Some of these IRQs are mapped by default to certain interrupt lines of one of the device INTCs, but there are IRQs which are not mapped by default to any interrupt line of any device INTC. All IRQs, connected to the IRQ_CROSSBAR inputs, can be remapped to other interrupt lines of the different device INTCs through the CTRL_CORE_X_IRQ_B_A registers. Each of these registers has a structure described in Table 18-14.

Table 18-14. Generic Description of the CTRL_CORE_X_IRQ_B_A IRQ_CROSSBAR Control Registers

Bits	Field Name	Description	Type	Note
31:25	RESERVED		R	
24:16	X_IRQ_A	Selects an interrupt source signal for the X_IRQ_A INTC line 0x0: Reserved 0x1: Maps IRQ_CROSSBAR input 1 to X_IRQ_A INTC line 0x2: Maps IRQ_CROSSBAR input 2 to X_IRQ_A INTC line 0x-: .... 0x64: Maps IRQ_CROSSBAR input 100 to X_IRQ_A INTC line 0x-: .... 0x190 to 0x1FF: Reserved	RW	X is summarization. It is equal to: • MPU • DSP1 • DSP2 • IPU1 • IPU2 • EVE1 • EVE2 X shows the module name to which interrupt controller all inputs of the IRQ_CROSSBAR module can be mapped. A is also summarization. It shows the number of the line for the corresponding INTC. A is equal to 0, 1, 2, ..., and so on, depending on the count of the INTC lines controlled by the IRQ_CROSSBAR module. For more details, see Table 18-15.
15:9	RESERVED		R	

Table 18-14. Generic Description of the CTRL_CORE_X_IRQ_B_A IRQ_CROSSBAR Control Registers (continued)

Bits	Field Name	Description	Type	Note
8:0	X_IRQ_B	Selects an interrupt source signal for the X_IRQ_B INTC line 0x0: Reserved 0x1: Maps IRQ_CROSSBAR input 1 to X_IRQ_B INTC line 0x2: Maps IRQ_CROSSBAR input 2 to X_IRQ_B INTC line 0x-: .... 0x64: Maps IRQ_CROSSBAR input 100 to X_IRQ_B INTC line 0x-: .... 0x190 to 0x1FF: Reserved	RW	B is summarization. It shows the number of the line for the corresponding INTC. B is equal to 0, 1, 2, ..., and so on, depending on the count of the INTC lines controlled by the IRQ_CROSSBAR module.

Figure 18-9 represents the way in which the IRQ_CROSSBAR module works. It shows the device modules and their IRQs connected to the IRQ_CROSSBAR inputs, the structure of the cross-bar and its outputs connected to the device INTCs.

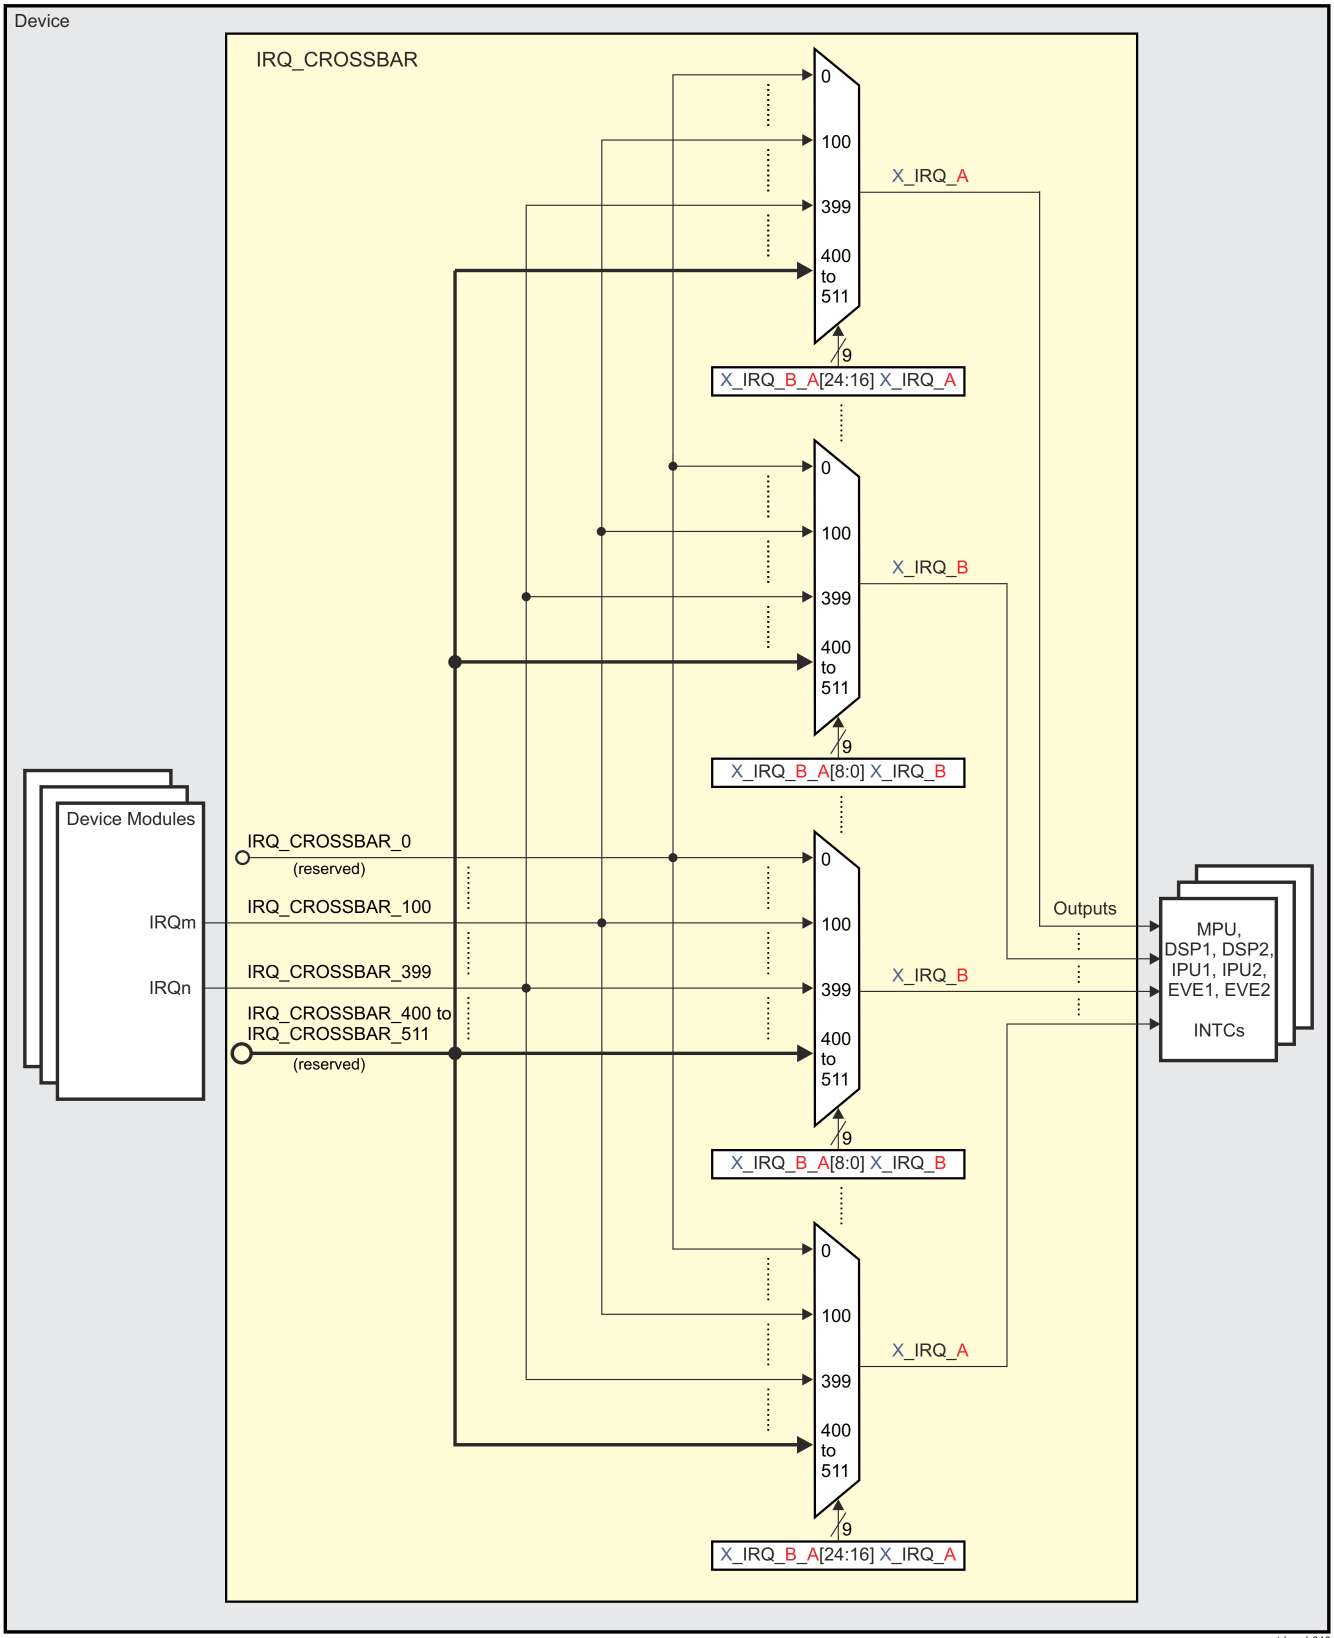

Figure 18-9. IRQ_CROSSBAR Module Functional Diagram

Each IRQ_CROSSBAR control register has two 9-bit fields. Each 9-bit field is associated only with one interrupt line. Through this 9-bit field any of the IRQs connected to the IRQ_CROSSBAR inputs can be mapped to the INTC line associated with this 9-bit field. For example, the register CTRL_CORE_MPU_IRQ_74_75 is associated with MPU_IRQ_74 and MPU_IRQ_75. The 9-bit field CTRL_CORE_MPU_IRQ_74_75[24:16] MPU_IRQ_75 is associated only with MPU_IRQ_75 interrupt line of the MPU INTC. Setting this bit field to any other value different than its reset value will map another module IRQ to the MPU_IRQ_75 interrupt line. The default (reset) value of this bit field is 0x46 which corresponds to the IRQ_CROSSBAR_70 input. The PBIAS_IRQ is connected to this cross-bar input. Setting another register to 0x46 will cause the PBIAS_IRQ to be mapped to another INTC line. For example, if the CTRL_CORE_DSP1_IRQ_40_41[8:0] DSP1_IRQ_40 is set to 0x46 the PBIAS_IRQ will be mapped to the DSP1_IRQ_40 interrupt line. The same logic also applies to the other interrupt lines of the device INTCs.

In addition, not all of the interrupt lines of a given INTC are controlled by the IRQ_CROSSBAR registers. This means, that there are interrupt lines which are not connected to any IRQ_CROSSBAR output and thus only one IRQ is connected to these interrupt lines. In the most common case these lines are used by interrupt sources internal or specific for the corresponding module, which has an INTC.

Table 18-15 shows which lines of each INTC are associated with the IRQ_CROSSBAR control registers. The rest of the INTC lines (not listed in the table) cannot be controlled by the cross-bar registers.

Table 18-15. Interrupt Lines Associated With The IRQ_CROSSBAR Control Registers

MPU INTC Lines	DSP INTC Lines	IPU INTC Lines	EVE INTC Lines
MPU_IRQ_4, MPU_IRQ_7 to MPU_IRQ_130, MPU_IRQ_133 to MPU_IRQ_159	DSP1_IRQ_32 to DSP1_IRQ_95, DSP2_IRQ_32 to DSP2_IRQ_95	IPU1_IRQ_23 to IPU1_IRQ_79, IPU2_IRQ_23 to IPU2_IRQ_79	EVE1_IRQ_0 to EVE1_IRQ_7, EVE2_IRQ_0 to EVE2_IRQ_7

The individual connection between all module IRQs and all IRQ_CROSSBAR inputs is shown in Section 17.3.8, *Mapping of Device Interrupts to IRQ_CROSSBAR Inputs* of Chapter 17, *Interrupt Controllers*.

In addition, the CTRL_CORE_OVS_IRQ_IO_MUX register is used to select for observation on two external pads any IRQ connected to the IRQ_CROSSBAR inputs. Using the CTRL_CORE_OVS_IRQ_IO_MUX[17:9] OVS_IRQ_IO_MUX_2 bit field all IRQs can be mapped to the obs_irq2 signal. The CTRL_CORE_OVS_IRQ_IO_MUX[8:0] OVS_IRQ_IO_MUX_1 bit field maps all IRQs to the obs_irq1 signal. For example, setting the CTRL_CORE_OVS_IRQ_IO_MUX[8:0] OVS_IRQ_IO_MUX_1 to 0x18 maps the GPIO1_IRQ_1 to the obs_irq1 line and thus this IRQ can be observed.

18.4.6.5 DMA_CROSSBAR Module Functional Description

There is a DMA_CROSSBAR module in the device, which is controlled by registers in the CTRL_MODULE_CORE submodule. The DMA_CROSSBAR is able to map any of its input signals to any of its outputs. This module is associated with the device DMA request source signals. The DREQs from all the device modules are connected to the DMA_CROSSBAR inputs. Each DREQ signal is connected only to one DMA cross-bar input. Each output of the DMA_CROSSBAR module is connected only to one input line of the device DMA modules. The DMAs associated with the DMA_CROSSBAR are the following:

- DMA_SYSTEM
- DMA_EDMA
- DMA_DSP1_EDMA
- DMA_DSP2_EDMA

All DREQs, connected to the DMA_CROSSBAR inputs, can be remapped to other lines of the these DMA modules through the CTRL_CORE_DMA_X_DREQ_B_A registers. Each of these registers has a structure described in Table 18-16.

Table 18-16. Generic Description of the CTRL_CORE_DMA_X_DREQ_B_A DMA_CROSSBAR Control Registers

Bits	Field Name	Description	Type	Note
31:24	RESERVED		R	

Table 18-16. Generic Description of the CTRL_CORE_DMA_X_DREQ_B_A DMA_CROSSBAR Control Registers (continued)

Bits	Field Name	Description	Type	Note
23:16	DMA_X_DREQ_A_IRQ_A	Selects a DMA request source signal for the DMA_X_DREQ_A_IRQ_A DMA line 0x0: Reserved 0x1: Reserved 0x2: Maps DMA_CROSSBAR input 2 to DMA_X_DREQ_A_IRQ_A DMA line 0x3: Maps DMA_CROSSBAR input 3 to DMA_X_DREQ_A_IRQ_A DMA line 0x-: .... 0x32: Maps DMA_CROSSBAR input 50 to DMA_X_DREQ_A_IRQ_A DMA line 0x-: .... 0xCC to 0xFF: Reserved	RW	X is summarization. It is equal to: • SYSTEM • EDMA • DSP1_EDMA • DSP2_EDMA X shows to which DMA all inputs of the DMA_CROSSBAR module can be mapped. A is also summarization. It shows the number of the DREQ line for the corresponding DMA module. A is equal to 0, 1, 2, ..., and so on, depending on the count of the DMA lines controlled by the DMA_CROSSBAR module. For more details, see Table 18-17.
15:8	RESERVED		R	
7:0	DMA_X_DREQ_B_IRQ_B	Selects a DMA request source signal for the DMA_X_DREQ_B_IRQ_B DMA line 0x0: Reserved 0x1: Reserved 0x2: Maps DMA_CROSSBAR input 2 to DMA_X_DREQ_B_IRQ_B DMA line 0x3: Maps DMA_CROSSBAR input 3 to DMA_X_DREQ_B_IRQ_B DMA line 0x-: .... 0x32: Maps DMA_CROSSBAR input 50 to DMA_X_DREQ_B_IRQ_B DMA line 0x-: .... 0xCC to 0xFF: Reserved	RW	B is also summarization. It shows the number of the DREQ line for the corresponding DMA module. B is equal to 0, 1, 2, ..., and so on, depending on the count of the DMA lines controlled by the DMA_CROSSBAR module. For more details, see Table 18-17.

Figure 18-10 represents the way in which the DMA_CROSSBAR module works. It shows the device modules and their DREQs connected to the DMA_CROSSBAR inputs, the structure of the cross-bar and its outputs connected to the device DMA modules.

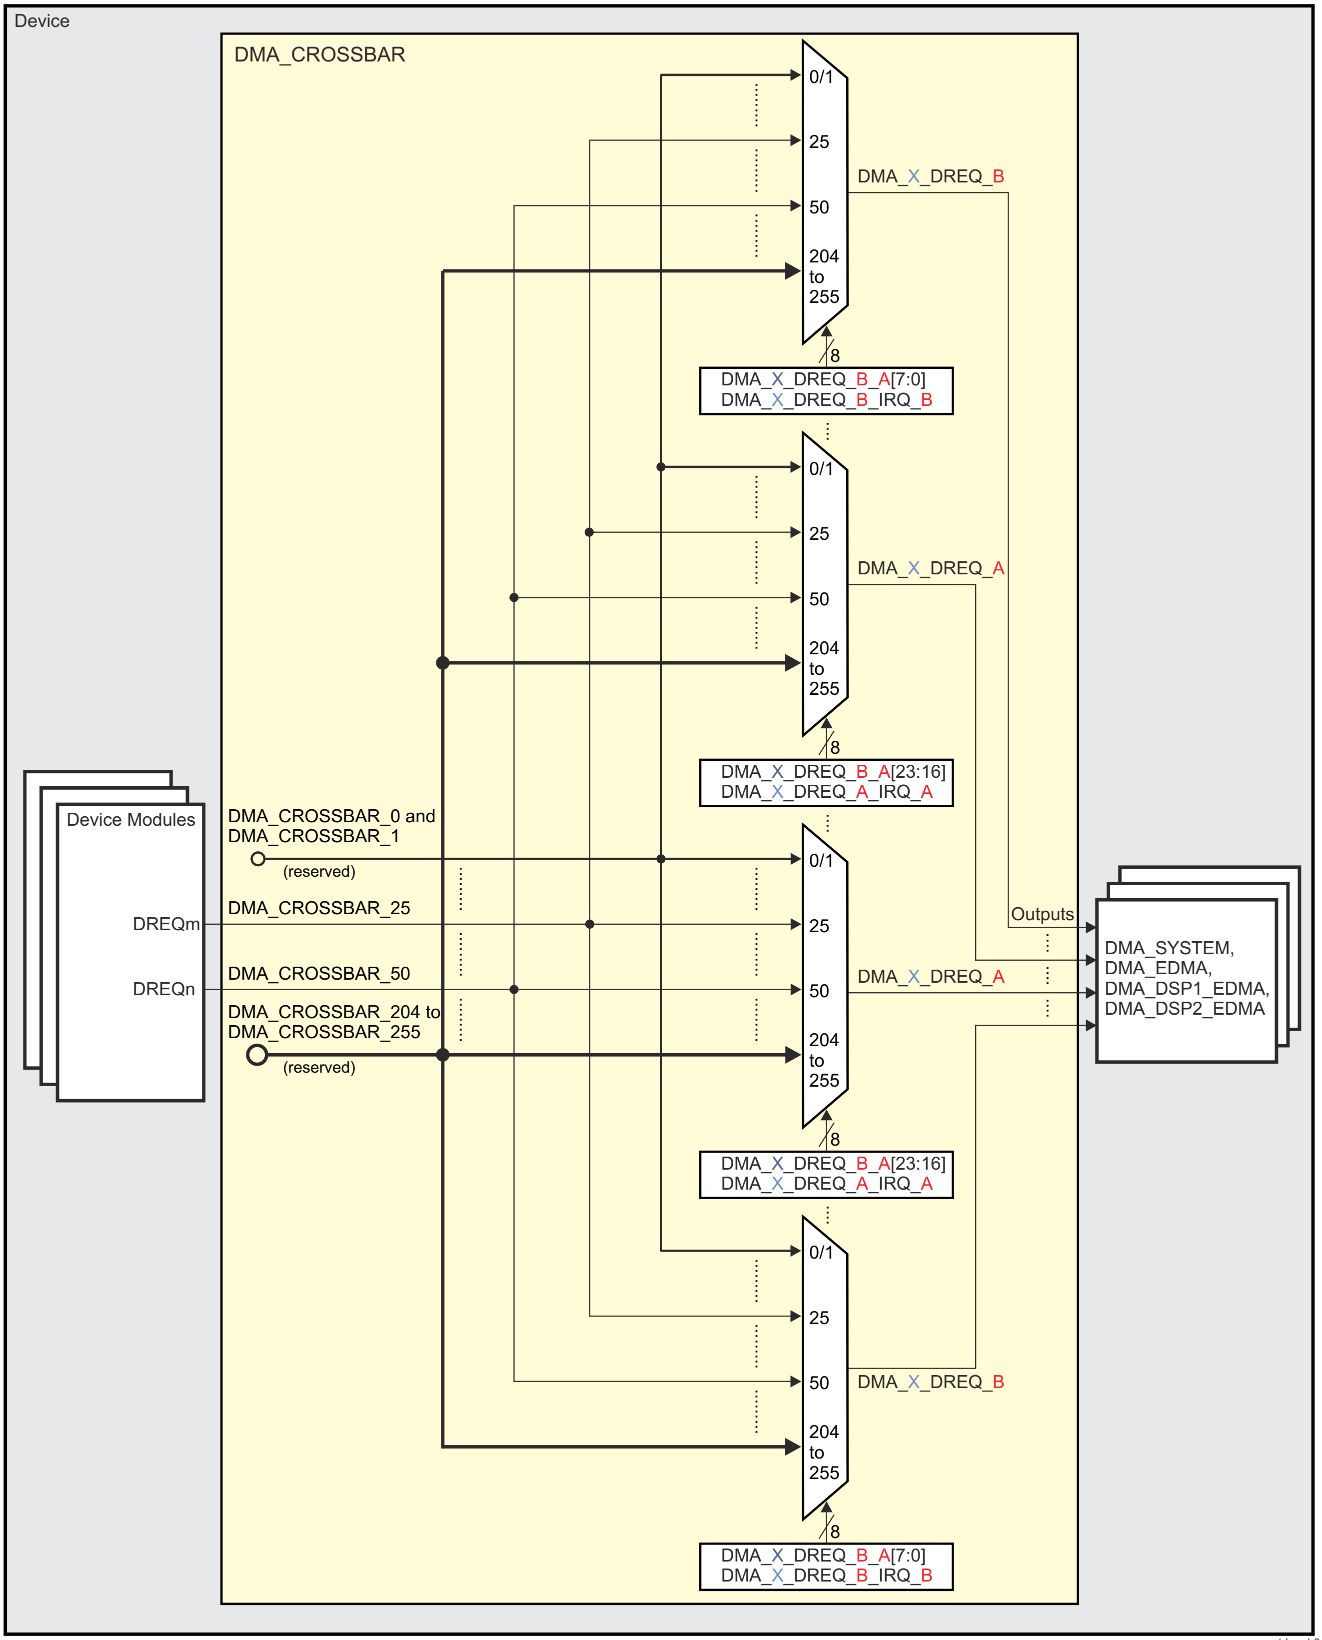

Figure 18-10. DMA_CROSSBAR Module Functional Diagram

Each DMA_CROSSBAR control register has two 8-bit fields. Each 8-bit field is associated only with one line of certain DMA module. Through this 8-bit field any of the DREQs connected to the DMA_CROSSBAR inputs can be mapped to the DMA line associated with this 8-bit field. For example, the register CTRL_CORE_DMA_EDMA_DREQ_62_63 is associated with DMA_EDMA_DREQ_62 and DMA_EDMA_DREQ_63 lines. The 8-bit field CTRL_CORE_DMA_EDMA_DREQ_62_63[7:0] DMA_EDMA_DREQ_62_IRQ_62 is associated only with DMA_EDMA_DREQ_62 line of the DMA_EDMA module. Setting this bit field to any other value different than its reset value will map another DREQ from the device modules to the DMA_EDMA_DREQ_62 line. The default (reset) value of this bit field is 0x3F which corresponds to the DMA_CROSSBAR_63 input. The UART5_DREQ_TX is connected to this cross-bar input. Setting another register to 0x3F will cause the UART5_DREQ_TX to be mapped to another DMA line. For example, if the CTRL_CORE_DMA_EDMA_DREQ_30_31[23:16] DMA_EDMA_DREQ_31_IRQ_31 is set to 0x3F the UART5_DREQ_TX will be mapped to the DMA_EDMA_DREQ_31 line. The same logic also applies to the other lines of the device DMAs.

Table 18-17 shows which lines of each DMA are associated with the DMA_CROSSBAR control registers. The rest of the lines (not listed in the table) cannot be controlled by the cross-bar registers.

Table 18-17. DREQ Lines Associated With The DMA_CROSSBAR Control Registers

DMA_SYSTEM DREQ Lines	DMA_EDMA DREQ Lines	DMA_DSP1_EDMA DREQ Lines	DMA_DSP2_EDMA DREQ Lines
DMA_SYSTEM_DREQ_0 to DMA_SYSTEM_DREQ_126	DMA_EDMA_DREQ_0 to DMA_EDMA_DREQ_63	DMA_DSP1_DREQ_0 to DMA_DSP1_DREQ_19	DMA_DSP2_DREQ_0 to DMA_DSP2_DREQ_19

The individual connection between all module DREQs and all DMA_CROSSBAR inputs is shown in Section 16.1.3.2, *Mapping of DMA Requests to DMA_CROSSBAR Inputs* of Section 16.1, *System DMA*.

In addition, the CTRL_CORE_OVS_DMARQ_IO_MUX register is used to select for observation on two external pads any DREQ connected to the DMA_CROSSBAR inputs. Using the CTRL_CORE_OVS_DMARQ_IO_MUX[15:8] OVS_DMARQ_IO_MUX_2 bit field all DREQs can be mapped to the obs_dmarq2 signal. The CTRL_CORE_OVS_DMARQ_IO_MUX[7:0] OVS_DMARQ_IO_MUX_1 bit field maps all DREQs to the obs_dmarq1 signal. For example, setting the CTRL_CORE_OVS_DMARQ_IO_MUX[7:0] OVS_DMARQ_IO_MUX_1 to 0x6 maps the DISPC_DREQ to the obs_dmarq1 line and thus this DREQ can be observed.

18.4.6.6 SDRAM Initiator Priority Registers

The CTRL_CORE_EMIF_INITIATOR_PRIORITY_1 to CTRL_CORE_EMIF_INITIATOR_PRIORITY_6 registers are intended to control the priority of each initiator accessing the two EMIFs. Each 3-bit field in these registers is associated only with one initiator. Setting this bit field to 0x0 means that the corresponding initiator has a highest priority over the others and setting it to 0x7 is for lowest priority. This feature is useful in case of concurrent access to the external SDRAM from several initiators.

Note

The priorities configured through the CTRL_CORE_EMIF_INITIATOR_PRIORITY_1 to CTRL_CORE_EMIF_INITIATOR_PRIORITY_6 registers have affect only at the L3 switch levels and are always overridden at DMM level by the priorities configured thorough the DMM_PEG_PRIO_k registers.

18.4.6.7 L3_MAIN Initiator Priority Registers

The CTRL_CORE_L3_INITIATOR_PRESSURE_1 to CTRL_CORE_L3_INITIATOR_PRESSURE_6 registers are used for controlling the priority of certain initiators on the L3_MAIN. Each 2-bit field in these registers is associated only with one initiator. Setting this bit field to 0x3 means that the traffic of this initiator has highest proiroty over the other traffics. A value of 0x0 is for lowest priority. Through these registers a dynamic priority escalation for the following L3_MAIN initiators is provided:

- MPU

- DSP1
- DSP2
- IPU1
- IPU2
- GPU P1
- GPU P2
- SATA
- MMC1
- MMC2
- USB1
- USB2
- USB3
- USB4

18.4.6.8 Memory Region Lock Registers

There are five registers used to lock different memory regions of CTRL_MODULE_CORE memory mapped space. A memory region is locked, means that all wite accesses to this region are ignored. Writing a value unique for each register will lock certain memory region and writing another unique value results in unlocking of the same region. These five registers can lock the entire memory space of the CTRL_MODULE_CORE submodule. Table 18-18 gives more details.

Table 18-18. Memory Region Lock Registers

Register	Memory Space to Lock	Groups of Registers Associated With This Memory Region	Lock/Unlock (register reset value)
CTRL_CORE_MMR_LOCK_1	Region from 0x0000 0100 to 0x0000 079F	Thermal management related registers, EMIF initiator priority, L3_MAIN initiator pressure (priority), standard eFuse and other registers	locked
CTRL_CORE_MMR_LOCK_2	Region from 0x0000 07A0 to 0x0000 0D9F	IRQ_CROSSBAR and DMA_CROSSBAR registers	locked
CTRL_CORE_MMR_LOCK_3	Region from 0x0000 0DA0 to 0x0000 0FFF	A few registers associated with device I/Os	locked
CTRL_CORE_MMR_LOCK_4	Region from 0x0000 1000 to 0x0000 13FF	Reserved range	locked
CTRL_CORE_MMR_LOCK_5	Region from 0x0000 1400 to 0x0000 1FFF	Mainly pad configuration registers	locked

Note

By default the entire CTRL_MODULE_CORE memory space is locked but the ROM code unlocks it by writing corresponding unlock values to all CTRL_CORE_MMR_LOCK_x registers.

18.4.6.9 NMI Mapping To Respective Cores

Two registers CTRL_CORE_NMI_DESTINATION_1 and CTRL_CORE_NMI_DESTINATION_2 are intended to map the external non-maskable interrupt (NMI) to certain of the device host processors. Writing 0x1 into a bit field of these registers enables the NMI to be mapped to the corresponding processor associated with this bit field. Writing 0x0 disables the NMI mapping to this processor.

18.4.6.10 Software Controls for the DDR2/DDR3 I/O Cells

There are two types of I/O cells associated with the DDR2/DDR3 interface. These are single-ended and differential I/O cells.

These I/O cells have the following software controls which reside in registers of the CTRL_MODULE_CORE:

- Output impedance controls - I[2:0]
- Slew rate controls - SR[2:0]

- Weak driver controls - WD[1:0]

The I and SR controls apply when the I/Os operate as outputs. The WD controls apply when the I/Os operate as both inputs or outputs.

The bits I[2:0] are used for programming the desired impedance value of the output buffer. Table 18-19 describes the I[2:0] controls which are valid for pull-up and pull-down outputs.

Table 18-19. Output Impedance Controls - I[2:0]

I[2]	I[1]	I[0]	Drive Setting Name	Output Impedance
0	0	0	Imp80	80 Ohms
0	0	1	Imp60	60 Ohms
0	1	0	Imp48	48 Ohms
0	1	1	Imp40	40 Ohms
1	0	0	Imp34	34 Ohms
1	0	1	Reserved	Reserved
1	1	0	Reserved	Reserved
1	1	1	Reserved	Reserved

To achieve optimal noise/speed trade-off the slew rate of the output signal can also be programmed using the slew rate control bits SR[2:0] shown in Table 18-20. These SR settings do not affect the DC drive strength of the output buffer. They only control its turn-on time.

Table 18-20. Slew Rate Controls - SR[2:0]

SR[2]	SR[1]	SR[0]	Turn-On Time Level	Note
0	0	0	fastest	All 8 values are valid.
...	...	...		
...	...	...		
1	1	1	slowest	

Weak pull-up, pull-down or keeper option for device DDR2/3 pads is enabled through the WD[1:0] bits. The weak pull-up or pull-down option is used to define the pad state (high or low) when no signal is driving the pad. The weak keeper option is used to maintain the previous output value when nothing is driving the pad. Table 18-21 describes the WD controls. They are used for avoiding floating pads on the DDR2/DDR3 interface.

Table 18-21. Weak Driver Controls - WD[1:0]

WD[1]	WD[0]	Single-Ended Operation	Differential Pair Operation	
			padp	padn
0	0	Pull logic disabled	Pull logic disabled	Pull logic disabled
0	1	Weak pullup enabled	Weak pullup enabled	Weak pulldown enabled
1	0	Weak pulldown enabled	Weak pulldown enabled	Weak pullup enabled
1	1	Weak keeper enabled	Weak keeper enabled	Weak keeper enabled

Note

To avoid unnecessary power consumption, software must overwrite the Weak Driver (WD) reset values by setting them to 0x0.

It must be taken into account that the I, SR and WD software controls apply for several pads combined in groups, and not for a single pad. For example, writing 0x1 to the CTRL_CORE_CONTROL_DDRCACH1_0[17:16] DDR3CH1_PART5A_WD bit field enables the weak pull-up resistors for all 16 pads in the PART5A group. These are the ddr1_a[15:0] pads. Table 18-22 shows the I, SR and WD controls for the different DDR2/DDR3 pad groups.

Table 18-22. Software Group Controls for the DDR2/DDR3 Pads

18.4.6.11 Reference Voltage for the Device DDR2/DDR3 Receivers

The device DDR2/DDR3 input buffers work in so-called Vref-based receiver mode. In this mode, the buffers act like differential comparators with positive terminal connected to a device pad which receives signals from DDR2/DDR3 memory and negative terminal connected to a source of reference voltage.

To work properly, a reference voltage must be provided to the device DDR2/DDR3 input buffers. There are two Vref-generation cells per memory channel in the device intended to supply this internal reference voltage.

Figure 18-11 shows the Vref-generation cells in the device.

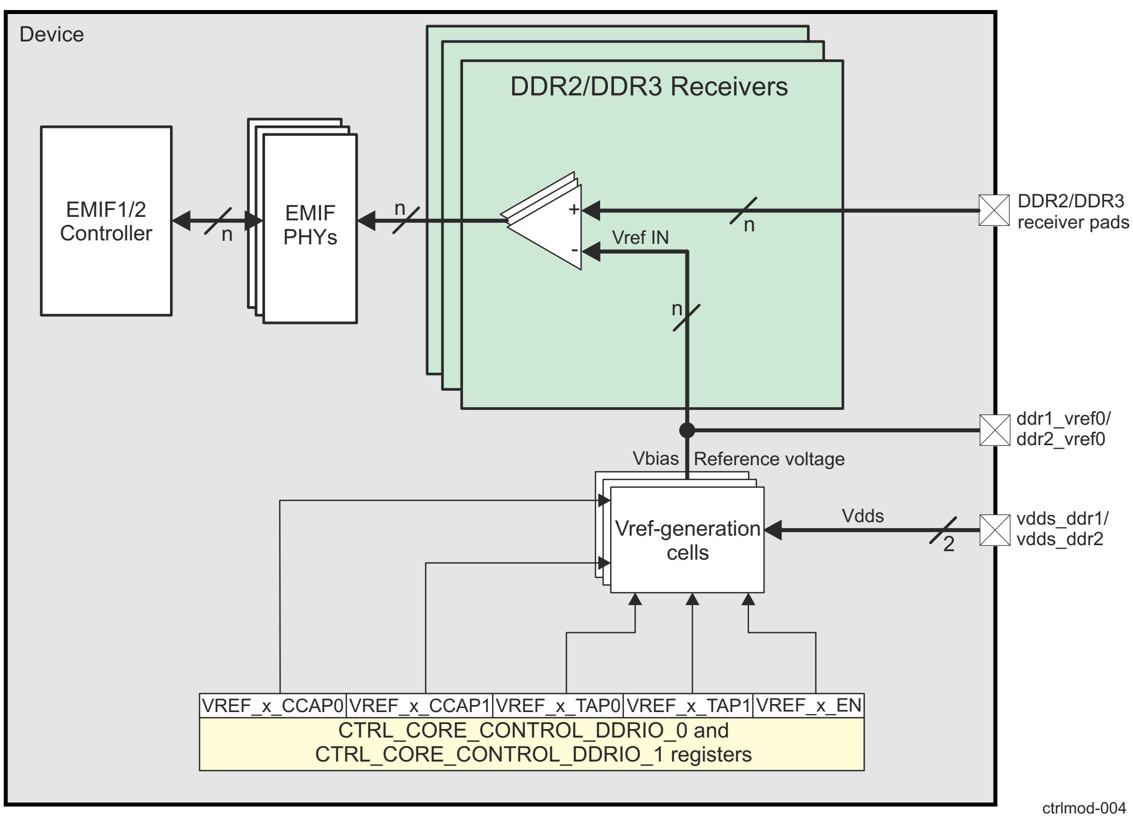

Figure 18-11. Vref-Generation Cells and Their Controls

Both the Vref-generation cells associated with EMIF1 are powerd through the vdds_ddr1 ball. Both the Vref-generation cells associated with EMIF2 are powerd through the vdds_ddr2 ball. For more information, see the device data manual.

The control bits for the Vref-generation cells reside in the CTRL_CORE_CONTROL_DDRIO_0 and CTRL_CORE_CONTROL_DDRIO_1 registers. There are VREF_x_TAP[1:0] control bits which set the output drive capability of the Vref cells. Table 18-23 lists the possible options for selection of load current sourced from the output of each Vref-generation cell.

Table 18-23. Vref Cell Load Current Selection

VREF_x_TAP1	VREF_x_TAP0	Description
0	0	2-μA load current
0	1	4-μA load current
1	0	8-μA load current
1	1	32-μA load current

According to the noise environment, the user can choose to filter the supplied reference voltage. Two coupling capacitors internal to each Vref-generation cell are available and configurable through the VREF_x_CCAP[1:0] control bits in the CTRL_CORE_CONTROL_DDRIO_0 and CTRL_CORE_CONTROL_DDRIO_1 registers, as specified in Table 18-24.

Table 18-24. Vref Cell Coupling Capacitor Selection

VREF_x_CCAP1	VREF_x_CCAP0	Capacitor
0	0	No capacitor connected.
0	1	One capacitor connected between Vbias and ground.(1)
1	0	One capacitor connected between Vbias and Vdds.(2)
1	1	One capacitor connected between Vbias and ground and one capacitor connected between Vbias and Vdds.

(1) Vbias is the output of the Vref-generation cell which provides the reference voltage.
(2) Vdds is the power supply voltage of the Vref-generation cell.

The Vref-gereration cells can be enabled by setting to 0x1 the VREF_x_EN bits in the CTRL_CORE_CONTROL_DDRIO_0 and CTRL_CORE_CONTROL_DDRIO_1 registers. These cells can be disabled (for leakage improvement and when not in use) by clearing the same VREF_x_EN bits.

Table 18-25 shows the Vref-generation cells control bits and the DDR2/DDR3 pads used as receivers to which the corresponding Vref cell supplies reference voltage.

Table 18-25. Controls for the Vref-Generation Cells Versus DDR2/DDR3 Receiver Pads

18.4.6.12 AVS Class 0 Associated Registers

AVS Class 0 attempts to normalize the power consumption across all devices by lowering the operating voltage of certain voltage rails. This procedure of lowering the voltage should be performed in the boot loader after ROM code. The new voltage to be set for each AVS Class 0 supported voltage rail should be read from the eFuse using dedicated registers. Then the power supply output voltage is adjusted to this new voltage value.

The following voltage rails support AVS Class 0:

- vdd_iva
- vdd_dspeve
- vdd
- vdd_gpu
- vdd_mpu

Note

For descriptions of the voltage rails previously listed see the *"Power Supply Signal Descriptions"* table in the device Data Manual.

Table 18-26 shows all registers associated with AVS Class 0. The corresponding AVS Class 0 voltage value can be read from the 12 LSbits of each of the listed registers. They contain the voltage value in hex format. To find the actual value in mV a conversion from hex to decimal value is needed. For example, if the value read from CTRL_CORE_STD_FUSE_OPP_VMIN_MPU_2[11:0] STD_FUSE_OPP_VMIN_MPU_2 is 0x041F, then this corresponds to 1055 mV.

Table 18-26. Registers Associated With AVS Class 0 Voltage

Physical Address	Bit Field Containing the AVS Class 0 Voltage Value	Voltage Rail	Supported OPP
0x4A00 25CC	CTRL_CORE_STD_FUSE_OPP_VMIN_IVA_2[11:0] STD_FUSE_OPP_VMIN_IVA_2	vdd_iva	OPP_NOM

0x4A00 3B08	CTRL_CORE_STD_FUSE_OPP_VMIN_GPU_2[11:0] STD_FUSE_OPP_VMIN_GPU_2	vdd_gpu	OPP_NOM
0x4A00 3B0C	CTRL_CORE_STD_FUSE_OPP_VMIN_GPU_3[11:0] STD_FUSE_OPP_VMIN_GPU_3		OPP_OD
0x4A00 3B10	CTRL_CORE_STD_FUSE_OPP_VMIN_GPU_4[11:0] STD_FUSE_OPP_VMIN_GPU_4		OPP_HIGH
0x4A00 3B14	CTRL_CORE_STD_FUSE_OPP_VMIN_GPU_5[11:0] STD_FUSE_OPP_VMIN_GPU_5		OPP_PLUS
0x4A00 3B1C	CTRL_CORE_STD_FUSE_OPP_VMIN_MPU_1[11:0] STD_FUSE_OPP_VMIN_MPU_1	vdd_mpu	OPP_LOW
0x4A00 3B20	CTRL_CORE_STD_FUSE_OPP_VMIN_MPU_2[11:0] STD_FUSE_OPP_VMIN_MPU_2		OPP_NOM
0x4A00 3B24	CTRL_CORE_STD_FUSE_OPP_VMIN_MPU_3[11:0] STD_FUSE_OPP_VMIN_MPU_3		OPP_OD
0x4A00 3B28	CTRL_CORE_STD_FUSE_OPP_VMIN_MPU_4[11:0] STD_FUSE_OPP_VMIN_MPU_4		OPP_HIGH
0x4A00 3B2C	CTRL_CORE_STD_FUSE_OPP_VMIN_MPU_5[11:0] STD_FUSE_OPP_VMIN_MPU_5		OPP_PLUS

Some of the OPPs listed in Table 18-26 may not be supported for some devices. In these cases the voltage values in the corresponding AVS Class 0 registers can be disregarded.

Note

For more information about the supported OPPs, see the "*Operating Performance Points*" section of the device Data Manual.

In some cases, the AVS Class 0 voltage that is read from the CTRL_CORE_STD_FUSE_OPP_VMIN_xxx_y registers has a value between two incremental voltage steps of the power supply. If such a case occurs, the higher voltage value should be selected.

If several AVS Class 0 supported voltage rails are combined with each other, then all corresponding registers should be read and the highest value should be selected. The power supply of the combined rails should be changed to this highest voltage value.

Note

For a list of the supported voltage rail combinations, see the device Data Manual.

Figure 18-12 shows a general example of how AVS Class 0 should be performed.

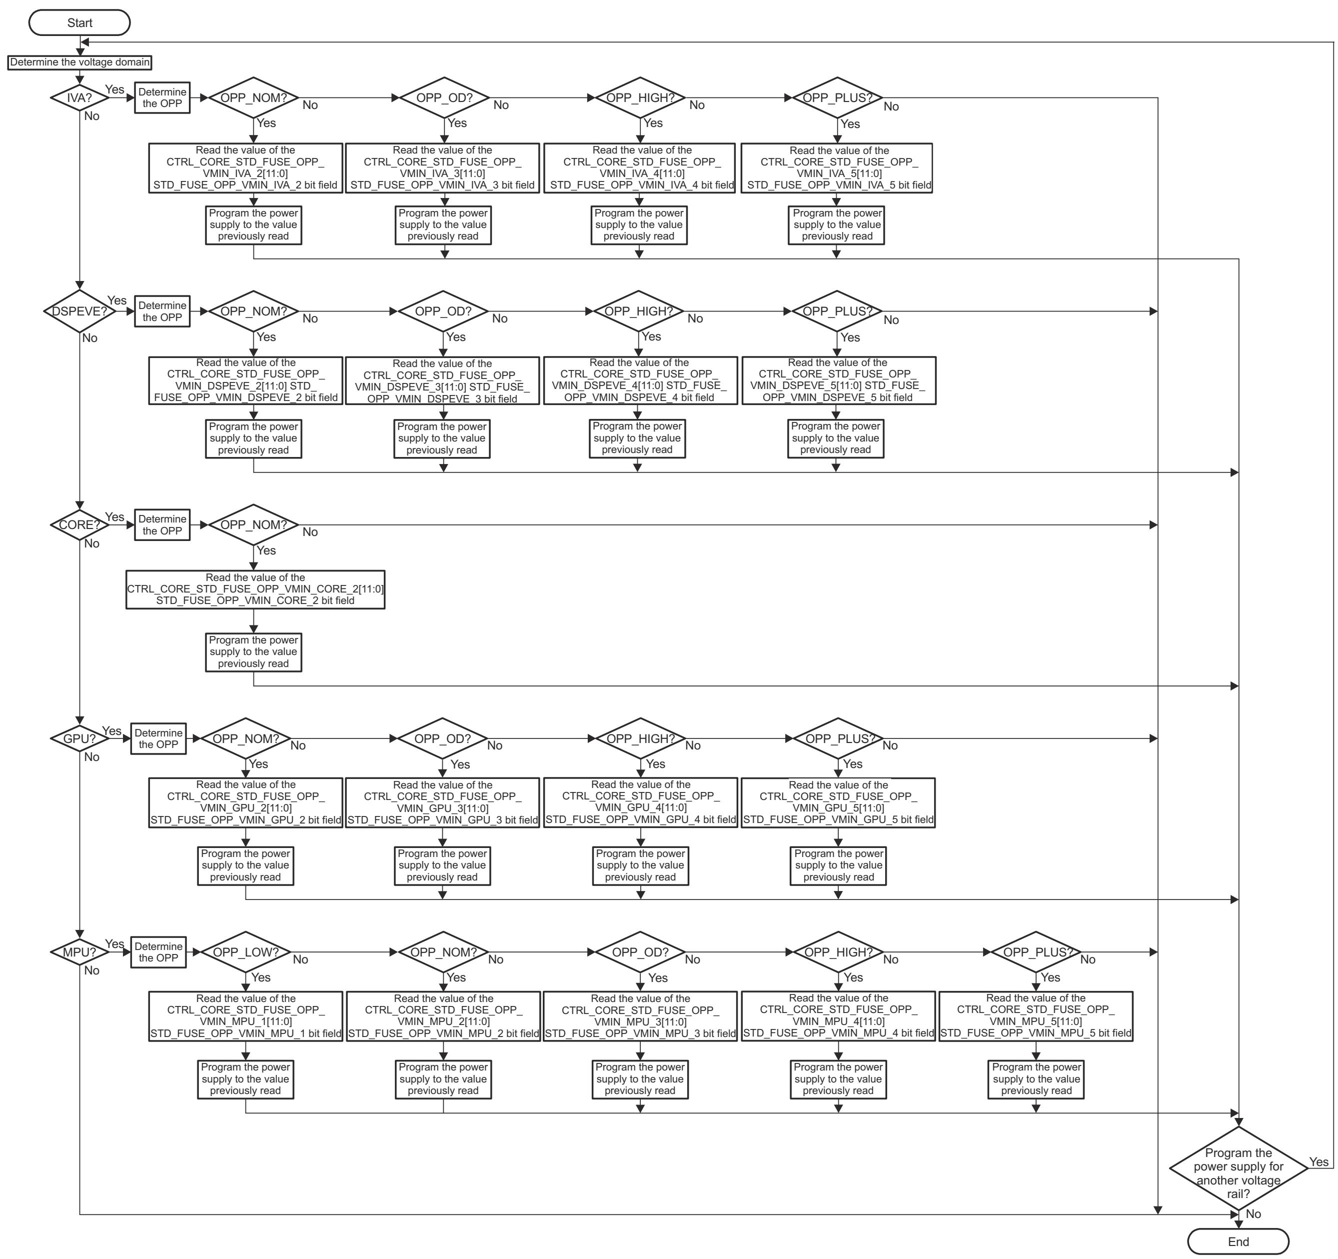

Figure 18-12. AVS Class 0 Procedure

18.4.6.13 ABB Associated Registers

When ABB is needed the following registers should be used:

- CTRL_CORE_LDOVBB_DSPEVE_VOLTAGE_CTRL
- CTRL_CORE_LDOVBB_IVA_VOLTAGE_CTRL
- CTRL_WKUP_LDOVBB_GPU_VOLTAGE_CTRL
- CTRL_WKUP_LDOVBB_MPU_VOLTAGE_CTRL
- The CTRL_CORE_STD_FUSE_OPP_VMIN_xxx_y registers depending on the OPP. There are different values for each OPP stored in each one of these registers.

The ABB LDO target value can be read from CTRL_CORE_STD_FUSE_OPP_VMIN_xxx_y[24:20] VSETABB bits, if CTRL_CORE_STD_FUSE_OPP_VMIN_xxx_y[25] ABBEN is set to 0x1. Then this value should be written to bits FBB_VSET_OUT (bits [4:0]) of registers CTRL_CORE/WKUP_LDOVBB_x_VOLTAGE_CTRL. The ABB LDO target value applies when CTRL_CORE/WKUP_LDOVBB_x_VOLTAGE_CTRL[10] FBB_ MUX_CTRL is set to 0x1, that is, FBB_VSET_OUT is used as a target bias voltage. When ABB is bypassed (not used) the FBB_VSET_OUT bits should be loaded with 0x0 and FBB_ MUX_CTRL should be set to 0x0.

It must be taken into account that the ABB LDO target value depends on the OPP. For example, concerning the MPU voltage domain:

- in case of OPP_NOM the value from CTRL_CORE_STD_FUSE_OPP_VMIN_MPU_2[24:20] VSETABB should be used.
- in case of OPP_OD the value from CTRL_CORE_STD_FUSE_OPP_VMIN_MPU_3[24:20] VSETABB should be used.

Note

Before enabling the ABB LDO in FBB mode the FBB_VSET_OUT and FBB_ MUX_CTRL bits must be programmed. The FBB_VSET_OUT bits must be loaded with a value which corresponds to the relevant OPP.

For more details regarding ABB see Section 3.8.3.4 *ABB LDO Programming sequence*.

18.4.6.14 Registers For Other Miscellaneous Functions

18.4.6.14.1 System Boot Status Settings

The CTRL_CORE_BOOTSTRAP register is a status register which indicates the state of the sysboot0 to sysboot15 input signals. Their purpose is to select the boot interface, the device source clock configuration and also other boot related settings.

Note

For proper device operation, sysboot14 must be tied to vss . For SR1.1, sysboot15 must be tied to vdd, but for SR2.0 it is configurable. For more information, see Section 18.4.6.1.1.1, *Permanent PU/PD disabling (SR 2.0 only)* in Chapter 18, *Control Module*.

18.4.6.14.2 Force MPU Write Nonposted Transactions

The control module provides a way for software to force all writes from the MPU subsystem to the L3_MAIN to be nonposted regardless of the attributes of the transactions coming from the MPU. This is done by setting to 0x1 the CTRL_CORE_MPU_FORCEWRNP[0] MPU_FORCEWRNP bit. This bit must not be changed until the transfer completes.

18.4.6.14.3 Firewall Error Status Registers

There are four status registers which show when there is a firewall error. The CTRL_CORE_SEC_ERR_STATUS_FUNC_1 and CTRL_CORE_SEC_ERR_STATUS_FUNC_2 registers are used in device normal operation mode. The x_FW_ERROR bits from these two registers are combined into a single interrupt signal sent to the IRQ_CROSSBAR module as shown in Figure 18-13. The CTRL_CORE_SEC_ERR_STATUS_DEBUG_1 and CTRL_CORE_SEC_ERR_STATUS_DEBUG_2 registers are used when the device is in debug mode. These two registers have bits same as in the CTRL_CORE_SEC_ERR_STATUS_FUNC_1 and CTRL_CORE_SEC_ERR_STATUS_FUNC_2 registers.

All bits in these registers are cleared when the ERROR_LOG_k and L4_IA_ERROR_LOG_L registers are cleared.

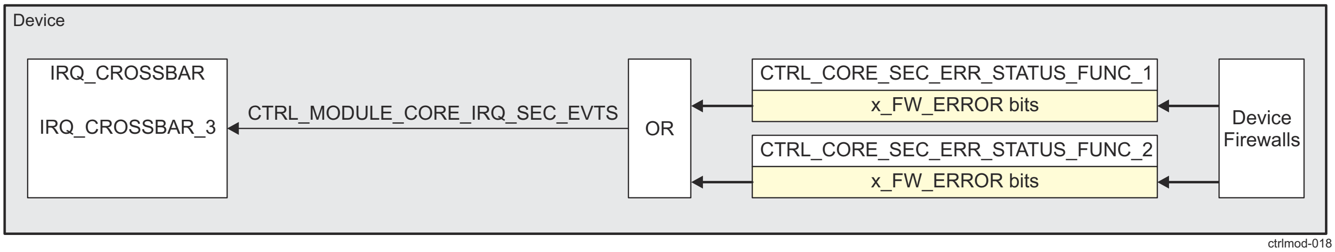

Figure 18-13. Combined Firewall Error Interrupt

18.4.6.14.4 Settings Related To Different Peripheral Modules

The CTRL_CORE_CONTROL_IO_1 and CTRL_CORE_CONTROL_IO_2 registers have controls for specific settings of several device peripheral modules.

18.4.7 Functional Description Of The Various Register Types In CTRL_MODULE_WKUP Submodule

The following sections describe in detail the purpose of the various kinds of registers and register groups which reside in the CTRL_MODULE_WKUP submodule.

18.4.7.1 Registers For Basic EMIF Configuration

The CTRL_WKUP_SECURE_EMIF1_SDRAM_CONFIG and CTRL_WKUP_SECURE_EMIF2_SDRAM_CONFIG registers have bits which determine the basic settings of the two EMIF controllers. These are, for example, settings like CAS write latency, SDRAM drive strength, SDRAM termination resistor values, SDRAM type and others.

The CTRL_WKUP_SECURE_EMIF1_SDRAM_CONFIG bit field values are exported upon POR to the EMIF1.EMIF_SDRAM_CONFIG register.

The CTRL_WKUP_SECURE_EMIF2_SDRAM_CONFIG bit field values are exported upon POR to the EMIF2.EMIF_SDRAM_CONFIG register.

The CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT and CTRL_WKUP_EMIF2_SDRAM_CONFIG_EXT registers are associated with DDR PHY controls, ODT values for device DDR I/Os, some leveling related parameters and others.

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17	EMIF1_NARROW_ONLY	EMIF1 operates in narrow mode, to allow for data macros to be powered down to save power 0x0 = narrow mode disabled 0x1 = narrow mode enabled	RW	0x0
16	EMIF1_EN_ECC	EMIF1 ECC enable 0x0 = ECC is disabled 0x1 = ECC is enabled	RW	0x0
15:14	EMIF1_REG_PHY_NUM_OF_SAMPLES	Controls the number of DQ samples required for read leveling. The recommended setting for full leveling is 0x3 (128 samples) . 0x0 = 4 samples 0x1 = 8 samples. 0x2 = 16 samples 0x3 = 128 samples	RW	0x0
13	EMIF1_REG_PHY_SEL_LOGIC	Selects an algorithm for read leveling. The use of algorithm 1 (set by default) is recommended. 0x0 = Algorithm 1 is used 0x1 = Algorithm 2 is used	RW	0x0

Bits	Field Name	Description	Type	Reset
12	EMIF1_REG_PHY_ALL_DQ_MPR_RD_RESP	Analysis method of DQ bits during read leveling. 0x0: if the DRAM provides a read response on only one DQ bit (this can be any bit, since in this mode all 8 DQ bits are OR-ed together). This is the default setting and works with all memory types (memories send responses on all DQ bits or on a single DQ bit). 0x1: if the DRAM provides a read response on all DQ bits.	RW	0x0
11:9	EMIF1_REG_PHY_OUTPUT_STATUS_SELECT	Selects the status to be observed on the outputs of the DDR PHYs through CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT_1 register. 0x0 = selects phy_reg_rdlvl_start_ratio[7:0] 0x1 = selects phy_reg_rdlvl_start_ratio[15:8] 0x2 = selects phy_reg_rdlvl_end_ratio[7:0] 0x3 = selects phy_reg_rdlvl_end_ratio[15:8]	RW	0x0
8	RESERVED		R	0x1
7	EMIF1_SDRAM_DISABLE_RESET	DDR3 SDRAM reset disable. 0x0 = DDR3 SDRAM reset signal is enabled. It can be asserted by EMIF 0x1 = DDR3 SDRAM reset signal is disabled. It is forbidden to EMIF to assert it.	RW	0x0
6:5	EMIF1_PHY_RD_LOCAL_ODT	Control of ODT (on – die termination) settings for the device DDR I/Os. ODT is enabled only during read operations when termination is required. 0x0 = ODT disabled 0x1= 60 Ohms 0x2 = 80 Ohms 0x3 =120 Ohms	RW	0x0
4	RESERVED		RW	0x0
3	EMIF1_DFI_CLOCK_PHASE_CTRL	EMIF_FICLK clock phase control (shifting by 180°). For normal operation this bit must always be set to 0x0 (disabled).	RW	0x0
2	EMIF1_EN_SLICE_2	Enable command PHY 2. When using DDR3 this bit can be set to 0x0 or 0x1. For lower power consumption 0x0 is used.	RW	0x1
1	EMIF1_EN_SLICE_1	Enable command PHY 1. 0x1 is the mandatory setting if DDR3 is used. EMIF1_EN_SLICE_0 and EMIF1_EN_SLICE_1 have to be programmed with the same value.	RW	0x1
0	EMIF1_EN_SLICE_0	Enable command PHY 0. 0x1 is the mandatory setting if DDR3 is used. EMIF1_EN_SLICE_0 and EMIF1_EN_SLICE_1 have to be programmed with the same value.	RW	0x1

18.7.4 IODELAYCONFIG Register Description

Table 18-913. CONFIG_REG_0

Address Offset	0x0000 000C		
Physical Address	0x4844 A00C	**Instance**	IODELAYCONFIG
Description	Calibration Control Register		
Type	RW		

31–2	1	0
RESERVED	ROM_READ	CALIBRATION_START

Bits	Field Name	Description	Type	Reset
31:2	RESERVED		R	0x0
1	ROM_READ	Triggers complete ROM read when '1' is written. Cleared when ROM read is complete.	RW	0x0
0	CALIBRATION_START	Triggers hardware calibration when '1' is written. Cleared when hardware completes calibration.	RW	0x0

Table 18-914. Register Call Summary for Register CONFIG_REG_0

Control Module Functional Description

- IO Delay Recalibration: [0] [1] [2] [3]

IODELAYCONFIG Module Register Manual

Table 18-915. CONFIG_REG_2

Address Offset	0x0000 0014		
Physical Address	0x4844 A014	**Instance**	IODELAYCONFIG
Description	Reference Clock Period Register.		
Type	RW		

31:16	15:0
RESERVED	REFCLK_PERIOD

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:0	REFCLK_PERIOD	15:0 stores the binary equivalent of reference clock period in units of 10ps. This value (along with calibration results) is used for computing the coarse/fine element delay Example: 0xF0 means 2400ps.	RW	0x21D2

Table 18-916. Register Call Summary for Register CONFIG_REG_2

Table 18-921. CONFIG_REG_8

Address Offset	0x0000 002C		
Physical Address	0x4844 A02C	**Instance**	IODELAYCONFIG
Description	Global Lock Register.		
Type	RW		

31:1	0
RESERVED	GLOBAL_LOCK_BIT

Bits	Field Name	Description	Type	Reset
31:1	RESERVED		R	0x0
0	GLOBAL_LOCK_BIT	Global Lock Bit Register. A '1' in this bit protects the writes to MMRs that store delay line select values. A '0' in this bit indicates that MMRs that store delay line select values are writeable. To write a '0' to this bit, signature of 0x5555 must be used on the MSB bits 16:1 of mdata.	RW	0x1

Description	Delay Select Value in binary coded form for cfg_mmc1_clk_oen interface		
Type	RW		

31:18	17:12	11	10	9:0
RESERVED	SIGNATURE	RESERVED	LOCK_BIT	BINARY_DELAY

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Description	Delay Select Value in binary coded form for cfg_mmc1_sdwp_out interface		
Type	RW		

31:18	17:12	11	10	9:0
RESERVED	SIGNATURE	RESERVED	LOCK_BIT	BINARY_DELAY

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Description	Delay Select Value in binary coded form for cfg_mmc3_dat5_in interface		
Type	RW		

31:18	17:12	11	10	9:0
RESERVED	SIGNATURE	RESERVED	LOCK_BIT	BINARY_DELAY

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0
