TEXAS INSTRUMENTS

SN74CBT3244

SCDS001O – NOVEMBER 1992 – REVISED SEPTEMBER 2015

SN74CBT3244 Octal FET Bus Switch

1 Features

- High-Bandwidth Data Path (Up to 200 MHz)
- Control Inputs Can Be Driven by TTL or 5-V/3.3-V CMOS Outputs
- Low and Flat ON-State Resistance (r_{on}) Characteristics Over Operating Range (r_{on}= 5 Ω Typical)
- Bidirectional Data Flow With Near-Zero Propagation Delay
- Low Input/Output Capacitance Minimizes Loading and Signal Distortion ($C_{io(OFF)}$ = 6 pF Typical)
- Low Power Consumption (I_{CC} = 50 µA Maximum)
- V_{CC} Operating Range From 4.5 V to 5 V
- Data I/Os Support 0- to 5-V Signaling Levels (0.8 V, 1.2 V, 1.5 V, 1.8 V, 2.5 V, 3.3 V, 5 V)
- Standard '244-Type Pinout

2 Applications

- Multi-Processor Communications
- Test and Measurement Systems
- Factory Automation Control Boards
- Building Automation Control Boards

3 Description

The SN74CBT3244 device provides eight bits of high-speed TTL-compatible bus switching. The SOIC, SSOP, TSSOP, and TVSOP packages provide a standard '244 device pinout. The low ON-state resistance of the switch allows connections to be made with minimal propagation delay. The device is organized as two 4-bit low-impedance switches with separate output-enable ($\overline{OE}$) inputs.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

	MIN	MAX	UNIT
Supply voltage, V_{CC}	−0.5	7	V
Input voltage, V_I [2]	−0.5	7	V
Continuous channel current		128	mA
Clamp current, I_K ($V_{I/O} < 0$)		−50	mA
Storage temperature, T_{stg}	−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±1500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
V_{CC}	Supply voltage	4.5	5.5	V
V_{IH}	High-level control input voltage	2		V
V_{IL}	Low-level control input voltage		0.8	V
T_A	Operating free-air temperature	−40	85	°C

(1) All unused control inputs of the device must be held at V_{CC} or GND to ensure proper device operation. Refer to the TI application report, *Implications of Slow or Floating CMOS Inputs*, SCBA004.

6.4 Thermal Information Package

	SN74CBT3244					
THERMAL METRIC[1][2]	**DB (SSOP)**	**DBQ (SSOP)**	**DGV (TVSOP)**	**PW (TSSOP)**	**RGY (VQFN)**	**UNIT**
	20 PINS	**20 PINS**	**20 PINS**	**20 PINS**	**20 PINS**	
$R_{\theta JA}$ Junction-to-ambient thermal resistance	70	68	92	83	37	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.
(2) The package thermal impedance is calculated in accordance with JESD 51-7.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS			MIN	TYP[1]	MAX	UNIT
V_{IK}		V_{CC} = 4.5 V	I_I = –18 mA				–1.2	V
I_I		V_{CC} = 5.5 V	V_I = 5.5 V or GND				±5	µA
I_{CC}		V_{CC} = 5.5 V	I_O = 0,	V_I = V_{CC} or GND			50	µA
ΔI_{CC}[2]	Control inputs	V_{CC} = 5.5 V	One input at 3.4 V,	Other inputs at V_{CC} or GND			3.5	mA
C_i	Control inputs	V_I = 3 V or 0				3		pF
$C_{io(OFF)}$		V_O = 3 V or 0	$\overline{OE}$ = V_{CC}			6		pF
r_{on}[3]		V_{CC} = 4.5 V	V_I = 0 V	I_I = 64 mA		5	7	Ω
				I_I = 30 mA		5	7	
			V_I = 2.4 V	I_I = 15 mA		10	15	

(1) All typical values are at V_{CC} = 5 V, T_A = 25°C.
(2) This is the increase in supply current for each input that is at the specified TTL voltage level, rather than V_{CC} or GND.
(3) Measured by the voltage drop between the A and the B terminals at the indicated current through the switch. On-state resistance is determined by the lowest voltage of the two (A or B) terminals.

6.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER	FROM (INPUT)	TO (OUTPUT)	MIN	TYP	MAX	UNIT
t_{pd}[1]	A or B	B or A			0.25	ns
t_{en}	$\overline{OE}$	A or B	1		8.9	ns
t_{dis}	OE	A or B	1		7.4	ns

(1) This propagation delay is the calculated RC time constant of the typical on-state resistance of the switch and the specified load capacitance, when driven by an ideal voltage source (zero output impedance).

NOTES: A. C_L includes probe and jig capacitance.
   B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control.
      Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
   C. All input pulses are supplied by generators having the following characteristics: PRR ≤ 10 MHz, Z_O = 50 Ω, t_r ≤ 2.5 ns, t_f ≤ 2.5 ns.
   D. The outputs are measured one at a time with one transition per measurement.
   E. t_{PLZ} and t_{PHZ} are the same as t_{dis}.
   F. t_{PZL} and t_{PZH} are the same as t_{en}.
   G. t_{PLH} and t_{PHL} are the same as t_{pd}.
   H. All parameters and waveforms are not applicable to all devices.

Figure 2. Load Circuit and Voltage Waveforms

8 Detailed Description

8.1 Overview

The SN74CBT3244 has eight bits of high-speed TTL-compatible bus switching. The switches are grouped in the 2 groups of 4 bits each. Each group has output-enabled inputs to allow signals to pass between A and B ports. The signals can travel from A port to B port or vice versa.

The low ON-state resistance of the switch allows connections to be made with minimal propagation delay. The device is ideal for switching high speed digital signals between microprocessors and peripheral devices which is useful in test applications, measurement applications, and control boards for factory automation.
8.2 Functional Block Diagram

Figure 3. Simplified Schematic

8.3 Feature Description

The SN74CBT3244 device support same pin configuration as industry standard '244. This device has a near zero propagation delay allowing high speed signal switching up to 200 Mhz. The signals see lower distortion since the device has low ON-resistance (5 Ω) coupled with low-output capacitance (6 pF) . SN74CBT3244 has a very low power consumption in idle state consuming I_{CC} of 50 μA only allowing power-saving for the system. The device supports signal inputs any where between 0 V to 5 V.

8.4 Device Functional Modes

The device is organized as two 4-bit low-impedance switches with separate output-enable ($\overline{OE}$) inputs.The Output Enable $\overline{OE}$ is active low, implying when low A port is connected to B port. This switch is bidirectional in nature. Asserting $\overline{OE}$ high will disconnect A port from B port. To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pullup resistor. The minimum value of the resistor is determined by the current-sinking capability of the driver.

9 Application and Implementation

> **NOTE**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The SN74CBT3244 device can be used to control up to 4 bits with 2 channels simultaneously. The application shown in Figure 4 is a 8-bit bus being controlled. The $\overline{OE}$ pins are used to control the chip from the bus controller. This is a generic example and can apply to many situations. If an application requires fewer than 8 bits, ensure that the A side is tied either high or low on unused channels.

9.2 Typical Application
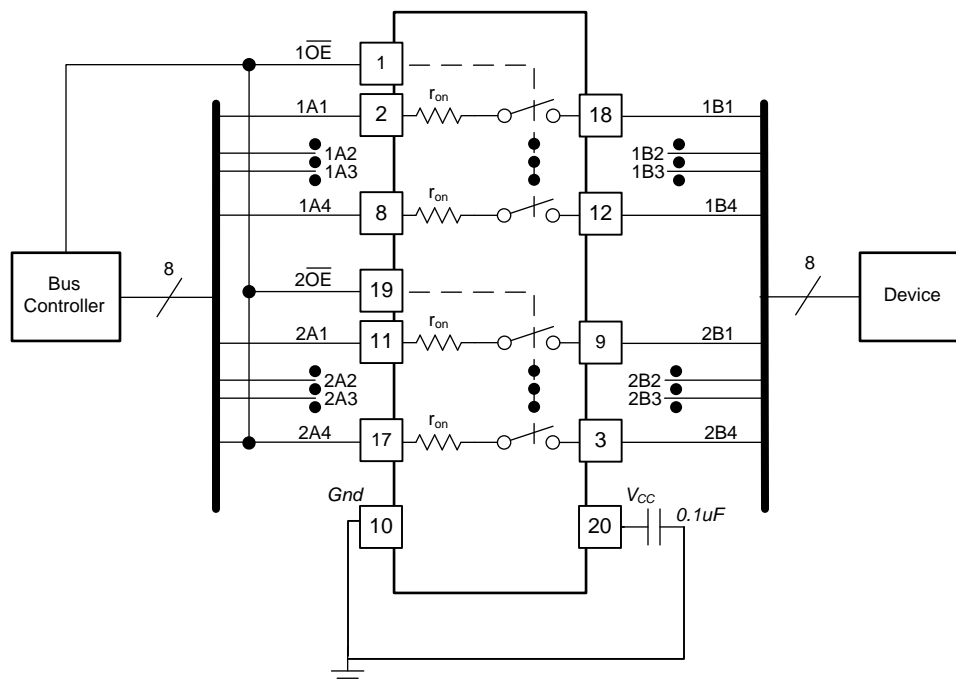

Figure 4. Typical Application

9.2.1 Design Requirements

A 0.1-µF bypass capacitor should be placed between each V_{CC} pin and GND. Each capacitor should be placed as close as possible to the SN74CBT3244 device.

9.2.2 Detailed Design Procedure

1. Recommended input conditions:
   – For specified high and low levels, see V_{IH} and V_{IL} in *Electrical Characteristics*
   – Inputs and outputs are overvoltage tolerant, which allows them to go as high as 5.5 V at any valid V_{CC}
2. Recommended output conditions:
   – Load currents must not exceed ±64 mA per channel
3. Frequency selection criterion:
   – Added trace resistance or capacitance can reduce maximum frequency capability; use layout practices as directed in *Layout Guidelines*

Typical Application (continued)

9.2.3 Application Curve
Figure 5. ON-Resistance (R$_{on}$) Variation vs Temperature

(1)   Note device variation mentioned in *Electrical Characteristics*

10 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating listed in the *Absolute Maximum Ratings* table.

Each V_{CC} terminal should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, a 0.1-µF bypass capacitor is recommended. If multiple pins are labeled V_{CC}, then a 0.01-µF or 0.022-µF capacitor is recommended for each V_{CC} because the V_{CC} pins are tied together internally. For devices with dual-supply pins operating at different voltages, for example V_{CC} and V_{DD}, a 0.1-µF bypass capacitor is recommended for each supply pin. To reject different frequencies of noise, use multiple bypass capacitors in parallel. Capacitors with values of 0.1 µF and 1 µF are commonly used in parallel. The bypass capacitor must be installed as close to the power terminal as possible for best results.

11 Layout

11.1 Layout Guidelines

Reflections and matching are closely related to the loop antenna theory but are different enough to be discussed separately from the theory. When a PCB trace turns a corner at a 90° angle, a reflection can occur. A reflection occurs primarily because of the change of width of the trace. At the apex of the turn, the trace width increases to 1.414 times the width. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self-inductance of the trace, which results in the reflection. Not all PCB traces can be straight; therefore, some traces must turn corners. Figure 6 shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-150.
