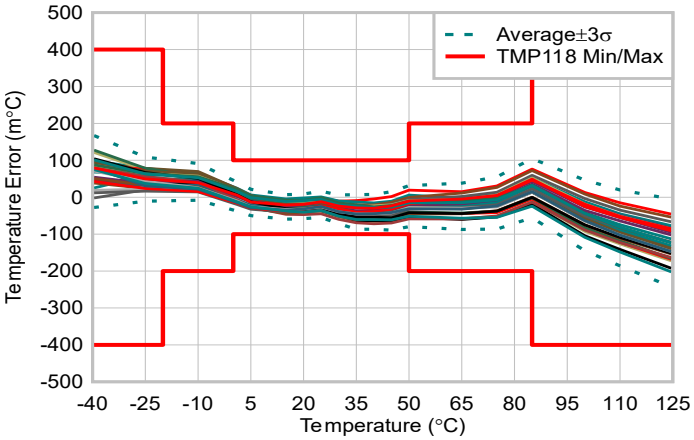
TMP118 Ultra-small, High-Accuracy, Low-power, Digital Temperature Sensor With SMBus™- and I²C-compatible Interface

1 Features

- Ultra-small, ultra-thin PicoStar™ package:
  - Size: 0.55 × 0.61 × 0.24mm
  - Small thermal mass: 0.14mJ/°C
- TMP118 high-accuracy temperature sensor:
  - ±0.05°C (typical) from 0°C to 50°C
  - ±0.1°C (maximum) from 0°C to 50°C
  - ±0.2 °C (maximum) from –20°C to 85°C
  - ±0.4 °C (maximum) from –40°C to 125°C
- Low power consumption:
  - 55µA active current
  - 80nA shutdown current
  - 1.4µA average current, 1Hz conversion cycle
- Supply range: 1.4V to 5.5V
- 1.2V logic compatible (independent of supply)
- 3 averaging options to reduce measurement noise
- 16-bit resolution: 0.0078125°C (LSB)
- I²C and SMBus compatible
- I3C Mixed Bus co-existence capable
- Programmable temperature alert limits
- NIST traceability with unique device IDs

2 Applications

- Mobile Phones
- Smartwatch
- Smart Trackers
- Tablets
- Medical Sensor Patches



TMP118 Temperature Accuracy (1.8V supply)

3 Description

The TMP118 is the industry smallest temperature sensor in an industry leading 0.55mm × 0.61mm × 0.24mm PICOSTAR package. The TMP118 provides a 16-bit temperature result with a resolution of 0.0078125°C and an accuracy of up to ±0.1°C across the temperature range of 0°C to 50°C with no additional calibration. The device is designed to help meet the system level ASTM E1112 and ISO 80601 accuracy requirements for electronic patient thermometers.

The TMP118 is designed to operate from a supply voltage as low as 1.4V, with a low average and shutdown current of 1.4µA (at 1Hz, no averaging) and 80nA, respectively, allowing for an on-demand temperature conversion to maximize battery life. The TMP118 has an interface that is I²C- and SMBus-compatible and has programmable alert functionality. Logic level as low as 1V can be supported regardless of the main supply rail, enabling interoperability with a low voltage 1.2V controller without an additional voltage level shifter.

The device offers unique IDs for improved traceability. The TMP118 units are 100% tested on a production setup that is NIST traceable and verified with equipment that is calibrated to ISO/IEC 17025 accredited standards.

Package Information

PART NUMBER(1)	PACKAGE	PACKAGE SIZE(2)
TMP118	PICOSTAR (4)	0.55mm × 0.61mm × 0.24mm

(1) For more information, see Section 12.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

Table 5-1. Pin Functions

PIN		TYPE[1]	DESCRIPTION
NAME	PICOSTAR-4		
VDD	A1	I	Supply voltage
SDA	B1	I/O	Serial data input and open-drain output. Requires a pullup resistor.
GND	A2	-	Ground
SCL	B2	I	Serial Clock

(1) I = Input; O = Output, I/O = Input or Output

6 Specifications

6.1 Absolute Maximum Ratings

Over free-air temperature range unless otherwise noted(1)

		MIN	MAX	UNIT
Supply voltage	V+	–0.3	6	V
Input/Output Voltage	SCL, SDA	–0.3	6	V
Operating temperature, T_A		–40	125	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±500	

(1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{DD}	Supply voltage	1.4		5.5	V
$V_{I/O}$	SCL, SDA	1.08		5.5	V
I_{OL}	Output current	0		2	mA
T_A	Operating free-air temperature	–40		125	°C

6.4 Thermal Information

THERMAL METRIC(1)		TMP118 YMS (PICOSTAR-4) 4 PINS	Unit
$R_{\theta JA}$	Junction-to-ambient thermal resistance	218.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	2.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	68.3	°C/W
ψ_{JT}	Junction-to-top characterization parameter	1.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	68.1	°C/W
M_T	Thermal mass	0.14	mJ/°C

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application note, SPRA953.

6.5 Electrical Characteristics

Over free-air temperature range and V_{DD} = 1.4V to 5.5V for T_A = -40°C to 125°C (unless otherwise noted); Typical specifications are at T_A = 25°C and V_{DD} = 1.8V (unless otherwise noted)

PARAMETER			TEST CONDITIONS		MIN	TYP	MAX	UNIT
TEMPERATURE TO DIGITAL CONVERTER								
T_{ERR}	Temperature accuracy	TMP118	8x averaging 1-Hz conversion cycle, serial bus idle, V_{DD} = 1.62V to 3.6V(1)	0°C to 50°C	–0.1	±0.05	0.1	°C
				–20°C to 85°C	–0.2		0.2	
			8x averaging 1-Hz conversion cycle, serial bus idle, V_{DD} = 1.4V to 5.5V	–40°C to 125°C	–0.4		0.4	
		TMP118M	8x averaging 1-Hz conversion cycle, serial bus idle, V_{DD} = 1.62V to 3.6V(1)	10°C to 50°C	–0.1		0.1	
				0°C to 85°C	–0.2		0.2	
PSR_{DC}	DC power supply sensitivity		1.62V to 5.5V			17		m°C/V
T_{RES}	Temperature resolution (LSB)					7.8125		m°C
T_{REPEAT}	Repeatability(2)		8x averaging			±1		LSB
			No averaging			±2		
T_{LTD}	Long-term stability and drift		3000 hours at 125°C, V_{DD} = 5.5V			0.024		°C
T_{HYS}	Temperature cycling and hysteresis(3)		8 averages			±2		LSB
t_{LIQUID}	Response time (stirred liquid)		τ = 63% for step response from 25 °C to 75 °C	Single layer Flex PCB 0.13 mm thickness		0.11		s
				Single layer FR4 PCB 1.575 mm thickness		1.4		s
t_{CONV}	Conversion time		One-shot mode			11.1		ms
T_{GAIN}	Gain error		Temp Error Drift over 10 °C to 50 °C; Continuous sweep; Normalized at 35 °C		–0.4		0.4	%
DIGITAL INPUT/OUTPUT								
C_{IN}	Input capacitance		f = 100kHz			3		pF
V_{IH}	Input logic high level				1			V
V_{IL}	Input logic low level						0.4	V
I_{IN}	Input leakage current				–0.1		0.1	µA
V_{OL}	SDA output logic low level		I_{OL} = –2 mA				0.25	V
POWER SUPPLY								
I_{DD_ACTIVE}	Supply current during active conversion		Active conversion, serial bus idle			55	95	µA
I_{DD_AVG}	Average current consumption		Continous conversion mode 1 Hz conversion frequency	Serial bus idle, no averaging		1.4	4	µA
				Serial bus idle, 8x averaging		4.8	12	
				SCL frequency = 400kHz, no averaging(5)		5.3		
I_{DD_SB}	Standby current(4)		Continous conversion mode, serial bus idle			0.75	3	µA
I_{DD_SD}	Shutdown current		Serial bus idle	25 °C		0.08	0.25	µA
				0 °C to 55 °C		0.11	0.3	
				–40 °C to 125 °C			1.5	
V_{POR}	Power-on reset threshold voltage		Supply voltage rising		1.07			V
V_{BOR}	Brownout detect		Supply voltage falling				0.9	V

Over free-air temperature range and V_{DD} = 1.4V to 5.5V for T_A = -40°C to 125°C (unless otherwise noted); Typical specifications are at T_A = 25°C and V_{DD} = 1.8V (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{INIT}	Initialization time after power-on reset(6)			1		ms
t_{RESET}	Reset Time(7)	General Call Reset		0.1		ms

(1) For V_{DD} above 3.6V, refer to the PSR_{DC} specification to calculate the accuracy shift as a result of the power supply variation
(2) Repeatability is the ability to reproduce a reading when the measured temperature is applied consecutively, under the same conditions.
(3) Hysteresis is defined as the ability to reproduce a temperature reading as the temperature varies from room → hot →room→cold→room. The temperatures used for this test are -40°C, 25°C, and 125°C.
(4) Quiescent current between conversions
(5) For best temperature measurement accuracy, it is recommended to avoid any serial bus traffice during active temperature conversion
(6) From device power-on reset to start of temperature conversion
(7) From General Call Reset command received to start of temperature conversion

6.6 Two-Wire Interface Timing

Over free-air temperature range and V_{DD} = 1.4V to 5.5V for T_A = -40 °C to 125 °C (unless otherwise noted)

		STANDARD		FAST-MODE		FAST-MODE PLUS		UNIT
		Min	Max	Min	Max	Min	Max	
$f_{(SCL)}$	SCL operating frequency	1	100	100	400	400	1000	kHz
$t_{(BUF)}$	Bus-free time between STOP and START conditions	4.7		1.3		0.5		µs
$t_{(SUSTA)}$	Repeated START condition setup time	4.7		0.6		0.26		µs
$t_{(HDSTA)}$	Hold time after repeated START condition. After this period, the first clock is generated.	4.0		0.6		0.26		µs
$t_{(SUSTO)}$	STOP condition setup time	4.0		0.6		0.26		µs
$t_{(HDDAT)}$	Data hold time(1)	0	900	0	900	0	150	ns
$t_{(SUDAT)}$	Data setup time	250		100		50		ns
$t_{(LOW)}$	SCL clock low period	4.7		1.3		0.5		µs
$t_{(HIGH)}$	SCL clock high period	4.0		0.6		0.26		µs
$t_{(VDAT)}$	Data valid time (data response time)(2)		3.45		0.9		0.45	µs
t_R	SDA, SCL rise time		1000	20	300		120	ns
t_F	SDA, SCL fall time		300		300		120	ns
$t_{timeout}$	Timeout	30		30		30		ms
t_{LPF}	Glitch suppression filter	50		50		50		ns

(1) The maximum $t_{(HDDAT)}$ could be 0.9µs for Fast-Mode, and is less than the maximum $t_{(VDAT)}$ by a transition time.
(2) $t_{(VDAT)}$ = time for data signal from SCL "LOW" to SDA output ("HIGH" to "LOW", depending on which is worse).

7 Detailed Description

7.1 Overview

The TMP118 is a digital output temperature sensor designed for high-accuracy, space constrained applications that comes factory calibrated for accuracy. The device features a two-wire, SMBus and I^2C compatible interface with two modes of operation: continuous conversion mode and one-shot conversion mode. The TMP118 also includes an alert status flag with individual high and low thresholds registers. The device is specified over an ambient air operating temperature range of –40 °C to 125 °C. Figure 7-1 shows a block diagram of the device.

7.2 Functional Block Diagrams

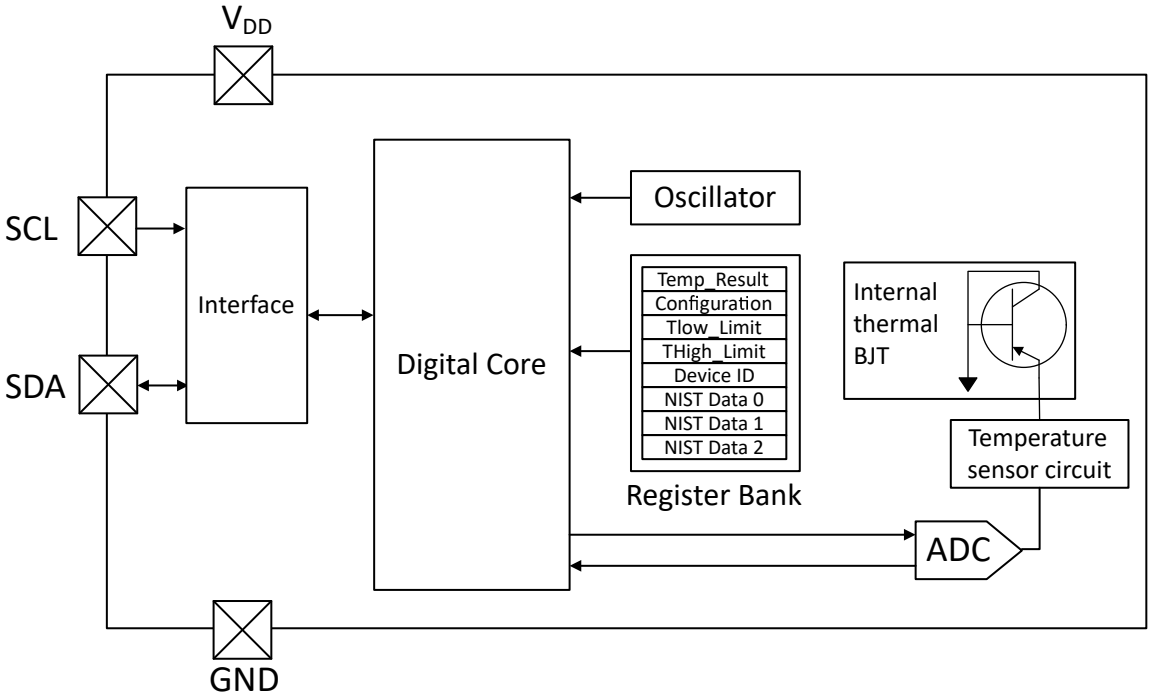

Figure 7-1. Internal Block Diagram

7.3 Feature Description

7.3.1 Digital Temperature Output

The Temp_Result registers use a 16-bit format. Temperature data is represented by a 16-bit 2's complement word with a Least Significant Bit (LSB) equal to 0.0078125°C. The fractional values are included in the temperature readings, which can be denoted using Q notation, a simple way to represent the length of the fractional portion of the value. 2's Compliment is employed to describe negative temperatures. C code can easily convert the 2's Compliment data when the data is typecast into the correct signed data type. For more details on using Q notation to decode digital temperature data, refer to How to Read and Interpret Digital Temperature Sensor Output Data (SBAA588).

Note following power-up or reset, the temperature register reads 0°C until the first conversion is complete. Also note the decoding scheme allows temperature measurement beyond the recommended operating temperature range of -40°C to 125°C, but the device performance is not guaranteed beyond this range.

–25	1111 0011 1000 0000	F380
–40	1110 1100 0000 0000	EC00

(1) The resolution for the Temp ADC in Internal Temperature mode is 0.0078125°C/count.

7.3.2 Averaging

The device supports 4 different averaging modes to help suppress noise as well as reduce the impact from external temperature fluctuations. The AVG [3:2] bits in the Configuration register can be programmed to control the averaging behavior of the device:

- No Averaging [00b]: The device performs 1 single conversion per conversion period, and temperature result is stored immediately into the Temp_Result register at the end of every conversion.

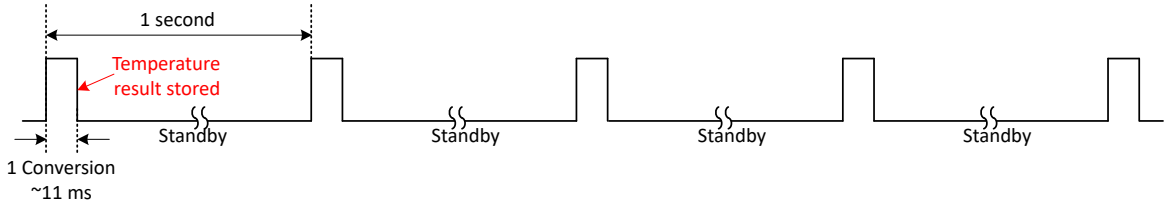

Figure 7-2. Conversion (1Hz Conversion Rate Example) With No Averaging

- Back-to-back Averaging [01b or 10b]: The device accumulates and stores a number of temperature conversion results and reports the average of all the stored results at the end of the process. If AVG [3:2] is set to 01b, 4 conversions are executed back-to-back in every conversion period and the average temperature result is stored into the Temp_Result register after the 4 conversions are completed. If AVG [3:2] is set to 10b, 8 conversions are executed back-to-back in every conversion period and the average temperature result is stored into the Temp_Result register after the 8 conversions are completed.

  The Back-to-back Averaging feature is useful to reduce the impact from the device's internal noise sources, such as the device thermal noise and ADC quantization noise. Figure 6-8 and Figure 6-9 illustrates the improved noise performance of the device as a result of turning on the 8x regular averaging. Note Back-to-back Averaging increases the average current consumption of the device due to increased active conversion time in every conversion period.

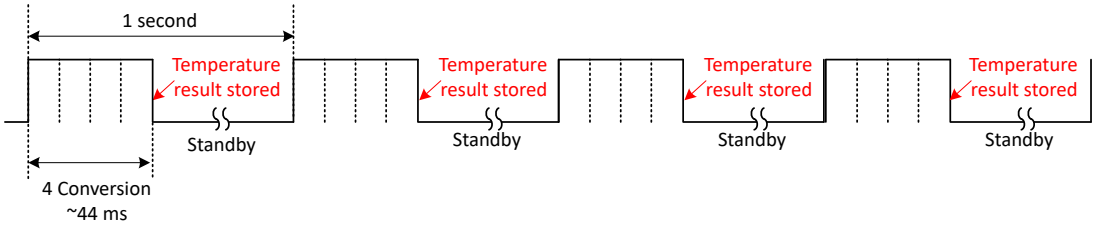

Figure 7-3. Conversion (1Hz Conversion Rate Example) With 4x Back-to-back Averaging

- Moving 4x Averaging [11b]: If AVG [3:2] is set to 11b, the device performs 1 single conversion per conversion period, and the new temperature result is averaged together with the results from the 3 previous conversion period and stored into the Temp_Result register. The moving averaging feature can be beneficial to filter out fluctuation of external temperature source by taking multiple samples and averaging out the result.

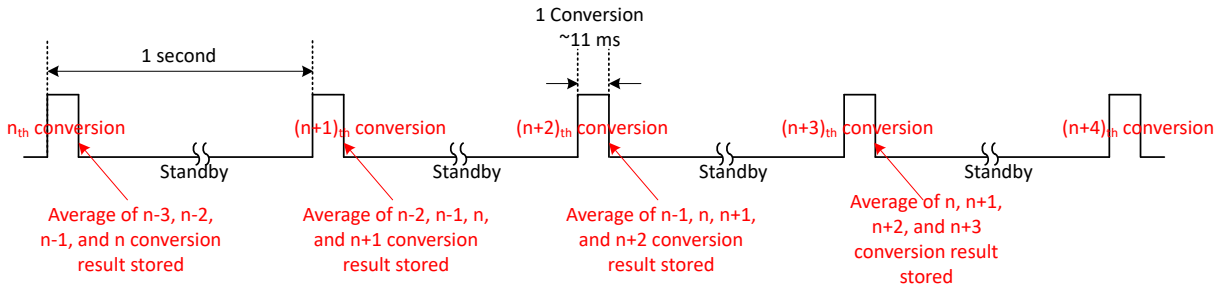

Figure 7-4. Conversion (1Hz Conversion Period) With 4x Running Averaging

Averaging can be used in both the continuous conversion mode and the one-shot mode.

7.3.3 Temperature Comparator and Hysteresis

The TMP118 has a temperature comparator feature that uses the THigh_Limit register for high temperature comparator threshold and the TLow_limit register for low temperature comparator threshold. The low temperature comparator threshold is used to program the comparator hysteresis. The comparator thresholds are programmed in the TMP118 in a 12-bit two's complement format and with a resolution of 62.5m°C. The Alert_Flag bit in the Configuration register is asserted when the temperature result equals or exceeds the THigh_Limit for a consecutive number of conversions as set by the Fault bits in the Configuration Register, which can be programmed to 1, 2, 4, or 6 consecutive conversions. The Alert_Flag clears when the temperature result drops below the TLow_Limit for the same consecutive number of conversions. The difference between the two limits acts as a hysteresis on the comparator output, and the fault counter prevents false alerts as a result of environmental temperature fluctuations. The Alert_Flag can be programmed to active low or active high by configuring the Polarity bit in the Configuration Register.

As shown in Figure 7-5, the alert status becomes active when the temperature equals or exceeds the value in THigh_Limit for Fault number of consecutive conversions. The alert status remains active until the temperature falls below the TLow_Limit for the same number of consecutive conversions. The Alert_Flag can also be cleared by issuing the General Call Reset command.

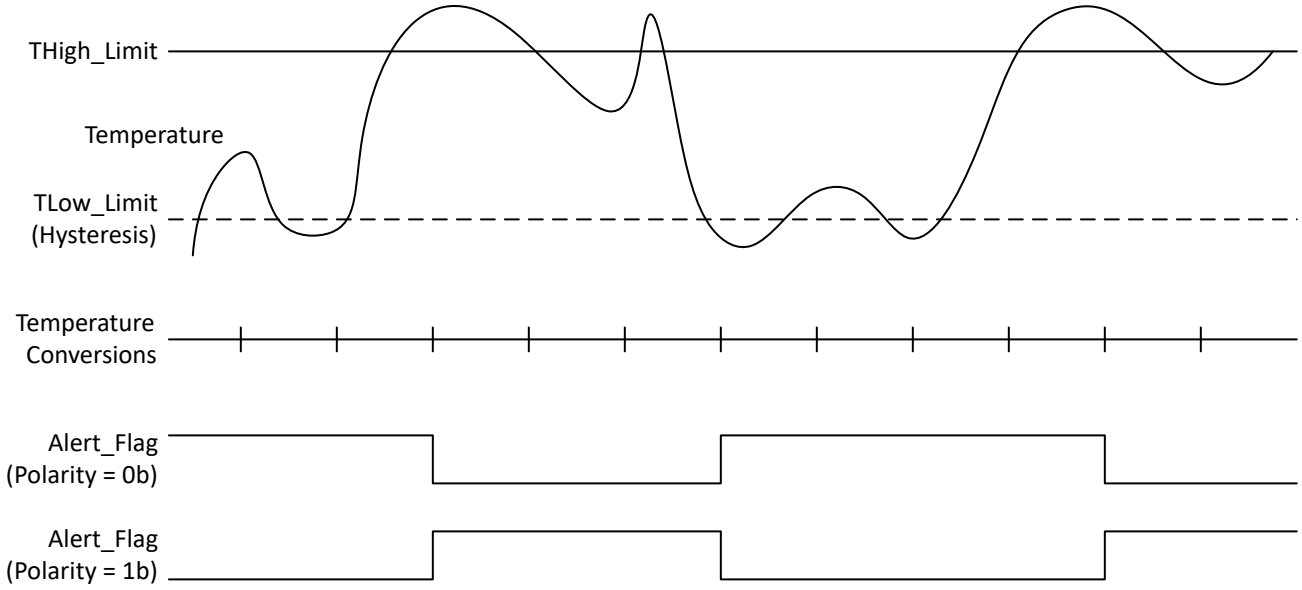

Figure 7-5. Alert_Flag Behavior

7.3.4 Strain Tolerance

The TMP118 features internal strain tolerance that helps mitigate error resulting from strain developed in the PicoStar package from various common manufacturing areas, including but not limited to device solder, molding, under-fill, and board flex.

To demonstrate this capability, multiple TMP118 devices are soldered onto a rigid 62mil thick PCB, and tested under multiple compression and tensile flexing orientations, with pin 1 located both orthogonal and parallel to the applied microstrain examined during the test, measured through a strain gauge. The test is performed under room temperature condition (30°C) V_{DD} of 1.8V, and continuous conversion mode (1Hz conversion interval) with 8x averaging turned on. The resultant temp error under this strain is measured against a known reference, and are recorded at increasing flex levels of the PCB. Figure 7-6 demonstrates device distribution under these microstrain conditions. Several non-strain tolerant devices were also subjected to the same test to demonstrate the difference.

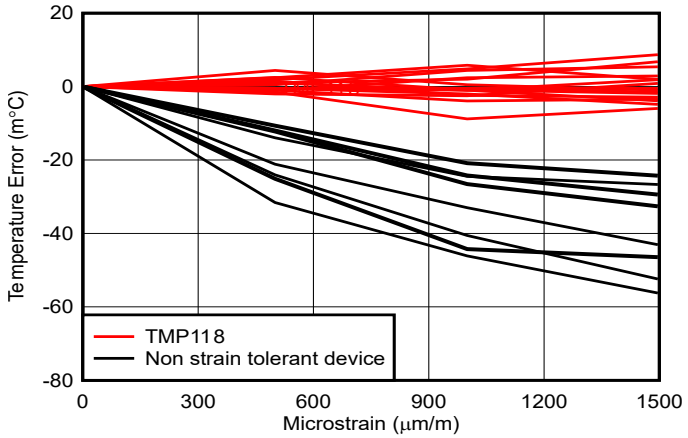

Figure 7-6. Temperature Error vs. Strain

7.3.5 NIST Traceability

The TMP118 offers 3Unique ID registers to support NIST traceability. These unique IDs can be used to provide an audit trail to standards provided by the National Institute of Standards and Technology (NIST), a US Commerce Department agency.

Reading the Unique ID registers requires a specific procedure to retrieve the content from the memory. The procedure is as follows:

1. Place the device in Shutdown Mode by setting bit 8 of Register 01h to 1b.
2. Write 0x0000 to desired Unique ID pointer address (0Ch, 0Dh, or 0Eh).
3. Read Unique ID from the same pointer address.
4. Repeat step #2 above for each pointer address as desired.

7.4 Device Functional Modes

The TMP118 can be configured to operate in continuous or shutdown mode. This flexibility enables designers to balance the requirements of power efficiency and performance.

7.4.1 Continuous Conversion Mode

When the Shutdown bit is set to 0b in the configuration register, the device operates in continuous conversion mode. Figure 7-7 shows the device in a continuous conversion cycle. In this mode, the device performs conversion at fixed intervals and updates the temperature result register at the end of every conversion, The typical active conversion time is 11ms (with no averaging).

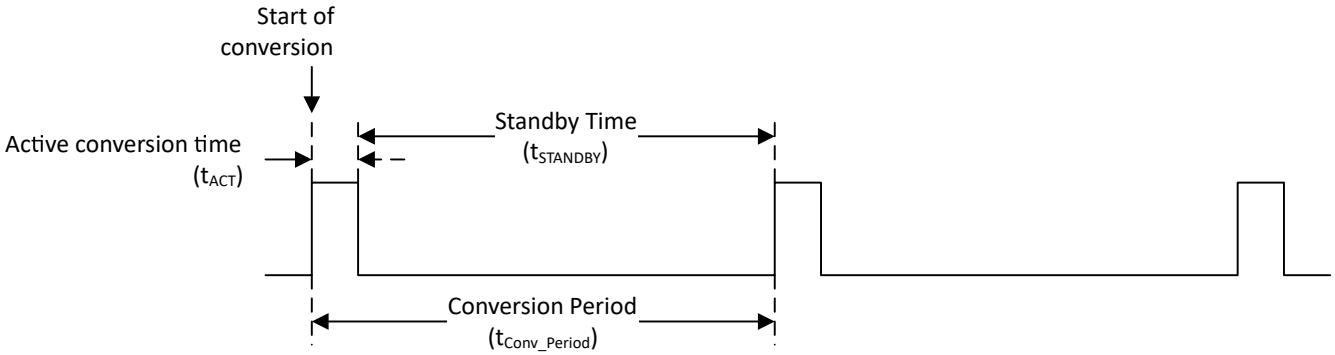

Figure 7-7. Continuous Conversion Cycle Timing Diagram

The Conversion_Rate[1:0] bits in the configuration register controls the rate at which the conversions are performed. The device typically consumes 55µA during conversion and 750nA during the low power standby period. By decreasing the rate at which conversions are performed, the application can benefit from reduced average current consumption in continuous mode.

Use Equation 1 to calculate the average current in continuous mode.

$$\text{Average Current} = ((I_{DD\_ACTIVE} \times t_{ACT}) + (I_{DD\_SB} \times t_{STANDBY})) / t_{Conv\_Period} \quad (1)$$

Where

- t_{ACT} = Active conversion time
- t_{Conv_Period} = Conversion Period
- $t_{STANDBY}$ = Standby time between conversions calculated as t_{Conv_Period} - t_{ACT}

7.4.2 One-Shot Mode (OS)

The TMP118 features a one-shot temperature-measurement mode. When the device is in shutdown mode (bit Shutdown= 1b in the Configuration Register), writing 1b to both the OS and Shutdown bits in the Configuration Register begins a single temperature conversion, which typically takes 12ms. During the conversion, the OS bit reads 0b. The device returns to the shutdown state at the completion of the single conversion. After the conversion, the OS bit reads 1b. To trigger another one-short temperature conversion, write 1b to both the OS and Shutdown bits again in the Configuration Register. This feature is useful for reducing power consumption in the device when continuous temperature monitoring is not required.

In Continuous Conversion Mode (bit Shutdown= 0b in the Configuration Register), the OS bit always reads 0b.

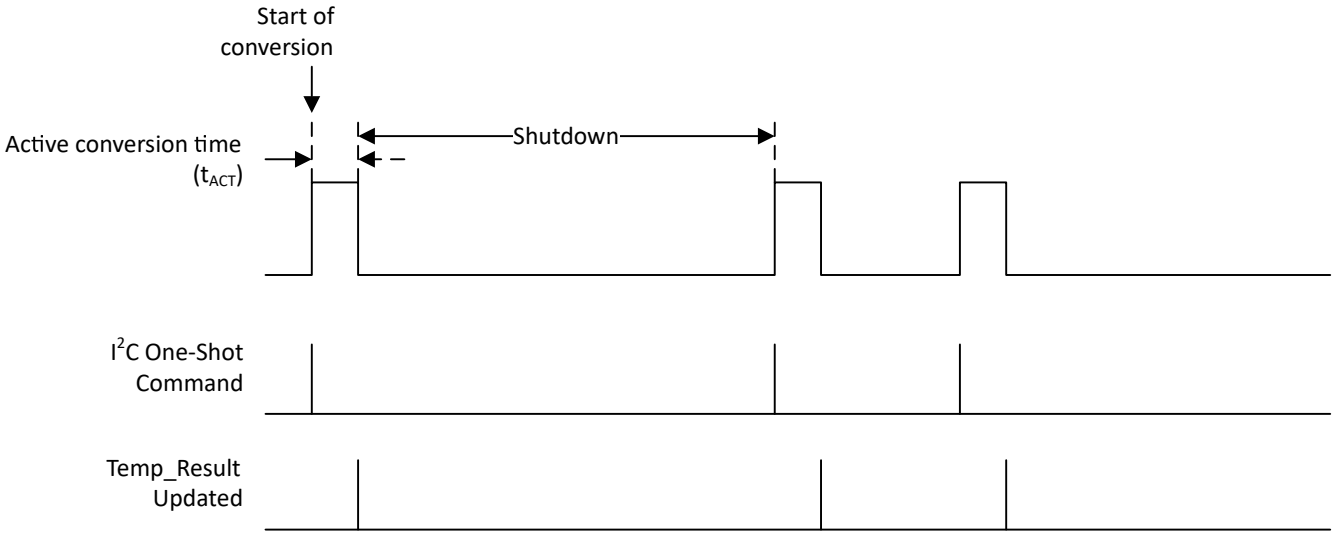

Figure 7-8. One-Shot Timing Diagram

7.5 Programming

7.5.1 I²C and SMBus Interface

7.5.1.1 Serial Interface

The TMP118 has a standard bidirectional I²C interface that is controlled by a controller device. Each target on the I²C bus has a specific device address to differentiate between other target devices that are on the same I²C bus. Many target devices require configuration upon start-up to set the behavior of the device. This is typically done when the controller accesses internal register maps of the target, which have unique register pointers. The TMP118 supports transmission data rates up to 1MHz.

7.5.1.1.1 Bus Overview

The physical I²C interface consists of the serial clock (SCL) and serial data (SDA) lines. Both SDA and SCL lines must be connected to a supply through an external pullup resistor (unless integrated within the controller). The size of the pullup resistor is determined by the amount of capacitance on the I²C lines, the pullup bus voltage, and the communication frequency. For further details, see the I²C Pullup Resistor Calculation application note. Data transfer can be initiated only when the bus is idle. A bus is considered idle if both SDA and SCL lines are high after a STOP condition.

I²C communication with this device is initiated by the controller sending a START condition and terminated by the controller sending a STOP condition. A high-to-low transition on the SDA line while the SCL is high defines a START condition. A low-to-high transition on the SDA line while the SCL is high defines a STOP condition.

A repeated START condition is similar to a START condition and is used in place of a back-to-back STOP then START condition. A repeated START condition looks identical to a START condition, but differs from a START condition because the condition occurs without a STOP condition (when the bus is not idle).

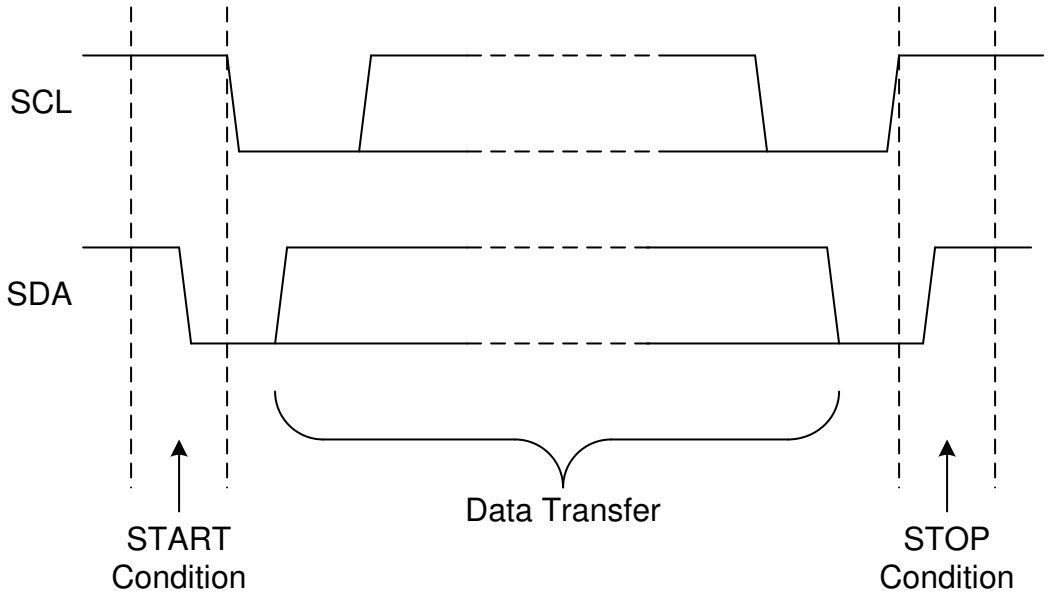

Figure 7-9. Definition of Start and Stop Conditions

One data bit is transferred during each clock pulse of the SCL. One byte is comprised of eight bits on the SDA line. A byte can either be a device address, register pointer, or data written to or read from a target. Data is transferred Most Significant Bit (MSB) first. 2 bytes of data can be transferred from the controller to target between the START and STOP conditions. Data on the SDA line must remain stable during the high phase of the clock period, as changes in the data line when the SCL is high are interpreted as control commands (START or STOP).

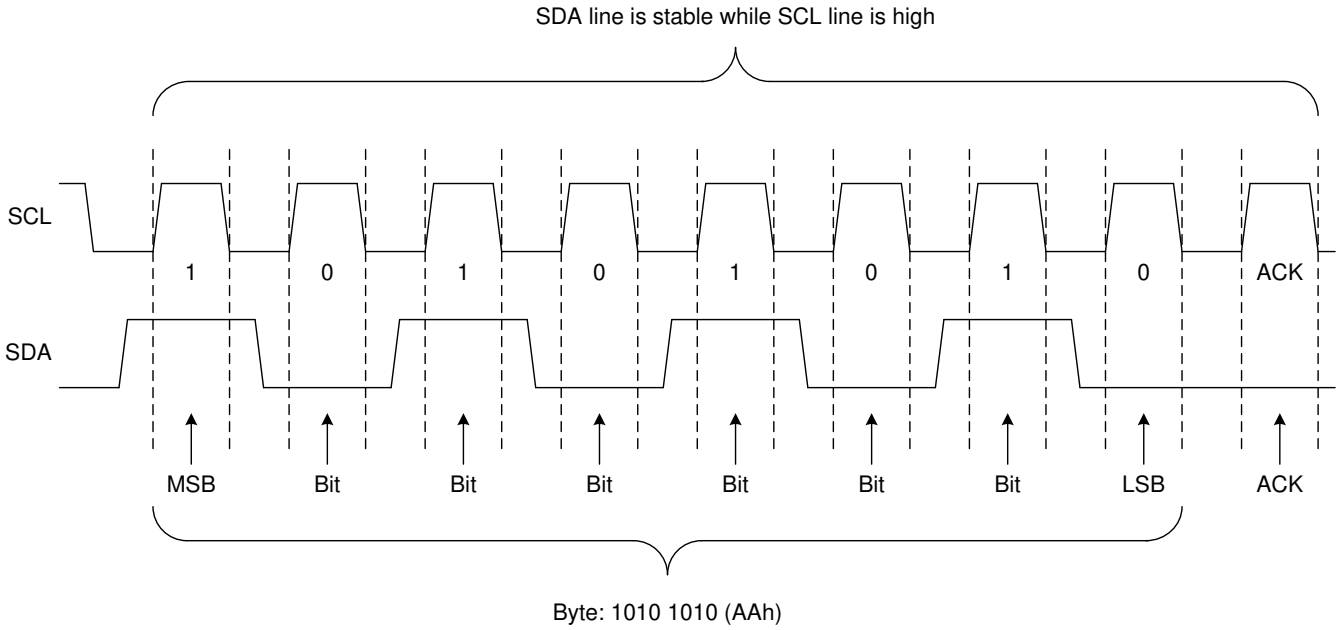

Figure 7-10. One Byte of Data Transfer

7.5.1.1.2 Device Address

To communicate with the TMP118 , the controller must first address target devices through an address byte. The address byte has seven address bits and a read-write (R/$\overline{W}$) bit that indicates the intent of executing a read or write operation. The TMP118 utilizes hardwired orderables for addressing to allow up to 4 target devices to be addressed on a single bus.

Table 7-4. Device Address Options

	7-BIT I²C TARGET ADDRESS	
DEVICE	**HEX**	**BINARY**
TMP118A/ TMP118MA	0x48	1001000'b
TMP118B/ TMP118MB	0x49	1001001'b
TMP118C/ TMP118MC	0x4A	1001010'b
TMP118D/ TMP118MD	0x4B	1001011'b

7.5.1.1.3 Writing and Reading Operation

7.5.1.1.3.1 Writes

To write on the I^{2}C bus, the controller sends a START condition on the bus with the address of the target, as well as the last bit (the R/$\overline{W}$ bit) set to 0b, which signifies a write. The target acknowledges, letting the controller know the target is present on the bus and ready. After this, the controller starts sending the register pointer and register data to the target until the controller has sent all the data necessary, and the controller terminates the transmission with a STOP condition.

Writes to read-only registers or register locations outside of the register map are ignored. The TMP118 still acknowledges (ACK) when writing outside of the register map. Figure 7-11 shows an example of writing 2-byte data to a single register.

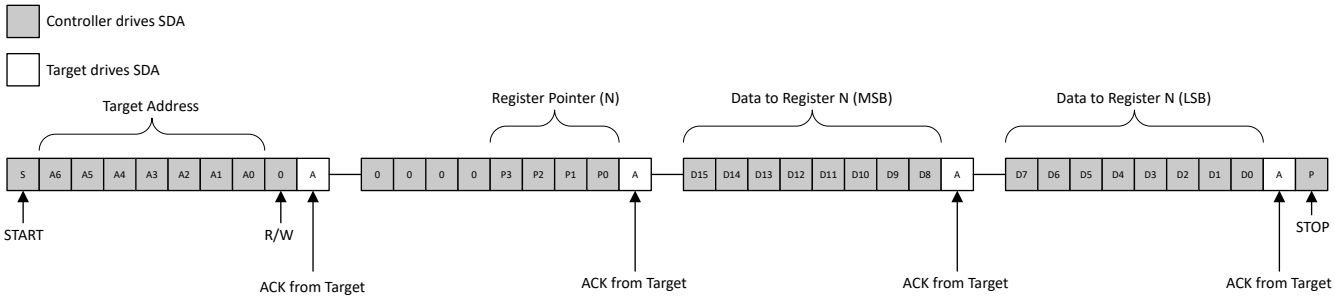

Figure 7-11. Write to Single Register

7.5.1.1.3.2 Reads

For a read operation the controller sends a START condition, followed by the target address with the R/$\overline{W}$ bit set to 0b (signifying a write). The target acknowledges the write request, and the controller then sends the register pointer in the next frame. The controller then initiates a START or RESTART followed by the target address with the R/$\overline{W}$ bit set to 1b (signifying a read). A START initiates communication with an target, while a RESTART allows the controller to access different registers on the same target without needing to send a full STOP signal first. The controller continues to send out clock pulses but releases the SDA line so that the target can transmit data. At the end of every byte of data, the controller sends an ACK to the target, letting the target know that the controller is ready for more data. Once the controller has received the number of bytes the controller is expecting, the controller sends a NACK, signaling to the target to halt communications and release the SDA line. The controller follows this up with a STOP condition.

Note that:

- If the controller needs to read from the same register repeatedly, the controller is not required to resend the pointer over and over again. The pointer value is stored in the device.
- The default pointer value upon device POR is 0h, so the controller can immediately proceed to read the temperature result after device power-up without sending the pointer value for the Temp_Result register.
- Reading from a non-indexed register location returns 0x0h.

Figure 7-12 shows an example of reading a single word from a target register.

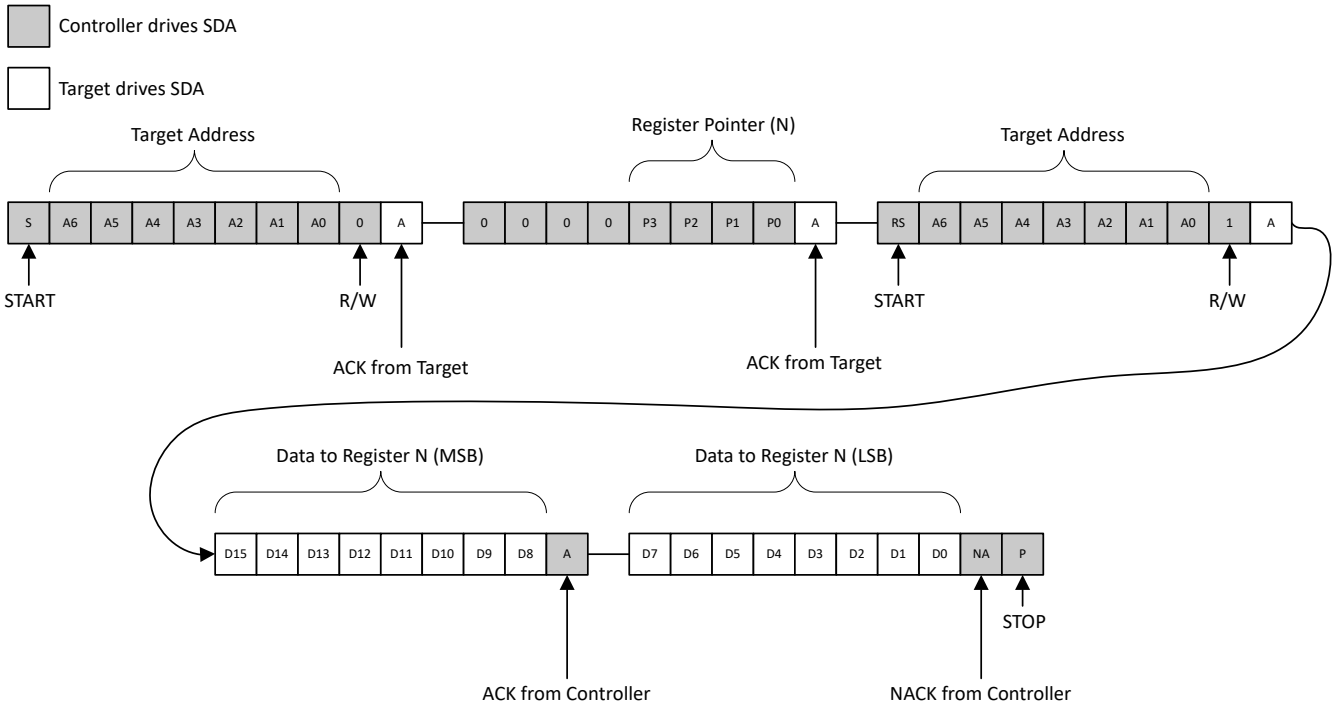

Figure 7-12. Read from Single Register

7.5.1.1.4 General-Call Reset Function

A "General-Call Reset Function" in SMBus refers to a mechanism where a controller can send a signal to all target devices on the bus simultaneously, essentially initiating a reset operation on every connected device by broadcasting a special address known as the "General Call Address" instead of addressing to a specific target address. The feature allows for a coordinated reset across all devices on the bus, often used for system-wide initialization or error recovery scenarios.

The TMP118 responds to a two-wire, general-call address (0000000b) if the eighth bit is 0b. The device acknowledges the general-call address and responds to commands in the second byte. If the second byte is 0000011b or 06h, the TMP118 internal registers are reset to power-up values as shown in Figure 7-13.

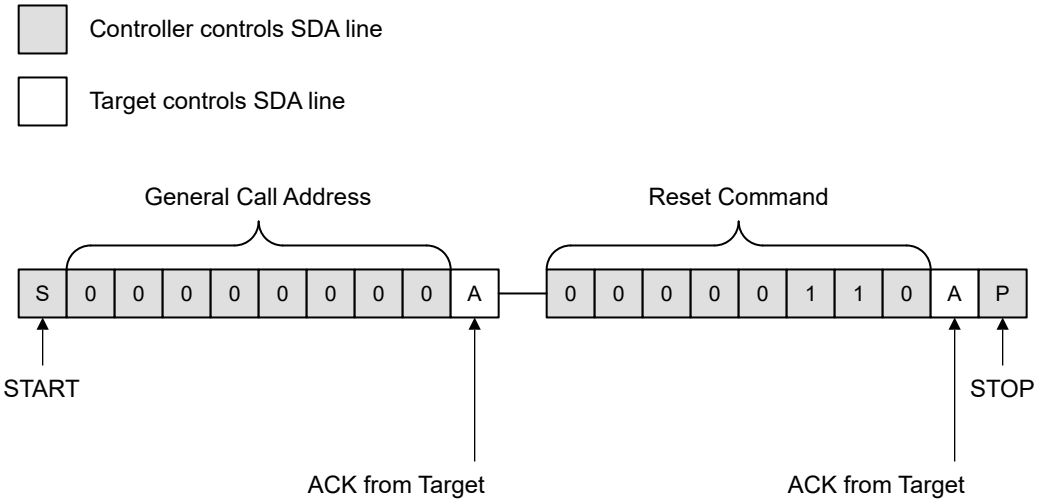

Figure 7-13. SMBus General Call Reset Diagram

7.5.1.1.5 Timeout Function

The TMP118 resets the internal serial interface if the SCL line is held low by the controller or the SDA line is held low by the TMP118 for longer than 30ms (typical) between a START and STOP condition. The TMP118 releases the SDA line if the SCL pin is pulled low and waits for a START condition from the controller. To avoid activating the timeout function, maintain a communication speed of at least 1kHz for the SCL operating frequency.

7.5.1.1.6 Coexistence on I3C Mixed Bus

A bus with both I3C and I^2C interfaces is referred to as a mixed bus with clock speeds up to 12.5MHz. The TMP118 is an I^2C device that can be on the same bus that has an I3C device attached as the device incorporates a spike suppression filter of 50ns on the SDA and SCL pins to filter out any communication above 4Mhz. The filter helps avoid any interference to the bus when I3C communication takes place on the bus. I^2C bus targets (with 50ns filter) can coexist with I3C controllers operating at 12.5MHz, enabling the migration of existing I^2C bus designs to the I3C specification.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The TMP118 is used to measure the temperature of the mounting location. The different address options allow up to four TMP118 sensors on a single serial bus. For more information, refer to the related *Considerations for Measuring Ambient Air Temperature* (SNOA966), *Replacing resistance temperature detectors with the TMP116 temp sensor* (SNOA969), and *Temperature sensors: PCB guidelines for surface mount devices* (SNOA967) application reports on ti.com.

9.2 Typical Application

9.2.1 Separate I²C Pullup and Supply Application

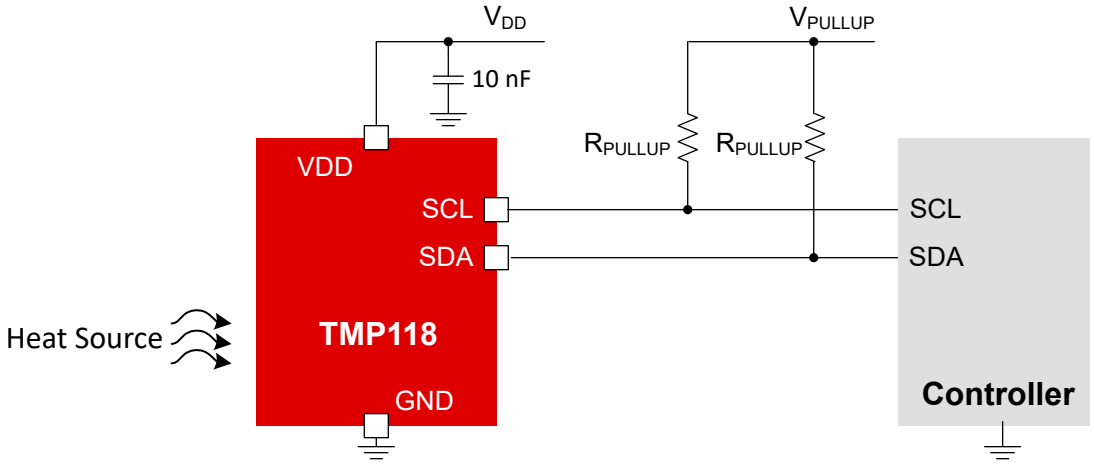

Figure 9-1. Separate I2C Pullup and Supply Voltage Application

9.2.1.1 Design Requirements

For this design example, use the parameters listed below.

Table 9-1. Design Parameters

PARAMETER	VALUE
Supply (V_{DD})	1.4V to 5.5V
V_{PULLUP}	1.2V
R_{PULLUP}	V_{PULLUP} / 1mA

9.2.1.2 Detailed Design Procedure

The TMP118 converts temperature at fixed intervals in continuous conversion mode. The SDA and SCL pin voltage of the TMP118 can be at a different voltage than the V_{DD} pin voltage, removing the need for power sequencing when using the TMP118 . The I/O current is rated up to 2mA. The pullup resistors can be selected such that the I/O current is below the I/O current (1mA in this design example).

The TMP118 is a very small package with low thermal mass and can be placed as close to the temperature source as possible for better thermal coupling.

9.2.2 Equal I²C Pullup and Supply Voltage Application

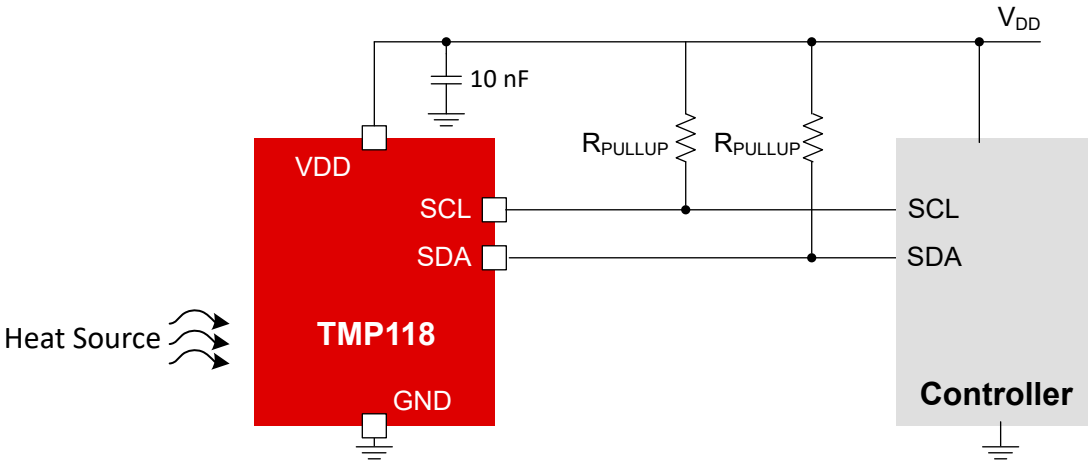

Figure 9-2. Equal I²C Pullup and Supply Voltage Application

9.2.2.1 Design Requirements

For this design example, use the parameters listed below.

Table 9-2. Design Parameters

PARAMETER	VALUE
Supply (V_{DD})	1.4V to 5.5V
V_{PULLUP}	V_{DD}
R_{PULLUP}	V_{DD} /1mA

9.2.2.2 Detailed Design Procedure

The SDA and SCL pin voltage of the TMP118 can be the same as the supply voltage V_{DD}. The accuracy of the device is not affected by the pullup voltage. The I/O current is rated up to 2mA. The pullup resistors must be selected such that the I/O current is below the I/O current (1mA in this design example).

9.3 Power Supply Recommendations

9.4 Layout

9.4.1 Layout Guidelines

The TMP118 is a simple device to layout. Place the power-supply bypass capacitor as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 10nF. Pull up the open-drain output pin SDA and the I2C clock SCL through R_{PULLUP} pullup resistors. In some cases, the pullup resistor can be the heat source, therefore, maintain some distance between the resistor and the device. Avoid the direct light coming to the part as much as possible as the measurement accuracy and current consumption can be impacted under excessive light.

For more information on board layout, refer to the related *Precise temperature measurements with TMP116 and TMP117* (SNOA986) and *Wearable temperature-sensing layout considerations optimized for thermal response* (SNIA021) application notes on ti.com.

1. If the device is used to measure solid surface temperature:
   - Use PCB with minimal thickness.
   - Prevent PCB bending which can create a mechanical stress to package.
   - Cover bottom of the PCB with copper plane.
   - Remove bottom solder mask and cover exposed copper with gold layer if possible.
   - Use thermal conductive paste between PCB and object surface.
   - If PCB has unused internal layers, extend these layers under the sensor.
   - Minimize amount of copper wires on top of the board.
   - To minimize temperature “leakage” to surrounding air locate sensor in place with minimal air movement. Horizontal surfaces are preferable.
   - To minimize temperature offset due to “leakage” to surrounding air cover sensor with thermo isolating foam, tape or at least cover with a stain.
2. If the device is used to measure moving air temperature:
   - Because moving air temperature typically has a lot of fluctuations the PCB increased thermal mass reduces measurement noise.
   - Use a PCB with thicker copper layers if possible.
   - Cover both side of unused board space with copper layer.
   - Place PCB vertically along air flow.
3. If the device is used to measure still air temperature:
   - Miniaturize the board to reduce thermal mass. Smaller thermal mass results in faster thermal response.
   - Remove the top solder mask.
   - To prevent oxidation, cover any exposed copper with solder paste.
   - Thermal isolation is required to avoid thermal coupling from heat source components through the PCB.
   - Avoid running the copper plane underneath the temperature sensor.
   - Maximize the air gap between the sensor and the surrounding copper areas (anti-etch), especially when close to the heat source.
   - Create a PCB cutout between sensor and other circuits.
   - If the heat source is top side, avoid running traces on top; instead, route all signals on the bottom side.
   - Place the board vertically to improve air flow and to reduce dust collection.

10 Device and Documentation Support

10.1 Documentation Support

10.1.1 Related Documentation

For related documentation see the following:

- *TMPx75 temperature sensor with I²C and SMBus interface in industry standard LM75 form factor and pinout* (SBOS288)
- *TMP275 ±0.5°C temperature sensor with I2C and SMBus interface in industry standard LM75 form factor and pinout* (SBOS363)
- *Design Considerations for Measuring Ambient Air Temperature* (SNOA966)
- *Replacing resistance temperature detectors with the TMP116 temp sensor* (SNOA969)
- *Temperature sensors: PCB guidelines for surface mount devices* (SNOA967)
- *Precise temperature measurements with TMP116 and TMP117* (SNOA986)
- *Wearable temperature-sensing layout considerations optimized for thermal response* (SNIA021)

10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.3 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.6 Glossary

TI Glossary — This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
December 2024	*	Initial Release

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMP118MAIYMSR	ACTIVE	PICOSTAR	YMS	4	12000	RoHS & Green	Call TI	Level-1-260C-UNLIM	-15 to 75	P	Samples
TMP118MBIYMSR	ACTIVE	PICOSTAR	YMS	4	12000	RoHS & Green	CUNIPD	Level-1-260C-UNLIM	-15 to 75	Q	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

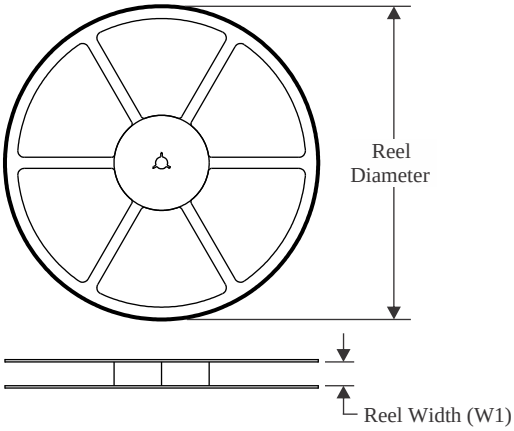
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

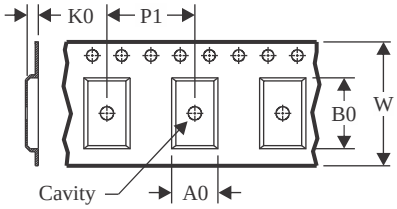
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

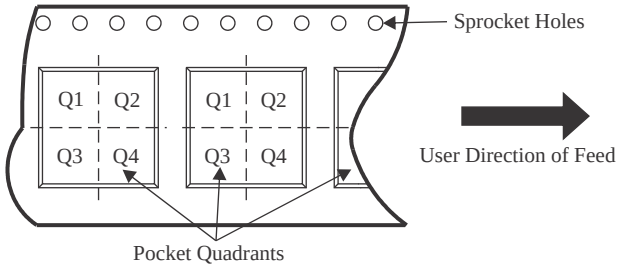


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

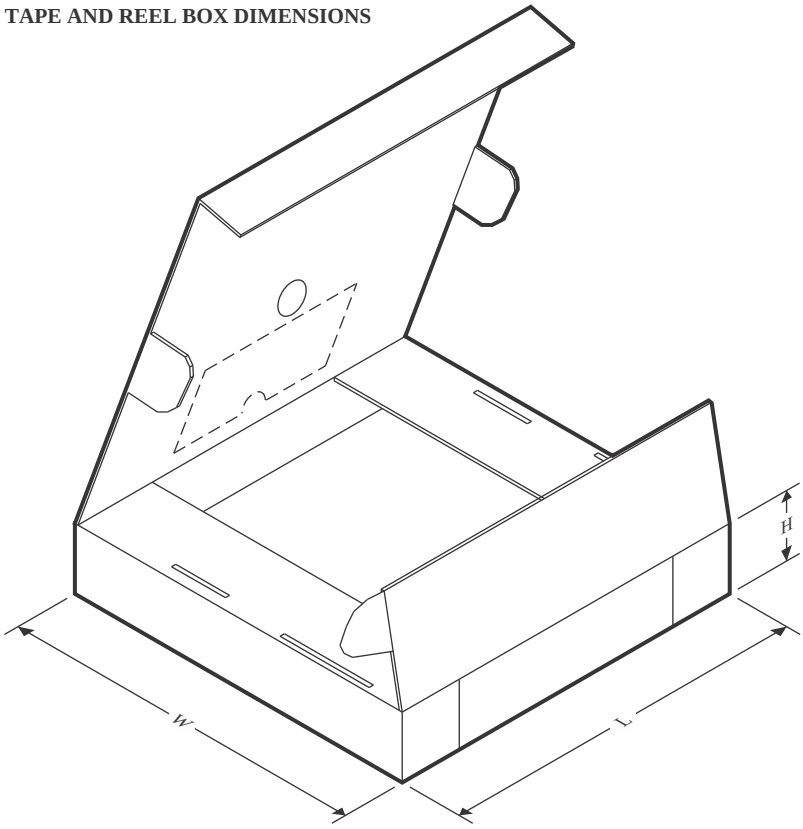
QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TMP118MAIYMSR	PICOSTAR	YMS	4	12000	180.0	8.4	0.7	0.64	0.32	2.0	8.0	Q1
TMP118MBIYMSR	PICOSTAR	YMS	4	12000	180.0	8.4	0.7	0.64	0.32	2.0	8.0	Q1

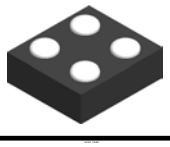
TAPE AND REEL BOX DIMENSIONS



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TMP118MAIYMSR	PICOSTAR	YMS	4	12000	182.0	182.0	20.0
TMP118MBIYMSR	PICOSTAR	YMS	4	12000	182.0	182.0	20.0

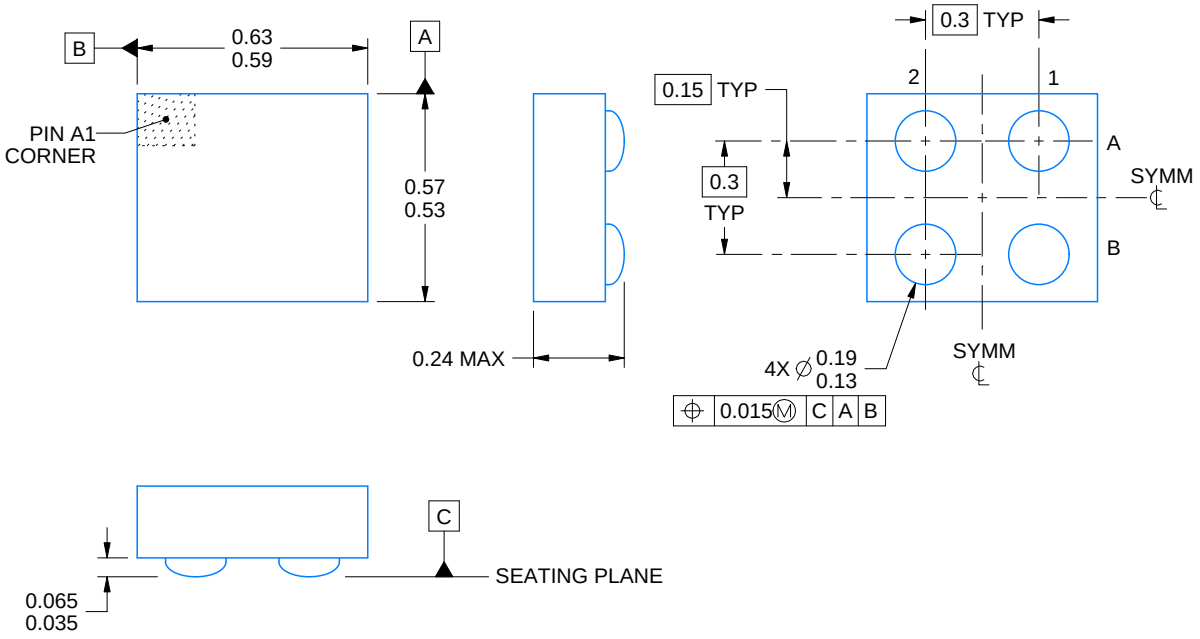
YMS0004A



PACKAGE OUTLINE

PicoStar ™ - 0.24 mm max height

PicoStar



D: Max = 0.6 mm, Min = 0.54 mm

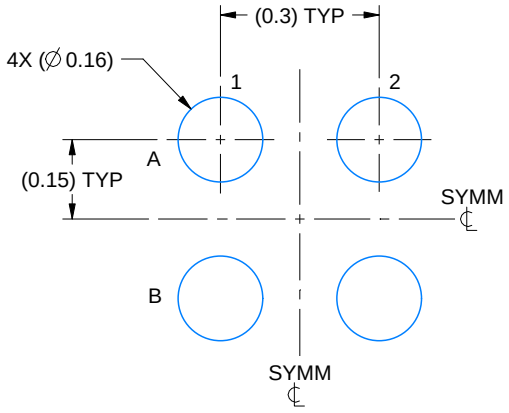
E: Max = 0.54 mm, Min = 0.48 mm

4230353/C 06/2024

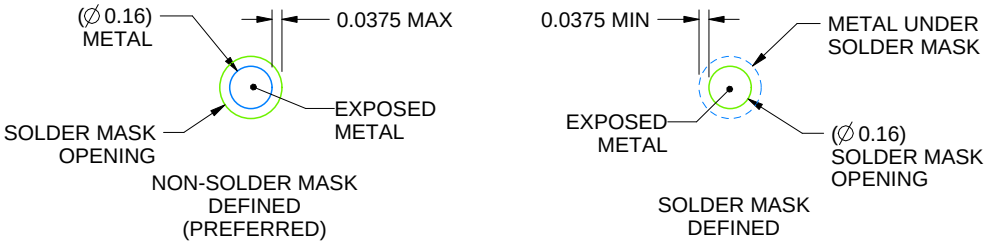
PicoStar is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:70X

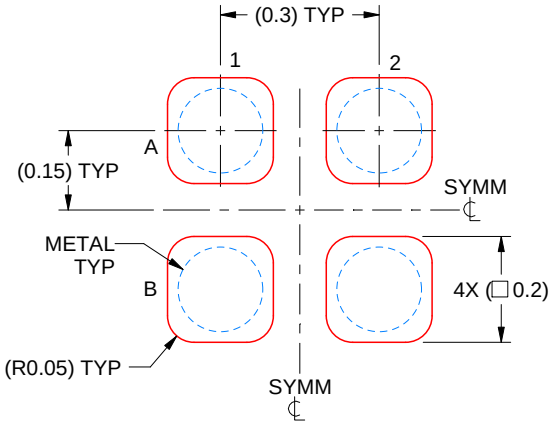


SOLDER MASK DETAILS
NOT TO SCALE

4230353/C 06/2024

NOTES: (continued)

3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints.
For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).



SOLDER PASTE EXAMPLE
BASED ON 0.075 mm THICK STENCIL
SCALE:70X

4230353/C 06/2024

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.
