

# SN74ACT595-Q1 Automotive 8-Bit Shift Register With TTL-Compatible Inputs And Output Registers

## 1 Features

- AEC-Q100 qualified for automotive applications:
  - Device temperature grade 1: -40°C to +125°C
  - Device HBM ESD classification level 2
  - Device CDM ESD classification level C4B
- Available in [wetable flank](#) QFN package
- Operating voltage range of 4.5V to 5.5V
- TTL-compatible inputs
- Continuous ±24mA output drive at 5V
- Supports up to ±75mA output drive at 5V in short bursts
- Drives 50Ω transmission lines
- Fast operation with delay of 11.9ns max

## 2 Applications

- [Increase the number of outputs on a microcontroller](#)
- Store up to 8 bits of data temporarily

## 3 Description

The SN74ACT595-Q1 device contains an 8-bit, serial-in, parallel-out shift register that feeds an 8-bit D-type storage register. The storage register has parallel outputs. Separate clocks are provided for both the shift and storage register. The shift register has a direct overriding clear (SRCLR) input, serial (SER) input, and a serial output (QH) for cascading. When the output-enable (OE) input is high, the register outputs are in a high-impedance state. Internal register data is not impacted by the operation of the OE input.

### Device Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>	BODY SIZE <sup>(3)</sup>
SN74ACT595-Q1	BQB (WQFN, 16)	3.5mm × 2.5mm	3.5mm × 2.5mm
	PW (TSSOP, 16)	5mm × 6.4mm	5mm × 4.4mm

- (1) For more information, see [Section 11](#).
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.
- (3) The body size (length × width) is a nominal value and does not include pins.

## 4 Pin Configuration and Functions

**PW Package, 16-Pin TSSOP (Top View)**

**BQB Package, 16-Pin WQFN (Transparent Top View)**

**Table 4-1. Pin Functions**

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
Q <sub>B</sub>	1	O	Q <sub>B</sub> output
Q <sub>C</sub>	2	O	Q <sub>C</sub> output
Q <sub>D</sub>	3	O	Q <sub>D</sub> output
Q <sub>E</sub>	4	O	Q <sub>E</sub> output
Q <sub>F</sub>	5	O	Q <sub>F</sub> output
Q <sub>G</sub>	6	O	Q <sub>G</sub> output
Q <sub>H</sub>	7	O	Q <sub>H</sub> output
GND	8	G	Ground
Q <sub>H</sub> '	9	O	Serial output, can be used for cascading
$\overline{\text{SRCLR}}$	10	I	Shift register clear, active low
SRCLK	11	I	Shift register clock, rising edge triggered
RCLK	12	I	Output register clock, rising edge triggered
$\overline{\text{OE}}$	13	I	Output Enable, active low
SER	14	I	Serial input
Q <sub>A</sub>	15	O	Q <sub>A</sub> output
V <sub>CC</sub>	16	P	Positive supply
Thermal Pad <sup>(2)</sup>		—	The thermal pad can be connect to GND or left floating. Do not connect to any other signal or supply.

(1) Signal Types: I = Input, O = Output, I/O = Input or Output, P = Power, G = Ground.

(2) BQB package only.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage range		-0.5	7	V
V <sub>I</sub>	Input voltage range <sup>(2)</sup>		-0.5	V <sub>CC</sub> + 0.5V	V
V <sub>O</sub>	Output voltage range <sup>(2)</sup>		-0.5	V <sub>CC</sub> + 0.5V	V
I <sub>IK</sub>	Input clamp current	V <sub>I</sub> < -0.5V or V <sub>I</sub> > V <sub>CC</sub> + 0.5V		±20	mA
I <sub>OK</sub>	Output clamp current	V <sub>O</sub> < -0.5V or V <sub>O</sub> > V <sub>CC</sub> + 0.5V		±50	mA
I <sub>O</sub>	Continuous output current	V <sub>O</sub> = 0 to V <sub>CC</sub>		±50	mA
	Continuous output current through V <sub>CC</sub> or GND			±200	mA
T <sub>J</sub>	Junction temperature			150	°C
T <sub>stg</sub>	Storage temperature		-65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. Absolute maximum ratings do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If briefly operating outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not sustain damage, but it may not be fully functional. Operating the device in this manner may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

### 5.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 HBM ESD Classification Level 2 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per AEC Q100-011 CDM ESD Classification Level C4B	±1000	

- (1) AEC Q100-002 indicate that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage		4.5	5.5	V
V <sub>IH</sub>	High-level input voltage		2		V
V <sub>IL</sub>	Low-Level input voltage			0.8	V
V <sub>I</sub>	Input Voltage		0	V <sub>CC</sub>	V
V <sub>O</sub>	Output Voltage		0	V <sub>CC</sub>	V
I <sub>OH</sub>	High-level output current			-24	mA
I <sub>OL</sub>	Low-level output current			24	mA
Δt/Δv	Input transition rise or fall rate			20	ns/V
T <sub>A</sub>	Operating free-air temperature		-40	125	°C

### 5.4 Thermal Information

PACKAGE	PINS	THERMAL METRIC <sup>(1)</sup>						UNIT
		R <sub>θJA</sub>	R <sub>θJC(top)</sub>	R <sub>θJB</sub>	Ψ <sub>JT</sub>	Ψ <sub>JB</sub>	R <sub>θJC(bot)</sub>	
PW (TSSOP)	16	126.2	60.5	84.2	7.5	83.3	-	°C/W
BQB (WQFN)	16	91.2	95.1	61.4	18.0	61.2	38.0	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

## 5.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	V <sub>CC</sub>	-40°C to 125°C			UNIT
			MIN	TYP	MAX	
V <sub>OH</sub>	I <sub>OH</sub> = -50µA	4.5V	4.4	4.499	V	
		5.5V	5.4	5.499		
	I <sub>OH</sub> = -24mA	4.5V	3.7			
		5.5V	4.7			
I <sub>OH</sub> = -75mA <sup>(3)</sup>	5.5V	3.85				
V <sub>OL</sub>	I <sub>OL</sub> = 50µA	4.5V		0.001	0.1	V
		5.5V		0.001	0.1	
	I <sub>OL</sub> = 24mA	4.5V			0.5	
	I <sub>OL</sub> = 24mA	5.5V			0.5	
I <sub>OL</sub> = 75mA <sup>(3)</sup>	5.5V			1.65		
I <sub>I</sub>	V <sub>I</sub> = 5.5V or GND	0V to 5.5V			±1	µA
I <sub>OZ</sub>	V <sub>O</sub> = V <sub>CC</sub> or GND	5.5V			±1	µA
I <sub>CC</sub>	V <sub>I</sub> = V <sub>CC</sub> or GND, I <sub>O</sub> = 0	5.5V			2	µA
ΔI <sub>CC</sub>	V <sub>I</sub> = V <sub>CC</sub> - 2.1V; Any Input	4.5V to 5.5V			200	µA
C <sub>I</sub>	V <sub>I</sub> = V <sub>CC</sub> or GND	5V		2		pF
C <sub>O</sub>	V <sub>O</sub> = V <sub>CC</sub> or GND	5V		4		pF
C <sub>PD</sub> <sup>(1) (2)</sup>	C <sub>L</sub> = 50pF, F = 1MHz	5V		57		pF

(1) C<sub>PD</sub> is used to determine the dynamic power consumption, per channel

(2) P<sub>D</sub> = V<sub>CC</sub><sup>2</sup> × F<sub>I</sub> × (C<sub>PD</sub> + C<sub>L</sub>) where F<sub>I</sub> = input frequency, C<sub>L</sub> = output load capacitance, V<sub>CC</sub> = supply voltage

(3) Not more than one output should be tested at a time, and the duration of the test should not exceed 2 ms.

## 5.6 Timing Characteristics

over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER	DESCRIPTION	CONDITION	V <sub>CC</sub>	-40°C to 125°C		UNIT
				MIN	MAX	
f <sub>clock</sub>	Clock frequency		5V		100	MHz
t <sub>w</sub>	Pulse duration	RCLK or SRCLK high or low	5V	1.5		ns
t <sub>w</sub>	Pulse duration	SRCLR low	5V	1.8		ns
t <sub>su</sub>	Setup time	SER before SRCLK↑	5V	1		ns
t <sub>su</sub>	Setup time	SRCLK↑ before RCLK↑	5V	2.5		ns
t <sub>su</sub>	Setup time	SRCLR low before RCLK↑	5V	2.4		ns
t <sub>su</sub>	Setup time	SRCLR high (inactive) before SRCLK↑	5V	0.4		ns
t <sub>h</sub>	Hold time	SER after SRCLK↑	5V	0.7		ns

## 5.7 Switching Characteristics

C<sub>L</sub> = 50 pF; over operating free-air temperature range; typical values measured at T<sub>A</sub> = 25°C (unless otherwise noted)

PARAMETER	FROM (INPUT)	TO (OUTPUT)	V <sub>CC</sub>	-40°C to 125°C			UNIT
				MIN	TYP	MAX	
t <sub>pzl</sub>	OE	Q <sub>A</sub> -Q <sub>H</sub>	5V		8.4	11.9	ns
t <sub>pzh</sub>	OE	Q <sub>A</sub> -Q <sub>H</sub>	5V		8.2	11.7	ns
t <sub>plz</sub>	OE	Q <sub>A</sub> -Q <sub>H</sub>	5V		4.4	6.3	ns
t <sub>phz</sub>	OE	Q <sub>A</sub> -Q <sub>H</sub>	5V		5.4	7.8	ns
t <sub>plh</sub>	RCLK	Q <sub>A</sub> -Q <sub>H</sub>	5V		7.3	10.7	ns
t <sub>phl</sub>	RCLK	Q <sub>A</sub> -Q <sub>H</sub>	5V		7.3	10.5	ns

$C_L = 50$  pF; over operating free-air temperature range; typical values measured at  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

PARAMETER	FROM (INPUT)	TO (OUTPUT)	$V_{CC}$	-40°C to 125°C			UNIT
				MIN	TYP	MAX	
$t_{plh}$	SRCLK	$Q_{H'}$	5V		7.3	10.6	ns
$t_{phl}$	SRCLK	$Q_{H'}$	5V		7.3	10.6	ns
$t_{phl}$	SRCLR	$Q_{H'}$	5V		7.7	10.8	ns

## 5.8 Typical Characteristics

$T_A = 25^\circ\text{C}$  (unless otherwise noted)

Figure 5-1. Supply Current Across Supply Voltage

Figure 5-2. Output Voltage vs Current in HIGH State; 5V Supply

Figure 5-3. Output Voltage vs Current in LOW State; 5V Supply

## 6 Parameter Measurement Information

Phase relationships between waveforms were chosen arbitrarily for the examples listed in the following table. All input pulses are supplied by generators having the following characteristics:  $PRR \leq 1\text{MHz}$ ,  $Z_O = 50\Omega$ ,  $t_f < 2.5\text{ns}$ ,  $V_t = 1.5\text{V}$ . For push-pull outputs,  $R_L = 500\Omega$ .

For clock inputs,  $f_{\text{max}}$  is measured when the input duty cycle is 50%.

The outputs are measured individually with one input transition per measurement.

TEST	S1	S2	$R_L$	$C_L$	$\Delta V$	$V_{\text{LOAD}}$
$t_{\text{PLH}}$ , $t_{\text{PHL}}$	OPEN	OPEN	$500\Omega$	$50\text{pF}$	—	—
$t_{\text{PLZ}}$ , $t_{\text{PZL}}$	CLOSED	OPEN	$500\Omega$	$50\text{pF}$	$0.3\text{V}$	$2 \times V_{\text{CC}}$
$t_{\text{PHZ}}$ , $t_{\text{PZH}}$	OPEN	CLOSED	$500\Omega$	$50\text{pF}$	$0.3\text{V}$	—

(1)  $C_L$  includes probe and test-fixture capacitance.

## 7 Detailed Description

### 7.1 Overview

Figure 7-1 describes the SN74ACT595-Q1, an 8-bit shift register that feeds an 8-bit D-type storage register. Both the shift register clock (SRCLK) and storage register clock (RCLK) are positive-edge triggered. If both clocks are connected together, the shift register always is one clock pulse ahead of the storage register. Outputs  $Q_A$  through  $Q_H$  are controlled by the output enable ( $\overline{OE}$ ) input. The serial output  $Q_H$  is always active.

### 7.2 Functional Block Diagram

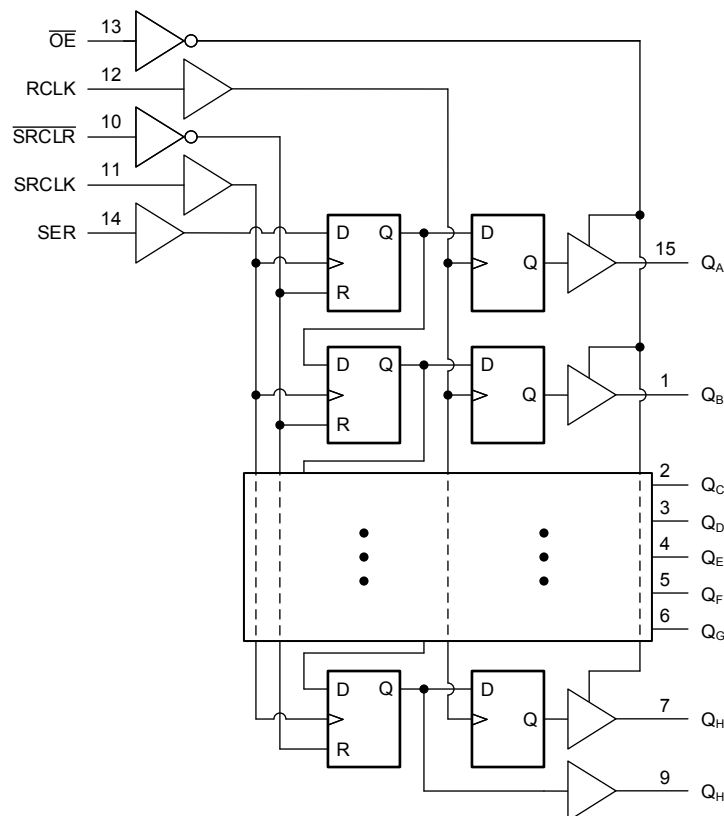

Figure 7-1. Logic Diagram (Positive Logic) for the SN74ACT595-Q1

### 7.3 Feature Description

#### 7.3.1 Balanced CMOS Push-Pull Outputs

This device includes balanced CMOS push-pull outputs. The term *balanced* indicates that the device can sink and source similar currents. The drive capability of this device may create fast edges into light loads, so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. It is important to limit the output power of the device to avoid damage due to overcurrent. The electrical and thermal limits defined in the *Absolute Maximum Ratings* must be followed at all times.

Unused push-pull CMOS outputs must be left disconnected.

#### 7.3.2 Balanced CMOS 3-State Outputs

This device includes balanced CMOS 3-state outputs. Driving high, driving low, and high impedance are the three states that these outputs can be in. The term *balanced* indicates that the device can sink and source similar currents. The drive capability of this device may create fast edges into light loads, so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device can drive larger currents than the device can sustain without being damaged. It is important for the output power of the device

to be limited to avoid damage due to overcurrent. The electrical and thermal limits defined in the *Absolute Maximum Ratings* must be followed at all times.

When placed into the high-impedance state, the output will neither source nor sink current, with the exception of minor leakage current as defined in the *Electrical Characteristics* table. In the high-impedance state, the output voltage is not controlled by the device and is dependent on external factors. If no other drivers are connected to the node, then this is known as a floating node and the voltage is unknown. A pull-up or pull-down resistor can be connected to the output to provide a known voltage at the output while it is in the high-impedance state. The value of the resistor will depend on multiple factors, including parasitic capacitance and power consumption limitations. Typically, a 10kΩ resistor can be used to meet these requirements.

Unused 3-state CMOS outputs should be left disconnected.

### 7.3.3 TTL-Compatible CMOS Inputs

This device includes TTL-compatible CMOS inputs. These inputs are specifically designed to interface with TTL logic devices by having a reduced input voltage threshold.

TTL-compatible CMOS inputs are high impedance and are typically modeled as a resistor in parallel with the input capacitance given in the *Electrical Characteristics*. The worst case resistance is calculated with the maximum input voltage, given in the *Absolute Maximum Ratings*, and the maximum input leakage current, given in the *Electrical Characteristics*, using Ohm's law ( $R = V \div I$ ).

TTL-compatible CMOS inputs require that input signals transition between valid logic states quickly, as defined by the input transition time or rate in the *Recommended Operating Conditions* table. Failing to meet this specification will result in excessive power consumption and could cause oscillations. More details can be found in the [Implications of Slow or Floating CMOS Inputs](#) application report.

Do not leave TTL-compatible CMOS inputs floating at any time during operation. Unused inputs must be terminated at  $V_{CC}$  or GND. If a system will not be actively driving an input at all times, a pull-up or pull-down resistor can be added to provide a valid input voltage during these times. The resistor value will depend on multiple factors; however, a 10kΩ resistor is recommended and typically will meet all requirements.

### 7.3.4 Wettable Flanks

This device includes wettable flanks for at least one package. See the *Features* section on the front page of the data sheet where packages include this feature.

**Figure 7-2. Simplified Cutaway View of Wettable-Flank QFN Package and Standard QFN Package After Soldering**

Wettable flanks help improve side wetting after soldering, which makes QFN packages easier to inspect with automatic optical inspection (AOI). As shown in [Figure 7-2](#), a wettable flank can be dimpled or step-cut to provide additional surface area for solder adhesion which assists in reliably creating a side fillet. See the mechanical drawing for additional details.

### 7.3.5 Clamp Diode Structure

As shown in Figure 7-3, the inputs and outputs to this device have both positive and negative clamping diodes.

**CAUTION**

Voltages beyond the values specified in the *Absolute Maximum Ratings* table can cause damage to the device. The input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

**Figure 7-3. Electrical Placement of Clamping Diodes for Each Input and Output**

### 7.4 Device Functional Modes

[Function Table](#) lists the functional modes of the SN74ACT595-Q1.

**Table 7-1. Function Table**

INPUTS					FUNCTION
SER	SRCLK	SRCLR	RCLK	OE	
X	X	X	X	H	Outputs Q <sub>A</sub> – Q <sub>H</sub> are disabled
X	X	X	X	L	Outputs Q <sub>A</sub> – Q <sub>H</sub> are enabled.
X	X	L	X	X	Shift register is cleared.
L	↑	H	X	X	First stage of the shift register goes low. Other stages store the data of previous stage, respectively.
H	↑	H	X	X	First stage of the shift register goes high. Other stages store the data of previous stage, respectively.
X	X	H	↑	X	Shift-register data is stored in the storage register.
X	↑	H	↑	X	Data in shift register is stored in the storage register, the data is then shifted through.

## 8 Application and Implementation

---

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

---

### 8.1 Application Information

In this application, the SN74ACT595-Q1 is used to control seven-segment displays. Utilizing the serial output and combining a few of the input signals, this implementation reduces the number of I/O pins required to control the displays from sixteen to four. Unlike other I/O expanders, the SN74ACT595-Q1 does not need a communication interface for control. It can be easily operated with simple GPIO pins.

The  $\overline{OE}$  pin is used to easily disable the outputs when the displays need to be turned off or connected to a PWM signal to control brightness. However, this pin can be tied low and the outputs of the SN74ACT595-Q1 can be controlled accordingly to turn off all the outputs reducing the I/O needed to three. There is no practical limitation to how many SN74ACT595-Q1 devices can be cascaded. To add more, the serial output will need to be connected to the following serial input and the clocks will need to be connected accordingly. With separate control for the shift registers and output registers, the desired digit can be displayed while the data for the next digit is loaded into the shift register.

At power-up, the initial state of the shift registers and output registers are unknown. To give them a defined state, the shift register needs to be cleared and then clocked into the output register. As shown in [Figure 8-1](#), an RC circuit can be connected to the  $\overline{SRCLR}$  pin to initialize the shift register to all zeros. With the  $\overline{OE}$  pin pulled up with a resistor, this process can be performed while the outputs are in a high-impedance state eliminating any erroneous data causing issues with the displays.

## 8.2 Typical Application

**Figure 8-1. Typical Application Block Diagram**

## 8.2.1 Design Requirements

### 8.2.1.1 Power Considerations

Ensure the desired supply voltage is within the range specified in the *Recommended Operating Conditions*. The supply voltage sets the device's electrical characteristics of the device as described in the *Electrical Characteristics* section.

The positive voltage supply must be capable of sourcing current equal to the total current to be sourced by all outputs of the SN74ACT595-Q1 plus the maximum static supply current,  $I_{CC}$ , listed in the *Electrical Characteristics*, and any transient current required for switching. The logic device can only source as much current that is provided by the positive supply source. Ensure the maximum total current through  $V_{CC}$  listed in the *Absolute Maximum Ratings* is not exceeded.

The ground must be capable of sinking current equal to the total current to be sunk by all outputs of the SN74ACT595-Q1 plus the maximum supply current,  $I_{CC}$ , listed in the *Electrical Characteristics*, and any transient current required for switching. The logic device can only sink as much current that can be sunk into its ground connection. Ensure the maximum total current through GND listed in the *Absolute Maximum Ratings* is not exceeded.

The SN74ACT595-Q1 can drive a load with a total capacitance less than or equal to 50pF while still meeting all of the data sheet specifications. Larger capacitive loads can be applied; however, it is not recommended to exceed 50pF.

The SN74ACT595-Q1 can drive a load with total resistance described by  $R_L \geq V_O / I_O$ , with the output voltage and current defined in the *Electrical Characteristics* table with  $V_{OH}$  and  $V_{OL}$ . When outputting in the HIGH state, the output voltage in the equation is defined as the difference between the measured output voltage and the supply voltage at the  $V_{CC}$  pin.

Total power consumption can be calculated using the information provided in [CMOS Power Consumption and Cpd Calculation](#).

Thermal increase can be calculated using the information provided in [Thermal Characteristics of Standard Linear and Logic \(SLL\) Packages and Devices](#).

#### CAUTION

The maximum junction temperature,  $T_{J(max)}$  listed in the *Absolute Maximum Ratings*, is an additional limitation to prevent damage to the device. Do not violate any values listed in the *Absolute Maximum Ratings*. These limits are provided to prevent damage to the device.

### 8.2.1.2 Input Considerations

Input signals must cross  $V_{IL(max)}$  to be considered a logic LOW, and  $V_{IH(min)}$  to be considered a logic HIGH. Do not exceed the maximum input voltage range found in the *Absolute Maximum Ratings*.

Unused inputs must be terminated to either  $V_{CC}$  or ground. The unused inputs can be directly terminated if the input is completely unused, or they can be connected with a pull-up or pull-down resistor if the input will be used sometimes, but not always. A pull-up resistor is used for a default state of HIGH, and a pull-down resistor is used for a default state of LOW. The drive current of the controller, leakage current into the SN74ACT595-Q1 (as specified in the *Electrical Characteristics*), and the desired input transition rate limits the resistor size. A 10k $\Omega$  resistor value is often used due to these factors.

The SN74ACT595-Q1 has CMOS inputs and thus requires fast input transitions to operate correctly, as defined in the *Recommended Operating Conditions* table. Slow input transitions can cause oscillations, additional power consumption, and reduction in device reliability.

Refer to the *Feature Description* section for additional information regarding the inputs for this device.

### 8.2.1.3 Output Considerations

The positive supply voltage is used to produce the output HIGH voltage. Drawing current from the output will decrease the output voltage as specified by the  $V_{OH}$  specification in the *Electrical Characteristics*. The ground voltage is used to produce the output LOW voltage. Sinking current into the output will increase the output voltage as specified by the  $V_{OL}$  specification in the *Electrical Characteristics*.

Push-pull outputs that could be in opposite states, even for a very short time period, should never be connected directly together. This can cause excessive current and damage to the device.

Two channels within the same device with the same input signals can be connected in parallel for additional output drive strength.

Unused outputs can be left floating. Do not connect outputs directly to  $V_{CC}$  or ground.

Refer to the *Feature Description* section for additional information regarding the outputs for this device.

### 8.2.2 Detailed Design Procedure

1. Add a decoupling capacitor from  $V_{CC}$  to GND. The capacitor needs to be placed physically close to the device and electrically close to both the  $V_{CC}$  and GND pins. An example layout is shown in the *Layout* section.
2. Ensure the capacitive load at the output is  $\leq 50\text{pF}$ . This is not a hard limit; by design, however, it will optimize performance. This can be accomplished by providing short, appropriately sized traces from the SN74ACT595-Q1 to one or more of the receiving devices.
3. Ensure the resistive load at the output is larger than  $(V_{CC} / I_{O(\text{max})})\Omega$ . Doing this will prevent the maximum output current from the *Absolute Maximum Ratings* from being violated. Most CMOS inputs have a resistive load measured in  $\text{M}\Omega$ ; much larger than the minimum calculated previously.
4. Thermal issues are rarely a concern for logic gates; the power consumption and thermal increase, however, can be calculated using the steps provided in the application report, [CMOS Power Consumption and Cpd Calculation](#).

### 8.2.3 Application Curves

**Figure 8-2. Simplified Functional Diagram Showing Clock Operation**

## 8.3 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the *Recommended Operating Conditions*. Each  $V_{CC}$  terminal should have a good bypass capacitor to prevent power disturbance. A  $0.1\mu\text{F}$  capacitor is recommended for this device. It is acceptable to parallel multiple bypass capacitors to reject different frequencies of noise. The  $0.1\mu\text{F}$  and  $1\mu\text{F}$  capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible for best results.

## 8.4 Layout

### 8.4.1 Layout Guidelines

- Bypass capacitor placement
  - Place near the positive supply terminal of the device
  - Provide an electrically short ground return path
  - Use wide traces to minimize impedance
  - Keep the device, capacitors, and traces on the same side of the board whenever possible
- Signal trace geometry
  - 8mil to 12mil trace width

- Lengths less than 12cm to minimize transmission line effects
- Avoid 90° corners for signal traces
- Use an unbroken ground plane below signal traces
- Flood fill areas around signal traces with ground
- For traces longer than 12cm
  - Use impedance controlled traces
  - Source-terminate using a series damping resistor near the output
  - Avoid branches; buffer signals that must branch separately

## 9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 9.1 Documentation Support

#### 9.1.1 Related Documentation

For related documentation, see the following:

- Texas Instruments, [CMOS Power Consumption and  \$C\_{pd}\$  Calculation application report](#)
- Texas Instruments, [Designing With Logic application report](#)
- Texas Instruments, [Thermal Characteristics of Standard Linear and Logic \(SLL\) Packages and Devices application report](#)

### 9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.3 Support Resources

TI E2E™ [support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

### 9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
November 2024	*	Initial release

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN74ACT595PWRQ1	ACTIVE	TSSOP	PW	16	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	ACT595Q	<a href="#">Samples</a>
SN74ACT595WBQBRQ1	ACTIVE	WQFN	BQB	16	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	AD595Q	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

4226135/A 08/2020

**NOTES:**

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 20X

4226135/A 08/2020

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

SOLDER PASTE EXAMPLE

EXPOSED PAD  
 85% PRINTED COVERAGE BY AREA  
 SCALE: 20X

4226135/A 08/2020

NOTES: (continued)

- 6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

4220204/A 02/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.
