

# LM5017 100-V, 600-mA Constant On-Time Synchronous Buck / Fly-Buck™ Regulator

## 1 Features

- Wide 7.5-V to 100-V input range
- Integrated 100-V high-side and low-side switches
- No schottky required
- Constant on-time control
- No loop compensation required
- Ultra-fast transient response
- Nearly constant operating frequency
- Intelligent peak current limit
- Adjustable output voltage from 1.225 V
- Precision 2% feedback reference
- Frequency adjustable to 1 MHz
- Adjustable undervoltage lockout (UVLO)
- Remote shutdown
- Thermal shutdown
- Packages:
  - WSON-8
  - SO PowerPAD™-8
- Create a custom regulator design using [WEBENCH® Power Designer](#)

## 2 Applications

- [Industrial programmable logic controllers \(PLC\)](#)
- [Smart power meters](#)
- [Telecom primary and secondary side bias](#)
- [Low-power isolated DC/DC \(Fly-Buck™\)](#)

**Typical Synchronous Buck Application Circuit**

## 3 Description

The LM5017 is a 100-V, 600-mA synchronous stepdown regulator with integrated high side and low side MOSFETs. The constant on-time (COT) control scheme employed in the LM5017 requires no loop compensation, provides excellent transient response, and enables very high step-down ratios. The on-time varies inversely with the input voltage resulting in nearly constant frequency over the input voltage range. A high voltage startup regulator provides bias power for internal operation of the IC and for integrated gate drivers.

A peak current limit circuit protects against overload conditions. The undervoltage lockout (UVLO) circuit allows the input undervoltage threshold and hysteresis to be independently programmed. Other protection features include thermal shutdown and bias supply undervoltage lockout ( $V_{CC}$  UVLO).

The LM5017 device is available in WSON-8 and HSOP PowerPAD-8 plastic packages.

### Device Information

PART NUMBER	PACKAGE <sup>(1)</sup>	BODY SIZE (NOM)
LM5017	SO PowerPAD (8)	4.89 mm × 3.90 mm
	WSON (8)	4.00 mm × 4.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

Figure 5-1. DDA Package 8-Pin SO PowerPAD Top View

Figure 5-2. NGU Package 8-Pin WSON With Exposed Thermal Pad Top View

Table 5-1. Pin Functions

PIN		I/O	DESCRIPTION	APPLICATION INFORMATION
NO.	NAME			
1	RTN	—	Ground	Ground connection of the integrated circuit.
2	VIN	P	Input voltage	Operating input range is 7.5 V to 100 V.
3	UVLO	I	Undervoltage comparator input	Resistor divider from VIN to UVLO to GND programs the undervoltage detection threshold. An internal current source is enabled when UVLO is above 1.225 V to provide hysteresis. When UVLO pin is pulled below 0.66 V externally, the regulator is in shutdown mode.
4	RON	I	On-time control	A resistor between this pin and VIN sets the buck switch on-time as a function of VIN. Minimum recommended on-time is 100 ns at maximum input voltage.
5	FB	I	Feedback	This pin is connected to the inverting input of the internal regulation comparator. The regulation level is 1.225 V.
6	VCC	O	Output from the internal high-voltage series pass regulator. Regulated at 7.6 V.	The internal VCC regulator provides bias supply for the gate drivers and other internal circuitry. A 1- $\mu$ F decoupling capacitor is recommended.
7	BST	I	Bootstrap capacitor	An external capacitor is required between the BST and SW pins (0.01- $\mu$ F ceramic). The BST capacitor is charged by the VCC regulator through an internal diode when SW is low.
8	SW	P	Switching node	Power switching node. Connect to the output inductor and bootstrap capacitor.
	EP	—	Exposed Pad	Exposed pad must be connected to the RTN pin. Solder to the system ground plane on application board for reduced thermal resistance.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

See (1)

	MIN	MAX	UNIT
VIN, UVLO to RTN	-0.3	100	V
SW to RTN	-1.5	V <sub>IN</sub> + 0.3	V
SW to RTN (100-ns transient)	-5	V <sub>IN</sub> + 0.3	V
BST to VCC		100	V
BST to SW		13	V
RON to RTN	-0.3	100	V
VCC to RTN	-0.3	13	V
FB to RTN	-0.3	5	V
Maximum Junction Temperature <sup>(2)</sup>		150	°C
Storage temperature, T <sub>stg</sub>	-55	150	°C

- (1) *Absolute Maximum Ratings* are limits beyond which damage to the device may occur. [Section 6.3](#) are conditions under which operation of the device is intended to be functional. For ensured specifications and test conditions, see the [Section 6.5](#). The RTN pin is the GND reference electrically connected to the substrate.
- (2) High junction temperatures degrade operating lifetimes. Operating lifetime is de-rated for junction temperatures greater than 125°C.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
V <sub>IN</sub> Voltage <sup>(1)</sup>	7.5	100	V
Operating Junction Temperature <sup>(2)</sup>	-40	125	°C

- (1) *Recommended Operating Conditions* are conditions under the device is intended to be functional. For specifications and test conditions, see [Section 6.5](#).
- (2) High junction temperatures degrade operating lifetimes. Operating lifetime is de-rated for junction temperatures greater than 125°C.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	LM5017		UNIT

## 6.5 Electrical Characteristics

Typical values correspond to  $T_J = 25^\circ\text{C}$ . Minimum and maximum limits apply over  $-40^\circ\text{C}$  to  $125^\circ\text{C}$  junction temperature range, unless otherwise stated.  $V_{IN} = 48\text{ V}$ , unless otherwise stated. See<sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>V<sub>CC</sub> SUPPLY</b>						
V <sub>CC</sub>	VCC regulator output	$V_{IN} = 48\text{ V}$ , $I_{CC} = 20\text{ mA}$	6.25	7.6	8.55	V
I <sub>LIM-VCC</sub>	VCC current limit	$V_{IN} = 48\text{ V}$ <sup>(2)</sup>	26			mA
V <sub>CC-UV</sub>	VCC undervoltage lockout voltage ( $V_{VCC}$ increasing)	$-40^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$	4.15	4.5	4.9	V
V <sub>CC-UV-HYS</sub>	VCC undervoltage hysteresis			300		mV
V <sub>CC-LDO</sub>	VIN – VCC dropout voltage	$V_{IN} = 9\text{ V}$ , $I_{CC} = 20\text{ mA}$		2.3		V
I <sub>OP</sub>	I <sub>IN</sub> operating current	Non-switching, $V_{FB} = 3\text{ V}$		1.75		mA
I <sub>SHD</sub>	I <sub>IN</sub> shutdown current	$V_{UVLO} = 0\text{ V}$		50	225	μA
<b>SWITCH CHARACTERISTICS</b>						
R <sub>DS(ON)1</sub>	Buck switch R <sub>DS(on)</sub>	$I_{TEST} = 200\text{ mA}$ , $V_{BST} - V_{SW} = 7\text{ V}$		0.8	1.8	Ω
R <sub>DS(ON)2</sub>	Synchronous switch R <sub>DS(on)</sub>	$I_{TEST} = 200\text{ mA}$		0.45	1	Ω
BST <sub>UV</sub>	Gate drive UVLO	$V_{BST} - V_{SW}$ rising	2.4	3	3.6	V
BST <sub>UV-HYS</sub>	Gate drive UVLO hysteresis			260		mV
<b>CURRENT LIMIT</b>						
I <sub>LIM-HS</sub>	Current limit threshold	$-40^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$	0.7	1.02	1.3	A
t <sub>RES</sub>	Current limit response time	Time to switch off		150		ns
t <sub>OFF1</sub>	OFF-time generator (test 1)	$V_{FB} = 0.1\text{ V}$ , $V_{IN} = 48\text{ V}$		12		μs
t <sub>OFF2</sub>	OFF-time generator (test 2)	$V_{FB} = 1\text{ V}$ , $V_{IN} = 48\text{ V}$		2.5		μs
<b>REGULATION AND OVERVOLTAGE COMPARATORS</b>						
V <sub>FB</sub>	FB regulation level	Internal reference trip point for switch ON	1.2	1.225	1.25	V
V <sub>FB-OV</sub>	FB overvoltage threshold	Trip point for switch OFF		1.62		V
I <sub>FB-BIAS</sub>	FB bias current			60		nA
<b>UNDERVOLTAGE SENSING FUNCTION</b>						
V <sub>UVLO-TH</sub>	UVLO threshold	Voltage at UVLO rising	1.19	1.225	1.26	V
I <sub>UVLO-HYS</sub>	UVLO hysteresis input current	$V_{UVLO} = 2.5\text{ V}$	-10	-20	-29	μA
V <sub>SD-TH</sub>	Remote shutdown threshold	Voltage at UVLO falling	0.32	0.66		V
V <sub>SD-HYS</sub>	Remote shutdown hysteresis			110		mV
<b>THERMAL SHUTDOWN</b>						
T <sub>SD</sub>	Thermal shutdown temperature			165		°C
T <sub>SD-HYS</sub>	Thermal shutdown hysteresis			20		°C

- (1) All hot and cold limits are specified by correlating the electrical characteristics to process and temperature variations and applying statistical process control.
- (2) VCC provides self bias for the internal gate drive and control circuits. Device thermal limitations limit external loading.

## 6.6 Timing Requirements

Typical values correspond to  $T_J = 25^\circ\text{C}$ . Minimum and maximum limits apply over  $-40^\circ\text{C}$  to  $125^\circ\text{C}$  junction temperature range unless otherwise stated.  $V_{IN} = 48\text{ V}$  unless otherwise stated.

			MIN	NOM	MAX	UNIT

## 7 Detailed Description

### 7.1 Overview

The LM5017 step-down synchronous switching converter features all the functions needed to implement a low-cost, efficient buck regulator capable of supplying 600 mA to the load. This high-voltage regulator contains 100-V N-channel buck and synchronous rectifier switches and is available in 8-pin thermally-enhanced WSON and SO packages with pin pitches of 0.8 mm and 1.27 mm, respectively. The regulator operation is based on an adaptive constant on-time control architecture where the on-time is inversely proportional to input voltage  $V_{IN}$ . This feature maintains a relatively constant operating frequency with load and input voltage variations. A constant on-time switching regulator requires no loop compensation resulting in fast load transient response.

The LM5017 can be applied in numerous end equipment systems requiring efficient step-down regulation from higher input voltages. This regulator is well-suited for 24-V industrial systems as well as 48-V communications and PoE voltage ranges. The LM5017 integrates an undervoltage lockout (UVLO) circuit to prevent faulty operation of the device at low input voltages and features intelligent current limit and thermal shutdown to protect the device during overload or short circuit. Peak current limit detection circuit is implemented with a forced off-time during current limiting that is inversely proportional to  $V_{OUT}$  and directly proportional to  $V_{IN}$ . Varying the current limit off-time with  $V_{OUT}$  and  $V_{IN}$  ensures short-circuit protection with minimal current limit foldback. Additional protection features include thermal shutdown with automatic recovery, VCC and gate drive UVLO, minimum forced off-time, and remote shutdown.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Control Overview

The LM5017 buck regulator employs a control principle based on a comparator and a one-shot on-timer, with the output voltage feedback (FB) compared to an internal reference (1.225 V). If the FB voltage is below the reference the internal buck switch is turned on for the one-shot timer period, which is a function of the input voltage and the programming resistor ( $R_{ON}$ ). Following the on-time the switch remains off until the FB voltage falls below the reference, but never before the minimum off-time forced by the minimum off-time one-shot timer. When the FB pin voltage falls below the reference and the minimum off-time one-shot period expires, the buck switch is turned on for another on-time one-shot period. This will continue until regulation is achieved and the FB voltage is approximately equal to 1.225 V (typ).

In a synchronous buck converter, the low-side (sync) FET is on when the high-side (buck) FET is off. The inductor current ramps up when the high-side switch is on and ramps down when the high-side switch is 'off'. There is no diode emulation feature in this IC, and therefore, the inductor current may ramp in the negative direction at light load. This causes the converter to operate in continuous conduction mode (CCM) regardless of the output loading. The operating frequency remains relatively constant with load and line variations. Calculate the operating frequency as shown in [Equation 1](#).

$$f_{sw} = \frac{V_{OUT}}{K \times R_{ON}} \quad (1)$$

where

- $K = 9 \times 10^{-11}$

The output voltage ( $V_{OUT}$ ) is set by two external resistors ( $R_{FB1}$ ,  $R_{FB2}$ ). The regulated output voltage is calculated as shown in [Equation 2](#).

$$V_{OUT} = 1.225V \times \frac{R_{FB2} + R_{FB1}}{R_{FB1}} \quad (2)$$

This regulator regulates the output voltage based on ripple voltage at the feedback input, requiring a minimum amount of ESR for the output capacitor ( $C_{OUT}$ ). A minimum of 25 mV of ripple voltage at the feedback pin (FB) is required for the LM5017. In cases where the capacitor ESR is too small, additional series resistance may be required ( $R_C$  in [Figure 7-1](#)).

For applications where lower output voltage ripple is required the output can be taken directly from a low ESR output capacitor, as shown in [Figure 7-1](#). However,  $R_C$  slightly degrades the load regulation.

**Figure 7-1. Low Ripple Output Configuration**

### 7.3.2 $V_{CC}$ Regulator

The LM5017 device contains an internal high-voltage linear regulator with a nominal output of 7.6 V. The input pin ( $V_{IN}$ ) can be connected directly to the line voltages up to 100 V. The  $V_{CC}$  regulator is internally current limited to 30 mA. The regulator sources current into the external capacitor at  $V_{CC}$ . This regulator supplies current to internal circuit blocks including the synchronous MOSFET driver and the logic circuits. When the voltage on the  $V_{CC}$  pin reaches the undervoltage lockout ( $V_{CC}$  UVLO) threshold of 4.5 V, the IC is enabled.

An internal diode connected from  $V_{CC}$  to the BST pin replenishes the charge in the gate drive bootstrap capacitor when SW pin is low.

At high input voltages, the power dissipated in the high voltage regulator is significant and can limit the overall achievable output power. As an example, with the input at 48 V and switching at high frequency, the  $V_{CC}$  regulator may supply up to 7 mA of current resulting in  $48\text{ V} \times 7\text{ mA} = 336\text{ mW}$  of power dissipation. If the  $V_{CC}$  voltage is driven externally by an alternate voltage source between 8.55 V and 13 V, the internal regulator is disabled. This reduces the power dissipation in the IC.

### 7.3.3 Regulation Comparator

The feedback voltage at FB is compared to an internal 1.225 V reference. In normal operation, when the output voltage is in regulation, an on-time period is initiated when the voltage at FB falls below 1.225 V. The high side switch will stay on for the on-time, causing the FB voltage to rise above 1.225 V. After the on-time period, the high side switch will stay off until the FB voltage again falls below 1.225 V. During start-up, the FB voltage will be below 1.225 V at the end of each on-time, causing the high side switch to turn on immediately after the minimum forced off-time of 144 ns. The high side switch can be turned off before the on-time is over if the peak current in the inductor reaches the current limit threshold.

### 7.3.4 Overvoltage Comparator

The feedback voltage at FB is compared to an internal 1.62 V reference. If the voltage at FB rises above 1.62 V the on-time pulse is immediately terminated. This condition can occur if the input voltage and/or the output load changes suddenly. The high side switch will not turn on again until the voltage at FB falls below 1.225 V.

### 7.3.5 On-Time Generator

The on-time for the LM5017 device is determined by the  $R_{ON}$  resistor and is inversely proportional to the input voltage ( $V_{IN}$ ), resulting in a nearly constant frequency as  $V_{IN}$  is varied over the operating range. The on-time for the LM5017 can be calculated using [Equation 3](#).

$$T_{ON} = \frac{10^{-10} \times R_{ON}}{V_{IN}} \quad (3)$$

See [Figure 6-5](#).  $R_{ON}$  should be selected for a minimum on-time (at maximum  $V_{IN}$ ) greater than 100 ns for proper operation. This requirement limits the maximum switching frequency for high  $V_{IN}$ .

### 7.3.6 Current Limit

The LM5017 device contains an intelligent current limit off-timer. If the current in the buck switch exceeds 1.02 A, the present cycle is immediately terminated, and a non-resettable off-timer is initiated. The length of the off-time is controlled by the FB voltage and the input voltage  $V_{IN}$ . As an example, when  $FB = 0\text{ V}$  and  $V_{IN} = 48\text{ V}$ , the off-time is set to 16  $\mu\text{s}$ . This condition occurs when the output is shorted and during the initial part of start-up. This  $V_{IN}$  dependent off-time ensures safe short circuit operation up to the maximum input voltage of 100 V.

In cases of overload where the FB voltage is above zero volts (not a short circuit) the current limit off-time is reduced. Reducing the off-time during less severe overloads reduces the amount of foldback, recovery time, and start-up time. The off-time is calculated from [Equation 4](#).

$$T_{OFF(ILIM)} = \frac{0.07 \times V_{IN}}{V_{FB} + 0.2\text{ V}} \mu\text{s} \quad (4)$$

The current limit protection feature is peak limited. The maximum average output current will be less than the peak.

### 7.3.7 N-Channel Buck Switch and Driver

The LM5017 device integrates an N-Channel Buck switch and associated floating high voltage gate driver. The gate driver circuit works in conjunction with an external bootstrap capacitor and an internal high voltage diode. A 0.01  $\mu\text{F}$  ceramic capacitor connected between the BST pin and the SW pin provides the voltage to the driver during the on-time. During each off-time, the SW pin is at approximately 0 V, and the bootstrap capacitor charges from  $V_{CC}$  through the internal diode. The minimum off-timer, set to 144 ns, ensures a minimum time each cycle to recharge the bootstrap capacitor.

### 7.3.8 Synchronous Rectifier

The LM5017 provides an internal synchronous N-Channel MOSFET rectifier. This MOSFET provides a path for the inductor current to flow when the high-side MOSFET is turned off.

The synchronous rectifier has no diode emulation mode, and is designed to keep the regulator in continuous conduction mode even with light loads which would otherwise result in discontinuous operation.

### 7.3.9 Undervoltage Detector

The LM5017 device contains a dual level undervoltage lockout (UVLO) circuit. A summary of threshold voltages and operational states is provided in [Section 7.4](#). When the UVLO pin voltage is below 0.66 V, the regulator is in a low current shutdown mode. When the UVLO pin voltage is greater than 0.66V but less than 1.225 V, the regulator is in standby mode. In standby mode the  $V_{CC}$  bias regulator is active while the regulator output is disabled. When the  $V_{CC}$  pin exceeds the  $V_{CC}$  undervoltage threshold and the UVLO pin voltage is greater than 1.225 V, normal operation begins. An external set-point voltage divider from  $V_{IN}$  to GND can be used to set the minimum operating voltage of the regulator.

UVLO hysteresis is accomplished with an internal 20- $\mu$ A current source that is switched on or off into the impedance of the set-point divider. When the UVLO threshold is exceeded, the current source is activated to quickly raise the voltage at the UVLO pin. The hysteresis is equal to the value of this current times the resistance  $R_{UV2}$ .

If the UVLO pin is connected directly to the  $V_{IN}$  pin, the regulator will begin operation once the  $V_{CC}$  undervoltage is satisfied.

**Figure 7-2. UVLO Resistor Setting**

### 7.3.10 Thermal Protection

The LM5017 device should be operated so the junction temperature does not exceed 150°C during normal operation. An internal Thermal Shutdown circuit is provided to protect the LM5017 in the event of a higher than normal junction temperature. When activated, typically at 165°C, the regulator is forced into a low power reset state, disabling the buck switch and the  $V_{CC}$  regulator. This feature prevents catastrophic failures from accidental device overheating. When the junction temperature falls below 145°C (typical hysteresis = 20°C), the  $V_{CC}$  regulator is enabled, and normal operation is resumed.

### 7.3.11 Ripple Configuration

LM5017 uses Constant-On-Time (COT) control in which the on-time is terminated by an on-timer and the off-time is terminated by the feedback voltage ( $V_{FB}$ ) falling below the reference voltage ( $V_{REF}$ ). Therefore, for stable operation, the feedback voltage must decrease monotonically, in phase with the inductor current during the off-time. Furthermore, this change in feedback voltage ( $V_{FB}$ ) during off-time must be larger than any noise component present at the feedback node.

[Table 7-1](#) shows three different methods for generating appropriate voltage ripple at the feedback node. Type 1 and Type 2 ripple circuits couple the ripple at the output of the converter to the feedback node (FB). The output voltage ripple has two components:

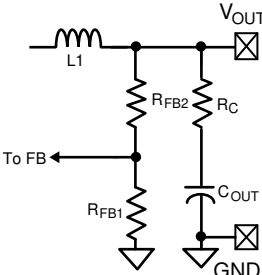

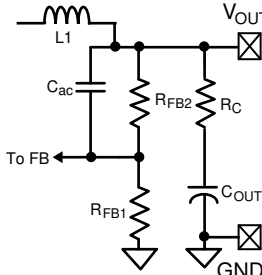

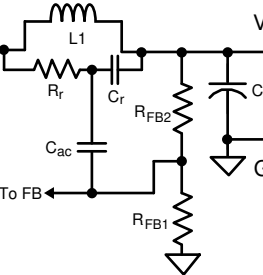

1. Capacitive ripple caused by the inductor current ripple charging/discharging the output capacitor.
2. Resistive ripple caused by the inductor current ripple flowing through the ESR of the output capacitor.

The capacitive ripple is not in phase with the inductor current. As a result, the capacitive ripple does not decrease monotonically during the off-time. The resistive ripple is in phase with the inductor current and

decreases monotonically during the off-time. The resistive ripple must exceed the capacitive ripple at the output node ( $V_{OUT}$ ) for stable operation. If this condition is not satisfied unstable switching behavior is observed in COT converters, with multiple on-time bursts in close succession followed by a long off-time.

Type 3 ripple method uses  $R_r$  and  $C_r$  and the switch node (SW) voltage to generate a triangular ramp. This triangular ramp is ac coupled using  $C_{ac}$  to the feedback node (FB). Since this circuit does not use the output voltage ripple, it is ideally suited for applications where low output voltage ripple is required. For more information on each ripple generation method, refer to the [AN-1481 Controlling Output Ripple and Achieving ESR Independence in Constant On-Time \(COT\) Regulator Designs](#) application report.

**Table 7-1. Ripple Configuration**

TYPE 1 LOWEST COST CONFIGURATION	TYPE 2 REDUCED RIPPLE CONFIGURATION	TYPE 3 MINIMUM RIPPLE CONFIGURATION
		
$R_C \geq \frac{25 \text{ mV}}{\Delta I_{L(\text{MIN})}} \times \frac{V_{OUT}}{V_{REF}} \quad (5)$	$C \geq \frac{5}{f_{sw} (R_{FB2}    R_{FB1})}$ $R_C \geq \frac{25 \text{ mV}}{\Delta I_{L(\text{MIN})}} \quad (6)$	$R_r C_r \leq \frac{(V_{IN(\text{MIN})} - V_{OUT}) \times T_{ON}}{25 \text{ mV}} \quad (7)$ <p> <math>C_r = 3300 \text{ pF}</math>  <math>C_{ac} = 100 \text{ nF}</math> </p>

### 7.3.12 Soft-Start

A soft-start feature can be implemented with the LM5017 using an external circuit. As shown in [Figure 7-3](#), the soft-start circuit consists of one capacitor,  $C_1$ , two resistors,  $R_1$  and  $R_2$ , and a diode,  $D$ . During the initial start-up, the VCC voltage is established prior to the  $V_{OUT}$  voltage. Capacitor  $C_1$  is discharged and  $D$  is thereby forward biased to pull up the FB voltage. The FB voltage exceeds the reference voltage (1.225 V) and switching is therefore disabled. As capacitor  $C_1$  charges, the voltage at node B gradually decreases and switching commences.  $V_{OUT}$  will gradually rise to maintain the FB voltage at the reference voltage. Once the voltage at node B is less than a diode drop above FB voltage, the soft-start is finished and  $D$  is reverse biased.

During the initial part of the start-up, the FB voltage can be approximated as follows. Please note that the effect of  $R_1$  has been ignored to simplify the calculation shown in [Equation 8](#).

$$V_{FB} = (V_{CC} - V_D) \times \frac{R_{FB1} \times R_{FB2}}{R_2 \times (R_{FB1} + R_{FB2}) + R_{FB1} \times R_{FB2}} \quad (8)$$

$C_1$  is charged after the first start up. Diode  $D_1$  is optional and can be added to discharge  $C_1$  when the input voltage experiences a momentary drop to initialize the soft-start sequence.

To achieve the desired soft-start, the following design guidance is recommended:

- (1)  $R_2$  is selected so that  $V_{FB}$  is higher than 1.225 V for a  $V_{CC}$  of 4.5 V, but is lower than 5 V when  $V_{CC}$  is 8.55 V. If an external  $V_{CC}$  is used,  $V_{FB}$  should not exceed 5 V at maximum  $V_{CC}$ .
- (2)  $C_1$  is selected to achieve the desired start-up time that can be determined from [Equation 9](#).

$$t_s = C_1 \times \left( R_2 + \frac{R_{FB1} \times R_{FB2}}{R_{FB1} + R_{FB2}} \right) \quad (9)$$

- (3)  $R_1$  is used to maintain the node B voltage at zero after the soft-start is finished. A value larger than the feedback resistor divider is preferred. Note that the effect of  $R_1$  is ignored in the previous equations.

Based on the schematic shown in [Figure 8-1](#), selecting  $C_1 = 1 \mu\text{F}$ ,  $R_2 = 1 \text{ k}\Omega$ ,  $R_1 = 30 \text{ k}\Omega$  results in a soft-start time of about 2 ms.

**Figure 7-3. Soft-Start Circuit**

## 7.4 Device Functional Modes

**Table 7-2. UVLO Modes**

UVLO	$V_{CC}$ Regulator	MODE	DESCRIPTION
< 0.66 V	Disabled	Shutdown	$V_{CC}$ regulator disabled. Switching disabled.
0.66 V – 1.225 V	Enabled	Standby	$V_{CC}$ regulator enabled Switching disabled.
> 1.225 V	$V_{CC} < 4.5 \text{ V}$	Standby	$V_{CC}$ regulator enabled. Switching disabled.
	$V_{CC} > 4.5 \text{ V}$	Operating	$V_{CC}$ enabled. Switching enabled.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

The LM5017 device is step-down DC-DC converter. The device is typically used to convert a higher DC voltage to a lower DC voltage with a maximum available output current of 650 mA. Use the following design procedure to select component values for the LM5017 device. Alternately, use the WEBENCH® software to generate a complete design. The WEBENCH software uses an iterative design procedure and accesses a comprehensive database of components when generating a design. This section presents a simplified discussion of the design process.

### 8.2 Typical Application

#### 8.2.1 Application Circuit: 12.5-V to 95-V Input and 10-V, 600-mA Output Buck Converter

The application schematic of a buck supply is shown in Figure 8-1. For output voltage ( $V_{OUT}$ ) more than one diode drop above the maximum regulation threshold of  $V_{CC}$  (8.55 V, see Section 6.5), the  $V_{CC}$  pin can be connected to  $V_{OUT}$  through a diode (D2), as shown in Figure 8-1, for higher efficiency and lower power dissipation in the IC.

The design example below uses equations from the Section 7.3 with component names provided. Corresponding component designators from Figure 8-1 are also provided for each selected value.

Figure 8-1. Final Schematic for 12.5-V to 95-V Input, and 10-V, 600-mA Output Buck Converter

#### 8.2.1.1 Design Requirements

Selection of external components is illustrated through a design example. The design example specifications are shown in Table 8-1.

Table 8-1. Buck Converter Design Specifications

DESIGN PARAMETERS	VALUE
Input voltage range	12.5 V to 95 V
Output voltage	10 V
Maximum Load current	600 mA
Switching Frequency	≈ 225 kHz

#### 8.2.1.2 Detailed Design Procedure

##### 8.2.1.2.1 Custom Design with WEBENCH Tools

[Click here](#) to create a custom design using the WEBENCH® Power Designer.

1. Start by entering your  $V_{IN}$ ,  $V_{OUT}$  and  $I_{OUT}$  requirements.
2. Optimize your design for key parameters like efficiency, footprint and cost using the optimizer dial and compare this design with other possible solutions from Texas Instruments.
3. WEBENCH Power Designer provides you with a customized schematic along with a list of materials with real time pricing and component availability.
4. In most cases, you will also be able to:
  - Run electrical simulations to see important waveforms and circuit performance,
  - Run thermal simulations to understand the thermal performance of your board,
  - Export your customized schematic and layout into popular CAD formats,
  - Print PDF reports for the design, and share your design with colleagues.

#### 8.2.1.2.2 $R_{FB1}$ , $R_{FB2}$

$V_{OUT} = V_{FB} \times (R_{FB2}/R_{FB1} + 1)$ , and because  $V_{FB} = 1.225$  V, the ratio of  $R_{FB2}$  to  $R_{FB1}$  calculates as 7 : 1. Standard values are chosen with  $R_{FB2} = R1 = 6.98$  k $\Omega$  and  $R_{FB1} = R6 = 1$  k $\Omega$ . Other values could be used as long as the 7 : 1 ratio is maintained.

#### 8.2.1.2.3 Frequency Selection

At the minimum input voltage, the maximum switching frequency of LM5017 is restricted by the forced minimum off-time ( $T_{OFF(MIN)}$ ) as given by [Equation 10](#).

$$f_{SW(MAX)} = \frac{1 - D_{MAX}}{T_{OFF(MIN)}} = \frac{1 - 10/12.5}{200 \text{ ns}} = 1 \text{ MHz} \quad (10)$$

Similarly, at maximum input voltage, the maximum switching frequency of LM5017 is restricted by the minimum  $T_{ON}$  as given by [Equation 11](#).

$$f_{SW(MAX)} = \frac{D_{MIN}}{T_{ON(MIN)}} = \frac{10/95}{100 \text{ ns}} = 1.05 \text{ MHz} \quad (11)$$

Resistor  $R_{ON}$  sets the nominal switching frequency based on [Equation 12](#).

$$f_{SW} = \frac{V_{OUT}}{K \times R_{ON}} \quad (12)$$

where

- $K = 9 \times 10^{-11}$

Operation at high switching frequency results in lower efficiency while providing the smallest solution. For this example a conservative 225 kHz was selected, resulting in  $R_{ON} = 493$  k $\Omega$ . A standard value for  $R_{ON} = R3 = 499$  k $\Omega$  is selected.

#### 8.2.1.2.4 Inductor Selection

The minimum inductance is selected to limit the output ripple to 15 to 40 percent of the maximum load current. In addition, the peak inductor current at maximum load should be smaller than the minimum current limit as given in [Section 6.5](#) table.

The inductor current ripple is given by [Equation 13](#).

$$\Delta I_L = \frac{V_{IN} - V_{OUT}}{L1 \times f_{SW}} \times \frac{V_{OUT}}{V_{IN}} \quad (13)$$

The maximum ripple is observed at maximum input voltage. Substituting  $V_{IN} = 95$  V and  $\Delta I_L = 40$  percent  $\times I_{OUT(max)}$  results in  $L1 = 198$   $\mu$ H. The next higher standard value of 220  $\mu$ H is chosen. The peak-to-peak minimum and maximum inductor current ripple are 40 mA and 181 mA at the minimum and maximum input voltages respectively. The peak inductor and switch current is given by [Equation 14](#).

$$I_{L1}(\text{peak}) = I_{\text{OUT}} + \frac{\Delta I_{L(\text{MAX})}}{2} = 690 \text{ mA} \quad (14)$$

690 mA is less than the minimum current limit threshold of 0.7 A. The selected inductor should be able to withstand the maximum current limit of 1.3 A during startup and overload conditions without saturating.

#### 8.2.1.2.5 Output Capacitor

The output capacitor is selected to minimize the capacitive ripple across it. The maximum ripple is observed at maximum input voltage and is given by:

$$C_{\text{OUT}} = \frac{\Delta I_L}{8 \times f_{\text{sw}} \times \Delta V_{\text{ripple}}} \quad (15)$$

where

- $\Delta V_{\text{ripple}}$  is the voltage ripple across the capacitor.

Assuming  $V_{\text{IN}} = 95 \text{ V}$  and substituting  $\Delta V_{\text{ripple}} = 10 \text{ mV}$  gives  $C_{\text{OUT}} = 10.1 \text{ } \mu\text{F}$ . A 22- $\mu\text{F}$  standard value is selected for  $C_{\text{OUT}} = \text{C9}$ . An X5R or X7R type capacitor with a voltage rating 16 V or higher should be selected.

#### 8.2.1.2.6 Type III Ripple Circuit

Type III ripple circuit as described in [Section 7.3.11](#) is chosen for this example. For a constant on-time converter to be stable, the injected in-phase ripple should be larger than the capacitive ripple on  $C_{\text{OUT}}$ .

Using the type III ripple circuit equation, the target ripple will be greater than the capacitive ripple generated at the primary-side output if the following condition is satisfied:

$$C_r = \text{C6} = 3300 \text{ pF}$$

$$C_{\text{ac}} = \text{C8} = 100 \text{ nF}$$

$$R_r \leq \frac{(V_{\text{IN}(\text{MIN})} - V_{\text{OUT}}) \times T_{\text{ON}(\text{VINMIN})}}{(25 \text{ mV} \times C_r)} \quad (16)$$

For  $T_{\text{ON}}$ , refer to [Equation 3](#).

Ripple resistor  $R_r$  is calculated to be 57.6 k $\Omega$ . This value provides the minimum ripple for stable operation. A smaller resistance should be selected to allow for variations in  $T_{\text{ON}}$ ,  $C_{\text{OUT}}$ , and other components.  $R_r = R4 = 46.4 \text{ k}\Omega$  is selected for this example application.

#### 8.2.1.2.7 $V_{\text{CC}}$ and Bootstrap Capacitors

The  $V_{\text{CC}}$  capacitor provides charge to bootstrap capacitor as well as internal circuitry and low side gate driver. The Bootstrap capacitor provides charge to high side gate driver. The recommended value for  $C_{V_{\text{CC}}} = \text{C7} = 1 \text{ } \mu\text{F}$ . A good value for  $C_{\text{BST}} = \text{C1} = 0.01 \text{ } \mu\text{F}$ .

#### 8.2.1.2.8 Input Capacitor

Input capacitor should be large enough to limit the input voltage ripple as shown in [Equation 17](#).

$$C_{\text{IN}} \geq \frac{I_{\text{OUT}(\text{MAX})}}{4 \times f_{\text{SW}} \times \Delta V_{\text{IN}}} \quad (17)$$

Choosing a  $\Delta V_{\text{IN}} = 0.5 \text{ V}$  gives a minimum  $C_{\text{IN}} = 1.3 \text{ } \mu\text{F}$ . A standard value of 2.2  $\mu\text{F}$  is selected for  $C_{\text{IN}} = \text{C4}$ . The input capacitor should be rated for the maximum input voltage under all conditions. A 100-V, X7R dielectric should be selected for this design.

The input capacitor should be placed directly across  $V_{\text{IN}}$  and RTN (pin 1 and 2) of the IC. If it is not possible to place all of the input capacitor close to the IC, a 0.47- $\mu\text{F}$  capacitor should be placed near the IC to provide a bypass path for the high frequency component of the switching current.

### 8.2.1.2.9 UVLO Resistors

The UVLO resistors  $R_{FB1}$  and  $R_{FB2}$  set the UVLO threshold and hysteresis according to the relationship shown in [Equation 18](#) and [Equation 19](#).

$$V_{IN}(HYS) = I_{HYS} \times R_{UV2} \quad (18)$$

where

- $I_{HYS} = 20 \mu A$

$$V_{IN}(UVLO, rising) = 1.225 V \times \left( \frac{R_{UV2}}{R_{UV1}} + 1 \right) \quad (19)$$

Setting UVLO hysteresis of 2.5 V and UVLO rising threshold of 12 V results in  $R_{UV1} = 14.53 \text{ k}\Omega$  and  $R_{UV2} = 125 \text{ k}\Omega$ . Selecting standard values of  $R_{UV1} = R7 = 14 \text{ k}\Omega$  and  $R_{UV2} = R5 = 127 \text{ k}\Omega$  results in UVLO threshold and hysteresis of 12.4 V and 2.5 V respectively.

### 8.2.1.3 Application Curves

Figure 8-2. Efficiency vs Load Current

Figure 8-3. Frequency vs Input Voltage

Figure 8-4. Typical Switching Waveform ( $V_{IN} = 48\text{ V}$ ,  $I_{OUT} = 200\text{ mA}$ )

### 8.2.2 Isolated DC/DC Converter Using LM5017

An isolated supply using the LM5017 is shown in [Figure 8-5](#). Inductor (L) in a typical buck circuit is replaced with a coupled inductor (X1). A diode (D1) is used to rectify the voltage on a secondary output. The nominal voltage at the secondary output ( $V_{OUT2}$ ) is given by [Equation 20](#).

$$V_{OUT2} = V_{OUT1} \times \frac{N_S}{N_P} - V_F \quad (20)$$

where

- $V_F$  is the forward voltage drop of D1
- $N_P$  and  $N_S$  are the number of turns on the primary and secondary of coupled inductor X1.

For output voltage ( $V_{OUT1}$ ) more than one diode drop above the maximum  $V_{CC}$  (8.55 V), the  $V_{CC}$  pin can be diode connected to  $V_{OUT1}$  for higher efficiency and low dissipation in the IC. For a complete isolated bias design with LM5017, refer to the [AN-2204 LM5017 Isolated Supply Evaluation Board application report](#).

Figure 8-5. Typical Isolated Application Schematic

### 8.2.2.1 Design Requirements

DESIGN PARAMETERS	VALUE
Input Voltage Range	20 V – 100 V
Primary Output Voltage	10 V
Secondary (Isolated) Output Voltage	9.5 V
Maximum Load Current (Primary + Secondary)	300 mA
Maximum Power Output	3 W
Nominal Switching Frequency	750 kHz

### 8.2.2.2 Detailed Design Procedure

#### 8.2.2.2.1 Transformer Turns Ratio

The transformer turns ratio is selected based on the ratio of the primary output voltage to the secondary (isolated) output voltage. In this design example, the two outputs are nearly equal and a 1 : 1 turns ratio transformer is selected. Therefore,  $N2 / N1 = 1$ .

If the secondary (isolated) output voltage is significantly higher or lower than the primary output voltage, a turns ratio less than or greater than 1 is recommended. The primary output voltage is normally selected based on the input voltage range such that the duty cycle of the converter does not exceed 50% at the minimum input voltage. This condition is satisfied if  $V_{OUT1} < V_{IN\_MIN} / 2$ .

#### 8.2.2.2.2 Total $I_{OUT}$

Calculate the total primary-referred load current by multiplying the isolated output loads by the turns ratio of the transformer as shown in Equation 21.

$$I_{OUT(MAX)} = I_{OUT1} + I_{OUT2} \times \frac{N2}{N1} = 0.3 \text{ A} \quad (21)$$

#### 8.2.2.2.3 $R_{FB1}$ , $R_{FB2}$

The feedback resistors are selected to set the primary output voltage. The selected value for  $R_{FB1}$  is 1 kΩ.  $R_{FB2}$  can be calculated using the following equations to set  $V_{OUT1}$  to the specified value of 10 V. A standard resistor value of 7.32 kΩ is selected for  $R_{FB2}$ .

$$V_{OUT1} = 1.225 \text{ V} \times \left( 1 + \frac{R_{FB2}}{R_{FB1}} \right) \quad (22)$$

$$\rightarrow R_{FB2} = \left( \frac{V_{OUT1}}{1.225} - 1 \right) \times R_{FB1} = 7.16 \text{ k}\Omega \quad (23)$$

#### 8.2.2.2.4 Frequency Selection

Calculate the value of  $R_{ON}$  to achieve the desired switching frequency using [Equation 24](#).

$$f_{SW} = \frac{V_{OUT1}}{K \times R_{ON}} \quad (24)$$

where

- $K = 9 \times 10^{-11}$

For  $V_{OUT1}$  of 10 V and  $f_{SW}$  of 750 kHz, the calculated value of  $R_{ON}$  is 148 k $\Omega$ . A lower value of 130 k $\Omega$  is selected for this design to allow for second-order effects at high switching frequency that are not included in [Equation 24](#).

#### 8.2.2.2.5 Transformer Selection

A coupled inductor or a flyback-type transformer is required for this topology. Energy is transferred from primary to secondary when the low-side synchronous switch of the buck converter is conducting.

The maximum inductor primary ripple current that can be tolerated without exceeding the buck switch peak current limit threshold (0.7 A minimum) is given by [Equation 25](#).

$$\Delta I_{L1} = \left( 0.7 - I_{OUT1} - I_{OUT2} \times \frac{N2}{N1} \right) \times 2 = 0.8 \text{ A} \quad (25)$$

Using the maximum peak-to-peak inductor ripple current  $\Delta I_{L1}$  from [Equation 25](#), the minimum inductor value is given by [Equation 26](#).

$$L1 = \frac{V_{IN(MAX)} - V_{OUT}}{\Delta I_{L1} \times f_{SW}} \times \frac{V_{OUT}}{V_{IN(MAX)}} = 14.9 \mu\text{H} \quad (26)$$

A higher value of 33  $\mu\text{H}$  is selected to insure the high-side switch current does not exceed the minimum peak current limit threshold. With this inductance, the inductor current ripple is  $\Delta I_{L1} = 0.36 \text{ A}$  at the maximum  $V_{IN}$ .

#### 8.2.2.2.6 Primary Output Capacitor

In a conventional buck converter the output ripple voltage is calculated as shown in [Equation 27](#).

$$\Delta V_{OUT} = \frac{\Delta I_{L1}}{8 \times f \times C_{OUT1}} \quad (27)$$

To limit the primary output ripple voltage  $\Delta V_{OUT1}$  to approximately 50 mV, an output capacitor  $C_{OUT1}$  of 1.2  $\mu\text{F}$  would be required for a conventional buck.

[Figure 8-6](#) shows the primary winding current waveform ( $I_{L1}$ ) of a Fly-Buck™ converter. The reflected secondary winding current adds to the primary winding current during the buck switch off-time. Because of this increased current, the output voltage ripple is not the same as in conventional buck converter. The output capacitor value calculated in [Equation 27](#) should be used as the starting point. Optimization of output capacitance over the entire line and load range must be done experimentally. If the majority of the load current is drawn from the secondary isolated output, a better approximation of the primary output voltage ripple is given by [Equation 28](#).

$$\Delta V_{OUT1} = \frac{\left( I_{OUT2} \times \frac{N2}{N1} \right) \times T_{ON(MAX)}}{C_{OUT1}} \approx 67 \text{ mV} \quad (28)$$

**Figure 8-6. Current Waveforms for  $C_{OUT1}$  Ripple Calculation**

A standard 1- $\mu$ F, 25 V capacitor is selected for this design. If lower output voltage ripple is required, a higher value should be selected for  $C_{OUT1}$  and/or  $C_{OUT2}$ .

#### 8.2.2.2.7 Secondary Output Capacitor

A simplified waveform for secondary output current ( $I_{OUT2}$ ) is shown in [Figure 8-7](#).

**Figure 8-7. Secondary Current Waveforms for  $C_{OUT2}$  Ripple Calculation**

The secondary output current ( $I_{OUT2}$ ) is sourced by  $C_{OUT2}$  during on-time of the buck switch,  $T_{ON}$ . Ignoring the current transition times in the secondary winding, the secondary output capacitor ripple voltage can be calculated using [Equation 29](#).

$$\Delta V_{OUT2} = \frac{I_{OUT2} \times T_{ON(MAX)}}{C_{OUT2}} \quad (29)$$

For a 1 : 1 transformer turns ratio, the primary and secondary voltage ripple equations are identical. Therefore,  $C_{OUT2}$  is chosen to be equal to  $C_{OUT1}$  (1  $\mu$ F) to achieve comparable ripple voltages on primary and secondary outputs.

If lower output voltage ripple is required, a higher value should be selected for  $C_{OUT1}$  and/or  $C_{OUT2}$ .

#### 8.2.2.2.8 Type III Feedback Ripple Circuit

Type III ripple circuit as described in [Section 7.3.11](#) is required for the Fly-Buck topology. Type I and Type II ripple circuits use series resistance and the triangular inductor ripple current to generate ripple at  $V_{OUT}$  and the FB pin. The primary ripple current of a Fly-Buck is the combination of primary and reflected secondary currents as illustrated in [Figure 8-6](#). In the Fly-Buck topology, Type I and Type II ripple circuits suffer from large jitter as the reflected load current affects the feedback ripple.

**Figure 8-8. Type III Ripple Circuit**

Selecting the Type III ripple components using the equations from [Section 7.3.11](#) will ensure that the FB pin ripple is be greater than the capacitive ripple from the primary output capacitor  $C_{OUT1}$ . The feedback ripple component values are chosen as shown in [Equation 30](#).

$$\begin{aligned} C_r &= 1000 \text{ pF} \\ C_{ac} &= 0.1 \text{ } \mu\text{F} \\ R_r C_r &\leq \frac{(V_{IN(MIN)} - V_{OUT}) \times T_{ON}}{50 \text{ mV}} \end{aligned} \quad (30)$$

The calculated value for  $R_r$  is 66 k $\Omega$ . This value provides the minimum ripple for stable operation. A smaller resistance should be selected to allow for variations in  $T_{ON}$ ,  $C_{OUT1}$  and other components. For this design,  $R_r$  value of 46.4 k $\Omega$  is selected.

#### 8.2.2.2.9 Secondary Diode

The reverse voltage across secondary-rectifier diode D1 when the high-side buck switch is off can be calculated using [Equation 31](#).

$$V_{D1} = \frac{N_2}{N_1} V_{IN} \quad (31)$$

For a  $V_{IN\_MAX}$  of 95 V and the 1:1 turns ratio of this design, a 100 V Schottky is selected.

#### 8.2.2.2.10 $V_{CC}$ and Bootstrap Capacitor

A 1- $\mu\text{F}$  capacitor of 16 V or higher rating is recommended for the  $V_{CC}$  regulator bypass capacitor. A good value for the BST pin bootstrap capacitor is 0.01- $\mu\text{F}$  with a 16 V or higher rating.

#### 8.2.2.2.11 Input Capacitor

The input capacitor is typically a combination of a smaller bypass capacitor located near the regulator IC and a larger bulk capacitor. The total input capacitance should be large enough to limit the input voltage ripple to a desired amplitude. For input ripple voltage  $\Delta V_{IN}$ ,  $C_{IN}$  can be calculated using [Equation 32](#).

$$C_{IN} \geq \frac{I_{OUT(MAX)}}{4 \times f \times \Delta V_{IN}} \quad (32)$$

Choosing a  $\Delta V_{IN}$  of 0.5 V gives a minimum  $C_{IN}$  of 0.2  $\mu\text{F}$ . A standard value of 0.47  $\mu\text{F}$  is selected for  $C_{BYP}$  in this design. A bulk capacitor of higher value reduces voltage spikes due to parasitic inductance between the power source to the converter. A standard value of 2.2  $\mu\text{F}$  is selected for  $C_{IN}$  in this design. The voltage ratings of the two input capacitors should be greater than the maximum input voltage under all conditions.

#### 8.2.2.2.12 UVLO Resistors

UVLO resistors  $R_{UV1}$  and  $R_{UV2}$  set the undervoltage lockout threshold and hysteresis according to [Equation 33](#) and [Equation 34](#).

$$V_{IN(HYS)} = I_{HYS} \times R_{UV2} \quad (33)$$

where

- $I_{HYS} = 20 \text{ } \mu\text{A}$ , typical.

$$V_{IN(UVLO, \text{ rising})} = 1.225\text{V} \times \left( \frac{R_{UV2}}{R_{UV1}} + 1 \right) \quad (34)$$

For a UVLO hysteresis of 2.5 V and UVLO rising threshold of 20 V, [Equation 33](#) and [Equation 34](#) require  $R_{UV1}$  of 8.25 k $\Omega$  and  $R_{UV2}$  of 127 k $\Omega$  and these values are selected for this design example.

### 8.2.2.2.13 V<sub>CC</sub> Diode

Diode D2 is an optional diode connected between V<sub>OUT1</sub> and the V<sub>CC</sub> regulator output pin. When V<sub>OUT1</sub> is more than one diode drop greater than the V<sub>CC</sub> voltage, the V<sub>CC</sub> bias current is supplied from V<sub>OUT1</sub>. This results in reduced power losses in the internal V<sub>CC</sub> regulator which improves converter efficiency. V<sub>OUT1</sub> must be set to a voltage at least one diode drop higher than 8.55 V (the maximum V<sub>CC</sub> voltage) if D2 is used to supply bias current.

### 8.2.2.3 Application Curves

**Figure 8-9. Steady State Waveform (V<sub>IN</sub> = 48 V, I<sub>OUT1</sub> = 100 mA, I<sub>OUT2</sub> = 200 mA)**

**Figure 8-10. Step Load Response (V<sub>IN</sub> = 48 V, I<sub>OUT1</sub> = 0 A, Step Load on I<sub>OUT2</sub> = 100 mA to 200 mA)**

**Figure 8-11. Efficiency at 750 kHz, V<sub>OUT1</sub> = 10 V**

## 9 Power Supply Recommendations

The LM5017 DC/DC converter is designed to operate from a wide input voltage range of 7.5 V to 100 V. The characteristics of the input supply must be compatible with the [Section 6.1](#) and [Section 6.3](#) tables. In addition, the input supply must be capable of delivering the required input current to the fully-loaded regulator. Estimate the average input current with [Equation 35](#).

$$I_{IN} = \frac{P_{OUT}}{V_{IN} \cdot \eta} \quad (35)$$

where

- $\eta$  is the efficiency

If the regulator is connected to an input supply through long wires or PCB traces with a large impedance, take special care to achieve stable performance. The parasitic inductance and resistance of the input cables may have an adverse affect on converter operation, particularly during operation at low input voltage. The parasitic inductance in combination with the low-ESR ceramic input capacitors form an underdamped resonant circuit. This circuit can cause overvoltage transients at VIN each time the input supply is cycled on and off. The parasitic resistance causes the input voltage to dip during a load transient. The best way to solve such issues is to reduce the distance from the input supply to the regulator and use an aluminum or tantalum input capacitor in parallel with the ceramics. The moderate ESR of the electrolytic capacitors helps to damp the input resonant circuit and reduce any voltage overshoots. A capacitance in the range of 4.7  $\mu$ F to 22  $\mu$ F is usually sufficient to provide input parallel damping and helps to hold the input voltage steady during large load transients.

An EMI input filter is often used in front of the regulator that, unless carefully designed, can lead to instability as well as some of the effects mentioned above. The application report [Simple Success with Conducted EMI for DC-DC Converters](#) (SNVA489) provides helpful suggestions when designing an input filter for any switching regulator.

## 10 Layout

### 10.1 Layout Guidelines

A proper layout is essential for optimum performance of the circuit. In particular, the following guidelines should be observed:

1.  $C_{IN}$ : The loop consisting of input capacitor ( $C_{IN}$ ),  $V_{IN}$  pin, and RTN pin carries switching currents. Therefore, the input capacitor should be placed close to the IC, directly across  $V_{IN}$  and RTN pins and the connections to these two pins should be direct to minimize the loop area. In general it is not possible to accommodate all of input capacitance near the IC. A good practice is to use a 0.1- $\mu$ F or 0.47- $\mu$ F capacitor directly across the  $V_{IN}$  and RTN pins close to the IC, and the remaining bulk capacitor as close as possible (see [Figure 10-1](#)).
2.  $C_{VCC}$  and  $C_{BST}$ : The  $V_{CC}$  and bootstrap (BST) bypass capacitors supply switching currents to the high and low side gate drivers. These two capacitors should also be placed as close to the IC as possible, and the connecting trace length and loop area should be minimized (see [Figure 10-1](#)).
3. The Feedback trace carries the output voltage information and a small ripple component that is necessary for proper operation of LM5017. Therefore, care should be taken while routing the feedback trace to avoid coupling any noise to this pin. In particular, feedback trace should not run close to magnetic components, or parallel to any other switching trace.
4. SW trace: The SW node switches rapidly between  $V_{IN}$  and GND every cycle and is therefore a possible source of noise. The SW node area should be minimized. In particular, the SW node should not be inadvertently connected to a copper plane or pour.

### 10.2 Layout Example

**Figure 10-1. Placement of Bypass Capacitors**

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

#### 11.1.2 Development Support

For development support, see the following:

- [LM5017 Buck Converter Quick-start Calculator](#)
- [Fly-Buck Converter Quick-start Calculator](#)
- [LM5017 PSPICE Transient Model](#)
- [LM5017 TINA-TI Transient Spice Model](#)
- [LM5017 TINA-TI Transient Reference Design](#)
- For TI's reference design library, visit [TI Reference Designs](#)
- For TI's WEBENCH Design Environment, visit the [WEBENCH® Design Center](#).
- To view a related device of this product, see the [LM5018](#) 100-V, 300-mA synchronous buck converter.
- Power House Blogs:
  - [Fly-Buck: Frequently Asked Questions \(FAQs\)](#)
  - [Lower EMI and Quiet Switching With the Fly-Buck Topology](#)
  - [Fly-Buck Converter PCB Layout Tips](#)
  - [When is Fly-Buck the Right Choice for Your Isolated Power Needs?](#)
  - [How to Design for EMC and Isolation With Fly-Buck Converters](#)
  - [Create a Fly-Buck Converter in WEBENCH® Power Designer](#)

##### 11.1.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the LM5017 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage ( $V_{IN}$ ), output voltage ( $V_{OUT}$ ), and output current ( $I_{OUT}$ ) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

### 11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 11.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 11.5 Trademarks

PowerPAD™ and are trademarks of Texas Instruments.  
 Fly-Buck™ and TI E2E™ are trademarks of Texas Instruments.  
 WEBENCH® are registered trademarks of Texas Instruments.  
 All trademarks are the property of their respective owners.

### 11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# DDA0008B

# PACKAGE OUTLINE

## PowerPAD™ SOIC - 1.7 mm max height

PLASTIC SMALL OUTLINE

4214849/A 08/2016

PowerPAD is a trademark of Texas Instruments.

### NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MS-012.

# EXAMPLE BOARD LAYOUT
