Table 18-1657. CTRL_WKUP_SECURE_EMIF1_SDRAM_CONFIG

Address Offset 0x0000 0110

Physical Address 0x4AE0 C110 **Instance** CTRL_MODULE_WKUP

Description EMIF1 SDRAM configuration register. Its values are exported to EMIF_SDRAM_CONFIG register at POR. For bit field descriptions see EMIF_SDRAM_CONFIG register in Section 15.3, *EMIF Controller*, in Chapter 15, *Memory Subsystem*. Write to this register is allowed if the CTRL_WKUP_SEC_CTRL[4] SECURE_EMIF_CONFIG_RO_EN bit is set to 0x0 (default).

Type RW

Description	SLICE register for emif1		

Table 18-1663. CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT (continued)

Type RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED														EMIF1_NARROW_ONLY	EMIF1_EN_ECC	EMIF1_REG_PHY_NUM_OF_SAMPLES		EMIF1_REG_PHY_SEL_LOGIC	EMIF1_REG_PHY_ALL_DQ_MPR_RD_RESP	EMIF1_REG_PHY_OUTPUT_STATUS_SELECT			RESERVED	EMIF1_SDRAM_DISABLE_RESET		EMIF1_PHY_RD_LOCAL_ODT		RESERVED		EMIF1_DFI_CLOCK_PHASE_CTRL	EMIF1_EN_SLICE_2	EMIF1_EN_SLICE_1	EMIF1_EN_SLICE_0

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17	EMIF1_NARROW_ONLY	EMIF1 operates in narrow mode, to allow for data macros to be powered down to save power 0x0 = narrow mode disabled 0x1 = narrow mode enabled	RW	0x0
16	EMIF1_EN_ECC	EMIF1 ECC enable 0x0 = ECC is disabled 0x1 = ECC is enabled	RW	0x0
15:14	EMIF1_REG_PHY_NUM_OF_SAMPLES	Controls the number of DQ samples required for read leveling. The recommended setting for full leveling is 0x3 (128 samples) and for incremental leveling is 0x0 (4 samples). 0x0 = 4 samples 0x1 = 8 samples. 0x2 = 16 samples 0x3 = 128 samples	RW	0x0
13	EMIF1_REG_PHY_SEL_LOGIC	Selects an algorithm for read leveling. The use of algorithm 1 (set by default) is recommended. 0x0 = Algorithm 1 is used 0x1 = Algorithm 2 is used	RW	0x0
12	EMIF1_REG_PHY_ALL_DQ_MPR_RD_RESP	Analysis method of DQ bits during read leveling. 0x0: if the DRAM provides a read response on only one DQ bit (this can be any bit, since in this mode all 8 DQ bits are OR-ed together). This is the default setting and works with all memory types (memories send responses on all DQ bits or on a single DQ bit). 0x1: if the DRAM provides a read response on all DQ bits.	RW	0x0
11:9	EMIF1_REG_PHY_OUTPUT_STATUS_SELECT	Selects the status to be observed on the outputs of the DDR PHYs through CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT_1 register. 0x0 = selects phy_reg_rdlvl_start_ratio[7:0] 0x1 = selects phy_reg_rdlvl_start_ratio[15:8] 0x2 = selects phy_reg_rdlvl_end_ratio[7:0] 0x3 = selects phy_reg_rdlvl_end_ratio[15:8]	RW	0x0

Bits	Field Name	Description	Type	Reset
8	RESERVED		R	0x1
7	EMIF1_SDRAM_DISABLE_RESET	DDR3 SDRAM reset disable. 0x0 = DDR3 SDRAM reset signal is enabled. It can be asserted by EMIF 0x1 = DDR3 SDRAM reset signal is disabled. It is forbidden to EMIF to assert it.	RW	0x0
6:5	EMIF1_PHY_RD_LOCAL_ODT	Control of ODT (on – die termination) settings for the device DDR I/Os. ODT is enabled only during read operations when termination is required. 0x0 = ODT disabled 0x1= 60 Ohms 0x2 = 80 Ohms 0x3 =120 Ohms	RW	0x0
4	RESERVED		RW	0x0
3	EMIF1_DFI_CLOCK_PHASE_CTRL	EMIF_FICLK clock phase control (shifting by 180°). For normal operation this bit must always be set to 0x0 (disabled).	RW	0x0
2	EMIF1_EN_SLICE_2	Enable command PHY 2. When using DDR3 this bit can be set to 0x0 or 0x1. For lower power consumption 0x0 is used.	RW	0x1
1	EMIF1_EN_SLICE_1	Enable command PHY 1. 0x1 is the mandatory setting if DDR3 is used. EMIF1_EN_SLICE_0 and EMIF1_EN_SLICE_1 have to be programmed with the same value.	RW	0x1
0	EMIF1_EN_SLICE_0	Enable command PHY 0. 0x1 is the mandatory setting if DDR3 is used. EMIF1_EN_SLICE_0 and EMIF1_EN_SLICE_1 have to be programmed with the same value.	RW	0x1

18.7.4 IODELAYCONFIG Register Description

Table 18-1705. CONFIG_REG_0

Address Offset	0x0000 000C		
Physical Address	0x4844 A00C	**Instance**	IODELAYCONFIG
Description	Calibration Control Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																														ROM_READ	CALIBRATION_START

Bits	Field Name	Description	Type	Reset
31:2	RESERVED		R	0x0
1	ROM_READ	Triggers complete ROM read when '1' is written. Cleared when ROM read is complete.	RW	0x0
0	CALIBRATION_START	Triggers hardware calibration when '1' is written. Cleared when hardware completes calibration.	RW	0x0

Table 18-1707. CONFIG_REG_2

Address Offset	0x0000 0014		
Physical Address	0x4844 A014	**Instance**	IODELAYCONFIG
Description	Reference Clock Period Register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																REFCLK_PERIOD															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0
15:0	REFCLK_PERIOD	15:0 stores the binary equivalent of reference clock period in units of 10ps. This value (along with calibration results) is used for computing the coarse/fine element delay Example: 0xF0 means 2400ps.	RW	0x21D2

Table 18-1709. CONFIG_REG_3

Address Offset	0x0000 0018		
Physical Address	0x4844 A018	**Instance**	IODELAYCONFIG
Description	coarse calibration results register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COARSE_DELAY_COUNT																COARSE_REF_COUNT															

Bits	Field Name	Description	Type	Reset
31:16	COARSE_DELAY_COUNT	Results of 16 bit counter clocked by "delay line oscillator" clock during calibration.	RW	0x0
15:0	COARSE_REF_COUNT	Results of 16 bit counter clocked by "reference" clock during coarse calibration.	RW	0x0

Table 18-1711. CONFIG_REG_4

Address Offset	0x0000 001C		
Physical Address	0x4844 A01C	**Instance**	IODELAYCONFIG
Description	fine calibration results register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FINE_DELAY_COUNT																FINE_REF_COUNT															

Bits	Field Name	Description	Type	Reset
31:16	FINE_DELAY_COUNT	Results of 16 bit counter clocked by "delay line oscillator" clock during fine calibration.	RW	0x0
15:0	FINE_REF_COUNT	Results of 16 bit counter clocked by "reference" clock during fine calibration.	RW	0x0

Table 18-1712. Register Call Summary for Register CONFIG_REG_4

Table 18-1713. CONFIG_REG_8

Address Offset	0x0000 002C		
Physical Address	0x4844 A02C	**Instance**	IODELAYCONFIG
Description	Global Lock Register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															GLOBAL_LOCK_BIT

Bits	Field Name	Description	Type	Reset
31:1	RESERVED		R	0x0
0	GLOBAL_LOCK_BIT	Global Lock Bit Register. A '1' in this bit protects the writes to MMRs that store delay line select values. A '0' in this bit indicates that MMRs that store delay line select values are writeable. To write a '0' to this bit, signature of 0x5555 must be used on the MSB bits 16:1 of mdata.	RW	0x1

Description	Delay Select Value in binary coded form for cfg_emu2_oen interface		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SIGNATURE				RESERVED	LOCK_BIT	BINARY_DELAY									

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Description	Delay Select Value in binary coded form for cfg_gpio6_15_out interface		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SIGNATURE				RESERVED	LOCK_BIT	BINARY_DELAY									

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Table 18-1859. CFG_GPMC_A14_IN

Address Offset	0x0000 0150		
Physical Address	0x4844 A150	**Instance**	IODELAYCONFIG
Description	Delay Select Value in binary coded form for cfg_gpmc_a14_in interface		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SIGNATURE				RESERVED	LOCK_BIT	BINARY_DELAY									

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Table 18-2555. CFG_MMC3_DAT4_IN

Address Offset	0x0000 06C0		
Physical Address	0x4844 A6C0	**Instance**	IODELAYCONFIG
Description	Delay Select Value in binary coded form for cfg_mmc3_dat4_in interface		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SIGNATURE				RESERVED	LOCK_BIT	BINARY_DELAY									

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Table 18-2669. CFG_SPI1_CS2_IN

Address Offset	0x0000 07A4		
Physical Address	0x4844 A7A4	**Instance**	IODELAYCONFIG
Description	Delay Select Value in binary coded form for cfg_spi1_cs2_in interface		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SIGNATURE				RESERVED	LOCK_BIT	BINARY_DELAY									

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Description	Delay Select Value in binary coded form for cfg_trstn_out interface		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SIGNATURE				RESERVED	LOCK_BIT	BINARY_DELAY									

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

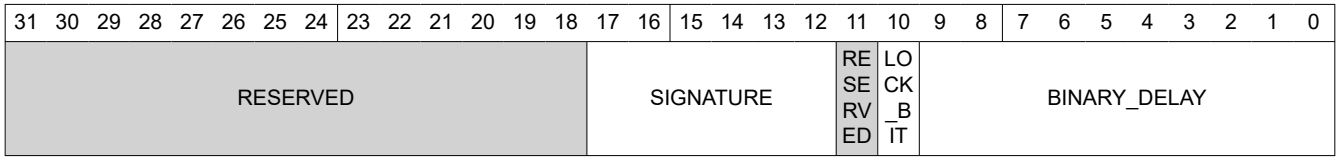
Table 18-2821. CFG_VIN1A_CLK0_OEN

Address Offset	0x0000 08D4		
Physical Address	0x4844 A8D4	**Instance**	IODELAYCONFIG
Description	Delay Select Value in binary coded form for cfg_vin1a_clk0_oen interface		
Type	RW		



Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:12	SIGNATURE	Write to this register will succeed only if data on these bits carries a signature of 6'h29 (6'b101001)	RW	0x0
11	RESERVED		R	0x0
10	LOCK_BIT	When '1', prevents HW update to this MMR. When '0', allows HW update of this MMR.	RW	0x0
9:0	BINARY_DELAY	Delay Select Value in binary coded form. Indicates the number of coarse (9:5) and fine (4:0) delay elements to be used on the delay line connected to this pad.	RW	0x0

Chapter 19

Mailbox

This chapter describes the mailbox module in the device.

19.1 Mailbox Overview

Communication between the on-chip processors of the device uses a queued mailbox-interrupt mechanism.

The queued mailbox-interrupt mechanism allows the software to establish a communication channel between two processors through a set of registers and associated interrupt signals by sending and receiving messages (mailboxes).

The device implements the following mailbox types:

- System mailbox:
  - Number of instances: 13
  - Used for communication between: MPU, DSP1, IPU1, IPU2, PRU-ICSS1, and PRU-ICSS2 subsystems
  - Reference name: MAILBOX(1..13)
- IVA mailbox:
  - Number of instances: 1
  - Used for communication between: IVA local user (ICONT1, or ICONT2) and three external users (selected among MPU, DSP1, IPU1, IPU2, PRU-ICSS1, and PRU-ICSS2 subsystems)
  - Reference name: IVA_MBOX

Each mailbox module supports the following features:

- Parameters configurable at design time (see Table 19-1):
  - Number of users
  - Number of mailbox message queues
  - Number of messages (FIFO depth) for each message queue
- 32-bit message width
- Message reception and queue-not-full notification using interrupts
- Support of 16-/32-bit addressing scheme
- Power management support

Table 19-1 shows the configuartion of the mailbox modules in the device.

Table 19-1. Mailbox Configuration in the Device

Module Parameters	Mailbox Type		
	System Mailbox		IVA Mailbox
	MAILBOX1	MAILBOX2..13	
Number of users	3	4	4
Number of mailbox message queues	8	12	6
Number of messages (FIFO depth) for each message queue	4		4

19.2 Mailbox Integration

This section describes the mailbox integration in the device, including information about clocks, resets, and hardware requests.

19.2.1 System MAILBOX Integration

The integration of MAILBOX1 in the device differs from the integration of the rest of the system mailboxes (MAILBOX2..13). Figure 19-1 and Figure 19-2 show the MAILBOX1 and MAILBOX2..13 integration, respectively.

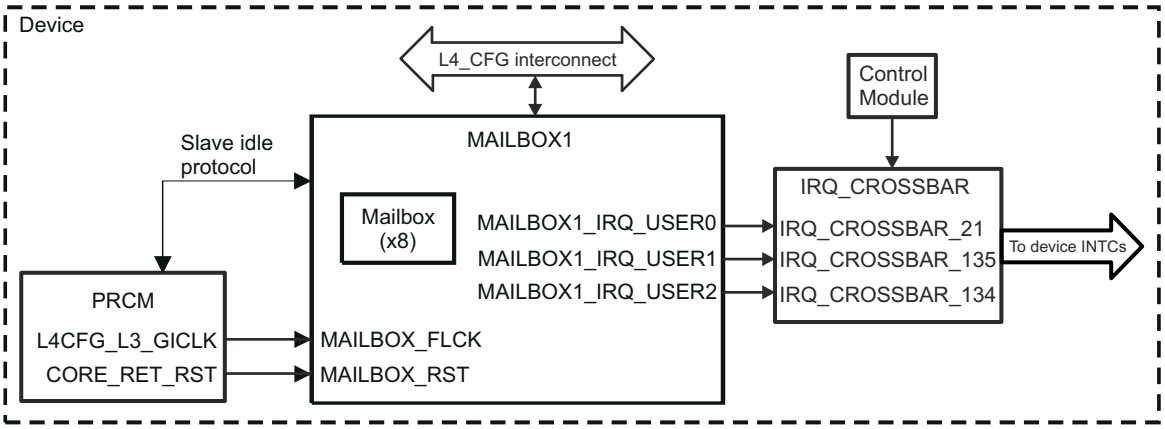

Figure 19-1. MAILBOX1 Integration

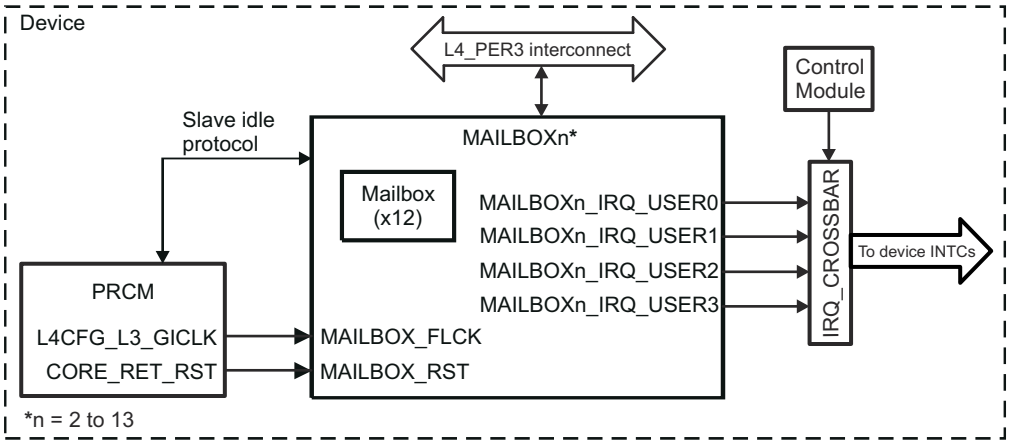

Figure 19-2. MAILBOX2..13 Integration

Note

For more information about the Slave idle protocol, see *Module-Level Clock Management* in *Power, Reset, and Clock Management*.

Table 19-2 through Table 19-4 summarize the MAILBOX(1..13) integration in the device.

Table 19-2. MAILBOX Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
MAILBOX1	PD_COREAON	N/A	L4_CFG
MAILBOX2..13	PD_COREAON	N/A	L4_PER3

Table 19-3. MAILBOX Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
MAILBOX	MAILBOX_FCLK	L4CFG_L3_GICLK	PRCM	MAILBOX interface clock. This clock is used for all interface and functional operations.
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**

Table 19-3. MAILBOX Clocks and Resets (continued)

MAILBOX	MAILBOX_RST	CORE_RET_RST	PRCM	MAILBOX hardware reset. This reset is asynchronously applied to the MAILBOX registers.

Table 19-4. MAILBOX Hardware Requests

Interrupt Requests				
Module Instance	**Interrupt Name (Source)**	**IRQ_CROSSBAR Input (Destination)**	**Default Mapping**	**Description**
MAILBOX1	MAILBOX1_IRQ_USER0	IRQ_CROSSBAR_21	MPU_IRQ_26; DSP1_IRQ_52;	MAILBOX1 user 0 interrupt request.
	MAILBOX1_IRQ_USER1	IRQ_CROSSBAR_135	–	MAILBOX1 user 1 interrupt request.
	MAILBOX1_IRQ_USER2	IRQ_CROSSBAR_134	IPU1_IRQ_50; IPU2_IRQ_50;	MAILBOX1 user 2 interrupt request.
MAILBOX2	MAILBOX2_IRQ_USER0	IRQ_CROSSBAR_237	–	MAILBOX2 user 0 interrupt request.
	MAILBOX2_IRQ_USER1	IRQ_CROSSBAR_238	–	MAILBOX2 user 1 interrupt request.
	MAILBOX2_IRQ_USER2	IRQ_CROSSBAR_239	–	MAILBOX2 user 2 interrupt request.
	MAILBOX2_IRQ_USER3	IRQ_CROSSBAR_240	–	MAILBOX2 user 3 interrupt request.
MAILBOX3	MAILBOX3_IRQ_USER0	IRQ_CROSSBAR_241	–	MAILBOX3 user 0 interrupt request.
	MAILBOX3_IRQ_USER1	IRQ_CROSSBAR_242	–	MAILBOX3 user 1 interrupt request.
	MAILBOX3_IRQ_USER2	IRQ_CROSSBAR_243	–	MAILBOX3 user 2 interrupt request.
	MAILBOX3_IRQ_USER3	IRQ_CROSSBAR_244	–	MAILBOX3 user 3 interrupt request.
MAILBOX4	MAILBOX4_IRQ_USER0	IRQ_CROSSBAR_245	–	MAILBOX4 user 0 interrupt request.
	MAILBOX4_IRQ_USER1	IRQ_CROSSBAR_246	–	MAILBOX4 user 1 interrupt request.
	MAILBOX4_IRQ_USER2	IRQ_CROSSBAR_247	–	MAILBOX4 user 2 interrupt request.
	MAILBOX4_IRQ_USER3	IRQ_CROSSBAR_248	–	MAILBOX4 user 3 interrupt request.
MAILBOX5	MAILBOX5_IRQ_USER0	IRQ_CROSSBAR_249	–	MAILBOX5 user 0 interrupt request.
	MAILBOX5_IRQ_USER1	IRQ_CROSSBAR_250	–	MAILBOX5 user 1 interrupt request.
	MAILBOX5_IRQ_USER2	IRQ_CROSSBAR_251	–	MAILBOX5 user 2 interrupt request.
	MAILBOX5_IRQ_USER3	IRQ_CROSSBAR_252	–	MAILBOX5 user 3 interrupt request.
MAILBOX6	MAILBOX6_IRQ_USER0	IRQ_CROSSBAR_253	–	MAILBOX6 user 0 interrupt request.
	MAILBOX6_IRQ_USER1	IRQ_CROSSBAR_254	–	MAILBOX6 user 1 interrupt request.
	MAILBOX6_IRQ_USER2	IRQ_CROSSBAR_255	–	MAILBOX6 user 2 interrupt request.
	MAILBOX6_IRQ_USER3	IRQ_CROSSBAR_256	–	MAILBOX6 user 3 interrupt request.
MAILBOX7	MAILBOX7_IRQ_USER0	IRQ_CROSSBAR_257	–	MAILBOX7 user 0 interrupt request.
	MAILBOX7_IRQ_USER1	IRQ_CROSSBAR_258	–	MAILBOX7 user 1 interrupt request.
	MAILBOX7_IRQ_USER2	IRQ_CROSSBAR_259	–	MAILBOX7 user 2 interrupt request.
	MAILBOX7_IRQ_USER3	IRQ_CROSSBAR_260	–	MAILBOX7 user 3 interrupt request.
MAILBOX8	MAILBOX8_IRQ_USER0	IRQ_CROSSBAR_261	–	MAILBOX8 user 0 interrupt request.
	MAILBOX8_IRQ_USER1	IRQ_CROSSBAR_262	–	MAILBOX8 user 1 interrupt request.
	MAILBOX8_IRQ_USER2	IRQ_CROSSBAR_263	–	MAILBOX8 user 2 interrupt request.
	MAILBOX8_IRQ_USER3	IRQ_CROSSBAR_264	–	MAILBOX8 user 3 interrupt request.
MAILBOX9	MAILBOX9_IRQ_USER0	IRQ_CROSSBAR_265	–	MAILBOX9 user 0 interrupt request.
	MAILBOX9_IRQ_USER1	IRQ_CROSSBAR_266	–	MAILBOX9 user 1 interrupt request.
	MAILBOX9_IRQ_USER2	IRQ_CROSSBAR_267	–	MAILBOX9 user 2 interrupt request.
	MAILBOX9_IRQ_USER3	IRQ_CROSSBAR_268	–	MAILBOX9 user 3 interrupt request.
MAILBOX10	MAILBOX10_IRQ_USER0	IRQ_CROSSBAR_269	–	MAILBOX10 user 0 interrupt request.
	MAILBOX10_IRQ_USER1	IRQ_CROSSBAR_270	–	MAILBOX10 user 1 interrupt request.
	MAILBOX10_IRQ_USER2	IRQ_CROSSBAR_271	–	MAILBOX10 user 2 interrupt request.
	MAILBOX10_IRQ_USER3	IRQ_CROSSBAR_272	–	MAILBOX10 user 3 interrupt request.

Table 19-4. MAILBOX Hardware Requests (continued)

MAILBOX11	MAILBOX11_IRQ_USER0	IRQ_CROSSBAR_273	–	MAILBOX11 user 0 interrupt request.
	MAILBOX11_IRQ_USER1	IRQ_CROSSBAR_274	–	MAILBOX11 user 1 interrupt request.
	MAILBOX11_IRQ_USER2	IRQ_CROSSBAR_275	–	MAILBOX11 user 2 interrupt request.
	MAILBOX11_IRQ_USER3	IRQ_CROSSBAR_276	–	MAILBOX11 user 3 interrupt request.
MAILBOX12	MAILBOX12_IRQ_USER0	IRQ_CROSSBAR_277	–	MAILBOX12 user 0 interrupt request.
	MAILBOX12_IRQ_USER1	IRQ_CROSSBAR_278	–	MAILBOX12 user 1 interrupt request.
	MAILBOX12_IRQ_USER2	IRQ_CROSSBAR_279	–	MAILBOX12 user 2 interrupt request.
	MAILBOX12_IRQ_USER3	IRQ_CROSSBAR_280	–	MAILBOX12 user 3 interrupt request.
MAILBOX13	MAILBOX13_IRQ_USER0	IRQ_CROSSBAR_379	–	MAILBOX13 user 0 interrupt request.
	MAILBOX13_IRQ_USER1	IRQ_CROSSBAR_380	–	MAILBOX13 user 1 interrupt request.
	MAILBOX13_IRQ_USER2	IRQ_CROSSBAR_381	–	MAILBOX13 user 2 interrupt request.
	MAILBOX13_IRQ_USER3	IRQ_CROSSBAR_382	–	MAILBOX13 user 3 interrupt request.
No DMA Requests				

Note

The "**Default Mapping**" column in Table 19-4, Table 19-7 shows the default mapping of module interrupts. These interrupts can also be mapped to other input lines of each device interrupt controller through the IRQ_CROSSBAR module.

For more information about the IRQ_CROSSBAR module, see *Control Module*.

For more information about the device interrupt controllers, see *Interrupt Controllers*.

Note

For information about interrupt source description, see *Mailbox Interrupt Requests*.

19.2.2 IVA Mailbox Integration

Figure 19-3 shows the IVA mailbox integration.

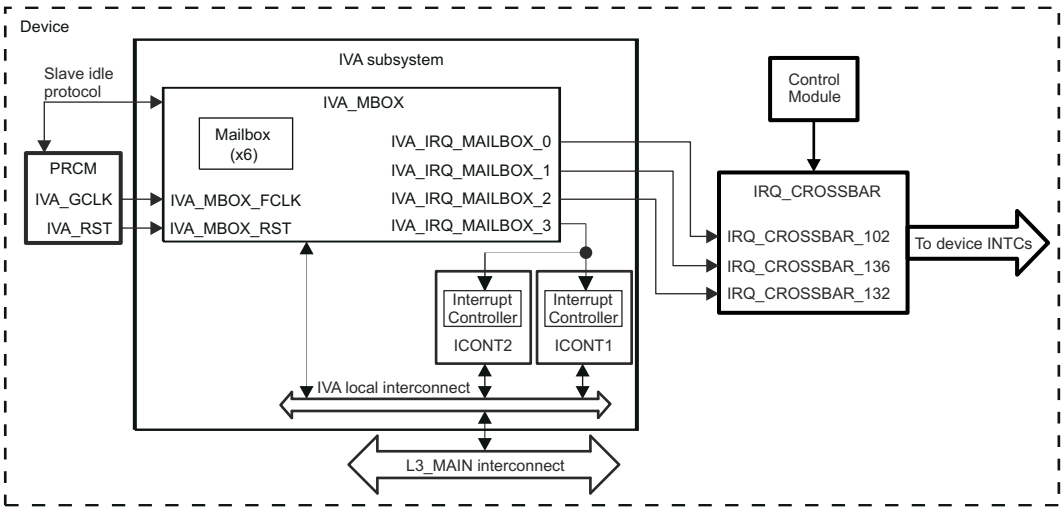

Figure 19-3. IVA Mailbox Integration

Note

The IVA_IRQ_MAILBOX_3 interrupt is mapped on both ICONT1 and ICONT2 interrupt controllers. It is recommended that this interrupt is unmasked at only one one interrupt controller at a time.

Table 19-5 through Table 19-7 summarize the IVA_MBOX integration in the device.

Table 19-5. IVA_MBOX Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
IVA_MBOX	PD_IVA	N/A	IVA local interconnect

Table 19-6. IVA_MBOX Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
IVA_MBOX	IVA_MBOX_FCLK	IVA_GCLK	PRCM	IVA_MBOX interface clock. This clock is used for all interface and functional operations.
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
IVA_MBOX	IVA_MBOX_RST	IVA_RST	PRCM	IVA_MBOX hardware reset. This reset is asynchronously applied to the IVA_MBOX registers.

Table 19-7. IVA_MBOX Hardware Requests

Interrupt Requests				
Module Instance	**Interrupt Name (Source)**	**IRQ_CROSSBAR Input (Destination)**	**Default Mapping**	**Description**
IVA_MBOX	IVA_IRQ_MAILBOX_0	IRQ_CROSSBAR_102	MPU_IRQ_107	IVA_MBOX user 0 interrupt request.
	IVA_IRQ_MAILBOX_1	IRQ_CROSSBAR_136	–	IVA_MBOX user 1 interrupt request.
	IVA_IRQ_MAILBOX_2	IRQ_CROSSBAR_132	IPU1_IRQ_38; IPU2_IRQ_38	IVA_MBOX user 2 interrupt request.
	IVA_IRQ_MAILBOX_3	–	ICONT1_IRQ_11; ICONT2_IRQ_11	IVA_MBOX user 3 interrupt request.
No DMA Requests				

19.3 Mailbox Functional Description

Note

The functionality of all mailbox instances in the device is the same and is described in this section.

Note

In this chapter, *u* is the user number and *m* is the mailbox number as follows:

- For MAILBOX1: *u* = 0 to 2 and *m* = 0 to 7;
- For MAILBOX2..13: *u* = 0 to 3 and *m* = 0 to 11;
- For IVA_MBOX: *u* = 0 to 3 and *m* = 0 to 5;

The mailbox module provides a means of communication through message queues among the users. The individual mailbox modules, or FIFOs, can associate (or de-associate) with any of the processors using the MAILBOX_IRQENABLE_SET_u (or MAILBOX_IRQENABLE_CLR_u) register.

Table 19-8 shows the potential users of the mailbox modules in the device.

Table 19-8. Mailbox Users in the Device

Mailbox Type		Users			
		User 0	User 1	User 2	User 3
System Mailbox	MAILBOX1	Any of: MPU, DSP1, IPU1, IPU2, PRU-ICSS1, PRU-ICSS2			–
	MAILBOX2..13	Any of: MPU, DSP1, IPU1, IPU2, PRU-ICSS1, PRU-ICSS2			
IVA Mailbox		Any of: MPU, DSP1, IPU1, IPU2, PRU-ICSS1, PRU-ICSS2			IVA local - ICONT, or ICONT2

Note

It is software responsibility to select a user by mapping (via IRQ_CROSSBAR) the corresponding mailbox interrupt to the interrupt controller of the appropriate processor subsystem.

Each user has a dedicated interrupt signal from the corresponding mailbox module instance and dedicated interrupt enabling and status registers.
Each MAILBOX_IRQSTATUS_RAW_u/MAILBOX_IRQSTATUS_CLR_u interrupt status register corresponds to a particular user.

19.3.1 Mailbox Block Diagram

19.3.1.1

Figure 19-4 shows the mailbox block diagram.

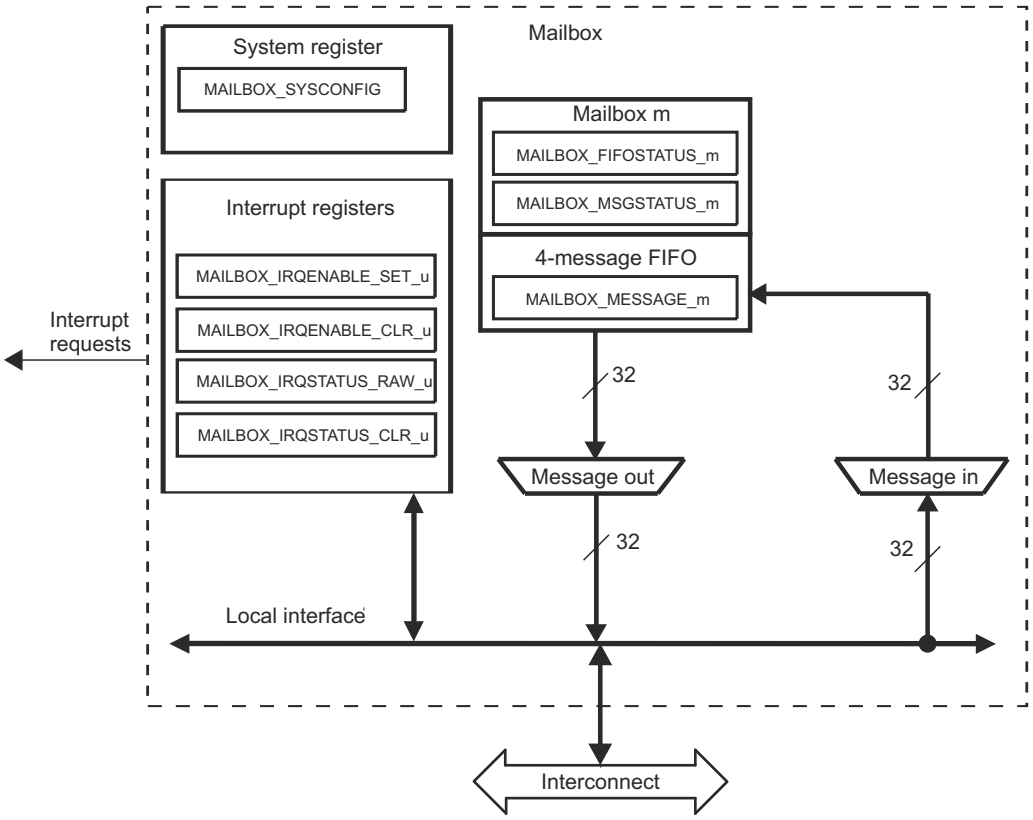

Figure 19-4. Mailbox Block Diagram

19.3.2 Mailbox Software Reset

The mailbox module supports a software reset through the MAILBOX_SYSCONFIG[0] SOFTRESET bit. Setting this bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Reading the MAILBOX_SYSCONFIG[0] SOFTRESET bit gives the status of the software reset:

- Read 1: the software reset is on-going.
- Read 0: the software reset is complete.

The software must ensure that the software reset completes before doing mailbox operations.

19.3.3 Mailbox Power Management

Table 19-9 describes power-management features available for the mailbox module.

Table 19-9. Local Power Management Features

Feature	Registers	Description
Clock autogating	N/A	Feature not available
Slave idle modes	MAILBOX_SYSCONFIG[3:2] SIDLEMODE bit field	Force-idle, no-idle and smart-idle modes are available
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	N/A	Feature not available

The mailbox module can be configured using the MAILBOX_SYSCONFIG[3:2] SIDLEMODE bit field to one of the following acknowledgment modes:

- Force-idle mode (SIDLEMODE = 0x0): The mailbox module immediately enters the idle state on receiving a low-power-mode request from the PRCM module. In this mode, the software must ensure that there are no asserted output interrupts before requesting this mode to go into the idle state.
- No-idle mode (SIDLEMODE = 0x1): The mailbox module never enters the idle state.
- Smart-idle mode (SIDLEMODE = 0x2): After receiving a low-power-mode request from the PRCM module, the mailbox module enters the idle state only after all asserted output interrupts are acknowledged.

19.3.4 Mailbox Interrupt Requests

An interrupt request allows the user of the mailbox to be notified when a message is received or when the message queue is not full. There is one interrupt per user.

Table 19-10 lists the event flags, and their mask, that can cause module interrupts.

Table 19-10. Interrupt Events

Non-Maskable Event Flag(1)	Maskable Event Flag	Event Mask Bit	Event Unmask Bit	Description
MAILBOX_IRQSTATUS_RAW_u[0+m*2] NEWMSGSTATUSUUMBm	MAILBOX_IRQSTATUS_CLR_u[0+m*2] NEWMSGSTATUSUUMBm	MAILBOX_IRQENABLE_CLR_u[0+m*2] NEWMSGSTATUSUUMBm	MAILBOX_IRQENABLE_SET_u[0+m*2] NEWMSGSTATUSUUMBm	Mailbox *m* receives a new message.
MAILBOX_IRQSTATUS_RAW_u[1+m*2] NOTFULLSTATUSUUMBm	MAILBOX_IRQSTATUS_CLR_u[1+m*2] NOTFULLSTATUSUUMBm	MAILBOX_IRQENABLE_CLR_u[1+m*2] NOTFULLSTATUSUUMBm	MAILBOX_IRQENABLE_SET_u[1+m*2] NOTFULLSTATUSUUMBm	Mailbox *m* message queue is not full.

(1) MAILBOX_IRQSTATUS_RAW_u register is mostly used for debug purposes.

CAUTION

Once an event generating the interrupt request has been processed by the software, it must be cleared by writing a logical 1 in the corresponding bit of the MAILBOX_IRQSTATUS_CLR_u register.

Writing a logical 1 in a bit of the MAILBOX_IRQSTATUS_CLR_u register will also clear to 0 the corresponding bit in the appropriate MAILBOX_IRQSTATUS_RAW_u register.

An event can generate an interrupt request when a logical 1 is written to the corresponding unmask bit in the MAILBOX_IRQENABLE_SET_u register. Events are reported in the appropriate MAILBOX_IRQSTATUS_CLR_u and MAILBOX_IRQSTATUS_RAW_u registers.

An event stops generating interrupt requests when a logical 1 is written to the corresponding mask bit in the MAILBOX_IRQENABLE_CLR_u register. Events are only reported in the appropriate MAILBOX_IRQSTATUS_RAW_u register.

In case of the MAILBOX_IRQSTATUS_RAW_u register, the event is reported in the corresponding bit even if the interrupt request generation is disabled for this event.

19.3.5 Mailbox Assignment

19.3.5.1 Description

To assign a receiver to a mailbox, set the new message interrupt enable bit corresponding to the desired mailbox in the MAILBOX_IRQENABLE_SET_u register. The receiver reads the MAILBOX_MESSAGE_m register to retrieve a message from the mailbox.

An alternate method for the receiver that does not use the interrupts is to poll the MAILBOX_FIFOSTATUS_m and/or MAILBOX_MSGSTATUS_m registers to know when to send or retrieve a message to or from the mailbox. This method does not require assigning a receiver to a mailbox. Because this method does not include the

explicit assignment of the mailbox, the software must avoid having multiple receivers use the same mailbox, which can result in incoherency.

To assign a sender to a mailbox, set the queue-not-full interrupt enable bit of the desired mailbox in the MAILBOX_IRQENABLE_SET_u register, where *u* is the number of the sending user. However, direct allocation of a mailbox to a sender is not recommended because it can cause the sending processor to be constantly interrupted.

It is recommended that register polling be used to:

- Check the status of either the MAILBOX_FIFOSTATUS_m or MAILBOX_MSGSTATUS_m registers
- Write the message to the corresponding MAILBOX_MESSAGE_m register, if space is available.

The sender might use the queue-not-full interrupt when the initial mailbox status check indicates the mailbox is full. In this case, the sender can enable the queue-not-full interrupt for its mailbox in the appropriate MAILBOX_IRQENABLE_SET_u register. This allows the sender to be notified by interrupt only when a FIFO queue has at least one available entry.

Reading the MAILBOX_IRQSTATUS_CLR_u register determines the status of the new message and the queue-not-full interrupts for a particular user. Writing 1 to the corresponding bit in the MAILBOX_IRQSTATUS_CLR_u register acknowledges, and subsequently clears, an interrupt.

CAUTION

Assigning multiple senders or multiple receivers to the same mailbox is not recommended.

19.3.6 Sending and Receiving Messages

19.3.6.1 Description

When a 32-bit message is written to the MAILBOX_MESSAGE_m register, the message is appended into the FIFO queue. This queue holds four messages. If the queue is full, the message is discarded.

Queue overflow can be avoided by first reading the MAILBOX_FIFOSTATUS_m register to check that the mailbox message queue is not full before writing a new message to it.

Reading the MAILBOX_MESSAGE_m register returns the message at the beginning of the FIFO queue and removes it from the queue. If the FIFO queue is empty when the MAILBOX_MESSAGE_m register is read, the value 0 is returned.

The new message interrupt is asserted when at least one message is in the mailbox message FIFO queue. To determine the number of messages in the mailbox message FIFO queue, read the MAILBOX_MSGSTATUS_m register.

19.3.7 16-Bit Register Access

19.3.7.1 Description

So that 16-bit processors can access the mailbox module, the module allows 16-bit register read and write access, with restrictions for the MAILBOX_MESSAGE_m registers. The 16-bit half-words are organized in little endian fashion; that is, the least-significant 16 bits are at the low address and the most-significant 16 bits are at the high address (low address + 0x02).

All mailbox module registers can be read or written to directly using individual 16-bit accesses with no restriction on interleaving, except the MAILBOX_MESSAGE_m registers, which must always be accessed by either single 32-bit accesses or two consecutive 16-bit accesses.

CAUTION

When using 16-bit accesses to the MAILBOX_MESSAGE_m registers, the order of access must be the least-significant half-word first (low address) and the most-significant half-word last (high address). This requirement is because of the update operation by the message FIFO of the MAILBOX_MSGSTATUS_m registers. The update of the FIFO queue contents and the associated status registers and possible interrupt generation occurs only when the most-significant 16 bits of a MAILBOX_MESSAGE_m are accessed.

19.3.8 Example of Communication

Figure 19-5 shows an example of communication between MPU and DSP1 subsystems.

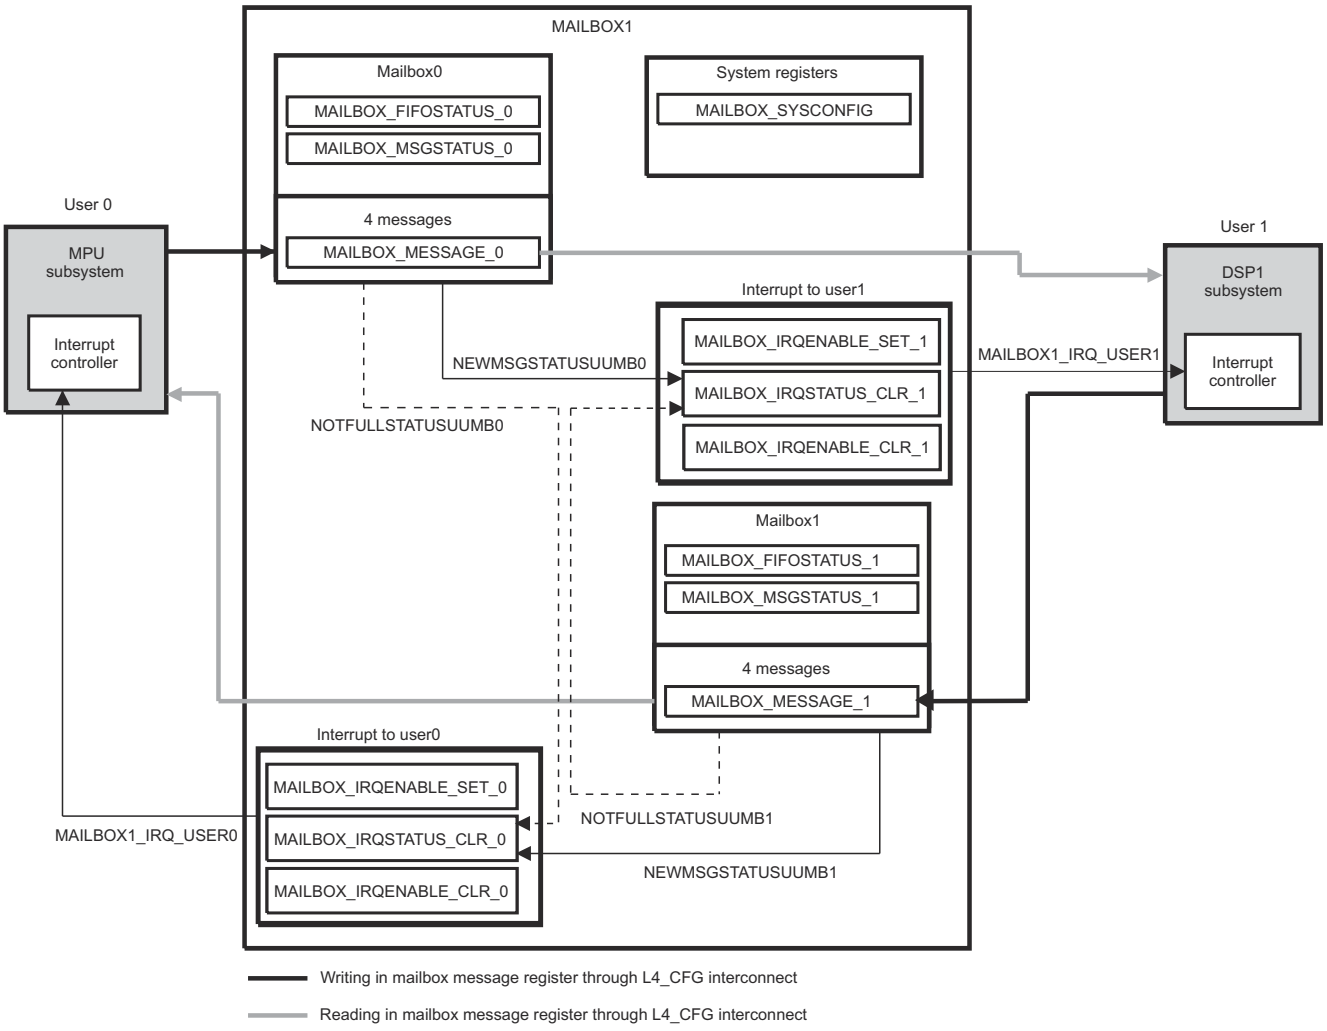

Figure 19-5. Example of Communication

19.4 Mailbox Programming Guide

19.4.1 Mailbox Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the mailbox module.

19.4.1.1 Global Initialization

19.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the mailbox module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the mailbox.

See Section 19.2, *Mailbox Integration*, for further information.

Table 19-11. Global Initialization of Surrounding Modules for MAILBOX

Surrounding Modules	Comments
PRCM	MAILBOX functional/interface clock must be enabled.
Interrupt Controllers	MPU, or IPU1, or IPU2, or DSP1, or PRU-ICSS1, or PRU-ICSS2 interrupt controller must be configured to enable the interrupt request generation to the corresponding subsystem.
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.

Table 19-12. Global Initialization of Surrounding Modules for IVA_MBOX

Surrounding Modules	Comments
PRCM	IVA_MBOX functional/interface clock must be enabled.
Interrupt Controllers	MPU, or IPU1, or IPU2, or DSP1, or PRU-ICSS1, or PRU-ICSS2, or IVA ICONT1/ICONT2 interrupt controller must be configured to enable the interrupt request generation to the corresponding subsystem.
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.

19.4.1.1.2 Mailbox Global Initialization

19.4.1.1.2.1 Main Sequence - Mailbox Global Initialization

This procedure initializes the mailbox module after a power-on or software reset.

Table 19-13. Mailbox Global Initialization

Step	Register/ Bit Field / Programming Model	Value
Perform a software reset	MAILBOX_SYSCONFIG[0] SOFTRESET	0x1
Wait until reset is complete	MAILBOX_SYSCONFIG[0] SOFTRESET	= 0x0
Set idle mode configuration	MAILBOX_SYSCONFIG[3:2] SIDLEMODE	0x-

19.4.1.2 Mailbox Operational Modes Configuration

19.4.1.2.1 Mailbox Processing modes

19.4.1.2.1.1 Main Sequence - Sending a Message (Polling Method)

Table 19-14. Sending a Message (Polling Method)

Step	Register/ Bit Field / Programming Model	Value
IF : Is FIFO full ?	MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB	= 0x1
Wait until at least one message slot is available	MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB	= 0x0
ELSE		
Write message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
ENDIF		

19.4.1.2.1.2 Main Sequence - Sending a Message (Interrupt Method)

Table 19-15. Sending a Message (Interrupt Method)

Step	Register/ Bit Field / Programming Model	Value
IF : Is FIFO full ?	MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB	= 0x1
Enable interrupt event	MAILBOX_IRQENABLE_SET_u[1+ m*2]	0x1
User (processor) can perform another task until interrupt occurs See Section 19.4.1.3.1 for interrupt handling in sending mode		
ELSE		
Write message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
ENDIF		

19.4.1.2.1.3 Main Sequence - Receiving a Message (Polling Method)

Table 19-16. Receiving a Message (Polling Method)

Step	Register/ Bit Field / Programming Model	Value
IF : Number of messages is not equal to 0	MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB	!= 0x0
Read message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
ENDIF		

19.4.1.2.1.4 Main Sequence - Receiving a Message (Interrupt Method)

Table 19-17. Receiving a Message (Interrupt Method)

Step	Register/ Bit Field / Programming Model	Value
Enable interrupt event	MAILBOX_IRQENABLE_SET_u[0 + m*2]	0x1
User (processor) can perform another task until interrupt occurs See Section 19.4.1.3.2 for interrupt handling in receiving mode		

19.4.1.3 Mailbox Events Servicing

19.4.1.3.1 Events Servicing in Sending Mode

Table 19-18 describes the events servicing in sending mode.

Table 19-18. Events Servicing in Sending Mode

Step	Register/ Bit Field / Programming Model	Value
Read interrupt status bit	MAILBOX_IRQSTATUS_CLR_u[1 + m*2]	0x1
Write message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
Write 1 to acknowledge interrupt	MAILBOX_IRQSTATUS_CLR_u[1 + m*2]	0x1

19.4.1.3.2 Events Servicing in Receiving Mode

Table 19-19 describes the events servicing in receiving mode.

Table 19-19. Events Servicing in Receiving Mode

Step	Register/ Bit Field / Programming Model	Value
Read interrupt status bit	MAILBOX_IRQSTATUS_CLR_u[0 + m*2]	0x1
IF : Number of messages is not equal to 0 ?	MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB	!= 0x0
Read message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----

Table 19-19. Events Servicing in Receiving Mode (continued)

Step	Register/ Bit Field / Programming Model	Value
ELSE		
Write 1 to acknowledge interrupt	MAILBOX_IRQSTATUS_CLR_u[0 + m*2]	0x1
ENDIF

Chapter 20

Memory Management Units

This chapter describes the memory management units (MMUs) in the device.

20.1 MMU Overview

A memory management unit (MMU) is a hardware component responsible for handling accesses to memory requested by a processing unit, DMA controller, or other bus requestor. MMU functions include:

- Translation of initiator internal (virtual) addresses to physical addresses (that is, virtual memory management)
- Preventing an initiator from making accesses to unmapped pages of the system memory

This device includes the following MMUs:

- Two top-level (system) MMUs:
  - MMU1 dedicated to EDMA Transfer Controller 0 (TC0), and EDMA Transfer Controller 1 (TC1)
  - MMU2 dedicated to PCIe_SS1, and PCIeSS2
- One MMU inside the MPU (single Cortex®-A15) subsystem – MPU_MMU. This MMU is integrated in the Cortex-A15 processor.
- Two MMUs inside the DSP1 subsystem: DSP1_MMU0, and DSP1_MMU1
- Two MMUs inside each of the IPU1, and IPU2 subsystems:
  - L1 unicache MMU – IPU1_UNICACHE_MMU, and IPU2_UNICACHE_MMU
  - L2 MMU – IPU1_MMU, and IPU2_MMU
- One MMU inside the 3D GPU (single SGX544 core) subsystem
- One MMU inside the BB2D subsystem

Note

There is a Physical Address Translator (PAT) module in the Dynamic Memory Manager (DMM), which has similar to the MMU functionality. For more information about this module, see Section 15.2, *Dynamic Memory Manager*.

Note

This chapter provides a detailed description of the following MMUs:

- System MMUs
- DSP MMUs
- IPU L2 MMU

System MMUs and DSP MMUs are fully identical from functional perspective. IPU L2 MMU is different in that it does not support “bypass” functionality.

For more information about:

- Cortex-A15 MMU, see the Arm® *Cortex®-A15 Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).
- IPU unicache MMU, see Chapter 7, *Dual Cortex-M4 IPU Subsystem*.

Figure 20-1 and Figure 20-2 show an overview of system MMU1 and MMU2, respectively. In summary, requests initiated by a given requestor (EDMA TC0 and TC1 [both read and write ports] for system MMU1; PCIe_SS1 and PCIe_SS2 for system MMU2) can optionally be routed through the corresponding system MMU. Each requestor’s use (or not) of the MMU is independently controllable via the Control Module CTRL_CORE_SMA_SW_7 register bitfields. It is recommended that this register is set during system initialization and remain static.

If the MMU loopback path is enabled for a given requestor, requests will be routed via the L3_MAIN interconnect to the MMU and will again go through the L3 interconnect to the requested physical address. If the MMU loopback path is disabled for a given requestor, those bus requests go directly through the L3_MAIN interconnect to the requested physical address, thus minimizing bus request latency.

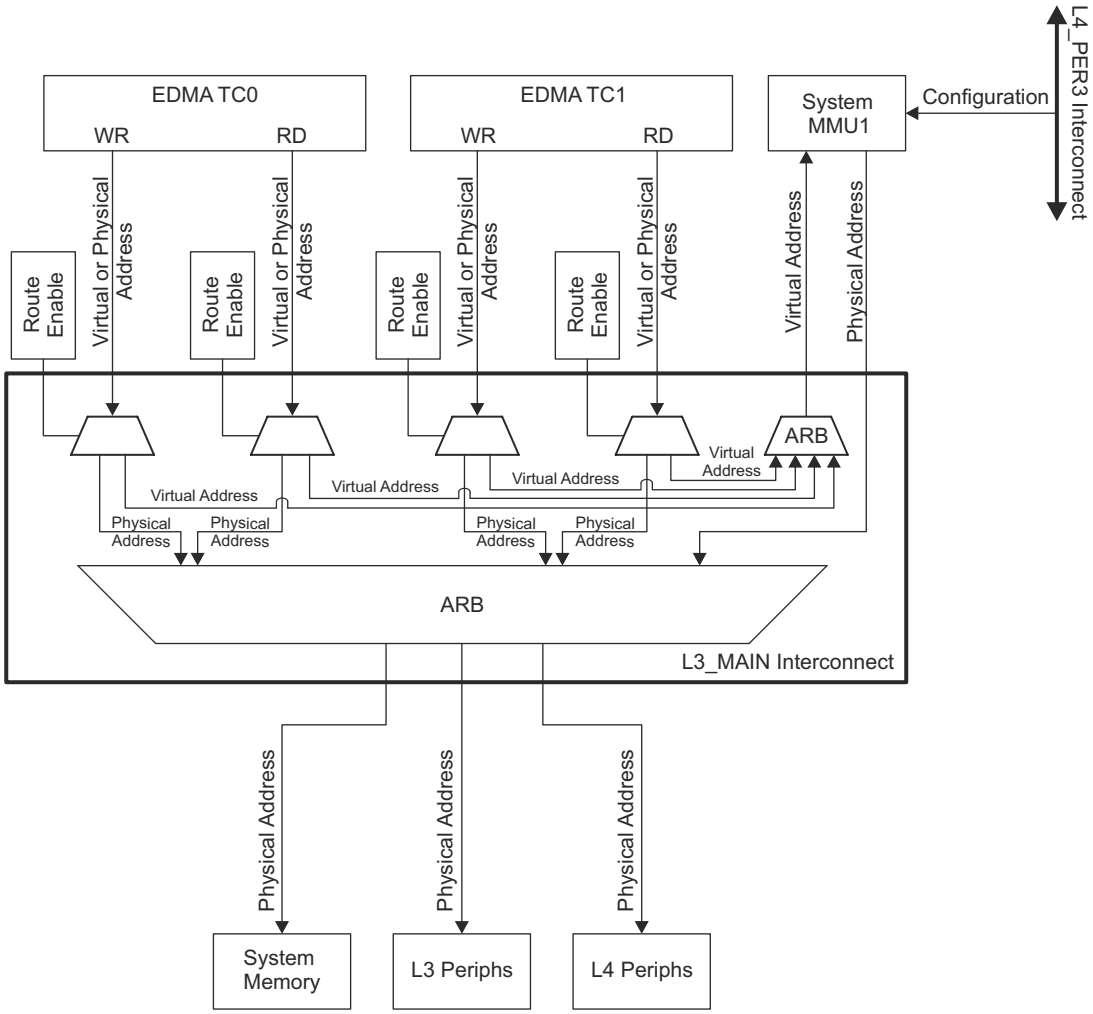

Figure 20-1. System MMU1 Overview

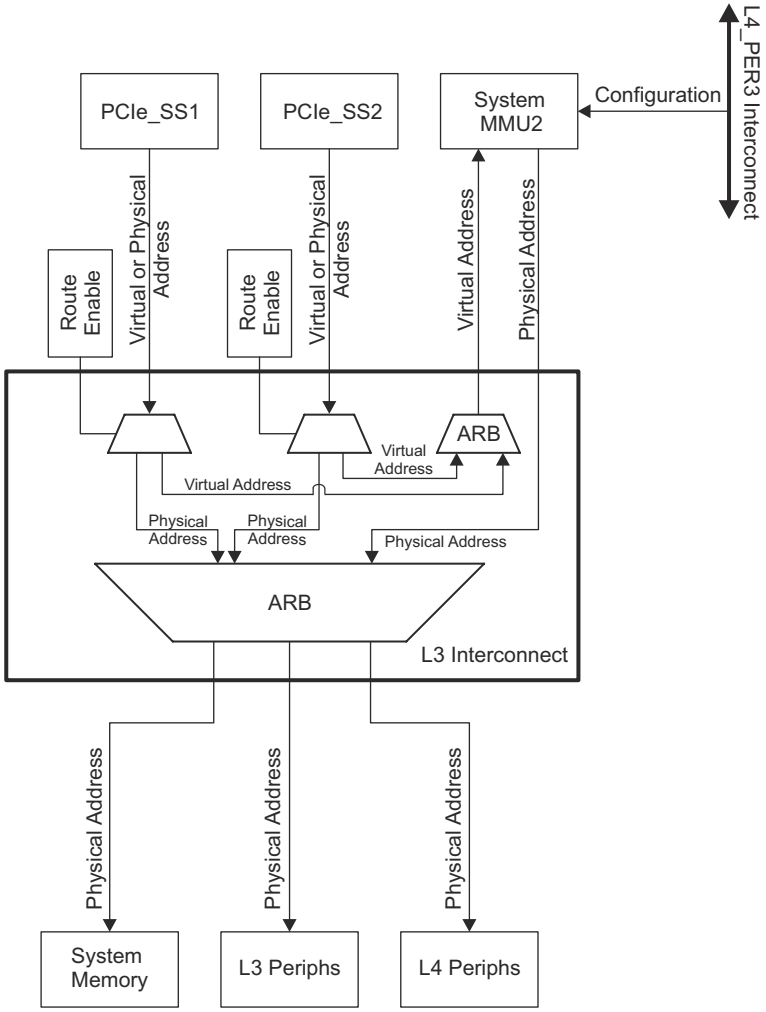

Figure 20-2. System MMU2 Overview

20.2 MMU Integration

This section describes the system MMUs integration in the device, including information about clocks, resets, and hardware requests. For more information about DSP, and IPU MMUs integration, refer to their respective chapters.

Figure 20-3 and Figure 20-4 show system MMU1, and MMU2 integration, respectively.

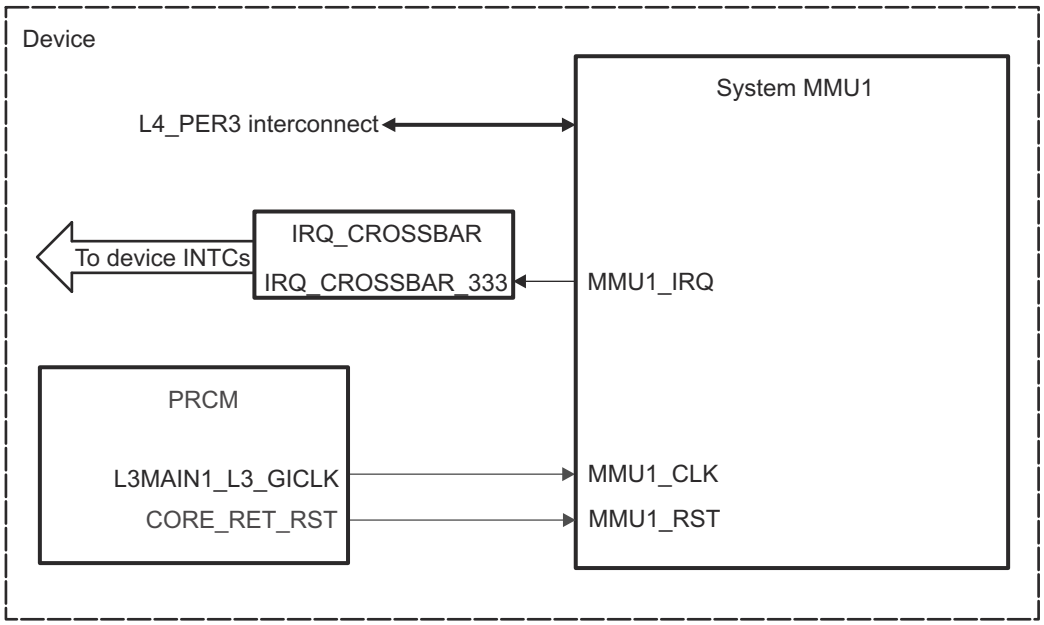

Figure 20-3. System MMU1 Integration

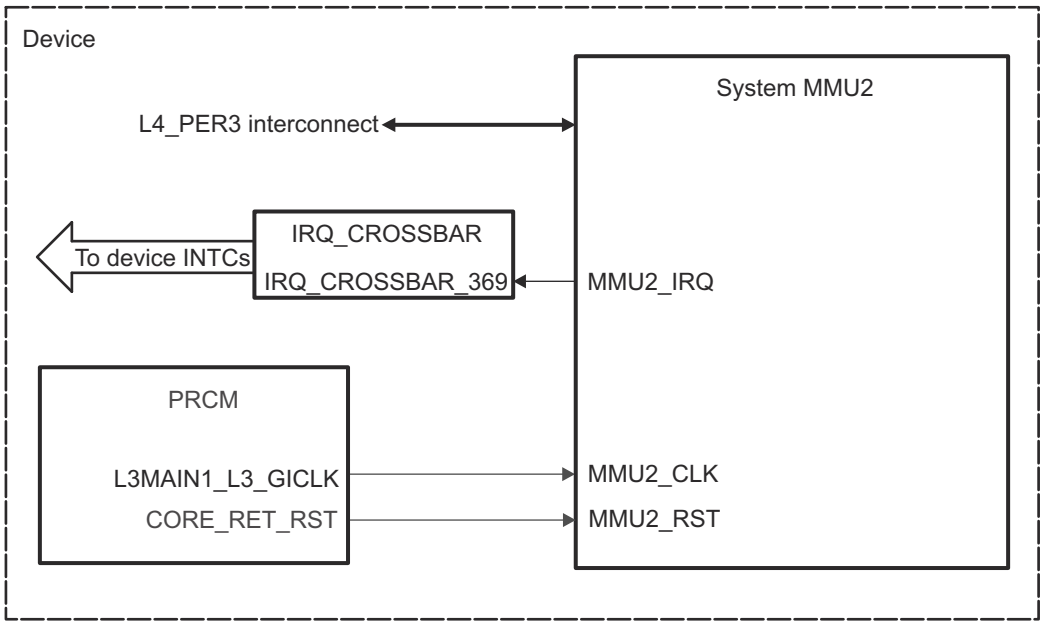

Figure 20-4. System MMU2 Integration

Table 20-1 through Table 20-3 summarize the system MMUs integration.

Table 20-1. MMU Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
System MMU1	PD_COREAON	L4_PER3
System MMU2	PD_COREAON	L4_PER3

Table 20-2. MMU Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
System MMU1	MMU1_CLK	L3MAIN1_L3_GICLK	PRCM	System MMU1 interface/functional clock. This clock is used for all interface and functional operations.
System MMU2	MMU2_CLK	L3MAIN1_L3_GICLK	PRCM	System MMU2 interface/functional clock. This clock is used for all interface and functional operations.
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
System MMU1	MMU1_RST	CORE_RET_RST	PRCM	System MMU1 hardware reset. This reset is asynchronously applied to the MMU1 internal registers.
System MMU2	MMU2_RST	CORE_RET_RST	PRCM	System MMU2 hardware reset. This reset is asynchronously applied to the MMU2 internal registers.

Table 20-3. MMU Hardware Requests

Interrupt Requests				
Module Instance	**Interrupt Name (Source)**	**IRQ_CROSSBAR Input (Destination)**	**Default Mapping**	**Description**
System MMU1	MMU1_IRQ	IRQ_CROSSBAR_333	–	System MMU1 interrupt.
System MMU2	MMU2_IRQ	IRQ_CROSSBAR_369	–	System MMU2 interrupt.
No DMA Requests				

Note

For a description of the interrupt sources, see Section 20.3.4, *MMU Interrupt Requests*.

20.3 MMU Functional Description

20.3.1 MMU Block Diagram

The MMU manages the virtual to physical address translation for external addresses. Figure 20-5 shows the MMU block diagram.

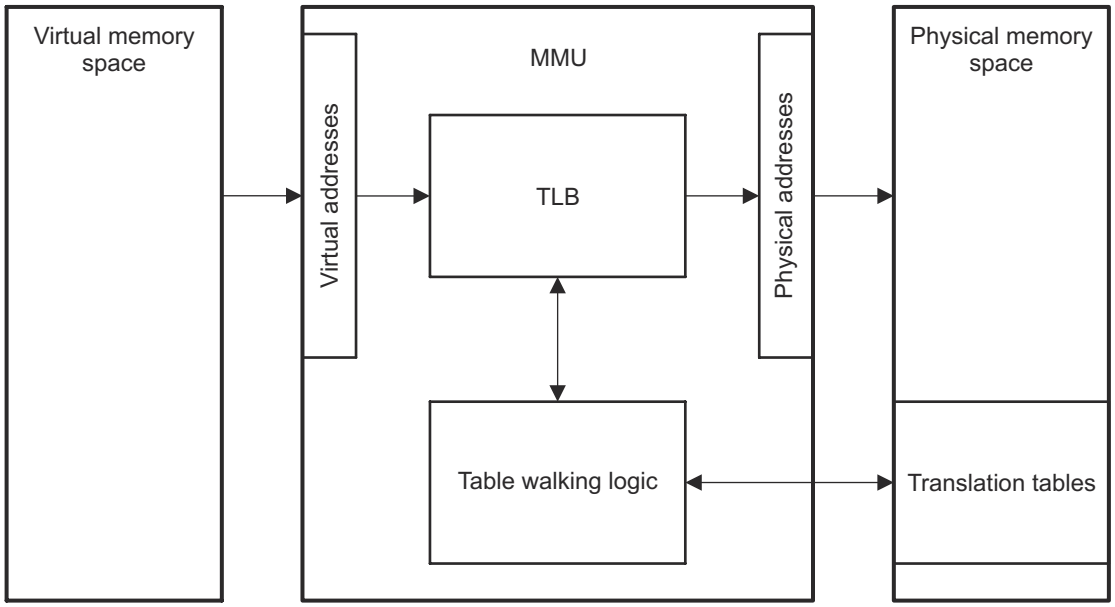

Figure 20-5. MMU Block Diagram

Each table entry describes the translation of one contiguous memory region. For a description of the structure of these tables, see Section 20.3.1.2, *Translation Tables*.

Two major functional units exist in the MMU to provide address translation automatically based on the table entries:

- The table walker automatically retrieves the correct translation table entry for a requested translation. If two-level translation is used (for the translation of small memory pages), the table walker also automatically reads the required second-level translation table entry. The two-level translation is described later in the chapter.
- The translation look-aside buffer (TLB) stores recently used translation entries, acting like a cache of the translation table.

20.3.1.1 MMU Address Translation Process

Whenever an address translation is requested (that is, for every access with the MMU enabled), the MMU first checks whether the translation is contained in the TLB, which acts like a cache storing recent translations. The TLB can also be programmed manually to ensure that time-critical data can be translated without delay.

If the requested translation is not in the TLB, the table-walking logic retrieves this translation from the translation table(s), and then updates the TLB. The address translation is then performed. Figure 20-6 summarizes the process.

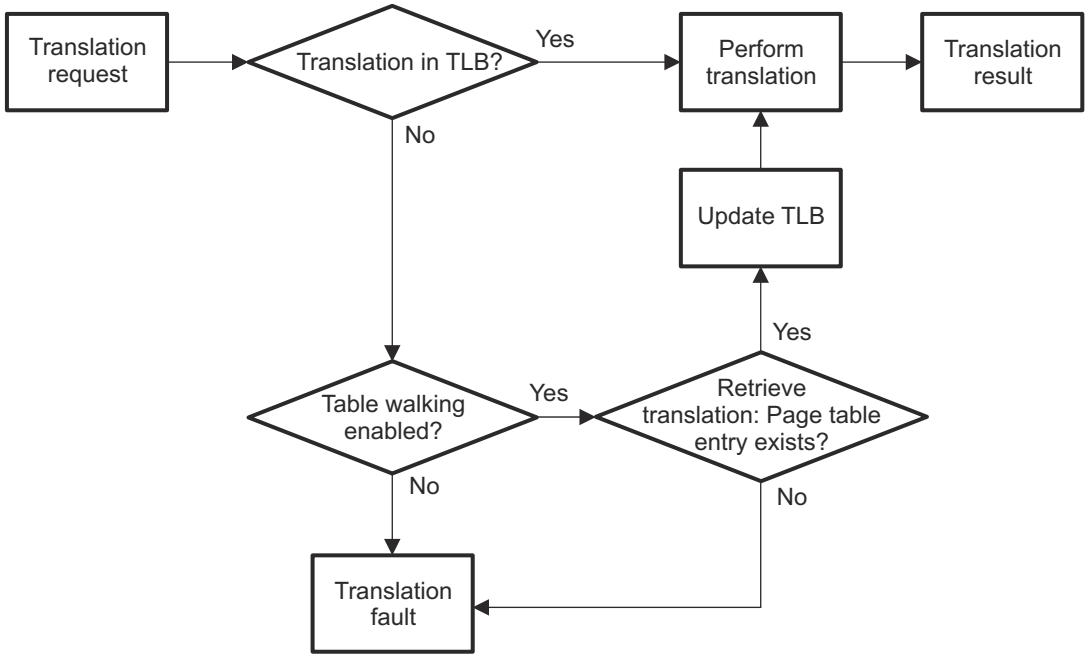

Figure 20-6. Translation Process

20.3.1.2 Translation Tables

The translation of virtual to physical addresses is based on entries in translation tables that define the following properties:

- Address translation, that is, the correspondence between virtual and physical addresses
- Size of the memory region the entry translates

The virtual addresses index the translation tables. Each virtual address corresponds to exactly one entry in the translation table.

20.3.1.2.1 Translation Table Hierarchy

When developing a table-based address translation scheme, one of the most important design parameters is the memory page size described by each translation table entry. MMU instances support 4-KiB and 64-KiB pages, a 1-MiB section, and a 16-MiB supersection. Using bigger page sizes means a smaller translation table.

Using a smaller page size greatly increases the efficiency of dynamic memory allocation and defragmentation. That is why many operating systems (OSs) can operate on memory blocks as small as 4 KiB; however, the smaller size implies a more complex table structure.

A quick calculation shows that using 4 KiB memory pages with one translation table would require one million entries to span the entire 4-GiB address range. The table itself would be 32 MiB, a size that is not feasible.

However, using bigger pages reduces the flexibility of typical OS memory management. Implementing a two-level hierarchy reconciles these two requirements. Within this hierarchy, one first-level translation table describes the translation properties based on 1 MiB memory regions.

Each of the entries in this first-level translation table can specify the following:

- The translation properties for a big memory section. This memory section can be either 1 MiB (section) or 16 MiB (supersection). In this case, all translation parameters are specified in the first-level translation table entry.
- A pointer to a second-level translation table that specifies individual translation properties based on smaller pages within the 1-MiB page of memory. These pages can be either 64 KiB (large page) or 4 KiB (small page). In this case, the actual translation parameters are specified in the second-level translation table entry. The first-level translation table entry specifies only the base address of the second-level translation table.

This hierarchical approach means that additional translation information for smaller pages must be provided only when the pages are actually used. Figure 20-7 shows the hierarchy.

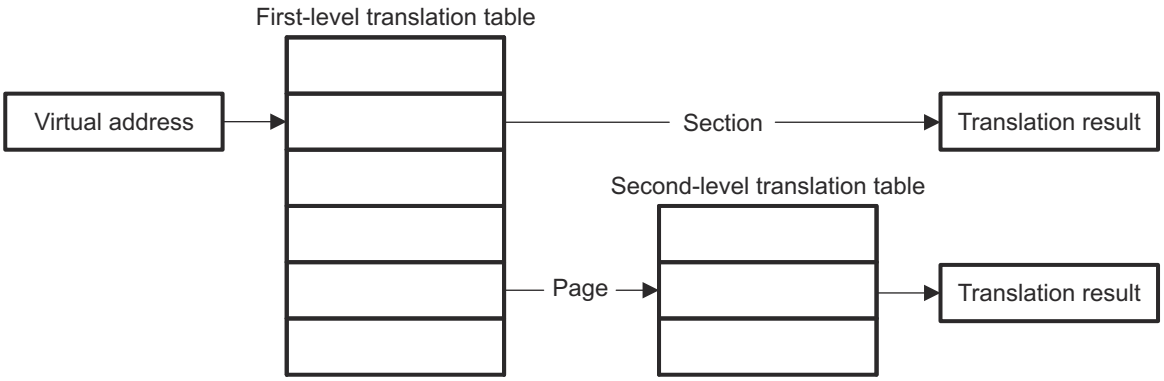

Figure 20-7. Translation Hierarchy

The structure of the first and second-level translation tables and their entries are described in more detail in Section 20.3.1.2.2, *First-Level Translation Table*, and Section 20.3.1.2.3, *Two-Level Translation*.

20.3.1.2.2 First-Level Translation Table

The first-level translation table describes the translation properties for 1-MiB sections. To describe a 4-GiB address range requires 4096 32-bit entries (so-called first-level descriptors).

The first-level translation table start address must be aligned on a multiple of the table size with a 128-byte minimum. Consequently, an alignment of at least 16K bytes is required for a complete 4096-entry table; that is, at least the last fourteen address bits must be zero.

The start address of the first-level translation table is specified by the so-called translation table base. The table is indexed by the upper 12-bits of the virtual address. Figure 20-8 shows this mechanism.

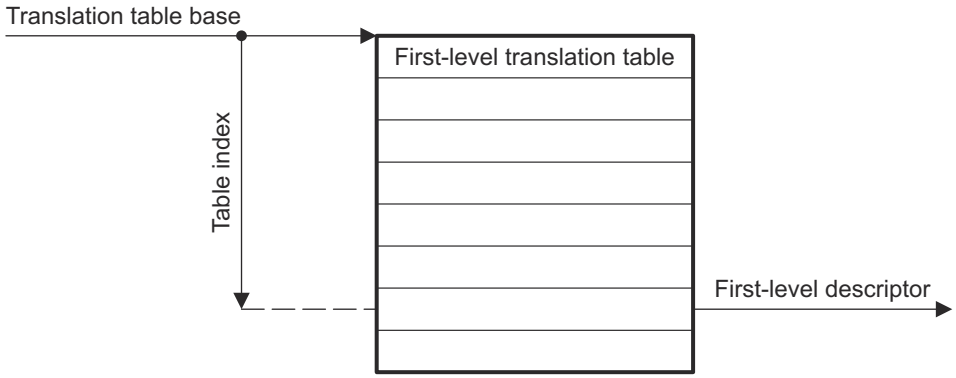

Figure 20-8. First-level Descriptor Address Calculation

To summarize, the translation table base and the translation table index together define the first-level descriptor address. Figure 20-9 outlines the precise mechanism used to calculate this address.

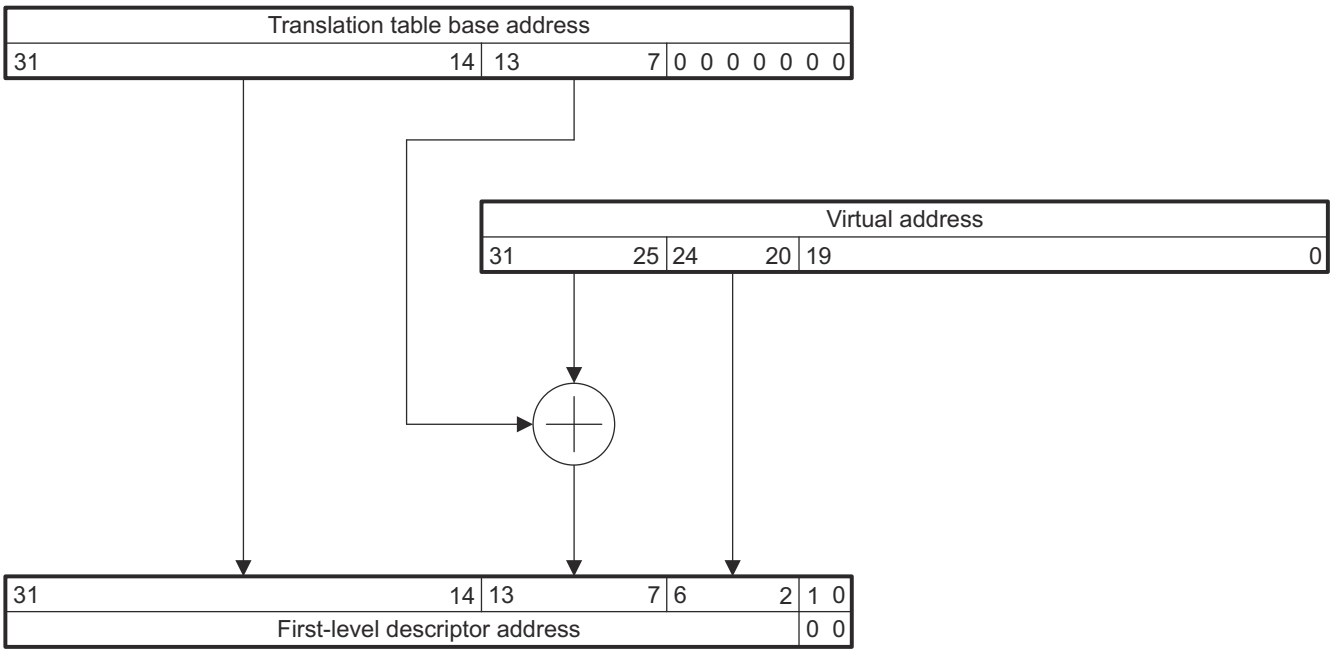

Figure 20-9. Detailed First-Level Descriptor Address Calculation

As an example of this mechanism, consider a translation table base address of 0x8000:0000 and a virtual address of 0x1234:5678. In this case, the first-level descriptor address is 0x8000:0000 + (0x123 << 2) = 0x8000:048C.

20.3.1.2.2.1 First-Level Descriptor Format

Each first-level descriptor provides either the complete address translation for 1-MiB or 16-MiB sections or provides a pointer to a second-level translation table for 4 KiB or 64 KiB pages. Table 20-4 shows the first-level descriptor format.

Table 20-4. First-Level Descriptor Format

First-Level Descriptor Format								
31:24	23:20	19	18	17:10	9:2	1	0	
X						0	0	Fault
Second-Level Translation Table Base Address					X	0	1	Page
Section Base Address		X	0	X		1	0	Section
Supersection Base Address	X		1	X		1	0	Supersection
X						1	1	Fault

X = Don't care. Set to 0 for future compatibility.

20.3.1.2.2.2 First-Level Page Descriptor Format

If a translation granularity smaller than 1 MiB is required, a two-level translation process is used. In this case, the first-level block descriptor specifies only the start address of a second-level translation table. The second-level translation table entries specify the actual translation properties.

20.3.1.2.2.3 First-Level Section Descriptor Format

Each section descriptor in the first-level translation table specifies the complete translation properties for a 1-MiB section or a 16-MiB supersection.

Note

Supersection descriptors must be repeated 16 times, because each descriptor in the first-level translation table describes 1 MiB of memory. If an access points to a descriptor that is not initialized, the MMU will behave in an unpredictable way.

20.3.1.2.2.4 Section Translation Summary

Sections and supersections can be translated based solely on the information in the first-level translation table. Figure 20-10 summarizes the address translation process for a section.

Figure 20-10. Section Translation Summary

20.3.1.2.2.5 Supersection Translation Summary

The translation of a supersection is similar to the translation of a section. The difference is that for a supersection only bits 31 to 24 index into the first-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a supersection.

Figure 20-11 shows the translation mechanism for a supersection.

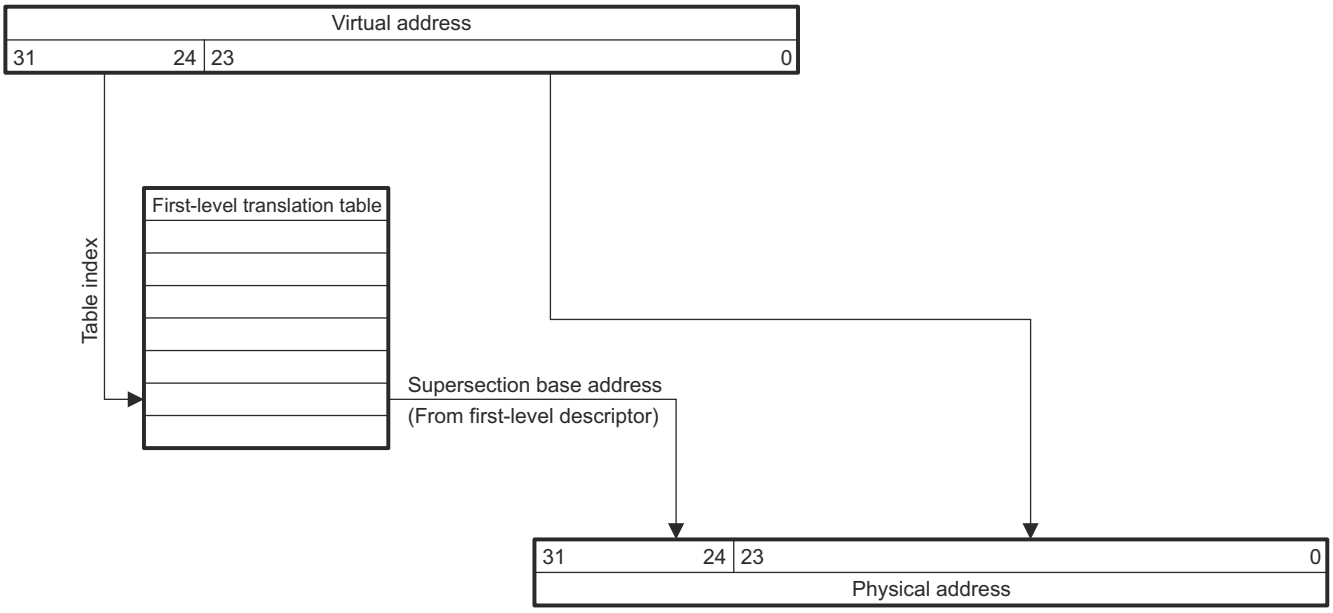

Figure 20-11. Supersection Translation Summary

20.3.1.2.3 Two-Level Translation

Two-level translation is used when fine-grain granularity is required, that is, when memory sections smaller than 1 MiB are needed. In this case, the first-level descriptor provides a pointer to the base address of a second-level translation table. This second-level table is indexed by bits 19 to 12 of the virtual address. Figure 20-12 shows this indexing mechanism.

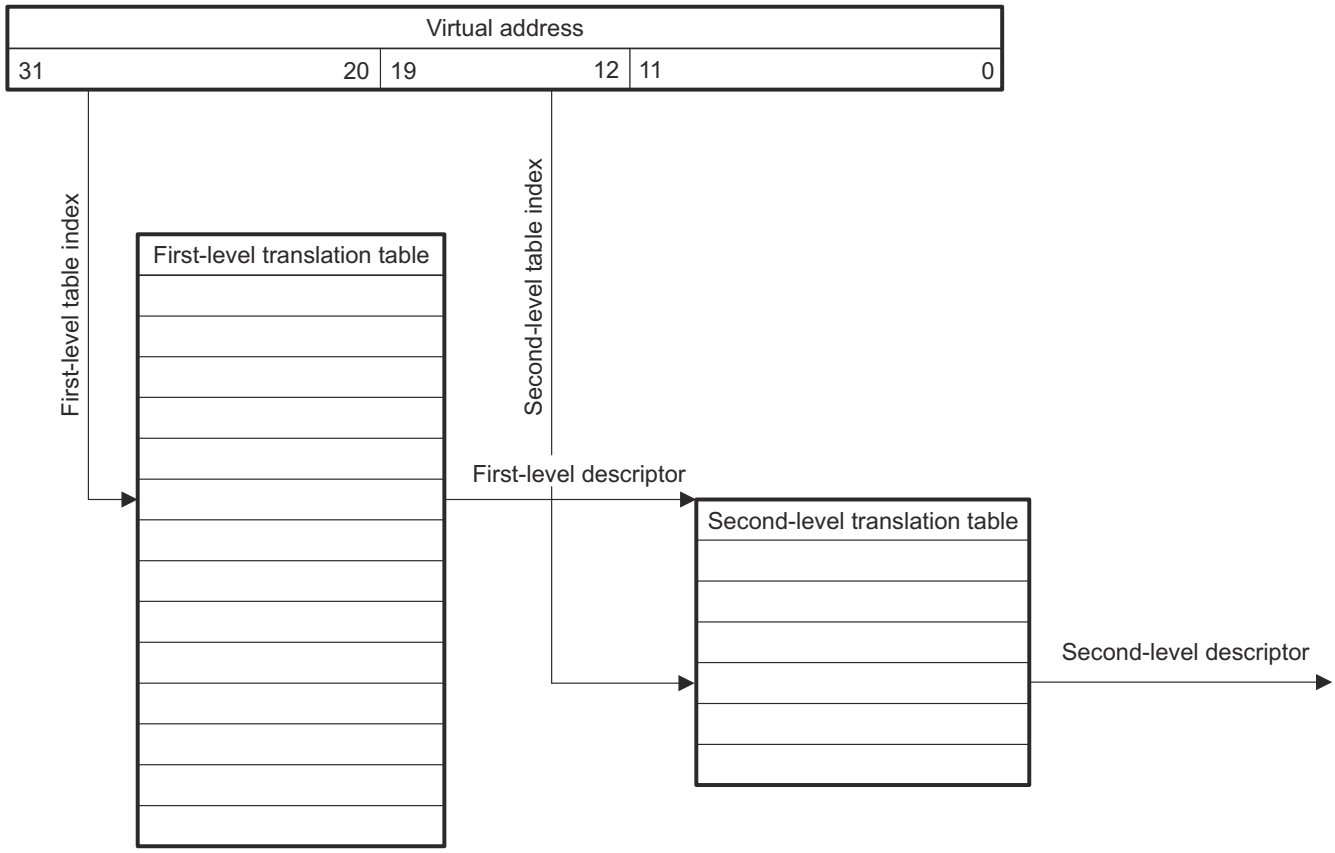

Figure 20-12. Two-Level Translation

Each second-level translation table describes the translation of 1 MiB of address space in pages of 64 KiB (large page) or 4 KiB (small page). It consists of 256 second-level descriptors describing 4 KiB each.

Note

In the case of a large page, the same descriptor must be repeated 16 times. If an access points to a descriptor that is not initialized, the MMU will behave in an unpredictable way.

20.3.1.2.3.1 Second-Level Descriptor Format

Similar to first-level section descriptors, second-level descriptors provide all of the necessary information for the translation of a large or small page. Table 20-5 shows the format of second-level descriptors.

Table 20-5. Second-Level Descriptor Format

Second-Level Descriptor Format					
31:16	15:12	11:2	1	0	
X			0	0	Fault
Large Page Base Address	X		0	1	Large Page
Small Page Base Address		X	1	X	Small Page

X = Don't care. Set to 0 for future compatibility.

20.3.1.2.3.2 Small Page Translation Summary

Figure 20-13 summarizes the translation process for small pages.

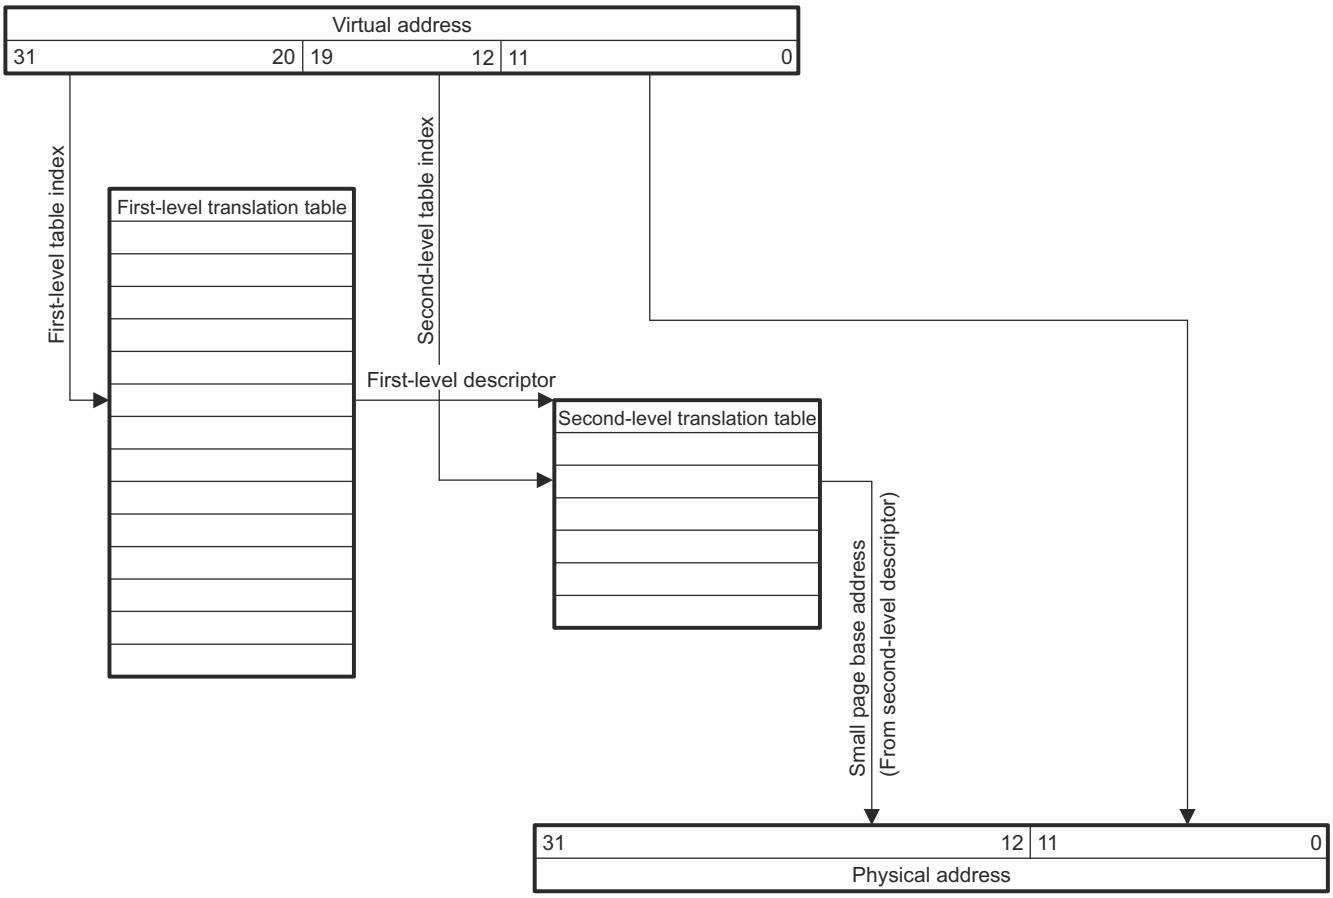

Figure 20-13. Small Page Translation Summary

20.3.1.2.3.3 Large Page Translation Summary

The translation of a large page is similar to the translation of a small page. The difference is that, for a large page, only bits 19 to 16 index into the second-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a large page. This is shown in Figure 20-14.

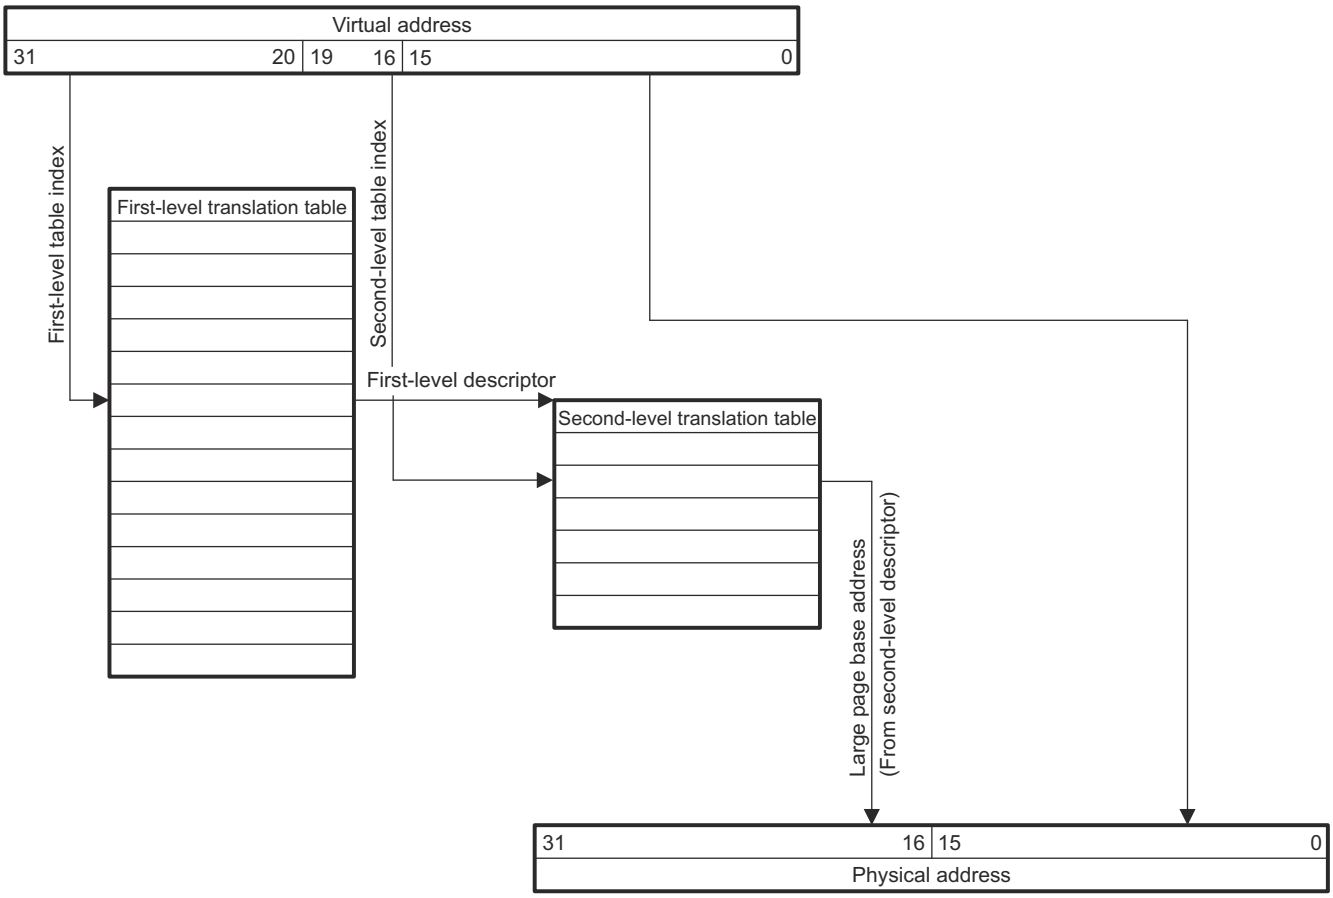

Figure 20-14. Large Page Translation Summary

20.3.1.3 Translation Lookaside Buffer

Translating virtual addresses to physical addresses is required for each memory access in systems using an MMU. To accelerate this translation process, a cache, or TLB, holds the result of recent translations.

For every translation, the MMU internal logic first checks whether the requested translation is already cached in the TLB. If the translation is cached, this translation is used; otherwise the translation is retrieved from the translation tables and the TLB is updated. If the TLB is full, one of its entries must be replaced. This entry is selected on a random basis.

The first *n* TLB entries, where *n* < *Total Number N of TLB Entries*, can be protected (locked) against being overwritten by setting the TLB base pointer to *n*. When this mechanism is used, only unprotected entries can be overwritten. The victim pointer indicates the next TLB entry to be written. Figure 20-15 shows an example of the TLB with N TLB entries (ranging from 0 to N-1). The base pointer contains the value "3" protecting Entry 0, Entry 1, and Entry 2 and the victim pointer points to the next TLB entry to be updated.

Note

The last TLB entry (Entry N-1) always remains unprotected.

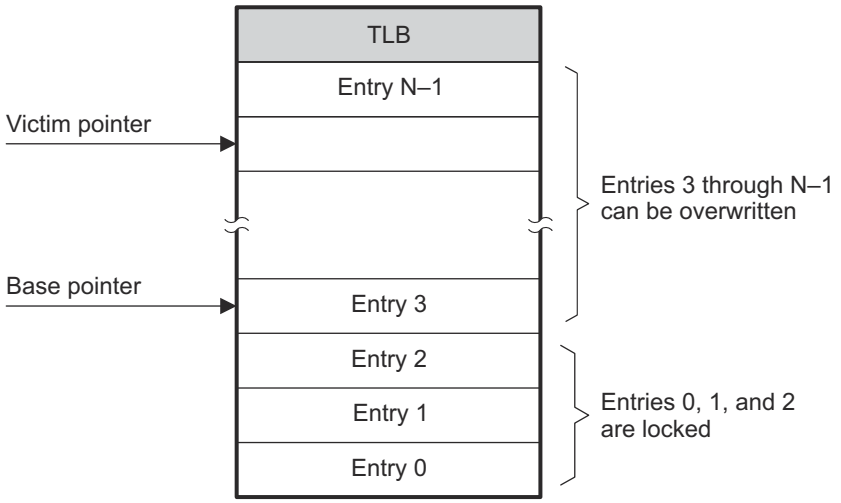

Figure 20-15. TLB Entry Lock Mechanism

The table walking logic automatically writes the TLB entries. The entries can also be manually written, which is done typically to ensure that the translation of time-critical data accesses is already present in the TLB so that they execute as fast as possible. The entries must be locked to prevent them from being overwritten.

20.3.1.3.1 TLB Entry Format

TLB entries consist of two parts:

- The Content Addressable Memory (CAM) part contains the virtual address tag used to determine if a virtual address translation is in the TLB. The TLB acts like a fully associative cache addressed by the virtual address tag. The CAM part also contains the section/page size, as well as the preserved and the valid parameters. See the MMU_CAM register table for more details.
- The Random Addressable Memory (RAM) part contains the address translation that belongs to the virtual address tag. See the MMU_RAM register table for more details.

The valid parameter specifies whether an entry is valid or not. The preserved parameter determines the behavior of an entry in the event of a TLB flush. If an entry is set as preserved, it is not deleted when a TLB is flushed, that is, when MMU_GFLUSH[0] GLOBALFLUSH is set to 1. Preserved entries must be deleted manually. Section 20.3.1.2.2, *First-Level Translation Table* describes the procedure to delete TLB entries.

Figure 20-17 shows the TLB entry structure.

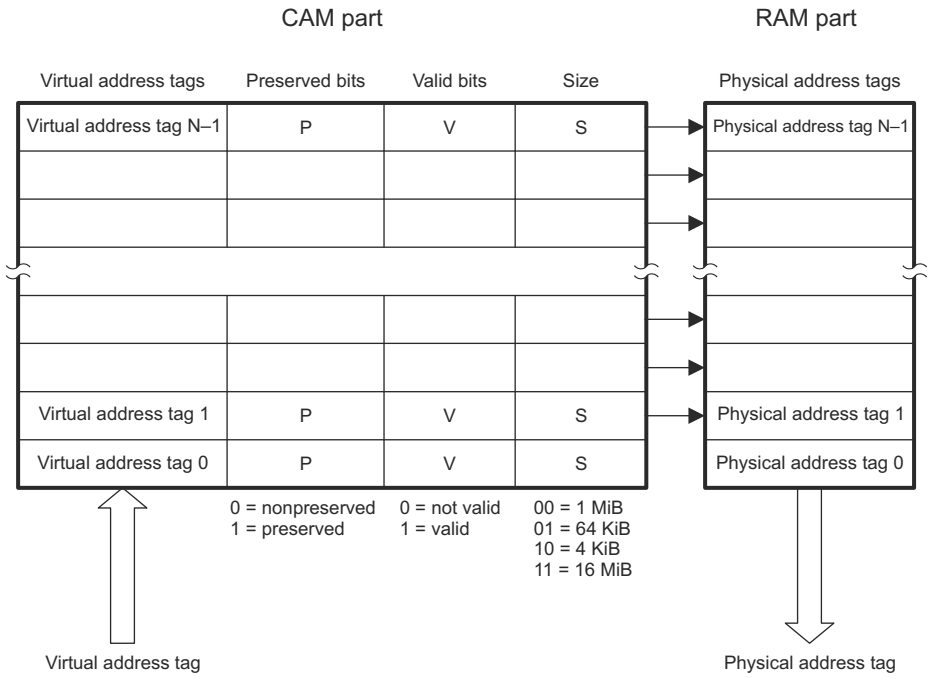

Figure 20-16. TLB Entry Structure

20.3.1.4 No Translation (Bypass) Regions

The MMU provides support for up to four user programmable regions where there is no address translation. Any access to a region specified by the MMU_BYPASS_REGIONx_ADDR and MMU_BYPASS_REGIONx_SIZE registers (where x = 1 to 4) will have no virtual to physical address translation.

20.3.2 MMU Software Reset

To perform a software reset, write 1 in the MMU_SYSCONFIG[1] SOFTRESET bit. The MMU_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1. When the software reset completes, the MMU_SYSCONFIG[1] SOFTRESET bit is automatically reset. The software must ensure that the software reset completes before doing MMU operations. When an MMU instance is released from reset, its TLB is empty and the MMU is disabled.

20.3.3 MMU Power Management

Table 20-6 describes the power-management features available for the MMU modules.

Table 20-6. MMU Local Power Management Features

Feature	Register
Idle modes	MMU_SYSCONFIG[4:3] IDLEMODE
Clock activity	MMU_SYSCONFIG[9:8] CLOCKACTIVITY
Clock autogating	MMU_SYSCONFIG[0] AUTOIDLE

Note

The MMU_SYSCONFIG[9:8] CLOCKACTIVITY bit field is read only.

20.3.4 MMU Interrupt Requests

Table 20-7. MMU Events

Event Flag	Event Mask	Description
MMU_IRQSTATUS[4] MULTIHITFAULT	MMU_IRQENABLE[4] MULTIHITFAULT	Error due to multiple matches in the TLB

Table 20-7. MMU Events (continued)

Event Flag	Event Mask	Description
MMU_IRQSTATUS[3] TABLEWALKFAULT	MMU_IRQENABLE[3] TABLEWALKFAULT	Error due to error response received during a Table Walk
MMU_IRQSTATUS[2] EMUMISS	MMU_IRQENABLE[2] EMUMISS	Error due to unrecoverable TLB miss during debug (hardware TWL disabled)
MMU_IRQSTATUS[1] TRANSLATIONFAULT	MMU_IRQENABLE[1] TRANSLATIONFAULT	Error due to invalid descriptor in the translation tables (translation fault)
MMU_IRQSTATUS[0] TLBMISS	MMU_IRQENABLE[0] TLBMISS	Error due to unrecoverable TLB miss (hardware TWL disabled)

20.3.5 MMU Error Handling

Table 20-8 summarizes the intended operation for real and potential error conditions.

Table 20-8. Error Handling

Item	Condition	Action
1	Table-walk read has an error response.	Treat generally the same as a translation fault, but set the TableWalkFault interrupt status bit to aid in diagnosis
2	MMU is disabled during table-walk.	Not permitted; can result in loss of the current transaction but must not deadlock the MMU. Avoid this condition by first disabling the table-walk logic and then polling the TWLRunning bit to ensure that no table walk is pending
3	MMU is disabled during an address translation.	Not permitted; can result in access to an unintended location, but must not deadlock MMU. This condition should be avoided by ensuring that no accesses are pending.
4	TLB is accessed during an address translation or a table walk.	Reading permitted; write should be done with care to ensure that the TLB is self-consistent at all times that a translation can occur.
5	TLB is flushed during address translation or a table walk.	Permitted; the flush is processed first, followed by the TWL update.
6	MMU is disabled while an interrupt is pending.	Not permitted; all pending interrupts should be processed before disabling the MMU.
7	Interrupt is not enabled and a fault/miss happens during translation.	If MMU_GPR[0] FAULT_INTR_DIS = 1 : Error response is sent back. If MMU_GPR[0] FAULT_INTR_DIS = 0 : • Mreqdebug = 1 (debug access) : Error response is sent back • Mreqdebug = 0 (application access) : Error response is not sent. MMU is waiting for TLB to be updated through config port. But since the interrupt is not asserted, system does not know there was a fault. This results in deadlock. Software must take care of this by enabling interrupts.

20.4 MMU Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the module.

20.4.1 Global Initialization

20.4.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the MMU module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the MMU. For more information, see Section 20.2, *MMU Module Integration* .

Table 20-9. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Enable MMU interface/functional clock.
(optional) Interrupt controller(s)	Configure device interrupt controller(s) to enable the interrupts from MMU.
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.

20.4.1.2 MMU Global Initialization

20.4.1.2.1 Main Sequence - MMU Global Initialization

Figure 20-17 shows the procedure to initialize the MMU after a power-on or software reset.

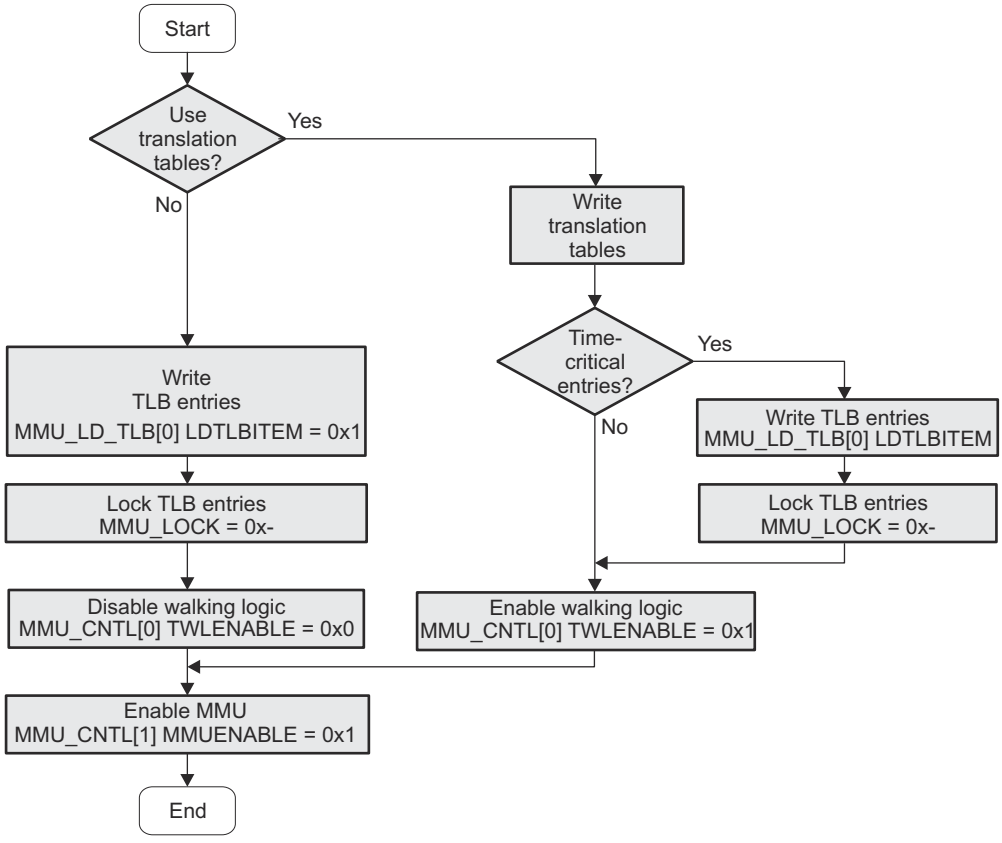

Figure 20-17. MMU Global Initialization

20.4.1.2.2 Subsequence - Configure a TLB entry

Table 20-10. Configure a TLB Entry

Step	Register / Bit Field / Programming Model	Value
Load the Virtual Address Tag	MMU_CAM[31:12] VATAG	0x-
Protect the TLB entry against flush	MMU_CAM[3] P	0x1
Validate the TLB entry	MMU_CAM[2] V	0x1
Define the page size	MMU_CAM[1:0] PAGESIZE	0x-

20.4.1.3 Operational Modes Configuration

20.4.1.3.1 Main Sequence - Writing TLB Entries Statically

Writing TLB entries statically avoids the need to write translation tables in memory and is commonly used for relatively small address spaces. This method ensures that the translation of time-critical data accesses execute as fast as possible with entries already present in the TLB. These entries must be locked to prevent them from being overwritten.

Table 20-11. MMU Writing TLB Entries Statically

Step	Register/ Bit Field / Programming Model	Value
Execute software reset	MMU_SYSCONFIG[1] SOFTRESET	0x1
Wait for reset to complete	MMU_SYSSTATUS[0] RESETDONE	=0x1
Enable power saving via automatic interface clock gating	MMU_SYSCONFIG[0] AUTOIDLE	0x1
Configure TLB entries	See Table 20-10	
Load the physical Address of the page	MMU_RAM[31:12] PHYSICALADDRESS	0x-
Specify the TLB entry you want to write	MMU_LOCK[8:4] CURRENTVICTIM	0x-
Load the specified entry in the TLB	MMU_LD_TLB[0] LDTLBITEM	0x1
Enable multihit fault and TLB miss	MMU_IRQENABLE[4] MULTIHITFAULT	0x1
	MMU_IRQENABLE[0] TLBMISS	0x1
Enable memory translations	MMU_CNTL[1] MMUENABLE	0x1

20.4.1.3.2 Main Sequence - Protecting TLB Entries

The first *n* TLB entries (with *n* < total number of TLB entries) can be protected from being overwritten with new translations. This is useful to ensure that certain commonly used or time-critical translations are always in the TLB and do not require retrieval using the table walking process.

Table 20-12. Protecting TLB Entries

Step	Registe/Bit Field/Programming Model	Value
Locks the TLB entries	MMU_LOCK[14:10] BASEVALUE	0x-

20.4.1.3.3 Main Sequence - Deleting TLB Entries

Two mechanisms exist to delete TLB entries. All unpreserved TLB entries, that is, TLB entries written with the preserved bit set to zero, can be deleted by invoking a TLB flush. The preserved bit should only be used on protected TLB entries, as it does not prevent replacement by the table walking logic.

Table 20-13. Deleting TLB Entries

Step	Registet / Bit Field / Programming Model	Value
Flush all nonprotected TLB entries	MMU_GFLUSH[0] GLOBALFLUSH	0x1
Flush all TLB entries specified by the CAM register	MMU_FLUSH_ENTRY[0] FLUSHENTRY	0x1

20.4.1.3.4 Main Sequence - Read TLB Entries

TLB entries can be read by the programmer to determine the TLB content at runtime.

Table 20-14. Read TLB Entries

Step	Register / Bit Field / Programming Model	Value
Set the current victim pointer	MMU_LOCK[8:4] CURRENTVICTIM	0x-
Read RAM parts of the TLB entry	MMU_READ_RAM	
Read CAM parts of the TLB entry	MMU_READ_CAM	

20.5 MMU Register Manual

20.5.1 MMU Instance Summary

Table 20-15. MMU Instance Summary

Module Name	Base Address (L3/L4 Access)	Base Address (CPU Private Access)	Size
System MMU1	0x4881 C000	–	176 Bytes
System MMU2	0x4881 E000	–	176 Bytes

20.5.2.2 MMU Register Description

Table 20-19. MMU_REVISION

Address Offset	0x0000 0000		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register contains the IP revision code		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REVISION																															

Bits	Field Name	Description	Type	Reset
31:0	REVISION	IP Revision	R	See (1)

(1) TI internal data

Table 20-20. MMU_SYSCONFIG

Address Offset	0x0000 0010		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register controls the various parameters of the OCP interface		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																						CLOCKACTIVITY		RESERVED			IDLEMODE		RESERVED	SOFTRESET	AUTOIDLE

Bits	Field Name	Description	Type	Reset
31:10	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x000000
9:8	CLOCKACTIVITY	Clock activity during wake-up mode 0x0: Functional and OCP clocks can be switched off	R	0x0
7:5	RESERVED	Write 0's for future compatibility Reads returns 0	R	0x0
4:3	IDLEMODE	Idle mode 0x0: Force-idle. An idle request is acknowledged unconditionally 0x1: No-idle. An idle request is never acknowledged 0x2: Smart-idle. Acknowledgement to an idle request is given based on the internal activity of the module 0x3: Reserved. Do not use	RW	0x0
2	RESERVED	Write 0's for future compatibility Reads returns 0	R	0x0
1	SOFTRESET	Software reset. This bit is automatically reset by the hardware. During reads, it always return 0 Write 0x0: No functional effect Write 0x1: The module is reset	W	0x0
0	AUTOIDLE	Internal OCP clock gating strategy 0x0: OCP clock is free-running 0x1: Automatic interconnect clock gating strategy is applied, based on the interconnect interface activity	RW	0x0

Table 20-21. MMU_SYSSTATUS

Address Offset	0x0000 0014		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register provides status information about the module, excluding the interrupt status information		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															RESETDONE

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Reads returns 0	R	0x000000
0	RESETDONE	Internal reset monitoring Read 0x0: Internal module reset in on-going Read 0x1: Reset completed	R	-

Table 20-22. MMU_IRQSTATUS

Address Offset	0x0000 0018		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This interrupt status register regroups all the status of the module internal events that can generate an interrupt.		

Table 20-22. MMU_IRQSTATUS (continued)

Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																											MULTIHITFAULT	TABLEWALKFAULT	EMUMISS	TRANSLATIONFAULT	TLBMISS

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Write 0's for future compatibility. Read returns 0	R	0x0000000
4	MULTIHITFAULT	Error due to multiple matches in the TLB Read 0x0: MultiHitFault false Write 0x0: MultiHitFault status bit unchanged Write 0x1: MultiHitFault status bit is reset Read 0x1: MultiHitFault is true ('pending')	RW (W1toClr)	0x0
3	TABLEWALKFAULT	Error response received during a Table Walk Read 0x0: TableWalkFault false Write 0x0: TableWalkFault status bit unchanged Write 0x1: TableWalkFault status bit is reset Read 0x1: TableWalkFault is true ('pending')	RW (W1toClr)	0x0
2	EMUMISS	Unrecoverable TLB miss during debug (hardware TWL disabled) Read 0x0: EMUMiss false Write 0x0: EMUMiss status bit unchanged Write 0x1: EMUMiss status bit is reset Read 0x1: EMUMiss is true ('pending')	RW (W1toClr)	0x0
1	TRANSLATIONFAULT	Invalid descriptor in translation tables (translation fault) Read 0x0: TranslationFault false Write 0x0: TranslationFault status bit unchanged Write 0x1: TranslationFault status bit is reset Read 0x1: TranslationFault is true ('pending')	RW (W1toClr)	0x0
0	TLBMISS	Unrecoverable TLB miss (hardware TWL disabled) Read 0x0: TLBMiss false Write 0x0: TLBMiss status bit unchanged Write 0x1: TLBMiss status bit is reset Read 0x1: TLBMiss is true ('pending')	RW (W1toClr)	0x0

Table 20-23. MMU_IRQENABLE

Address Offset	0x0000 001C		
Physical Address	See Section 20.5.2.1	Instance	See Table 20-15
Description	The interrupt enable register allows to mask/unmask the module internal sources of interrupt, on a event-by-event basis.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RESERVED	MULTIHITFAULT	TABLEWALKFAULT	EMUMISS	TRANSLATIONFAULT	TLBMISS

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Write 0's for future compatibility Read returns 0	R	0x0000000
4	MULTIHITFAULT	Error due to multiple matches in the TLB 0x0: MultiHitFault is masked 0x1: MultiHitFault event generates an interrupt if occurs	RW	0x0
3	TABLEWALKFAULT	Error response received during a Table Walk 0x0: TableWalkFault is masked 0x1: TableWalkFault event generates an interrupt if occurs	RW	0x0
2	EMUMISS	Unrecoverable TLB miss during debug (hardware TWL disabled) 0x0: EMUMiss interrupt is masked 0x1: EMUMiss event generates an interrupt when it occurs	RW	0x0
1	TRANSLATIONFAULT	Invalid descriptor in translation tables (translation fault) 0x0: TranslationFault is masked 0x1: TranslationFault event generates an interrupt if occurs	RW	0x0
0	TLBMISS	Unrecoverable TLB miss (hardware TWL disabled) 0x0: TLBMiss interrupt is masked 0x1: TLBMiss event generates an interrupt when if occurs	RW	0x0

Table 20-24. MMU_WALKING_ST

Address Offset	0x0000 0040		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register provides status information about the table walking logic		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															TWLRUNNING

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Reads return 0	R	0x0000 0000
0	TWLRUNNING	Table Walking Logic is running Read 0x0: TWL Completed Read 0x1: TWL Running	R	0x0

Table 20-25. MMU_CNTL

Address Offset	0x0000 0044		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register programs the MMU features		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												EMUTLBUPDATE	TWLENABLE	MMUENABLE	RESERVED

Bits	Field Name	Description	Type	Reset
31:4	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x0000000
3	EMUTLBUPDATE	Enable TLB update on emulator table walk 0x0: Emulator TLB update disabled 0x1: Emulator TLB update enabled	RW	0x0
2	TWLENABLE	Table Walking Logic enable 0x0: TWL disabled 0x1: TWL enabled	RW	0x0
1	MMUENABLE	MMU enable 0x0: MMU disabled 0x1: MMU enabled	RW	0x0
0	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x0

Table 20-26. MMU_FAULT_AD

Address Offset	0x0000 0048		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register contains the virtual address that generated the interrupt		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FAULTADDRESS																															

Bits	Field Name	Description	Type	Reset
31:0	FAULTADDRESS	Virtual address of the access that generated a fault	R	0x0000 0000

Table 20-27. MMU_TTB

Address Offset	0x0000 004C		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register contains the Translation Table Base address		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TTBADDRESS																								RESERVED							

Bits	Field Name	Description	Type	Reset
31:7	TTBADDRESS	Translation Table Base Address	RW	0x0000000
6:0	RESERVED	Write 0's for future compatibility. Reads retiurn 0	R	0x00

Table 20-28. MMU_LOCK

Address Offset	0x0000 0050		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register locks some of the TLB entries		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																BASEVALUE						RESERVED		CURRENTVICTIM						RESERVED			

Bits	Field Name	Description	Type	Reset
31:15	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x00000
14:10	BASEVALUE	Locked entries base value.	RW	0x00
9	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x0
8:4	CURRENTVICTIM	Current entry to be updated either by the TWL or by the software. Write value : TLB entry to be updated by software Read value : TLB entry that will be updated by table walk logic. This will be same as BASEVALUE when there are no tablewalks.	RW	0x00
3:0	RESERVED	Write 0's for future compatibility. Reads return 0	R	0x0

Table 20-29. MMU_LD_TLB

Address Offset	0x0000 0054		
Physical Address	See Section 20.5.2.1	**Instance**	See Table 20-15
Description	This register loads a TLB entry (CAM+RAM)		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Chapter 21

Spinlock

This chapter describes the Spinlock module of the device.

21.1 Spinlock Overview

The Spinlock module provides hardware assistance for synchronizing the processes running on multiple processors in the device:

- Cortex®-A15 microprocessor unit (MPU) subsystem
- Digital signal processor (DSP) subsystem – DSP1
- Dual Cortex-M4 image processing unit (IPU) subsystems – IPU1 and IPU2

The Spinlock module implements 256 spinlocks (or hardware semaphores), which provide an efficient way to perform a lock operation of a device resource using a single read-access, avoiding the need of a read-modify-write bus transfer that the programmable cores are not capable of.

Figure 21-1 shows an overview of the Spinlock module.

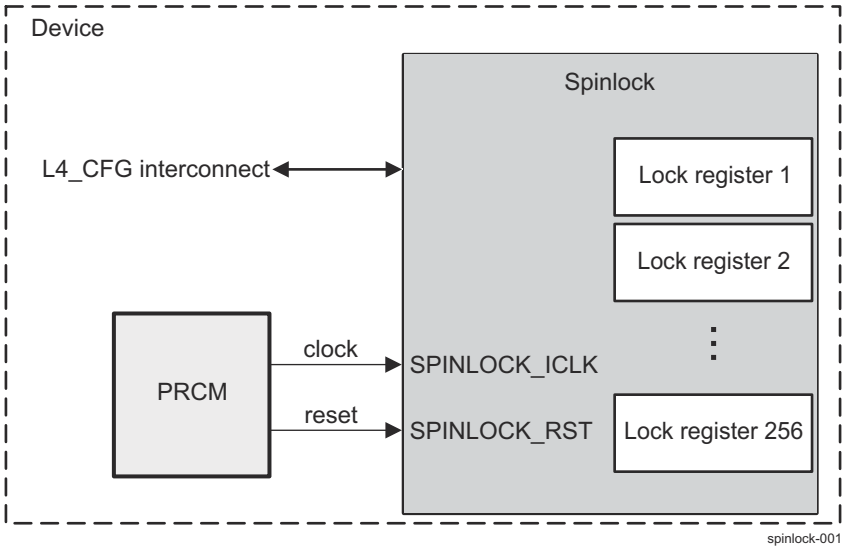

Figure 21-1. Spinlock Overview

21.2 Spinlock Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 21-2 shows the Spinlock integration.

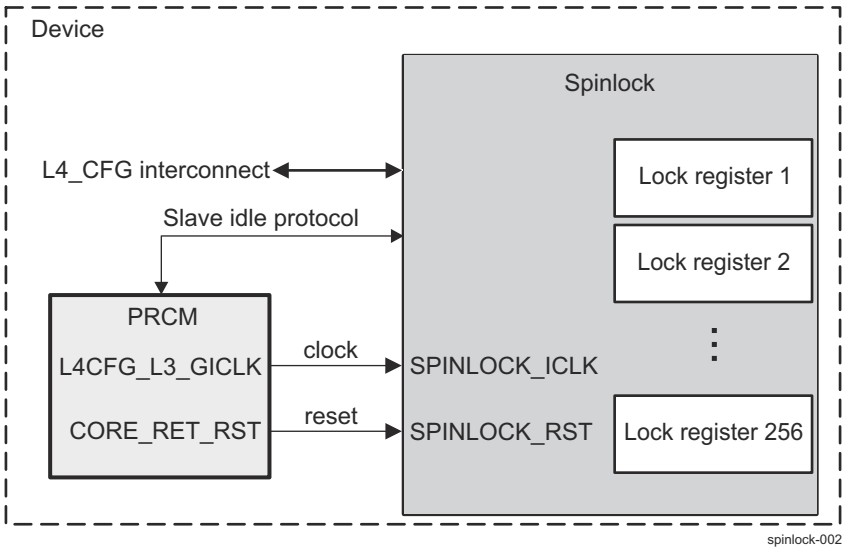

Figure 21-2. Spinlock Integration

Note

For more information about the Slave idle protocol and the wake-up request, see *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.

Table 21-1 and Table 21-2 summarize the integration of the module in the device.

Table 21-1. Spinlock Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
SPINLOCK	PD_COREAON	L4_CFG

Table 21-2. Spinlock Clocks and Resets

Clocks

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SPINLOCK	SPINLOCK_ICLK	L4CFG_L3_GICLK	PRCM	Spinlock interface/functional clock. This clock is used for all interface and functional operations.

Resets

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SPINLOCK	SPINLOCK_RST	CORE_RET_RST	PRCM	Spinlock hardware reset. This reset is asynchronously applied to the Spinlock internal registers.

Note

The Spinlock module does not support any interrupt and DMA requests.

21.3 Spinlock Functional Description

21.3.1 Spinlock Software Reset

The Spinlock module can be reset by software through the SPINLOCK_SYSCONFIG[1] SOFTRESET bit. Setting this bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. The SPINLOCK_SYSTATUS[0] RESETDONE bit can be polled to check the reset status (reading 1 indicates that reset sequence is done; reading 0 indicates that reset sequence is in progress). The software must ensure that the software reset completes before doing Spinlock operations.

21.3.2 Spinlock Power Management

Table 21-3 describes power-management features available to the Spinlock module.

Table 21-3. Spinlock Local Power Management Features

Feature	Registers	Description
Clock auto gating	SPINLOCK_SYSCONFIG[0] AUTOGATING bit	This bit indicates that the Spinlock module uses an automatic internal interface clock gating strategy, based on interface activity.
Global wake-up enable	SPINLOCK_SYSCONFIG[2] ENAWAKEUP bit	This bit indicates that the wake-up generation feature (at Spinlock module level) is disabled.
Slave idle modes	SPINLOCK_SYSCONFIG[4:3] SIDLEMODE bit field	This bit field indicates that the Spinlock module uses smart-idle mode.

Note

All Spinlock local power management features are non-configurable – that is, their respective bit fields are read-only and only show the actual hardware implementation.

For information about source clock gating and sleep/wake-up transitions description, see *Clock Domain-Level Clock Management*, in *Power, Reset, and Clock Management*. For descriptions of EnaWakeUp, and IdleMode features, see *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.

The Spinlock module is normally idle, except when processing a request from its slave interface port. The smart-idle mode acknowledges idle requests from the PRCM only when the module is prepared to go idle. The Spinlock module is always ready to go idle if it does not have any request that it is processing.

21.3.3 About Spinlocks

Spinlocks are present to solve the need for synchronization and mutual exclusion between heterogeneous processors and those not operating under a single, shared operating system. There is no alternative mechanism to accomplish these operations between processors in separate subsystems.

Spinlocks are not the best way to synchronize between tasks or threads on one CPU. Instead, spinlocks are for use in synchronization between different subsystems in the device that don't have any other means of hardware-based synchronization.

Spinlocks do not solve all system synchronization issues. They have limited applicability and should be used with care to implement higher level synchronization protocols.

A spinlock is appropriate for mutual exclusion for access to a shared data structure. It should be used only when:

1. The time to hold the lock is predictable and small (for example, a maximum hold time of less than 200 CPU cycles may be acceptable).
2. The locking task cannot be preempted, suspended, or interrupted while holding the lock (this would make the hold time large and unpredictable).
3. The lock is lightly contended, that is the chance of any other process (or processor) trying to acquire the lock while it is held is small.

If these conditions are met, then the locking code can retry a failed attempt to acquire the lock until success.

If the conditions are not met, then a spinlock is not a good candidate. One alternative is to use a spinlock for critical section control (engineered to meet the conditions) to implement a higher level semaphore that can support preemption, notification, timeout or other higher level properties.

21.3.4 Spinlock Functional Operation

The Spinlock module supports 256 spinlocks. It accepts only a single command at a time and processes the command fully before accepting the next command. A lock is requested by reading the SPINLOCK_LOCK_REG_i[0] TAKEN bit. There are two states: Taken (SPINLOCK_LOCK_REG_i[0] TAKEN = 1) or Not Taken (SPINLOCK_LOCK_REG_i[0] TAKEN = 0).

When the status of lock *i* (where i = 0 to 255) is Not Taken (free), a read from the SPINLOCK_LOCK_REG_i register returns 0 and sets the lock to Taken (locked). When the status of lock *i* is Taken, a read returns 1 and does not change the state of the lock.

A write to the SPINLOCK_LOCK_REG_i register does not change the state of lock, unless when writing 0 when the lock is in Taken state. By doing this, the requester frees the lock.

CAUTION

Only 32-bit reads and writes are supported.

Figure 21-3 shows the SPINLOCK_LOCK_REG_i register state diagram.

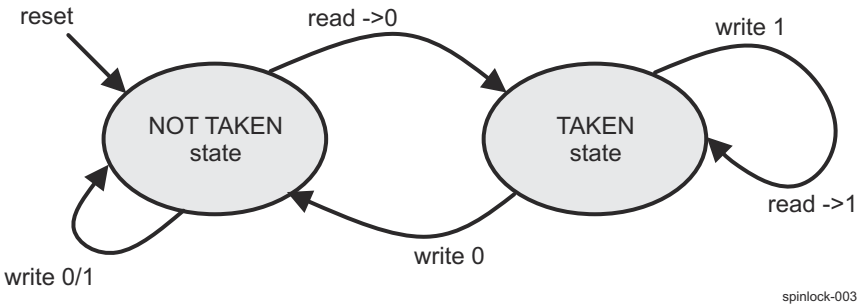

Figure 21-3. Lock Register State Diagram

Note

- There is no support to ensure that a lock register is locked and unlocked by the same process. This must be ensured in software.
- There is no support to check that the same initiator that acquired the lock is the one that is freeing the lock.

21.4 Spinlock Programming Guide

21.4.1 Spinlock Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the module.

21.4.1.1 Surrounding Modules Global Initialization

This procedure initializes the surrounding modules when the Spinlock module is used for the first time after a device reset.

Table 21-4. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Spinlock interface clock must be enabled. For more information, see *CD_L4_CFG Clock Domain*, in *Power, Reset, and Clock Management*.
Interconnect	For more information about the L4_CFG interconnect configuration, see *L4 Interconnects*.

21.4.1.2 Basic Spinlock Operations

The main spinlock operations are:

- Clear all the Taken spinlocks (only after a system bug recovery)
- Take a spinlock
- Release spinlock

21.4.1.2.1 Spinlocks Clearing After a System Bug Recovery

Module initialization (after reset) is not needed, except after system bug recovery. The following table presents the Spinlock initialization after a system bug recovery. Software should store 0 into each of the SPINLOCK_LOCK_REG_i registers at system startup to insure that all locks are initialized to Not Taken.

Table 21-5. Spinlock System Bug Recovery

Step	Register	Value
IF: SPINLOCK_SYSTATUS[0] IU0 = = 1?	SPINLOCK_SYSTATUS[0] IU0	
Free the 256 locks	SPINLOCK_LOCK_REG_i[0] TAKEN (i = 0 to 255)	0x0
END		

21.4.1.2.2 Take and Release Spinlock

This procedure configures the take and release (free) operations for the Spinlock module. A spinlock should only be held with interrupts disabled. So, before attempting to obtain the spinlock, software should disable interrupts. Then it should read the SPINLOCK_LOCK_REG_i[0] TAKEN bit to attempt to obtain the lock. If it succeeds, it should proceed directly through the critical section then unlock and re-enable interrupts. If the acquisition attempt fails, the acquisition should be reattempted. To prevent unknown interrupt disabled time, interrupts should be re-enabled and then disabled before reattempting to acquire the lock. Figure 21-4 shows the described above procedure.

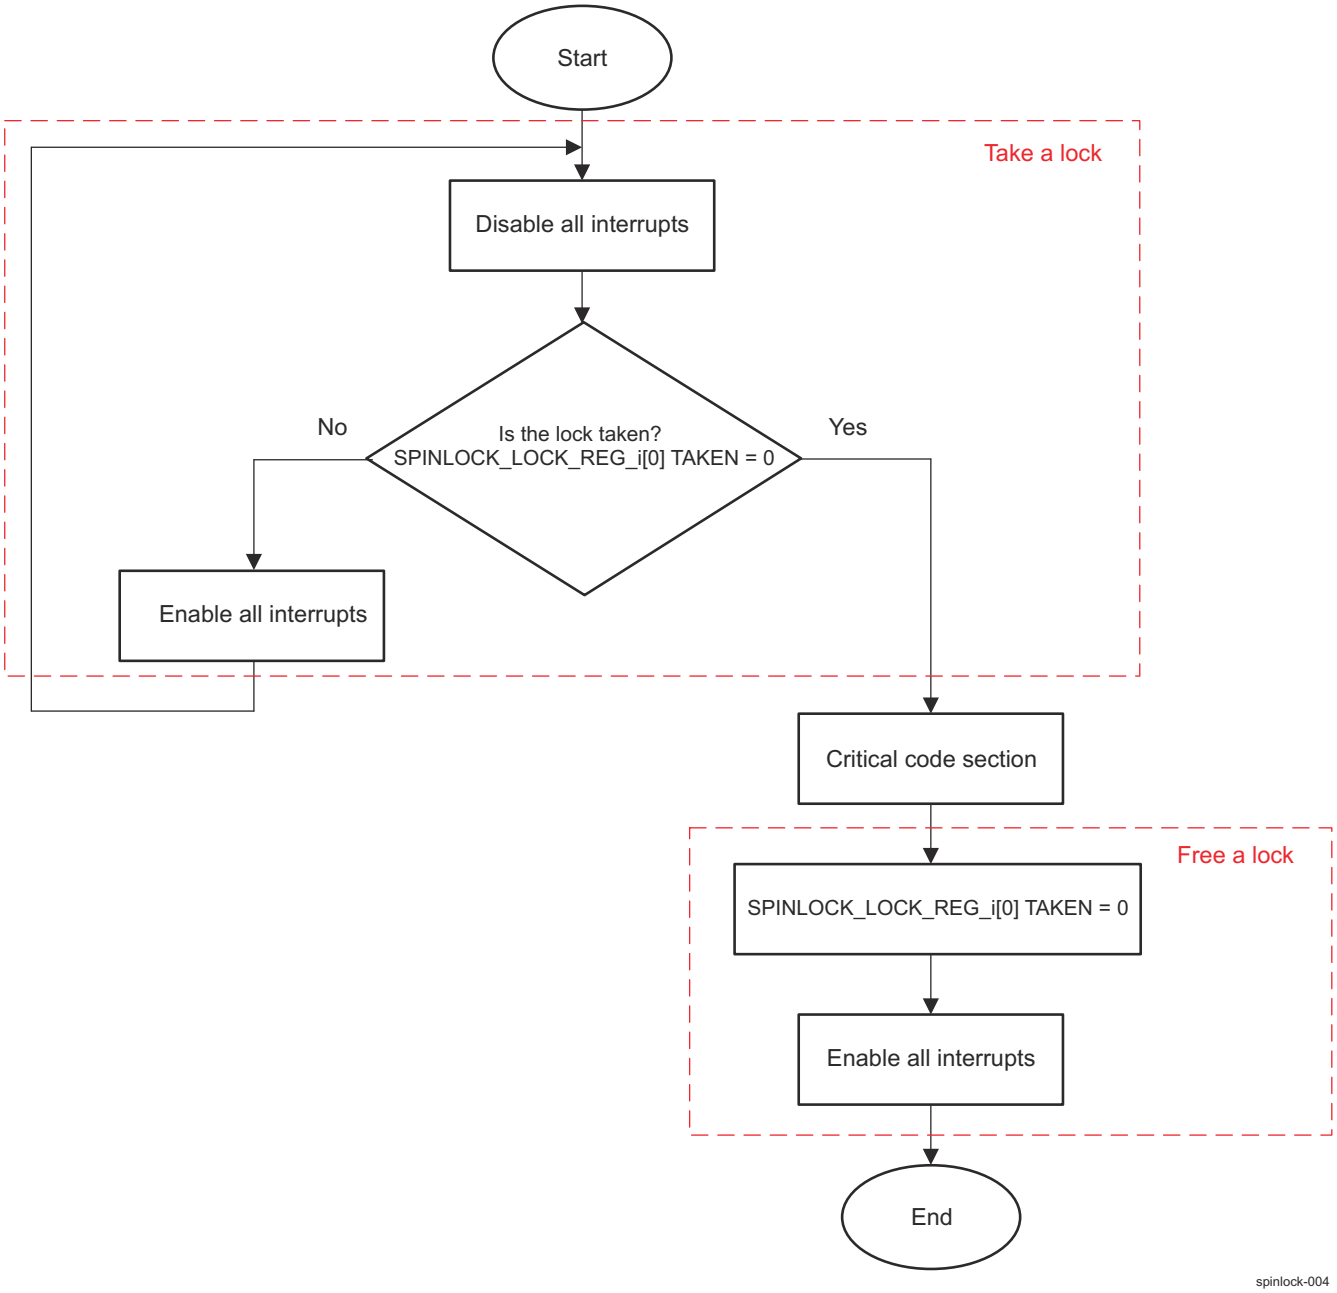

Figure 21-4. Take and Release Spinlock

Chapter 22

Timers

This chapter describes the timer modules for the device.

22.1 Timers Overview

The device includes several types of timers used by the system software, including 16 general-purpose (GP) timers, one watchdog timer, and a 32-kHz synchronized timer (COUNTER_32K). Figure 22-1 is a high-level block diagram of the device timers.

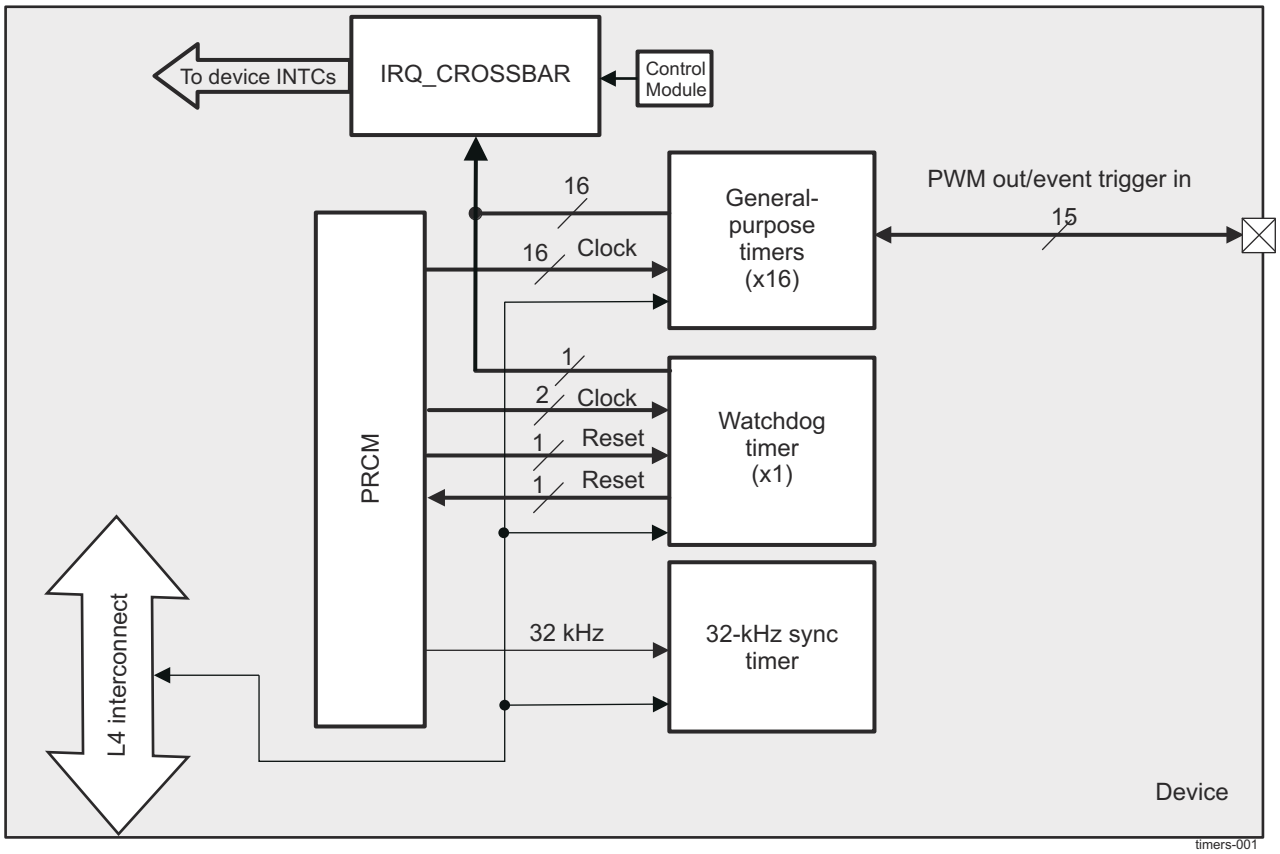

Figure 22-1. Timers Overview

The watchdog timer is clocked with 32-kHz clocks. The 32-kHz sync timer, which is reset only at power up, provides the operating system (OS) with a stable timing source that stores the relative time since the last power cycle of the product. The fifteen GP timers, which are useful as basic timers, are included to generate time-stamp-based interrupts to the system software or to use as a source of pulse-width modulation (PWM) signals.

22.2 General-Purpose Timers

22.2.1 General-Purpose Timers Overview

The device has 16 GP timers: TIMER1 through TIMER16.

- TIMER1(1ms tick): has its event capture pin tied to 32KHz clock and can be used to gauge the system clock input and detects its frequency among 19.2, 20, or 27 MHz. It includes specific functions to generate accurate tick interrupts to the operating system
- TIMER2 and TIMER10: (1ms tick timers): they include specific functions to generate accurate tick interrupts to the operating system

Each timer (except TIMER12) can be clocked from the system clock (19.2, 20, or 27 MHz) or the 32-kHz clock. The selection of clock source is made at the power, reset, and clock management (PRCM) module level. TIMER12 can be clocked only from the internal oscillator (on-die oscillator). For more information, see *PRM Clock Source*.

Each timer provides an interrupt via the device IRQ_CROSSBAR.

Each timer is connected to external pin by its PWM output or its event capture input pin (for external timer triggering). Figure 22-2 is an overview of the GP timers.

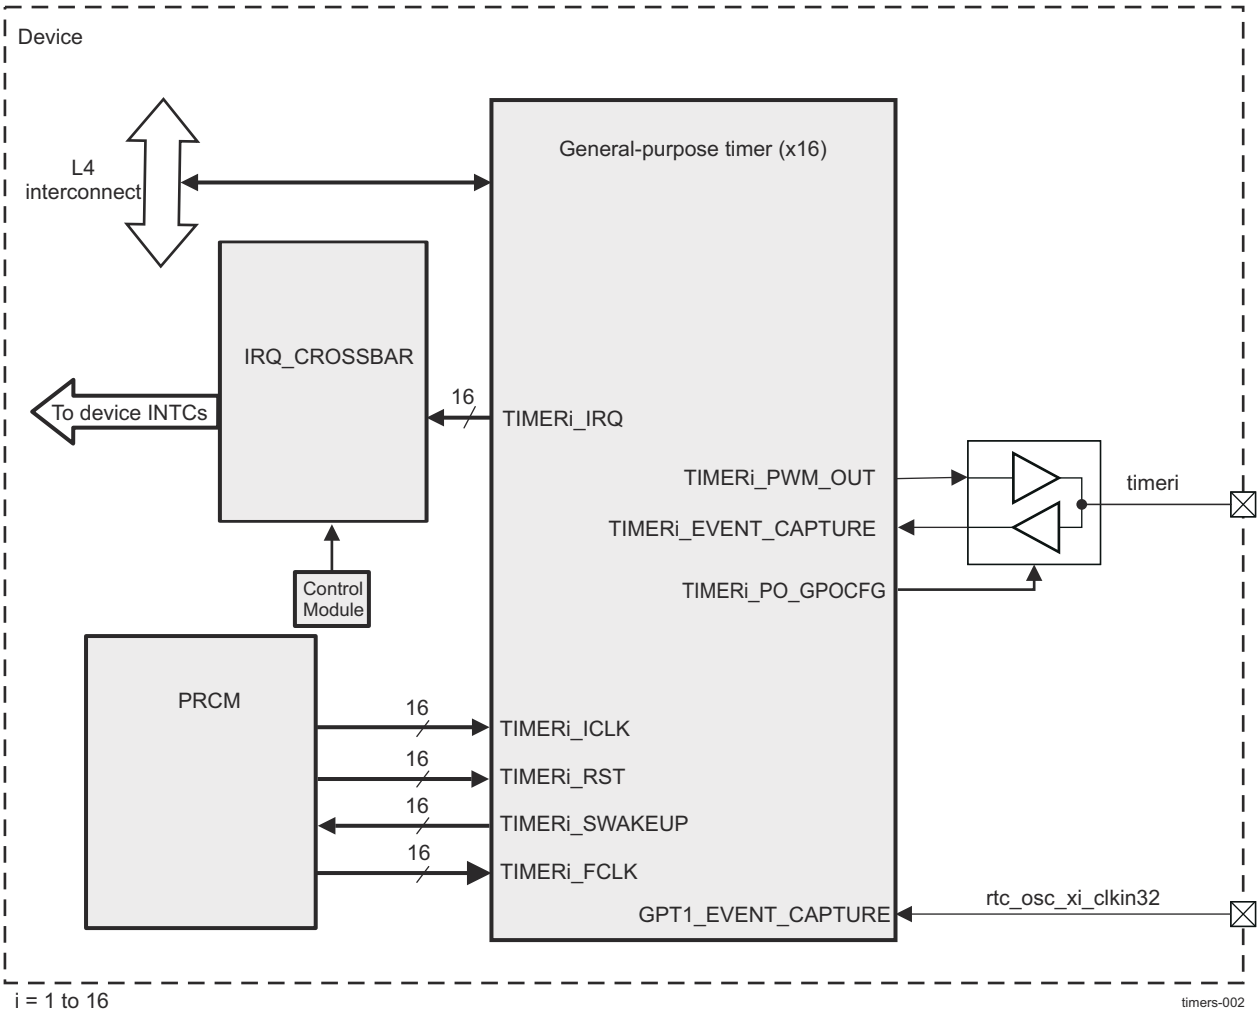

Figure 22-2. GP Timers Overview

Note

GPT1_EVENT_CAPTURE is not supported on the AM570x family of devices (rtc_osc_xi_clkin32 is not pinned out).

22.2.1.1 GP Timer Features

The following are the main features of the GP timer controllers:

- Level 4 (L4) slave interface support:
  - 32-bit data bus width
  - 32-/16-bit access supported
  - 8-bit access not supported
  - 10-bit address bus width
  - Burst mode not supported
  - Write nonposted transaction mode supported
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Compare and capture modes
- Autoreload mode
- Start/stop mode
- Programmable divider clock source (2^n, where n = [0:8])
- Dedicated input trigger for capture mode and dedicated output trigger/PWM signal
- Dedicated GP output signal for using the TIMERi_GPO_CFG signal
- On-the-fly read/write register (while counting)
- 1-ms tick with 32.768-Hz functional clock generated (only TIMER1, TIMER2, and TIMER10)

22.2.2 GP Timer Environment

22.2.2.1 GP Timer External System Interface

Each timer can send or receive stimulus to/from the external (off-chip) system. In the device all timers are configured to output a PWM pulse or receive an external event signal used as a trigger to capture the current timer count. TIMER1 is also configured to receive an event trigger input (GPT1_EVENT_CAPTURE) tied to the internal 32-kHz clock. This event signal gauges the system clock input, detecting its frequency among 19.2, 20, or 27 MHz.

Figure 22-3 shows the external system interface for the GP timers, and Table 22-1 describes the GP timer inputs and outputs.

Note

Software control must ensure that MUX mode is configured to select the timeri (where i = 1 to 16) signal on only one pad. Other pads on which the same signal is multiplexed must be configured in safe mode or non-dmtimer mode to avoid two different pads driving the same signal.

For more information about the configuration of the timeri I/O pads, see *Pad Configuration Registers*.

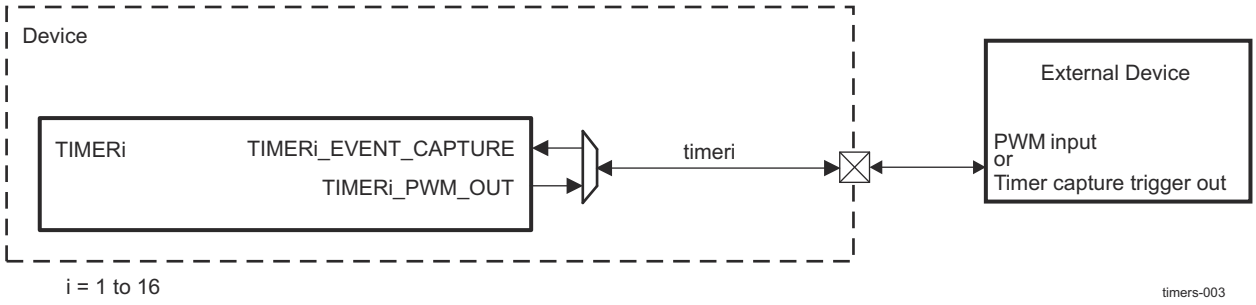

Figure 22-3. GP Timers External System Interface

Table 22-1. Input/Output Description

Pin Name	Type [1]	Reset Value	Signal Name	Description
timer1	I/O	0	TIMER1_PI_EVENT_CAPTURE TIMER1_PWM_OUT	TIMER1 trigger input/ PWM output
timer2	I/O	0	TIMER2_PI_EVENT_CAPTURE TIMER2_PWM_OUT	TIMER2 trigger input/ PWM output
timer3	I/O	0	TIMER3_PI_EVENT_CAPTURE TIMER3_PWM_OUT	TIMER3 trigger input/ PWM output
timer4	I/O	0	TIMER4_PI_EVENT_CAPTURE TIMER4_PWM_OUT	TIMER4 trigger input/ PWM output
timer5	I/O	0	TIMER5_PI_EVENT_CAPTURE TIMER5_PWM_OUT	TIMER5 trigger input/ PWM output
timer6	I/O	0	TIMER6_PI_EVENT_CAPTURE TIMER6_PWM_OUT	TIMER6 trigger input/ PWM output
timer7	I/O	0	TIMER7_PI_EVENT_CAPTURE TIMER7_PWM_OUT	TIMER7 trigger input/ PWM output
timer8	I/O	0	TIMER8_PI_EVENT_CAPTURE TIMER8_PWM_OUT	TIMER8 trigger input/ PWM output
timer9	I/O	0	TIMER9_PI_EVENT_CAPTURE TIMER9_PWM_OUT	TIMER9 trigger input/ PWM output
timer10	I/O	0	TIMER10_PI_EVENT_CAPTURE TIMER10_PWM_OUT	TIMER10 trigger input/ PWM output
timer11	I/O	0	TIMER11_PI_EVENT_CAPTURE TIMER11_PWM_OUT	TIMER11 trigger input/ PWM output

Table 22-1. Input/Output Description (continued)

Pin Name	Type (1)	Reset Value	Signal Name	Description
timer12	I/O	0	TIMER12_PI_EVENT_CAPTURE TIMER12_PWM_OUT	TIMER11 trigger input/ PWM output
timer13	I/O	0	TIMER13_PI_EVENT_CAPTURE TIMER13_PWM_OUT	TIMER13 trigger input/ PWM output
timer14	I/O	0	TIMER14_PI_EVENT_CAPTURE TIMER14_PWM_OUT	TIMER14 trigger input/ PWM output
timer15	I/O	0	TIMER15_PI_EVENT_CAPTURE TIMER15_PWM_OUT	TIMER15 trigger input/ PWM output
timer16	I/O	0	TIMER16_PI_EVENT_CAPTURE TIMER16_PWM_OUT	TIMER16 trigger input/ PWM output

(1) When configured for that function; I = Input, O = Output

Note

Each TIMERi_PO_GPOCFG signal is used to as an output enable to control the function of the TIMERi pin (where i = 1 to 16) as the PWM output (PO_GPOCFG =0) or capture input (PO_GPOCFG = 1).

22.2.3 GP Timer Integration

Figure 22-4 shows the integration of the GP timer in the device.

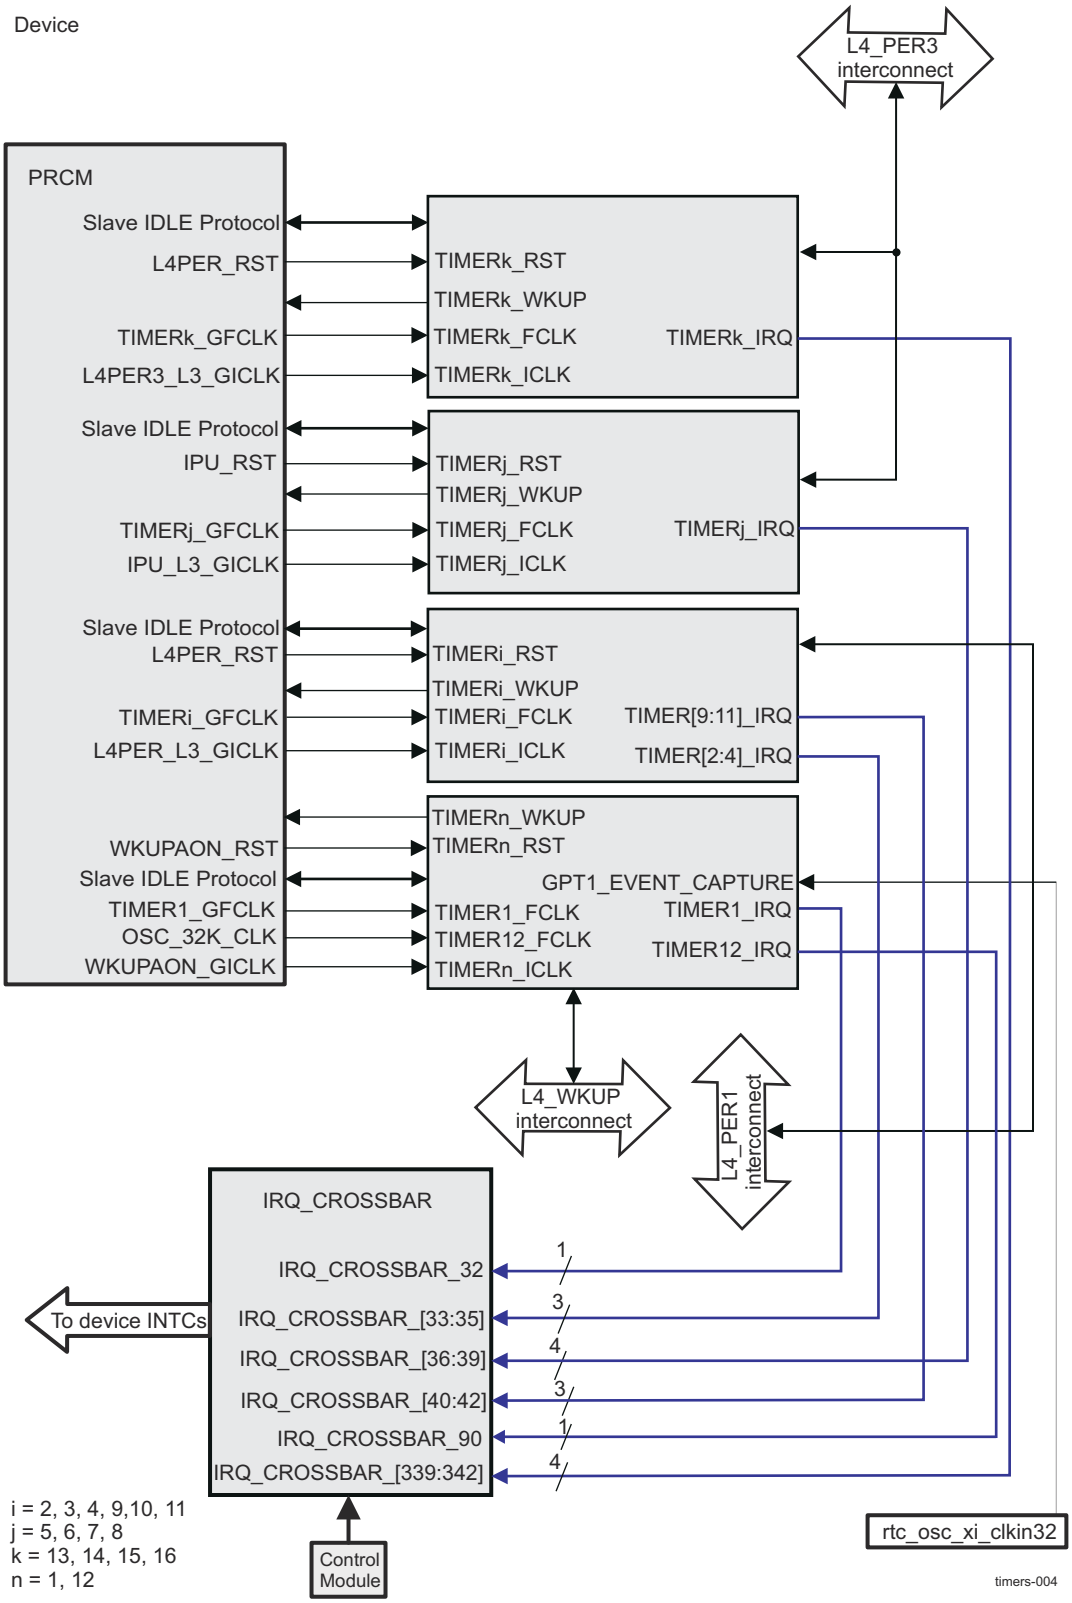

Figure 22-4. GP Timer Integration

Note

GPT1_EVENT_CAPTURE is not supported on the AM570x family of devices (rtc_osc_xi_clkin32 is not pinned out).

Table 22-2 through Table 22-4 summarize the integration of the module in the device.

Table 22-2. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
TIMER1	PD_WKUPAON	Yes	L4_WKUP
TIMER2	PD_COREAON	Yes	L4_PER1

TIMER12	TIMER12_IRQ	IRQ_CROSSBAR_90	MPU_IRQ_95	TIMER12 interrupt
TIMER13	TIMER13_IRQ	IRQ_CROSSBAR_339	-	TIMER13 interrupt. This IRQ source signal is not mapped by default to any device INTC
TIMER14	TIMER14_IRQ	IRQ_CROSSBAR_340	-	TIMER14 interrupt. This IRQ source signal is not mapped by default to any device INTC
TIMER15	TIMER15_IRQ	IRQ_CROSSBAR_341	-	TIMER15 interrupt. This IRQ source signal is not mapped by default to any device INTC
TIMER16	TIMER16_IRQ	IRQ_CROSSBAR_342	-	TIMER16 interrupt. This IRQ source signal is not mapped by default to any device INTC
No DMA Requests				

Note

The "**Default Mapping**" column in Table 22-4 *GP Timers Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.

Note

For the description of the interrupt source, see Section 22.2.4.5, *GP Timer Interrupt*.

22.2.4 GP Timer Functional Description

Each GP timer contains a free-running upward counter with autoreload capability on overflow. The timer counter can be read and written on-the-fly (while counting). Each GP timer includes compare logic to allow an interrupt event on a programmable counter matching value. A dedicated output signal can be pulsed or toggled on either an overflow or a match event. This offers time-stamp trigger signaling or PWM signal sources. A dedicated input signal can be used to trigger an automatic timer counter capture or an interrupt event on a programmable input signal transition. A programmable clock divider (prescaler) allows reduction of the timer input clock frequency. All internal timer interrupt sources are merged into one module interrupt line and one wake-up line.

Each internal interrupt source can be independently enabled and disabled by a dedicated bit in the IRQSTATUS_SET and IRQSTATUS_CLR register for the interrupt features, and a dedicated bit of the IRQWAKEEN register for the wake-up of TIMER1, TIMER2, and TIMER10. In addition, these timers have a mechanism implemented to generate an accurate tick interrupt.

For all other internal interrupt source can be independently enabled and disabled through the IRQENABLE_SET and IRQENABLE_CLR registers.

For each GP timer implemented in the device, there are two possible clock sources:

- 32-kHz clock
- System clock

Selection of the input clock source is done in the registers in the PRCM configuration (see Section 22.2.1, *GP Timer Overview*).

Each GP timer supports three functional modes:

- Timer mode
- Capture mode
- Compare mode

The capture and compare modes are disabled by default after core reset.

22.2.4.1 GP Timer Block Diagram

Figure 22-5 is a block diagram of the common GP timers, and Figure 22-6 is a block diagram of the GP timers with a 1-ms tick generation module.

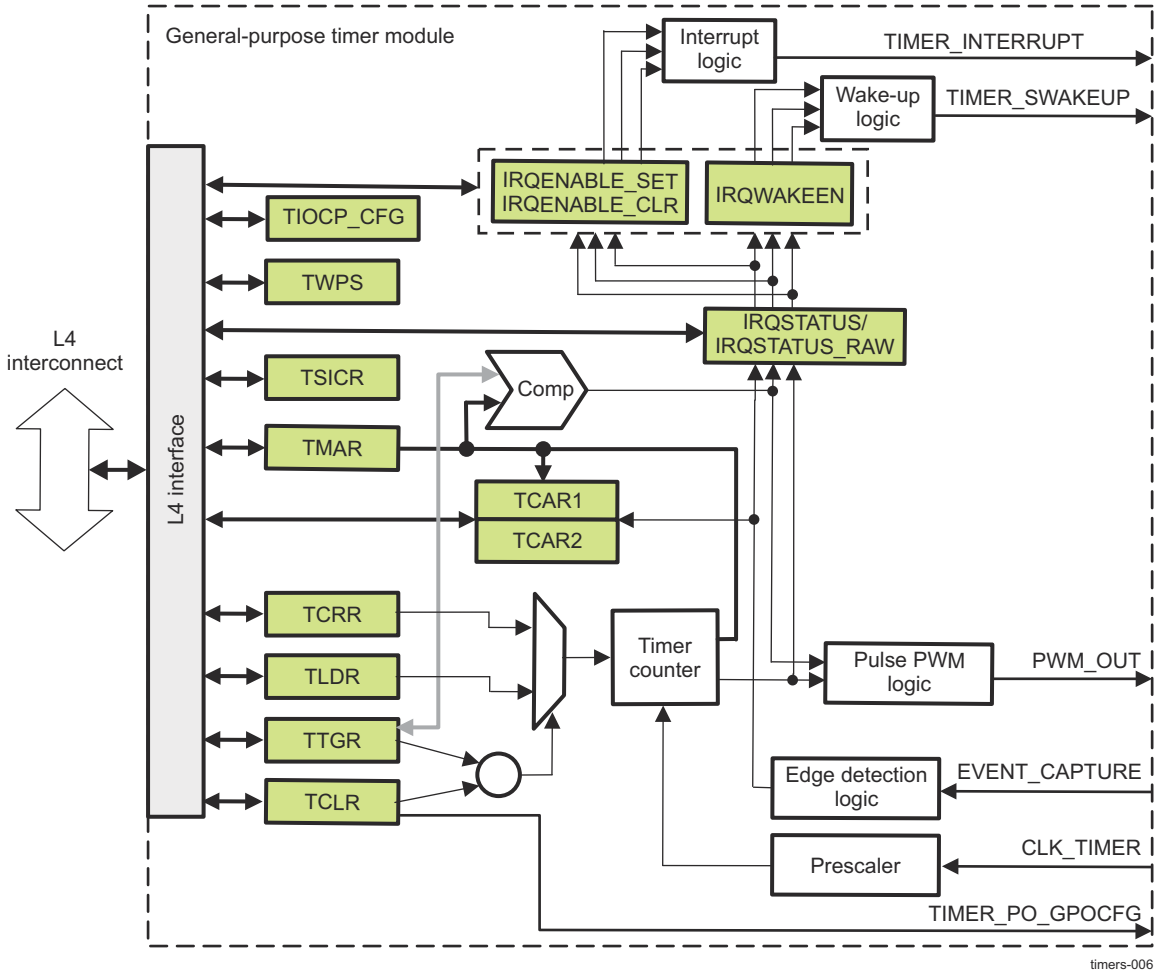

Figure 22-5. Block Diagram of TIMER3 Through TIMER9 and TIMER11 Through TIMER16

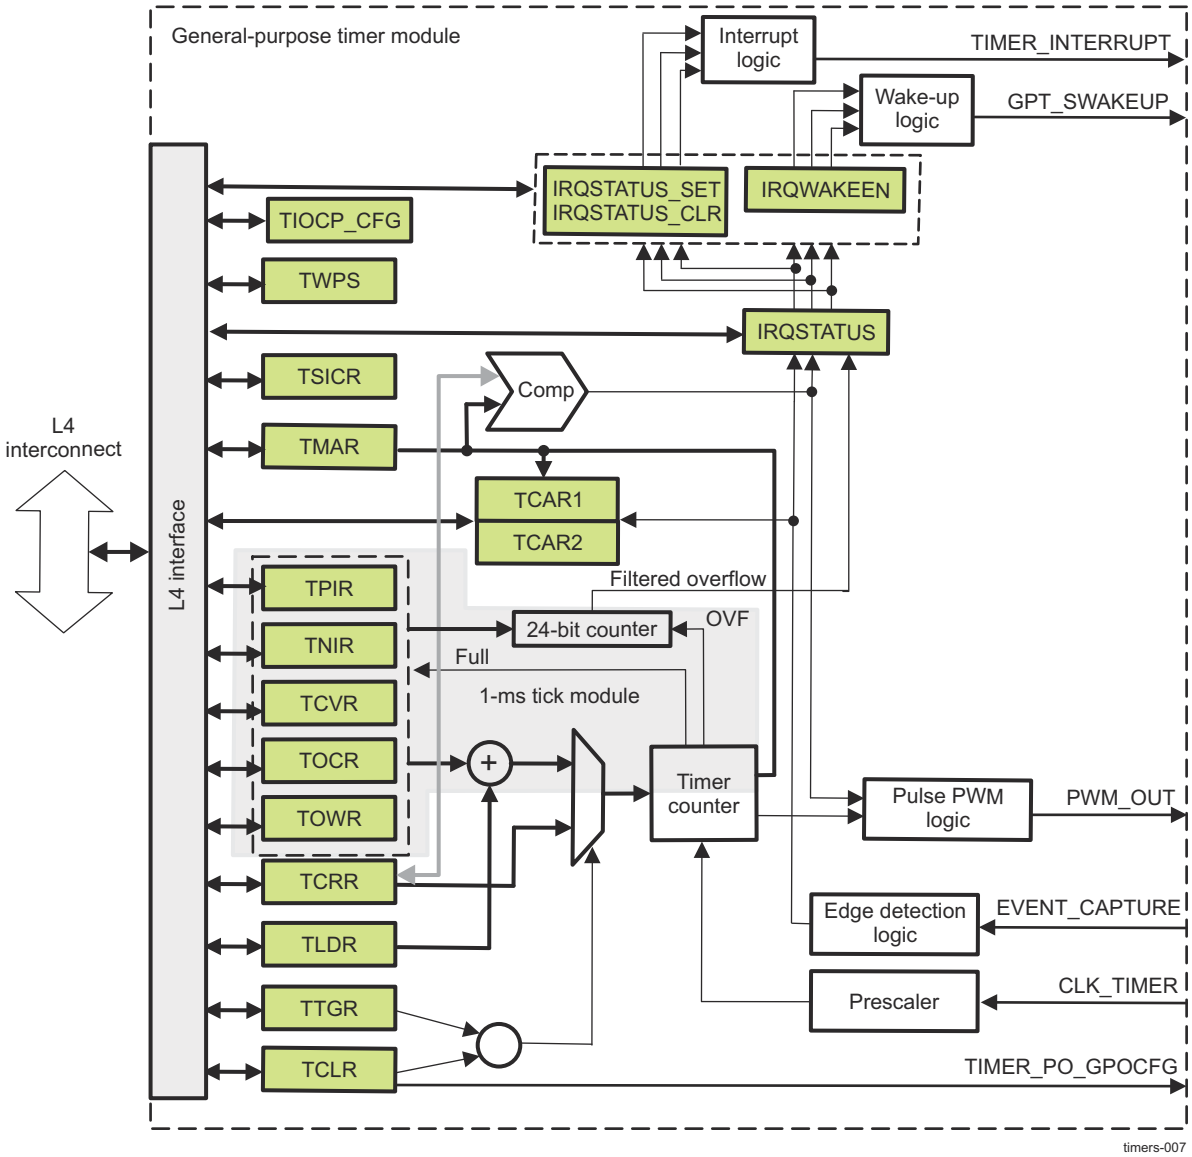

Figure 22-6. Block Diagram of TIMER1, TIMER2 and TIMER10

22.2.4.2 TIMER1, TIMER2 and TIMER10 Power Management

At the PRCM module level, when all conditions to shut off the functional or interface output clocks in the PRCM module are met (see *Clock Domain-Level Clock Management*), the PRCM module automatically launches a hardware handshake protocol to ensure the GP timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the GP timer.

Although this handshake is a hardware function and is out of software control, the way the GP timer acknowledges the PRCM IDLE request is configurable through the TIOCP_CFG[3:2] IDLEMODE bit field.

Table 22-5 lists the IDLEMODE settings and the related acknowledgment modes.

Table 22-5. IDLEMODE Settings

IDLEMODE Value	Selected Mode	Description
00	Force-idle	The GP timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent the loss of data when the clock is switched off.
01	No-idle	The GP timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, because it does not allow the PRCM output clock to be shut off, and thus the power domain to be set to a lower power state.
10	Smart-idle	The GP timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach to efficient system power management.
11	Smart-idleWakeup	The module behaves like in Smart-idle mode, with the exception, that it can issue a wake-up request in sleep mode, if the functional clock is not cut off.

22.2.4.2.1 Wake-Up Capability

If the TIOCP_CFG[3:2] IDLEMODE bit field sets the smart-idle mode or smart-idle with wakeup mode, the timer evaluates its internal capability to have the interface clock switched off. When there is no further internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters sleep mode, ready to issue a wake-up request if is configured in smart-idle with wakeup mode.

Figure 22-7 shows the wake-up request generation. For more information about the GP timer clock control, *Clock Management Functional Description*, in *Power, Reset, and Clock Management*.

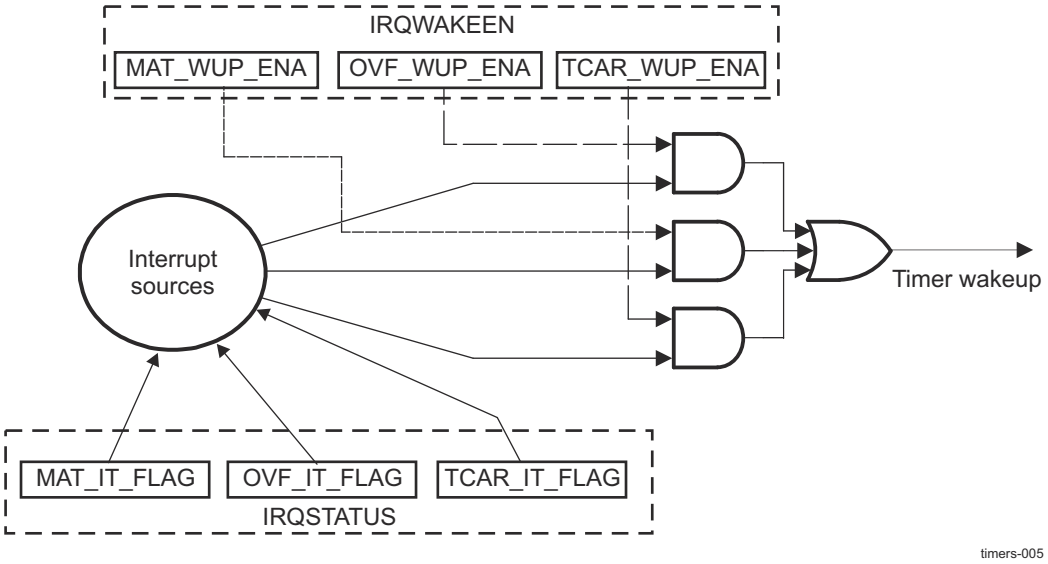

Figure 22-7. Wake-Up Request Generation

For TIMER1, TIMER2 and TIMER10, the timer wake-up-enable register allows masking of the expected source of the wake-up event that generates a wake-up request. The register is synchronously programmed with the interface clock before the PRCM module sends an idle mode request. The expected source of the wake-up event is an overflow (TCRR), a timer match (the compare result of TCRR and TMAR matches the counter value), and a timer capture (detection of an external pulse transition of the correct polarity on the TIMER_EVENT_CAPTURE).

When the wake-up event is issued, the associated interrupt status bit is set in the timer status register (IRQSTATUS). The pending wake-up event is reset when the set status bit is overwritten with 1.

Note

The status bit must be reset to re-enter idle mode.

22.2.4.3 Power Management of Other GP Timers

At the PRCM module level, when all conditions to shut off the functional or interface output clocks of the PRCM module are met (see *Clock Domain-Level Clock Management*), the PRCM module automatically launches a hardware handshake protocol to ensure the GP timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the GP timer.

Although this handshake is a hardware function and is out of software control, the way the GP timer acknowledges the PRCM IDLE request is configurable through the TIOCP_CFG[3:2] IDLEMODE bit field.

Table 22-6 lists the IDLEMODE settings and the related acknowledgment modes.

Table 22-6. IDLEMODE Settings

IDLEMODE Value	Selected Mode	Description
00	Force-idle	The GP timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent the loss of data when the clock is switched off.
01	No-idle	The GP timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, however, because it does not allow the PRCM output clock to be shut off and thus the power domain to be set to a lower power state.
10	Smart-idle	The GP timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach to efficient system power management.
11	Smart-idleWakeup	The module behaves like in Smart-idle mode, with the exception, that it can issue a wake-up request in sleep mode, if the functional clock is not cut off.

22.2.4.3.1 Wake-Up Capability

If the TIOCP_CFG[3:2] IDLEMODE bit field sets the smart-idle mode or smart-idle with wakeup mode, the timer evaluates its internal capability to have the interface clock switched off. When there is no further internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters sleep mode, ready to issue a wake-up request if is configured in smart-idle with wakeup mode. This wake-up request is sent only if the IRQWAKEEN[2:0] bit field enables the timer wake-up capability.

Figure 22-8 shows the wake-up request generation. For more information about the GP timer clock control, see *Clock Management Functional Description*, in *Power, Reset, and Clock Management*.

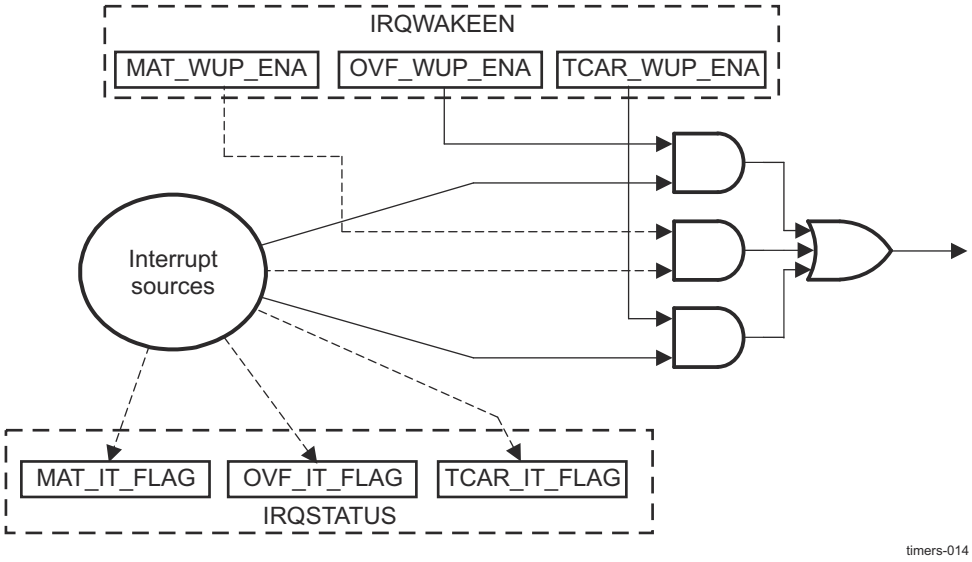

Figure 22-8. Wake-Up Request Generation

When the wake-up event is issued, the associated interrupt status bit is set in the timer status register (IRQSTATUS). The pending wake-up event is reset when the set status bit is overwritten with 1.

Note

The status bit must be reset to re-enter idle mode.

22.2.4.4 Software Reset

Two bits can generate a software reset of the GP timer:

- TIOCP_CFG[0] SOFTRESET
- TSICR[1] SFT

For both bits, all read accesses return 0.

The TIOCP_CFG[0] SOFTRESET bit allows resetting of the functional and interface domains. The TSICR[1] SFT bit allows resetting the functional part of the GP timer.

Before accessing or using the GP timer, the local host must ensure that both internal resets are released by reading the TIOCP_CFG[0] SOFTRESET bit. This bit monitors the internal reset status.

22.2.4.5 GP Timer Interrupts

The timer can issue an overflow interrupt, a timer match interrupt, and a timer capture interrupt. Each internal interrupt source can be independently enabled and disabled in the interrupt-enable register (IRQSTATUS_SET for TIMER1/2/10 and IRQENABLE_SET for other timers) and disabled in the interrupt-disable register (IRQSTATUS_CLR for TIMER1/2/10 and IRQENABLE_CLR for other timers). When the interrupt event is issued, the associated interrupt status bit is set in the timer status register (IRQSTATUS).

22.2.4.6 Timer Mode Functionality

The timer is an upward counter that can be started and stopped at any time through the timer control register (the TCLR[0] ST bit). The timer counter register (TCRR) can be loaded when stopped or on-the-fly (while counting). TCRR can be loaded directly by a TCRR write access with a new timer value. TCRR can also be loaded with the value held in the timer load register (TLDR) by a trigger register (TTGR) write access. The loading of TCRR is done regardless of the written value of TTGR. The value of TCRR can be read when stopped or captured on-the-fly by a TCRR read access. The timer is stopped and the counter value is set to 0 when the module reset is asserted. The timer is maintained at stop after the reset is released.

In one-shot mode (the TCLR[1] AR bit is set to 0), the counter is stopped after counting overflow occurs (the counter value remains at 0).

When the autoreload mode is enabled (the TCLR[1] AR bit is set to 1), TCRR is reloaded with the value of TLDR after a counting overflow occurs.

CAUTION

Do not put the overflow value (0xFFFF FFFF) in the TLDR register because it can lead to undesirable results.

An interrupt can be issued on overflow if the overflow interrupt-enable bit is set in the timer interrupt-enable register (the IRQSTATUS_SET[1] OVF_EN_FLAG bit is set to 1 for TIMER1/2/10 and the IRQENABLE_SET[1]OVF_EN_FLAG bit is set to 1 for other timers). A dedicated output pin (timer PWM) can be programmed in the TCLR[12] PT bit through the TCLR[11:10] (PT and TRG bits) to generate one positive pulse (prescaler duration) or to invert the current value (toggle mode) when an overflow occurs. The TCLR[12] PT bit selects pulse/toggle modulation (the TCLR[11:10] TRG bit field selects trigger mode).

Figure 22-9 shows the TCRR timing value.

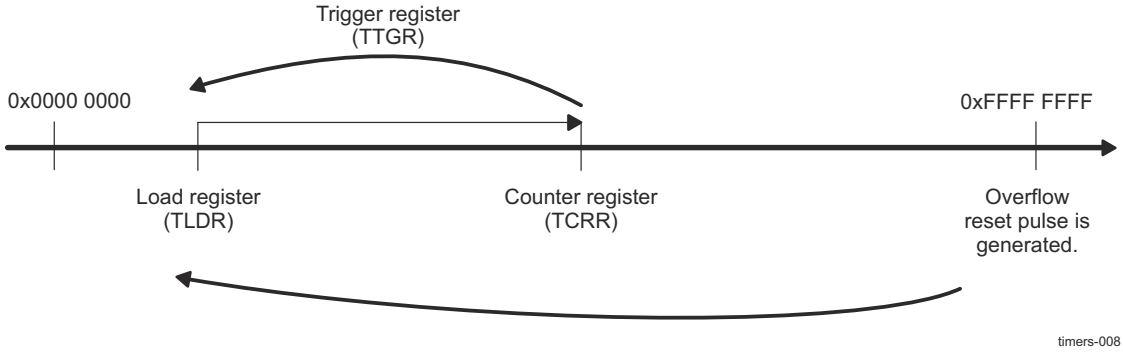

Figure 22-9. TCRR Timing Value

22.2.4.6.1 1-ms Tick Generation (Only TIMER1, TIMER2 and TIMER10)

The interrupt period is not exactly 1 ms, because the timer input clock is 32.768 Hz. If the clock counts up to 32, it obtains a 0.977-ms period; if it counts up to 33, it obtains a 1.007-ms period. For large granularity, the error is cumulative and can generate important deviations from the standard value.

To minimize the error between a true 1-ms tick and the tick generated by the 32.768-Hz timer, the sequencing of periods less than 1 ms and periods greater than 1 ms must be shuffled. An additional 1-ms block is used to correct this error. See Figure 22-10.

In this implementation, the increment sequencing is automatically managed by the timer to minimize the error. The user must define only the value of the timer positive increment register (the TPIR[31:0] POSITIVE_INC_VALUE bit field) and the timer negative increment register (the TNIR[31:0] NEGATIVE_INC_VALUE bit field). An automatic adaptation mechanism is used to simplify the programming model.

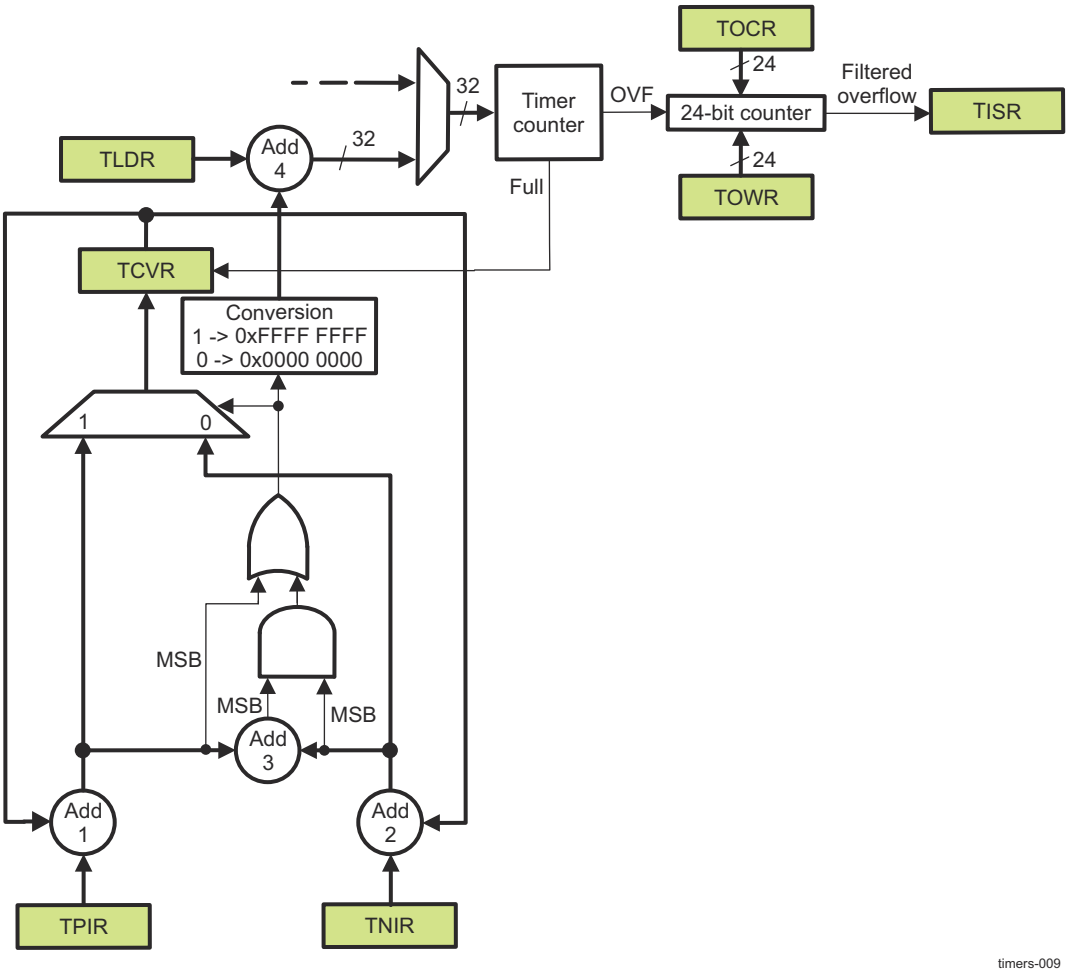

Figure 22-10. Block Diagram of the 1-ms Tick Module

The TPIR, TNIR, and TCVR registers and adders Add1, Add2, and Add3 are used to define whether the next value loaded in the timer counter register (the TCRR[31:0] TIMER_COUNTER bit field) is the value of the TLDR[31:0] LOAD_VALUE bit field (period less than 1 ms) or the value of TLDR[31:0] LOAD_VALUE –1 (period greater than 1 ms).

Table 22-7 lists the value loaded in the TCRR according to the sign of the result of Add1, Add2, and Add3.

MSB = 0: Positive value; MSB = 1: Negative value

Table 22-7. Value Loaded in TCRR to Generate 1-ms Tick

Add1 MSB	Add2 MSB	Add3 MSB	Value of TCRR Register
0	0	0	TLDR[31:0] LOAD_VALUE bit field
0	0	1	TLDR[31:0] LOAD_VALUE bit field
0	1	0	TLDR[31:0] LOAD_VALUE bit field
0	1	1	TLDR[31:0] LOAD_VALUE –1
1	0	0	N/A
1	0	1	N/A
1	1	0	TLDR[31:0] LOAD_VALUE –1
1	1	1	TLDR[31:0] LOAD_VALUE –1

The values of the TPIR and TNIR registers are calculated using the following formulas:

- Positive increment value = ((INTEGER[F_{clk} × T_{tick}] + 1) × 1e6) – (F_{clk} × T_{tick} × 1e6)
- Negative increment value = (INTEGER[F_{clk} × T_{tick}] × 1e6) – (F_{clk} × T_{tick} × 1e6)

Note

F_{clk} clock frequency (kHz)

T_{tick} tick period (ms)

The timer overflow counter register (TOCR) and the timer overflow wrapping register (TOWR) are used to filter interrupts. When the timer overflows, it increments the 24-bit TOCR. When the values in the 24-bit TOCR match the values in the 24-bit TOWR and the timer overflow is asserted, the TOCR is reset and an interrupt is generated to the IRQSTATUS register.

Note

TOWR has to be set to requested value. For example, if no interrupt needs to be masked TOWR must be set ot 0, if one interrupt needs to TOWR must be set to 1, if two interrupt need to be masked TOWR must be set to 2 and so on.

It is important to have in mind that the case when FFFFFF interrupt need to be masked is not possible.

With the conversion block in reset state (the positive increment register, negative increment register, and counter value register are zeroed), the programming model and the behavior of TIMER1, TIMER2, and TIMER10 remain unchanged.

For 1-ms tick with a 32.768-Hz clock:

- TPIR[31:0] POSITIVE_INC_VALUE = 232,000
- TNIR[31:0] NEGATIVE_INC_VALUE = –768,000
- TLDR[31:0] LOAD_VALUE = 0xFFFF FFE0

Note

Any value of the tick period can be generated with the appropriate value of the TPIR, TNIR, and TLDR.

By default, the TPIR, TNIR, TCVR, TOCR, and TOWR and the associated logic are in reset mode (all 0s) and have no effect on the programming model.

22.2.4.7 Capture Mode Functionality

When a transition is detected on the module input pin (EVENT_CAPTURE), the timer value in the TCRR can be captured and saved in the TCAR1 or TCAR2 register function of the mode selected in the TCLR[13] CAPT_MODE bit. The edge detection circuitry monitors transitions on the input pin (EVENT_CAPTURE).

The rising edge, falling edge, or both, can be selected in the TCLR[9:8] TCM bit field to trigger the timer counter capture. The module sets the IRQSTATUS[2] TCAR_IT_FLAG bit when an active edge is detected, and at the same time, the counter value TCRR is stored in timer capture register TCAR1 or TCAR2, as follows:

- If the TCLR[13] CAPT_MODE bit is 0, on the first enabled capture event, the value of the counter register is saved in the TCAR1 register, and the next events are ignored (no update on the TCAR1 register and no interrupt triggering) until the detection logic is reset or the IRQSTATUS[2] TCAR_IT_FLAG is cleared by writing 1 to it.
- If the TCLR[13] CAPT_MODE bit is 1, on the first enabled capture event, the value of the counter register is saved in the TCAR1 register, and on the second enabled capture event, the value of the counter register is saved in the TCAR2 register. If a capture interrupt is enabled, the interrupt triggers on the second event capture. All other events are ignored (no update on TCAR1/TCAR2 and no interrupt triggering) until the

detection logic is reset or the IRQSTATUS[2] TCAR_IT_FLAG bit is cleared by writing 1 to it. This mechanism is useful for period calculation of a clock, if that clock is connected to the EVENT_CAPTURE input pin.

The edge detection logic is reset (a new capture is enabled) when the active capture interrupt is served. The IRQSTATUS[2] TCAR_IT_FLAG bit is cleared by writing 1 to it or when the edge detection mode bits (the TCLR[9:8] TCM bit field) are changed from no-capture mode detection to any other mode. The timer functional clock (input to prescaler) is used to sample the input pin (EVENT_CAPTURE). A negative or positive pulse input can be detected when the pulse time is greater than the functional clock period. An interrupt is issued on edge detection if the capture interrupt-enable bit is set in the IRQSTATUS_SET[2] TCAR_EN_FLAG bit (for TIMER1/2/10) or in the IRQENABLE_SET[2] TCAR_EN_FLAG bit (for other timers). See the examples in Figure 22-11 and Figure 22-12.

In Figure 22-11, the value of the TCLR[9:8] TCM bit field is 0b01, and the TCLR[13] CAPT_MODE bit is 0. Only the rising edge of EVENT_CAPTURE triggers a capture in the TCAR1 and TCAR2 registers, and only the TCAR1 register updates.

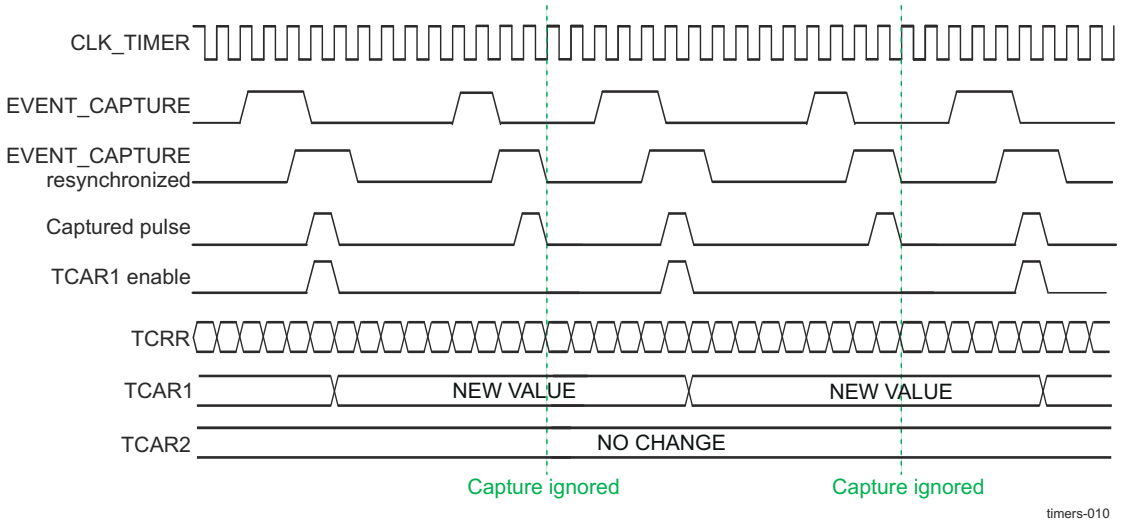

Figure 22-11. Capture Wave Example for TCLR[13] CAPT_MODE = 0

In Figure 22-12, the value of the TCLR[9:8] TCM bit field is 0b01, and the TCLR[13] CAPT_MODE bit is 1. Only the rising edge of EVENT_CAPTURE triggers a capture in the TCAR1 register on the first enabled event, and the TCAR2 register updates on the second enabled event.

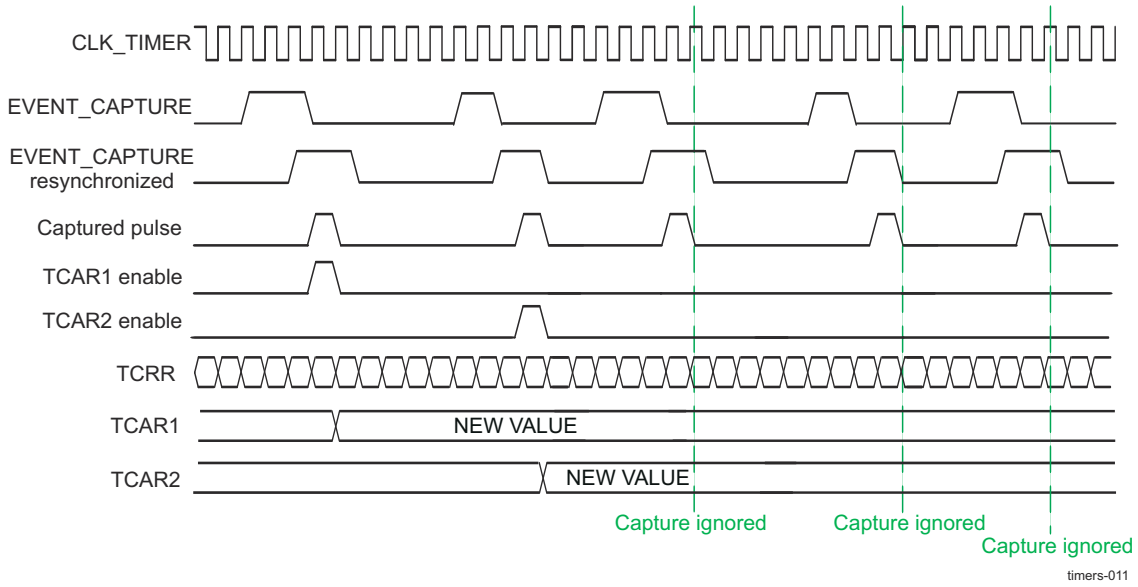

Figure 22-12. Capture Wave Example for TCLR[13] CAPT_MODE = 1

22.2.4.8 Compare Mode Functionality

When the compare-enable register TCLR[6] CE bit is set to 1, the timer value (the TCRR[31:0] TIMER_COUNTER bit field) is continuously compared to the value held in the timer match register (TMAR). The value of the TMAR[31:0] COMPARE_VALUE bit field can be loaded at any time (timer counting or stopped). When the TCRR and the TMAR values match, an interrupt is issued, if the IRQSTATUS_SET[0] MAT_EN_FLAG bit (for TIMER1, TIMER2, and TIMER10), or the IRQENABLE_SET[0] MAT_EN_FLAG bit (for other timers) is set.

To prevent any unwanted interrupts due to reset value matching effect, write a compare value to the TMAR before setting the TCLR[6] CE bit.

The dedicated output pin (timer PWM) can be programmed in the TCLR[12] PT bit through the TCLR[11:10] TRG bit field to generate one positive pulse (timer clock duration) or to invert the current value (toggle mode) when an overflow or a match occurs.

22.2.4.9 Prescaler Functionality

A prescaler can be used to divide the timer counter input clock frequency. The prescaler is enabled when the TCLR[5] PRE bit is set. The TCLR[4:2] PTV bit field sets the 2^n division ratio (prescaler value is $2^{(PTV + 1)}$. The prescaler counter is reset when the timer counter is stopped or reloaded on-the-fly.

Table 22-8 lists the prescaler/timer reload values versus contexts.

Table 22-8. Prescaler/Timer Reload Values Versus Contexts

Context	Prescaler	Timer Counter
Overflow (when autoreload is on)	Reset	TLDR[31:0]
TCRR write	Reset	TCRR[31:0]
TTGR write	Reset	TLDR[31:0]
Stop	Reset	Frozen

22.2.4.10 Pulse-Width Modulation

The timer can be configured to provide a programmable PWM output. The timer PWM output pin can be configured to toggle on an event. The TCLR[11:10] TRG bit field determines on which register value the PWM pin toggles. Either overflow or both overflow and match can be selected to toggle the timer PWM pin when a compare condition occurs.

Note

In toggle mode, when TCLR[11:10] TRG = 0x2 (overflow and match), the first event that toggles the PWM line is an overflow event. If a match event occurs first, it does not toggle the PWM line (see Figure 22-14).

The TCLR[7] SCPWM bit can be programmed to set or clear the timer PWM output signal only while the counter is stopped or the trigger is off. This allows setting the output pin to a known state before modulation starts. Modulation synchronously stops when the TCLR[11:10] TRG bit field is cleared and overflow occurs. This allows fixing a deterministic state of the output pin when modulation stops.

In Figure 22-13, the internal overflow pulse is set each time the (0xFFFF FFFF – TLDR[31:0] LOAD_VALUE + 1) value is reached, and the internal match pulse is set when the counter reaches the value of TMAR. Depending on the value of the TCLR[12] PT bit and TCLR[11:10] TRG bit field, the timer provides pulse or PWM event on the output pin (timer PWM).

The TLDR and TMAR must keep values below the overflow value (0xFFFF FFFF) by at least two units. If the PWM trigger events are both overflow and match, the difference between the values kept in the TMAR and the value in the TLDR must be at least two units. When match event is used, the compare mode TCLR[6] CE bit must be set.

In Figure 22-13, the TCLR[7] SCPWM bit is set to 0. In Figure 22-14, the TCLR[7] SCPWM bit is set to 1. To obtain the desired wave form, start the counter at 0xFFFF FFFE value (to ensure an overflow first) or adjust the line polarity (TCLR[7] SCPWM bit).

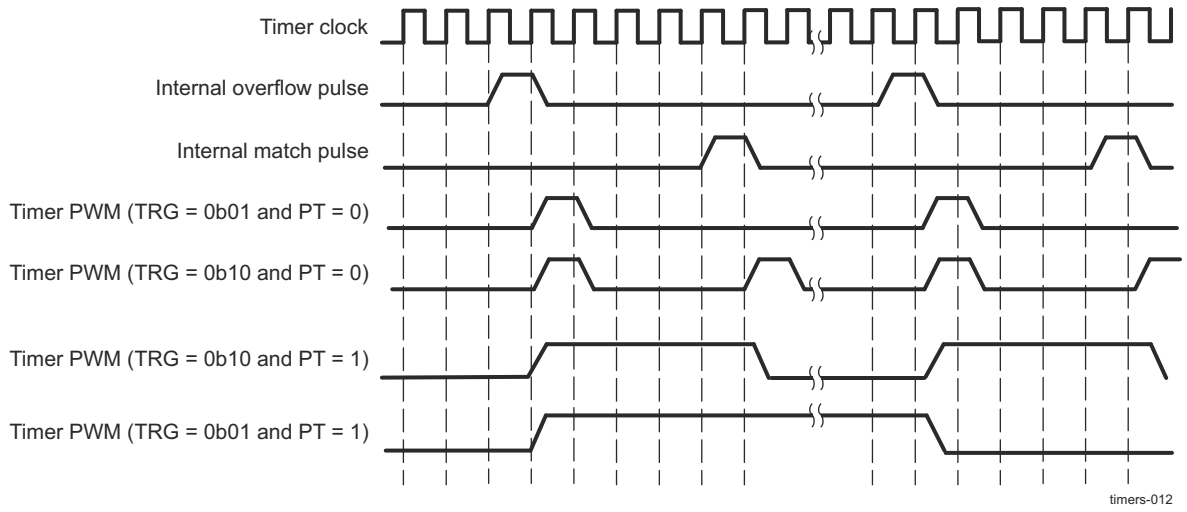

Figure 22-13. Timing Diagram of PWM With TCLR[7] SCPWM Bit = 0

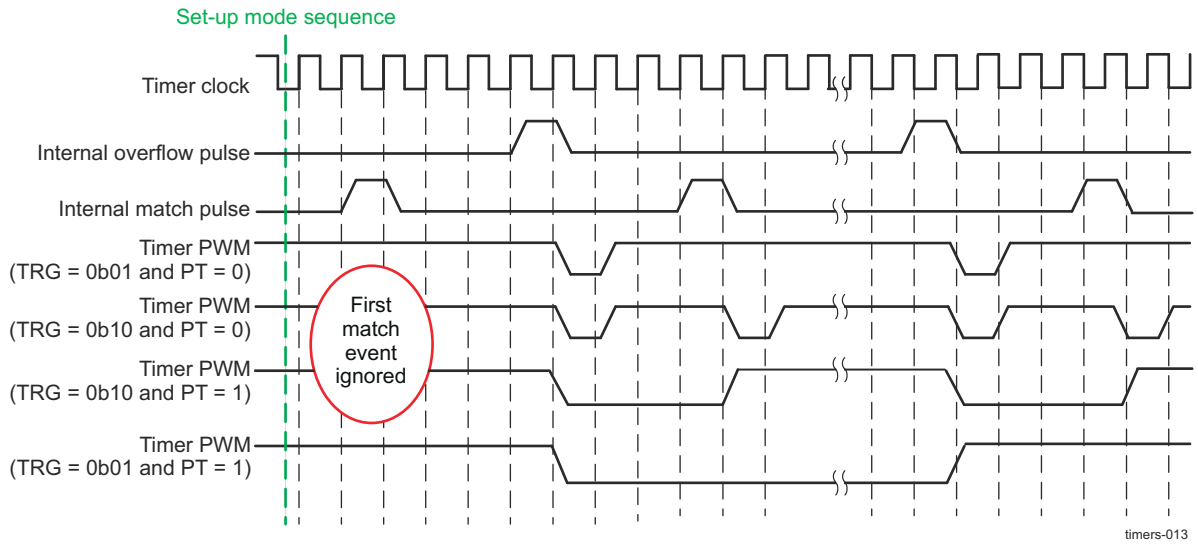

Figure 22-14. Timing Diagram of PWM With TCLR[7] SCPWM Bit = 1

22.2.4.11 Timer Counting Rate

The timer rate is defined by the following values:

- Value of the prescaler fields (the TCLR[5] PRE bit and TCLR[4:2] PTV bit field)
- Value loaded into the TLDR

Table 22-9 lists the prescaler clock ratio values.

Table 22-9. Prescaler Clock Ratio Values

TCLR[5] PRE	TCLR[4:2] PTV	Divisor (PS)
0	X	1
1	0	2
1	1	4
1	2	8
1	3	16
1	4	32
1	5	64
1	6	128
1	7	256

Thus, the timer overflow rate is expressed as:

OVF_Rate = (0xFFFF FFFF – TLDR + 1) × (timer-functional clock period) × PS

With (timer-functional clock period) = 1/(timer-functional clock frequency) and PS = $2^{(PTV + 1)}$ if prescaler is enabled, or PS = 1 if prescaler is disabled.

CAUTION

Internal resynchronization causes any write to the TCLR[1] ST bit to have some latency before the register is updated:

2.5 × functional clock cycles write_TIMER_TCLR_latency 3.5 × functional clock cycles

Remember to consider this latency whenever the timer must be started or stopped by a software change to the TCLR[1] ST bit.

CAUTION

- In non-PWM mode, TLDR must be maintained at less than or equal to 0xFFFF FFFE.
- In PWM mode, TLDR must be maintained at less than or equal to 0xFFFF FFFD.

For example, with a timer clock input of 32 kHz and the TCLR[5] PRE bit set to 0, the timer output period is as listed in Table 22-10.

Table 22-10. Value and Corresponding Interrupt Period

TLDR[31:0] LOAD_VALUE	Interrupt Period
0x0000 0000	37 h
0xFFFF 0000	2 s
0xFFFF FFF0	500 µs
0xFFFF FFFE	62.5 µs

22.2.4.12 Timer Under Emulation

During emulation mode, the timer continues to run according to the value of the TIOCP_ CFG[1] EMUFREE bit.

If the TIOCP_CFG[1] EMUFREE bit is set to 1, timer execution is not stopped in emulation mode and the interrupt is still generated when overflow or match is reached.

If the TIOCP_CFG[1] EMUFREE bit is set to 0, the prescaler and timer are frozen and both resume on exit from emulation mode. The asynchronous external input pin (timerx_pwm_evt, where x = [8:11]) is internally synchronized on two timer-clock rising edges.

22.2.4.13 Accessing GP Timer Registers

All accesses are nonposted until software reconfiguration. All registers are 32 bits wide, accessible through the OCP interface with 16- or 32-bit access (read/write).

Any 16-bit write access must be least-significant bit (LSB) first, and the second write access must be most-significant bit (MSB) first. Write operations to the following GP timer registers can skip the MSB access if it is not necessary to update the 16 MSBs of the register:

- TIDR (all GP timers)
- TIOCP_CFG (all GP timers)
- IRQSTATUS_SET (GP timers 1, 2, 10)
- IRQSTATUS_RAW (all GP timers)
- IRQSTATUS (all GP timers)
- IRQENABLE_SET(all GP timers except 1,2,10)
- IRQENABLE_CLR(all GP timers except 1,2,10)
- IRQSTATUS_SET (GP timers 1, 2, 10)
- IRQSTATUS_CLR (GP timers 1, 2, 10)
- IRQWAKEEN (all GP timers)
- TSICR (all GP timers)

Write operations to the following functional registers must be complete (the MSB must be written even if the MSB data is not used):

- TCLR (all GP timers)
- TCRR (all GP timers)
- TLDR (all GP timers)
- TTGR (all GP timers)
- TMAR (all GP timers)
- TPIR (GP timers 1, 2, 10)
- TNIR (GP timers 1, 2, 10)
- TCVR (GP timers 1, 2, 10)
- TOCR (GP timers 1, 2, 10)

- TOWR (GP timers1, 2, 10)

The following L4 synchronous registers are not affected by the posted/nonposted mode selection; the write/read operation is effective and acknowledged (command accepted) after one L4 clock cycle from command assertion:

- TIDR
- TIOCP_CFG
- IRQSTATUS
- IRQSTATUS_RAW
- IRQENABLE_SET
- IRQENABLE_CLR
- IRQSTATUS_SET
- IRQSTATUS_CLR
- IRQWAKEEN
- TWPS
- TSICR

22.2.4.13.1 Writing to Timer Registers

The host uses the OCP interface to write to the following registers synchronously with the timer interface clock:

- TLDR
- TCRR
- TCLR
- TIOCP_CFG
- IRQSTATUS
- IRQENABLE_SET
- IRQENABLE_CLR
- IRQWAKEEN
- TTGR
- TSICR
- TMAR

TIMER1, TIMER2, and TIMER10 also have the following registers:

- IRQSTATUS_SET
- IRQSTATUS_CLR
- TPIR
- TNIR
- TCVR
- TOCR
- TOWR

In 16-bit access mode, the 16 LSBs must be written before writing to the 16 MSBs.

22.2.4.13.1.1 Write Posting Synchronization Mode

This mode is used if the TSICR[2] POSTED bit is set to 1.

This mode uses a posted write scheme to update any internal register (TCLR, TCRR, TLDR, TTGR, TMAR, and TPIR, TNIR, TCVR, TOCR, and TOWR for TIMER1, TIMER2, and TIMER10). Therefore, the write transaction is immediately acknowledged on the open-core protocol (OCP) interface, although the effective write operation occurs later because of a resynchronization in the timer clock domain. The advantage is that neither the interconnect nor the device that requested the write transaction is stalled.

For each register, a status bit is provided in the timer write-posted status (TWPS) register. In this mode, it is mandatory that software check this status bit before any write access. If a write is attempted to a register with a previous access pending, the previous access is discarded without notice.

The timer module updates the value of the timer counter register synchronously with the OCP clock. Consequently, any read access to TCRR does not add any resynchronization latency; the current value is always available.

Note

Because the overflow IRQ is generated when the value of TCRR reaches 0xFFFF FFFF, and not when it changes its value to the value after overflow, it is necessary to wait a delay of (1 × PS × timer functional clock period) before any read access to TCRR to ensure a correct reading of its content.

Note

If TTGR register is written during posted write to TCRR, the value to be written to TCRR will be discarded.

If a posted write to TCVR is started, the user must not write to TPIR or TNIR before the TCVR write is finished, because the value of TCVR is re-evaluated, so both the value to be written, and the recalculated value will be discarded.

If a write access is pending for a register, reading from this register does not yield a correct result. Software synchronization must be used to avoid incorrect results.

Functional frequency range: freq(timer clock) < freq(OCP interface clock) / 4.

22.2.4.13.1.2 Write Nonposting Synchronization Mode

This mode is used if the TSICR[2] POSTED bit is set to 0 (default value). It uses a nonposted write scheme to update any internal register. Therefore, the write transaction is not acknowledged on the L4 interface until the effective write operation occurs after the resynchronization in the timer functional clock domain. The drawback is that the interconnect and the device that requested the write transaction are stalled during this period.

The same full resynchronization scheme is used for a read transaction, and the same stall period applies. A register read following a write to the same register is always coherent.

This mode is functional regardless of the ratio between the OCP interface frequency and the timer clock frequency.

22.2.4.13.2 Reading From Timer Counter Registers

In 16-bit access mode, reading the 16 LSBs from the timer counter registers (TCRR, TCAR1, and TCAR2) captures the current timer counter value. This must be followed by reading the 16 MSBs. The synchronization schemes for read posted and read non-posted transactions are the same as the corresponded write transactions described before.

Note

LSB/MSB accesses cannot be interleaved (that is, the sequence LSB register 1, LSB register 2, MSB register 1, MSB register 2 is not supported).

The TCRR is a 32-bit “atomic datum” and its 16-bit capture is done on the 16-bit LSB first to allow atomic LSB16 + MSB16 capture. This capture scheme is also performed for the TCAR1 and TCAR2 registers as they can be changed due to internal processes too. DSP 16 bit accesses can be interleaved with MCU 32 bit accesses.

Note

Reading of counter value of GPTimer5 through GPTimer8 should be done with delay of 10 L4_PER clock cycles when the functional clock source is 32kHz and the IPU CD is in the hardware AUTO state.

Note

Reading of counter value of GPTimer5 through GPTimer8 can be done without any delay when the functional clock source is 32kHz and the IPU CD is in software wakeup mode, or the static dependency between IPU and MPU is enabled.

22.2.4.13.2.1 Read Posted

This mode is functional whatever the ratio between the OCP interface frequency and the functional clock frequency are. The recommended functional frequency range is freq(timer) < freq(OCP) / 4.

Read posted mode is used if TSICR[2] POSTED = 0x1 or TSICR[3] READ_MODE is set to 0. This mode uses a posted-read scheme for reading any internal timer register. The read transaction is immediately acknowledged on the OCP interface, and the value to be read has been resynchronized. With this method, neither the interconnect nor the device that requested the read transaction are stalled.

Read posted mode applies to TCRR, TCAR1, TCAR2, TCVR, and TOWR, which need resynchronization from functional to OCP clock domains.

22.2.4.13.2.2 Read Non-Posted

This mode is functional regardless of the ratio between the OCP interface frequency and the functional clock frequency. Recommended functional frequency range is freq(timer) >= freq(OCP) / 4.

Read non-posted mode is used if TSICR[2] POSTED = 0x0 and TSICR[3] READ_MODE = 0x1. This mode uses a non-posted read scheme for reading internal timer registers. The read transaction is not acknowledged on the OCP interface until the effective read operation occurs, after the resynchronization in the timer clock domain. The result is that both the interconnect and the device that requested the read transaction are stalled during this period.

This mode applies to TCRR, TCAR1, TCAR2, TCVR, and TOWR, which need resynchronization from functional to OCP clock domains.

22.2.4.14 Posted Mode Selection

A choice between two synchronization modes is made taking into account the frequency ratio and the stall periods that can be supported by the system, without impacting the global performance.

The posted mode selection applies only to registers that require synchronization on or from the timer clock domain. For write operation, the registers affected by posted and non-posted selection are TCLR, TLDR, TCRR, TTGR, TMAR, TPIR, TNIR, TCVR, TOCR, and TOWR. For read operation, the registers affected by this selection are: TCRR, TCAR1, TCAR2, TCVR, and TOWR.

The OCP clock domain synchronous registers TIDR, TIOCP_CFG, IRQSTATUS, IRQSTATUS_SET, IRQWAKEEN, TWPS, and TSICR are not affected by posted and non-posted mode selection. The operation (read or write) is effective and acknowledged after one OCP clock cycle from the command assertion.

The configuration of posted or non-posted mode can be changed (overwritten) by software by writing in TSICR[2] POSTED bit. The TSICR[3] READ_MODE defines how the read operation is performed when the module is configured in non-posted mode (see TSICR). The following cases are possible:

- TSICR[2] POSTED = 0x1 and TSICR[3] READ_MODE = x (don't care): read and write operations are expected in posted mode.
- TSICR[2] POSTED = 0x0 and TSICR[3] READ_MODE = 0x0: the write operation is executed in non-posted mode and read is executed in posted mode.

- TSICR[2]POSTED = 0x0 and TSICR[3] READ_MODE = 0x1: write is executed in non-posted mode and read is executed in non-posted mode.

22.2.5 GP Timer Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the module.

22.2.5.1 Global Initialization

22.2.5.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the GP timer module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the GP timer. For more information, see Section 22.2.3, *GP Timers Integration*, and Section 22.2.2, *GP Timers Environment*. Table 22-11 summarizes the surrounding modules.

Table 22-11. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. For more information about the module configuration, see *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.
Control module	The module-specific pad muxing must be set in the control module. For more information about the module configuration, see *Pad Configuration Registers,* in *Control Module*.
IRQ_CROSSBAR	The IRQ_CROSSBAR configuration must be done to enable the interrupts from the GP timer module. See *IRQ_CROSSBAR Module Functional Description*.

22.2.5.1.2 GP Timer Module Global Initialization

22.2.5.1.2.1 Main Sequence – GP Timer Module Global Initialization

Table 22-12 identifies the main steps for initializing the GP timer module when the module is to be used for the first time.

Table 22-12. GP Timer Module Global Initialization

Step	Register/Bit Field/Programming Model	Value
Execute software reset.	TIOCP_CFG[0] SOFTRESET	0x1
Wait until reset release?	TIOCP_CFG[0] SOFTRESET	0x0
Configure idle mode.	TIOCP_CFG[3:2] IDLEMODE	0x-
Enable wake-up interrupt events.	IRQWAKEEN[2:0]	0x-
Select posted mode.	TSICR[2] POSTED	0x-

22.2.5.2 Operational Mode Configuration

22.2.5.2.1 GP Timer Mode

22.2.5.2.1.1 Main Sequence – GP Timer Mode Configuration

Table 22-13 lists the steps in the GP timer mode configuration.

Table 22-13. GP Timer Mode Configuration

Step	Register/Bit Field/Programming Model	Value
Select autoreload mode.	TCLR[1] AR	0x-
Set prescale timer value.	TCLR[4:2] PTV	0x-
Enable prescaler.	TCLR[5] PRE	0x1
Enable overflow interrupt.	IRQSTATUS_SET[1] OVF_EN_FLAG(1) or IRQENABLE_SET[1] OVF_EN_FLAG(2)	0x1
Load timer counter value.	TCRR	0x-
Load timer load value.	TLDR	0x-
Start the timer.	TCLR[0] ST	0x1

(1) Applies only to TIMER1, TIMER2, and TIMER10.
(2) Applies to TIMER3 through TIMER 9 and TIMER11 through TIMER16.

22.2.5.2.2 GP Timer Compare Mode

22.2.5.2.2.1 Main Sequence – GP Timer Compare Mode Configuration

Table 22-14 lists the steps in the GP timer compare mode configuration.

Table 22-14. GP Timer Compare Mode Configuration

Step	Register/Bit Field/Programming Model	Value
Select autoreload mode.	TCLR[1] AR	0x-
Set prescale timer value.	TCLR[4:2] PTV	0x-
Enable prescaler.	TCLR[5] PRE	0x1
Enable match interrupt.	IRQSTATUS_SET[0] MAT_EN_FLAG(1) or IRQENABLE_SET[0] MAT_EN_FLAG(2)	0x1
Load timer counter value.	TCRR	0x-
Load timer compare value.	TMAR	0x-
Enable compare mode.	TCLR[6] CE	0x1
Start the timer.	TCLR[0] ST	0x1

(1) Applies only to TIMER1, TIMER2, and TIMER10.
(2) Applies to TIMER3 through TIMER9 and TIMER11 through TIMER16.

22.2.5.2.3 GP Timer Capture Mode

22.2.5.2.3.1 Main Sequence – GP Timer Capture Mode Configuration

Table 22-15 lists the steps in the GP timer capture mode configuration.

Table 22-15. GP Timer Capture Mode Configuration

Step	Register/Bit Field/Programming Model	Value
Initialize capture mode.	See Section 22.2.5.2.3.2.	
Enable capture interrupt.	IRQENABLE_SET[2] TCAR_EN_FLAG (2) or IRQSTATUS_SET[2] TCAR_EN_FLAG (1)	0x1
Start the timer.	TCLR[0] ST	0x1
Detect event.	See Section 22.2.5.2.3.3.	

(1) Applies only to TIMER1, TIMER2, and TIMER10.
(2) Applies only to TIMER3 through TIMER9 and TIMER11 through TIMER16.

22.2.5.2.3.2 Subsequence – Initialize Capture Mode

Table 22-16 lists the steps to initialize capture mode.

Table 22-16. Initialize Capture Mode

Step	Register/Bit Field/Programming Model	Value
Select autoreload mode.	TCLR[1] AR	0x-
Set prescale timer value.	TCLR[4:2] PTV	0x-
Enable prescaler.	TCLR[5] PRE	0x1
Select TIMERi (where i = 2 to 11 and 13 to 16). Capture input at device pin timeri.	TCLR[14] GPO_CFG	0x1
Select single or second event capture.	TCLR[13] CAPT_MODE	0x-
Select transition capture mode.	TCLR[9:8] TCM	0x-

22.2.5.2.3.3 Subsequence – Detect Event

Table 22-17 lists the steps in detecting an event.

Table 22-17. Detect Event

Step	Register/Bit Field/Programming Model	Value
Wait until event detected?	IRQSTATUS[2] TCAR_IT_FLAG	= 0x1

Table 22-17. Detect Event (continued)

Step	Register/Bit Field/Programming Model	Value
Read timer capture value.	TCAR1 and/or TCAR2	
Clear capture interrupt request.	IRQSTATUS[2] TCAR_IT_FLAG	0x1

22.2.5.2.4 GP Timer PWM Mode

22.2.5.2.4.1 Main Sequence – GP Timer PWM Mode Configuration

Table 22-18 lists the steps in the GP timer PWM mode configuration.

Table 22-18. GP Timer PWM Mode Configuration

Step	Register/Bit Field/Programming Model	Value
Select autoreload mode.	TCLR[1] AR	0x-
Set prescale timer value.	TCLR[4:2] PTV	0x-
Enable prescaler.	TCLR[5] PRE	0x1
Select trigger output mode.	TCLR[11:10] TRG	0x-
Select pulse or toggle modulation PWM mode.	TCLR[12] PT	0x-
Select TIMERi (where i = 2 to 11 and 13 to 16) PWM output at device pin timeri.	TCLR[14] GPO_CFG	0x0
Configure PWM output pin default value.	TCLR[7] SCPWM	0x-
Load timer load value.	TLDR	0x-
Load timer compare value.	TMAR	0x-
Enable compare.	TCLR[6] CE	0x1
Start the timer.	TCLR[0] ST	0x1

22.2.6 GP Timer Register Manual

22.2.6.1 GP Timer Instance Summary

Table 22-19 lists the base address and block size for the GP timer module instances.

Table 22-19. GP Timer Instance Summary

Module Name	Base Address L4_PER1 Interconnect	Base Address L4_PER3 Interconnect	Base Address L4_WKUP Interconnect	Size
TIMER2	0x4803 2000	–	–	112 Bytes
TIMER3	0x4803 4000	–	–	92 Bytes
TIMER4	0x4803 6000	–	–	92 Bytes
TIMER9	0x4803 E000	–	–	92 Bytes

22.2.6.2 GP Timer Registers

22.2.6.2.1 GP Timer Register Summary

CAUTION

The GP timer registers are limited to 32- and 16-bit data accesses; 8-bit access is not allowed and can corrupt the register content.

Table 22-20 through Table 22-25 provide the register summary and associated offset addresses for the 15 GP timer internal registers.

Table 22-20. TIMER1, TIMER2, and TIMER10 Register Mapping Summary

Register Name	Type	Register Width (Bits)	Address Offset	TIMER1 Physical Address L4_WKUP Interconnect	TIMER2 Physical Address L4_PER1 Interconnect	TIMER10 Physical Address L4_PER1 Interconnect
TIDR	RO	32	0x0000 0000	0x4AE1 8000	0x4803 2000	0x4808 6000
TIOCP_CFG	RW	32	0x0000 0010	0x4AE1 8010	0x4803 2010	0x4808 6010

Description	This register controls the various parameters of the L4 interface.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												IDLEMODE		EMUFREE	SOFTRESET

Bits	Field Name	Description	Type	Reset
31:4	RESERVED	Reserved	R	0x0000000

Bits	Field Name	Description	Type	Reset
3:2	IDLEMODE	Power management, req/ack control 0x0: Force-idle mode: local target idle state follows (acknowledges) the system idle requests unconditionally, that is, regardless of the IP module internal requirements. Back-up mode, for debug only. 0x1: No-idle mode: local target never enters idle state. Back-up mode, for debug only. 0x2: Smart-idle mode: local target idle state eventually follows (acknowledges) the system idle requests, depending on the IP module internal requirements. IP module should not generate (IRQ- or DMA-request-related) wake-up events. 0x3: Smart-idle wake-up-capable mode: local target idle state eventually follows (acknowledges) the system idle requests, depending on the IP module internal requirements. IP module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. Mode is relevant only if the appropriate IP module *swake-up* output(s) is (are) implemented.	RW	0x0
1	EMUFREE	Emulation mode 0x0: The timer is frozen in emulation mode (PINSUSPENDN signal active). 0x1: The timer runs free, regardless of PINSUSPENDN value.	RW	0
0	SOFTRESET	Software reset 0x0: Read 0: reset done, no pending action Write 0: No action 0x1: Read 1: initiate software reset Write 1: Reset ongoing	RW	0

Description	This register controls optional features specific to the timer functionality.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																	GPO_CFG	CAPT_MODE	PT	TRG		TCM		SCPWM	CE	PRE	PTV			AR	ST

Bits	Field Name	Description	Type	Reset
31:15	RESERVED	Reserved	R	0x00000
14	GPO_CFG	General-purpose output - this register directly drives the PO_GPOCFG output. For specific use of the GPO_CFG bit, see *GP Timer External System Interface*. 0x0: PO_GPOCFG drives 0. 0x1: PO_GPOCFG drives 1.	RW	0
13	CAPT_MODE	Capture mode select bit (first/second) 0x0: Single capture: Capture the first enabled capture event in TCAR1. 0x1: Capture on second event: Capture the second enabled capture event in TCAR1 and the second enabled capture event in TCAR2.	RW	0
12	PT	Pulse or toggle mode on TIMERi_PWM_out output pin 0x0: Pulse modulation 0x1: Toggle modulation	RW	0

Bits	Field Name	Description	Type	Reset
11:10	TRG	Trigger output mode on TIMERi_PWM_out output pin 0x0: No trigger 0x1: Trigger on overflow. 0x2: Trigger on overflow and match. 0x3: Reserved	RW	0x0
9:8	TCM	Transition capture mode on TIMERi_EVENT_CAPTURE input pin (When the TCM field passed from (00) to any other combination, the TCAR_IT_FLAG and the edge detection logic are cleared.) 0x0: No capture 0x1: Capture on rising edges of TIMERi_EVENT_CAPTURE pin 0x2: Capture on falling edges of TIMERi_EVENT_CAPTURE pin 0x3: Capture on both edges of TIMERi_EVENT_CAPTURE pin	RW	0x0
7	SCPWM	Pulse width modulation output pin default setting This bit must be set or clear while the timer is stopped or the trigger is off. 0x0: Clear the TIMERi_PWM_out output pin and select positive pulse for pulse mode. 0x1: Set the TIMERi_PWM_out output pin and select negative pulse for pulse mode.	RW	0
6	CE	Compare enable 0x0: Compare mode is disable. 0x1: Compare mode is enable.	RW	0
5	PRE	Prescaler enable 0x0: The TIMER clock input pin clocks the counter. 0x1: The divided input pin clocks the counter.	RW	0
4:2	PTV	Prescale clock timer value The timer counter is prescaled with the value $2^{(PTV+1)}$. Example: PTV = 3, counter increases value (if started) after 16 functional clock periods.	RW	0x0
1	AR	Autoreload mode 0x0: One shot timer 0x1: Autoreload timer	RW	0
0	ST	Start/stop timer control 0x0: Stop timer: Only the counter is frozen. If one-shot mode selected (AR =0), this bit is automatically reset by internal logic when the counter is overflowed. 0x1: Start timer	RW	0

22.3 32-kHz Synchronized Timer (COUNTER_32K)

22.3.1 32-kHz Synchronized Timer Overview

The 32-kHz synchronized timer (COUNTER_32K) is a 32-bit counter clocked by the falling edge of the 32-kHz system clock.

Figure 22-15 is the block diagram of the 32-kHz synchronized timer.

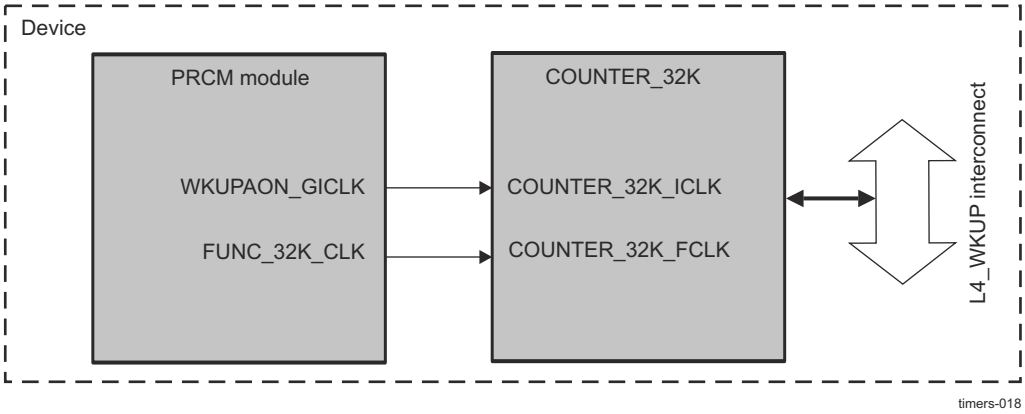

Figure 22-15. 32-kHz Synchronized Timer Block Diagram

22.3.1.1 32-kHz Synchronized Timer Features

The main features of the 32-kHz synchronized timer controller are:

- L4 slave interface (OCP) support:
  - 32-bit data bus width
  - 32-/16-bit access supported
  - 8-bit access not supported
  - 16-bit address bus width
  - Burst mode not supported
  - Write nonposted transaction mode not supported
- Only read operations are supported on the module registers; no write operation is supported (no error/no action on write).
- Free-running 32-bit upward counter
- Start and keep counting after power-on reset
- Automatic roll over to 0; highest value reached: 0xFFFF FFFF
- On-the-fly read (while counting)

22.3.2 32-kHz Synchronized Timer Integration

The synchronized timer is accessible only through the L4_WKUP interface.

Table 22-50 through Table 22-52 summarize the integration of the module in the device.

Table 22-50. COUNTER_32K Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect

Table 22-52. COUNTER_32K Hardware Requests

No Interrupt Requests
No DMA Requests

22.3.3 32-kHz Synchronized Timer Functional Description

The synchronized timer is a counter that starts on the rising edge of an external asynchronous signal (COUNTER_32K_NRESPWRON). When COUNTER_32K_NRESPWRON is released (on the rising edge of COUNTER_32K_FCLK), the counter starts counting up from the reset value of the counter register on the falling edge of the 32-kHz COUNTER_32K_FCLK clock after three inverted 32-kHz clock periods. After reaching its highest value, the counter wraps back to 0 and starts counting again with no additional delay.

Figure 22-16 shows the reset synchronization timing diagram.

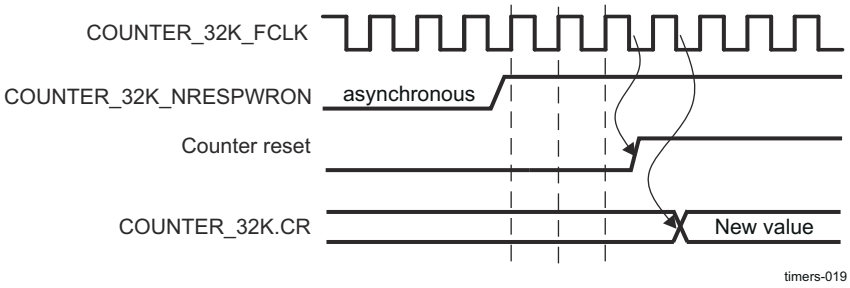

Figure 22-16. Reset Resynchronization Timing Diagram

Figure 22-17 is the block diagram of the synchronized timer.

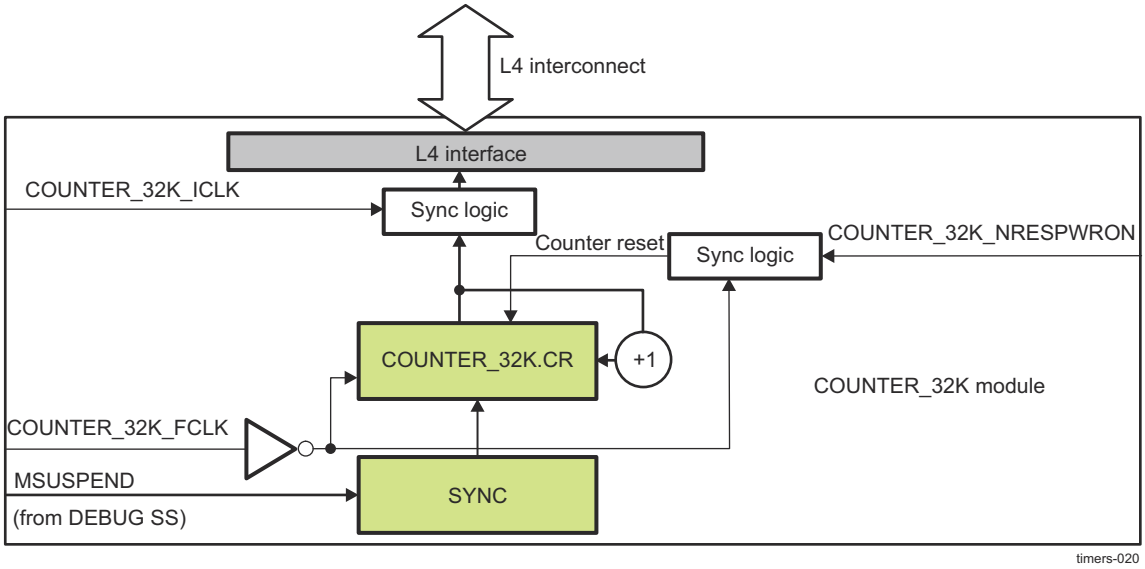

Figure 22-17. CONTER_32K Block Diagram

The sync logic ensures the correctness of the read transaction by synchronizing the counter register read access on COUNTER_32K_ICLK, because the COUNTER_32K_ICLK clock signal is completely asynchronous with COUNTER_32K_FCLK. The COUNTER_32K_NRESPWRON input resets the counter register (CR). The inverted COUNTER_32K_FCLK clocks the counter register CR.

The counting is temporally stopped when MSUSPEND control signal (coming from DEBUG SS) is asserted.

22.3.3.1 Reading the 32-kHz Synchronized Timer

The counter register (CR) is 32 bits wide. For correct count capture, it must be accessed as 16-bit LSB access first and 16-bit MSB access next. The value of the counter is read through the L4 interconnect slave interface. Internal synchronization logic allows the reading of the counter value with COUNTER_32K_ICLK while the counter is running. The time latency to read the synchronized counter register is one COUNTER_32K_ICLK clock period.

The user can select between two syncronization schemes by setting SYSCONFIG[0]SYNCMODE bit.

- SYSCONFIG[0]SYSCMODE = 0x0 - default. In this mode COUNTER_32K timer uses Gray encode/decode scheme. When the L4 interface sends a LSB16 read request command, the 32 bit coded value is registered directly to the interface domain. Due to the characteristics of this encoding if a read command arrives during a count up event either the old or the new value of CR is captured, not a transient value. The captured value will be decoded and send on the SDATA bus. The MSB16 read command reads upper 16 bits of the 32 bit value of counter register captured during the last LSB16 read access.
- SYSCONFIG[0]SYNCMODE = 0x1 - legacy synchronization scheme. In this mode the value of the CR is synchronized to the OCP domain at every count up event. This synchronization is possible because the COUNTER_32K_ICLK is much faster that the 32KHz clock (COUNTER_32K_FCLK). The drawback of this method is that if the interface clock is switched back after wake up from idle mode, the syncronized value will be updated only at the next count up event, until then it will be incorrect.

22.3.4 COUNTER_32K Timer Register Manual

Table 22-53 lists the base address and block size for the 32-kHz synchronized timer. It is memory-mapped to the L4 peripheral bus memory space.

Table 22-53. COUNTER_32K Timer Instance Summary

Module Name	Module Base Address	Size
L4_WKUP_COUNTER_32K	0x4AE0 4000	52 Bytes

22.3.4.1 COUNTER_32K Timer Register Mapping Summary

CAUTION

The 32-kHz synchronized timer registers are limited to 32- and 16-bit data accesses; 8-bit access is not allowed and can corrupt the register content.

Table 22-54 lists the 32-kHz synchronized timer registers. Table 22-55 through Table 22-59 describe the register bits.

22.4 Watchdog Timer

22.4.1 Watchdog Timer Overview

The device includes one instance of the 32-bit watchdog timer: WD_TIMER2. Figure 22-18 shows how the timer is connected in the device.

The watchdog timer is an upward counter capable of generating a pulse on the reset pin and an interrupt to the device system modules following an overflow condition. The WD_TIMER2 timer serves resets to the PRCM module (its interrupt outputs are unused).

WD_TIMER2 is located in the PD_WKUPAON power domain, and can run when the device is in lowest power state above RTC mode (all power domains are off except always-on (AON), WKUP, and RTC domains).

Note

Device RTC low-power mode (only RTC active in the device) is not supported on the AM571x family of devices.

Note

RTC module is not supported on the AM570x family of devices.

The watchdog timer can be accessed, loaded, and cleared by registers through the L4_WKUP interface. The watchdog timer has the 32-kHz clock for its timer clock input. WD_TIMER2 directly generates a warm reset condition on overflow.

WD_TIMER2 connects to a single target agent port on the L4_WKUP interconnect.

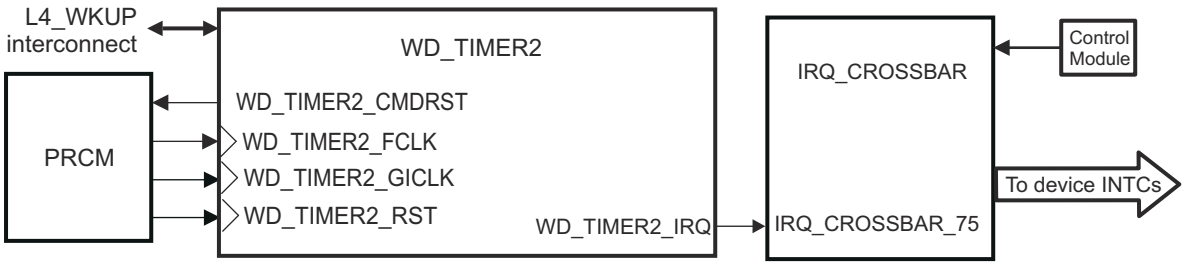

Figure 22-18. Watchdog Timer Block Diagram

Table 22-61 lists the default state of the watchdog timer in the device.

Table 22-61. Watchdog Timer Default State

Timer	Default State	
WD_TIMER2	Enabled	Not running

Note

The default state of the watchdog timer described in Table 22-61 is considered to be its state immediately after ROM code execution. For more information, see *Initialization*.

22.4.1.1 Watchdog Timer Features

The main features of the watchdog timer controllers are:

- L4 slave interface support:
  - 32-bit data bus width
  - 32-/16-bit access supported
  - 8-bit access not supported

  - 11-bit address bus width
  - Burst mode not supported
  - Write nonposted mode supported

- Free-running 32-bit upward counter
- Programmable divider clock source (2^n where n = [0:7])
- On-the-fly read/write register (while counting)
- Subset programming model of the GP timer
- The watchdog timer is reset either on power on or after a warm reset before it starts counting.
- Reset or interrupt actions when a timer overflow condition occurs
- The watchdog timer generates a reset or an interrupt in its hardware integration.

22.4.2 Watchdog Timer Integration

Figure 22-19 shows the integration of the watchdog timers in the device.

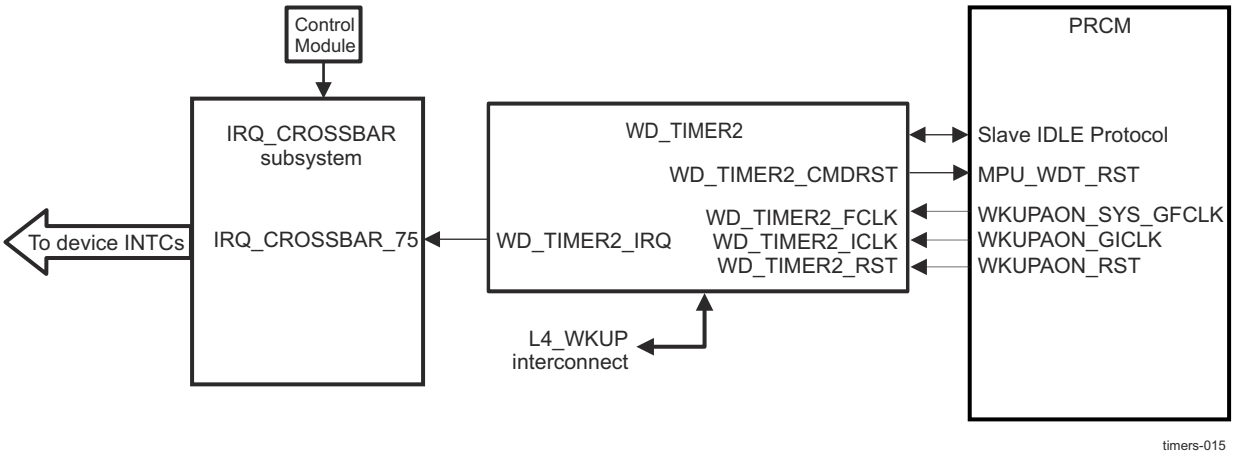

Figure 22-19. Watchdog Timer Integration

Table 22-62 through Table 22-64 summarize the integration of the module in the device.

WD_TIMER2	WD_TIMER2_FCLK	WKUPAON_SYS_GFCLK	PRCM	WD_TIMER2 functional clock
WD_TIMER2	WD_TIMER2_ICLK	WKUPAON_GICLK	PRCM	WD_TIMER2 interface clock
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
WD_TIMER2	WD_TIMER2_RST	WKUPAON_RST	PRM	Reset to WD_TIMER2
	MPU_WDT_RST	WD_TIMER2_CMDRST	WD_TIMER2	Reset to MPU

Note

WD_TIMER2 is reset on power on or after a warm reset before it starts counting.

Table 22-64. Watchdog Timer Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
WD_TIMER2	WD_TIMER2_IRQ	IRQ_CROSSBAR_75	MPU_IRQ_80	WD_TIMER2 interrupt request
No DMA Requests				

Note

The “**Default Mapping**” column in Table 22-64 *Watchdog Timer Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.

22.4.3 Watchdog Timer Functional Description

22.4.3.1 Power Management

There are two clock domains in the watchdog timer:

- Functional clock domain: WD_TIMER2_FCLK is the watchdog timer functional clock. It is used to clock the watchdog timer internal logic.
- Interface clock domain: WD_TIMER2_ICLK is the watchdog timer interface clock. It is used to synchronize the watchdog timer L4 port to the L4 interconnect. All accesses from the interconnect are synchronous to WD_TIMER2_ICLK.

Table 22-63 lists the source clocks for the watchdog timer in the device. For more information about clock control and domains, see *Clock Management Functional Description,* in *Power, Reset, and Clock Management*.

From a global system power-management perspective, when the watchdog timer clocks is no longer required, the watchdog timer can be deactivated at the PRCM module level in the corresponding registers.

At the PRCM module level, when the conditions to shut off the PRCM module functional or interface output clocks are met (for more information, see *Clock Domain-Level Clock Management*), the PRCM module automatically launches a hardware handshake protocol to ensure the watchdog timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the watchdog timer.

Although this handshake is a hardware function and out of software control, the way on which the watchdog timer acknowledges the PRCM IDLE request is configurable through the WDSC[4:3] IDLEMODE bit field. Table 22-65 lists the settings and related acknowledgment modes of the IDLEMODE bit field.

Table 22-65. IDLEMODE Settings

IDLEMODE Value	Selected Mode	Description
00	Force-idle	The watchdog timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent loss of data when the clock is switched off.
01	No-idle	The watchdog timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, however, because it does not allow the PRCM module output clock to be shut off and thus the power domain to be set to a lower power state.
10	Smart-idle	The watchdog timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach for efficient system power management.
11	Smart-idle wakeup-capable mode	The watchdog timer acknowledges the IDLE request, basing its decision on its internal activity. The timer generates (IRQ-request-related) wake-up events when in IDLE state if the WIRQWAKEEN[1:0] bit field is set to 1.

22.4.3.1.1 Wake-Up Capability

If the WDSC[4:3] IDLEMODE bit field sets smart-idle wakeup-capable mode (= 0 × 3), the timer evaluates its internal capability to have the interface clock switched off. When there is no more internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters into sleep mode, ready to issue a wake-up request. This wake-up request is sent only if the WIRQWAKEEN[0] OVF_WK_ENA and/or the WIRQWAKEEN[1] DLY_WK_ENA bits enable the overflow and/or the delay wake-up capability.

22.4.3.2 Interrupts

Table 22-66 list the event flags, and their masks that cause module interrupts.

Table 22-66. Watchdog Timer Events

Event Flag	Event Mask	Mapping	Comments
WIRQSTAT[0] EVENT_OVF	WIRQENSET/WIRQENCLR[0] OVF_IT_ENA	WD_TIMER2_IRQ	Watchdog timer overflow

Table 22-66. Watchdog Timer Events (continued)

Event Flag	Event Mask	Mapping	Comments
WIRQSTAT[1] EVENT_DLY	WIRQENSET/WIRQENCLR[1] DLY_IT_ENA	WD_TIMER2_IRQ	Watchdog delay value reached

22.4.3.3 General Watchdog Timer Operation

The watchdog timer is based on an upward 32-bit counter coupled with a prescaler. The counter overflow is signaled through two independent signals: a simple reset signal and an interrupt signal, both active low. The use of these signals depends on whether they are connected or not. For this information, see Figure 22-18. The interrupt generation mechanism is controlled through the WIRQENSET/WIRQENCLR and WIRQSTAT registers.

The prescaler ratio can be set from 1 to 128 by accessing the WCLR[4:2] PTV bit field and the WCLR[5] PRE bit of the watchdog control register (WCLR).

The current timer value can be accessed on-the-fly by reading the watchdog timer counter register (WCRR), modified by accessing the watchdog timer load register (WLDR) (no on-the-fly update), or reloaded by following a specific reload sequence on the watchdog timer trigger register (WTGR). A start/stop sequence applied to the watchdog timer start/stop register (WSPR) can start and stop the watchdog timers.

Figure 22-20 is a functional block diagram of the watchdog timer.

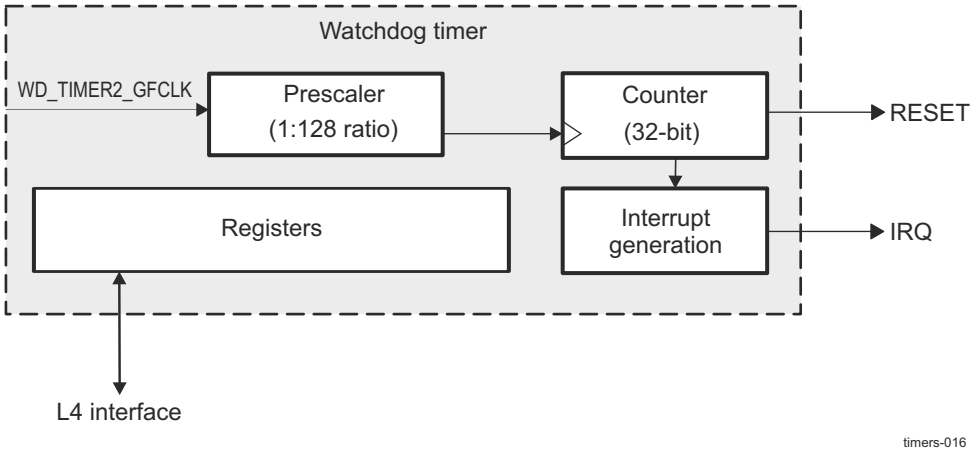

Figure 22-20. 32-Bit Watchdog Timer Functional Block Diagram

22.4.3.4 Reset Context

The watchdog timer is enabled after reset. Table 22-67 lists the default reset values of the two watchdog timer load registers (WLDR) and prescaler ratios (the WCLR[4:2] PTV bit field). To get these values, software must read the corresponding WCLR[4:2] PTV bit field and the 32-bit register to retrieve the static configuration of the module.

Table 22-67. Count and Prescaler Default Reset Values

Timer	WLDR Reset Value	PTV Reset Value
WD_TIMER2	0xFFFB 0000	0

22.4.3.5 Overflow/Reset Generation

When the WCRR overflows, an active-low reset pulse is generated to the PRCM module. This pulse is one prescaled timer clock cycle wide and occurs at the same time as the timer counter overflow.

After reset generation, the counter is automatically reloaded with the value stored in the WLDR and the prescaler is reset (the prescaler ratio remains unchanged). When the reset pulse output is generated, the timer counter begins incrementing again.

Figure 22-21 shows a general functional view of the watchdog timers.

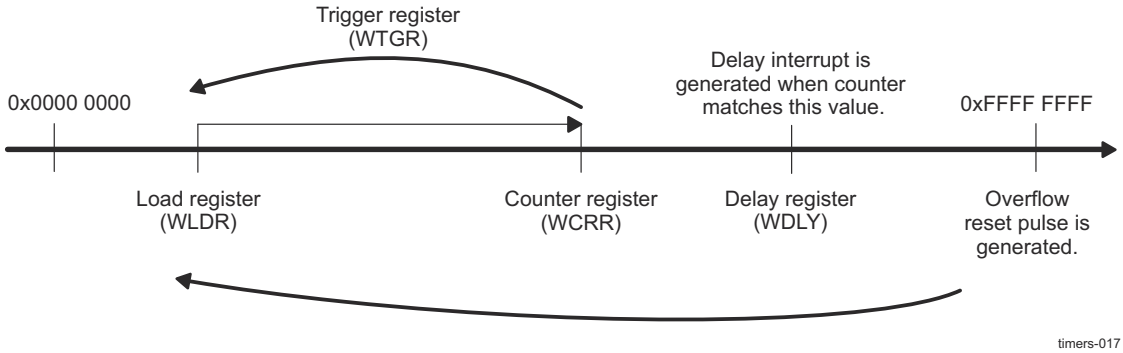

Figure 22-21. Watchdog Timers General Functional View

22.4.3.6 Prescaler Value/Timer Reset Frequency

The watchdog timer is composed of a prescaler stage and a timer counter.

The timer rate is defined by the following values:

- Value of the prescaler fields (the WCLR[5] PRE bit and the WCLR[4:2] PTV bit field)
- Value loaded into WLDR

The prescaler stage is clocked with the timer clock and acts as a clock divider for the timer counter stage. The ratio is managed by accessing the ratio definition field (the WCLR [4:2] PTV bit field) and is enabled with the WCLR[5] PRE bit.

Table 22-68 lists the prescaler clock ratio values.

Table 22-68. Prescaler Clock Ratio Values

WCLR[5] PRE	WCLR[4:2] PTV	Clock Divider (PS)
0	X	1
1	0	1
1	1	2
1	2	4
1	3	8
1	4	16
1	5	32
1	6	64
1	7	128

Thus the watchdog timer overflow rate is expressed as:

OVF_Rate = (0xFFFF FFFF – WLDR + 1) × (timer clock period) × PS

where wd-functional clock period = 1 / (timer clock frequency) and PS = $2^{(PTV)}$

CAUTION

Internal resynchronization causes some latency in any software write to WSPR before WSPR is updated with the programmed value:

1.5 × functional clock cycles ≤ write_WD_TIMER_WSPR_latency ≤ 2.5 × functional clock cycles

Remember to consider this latency whenever the watchdog timer must be started or stopped.

For example, for a timer clock input of 32 kHz with a prescaler ratio value of 0x1 (clock divided by 2) and WCLR[5] PRE = 1 (clock divider enabled), the reset period is as listed in Table 22-69.

Table 22-69. Reset Period Examples

WLDR Value	Reset Period
0x0000 0000	74 h 56 min
0xFFFF 0000	4 s
0xFFFF FFF0	1 ms
0xFFFF FFFF	62.5 µs

CAUTION

- Ensure that the reloaded value allows the correct operation of the application. When a watchdog timer is enabled, software must periodically trigger a reload before the counter overflows. Hence, the value of the WLDR[31:0] bit field must be chosen according to the ongoing activity preceding the watchdog reload.
- Due to design reasons, WLDR[31:0] = 0xFFFF FFFF is a special case, although such value of WLDR is meaningless. When WLDR is programmed with the overflow value, a triggering event generates a reset/interrupt one functional clock cycle later, even if the watchdog timer is stopped.

Table 22-70 lists the default reset periods for the watchdog timer.

Table 22-70. Default Watchdog Timer Reset Periods

Watchdog Timers	Clock Source	Default Reset Period
WD_TIMER2	32 kHz	10 s

22.4.3.7 Triggering a Timer Reload

To reload the timer counter and reset the prescaler before reaching overflow, a reload command is executed by accessing the WTGR using a specific reload sequence.

The specific reload sequence is performed whenever the written value on the WTGR differs from its previous value. In this case, reload is executed in the same way as an overflow autoreload, but without the generation of a reset pulse.

The timer counter is loaded with the value of the watchdog timer load register (the WLDR[31:0] TIMER_LOAD bit field), and the prescaler is reset.

22.4.3.8 Start/Stop Sequence for Watchdog Timer (Using the WSPR Register)

To start and stop a watchdog timer, access must be made through the WSPR using a specific sequence.

To disable the timer, follow this sequence:

1. Write 0xXXXX AAAA in the WSPR.
2. Write 0xXXXX 5555 in the WSPR.

To enable the timer, follow this sequence:

1. Write 0xXXXX BBBB in the WSPR.
2. Write 0xXXXX 4444 in the WSPR.

All other write sequences on the WSPR have no effect on the start/stop feature of the module.

22.4.3.9 Modifying Timer Count/Load Values and Prescaler Setting

To modify the timer counter value (the WCRR), the prescaler ratio (the WCLR[4:2] PTV bit field), delay configuration value (the WDLY[31:0] DLY_VALUE bit field), or the load value (the WLDR[31:0] TIMER_LOAD bit field), the watchdog timer must be disabled by using the start/stop sequence (the WSPR).

After a write access, the load register value and prescaler ratio registers are updated immediately, but new values are considered only after the next consecutive counter overflow or after a new trigger command (the WTGR).

22.4.3.10 Watchdog Counter Register Access Restriction (WCRR)

A 32-bit shadow register is implemented to read a coherent value of the WCRR because the WCRR is directly related to the timer counter value and is updated on the timer clock (WD_TIMER_FCLK). The shadow register is updated by a 16-bit LSB read command.

Note

Although the L4 clock (WD_TIMER_ICLK) is completely asynchronous with the timer clock (WD_TIMER_FCLK), some synchronization is performed to ensure that the value of the WCRR is not read while it is being incremented.

When 32-bit read access is performed, the shadow register is not updated. Read access is performed directly from the accessed register.

To ensure that a coherent value is read inside the WCRR, the first read access is to the lower 16 bits (offset = 0x08), followed by read access to the upper 16 bits (offset = 0x0A).

22.4.3.11 Watchdog Timer Interrupt Generation

When an interrupt source occurs, the interrupt status bit (the WISR[0] OVF_IT_FLAG or WISR[1] DLY_IT_FLAG bit) is set to 1. The output interrupt line (WD_TIMER_IRQ) is asserted (active high) when status (the EVENT_xxx bit) and enable (the xxx_IT_ENA bit) flags are set to 1; the order is not relevant. Writing 1 to the enable bit (the status is already set at 1) also triggers the interrupt in the normal order (enable first, status next). The pending interrupt event is cleared when the set status bit is overwritten by a value of 1 by a write command in the WISR. Reading the WISR and writing the value back allows a fast interrupt acknowledge process.

The watchdog timer issues an overflow interrupt if this interrupt is enabled in the watchdog interrupt-enable register (WIER[0] OVF_IT_ENA = 1). When the overflow occurs, the interrupt status bit (the WISR[0] OVF_IT_FLAG bit) is set to 1. The output interrupt line (WD_TIMER_IRQ) is asserted (active high) when status (OVF_IT_FLAG) and enable (OVF_IT_ENA) flags are set to 1; the order is not relevant. This interrupt can be disabled by setting the WIER [0] OVF_IT_ENA bit to 1.

The watchdog can issue the delay interrupt if this interrupt is enabled in the interrupt-enable register (WIER[1] DLY_IT_ENA = 1). When the counter is running and the counter value matches the value stored in the delay configuration register (WDLY), the corresponding interrupt status bit is set in the watchdog status register (WISR) and the output interrupt line is asserted (active high) when the flag (DLY_IT_FLAG) and enable (DLY_IT_ENA) bits are set to 1 in the WISR and WIER registers, respectively; the order (normally enable, then flag) is not relevant. This interrupt can be disabled by setting the WIER[1] DLY_IT_ENA bit to 1.

Note

Writing 0 to the WISR[0] OVF_IT_FLAG or WISR[1] DLY_IT_FLAG bit has no effect.

The two clock domains are resynchronized because the interrupt event is generated on the functional clock domain (WD_TIMERi_FCLK) during the updating of the interrupt status register.

The WDLY register is used to specify the value of the delay configuration register. The delay time to interrupt is the difference between the reload value stored in the counter load register (WLDR) and the programmed value in this register (WDLY).

Use the following formula to estimate the delay time:

Delay time period = (WDLY – WLDR + 1) × Timer clock period × Clock divider

Where:

- Timer clock period = 1 / (Timer clock frequency)
- Clock divider = 2PTV

If the counter value (WCRR) reaches the programmed value (WDLY), the status bit (EVENT_DLY) is set in the interrupt status register (WIRQSTAT), and an interrupt occurs if the corresponding enable bit is set in the interrupt enable register (WIRQENSET).

CAUTION

If the reload event occurs (after a triggering sequence or after a reset sequence) before reaching the programmed value (the WDLY[31:0] WDLY_VALUE bit field), no interrupt is generated.

Also, no interrupt is generated if the value programmed in the WDLY register is less than the value stored in the WLDR.

22.4.3.12 Watchdog Timer Under Emulation

During emulation mode, the watchdog timer can or cannot continue to run, according to the value of the WDSC[5] EMUFREE bit of the system configuration register (WDSC).

- When EMUFREE is 1, watchdog timer execution is not stopped and a reset pulse is still generated when overflow is reached.
- When EMUFREE is 0, the counters (prescaler/timer) are frozen and incrementation restarts after exiting emulation mode.

22.4.3.13 Accessing Watchdog Timer Registers

Posted/nonposted selection applies only to functional registers that require synchronization on/from the timer functional clock domain (WD_TIMER2_FCLK). For write/read operation, the following registers are affected:

- WCLR
- WCRR
- WLDR
- WTGR
- WDLY
- WSPR

The timer interface clock domain synchronous registers are not affected by the posted/nonposted selection; the write/read operation is effective and acknowledged (command accepted) after one WD_TIMER_ICLK cycle from the command assertion. The timer interface clock domain synchronous registers are:

- WIDR
- WDSC
- WDST
- WISR
- WIER
- WWER
- WWPS

Note

Accesses to WD_TIMER2 is posted.

22.4.4 Watchdog Timer Low-Level Programming Model

This section covers the low-level hardware programming sequences for the configuration and use of the module.

22.4.4.1 Global Initialization

22.4.4.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the watchdog timer is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the watchdog timer (see Table 22-71). For more information, see Section 22.4.2, *Watchdog Timer Integration.*

Table 22-71. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. For more information about the module configuration, see *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.
Control module	Module-specific pad muxing must be set in the control module. For more information about the module configuration, see *Pad Configuration Registers* in *Control Module*.
IRQ_CROSSBAR	The IRQ_CROSSBAR configuration must be performed to enable the interrupts from the watchdog timer. See *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.

22.4.4.1.2 Watchdog Timer Module Global Initialization

22.4.4.1.2.1 Main Sequence – Watchdog Timer Module Global Initialization

Table 22-72 lists the steps for initializing the watchdog timer module when the module is to be used for the first time.

Table 22-72. Watchdog Timer Module Global Initialization

Step	Register/Bit Field/Programming Model	Value
Execute software reset.	WDSC[1] SOFTRESET	0x1
Wait until reset release?	WDSC[1] SOFTRESET	0x0
Configure idle mode.	WDSC[4:3] IDLEMODE	0x-
Enable delay wakeup.	WIRQWAKEEN[1] DLY_WK_ENA	0x1
Enable overflow wakeup.	WIRQWAKEEN[0] OVF_WK_ENA	0x1

Chapter 23

Real-Time Clock (RTC)

This chapter provides a functional presentation of the Real-Time Clock (RTC) module.

23.1 RTC Overview

Note

Device RTC low-power mode (only RTC active in the device) is not supported on the AM571x family of devices.

Note

RTC module is not supported on the AM570x family of devices.

The real-time clock is a precise timer which can generate interrupts on intervals specified by the user. Interrupts can occur every second, minute, hour, or day. The clock can track the passage of real time for durations of several years, provided it has a sufficient power source the entire time.

The basic purpose of the RTC is to keep time of day. The other equally important purpose of the RTC is for Digital Rights management. Some degree of tamper proofing is needed to ensure that simply stopping, resetting, or corrupting the RTC does not go unnoticed so that if this occurs, the application can re-acquire the time of day from a trusted source. Another purpose of the RTC is to wake up the rest of the chip from a power-down state.

Alarms are available to interrupt the host processor at a particular time, or at periodic intervals, such as once per minute or once per day. In addition, the RTC can interrupt the CPU every time the calendar and time registers are updated, or at programmable periodic intervals.

Figure 23-1 shows the RTC functional block diagram.

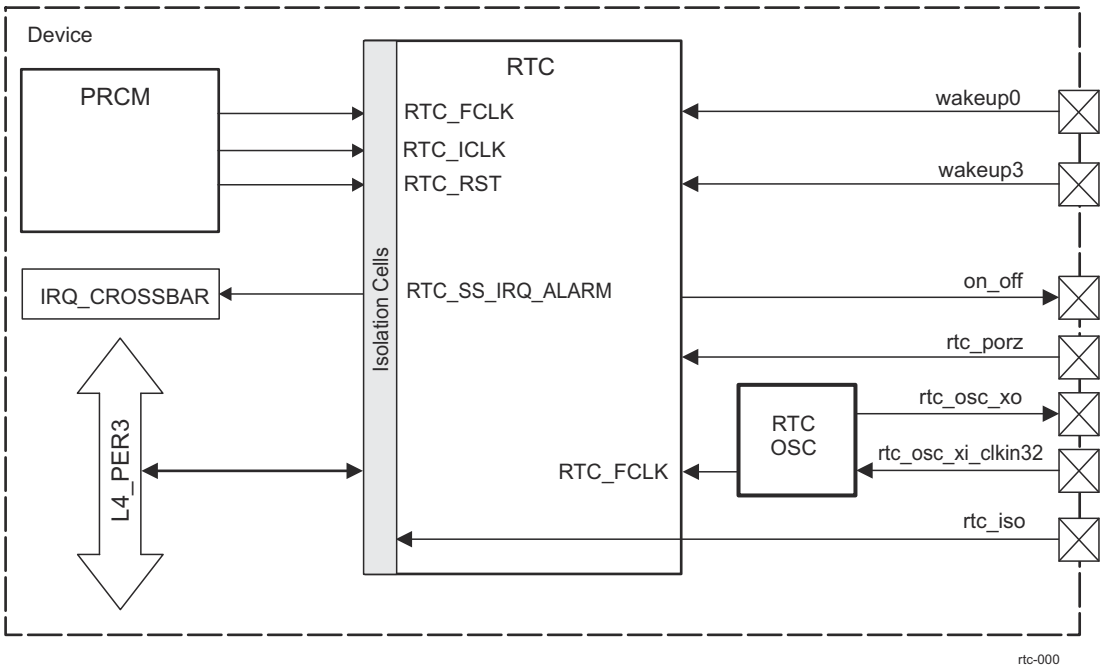

Figure 23-1. RTC Block Diagram

23.1.1 RTC Features

The main features of the RTC are:

- 100-year calendar
- Counts seconds, minutes, hours, day of the week, date, month, and year with leap year compensation
- Binary-coded decimal (BCD) representation of time, calendar and alarm
- Alarm interrupt

- Periodic interrupt
- Single interrupt to the host processor
- External 32-kHz clock
- Isolated RTC voltage domain which remains powered during standby (RTC) mode while the rest of chip supplies are turned off
- RTC voltage domain has 3 × 32-bit read/write scratch registers retained in RTC modes
- RTC supports two wakeup input pins:
  - Each input has a filter to detect high or low transition with pulse duration.
  - Each pin has the following controls retained in standby mode and modified and read by control module in ON mode.
    - Enable bit (decides if the pin causes wakeup or not)
    - Edge sensitivity (rising, falling, or both causing wakeup)
    - Wake-up flag (sticky bits indicating wake-up source)
  - Allow paths for optional input to GPIO if not used for wakeup.
- PMIC enable output pin to indicate external switched MAIN domain supplies to turn on or off based on wakeup state

23.2 RTC Environment

Note

RTC is not supported on the AM570x family of devices.

23.2.1 RTC External Interface

The RTC is connected to two external system wake-up signals. The RTC also can operate on external 32-kHz clock and has dedicated power-on reset pin. An external control of the RTC isolation cells is available to isolate RTC from other power domains when the PD_RTC is the only powered domain.

The RTC module can be configured to produce a power-up/down control signal for the power-management chip (PMIC, if present).

Table 23-1 summarizes the external signals received and produced by the RTC module.

Table 23-1. RTC External Signals

Device-Level Pin	Module-Level Signal	I/O	Description
rtc_osc_xi_clkin32	RTC_32K_CLK	I	RTC clock input
rtc_osc_xo	—(1)	O	32k oscillator crystal driver output. Unused if clock is provided from external source (crystal not connected)
wakeup0	EXT_WAKEUP0	I	External wake-up signal
wakeup3	EXT_WAKEUP3	I	External wake-up signal
on_off	PMIC_PWR_ENABLE	O	Companion PMIC control output (on/off) (optional)
rtc_porz	RTC_POR_ARST	I	External power-on-reset input (optional)
rtc_iso	—(2)	I	External control of isolation cells. This signal must be kept low (0) during RTC mode and high (1) after the device power supplies ramped-up. This can typically be achieved by connecting rtc_iso to the porz (not rtc_porz) with appropriate voltage level translation if necessary.

(1) Not a RTC module's signal. Crystal driver output from oscillator.
(2) Not a RTC module's signal. Controls isolation cells.

Figure 23-2 shows the described signals.

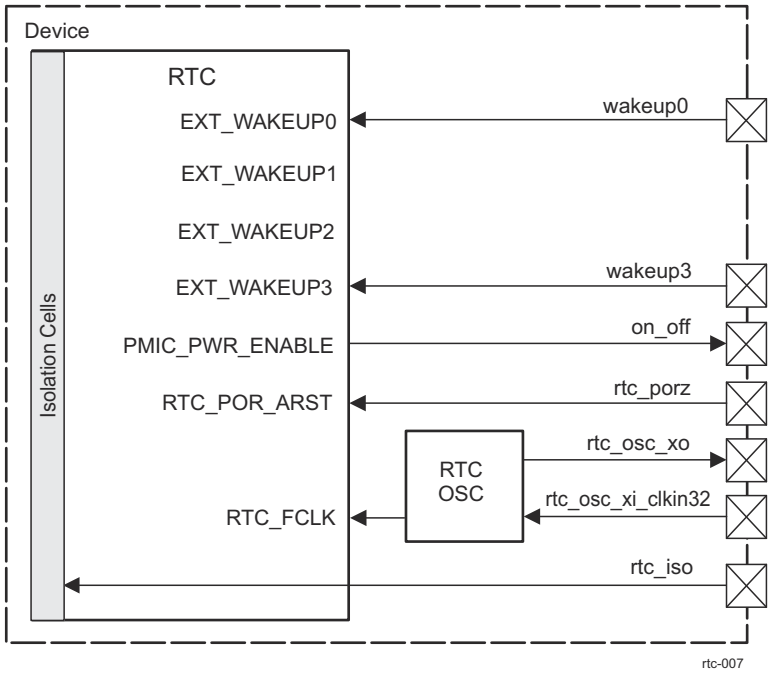

Figure 23-2. RTC External Signals

23.3 RTC Integration

Note

RTC is not supported on the AM570x family of devices.

Figure 23-3 shows the integration of the Real-time clock subsystem inside the device.

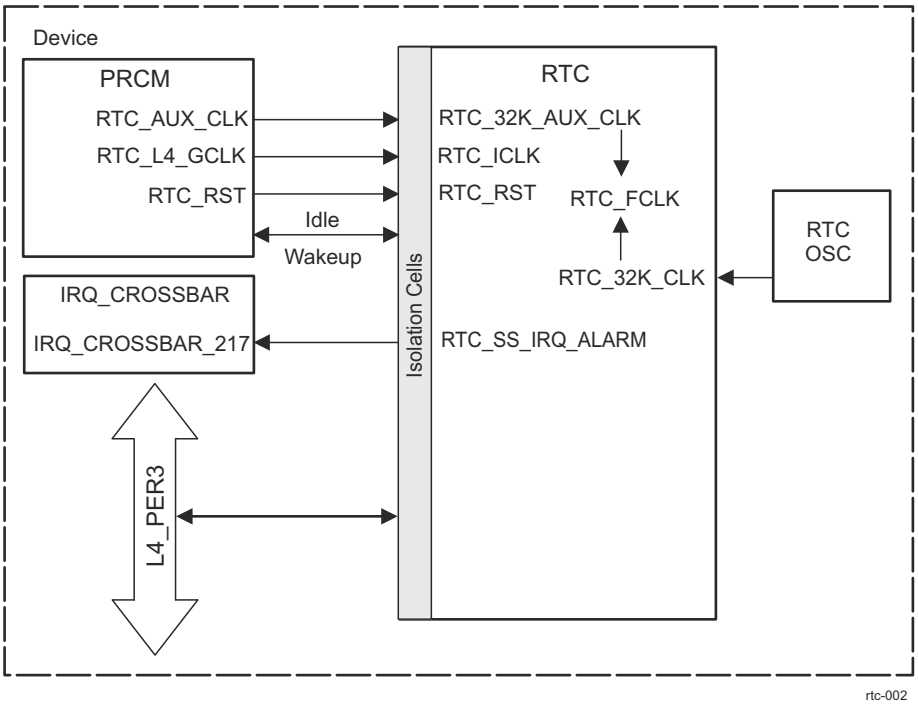

Figure 23-3. RTC Module Integration

Table 23-2. RTC Integration Attributes

Module Instance	**Source Signal Name**	**IRQ_CROSSBAR**	**Default Mapping**	**Description**
RTC	RTC_SS_IRQ_ALARM	IRQ_CROSSBAR_217	-	Alarm interrupt going to device IRQ_CROSSBAR.

Table 23-4. RTC Hardware Requests (continued)

No DMA Requests

Note

The **Default Mapping** column in Table 23-4, *RTC Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other inputs of each device Interrupt controller through the IRQ_CROSSBAR module.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.

23.4 RTC Functional Description

Note

RTC is not supported on the AM570x family of devices.

This section defines the module interrupt capabilities and requirements.

Figure 23-4 shows the functional block diagram of the RTC module.

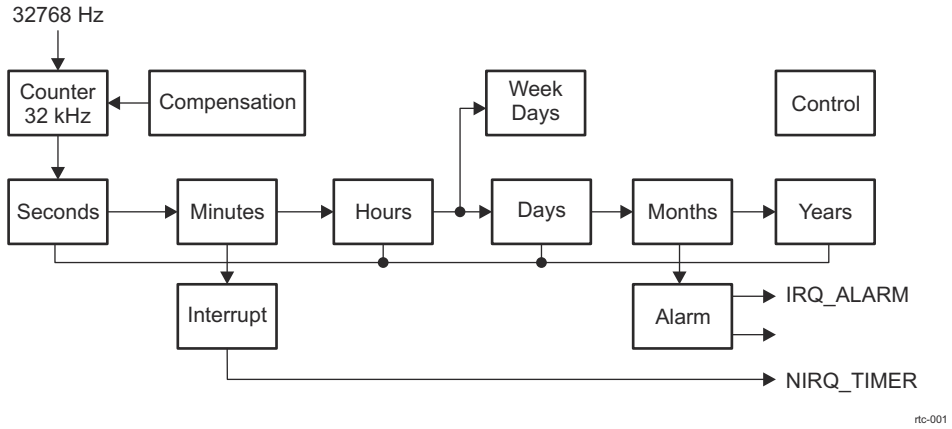

Figure 23-4. RTC Functional Block Diagram

23.4.1 Clock Source

The clock reference for the RTC is an internal 32-kHz clock signal (RTC_AUX_CLK from PRCM) or an external clock source of the 32.768 Hz frequency on the RTC_32K_CLK pin.

The RTC_DISABLE bit in the control register (RTC_CTRL_REG) can be set to save power; however, the RTC_DISABLE bit is not to be cleared once it has been set. If the application requires the RTC module to stop and continue, the STOP_RTC bit in RTC_CTRL_REG is used instead.

The selection between external and internal clock is done through the RTC_OSC_REG register. Setting the RTC_OSC_REG[3] K32CLK_SEL = 1 selects the 32-kHz external/oscillator clock (RTC_32K_CLK), setting it to 0 selects the PRCM clock (RTC_AUX_CLK). RTC_OSC_REG[2] RES_SELECT enables the internal feedback resistor. By modifying the RTC_OSC_REG[4] OSC32K_GZ bit, software enables or disables the 32-kHz oscillator.

If the RTC module or RTC oscillator is not used, the rtc_osc_xi_clkin32 device pin should be held low and rtc_osc_xo should be left unconnected. For more information about rtc pin connection if RTC is not used in the design, see the device-specific data manual.

23.4.2 Interrupt Support

23.4.2.1 CPU Interrupts

The RTC generates two interrupt outputs:

- timer_intr is a timer interrupt.
- alarm_intr is an alarm interrupt.

These two interrupts are OR-ed inside the RTC subsystem and a single interrupt (RTC_SS_IRQ_ALARM) is passed to the IRQ_CROSSBAR module.

Note

Both interrupt outputs support high-level and high-pulse.

23.4.2.2 Interrupt Description

23.4.2.2.1 Timer Interrupt (timer_intr)

The timer interrupt can be generated periodically: every second, every minute, every hour, or every day (see RTC_INTERRUPTS_REG[1:0] for a description of how to set this up). The IT_TIMER bit of RTC_INTERRUPTS_REG enables this interrupt. The timer interrupt is active-low.

The RTC_STATUS_REG bits are only updated at each new interrupt and occur according to Table 23-5. For example, bit 2 (SEC) is set every time one second has passed. Bit 2 is also set when 1 minute has passed, because the completion of 1 minute also marks the completion of 1 second (from 59 seconds to 60 seconds). The same holds true for hours and days: each of them also corresponds to the passing of a second.

Conversely, bit 5 (DAY) is always set when a day has passed. It might also be set when an hour, minute, or second has passed. However, this only occurs when the elapsed hour, minute, or second corresponds to the start of a new day.

Table 23-5. Interrupt Trigger Events

STATUS_REG Bit	One Day Has Passed	One Hour Has Passed	One Minute Has Passed	One Second Has Passed
[5] (DAY)	1	0/1(1)	0/1(1)	0/1(1)
[4] (HOUR)	1	1	0/1(1)	0/1(1)
[3] (MIN)	1	1	1	0/1(1)
[2] (SEC)	1	1	1	1

(1) This event is triggered only when the elapsed time unit (for example, Day) corresponds to the passage of another unit (for example, Seconds). For example, when the clock ticks from 00:23:59:59 (days : hours : minutes : seconds) to 01:00:00:00.

23.4.2.2.2 Alarm Interrupt (alarm_intr)

The alarm interrupt can be generated when the time set into the Timer/Calendar (TC) ALARM registers (see Section 23.4.3.2) is exactly the same as in the TC registers. This interrupt is then generated, if the IT_ALARM bit in the interrupt register (RTC_INTERRUPTS_REG) is set. This interrupt is low-level sensitive. The RTC_STATUS_REG[6] ALARM bit indicates that alarm interrupt has occurred. This interrupt is disabled by setting the RTC_STATUS_REG[6] ALARM bit to 1.

To set up an alarm:

- Modify the RTC_ALARM_SECONDS_REG, RTC_ALARM_MINUTES_REG, RTC_ALARM_HOURS_REG, RTC_ALARM_DAYS_REG, RTC_ALARM_MONTHS_REG, and RTC_ALARM_YEARS_REG registers to the exact time an alarm is to be generated.
- Set the IT_ALARM bit in RTC_INTERRUPTS_REG to enable the alarm interrupt.

When the RTC_PMIC_REG[3:0] EXT_WAKEUP_EN and RTC_PMIC_REG[16] PWR_ENABLE_EN bits are set to 0x1, the PMIC_PWR_ENABLE is controlled by EXT_WAKEUP[3:0] ALARM and ALARM2.

The ALARM2 is set by writing the exact time and date to generate an alarm in RTC_ALARM2_SECONDS_REG, RTC_ALARM2_MINUTES_REG, RTC_ALARM2_HOURS_REG, RTC_ALARM2_DAYS_REG, RTC_ALARM2_MONTHS_REG, and RTC_ALARM2_YEARS_REG registers.

23.4.3 RTC Programming/Usage Guide

23.4.3.1 Time/Calendar Data Format

The time and calendar data in the RTC is stored in BCD format. In BCD format, the decimal numbers 0 through 9 are encoded with their binary equivalent. Four bits are assigned to each BCD digit in most time/calendar registers; however, some of the register fields are shorter, because the range of valid numbers may be limited. For example, only three bits are required to represent the day of the week (RTC_WEEKS_REG), because only BCD numbers 1 through 7 are required. The following time and calendar registers are supported (BCD Format):

- RTC_SECONDS_REG — Second Count (00–59)
- RTC_MINUTES_REG — Minute Count (00–59)
- RTC_HOURS_REG — Hour Count (12HR: 01–12; 24HR: 00–23)
- RTC_DAYS_REG — Day of the Month Count (01–31)

- RTC_WEEKS_REG — Day of the Week (0–6: SUN = 0)
- RTC_MONTHS_REG — Month Count (01–12; JAN = 1)
- RTC_YEARS_REG — Year Count (00–99)

23.4.3.2 Register Access

The three register types are as follows and each has its own access constraints:

- TC registers and TC alarm registers
  - TC registers (see Section 23.4.3.1)
  - TC alarm registers:
    - RTC_ALARM_SECONDS_REG
    - RTC_ALARM_MINUTES_REG
    - RTC_ALARM_HOURS_REG
    - RTC_ALARM_DAYS_REG
    - RTC_ALARM_MONTHS_REG
    - RTC_ALARM_YEARS_REG
    - RTC_ALARM2_SECONDS_REG
    - RTC_ALARM2_MINUTES_REG
    - RTC_ALARM2_HOURS_REG
    - RTC_ALARM2_DAYS_REG
    - RTC_ALARM2_MONTHS_REG
    - RTC_ALARM2_YEARS_REG
- General registers:
  - RTC_CTRL_REG
  - RTC_STATUS_REG

23.4.3.3 Register Spurious Write Protection

The module also contains a kicker mechanism (see Figure 23-5) to prevent any spurious writes from changing the register values.

Note

This mechanism requires two register writes to the KICK0 and KICK1 registers with exact data values before the kicker lock mechanism is released. Once released, the registers are writeable. The KICK0 data is 83E7 0B13h; the KICK1 data is 95A4 F1E0h. The mechanism remains in an unlocked state until a reset or invalid data pattern is written to one of the RTC_KICK0_REG or RTC_KICK1_REG registers.

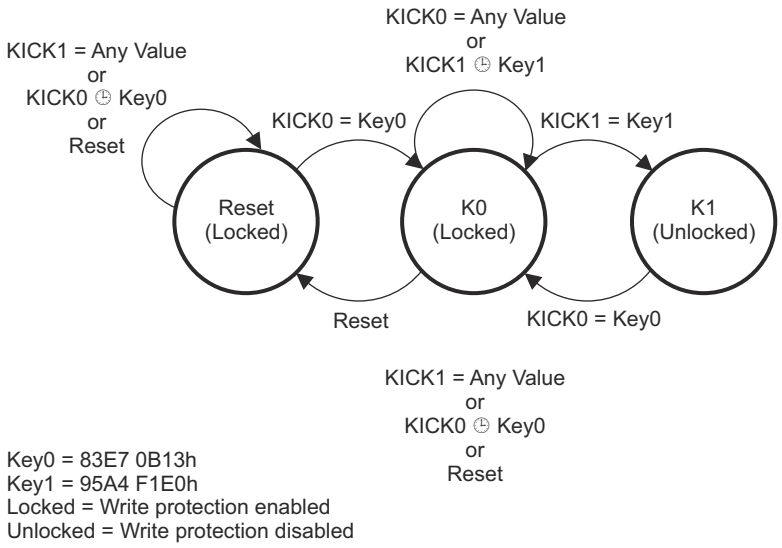

Figure 23-5. Kick Register State Machine Diagram

- S0 is the Reset/Idle state
- S1 is an write cycle of 83E7 0B13h at KICK0 completed state
- S2 is the UNLOCK register WRT state
- S0 → S1 when write cycle of 83E7 0B13h at KICK0
- S1 → S2 when write cycle of 95A4 F1E0h at KICK1
- S1 → S0 when reset event
- S2 → S0 when reset event or write cycle of NOT 83E7 0B13h at KICK0 or write cycle at KICK1
- S2 → S1 when write cycle of 83E7 0B13h at KICK0

23.4.3.4 Reading the Timer/Calendar (TC) Registers

The TC registers have a read-show register. The reading of the SECONDS register updates all TC registers. For example, the Year is updated only on a reading of the SECONDS register. The TC registers are updated every second as the time changes. During a read of the SECONDS register, the RTC copies the current values of the time/date registers into shadow read registers. This isolation assures that the CPU can capture all the time/date values when the SECONDS read request occurs and is not subject to changing register values from time updates.

If desired, the RTC also provides a one-time-triggered minute-rounding feature to round the MINUTE:SECOND registers to the nearest minute (with zero seconds). This feature is enabled by setting the ROUND_30S bit in the control register (RTC_CTRL_REG). The RTC automatically rounds the time values to the nearest minute the next time the SECONDS register is read.

Note

Software should always read the SECONDS register first. However, software does not have to poll any status bit to determine when to read the TC registers. Table 23-6 defines the TC set that gets shadowed.

Table 23-6. RTC Register Names and Values

Time Unit	Range	Remarks
Year	00 to 99	
Month	01 to 12	

Table 23-6. RTC Register Names and Values (continued)

Time Unit	Range	Remarks
Day	01 to 31	Months 1, 3, 5, 7, 8, 10, 12
	01 to 30	Months 4, 6, 9, 11
	01 to 29	Month 2 (leap year)
	01 to 28	Month 2 (common year)
Week	00 to 06	Day of week
Hour	00 to 23	24-hour mode
	01 to 12	AM/PM mode
Minute	00 to 59	
Seconds	00 to 59	

23.4.3.4.1 Rounding Seconds

Time can be rounded to the closest minute, by setting the ROUND_30S bit of the control register (RTC_CTRL_REG). When this bit is set, TC values are set to the closest minute value at the next second. The ROUND_30S bit is automatically cleared when rounding time is performed.

Example:

- If current time is 10H59M45S, round operation changes time to 11H00M00S.
- If current time is 10H59M29S, round operation changes time to 10H59M00S.

23.4.3.5 Modifying the TC Registers

To write correct data from and to the TC and TC alarm registers and read the TC alarm registers, the MPU must first read the BUSY bit of the status register (RTC_STATUS_REG) until BUSY is equal to zero. Once the BUSY flag is zero, there is a 15-µs access period in which the MPU can program the TC and TC alarm registers. Once the 15-µs access period passes, the BUSY flag must again be read from the STATUS register as previously described. If the MPU accesses the TC registers outside of the access period, then the access is not assured.

The MPU can access the RTC_STATUS_REG and the RTC_CTRL_REG registers at any time, with the exception of the RTC_CTRL_REG[5] bit, which can only be changed when the RTC is stopped. The MPU can stop the RTC by clearing the STOP_RTC bit of RTC_CTRL_REG. After clearing this bit, the RUN bit in RTC_STATUS_REG must be checked to verify the RTC has stopped. Once this is confirmed, the TC values can be updated. After the values have been updated, the RTC can be restarted by resetting the STOP_RTC bit.

Note

After writing to a TC register, software must wait four clock cycles before reading the value from the register. If this wait time is not observed and the TC register is accessed, then old data will be read from the register.

CAUTION

To remove any possibility of interrupting the register read process, which introduces a risk of violating the authorized 15-µs access period, TI recommends disabling all incoming interrupts during the register read process.

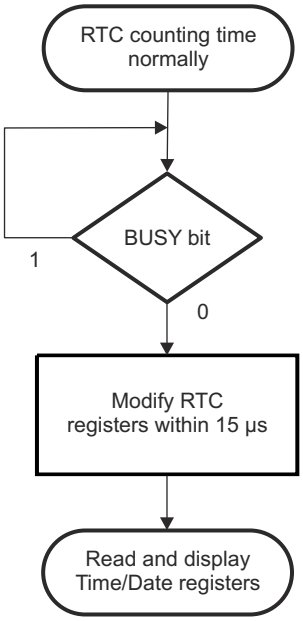

Figure 23-6. Flow Control for Updating RTC Registers

23.4.3.5.1 General Registers

The MPU can access the RTC_STATUS_REG and the RTC_CTRL_REG registers at any time (except the CTRL_REG[5] bit, which must be changed only when the RTC is stopped). For the RTC_INTERRUPTS_REG register, the MPU should respect the available access period to prevent spurious interrupt.

The RTC_DISABLE bit of the RTC_CTRL_REG register must only be used to completely disable the RTC function. When this bit is set, the 32-kHz clock is gated, and the RTC is frozen. From this point, resetting the RTC_DISABLE bit to zero can lead to unexpected behavior. To save power, this bit should only be used if the RTC function is unwanted in the application.

23.4.3.6 Crystal Compensation

To compensate for any inaccuracy of the 32-kHz oscillator the MPU can perform a calibration of the oscillator frequency, calculate the drift compensation versus a 1-hour period, and load the compensation registers with the drift compensation value. Auto compensation is enabled by the AUTO_COMP bit in the RTC_CTRL_REG register. If the value of the COMP_REG registers (RTC_COMP_LSB_REG and RTC_COMP_MSB_REG) is positive, compensation occurs after the second change event. COMP_REG cycles are removed from the next second. If the COMP_REG value is negative, compensation occurs before the second change event. COMP_REG cycles are added to the current second. This enables compensation with a 1 32-kHz period accuracy each hour. The waveform in Figure 23-7 summarizes positive and negative compensation effect.

Access to the RTC_COMP_MSB_REG and RTC_COMP_LSB_REG registers must respect the available access period. These registers should not be updated during compensation (the first second of each hour), but it is alright to update them during the second preceding a compensation event. For example, the MPU could load the compensation value into these registers after each hour event, during an available access period.

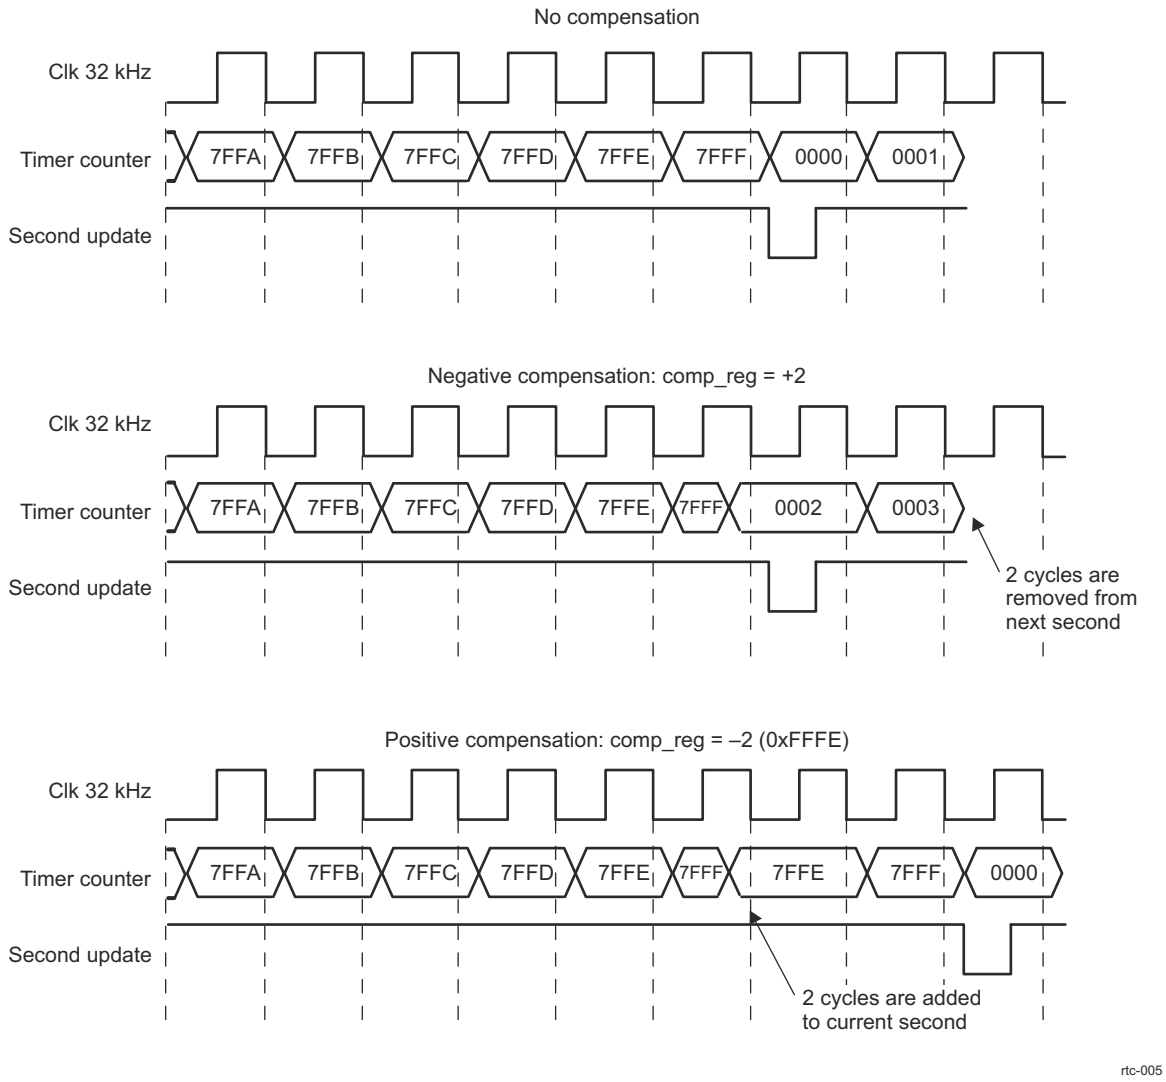

Figure 23-7. Compensation Illustration

23.4.4 Scratch Registers

The RTC provides three general-purpose registers (RTC_SCRATCHx_REG) that can be used to store 32-bit words -- these registers have no functional purpose for the RTC. Software using the RTC may find the SCRATCHx_REG registers to be useful in indicating RTC states. For example, the RTC_SCRATCHx_REG (RTC_SCRATCH0_REG, RTC_SCRATCH1_REG, RTC_SCRATCH2_REG) registers may be used to indicate write-protection lock status or unintentional power downs. To indicate write-protection, the software should write a unique value to one of the RTC_SCRATCHx_REG registers when write-protection is disabled and another unique value when write-protection is enabled again. In this way, the lock-status of the registers can be determined quickly by reading the RTC_SCRATCHx_REG register. To indicate unintentional power downs, the software should write a unique value to one of the RTC_SCRATCHx_REG registers when RTC is configured and enabled. If the RTC is unintentionally powered down, the value written to the RTC_SCRATCHx_REG register is cleared.

23.4.5 Debouncing

The debounce timer uses the 32768-Hz clock or the clock coming from the external oscillator, depending on the SW configurations for the RTC. It allows choosing the timing or accuracy of the "debouncing".

A register receives a bit from the reference pin. Software then chooses the timing if it uses the debouncing feature like a timer, or it chooses the accuracy if it uses the debouncing like a real debouncing. The debouncing is finished when the reference pin stays the same value, defined in RTC_RTL_DEBOUNCE_REG[7:0] DEBOUNCE_REG, for a defined time.

If the RTC module uses the internal 32-kHz clock then setting the RTC_RTL_DEBOUNCE_REG[7:0] DEBOUNCE_REG to 0x0 results in a debounce time of 30.52us. Otherwise (DEBOUNCE_REG = n) the debounce time is 30.52µs × (n + 1). The debounce time may be different, depending on, whether the module uses the internal 32 kHz clock, or an external clock source.

23.4.6 Power Management

23.4.6.1 Device-Level Power Management

The RTC supports the power idle protocol. The RTC has two SWakeup ports: one for the alarm event and one for a timer event.

When the RTC is in IDLE mode, the clock is turned off and the 32 kHz clock remains on. The time and calendar continue to count in IDLE mode. When the RTC is placed back in FUNCTIONAL mode, the TC registers can be read. The RTC idle mode configuration is done through the RTC_SYSCONFIG_REG[1:0] IDLEMODE bit (see Table 23-7).

Table 23-7. RTC Idle Configuration

IDLEMODE	Description
0x0	Force IDLE: idle state of the local target follows (acknowledges) the system IDLE request unconditionally
0x1	No-idle mode: RTC never enters idle state
0x2	Smart-idle mode: RTC subsystem waits for all interrupts/events to be serviced before entering in IDLE mode.
0x3	Smart-idle wakeup-capable mode: RTC eventually acknowledges the system IDLE requests, depending on its internal requirements, RTC can generate wakeup events when in idle state.

The Alarm SWakeup event can be used to wake up the RTC when it is in idle state. To do so, the alarm must be set and enabled before RTC enters idle state. Also the wakeup generation for alarm/timer event must be set (bits [1:0] in the RTC_IRQWAKEEN register). Once this is done, the SWakeup event occurs when the alarm event triggers.

Note

SWakeup is not periodic, using Timer SWakeup event to wake up the RTC when in idle state is not recommended. Use Alarm SWakeup instead.

There are two idle modes: smart-idle mode and smart-idle wakeup-capable mode. The RTC should be configured to smart-idle wakeup-capable mode in order to use the SWakeup events.

23.4.6.2 Subsystem-Level Power Management — PMIC Mode

The RTC generates PMIC_PWR_ENABLE control, which can be used to control an external PMIC. The control of the associated PMIC wakeups and alarms is done through the RTC_PMIC_REG[22:0] bits.

23.5 RTC Low-Level Programming Guide

Note

RTC is not supported on the AM570x family of devices.

23.5.1 Global Initialization

23.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the real time clock is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the RTC.

Table 23-8. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. for more information about the module configuration. For more information about the module configuration, see *Module Level Clock Management*, in *Power, Reset, and Clock Management*.
Control module	Module-specific pad muxing must be set in the control module. For more information about the module configuration, see *Pad Configuration Registers* in *Control Module*.
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.

23.5.1.2 RTC Module Global Initialization

23.5.1.2.1 Main Sequence – RTC Module Global Initialization

Table 23-9 lists the steps for initializing the RTC module when the module is to be used for the first time.

Table 23-9. RTC Module Global Initialization

Step	Register/Bit Field/Programming Model	Value
Write 0x83E7 0B13 to the Kick0 Register to unlock register writes	RTC_KICK0_REG	0x83E70B13
Write 0x95A4 F1E0 to the Kick1 Register to unlock register writes	RTC_KICK1_REG	0x95A4F1E0
Select the clock source (internal or external 32-kHz clock)	RTC_OSC_REG[3] 32KCLK_SEL	-
If external clock is selected, start the oscillator. Wait for oscillator to stabilize.	RTC_OSC_REG[4] OSC32K_GZ	0
Enable the 32-kHz clock	RTC_OSC_REG[6] 32KCLK_EN	1
Configure slave idle mode	RTC_SYSCONFIG_REG [1:0] IDLEMODE	0x-
Enable interrupts, if needed	RTC_INTERRUPTS_REG[4:0]	0x-
Enable wakeup interrupts, if needed	RTC_IRQWAKEEN[1:0]	0x-
Set current time	RTC_SECONDS_REG[6:0]	BCD
	RTC_MINUTES_REG[6:0]	BCD
	RTC_HOURS_REG[5:0]	BCD
Set current date	RTC_DAYS_REG[5:0]	BCD
	RTC_MONTHS_REG[4:0]	BCD
	RTC_YEARS_REG[7:0]	BCD
	RTC_WEEKS_REG[2:0]	BCD
Run the real-time clock	RTC_CTRL_REG[0] STOP_RTC	1

23.6 RTC Register Manual

Note

RTC is not supported on the AM570x family of devices.

Chapter 24

Serial Communication Interfaces

This chapter describes the features and operation of the device serial communication interfaces (SCI).

24.1 Multimaster High-Speed I²C Controller

This section describes the high-speed inter-integrated circuit (I²C) controller modules in the device.

Note

Not all I²C instances support HS-mode operation. See the Device Data Manual for details.

Note

I2C6 is not supported on the AM571x/AM570x family of devices.

24.1.1 HS I²C Overview

The device contains six multimaster high-speed (HS) inter-integrated circuit (I²C) controllers (I2C*i* modules, where *i* = 1, 2 ,3, 4, 5 , 6) each of which provides an interface between a local host (LH), such as a digital signal processor (DSP), and any I²C-bus-compatible device that connects through the I²C serial bus. External components attached to the I²C bus can serially transmit and receive up to 8 bits of data to and from the LH device through the 2-wire I²C interface.

Each multimaster HS I²C controller can be configured to act like a slave or master I²C-compatible device.

I2C1 and I2C2 controllers have dedicated I2C compliant open drain buffers, and support Fast mode (up to 400Kbps). I2C3, I2C4, I2C5 and I2C6 controllers are multiplexed with standard LVCMOS IO and connected to emulate open drain. I²C emulation is achieved by configuring the LVCMOS buffers to output Hi-Z instead of driving high when transmitting logic 1. These controllers support HS mode (up to 3.4Mbps). For the specific IO timing characteristics of the different I²C instances, see the device data manual.

Figure 24-1 shows the I²C.

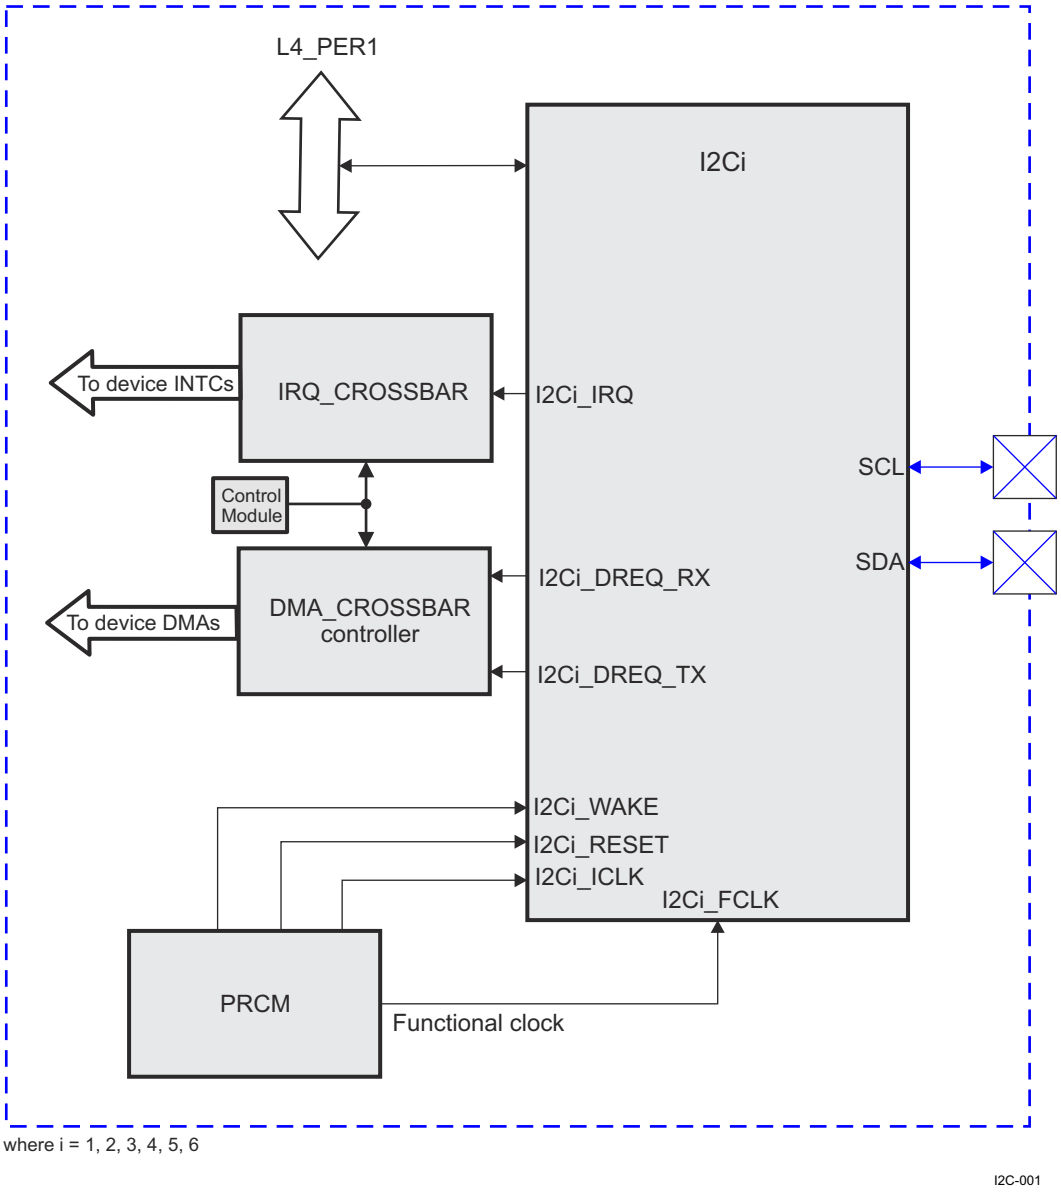

Figure 24-1. HS I²C Controllers

The multimaster HS I²C controllers have the following features:

- Compliant with Philips I²C specification version 2.1
- Supports a standard mode (up to 100 kbps) and fast mode (up to 400 kbps)
- Supports HS mode for transfer up to 3.4 Mbps (only for I2C3, I2C4, I2C5 and I2C6)
- 7-bit and 10-bit device addressing modes
- General call
- Start/Restart/Stop
- Multimaster transmitter/slave receiver mode
- Multimaster receiver/slave transmitter mode
- Combined master transmit/receive and receive/transmit mode
- Built-in FIFOs (16 bytes) for buffered read or write
- Module enable/disable capability
- Programmable multislave channel (responds to four separate addresses)
- Programmable clock generation

- 8-bit-wide data access
- Designed for low power consumption
- Implement Auto Idle mechanism
- Implement Idle Request/Idle Acknowledge handshake mechanism
- Support for asynchronous wakeup mechanism
- Two direct memory access (DMA) channels
- Wide interrupt capability

24.1.2 HS I²C Environment

This section describes the HS I²C application fields from an environment point of view (external connections). It describes HS I²C connectivity options, lists all possible interfaces, and describes the protocol and data format used in each case.

24.1.2.1 HS I²C Typical Application

Figure 24-2 shows the multimaster HS I²C controllers and their related connections with I²C-compliant devices.

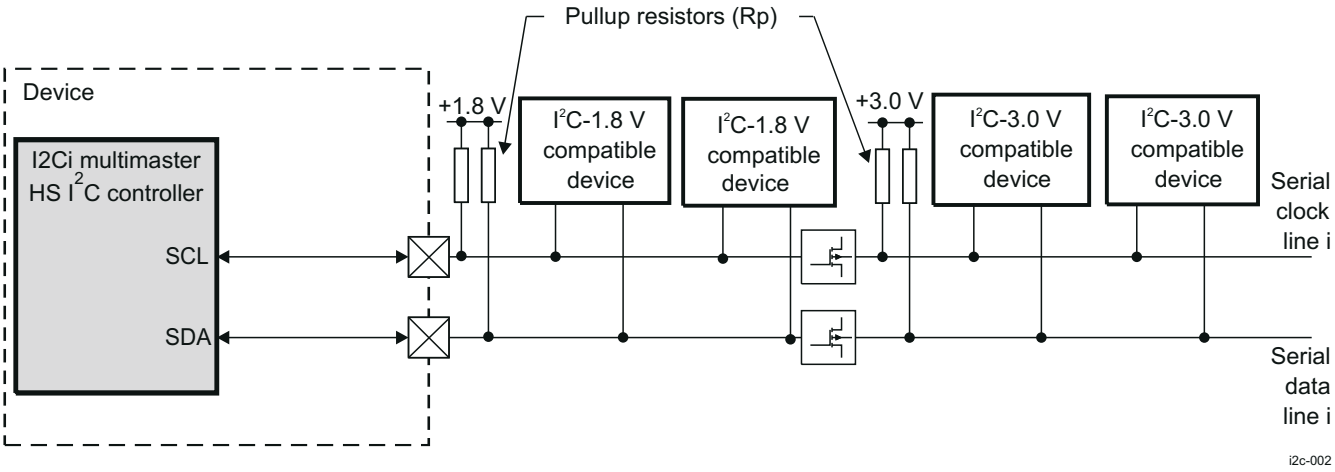

Figure 24-2. HS I²C and Typical Connections to I²C Devices

24.1.2.1.1 HS I²C Pins for Typical Connections in I²C Mode

Figure 24-3 shows the multimaster HS I²C controller pins used for typical connections with I²C devices.

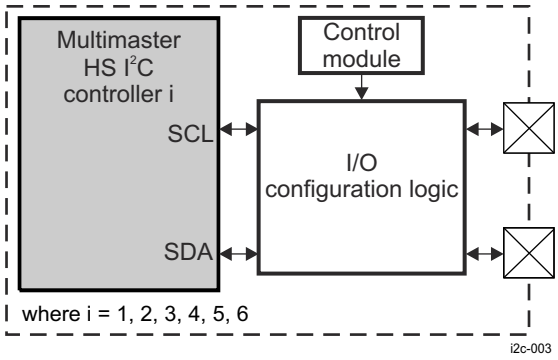

Figure 24-3. HS I²C Interface Signals

24.1.2.1.2 HS I²C Interface Typical Connections

Table 24-1 lists the pins associated with the I²C interface.

Table 24-1. HS I²C Input/Output

Signal	Device Level Signal	I/O(1)	Description	Reset Value
SCL	i2c*j*_scl(2)	I/O	I²C serial clock line. Open-drain output buffer.	1
SDA	i2c*j*_sda(2)	I/O	I²C serial data line. Open-drain output buffer.	1
SCL	i2c*i*_scl(3)	I/O	I²C serial clock line. Emulated open-drain output buffer.	1
SDA	i2c*i*_sda(3)	I/O	I²C serial data line. Emulated open-drain output buffer.	1

(1) I = Input; O = Output
(2) j= 1 and 2
(3) i= 3 to 6

Note

For the i2c*j*_scl and i2c*i*_scl signals to work properly, the INPUTENABLE bit of the appropriate CTRL_CORE_PAD_x registers should be set to 0x1 because of retiming purposes.

Note

The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the Control Module registers. Refer to the sections *Pad Functional Multiplexing* of the chapter *Control Module*, for more information.

24.1.2.1.3

Note

For the i2c*j*_scl and i2c*i*_scl signals to work properly, the INPUTENABLE bit of the appropriate CTRL_CORE_PAD_x registers should be set to 0x1 because of retiming purposes.

Note

The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the Control Module registers. Refer to the sections Section 18.4.6.1.1 *Pad Functional Multiplexing* of the chapter Chapter 18 *Control Module*, for more information.

24.1.2.2 HS I²C Typical Connection Protocol and Data Format

24.1.2.2.1 HS I²C Serial Data Format

The I²C controller operates in 8-bit word data format (byte write access supported for the last access). Each byte transmitted or received on the serial data line is 8 bits long. The number of bytes that can be transmitted or received is not restricted. The data is transferred with the most-significant bit (MSB) first. In receiver mode, each byte is followed by an acknowledge bit from the I²C. Figure 24-4 shows a typical I²C communication format.

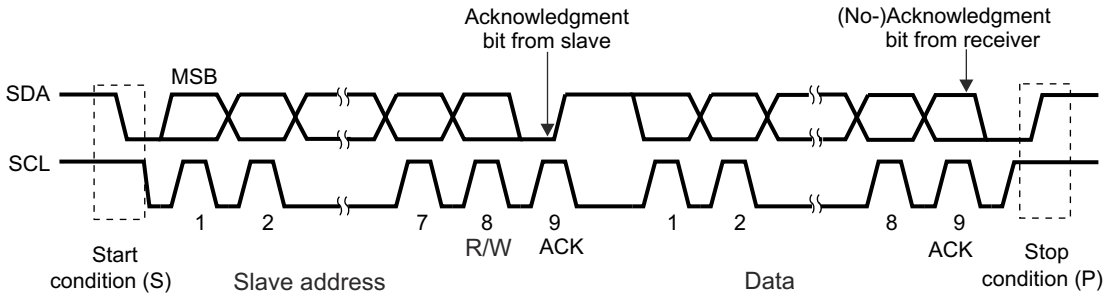

Figure 24-4. HS I²C Data Transfer

24.1.2.2.2 HS I²C Data Validity

The data on the serial data line (SDA) must be stable during the high period of the serial clock line. The high and low states of the data line can change only when the clock signal on the serial clock line (SCL) is low.

Figure 24-5 is an example of data validity requirements.

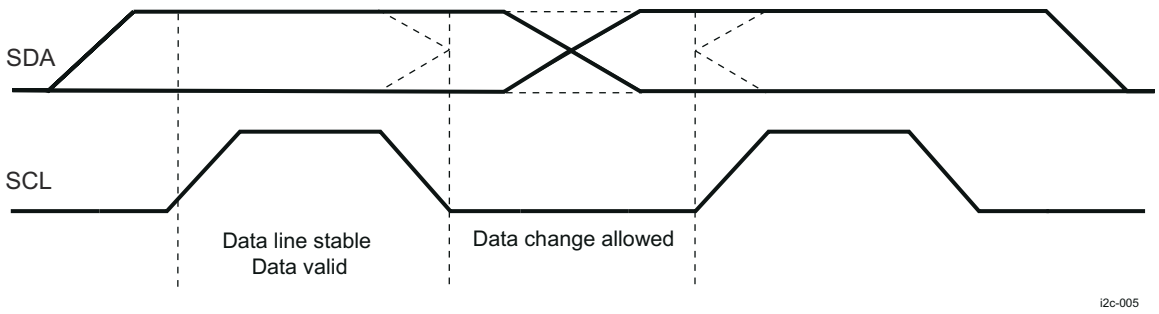

Figure 24-5. HS I²C Bit Transfer on the I²C Bus

24.1.2.2.3 HS I²C Start and Stop Conditions

The I²C module generates start (S) and stop (P) conditions when it is configured as a master.

- An S condition is a high-to-low transition on the serial data line while serial clock line is high.
- A P condition is a low-to-high transition on the serial data line while serial clock line is high.

The bus is considered busy after the S condition (the I2C*i*. [12] BB bit is 1 to indicate that the bus is busy) and free after the P condition (the I2C*i*.I2C_IRQSTATUS_RAW [12] BB bit is 0 to indicate that the bus is free).

Figure 24-6 shows the waveforms that occur during an S and a P condition.

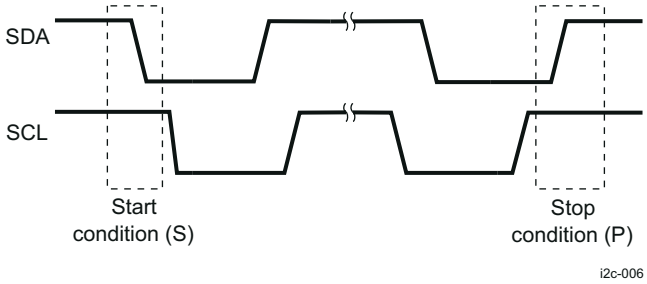

Figure 24-6. HS I²C S and P Condition Events

Note

I²C controller does not support messages non-compliant with I2C standard. Void messages are non-standard I²C messages and will lockup the controller. A void message is a START condition followed by a STOP condition, in other words, while the bus is free the SDA line is pulled low (START) and then released (STOP). This would result in a timeout (software) of the next master transfer which would never complete. A soft reset of the controller is recommended for recovery.

24.1.2.2.4 HS I²C Addressing

The I²C module supports two data formats in fast/standard (F/S) and HS modes:

- 7-bit/10-bit addressing format
- 7-bit/10-bit addressing format with repeated start (Sr) condition

24.1.2.2.4.1 Data Transfer Formats in F/S Mode

Figure 24-7 shows the I²C data transfer formats in F/S mode.

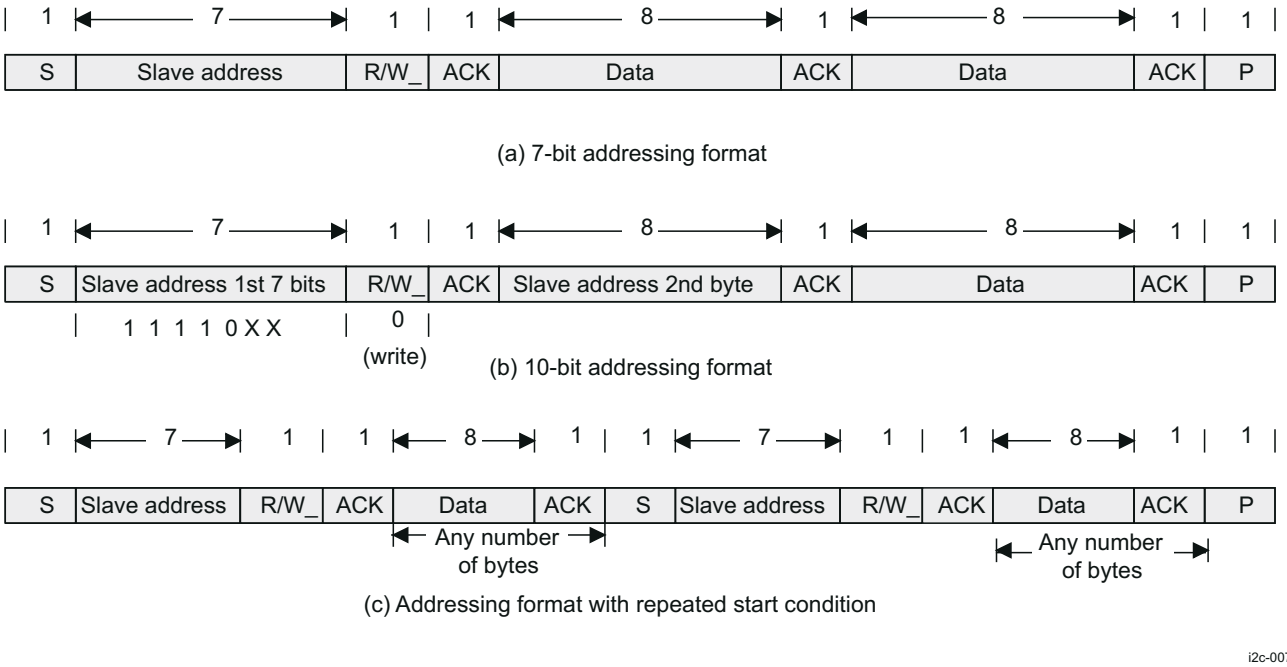

Figure 24-7. HS I²C Data Transfer Formats in F/S Mode

The first word after an S condition consists of 8 bits. In acknowledge mode, an extra dedicated acknowledgment bit is inserted after each byte.

In addressing formats with 7-bit addresses, the first byte is composed of 7 MSB slave address bits and 1 least-significant bit (LSB) R/W_ bit.

The LSB R/W_ bit of the address byte indicates the transmission direction of the data bytes that follow it. If R/W_ is 0, the master writes data to the selected slave; if it is 1, the master reads data from the slave.

In addressing formats with 10-bit addresses, the structure of the first byte is 11110XXY, where XX is the two MSBs of the 10-bit addresses, and Y is the R/W_ bit. If the R/W_ bit is 0, the next byte contains the last 8 bits of the slave address. If the R/W_ bit is 1, the next byte contains data transmitted from the slave to the master.

24.1.2.2.4.2 Data Transfer Format in HS Mode

Figure 24-8 shows the I²C data transfer format in HS mode.

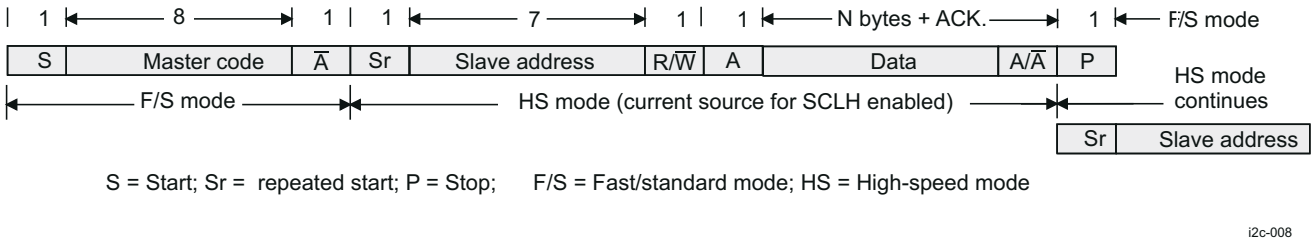

Figure 24-8. HS I²C Data Transfer in HS Mode

Each multimaster HS I²C controller can also operate in HS mode. In this case, after the S condition, the module, which is in F/S mode, writes the master code address (000001XXX, where XXX is the variable portion of the master code) on the bus. No device connected on the same bus acknowledges this address. The module switches the clock to the HS clock and after an Sr condition, and sends the slave address and the data, as shown in Figure 24-8.

24.1.2.2.5 HS I²C Master Transmitter

In master transmitter mode, data assembled in one of the previously described data formats is shifted out on the serial data line SDA in sync with the self-generated clock pulses on the serial clock line SCL. The clock pulses are inhibited and SCL is held low when the intervention of the processor is required (XUDF) after a byte is transmitted.

24.1.2.2.6 HS I²C Master Receiver

Master receiver mode can be entered only from master transmitter mode. With any of the address formats (a), (b), or (c) (see Figure 24-7), if R/W_ is high, the module enters master receiver mode after the slave address byte and bit R/W_ are transmitted. Serial data bits received on bus line SDAI are shifted in synchronization with the self-generated clock pulses on SCLI.

24.1.2.2.7 HS I²C Slave Transmitter

Slave transmitter mode can be entered only from slave receiver mode. With any of the address formats (a), (b), or (c) (see Figure 24-7), the slave transmitter is entered if the slave address byte is the same as its own address and bit R/W_ is transmitted, if R/W_ is high. The slave transmitter shifts the serial data out on the data line SDA in sync with the clock pulses that are generated by the master device. It does not generate the clock but it can hold clock line SCL low while intervention of the LH is required (XUDF).

24.1.2.2.8 HS I²C Slave Receiver

In this mode, serial data bits received on the bus line SDA are shifted-in in sync with the clock pulses on SCL that are generated by the master device. It does not generate the clock but it can hold clock line SCL low while intervention of the LH is required (ROVR) after a byte is received.

24.1.2.2.9 HS I²C Bus Arbitration

If two or more master transmitters start a transmission on the same bus almost simultaneously, an arbitration procedure is invoked. The arbitration procedure uses the data presented on the serial bus by the competing transmitters. When a transmitter senses that a high signal it has presented on the bus has been overruled by a low signal, it switches to the slave receiver mode, sets the arbitration lost (AL) flag, and generates the arbitration lost interrupt. Figure 24-9 shows the arbitration procedure between two devices. The arbitration procedure gives priority to the device that transmits the serial data stream with the lowest binary value. If two or more devices send identical first bytes, arbitration continues on the subsequent bytes.

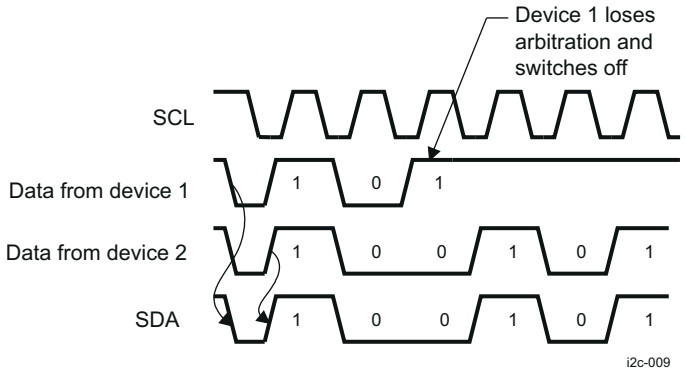

Figure 24-9. HS I²C Arbitration Between Master Transmitters

24.1.2.2.10 HS I²C Clock Generation and Synchronization

Under normal conditions, only one master device generates the clock signal, SCL. However, there are two or more master devices during the arbitration procedure, and the clock must be synchronized so that the data output can be compared. The wired-AND property of the clock line means that a device that first generates a low period of the clock line overrules the other devices. At this high/low transition, the clock generators of the other devices are forced to start generation of their own low period. The clock line is then held low by the device with the longest low period, while the other devices that finish their low periods must wait for the clock line to be

released before starting their high periods. A synchronized signal on the clock line is thus obtained, where the slowest device determines the length of the low period and the fastest device determines the length of the high period. If a device pulls down the clock line for a longer time, the result is that all clock generators must enter the WAIT-state. In this way a slave can slow down a fast master and the slow device can create enough time to store a received byte or prepare a byte to be transmitted (clock stretching).

Note

In case the SCL or SDA lines are stuck low, a bus clearing operation is supported:

- If the clock line (SCL) is stuck low, the preferential procedure is to reset the bus using the hardware reset signal if your I^2C devices have hardware reset inputs. If the I^2C devices do not have hardware reset inputs, cycle power to the devices to activate the mandatory internal power-on reset (POR) circuit.
- If the data line (SDA) is stuck low, the master should send nine clock pulses. The device that held the bus low should release it sometime within those nine clocks. If not, then use the hardware reset or cycle power to clear the bus.

Figure 24-10 shows clock synchronization.

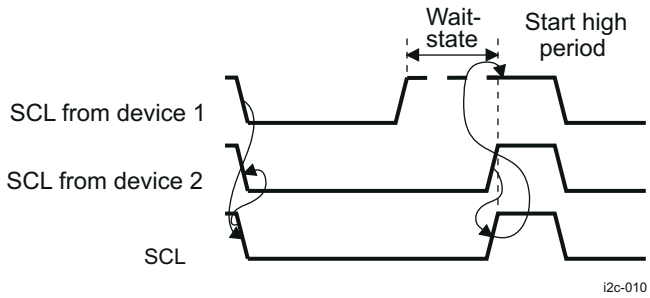

Figure 24-10. HS I^2C Clock Generators Synchronization

24.1.3 HS I²C Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 24-11 shows the integration of the six HS I²C controllers in the device.

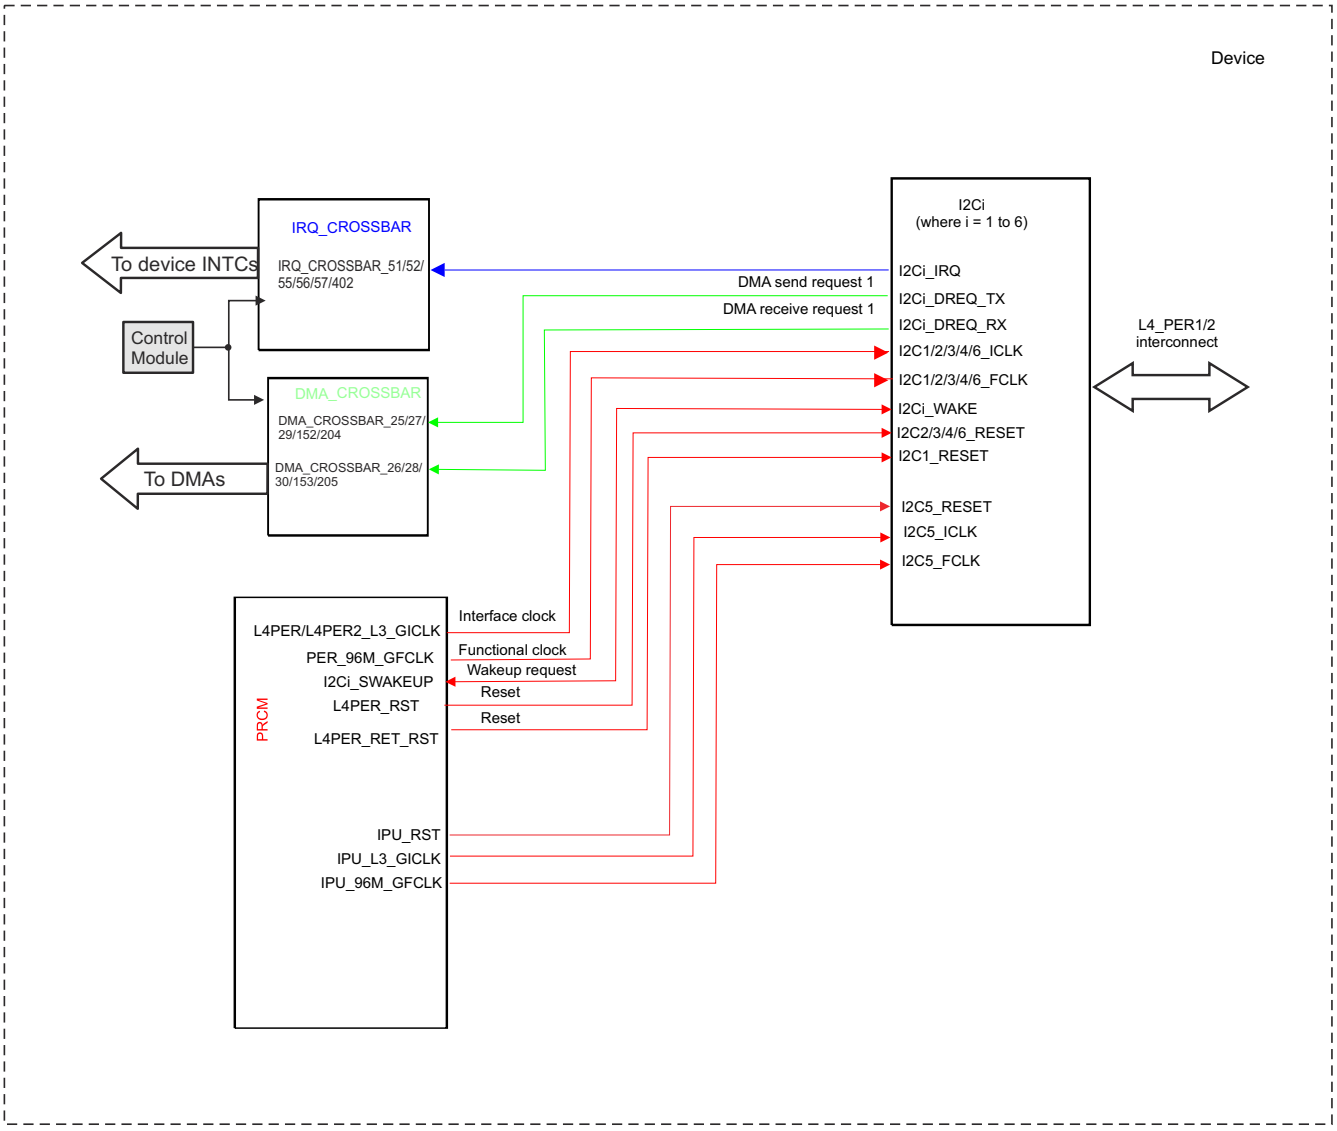

Figure 24-11. HS I²C Integration

Note

For more information about the slave idle protocol and the wake-up request, see *Power Management Functional Description*, in *Power, Reset, and Clock Management*.

Table 24-2 through Table 24-4 summarize the integration of the module in the device.

	I2C6_DREQ_RX	DMA_CROSSBAR_205	-	I2C6 DMA receive request

Note

The **Default Mapping** column in Table 24-4 *HS I²C Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.
For more information about the device DMA_SYSTEM module, see *System DMA*.
For more information about the device EDMA module, see *Enhanced DMA*.

Note

- For a description of interrupt source, see Table 24-10.
- For a description of DMA source, see Table 24-11.

24.1.4 HS I²C Functional Description

24.1.4.1 HS I²C Block Diagram

Figure 24-12 is the multimaster I²C HS controller block diagram.

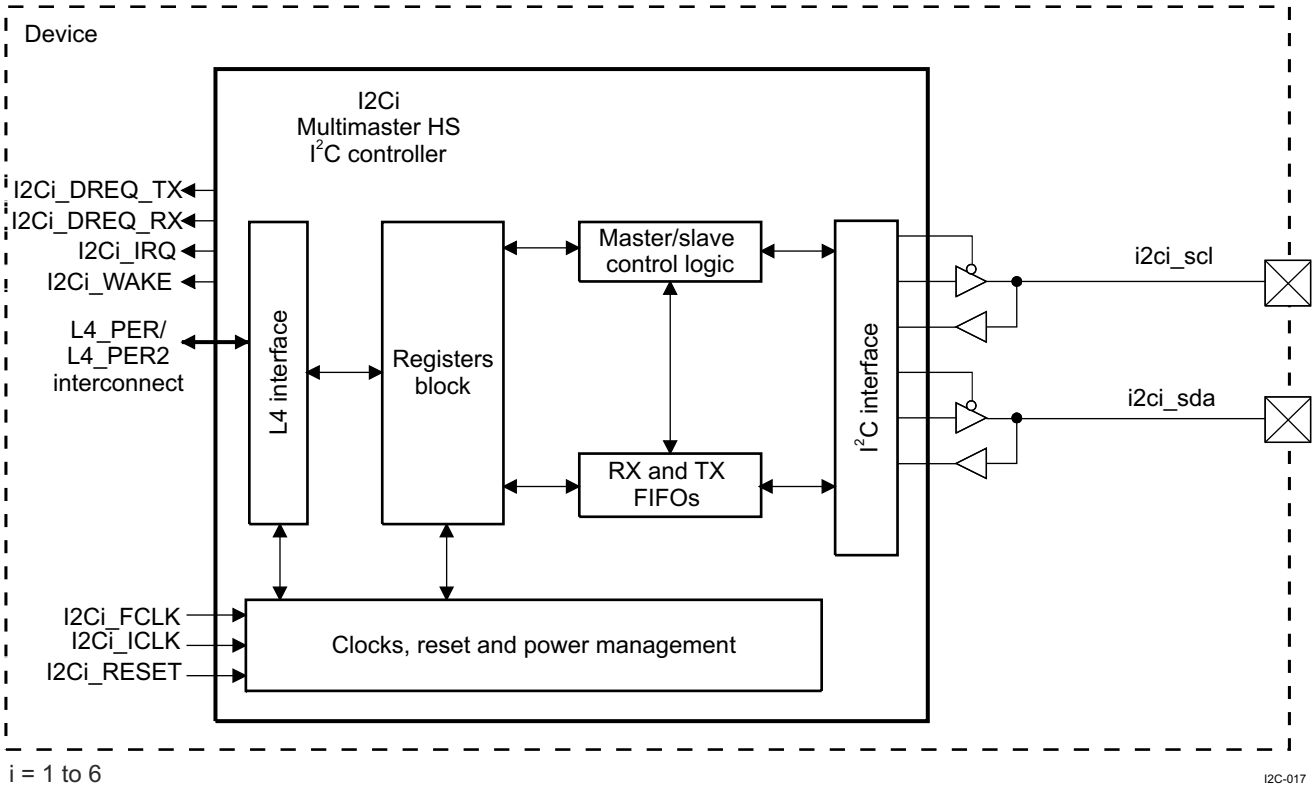

Figure 24-12. HS I²C Block Diagram

The six multimaster HS I²C controllers can be configured in F/S I²C mode or HS I²C mode. The operation mode is selected by configuring the I2C*i*.I2C_CON[13:12] OPMODE bit field. Table 24-5 lists the available operation modes.

Table 24-5. HS I²C Operation Mode Selection

Operation Mode	Value of I2C*i*.I2C_CON[13:12] OPMODE
F/S I²C	0x0
HS I²C	0x1
Reserved	0x2
Reserved (not used)	0x3

24.1.4.2 HS I²C Clocks

24.1.4.2.1 HS I²C Clocking

Figure 24-13 shows the I²C clock generation of the HS I²C controllers.

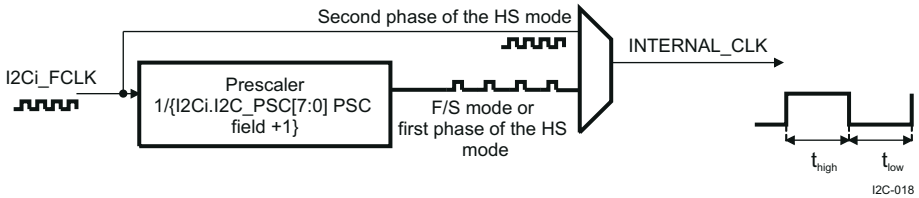

Figure 24-13. HS I²C Clock Generation

Each multimaster HS I^2C controller uses the I2C*i*_FCLK functional clock in the PRCM module. The internal sampling clock I2C*i*_INTERNAL_CLK is generated by dividing the functional clock by the I2C*i*.I2C_PSC[7:0] PSC bit field value + 1 in F/S mode, or in the first phase of HS mode; or by directly using the functional clock in the second phase of HS mode (prescaler is bypassed).

The low time of the I2C*i*_SCLL signal is determined by the I2C*i*.I2C_SCLL[7:0] SCLL bit field in F/S mode and in the first phase of HS mode; or by the I2C*i*.I2C_SCLL[15:8] HSSCLL bit field in the second phase of HS mode.

The high time of the I2C*i*_SCLL signal is determined by the I2C*i*.I2C_SCLH[7:0] SCLH bit field in F/S mode and in the first phase of HS mode; or by the I2C*i*.I2C_SCLH[15:8] HSSCLH bit field in the second phase of HS mode.

Table 24-6 lists the t_{LOW} and t_{high} values in master mode only (in slave mode, the I^2C controller does not generate the I^2C clock).

Table 24-6. HS I^2C t_{LOW} and t_{high}Values of the I^2C Clock

Mode	I2C*i* Clock	t_{LOW}	t_{high}
F/S or HS first phase	I2C*i*_INTERNAL_CLK = I2C*i*_FCLK / (I2C*i*.I2C_PSC[7:0] PSC bit field + 1)	(I2C*i*.I2C_SCLL[7:0] SCLL bit field value + 7) x I2C*i*_INTERNAL_CLK period	(I2Ci.I2C_SCLH [7:0] SCLH bit filed value + 5) x I2Ci_INTERNAL_CLK period
HS second phase	I2C*i*_FCLK	(I2C*i*.I2C_SCLL[15:8] HSSCLL bit field value + 7) x I2C*i*_FCLK period	(I2Ci.I2CSCLL [15:8] HSSCLH bit field value + 5) x I2Ci_FCLK period

Note

For HS mode, the I2C*i*.I2C_SCLL[15:8] HSSCLL and I2C*i*.I2C_SCLL[7:0] SCLL bit fields must be programmed (the first phase of an HS transaction is performed at F/S speed).

For HS mode, the I2C*i*.I2C_SCLH[15:8] HSSCLH and I2C*i*.I2C_SCLH[7:0] SCLH bit fields must be programmed (the first phase of an HS transaction is performed at F/S speed).

Note

The equations in Table 24-6 give the SCLL timing values for SCLL/SCLH/HSSCLL/HSSCLH at HS I^2C controller outputs. Actual tlow and thigh periods may vary depending on the board (the load capacitance on the SCLL signal). If necessary, any adjustments to the SCLL/SCLH/HSSCLL/HSSCLH values must be determined by measurements of actual SCL signal on the board.

CAUTION

During active mode (the I2C*i*.I2C_CON[15] I2C_EN bit is set to 1), make no changes to the I2C*i*.I2C_SCLL and I2C*i*.I2C_SCLH registers. Changes may result in unpredictable behavior.

Table 24-7 lists the register values for obtaining the maximum I^2C bit rates and the maximum period of the filtered spikes in F/S mode and HS mode.

Table 24-7. HS I^2C Register Values for Maximum I^2C Bit Rates in I^2C F/S, I^2C HS Modes

(1)	I^2C Mode for I2C*i*,			Description
	Standard Mode	Fast Mode	High-Speed Mode(2)	
I2C*i*_FCLK frequency (MHz)	96			

Table 24-7. HS I²C Register Values for Maximum I²C Bit Rates in I²C F/S, I²C HS Modes (continued)

(1)	I²C Mode for I2C*i*,			Description
I2C *i* .I2C_PSC[7:0] PSC	**23**	**9**	**1**	Prescaler value for F/S and HS modes
I2C*i*_INTERNAL_CLK frequency (MHz)	4	9.6	96	
I2C *i* .I2C_SCLL[7:0] SCLL	**13**	**5**	**115**	Value for F/S mode and first phase of HS mode
I2C *i* .I2C_SCLH[7:0] SCLH	**15**	**7**	**113**	Value for F/S mode and first phase of HS mode
Maximum bit rate (Mbps)	0.1	0.4	0.4	F/S mode and first phase in HS mode maximum bit rate
Maximum filter period (ns)	250	104.2	10	
I2C *i* .I2C_SCLL[15:8] HSSCLL			**12**	Values for second phase of HS mode
I2C *i* .I2C_SCLH[15:8] HSSCLH			**5**	Values for second phase of HS mode
HS mode maximum bit rate (Mbps)			3.31	HS mode maximum bit rate
Maximum filter period (ns)			10	

(1) Programmable fields are in bold.
(2) Supported only on I2C3, I2C4, I2C5 and I2C6.

Note

This table presents informative values only for the configuration parameters and the I²C bus performance obtained according to these values. The delays added by the analog pads are not considered in these figures.

Note

For I2Ci (where i=1, 2, 3, 4, 5, 6)

I2Ci_INTERNAL_CLK freq = I2Ci_FCLK / (PSC +1)

F/S filter period = 1 / I2Ci_INTERNAL_CLK

HS filter period = 1 / I2Ci_FCLK freq

HS bit rate = I2Ci_FCLK freq / (HSSCLL+ 7 + HSSCLH + 5)

FS bit rate = I2Ci_INTERNAL_CLK / (SCLL+ 7 + SCLH + 5)

24.1.4.2.2 HS I²C Automatic Blocking of the I²C Clock Feature

This feature offers the possibility for the LH to command the blocking of the I²C clock after the slave addressing phase, when the I²C controller is addressed by an external master device using a certain Own Address.

The release of the I²C clock can be performed independently for each Own Address (I2C*i*.I2C_OA, and I2C*i*.I2C_OAx registers, where *i* = 1 to 6, x = 1, 2, 3) by deasserting the corresponding bit in the I2C*i*.I2C_SBLOCK register.

24.1.4.3 HS I²C Software Reset

Each multimaster HS I²C controller supports the software reset by accessing the I2C*i*.I2C_SYSC[1] SRST bit (1: reset; 0: normal mode).

The software reset status can be checked by accessing the I2C*i*.I2C_SYSS[0] RDONE bit (1: reset is done; 0: reset is ongoing).

To do a software reset, the following steps must be done:

1. Ensure that the module is disabled (clear the I2C*i*.I2C_CON[15] I2C_EN bit to 0).
2. Set the I2C*i*.I2C_SYSC[1] SRST bit to 1.
3. Enable the module by setting I2C*i*.I2C_CON[15] I2C_EN bit to 1.
4. Check the I2C*i*.I2C_SYSS[0] RDONE bit until it is set to 1 to indicate the software reset is complete.

Note

The I2C*i*.I2C_CON[15] I2C_EN bit can hold the functional clock domain of the multimaster HS I^2C controller in reset after the device reset has been released. When the system bus reset is removed, this bit remains cleared. The functional part of the I^2C controller is held in reset state while this bit is 0, and all configuration registers can be accessed.

The I2C*i*.I2C_CON[15] I2C_EN bit must be set to 1 to enable the functional part of the I^2C controller.

The I2C*i*.I2C_SYSS[0] RDONE bit is asserted only after the module is enabled by setting the I2C*i*.I2C_CON[15] I2C_EN bit to 1.

24.1.4.4 HS I^2C Power Management

Table 24-8 describes power-management features available for the multimaster HS I^2C controllers.

Note

- For information about source clock gating and sleep/wake-up transitions description, see *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.
- For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.

Table 24-8. HS I^2C Local Power-Management Features

Feature	Registers	Description
Clock auto gating	I2C*i*.I2C_SYSC[0] AUTOIDLE	This bit allows a local power optimization inside the module.
Slave idle modes	I2C*i*.I2C_SYSC[4:3] IDLEMODE	Force-idle, no-idle, smart-idle, and smart-idle wakeup-capable modes are available.
Clock activity	I2C*i*.I2C_SYSC[9:8] CLOCKACTIVITY	For configuration details, see Table 24-9.
Global wake-up enable	I2C*i*.I2C_SYSC[2] ENAWAKEUP	This bit enables the wake-up feature at module level.

Note

The voltage controllers, in which the HS I^2C controller is implemented, have no idle request/acknowledge mechanism. The idle modes for the voltage controllers are directly managed by the PRCM module.

Table 24-9. HS I^2C Clock Activity Settings

I2C*i*.I2C_SYSC[9:8] CLOCKACTIVITY	Clock State When Module is in IDLE State		Features Available/Unavailable When Module is in IDLE State
	I2C*i*_ICLK	I2C*i*_ FCLK	
00	OFF	OFF	Both clocks are disabled.
10	OFF	ON	Interface clock is disabled; functional clock is enabled
01	ON	OFF	Functional clock is disabled; interface clock is enabled
11	ON	ON	Both clocks are enabled.

CAUTION

The PRCM module has no hardware means of reading the settings of CLOCKACTIVITY. Thus, software must ensure consistent programming between the I^2C CLOCKACTIVITY and I^2C clock PRCM control bits. For a description of the ClockActivity feature, see *Module-Level Clock Management* in *Power, Reset, and Clock Management*.

24.1.4.5 HS I^2C Interrupt Requests

Table 24-10 lists the event flags, and their mask, that can cause module interrupts.

Table 24-10. HS I^2C Events

Event Flag	Event Unmask	Event Mask	Description
I2C*i*.I2C_IRQSTATUS[0] AL	I2C*i*.I2C_IRQENABLE_SET[0] AL_IE	I2C*i*.I2C_IRQENABLE_CLR [0] AL_IE	Arbitration lost. This bit is automatically set by the hardware when it loses the arbitration in master transmit mode, an interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[1] NACK	I2C*i*.I2C_IRQENABLE_SET[1] NACK_IE	I2C*i*.I2C_IRQENABLE_CLR [1] NACK_IE	No acknowledgement. Bit is set when No Acknowledge is received, an interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[2] ARDY	I2C*i*.I2C_IRQENABLE_SET[2] ARDY_IE	I2C*i*.I2C_IRQENABLE_CLR [2] ARDY_IE	Register access ready. When set to 1 it indicates that previous access has been performed and registers are ready to be accessed again. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[3] RRDY	I2C*i*.I2C_IRQENABLE_SET[3] RRDY_IE	I2C*i*.I2C_IRQENABLE_CLR [3] RRDY_IE	Receive data ready. Set to 1 by core when in receiver mode, a new data can be read. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[4] XRDY	I2C*i*.I2C_IRQENABLE_SET[4] XRDY_IE	I2C*i*.I2C_IRQENABLE_CLR [4] XRDY_IE	Transmit data ready. Set to 1 by core when transmitter is ready for new data. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[5] GC	I2C*i*.I2C_IRQENABLE_SET[5] GC_IE	I2C*i*.I2C_IRQENABLE_CLR [5] GC_IE	General call. Set to 1 by core when General Call address was detected. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[6] STC	I2C*i*.I2C_IRQENABLE_SET[6] STC_IE	I2C*i*.I2C_IRQENABLE_CLR [6] STC_IE	Start condition detected. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[7] AERR	I2C*i*.I2C_IRQENABLE_SET[7] AERR_IE	I2C*i*.I2C_IRQENABLE_CLR [7] AERR_IE	Bus Access Error. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[8] BF	I2C*i*.I2C_IRQENABLE_SET[8] BF_IE	I2C*i*.I2C_IRQENABLE_CLR [8] BF_IE	Bus free. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[9] AAS	I2C*i*.I2C_IRQENABLE_SET[9] AAS_IE	I2C*i*.I2C_IRQENABLE_CLR [9] AAS_IE	Address recognized as slave. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[10] XUDF	I2C*i*.I2C_IRQENABLE_SET [10] XUDF_IE	I2C*i*.I2C_IRQENABLE_CLR [10] XUDF_IE	Transmit underflow. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[11] ROVR	I2C*i*.I2C_IRQENABLE_SET [11] ROVR_IE	I2C*i*.I2C_IRQENABLE_CLR [11] ROVR_IE	Receive overrun. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[12] BB	N/A	N/A	Bus busy indicator
I2C*i*.I2C_IRQSTATUS[13] RDR	I2C*i*.I2C_IRQENABLE_SET [13] RDR_IE	I2C*i*.I2C_IRQENABLE_CLR [13] RDR_IE	Receive draining. An interrupt is signaled to the host.
I2C*i*.I2C_IRQSTATUS[14] XDR	I2C*i*.I2C_IRQENABLE_SET [14] XDR_IE	I2C*i*.I2C_IRQENABLE_CLR [14] XDR_IE	Transmit draining. An interrupt is signaled to the host.

24.1.4.6 HS I²C DMA Requests

Each multimaster HS I²C controller can generate two DMA requests to the device DMA controllers through the DMA_CROSSBAR module. Table 24-11 lists the DMA requests. For information about DMA generation, see Section 24.1.4.8.3, *HS I²C FIFO DMA Mode (I²C Mode Only)*.

Table 24-11. HS I²C DMA Requests

Name	Source	Description
I2C1_DREQ_TX	I2C1	I2C1 DMA write request to inform the DMAs to write new data in the I2C1.I2C_DATA[7:0] DATA bit field
I2C1_DREQ_RX	I2C1	I2C1 DMA read request to inform the DMAs to read the data in the I2C1.I2C_DATA[7:0] DATA bit field
I2C2_DREQ_TX	I2C2	I2C2 DMA write request to inform the DMAs to write new data in the I2C2.I2C_DATA[7:0] DATA bit field
I2C2_DREQ_RX	I2C2	I2C2 DMA read request to inform the DMAs to read the data in the I2C2.I2C_DATA[7:0] DATA bit field
I2C3_DREQ_TX	I2C3	I2C3 DMA write request to inform the DMAs to write new data in the I2C3.I2C_DATA[7:0] DATA bit field
I2C3_DREQ_RX	I2C3	I2C3 DMA read request to inform the DMAs to read the data in the I2C3.I2C_DATA[7:0] DATA bit field
I2C4_DREQ_TX	I2C4	I2C4 DMA write request to inform the DMAs to write new data in the I2C4.I2C_DATA[7:0] DATA bit field
I2C4_DREQ_RX	I2C4	I2C4 DMA read request to inform the DMAs to read the data in the I2C4.I2C_DATA[7:0] DATA bit field
I2C6_DREQ_TX	I2C6	I2C6 DMA write request to inform the DMAs to write new data in the I2C6.I2C_DATA[7:0] DATA bit field
I2C6_DREQ_RX	I2C6	I2C6 DMA read request to inform the DMAs to read the data in the I2C6.I2C_DATA[7:0] DATA bit field

Note

For more information about I2C*i*_DREQ_TX and I2C*i*_DREQ_RX (where *i* = 1 to 6)signals mapping to DMA_CROSSBAR, see Section 16.1.3.2 Section 16.1.3.2, *Mapping of DMA Requests to DMA_CROSSBAR Inputs*, in Table 24-4, *HS I²C Hardware Requests*.

24.1.4.7 HS I²C Programmable Multislave Channel Feature

This feature allows each multimaster HS I²C controller to be addressed using four separate Own Addresses configured in the I2C*i*.I2C_OA and I2C*i*.I2C_OAx registers (where = 1 to 6, x = 1, 2, 3). An additional register (I2C*i*.I2C_ACTOA) is used to indicate to the LH which address is used by the external master to communicate with the I²C controller.

Each Own Address can be independently configured in 7-bit or 10-bit mode by setting the corresponding bit (I2C*i*.I2C_CON[7] XOA0, I2C*i*.I2C_CON[6] XOA1, I2C*i*.I2C_CON[5] XOA2, or I2C*i*.I2C_CON[4] XOA3).

24.1.4.8 HS I²C FIFO Management

Each multimaster HS I²C controller implements two internal 8-bit FIFOs, the RX and TX FIFOs.

The depth of the RX and TX FIFOs can be checked by reading the I2C*i*.I2C_BUFSTAT[15:14] FIFODEPTH bit field (0x0: 8 bytes, 0x1: 16 bytes, 0x2: 32 bytes, and 0x3: 64 bytes).

24.1.4.8.1 HS I²C FIFO Interrupt Mode

In FIFO interrupt mode (relevant interrupts enabled by the I2C*i*.I2C_IRQENABLE_SET register), an interrupt signal informs the processor of the receiver and transmitter status. These interrupts are raised when the RX/TX FIFO thresholds (defined by the I2C*i*.I2C_BUF[13:8] RXTRSH bit field value + 1 for the RX FIFO or the I2C*i*.I2C_BUF[5:0] TXTRSH bit field value + 1 for the TX FIFO) are reached; the interrupt signals instruct the

LH to transfer data to the destination (from the I2C controller in receive mode and/or from any source to the I2C controller FIFO in transmit mode).

Figure 24-14 and Figure 24-15 show receive and transmit operations, respectively, from a FIFO management point of view.

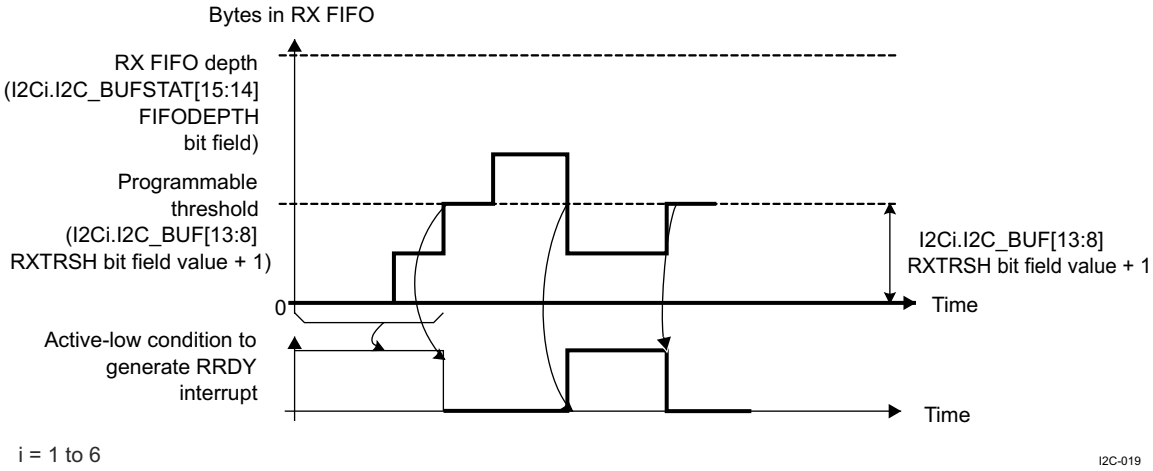

Figure 24-14. HS I2C Receive FIFO Interrupt Request Generation

In Figure 24-14, the RRDY interrupt condition shows that the condition for generating an RRDY interrupt is achieved. The interrupt request is generated when this signal is active, and it can be cleared only by the LH by writing 1 in the corresponding bit. If the condition is still present after clearing the previous interrupt, another interrupt request is generated.

In receive mode, an RRDY interrupt is generated as soon as the FIFO reaches its receive threshold (I2C*i*.I2C_BUF[13:8] RXTRSH bit field value + 1). The interrupt can be deasserted only when the LH has handled enough bytes to make the number of bytes in the RX FIFO lower than the programmed threshold. For each interrupt, the LH can be configured to read a number of bytes equal to the value of the RX FIFO threshold.

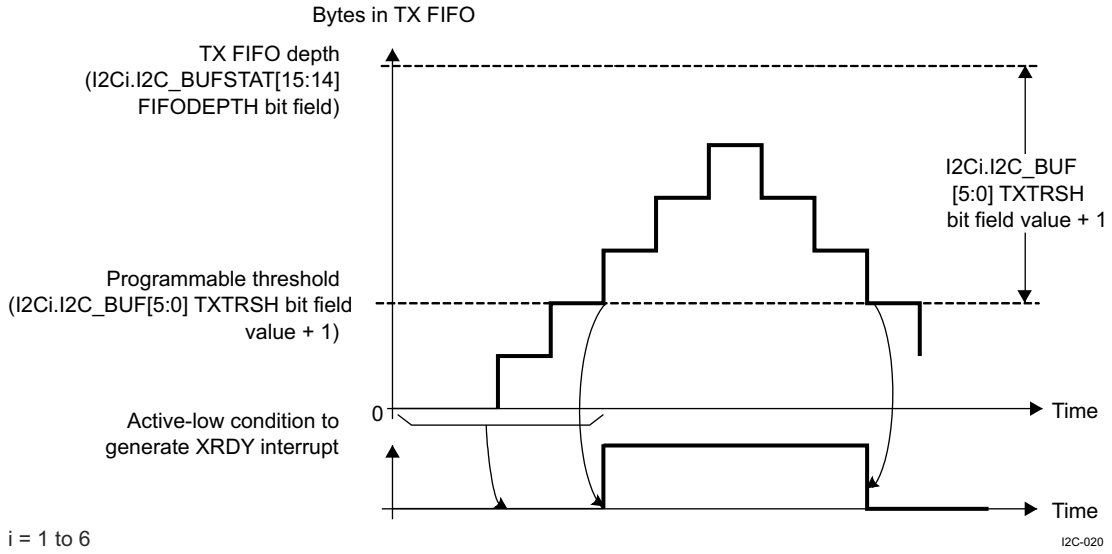

Figure 24-15. HS I2C Transmit FIFO Interrupt Request Generation

In Figure 24-15, the XRDY interrupt condition shows that the condition for generating an XRDY interrupt is achieved. The interrupt request is generated when TX FIFO is empty or when the TX FIFO threshold is not reached, and the LH can clear the XRDY status bit by setting the I2C*i*.I2C_IRQENABLE_CLR [4] XRDY_IE bit

to 1 after transmitting the configured number of bytes. If the condition is still present after clearing the previous interrupt, another interrupt request is generated.

In interrupt mode, the module offers two options for the LH application to handle the interrupts:

- When detecting an interrupt request (XRDY or RRDY type), the LH can write/read 1 data byte to/from the TX/RX FIFO and then clear the interrupt. The module reasserts the interrupt until the interrupt condition is not met.
- When detecting an interrupt request (XRDY or RRDY type), the LH can be programmed to write/read the amount of data bytes specified by the corresponding FIFO threshold (I2C_BUF[5:0] TXTRSH + 1 or I2C_BUF[5:0] RXTRSH + 1). In this case, the interrupt condition is cleared and the next interrupt is asserted again when the XRDY or RRDY condition is met again.

If the second-interrupt-serving approach is used, an additional mechanism (draining feature) is implemented for cases where the transfer length is not a multiple of the FIFO threshold value (see Section 24.1.4.8.4, *Draining Feature [I²C Mode Only]*).

Note

In slave transmit mode (the I2C*i*.I2C_CON[10] MST bit is cleared and the I2C*i*.I2C_CON[9] TRX bit is set to 1), the draining feature must not be used, because the transfer length is not known at configuration time, and the external master can end the transfer at any point by not acknowledging 1 data byte. If the draining feature is used in slave transmit mode, data can remain in the TX FIFO without being transmitted over the I²C bus. In this case, the TX FIFO must be cleared by setting the I2C*i*.I2C_BUF[6] TXFIFO_CLR bit.

24.1.4.8.2 HS I²C FIFO Polling Mode

In FIFO polling mode (the I2C*i*.I2C_IRQENABLE_SET [4] XRDY_IE and I2C*i*.I2C_IRQENABLE_SET [3] RRDY_IE bits are disabled), the status of the module (receiver or transmitter) can be checked by polling the I2C*i*.I2C_IRQSTATUS_RAW [4] XRDY and the I2C*i*.I2C_IRQSTATUS_RAW [3] RRDY bits (the I2C*i*.I2C_IRQSTATUS_RAW [13] RDR and I2C*i*.I2C_IRQSTATUS_RAW [14] XDR bits can also be polled if the draining feature is enabled). The I2C*i*.I2C_IRQSTATUS_RAW [4] XRDY and I2C*i*.I2C_IRQSTATUS_RAW [3] RRDY bits accurately reflect the interrupt conditions described in the discussion of FIFO interrupt mode.

24.1.4.8.3 HS I²C FIFO DMA Mode

In receive mode, a DMA request is generated by the I2C*i*_DREQ_RX signal as soon as the RX FIFO exceeds its threshold level (the I2C*i*.I2C_BUF[13:8] RXTRSH bit field value + 1). This request is deasserted when the number of bytes defined by the threshold level is read by the DMA controller.

Figure 24-16 shows the DMA request generation in receive mode.

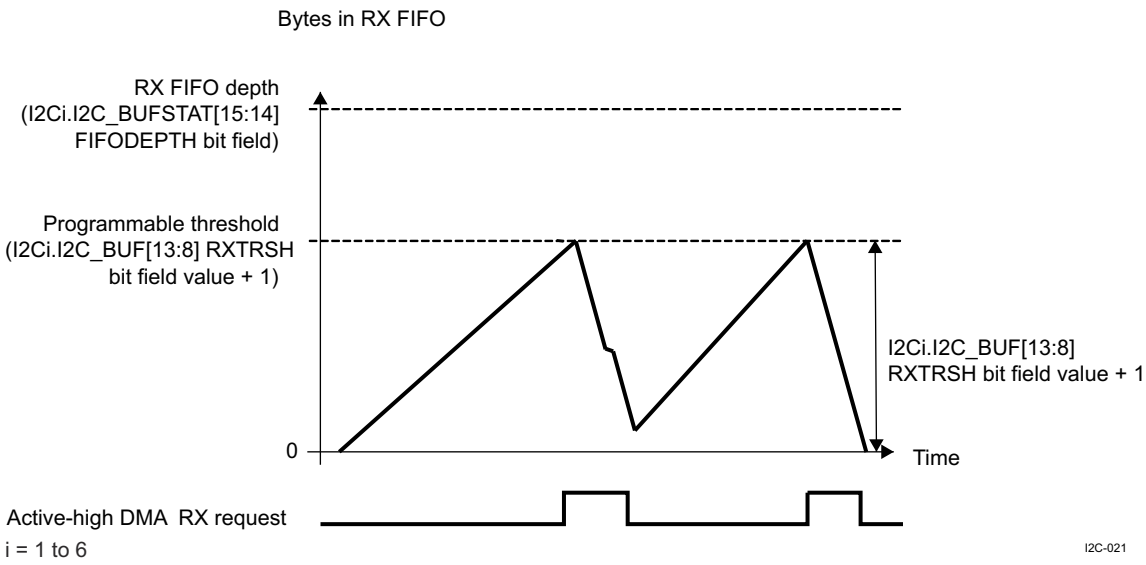

Figure 24-16. HS I²C Receive FIFO DMA Request Generation

In transmit mode, a DMA request is automatically asserted by the I2C*i*_DREQ_TX signal when the TX FIFO is empty. This request is deasserted when the number of bytes (the I2C*i*.I2C_BUF[5:0] TXTRSH bit field value + 1) is written in the FIFO by the DMA controller. If an insufficient number of bytes is written, the DMA request remains active. Figure 24-17 and Figure 24-18 show the DMA TX transfers with different values for the I2C*i*.I2C_BUF[5:0] TXTRSH bit field.

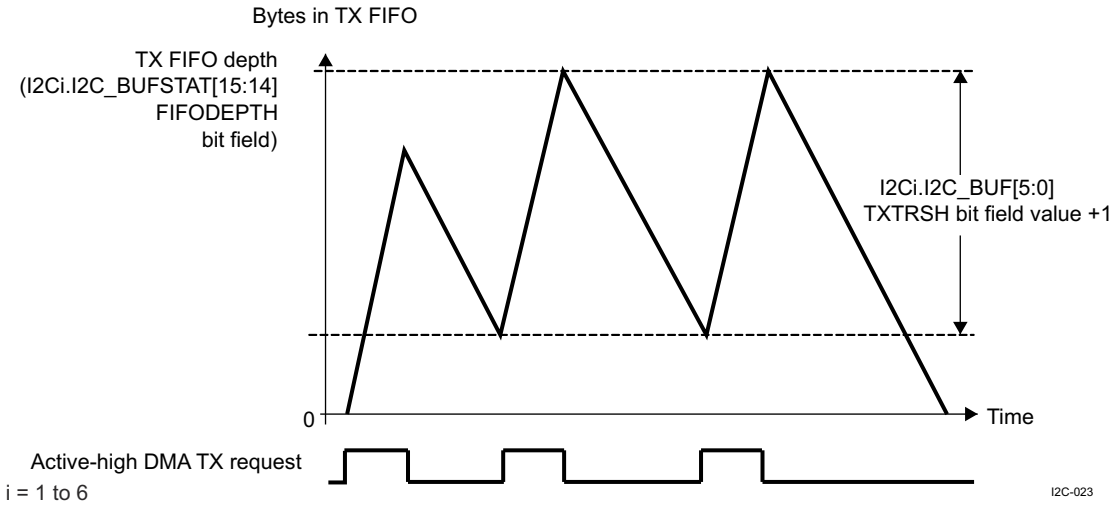

Figure 24-17. HS I²C Transmit FIFO Request Generation (High Threshold)

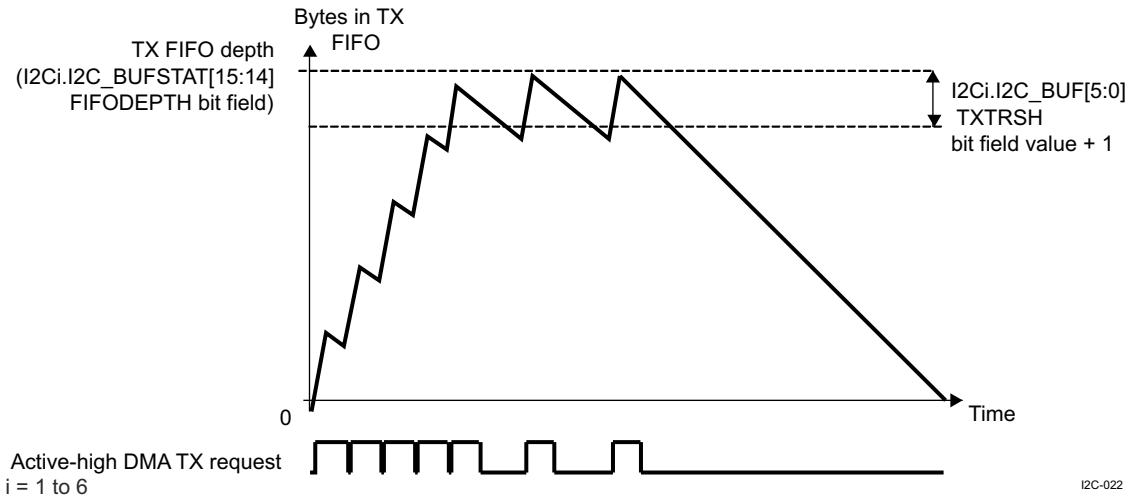

Figure 24-18. HS I²C Transmit FIFO Request Generation (Low Threshold)

The I2C module provides the possibility to the user to clear the RX or TX FIFO, by setting the I2Ci.I2C_BUF[14]RXFIFO_CLR and I2Ci.I2C_BUF[6]TXFIFO_CLR registers, which act like software reset for the FIFOs. In DMA mode, these bits will also reset the DMA state machines.

The FIFO clearing feature can be used when the following conditions are met:

1. The module is configured as a transmitter
2. The external receiver responds with a NACK in the middle of the transfer
3. There is still data in TX FIFO waiting to be transferred

24.1.4.8.4 HS I²C Draining Feature

The draining feature is implemented to handle the end of a transfer whose length is not a multiple of the FIFO threshold values (the I2C*i*.I2C_BUF[13:8] RXTRSH bit field value + 1 for the RX threshold and the I2C*i*.I2C_BUF[5:0] TXTRSH field value + 1 for the TX threshold). It can also transfer the remaining number of bytes (because the threshold is not reached).

This feature prevents the LH or the DMA controller from trying more FIFO accesses than necessary (for example, to generate at the end of a transfer a DMA RX request having fewer bytes in the FIFO than the configured DMA transfer length). Otherwise, an AERR interrupt is generated by the I2C*i*.I2C_IRQSTATUS_RAW [7] AERR bit.

The draining mechanism generates an interrupt using the I2C*i*.I2C_IRQSTATUS_RAW [13] RDR or I2C*i*.I2C_IRQSTATUS_RAW [14] XDR bit at the end of the transfer, informing the LH that it must check the amount of data left to be transferred (the I2C*i*.I2C_BUFSTAT[13:8] RXSTAT or I2C*i*.I2C_BUFSTAT[5:0] TXSTAT bit fields) and enable the draining feature of the DMA controller by reconfiguring the DMA transfer length according to this value (when the DMA mode is enabled) or perform only the required number of data accesses (when the DMA mode is disabled).

In receive mode (master or slave), if the RX FIFO threshold (the I2C*i*.I2C_BUF[13:8] RXTRSH bit field value + 1) is not reached, but the transfer ends on the I²C bus and data remains in the RX FIFO (less than the threshold), the receive draining interrupt (the I2C*i*.I2C_IRQSTATUS_RAW [13] RDR bit) is asserted to inform the LH that it can read the amount of data in the RX FIFO (the I2C*i*.I2C_BUFSTAT[13:8] RXSTAT bit field). The LH performs a number of data read accesses equal to the I2C*i*.I2C_BUFSTAT[13:8] RXSTAT bit field (interrupt or polling mode), or reconfigures the DMA controller with the required value to drain the FIFO.

In master transmit mode, if the TX FIFO threshold (the I2C*i*.I2C_BUF[5:0] TXTRSH bit field value + 1) is not reached, but the amount of data remaining to be written in the TX FIFO is less than the threshold, the transmit draining interrupt (the I2C*i*.I2C_IRQSTATUS_RAW [14] XDR bit) is asserted to inform the LH that it can read the amount of data remaining to be written in the TX FIFO (the I2C*i*.I2C_BUFSTAT[5:0] TXSTAT bit field). The LH

must write the required number of data bytes specified by the I2C*i*.I2C_BUFSTAT[5:0] TXSTAT bit field value or reconfigure the DMA controller with the value required to transfer the last bytes to the FIFO.

In master mode, the LH can alternately not check the values of the I2C*i*.I2C_BUFSTAT[5:0] TXSTAT and I2C*i*.I2C_BUFSTAT[13:8] RXSTAT bit fields, because it can obtain this information internally (by computing the I2C*i*.I2C_CNT[15:0] DATACOUNT bit field value modulo I2C*i*.I2C_BUF[13:8] RXTRSH or I2C*i*.I2C_BUF[5:0] TXTRSH).

By default, the draining feature is disabled; it can be enabled using the I2C*i*.I2C_IRQENABLE_SET [14] XDR_IE or I2C*i*.I2C_IRQENABLE_SET [13] RDR_IE bits (default disabled) only for transfers with lengths not equal to the threshold values (I2C*i*.I2C_BUF[5:0] TXTRSH bit field value + 1 for the TX threshold or the I2C*i*.I2C_BUF[13:8] RXTRSH bit field value + 1 for the RX threshold).

24.1.4.9 HS I²C Noise Filter

The noise filter is used to suppress any noise that is 50 ns or less in case of F/S operation modes, and any noise that is 10 ns or less in case of HS mode operation. The noise filter is always one period of the I2C*i*_INTERNAL_CLK clock. This way, for HS mode operation (prescaler bypassed), the filter suppresses spikes of less than 10.4 ns.

For standard mode (for example, the I2C*i*.I2C_PSC[7:0] PSC bit field = 4), the maximum width of suppressed spikes is 46.1 ns.

To ensure correct filtering, the prescaler must be programmed accordingly by the 2C*i*.I2C_PSC[7:0] PSC bit field.

24.1.4.10 HS I²C System Test Mode

A system test mode is available for multimaster HS I²C controller module testing. This mode is enabled by setting the I2C*i*.I2C_SYSTEST[15] ST_EN bit to 1. When this bit is cleared to 0, the I²C controller is configured in normal operation mode.

In system test mode, the I2C*i*.I2C_SYSTEST [13:12] TMODE bit field selects the type of test. Table 24-12 lists the tests available for the multimaster HS I²C controllers.

Table 24-12. HS I²C List of Tests

I2C*i*.I2C_SYSTEST[13:12] TMODE	Test	Description
00	Functional mode	Normal operation mode
01	Reserved (not used)	
10	Test of i2c*i*_scl serial clock line	The i2c*i*_scl line is driven with a permanent clock as if mastered with the parameters set in the I2C*i*.I2C_PSC, I2C*i*.I2C_SCLL, and I2C*i*.I2C_SCLH registers.
11	Loop-back mode + i2c*i*_scl/ i2c*i*_sda I/O	In master transmit mode only, data transmitted out of the I2C*i*.I2C_DATA register (write action) is received in the same I2C*i*.I2C_DATA register through an internal path through the FIFO buffers. The DMA and interrupt requests are normally generated if they are enabled. Moreover, the i2c*i*_scl and i2c*i*_sda are controlled with the I2C*i*.I2C_SYSTEST[3:0] bits.

Note

When the I2C*i*.I2C_SYSTEST[13:12] TMODE bit field is set to 11, the I²C controller must be configured in I²C F/S (I2C*i*.I2C_CON[13:12] OPMODE set to 00) or I²C HS mode (I2C*i*.I2C_CON[13:12] OPMODE set to 01).

Note

In normal operation mode (the I2C*i*.I2C_SYSTEST[15] ST_EN bit cleared to 0), the I2C*i*.I2C_SYSTEST[3:0] bits that control the i2c*i*_scl, i2c*i*_sda lines in system test mode are read-only bits.

In system test mode (the I2C*i*.I2C_SYSTEST[15] ST_EN bit set to 1), the I2C*i*.I2C_IRQSTATUS_RAW.XRDY, I2C_IRQSTATUS_RAW.RRDY, I2C_IRQSTATUS_RAW.XUDF, I2C_IRQSTATUS_RAW.ROVR, I2C_IRQSTATUS_RAW.ARDY and I2C_IRQSTATUS_RAW.NACK status bits can be set to 1 when the I2C*i*.I2C_SYSTEST[11] SSB bit is set to 1. Clearing the I2C*i*.I2C_SYSTEST[11] SSB bit to 0 does not clear the I2C*i*.I2C_IRQSTATUS_RAW bits to 0. The I2C*i*.I2C_IRQSTATUS_RAW bit field can be cleared to 0 only by writing 1 in the corresponding bits.

24.1.5 HS I²C Programming Guide

24.1.5.1 HS I²C Low-Level Programming Models

24.1.5.1.1 HS I²C Programming Model

This section describes the programming model of the multimaster HS I²C controllers configured in I²C mode.

24.1.5.1.1.1 Main Program

24.1.5.1.1.1.1 Configure the Module Before Enabling the I²C Controller

Before enabling the I²C controller, perform the following steps:

1. Enable the functional and interface clocks (see Table 24-3).
2. Program the prescaler to obtain an approximately 12-MHz internal sampling clock by programming the corresponding value in the I2C*i*.I2C_PSC[7:0] PSC bit field. This value depends on the frequency of the functional clock (I2C*i*_FCLK).
3. Program the I2C*i*.I2C_SCLL[7:0] SCLL and I2C*i*.I2C_SCLH[7:0] SCLH bit fields to obtain a bit rate of 100 kbps or 400 kbps. These values depend on the internal sampling clock frequency (see Table 24-6).
4. (Optional) Program the I2C*i*.I2C_SCLL[15:8] HSSCLL and I2C*i*.I2C_SCLH[15:8] HSSCLH bit fields to obtain a bit rate of 400 kbps or 3.4 Mbps (for the second phase of HS mode). These values depend on the internal sampling clock frequency (see Table 24-6).
5. Configure the Own Address of the I²C controller by storing it in the I2C*i*.I2C_OA register. Up to four Own Addresses can be programmed in the I2C*i*.I2C_OA and I2C*i*.I2C_OAx registers (where x = 1, 2, 3) for each I²C controller.

Note

For a 10-bit address, set the corresponding expand Own Address bit in the I2C*i*.I2C_CON register.

6. Set the TX threshold (in transmitter mode) and the RX threshold (in receiver mode) by setting the I2C*i*.I2C_BUF[5:0] TXTRSH bit field to (TX threshold – 1) and the I2C*i*.I2C_BUF[13:8] RXTRSH bit field to (RX threshold – 1), where the TX and RX thresholds are greater than or equal to 1.
7. Take the I²C controller out of reset by setting the I2C*i*.I2C_CON[15] I2C_EN bit to 1.

24.1.5.1.1.1.2 Initialize the I²C Controller

To initialize the I²C controller, perform the following steps:

1. Configure the I2C*i*.I2C_CON register:
   - For master or slave mode, set the I2C*i*.I2C_CON[10] MST bit (0: slave; 1: master).
   - For transmitter or receiver mode, set the I2C*i*.I2C_CON[9] TRX bit (0: receiver; 1: transmitter).
2. If using an interrupt to transmit and receive data, set the corresponding bit in the I2C*i*.I2C_IRQENABLE_SET register to 1 (the I2C*i*.I2C_IRQENABLE_SET [4] XRDY_IE bit for the transmit interrupt, the I2C*i*.I2C_IRQENABLE_SET [3] RRDY bit for the receive interrupt).
3. If using DMA to receive and transmit data, set the corresponding bit in the I2C*i*.I2C_BUF register to 1 (the I2C*i*.I2C_BUF[15] RDMA_EN bit for the receive DMA channel, the I2C*i*.I2C_BUF[7] XDMA_EN bit for the transmit DMA channel).

24.1.5.1.1.1.3 Configure Slave Address and the Data Control Register

In master mode, configure the slave address register by programming the I2C*i*.I2C_SA[9:0] SA bit field and the number of data bytes (I²C data payload) associated with the transfer by programming the I2C*i*.I2C_CNT[15:0] DCOUNT bit field.

Note

For a 10-bit address, set the I2C*i*.I2C_CON[8] XSA bit to 1.

24.1.5.1.1.1.4 Initiate a Transfer

Poll the I2C*i*.I2C_IRQSTATUS_RAW [12] BB bit. If it is cleared to 0 (bus not busy), configure the I2C*i*.I2C_CON[0] STT and I2C*i*.I2C_CON[1] STP bits. To initiate a transfer, the I2C*i*.I2C_CON[0] STT bit must be set to 1, and it is not mandatory to set the I2C*i*.I2C_CON[1] STP bit to 1.

24.1.5.1.1.1.5 Receive Data

Poll the I2C*i*.I2C_IRQSTATUS_RAW [3] RRDY bit, or use the RRDY interrupt (the I2C*i*.I2C_IRQENABLE_SET [3] RRDY_IE bit must be set to 1) or the DMA RX channel (the I2C*i*.I2C_BUF[15] RDMA_EN bit must be set to 1 together with I2C_DMARXENABLE_SET) to read the receive data in the I2C*i*.I2C_DATA register.

If the transfer length does not equal the RX FIFO threshold (the I2C*i*.I2C_BUF[13:8] RTRSH bit field + 1), use the draining feature (enable the RDR interrupt by setting the I2C*i*.I2C_IRQENABLE_SET [13] RDR_IE bit to 1).

Note

In receive mode only, the I2C*i*.I2C_IRQSTATUS_RAW [11] ROVR (receive overrun) bit indicates whether the receiver has experienced overrun. An overrun condition occurs when the shift register and the RX FIFO are full. An overrun condition does not result in data loss; the I^2C controller simply holds i2c*i*_scl to low to prevent other bytes from being received.

The I2C*i*.I2C_IRQSTATUS_RAW[7] AERR bit is set to 1 when a read access is performed in the I2C*i*.I2C_DATA register while the RX FIFO is empty. The corresponding interrupt can be enabled by setting the I2C*i*.I2C_IRQENABLE_SET [7] AERR_IE bit to 1.

24.1.5.1.1.1.6 Transmit Data

Poll the I2C*i*.I2C_IRQSTATUS_RAW [4] XRDY bit, or use the XRDY interrupt (the I2C*i*.I2C_IRQENABLE_SET [4] XRDY_IE bit must be set to 1) or the DMA TX channel (the I2C*i*.I2C_BUF[7] XDMA_EN bit must be set to 1 together with I2C_DMATXENABLE_SET) to write data to the I2C*i*.I2C_DATA register.

If the transfer length does not equal the TX FIFO threshold (the I2C*i*.I2C_BUF[5:0] TXTRSH bit field + 1), use the draining feature (enable the XDR interrupt by setting the I2C*i*.I2C_IRQENABLE_SET [14] XDR_IE bit to 1).

Note

In transmit mode only, the I2C*i*.I2C_IRQSTATUS_RAW [10] XUDF bit indicates whether the transmitter has experienced underflow.

In master transmit mode, underflow occurs when the shift register and the TX FIFO are empty and there are still some bytes to transmit (the value of the I2C*i*.I2C_CNT[15:0] DCOUNT bit field is not 0).

In slave transmit mode, underflow occurs when the shift register and the TX FIFO are empty and the external I^2C master device still requests data bytes to be read.

The I2C*i*.I2C_IRQSTATUS_RAW [7] AERR bit is set to 1 when a write access is performed in the I2C*i*.I2C_DATA register while the TX FIFO is full. The corresponding interrupt can be enabled by setting the I2C*i*.I2C_IRQENABLE_SET [7] AERR_IE bit to 1.

24.1.5.1.1.2 Interrupt Subroutine Sequence

1. Test for arbitration lost (the I2C*i*.I2C_IRQSTATUS_RAW [0] AL bit) and resolve accordingly.
2. Test for no acknowledgment (the I2C*i*.I2C_IRQSTATUS_RAW [1] NACK bit) and resolve accordingly.
3. Test for register access ready (the I2C*i*.I2C_IRQSTATUS_RAW [2] ARDY bit) and resolve accordingly.
4. Test for receive data ready (the I2C*i*.I2C_IRQSTATUS_RAW [3] RRDY bit) and resolve accordingly.
5. Test for transmit data ready (the I2C*i*.I2C_IRQSTATUS_RAW [4] XRDY bit) and resolve accordingly.
6. Test for general call (the I2C*i*.I2C_IRQSTATUS_RAW [5] GC bit) and resolve accordingly.
7. Test for start (S) condition (the I2C*i*.I2C_IRQSTATUS_RAW [6] STC bit) and resolve accordingly. For this test, the functional clock must be inactive.
8. Test for access error (the I2C*i*.I2C_IRQSTATUS_RAW [7] AERR bit) and resolve accordingly.

9. Test for bus free (the I2C*i*.I2C_IRQSTATUS_RAW [8] BF bit) and resolve accordingly.

24.1.5.1.1.3 Programming Flow-Diagrams

Figure 24-19 through Figure 24-27 are procedure flow charts for programming the F/S and HS I²C modes.

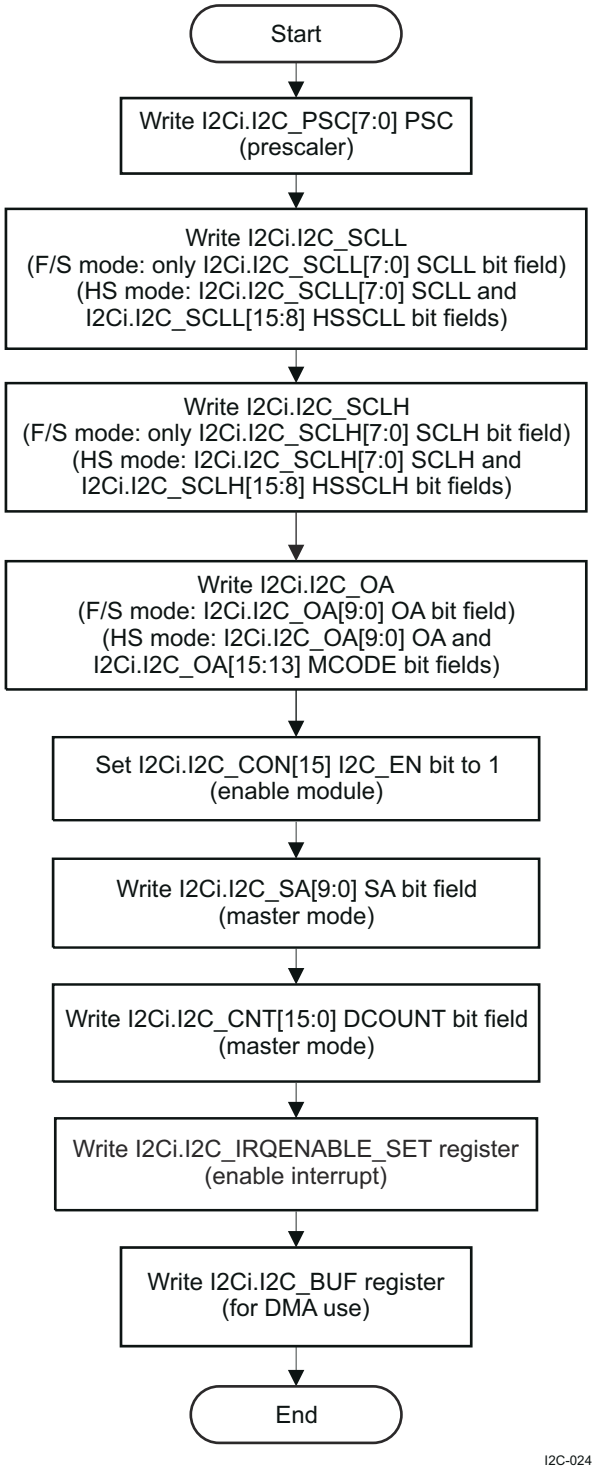

Figure 24-19. HS I²C Setup Procedure

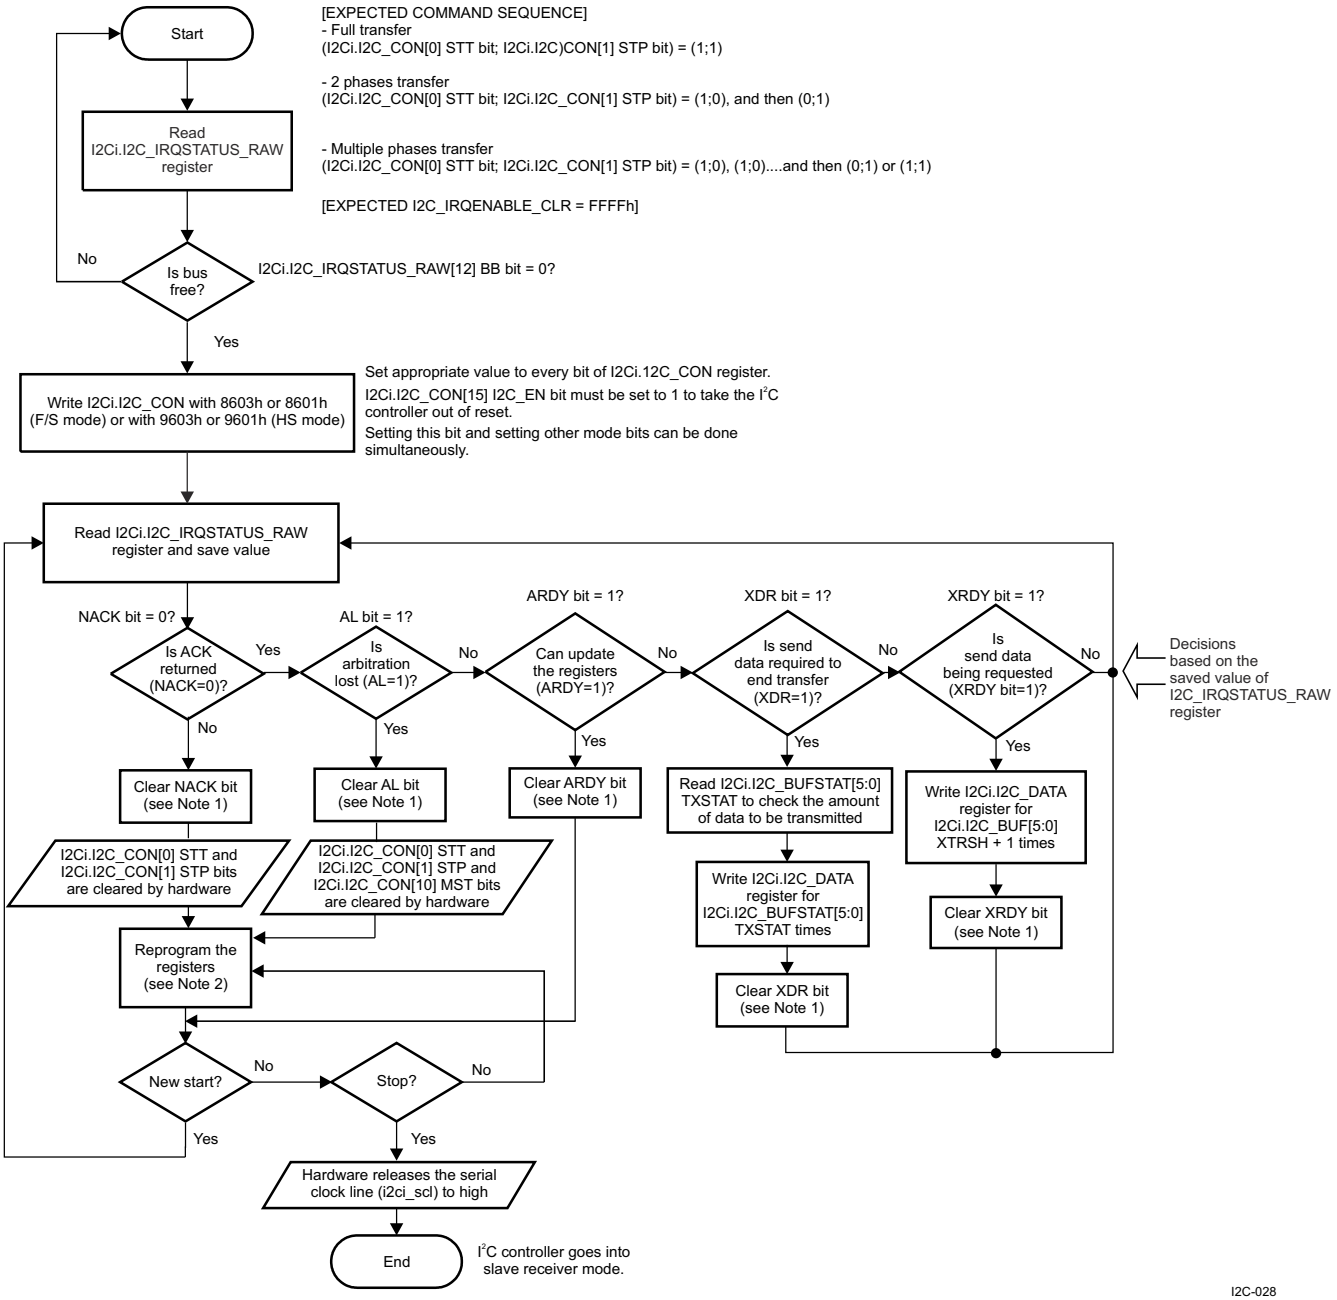
Table 24-13. Subprocess Call Summary for Sequence – I²C Setup Procedure

Subprocess Name	Cross-Reference
Pad configuration	See *PAD Configuration Registers* in *Control Module*

Table 24-14. HS I²C Register Call Summary for Sequence – Setup Procedure

Register Name	Register Name	Register Name
I2C*i*.I2C_PSC (1)	I2C*i*.I2C_CON (1)	I2C*i*.I2C_BUF (1)
I2C*i*.I2C_SCLL (1)	I2C*i*.I2C_SA (1)	I2C*i*.I2C_IRQENABLE_SET (1)
I2C*i*.I2C_SCLH (1)	I2C*i*.I2C_CNT (1)	I2C*i*.I2C_OA (1)

(1) *i* = 1 to 6



A. The NACK, AL, ARDY, XDR, and XRDY bits are cleared by writing 1 to each corresponding bit in the I2C*i*.I2C_IRQSTATUS register.

B. Reprogram the registers means: I2C*i*.I2C_CON[11] STB and/or I2C*i*.I2C_CON[10] MST bit and/or I2C*i*.I2C_SA[9:0] SA register and/or I2C*i*.I2C_CNT[15:0] DCOUNT register and/or I2C*i*.I2C_CON[0] STT bit and/or I2C*i*.I2C_CON[1] STP bit.

Figure 24-20. HS I²C Master Transmitter Mode, Polling Method, in F/S and HS Modes

Note

The FIFO clearing can be made when the module is configured as transmitter, the receiver send a NACK in the middle of the transfer, and there is still data in the FIFO.

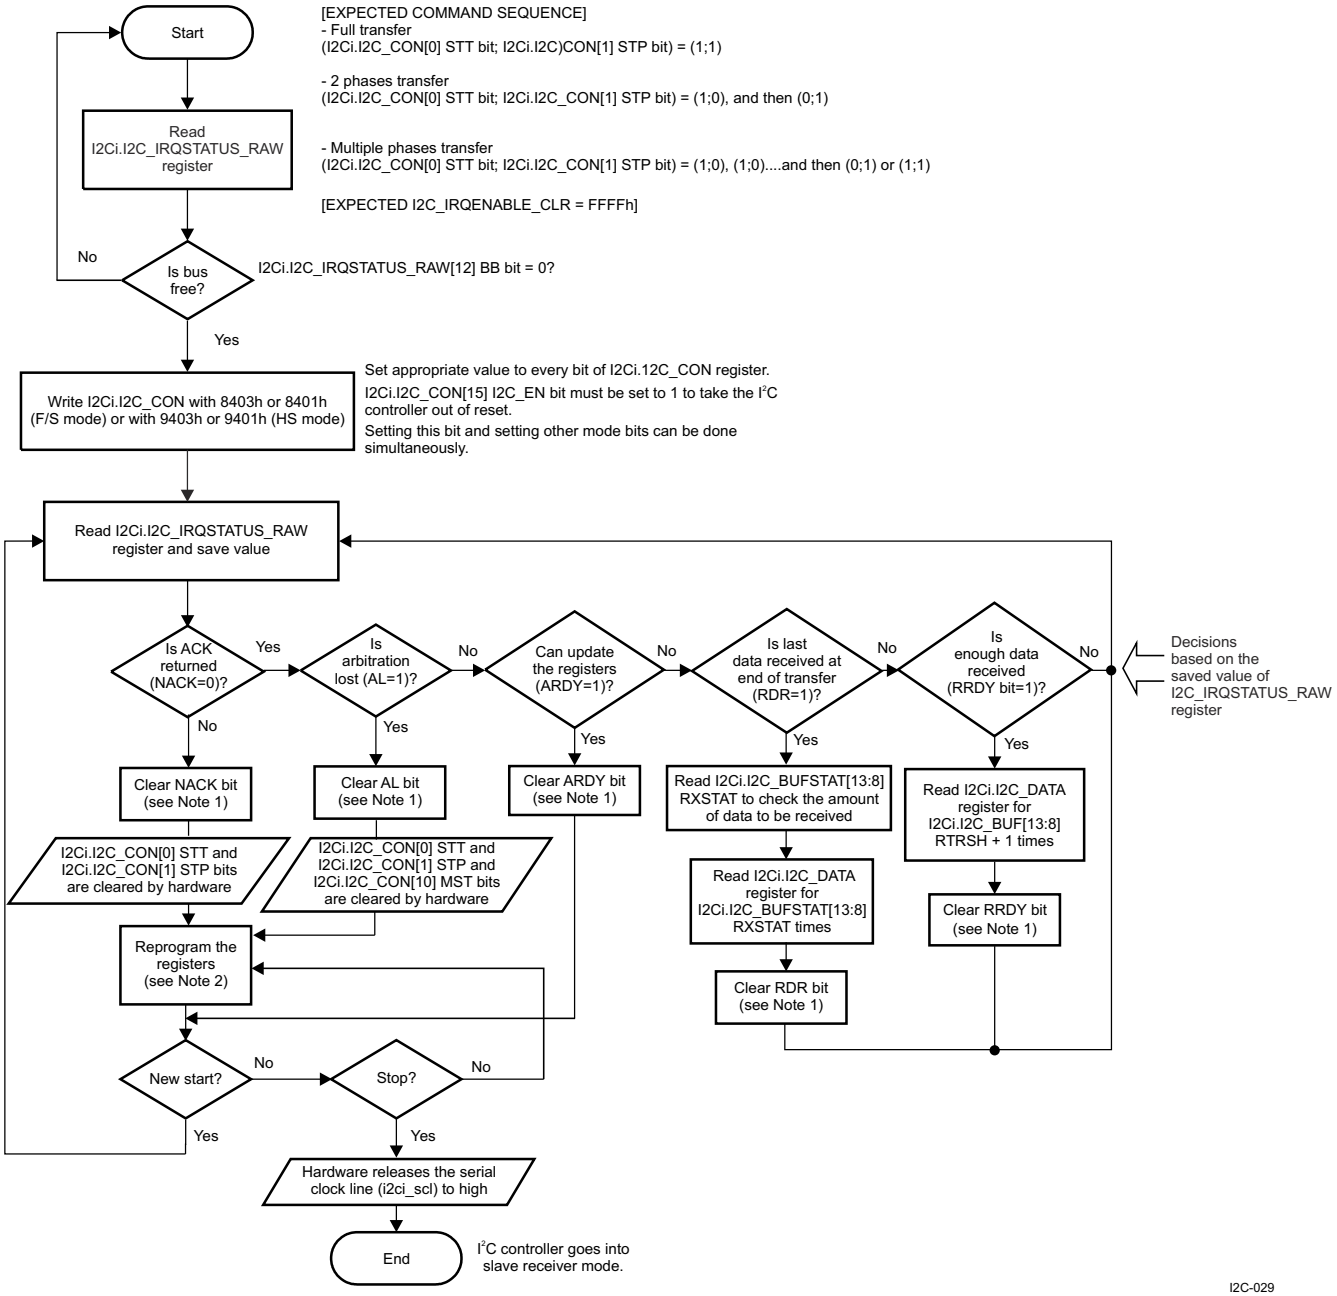
Note

In HS mode, the Sr condition and clock frequency switching are automatically generated by the multimaster HS I²C controller.

Table 24-15. HS I²C Register Call Summary for Sequence – Master Transmitter Mode, Polling Method, in F/S and HS Modes

Register Name	Register Name	Register Name
I2C*i*.I2C_IRQSTATUS_RAW (1)	I2C*i*.I2C_DATA (1)	I2C*i*.I2C_CON (1)
I2C*i*.I2C_BUFSTAT (1)	I2C*i*.I2C_CON (1)	I2C*i*.I2C_BUF (1)

(1) *i* = 1 to 6



A. The NACK, AL, ARDY, RDR, and RRDY bits are cleared by writing 1 to each corresponding bit in the I2C*i*.I2C_IRQSTATUS register.

B. Reprogram registers means: I2C*i*.I2C_CON[11] STB and/or I2C*i*.I2C_CON[10] MST bit and/or I2C*i*.I2C_SA[9:0] SA register and/or I2C*i*.I2C_CNT[15:0] DCOUNT register and/or I2C*i*.I2C_CON[0] STT bit and/or I2C*i*.I2C_CON[1] STP bit.

	0x4807 C024		I2C5
Description	Per-event raw interrupt status vector. The raw status is set even if event is not enabled. Write 1 to set the (raw) status. Used mostly for debug		
Type	RW		

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED	XDR	RDR	BB	ROVR	XUDF	AAS	BF	AERR	STC	GC	XRDY	RRDY	ARDY	NACK	AL

Bits	Field Name	Description	Type	Reset
15	RESERVED	Write 0s for future compatibility. Read returns 0.	RW	0
14	XDR	Transmit draining IRQ status. 0x0: Transmit draining inactive. 0x1: Transmit draining enabled.	RW	0
13	RDR	Receive draining IRQ status. 0x0: Receive draining inactive. 0x1: Receive draining enabled.	RW	0
12	BB	Bus busy status. Writing into this bit has no effect. Read 0x1: Bus is occupied. Read 0x0: Bus is free.	R	0
11	ROVR	Receive overrun status. Writing into this bit has no effect. Read 0x1: Receiver overrun. Read 0x0: Normal operation.	RW	0
10	XUDF	Transmit underflow status. Writing into this bit has no effect. Read 0x1: Transmit underflow. Read 0x0: Normal operation.	RW	0
9	AAS	Address recognized as slave IRQ status. 0x0: No action. 0x1: Address recognized.	RW	0
8	BF	Bus Free IRQ status. 0x0: No action. 0x1: Bus Free.	RW	0
7	AERR	Access Error IRQ status. 0x0: No action. 0x1: Access Error.	RW	0
6	STC	Start Condition IRQ status. 0x0: No action. 0x1: Start Condition detected.	RW	0

Bits	Field Name	Description	Type	Reset
5	GC	General call IRQ status. Set to 1 by core when General call address detected and interrupt signaled to IRQ_Crossbar. 0x0: No general call detected. 0x1: General call address detected.	RW	0
4	XRDY	Transmit data ready IRQ status. Set to 1 by core when transmitter and when new data is requested. When set to 1 by core, an interrupt is signaled to IRQ_Crossbar. 0x0: Transmision ongoing. 0x1: Transmit data ready.	RW	0
3	RRDY	Receive data ready IRQ status. Set to 1 by core when receiver mode, a new data is able to be read. When set to 1 by core, an interrupt is signaled to IRQ_Crossbar. 0x0: No data available. 0x1: Receive data available.	RW	0
2	ARDY	Register access ready IRQ status. When set to 1 it indicates that previous access has been performed and registers are ready to be accessed again. An interrupt is signaled to IRQ_Crossbar. 0x0: Module busy. 0x1: Access ready.	RW	0
1	NACK	No acknowledgement IRQ status. Bit is set when No Acknowledge has been received, an interrupt is signaled to IRQ_Crossbar. 0x0: Normal operation. 0x1: Not Acknowledge detected.	RW	0
0	AL	Arbitration lost IRQ status. This bit is automatically set by the hardware when it loses the Arbitration in master transmit mode, an interrupt is signaled to IRQ_Crossbar. During reads, it always returns 0. 0x0: Normal operation. 0x1: Arbitration lost detected.	RW	0

Table 24-31. I2C_IRQSTATUS

24.2 HDQ/1-Wire

This section describes the HDQ™/ 1-Wire® interface for the device.

24.2.1 HDQ1W Overview

The HDQ1W module implements the hardware protocol of the master functions of the TI/Benchmarq HDQ and the Dallas Semiconductor 1-Wire® protocols. These protocols use a single wire for communication between the master (HDQ1W controller) and the slaves (HDQ/1-Wire external compliant devices).

Figure 24-28 shows the HDQ1W.

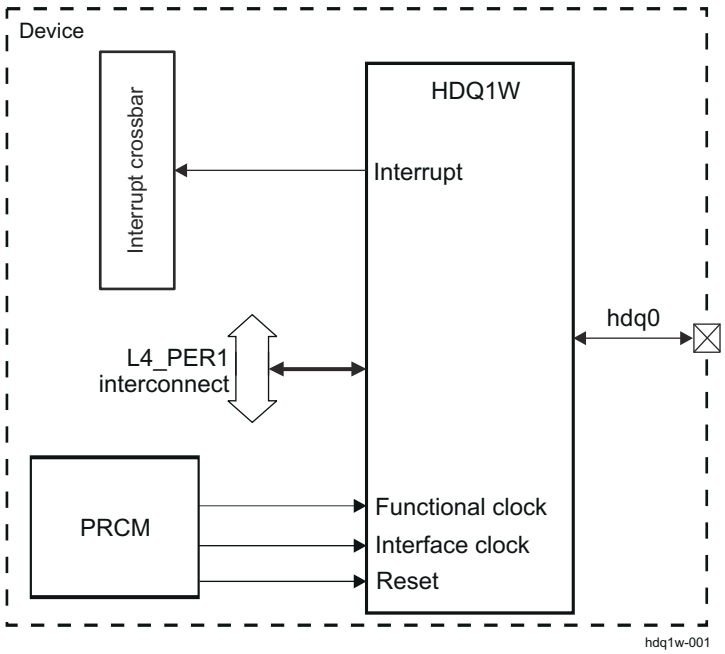

Figure 24-28. HDQ1W Overview

The HDQ1W has a generic L4 interface and is intended to be used in an interrupt-driven fashion. The 1-pin interface is implemented as an open-drain output at the device level.

The main features supported by the HDQ1W are the following:

- Benchmarq HDQ protocol
- Dallas Semiconductor 1-Wire protocol
- Power-down mode

The HDQ1W provides a communication rate of 5 Kbps over an address space of 128 bytes.

A typical application of the HDQ1W is the communication with battery monitor (gas gauge) integrated circuits.

24.2.2 HDQ1W Environment

24.2.2.1 HDQ1W Functional Modes

The HDQ1W has two main modes: HDQ and 1-Wire. Each of these modes includes idle, active, and power-down submodes. Table 24-58 lists the HDQ1W functional modes, and Figure 24-29 shows an overview of a typical application.

Table 24-58. Functional Modes

Functions	Description
HDQ	Benchmarq HDQ protocol
1-Wire	Dallas Semiconductor 1-Wire protocol

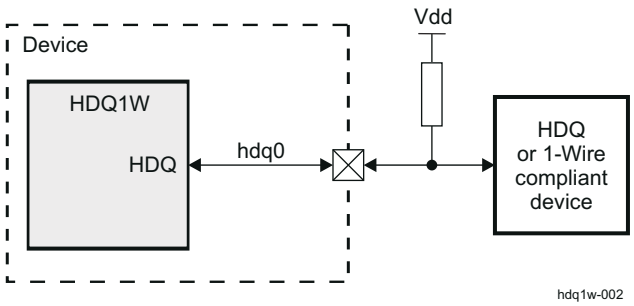

Figure 24-29. HDQ1W Typical Application System Overview

An external pullup is required, because the two protocols use a return-to-1 mechanism (that is, after any command by any of the connected devices, the line is pulled to a logical high level).

The HDQ1W operates according to a command structure that is programmed into transmit command registers (as described in Section 24.2.5.1.2, *HDQ1W Low-level Programming Model*).

The 1-Wire mode runs at slower speeds than the capabilities of the mode.

Table 24-59 describes the external signal of the HDQ/1-Wire compliant module.

Table 24-59. I/O Description

Signal	I/O(1)	Description	Value at Reset
hdq_sio	I/O	Serial data input/output. Output is open drain type.	HiZ (pulled to 1 by pullup)

(1) I = Input; O = Output

Note

The path from a module pin to device pad(s) is defined at the device I/O logic level. The control module registers assign the specific function to the device pads. For more information on control module settings, see *Pad Configuration Registers* in *Control Module*.

24.2.2.2 HDQ and 1-Wire (SDQ) Protocols

24.2.2.2.1 HDQ Protocol Initialization (Default)

In HDQ mode, the firmware does not require the host to create an initialization pulse to the slave. However, the slave can be reset by using an initialization pulse (also referred to as a break pulse). The initialization pulse is generated by setting the HDQ_CTRL_STATUS[2] INITIALIZATION bit and then setting the HDQ_CTRL_STATUS[4] GO bit. The slave does not respond with a presence pulse as it does in the 1-Wire protocol.

The HDQ is a command-based protocol in which the host sends a command byte to the slave. The command directs the slave either to store the next eight bits of data received to a register specified by the command byte (write operation) or to output the eight bits of data from a register specified by the command byte (read operation). The master implementation is a simple byte engine. Sending of the ID, command/address, and data is controlled by firmware. The master engine provides only a single HDQ_TX_DATA register.

The command and data bytes consist of a stream of eight bits with a maximum transmission rate of 5 Kbps. The least-significant bit (LSB) of a command or data byte is transmitted first. If a communication time-out occurs between the host and the slave (for example, if the host waits longer than the specified time for the slave to respond, or if this is the first access command), then the host must send an initialization pulse (BREAK) before sending the command again.

The slave detects a break when the HDQ pin is driven to a logic-low state for a specified break time $t_{(B)}$ or greater. The HDQ pin then returns to its normal ready-high logic state for a specified break-recovery time $t_{(BR)}$. The slave is then ready for a command from the host processor. Figure 24-30 shows this behavior.

An interrupt condition indicates a TX-complete, an RX-complete, or a time-out condition. Reading the interrupt status register clears all interrupt conditions. Only one interrupt signal is sent to the microcontroller, and only one overall mask bit can enable or disable the interrupt. The interrupt conditions cannot be individually masked.

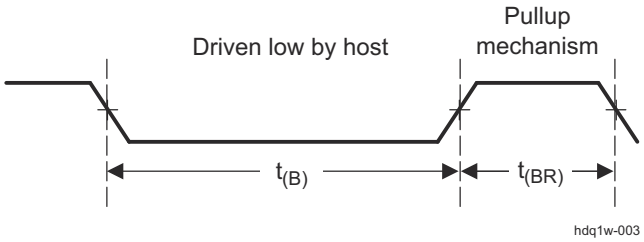

Figure 24-30. HDQ Break-Pulse Timing Diagram

24.2.2.2.2 1-Wire (SDQ) Protocol Initialization

In 1-Wire (SDQ) protocol, the host first sends an initialization pulse (by pulling the line to a logic-low state) and then waits for the slave to respond with a presence pulse before enabling any communication sequence.

As for the initialization pulse, the presence pulse is a low-level pulse on the line initiated by the slave. The timing diagram in Figure 24-31 shows the 1-Wire (SDQ) reset sequence.

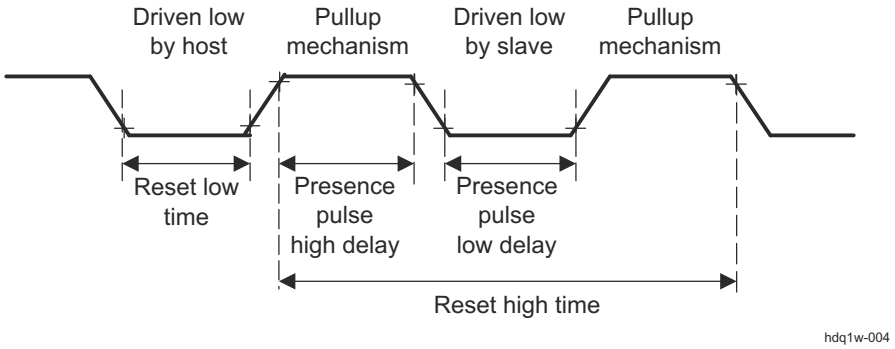

Figure 24-31. 1-Wire (SDQ) Reset Timing Diagram

The host drives the line to a logic-low state for a minimum of reset low time. Once the slave detects this pulse, it must drive the line to a logic-low state within the presence pulse high delay for a minimum period of presence pulse low time.

If the slave does not respond within this interval of time, a time-out event occurs and no transaction can be initiated. The host must initiate the reset sequence again before sending any command to the slave.

On the other hand, if the slave sends back its presence pulse within the specified time interval, the communication can be enabled after the reset high time.

24.2.2.2.3 Communication Sequence (HDQ and 1-Wire Protocols)

The description in this section applies to both protocols.

After a successful break pulse (HDQ mode) or initialization sequence (1-Wire protocol), the host and slave are ready for bit transmission. Each bit to transmit (either from the host to the slave or from the slave to the host) is preceded by a low-going edge on the line, as shown in Figure 24-32.

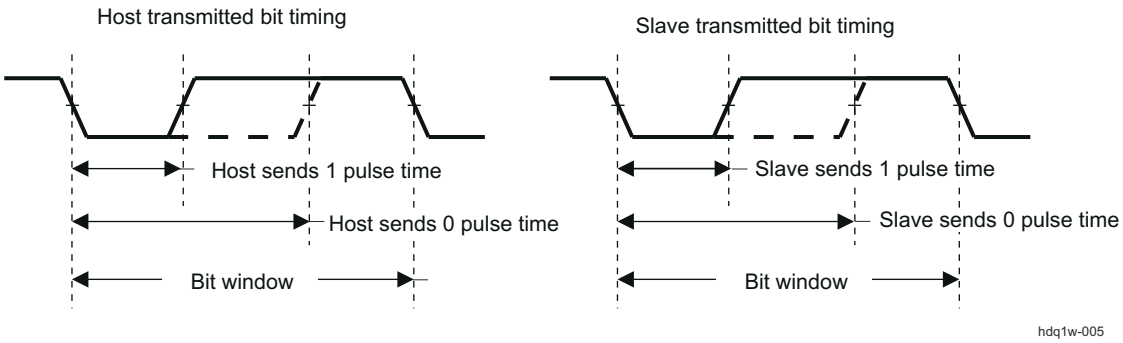

Figure 24-32. HDQ1W Transmitted Bit Timing

The return-to-1 data-bit frame consists of three distinct sections. The first section starts the transmission when either the slave or the host takes the line to a logic-low state. The next section is the actual data transmission in which the data must be valid during a specified period of time after the negative edge that starts the communication. The final section stops the transmission by returning the HDQ/1-Wire line to a logic-high state. Communication with an HDQ/1-Wire slave always occurs with the LSB being transmitted first.

The command byte of the HDQ/1-Wire protocols consists of eight contiguous valid command bits. The command byte contains two fields: R/W command and address. The R/W bit of the command byte determines whether the command is a read or a write, and the address field containing bits AD6-AD0 indicates the address to be read or written. Table 24-60 lists the command byte values.

Table 24-60. HDQ/1-Wire Command Byte

7	6	5	4	3	2	1	0
R/W	AD6	AD5	AD4	AD3	AD2	AD1	AD0

R/W Indicates whether the command byte is a read or a write. A 1 indicates a write command; the following eight bits must be written to the register specified by the address field of the command byte. A 0 indicates that the command is a read. On a read command, the slave outputs the requested register contents.

AD6-AD0 Represent the seven bits labeled AD6-AD0 containing the address portion of the register to be accessed. The communication sequence example in Figure 24-33 shows a read command at address 0x55; the received data is 0x65.

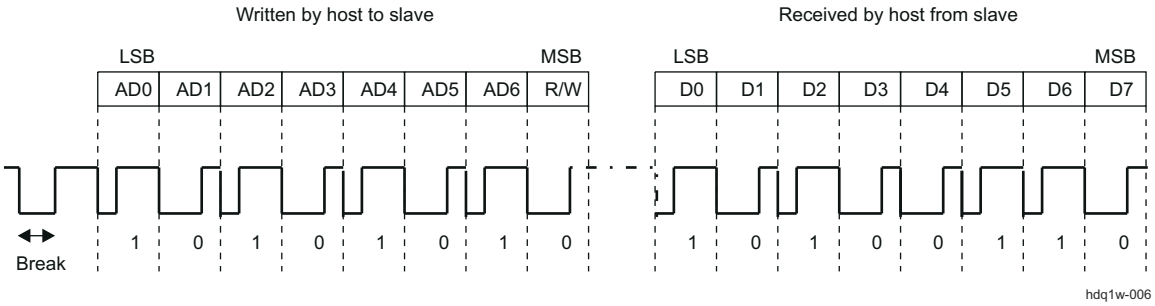

Figure 24-33. HDQ/1-Wire Communication Sequence

24.2.3 HDQ1W Integration

Figure 24-34 shows HDQ1W integration in the device.

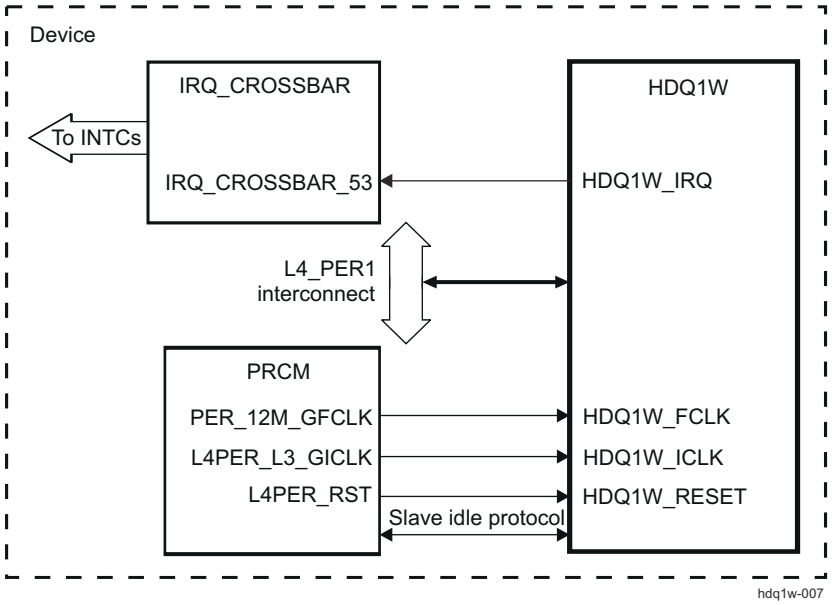

Figure 24-34. HDQ1W Integration

Table 24-61 through Table 24-63 summarize the integration of the module in the device.

Table 24-61. HDQ1W Integration Attributes

			DSP1_IRQ_84	

Note

The **"Default Mapping"** column in Table 24-63, *HDQ1W Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module.

For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.

For more information about the device interrupt controllers, see *Interrupt Controllers*.

24.2.4 HDQ1W Functional Description

The HDQ1W works with HDQ and 1-Wire protocols. The protocols use a single wire to establish communication between the master and the slave. Both protocols use a return-to-1 mechanism; that is, after any command is driven, the line is pulled to a high level. This mechanism requires an external pullup.

24.2.4.1 HDQ1W Block Diagram

Figure 24-35 is the HDQ1W block diagram.

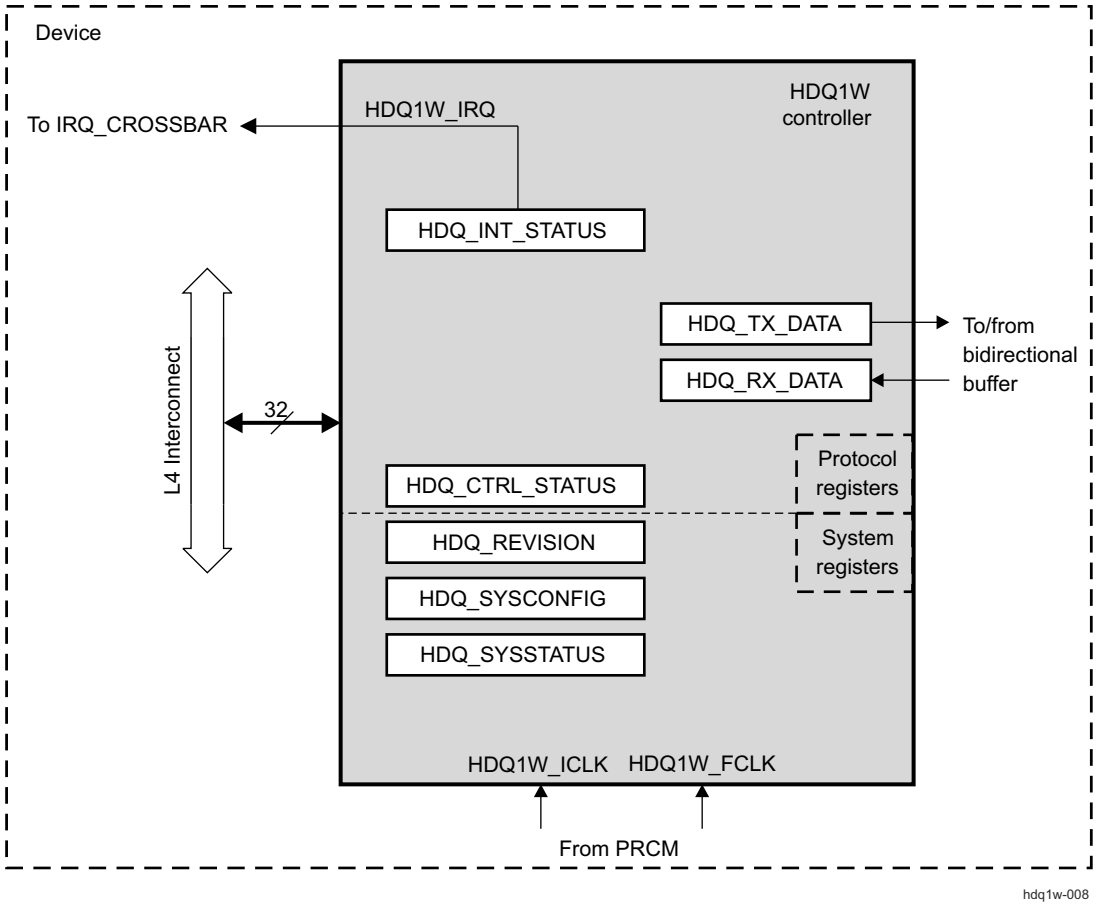

Figure 24-35. HDQ1W Block Diagram

The HDQ_CTRL_STATUS[0] MODE bit allows selection between the HDQ and 1-Wire protocols. This bit is assumed static for design purposes. The configuration is in HDQ mode by default.

Figure 24-36 shows the protocol-dedicated register scheme.

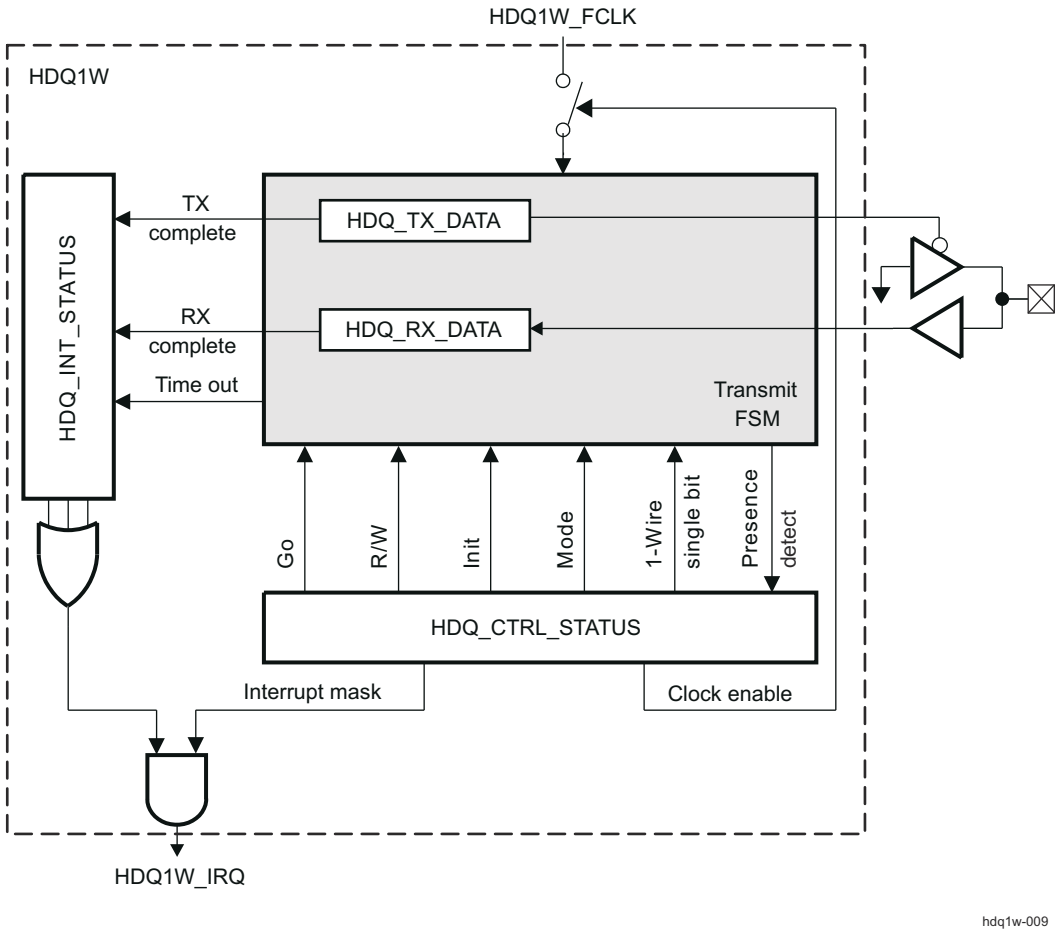

Figure 24-36. Protocol Registers Description

The receive and transmit operations of the HDQ1W module are performed with respect to the timing of the slower HDQ protocol. When the 1-Wire protocol is used, it runs at lower speed than its full capabilities, but is still able to meet the timing requirements and practical considerations.

24.2.4.2 HDQ1W Clocking Configuration

24.2.4.2.1 HDQ1W Clocks

The HDQ1W module operates from two clocks: a functional clock (HDQ1W_FCLK) and an interface clock (HDQ1W_ICLK). When these clocks are set in the PRCM module, the following rule must be observed: HDQ1W_ICLK ≥ HDQ1W_FCLK.

- The HDQ1W_FCLK functional clock is a fixed clock provided by the PRCM module. It is used to clock the internal module logic.

  For more information about the clock and the PRCM register settings, see *CD_L4PER1 Clock Domain*, in chapter *Power, Reset, and Clock Management*.

  When the HDQ1W no longer requires the HDQ1W_FCLK, the software can disable it at the PRCM level. The clock is effectively cut, provided the other modules that receive it do not require it either.
- The HDQ1W_ICLK interface clock runs at L4 interconnect clock speed and is used to trigger access to the HDQ1W L4 interface.

  When the HDQ1W no longer requires the HDQ1W_ICLK (no transfer is in progress), the software can disable it at the PRCM level. The clock is effectively cut, provided the other modules that receive it do not require it either.

24.2.4.3 HDQ1W Hardware and Software Reset

Global reset of the module is done at the power, reset, and clock management (PRCM) module level (for more information, see *CD_L4PER1 Clock Domain*) or by setting the HDQ_SYSCONFIG[1] SOFTRESET bit to 1. Setting this bit enables an active software reset functionality equivalent to a hardware reset. The HDQ1W_FCLK functional clock must be enabled from the PRCM level and locally through the HDQ_CTRL_STATUS[5] CLOCKENABLE bit (set to 1) for the software reset to complete.

24.2.4.4 HDQ1W Power Management

Table 24-64 describes power-management features available to the HDQ1W.

Table 24-64. Local Power-Management Features

Feature	Registers	Description
Clock auto gating	HDQ_SYSCONFIG [0] AUTOIDLE bit	Auto-idle mode
Slave idle modes	N/A	N/A
Clock enable	HDQ_CTRL_STATUS[5] CLOCKENABLE bit	Power-down mode
Master standby modes	N/A	N/A
Global wake-up enable	N/A	N/A
Wake-up sources enable	N/A	N/A

24.2.4.4.1 Auto-Idle Mode

The HDQ1W provides an auto-idle function in its interconnect clock domain.

The interconnect clock auto-idle power-saving mode is enabled or disabled through the HDQ_SYSCONFIG[0] AUTOIDLE bit. When this mode is enabled and there is no activity on the interconnect interface, the interconnect clock (HDQ1W_ICLK) is disabled inside the module, thereby reducing power consumption. When there is new activity on the interconnect interface, the interconnect clock is restarted with no latency penalty. This mode is disabled by default after a reset.

The auto-idle mode can be enabled in order to reduce power consumption.

24.2.4.4.2 Power-Down Mode

The HDQ1W also provides a power-saving function in its functional clock domain.

Setting the CLOCKENABLE bit in the control and status register (HDQ_CTRL_STATUS[5] CLOCKENABLE bit) to 0 shuts off the functional clock (HDQ1W_FCLK) to the state-machine. The state-machine is reset when the functional clock is disabled; if any transaction is ongoing, it is aborted into the reset state.

Before shutting off the functional clock, the software must wait for transaction-complete interrupt. In write operation the software must check whether the interrupt was generated after address/command byte was sent or after data byte was sent. The functional clock must not be shut off after address/command byte is sent; otherwise, the data is not written to the slave.

The register values are not affected by disabling the functional clock.

24.2.4.4.3

CAUTION

There is no hardware mechanism to prevent cutting off the HDQ1W clocks while the module is performing a transfer. This would result in loss of data being transferred.

24.2.4.5 HDQ Interrupt Requests

The HDQ1W can generate one interrupt:

- HDQ1W_IRQ: Table 24-65 lists the events that can generate this interrupt.

Table 24-65. Events

Event Flag	Event Mask	Sync	Sensitivity	Description
HDQ_INT_STATUS[2] TXCOMPLETE	HDQ_CTRL_STATUS[31] INTERRUPTMASK	Yes	Level	A write operation of one byte was completed.
HDQ_INT_STATUS[1] RXCOMPLETE	HDQ_CTRL_STATUS[31] INTERRUPTMASK	Yes	Level	A byte has been successfully read.
HDQ_INT_STATUS[0] TIMEOUT	HDQ_CTRL_STATUS[31] INTERRUPTMASK	Yes	Level	After a read command initiated by the host, the slave did not pull the line low within the specified time.

24.2.4.6 HDQ Mode (Default)

24.2.4.6.1 HDQ Mode Features

The HDQ mode supports the following:

- Benchmarq HDQ protocol
- Power-down mode

24.2.4.6.2 Description

In the HDQ mode, there is no need for the host to create an initialization pulse to the slave. However, the host can reset the slave by using an initialization pulse (also known as a break pulse). Setting the HDQ_CTRL_STATUS[2] INITIALIZATION bit and then setting the HDQ_CTRL_STATUS[4] GO bit creates this pulse by pulling the line down for a defined duration. When the slave receives the pulse, it is ready for communication but does not respond with a presence pulse.

In a typical write operation, two bytes are sent to the slave. The first byte corresponds to the command/address byte, and the second byte corresponds to the data to be written.

In a typical read operation, the host sends a command/address byte and the slave returns a byte of data.

The master is implemented to send and receive bytes. Sending the command/address and data is controlled by the firmware. The master provides only a single data TX register.

The HDQ protocol is a return-to-1 protocol. Consequently, after a byte is sent to the slave (either command/address + data for a write, or just command/address for a read), the host pulls the line up. The line is set to the high-impedance state in the device and an external pullup brings it to a logical high level.

In the case of a read operation, the slave also drives the line to a logic-low state before sending the requested data.

If the host initiates a read and does not receive data within a specified interval of time (that is, the slave does not drive the line low within this interval), the HDQ_INT_STATUS[0] TIMEOUT bit is set, thereby indicating a read failure. The TIMEOUT bit remains set until the host reads the interrupt status register (HDQ_INT_STATUS).

An interrupt condition indicates either a TX-complete, an RX-complete, or a time-out on a transaction. The corresponding bit is set in the interrupt status register (HDQ_INT_STATUS). This register is cleared as soon as it is read.

Only one interrupt signal is sent, and only an overall mask can enable or disable the interrupts. These interrupts cannot be individually masked.

24.2.4.6.3 Single-Bit Mode

In HDQ mode, the single-bit mode (HDQ_CTRL_STATUS[7] ONE_WIRE_SINGLE_BIT bit set to 1) has no effect because the HDQ protocol supports only byte transfers.

24.2.4.6.4 Interrupt Conditions

The HDQ1W provides the following interrupt status:

- Transmission complete:

A write operation of one byte was completed. Successful or failed completion is not indicated, because there is no acknowledgment from the slave in HDQ protocol. This interrupt condition is cleared by reading the interrupt status register (HDQ_INT_STATUS).

- Read complete:

  In HDQ mode, the interrupt status indicates that a byte has been successfully read. This interrupt condition is cleared by reading the interrupt status register (HDQ_INT_STATUS).
- Presence detect/time-out:

  In HDQ mode, the interrupt status indicates that after a read command initiated by the host, the slave did not pull the line low within the specified time. This interrupt condition is cleared by reading the interrupt status register (HDQ_INT_STATUS).

  In HDQ mode, a time-out condition is also used to indicate the successful completion of a break pulse. That is, if the master has sent the break pulse, it is indicated with a time-out instead of a TX-complete.

Only one interrupt is generated to the host CPU based on any of these interrupt conditions. A read operation on the interrupt status register clears all the interrupt status bits that were previously set.

24.2.4.7 1-Wire Mode

24.2.4.7.1 1-Wire Mode Features

The 1-Wire mode supports the following:

- Dallas Semiconductor 1-Wire protocol
- Power-down mode
- Single-bit mode

24.2.4.7.2 Description

The 1-Wire mode requires an initialization pulse to be sent to the slave(s) connected on the interface. If a slave is present, it responds with a presence pulse.

The initialization pulse is sent when the HDQ_CTRL_STATUS[2] INITIALIZATION bit is set and the HDQ_CTRL_STATUS[4] GO bit is set afterwards.

When the slave receives the initialization pulse, it sends back its presence pulse by pulling down the line for a defined duration. The module detects this low-level pulse and sets the HDQ_CTRL_STATUS[3] PRESENCEDETECT bit.

In a similar way, if a presence pulse is not received from the slave after an initialization pulse is sent, the PRESENCEDETECT bit remains cleared.

Whether or not a presence pulse is detected after an initialization pulse is sent, the HDQ_INT_STATUS[0] TIMEOUT bit is set and an interrupt condition is generated.

In 1-Wire mode, the generated interrupt condition means the maximum time allowed for receiving the response has elapsed and the software must check the PRESENCEDETECT bit to determine whether or not there was a presence pulse.

The INITIALIZATION bit is cleared at the end of the initialization pulse at the same time as the TIMEOUT bit is set. The TIMEOUT bit is cleared when the interrupt status register (HDQ_INT_STATUS) is read.

For read operations, 1-Wire is a bit-by-bit protocol, which means the slave must be clocked by the host for each bit of the byte to read.

The line is pulled up at the end of the command/address byte. On the first read, the host creates a low-going edge to initiate a bit read. The line is then pulled up (pulled to the high-impedance state by the host and set to a high logical level by the external pullup) and the slave either drives the line low to transmit a 0, or does not drive the line to transmit a 1. This sequence is repeated for each bit to read.

The first bit the host receives is the LSB, and the last bit is the most-significant bit (MSB) in the receive data register (HDQ_RX_DATA).

An interrupt condition indicates either a TX-complete, an RX-complete, or a time-out condition (that is, the time allowed for the slave to indicate its presence has elapsed). A read operation on the interrupt status register clears the interrupt conditions previously set. As in the HDQ mode, only one interrupt signal is sent to the host CPU. Only an overall mask bit can enable or disable the interrupt (the interrupt conditions cannot be masked individually).

24.2.4.7.3 1-Wire Single-Bit Mode Operation

A single-bit mode can be entered by setting the appropriate bit in the control and status register (ONE_WIRE_SINGLE_BIT bit HDQ_CTRL_STATUS[7]). In this mode, only one bit of data at a time is transferred between the master and the slave. After the bit is transferred, an interrupt is generated (that is, there is an RX-complete for a read operation and a TX-complete for a write operation). The ONE_WIRE_SINGLE_BIT bit is cleared by hardware after every single bit is received. Software must set this bit to re-enable reception in single-bit mode. Bit 0 of the RX register (HDQ_RX_DATA) is updated each time a bit is received from the slave; bit 0 of the TX register (HDQ_TX_DATA) contains the bit to be sent.

24.2.4.7.4 Interrupt Conditions

The HDQ1W provides the following interrupt status:

- Transmission complete:

  A write operation of one byte was completed. Successful or failed completion is not indicated, because there is no acknowledgment from the slave in 1-Wire protocol. This interrupt condition is cleared by reading the interrupt status register (HDQ_INT_STATUS).
- Read complete:

  In 1-Wire mode, the interrupt status indicates that a byte has been successfully read. This interrupt condition is cleared by reading the interrupt status register (HDQ_INT_STATUS).
- Presence detect/time-out:

  In 1-Wire mode, the interrupt status indicates that it is now valid to check the PRESENCEDETECT bit. This interrupt condition is cleared by reading the interrupt status register (HDQ_INT_STATUS).

Only one interrupt is generated to the host CPU based on any of these interrupt conditions. A read operation on the interrupt status register clears all interrupt status bits that were previously set.

24.2.4.7.5 Status Flags

The presence-condition-detected status flag is contained in the HDQ_CTRL_STATUS[3] PRESENCEDETECT bit. This is valid only in 1-Wire mode. The flag is updated when the HDQ_INT_STATUS[0] TIMEOUT bit is set. Therefore, its correct value shows only after the interrupt is generated. The firmware must wait for the time-out condition; otherwise, the flag keeps its previous value and is undefined.

24.2.4.8 BITFSM Delay

The return-to-one mechanism on the HDQ/1-Wire bus is a simple pull-up resistor. Consequently, an excessive wire load of the HDQ/1-Wire bus can cause a significant delay to the bus rise time. This can prevent the module state machine from working correctly by reading back an improper value caused by the line delay. To correct such condition by software, it is possible to configure the HDQ_CTRL_STATUS[10:8] BITFSM register bitfield with the expected line delay. This way the module state machine waits the proper time interval, before reading back the line value. The delay can be adjusted in 1.33 µs steps. The default value of BITFSM = 0x0 corresponds to 1.33 µs delay.

Bus delay can be calculated as follows: $T_{delay} \approx 2.2 \times R_{pullup} \times C_{line}$

See more information in the *Device Data Manual*.

24.2.5 HDQ1W Low-Level Programming Model

This section describes the low-level hardware programming sequences for configuration and usage of the module. The basic protocol functions, such as slave initialization (reset), read-byte, and write-byte operations,

are described. For a description of the high-level functions, see the HDQ/1-Wire protocol documentation and the slave device datasheet.

24.2.5.1 Global Initialization

24.2.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the HDQ1W module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the HDQ1W. Refer to the HDQ1W Module Integration and Environment Sections for further information.

Table 24-66. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. The interface clock must not be slower than the functional clock (HDQ1W_ICLK ≥ HDQ1W_FCLK). For more information about the module configuration, see *Power, Reset, and Clock Management*.
Control Module	Module specific pad muxing and pullup must be set in the control module. If an external pullup is used, the internal pullup/pulldown must be disabled. For more information about the module configuration, see *Control Module*.
IRQ_CROSSBAR/INTC	Interrupt crossbar and interrupt controller configuration must be done to enable the interrupts from HDQ1W module. See *Interrupt Controllers*, and *IRQ_CROSSBAR Module Functional Description*.

Table 24-76. HDQ1W Instance Summary

Module Name	Base Address	Size
HDQ1W	0x480B 2000	4 KiB

24.2.6.2 HDQ1W Registers

CAUTION

The following rules must be observed when accessing the module registers:

- A read from the HDQ_INT_STATUS register or the HDQ_RX_DATA register is not allowed unless the processor has been interrupted by the module.
- After the release of the GO bit in the HDQ_CTRL_STATUS register, no access to the HDQ_TX_DATA or HDQ_CTRL_STATUS register is allowed until the processor has been interrupted by the module.
- Polling of the HDQ_INT_STATUS register by software to determine whether an interrupt was generated is not allowed.

CAUTION

The HDQ1W registers are limited to 32-bit data accesses; 16-bit and 8-bit data accesses are not allowed and can corrupt register content.

24.3 UART/IrDA/CIR

This chapter describes the function, operation, and configuration of the universal asynchronous receiver/transmitter (UART)/infrared data association (IrDA)/consumer infrared (CIR) module in the device.

24.3.1 UART/IrDA/CIR Overview

The UART is a simple L4 slave peripheral that utilizes the DMA_SYSTEM or EDMA for data transfer or IRQ polling via CPU. There are 10 UART modules in the device. Only one UART supports IrDA features. Each UART can be used for configuration and data exchange with a number of external peripheral devices or interprocessor communication between devices.

Figure 24-37 shows the UART module overview.

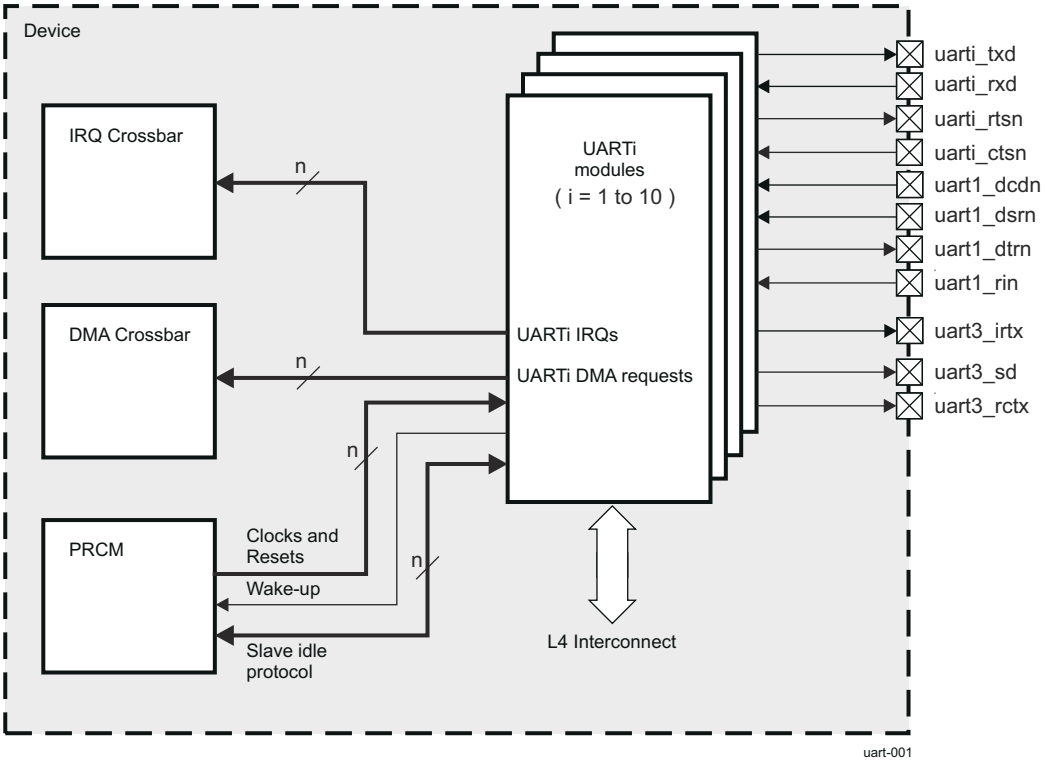

Figure 24-37. UART Overview

24.3.1.1 UART Features

The UARTi (where i = 1 to 10) include the following features:

- 16C750 compatibility
- 64-byte FIFO buffer for receiver and 64-byte FIFO for transmitter
- Programmable interrupt trigger levels for FIFOs
- Baud generation based on programmable divisors N (where N = 1…16,384) operating from a fixed functional clock of 48 MHz or 192 MHz

Oversampling is programmed by software as 16 or 13. Thus, the baud rate computation is one of two options:

- Baud rate = (functional clock / 16) / N
- Baud rate = (functional clock / 13) / N
- This software programming mode enables higher baud rates with the same error amount without changing the clock source
- Break character detection and generation
- Configurable data format:

  - Data bit: 5, 6, 7, or 8 bits
  - Parity bit: Even, odd, none
  - Stop-bit: 1, 1.5, 2 bit(s)
- Flow control: Hardware (RTS/CTS) or software (XON/XOFF)
- The 48 MHz functional clock option allows baud rates up to 3.6Mbps
- The 192 MHz functional clock option allows baud rates up to 12Mbps
- UART1 module has extended modem control signals (DCD, RI, DTR, DSR)
- UART3 supports IrDA

24.3.1.2 IrDA Features

UART3 supports the following IrDA key features:

- Support of IrDA 1.4 slow infrared (SIR), medium infrared (MIR), and fast infrared (FIR) communications:
  - Frame formatting: Addition of variable beginning-of-frame (xBOF) characters and end-of-frame (EOF) characters
  - Uplink/downlink cyclic redundancy check (CRC) generation/detection
  - Asynchronous transparency (automatic insertion of break character)
  - Eight-entry status FIFO (with selectable trigger levels) to monitor frame length and frame errors
  - Framing error, CRC error, illegal symbol (FIR), and abort pattern (SIR, MIR) detection

24.3.1.3 CIR Features

The CIR mode uses a variable pulse-width modulation (PWM) technique (based on multiples of a programmable *t* period) to encompass the various formats of infrared encoding for remote-control applications. The CIR logic transmits data packets based on a user-definable frame structure and packet content.

The CIR (UART3 only) includes the following features to provide CIR support for remote-control applications:

- Transmit mode only (receive mode is not supported)
- Free data format (supports any remote-control private standards)
- Selectable bit rate
- Configurable carrier frequency
- 1/2, 5/12, 1/3, or 1/4 carrier duty cycle

24.3.2 UART/IrDA/CIR Environment

This section describes the UART/IrDA/CIR connection with an external device.

- The UART interface is described in Section 24.3.2.1.
- The IrDA interface is described in Section 24.3.2.2, *IrDA Functional Interfaces*.
- The CIR interface is described in Section 24.3.2.3, *CIR Functional Interfaces*.

24.3.2.1 UART Interface

24.3.2.1.1 System Using UART Communication With Hardware Handshake

Each UART instance can be easily connected to the UART port of an external IC (see Figure 24-38).

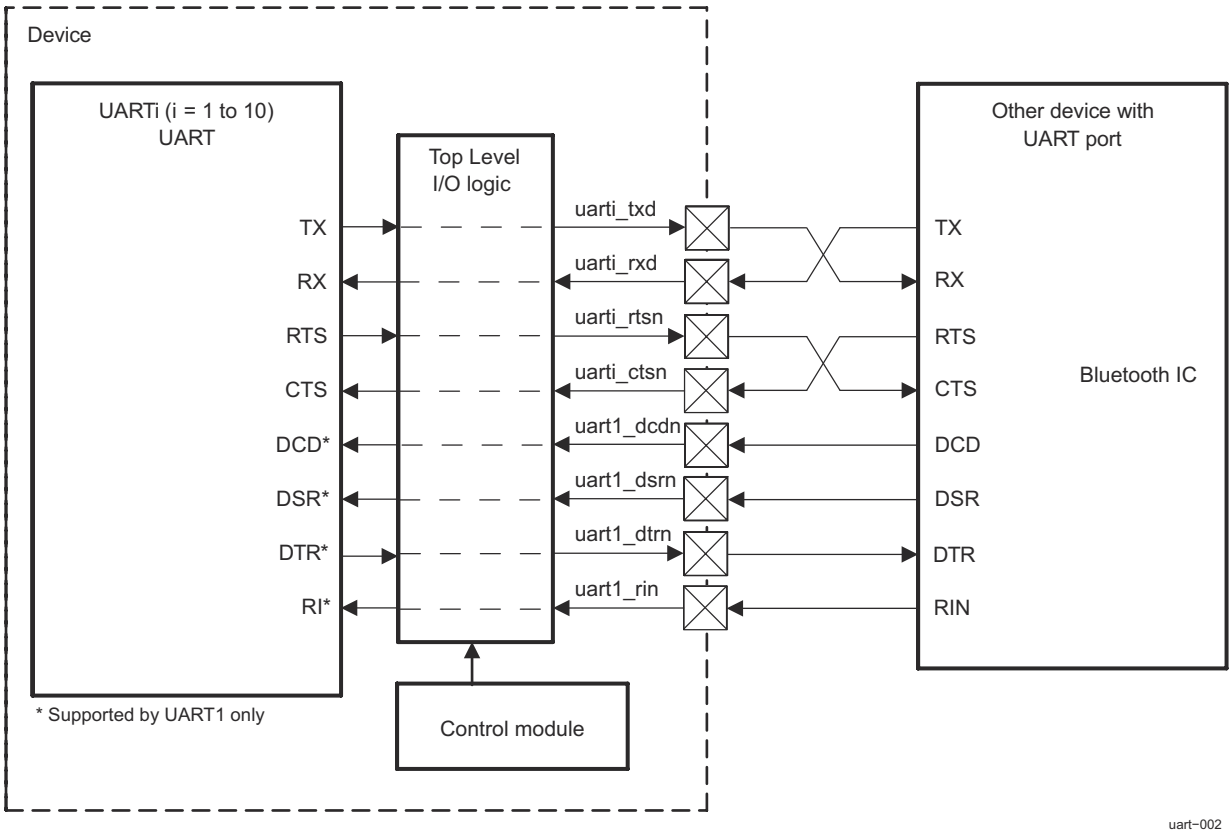

Figure 24-38. UART Mode Bus System Overview

24.3.2.1.2 UART Interface Description

Table 24-85 lists the UART interface input/output (I/O) signals.

Table 24-85. UART Interface Signals

Signal	I/O[1]	Description	Module Level Reset Value
UARTi Interface Signals[2]			
uarti_rxd	I	Serial data input.	HiZ
uarti_txd	O	Serial data output Because this pin is active high in IrDA mode and the output is muxed, this pin is set to low on reset (when the UARTi.UART_MDR1[2:0] bit field is set to 0x7) and takes the defined inactive level of that signal corresponding to when and how the UARTi.UART_MDR1 register is programmed; that is, the output is 1 (inactive for UART modem modes) and 0 (inactive for IrDA modes).	1
uarti_ctsn	I	Clear to send	HiZ

Table 24-85. UART Interface Signals (continued)

Signal	I/O(1)	Description	Module Level Reset Value
		Active-low modem status signal. Reading the UARTi.UART_MSR[4] NCTS_STS bit checks the condition of uarti_ctsn. Reading the UARTi.UART_MSR[0] CTS_STS bit checks a change of state of uarti_ctsn since the last read of the modem status register. The auto-CTS mode uses uarti_ctsn to control the transmitter.	
uarti_rtsn	O	Request to send When active (low), the module is ready to receive data. Setting the UARTi.UART_MCR[1] RTS bit activates uarti_rtsn, which becomes inactive as the result of a module reset, loopback mode, or clearing the UARTi.UART_MCR[1] RTS bit. In auto-RTS mode, uarti_rtsn becomes inactive as a result of the receiver threshold logic.	1
UART1 Modem Signals			
uart1_dcdn	I	Data Carrier Detect Active-low modem status signal. The condition of uart1_dcdn can be checked by reading UART_MSR[7] NCD_STS register bit. Any change in its state can be detected by reading UART_MSR[3] DCD_STS bit.	HiZ
uart1_dsrn	I	Data Set Ready Active-low modem status signal. Reading UART_MSR[5] NDSR_STS register bit checks the condition of uart1_dsrn. Reading UART_MSR[1] DSR_STS bit checks a change of state of uart1_dsrn since the last read of the UART_MSR register.	HiZ
uart1_dtrn	O	Data Terminal Ready When active (low), this signal informs the modem that the module is ready to communicate. It is activated by setting UART_MCR[0] DTR register bit.	1
uart1_rin	I	Ring Indicator Active-low modem status signal. The condition of uart1_rin can be checked by reading UART_MSR[6] NRI_STS register bit. Any change in its state can be detected by reading UART_MSR[2] RI_STS bit.	HiZ

(1) I = Input; O = Output; I/O = Bidirectional
(2) i = 1 to 10

Note

The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the Control Module registers. For more information on control module settings, see *Pad Configuration Registers*, in *Control Module*.

24.3.2.1.3 UART Protocol and Data Format

The UART device operates in three modes:

- UART 16x (<= 230.4 kbps)
- UART 16x with autobauding (>= 1200 bps and >= 115.2 kbps)
- UART 13x (>= 460.8 kbps)

CAUTION

To be used as a UART, the operating mode must be programmed appropriately in the UARTi.UART_MDR1[2:0] MODE_SELECT bit field to select UART, IrDA, or CIR mode.

The UART uses a wired interface for serial communication with a remote device.

The UART is functionally compatible with the TL16C750 UART and earlier designs such as the TL16C550.

Figure 24-39 shows the UART frame data format.

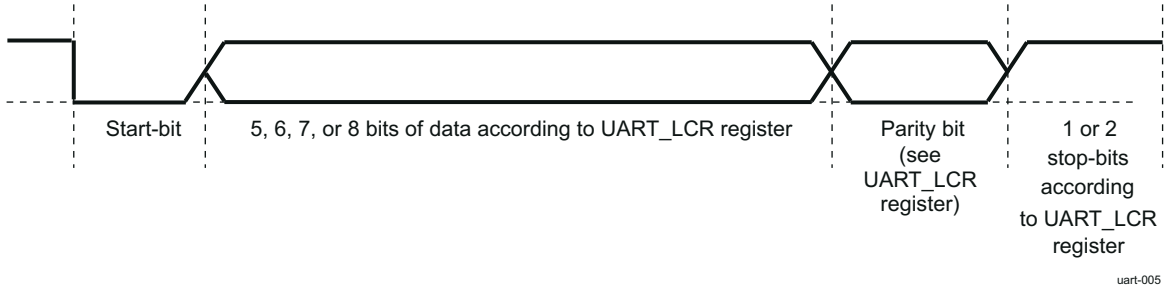

Figure 24-39. UART Frame Data Format

24.3.2.2 IrDA Functional Interfaces

24.3.2.2.1 System Using IrDA Communication Protocol

As Figure 24-40 shows, UART3 can be connected to an external infrared transceiver in the IrDA modes (FIR, SIR, and MIR).

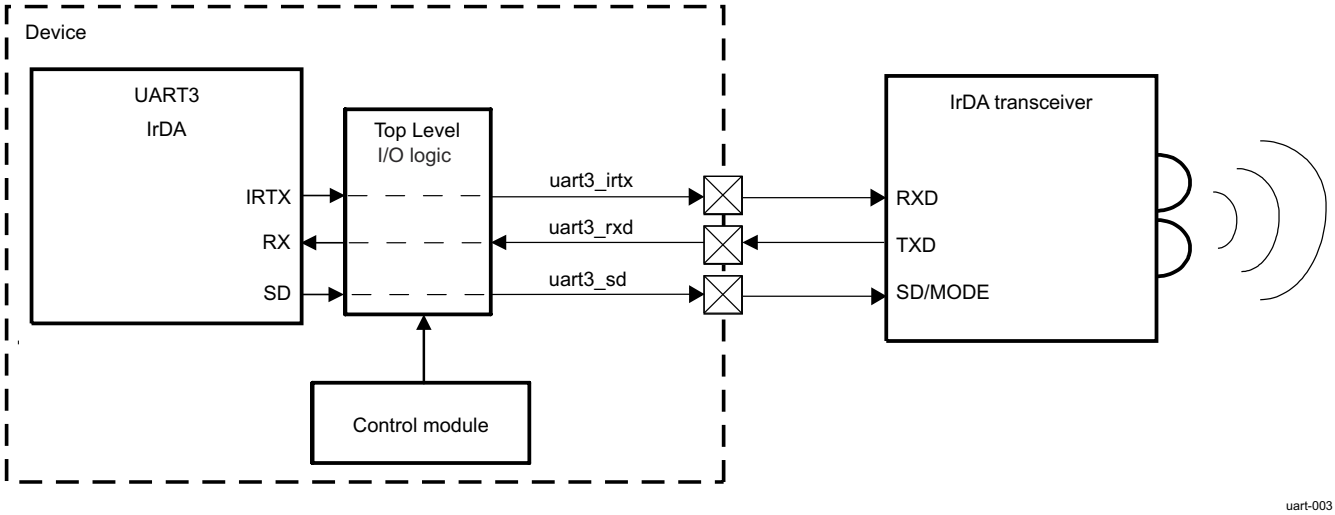

Figure 24-40. IrDA System Overview

24.3.2.2.2 IrDA Interface Description

Table 24-86 lists the IrDA interface I/O signals.

Table 24-86. IrDA I/O Signals

Signal	I/O[1]	Description	Reset
IrDA Signals			
uart3_rxd	I	Serial data input	HiZ
uart3_irtx	O	Serial data output in IrDA modes (SIR, MIR, and FIR). In other modes, this pin is set to the reset value (inactive state).	0
uart3_sd	O	SD mode is used to configure the transceivers. The SD pinout is an inverted value of the UART3.UART_ACREG[6] SD_MOD bit.	1

(1) I = Input; O = Output

24.3.2.2.3 IrDA Protocol and Data Format

24.3.2.2.3.1 SIR Mode

In SIR mode, data is transferred between the MPUand peripheral devices at speeds of up to 115,200 baud. A SIR transmit frame begins with start flags (a single 0xC0, a multiple 0xC0, or a single 0xC0 preceded by a number of 0xFF flags), followed by frame data and a CRC-16, and ends with a stop flag (0xC1).

The bit format for a single word uses 1 start-bit, 8 data bits, and 1 stop-bit, and is unaffected by the use and settings of the UART3.UART_LCR register.

The UART3.UART_BLR[6] XBOF_TYPE bit selects whether the 0xC0 or 0xFF start patterns are used when multiple start flags are required.

The SIR transmit state-machine attaches start flags, CRC-16, and stop flags, and checks the outgoing data to establish whether data transparency is required.

SIR transparency is carried out if the outgoing data between the start and stop flags contains 0xC0, 0xC1, or 0x7D. If one of these start flags is about to be transmitted, the SIR state-machine sends an escape character (0x7D), inverts the fifth bit of the real data to be sent, and then sends this data immediately after the 0x7D character.

The SIR receive state-machine recovers the receive clock, removes the start flags and any transparency from the incoming data, and determines the frame boundary with reception of the stop flag. The SIR state-machine also checks for errors such as a frame abort (0x7D character followed immediately by a 0xC1 stop flag without transparency), a CRC error, or a frame-length error. At the end of a frame reception, the MPUreads the line status register (UART3.UART_LSR_IRDA) to find possible errors of the received frame.

Note

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware. See the description of the UART3.UART_ACREG[5] DIS_IR_RX bit. This applies to all three modes: SIR, MIR, and FIR.

Infrared output in SIR mode can be 1.6-µs or 3/16 encoding, selected by the UART3.UART_ACREG[7] PULSE_TYPE bit. In 1.6-µs encoding, the infrared pulse width is 1.6 µs; and in 3/16th encoding, the infrared pulse width is 3/16th of a bit duration (1/baud rate).

For back-to-back frames, the transmitting device must send at least two start flags at the start of each frame.

Note

Reception supports variable-length stop-bits.

24.3.2.2.3.1.1 Frame Format

Figure 24-41 shows the IrDA SIR frame format.

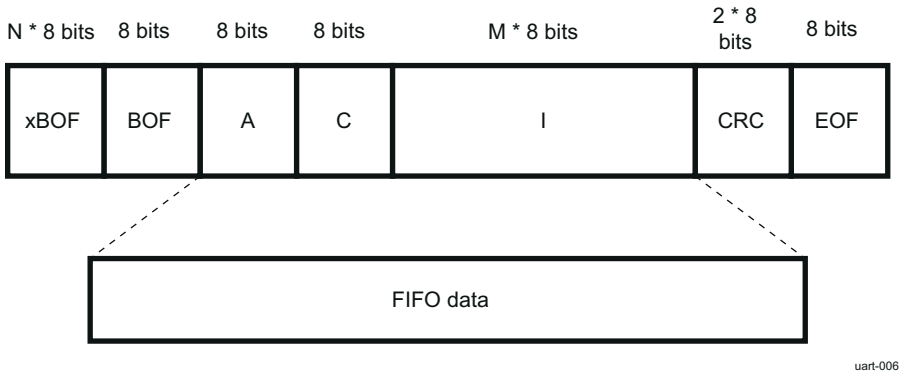

Figure 24-41. IrDA SIR Frame Format

The CRC is applied on the address (A), control (C), and information (I) bytes.

Note

The two words of CRC are written to the FIFO in reception.

24.3.2.2.3.1.2 Asynchronous Transparency

Before transmitting a byte, the UART IrDA controller examines each byte of the payload and the CRC field (between BOF and EOF). For each byte equal to 0xC0 (BOF), 0xC1 (EOF), or 0x7D (control escape), the controller performs certain tasks:

- In transmission:
  - Inserts a control escape (CE) byte preceding the byte
  - Complements bit 5 of the byte (that is, exclusive ORs the byte with 0x20)

  The byte sent for the CRC computation is the initial byte written in the TX FIFO (before the XOR with 0x20).
- In reception:

  For the A, C, I, and CRC fields:
  - Compares the byte with the CE byte; if they are not equal, sends the byte to the CRC detector and stores it in the RX FIFO.
  - If the byte is equal to the CE byte, discards the CE byte
  - Complements bit 5 of the byte following the CE
  - Sends the complemented byte to the CRC detector and stores it in the RX FIFO

24.3.2.2.3.1.3 Abort Sequence

The transmitter can prematurely close a frame (abort) by sending the sequence 0x7DC1. The abort pattern closes the frame without a CRC field or an ending flag.

When a 0x7D character that is followed immediately by a 0xC1 character is received without transparency, the receiver treats the frame as an aborted frame.

24.3.2.2.3.1.4 Pulse Shaping

The SIR mode supports the 3/16 and the 1.6-µs pulse duration methods. The UART3.UART_ACREG[7] PULSE_TYPE bit selects the pulse-width method in transmit mode.

24.3.2.2.3.1.5 Encoder

Serial data from the transmit state-machine are encoded to transmit data to the optoelectronics. While the TX FIFO output is high, the uart3_irtx line is always low, and the counter used to form a pulse on uart3_irtx is cleared continuously.

After the TX FIFO output resets to 0, uart3_irtx rises on the falling edge of the seventh 16XCLK. On the falling edge of the tenth 16XCLK pulse, uart3_irtx falls, creating a 3-clock-wide pulse. While the TX FIFO output stays low, a pulse is transmitted during the seventh clock to the tenth clock of each 16-clock bit cycle.

Figure 24-42 shows the IrDA SIR encoding mechanism.

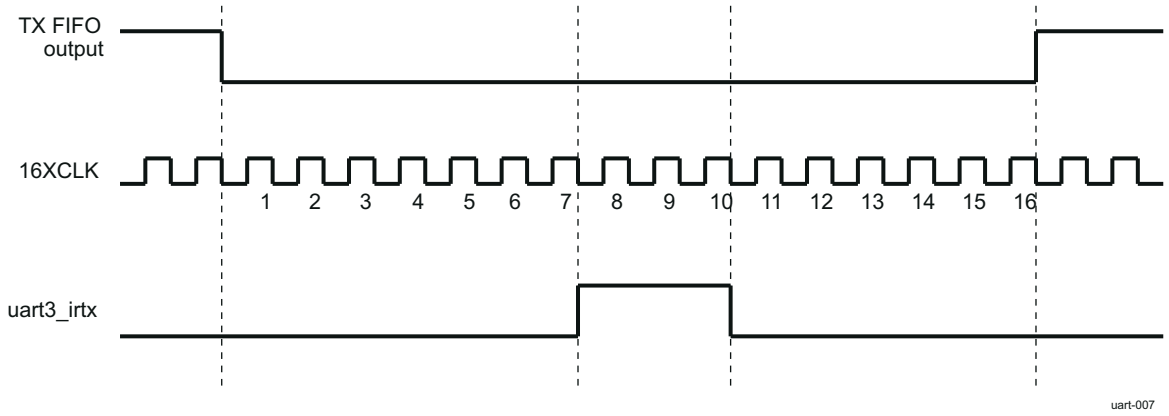

Figure 24-42. IrDA SIR Encoding Mechanism

24.3.2.2.3.1.6 Decoder

After reset, the RX FIFO input is high and the 4-bit counter is cleared. When a rising edge is detected on RX, the RX FIFO input falls on the next rising edge of 16XCLK with sufficient setup time. The RX FIFO input stays low for 16 cycles (16XCLK) and then returns to high as required by the IrDA specification. As long as no pulses (rising edges) are detected on the RX, the RX FIFO input remains high.

Figure 24-43 shows the IrDA SIR decoding mechanism.

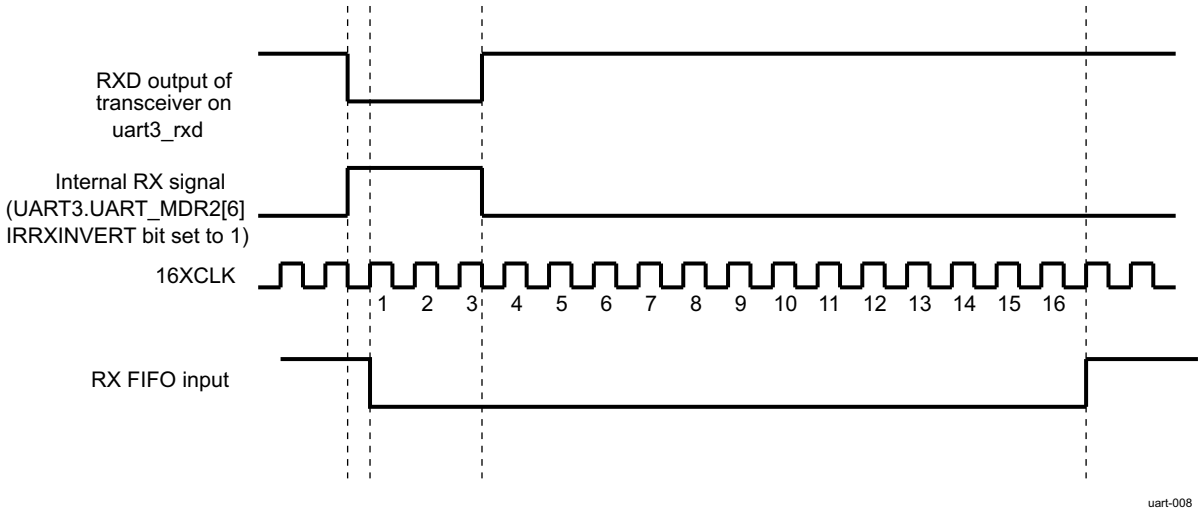

Figure 24-43. IrDA SIR Decoding Mechanism

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware. The operation of the uart3_rxd input can be disabled using the UART3.UART_ACREG[5] DIS_IR_RX bit. The UART3.UART_MDR2[6] IRRXINVERT bit can invert the signal from the transceiver (RXD) pin to the IR RX logic in the UART. This inversion is performed by default.

24.3.2.2.3.1.7 IR Address Checking

In all IR modes, when address checking is enabled by setting the UART3.UART_EFR[1:0] bit field (see Table 24-87), only frames intended for the device are written to the RX FIFO. This is to avoid receiving frames not

meant for this device in a multipoint infrared environment. To program two frame addresses that the UART3 receives in IrDA mode, use the UART3.UART_XON1_ADDR1[7:0] and UART3.UART_XON2_ADDR2[7:0] bit fields.

Table 24-87. UART_EFR[1:0] IR Address Checking Options

UART_EFR[1]	UART_EFR[0]	IR Address Checking
0	0	All address-checking operations disabled
0	1	Only address 1 checking enabled
1	0	Only address 2 checking enabled
1	1	All address-checking operations enabled

24.3.2.2.3.2 SIR Free-Format Mode

To allow complete software flexibility when transmitting and receiving infrared data packets, the SIR free-format (FF) mode is a subfunction of the existing SIR mode. In FF mode, all frames going to and from the FIFO buffers are untouched with respect to appending and removing control characters and CRC values.

The FF mode corresponds to a UART mode with a pulse modulation of 3/16 of baud rate pulse width.

For example, a normal SIR packet has BOF control and CRC error-checking data appended (transmitting) or removed (receiving) from the data going to and from the FIFOs.

Figure 24-44 shows SIR FF mode.

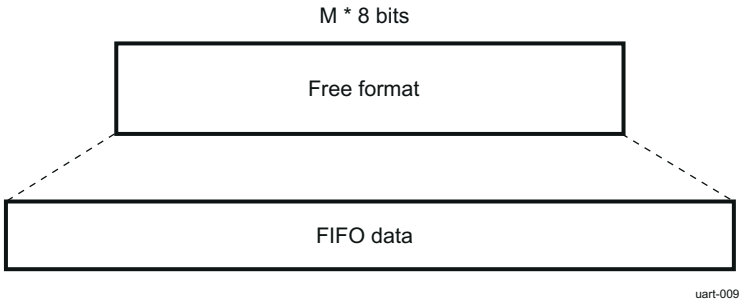

Figure 24-44. SIR FF Mode

In SIR FF mode, the MPU software must construct (that is, encode and decode) the entire FIFO data packet.

24.3.2.2.3.3 MIR Mode

In MIR mode, data is transferred between the MPUand the peripheral devices at 0.576 or 1.152 Mbps. A MIR transmit frame starts with at least two start flags, followed by a frame data and a CRC-16, and ends with a stop flag (see Figure 24-45).

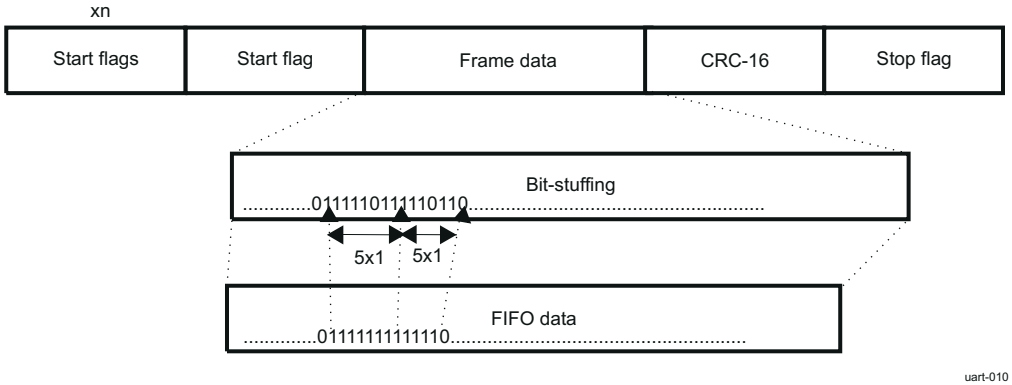

Figure 24-45. MIR Transmit Frame Format

On transmit, the MIR state-machine attaches start flags, a CRC-16, and stop flags, as in SIR mode. All fields are transmitted least-significant bit (LSB) of each byte first.

In MIR mode:

- The state-machine looks for consecutive 1s in the frame data and automatically inserts 0 after five consecutive 1s (this is called bit-stuffing).
- 0x7E is used for start and stop flags (unambiguously, not data, because of bit-stuffing).
- An abort sequence requires a minimum of seven consecutive 1s (unambiguously, not data, because of bit-stuffing).
- Back-to-back frames are allowed with three or more stop flags between them. If two consecutive frames are not back to back, the gap between the last stop flag of the first frame and the start flag of the second frame must be separated by at least seven bit durations.

On receive, the MIR receive state-machine recovers the receive clock, removes the start flags, destuffs the incoming data, and determines the frame boundary with reception of the stop flag. The state-machine also checks for errors such as frame abort, CRC error, and frame-length error. At the end of a frame reception, the MPU reads the line status register (UART3.UART_LSR_IRDA) to detect errors of the received frame.

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware.

24.3.2.2.3.3.1 MIR Encoder/Decoder

To meet the MIR baud rate tolerance of 0.1 percent with a 48-MHz clock input, a 42-41-42 encoding/decoding adjustment is performed. The reference start point is the first start flag, and the 42-41-42 cyclic pattern is repeated until the stop flag is sent or detected.

The jitter created this way is within MIR tolerances. The pulse width is not exactly 1/4, but it is within the tolerances defined by IrDA specifications.

Figure 24-46 shows the MIR baud rate adjustment mechanism.

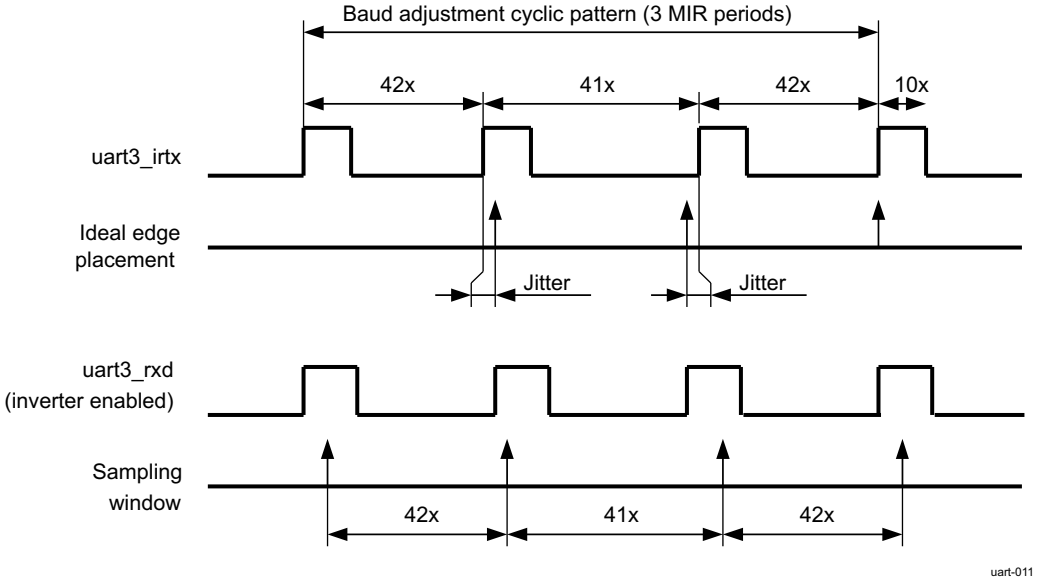

Figure 24-46. MIR Baud Rate Adjustment Mechanism

24.3.2.2.3.3.2 SIP Generation

In the MIR and FIR operation modes, the transmitter must send a serial infrared interaction pulse (SIP) at least once every 500 ms. The SIP informs slow devices (operating in SIR mode) that the medium is occupied.

Figure 24-47 shows the SIP.

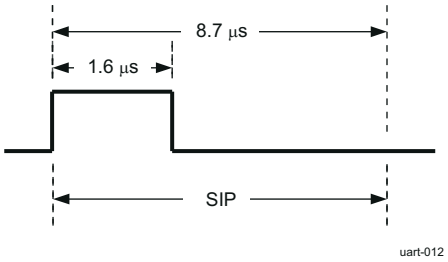

Figure 24-47. SIP

24.3.2.2.3.4 FIR Mode

In FIR mode, data is transferred between the MPU and the peripheral devices at 4 Mbps. A FIR transmit frame starts with a preamble that is followed by a start flag, frame data, CRC-32, and ends with a stop flag.

Figure 24-48 shows the FIR transmit frame format.

Figure 24-48. FIR Transmit Frame Format

Preamble (16x)	Start flag	Frame data	CRC-32	Stop flag

On transmit, the FIR transmit state-machine attaches the preamble, start flag, CRC-32, and stop flag. An abort sequence requires at least two transmissions of 0000. Back-to-back frames are allowed, but each frame must be complete.

The state-machine also encodes the transmit data into 4-PPM format (see Table 24-88) and generates the SIP (see Section 24.3.2.2.3.3.2, *SIP Generation*).

Table 24-88. 4-PPM Format

Data Bit Pair (Bin)	4-PPM Data Symbol (Bin)
00	1000
01	0100
10	0010
11	0001

The four symbols described in Table 24-88 are the legal, encoded data symbols. All other combinations are illegal for encoding data. Some of these illegal symbols are used in the definition of the preamble, start flag, and stop flag because they are unambiguously not data (see Table 24-89).

Table 24-89. FIR Preamble, Start Flag, and Stop Flag

Frame Part	Transmitted Frame (Bin)
Preamble	1000 0000 1010 1000 (16 repeated transmissions)
Start flag	0000 1100 0000 1100 0110 0000 0110 0000
Stop flag	0000 1100 0000 1100 0000 0110 0000 0110

All fields are transmitted LSBs of each byte first (see Table 24-90).

Table 24-90. FIR Data Byte Transmission Order Example

Data Byte (Hex)	Data Byte Pair (Bin)	4-PPM Data Symbol (Bin)	Transmission Order
0x0B	00	1000	4
	00	1000	3
	10	0010	2
	11	0001	1

On receive, the FIR receive state-machine recovers the receive clock, removes the preamble and the start flag, decodes the 4-PPM incoming data, and determines the frame boundary with reception of the stop flag. The state-machine also checks for errors such as illegal symbol, CRC error, and frame-length error. At the end of a frame reception, the MPU reads the line status register (UART3.UART_LSR_IRDA) to detect errors of the received frame.

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware.

24.3.2.3 CIR Functional Interfaces

24.3.2.3.1 System Using CIR Communication Protocol With Remote Control

UART3 can be connected to an external infrared transceiver in CIR mode (see Figure 24-49).

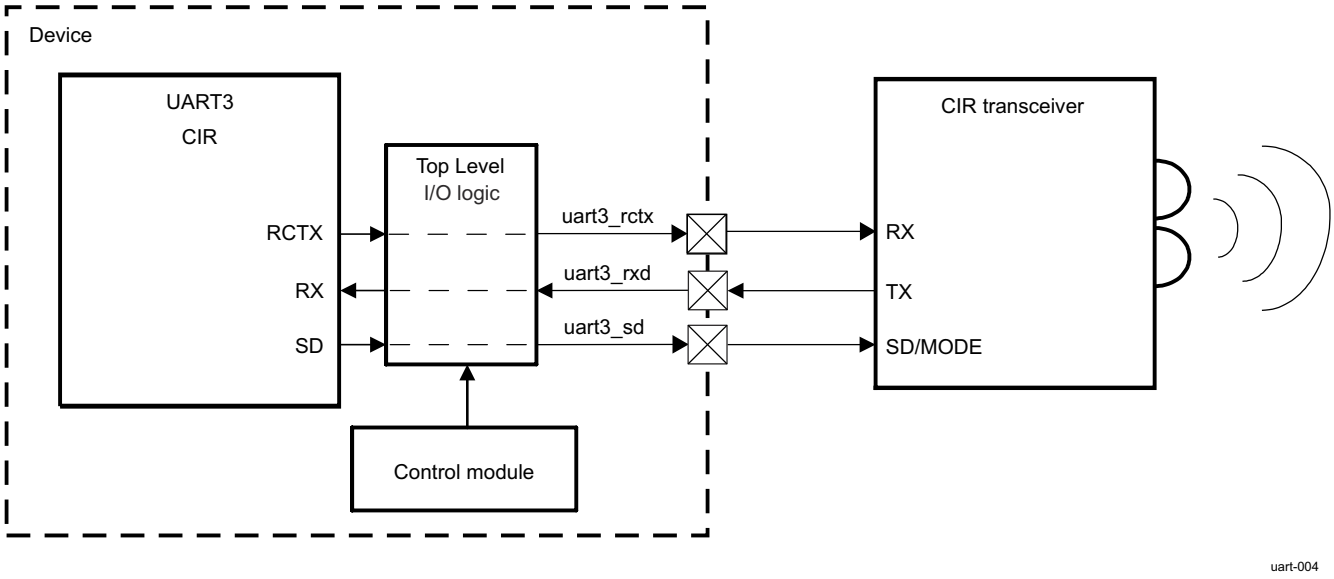

Figure 24-49. CIR System Overview

24.3.2.3.2 CIR Interface Description

Table 24-91 lists the CIR interface I/O signals.

Table 24-91. CIR I/O Signals

Signal	I/O(1)	Description	Reset
CIR Signals			
uart3_rxd	I	Serial data input	HiZ
uart3_rctx	O	Serial data output in CIR mode. In other modes, this pin is set to the reset value (inactive state).	0
uart3_sd	O	SD mode is used to configure the transceivers. The SD pinout is an inverted value of the UART3.UART_ACREG[6] SD_MOD bit.	1

(1) I = Input; O = Output

24.3.2.3.3 CIR Protocol and Data Format

In CIR mode, the infrared operation functions as a programmable (universal) remote control.

CIR mode uses a variable PWM technique (based on multiples of a programmable *t* period) to encompass the various formats of infrared encoding for remote-control applications. The CIR logic transmits data packets based on user-defined frame structure and packet content.

24.3.2.3.3.1 Carrier Modulation

Each modulated pulse that constitutes a digit is a train of on/off pulses (see Figure 24-50).

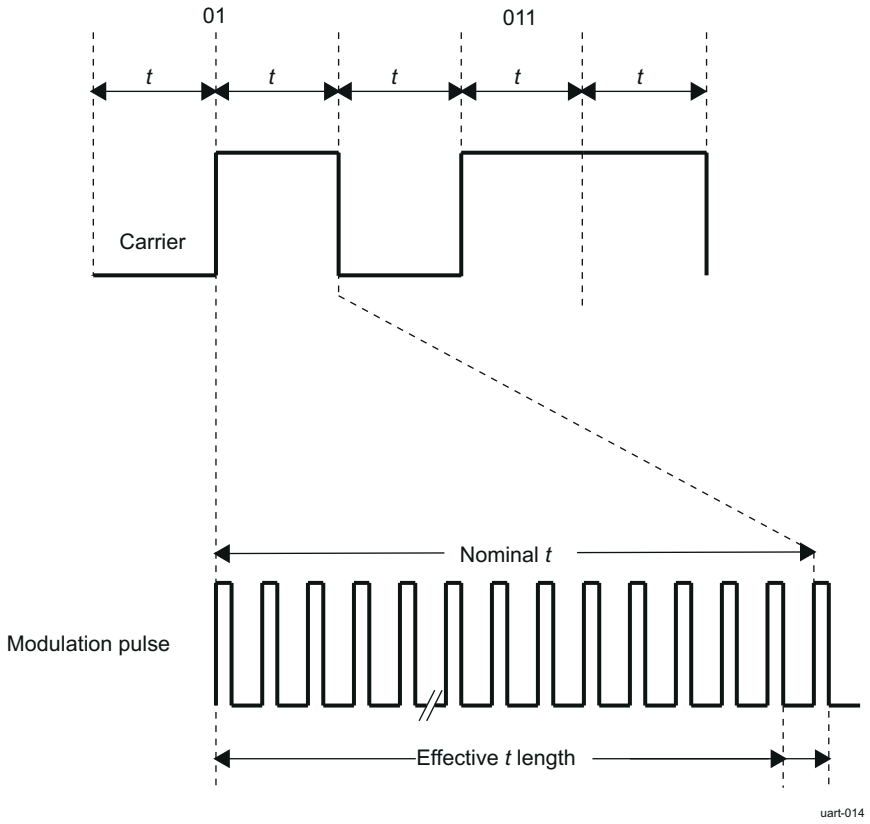

Figure 24-50. CIR Pulse Modulation

24.3.2.3.3.2 Pulse Duty Cycle

The programmer can choose one of four duty cycles for modulation pulses by setting the appropriate value in the UART3.UART_MDR2[5:4] CIR_PULSE_MODE bit field (1/4, 1/3, 5/12, or 1/2).

Figure 24-51 shows the CIR modulation duty cycles.

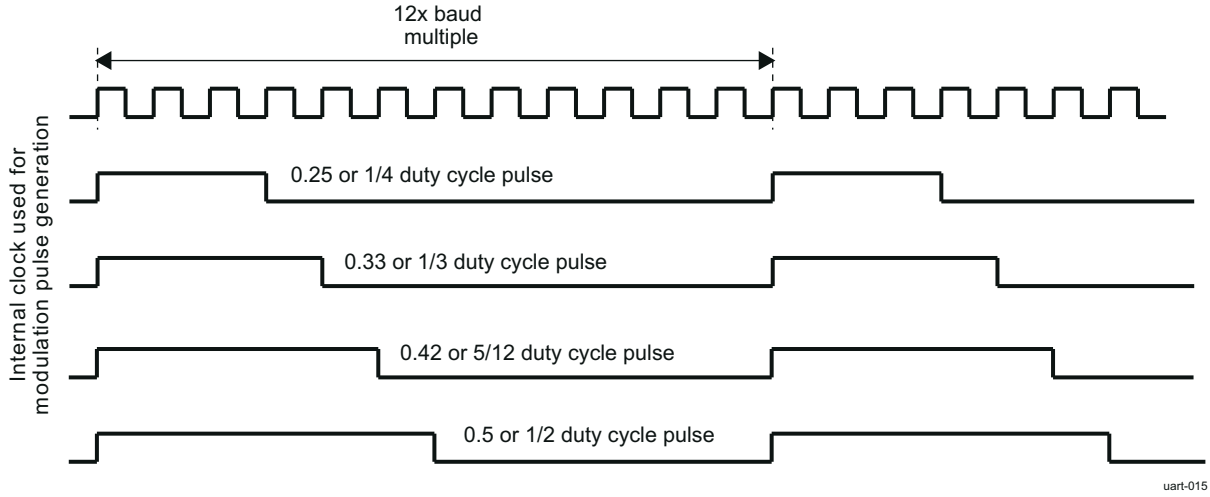

Figure 24-51. CIR Modulation Duty Cycle

The transmission logic ensures that all pulses are transmitted completely (no cutoff during transmission). While transmitting continuous bytes back-to-back, no delay is inserted between 2 transmitted bytes. Thus, software must handle the delay between consecutively transmitted bytes if the receiving end requires it.

24.3.2.3.3.3 Consumer IR Encoding/Decoding

There are two methods of encoding for remote-control applications:

- Pulse duration encoding (time-extended bit forms): A variable pulse distance, or duration, in which the difference between logic 1 and logic 0 is the length of the pulse width
- Biphase encoding: The encoding of logic 0 and logic 1 is in the change of signal level from 1 to 0 or 0 to 1, respectively.

Japanese manufacturers favor pulse duration encoding; European manufacturers favor biphase encoding.

CIR mode uses a completely flexible free-format encoding in which 1 is transmitted from the TX FIFO as a modulated pulse with duration *t*.

Similarly, 0 is transmitted as a blank duration T. The MPUconstructs and deciphers the protocol of the data. For example, the RC-5 protocol using Manchester encoding can be emulated as using a 01 pair for 1 and a 10 pair for 0 (see Figure 24-52).

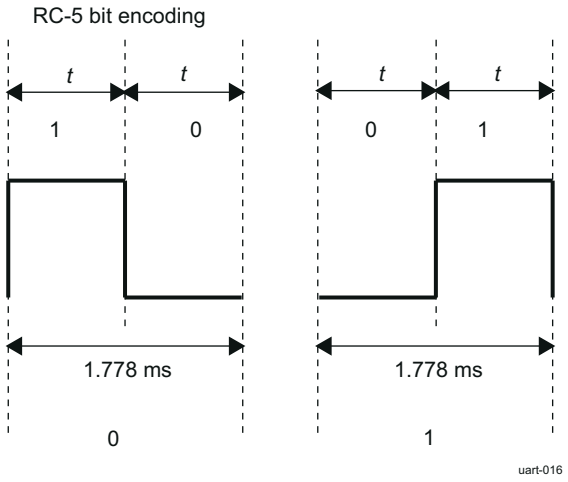

Figure 24-52. RC-5 Bit Encoding

Because CIR mode logic does not impose a fixed format for infrared packets of data, the MPUsoftware can define the format using simple data structures that are then modulated into an industry standard, such as RC-5 or SIRC. To send a sequence of 0101 in RC-5, the MPUsoftware must write an 8-bit binary character of 10011001 to the data FIFO of the UART.

For SIRC, the modulation length (multiples of *t*) is used to distinguish between 1 and 0. The subsequent SIRC digits show the difference in encoding between this and, for example, RC-5. The pulse width is extended for one digit.

Figure 24-53 shows SIRC bit encoding.

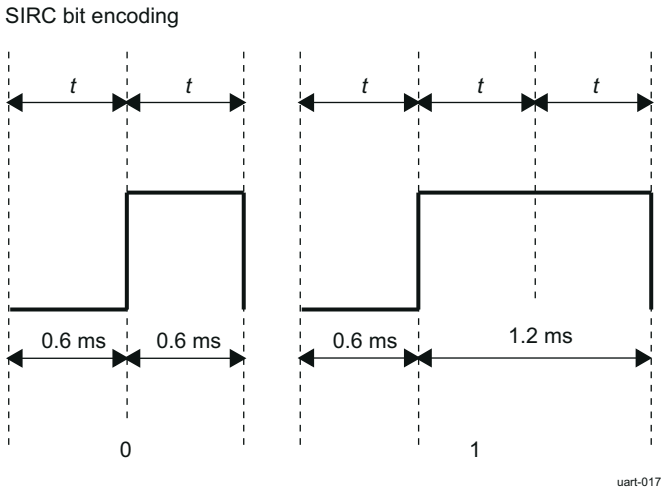

Figure 24-53. SIRC Bit Encoding

To construct comprehensive packets constituting remote-control commands, the MPU software must combine a number of 8-bit data characters in a sequence that follows one of the universally accepted formats.

Figure 24-54 shows a standard RC-5 frame as detected by UART3 in CIR mode (the SIRC format follows this). Each field in RC-5 can be considered as two *t* pulses (digital bits) from the TX FIFO.

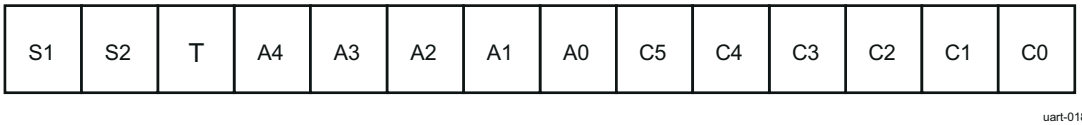

Figure 24-54. RC-5 Standard Packet Format

Where:

S1, S2:	Start-bits (always 1)
T:	Toggle bit
A4..A0:	Address (or system) bits
C5..C0:	Command bits

The toggle bit T changes when a new command is transmitted to detect when the same key is pressed twice (effectively receiving the same data from the host consecutively). A brief delay in the transmission of the same command is detected by the use of the toggle bit because a code is sent while the MPUtransmits characters to the UART for transmission. The address bits define the machine or device for which the infrared transmission is intended, and the command defines the operation.

To accommodate an extended RC-5 format, the S2 bit is replaced by an additional command bit (C6) that lets the command range increase to 7 bits. This format is known as the extended RC-5 format.

SIRC encoding uses the duration of modulation for mark and space; therefore, the duration of data bits in the standard frame length varies.

Figure 24-55 shows the packet format and bit encoding. As Figure 24-56 shows, 1 start-bit of 2.4 ms and control codes are followed by data that constitute the entire frame.

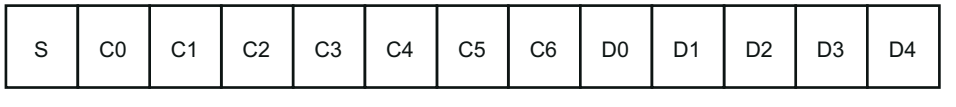

Figure 24-55. SIRC Packet Format

Note

The encoding must take a standard duration, but the contents of the data can vary. This implies that the control software for sending and receiving data packets must exercise a scheme of interpacket delay, where successive packets can be sent only after a real-time delay expires.

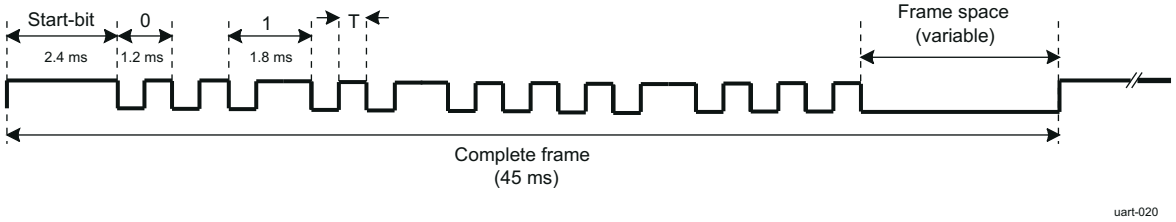

Figure 24-56. SIRC Bit Transmission Example

This document does not describe all encoding methods and techniques; the previous information discusses the considerations required to employ different encoding methods for different industry-standard protocols. See industry-standard documentation for specific methods of encoding and protocol use.

24.3.3 UART/IrDA/CIR Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 24-57 shows the device internal connections with related modules for UART functions.

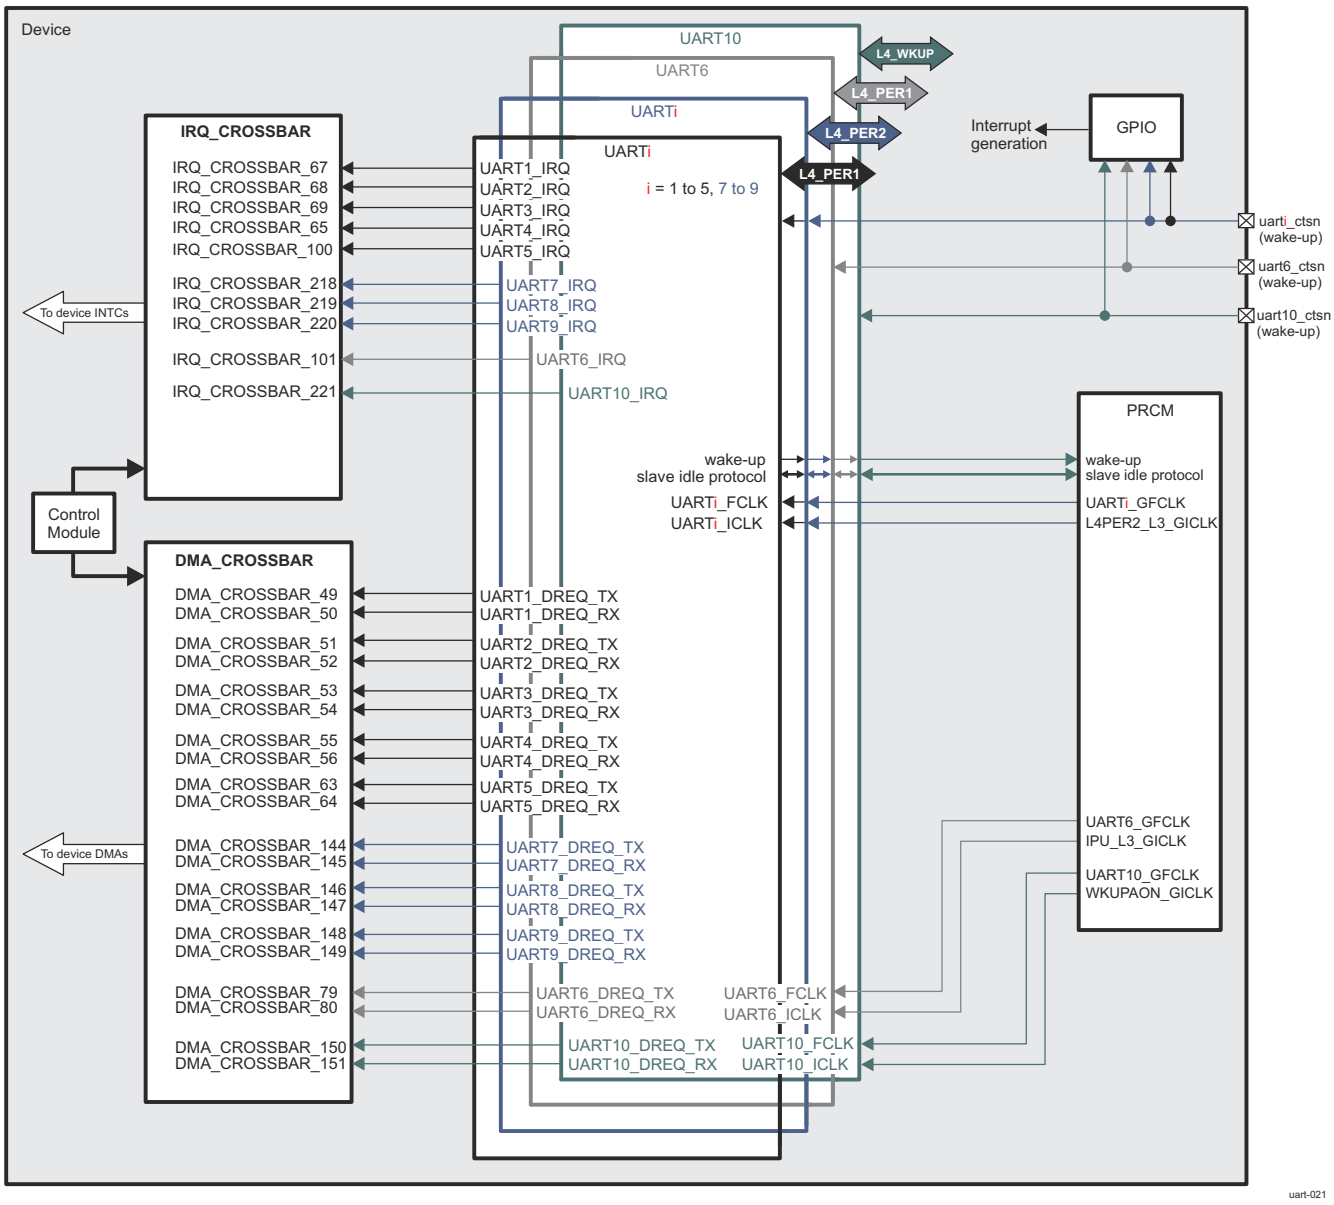

Figure 24-57. UART/IrDA/CIR Integration

Note

For more information about the master standby and slave idle protocols and the wake-up request, see *Clock Domain-Level Clock Management*, in *Power, Reset, and Clock Management*

24.3.3.1

Table 24-92 through Table 24-94 summarize the integration of the module in the device.

Table 24-92. UART Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
UART1	PD_COREAON	Yes	L4_PER1
UART2	PD_COREAON	Yes	L4_PER1

UART10	UART10_DREQ_TX	DMA_CROSSBAR_150	-	UART 10 – transmit request

Table 24-94. UART Hardware Requests (continued)

UART10_DREQ_RX	DMA_CROSSBAR_151	-	UART 10 – receive request

Note

The **Default Mapping** column in Table 24-94, *UART Hardware Requests*, shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.
For more information about the device DMA_SYSTEM module, see *System DMA*.
For more information about the device EDMA module, see *Enhanced DMA*.

24.3.4 UART/IrDA/CIR Functional Description

24.3.4.1 Block Diagram

The UART/IrDA/CIR module can be divided into three main blocks:

- FIFO management
- Mode selection
- Protocol formatting

FIFO management is common to all functions and enables the transmission and reception of data from the host processor point of view.

There are two modes:

- Function mode: Routes the data to the chosen function (UART, IrDA, or CIR) and enables the mechanism corresponding to the chosen function
- Register mode: Enables conditional access to registers

For more information about mode configuration, see Section 24.3.4.7, *Mode Selection*.

Protocol formatting has three subcategories:

- Clock generation: The 48-MHz input clock generates all necessary clocks.
- Data formatting: Each function uses its own state-machine that is responsible for the transition between FIFO data and frame data associated with it.
- Interrupt management: Different interrupt types are generated depending on the chosen function. In each mode, when an interrupt is generated, the UART_IIR register indicates the interrupt type.
  - UART mode interrupts: Seven interrupts prioritized in six different levels
  - IrDA mode interrupts: Eight interrupts. The interrupt line is activated when any interrupt is generated (there is no priority).
  - CIR mode interrupts: A subset of existing IrDA mode interrupts is used.

In parallel with these functional blocks, a power-saving strategy exists for each function.

Figure 24-58 is the UART/IrDA/CIR block diagram.

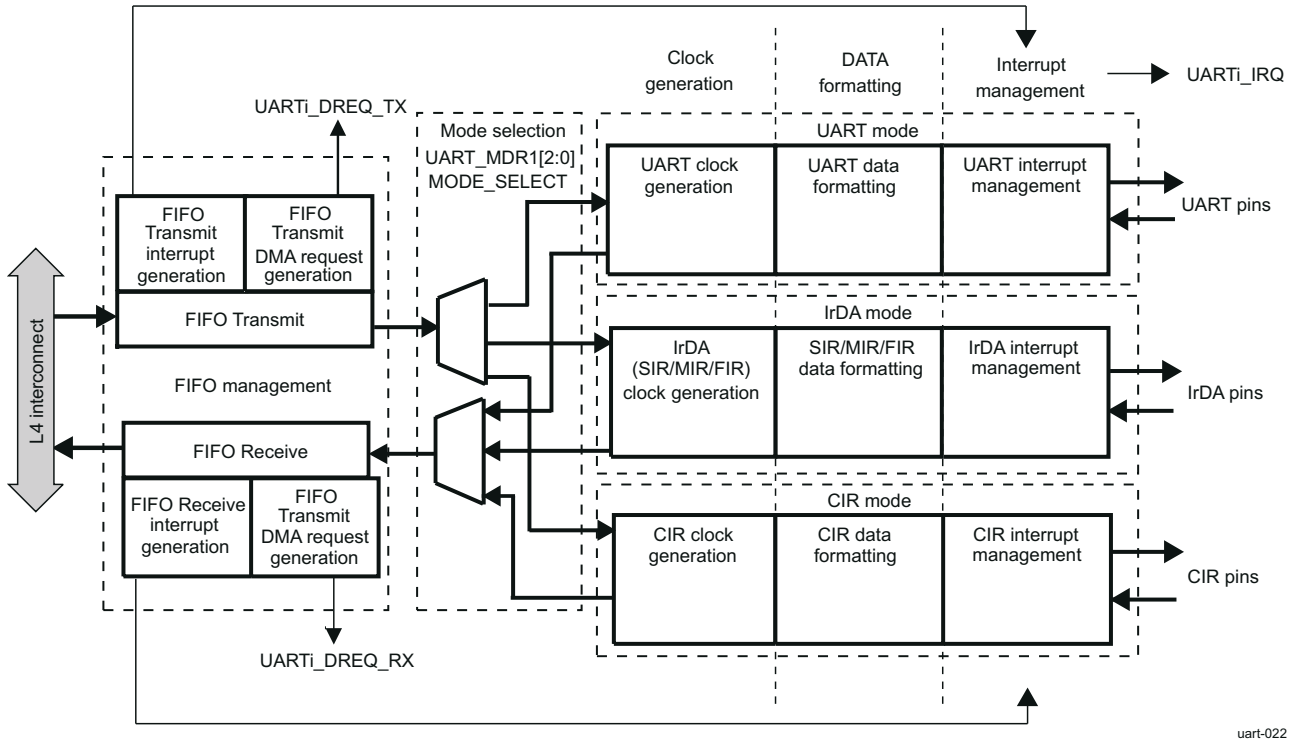

Figure 24-58. UART/IrDA/CIR Functional Block Diagram

24.3.4.2 Clock Configuration

Each UART uses a 48-MHz functional clock for its logic and to generate external interface signals. Each UART uses an interface clock for register accesses. The PRCM module generates and controls all these clocks (for more information, see *Clock Domain-Level Clock Management*, in *Power, Reset, and Clock Management*).

The idle and wake-up processes use a handshake protocol between the PRCM and the UART (for a description of the protocol, see *Clock Domain Level Clock Management*, in *Power, Reset, and Clock Management*). The UARTi.UART_SYSC[4:3] IDLEMODE bit field controls UART idle mode.

24.3.4.3 Software Reset

The UARTi.UART_SYSC[1] SOFTRESET bit controls the software reset; setting this bit to 1 triggers a software reset functionally equivalent to hardware reset.

24.3.4.4 Power Management

24.3.4.4.1 UART Mode Power Management

24.3.4.4.1.1 Module Power Saving

In UART modes, sleep mode is enabled by setting the UARTi.UART_IER[4] SLEEP_MODE bit to 1 (when the UARTi.UART_EFR[4] ENHANCED_EN bit is set to 1).

Sleep mode is entered when all of the following conditions exist:

- The serial data input line, uarti_rxd, is idle.
- The TX FIFO and TX shift register are empty.
- The RX FIFO is empty.
- The only pending interrupts are THR interrupts.

Sleep mode is a good way to lower UART power consumption, but this state can be achieved only when the UART is set to modem mode. Therefore, even if the UART has no key role functionally, it must be initialized in a functional mode to take advantage of sleep mode.

In sleep mode, the module clock and baud rate clock are stopped internally. Because most registers are clocked by these clocks, this greatly reduces power consumption. The module wakes up when a change is detected on the uarti_rxd line, when data is written to the TX FIFO, and when there is a change in the state of the modem input pins.

An interrupt can be generated on a wake-up event by setting the UARTi.UART_SCR[4] RX_CTS_WU_EN bit to 1. To understand how to manage the interrupt, see Section 24.3.4.5.1.2, *Wake-Up Interrupt*.

Note

There must be no writing to the divisor latches, UARTi.UART_DLL and UARTi.UART_DLH, to set the baud clock (BCLK) while in sleep mode. It is advisable to disable sleep mode using the UARTi.UART_IER[4] SLEEP_MODE bit before writing to the UARTi.UART_DLL or UARTi.UART_DLH register.

24.3.4.4.1.2 System Power Saving

Sleep and auto-idle modes are embedded power-saving features. Power-reduction techniques can be applied at the system level by shutting down certain internal clock and power domains of the device.

The UART supports an idle req/idle ack handshaking protocol used at the system level to shut down the UART clocks in a clean and controlled manner and to switch the UART from interrupt-generation mode to wake-up generation mode for unmasked events (see the UARTi.UART_SYSC[2] ENAWAKEUP bit and the UARTi.UART_WER register).

For more information, see *Module Level Clock Management*, *Power, Reset, and Clock Management*.

24.3.4.4.2 IrDA Mode Power Management (UART3 Only)

24.3.4.4.2.1 Module Power Saving

In IrDA modes, sleep mode is enabled by setting the UART3.UART_MDR1[3] IR_SLEEP bit to 1.

Sleep mode is entered when all of the following conditions exist:

- The serial data input line, RXD, is idle.
- The TX FIFO and TX shift register are empty.
- The RX FIFO is empty.
- No interrupts are pending except THR interrupts.

The module wakes up when a change is detected on the RXD line or when data is written to the TX FIFO.

24.3.4.4.2.2 System Power Saving

System power saving for the IrDA mode has the same function as for the UART mode (see Section 24.3.4.4.1.2, *System Power Saving*).

24.3.4.4.3 CIR Mode Power Management (UART3 Only)

24.3.4.4.3.1 Module Power Saving

Module power saving for the CIR mode has the same function as for the IrDA mode (see Section 24.3.4.4.2.1, *Module Power Saving*).

24.3.4.4.3.2 System Power Saving

System power saving for the CIR mode has the same function as for the UART mode (see Section 24.3.4.4.1.2, *System Power Saving*).

24.3.4.4.4 Local Power Management

Table 24-95 describes power-management features available for the UART.

Note

For information about source clock gating and the sleep/wake-up transitions description, see *Module Level Clock Management*, *Power, Reset, and Clock Management*.

Table 24-95. Local Power-Management Features

Feature	Registers	Description
Clock autogating	UART_SYSC[0] AUTOIDLE	This bit allows local power optimization in the module by gating the UARTi_ICLK clock on interface activity or gating the UARTi_FCLK clock on internal activity.
Slave idle modes	UART_SYSC[4:3] IDLEMODE	Force-idle, no-idle, smart-idle, and smart-idle wakeup-capable modes are available.
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	UART_SYSC[2] ENAWAKEUP	This bit enables the wake-up feature at module level.
Wake-Up sources enable	N/A	Feature not available

24.3.4.5 Interrupt Requests

24.3.4.5.1 UART Mode Interrupt Management

24.3.4.5.1.1 UART Interrupts

UART mode includes seven possible interrupts prioritized to six levels.

When an interrupt is generated, the interrupt identification register (UARTi.UART_IIR) sets the UARTi.UART_IIR[0] IT_PENDING bit to 0 to indicate that an interrupt is pending, and indicates the type of interrupt through the UARTi.UART_IIR[5:1] bit field. Table 24-96 summarizes the interrupt control functions.

Table 24-96. UART Mode Interrupts

IIR[5:0]	Priority Level	Interrupt Type	Interrupt Source	Interrupt Reset Method
000001	N/A	No Interrupt	N/A	N/A
000110	1	Receiver line status	OE, FE, PE, or BI errors occur in characters in the RX FIFO.	FE, PE, BI: Read the UART_RHR register. OE: Read the UART_LSR register.
001100	2	RX time-out	Stale data in RX FIFO	Read the UART_RHR register.
000100	2	RHR interrupt	DRDY (data ready) (FIFO disabled) RX FIFO above trigger level (FIFO enabled)	Read the UART_RHR register until the interrupt condition disappears
000010	3	THR interrupt	TFE (THR empty) (FIFO disabled) TX FIFO below trigger level (FIFO enabled)	Write to the UART_THR until the interrupt condition disappears
000000	4	Modem status	See the UART_MSR register.	Read the MSR register
010000	5	XOFF interrupt/ special character interrupt	Receive XOFF characters/special character	Receive XON character(s), if XOFF interrupt/read of the UART_IIR register, if special character interrupt
100000	6	CTS, RTS	RTS pin or CTS pin change state from active (low) to inactive (high)	Read the UART_IIR register

For the receiver-line status interrupt, the RX_FIFO_STS bit (UARTi.UART_LSR[7]) generates the interrupt.

For the XOFF interrupt, if an XOFF flow character detection caused the interrupt, the interrupt is cleared by an XON flow character detection. If special character detection caused the interrupt, the interrupt is cleared by a read of the UARTi.UART_IIR register.

24.3.4.5.1.2 Wake-Up Interrupt

Wake-up interrupt is a special interrupt that works differently from other interrupts. This interrupt is enabled when the UARTi.UART_SCR[4] RX_CTS_WU_EN bit is set to 1. The UARTi.UART_IIR register is not modified when this occurs; the UART3.UART_SSR[1] RX_CTS_WU_STS bit must be checked to detect a wake-up event.

When a wake-up interrupt occurs, it can be cleared only by resetting the UARTi.UART_SCR[4] RX_CTS_WU_EN bit. This bit must be reenabled (set to 1) after the current wake-up interrupt event is processed to detect the next incoming wake-up event.

24.3.4.5.2 IrDA Mode Interrupt Management

24.3.4.5.2.1 IrDA Interrupts

The IrDA function generates interrupts. All interrupts can be enabled and disabled by writing to the appropriate bit in the interrupt enable register (UART3.UART_IER_IRDA). The interrupt status of the device can be checked by reading the interrupt identification register (UART3.UART_IIR_IRDA).

UART, IrDA, and CIR modes have different interrupts in the UART/IrDA/CIR module and, therefore, different UART3.UART_IER_IRDA and UART3.UART_IIR_IRDA mappings, depending on the selected mode.

IrDA modes have eight possible interrupts (see Table 24-97). The interrupt line is activated when any interrupt is generated (there is no priority).

Table 24-97. IrDA Mode Interrupts

IIR_IRDA Bit	Interrupt Type	Interrupt Source	Interrupt Reset Method
0	RHR interrupt	DRDY (data ready) (FIFO disabled) RX FIFO above trigger level (FIFO enabled)	Read the UART_RHR register until the interrupt condition disappears.
1	THR interrupt	TFE (THR empty) (FIFO disabled) TX FIFO below trigger level (FIFO enabled)	Write to the UART_THR until the interrupt condition disappears.
2	Last byte in RX FIFO	Last byte of frame in RX FIFO is available to be read at the RHR port.	Read the UART_RHR register.
3	RX overrun	Write to the UART_RHR register when the RX FIFO is full.	Read UART_RESUME register.
4	Status FIFO interrupt	Status FIFO triggers level reached.	Read STATUS FIFO.
5	TX status	THR empty before EOF sent. Last bit of transmission of the IrDA frame occurred, but with an underrun error OR Transmission of the last bit of the IrDA frame completed successfully.	Read the UART_RESUME register OR Read the UART_IIR_IRDA register.
6	Receiver line status interrupt	CRC, ABORT, or frame-length error is written into the STATUS FIFO.	Read the STATUS FIFO (read until empty - maximum of eight reads required).
7	Received EOF	Received end-of-frame	Read the UART_IIR_IRDA register.

24.3.4.5.2.2 Wake-Up Interrupts

The wake-up interrupt for IrDA mode has the same function as that for UART mode (see Section 24.3.4.5.1.2, *Wake-Up Interrupt*).

CAUTION

Wake-up interface implementation in this mode is based on the UARTi_SIDLEACK low-to-high transition instead of the UARTi_SIDLEACK state.

This does not ensure wake-up event generation as expected when configured in smart-idle mode, and the system wakes up for a short period.

24.3.4.5.3 CIR Mode Interrupt Management

24.3.4.5.3.1 CIR Interrupts

The CIR function generates interrupts that can be enabled and disabled by writing to the appropriate bit in the interrupt enable register (UART3.UART_IER_CIR). The interrupt status of the device can be checked by reading the interrupt identification register (UART3.UART_IIR_CIR).

UART, IrDA, and CIR modes have different interrupts in the UART/IrDA/CIR module and, therefore, different UART3.UART_IER_CIR and UART3.UART_IIR_CIR mappings, depending on the selected mode.

Table 24-98 lists the interrupt modes to be maintained. In CIR mode, the sole purpose of the UART3.UART_IIR_CIR[5] bit is to indicate that the last bit of infrared data was passed to the uart3_rctx pin.

Table 24-98. CIR Mode Interrupts

IIR_CIR Bit Number	Interrupt Type	Interrupt Source	Interrupt Reset Method
0	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
1	THR interrupt	TFE (THR empty) (FIFO disabled) TX FIFO below trigger level (FIFO enabled)	Write to the THR register until the interrupt condition disappears
2	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
3	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
4	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
5	TX status	Transmission of the last bit of the frame is complete successfully	Read the IIR_CIR register
6	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
7	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode

24.3.4.5.3.2 Wake-Up Interrupts

The wake-up interrupt for CIR mode has the same function as that for UART mode (see Section 24.3.4.5.1.2, *Wake-Up Interrupt*).

24.3.4.6 FIFO Management

The FIFO is accessed by reading and writing the UARTi.UART_RHR and UARTi.UART_THR registers. Parameters are controlled using the FIFO control register (UARTi.UART_FCR) and supplementary control register (UARTi.UART_SCR). Reading the UARTi.UART_SSR[0] TX_FIFO_FULL bit at 1 means the FIFO is full.

The UARTi.UART_TLR register controls the FIFO trigger level, which enables DMA and interrupt generation. After reset, transmit (TX) and receive (RX) FIFOs are disabled; thus, the trigger level is the default value of 1 byte. Figure 24-59 shows the FIFO management registers.

Note

Data in the UARTi.UART_RHR register is not overwritten when an overflow occurs.

Note

The UARTi.UART_SFLSR, UARTi.UART_SFREGL, and UARTi.UART_SFREGH status registers are used in IrDA mode only. For information about their use, see Section 24.3.4.8.2.3, *IrDA Data Formatting*.

Note

Bits UARTI.UART_FCR[2] TX_FIFO_CLEAR and UARTI.UART_FCR[1] RX_FIFO_CLEAR are automatically cleared by hardware after 4* UARTi_ICLK + 5* UARTi_FCLK clock cycles. This delay is needed to finish the resetting of the corresponding FIFO and DMA control registers.

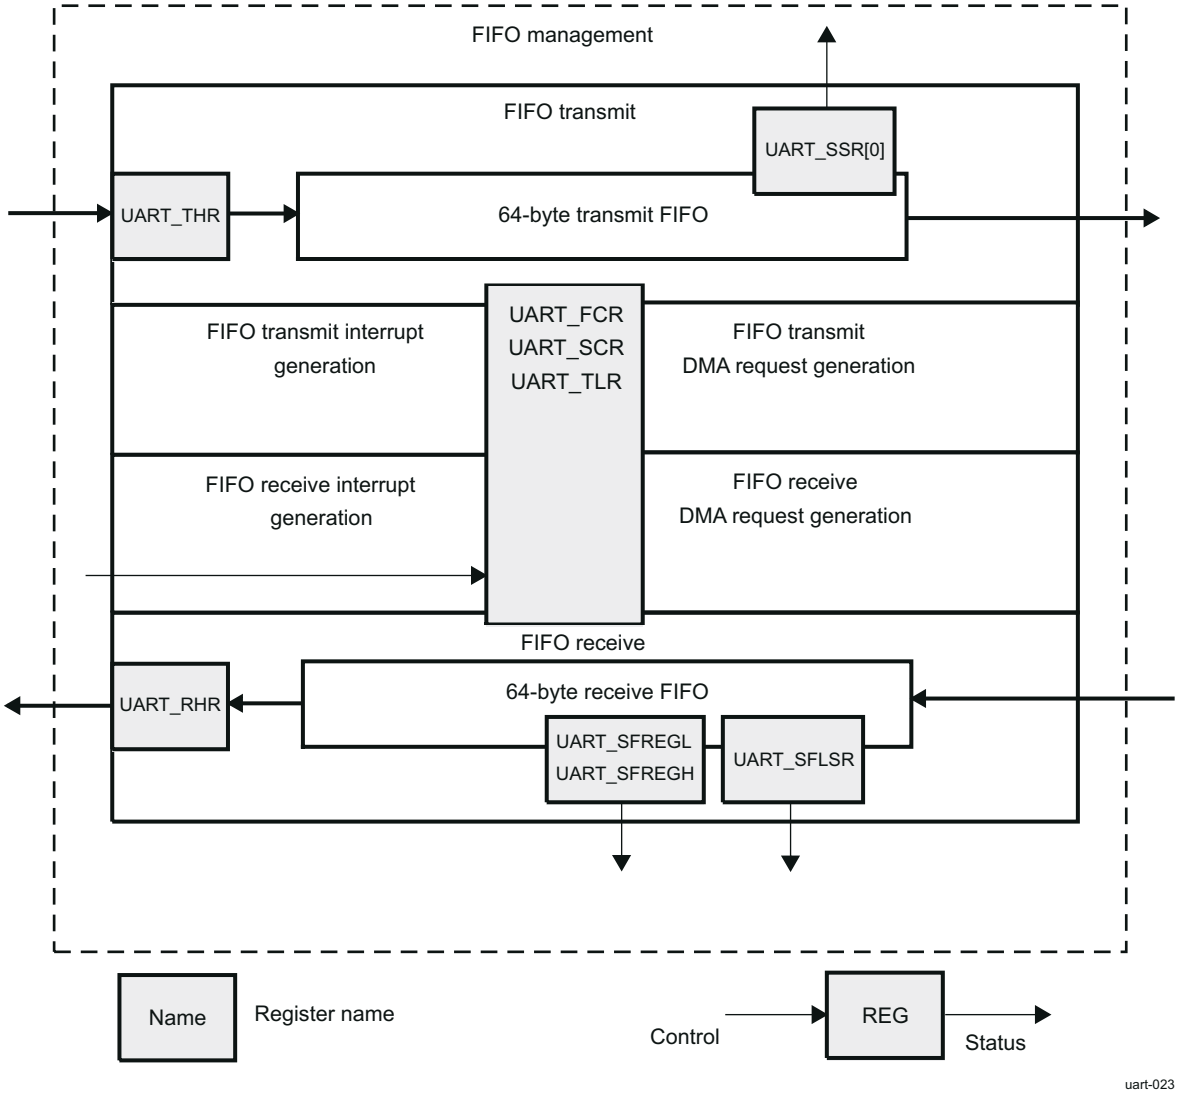

Figure 24-59. FIFO Management Registers

24.3.4.6.1 FIFO Trigger

24.3.4.6.1.1 Transmit FIFO Trigger

Table 24-99 lists the TX FIFO trigger level settings.

Table 24-99. TX FIFO Trigger Level Setting Summary

SCR[6]	TLR[3:0]	TX FIFO Trigger Level
0	= 0x0	Defined by the UARTi.UART_FCR[5:4] TX_FIFO_TRIG bit field (8,16, 32, or 56 spaces)
0	!= 0x0	Defined by the UARTi.UART_TLR[3:0] TX_FIFO_TRIG_DMA bit field (from 4 to 60 spaces with a granularity of 4 spaces)
1	Value	Defined by the concatenated value of TX_FIFO_TRIG_DMA and TX_FIFO_TRIG (from 1 to 63 spaces with a granularity of 1 space) **Note:** The combination of TX_FIFO_TRIG_DMA = 0x0 and TX_FIFO_TRIG = 0x0 (all zeros) is not supported (minimum of 1 space required). All zeros result in unpredictable behavior.

24.3.4.6.1.2 Receive FIFO Trigger

Table 24-100 lists the RX FIFO trigger-level settings.

Table 24-100. RX FIFO Trigger-Level Setting Summary

SCR[7]	TLR[7:4]	RX FIFO Trigger Level
0	= 0x0	Defined by the UARTi.UART_FCR[7:6] RX_FIFO_TRIG bit field (8,16, 56, or 60 characters)
0	!= 0x0	Defined by the UARTi.UART_TLR[7:4] RX_FIFO_TRIG_DMA bit field (from 4 to 60 characters with a granularity of 4 characters)
1	Value	Defined by the concatenated value of RX_FIFO_TRIG_DMA and RX_FIFO_TRIG (from 1 to 63 characters with a granularity of 1 character) **Note:** The combination of RX_FIFO_TRIG_DMA = 0x0 and RX_FIFO_TRIG = 0x0 (all zeros) is not supported (minimum of 1 character required). All zeros result in unpredictable behavior.

The receive threshold is programmed using the UARTi.UART_TCR[7:4] RX_FIFO_TRIG_START and UARTi.UART_TCR[3:0] RX_FIFO_TRIG_HALT bit fields:

- Trigger levels from 0 to 60 bytes are available with a granularity of 4 (trigger level = 4 × [4-bit register value]).
- To ensure correct device operation, ensure that RX_FIFO_TRIG_HALT > RX_FIFO_TRIG when auto-RTS is enabled.

  Delay = [4 + 16 × (1 + CHAR_LENGTH + Parity + Stop – 0.5)] × Baud_rate + 4 × FCLK

  Note

  The RTS signal is deasserted after the UART module receives the data over RX_FIFO_TRIG_HALT. Delay means how long the UART module takes to deassert the RTS signal after reaching RX_FIFO_TRIG_HALT.

- In FIFO interrupt mode with flow control, ensure that the trigger level to HALT transmission is greater than or equal to the RX FIFO trigger level (the UARTi.UART_TCR[7:4] RX_FIFO_TRIG_START bit field or the UARTi.UART_FCR[7:6] RX_FIFO_TRIG bit field); otherwise, FIFO operation stalls. In FIFO DMA mode with flow control, this concept does not exist, because a DMA request is sent when a byte is received.

24.3.4.6.2 FIFO Interrupt Mode

In FIFO interrupt mode (the FIFO control register UARTi.UART_FCR[0] FIFO_EN bit is set to 1 and relevant interrupts are enabled by the UARTi.UART_IER register), an interrupt signal informs the processor of the status of the receiver and transmitter. These interrupts are raised when the RX/TX FIFO threshold (the UARTi.UART_TLR[7:4] RX_FIFO_TRIG_DMA and UARTi.UART_TLR[3:0] TX_FIFO_TRIG_DMA bit fields or the UARTi.UART_FCR[7:6] RX_FIFO_TRIG and UARTi.UART_FCR[5:4] TX_FIFO_TRIG bit fields, respectively) is reached.

The interrupt signals instruct the MPU to transfer data to the destination (from the UART in receive mode and/or from any source to the UART FIFO in transmit mode).

When UART flow control is enabled with interrupt capabilities, the UART flow control FIFO threshold (the UARTi.UART_TCR[3:0] RX_FIFO_TRIG_HALT bit field) must be greater than or equal to the RX FIFO threshold.

Figure 24-60 shows the generation of the RX FIFO interrupt request.

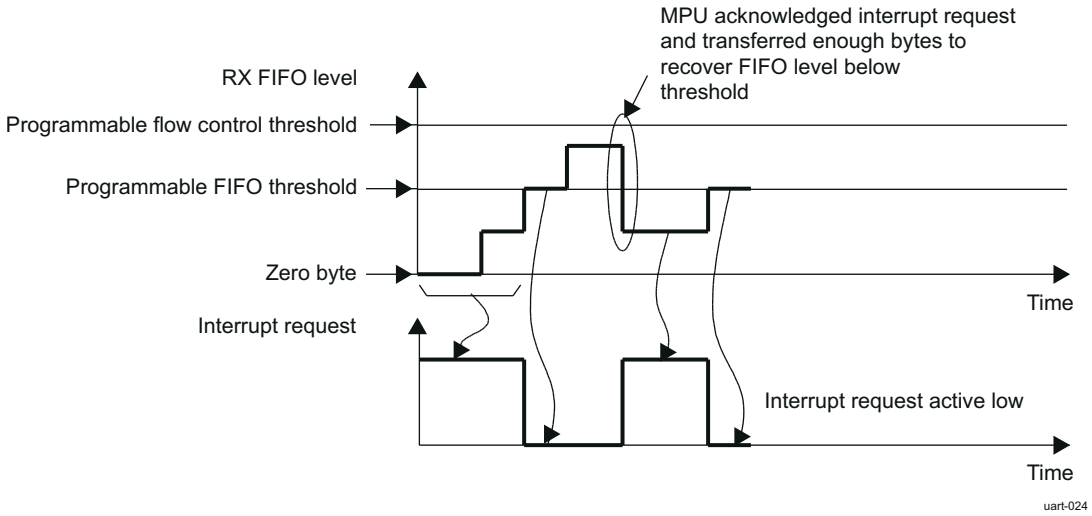

Figure 24-60. RX FIFO Interrupt Request Generation

In receive mode, no interrupt is generated until the RX FIFO reaches its threshold. Once low, the interrupt can be deasserted only when the MPU has handled enough bytes to put the FIFO level below threshold. The flow control threshold is set at a higher value than the FIFO threshold.

Figure 24-61 shows the generation of the TX FIFO interrupt request.

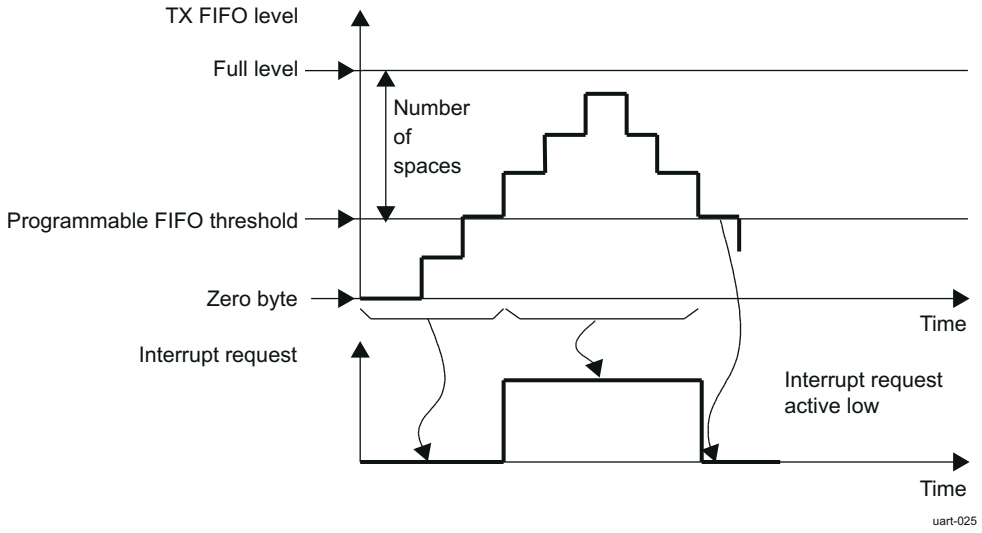

Figure 24-61. TX FIFO Interrupt Request Generation

In transmit mode, an interrupt request is automatically asserted when the TX FIFO is empty. This request is deasserted when the TX FIFO crosses the threshold level. The interrupt line is deasserted until a sufficient number of elements is transmitted to go below the TX FIFO threshold.

24.3.4.6.3 FIFO Polled Mode Operation

In FIFO polled mode (the UARTi.UART_FCR[0] FIFO_EN bit is set to 0 and the relevant interrupts are disabled by the UARTi.UART_IER register), the status of the receiver and transmitter can be checked by polling the line status register (UARTi.UART_LSR).

This mode is an alternative to the FIFO interrupt mode of operation in which the status of the receiver and transmitter is automatically determined by sending interrupts to the MPU.

24.3.4.6.4 FIFO DMA Mode Operation

Although the DMA operation includes four modes (DMA modes 0 through 3), the information in Table 24-94, *UART Hardware Requests*, assumes that mode 1 is used. (Mode 2 and mode 3 are legacy modes that use only one DMA request for each module.)

In mode 2, the remaining DMA request is used for RX. In mode 3, the remaining DMA request is used for TX.

DMA requests in mode 2 and mode 3 use the UARTi_DREQ_TX signals (where i = 1 to 10).

The UARTi_DREQ_RX signals are not used by the module in mode 2 and mode 3:

The DMA mode and signals usage can be selected as follows:

- When the UARTi.UART_SCR[0] DMA_MODE_CTL bit is set to 0, setting the UARTi.UART_FCR[3] DMA_MODE bit to 0 enables DMA mode 0. Setting the UARTi.UART_FCR[3] DMA_MODE bit to 1 enables DMA mode 1.
- When the UARTi.UART_SCR[0] DMA_MODE_CTL bit is set to 1, the UARTi.UART_SCR[2:1] DMA_MODE_2 bit field determines DMA mode 0 to mode 3 based on the supplementary control register (SCR) description.

For example:

- If no DMA operation is desired, set theUARTi.UART_SCR[0] DMA_MODE_CTL bit to 1 and the UARTi.UART_SCR[2:1] DMA_MODE_2 bit field to 0x0. (The DMA_MODE bit is discarded.)
- If DMA mode 1 is desired, set the UARTi.UART_SCR[0] DMA_MODE_CTL bit to 0 and the UARTi.UART_FCR[3] DMA_MODE bit to 1, or set the UARTi.UART_SCR[0] DMA_MODE_CTL bit to 1 and the SCR[2:1] DMA_MODE_2 bit field to 01. (The UARTi.UART_FCR[3] DMA_MODE bit is discarded.)

If the FIFOs are disabled (the UARTi.UART_FCR[0] FIFO_EN bit is set to 0), the DMA occurs in single-character transfers.

When DMA mode 0 is programmed, the signals associated with DMA operation are not active.

Depending on UARTi.UART_MDR3[2] SET_DMA_TX_THRESHOLD, the threshold can be programmed different ways:

- SET_TX_DMA_THRESHOLD = 1:

  The threshold value will be the value of the TX_DMA_THRESHOLD register. If SET_TX_DMA_THRESHOLD + TX trigger spaces 64, then the default method of threshold is used: threshold value = TX FIFO size.
- SET_TX_DMA_THRESHOLD = 0:

  The threshold value = TX FIFO size TX trigger space. The TX DMA line is asserted if the TX FIFO level is lower then the threshold. It remains asserted until TX trigger spaces number of bytes are written into the FIFO. The DMA line is then deasserted and the FIFO level is compared with the threshold value.

24.3.4.6.4.1 DMA sequence to disable TX DMA

In order to disable TX DMA if it is not needed anymore (e.g. all transfers are done and UART idle mode is desired), the following sequence must be use

1. DMA mode 1 is set (both TX/RX DMA) by registers UARTi.UART_SCR[0] = 0 and UARTi.UART_FCR[3] = 1:
   a. Set the UARTi.UART_SCR[2:1] DMA_MODE_2 bit fields to 01 (DMA mode 1)
   b. Set the UARTi.UART_SCR[0] DMA_MODE_CTL bit to1 (this setting of UARTi.UART_SCR[0] DMA_MODE-CTL will ignores UARTi.UART_FCR[3] DMA_MODE_CTL bit)

   Note

   It is strongly suggested to do steps ‘a’ and ‘b’ in two separate write in order to avoid malfunction of the device.

   c. Set the UARTi.UART_FCR[3] DMA_MODE bit to 0. It is not necessary but suggested to avoid restore of DMA mode 1 during accidental reset of UARTi.UART_SCR[0] DMA_MODE_CTL bit. Be sure that

all data was read out from RX FIFO and if it possible disable the RX side. In UART mode the RTS/CTS or XOFF/XON protocol can be used. In IrDA modes RX can be forcibly disabled by setting UARTi.UART_ACREG[5] DIS_IR_RX bit

Note

There can be RX DATA loss during the next steps if all DATA was not read out or there was an ongoing reception!

d. Set the UARTi.UART_FCR[2:1] DMA_MODE bit field to 11 (clear TX and RX FIFO and resets its counter logic to 0. Returns to 0 after clearing FIFO).
e. Set the UARTi.UART_SCR[2:1] DMA_MODE_2 bit field to 10 (DMA mode 2, RX only).
f. Set the UARTi.UART_FCR[2:1] DMA_MODE bit field to 11 (clear TX and RX FIFO and the DMA request again).
g. Set the UARTi.UART_SCR[2:1] DMA_MODE_2 bit field to 00 (no DMA) or keep 10 if RX DMA is needed.

2. DMA mode 1 is set (both TX/RX DMA) by registers UARTi.UART_FCR[3] = 0 and UARTi.UART_SCR[0] = 1, UARTi.UART_SCR[2:1] = 01. It is almost the same as above, but steps ‘a’, and ‘b’ can be skipped:
   a. Set the UARTi.UART_FCR[3] DMA_MODE bit to 0. It is not necessary but suggested to avoid restore of DMA mode 1 during accidental reset of UARTi.UART_SCR[0] DMA_MODE_CTL bit. Be sure that all data was read out from RX FIFO and if it possible disable the RX side. In UART mode the RTS/CTS or XOFF/XON protocol can be used. In IrDA modes RX can be forcibly disabled by setting UARTi.UART_ACREG[5] DIS_IR_RX bit

Note

There can be RX DATA loss during the next steps if all DATA was not read out or there was an ongoing reception!

   b. Set the UARTi.UART_FCR[2:1] DMA_MODE bit field to 11 (clear TX and RX FIFO and resets its counter logic to 0. Returns to 0 after clearing FIFO).
   c. Set the UARTi.UART_SCR[2:1] DMA_MODE_2 bit field to 10 (DMA mode 2, RX only).
   d. Set the UARTi.UART_FCR[2:1] DMA_MODE bit field to 11 (clear TX and RX FIFO and the DMA request again).
   e. Set the UARTi.UART_SCR[2:1] DMA_MODE_2 bit field to 00 (no DMA) or keep 10 if RX DMA is needed.

3. DMA mode 3 is set (TX DMA only) by registers UARTi.UART_FCR[3] = 0 and UARTi.UART_SCR[0] = 1, UARTi.UART_SCR[2:1] = 11. It is the same as above:
   a. Set the UARTi.UART_FCR[3] DMA_MODE bit to 0. It is not necessary but suggested to avoid restore of DMA mode 1 during accidental reset of UARTi.UART_SCR[0] DMA_MODE_CTL bit. Be sure that all data was read out from RX FIFO and if it possible disable the RX side. In UART mode the RTS/CTS or XOFF/XON protocol can be used. In IrDA modes RX can be forcibly disabled by setting UARTi.UART_ACREG[5] DIS_IR_RX bit

Note

There can be RX DATA loss during the next steps if all DATA was not read out or there was an ongoing reception!

   b. Set the UARTi.UART_FCR[2:1] DMA_MODE bit field to 11 (clear TX and RX FIFO and resets its counter logic to 0. Returns to 0 after clearing FIFO).
   c. Set the UARTi.UART_SCR[2:1] DMA_MODE_2 bit field to 10 (DMA mode 2, RX only).
   d. Set the UARTi.UART_FCR[2:1] DMA_MODE bit field to 11 (clear TX and RX FIFO and the DMA request again).
   e. Set the UARTi.UART_SCR[2:1] DMA_MODE_2 bit field to 00 (no DMA) or keep 10 if RX DMA is needed.

24.3.4.6.4.2 DMA Transfers (DMA Mode 1, 2, or 3)

Figure 24-62 through Figure 24-65 show the supported DMA operations.

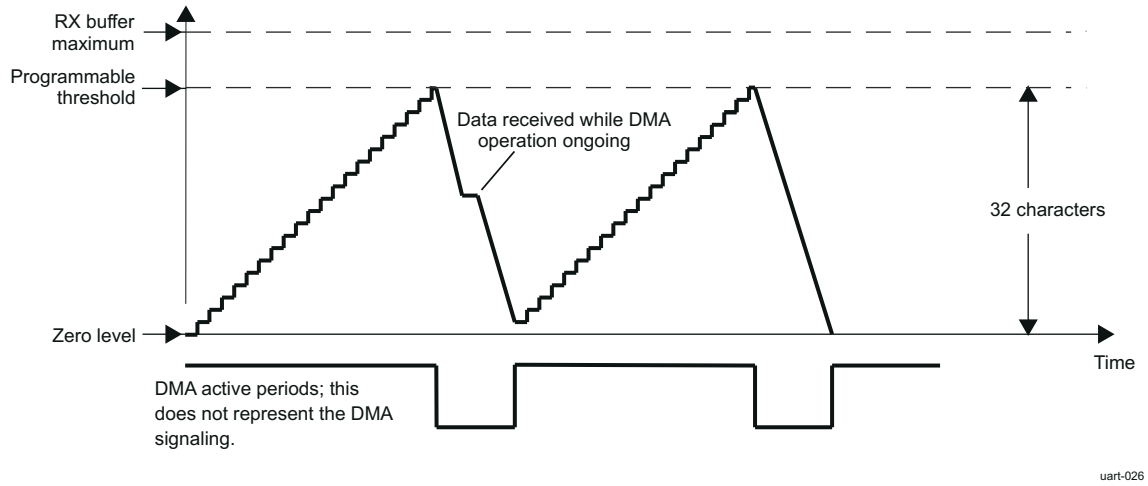

Figure 24-62. Receive FIFO DMA Request Generation (32 Characters)

In receive mode, a DMA request is generated when the RX FIFO reaches its threshold level defined in the trigger level register (UARTi.UART_TLR). This request is deasserted when the number of bytes defined by the threshold level is read by the device DMA controllers.

In transmit mode, a DMA request is automatically asserted when the TX FIFO is empty. This request is deasserted when the number of bytes defined by the number of spaces in the UARTi.UART_TLR register is written by the device DMA controllers. If an insufficient number of characters is written, the DMA request stays active.

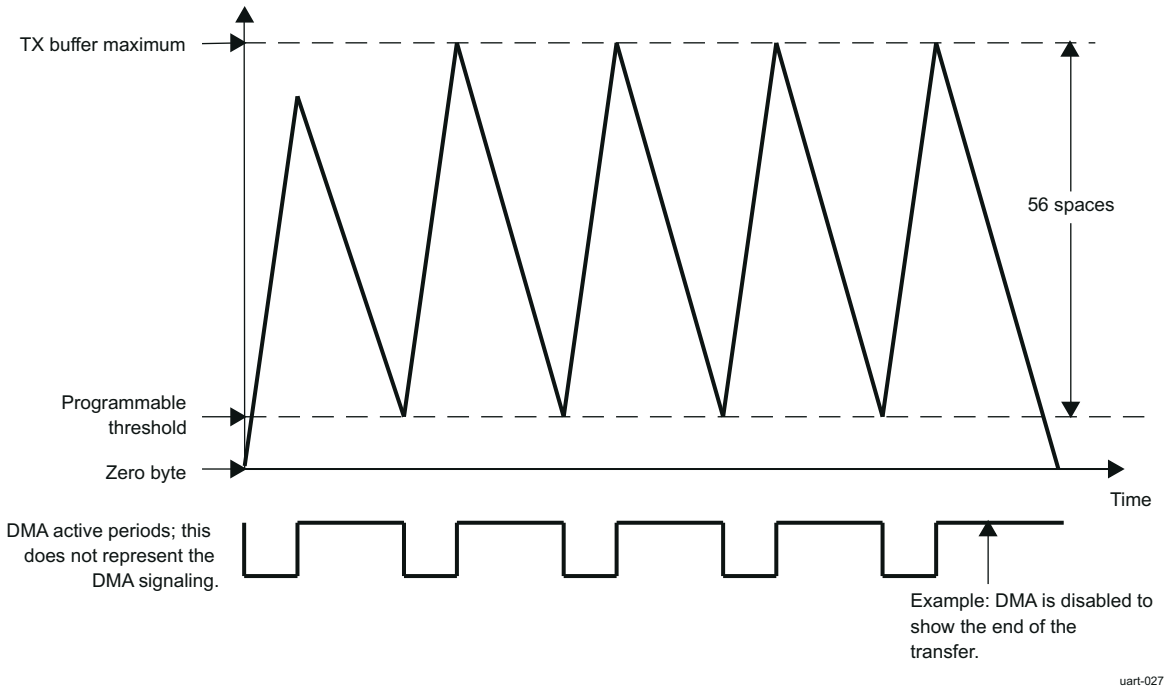

Figure 24-63. Transmit FIFO DMA Request Generation (56 Spaces)

The DMA request is again asserted if the FIFO can receive the number of bytes defined by the UARTi.UART_TLR register.

The threshold can be programmed in a number of ways. Figure 24-63 shows a DMA transfer operating with a space setting of 56 that can arise from using the auto settings in the UARTi.UART_FCR[5:4] TX_FIFO_TRIG bit field or the UARTi.UART_TLR[3:0] TX_FIFO_TRIG_DMA bit field concatenated with the TX_FIFO_TRIG bit field.

The setting of 56 spaces in the UART/IrDA/CIR module must correlate with the settings of the device DMA controllers, so that the buffer does not overflow (program the DMA request size of the LH controller to equal the number of spaces in the UART/IrDA/CIR module).

Figure 24-64 shows an example with eight spaces to show the buffer level crossing the space threshold. The LH DMA controller settings must correspond to those of the UART/IrDA/CIR module.

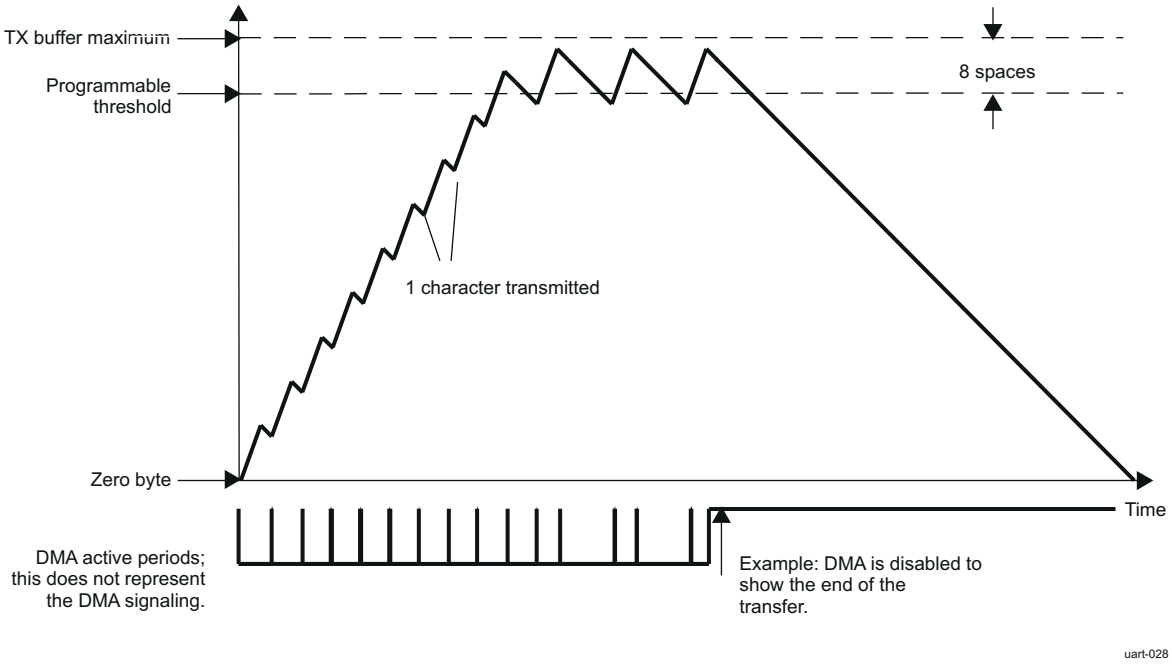

Figure 24-64. Transmit FIFO DMA Request Generation (8 Spaces)

The next example shows the setting of one space that uses the DMA for each transfer of one character to the transmit buffer (see Figure 24-65). The buffer is filled faster than the baud rate at which data is transmitted to the TX pin. Eventually, the buffer is completely full and the DMA operations stop transferring data to the transmit buffer.

On two occasions, the buffer holds the maximum amount of data words; shortly after this, the DMA is disabled to show the slower transmission of the data words to the TX pin. Eventually, the buffer is emptied at the rate specified by the baud rate settings of the UARTi.UART_DLL and UARTi.UART_DLH registers.

The DMA settings must correspond to the system LH DMA controller settings to ensure correct operation of this logic.

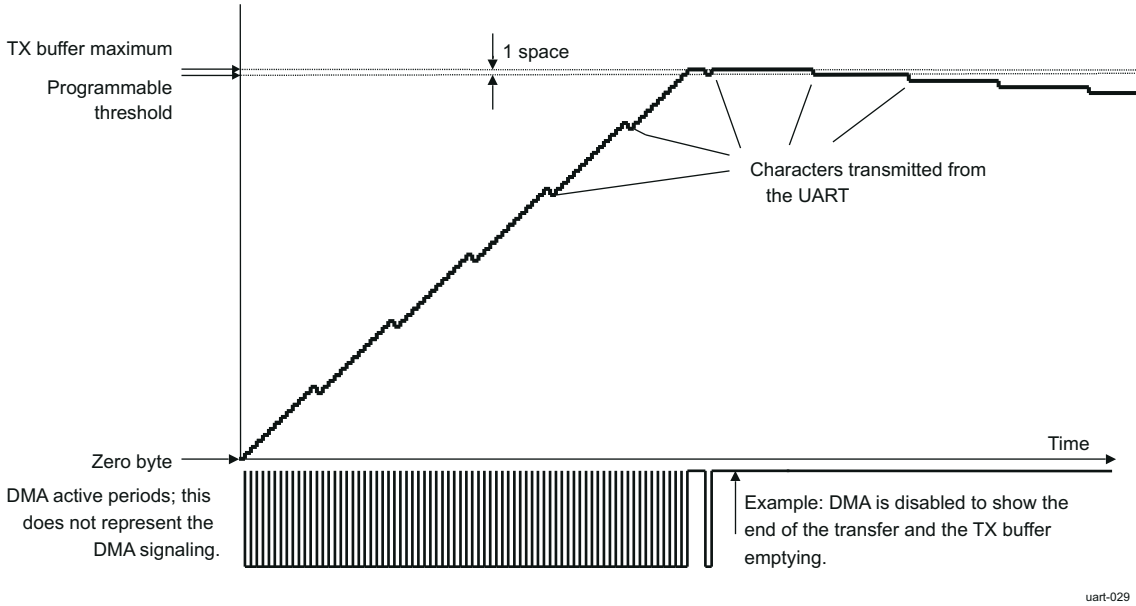

Figure 24-65. Transmit FIFO DMA Request Generation (1 Space)

The final example illustrates the setting of eight spaces but setting the TX DMA threshold directly by setting UART_MDR3[1] NONDEFAULT_FREQ bit and UART_TX_DMA_THRESHOLD register (see Figure 24-66). In the example, UART_TX_DMA_THRESHOLD[5:0] TX_DMA_THRESHOLD = 3 and the trigger level is 8. The buffer is filled at a faster rate than the BAUD rate transmits data to the TX pin. The buffer is filled with 8 bytes and the DMA operations stop transferring data to the transmit buffer. When the buffer is emptied to the threshold level by transmission, the DMA operation activates again to fill the buffer with 8 bytes.

Eventually, the buffer will be emptied at the rate specified by the BAUD Rate settings of the UART_DLL and UART_DLH registers.

If the selected threshold level + trigger level exceeds max buffer size, then the original TX DMA threshold method is used to prevent TX overrun, regardless of the UART_MDR3[1] NONDEFAULT_FREQ value.

The DMA settings should correspond to the system Local Host DMA controller settings in order to ensure the correct operation of this logic.

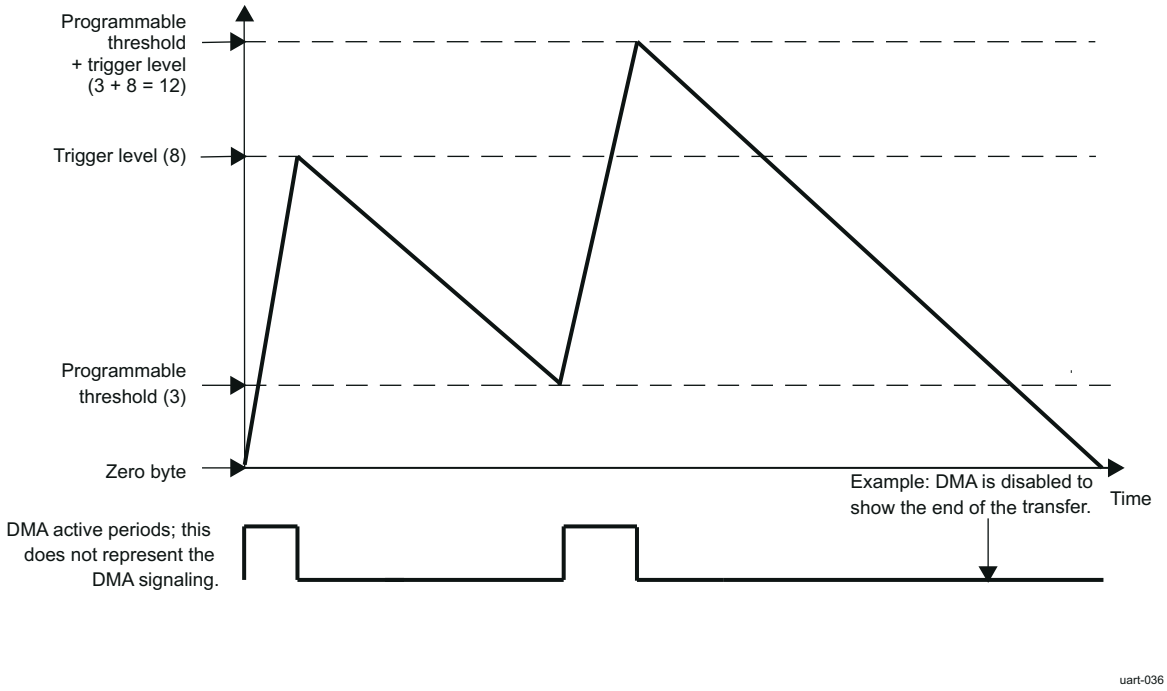

Figure 24-66. Transmit FIFO DMA Request Generation Using Direct TX DMA Threshold Programming. (Threshold = 3; Spaces = 8)

24.3.4.6.4.3 DMA Transmission

Figure 24-67 shows DMA transmission.

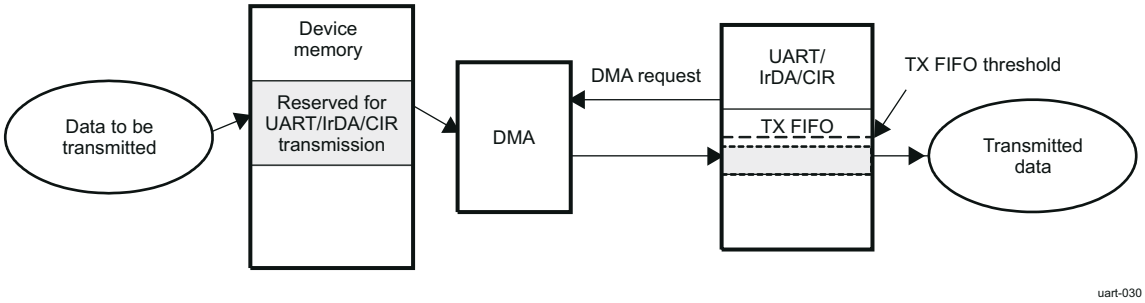

Figure 24-67. DMA Transmission

1. Data to be transmitted are put in the device memory reserved for UART/IrDA/CIR transmission by the DMA:
   a. Until the TX FIFO trigger level is not reached, a DMA request is generated
   b. An element (1 byte) is transferred from the SDRAM to the TX FIFO at each DMA request (DMA element synchronization).
2. Data in the TX FIFO are automatically transmitted.
3. The end of the transmission is signaled by the UARTi.UART_THR empty (TX FIFO empty).

Note

In IrDA mode, the transmission does not end immediately after the TX FIFO empties, at which point the last data byte, the CRC field, and the stop flag still must be transmitted; thus, the end of transmission occurs a few milliseconds after the UARTi.UART_THR register empties.

24.3.4.6.4.4 DMA Reception

Figure 24-68 shows DMA reception.

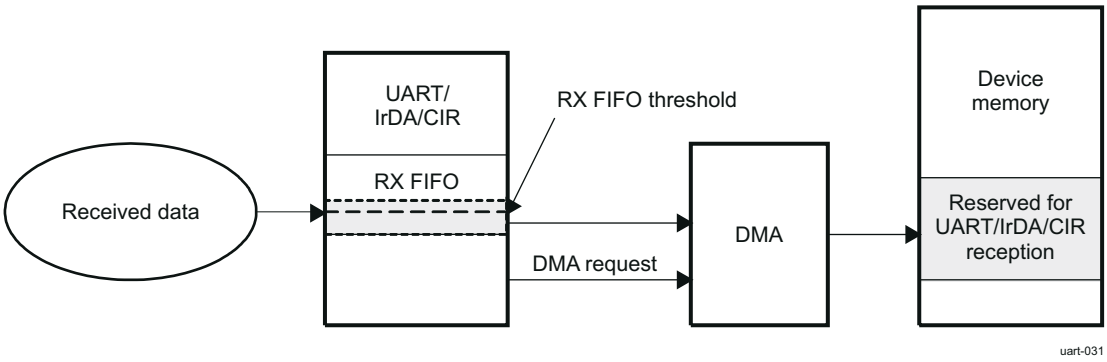

Figure 24-68. DMA Reception

1. Enable the reception.
2. Received data are put in the RX FIFO.
3. Data are transferred from the RX FIFO to the device memory by the DMA:
   a. At each received byte, the RX FIFO trigger level (one character) is reached and a DMA request is generated.
   b. An element (1 byte) is transferred from the RX FIFO to the SDRAM at each DMA request (DMA element synchronization).
4. The end of the reception is signaled by the EOF interrupt.

24.3.4.7 Mode Selection

24.3.4.7.1 Register Access Modes

24.3.4.7.1.1 Operational Mode and Configuration Modes

Register access depends on the register access mode, although register access modes are not correlated to functional mode selection. Three different modes are available:

- Operational mode
- Configuration mode A
- Configuration mode B

Operational mode is the selected mode when the function is active; serial data transfer can be performed in this mode.

Configuration mode A and configuration mode B are used during module initialization steps. These modes enable access to configuration registers, which are hidden in the operational mode. The modes are used when the module is inactive (no serial data transfer processed) and only for initialization or reconfiguration of the module.

The value of the UARTi.UART_LCR register determines the register access mode (see Table 24-101).

Table 24-101. UART/IrDA/CIR Register Access Mode Programming (Using UART_LCR)

Mode	Condition
Configuration mode A	UART_LCR[7] = 0x1 and UART_LCR[7:0] != 0xBF
Configuration mode B	UART_LCR[7] = 0x1 and UART_LCR[7:0] = 0xBF
Operational mode	UART_LCR[7] = 0x0

24.3.4.7.1.2 Register Access Submode

In each access register mode (operational mode or configuration mode A/B), some register accesses are conditional on the programming of a submode (MSR_SPR, TCR_TLR, and XOFF). These registers are identified in Section 24.3.6, *UART/IrDA/CIR Register Manual*.

Table 24-102 through Table 24-104 summarize the register access submodes.

Table 24-102. Subconfiguration Mode A Summary

Mode	Condition
MSR_SPR	(UART_EFR[4] = 0x0 or UART_MCR[6] = 0x0)
TCR_TLR	UART_EFR[4] = 0x1 and UART_MCR[6] = 0x1

Table 24-103. Subconfiguration Mode B Summary

Mode	Condition
TCR_TLR	UART_EFR[4] = 0x1 and UART_MCR[6] = 0x1
XOFF	(UART_EFR[4] = 0x0 or UART_MCR[6] = 0x0)

Table 24-104. Suboperational Mode Summary

Mode	Condition
MSR_SPR	UART_EFR[4] = 0x0 or UART_MCR[6] = 0x0
TCR_TLR	UART_EFR[4] = 0x1 and UART_MCR[6] = 0x1

24.3.4.7.1.3 Registers Available for the Register Access Modes

Table 24-105 lists the names of the register bits in each access register mode. Gray shading indicates that the register does not depend on the register access mode (available in all modes).

Table 24-105. UART/IrDA/CIR Register Access Mode Overview

24.3.4.7.2 UART/IrDA (SIR, MIR, FIR)/CIR Mode Selection

To select a mode, set the UARTi.UART_MDR1[2:0] MODE_SELECT bit field (see Table 24-106).

Table 24-106. UART Mode Selection

Value	Mode
0x0:	UART 16x mode
0x1:	SIR mode (UART3 only)
0x2:	UART 16x auto-baud
0x3:	UART 13x mode
0x4:	MIR mode (UART3 only)
0x5:	FIR mode (UART3 only)
0x6:	CIR mode (UART3 only)

MODE_SELECT is effective when the module is in operational mode (see Section 24.3.4.7.1, *Register Access Modes*).

24.3.4.7.2.1 Registers Available for the UART Function

Only the registers listed in Table 24-107 are used for the UART function.

(2) REGISTER_NAME[m:n] notation indicates that only register bits numbered m to n apply to the CIR function.

24.3.4.8 Protocol Formatting

24.3.4.8.1 UART Mode

24.3.4.8.1.1 UART Clock Generation: Baud Rate Generation

The UART function contains a programmable baud generator and a set of fixed dividers that divide the 48-MHz clock input down to the expected baud rate.

Figure 24-69 shows the baud rate generator and associated controls.

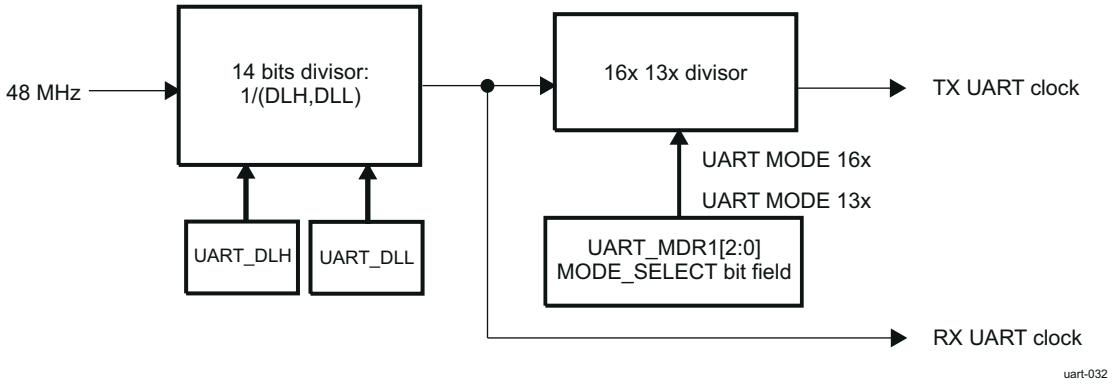

Figure 24-69. Baud Rate Generation

CAUTION

Before initializing or modifying clock parameter controls (UARTi.UART_DLH, UARTi.UART_DLL), MODE_SELECT = DISABLE (UARTi.UART_MDR1[2:0]) must be set to 0x7. Failure to observe this rule can result in unpredictable module behavior.

24.3.4.8.1.2 Choosing the Appropriate Divisor Value

Two divisor values are:

- UART 16x mode: Divisor value = Operating frequency / (16x baud rate)
- UART 13x mode: Divisor value = Operating frequency / (13x baud rate)

Table 24-110 and Table 24-111 describe the UART baud rate settings.

Table 24-110. UART Baud Rate Settings (48-MHz Clock)

Baud Rate	Baud Multiple	DLH, DLL (Decimal)	DLH, DLL (Hex)	Actual Baud Rate	Error (%)

24.3.4.8.1.3 UART Data Formatting

The UART can use hardware flow control to manage transmission and reception. Hardware flow control significantly reduces software overhead and increases system efficiency by automatically controlling serial data flow using the RTS output and CTS input signals.

The UART is enhanced with the autobauding function. In control mode, autobauding lets the speed, the number of bits per character, and the parity selected be set automatically.

24.3.4.8.1.3.1 Frame Formatting

When autobauding is not used, frame format attributes must be defined in the UARTi.UART_LCR register.

Character length is specified using the UARTi.UART_LCR[1:0] CHAR_LENGTH bit field.

The number of stop-bits is specified using the UARTi.UART_LCR[2] NB_STOP bit.

The parity bit is programmed using the UARTi.UART_LCR[5:3] PARITY_EN, PARITY_TYPE_1, and PARITY_TYPE_2 bit fields (see Table 24-112).

Table 24-112. UART Parity Bit Encoding

PARITY_EN	PARITY_TYPE_1	PARITY_TYPE_2	Parity
0	N/A	N/A	No parity
1	0	0	Odd parity
1	1	0	Even parity
1	0	1	Forced 1
1	1	1	Forced 0

24.3.4.8.1.3.2 Hardware Flow Control

Hardware flow control is composed of auto-CTS and auto-RTS. Auto-CTS and auto-RTS can be enabled and disabled independently by programming the UARTi.UART_EFR[7:6] AUTO_CTS_EN and AUTO_RTS_EN bit fields, respectively.

With auto-CTS, uarti_ctsn must be active before the module can transmit data.

Auto-RTS activates the uarti_rtsn output only when there is enough room in the RX FIFO to receive data. It deactivates the uarti_rtsn output when the RX FIFO is sufficiently full. The HALT and RESTORE trigger levels in the UARTi.UART_TCR register determine the levels at which uarti_rtsn is activated and deactivated.

If auto-CTS and auto-RTS are enabled, data transmission does not occur unless the RX FIFO has empty space. Thus, overrun errors are eliminated during hardware flow control. If auto-CTS and auto-RTS are not enabled, overrun errors occur if the transmit data rate exceeds the RX FIFO latency.

- Auto-RTS:

  Auto-RTS data flow control originates in the receiver block. The RX FIFO trigger levels used in auto-RTS are stored in the UARTi.UART_TCR register. uarti_rtsn is active if the RX FIFO level is below the HALT trigger level in the UARTi.UART_TCR[3:0] RX_FIFO_TRIG_HALT bit field. When the RX FIFO HALT trigger level is reached, uarti_rtsn is deasserted. The sending device (for example, another UART) can send an additional byte after the trigger level is reached because it may not recognize the deassertion of RTS until it begins sending the additional byte.

  uarti_rtsn is automatically reasserted when the RX FIFO reaches the RESUME trigger level programmed by the UARTi.UART_TCR[7:4] RX_FIFO_TRIG_START bit field. This reassertion requests the sending device to resume transmission.

  In this case, uarti_rtsn is an active-low signal.
- Auto-CTS:

  The transmitter circuitry checks uarti_ctsn before sending the next data byte. When uarti_ctsn is active, the transmitter sends the next byte. To stop the transmitter from sending the next byte, uarti_ctsn must be deasserted before the middle of the last stop-bit currently sent.

  The auto-CTS function reduces interrupts to the host system. When auto-CTS flow control is enabled, the uarti_ctsn state changes do not have to trigger host interrupts because the device automatically controls its own transmitter. Without auto-CTS, the transmitter sends any data present in the transmit FIFO, and a receiver overrun error can result.

  In this case, uarti_ctsn is an active-low signal.

24.3.4.8.1.3.3 Software Flow Control

Software flow control is enabled through the enhanced feature register (UARTi.UART_EFR) and the modem control register (UARTi.UART_MCR). Different combinations of software flow control can be enabled by setting different combinations of the UARTi.UART_EFR[3:0] bit field (see Table 24-113).

Two other enhanced features relate to software flow control:

- XON-any function (UARTi.UART_MCR[5]): Operation resumes after receiving any character after the XOFF character is recognized. If special character detect is enabled and special character is received after XOFF1, it does not resume transmission. The special character is stored in the RX FIFO.

  Note

  The XON-any character is written into the RX FIFO even if it is a software flow character.
- Special character (UARTi.UART_EFR[5]): Incoming data is compared to XOFF2. When the special character is detected, the XOFF interrupt (UARTi.UART_IIR[4]) is set, but it does not halt transmission. The XOFF interrupt is cleared by a read of UARTi.UART_IIR. The special character is transferred to the RX FIFO. Special character does not work with XON2, XOFF2, or sequential XOFFs.

Table 24-113. UART_EFR[3:0] Software Flow Control Options

Bit 3	Bit 2	Bit 1	Bit 0	TX, RX Software Flow Controls
0	0	X	X	No transmit flow control
1	0	X	X	Transmit XON1, XOFF1
0	1	X	X	Transmit XON2, XOFF2

Table 24-113. UART_EFR[3:0] Software Flow Control Options (continued)

Bit 3	Bit 2	Bit 1	Bit 0	TX, RX Software Flow Controls
1	1	X	X	Transmit XON1, XON2: XOFF1, XOFF2(1)
X	X	0	0	No receive flow control
X	X	1	0	Receiver compares XON1, XOFF1
X	X	0	1	Receiver compares XON2, XOFF2
X	X	1	1	Receiver compares XON1, XON2: XOFF1, XOFF2(1)

(1) In these cases, the XON1 and XON2 characters or the XOFF1 and XOFF2 characters must be transmitted/received sequentially with XON1/XOFF1 followed by XON2/XOFF2.
XON1 is defined in the UARTi.UART_XON1_ADDR1[7:0] XON_WORD1 bit field. XON2 is defined in the UARTi.UART_XON2_ADDR2[7:0] XON_WORD2 bit field.
XOFF1 is defined in the UARTi.UART_XOFF1[7:0] XOFF_WORD1 bit field. XOFF2 is defined in the UARTi.UART_XOFF2[7:0] XOFF_WORD2 bit field.

24.3.4.8.1.3.3.1 Receive (RX)

When software flow control operation is enabled, the UART compares incoming data with XOFF1/2 programmed characters (in certain cases, XOFF1 and XOFF2 must be received sequentially). When the correct XOFF characters are received, transmission stops after transmission of the current character completes. Detection of XOFF also sets the UARTi.UART_IIR[4] bit (if enabled by UARTi.UART_IER[5]) and causes the interrupt line to go low.

To resume transmission, an XON1/2 character must be received (in certain cases, XON1 and XON2 must be received sequentially). When the correct XON characters are received, the UARTi.UART_IIR[4] bit is cleared and the XOFF interrupt disappears.

Note

When a parity, framing, or break error occurs while receiving a software flow control character, this character is treated as normal data and is written to the RX FIFO.

When XON-any and special character detect are disabled and software flow control is enabled, no valid XON or XOFF characters are written to the RX FIFO. For example, when UARTi.UART_EFR[1:0] = 0x2, if XON1 and XOFF1 characters are received, they are not written to the RX FIFO.

When pairs of software flow characters are programmed to be received sequentially (UARTi.UART_EFR[1:0] = 0x3), the software flow characters are not written to the RX FIFO if they are received sequentially. However, received XON1/XOFF1 characters must be written to the RX FIFO if the subsequent character is not XON2/XOFF2.

24.3.4.8.1.3.3.2 Transmit (TX)

Two XOFF1 characters are transmitted when the RX FIFO passes the trigger level programmed by UARTi.UART_TCR[3:0]. As soon as the RX FIFO reaches the trigger level programmed by UARTi.UART_TCR[7:4], two XON1 characters are sent, so the data transfer recovers.

Note

If software flow control is disabled after an XOFF character is sent, the module transmits XON characters automatically to enable normal transmission.

The transmission of XOFF(s)/XON(s) follows the same protocol as transmission of an ordinary byte from the TX FIFO. This means that even if the word length is 5, 6, or 7 characters, the 5, 6, or 7 LSBs of XOFF1/2 and XON1/2 are transmitted. The 5, 6, or 7 bits of a character are seldom transmitted, but this function is included to maintain compatibility with earlier designs.

It is assumed that software flow control and hardware flow control are never enabled simultaneously.

24.3.4.8.1.3.4 Autobauding Modes

In autobauding mode, the UART can extract transfer characteristics (speed, length, and parity) from an "at" (AT) command (ASCII code). These characteristics are used to receive data after an AT and to send data.

The following AT commands are valid:

AT	DATA	<CR>
at	DATA	<CR>
A/		
a/		

A line break during the acquisition of the sequence AT is not recognized, and an echo function is not implemented in hardware.

A/ and a/ are not used to extract characteristics, but they must be recognized because of their special meaning. A/ or a/ is used to instruct the software to repeat the last received AT command; therefore, an a/ always follows an AT, and transfer characteristics are not expected to change between an AT and an a/.

When a valid AT is received, AT and all subsequent data, including the final <CR> (0x0D), are saved to the RX FIFO. The autobaud state-machine waits for the next valid AT command. If an a/ (A/) is received, the a/ (A/) is saved in the RX FIFO and the state-machine waits for the next valid AT command.

On the first successful detection of the baud rate, the UART activates an interrupt to signify that the AT (upper or lower case) sequence is detected. The UARTi.UART_UASR register reflects the correct settings for the baud rate detected. Interrupt activity can continue in this fashion when a subsequent character is received. Therefore, it is recommended that the software enable the RHR interrupt when using the autobaud mode.

The following settings are detected in autobaud mode with a module clock of 48 MHz:

- Speed:
  - 115.2K baud
  - 57.6K baud
  - 38.4K baud
  - 28.8K baud
  - 19.2K baud
  - 14.4K baud
  - 9.6K baud
  - 4.8K baud
  - 2.4K baud
  - 1.2K baud
- Length: 7 or 8 bits
- Parity: Odd, even, or space

Note

The combination of 7-bit character plus space parity is not supported.

Autobauding mode is selected when the UARTi.UART_MDR1[2:0] MODE_SELECT bit field is set to 0x2. In UART autobauding mode, UARTi.UART_DLL, UARTi.UART_DLH, and UARTi.UART_LCR[5:0] bit field settings are not used; instead, UASR is updated with the configuration detected by the autobauding logic.

UASR Autobauding Status Register Use

This register is used to set up transmission according to the characteristics of the previous reception instead of the UARTi.UART_LCR, UARTi.UART_DLL, and UARTi.UART_DLH registers when the UART is in autobauding mode.

To reset the autobauding hardware (to start a new AT detection) or to set the UART in standard mode (no autobaud), the UARTi.UART_MDR1[2:0] MODE_ SELECT bit field must be set to reset state (0x7) and then to the UART in autobauding mode (0x2) or to the UART in standard mode (0x0).

Use limitation:

- Only 7- and 8-bit characters (5- and 6-bit not supported)
- 7-bit character with space parity not supported
- Baud rate between 1200 and 115,200 bps (10 possibilities)

24.3.4.8.1.3.5 Error Detection

When the UARTi.UART_LSR register is read, the UARTi.UART_LSR[4:2] bit field reflects the error bits (BI: break condition, FE: framing error, PE: parity error) of the character at the top of the RX FIFO (the next character to be read). Therefore, reading the UARTi.UART_LSR register and then reading the UARTi.UART_RHR register identifies errors in a character.

Reading the UARTi.UART_RHR register updates the BI, FE, and PE bits (see Table 24-96 for the UART mode interrupts).

The UARTi.UART_LSR[7] RX_FIFO_STS bit is set when there is an error in the RX FIFO and is cleared only when no errors remain in the RX FIFO.

Note

Reading the UARTi.UART_LSR register does not cause an increment of the RX FIFO read pointer. The RX FIFO read pointer is incremented by reading the UARTi.UART_RHR register.

Reading the UARTi.UART_LSR register clears the OE bit if it is set (see Table 24-96 for the UART mode interrupts).

24.3.4.8.1.3.6 Overrun During Receive

Overrun during receive occurs if the RX state-machine tries to write data into the RX FIFO when it is already full. When overrun occurs, the device interrupts the MPUwith the UARTi.UART_IIR[5:1] IT_TYPE bit field set to 0x3 (receiver line status error) and discards the remaining portion of the frame.

Overrun also causes an internal flag to be set, which disables further reception. Before the next frame can be received, the MPU must:

- Reset the RX FIFO.
- Read the UARTi.UART_RESUME register, which clears the internal flag.

24.3.4.8.1.3.7 Time-Out and Break Conditions

24.3.4.8.1.3.7.1 Time-Out Counter

An RX idle condition is detected when the receiver line (uarti_rxd) is high for a time that equals 4x the programmed word length + 12 bits. uarti_rxd is sampled midway through each bit.

For sleep mode, the counter is reset when there is activity on uarti_rxd.

For the time-out interrupt, the counter counts only when there is data in the RX FIFO, and the count is reset when there is activity on uarti_rxd or when the UARTi.UART_RHR register is read.

24.3.4.8.1.3.7.2 Break Condition

When a break condition occurs, uarti_txd is pulled low. A break condition is activated by setting the UARTi.UART_LCR[6] BREAK_EN bit. The break condition is not aligned on word stream (a break condition can occur in the middle of a character). The only way to send a break condition on a full character is:

1. Reset the TX FIFO (if enabled).
2. Wait for the transmit shift register to empty (the UARTi.UART_LSR[6] TX_SR_E bit is set to 1).
3. Take a guard time according to stop-bit definition.

4. Set the BREAK_EN bit to 1.

The break condition is asserted while the BREAK_EN bit is set to 1.

The time-out counter and break condition apply only to UART modem operation and not to IrDA/CIR mode operation.

24.3.4.8.2 IrDA Mode (UART3 Only)

24.3.4.8.2.1 IrDA Clock Generation: Baud Generator

The IrDA function contains a programmable baud generator and a set of fixed dividers that divide the 48-MHz clock input down to the expected baud rate.

Figure 24-70 shows the baud rate generator and associated controls.

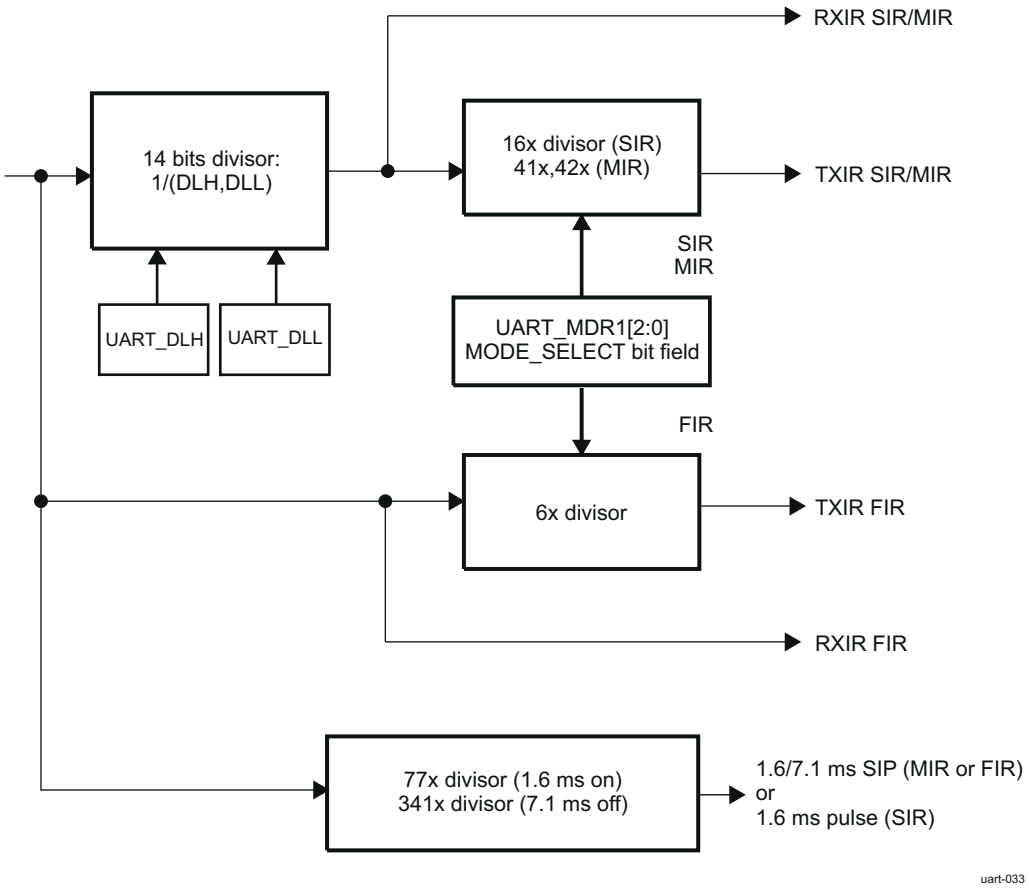

Figure 24-70. Baud Rate Generator

CAUTION

Before initializing or modifying clock parameter controls (UARTi.UART_DLH, UARTi.UART_DLL), MODE_SELECT=DISABLE (UARTi.UART_MDR1[2:0]) must be set to 0x7). Failure to observe this rule can result in unpredictable module behavior.

24.3.4.8.2.2 Choosing the Appropriate Divisor Value

Three divisor values are:

- SIR mode: Divisor value = Operating frequency/(16x baud rate)
- MIR mode: Divisor value = Operating frequency/(41x/42x baud rate)
- FIR mode: Divisor value = None

Table 24-114 lists the IrDA baud rate settings.

Table 24-114. IrDA Baud Rate Settings

Baud Rate	IR Mode	Baud Multiple	Encoding	DLH, DLL (Decimal)	Actual Baud Rate	Error (%)	Source Jitter (%)	Pulse Duration
2.4 kbps	SIR	16x	3/16	1250	2.4 kbps	0	0	78.1 µs
9.6 kbps	SIR	16x	3/16	312	9.6153 kbps	+0.16	0	19.5 µs
19.2 kbps	SIR	16x	3/16	156	19.231 kbps	+0.16	0	9.75 µs
38.4 kbps	SIR	16x	3/16	78	38.462 kbps	+0.16	0	4.87 µs
57.6 kbps	SIR	16x	3/16	52	57.692 kbps	+0.16	0	3.25 µs
115.2 kbps	SIR	16x	3/16	26	115.38 kbps	+0.16	0	1.62 µs
0.576 Mbps	MIR	41x/42x	1/4	2	0.5756 Mbps(1)	0	+1.63/-0.80	416 ns
1.152 Mbps	MIR	41x/42x	1/4	1	1.1511 Mbps(1)	0	+1.63/-0.80	208 ns
4 Mbps	FIR	6x	4 PPM	–	4 Mbps	0	0	125 ns

(1) Average value

Note

Baud rate error and source jitter table values do not include 48-MHz reference clock error and jitter.

24.3.4.8.2.3 IrDA Data Formatting

The methods described in this section apply to all IrDA modes (SIR, MIR, and FIR).

24.3.4.8.2.3.1 IR RX Polarity Control

The UART3.UART_MDR2[6] IRRXINVERT bit provides the flexibility to invert the uart3_rxd pin in the UART to ensure that the protocol at the output of the transceiver has the same polarity at module level. By default, the uart3_rxd pin is inverted because most transceivers invert the IR receive pin.

24.3.4.8.2.3.2 IrDA Reception Control

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware.

Operation of the uart3_rxd input can be disabled by the UART3.UART_ACREG[5] DIS_IR_RX bit.

24.3.4.8.2.3.3 IR Address Checking

In all IR modes, when address checking is enabled, only frames intended for the device are written to the RX FIFO. This restriction avoids receiving frames not meant for this device in a multipoint infrared environment. It is possible to program two frame addresses that the UART IrDA receives, with the UART3.UART_XON1_ADDR1[7:0] XON_WORD1 and UART3.UART_XON2_ADDR2[7:0] XON_WORD2 bit fields.

Setting the UART_EFR[0] bit to 1 selects address1 checking. Setting the UART_EFR[1] bit to 1 selects address2 checking. Setting the UART_EFR[1:0] bit field to 0 disables all address checking operations. If both bits are set, the incoming frame is checked for private and public addresses.

If address checking is disabled, all received frames write to the RX FIFO.

24.3.4.8.2.3.4 Frame Closing

A transmission frame can be terminated in two ways:

- Frame-length method: Set the UART3.UART_MDR1[7] FRAME_END_MODE bit to 0. The MPU writes the value of the frame length to the UART3.UART_TXFLH and UART3.UART_TXFLL registers. The device automatically attaches end flags to the frame when the number of bytes transmitted equals the value of the frame length.

- Set-EOT bit method: Set the FRAME_END_MODE bit to 1. The MPU writes 1 to the UART3.UART_ACREG[0] EOT bit just before it writes the last byte to the TX FIFO. When the MPU writes the last byte to the TX FIFO, the device internally sets the tag bit for that character in the TX FIFO. As the TX state-machine reads data from the TX FIFO, it uses this tag-bit information to attach end flags and correctly terminate the frame.

24.3.4.8.2.3.5 Store and Controlled Transmission

In store and controlled transmission (SCT) mode, the MPU starts writing data to the TX FIFO. Then, after writing a part of a frame (for a bigger frame) or an entire frame (a small frame; that is, a supervisory frame), the MPU writes 1 to the UART3.UART_ACREG[2] SCTX_EN bit (deferred TX start) to start transmission.

SCT mode is enabled by setting the UART3.UART_MDR1[5] SCT bit to 1. This transmission method differs from normal mode, in which data transmission starts immediately after data is written to the TX FIFO. SCT mode is useful for sending short frames without TX underrun.

24.3.4.8.2.3.6 Error Detection

When the UART3.UART_LSR register is read, the UART3.UART_LSR[4:2] bit field reflects the error bits [FL, CRC, ABORT] of the frame at the top of the STATUS FIFO (the next frame status to be read).

The error is triggered by an interrupt (for IrDA mode interrupts, see Table 24-97). The STATUS FIFO must be read until empty (a maximum of eight reads is required).

24.3.4.8.2.3.7 Underrun During Transmission

Underrun during transmission occurs when the TX FIFO is empty before the end of the frame is transmitted. When underrun occurs, the device closes the frame with end flags but attaches an incorrect CRC value. The receiving device detects a CRC error and discards the frame; it can then ask for a retransmission.

Underrun also causes an internal flag to be set, which disables additional transmissions. Before the next frame can be transmitted, the MPU must:

- Reset the TX FIFO.
- Read the UART3.UART_RESUME register, which clears the internal flag.

This function can be disabled by the UART3.UART_ACREG[4] DIS_TX_UNDERRUN bit, compensated by the extension of the stop-bit in transmission if the TX FIFO is empty.

24.3.4.8.2.3.8 Overrun During Receive

Overrun during receive for the IrDA mode has the same function as that for the UART mode (see Section 24.3.4.8.1.3.6, *Overrun During Receive*).

24.3.4.8.2.3.9 Status FIFO

In IrDA modes, a status FIFO records the received frame status. When a complete frame is received, the length of the frame and the error bits associated with the frame are written to the status FIFO.

Reading the UART3.UART_SFREGH[3:0] MSB and UART3.UART_SFREGL[3:0] (LSB) bit fields obtains the frame length. The frame error status is read in the UART3.UART_SFLSR register. Reading the UART3.UART_SFLSR register increments the status FIFO read pointer. Because the status FIFO is eight entries deep, it can hold the status of eight frames.

The MPU uses the frame-length information to locate the frame boundary in the received frame data. The MPU can screen bad frames using the error status information and can later request the sender to resend only the bad frames.

This status FIFO can be used effectively in DMA mode because the MPUmust be interrupted only when the programmed status FIFO trigger level is reached, not each time a frame is received.

24.3.4.8.2.4 SIR Mode Data Formatting

This section provides specific instructions for SIR mode programming.

24.3.4.8.2.4.1 Abort Sequence

The transmitter can prematurely close a frame (abort) by sending the sequence 0x7DC1. The abort pattern closes the frame without a CRC field or an ending flag.

A transmission frame can be aborted by setting the UART3.UART_ACREG[1] ABORT_EN bit to 1. When this bit is set to 1, 0x7D and 0xC1 are transmitted and the frame is not terminated with CRC or stop flags.

When a 0x7D character followed immediately by a 0xC1 character is received without transparency, the receiver treats a frame as an aborted frame.

CAUTION

When the TX FIFO is not empty and the UART3.UART_MDR1[5] SCT bit is set to 1, the UART IrDA starts a new transfer with data of a previous frame when the aborted frame is sent. Therefore, the TX FIFO must be reset before sending an aborted frame.

24.3.4.8.2.4.2 Pulse Shaping

SIR mode supports the 3/16 or the 1.6-µs pulse duration methods. The UART3.UART_ACREG[7] PULSE_TYPE bit selects the pulse width method in the transmit mode.

24.3.4.8.2.4.3 SIR Free Format Programming

The SIR FF mode is selected by setting the module in the UART mode (UART3.UART_MDR1[2:0] MODE_SELECT = 0x0) and the UART3.UART_MDR2[3] PULSE bit to 1 to allow pulse shaping.

Because the bit format stays the same, some UART mode configuration registers must be set at specific values:

- UART3.UART_LCR[1:0] CHAR_LENGTH bit field = 0x3 (8 data bits)
- UART3.UART_LCR[2] NB_STOP bit = 0x0 (1 stop-bit)
- UART3.UART_LCR[3] PARITY_EN bit = 0x0 (no parity)

The UART mode interrupts are used for the SIR FF mode, but many are not relevant (XOFF, RTS, CTS, modem status register, etc.).

24.3.4.8.2.5 MIR and FIR Mode Data Formatting

This section describes common instructions for FIR and MIR mode programming.

At the end of a frame reception, the MPU reads the line status register (UART3.UART_LSR) to detect errors in the received frame.

When the UART3.UART_MDR1[6] SIP_MODE bit is set to 1, the TX state-machine always sends one SIP at the end of a transmission frame. However, when the SIP_MODE bit is set to 0, SIP transmission depends on the UART3.UART_ACREG[3] SEND_SIP bit.

The MPU can set the SEND_SIP bit at least once every 500 ms. The advantage of this approach over the default approach is that the TX state-machine does not have to send the SIP at the end of each frame, thus reducing the overhead required.

24.3.4.8.3 CIR Mode (UART3 Only)

24.3.4.8.3.1 CIR Mode Clock Generation

Depending on the encoding method (variable pulse distance/biphase), the MPU must develop a data structure that combines 1 and 0 with a *t* period to encode the complete frame to transmit. This can then be transmitted to the infrared output with a modulation method, as shown in Figure 24-71.

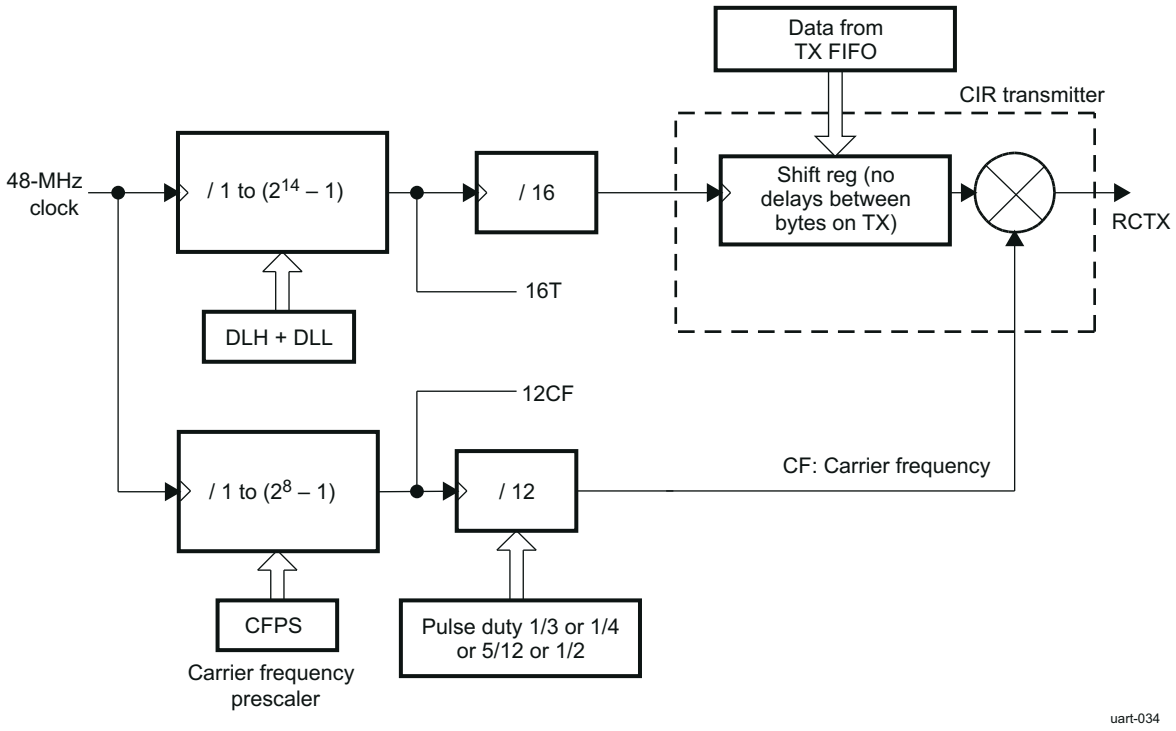

Figure 24-71. CIR Mode Block Components

Based on the requested modulation frequency, the UART3.UART_CFPS register must be set with the correct dividing value to provide an accurate pulse frequency:

Dividing value = (FCLK / 12) / MODfreq

Where:

FCLK = System clock frequency (48 MHz)

12 = Real value of baud multiple

MODfreq = Effective frequency of the modulation (MHz)

Example: For a targeted modulation frequency of 36 kHz, the value of CFPS must be set to 0x7 (decimal), which provides a modulation frequency of 36.04 kHz.

Note

The UART3.UART_CFPS register starts with a reset value of 105 (decimal), which translates to a frequency of 38.1 kHz.

The duty cycle of these pulses is user-defined by the pulse duty register bits in the UART3.UART_MDR2 register. Table 24-115 shows the duty cycle.

Table 24-115. Duty Cycle

UART_MDR2[5:4]	Duty Cycle (High-Level)
00	1/4
01	1/3
10	5/12
11	1/2

24.3.4.8.3.2 CIR Data Formatting

The methods described in this section apply to all CIR modes.

24.3.4.8.3.2.1 IR RX Polarity Control

The IR RX polarity control for CIR mode has the same function as that for IrDA mode (see Section 24.3.4.8.2.3.1, *IR RX Polarity Control*).

24.3.4.8.3.2.2 CIR Transmission

In transmission, the MPU software must exercise an element of real-time control to transmit data packets, each of which must be emitted at a constant delay from the start-bits of each individual packet. Thus, when sending a series of packets, the packet-to-packet delay must respect a specific delay. Two methods can be used to control this delay:

- Filling the TX FIFO with a number of zero bits that are transmitted with a *t* period
- Using an external system timer to control the delay between each start-of-frame or between the end of a frame and the start of the next one. This can be performed by:
  - Controlling the start of the frame using the UART3.UART_MDR1[5] SCT bit and the UART3.UART_ACREG[2] SCTX_EN bit, depending on the timer status
  - Using the UART3.UART_IIR[5] TX_STATUS_IT interrupt bit to preload the next frame in the TX FIFO and to control the start of the timer (in case of control delay between the end of a frame and the start of the next frame)

24.3.5 UART/IrDA/CIR Basic Programming Model

This section describes the procedure for operating the UART with FIFO and DMA or interrupts. This three-part procedure ensures the quick start of the UART. It does not cover every UART feature.

The first programming model covers software reset of the UART. The second programming model describes FIFO and DMA configuration. The last programming model describes protocol, baud rate, and interrupt configuration.

Note

Each programming model can be used independently of the other two; for instance, reconfiguring the FIFOs and DMA settings only.

Each programming model can be executed starting from any UART register access mode (register modes, submodes, and other register dependencies). However, if the UART register access mode is known before executing the programming model, some steps that enable or restore register access are optional. For more information, see Section 24.3.4.7.1, *Register Access Modes*.

24.3.5.1 Global Initialization

24.3.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the UART/IrDA/CIR module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the UART/IrDA/CIR.

For more information, see Section 24.3.3, *UART/IrDA/CIR Integration*.

Table 24-116. Global Initialization of Surrounding Modules for UART/IrDA/CIR

Surrounding Modules	Comments
PRCM	UART functional and interface clocks must be enabled. For more information, see *Power, Reset, and Clock Management*.
Control module	Module-specific pad muxing must be set in the control module. For more information, see *Control Module*.
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*
Interrupt controllers	Device INTCs must be configured to enable the interrupt request generation. For information about enabling interrupts, see *Interrupt Controllers*.
DMA_CROSSBAR	DMA_CROSSBAR configuration must be done to allow module DREQs to be mapped to certain device DMA line. For more information see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
DMA controllers	DMA controllers configuration must be done to enable the module DMA channel request. See Chapter 16, *DMA Controllers*
Interconnects	For information about the L4 interconnect configuration, see *Interconnect*.

24.3.5.1.2 UART/IrDA/CIR Module Global Initialization

The procedure in Table 24-117 can be used to initialize UART when performing software reset.

Table 24-117. UART/IrDA/CIR Global Initialization

Step	Register/Bit Field/Programming Model	Value
Perform a software reset.	UART_SYSC[1] SOFTRESET	1
Wait until reset is finished.	UART_SYSS[0] RESETDONE	=1

24.3.5.2 Mode selection

Table 24-118 describes how to set different register access mode.

Table 24-118. Configure Register Access Mode

Step	Register/Bit Field/Programming Model	Value
Set the register access mode A	UART_LCR[7] DIV_EN	1
	UART_LCR[7:0]	≠0xBF
Set the register access mode B	UART_LCR[7:0]	0xBF
Set the operational mode	UART_LCR[7] DIV_EN	0

24.3.5.3 Submode selection

This section describes how to set different register access submode.

Table 24-119. Configure Register Access Submode TCR_TLR

Step	Register/Bit Field/Programming Model	Value
Configure the submode TCR_TLR:		
Configure mode B	see Table 24-118	
Enable writing to register bits UART_MCR[6:5]	UART_EFR[4] ENHANCED_EN	1
Configure mode A	see Table 24-118	0x1
Set the submode TCR_TLR	UART_MCR[6] TCR_TLR	1

Table 24-120. Configure Register Access Submode MSR_SPR

Step	Register/Bit Field/Programming Model	Value
First option to configure the submode MSR_SPR:		
Configure mode B	see Table 24-118	
Set the submode MSR_SPR	UART_EFR[4] ENHANCED_EN	0
Second option to configure the submode MSR_SPR:		
Configure mode B	see Table 24-118	
Enable writing to register bits UART_MCR[6:5]	UART_EFR[4] ENHANCED_EN	1
Set the submode MSR_SPR	UART_MCR[6] TCR_TLR	0

Table 24-121. Configure Register Access Submode XOFF

Step	Register/Bit Field/Programming Model	Value
Configure of the XOFF:		
Configure B	see Table 24-118	
Set the submode XOFF	UART_EFR[4] ENHANCED_EN	0

24.3.5.4 Load FIFO trigger and DMA mode settings

24.3.5.4.1 DMA mode Settings

To enable and configure DMA mode, perform the following steps:

Table 24-122. DMA Mode Settings

Step	Register/Bit Field/Programming Model	Value
Set the option of DMA mode configuration	UART_SCR[0] DMA_MODE_CTL	-
IF Configure DMA mode 0 and 1	UART_SCR[0] DMA_MODE_CTL	=0
Select the DMA mode, for more information see Section 24.3.4.6.4	UART_FCR[3] DMA_MODE	-
IF Configure DMA mode from 0 to 3	UART_SCR[0] DMA_MODE_CTL	=1
Select the DMA mode, for more information see Section 24.3.4.6.4	UART_SCR[2:1] DMA_MODE_2	-

24.3.5.4.2 FIFO Trigger Settings

In this section is described configuration and settings of FIFO trigger level, which enable DMA and interrupt generation.

Table 24-123. Load FIFO Triggers Defined by the FCR

Step	Register/Bit Field/Programming Model	Value
Configure register submode TCR_TLR	see Table 24-119	0x-
Set the desire RX FIFO trigger level	UART_FCR[5:4] TX_FIFO_TRIG	0x-
Set the desire TX FIFO trigger level	UART_FCR[7:6] RX_FIFO_TRIG	0x-

Table 24-124. Load FIFO Triggers Defined by the TLR

Step	Register/Bit Field/Programming Model	Value
Configure register submode TCR_TLR	see Table 24-119	0x-
Set the desire RX FIFO trigger level	UART_TLR[7:4] RX_FIFO_TRIG_DMA	0x-
Set the desire TX FIFO trigger level	UART_TLR[3:0] TX_FIFO_TRIG_DMA	0x-

Table 24-125. Load FIFO Triggers Defined by the Concatenated Value

Step	Register/Bit Field/Programming Model	Value
Configure register submode TCR_TLR	see Table 24-119	0x-
Set the register bit	UART_SCR[7] RX_TRIG_GRANU1	1
Set the desire RX FIFO trigger level	UART_TLR[7:4] RX_FIFO_TRIG_DMA UART_FCR[7:6] RX_FIFO_TRIG	0x-
Set the register bit	UART_SCR[6] TX_TRIG_GRANU1	1
Set the desire TX FIFO trigger level	UART_TLR[3:0] TX_FIFO_TRIG_DMA UART_FCR[5:4] TX_FIFO_TRIG	0x-

24.3.5.5 Protocol, Baud rate and interrupt settings

24.3.5.5.1 Baud rate settings

Table 24-126. Baud Rate Settings

Step	Register/Bit Field/Programming Model	Value
Disable UART mode	UART_MDR1[2:0] MODE_SELECT	0x7
Switch to register configuration mode B	see Table 24-118	
Enable access to UART_IER[7:4]	UART_EFR[4] ENHANCED_EN	1
Switch register operational mode	see Table 24-118	
Disable sleep mode	UART_IER[4] SLEEP_MODE	0
Switch to register configuration mode A or B	see Table 24-118	
Set the appropriate divisor value	UART_DLL[7:0] CLOCK_LSB UART_DLH[5:0] CLOCK_MSB	0x-

24.3.5.5.2 Interrupt settings

Table 24-127. Interrupt Settings

Step	Register/Bit Field/Programming Model	Value
Switch to register configuration mode B	see Table 24-118	0x7
Enable access to UART_IER[7:4]	UART_EFR[4] ENHANCED_EN	1
Switch register operational mode	see Table 24-118	

Table 24-127. Interrupt Settings (continued)

Step	Register/Bit Field/Programming Model	Value
Set the desired interrupt configuration (0: Disable the interrupt; 1: Enable the interrupt)	UART_IER[7] CTS_IT	0x-
	UART_IER[6] RTS_IT	
	UART_IER[5] XOFF_IT	
	UART_IER[4] SLEEP_MODE	
	UART_IER[3] MODEM_STS_IT	
	UART_IER[2] LINE_STS_IT	
	UART_IER[1] THR_IT	
	UART_IER[0] RHR_IT	

24.3.5.5.3 Protocol settings

Load the desired protocol formatting (parity, stop-bit, character length) and switch to register operational mode.

Table 24-128. Protocol Settings

Step	Register/Bit Field/Programming Model	Value
Load desired protocol formatting, see Section 24.3.4.8.1.3.1 , *Frame Formatting*	UART_LCR[5] PARITY_TYPE_2	0x-
	UART_LCR[4] PARITY_TYPE_1	
	UART_LCR[3] PARITY_EN	
	UART_LCR[2] NB_STOP	
	UART_LCR[1:0] PARITY_LENGTH	
Switch to register operational mode	UART_LCR[7] DIV_EN	0
	UART_LCR[6] BREAK_EN	

24.3.5.5.4 UART/IrDA(SIR/MIR/FIR)/CIR

Table 24-129. UART/IrDA/CIR Mode Selection

Step	Register/Bit Field/Programming Model	Value
Load the desired UART mode, see Section 24.3.4.7.2, *UART/IrDA (SIR, MIR, FIR)/CIR Mode Selection*	UART_MDR1[2:0] MODE_SELECT	0x-

24.3.5.6 Hardware and Software Flow Control Configuration

This section describes the programming steps to enable and configure hardware and software flow control. Hardware and software flow control cannot be used at the same time.

24.3.5.6.1 Hardware Flow Control Configuration

Table 24-130. Hardware Flow Control Configuration

Step	Register/Bit Field/Programming Model	Value
Configure register submode TCR_TLR	see Table 24-119	0x7
Load the start and halt trigger value.	UART_TCR[7:4] AUTO_RTS_START	0x-
	UART_TCR[3:0] AUTO_RTS_HALT	
Enable or disable receive and transmit hardware flow control mode.	UART_EFR[7] AUTO_CTS_EN	0x-
	UART_EFR[6] AUTO_RTS_EN	

24.3.5.6.2 Software Flow Control Configuration

Table 24-131. Software Flow Control Configuration

Step	Register/Bit Field/Programming Model	Value
Set the register access submode XOFF	see Table 24-121	

Table 24-131. Software Flow Control Configuration (continued)

Step	Register/Bit Field/Programming Model	Value
Load the software control characters	UART_XON1_ADDR1[7:0] XON_WORD1	0x-
	UART_XON2_ADDR2[7:0] XON_WORD2	
	UART_XOFF1[7:0] XOFF_WORD1	
	UART_XOFF2[7:0] XOFF_WORD2	
Set the register access submode TCR_TLR	see Table 24-119	
Enable or disable XON any function (0: Disable; 1: Enable).	UART_MCR[5] XON_EN	--
Load start and halt trigger value for software flow control	UART_TCR[7:4] AUTO_RTS_START	0x-
	UART_TCR[3:0] AUTO_RTS_HALT	
Enable or disable special character function (0: Disable; 1: Enable)	UART_EFR[5] SPEC_CHAR	0x-
Set the software flow control mode	UART_EFR[3:0] SW_FLOW_CONTROL	0x-

24.3.5.7 IrDA Programming Model (UART3 Only)

24.3.5.7.1 SIR mode

24.3.5.7.1.1 Receive

The following programming model explains how to program the module to receive an IrDA frame with parity forced to 1, baud rate = 115.2 kbps, FIFOs disabled, 2 stop-bits, and 8-bit word length:

Table 24-132. SIR Mode Receive Settings

Step	Register/Bit Field/Programming Model	Value
Disable UART mode	UART_MDR1[2:0] MODE_SELECT	0x7
Grant access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x80
Load the baud rate(115.2 Kbps)	UART_DLL[7:0] CLOCK_LSB	0x1A
	UART_DLH[5:0] CLOCK_MSB	0x00
Set SIR mode	UART_MDR1[2:0] MODE_SELECT	0x1
Disable access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x00
Enable the UART_RHR interrupt	UART_IER_IRDA[0] RHR_IT	1

24.3.5.7.1.2 Transmit

The following programming model explains how to program the module to transmit an IrDA 6-byte frame with no parity, baud rate = 115.2 kbps, FIFOs disabled, 3/16 encoding, 2 stop-bits, and 7-bit word length:

Table 24-133. SIR Mode Transmit Settings

Step	Register/Bit Field/Programming Model	Value
Disable UART mode	UART_MDR1[2:0] MODE_SELECT	0x7
Grant access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x80
Load the baud rate (115.2 Kbps)	UART_DLL[7:0] CLOCK_LSB	0x1A
	UART_DLH[5:0] CLOCK_MSB	0x00
Set SIR mode	UART_MDR1[2:0] MODE_SELECT	0x1
Disable access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x00
Force DTR output to active	UART_MCR[0] DTR	1
Enable the THR interrupt	UART_IER_IRDA[1] THR_IT	0x1
Set transmit frame length to 6 bytes	UART_TXFLL[7:0] TXFLL	0x06
Set the seven starts of frame transmission	UART_EBLR[7:0] EBLR	0x08
Set SIR pulse width to be 1.6 µs	UART_ACREG[7] PULSE_TYPE	1

24.3.5.7.2 MIR mode

24.3.5.7.2.1 Receive

The following programming model explains how to program the module to receive an IrDA frame with no parity, baud rate = 1.152 Mpbs, and FIFOs disabled.

Table 24-134. MIR Mode Receive Settings

Step	Register/Bit Field/Programming Model	Value
Disable UART mode	UART_MDR1[2:0] MODE_SELECT	0x7
Grant access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x80
Load the baud rate (1.152bps)	UART_DLL[7:0] CLOCK_LSB	0x01
	UART_DLH[5:0] CLOCK_MSB	0x00
Set MIR mode	UART_MDR1[2:0] MODE_SELECT	0x4
Disable access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x00
Force outputs DTR and RTS to active	UART_MCR[1:0]	0x3
Enable the UART_RHR interrupt	UART_IER_IRDA[0] RHR_IT	1

24.3.5.7.2.2 Transmit

The following programming model explains how to program the module to transmit an IrDA 60-byte frame with no parity, baud rate = 1.152 Mpbs, and FIFOs disabled.

Table 24-135. MIR Mode Transmit Settings

Step	Register/Bit Field/Programming Model	Value
Disable UART mode	UART_MDR1[2:0] MODE_SELECT	0x7
Grant access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x80
Load the baud rate (115.2 kbps)	UART_DLL[7:0] CLOCK_LSB	0x01
	UART_DLH[5:0] CLOCK_MSB	0x00
Set SIR mode	UART_MDR1[2:0] MODE_SELECT	0x4
Disable access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x00
Force DTR output to active	UART_MCR[0] DTR	1
Enable the THR interrupt	UART_IER_IRDA[1] THR_IT	0x1
Set transmit frame length to 60 bytes	UART_TXFLL[7:0] TXFLL	0x3C
Set the eight additional starts of frame transmission	UART_EBLR[7:0] EBLR	0x08
SIP is sent at the end of transmission	UART_ACREG[3] SEND_SIP	1

24.3.5.7.3 FIR mode

24.3.5.7.3.1 Receive

The following programming model explains how to program the module to receive the IrDA frame with no parity, baud rate = 4 Mbps, FIFOs enabled, 8-bit word length.

Table 24-136. FIR Mode Receive Settings

Step	Register/Bit Field/Programming Model	Value
Disable UART mode	UART_MDR1[2:0] MODE_SELECT	0x7
Grant access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x80
Enable access to change UART_FCR[0]	UART_DLL[7:0] CLOCK_LSB	0x0
	UART_DLH[7:0] CLOCK_MSB	
FIFO clear and enable	UART_FCR[2:0]	0x7
Set the FIFO trigger level	see Section 24.3.5.4, *Load FIFO trigger and DMA mode settings*	

Table 24-136. FIR Mode Receive Settings (continued)

Step	Register/Bit Field/Programming Model	Value
Set FIR mode	UART_MDR1[2:0] MODE_SELECT	0x5
Set frame length	UART_RXFLL[7:0] RXFLL	0xA
Disable access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x00
Enable the UART_RHR interrupt	UART_IER_IRDA[0] RHR_IT	1

24.3.5.7.3.2 Transmit

The following programming model explains how to program the module to transmit an IrDA 4-byte frame with no parity, baud rate = 4 Mbps, FIFOs enabled, and 8-bit word length.

Table 24-137. FIR Mode Transmit Settings

Step	Register/Bit Field/Programming Model	Value
Disable UART mode	UART_MDR1[2:0] MODE_SELECT	0x7
Grant access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x80
Enable access to change UART_FCR[0]	UART_DLL[7:0] CLOCK_LSB	0x0
	UART_DLH[5:0] CLOCK_MSB	
FIFO clear and enable	UART_FCR[2:0]	0x7
Set the FIFO trigger level	see Section 24.3.5.4, *Load FIFO trigger and DMA mode settings*	
Set FIR mode	UART_MDR1[2:0] MODE_SELECT	0x1
Disable access to the UART_DLL and UART_DLH registers	UART_LCR[7:0]	0x00
Set FIR mode and enable auto-SIP mode	UART_MDR1[7:0]	0x45
Set frame length	UART_TXFLL[7:0] TXFLL	0x4
	UART_TXFLH[7:0] TXFLH	0x0
Force DTR output to active	UART_MCR[0] DTR	1
Enable the THR interrupt	UART_IER_IRDA[1] THR_IT	1
Set the eight additional starts of frame transmission	UART_EBLR[7:0] EBLR	0x08
SIP is sent at the end of transmission	UART_ACREG[3] SEND_SIP	1

24.3.6 UART/IrDA/CIR Register Manual

24.3.6.1 UART/IrDA/CIR Instance Summary

Table 24-138. UART/IrDA/CIR Instance Summary

Module Name	Module Base Address	Size
UART1	0x4806 A000	136 Bytes
UART2	0x4806 C000	136 Bytes
UART3	0x4802 0000	136 Bytes
UART4	0x4806 E000	136 Bytes
UART5	0x4806 6000	136 Bytes
UART6	0x4806 8000	136 Bytes
UART7	0x4842 0000	136 Bytes
UART8	0x4842 2000	136 Bytes
UART9	0x4842 4000	136 Bytes

24.3.6.2.2 UART/IrDA/CIR Register Description

Table 24-143. UART_THR

Address Offset	0x0000 0000		
Physical Address	0x4806 A000	**Instance**	UART1
	0x4806 C000		UART2
	0x4802 0000		UART3
	0x4806 E000		UART4
	0x4806 6000		UART5
	0x4806 8000		UART6
	0x4842 0000		UART7
	0x4842 2000		UART8
	0x4842 4000		UART9
	0x4AE2 B000		UART10
Description	The transmitter section consists of the transmit holding register (THR) and the transmit shift register. The THR is a 64-byte FIFO. The local host (LH) writes data to the THR. The data is placed in the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled, location 0 of the FIFO stores the data.		
Type	W		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7:0	THR	Transmit holding register	W	0x-

Table 24-144. UART_RHR

Address Offset	0x0000 0000		
Physical Address	0x4806 A000	**Instance**	UART1
	0x4806 C000		UART2
	0x4802 0000		UART3
	0x4806 E000		UART4
	0x4806 6000		UART5
	0x4806 8000		UART6
	0x4842 0000		UART7
	0x4842 2000		UART8
	0x4842 4000		UART9
	0x4AE2 B000		UART10
Description	The receiver section consists of the receiver holding register (RHR) and the receiver shift register. The RHR is a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the RHR. If the FIFO is disabled, location 0 of the FIFO stores the single data character. **Note:** If an overflow occurs, the data in the RHR is not overwritten.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	0x4842 2004		UART8
	0x4842 4004		UART9
	0x4AE2 B004		UART10

Description There are 8 types of interrupt in these modes, received EOF, LSR interrupt, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/disabled individually.
Note: The TX_STATUS_IT interrupt reflects two possible conditions. The UART_MDR2[0] should be read to determine the status in the event of this interrupt.

Type RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	0x4806 8004		UART6
	0x4842 0004		UART7
	0x4842 2004		UART8
	0x4842 4004		UART9
	0x4AE2 B004		UART10
Description	There are 6 types of interrupt in these modes, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/disabled individually. Notes: The RX_STOP_IT interrupt is generated based on the value set in the BOF Length register (UART_EBLR). In IR-CIR mode, contrary to the IR-IRDA mode, the TX_STATUS_IT has only one meaning corresponding to the case UART_MDR2[0] = 0.		
Type	RW

Description	Enhanced feature register		

Table 24-154. UART_EFR (continued)

This register enables or disables enhanced features. Most of the enhanced functions apply only to UART modes, but UART_EFR[4] enables write accesses to UART_FCR[5:4], the TX trigger level, which is also used in IrDA modes.

Type RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																								AUTO_CTS_EN	AUTO_RTS_EN	SPECIAL_CHAR_DETECT	ENHANCED_EN	SW_FLOW_CONTROL			

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Read returns 0. Write has no effect.	RW	0x000000
7	AUTO_CTS_EN	Auto-CTS enable bit 0x0: Normal operation 0x1: Auto-CTS flow control is enabled. Transmission is halted when the CTS* pin is high (inactive).	RW	0
6	AUTO_RTS_EN	Auto-RTS enable bit 0x0: Normal operation 0x1: Auto-RTS flow control is enabled. RTS* pin goes high (inactive) when the RX FIFO HALT trigger level, UART_TCR[3:0], is reached, and goes low (active) when the RX FIFO RESTORE transmission trigger level is reached.	RW	0
5	SPECIAL_CHAR_DETECT	0x0: Normal operation 0x1: Special character detect enable. Received data is compared with XOFF2 data. If a match occurs, the received data is transferred to the RX FIFO and the UART_IIR[4] bit is set to 1 to indicate that a special character was detected.	RW	0
4	ENHANCED_EN	Enhanced functions write enable bit 0x0: Disables writing to IER bits 4-7, UART_FCR bits 4-5, and UART_MCR bits 5-7. 0x1: Enables writing to IER bits 4-7, UART_FCR bits 4-5, and UART_MCR bits 5-7.	RW	0
3:0	SW_FLOW_CONTROL	Combinations of software flow control can be selected by programming bit 3 - bit 0. See Table 24-113.	RW	0x0

	0x4AE2 B014		UART10
Description	When the LSR is read, LSR[4:2] reflect the error bits [FL, CRC, ABORT] of the frame at the top of the STATUS FIFO (next frame status to be read).		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																								THR_EMPTY	STS_FIFO_FULL	RX_LAST_BYTE	FRAME_TOO_LONG	ABORT	CRC	STS_FIFO_E	RX_FIFO_E

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Read returns 0.	R	0x000000
7	THR_EMPTY	Read 0x0: Transmit holding register (TX FIFO) is not empty. Read 0x1: Transmit hold register (TX FIFO) is empty. The transmission is not necessarily complete.	R	1
6	STS_FIFO_FULL	Read 0x0: Status FIFO not full Read 0x1: Status FIFO full	R	0
5	RX_LAST_BYTE	Read 0x0: The RX FIFO (RHR) does not contain the last byte of the frame to be read.	R	0

Bits	Field Name	Description	Type	Reset
		Read 0x1: The RX FIFO (RHR) contains the last byte of the frame to be read. This bit is set only when the last byte of a frame is available to be read. It determines the frame boundary. It is cleared on a single read of the LSR register. See the note below.		
4	FRAME_TOO_LONG	Read 0x0: No frame-too-long error in frame Read 0x1: Frame-too-long error in the frame at the top of the STATUS FIFO, (next character to be read). This bit is set to 1 when a frame exceeding the maximum length (set by RXFLH and RXFLL registers) is received. When this error is detected, current frame reception is terminated. Reception is stopped until the next START flag is detected.	R	0
3	ABORT	Read 0x0: No abort pattern error in frame Read 0x1: Abort pattern is received. SIR and MIR: Abort pattern FIR: Illegal symbol	R	0
2	CRC	Read 0x0: No CRC error in frame Read 0x1: CRC error in the frame at the top of the STATUS FIFO (next character to be read)	R	0
1	STS_FIFO_E	Read 0x0: Status FIFO not empty Read 0x1: Status FIFO empty	R	1
0	RX_FIFO_E	Read 0x0: No data in the RX FIFO Read 0x1: At least one data character in the RX FIFO	R	1

Description	Transmission control register This register stores the RX FIFO threshold levels to start/stop transmission during hardware/software flow control. Notes: Trigger levels from 0 to 60 bytes are available with a granularity of 4. (Trigger level = 4 x [4-bit register value]) The programmer must ensure that UART_TCR[3:0] > UART_TCR[7:4] when auto-RTS or software flow control is enabled to avoid a mis-operation of the device. In FIFO interrupt mode with flow control, the programmer must ensure that the trigger level to halt transmission is greater than or equal to the RX FIFO trigger level (UART_TLR[7:4] or UART_FCR[7:6]); otherwise, FIFO operation stalls. In FIFO DMA mode with flow control, this concept does not exist because a DMA request is sent each time a byte is received.

Description	Mode definition register 1 The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on startup after configuration of the configuration registers (UART_DLL, UART_DLH, and UART_LCR). The value of MDR1[2:0] must not be changed again during normal operation. **Note:** If the module is disabled by setting the MODE_SELECT field to 111, interrupt requests can still be generated unless disabled through the interrupt enable register (UART_IER). In this case, UART mode interrupts are visible. Reading the interrupt identification register (UART_IIR) shows UART mode interrupt flags.

Table 24-169. UART_MDR2 (continued)

Description Mode definition register 2

IR-IrDA and IR-CIR modes only. UART_MDR2[0] describes the status of the interrupt in UART_IIR[5]. The IRTX_UNDERRUN bit should be read after an UART_IIR[5] TX_STATUS_IT interrupt. The bits [2:1] of this register set the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in UART_MDR1[2:0].

Note: The UART_MDR2[6] gives the flexibility to invert the RX pin in the UART to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most transceivers invert the IR receive pin.

Type RW

Description Status FIFO register high

IrDA modes only. The frame lengths of received frames are written into the status FIFO. This information can be read by reading the UART_SFREGL and UART_SFREGH registers (these registers do not physically exist). The LSBs are read from UART_SFREGL and the MSBs are read from UART_SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the UART_SFLSR register.

Type R

	0x4AE2 B034		UART10

Description Received frame length register high

IrDA modes only. The UART_RXFLL and UART_RXFLH registers hold the 12-bit receive maximum frame length. UART_RXFLL holds the LSBs and UART_RXFLH holds the MSBs. If the intended maximum receive frame length is n bytes, program the UART_RXFLL and UART_RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are the result of frame format with CRC and stop flag; 2 bytes are associated with the FIR stop flag).

Type W

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Description BOF control register

IrDA modes only. The UART_BLR[6] bit selects whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR mode. If only one start flag is required, this is always 0xC0. If n start flags are required, (-1) 0xC0 or (-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).

Type RW

Description	UART autobauding status register UART autobauding mode only. This status register returns the speed, the number of bits by characters, and the type of the parity in UART autobauding mode. In autobauding mode, the input frequency of the UART modem must be fixed to 48 MHz. Any other module clock frequency results in incorrect baud rate recognition. **Note:** When the UART is in autobauding mode, this register, instead of the UART_LCR, UART_DLL, and UART_DLH registers, is used to set up transmission according to the characteristics of the previous reception. To reset the autobauding hardware (to start a new AT detection), set UART_MDR1[2:0] to 111 (reset value), then set UART_MDR1[2:1] to 010 (UART in autobaud mode). To set the UART to standard mode (no autobaud), set UART_MDR1[2:1] to 000.

Description	Auxiliary control register. IR-IrDA and IR-CIR modes only.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																								PULSE_TYPE	SD_MOD	DIS_IR_RX	DIS_TX_UNDERRUN	SEND_SIP	SCTX_EN	ABORT_EN	EOT_EN

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Read returns 0. Write has no effect.	RW	0x000000
7	PULSE_TYPE	SIR pulse width select	RW	0
		0x0: 3/16 of baud-rate pulse width		
		0x1: 1.6 µs		
6	SD_MOD	Primary output used to configure transceivers. Connected to the SD/MODE input pin of IrDA transceivers.	RW	0
		0x0: SD pin is set to high.		
		0x1: SD pin is set to low.		
5	DIS_IR_RX	0x0: Normal operation (RX input automatically disabled during transmit but enabled outside of transmit operation)	RW	0
		0x1: Disables RX input (permanent state - independent of transmit)		
4	DIS_TX_UNDERRUN	It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting UART_ACREG[4] = 1, garbage data is sent over TX line.	RW	0
		0x0: Long stop-bits cannot be transmitted; TX underrun is enabled.		
		0x1: Long stop-bits can be transmitted; TX underrun is disabled.		

Bits	Field Name	Description	Type	Reset
3	SEND_SIP	MIR/FIR modes only. Send serial infrared interaction pulse (SIP). If this bit is set during an MIR/FIR transmission, the SIP is sent at the end of it. This bit is cleared automatically at the end of the SIP transmission. 0x0: No action 0x1: Send SIP pulse.	RW	0
2	SCTX_EN	Store and controlled TX start. When UART_MDR1[5] = 1 and the LH writes 1 to this bit, the TX state-machine starts frame transmission. This bit is self-clearing.	RW	0
1	ABORT_EN	Frame abort. The LH can intentionally abort transmission of a frame by writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame. If TX FIFO is not empty and UART_MDR1[5] = 1, UART IrDA starts a new transfer with data of the previous frame when the abort frame is sent. Therefore, TX FIFO must be reset before sending an abort frame.	RW	0
0	EOT_EN	EOT (end of transmission) bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit is cleared automatically when the LH writes to the THR (TX FIFO).	RW	0

Description	BOF length register IR-IrDA and IR-CIR modes only. In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must account for the BOF character; therefore, to send only one BOF with no XBOF, this register must be set to 1. To send one BOF with N XBOF, this register must be set to N + 1. The value 0 sends 1 BOF plus 255 XBOF. In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags). In IR-CIR mode, this register specifies the number of consecutive 0s to be received before generating the RX_STOP interrupt (UART_IIR[2]). All received 0s are stored in the RX FIFO. When the register is set to 0, this feature is deactivated and always in reception state, which can be disabled by setting the UART_ACREG[5] to 1. **Note:** If the RX_STOP interrupt occurs before a byte boundary, the remaining bits of the last byte are filled with 0s and passed into the RX FIFO.

Description System configuration register

The AUTOIDLE bit controls a power-saving technique to reduce the logic power consumption of the open-core protocol (OCP) interface. When the feature is enabled, the clock is gated off until an OCP command for this device is detected. When the software reset bit is set high, it causes a full device reset.

Description Wake-up enable register

The UART wake-up enable register is used to mask and unmask a UART event that would subsequently notify the system. An event is any activity in the logic that could cause an interrupt and/or an activity that would require the system to wake up. Even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, the UART registers the interrupt.

	0x4AE2 B060		UART10
Description	Carrier frequency prescaler Because the consumer IR works at modulation rates of 30 to 56.8 kHz, the 48-MHz clock must be prescaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote-control requirements in baud multiples of 12x. The value of the CFPS at reset is 0105 decimal, which equals 38.1 kHz output from starting conditions. The 48-MHz carrier is prescaled by the CFPS, which is then divided by the 12x baud multiple.

24.4 Multichannel Serial Peripheral Interface

This section describes the four Multichannel Serial Peripheral Interface (McSPI) modules for the device.

24.4.1 McSPI Overview

The SPI is a master/slave synchronous serial bus. There are four separate McSPI modules (McSPI1, McSPI2, McSPI3, and McSPI4) in the device (see Figure 24-72). All these four modules support up to four external devices (four chip selects) and are able to work as both master and slave.

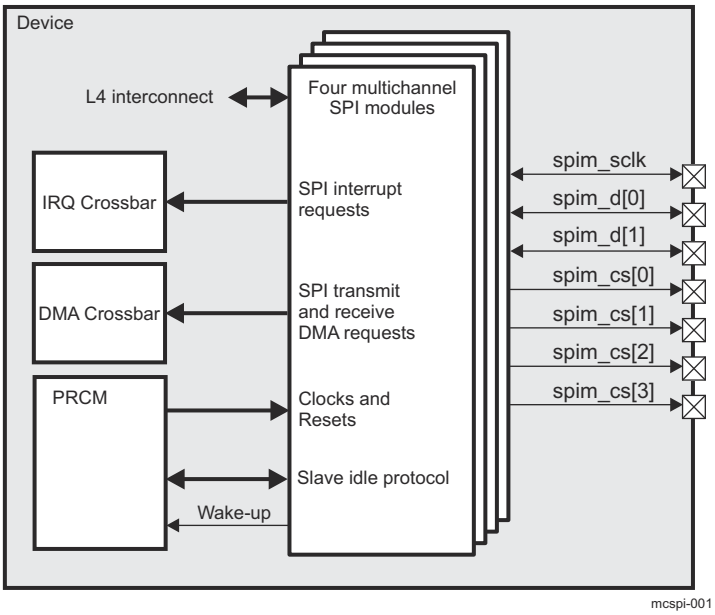

Figure 24-72. Multichannel SPI Modules

The McSPI modules include the following main features:

- Serial clock with programmable frequency, polarity, and phase for each channel
- Wide selection of SPI word lengths, ranging from 4 to 32 bits
- Up to four master channels, or single channel in slave mode
- Master multichannel mode:
  - Full duplex/half duplex
  - Transmit-only/receive-only/transmit-and-receive modes
  - Flexible input/output (I/O) port controls per channel
  - Programmable clock granularity
  - SPI configuration per channel. This means, clock definition, polarity enabling and word width
- Single interrupt line for multiple interrupt source events
- Power management through wake-up capabilities
- Enable the addition of a programmable start-bit for SPI transfer per channel (start-bit mode)
- Supports start-bit write command
- Supports start-bit pause and break sequence
- Programmable timing control between chip select and external clock generation
- Built-in FIFO available for a single channel

24.4.2 McSPI Environment

24.4.2.1 Basic McSPI Pins for Master Mode

Figure 24-73 shows all of the McSPI interface signals in master mode.

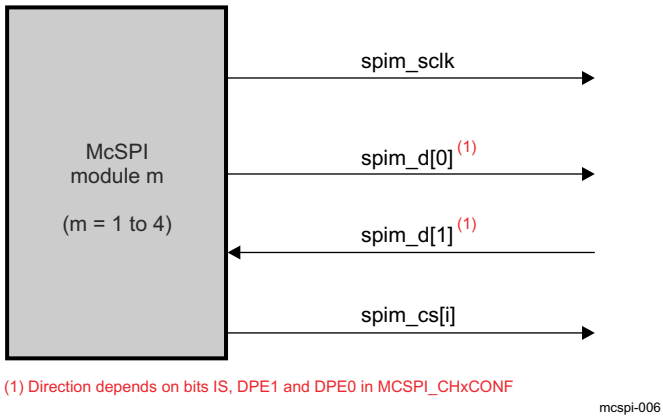

Figure 24-73. McSPI Interface Signals in Master Mode

Table 24-196 describes the McSPI I/O in master mode.

Table 24-196. McSPI I/O Description (Master Mode)

Device-Level Signal Name	Module Signal Name	I/O(1)	Description
spim_sclk	SPICLK	O	SPIm module serial clock output
spim_d[0]	SPIDAT[0]	O(2)	SPI Data I/O. Can be configured either as input or as output depending on MCSPI_CHxCONF[18] IS and MCSPI_CHxCONF[16] DPE0.
spim_d[1]	SPIDAT[1]	I(2)	SPI Data I/O. Can be configured either as input or as output depending on MCSPI_CHxCONF[18] IS and MCSPI_CHxCONF[17] DPE1.
spim_cs[i]	SPIEN[x]	O	SPIm module chip-select i output

(1) I = Input; O = Output
(2) Example configuration only.

Note

For the spim_sclk signals to work properly, the INPUTENABLE bit of the appropriate CTRL_CORE_PAD_x registers should be set to 0x1 because of retiming purposes.

24.4.2.2 Basic McSPI Pins for Slave Mode

Figure 24-74 shows all of the McSPI interface signals in slave mode.

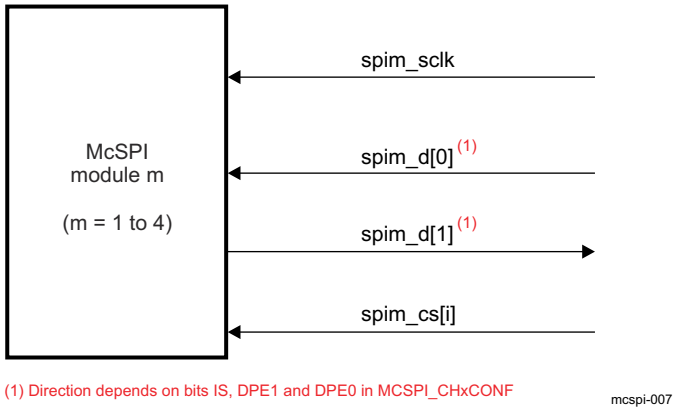

Figure 24-74. McSPI Interface Signals in Slave Mode

Table 24-197 describes the McSPI I/O in slave mode.

Table 24-197. McSPI I/O Description (Slave Mode)

Device-Level Signal Name	Module Signal Name	I/O(1)	Description
spim_sclk	SPICLK	I	McSPIm module serial clock input
spim_d[0]	SPIDAT[0]	I(2)	SPI Data I/O. Can be configured either as input or as output depending on MCSPI_CHxCONF[18] IS and MCSPI_CHxCONF[16] DPE0.
spim_d[1]	SPIDAT[1]	O(2)	SPI Data I/O. Can be configured either as input or as output depending on MCSPI_CHxCONF[18] IS and MCSPI_CHxCONF[17] DPE1.
spim_cs[i]	SPIEN[x]	I	McSPIm module chip-select i input. Can be selected through MCSPI_CH0CONF[22:21] SPIENSLV bit field

(1) I = Input; O = Output
(2) Example configuration only.

24.4.2.3 Multichannel SPI Protocol and Data Format

The synchronous SPI protocol allows a master device to initiate serial data transfers to a slave device. A slave select line (SPIEN[x]) allows selection of an individual slave SPI device. Slave devices that are not selected do not interfere with SPI bus activities.

McSPI offers the flexibility to modify the following parameters to adapt to the device features:

- Word length

  McSPI supports any SPI word ranging from 4 bits to 32 bits long (the MCSPI_CHxCONF[11:7] WL bit field).

  SPI word length can be changed between transmissions to allow the master device to communicate with peripheral slaves that have different requirements.
- SPI enable (SPIEN[x], for channel x of instance m)

  The polarity of the SPI enable signals is programmable (the MCSPI_CHxCONF[6] EPOL bit). SPIEN[x] signals can be active high or low.

  Assertion of the SPIEN[x] signals is programmable and can be done manually or automatically. The manual assertion mode is available in single master mode only. SPIEN[x] can be kept active between words with the MCSPI_CHxCONF[20] FORCE bit.

  Two consecutive words for two different slave devices can go along with active SPIEN[x] signals with different polarity.
- Programmable start-bit

In start-bit mode a start-bit is added before the SPI word length to indicate how the next SPI word must be handled. The start-bit is enabled by setting the MCSPI_CHxCONF[23] SBE bit to 1. The MCSPI_CHxCONF[24] SBPOL bit defines the polarity of the start-bit.

- Programmable SPI clock
  - Bit rate

    In master mode, the baud rate of the SPI serial clock is programmable using the 48-MHz reference clock (from the power, reset, and clock managment [PRCM] module). Table 24-198 lists the SPICLK bit rates obtained for data transfer when programming the clock divider (the MCSPI_CHxCONF[5:2] CLKD bit field).

Table 24-198. SPI Master Clock Rates

Divider	Clock Rate
1	48 MHz(1)
2	24 MHz(1)
4	12 MHz
8	6 MHz
16	3 MHz
32	1.5 MHz
64	750 kHz
128	375 kHz
256	~187 kHz
512	~93.7 kHz
1024	~46.8 kHz
2048	~23.4 kHz
4096	~11.7 kHz

(1) These frequencies are not necessarily supported by all SPI modules. For more information, see the *Timing Requirements and Switching Characteristics* chapter in the device data manual.

  - Polarity and phase

    The polarity (the MCSPI_CHxCONF[1] POL bit) and the phase (the MCSPI_CHxCONF[0] PHA bit) of the SPI serial clock (SPICLK) are configurable to offer four combinations. Software selects the right combination, depending on the device. See Table 24-199 and Figure 24-75.

Table 24-199. Phase and Polarity Combinations

Polarity (POL)	Phase (PHA)	SPI Mode	Description
0	0	Mode 0	SPICLK is inactive low and sampling occurs at the rising edge.
0	1	Mode 1	SPICLK is inactive low and sampling occurs at the falling edge.
1	0	Mode 2	SPICLK is inactive high and sampling occurs at the falling edge.
1	1	Mode 3	SPICLK is inactive high and sampling occurs at the rising edge.

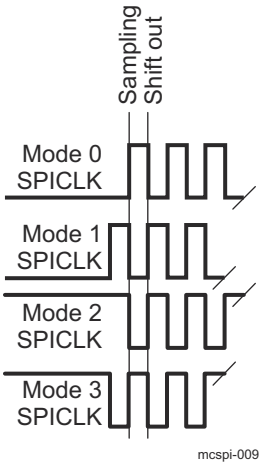

Figure 24-75. Phase and Polarity Combinations

24.4.2.3.1 Transfer Format

In master and slave modes, the McSPI drives the data lines when SPIEN[x] is asserted.

Each word is transmitted starting with the most-significant bit (MSB).

This section explains the two cases of data transmission determined by the clock phase (PHA) and the type of data transmission using a start-bit (SBE) called the start-bit mode:

- Transmission in mode 0 and mode 2 (PHA = 0)

  When PHA = 0, the first bit of the SPI word to transmit (on the master or the slave data output pin) is valid one-half cycle of SPICLK after the assertion of SPIEN.

  Therefore, the first edge of the SPICLK line is used by the master to sample the first data bit sent by the slave. On the same edge, the first data bit sent by the master is sampled by the slave.

  On the next SPICLK edge, the received data bit is shifted into the receive shift register and a new data bit is transmitted on the serial data line.

  This process continues for a number of pulses on the SPICLK line defined by the SPI word length programmed in the master device, with data being latched on odd-numbered edges and shifted on even-numbered edges. See Figure 24-76.

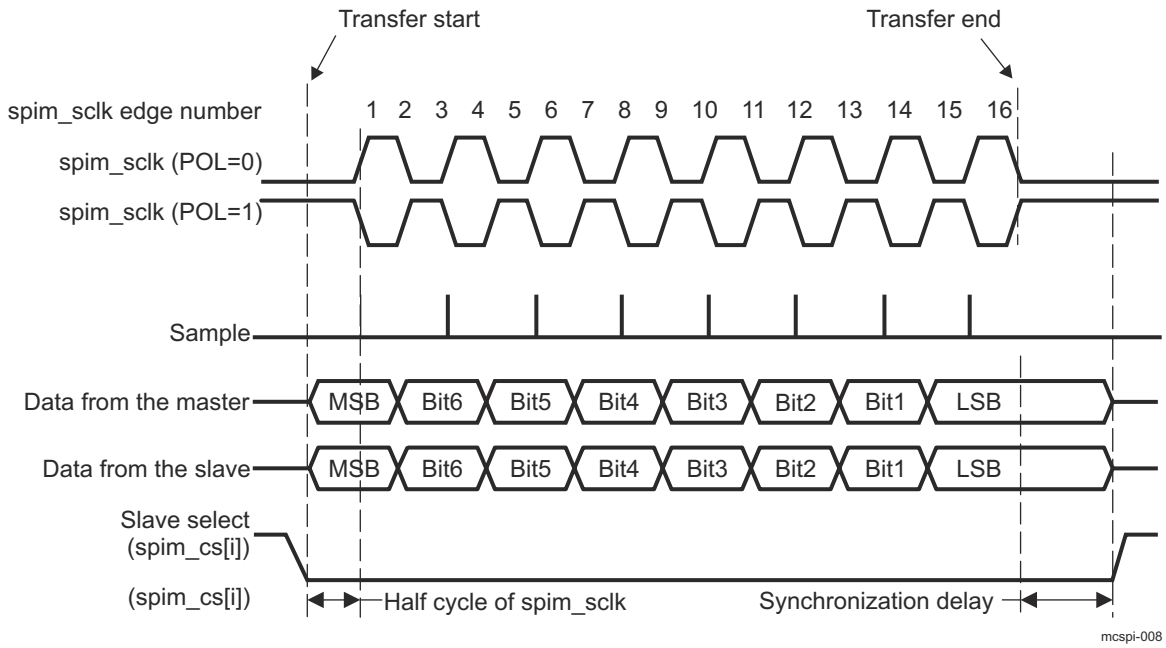

Figure 24-76. Full-Duplex Transfer Format With PHA = 0

- Transmission in mode 1 and mode 3 (PHA = 1)

  When PHA = 1, the first bit of the SPI word to transmit (on the master or the slave data output pin) is valid on the following SPICLK edge (one-half cycle later). This is the sampling edge for the master and slave. A synchronization delay is added between the activation of SPIEN[x] and the first SPICLK edge.

  The received data bit is shifted into the shift register on the third SPICLK edge.

  This process continues for a number of pulses on the SPICLK line defined by the SPI word length programmed in the master device, with data being latched on even-numbered edges and shifted on odd-numbered edges.

  Note

  The minimum synchronization delay is one cycle of SPICLK, if the frequency of SPICLK equals the frequency of SPIm_FCLK (McSPIm functional clock) in master mode. The minimum synchronization delay is one-half cycle of SPICLK, if the frequency of SPICLK is lower than the frequency of SPIm_FCLK in the master and slave modes.

- Transmission with a start-bit (SBE = 1)

  When the MCSPI_CHxCONF[23] SBE bit is set to 1, a start-bit is added before the MSB to indicate whether the next SPI word must be handled as a command or as data.

  Figure 24-77 shows an example of a data transfer with an extra start-bit.

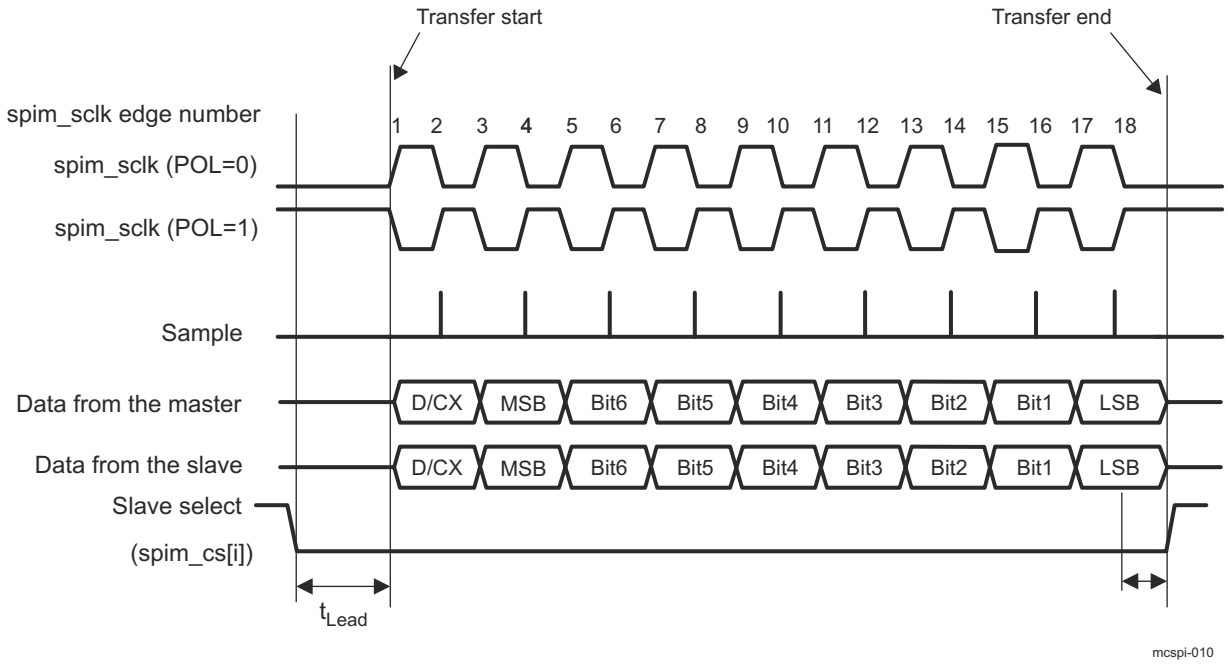

Figure 24-77. Extended SPI Transfer With a Start-Bit (SBE = 1)

24.4.2.4 SPI in Master Mode

Figure 24-78 shows a case in master mode (full-duplex) where the McSPI module is connected with two slave devices.

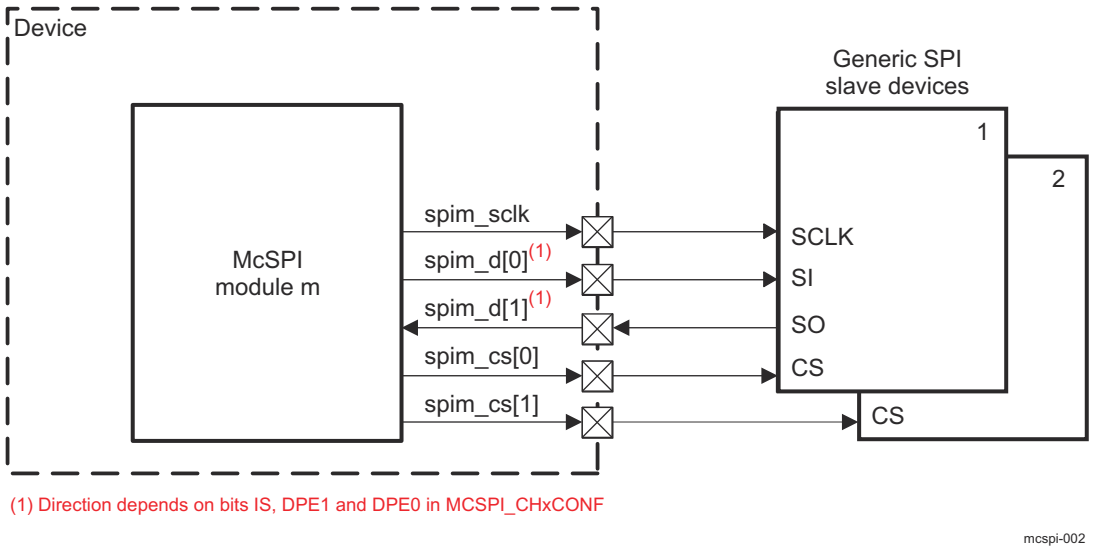

Figure 24-78. McSPI Master Mode (Full Duplex)

Figure 24-79 shows the master single mode, which can also be configured in receive-only mode.

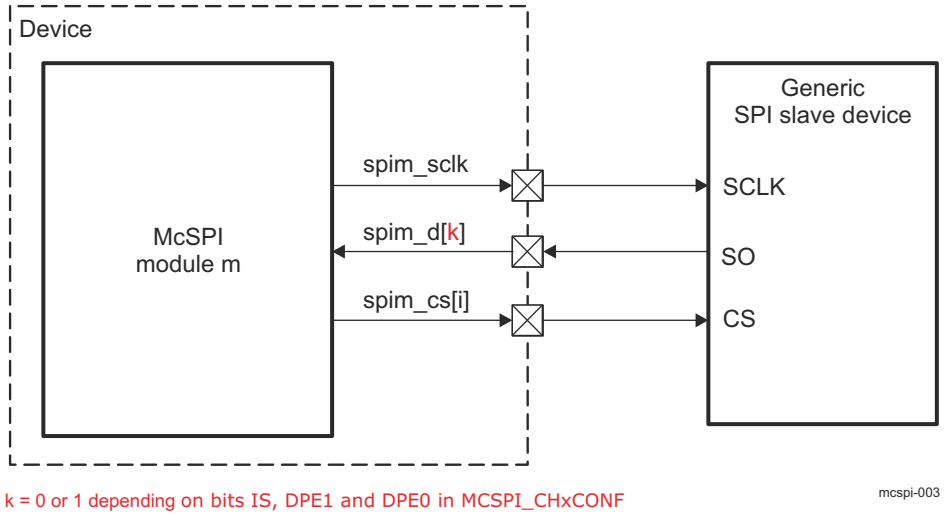

Figure 24-79. McSPI Master Single Mode (Receive Only)

24.4.2.5 SPI in Slave Mode

Figure 24-80 shows a case in slave mode (full-duplex).

Note

Only channel 0 can be configured as slave, but the chip-enable signal can be connected to any SPIEN[x] pin and then rerouted internally to channel 0 (the MCSPI_CHxCONF[22:21] SPIENSLV bit field [where x = 0]). For more information, see Section 24.4.4.4, *Slave Mode*.

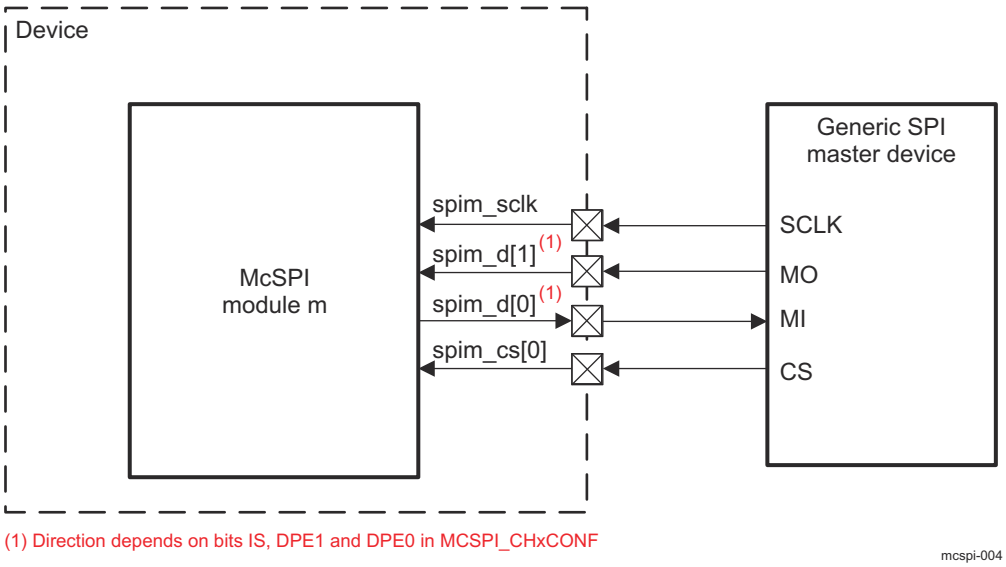

Figure 24-80. McSPI Slave Mode (Full Duplex)

Figure 24-81 shows the slave single mode, which can also be configured in transmit-only mode.

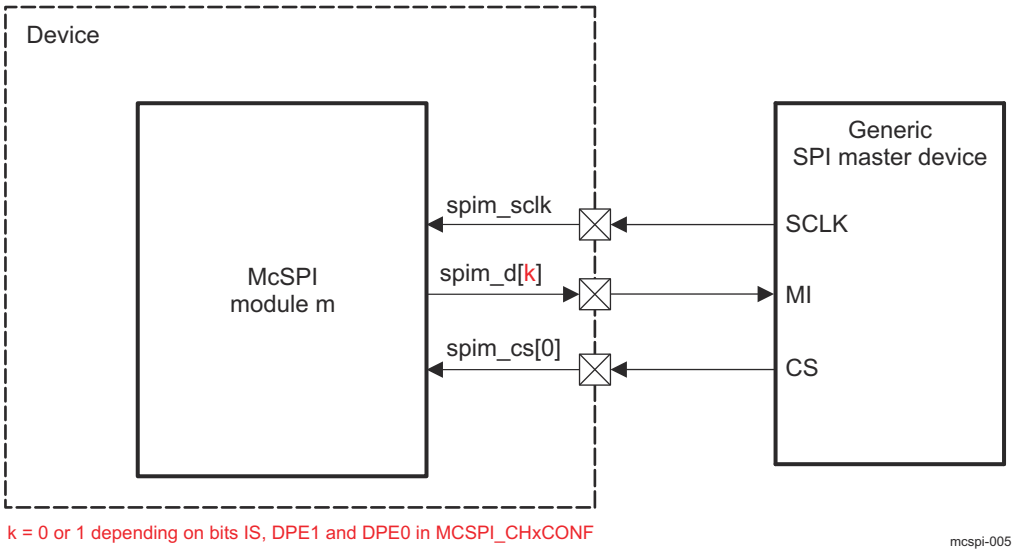

Figure 24-81. McSPI Slave Single Mode (Transmit Only)

24.4.3 McSPI Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 24-82 shows McSPI integration.

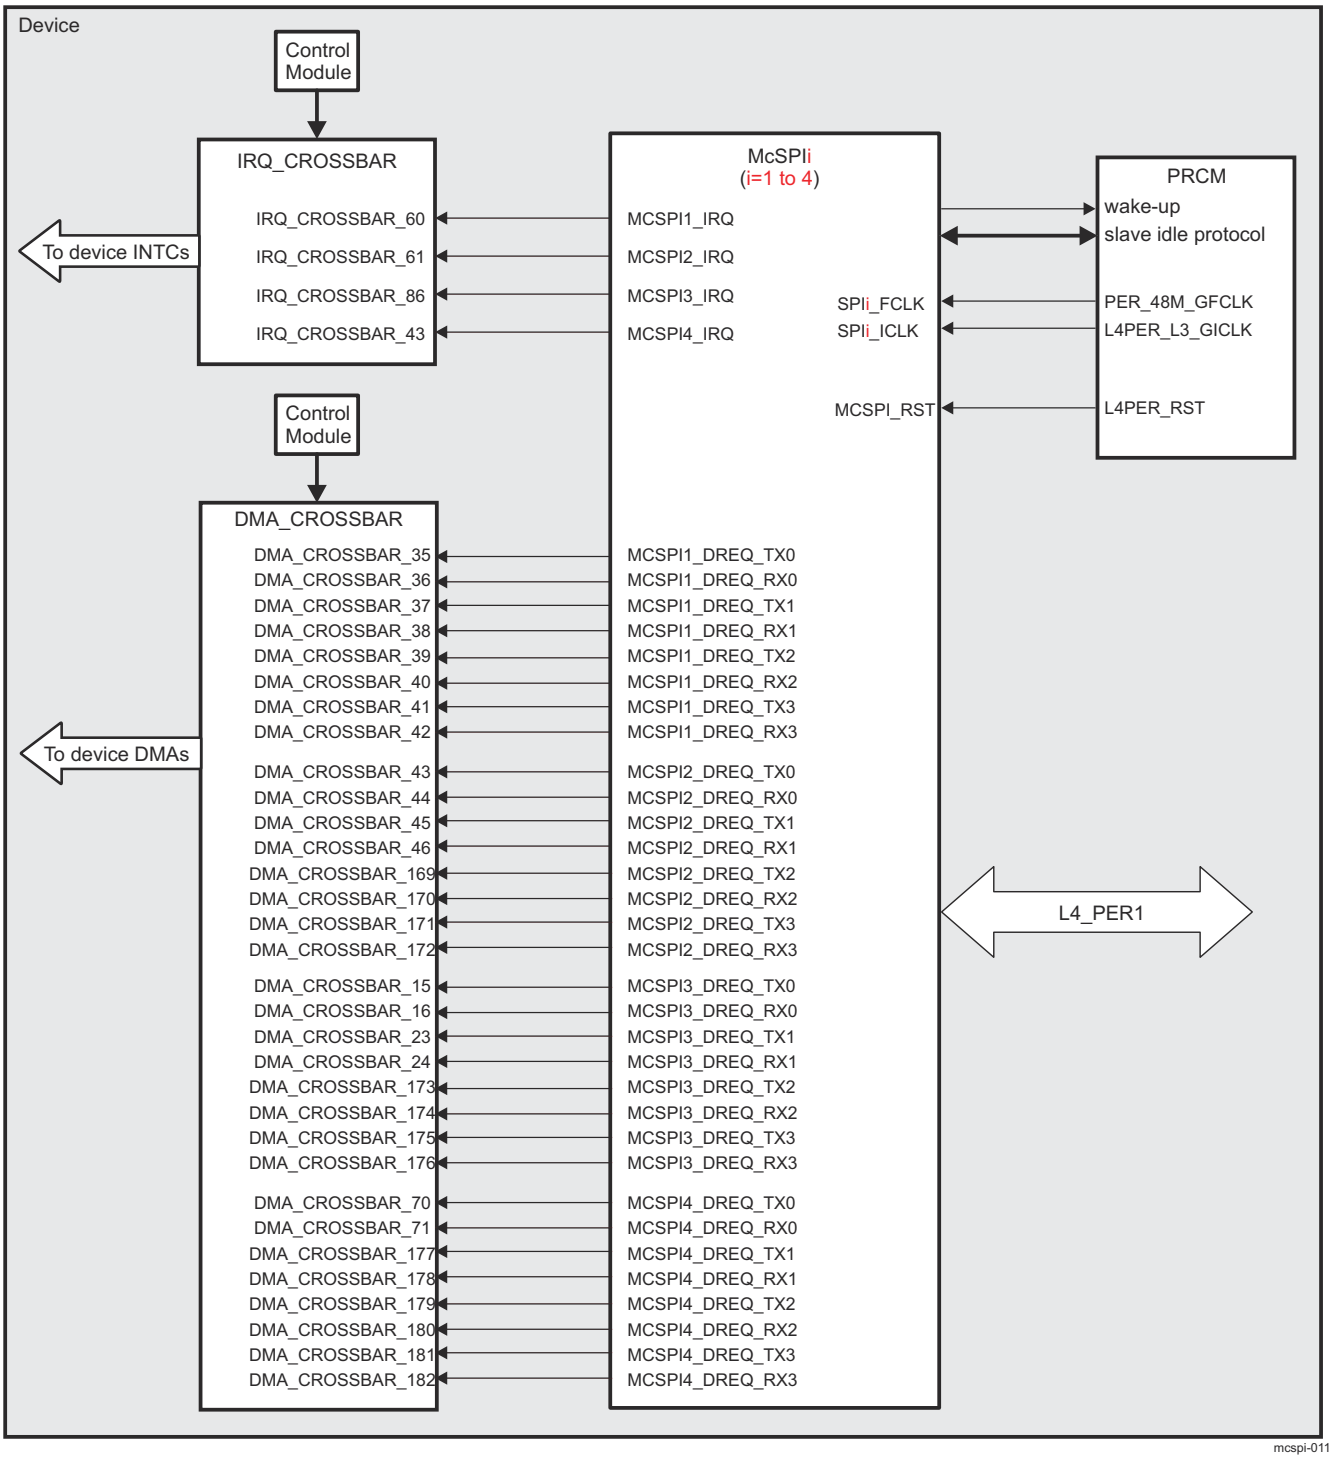

Figure 24-82. McSPI Integration

Table 24-200 through Table 24-202 summarize the integration of the module in the device.

	MCSPI2_DREQ_RX0	DMA_CROSSBAR_44	DMA_SYSTEM_DREQ_43 DMA_EDMA_DREQ_43	McSPI module 2 - receive request channel 0
	MCSPI2_DREQ_TX1	DMA_CROSSBAR_45	DMA_SYSTEM_DREQ_44 DMA_EDMA_DREQ_44	McSPI module 2 - transmit request channel 1
	MCSPI2_DREQ_RX1	DMA_CROSSBAR_46	DMA_SYSTEM_DREQ_45 DMA_EDMA_DREQ_45	McSPI module 2 - receive request channel 1
	MCSPI2_DREQ_TX2	DMA_CROSSBAR_169	-	McSPI module 2 - transmit request channel 2
	MCSPI2_DREQ_RX2	DMA_CROSSBAR_170	-	McSPI module 2 - receive request channel 2.
	MCSPI2_DREQ_TX3	DMA_CROSSBAR_171	-	McSPI module 2 - transmit request channel 3
	MCSPI2_DREQ_RX3	DMA_CROSSBAR_172	-	McSPI module 2 - receive request channel 3. This DREQ source signal is not mapped by default to any device DMA controller.
McSPI3	MCSPI3_DREQ_TX0	DMA_CROSSBAR_15	DMA_SYSTEM_DREQ_14 DMA_EDMA_DREQ_14	McSPI module 3 - transmit request channel 0
	MCSPI3_DREQ_RX0	DMA_CROSSBAR_16	DMA_SYSTEM_DREQ_15 DMA_EDMA_DREQ_15	McSPI module 3 - receive request channel 0
	MCSPI3_DREQ_TX1	DMA_CROSSBAR_23	DMA_SYSTEM_DREQ_22 DMA_EDMA_DREQ_22	McSPI module 3 - transmit request channel 1
	MCSPI3_DREQ_RX1	DMA_CROSSBAR_24	DMA_SYSTEM_DREQ_23 DMA_EDMA_DREQ_23	McSPI module 3 - receive request channel 1
	MCSPI3_DREQ_TX2	DMA_CROSSBAR_173	-	McSPI module 3 - transmit request channel 2
	MCSPI3_DREQ_RX2	DMA_CROSSBAR_174	-	McSPI module 3 - receive request channel 2
	MCSPI3_DREQ_TX3	DMA_CROSSBAR_175	-	McSPI module 3 - transmit request channel 3
	MCSPI3_DREQ_RX3	DMA_CROSSBAR_176	-	McSPI module 3 - receive request channel 3

Table 24-202. McSPI Hardware Requests (continued)

McSPI4	MCSPI4_DREQ_TX0	DMA_CROSSBAR_70	DMA_SYSTEM_DREQ_69	McSPI module 4 - transmit request channel 0
	MCSPI4_DREQ_RX0	DMA_CROSSBAR_71	DMA_SYSTEM_DREQ_70	McSPI module 4 - receive request channel 0
	MCSPI4_DREQ_TX1	DMA_CROSSBAR_177	-	McSPI module 4 - transmit request channel 1
	MCSPI4_DREQ_RX1	DMA_CROSSBAR_178	-	McSPI module 4 - receive request channel 1.
	MCSPI4_DREQ_TX2	DMA_CROSSBAR_179	-	McSPI module 4 - transmit request channel 2.
	MCSPI4_DREQ_RX2	DMA_CROSSBAR_180	-	McSPI module 4 - receive request channel 2.
	MCSPI4_DREQ_TX3	DMA_CROSSBAR_181	-	McSPI module 4 - transmit request channel 3
	MCSPI4_DREQ_RX3	DMA_CROSSBAR_182	-	McSPI module 4 - receive request channel 3

Note

The Default Mapping column in Table 24-202 *McSPI Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.

Note

For more information about the device interrupt controllers, see *Interrupt Controllers*.
For more information about the device DMA_SYSTEM module, see *System DMA*.
For more information about the device EDMA module, see *Enhanced DMA*.

24.4.4 McSPI Functional Description

24.4.4.1 McSPI Block Diagram

Figure 24-83 shows the McSPI module.

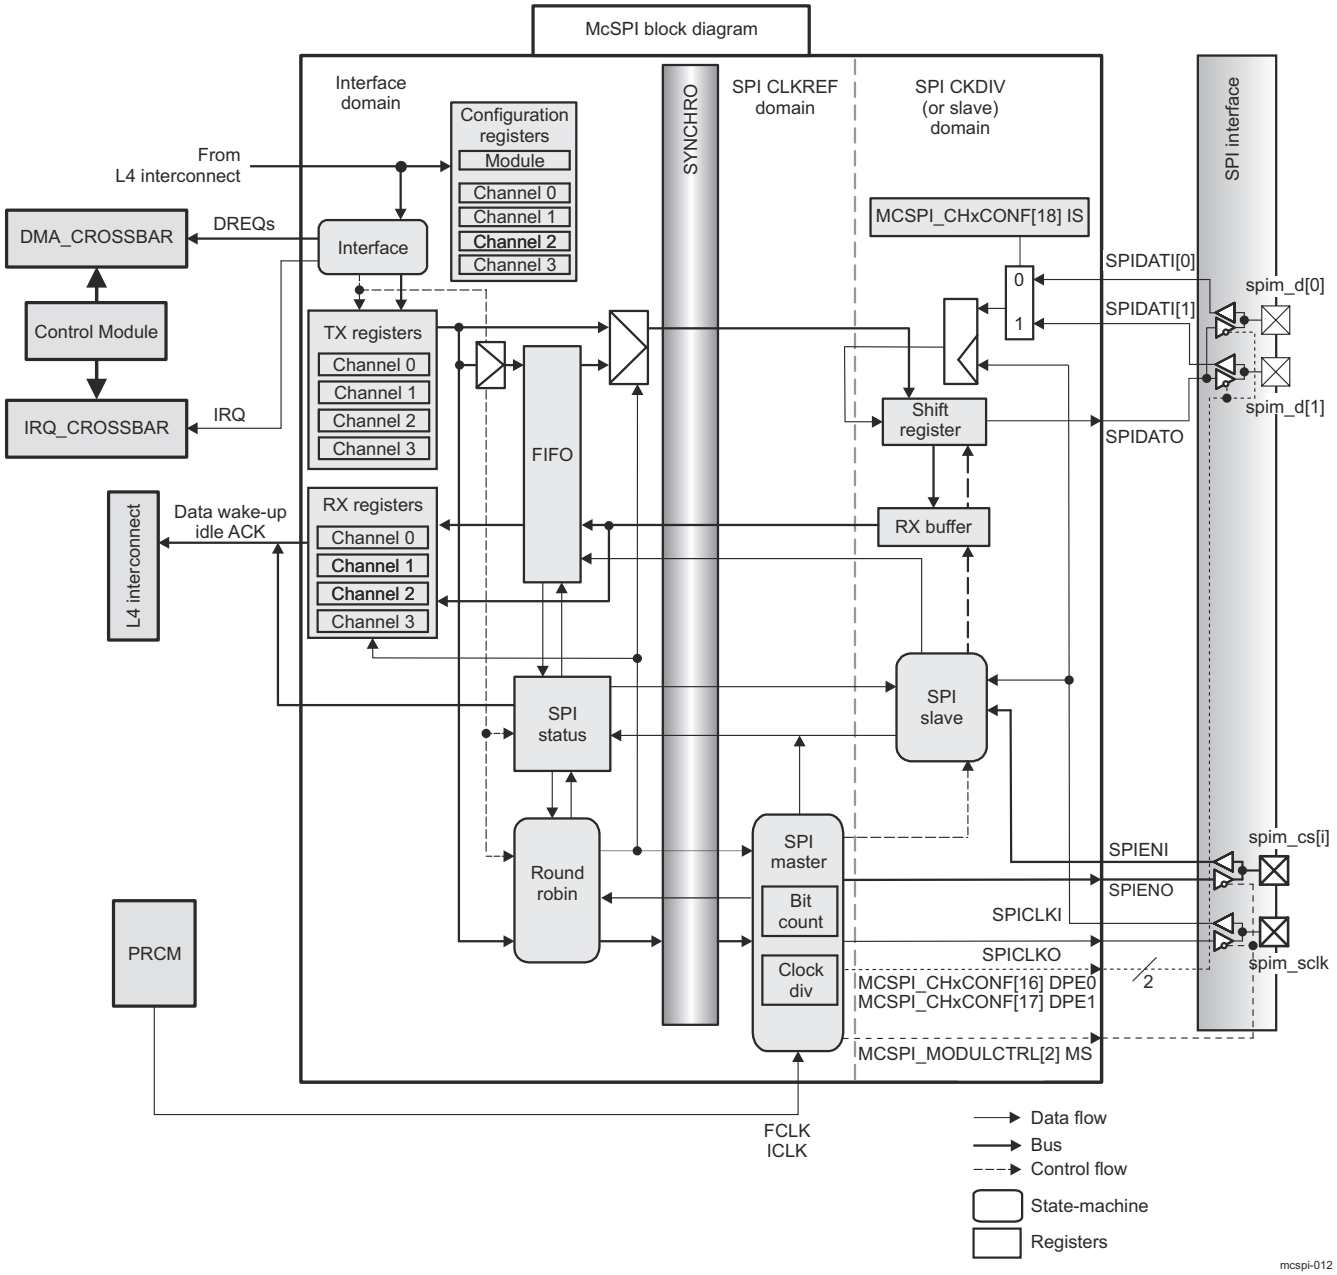

Figure 24-83. McSPI Block Diagram

24.4.4.2 Reset

The McSPI module can be reset either by hardware or by software reset. All configuration registers and all state machines are reset by the hardware reset signal (MCSPI_RST). McSPI can be reset by software through the MCSPI_SYSCONFIG[1] SOFTRESET bit. This bit has the same impact on the module as the hardware reset signal. The only exception is that the MCSPI_SYSCONFIG register is not affected by that software reset.

24.4.4.3 Master Mode

24.4.4.3.1 Master Mode Features

The McSPI master mode supports multichannel communication with up to four independent SPI communication channel contexts. The McSPI initiates a data transfer on the data lines (SPIDAT[0] and SPIDAT[1]) and generates clock (SPICLK) and control (SPIEN) signals.

Connected to multiple external devices, the McSPI exchanges data with one SPI device at a time through two main modes (available in slave mode):

- Two-data-pins interface mode (transmit-and-receive mode for full-duplex transmission)
- Single-data-pin interface mode (recommended for half-duplex transmission)

Note

There is a fixed chip select line allocation in multichannel master mode. Channel x SPIEN[x] is mapped to spim_cs[i] pin.

Two DMA request events (read and write) allow synchronized accesses of the DMA controller with the activity of McSPI.

Three interrupt events can be used for data transmission and reception in master mode (for more information about interrupts, see Section 24.4.4.7.1, *Interrupt Events in Master Mode*).

24.4.4.3.2 Master Transmit-and-Receive Mode (Full Duplex)

In full-duplex transmission, data is transmitted (shifted out serially on SPIDAT[0]) and received (shifted in serially on SPIDAT[1]) simultaneously on separate data lines.

The master transmit-and-receive mode is programmable per channel (the MCSPI_CHxCONF[13:12] TRM bit field).

Channel access to the shift registers for transmission/reception is based on the MCSPI_TXx transmitter register state, the MCSPI_RXx receiver register state, and round-robin arbitration.

Channels that meet the following rules are included in the round-robin list of active channels scheduled for transmission and/or reception. The arbiter skips channels that do not meet the rules and searches in the rotation for the next enabled channel.

- **Rule 1:** Only enabled channels (the MCSPI_CHxCTRL[0] EN bit) can be scheduled for transmission and/or reception.
- **Rule 2:** If its MCSPI_TXx transmitter register is not empty (the MCSPI_CHxSTAT[1] TXS bit), an enabled channel can be scheduled when the shift register is assigned. If the MCSPI_TXx register is empty when the shift register is assigned, the TXx_UNDERFLOW event is activated, and the next enabled channel with new data to transmit is scheduled (see also transmit-only mode).
- **Rule 3:** An enabled channel can be scheduled if its receive register is not full (the MCSPI_CHxSTAT[0] RXS bit) when the shift register is assigned (see also receive-only mode). Therefore, the MCSPI_RXx register cannot be overwritten. The SPI1.MCSPI_IRQSTATUS[3] RX0_OVERFLOW bit is never set to this mode.

When SPI word transfer completes (the MCSPI_CHxSTAT[2] EOT bit is set), the updated MCSPI_TXx register of the next scheduled channel is loaded into the shift register. The serialization (transmit-and-receive) starts depending on the channel communication configuration. When serialization completes, the received data transfers to the channel receive register.

The serial clock (SPICLK) synchronizes shifting and sampling of the information on the two serial data lines (SPIDAT[0] and SPIDAT[1]). Each time a bit transfers out from the master, 1 bit transfers in from the slave.

Figure 24-84 shows an example of a full-duplex system with a master device (McSPI module *m*) on the left and a slave device on the right. After eight cycles of the serial clock SPICLK, WordA transfers from the master to the slave. At the same time, WordB transfers from the slave to the master.

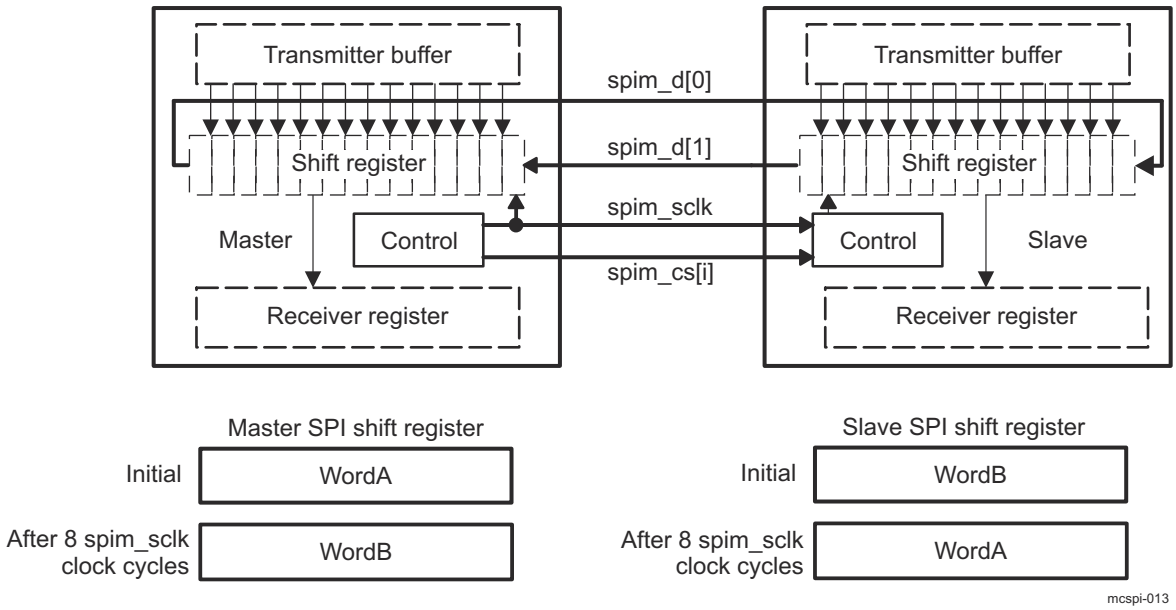

Figure 24-84. SPI Full-Duplex Transmission (Example)

24.4.4.3.3 Master Transmit-Only Mode (Half Duplex)

The master transmit-only mode prevents the microprocessor unit (MPU) from reading the MCSPI_RXx register (minimizing data movement) when only transmission is meaningful.

The master transmit-only mode is programmable per channel (the MCSPI_CHxCONF[13:12] TRM bit field). Transmission starts only after data is loaded into the MCSPI_TXx register.

Rule 1 and Rule 2, defined in Section 24.4.4.3.2, apply in this mode.

Rule 3, defined in Section 24.4.4.3.2, does not apply.

In master transmit-only mode, the MCSPI_RXx register state FULL does not prevent transmission and the MCSPI_RXx register is always overwritten with the new SPI word. This event is not significant when only transmission is meaningful. Thus, the RX0_OVERFLOW bit in the MCSPI_IRQSTATUS register is never set in this mode.

The hardware automatically disables the RX_FULL interrupt and the DMA read requests.

The transfer status is given by the MCSPI_CHxSTAT[2] EOT bit.

24.4.4.3.4 Master Receive-Only Mode (Half Duplex)

The master receive mode prevents the MPU from refilling the MCSPI_TXx register (minimizing data movement) when only reception is meaningful.

The master receive mode is programmable per channel (the MCSPI_CHxCONF[13:12] TRM bit field).

The master receive-only mode enables channel scheduling only on the empty state of the MCSPI_RXx register.

Rule 1 and Rule 3, defined in Section 24.4.4.3.2, apply in this mode.

Rule 2, defined in Section 24.4.4.3.2, does not apply.

In the master receive-only mode, software must write dummy data to the MCSPI_TXx register. Only one dummy write is enough to receive any number of words from the slave. Software must ensure that the MCSPI_TXx register is always full (the TXx_EMPTY bits of MCSPI_IRQSTATUS) when receiving. The content of the MCSPI_TXx register is always loaded into the shift register when the shift register is assigned. After writing the dummy data to the MCSPI_TXx register, the TXx_EMPTY and TXx_UNDERFLOW bits in the MCSPI_IRQSTATUS register are never set in receive-only mode.

The MCSPI_CHxSTAT[2] EOT bit gives the status of serialization. The RXx_FULL bits of the MCSPI_IRQSTATUS register are set when received data is loaded from the shift register to the corresponding MCSPI_RXx register. The MCSPI_IRQSTATUS[3] RX0_OVERFLOW bit is never set in this mode.

24.4.4.3.5 Single-Channel Master Mode

When the McSPI is configured as a master device with a single enabled channel (MCSPI_MODULCTRL[2] MS = 0 and MCSPI_MODULCTRL[0] SINGLE = 1), the assertion of the SPIEN[x] signal is optional depending on device connected to the controller. In 3-pin mode (MCSPI_MODULCTRL[1] PIN34 = 1) the controller starts transmitting data when a write to the MCSPI_TXx register or the FIFO is performed. In 4-pin mode (MCSPI_MODULCTRL[1] PIN34 = 0) the assertion and de-assertion of SPIEN[x] is controlled by software using the MCSPI_CHxCONF[20] FORCE bit.

24.4.4.3.5.1 Programming Tips When Switching to Another Channel

When a single channel is enabled and data transfer is ongoing:

- Wait for the SPI word transfer to complete (wait until the MCSPI_CHxSTAT[2] EOT bit is set to 1) before disabling the current channel and enabling a different channel.
- Disable the current channel, and then enable the other channel.

24.4.4.3.5.2 Force SPIEN[x] Mode

Continuous transfers are allowed manually by keeping the SPIEN[x] signal active for successive SPI words transfer. Several sequences (configuration/enable/disable of the channel) can be run without deactivating the SPIEN[x] line. This mode is supported by all channels and any master sequence can be used (transmit-receive, transmit-only, receive-only).

Keeping the SPIEN[x] active mode is supported when:

- A single channel is used (with the MCSPI_MODULCTRL[0] SINGLE bit set to 1).
- Transfer parameters are loaded in the configuration register of the appropriate channel (MCSPI_CHxCONF).

  The state of the SPIEN[x] signal is programmable:
  - Writing 1 to the MCSPI_CHxCONF[20] FORCE bit drives the SPIEN[x] line high when the MCSPI_CHxCONF[6] EPOL bit is set to 0. SPIEN[x] is driven low when the MCSPI_CHxCONF[6] EPOL bit is set to 1.
  - Writing 0 to the MCSPI_CHxCONF[20] FORCE bit drives the SPIEN[x] line low when the MCSPI_CHxCONF[6] EPOL bit is set to 0. SPIEN[x] is driven high when the MCSPI_CHxCONF[6] EPOL bit is set to 1.
- A single channel is enabled (the MCSPI_CHxCTRL[0] EN bit is set to 1). The first enabled channel activates the SPIEN[x] line.

When the channel is enabled, the SPIEN[x] signal activates with the programmed polarity. As in the multichannel master mode, the transfer start depends on the status of the MCSPI_TXx register (the MCSPI_CHxSTAT[1] TXS bit), the status of the MCSPI_RXx register (the MCSPI_CHxSTAT[1] RXS bit), and the defined mode (the MCSPI_CHxCONF[13:12] TRM bit field) of the channel enabled.

The MCSPI_CHxSTAT[2] EOT bit gives the transfer status of each SPI word. The RXx_FULL bit in the MCSPI_IRQSTATUS register is set when received data is loaded from the shift register to the MCSPI_RXx register.

A change in the configuration parameters is propagated directly on the SPI interface. If the SPIEN[x] signal is activated, ensure that the configuration is changed only between SPI words to avoid corrupting the current transfer.

Note

To avoid data corruption, SPIEN polarity and SPICLK phase and SPICLK polarity must not be modified when the SPIEN[x] signal is activated.

A delay between SPI words that requires the connected SPI slave device to switch from one configuration to another (for instance, from transmit-only to receive-only) must be handled by software.

At the end of the last SPI word, the channel must be deactivated (the MCSPI_CHxCTRL[0] EN bit set to 0) and SPIEN[x] can be forced to its INACTIVE state using the MCSPI_CHxCONF[20] FORCE bit.

Figure 24-85 and Figure 24-86 show successive transfers with SPIEN[x] maintained active low with a different configuration for each SPI word in single-data-pin and dual-data-pin interface modes, respectively.

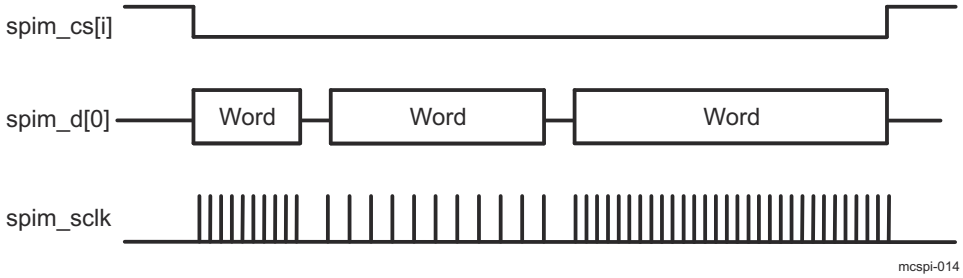

Figure 24-85. Continuous Transfers With SPIEN[x] Maintained Active (Single-Data-Pin Interface Mode)

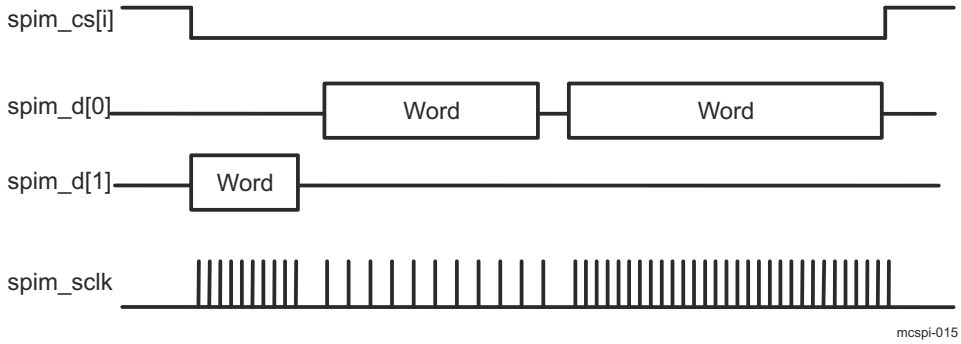

Figure 24-86. Continuous Transfers With SPIEN[x] Maintained Active (Dual-Data-Pin Interface Mode)

Note

The SPIEN[x] signal can be maintained active via software using the MCSPI_CHxCONF[20] FORCE bit only when the MCSPI_MODULCTRL[0] SINGLE bit is set to 0x1.

24.4.4.3.5.3 Turbo Mode

Turbo mode improves the throughput of the SPI interface when a single channel is enabled by allowing transfers until the shift register and the MCSPI_RXx register are full. Turbo mode is time saving when a transfer exceeds two words. This mode is programmable per channel (through the SPI1.MCSPI_CHxCONF[9] TURBO bit).

When several channels are enabled, the TURBO bit has no effect and the channel access to the shift registers remains as previously described.

In turbo mode, Rule 1 and Rule 2 apply, but Rule 3 does not (see Section 24.4.4.3.2, *Master Transmit-and-Receive Mode (Full Duplex)*). An enabled channel can be scheduled if its receive register is full (the MCSPI_CHxSTAT[0] RXS bit) when the shift-register is assigned until the shift register is full.

The MCSPI_RXx register cannot be overwritten in turbo mode. Consequently, the MCSPI_IRQSTATUS[3] RX0_OVERFLOW bit is never set in this mode.

24.4.4.3.6 Start-Bit Mode

In start-bit mode, an extended bit is added before the SPI word to indicate whether the next SPI word must be handled as a command or as data. This feature is available only in master mode. Start-bit mode cannot be

used at the same time as turbo mode and/or force SPIEN[x] mode. In this case, only one channel can be used; round-robin arbitration is not possible.

This mode is programmable per channel by setting the MCSPI_CHxCONF[23] SBE bit to 1. The polarity of the extended bit is programmable per channel. When the MCSPI_CHxCONF[24] SBPOL bit is set to 0, the SPI word must be handled as a command. When the MCSPI_CHxCONF[24] SBPOL bit is set to 1, the SPI word must be handled as data. Moreover, start-bit polarity can be changed dynamically during start-bit transfer without disabling the channel for reconfiguration; in this case, users must configure the MCSPI_CHxCONF[24] SBPOL bit before writing the SPI word to be transmitted to the TX register.

24.4.4.3.7 Chip-Select Timing Control

The chip-select (CS) timing control is available only in master mode with automatic CS generation (the MCSPI_MODULCTRL[0] SINGLE bit set to 0) to add a programmable delay between CS assertion and first clock edge, or CS removal and last clock edge. This option is available only in 4-pin mode when MCSPI_MODULCTRL[1] PIN34 set to 0.

This mode is programmable per channel through the MCSPI_CHxCONF[26:25] TCS0 bit field.

Figure 24-87 shows the CS SPIEN timing controls.

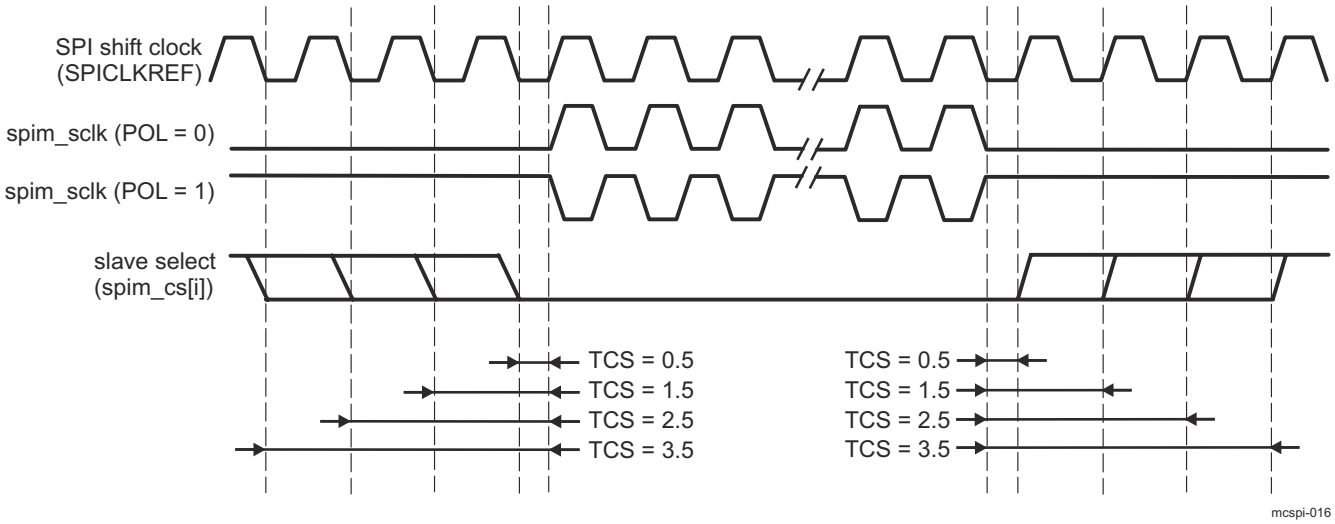

Figure 24-87. CS (SPIEN) Timing Controls

Note

Because of the design implementation for transfers using a clock divider ratio set to 1 (clock bypassed), a half cycle must be added to the value between CS assertion and the first clock edge with PHA = 1 or between CS removal and the last clock edge with PHA = 0.

24.4.4.3.8 Programmable SPI Clock

In master mode, the baud rate of the SPI serial clock is programmable.

An internal reference clock, SPIm_FCLK, is used as input of a programmable divider (the MCSPI_CHxCONF[5:2] CLKD bit field) to generate the bit rate of the serial output clock SPICLK. Table 24-203 summarizes the supported divisor values.

Table 24-203. SPI Master Clock Rates

Divider	Clock Rate
1	48 MHz(1)
2	24 MHz(1)

Table 24-203. SPI Master Clock Rates (continued)

Divider	Clock Rate
4	12 MHz
8	6 MHz
16	3 MHz
32	1.5 MHz
64	750 kHz
128	375 kHz
256	~187 kHz
512	~93.7 kHz
1024	~46.8 kHz
2048	~23.4 kHz
4096	~11.7 kHz
8192 and higher: Division not supported	–

(1) These frequencies are not necessarily supported by all SPI modules. For more information, see the *Timing Requirements and Switching Characteristics* chapter in the device data manual.

24.4.4.3.8.1 Clock Ratio Granularity

By default, the clock division ratio is defined by the MCSPI_CHxCONF[5:2] CLKD bit field with power-of-2 granularity leading to a clock division in the range 1 to 4096; in this case, the duty cycle is always 50 percent. With the MCSPI_CHxCONF[29] CLKG bit, clock division granularity can be changed to one clock cycle; in that case the MCSPI_CHxCTRL[15:8] EXTCLK bit field is concatenated with the MCSPI_CHxCONF[5:2] CLKD bit field to give a 12-bit-wide division ratio in the range 1 to 4096.

When granularity is one clock cycle (the CLKG bit set to 1), for the odd value of the clock ratio, the clock high level lasts one clock cycle more than the low level, depending on the MCSPI_CHxCONF[1] POL and MCSPI_CHxCONF[0] PHA bits (see Table 24-204).

Table 24-204. CLKSPIO High/Low Time Computation

Clock Ratio F_{RATIO}	CLKSPIO High Time	CLKSPIO Low Time
1	T_{HIGH_REF}	T_{LOW_REF}
Even ≥ 2	T_ref × (F_{RATIO}/2)	T_ref × (F_{RATIO}/2)
Odd ≥ (POL = PHA)	T_ref × (F_{RATIO}– 1)/2	T_ref × (F_{RATIO} + 1)/2
Odd ≥ (POL ≠ PHA)	T_ref × (F_{RATIO}+ 1)/2	T_ref × (F_{RATIO} – 1)/2

Note

F_{RATIO} = SPICLK frequency (F_{OUT}) division ratio
T_{HIGH} = SPICLK high time period
T_{LOW} = SPICLK low time period
T_ref = FCLK period
T_{HIGH_REF} = FCLK high time period
T_{LOW_REF} = FCLK low time period

If the CLKG bit is set to 1; F_{RATIO} = EXTCLK concatenated with CLKD + 1.

For odd ratio values, the duty cycle is calculated as follows:

Duty_cycle = (1 – 1/F_{RATIO})/2

Table 24-205 shows examples of clock granularity with a clock source frequency of 48 MHz.

Table 24-205. Clock Granularity Examples

EXTCLK	CLKD	CLKG	F_{RATIO}	PHA	POL	T_{HIGH} (ns)	T_{LOW} (ns)	T_{PERIOD} (ns)	Duty Cycle	F_{OUT} (MHz)
X	0	0	1	X	X	10.4	10.4	20.8	50–50	48
X	1	0	2	X	X	20.8	20.8	41.6	50–50	24
X	2	0	4	X	X	41.6	41.6	83.2	50–50	12
X	3	0	8	X	X	83.2	83.2	166.4	50–50	6
0	0	1	1	X	X	10.4	10.4	20.8	50–50	48
0	1	1	2	X	X	20.8	20.8	41.6	50–50	24
0	2	1	3	1	0	41.6	20.8	62.4	66–33	16
0	2	1	3	1	1	20.8	41.6	62.4	33–66	16
0	3	1	4	X	X	41.6	41.6	83.2	50–50	12
5	0	1	81	1	0	852.8	832	1684.8	50.6–49.4	0.592
5	7	1	88	X	X	915.2	915.2	1830.4	50–50	0.545

24.4.4.4 Slave Mode

To select the McSPI slave mode, set the MCSPI_MODULCTRL[2] MS bit.

A McSPI slave device can be connected to up to four external SPI master devices but handles transactions with one SPI master device at a time.

In slave mode, the McSPI initiates data transfer on the data lines (SPIDAT[0] and SPIDAT[1]) when it is selected by an active control signal (SPIEN[x]) and receives an SPI clock (SPICLK) from the external SPI master device. Only channel 0 can be configured as a slave but through the MCSPI_CH0CONF[22:21] SPIENSLV bit field any of the SPIEN[x] signals can be used to select the McSPI module. In slave mode and when the MCSPI_MODULCTRL[1] PIN34 is set to 0x0 (default behavior), the McSPI uses the edge of SPIEN[x] to detect word length. For this reason, SPIEN[x] must become inactive between each word.

When the MCSPI_MODULCTRL[1] PIN34 is set to 0x0, the McSPI does not support SPIEN[x] active between SPI words. In this case, the McSPI uses the edge to detect word length.

When the MCSPI_MODULCTRL[1] PIN34 is set to 0x1, a multiword transfer can be performed without needing the external SPI master to deactivate SPIEN[x] between each word as in this case the McSPI module works in 3-pin slave mode and SPIEN[x] is not needed.

24.4.4.4.1 Dedicated Resources

Only channel 0 can be enabled in slave mode. In this section, register names such as SPI1.MCSPI_CHxCTRL stand for SPI1.MCSPI_CH0CTRL, where x = 0 (channel 0 control register).

Figure 24-88 shows an example of four slaves wired on a single master device.

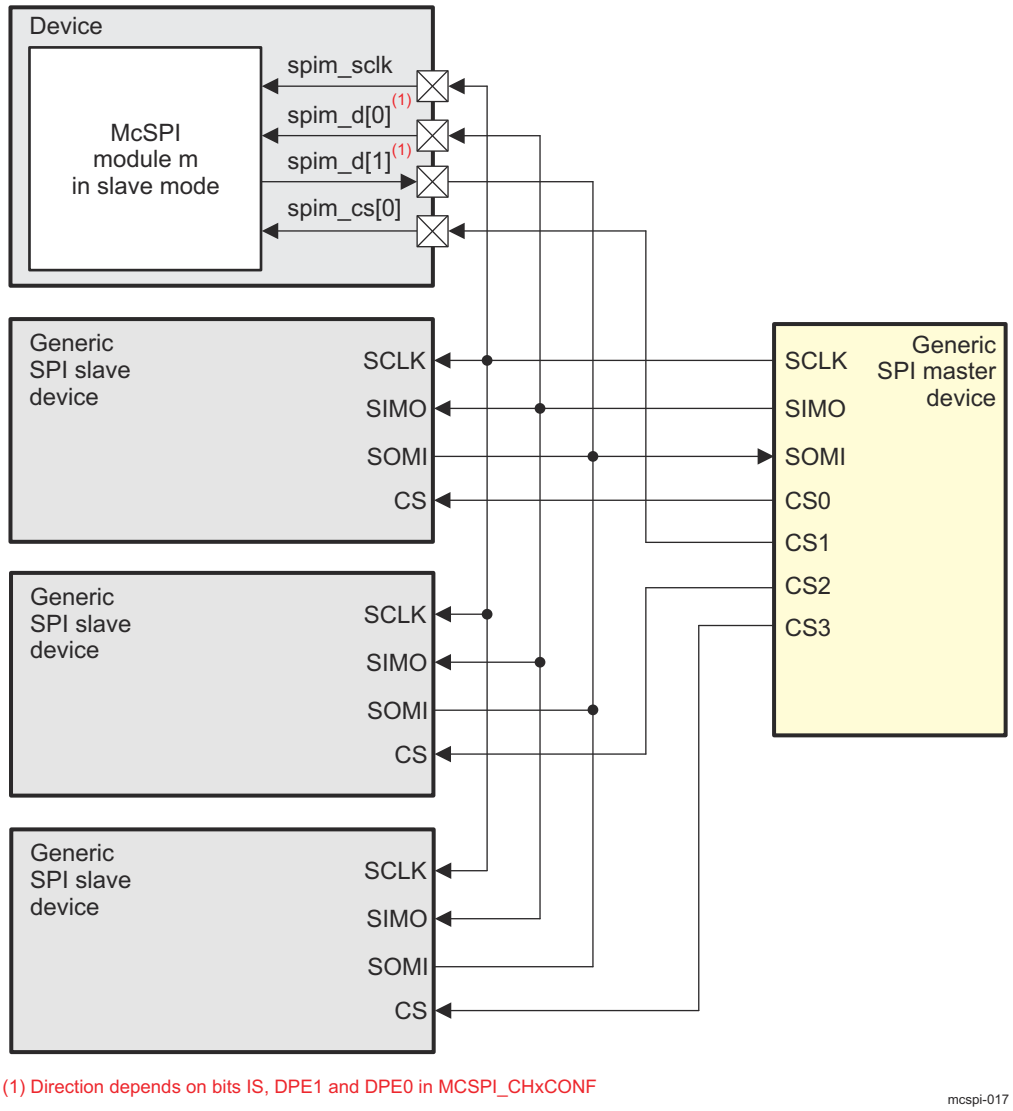

Figure 24-88. Example of McSPI Slave With One Master and Multiple Slave Devices on Channel 0

Channel 0 in slave mode has the following resources:

- Its own channel enable, programmable with the MCSPI_CHxCTRL[0] EN bit (where x = 0). This channel must be enabled before transmission and reception.
- For this mode, the slave-select signal can be detected on any of the SPIEN[x] ports. This is programmable with the MCSPI_CHxCONF[22:21] SPIENSLV bit field (where x = 0).
- Its own transmitter register, MCSPI_TXx (where x = 0), on top of the common transmit shift register. If the MCSPI_TXx register is empty, the MCSPI_CHxSTAT[1] TXS bit (where x = 0) is set. If McSPI is selected by an external master (the active signal on the SPIEN[x] port assigned to channel 0), the MCSPI_TXx register content of channel 0 is always loaded into the shift register, whether its content is updated or not. The MCSPI_TXx register must be loaded before McSPI is selected by a master.
- Its own receiver register, MCSPI_RXx (where x = 0), on top of the common receive shift register. If the MCSPI_RXx register is full, the MCSPI_CHxSTAT[0] RXS bit (where x = 0) is set.

Note

The MCSPI_TXx and MCSPI_RXx registers of the other channels are not used. Reading from or writing to a channel register other than channel 0 has no effect.

- Its own communication configuration with the following parameters through the MCSPI_CHxCONF register (where x = 0):
  - Transmit and receive modes, programmable with the TRM field
  - Interface mode (two data pins or single data pin) and data pins assignment, both programmable with the IS and DPE bits. (The SPIm modules are in slave mode after reset and must be properly configured for the modules to act in master mode.)
  - SPI word length, programmable with the WL bits
  - SPIEN[x] polarity, programmable with the EPOL bit
  - SPICLK polarity, programmable with the POL bit
  - SPICLK phase, programmable with the PHA bit

  The SPICLK frequency of a transfer is controlled by the external SPI master connected to the McSPI slave device. The MCSPI_CHxCONF[5:2] CLKD bit field (where x = 0) is not used in slave mode.

Note

The configuration of the channel can be loaded in the MCSPI_CHxCONF register (where x = 0) only when the channel is disabled.

- Two DMA request events, read and write, synchronize read/write accesses of the DMA controller with the activity of McSPI. DMA requests are asserted using the MCSPI_CHxCONF[15] DMAR bit (where x = 0) for reading and the MCSPI_CHxCONF[14] DMAW bit (where x = 0) for writing.
- Four interrupt events (see Section 24.4.4.7.2, *Interrupt Events in Slave Mode*)

24.4.4.4.2 Slave Transmit-and-Receive Mode

The slave receive mode is programmable (set the MCSPI_CHxCONF[13:12] TRM bit field [where x = 0] to 0x0).

In slave transmit-and-receive mode, the MCSPI_TXx register must be loaded before McSPI is selected by an external SPI master device.

After a channel is enabled, transmission and reception proceed with interrupt and DMA request events.

The MCSPI_TXx register content is always loaded in the shift register whether it is updated or not. The event TXx_UNDERFLOW is activated accordingly and does not prevent transmission.

When the SPI word transfer completes (the MCSPI_CHxSTAT0[2] EOT bit [where x = 0] is set to 1), the received data is transferred to the channel receive register.

To use McSPI as a slave transmit-only device, the RXx_FULL and RX0_OVERFLOW interrupts and DMA read requests must be disabled due to the state of the MCSPI_RXx register (see Section 24.4.4.7.2, *Interrupt Events in Slave Mode*).

24.4.4.4.3 Slave Transmit-Only Mode

The slave transmit-only mode is programmable (set the MCSPI_CHxCONF[13:12] TRM bit field [where x = 0] to 0x2) and avoids the requirement for the MPU to read the MCSPI_RXx register (minimizing data movement) only when transmission is meaningful.

To use the McSPI as a slave transmit-only device, the RXx_FULL and RX0_OVERFLOW interrupts and DMA read requests must be disabled due to the state of the MCSPI_RXx register.

When the SPI word transfer completes, the MCSPI_CHxSTAT[2] EOT bit is set (where x = 0).

Figure 24-89 shows a half-duplex system with a master device on the left and a transmit-only slave device on the right. Each time a bit transfers out from the slave, 1 bit transfers in the master. After eight cycles of the serial clock SPICLK, WordB transfers from the slave to the master.

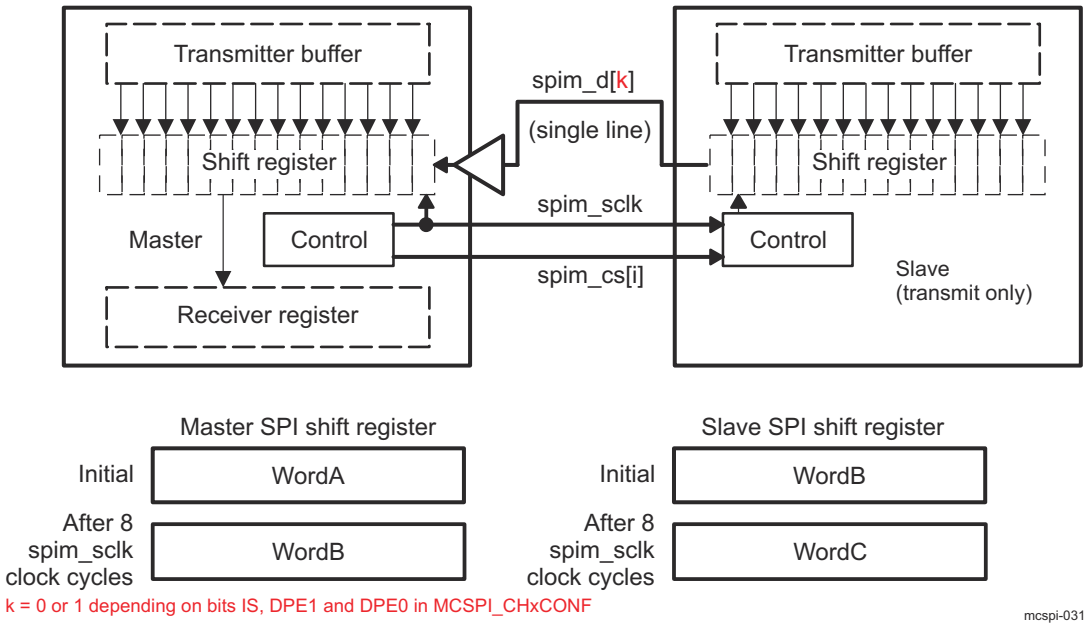

Figure 24-89. SPI Half-Duplex Transmission (Transmit-Only Slave)

24.4.4.4.4 Slave Receive-Only Mode

The slave receive mode is programmable (set the MCSPI_CHxCONF[13:12] TRM bit field [where x = 0] to 0x1).

In receive-only mode, the MCSPI_TXx register must be loaded before the McSPI is selected by an external SPI master device. The MCSPI_TXx register content is always loaded into the shift register whether it is updated or not. The TXx_UNDERFLOW event is activated accordingly and does not prevent transmission.

When the SPI word transfer completes (the MCSPI_CHxSTAT0[2] EOT bit [where x = 0] is set to 1), the received data is transferred to the channel receive register.

To use the McSPI as a slave receive-only device, the TXx_EMPTY and TXx_UNDERFLOW interrupts and the DMA write requests must be disabled due to the state of the MCSPI_TXx register.

For a full-duplex transmission, the serial clock (SPICLK) synchronizes shifting and sampling of the information on the single serial data line. For full duplex, two data lines are required. If SPICLK synchronizes on a single serial data line, the data line should be half-duplex.

Figure 24-90 shows a half-duplex system with a master device on the left and a receive-only slave device on the right. Each time a bit transfers out from the master, 1 bit transfers in from the slave. After eight cycles of the serial clock SPICLK, WordA transfers from the master to the slave.

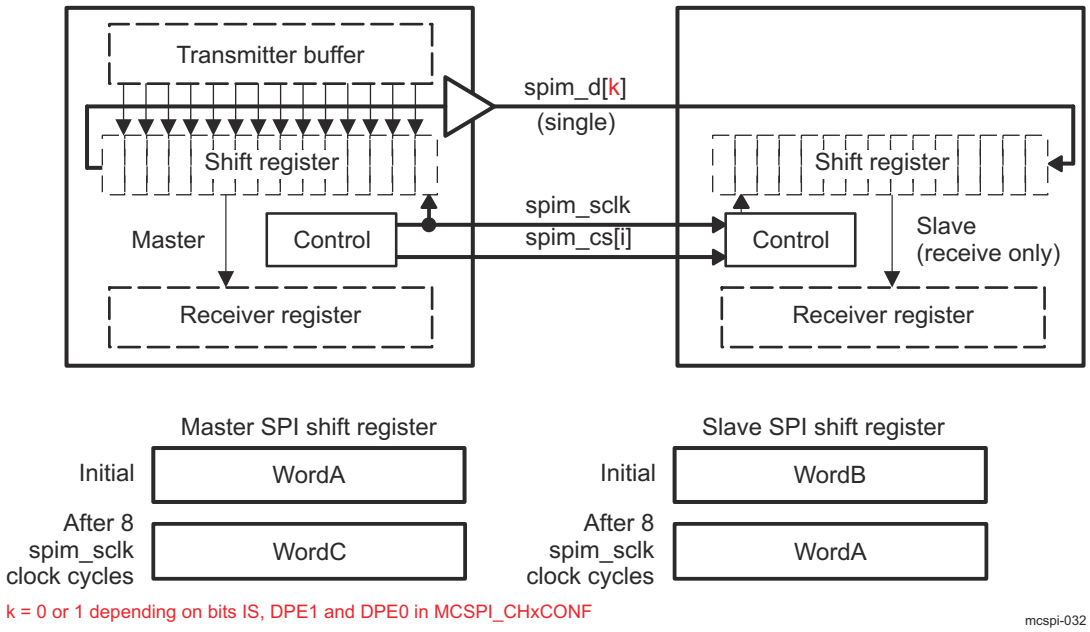

Figure 24-90. SPI Half-Duplex Transmission (Receive-Only Slave)

24.4.4.5 3-Pin or 4-Pin Mode

Depending on targeted application the SPI interface can be configured to use 3 or 4 pins through the MCSPI_MODULCTRL[1] PIN34 bit. If this bit is set to 0, McSPI is in 4-pin mode using the SPICLK, SPIDAT[0], SPIDAT[1] and SPIEN[x] signals. If PIN34 is set to 1 the controller is in 3-pin mode and SPIEN[x] is not used. In this mode all options related to chip select management are useless (EPOL, FORCE and TCS0 bits of MCSPI_CHxCONF). 3-pin and 4-pin operation applies to both master and slave modes.

24.4.4.6 FIFO Buffer Management

The McSPI controller has a built-in 128-byte buffer to unload the DMA or interrupt handler and improve data throughput.

This buffer can be used by only one channel at a time and is selected by setting the MCSPI_CHxCONF[28] FFER or MCSPI_CHxCONF[27] FFEW bit to 1. If several channels are selected and several FIFO enable bit fields are set to 1, the controller forces the buffer not to be used; the driver must set only one FIFO enable bit field.

The buffer can be used in the following modes:

- Master or slave mode
- Transmit-only, receive-only, or transmit-and-receive mode
- Single channel or turbo mode, or normal round-robin mode. In round-robin mode the buffer is used by only one channel.

Every word length (MCSPI_CHxCONF[11:7] WL) is supported.

In transmit-and-receive mode, the buffer can be used in transmit (see Figure 24-91) or receive (see Figure 24-92) directions, or in both directions. If only one direction is chosen in transmit-and-receive mode, the full buffer is used for this direction. In both directions, the buffer is split into two halves, one for each direction (see Figure 24-93).

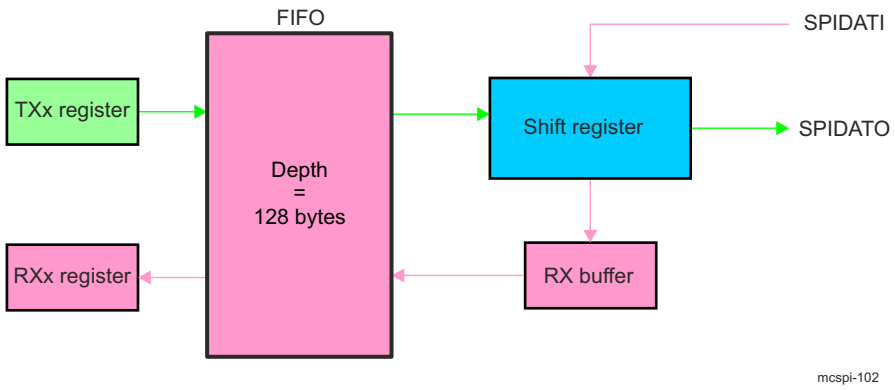

Figure 24-91. Buffer Used in Transmit Direction Only

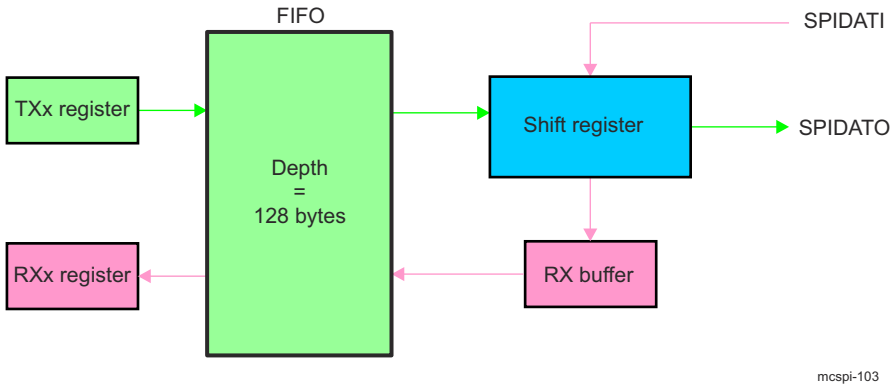

Figure 24-92. Buffer Used in Receive Direction Only

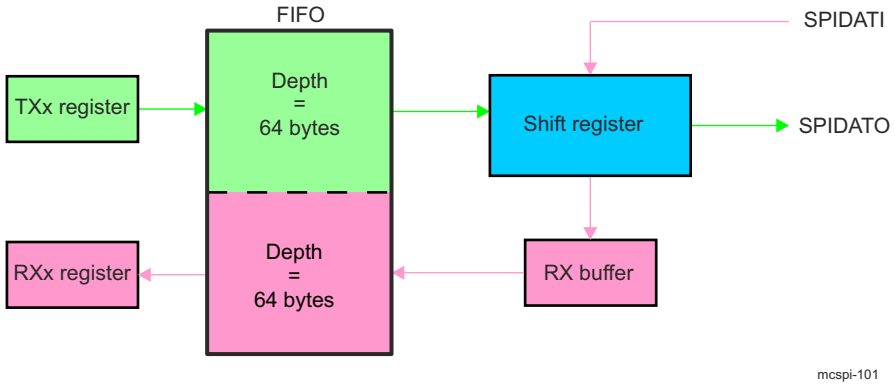

Figure 24-93. Buffer Used for Transmit and Receive Directions

Two levels (MCSPI_XFERLEVEL[5:0] AEL and MCSPI_XFERLEVEL[13:8] AFL) rule the buffer management. The granularity of these levels is 1 byte; it is not aligned with the SPI word length. The driver must set these values as a multiple of the SPI word length defined in MCSPI_CHxCONF[11:7] WL. Table 24-206 lists the number of bytes written in the FIFO, depending on the word length.

Table 24-206. FIFO Writes, Word Length Relationship

	SPI Word Length (WL)		
	3 ≤ WL≤ 7	**8 ≤ WL ≤ 15**	**16 ≤ WL ≤ 31**
Number of bytes written in the FIFO	1 byte	2 bytes	4 bytes

The FIFO buffer pointers are reset when the corresponding channel is enabled or the FIFO configuration changes.

24.4.4.6.1 Buffer Almost Full

The MCSPI_XFERLEVEL[15:8] AFL bit field is needed when the buffer is used to receive an SPI word from a slave (the MCSPI_CHxCONF[28] FFER bit must be set to 1). It defines the almost-full buffer status. See Figure 24-94.

When the FIFO pointer reaches this level, an interrupt or a DMA request is sent to the MPU to enable the system to read AFL + 1 bytes from the receive register.

Note

AFL + 1 must correspond to a multiple value of the MCSPI_CHxCONF[11:7] WL bit field.

When DMA is used, the request is deasserted after the first receive register read.

No new request is asserted again as long as the system has not performed the correct number of read accesses.

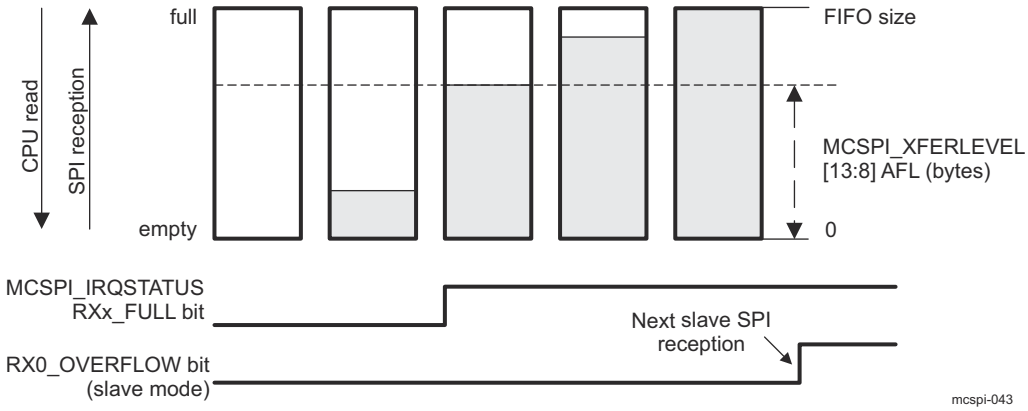

Figure 24-94. Buffer Almost Full Level (AFL)

Note

The MCSPI_IRQSTATUS register bits are not available in DMA mode. In DMA mode, the SPIm_DMA_RXx request is asserted on the same conditions as the MCSPI_IRQSTATUS RXx_FULL flag.

24.4.4.6.2 Buffer Almost Empty

The MCSPI_XFERLEVEL[7:0] AEL bit field is needed when the buffer is used to transmit an SPI word to a slave (the MCSPI_CHxCONF[27] FFEW bit must be set to 1). It defines the almost-empty buffer status. See Figure 24-95.

When the FIFO pointer does not reach this level, an interrupt or a DMA request is sent to the MPU to enable the system to write AEL + 1 bytes to the transmit register.

Note

AEL + 1 must correspond to a multiple value of the MCSPI_CHxCONF[11:7] WL bit field.

When DMA is used, the request is deasserted after the first transmit register write.

No new request is asserted again as long as the system has not performed the correct number of write accesses.

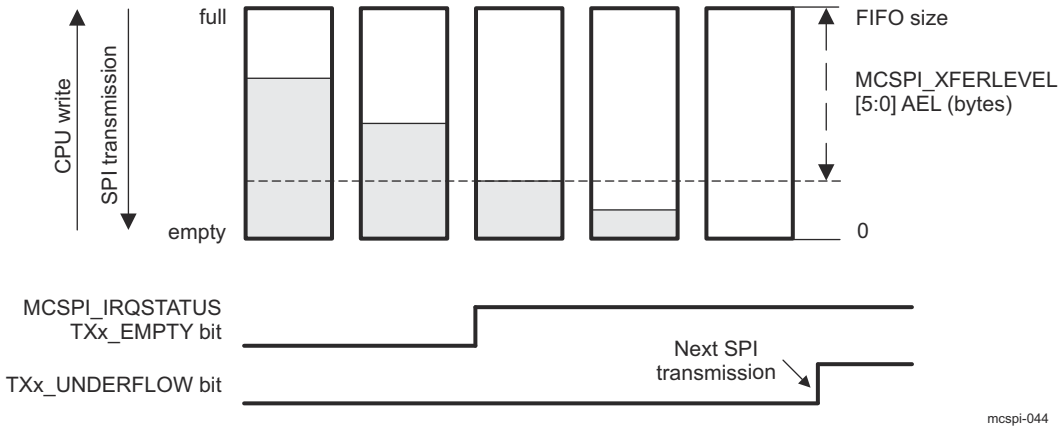

Figure 24-95. Buffer Almost Empty Level (AEL)

Note

The MCSPI_IRQSTATUS register bits are not available in DMA mode. In DMA mode, the SPIm_DMA_TXx request is asserted on the same conditions as the MCSPI_IRQSTATUS TXx_EMPTY flag.

24.4.4.6.3 End of Transfer Management

When the FIFO buffer is enabled for a channel, the user must previously configure in the MCSPI_XFERLEVEL register the AEL and AFL levels and especially the MCSPI_XFERLEVEL[31:16] WCNT bit field to define the number of SPI words to be transferred using the FIFO before enabling the channel.

This counter lets the controller stop the transfer correctly after a defined number of SPI word transfers. If WNCT is set to 0x0000, the counter is not used and the user must stop the transfer manually by disabling the channel; in this case, the user does not know how many SPI transfers have been done. For received words, software must poll the CHxSTAT[5] RXFFE bit and read the MCSPI_RXx receive register to empty the FIFO buffer.

When the end-of-word count interrupt is generated (the MCSPI_IRQSTATUS[17] EOW bit is set), the user can disable the channel and poll the MCSPI_CHxSTAT[5] RXFFE bit to know the last SPI words in the FIFO buffer and read them.

No new request is asserted as long as the system has not performed the correct number of write accesses.

24.4.4.7 Interrupts

Each channel can issue interrupt events.

Each interrupt event has status bits in the MCSPI_IRQSTATUS register (RXx_FULL, TXx_UNDERFLOW, TXx_EMPTY, etc.) (where x = 0, 3) that indicate whether service is required. Each status bit has an interrupt enable bit (a mask) in the MCSPI_IRQENABLE register (RXx_FULL_ENABLE, TXx_UNDERFLOW_ENABLE, TXx_EMPTY_ENABLE, etc.).

When an interrupt occurs and a mask is later applied on it, the interrupt line is not asserted again, even if the interrupt source is not serviced.

The McSPI supports interrupt-driven and polling operations.

24.4.4.7.1 Interrupt Events in Master Mode

In master mode, the interrupt events related to the state of the MCSPI_TXx register are TXx_EMPTY and TXx_UNDERFLOW. The interrupt event related to the state of the MCSPI_RXx register is RXx_FULL.

24.4.4.7.1.1 TXx_EMPTY

The TXx_EMPTY event is activated when a channel is enabled and its MCSPI_TXx register is empty (transient event). Enabling a channel automatically triggers this event, except in master receive-only mode (see Section 24.4.4.3.4, *Master Receive-Only Mode*). When the FIFO buffer is enabled (the MCSPI_CHxCONF[27] FFEW bit is set to 1), the MCSPI_IRQSTATUS TXx_EMPTY bit is set as soon as there is enough space in the buffer to write a number of bytes defined by the MCSPI_XFERLEVEL[5:0] AEL bit field.

The MCSPI_TXx register must be loaded with data to remove the source of the interrupt; the MCSPI_IRQSTATUS TXx_EMPTY interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

When FIFO is enabled, no new TXx_EMPTY event is asserted as long as the MPU has not performed the number of writes into the MCSPI_TXx register defined by the MCSPI_XFERLEVEL[5:0] AEL bit field. The MPU must perform the correct number of writes.

24.4.4.7.1.2 TXx_UNDERFLOW

The event TXx_UNDERFLOW is activated when the channel is enabled and if the MCSPI_TXx register or the FIFO is empty (not updated with new data) when an external master device starts a data transfer with the McSPI (transmit and receive).

The TXx_UNDERFLOW is a harmless warning in master mode.

To avoid having a TXx_UNDERFLOW event at the beginning of a transmission, the TXx_UNDERFLOW event is not activated when no data has been loaded into the MCSPI_TXx register, because the channel is enabled. To avoid having a TXx_UNDERFLOW event, the MCSPI_TXx register must seldom be loaded.

The MCSPI_IRQSTATUS TXx_UNDERFLOW interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

24.4.4.7.1.3 RXx_ FULL

The RXx_FULL event is activated when a channel is enabled and the MCSPI_RXx register becomes filled (transient event). When the FIFO buffer is enabled (the MCSPI_CHxCONF[28] FFER bit is set to 1), RXx_ FULL is asserted as soon as the number of bytes held in the FIFO to be read reaches the MCSPI_XFERLEVEL[13:8] AFL threshold.

The MCSPI_RXx register must be read to remove the source of the interrupt; the MCSPI_IRQSTATUS RXx_FULL interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

When FIFO is enabled, no new RXx_FULL event is asserted as long as the MPU has not performed AFL + 1 reads into MCSPI_RXx. The MPU must perform the correct number of reads.

24.4.4.7.1.4 End Of Word Count

The MCSPI_IRQSTATUS[17] EOW event (end of word count) is activated when the channel is enabled and configured to use the built-in FIFO. This interrupt is raised when the controller performs the number of transfers defined in the MCSPI_XFERLEVEL[31:16] WCNT bit field. If WCNT is set to 0x0000, the counter is not enabled and this interrupt is not generated.

The end of word count interrupt also indicates that the SPI transfer is halted on the channel using the FIFO buffer as soon as MCSPI_XFERLEVEL[31:16] WCNT is not reloaded and the channel is not re-enabled.

The MCSPI_IRQSTATUS[17] EOW interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

24.4.4.7.2 Interrupt Events in Slave Mode

In slave mode, the interrupt events related to the state of the MCSPI_TXx register are TXx_EMPTY and TXx_UNDERFLOW. The interrupt events related to the state of the MCSPI_RXx are RXx_FULL

and RX0_OVERFLOW (channels 1, 2, and 3 do not have a receiver overflow status bit). See the MCSPI_IRQSTATUS register.

24.4.4.7.2.1 TXx_EMPTY

The TXx_EMPTY event is activated when a channel is enabled and its MCSPI_TXx register is empty. Enabling the channel automatically raises this event. If the FIFO buffer is enabled (the MCSPI_CHxCONF[27] FFEW bit is set to 1), the TXx_EMPTY event is asserted as soon as there is enough space in buffer to write a number of bytes defined by the MCSPI_XFERLEVEL[5:0] AEL bit field.

The MCSPI_TXx register must be loaded with data to remove the source of the interrupt; the MCSPI_IRQSTATUS TXx_EMPTY interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

When FIFO is enabled, no new TXx_EMPTY event is asserted as long as the MPU has not performed the number of writes into the MCSPI_TXx register defined by MCSPI_XFERLEVEL[5:0] AEL bit field. The MPU must perform the correct number of writes.

24.4.4.7.2.2 TXx_UNDERFLOW

The TXx_UNDERFLOW event is activated when a channel is enabled and if the MCSPI_TXx register is empty (not updated with new data) when an external master device starts a data transfer with the McSPI (transmit and receive).

When FIFO is enabled, the data emitted while the underflow event is raised is not the last data written in the FIFO but the next data in the FIFO (an old transmitted value or a dummy data in the FIFO has been reset).

TXx_UNDERFLOW indicates an error (data loss) in slave mode.

To avoid having a TXx_UNDERFLOW event at the beginning of a transmission, the TXx_UNDERFLOW event is not activated when no data has been loaded into the MCSPI_TXx register because the channel is enabled.

The MCSPI_IRQSTATUS TXx_UNDERFLOW interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

24.4.4.7.2.3 RXx_FULL

The RXx_FULL event is activated when a channel is enabled and the MCSPI_RXx register is being filled (transient event). When the FIFO buffer is enabled (the MCSPI_CHxCONF[28] FFER bit is set to 1), RXx_FULL is asserted as soon as the number of bytes held in the buffer to read defined by the MCSPI_XFERLEVEL[13:8] AFL bit field.

The MCSPI_RXx register must be read to remove the source of the interrupt; the MCSPI_IRQSTATUS RXx_FULL interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

When FIFO is enabled, no new RXx_FULL event is asserted as long as the MPU has not performed AFL + 1 reads into MCSPI_RXx. The MPU must perform the correct number of reads.

24.4.4.7.2.4 RX0_OVERFLOW

The RX0_OVERFLOW event is activated in slave mode in transmit-and-receive mode or receive-only mode when a channel is enabled and the MCSPI_RXx register or FIFO is full when a new SPI word is received. The MCSPI_RXx register is always overwritten with the new SPI word. If the FIFO is enabled, data within the FIFO are overwritten; it must be considered as corrupted. The RX0_OVERFLOW event should not appear in slave mode using the FIFO.

The RX0_OVERFLOW event indicates an error (data loss) in slave mode.

The MCSPI_IRQSTATUS[3] RX0_OVERFLOW interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

24.4.4.7.2.5 End Of Word Count

The MCSPI_IRQSTATUS[17] EOW event (end of word count) is activated when the channel is enabled and configured to use the built-in FIFO. This interrupt is raised when the controller performs the number of transfers defined in the MCSPI_XFERLEVEL[31:16] WCNT bit field. If WCNT is set to 0x0000, the counter is not enabled and this interrupt is not generated.

The end of word count interrupt also indicates that the SPI transfer is halted on the channel using the FIFO buffer as soon as WCNT is not reloaded and the channel is not re-enabled.

The MCSPI_IRQSTATUS[17] EOW interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

24.4.4.7.3 Interrupt-Driven Operation

An interrupt enable bit in the MCSPI_IRQENABLE register can be set to enable each event to generate interrupt requests when the corresponding event occurs. Status bits are automatically set by hardware logic conditions.

When an event occurs (the single interrupt line is asserted), the MPU must :

1. Read the MCSPI_IRQSTATUS register to identify which event occurred.
2. Read the MCSPI_RXx register that corresponds to the event to remove the source of an RXx_FULL event or write into the MCSPI_TXx register that corresponds to the event to remove the source of a TXx_EMPTY event. No action is required to remove the source of the WKS (wake-up), TXx_ UNDERFLOW, and RX0_OVERFLOW events.
3. Set the corresponding bit of the MCSPI_IRQSTATUS register to 1 to clear an interrupt status and then release the interrupt line.

The interrupt status bit must always be reset after channel enabling and before events are enabled as interrupt sources.

24.4.4.7.4 Polling

When the interrupt capability of an event is disabled in the MCSPI_IRQENABLE register, the interrupt line is not asserted, but the status bits in the MCSPI_IRQSTATUS register can be polled by software to detect when the corresponding event occurs.

Once the expected event occurs:

- RXx_FULL: To remove the source of the event, the MPU must read the corresponding MCSPI_RXx register .
- TXx_EMPTY: To remove the source of the event, the MPU must write into the corresponding MCSPI_TXx register.
- WKS (wake-up), TXx_UNDERFLOW, and RX0_OVERFLOW: No action is required to remove the source of the event.

To clear an interrupt, set the corresponding status bit of the MCSPI_IRQSTATUS register to 1. This does not affect the interrupt line state.

24.4.4.8 DMA Requests

Each McSPI channel, if enabled, can issue DMA requests. There are two DMA request lines per McSPI channel (one for read and one for write).

The DMA read request line is asserted when the McSPI channel is enabled and new data is available in the receive register of the McSPI channel. A DMA read request can be individually masked with the SPI1.MCSPI_CHxCONF[15] DMAR bit. The DMA read request line is deasserted when reading of the MCSPI_RXx register of the McSPI channel completes.

The DMA write request line is asserted when the McSPI channel is enabled and the MCSPI_TXx register of the McSPI channel is empty. A DMA write request can be individually masked with the SPI1.MCSPI_CHxCONF[14] DMAW bit. The DMA write request line is deasserted when loading of the MCSPI_TXx register of the channel completes.

24.4.4.9 Power Saving Management

Power consumption can be optimized by switching off internal clocks (interface and functional clock) when there is no activity. The McSPI is compliant with the idle and wake-up system handshake protocol.

24.4.4.9.1 Normal Mode

In normal mode, internal SPI module clocks are automatically switched off (autogated) when there is no activity in slave or master mode.

Autogating of the module interface clock and functional clock occurs when the following conditions are met:

- The MCSPI_SYSCONFIG[0] AUTOIDLE bit is set.
- In master mode, there is no data to transmit or receive in all channels.
- In slave mode, the McSPI is not selected by the external master and there are no register accesses.

Autogating of the module interface clock and functional clock stops when the following conditions are met:

- In master mode, an internal access occurs.
- In slave mode, an internal access occurs or the McSPI is selected by the external master.

24.4.4.9.2 Idle Mode

At the PRCM module level, when all conditions are met to shut off the PER_48M_GFCLK or L4PER_L3_GICLK output clock, the PRCM module automatically launches a hardware handshake protocol to ensure that the McSPI is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the McSPI.

Although this handshake is completely hardware-oriented and out of software control, the method in which the McSPI module acknowledges the PRCM IDLE request is configurable through the MCSPI_SYSCONFIG[4:3] SIDLEMODE bit field.

The settings of the SIDLEMODE bit field and the related acknowledgment modes are:

- Force-idle mode (the MCSPI_SYSCONFIG[4:3] SIDLEMODE bit field is set to 0x0): The McSPI module acknowledges unconditionally the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully in this case because it does not prevent the loss of data when the clock is switched off.
- No-idle mode (the SIDLEMODE bit field is set to 0x1): The McSPI never acknowledges an IDLE request from the PRCM module and is safe from a module point of view because it ensures that the clocks remain active. However, it is not efficient to save power because it does not allow the PRCM output clock to be shut off and thus the power domain to be set to a lower power state.
- Smart-idle mode (the SIDLEMODE bit field is set to 0x2): The McSPI acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, IRQs, or DMA requests are treated. This is the best approach for efficient system power management.

When configured in smart-idle mode, the McSPI also offers an additional granularity on the PER_48M_GFCLK and L4PER_L3_GICLK gating. The MCSPI_SYSCONFIG[9:8] CLOCKACTIVITY bit field determines which clock shuts down (the PER_48M_GFCLK, L4PER_L3_GICLK, neither clock, or both clocks).

The setting of the CLOCKACTIVITY bit field is used internally to the McSPI to determine on which part of the module the conditions to acknowledge the PRCM IDLE request are tested. For example, if PER_48M_GFCLK is not shut down on a PRCM IDLE request, the McSPI considers only L4PER_L3_GICLK and the associated pending activities before acknowledging the request.

Some McSPI features are associated with L4PER_L3_GICLK and others with PER_48M_GFCLK. Using the CLOCKACTIVITY bit field with the smart-idle mode ensures that the features associated with the clock that remains active are always enabled, even if the McSPI acknowledges an IDLE request.

The settings of the CLOCKACTIVITY bit field and the associated features are:

- CLOCKACTIVITY set to 00: ICLK off and FCLK off, ICLK and FCLK are considered for generating the acknowledge. This setting also means that FCLK and ICLK are likely to be shut down on a PRCM IDLE request.
- CLOCKACTIVITY set to 01: ICLK on and FCLK off, ICLK is not shut down on a PRCM IDLE request; only FCLK is concerned.
- CLOCKACTIVITY set to 10: ICLK off and FCLK on, FCLK is not shut down on a PRCM IDLE request; only ICLK is concerned.
- CLOCKACTIVITY set to 11: ICLK on and FCLK on, none of the clocks are shut down. This means the McSPI can potentially acknowledge the IDLE request without checking the internal functions linked to its clocks.

CAUTION

The PRCM module does not have a hardware means of reading the CLOCKACTIVITY settings. Therefore, software must ensure consistent programming between CLOCKACTIVITY and the PER_48M_GFCLK and L4PER_L3_GICLK control bits in the PRCM module. If the McSPI is disabled in the CM_FCLKEN and CM_ICLKEN PRCM registers while CLOCKACTIVITY is set to 11, nothing prevents the PRCM module from asserting its IDLE request, which is acknowledged regardless of the features associated with the McSPI clocks. This can lead to unpredictable behavior.

24.4.4.9.2.1 Wake-Up Event in Smart-Idle Mode

The module wake-up feature is enabled when the MCSPI_SYSCONFIG[2] ENAWAKEUP and MCSPI_WAKEUPENABLE[0] WKEN bits are set. Wake-up capability is relevant only when the module is configured in slave mode.

The module generates an asynchronous wake-up request to the system power manager to switch back the interface clock and the functional clock. A wakeup is requested when channel 0 is enabled and an asynchronous selection occurs on the mcspim.csx port associated with channel 0 (see the definition for the MCSPI_CHxCONF[22:21] SPIENSLV bit field [where x = 0] in the register table description).

After the McSPI wake-up request, the system power manager must reactivate the interface clock:

- Before the beginning of the second SPI word serialization when the McSPI is in slave transmit-only mode or in slave transmit-and-receive mode
- Before the end of the second received SPI word in slave receive-only mode. To avoid data loss, the first received SPI word must be read from the MCSPI_RXx register (where x = 0) before the completion of the second SPI word serialization.

Table 24-207 lists the supported cases in smart-idle mode.

Table 24-207. Smart-Idle Mode and Wake-Up Capabilities

Mode	Interface Clock	SPI Clock Ref	Functionality	Wake-Up Event
Master	Must be maintained	Must be maintained	Full functionality, but the module does not generate a new interrupt or DMA request until the system exits wake-up mode	No wake-up event
Slave	Can be switched off	Can be switched off	An SPI word can be transmitted and/or received, but the module does not generate any new interrupts or DMA requests until the system exits wake-up mode.	The module asynchronously sends a wake-up request if an event on the SPIEN[x] port associated with channel 0 is detected.

In wake-up mode, the interrupt and DMA request lines are no longer asserted.

Any access to the module in wake-up mode generates an error as long as the interface clock is alive.

24.4.4.9.2.2 Transitions From Smart-Idle Mode to Normal Mode

The McSPI detects the end of the wake period through the idle and wake-up hardware handshake protocol.

The interrupt status register (the MCSPI_IRQSTATUS[16] WKS bit) is updated with the event causing the wakeup; the wake-up event at the origin of the transition to the normal mode is converted to its corresponding interrupt when enabled by the MCSPI_IRQENABLE[16] WKE bit or the DMA request.

Interrupts and wake-up events have independent enable and disable controls, accessible through the MCSPI_IRQENABLE and MCSPI_WAKEUPENABLE registers. Software must ensure the overall consistency.

The interrupt status register MCSPI_IRQSTATUS is updated with the event causing the wakeup; the wake-up event at the origin of the transition to normal mode is converted to its corresponding interrupt request or DMA request. The module is fully operational.

24.4.4.9.2.3 Force-Idle Mode

Force-idle mode is enabled and exited as follows:

- Force-idle mode is enabled when the MCSPI_SYSCONFIG[4:3] SIDLEMODE bit field is set to 0x0.
  - In force-idle mode, the McSPI responds unconditionally to the IDLE request by deasserting unconditionally the interrupt and DMA request lines, if asserted. In addition, the wake-up capability is totally inhibited even if the MCSPI_SYSCONFIG[2] ENAWAKEUP and MCSPI_WAKEUPENABLE[0] WKEN bits are set.
  - The transition from normal mode to idle mode does not affect the interrupt event bits of the MCSPI_IRQSTATUS register.
  - In force-idle mode, because the module must be disabled, the interrupt and DMA request lines are likely deasserted. The interface clock and SPI clock provided to the McSPI can be switched off.
  - An IDLE request during an SPI data transfer can lead to an unexpected and unpredictable result. Software must avoid such a request.
- The module exits force-idle mode through the idle and wake-up hardware handshake protocol.

  The module is fully operational. The interrupt and DMA request lines are optionally asserted one clock cycle later.

24.4.5 McSPI Programming Guide

This section describes the low-level hardware programming sequences for the configuration and use of the McSPI module.

24.4.5.1 Global Initialization

24.4.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the McSPI module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the McSPI. For further information, see Section 24.4.3, *McSPI Integration* and Section 24.4.2, *McSPI Environment*.

Table 24-208 lists the information on the global initialization of the surrounding modules.

Table 24-208. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	MCSPI_FCLK functional clock must be enabled. See *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.
L4 Interconnect	For information about L4_PER1 interconnect configuration, see *L4 Interconnects*, in *Interconnect*.
DMA_CROSSBAR	DMA_CROSSBAR configuration must be done to allow module DREQs to be mapped to certain device DMA line. For more information see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
Device DMAs	Device DMAs configuration must be done to enable the module DMA channel requests.
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see *Interrupt Controllers*

24.4.5.1.2 McSPI Global Initialization

24.4.5.1.2.1 Main Sequence – McSPI Global Initialization

The procedure in Table 24-209 can be used to initialize McSPI when performing software reset.

Table 24-209. McSPI Global Initialization

Step	Register/Bit Field/Programming Model	Value
Perform a software reset.	MCSPI_SYSCONFIG[1] SOFTRESET	1
Wait until reset is finished?	MCSPI_SYSSTATUS[0] RESETDONE	=1
Configure static settings (such as SPI master or slave) as required.	MCSPI_MODULCTRL[8:0]	0x-
Write MCSPI_SYSCONFIG	MCSPI_SYSCONFIG	0x-

24.4.5.2 Operational Mode Configuration

24.4.5.2.1 McSPI Operational Modes

The selection of the working mode is done with the MCSPI_CHxCONF register.

Table 24-210. McSPI Receive Mode Initialization

Step	Register/Bit Field/Programming Model	Value
Set receive mode for the channel.	MCSPI_CHxCONF[13:12] TRM	0x1
Configure SPI clock polarity/phase, clock divider, word length, and others for the channel.	MCSPI_CHxCONF	0x-

Table 24-210. McSPI Receive Mode Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
Reset the status bits.	MCSPI_IRQSTATUS	0x0

Table 24-211. McSPI Transmit Mode Initialization

Step	Register/Bit Field/Programming Model	Value
Set transmit mode for the channel.	MCSPI_CHxCONF[13:12] TRM	0x2
Configure SPI clock polarity/phase, clock divider, word length, and others for the channel.	MCSPI_CHxCONF	0x-
Reset the status bits.	MCSPI_IRQSTATUS	0x0

Table 24-212. McSPI Transmit-and-Receive Mode Initialization

Step	Register/Bit Field/Programming Model	Value
Set transmit and receive mode for the channel.	MCSPI_CHxCONF[13:12] TRM	0x0
Configure SPI clock polarity/phase, clock divider, word length, and others for the channel.	MCSPI_CHxCONF	0x-
Reset the status bits.	MCSPI_IRQSTATUS	0x0

24.4.5.2.1.1 Common Transfer Sequence

McSPI module allows the transfer of one or several words, according to different modes:

- MASTER Normal, MASTER Turbo, SLAVE
- TRANSMIT–RECEIVE, TRANSMIT-ONLY, RECEIVE-ONLY
- Write and Read requests: Interrupts, DMA
- SPIEN[x] lines assertion/deassertion: automatic, manual

For all these sequences, the host process contains the main process and the interrupt routines.

The interrupt routines are called on the interrupt signals or by an internal call if the module is used in polling mode.

Table 24-213 represents the main sequence which is common to all transfers.

In multi-channel master mode, the sequences of different channels can be run simultaneously.

Table 24-213. Common Transfer Sequence (Main Process)

Step	Register/Bit Field/Programming Model	Value
Write MCSPI_IRQSTATUS to reset channel status bits	MCSPI_IRQSTATUS[channel x bits]	0b1111
Write MCSPI_IRQENABLE to enable interrupts	MCSPI_IRQENABLE	0x-
Write MCSPI_CHxCONF to configure the channel	MCSPI_CHxCONF	0x-
Start the channel	MCSPI_CHxCTRL[0] EN	1
Wait for the first write request (TX empty or DMA write)		
Write the transmitter register with data	MCSPI_TXx	0x-
Wait for the host event for end of transfer		
Stop the channel	MCSPI_CHxCTRL[0] EN	0

24.4.5.2.1.2 End of Transfer Sequences

The end of transfer depends on the transfer mode. Table 24-214 summarizes the type of end of transfer per transfer mode and gives a reference to the appropriate section for details.

Table 24-214. End of Transfer Sequences

		TRANSMIT-AND-RECEIVE		TRANSMIT-ONLY		RECEIVE-ONLY	
		INTERRUPT	DMA	INTERRUPT	DMA	INTERRUPT	DMA
MASTER Normal	End of transfer sequence	See Section 24.4.5.2.1.3		See Section 24.4.5.2.1.4.1	See Section 24.4.5.2.1.4.2	See Section 24.4.5.2.1.5.1	See Section 24.4.5.2.1.5.2
	Minimum number of word	1	1	1	1	1	2
	DMA transfer size		N		N		N-1
MASTER Turbo	End of transfer sequence	See Section 24.4.5.2.1.3		See Section 24.4.5.2.1.4.1	See Section 24.4.5.2.1.4.2	See Section 24.4.5.2.1.6.1	See Section 24.4.5.2.1.6.2
	Minimum number of word	1	1	1	1	2	3
	DMA transfer size		N		N		N-2
SLAVE	End of transfer sequence	See Section 24.4.5.2.1.3		See Section 24.4.5.2.1.4.1	See Section 24.4.5.2.1.4.2	See Section 24.4.5.2.1.7	
	Minimum number of word	1	1	1	1	1	1
	DMA transfer size		N		N	N	N

The transfer to execute has a size of N words.

The different sequences can be merged in one process to manage transfers of several types. The end of transfer sequences are described from the start of the channel.
