30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel nf_write_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_CONTROL_DESCRIPTOR_INT15	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_CONTROL_DESCRIPTOR_INT14	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_CONTROL_DESCRIPTOR_INT13	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_CONTROL_DESCRIPTOR_INT12	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

CAPTURE_MODE		STOP_CLIENT		RESERVED		STOP_COUNT		RESERVED		START_CLIENT		RESERVED		START_COUNT		CURR_COUNT															

Bits	Field Name	Description	Type	Reset
31:30	CAPTURE_MODE	Sets how the counter should be updated. Updating this value will also clear the current counter stored value. 0: Running Average 1: Minimum Value 2: Maximum Value 3: Last Value	RW	0x0
29:28	STOP_CLIENT	Sets the client whose event stops the performance monitor counter. 0: vpi_ctl 1: dei_hq_1_chroma 2: dei_hq_1_chroma 3: dei_hq_1_luma	RW	0x0
27	RESERVED		R	0x0
26:24	STOP_COUNT	Sets the value that stops the performance monitor counter. 0: command request 1: command accept 2: data request 3: data rcvd 4: data empty 5: data full 6: frame start 7: frame end	RW	0x0
23:22	RESERVED		R	0x0
21:20	START_CLIENT	Sets the client whose event starts the performance monitor counter. 0: vpi_ctl 1: dei_hq_1_chroma 2: dei_hq_1_chroma 3: dei_hq_1_luma	RW	0x0
19	RESERVED		R	0x0
18:16	START_COUNT	Sets the value that starts the performance monitor counter. 0: command request 1: command accept 2: data request 3: data rcvd 4: data empty 5: data full 6: frame start 7: frame end	RW	0x0
15:0	CURR_COUNT	The current value of the perfomance monitor counter	R	0x0

Physical Address	0x489D D300	**Instance**	VPE_VPDMA
Description	The register holds status information and control for the client.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REQ_DELAY								REQ_RATE								BUSY	DMA_ACTIVE	FRAME_START				LINE_MODE		RESERVED							

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles..This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles.This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0
13:10	FRAME_START	The source of the start frame event for the client. 0 : Change in value of hdmi_field_id 1 : Change in value of dvo2_field_id 2 : Change in value of hdcomp_field_id 3 : Change in value of sd_field_id 4 : Use List Manager Internal Field0 5 : Use List Manager Internal Field1 6 : Use List Manager Internal Field2 7 : Start on channel active	RW	0x0
9:8	LINE_MODE	Selects the output mode of the line buffer. 0: repeat lines twice each output data line gets 2 times the number of frame lines. 1: each line once with Line Buffer Disabled, so no mirroring. Each line gets frame lines with identical data. 2: Each line seen once Mirroring is enabled so the top lines get the top lines repeated at the top of the frame and the bottom lines have the bottom lines repeated. Each line of data gets frame lines + number of buffered lines. 3: each line once only on one line. Each data line gets number of frame lines divided by number of buffered lines.	RW	0x0
7:0	RESERVED		R	0x0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																										STANDBYMODE		IDLEMODE		RESERVED	

Bits	Field Name	Description	Type	Reset
31:6	RESERVED		R	0x0
5:4	STANDBYMODE	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state 0x0: Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only 0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only 0x2: Same behavior as bit-field value of 0x1. 0x3: Reserved	RW	0x2
3:2	IDLEMODE	Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state 0x0: Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only 0x1: No-idle mode: local target never enters idle state. Backup mode, for debug only 0x2: Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wakeup events 0x3: Smart-idle wakeup-capable mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module may generate (IRQ- or DMA-request-related) wakeup events when in idle state. Mode is only relevant if the appropriate IP module "swakeup" output(s) is (are) implemented	RW	0x2
1:0	RESERVED		R	0x0

Chapter 11

Display Subsystem

This chapter describes the display subsystem for the device.

Note

This chapter describes a module (subsystem) in the superset device. The availability is device part number dependent. Refer to device Data Manual, for more information.

Note

All the Display and HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. Refer to the software development kit (SDK) for which Display and HDMI features are supported.

11.1 Display Subsystem Overview

The Display Subsystem (DSS) provides the logic to display a video frame from the system memory frame buffer on a liquid-crystal display (LCD) panel or TV set.

The display subsystem can display different pictures simultaneously by using three LCD outputs (LCD1, LCD2, and LCD3), in addition to a TV output.

All three LCD outputs are available on three parallel interfaces (DPI1, DPI2, and DPI3), providing support for MIPI DPI 2.0, or BT-656 or BT-1120.

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

The TV output is available on one of the following interfaces

- High-Definition Multimedia Interface (HDMI)
- DPI1 parallel interface

The modules integrated in the display subsystem are:

- Display controller (DISPC):
  - One direct memory access (DMA) engine
  - One graphics pipeline (GFX), three video (VID) pipelines, and one write-back (WB) pipeline
  - Three LCD outputs and one TV output, each with a dedicated overlay manager
- HDMI protocol engine:
  - HDMI 1.4a support up to 1080p@60Hz (including 3D frame-packing support)
  - 36-bit RGB color
  - HDCP 1.4 key protection
  - Deep color mode support (10-bit/12-bit for 148.5-MHz pixel clock)

The necessary video phase-locked loops (PLLs) with their corresponding control modules, and the physical layer (PHY) for HDMI are outside the display subsystem. The video PLLs allow independant display outputs at different frequencies. The supported PLLs and PHY are:

- DPLL_HDMI / HDMI_PHY
- DPLL_VIDEO1

To ensure efficient bandwidth, the display subsystem integrates a connection between the device L3_MAIN interconnect and the DISPC to exchange data with synchronous dynamic random access memory (SDRAM) using the DISPC DMA engine. The same connection is also used for configuration.

Note

All the Display and HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. Refer to the software development kit (SDK) for which Display and HDMI features are supported.

Figure 11-1 is a high-level diagram of the display subsystem.

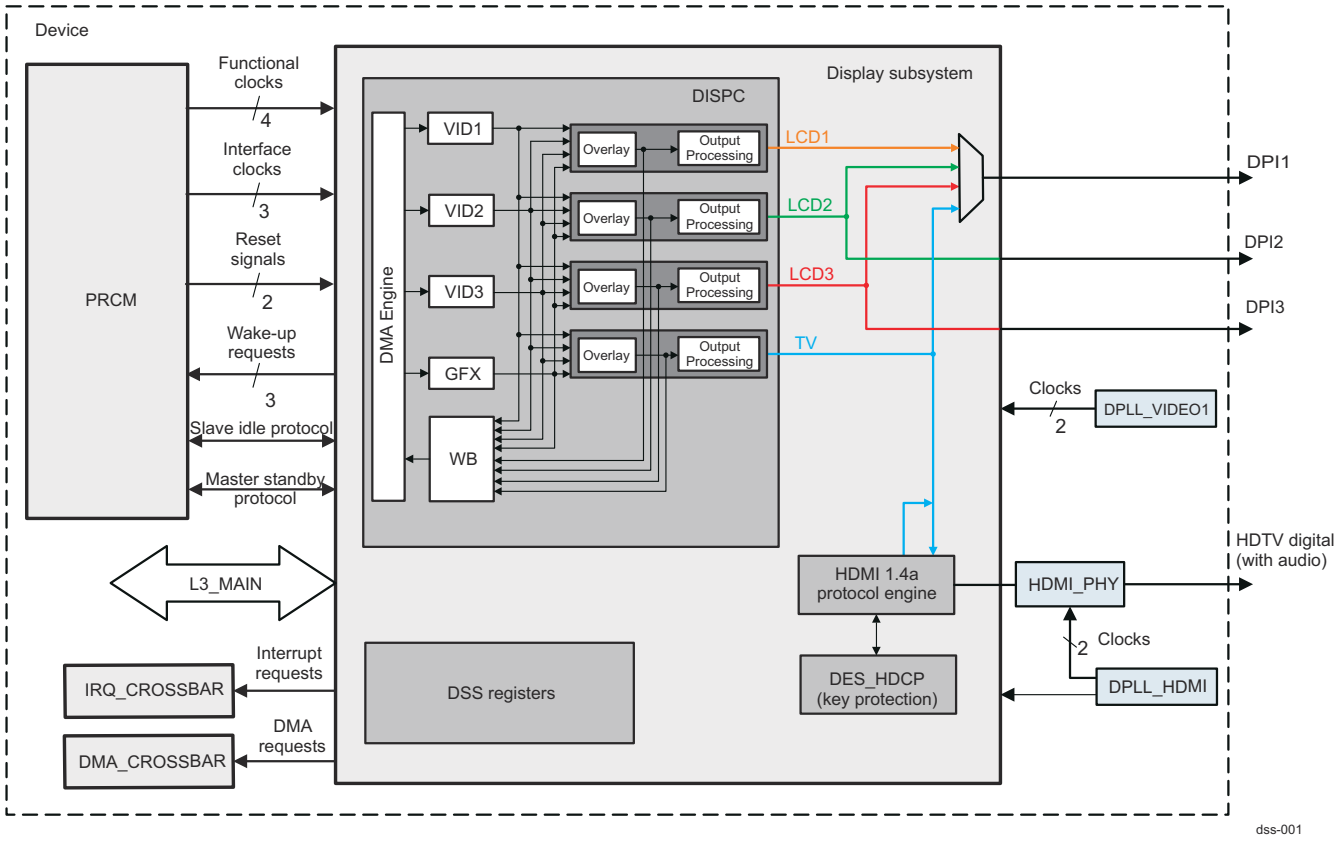

Figure 11-1. Display Subsystem Overview

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.1.1 Display Subsystem Environment

This section describes the various outputs handled by the display subsystem:

- LCD support
- TV display support

Figure 11-2 is a diagram of the display subsystem environment.

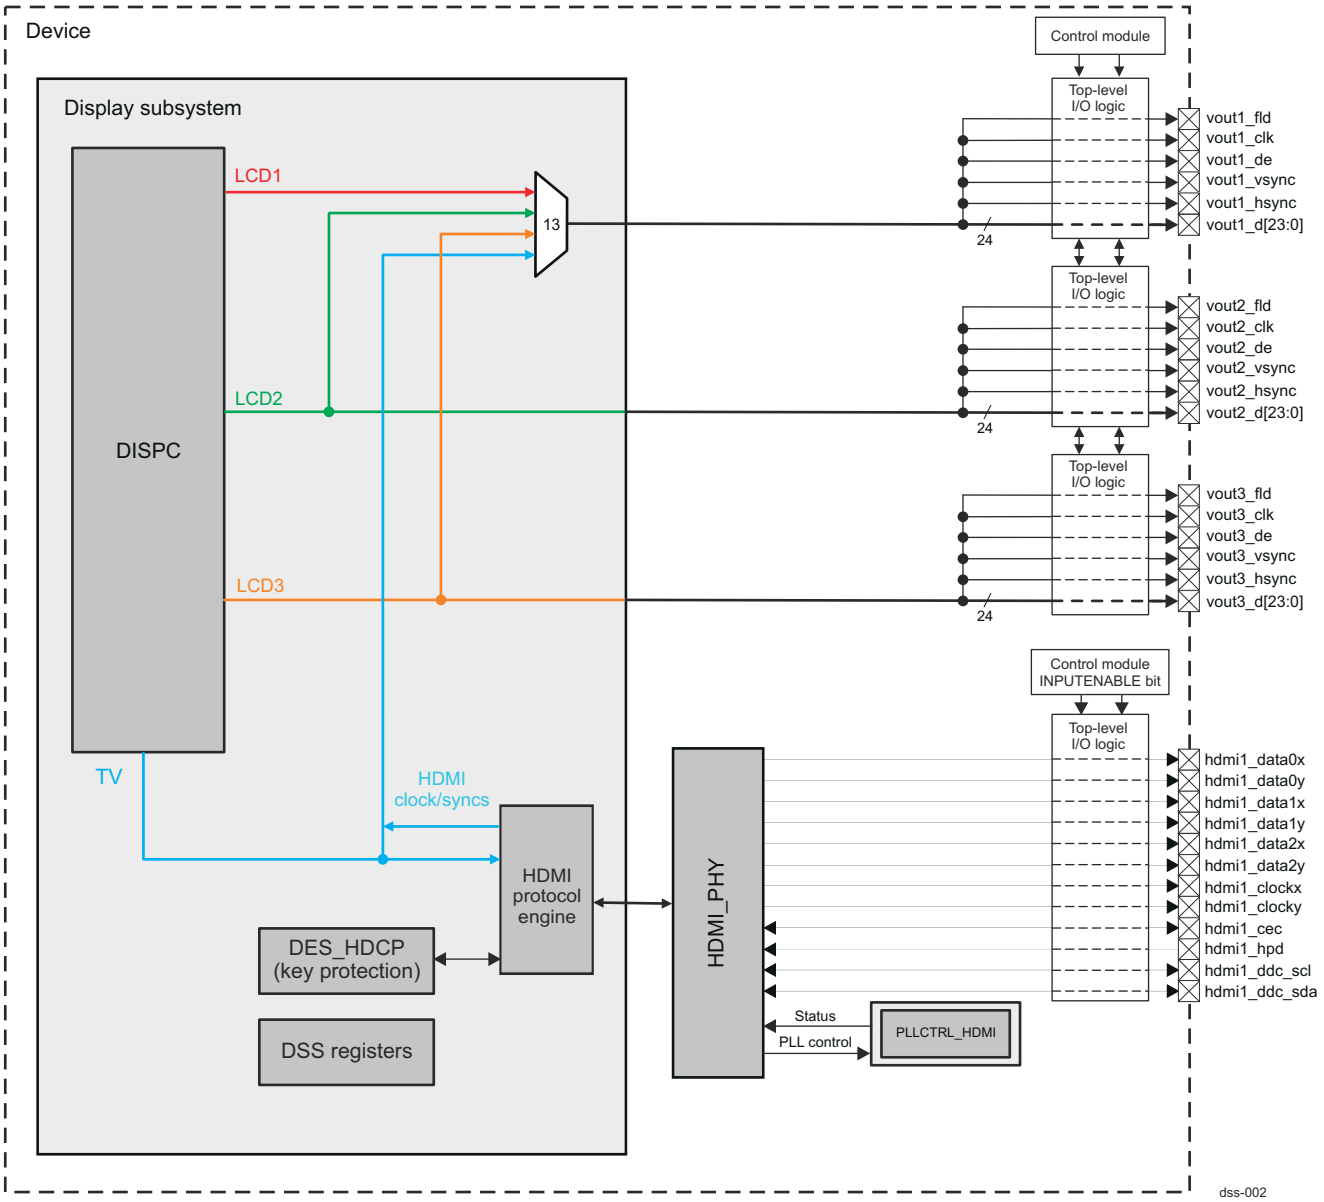

Figure 11-2. Display Subsystem Environment

Note

The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see *Pad Configuration Registers* in *Control Module*.

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.1.1.1 Display Subsystem LCD Support

LCD panels can be connected to the display subsystem of the device using DPI1, DPI2, and/or DPI3 parallel interfaces.

11.1.1.1.1 Display Subsystem LCD with Parallel Interfaces

Using parallel output mode, the module on the display subsystem processing path is DISPC.

In synchronous parallel interface, the required data and control signals are provided directly to external MIPI DPI 2.0, or BT-656 or BT-1120 compatible parallel panels.

The DISPC is connected to the system memory through the device L3_MAIN interconnect and uses its own DMA engine (with embedded FIFO) to read data from the system memory. For more details, see Section 11.2.1, *Display Controller*.

All three DISPC LCD outputs are available for DSS DPI1 output, with selection done through the DSS_CTRL[17:16] PARALLEL_SEL bit field (multiplexer 13 in Figure 11-2). DSS DPI2 and DPI3 outputs are hardwired to DISPC LCD2 and LCD3 outputs.

Table 11-1 to Table 11-3 lists the outgoing display subsystem signals on the device boundary pads.

Table 11-1. Display Subsystem DPI1 Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DSS_CTRL[17:16] PARALLEL_SEL = 1, 2, or 3 DISPC LCDx Channel Out (pixel data, clock, syncs) (where x = 1, 2, or 3)
vout1_fid	DISPC_LCDx_FID
vout1_clk	DISPC_LCDx_PCLK
vout1_de	DISPC_LCDx_DE
vout1_vsync	DISPC_LCDx_VSYNC
vout1_hsync	DISPC_LCDx_HSYNC
vout1_d[23:0]	DISPC_LCDx_DATA[23:0]

Note

By default, DSS_CTRL[17:16] PARALLEL_SEL = 0x0, and DISPC TV data and HDMI clk/sync signals are output on DPI1 interface pins. Software must program the PARALLEL_SEL bit-field to value other than 0x0, in order DISPC LCD data and clk/sync signals to be output on DPI1 interface pins.

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

Table 11-2. Display Subsystem DPI2 Interface Signals Mapping

vout3_d[23:0]	DISPC_LCD3_DATA[23:0]

For more details on LCD output pixel data formats for the parallel interface, see Section 11.2 *DISPC Environment*, in *Display Controller*.

11.1.1.2 Display Subsystem TV Display Support

When TV data flow is needed from the display subsystem, the DPI1 output or HDMI output can be used.

11.1.1.2.1 Display Subsystem TV With Parallel Interfaces

In synchronous parallel interface configuration, the required data is provided by the DISPC TV output, and control signals are provided by the HDMI module. Then they are merged and provided to the DPI1 output.

This configuration option is available and can be selected through the DSS_CTRL[17:16] PARALLEL_SEL bit field (multiplexer 13 in Figure 11-4).

Table 11-4 lists the outgoing display subsystem signals on the device boundary pads.

Table 11-4. Display Subsystem TV Parallel Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DSS_CTRL[17:16] PARALLEL_SEL = 0 DISPC TV Channel Out (pixel data) HDMI (pixel clock, syncs)
vout1_fid	HDMI_M_FID
vout1_clk	DSS_HDMI_PCLK
vout1_de	HDMI_M_DE
vout1_vsync	HDMI_M_VS
vout1_hsync	HDMI_M_HS
vout1_d[23:0]	DISPC_TV_DATA[29:0]

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

For more details on TV output pixel data formats for the parallel interface, see Section 11.2.2 *DISPC Environment*, in *Section 11.2.1 Display Controller*.

11.1.1.2.2 Display Subsystem TV With Serial Interfaces

In serial interface configuration, the HDMI module is used. The DISPC, HDMI, DES_HDCP, and the associated HDMI PHY module are used in the data path. The HDMI module converts the RGB video into standard high-definition digital video format. The HDMI module has a dedicated PLL, which can multiply the pixel clock by an appropriate factor. The data is transmitted on three differential data pairs and an additional clock pair.

For more details, see Section 11.3, in *High-Definition Multimedia Interface*.

11.1.2 Display Subsystem Integration

This section describes the integration of the display subsystem module in the device, including information about clocks, resets, and hardware requests.

Figure 11-3 shows the integration of the display subsystem in the device.

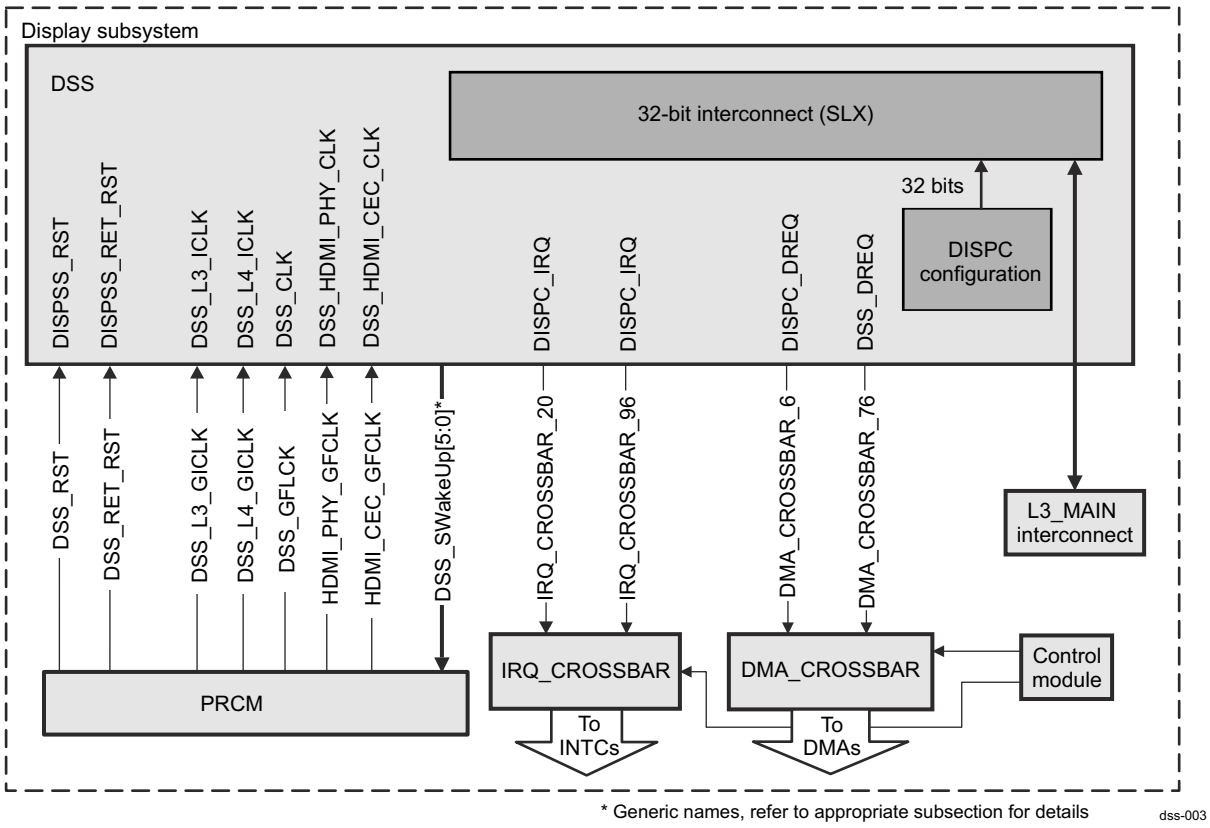

Figure 11-3. Display Subsystem Integration

Table 11-5. Display Subsystem Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	MPU_IRQ_25 DSP1_IRQ_58 PRUSS1_IRQ_51 PRUSS2_IRQ_51 IPU1_IRQ_26 IPU2_IRQ_26	DISPC interrupt requests.
HDMI	HDMI_IRQ	IRQ_CROSSBAR_96	MPU_IRQ_101 IPU1_IRQ_26 IPU2_IRQ_26	HDMI interrupt requests.
DMA Requests				
Module Instance	**Source Signal Name**	**Destination DMA_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5 DMA_SYSTEM_DREQ_5	The line trigger signal to synchronize a memory-to-memory logical channel in the DMA is generated by the DISPC IP.

Table 11-5. Display Subsystem Hardware Requests (continued)

HDMI	DSS_DREQ	DMA_CROSSBAR_76	DMA_SYSTEM_DREQ_75	Display subsystem HDMI audio DMA request

Note

The "**Default Mapping**" column in Table 11-5 *Display Subsystem Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.
For more information about the device DMA_SYSTEM module, see *System DMA*.
For more information about the device EDMA module, see *Enhanced DMA*.

11.1.2.1 Display Subsystem Clocks

The power, reset, and clock management (PRCM) module provides clock signals to the display subsystem.

Figure 11-4 shows the details of the display subsystem clock tree.

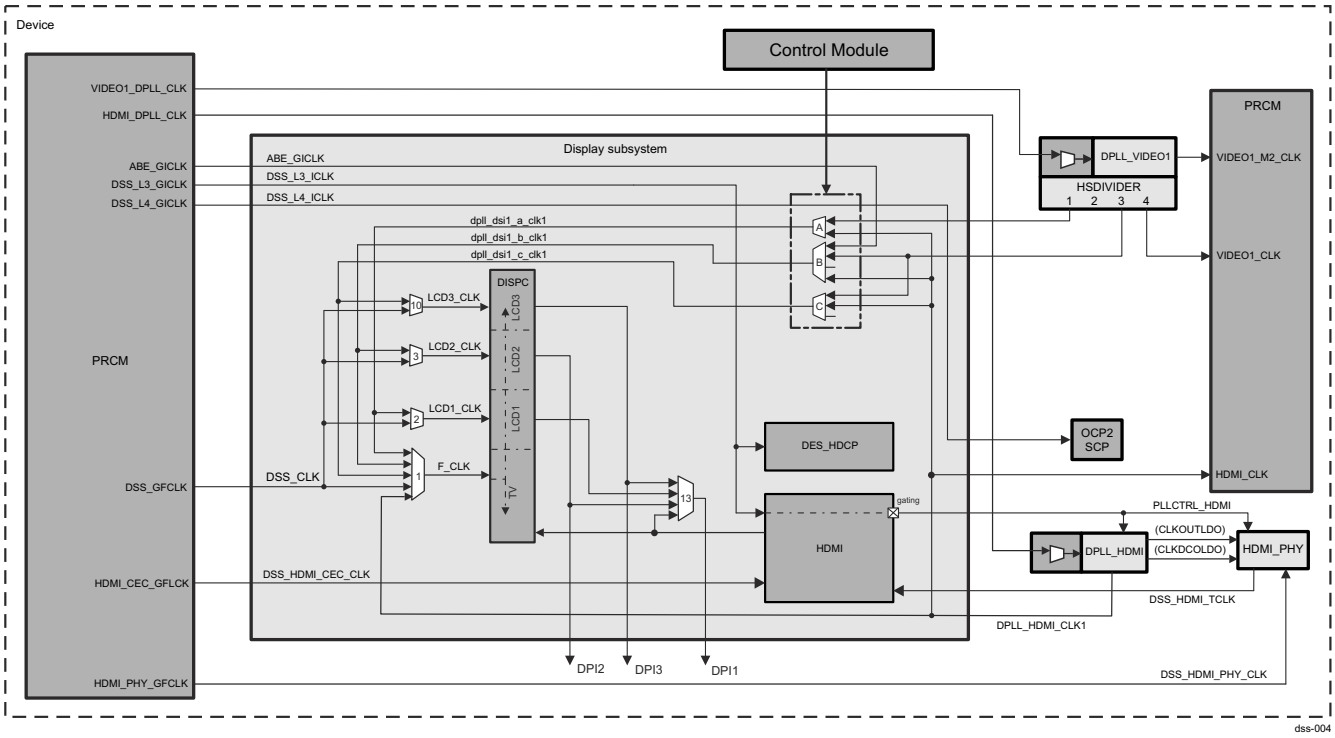

Figure 11-4. Display Subsystem Clock Tree

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

Table 11-6 lists the main DSS clocks and their sources.

Table 11-6. Display Subsystem Clocks

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DSS	DPLL_VIDEO1 input	VIDEO1_DPLL_CLK	PRCM module	Functional clock
	DPLL_HDMI input	HDMI_DPLL_CLK	PRCM module	Functional clock
	DSS_L3_ICLK	DSS_L3_GICLK	PRCM module	Interface clock
	DSS_L4_ICLK	DSS_L3_GICLK	PRCM module	Interface clock
	-	ABE_GICLK	PRCM, DPLL_ABE	Functional clock
	DSS_CLK	DSS_GFCLK	PRCM module	Main display subsystem functional clock
	HDMI_CEC_GFCLK	DSS_HDMI_CEC_CLK	PRCM module	HDMI core CEC engine clock
	HDMI_PHY_GFCLK	DSS_HDMI_PHY_CLK	PRCM module	HDMI_PHY clock

- The clock source for the L3 interface clock is DSS_L3_ICLK. All clocks can be gated at PRCM level. See *Module-Level Clock Management*, in *Power, Reset and Clock Management*.
- The clock sources for the display subsystem modules are listed in Table 11-7.

Table 11-7. Display Subsystem Modules Clock Sources

Destination	Source Signal Name	Source	Multiplexer Number in Figure 11-4	DSS_CTRL Register Bit-field
DISPC functional clock (F_CLK)	DSS_CLK	PRCM	1	[9:7] F_CLK_SWITCH
	DPLL_DSI1_A_CLK1	DPLL_VIDEO1, DPLL_HDMI		
	DPLL_DSI1_B_CLK1	DPLL_VIDEO1, DPLL_HDMI, DPLL_ABE

	DSS_DISPC_LCD3_PCLK	DISPC		
	DSS_HDMI_PCLK	HDMI		
DPI2 functional/pixel clock	DSS_DISPC_LCD2_PCLK	DISPC	N/A	N/A
DPI3 functional/pixel clock	DSS_DISPC_LCD3_PCLK	DISPC	N/A	N/A

Table 11-7. Display Subsystem Modules Clock Sources (continued)

Destination	Source Signal Name	Source	Multiplexer Number in Figure 11-4	DSS_CTRL Register Bit-field
HDMI timing clock (DSS_HDMI_TCLK)	N/A	HDMI_PHY	N/A	N/A

Note

- In Figure 11-4, clkout1, clkout3, and clkout4 of DPLL_VIDEO1 correspond to M4, M6, and M7 outputs of the associated HS divider module (HSDIVIDER). For more information on the configuration of DPLL_VIDEO clocks, see Section 11.1.3.3, *DPLL_VIDEO Functional Description*.
- For synchronization purpose, the clkout4 (M7) output of each HSDIVIDER is used to source McASP module and peripheral timers. For more information, see *Timers,* and *Multichannel Audio Serial Ports*.
- Multiplexers A, B, and C in Figure 11-4 are controlled by [4:3] DSI1_A_CLK1_SELECTION, [6:5] DSI1_B_CLK1_SELECTION, and [8:7] DSI1_C_CLK1_SELECTION bit-fields, respectively, of DSS_PLL_CONTROL register in the device Control Module. For more information, see *Control Module*.

11.1.2.2 Display Subsystem Resets

The PRCM module provides two reset signals to the display subsystem.

Figure 11-5 shows the details of the reset tree for the display subsystem.

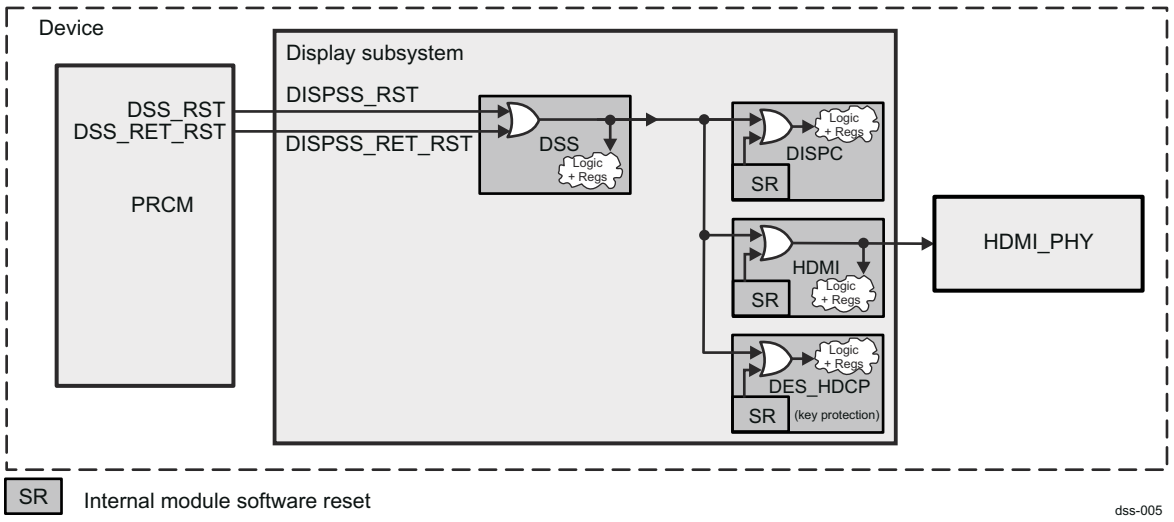

Figure 11-5. Display Subsystem Reset Scheme

Table 11-8 lists the resets for the display subsystem.

Table 11-8. Display Subsystem Resets

Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DSS	DISPSS_RET_RST	DSS_RET_RST	PRCM module	Retention reset
	DISPSS_RST	DSS_RST	PRCM module	Nonretention reset

The display subsystem receives its DISPSS_RST reset signal (the reset signal of the display subsystem power domain) from the PRCM module. The DISPSS_RET_RST is used only for the DES_HDCP key protection module and HDMI.

11.1.2.3 Display Subsystem Power Management

The display subsystem modules are in the display subsystem power domain.

Table 11-9 lists the power domains in the display subsystem.

Table 11-9. Display Subsystem Power Domains

Module Instance	Attributes
	Power Domain
Display subsystem	PD_DSS
DISPC	For more details, see Section 11.2.1 *DISPC Overview*, in *Display Controller*.
HDMI	For more details, see Section 11.3.1 *HDMI Overview*, in *High-Definition Multimedia Interface*.

11.1.2.3.1 Display Subsystem Standby Mode

As part of the system-wide power-management scheme, the display subsystem supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

- MStandby/MWait
  - DISPC
- SIdleReq/SIdleAck
  - DISPC
  - HDMI
  - DES_HDCP (key protection)
  - DSS interconnect

The PRCM module asserts the MWait and received MStandby directly from DISPC. When the display subsystem initiates a standby procedure, it also initiates a master standby/wait protocols with the PRCM module that lets the PRCM module cut the display subsystem clocks. For information about the conditions that allow the subsystem to exit standby mode, see Section 11.2.1 *DISPC Overview*, in *Display Controller*.

The PRCM also asserts the SIdleReq. Then, it is split at the display subsystem level and send to the appropriate modules. Consequently, all SIdleAck are merged into one and sent back to PRCM.

11.1.2.3.2

Figure 11-6 shows the generation of SIdleAck/MStandby in the display subsystem.

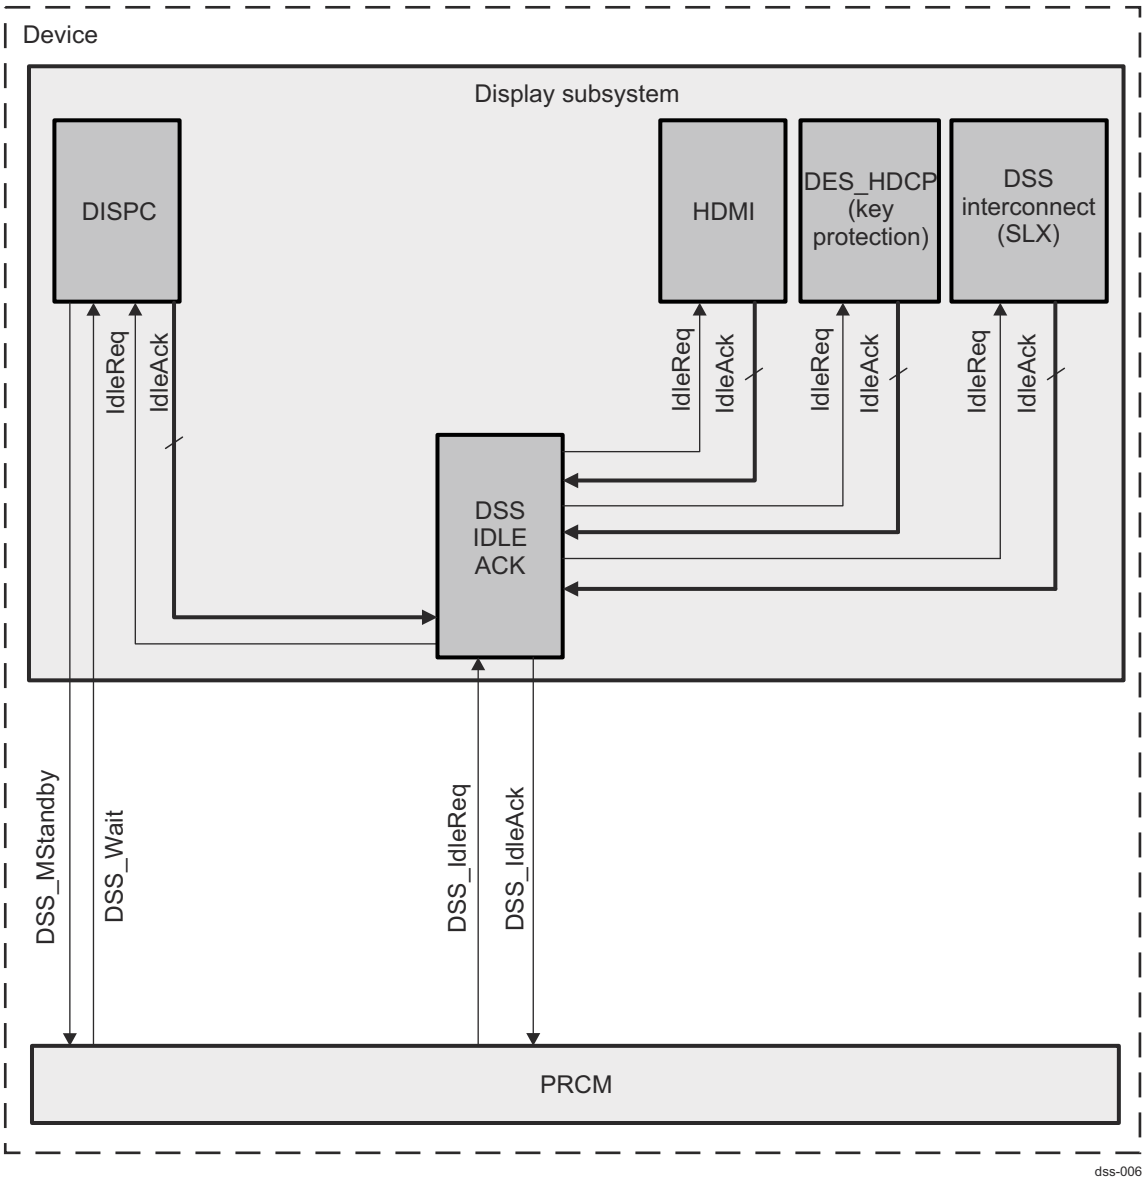

Figure 11-6. Display Subsystem SIdleAck/MStandby Generation

11.1.2.3.3 Display Subsystem Wake-Up Mode

The DISPC and HDMI modules support the wake-up protocol. DSS_HDMI_SWakeUp is associated with HMDI_IRQ, which is generated by the HDMI module. For the events that generate an Swakeup and the description and configuration of the registers, see the DISPC and HDMI TRM chapters.

Figure 11-7 shows wake-up generation in the display subsystem.

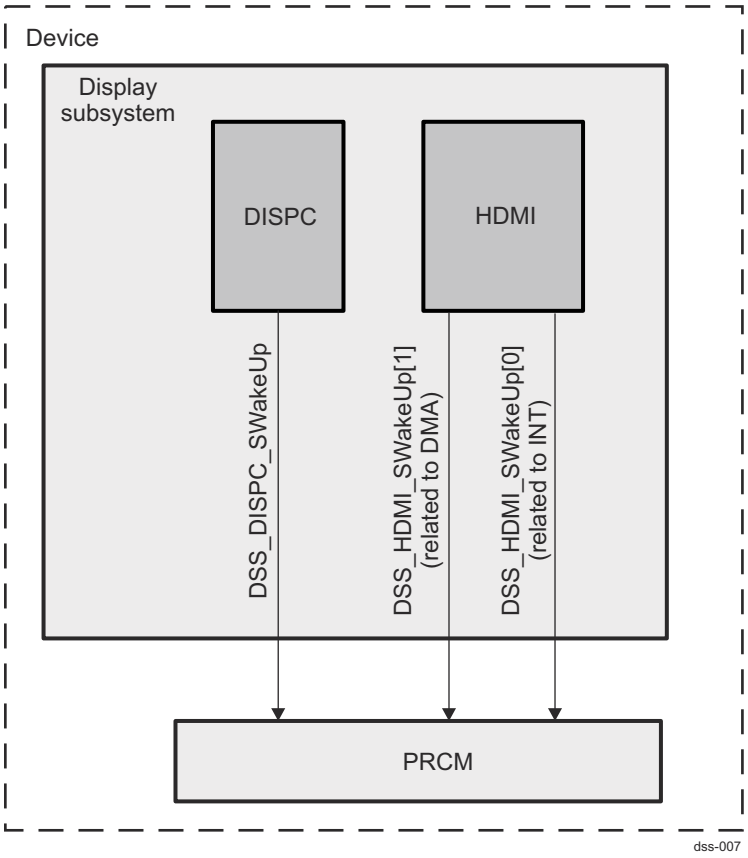

Figure 11-7. Display Subsystem Wake-Up Generation

11.1.3 Display Subsystem DPLL Controllers Functional Description

11.1.3.1 DPLL Controllers Overview

Two PLL controller modules are part of the display subsystem. They use the SCP and power-management port (PMP) as the primary interfaces. The SCP interface sets the configuration of the digital phase-locked loop (DPLL) and HSDIVIDER modules, primarily the various counter values. The PMP controls the power state of the DPLL and HSDIVIDER modules. Figure 11-8 is an overview of a single DPLL_VIDEO controller module in the display subsystem. For more information on DPLL_HDMI control, see Section 11.1.3.4, *DPLL_HDMI*.

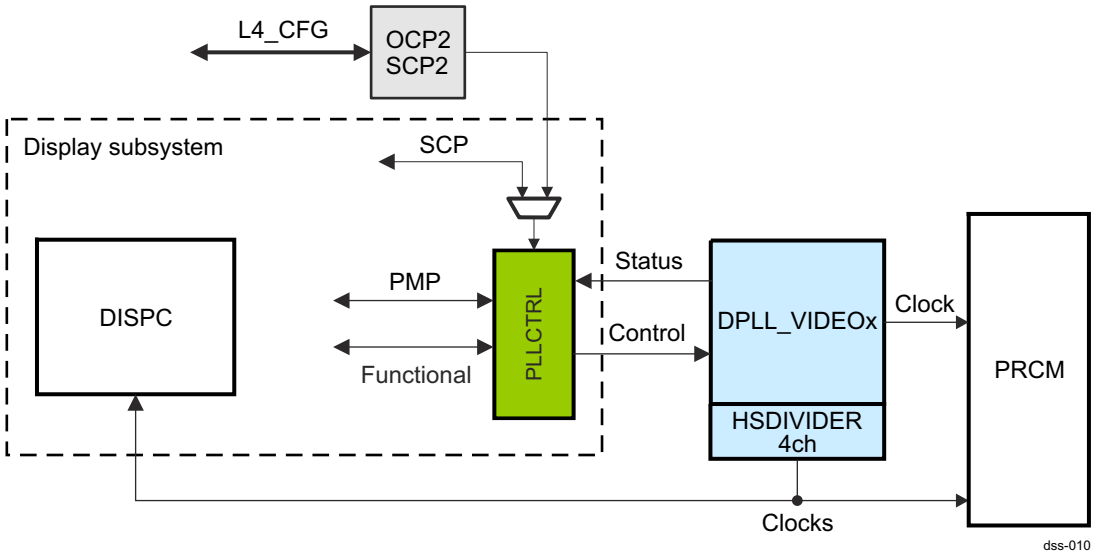

Figure 11-8. PLL Controller Overview

11.1.3.2 OCP2SCP2 Functional Description

In case DSS module is not used, DPLL_VIDEO1 and DPLL_HDMI can be still used to source other modules in the device. The OCP2SCP2 module, which serves as a L4_CFG interconnect adapter, lets user software configure the PLLCTRL for DPLL_VIDEO1 and DPLL_HDMI registers over the L4_CFG port. Figure 11-9 is an overview of the OCP2SCP2 bridge interface.

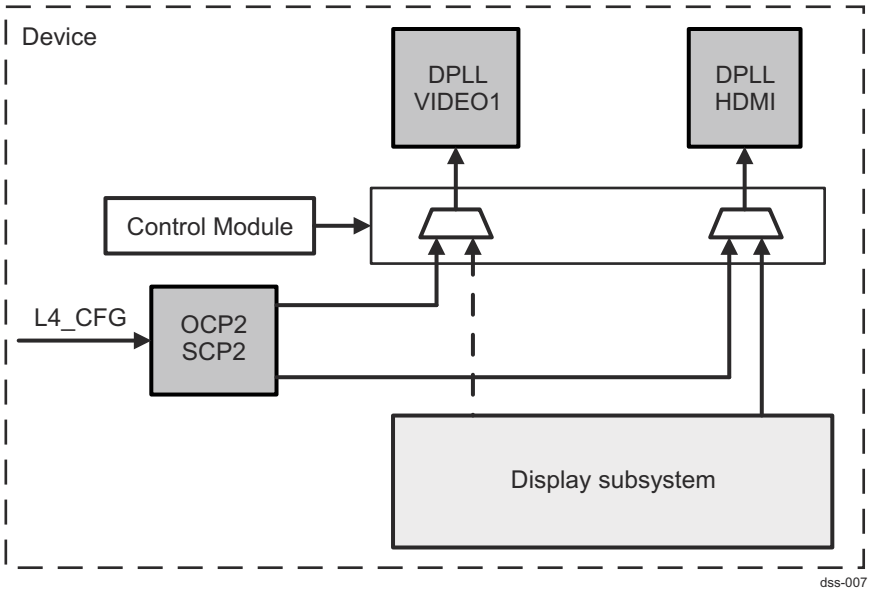

Figure 11-9. OCP2SCP2 Overview

Note

Selection of how DPLLs are controlled is done through registers DSS_PLL_CONTROL[0] PLL_VIDEO1_DSS_CONTROL_DISABLE and DSS_PLL_CONTROL[2] PLL_HDMI_DSS_CONTROL_DISABLE of the device Control Module. For more information, see *Control Module*.

11.1.3.2.1 OCP2SCP2 Reset

11.1.3.2.1.1 Hardware Reset

The module receives an asynchronous hardware reset (L3INIT_RST) upon power-on reset (POR) at its active low PIRSTNA input. For more information on the hardware reset source, see *Reset Domains*, in *Power, Reset, and Clock Management.*

11.1.3.2.1.2 Software Reset

Setting the OCP2SCP_SYSCONFIG[1] SOFTRESET bit to 1 triggers a software reset on the OCP2SCP2 interconnect adapter. The OCP2SCP_SYSSTATUS[0] RESETDONE bit is used by software to monitor the status of reset completion. Hardware keeps this bit it at 0 while the reset is being executed. A RESETDONE bit transition from 0 to 1 indicates the OCP2SCP2 reset is complete.

11.1.3.2.2 OCP2SCP2 Power Management

The OCP2SCP2 features idle acknowledgement protocol with the PRCM.

11.1.3.2.2.1 Idle Mode

The smart-idle mode supported by OCP2SCP2 is not wakeup capable, meaning that software should explicitly take care to wake the OCP2SCP2, setting the OCP2SCP_SYSCONFIG[4:3] IDLEMODE bit field to 0x1 (no-idle), once it has previously gone to an idle mode. For more information, see *Module-Level Clock Management*, in *Power, Reset, and Clock Management.*

Note

Software must get the OCP2SCP2 module out of IDLE state by setting the OCP2SCP_SYSCONFIG[4:3] IDLEMODE bit field to 0x1, once smart-ilde mode has been selected (OCP2SCP_SYSCONFIG[4:3] IDLEMODE = 0x2).

11.1.3.2.2.2 Clock Gating

OCP2SCP2 module has a local support for an automatic clock gating based on L4_CFG interconnect activity. This feature is enabled by setting the OCP2SCP2[0] AUTOIDLE bit to 0x1, otherwise the module interface clock is free running. For more information, see *Clock Domain-Level Clock Management*, in *Power, Reset, and Clock Management.*

11.1.3.2.3 OCP2SCP2 Timing Registers

The timing configuration register sets various parameters controlling the timing constraints of the OCP2SCP2 module. The division ratio between the L4_CFG interconnect clock - L3INIT_L4_GICLK and the serial configuration port output clock is set through the OCP2SCP_TIMING[9:7] DIVISIONRATIO bit field, with a valid range of 0x1 to 0x7. The OCP2SCP_TIMING[6:4] SYNC1 timing information is programmable in the range 0 to 7 clock cycles, and shows the acceptable delay between the enable and command availability on SCP. The value of OCP2SCP_TIMING[3:0] SYNC2 is also programmable in the range 1 to 15 clock cycles, measured from the moment the command is available on SCP until data is accessible.

11.1.3.3 DPLL_VIDEO Functional Description

11.1.3.3.1 DPLL_VIDEO Controller Architecture

VIDEO1 PLL use type-A instances of the DPLL modules. For information regarding DPLL types, see *Power, Reset, and Clock Management*.

Figure 11-10 shows the internal reference diagram of a single VIDEO PLL.

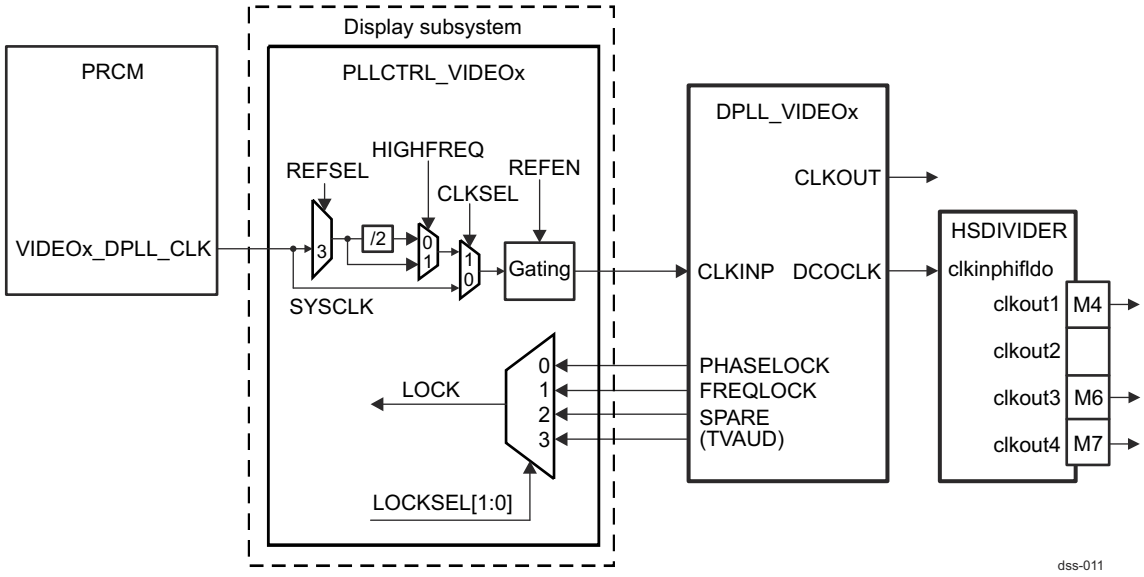

Figure 11-10. VIDEO PLL Reference Diagram

Reference clock control is enabled with PLL_CONFIGURATION2[13] PLL_REFEN bit.

Figure 11-11 is a simplified block diagram of the DPLL_VIDEO instance used for pixel clock generation.

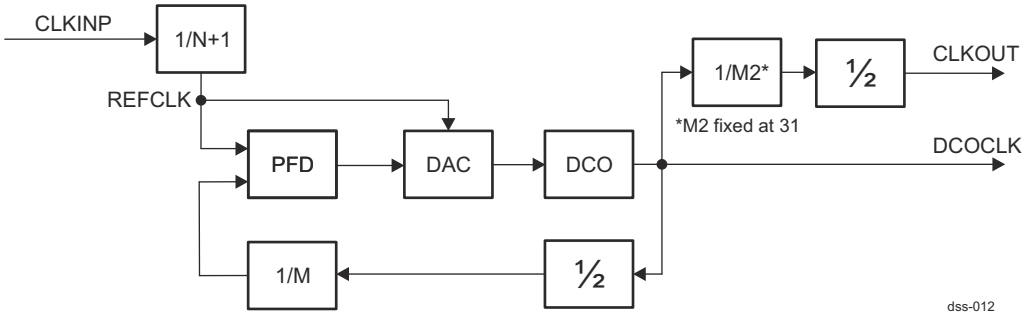

Figure 11-11. DPLL_VIDEO Functional Block Diagram

The input clock CLKINP goes to a pre-divider N + 1.The entire loop runs on the REFCLK clock after this pre-divider. The value of N + 1 is controlled through the PLL_CONFIGURATION1[8:1] PLL_REGN bit field. The CLKINP range is 0.032MHz to 52MHz. The REFCLK range is 0.15MHz to 52MHz.

The output clock DCOCLK is synthesized by a digitally controlled oscillator (the DCO block) that automatically detects the frequency range. The DCOCLK frequency can be given with DCOCLK = CLKINP × 2 × M / (N + 1). For that purpose the feedback multiplier M must be configured through the PLL_CONFIGURATION1[20:9] PLL_REGM bit field.

The CLKOUT frequency can be given with CLKOUT = DCOCLK / (M2 × 2) = DCOCLK / 62. The M2 divider value is hardcoded in HW at 31 (0x1F).

11.1.3.3.2 DPLL_VIDEO Operations

The PLL configuration signals operate according to Table 11-10, which indicates the operation when the PLLs are not locked.

Table 11-10. VIDEO PLL Operation Modes When Not Locked

PLL Operation Mode	Stop Mode Low Power(1)	Stop Mode Fast Relock(1)	Idle Bypass
Mode Description	Output clocks stopped Lowest power standby	Output clocks stopped Fastest start-up time	Selects when PLL and HSDIVIDER bypass clocks are used
PLL_CONFIGURATION2[0] PLL_IDLE	0	0	1
PLL_CONFIGURATION2[6] PLL_LOWCURRSTBY	1	0	1

(1) This mode must be used for better performance.

When locked, the PLL output frequency (DCOCLK) is: Input frequency × 2 × M / (N + 1), where:

- M multiplier is programmed in the PLL_CONFIGURATION1[20:9] PLL_REGM bit field.
- N divider is programmed in the PLL_CONFIGURATION1[8:1] PLL_REGN bit field.

Note

When the PLL_REGM bit field is set to 1, the PLL enters a MN-Bypass mode. The DCOCLK clock output goes low and remains low until the PLL exits MN-Bypass mode (by changing the PLL_REGM bit field to a value other than 0 or 1).

11.1.3.3.3 DPLL_VIDEO Error Handling

The PLL lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The PLL_STATUS[1] PLL_LOCK status bit gives the VIDEOx PLL lock state.
- The PLL_STATUS[2] PLL_RECAL status bit informs whether the PLL must be uncalibrated.

11.1.3.3.4 DPLL_VIDEO Software Reset

The VIDEO PLL control module does not have its own software reset. It is reset by the global DSS_RST signal at PRCM module level. See Section 11.1.2.2, *Display Subsystem Resets*. Nevertheless, software users can monitor the reset statuse of the VIDEO PLL control module by reading the PLL_STATUS[0] PLLCTRL_RESET_DONE status bits.

11.1.3.3.5 DPLL_VIDEO Power Management

PLLCTRL manages only the LDO power of the DPLL and HSDIVIDER; this is done by overriding the SYSRESET signals. All other power-management signals are integrated with the display subsystem power management.

The PMP is used to manage the LDO power of the VIDEO digital phase-locked loop (DPLL) through the PLLCTRL module.

Figure 11-12 shows the power states, which can be controlled through DSI_CLK_CTRL[31:30] PLL_PWR_CMD bit field.

The PLLCTRL power status can be read through the DSI_CLK_CTRL [29:28] PLL_PWR_STATUS bit field.

- OFF power state: PLLCTRL is powered down. Internal clock is off.
- ONHSCLK: Power command received
- ONDIV: Clock dividers set.
- ONALL: PLLCTRL is in active state.

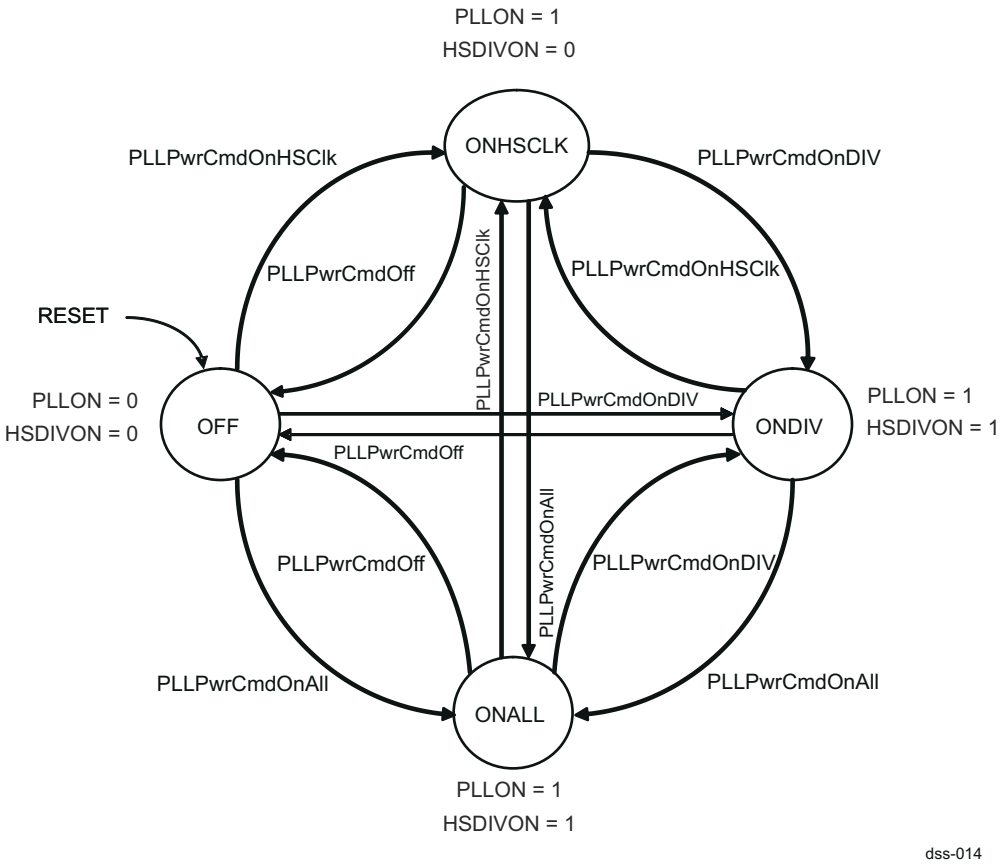

Figure 11-12. VIDEO PLL Power State Diagram

11.1.3.3.6 DPLL_VIDEO HSDIVIDER Loading Operation

In manual mode (PLL_CONTROL[0] PLL_AUTOMODE = 0), it is possible to update the configuration values of HSDIVIDER without starting the DPLL locking sequence. Once all the configuration values have been programmed into the registers, the PLL_GO[1] HSDIVLOAD bit must be set. The TENABLEDIV output is driven high for six SCP clock periods while the TINITZ and TENABLE signals remain unchanged. The HSDIVLOAD bit is cleared at the end of the sequence.

The SCPBUSY signal is high during the sequence until the HSDIVLOAD bit is cleared, thus indicating that there is pending activity in the SCPClk domain. SCPClk must be kept running while this signal is asserted.

The HSDIVIDER sequence and the GO sequence cannot be performed at the same time. If one of the two sequences is running and the trigger bit of the other sequence is set, PLLCTRL finishes the first sequence and then immediately starts the other sequence.

11.1.3.3.7 DPLL_VIDEO Clock Sequence

The VIDEO PLL generates DCOCLK clock to a dedicated HSDIVIDER, which outputs three clocks (clkout1, clkout3, clkout4). If these three clocks are not used, the HSDIVIDER functions are not required.

In addition, a CLKOUT clock is also generated. It is output directly, and does not go through HSDIVIDER.

The following must be considered for Figure 11-13:

- REGM factor is programmed by the PLL_CONFIGURATION1[20:9] PLL_REGM bit field. It is used to tune DCOCLK clock.
- REGN factor is programmed by the PLL_CONFIGURATION1[8:1] PLL_REGN bit field. It is used to tune DCOCLK clock.

- M4REG factor is programed by the PLL_CONFIGURATION1[25:21] M4_CLOCK_DIV bit field, and applies to clkout1 of the DPLL_VIDEO HSDIVIDER.
- M6REG factor is programmed by the PLL_CONFIGURATION3[4:0] M6_CLOCK_DIV bit field, and applies to clkout3 of the DPLL_VIDEO HSDIVIDER.
- M7REG factor is programmed by the PLL_CONFIGURATION3[9:5] M7_CLOCK_DIV bit field, and applies to clkout4 of the DPLL_VIDEO HSDIVIDER.
- M2 divider is hardcoded in HW at 31 (0x1F), and applies to CLKOUT.

Figure 11-13 shows the programming sequence.

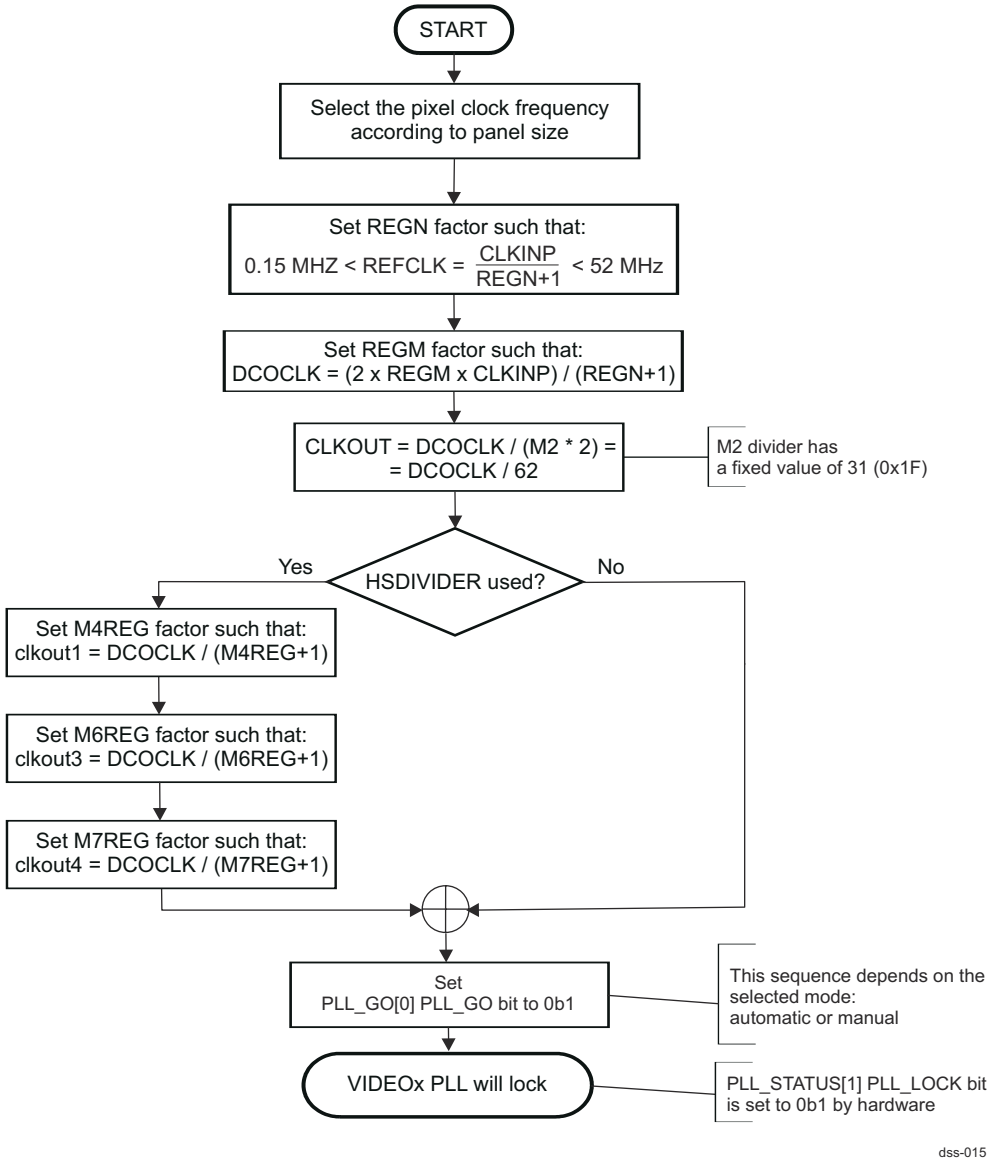

Figure 11-13. VIDEO PLL Programming Sequence

Note

- Most of the VIDEO PLL programming values are available for software flexibility, but it is not recommended to update the values in normal use. For the recommended VIDEO PLL values, see Section 11.1.3.3.9, *VIDEO PLL Recommended Values*.

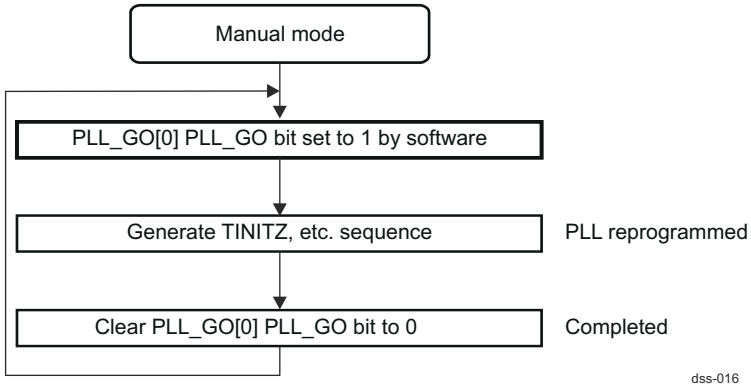
11.1.3.3.8 DPLL_VIDEO Go Sequence

In manual mode (the PLL_CONTROL[0] PLL_AUTOMODE bit is set to 0), the DPLL requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DPLL. The PLL_GO[0] PLL_GO bit is cleared to 0 at the end of the sequence.

The TENABLEDIV signal is shared with the HSDIVIDER module so that it is programmed at the same time. In this mode, software must deassert CLKINEN by setting the PLL_CONFIGURATION2[14] PHY_CLKINEN bit to 0 and assert HSDIVBYPASS correctly by setting the PLL_CONFIGURATION2[20] HSDIVBYPASS bit to 1 to prevent uncontrolled frequencies affecting the display subsystem or the other modules using DPLL_VIDEO during PLL locking. In manual mode, the shadow register is updated anyway so that valid values are present when later selecting automatic mode.

Figure 11-14 shows the VIDEO PLL Go flow chart in manual mode (the PLL_CONTROL[0] PLL_AUTOMODE bit is set to 0).

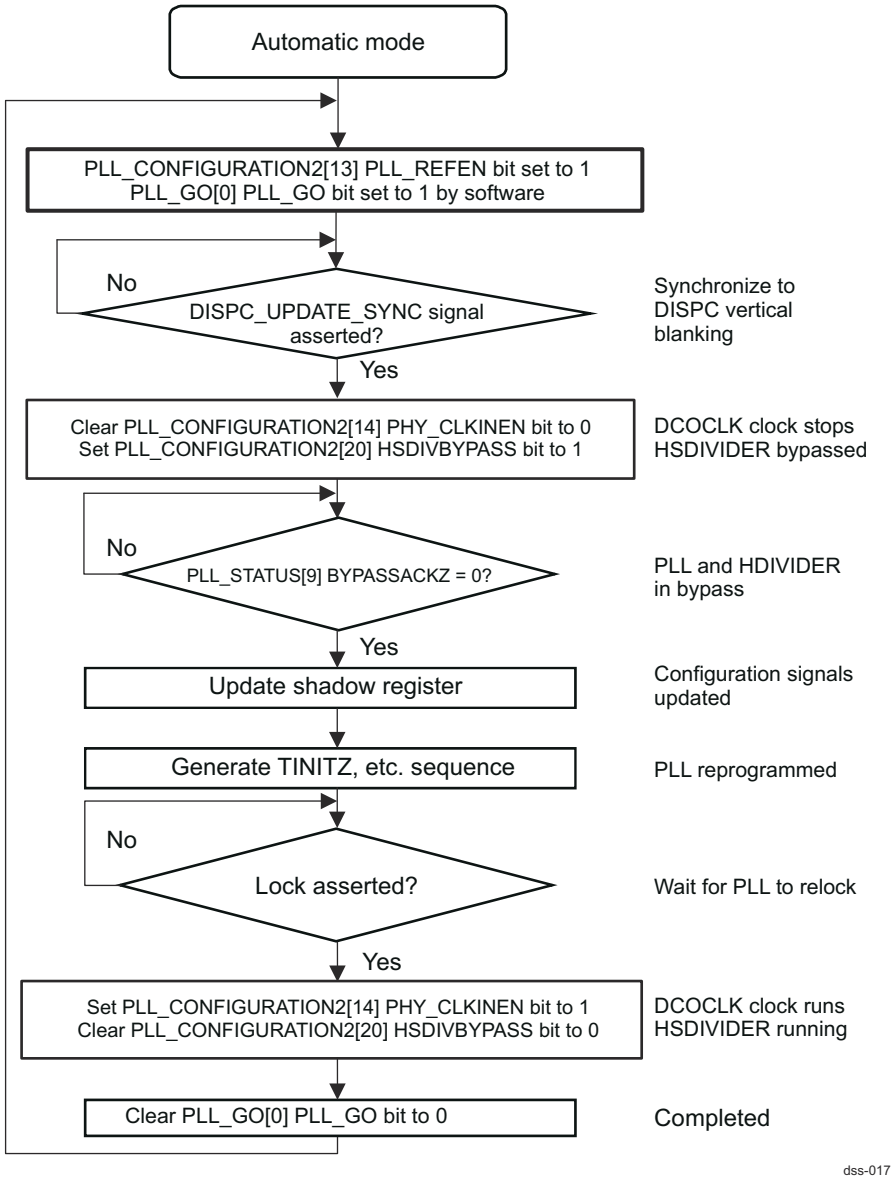


All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

Figure 11-14. VIDEO PLL Go Sequence (Manual Mode)

In automatic mode (the PLL_CONTROL[0] PLL_AUTOMODE bit is set to 1), the TINITZ, TENABLE, and TENABLEDIV sequence and the update of the PLL configuration from the PLL_CONFIGURATION2 register are deferred until the time of the front porch time signal sent by the DISPC module. This is intended to simplify the software to implement a configuration change (such as a frequency change to support a different link bandwidth). In this mode, CLKINEN, HSDIVBYPASS, and REFEN are automatically controlled and the register value is overridden.

Figure 11-15 shows the VIDEO PLL Go flow chart in automatic mode (the PLL_CONTROL[0] PLL_AUTOMODE bit is set to 1).



All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

Figure 11-15. VIDEO PLL Go Sequence (Automatic Mode)

11.1.3.3.9 DPLL_VIDEO Recommended Values

Table 11-11 shows the recommended values for PLL configuration.

Table 11-11. DPLL_VIDEO Recommended Programming Values

Field Name	Value	Description
PLL_CONTROL[4] HSDIV_SYSRESET	0	Allow power FSM to control
PLL_CONTROL[3] PLL_SYSRESET	0	Allow power FSM to control
PLL_GO[0] PLL_GO	1–>0	Write 1 when PLL is to be (re)locked with new parameters. This bit is cleared by hardware when the PLL request completes.
PLL_CONFIGURATION2[20] HSDIVBYPASS	0	PLL controls HSDIVIDER bypass
PLL_CONFIGURATION2[16] M4_CLOCK_EN or PLL_CONFIGURATION2[23] M6_CLOCK_EN or PLL_CONFIGURATION2[25] M7_CLOCK_EN	1	If PLL/HSDIVIDER is used as the clock source

Table 11-11. DPLL_VIDEO Recommended Programming Values (continued)

Field Name	Value	Description
PLL_CONFIGURATION2[14] PHY_CLKINEN	1	Enable DCOCLK clock
PLL_CONFIGURATION2[13] PLL_REFEN	1	Enable PLL reference
PLL_CONFIGURATION2[10:9] PLL_LOCKSEL	0x0	Phase lock criteria to lock the PLL
PLL_CONFIGURATION2[8] PLL_DRIFTGUARDEN	0x0	The RECAL status/interrupt must be used to decide when to perform a PLL uncalibration. No automatic uncalibration is performed.
PLL_CONFIGURATION2[6] PLL_LOWCURRSTDBY	0/1	Set to 0 for fast PLL unlock, but higher standby current. Set to 1 for leakage level standby current, but longer unlock time.
PLL_CONFIGURATION2[5] PLL_PLLLPMODE	0	Normal operation. For smaller display sizes, it may be possible to set to 1.
PLL_CONFIGURATION2[0] PLL_IDLE	0	PLL active

11.1.3.4 DPLL_HDMI Functional Description

11.1.3.4.1 DPLL_HDMI and PLLCTRL_HDMI Overview

The DPLL_HDMI control module (PLLCTRL_HDMI) uses the SCP and PMP as the primary interfaces to the HDMI module. The SCP interface is used to set the configuration of the digital phase-locked loop (DPLL) module, primarily the various counter values. The PMP is used to control the power state of the DPLL_HDMI module.

Figure 11-16 shows an overview of the PLLCTRL_HDMI and DPLL_HDMI modules in the display subsystem.

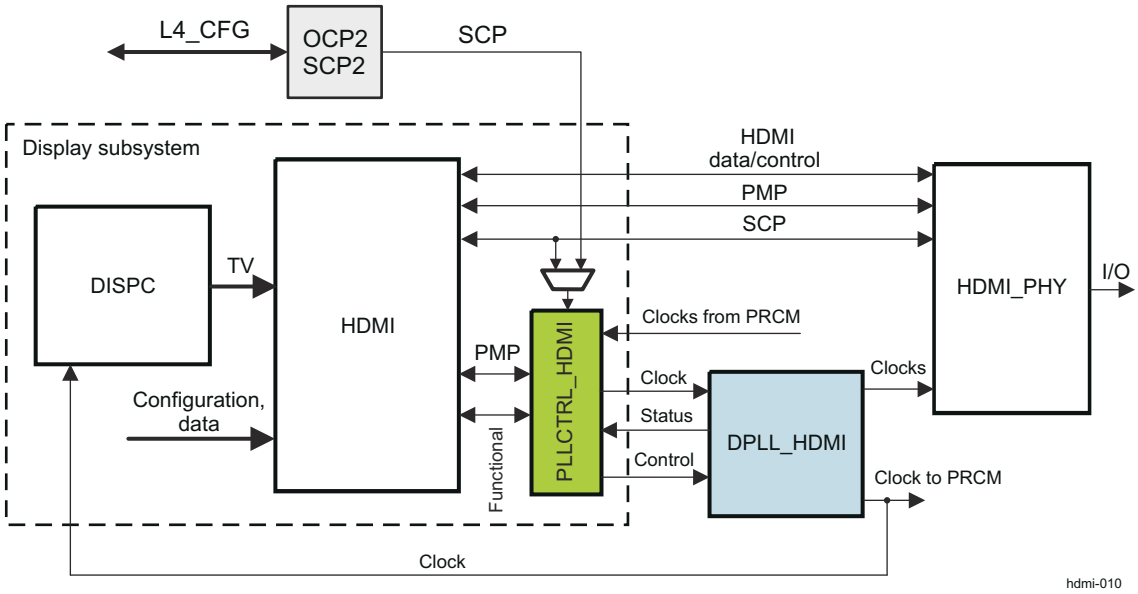


Figure 11-16. DPLL_HDMI and PLLCTRL_HDMI Overview

Note

The PLLCTRL_HDMI module does not have an interface to L3_MAIN interconnect. The programmable features are managed by registers mapped into the HDMI_WP module.

11.1.3.4.2 DPLL_HDMI and PLLCTRL_HDMI Architecture

The DPLL_HDMI uses instance of the DPLL module of type B. For information regarding DPLL types, see *PRCM.*

Figure 11-17 shows the internal reference diagram of the DPLL_HDMI and PLLCTRL_HDMI interconnection in the device.

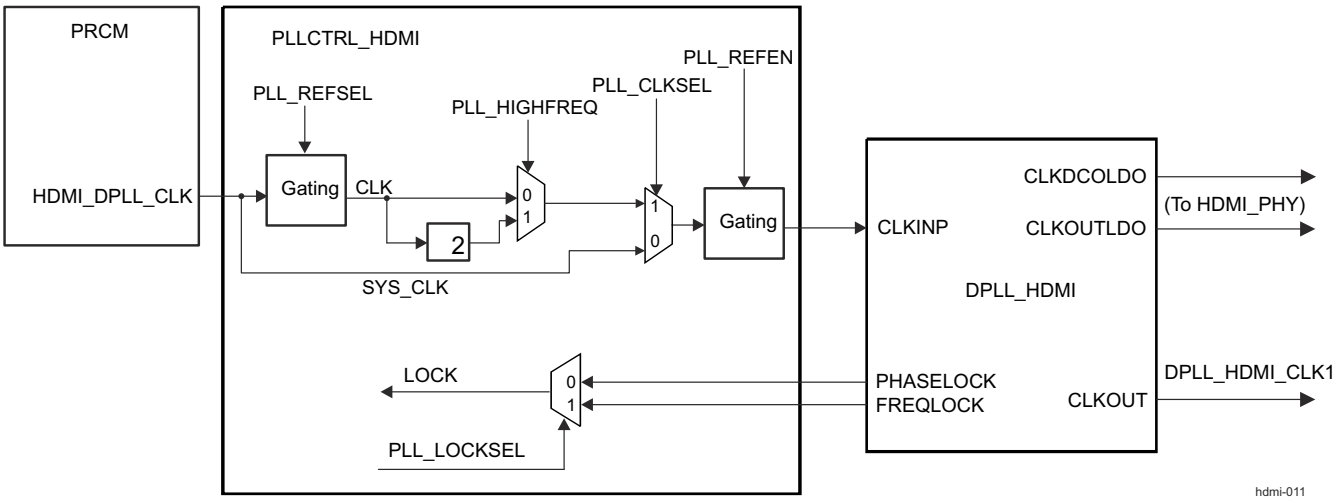

Figure 11-17. DPLL_HDMI and PLLCTRL_HDMI Reference Diagram

Figure 11-18 shows a simplified block diagram of the DPLL instance used for the DPLL_HDMI.

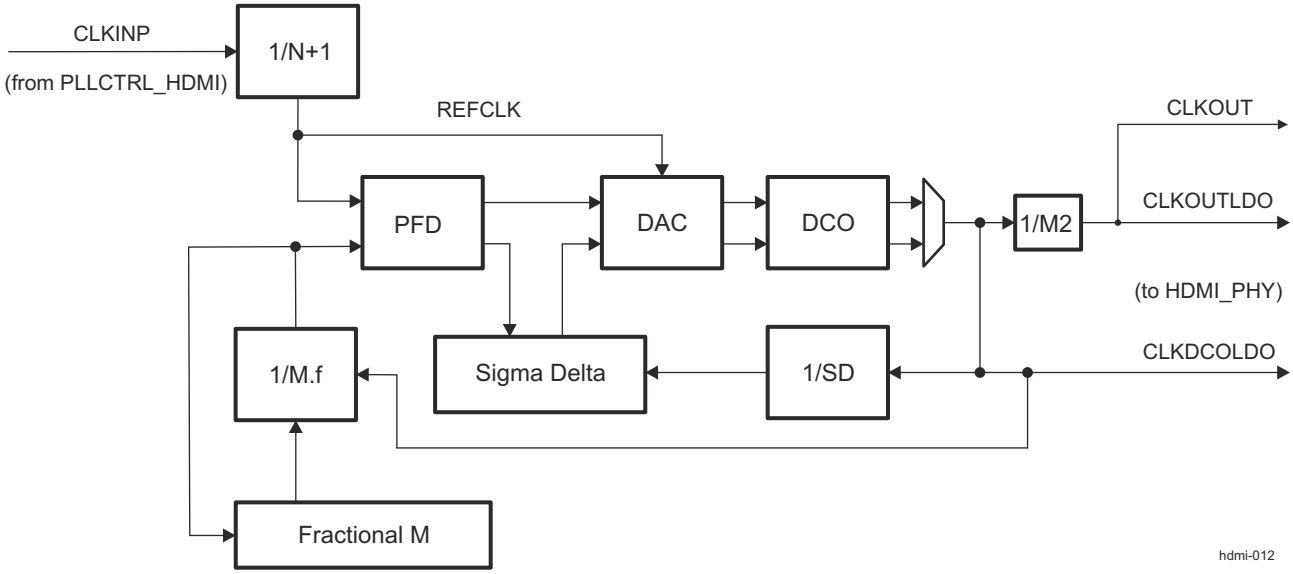

Figure 11-18. DPLL_HDMI Functional Block Diagram

The DPLL input clock CLKINP goes to a predivider N + 1. The entire loop runs on the REFCLK clock after this predivider. The value of N + 1 is controlled through the PLLCTRL_HDMI_CONFIGURATION1[8:1] PLL_REGN bit field. The CLKINP range is 0.62 to 60MHz. The REFCLK range is 0.62 to 2.5MHz.

The output clock CLKDCOLDO is synthesized by a digitally controlled oscillator (DCO block). The CLKDCOLDO frequency can be given with CLKDCOLDO = CLKINP × M/(N + 1). For this purpose, the feedback multiplier M must be configured through the PLLCTRL_HDMI_CONFIGURATION1[20:9] PLL_REGM bit field. The frequency range of the DCO must be selected via the PLLCTRL_HDMI_CONFIGURATION2[3:1] PLL_SELFREQDCO register bit-field depending on the CLKDCOLDO frequency.

The DPLL module supports fractional synthesis. That is, the frequency multiplication factor M can be programmed as fractional. This is done through the use of a sigma-delta feedback divider (M). A fractional value

(REGM.f) of 18 bits is supported, thereby enabling control for better accuracy. Programming the fractional value is done by setting the PLLCTRL_HDMI_CONFIGURATION4[17:0] PLL_REGM_F bit field. Fractional synthesis is not supported for M > 4093. For integer only division the PLL_REGM_F bit-field must be set to 0x00000.

The programming of the sigma-delta feedback divider is mandatory to get the optimal jitter performance. The value is determined by PLL_SD = ceiling ((M/(N + 1)) × CLKINP/250), and can be programmed into the PLLCTRL_HDMI_CONFIGURATION3[17:10] PLL_SD register bit-field.

11.1.3.4.3 DPLL_HDMI Operations

Note

The DPLL_HDMI must be configured before any transfer on the HDMI link. The HDMI module is fully operational only when the DPLL_HDMI runs and provides the TMDS clock.

The DPLL_HDMI configuration signals operate according to Table 11-12, which indicates the operation when the DPLL is not locked.

Table 11-12. DPLL_HDMI Operation Modes When Not Locked

DPLL_HDMI Operation Mode	Idle Bypass
Mode Description	Selects when DPLL_HDMI Bypass Clocks Are Used
PLLCTRL_HDMI_CONFIGURATION2[0] PLL_IDLE	1

When locked, the DPLL_HDMI output frequency is:

- For CLKOUT output: [(M+M.f)/(N+1)] * CLKINP * [1/M2]
- For CLKOUTLDO output: [(M+M.f)/(N+1)] * CLKINP * [1/M2]
- For CLKDCOLDO output: [(M+M.f)/(N+1)] * CLKINP

CLKINP is the input frequency in MHz. The divider and multiplier values in the above formulas can be set through the following registers:

- M frequency multiplier is programmed in the PLLCTRL_HDMI_CONFIGURATION1[20:9] PLL_REGM bit field.
- Fractional M (if fractional M divider is required by the use case) is programmed in the PLLCTRL_HDMI_CONFIGURATION4[17:0] PLL_REGM_F bit field
- N divider is programmed in the PLLCTRL_HDMI_CONFIGURATION1[8:1] PLL_REGN bit field.
- M2 divider is programmed in the PLLCTRL_HDMI_CONFIGURATION4[24:18] PLL_REGM2 bit field.
- SD divider is programmed in the PLLCTRL_HDMI_CONFIGURATION3[17:10] PLL_SD bit field.

Note

When the PLL_REGM bit field is set to 1, the DPLL enters a MN-Bypass mode. This is a low-power mode, where the DPLL gates its internal clocks and powers down the analog blocks. The CLKDCOLDO and CLKOUTLDO clock outputs go low and remain like that until the DPLL exits MN-Bypass mode (by changing the PLL_REGM bit-field to a value other than 0 or 1).

Note

The DPLL_HDMI must be configured before any data transfer to HDMI_PHY.

11.1.3.4.4 DPLL_HDMI Register Access

The configuration registers are accessed through the HDMI module register spaces using the SCP interface. This includes all the configuration signals and returning status signals.

CAUTION

All writes must be 32-bit operations because the SCP interface always transfers 32 bits; 16- or 8-bit operations can lead to unpredictable errors.

11.1.3.4.5 DPLL_HDMI Error Handling

The DPLL_HDMI lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The PLLCTRL_HDMI_STATUS[1] PLL_LOCK bit gives the DPLL_HDMI lock state.
- The PLLCTRL_HDMI_STATUS[2] PLL_RECAL bit informs whether the PLL must be recalibrated.

These signals can also generate interrupts at the HDMI module level.

The PLL reference loss status signal can also be monitored:

- The PLLCTRL_HDMI_STATUS[3] PLL_LOSSREF bit informs whether the DPLL_HDMI has lost the reference clock.

11.1.3.4.6 DPLL_HDMI Software Reset

The PLLCTRL_HDMI module does not have its own software reset. It is reset by the HDMI module. Nevertheless, the reset status of the PLLCTRL_HDMI module can be monitored by reading the PLLCTRL_HDMI_STATUS[0] PLLCTRL_RESET_DONE bit.

11.1.3.4.7 DPLL_HDMI Power Management

The PLLCTRL_HDMI manages only the LDO power of the DPLL_HDMI. This is done by overriding the SYSRESET signal. All other power-management signals are integrated with the display subsystem power management.

The PMP is used to manage the LDO power of the HDMI_DPLL through the PLLCTRL_HDMI module.

Figure 11-19 shows the power states, which can be controlled through HDMI_WP_PWR_CTRL[3:2] PLL_PWR_CMD bit field.

The PLLCTRL_HDMI power status can be read through the HDMI_WP_PWR_CTRL[1:0] PLL_PWR_STATUS bit field.

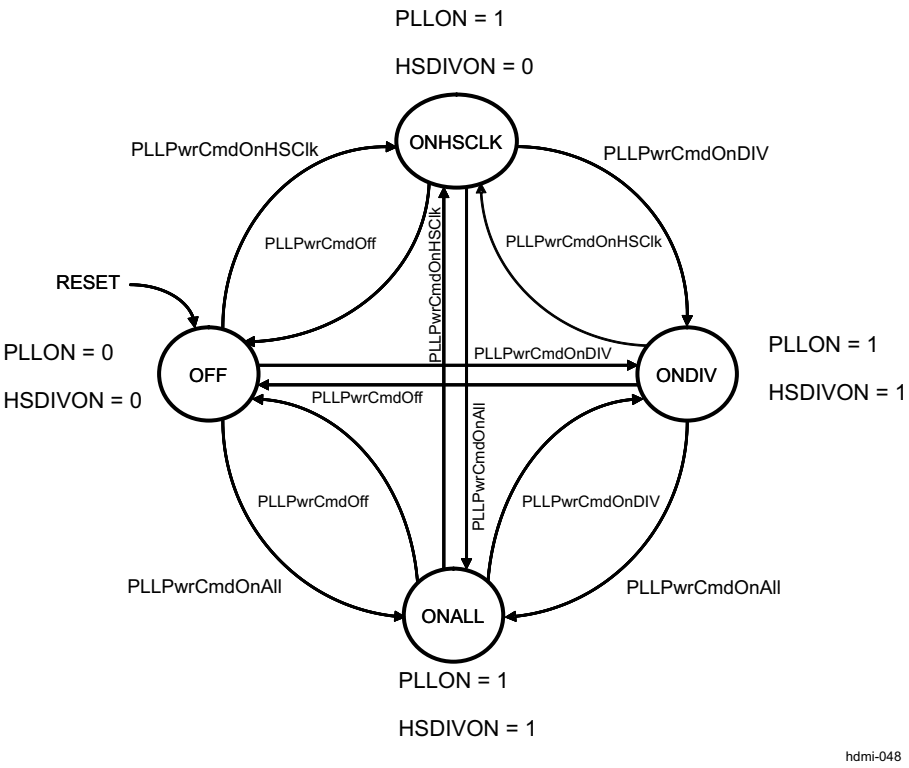

Figure 11-19. PLLCTRL_HDMI Power State Diagram

- OFF power state: PLLCTRL_HDMI is powered down. Internal clock is off.
- ONHSCLK: Power command received
- ONDIV: Clock dividers set.
- ONALL: PLLCTRL_HDMI is in active state.

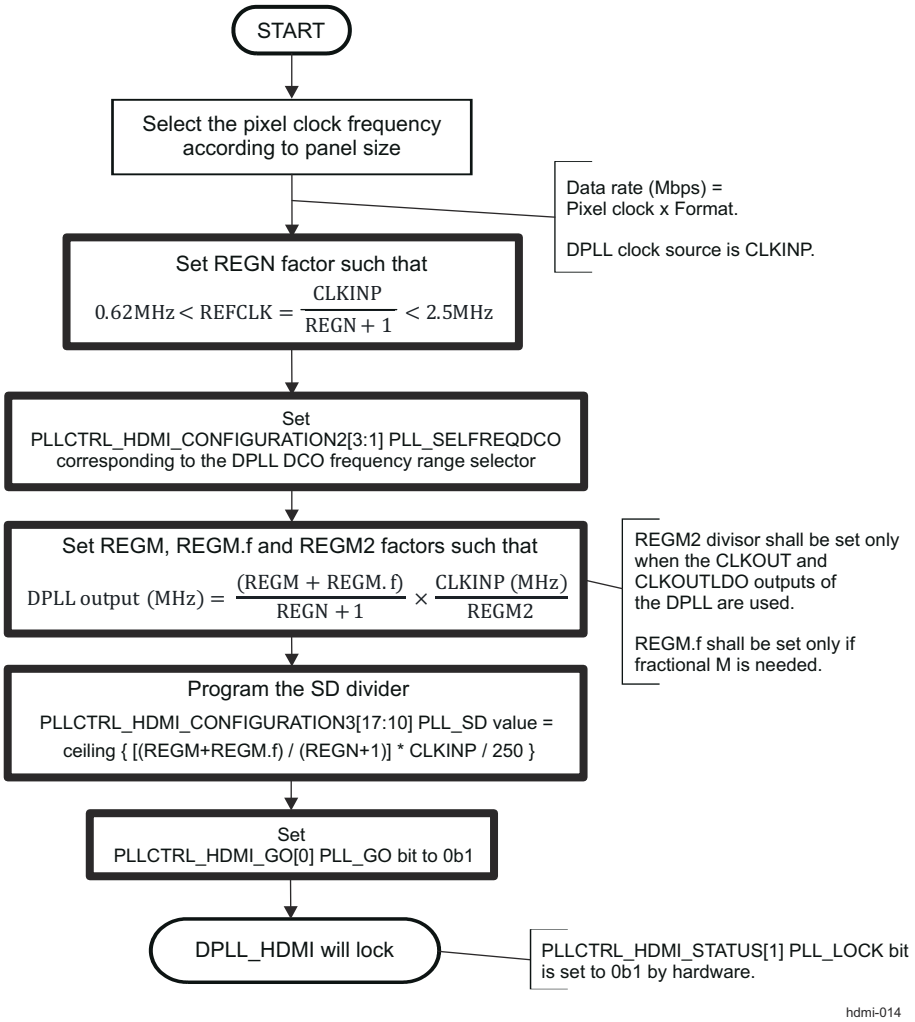
11.1.3.4.8 DPLL_HDMI Lock Sequence

The DPLL_HDMI generates the clocks to the HDMI_PHY module and the DPLL_HDMI_CLK1 clock used by the DISPC and various system modules.

The DPLL_HDMI factors must be calculated based on the required input and output frequencies, keeping the DPLL_HDMI internal reference frequency in the appropriate range:

- REGM factor is programmed in the PLLCTRL_HDMI_CONFIGURATION1[20:9] PLL_REGM bit field.
- REGM.f factor (if fractional M divider is required by the use case) is programmed in the PLLCTRL_HDMI_CONFIGURATION4[17:0] PLL_REGM_F bit field.
- REGN factor is programmed in the PLLCTRL_HDMI_CONFIGURATION1[8:1] PLL_REGN bit field.
- REGM2 factor is programmed in the PLLCTRL_HDMI_CONFIGURATION4[24:18] PLL_REGM2 bit field.
- SD divider is programmed in the PLLCTRL_HDMI_CONFIGURATION3[17:10] PLL_SD bit field.

Figure 11-20 shows the programming sequence.



All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

Figure 11-20. DPLL_HDMI Programming Sequence

Table 11-13 summarizes the registers for the DPLL_HDMI programming sequence.

Table 11-13. DPLL_HDMI Register Call Summary for HDMI PLL Programming Sequence

Register Name	Register Name	Register Name	Register Name	Register Name
PLLCTRL_HDMI_CONFIGURATION2	PLLCTRL_HDMI_GO	PLLCTRL_HDMI_STATUS	PLLCTRL_HDMI_CONFIGURATION3	PLLCTRL_HDMI_CONFIGURATION4

Note

The following should be considered for the programming sequence in Figure 11-20:

- The equation for the DPLL output applies to both CLKDCOLDO and CLKOUTLDO outputs of the DPLL_HDMI. The REGM2 divisor value must be considered only in case the CLKOUTLDO frequency needs to be calculated. Programming of REGM.f is needed only if fractional M divider is required by the use case.
- The DPLL_HDMI_CLK1 clock is sourced from the CLKDCOLDO output of the DPLL_HDMI:
  - The DPLL_HDMI_CLK1 frequency must be a multiple of the PCLK frequency (for proper settings of the PCD and LCD factors in the DISPC).
  - The DPLL_HDMI_CLK1 frequency must be lower than 186 MHz.
- The PLLCTRL_HDMI_CONFIGURATION2[3:1] PLL_SELFREQDCO register bit field should be programmed depending on the value of CLKDCOLDO = CLKINP × M/(N + 1). See Section 11.1.3.4.3, *DPLL_HDMI Operations*.
- Programming of other DPLL_HDMI parameters is available for software flexibility, but it is not recommended to update their values in normal use. For the recommended DPLL_HDMI values, see Section 11.1.3.4.10, *DPLL_HDMI Recommended Values*.

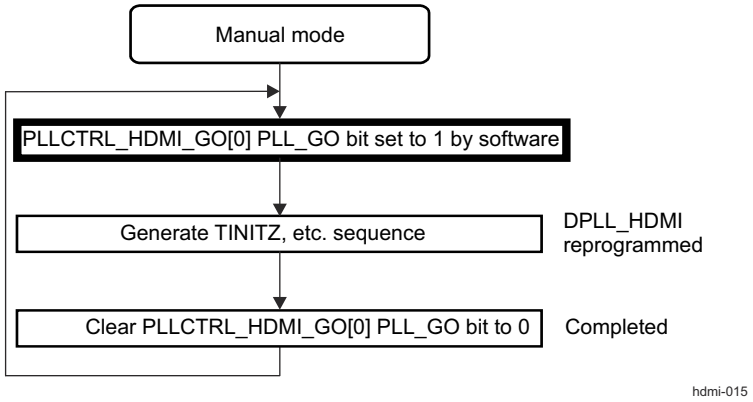
11.1.3.4.9 DPLL_HDMI Go Sequence

The DPLL_HDMI controller works in manual mode. In this mode the DPLL_HDMI requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DPLL_HDMI. The PLLCTRL_HDMI_GO[0] PLL_GO bit is cleared to 0 at the end of the sequence.

In this mode, software must deassert CLKINEN by resetting the PLLCTRL_HDMI_CONFIGURATION2[14] PHY_CLKINEN bit to 0 to prevent uncontrolled frequencies affecting HDMI_PHY and the display subsystem during DPLL_HDMI locking.

Figure 11-21 shows the PLLCTRL HDMI GO flow chart in manual mode.



All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

Figure 11-21. DPLL_HDMI GO Sequence (Manual Mode)

11.1.3.4.10 DPLL_HDMI Recommended Values

Table 11-14 lists the main DPLL_HDMI and PLLCTRL_HDMI recommended values.

Table 11-14. DPLL_HDMI Recommended Programming Values

Field Name	Value	Description
PLLCTRL_HDMI_GO[0] PLL_GO	1 - 0	Write 1 when DPLL_HDMI is to be (re)locked with new parameters. This bit is cleared to 0 by hardware when the DPLL_HDMI request completes.

Table 11-14. DPLL_HDMI Recommended Programming Values (continued)

Field Name	Value	Description
PLLCTRL_HDMI_CONFIGURATION1[20:9] PLL_REGM	See (1)	DPLL_HDMI feedback clock divider.
PLLCTRL_HDMI_CONFIGURATION4[17:0] PLL_REGM_F	See (1)	Fractional part of the DPLL_HDMI feedback clock divider. Must be kept at 0, if integer divider only will be used.
PLLCTRL_HDMI_CONFIGURATION1[8:1] PLL_REGN	See (1)	DPLL_HDMI reference clock divider.
PLLCTRL_HDMI_CONFIGURATION2[15] BYPASSEN	0	When this bit is 0, the CLKOUT clock depends on the DPLL_HDMI configuration (DPLL locked). For small displays, it may be possible to use the functional clock, in which case this bit must be set to 1. When 1, the internal DPLL_HDMI configuration path is bypassed, and CLKINP is sent on the CLKOUT output.
PLLCTRL_HDMI_CONFIGURATION2[14] PHY_CLKINEN	1	Enable DPLL_HDMI clock output to HDMI_PHY.
PLLCTRL_HDMI_CONFIGURATION2[13] PLL_REFEN	1	Enable the DPLL_HDMI reference clock.
PLLCTRL_HDMI_CONFIGURATION2[10:9] PLL_LOCKSEL	0x0	Phase-lock criteria to lock the DPLL_HDMI.
PLLCTRL_HDMI_CONFIGURATION2[8] PLL_DRIFTGUARDEN	0	The RECAL status/interrupt must be used to decide when to perform a DPLL_HDMI uncalibration. No automatic uncalibration is performed.
PLLCTRL_HDMI_CONFIGURATION2[3:1] PLL_SELFREQDCO	See (1)	Must be programmed based on the DPLL_HDMI lock frequency.
PLLCTRL_HDMI_CONFIGURATION2[0] PLL_IDLE	0	DPLL_HDMI active.
PLLCTRL_HDMI_CONFIGURATION3[17:10] PLL_SD	See (1)	Sigma-delta divider = ceiling { [PLL_REGM / (PLL_REGN+1)] * CLKINP(MHz) / 250 }

(1) The value of the bit field must be set according to the desired clock frequency.

11.1.4 Display Subsystem Programming Guide

This section provides recommended steps for initializing the DSS module.

Table 11-15. DSS Initialization Sequence

Step	Register / Bit Field / Chapter	Value
Enable DSS clock domain		
Configure DPLL_PER and associated HS12 divider, according to the desired DSS_GFCLK frequency	Refer to *Power, Reset, and Clock Management*, section *DPLL_PER Description*	-
Enable DES_HDCP clock	Set CTRL_CORE_CONTROL_IO_2[0] DSS_DESHDCP_CLKEN register bit; Refer to *Control Module Register Manual*	0x1
Set SW wake-up transition for DSS clock domain	Set CM_DSS_CLKSTCTRL[1:0] CLKTRCTRL register bitfield; Refer to *PRCM Register Manual*	0x2
Enable (ungate) DSS_GFCLK clock	Set CM_DSS_DSS_CLKCTRL[8] OPTFCLKEN_DSSCLK register bit; Refer to *PRCM Register Manual*	0x1
Enable DSS clocks	Set CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE register bitfield; Refer to *PRCM Register Manual*	0x2
Wait for DSS idle status (functional or in idle mode)	Read CM_DSS_DSS_CLKCTRL[17:16] IDLEST register bit-field; Refer to *PRCM Register Manual*	0x0 or 0x2
Make DSS DPLLs accessible via DSS address space		
Make VIDEO1 and HDMI DPLLs accessible via DSS	Clear the following bits in CTRL_CORE_DSS_PLL_CONTROL register: [2] PLL_HDMI_DSS_CONTROL_DISABLE bit; [0] PLL_VIDEO1_DSS_CONTROL_DISABLE bit; Refer to *Control Module Register Manual*	0x0
Enable DSS internal SCP interface		
Enable DSS internal SCP interface for VIDEO1 register configuration	Set DSI_CLK_CTRL[14] CIO_CLK_ICG register bit	0x1
Configure DSS internal SCP interface for HDMI DPLL register configuration	Set HDMI_WP_CLK[10:8] SCP_PWR_DIV register bit-field	0x-
Configure DSS DPLLs		
Enable (ungate) VIDEO1 and HDMI DPLLs source clocks	Set the following bits in CM_DSS_DSS_CLKCTRL register: [12] OPTFCLKEN_VIDEO1_CLK bit; [10] OPTFCLKEN_HDMI_CLK bit; Refer to *PRCM Register Manual*	0x1
Proceed with VIDEO1 and HDMI DPLLs configuration	Refer to *Display Subsystem DPLL Controllers Functional Description*	-

11.1.5.4.2 DPLL_VIDEO Register Description

Table 11-28. PLL_CONTROL

Address Offset	0x0000 0000		
Physical Address	0x5800 4300 0x4A0A 4000	**Instance**	DPLL_VIDEO1_MAIN_L3 DPLL_VIDEO1_CFG_L4
Description	This register controls the PLL reset/power and modes		
Type	RW		

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5	4	3	2	1	0
RESERVED				HSDIV_SYSRESET	PLL_SYSRESET	PLL_HALTMODE	PLL_GATEMODE	PLL_AUTOMODE

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Reads as zero.	R	0x0000000
4	HSDIV_SYSRESET	Force HSDIVIDER SYSRESETN. Reserved when DBGSSV is 1. 0x0: HSDIVIDER SYSRESET forced active 0x1: HSDIVIDER SYSRESET controlled by power FSM	RW	1

Bits	Field Name	Description	Type	Reset
3	PLL_SYSRESET	Force DPLL SYSRESETN. Reserved when DBGSSV is 1. 0x0: PLL SYSRESET forced active 0x1: PLL SYSRESET controlled by power FSM	RW	1
2	PLL_HALTMODE	Allow PLL to be halted if no activity. Reserved when PLLCTRL_AUTO is 0. 0x0: PLL will not be halted 0x1: PLL will be halted based on activity	RW	0
1	PLL_GATEMODE	Allow PLL clock gating for power saving Reserved when PLLCTRL_AUTO is 0. 0x0: PHY clock on 0x1: Reserved	RW	0
0	PLL_AUTOMODE	Automatic update mode. If this bit is set then the configuration updates will be synchronized to DISPCUpdateSync. If this bit is clear configuration updates will be done immediately. Reserved when PLLCTRL_AUTO is 0. 0x0: Manual mode 0x1: Automatic mode	RW	0

Table 11-29. PLL_STATUS

Address Offset	0x0000 0004		
Physical Address	0x5800 4304 0x4A0A 4004	**Instance**	DPLL_VIDEO1_MAIN_L3 DPLL_VIDEO1_CFG_L4
Description	This register contains the status information		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31:17	RESERVED	Reads as zero.	R	0x0000
16	PLL_TICOPWDN	PLL TICOPWDN status. Read 0x1: Internal oscillator power down Read 0x0: Internal oscillator power up	R	0
15	PLL_LDOPWDN	PLL LDOPWDN status. Read 0x1: PLL's internal LDO is power down Read 0x0: PLL's internal LDO is power up	R	0
14:13	BYPASSACKZ	State of bypass mode on PHY and HSDIVIDER. The status is shown separately for each source. Read 0x1: PLL outputs are still being used by the PHY or HSDIVIDER. Read 0x0: PHY or HSDIVIDER has switched to using the bypass clocks.	R	0x0

Bits	Field Name	Description	Type	Reset
12	SSC_EN_ACK	Spread Spectrum Clocking acknowledge Read 0x1: Spread Spectrum Clocking active Read 0x0: Spread Spectrum Clocking inactive Note: SSC feature is not supported.	R	0
11	M7_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x0: M7 clock inactive Read 0x1: M7 clock active	R	0x0
10	M6_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x1: M6 clock active Read 0x0: M6 clock inactive	R	0
9	BYPASSACKZ_MERGED	Merged state of bypass mode on PHY and HSDIVIDER Read 0x1: PLL outputs are still being used by the PHY or HSDIVIDER Read 0x0: PHY and HSDIVIDER have switched to using the bypass clocks.	R	0
8	RESERVED	Reads as zero.	R	0x0000
7	M4_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x1: M4 clock active Read 0x0: M4 clock inactive	R	0
6	PLL_BYPASS	PLL Bypass status Read 0x1: PLL bypass Read 0x0: PLL not bypassing	R	0
5	PLL_HIGHJITTER	PLL High Jitter status Read 0x1: PLL in high jitter condition: Phase error > 24% Read 0x0: PLL in normal jitter condition	R	0
4	RESERVED	Read returns zero.	R	0
3	PLL_LOSSREF	PLL Reference Loss status Read 0x1: Reference input inactive Read 0x0: Reference input active	R	0
2	PLL_RECAL	PLL re-calibration status If this bit is active, the PLL needs to be re-calibrated Read 0x1: Recalibration is required Read 0x0: Recalibration is not required	R	0
1	PLL_LOCK	PLL Lock status See the programming guide for the use of this bit Read 0x1: PLL is locked Read 0x0: PLL is not locked	R	0
0	PLLCTRL_RESET_DONE	PLLCTRL reset done status Read 0x1: Reset has completed Read 0x0: Reset is in progress	R	0

Table 11-30. PLL_GO

Address Offset	0x0000 0008

Table 11-30. PLL_GO (continued)

Physical Address	0x5800 4308 0x4A0A 4008	**Instance**	DPLL_VIDEO1_MAIN_L3 DPLL_VIDEO1_CFG_L4
Description	This register contains the GO bit		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																														HSDIVLOAD	

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Reserved. Write only zero for future compatibility. Reads return zero.	R	0x0000 0000
1	HSDIVLOAD	In manual mode start HSDIVIDER update sequence.	RW	0x0
0	PLL_GO	Request (re-)locking sequence of the PLL. If the AutoMode bit is set, then this will be deferred until DISPCUpdate Sync goes active 0x0: No pending action 0x1: Request PLL (re-)locking/locking pending	RW	0x0

Table 11-31. PLL_CONFIGURATION1

Address Offset	0x0000 000C		
Physical Address	0x5800 430C 0x4A0A 400C	**Instance**	DPLL_VIDEO1_MAIN_L3 DPLL_VIDEO1_CFG_L4
Description	This register contains the latched PLL and HSDIVDER configuration bits		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED	RESERVED							M4_CLOCK_DIV					PLL_REGM										PLL_REGN								RESERVED

Bits	Field Name	Description	Type	Reset
31	RESERVED	Read returns zero.	R	0
30:26	RESERVED	Reserved	R	0x0000
25:21	M4_CLOCK_DIV	Divider value for clock source M4REG Divider value = M4_CLOCK_DIV + 1	RW	0x00
20:9	PLL_REGM	M Divider for PLL. Valid values range is from 1 to 2047. Values 2048 and above are reserved and must not be used. When the PLL_REGM bit field is set to 1, the PLL enters a MN-Bypass mode. The DCOCLK clock output goes low and remains low until the PLL exits MN-Bypass mode (by changing the PLL_REGM bit field to a value other than 0 or 1).	RW	0x000
8:1	PLL_REGN	N Divider for PLL (Reference). Divider value = PLL_REGN+1. Valid values range is from 0 to 127. Values 128 and above are reserved and must not be used.	RW	0x00
0	RESERVED	Read returns zero.	R	0

Table 11-32. PLL_CONFIGURATION2

Address Offset	0x0000 0010		
Physical Address	0x5800 4310 0x4A0A 4010	**Instance**	DPLL_VIDEO1_MAIN_L3 DPLL_VIDEO1_CFG_L4
Description	This register contains the unlatched PLL and HSDIVDER configuration bits These bits are "shadowed" when automatic mode is selected		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31:26	RESERVED	Read as zero.	R	0x00
25	M7_CLOCK_EN	Enable for M7 clock source 0x0: M7 clock divider is disabled 0x1: M7 clock divider is enabled	RW	0x0
24	RESERVED	Read returns zero.	R	0
23	M6_CLOCK_EN	Enable for M6 clock source 0x0: M6 clock divider is disabled 0x1: M6 clock divider is enabled	RW	0
22:21	REFSEL	Selects the reference clock with optional divide by 2 0x0: Reserved 0x1: Reserved 0x3: Select SYSCLK reference 0x2: Reserved	RW	0x0
20	HSDIVBYPASS	Forces HSDIVIDER to bypass mode 0x0: HSDIVIDER in normal operation. Bypass controlled by PLL. 0x1: HSDIVIDER forced to bypass mode.	RW	0
19	RESERVED	Read returns zero.	R	0
18	RESERVED	Read returns zero.	R	0
17	RESERVED	Read returns zero	R	0
16	M4_CLOCK_EN	Enable for M4 clock source 0x0: Sub-system clock divider is disabled 0x1: Sub-system clock divider is enabled	RW	0
15	BYPASSEN	Selects sub-system functional clock as PHY clock source 0x0: PLL controls the PHY clock source: PLL DCO if PLL is locked Sub-system functional clock if not locked 0x1: Force sub-system functional clock to be used as the PHY clock source	RW	0
14	PHY_CLKINEN	PHY clock control 0x0: PHY clock is disabled 0x1: PHY clock is enabled	RW	0

Bits	Field Name	Description	Type	Reset
13	PLL_REFEN	PLL reference clock control 0x0: PLL reference clock disabled 0x1: PLL reference clock enabled	RW	1
12	PLL_HIGHFREQ	Enables a division of pixel clock by 2 before input to the PLL Required for pixel clock frequencies above 32 MHz (21 MHZ if N = 0) 0x0: Pixel clock is not divided 0x1: Pixel clock is divided by 2	RW	0
11	PLL_CLKSEL	Reference clock selection 0x0: Selects SYSCLK as PLL reference clock 0x1: Selects Pixel Clock (PCLK) as PLL reference clock	RW	0
10:9	PLL_LOCKSEL	Selects the lock criteria for the PLL 0x0: Phase Lock 0x1: Frequency Lock 0x2: Spare	RW	0x0
8	PLL_DRIFTGUARDEN	PLL DRIFTGUARDEN 0x0: Only RECAL flag is asserted in case of temperature drift. The programmer should take appropriate action. 0x1: Temperature drift will initiate automatic recalibration. RECAL flag will be asserted while this is taking place.	RW	0
7	RESERVED		R	0
6	PLL_LOWCURRSTBY	PLL LOW CURRENT STANDBY 0x0: LOWCURRSTBY is not selected 0x1: LOWCURRSTBY is selected	RW	0
5	PLL_PLLLPMODE	Select the power / performance of the PLL 0x0: Full performance, minimized jitter 0x1: Reduced power, increased jitter	RW	0
4	RESERVED	Reads as zero.	R	0
3:1	RESERVED	Reserved	R	0
0	PLL_IDLE	PLL IDLE: 0x0: IDLE is not selected 0x1: IDLE is selected	RW	0

Table 11-33. PLL_CONFIGURATION3

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x00 0000

Bits	Field Name	Description	Type	Reset
10:8	SCP_PWR_DIV	Defines the divisor value to be used for the generation of the SCP_PWR clock (up to 66.5MHz) from the input interface clock (up to 266MHz). 0x0 means gated 0x1 means free-running The valid values are from 0 to 7. In case of interface access to register through SCP interface, if the SCP_PWR clock is gated, the HW automatically generates the clock by using a divisor of 7 and updates the bit-field with the value 7. It is then software responsibility to change the value at any time in order to improve SCP latency when accessing the registers in the HDMI_PHY and PLLCTRL_HDMI by reducing the value.	RW	0x0
7:0	RESERVED		R	0x0

11.1.5.7 DSI Registers

Note

This family of devices does not support DSI functionality, but the registers documented in this section are required for the configuration of DPLL_VIDEO1 (via DSI1_A registers) .

11.2 Display Controller

11.2.1 DISPC Overview

Figure 11-22 shows a block diagram of the display controller (DISPC) within the display subsystem.

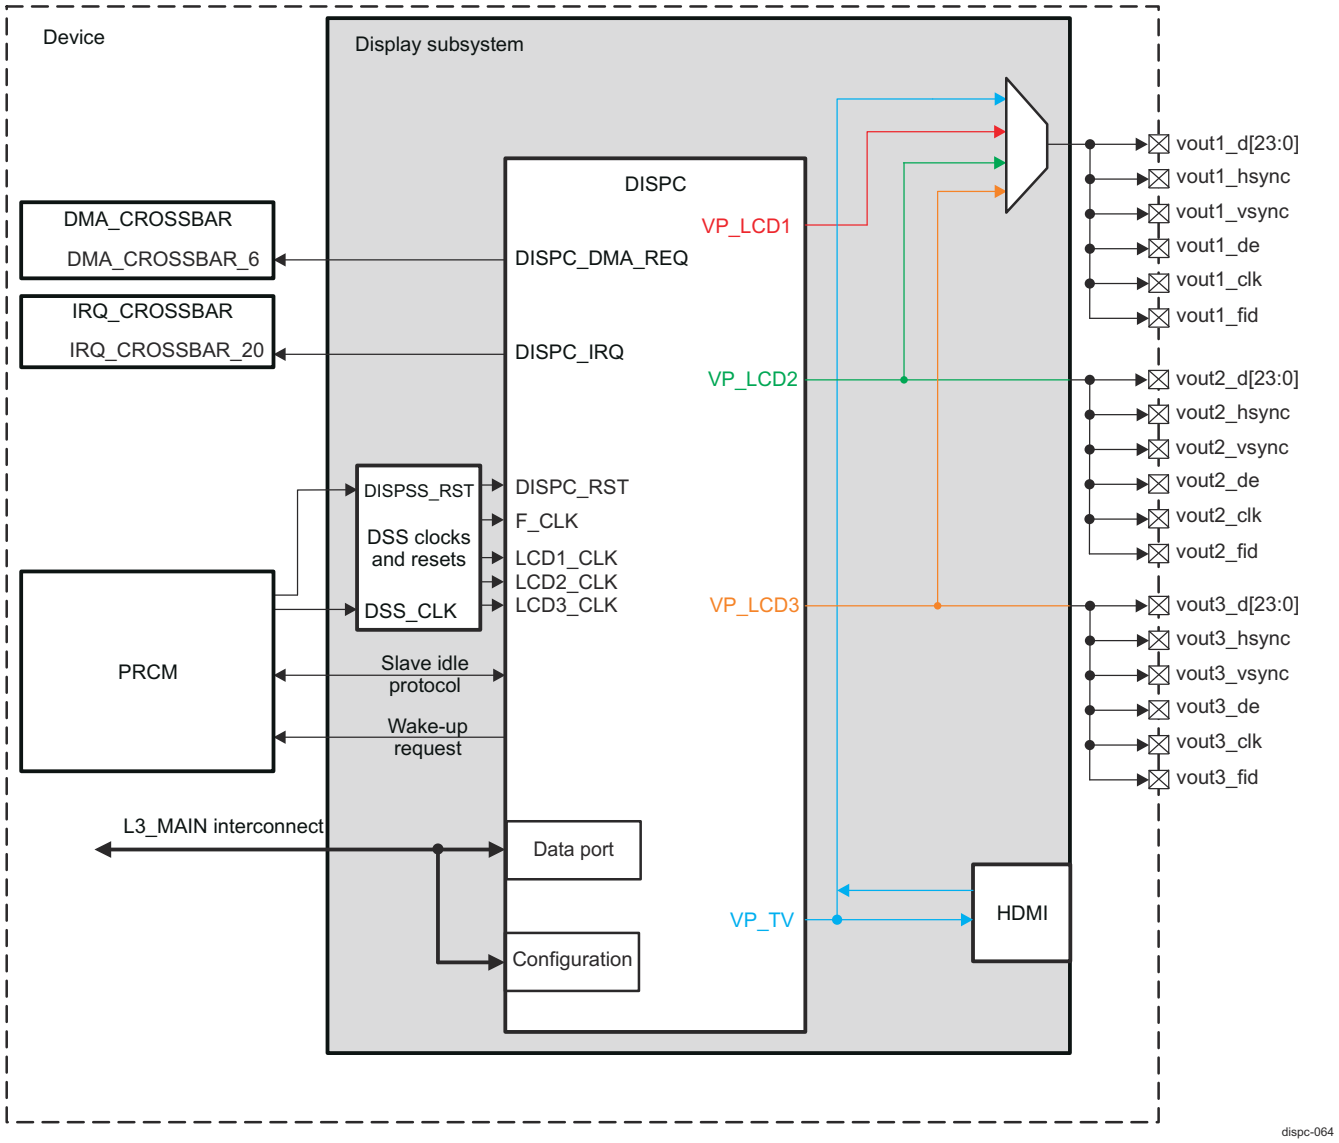

Figure 11-22. DISPC Overview

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

The DISPC includes the following main features:

- Five pipelines for processing:
  - One Graphics (GFX):
    - Pixel formats: ARGB16-4444, xRGB12-4444, RGBA16-4444, RGBx12-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, xRGB24-8888, RGBx24-8888, BGRA32-8888, RGB24-888 (packed), where x means that the corresponding bits in the container are not used
    - Premultiplied ARGB and RGBA formats
    - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the most significant bits [MSBs] or adding 0s)
    - Support for antiflicker on RGB pixel formats using 3-tap filter

- Three Video pipelines (VID1, VID2, and VID3):
  - Pixel formats: ARGB16-4444, xRGB12-4444, RGBx12-4444, RGBA12-3333, RGBA16-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, RGB24-888, BGRA32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21 (where x means that the corresponding bits in the container are not used)
  - Premultiplied ARGB and RGBA formats
  - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the MSBs or adding 0s)
  - Programmable poly-phase filter:
    - Independent horizontal and vertical resampling: Upsampling (up to x8) and downsampling (down to 1/4)
    - Maximum input width of 1920 pixels
    - No limitation on the input height
    - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21
    - Alpha blending factor is rescaled like the R, G, and B color components.
  - Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB32-8888. Images in YUV4:2:2 format with 90- or 270-degree rotation are preprocessed to YUV4:4:4 before the scaler, by duplicating the missing Chroma.
  - Programmable VC-1 range mapping
- One write-back (WB) pipeline: Allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame
  - Programmable color space conversion RGB24 into YUV4:4:4 or to YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21 using programmable poly-phase filter
  - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21
  - Selection of the color depth reduction from RGB24 to RGB16
  - Programmable poly-phase filter:
    - Independent horizontal and vertical resampling: Upsampling (up to x8) and downsampling (down to 1/4)
    - Maximum input width of 1920 pixels
    - No limitation on the input height
    - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21
    - Alpha blending factor is rescaled like the R, G, and B color components.
  - Selection of the source of the data:
    - Overlay output:
      - Primary LCD output
      - Secondary LCD output
      - Third LCD output
      - TV output
    - Pipelines:
      - Graphic
      - Video 1
      - Video 2
      - Video 3
- Three LCD outputs: primary (LCD1), secondary (LCD2), and tertiary (LCD3):
  - Input pixel format: ARGB32-8888
  - Output pixel format: RGB24-888 and YUV4:2:2 (YUV4:2:2 only available when BT mode output is enabled)
  - Overlay of graphic and video for one to four pipelines
  - Source and destination transparency color key

  - Global and pixel alpha blending (up to 8-bit blending factor)
  - Z-order programmable (full flexibility)
  - Displays supported:
    - Active matrix color: 12-, 16-, 18-, and 24-bit panel interface support (replicated or dithered encoded pixel values)
  - Independent programmable timing generators for LCD1, LCD2, and LCD3 to support:

Using DPI1 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps
Using DPI2 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps
Using DPI3 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

  - Configurable LCD output mode: progressive or interlace mode
  - Multiple-cycle output format on 8-, 9-, 12-, and 16-bit interface time division multiplexing (TDM)
- One TV output:
  - Input pixel format: ARGB40-10.10.10.10
  - Output pixel format: ARGB40-10.10.10.10
  - Overlay of graphic and video for one to four pipelines
  - Source and destination transparency color key
  - Global and pixel alpha blending (up to 10-bit blending factor)
  - Z-order programmable (full flexibility)
  - Slave mode support (no master mode support) with synchronization signals provided by HDMI TX:
    - HSYNC (horizontal synchronization signal)
    - VSYNC (vertical synchronization signal)
    - RE (data request signal)
    - FID (field ID: even and odd field information)
  - RGB30-10.10.10 data bus output for connection to HDMI TX and extended to 36 by duplication of the MSBs
  - HD-1080p, HD-1080i, HD-720p, SD-480p, SD-576p, SD-576i, and SD-480i using HDMI
  - HDMI deep color mode support, 30-bit data output to HDMI encoder
  - Pixel duplication capability (from one pixel clock cycle up to eight cycles)
- Panel support with MIPI DPI protocol:
  - 12-, 16-, 18-, and 24-bit active matrix panel interface support (replicated or dithered encoded pixel values)
- Common:
  - Rotation 0, 90, 180, and 270 degrees using DMM-TILER
  - Synchronized buffer update
  - Hardware cursor (using the graphics pipeline or one of the video pipelines)
  - Independent gamma curve support on LCDs outputs and TV output
  - Multiple-buffer support
  - Mirroring/flip-flop support (using DMM-TILER)
  - Programmable color phase rotation (CPR)
  - Alpha blending support:
    - Embedded pixel factor (ARGB and RGBA)
    - Global alpha
- DMA (internal to the DISPC):
  - Support for accessing tiled structure through the TILER inside the dynamic memory management (DMM)
  - Support for accessing nontiled structure through the TILER or directly
  - Support for rotation, flip-flop, and mirroring through the TILER inside the DMM

  - Support for memory fragmentation through the TILER inside the DMM
  - Integrated shared buffers between DMA engine and pipelines
  - Programmable buffer thresholds
  - Bandwidth limiter on write request (insertion on idle cycles between requests)
- Advanced:
  - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
  - DMA buffer hand-check in stall mode
  - Arbitration between high and low priority (GFX, VID1, VID2, VID3, and WB pipelines)
- Power modes:
  - Low-power saving modes
  - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
  - Merge capability of the DMA buffers to support greater OFF period on the L3_MAIN interconnect
    - All buffers associated to a single pipeline
    - Reallocation of the buffers of the nonactive pipelines to the active pipelines

11.2.2 DISPC Environment

The DISPC provides the required control signals to interface directly to an external parallel panel for the MIPI DPI protocol.

Figure 11-23 shows the LCD support parallel interface.

Note

Parallel interface is available through the LCD1, LCD2, LCD3, and TV outputs of the DISPC.

The LCD data and control signals are multiplexed with the TV output data, and control signals are provided by the HDMI module.

The selection can be done at the top level of the display subsystem. For further details and signal mapping, see Section 11.1.1, *Display Subsystem Environment*.

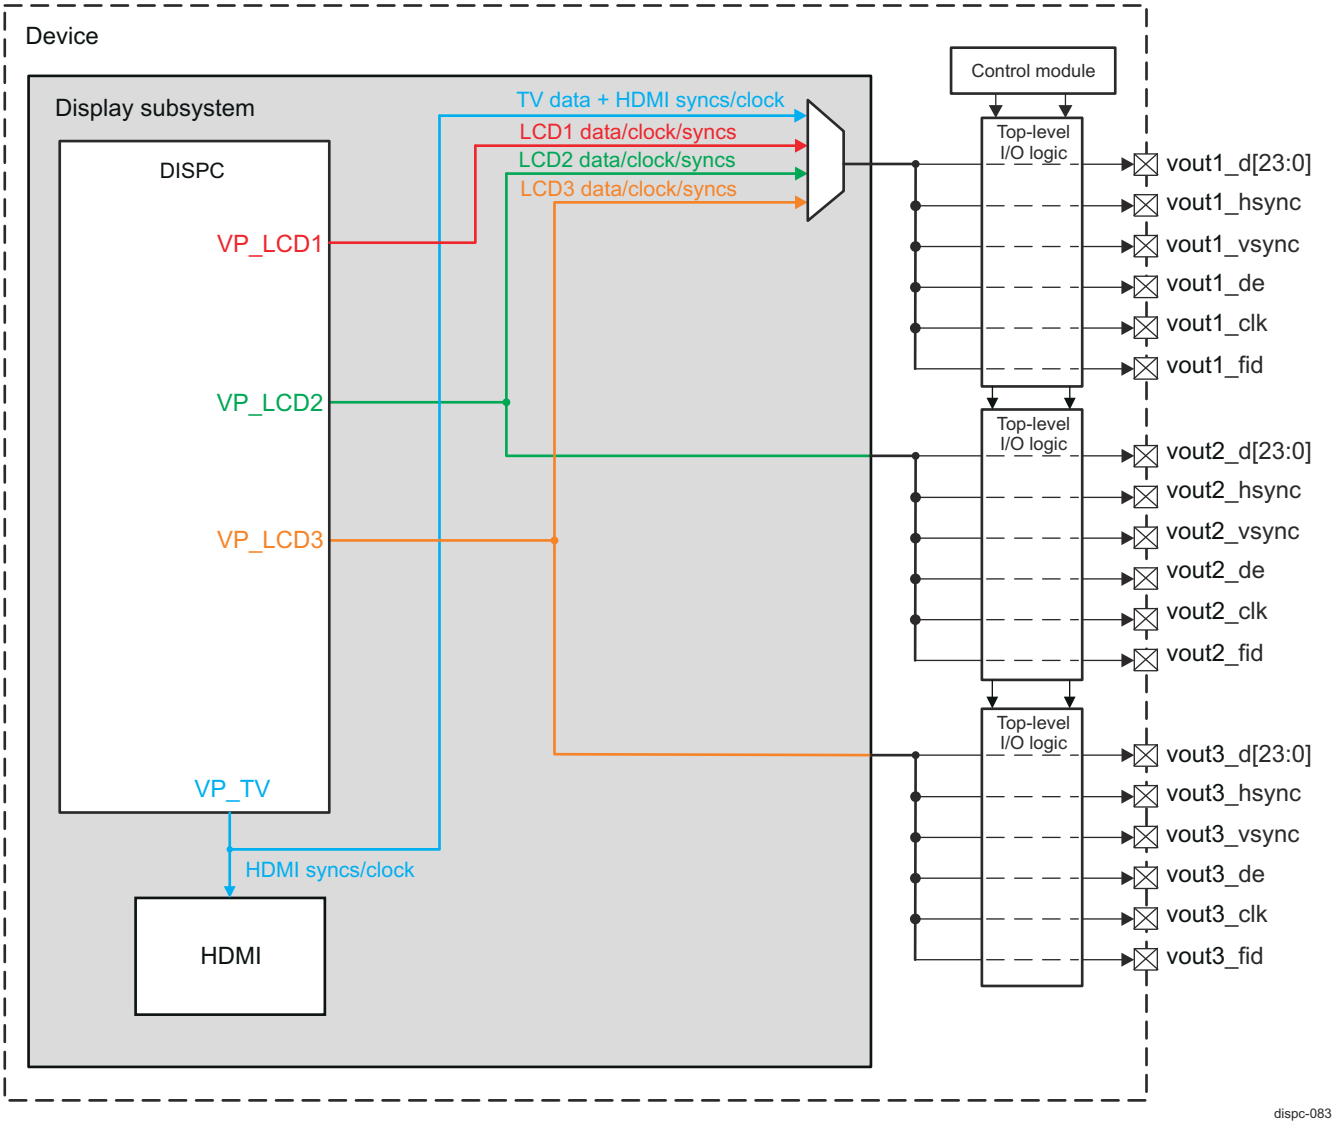

Figure 11-23. DISPC LCD Support Parallel Interface

Note

The path from a module pin to device pad (or pads) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see *Pad Configuration Registers*, in *Control Module*.

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

Table 11-52 describes the interface signals to/from the LCD panel in bypass mode.

Table 11-52. DISPC Parallel Interface Signals

Signal Name(2)	Type(1)	Description
voutX_d[23:0]	O	Pixel data
voutX_clk	O	Pixel clock
voutX_vsync	O	Vertical synchronization. The LCD frame clock (vsync) toggles after all the lines in a frame are transmitted to the LCD panel and a programmable number of line clock cycles has elapsed at the beginning and end of each frame.
voutX_hsync	O	Horizontal synchronization. The LCD line clock (hsync) toggles after all pixels in a line are transmitted to the LCD panel and a programmable number of pixel clock wait-states has elapsed at the beginning and end of each line.
voutX_de	O	In active matrix technology, the DE signal acts as an output-enable signal to indicate when data must be latched using the pixel clock.
voutX_fid	O	The FID signal indicates the field identifier for the LCD output field: • 0 means even. • 1 means odd.

(1) I = Input, O = Output, I/O = Input/Output
(2) X = 1, 2, or 3, indicates the corresponding parallel video output (VOUT1, VOUT2, or VOUT3)

11.2.2.1 DISPC LCD Output and Data Format for the Parallel Interface

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

Figure 11-24 through Figure 11-27 show the pixel data bus, depending on the use of 12-, 16-, 18-, or 24-pixel data output pins.

In the Active matrix display type, one pixel per pixel clock is displayed.

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel.

Figure 11-24 through Figure 11-27 show 12-, 16-, 18-, and 24-bit active matrix displays, respectively.

(1) X = 1, 2, or 3, indicates the corresponding VOUT output (VOUT1, VOUT2, or VOUT3)

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.2.2.2 DISPC Transaction Timing Diagrams

Figure 11-28 through Figure 11-31 show timing diagrams of synchronization signals and pixel clocks for active matrix panels. The DISPC directly drives these signals, which are related to the programmable fields listed in Table 11-54.

Table 11-54. DISPC Programmable Fields in Bypass Mode

Name	Register	Description
PPL	DISPC_SIZE_LCDo[11:0] PPL value + 1	Pixels per line
LPP	DISPC_SIZE_LCDo[27:16] LPP value + 1	Lines per panel
HBP	DISPC_TIMING_Ho[31:20] HBP value + 1	Horizontal back porch
HFP	DISPC_TIMING_Ho[19:8] HFP value + 1	Horizontal front porch
HSW	DISPC_TIMING_Ho[7:0] HSW value + 1	Horizontal synchronization pulse width
VBP	DISPC_TIMING_Vo[31:20] VBP value	Vertical back porch
VFP	DISPC_TIMING_Vo[19:8] VFP value	Vertical front porch
VSW	DISPC_TIMING_Vo[7:0] VSW value + 1	Vertical synchronization pulse width
ONOFF(1)	DISPC_POL_FREQo[17] ONOFF	DISPC_HSYNC and DISPC_VSYNC pixel clock control
RF(2)	DISPC_POL_FREQo[16] RF	DISPC_HSYNC and DISPC_VSYNC pixel clock edge control
IEO	DISPC_POL_FREQo[15] IEO	Invert DISPC_ACBIAS
IPC(3)	DISPC_POL_FREQo[14] IPC	Invert DISPC_PCLK
IHS	DISPC_POL_FREQo[13] IHS	Invert DISPC_HSYNC
IVS	DISPC_POL_FREQo[12] IVS	Invert DISPC_VSYNC

(1) DISPC_POL_FREQo[17] ONOFF and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_ON_OFF must match (x = 0,1,2).
(2) DISPC_POL_FREQo[16] RF and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_RF must match (x = 0,1,2).
(3) DISPC_POL_FREQo[14] IPC and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC must match (x = 0,1,2).

- Active matrix timing configuration 1:
  - DISPC_POL_FREQo[17] ONOFF = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_ON_OFF = 0
  - DISPC_POL_FREQo[16] RF = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_RF = 0

    The HSYNC and VSYNC signals are driven on the opposite edge of PCLK from the pixel data.
  - DISPC_POL_FREQo[15] IEO = 0

    The DE signal is active high.
  - DISPC_POL_FREQo[14] IPC = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC = 0

    The pixel data are driven on the rising edge of PCLK.
  - DISPC_POL_FREQo[13] IHS = 0

    The HSYNC signal is active high.
  - DISPC_POL_FREQo[12] IVS = 0

    The VSYNC signal is active high.

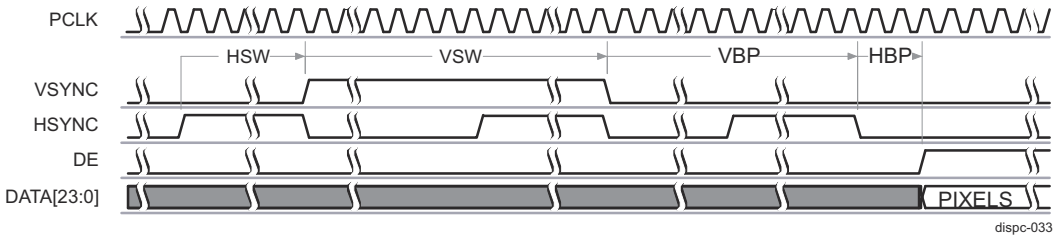

Figure 11-28. DISPC Active Matrix Timing Diagram of Configuration 1 (Start of Frame)

11.2.2.3 DISPC TV Output and Data Format for the Parallel Interface

This section describes the TV output pixel data bus for the parallel interface.

The TV pixel data interface is a 30-bit RGB interface. Only the MSB part of each color component is connected to the display subsystem boundary: R[9:2], G[9:2], B[9:2]. The output of the data is synchronized to the data request signal (HDMI_M_DE) from the HDMI encoder.

Figure 11-40 shows the format of the TV output pixel data.

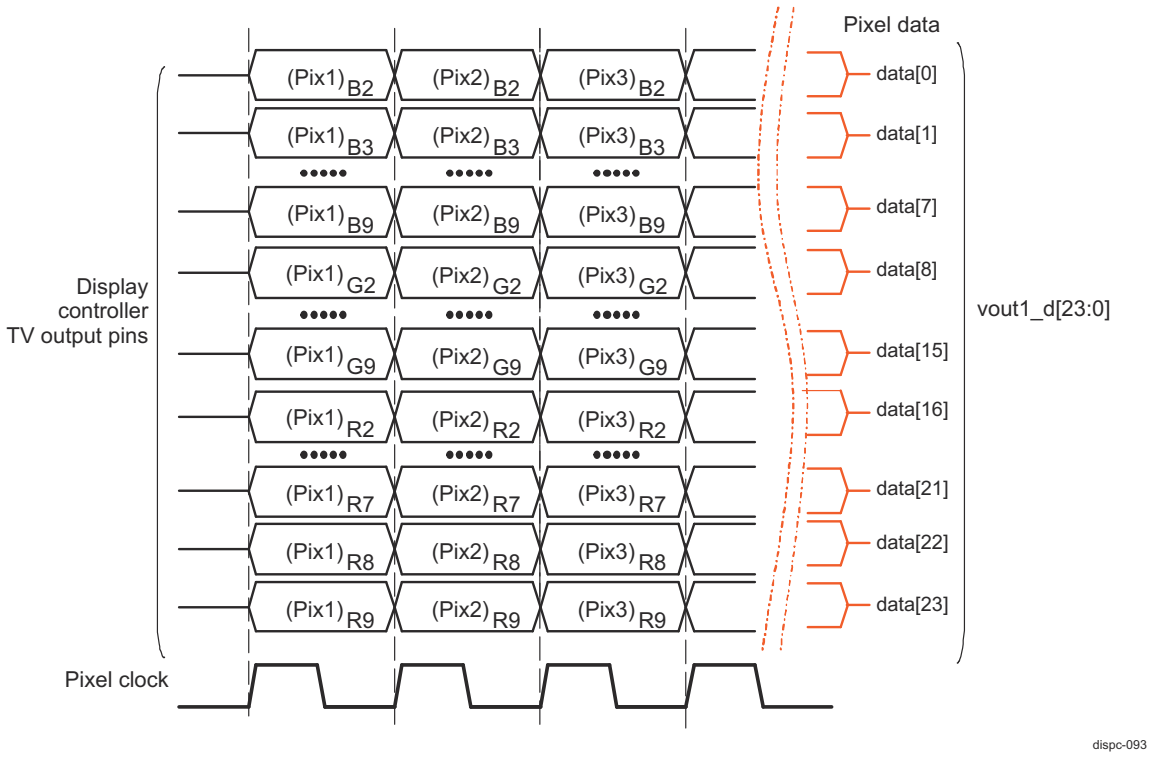

Figure 11-40. DISPC TV Output Pixel Data

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.2.3 DISPC Integration

This section describes the DISPC integration in the device (see Figure 11-41). For complete details about clocks and resets, see Section 11.1, *Display Subsystem Overview*.

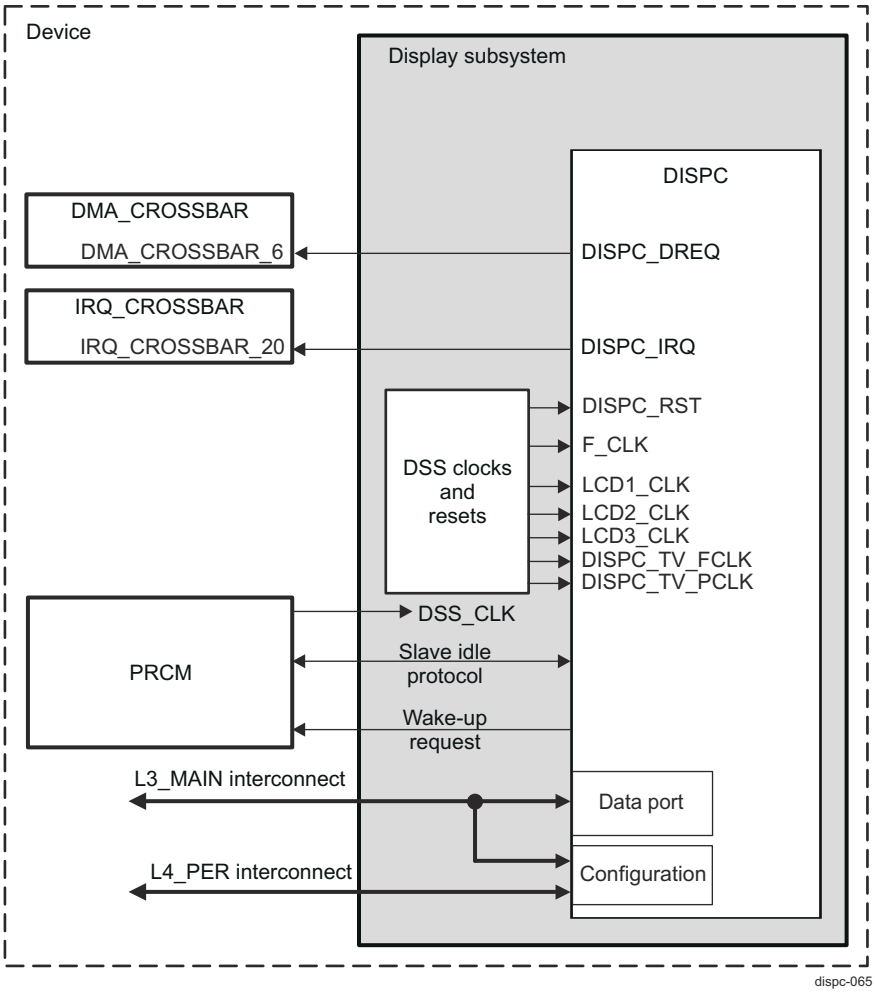

Figure 11-41. DISPC Integration

Table 11-55 and Table 11-56 list the integration attributes and clock and resets, respectively.

Table 11-55. DISPC Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
DISPC	PD_DSS	L3_MAIN for data transfer and configuration

Table 11-56. DISPC Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DISPC	F_CLK	DSS_CLK DPLL_DSI1_A_CLK1 DPLL_DSI1_B_CLK1 DPLL_DSI1_C_CLK1 DPLL_HDMI_CLK1	PRCM DPLL_VIDEO1 DPLL_HDMI	Functional clock for the DISPC logic. For the multiplexing description, see Section 11.1.2.1, *Display Subsystem Clocks*.
	LCD1_CLK	DSS_CLK DPLL_DSI1_A_CLK1	DPLL_VIDEO1 DPLL_HDMI	Clock used to generate the divided pixel clock for the primary LCD interface. For the multiplexing description, see Section 11.1.2.1, *Display Subsystem Clocks*.
	LCD2_CLK	DSS_CLK DPLL_DSI1_B_CLK1	PRCM DPLL_VIDEO1 DPLL_HDMI	Clock used to generate the divided pixel clock for the secondary LCD interface. For the multiplexing description, see Section 11.1.2.1, *Display Subsystem Clocks*.
	LCD3_CLK	DSS_CLK DPLL_DSI1_C_CLK1	DPLL_VIDEO1 DPLL_HDMI	Clock used to generate the divided pixel clock for the third LCD interface. For the multiplexing description, see Section 11.1.2.1, *Display Subsystem Clocks*.
	DISPC_TV_FCLK	F_CLK DPLL_HDMI_CLK1	DSS DPLL_HDMI	TV functional clock (this is either the F_CLK or a clock driven from the DPLL_HDMI). For the multiplexing description, see Section 11.1.2.1, *Display Subsystem Clocks*.
	DISPC_TV_CLK	DSS_HDMI_PCLK	HDMI	Pixel clock provided by the HDMI module. For the multiplexing description, see Section 11.1.2.1, *Display Subsystem Clocks*.

Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DISPC	DISPC_RST	DSS_RST	PRCM	Hardware reset is coming from the PRCM module or through a software reset performed at the DSS level. For the tree reset description, see Section 11.1.2, *Display Subsystem Integration*. **NOTE:** The DSS_RST signal is provided to the entire display subsystem. When inside the display subsystem boundaries, it is named DISPSS_RST, which on its end is provided to the DISPC and is named DISPC_RST.

Table 11-57. DISPC Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	MPU_IRQ_25 DSP1_IRQ_58 IPU1_IRQ_26 IPU2_IRQ_26	DISPC interrupt requests.

DMA Requests				
Module Instance	**Source Signal Name**	**Destination DMA_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5	The line trigger signal to synchronize a memory-to-memory logical channel in the device DMA is generated by the DISPC IP.

Table 11-57. DISPC Hardware Requests (continued)

	DMA_SYSTEM_DREQ_5

Note

The "**Default Mapping**" column in Table 11-57 *DISPC Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.
For more information about the device DMA_SYSTEM module, see *System DMA*.
For more information about the device EDMA module, see *Enhanced DMA*.

11.2.4 DISPC Functional Description

The DISPC can read and display the encoded pixel data stored in memory (see Figure 11-42).

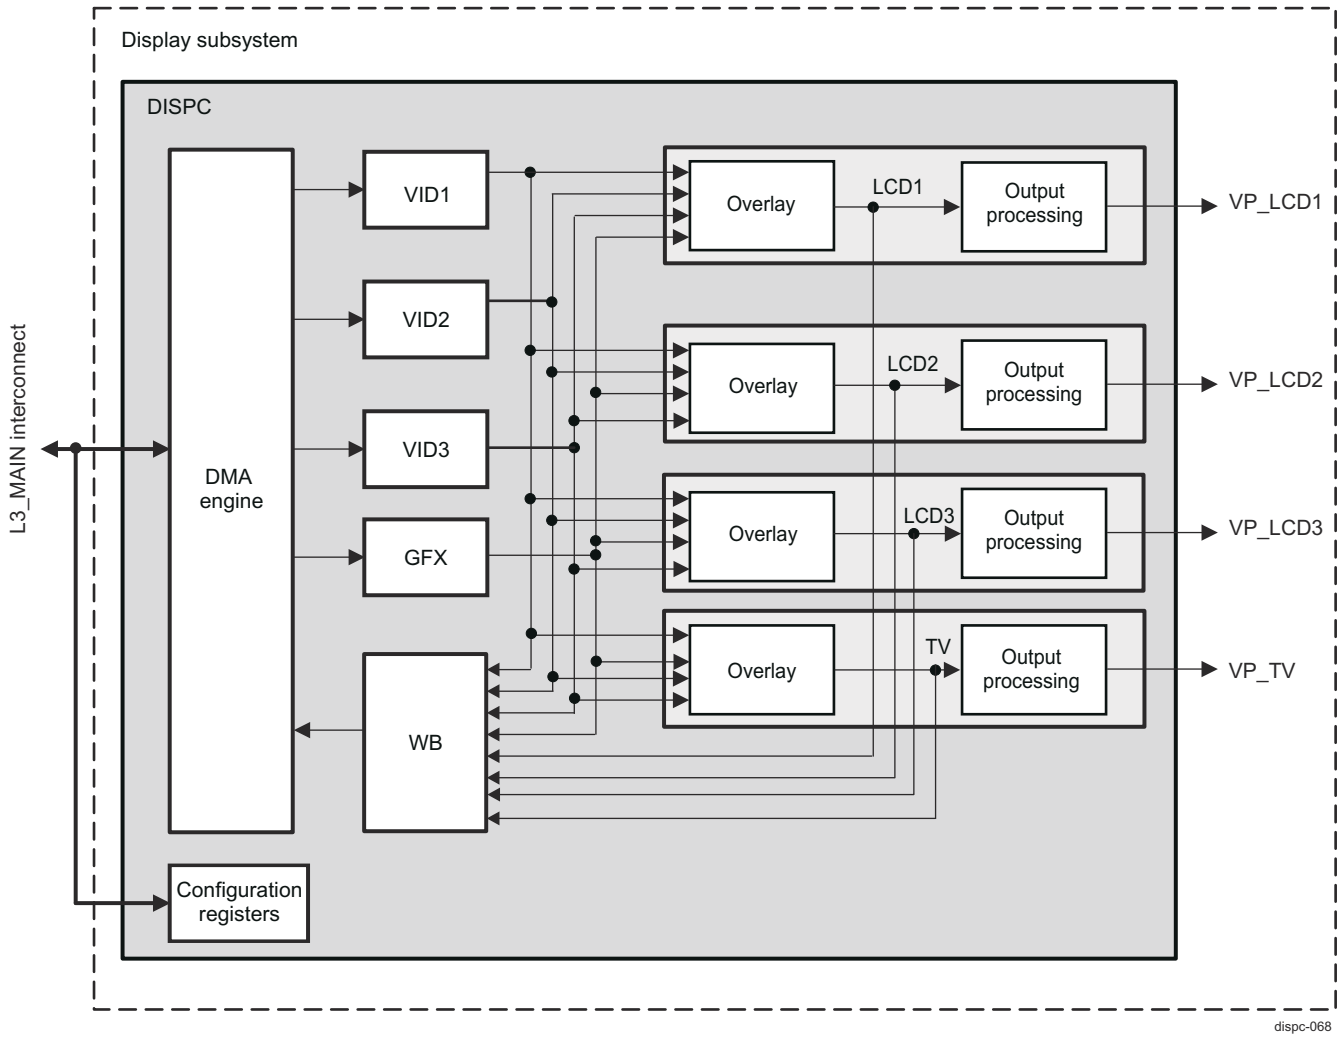

Figure 11-42. DISPC Architecture Overview

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (replication, antiflicker) and video pipelines (VC-1, color space conversion, scaling, overlay, transparency, and so forth).

The data coming out of a pipeline is sent to one of the four outputs, depending on the user configuration. An overlay manager manages inputs of multiple pipelines. User timing configurations for LCD and TV are available.

The DISPC allows the capturing of one output of the pipeline or overlay manager to redirect it into the WB pipeline. It allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing, and so forth to perform memory-to-memory transfer with data processing.

11.2.4.1 DISPC Clock Configuration

The PCLK frequency for each LCD output is derived from a dedicated input clock: LCD1_CLK, LCD2_CLK, or LCD3_CLK for the three LCD outputs, respectively. Each input clock is divided by the values of the DISPC_DIVISORo[23:16] LCD bit field and then the DISPC_DIVISORo[7:0] PCD bit field independently for each LCD pixel clock (see Figure 11-43). DSS_DISPC_LCD1_PCLK, DSS_DISPC_LCD2_PCLK, and DSS_DISPC_LCD3_PCLK are independent:

- DSS_DISPC_LCD1_PCLK = (LCD1_CLK/LCD1) / PCD1
- DSS_DISPC_LCD2_PCLK = (LCD2_CLK/LCD2) / PCD2
- DSS_DISPC_LCD3_PCLK = (LCD3_CLK/LCD3) / PCD3

The functional clock of the DISPC is derived from F_CLK by an independent divisor. The dividing value is set in the DISPC_DIVISORo[23:16] LCD bit field.

For backward compatibility, the divisor value LCD can be set to the value of LCD1. To enable this functionality, the DISPC_DIVISOR[0] ENABLE bit must be set to 1.

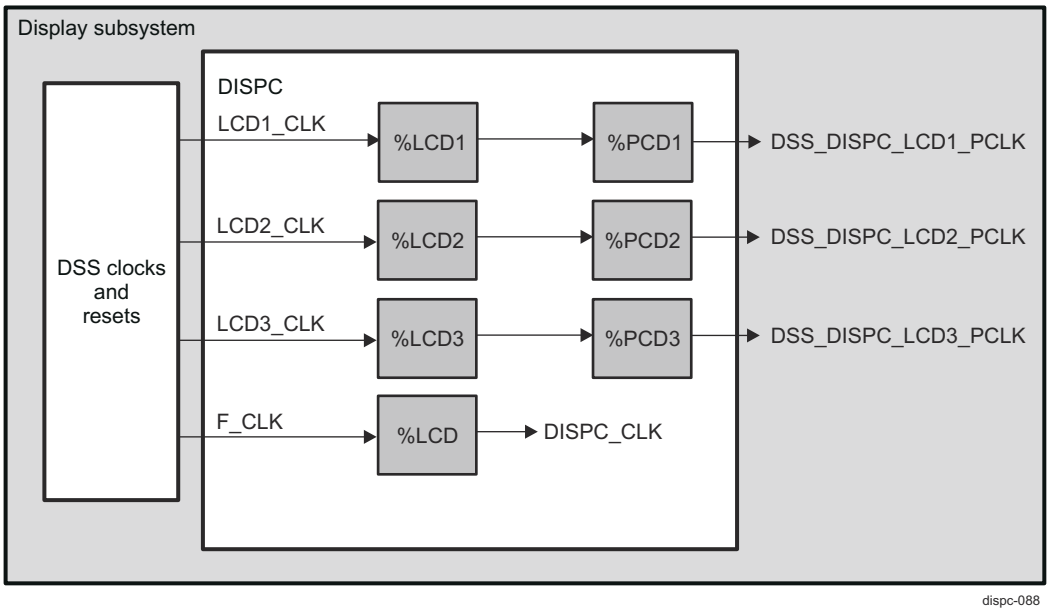

Figure 11-43. DISPC Clock Tree Overview

11.2.4.2 DISPC Software Reset

To perform a software reset on the DISPC, set the DISPC_SYSCONFIG[1] SOFTRESET bit to 0x1. The DISPC_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the DISPC_SYSCONFIG[1] SOFTRESET bit is automatically reset. Software must ensure that the software reset completes before performing DISPC operations.

11.2.4.3 DISPC Power Management

The DISPC supports the MStandby/Wait, IdleReq/SidleAck, and wake-up protocols as defined in *Power, Reset, and Clock Management*.

11.2.4.3.1 DISPC Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the DISPC_SYSCONFIG[4:3] SIDLEMODE bit field.

Condition of assertion of the SIdleAck signal:

- In no-idle mode: SIdleAck is never asserted.
- In force-idle mode: SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle delay with respect to an IdleReq assertion.

Note

The proper use of force-idle mode assumes that no interrupt needs to be generated.

- In smart-idle mode: SIdleAck is asserted when at least the following conditions are satisfied:
  - No interrupt is pending.
  - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted, the DISPC interface lock used by the slave port can be shut down at any time.

The conditions of deassertion of the SIdleAck signal are:

- In force-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.
- In smart-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.

Once SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

11.2.4.3.2 DISPC StandBy Mode

The DISPC supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the DISPC_SYSCONFIG[13:12] MIDLEMODE bit field. The functional clock is always active if the module is enabled. The L3_MAIN clock can be shut down at any time independently of the status of MStandby.

The conditions of assertion of the MStandby signal are:

- In no-standby mode: MStandby is never asserted.
- In force-standby mode: MStandby is asserted when the module is disabled.
- In smart-standby: In the case of one of the following conditions:
  - The GFX pipeline is disabled or enabled and the data fetch is complete for the GFX window, or the GFX pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
  - The VID1 pipeline is disabled or enabled and the data fetch is complete for the VID1 window, or the VID1 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
  - The VID2 pipeline is disabled or enabled and the data fetch is complete for the VID2 window, or the VID2 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.

  - The VID3 pipeline is disabled or enabled and the data fetch is complete for the VID3 window, or the VID3 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
  - The WB pipeline is disabled or enabled and the data store to memory is complete for the WB picture, or the WB pipeline is enabled but the data storage did not complete and data in the DMA buffer is lower than the low threshold value.

The MStandby signal asserts whenever all five events have occurred or the DISPC is disabled. While MStandby is asserted, the DISPC does not generate any transaction on the L3_MAIN master port.

The conditions of deassertion of the MStandby signal are:

- In force-standby mode: MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode: In the case of one of the following conditions:
  - The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
  - The VID1 pipeline is enabled but the data fetch did not complete for the VID1 window, and the data in the DMA buffer is less than the low threshold value.
  - The VID2 pipeline is enabled but the data fetch did not complete for the VID2 window, and the data in the DMA buffer is less than the low threshold value.
  - The VID3 pipeline is enabled but the data fetch did not complete for the VID3 window, and the data in the DMA buffer is less than the low threshold value.
  - The WB pipeline is enabled but the data store did not complete for the WB picture, and the data in the DMA buffer more than the high threshold value.

Detection of the deassertion conditions assumes that the interface clocks are active.

11.2.4.3.3 DISPC Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the DISPC_SYSCONFIG[2] ENAWAKEUP bit. Because the SWakeUp signal is asynchronous, it does not require the interface clock.

The conditions of assertion of the SWakeUp signal are:

- The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
- The VID1 pipeline is enabled but the data fetch did not complete for the VID1 window, and the data in the DMA buffer is less than the low threshold value.
- The VID2 pipeline is enabled but the data fetch did not complete for the VID2 window, and the data in the DMA buffer is less than the low threshold value.
- The VID3 pipeline is enabled but the data fetch did not complete for the VID3 window, and the data in the DMA buffer is less than the low threshold value.
- The WB pipeline is enabled and the data in the DMA buffer is more than the high threshold value.
- The last pixel displayed into the LCD1 panel if it is not the last frame
- The last pixel displayed into the LCD2 panel if it is not the last frame
- The last pixel displayed into the LCD3 panel if it is not the last frame
- The last pixel displayed into the TV panel if it is not the last frame

The SWakeUp signal is asserted whenever any one of these nine events occurs and IdleAck is asserted.

When one of the active pipelines reaches the low threshold and must refill its DMA buffer for the current frame, all other pipelines refill their own DMA buffer even if their low threshold has not been reached. The DISPC_CONFIG1[17] BUFFERFILLING bit is used to increase the probability that the time increases, where there is no access to the L3_MAIN interconnect.

The condition of deassertion of the SWakeUp signal is:

- Immediately after deassertion of IdleReq

11.2.4.4 DISPC Interrupt Requests

The interrupt line, DISPC_DREQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the DISPC_IRQENABLE register.

To check when a particular interrupt event occurs and to reset a particular event, the DISPC_IRQSTATUS register must be accessed. This register regroups the status of internal events in the module that generate an interrupt (read 0: no interrupt occurred; read 1: interrupt occurred; write 1: status bit reset). For more information about checking and clearing interrupt events, see Section 11.1.5, *Display Subsystem Register Manual*.

Table 11-58 describes the interrupts generated for the DISPC.

Table 11-58. DISPC Interrupts

Interrupt Name	Description
FLIPIMMEDIATEDONE_IRQ	Flip immediate done: Occurs when the DMA engine has acknowledged the immediate BA change, and software can write the new BA0.
FRAMEDONE1_IRQ	Frame done for LCD1 output: Active frame related to the LCD1 is complete and LCD1 output of the DISPC is disabled.
FRAMEDONE2_IRQ	Framedone for LCD2 output: Active frame related to the LCD2 is complete and LCD2 output of the DISPC is disabled.
FRAMEDONE3_IRQ	Frame done for LCD3 output: Active frame related to the LCD3 is complete and LCD3 output of the DISPC is disabled.
FRAMEDONETV_IRQ	Frame done for TV output: Active frame related to the TV output is complete and TV output of the DISPC is disabled.
FRAMEDONEWB_IRQ	Frame done for WB output: Active frame related to the WB is complete. First, it is used when the WB channel is connected to one of the pipelines to determine when the memory-to-memory transfer through DISPC is completed. Second, it is used when the WB channel is connected to one of the overlay output in nonreal-time mode to determine when the memory-to-memory transfer with overlay processing is completed.
VSYNC1_IRQ	VSYNC for primary LCD output: VSYNC interrupt for the primary LCD has occurred at the end of the frame.
VSYNC2_IRQ	VSYNC for secondary LCD output: VSYNC interrupt for the secondary LCD has occurred at the end of the frame.
VSYNC3_IRQ	VSYNC for third LCD output: VSYNC interrupt for the third LCD has occurred at the end of the frame.
EVSYNC_EVEN_IRQ	VSYNC for even field: EVSYNC_EVEN interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is even) (HDMI)
EVSYNC_ODD_IRQ	VSYNC for odd field: EVSYNC_ODD interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is odd) (HDMI)
ACBIASCOUNTSTATUS1_IRQ	AC bias count status for LCD1 output: AC bias transition counter has decremented to 0.
ACBIASCOUNTSTATUS2_IRQ	AC bias count status for LCD2 output: AC bias transition counter has decremented to 0.
ACBIASCOUNTSTATUS3_IRQ	AC bias count status for LCD3 output: AC bias transition counter has decremented to 0.
PROGRAMMEDLINENUMBER_IRQ	Programmed line number: The primary LCD has reached the user programmed line number.
VID1ENDWINDOW_IRQ	End of the VID1 window: The DMA engine has fetched all the data from memory for the VID1 for the current frame.
VID2ENDWINDOW_IRQ	End of the VID2 window: The DMA engine has fetched all the data from memory for the VID2 for the current frame.
VID3ENDWINDOW_IRQ	End of the VID3 window: The DMA engine has fetched all the data from memory for the VID3 for the current frame.

Table 11-58. DISPC Interrupts (continued)

Interrupt Name	Description
GFXENDWINDOW_IRQ	End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame.
VID1BUFFERUNDERFLOW_IRQ	VID1 DMA buffer underflow: The input VID1 DMA buffer goes underflow.
VID2BUFFERUNDERFLOW_IRQ	VID2 DMA buffer underflow: The input VID2 DMA buffer goes underflow.
VID3BUFFERUNDERFLOW_IRQ	VID3 DMA buffer underflow: The input VID3 DMA buffer goes underflow.
WBBUFFEROVERFLOW_IRQ	WB DMA buffer overflow: The output WB DMA buffer goes overflow. It cannot occur when WB channel is used in memory-to-memory transfer mode but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory-to-memory mode, there is timing constraint.
GFXBUFFERUNDERFLOW_IRQ	GFX DMA buffer underflow: The input graphics DMA buffer goes underflow.
PALETTEGAMMALOADING_IRQ	Gamma table loading: Gamma table in the graphics pipeline has been loaded using the DISPC DMA engine.
WBUNCOMPLETEERROR_IRQ	The write-back buffer has been flushed before being fully drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that, and will trigger every frame.
OCPERROR_IRQ	OCP error: L3_MAIN interconnect has sent SResp = ERR
SYNCLOST1_IRQ	Synchronization lost on LCD1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOST2_IRQ	Synchronization lost on LCD2 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOST3_IRQ	Synchronization lost on LCD3 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOSTTV_IRQ	Synchronization lost on TV output: Occurs when porches are not wide enough to load the pipelines with data (TV output connected to the HDMI).
WAKEUP_IRQ	Wakeup: Occurs when the SWakeUp signal is asserted.

11.2.4.5 DISPC DMA Requests

The DMA synchronization line, DISPC_DREQ, is connected to the device DMA controllers (see Table 11-57, *DMA Requests*). This DMA request is not a classical one, but rather a synchronization signal between the DISPC and device DMA. The device DMA is informed that a programmable number of lines are output to the LCD and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER_IRQ described in Table 11-58. This allows the device DMA channel to be synchronized with the internal DMA controller in the display subsystem.

In other words, it allows synchronizing a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DISPC_DREQ request is generated at a programmable line number defined in the DISPC_LINE_NUMBER[11:0] LINENUMBER bit field. This process allows an application to use a single frame buffer and to update it after a certain number of lines are read by the DISPC.

11.2.4.6 DISPC DMA Engine

The DMA engine:

- Supplies data (encoded pixel data and gamma curve) from memories to the GFX, VID1, VID2, and VID3 pipelines through the interconnect based on the configuration of the DISPC and pipeline setting.

- Stores encoded pixel data from GFX/VID pipelines or overlays to memories through the WB pipeline and interconnect based on the configuration of the DISPC and WB pipeline setting.

Each pipeline has a dedicated buffer and a channel with independent settings. Table 11-59 lists the default size and allocation of the DMA buffer. Each DMA buffer is divided into two spaces, top and bottom. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each pipeline is from 0 (pipeline inactive) to the number of pipelines × 2 (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of available spaces. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and system latency. The space assignations are done in the DISPC_GLOBAL_BUFFER register.

Table 11-59. DISPC DMA Buffer Size

Pipelines	DMA Buffer Size
GFX	2 lines × 640 × 128 bits
VID1	2 lines × 1024 × 128 bits
VID2	2 lines × 1024 × 128 bits
VID3	2 lines × 1024 × 128 bits
WB	2 lines × 1024 × 128 bits

Figure 11-44 is an overview of the DMA engine.

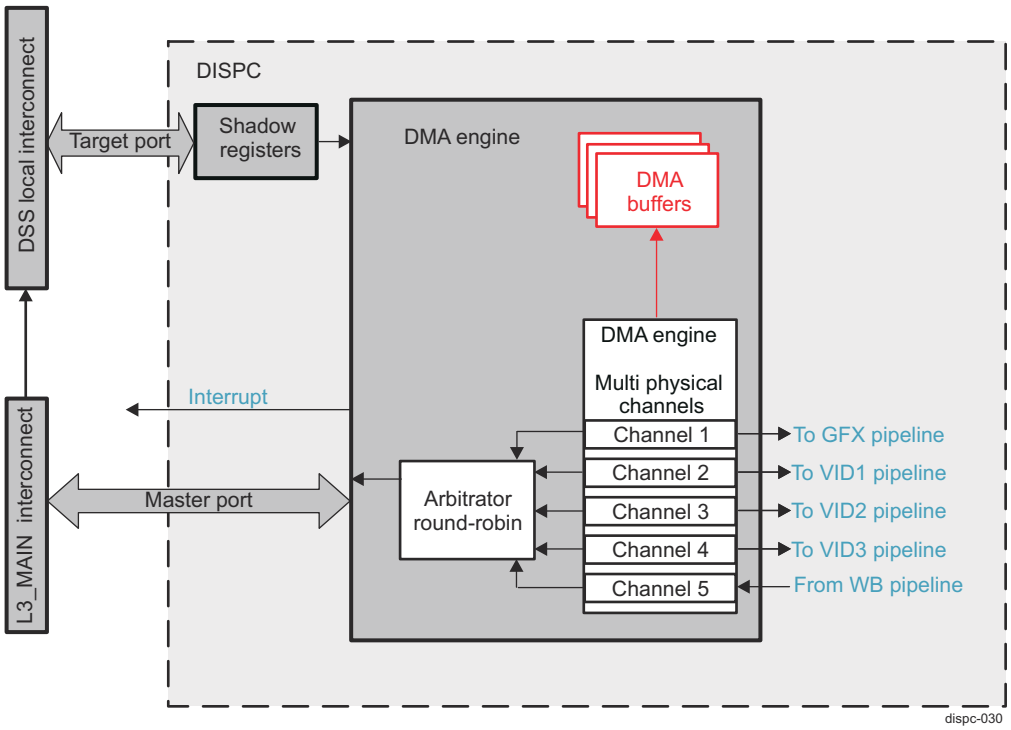

Figure 11-44. DISPC DMA Engine Overview

11.2.4.6.1 DISPC Addressing and Bursts

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address
- Aligns the address
- Defines the burst structure:
  - Type of burst (1D- or 2D-burst structure)

– Length of the burst

The DMA engine generates scan addresses to read and write data to and from system memory. The base address defines the start address of the first pixel, and then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The byte address of each pixel in the frame buffer in the system memory is determined by:

Pixel address = Base address + x × bpp + (y × ((width × bpp) + increment))

where:

- Base address corresponds to the base address (for YUV–NV12 or YUV4:2:0-NV21 format) defined by:
  - DISPC_GFX_BA_0[31:0] BA bit field
  - DISPC_GFX_BA_1[31:0] BA bit field
  - DISPC_VIDp_BA_0[31:0] BA bit field
  - DISPC_VIDp_BA_1[31:0] BA bit field
  - DISPC_VIDp_BA_UV_0[31:0] BA bit field
  - DISPC_VIDp_BA_UV_1[31:0] BA bit field
- bpp corresponds to the number of bits per pixel defined by the DISPC_GFX_ATTRIBUTES[4:1] FORMAT bit field or the DISPC_VIDp_ATTRIBUTES[4:1] FORMAT bit field.
- width corresponds to the number of pixels per line defined by the DISPC_GFX_SIZE[10:0] SIZEX + 1 bit field or DISPC_VIDp_SIZE[10:0] SIZEX + 1 bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by the DISPC_GFX_ROW_INC[31:0] ROWINC – 1 bit field or the DISPC_VIDp_ROW_INC[31:0] ROWINC – 1 bit field.
- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

Note

For YUV format, the pixel values are defined in two buffers (Y and UV). The base address of the Y buffers is defined in the DISPC_VIDp_BA_j[31:0] BA bit field. The base address of the UV buffers is defined in the DISPC_VIDp_BA_UV_j[31:0] BA bit field.

Table 11-60 summarizes the register settings for a simple access of a picture in the system memory.

Table 11-60. DISPC Register Settings for Accessing Image in Internal Memory

Registers	Value
DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j	PBA, the physical base address of image in the memory
DISPC_VIDp_BA_UV_j/DISPC_WB_BA_UV_j	PBA, the physical base address of UV buffers image in the memory
DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC	1 or other in pixel incremental value
DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC (1)	1 or other in row incremental value

(1) The DISPC_WB_ROW_INC register can be used only in 2D mode (using the Tiler). In order to use the DISPC_WB_ROW_INC register, the DISPC_WB_ATTRIBUTES[8] BURSTTYPE bit must be set to 1.

An interconnect request (128 bits) corresponds to one or several pixels, depending on the bits per pixel. Therefore, the DMA engine determines the appropriate burst sequence to optimize the fetching/storing of each new line. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports bursts of 2 × 128 bits, 4 × 128 bits, and 8 × 128 bits. The default burst size at reset time is 8 × 128 bits. The maximum burst size can be configured for each pipeline by setting the DISPC_GFX_ATTRIBUTES[7:6] BURSTSIZE or DISPC_VIDp_ATTRIBUTES[15:14] BURSTSIZE bit field. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue one request and/or smaller burst requests. Two types of burst are present which can be configured from the DISPC_GFX_ATTRIBUTES[29] BURSTTYPE or DISPC_VIDp_ATTRIBUTES[29] BURSTTYPE bit. Also, a force function is present configured from the DISPC_GFX_ATTRIBUTES[16] FORCE1DTILEDMODE or DISPC_VIDp_ATTRIBUTES[20]

FORCE1DTILEDMODE or DISPC_WB_ATTRIBUTES[20] FORCE1DTILEDMODE bit for the following burst types:

- 1-D burst is used if the fetch/storage is linear in memory through the TILER. There is no rotation of the frame buffer. The frame buffer is not tiled.
- 2-D burst is used if the frame buffer is tiled.

Even if the DISPC_VIDp_ROW_INC register does not equal 1, the user can select 2-D burst. 2-D burst is used when the DISPC is configured to read one field of a frame by accessing only the even and odd lines.

Note

The burst size is initialized once at configuration and can be changed when the DISPC is disabled.

11.2.4.6.2 DISPC Immediate Base Address Flip Mechanism

The Flip Immediate mechanism is used to change of the fly the content of the frame buffer which is currently being displayed. The mechanism allows multiple changes (flips) of the base address (BA) during a frame. The mechanism is available for all pipelines (VID1, VID2, VID3, and GFX). Changes to the BA can be applied during the same line, or during different lines.

The following considerations must be considered:

- Data fetching from a new immediate BA is aligned with the data fetch mechanism of the DISPC DMA engine itself, and not with HSYNC or any other DISPC timing signal. After new VSYNC frame pulse, new BA is taken by hardware, as soon as the first set of lines is sent to internal pipeline of the DMA engine.
  - If multiple new BAs are written during the same line (before DMA engine acknowledges the first BA change), then programming steps 1 and 2 must be applied for each new BA (see the programming sequence in this section). The DMA takes only the last BA provided within the current line scan.
  - If multiple new BAs are written during different lines within the current frame, then programming steps 1 and 2 must be applied for each new BA (see the programming sequence in this section). The DMA takes the new BA each time it is updated.
- Immediate BA change cannot be achieved synchronously for two or more pipelines.
- Immediate BA change is possible only for BA0; it is not possible for BA1. Interlaced mode using BA0 and BA1 is not supported.
- Immediate BA change is supported only in RGB color space.

The Flip Immediate mechanism programming sequence follows:

1. Software writes the new immediate BA to the DISPC_GFX_BA_j register (where j=0) for the GFX pipeline, or to the DISPC_VID1_BA_j / DISPC_VID2_BA_j / DISPC_VID3_BA_j register (where j=0) for the required VID pipeline.
2. Software sets to 0x1 the corresponding EN bit for the required pipeline in the DISPC_BA0_FLIPIMMEDIATE_EN register.
3. The DISPC DMA engine, after completing its current line (or set of lines) fetch, takes the new immediate BA.
4. Hardware resets the EN bit in DISPC_BA0_FLIPIMMEDIATE_EN register and asserts a flip immediate IRQ. The IRQ can be enabled through the DISPC_IRQENABLE[31] FLIPIMMEDIATEDONE_EN bit. The status of the event is available in the DISPC_IRQSTATUS[31] FLIPIMMEDIATEDONE_IRQ bit.

11.2.4.6.3 DISPC DMA Buffers

11.2.4.6.3.1 DISPC READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line or the external VSYNC is received, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3_MAIN interconnect. Enabling or disabling the DISPC flushes the DMA buffers (except the WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3_MAIN interconnect.

- When low threshold (set in the DISPC_GFX_BUF_THRESHOLD[15:0] BUFLOWTHRESHOLD or DISPC_VIDp_BUF_THRESHOLD[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3_MAIN interconnect to fill the DMA buffer.
- When high threshold (set in the DISPC_GFX_BUF_THRESHOLD[31:16] BUFHIGHTHRESHOLD or DISPC_VIDp_BUF_THRESHOLD[31:16] BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.

To avoid underflow at the beginning of a frame and have sufficient encoded pixel data to start some processing, a preloading of the DMA buffer is configurable between a fixed value of bytes or the high threshold value. The preload ensures a minimum number of pixels present in the buffer. When the preload value is reached, the associated channel must start pulling pixels out of the DMA buffer. To enable the preload based on the value entered in the DISPC_GFX_PRELOAD[11:0] PRELOAD or DISPC_VIDp_PRELOAD[11:0] PRELOAD bit field, the DISPC_GFX_ATTRIBUTES[11] BUFPRELOAD bit, or the DISPC_VIDp_ATTRIBUTES[19] BUFPRELOAD bit must be set to 0x0.

Note

When self-refresh mode is selected, meaning the data in the DMA buffers are used for multiple frames, and at the end of each frame, the DMA buffers are not flushed.

11.2.4.6.3.2 DISPC WRITE DMA Buffer (WB Pipeline)

Two modes are supported by the WB channel, selectable through the DISPC_WB_ATTRIBUTES[19] WRITEBACKMODE bit:

- Capture mode, WRITEBACKMODE bit set to 0: One of the overlay outputs going to LCD or TV outputs is captured and at the same time the data are sent on the output. The WB timings are controlled by the LCD or TV timings. The output of a VID/GFX pipeline is not sent to the write back, when the WB pipeline is connected to an overlay used in capture mode.
- Memory-to-memory mode, WRITEBACKMODE bit set to 1: One of the overlay outputs or one of the pipelines is captured to perform a memory-to-memory transfer, with some processing by the DISPC (rescaling, overlaying, color space conversion, etc.).

In capture mode: The WB DMA buffers are flushed when the VFP period starts after the HFP following the last line, or when the external VSYNC is received, depending on which output (LCD/TV) the WB pipeline is capturing data, if the programmed value in DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNT bit field is set to 0. If the programmed value in DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNT bit field is set to N (1:255), the write buffers DMA are flushed N lines later. The DMA engine starts storing data to memory through the L3_MAIN-based interconnect as soon as enough data is available for the programmed burst size. When enabling/disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

Note

If the DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNT bit field is set to 0, the WB is reinitialized at the end of the last line of a frame at the beginning of the VFP signal. To let the WB complete the data write to the external memory, the highest possible value compatible with the vertical blanking period must be set.

Note

In WB capture mode, if a new frame starts before the WB DMA buffers contents are fully written onto external memory, then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). The DISPC_IRQSTATUS[26] WBUNCOMPLETEERROR_IRQ interrupt bit indicates this situation and triggers every frame. The WBUNCOMPLETEERROR interrupt can be enabled through the DISPC_IRQENABLE[26] WBUNCOMPLETEERROR_EN register bit.

Software can avoid this by delaying the flush of WB DMA buffers through proper programming of the DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNT bit field.

In memory-to-memory mode: The WB pipeline is not synchronized to any internal or external timing generator. The WB pipeline stores the output of one of the overlay outputs or one of the pipelines. When enabling or disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

Programmable high and low thresholds are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

- When high threshold (set in the DISPC_WB_BUF_THRESHOLD[31:16] BUFHIGHTHRESHOLD bit field) is reached, the DMA engine starts sending data on the L3_MAIN interconnect to empty buffer.
- When low threshold (set in the DISPC_WB_BUF_THRESHOLD[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine stops sending encoded pixels.

At the end of the frame, to completely drain the DMA buffer, some smaller bursts (even single requests) must be issued. To limit the number of interconnect requests from the DISPC, a number of IDLE cycles between requests can be inserted. IDLE cycles can be inserted only when WB is used in memory-to-memory mode. It is ignored when WB is in capture mode.

The number of IDLE cycles between requests can be activated and determined by:

- Setting the DISPC_WB_ATTRIBUTES[27] IDLESIZE bit to 0x0 (default value) and entering the number of idles between requests in the DISPC_WB_ATTRIBUTES[31:28] IDLENUMBER bit field. Idle numbers vary from 0 to 15.
- Setting the DISPC_WB_ATTRIBUTES[27] IDLESIZE bit to 0x1, which considers the size of the burst (the DISPC_WB_ATTRIBUTES[15:14] BURSTSIZE bit field) to determine the number of IDLE cycles.
  - If BURSTSIZE = 0x0, then the number of IDLE cycles equals IDLENUMBER (0 to 15).
  - If BURSTSIZE = 0x1, then the number of IDLE cycles equals IDLENUMBER × 4 (0 to 60).
  - If BURSTSIZE = 0x2, then the number of IDLE cycles equals IDLENUMBER × 8 (0 to 120).

11.2.4.6.4 DISPC MFLAG Mechanism and Arbitration

The MFLAG mechanism allows a dynamic increase of the priority of DISPC real-time traffic, when required, based on the fullness of the DISPC DMA read and write buffers.

The mechanism is implemented for all DMA buffers (GFX, VID1, VID2, VID3 and WB). Only high-priority pipelines can contribute to the MFLAG mechanism.

Programmable buffer thresholds (hysteresis) for each pipeline are used to indicate when the local MFLAG signal for each pipeline is generated. All local MFLAG signals are ORed to generate a single DSS MFLAG out band signal, which is provided to the L3 interconnect for granting OCP requests. The out band DSS MFLAG signal is asynchronous to any ongoing OCP transaction.

The threshold for each pipeline corresponds to the fullness of the associated DMA buffer, and is defined by two threshold parameters:

- HT_MFLAG: High threshold.

  - For read access from the GFX, VID1, VID2, and VID3 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
  - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
  - This threshold can be programmed in the following bit fields:
    - For the GFX pipeline in the DISPC_GFX_MFLAG_THRESHOLD[31:16] HT_MFLAG bit field
    - For the VID1 pipeline in the DISPC_VID1_MFLAG_THRESHOLD[31:16] HT_MFLAG bit field
    - For the VID2 pipeline in the DISPC_VID2_MFLAG_THRESHOLD[31:16] HT_MFLAG bit field
    - For the VID3 pipeline in the DISPC_VID3_MFLAG_THRESHOLD[31:16] HT_MFLAG bit field
    - For the WB pipeline in the DISPC_WB_MFLAG_THRESHOLD[31:16] HT_MFLAG bit field
- LT_MFLAG: Low threshold.
  - For read access from the GFX, VID1, VID2, and VID3 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
  - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
  - This threshold can be programmed in the following bit fields:
    - For the GFX pipeline in the DISPC_GFX_MFLAG_THRESHOLD[15:0] LT_MFLAG bit field
    - For the VID1 pipeline in the DISPC_VID1_MFLAG_THRESHOLD[15:0] LT_MFLAG bit field
    - For the VID2 pipeline in the DISPC_VID2_MFLAG_THRESHOLD[15:0] LT_MFLAG bit field
    - For the VID3 pipeline in the DISPC_WB_MFLAG_THRESHOLD[15:0] LT_MFLAG bit field
    - For the WB pipeline in the DISPC_WB_MFLAG_THRESHOLD [15:0] LT_MFLAG bit field

By default, the MFLAG mechanism is disabled (DISPC_GLOBAL_MFLAG_ATTRIBUTE[1:0] MFLAG_CTRL bit field = 0x0), and the DSS MFLAG out band signal is low (deasserted). The arbitration scheme for the DISPC pipelines is the same as described in Section 11.2.4.6.7, *DISPC Arbitration*. That is, round-robin either between high-priority pipelines, or between normal-priority pipelines (if all pipelines are of normal priority).

When the DISPC_GLOBAL_MFLAG_ATTRIBUTE[1:0] MFLAG_CTRL bit field is set to 0x2, the MFLAG mechanism is enabled, and the DSS MFLAG out band signal is dynamically set to 0 or 1, depending on DMA buffers fullness and programmed threshold levels, as explained previously in this section. In this case, the arbitration scheme for DISPC pipelines is round-robin between those high-priority pipelines, which have asserted local MFLAG signals. If there are no high-priority pipelines with asserted local MFLAG signals, then the arbitration scheme is the same as described in Section 11.2.4.6.7, *DISPC Arbitration*.

The DISPC_GLOBAL_MFLAG_ATTRIBUTE[2] MFLAG_START bit defines additional rules for the MFLAG mechanism:

- If the MFLAG_START bit is set to 0x0 (default value), then in the beginning of the frame when the DMA buffer is empty, the local MFLAG signal of each pipeline is kept at 0 until PRELOAD is reached (for more information on preloading, see Section 11.2.4.6.3.1, *DISPC READ DMA Buffers (GFX and VID Pipelines)*. Then, based on the setting of the DISPC_GLOBAL_MFLAG_ATTRIBUTE[1:0] MFLAG_CTRL bit field, the MFLAG signal is generated and internal logic is arbitrating between pipeline requests.
- If the MFLAG_START bit is set to 0x1, then even in the beginning of the frame when the DMA buffer is empty, the DISPC_GLOBAL_MFLAG_ATTRIBUTE[1:0] MFLAG_CTRL bit field defines the generation of the MFLAG signal for each pipeline.

11.2.4.6.5 DISPC Predecimation

The predecimation process consists of downscaling an image by fetching only the necessary pixels in the memory. Vertical and horizontal predecimation are possible:

- Vertical predecimation: The picture stored in memory can be predecimated vertically by skipping lines. Burst mode is used to fetch the data when skipping lines. Only the lines that will be used by the DISPC are fetched from memory; the other lines are skipped. The DMA engine sends requests only for the useful lines using 1-D or 2-D burst, depending on the setting. The base address indicates the first valid pixel to fetch from memory. The number of lines to skip is set in the DISPC_GFX_ROW_INC[31:0] ROWINC or DISPC_VIDp_ROW_INC[31:0] ROWINC bit field.

Note

When 2-D burst mode is used, the access to data in memory is performed through the TILER module of DMM (for more details, see Section 15.1.2, *TILER Overview*, in Section 15.1, *Memory Subsystem*), and as a result a maximum of one line can be skipped.

- Horizontal predecimation: When fetching data from memory, it is possible to skip 1 of 2 pixel data containers, up to 1 of 16 pixel data containers, by setting the DISPC_GFX_PIXEL_INC[7:0] PIXELINC or DISPC_VIDp_PIXEL_INC[7:0] PIXELINC bit field to the number of pixel data containers to skip (n), multiplied by the size of a pixel data container (in bytes), + 1. See the following note for more details.

Note

The restriction to horizontal predecimation is that there is at least one useful pixel per 128-bit request. In that case, the DMA engine uses burst mode instead of singles to optimize the requests in terms of latency and SDRAM efficiency.

For RGB and YUV4:2:0 data formats, each pixel data container in memory holds 1 pixel. Thus, when configuring the PIXELINC bit field, the value of n equals the number of pixels to skip:

– For RGB format, one pixel data container = 32 bits = 1 pixel
– For YUV format:
  - One Y pixel data container = 8 bits = 1 pixel
  - One UV pixel data container = 16 bits = 1 pixel

For YUV4:2:2 format, each 32-bit pixel data container holds the Luma components for 2 pixels, and the Chrominance component of 1 pixel (see Figure 11-45). Therefore, for the valid values of the PIXELINC bit field in the case of the following YUV4:2:2 format, caution must be taken because n equals the number of pixel data containers to skip, not the number of pixels:

– For n = 1, PIXELINC = 5
– For n = 2, PIXELINC = 9
– For n = 3, PIXELINC = 13
– For n = 4, PIXELINC = 17, etc.

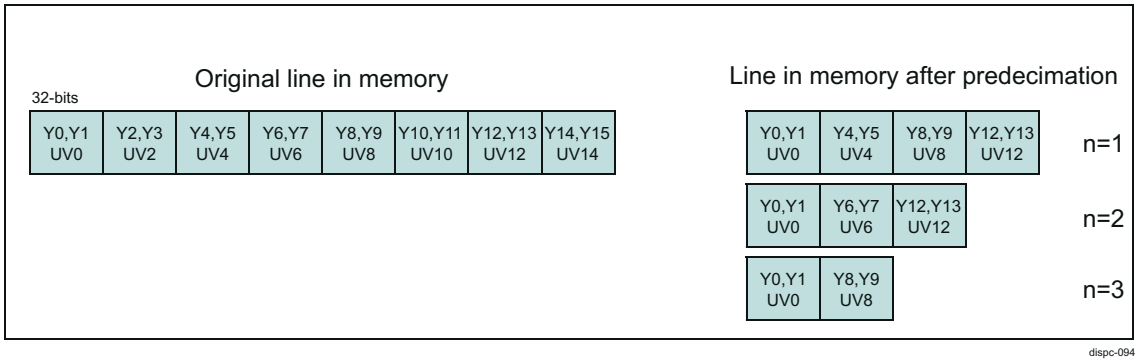

Figure 11-45. YUV4:2:2 Predecimation

11.2.4.6.6 DISPC Progressive-to-Interlaced Format Conversion

The DMA engine can be used to perform YUV4:2:0 NV12 and YUV4:2:0 NV21 progressive-to-interlaced data conversion with 0-degree orientation. Such conversion performed in the DSS consists of separating each progressive frame into two fields containing odd and even lines.This section provides generic approach details.

Two possible configurations are available, depending on the setting of the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit, which defines the stride of each pixel value buffer for the YUV format. The following must be considered for both configurations:

- The DISPC_VIDn_BA_j[31:29] BA and DISPC_VIDn_BA_UV_j[31:29] BA bit fields, and the DISPC_VIDn_ATTRIBUTES[13:12] ROTATION bit field must be set to 0x0 to indicate 0-degree orientation.
- The DISPC_VIDn_BA_j[31:29] BA and DISPC_VIDn_BA_UV_j[31:29] BA bit fields must be set to 0x3, and the DISPC_VIDn_ATTRIBUTES[13:12] ROTATION bit field must be set to 0x2 to indicate 180-degree orientation.

Configuration 1 – YUV4:2:0 progressive to interlaced conversion

The DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x1. The CbCr container is twice the size of the Y container. All Luma and Chroma lines for even and odd fields are fetched from memory. The scaler unit of the respective pipeline can be used to downscale by 2 (through filtering) the fetched data to create the interlaced output. For more information about the scaler configuration, see Section 11.2.4.10.4, *Scaler Unit*.

Configuration 2 – YUV4:2:0 progressive to YUV4:2:2 interlaced conversion

The DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x0. The CbCr container is the same size as the Y container. The DISPC_VIDn_ROW_INC register for the respective pipeline must be configured so that only the Y data is vertically predecimated by 2 (for more information, see Section 11.2.4.6.5, *Predecimation*). The CbCr data must not be predecimated. As a result, only the even Luma lines for the even field and the odd Luma lines for the odd field are fetched from memory. To create the interlaced output, all the Chroma lines are fetched from memory.

11.2.4.6.7 DISPC Arbitration

The requests (reads or writes) sent to the L3_MAIN interconnect are pipelined and arbitrated in a round-robin scheme. The default arbitration scheme must be modified by setting the priority attribute of each pipeline as defined in the following bits:

- DISPC_GFX_ATTRIBUTES[14] ARBITRATION
- DISPC_VIDp_ATTRIBUTES[14] ARBITRATION
- DISPC_WB_ATTRIBUTES[14] ARBITRATION

By default, all pipelines have the same priority (normal), which means all pipeline requests are treated in a round-robin order manner. If one or more pipelines require a higher number of requests going to the L3_MAIN interconnect, its priority can be moved up to high priority. In this case, the high-priority pipeline is granted access before any pipeline in normal priority. If more than one active pipeline is in high priority, the behavior is the same as all active pipelines in normal priority. Normal active pipelines are not treated until all high active pipelines are finished. The ARBITRATION bit cannot be modified during the entire frame.

This functionality balances the bandwidth of the pipeline depending on its constraint. It can be used to give higher priority to the pipelines with real-time constraints versus non-real-time pipelines. For example, pipelines associated with the LCD output in stall mode must have lower priority than pipelines associated with TV output.

11.2.4.6.8 DISPC DMA Power Modes

11.2.4.6.8.1 DISPC DMA Low-Power Mode

Each DMA buffer is divided into two spaces. Each space can be associated with the pipeline or merged with other DMA buffers. The total number of DMA buffers for each pipeline is from 0 (pipeline inactive) to the number of pipelines × 2 (in that case all the DMA buffers are associated with a single pipeline). The sum of the number of DMA buffers allocated for each pipeline must not be greater than the maximum available. The correct number of DMA buffers must be allocated to ensure no underflow. The number of DMA buffers allocated to each pipeline must be greater than or equal to the minimum required to support the throughput and the system latency.

Note

When the number of buffers is changed, the thresholds must be reprogrammed to reflect the new configuration of the DMA buffer.

11.2.4.6.8.2 DISPC DMA Ultralow-Power Mode

In low-power mode, the L3_MAIN interconnect is used to fill up the DMA buffers to store all the data required to display a full frame. The L3_MAIN interconnect is not used to fetch new pixels for the following frames. The data in the DMA buffer are reused to display on the screen.

The setting of the mode is independent for each pipeline. One pipeline may have all the frame pixels in its DMA buffer and the other pipelines may have to refill their respective DMA buffers along the display scan because the frame buffer is too big to be stored in the DMA buffer.

The DMA buffers can be merged to optimize the L3_MAIN interconnect off time. Merging the DMA buffers into a single buffer can be used at the same time to improve ultralow-power mode (see Section 11.2.4.6.8.1, *Low-Power Mode*).

During the time in which the frames are fetched in the internal DMA buffer, MStandby must be asserted if the DISPC_SYSCONFIG[13:12] MIDLEMODE bit field is set to 0x2 (smart-standby mode).

Two ultralow-power modes can be entered manually or automatically:

- Self-refresh mode: Starting self-refresh mode is done manually by setting the DISPC_GFX_ATTRIBUTES[15] SELFREFRESH or DISPC_VIDp_ATTRIBUTES[15] SELFREFRESH bit to 0x1 after capturing a frame in the DMA buffers. Self-refresh mode is stopped by setting the SELFREFRESH bit to 0x0.
- Automatic self-refresh mode: By setting the DISPC_GFX_ATTRIBUTES[17] SELFREFRESHAUTO or DISPC_VIDp_ATTRIBUTES[17] SELFREFRESHAUTO bit to 0x1, the transition from off to on self-refresh mode is done by hardware after capturing the first frame. The hardware reflects the status of the self-refresh mode by setting the SELFREFRESH bit to 0x1, which means that the data are read inside the DMA buffer without accessing the interconnect and system memory during the frame. Setting the SELFREFRESH bit to 0x0 updates the DMA buffer.

Note

The WB pipeline does not support ultralow-power mode.

11.2.4.7 DISPC Rotation and Mirroring

The DISPC provides flexible mechanisms for efficient implementation of rotation using the DISPC, its DMA engine, and the rotation engine of the TILER. The rotation is handled only through the TILER, which supplies the encoded pixels to the DISPC.

Note

No rotation or mirroring is supported when accessing the SDRAM directly.

The TILER supports:

- Rotation: 0-, 90-, 180-, and 270-degree views
- Mirroring
- Any combination of rotation and mirroring (for example, Rot-90 + mirroring)

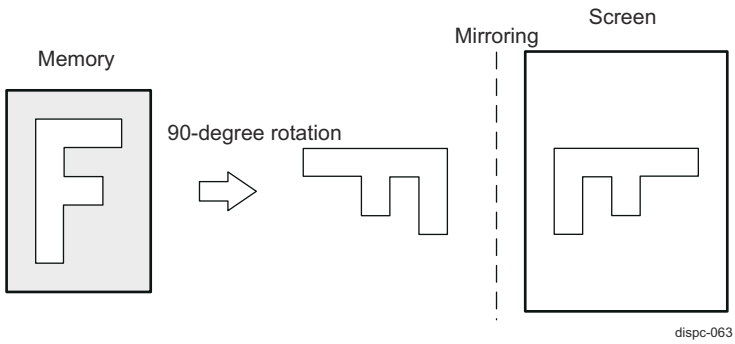

Figure 11-46. DISPC 90-Degree Rotation With Mirroring

When accessing YUV4:2:2 data, each 32-bit value loaded into the DMA buffer can represent either:

- Two consecutive pixels on the same line (for instance, 0- to 180-degree rotation)
- Two pixels adjacent vertically (for instance, 90- to 270-degree rotation)

The reading from the DMA buffer supports the extraction of the two pixels, regardless of the rotation. When the pixels are not consecutive on the same line (90- to 270-degree rotation), the chrominance sample of the first pixel of each 32-bit value is duplicated for the second pixel in the same 32-bit value.

The rotation flag DISPC_VIDn_ATTRIBUTES[13:12] ROTATION and DISPC_VIDn_ATTRIBUTES[4:1] FORMAT bit fields define the processing to extract the pixels from YUV4:2:2 32-bit values. Software must ensure that the settings of the ROTATION and FORMAT bit fields are coherent with the rotation and mirroring defined through the address format in the TILER-specific address map. For more information, see Section 15.2, *Dynamic Memory Manager*, in*Section 15.1, Memory Subsystem*.

Note

For YUV4:2:0 NV12, 2D tiled memory access cases, the DISPC_VIDn_ATTRIBUTES[13:12] ROTATION bit field should be set properly to match with the intended rotation of the use case.

Table 11-61 describes the register settings of the DISPC when accessing, rotating, and mirroring an image using the TILER. A physical base address (PBA) for each rotation is determined and set as the buffer address (BA). The row incremental is determined and set in ROW_INC. The value of the pixel increment, PIXEL_INC, is set to 0x1 (contiguous pixels).

Table 11-61. DISPC Register Settings for Rotation Using TILER

Rotation	Registers	Rotation With and Without Mirroring
0 degree	DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j	PBA0
	DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC	1 to 16
	DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	ROW0
90 degrees	DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j	PBA90
	DISPC_GFX_PIXEL_INC/ DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC	1 to 16
	DISPC_GFX_ROW_INC/ DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	ROW90
180 degrees	DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j	PBA180
	DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC	1 to 16
	DISPC_GFX_ROW_INC/ DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	ROW180
270 degrees	DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j	PBA270
	DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC	1 to 16
	DISPC_GFX_ROW_INC/ DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	ROW270

Note

For YUV format, in addition to the DISPC_VIDp_BA_j register used for the Y component, the DISPC_VIDp_BA_UV_j register must be set to define the base address of the UV frame buffer in memory.

The DISPC_WB_ROW_INC register can be used only in 2D mode (using the Tiler). In order to use the DISPC_WB_ROW_INC register, the DISPC_WB_ATTRIBUTES[8] BURSTTYPE bit must be set to 1.

The PBA rotation is determined by:

- PBA0 = PBA | (mode << 27) | (orientation << 29) | (1<<32)
- PBA90 = PBA | (mode << 27) | (orientation << 29) | (1<<32)
- PBA180 = PBA | (mode << 27) | (orientation << 29) | (1<<32)
- PBA270 = PBA | (mode << 27) | (orientation << 29) | (1<<32)

Where PBA is the physical base address of the image in the memory.

The ROW rotation is determined by:

- If 8 bits per pixel:
  - ROW0 = 16384: Width of the video picture in memory (in bytes) + 1
  - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
  - ROW180 = 16384: Width of the video picture in memory (in bytes) + 1
  - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 16 bits per pixel:
  - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
  - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
  - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
  - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 32 bits per pixel:
  - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
  - ROW90 = 16384: Width of the video picture in memory (in bytes) + 1
  - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
  - ROW270 = 16384: Width of the video picture in memory (in bytes) + 1

Table 11-62 and Table 11-63 list the DISPC rotation mode and rotation orientation definitions, respectively.

Table 11-62. DISPC Rotation Mode Definition

	8-Bit Tiled	16-Bit Tiled	32-Bit Tiled	Page Tiled
Mode	0	1	2	3

Table 11-63. DISPC Rotation Orientation Definition

Type of Orientation	Value
0-degree view	0x0
180-degree view with mirroring	0x1
0-degree view with mirroring	0x2
180-degree view	0x3
270-degree view with mirroring	0x4
270-degree view	0x5
90-degree view	0x6
90-degree view with mirroring	0x7

Note

For YUV4:2:0 progressive pixel format, because the value of the DISPC_VIDp_ROW_INC register is defined for the Y buffer, the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit must be set to 1 when rotating the picture by 0 and 180 degrees, and must be reset to 0 when rotating the picture by 90 and 270 degrees.

For YUV4:2:0 interlaced pixel format, because the value of the DISPC_VIDp_ROW_INC register is defined for the Y buffer, the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit must be set to 1 when rotating the picture by 0 and 180 degrees. Rotations of 90 and 270 degrees are not supported with this pixel format.

11.2.4.8 DISPC Memory Format

The graphic and video pipelines support various types of memory formats. Table 11-64 lists all supported formats for each pipeline.

Table 11-64. DISPC Memory Formats Supported

Formats	GFX	VID1	VID2	VID3	WB

11.2.4.9 DISPC Graphics Pipeline

The graphics pipeline input port is connected to the GFX FIFO, and to the four overlay managers or WB pipeline at its output. The pixel output is directed to an LCD, TV, or WB path by setting the DISPC_GFX_ATTRIBUTES[8] CHANNELOUT bit and the DISPC_GFX_ATTRIBUTES[31:30] CHANNELOUT2 bit field. Table 11-80 lists the bit field settings to orient a pipeline to an LCD, TV, or WB output. The default value directs the GFX pipeline to LCD1. The GFX pipeline can be enabled by setting the DISPC_GFX_ATTRIBUTES[0] ENABLE bit to 0x1.

Note

It is not possible to change the direction of the GFX pipeline on the fly. If the graphics pipeline must be connected to an overlay manager different from the one to which it is currently connected, then the following steps must be performed:

1. Disable the GFX pipeline by setting the DISPC_GFX_ATTRIBUTES[0] ENABLE bit to 0x0.
2. Direct the GFX pipeline to the new overlay manager by modifying the DISPC_GFX_ATTRIBUTES[8] CHANNELOUT and [31:30] CHANNELOUT2 bits.
3. Disable the DISPC output which corresponds with the overlay manager to which the GFX pipeline will be connected next. This is done by setting the in the following bits to 0x0 for the listed outputs:
   - The DISPC_CONTROL1[0] LCDENABLE bit for LCD1 output
   - The DISPC_CONTROL2[0] LCDENABLE bit for LCD2 output
   - The DISPC_CONTROL3[0] LCDENABLE bit for LCD3 output
   - The DISPC_CONTROL1[1] TVENABLE bit for TV output
4. Enable the GFX pipeline by setting the DISPC_GFX_ATTRIBUTES[0] ENABLE bit to 0x1.
5. Enable the DISPC output that corresponds with the overlay manager to which the GFX pipeline will be connected. This is done by setting the following bits to 0x1 for the listed outputs:
   - The DISPC_CONTROL1[0] LCDENABLE bit for LCD1 output
   - The DISPC_CONTROL2[0] LCDENABLE bit for LCD2 output
   - The DISPC_CONTROL3[0] LCDENABLE bit for LCD3 output
   - The DISPC_CONTROL1[1] TVENABLE bit for TV output

The pipeline consists of a programmable replication logic and an antiflicker filter. The replication logic is used to convert the RGB pixel formats into an ARGB40-based format. The antiflicker filter processes the graphics data in RGB format to remove some of the vertical flicker.

Note

The GFX pipeline does not include a scaler.

Table 11-64 lists the input formats supported by the graphics pipeline.

Figure 11-47 shows the graphics pipeline.

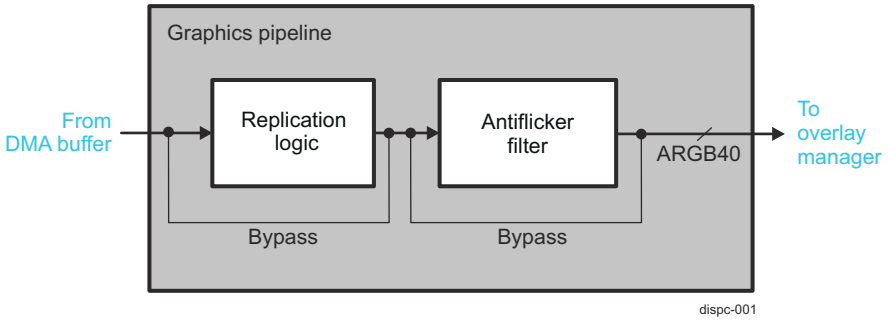

Figure 11-47. DISPC Graphics Pipeline

11.2.4.9.1 DISPC Replication Logic

The replication logic increases the color depth of the graphics-encoded pixels (from true color RGB 12, and 16 to 40 bpp).

- When the replication logic is enabled by setting the DISPC_GFX_ATTRIBUTES[5] REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSB. Table 11-65 describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 11-65. DISPC Replication Enabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

	A[9:0]	R[9:0]	G[9:0]	B[9:0]
Format	**MSB LSB**	**MSB LSB**	**MSB LSB**	**MSB LSB**
xRGB12-4444	1111111111	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGBx12-4444	1111111111	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGB16-565	1111111111	R[4:0]R[4:0]	G[5:0]G[5:2]	B[4:0]B[4:0]
xRGB16-1555	1111111111	R[4:0]R[4:0]	G[4:0]G[4:0]	B[4:0]B[4:0]
ARGB16-1555	AAAAAAAAAA	R[4:0]R[4:0]	G[4:0]G[4:0]	B[4:0]B[4:0]
ARGB16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGBA16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]

- When the replication logic is disabled by setting the DISPC_GFX_ATTRIBUTES[5] REPLICATIONENABLE bit to 0x0, the encoded pixel values are shifted to the MSB boundary of the 24-bit format. The missing bit values are filled with 0s. Table 11-66 describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 11-66. DISPC Replication Disabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

	A[7:0]	R[7:0]	G[7:0]	B[7:0]

ARGB16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]000000	G[3:0]000000	B[3:0]000000
RGBA16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]000000	G[3:0]000000	B[3:0]000000

11.2.4.9.2 DISPC Antiflicker Filter

The antiflicker filter processes the graphics data to remove some of the vertical flicker. It is based on a 3-tap FIR filter with fixed coefficients. For each pixel to be output from the graphics pipeline, the pixel above and below the current line must be read from the DMA graphics FIFO. Therefore, three lines of pixels must be stored in the DMA graphics FIFO.

The antiflickering equations for A, R, G, and B components are:

$A_{out}(x,y) = 0.25 \times A_{in}(x,y-1) + 0.5 \times A_{in}(x,y) + 0.25 \times A_{in}(x,y+1)$

$R_{out}(x,y) = 0.25 \times R_{in}(x,y-1) + 0.5 \times R_{in}(x,y) + 0.25 \times R_{in}(x,y+1)$

$G_{out}(x,y) = 0.25 \times G_{in}(x,y-1) + 0.5 \times G_{in}(x,y) + 0.25 \times G_{in}(x,y+1)$

$B_{out}(x,y) = 0.25 \times B_{in}(x,y-1) + 0.5 \times B_{in}(x,y) + 0.25 \times B_{in}(x,y+1)$

For the first line of processing, because there is no pixel above, the value (x,y) is duplicated.

$Out(x,y) = 0.25 \times In(x,y) + 0.5 \times In(x,y) + 0.25 \times In(x,y+1)$

For the last line of processing, because there is no pixel below, the value (x,y) is duplicated.

$Out(x,y) = 0.25 \times In(x,y-1) + 0.5 \times In(x,y) + 0.25 \times In(x,y)$

Note

Antiflicker filtering is supported only in RGB formats.

Antiflickering is not supported for pictures with fewer than two lines. In this case, the user must disable the antiflickering processing.

By default, the antiflicker filtering is disabled. It can be enabled by setting the DISPC_GFX_ATTRIBUTES[24] ANTIFLICKER bit to 0x1.

11.2.4.10 DISPC Video Pipelines

Three identical video pipelines are available, VID1, VID2, and VID3. Each video pipeline is connected to its video FIFO controller for the input port and to the four overlay managers, LCD1, LCD2, LCD3, and TV or WB pipeline. The pixel output is directed to the LCD, TV, or WB path by setting the DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT bit and the DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2 bit field. Table 11-80 summarizes the bit field settings to orient a pipeline to LCD, TV, or WB output. The default value directs all video pipelines to LCD1.

Note

It is not possible to change the direction of the video pipelines on the fly. If a video pipeline needs to be connected to a different overlay manager than what it is currently connected, then the following steps need to be performed:

1. Disable the VIDp pipeline by setting the DISPC_VIDp_ATTRIBUTES[0] ENABLE bit to 0x0.
2. Direct the VIDp pipeline to the new overlay manager by modifying the [16] CHANNELOUT bit and the [31:30] CHANNELOUT2 bit in the DISPC_VIDp_ATTRIBUTES register.
3. Disable the DISPC output that corresponds with the overlay manager to which the VIDp pipeline will be connected next. This is done by setting the following bits to 0x0 for the listed outputs:
   - The DISPC_CONTROL1[0] LCDENABLE bit for LCD1 output
   - The DISPC_CONTROL2[0] LCDENABLE bit for LCD2 output
   - The DISPC_CONTROL3[0] LCDENABLE bit for LCD3 output
   - The DISPC_CONTROL1[1] TVENABLE bit for TV output
4. Enable the VIDp pipeline by writing 0x1 to the DISPC_VIDp_ATTRIBUTES [0] ENABLE bit.
5. Enable the DISPC output that corresponds with the overlay manager to which the VIDp pipeline will be connected next. This is done by setting the following bits to 0x1 for the listed outputs:
   - The DISPC_CONTROL1[0] LCDENABLE bit for LCD1
   - The DISPC_CONTROL2[0] LCDENABLE bit for LCD2 output
   - The DISPC_CONTROL3[0] LCDENABLE bit for LCD3 output
   - The DISPC_CONTROL1[1] TVENABLE bit for TV output

A video pipeline consists of a scaler unit, color space conversion (CSC) unit, VC-1 range mapping unit, and some programmable replication logic. The order of the video pipeline unit can be configured in two manners (see Figure 11-48 and Figure 11-49):

- Configuration 1 (YUVCHROMARESAMPLING = 0): VC-1 range mapping unit followed by a CSC unit and then a scaler unit. The configuration is used to support RGB, ARGB, and RGBA formats and YUV4:2:2 in backward mode for both data types. Each block can be independently bypassed.
- Configuration 2 (YUVCHROMARESAMPLING = 1): VC-1 range mapping unit followed by a scaler unit and then a CSC unit. The configuration is used to support RGB, ARGB, and RGBA formats and YUV4:2:2, YUV420-NV12, and YUV420-NV21 formats, taking advantage of the scaler to resample the chrominance using five taps horizontally and three or five taps vertically. Each block can be independently bypassed.

The DISPC_VIDn_ATTRIBUTES2[8] YUVCHROMARESAMPLING bit controls the order of the scaler unit in the video pipeline:

- When the YUVCHROMARESAMPLING bit is set to 0x0, the video pipeline is in configuration 1, and the scaler comes after the CSC unit. In case of YUV input data in 4:2:2 format, the chrominance resampling (4:2:2 to 4:4:4 format) is done by averaging the chrominance adjacent samples for only 0 degrees (zero rotation), because other rotation (90/180/270 degrees) is not supported in this mode. For more information about the supported chrominance resampling methods, see Section 11.2.4.10.3.1, *Chrominance Resampling*.
- When the YUVCHROMARESAMPLING bit is set to 0x1, the video pipeline is in configuration 2, and the scaler comes before the CSC unit.
  - In case of YUV4:2:2 input data with 90-/270-degree rotation, the data is preprocessed by duplicating the missing chrominance samples.
  - In case of YUV4:2:2 input data with 0-/180-degree rotation, the Chroma upsampling is performed in the scaler unit.

Table 11-64 lists the input formats supported by the video pipelines.

The video pipeline is enabled by setting the DISPC_VIDp_ATTRIBUTES[0] ENABLE bit to 0x1.

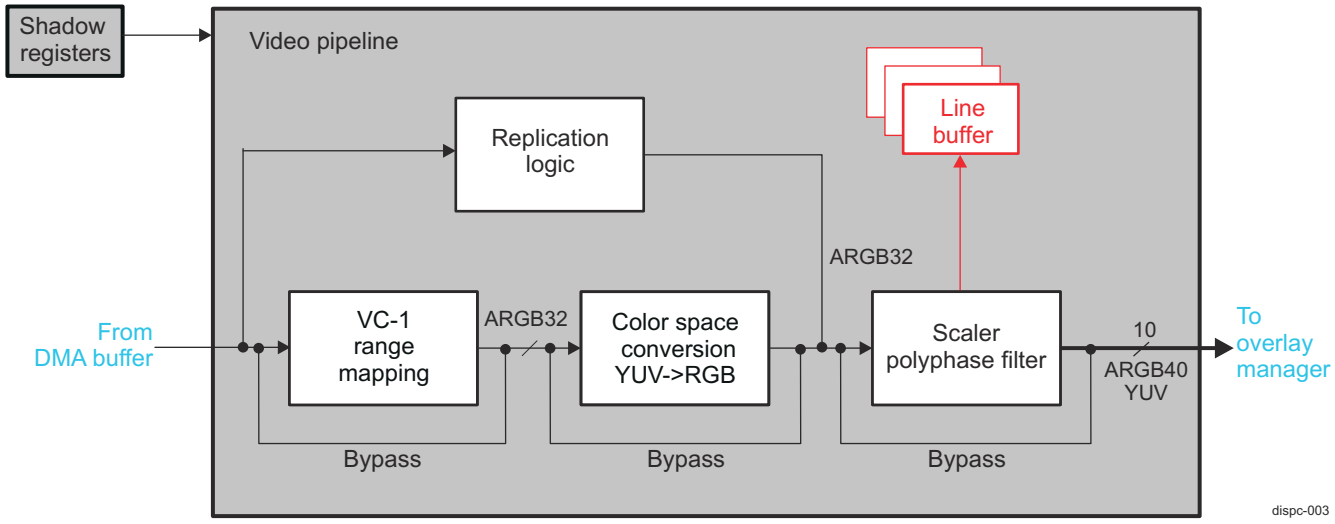

Figure 11-48. DISPC Configuration 1: Video Pipeline

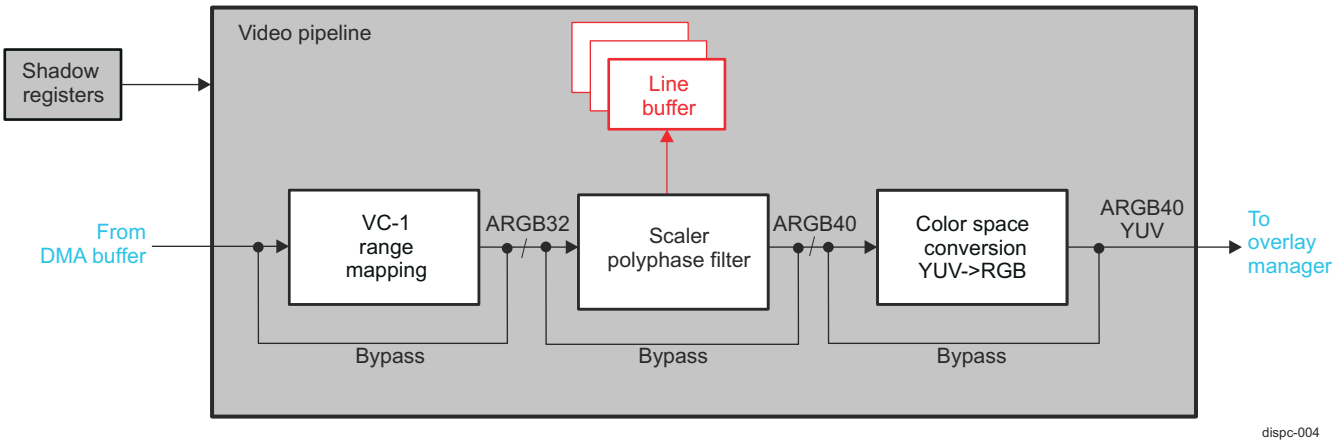

Figure 11-49. DISPC Configuration 2: Video Pipeline

11.2.4.10.1 DISPC Replication Logic

The replication logic increases the color depth of the video-encoded pixels (from true color RGB 12, and 16 to 32 bpp) available only in configuration 1.

The expansion from 8- to 10-bit color component is done by the following units:

- The CSC unit, when the scaler is after the CSC module and when the vertical scaler is disabled
- The vertical scaler, when the scaler is after the CSC unit and enabled
- The replication bit module, when the CSC unit and scaler are disabled
- When the replication logic is enabled by setting the DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSBs. Table 11-67 describes the remapping of the RGB pixels into ARGB 32-bit values.

Table 11-67. DISPC Replication Enabled: RGB Pixel Formats Remapping Into ARGB32-8888

	A[7:0]	R[7:0]	G[7:0]	B[7:0]

11.2.4.10.2 DISPC VC-1 Range Mapping Unit

The VC-1 range mapping unit is used when the video frame picture is decoded using a VC-1 codec by the video accelerator. It remaps the Y, Cb, and Cr components. The unit is used primarily for YUV4:2:0-NV12 and YUV4:2:0-NV21 pixel formats but also can be applied to YUV4:2:2 pixel formats (YUV2 and UYVY).

The VC-1 range mapping unit is enabled by setting the DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE bit to 0x1. The DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y and DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR bit fields are two 3-bit values programmed by the user and are independent for each video pipeline. The module is governed by the equations:

Y_{out} = CLIP((((Y_{int} – 128) × (VC1_RANGE_Y + 9) + 4) / 8) + 128)

C_b = CLIP((((C_b – 128) × (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)

C_r = CLIP((((C_r – 128) × (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)

Note

The input and output pixel values are unsigned (Y, Cr, and Cb).

The function CLIP () clips to 0 or 255 when minimum or maximum, respectively, are reached; otherwise, the resulting output remains identical.

11.2.4.10.3 DISPC CSC Unit YUV to RGB

The CSC unit converts the video-encoded pixel values from YUV4:4:4 format into RGB24 or RGB30 format. The output format depends on the video pipeline configuration selected:

- Configuration 1: RGB24 output format, with 8-bit value per component: red, green, and blue
- Configuration 2: RGB30 output format, with 10-bit value per component: red, green, and blue

In case of YUV4:2:0 or YUV4:2:2 formats, a chrominance resampling to YUV4:4:4 is required before converting the YUV into RGB values (see Section 11.2.4.10.3.1, *Chrominance Resampling*). YUV4:2:2 or YUV4:2:0 to YUV4:4:4 chrominance resampling is a preprocessing to the color space conversion.

Figure 11-50 through Figure 11-53 show the 3 × 3 11-bit coefficients used to convert from YUV4:4:4 into RGB24. The coefficients are set according to the standard used to encode the pixel data in YUV color space. Table 11-69 summarizes the coefficients with their respective bit fields.

Table 11-69. DISPC Color Space Conversion YUV to RGB Bit Field Setting

Coefficients	Bit Field Registers
R_Y	DISPC_VIDp_CONV_COEF0[10:0] RY
R_{Cr}	DISPC_VIDp_CONV_COEF0[26:16] RCR
R_{Cb}	DISPC_VIDp_CONV_COEF1[10:0] RCB
G_Y	DISPC_VIDp_CONV_COEF1[26:16] GY
G_{Cr}	DISPC_VIDp_CONV_COEF2[10:0] GCR
G_{Cb}	DISPC_VIDp_CONV_COEF2[26:16] GCB
B_Y	DISPC_VIDp_CONV_COEF3[10:0] BY
B_{Cr}	DISPC_VIDp_CONV_COEF3[26:16] BCR
B_{Cb}	DISPC_VIDp_CONV_COEF4[10:0] BCB

- For configuration 1 with an RGB24 output:

  If the active range for the luminance samples (Y) is [235:16] and [240:16] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [255:0].

Note

The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{cr} & R_{cb} \\ G_Y & G_{cr} & G_{cb} \\ B_Y & B_{cr} & B_{cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 16 \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-005

Figure 11-50. DISPC YCbCr to RGB Registers (FULLRANGE = 0), 8-Bit Outputs

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [255:0], the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [255:0].

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{cr} & R_{cb} \\ G_Y & G_{cr} & G_{cb} \\ B_Y & B_{cr} & B_{cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-006

Figure 11-51. DISPC YCbCr to RGB Registers (FULLRANGE = 1), 8-Bit Outputs

- For configuration 2 with an RGB30 output:

  If the active range for the luminance samples (Y) is [940:64] and [960:64] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [1023:0].

Note

The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{cr} & R_{cb} \\ G_Y & G_{cr} & G_{cb} \\ B_Y & B_{cr} & B_{cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 64 \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-074

Figure 11-52. DISPC YCbCr to RGB Registers (FULLRANGE = 0), 10-Bit Outputs

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [1023:0], the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [1023:0].

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{cr} & R_{cb} \\ G_Y & G_{cr} & G_{cb} \\ B_Y & B_{cr} & B_{cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-075

11.2.4.10.3.1 DISPC Chrominance Resampling

Two methods are supported to resample chrominance:

- Averaging of the chrominance is done by software, followed by hardware conversion when the video pipeline is in configuration 1.
- Filtering of the chrominance using the scaler unit (chrominance resampling and rescaling can be combined to support native rescaling of YUV format) when the video pipeline is in configuration 2.

To convert the YUV4:2:2 encoded pixel values into YUV4:4:4 format, the averaging of the chrominance technique can be used as shown in Figure 11-54. The missing chrominance samples (Cb and Cr) are interpolated using the average values of the two closest values on the same line (,) or are repeated from the second pixel in the same 32-bit container (see Figure 11-55). For the last pixel, the chrominance samples are duplicated using the values from the previous pixel; otherwise, the chrominance samples are averaged using the two adjacent values. Figure 11-56 shows the flow of the pixel.

$$Cb_n(YCbCr\ 444) = \frac{Cb_{n-1}(YCbCr\ 422) + Cb_{n+1}(YCbCr\ 422)}{2}\ (\text{n odd})$$

$$Cr_n(YCbCr\ 444) = \frac{Cr_{n-1}(YCbCr\ 422) + Cr_{n+1}(YCbCr\ 422)}{2}\ (\text{n odd})$$

dispc-010

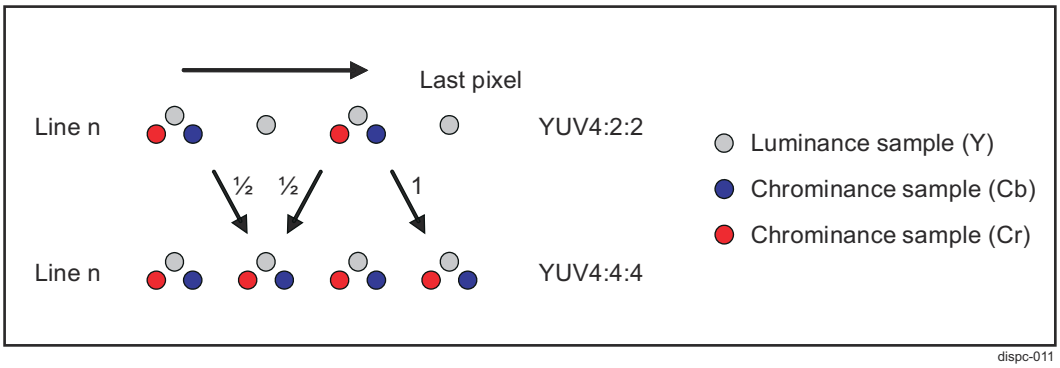

Figure 11-55. DISPC Averaging of the Chrominance Representation

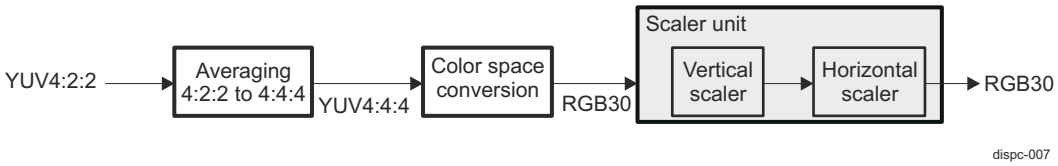

Figure 11-56. DISPC YUV4:2:2 to RGB30 Using Averaging of the Chrominance

The scaler unit can be used to resample the chrominance of YUV4:2:0 and YUV4:2:2, as shown in Figure 11-57 and Figure 11-58, respectively. The settings of the scaler unit to perform chrominance resampling are described in Section 11.2.4.10.4, *DISPC Scaler Unit*.

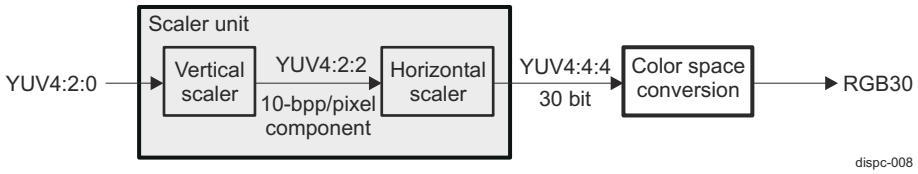

Figure 11-57. DISPC YUV4:2:0 to RGB30 Using Scaler Unit for Resampling Chrominance

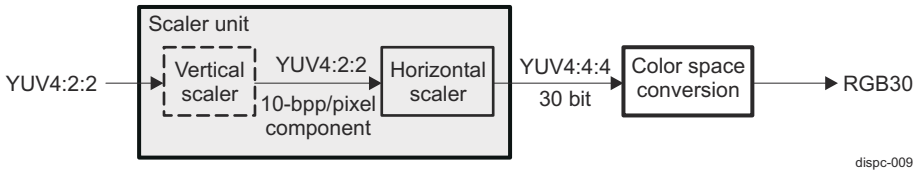

Figure 11-58. DISPC YUV4:2:2 to RGB30 Using Scaler Unit for Resampling Chrominance

Note

If rotation must be supported, YUV4:2:2 and YUV4:2:0 (0-/180-degree rotation) chrominance resampling is done as shown in Figure 11-58 and Figure 11-57, respectively.
For YUV4:2:2 (90-/270-degree rotation) data are preprocessed to present YUV4:4:4 on the scaler input (duplication of the missing chroma), as shown in Figure 11-56.

11.2.4.10.4 DISPC Scaler Unit

All video formats are supported, including formats with alpha blending. Alpha blending is scaled with the same parameters as RGB color components. For the YUV formats, Y and Cb/Cr are processed independently. The filter is based on a finite impulse response (FIR) filter. The filtering can be used for different processing:

- Upsampling of the picture
- Downsampling of the picture

- Antiflicker reduction
- Spatial de-interlacing using bob algorithm
- Chrominance resampling in case of YUV data formats

Note

The user must ensure that the resizing frame displays in the LCD/screen boundaries.

Figure 11-59 shows an example of video upsampling.

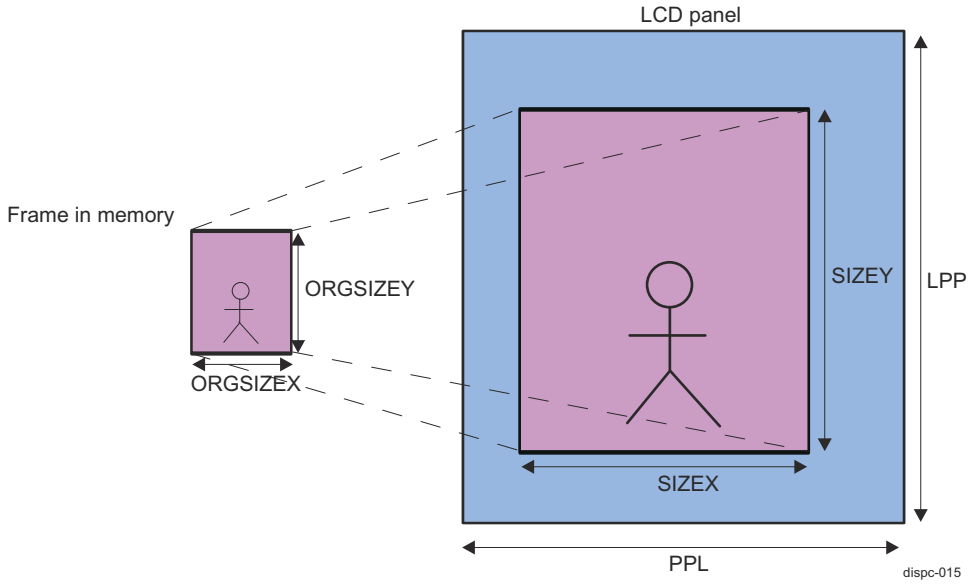

Figure 11-59. DISPC Video Upsampling

The upsampling and downsampling filter is a polyphase filter with five taps and eight phases for the horizontal filter, and a programmable number of taps (three or five) and eight phases for vertical filter. The input buffer has five input memory lines. The following limitations must be considered:

- The upsampling ratio is up to x8.
- The downsampling ratio using 3-tap configuration is down to x0.5 for RGB format.
- The downsampling ratio using 5-tap configuration is down to x0.25 for RGB format.
- If the input format is changed from YUV4:2:2 to YUV4:2:0 (WB pipeline), the downsampling ratio is further reduced:
  - Using 5-tap configuration, the ratio is down to x0.5 for RGB format.
  - Using 3-tap configuration, no downscaling is available.

For vertical upsampling and downsampling in a 3-tap configuration, the equations are:

For RGB formats

$$A_{out}(n)=(\sum_{i=-1}^{i=1} C_{vi}(\Phi)*A_{in}(n+i))>>5$$
$$R_{out}(n)=(\sum_{i=-1}^{i=1} C_{vi}(\Phi)*R_{in}(n+i))>>5$$
$$G_{out}(n)=(\sum_{i=-1}^{i=1} C_{vi}(\Phi)*G_{in}(n+i))>>5$$
$$B_{out}(n)=(\sum_{i=-1}^{i=1} C_{vi}(\Phi)*B_{in}(n+i))>>5$$

For YUV formats

$$Y_{out}(n)=(\sum_{i=-1}^{i=1} C_{vi}(\Phi_y)*Y_{in}(n+i))>>5$$
$$Cr_{out}(n)=(\sum_{i=-1}^{i=1} C_{vci}(\Phi_c)*Cb_{in}(n+i))>>5$$
$$Cb_{out}(n)=(\sum_{i=-1}^{i=1} C_{vci}(\Phi_c)*Cr_{in}(n+i))>>5$$

dispc-013

(1)

For vertical upsampling and downsampling in a 5-tap configuration, the equations are:

For RGB formats

$$A_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{vi}(\Phi)*A_{in}(n+i)\right)>>5$$

$$R_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{vi}(\Phi)*R_{in}(n+i)\right)>>5$$

$$G_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{vi}(\Phi)*G_{in}(n+i)\right)>>5$$

$$B_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{vi}(\Phi)*B_{in}(n+i)\right)>>5$$

For YUV formats

$$Y_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{vi}(\Phi_y)*Y_{in}(n+i)\right)>>5$$

$$Cb_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{vci}(\Phi_c)*Cb_{in}(n+i)\right)>>5$$

$$Cr_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{vci}(\Phi_c)*Cr_{in}(n+i)\right)>>5$$

dispc-012

(2)

For horizontal upsampling and downsampling in a 5-tap configuration, the equations are:

For RGB formats

$$A_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{hi}(\Phi)*A_{in}(n+i)\right)>>7$$

$$R_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{hi}(\Phi)*R_{in}(n+i)\right)>>7$$

$$G_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{hi}(\Phi)*G_{in}(n+i)\right)>>7$$

$$B_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{hi}(\Phi)*B_{in}(n+i)\right)>>7$$

For YUV formats

$$Y_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{hi}(\Phi_y)*Y_{in}(n+i)\right)>>7$$

$$Cb_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{hci}(\Phi_c)*Cb_{in}(n+i)\right)>>7$$

$$Cr_{out}(n)=\left(\sum_{i=-2}^{i=2} C_{hci}(\Phi_c)*Cr_{in}(n+i)\right)>>7$$

dispc-014

(3)

Note

The pixel (n + 1) is the previous pixel with respect to pixel (n). The line (n + 1) is the previous line with respect to line (n).

The coefficients Ci() depend on the phase between input and output pixels.

Note

The coefficients are different for Y and Cr, Cb filtering because the calculations are independent due to the chrominance resampling for YUV4:2:2 and YUV4:2:0.

First, the vertical filter is applied to the encoded input pixel data, and then the horizontal filter is applied on the resulting pixel values to generate the output pixel values. The vertical input of the filter consists of five lines of 2048 × 32 bits for both 3-tap and 5-tap configurations (see Table 11-70).

Table 11-70. DISPC Line Buffer Width for Scaler Unit

Vertical Taps	Maximum Input Width (Pixels)
3, 5	2048 × 32 bits

At the beginning of frame scaling processing, the first line is duplicated to fill the first two lines in 3-tap configuration and the first three lines in 5-tap configuration.

At the end of frame scaling processing, the last line is duplicated if the scaling logic requires loading more lines and the last line has been reached.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The video scalers have an 8-bit input and a 10-bit output. The vertical scaling changes the 8-bit input into a 10-bit clipped output and the horizontal scaling takes the 10-bit input.

Figure 11-60 and Figure 11-61 show the scaler macro-architecture for the component A, R, G, B, and Y. Figure 11-62 and Figure 11-63 show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [1023:0] or [960:64] by configuring the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit.

Note

The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

The VID scaler unit vertical or/and horizontal sampling is defined by setting/resetting the DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE bit field.

A set of configurations must be valid before enabling the video upsampling and downsampling block.

The following fields define the configuration of the video upsampling downsampling block for VIDp:

- Vertical upsampling and downsampling increments the value of the DISPC_VIDp_FIR[28:16] FIRVINC bit field. The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left(\frac{SIZEY}{MEMSIZEY} \right)$$

dispc-066 (4)

Note

– If the value of the DISPC_VIDp_FIR[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
– If the DISPC_VIDp_SIZE[27:16] SIZEY bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
– The values of the DISPC_VIDp_PICTURE_SIZE[27:16] MEMSIZEY and DISPC_VIDp_SIZE[27:16] SIZEY bit fields must be programmed with the value desired minus 1.

- Horizontal upsampling and downsampling increments the value of the DISPC_VIDp_FIR[12:0] FIRHINC bit field. The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left(\frac{SIZEX}{MEMSIZEX} \right) \quad \text{dispc-067} \tag{5}$$

Note

– If the value of the DISPC_VIDp_FIR[12:0] FIRHINC bit field is greater than 4096, it is clipped to 4096.
– If the DISPC_VIDp_SIZE[10:0] SIZEX bit field equals 1, SIZEX is replaced by 2 in the previous equation.
– The values of the DISPC_VIDp_PICTURE_SIZE[10:0] MEMSIZEX and DISPC_VIDp_SIZE[10:0] SIZEX bit fields must be programmed with the value desired minus 1.

- Vertical up/downsampling accumulator value DISPC_VIDp_ACCU_j[26:16] VERTICALACCU bit field: The signed integer value range is [–1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register DISPC_VIDp_ACCU_0 is used for progressive output and for interlace output; the DISPC_VIDp_ACCU_0 and DISPC_VIDp_ACCU_1 registers are used. Similarly, DISPC_VIDp_ACCU2_0 and DISPC_VIDp_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
- Vertical upsampling and downsampling line buffer configuration DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
- Horizontal upsampling and downsampling accumulator value DISPC_VIDp_ACCU_j[10:0] HORIZONTALACCU bit field: The signed integer value range is [–1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register DISPC_VIDp_ACCU_0 is used for progressive output and for interlace output; the DISPC_VIDp_ACCU_0 and DISPC_VIDp_ACCU_1 registers are used. Similarly, DISPC_VIDp_ACCU2_0 and DISPC_VIDp_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.

Table 11-73 lists the DISPC vertical and horizonatal accumulator values and phases.

Table 11-73. DISPC Vertical and Horizontal Accumulator Phase

Accumulator Value	Phases f
0	0
128 or –896	1
256 or –768	2
384 or –640	3
512 or –512	4
640 or –384	5
768 or –256	6
896 or –128	7

- Vertical upsampling and downsampling coefficients:

  - The 3-tap vertical upsampling and downsampling coefficients are defined in the DISPC_VIDp_FIR_COEF_HV_i registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical upsampling and downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
  - The 5-tap vertical upsampling and downsampling coefficients: Two extra-tap vertical upsampling and downsampling coefficients are defined in the DISPC_VIDp_FIR_COEF_V_i registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical upsampling downsampling block are used in addition to the 3-tap registers previously defined.

  Four YUV vertical upsampling and downsampling coefficients are set in DISPC_VIDp_FIR_COEF_HV2_i and DISPC_VIDp_FIR_COEF_V2_i registers. Table 11-71 and Table 11-72 summarize all coefficients and their respective registers.
- Horizontal upsampling and downsampling coefficients:
  - The DISPC_VIDp_FIR_COEF_H_i and DISPC_VIDp_FIR_COEF_HV_i registers define the 5-tap horizontal up/downsampling coefficients. Each DISPC_VIDp_FIR_COEF_H_i register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each DISPC_VIDp_FIR_COEF_HV_i register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal upsampling and downsampling block are used.

Four YUV horizontal upsampling and downsampling coefficients are set in the DISPC_VIDp_FIR_COEF_HV2_i and DISPC_VIDp_FIR_COEF_H2_i registers. Table 11-71 and Table 11-72 summarize all coefficients and their respective registers.

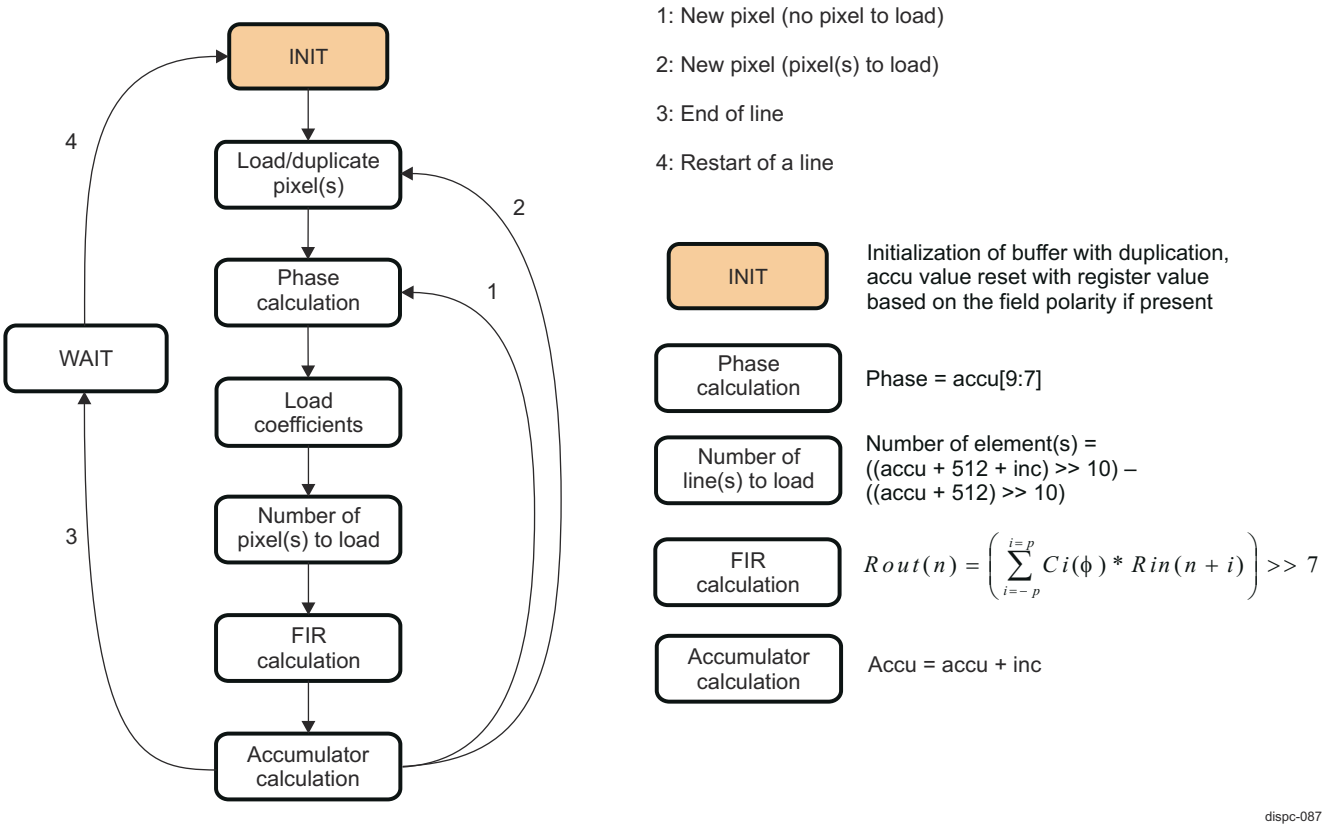

Figure 11-65. DISPC Horizontal Up/Downsampling Algorithm

11.2.4.10.4.2 DISPC Scaling limitations

Table 11-74 lists the minimum ratio between the pixel clock frequency (DSS_DISPC_LCDn_PCLK) and the functional clock (F_CLK) in the input pixel format when using the scaler unit. DSS_DISPC_LCDn_PCLK and F_CLK are asynchronous. For each LCD output, a dedicated LCD clock is programmable with the LCD and PCD divisor values in DISPC_DIVISORo[23:16][7:0].

Note

The F_CLK is derived from DSS_FCLK through the LCD divisor.

Note

The downscaling ratio is not an integer, it is the ratio F_CLK / DSS_DISPC_LCDn_PCLK, meaning if the ratio is 2.7, then the downscaling ratio is 2.7 and not 2.

Table 11-74. DISPC Pixel Clock Frequency Limitations (Any Pixel Format) – Active Matrix Display

F_CLK/DSS_DISPC_LCDn_PCLK Minimum Ratio	Horizontal Resampling				
	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4
	2 or 1(1)	2 or 1(1))	2	3	4

(1) The minimum ratio can be 1 if the data are output on the rising edge of the PCLK (DISPC_POL_FREQo.IPC = 0 and CTRL_CORE_SMA_SW_1[]DSS_CHx_IPC); otherwise, the minimum ratio must be 2.

11.2.4.11 DISPC Write-Back Pipeline

The write-back pipeline is used to store in the system memory the capture of the overlay output or the output of one of the pipelines. The WB pipeline consists of a CSC unit, a scaler unit, and an RGB truncation logic. Because the overlay works on ARGB32-8888 format and the video accelerator works on YUV format, the color space conversion from RGB to YUV is used to directly output to memory the format that can be encoded with no extra processing.

The write-back pipeline is connected to all the pipeline outputs (GFX, VD1, VID2, and VID3 pipelines) and to the output of the three overlay managers (LCD1, LCD2, LCD3, and TV). The input is selected by setting the DISPC_WB_ATTRIBUTES[18:16] CHANNELIN bit field, and the capture frame rate is set in the DISPC_WB_ATTRIBUTES[26:24] CAPTUREMODE bit field.

Because the output format of the TV overlay manager is ARGB40, the graphics pipeline output is ARGB40, the video pipeline outputs are YUV4:2:2, YUV4:2:0, or ARGB40, and the write-back input is ARGB32, the write-back input does not consider the 2 LSBs of each ARGB component.

The write-back pipeline is enabled by setting the DISPC_WB_ATTRIBUTES[0] ENABLE bit to 0x1.

Figure 11-66 shows the graphics pipeline.

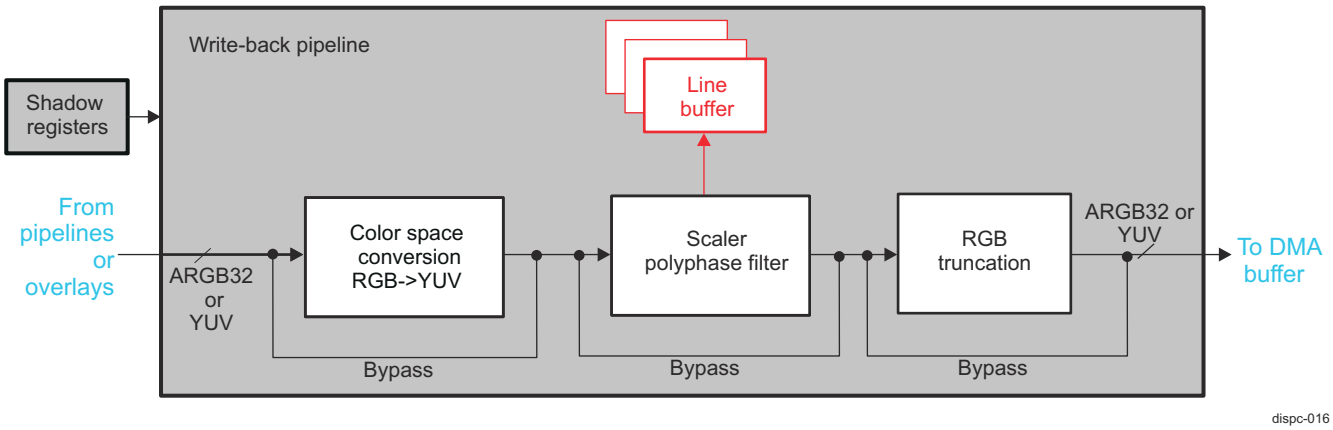

Figure 11-66. DISPC Write-Back Pipeline

11.2.4.11.1 DISPC Write-Back CSC Unit RGB to YUV

The RGB-to-YUV CSC unit converts the encoded pixel values from RGB24 into YUV4:4:4 format. For YUV4:2:0 or YUV4:2:2 formats, a chrominance sub-sampling is required after converting the RGB into YUV values. Because of the subsampling, the following limitations must be considered:

- When converting RGB into YUV4:2:0 NV12 format:
  - Maximum horizontal downscale = x0.5
  - Maximum vertical downscale = x0.5
- When converting RGB into YUV4:2:2 format:
  - Maximum horizontal downscale = x0.5
  - Maximum vertical downscale = x0.25

Figure 11-67 and Figure 11-68 show the 3 × 3 11-bit coefficients used to convert from RGB24 into YUV4:4:4. The user sets the coefficients according to the standard used to encode the pixel data in YUV color space. Table 11-75 lists the coefficients with their respective bit fields.

Table 11-75. DISPC CSC RGB to YUV Bit Field Setting

Coefficients	Bit Fields
Y_R	DISPC_WB_CONV_COEF0[10:0] YR
Y_G	DISPC_WB_CONV_COEF0[26:16] YG
Y_B	DISPC_WB_CONV_COEF1[10:0] YB

Table 11-75. DISPC CSC RGB to YUV Bit Field Setting (continued)

Coefficients	Bit Fields
Cr_R	DISPC_WB_CONV_COEF1[26:16] CRR
Cr_G	DISPC_WB_CONV_COEF2[10:0] CRG
Cr_B	DISPC_WB_CONV_COEF2[26:16] CRB
Cb_R	DISPC_WB_CONV_COEF3[10:0] CBR
Cb_G	DISPC_WB_CONV_COEF3[26:16] CBG
Cb_B	DISPC_WB_CONV_COEF4[10:0] CBB

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the DISPC_WB_ATTRIBUTES[11] FULLRANGE bit to 0x0.

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix}$$

dispc-017

Figure 11-67. DISPC RGB to YCbCr (FULLRANGE = 0)

If the active range for the luminance samples (Y) and or the chrominance samples (Cb and Cr)is [0:255], the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the DISPC_WB_ATTRIBUTES[11] FULLRANGE bit to 0x1.

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-018

Figure 11-68. DISPC RGB to YCbCr (FULLRANGE = 1)

11.2.4.11.2 DISPC Write-Back Scaler Unit

The functional aspect of the write-back pipeline scaler unit is identical to the video pipeline scaler unit (see Section 11.2.4.10.4, *DISPC Scaler Unit*), except in the output width when scaling ARGB components. The resulting output format is ARGB32 instead of ARGB40.In addition, the scaling limitations described in Section 11.2.4.10.4.2 are relevant only to the video pipelines scaler units. In write-back memory-to-memory mode there are no limitations on the F_CLK/DSS_DISPC_LCDn_PCLK ratio for horizontal resampling.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The write-back scaler component has an 8-bit input and an 8-bit output.

Figure 11-69 and Figure 11-70 show the scaler macro-architecture for the component A, R, G, B, and Y. Figure 11-71 and Figure 11-72 show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:255] or [16:240] by configuring the DISPC_WB_ATTRIBUTES[11] FULLRANGE bit.

	Chc(1)		FIRHC1	DISPC_WB_FIR_COEF_H2_i
	Chc(2)		FIRHC0	DISPC_WB_FIR_COEF_H2_i

The WB scaler unit vertical or/and horizontal sampling is defined by setting/resetting the DISPC_WB_ATTRIBUTES[6:5] RESIZEENABLE bit field.

A set of configuration must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for WB:

- Vertical up/downsampling increments the value of the DISPC_WB_FIR[28:16] FIRVINC bit field. The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left(\frac{SIZEY}{MEMSIZEY} \right) \quad \text{dispc-066} \tag{6}$$

Note

  - If the value of the DISPC_WB_FIR[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
  - If the DISPC_WB_SIZE[27:16] SIZEY bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
  - The values of the DISPC_WB_PICTURE_SIZE[27:16] MEMSIZEY and DISPC_WB_SIZE[27:16] SIZEY bit fields must be programmed with the value desired minus 1.

- Horizontal up/downsampling increments the value of the DISPC_WB_FIR[12:0] FIRHINC bit field: The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left(\frac{SIZEX}{MEMSIZEX} \right) \quad \text{dispc-067} \tag{7}$$

Note

- If the value of the DISPC_WB_FIR[12:0] FIRHINC bit field is greater than 4096, it is clipped to 4096.
- If the DISPC_WB_SIZE[10:0] SIZEX bit field equals 1, the DISPC_WB_SIZE[10:0] SIZEX bit field is replaced by 2 in the previous equation.
- The value of the DISPC_WB_PICTURE_SIZE[10:0] MEMSIZEX and DISPC_WB_SIZE[10:0] SIZEX bit fields must be programmed with the value desired minus 1.

- Vertical up/downsampling accumulator value DISPC_WB_ACCU_j[26:16] VERTICALACCU bit field: The signed integer value range is [–1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register DISPC_WB_ACCU_0 is used for progressive output and for interlace output the DISPC_WB_ACCU_0 and DISPC_WB_ACCU_1 registers are used. Similarly, DISPC_WB_ACCU2_0 and DISPC_WB_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
- Vertical up/downsampling line buffer configuration DISPC_WB_ATTRIBUTES[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
- Horizontal up/downsampling accumulator value DISPC_WB_ACCU_j[10:0] HORIZONTALACCU bit field: The signed integer value range is [–1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register DISPC_WB_ACCU_0 is used for progressive output and for interlace output the DISPC_WB_ACCU_0 and DISPC_WB_ACCU_1 registers are used. Similarly, DISPC_WB_ACCU2_0 and DISPC_WB_ACCU2_1 are used in progressive or interlace output to set the accumulator value of Cb and Cr components when scaling YUV format.

Table 11-78 lists the DISPC vertical and horizontal accumulator values and phases.

Table 11-78. DISPC Vertical/Horizontal Accumulator Phase

Accumulator Value	Phases f
0	0
128 or –896	1
256 or –768	2
384 or –640	3
512 or –512	4
640 or –384	5
768 or –256	6
896 or –128	7

- Vertical up/downsampling coefficients:
  - The 3-tap vertical up/downsampling coefficients are defined in the DISPC_WB_FIR_COEF_HV_i registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
  - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the DISPC_WB_FIR_COEF_V_i registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined.

  Four YUV vertical up/downsampling coefficients are set in the DISPC_WB_FIR_COEF_HV2_i and DISPC_WB_FIR_COEF_V2_i registers. Table 11-76 and Table 11-77 summarize all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:
  - The DISPC_WB_FIR_COEF_H_i and DISPC_WB_FIR_COEF_HV_i registers define the 5-tap horizontal up/downsampling coefficients. Each DISPC_WB_FIR_COEF_H_i register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each DISPC_WB_FIR_COEF_HV_i

register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used.

Four YUV horizontal up/downsampling coefficients are set in the DISPC_WB_FIR_COEF_HV2_i and DISPC_WB_FIR_COEF_H2_i registers. Table 11-76 and Table 11-77 summarize all coefficients and their respective registers.

11.2.4.11.3 DISPC Write-Back RGB Truncation Logic

Truncation logic is used to convert a pixel from ARGB 32-bit format into a lower color depth: 12- or 16-bit format based. Setting the DISPC_WB_ATTRIBUTES[10] TRUNCATIONENABLE bit to 0x1 enables the truncation to the pixel format defined by the DISPC_WB_ATTRIBUTES[4:1] FORMAT bit field. The truncation is done by removing the necessary LSB of each component to match the output format. Table 11-79 describes the truncation done on each component of the pixel.

Table 11-79. DISPC Truncation Logic

	A[7:0]	R[7:0]	G[7:0]	B[7:0]
Output Formats	**MSB LSB**	**MSB LSB**	**MSB LSB**	**MSB LSB**
xRGB12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGBx12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGB16-565	Ignored	R[7:3]	G[7:2]	B[7:3]
xRGB16-1555	Ignored	R[7:3]	G[7:3]	B[7:3]
ARGB16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
RGBA16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
ARGB16-1555	A[7]	R[7:3]	G[7:3]	B[7:3]

Note

If there is no alpha field in the pixel format description, 0s or 1s must fill the container. 0s must be used for transparent and 1s for opaque. For example, in xRGB12 pixel format, the upper 4 bits are set to 0s because the RGB value is only 12 bits inside a 16-bit container.

11.2.4.12 DISPC Hardware Cursor

The video layer or graphics layer can be used to display the hardware cursor. The encoded pixel data for the cursor image are in one of the following formats if the source transparency color key is used:

- xRGB12-4444
- ARGB16-4444
- RGBx12-4444
- RGBA16-4444
- ARGB16-1555
- RGB16-565
- RGB24-888
- xRGB24-88888
- RGBA32-8888
- BGRA32-8888
- ARGB32-8888

Otherwise, any pixel format can be used for the cursor image, considering the limitation in terms of pixels supported by the pipeline used to display the cursor image. To display a nonrectangle cursor, the transparency color key or alpha blending (pixel alpha blending) can be used (see Section 11.2.4.13.1.3, *DISPC Transparency Color Keys*). Global alpha blending can be used in addition to the transparency source color key to create a fading effect when the cursor (with a nonrectangle shape) appears and disappears on the screen. The image of the cursor can be stored entirely inside the DMA buffer to use the self-refresh mode (see Section 11.2.4.6.8.2, *DISPC DMA Ultralow-Power Mode*). In that case, the image is loaded once and then displayed without

accessing the system memory for loading the image for each frame. This saves bandwidth on interconnect and memory.

11.2.4.13 DISPC LCD Outputs

The LCD1, LCD2, LCD3 output paths consist of several processing blocks (see Figure 11-73):

- Overlay manager
- Gamma correction unit
- Color phase rotation (CPR) block, also used for RGB-to-YUV color space conversion (CSC)
- Active matrix dithering with TDM
- BT.656
- BT.1120
- Synchronization buffer
- Timing generator

The display subsystem supports active matrix technologie (monochrome and color modes):

- Active matrix displays: the configuration of colors depends on the color depth:
  - 24 bpp supports 16,777,216 colors.
  - 18 bpp supports 262,144 colors.
  - 16 bpp supports 65,536 colors.
  - 12 bpp supports 4096 colors.

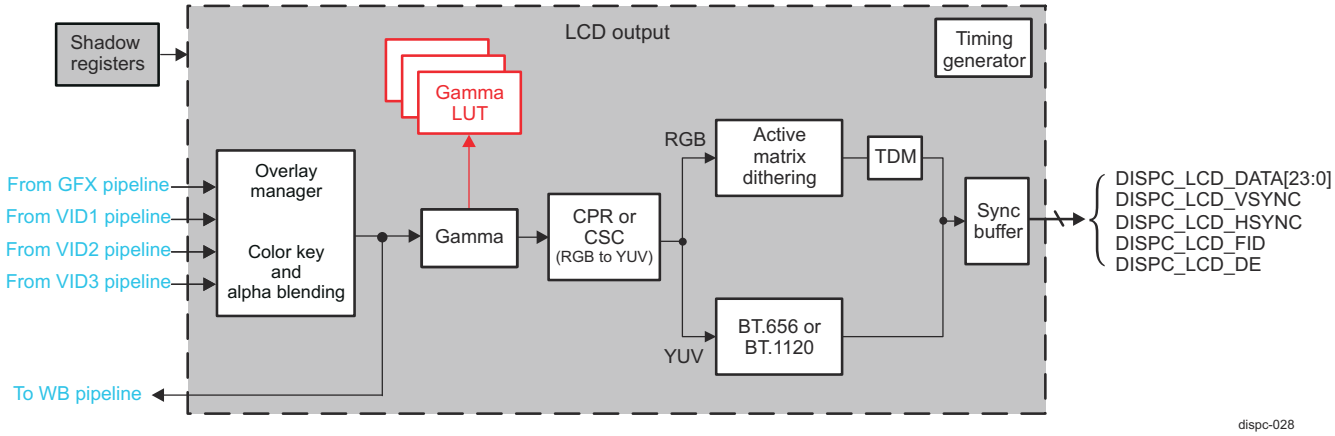

Figure 11-73. DISPC LCD Output Architecture

Note

In BT.656 mode only bits 9 through 0 are used from DISPC_LCD_DATA[23:0] data bus.

11.2.4.13.1 DISPC Overlay Manager

The overlay mechanism consists of displaying more than one layer (GFX, VID1, VID2, and VID3 layers) using:

- A priority rule based on a Z-order: Application can set the ordering layer of the frames.
- Transparency color keys: Destination and source transparency color keys can be set.
- Alpha blending values: Using the A component of a pixel or a blending set by the user for a layer, a level of transparency can be determined.

Each pipeline (GFX, VID1, VID2, and VID3) is assigned to a single overlay and, as a consequence, to a single display controller output, LCD1, LCD2, LCD3, TV, or WB pipeline. An overlay manager can be connected to all four pipelines outputs simultaneously. The pipeline output is directed using the DISPC_GFX_ATTRIBUTES[8] CHANNELOUT bit and the DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2

bit field. Table 11-80 summarizes the bit field settings to direct a pipeline to an LCD/TV or WB output. The default value directs all pipelines to LCD1.

Table 11-80. DISPC Pipeline Connection to LCD, TV, or WB Output

	DISPC_GFX_ATTRIBUTES/DISPC_VIDp_ATTRIBUTES	
Overlay Manager/Output	**CHANNELOUT Bit**	**CHANNELOUT2 Bit Field**
LCD1	0x0	0x0
LCD2	0x0	0x1
LCD3	0x0	0x2
WB	0x0	0x3
TV	0x1	0x0 (See the following note)

Note

When CHANNELOUT = 0x1, the settings CHANNELOUT2 = 0x0, 0x1, 0x2, and 0x3 are reserved.

The output of each LCD overlay manager is connected to CPR block through the gamma table unit in the case of gamma correction.

Note

When the pixel format is ARGB or RGBA, the color key match logic uses only the RGB value defined by ARGB or RGBA. The alpha blending factor is ignored.

11.2.4.13.1.1 DISPC Priority Rule

The overlay manager is configured using the Z-order parameter. The Z-order value defined for each pipeline indicates the visibility order to the window on the screen. If the Z-order value of window A is lower than the Z-order to layer B, layer A is displayed below layer B. The transparency color keys and the alpha blending factors are then used to blend the layers together (see Section 11.2.4.13.1.2, *DISPC ALPHA Blender*, and Section 11.2.4.13.1.3, *DISPC Transparency Color Keys*). The Z-order is enabled by setting the DISPC_GFX_ATTRIBUTES[25] ZORDERENABLE bit or the DISPC_VIDp_ATTRIBUTES[25] ZORDERENABLE bit to 0x1 and by defining the Z-order in the DISPC_GFX_ATTRIBUTES[27:26] and DISPC_VIDp_ATTRIBUTES[27:26] ZORDER bit fields. Table 11-81 summarizes the register settings to enable and set the Z-order of a pipeline. Table 11-81 shows the default Z-order values when LCDALPHABLENDERENABLE and ZORDERENABLE are disabled.

Table 11-81. DISPC Z-Order Register Settings and Default Configuration

Pipeline	LCDALPHA BLENDERENABLE(1)	ZORDERENABLE	ZORDER	Resulting Z-Order Number
GFX	0	0	Don't care	0
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	3
VID1	0	0	Don't care	1
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	0
VID2	0	0	Don't care	2
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	1

Table 11-81. DISPC Z-Order Register Settings and Default Configuration (continued)

Pipeline	LCDALPHA BLENDERENABLE(1)	ZORDERENABLE	ZORDER	Resulting Z-Order Number
VID3	0	0	Don't care	3
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	2

(1) Applies only to LCD1

Figure 11-74 shows the architecture of the priority rule.

Note

- If ZORDERENABLE = 1, each Z-order must be different for each active pipeline. It is not possible to use the same value for more than one pipeline.
- Two modes are maintained for backward compatibility with legacy devices:
  - LCDALPHABLENDERENABLE = 0 and ZORDERENABLE = 0 equivalent to the normal mode overlay settings
  - LCDALPHABLENDERENABLE = 1 equivalent to the alpha mode overlay settings

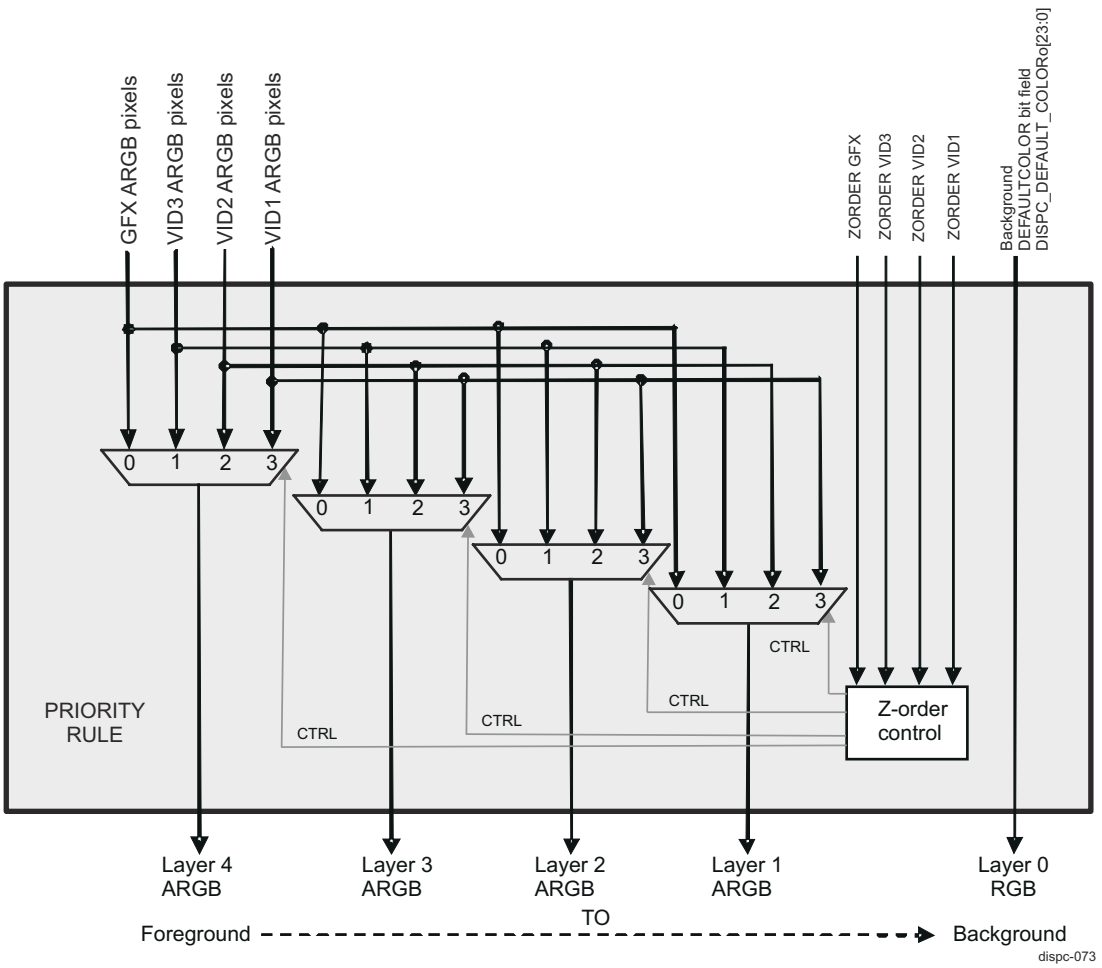

Figure 11-74. DISPC Priority Rule Architecture

The height and width of each enabled layer (pipeline) must be defined in the SIZEY and SIZEX bit fields DISPC_GFX_SIZE[27:16][10:0]/ DISPC_VIDp_SIZE[27:16][10:0], and its x and y positions defined in the POSX

and POSY bit fields DISPC_GFX_POSITION[26:16][10:0]/DISPC_VIDp_POSITION[26:16][10:0]. If there are no graphics or video-encoded pixels at a specific position, the programmable, solid background color appears. The solid background color is set in the DISPC_DEFAULT_COLORo[23:0] DEFAULTCOLOR bit field. Figure 11-75 is an example of priority rule.

The Z-order reordering block must always map the pipelines to the blender logic in the same order—from background to foreground.

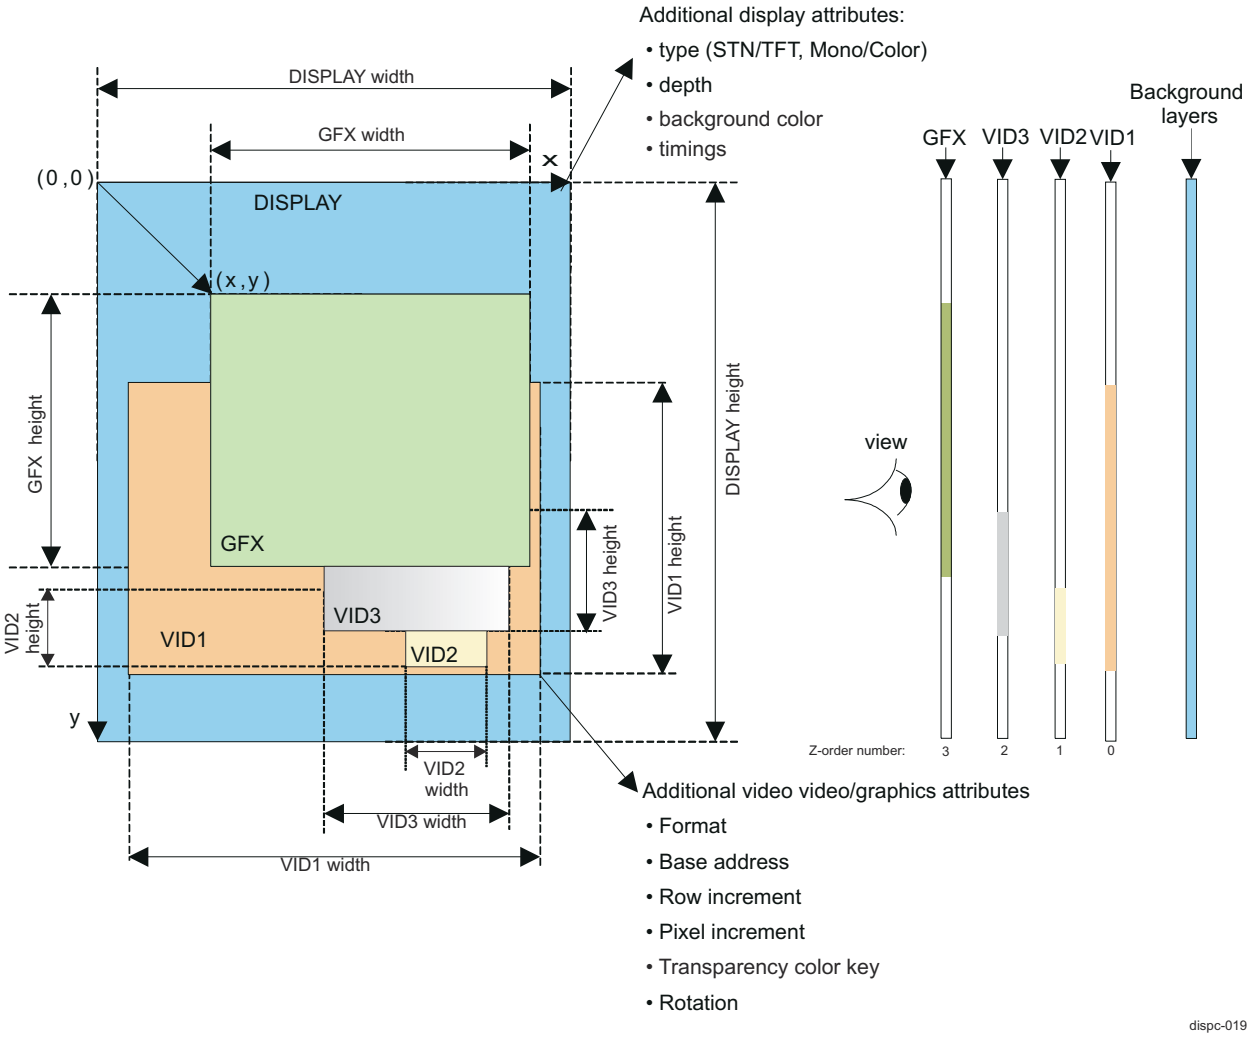

Figure 11-75. DISPC Example of Priority Rule: From Lower to Higher VID1, VID2, VID3, GFX

The DISPC is capable of outputting simultaniously two graphic/video windows in frame packing mode. Framepacking mode is enabled from DISPC_GFX_ATTRIBUTES[10] FRAMEPACKINGMODE / DISPC_VIDp_ATTRIBUTES[8] FRAMEPACKINGMODE. The position of the second graphic/video windows is defined in DISPC_GFX_POSITION2 / DISPC_VIDp_POSITION2 registers. The size is again defined in SIZEY and SIZEX bit fields of DISPC_GFX_SIZE[27:16][10:0]/ DISPC_VIDp_SIZE[27:16][10:0] registers.

11.2.4.13.1.2 DISPC Alpha Blender

Figure 11-76 shows the alpha blending processing in detail.

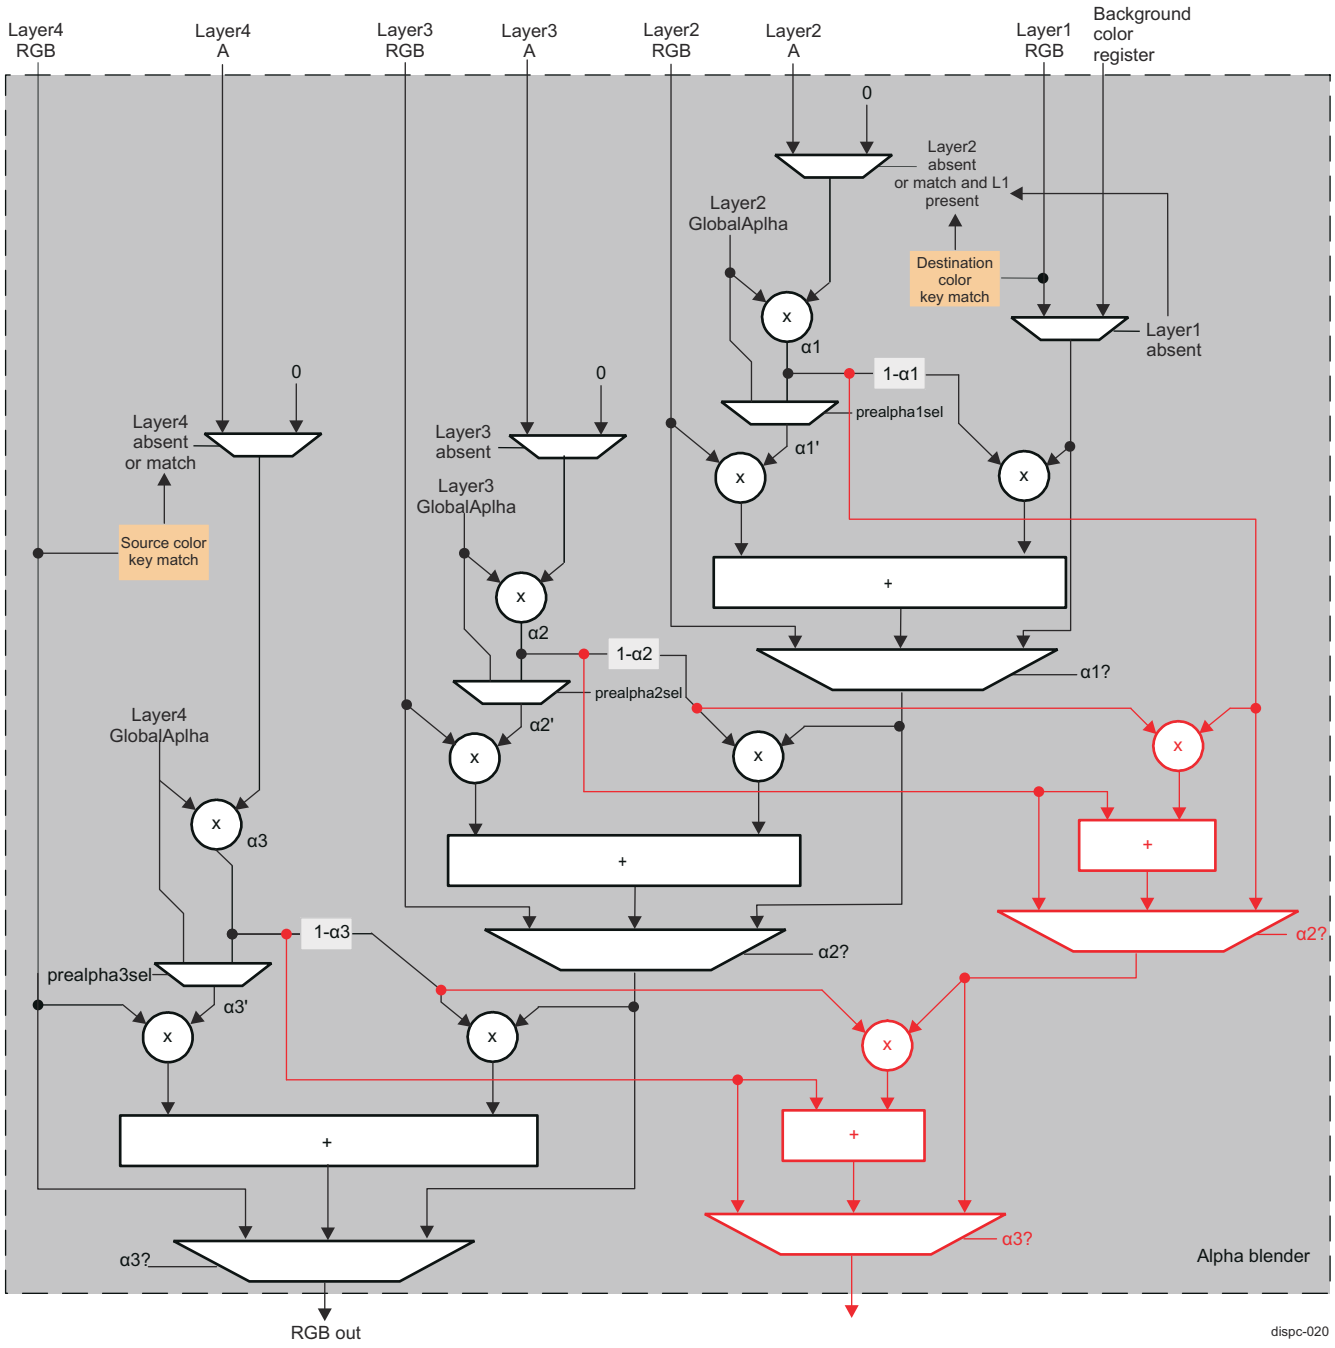

Figure 11-76. DISPC Alpha Blending Architecture With Premultiplied Alpha Support

CAUTION

The Z order of the Source Transparency Layer must have the value 3 (0x3: Z-order 3: layer above all the other layers).

Note

1-alpha operator corresponds to the basic 1s-complement operation.

The alpha blending value is defined by:

- The component value A when using an ARGB or RGBA pixel format.
  - For ARGB-1555, the alpha blending is defined using a 1-bit value. It is converted into an 8-bit value by duplicating the 1-bit value (see Table 11-82).
  - For ARGB-4444, the alpha blending is defined using a 4-bit value. It is converted into an 8-bit value by duplicating the 4-bit value (see Table 11-82).
  - If the pixel format contains no alpha blending value, the pixel alpha value is considered to be 0xFF and if alpha is equal to 0xFF, there is no multiplication.
  - For YUV formats, there is no alpha blending factor associated with each pixel value. Only the global alpha blending factor associated with the window displaying the YUV format is used.
- The global alpha blending value set in the individual bit fields of the DISPC_GLOBAL_ALPHA register for LCD:
  - VID3GLOBALALPHA
  - VID2GLOBALALPHA
  - VID1GLOBALALPHA
  - GFXGLOBALALPHA
- A total alpha blending value can be used when a combination of the pixel alpha blending value A and a global alpha blending is present. The resulting alpha value is determined as: Alpha = (Pixel Alpha × Global Alpha) / 256.

Table 11-82 lists the percentage of alpha blending in the function of the alpha blending value on 8 bits.

Table 11-82. DISPC Alpha Blending – ARGB

Alpha Blending 1-Bit Value	Alpha Blending 4-Bit Value	Alpha Blending 8-Bit Value (Converted Value or Resulting Alpha)	Percent Blending
0x0	0x0	0x00	100 (transparent)
N/A	0x1	0x11	93.33
N/A	0x2	0x22	86.6
N/A	...	...	...
N/A	0xE	0xEE	6.6
0x1	0xF	0xFF	0 (opaque)

Premultiplied Alpha

The image ARGB may have its RGB component already premultiplied with the alpha (ARGB) where:

- R = A*R
- G = A*G
- B = A*B

In that case, the processing is as follows:

- Color component of premultiplied layers are multiplied with the Global Alpha, if Global Alpha is not equal to 0.
- Color component of the composed underlying layers are multiplied with (1-A) × Global Alpha.

The additional premultiplied alpha option is associated with the pipelines GFX, VID1, VID2, and VID3. The option is accessible through the [28] PREMULTIPLYALPHA bit for the respective pipeline register:

- DISPC_GFX_ATTRIBUTES
- DISPC_VID1_ATTRIBUTES
- DISPC_VID2_ATTRIBUTES
- DISPC_VID3_ATTRIBUTES

The following settings are available:

- PREMULTIPLYALPHA bit = 0: Source is not premultiplied with alpha. Full blending is done in the DISPC.

- PREMULTIPLYALPHA bit = 1: Source is premultiplied with alpha. Partial blending is done.

Note

The *prealphasel* controls in Figure 11-76, correspond to the PREMULTIPLYALPHA of the pipelines mapped on the respective layers.

The logic marked in red in Figure 11-76 corresponds to the alpha value, computed when the write-back channel copies back to memory the premultiplied color component: A (destination) = A (source) + (1-A (source) × A (destination))

When the DISPC_WB_ATTRIBUTES[7] ALPHAENABLE bit is cleared, or when the overlay channel is not selected for WB, the computation of the A(destination) is disabled. The default value for DISPC_WB_ATTRIBUTES[7] ALPHAENABLE bit is 0x0. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available:

- The ALPHAENABLE bit is set to 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay.
- The ALPHAENABLE bit is set to 0x0: The alpha value is not written back.

Note

The DISPC_WB_ATTRIBUTES[7] ALPHAENABLE bit is effective only when one of the output channels is written back, otherwise it is ignored.

11.2.4.13.1.3 DISPC Transparency Color Keys

The two transparency color keys are the source transparency color key and the destination transparency color key. The transparency color key can be used only with RGB formats (ARGB, RGB, RGBA, xRGB, and RGBx). in this case the A information is ignored for the comparison between the pixel value and the color key value. It is possible to use YUV formats with some care because the comparison is between the input pixel value of the overlay manager from pipeline (GFX or one of the VID pipelines depending on the Z-order) and the color key value. The YUV data is converted to RGB format. If the original format is YUV, the user must consider the color space conversion processing to define the RGB color key value used for the comparison.

The transparency color key is enabled by setting the following bits to 0x1:

- DISPC_CONFIG1[10] TCKLCDENABLE (for LCD1)
- DISPC_CONFIG2[10] TCKLCDENABLE (for LCD2)
- DISPC_CONFIG3[10] TCKLCDENABLE (for LCD3)
- DISPC_CONFIG1[12] TCKTVENABLE (for TV)

The transparency color key is determined in the following bit fields.

- DISPC_TRANS_COLOR0[23:0] TRANSCOLORKEY (for LCD1)
- DISPC_TRANS_COLOR2[23:0] TRANSCOLORKEY (for LCD2)
- DISPC_TRANS_COLOR3[23:0] TRANSCOLORKEY (for LCD3)
- DISPC_TRANS_COLOR1[23:0] TRANSCOLORKEY (for TV)

Note

The video source transparency color key and graphics destination transparency color key cannot be active at the same time.

- Video source transparency color key

  The value of the video source transparency color key defines the encoded pixel data considered as a transparent pixel. The encoded pixel values with the source color key value are not visible, and the encoded

pixel values of the under layers or solid background color are visible (the pixel alpha blending value of layer 4 is forced to 0x00, fully transparent).

The scaler can be enabled as a preprocessor in the VID pipeline, but it is necessary to consider the pixel scaling preprocessing in order to define the color key value to be used after the rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The source transparency color key mode is selected by setting the following bits to 0x1:
– DISPC_CONFIG1[11] TCKLCDSELECTION (for LCD1)
– DISPC_CONFIG2[11] TCKLCDSELECTION (for LCD2)
– DISPC_CONFIG3[11] TCKLCDSELECTION (for LCD3)
– DISPC_CONFIG1[13] TCKTVENABLE (for TV)

Figure 11-77 shows an example of source color key. The pixels with the transparency color key are not displayed; instead, pixels of the resulting layer underneath are shown.

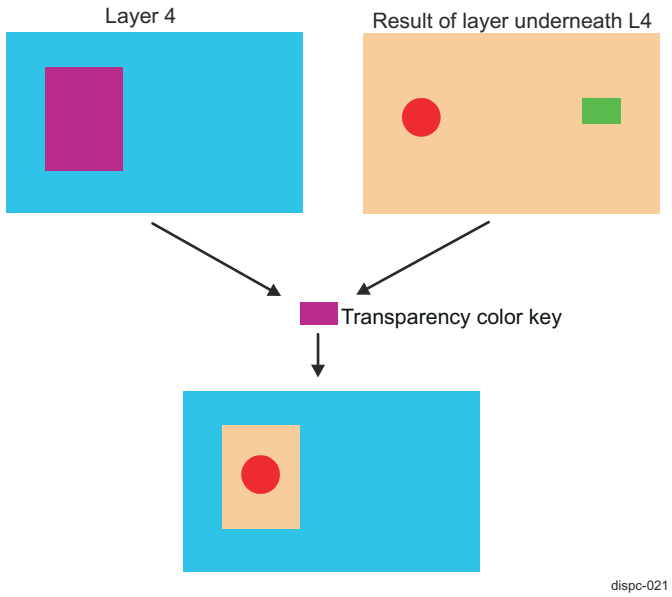

Figure 11-77. DISPC Source Transparency Color Key Example

- Graphics destination transparency color key value

The graphics destination transparency color key value defines the encoded pixels in layer 1, which are not displayed. Other layer 1 pixels (nonequal to destination transparency color key) are displayed over layer 2. The encoded pixel values with the destination color key value are pixels not visible on the screen because pixels at the same position in layer 2 are visible; otherwise, encoded pixels are visible above layer 2 . The destination transparency color key applies only if layer 1 overlaps layer 2 (see the Z-order section for details on layer position depending on the Z-order parameter in Section 11.2.4.13.1.1, *Priority Rule*); otherwise, the destination transparency color key is ignored.

The scaler can be enabled as a preprocessor in the VID pipeline. It is necessary, however, to consider the pixel scaling preprocessing in order to define the color key value to be used after rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The destination transparency color key mode is selected by setting the following bits to 0x0:
– DISPC_CONFIG1[11] TCKLCDSELECTION (for LCD1)
– DISPC_CONFIG2[11] TCKLCDSELECTION (for LCD2)
– DISPC_CONFIG3[11] TCKLCDSELECTION (for LCD3)
– DISPC_CONFIG1[13] TCKTVSELECTION (for TV)

Figure 11-78 shows an example of the destination color key. The pixels, equal to the transparency color key, are not displayed and are replaced by layer 2 pixels. All other layer 1 pixels, different from the transparency color key, are displayed over layer 2.

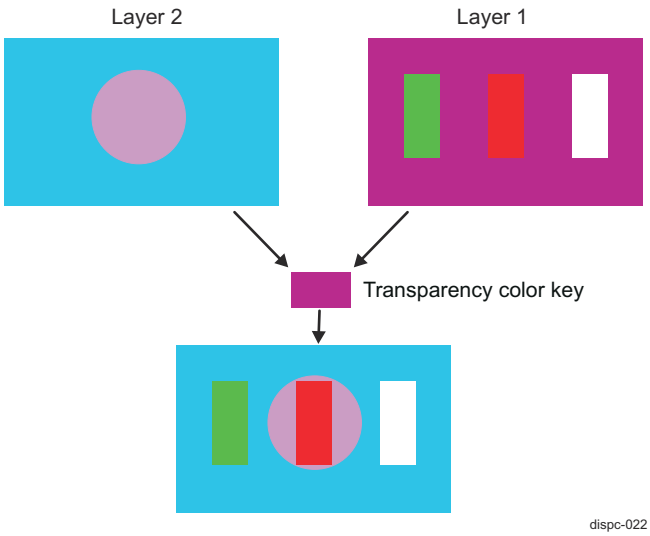

Figure 11-78. DISPC Destination Transparency Color Key Example

11.2.4.13.1.4 DISPC Overlay Optimization

The overlay optimization consists in fetching only the required pixels (that is, pixels that contribute to the final picture to be displayed [LCD1, LCD2, LCD3, or TV]). The decision to fetch the pixel from memory is based on the information available in the registers and on the following rules:

- The layer is enabled.
- The global alpha blending factor for the layer is different than 0x00.
- The current layer is behind an nonopaque layer (global alpha blending factor is different than 0xFF for the layer in the preceding).

The result of the overlay optimization is a reduction of the bandwidth by fetching only the mandatory pixels. The overlay mechanism is independent for each overlay: LCD1, LCD2, LCD3, and TV. Because each layer (GFX, VID1, VID2, and VID3) can be associated to only one overlay at a time, it is possible to optimize the fetch of the pixels for each layer based on the overlay information. The overlay optimization must be run on the DMA engine time window and not on the display time window. The pixels are fetched by the DMA engine before the display processing.

The overlay optimization is enabled by setting the following bits to 0x1:

- DISPC_CONTROL1[12] OVERLAYOPTIMIZATION (for LCD1)
- DISPC_CONTROL2[12] OVERLAYOPTIMIZATION (for LCD2)
- DISPC_CONTROL3[12] OVERLAYOPTIMIZATION (for LCD3)
- DISPC_CONTROL2[13] TVOVERLAYOPTIMIZATION (for TV)

Note

- The pixel alpha blending factor in case of ARGB and RGBA formats cannot be used to take advantage of the pixel fully transparent (alpha blending factor equals 0x00).
- By default, the overlay optimization is disabled (OVERLAYOPTIMIZATION bits = 0x0 for all DISPC outputs), and all the data for all the enabled pipelines are fetched from memory regardless of the overlay or alpha blending configuration.

11.2.4.13.2 DISPC Gamma Correction Unit

Each LCD output supports a look up table to perform gamma correction on the display output.

Figure 11-79 shows the internal architecture of the gamma table for LCD1 output.

The gamma table is split into three memories of 256 × 8-bit entries and indexed by the R/G/B component data.

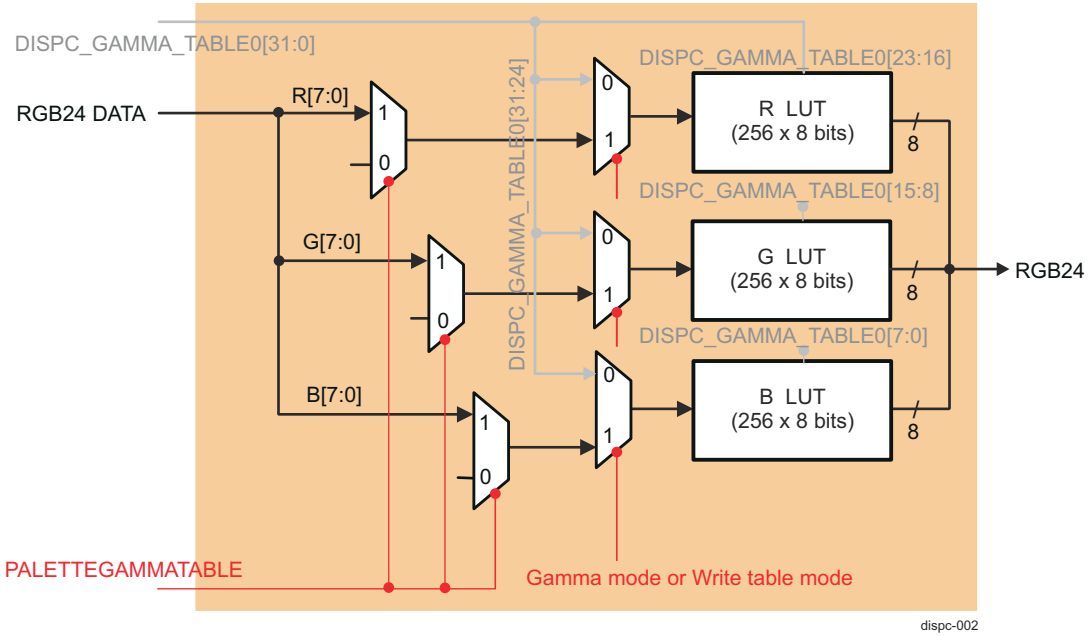

Figure 11-79. DISPC LCD1 Gamma Correction Architecture

When performing gamma correction, the selected encoded pixel values based on the color keys by the overlay manager from the video or graphics paths are sent to the gamma curve table. Each component of encoded pixel value is used as a pointer to index 1 out of 256 × 24-bit gamma curve entries in the table. Each 8-bit component is replaced with the 8-bit table value corresponding to R, G, or B component. The table is loaded by software. It is possible to load only part of the table. For each access to the table, the 24-bit value is associated with index in the table by concatenating the 24-bit value (LSB of 32-bit access) and the 8-bit index value (MSB of the 32-bit access).

The sequence to load the gamma table is:

1. SW writes (only writes are supported) 32-bit gamma correction values using single access, or burst access in streaming mode, into DISPC_GAMMA_TABLE0 register (for LCD1 output). The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table.
2. Loop to Step 1, if there is a new access to the gamma table register. The SW can access other registers between two accesses to the gamma table register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

For LCD1 output the usage of the gamma table is activated by setting DISPC_CONFIG1[3] PALETTEGAMMATABLE register bit to 0x1.

For LCD2 and LCD3 outputs, the associated gamma tables are enabled by setting DISPC_CONFIG1[9] GAMATABLEENABLE register bit to 0x1.

- For LCD2 output the gamma values are loaded into DISPC_GAMMA_TABLE1 register
- For LCD3 output the gamma values are loaded into DISPC_GAMMA_TABLE3 register

Figure 11-80 describes the format of one of the gamma curve values in the memory.

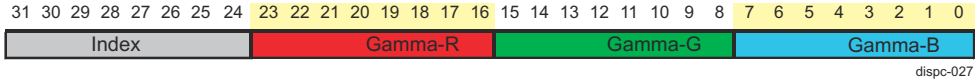

Figure 11-80. DISPC Data Memory Organization for Gamma Mode in LCD Output

11.2.4.13.3 DISPC Color Phase Rotation Unit

The CPR unit can be used to correct the LCD output colorimetry in case of nonpure white backlight.

The CPR is enabled by setting the DISPC_CONFIGo[15] CPR bit to 0x1. The coefficients are programmed in the following registers:

- Red 10-bit signed coefficients in DISPC_CPRo_COEF_R
- Green 10-bit signed coefficients in DISPC_CPRo_COEF_G
- Blue 10-bit signed coefficients in DISPC_CPRo_COEF_B

The CPR can be selected for active matrix panel. The logic is integrated after the LCD overlay manager and the gamma correction, and before the spatial/temporal dithering. The CPR can be selected to correct the nonpure white backlight of the LCD module by using a programmable matrix to convert the 24-bit RGB pixel value into a new 24-bit RGB pixel value. The matrix is programmed through a set of nine 10-bit signed coefficients. The output of the calculation is clipped to [0:255]. The CPR is processed by the equation shown in Figure 11-81. Table 11-83 lists all coefficients with their respective bit field registers for settings.

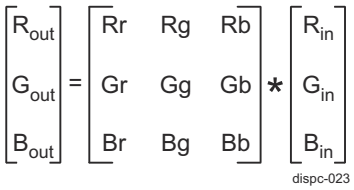

Figure 11-81. DISPC CPR Matrix

Table 11-83. DISPC CPR or RGB to YUV Coefficients With Associated Bit Fields

Registers	Bit Field	Color Phase Rotation	RGB to YUV
DISPC_CPRo_COEF_R	RR	Rr	Yr
	RG	Rg	Yg
	RB	Rb	Yb
DISPC_CPRo_COEF_G	GR	Gr	Cbr
	GG	Gg	Cbg
	GB	Gb	Cbb
DISPC_CPRo_COEF_B	BR	Br	Crr
	BG	Bg	Crg
	BB	Bb	Crb

Figure 11-82 shows the CPR macro-architecture.

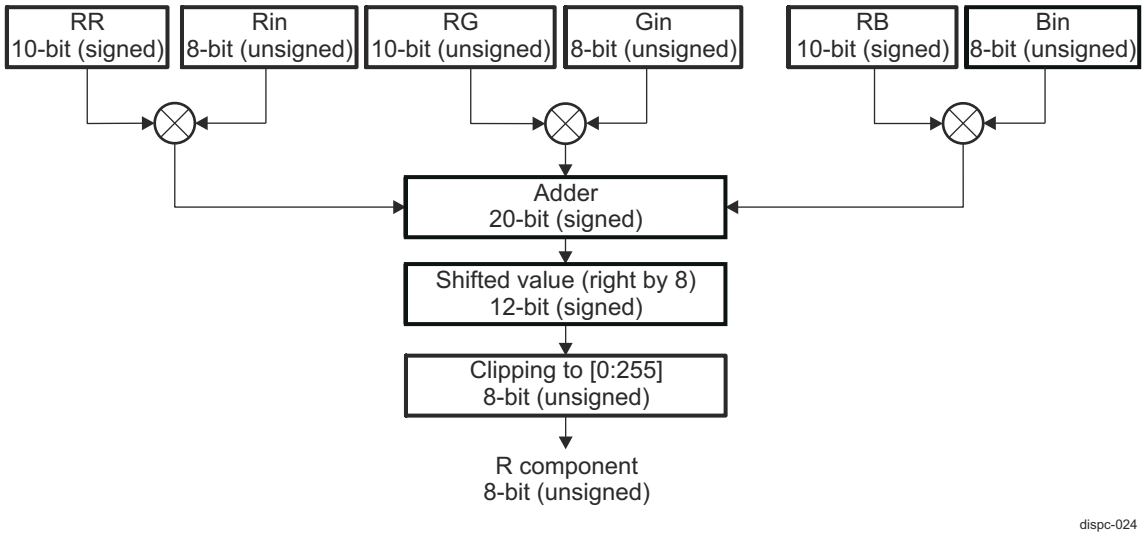

Figure 11-82. DISPC CPR Macro-Architecture

Note

CPR is kept as 8 bit output. For the optional 10 bit BT.656-4 format, zero is simply added as 2 LSBs.

11.2.4.13.4 DISPC Color Space Conversion

The Color Phase Rotation block can be used to perform color space conversion. Table 11-83 lists the associated coefficients with their respective register bit-fields. The Color Space Conversion logic uses the CPR registers for the coefficients. The Color Space Conversion processing is enabled by setting the DISPC_CONFIGo[24] COLORCONVENABLE register bit to 0x1.

The color space conversion on the LCD output can be selected in order to convert from 24-bit RGB to YUV444. The matrix is programmed through a set of nine 10-bit signed coefficients. The result is clipped to [16:235] for the luminance and [16:240] for the chrominance, when full-range equals zero (DISPC_CONFIGo[25] FULLRANGE = 0).

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

Figure 11-83. DISPC RGB to YUV Registers (FullRange=0)

If the programmed active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:255], the values Y, Cb, and Cr are clipped to the range [0:255]. The following equation gives the 11-bit coefficients of the RGB to YUV color space conversion, for full-range (DISPC_CONFIGo[25] FULLRANGE = 1)

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

Figure 11-84. DISPC RGB to YUV Registers (FullRange=1)

In order to provide YUV422 data to the BT-656 or BT-1120 blocks, the YUV444 format is converted to YUV422 by sub-sampling the chrominance values. The hardware does this by averaging two-by-two the chrominance samples. The conversion from YUV444 to YUV422 is performed when the color space conversion is enabled. Thus, the output of the CPR unit is always YUV422 after color space conversion.

11.2.4.13.5 DISPC BT.656 and BT.1120 Modes

The LCD outputs (LCD1, LCD2 and LCD3) can be configured in BT.656 or BT.1120 mode. The following standards are not supported in BT.656 mode:

- BT.470 (Support for conventional Analog TV Systems)
- BT.803 (The avoidance of interference generated by digital television studio equipment)
- BT.1364 (Format of ancillary data signals carried in digital component studio interfaces)

Unsupported formats when BT.1120 mode is used:

- BT.1364 (Support for Ancillary Data during blanking period)

BT.656/BT.1120 modes use embedded EAV/SAV syncs.

CAUTION

DISPC supports maximum 256 bytes of horizontal blanking when the LCD outputs are configured in BT modes (bitfield HSW of DISPC_TIMING_H1/2/3 registers is 8 bits wide). This is not compliant with BT.656 and BT.1120 standards, both of which require higher blanking periods. If more than 256 bytes of horizontal blanking are required by the application, then the RGB mode must be used for the LCD outputs.

Figure 11-85 shows signal mapping on DISPC_LCD_DATA[23:0] data bus. Bits 9 to 0 are used in BT.656 mode (10-bit).

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Unused														BT.656									

Figure 11-85. DISPC Signal Mapping in BT.656 Mode

Note

For compatibility with existing 8-bit interfaces, the two LSB are ignored, and only bits [9:2] are used.

Figure 11-86 shows signal mapping on DISPC_LCD_DATA[23:0] data bus for BT.1120 mode. Bits [19:10] (CbCr) and [9:0] (Y) are used in 20-bit mode. Bits [19:12] (CbCr) and [9:2] (Y) are used in 16-bit mode (YCbCr 4:2:2).

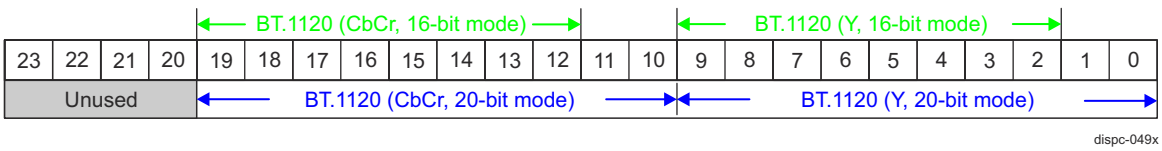

Figure 11-86. DISPC Signal Mapping in BT.1120 Mode

Note

The LCD outputs support both interlace and progressive content in BT.656/BT.1120 modes.

In progressive mode the maximum resolution will be limited, as it requires two clock cycles to send out one pixel.

11.2.4.13.5.1 Blanking

During the transmission of the video signal, the portion of the stream in-between active video data segments is known as the horizontal blanking interval.

Strictly speaking this entire region is the blanking interval, but this interval also includes the EAV and SAV codes. The remaining bytes of information in a digital blanking interval are filled with values corresponding to the blanking levels of the Cb, Y and Cr signals respectively, and in accordance with the standard multiplex sequence for the stream (CbYCrY..). The blanking levels are as follows:

- Cb = 80h
- Y = 10h
- Cr = 80h.

The sequence in the BLANKING region of the data stream is therefore: *80h, 10h, 80h, 10h.....80h, 10h*

For more details on setting the blanking timing values for BT.1120 and/or BT.656 mode, see Section 11.2.4.13.8, *DISPC Timing Generator and Panel Settings*.

11.2.4.13.5.2 EAV and SAV

The End of Active Video(EAV) and Start of Active Video (SAV) parts of the stream are timing codes. Their function can be summarized as follows:

- EAV – marks the end of the active video data within the current line and therefore also the start of the subsequent line.
- SAV – heralds the start of the active video data within the current line.

These codes are embedded within the BT.656 video data stream, thereby eliminating the need for additional timing signals (HSYNC, VSYNC) to be included as part of the interface.

Both EAV and SAV codes are comprised of a sequence of four bytes (FFh – 00h – 00h - XY). The first three bytes in the sequence constitute a fixed preamble. The fourth byte, contains information about the field being transmitted (Field 1 or Field 2 in an interlaced video signal), the state of field blanking (Vertical) and the state of line blanking (Horizontal). The bit assignment for this byte of the code is shown in Figure 11-87, with the function of each bit described inTable 11-84.

MSB							LSB
1	F	V	H	P3	P2	P1	P0

Figure 11-87. Bit-assignment for the fourth byte of EAV/SAV codes

Table 11-84. Bit function

Bit	Symbol	Function
7	1	Always set to '1'.
6	F	Field bit. 0 – Field 1 1 – Field 2

Table 11-84. Bit function (continued)

Bit	Symbol	Function
5	V	Vertical Blanking Status bit. This bit goes High during a vertical field blanking interval, otherwise it remains Low.
4	H	Horizontal Blanking Status bit. 0 – byte is part of SAV code (i.e. stream is entering an active video data region for the current line) 1 – byte is part of EAV code (i.e. stream has entered a horizontal blanking interval - start of a new line)
3	P3	Protection bit 3
2	P2	Protection bit 2
1	P1	Protection bit 1
0	P0	Protection bit 0

The protection bits allow for detection and correction of 1-bit errors and the detection of 2-bit errors. The status of P3, P2, P1 and P0 depend on the states of bits F, V and H. This dependency is shown in Table 11-85.

Table 11-85. Status of protection bits as F, V and H vary

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

Enabling BT.656 or BT.1120 format is done by setting:

- DISPC_CONFIG1[20] BT656ENABLE or DISPC_CONFIG1[21]BT1120ENABLE registers for LCD1 output
- DISPC_CONFIG2[20] BT656ENABLE or DISPC_CONFIG2[21]BT1120ENABLE registers for LCD2 output
- DISPC_CONFIG3[20] BT656ENABLE or DISPC_CONFIG3[21]BT1120ENABLE registers for LCD3 output

Note

It is not posssible to enable BT.656 and BT.1120 mode simultaneously on the same LCD output

11.2.4.13.6 DISPC Active Matrix

Depending on the color depth, the active matrix output:

- 24 bpp supports 16,777,216 colors.
- 18 bpp supports 262,144 colors.
- 16 bpp supports 65,536 colors.
- 12 bpp supports 4096 colors.

When in active matrix path configuration, after setting the DISPC_CONTROLo[3] STNTFT bit to 0x1, two submodules must be configured:

- Spatial/temporal dithering
- Multiple cycle output format (TDM)

11.2.4.13.6.1 DISPC Spatial/Temporal Dithering

When the active matrix path is used, the spatial/temporal dithering logic can be selected to enhance the quality of the active matrix outputs. The encoded pixel values are used by spatial/temporal dithering logic to

display the data in a lower color depth on the LCD panel. The dithering logic is integrated after the CPR and before the TDM. The spatial/temporal dithering algorithm is based on the (x,y) pixel position and frame rate control. The dithering logic can process the pixels over one frame, two frames, or four frames. The number of frames is selected by setting the DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES bit field. In the case of a single frame, only spatial processing is applied, and in multiple frames, spatial and temporal processing are applied to the pixels. The spatial/temporal dithering logic is enabled by setting the DISPC_CONTROLo[7] STDITHERENABLE bit to 0x1.

Note

When the spatial/temporal dithering logic is disabled (see also Table 11-86):

- If the interface data bus is smaller than the pixel format size, then the MSBs of the pixel color components are output on the interface data bus.
- If the interface data bus is larger than the pixel format size, then by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus (when replication is enabled), or the LSB is filled with 0s (when replication is disabled). The pixel components replication is performed in the associated pipeline, as described in Section 11.2.4.9.1 and Section 11.2.4.10.1, *DISPC Replication Logic*.

Table 11-86. DISPC LCD Data Output (Spatial/Temporal Dithering Disabled)

Pixel Format	RGB12[2]				RGB16[2]				RGB24[2]			
Display Panel Interface[1]	12-bit	16-bit	18-bit	24-bit	12-bit	16-bit	18-bit	24-bit	12-bit	16-bit	18-bit	24-bit

voutX_d0	B0	B3/0	B2/0	B0/0	B1	B0	B4/0	B2/0	B4	B3	B2	B0

(1) X = 1, 2, or 3 indicates the corresponding parallel video output (VOUT1, VOUT2, or VOUT3)
(2) Rx/0, Gx/0, and Bx/0 indicate, if the MSB is replicated to the LSB, or the LSB is filled with 0s.

Note

LCD1 / DPI1 (VOUT1) is not supported on the AM570x family of devices.

11.2.4.13.6.2 DISPC Multiple Cycle Output Format (TDM)

When the TDM is enabled (DISPC_CONTROLo[20] TDMENABLE = 1), after the active matrix display processing, the pixels are formatted on one or multiple cycles (a maximum of three cycles). The number of bits for each cycle is set in the DISPC_DATAo_CYCLE1 register for the first cycle, the DISPC_DATAo_CYCLE2 register for the second cycle, and the DISPC_DATAo_CYCLE3 register for the third cycle. The interface data bus width can be 8, 9, 12, or 16 bits. The configuration of the data bus is done in the DISPC_CONTROLo[22:21] TDMPARALLELMODE bit field.

When the TDM is disabled (DISPC_CONTROLo[20] TDMENABLE = 0), the DISPC outputs the pixels using the conventional formats: active matrix display monochrome/color. In this case, the configuration of the data bus width is done through the DISPC_CONTROLo[9:8] TFTDATALINES bit field.

Figure 11-88 through Figure 11-91 show various examples of TDM settings in the function of pixel data formats and the interface data bus width.

Figure 11-91. DISPC 16-Bit Interface Settings

11.2.4.13.7 DISPC Synchronized Buffer Update

A synchronization mismatch between the frame buffer and the display refreshes, named tearing effect, can lead to images that appear to be stretched on the screen. To avoid it, a synchronization mechanism is used between the DISPC and the process that updates the buffer. An interrupt is generated when the display reaches a predefined line number. The PROGRAMMEDLINENUMBER_IRQ interrupt (DISPC_IRQSTATUS and DISPC_IRQENABLE) is a level signal and stays active during the programmed line of the display.

11.2.4.13.8 DISPC Timing Generator and Panel Settings

When Active Matrix Display is used the following registers must be set:

The size of and panel is defined by:

- Number of lines, DISPC_SIZE_LCDo[27:16] LPP bit field, with a value from 1 to 4096
- Number of pixels per line, DISPC_SIZE_LCDo[11:0]PPL bit field, with a value from 1 to 4096

Standard HSYNC/VSYNC timing generation are programmable for each LCD outputs independently:

- Horizontal front porch is set in the DISPC_TIMING_Ho[19:8] HFP bit field.
- Horizontal back porch is set in the DISPC_TIMING_Ho[31:20] HBP bit field.
- Horizontal synchronization pulse width is set in the DISPC_TIMING_Ho[7:0] HSW bit field.
- Vertical front porch is set in the DISPC_TIMING_Vo[19:8] VFP bit field.
- Vertical back porch is set in the DISPC_TIMING_Vo[31:20] VBP bit field.
- Vertical synchronization pulse width is set in the DISPC_TIMING_Vo[7:0] VSW bit field.

When the output is in BT.1120 or BT.656 mode, the following timing constant are mapped onto the DISPC_TIMING_Ho and DISPC_TIMING_Vo registers:

- Progressive mode:
  - Horizontal blanking is set in the DISPC_TIMING_Ho[7:0] HSW bit field
  - Vertical frame blanking No 1 is set in the DISPC_TIMING_Vo[19:8] VFPbit field.
  - Vertical frame blanking No 2 is set in the DISPC_TIMING_Vo[31:20] VBPbit field.
  - Number of lines is set in the DISPC_SIZE_LCD1[27:16] LPP bit field
  - Number of pixels per line is set in the DISPC_SIZE_LCD1[11:0] PPL bit field.
- Interlaced mode:
  - Horizontal blanking is set in the DISPC_TIMING_Ho[7:0] HSW bit field.
  - Vertical field blanking No 1 for Even Field is set in the DISPC_TIMING_Ho[19:8] HFP bit field.
  - Vertical field blanking No 2 for Even Field is set in the DISPC_TIMING_Ho[31:20] HBP bit field.
  - Vertical field blanking No 1 for Odd Field is set in the DISPC_TIMING_Vo[19:8] VFP bit field.
  - Vertical field blanking No 2 for Odd Field is set in the DISPC_TIMING_Vo[31:20] VBP bit field.
  - Number of lines per field (even) is set in the DISPC_SIZE_LCD1[27:16] LPP bit field.
  - Delta number of odd field compared to even field (in a single line) is set in the DISPC_SIZE_LCD1[15:14] DELTA bit field.
  - Number of pixels per line is set in the DISPC_SIZE_LCD1[11:0] PPL bit field.

Horizontal/vertical synchronization and ACBIAS signals polarity are programmable by setting the DISPC_POL_FREQo[12] IVS, DISPC_POL_FREQo[13] IHS, and DISPC_POL_FREQo[15] IEO bits. These signals can be gated by setting the DISPC_CONFIGo[7] VSYNCGATED and DISPC_CONFIGo[6] HSYNCGATED bits.

The latch of data can be driven on the rising or falling edge of the pixel clock by setting the IPC bit of DISPC_POL_FREQo[14] IPC and CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC (the values must mach) registers. The drive of the SYNC and VSYNC signals in the function of the pixel clock is done by setting the DISPC_POL_FREQo[16] RF and CTRL_CORE_SMA_SW_1[] DSS_CHx_RF bit.

Table 11-87 describes the programming rules for LCD timing.

Table 11-87. DISPC Programming Rules

	No Downsampling	Downsampling H or V	Downsampling H + V
(HBP + HSW + HFP) × PCD	>8	>10	>20

Figure 11-92 shows the timing values description in the case of an active matrix display.

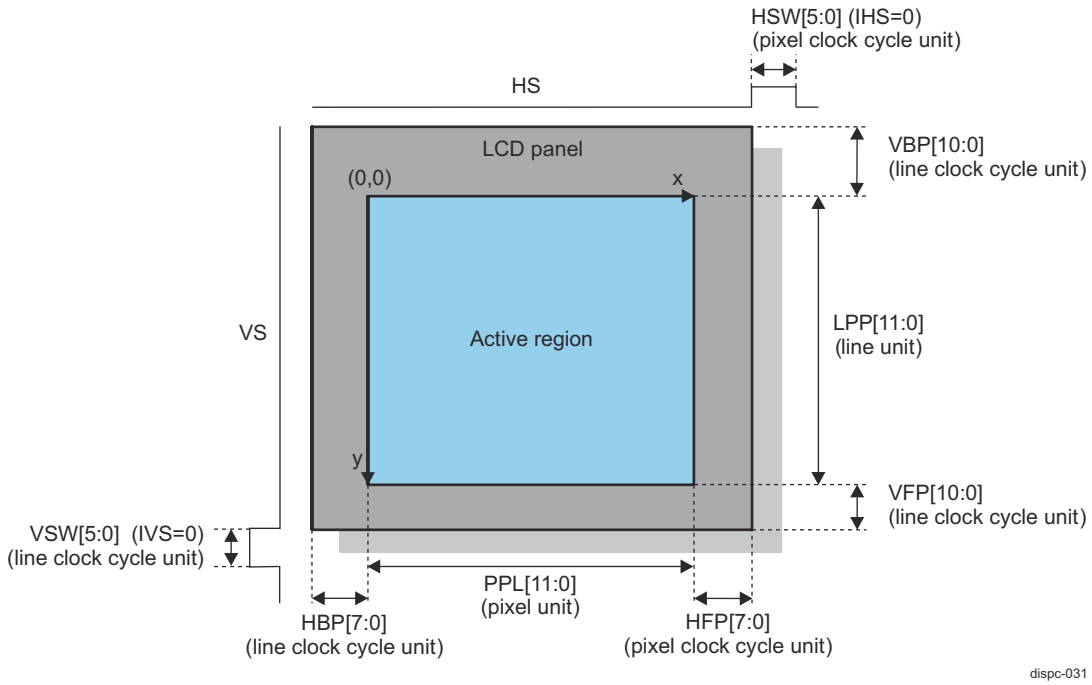

Figure 11-92. DISPC Timing Values (Active Matrix Display)

The 8-bit pixel clock divider (the DISPC_DIVISORo[7:0] PCD bit field) selects the pixel clock frequency. This bit field generates a range of pixel clock frequencies from LC/2 to LC/256, where LC is the logic clock from the divided functional clock of the DISPC by the DISPC_DIVISOR[23:16] LCD bit field.

The pixel clock is defined by the following equation:

Pixel Clock = (FunctionalClock/LCD[7:0])/PCD[7:0]

The pixel clock can be gated by setting the DISPC_CONFIGo[5] PIXELCLOCKGATED bit to 0x1.

The LCD output can be configured in progressive output or interlace output. The selection is done by writing into the DISPC_CONFIGo[22] OUTPUTMODEENABLE bit. The reset value is 0x0, which means progressive mode. When progressive mode is selected, the FID signal associated to the LCD output is driven low (INACTIVE state). The selection can be changed only if the corresponding LCD output is disabled. The configuration is independent for each LCD output.

When in interlaced mode, the DISPC_CONFIGo[23] FIDFIRST bit indicates which field is output first:

- 0x0: Even field first (FID = 0)
- 0x1: Odd field first (FID = 1)

11.2.4.14 DISPC TV Output

The TV output paths consist of several processing blocks (see Figure 11-93):

- Overlay manager
- Gamma correction unit
- Synchronization buffer

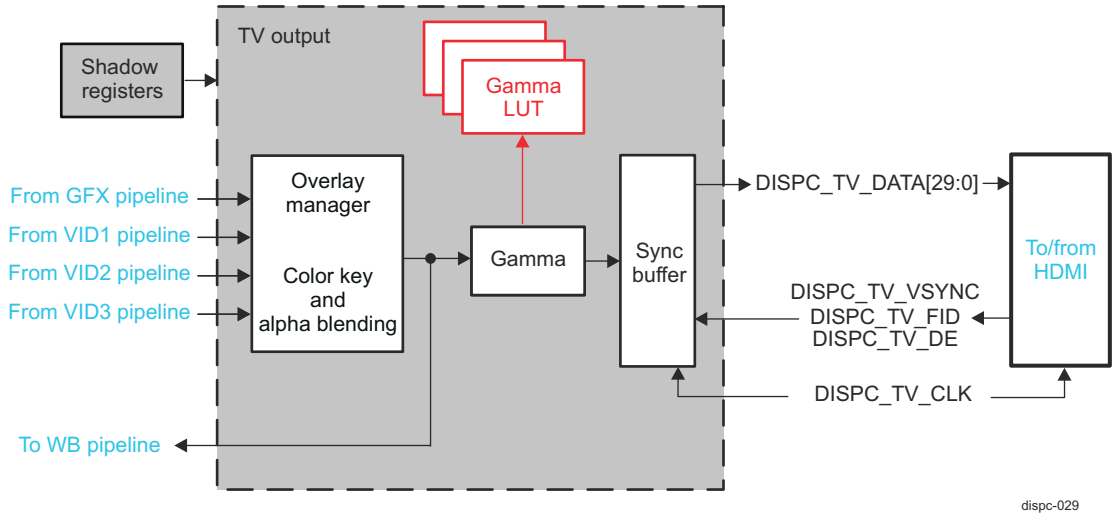

Figure 11-93. DISPC TV Output Architecture

The TV output is connected to the HDMI. In analog output or HDMI, the DISPC TV output receives an external clock, DISPC_TV_CLK, and based on the VSYNC generated by the HDMI, hold time, vertical offset, and horizontal offset, outputs the pixels synchronously. The size of the field/frame to output defines the number of pixels to output on each line and the number of lines for each field/frame.

11.2.4.14.1 DISPC Overlay Manager

The overlay mechanism is identical in LCD1, LCD2, and LCD3 (see Section 11.2.4.13.1, *Overlay Manager*).

11.2.4.14.2 DISPC Gamma Correction Unit

The gamma correction unit works as described in Section 11.2.4.13.2, *Gamma Correction Unit*. The only difference is in the input pixel format RGB30. Each component of encoded pixel value is used as a pointer to index 1 out of 1024 × 30-bit gamma curve entries in the table. Each 10-bit component is replaced with the 10-bit table value corresponding to R, G, or B component. The table is loaded by software, through the DISPC_GAMMA_TABLE2 register, and enabled via DISPC_CONFIG1[9] GAMATABLEENABLE register bit. It is possible to load only part of the table. For each write access to the table, the 30-bit gamma value is associated with bit [31] INDEX to indicate that a new table is defined. Setting bit [31] INDEX to 0x1 for the first time, resets the internal index counter. All the following accesses are considered to be for incremented index addressing in the table (bit [31] INDEX is set to 0 for each subsequent access). Figure 11-94 shows the format of one of the gamma curve values in the memory.

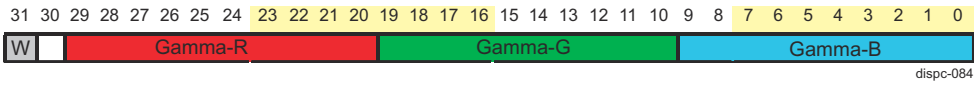

Figure 11-94. DISPC Data Memory Organization for Gamma Mode in TV Output

11.2.4.14.3 DISPC Synchronized Buffer Update

The synchronized buffer update is identical in LCD1, LCD2, and LCD3 (see Section 11.2.4.13.7, *Synchronized Buffer Update*).

11.2.4.14.4 DISPC Timing and TV Format Settings

Figure 11-95 shows the TV formats supported.

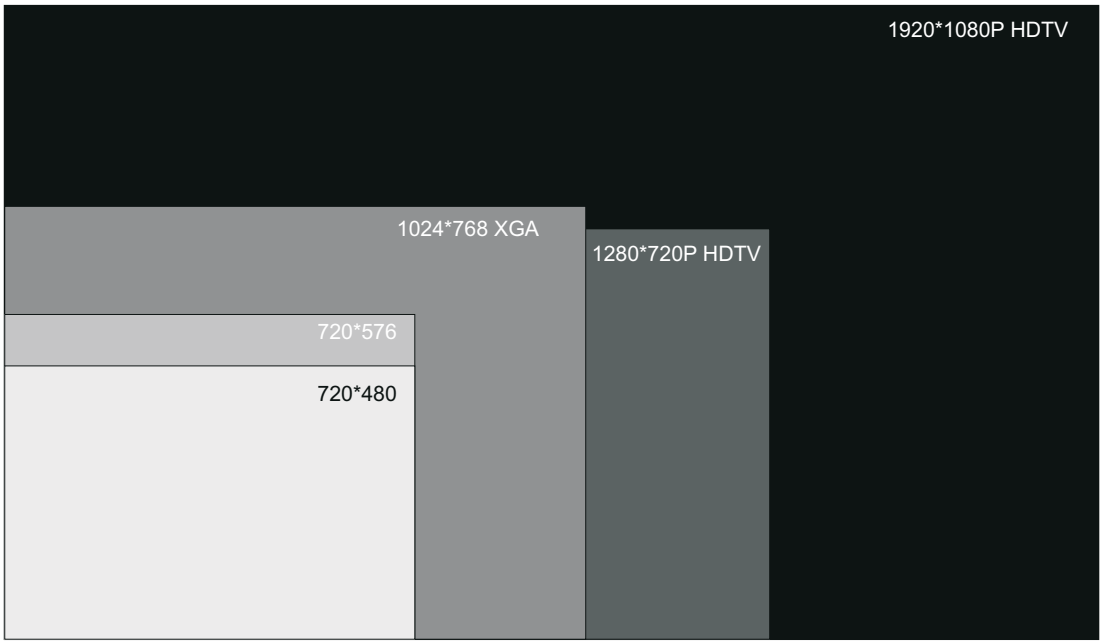

Figure 11-95. DISPC Example Timing TV Formats

The size of a TV output format is defined by:

- Number of lines, DISPC_SIZE_TV[27:16] LPP bit field, with a value from 1 to 4096
- Number of pixels per line, DISPC_SIZE_TV[11:0] PPL bit field, with a value from 1 to 4096
- Delta size between odd/even field, DISPC_SIZE_TV[15:14] DELTA_LPP bit field. This bit field controls only the output channel and not the size of the data field fetched from the frame buffer in memory.

The hold time of the pixels on the data bus is determined in clock cycles by the DISPC_CONTROL1[19:17] HT bit field. The default value at reset time is 0x0 (one cycle).

- When connected to the HDMI encoder, Table 11-88 indicates the DISPC_SIZE_TV (PPL and LPP) value for each HD standard.

Table 11-88. DISPC PPL and LLP Value for HD Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
HDTV	720p	1280	720	74.25/74.125 MHz (60/59.99..frames/s)	0x02CF 04FF
	1080i	1920	540	74.25/74.125 MHz (60/59.99..frames/s)	0x021B 07FF
	1080p	1920	1080	148.5/148.25 MHz (60/59.99..frames/s)	0x0437 07FF
	720p 3D (frame packing)	1280	1470	148.5/148.35/148.5 MHz (60/59.94/50 frames/s)	0x05BD 04FF
	1080p 3D (frame packing)	1920	2205	148.5/148.35 MHz (24/23.98 frames/s)	0x089C 07FF
	1080p 3D (side-by-side half)	1920	1080	148.5 MHz (60 frames/s)	0x0437 07FF

Note

When configuring the DISPC for outputting any supported 3D frame-packing format, the following generic details must be considered:

- As defined by the *HDMI v1.4a Specification*, Section 8.2.3.2, 3D frame-packing is a video format structure composed of two stereoscopic pictures: left and right.
- The stereoscopic pictures can be processed through the three video pipelines (VID1, VID2, or VID3). For more information about the configuration of video pipelines, see Section 11.2.4.10, *Video Pipelines*.
- The 3D frame is generated by setting the TV overlay manager to combine the outputs of the selected video pipelines that hold the pictures. One video pipeline (VID1 or VID3) must carry the top field of the 3D frame (left stereoscopic picture), and the other video (VID2) pipeline must always carry the bottom field of the frame (right stereoscopic picture). The top and bottom fields are separated by an active space area. For more information, see the *HDMI v1.4a Specification*, Section 8.2.3.2.
- The pipeline carrying each field (top and bottom) of the 3D frame must have its height and width parameters defined in the [27:16] SIZEY and [10:0] SIZEX bit fields of the DISPC_VIDp_SIZE register, and its Y and X positions defined in the [26:16] POSY and [10:0] POSX bit fields of the DISPC_VIDp_POSITION register. The active space area of the 3D frame can be encoded by setting the solid background color for the TV output (the DISPC_DEFAULT_COLOR1[23:0] DEFAULTCOLOR bit field). For more information about the overlay mechanism, see Section 11.2.4.14.1, *DISPC Overlay Manager*.

11.2.4.15 DISPC Frame Width Considerations

DISPC provides three sets of configuration registers to control the maximum frame size in different stages of its internal pipelines (see Figure 11-96, *DISPC Frame Width Control*):

- DISPC_VID#_PICTURE_SIZE registers: MEMSIZEX and MEMSIZEY bit-fields define the number of pixels and lines to fetch from memory (via DISPC DMA engine).
- DISPC_GFX/VID#_SIZE registers: SIZEX and SIZEY bit-fields define the size of the output frame from each processing pipeline to LCD/TV overlay manager for blending.
- DISPC_SIZE_TV/LCD# registers: LPP and PPL bit-fields define the final display panel output resolution.

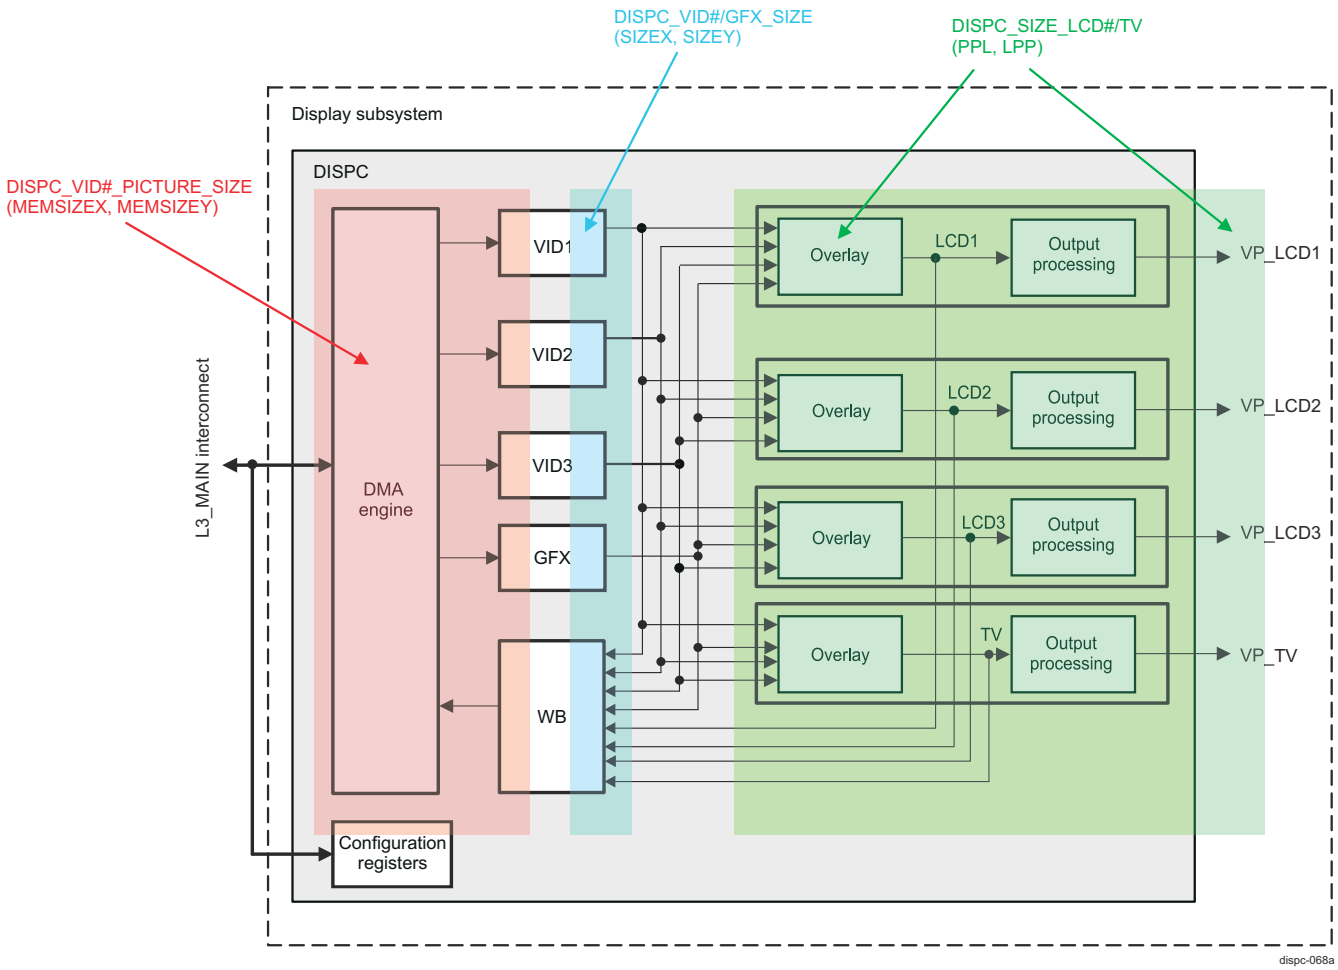

Figure 11-96. DISPC Frame Width Control

The MEMSIZEX and SIZEX bit-fields are 11-bit, meaning the maximum horizontal frame size allowed is 2048 pixels. This parameter determines the maximum source frame (including the input to the scalers) that can be displayed.

The MEMSIZEY and SIZEY bit-fields are 12-bit, meaning the maximum vertical size allowed is 4096 lines.

The LPP and PPL bit-fields are also 12-bit, which means that starting at the LCD/TV overlay manager and including the output to the display panel, the frame size can be up to 4096x4096 as long as the pixel clock constraints are met.

Implication: The output to display panel can be as large as 4096 x 4096 (4K x 4K), although the actual size of the output frame would be smaller due to the maximum pixel clock limitation. However, the maximum source frame that can be read from memory by a single GFX/VID pipeline can be 2048 x 4096 (2K x 4K) only. Therefore, to display a source frame with width > 2048 pixels, two layers must be used and corresponding pipeline outputs must be merged in the overlay manager before being sent out to the display panel.

Refer to device Data Manual for details on the maximum supported pixel clock (VOUTx_CLK) or HDMI supported frame rates.

11.2.4.16 DISPC Extended 3D Support

The DISPC supports several formats to support 3D displays. The following three sections provide further details.

11.2.4.16.1 DISPC Extended 3D Support - Line Alternative Format

Line alternative format is defined by the HDMI Specification 1.4a. In general the functionality is:

- Lines from the left and the right frames are interleaved alternatively on the screen to produce a 3D image.
- Required also to support interleaving column-wise to support all possible screen orientations.

The functionality is done in the overlay manager:

- The layers are grouped into two categories based on the z-order: Odd z-order may blend together and will interleave with even z-order pipes, which may blend together.
- Two types of interleaves are possible, line-based interleaving and pixel-based interleaving to support landscape and portrait screen orientations.

The configuration is done from the DISPC_CONFIG1[29:28] TVINTERLEAVE for the TV output, DISPC_CONFIG1[27:26] PLCDINTERLEAVE for the primary LCD, DISPC_CONFIG2[27:26] SLCDINTERLEAVE for the secondary LCD, and DISPC_CONFIG3[27:26] TLCDINTERLEAVE for the third LCD. The following values apply for the these bitfields:

- 0x0: If zero then no interleaving happens in the overlay manager.
- 0x1: Checkerboard pattern:
  - All even pixels on even lines have a contribution from even z-order pipes.
  - All odd pixels on even lines have a contribution from odd z-order pipes.
  - All even pixels on odd lines have a contribution from odd z-order pipes.
  - All odd pixels on odd lines have a contribution from even z-order pipes.
- 0x2: All even lines (all pixels) have a contribution from even z-order pipes. All odd lines (all pixels) have a contribution from the odd z-order pipes.
- 0x3: All even pixels (for all lines) have a contribution from even z-order pipes. All odd pixels (for all lines) have a contribution from the odd z-order pipes.

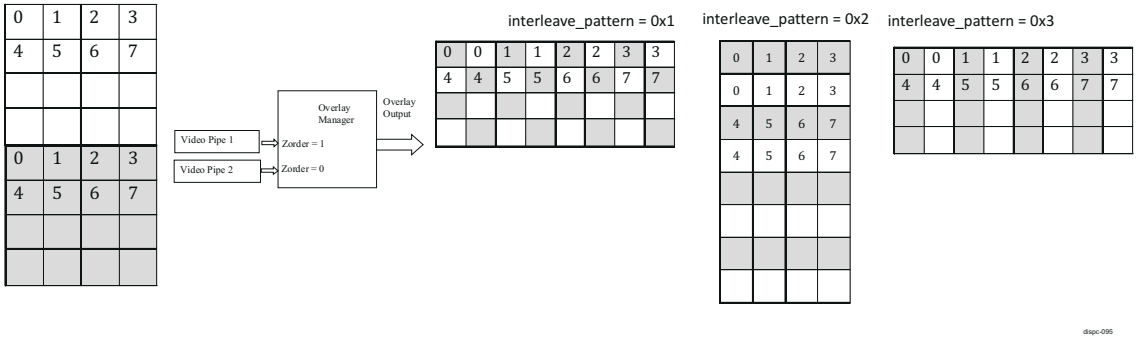

Figure 11-97. DISPC Illustration of 3D Interleaving

11.2.4.16.2

Moreover, from Figure 11-97 above, if interleave_pattern is programmed as 0x2, in this case the entire screen composited by the overlay manager (PPL x LPP) gets sub-divided into odd and even lines. It is possible for a 3D window created using the two pipes to have a non-zero position (that is, POSX and POSY not equal to zero).

In such cases depending on the oddness or evenness of the POSY setting, the first line in the window may come from Video Pipe 1 or Video Pipe 2.

For instance, if the POSX = 3, POSY = 3 (set in DISPC_GFX_POSITION, DISPC_VID1_POSITION, DISPC_VID2_POSITION, DISPC_VID3_POSITION registers), then the final composited screen with PPL = 8, LPP = 12 may look like below:

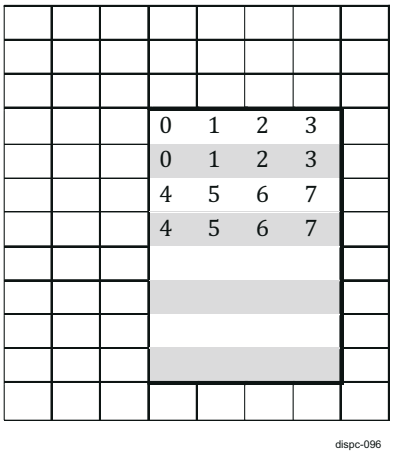

Figure 11-98. DISPC Illustration of a Non-zero Position of 3D Window

Note

In this case the first line comes from the odd z-order pipeline, that is Video Pipe 1.

The following limitations apply to the 3D Line alternative format:

- Software must ensure that the left/right frames are of same size.
- Software must ensure that in case of line interleaving the SIZEY is not greater than LPP/2.
- Software must ensure that in case of pixel interleaving the SIZEX is not greater than PPL/2.
- Software must program POSX and POSY for both left and right frame to be the same.
- Color-keying is not available for 3D formats.
- Since each overlay manager can support 4k x 4k frames, max resolution of each left/right frame will be restricted to 2k x 2k.

11.2.4.16.3 DISPC Extended 3D Support - Frame Packing Format Format

In this mode the pipe fetches two windows (of SIZEX x SIZEY) during a complete panel frame (PPL x LPP). The mode is enabled from DISPC_GFX_ATTRIBUTES[10] FRAMEPACKINGMODE and DISPC_VID1_ATTRIBUTES[8], DISPC_VID2_ATTRIBUTES[8], DISPC_VID3_ATTRIBUTES[8] FRAMEPACKINGMODE

The position for the first window is set in DISPC_GFX_POSITION, DISPC_VID1_POSITION, DISPC_VID2_POSITION, DISPC_VID3_POSITION, while the position for the second window is set in DISPC_GFX_POSITION2, DISPC_VID1_POSITION2, DISPC_VID2_POSITION2, DISPC_VID3_POSITION2

When it is detected that a pipe has finished sending the programmed number of lines to the overlay or Write-back pipe, a reset is generated for the pipe as well as the DMA channel associated with the pipe. At the same instant, the base address configuration for the DMA channel is changed from the BA0 to the BA1.

Due to the reset the pipe and DMA starts fetching the data from BA1. At the end of the processing of BA1 data, the DMA channel and the pipe become idle and clock gated.

The overlay manager composes the final frame to be sent to the panel and uses the (POSX, POSY) coordinates for the first window and (POSX2, POSY2) for the second window.

The following limitations apply to the 3D Frame Packing format:

- Only frame packing for progressive mode is supported. Frame packing of interlaced formats is not supported.
- End-of-window interrupts will be generated twice per outgoing-frame.
- Flip Immediate will not work as expected.
- It is software responsibility to calculate and program the (POSX2, POSY2) as per the active space required by the panel.

11.2.4.16.4 DISPC Extended 3D Support - DLP 3D Format

The DLP 3D format sub-samples the left and right frames across the diagonal before interleaving the frames in a checker-board fashion.

The sub-sampling required on the left and the right frame is complementary. This sampling pattern is also defined in the HDMI 3D Specification 1.4a as two Quincunx matrices. The format is configured from DISPC_GFX_ATTRIBUTES[20:18] SUBSAMPLINGPATTERN, DISPC_VID1_ATTRIBUTES2[11:9], DISPC_VID2_ATTRIBUTES2[11:9], DISPC_VID3_ATTRIBUTES2[11:9] SUBSAMPLINGPATTERN with the following possible configuration values:

- 0x0: All pixels from the pipes are used. No sub-sampling.
- 0x1: Quincunx Matrix Odd-position sub-sampling is used.
- 0x2: Quincunx Matrix Even-position sub-sampling is used.
- 0x3 to 0x7: Reserved

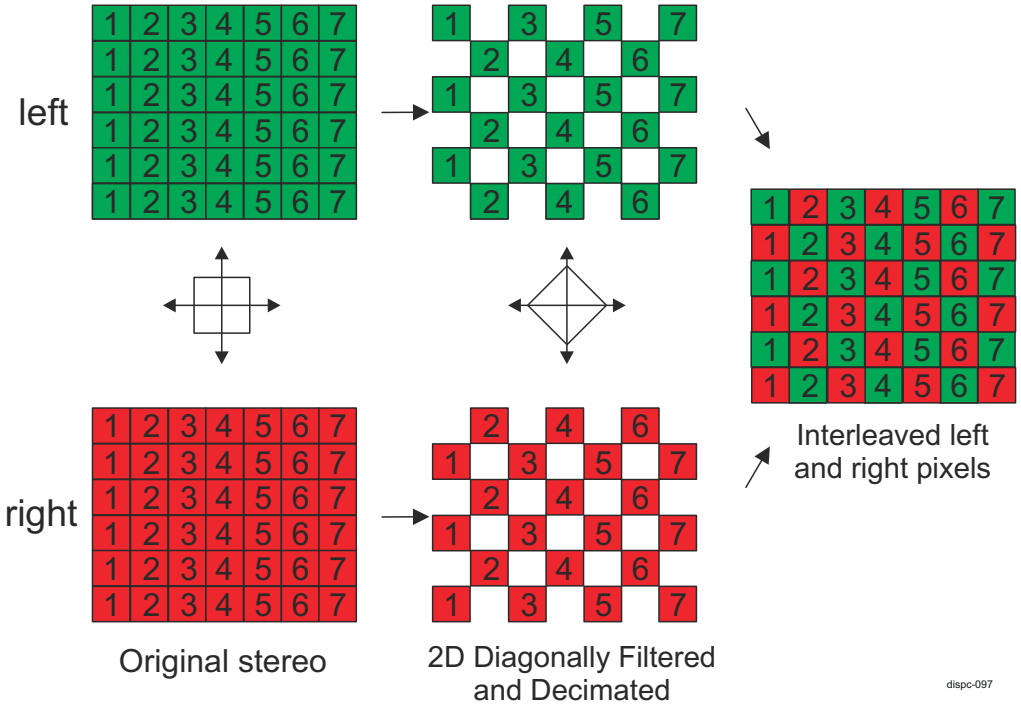

Figure 11-99. DISPC Illustration of DLP 3D Format

The following limitations apply to the DLP 3D Format :

- Even z-order pipes can have only sub-sampling = 0x1.
- Odd z-order pipes can only have sub-sampling = 0x2.

11.2.4.17 DISPC Shadow Registers

Some DISPC registers are termed *shadow registers*. A shadow register change has no direct effect on the configuration of the DISPC. The registers are shadow registers let software change the values of the registers at any time. When all the registers for a given configuration are into the registers, software must set 1 bit only to validate the configuration. When hardware reaches the end of the current frame and sees that the bit field has been set by software, the new configuration is now the configuration used by the hardware.

Note

As a general rule, all shadow registers are updated with the value of their shadows when:

- The interface is enabled.
- The GO bit field of the pipeline, with which the register is associated, is set and the output sync is active.

The bits enabling the hardware to use the new configuration are:

- DISPC_CONTROL1[5] GOLCD bit for all the registers associated to the LCD1 output, and for all registers of WB and DMA, if the LCD1 channel is captured. The update of the registers of the WB and DMA is further delayed by the DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the DISPC_WB_ATTRIBUTES[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- DISPC_CONTROL1[6] GOTV bit for all the registers associated to the TV output, and for all registers of WB and DMA, if the TV channel is captured. The update of the registers of the WB and DMA is further delayed by the DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the DISPC_WB_ATTRIBUTES[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the external EVSYNC.
- DISPC_CONTROL2[5] GOLCD bit for all the registers associated to the LCD2 output, and for all registers of WB and DMA, if the LCD2 channel is captured. The update of the registers of the WB and DMA is further delayed by the DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the DISPC_WB_ATTRIBUTES[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- DISPC_CONTROL3[5] GOLCD bit for all the registers associated to the LCD3 output, and for all registers of WB and DMA, if the LCD3 channel is captured. The update of the registers of the WB and DMA is further delayed by the DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the DISPC_WB_ATTRIBUTES[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- DISPC_WB_ATTRIBUTES[0] ENABLE bit for all the registers associated to the WB, if the transfer memory-to-memory is not associated with a channel out.
- The DISPC_CONTROL2[6] GOWB bit and the [5] GOLCD and [6] GOTV bits in the DISPC_CONTROL1/ DISPC_CONTROL2 registers, combined with the synchronization event of the channel output selected for write back. This applies to all registers associated with the selected channel out and further delayed by the setting in the DISPC_WB_ATTRIBUTES2[7:0] WBDELAYCOUNT bit field, for all registers of the write back and DMA. The GOWB bit is required to be set only in WB capture mode; it is not required when WB memory-to-memory mode is used.

Note

Before setting the GOLCD, GOTV, or GOWB bits, the user must ensure that the bits are cleared. The hardware resets the bits when the update completes.

Table 11-89 lists the shadow registers. Registers that do not have a mark in any column are not shadowed.

11.2.5 DISPC Programming Guide

11.2.5.1 DISPC Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the module.

11.2.5.1.1 DISPC Global Initialization

11.2.5.1.1.1 DISPC Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the DISPC module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DISPC. For more information, see *DISPC Integration*, and *DISPC Environment*.

Table 11-90. DISPC Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.
Control module	Module-specific pad muxing and configuration must be set in the control module. See *Pad Configuration Registers*, in *Control Module*.
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see *Interrupt Controllers*.
Interconnect	For more information about interconnect configuration, see *L3 Interconnect.*
DMA_CROSSBAR	DMA_CROSSBAR configuration must be done to allow module DREQs to be mapped to certain device DMA line. For more information see *DMA_CROSSBAR Module Functional Description*, in *Control Module.*
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see , *IRQ_CROSSBAR Module Functional Description,* in *Control Module.*

11.2.5.1.2 DISPC Operational Modes Configuration

Table 11-91 lists the steps to configure the operational modes in the DISPC.

Table 11-91. DISPC Configuration

Step	Register/Bit Field/Programming Model
For a GFX pipeline configuration	
Configure the GFX DMA channel.	See Table 11-92.
Configure the GFX pipeline.	See Table 11-95.
Configure the LCD or TV output.	For LCD output, see Table 11-112.
	For TV output, see Table 11-121.
For a Video pipeline configuration	
Configure the video DMA channel.	See Table 11-93.
Configure the video pipeline.	See Table 11-99.
Configure the LCD or TV output.	For LCD output, see Table 11-112.
	For TV output, see Table 11-121.
For a WB pipeline configuration	
Configure the WB DMA channel.	See Table 11-94.
Configure the WB pipeline.	For video pipelines, see Table 11-107.

11.2.5.1.2.1 DISPC DMA Configuration

11.2.5.1.2.1.1 DISPC Main Sequence – DISPC DMA Channel Configuration

This procedure describes the parameters of the GFX, video, and WB DMA channel parameters (see Table 11-92 through Table 11-94, respectively).

Table 11-92. DISPC Configure the GFX DMA Channel

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format according to memory access type, rotation, mirroring (see Section 11.2.4.6, *DISPC DMA Engine*).	DISPC_GFX_BA_j[31:0] BA	0x—
Set the rotation flag.	DISPC_GFX_ATTRIBUTES[13:12] ROTATION	0x–
Set the number of bytes to increment at the end of the row.	DISPC_GFX_ROW_INC[31:0] ROWINC	0x–
Set the number of bytes to increment between two pixels.	DISPC_GFX_PIXEL_INC[7:0] PIXELINC	0x–
Determine the FIFO preload mode.	DISPC_GFX_ATTRIBUTES[11] BUFPRELOAD	0x–
Set the preload value.	DISPC_GFX_PRELOAD[11:0] PRELOAD	0x–
Determine the burst type.	DISPC_GFX_ATTRIBUTES[29] BURSTTYPE	0x–
Set the burst size.	DISPC_GFX_ATTRIBUTES[7:6] BURSTSIZE	0x–
Set the high level of DMA FIFO threshold.	DISPC_GFX_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x–
Set the low level of DMA FIFO threshold.	DISPC_GFX_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x–
Enable self-refresh.	DISPC_GFX_ATTRIBUTES[24] SELFREFRESH	0x–
Select priority over the other pipeline.	DISPC_GFX_ATTRIBUTES[23] ARBITRATION	0x–

(1) Applicable only for YUV pixel format

Table 11-93. DISPC Configure the Video DMA Channel

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (seeSection 11.2.4.6, *DISPC DMA Engine*).	DISPC_VIDp_BA_j[31:0] BA	0x—
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (seeSection 11.2.4.6, *DISPC DMA Engine*)(1).	DISPC_VIDp_BA_UV_j[31:0] BA	0x—
Set the rotation flag.	DISPC_VIDp_ATTRIBUTES[13:12] ROTATION	0x–
Set the number of bytes to increment at the end of the row.	DISPC_VIDp_ROW_INC[31:0] ROWINC	0x–
Set the number of bytes to increment between two pixels.	DISPC_VIDp_PIXEL_INC[7:0] PIXELINC	0x–
Set the X original image size.	DISPC_VIDp_PICTURE_SIZE[10:0] MEMSIZEX	0x–
Set the Y original image size.	DISPC_VIDp_PICTURE_SIZE[27:16] MEMSIZEY	0x–
Determine the FIFO preload mode.	DISPC_VIDp_ATTRIBUTES[19] BUFPRELOAD	0x–
Set the preload value.	DISPC_VIDp_PRELOAD[11:0] PRELOAD	0x–
Determine the burst type.	DISPC_VIDp_ATTRIBUTES[29] BURSTTYPE	0x–
Set the burst size.	DISPC_VIDp_ATTRIBUTES[15:14] BURSTSIZE	0x–
Set the high level of DMA FIFO threshold.	DISPC_VIDp_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x–
Set the low level of DMA FIFO threshold.	DISPC_VIDp_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x–
Enable self-refresh.	DISPC_VIDp_ATTRIBUTES[24] SELFREFRESH	0x–
Select priority over the other pipeline.	DISPC_VIDp_ATTRIBUTES[23] ARBITRATION	0x–

(1) Applicable only for YUV pixel format

Table 11-94. DISPC Configure the WB DMA Channel

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (see Section 11.2.4.6, *DISPC DMA Engine*).	DISPC_WB_BA_j[31:0] BA	0x—
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (see Section 11.2.4.6, *DISPC DMA Engine*) (1).	DISPC_WB_BA_UV_j[31:0] BA	0x—
Set the stride of CbCr component (1).	DISPC_WB_ATTRIBUTES[22] DOUBLESTRIDE	0x–
Set the rotation flag.	DISPC_WB_ATTRIBUTES[13:12] ROTATION	0x–
Set the number of bytes to increment at the end of the row.	DISPC_WB_ROW_INC[31:0] ROWINC (2)	0x–
Set the number of bytes to increment between two pixels.	DISPC_WB_PIXEL_INC[7:0] PIXELINC	0x–
Set the X final image size in system memory.	DISPC_WB_PICTURE_SIZE[10:0] ORGSIZEX	0x–
Set the Y final image size in system memory.	DISPC_WB_PICTURE_SIZE[27:16] ORGSIZEY	0x–
Set the burst size.	DISPC_WB_ATTRIBUTES[15:14] BURSTSIZE	0x–
Set the high level of DMA FIFO threshold.	DISPC_WB_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x–
Set the low level of DMA FIFO threshold.	DISPC_WB_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x–
Select priority over the other pipeline.	DISPC_WB_ATTRIBUTES[23] ARBITRATION	0x–

(1) Applicable only for YUV pixel format.
(2) The DISPC_WB_ROW_INC register can be used only in 2D mode (using the Tiler). In order to use the DISPC_WB_ROW_INC register, the DISPC_WB_ATTRIBUTES[8] BURSTTYPE bit must be set to 1.

11.2.5.1.2.2 DISPC GFX Pipeline Configuration

11.2.5.1.2.2.1 DISPC Main Sequence – Configure the GFX Pipeline

This procedure details the steps for a GFX pipeline configuration (see Table 11-95).

Table 11-95. DISPC Configure the GFX Pipeline

Step	Register/Bit Field/Programming Model	Value
Configure the GFX window.	See Table 11-96.	
Configure the GFX pipeline processing.	See Table 11-97.	
Configure the GFX pipeline layer output.	See Table 11-98.	
Validate the GFX configuration according to outputs associated to the pipeline.	DISPC_CONTROL1[5] GOLCD	
	DISPC_CONTROL2[5] GOLCD	
	DISPC_CONTROL2[6] GOWB	
	DISPC_CONTROL1[6] GOTV	
Enable the GFX pipeline.	DISPC_GFX_ATTRIBUTES[0] ENABLE	0x1

11.2.5.1.2.2.2 DISPC Subsequence – Configure the GFX Window

This subsequence describes the parameters of the image to be displayed on the LCD panel (see Table 11-96).

Table 11-96. DISPC Configure the GFX Window

Step	Register/Bit Field/Programming Model	Value
Select the format of image.	DISPC_GFX_ATTRIBUTES[4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel.	DISPC_GFX_SIZE[10:0] SIZEX	0x–
Set the Y size of image to be displayed onto LCD panel.	DISPC_GFX_SIZE[27:16] SIZEY	0x–
Set the X position of image in respect to LCD panel.	DISPC_GFX_POSITION[10:0] POSX	0x–
Set the Y position of image in respect to LCD panel.	DISPC_GFX_POSITION[26:16] POSY	0x–

11.2.5.1.2.2.3 DISPC Subsequence – Configure the GFX Pipeline Processing

This subsequence describes the steps to configure the GFX pipeline processing in the DISPC (seeTable 11-97).

Table 11-97. DISPC Configure the GFX Pipeline Processing

Step	Register/Bit Field/Programming Model	Value
Enable replication logic.	DISPC_GFX_ATTRIBUTES[5] REPLICATIONENABLE	0x1
Enable antiflicker filter.	DISPC_GFX_ATTRIBUTES[24] ANTIFLICKER	0x1

Figure 11-100 shows the configuration of the DISPC graphics pipeline processing.

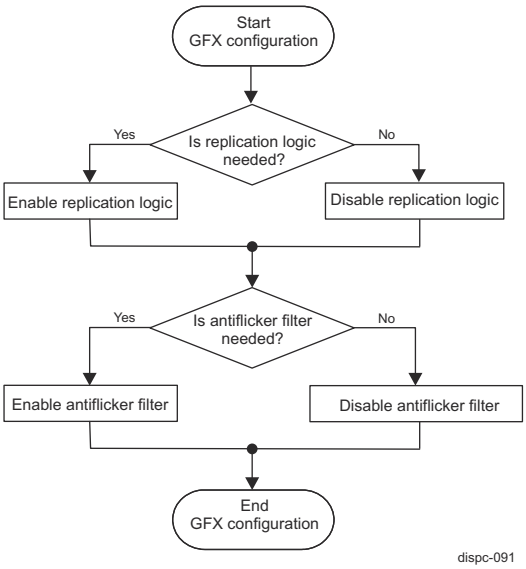

Figure 11-100. DISPC GFX Pipeline Processing Configuration

11.2.5.1.2.2.4 DISPC Subsequence – Configure the GFX Pipeline Layer Output

This subsequence describes the video layer settings available at the pipeline level necessary when using the overlay manager (see Table 11-98).

Table 11-98. DISPC Configure the GFX Pipeline Layer Output

Step	Register/Bit Field/Programming Model	Value
Set the LCD/TV output.	DISPC_GFX_ATTRIBUTES[8] CHANNELOUT	0x–
If DISPC_GFX_ATTRIBUTES[8] = 0, set the LCD output.	DISPC_GFX_ATTRIBUTES[31:30] CHANNELOUT2	0x–
Set the Z-order priority of the layer for overlay manager.	DISPC_GFX_ATTRIBUTES[27:26] ZORDER	0x–
Enable the video pipeline Z-order.	DISPC_GFX_ATTRIBUTES[25] ZORDERENABLE	0x–
Set the Global Alpha value for the alpha blender unit.	DISPC_GLOBAL_ALPHA[7:0] GFXGLOBALALPHA	0x–

11.2.5.1.2.3 DISPC Video Pipeline Configuration

11.2.5.1.2.3.1 DISPC Main Sequence – Configure the Video Pipeline

This sequence describes the steps to configure the video pipeline (see Table 11-99).

Table 11-99. DISPC Configure the Video Pipeline

Step	Register/Bit Field/Programming Model	Value
Configure the video window.	See Table 11-100.	
Configure the video pipeline processing.	See Table 11-101.	
Configure the video pipeline layer output.	See Table 11-106.	
Validate the video configuration according to outputs associated to the pipeline.	DISPC_CONTROL1[5] GOLCD	
	DISPC_CONTROL2[5] GOLCD	
	DISPC_CONTROL2[6] GOWB	
	DISPC_CONTROL1[6] GOTV	
Enable video pipeline.	DISPC_VIDp_ATTRIBUTES[0] ENABLE	0x1

11.2.5.1.2.3.2 DISPC Subsequence – Configure the Video Window

This subsequence describes the parameters of the image to be displayed on the LCD panel (see Table 11-100).

Table 11-100. DISPC Configure the Video Window

Step	Register/Bit Field/Programming Model	Value
Select the format of image.	DISPC_VIDp_ATTRIBUTES[4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel.	DISPC_VIDp_SIZE[10:0] SIZEX	0x–
Set the Y size of image to be displayed onto LCD panel.	DISPC_VIDp_SIZE[27:16] SIZEY	0x–
Set the X position of image in respect to LCD panel.	DISPC_VIDp_POSITION[10:0] POSX	0x–
Set the Y position of image in respect to LCD panel.	DISPC_VIDp_POSITION[26:16] POSY	0x–

11.2.5.1.2.3.3 DISPC Subsequence – Configure the Video Pipeline Processing

This subsequence describes the steps to configure video pipeline processing (see Table 11-101 and Figure 11-101).

Table 11-101. DISPC Configure the Video Pipeline Processing

Step	Register/Bit Field/Programming Model	Value
Select the video pipeline configuration 1 or 2.	DISPC_VIDp_ATTRIBUTES2[8] YUVCHROMARESAMPLING	0x–
Enable/disable replication logic(1).	DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE	0x1
Configure the VC-1 range mapping(1).	See Section 11.2.5.1.2.3.4.	
Configure the video color space conversion(1).	See Section 11.2.5.1.2.3.5.	
Configure the video scaler unit(1).	See Section 11.2.5.1.2.3.6.	

(1) This module configuration can be optional depending on:
- The video mode configuration selected. See Figure 11-101.
- The video format and application needs

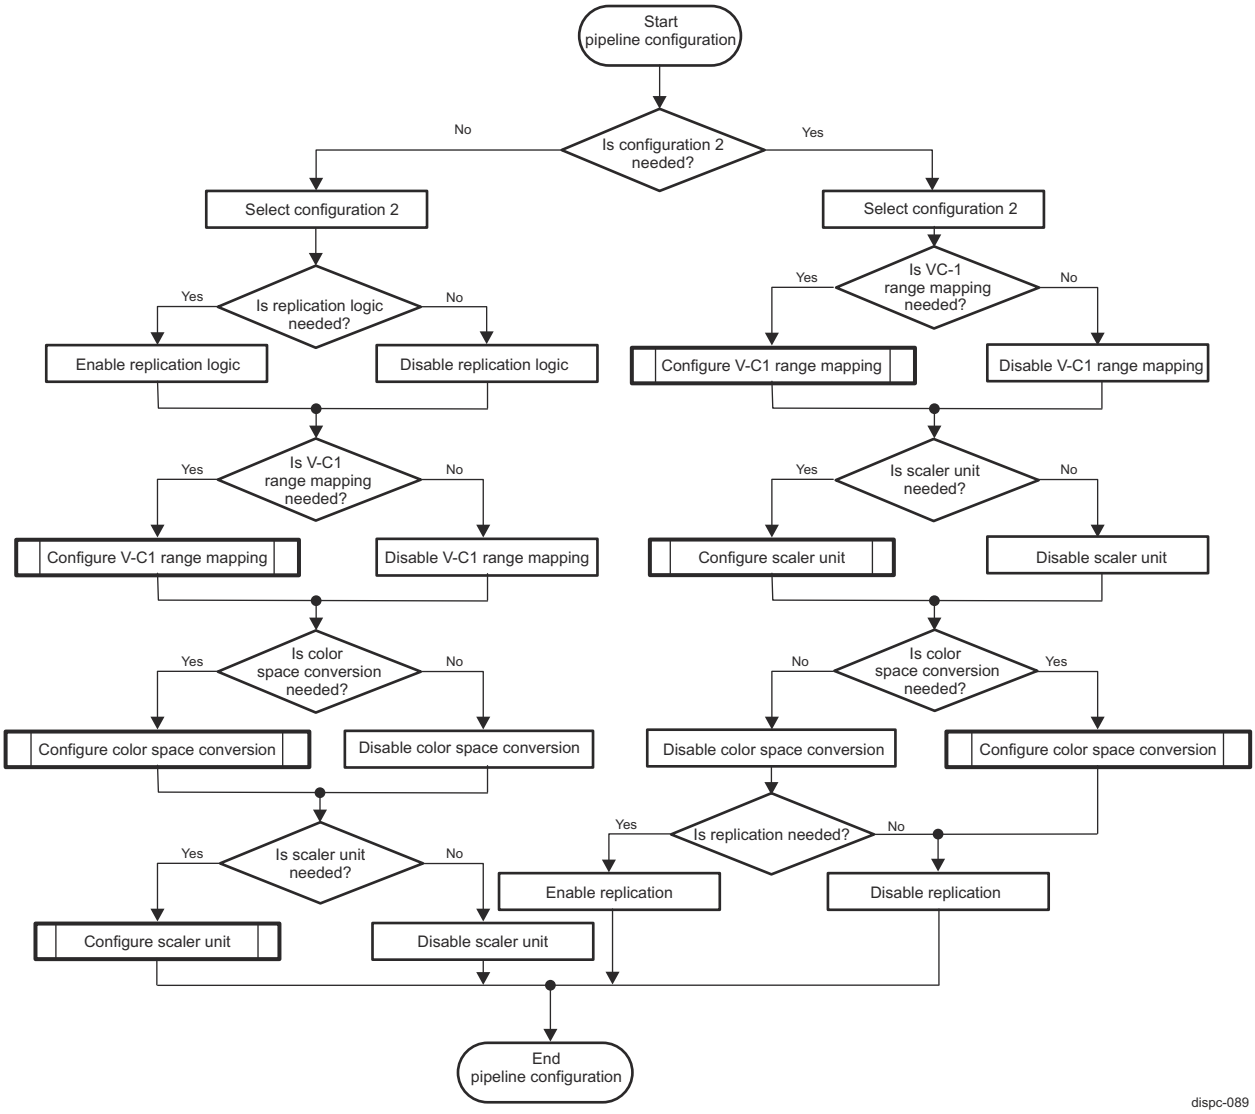

Figure 11-101. DISPC Video Pipeline Processing Configuration

11.2.5.1.2.3.4 DISPC Subsequence – Configure the VC-1 Range Mapping

This subsequence describes the steps to configure the VC-1 range mapping (see Table 11-102).

Table 11-102. DISPC Configure the VC-1 Range Mapping

Step	Register/Bit Field/Programming Model	Value
Set the Y component VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y	0x–
Set the Cb and Cr component VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR	0x–
Enable VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE	0x1

11.2.5.1.2.3.5 DISPC Subsequence – Configure the Video Color Space Conversion

This subsequence describes the steps to configure the video color space conversion (see Table 11-103).

Table 11-103. DISPC Configure the Video Color Space Conversion

Step	Register/Bit Field/Programming Model	Value
Select the range of the color space conversion.	DISPC_VIDp_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients.	DISPC_VIDp_CONV_COEF0[26:16][10:0] RCR, RY	0x–

Table 11-103. DISPC Configure the Video Color Space Conversion (continued)

Step	Register/Bit Field/Programming Model	Value
Set the GY and RCb coefficients.	DISPC_VIDp_CONV_COEF1[26:16][10:0] GY, RCB	0x–
Set the GCb and GCr coefficients.	DISPC_VIDp_CONV_COEF2[26:16][10:0] GCB, GCR	0x–
Set the BCr and BY coefficients.	DISPC_VIDp_CONV_COEF3[26:16][10:0] BCR, BY	0x–
Set the BCb coefficient.	DISPC_VIDp_CONV_COEF4[10:0] BCB	0x–
Enable color space conversion.	DISPC_VIDp_ATTRIBUTES[9] COLORCONVENABLE	0x1

11.2.5.1.2.3.6 DISPC Subsequence – Configure the Video Scaler Unit

This subsequence configures the video scaler unit. Table 11-104 is applicable for RGB pixel format. Table 11-104 and Table 11-105 are applicable for YUV pixel format.

Table 11-104. DISPC Configure the Video Scaler Unit for RGB Pixel Formats or Y Component

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio.	DISPC_VIDp_FIR[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients.	DISPC_VIDp_FIR_COEF_H_i[31:24][23:16][15:8] [7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value.	DISPC_VIDp_ACCU_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps.	DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS	0x–
Set the vertical resizing ratio.	DISPC_VIDp_FIR[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component.	DISPC_VIDp_FIR_COEF_HV_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component.	DISPC_VIDp_ACCU_j[26:16] VERTICALACCU	0x–
Enable horizontal and vertical scaler unit.	DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE	0x–

Table 11-105. DISPC Configure the Video Scaler Unit for Cb and Cr Components

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components.	DISPC_VIDp_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components.	DISPC_VIDp_FIR_COEF_H2_i[31:24][23:16][15:8] [7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV2_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components.	DISPC_VIDp_ACCU2_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components.	DISPC_VIDp_FIR2[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for Cb and Cr components.	DISPC_VIDp_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for Cb and Cr components.	DISPC_VIDp_ACCU2_j[26:16] VERTICALACCU	0x–

Figure 11-102 shows the programming flow of the DISPC scaler unit.

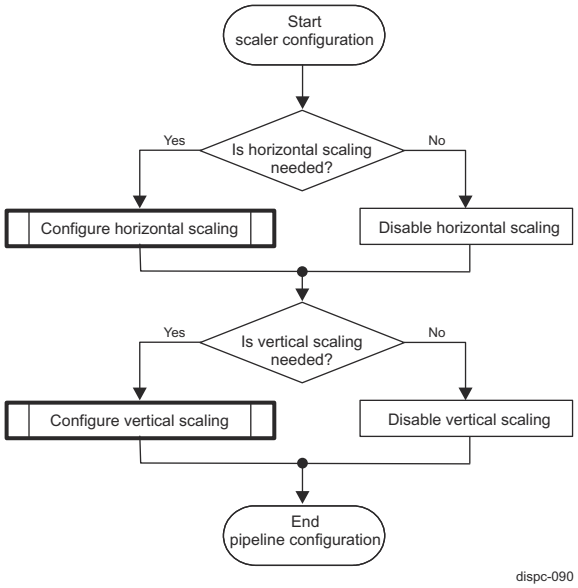

Figure 11-102. DISPC Scaler Unit Programming Flow

11.2.5.1.2.3.7 DISPC Subsequence – Configure the Video Pipeline Layer Output

This subsequence describes the video layer settings available at the pipeline level necessary when using the overlay manager (see Table 11-106).

Table 11-106. DISPC Configure the Video Pipeline Layer Output

Step	Register/Bit Field/Programming Model	Value
Set the LCD/TV output.	DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT	0x–
If DISPC_VIDp_ATTRIBUTES[16] = 0, set the LCD output.	DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2	0x–
Set the Z-order priority of the layer for overlay manager.	DISPC_VIDp_ATTRIBUTES[27:26] ZORDER	0x–
Enable the video pipeline Z-order.	DISPC_VIDp_ATTRIBUTES[25] ZORDERENABLE	0x–
Set the Global Alpha value for the alpha blender unit.	DISPC_GLOBAL_ALPHA[31:24][23:16][15:8] VID3GLOBALALPHA, VID2GLOBALALPHA, VID1GLOBALALPHA	0x–

11.2.5.1.2.4 DISPC WB Pipeline Configuration

11.2.5.1.2.4.1 DISPC Main Sequence – Configure the WB Pipeline

This procedure describes the steps to configure the WB pipeline (see Table 11-107).

Table 11-107. DISPC Configure the WB Pipeline

Step	Register/Bit Field/Programming Model	Value
Configure the capture window.	See Table 11-108.	
Configure the WB scaler unit.	See Table 11-109.	
Enable truncation logic to match pixel size defined in the format of image DISPC_WB_ATTRIBUTES[4:1] FORMAT.	DISPC_WB_ATTRIBUTES[10] TRUNCATIONENABLE	0x–
If DISPC_WB_ATTRIBUTES[10] !=, configure the WB color space conversion unit.	See Table 11-111.	
Validate the configuration according to the registers modification.	DISPC_CONTROL2[6] GOWB	

Table 11-107. DISPC Configure the WB Pipeline (continued)

Step	Register/Bit Field/Programming Model	Value
Enable WB pipeline.	DISPC_WB_ATTRIBUTES[0] ENABLE	0x1

11.2.5.1.2.4.2 DISPC Subsequence – Configure the Capture Window

This subsequence describes the parameters of the image to be captured in the system memory (see Table 11-108).

Table 11-108. DISPC Configure the Capture Window

Step	Register/Bit Field/Programming Model	Value
Set the input source.	DISPC_WB_ATTRIBUTES[18:16] CHANNELIN	0x–
Select the format of image.	DISPC_WB_ATTRIBUTES[4:1] FORMAT	0x–
Set the X size of image to be captured.	DISPC_WB_SIZE[10:0] SIZEX	0x–
Set the Y size of image to be captured.	DISPC_WB_SIZE[10:0] SIZEY	0x–

11.2.5.1.2.4.3 DISPC Subsequence – Configure the WB Scaler Unit

This subsequence configures the scaler unit. Table 11-109 is applicable for RGB pixel format. Table 11-109 and Table 11-110 are applicable for YUV pixel format.

Table 11-109. DISPC Configure the WB Scaler Unit for RGB Pixel Formats or Y Component

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio.	DISPC_WB_FIR[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients.	DISPC_WB_FIR_COEF_H_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_WB_FIR_COEF_HV_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value.	DISPC_WB_ACCU_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps.	DISPC_WB_ATTRIBUTES[21] VERTICALTAPS	0x–
Set the vertical resizing ratio.	DISPC_WB_FIR[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component.	DISPC_WB_FIR_COEF_HV_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_WB_FIR_COEF_V_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component.	DISPC_WB_ACCU_j[26:16] VERTICALACCU	0x–
Enable horizontal and vertical scaler unit.	DISPC_WB_ATTRIBUTES[6:5] RESIZEENABLE	0x–

Table 11-110. DISPC Configure the WB Scaler Unit for Cb and Cr Components

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components.	DISPC_WB_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components.	DISPC_WB_FIR_COEF_H2_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_WB_FIR_COEF_HV2_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components.	DISPC_WB_ACCU2_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components.	DISPC_WB_FIR2[28:16] FIRVINC	0x–

Table 11-110. DISPC Configure the WB Scaler Unit for Cb and Cr Components (continued)

Step	Register/Bit Field/Programming Model	Value
Set the vertical FIR coefficients for Cb and Cr components.	DISPC_WB_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_WB_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for Cb and Cr components.	DISPC_WB_ACCU2_j[26:16] VERTICALACCU	0x–

11.2.5.1.2.4.4 DISPC Subsequence – Configure the WB Color Space Conversion Unit

This subsequence describes the steps to configure the WB color space conversion unit (see Table 11-111).

Table 11-111. DISPC Configure the WB Color Space Conversion Unit

Step	Register/Bit Field/Programming Model	Value
Select the range of the color space conversion.	DISPC_WB_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients.	DISPC_WB_CONV_COEF0[26:16][10:0] YG, YR	0x–
Set the GY and RCb coefficients	DISPC_WB_CONV_COEF1[26:16][10:0] CRR, YB	0x–
Set the GCb and GCr coefficients.	DISPC_WB_CONV_COEF2[26:16][10:0] CRB, CRG	0x–
Set the BCr and BY coefficients.	DISPC_WB_CONV_COEF3[26:16][10:0] CBG, CBR	0x–
Set the BCb coefficient.	DISPC_WB_CONV_COEF4[10:0] CBB	0x–
Enable color space conversion.	DISPC_WB_ATTRIBUTES[9] COLORCONVENABLE	0x1

11.2.5.1.2.5 DISPC LCD Output Configuration

11.2.5.1.2.5.1 DISPC Main Sequence – Configure the LCD Output

This procedure details the LCD output configuration (see Table 11-112).

Table 11-112. DISPC Configure the LCD Output

Step	Register/Bit Field/Programming Model
Configure the LCD overlay manager.	See Table 11-113.
Configure the gamma table for gamma correction.	See Section 11.2.5.1.2.5.3.
Configure the CPR.	See Table 11-117.
Configure the LCD panel timings and parameters.	See Table 11-118.
Configure BT.656 or BT.1120 mode.	See Table 11-119
Validate the LCD output configuration according.	DISPC_CONTROL1[5] GOLCD
	DISPC_CONTROL2[5] GOLCD
Enable LCD output.	DISPC_CONTROL1[0] LCDENABLE
	DISPC_CONTROL2[0] LCDENABLE

11.2.5.1.2.5.2 DISPC Subsequence – Configure the Overlay Manager

This subsequence describes the overlay manager settings and transparency color key configuration (see Table 11-113).

Table 11-113. DISPC Configure the LCD Overlay Manager

Step	Register/Bit Field/Programming Model	Value
Set the LCD panel background color.	DISPC_DEFAULT_COLORo[23:0] DEFAULTCOLOR	0x–
Enable/disable overlay optimization.	DISPC_CONTROLo[12] OVERLAYOPTIMIZATION	0x–
Enable the alpha blender.	DISPC_CONFIG1[18] LCDALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode.	DISPC_CONFIGo[11] TCKLCDSELECTION	0x–
Set the transparency color value.	DISPC_TRANS_COLORo[23:0] TRANSCOLORKEY	0x–

Table 11-113. DISPC Configure the LCD Overlay Manager (continued)

Step	Register/Bit Field/Programming Model	Value
Enable transparency color key mode.	DISPC_CONFIGo[10] TCKLCDENABLE	0x–

11.2.5.1.2.5.3 DISPC Subsequence – Configure the Gamma Table for Gamma Correction

This subsequence describes the settings for configuring the gamma correction for LCD1, LCD2, and LCD3 (see Table 11-114 through Table 11-116, respectively).

Note

Software must ensure there is no visible effect when modifying the table because it is not under hardware control. The synchronization done using the DMA engine inside the DISPC to load the table when it is not used to display the picture on the screen is not present for this mode.

Table 11-114. DISPC Configure the Gamma Table for LCD1

Step	Register/Bit Field/Programming Model	Value
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE0[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–
Enable the gamma table.	DISPC_CONFIG1[3] PALETTEGAMMATABLE	0x1
Select the load mode of the gamma look-up table.	DISPC_CONFIG1[2:1] LOADMODE	0x–

Table 11-115. DISPC Configure the Gamma Table for LCD2

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD2 and TV.	DISPC_CONFIG1[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE2[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

Table 11-116. DISPC Configure the Gamma Table for LCD3

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD3 and TV.	DISPC_CONFIG3[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE3[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

11.2.5.1.2.5.4 DISPC Subsequence – Configure the Color Phase Rotation

Table 11-117 describes the settings for the CPR unit (see Table 11-117).

Table 11-117. DISPC Configure the Color Phase Rotation

Step	Register/Bit Field/Programming Model	Value
For Color Phase Rotation Processing		
Set the Red coefficients.	DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB	0x–
Set the Green coefficients	DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB	0x–
Set the Blue coefficients.	DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB	0x–
Disable the CPR unit in RGB to YUV conversion.	DISPC_CONFIGo[24] COLORCONVENABLE	0x0
Enable the CPR unit.	DISPC_CONFIGo[15] CPR	0x1
For Color Space Conversion Processing		
Set the Y coefficients.	DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB	0x–
Set the Cb coefficients.	DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB	0x–
Set the Cr coefficients.	DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB	0x–
Set the CSC range.	DISPC_CONFIGo[25] FULLRANGE	0x–

Table 11-117. DISPC Configure the Color Phase Rotation (continued)

Step	Register/Bit Field/Programming Model	Value
Enable the CPR unit in RGB to YUV conversion.	DISPC_CONFIGo[24] COLORCONVENABLE	0x1
Disable the CPR unit.	DISPC_CONFIGo[15] CPR	0x0

11.2.5.1.2.5.5 DISPC Subsequence – Configure the LCD Panel Timings and Parameters

This subsequence describes the setting for horizontal and vertical synchronization and signal polarity (see Table 11-118).

Table 11-118. DISPC Configure the LCD Panel Timings and Parameters

Step	Register/Bit Field/Programming Model	Value
Configure spatial/temporal dithering		
Select spatial/temporal number of frames.	DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES	0x–
Enable spatial/temporal dithering.	DISPC_CONTROLo[7] STDITHERENABLE	0x–
Configure AC-bias		
Configure the VSYNC, HSYNC and AC bias polarity.	DISPC_POL_FREQo	0x–
Configure the gating of AC bias polarity.	DISPC_CONFIGo[8] ACBIASGATED	0x–
Configure the AC bias polarity.	DISPC_POL_FREQo[15] IEO	0x–
Set the AC bias frequency.	DISPC_POL_FREQo[7:0] ACB	0x–
Set the number of AC bias transitions per interrupt.	DISPC_POL_FREQo[11:8] ACBI	0x–
Configure the pixel clock		
Set the DISPC logic clock divisor.	DISPC_DIVISORo[23:16] LCD	0x–
Set the pixel clock divisor.	DISPC_DIVISORo[7:0] PCD	0x–
Configure the gating of pixel clock.	DISPC_CONFIGo[5] PIXELCLOCKGATED	0x–
Configure the data		
Set the pixel clock edge to drive data output.	DISPC_POL_FREQo[14] IPC and CTRL_CORE_SMA_SW_1[]DSS_CHx_IPC(1)	0x–
Configure the gating of data output.	DISPC_CONFIGo[4] PIXELDATAGATED	0x–
Set the data output mode.	DISPC_CONFIGo[22] OUTPUTMODEENABLE	0x–
Configure the panel parameters		
Set the vertical TV size.	DISPC_SIZE_LCDo[27:16] LPP	0x–
Set the horizontal TV size.	DISPC_SIZE_LCDo[11:0] PPL	0x–
Set the panel type.	DISPC_CONTROLo[3] STNTFT	0x–
Configure the refresh rate and horizontal and vertical parameters		
Set the vertical synchronization timing.	DISPC_TIMING_Vo[31:20][19:8][7:0], VBP, VFP, VSW	0x–
Configure the VSYNC polarity.	DISPC_POL_FREQo[12] IVS	0x–
Configure the gating of VSYNC.	DISPC_CONFIGo[7] VSYNCGATED	0x–
Set the horizontal synchronization timing.	DISPC_TIMING_Ho[31:20][19:8][7:0], HBP, HFP, HSW	0x–
Configure the HSYNC polarity.	DISPC_POL_FREQo[13] IHS	0x–
Configure the gating of HSYNC.	DISPC_CONFIGo[6] HSYNCGATED	0x–
Set the opposition of HSYNC and VSYNC driving.	DISPC_POL_FREQo[17] ONOFF and CTRL_CORE_SMA_SW_1[]DSS_CHx_ON_OFF(1)	0x–
If DISPC_POL_FREQo[17] = 1, set the pixel clock edge to drive HSYNC and VSYNC.	DISPC_POL_FREQo[16] RF and CTRL_CORE_SMA_SW_1[]DSS_CHx_RF(1)	0x–
Set the alignment of HSYNC and VSYNC.	DISPC_POL_FREQo[18] ALIGN	0x–

(1) The values of the DISPC and Control Module registers must mach

11.2.5.1.2.5.6 DISPC Subsequence – Configure BT.656 or BT.1120 Mode

CAUTION

DISPC supports maximum 256 bytes of horizontal blanking when the LCD outputs are configured in BT modes (bitfield HSW of DISPC_TIMING_H1/2/3 registers is 8 bits wide). This is not compliant with BT.656 and BT.1120 standards, both of which require higher blanking periods. If more than 256 bytes of horizontal blanking are required by the application, then the RGB mode must be used for the LCD outputs.

Table 11-119 lists the steps to configure BT.656 or BT1120.

Table 11-119. DISPC Configure BT.656 or BT.1120 Mode

Step	Register/Bit Field/Programming Model	Value
Enable BT.656 mode (1)	DISPC_CONFIGo[20] BT656ENABLE	0x1
Enable BT.1120 mode (1)	DISPC_CONFIGo[21] BT1120ENABLE	0x1
Configure the blanking values	See Table 11-120	-
Configure the color phase rotation block	See Table 11-117	-
Disable STALL mode	DISPC_CONTROLo[11] STALLMODE	0x0
Disable TDM	DISPC_CONTROLo[20] TDMENABLE	0x0

(1) It is not possible to enable BT.656 and BT.1120 modes simultaneously on one LCD output.

Table 11-120 lists the blankng values for BT.656 and BT.1120.

Table 11-120. DISPC Configure BT.656 or BT.1120 Blanking Values

Step	Register/Bit Field/Programming Model	Value
For Progressive Mode		
Select progressive mode	DISPC_CONFIGo[22] OUTPUTMODEENABLE	0x0
Set Horizontal blanking	DISPC_TIMING_Ho[7:0] HSW	0x-
Set Vertical frame blanking No 1	DISPC_TIMING_Vo[19:8] VFP	0x-
Set Vertical frame blanking No 2	DISPC_TIMING_Vo[31:20] VBP	0x-
Set Number of lines	DISPC_SIZE_LCD1[27:16] LPP	0x-
Set Number of pixels per line	DISPC_SIZE_LCD1[11:0] PPL	0x-
For Interlaced Mode		
Select interlaced mode	DISPC_CONFIGo[22] OUTPUTMODEENABLE	0x1
Set Horizontal blanking	DISPC_TIMING_Ho[7:0] HSW	0x-
Set Vertical field blanking No 1 for Even Field	DISPC_TIMING_Ho[19:8] HFP	0x-
Set Vertical field blanking No 2 for Even Field	DISPC_TIMING_Ho[31:20] HBP	0x-
Set Vertical field blanking No 1 for Odd Field	DISPC_TIMING_Vo[19:8] VFP	0x-
Set Vertical field blanking No 2 for Odd Field	DISPC_TIMING_Vo[31:20] VBP	0x-
Set Number of lines per field (even)	DISPC_SIZE_LCD1[27:16] LPP	0x-
Set Delta number of odd field compared to even field (in a single line)	DISPC_SIZE_LCD1[15:14] DELTA	0x-
Set Number of pixels per line	DISPC_SIZE_LCD1[11:0] PPL	0x-

11.2.5.1.2.6 DISPC TV Output Configuration

11.2.5.1.2.6.1 DISPC Main Sequence – Configure the TV Output

This procedure describes the TV output configuration (see Table 11-121).

Table 11-121. DISPC Configure the TV Output

Step	Register/Bit Field/Programming Model
Configure the TV overlay manager.	See Table 11-122.
Configure the gamma table for gamma correction.	See Table 11-123.
Configure the TV panel timings and parameters.	See Table 11-124.
Validate the TV output configuration accordingly.	DISPC_CONTROL1[6] GOTV
Enable the TV output.	DISPC_CONTROL1[1] TVENABLE

11.2.5.1.2.6.1.1 DISPC Subsequence – Configure the TV Overlay Manager

This subsequence describes the overlay manager settings and transparency color key configuration (see Table 11-122).

Table 11-122. DISPC Configure the TV Overlay Manager

Step	Register/Bit Field/Programming Model	Value
Set the TV panel background color.	DISPC_DEFAULT_COLOR1[23:0] DEFAULTCOLOR	0x–
Enable/disable overlay optimization.	DISPC_CONTROL2[13] TVOVERLAYOPTIMIZATION	0x–
Enable the alpha blender.	DISPC_CONFIG1[19] TVALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode.	DISPC_CONFIG1[13] TCKTVSELECTION	0x–
Set the transparency color value.	DISPC_TRANS_COLOR1[23:0] TRANSCOLORKEY	0x–
Enable transparency color key mode.	DISPC_CONFIG1[10] TCKTVENABLE	0x–

11.2.5.1.2.6.1.2 DISPC Subsequence – Configure the Gamma Table for Gamma Correction

This subsequence describes the steps to configure the gamma table for gamma correction (see Table 11-123).

Note

Software must ensure there is no visible effect when modifying the table because it is not under hardware control. The synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.

Table 11-123. DISPC Configure the Gamma Table for TV Output

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD2 and TV.	DISPC_CONFIG1[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values. For more information, see Section 11.2.4.14.2, *Gamma Correction Unit*.	DISPC_GAMMA_TABLE2[31][29:20][19:10][9:0] INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

11.2.5.1.2.6.1.3 DISPC Subsequence – Configure the TV Panel Timings and Parameters

This subsequence describes the settings for horizontal and vertical synchronization and signal polarity (see Table 11-124).

Table 11-124. DISPC Configure the TV Panel Timings and Parameters

Step	Register/Bit Field/Programming Model	Value
Set the hold time for TV data outputs.	DISPC_CONFIG1[19:17]	0x–
Set the vertical TV size.	DISPC_SIZE_TV[27:16] LPP	See Table 11-88 for HD standards.
Set the horizontal TV size.	DISPC_SIZE_TV[11:0] PPL	

11.2.6 DISPC Register Manual

11.2.6.1 DISPC Instance Summary

DISPC_VID1_CONV_COEF4	Configuration of the Color Space Conversion coefficients for the video pipeline 1
DISPC_VID2_CONV_COEF4	Configuration of the Color Space Conversion coefficient for the video pipeline 2
DISPC_VID3_CONV_COEF4	Configuration of the Color Space Conversion coefficient for the video pipeline 3

Table 11-149. DISPC_CONTROLo Logical Register Mapping

Hardware Register	Description
DISPC_CONTROL1	Configuration control of the LCD1 and TV.
DISPC_CONTROL2	Configuration control of the LCD2.
DISPC_CONTROL3	Configuration control of the LCD3.

Table 11-150. DISPC_CONFIGo Logical Register Mapping

Hardware Register	Description
DISPC_CONFIG1	Configuration of the LCD1 and TV.
DISPC_CONFIG2	Configuration of the LCD2.
DISPC_CONFIG3	Configuration of the LCD3.

Table 11-151. DISPC_DEFAULT_COLORo Logical Register Mapping

Hardware Register	Description
DISPC_DEFAULT_COLOR0	Configuration of the background color for LCD1.
DISPC_DEFAULT_COLOR1	Configuration of the background color for TV.
DISPC_DEFAULT_COLOR2	Configuration of the background color for LCD2.
DISPC_DEFAULT_COLOR3	Configuration of the background color for LCD3.

Table 11-152. DISPC_TRANS_COLORo Logical Register Mapping

Hardware Register	Description
DISPC_TRANS_COLOR0	Configuration of the transparency color key for LCD1.
DISPC_TRANS_COLOR1	Configuration of the transparency color key for TV.
DISPC_TRANS_COLOR2	Configuration of the transparency color key for LCD2.
DISPC_DEFAULT_COLOR3	Configuration of the background color for LCD3.

Table 11-153. DISPC_GAMMA_TABLEo Logical Register Mapping

Hardware Register	Description
DISPC_GAMMA_TABLE0	Configuration of the gamma table for LCD1.
DISPC_GAMMA_TABLE1	Configuration of the gamma table for LCD2.
DISPC_GAMMA_TABLE2	Configuration of the gamma table for TV output.
DISPC_GAMMA_TABLE3	Configuration of the gamma table for LCD3.

Table 11-154. DISPC_TIMING_Ho Logical Register Mapping

Hardware Register	Description
DISPC_TIMING_H1	Configuration of the horizontal timing for LCD1.
DISPC_TIMING_H2	Configuration of the horizontal timing for LCD2.
DISPC_TIMING_H3	Configuration of the horizontal timing for LCD3.

Table 11-155. DISPC_TIMING_Vo Logical Register Mapping

Hardware Register	Description
DISPC_TIMING_V1	Configuration of the vertical timing for LCD1.
DISPC_TIMING_V2	Configuration of the vertical timing for LCD2.
DISPC_TIMING_V3	Configuration of the vertical timing for LCD3.

Table 11-156. DISPC_POL_FREQo Logical Register Mapping

Hardware Register	Description
DISPC_POL_FREQ1	Configuration of the output signals for LCD1.
DISPC_POL_FREQ2	Configuration of the output signals for LCD2.
DISPC_POL_FREQ3	Configuration of the output signals for LCD3.

Table 11-157. DISPC_DIVISORo Logical Register Mapping

Hardware Register	Description
DISPC_DIVISOR1	Configuration of the divisors for LCD1.
DISPC_DIVISOR2	Configuration of the divisors for LCD2.
DISPC_DIVISOR3	Configuration of the divisors for LCD3.

Table 11-158. DISPC_SIZE_LCDo Logical Register Mapping

Hardware Register	Description
DISPC_SIZE_LCD1	Configuration of the divisors for LCD1.
DISPC_SIZE_LCD2	Configuration of the divisors for LCD2.
DISPC_SIZE_LCD3	Configuration of the divisors for LCD3.

Table 11-159. DISPC_SIZE Logical Register Mapping

Hardware Register	Description
DISPC_SIZE_LCD1	Configuration of the LCD size on LCD1.
DISPC_SIZE_LCD2	Configuration of the LCD size on LCD2.
DISPC_SIZE_LCD3	Configuration of the LCD size on LCD3.

Table 11-160. DISPC_DATAo_CYCLE1 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE1	Configuration of the output data format for first cycle on LCD1.
DISPC_DATA2_CYCLE1	Configuration of the output data format for first cycle on LCD2.
DISPC_DATA3_CYCLE1	Configuration of the output data format for first cycle on LCD3.

Table 11-161. DISPC_DATAo_CYCLE2 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE2	Configuration of the output data format for second cycle on LCD1.
DISPC_DATA2_CYCLE2	Configuration of the output data format for second cycle on LCD2.
DISPC_DATA3_CYCLE2	Configuration of the output data format forsecond cycle on LCD3.

Table 11-162. DISPC_DATAo_CYCLE3 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE3	Configuration of the output data format for third cycle on LCD1.
DISPC_DATA2_CYCLE3	Configuration of the output data format for third cycle on LCD2.
DISPC_DATA3_CYCLE3	Configuration of the output data format for third cycle on LCD3.

Table 11-163. DISPC_CPRo_COEF_R Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_R	Configuration of the CPR matrix coefficients for the red component on LCD1.
DISPC_CPR2_COEF_R	Configuration of the CPR matrix coefficients for the red component on LCD2.
DISPC_CPR3_COEF_R	Configuration of the CPR matrix coefficients for the red component on LCD3

Table 11-164. DISPC_CPRo_COEF_G Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_G	Configuration of the CPR matrix coefficients for the green component on LCD1.
DISPC_CPR2_COEF_G	Configuration of the CPR matrix coefficients for the green component on LCD2.
DISPC_CPR3_COEF_G	Configuration of the CPR matrix coefficients for the green component on LCD3.

Table 11-165. DISPC_CPRo_COEF_B Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD1.
DISPC_CPR2_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD2.
DISPC_CPR3_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD3.

Table 11-168. DISPC_SYSCONFIG

Address Offset	0x0000 0010		
Physical Address	0x5800 1010	**Instance**	DISPC
Description	This register allows to control various parameters of the OCP interface.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																		MIDLEMODE		RESERVED		CLOCKACTIVITY		RESERVED		WARMRESET		SIDLEMODE		ENWAKEUP		SOFTRESET		AUTOIDLE	

Bits	Field Name	Description	Type	Reset
31:14	RESERVED	Write 0s for future compatibility. Reads returns 0.	R	0x00000
13:12	MIDLEMODE	Master interface power management, standby/wait control 0x0: Force-standby. MStandby is only asserted when the module is disabled. MStandby is only asserted when the module is disabled. 0x1: No-Standby: MStandby is never asserted. 0x2: Smart-Standby. MStandby is asserted based on the internal activity of the module. 0x3: Reserved	RW	0x0
11:10	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0
9:8	CLOCKACTIVITY	Clocks activity during wake up mode period 0x0: OCP and functional clocks can be switched off. 0x1: Functional clocks can be switched off and OCP clocks are maintained during wake up period. 0x2: OCP clocks can be switched off and Functional clocks are maintained during wake up period. 0x3: OCP and functional clocks are maintained during wake-up period.	RW	0x0
7:6	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0

Bits	Field Name	Description	Type	Reset
5	WARMRESET	Warm reset. Set this bit to 1 triggers a module warm reset. The bit is automatically reset by the hardware. During reads, it always returns 0. The warm reset keep the configuration registers unchanged. 0x0: Normal mode 0x1: The warm reset is set.	RW	0
4:3	SIDLEMODE	Slave interface power management, Idle req/ack control 0x0: Force-idle. An idle request is acknowledged unconditionally. 0x1: No-idle. An idle request is never acknowledged. 0x2: Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module. 0x3: Reserved	RW	0x0
2	ENWAKEUP	WakeUp feature control 0x0: Wakeup is disabled. 0x1: Wakeup is enabled.	RW	0
1	SOFTRESET	Software reset. Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0. 0x0: Normal mode 0x1: The module is reset.	RW	0
0	AUTOIDLE	Internal interface clock gating strategy 0x0: Interface clock is free-running. 0x1: Automatic interface L3_MAIN gating strategy is applied, based on the OCP interface activity. Automatic functional clock gating is also applied to the functional clock based on the module activity (for instance DISPC_<pipe>_ATTRIBUTES.ENABLE).	RW	1

Table 11-169. DISPC_SYSSTATUS

Address Offset	0x0000 0014		
Physical Address	0x5800 1014	**Instance**	DISPC
Description	This register provides status information about the module, excluding the interrupt status information.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															RESETDONE

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x000000
0	RESETDONE	Internal reset monitoring Read 0x0: Internal module reset is on-going. Read 0x1: Reset completed	R	1

Table 11-170. DISPC_IRQSTATUS

Address Offset	0x0000 0018		
Physical Address	0x5800 1018	**Instance**	DISPC
Description	This register regroups all the status of the module internal events that generate an interrupt. Write 1 to a given bit resets this bit		

Table 11-170. DISPC_IRQSTATUS (continued)

Type RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31	FLIPIMMEDIATEDONE_IRQ	Flip Immediate Done. The DMA engine has acknowledged the immediate BA change, and software can write the new BA0. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
30	FRAMEDONE3_IRQ	Frame done for the third LCD. The third LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
29	ACBIASCOUNT STATUS3_IRQ	AC bias count status for the third LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
28	VSYNC3_IRQ	Vertical synchronization for the third LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
27	SYNCLOST3_IRQ	Synchronization lost on the third LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the third LCD output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
26	WBUNCOMPLETE ERROR_IRQ	Write-back DMA buffer is flushed before it is completely drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that case and will trigger every frame 0x0: READS: Event is false. WRITES: Status bit unchanged 0x1: READS: Event is true (Pending) WRITES: Status bit is reset	RW W1toClr	0
25	WBBUFFER OVERFLOW_IRQ	Write-back DMA buffer overflow. The DMA buffer is full. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
24	FRAME DONETV_IRQ	Frame done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
23	FRAME DONEWB_IRQ	Frame done for the write-back channel. The write-back channel has output the frame. All the data of the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. It is available only when the write-back pipeline transfers back to memory the output of one of the pipelines. In case of overlay capture, the interrupt is not generated and the user shall use the FrameDone for the corresponding captured output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
22	FRAME DONE2_IRQ	Frame done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
21	ACBIASCOUNT STATUS2_IRQ	AC bias count status for the secondary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
20	VID3BUFFER UNDERFLOW_IRQ	Video 3 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
19	VID3END WINDOW_IRQ	The end of the video 3 window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
18	VSYNC2_IRQ	Vertical synchronization for the secondary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
17	SYNC LOST2_IRQ	Synchronization lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
16	WAKEUP_IRQ	Wakeup 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
15	SYNCLOST TV_IRQ	Synchronization lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
14	SYNC LOST1_IRQ	Synchronizationl ost on the primary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the primary LCD output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
13	VID2END WINDOW_IRQ	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
12	VID2BUFFER UNDERFLOW_IRQ	Video 2 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
11	VID1END WINDOW_IRQ	The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
10	VID1BUFFER UNDERFLOW_IRQ	Video 1 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
9	OCPERROR_IRQ	OCP error. L3_MAIN Interconnect has sent SResp=ERR. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
8	PALETTEGAMMA LOADING_IRQ	Palette Gamma loading status. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully. **NOTE: CLUT and BITMAP formats are not supported in this family of devices.** 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
7	GFXEND WINDOW_IRQ	The end of the graphics wndow has been reached. It is detected by the overlay manager when the full graphics has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
6	GFXBUFFER UNDERFLOW_IRQ	Graphics DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
5	PROGRAMMED LINENUMBER_IRQ	Programmed line number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
4	ACBIASCOUNT STATUS1_IRQ	AC bias count status for the primary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
3	EVSYNC_ ODD_IRQ	VSYNC for odd field from the TV encoder (HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
2	EVSYNC_ EVEN_IRQ	VSYNC for even field from the TV encoder (HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
1	VSYNC1_IRQ	Vertical synchronization for the primary LCD. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
0	FRAME DONE1_IRQ	Frame done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Table 11-171. DISPC_IRQENABLE

Address Offset	0x0000 001C		
Physical Address	0x5800 101C	**Instance**	DISPC
Description	This register allows to mask/unmask the module internal sources of interrupt, on an event-by-event basis

Bits	Field Name	Description	Type	Reset
31	FLIPIMMEDIATEDONE_EN	Flip Immediate Done. The DMA engine has acknowledged the immediate BA change, and software can write the new BA0. 0x0: FrameDone for the primary LCD output is masked 0x1: FrameDone for the primary LCD output generates an interrupt when it occurs	RW	0

Bits	Field Name	Description	Type	Reset
30	FRAME DONE3_EN	Frame done for the third LCD. The third LCD output has been disabled by user. All the data have been sent. 0x0: Frame Done for the secondary LCD is masked. 0x1: Frame Done for the secondary LCD generates an interrupt when it occurs.	RW	0
29	ACBIASCOUNT STATUS3_EN	AC Bias count status for the third LCD 0x0: ACBiasCountStatus for the secondary LCD output is masked 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs	RW	0
28	VSYNC3_EN	Vertical synchronization for the third LCD 0x0: VSYNC for the secondary LCD output is masked. 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs.	RW	0
27	SYNC LOST3_EN	Synchronization lost on the third LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the third LCD output. 0x0: Synchronization Lost on the secondary LCD output is masked. 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs.	RW	0
26	WBUNCOMPLETE ERROR_EN	The write back buffer has been flushed before been fully drained. Enable. 0x0: Interrupt is masked. 0x1: Interrupt is enabled.	RW	0
25	WBBUFFER OVERFLOW_EN	Write-back DMA buffer overflow. The DMA buffer is full. 0x0: WBBufferOverflow is masked. 0x1: WBBufferOverflow generates an interrupt when it occurs.	RW	0
24	FRAME DONETV_EN	Frame done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: Frame Done for the TV output is masked. 0x1: Frame Done for the TV output generates an interrupt when it occurs.	RW	0
23	FRAME DONEWB_EN	Frame done for the write-back channel. The write-back channel has output the frame. All the data have been sent for the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. 0x0: Frame done for the write-back is masked. 0x1: Frame done for the write-back generates an interrupt when it occurs.	RW	0
22	FRAME DONE2_EN	Frame done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: Frame done for the secondary LCD is masked. 0x1: Frame done for the secondary LCD generates an interrupt when it occurs.	RW	0
21	ACBIASCOUNT STATUS2_EN	AC Bias count status for the secondary LCD 0x0: ACBiasCountStatus for the secondary LCD output is masked. 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs.	RW	0

Bits	Field Name	Description	Type	Reset
20	VID3BUFFER UNDERFLOW_EN	Video 3 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid3BufferUnderflow is masked. 0x1: Vid3BufferUnderflow generates an interrupt when it occurs.	RW	0
19	VID3END WINDOW_EN	The end of the video 3 window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: Vid3EndWindow is masked. 0x1: Vid3EndWindow generates an interrupt when it occurs.	RW	0
18	VSYNC2_EN	Vertical synchronization for the secondary LCD 0x0: VSYNC for the secondary LCD output is masked. 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs.	RW	0
17	SYNC LOST2_EN	Synchronization lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: Synchronization Lost on the secondary LCD output is masked. 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs.	RW	0
16	WAKEUP_EN	Wake up mask 0x0: WakeUp is masked. 0x1: WakeUp generates an interrupt when it occurs.	RW	0
15	SYNC LOSTTV_EN	Synchronization lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output. 0x0: Synchronization Lost on the TV output is masked. 0x1: Synchronization Lost on the TV output generates an interrupt when it occurs.	RW	0
14	SYNC LOST1_EN	Synchronization lost for the primary LCD 0x0: SyncLost for the primary LCD output is masked. 0x1: SyncLost for the primary LCD output generates an interrupt when it occurs.	RW	0
13	VID2END WINDOW_EN	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed. 0x0: Vid2EndWindow is masked. 0x1: Vid2EndWindow generates an interrupt when it occurs.	RW	0
12	VID2BUFFER UNDERFLOW_EN	Video 2 DMA buffer underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid2BufferUnderflow is masked. 0x1: Vid2BufferUnderflow generates an interrupt when it occurs.	RW	0

Bits	Field Name	Description	Type	Reset
11	ENDVID1 WINDOW_EN	The end of the video 1 window has been reached. It is detected by the overlay manager when the full video 1 has been displayed. 0x0: EndVid1Window is masked. 0x1: EndVid1Window generates an interrupt when it occurs.	RW	0
10	VID1BUFFER UNDERFLOW_EN	Video 1 DMA buffer underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid1bufferunderflow is masked. 0x1: Vid1bufferunderflow generates an interrupt when it occurs.	RW	0
9	OCPERROR_EN	OCP Error. L3_MAIN Interconnect has sent SResp=ERR. 0x0: OCPError is masked. 0x1: OCPError generates an interrupt when it occurs.	RW	0
8	PALETTE GAMMA_EN	Palette gamma loading mask. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully. **NOTE: CLUT and BITMAP formats are not supported in this family of devices.** 0x0: PaletteGamma is masked. 0x1: PaletteGamma generates an interrupt when it occurs.	RW	0
7	GFXEND WINDOW_EN	The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed. 0x0: GfxEndWindow is masked. 0x1: GfxEndWindow generates an interrupt when it occurs.	RW	0
6	GFXBUFFER UNDERFLOW_EN	Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: GfxBufferUnderflow is masked. 0x1: GfxBufferUnderflow generates an interrupt when it occurs.	RW	0
5	PROGRAMMED LINENUMBER_EN	Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: ProgrammedLineNumber is masked. 0x1: ProgrammedLineNumber generates an interrupt when it occurs.	RW	0
4	ACBIASCOUNT STATUS1_EN	AC Bias count status for the primary LCD 0x0: ACBiascountstatus for the primary LCD output is masked. 0x1: ACBiascountstatus for the primary LCD output generates an interrupt when it occurs.	RW	0
3	EVSYNC_ODD_EN	VSYNC for odd field from the TV encoder (HDMI) 0x0: EVSYNC_ODD for the TV output is masked. 0x1: EVSYNC_ODD for the TV output generates an interrupt when it occurs.	RW	0

Bits	Field Name	Description	Type	Reset
2	EVSYNC_EVEN_EN	VSYNC for even field from the TV encoder (HDMI) 0x0: EVSYNC_EVEN for the TV output is masked. 0x1: EVSYNC_EVEN for the TV output generates an interrupt when it occurs.	RW	0
1	VSYNC1_EN	Vertical synchronization for the primary LCD. 0x0: VSYNC for the primary LCD output is masked. 0x1: VSYNC for the primary LCD output generates an interrupt when it occurs.	RW	0
0	FRAMEDONE_EN	Frame done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: Frame Done for the primary LCD output is masked. 0x1: FrameDone for the primary LCD output generates an interrupt when it occurs.	RW	0

Table 11-172. DISPC_CONTROL1

Address Offset	0x0000 0040		
Physical Address	0x5800 1040	**Instance**	DISPC
Description	The control register configures the Display Controller module for the primary LCD and TV outputs.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

27:26	PLCDINTERLEAVE	pLCD Interleave Pattern	RW	0x0
25	FULLRANGE	Color Space Conversion full range setting. wr: VFP start of primary LCD 0x0: Limited range selected. 0x1: Full range selected.	RW	0

Bits	Field Name	Description	Type	Reset
24	COLORCONV ENABLE	Enable the color space conversion. It shall be reset when CPR bit field is set to 0x1. wr: VFP start of primary LCD 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
23	FIDFIRST	Selects the first field to output in case of interlace mode. In case of progressive mode, the value is not used. wr: VFP start of primary LCD 0x0: First field is even. 0x1: Odd field is first.	RW	0
22	OUTPUTMODE ENABLE	Selects between progressive and interlace mode for the primary LCD output. wr: VFP start of primary LCD 0x0: Progressive mode selected. 0x1: Interlace mode selected.	RW	0
21	BT1120ENABLE	Selects BT.1120 format on the primary LCD output. It is not posssible to enable BT.656 and BT.1120 at the same time one the same LCD output. wr: VFP start of primary LCD 0x0: BT.1120 is disabled 0x1: BT.1120 is enabled.	RW	0
20	BT656ENABLE	Selects BT.656 format on the primary LCD output. It is not posssible to enable BT.656 and BT.1120 at the same time one the same LCD output. wr: VFP start of primary LCD 0x0: BT.656 is disabled. 0x1: BT.656 is enabled.	RW	0
19	TVALPHABLENDER ENABLE	Selects the alpha blender overlay manager for the TV output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated pipeline connected to the TV output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order =1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: EVSYNC start of primary LCD 0x0: Alpha blender is disabled. 0x1: The alpha blender is enabled.	RW	0
18	LCDALPHABLENDER ENABLE	Selects the alpha blender overlay manager for the primary LCD output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated with the primary LCD output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order =1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: VFP start of primary LCD 0x0: Alpha blender is disabled. The color key alpha blending is used. 0x1: The alpha blender is enabled.	RW	0

Bits	Field Name	Description	Type	Reset
17	BUFFERFILLING	Controls if the DMA buffers are refilled only when the LOW threshold is reached or if all DMA buffers are refilled when at least one of them reaches the LOW threshold. wr: immediate 0x0: Each DMA buffer is refilled when it reaches LOW threshold. 0x1: All DMA buffers are refilled up to high threshold when at least one of them reaches the LOW threshold. (only active DMA buffers shall be considered and when reaching the end of the frame the DMA buffer goes to empty condition so no need to fill it again).	RW	0
16	RESERVED	Write 0s for future compatibility. Reads return 0.	RW	0
15	CPR	Color phase rotation control (primary LCD output). It shall be reset when ColorConvEnable bit field is set to 1 wr: VFP start period of primary LCD output 0x0: Color Phase Rotation Disabled 0x1: Color Phase Rotation Enabled	RW	0
14	BUFFERMERGE	Buffer merge control wr: EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory or VFP When enabled, the DISPC_GLOBAL_BUFFER register is ignored. This bit must be set to zero when the write back channel is used. When DISPC_CONTROL2.GOWB is used BUFFERMERGE MUST be zero. When DISPC_CONTROL2.GOWB is used BUFFERMERGE MUST be zero. WR: immediate 0x0: DMA buffer merge disabled Each DMA buffer is dedicated to one pipeline. 0x1: DMA buffer merge enabled All the DMA buffers are merged into a single one to be used by the single active pipeline.	RW	0
13	TCKTV SELECTION	Transparency color key selection (TV output) wr: EVSYNC 0x0: Destination transparency color key selected 0x1: Source transparency color key selected	RW	0
12	TCKTVENABLE	Transparency color key enabled (TV output) WR: EVSYNC 0x0: Disable the transparency color key for the TV output 0x1: Enable the transparency color key for the TV output	RW	0
11	TCKLCD SELECTION	Transparency color key selection (primary LCD output) wr: VFP start period of primary LCD output 0x0: Destination transparency color key selected 0x1: Source transparency color key selected	RW	0
10	TCKLCDENABLE	Transparency color key enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: Disable the transparency color key for the LCD 0x1: Enable the transparency color key for the LCD	RW	0

Bits	Field Name	Description	Type	Reset
9	GAMATABLE ENABLE	For backward compatibility, an enable bit has been added on the 2 additional gamma tables (secondary display and TV). Gamma table of LCD1 is always enabled. 0x0: Gamma table LCD2 and TV are bypassed 0x1: Gamma table LCD2 and TV are enabled	RW	0
8	ACBIASGATED	ACBias Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: AcBias gated disabled 0x1: AcBias gated enabled	RW	0
7	VSYNCGATED	VSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: VSYNC gated disabled 0x1: VSYNC gated enabled	RW	0
6	HSYNCGATED	HSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: HSYNC gated disabled 0x1: HSYNC gated enabled	RW	0
5	PIXELCLOCK GATED	Pixel Clock Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: Pixel clock gated disabled 0x1: Pixel clock gated enabled	RW	0
4	PIXELDATAGATED	Pixel data gated enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: Pixel data gated disabled 0x1: Pixel data gated enabled	RW	0
3	PALETTEGAMMA TABLE	Palette/gamma table selection wr: VFP start period of primary LCD output or VFP start period of secondary LCD output or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the graphics pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory. In case of the table is used as gamma table, it is used for the primary LCD output only. **NOTE: CLUT and BITMAP formats are not supported in this family of devices.** 0x0: LUT used as palette (only if graphics format is BITMAP1, 2, 4, and 8) 0x1: LUT used as gamma table (only if graphics format is NOT BITMAP1, 2, 4, and 8 or no graphics window present)	RW	0

Bits	Field Name	Description	Type	Reset
2:1	LOADMODE	Loading mode for the palette/gamma table wr: VFP start period of primary LCD output or VFP start period of secondary LCD output or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory 0x0: Palette/Gamma Table and data are loaded every frame 0x1: Palette/Gamma Table to be loaded. The user sets the bit when the palette/gamma table has to be loaded. Hardware resets the bit to 0x2 when table has been loaded. (DISPC_GFX_ATTRIBUTES.ENABLE has to be set to 1). 0x2: Frame data only loaded every frame 0x3: Palette/Gamma Table and frame data loaded on first frame then switch to 0x2 (Hardware).	RW	0x0
0	PIXELGATED	Pixel gated enable (only for TFT) (primary LCD output) wr: VFP start period of primary LCD output 0x0: Pixel clock always toggles (only in TFT mode) 0x1: Pixel clock only toggles when there is valid data to display. (only in TFT mode)	RW	0

Bits	Field Name	Description	Type	Reset
31:28	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
27:16	SIZEY	Number of lines of the graphics window. Encoded value (from 1 to 4096) to specify the number of lines of the graphics window (program to value minus 1).	RW	0x000
15:11	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
10:0	SIZEX	Number of pixels of the graphics window. Encoded value (from 1 to 2048) to specify the number of pixels per line of the graphics window (program to value minus 1).	RW	0x000

Table 11-190. DISPC_GFX_ATTRIBUTES

Address Offset	0x0000 00A0		
Physical Address	0x5800 10A0	**Instance**	DISPC
Description	The register configures the graphics attributes. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CHANNELOUT2	BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	ANTIFLICKER	RESERVED	SUBSAMPLINGPATTERN	SELFREFRESHAUTO	FORCE1DTILEDMODE	SELFREFRESH	ARBITRATION	ROTATION	BUFPRELOAD	FRAMEPACKINGMODE	NIBBLEMODE	CHANNELOUT	BURSTSIZE	REPLICATIONENABLE	FORMAT	ENABLE

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should set to zero) wr: immediate 0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. (It does not apply to the palette loading OCP requests using INCR burst only) 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC GFX to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplyalpha data color component 0x1: Premultiplyalpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	ANTIFLICKER	Antiflicker filtering using a 3-tap filter with hardcoded coefficients (1/4, 1/2, 1/4) 0x0: Antiflicker disabled. 0x1: Antiflicker enabled.	RW	0
23:21	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0

Bits	Field Name	Description	Type	Reset
20:18	SUBSAMPLINGPATTERN	Subsampling pattern setting.	RW	0x0
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from Selfrefresh disabled to enabled is controlled by software 0x1: The transition from Selfrefresh disabled to enabled is controlled only by hardware	RW	0
16	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D. 0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0x0
15	SELFREFRESH	Enables the self refresh of the graphics window from its own DMA buffer. This bit should be set only after having set the GO bit of the channel and read back a zero in its field. 0x0: The graphics pipeline accesses the interconnect to fetch data from the system memory. 0x1: The graphics pipeline does not need anymore to fetch data from memory. Only the graphics DMA buffer is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
14	ARBITRATION	Determines the priority of the graphics pipeline. When the graphics pipeline is one of the high priority pipelines. The arbitration wheel gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The graphics pipeline is one of the normal priority pipeline. 0x1: The graphics pipeline is one of the high priority pipeline.	RW	0
13:12	ROTATION	Graphics rotation flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	BUFPRELOAD	Graphics preload value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
10	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0x0
9	NIBBLEMODE	Graphics nibble mode (only for 1-, 2- and 4 bpp) **NOTE: BITMAP formats and associated Nibble Mode are not supported in this family of devices.** 0x0: Nibble mode is disabled 0x1: Nibble mode is enabled	RW	0
8	CHANNELOUT	Graphics Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0

Bits	Field Name	Description	Type	Reset
7:6	BURSTSIZE	Graphics DMA burst size 0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
5	REPLICATIONENABLE	Graphics replication enabled: RGB . ARGB, and RGBA formats are converted into ARGB32-8888 using replication of the MSBs or 0s 0x0: Disable graphics replication logic. The conversion to ARGB32-8888 is done by adding 0s for the LSBs 0x1: Enable graphics replication logic. The conversion to ARGB32-8888 is done by duplicating the MSBs for the LSBs	RW	1
4:1	FORMAT	Graphics format. It defines the pixel format when fetching the graphics picture into memory. 0x6: RGB16-565 0xA: RGBx12-4444 0x7: ARGB16-1555 0xD: RGBA32-8888 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: RGBA12-4444 0x4: xRGB12-4444 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Graphics enable 0x0: Graphics disabled (graphics pipeline inactive and graphics window not present) 0x1: Graphics enabled (graphics pipeline active and graphics window present on the screen)	RW	0

Table 11-191. DISPC_GFX_BUF_THRESHOLD

Address Offset	0x0000 00A4
Physical Address	0x5800 10A4 **Instance** DISPC
Description	The register configures the graphics buffer. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

Bits	Field Name	Description	Type	Reset
27:16	SIZEY	Number of lines of the video 1 Encoded value (from 1 to 4096) to specify the number of lines of the video window 1. Program to value minus 1.	RW	0x000
15:11	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
10:0	SIZEX	Number of pixels of the video window 1 Encoded value (from 1 to 2048) to specify the number of pixels of the video window 1. Program to value minus 1.	RW	0x000

Table 11-199. DISPC_VID1_ATTRIBUTES

Address Offset	0x0000 00CC		
Physical Address	0x5800 10CC	**Instance**	DISPC
Description	The register configures the attributes of the video window 1. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2		BURSTTYPE	PREMULTIPHYALPHA	ZORDER		ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	FORCE1DTILEDMODE	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE		ROTATION		FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	FRAMEPACKINGMODE	HRESIZECONF	RESIZEENABLE		FORMAT					ENABLE

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate 0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPHYALPHA	The field configures the DISPC VID1 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplyalpha data color component 0x1: Premultiplyalpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video1 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0
21	VERTICALTAPS	Video vertical resize tap number. The vertical polyphase filter can be configured in 3-tap or 5-tap configuration. According to the number of taps, the maximum input picture width is double while using 3-tap compared to 5-tap. 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D. 0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0

Bits	Field Name	Description	Type	Reset
19	BUFPRELOAD	Video Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video channel out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA burst size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts	RW	0x2
13:12	ROTATION	Video rotation flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color space conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0

Bits	Field Name	Description	Type	Reset
6:5	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 1 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

Table 11-200. DISPC_VID1_BUF_THRESHOLD

Address Offset	0x0000 00D0		
Physical Address	0x5800 10D0	**Instance**	DISPC
Description	The register configures the video buffer associated with the video pipeline 1. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

ROWINC																															

Bits	Field Name	Description	Type	Reset
31:0	ROWINC	Number of bytes to increment at the end of the row Encoded signed value (from $2^{31}1$ to 2^{31}) to specify the number of bytes to increment at the end of the row in the video buffer. The value 0 is invalid. The value 1 means next pixel. The value 1 + n * bpp means increment of n pixels. The value 1 (n + 1)* bpp means decrement of n pixels.	RW	0x0000 0001

Table 11-203. DISPC_VID1_PIXEL_INC

Address Offset	0x0000 00DC		
Physical Address	0x5800 10DC	**Instance**	DISPC
Description	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 2. For more information, see *Predecimation*.The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD orEVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

BA																															

Bits	Field Name	Description	Type	Reset
31:0	BA	Video base address Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV4:2:2, 2-pixel alignment is required, and YUV4:2:0, byte alignment is supported)). In case of YUV4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0000 0000

Table 11-215. DISPC_VID2_POSITION

Address Offset	0x0000 0154		
Physical Address	0x5800 1154	**Instance**	DISPC
Description	The register configures the position of the video window 2. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

Bits	Field Name	Description	Type	Reset
27:16	SIZEY	Number of lines of the video 2 encoded value (from 1 to 4096) to specify the number of lines of the video window 2. Program to value minus 1.	RW	0x000
15:11	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
10:0	SIZEX	Number of pixels of the video window 2 encoded value (from 1 to 2048) to specify the number of pixels of the video window 2. Program to value minus 1.	RW	0x000

Table 11-217. DISPC_VID2_ATTRIBUTES

Address Offset	0x0000 015C		
Physical Address	0x5800 115C	**Instance**	DISPC
Description	The register configures the attributes of the video window 2. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2		BURSTTYPE	PREMULTIPLYALPHA	ZORDER		ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	FORCE1DTILEDMODE	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE		ROTATION		FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	FRAMEPACKINGMODE	HRESIZECONF	RESIZEENABLE		FORMAT					ENABLE

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (must be set to zero) wr: immediate 0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC VID2 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplyalpha data color component 0x1: Premultiplyalpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video2 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0
21	VERTICALTAPS	Video Vertical Resize Tap Number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D. 0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0
19	BUFPRELOAD	Video Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0

Bits	Field Name	Description	Type	Reset
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA burst size 0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
13:12	ROTATION	Video Rotation Flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color space conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication Enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable color space conversion YUV to RGB 0x1: Enable color space conversion YUV to RGB	RW	0
8	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 2 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	VidEnable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

Table 11-218. DISPC_VID2_BUF_THRESHOLD

Address Offset	0x0000 0160		
Physical Address	0x5800 1160	**Instance**	DISPC
Description	The register configures the DMA buffer associated with the video pipeline 2. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

RESERVED								MEMSIZEY								RESERVED								MEMSIZEX							

Bits	Field Name	Description	Type	Reset
31:28	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
27:16	MEMSIZEY	Number of lines of the video picture Encoded value (from 1 to 4096) to specify the number of lines of the video picture in memory (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the maximum size of the unpredecimated image size in memory is still bounded 2^{11}.	RW	0x000
15:11	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00

Bits	Field Name	Description	Type	Reset
10:0	MEMSIZEX	Number of pixels of the video picture Encoded value (from 1 to 2048) to specify the number of pixels of the video picture in memory (program to value minus 1). The size is limited to the size of the line buffer of the vertical sampling block in case the video picture is processed by the vertical filtering unit. (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the max size of the unpredecimated image size in memory is still bounded 2^{11}.	RW	0x000

Table 11-224. DISPC_VID2_ACCU_j

Address Offset	0x0000 0178 + (0x4 * j)	**Index**	j = 0 to 1
Physical Address	0x5800 1178 + (0x4 * j)	**Instance**	DISPC
Description	The register configures the resize accumulator init values for horizontal and vertical up/downsampling of the video window 2 (DISPC_VID2_ACCU_0 and DISPC_VID2_ACCU_1 for ping-pong mechanism with external trigger, based on the field polarity). It is used for ARGB and Y setting. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

Table 11-242. DISPC_VID2_PRELOAD

Address Offset	0x0000 0234		
Physical Address	0x5800 1234	**Instance**	DISPC
Description	The register configures the DMA buffer of the video 2 pipeline. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

Address Offset	0x0000 0238		
Physical Address	0x5800 1238	**Instance**	DISPC

Table 11-243. DISPC_CONTROL2 (continued)

Description The control register configures the Display Controller module for the secondary LCD output. Shadow registers are updated during the VFP start period of the secondary LCD, EVSYNC, or when DISPC_CONTROL2.GOWB is set to 1 by software and the current WB frame is complete (that is, has no more data in the write-back pipeline).

Type RW

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate 0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC VID3 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplyalpha data color component 0x1: Premultiplyalpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0

Bits	Field Name	Description	Type	Reset
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is used only when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video3 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0
21	VERTICALTAPS	Video vertical resize tap number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D. 0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0
19	BUFPRELOAD	Video Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video channel out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0

Bits	Field Name	Description	Type	Reset
15:14	BURSTSIZE	Video DMA burst size 0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
13:12	ROTATION	Video rotation flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video resize enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Video format. It defines the pixel format when fetching the video 3 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: RGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

Table 11-254. DISPC_VID3_CONV_COEF0

Address Offset	0x0000 0374		
Physical Address	0x5800 1374	**Instance**	DISPC
Description	The register configures the color space conversion matrix coefficients for the video pipeline 3. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

Physical Address	0x5800 1550 + (0x4 * i)	**Instance**	DISPC

Description The bank of registers configure the down/up/down-scaling coefficients for the vertical resize of the video picture associated with the write back pipeline for the phases from 0 to 7. It is used for ARGB and Y setting. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline), when the WB pipeline is directly connected to one of the pipelines (graphics or video), combined with the synchronization event of the channel overlay output selected as an input to the WB pipeline (that is, VFP start period of primary LCD, or VFP start period of secondary LCD, or VFP start period of the third LCD, or EVSYNC), for all registers associated with the selected channel out and further delayed by the DISPC_WB_ATTRIBUTES2.WBDELAYCOUNT bit-field, for all registers of the Write back and DMA. In WB capture mode, both DISPC_CONTROL2.GOWB and DISPC_CONTROL#.GOLCD/TV corresponding to the selected output channel shall be set. It is not required to set the GOWB bit when WB memory-to-memory mode is used.

Bits	Field Name	Description	Type	Reset
31:28	IDLENUMBER	Determines the number of idles between requests on the L3_MAIN interconnect. It is only used when the write-back pipeline does data transfer from memory to memory. When the output of an overlay is stored in memory through the write-back pipeline in capture mode, the bit field IDLENUMBER is ignored since a timing generator is used to time the transfer. The number of IDLE cycles is IDLENUMBER (from 0 to 15) if IDLESIZE = 0. The number of IDLE cycles is IDLENUMBERx8 (from 0 to 120) if IDLESIZE = 1 and BURSTSIZE = 2. The number of IDLE cycles is IDLENUMBERx4 (from 0 to 60) if IDLESIZE = 1 and BURSTSIZE = 1. The number of IDLE cycles is IDLENUMBERx2 (from 0 to 30) if IDLESIZE = 1 and BURSTSIZE = 0.	RW	0x0
27	IDLESIZE	Determines if the IDLENUMBER corresponds to a number of bursts or singles. 0x0: The number of idles between requests is defined by IDLENUMBER as number of cycles. 0x1: The number of idles between requests is defined by IDLENUMBER multiplied by burst size as number of cycles.	RW	0

Bits	Field Name	Description	Type	Reset
26:24	CAPTUREMODE	Defines the frame rate capture. 0x6: Only one out of six frames is captured. The first one is captured then the second one is skipped and so on. 0x1: Only one frame is captured. 0x7: Only one out of seven frames is captured. The first one is captured then the second one is skipped and so on. 0x0: All frames are captures until the write-back channel is disabled or there is no more data generated by the overlay or the pipeline attached to the write-back channel. 0x2: Only one out of two frames is captured. The first one is captured, and then the second one is skipped, and so on. 0x4: Only one out of four frames is captured. The first one is captured, and then the second one is skipped, and so on. 0x5: Only one out of five frames is captured. The first one is captured, and then the second one is skipped, and so on. 0x3: Only one out of three frames is captured. The first one is captured, and then the second one is skipped, and so on.	RW	0x0
23	ARBITRATION	Determines the priority of the write-back pipeline. The write-back pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The write-back pipeline is one of the normal priority pipeline. 0x1: The write-back pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0
21	VERTICALTAPS	Video Vertical Resize Tap Number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D. 0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0x0
19	WRITEBACKMODE	When connected to the overlay output of a channel the write back can operate as a simple transfer from memory to memory (composition engine) or as a capture channel. 0x0: Capture mode (default mode) 0x1: Memory-to-memory mode	RW	0x0

Bits	Field Name	Description	Type	Reset
18:16	CHANNELIN	Video Channel In configuration WR: immediate 0x6: Video3 pipeline output 0x1: Secondary LCD output 0x0: Primary LCD overlay output 0x2: TV overlay output 0x4: Video1 pipeline output 0x5: Video2 pipeline output 0x3: Graphics pipeline output 0x7: Third LCD output	RW	0x0
15:14	BURSTSIZE	Write-back DMA Burst Size 0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
13:12	RESERVED	Reserved	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	TRUNCATIONENABLE	It applies only when the input format to the write-back pipeline from the overlay or directly from one of the pipelines is ARGB32. If the format is one of the YUV supported formats, the bit field is ignored. 0x0: Disable truncation logic 0x1: Enable truncation logic from ARGB32 to the pixel format defined in the field FORMAT.	RW	0
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
8	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
7	ALPHAENABLE	Premultiplied alpha enable Read 0x1: Enabled Read 0x0: Disabled. This bit also disable the logic present in the associated channel out that compute the alpha component sent to the WB pipe. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available: 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay. 0x0: The alpha value is not written back.	RW	0

Bits	Field Name	Description	Type	Reset
6:5	RESIZEENABLE	Resize Enable 0x0: Disable the resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Write-back format. It defines the pixel format when storing the write-back picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Write-back enable. wr: immediate 0x0: Write-back disabled 0x1: Write-back enabled	RW	0

Table 11-287. DISPC_WB_CONV_COEF0

Table 11-296. DISPC_WB_PIXEL_INC

Address Offset 0x0000 0598

Physical Address 0x5800 1598 **Instance** DISPC

Description The register configures the number of bytes to increment between two pixels for the buffer associated with the write back pipeline. The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline), when the WB pipeline is directly connected to one of the pipelines (graphics or video), combined with the synchronization event of the channel overlay output selected as an input to the WB pipeline (that is, VFP start period of primary LCD, or VFP start period of secondary LCD, or VFP start period of the third LCD, or EVSYNC), for all registers associated with the selected channel out and further delayed by the DISPC_WB_ATTRIBUTES2.WBDELAYCOUNT bit-field, for all registers of the Write back and DMA. In WB capture mode, both DISPC_CONTROL2.GOWB and DISPC_CONTROL#.GOLCD/TV corresponding to the selected output channel shall be set. It is not required to set the GOWB bit when WB memory-to-memory mode is used.

Table 11-297. DISPC_WB_ROW_INC

Address Offset	0x0000 05A4		
Physical Address	0x5800 15A4	**Instance**	DISPC
Description	The register configures the number of bytes to increment at the end of the row for the buffer associated with the vwrite back pipeline. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline), when the WB pipeline is directly connected to one of the pipelines (graphics or video), combined with the synchronization event of the channel overlay output selected as an input to the WB pipeline (that is, VFP start period of primary LCD, or VFP start period of secondary LCD, or VFP start period of the third LCD, or EVSYNC), for all registers associated with the selected channel out and further delayed by the DISPC_WB_ATTRIBUTES2.WBDELAYCOUNT bit-field, for all registers of the Write back and DMA. In WB capture mode, both DISPC_CONTROL2.GOWB and DISPC_CONTROL#.GOLCD/TV corresponding to the selected output channel shall be set. It is not required to set the GOWB bit when WB memory-to-memory mode is used. Note: The DISPC_WB_ROW_INC register can be used only in 2D mode (using the Tiler). In order to use the DISPC_WB_ROW_INC register, the DISPC_WB_ATTRIBUTES[8] BURSTTYPE bit must be set to 1.		
Type	RW

Table 11-321. DISPC_VID3_ACCU2_j

Address Offset	0x0000 0728 + (0x4 * j)	**Index**	j = 0 to 1
Physical Address	0x5800 1728 + (0x4 * j)	**Instance**	DISPC
Description	The register configures the resize accumulator init values for horizontal and vertical up/downsampling of the video window 3 (DISPC_VID3_ACCU2_0 and DISPC_VID3_ACCU2_1 for ping-pong mechanism with external trigger, based on the field polarity). It is used for Cb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

11.3 High-Definition Multimedia Interface

This section introduces the high-definition multimedia interface (HDMI) module and describes its main functions and connections in the device.

Note

All the HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. Refer to the software development kit (SDK) for which HDMI features are supported.

11.3.1 HDMI Overview

Figure 11-103 shows an overview of the HDMI module.

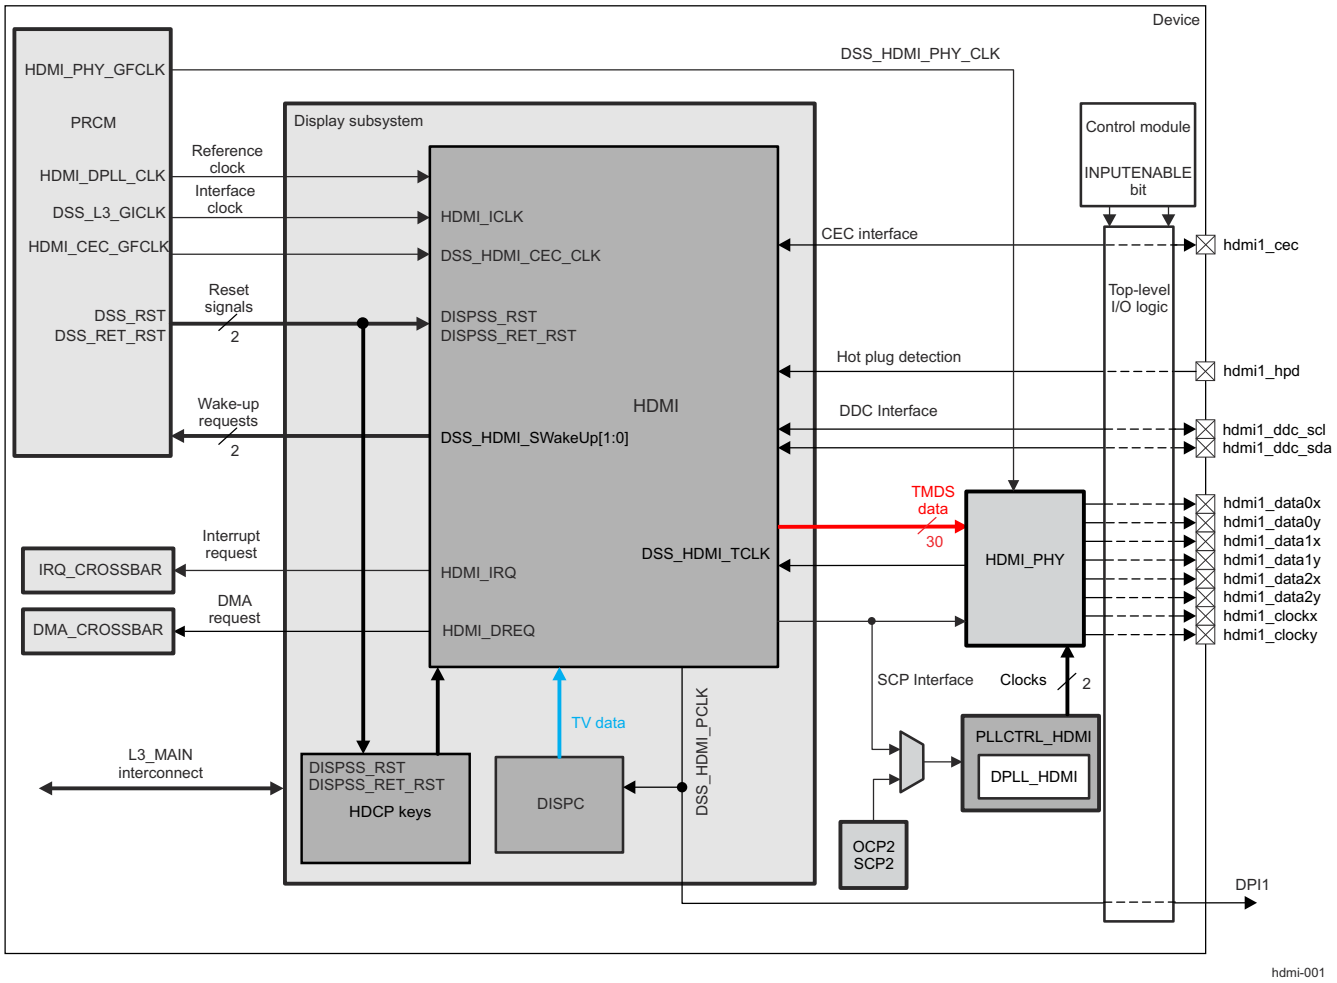

Figure 11-103. HDMI Overview

11.3.1.1 HDMI Main Features

The HDMI module provides the following main features:

- HDMI 1.4a, HDCP 1.4, and DVI 1.0 compliant
  - Includes support for the 3D stereoscopic frame-packing formats of the HDMI v1.4a standard (1080p24Hz, 720p50Hz, 720p60Hz + side-by-side half structure: 1080p60Hz)
- EIA/CEA-861-D video format support (See Table 11-357 for more information.)
- VESA® display monitor timing (DMT) video format support(See Table 11-358 for more information.)

- Support for deep-color mode:
  - 10-bit color component deep-color modes up to 1080p @ 60 Hz
  - 12-bit color component deep-color modes up to 720p/1080i @ 60 Hz
  - 16-bit/component color depth is not supported
- Support for x.v.Color (x.v.Color data from memory outputted by HDMI. No processing, pass-through mode only)
- Supports up to 148.5-MHz pixel clock with deep-color modes (10-bit or 12-bit)
- Supports up to 186 MHz pixel clock with no deep-color mode (8-bit)
- Video formats: 24-bit RGB input
  - 24/30/36-bit RGB/YCbCr 4:4:4 (deep color) output
  - 16/20/24-bit YCbCr 4:2:2 output
- Uncompressed multichannel (up to eight channels) audio (L-PCM) support.
- Master inter-integrated circuit (I^2C™) interface for display data channel (DDC) connection
- Consumer electronic control (CEC) interface
- Integrated transition minimized differential signaling (TMDS®) and TMDS error reduction coding (TERC4) encoders for data island support
- Integrated TMDS physical layer (PHY) (three TMDS differential data lanes + TMDS differential clock lane)
  - Up to 1.86 Gbps per lane at (1080p @ 60 Hz at 10 bits/component)

11.3.1.2 HDMI Video Formats and Timings

11.3.1.2.1 HDMI CEA-861-D Video Formats and Timings

Table 11-357 presents the video timings supported by the HDMI module, according to the CEA-861-D standard:

Table 11-357. HDMI Video Timings (CEA-861-D)

Refresh Rate	Resolution
24 Hz (Low field rate)	1920 x 1080p
50 Hz	1920 x 1080p 1920 x 1080i 2880 x 576p 2880 x 288p 1440 x 576p 1440 x 288p 1280x720p 720 x 576p
59.94 Hz	1920 x 1080p 1920 x 1080i 1280 x 720p 2880 x 480p 2880 x 240p 1440 x 480p 1440 x 480i 1440 x 240p 720 x 480p 640 x 480p

Table 11-357. HDMI Video Timings (CEA-861-D) (continued)

Refresh Rate	Resolution
60 Hz	1920 x 1080p
	1920 x 1080i
	2880 x 480p
	2880 x 240p
	1280 x 720p
	1440 x 480p
	1440 x 480i
	1440 x 240p
	1280 x 720p
	720 x 576p
	720 x 480p
	640 x 480p
200 Hz	720 x 576p
239 Hz	720 x 480p
240 Hz	720 x 480p

11.3.1.2.2 VESA DMT Video Formats and Timings

Table 11-358 lists the video timings supported by the HDMI module and based on the VESA DMT standard:

Table 11-358. HDMI Video timings (VESA DMT)

Refresh Rate	Resolution
60 Hz	640 x 480p
	800 x 600p
	848 x 480p
	1024 x 768p
	1280 x 768p
	1280 x 800p
	1280 x 960p
	1280 x 1024p
	1360 x 768p
	1366 x 768p
	1400 x 1050p
	1440 x 900p
	1680 x 1200p
	1680 x 1050p
	1920 x 1080p
60 Hz (reduced blanking)	1280 x 768p
	1280 x 800p
	1400 x 1050p
	1440 x 900p
	1680 x 1050p
	1920 x 1200p

Note

Custom resolutions may work, but are not supported by the device. Using non-standard values can lead to noncompliance with the HDMI interface standard.

Chapter 12

3D Graphics Accelerator

This chapter is a basic overview and describes the integration of the 3D graphics processing unit (GPU) subsystem in the device.

Note

The GPU subsystem is an instantiation by Texas Instruments of the PowerVR® SGX544 core from Imagination Technologies Limited.

This document contains materials that are © Imagination Technologies Limited.

USSE and PowerVR are trademarks or registered trademarks of Imagination Technologies Limited.

Note

This chapter describes a module (subsystem) in the superset device. The availability is device part number dependent. Refer to device Data Manual, for more information.

12.1 GPU Overview

Note

For AM570x: This chapter describes a module (subsystem) in the superset device. The availability is device part number dependent. Refer to device Data Manual, for more information.

The 3D graphics processing unit (GPU) accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics and compute applications. It is based on the PowerVR® SGX544-MP subsystem from Imagination Technologies Limited.

SGX is a new generation of programmable PowerVR graphics and video processing subsystems. The PowerVR SGX is a scalable architecture which efficiently processes a number of differing multimedia data types concurrently:

- Pixel Data
- Vertex Data
- General Purpose Processing

Figure 12-1 shows the device GPU subsystem.

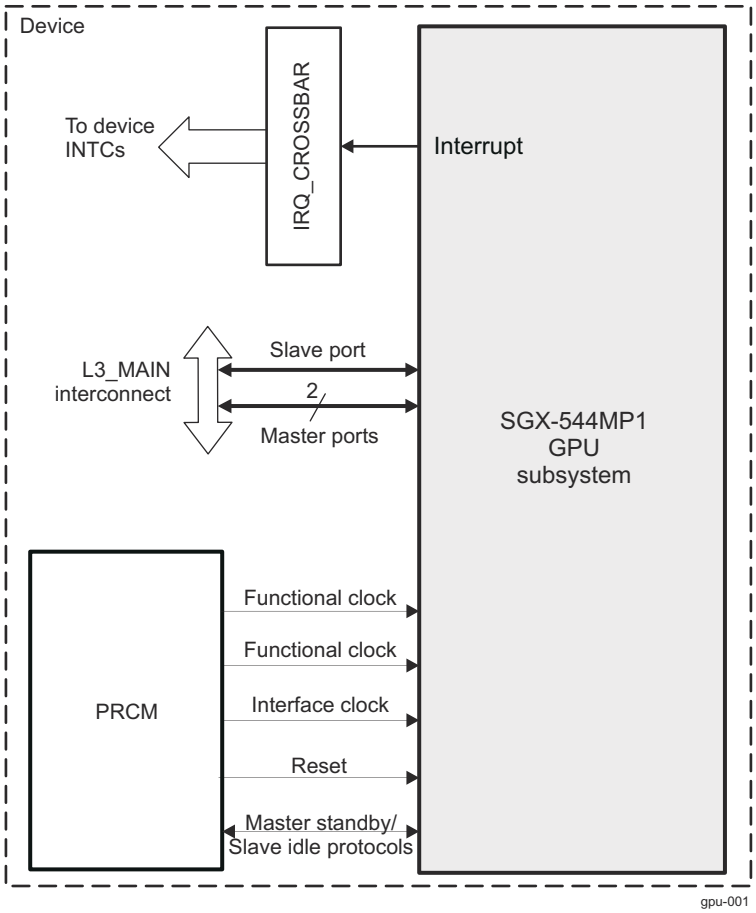

Figure 12-1. GPU Overview

12.1.1 GPU Features Overview

- API support for industry standards:
  - Direct3D ® Feature Level 9.3
- Single-core GPU architecture:

  - 1 × SGX544 core
  - System level cache of 64 KiB
- Tile-based deferred rendering architecture:
  - Reduces external bandwidth to SDRAM
- Universal Scalable Shader Engine (USSE™):
  - Multithreaded engine incorporating vertex and pixel shader functionality
  - Automatic load balancing of vertex and pixel processing tasks
- Present and texture load accelerator (PTLA):
  - Enables to move, rotate, twiddle, and scale texture surfaces
  - Supports RGB, ARGB, YUV4:2:2, and YUV4:2:0 surface formats
  - Supports bilinear upscale
  - Supports source color key
- Fully virtualized memory addressing for operating system (OS) in a unified memory architecture:
  - Memory management unit (MMU)
  - Up to 4-GiB virtual address space

The 3D-GPU subsystem generates a single (aggregate) interrupt connected to the device Interrupt Crossbar. This allows for this interrupt to be programmatically mapped to multiple device host interrupt controllers (see Section 12.2).

12.1.2 Graphics Feature Overview

- Texture support:
  - Cube map
  - Projected textures
  - Non-square textures
- Texture formats:
  - RGBA 8888, 565, 1555, and 1565
  - Monochromatic 8, 16, 16f, 32f, and 32int
  - Dual channel, 8:8, 16:16, and 16f:16f
  - Compressed textures:
    - PVRTC-i 2 bpp
    - PVRTC-i 4 bpp
    - PVRTC-ii 2 bpp
    - PVRTC-ii 4 bpp
    - ETC1
    - DXT 1-5 and BC 4-5
  - Programmable support for YUV formats:
    - Programmable matrix in hardware, coefficients on 12 bits
    - YUV4:2:2, YUV4:2:0, two planes (NV12 or NV21); YUV4:2:0, three planes
- Resolution support:
  - Frame buffer maximum = 4096 × 4096
  - Texture maximum size = 4096 × 4096
- Texture filtering:
  - Bilinear, trilinear
  - Independent minimum and mag control
- Anti-aliasing:
  - 4× multisampling
  - Programmable sample positions

Note

TI provides the DXT1-5 and BC4-5 texture compression technology for use only with a Microsoft® Windows® operating system. A separate license is required for the use of this technology (also referred to as S3 texture compression technology) with any other operating system.

12.2 GPU Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 12-2 shows the GPU integration.

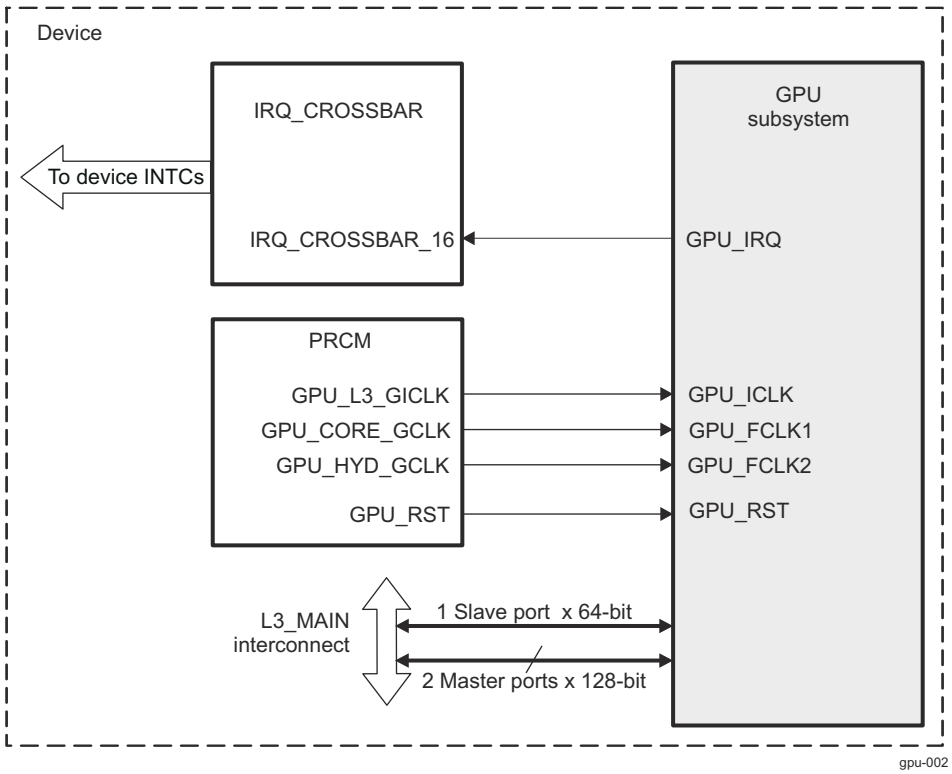

Figure 12-2. GPU Integration

The GPU subsystem is connected to the level 3 (L3_MAIN) interconnect by two 128-bit master and a 64-bit slave interfaces.

Table 12-1 through Table 12-3 summarize the integration of the module in the device.

Table 12-1. GPU Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
GPU	PD_GPU	L3_MAIN

Table 12-2. GPU Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPU	GPU_ICLK	GPU_L3_GICLK	PRCM	GPU interface clock
	GPU_FCLK1	GPU_CORE_GCLK	PRCM	GPU functional clock of the internal graphic cores

Table 12-2. GPU Clocks and Resets (continued)

	GPU_FCLK2	GPU_HYD_GCLK	PRCM	GPU functional clock of the internal L2-cache controller and memories

Resets

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPU	GPU_RST	GPU_RST	PRCM	GPU non-retention reset signal

Table 12-3. GPU Hardware Requests

Interrupt Requests

Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
GPU	GPU_IRQ	IRQ_CROSSBAR_16	MPU_IRQ_21 DSP1_IRQ_47	GPU interrupt request mapped to the device Interrupt Crossbar

Note

The "**Default Mapping**" column in Table 12-3, *GPU Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.

Note

No DMA and no wake-up requests are generated by the GPU subsystem.

12.3 GPU Functional Description

12.3.1 GPU Block Diagram

The GPU subsystem is based on the PowerVR SGX544-MP1 subsystem. The GPU architecture comprises the following elements:

- SGX544 core
- PTLA
- Cross bar
- System-level cache (SLC)

Figure 12-3 shows the GPU top-level block diagram.

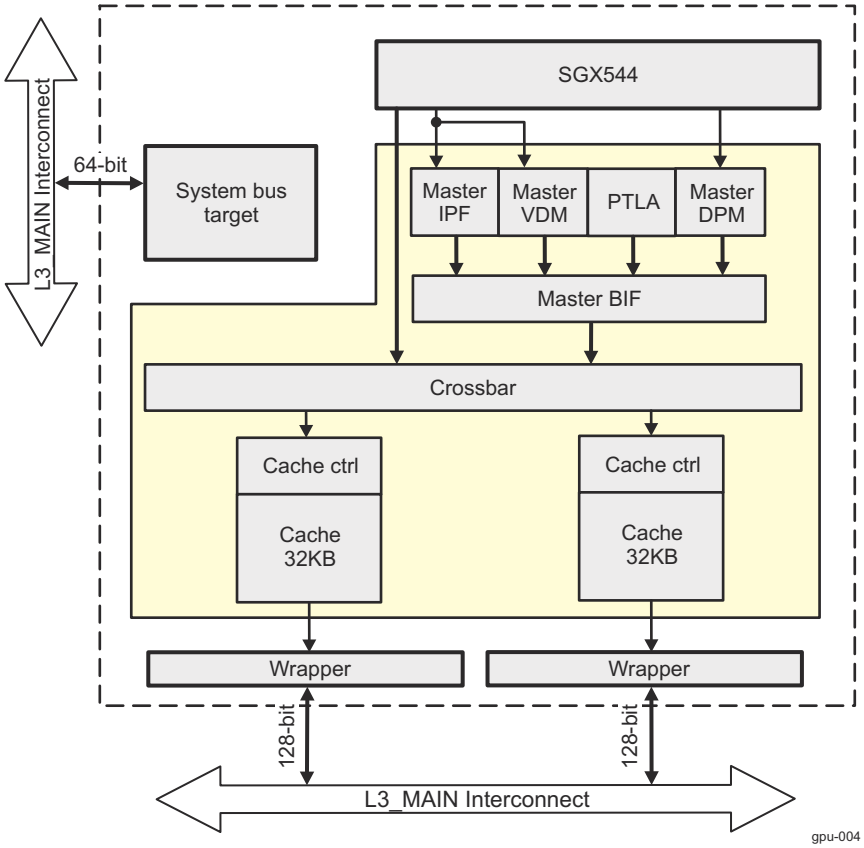

Figure 12-3. GPU Block Diagram

The SGX544-MP1 has 1 × SGX544 core. The crossbar enables SGX544 core to access the SLC. The SLC is a 64-KiB unified multibanked cache with two banks of 32 KiB. The cache line size is 64 bytes. The SGX544 core accesses are interleaved in the different banks.

12.3.2 GPU Clock Configuration

The GPU subsystem operates from three clocks: an interface clock (GPU_ICLK) and two functional clocks (GPU_FCLK1 and GPU_FCLK2). The power, reset, and clock management (PRCM) module generates and distributes the clocks inside the device.

- The GPU_ICLK manages the data transfer on the L3_MAIN master and slave ports.

  The GPU_ICLK frequency is selected based on the L3_MAIN interconnect clock frequency of the whole device. For more information about the interface clock, see Section 3.6.4.11, *CD_GPU Clock Domain*, in the *Power, Reset, and Clock Management*.

  When no longer required by the GPU subsystem, GPU_ICLK can be disabled by software at the PRCM level. For more information, see Section 3.7.9, *PD_GPU Description*, in the *Power, Reset, and Clock Management*.

  Note

  GPU_ICLK is cut only if the GPU is ready to go into IDLE state.

- GPU_FCLK1 and GPU_FCLK2 are the functional clocks and are used inside the GPU subsystem to generate clock signals to multiple GPU clock domains. The GPU_FCLK1 input supplies clock to the internal graphics core and the GPU_FCLK2 input supplies clock to the shared-cache memories and controllers.

  Using the clock source selection and the digital phase-locked loop (DPLL) settings, GPU_FCLK1 and GPU_FCLK2 frequencies can be adjusted.

The GPU_FCLK1 and GPU_FCLK2 clocks are provided by the peripheral DPLL and the core DPLL, as described in Section 3.6.4.11, *CD_GPU Clock Domain* in the *Power, Reset, and Clock Management*. Selection is made at the PRCM level.

When no longer needed by the GPU subsystem, GPU_FCLK1 and GPU_FCLK2 can be cut by software at the PRCM level if the module is ready to enter IDLE state. For more information, see Section 3.7.9, *PD_GPU Description* in the *Power, Reset, and Clock Management*.

12.3.3 GPU Software Reset

The GPU subsystem has its own reset domain. Global reset of the GPU is performed by activating the GPU_RST signal in the GPU_RST domain.

Note

The APIs delivered with the GPU provide a software reset functionally equivalent to a hardware reset.

12.3.4 GPU Power Management

The GPU subsystem has its own power domain (GPU power domain - PD_GPU).

The GPU handles automatic clock gating performed on the multiple internal module clock domains.

In addition, software-controlled clock gating is managed inside the GPU and handled by the related API delivered with the module.

For additional information about the GPU power domain, see Section 3.7.9, *PD_GPU Description* in the *Power, Reset, and Clock Management*.

12.3.5 GPU Thermal Management

There is a dedicated thermal sensor to monitor operating temperature of the GPU subsystem in the chip. The GPU temperature processing logic is located within the device CTRL_MODULE_CORE and is capable to generate a thermal alert interrupt which can be mapped to all (host) interrupt controllers within the device, via the device IRQ_CROSSBAR. The thermal logic can also generate a thermal shut-down warm reset event to the device PRCM. For further details on the GPU thermal management operation features and register settings, refer to the *Thermal Management Related Registers* of the *Control Module*.

12.3.6 GPU Interrupt Requests

The GPU subsystem can generate one interrupt signal - GPU_IRQ mapped to the IRQ_CROSSBAR_16 input of the device interrupt crossbar.

For more details on programmable configuration of the GPU_IRQ mapping to the different device host interrupt controllers, refer to *Control Module* and *Interrupt Controllers*.

12.4 GPU Register Manual

CAUTION

All GPU registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

12.4.1 GPU Instance Summary

Table 12-4. GPU Instance Summary

Module Name	Base Address	Size
GPU_WRAPPER	0x5600 FE00	512 bytes

The GPU domain's base address is at 0x5600 0000. GPU address space is 32MiB wide.

Chapter 13

2D Graphics Accelerator

This chapter describes the advanced bit blitter 2-dimensional (2D) graphics accelerator (BB2D) for the device.

Note

The BB2D subsystem is an instantiation by Texas Instruments of the GC320™ core from Vivante Corp.

This document contains materials that are © Vivante Corp.

GC320 is a trademark or registered trademark of Vivante Corp.

Note

This chapter describes a module (subsystem) in the superset device. The availability is device part number dependent. Refer to device Data Manual, for more information.

13.1 BB2D Overview

The 2D graphics accelerator subsystem accelerates 2D graphics applications. The 2D graphics accelerator subsystem is based on the GC320 2D GPU core from Vivante Corporation. The hardware acceleration is brought to numerous 2D applications, including on-screen display and touch screen user interfaces, graphical user interfaces (GUIs) and menu displays, flash animation, and gaming.

Figure 13-1 shows the BB2D subsystem.

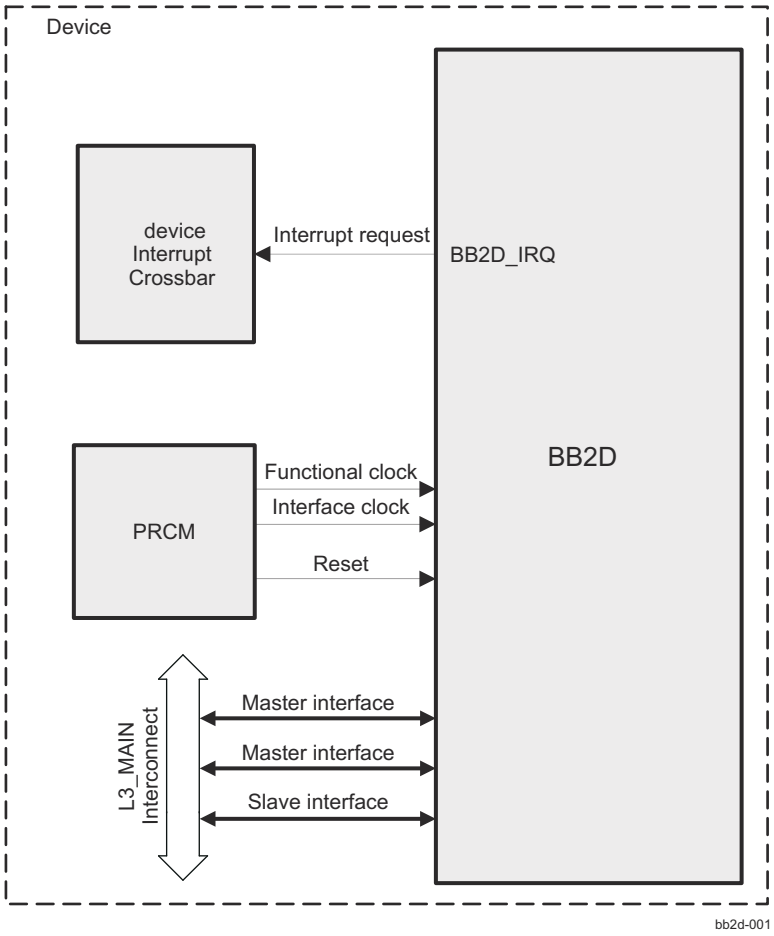

Figure 13-1. BB2D Overview

13.1.1 BB2D Key Features Overview

- API support:
  - OpenWF™, DirectFB
  - GDI/DirectDraw™
- **BB2D architecture:**
  - BitBlt and StretchBlt
  - DirectFB hardware acceleration
  - ROP2, ROP3, ROP4 full alpha blending and transparency
  - Clipping rectangle support
  - Alpha blending includes Java® 2 Porter-Duff compositing rules
  - 90-, 180-, 270-degree rotation on every primitive
  - YUV-to-RGB color space conversion
  - Programmable display format conversion with 14 source and 7 destination formats
  - High-quality 9-tap, 32-phase filter for image and video scaling at 1080p

  - Monochrome expansion for text rendering
  - 32 K × 32 K coordinate system
- **Hardware acceleration for DirectFB**:
  - High-speed video scaler
  - ROP2/3/4
  - Rectangle filling and drawing
  - Line drawing
  - Simple blitting
  - Stretch blitting
  - Blending with alpha channel (per-pixel alpha)
  - Blending with alpha factor (alpha modulation)
  - Nine source and destination blending functions
  - Porter-Duff rules support
  - Premultiplied alpha support
  - Colorized blitting (color modulation)
  - Source color keying
  - Destination color keying

The device BB2D generates a single (aggregate) interrupt request connected to the device Interrupt Crossbar. This allows for this interrupt to be programmatically mapped to multiple device host interrupt controllers (see Section 13.2).

13.2 BB2D Integration

This section describes subsystem integration in the device, including information about clocks, resets, and hardware requests.

Figure 13-2 shows BB2D integration.

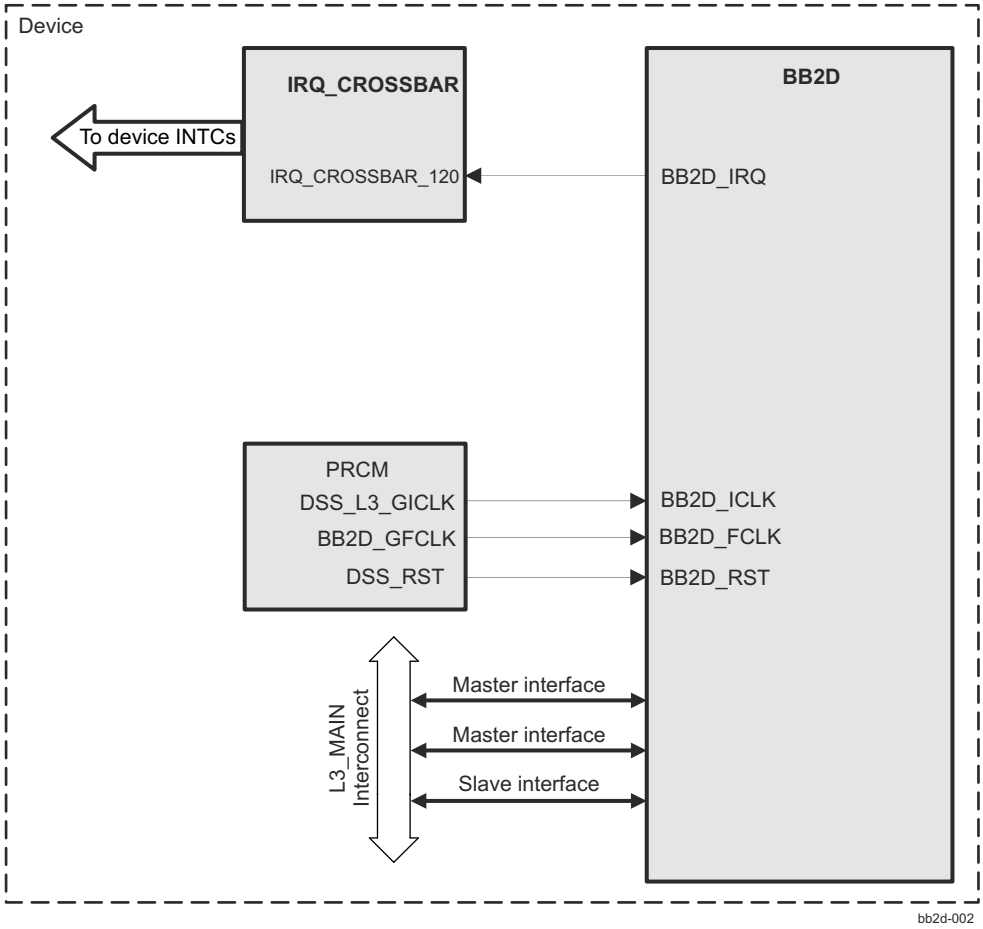

Figure 13-2. BB2D Integration

The BB2D subsystem is connected to the level 3 (L3_MAIN) interconnect by two 128-bit master interfaces and one 32-bit slave interface.

Table 13-1 through Table 13-3 summarize the integration of the subsystem in the device.

Table 13-1. BB2D Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
BB2D	PD_DSS	L3_MAIN

Table 13-2. BB2D Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
BB2D	BB2D_ICLK	DSS_L3_GICLK	PRCM	BB2D interfaces clock
	BB2D_FCLK	BB2D_GFCLK	PRCM	BB2D functional clock.
Resets				

Table 13-2. BB2D Clocks and Resets (continued)

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
BB2D	BB2D_RST	DSS_RST	PRCM	BB2D non-retention reset signal

Table 13-3. BB2D Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
BB2D	BB2D_IRQ	IRQ_CROSSBAR_120	MPU_IRQ_125 IPU1_IRQ_65 IPU2_IRQ_65	BB2D interrupt request to the device interrupt crossbar

Note

The "**Default Mapping**" column in Table 13-3, *BB2D Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.

Note

No DMA and no wake-up requests are generated by the BB2D module.

13.3 BB2D Functional Description

13.3.1 BB2D Block Diagram

The BB2D subsystem is based on the following main blocks:

- Host interface: Allows the BB2D core to communicate with external memory and the MPU through the L3_MAIN interconnect. In this block, data crosses clock domain boundaries.
- Memory controller: Internal memory unit that is the block-to-host interface for memory requests
- Graphics pipeline front-end: Inserts high-level primitives and commands into the graphics pipeline.
- 2D drawing and scaling engine: Draws 2D graphics primitives and rasterizes 2D images.
- Pixel engine: manipulates and filters pixels in rendered images. BB2D has four pixel pipes.

Figure 13-3 shows the BB2D top-level block diagram.

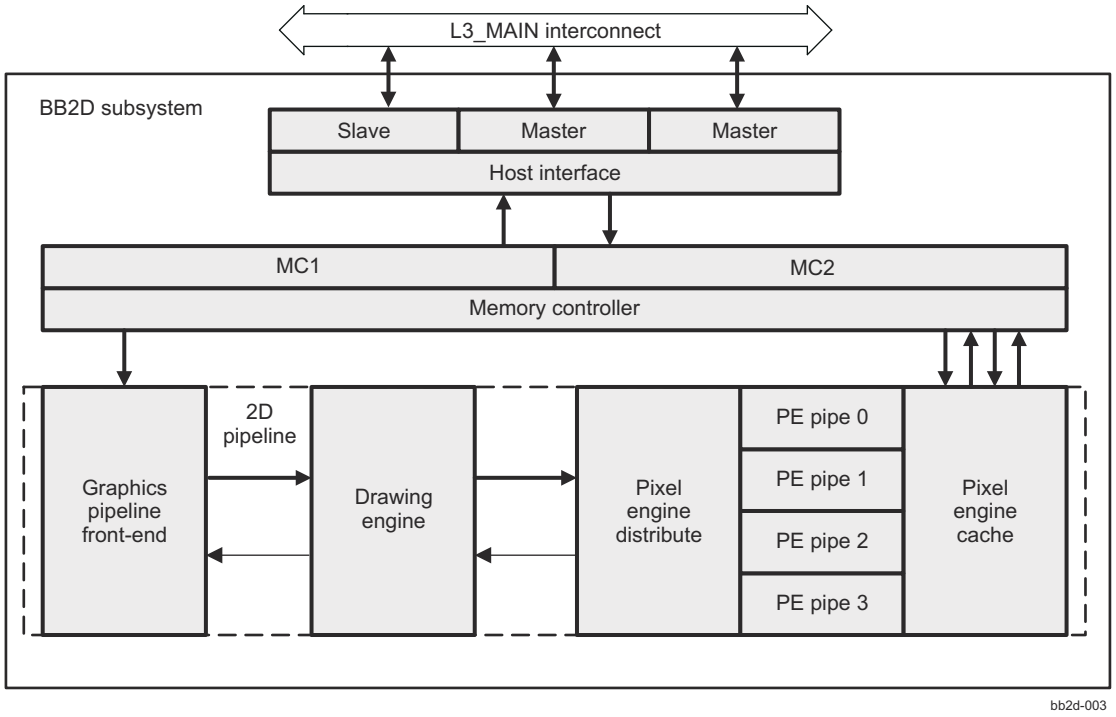

Figure 13-3. BB2D Block Diagram

13.3.2 BB2D Clock Configuration

The BB2D subsystem operates from two clocks: an interface clock (BB2D_ICLK) and functional clock (BB2D_FCLK). The power, reset, and clock management (PRCM) module generates and distributes the clocks inside the device.

- The BB2D_ICLK interface clock manages the data transfer on the L3_MAIN master and slave ports.

  The BB2D_ICLK frequency is selected based on the whole device L3_MAIN interconnect clock frequency. For more information on the interface clock, see *CD_DSS Clock Domain* , in the chapter, *Power, Reset and Clock Management* .

  When BB2D_ICLK is no longer required by the BB2D subsystem, it can be disabled by software at the PRCM level.

  Note

  BB2D_ICLK is cut only if the BB2D is ready to go into IDLE state.

- The BB2D_FCLK functional clock is used inside the BB2D subsystem to generate clock signals to multiple BB2D clock domains. The BB2D automatically gates clocks to domains, that are not currently in use.

Using the clock source selection and the DPLL settings, the frequency of BB2D_FCLK can be adjusted.

When BB2D_FCLK is no longer needed by the BB2D subsystem, it can be cut by software at the PRCM level, if the module is ready to enter IDLE state.

13.3.3 BB2D Software Reset

The BB2D subsystem is part of the DSS reset domain. A global reset of the BB2D is performed by activating the BB2D_RST signal in the DSS_RST domain.

Note

The APIs delivered with the BB2D provide a software reset functionally equivalent to a hardware reset.

13.3.4 BB2D Power Management

The BB2D subsystem is part of the DSS power domain (PD_DSS). For additional information about PD_DSS, see *PD_DSS Description* in the *Power, Reset, and Clock Management*.

Note

The BB2D handles automatic clock gating performed on the multiple internal clock domains.

When 2D operations are complete, software may set the GCGPOUT0[0] GCHOLD bit to 1 to enter a low-power state. Setting GCHOLD to 1 moves the BB2D operational state into IDLE. Once in IDLE state, the system standby hardware signal (mstandby) is asserted.

13.4 BB2D Register Manual

CAUTION

All BB2D registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

Bits	Field Name	Description	Type	Reset
31	FE20_BIT_INDEX	Supports 20 bit index.	R	1
30	RS_YUV_TARGET	Supports resolveing into YUV target.	R	1
29	BYTE_WRITE_3D	3D PE has byte write capability.	R	1
28	FE20	FE 2.0 is present.	R	0
27	VGTS	VG tesselator is present.	R	0
26	PIPE_VG	VG pipe is present.	R	0
25	MEM32_BIT_SUPPORT	32 bit memory address support.	R	0
24	YUY2_RENDER_TARGET	YUY2 support in PE and YUY2 to RGB conversion in resolve.	R	0
23	HALF_TX_CACHE	TX cache is half.	R	0
22	HALF_PE_CACHE	PE cache is half.	R	0
21	YUY2_AVERAGING	YUY2 averaging support in resolve.	R	1
20	NO_SCALER	No 2D scaler.	R	0
19	BYTE_WRITE_2D	Supports byte write in 2D.	R	1
18	BUFFER_INTERLEAVING	Supports interleaving depth and color buffers.	R	1
17	NO422_TEXTURE	No 422 texture input format.	R	0
16	NO_EZ	No early-Z.	R	0
15	MIN_AREA	Configured to have minimum area.	R	1
14	MODULE_CG	Second level clock gating is available.	R	1
13	YUV420_TILER	YUV 4:2:0 tiler is available.	R	1
12	HIGH_DYNAMIC_RANGE	Shows if there is HDR support.	R	1
11	FAST_SCALER	Shows if there is HD scaler.	R	1

Bits	Field Name	Description	Type	Reset
10	ETC1_TEXTURE_COMPRESSION	ETC1 texture compression.	R	1
9	PIPE_2D	Shows if there is 2D engine.	R	1
8	DC	Shows if there is a display controller.	R	0
7	MSAA	MSAA support.	R	1
6	YUV420_FILTER	YUV 4:2:0 support in filter blit.	R	1
5	ZCOMPRESSION	Depth and color compression.	R	0
4	DEBUG_MODE	Debug registers.	R	0
3	DXT_TEXTURE_COMPRESSION	DXT texture compression.	R	1
2	PIPE_3D	3D pipe.	R	0
1	SPECIAL_ANTI_ALIASING	Full-screen anti-aliasing.	R	1
0	FAST_CLEAR	Fast clear.	R	0

Table 13-14. GCCHIPID

Address Offset	0x0000 0020

Bits	Field Name	Description	Type	Reset
31	ENHANCE_VR	Enhance VR and add a mode to walk 16 pixels in 16-bit mode in vertical pass to improve cache hit rate when rotating 90/270.	R	1
30	CORRECT_STENCIL	Correct stencil behavior in depth only.	R	1
29	A8_TARGET_SUPPORT	2D engine supports A8 target.	R	0
28	NEW_TEXTURE	New texture unit is available.	R	0
27	HIERARCHICAL_Z	Hierarchiccal Z is supported.	R	1
26	BYPASS_IN_MSAA	Shader supports bypass mode when MSAA is enabled.	R	0
25	VAA	VAA is available or not.	R	0
24	BUG_FIXES0		R	1
23	SHADER_MSAA_SIDEBAND	Put the MSAA data into sideband fifo.	R	0
22	MC_20	New style MC with separate paths for color and depth.	R	0
21	DEFAULT_REG0	Unavailable registers will return 0.	R	1
20	EXTRA_SHADER_INSTRUCTIONS1	Sqrt, sin, cos instructions are available.	R	1
19	SHADER_GETS_W	W is sent to SH from RA.	R	1
18	VG_21	Minor updates to VG pipe (Event generation from VG, TS, PE). Tiled image support.	R	0
17	VG_FILTER	VG filter is available.	R	0
16	EXTRA_SHADER_INSTRUCTIONS0	Floor, ceil, and sign instructions are available.	R	1
15	COMPRESSION_FIFO_FIXED	If this bit is not set, the FIFO counter should be set to 50. Else, the default should remain.	R	1
14	TS_EXTENDED_COMMANDS	New commands added to the tessellator.	R	0
13	VG_20	Major updates to VG pipe (TS buffer tiling. State masking.).	R	0
12	SUPER_TILED_32X32	32 × 32 super tile is available.	R	1
11	SEPARATE_TILE_STATUS_WHEN_INTERLEAVED	Use 2 separate tile status buffers in interleaved mode.	R	1
10	TILE_STATUS_2BITS	2 bits are used instead of 4 bits for tile status.	R	1
9	RENDER_8K	Supports 8K render target.	R	1
8	CORRECT_AUTO_DISABLE	Reserved.	R	0
7	PE20_2D	2D PE 2.0 is present.	R	1
6	FAST_CLEAR_FLUSH	Proper flush is done in fast clear cache.	R	1
5	SPECIAL_MSAA_LOD	Special LOD calculation when MSAA is on.	R	1
4	CORRECT_TEXTURE_CONVERTER	Driver hack is not needed.	R	1
3	TEXTURE8_K	Supports 8K × 8K textures.	R	1
2	ENDIANNESS_CONFIG	Configurable endianness support.	R	1
1	DUAL_RETURN_BUS	Dual Return Bus from HI to clients.	R	1
0	FLIP_Y	Y flipping capability is added to resolve.	R	1

Table 13-20. GCRESETMEMCOUNTERS

Address Offset	0x0000 003C

Table 13-48. GCDISPLAYPRIORITY

Address Offset	0x0000 0434		
Physical Address	0x5900 0434	**Instance**	BB2D
Description	Controls the priority of the display controller requests. This works like a PWM. One register gives the period, and the other gives the ON time. When PWM is ON, display requests are accepted if both display and the other request is valid. If it is OFF, the other request will be accepted. If only one request is valid, it takes the bus regardless of the PWM bit.

Description	32 bit debug signal from RA.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SIGNAL																															

Bits	Field Name	Description	Type	Reset
31:0	SIGNAL	Signals according to GCDEBUGCONTROL1[19:16] RA: 0x0: Valid pixel count. 0x1: Total quad count (after EEZ). 0x2: Valid quad count (after EZ and EEZ). 0x3: Total primitive count. 0x4: Various signals from input stage. See GC320 spec for details. 0x5: Various signals from input stage. See GC320 spec for details. 0x6: Various signals from render pipe. See GC320 spec for details. 0x7: Various signals from render cache. See GC320 spec for details. 0x8: Various signals from raster engine. See GC320 spec for details. 0x9: Cache miss count (in the pipeline). 0xA: Cache miss count (in the prefetcher). 0xB: EEZ culled quads. 0xF: Signature = 0x12344321.	R	0x0000 0000

Table 13-54. GCDEBUGSIGNALSTX

Address Offset	0x0000 044C		
Physical Address	0x5900 044C	**Instance**	BB2D
Description	32 bit debug signal from TX.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SIGNAL																															

Bits	Field Name	Description	Type	Reset
31:0	SIGNAL	Signals according to GCDEBUGCONTROL1[27:24] TX : 0x0: Total bilinear texture requests. 0x1: Total trilinear texture requests. 0x2: Total discarded texture requests. 0x3: Total texture requests. 0x4: Various signals from input stage. See GC320 spec for details. 0x5: Memory read count. 0x6: Memory read count in 8B. 0x7: Cache miss count (in the pipeline). 0x8: Total hitting texels (in pre-fetcher). 0x9: Total missing texels (in pre-fetcher). 0xF: Signature = 0x12211221.	R	0x0000 0000

Table 13-55. GCDEBUGSIGNALSFE

Address Offset	0x0000 0450		
Physical Address	0x5900 0450	**Instance**	BB2D
Description	32 bit debug signal from FE.

SLX is an abbreviation for SonicsLX®.

14.1 Interconnect Overview

14.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- Initiator: Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).
- Target: Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

Note

A module can have several separate ports; therefore, a module can be an initiator and a target.

- Agent: Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- Interconnect: The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it. Quality of service (QoS) is guaranteed.
- Register target (RT): Special TA used to access the interconnect internal configuration registers
- Data-flow signal: Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behaviour is defined by the protocol semantics.
- Sideband signal: Any signal whose behaviour is not associated to a precise transaction or data flow.
- Out-of-band error: Any signal whose behaviour is associated to a device error-reporting scheme, as opposed to in-band errors.

Note

Interrupt requests and DMA requests are not routed by the interconnect in the device.

- Firewall: A programmable feature integrated in a target agent or L4 interconnect to prevent unauthorized access to or from a module. A firewall can be configured using three criteria:
  - Initiator requesting access
  - Address space access
  - Type of access
- ConnID: Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for firewall and error-logging mechanism.
- Firewall comparison mechanism: A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- MCmd qualifier: Command bus that indicates the type of transfer requested. Table 14-1 lists the commands encoded. For information specific to L3 Interconnect error logging, see Section 14.2.3.7.3.4.

Table 14-1. MCmd Qualifier Description

MCmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Read link
1 0 1	Write nonposted
1 1 0	Write conditional

Table 14-1. MCmd Qualifier Description (continued)

MCmd[2:0]	Transaction Type
1 1 1	Write broadcast

- MReqInfo qualifier: Four MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in Table 14-2.

Table 14-2. MReqInfo Qualifier Description

Qualifiers	Description
MReqType	0: Data access
	1: Opcode fetch
MReqSupervisor	0: User mode
	1: Supervisor mode
MReqDebug	0: Functional access
	1: Debug access
MreqDomain[2:0]	0b000: Domain 0
	0b001: Domain 1
	0b010: Domain 2
	0b011: Domain 3
	0b100: Domain 4
	0b101: Domain 5
	0b110: Domain 6
	0b111: Domain 7

Note

MreqDomain is supported only on SR2.1.

- Register that configures the combination of the MReqInfo, allowing access permission to the target module (TM) based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction, as described in Table 14-3.

Table 14-3. SResp Qualifier Description

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

- MTagID: Interconnect qualifier generated by the L3_MAIN masters which purpose is to identify whether reordering is allowed or not relative to other transactions. Strong ordering is ensured by using same MTagID values between transactions. Reordering is allowed by using different MTagID values between transactions.

The MTagID values may or may not be changed by the interconnect, but the intended reordering restriction must match what came from the master. In other words, the interconnect allocates dynamically MTagID values in such a way that the intended reordering restrictions from each master are honored.

14.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- L1 is internal to the CPUs. It concerns data exchange with the internal Level1 cache memory subsystem, and it is the closest memory to the microprocessor unit (MPU) core and the IVA core.
- L2 is included in the IPU subsystem and the MPU subsystem.
- The chip-level interconnect consists of one L3 interconnect and five L4 interconnects. It enables communication among the modules and subsystems in the device.

Figure 14-1 shows an overview of the L3 and L4 interconnect architecture.

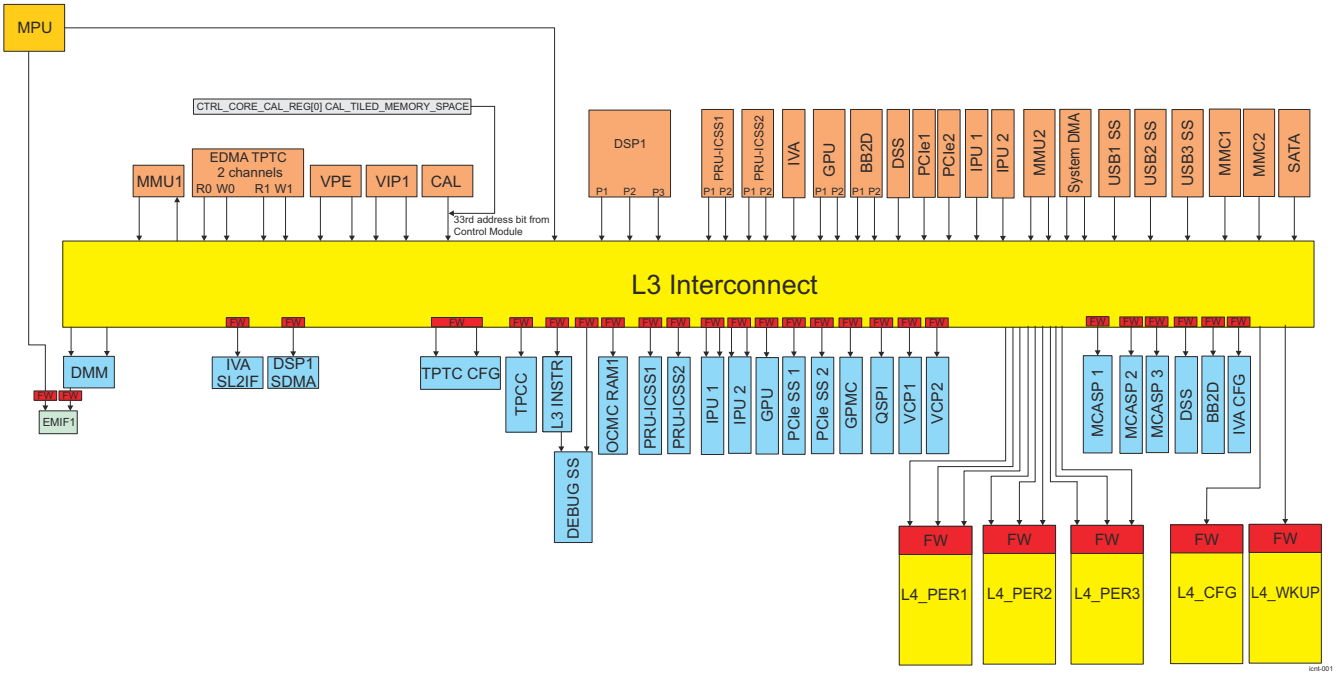

Figure 14-1. Interconnect Overview

Note

ATL, VCP1, VCP2, MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

Furthermore, for AM570x the supported set of features and peripherals is device part number dependent. Refer to device Data Manual, for more information.

- L3 handles many types of data transfers, especially exchanges with system-on-chip/external memories. L3 transfers data with a maximum width of 128 bits from the initiator to the target. The L3 interconnect is a little-endian platform
- The L4 is composed of the following:
  - L4_CFG: Includes the majority of the firewall configuration interface for level 3 (L3) system modules and peripheral interconnect;

- L4_PER: Includes the main peripherals that require system direct memory access (sDMA) access. L4_PER has three instances L4_PER1, L4_PER2 and L4_PER3. Each of these three instances has three ports connecting it to L3_MAIN interconnect:
  - L4_PER1_P1, L4_PER1_P2, L4_PER1_P3
  - L4_PER2_P1, L4_PER2_P2, L4_PER2_P3
  - L4_PER3_P1, L4_PER3_P2, L4_PER3_P3.

  Through the L3_MAIN interconnect, different initiators can access each of these L4_PERx_Pi ports. For information regarding which L4_PERx_Pi port each initiator accesses, see .
- L4_WKUP: Includes peripherals attached to the WKUP power domain.

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access, depending on the characteristics of the module.

To unauthorize a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default settings are fully functional; they enable all possible functional data paths and a minimal default protection setting.

14.2 L3_MAIN Interconnect

This section describes the L3_MAIN interconnect and its components. With the exception of register points, each component includes functions for the request and response networks.

14.2.1 L3_MAIN Interconnect Overview

The L3_MAIN interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

The main features of the L3_MAIN interconnects are:

- NIUs: Master NIUs for the IAs and slave NIUs for the TAs
- A partially depleted cross-bar exchange network
- A special internal slave NIU for accessing L3_MAIN interconnect configuration registers
- QoS management for real-time hardware operators, while maintaining optimal memory latency for CPU access to memory resources
- True little-endian platform
- Transaction errors tracking and logging registers
- All signaling support for chip-level power-management infrastructure
- One interrupt line signaling transaction error
- One interrupt line for reporting statistical events on the L3_MAIN interconnect

Figure 14-2 shows an overview of the L3 interconnect and the peripherals attached to it.

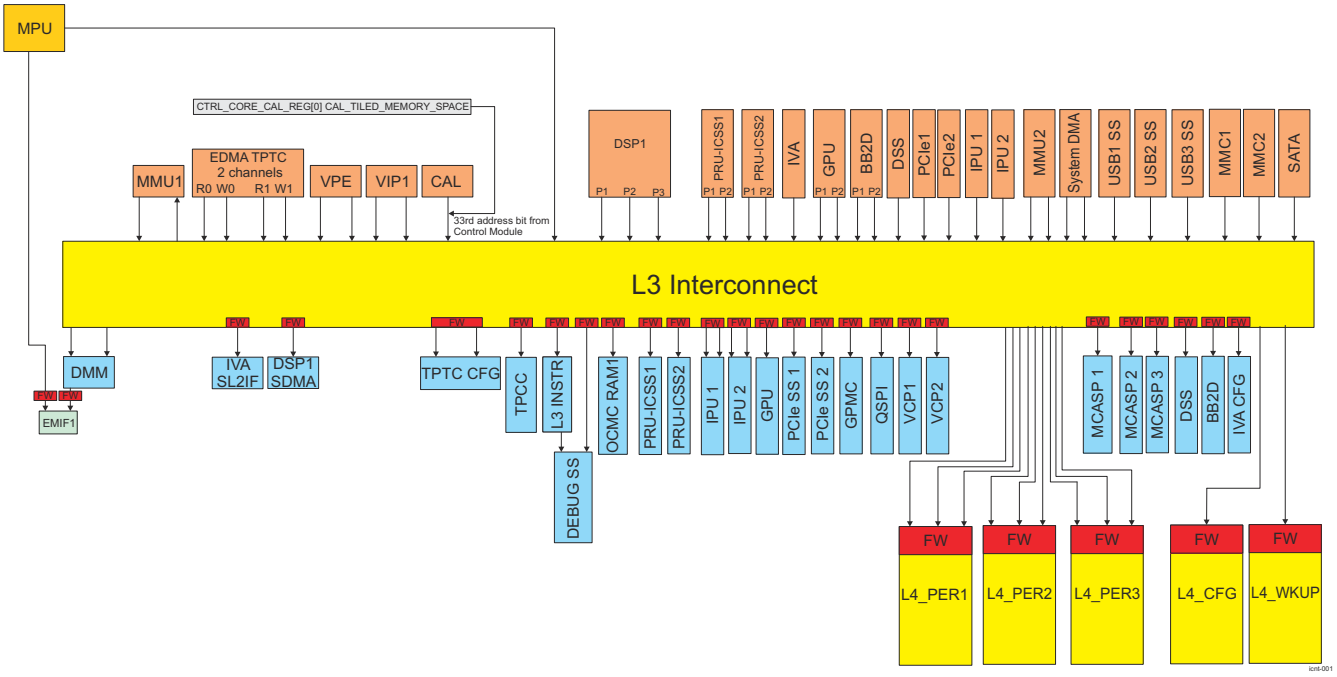

Figure 14-2. L3_MAIN Interconnect Overview

Note

ATL, VCP1, VCP2, MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

Furthermore, for AM570x the supported set of features and peripherals is device part number dependent. Refer to device Data Manual, for more information.

14.2.2 L3_MAIN Interconnect Integration

Table 14-4 through Table 14-6 summarize the integration of the module in the device.

Table 14-4. L3_MAIN Integration Attributes

Module Instance	Attributes
	Power Domain
L3_MAIN	PD_COREAON

Table 14-5. L3_MAIN Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
L3_MAIN	L3_CLK1	L3MAIN1_L3_GICLK	PRCM	Functional and interface clock
	L3_CLK2	L3INSTR_L3_GICLK	PRCM	Functional and interface clock
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
L3_MAIN_MAIN	L3_CORE_RET_RST	CORE_PWRON_RET_RST	PRCM	Reset of L3_MAIN interconnect registers
	L3_CORE_RST	CORE_RST	PRCM	Reset of L3_MAIN interconnect

Table 14-6. L3_MAIN Hardware Requests

Interrupts Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
L3_MAIN	L3_MAIN_IRQ_DBG_ERR	IRQ_CROSSBAR_4	MPU_IRQ_9 DSP1_IRQ_35	Interrupt indicating debug error occurrence.
	L3_MAIN_IRQ_APP_ERR	IRQ_CROSSBAR_5	MPU_IRQ_10(1) DSP1_IRQ_36 IPU1_IRQ_46 IPU2_IRQ_46	Interrupt indicating application error occurrence.
	L3_MAIN_IRQ_STAT_ALARM	IRQ_CROSSBAR_11	MPU_IRQ_16 DSP1_IRQ_42 DSP2_IRQ_42	Statistic collector alarm interrupt.

(1) The L3_MAIN_IRQ_APP_ERR interrupt is directly mapped to the MPU_IRQ_10 line bypassing IRQ_CROSSBAR_5. In all other cases IRQ_CROSSBAR_5 is used to map L3_MAIN_IRQ_APP_ERR to the corresponding INTC.

Note

The “**Default Mapping**” column in Table 14-6 *L3_MAIN Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module.
For more information about the IRQ_CROSSBAR module, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.
For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.

14.2.3 L3_MAIN Interconnect Functional Description

14.2.3.1 Module Use in L3_MAIN Interconnect

The L3_MAIN interconnect network components have ConnID values for each master NIU or slave NIU. The ID uniquely identifies the master NIU or the slave NIU for an interconnect transfer. The interconnect uses ConnIDs for a number of purposes, including the following:

- Slave NIUs for error logging
- Power disconnect slave NIU for error logging
- Eight FLAGMUXes to mask interrupts
- STATCOLL for configuring and monitoring: The STATCOLL components compute the traffic statistics within a user-defined window and periodically report to the user through the debug interface.
- Bandwidth regulator for configuration

14.2.3.2 Module Distribution

Master NIUs and slave NIUs provide the interface to connect the different modules to their associated interconnect.

Table 14-7 and Table 14-8 list all the modules and subsystems with their associated agents. The agents are listed for each L3_MAIN interconnect domain.

14.2.3.2.1 L3_MAIN Interconnect Agents

Any initiator or target core is connected to the L3_MAIN interconnect through an NIU. NIUs act as entry points to the L3_MAIN interconnect, and also include various programming registers. Table 14-7 lists the supported master NIU ports.

Table 14-7. Master NIUs

Master NIU	Description
MPU_INIT	MPU initiator port. One 64b OCP initiator port, and two 128b ports connected directly to the EMIF, bypassing L3
DSP1_INIT	DSP Initiator port. One 128b MDMA interconnect initiator port (used also for cache requests) One EDMA initiator port per instance
IVA_INIT	Image and video accelerator (IVA) initiator port. One 128b initiator port
GPU_P1_INIT	GPU 128b initator port 1
GPU_P2_INIT	GPU 128b initiator port 2
BB2D_P1_INIT	2D Graphics Accelerator 128b port 1
BB2D_P2_INIT	BB2D 128b port 2
DSS_INIT	Display SubSystem initiator port. One 128b initiator port
VIP1_INIT	VIP initiator ports. Two 128b initiator ports
CAL_INIT	CAL initiator port. One 128b initiator port
VPE_INIT	Video Processing engine
PCIE1_INIT	PCIe 1 64b initiator port
PCIE2_INIT	PCIe 2 64b initiator port
PRUSS1_P1_INIT	PRU-ICSS1 32b initiator port 1
PRUSS1_P2_INIT	PRU-ICSS1 32b initiator port 2
PRUSS2_P1_INIT	PRU-ICSS2 32b initiator port 1
PRUSS2_P2_INIT	PRU-ICSS2 32b initiator port 2
TPTC1_INIT	EDMA TPTC initiator port. Two 128b initiator ports(one read port and one write port)
TPTC2_INI	EDMA TPTC initiator port. Two 128b initiator ports(one read port and one write port)

Table 14-7. Master NIUs (continued)

Master NIU	Description
MMU1_INIT	MMU initiator port.One 128b initiator port
MMU2_INIT	MMU initiator port. One 128b initiator port
IPU1_INIT	IPU initiator port. One 64b initiator port
IPU2_INIT	IPU initiator port. One 64b initiator port
SYSTEM_DMA_INIT	System Direct Memory Access engine 32 initiator port (32b initiator read port and 32b initiator write port)
MLBSS_INIT(1)	MLB 32b initiator port
GMAC_SW_INIT	GMAC_SW 32b initiator port
MMC1_INIT	MMC initiator port. One 32b initiator port
MMC2_INIT	MMC2 32b initiator port
SATA_INIT(2)	SATA 32b initiator port
IEEE1500_INIT	IEEE1500 32b initiator port
DEBUGSS_INIT	Debug subsystem 32b initiator port

(1) MLB is not supported on the AM571x / AM570x family of devices.
(2) SATA is not supported on the AM570x family of devices.

Table 14-8 lists the supported slave NIU ports.

Table 14-8. Slave NIUs

Slave NIU	Description
DSP1_TARG	DSP1 128b target port
DMM_P1_TARG	Dynamic memory management128b target port 1
DMM_P2_TARG	Dynamic memory management 128b target port 2
IVA_CONFIG_TARG	Video accelerator subsystem 32b configuration target port
IVA_SL2IF_TARG	Video accelerator subsystem 128b SL target port
L4_CFG_TARG	L4 CFG 32b target port
L4_WKUP_TARG	L4 WKUP 32b target port
TPTC_P1_TARG	EDMA_TPTC 32b target port 1
TPTC_P2_TARG	EDMA_TPTC 32b target port 2
TPCC_TARG	EDMA_TPCC (TPCC) 32b target port
VCP1_TARG(1)	VCP 64b target port 1
VCP2_TARG(1)	VCP 64b target port 2
OCMC_RAM1_TARG	On-chip memory controller 128b target port 1
PCIe1/2_TARG	PCIe1/2 64b target port
GPU_TARG	3D graphics accelerator 64b target port
IPU1_P1_TARG	DUAL Cortex M4 subsystem 64b target port 1
IPU1_P2_TARG	IPU1 64b target port 2
IPU2_P1_TARG	IPU2 64b target port 1
IPU2_P2_TARG	IPU2 64b target prot2
GPMC_TARG	General-purpose memory controller target port
L4_PER/1/2/3_TARG	L4 interconnect peripherals 32b initiator port
MCASP1_TARG	McASP1 32b target port
MCASP2_TARG	McASP2 32b target port
MCASP3_TARG	McASP3 32b target port
DSS_TARG	Display subsystem 64b target port
BB2D_TARG	BB2D 32b target port

Table 14-8. Slave NIUs (continued)

Slave NIU	Description
QSPI_TARG	QSPI 32b target port
MMU1_TARG	Memory management unit (MMU) 128b target port 1
MMU2_TARG	MMU 128b target port 2
PRUSS1_TARG	PRU-ICSS1 32b target port
PRUSS2_TARG	PRU-ICSS2 32b target port
L3_INSTR_TARG	L3 instrumentation 32b target port
DEBUGSS_TARG	Debug subsystem 32b target port

(1) VCP1 and VCP2 are not supported on the AM571x / AM570x family of devices.

14.2.3.2.2 L3_MAIN Connectivity Matrix

The L3 interconnect is divided into two clock domains L3_CLK1 and L3_CLK2. CLK1 domain is further splitted into two sub groups:

- L3_CLK1_1: Low-power domain
- L3_CLK1_2: Peripherals and multimedia
- L3_CLK2: Instrumentation (debug)

The two clock elements (CLK1 and CLK2) are implemented in a different clock domain.

14.2.3.2.2.1 Clock Domain Mapping of the L3_MAIN Interconnect Modules

Each clock domain (CLK1 and CLK2) has it own host, flag mux, slave NIUs, and bandwidth regulators. Table 14-9 lists the relationships between these domains and these elements.

Table 14-9. L3_MAIN Clock Domains and Elements

14.2.3.2.2.2

Figure 14-3 shows the functional paths between the L3_MAIN master NIUs and the L3_MAIN and L3 slave NIU agents. The functional paths in L3_MAIN are indicated by the following:

- A cell contains the letter C when a functional path exists.
- A cell is empty when a functional path does not exist.

Figure 14-3. Connectivity Matrix

Note

SATA is NOT supported on the AM570x family of devices.

14.2.3.2.3 Master NIU Identification

A master NIU ID (ConnID) is assigned to every module in the device. The ID uniquely identifies the master NIU for an interconnect transfer (see Table 14-10). The interconnect uses ConnID values for a number of purposes, including:

- Master source identification for the protection mechanism
- Response route generation

- Firewall error logging
- L3_MAIN interconnect error logging

Table 14-10. ConnID Values

8-bit ConnID (hex)	4-bit ConnID (hex)	Master NIU
0	0	MPU
10	1	CS_DAP
20	2	DSP1 MDMA
24	2	DSP1 CFG
28	2	DSP1 DMA
3A	3	IVA
50	5	PRU-ICSS1 PRU0
54	5	PRU-ICSS1 PRU1
58	5	PRU-ICSS2 PRU0
5C	5	PRU-ICSS2 PRU1
60	6	IPU1
64	6	IPU2
68	6	DMA_SYSTEM RD
6A	6	DMA_SYSTEM WR
70	7	TC1_EDMA_WR
72	7	TC1_EDMA_RD
74	7	TC2_EDMA_WR
76	7	TC2_EDMA_RD
80	8	DSS
84	8	MLB(1)
86	8	MMU1
88	8	PCIE1
8C	8	PCIE2
8E	8	MMU2
90	9	VIP1 P1
92	9	VIP1 P2
94	9	CAL
9C	9	VPE P1

A4	A	MMC2
A6	A	GPU P2
A8	A	BB2D P1
AA	A	BB2D P2
AC	A	GMAC_SW
B0	B	USB1 (USB 3.0 SS)
B4	B	USB2 (USB2.0 SS)
B8	B	USB3 (USB2_ULPI_SS1)(1)
CC	C	SATA(2)

(1) MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.
(2) SATA is not supported on the AM570x family of devices.

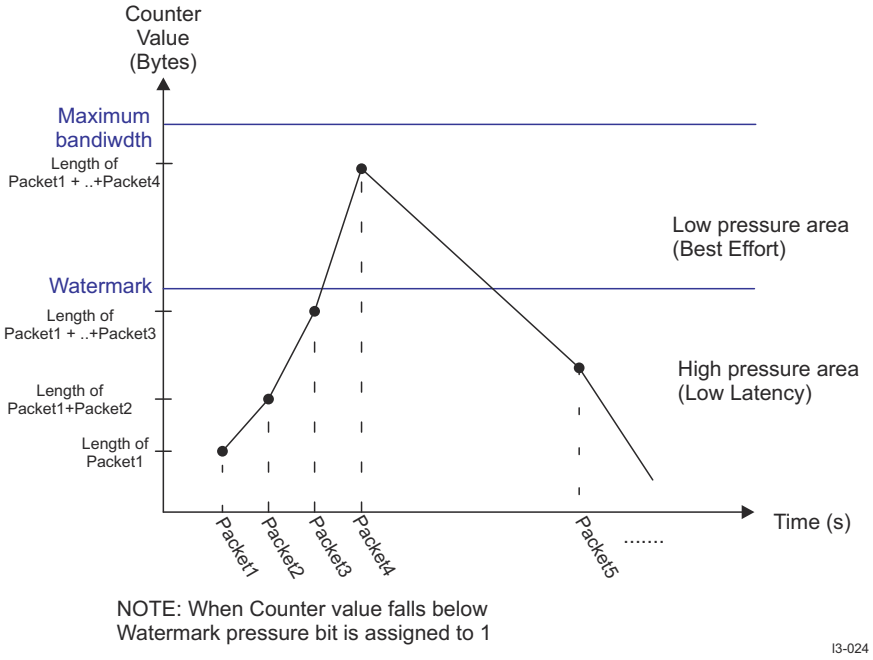
The 8-bit ConnID values are used by error decoding to distinguish the different initiators, see Section 14.2.3.8.5, *Example for Decoding Standard/Custom Errors Logged in L3_MAIN*. They are also used by the EMIF controller. The 4-bit ConnID values are used by the firewalls to allow or not an access to a slave NIU, see Table 14-18.

14.2.3.3 Bandwidth Regulators

The bandwidth regulators prevent master NIUs from consuming too much bandwidth of a link, or a slave NIU that is shared between several data flows: packets are then transported at a slower rate. The value of a bandwidth can be programmed in the bandwidth regulator. When the bandwidth is below the programmed value, the pressure bit is set to 1, giving priority to this master. When the bandwidth is above the programmed value, the pressure bit is set to 0 and the concerned master has the same weight as others.

A counter is used to store the sum of data lengths (in bytes) of each packet passing through the bandwidth regulator, and a value equal to the expected bandwidth is subtracted from the counter at each clock cycle. The value of the counter is compared to a programmable threshold (called Watermark), and this comparison determines whether the packet is processed with high pressure for minimum latency or low pressure for best effort processing.

The bandwidth regulator monitors the traffic using open connections between the initiators and the targets. If there is insufficient bandwidth allocated to the connection, the bandwidth regulator can increase the pressure on connections. Generally, the connection is a dataflow between master and slave NIUs. In some cases, the bandwidth regulator is attached to the master and monitors single dataflow to a target (single connection).



When Counter Value (bytes) falls below Watermark, the pressure bit is assigned to 1

Figure 14-4. Bandwidth Regulator Pressure Settings

The bandwidth regulator effective resolution is set to 8.3125 MBps. The maximum average bandwidth (max watermark value) computed in a moving window is set to up to 4096 bytes of payload. These settings are implemented by hardware.

The following is an example of bandwidth regulator settings:

Suppose the bandwidth regulator is set to run at 200 MHz and the application requires an expected bandwidth of 165.888 MBps (±5 MBps), computed through a moving window of 5 µs (1000 cycles). To attribute high pressure on all packet requests, the watermark could be set to the maximum bandwidth needed in the 5-µs window.

Considering the example, the settings of the bandwidth regulator are:

- L3_BW_REGULATOR_WATERMARK[11:0] WATERMARK = moving window × expected bandwidth = 829.44 bytes = 0x33D
- L3_BW_REGULATOR_BANDWIDTH[15:0] BANDWIDTH = ceil(165.888/8.3125) = ceil(19.956) = 20d = 0x14

The bandwidth registers regulate the packet flow by applying flow control on the RX port, thus ensuring that the traffic does not exceed the allocated bandwidth. The next packet is sent only when an internal timer expires. The registers in this group are:

- L3_BW_REGULATOR_WATERMARK: Gives the amount of data allowed to exceed the average bandwidth during a short time period
- L3_BW_REGULATOR_PRESS: Describes the pressure applied to outgoing packets
- L3_BW_REGULATOR_CLEARHISTORY: Resets the traffic counter when set to 1. This register is used after an update in the L3_BW_REGULATOR_BANDWIDTH and L3_BW_REGULATOR_WATERMARK registers (see Section 14.2.5.1.7, *L3 BW Regulator Register Summary and Description*).

Bandwidth regulators are mainly used to give priority to the following masters: DSP1 MDMA, IVA, MMU2, PCIe, DSP1 EDMA, GMAC SW, BB2D.

Priority to: DSP1_CFG, DSS, GPU_P1, GPU_P2, IPU, MMU1initiator port, MPU initiator port, PCIe1 and PCIe2 initiator ports, TPTC1 and TPTC2 (RD and WR initiator ports), USB initiator ports, MLB, VIP1_P1/P2, CAL initiator ports is given by setting their internal MFlag signal.

14.2.3.4 Bandwidth Limiters

The bandwidth limiter is added to control the bandwidth of GPU, EDMA_TPTC (RD and WR ports) and MMU1. This prevents a large number of RD requests being processed together, thus avoiding a large number of RD responses.

The bandwidth limiter regulates the packet flow in the L3_MAIN interconnect by applying flow control when a user-defined bandwidth limit is reached. The next packet is served only after an internal timer expires, thus ensuring that traffic does not exceed the allocated bandwidth. Bandwidth limiter can be used with a watermark mechanism that allows traffic to temporarily exceeds the peak bandwidth.

The registers in this group are:

- L3_BW_LIMITER_WATERMARK_0: Gives the amount of data allowed to exceed the average bandwidth during a short time period. To set the actual watermark to n bytes, the register must be set to n + 1.
- L3_BW_LIMITER_CLEARHISTORY: Resets the traffic counter when set to 1.
- L3_BW_LIMITER_BANDWIDTH_FRACTIONAL and L3_BW_L_BANDWIDTH_INTEGER: These two registers are used to set the average payload bandwidth.

Example of setting the Bandwidth Limiters:

L3_BW_LIMITER_BANDWIDTH_FRACTIONAL must be set to BandwidthConf [4 down to 0] and L3_BW_LIMITER_BANDWIDTH_INTEGER contains the remaining BandiwdthConf bits, shifted to the right. BandwidthConf = AverageBandwidth / EffectiveResolution, where EffectiveResolution parameter is set to 8.3125 MHz at design time

AverageBandwidth is a parameter representing the value to which the payload bandwidth must be limited in average; this parameter depends on the use case and is the reason that makes the content of the registers variable. In addition the maximum packet length is 8 cells, that is 32 bytes.

Assuming that the use case requires that in average the payload bandwidth is limited to 200 MB/s, then registers must be set to the following values:

BandwidthConf = 200 MBps / 8.3125 MHz = 38 (0x26)

L3_BW_LIMITER_BANDWIDTH_FRACTIONAL = LSBs [4 down to 0] of BandwidthConf = 0x6.

L3_BW_LIMITER_BANDWIDTH_INTEGER = the remaining bits of BandwidthConf shifted to the right = 0x1.

By setting L3_BW_LIMITER_WATERMARK to 65 (L3_BW_LIMITER_WATERMARK_0 = 0x41), the bandwidth limiter is able to send three packets consecutively during peaks, therefore exceeding the peak traffic with two packets (64 bytes)

14.2.3.5 Flag Muxing

The flag mux generator collects information such as errors and interrupts from slave NIUs and the interconnect firewall. The result signals are then sent to the MPU interrupt controller (INTC) without interfering with the interconnect traffic. Using the L3_FLAGMUX_MASK registers can prevent the flag mux from seeing certain events.

The unit has a standard COREREG register for identification of the attached core type. The L3_FLAGMUX_STDHOSTHDR_VERSIONREG register identifies the characteristics of the attached core. Use unit-specific registers (MASK bit 0 or bit 1 of the flag inputs, and L3_FLAGMUX_REGERR bit 0 or bit 1) to read the input errors. Each register is dedicated to reporting the bit corresponding to the register number; for example, L3_FLAGMUX_REGERR0 reports on bit 0, and L3_FLAGMUX_REGERR1 reports on bit 1. Any given L3_FLAGMUX_REGERR register reports the same bit for all flag source inputs (see Table 14-173).

There are three flag muxs (CLK1_FLAGMUX_CLK1_1, CLK1_FLAGMUX_CLK1_2 and CLK2_FLAGMUX_CLK2_1) collecting information from targats in each clock domain in L3_MAIN interconnect (CLK1_1, CLK1_2 and CLK2_1). Both CLK1_FLAGMUX_CLK1_1 and CLK1_FLAGMUX_CLK1_2 flag muxes are located in the CLK1_2 clock domain (with base address 0x4480 0000).

Also there is a separate mux (L3_FMAGMUX_CLK1MERGE) that merges the inputs from CLK1_1 and CLK1_2 flag muxes. Its functionality is similar to the functionality of the other L3_FLAGMUXES:

- L3_FLAGMUX_CLK1MERGE_COREREG and L3_FLAGMUX_STDHOSTHDR_VERSIONREG registers are used to identify the attached core and its characteristics.
- L3_FLAGMUX_CLK1MERGE_MASK0 is used to mask (enable) application error sources
- L3_FLAGMUX_CLK1MERGE_REGERR0 is used to check which application error sources are active
- L3_FLAGMUX_CLK1MERGE_MASK1 is used to mask debug error sources
- L3_FLAGMUX_CLK1MERGE_REGERR1 is used to check which debug error sources are active

Following is a block diagram of the flag mux organization in L3_MAIN interconnect:

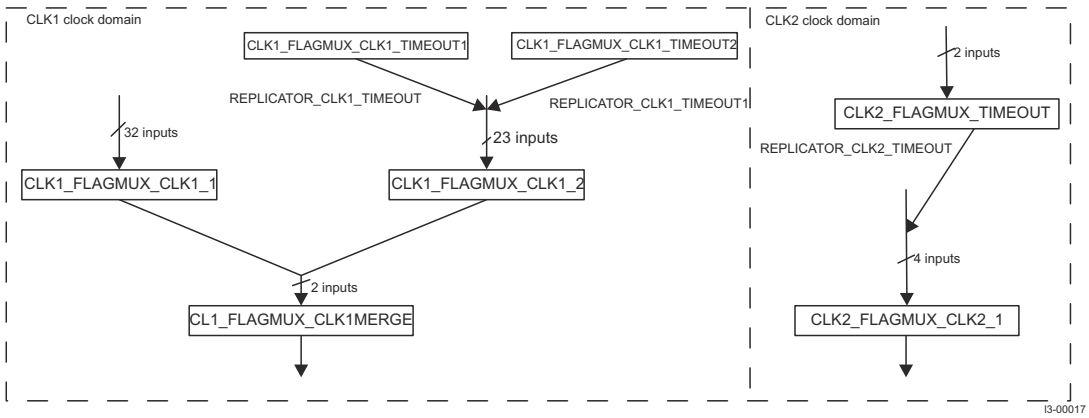


Figure 14-5. Flag Mux Structure

14.2.3.5.1 Flag Mux Time-out

If a target does not respond after a fixed number of clock cycles, an error time-out flag is generated, in case it is enabled. The value of the flag is always 3 if a time-out error is present.

To enable time-out for each target, set the corresponding bit in L3_FLAGMUX_TIMEOUT_MASK0 register to 1. See Table 14-11.

Table 14-11. L3 Time-out Flag Mapping

	Flag Mux Input	Source
CLK1_1 Time-out FlagMux (TIMEOUT1)	2	DSP1 SDMA
	4	DSS
	9	GPU
	10	BB2D
	11	IPU1
	12	IPU2
	13	IVA CONFIG
	14	MMU1
	15	DMM P1
	16	DMM P2
	17	IVA SL2IF
	18	MMU2
	19	L4_PER1 P1
	20	L4_PER1 P2
	21	L4_PER1 P3
	22	L4_PER2 P2
	23	L4_PER2 P1
	24	L4_PER2 P3
	25	L4_PER3 P2
	26	L4_PER3 P1
	27	L4_PER3 P3
	28	L4_CFG
	29	L4_WKUP

	3	PRU-ICSS1
	5	PRU-ICSS2
	6	QSPI
	8	TPCC
	9	TPTC1
	10	TPTC2
	13	MCASP1
	14	MCASP2
	15	MCASP3
	16	OCMC_RAM1
	18	GPMC
	19	VCP1(1)
	20	VCP2(1)
CLK2_1 Time-out FlagMux	0	L3_INSTR
	1	DEBUGSS_CT_TBR

(1) VCP1 and VCP2 are not supported on the AM571x / AM570x family of devices.

Note

Missing inputs in Table 14-11 are reserved locations. Writing in them has no effect.

For example, to enable all targets in CLK1_1, write 0x3FFF FFFF in L3_FLAGMUX_TIMEOUT1_MASK0; to enable all targets in CLK1_2, write 0x1F FFFF in L3_FLAGMUX_TIMEOUT2_MASK0. To enable only OCMC_RAM1 (target in CLK1_2) write 0x1 0000 in L3_FLAGMUX_TIMEOUT2_MASK0. If an error-timeout occurs, read the registers L3_FLAGMUX_TIMEOUT1_REGERR0 and L3_FLAGMUX_TIMEOUT2_REGERR0 to determine the source of error concerning Table 14-11. CLK2 timeouts are reported through CLK1_FLAGMUX_CLK2_1 status registers (L3_FLAGMUX_REGERR0, L3_FLAGMUX_REGERR1) and masked through L3_FLAGMUX_MASK0 and L3_FLAGMUX_MASK1 registers.

Similarly, to enable a target in CLK2_1, write the appropriate value (as described in Table 14-11) in L3_FLAGMUX_TIMEOUT_MASK0.

If an error time-out occurs in CLK2_1, read the L3_FLAGMUX_TIMEOUT_REGERR0 register to determine the source of error concerning Table 14-11.

14.2.3.6 Statistic Collectors Group

Statistic collectors are internal masters that share the same master address as the master NIUs. These components compute the traffic statistics within a defined window and periodically report through the DEBUG interface. The key features of the statistic collector are:

- Nonintrusive monitoring
- Programmable filters and counters
- Collects results at a programmable time interval

Event detectors are programmed through the L3_STCOL_REQEVT and L3_STCOL_RSPEVT configuration registers for request and response ports, respectively. The following events can be identified:

- Word transfer
- WAIT cycles
- Flow control
- Payload transfers
- Latency measurements

Performance monitoring is enabled through the L3_STCOL_EN register. The L3_STCOL_SOFTEN register enables software to monitor the performance. Event muxes are programmed through the L3_STCOL_EVTMUX_SEL0 configuration register, which determines which port will be monitored by a filter configured by the filter registers (see Section 14.2.5.1.9).

Filters are programmed through the L3_STCOL_FILTER_i_GLOBALEN configuration register, along with additional selection criteria programmed through the mask/match registers (see Table 14-237). A filter can be configured to accept or reject:

- Read operations
- Write operations
- Errors
- Addresses

Filter operation is programmed through the L3_STCOL_OP registers (see Table 14-237).

There are ten statistic collectors used to monitor the traffic on DRAM (EMIF1 and MA_MPU_P1), MPU, MMU, TPTC, VIP, DSP MDMA/EDMA, IVA, GPU, DSS, IPU, OCMC RAM, PCIe Subsystem, VCP, DSP CFG and GPMC ports. For more detailed descriptions of statistic collectors, see Section 34.10.6.1, *L3 Target Load Monitoring*, and Section 34.10.6.2, *Master Latency Monitoring*.

14.2.3.7 L3_MAIN Protection and Firewalls

Device protection relies on L3 firewalls and their configuration.

14.2.3.7.1 L3_MAIN Firewall Reset

The values of L3_MAIN firewall registers on reset are tied in hardware or exported from the control module registers.

Values exported from the control module are intended to give defined rights to the firewalls at reset and thus ensure the content after going out of reset.

The L3_MAIN firewall registers are located in the CORE AON power domain and thus no retention capability is needed. The control module registers are reset by a cold reset only, whereas the L3_MAIN firewall registers are reset by clearing the REGUPDATE_CONTROL[1] FW_LOAD_REQ bit. When the REGUPDATE_CONTROL[1] FW_LOAD_REQ bit comes back automatically to 1, the exported values are loaded.

CAUTION

Before reprogramming the firewall registers and/or before using the FW_LOAD_REQ mechanism, the request must be asserted by configuring the REGUPDATE_CONTROL[0] BUSY_REQ bit.

To load the exported values at run time:

1. Set the REGUPDATE_CONTROL[0] BUSY_REQ bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Clear the REGUPDATE_CONTROL[1] FW_LOAD_REQ bit by writing 0x1 to it.
3. Wait until the REGUPDATE_CONTROL[1] FW_LOAD_REQ bit is reset to 0x1 by hardware.
4. Set the REGUPDATE_CONTROL[0] BUSY_REQ bit to 0x0 to allow transactions to reach the slave NIU (resume).

To reprogram the firewall registers at run time:

1. Write 0x1 to the REGUPDATE_CONTROL register.
2. Update the firewall registers.
3. Write 0x0 to the REGUPDATE_CONTROL register.

Note

While reprogramming the firewall registers at run time it must be taken into account that the REGUPDATE_CONTROL[1] FW_LOAD_REQ bit is written as '0' because a value of '1' reloads the firewall default values.

Note

At reset, exported values from the control module can modify hardware reset values.

14.2.3.7.1.1 L3_MAIN Firewall – Exported Reset Values

Table 14-12 and Table 14-13 list the exported reset values and mapping, respectively.

Table 14-12. L3_MAIN Firewall Exported Reset Values

MRM_PERMISSION_REGION_LOW_j [15:12]	MRM_PERMISSION_REGION_LOW_j [11:0]
0x0	0xFFF

[10]	EDMA TPCC

For more information, see Chapter 18, *Control Module*.

14.2.3.7.2 Power Management

As part of the system-wide power-management scheme, the L3_MAIN interconnect goes into IDLE state after receiving a request from the power, reset, and clock management (PRCM) module after all commands are serviced. This function is handled by hardware.

To reduce power consumption, the L3_MAIN interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

L3_MAIN supports a partial retention scheme. Retention is performed on the follwoing registers:

- Statistic collectors
- Bandwidth regulators
- Firewalls

This process prevents reconfiguration after a clock domain switches off.

14.2.3.7.3 L3_MAIN Firewall Functionality

The access to the slave NIUs is granted only to master NIUs according to in-band attributes sent in each transaction crossing the L3_MAIN interconnect, such as:

- MCMD: Specifies the type of access (read or write) required by the master NIU
- ConnID: Used to determine the permission of the master NIU

- MReqInfo: Transaction attribute adding information about the access type
- MreqDomain: Specifies the domain an initiator belongs to

Table 14-15 lists the MReqInfo values.

Table 14-15. MReqInfo Values

Qualifier	Access Definition	Access Description
MReqType	00: Processor data access 01: Processor instruction access 10: DMA access 11: Other	Indicates whether the request is for processor instruction fetch, processor data access or DMA access
MReqDebug	0: Functional 1: Debug	When set, indicates that the request has been issued by a master NIU in DEBUG state
MReqSupervisor	0: User 1: Privilege	When set, indicates that the request is qualified with the supervisor attribute. It can be provided by a processor running in supervisor mode or by a module that inherited this attribute from the processor (DMA channel with a supervisor attribute).
MreqDomain	0b000: Domain 0 0b001: Domain 1 0b010: Domain 2 0b011: Domain 3 0b100: Domain 4 0b101: Domain 5 0b110: Domain 6 0b111: Domain 7	MreqDomain allows a set of initiators to be grouped together. Using this domain qualifier, hardware isolation of domains is possible. The MreqDomain value is assigned from the control module via the following registers: • CTRL_CORE_MREQDOMAIN_EXP1 • CTRL_CORE_MREQDOMAIN_EXP2 • CTRL_CORE_MREQDOMAIN_EXP3 • CTRL_CORE_MREQDOMAIN_EXP4 • CTRL_CORE_MREQDOMAIN_EXP5 • CTRL_CORE_SMA_SW_4

Note

MreqDomain is supported only on SR2.1.

The firewall comparison mechanism enables access to a protected slave NIU only when a correct combination of the MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed pattern that corresponds to a combination of the parameters MReqDebug, MReqType, MreqDomain, and MReqSupervisor. See Table 14-16.

(1) VCP1, VCP2, MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.
(2) SATA is not supported on the AM570x family of devices.

14.2.3.7.3.1 Protection Regions

Each slave NIU address space is subdivided into protection regions (maximum of 10). The regions are configurable with a size of 4-KiB granularity. The firewalls can also be multiport while using the description of the same regions for dual access memories or to support interleaving mechanisms on several memories.

Table 14-17 lists the number of protected regions and ports for each slave NIU.

Table 14-17. Slave NIU Firewall and Region Configuration

Domain	Slave NIU	Firewall	Number of Regions	Number of Ports
CLK1	DSP1_SDMA	DSP1_SDMA_FW	1	1
	DSS	DSS_FW	8	1
	GPMC	GPMC_FW	8	1
	GPU	GPU_FW	1	1
	IPU1	IPU1_FW	4	1
	IPU2	IPU2_FW	4	1

Table 14-17. Slave NIU Firewall and Region Configuration (continued)

Domain	Slave NIU	Firewall	Number of Regions	Number of Ports
	TPTC	TPTC_FW	2	2
	VCP1(1)	VCP1_FW	1	1
	VCP2(1)	VCP2_FW	1	1
	MCASP1	MCASP1_FW	1	1
	MCASP2	MCASP2_FW	1	1
	MCASP3	MCASP3_FW	1	1
CLK2	L3_INSTR	L3_INSTR_FW	2	1
	DEBUGSS_CT_TBR	DEBUGSS_CT_TBR_FW	1	1

(1) VCP1, VCP2, MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.

Two types of regions are distinguished in a slave NIU firewall:

- Default region: Available in all slave NIUs. The default region covers the entire slave NIU address range. Other firewall-configured regions must reset or overlay the default region, because it always has the lowest priority.
- Normal region: The number of normal regions varies in a slave NIU; they have identical capabilities (see Table 14-17).

Each region has the following characteristics:

- Start address: Physical slave NIU start address
- End address: Physical slave NIU end address
- Specific access rights (see Section 14.2.3.7.3.3, *Protection Mechanism per Region Examples*)
- Priority level from 0 (lowest) to 10 (highest)

Depending on its priority level, a region can override the settings of another region; the access rights of the region with the highest priority apply. All regions have a fixed (not configurable) priority level that corresponds to their number: Region 1 has priority level 1, region 2 has priority level 2, and so on.

Figure 14-6 shows the priority level with associated regions. This priority level scheme allows multiplying the flexibility and capability of the firewall. Figure 14-6 shows a 7-region firewall setting that creates 16 regions (twice the number of regions created than originally available).

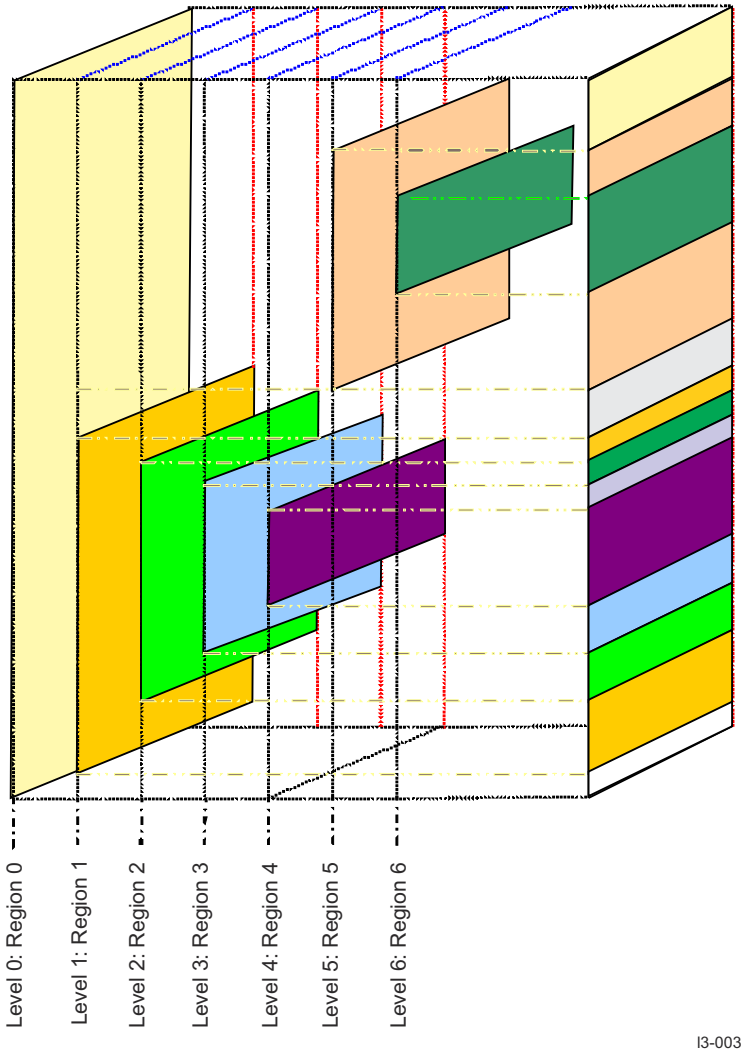

Figure 14-6. L3 Interconnect Region Overlay and Priority Level Overview

The address range covered by the regions is defined in the START_REGION_i and END_REGION_i registers. The boundary checks are done on a minimum size of 4-KiB pages; thus, bits [11:0] of those 32-bit registers are not checked.

The address space size of the slave NIUs ([bits [31:12]) depends on the size of the slave NIU to protect (that is, if a memory is only 48KiB, then the size is defined through bits [16:12] of the slave NIU start and end address registers of the firewall region (START_REGION_i[16:12] and END_REGION_i[16:12]).

Most slave NIUs support only one input port (port 0) except:

- The EDMA_TC firewall which has two ports:
  - Port 0 logs errors in the ERROR_LOG_0 register for the traffic to EDMA_TPTC0 module generated by the MPU, DSP1, IPU1/2, DMA_SYSTEM, MLB, PCIESS1, MMU1/2, PRU-ICSS1, PRU-ICSS2 and DAP modules.
  - Port 1 logs errors in the ERROR_LOG_1 register for the traffic to EDMA_TPTC1 module generated by the MPU, DSP1, IPU1/2, DMA_SYSTEM, MLB, PCIESS1, MMU1/2, PRU-ICSS1, PRU-ICSS2 and DAP modules.

A region can be applied or not to each port independently. To enable and disable the regions:

- For port 0: Set/clear the END_REGION_i[0] END_REGION_i_ENABLE_CORE0 bit (for all L3_MAIN firewalls).
- For port 1: Set/clear the END_REGION_i[1] END_REGION_i_ENABLE_CORE1 bit (for EDMA_TC firewall).

The EMIF firewall (EMIF_OCP_FW) uses 16 GiB address space and protects both the SDRAM and the EMIF configuration registers. The EMIF firewall allows defining access restrictions per region. This per-region capability is defined by setting to 0x1 the END_REGION_i[0] END_REGION_i_ENABLE_CORE_0 bit.

The protection regions for EMIF firewall are configurable with a size of 4-KiB granularity (the same applies to the MA_MPU_NTTP_FW). The address range covered by the regions is defined in the START_REGION_i and END_REGION_i registers. Since EMIF firewall sees 16 GiB address space but these two registers have only 32 bits, the START_REGION_i/END_REGION_i[31] bit is mapped to bit [33] of the EMIF address space, that is, bits [31:10] of START_REGION_i/END_REGION_i are mapped to EMIF Address [33:12]. START_REGION_i/END_REGION_i [9:0] are not checked for the minimum page size of 4KiB.

The start address in the EMIF address space for accessing the EMIF configuration registers is 0x3_0000_0000. If protection of these registers is needed, that address must be right shifted by 2 bits and then the result (0xC000_0000) must be written to the START_REGION_i register. The REGUPDATE_CONTROL[19:16] FW_ADDR_SPACE_MSB bit field indicates how many bits are shifted in the firewall address space. In case of EMIF_OCP_FW and MA_MPU_NTTP_FW, 2 bits are shifted. If target address space is ≤ 4 GiB then REGUPDATE_CONTROL[19:16] FW_ADDR_SPACE_MSB is 0x0 and the START_REGION_i/END_REGION_i [31:12] bits match target physical address [31:12]. Bits [11:0] are ignored by the firewall. These bits are not involved in the address check. To match address spaces greater than 4 GiB but keep the minimum page size of 4 KiB some of the START_REGION_i/END_REGION_i [11:0] bits must also be configured. In the EMIF case bits [11:10] are also used.

For example, the EMIF1 configuration registers are accessible through system base address 0x4C00_0000. But the EMIF_OCP_FW sees them at start address 0x3_0000_0000. As previously mentioned that address must be shifted before being programmed to the START_REGION_i register. In this case the programmed value should be 0xC000_0000. This has to be taken into account.

14.2.3.7.3.2 L3_MAIN Firewall Registers Overview

Table 14-18 and Table 14-19 list the L3_MAIN firewall permission-setting registers.

Table 14-18. L3_MAIN Firewall Read/Write Permission-Setting Register

Register Name	Bits	Field Name	4-bit ConnID Value (hex) (see Table 14-10)	Field Modifiability
MRM_PERMISSION_REGION_HIGH_j	31	W	ConnID = F write permission	RW
	30	R	ConnID = F read permission	RW
	29	W	ConnID = E write permission	RW
	28	R	ConnID = E read permission	RW
	27	W	ConnID = D write permission	RW
	26	R	ConnID = D read permission	RW
	25	W	ConnID = C write permission	RW
	24	R	ConnID = C read permission	RW
	23	W	ConnID = B write permission	RW
	22	R	ConnID = B read permission	RW
	21	W	ConnID = A write permission	RW
	20	R	ConnID = A read permission	RW
	19	W	ConnID = 9 write permission	RW
	18	R	ConnID = 9 read permission	RW
	17	W	ConnID = 8 write permission	RW
	16	R	ConnID = 8 read permission	RW
	15	W	ConnID = 7 write permission	RW
	14	R	ConnID = 7 read permission	RW
	13	W	ConnID = 6 write permission	RW
	12	R	ConnID = 6 read permission	RW
	11	W	ConnID = 5 write permission	RW
	10	R	ConnID = 5 read permission	RW
	9	W	ConnID = 4 write permission	RW
	8	R	ConnID = 4 read permission	RW
	7	W	ConnID = 3 write permission	RW
	6	R	ConnID = 3 read permission	RW
	5	W	ConnID = 2 write permission	RW
	4	R	ConnID = 2 read permission	RW
	3	W	ConnID = 1 write permission	RW
	2	R	ConnID = 1 read permission	RW
	1	W	ConnID = 0 write permission	RW
	0	R	ConnID = 0 read permission	RW

Table 14-19. L3_MAIN Firewall Permission-Setting Register

Register name	Type of Permission	Bits	Field Name	Description	Field Modifiability
MRM_PERMISSION_REGION_LOW_j	Reserved	31:16		Reserved	
	Debug	15	DEBUG	PUBLIC PRIVILEGE DOMAIN DEBUG ALLOWED	RW
		14	DEBUG	PUBLIC USER DOMAIN DEBUG ALLOWED	RW
	Reserved	13:12		Reserved	
	Access	11	READ	PUBLIC PRIVILEGE READ ACCESS ALLOWED	RW
		10	WRITE	PUBLIC PRIVILEGE WRITE ACCESS ALLOWED	RW
		9	EXE	PUBLIC PRIVILEGE EXE ACCESS ALLOWED	RW
		8	READ	PUBLIC USER READ ACCESS ALLOWED	RW
		7	WRITE	PUBLIC USER WRITE ACCESS ALLOWED	RW
		6	EXE	PUBLIC USER ECXE ACCESS ALLOWED	RW

14.2.3.7.3.3 Protection Mechanism per Region Examples

The access permission of each region is configurable and defined through the MRM_PERMISSION_REGION_HIGH_j and MRM_PERMISSION_REGION_LOW_j registers (see Section 14.2.3.7.3.2, *L3_MAIN Firewall Registers Overview*).

Master NIU permissions:

1. To give read access to the master NIU with 4-bit ConnID = n(1), set the MRM_PERMISSION_REGION_HIGH_j[n × 2] R bit.
2. To give write access to the master NIU with 4-bit ConnID = n(1), set the MRM_PERMISSION_REGION_HIGH_j[n × 2 + 1] W bit.

(1) - n should be first converted from hex to decimal value

Debug permissions:

1. To give privilege debug access, set the MRM_PERMISSION_REGION_LOW_j[15] DEBUG bit.
2. To give user debug access, set the MRM_PERMISSION_REGION_LOW_j[14] DEBUG bit.

User, read, write, and executable permissions:

1. To give privileged read access, set the MRM_PERMISSION_REGION_LOW_j[11] READ bit.
2. To give privileged write access, set the MRM_PERMISSION_REGION_LOW_j[10] WRITE bit.
3. To give privileged executable access, set the MRM_PERMISSION_REGION_LOW_j[9] EXE bit.
4. To give user read access, set the MRM_PERMISSION_REGION_LOW_j[8] READ bit.
5. To give user write access, set the MRM_PERMISSION_REGION_LOW_j[7] WRITE bit.
6. To give user executable access, set the MRM_PERMISSION_REGION_LOW_j[6] EXE bit.

Example: To provide debug write privilege access to the master NIU with 4-bit ConnID = 0x7, set the following bits:

- MRM_PERMISSION_REGION_HIGH_j[15] W
- MRM_PERMISSION_REGION_LOW_j[15] DEBUG

14.2.3.7.3.4 L3_MAIN Firewall Error Logging

If a protection violation error is detected, the following signals are generated:

- An in-band error (SRESP = ERROR) is generated to the master NIU of the access.
- An out-band error is sent to the control module
- An interrupt is generated to the Cortex-A15 INTC.

The L3_MAIN interconnect does not differentiate errors generated by firewalls from all other supported types of errors.

An in-band error is generated by modules each time an access is not allowed. When an in-band error is sent back into the transaction it is seen as an external prefetch or data abort by the initiator, depending on whether the transaction was an instruction fetch or a data access.

Information about in-band errors is logged into two registers:

- ERROR_LOG_k: Logs the information about the start/end address of the hit region and the qualifiers of the transaction
- LOGICAL_PHYSICAL_ADDRESS_ERRLOG_k[31:12]: Logs the address of the failed access

Note

When a multiport firewall is implemented, these registers are duplicated for each port.

Table 14-20 lists the L3_MAIN firewall error-logging registers.

Table 14-20. L3 Firewall Error-Logging Registers

Register Name	Register Field Name	Field Modifiability	Parameter Comments
ERROR_LOG_k (When multiport firewall is implemented the error log register is duplicated for each port.)	RESERVED[31:24]	Read only	Reads return 0s.
	BLK_BURST_VIOLATION[23]	Read/write	Read 0x1: 2D burst not allowed or exceeds allowed size. Write to clear the ERROR_LOG and LOGICAL_PHYSICAL_ADDRESS_ERRLOG registers.
	RESERVED[22]	Read only	Read return 0s.
	REGION_START_ERRLOG[21:17]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG and LOGICAL_PHYSICAL_ADDRESS_ERRLOG registers.
	REGION_END_ERRLOG[16:12]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG and LOGICAL_PHYSICAL_ADDRESS_ERRLOG registers.
	REQINFO_ERRLOG[11:0]	Read/write	Mapping of the error according to the reqinfo vector: ConnID [3:0] MCMD [0] [6:4] MReqDomain(1) [3] MReqDebug [1] MReqSupervisor [0] MReqType

(1) MreqDomain is supported only on SR2.1.

L3 firewall errors can be cleared by writing to the ERROR_LOG_k register in the firewall that recorded the error. Clearing the ERROR_LOG_k register deasserts the corresponding error if it exists.

The L3 firewall register ERROR_LOG_k must be cleared before clearing the SEC_ERR_STATUS_FUNC_1/2 and SEC_ERR_STATUS_DEBUG_1/2 registers in the control module.

When a protection violation occurs, an interrupt is sent to the IRQ_CROSSBAR. An in-band error is sent back, and an error is logged in the SEC_ERR_STATUS_FUNC_1/2 and SEC_ERR_STATUS_DEBUG_1/2 registers, depending on the functional mode:

- In application mode:

  - SEC_ERR_STATUS_FUNC_1[1] – L3 RAM protection violation
  - SEC_ERR_STATUS_FUNC_1[2] – GPMC protection violation
  - SEC_ERR_STATUS_FUNC_1[3] – EMIF protection violation
  - SEC_ERR_STATUS_FUNC_1[4] – IVA protection violation
  - SEC_ERR_STATUS_FUNC_1[5] – IPU protection violation
  - SEC_ERR_STATUS_FUNC_1[6] – IVA SL2 protection violation
  - SEC_ERR_STATUS_FUNC_1[8] – SYSTEM DMA protection violation
  - SEC_ERR_STATUS_FUNC_1[10] – DSPDMA slave NIU protection violation
  - SEC_ERR_STATUS_FUNC_1[13] – GPU protection violation
  - SEC_ERR_STATUS_FUNC_1[14] – DSS protection violation
  - SEC_ERR_STATUS_FUNC_1[16] – L4_PER1 protection violation
  - SEC_ERR_STATUS_FUNC_1[17] – L4_CFG protection violation
  - SEC_ERR_STATUS_FUNC_1[18] – DEBUG subsystem protection violation
  - SEC_ERR_STATUS_FUNC_1[22] – L4_WKUP protection violation
  - SEC_ERR_STATUS_FUNC_1[23] - BB2D protection violation
  - SEC_ERR_STATUS_FUNC_1[26] – CT_TBR protection violation
  - SEC_ERR_STATUS_FUNC_2[0] – DSP1 protection violation
  - SEC_ERR_STATUS_FUNC_2[4] – L4_PER2 protection violation
  - SEC_ERR_STATUS_FUNC_2[5] – L4_PER3 protection violation
  - SEC_ERR_STATUS_FUNC_2[6] - IPU2 protection violation
  - SEC_ERR_STATUS_FUNC_2[7] – PCIESS1 protection violation
  - SEC_ERR_STATUS_FUNC_2[8] - PCIESS2 protection violation
  - SEC_ERR_STATUS_FUNC_2[16] – EDMA_TPTC1 protection violation
  - SEC_ERR_STATUS_FUNC_2[17] – EDMA_TPCC protection violation
  - SEC_ERR_STATUS_FUNC_2[20] – PRU-ICSS1 protection violation
  - SEC_ERR_STATUS_FUNC_2[21] - PRU-ICSS2 protection violation
  - SEC_ERR_STATUS_FUNC_2[22] – QSPI protection violation
  - SEC_ERR_STATUS_FUNC_2[23] – EDMA_TPTC2 protection violation
- In debug mode:
  - SEC_ERR_STATUS_DEBUG_1[1] – L3 RAM protection violation
  - SEC_ERR_STATUS_DEBUG_1[2] – GPMC protection violation
  - SEC_ERR_STATUS_DEBUG_1[3] – EMIF protection violation
  - SEC_ERR_STATUS_DEBUG_1[4] – IVA protection violation
  - SEC_ERR_STATUS_DEBUG_1[5] – IPU protection violation
  - SEC_ERR_STATUS_DEBUG_1[6] – IVA SL2 protection violation
  - SEC_ERR_STATUS_DEBUG_1[8] - SYSTEM DMA protection violation
  - SEC_ERR_STATUS_DEBUG_1[10] – DSPDMA slave NIU protection violation
  - SEC_ERR_STATUS_DEBUG_1[13] – GPU protection violation
  - SEC_ERR_STATUS_DEBUG_1[14] – DSS protection violation
  - SEC_ERR_STATUS_DEBUG_1[16] – L4_PER1 protection violation
  - SEC_ERR_STATUS_DEBUG_1[17] – L4_CFG protection violation
  - SEC_ERR_STATUS_DEBUG_1[18] – DEBUG subsystem protection violation
  - SEC_ERR_STATUS_DEBUG_1[22] – L4_WKUP protection violation
  - SEC_ERR_STATUS_DEBUG_1[23] - BB2D protection violation
  - SEC_ERR_STATUS_DEBUG_1[26] – CT_TBR protection violation
  - SEC_ERR_STATUS_DEBUG_2[0] – DSP1 protection violation
  - SEC_ERR_STATUS_DEBUG_2[4] – L4_PER2 protection violation
  - SEC_ERR_STATUS_DEBUG_2[5] – L4_PER3 protection violation
  - SEC_ERR_STATUS_DEBUG_2[6] - IPU2 protection violation
  - SEC_ERR_STATUS_DEBUG_2[7] – PCIESS1 protection violation
  - SEC_ERR_STATUS_DEBUG_2[8] - PCIESS2 protection violation
  - SEC_ERR_STATUS_DEBUG_2[16] – EDMA_TPTC1 protection violation
  - SEC_ERR_STATUS_DEBUG_2[17] – EDMA_TPCC protection violation
  - SEC_ERR_STATUS_DEBUG_2[20] – PRU-ICSS1 protection violation

- SEC_ERR_STATUS_DEBUG_2[21] - PRU-ICSS2 protection violation
- SEC_ERR_STATUS_DEBUG_2[22] – QSPI protection violation
- SEC_ERR_STATUS_DEBUG_2[23] – EDMA_TPTC2 protection violation

For more information, see Chapter 18, *Control Module*.

14.2.3.7.3.5 L3_MAIN Firewall Default Configuration

Table 14-21 summarizes the configuration of the L3_MAIN firewalls.

Table 14-21. L3_MAIN Firewalls Default Configurations

Device/Region: 0						
Permission Type	**Reset Value**	**Reset Value**	**Reset Type**	**Run Time**	**Firewall Register (where j = 0)**	**Control Module Register**

[10]	EDMA TPCC	1

(1) VCP1 and VCP2 are not supported on the AM571x / AM570x family of devices.

14.2.3.8 L3_MAIN Interconnect Error Handling

Error logging is enabled in the L3_MAIN interconnect. The three major types of errors are:

- Slave NIU errors
- Firewall errors (see Section 14.2.3.7.3.4, *L3_MAIN Firewall Error Logging*)
- Flag mux errors

14.2.3.8.1 Global Error-Routing Scheme

Figure 14-7 shows the L3_MAIN global error-routing scheme.

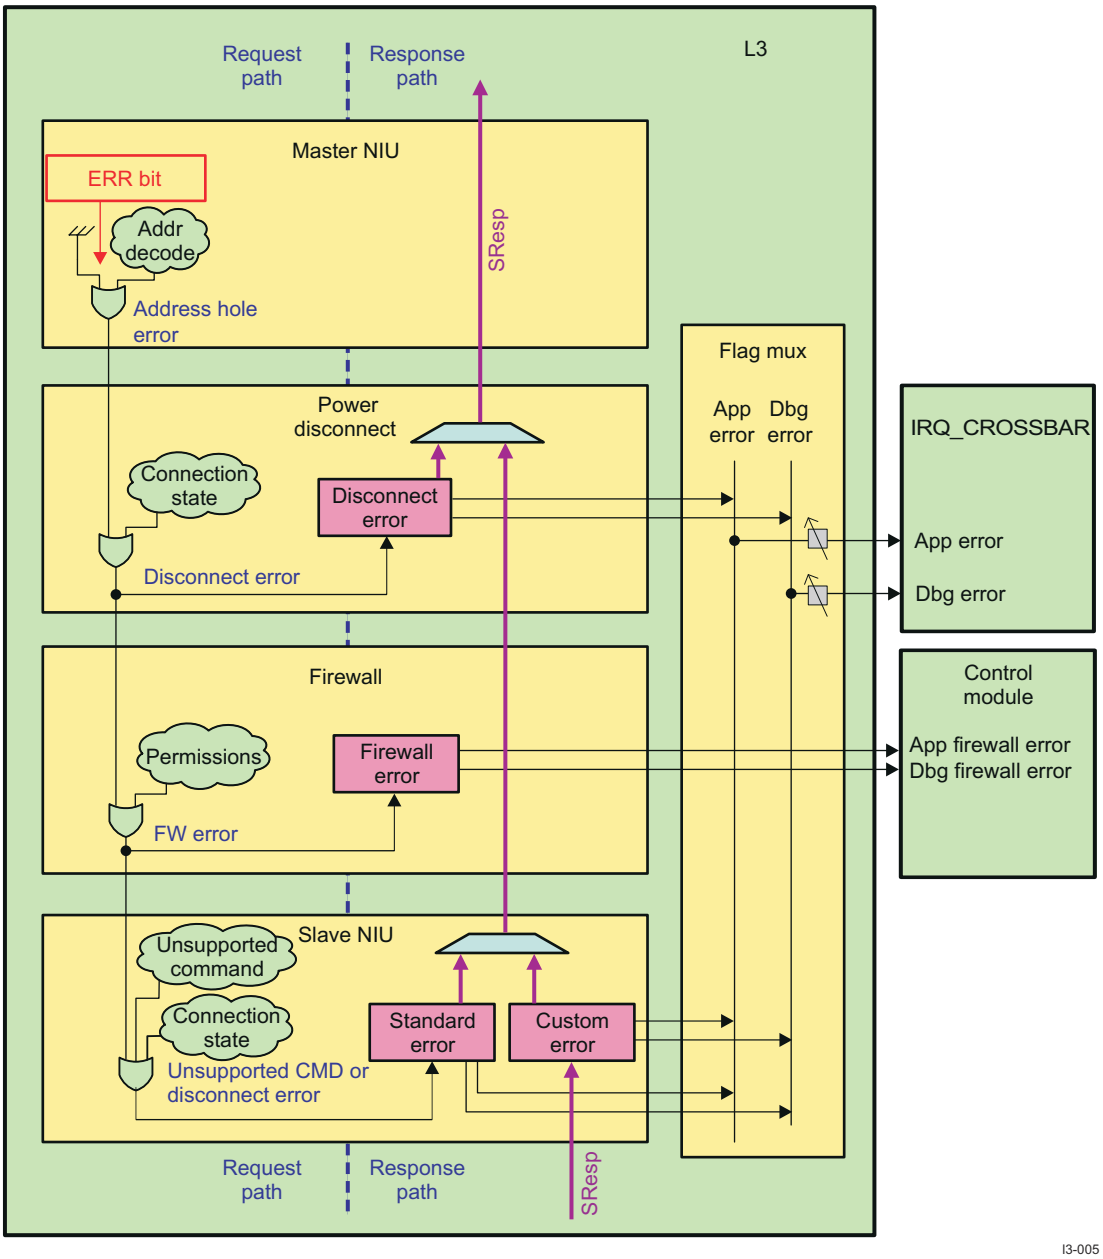

Figure 14-7. L3_MAIN Global Error-Routing Scheme

14.2.3.8.2 Slave NIU Error Logging

Error logging is implemented only at slave NIUs. Because the interconnect does not support master NIU error logging, an erroneous packet must be created and sent to one of the slave NIUs. The slave NIU that receives an erroneous packet is predictable but can change per master (see Table 14-23).

Table 14-23. L3_MAIN Connectivity and Holes Error Routing

Master	Connectivity and Holes Errors Logged Into Slave NIUs
All initiators except DSP1_CFG	GPMC_TARG
DSP1_CFG	EVE1_TARG

The slave NIU can be configured to report standard errors (errors generated within the interconnect):

- Firewall error: Protection violation; this error indicates that a request was rejected by a firewall and is reported to the control module. For more information, see Section 14.2.3.7.3.4, *L3_MAIN Firewall Error Logging.*
- Address hole: This error reports an unknown address for a request. The address map is local to each master NIU; therefore, an address hole error is reported each time a master NIU requests an access to a slave NIU to which it is not logically connected, even if this address exists in the global L3_MAIN address map. This error is detected only once per burst.
- Unsupported commands: This error reports that the master NIU sent a command that cannot be processed, because the slave NIU cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
- Report custom errors: Basically, when the slave answer is SResp = ERR
- Report severity level, for standard error and custom errors:
  - None: Error logging for this type of error is disabled.
  - Error: Error is logged for this type of error.
  - Fault: Error is logged and interrupt is generated for this type of error.
- Generate interrupt on 2 bits depending on the MReqDebug qualifier:
  - Application error - FAULT[0]
  - Debug error - FAULT[1]

  By default, all slave NIUs are configured with standard and custom error levels set to FAULT. The errors are reported on the two flag muxes (see Figure 14-7), depending on the access type, application or debug. For more information, see Section 14.2.3.8.3, *Flag Mux Error Logging*.

  The slave NIU power-disconnect component also has error logging enabled, because in this case the slave NIU is in a clock domain that is switched off and therefore cannot catch the error. By nature, this component can generate only standard errors. By default, it is configured with the error level set to FAULT.

  Wake up on demand: If an error packet reaches a slave NIU that is set with MDiscBehave = 1 (wake up on demand), then the active signal is asserted and L3 processes the error generation when the slave is awake. Although this is inefficient, it simplifies NIU implementation and should not be a problem because errors are supposed to occur only during software debug.

14.2.3.8.3 Flag Mux Error Logging

All fault signals are sent to a flag mux component. There are four important FLAGMUX registers:

- L3_FLAGMUX_MASK0: Masks application error sources
- L3_FLAGMUX_MASK1: Masks debug error sources
- L3_FLAGMUX_REGERR0: Checks which application error sources are active
- L3_FLAGMUX_REGERR1: Checks which debug error sources are active

The two L3_FLAGMUX_MASK registers mask bit 0 or bit 1 of the flag inputs, and the L3_FLAGMUX_REGERR registers read input errors. Each register is dedicated to reporting the bit corresponding to the register number.

Table 14-24 describes the mapping of the flags to the corresponding sources.

Table 14-24. Interconnect Flag Mapping

	Flag Mux Input	Source
CLK1_1 Flag Mux	1	DMM_P1
	4	DMM_P2
	6	DSP1 SDMA

(1) VCP1 and VCP2 are not supported on the AM571x / AM570x family of devices.

Note

Missing inputs in Table 14-24 are reserved. Writing inside the reserved spaces has no effect.

14.2.3.8.4 Severity Level of Standard and Custom Errors

The slave NIU registers are important for error logging.

- The L3_TARG_STDERRLOG_SVRTSTDLVL register shows the severity level for standard errors. According to the severity level, error logging is disabled, enabled with level ERROR, or enabled with level ERROR and flag FAULT.
- The L3_TARG_STDERRLOG_SVRTCUSTOMLVL register shows the severity level for custom errors.
- The L3_TARG_STDERRLOG_MAIN register (the main register for error-logging management) shows the validity of the logged information, standard or custom.
- The L3_TARG_STDERRLOG_HDR register stores packets in case of a standard error.
- The L3_TARG_STDERRLOG_MSTADDR register returns the MSTADDR field of the logged packet.
- The L3_TARG_STDERRLOG_SLVADDR register returns the SLVADDR field of the stored packet.
- The L3_TARG_STDERRLOG_INFO register saves the information field of the logged packet.

14.2.3.8.5 Example for Decoding Standard/Custom Errors Logged in L3_MAIN

Following is a procedure that must be followed for identifying Standard/Custom errors logged in L3_MAIN:

- Read the *_STDERRLOG_MAIN registers (L3_HOST_STDERRLOG_MAIN & L3_TARG_STDERRLOG_MAIN):
  - bit[0]STDERRLOG_MAIN_ERRLOGVLD = 0 -> NO ERROR
  - bit[0]STDERRLOG_MAIN_ERRLOGVLD = 1 -> ERROR
  - Error type is visible through:
    - bit[1]STDERRLOG_MAIN_ERRTYPE = 0 -> Standard Error (FW error, Address Hole, Unsupported command, OCP disconnect)
    - bit[1]STDERRLOG_MAIN_ERRTYPE = 1 -> Custom Error
- Standard Error:
  - Read L3_TARG_STDERRLOG_HDR[3:0] STDERRLOG_HDR_OPCODE
  - Read L3_TARG_STDERRLOG_MSTADDR[7:0] STDERRLOG_MSTADDR - > 8-bit NTTP master address used to distinguish the different initiators (see Table 14-10). That master address is also referred to as ConnID or MConnID.
  - Read L3_TARG_STDERRLOG_SLVADDR[4:0] STDERRLOG_SLVADDR -> NTTP Slave Address of the logged packet
  - Read L3_TARG_STDERRLOG_INFO[7:0]STDERRLOG_INFO -> see Section 14.1.1, *Terminology* for details.

The procedure for Custom error is the same, but the *_STDERRLOG_CUSTOMINFO_* registers should be read.

14.2.4 L3_MAIN Interconnect Programming Guide

14.2.4.1 L3 _MAIN Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L3_MAIN interconnect module.

14.2.4.1.1 Global Initialization

14.2.4.1.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the L3_MAIN interconnect module is to be used for the first time after a device reset. The initialization of surrounding modules is based on the integration and environment of the L3_MAIN interconnect. For more information, see Section 14.2.2, *L3_MAIN Interconnect Integration* .

Table 14-25. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see Chapter 3, *Power, Reset, and Clock Management*.
Control module	For information about the configuration of the control module, see Chapter 18, *Control Module*.
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 17, *Interrupt Controllers*.

Table 14-25. Global Initialization of Surrounding Modules (continued)

Surrounding Modules	Comments
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.

14.2.4.2 Operational Modes Configuration

14.2.4.2.1 L3_MAIN Interconnect Error Analysis Mode

14.2.4.2.1.1 Main Sequence: L3_MAIN Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

Figure 14-8 shows the software sequence required in most cases.

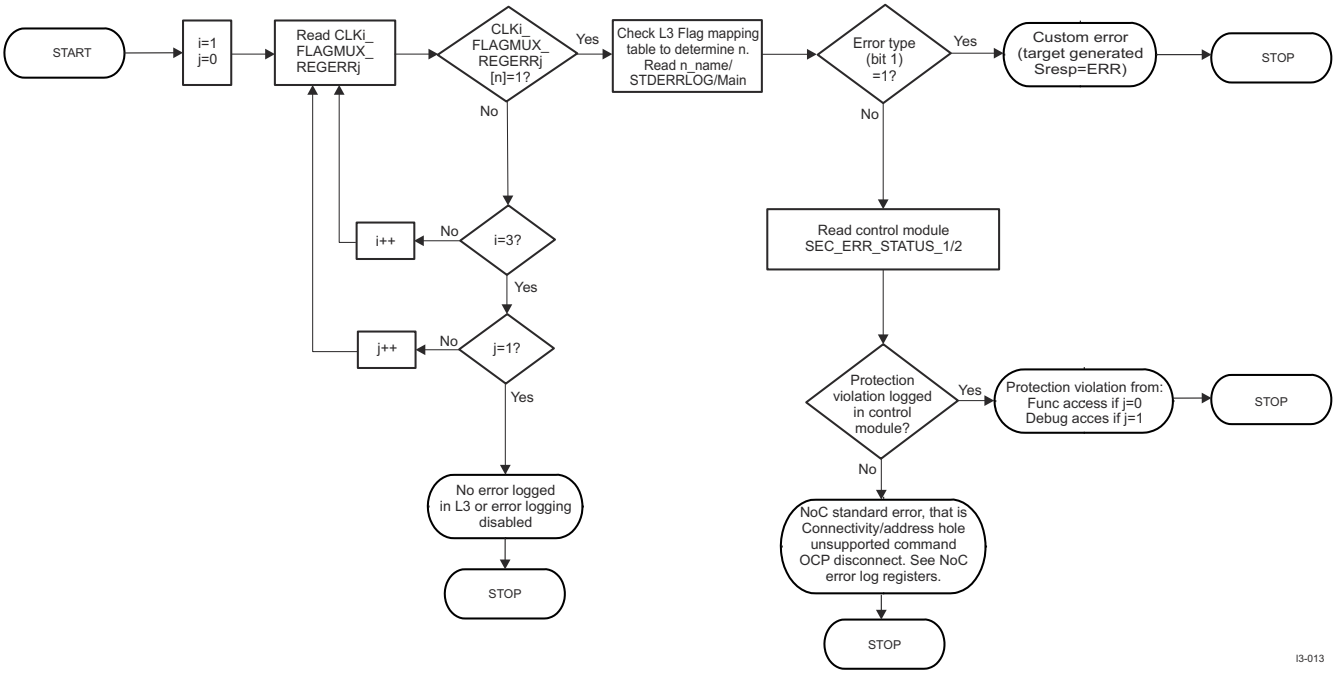

Figure 14-8. Typical Error Analysis Sequence

Note

In case flag is set due to timeout flagmux, the user can check the status in CONTROL_SEC_ERR_STATUS for that timeout flagmux.

Table 14-26 lists the subprocess call summary for error analysis mode in the main sequence.

Table 14-26. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L3 interconnect error analysis	See Section 14.2.4.2.1, *L3_MAIN Interconnect Error Analysis Mode.*
L3_MAIN interconnect protection violation error identification	See Section 14.2.4.2.1.1.2, *Subsequence: L3_MAIN Interconnect Protection Violation Error Identification.*
L3_MAIN interconnect unsupported command/address hole error identification	See Section 14.2.4.2.1.1.3, *Subsequence: L3_MAIN Interconnect Standard Error Identification.*
L3_MAIN interconnect reset FLAGMUX and module	See Section 14.2.4.2.1.1.4, *Subsequence: L3_MAIN Interconnect FLAGMUX Configuration.*

14.2.4.2.1.1.1 Subsequence: L3_MAIN Custom Error Identification

The procedure listed in Table 14-27 describes custom error identification.

Table 14-27. Custom Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is custom error detected?	L3_TARG_STDERRLOG_MAIN[1] STDERRLOG_MAIN_ERRTYPE	=0x1
Read information field of the response packet.	L3_TARG_STDERRLOG_CUSTOMINFO_INFO[7:0] STDERRLOG_CUSTOMINFO_INFO	xxx
Read the address of the initiator that caused error.	L3_TARG_STDERRLOG_CUSTOMINFO_MSTADDR[10:0] STDERRLOG_CUSTOMINFO_MSTADDR	xxx
Read the type of operation (read/write).	L3_TARG_STDERRLOG_CUSTOMINFO_OPCODE[1:0] STDERRLOG_CUSTOMINFO_OPCODE	xxx
ENDIF		

14.2.4.2.1.1.2 Subsequence: L3_MAIN Interconnect Protection Violation Error Identification

The procedure listed in Table 14-28 describes protection violation error identification and where it is logged in the control module registers. Two types of errors are logged: application errors and debug errors.

Table 14-28. L3_MAIN Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read the burst violation.	ERROR_LOG_k[23] 2D_BURST_VIOLATION	xxx
Read the initiator ID.	ERROR_LOG_k[3:0] ConnID	xxx
Read the command that caused the error.	ERROR_LOG_k[7] MCMD	xxx
Read the address of the request that caused the error.	ERROR_LOG_k[31:12] SLVOFS_LOGICAL	xxx
IF: Is it an application error?	L3_FLAGMUX_REGERR0 [31:0] REGERROR0	0x0
Read the status bits to see which module firewall has worked.	CONTROL.SEC_ERR_STATUS_FUNC_1[20:0]	xxx
Clear the status bits.	CONTROL.SEC_ERR_STATUS_FUNC_1[20:0]	xxx
Clear the status bit.	L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG	0x0
ELSE IF	L3_FLAGMUX_REGERR1[7:0] REGERROR1	= 0x1
Read the status bits to see the module.	CONTROL.SEC_ERR_STATUS_DEBUG_1[20:0]	xxx
Clear the status bits.	CONTROL.SEC_ERR_STATUS_DEBUG_1[20:0]	xxx
Clear the status bit.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_MAIN_CLRLOG	0x0
ENDIF		
Clear the burst violation.	ERROR_LOG_k[23] 2D_BURST_VIOLATION	0x0
Clear the error status.	ERROR_LOG_k[21:17] REGION_START_ERRLOG	0x00

14.2.4.2.1.1.3 Subsequence: L3_MAIN Interconnect Standard Error Identification

The procedure listed in Table 14-29 describes the identification of standard errors inside the L3_MAIN interconnect. The standard errors are: unsupported command, address hole, and disconnect.

Table 14-29. L3_MAIN Standard Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is an error detected?	L3_TARG_STDERRLOG_MAIN[18] STDERRLOG_MAIN_ERRCNT	= 0x1
Read the corresponding flag.	L3_FLAGMUX_REGERR0[31:0] REGERROR0	xxx
Read the corresponding flag.	L3_FLAGMUX_REGERR1[31:0] REGERROR1	xxx
Localize the slave NIU that generated the error.	See Table 14-24.	
ELSE		
Clear the error log.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_MAIN_CLRLOG	0x0

Table 14-29. L3_MAIN Standard Error Identification (continued)

Step	Register/Bit Field/Programming Model	Value
Clear the severity error status.	L3_TARG_STDERRLOG_SVRTSTDLVL[1:0] STDERRLOG_SVRTSTDLVL_0	0x2
ENDIF		

14.2.4.2.1.1.4 Subsequence: L3_MAIN Interconnect FLAGMUX Configuration

The procedures listed in Table 14-30 and Table 14-31 give information about the configuration of FLAGMUX masks.

Table 14-30. FLAGMUX Configuration

Step	Register/Bit Field/Programming Model	Value
Set the FLAGMUX masks to mask an event.	L3_FLAGMUX_MASK031:0] MASK0 L3_FLAGMUX_MASK1[31:0] MASK1	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_REGERR0[31:0] REGERR0 L3_FLAGMUX_REGERR1[31:0] REGERR1	xxx
Clear the slave NIU error log and the FLAGMUX error.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_SVRTSTDLVL_0	0x1

Table 14-31. FLAGMUX Time-out1/2 Configuration (fro CLK1_1 and CLK1_2)

Step	Register/Bit Field/Programming Model	Value
Enable time-out for target.	L3_FLAGMUX_TIMEOUTx_MASK0[24:0] MASK0 (1)	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_TIMEOUTx_REGERR0[24:0] REGERR0 (1)	xxx

(1) x = 1 for CLK1_FLAGMUX_CLK1_1
x=2 for CLK1_FLAGMUX_CLK1_2
Bit fields are [24:0] for CLK1_FLAGMUX_CLK1_1, [20:0] for CLK1_FLAGMUX_CLK1_2

Table 14-32. FLAGMUX Time-out Configuration (for CLK2_1)

Step	Register/Bit Field/Programming Model	Value
Enable time-out for target.	L3_FLAGMUX_TIMEOUT_MASK0[1:0] MASK0	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_TIMEOUT_REGERR0[1:0] REGERR0	xxx

14.2.5 L3_MAIN Interconnect Register Manual

Note

ATL, VCP1, VCP2, MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

14.2.5.1 L3_MAIN Register Group Summary

The registers in the L3 interconnect are divided into eight groups:

- Firewall registers (see Table 14-34)
- HOST registers (see Table 14-62)
- TARG registers (see Table 14-98)
- FLAGMUX registers (see Section 14.2.5.1.4 thru Section 14.2.5.1.6)
- BW registers (see Table 14-200)
- STATCOLL registers (see Table 14-237)

14.2.5.1.1.2 L3_MAIN Firewall Registers Description

Note

Hardware reset values can be modified by exported values from the control module at reset.

Table 14-44. ERROR_LOG_k

Address Offset	0x0000 0000+(0x10*k)	**Index**	See Table 14-34 to Table 14-43.
Physical Address	See Table 14-34 to Table 14-43.	**Instance**	See Table 14-34 to Table 14-43.
Description	Error log register for port k		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								BLK_BURST_VIOLATION	RESERVED	REGION_START_ERRLOG						REGION_END_ERRLOG								REQINFO_ERRLOG							

Bits	Field Name	Description	Type	Reset
31:24	RESERVED	Reads return 0s.	R	0x00
23	BLK_BURST_VIOLATION	Read 0x1: 2D burst not allowed or exceeding allowed size Write to clear ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers	RW	0
22	RESERVED	Reads return 0s.	R	0
21:17	REGION_START_ERRLOG	Read: Wrong access hit this region number Write to clear ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers	RW	0x00
16:12	REGION_END_ERRLOG	Read: Wrong access hit this region number Write to clear ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers	RW	0x00
11:0	REQINFO_ERRLOG	Read: Error in reqinfo vector mapped as follows: [11: 8] ConnID [3:0] [7] MCMD [0] [6:4] MreqDomain(1) [3] MReqDebug [2] Reserved [1] MReqSupervisor [0] MReqType Write to clear ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers	RW	0x000

(1) MreqDomain is supported only on SR2.1.

14.2.5.1.3 L3_MAIN TARG Register Summary and Description

Note

ATL, VCP1, VCP2, MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

Table 14-115. L3_TARG_STDHOSTHDR_MAINCTLREG

Address Offset	See Table 14-98.		
Physical Address	See Table 14-98 to Table 14-110	**Instance**	See Table 14-98 to Table 14-110
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												STDHOSTHDR_MAINCTLREG_CM	STDHOSTHDR_MAINCTLREG_FLT	RESERVED	STDHOSTHDR_MAINCTLREG_EN

Bits	Field Name	Description	Type	Reset
31:4	RESERVED	Reserved	R	0x0000000
3	STDHOSTHDR_MAINCTLREG_CM	Reserved for internal testing. Must be set to 0. Type: Control. Reset value: 0x0.	R	0
2	STDHOSTHDR_MAINCTLREG_FLT	Asserted when a Fault condition is detected: if the unit includes Error Logging, Flt is asserted when the FltCnt register field indicates a Fault, and deasserted when FltCnt is reset. If no Error Logging is implemented, this bit becomes unit-dependent. In all cases, Flt bit and Flt pin (service network) have the same logical level. Type: Status. Reset value: X.	R	0
1	RESERVED	Reserved	R	0
0	STDHOSTHDR_MAINCTLREG_EN	Sets the global core enable. Note: A disabled master does not generate any NTTP requests, and a disabled slave replies with an error packet to any request it receives. Type: Control. Reset value: 0x1.	RW	1

14.2.5.1.7 L3_MAIN BW Regulator Register Summary and Description

Note

ATL, VCP1, VCP2, MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

14.2.5.1.9 L3_MAIN STATCOLL Register Summary and Description

Note

ATL, VCP1, VCP2, MLB and USB3 (ULPI) are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

Table 14-235. STATCOLL Instance Summary

Module Name	Base Address	Size

14.3 L4 Interconnects

This section details the device L4 interconnects.

14.3.1 L4 Interconnect Overview

The device uses three separate L4 interconnect structures to connect peripheral modules. All L4s handle transfers with peripherals but are located in distinct power domains.

Figure 14-9 is an overview of the L4 interconnects and the peripherals attached to them.

The L4 interconnect is composed of the following interconnects:

- L4_CFG: Includes the majority of the configuration interface for L3_MAIN system modules and peripheral interconnect
- L4 PER: Includes the main peripherals in the device. L4_PER is further divided into three sub-interconnects: L4_PER1, L4_PER2 and L4_PER3. As shown in Figure 14-9, each of these L4_PERx sub-interconnects is connected to L3_MAIN initiators via three ports:
  - L4_PER1_P1, L4_PER1_P2, L4_PER1_P3
  - L4_PER2_P1, L4_PER2_P2, L4_PER2_P3
  - L4_PER3_P1, L4_PER3_P2, L4_PER3_P3

  L3_MAIN initiators access the L4_PERx peripherals through these ports. All peripherals attached to L4_PER1 are visible from all three L4_PER1 ports; this is also correct for L4_PER2 and L4_PER3. For information on which initiator can access which L4_PERx port, see .
- L4_WKUP: Includes peripherals attached to the WKUP power domain

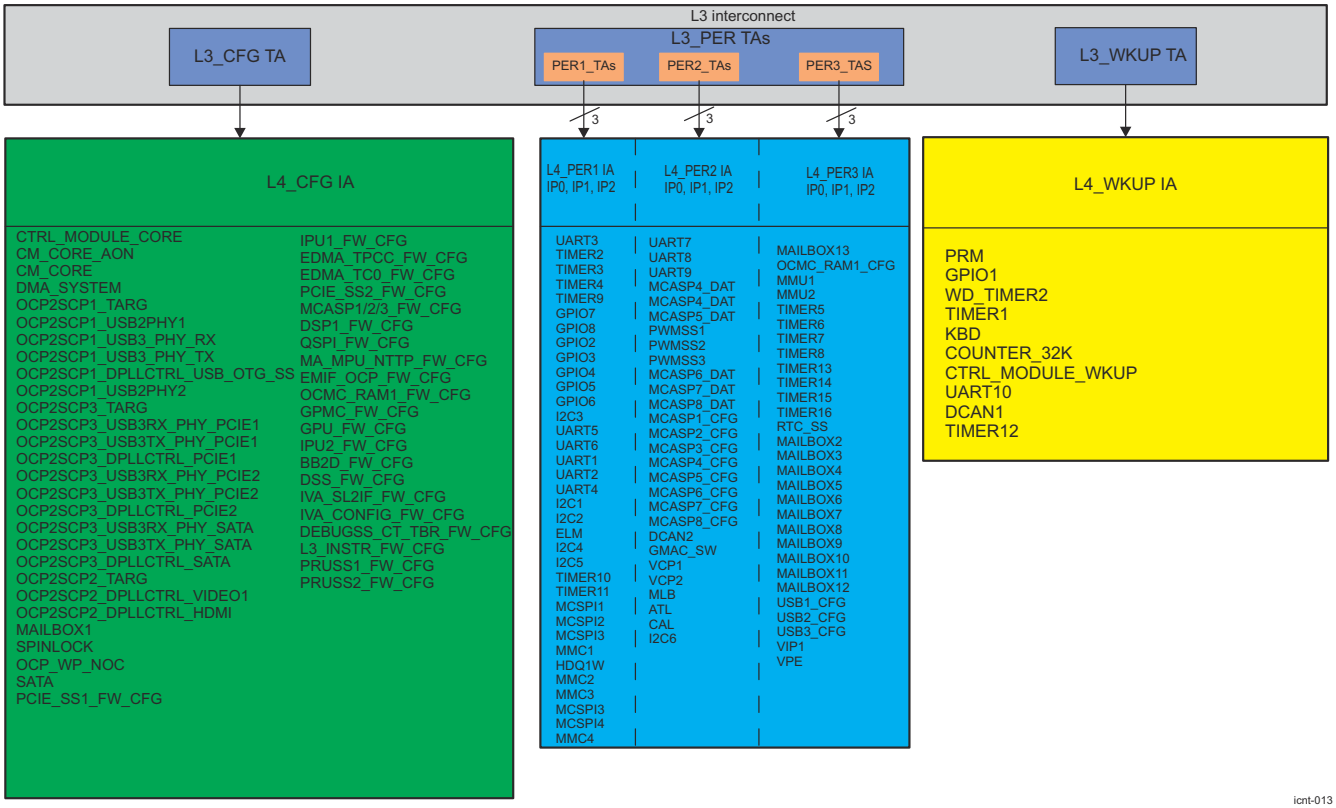

Figure 14-9. L4 Interconnect Overview

Note

ATL, VCP1, VCP2, MLB, USB3 (ULPI) and I2C6 are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

The main features of the L4 interconnects are:

- Eleven ports from L3_MAIN interconnect onto 5 parallel L4 interconnects
- From one to three 32-bit initiator ports for each L4 interconnect instance (11 in total)
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little-endian platform
- Non-blocking architecture with fair arbitration between masters
- Target interfaces: Fully synchronous or divided synchronous clock frequencies
- L4_CFG and L4_PER1, L4_PER2, L4_PER3 frequency equals half of L3 frequency
- Protection logic that provides user-configurable access control to targets by each initiator

14.3.2 L4 Interconnect Integration

Table 14-379 and Table 14-380 summarize the integration of the module in the device.

Table 14-379. Integration Attributes

Module Instance	Attributes
	Power Domain
L4_PER1, L4_PER2, L4_PER3	PD_COREAON
L4_CFG	PD_COREAON
L4_WKUP	PD_WKUPAON

14.3.3 L4 Interconnect Functional Description

14.3.3.1 Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

Table 14-381 through Table 14-390 list all the modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

14.3.3.1.1 L4_PER1 Interconnect Agents

The L4_PER1 interconnect handles transfers only to peripherals in the PER power domain. Table 14-381 lists the L4_PER1 TAs.

Table 14-381. L4_PER1 TAs

Module Target Name	Description
UART3_TARG	Universal Asynchronous Receiver/Transmitter target port
TIMER2_TARG	General Purpose Timer 2 target port
TIMER3_TARG	TIMER3 target port
TIMER4_TARG	TIMER4 target port
TIMER9_TARG	TIMER9 target port
GPIO7_TARG	General-Purpose Interface 7 target port
GPIO8_TARG	GPIO8 target port
GPIO2_TARG	GPIO2 target port
GPIO3_TARG	GPIO3 target port
GPIO4_TARG	GPIO4 target port
GPIO5_TARG	GPIO5 target port
GPIO6_TARG	GPIO6 target port
I2C3_TARG	Inter-Integrated Circuit 3 target port
UART5_TARG	UART5 target port
UART6_TARG	UART6 target port
UART1_TARG	UART1 target port
UART2_TARG	UART2 target port
UART4_TARG	UART4 target port
I2C1_TARG	I2C1 target port
I2C2_TARG	I2C2 target port
ELM_TARG	Error Location Module target port
I2C4_TARG	I2C4 target port
I2C5_TARG	I2C5 target port
TIMER10_TARG	TIMER10 target port
TIMER11_TARG	TIMER11 target port
MCSPI1_TARG	Multi-channel Serial Peripheral Interface 1 target port
MCSPI2_TARG	MCSPI2 target port
MMC1_TARG	MMC1 target port
MMC2_TARG	MMC2 target port
MMC3_TARG	MMC3 target port
HDQ1W_TARG	HDQ1W target port
MCSPI3_TARG	MCSPI3 target port
MCSPI4_TARG	MCSPI4 target port
MMC4_TARG	MMC4 target port

Four ports communicate between the L3_MAIN interconnect and the L4_PER1 interconnect to allow the L3_MAIN initiators to access the L4_PER1 targets. Table 14-382 lists the L4_PER1 initiator TAs.

For the list of initiators authorized to access the L4_PER1, peripherals, see Section 14.2.3.2.2, *Connectivity Matrix*.

Table 14-382. L4_PER1 IAs

Module Iniator Name	Description
L3_MAIN_IP0_INIT	L3 sDMA RD interconnect port
L3_MAIN_IP1_INIT	L3 sDMA WR interconnect port
L3_MAIN_IP2_INIT	L3 MPU subsystem interconnect port

14.3.3.1.2 L4_PER2 Interconnect Agents

The L4_PER2 interconnect handles transfers only to peripherals in the PER power domain. Table 14-383 lists the L4_PER2 TAs.

Table 14-383. L4_PER2 TAs

Module Target Name	Description
UART7_TARG	UART7 target port
UART8_TARG	UART8 target port
UART9_TARG	UART9 target port
MCASP4_DAT_TARG	Multi-Channel Audio Serial Port - DAT target port
MCASP5_DAT_TARG	MCASP5_DAT target port
MCASP6_DAT_TARG	MCASP6_DAT target port
MCASP7_DAT_TARG	MCASP7_DAT target port
MCSAP8_DAT_TARG	MCASP8_DAT target port
MCASP1_CFG_TARG	MCASP1_CFG target port
MCASP2_CFG_TARG	MCASP2_CFG target port
MCASP3_CFG_TARG	MCASP3_CFG target port
MCASP4_CFG_TARG	MCASP4_CFG target port
MCASP5_CFG_TARG	MCASP5_CFG target port
MCASP6_CFG_TARG	MCASP6_CFG target port
MCASP7_CFG_TARG	MCASP7_CFG target port
MCASP8_CFG_TARG	MCASP8_CFG target port
PWM1_TARG	Pulse-Width Modulation 1 target port
PWM2_TARG	PWM2 target port
PWM3_TARG	PWM3 target port
VCP1_CFG_TARG(1)	Viterby Coder/Decoder 1 target port
VCP2_CFG_TARG(1)	Viterby Coder/Decoder 2 target port
MLB_TARG(1)	Media Local Bus target port
ATL_TARG(1)	Audio Tracking Logic target port
DCAN2_TARG	DCAN2 target port
GMAC_SW_TARG	Ethernet Controller target port
I2C6_TARG(1)	I2C6 target port
CAL_TARG	CAL target port

(1) ATL, VCP1, VCP2, MLB, and I2C6 are not supported on the AM571x / AM570x family of devices.

Three ports communicate between the L3_MAIN interconnect and the L4_PER2 interconnect to allow the L3_MAIN initiators to access the L4_PER2 targets. Table 14-384 lists the L4_PER2 initiator TAs.

For the list of initiators authorized to access the L4_PER2 peripherals, see Section 14.2.3.2.2, *Connectivity Matrix*.

Table 14-384. L4_PER2 IAs

Module Iniator Name	Description
L3_MAIN_IP0_INIT	L3 sDMA RD interconnect port
L3_MAIN_IP1_INIT	L3 sDMA WR interconnect port
L3_MAIN_IP2_INIT	L3 MPU subsystem interconnect port

14.3.3.1.3 L4_PER3 Interconnect Agents

The L4_PER3 interconnect handles transfers only to peripherals in the PER power domain. Table 14-385 lists the L4_PER3 TAs.

Table 14-385. L4_PER3 TAs

Module Target Name	Description
TIMER5_TARG	TIMER5 target port
TIMER6_TARG	TIMER6 target port
TIMER7_TARG	TIMER7 target port

MMU1_TARG	Memory Management Unit 1 target port
MMU2_TARG	MMU2 target port
MBX13_TARG	Mailbox 13 target port

(1) USB3 (ULPI) is not supported on the AM571x / AM570x family of devices.
(2) RTC is not supported on the AM570x family of devices.

Three ports communicate between the L3_MAIN interconnect and the L4_PER3 interconnect to allow the L3_MAIN initiators to access the L4_PER3 targets. Table 14-386 lists the L4_PER3 initiator TAs.

For the list of initiators authorized to access the L4_PER3 peripherals, see Section 14.2.3.2.2, *Connectivity Matrix*.

Table 14-386. L4_PER3 IAs

Module Iniator Name	Description
L3_MAIN_IP0_INIT	L3 sDMA RD interconnect port
L3_MAIN_IP1_INIT	L3 sDMA WR interconnect port
L3_MAIN_IP2_INIT	L3 MPU subsystem interconnect port

14.3.3.1.4 L4_CFG Interconnect Agents

The L4_CFG interconnect handles only transfers to peripherals in the CORE power domain. Table 14-387 lists the TAs.

Table 14-387. L4_CFG TAs

Module Target Name	Description
CTRL_MODULE_CORE_TARG	Control Module core target
CM_CORE_AON_TARG	CORE_AON module
CM_CORE_TARG	CM_CORE module

PCIESS2_FW_CFG_TARG	PCIE2 firewall

(1) VCP1 and VCP2 are not supported on the AM571x / AM570x family of devices.
(2) SATA is not supported on the AM570x family of devices.

A unique port, L3_MAIN_INIT, communicates between the L3 interconnect and the L4_CFG interconnect to allow the L3 initiators to access the L4_CFG targets (see Table 14-388).

For the list of initiators authorized to access the L4_CFG peripherals, see Section 14.2.3.2.2, *Connectivity Matrix*.

Table 14-388. L4_CFG IAs

Module Iniator Name	Description
L3_MAIN_IP0	L3 interconnect port

14.3.3.1.5 L4_WKUP Interconnect Agents

The L4-WKUP interconnect handles transfers only to peripherals in the WKUP power domain. Table 14-389 lists the TAs. Table 14-390 lists the L4 WKUP IAs.

Table 14-389. L4_WKUP TAs

Module Target Name	Description
PRM_TARG	PRM module
GPIO1_TARG	GPIO1 module
WD_TIMER2_TARG	Watchdog Timer 2

TIMER12_TARG	Timer 12
KBD_TARG	Keyboard controller
COUNTER_32K_TARG	Counter 32k timer
CTRL_MODULE_WKUP_TARG	Control Module Wakeup module
UART10_TARG	UART10 module
DCAN1_TARG	CAN1 module

Table 14-390. L4_WKUP IAs

Module Iniator Name	Description
L3_MAIN_IP0	L3 interconnect port

14.3.3.2 Power Management

As part of the system-wide power-management scheme, the L4 interconnects go into IDLE state after receiving a request from the PRCM module after all commands are serviced. This function is handled by hardware. For more information, see Chapter 3, *Power, Reset, and Clock Management*.

To reduce power consumption, each L4 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

L4_CFG, L4_PER1, L4_PER2, L4_PER3, and L4_WKUP are located in the always-on power domain and no retention is needed for these L4 interconnects.

14.3.3.3 L4 Firewalls

Figure 14-10 is an internal view of the L4 interconnects in the overall interconnect. This architecture, with one initiator subsystem centralizing all initiator master requests and distributing them to all target modules (peripherals), enables the L4 interconnect firewall functions to be centralized at the L4 initiator subsystem level. The L4 firewall filters the accesses based on the configurable protection groups defined in the L4 address protection (AP) registers. Each module or TA is assigned to a protection group. The configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

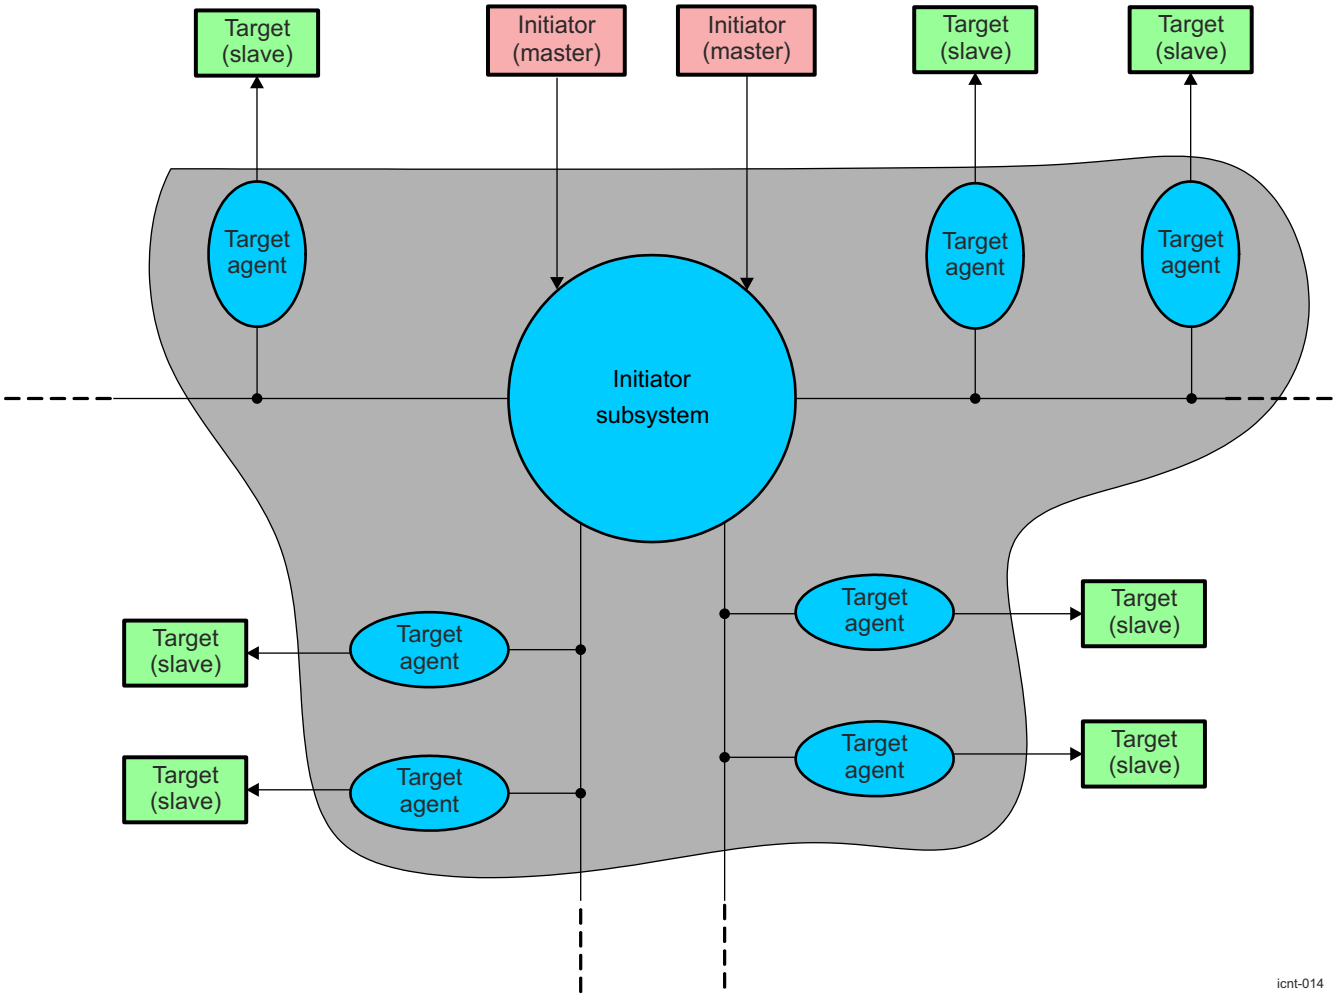

Figure 14-10. L4 Initiator-Target Connectivity

Note

As Figure 14-10 shows, targets are attached to branches. Branches do not impact the function of the L4 interconnect but are present to simplify timing closure and reduce active power consumption.

Because of the large address spaces and the number of peripherals connected to an L4 interconnect, two parameters are used to set up access permission:

- Programmable groups for initiators:
  - Eight protection groups for the L4 interconnect
- Segments divided into regions
  - 85 regions for the L4_PER1 interconnect
  - 63 regions for the L4_PER2 interconnect
  - 97 regions for the L4_PER3 interconnect
  - 129 regions for the L4_CFG interconnect
  - 44 regions for the L4_WKUP interconnect

Protection group members are TAs with the same protection settings. A region is programmed to allow access to a unique selectable protection group. For better protection, different regions are grouped into protection group regions and associated with a protection group member.

14.3.3.3.1 Protection Group

A protection group is defined by its initiators (or members) and MReqInfo is allowed. Two registers define these two settings:

- The 64-bit CONNID_BIT_VECTOR field L4_AP_PROT_GROUP_MEMBERS_k_L and L4_AP_PROT_GROUP_MEMBERS_k_H registers define which initiator belongs to a group. A protection group is accessible by an initiator when the bit position corresponding to its ConnID is set to 1 in the CONNID_BIT_VECTOR field. Table 14-391 lists all the ConnIDs available at the L4 levels.
- The ENABLE field L4_AP_PROT_GROUP_ROLES_k_L register lists all possible MReqInfo combinations associated with the L4_AP_PROT_GROUP_MEMBERS register. Setting a Req bit in this register determines the initiators type of access. For more information, see Section 14.2.3.7, *L3 Firewall Functionality*. Two MReqInfos are used in L4 interconnects: MReqDebug and MReqSupervisor.

Note

Permissions are identical for read and write accesses in L4 interconnect.

k indicates the protection group number.

L indicates the region number.

Table 14-391. L4 ConnID Definition

ConnID	Initiator
0	Cortex-A15 MPU subsystem
1	Debug subsystem
2	DSP1 subsystem (CFG, EDMA, MDMA)
3	IVAHD
5	PRU-ICSS1, PRU-ICSS2
6	IPU1/2; SYSTEM_DMA
7	EDMA
8	DSS, MLB, MMU1, MMU2, PCIE1 and PCIE2
9	VIP1, VPE
A	MMC1, MMC2, GPU, BB2D, GMAC

Table 14-391. L4 ConnID Definition (continued)

ConnID	Initiator
B	USB1, USB2, USB3
C	SATA
D	Reserved
E	Reserved
F	Reserved

Note

ATL, VCP1, VCP2, MLB, USB3 (ULPI) and I2C6 are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

Figure 14-11 is an example of CONNID_BIT_VECTOR.

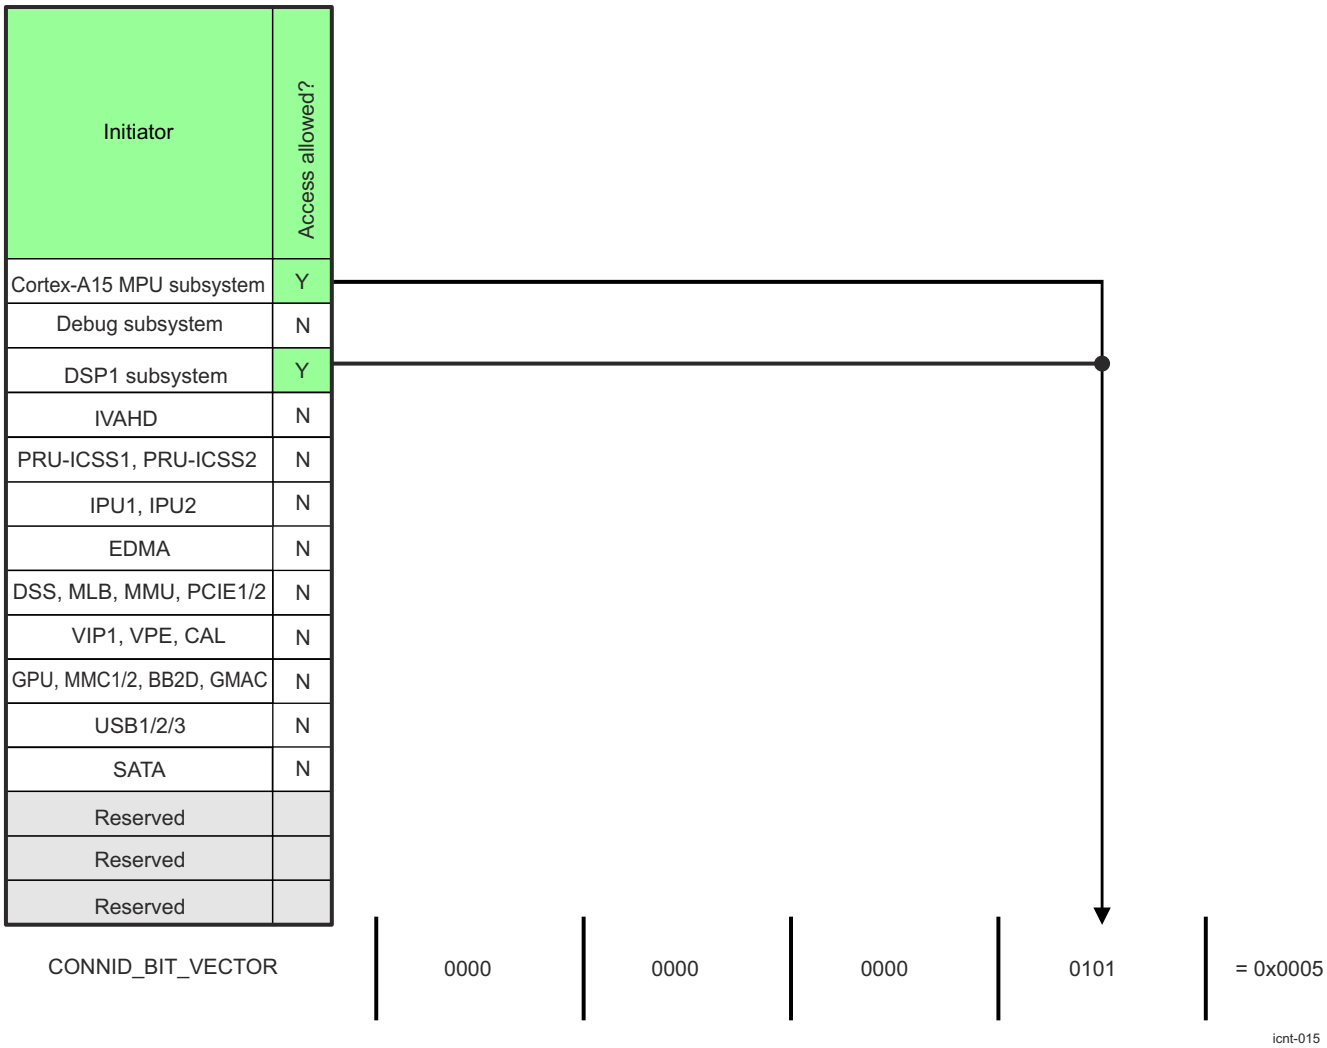

Figure 14-11. Example of CONNID_BIT_VECTOR L4_AP_PROT_GROUP_MEMBERS_k

Setting bits 0 and 2 in the PROT_GROUP_MEMBERS_L register defines a group initiator that can access targets in protection group 1, and includes the following:

- Cortex-A15 MPU subsystem
- DSP subsystem

Protection group 1 can be applied to multiple protection regions with no limitation. Each protection region that is configured with protection group 1 enables permission access only to the two initiators.

The L4_AP_REGION_i_H PROT_GROUP_ID field determines the region to which the protection group member is attached.

The values of some CONNID_BIT_VECTOR and ENABLE fields are exported by the system control module (SCM) at reset or are user writable (see Figure 14-11 for more information).

Table 14-392 and Table 14-395 list the default configuration of the various groups for each L4 interconnect. For each group, some modules or regions are associated with it using default initiator members.

Table 14-392. L4_PER1 Firewall Default Configuration

Group	Default Modules Associated With Group	Register	Modifiability	Default Value

Note

For EXPORTED default values see CTRL_CORE_SEC_ LOAD_FW_EXPORTED_VALUE register in Chapter 18, *Control Module*

14.3.3.3.2 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation, as shown in Figure 14-12. By default, some regions are attached to specific protection group members. This specificity lets users set up the permission access to certain types of modules requiring the same access protection without managing region allocation.

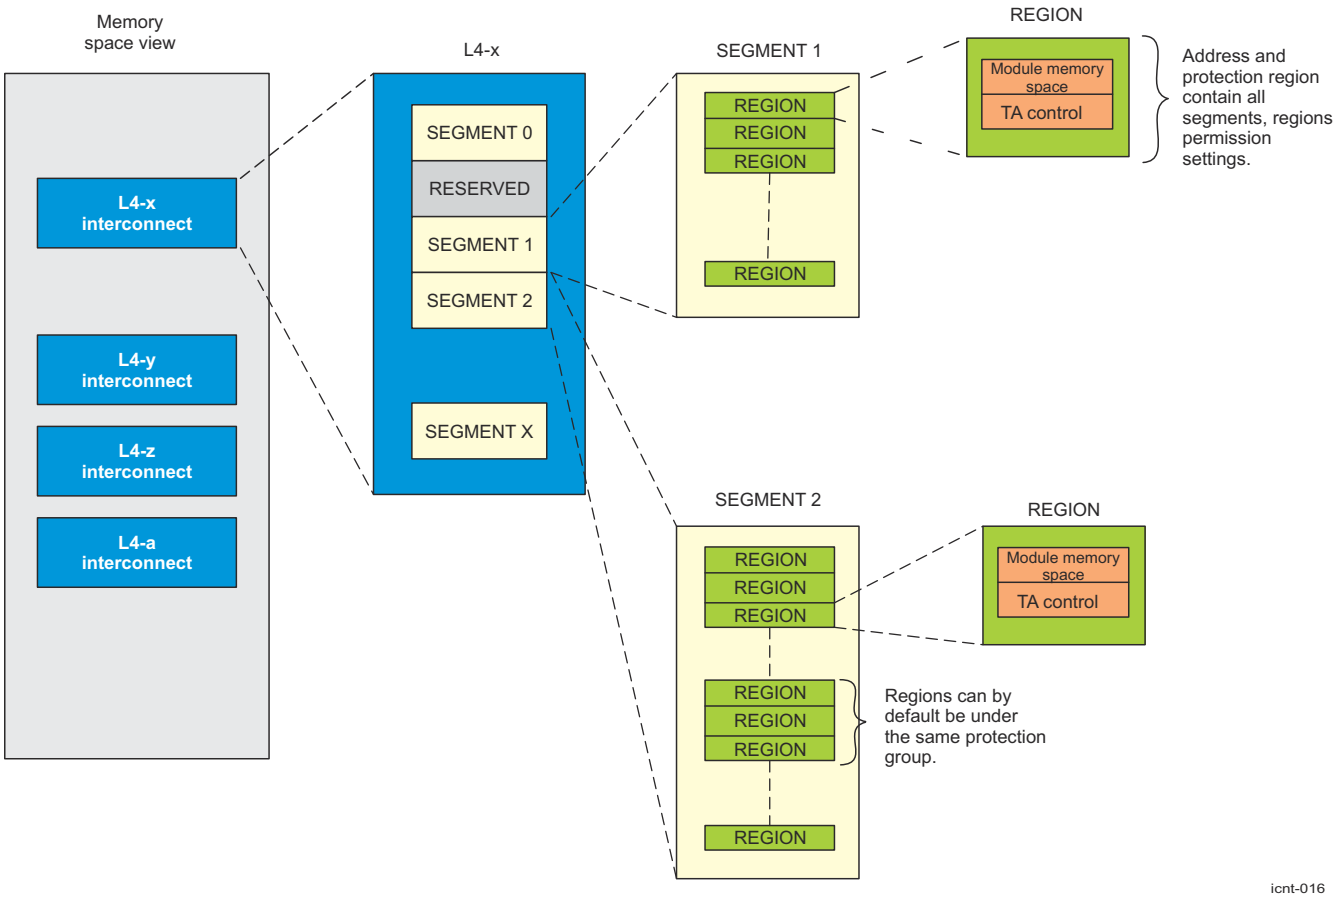

Figure 14-12. L4 Segmentation

All interconnect address spaces are covered by regions. Table 14-397 through Table 14-401 list the module mapping with their addresses, region numbers, and default protection group allocated to them.

Note

Module refers to the configuration registers of the module.

TA (Target Agent) refers to the interconnect configuration registers of the TA associated with the module.

14.3.3.3.3 L4 Firewall Address and Protection Register Settings

Table 14-402 lists the settings of the AP registers relative to an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

Table 14-402. L4 Firewall Register Description Overview

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_i_L (2)	31:0	BASE	Segment base address
	L4_AP_SEGMENT_i_H (2)	5:0	SIZE	Segment size equals to 2^{SIZE}
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L (3)	15:0	CONNID_BIT_VECTOR	For L4ConnID, see Table 14-391.
	L4_AP_PROT_GROUP_ROLES_k_L (3) L4_AP_PROT_GROUP_ROLES_k_H	31:0	ENABLE	See Section 14.2.3.7.3 for REQ_INFO description. (1)

Table 14-402. L4 Firewall Register Description Overview (continued)

Register Type	Register Name	Bits	Field	Description
Region setting	L4_AP_REGION_I_L (4)	20:0	BASE	Defines the base address of region with respect to its segment base address
	L4_AP_REGION_I_H (4)	31:28	MADDRSPACE	Target interconnect MAddrSpace
		26:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	Protection group member attached to the region
		18:17	BYTE_DATA_WIDTH_EXP	Determines the number of bytes in an access
		14:8	PHY_TARGET_ID	Physical target ID
		6:1	SIZE	Size of the region equals to 2^{SIZE}
		0	ENABLE	Enables the region protection

(1) For L4 interconnects, only MReqDebug and MReqSupervisor are available.
(2) i = 0 to 1 for PER1_AP
i = 0 for PER2_AP
i = 0 for PER3_AP
i = 0 to 2 for CFG_AP
i = 0 to 3 for WKUP_AP
(3) k = 0 to 7 for PER1_AP
k = 0 to 7 for PER2_AP
k = 0 to 7 for PER3_AP
k = 0 to 7 for CFG_AP
k = 0 to 7 for WKUP_AP
(4) l = 0 to 84 for PER1_AP
l = 0 to 56 for PER2_AP
l = 0 to 96 for PER3_AP
l = 0 to 128 for CFG_AP
l = 0 to 43 for WKUP_AP

14.3.3.4 L4 Error Detection and Reporting

14.3.3.4.1 IA and TA Error Detection and Logging

The L4 interconnect provides mechanisms for handling internally detected errors or errors reported by modules attached to the L4 target ports.

Note

L4_IA denotes the IA for all L4 interconnects: L4_PER1, L4_PER2, L4_PER3, L4_CFG, and L4_WKUP.

L4_TA denotes the TA for all L4 interconnects: L4_PER1, L4_PER2, L4_PER3, L4_CFG, and L4_WKUP.

The L4 interconnects handle four types of errors:

- No target core found or address hole, detected and logged at IA
- Unsupported command, detected and logged at IA
- Protection violation, detected and logged at IA (see Section 14.3.3.3, *L4 Firewalls*)
- Target does not service a request before a time-out expires. The error is detected and logged at TA (see Section 14.3.3.4.2, *Time-Out*).

Table 14-403 lists the value of the L4_IA_ERROR_LOG_L[25:24] CODE bit field stored when an error occurs.

Table 14-403. L4 CODE Bit Field Definition

CODE (bits 1:0)	Error Type	REQ_INFO	Secondary	ConnID	CMD
0	No error				
1	Unsupported command	x	x	x	x

Table 14-403. L4 CODE Bit Field Definition (continued)

CODE (bits 1:0)	Error Type	REQ_INFO	Secondary	ConnID	CMD
2	Address hole	x	x	x	x
3	Protection violation	x		x	x

- No target core found/address hole: This error indicates that a request was addressed to a hole in the L4 address map. When this error occurs, an in-band error response is returned to the L3 level. The error is also logged into the L4_IA_AGENT_STATUS_L[27] INBAND_ERROR bit. Additionally, an address hole error code is logged to the L4_IA_ERROR_LOG_L[25:24] CODE bit field.
- Unsupported command: This error indicates that the command type of the request is not supported by the accessed target register. The error is logged into the L4_IA_AGENT_STATUS_L[27] INBAND_ERROR bit. An unsupported command error code is written to the L4_IA_ERROR_LOG_L[25:24] CODE bit field for the initiator interface.
- Protection violation: This error indicates that a request is not issued from an allowed initiator member or is issued with the inappropriate ReqInfo qualifiers associated with the target region. This error is reported using an in-band error and is written to the L4_IA_AGENT_STATUS_L[27] INBAND_ERROR bit. A protection violation error code is saved into the L4_IA_ERROR_LOG_L[25:24] CODE bit field for the same initiator interface. A protection violation is also logged in the L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY or [30] PROT_ERROR_PRIMARY bit when in debug or applicative mode, respectively.

  The L4_IA_ERROR_LOG_L[30] SECONDARY bit indicates whether the error occurred in application or debug.

  The L4_IA_ERROR_LOG_H[15:0] REQ_INFO bit field returns the type of access (REQ_INFO qualifier) that caused the error.

  The L4_IA_ERROR_LOG_L[13:8] CONNID bit field returns the ID of the initiator that caused the error.

  The L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR register logs the address for error conditions.

14.3.3.4.2 Time-Out

A time-out mechanism can be enabled at the interconnect level and on a per-target basis. If the mechanism is enabled for a TA and interconnect and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

Note

The time-out mechanism is not available on the L4_WKUP interconnect, but L4_WKUP time-outs are detected in CFG_TA_L4WKUP of the L4_CFG interconnect.

The error is logged in the L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT bit. The affected TA enters an error state that causes it to send an error response to any new request targeted at it. To recover from this state, system software must reset the TA. The time-out is counted starting from the moment a command is presented to the target, regardless of the target response to this command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. The time-base circuit offers four possible sets of four time-base signals. The time-base signals are selected by programming the L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE bit field.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, using the L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT bit field. These four signals are referred to as 1X time-base, 4X time-base, 16X time-base, and 64X time-base.

Table 14-404 lists all values in number of L4 clock cycles.

Table 14-404. L4 Time-out Link and TA Programming

	L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT				
L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	0	1	2	3	4
0	All L4 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16,384
3		1024	4096	16,384	65,536
4		4096	16,384	65,536	262,144

The default reset value is 0x2 for REQ_TIMEOUT and 0x4 for TIMEOUT_BASE, implying 16,384 clock cycles.

A time-out condition is detected when the command acceptance or the response is not received after a delay of from one to three time-base periods.

Example:

- L4 frequency = 65-MHz, 15.3-µs period
- TIMEOUT_BASE = 4 in the L4_LA_NETWORK_CONTROL_L register
- REQ_TIMEOUT = 2 in the L4_TA_AGENT_CONTROL_L for TA A
- REQ_TIMEOUT = 4 in the L4_TA_AGENT_CONTROL_L for TA B

At agent A, the time-base unit is 16,384 cycles. A time-out is issued when a request to the attached module is not accepted, or no response is sent after a delay of 252 µs to 756 µs.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 4 ms to 12 ms.

When a time-out condition is detected, the TA logs the error in the L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT bit, and it also reports the error to the IA, which forwards it to the L3 interconnects.

After the time-out is detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed-out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, software is assumed to first reset the faulty module and then the TA using the L4_TA_AGENT_CONTROL_L[0] OCP_RESET bit.

14.3.3.4.3 Error Reporting

Figure 14-13 shows the error-reporting scheme used in the L4 interconnects. All L4 in-band errors are reported to their respective L3 TA, where errors are converted in an out-of band error signal (the L3 applicative and debug composite flags) going to the L3 INTCs.

Two levels of mask are present to report the error at INTC level:

- At the applicative and debug composite flag, to enable interrupt reporting, the following bits must be set:
  - L4_CFG in L3_FLAGMUX_MASK0 and L3_FLAGMUX_STATUS1
  - L4_PER in L3_FLAGMUX_MASK0 and L3_FLAGMUX_STATUS1
- At the L3 TA level, see Section 14.2.1, *L3 Interconnect*.

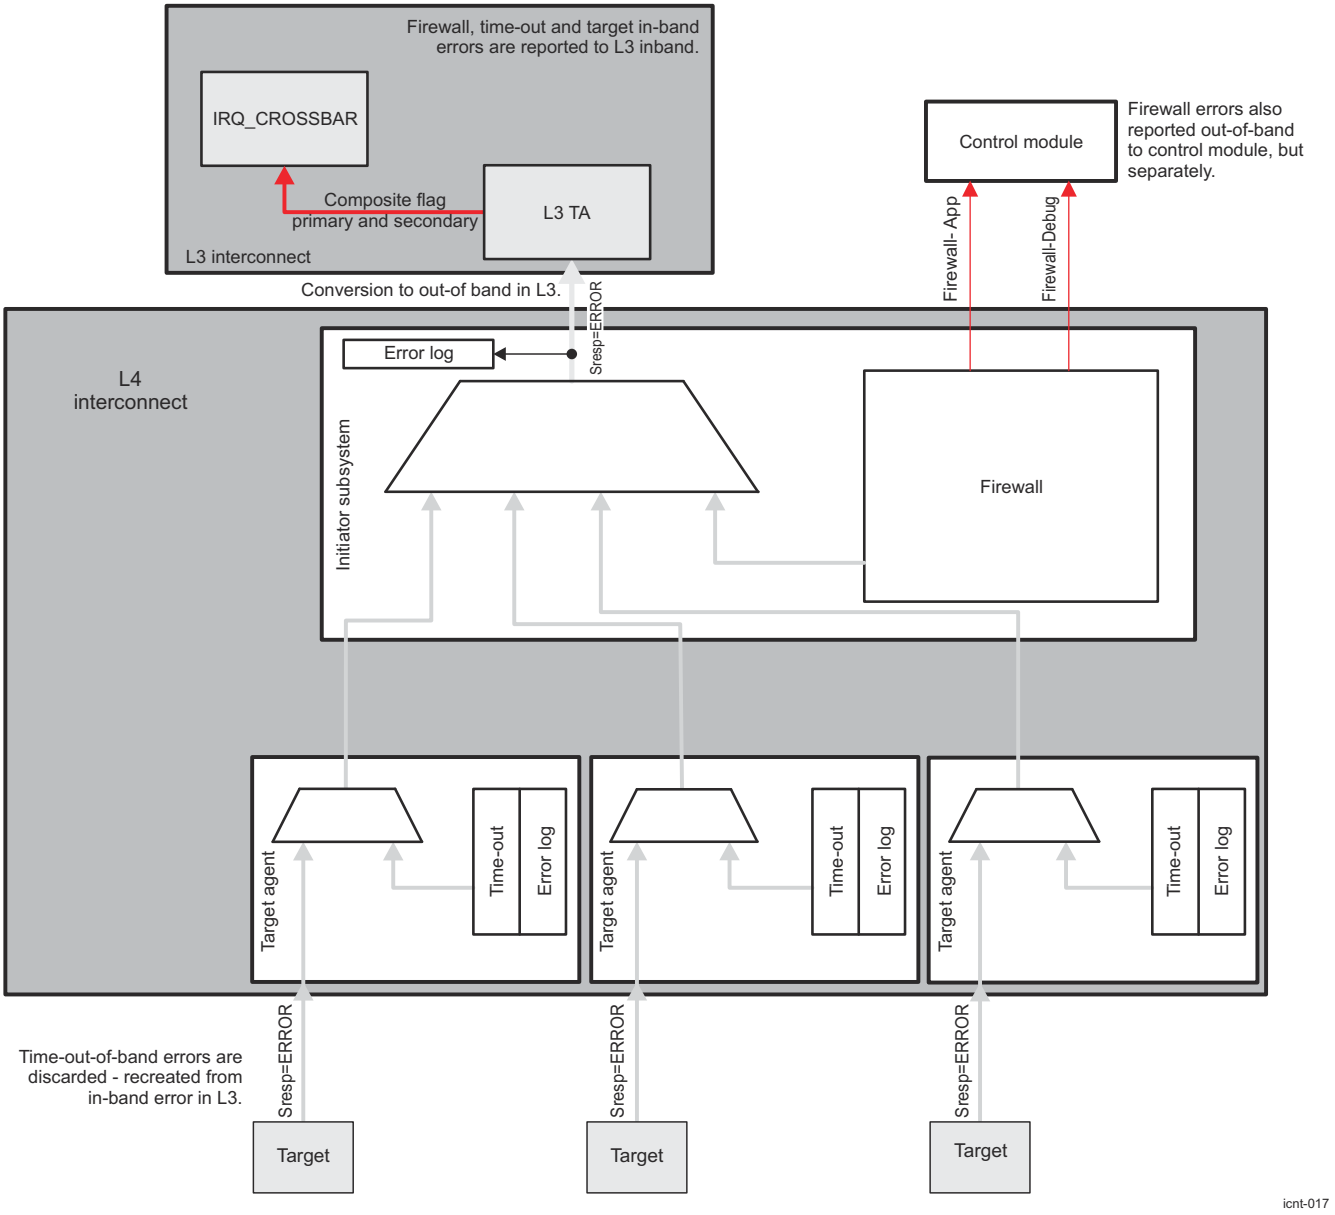

Figure 14-13. L4 Error Reporting

14.3.3.4.4 Error Recovery

Setting the L4_TA_AGENT_CONTROL_L[0] OCP_RESET bit to 1 initiates the software reset period. Software reset must be asserted for at least 16 cycles of the target module interface clock, which can be a divided clock with respect to the L4 clock.

During the software reset period:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to prevent unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT status bit is cleared.

Setting the L4_TA_AGENT_CONTROL_L[0] OCP_RESET bit to 0 terminates the software reset period.

Reset the attached module to complete the recovery.

14.3.3.4.5 Firewall Error Logging in the Control Module

When a protection violation occurs, an interrupt is send to the INTCs (if enabled). An in-band error is sent back to L3 IA and an out-of-band error can also be logged in the CONTROL.CONTROL_SEC_ERR_STATUS register in the SCM. These out-of-band errors are enabled and disabled at the L4 IA level by setting the L4_IA_AGENT_CONTROL_L[31][30] PROT_ERROR_SECONDARY_REP or PROT_ERROR_PRIMARY_REP bit to 1 for debug and application mode, respectively.

At the control module level, two logging registers are used, depending on the mode:

- In application mode or primary error reporting:
  - SEC_ERR_STATUS_FUNC_1[16] = L4_PER1 protection violation
  - SEC_ERR_STATUS_FUNC_2[4] = L4_PER2 protection violation
  - SEC_ERR_STATUS_FUNC_2[5] = L4_PER3 protection violation
  - SEC_ERR_STATUS_FUNC_1[17] = L4_CFG protection violation
  - SEC_ERR_STATUS_FUNC_1[22] = L4_WKUP protection violation
- In debug mode or secondary error reporting:
  - SEC_ERR_STATUS_DEBUG_1[16] = L4_PER1 protection violation
  - SEC_ERR_STATUS_DEBUG_2[4] = L4_PER2 protection violation
  - SEC_ERR_STATUS_DEBUG_2[5] = L4_PER3 protection violation
  - SEC_ERR_STATUS_DEBUG_1[17] = L4_CFG protection violation
  - SEC_ERR_STATUS_DEBUG_1[22] = L4_WKUP protection violation

Figure 14-14 shows the global protection error reporting to the control module.

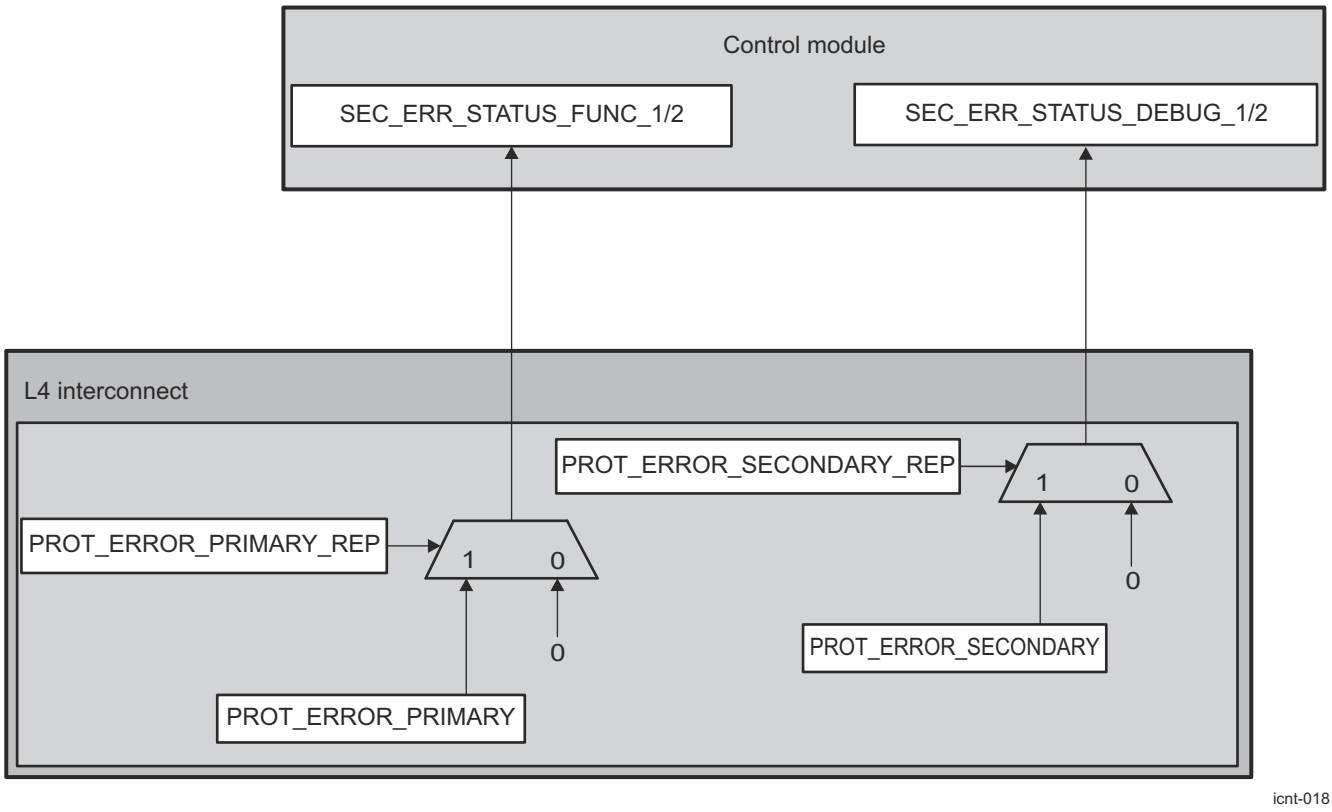

Figure 14-14. Protection Violation Out-of-Band Error Reporting

14.3.4 L4 Interconnect Programming Guide

14.3.4.1 L4 Interconnect Low-level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

14.3.4.1.1 Global Initialization

14.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the L4 interconnect module is used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the L4 interconnect. For more information, see Section 14.3.2, *L4 Interconnect Integration*.

Table 14-405 lists the surrounding modules.

Table 14-405. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For more information about the configuration of the module, see Chapter 3, *Power, Reset, and Clock Management*.
Control module	For more information about the configuration of the module, see Chapter 18, *Control Module*.
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see Chapter 17, *Interrupt Controllers*.
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.
L3 interconnect	For more information about the interconnect configuration, see Section 14.2, *L3 Interconnect*.

14.3.4.1.2 Operational Modes Configuration

14.3.4.1.2.1 L4 Interconnect Error Analysis Mode

14.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

Figure 14-15 shows the software sequence required in most cases.

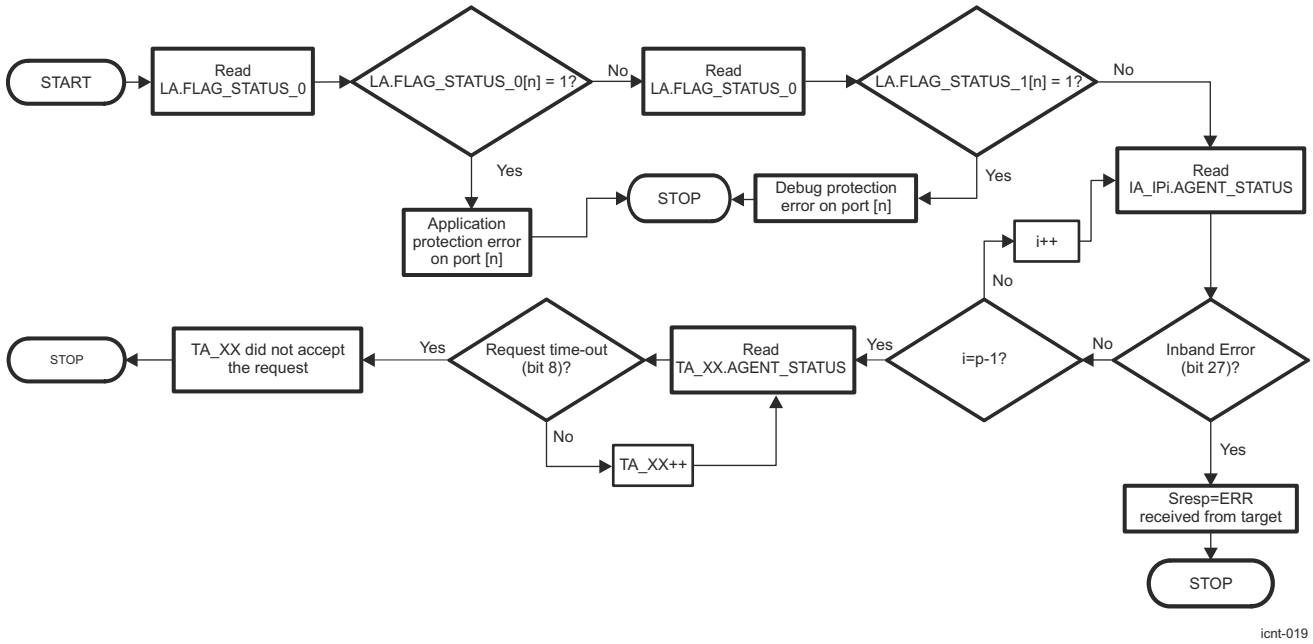

Figure 14-15. Typical Error Analysis Sequence

Note

L4 interconnects don't log any address or other specific information for a custom error returned from any target IP. They rather pass an error response up to the master supposed to analyze it.

In case of posted writes, the master access completes before it actually completed at the end slave level, this way no error response is sent back to the master, making it impossible to have a direct way of uderstanding the origin of L4 error during posted writes. However, even though no address is logged, an error flag is generated and needs to be processed.

14.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see Table 14-406).

Table 14-406. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	x
Read initiator ID.	L4_IA_ERROR_LOG_L[13:8] CONNID	xxxxx
Read command that cause the error.	L4_IA_ERROR_LOG_L[2:0] CMD	xxx
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	xxxxxxxxx
IF: Is it a primary error?	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	=0x1
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_FUNC	xx
Write 1 to clear status bits.	CONTROL.SEC_ERR_STATUS_FUNC_1 [16][17][22] CONTROL.SEC_ERR_STATUS_FUNC_2 [4][5]	xxxx
Write 1 to clear IA status bit.	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
ELSE		
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG	xx
Write 1 to clear status bits.	CONTROL.SEC_ERR_STATUS_DEBUG_1 [16][17][22] CONTROL.SEC_ERR_STATUS_DEBUG_2 [4][5]	xxx

Table 14-406. Protection Violation Error Identification (continued)

Step	Register/Bit Field/Programming Model	Value
Write 1 to clear IA status bit	L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY	0x1
ENDIF		
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear in-band error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

14.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see Table 14-407).

Table 14-407. Unsupported Command/Address Hole Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	x
Read initiator ID.	L4_IA_ERROR_LOG_L[11:8] CONNID	xxxx
Read command that caused the error.	L4_IA_ERROR_LOG_L[2:0] CMD	xxx
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	xxxxxxxx
Read secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	x
Write 1 to clear secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x1
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear inband error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

14.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure describes the reset TA and module (see Table 14-408).

Table 14-408. Reset TA and Module

Step	Register/Bit Field/Programming Model	Value
Reset TA.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x1
Wait until target module clock = 16 cycles.		
Write 0 to clear TA time-out status.	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	0x0
Write 0 to clear TA reset.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x0
Reset the attached module.(1)		

(1) For more information, see the respective module chapter.

14.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

14.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see Table 14-409).

Table 14-409. Time-Out Configuration

Step	Register/Bit Field/Programming Model	Value
Disable time-out.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	0x0
Clear TA time-out error status.(1)	L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT	0x1
Set time-out at TA level.(1)	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	xxx
Set time-out base.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	xxx

(1) Required for each TA.

14.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

14.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see Table 14-410).

Table 14-410. Firewall Configuration

Step	Register/Bit Field/Programming Model	Value
Define the members of protection group k.(1)	L4_AP_PROT_GROUP_MEMBERS_k_L[15:0] CONNID_BIT_VECTOR	xxx
Define the access type of a protection group k.(1)	L4_AP_PROT_GROUP_ROLES_k_L[15:0] ENABLE	xx
Set region affiliation to protection group.(2)	L4_AP_REGION_I_L[22:20] PROT_GROUP_ID	xxx

(1) Required for each protection group.
(2) Required for each region.

14.3.5 L4 Interconnects Register Manual

Table 14-411 through Table 14-415 list all L4 register blocks for IA, TA, AP, and LA. Each module instance is shown with the module register mapping and bit and bit field definitions.

14.3.5.1 L4 Interconnects Instance Summary

Note

ATL, VCP1, VCP2, MLB, USB3 (ULPI) and I2C6 are not supported on the AM571x / AM570x family of devices.

SATA and RTC are not supported on the AM570x family of devices.

Table 14-411. L4_PER1 Instance Summary

Address Offset	0x0000 0020		
Physical Address	See Table 14-444 to Table 14-488	**Instance**	See Table 14-444 to Table 14-488
Description	Enable error reporting		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED							SERROR_REP	RESERVED													REQ_TIMEOUT			RESERVED							OCP_RESET

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	SERROR_REP	Enable logging of error	R	0x0
23:11	RESERVED	Read returns 0.	R	0x0
10:8	REQ_TIMEOUT	Time-out Bound. Values are: 0 - No time-out 1 - 1x base cycles. 2 - 4x base cycles. 3 - 16x base cycles. 4 - 64x base cycles.	RW	0x0
7:1	RESERVED	Read returns 0.	R	0x00
0	OCP_RESET	The OCP_RESET field controls the OCP reset signal to the attached core. Setting this bit clears any pending transfers and resets the OCP interface. The bit must be cleared to deassert the OCP reset signal. When the software reset feature is available on a target agent, the target agent OCP must also have a reset signal directed to the target core.	RW	0

Description	Control interconnect global power control		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED							CLOCK_GATE_DISABLE	RESERVED			THREAD0_PRI	RESERVED											EXT_CLOCK	RESERVED							

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0
23:21	RESERVED	Read returns 0.	R	0x0

Bits	Field Name	Description	Type	Reset
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	1
19:9	RESERVED	Read returns 0.	R	0x000
8	EXT_CLOCK	Global external clock control. When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	RESERVED	Read returns 0.	R	0x00

Chapter 15

Memory Subsystem

This chapter introduces the memory subsystem of the device.

15.1 Memory Subsystem Overview

Figure 15-1 shows a functional diagram of all memory subsystems in the device.

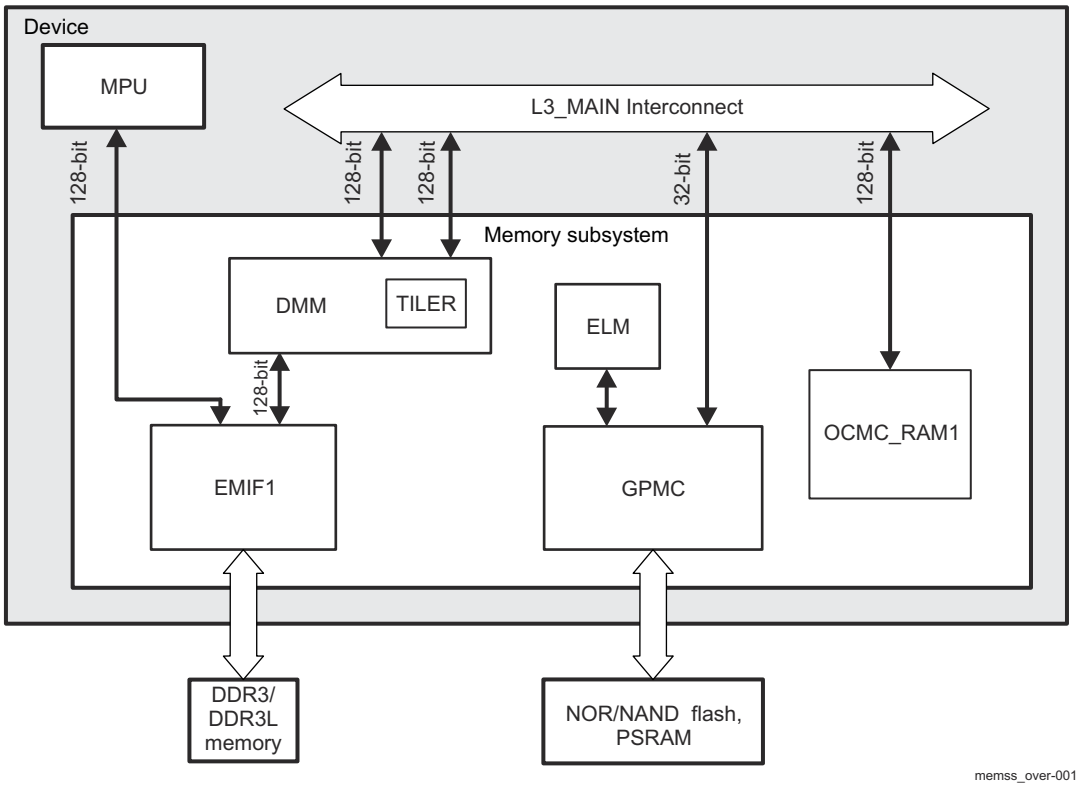

Figure 15-1. Memory Subsystem Functional Diagram

15.1.1 DMM Overview

The dynamic memory manager (DMM) module is typically located immediately in front of the SDRAM controller (EMIF), as shown in Figure 15-1, *Memory Subsystem Functional Diagram*.

In a broad sense, the DMM manages various aspects of memory accesses such as:

- Initiator-indexed priority generation
- Block object transfer optimization – tiling
- Centralized low-latency page translation – MMU-like feature

The dynamic qualifier for memory management highlights the software configurability, and hence the runtime nature, of the four aspects of memory management handled by the DMM.

From a functional perspective, the role of the DMM is to:

- Add initiator-based priority to any incoming requests
- Perform to/from tiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally, provide a low-latency page-based translation to handle memory fragmentation – MMU

The main features of the DMM are:

- Programmable multizone DRAM mapping configuration
- Programmable initiator-based request priority extension
- Single SDRAM page request generation
- Low-latency interconnect port
- Page-grained address translation to manage memory fragmentation

- Automatic synchronized reloading of the address translation table

15.1.2 TILER Overview

The tiling and isometric lightweight engine for rotation (TILER) is a submodule of the DMM and is therefore described in Section 15.2, *Dynamic Memory Manager*.

The TILER is intended to improve bidimensional (tiled) block transfer efficiency. It is, therefore, a module aimed at:

- Primarily, efficient handling of 2-dimension (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally, managing the memory fragmentation and zero-copy physical frame-buffer swapping through a page-grained translation
- Making isometric (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection

The lightweight qualifier of this engine highlights its limited support of isometric transforms, as:

- Rotation performs only basic quadrant rotations by some multiple of 90 degrees.
- Reflection is limited to horizontal and vertical flip.
- Translation is restricted to a 4-KiB page granularity.

Written differently, the functionality of the TILER is to map a 2D virtually addressed interconnect request into one or more physically addressed interconnect requests by:

- Transforming the virtual address, data, and byte-enable to match the requested 0-, 90-, 180-, or 270-degree orientation in a tiled 2D addressing space
- Optionally, translating the oriented tiled address by a page-specific vector to manage memory fragmentation and physical object aliasing

The main features of the TILER are:

- Efficiency improvement of 2D block access on SDRAM
- Optimized interlaced access on tiled frames
- 2D virtual-to-physical address translation of SDRAM bidimensional objects to handle rotation
- Page-grained address translation to manage memory fragmentation and physical buffer aliasing
- Unlimited number of 2D tiled objects supported in any (0, 90, 180, or 270 degrees) orientation
- Full bandwidth use by minimizing the size of raster-based initiator buffers
- Optimization of multichannel memory transfers
- Interconnect request granularity balance (in X and Y directions)

15.1.3 EMIF Overview

The external memory interface (EMIF) moduleis typically located near the DMM module, as shown in Figure 15-1, *Memory Subsystem Functional Diagram*.

The EMIF module provides connectivity between DDR memory types and manages data bus read/write accesses between external memory and device subsystems which have master access to the L3_MAIN interconnect and DMA capability.

The EMIF module has the following capabilities:

- Supports JEDEC standard-compliant DDR3/DDR3L-SDRAM memory types
- 2-GiB SDRAM address range over one chip-select. This range is configurable through the dynamic memory manager (DMM) module
- Supports SDRAM devices with one, two, four or eight internal banks
- Supports SDRAM devices with single or dual die packages
- Data bus widths:
  - 128-bit L3_MAIN (system) interconnect data bus width
  - 128-bit port for direct connection with MPU subsystem
  - 32-bit SDRAM data bus width
  - 16-bit SDRAM data bus width used in narrow mode

- Supported CAS latencies:
  - DDR3: 5, 6, 7, 8, 9, 10 and 11
- Supports 256-, 512-, 1024-, and 2048-word page sizes
- Supported burst length: 8
- Supports sequential burst type
- SDRAM auto initialization from reset or configuration change
- Supports self refresh and power-down modes for low power
- Partial array self-refresh mode for low power
- Output impedance (ZQ) calibration
- Supports on-die termination (ODT)
- Supports prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Programmable SDRAM timing parameters
- Write and read leveling/calibration and data eye training for DDR3.
- ECC on the SDRAM data bus for EMIF1 :
  - 7-bit ECC over 32-bit data
  - 6-bit ECC over 16-bit data when narrow mode is used
  - 1-bit error correction and 2-bit error detection
  - Programmable address ranges to define ECC protected region
  - ECC calculated and stored on all writes to ECC protected address region
  - ECC verified on all reads from ECC protected address region
  - Statistics for 1-bit ECC and 2-bit ECC errors
  - The total width of the ECC DDR data bus is 8 bits

The EMIF module does not support:

- Burst chop for DDR3
- Interleave burst type
- Auto precharge because of better Bank Interleaving performance
- DLL disabling from EMIF side
- SDRAM devices with more than one die, or topologies which require more than one chip select on a single EMIF channel

15.1.4 GPMC Overview

The General Purpose Memory Controller (GPMC) is an external memory controller of the device. Its data access engine provides a flexible programming model for communication with all standard memories.

The GPMC supports the following various access types:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, and 16 Word16)
- Synchronous read/write access
- Synchronous read/write burst access without wrap capability (4, 8 and 16 Word16)
- Synchronous read/write burst access with wrap capability (4, 8 and 16 Word16)
- Address-data-multiplexed (AD) access
- Address-address-data (AAD) multiplexed access
- Little- and big-endian access

The GPMC can communicate with a wide range of external devices:

- External asynchronous or synchronous 8-bit wide memory or device (non burst device)
- External asynchronous or synchronous 16-bit wide memory or device
- External 16-bit non-multiplexed NOR flash device
- External 16-bit address and data multiplexed NOR Flash device
- External 8-bit and 16-bit NAND flash device
- External 16-bit pseudo-SRAM (pSRAM) device

The main features of the GPMC are:

- 8- or 16-bit-wide data path to external memory device
- Supports up to eight CS regions of programmable size and programmable base addresses in a total address space of 1 GiB
- Supports transactions controlled by a firewall
- On-the-fly error code detection using the Bose-ChaudhurI-Hocquenghem (BCH) (t = 4, 8, or 16) or Hamming code to improve the reliability of NAND with a minimum effect on software (NAND flash with 512-byte page size or greater)
- Fully pipelined operation for optimal memory bandwidth use
- The clock to the external memory is provided from GPMC functional clock divided by 1, 2, 3, or 4
- Supports programmable autoclock gating when no access is detected
- Independent and programmable control signal timing parameters for setup and hold time on a per-chip basis. Parameters are set according to the memory device timing parameters, with a timing granularity of one GPMC functional clock cycle.
- Flexible internal access time control (WAIT state) and flexible handshake mode using external WAIT pin monitoring
- Support bus keeping
- Support bus turnaround
- Prefetch and write posting engine associated with a device DMA controller to achieve full performance from the NAND device with minimum effect on NOR/SRAM concurrent access

Note

Page mode is available only in nonmultiplexed mode.

15.1.5 ELM Overview

In the case of NAND modules with no internal correction capability, sometimes referred to as bare NAND, the correction process can be delegated to the error location module (ELM) used in conjunction with the GPMC.

The ELM supports the following features:

- 4, 8, and 16 bits per 512-byte block error location based on BCH algorithm
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation when error location process completes:
  - When the full page has been processed in page mode
  - For each syndrome polynomial (checksum-like information) in continuous mode

15.1.6 OCM Overview

There is one on-chip memory controller (OCMC) in the device.

The OCM Controller supports the following features:

- L3_MAIN data interface:
  - Used for maximum throughput performance
  - 128-bit data bus width
  - Burst supported
- L4 interface:
  - Used for access to configuration registers
  - 32-bit data bus width
  - Only single accesses supported
  - The L4 associated OCMC clock is two times lower than the L3 associated OCMC clock
- Error correction and detection:
  - Single error correction and dual error detection

  - 9-bit Hamming error correction code (ECC) calculated on 128-bit data word which is concatenated with memory address bits
  - Hamming distance of 4
  - Enable/Disable mode control through a dedicated register
  - Single bit error correction on a read transaction
  - Exclusion of repeated addresses from correctable error address trace history
  - ECC valid for all write transactions to an enabled region
  - Sub-128-bit writes supported via read modify write
- ECC Error Status Reporting:
  - Trace history buffer (FIFO) with depth of 4 for corrected error address
  - Trace history buffer with depth of 4 for non correctable error address and also including double error detection
  - Interrupt generation for correctable and uncorrectable detected errors
- ECC Diagnostics Configuration:
  - Counters for single error correction (SEC), double error detection (DED) and address error events (AEE)
  - Programmable threshold registers for exceptions associated with SEC, DED and AEE counters
  - Register control for enabling and disabling of diagnostics
  - Configuration registers and ECC status accessible through L4 interconnect
- Circular buffer for sliced based VIP frame transfers:
  - Up to 12 programmable circular buffers mapped with unique virtual frame addresses
  - On the fly (with no additional latency) address translation from virtual to OCMC circular buffer memory space
  - Virtual frame size up to 8 MiB and circular buffer size up to 1 MiB
  - Error handling and reporting of illegal CBUF addressing
  - Underflow and Overflow status reporting and error handling
  - Last access read/write address history
- Two Interrupt outputs configured independently to service either ECC or CBUF interrupt events

The OCM controller does not have a memory protection logic and does not support endianism conversion.

15.2 Dynamic Memory Manager

15.2.1 DMM Overview

The function of the dynamic memory manager (DMM) is to:

- Add initiator-based priority to any incoming requests
- Perform to-and-from tiling and subtiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally provide a low-latency page-based translation to handle memory fragmentation – memory management unit (MMU)

The DMM is introduced also in Section 15.1.1, *DMM Overview* of Section 15.1, *Memory Subsystem Overview*.

The functions of the TILER are:

- Primary handling efficiently 2-dimensional (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally managing the memory fragmentation and zero-copy physical frame buffers swapping through a page-grained translation
- Allowing optimized interlaced accesses on tiled frames
- Making (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection

The TILER is also introduced in Section 15.1.2, *TILER Overview* of Section 15.1, *Memory Subsystem Overview*.

Figure 15-2 is an overview of the DMM and TILER in the device.

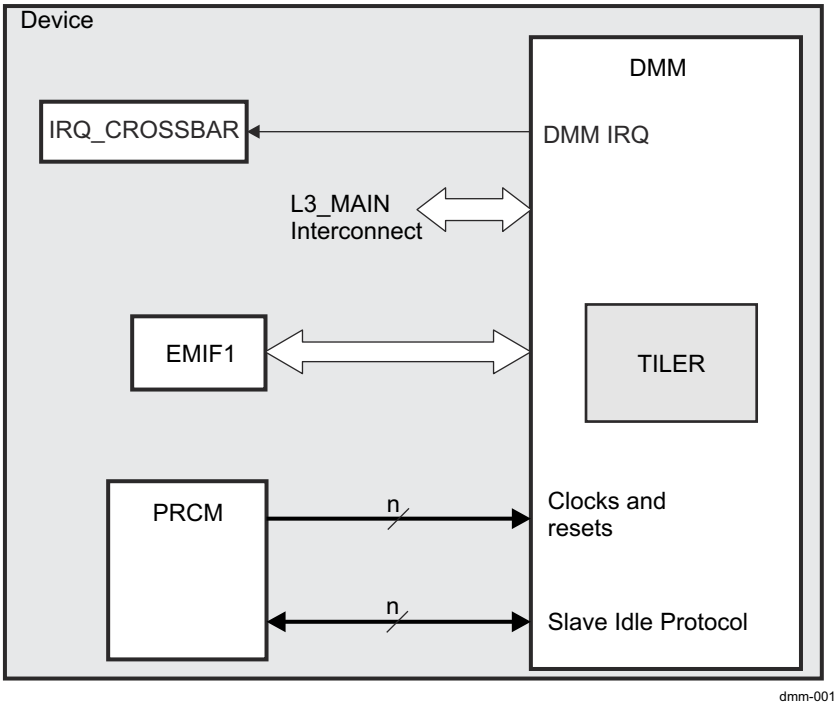

Figure 15-2. DMM and Tiler Overview

15.2.2 DMM Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- Slave idle protocol (the DMM supports only smart-idle mode)
- No master standby protocol
- No wake-up request

- No system direct memory access requests
- One interrupt line for interrupt request (IRQ)
- One functional clock

Figure 15-3 shows the integration of DMM in the device.

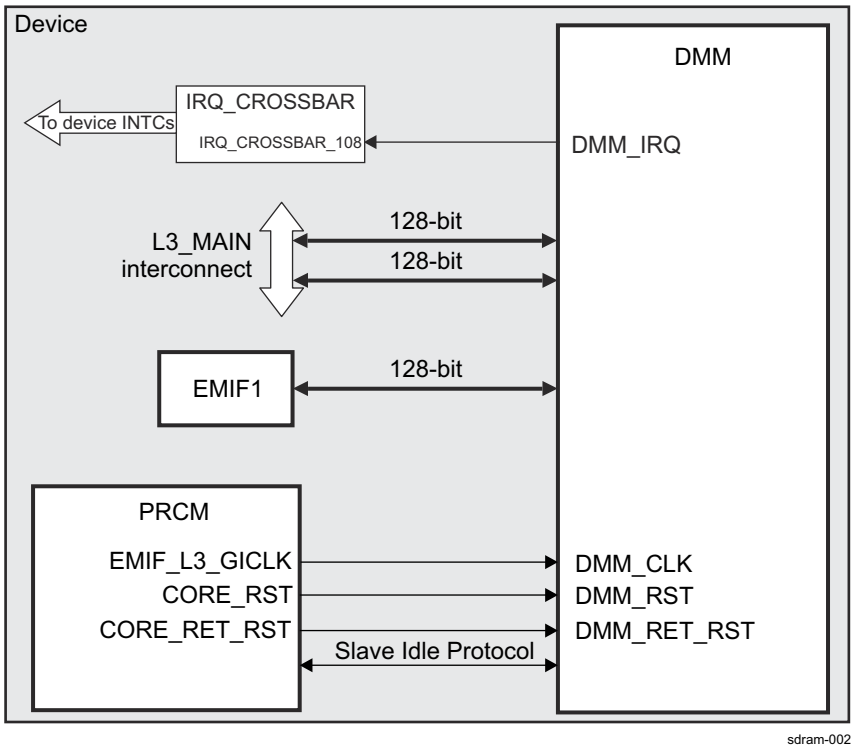

Figure 15-3. DMM Integration

Note

For more information about the slave idle protocol, see *Power, Reset, and Clock Management*.

Table 15-1 through Table 15-3 summarize the integration of DMM in the device.

Table 15-1. DMM Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
DMM	PD_COREAON	No	L3_MAIN

15.2.3 DMM Functional Description

15.2.3.1 DMM Block Diagram

Figure 15-4 shows the DMM macro architecture. The DMM consists of six blocks:

- Two TILERs, each with its own interconnect slave port for converting requests back and forth between the input virtual addressing mode and the output physical tiled addressing mode. The tiling conversions of requests, write data, and responses is performed entirely in the TILER blocks.
- One reordering buffer and initiator node (ROBIN) with its own interconnect master port to initiate requests to the SDRC and allow tiled data, tiled response, and split response reconstruction. The ROBIN block manages only the reordering buffer and performs data reordering due to the orientation.
- A physical address translator (PAT) for managing the memory fragmentation
- A priority extension generator (PEG) to generate priorities required by the SDRC; these priorities are not used in the DMM.
- A local interconnect and synchronization agent (LISA) to synchronize all DMM subsystems and provide access to their configuration registers

Figure 15-4 is a block diagram of the DMM.

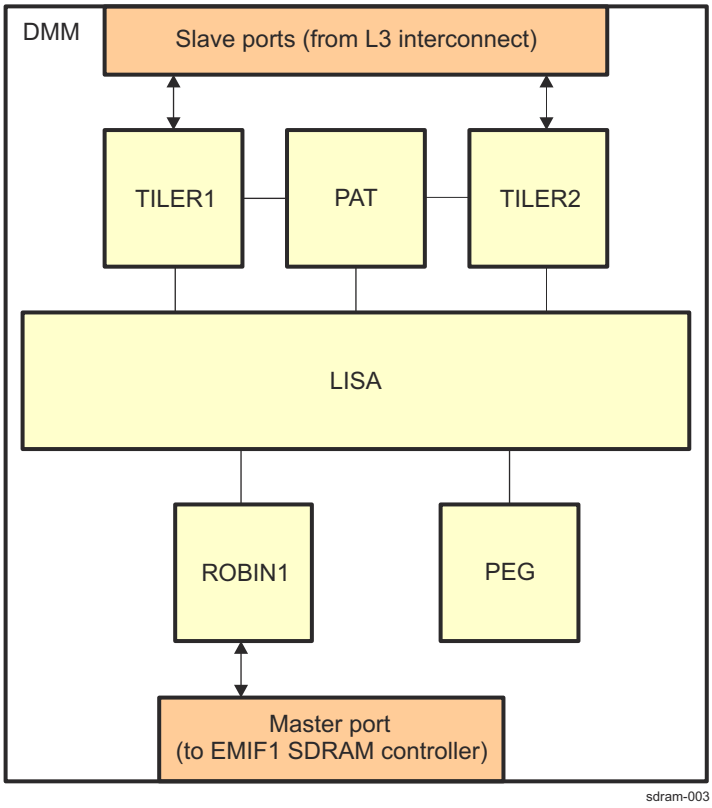

Figure 15-4. DMM Block Diagram

CAUTION

The interconnect must ensure that virtually addressed requests target only a TILER port.

15.2.3.2 DMM Clock Configuration

Table 15-5 describes the DMM clocks.

Table 15-5. DMM Clocks

Signal	I/O(1)	Description
DMM_CLK	I	Functional and interface clock

(1) I = Input; O = Output

The DMM is concerned with SDRC management and is in the MEMIF clock domain . The DMM is a fully synchronous module, which uses the clock and clock-enable signals provided in the MEMIF clock domain to generate its interface and functional clocks.

To configure DMM_CLK control and settings, see Table 15-2.

15.2.3.3 DMM Power Management

DMM power is supplied by the CORE power domain, and DMM power management complies with system power-management guidelines.

Table 15-6 describes the power-management features available for the DMM module.

Table 15-6. DMM Local Power-Management Features

Feature	Registers		Description
Slave idle modes	DMM_SYSCONFIG[3:2] bit field	SIDLEMODE	Only smart-idle wake-up mode is available.

Some of the DMM module registers are affected by the save-and-restore (SAR) mechanism. For more information about SAR, see *Power, Reset, and Clock Management*.

15.2.3.4 DMM Interrupt Requests

Errors in PAT area refill registers are reported through the DMM_PAT_STATUS_i[15:10] ERROR bit field (see Table 15-7).

Table 15-7. DMM Hardware Status Features

Feature	Type	Register	Description
PAT error flags	Read-only	DMM_PAT_STATUS_i[15:10] ERROR (where i = 0 to 3)	Unexpected update of the PAT area refill registers

Table 15-8 lists the event flags, and their masks, that can cause module interrupts.

Table 15-8. Events

Interrupt	Event Flag	Event Mask

15.2.3.5 DMM

15.2.3.5.1 DMM Concepts

The DMM introduces the concepts of dynamic mapping and DMM atomic units.

15.2.3.5.1.1 Dynamic Mapping

The DMM manages its internal memory space as an ordered set of up to four sections. Figure 15-5 shows the DMM sections and memory mapping.

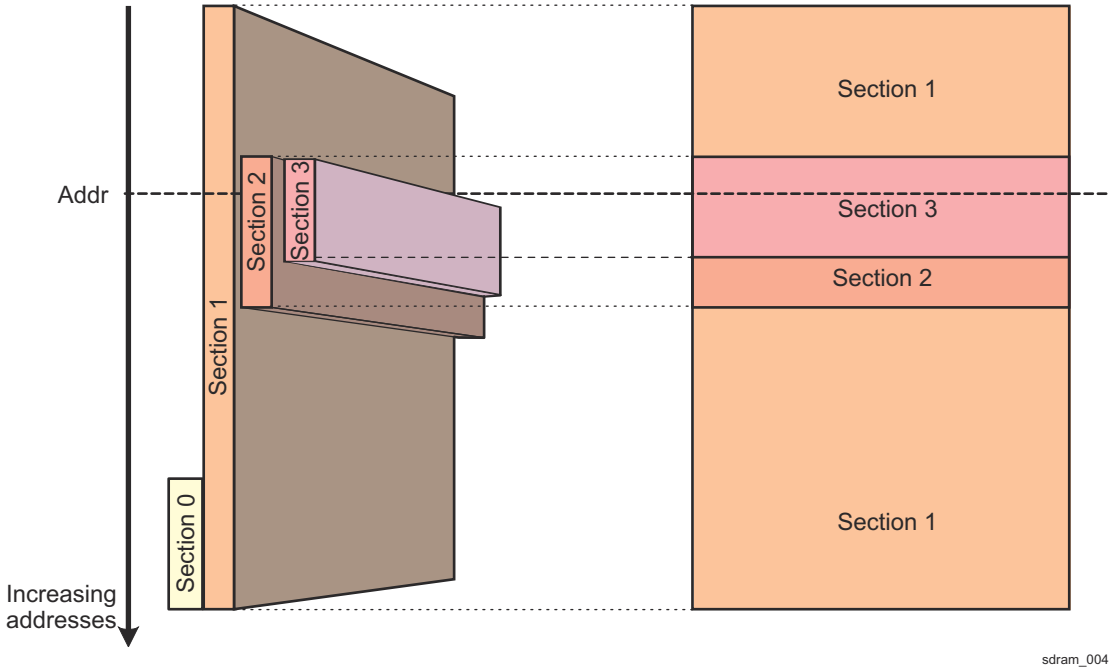

Figure 15-5. DMM Sections and Memory Mapping

In the DMM, a section is:

- A segment of 16MiB to 2GiB, which is power-of-two in size and aligned to that size in the system map
- Given a priority equal to its index: the higher the index, the higher the priority

Each of the four sections is configured through a DMM_LISA_MAP_i register, where i = 0 to 3.

Note

The DMM and EMIF registers (see *EMIF Controller*) are declared in two extra static DMM sections of the highest priority so that they cannot be masked by any standard programmable DMM section.

Note

The DMM atomic size is 1KiB.

15.2.3.5.1.2 Address Mapping

The address mapping inside the DMM is configurable through up to four sections. A DMM section description fits in a single register (DMM_LISA_MAP_i). Each section is defined based on:

- Its system address: The base address of the decoding range for the section
- Its size: The encoding is the number of bits used in the upper 8 bits of the incoming system address
- Its physical address: The base address of the memory range access in the external memory controller
- Its address space: The address space used on the external memory controller (for the DMM) when hitting this section. For details, see *Local Interface* in *EMIF Controller*.
- The target memory controller.

The address decoding is priority-based. In case of overlapping sections, only the highest-order one is hit. Register memory spaces have priority over regular memory sections. In case of four sections, the priority order is therefore:

1. Registers
2. DMM_LISA_MAP_3

3. DMM_LISA_MAP_2
4. DMM_LISA_MAP_1
5. DMM_LISA_MAP_0

All register-related addresses are reserved and fixed in the overall address mapping:

- DMM registers: 0x4E00_0000 to 0x4FFF_FFFF
- EMIF1 registers: 0x4C00_0000 to 0x4CFF_FFFF

There is no overlapping between register sections.

Note

Section decoding happens after PAT address translation in the case of TILER. In non-bypass mode, the system address considered for TILER accesses is the virtual address computed based on the PAT translation tables.

The DMM_LISA_LOCK register is used to lock the configuration once set. If written to 1, the LOCK bit prevents further writes to all DMM_LISA_MAP_i registers. The LOCK bit cannot be written back to 0. A reset is required to reprogram the sections.

15.2.3.5.1.3 Address Translation

The PAT engine of the DMM is composed of a 32-k entry physical address translation vector table and one or two refill engines. The refill engine is a specialized DMA for refilling the content of the PAT table.

The address translation mechanism is available only when the incoming request hits a page mode or tiled mode container; that is, when the incoming address targets the TILER or its aliased view in the system addressing space. Otherwise, the PAT logic is bypassed so that the resulting physical address corresponds to the input address.

The PAT engine supports multiple address translation schemes, called views, which can be bound to one or more initiators through a view mapping mechanism.

15.2.3.5.1.3.1 PAT View Mappings

The PAT engine can have up to 16 groups of initiators that share a set of four PAT views. The connection from an initiator to a PAT view is made through the DMM_PAT_VIEW register. Given that each PAT view index is coded on 4 bits, the DMM_PAT_VIEW register is a 64-bit register split into two 32-bit registers (DMM_PAT_VIEW0 for the first eight PAT view indexes and DMM_PAT_VIEW1 for the last eight PAT view indexes.

The PAT view index that corresponds to the initiator having the value i as the 4 most-significant bits (MSBs) of its L3 ConnID uses the view referenced in entry i of the DMM_PAT_VIEW. For example, the initiator 0xC7 uses the thirteenth view index of the DMM_PAT_VIEW register, the fifth view index in the DMM_PAT_VIEW1 register.

The PAT view index of the initiator i is found in the Vi field. The Wi field is aimed at writing the corresponding Vi. When writing to the DMM_PAT_VIEW registers, the only Vi view indexes that are updated are those having their corresponding Wi bit, and byte enable, set. The Wi bits are always read as 0. For instance, to set the PAT view indexes V3 and V7 to 2 and 1, respectively, the DMM_PAT_VIEW0 register must be written with 5000 6000h.

15.2.3.5.1.3.2 PAT View Map Base Address

The PAT view map base address defines the base address of all PAT translated addresses.

Bit [31] of all PAT translated addresses is set to BASE_ADDR. For example, if the DMM_PAT_VIEW_MAP_BASE register is set to 8000 0000h, all PAT translated addresses will have bit [31] set to 1 so that the translated addresses range from 8000 0000h to FFFF FFFFh. All reserved bits of this DMM PAT base address register are read to 0.

15.2.3.5.1.3.3 PAT Views

A PAT view defines the kind of physical address translation to perform for each mode accesses (page, 8-bit, 16-bit and 32-bit). Each mode of each PAT view can be configured to use a container-grained translation or page-mode translation.

15.2.3.5.1.3.3.1 PAT Direct Access Translation

The container-grained translation is named the direct access. In this mode, the translation vector is given directly by the CONT_x bit field that corresponds to the accessed mode.

- A page mode access uses the vector contained in the DMM_PAT_VIEW_MAP_i[26:24] CONT_PAGE bit field concatenated with 1 (bit 27 of translated address).
- A 32-bit mode access uses the vector contained in the DMM_PAT_VIEW_MAP_i[18:16] CONT_32 bit field concatenated with 0 (bit 27 of translated address).
- A 16-bit mode access uses the vector contained in the DMM_PAT_VIEW_MAP_i[10:8] CONT_16 bit field concatenated with 0 (bit 27 of translated address).
- An 8-bit mode access uses the vector contained in the DMM_PAT_VIEW_MAP_i[2:0] CONT_8 bit field concatenated with 0 (bit 27 of translated address).

Figure 15-6, *PAT Direct Access Translation* describes PAT direct access translation .

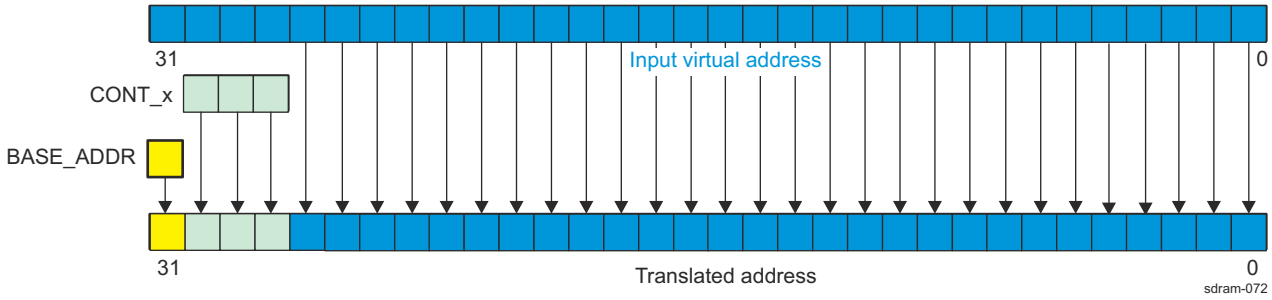

Figure 15-6. PAT Direct Access Translation

15.2.3.5.1.3.3.2 PAT Indirect Access Translation

The page-grained translation is named the indirect access. In this mode the translation vector is found in the internal 32-k entry physical address translation vector table at the index given by bits [26:12] of the input virtual address, and the DMM_PAT_VIEW_MAP_i CONT_x bit field references the internal physical address translation table to use. Because the DMM uses only one such table, in this mode the CONT_x bit field must be written as 0. See Figure 15-7.

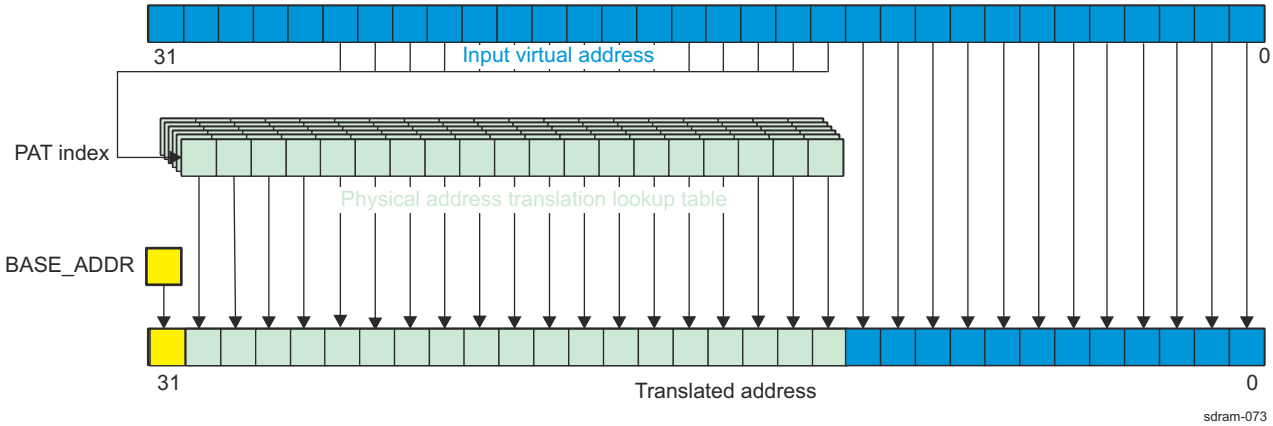

Figure 15-7. PAT Indirect Access Translation

Each entry of the PAT lookup table (LUT) is a 19-bit vector that replaces bits [30:12] of the input virtual address. The PAT index aimed at selecting the vector in the table consists of bits [26:12] of the input virtual address.

The mode associated to the transaction is used to define if the upper or lower half of the LUT is effectively used:

- If the mode is 8-, 16- or 32-bit, the lower part of the LUT (indexes 0x0000 to 0x7FFF; that is, lines 0 to 127) is used.
- If the mode is page, the upper part of the LUT (indexes 0x8000 to 0xFFFF; that is, ines 128 to 256) is used.

This means the PAT index used is the concatenation of 0 and address bits 12 to 26 in 8-, 16- or 32-bit mode, and the concatenation of 1 and address bits 12 to 26 in page mode.

Using different LUT indexes depending on the mode enables the user to define a larger tiled space, with the constraint that half of the space can be used only in 8-, 16- or 32-bit mode and the other half only in page mode. If the user wishes to preserve software compatibility with the case CONT_HGHT = 128, it is required to mirror the configuration for the lower half of the LUT on the upper half of the LUT. In that way, all views see the same address decoding through PAT.

15.2.3.5.1.3.3.3 PAT View Configuration

There are four different views in a DMM, each with its own DMM_PAT_VIEW_MAP_i register for defining the kind of address translation to perform.

The PAT view type of each mode is selected by the ACCESS_x bit field in the DMM_PAT_VIEW_MAP_i register, i being the index of the considered view. When this field is set to 1, the indirect access scheme is used; otherwise, the PAT performs the address translation in a direct way with the corresponding CONT_x vector.

When configuring a mode in a view to use the indirect access, the corresponding CONT_x bit field must be filled with 0.

15.2.3.5.1.3.3.4 PAT Address Translation LUT

The PAT LUT does not have the same geometry as the DMM container. The PAT LUT has 256 lines of 256 entries of 19 bits each. The geometry of the DMM container is 256 × 128 entries.

- The lower 128MiB are restricted for use with 8-, 16-, and 32-bit modes.
- The upper 128MiB are restricted for use with page mode.

See Figure 15-8.

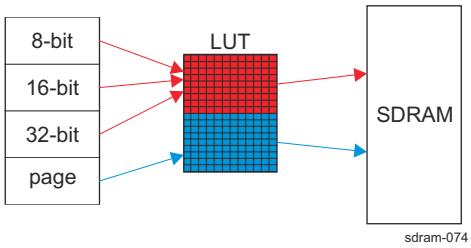

Figure 15-8. Physical Address Translation Table

15.2.3.5.1.3.3.5 Direct Access to the PAT Table Vectors

The PAT table is typically refilled with specialized DMA called refill engines. Some direct read and write access to the content of this table is granted when disabling the use of one or the other refill engine by writing 1 in the MODEi field of the DMM_PAT_CONFIG register that corresponds to the refill engine i to disable.

In this mode, often called the debug mode, the data read in or written to the DMM_PAT_DATA_i register corresponds to the vector in the PAT table, whose index is in the X0 and Y0 fields of the DMM_PAT_AREA_i register.

15.2.3.5.1.3.3.6 Automatic Refill Through the Refill Engines

See Section 15.2.4.1, *PAT Use Cases*.

15.2.3.5.2 DMM Transaction Flows

15.2.3.5.2.1 Nontiled Transaction Flow

Each nontiled interconnect transaction that reaches the DMM on a TILER port is subject to the same processing.

The TILER blocks consider separated request, data, and response paths. An overview of each path follows and more detailed information is in Section 15.2.3.5.3, *DMM Internal Macro-Architecture*.

On the request path, the flow consists of:

- Allocating a TILER response context for the timely generation of the appropriate responses
- Splitting 2D requests in a collection of 1D requests – TILER ports
- Splitting requests at DMM unit boundaries; the split granularity is provided by the LISA mapping registers
- Allocating an available buffer in the ROBIN, for both read and write requests
- In case of a write request, allocating and updating a TILER write context to direct the incoming write data into the reordering buffer
- Generating the initiator-indexed priority extension by use of the PEG block

On the write data path, the flow consists of forwarding incoming data to the reordering buffer in accordance with the corresponding TILER write context.

On the response path, responses are returned when:

- At least one response has entered each related buffer, in case of read requests.
- All related responses have returned from the SDRC, in case of write requests.
- No other previous pending response with the same tag exists.

15.2.3.5.2.2 Tiled Transaction Flow

Similarly, each tiled interconnect transaction that reaches the DMM is subject to the same processing.

The TILER blocks consider separated request, data, and response paths. An overview of each path follows, and more detailed information is in Section 15.2.3.5.3, *DMM Internal Macro-Architecture*.

On the request path, the processing phase consists of:

- Decoding the address to qualify whether the request targets the TILER or the memory directly
- Transforming TILER-specific requests to their natural representation; the address, width, and height are modified accordingly

On the request path, the generation phase consists of:

- Allocating a TILER response context for the timely generation of the appropriate responses
- Splitting malformed: The request stride differs from the container stride and from the double of this container stride – tiled 2D requests in a collection of 1D requests
- Splitting tiled requests at tile boundaries
- Performing the page-based address translation by use of the PAT block
- Allocating an available buffer in the ROBIN, for read and write requests
- In case of a write request, allocating and updating a TILER write context to direct the incoming write data into the reordering buffer
- Generating the initiator-indexed priority extension by use of the PEG block

On the data path, any incoming data is transformed in accordance with the corresponding TILER write context and sent to the reordering buffer.

On the response path, responses are returned when:

- A minimal number of responses have entered the corresponding buffers, in case of read requests.
- All related responses have returned from the SDRC, in case of write requests.
- No other previous pending response with the same tag exists.

15.2.3.5.3 DMM Internal Macro-Architecture

This section describes the DMM internal macro-architecture, specifically:

- Input request decoding
- PAT and synchronized translation table reloading
- Output request and response generation
- Memory mapping in the system addressing space
- Tag management
- Priority handling
- Contexts
- Maximum allowed burst size
- Reconstruction buffer dimensioning

15.2.3.5.3.1 LISA Description

The LISA is a full crossbar aimed at setting priorities, managing tags, and mapping memory.

The interconnect routes are:

- TILER requests on the ROBIN initiator nodes
- TILER write data on the ROBIN write buffers
- ROBIN read data to the relevant TILER initiators

The LISA block registers are DMM_LISA_MAP_i (where i = 0 to 3) and DMM_LISA_LOCK.

15.2.3.5.3.2 PAT Description

The PAT block maps physical pages to each TILER container page. The internal address translation memories used in the PAT block are designed with RFFs. It consists of:

- A memory-based LUT which has the same geometry as the container pages
- A refill engine for modifying entries in a given area of the internal LUT

A PAT descriptor is a singly-linked list node (see Figure 15-9) that contains:

- A description of the LUT area to reload
- A description of how to reload the defined LUT area
- A pointer to the location where the corresponding LUT entries are stored

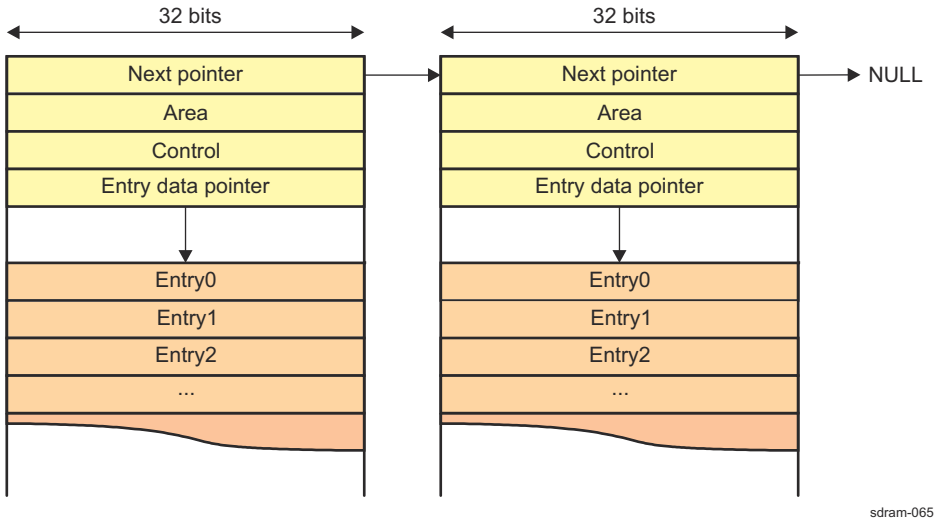

Figure 15-9. PAT Descriptors

PAT descriptors are chained and processed until a NULL pointer is encountered. The PAT bank allocation scheme allows the updating of four consecutive entries of a line in a single cycle regardless of the refilling orientation.

The PAT descriptor structure directly maps the following registers (where i = 0 to 3):

- DMM_PAT_DESCR_i
- DMM_PAT_AREA_i
- DMM_PAT_CTRL_i
- DMM_PAT_DATA_i

The PAT refill engine can be started either of the following:

- Filling manually all the necessary registers:
  - DMM_PAT_AREA_i with the (x0, y0) (x1, y1) area definition
  - DMM_PAT_DATA_i with the physical address of the corresponding area entry table
  - DMM_PAT_CTRL_i[6:4] DIRECTION bit field with the relevant (S, Y, X) direction of the area refill
  - DMM_PAT_CTRL_i[0] START bit with 1
- Writing the physical address of a memory-mapped PAT descriptor in DMM_PAT_DESCR_i register, which updates:
  - DMM_PAT_AREA_i with the area value of the descriptor
  - DMM_PAT_DATA_i with the data value of the descriptor
  - DMM_PAT_CTRL_i with the control value of the descriptor
  - DMM_PAT_DESCR_i with the next value of the descriptor

The data part of the PAT refill starts only when the DMM_PAT_CTRL_i[0] START bit is asserted.

The DMM_PAT_STATUS_i register can be used to determine whether the process has completed without errors.

15.2.3.5.3.3 PEG Description

The PEG is a dynamic software-programmable, initiator-indexed table of priorities. Its unique role is to bind a priority to an initiator on the fly. The mapping of each initiator to the table (split into eight registers) is based on its 6-MSB group ConnID (see *L3_MAIN Connectivity Matrix*, in *Interconnect*).

When an interconnect request enters the DMM, its priority is extracted from the PEG LUT.

The 64 priority entries are software-programmable with the DMM_PEG_PRIO_k register. A priority of 0 defines the highest priority and a priority of 7 defines the lowest priority. At reset, all priorities are set to 4.

These registers are each split into eight 4-bit fields, each field mapping an entry of the LUT with:

- The 3-bit priority coded on the 3 least-significant bits (LSBs): P field
- A $\overline{W}$ field-specific active-low local write enable bit, always read as 0, on the MSB. The role of the $\overline{W}$ bit is to allow the modification of a single entry without requiring a read-modify-write sequence. Because its $\overline{W}$ bits are always read as 0, writing back the modified register updates all priority fields of the register.

Table 15-9 lists the initiator ConnIDs that are mapped to PEG priority register fields (P/W).

Table 15-9. ConnIDs vs PEG Priority Register Fields

Registers	P0/W0	P1/W1	P2/W2	P3/W3	P4/W4	P5/W5	P6/W6	P7/W7
DMM_PEG_PRIO_0	0	1	2	3	4	5	6	7
DMM_PEG_PRIO_1	8	9	10(0xA)	11(0xB)	12(0xC)	13(0xD)	14(0xE)	15(0xF)
DMM_PEG_PRIO_2	16(0x10)	17(0x11)	18(0x12)	19(0x13)	20(0x14)	21(0x15)	22(0x16)	23(0x17)
DMM_PEG_PRIO_3	24(0x18)	25(0x19)	26(0x1A)	27(0x1B)	28(0x1C)	29(0x1D)	30(0x1E)	31(0x1F)
DMM_PEG_PRIO_4	32(0x20)	33(0x21)	34(0x22)	35(0x23)	36(0x24)	37(0x25)	38(0x26)	39(0x27)
DMM_PEG_PRIO_5	40(0x28)	41(0x29)	42(0x2A)	43(0x2B)	44(0x2C)	45(0x2D)	46(0x2E)	47(0x2F)
DMM_PEG_PRIO_6	48(0x30)	49(0x31)	50(0x32)	51(0x33)	52(0x34)	53(0x35)	54(0x36)	55(0x37)
DMM_PEG_PRIO_7	56(0x38)	57(0x39)	58(0x3A)	59(0x3B)	60(0x3C)	61(0x3D)	62(0x3E)	63(0x3F)

Although this priority information is generated before entering the LISA block, it is not used internally in the local interconnect arbitration but is forwarded to the EMIF as MReqInfo, where it indicates the command priority.

It is also possible to give a priority for the internal PAT engine through the DMM_PEG_PRIO_PAT register.

15.2.3.5.3.4 LISA Interconnect Arbitration

When Mflag[i][63:0] ≠ 0 is signaled at TILERi or both TILERs, the transactions of TILERi or both TILERs form an additional new group called the high priority group. Within this group, reads and writes are sorted and arbitrated the same way as in the normal priority group. Arbitration between transactions out of the high priority group and out of the normal priority group is based on a weighted round-robin algorithm. Weight is software selectable using the DMM_EMERGENCY[20:16] WEIGHT bit field. Weight selection is considered static (that is, behavior is undefined when software changes the weight, and DMM is not empty of transaction).

The counter that is implemented to support the weighted round-robin is enabled as long as emergency signaling is present. The counter increments by one each time a command (from the normal or the high priority group) is pushed to ROBIN. The counter wraps on DMM_EMERGENCY[20:16] WEIGHT value. One command from the normal priority group is serviced in any of the following scenarios:

- The counter is enabled and wraps.
- The counter is enabled, has not reached its wrap value, and no command is queued in the high priority group (a case where one device module is signaling emergency but its requests have not yet reached the TILERs).
- The counter is disabled.

Setting the DMM_EMERGENCY[0] ENABLE bit to 1 enables the emergency arbitration scheme.

Note

It is recommended to set the DMM_EMERGENCY[0] ENABLE bit to 1, and the DMM_EMERGENCY[20:16] WEIGHT bit to 0x8. This provides better and faster recovery behavior, and benefits system performance.

15.2.3.5.3.5 ROBIN Description

The ROBIN is a block that provides some working buffering for converting data and responses to-and-from between raster and tiled organizations, and a master port to connect to the EMIF.

The ROBIN block:

- Forwards requests
- Writes data and buffers responses
- Keeps write data ordering
- Performs intraword tiling and orientation transforms
- Handles tags

15.2.3.5.3.6 TILER Description

The main function of the TILER is request conversion caused by tiling .

The TILER block:

- Decodes the address to qualify whether the request targets the TILER or the memory directly
- Converts TILER-specific requests to their natural representation; address, width, and height are modified accordingly
- Allocates an internal response context for the timely generation of appropriate responses
- Splits tiled requests at tile boundaries and not-tiled requests at DMM atomic section boundaries
- Requests the page-based address translation
- Requests buffer allocation in the ROBIN
- In case of a write request, allocates and updates an internal write context to direct the incoming write data into the reordering buffer

The interdependent tiling and isometric transform concepts introduced in the TILER are described in the following section.

15.2.3.6 TILER

15.2.3.6.1 TILER Concepts

This section describes the concepts behind the TILER transforms, through a top-down approach starting from the main object container.

15.2.3.6.1.1 TILER Rationale

This section is a synthesis of all TILER concepts, giving one rule per TILER structure level.

Figure 15-10 shows the TILER address space structure for tiled modes.

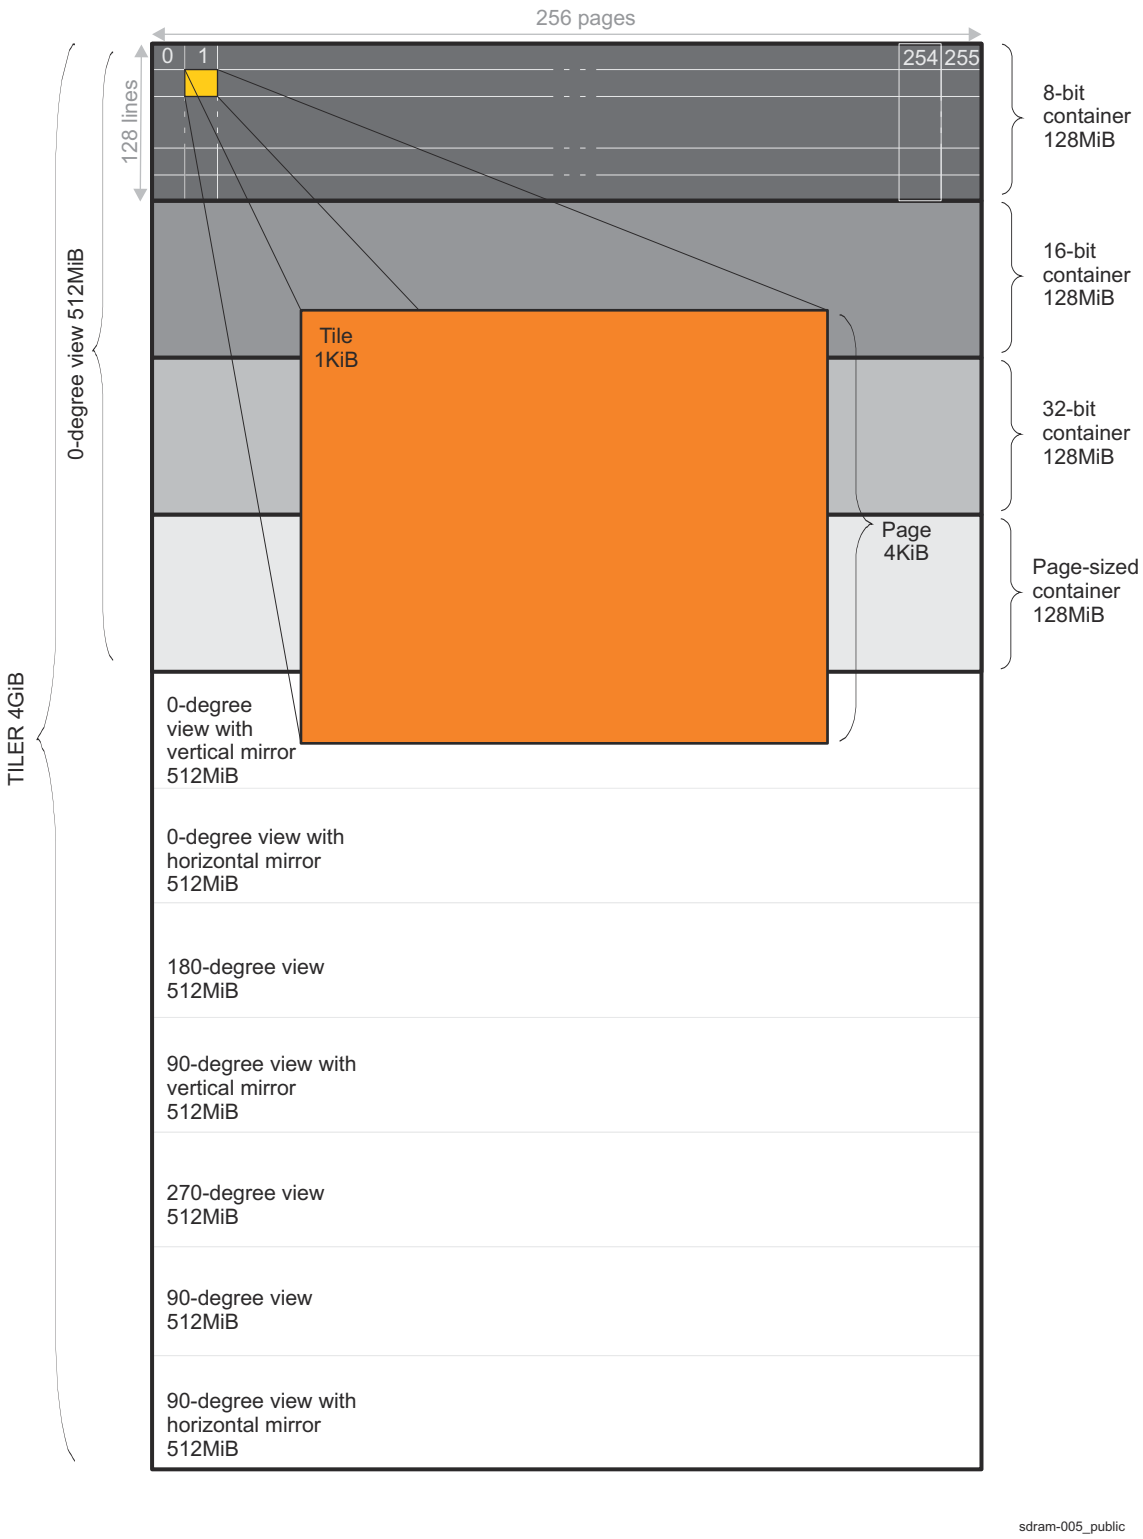

Figure 15-10. TILER Address Space Structure for Tiled Modes

15.2.3.6.1.1.1 The TILER is a 4-GiB Virtual Address Space Composed of Eight Views

There is one view for each of the eight possible ways of scanning a frame-buffer:

- From left to right and then from top to bottom

- From right to left and then from top to bottom
- From left to right and then from bottom to top
- From right to left and then from bottom to top
- From top to bottom and then from left to right
- From top to bottom and then from right to left
- From bottom to top and then from left to right
- From bottom to top and then from right to left

15.2.3.6.1.1.2 A View is a 512-MiB Virtual Address Space Composed of Four Containers

There is one container per element size to allow correct access patterns in any of the eight possible orientations. The container is the entity where all objects of a given element type are allocated.

The element is the entity of maximum size (8, 16, 32 bits, or page-sized), which is invariant in any orientation.

15.2.3.6.1.1.3 A Container is a 128-MiB Virtual Address Space

A container is composed of an array of 128 lines of 256 pages of 4kiB each.

The page defines the granularity of physical memory allocation through a PAT unit – MMU.

15.2.3.6.1.1.4 A Page is a 4-kiB Virtual Address Space

A page is composed of two lines. Each line consists of two tiles.

15.2.3.6.1.1.5 A Tile is a 1-kiB Address Space

The tile is designed to offer bidimensional data locality in a single SDRAM page. In this respect, it is sized to 1kiB; that is, to the size of the smallest SDRAM page.

15.2.3.6.1.1.6

15.2.3.6.1.1.7 A Subtile is a 128-Bit Address Space

A subtile is composed of:

- In 8-bit tiled mode: An array of four horizontal lines of four elements of 8 bits
- In 16-bit tiled mode: An array of two horizontal lines of four elements of 16 bits
- In 32-bit tiled mode: An array of two horizontal lines of two elements of 32 bits

The subtile structure is designed to increase the SDRAM access payload on macroblock requests; that is, to minimize the required line buffering of raster-based initiators to handle on-the-fly rotation, and to improve interlaced accesses to tiled frame-buffers.

15.2.3.6.1.2 TILER Modes

The TILER supports three major modes, bypass, page, and tiled. Each mode has a specific output request generation.

15.2.3.6.1.2.1 Bypass Mode

This mode is transparent from the TILER perspective. However, from the DMM perspective:

- 2D block bursts are broken down on a line basis in a set of incremental bursts.
- Incremental bursts, including those issued by a 2D block burst breakdown, are split at the DMM atomic unit of the section hit by the burst at 1-kiB boundary.

15.2.3.6.1.2.2 Page Mode

This mode uses the DMM address translation mechanism for nontiled accesses. In this respect it is similar to bypass mode:

- 2D block bursts are broken down on a line basis in a set of incremental bursts.
- Incremental bursts, including those issued by a 2D block burst breakdown, are split at -kiB boundary.

15.2.3.6.1.2.3 Tiled Mode

Tiled mode has two major breakdown algorithms:

- One for well-formed 2D block requests that conform to the orientation, mode, and stride listed in Table 15-10
- One for 1D incremental requests and ill-formed 2D block requests

Table 15-10. Well-Formed Tiled Mode 2D Block Requests

Orientation			Mode		Stride	Description
S	$\overline{Y}$	$\overline{X}$	M1	M0	(bytes)	
0	x	x	0	0	16,384	Plain access to an 8-bit progressive frame in 0 or 180 degrees
					32,768	Field access to an 8-bit interlaced frame 0 or 180 degrees
				1	32,768	Plain access to a 16-bit progressive frame in 0 or 180 degrees
					65,536	Field access to a 16-bit interlaced frame 0 or 180 degrees
			1	0	32,768	Plain access to a 32-bit progressive frame in 0 or 180 degrees
					65,536	Field access to a 32-bit interlaced frame 0 or 180 degrees
1	x	x	0	0	8192	Plain access to an 8-bit progressive frame in 90 or 270 degrees
					16,384	Field access to an 8-bit interlaced frame 90 or 270 degrees
				1	8192	Plain access to a 16-bit progressive frame in 90 or 270 degrees
					16,384	Field access to a 16-bit interlaced frame 90 or 270 degrees
			1	0	16,384	Plain access to a 32-bit progressive frame in 90 or 270 degrees
					32,768	Field access to a 32-bit interlaced frame 90 or 270 degrees

Similar to the bypass and page modes, ill-formed 2D block requests are broken down on a line basis in a set of incremental bursts. In tiled mode, however, these incremental virtual bursts do not translate to 1D physical burst requests.

15.2.3.6.1.3 Object Container Definition

The object container is the unique addressable entry point of the TILER. It is a 128-MiB virtual address space, where all objects of a same kind and orientation are allocated.

Four main types of containers are present in the TILER, each referred by a mode:

- 8-bit element mode, for efficiently accessing bidimensional arrays of 8-bit data
- 16-bit element mode, for efficiently accessing bidimensional arrays of 16-bit data
- 32-bit element mode, for efficiently accessing bidimensional arrays of 32-bit data
- Page mode, for efficient 1D accesses

Figure 15-11 shows the TILER object containers and views.

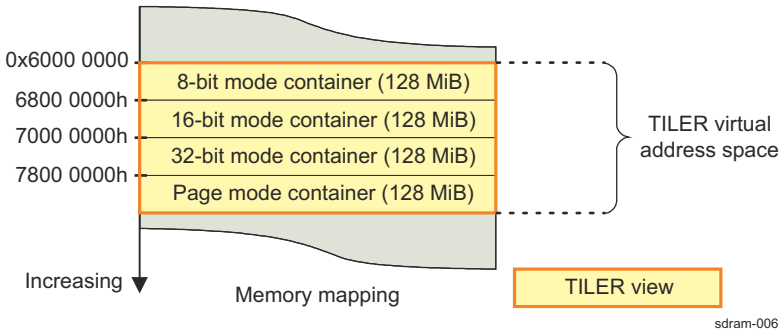

Figure 15-11. TILER Object Containers and Views

The 512-MiB virtual address space composed of four 128-MiB object containers of different modes is called a view. Because eight orientations are available per mode, the TILER actually manages 32 kinds of containers.

The physical memory footprint of a 512-MiB TILER view is directly subject to the nature of the PAT unit.

A unique PAT LUT is instantiated in the DMM. This table is shared by all TILER modes. Hence, each of the four modes cannot be given its own private page-grained PAT LUT. A maximum of 128MiB of objects among all TILER modes can be managed as shown in Figure 15-12.

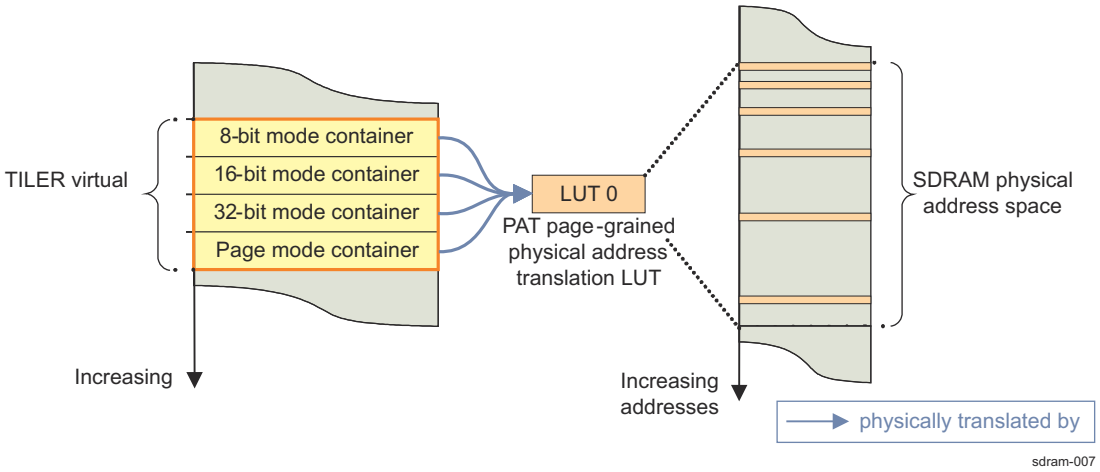

Figure 15-12. TILER Memory Footprint With PAT and Shared Physical Address Translation LUT

Although each of the four modes has its own separate virtual 128-MiB object container, these containers are all mapped to the same piecewise 128-MiB physical address space, and are then not physically separated. Consequently, a memory-related system constraint is that no more than 128-MiB of objects can be available simultaneously in a TILER view.

Note

Software must ensure that any object allocated in a mode does not physically overlap with any other object, even in another mode.

15.2.3.6.1.4 Page Definition

A TILER page defines the granularity of object allocation in virtual TILER containers.

Because the subpage structure is mode-specific, the page is the smallest granularity common to all modes, making it the granularity to consider in the TILER resource manager for object allocation.

15.2.3.6.1.4.1 Container Geometry With 4-kiB Pages

Because the size of the page is 4kiB, any 128-MiB object container is a set of 32,768 pages, organized in an array of 256 columns and 128 rows, as shown in Figure 15-13.

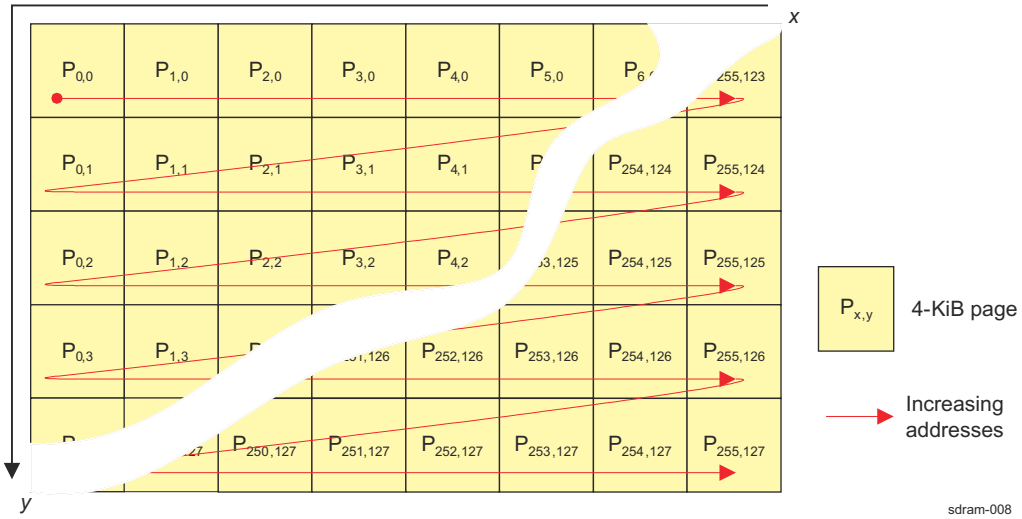

Figure 15-13. Object Container Geometry With 4-kiB Pages

This array of pages is mapped to the system address space, as shown in Figure 15-14.

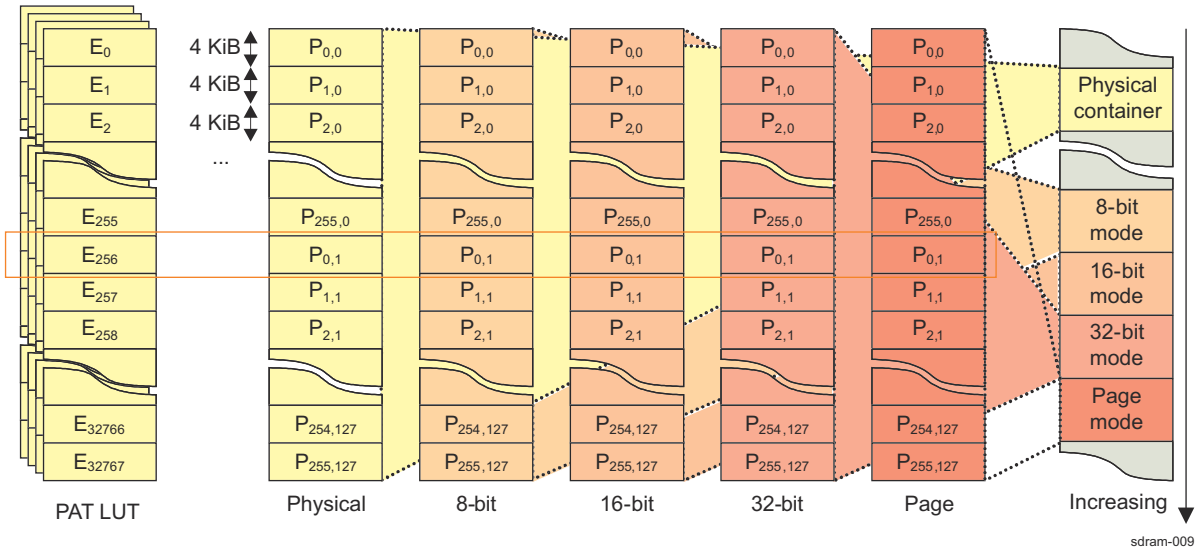

Figure 15-14. TILER Page Mapping When Using 4-kiB Pages

In any 128-MiB object container, the 4-kiB page Px,y at column x (where 0 =< x < 256) and row y (where 0 =< y < 128), is found at an offset of 4096.(x+256.y) bytes from the base address of the related object container.

Similarly, the page Px,y at column x (where 0 =< x < 256) and row y (where 0 =< y < 128), is translated by the LUT entry Ex+256.y found at the index x+256.y.

15.2.3.6.1.4.2 Container Geometry and Page Mapping Summary

The TILER has a page size of 4096 bytes. The page $P_{x,y}$:

- Has max_x = 256 and max_y = 128
- Is found at an offset of 4096.(x + max_x.y) bytes from the base address of the related object container
- Is translated by the entry at the index (x + max_x.y) of the LUT

15.2.3.6.1.5 Orientation

This section describes the eight on-the-fly orientation-related isometric transforms, which correspond to all available changes of orthonormal basis in the bidimensional space of the TILER container.

Figure 15-15 shows isometric transforms in the TILER container

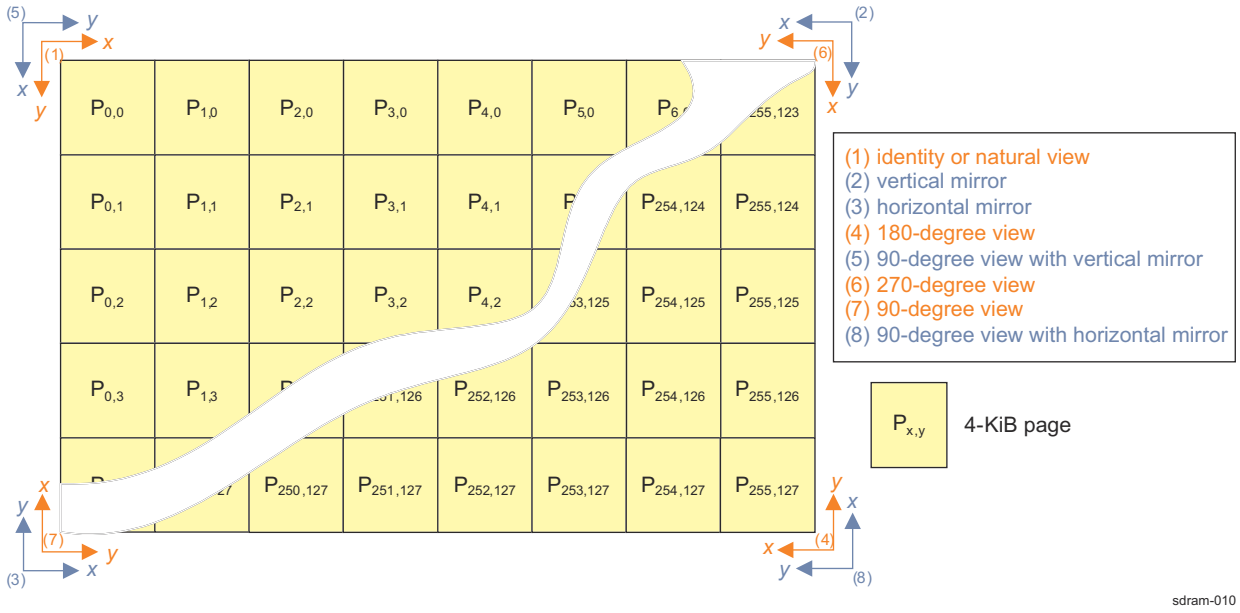

Figure 15-15. Isometric Transforms in the TILER Container

Mathematically speaking, all these transforms correspond to the composition of a 0-, 90-, 180-, or 270-degree rotation with an optional reflection. The nature of this orientation is based on the three following binary parameters:

- *X* to change the direction of the$_x$ axis of the TILER container
- *Y* to change the direction of the$_y$ axis of the TILER container
- *S* to swap the modified$_x$ and$_y$ axis

Hereafter in this document the term orientation refers to any composition of a "quadrant" rotation with an optional horizontal (flip-flop) or vertical mirroring.

15.2.3.6.1.6 Tile Definition

A tile is a subdivision of a page that is aimed at:

- Representing a 2D block to better balance accesses in both directions
- Ensuring that any tiled access that fits within a tile is made atomic in the SDRC and fits in a single SDRAM memory page
- Minimizing the number of SDRAM page openings per 2D block transfer

The tile is defined as a 1-kiB 2D block, and a 4-kiB page as an array of two lines of two tiles each.

15.2.3.6.1.7 Subtiles

15.2.3.6.1.7.1 Subtiling Definition

To summarize, a subtile is a subtle refinement of a tile whose purpose is to:

- Lower the size (length × height) of 128-bit bursts in case of relatively small 2D block requests, such as video macroblocks
- Better balance the granularity in the two directions
- Better balance the accesses in the two (x and y) directions
- Minimize the size of the line buffer of the raster-based initiators to handle isometric transforms efficiently

A subtile is defined as a 128-bit 2D block, and a tile as an array of eight lines of eight subtiles, as shown in Figure 15-16.

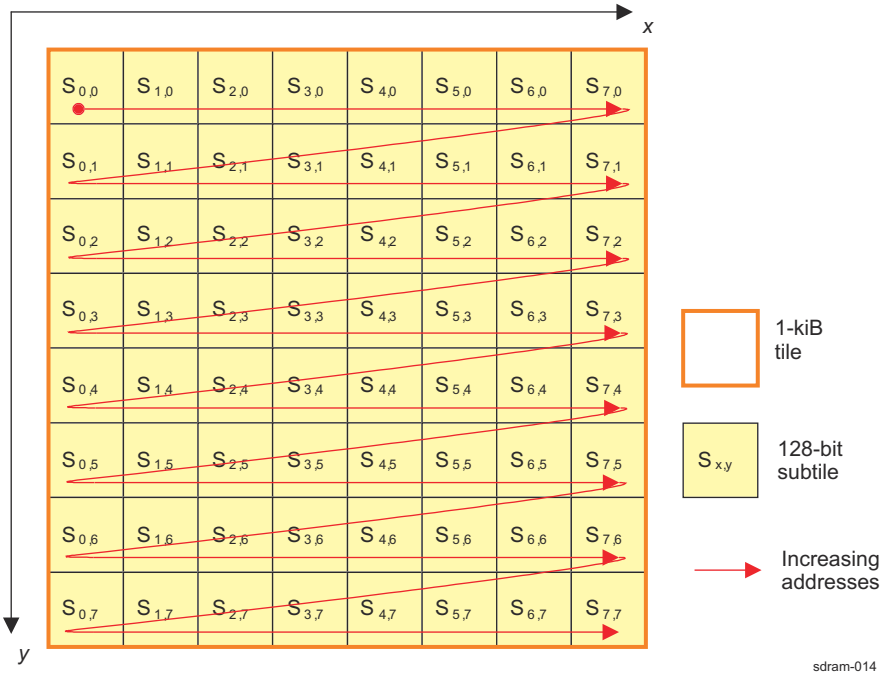

Figure 15-16. Tile Geometry

In any tile, the subtile Sx,y at column x (0 =< x < 8) and row y (0 =< y < 8) is found at an offset of 16.(x + 8.y) bytes from the base address of the related tile. Besides, this array organization of subtiles is common to each tiled mode. For instance, the subtile S0,1 is always located at an offset of 128 bytes (that is, 16.(0 + 8 x 1)) from the base address of the related tile.

Figure 15-17 shows the subtile mapping.

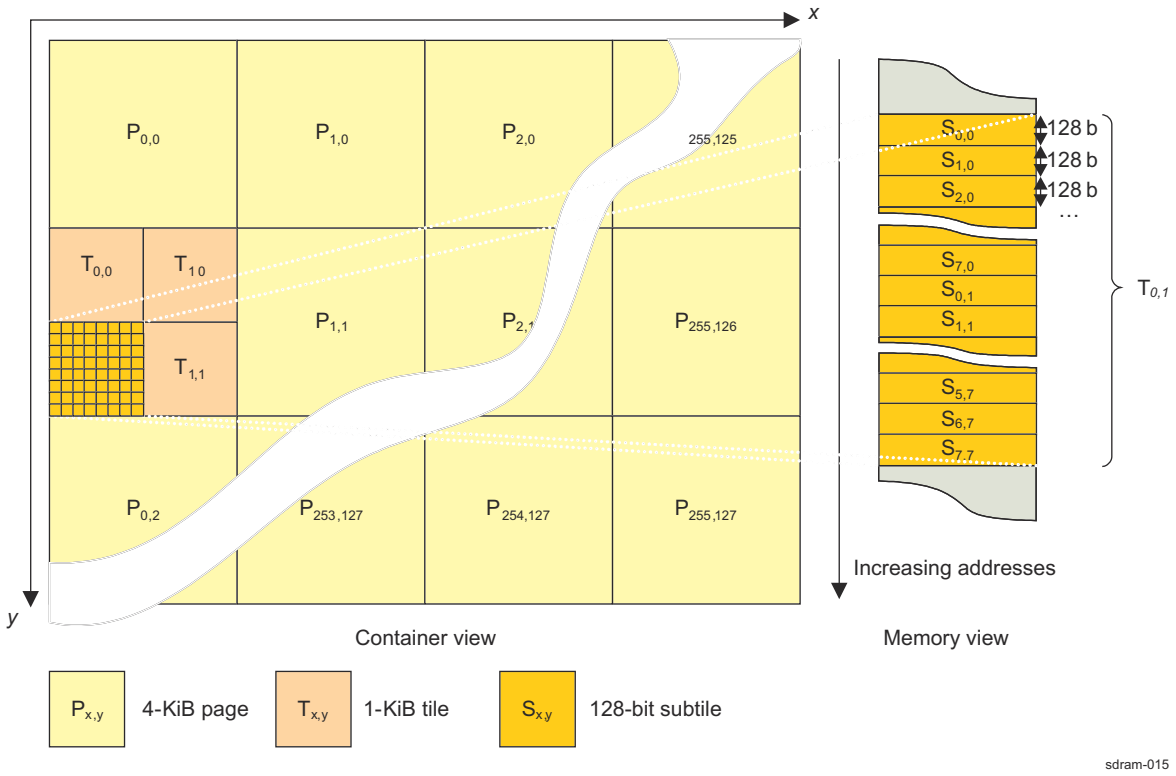

Figure 15-17. Subtile Mapping

15.2.3.6.1.8 TILER Virtual Addressing

The TILER can be virtually accessed in four different modes: 8-, 16-, 32-bit, and page modes. Each mode defines the element granularity to apply isometric transforms, as summarized in Table 15-11.

Table 15-11. Coding and Description of TILER Modes

Mode	Name	Granularity (Element Size)
0	8-bit tiled mode	8 bits
1	16-bit tiled mode	16 bits
2	32-bit tiled mode	32 bits
3	Page mode	4096 bytes

For instance, making a vertical mirror of a 16-byte horizontal line that contains the word 000102030405060708090A0B0C0D0E0Fh, leads to:

- 0F0E0D0C0B0A09080706050403020100h in 8-bit tiled mode
- 0E0F0C0D0A0B08090607040502030001h in 16-bit tiled mode
- 0C0D0E0F08090A0B0405060700010203h in 32-bit tiled mode
- 000102030405060708090A0B0C0D0E0Fh in page mode – unchanged because the element granularity is 4 KiB

Besides, because each of the eight orientations is available for any of the four modes, the TILER has 32 addressing possibilities (see Table 15-12).

Table 15-12. Coding and Description of TILER Orientations

S	$\overline{Y}$	$\overline{X}$	Description	Alternate description
0	0	0	0-degree view	Natural view
0	0	1	0-degree view with vertical mirror	180-degree view with horizontal mirror
0	1	0	0-degree view with horizontal mirror	180-degree view with vertical mirror

Table 15-12. Coding and Description of TILER Orientations (continued)

S	$\overline{Y}$	$\overline{X}$	Description	Alternate description
0	1	1	180-degree view	
1	0	0	90-degree view with vertical mirror	270-degree view with horizontal mirror
1	0	1	270-degree view	
1	1	0	90-degree view	
1	1	1	90-degree view with horizontal mirror	270-degree view with vertical mirror

15.2.3.6.1.8.1 Page Mode Virtual Addressing and Characteristics

When used in page mode, the 128-MiB TILER space is seen as an orientation-specific sequence of 32,768 pages of 4kiB each. The access sequence inside a page is left unchanged.

Therefore, in page mode, the TILER is accessed similarly to any 128-MiB memory, with a 27-bit byte-based address.

Note

From here forward, the address is noted as *a* (see Figure 15-18).

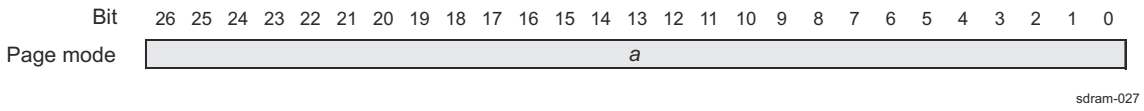

Figure 15-18. Page Mode Virtual Addressing

15.2.3.6.1.8.2 Tiled Mode Virtual Addressing and Characteristics

When used in tiled mode, the 128-MiB TILER space is seen as a giant frame-buffer, the container. The addressing and characteristics of this giant frame-buffer depend on:

- The tiled mode, which defines the considered atomic element size
- The orientation, which potentially swaps its x and y axis, and hence the container geometry

Table 15-13 summarizes the container characteristics in tiled mode.

Table 15-13. Tiled Mode Container Characteristics

Orientation			Element Size (Bits)	Width (Elements)	Height (Elements)	Stride (Bytes)	
S	$\overline{Y}$	$\overline{X}$				Progressive	Interlaced
0	x	x	8	16,384	8192	16,384	32,768
			16	16,384	4096	32,768	65,536
			32	8192	4096	32,768	65,536
1	x	x	8	8192	16,384	8192	16,384
			16	4096	16,384	8192	16,384
			32	4096	8192	16,384	32,768

As a result, the coordinate (x_0, y_0) of a pixel in an oriented view is translated in a virtual address, as shown in Figure 15-19 and Figure 15-20.

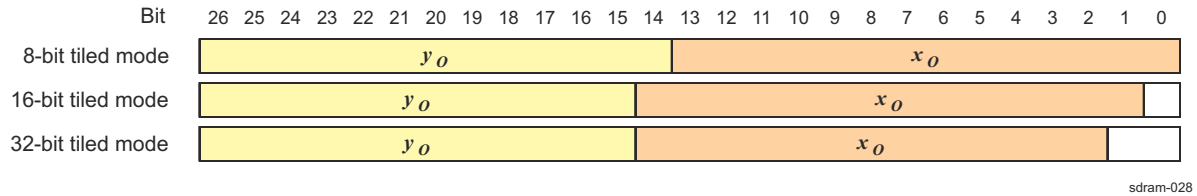

Figure 15-19. Tiled Mode Addressing in 0- or 180-Degree Orientation (S = 0)

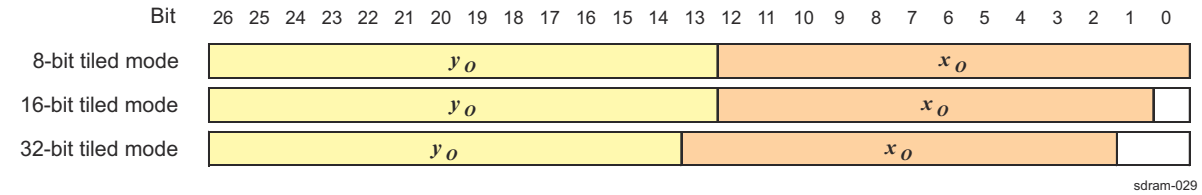

Figure 15-20. Tiled Mode Addressing in 90- or 270-Degree Orientation (S = 1)

15.2.3.6.1.8.3 Element Ordering in the TILER Container

This section describes how elements (8-, 16-, or 32-bit data or a 4-kiB page) are ordered in the container. In other words, this section describes how the path of incrementing virtual addresses is mapped in the container.

Regardless of the mode, and hence the element size, the sequence for ordering the elements in their related container is strictly similar and depends only on the related orientation. In other words:

- Mode is concerned with element granularity.
- Orientation is concerned with change of orthornormal basis for ordering the elements in the mode-specific container.

A corollary to the previous statements is that in a given mode the internal structure of an element is unchanged regardless of the orientation. In page mode for instance, the offset of a word inside a page is invariant by orientation; the content of a page is always accessed in the same manner.

In the following sections, the natural container orthonormal basis is referenced as:

$$(\vec{x}_N, \vec{y}_N)$$

sdram-030

and the oriented orthonormal basis is referenced as:

$$(\vec{x}_O, \vec{y}_O)$$

sdram-031

15.2.3.6.1.8.3.1 Natural View or 0-Degree View (Orientation 0)

This orientation defined by S = 0, $\overline{Y}$ = 0, and $\overline{X}$ = 0 means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-032

In any TILER mode, the elements are ordered from left to right and then from top to bottom in their container, as shown in Figure 15-21 and Figure 15-22.

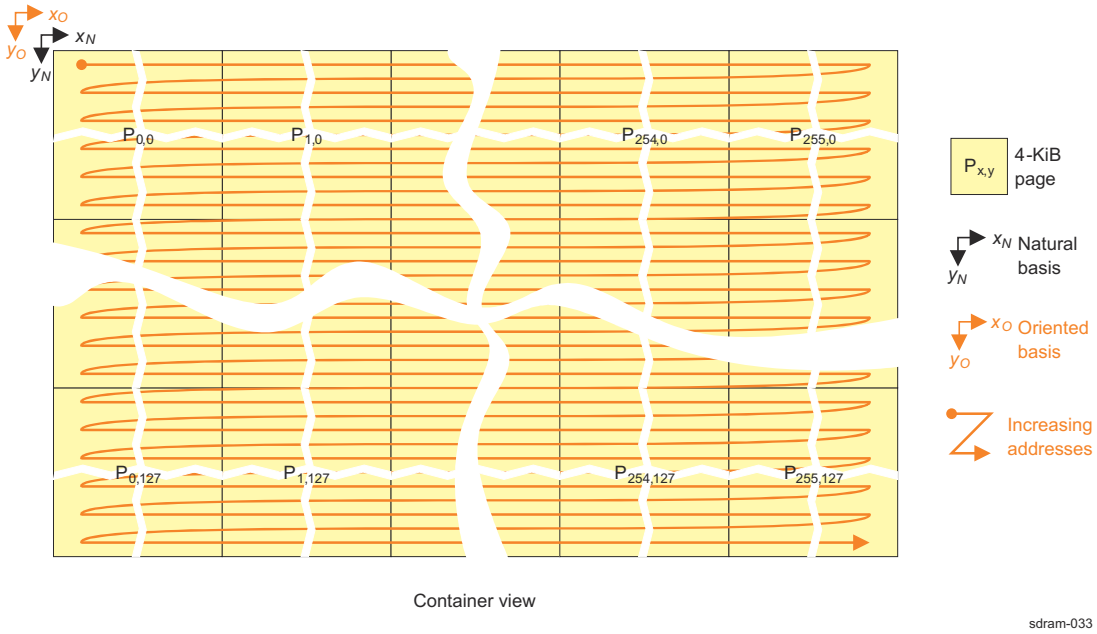

Figure 15-21. Tiled Mode Ordering of Elements in Natural View

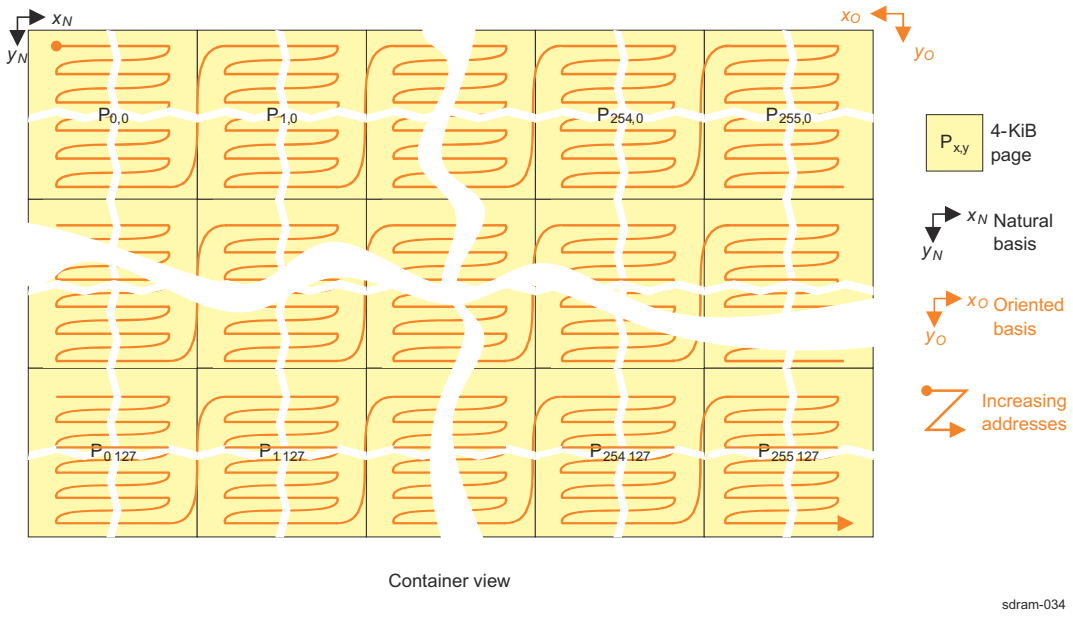

Figure 15-22. Page Mode Ordering of Elements in Natural View

15.2.3.6.1.8.3.2 0-Degree View With Vertical Mirror or 180-Degree View With Horizontal Mirror (Orientation 1)

This orientation defined by S = 0, $\overline{Y}$ = 0, and $\overline{X}$ = 1 and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-035

In any TILER mode, the elements are then ordered from right to left and then from top to bottom in their container, as shown in Figure 15-23 and Figure 15-24.

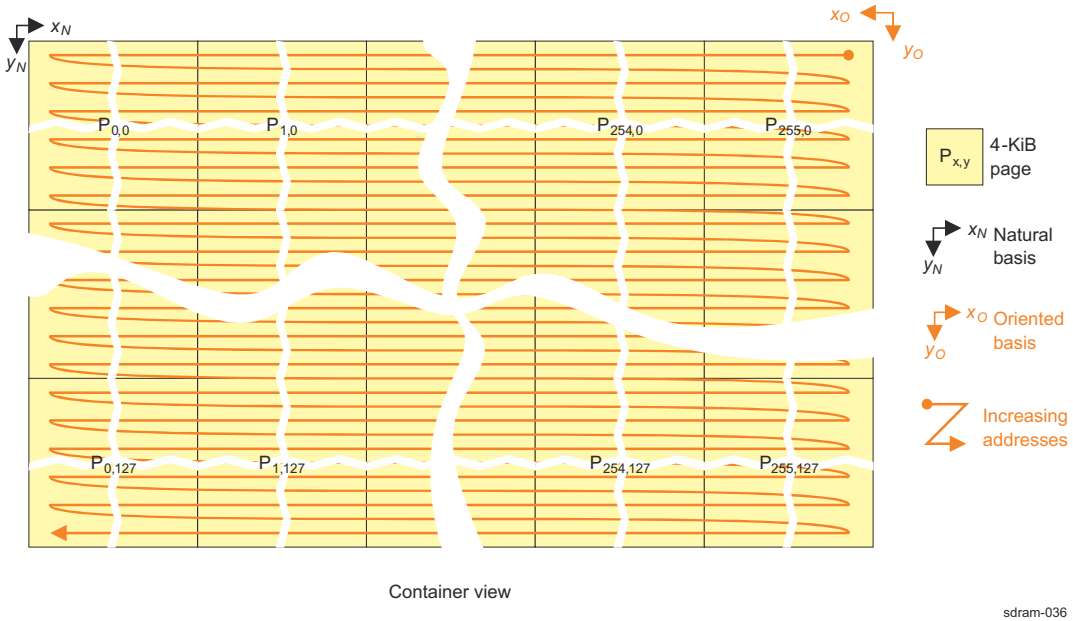

Figure 15-23. Tiled Mode Ordering of Elements in 0-Degree View With Vertical Mirror

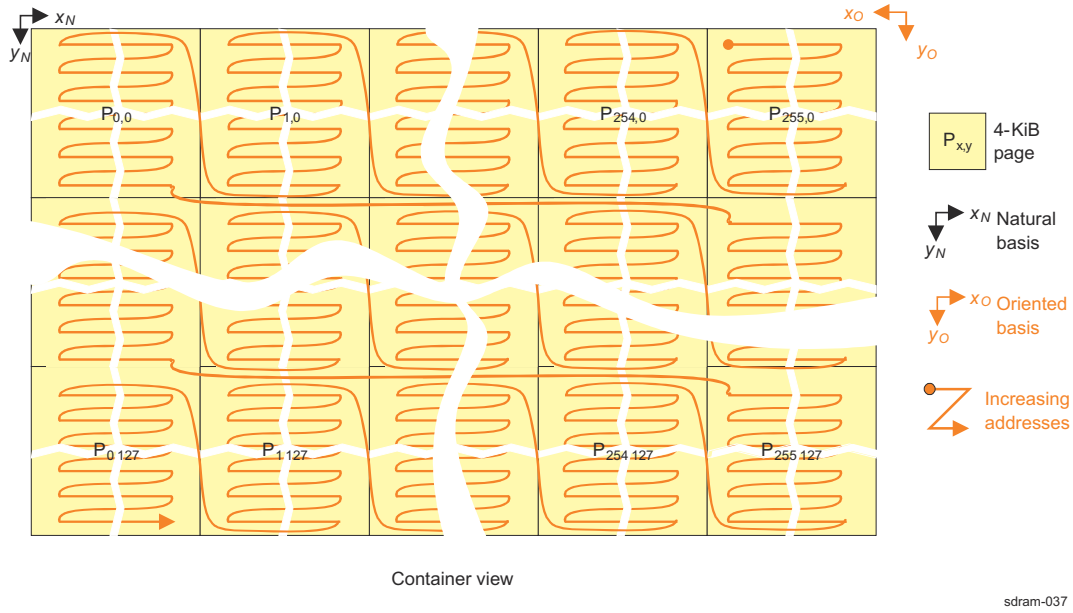

Figure 15-24. Page Mode Ordering of Elements in 0-Degree View With Vertical Mirror

15.2.3.6.1.8.3.3 0-Degree View With Horizontal Mirror or 180-Degree View With Vertical Mirror (Orientation 2)

This orientation defined by S = 0, $\overline{Y}$ = 1, and $\overline{X}$ = 0 and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{x}_N \\ \vec{y}_O = -\vec{y}_N \end{cases}$$

sdram-038

In any TILER mode, the elements are ordered from left to right and then from bottom to top in their container, as shown in Figure 15-25 and Figure 15-26.

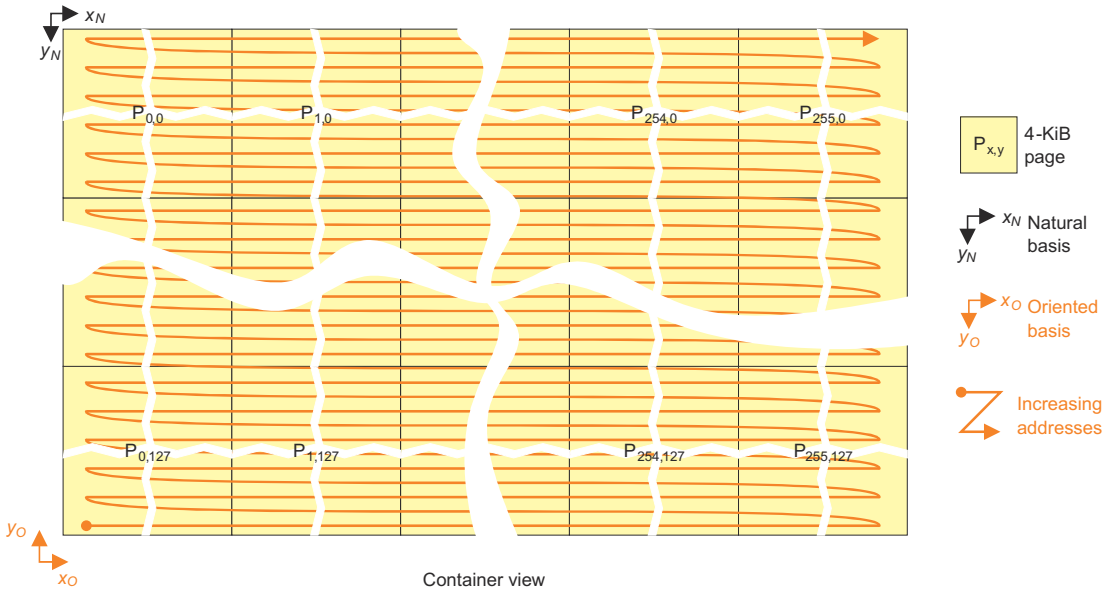

Figure 15-25. Tiled Mode Ordering of Elements in 0-Degree View With Horizontal Mirror

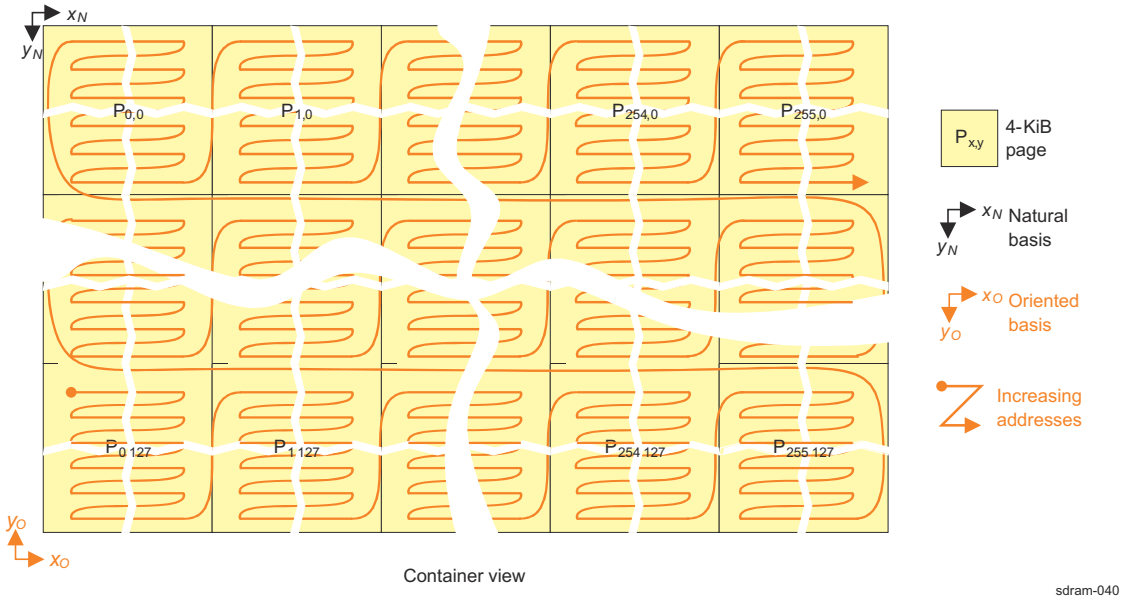

Figure 15-26. Page Mode Ordering of Elements in 0-Degree View With Horizontal Mirror

15.2.3.6.1.8.3.4 180-Degree View (Orientation 3)

This orientation defined by S = 0, $\overline{Y}$ = 1, and $\overline{X}$ = 1 and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{x}_N \\ \vec{y}_O = -\vec{y}_N \end{cases}$$

sdram-041

In any TILER mode, the elements are ordered from right to left and then from bottom to top in their container, as shown in Figure 15-27 and Figure 15-28.

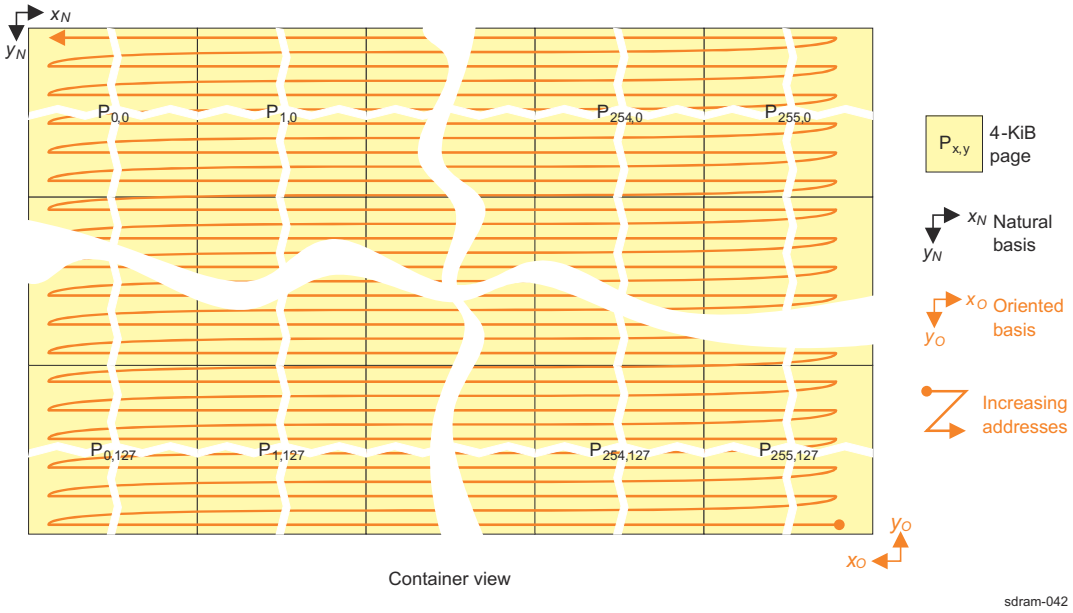

Figure 15-27. Tiled Mode Ordering of Elements in 180-Degree View

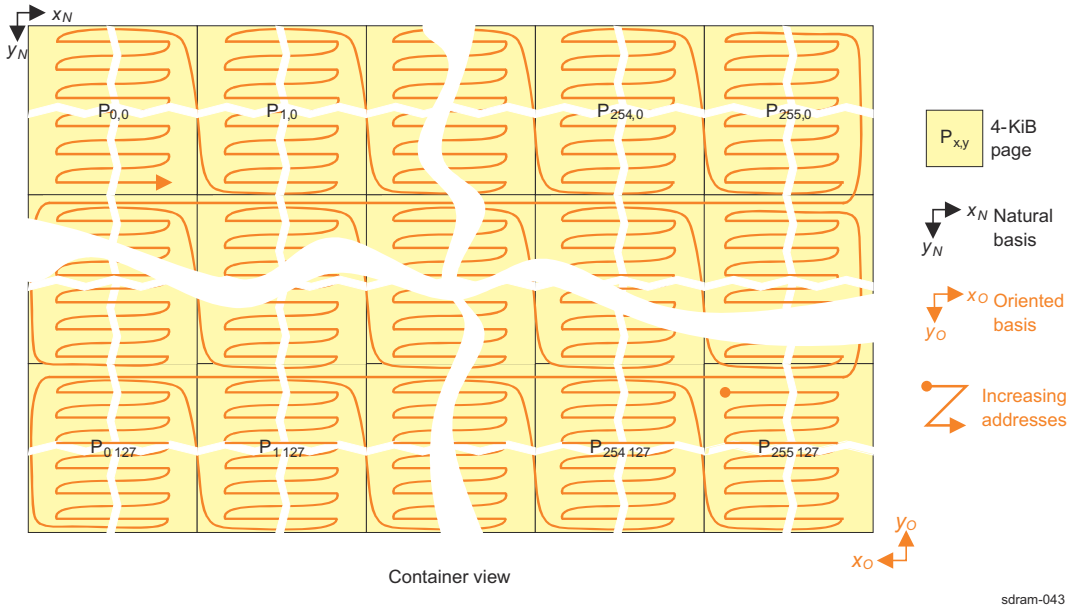

Figure 15-28. Page Mode Ordering of Elements in 180-Degree View

15.2.3.6.1.8.3.5 90-Degree View With Vertical Mirror or 270-Degree View With Horizontal Mirror (Orientation 4)

This orientation defined by S = 1, $\overline{Y}$ = 0, and $\overline{X}$ = 0 and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{y}_N \\ \vec{y}_O = \vec{x}_N \end{cases}$$

sdram-044

In any TILER mode, the elements are ordered from top to bottom and then from left to right in their container, as shown in Figure 15-29 and Figure 15-30.

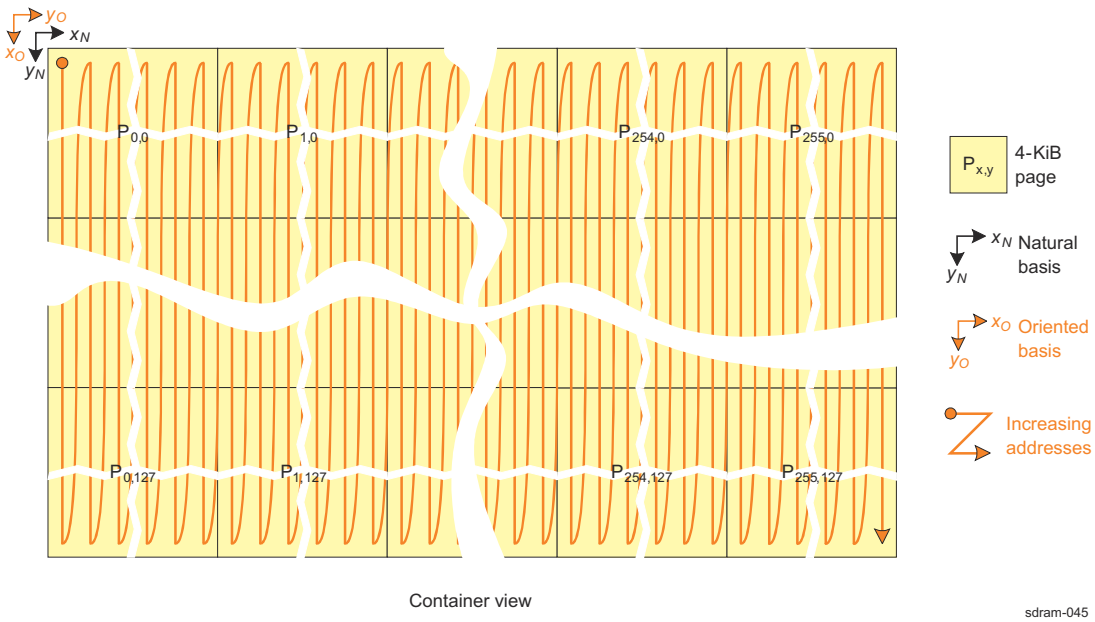

Figure 15-29. Tiled Mode Ordering of Elements in 90-Degree View With Vertical Mirror

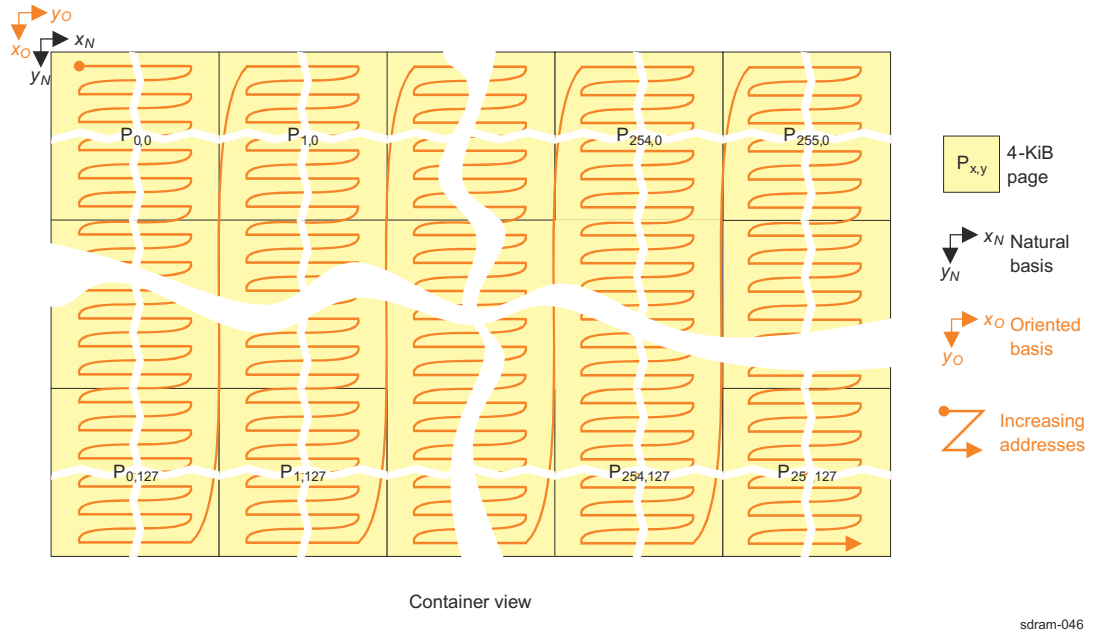

Figure 15-30. Page Mode Ordering of Elements in 90-Degree View With Vertical Mirror

15.2.3.6.1.8.3.6 270-Degree View (Orientation 5)

This orientation defined by S = 1, $\overline{Y}$ = 0, and $\overline{X}$ = 1 and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{y}_N \\ \vec{y}_O = -\vec{x}_N \end{cases}$$

sdram-047

In any TILER mode, the elements are ordered from top to bottom and then from right to left in their container, as shown in Figure 15-31 and Figure 15-32.

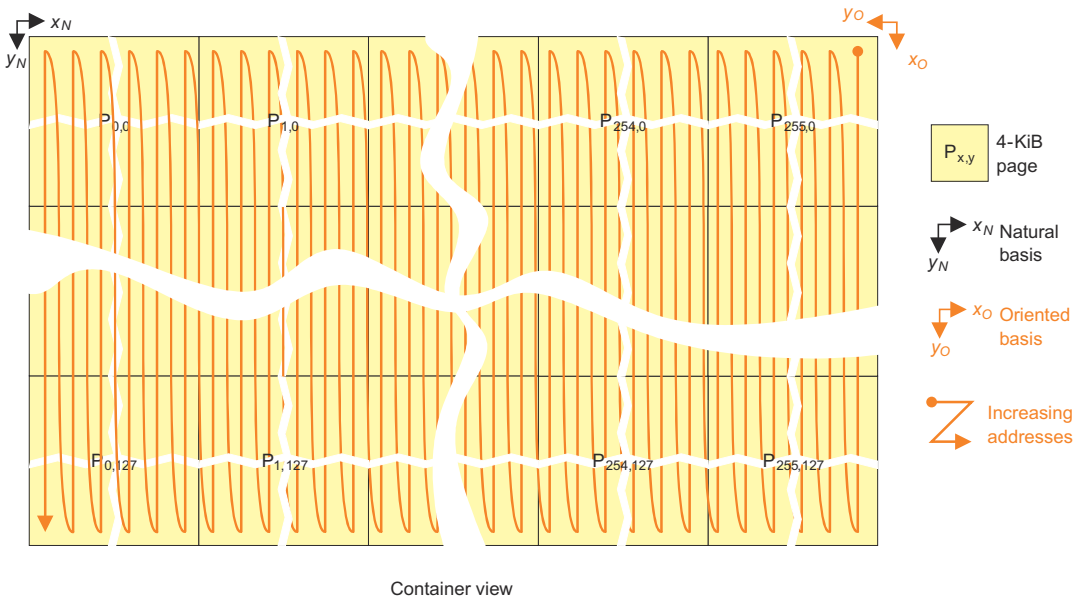

Figure 15-31. Tiled Mode Ordering of Elements in 270-Degree View

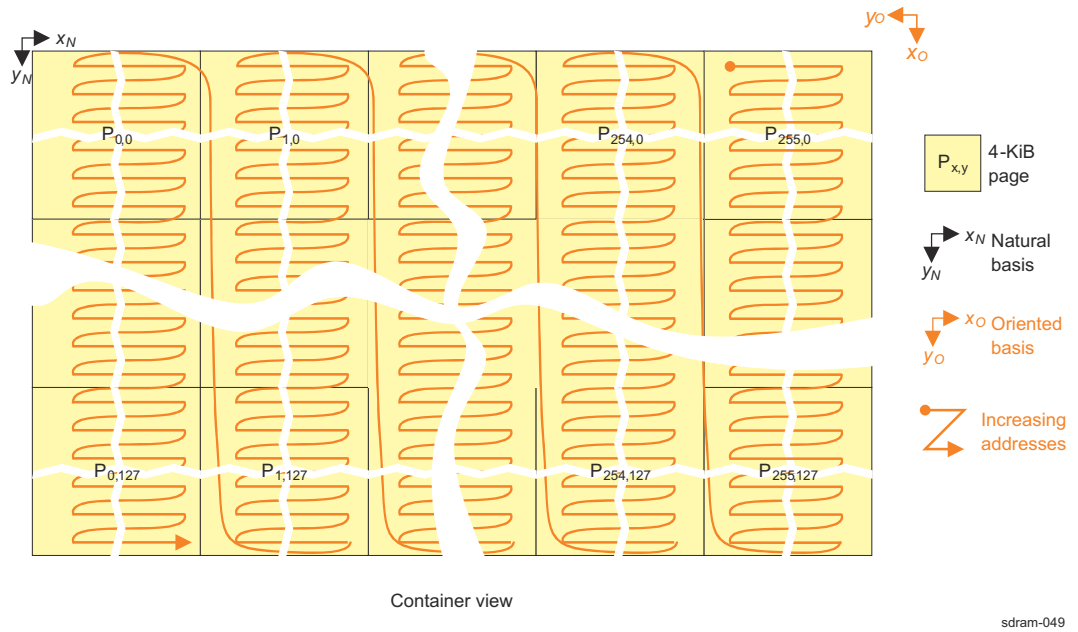

Figure 15-32. Page Mode Ordering of Elements in 270-Degree View

15.2.3.6.1.8.3.7 90-Degree View (Orientation 6)

This orientation defined by S = 1, $\overline{Y}$ = 1, and $\overline{X}$ = 0 and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{y}_N \\ \vec{y}_O = \vec{x}_N \end{cases}$$

sdram-050

In any TILER mode, the elements are ordered from bottom to top and then from left to right in their container, as shown in Figure 15-33 and Figure 15-34.

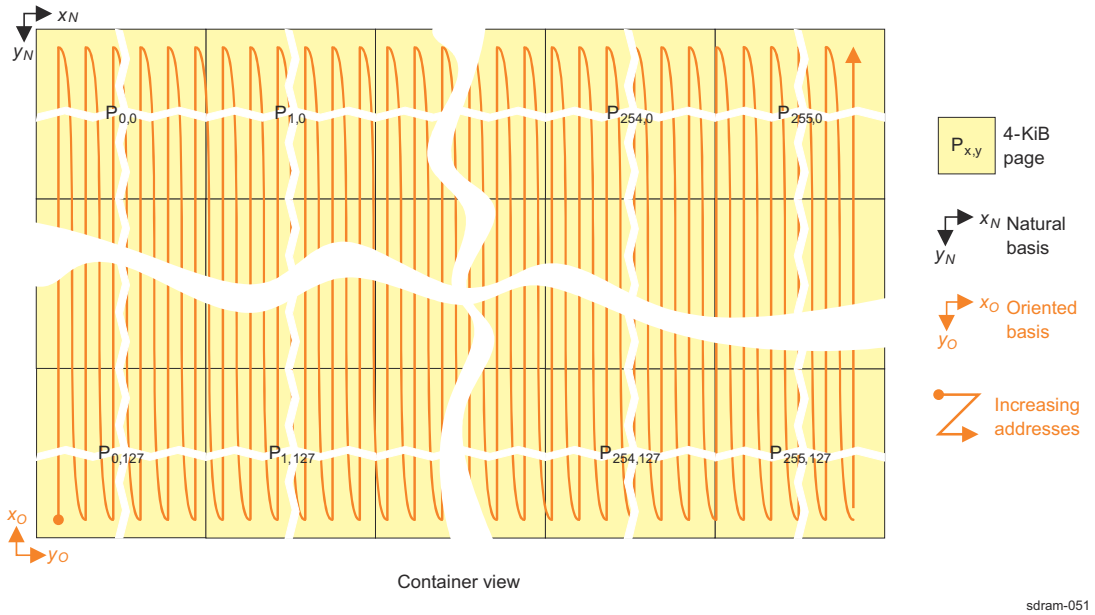

Figure 15-33. Tiled Mode Ordering of Elements in 90-Degree View

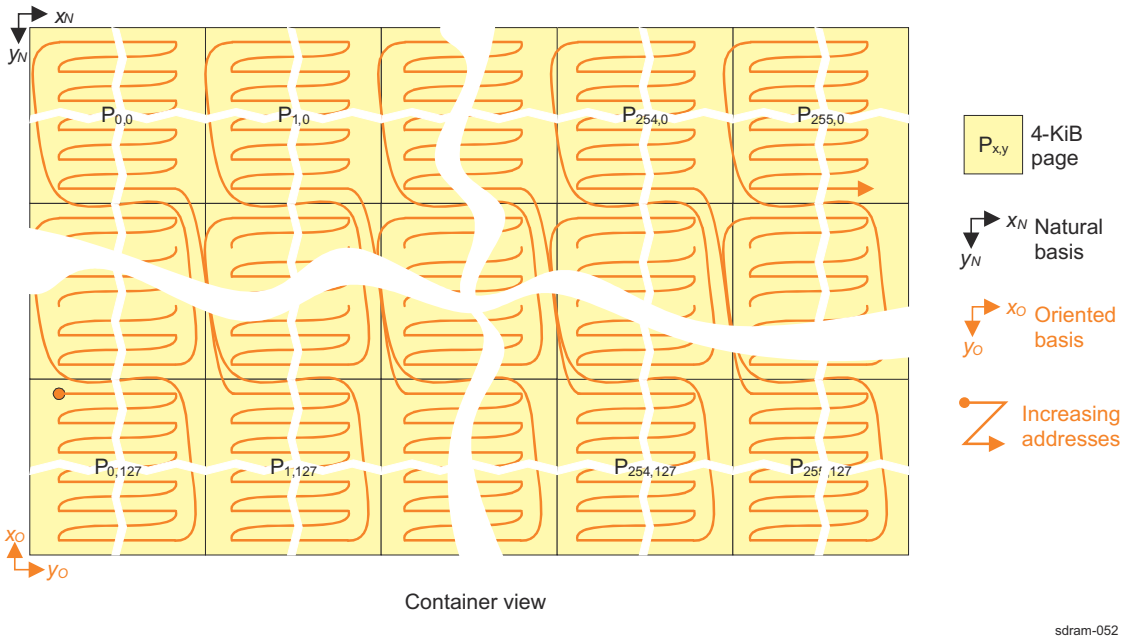

Figure 15-34. Page Mode Ordering of Elements in 90-Degree View

15.2.3.6.1.8.3.8 90-Degree View With Horizontal Mirror or 270-Degree View With Vertical Mirror (Orientation 7)

This orientation defined by S = 1, $\overline{Y}$ = 1, and $\overline{X}$ = 1 and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{y}_N \\ \vec{y}_O = -\vec{x}_N \end{cases}$$

sdram-053

In any TILER mode, the elements are ordered from bottom to top and then from right to left in their container, as shown in Figure 15-35 and Figure 15-36.

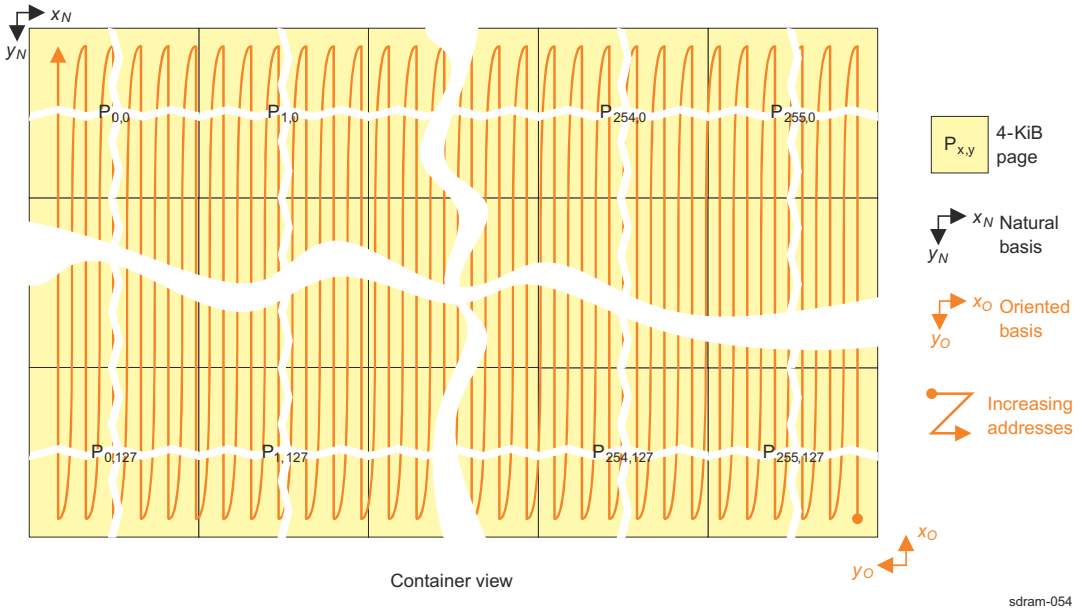

Figure 15-35. Tiled Mode Ordering of Elements in 90-Degree View With Horizontal Mirror

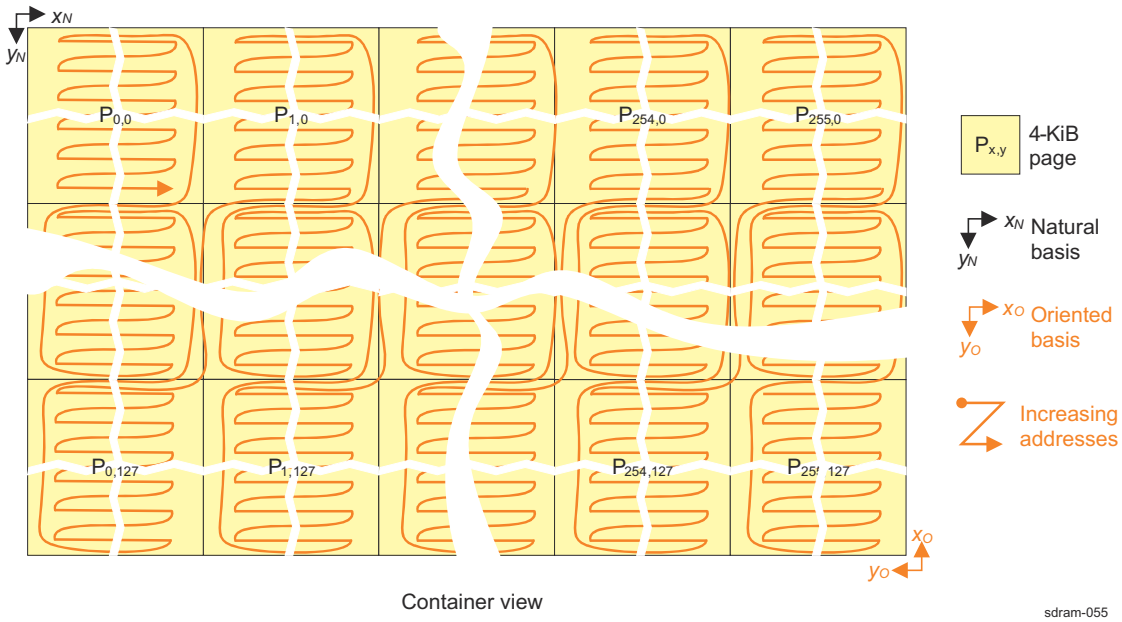

Figure 15-36. Page Mode Ordering of Elements in 90-Degree View With Horizontal Mirror

15.2.3.6.2 TILER Macro-Architecture

The TILER requires a 4-GiB addressing space to map its 128-MiB physical container in four modes and eight orientations. Because its addressing space alone fills the 4-GiB global system address map, the TILER addressing space cannot enter as-is into the system address map. Besides, putting in place a register-based mechanism per initiator to specify the orientation of the following accesses and then reducing the TILER addressing space to a single 512-MiB view is not an option; this is because most of the bandwidth-hungry initiators require simultaneous accesses to the TILER container in different views.

As a result, 32 bits are not enough to address all these requests, because the TILER port must convey not only virtually addressed requests to the "oriented" TILER containers but also physically addressed requests to the

attached SDRC. A thirty-third address bit is necessary to distinguish the two separated address maps, as shown in Figure 15-37.

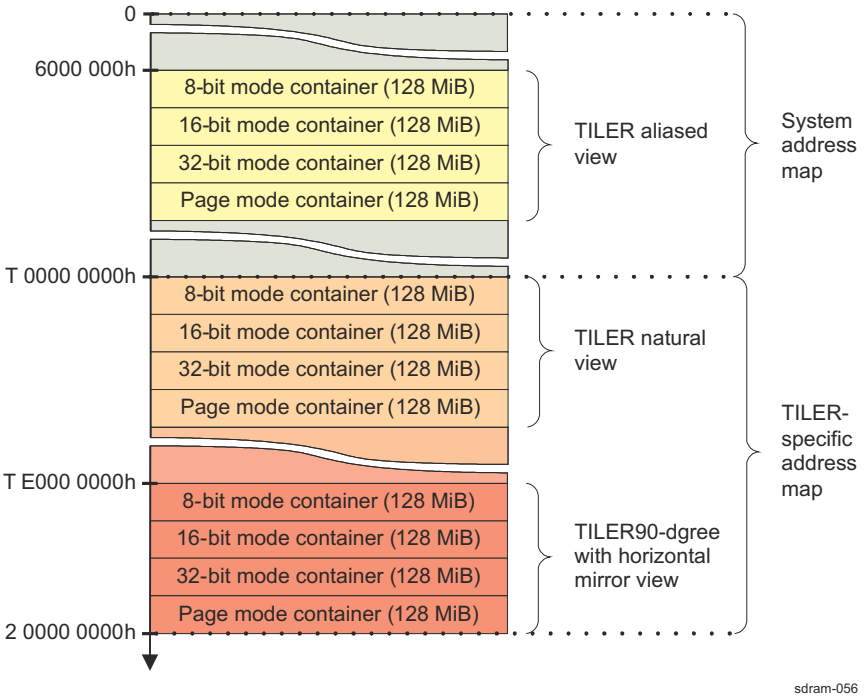

Figure 15-37. TILER Port Address Map

Still, having separated systems and TILER-specific address maps is not sufficient. In a system many existing and external IP blocks still rely on a 32-bit address and would then be limited to one or the other 4-GiB addressing space. To overcome this limitation, one 512-MiB view is aliased in the system address map as (see Table 15-14 and Figure 15-38).

Table 15-14. TILER Aliased View in the L3 Interconnect Mapping

Start Address (hex)	End Address (hex)	Size
0x6000_0000	0x7FFF_FFFF	512 MiB

From all incoming requests, TILER requests are filtered as having an address that fits one of the following:

- The address format in the TILER-specific address map given in Table 15-15
- The address format of the aliased view in the system address map given in Table 15-16

Other requests are forwarded directly to the SDRC in TILER bypass mode.

Table 15-15. Address Format in the TILER-Specific Address Map

32	31	30	29	28	27	26 ... 4	3 ... 0
T	Orientation			Mode		Virtual address	
1	S	$\overline{Y}$	$\overline{X}$	M1	M0	A26 ... A4	0

Table 15-16. Address Format of the TILER Aliased View in the System Address Map

32	31	30	29	28	27	26 ... 4	3 ... 0
T	TILER aliasing			Mode		Virtual address	
0	0	1	1	M1	M0	A26 ... A4	0

In these address formats:

- The thirty-third bit, noted T, is aimed at distinguishing the standard 4-GiB system address map from the 4-GiB TILER-specific address map.
- The orientation bits, noted S, $\overline{Y}$, and $\overline{X}$, define the request orientation, as specified in Table 15-12.
- The mode bits, noted M1 and M0, define the request mode, as specified in Table 15-11.
- The remaining 27 bits, noted A0 to A26, define the mode and orientation specific virtual address, as defined in Figure 15-18, Figure 15-19, and Figure 15-20.

The orientation of the aliased TILER view is extracted from an initiator-indexed LUT, as shown in Figure 15-38.

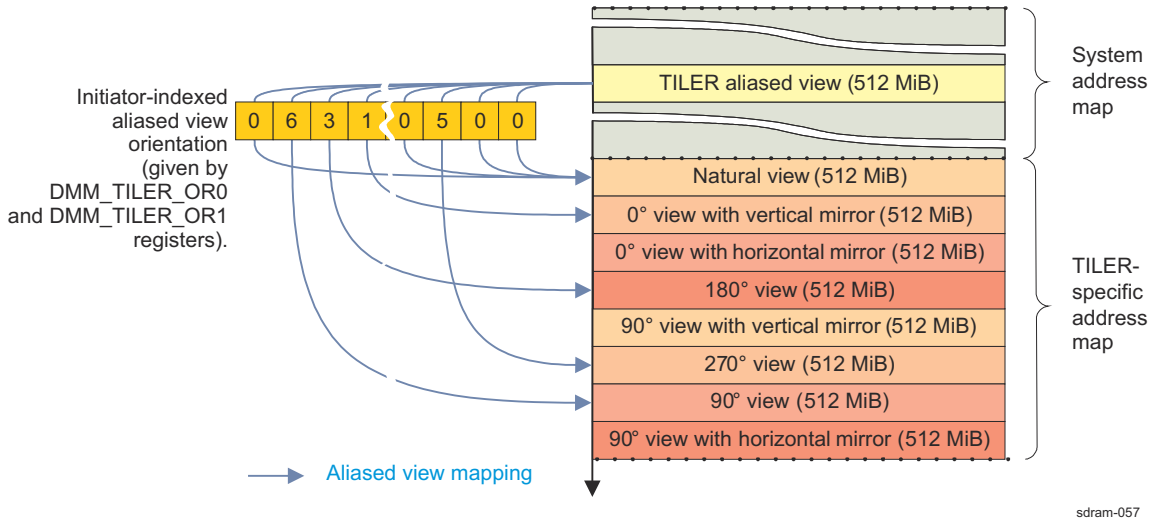

Figure 15-38. TILER Aliased View Orientation

As shown in Figure 15-38, an internal initiator-indexed LUT stores the current orientation of the aliased view for each initiator.

When an interconnect request hits the TILER aliased view in the system address map, the request initiator orientation is extracted from the LUT and the request address is translated according to this orientation: the T bit is set and bits [31:29] are replaced with the orientation.

Regarding the dimensioning of this LUT, given that initiators simultaneously accessing multiple views use the TILER-specific address map, and many initiators do not need to access any view or can be restricted to accessing only the natural view, only a limited number of initiators are likely to dynamically modify the orientation of its aliased TILER view.

The orientation LUT is limited to 16 entries. These 16 orientation entries are mapped on the two 32-bit DMM_TILER_OR0 and DMM_TILER_OR1 registers.

The first eight entries of the LUT are mapped in the DMM_TILER_OR0 register, and the last eight entries are mapped in the DMM_TILER_OR1 register. Therefore, given an index x, the orientation related to this index is given in the ORx field.

Each of these registers is split into eight 4-bit fields, each field mapping an entry of the LUT with:

- An S, $\overline{Y}$, $\overline{X}$ orientation code on the 3 LSBs
- An $\overline{W}$ field-specific active-low local write-enable bit, always read as 0, on the MSB.

The registers fields that correspond to initiators that do not need any dynamic configuration of their aliased view orientation must be specified as reserved fields, and only written with zeros.

The $\overline{W}$ bit allows the modification of a single entry without requiring a read-modify-write sequence. This approach is then more accommodating:

- In a system where multiple initiators can modify their own fields in the registers
- With initiators unable to make the read-modify-write sequence, such as DMA

Still, the $\overline{W}$ bit is active-low to keep the compatibility with the usual read-modify-write sequence. When reading an aliased view orientation register, because all its $\overline{W}$ bits are read as 0, if these bits are untouched by the modification—as they should be—writing back the modified register updates all orientation fields of the register.

15.2.3.6.3 TILER Guidelines for Initiators

15.2.3.6.3.1 Buffered Raster-Based Initiators

15.2.3.6.3.1.1 Buffer Size

The necessary minimum buffer size depends on the SDRAM prefetch size and on initiator support in terms of the following:

- Element size
- Orientation
- Maximum number of elements per line in all supported element sizes and orientations

Let N be the maximum number of elements per line for a given mode (element size) and orientation, P be the SDRAM memory prefetch size in bytes, and *max* be the function returning the maximum of the two parameters. The minimum necessary line buffer size to handle all resolutions in a given mode and orientation is listed in Table 15-17.

Table 15-17. Minimum Buffer Size to Efficiently Handle Lines of up to N Elements

	0- or 180- Degree Orientation (S = 0)	90- or 270-Degree Orientation (S = 1)
8-bit mode	4 × N bytes	*max* (4,P/4) × N bytes
16-bit mode	None	*max* (8,P/2) × N bytes
32-bit mode	None	*max* (8,P/2) × N bytes

This minimal buffer size can be reached only with an advanced FIFO management scheme. The standard ping-pong buffer requires twice this buffer size.

Note

Given their nature, field accesses to an interlaced frame-buffer require buffers twice as small as in the standard progressive case.

For instance, an initiator that must handle only a single progressive frame-buffer in any orientation of:

- Up to 1920 × 1080 in YUV4:2:0
- Up to 1600 × 1200 in 16-bit RGB565
- Up to 800 × 600 in 32-bit ARGB

requires a line buffer of at least 15,360 bytes because:

- 4 × 1920 + 4 × 2960 = 15,360 bytes required for a 3-plane YUV4:2:0 frame of 1920 × 1080
- 4 × 1920 + 8 × 960 = 15,360 bytes required for a 2-plane YUV4:2:0 frame of 1920 × 1080
- 8 × 1600 = 12,800 bytes required for a 16-bit RGB565 frame of 1600 × 1200
- 8 × 800 = 6400 bytes required for a 32-bit ARGB frame of 800 × 600

and a line buffer of at least 30,720 bytes when using a simple ping-pong buffer scheme.

15.2.3.6.3.1.2 Performance

Table 15-18 lists the ratio of effective data-to-transferred data at the external memory interface for the buffered raster-based initiators in each mode and orientation when using a 32-bit DDR3 memory.

Table 15-18. Memory Data Payload for Buffered Raster-Based Initiators on 32-Bit DDR3

	0- or 180-Degree Orientation (S = 0)		90- or 270-Degree Orientation (S = 1)	
	Progressive	Interlaced	Progressive	Interlaced
8-bit mode	100%	50%	100%	50%
16-bit mode	100%	50%	100%	50%
32-bit mode	100%	50%	100%	50%
Page mode	100%	N/A	100%	100%

When using 32-bit DDR3 SDRAM, whenever all previous guidelines are fulfilled, there is no penalty for these initiators to access a tiled object in any orientation, except for accesses to an interlaced frame in any orientation where the memory bandwidth is twice the requested bandwidth.

When using DDR3 SDRAM, all accesses, except interlaced accesses, are equally efficient and offer the full possible memory bandwidth.

Similarly, page mode does not introduce any performance hit.

15.2.4 DMM Use Cases and Tips

15.2.4.1 PAT Use Cases

Five ways to use PAT are:

- Simple manual area refill: Section 15.2.4.1.1
- Single auto-configured area refill: Section 15.2.4.1.2
- Chained auto-configured area refill: Section 15.2.4.1.3
- Synchronized auto-configured area refill: Section 15.2.4.1.4
- Cyclic synchronized auto-configured area refill: Section 15.2.4.1.5

Note

PAT refill area must be fully contained within either the LUT lower half or the LUT upper half. It must not span over both areas. That is, y0 MS

bit y0[7] must be equal to y1 MSbit y1[7] when defining the area descriptor.

15.2.4.1.1 Simple Manual Area Refill

The following must be performed to create a 16-byte aligned memory-mapped entry table containing all entries of the defined area (see Figure 15-39):

1. Write the DMM_PAT_AREA_i register with the relevant (x0, y0) (x1, y1) area definition.
2. Write the DMM_PAT_DATA_i register with the physical address of the created entry table.
3. Write the DMM_PAT_CTRL_i register with the requested refill direction and assert the DMM_PAT_CTRL_i[0] START bit with the requested refill direction D and with the LUT ID L if multiple LUTs are present in the system.
4. The refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
5. A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set.

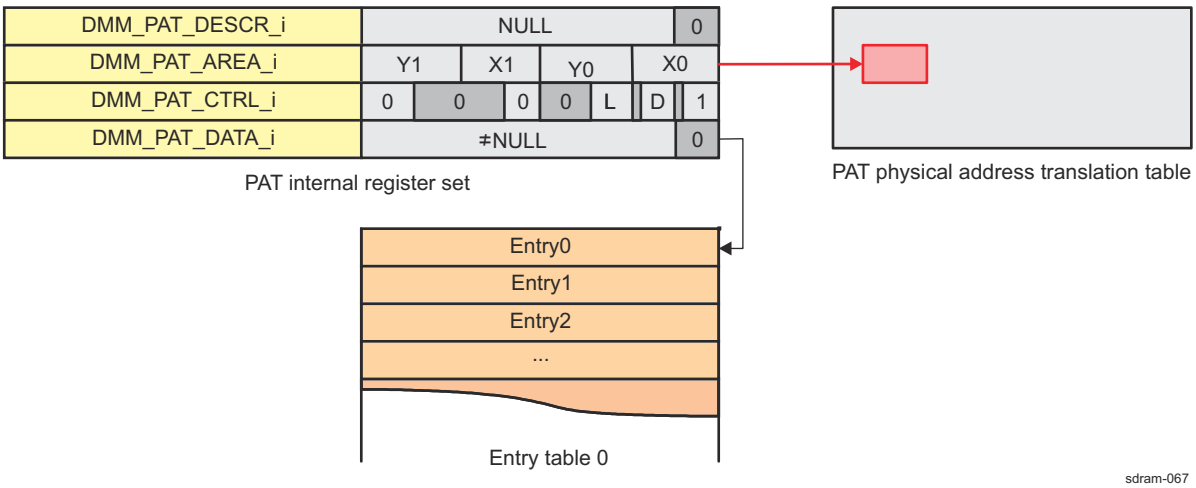

Figure 15-39. Simple Manual Area Refill Scheme

15.2.4.1.2 Single Auto-Configured Area Refill

The following must be performed to create a 16-byte aligned memory-mapped entry table containing all entries of the defined area (see Figure 15-40):

1. Create a 16-byte aligned memory-mapped descriptor structure where:
   - The next field is set to NULL.
   - The area field is set with the relevant (x0, y0) (x1, y1) area definition.

- The ctrl field is set with the requested direction D, with the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as this descriptor enters the PAT refill engine.
- The data field is set to the physical address of the created entry table.

2. Write the DMM_PAT_DESCR_i register with the physical address of the created descriptor.
3. The refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
4. A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set.

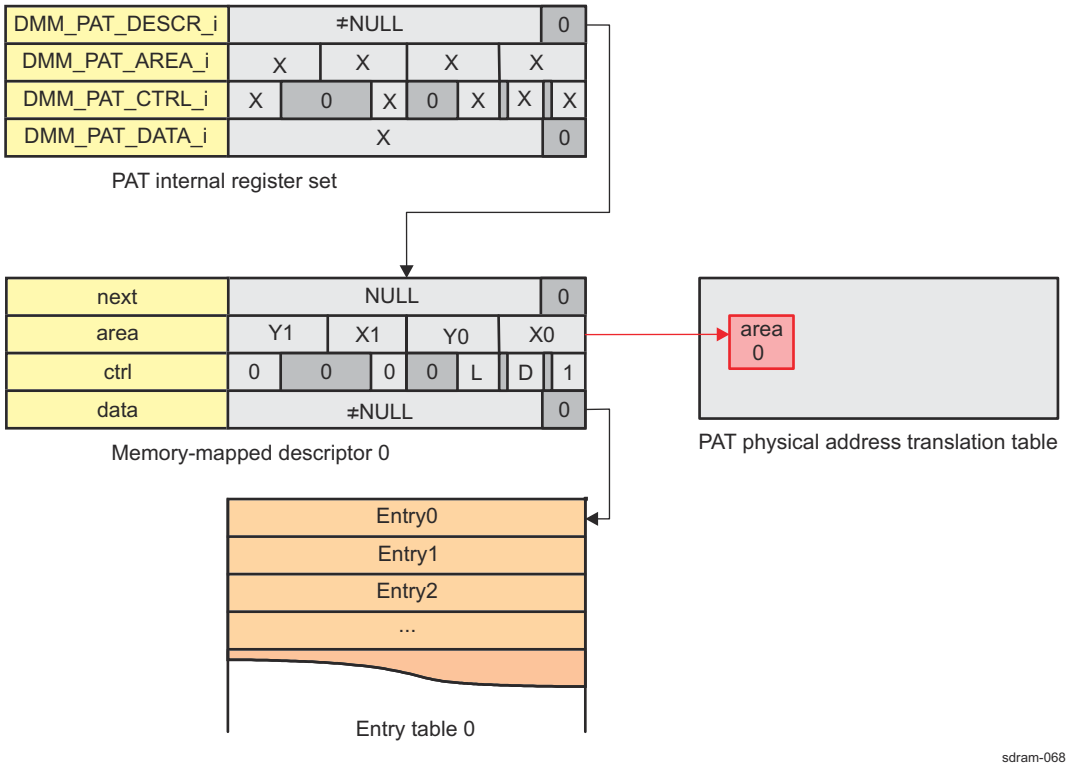

Figure 15-40. Single Auto-Configured Area Refill Scheme

15.2.4.1.3 Chained Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-41):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
   - The next field is set to the physical address of the next descriptor or NULL for the last one.
   - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
   - The ctrl field is set with the requested direction D, with the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done.
   - The data field is set to the physical address of the corresponding entry table.
2. Write the DMM_PAT_DESCR_i register with the physical address of the first created descriptor.
3. Each area refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
4. All area refills are done when the DMM_PAT_STATUS_i[0] READY bit is set.
5. A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set.

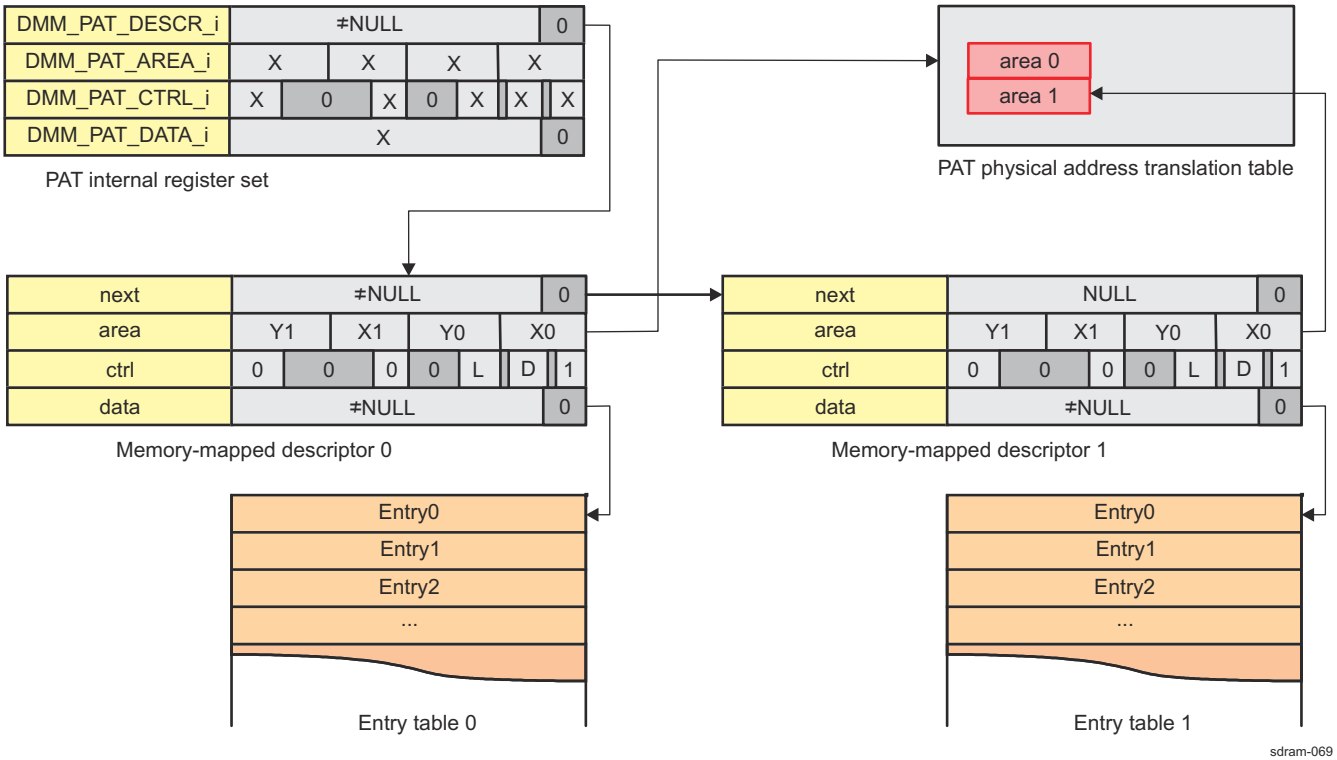

Figure 15-41. Chained Auto-Configured Area Refill Scheme

15.2.4.1.4 Synchronized Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-42):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
   - The next field is set to the physical address of the next descriptor or NULL for the last one.
   - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
   - The ctrl field is set with the synchronizing initiator identifier I, the SYNC bit is asserted, the requested direction D and the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area.
   - The data field is set to the physical address of the corresponding entry table.
2. Write the DMM_PAT_DESCR_i register with the physical address of the first created descriptor.
3. Each area refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
4. All area refills are done when the DMM_PAT_STATUS_i[0] READY bit is set.
5. A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set.

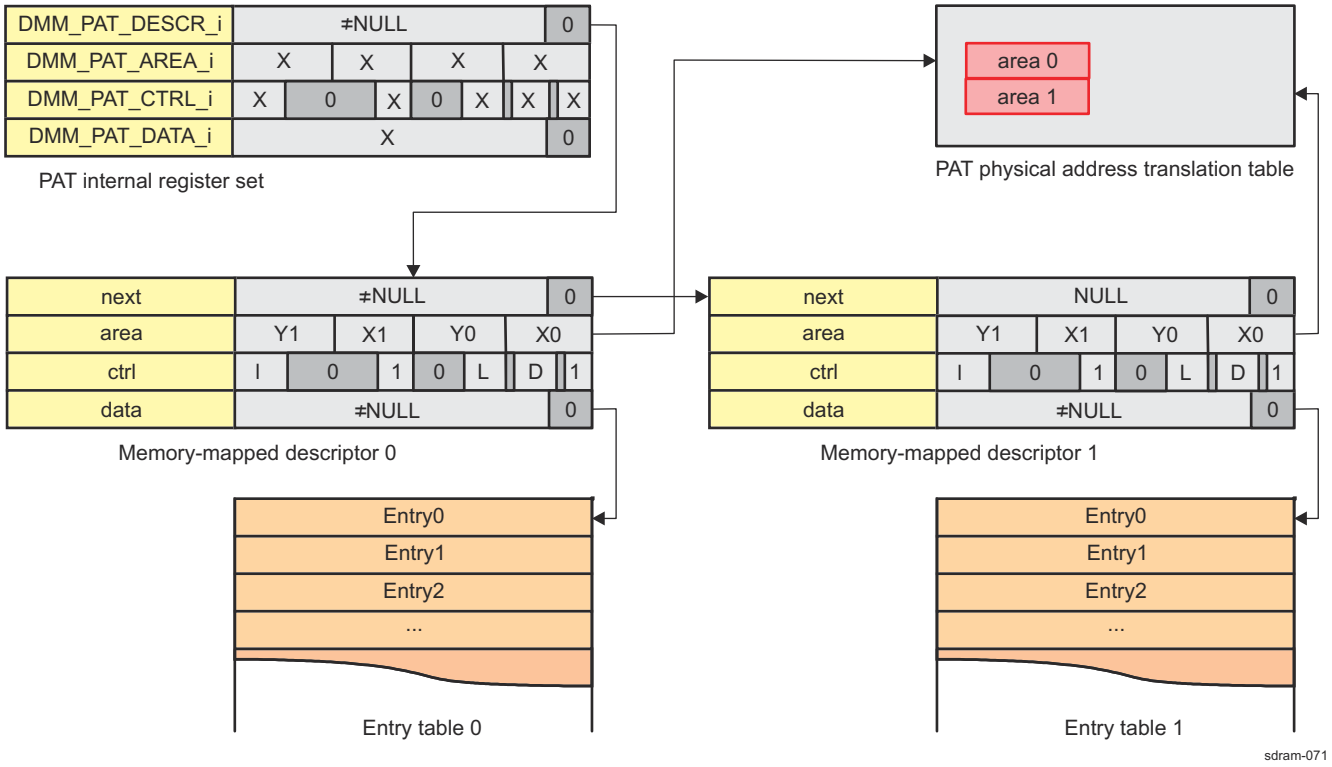

Figure 15-42. Synchronized Auto-Configured Area Refill Scheme

15.2.4.1.5 Cyclic Synchronized Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-43):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
   - The next field is set to the physical address of the next descriptor in the circular list.
   - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
   - The ctrl field is set with the synchronizing initiator identifier I, the SYNC bit asserted, the requested direction D and requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area.
   - The data field is set to the physical address of the corresponding entry table.
2. Write the DMM_PAT_DESCR_i register with the physical address of the initial descriptor.
3. Each area refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
4. A new refill can be initiated by writing any value to the DMM_PAT_DESCR_i register to abort the current one.

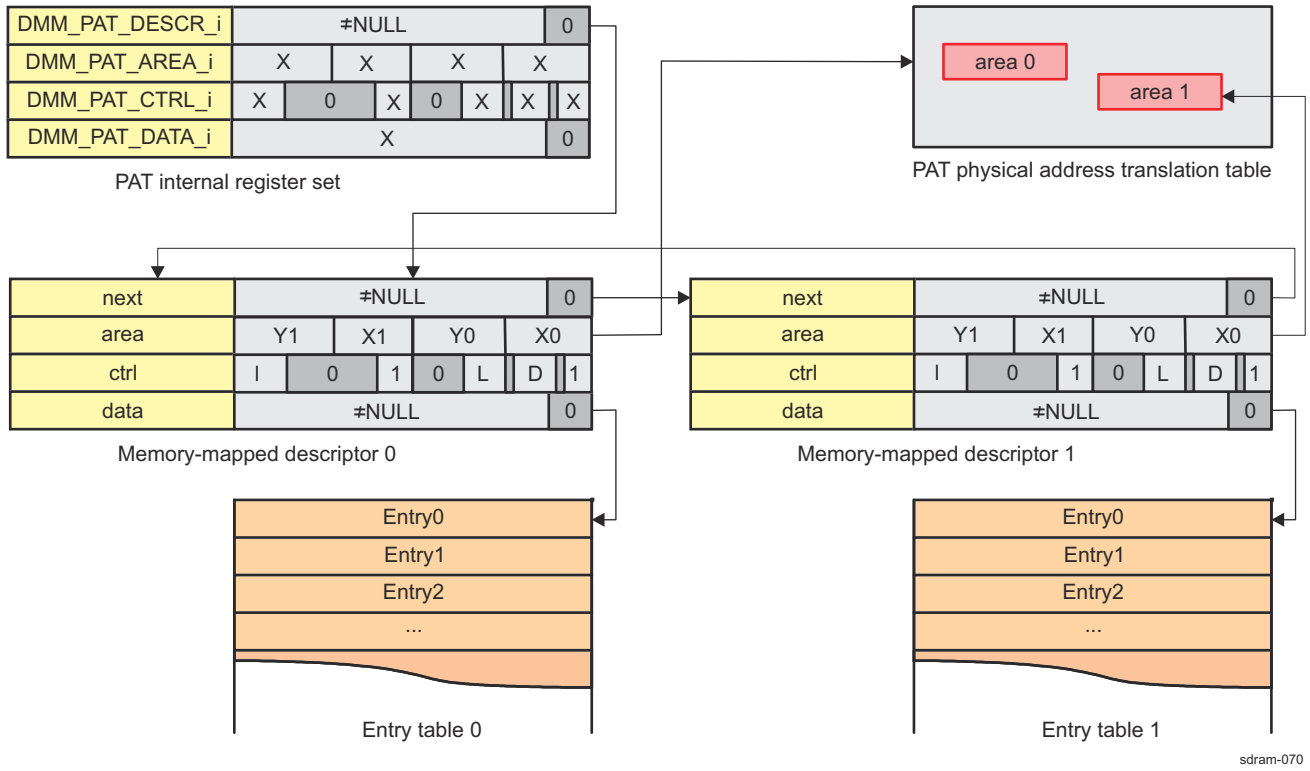

Figure 15-43. Cyclic Synchronized Auto-Configured Area Refill Scheme

Note

Never use circular lists of descriptors where all descriptors have the DMM_PAT_CTRL_i[0] START bit set and there is no synchronization. This leads to an endless continuous refill.

15.2.4.2 Addressing Management with LISA

15.2.4.2.1 Case 1: Use of One Memory Controller

In this example, assume there is 1 GiB of external memory evenly spread onto two address spaces. The address range for address space 0 must start at offset 0x2000_0000 (see Table 15-19).

Table 15-19. Address Definition

Address Range	Memory Controller	Memory Controller Address Space(1)	Memory Controller Address Range
0x8000_0000 to 0x9FFF_FFFF	EMIF1	0x0	0x0000_0000 to 0x1FFF_FFFF
0xA000_0000 to 0xBFFF_FFFF	EMIF1	0x0	0x2000_0000 to 0x3FFF_FFFF

(1) For memory controller address spaces, see *Local Interface* in *EMIF Controller*.

This configuration requires two nonoverlapping sections to be set. They can be defined in any order because there is no concern with priority in this case (see Table 15-20):

Table 15-20. Configuration

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[31:24] SYS_ADDR	0x80	0xA0
[22:20] SYS_SIZE	0x5	0x5
[17:16] SDRC_ADDRSPC	0x0	0x0
[9:8] SDRC_MAP	0x1 (only EMIF1)	0x1 (only EMIF1)
[7:0] SDRC_ADDR	0x00	0x20

To check whether an address hits a section, use the 8 upper address bits of the address and mask them with the hit mask: 2^8–2^{SYS_SIZE}. If the result is equal to SYS_ADDR, the section is hit.

To define the physical address to be issued to the memory controller, use the 8 upper address bits of the system address, mask them with the address mask: 2^{SYS_SIZE}–1, and OR them with SDRC_ADDR. This gives the resulting 8 upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE_37F0:

- Upper address bits: 0x99
- Hit mask: 2^8–2^5 = 0xE0
- Masked upper address bits: 0x80, that is, hits section 0
- Address mask: 2^5–1 = 0x1F
- Masked upper address bits: 0x19
- OR with SDRC_ADDR: 0x19
- Physical address: 0x19AE_37F0

This request is forwarded to address 0x19AE_37F0, address space 1 of the memory controller.

Request to address 0xB7FF_0340:

- Upper address bits: 0xB7
- Hit mask: 2^8–2^5 = 0xE0
- Masked upper address bits: 0xA0, that is, hits section 1
- Address mask: 2^5–1 = 0x1F
- Masked upper address bits: 0x17
- OR with SDRC_ADDR: 0x37
- Physical address: 0x37FF_0340

This request is forwarded to address 0x37FF_0340, address space 0 of the memory controller.

15.2.5 DMM Basic Programming Model

The programming model section:

- Describes how objects can be addressed in all TILER modes and orientations
- Explains how the physical containers and PAT LUT can be shared between different modes
- Does not give an exhaustive description of the TILER and DMM registers, because these are described in Section 15.2.3.5, *DMM*, and Section 15.2.3.6, *TILER*.

15.2.5.1 Global Initialization

This section identifies the requirements for initializing the surrounding modules when the DMM is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DMM (see Table 15-21).

Table 15-21. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. See *Power, Reset, and Clock Management.*
Image processing unit (IPU)	IPU interrupt controller (INTC) configuration must be done to enable the interrupts from the DMM. See *Interrupt Controllers.*
Main processing unit (MPU)	MPU INTC configuration must be done to enable interrupts from the DMM. See *Interrupt Controllers.*
L3_MAIN interconnect	Data interface

15.2.5.2 DMM Module Global Initialization

Theprocedure in Table 15-22 initializes the DMM after a power-on reset (POR).

Table 15-22. DMM Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure the DMM for smart-idle power management mode.	DMM_SYSCONFIG[3:2] IDLE_MODE	0x2

15.2.5.3 DMM Operational Modes Configuration

15.2.5.3.1 Different Operational Modes

The TILER can be virtually accessed in four different modes: 8-, 16-, 32-bit, and page modes. Each mode defines the element granularity to apply isometric transforms (see Table 15-23).

Table 15-23. Coding and Description of TILER Modes

Mode	Name	Granularity (Element Size)
0	8-bit tiled mode	8 bits
1	16-bit tiled mode	16 bits
2	32-bit tiled mode	32 bits
3	Page mode	4096 bytes

15.2.5.3.2 Configuration Settings and LUT Refill

The procedure in Table 15-24 provides the configuration settings and LUT refill.

Table 15-24. Configuration Settings and LUT Refill

Step	Register/Bit Field/Programming Model	Value
PAT configuration refill Engine 0	DMM_PAT_CONFIG[0] MODE0	xxx
PAT configuration refill Engine 1	DMM_PAT_CONFIG[1] MODE1	xxx
Set DMM PAT view register value for each initiator.	DMM_PAT_VIEW0 Vx DMM_PAT_VIEW1 Vx	xxx
Set DMM PAT write enable for the initiators.	DMM_PAT_VIEW0 Wx DMM_PAT_VIEW1 Wx	xxx
Choosing container type and access method	DMM_PAT_VIEW_MAP_i	xxx
Define the base address of all view mappings.	DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR	xxx
Set area definition for DMM physical address translator.	DMM_PAT_AREA_i	xxx
Set the physical address of the current table refill entry data or entry data when in manual mode.	DMM_PAT_DATA_i[31:4] ADDR	xxx
Define the direction of this PAT table refill (S Y X), different from 0x011.	DMM_PAT_CTRL_i[6:4] DIRECTION	xxx
Start a PAT table refill.	DMM_PAT_CTRL_i[0] START	0x1

15.2.5.3.3 LISA Settings

The procedure in Table 15-25 provides the LISA settings.

Table 15-25. LISA Settings

Step	Register/Bit Field/Programming Model	Value
Set DMM system section address MSB.	DMM_LISA_MAP_i[31:24] SYS_ADDR	xxx
Set DMM system section size.	DMM_LISA_MAP_i[22:20] SYS_SIZE	xxx
Set SDRC address space.	DMM_LISA_MAP_i[17:16] SDRC_ADDRSPC	xxx
Set SDRC mapping.	DMM_LISA_MAP_i[9:8] SDRC_MAP	xxx
Set SDRC address MSB.	DMM_LISA_MAP_i[7:0] SDRC_ADDR	xxx
Enable/disable DMM memory mapping lock.	DMM_LISA_LOCK[0] LOCK	xxx

15.2.5.3.4 Aliased Tiled View Orientation Settings and LUT Refill

The procedure in Table 15-26 provides the settings for aliased tiled view and LUT refill.

Table 15-26. Aliased Tiled View Orientation Settings and LUT Refill

Step	Register/Bit Field/Programming Model	Value
Set DMM TILER orientation for each initiator.	DMM_TILER_OR0 ORx DMM_TILER_OR1 ORx	xxx
Set DMM TILER write enable for the initiators.	DMM_TILER_OR0 Wx DMM_TILER_OR1 Wx	xxx
Define the base address of all view mappings.	DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR	xxx
DMM PAT initiator for synchronization	DMM_PAT_CTRL_i[31:28] INITIATOR	xxx
Set DMM PAT table reload synchronization.	DMM_PAT_CTRL_i[16] SYNC	xxx
Set DMM PAT LUT index (when more than one LUTs).	DMM_PAT_CTRL_i[9:8] LUT_ID	xxx
Define the direction of this PAT table refill (S Y X).	DMM_PAT_CTRL_i[6:4] DIRECTION	xxx
Start a PAT table refill.	DMM_PAT_CTRL_i[0] START	0x1

15.2.5.3.5 Priority Settings

The procedure in Table 15-27 provides the sequence to set priorities.

Table 15-27. Priority Settings

Step	Register/Bit Field/Programming Model	Value
Set priority for each initiator.	DMM_PEG_PRIO_k Px	xxx
Set write enable for P_PAT field.	DMM_PEG_PRIO_PAT[4] W_PAT	xxx
Set priority for PAT engine.	DMM_PEG_PRIO_PAT[2:0] W_PAT	xxx

15.2.5.3.6 Error Handling

The procedure in Table 15-28 provides the sequence for error handling.

Table 15-28. Error Handling

Step	Register/Bit Field/Programming Model	Value
Enable interrupt for selected type of error.	DMM_PAT_IRQENABLE_SET[15:9] DMM_PAT_IRQENABLE_SET[7:0]	xxx
When interrupt occurs		
Disable type of error to handle.	DMM_PAT_IRQENABLE_CLR[15:9] DMM_PAT_IRQENABLE_CLR[7:0]	xxx
Check error status.	DMM_PAT_IRQSTATUS[15:9] DMM_PAT_IRQSTATUS[7:0]	xxx

15.2.5.3.7 PAT Programming Model

The PAT maps the tiled data anywhere in the 4-GiB physical address range, with a PAGE granularity. (The TILER page is the granularity of physical memory allocation in the TILER container. Each page is 4kiB).

A PAT view defines the kind of PAT to perform for each page, 8-, 16-, and 32-bit mode access. Each mode in each PAT view can be programmed in two different modes: direct translation and indirect translation.

15.2.5.3.7.1 PAT in Direct Translation Mode

In this mode, the PAT performs a translation of the 128-MiB virtual container as a whole in the physical address space (that is, in the SDRAM). This mode is used only for debug or in case of a DMM without a PAT.

15.2.5.3.7.2 PAT in Indirect Translation Mode

This is the most commonly used mode. In this mode, the PAT performs a translation of each 4-KiB page individually. In this way the 128-MiB virtual address space can be scattered in the whole 2 GiB of the physical

address space. This is achieved by using a 32,678-word LUT that converts each page index (32,768 possible values) into 19 address bits that represent this page address in the physical memory. The main characteristic of this mode is there is no constraint on the use of the physical memory except that it is uses a multiple of 4-KiB areas located at 4-KiB boundaries in the physical memory. In this mode, the translation vector is in the internal 32-k entry PAT vector table at the index given by bits [26:12] of the input virtual address, and CONT_x = 0.

Programming sequence:

1. Set the DMM_PAT_VIEW0 register (or DMM_PAT_VIEW1, depending on the L3 CONN_ID of the initiator that is to perform the tiled accesses) with the appropriate value. For example, if the L3 CONN_ID equals 0, then the DMM_PAT_VIEW0 register must be programmed with the value 0x0000_0001 (PAT view 1 selected for initiator 0).
2. Set DMM_PAT_VIEW_MAP_BASE[31] = 0x8000_0000 (must always be programmed at 1 to select the upper 2 GiB of the physical address space that corresponds to the external memory).
3. Set all 16-bit tiled accesses in indirect translation mode by setting at least the field ACCESS_16 to 1 (DMM_PAT_VIEW_MAP_1 = 0x0000_8000), program DMM_PAT_VIEW_MAP_1 at 0x8080_8080.

15.2.5.4 Addressing an Object in Tiled Mode

This section describes how a frame-buffer with a top-left pixel at (x0,y0) in the natural view container and a bottom right pixel at (x1,y1) in the natural view container is addressed in any tiled mode and orientation.

15.2.5.4.1 Frame-Buffer Addressing

Note

In this section, the (x,y) coordinates are given in pixel units.

Given an (S, $\overline{Y}$, $\overline{X}$) orientation, the (x,y) coordinates of the first pixel of the frame in the oriented view (where W = the width and H = the height in pixels of the container in the considered frame mode) is:

$(x,y) = (x_{or}, y_{or})$ when S, (y_{or}, x_{or}) otherwise
with:
$x_{or} = x_0$ when $\overline{X}$, $W\text{-}1\text{-}x_1$ otherwise
$y_{or} = y_0$ when $\overline{Y}$, $H\text{-}1\text{-}y_1$ otherwise

Given a (M_1, M_0) TILER mode where $M_1 \# 0$ or $M_0 \# 0$, the size in bytes of a pixel is 2^{2M1+M0}.

Therefore, given an (S, $\overline{Y}$, $\overline{X}$) orientation and a $n(M_1, M_0)$ TILER mode where $M_1 \# 0$ or $M_0 \# 0$, the byte offset of the base address of the considered oriented frame in its container is:
$base\_address((x_0, y_0), (x_1, y_1), (S, \overline{Y}, \overline{X}), (M_1, M_0)) = (y_{or}W + x_{or})\ P_5$ when S, $(x_{or}H + y_{or})\ P_5$ otherwise
with:
$x_{or} = x_0$ when $\overline{X}$, $W\text{-}1\text{-}x_1$ otherwise
$y_{or} = y_0$ when $\overline{Y}$, $H\text{-}1\text{-}y_1$ otherwise
$P_5 = 2^{2M1+M0}$

In its natural orientation, the TILER container consists of 8192 lines of 16,384 pixels of 8 bits, or 4096 lines of 16,384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32 bits.

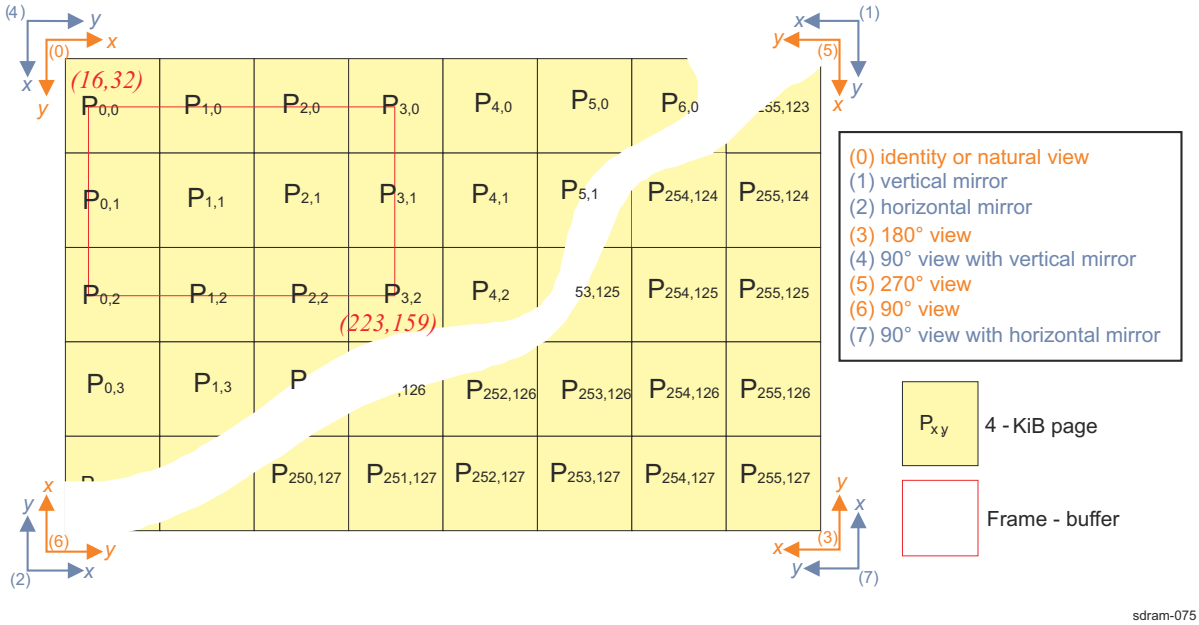

Figure 15-44. Example of 8-Bit Frame-Buffer Addressing in any Orientation

This frame-buffer address generation is independent from the page size. For instance, the 8-bit frame-buffer shown in Figure 15-44 that ranges from the top-left pixel at (16, 32) to the bottom-right pixel at (223, 159) in the natural orientation view, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in Table 15-29.

Table 15-29. 29-Bit View Address Offset and 33-Bit Full TILER Address for an 8-Bit Frame-Buffer

S	$\overline{Y}$	$\overline{X}$	x_{or}	y_{or}	29-Bit Address Offset in View	Full 33-Bit TILER Address
0	0	0	16	32	00080010h	100080010h
0	0	1	16,160	32	00083F20h	120083F20h
0	1	0	16	8032	07D80010h	147D80010h
0	1	1	16,160	8032	07D83F20h	167D83F20h
1	0	0	16	32	00020020h	180020020h
1	0	1	16,160	32	07E40020h	1A7E40020h
1	1	0	16	8032	00021F60h	1C0021F60h
1	1	1	16,160	8032	07E41F60h	1E7E41F60h

In this example the TILER is addressed in 8-bit mode, which translates to addresses with all mode bits (bits 27 and 28) cleared in the 29-bit address offset in view and in the full 33-bit TILER address.

15.2.5.4.2 TILER Page Mapping

Let:

- c (c = 0, 1, or 2) be the TILER page configuration (0 for 4-kiB pages, 1 for 16-kiB pages, and 2 for 64-kiB pages)
- (x_0, y_0) be the top-left pixel and (x_1, y_1) be the bottom-right pixel of a frame in its natural orientation
- W be the width and H the height in pixels of the container in the considered frame mode

The top-left page coordinates (P_{x0}, P_{y0}) and bottom-right page coordinates (P_{x1}, P_{y1}) that correspond to the frame are given by: $P_{x0} = (64.x_0.2^{2-c}) / W$, $P_{y0} = (32.y_0.2^{2-c}) / H$, $P_{x1} = (64.x_1.2^{2-c}) / W$ and $P_{y1} = (32.y_1.2^{2-c}) / H$.

In its natural orientation, the TILER container consists of 8192 lines of 16,384 pixels of 8 bits, or 4096 lines of 16,384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32 bits.

Note

The page area type has the same structure as the DMM_PAT_AREA_i registers. For instance, the 8-bit frame-buffer described in Figure 15-44 and ranging from the top-left pixel at (16, 32) to the bottom-right pixel at (223, 159) in the natural orientation view, is mapped from the top-left page at P0,0 to the bottom-right page P3,2.

15.2.5.5 Addressing an Object in Page Mode

In page mode, the orientation modifies only the sequence of accessed pages, not their content. In this respect the orientation must be seen as a way to optimize the one-dimensional (1D) object allocation in a TILER container by allowing a 1D object spanning multiple pages to map a set of adjacent pages in any direction. For instance, a 1.25-MiB object, mapped on 320 pages of 4kiB can be allocated in a TILER container in any of the eight orientations (see Section 15.2.3.6.1.8.3, *Element Ordering in the TILER Container*).

The initial page can be chosen freely among all pages. In this respect, the address offset of a page in a TILER container is expressed as:

Let:

- c (c = 0, 1 or 2) be the TILER page configuration (0 for 4-kiB pages, 1 for 16-kiB pages, and 2 for 64-kiB pages)
- (S, $\overline{Y}$, $\overline{X}$) be the orientation of the considered 1D object in page mode
- (P_x, P_y) be the coordinate of the initial page in the natural orientation view

The byte offset of the base address of the considered initial page in its oriented container is:
base_address((P_x, P_y), (S, $\overline{Y}$, $\overline{X}$)) = $4096.(64.y_{or}.2^{2-c} + x_{or}).2^{2.c}$ when S, $4096.(32.x_{or}.2^{2-c} + y_{or}).2^{2.c}$ otherwise
with:
$x_{or} = P_x$ when $\overline{X}$, $64.2^{2-c}-1-P_x$ otherwise
$y_{or} = P_y$ when $\overline{Y}$, $32.2^{2-c}-1-P_y$ otherwise

For instance, a 1D object starting from the page P32,63 in the natural orientation view on a DMM using 4-kiB pages, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in Table 15-30.

Table 15-30. 29-Bit View Address Offset and 33-Bit Full TILER Address for a 1D Object

S	$\overline{Y}$	$\overline{X}$	x_{or}	y_{or}	29-Bit Address Offset in View	Full 33-Bit TILER Address
0	0	0	32	63	1BF20000h	11BF20000h
0	0	1	223	63	1BFDF000h	13BFDF000h
0	1	0	32	64	1C020000h	15C020000h
0	1	1	223	64	1C0DF000h	17C0DF000h
1	0	0	32	63	1903F000h	19903F000h
1	0	1	223	63	1EFBF000h	1BEFBF000h
1	1	0	32	64	19040000h	1D9040000h
1	1	1	223	64	1EFC0000h	1FEFC0000h

In this example the TILER is addressed in page mode, which translates to addresses with mode bits (bits 27 and 28) set in the 29-bit address offset in view and full 33-bit TILER address.

15.2.5.6 Sharing Containers Between Different Modes

When allocating objects in TILER containers, ensure that no two objects physically overlap.

In this respect, and to ease the object allocation and deallocation, it is strongly advised to share a TILER page only for different objects that do both of the following:

- Belong to the same mode
- Have the same lifetime (that is, are allocated and deallocated simultaneously)

Two objects of different modes can physically overlap if:

- One physical page is mapped twice in two different locations of the DMM LUT.
- The two objects share the DMM LUT and the intersection of their two page set is not empty.

  These two issues can be easily avoided by allocating a physical page only once in the DMM LUT.

  The second issue is a bit more difficult, especially if the allocation of objects in the various TILER containers must be dynamic. Managing the fragmentation within a flat memory model in a space-constrained system is not straightforward, and is the main reason for the existence of MMUs in most current processors, which adds yet another constraint to the problem (the y dimension, which makes it even more difficult).

Returning to the CPU-analogy, the memory fragmentation issue is mostly solved by using a virtual memory space larger than the actual physical memory space and a virtual-to-physical translation system. This allows contiguous virtual memory allocation when sufficient physical memory is available and the larger contiguous physical buffer is smaller than the requested memory allocation.

Similarly, the DMM answer to this object allocation in the TILER containers is two-fold:

- The DMM must have sufficient virtual address space in all modes to permit a static allocation of a pool of virtual buffers in all TILER modes for all TILER-aware initiators.
- Each TILER-aware initiator must dynamically manage its own pool of virtual buffers.

15.2.6 DMM Register Manual

This section provides information about the DMM registers. Table 15-31 describes the DMM instance.

15.2.6.1 DMM Instance Summary

Table 15-31. DMM Instance Summary

Table 15-51. DMM_PAT_IRQSTATUS_RAW

Address Offset	0x0000 0480		
Physical Address	0x4E00 0480	**Instance**	DMM
Description	Per-event raw interrupt status vector. Raw status is set even if the related event is not enabled. Write 1 to set the (raw) status, mostly for debug. n = 0 for the first interrupt status raw register, n = 1 for the second interrupt status raw register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

13	ERR_UPD_CTRL1	Control register update whilst refilling error event in area 4.n+1 Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
12	ERR_UPD_AREA1	Area register update whilst refilling error event in area 4.n+1 Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
11	ERR_INV_DATA1	Invalid entry-table pointer error event in area 4.n+1 Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
10	ERR_INV_DSC1	Invalid descriptor pointer error event in area 4.n+1 Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0

Bits	Field Name	Description	Type	Reset
9	FILL_LST1	End of refill event for the last descriptor in area 4.n+1 Write 0x0: Keep area 1 refill done event. Write 0x1: Set area 1 refill done event. Read 0x1: Area 1 is refilled. Read 0x0: Area 1 is yet-to-be refilled.	RW W1toSet	0
8	FILL_DSC1	End of refill event for any descriptor in area 4.n+1 Write 0x0: Keep area 1 refill done event. Write 0x1: Set area 1 refill done event. Read 0x1: Area 1 is refilled. Read 0x0: Area 1 is yet-to-be refilled.	RW W1toSet	0
7	ERR_LUT_MISS0	Access to a yet-to-be-refilled area event in area 4.n Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
6	ERR_UPD_DATA0	Data register update whilst refilling error event in area 4.n Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
5	ERR_UPD_CTRL0	Control register update whilst refilling error event in area 4.n Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
4	ERR_UPD_AREA0	Area register update whilst refilling error event in area 4.n Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
3	ERR_INV_DATA0	Invalid entry-table pointer error event in area 4.n Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
2	ERR_INV_DSC0	Invalid descriptor pointer error event in area 4.n Write 0x0: Keep current error event. Write 0x1: Set error event. Read 0x1: Error event happened. Read 0x0: No such error event	RW W1toSet	0
1	FILL_LST0	End of refill event for the last descriptor in area 4.n Write 0x0: Keep area 0 refill done event. Write 0x1: Set area 0 refill done event. Read 0x1: Area 0 is refilled. Read 0x0: Area 0 is yet-to-be refilled.	RW W1toSet	0

Bits	Field Name	Description	Type	Reset
0	FILL_DSC0	End of refill event for any descriptor in area 4.n Write 0x0: Keep area 0 refill done event. Write 0x1: Set area 0 refill done event. Read 0x1: Area 0 is refilled. Read 0x0: Area 0 is yet-to-be refilled.	RW W1toSet	0

Table 15-52. DMM_PAT_IRQSTATUS

Address Offset	0x0000 0490		
Physical Address	0x4E00 0490	**Instance**	DMM
Description	Per-event "enabled" interrupt status vector. Enabled status is not set unless the event is enabled. Write 1 to clear the status after interrupt has been serviced (raw status gets cleared, that is, even if not enabled). n = 0 for the first interrupt status register, n = 1 for the second interrupt status register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15.3 EMIF Controller

This section describes mainly the features and functions of the external memory interface (EMIF) controller and also its associated PHYs.

15.3.1 EMIF Controller Overview

The EMIF controller provides connectivity between the device and DDR3/DDR3L type of memories and manages data bus read/write accesses between external memories and the device subsystems which have access to the L3_MAIN interconnect and DMA capability too.

The EMIF features are introduced in Section 15.1.3 *EMIF Overview* of Section 15.1 *Memory Subsystem Overview*.

The device includes one EMIF controller. Figure 15-45 shows an overview of this EMIF controller and also the connections to the other surrounding modules. As can be seen on Figure 15-45 the EMIF is not directly available on device pads. That is, it is not directly connected to the external SDRAM. There are a DDR PHYs and then DDR I/Os between the EMIF controller and external SDRAM. The EMIF controller, the DDR PHYs and the DDR I/Os work like a single unit to manage data exchanges to and from external memories. To achieve successful data transaction between an internal device initiator and external SDRAM all these three components must be used.

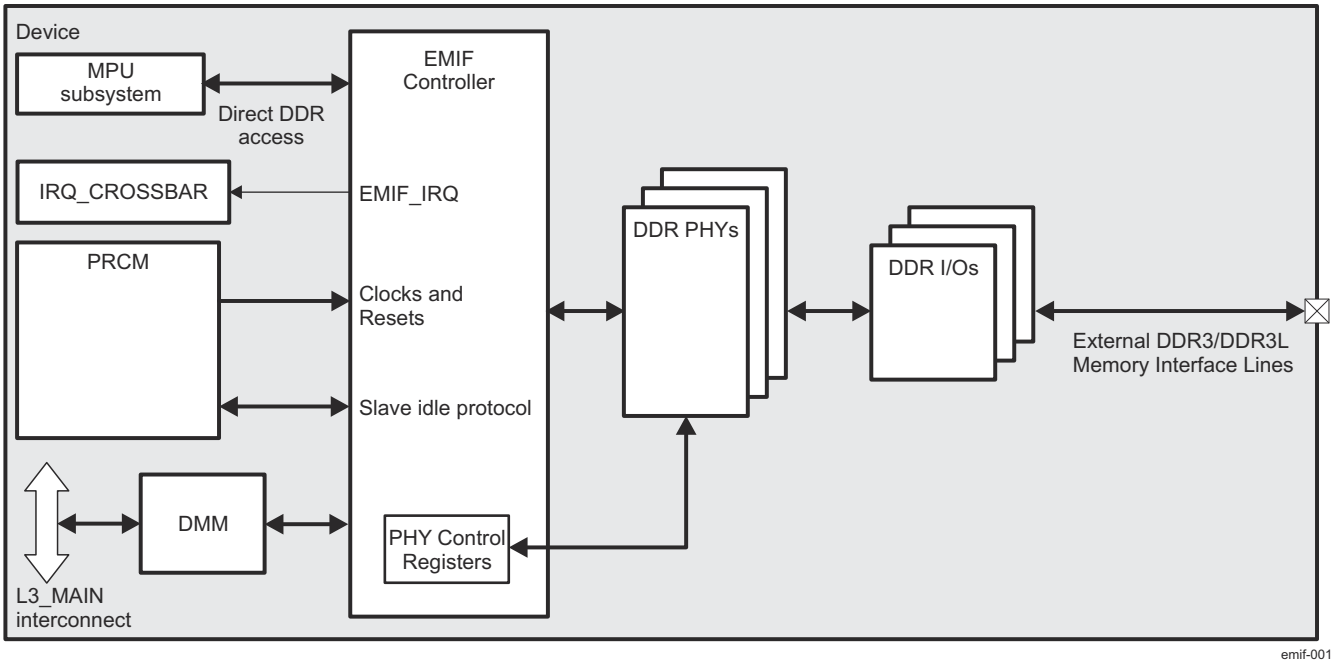

Figure 15-45. EMIF Controller Overview

15.3.2 EMIF Module Environment

This section describes the external connections of the EMIF module.

Figure 15-46 shows an example EMIF DDR3/DDR3L configuration without ECC memory connected.

Figure 15-47 shows an example EMIF DDR3/DDR3L configuration with ECC memory connected.

For simplification the DDR PHYs and DDR I/Os are not shown. Only the I/O signals and their corresponding EMIF pins are shown.

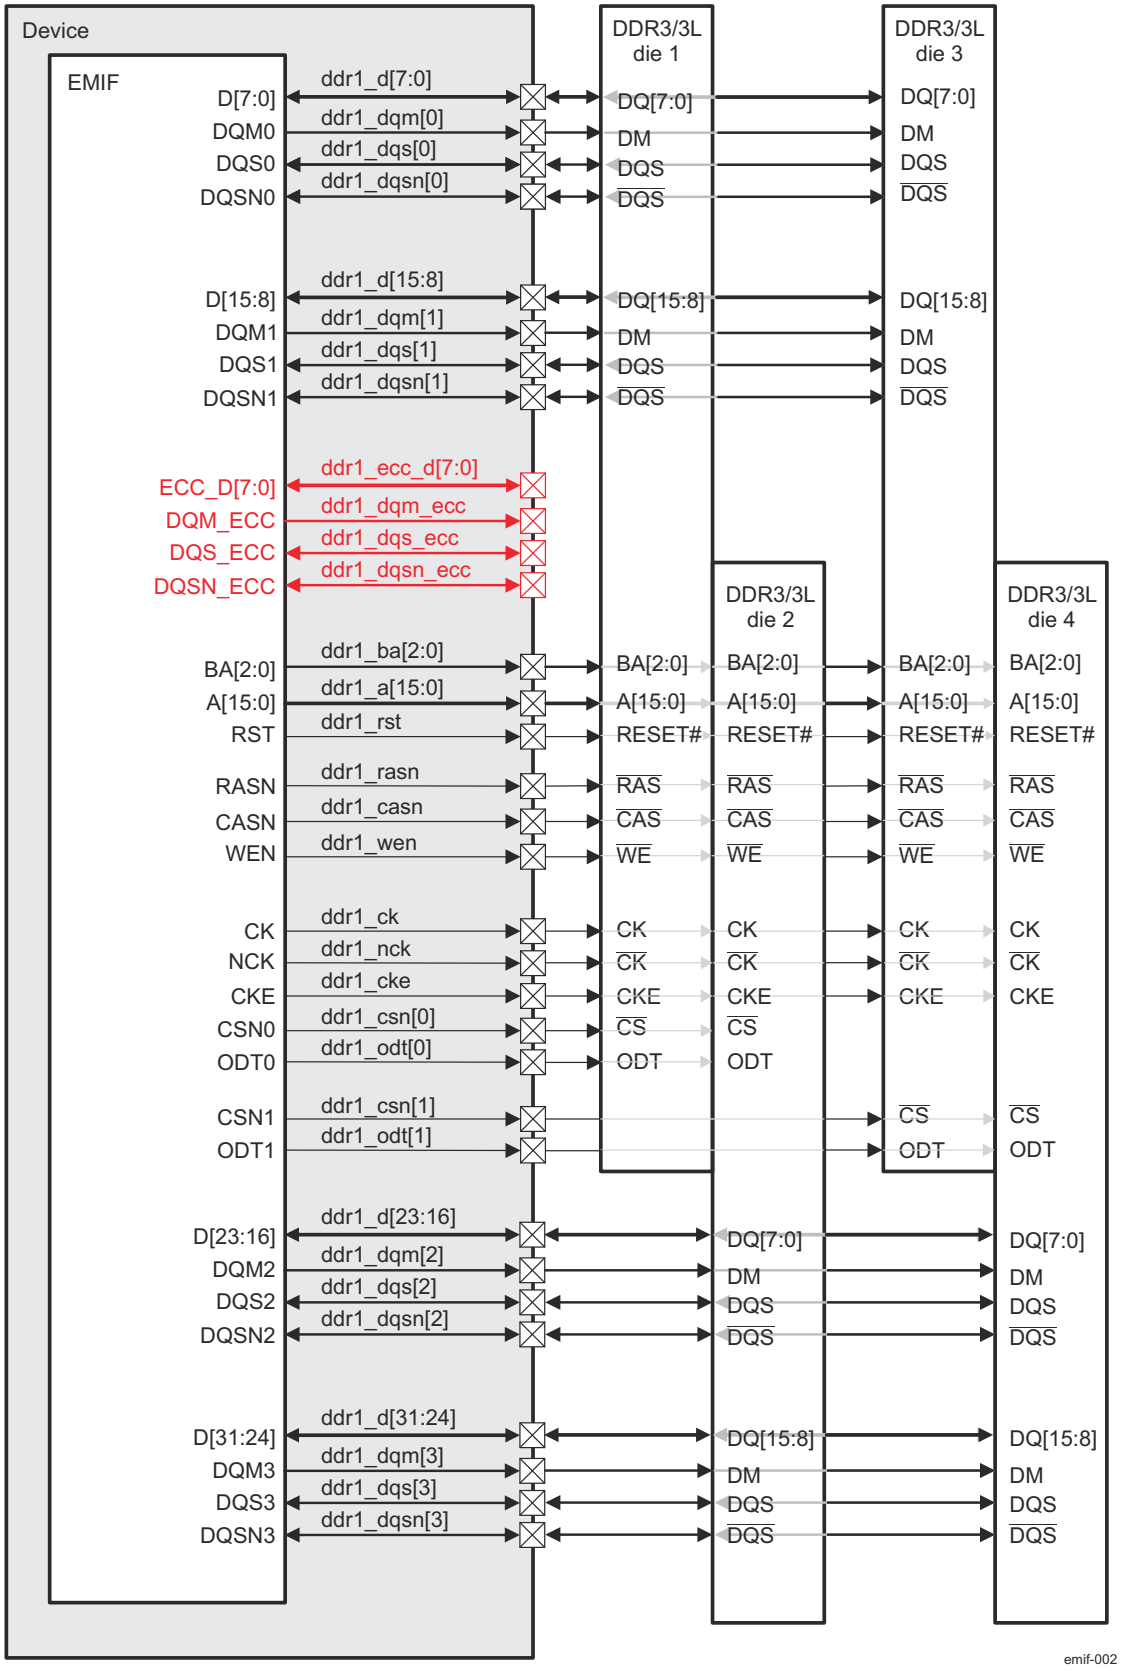

Figure 15-46. EMIF DDR3/DDR3L Configuration Without ECC

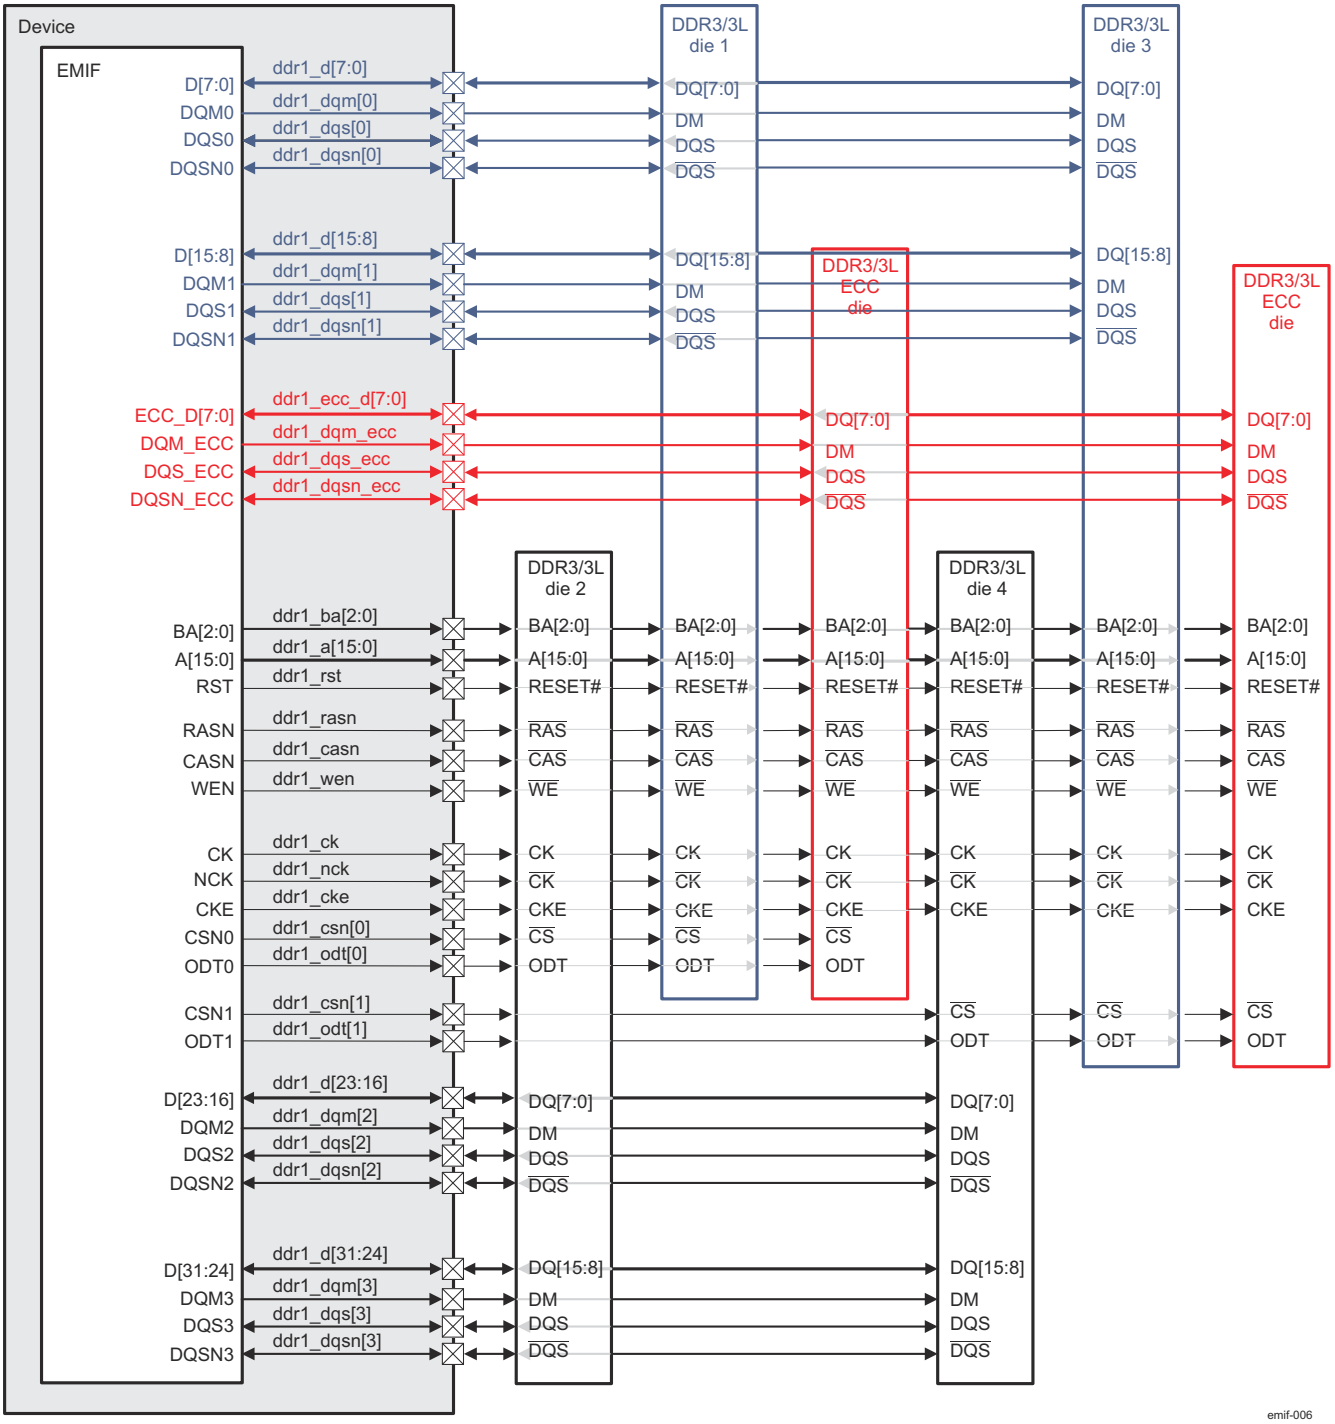

Figure 15-47. EMIF DDR3/DDR3L Configuration With ECC

Table 15-63 describes the EMIF module associated I/O signals used for connection to DDR3/DDR3L memory types.

Table 15-63. EMIF Module I/O signals

EMIF Pin Name	Device I/O Signal Names	I/O[1]	Description
		EMIF1 Data PHYs	
D[31:0]	ddr1_d[31:0]	I/O	Data bus

Table 15-63. EMIF Module I/O signals (continued)

EMIF Pin Name	Device I/O Signal Names	I/O[1]	Description
DQM[3:0]	ddr1_dqm[3:0]	O	Data mask
DQS[3:0]	ddr1_dqs[3:0]	I/O	Data strobe
DQSN[3:0]	ddr1_dqsn[3:0]	I/O	Data strobe invert
ECC_D	ddr1_ecc_d[7:0]	I/O	Data bus used for ECC
DQM_ECC	ddr1_dqm_ecc	O	Data mask used for ECC
DQS_ECC	ddr1_dqs_ecc	I/O	Data strobe used for ECC
DQSN_ECC	ddr1_dqsn_ecc	I/O	Data strobe invert used for ECC
EMIF1 Command PHYs			
A[15:0]	ddr1_a[15:0]	O	Row/column address bus

RST	ddr1_rst	O	Active low asynchronous reset
ODT[0]	ddr1_odt[0]	O	On-die termination enable signal for rank 0
ODT[1]	ddr1_odt[1]	O	On-die termination enable signal for rank 1

(1) I = Input; O = Output

Note

Chip select 1 is not supported on this device.

The CKE memory pad is dynamically driven by the EMIF module according to the memory interface activity. The ddr1_cke pad can also be forced to tri-state by a dedicated Control Module register. For more information, see Section 15.3.4.17 *Forcing CKE to tri-state*.

The DDR memory connected to the DDR ECC bus does NOT need to be the same part number as the DDR memories connected to the DDR data bus. However, some constraints do apply. When selecting a memory for the DDR ECC bus, the following restrictions must be adhered to.

Compared to the DDR memories on the data bus, the DDR ECC memory must:

- Match the same DDR type (for example, DDR3) and speed grade
- Have an equal number of internal banks
- Have an equal number of columns
- Have a greater or equal number of rows

In addition,

- Unused pins should be properly tied off as described in the routing guidelines of the device data manual.
- EMIF register settings should be configured to satisfy the larger minimum timing requirements and the smaller maximum timing requirements between the two different DDR memories to ensure that all DDR memories connected to the EMIF channel are running within their specified range.

Note

For a full list of supported DDR device types, frequencies, and topologies, refer to the routing guidelines of the device data manual.

15.3.3 EMIF Module Integration

This section describes the integration of the EMIF module in the device and includes information about clocks, resets, and hardware requests.

Figure 15-48 shows the integration of the EMIF module in the device.

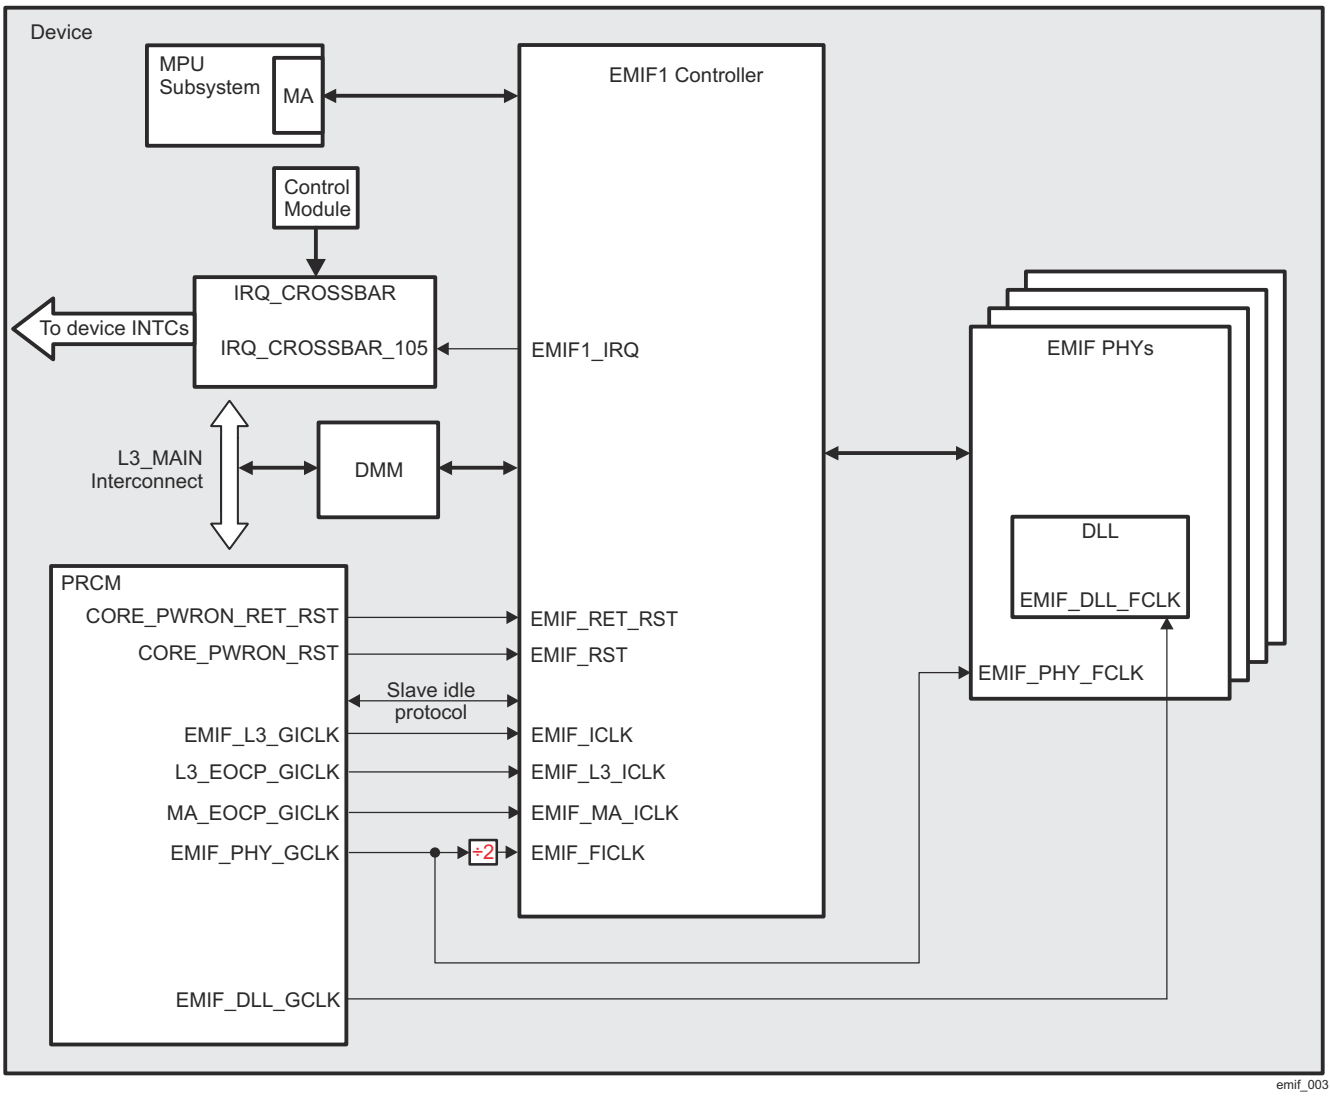

Figure 15-48. EMIF Module Integration

Note

For more information about the slave idle protocol, see Section 3.1.1.1.3, *Module-Level Clock Management*, in *Power, Reset, and Clock Management*.

Table 15-64 through Table 15-66 summarize the integration of the EMIF module in the device.

Table 15-64. EMIF Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect

Table 15-64. EMIF Integration Attributes (continued)

EMIF1	PD_COREAON	No	EMIF1 Controller is accessible via L3_MAIN interconnect but not directly, and only through the DMM.

Table 15-65. EMIF Clocks and Resets

Clocks

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF1	EMIF_ICLK	EMIF_L3_GICLK	PRCM	Interface clock for EMIF1 used for driving the L3 interface logic and for SDRAM Read Data FIFO.
	EMIF_L3_ICLK	L3_EOCP_GICLK	PRCM	Interface clock for EMIF1 Controller which frequency is equal to EMIF_L3_GICLK interface clock. Used for command/write data pre-FIFO to Command/Write Data FIFO paths when MPU is idle.
	EMIF_MA_ICLK	MA_EOCP_GICLK	PRCM	Additional interface clock for EMIF1 which frequency is equal to MPU_GCLK/4. Used for command/write data pre-FIFO to Command/Write Data FIFO paths when MPU is active.
	EMIF_PHY_FCLK	EMIF_PHY_GCLK	PRCM	Common functional clock for the EMIF1 associated PHYs. This clock is equal to the DDR3/DDR3L clock rate.
	EMIF_FICLK	EMIF_PHY_GCLK/2	PRCM	Functional and interface clock for EMIF1. This clock runs at half the DDR3/DDR3L clock rate.
	EMIF_DLL_FCLK	EMIF_DLL_GCLK	PRCM	Common functional clock for all DLLs associated with the EMIF1 PHYs.

Resets

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF1	EMIF_RET_RST	CORE_PWRON_RET_RST	PRCM	Power-on reset
	EMIF_RST	CORE_PWRON_RST	PRCM	Power-on reset

Note

The two clocks MA_EOCP_GICLK and L3_EOCP_GICLK are mutually exclusive. The EMIF is clocked by EMIF_MA_ICLK when MPU interface is active. When system interface is active, EMIF_L3_ICLK clock is used. This action is done automatically by the PRCM.

Table 15-66. EMIF Hardware Requests

Interrupt Requests

Module Instance	IRQ Source Name	IRQ_CROSSBAR Input	Default IRQ Source Mapping	Description
EMIF1	EMIF1_IRQ	IRQ_CROSSBAR_105	MPU_IRQ_110	EMIF1 interrupt request

Note

The “**Default IRQ Source Mapping**” column in Table 15-66 *EMIF Hardware Requests* shows the default mapping of the IRQ sources listed in column “**IRQ Source Name**” to a certain interrupt line of one of the device interrupt controllers. These IRQ sources can also be mapped to other interrupt lines of each device interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*. For more information about the device interrupt controllers, see *Interrupt Controllers*.

Note

For the description of the interrupt source, see *Interrupt Requests*.

15.3.4 EMIF Functional Description

15.3.4.1 Block Diagram

The EMIF module provides an interface to DDR3/DDR3L SDRAM memories.

Figure 15-49 shows the interconnection between the EMIF module and the other modules.

Digital locked loops (DLLs) are used to delay the input DQS signals during reads so that these strobe signals can be used to latch incoming data on the DQ pins, as required by the DDR standard.

Physical layers (PHYs) convert single-data rate (SDR) signals to DDR signals.

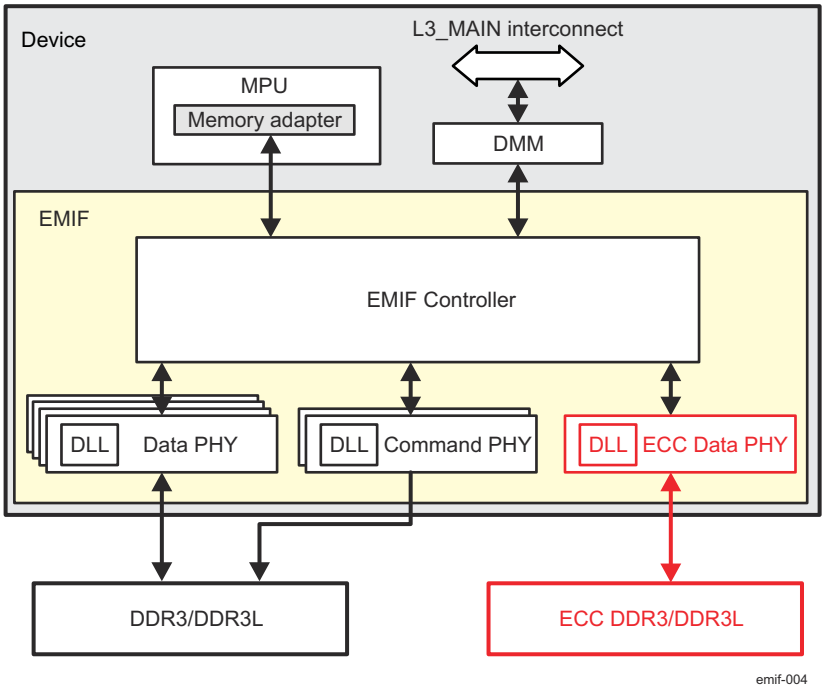

Figure 15-49. EMIF Block Diagram

15.3.4.1.1 Local Interface

The EMIF supports two local (on-chip) interfaces:

- System interface (from L3_MAIN interconnect)
- MPU interface (from MPU subsystem)

System interface is used to request all external memory device accesses, to access the EMIF registers, and to transfer all data to and from the EMIF controller. MPU interface is used to process memory accesses. Table 15-67 shows the MAddrSpace mapping.

Note

Chip select 1 is not supported on this device.

Table 15-67. MAddrSpace Mapping

MAddrSpace(1)	Chip-Select	Description	Exclusions
0x0	CSN0 and CSN1	SDRAM(s)	
0x1	N/A	Reserved.	
0x2	N/A	Reserved. Any access to this area will generate an error on the L3 interface. This can be used by the software to track any unwanted access to the section defined in the DMM_LISA_MAP_i register.	Not visible thtough the MPU port

Table 15-67. MAddrSpace Mapping (continued)

MAddrSpace(1)	Chip-Select	Description	Exclusions
0x3	N/A	Internal registers	Not visible through the MPU port

(1) See DMM_LISA_MAP_i [17:16] SDRC_ADDRSPC register bitfield in Section 15.2, *Dynamic Memory Manager*.

15.3.4.1.2 FIFO Description

The EMIF module contains the following FIFOs:

- Command FIFO
- Write data FIFO
- Return command FIFO
- Two read data FIFOs

Figure 15-50 shows the overall architecture of the EMIF FIFOs.

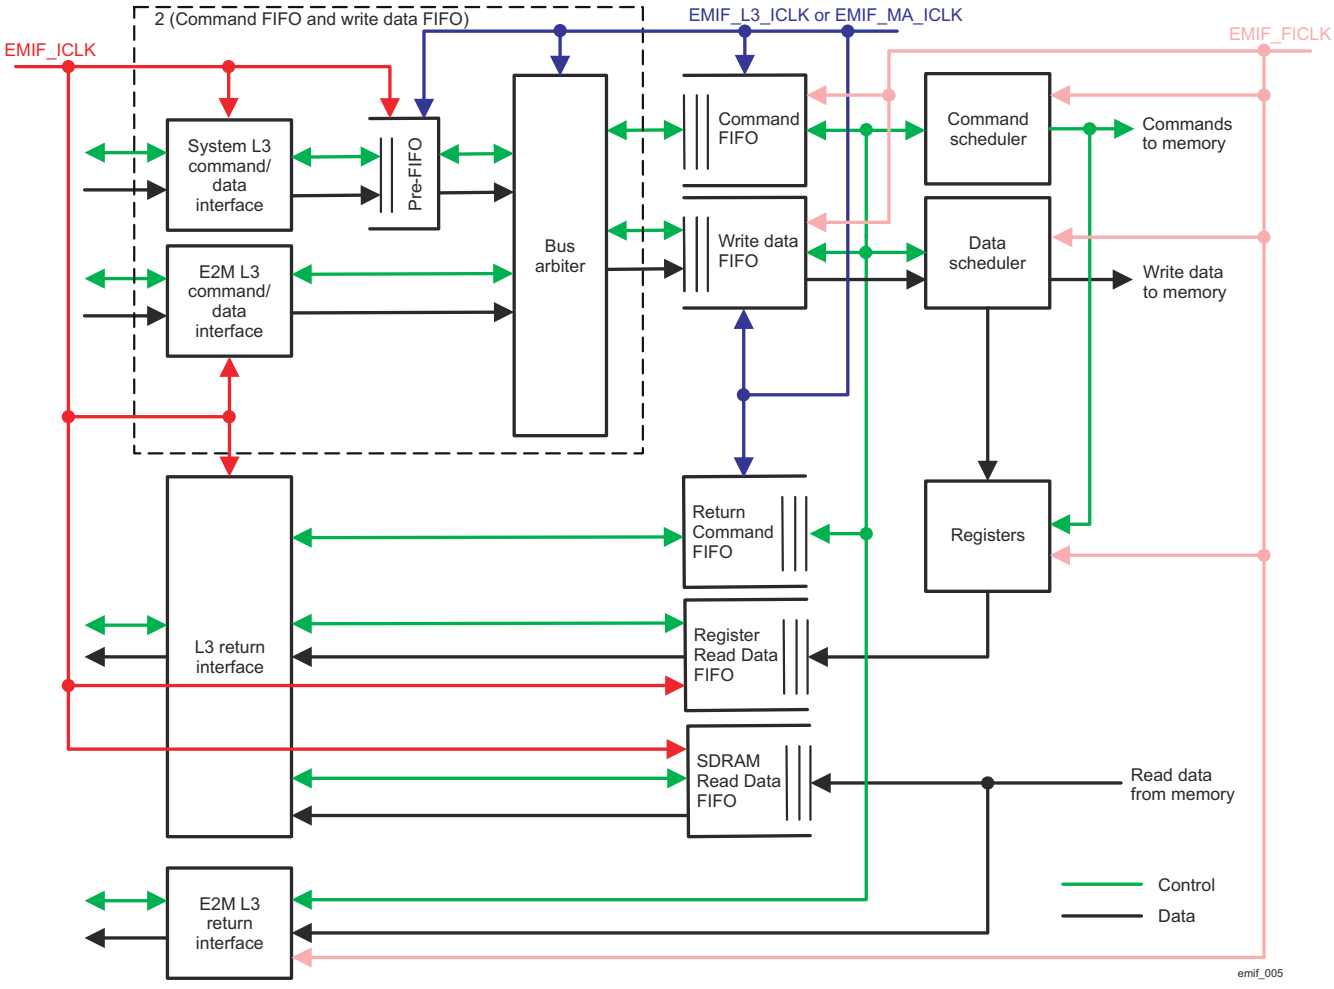

Figure 15-50. FIFO Block Diagram

Table 15-68 lists the allocation of the entries.

Table 15-68. FIFO Allocation

Parameter	System Local Interface Entries	MPU Local Interface Entries
Pre Command FIFO	6	4
Command FIFO	Programmable (1)	Programmable (1)

Table 15-68. FIFO Allocation (continued)

Parameter	System Local Interface Entries	MPU Local Interface Entries
Pre Write FIFO	6	8
Write Data FIFO (256-bit)	Up to (19 × 256 bits) + 6	Up to 19 + 8
Return Command FIFO	22	24
SDRAM Read Data FIFO	22	24
Register Read Data FIFO	2	0

(1) The total number of entries in the command FIFO is 10.

The command FIFO is shared between the two local interfaces, whereas there are two different FIFOs for every other type, one dedicated to each local interface.

The command FIFO stores all the commands coming in on the local command interface. The allocation of entries in the command FIFO is programmable per local interface using the following bit fields:

- EMIF_OCP_CONFIG[27:24] SYS_THRESH_MAX
- EMIF_OCP_CONFIG[23:20] MPU_THRESH_MAX

15.3.4.1.3 MPU Port Restrictions

The EMIF MPU port is defined only to process memory requests. All register accesses are processed through the system port of the EMIF. The EMIF MPU port does not support 2D or register requests required or provided by the system interface. The MPU port has a fixed ConnID equal to 0x0. The access burst length of the MPU port must not exceed 7.

To maintain coherency, the following rules must be followed:

- Any command arriving on MPU or system interface that matches an address in the command FIFO is executed after the command in the command FIFO
- The matching address is any address within a 2,000-address boundary
- On a 2D transfer, the starting address is the compared address. The computed addresses of the 2D transfer are not considered in address overlapping.
- Any command arriving within a 10-cycle window of another, from the different interfaces that do not match any address in the command FIFO, but may match command addresses arriving on a different interface, can be executed in any order.

15.3.4.1.4 Arbitration of Commands in the Command FIFO

The EMIF looks at all the commands stored in the command FIFO to schedule commands to the external memory. All commands with the same MTagID on a particular local interface complete in order. The EMIF does not ensure ordering between commands with different MTagIDs or between commands from two local interfaces.

However, the EMIF does maintain data coherency. Therefore, the EMIF blocks a command, regardless of priority or the local interface, if that command is to the same block address (2048 bytes) as an older command that is not complete. Thus, the EMIF may have one pending read or write for each MTagID. For information about MTagID, see *Terminology* in *Interconnect*. Among all pending reads, the EMIF selects all reads that have their corresponding SDRAM banks already open. Similarly, among all pending writes, the EMIF selects all writes that have their corresponding SDRAM banks already open. Accesses to memory mapped registers are treated as accesses that have open banks.

As a result of this reordering, the EMIF may now have several pending reads and writes that have their corresponding banks open. The EMIF then selects the highest priority read from pending reads, and the highest priority write from pending writes. If two or more commands have the highest priority, the EMIF selects the oldest command. As a result, the EMIF may now have the next read and a write command. If the return command FIFO and the read data FIFO have space and the external bus conflict is resolved, the EMIF performs the final read command before the final write command. If the return command FIFO has space but the read data FIFO is full, the EMIF performs the final write command before the final read command. Resolution of

external bus conflict means all the SDRAM command-to-command counters are satisfied and the read-to-write or write-to-read turnaround time is met.

The EMIF does not support tag interleaving. In other words, for an local interface, the EMIF completes executing an local command before it switches to another command. The EMIF can, however, interleave execution between commands from two local interfaces.

The data coherency inside the EMIF is ensured only in a single level of local infrastructure. For example, if a write from a secondary local bus segment is blocked by a bridge element, the read from a tertiary bus can still beat the write to the EMIF. In such a case, to confirm that a write from master A has landed before a read from master B is performed, master A must wait for the write status from the EMIF before indicating to master B that the data is ready to be read. If master A does not use the local wait status, it must do the following:

1. Perform the required write.
2. Perform a dummy write to the EMIF_REVISION register.
3. Perform a dummy read to the EMIF_REVISION register.
4. Indicate to master B that the data is ready to be read after completion of read in Step 3. The completion of read in Step 3 ensures that the previous writes were done.

Apart from reads and writes, the EMIF must also open and close SDRAM banks and maintain the refresh counts for an SDRAM. The priority of SDRAM commands with respect to refresh levels are:

1. SDRAM refresh request when refresh-must level is reached (highest priority)
2. ZQ calibration
3. Leveling
4. local request for a read or write
5. local request for a write
6. SDRAM activate commands
7. SDRAM deactivate commands
8. SDRAM power-down request
9. SDRAM refresh request when refresh-may or release level is reached
10. SDRAM self-refresh request (lowest priority)

To avoid continuous blocking effect which can be caused by a continuous stream of high-priority commands which thus block the lower priority commands, the EMIF momentarily raises the priority of the oldest command over all other commands when the time for the oldest command configured through the EMIF_COS_CONFIG[7:0] PR_OLD_COUNT bit field expires.

It should be taken into account that while performing the scheduling algorithm described, the EMIF may also encounter a condition in which continuous stream of SDRAM commands to a row in an open bank can block commands to another row in the same bank.

In addition to this scheduling, the highest priority condition is a reset command. If this condition occurs, the EMIF abandons what it is currently doing and begins its start-up sequence. In this case, commands and data stored in the FIFOs are lost. The EMIF also starts its start-up sequence whenever the EMIF_SDRAM_CONFIG register is written and the EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS bit is set to 0. In this case, commands and data stored in the FIFOs are not lost. The EMIF ensures that in-flight read or write transactions to the SDRAM are complete before starting the initialization sequence.

All the accesses to an SDRAM are pipelined to maximize use of the external bus. All of these are done while fulfilling the access timing requirements of an SDRAM.

15.3.4.2 Clock Management

15.3.4.2.1 EMIF_FICLK Overview

The EMIF can gate EMIF_FICLK. There is an internal mechanism that can stop EMIF_FICLK automatically. EMIF_FICLK is stopped only after the SDRAM is put into self-refresh mode and the power-idle protocol on the local bus completes. The EMIF_FICLK frequency can be changed only after putting the external SDRAM in self-refresh mode.

The EMIF waits for the DLL lock before performing any memory access.

EMIF_FICLK frequency is equal to half of the EMIF_PHY_FCLK frequency.

15.3.4.2.2 EMIF Dependency on MPU Clock Rate

The EMIF Write Data FIFO and Command FIFO clocks are derived from the MPU clock (specifically, EMIF_MA_ICLK = MPU_GCLK/4) any time the MPU is active. As such, the DDR Peak Write bandwidth scales in proportion to the MPU clock frequency. At lower MPU clock frequencies (< 1 GHz), the Write Data FIFO limits writes to less than peak DDR bandwidth (assuming DDR3-1066 operating conditions).

The SDRAM Read Data FIFO is always clocked by the EMIF_ICLK, so there is no relationship for read bandwidth relative to the MPU operating frequency.

The Command FIFO bandwidth is also controlled by the EMIF_MA_ICLK. Because the command bandwidth is much lower than the data bandwidth, there is no visible bandwidth scaling for the command interface (and as a result, the read interface can be fully utilized).

The total available bandwidth is not affected for most systems. The write bandwidth is limited on an internal path, not on the DDR pins. The DDR pin bandwidth is still available for reads. Because most systems have higher bandwidth requirements for read relative to write, the available DDR bandwidth is still usable.

15.3.4.3 Reset

The EMIF does not support a software reset.

The EMIF supports a global warm reset mode, during which the EMIF keeps the SDRAM content. Upon a request from the PRCM module indicating a need to enter global warm reset mode, the EMIF does the following:

1. During leveling operation, EMIF will immediately exit this mode and automatically perform a write to the MR1 register of DDR3 memory to disable the leveling at the memory side too.
2. EMIF completes the ongoing access, and then puts the SDRAM in self-refresh mode. If the EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS field is set to 1, the EMIF does not put SDRAM in self-refresh mode.
3. EMIF clears all its FIFO contents.
4. EMIF does not wait for all interrupts to be serviced.

To exit the global warm reset:

1. If the EMIF was in Self Refresh state, it will exit Self Refresh state.
2. If leveling was enabled at the time of a global warm reset, a PHY reset must occur to bring the PHY back into a known state, as it may have been left in a leveling state upon warm reset assertion.
   To guarantee that the SDRAM memory clocks are off when issuing PHY reset, software can use the EMIF_POWER_MANAGEMENT_CONTROL register to enter self refresh before asserting the PHY reset.

15.3.4.4 System Power Management

15.3.4.4.1 Power-Down Mode

The EMIF supports SDRAM power-down mode for low power. The EMIF automatically puts the SDRAM into power-down mode after it is idle for EMIF_POWER_MANAGEMENT_CONTROL[15:12] PD_TIM number of DDR clock cycles and the EMIF_POWER_MANAGEMENT_CONTROL[10:8] LP_MODE bit field is set to 0x4. In power-down mode, the EMIF does not stop the clocks to the SDRAM. The EMIF maintains CKE pin low to maintain the power-down mode.

If refresh-must level is not reached before power-down entering, EMIF will not precharge all SDRAM banks before it issues the power-down command. As a result of this EMIF puts the SDRAM in active power-down mode. If refresh-must level is reached before power-down entering, EMIF will precharge all SDRAM banks and before it issues the power-down command, EMIF issues refreshes until refresh-release level is reached. As a result of this EMIF puts the SDRAM in precharge power-down mode.

When the SDRAM is in power-down mode, the EMIF services register accesses normally.

If the SDRAM is in power-down mode and one of the following occurs, the EMIF brings SDRAM out of power-down mode:

- EMIF_POWER_MANAGEMENT_CONTROL[10:8] LP_MODE bit field is changed from 0x4 to some other value.
- An SDRAM access is requested.
- The refresh-must level is reached.

If refresh-must level brings the SDRAM out of power-down mode, EMIF puts it in power-down again when the refreshes are complete and keeps this state until the next SDRAM request.

To exit power-down, the EMIF:

1. Drives CKE high after t_cke + 1 cycles have elapsed since the power-down command was issued. The value of t_cke is taken from EMIF_SDRAM_TIMING_2[2:0] T_CKE bit field.
2. Waits for EMIF_SDRAM_TIMING_2[30:28] T_XP + 1 cycles
3. Enters its idle state and can issue any commands

15.3.4.4.2 Self-Refresh Mode

The EMIF supports SDRAM self-refresh mode for low power. The EMIF automatically puts the SDRAM into self-refresh mode after the EMIF is idle for EMIF_POWER_MANAGEMENT_CONTROL[7:4] SR_TIMING number of DDR clock cycles and the EMIF_POWER_MANAGEMENT_CONTROL[10:8] LP_MODE bit field is set to 0x2. The EMIF will complete all pending refreshes before it puts the SDRAM into self-refresh. Therefore, after the expiration of SR_TIMING, the EMIF will start issuing refreshes to complete the refresh backlog, and then issue a self-refresh command to the SDRAM.

In self-refresh mode, the EMIF automatically stops the SDRAM clock. The EMIF drives CKE pin low to maintain self-refresh mode.

When the SDRAM is in self-refresh mode, the EMIF services register accesses normally.

If the SDRAM is in self-refresh mode and one of the following occurs, the EMIF brings SDRAM out of self-refresh mode:

- The EMIF_POWER_MANAGEMENT_CONTROL[10:8] LP_MODE bit field is changed from 0x2 to some other value.
- SDRAM access is requested.
- EMIF_SDRAM_TIMING_2[2:0] T_CKE + 1 cycles have elapsed since the last self-refresh command.

To exit self-refresh, for DDR3, the EMIF does the following:

1. Enables the SDRAM clock
2. Drives CKE pin high
3. Waits EMIF_SDRAM_TIMING_2[24:16] T_XSNR + 1 cycles
4. Starts a refresh cycle in the next cycle. EMIF also services all refreshes down to the refresh-release level.
5. Enters its idle state and can issue any other command except write or read command. A write or a read command is issued only after EMIF_SDRAM_TIMING_2[15:6] T_XSRD + 1 cycles clock cycles have elapsed since pin CKE is driven high.

To use partial array self-refresh, the EMIF_SDRAM_REFRESH_CONTROL[26:24] PASR bits must be appropriately programmed. The EMIF performs bank interleaving when EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0x0. Because the SDRAM is partially refreshed during partial array self-refresh, for software ease, it is recommended that the IBANK_POS bit field to be set to 0x1, 0x2, or 0x3 depending on the scheme used. If IBANK_POS is set to 0x0, software must move critical data into the banks that are going to be refreshed during partial array self-refresh.

15.3.4.5 Interrupt Requests

The EMIF controller generates one interrupt request (EMIF1_IRQ) which is connected to the IRQ_CROSSBAR module. This interrupt line can be asserted by one of the interrupt events listed in Table 15-69.

The EMIF controller generates an interrupt on its interrupt line only if the interrupts are enabled by setting to 0x1 the corresponding bits in the EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET register. These interrupts can be disabled by setting to 0x1 the corresponding bits in the EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_CLEAR register. After the interrupt has been serviced the corresponding status flag must be cleared by software. This is done by setting to 0x1 the corresponding bit in the EMIF_SYSTEM_OCP_INTERRUPT_STATUS register which also clears the corresponding bit in the EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS register. The status flags in the EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS register are set even if the corresponding interrupt is disabled unlike those in the EMIF_SYSTEM_OCP_INTERRUPT_STATUS register, which are set only if the corresponding interrupt is enabled. An interrupt is also generated by the EMIF controller, if certain bit in the EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS register is set to 0x1 and the corresponding interrupt is enabled through the EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET register. This feature is useful when user software debugging is performed. In addition, even if interrupts are not enabled, certain status bit in EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS register can be cleared by setting to 0x1 the corresponding bit in the EMIF_SYSTEM_OCP_INTERRUPT_STATUS register.

The EMIF sets both the EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[0] ERR_SYS and EMIF_SYSTEM_OCP_INTERRUPT_STATUS[0] ERR_SYS bits to 0x1, if access request for an unsupported command type, an unsupported addressing mode or an access request to an unsupported MAddrSpace is received. If such an error occurs, it is due to bad programming of the DMM. For more information about addressing, see Section 15.2, *Dynamic Memory Manager*.

The EMIF sets both the EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[3] WR_ECC_ERR_SYS and EMIF_SYSTEM_OCP_INTERRUPT_STATUS[3] WR_ECC_ERR_SYS bits to 0x1, if a write access with byte count that is not multiple of the ECC quanta or with a non ECC quanta aligned address is performed within the address range protected by the ECC.

The EMIF sets both the EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[4] TWOBIT_ECC_ERR_SYS and EMIF_SYSTEM_OCP_INTERRUPT_STATUS[4] TWOBIT_ECC_ERR_SYS bits to 0x1, if 2-bit ECC error for a read access performed within the address range protected by the ECC occurs.

The EMIF sets both the EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[5] ONEBIT_ECC_ERR_SYS and EMIF_SYSTEM_OCP_INTERRUPT_STATUS[5] ONEBIT_ECC_ERR_SYS bits to 0x1, if the threshold for 1-bit ECC error is reached. For more information about the EMIF ECC feature, see Section 15.3.4.14, *Error Correction And Detection Feature*.

Table 15-69 lists the event flags and their corresponding event mask bits of the sources which can cause module interrupts.

Table 15-69. Events

Event Flag	Event Mask	Description
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[5] ONEBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[5] ONEBIT_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET[5] ONEBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_CLEAR[5] ONEBIT_ECC_ERR_SYS	Interrupt if one bit ECC error threshold is reached
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[4] TWOBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[4] TWOBIT_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET[4] TWOBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_CLEAR[4] TWOBIT_ECC_ERR_SYS	Interrupt for two bit error detection
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[3] WR_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[3] WR_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET[3] WR_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_CLEAR[3] WR_ECC_ERR_SYS	Interrupt for memory access made to a non-quanta aligned location or done with byte count not multiple of the ECC quanta
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[0] ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[0] ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET[0] EN_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_CLEAR[0] EN_ERR_SYS	Interrupt for command or address error

15.3.4.6 SDRAM Refresh Scheduling

The EMIF uses two counters to schedule the Refresh (REF) commands: a 13-bit decrementing refresh interval counter and a 4-bit refresh backlog counter. The interval counter is used to define the rate at which connected SDRAM devices are refreshed. It is loaded with the value of the EMIF_SDRAM_REFRESH_CONTROL[15:0] REFRESH_RATE bit field at reset (only the 13 LSBs are taken). The interval counter decrements by 1 each cycle until it reaches 0x0, at which point it reloads from the EMIF_SDRAM_REFRESH_CONTROL[15:0] REFRESH_RATE bit field and restarts decrementing. The counter also reloads and restarts decrementing whenever the EMIF_SDRAM_REFRESH_CONTROL[15:0] REFRESH_RATE bit field is updated.

The refresh backlog counter records the number of the outstanding REF commands which the EMIF controller currently has. The backlog counter increments by 1 each time the interval counter reloads (unless it has reached its maximum value of 8). The backlog counter decrements by 1 each time the EMIF issues a REF command (unless it is already 0). For the range of values that the backlog counter can take, there are three levels of urgency with which the EMIF must perform refresh cycle in which it issues REF commands:

1. Refresh-may level is reached when the backlog count is greater than 0x0, which indicates that there is a refresh backlog and if the EMIF is not busy and there are no open SDRAM banks, the EMIF must perform refresh cycle.
2. Refresh-release level is reached when the backlog count is greater than 0x4, which indicates that the refresh backlog is getting bigger and if the EMIF is not busy it must perform refresh cycle even if there is an open SDRAM bank.
3. Refresh-must level is reached when the backlog count is greater than 0x7, which indicates that the refresh backlog is becoming excessive and the EMIF must perform refresh cycle before any new memory access request being serviced. The EMIF starts servicing new memory accesses after the refresh-release level is cleared.

The two counters do not operate when SDRAM is in self-refresh mode. They start tracking the missed refreshes (the outstanding REF commands) only after initialization is complete.

The time between two REF commands is set through the EMIF_SDRAM_TIMING_3[12:4] T_RFC bit field.

15.3.4.7 SDRAM Initialization

Note

To avoid error responses from the EMIF controller the SDRAM initialization must be performed per 16-Byte blocks if EMIF_SDRAM_CONFIG[15:14] NARROW_MODE = 0x0 or per 8-Byte blocks if EMIF_SDRAM_CONFIG[15:14] NARROW_MODE = 0x1.

15.3.4.7.1 DDR3/DDR3L SDRAM Initialization

On coming out of reset, the EMIF controller begins the DDR3 initialization sequence after a write to any one of the following three registers, providing that the corresponding listed conditions are met:

1. EMIF_SDRAM_CONFIG
   a. Condition 1: EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS = 0 (that is, cleared before the write to EMIF_SDRAM_CONFIG)
2. EMIF_SDRAM_TIMING_1
   a. Condition 1: EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS = 0 (that is, cleared before the write to EMIF_SDRAM_TIMING_1) AND
   b. Condition 2: The write access modifies the register bit field T_WR (bits 20:17)
3. EMIF_SDRAM_REFRESH_CONTROL
   a. Condition 1: EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS = 0 AND
   b. Condition 2: The write access modifies the register bit field SRT (bit 29), ASR (bit 28), or PASR (bits 26:24).

For the first DDR3 initialization sequence, the EMIF controller performs the following actions:

1. After 7 SDRAM refresh rate intervals, de-asserts the RST pin.
2. After 16 SDRAM refresh rate intervals, issues a NOP command with CKE pin held high. The SDRAM refresh rate is as defined in the EMIF_SDRAM_REFRESH_CONTROL[15:0] REFRESH_RATE bit field.
3. After 1 SDRAM refresh rate interval, issues MRS command to the DDR3/DDR3L MR2 register (bits BA[2:0] = 0x2) with bits A[15:0] set as in Table 15-70

Table 15-70. Load Value For The MR2 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:11]	0x0	Reserved
A[10:9]	EMIF_SDRAM_CONFIG[22:21] DYN_ODT	Dynamic ODT value
A[8]	0x0	Reserved
A[7]	EMIF_SDRAM_REFRESH_CONTROL[29] SRT	Self-refresh temperature range
A[6]	EMIF_SDRAM_REFRESH_CONTROL[28] ASR	Auto self-refresh enable
A[5]	0x0	Reserved
A[4:3]	EMIF_SDRAM_CONFIG[17:16] CWL	CAS write latency
A[2:0]	EMIF_SDRAM_REFRESH_CONTROL[26:24] PASR	Partial array self-refresh

4. After T_RFC + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR3 register (bits BA[2:0] = 0x3) with A[15:0] = 0x0
5. After T_RFC + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR1 register (BA[2:0] = 0x1) with A[15:0] set as in Table 15-71

Table 15-71. Load Value For The MR1 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Output buffer enabled
A[11]	0x0	TDQS disable
A[10]	0x0	Reserved
A[9], A[6], A[2]	EMIF_SDRAM_CONFIG[26:24] DDR_TERM	DDR3/DDR3L termination resistor value
A[8]	0x0	Reserved
A[7]	0x0	Write leveling disabled
A[5], A[1]	EMIF_SDRAM_CONFIG[19:18] SDRAM_DRIVE	SDRAM drive strength
A[4:3]	0x0	Additive latency = 0
A[0]	EMIF_SDRAM_CONFIG[20] DDR_DISABLE_DLL = 0x0	Enable SDRAM DLL

6. After T_RFC + 1 DDR clock cycles, issues MRS command to the DDR3/DDR3L MR0 register (BA[2:0] = 0x0) with A[15:0] set as in Table 15-72

Table 15-72. Load Value For The MR0 Register During DDR3/DDR3L SDRAM Initialization

Bits	Value	Description
A[15:13]	0x0	Reserved

Table 15-72. Load Value For The MR0 Register During DDR3/DDR3L SDRAM Initialization (continued)

Bits	Value	Description
A[12]	0x0	Slow exit. The DDR3/DDR3L SDRAM DLL is “OFF” after entering precharge power-down.
A[11:9]	EMIF_SDRAM_TIMING_1[20:17] T_WR	Write recovery for autoprecharge
A[8]	0x1	DLL reset
A[7]	0x0	Normal mode
A[6:4], A[2]	EMIF_SDRAM_CONFIG[13:10] CL	Value for CAS latency
A[3]	0x0	Nibble sequential read burst type
A[1:0]	0x0	Burst length of 8

7. After T_RFC + 1 DDR clock cycles, issues a ZQCL command to start long ZQ calibration
8. Waits for t_{DLLK} and t_{ZQinit} to complete
9. Issues REF command
10. The EMIF enters its IDLE state.

The EMIF updates the DDR Mode registers if the DDR3 initialization sequence is triggered again. However, the EMIF controller first issues a precharge command and then starts from Step 3.

The EMIF does not perform any transactions until the DDR3/DDR3L initialization sequence is complete.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately 16 × REFRESH_RATE / input frequency.

15.3.4.8 DDR3/DDR3L Read-Write Leveling

The EMIF supports one type of write/read leveling for DDR3/DDR3L memories - full leveling.

The full leveling consists of three parts:

1. Write leveling
2. Read data eye training
3. Read DQS gate training

Write leveling

The goal of write leveling is to locate the delay between the rising edge of the write DQS signal and the rising edge of the SDRAM memory clock (CK). When this delay is identified, the system is able to accurately align the write DQS signal with the DDR3 memory clock. During Write leveling, the ODT function must be on and proper ODT values must be selected at the external memory side by setting Rtt_Nom (A9, A6, A2) bits in MR1 register of the external DDR3 memory. For more information about write leveling, see the *DDR3 SDRAM Standard*, section *Write leveling*.

Read data eye training

Through the read data eye training the delay between the rising edge of the read DQS signal and the rising and falling edges of the associated DQ data eye is determined. By identifying these delays, the midpoint between them can be calculated and thus the rising edge of the read DQS signal can be accurately centered within the DQ data eye.

Read DQS gate training

Read DQS Gate training is used for timing the internal read window during a read operation as opposed to the write leveling and read data eye training which are used for skew compensation of external signals. The goal of read DQS gate training is to locate the shortest delay that can be applied to each DQS gate such that it functions

properly, then find the longest delay that can be applied to each DQS gate and keep its proper function again, and then align the midpoint of the DQS gate delay between these two.

15.3.4.8.1 Full Leveling

The EMIF does not perform full leveling after initialization upon reset. Full leveling must be triggered by software after the EMIF's registers are properly configured.

Full leveling is triggered by setting the EMIF_READ_WRITE_LEVELING_CONTROL[31] RDWRLVLFULL_START bit to 0x1. The leveling execution order is as follows:

1. Write leveling
2. Read DQS gate training
3. Read data eye training

After leveling procedure has finished the EMIF_READ_WRITE_LEVELING_CONTROL[31] RDWRLVLFULL_START bit clears itself automatically.

Note

SDRAM Refreshes must be disabled before triggering full leveling.

Note

The EMIF_EXT_PHY_CONTROL_2 through EMIF_EXT_PHY_CONTROL_21 registers have to be configured only in case of software leveling.

15.3.4.8.2 Software Leveling

In case of software leveling, the following registers must be configured:

- EMIF_EXT_PHY_CONTROL_2 to EMIF_EXT_PHY_CONTROL_6 containing the PHY_REG_FIFO_WE_SLAVE_RATIO value
- EMIF_EXT_PHY_CONTROL_26 to EMIF_EXT_PHY_CONTROL_30 containing the REG_PHY_GATELVL_INIT_RATIO value
- EMIF_EXT_PHY_CONTROL_25 containing the DQ offset value

The bit fields of the EMIF_EXT_PHY_CONTROL_2 to EMIF_EXT_PHY_CONTROL_6 registers must be loaded with same values. The bit fields of the EMIF_EXT_PHY_CONTROL_26 to EMIF_EXT_PHY_CONTROL_30 registers must also be loaded with same values.

The REG_PHY_DQ_OFFSET fields in register EMIF_EXT_PHY_CONTROL_25 must be loaded with 0x40. That value corresponds to quarter cycle shift between the DQS signals and the data to be written to the SDRAM.

To calculate the PHY_REG_FIFO_WE_SLAVE_RATIO value one of the following two formulas can be used:

- 0x80 + 2*[(Board Delay in ps)*0x100]/(Clock Period in ps). This formula is used when the EMIF_DDR_PHY_CONTROL_1[18] PHY_INVERT_CLKOUT bit is set to 0x1.
- 2*[(Board Delay in ps)*0x100]/(Clock Period in ps). This formula is used when the EMIF_DDR_PHY_CONTROL_1[18] PHY_INVERT_CLKOUT bit is set to 0x0.

The Board Delay in the previously described formulas is measured directly from the board. It depends on the trace length. When the calculated value for PHY_REG_FIFO_WE_SLAVE_RATIO is greater than 0x20, then a value of 0x27 must be used. That means, 0x27 must be loaded in registers EMIF_EXT_PHY_CONTROL_2 to EMIF_EXT_PHY_CONTROL_6.

To calculate the REG_PHY_GATELVL_INIT_RATIO value the following formula is used:

REG_PHY_GATELVL_INIT_RATIO = PHY_REG_FIFO_WE_SLAVE_RATIO – 0x20

When the calculated value for REG_PHY_GATELVL_INIT_RATIO is less than 0x0, then a value of 0x0 must be used. When the calculated value is greater than or equal to 0x0, then that value is used for registers EMIF_EXT_PHY_CONTROL_26 to EMIF_EXT_PHY_CONTROL_30.

In addition, when read DQS gate training is not performed the PHY_REG_FIFO_WE_SLAVE_RATIO value is used. When read DQS gate training is performed REG_PHY_GATELVL_INIT_RATIO is used and PHY_REG_FIFO_WE_SLAVE_RATIO is don't care.

Note

Software leveling is not recommended to be used. Hardware leveling must be used instead.

15.3.4.9 EMIF Access Cycles

By default, the EMIF keeps its SDRAM $\overline{CS}$ signals high (CSs are active-low). To direct a command to only one of the SDRAMs, EMIF asserts the $\overline{CS}$ signal (CSN0 or CSN1) to the SDRAM for the duration of the command. If the EMIF_SDRAM_CONFIG[3] EBANK bit is set to 0x0, CSN1 will always be driven high except during initialization and for the Refresh, Power-Down and Self-Refresh commands.

The EMIF always performs burst accesses to the SDRAM. Multiple SDRAM bursts may need to service a single local burst request. Table 15-73 through Table 15-75 show a few examples how EMIF performs SDRAM accesses for a linear incrementing transaction type. T0, T1, etc. are clock cycles. R0 is read starting at column 0, R8 is read starting at column 8, and R16 is read starting at column 16. D0-1 is the data from column 0 and 1, D2-3 is the data from column 2 and 3, and so on.

Table 15-73. 64-Byte Linear Read Starting at Address 0x0

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11
R0				R8							
				D0-1	D2-3	D4-5	D6-7	D8-9	D10-11	D12-13	D14-15

Table 15-74. 64-Byte Linear Read Starting at Address 0x10

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13
R4		R8				R16							
				D4-5	D6-7	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	Unused	Unused

Table 15-75. 64-Byte Linear Read Starting at Address 0x18

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13
R6		R8				R16							
				D6-7	Unused	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	D20-21	Unused

The EMIF uses the unused data phases in the preceding figures by issuing successive read commands if there are reads to open banks pending in the command FIFO.

The write data conversion from SDR to DDR is done outside the EMIF.

15.3.4.10 Turnaround Time

Table 15-76 lists the turnaround time that EMIF introduces on the data bus for various back-to-back accesses. The EMIF takes advantage of the CAS latencies and packs the commands as close as possible on the control bus to introduce the following turnaround time on the data bus.

Note

Chip select 1 is not supported on this device.

Table 15-76. Turnaround Time

Current Access	Next Access	Turnaround Time (Number of DDR Clock Cycles)
SDRAM write	SDRAM write to same chip select	0
SDRAM write	SDRAM write to different chip select	EMIF_SDRAM_TIMING_3[27:24] T_CSTA + 1
SDRAM read	SDRAM read to same chip select	0
SDRAM read	SDRAM read to different chip select	EMIF_SDRAM_TIMING_3[27:24] T_CSTA + 1
SDRAM write	SDRAM read	EMIF_SDRAM_TIMING_1[2:0] T_WTR + 1 + CL
SDRAM read	SDRAM write	EMIF_SDRAM_TIMING_1[31:29] T_RTW + 1

15.3.4.11 PHY DLL Calibration

When running in normal locked mode, the PHY DLL gets a reference clock (EMIFi_DLL_FCLK) from the PRCM, which is used by the DLL master to lock to the right frequency and provide the control code for a full period phase shift to the slave. The slave uses this code as a control for its internal delay line to produce the required delay for the signal considered.

When working in locked mode, the delay lines only get an updated control value from the master DLLs when an explicit dll_calib command is issued by the EMIF controller. Failure to send such commands on a timely basis will result in inaccurate delay-line information if there is a significant voltage and temperature drift in the system. It is recommended to issue at least one command every 100 µs. EMIF automatically sends ctrl_update commands for:

- Refresh Exit
- Self Refresh Exit
- phy_ready asserted during initialization

The PHY also internally generates a control value update upon completion of a leveling operation. Control is also added when leveling is not used and there are gradual voltage changes during frequency change. The EMIF_DLL_CALIB_CTRL register can be programmed to generate a phy_dll_calib for a periodic interval based on EMIF_FICLK cycles, so allow continued memory access as voltage is changing. A safe window of no activity will be guaranteed for this periodic generation of phy_dll_calib. In addition, a one shot generator for phy_pll_calib has also been added that will generate a single phy_dll_calib by setting the EMIF_MISC_REG[0] DLL_CALIB_OS bit to 1.

15.3.4.12 SDRAM Address Mapping

The EMIF controller interleaves the internal banks for SDRAM connected to both chip selects. From the system point of view, the external SDRAM is seen as one block of SDRAM. If two external 64-MiB devices are used, a 128-MiB memory block is observed. If two external 32-MiB devices are used, a 64-MiB block is observed.

Table 15-77 shows the SDRAM address space.

Note

Chip select 1 is not supported on this device.

Table 15-77. SDRAM Addressing Space

Module Name	Base Address	Size
EMIF1-CS0-SDRAM	0x8000 0000	0 to 1GiB, programmable in DMM (see Section 15.2, *Dynamic Memory Manager*)
EMIF1-CS1-SDRAM	0xC000 0000	0 to 1GiB, programmable in DMM (see Section 15.2, *Dynamic Memory Manager*)

When addressing SDRAM, if the EMIF_SDRAM_CONFIG[28:27] IBANK_POS bit field is set to 0, the EMIF uses the following three bit fields to determine the mapping from the source address to the SDRAM row, column, bank and chip select:

- EMIF_SDRAM_CONFIG[6:4] IBANK
- EMIF_SDRAM_CONFIG[3] EBANK
- EMIF_SDRAM_CONFIG[2:0] PAGESIZE

If the EMIF_SDRAM_CONFIG[28:27] IBANK_POS bit field is set to 1, 2, or 3, the EMIF uses the following four bit fields to determine the mapping from the source address to the SDRAM row, column, bank and chip select:

- EMIF_SDRAM_CONFIG[6:4] IBANK
- EMIF_SDRAM_CONFIG[2:0] PAGESIZE
- EMIF_SDRAM_CONFIG[3] EBANK
- EMIF_SDRAM_CONFIG[9:7] ROWSIZE

In all cases the EMIF considers its SDRAM address space to be a single logical block, regardless of the number of physical devices or whether the devices are mapped across one or two EMIF chip selects.

15.3.4.12.1 Address Mapping for IBANK_POS = 0 and EBANK_POS = 0

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0 and EMIF_SDRAM_CONFIG_2[27] EBANK_POS = 0, Table 15-78 lists which source address bits (MAddr) are mapped to the SDRAM row, column, bank and chip select bits for all combinations of IBANK, EBANK and PAGESIZE.

Table 15-78. Local Address to SDRAM Address Mapping for IBANK_POS = 0 and EBANK_POS = 0

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
row address		chip select		bank address		column address	
ROWSIZE value	row width (bits)	EBANK value	chip select width (bits)	IBANK value	bank[2:0] width (bits)	PAGESIZE value	col width (bits)
In this case the ROWSIZE bit field is not used	16	0	0	0	0	0	8
		1	1	1	1	1	9
				2	2	2	10
				3	3	3	11

Note

The ROWSIZE bit field is unused in case of IBANK_POS = 0 and EBANK_POS = 0.

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0, the effect of the address-mapping scheme is that as the source address increments across the SDRAM pages, EMIF moves to page with the same number as in the previous bank within the current device (CSN0). This movement across the banks continues until the same page is accessed in all banks and then EMIF moves to the next page in the first bank if the EMIF_SDRAM_CONFIG[3] EBANK bit is set to 0x0. If EBANK is set to 0x1 the EMIF proceeds to the same page in the next device (CSN1) and then continues until the same page is accessed in all banks before modifying the next page of the first device (CSN0).The EMIF uses this movement across chip selects and internal banks while remaining on the same page to maximize the number of the open SDRAM banks within the overall SDRAM space.

Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip selects) open at a time, and can interleave among all of them.

15.3.4.12.2 Address Mapping for IBANK_POS = 1 and EBANK_POS = 0

Table 15-79 list the local address to SDRAM address mapping when IBANK_POS = 1 and EBANK_POS = 0.

Table 15-79. Local Address to SDRAM Address Mapping for IBANK_POS = 1 and EBANK_POS = 0

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width									
bank address[2]		row address		chip select		bank address[1:0]		column address	
IBANK value	bank[2] width (bits)	ROWSIZE value	row width (bits)	EBANK value	chip select width (bits)	IBANK value	bank[1:0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	0	0	8
1	0	1	10	1	1	1	1	1	9
2	0	2	11			2	2	2	10
3	1	3	12			3	2	3	11
		4	13						
		5	14						
		6	15						
		7	16						

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 1, the EMIF interleaves banks the same as for EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0 but the interleaving of banks within a device (per CS) is limited to four banks. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time but can interleave among only 8 of them.

15.3.4.12.3 Address Mapping for IBANK_POS = 2 and EBANK_POS = 0

Table 15-80 list the local address to SDRAM address mapping when IBANK_POS = 2 and EBANK_POS = 0.

Table 15-80. Local Address to SDRAM Address Mapping for IBANK_POS = 2 and EBANK_POS = 0

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width									
bank address[2:1]		row address		chip select		bank address[0]		column address	
IBANK value	bank[2:1] width (bits)	ROWSIZE value	row width (bits)	EBANK value	chip select width (bits)	IBANK value	bank[0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	0	0	8
1	0	1	10	1	1	1	1	1	9
2	1	2	11			2	1	2	10
3	2	3	12			3	1	3	11
		4	13						
		5	14						
		6	15						
		7	16						

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 2, the EMIF interleaves banks the same as for EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0 but the interleaving of banks within a device (per CS) is limited to two banks. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time but can interleave among only 4 of them.

15.3.4.12.4 Address Mapping for IBANK_POS = 3 and EBANK_POS = 0

Table 15-81 list the local address to SDRAM address mapping when IBANK_POS = 3 and EBANK_POS = 0.

Table 15-81. Local Address to SDRAM Address Mapping for IBANK_POS = 3 and EBANK_POS = 0

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address		row address		chip select		column address

		4	13				
		5	14				
		6	15				
		7	16				

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 3, the EMIF cannot interleave banks within a device (per CS). However, it can interleave banks between the two CSs. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time but can interleave among only two of them.

15.3.4.12.5 Address Mapping for IBANK_POS = 0 and EBANK_POS = 1

Table 15-82 list the local address to SDRAM address mapping when IBANK_POS = 0 and EBANK_POS = 1.

Table 15-82. Local Address to SDRAM Address Mapping for IBANK_POS = 0 and EBANK_POS = 1

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
chip select		row address		bank address		column address	
EBANK value	chip select width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	1	1	10	1	1	1	9
		2	11	2	2	2	10
		3	12	3	3	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0, and EMIF_SDRAM_CONFIG_2[27] EBANK_POS = 1, the EMIF interleaves among all the banks within a device (per CS) but cannot interleave banks between the two CSs. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two CSs) open at a time but can interleave among only 8 of them.

15.3.4.12.6 Address Mapping for IBANK_POS = 1 and EBANK_POS = 1

Table 15-83 list the local address to SDRAM address mapping when IBANK_POS = 1 and EBANK_POS = 1.

Table 15-83. Local Address to SDRAM Address Mapping for IBANK_POS = 1 and EBANK_POS = 1

				6	15				
				7	16				

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 1, and EMIF_SDRAM_CONFIG_2[27] EBANK_POS = 1, the EMIF interleaves banks the same as for EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0 but the interleaving of banks within a device (per CS) is limited to four banks. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time but can interleave among only 4 of them.

15.3.4.12.7 Address Mapping for IBANK_POS = 2 and EBANK_POS = 1

Table 15-84 list the local address to SDRAM address mapping when IBANK_POS = 2 and EBANK_POS = 1.

15.3.4.12.8

Table 15-84. Local Address to SDRAM Address Mapping for IBANK_POS = 2 and EBANK_POS = 1

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width									
chip select		bank address[2:1]		row address		bank address[0]		column address	
EBANK value	chip select width (bits)	IBANK value	bank[2:1] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	0	0	9	0	0	0	8
1	1	1	0	1	10	1	1	1	9
		2	1	2	11	2	1	2	10
		3	2	3	12	3	1	3	11
				4	13				
				5	14				
				6	15				
				7	16				

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 2 and EMIF_SDRAM_CONFIG_2[27] EBANK_POS = 1, the EMIF interleaves banks the same as for EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0 but the interleaving of banks within a device (per CS) is limited to two banks. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time but can interleave among only two of them.

15.3.4.12.9 Address Mapping for IBANK_POS = 3 and EBANK_POS = 1

Table 15-85 list the local address to SDRAM address mapping when IBANK_POS = 3 and EBANK_POS = 1.

Table 15-85. Local Address to SDRAM Address Mapping for IBANK_POS = 3 and EBANK_POS = 1

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
chip select		bank address		row address		column address	
EBANK value	chip select width (bits)	IBANK value	bank width (bits)	ROWSIZE value	row width (bits)	PAGESIZE value	col width (bits)
				7	16		

For EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 3 and EMIF_SDRAM_CONFIG_2[27] EBANK_POS = 1, the EMIF cannot interleave banks within a device (per CS). Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time but cannot interleave among them.

15.3.4.12.10

Note

Because the EMIF interleaves among a fewer number of banks when EMIF_SDRAM_CONFIG[28:27] IBANK_POS ≠ 0 or EMIF_SDRAM_CONFIG_2[27] EBANK_POS = 1, these cases are lower in performance than the EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0 case. Thus, these cases are recommended to be used only with partial array self-refresh where performance can be traded off for power savings.

15.3.4.13 DDR3/DDR3L Output Impedance Calibration

Note

Chip select 1 is not supported on this device.

The EMIF controller supports automatic output impedance (ZQ) calibration for DDR3/DDR3L memories. The ZQ calibration can be enabled per CS by setting the EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[31] ZQ_CS1EN and EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[30] ZQ_CS0EN bits. The EMIF supports three types of ZQ calibration commands:

- ZQINIT: ZQ calibration command during initialization
- ZQCL: ZQ calibration long command
- ZQCS: ZQ calibration short command

The EMIF automatically issues ZQINIT command during DDR3/DDR3L memory initialization. It also issues ZQCS command each time the EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[15:0] ZQ_REFINTERVAL bit field expires. In other words, the ZQ_REFINTERVAL defines the interval between two ZQCS commands. When ZQCS command is issued, the EMIF waits and blocks any other command for EMIF_SDRAM_TIMING_3[20:15] ZQ_ZQCS + 1 number of DDR clock cycles.

If the EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[28] ZQ_SFEXITEN bit field is set to 0x1, the EMIF issues ZQCL command every time it exits self-refresh, active power-down and precharge power-down modes. When ZQCL command is issued, the EMIF waits and blocks any other command for (EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[17:16] ZQ_ZQCL_MULT + 1) × (EMIF_SDRAM_TIMING_3[20:15] ZQ_ZQCS + 1) number of DDR clock cycles.

If a separate calibration resistor is used per device, the ZQ calibration can be performed simultaneously over both CSs. To enable ZQ calibration to be performed simultaneously over both CSs, the EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[27] ZQ_DUALCALEN bit must be set to 0x1. If ZQ_DUALCALEN is set to 0x0, the EMIF performs ZQ calibration serially per chip select.

The ZQINIT is a non periodic command issued only once during DDR initialization as opposed to the ZQCL and ZQCS calibration commands which are issued by the EMIF periodically at regular intervals.

15.3.4.14 Error Correction And Detection Feature

Note

The ECC feature is not available on this device, but signal names and configuration contexts are retained for consistency with the AM572x family of devices.

For data integrity, the EMIF1 supports ECC on the data written or read from the SDRAM and is enabled by programming the EMIF_ECC_CTRL_REG register. ECC accesses are allowed for the both SYS and the MPU ports. 7-bit ECC is calculated over 32-bit data when in 32-bit DDR mode. 6-bit ECC is calculated over 16-bit data when in 16-bit DDR mode. The ECC is calculated for all accesses that are within the address ranges protected by ECC. The address ranges are specified in the EMIF_ECC_ADDRESS_RANGE_1 and EMIF_ECC_ADDRESS_RANGE_2 registers. Both registers have identical bits and functionality. This provides flexibility allowing two non-overlapping memory regions to be ECC protected.

The system must ensure that any burst access with starting address in the ECC protected region must not cross over to the un-protected region and vice-versa. The ECC is stored inside the SDRAM during writes. If a write access with byte count that is not a multiple of ECC quanta or with a non quanta aligned address is performed within the address range protected by ECC, the EMIF will send out a write ECC error interrupt. The EMIF will also report an error on the SYS and MPU response interface. In this case, the EMIF will perform the write to the SDRAM. However, the ECC value written to the SDRAM will be corrupted. The EMIF will also log the MConnID, MCmd, MBurstSeq, and MAddrSpace for the first error transaction in the EMIF_OCP_ERROR_LOG register.

The ECC quanta is either 32-bit or 16-bit based on the EMIF_SDRAM_CONFIG[15:14] NARROW_MODE bit field. For 32-bit mode (128 bits per EMIF clock cycle), an ECC quanta is 32 bits. For 16-bit narrow mode (64 bits per EMIF clock cycle), the ECC quanta is 16 bits.

Once ECC is enabled the entire protected region must be initialized with data. These writes must be quanta-sized and quanta-aligned.

The ECC is read and verified during reads. For 1-bit ECC error in the data, the EMIF will correct the data and send it on the SYS or MPU return interface. The EMIF will log the starting address of the SDRAM burst in an internal 4 deep address FIFO. The internal FIFO will store the first four 1-bit ECC errors. The EMIF_1B_ECC_ERR_ADDR_LOG register will display the address on top of the internal FIFO. The software must write a 0x1 to the EMIF_1B_ECC_ERR_ADDR_LOG register to pop the FIFO and display the next address stored. For subsequent reads in the ECC regions, the FIFO will be loaded with the address for the next 1-bit ECC error if it is not full. It must be noted that no address comparison will be performed, that is, if a single address has ECC errors back-to-back, that address will be logged twice.

The number of 1-bit ECC errors can be counted using the EMIF_1B_ECC_ERR_CNT register. The EMIF also supports programming a threshold and a window in the EMIF_1B_ECC_ERR_THRSH register. The window is programmed in number of refresh periods. When the programmed window value is 0x0, that is, window is disabled, and the internal error count meets the programmed threshold, the EMIF will generate a 1-bit ECC error interrupt. When the programmed window value is non-zero, that is, window is enabled, the EMIF will generate a 1-bit ECC error interrupt only if the internal error count meets the programmed threshold in that window. The internal error count is reset every time the window expires. The software can use this to gauge the degree of 1-bit ECC errors occurring in the system.

For diagnosis, the EMIF supports a 1-Bit ECC data error distribution register (EMIF_1B_ECC_ERR_DIST_1) that represent whether an error has occurred in a given data channel location. This is advantageous to detect whether the errors are random or systemic. The distribution registers will be overlay of all 1-bit ECC errors until the software clears the register. Therefore, multiple bits could be set as a result of multiple 1-bit ECC errors occurring over multiple read accesses.

For 2-bit ECC errors in the data, the EMIF will generate a 2-bit ECC error interrupt. For any bit errors in the address, the EMIF will generate an address error interrupt. It must be noted that the EMIF will neither correct the data for these uncorrectable errors. Along with generating the interrupts, the EMIF will also report an error on the SYS or MPU return interface. In this case the EMIF will send the resultant data from the ECC correction logic.

The read data received from the memory may have further been corrupted by the ECC correction logic since it will have attempted to correct the read data but failed due to uncorrectable error.

For all uncorrectable ECC errors listed above, the EMIF will log the starting address of the SDRAM burst in the EMIF_2B_ECC_ERR_ADDR_LOG register. This register will show the address of the first uncorrectable error. After the software clears the register, it will be loaded with the address for the next uncorrectable error.

In the event that the EMIF detects a single bit ECC error, although the error is corrected on the returned data, the data in the SDRAM is not corrected. It is the responsibility of the system software to correct the ECC error at that location. To the extent possible, the system software should correct multiple bit errors with the caveat that the returned data was not corrected but corrupted by the ECC correction logic.

15.3.4.15 Class of Service

The class of service mechanism can be enabled by setting to 0x1 the EMIF_READ_WRITE_EXECUTION_THRESHOLD[31] MFLAG_OVERRIDE bit. In this case EMIF services the order of commands given by the class of service rules described in the following paragraphs. If MFLAG_OVERRIDE is set to 0x0 then class of service does not apply. When MFLAG_OVERRIDE is 0x0 and the MFLAG is high then the EMIF alternates between one command coming from the MPU interface and one from the System interface and so forth. The MFLAG value is ignored if MFLAG_OVERRIDE is 0x1.

The commands in the Command FIFO can be mapped to two classes of service namely 1 and 2. The mapping of commands to a particular class of service can be done based on the priority or the master ID. The mapping based on priority can be done by setting the appropriate values in the EMIF_PRIORITY_TO_CLASS_OF_SERVICE_MAPPING register. The mapping based on master ID can be done by setting the appropriate values of master ID and the masks in the EMIF_CONNECTION_ID_TO_CLASS_OF_SERVICE_1_MAPPING and EMIF_CONNECTION_ID_TO_CLASS_OF_SERVICE_2_MAPPING registers. There are 3 master ID and mask values that can be set for each class of service. In conjunction with the masks, each class of service can have a maximum of 144 master IDs mapped to it. For example, a master ID value of 0xFF along with a mask value of 0x3 will map all master IDs from 0xF8 to 0xFF to that particular class of service.

Each class of service has an associated latency counter (EMIF_COS_CONFIG[23:16] COS_COUNT_1 and EMIF_COS_CONFIG[15:8] COS_COUNT_2). When the latency counter for a command expires, that is, reaches the value programmed for the class of service that the command belongs to, that command is executed next. If there is more than one command that has expired latency counter, the command with the highest priority is executed first. One exception to this rule is, if the EMIF_COS_CONFIG[7:0] PR_OLD_COUNT value expires for the oldest command in the queue. That command is executed first irrespective of priority or class of service. This is done to prevent the continuous blocking effect.

The EMIF_COS_CONFIG[7:0] PR_OLD_COUNT value is used to identify when the oldest command in the command FIFO has timed out. At this point during the arbitration process, this oldest command is issued regardless of the priority of the other commands in the FIFO. This feature is disabled when writing 0x0 to the EMIF_COS_CONFIG[7:0] PR_OLD_COUNT bit field. After issuing the oldest command, the other remaining commands in the FIFO are reordered by age. The next oldest command in the FIFO is given highest priority again and issued after the EMIF_COS_CONFIG[7:0] PR_OLD_COUNT value expires. If a new value in the PR_OLD_COUNT bit field is written during counting, that is, before PR_OLD_COUNT expires, the counter keeps working but if this value is smaller the oldest command is issued sooner and if this value is larger the oldest command is issued later.

The master ID mapping allows the same master ID to be put in both class of service 1 and 2. Also, a transaction might belong to one class of service if viewed by master ID and might belong to another class of service if viewed by priority. In these cases, the command will belong to both class of service. The EMIF will try executing the command as soon as possible, when the smaller of the two counters (EMIF_COS_CONFIG[23:16] COS_COUNT_1 and EMIF_COS_CONFIG[15:8] COS_COUNT_2) expires.

15.3.4.16 Performance Counters

The EMIF_PERFORMANCE_COUNTER_1 and EMIF_PERFORMANCE_COUNTER_2 registers are used to monitor or calculate the EMIF Controller bandwidth and efficiency. These counters are able to count events such as accesses made to EMIF, Activate (ACT) commands sent to SDRAM, read and write accesses made to EMIF, and other events. Each counter counts independently of the other. In addition to the ability of events counting, the counters can also filter the events from a particular master or address space. The events counting and filter enabling are configured using the EMIF_PERFORMANCE_COUNTER_CONFIG register. The filter value used is configured through the EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT register. Each counter can be configured independently.

Table 15-86 lists all the events that can be counted and whether a filter can be applied to a particular event. A filter is applied to an event if the following bits are set to 0x1 for that event:

- For Performance Counter 1: EMIF_PERFORMANCE_COUNTER_CONFIG[15] CNTR1_MCONNID_EN and EMIF_PERFORMANCE_COUNTER_CONFIG[14] CNTR1_REGION_EN;
- For Performance Counter 2: EMIF_PERFORMANCE_COUNTER_CONFIG[31] CNTR2_MCONNID_EN and EMIF_PERFORMANCE_COUNTER_CONFIG[30] CNTR2_REGION_EN.

Table 15-86. Performance Counter Filter Configuration

CNTRn_CFG(1)	CNTRn_REGION_EN	CNTRn_MCONNID_EN	Description
0x0	0x0	0x0 or 0x1	Count the accesses made to EMIF
0x1	0x0	0x0 or 0x1	Count the Activate (ACT) commands sent to SDRAM
0x2	0x0 or 0x1	0x0 or 0x1	Count the read accesses made to EMIF
0x3	0x0 or 0x1	0x0 or 0x1	Count the write accesses made to EMIF
0x4	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Command FIFO is full
0x5	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Write Data FIFO is full
0x6	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Read Data FIFO is full
0x7	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Return Command FIFO is full
0x8	0x0 or 0x1	0x0 or 0x1	Count number of priority elevations
0x9	0x0	0x0	Count number of EMIF_FICLK clock cycles that a command was pending
0xA	0x0	0x0	Count number of EMIF_FICLK cycles used by the EMIF controller for reads and writes.
0xB - 0xF	0x0	0x0	Reserved for future use.

(1) n = 1 or 2

Note

When the MReqDebug qualifier is set to 0x1 for a particular local command, the performance counters are not incremented for that particular command if the CNTRn_CFG values are equal to 0x0, 0x1, 0x2, 0x3, or 0xA.

Note

The EMIF performance counters cannot distinguish between single access and burst access. In both cases they are incremented by 1. If the actual SDRAM bandwidth of an initiator has to be measured the EMIF performance counters may not be sufficient.

15.3.4.16.1 Performance Counters General Examples

- **General Example for Counting All Write Accesses made to EMIF**
  If the EMIF_PERFORMANCE_COUNTER_1 register is used to count all write accesses made to EMIF from master with connection ID equal to 0x86 (this is the system MMU) the following steps should be performed:
  - To enable the writes counting, the EMIF_PERFORMANCE_COUNTER_CONFIG[3:0] CNTR1_CFG bit field must be set to 0x3.
  - The EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT[15:8] MCONNID1 bit field must be set to 0x86.
  - To enable filtering, the EMIF_PERFORMANCE_COUNTER_CONFIG[15] CNTR1_MCONNID_EN bit must be set to 0x1.

    With this configuration EMIF_PERFORMANCE_COUNTER_1 counts every write made to the EMIF from master 0x86 to any address space. This does not include accesses from other masters and commands other than writes.
- **General Example for Counting Total Accesses made to EMIF**
  If the EMIF_PERFORMANCE_COUNTER_2 register is used to count total accesses made to EMIF regardless of the address space or master the following steps should be performed:
  - To enable counting of all accesses to the SDRAM, the EMIF_PERFORMANCE_COUNTER_CONFIG[19:16] CNTR2_CFG bit field must be set to 0x0.
  - To disable filtering, both the EMIF_PERFORMANCE_COUNTER_CONFIG[31] CNTR2_MCONNID_EN and EMIF_PERFORMANCE_COUNTER_CONFIG[30] CNTR2_REGION_EN bits must be set to 0x0.

    With this configuration EMIF_PERFORMANCE_COUNTER_2 counts every access made to the EMIF. This includes all accesses from all masters and to any address space.
- **General Example for Counting All Read Accesses made to EMIF**
  If the EMIF_PERFORMANCE_COUNTER_1 register is used to count all read accesses made to EMIF from master with connection ID equal to 0x86 (this is the system MMU) to address space 0x0 the following steps should be performed:
  - To enable the reads counting, the EMIF_PERFORMANCE_COUNTER_CONFIG[3:0] CNTR1_CFG bit field must be set to 0x2.
  - The EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT[15:8] MCONNID1bit field must be set to 0x86
  - The EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT[1:0] REGION_SEL1 bit field must be set to 0x0.
  - To enable filtering, both the EMIF_PERFORMANCE_COUNTER_CONFIG[15] CNTR1_MCONNID_EN and the EMIF_PERFORMANCE_COUNTER_CONFIG[14] CNTR1_REGION_EN bits must be set to 0x1.

    With this configuration, EMIF_PERFORMANCE_COUNTER_1 counts every read made to the EMIF from master 0x86 to address space 0x0. This does not include accesses from other masters or to other address spaces and does not include commands other than reads.

15.3.4.17 Forcing CKE to tri-state

The CKE pad can be forced to tri-state when the CTRL_CORE_SMA_SW_0[0] CKE_GATING_CTRL bit is set to 0x1. This functionality facilitates fast resume by allowing a strong external pull-down resistor to hold the CKE memory pad low thus keeping the SDRAM in self-refresh while the device is completely powered off. Figure 15-51 and the following example sequence provide more details how this functionality can be used:

- When device is running configure EMIF for self refresh. As a result it drives CKE low.
- Disable V_{TT} supply (can be controlled through a device GPIO pad).
- Ramp down all power rails to the device. When power is already off, EMIF doesn't drive CKE low. The external pull-down does this instead. Note that only V_{TT} must be off. All SDRAM supplies (including V_{REF}) must be on.
- After these three steps the device is completely powered off and the SDRAM is in self-refresh. The waking-up from this state is system specific.

- To resume from self-refresh the CKE pad must be forced to tri-state by writing 0x1 to one of the CKE_GATING_CTRL bits previously mentioned. Then EMIF must be configured for self-refresh so that its state becomes consistent with the actual SDRAM state.
- Write 0x0 to the corresponding CKE_GATING_CTRL bit to release CKE driver from tri-state. This allows EMIF to take control over CKE which is now driven low as EMIF has already been configured for self-refresh.
- Enable V_{TT} supply.
- Access the SDRAM to bring it out of self refresh and resume application.

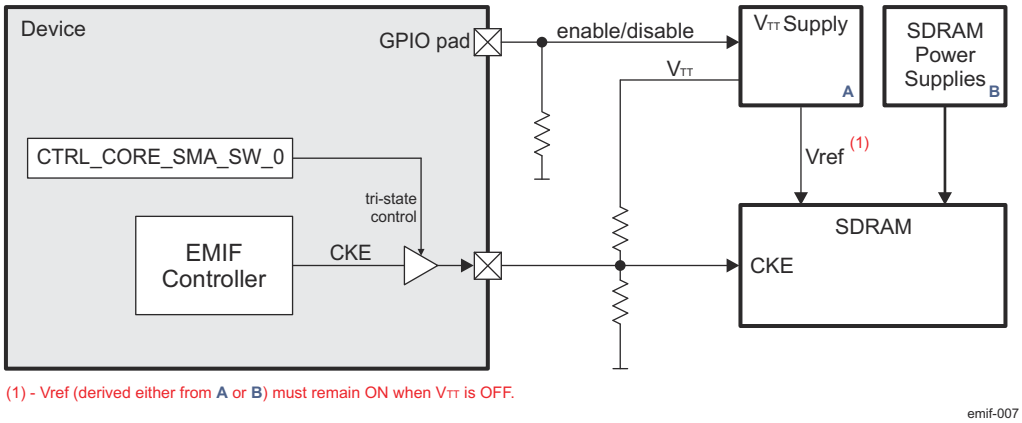

Figure 15-51. Example for Using the CKE Tri-state Functionality

Note

In case the device is powered off but the SDRAM is in self-refresh (as previously described) it must be taken into account that the SDRAM RESET# signal has to be controlled externally to preserve the SDRAM contents. This is needed as ddr1_rst signal is not controlled by the CTRL_CORE_SMA_SW_0 register and therefore cannot be used.

15.3.5 EMIF Programming Guide

15.3.5.1 EMIF Low-Level Programming Models

This section describers the low-level hardware programming sequences for the configuration and use of the EMIF module.

15.3.5.1.1 Global Initialization

Table 15-87. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. See *Power, Reset, and Clock Management*.
DMM	The EMIF is a slave to the DMM. The DMM must be enabled and configured. See Section 15.2, *Dynamic Memory Manager*.
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see *Interrupt Controllers*.
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.

15.3.5.1.1.1 EMIF Configuration Sequence

Table 15-88 shows all steps needed to configure and use the EMIF.

Table 15-88. EMIF Configuration Sequence

Step	Register/ Bit Field	Value
Configure DPLL_DDR to the required frequency:		
· **IF** DPLL_DDR is locked:	CM_IDLEST_DPLL_DDR[0] ST_DPLL_CLK	0x1
Unlock DPLL_DDR	CM_CLKMODE_DPLL_DDR[2:0] DPLL_EN	0x6
· **ENDIF**		
· Configure the DPLL multiplier and divider factors	CM_CLKSEL_DPLL_DDR[18:8] DPLL_MULT and CM_CLKSEL_DPLL_DDR[6:0] DPLL_DIV	0x-
· Configure the M2 post-divider factor	CM_DIV_M2_DPLL_DDR[4:0] DIVHS	0x-
· Configure the H11 post-divider factor	CM_DIV_H11_DPLL_DDR[5:0] DIVHS	0x-
· Lock the DPLL_DDR	CM_CLKMODE_DPLL_DDR[2:0] DPLL_EN	0x7
Disable DLL Override	CM_DLL_CTRL[0] DLL_OVERRIDE	0x0
Configure the output impedance, slew rate and weak pull resistors of the DDR IO cells. For more information, see *Software Controls for the DDR3 I/O Cells*.	CTRL_CORE_CONTROL_DDRCACH1_0	0x-
	CTRL_CORE_CONTROL_DDRCH1_0

Configure the LISA_MAP registers based on the EMIF1 usage. For more information see *Addressing Management with LISA*.	DMM_LISA_MAP_i (i = 0 to 3)	0x-
	MA_LISA_MAP_i (i = 0 to 3)	0x-

(1) These values are only used when CM_DLL_CTRL[0] DLL_OVERRIDE is set to 0x1. This is used only for debug purposes.
(2) The values of these fields do not depend on the board topology.
(3) These fields control the delay between the corresponding DQ byte lane and DQS/DQSN pair. Their values should correspond to delay of 1/4 clock cycle to center the DQ relative to the rising/falling edges of DQS/DQSN. Regardless of topology, it is recommended that all the DQ bits are skew matched to the corresponding DQS/DQSN pair.
(4) Values loaded in these registers depend on OPP.
(5) Writes to these registers do not have any impact. It's up to the user to skip these steps.
(6) In some special use-cases with features like suspend to RAM where EMIF may be reset but SDRAM content needs to be maintained correctly across such an event. In such cases, when EMIF is configured at first boot with hardware leveling enabled, the hardware leveling output from EMIF_PHY_STATUS_x registers is copied to the EMIF_EXT_PHY_CONTROL_x registers. When EMIF comes back from a reset state and needs to be reconfigured without losing SDRAM content, the EMIF_READ_WRITE_LEVELING_RAMP_CONTROL[31] RDWRLVL_EN bit must be 0 and hardware leveling must not be triggered. In this case, the EMIF_EXT_PHY_CONTROL_2 through EMIF_EXT_PHY_CONTROL_21 registers take effect. Here it is expected that SDRAM is moved to self-refresh mode before EMIF enters reset state and SDRAM content is maintained correctly by appropriate circuitry external to the SoC.

15.3.5.1.2 Operational Modes Configuration

15.3.5.1.2.1 EMIF Output Impedance Calibration Mode

Note

Chip select 1 is not supported on this device.

Table 15-89. EMIF Output Impedance Calibration Mode

Step	Register/ Bit Field / Programming Model	Value
IF : Calibration per CS		
Determine on which chip select (1 or 0) the calibration is enabled.	EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[31:30] ZQ_CS1EN/ZQ_CS0EN	0x-
ELSE : (Calibration on both the CS0 and CS1)		
Enable automatic output impedance calibration for both the chip selects simultaneously.	EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[29] ZQ_DUALCALEN	0x1
ENDIF		
Define the interval (number of refresh periods) between ZQCS commands.	EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[15:0] ZQ_REFINTERVAL	0x-
Define the number of ZQCL durations that build the ZQINIT duration.	EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[19:18] ZQ_ZQINIT_MULT	0x-
Define the number of ZQCS intervals that build the ZQCL duration.	EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[17:16] ZQ_ZQCL_MULT	0x-

Table 15-89. EMIF Output Impedance Calibration Mode (continued)

Step	Register/ Bit Field / Programming Model	Value
Enable the issuing of ZQ-Long Command on Self-Refresh, Active Power-Down, and Precharge Power-Down exit.	EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG[28] ZQ_SFEXITEN	0x1

15.3.5.1.2.2 EMIF SDRAM Self-Refresh

Table 15-90. EMIF SDRAM Self-Refresh Entering

Step	Register/ Bit Field / Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Self Refresh mode, when EMIF is idle.	EMIF_POWER_MANAGEMENT_CONTROL[7:4] SR_TIM	0x-
Enable the Self-Refresh mode	EMIF_POWER_MANAGEMENT_CONTROL[10:8] LP_MODE	0x2
Write the shadow register of EMIF_POWER_MANAGEMENT_CONTROL	EMIF_POWER_MANAGEMENT_CONTROL_SHADOW	0x-

Table 15-91. EMIF SDRAM Self-Refresh Exiting

Step	Register/ Bit Field / Programming Model	Value
Change LP_MODE bitfield from 0x2 to any value.	EMIF_POWER_MANAGEMENT_CONTROL[10:8] LP_MODE	0x-
Write the shadow register of EMIF_POWER_MANAGEMENT_CONTROL	EMIF_POWER_MANAGEMENT_CONTROL_SHADOW	0x-

15.3.5.1.2.3 EMIF SDRAM Power-Down Mode

Table 15-92. EMIF SDRAM Power-Down Mode Entering

Step	Register/ Bit Field / Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Power Down mode, when EMIF is idle.	EMIF_POWER_MANAGEMENT_CONTROL[15:12] PD_TIM	0x-
Enable (enter) the Power-down mode	EMIF_POWER_MANAGEMENT_CONTROL[10:8] LP_MODE	0x4
Write the shadow register of EMIF_POWER_MANAGEMENT_CONTROL	EMIF_POWER_MANAGEMENT_CONTROL_SHADOW	0x-

Table 15-93. EMIF SDRAM Power-Down Mode Exiting

Step	Register/ Bit Field / Programming Model	Value
Change LP_MODE bitfield from 0x4 to any value.	EMIF_POWER_MANAGEMENT_CONTROL[10:8] LP_MODE	0x-
Write the shadow register of EMIF_POWER_MANAGEMENT_CONTROL	EMIF_POWER_MANAGEMENT_CONTROL_SHADOW	0x-

15.3.5.1.2.4 EMIF ECC Configuration

Table 15-94 lists the EMIF ECC configuration settings.

Table 15-94. EMIF ECC Configuration

Step	Register/ Bit Field / Programming Model	Value
Before configuring the EMIF ECC registers, the ECC must be enabled from the Control Module	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT [16] EMIF1_EN_ECC	0x1
Configure the address ranges which have to be ECC protected	EMIF_ECC_ADDRESS_RANGE_1 and EMIF_ECC_ADDRESS_RANGE_2(1)	0x-
Enable the first ECC protected address range	EMIF_ECC_CTRL_REG[0] REG_ECC_ADDR_RGN_1_EN	0x1

Table 15-94. EMIF ECC Configuration (continued)

Step	Register/ Bit Field / Programming Model	Value
Enable the second ECC protected address range	EMIF_ECC_CTRL_REG[1] REG_ECC_ADDR_RGN_2_EN(1)	0x1
Configure whether the EMIF accesses within the address ranges defined by EMIF_ECC_ADDRESS_RANGE_1 and EMIF_ECC_ADDRESS_RANGE_2 are ECC protected (=0x1) or the EMIF accesses outside these address ranges are ECC protected (=0x0).	EMIF_ECC_CTRL_REG[30] REG_ECC_ADDR_RGN_PROT	0x-
(Optional) Configure the thresholds to generate 1-bit error interrupt	EMIF_1B_ECC_ERR_THRSH	0x-
Enable ECC	EMIF_ECC_CTRL_REG[31] REG_ECC_EN	0x1
Initialize the ECC protected memory regions with quanta-sized and quanta-aligned data		
Clear the status flags and other status history	EMIF_1B_ECC_ERR_CNT	Read the register value and write it back to clear
	EMIF_1B_ECC_ERR_DIST_1	0xFFFF FFFF
	EMIF_2B_ECC_ERR_ADDR_LOG	0x1
	EMIF_SYSTEM_OCP_INTERRUPT_STATUS [5:3]	0x7

Note

The xxx_RATIO8 and xxx_RATIO9 bit fields are associated with the ECC data PHY and in case of software leveling must be loaded with values same as in the xxx_RATIO0 through xxx_RATIO7 bit fields from registers EMIF_EXT_PHY_CONTROL_x. This must be taken into account to avoid unexpected behavior and possible errors, if ECC is used.

15.3.6 EMIF Register Manual

Table 15-95 lists the EMIF instance.

15.3.6.1 EMIF Instance Summary

Table 15-95. EMIF Instance Summary

Module Name	Base Address	Size
EMIF1	0x4C00 0000	16 MiB

15.3.6.2 EMIF Registers

Many register values are programmed with full-speed DDR clock cycles, whereas EMIF always runs at half the speed of this clock. Because EMIF is only capable of decrementing these values at half speed (taking into account the minus 1 programming model) the following model applies for data issued on a lower bus:

- REG_VALUE = 0 → 2 DDR clocks
- REG_VALUE = 1 → 2 DDR clocks
- REG_VALUE = 2 → 4 DDR clocks
- REG_VALUE = 3 → 4 DDR clocks
- REG_VALUE = 4 → 6 DDR clocks
- REG_VALUE = 5 → 6 DDR clocks
- REG_VALUE = 6 → 8 DDR clocks
- REG_VALUE = 7 → 8 DDR clocks

Activate and deactivate commands use the upper bus. Register values associated with these operations follow the general rule:

- REG_VALUE = 0 → 1 DDR clocks
- REG_VALUE = 1 → 2 DDR clocks
- REG_VALUE = 2 → 2 DDR clocks
- REG_VALUE = 3 → 4 DDR clocks
- REG_VALUE = 4 → 4 DDR clocks
- REG_VALUE = 5 → 6 DDR clocks
- REG_VALUE = 6 → 6 DDR clocks

Note

Shadow registers are loaded on any frequency change or SidleReq/SidleAck transition at the point where the EMIF has put SDRAM into self-refresh mode.

Table 15-96 summarizes the EMIF register mapping.

15.3.6.2.1 EMIF Register Summary

Note

The ECC feature is not available on this device, but signal names and configuration contexts are retained for consistency with the AM572x family of devices.

Table 15-96. EMIF Registers Mapping Summary

Register Name	Type	Register Width (Bits)	Address Offset	EMIF1 Physical Address
EMIF_REVISION	R	32	0x0000 0000	0x4C00 0000

15.3.6.2.2 EMIF Register Description

Table 15-97. EMIF_REVISION

Address Offset	0x0000 0000		
Physical Address	0x4C00 0000	**Instance**	EMIF1
Description	Revision number register		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REVISION																															

Bits	Field Name	Description	Type	Reset
31:0	REVISION	Module revision	R	0x- (1)

(1) TI internal data

Table 15-98. EMIF_STATUS

Address Offset	0x0000 0004		
Physical Address	0x4C00 0004	**Instance**	EMIF1
Description	SDRAM Status Register (STATUS)		

Table 15-98. EMIF_STATUS (continued)

Type R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BE	DUAL_CLK_MODE	FAST_INIT	RESERVED																						RDLVLGATETO	RDLVLTO	WRLVLTO	RESERVED	PHY_DLL_READY	RESERVED	

Bits	Field Name	Description	Type	Reset
31	BE	Big endian mode select for 8 and 16-bit devices, set to 1 for big endian or 0 for little endian operation. In current implementation, only 32-bit devices are supported - this bit is don't care.	R	0
30	DUAL_CLK_MODE	Dual Clock mode. Defines whether the EMIFi_L3_ICLK and EMIF_FICLK clock are asynchronous. EMIFi_L3_ICLK and EMIF_FICLK clock are asynchronous, if set to 1.	R	0
29	FAST_INIT	Fast Init. Defines whether the EMIF fast initialization mode has been enabled. Fast initialization is enabled if set to 1.	R	0
28:7	RESERVED	Reserved	R	0x00 0000
6	RDLVLGATETO	Read DQS Gate Training Timeout. Value of 1 indicates read DQS gate training has timed out because read DQS gate training done was not received from the PHY.	R	0
5	RDLVLTO	Read Data Eye Training Timeout. Value of 1 indicates read data eye training has timed out because read data eye training done was not received from the PHY.	R	0
4	WRLVLTO	Write Leveling Timeout. Value of 1 indicates write leveling has timed out because write leveling done was not received from the PHY.	R	0
3	RESERVED		R	0
2	PHY_DLL_READY	DDR PHY Ready. The DDR PHY is ready for normal operation, if set to 1.	R	0
1:0	RESERVED	Reserved	R	0x0

Table 15-99. EMIF_SDRAM_CONFIG

Address Offset 0x0000 0008

Physical Address 0x4C00 0008 **Instance** EMIF1

Description SDRAM Config Register.
A write to this register will cause the EMIF to start the SDRAM initialization sequence.
CAUTION: This register is loaded with values by control module at device reset.

Type RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SDRAM_TYPE			IBANK_POS		DDR_TERM			DDR2_DDQS	DYN_ODT		DDR_DISABLE_DLL	SDRAM_DRIVE		CWL		NARROW_MODE		CL		ROWSIZE		IBANK		EBANK	PAGESIZE						

Bits	Field Name	Description	Type	Reset
31:29	SDRAM_TYPE	SDRAM Type selection. This field is loaded from e-fuse. Set to 3 for DDR3 All other values are reserved.	RW	0x0
28:27	IBANK_POS	Internal bank position. See *SDRAM Address Mapping*.	RW	0x0
26:24	DDR_TERM	DDR3 termination resistor value. Set to 0 to disable termination. For DDR3, set to 1 for RZQ/4, set to 2 for RZQ/2, set to 3 for RZQ/6, set to 4 for RZQ/12, and set to 5 for RZQ/8. All other values are reserved.	RW	0x0
23	DDR2_DDQS	Differential DQS enable. Set to 0 for single ended DQS (**Not supported**). Set to 1 for differential DQS.	RW	0
22:21	DYN_ODT	DDR3 Dynamic ODT. NOT SUPPORTED. Set to 0 to turn off dynamic ODT.	RW	0x0
20	DDR_DISABLE_DLL	Disable DLL select. Set to 1 to disable DLL inside SDRAM.	RW	0
19:18	SDRAM_DRIVE	SDRAM drive strength.For DDR3, set to 0 for RZQ/6 and set to 1 for RZQ/7. All other values are reserved.	RW	0x0
17:16	CWL	DDR3 CAS Write latency. Value of 0, 1, 2, and 3 (CAS write latency of 5, 6, 7, and 8) are supported. Use the lowest value supported for best performance. All other values are reserved.	RW	0x0
15:14	NARROW_MODE	SDRAM data bus width. Set to 0 for 32-bit data bus width. Set to 1 for 16-bit data bus width. All other values are reserved.	RW	0x0
13:10	CL	CAS Latency (referred to as read latency (RL) in some SDRAM specs). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices. Values of 2, 4, 6, 8, 10, 12 and 14 (CAS latency of 5, 6, 7, 8, 9, 10 and 11) are supported for DDR3. All other values are reserved.	RW	0x0
9:7	ROWSIZE	Row Size. Defines the number of row address bits of connected SDRAM devices. Set to 0 for 9 row bits, Set to 1 for 10 row bits, Set to 2 for 11 row bits, Set to 3 for 12 row bits, Set to 4 for 13 row bits, Set to 5 for 14 row bits, Set to 6 for 15 row bits, Set to 7 for 16 row bits. This field is only used when EMIF_SDRAM_CONFIG[28:27] IBANK_POS field is set to 1, 2, or 3 or EBANK_POS field in EMIF_SDRAM_CONFIG_2 register is set to 1.	RW	0x0
6:4	IBANK	Internal Bank setup. Defines number of banks inside connected SDRAM devices. Set to 0 for 1 bank, Set to 1 for 2 banks, Set to 2 for 4 banks, Set to 3 for 8 banks. All other values are reserved.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	EBANK	External chip select setup. Defines whether SDRAM accesses will use 1 or 2 chip select lines. Set to 0 to use CSN0 only. Set to 1 to use CSN[1:0]. **NOTE: Chip select 1 is not supported on this device.**	RW	0
2:0	PAGESIZE	Page Size. Defines the internal page size of connected SDRAM devices. Set to 0 for 256-word page (8 column bits), Set to 1 for 512-word page (9 column bits), Set to 2 for 1024-word page (10 column bits), Set to 3 for 2048-word page (11 column bits). All other values are reserved.	RW	0x0

Bits	Field Name	Description	Type	Reset
31:28	RESERVED		R	0x0
27	EBANK_POS	External bank position. Set to 0 to assign external bank address bits from lower OCP address. Set to 1 to assign external bank address bits from higher OCP address bits. See *SDRAM Address Mapping*.	RW	0
26:0	RESERVED		R	0x00 0000

Table 15-101. EMIF_SDRAM_REFRESH_CONTROL

Address Offset	0x0000 0010		
Physical Address	0x4C00 0010	**Instance**	EMIF1
Description	SDRAM Refresh Control Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
INITREF_DIS	RESERVED	SRT	ASR	RESERVED	PASR			RESERVED								REFRESH_RATE															

Bits	Field Name	Description	Type	Reset
31	INITREF_DIS	Initialization and Refresh disable. When set to 1, EMIF will disable SDRAM initialization and refreshes, but will carry out SDRAM write/read transactions.	RW	1
30	RESERVED		R	0

Bits	Field Name	Description	Type	Reset
29	SRT	DDR3 Self Refresh temperature range. Set to 0 for normal operating temperature range and set to 1 for extended operating temperature range when the ASR field is set to 0. This bit must be set to 0 if the ASR field is set to 1. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0
28	ASR	DDR3 Auto Self Refresh enable. Set to 1 for auto Self Refresh enable. Set to 0 for manual Self Refresh reference indicated by the SRT field. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0
27	RESERVED		R	0
26:24	PASR	Partial Array Self Refresh. These bits get loaded into the Extended Mode Register of DDR3 during initialization. For DDR3, set to 0 for full array, set to 1 or 5 for 1/2 array, set to 2 or 6 for 1/4 array, set to 3 or 7 for 1/8 array, and set to 4 for 3/4 array to be refreshed. All other values are reserved. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0x0
23:16	RESERVED		R	0x00
15:0	REFRESH_RATE	Refresh Rate. Value in this field is used to define the rate at which connected SDRAM devices will be refreshed. SDRAM refresh rate = REFRESH_RATE / EMIF_PHY_FCLK. A 533-MHz DDR clock rate system that requires a 7.8 µs refresh rate would need 7.8 × 533 = 4157 or 0x103D value to be written. To avoid lock-up situations, the programmer must not program REFRESH_RATE < (6 × EMIF_SDRAM_TIMING_3[12:4] T_RFC). **Note** **NOTE:** The SDRAM refresh rate can be changed on-the-fly by writing to this field. When changing the SDRAM refresh rate all timing parameters that use the refresh rate value have to be recalculated. For example, tRASmax specified in the EMIF_SDRAM_TIMING_3[3:0] T_RAS_MAX field must be recalculated.	RW	0x0000

Bits	Field Name	Description	Type	Reset
31	CNTR2_MCONNID_EN	MConnID filter enable for EMIF_PERFORMANCE_COUNTER_2 register.	RW	0

Bits	Field Name	Description	Type	Reset
30	CNTR2_REGION_EN	Chip Select filter enable for EMIF_PERFORMANCE_COUNTER_2 register.	RW	0
29:20	RESERVED	Reserved for future use	R	0x000
19:16	CNTR2_CFG	Filter configuration for EMIF_PERFORMANCE_COUNTER_2. Refer to Table 15-86 for details.	RW	0x1
15	CNTR1_MCONNID_EN	MConnID filter enable for EMIF_PERFORMANCE_COUNTER_1 register.	RW	0
14	CNTR1_REGION_EN	Chip Select filter enable for EMIF_PERFORMANCE_COUNTER_1 register.	RW	0
13:4	RESERVED	Reserved for future use	R	0x000
3:0	CNTR1_CFG	Filter configuration for EMIF_PERFORMANCE_COUNTER_1. Refer to Table 15-86 for details.	RW	0x0

Table 15-120. EMIF_PERFORMANCE_COUNTER_MASTER_REGION_SELECT

Address Offset	0x0000 008C		
Physical Address	0x4C00 008C	**Instance**	EMIF1
Description	Performance Counter Master Region Select Register The values programmed into the MCONNIDx fields are those in the *ConnID Values* table in *Interconnect*.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MCONNID2								RESERVED						REGION_SEL2		MCONNID1								RESERVED						REGION_SEL1	

Bits	Field Name	Description	Type	Reset
31:24	MCONNID2	MConnID for EMIF_PERFORMANCE_COUNTER_2 register.	RW	0x00
23:18	RESERVED	Reserved	R	0x00
17:16	REGION_SEL2	MAddrSpace for EMIF_PERFORMANCE_COUNTER_2 register.	RW	0x0
15:8	MCONNID1	MConnID for EMIF_PERFORMANCE_COUNTER_1 register.	RW	0x00
7:2	RESERVED	Reserved	R	0x00
1:0	REGION_SEL1	MAddrSpace for EMIF_PERFORMANCE_COUNTER_1 register.	RW	0x0

Table 15-121. EMIF_PERFORMANCE_COUNTER_TIME

Address Offset	0x0000 0090		
Physical Address	0x4C00 0090	**Instance**	EMIF1
Description	Performance Counter Time Register. This is a free running counter.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TOTAL_TIME																															

Bits	Field Name	Description	Type	Reset
31:0	TOTAL_TIME	32-bit counter that continuously counts number for EMIF_FICLK clock cycles elapsed after EMIF is brought out of reset.	R	0x0000 0000

Table 15-122. EMIF_MISC_REG

Address Offset	0x0000 0094		
Physical Address	0x4C00 0094	**Instance**	EMIF1
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															DLL_CALIB_OS

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Reserved	R	0x0
0	DLL_CALIB_OS	Phy_dll_calib one shot : Setting bit to 1 generates a phy_pll_calib pulse. Bit is self cleared when pll_calib gets generated and ack_wait has been satisfied. Software can poll to confirm completion. Uses the EMIF_DLL_CALIB_CTRL[19:16] ACK_WAIT bit field for time to wait after firing off the phy_dll_calib.	RW	0x0

Table 15-123. EMIF_DLL_CALIB_CTRL

Address Offset	0x0000 0098		
Physical Address	0x4C00 0098	**Instance**	EMIF1
Description	Control register to force idle window time to generate a phy_dll_calib that can be used for updating PHY DLLs during voltage ramps. NOTE: Should always be loaded via the shadow register.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED												ACK_WAIT				RESERVED								DLL_CALIB_INTERVAL							

Bits	Field Name	Description	Type	Reset
31:20	RESERVED		R	0x000
19:16	ACK_WAIT	The ack_wait determines the required wait time after a phy_dll_calib is generated before another command can be sent. Value program is in terms of EMIF_FICLK cycle count. **CAUTION:** 5 must be the minimum value ever programmed.	RW	0x9
15:9	RESERVED		R	0x00
8:0	DLL_CALIB_INTERVAL	This field determines the interval between phy_dll_calib generation. This value is multiplied by a precounter of 16 EMIF_FICLK cycles. Program this field one less the value you are targeting; program 1 to achieve interval of 2 (minimum interval supported). Programming zero turns off function. Note the final intervals between dll_calib generation is also a function of ACK_WAIT. Final periodic interval is calculated by: ((DLL_CALIB_INTERVAL + 1) × 16) + ACK_WAIT	RW	0x000

Table 15-124. EMIF_DLL_CALIB_CTRL_SHADOW

Address Offset	0x0000 009C		
Physical Address	0x4C00 009C	**Instance**	EMIF1
Description	Read Idle Control Shadow Register		

Table 15-124. EMIF_DLL_CALIB_CTRL_SHADOW (continued)

Type	RW

4	TWOBIT_ECC_ERR_SYS	Enabled status of system ECC two bit error detection interrupt. Writing a 1 will disable the interrupt, and clear this bit as well as the corresponding Interrupt Enable Set Register. Writing a 0 has no effect.	RW W1toClr	0x0
3	WR_ECC_ERR_SYS	Enabled status of system ECC Error interrupt when a memory access is made to a non-quanta aligned location. Writing a 1 will disable the interrupt, and clear this bit as well as the corresponding Interrupt Enable Set Register. Writing a 0 has no effect.	RW W1toClr	0x0
2:1	RESERVED		R	0x0
0	EN_ERR_SYS	Enable clear for system OCP interrupt for command or address error. Writing a 1 will disable the interrupt, and clear this bit as well as the corresponding Interrupt Enable Set Register. Writing a 0 has no effect.	RW W1toClr	0

Table 15-130. EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG

Address Offset	0x0000 00C8		
Physical Address	0x4C00 00C8	**Instance**	EMIF1
Description	SDRAM Output Impedance Calibration Config Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ZQ_CS1EN	ZQ_CS0EN	ZQ_DUALCALEN	ZQ_SFEXITEN	RESERVED								ZQ_ZQINIT_MULT		ZQ_ZQCL_MULT		ZQ_REFINTERVAL																	

Bits	Field Name	Description	Type	Reset
31	ZQ_CS1EN	Writing a 1 enables ZQ calibration for CS1.	RW	0x0
30	ZQ_CS0EN	Writing a 1 enables ZQ calibration for CS0.	RW	0x0
29	ZQ_DUALCALEN	ZQ Dual Calibration enable. Allows both ranks to be ZQ calibrated simultaneously. Setting this bit requires both chip selects to have a separate calibration resistor per device. **NOTE: Chip select 1 is not supported on this device.**	RW	0x0
28	ZQ_SFEXITEN	Writing a 1 enables the issuing of ZQCL on Self-Refresh, Active Power-Down, and Precharge Power-Down exit.	RW	0x0
27:20	RESERVED		R	0x00
19:18	ZQ_ZQINIT_MULT	Indicates the number of ZQCL durations that make up a ZQINIT duration, minus one.	RW	0x0
17:16	ZQ_ZQCL_MULT	Indicates the number of ZQCS intervals that make up a ZQCL duration, minus one. ZQCS interval is defined by ZQ_ZQCS in EMIF_SDRAM_TIMING_3.	RW	0x0
15:0	ZQ_REFINTERVAL	Number of refresh periods between ZQCS commands. This field supports between one refresh period to 256 ms between ZQCS calibration commands. Refresh period is defined by REFRESH_RATE in EMIF_SDRAM_REFRESH_CONTROL register.	RW	0x0000

Table 15-131. EMIF_TEMP_ALERT_CONFIG

Address Offset	0x0000 00CC		
Physical Address	0x4C00 00CC	**Instance**	EMIF1
Description	Temperature Alert Configuration Register. **NOTE: This register is only applicable to LPDDR2 memories and cannot be used in this device.**		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TA_CS1EN		TA_CS0EN		RESERVED		TA_SFEXITEN		TA_DEVWDT				TA_DEVCNT				RESERVED								TA_REFINTERVAL							

Bits	Field Name	Description	Type	Reset
31	TA_CS1EN	Writing 1 enables temperature alert polling for CS1.	RW	0x0
30	TA_CS0EN	Writing 1 enables temperature alert polling for CS0.	RW	0x0
29	RESERVED	Reserved	R	0x0
28	TA_SFEXITEN	Temperature Alert Poll on Self-Refresh, Active Power-Down, and Precharge Power-Down exit enable. Writing 1 enables the issuing of a temperature alert poll on Self-Refresh exit.	RW	0x0
27:26	TA_DEVWDT	This field indicates how wide a physical device is. It is used in conjunction with the TA_DEVCNT field to determine which byte lanes contain the temperature alert info. A value of 0: 8-bit wide, 1: 16-bit wide, 2: 32-bit wide. All others are reserved. If this field is set to 1 and the TA_DEVCNT field is set to 1 the byte mask for checking is 4'b0101.	RW	0x0
25:24	TA_DEVCNT	This field indicates which external byte lanes contain a device for temperature monitoring. A value of 0: one device, 1: two devices, 2: four devices. All other reserved.	RW	0x0
23:22	RESERVED	Reserved	R	0x0
21:0	TA_REFINTERVAL	Number of refresh periods between temperature alert polls. This field supports between one refresh period to 10 seconds between temperature alert polls. Refresh period is defined by REFRESH_RATE in EMIF_SDRAM_REFRESH_CONTROL register.	RW	0x0

Table 15-132. EMIF_OCP_ERROR_LOG

Address Offset	0x0000 00D0		
Physical Address	0x4C00 00D0	**Instance**	EMIF1
Description	OCP Error Log Register. This register is overwritten by any first error transaction once after the interrupt is serviced and cleared by writing 0x1 to the EMIF_SYSTEM_OCP_INTERRUPT_STATUS[0] ERR_SYS bit.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Description	Read/write leveling ramp control register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RDWRLVL_EN	RDWRLVLINC_RMP_PRE							RDLVLINC_RMP_INT								RDLVLGATEINC_RMP_INT								WRLVLINC_RMP_INT							

Bits	Field Name	Description	Type	Reset
31	RDWRLVL_EN	Read-Write Leveling enable. Set 1 to enable leveling. Set 0 to disable leveling.	RW	0
30:24	RDWRLVLINC_RMP_PRE	Incremental leveling pre-scalar in number of refresh periods during ramp window. The value programmed is minus one the required value. Refresh period is defined by REFRESH_RATE in EMIF_SDRAM_REFRESH_CONTROL register. **NOTE: Incremental leveling is not supported on this device.**	RW	0x00

Bits	Field Name	Description	Type	Reset
23:16	RDLVLINC_RMP_INT	Incremental read data eye training interval during ramp window. Number of RDWRLVLINC_RMP_PRE intervals between incremental read data eye training during ramp window. A value of 0 will disable incremental read data eye training.**NOTE: Incremental leveling is not supported on this device.**	RW	0x00
15:8	RDLVLGATEINC_RMP_INT	Incremental read DQS gate training interval during ramp window. Number of RDWRLVLINC_RMP_PRE intervals between incremental read DQS gate training during ramp window. A value of 0 will disable incremental read DQS gate training.**NOTE: Incremental leveling is not supported on this device.**	RW	0x00
7:0	WRLVLINC_RMP_INT	Incremental write leveling interval during ramp window. Number of RDWRLVLINC_RMP_PRE intervals between incremental write leveling during ramp window. A value of 0 will disable incremental write leveling.**NOTE: Incremental leveling is not supported on this device.**	RW	0x00

Table 15-135. EMIF_READ_WRITE_LEVELING_CONTROL

Address Offset	0x0000 00DC		
Physical Address	0x4C00 00DC	**Instance**	EMIF1
Description	Read/write leveling control register		
Type	RW		

31	30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
RDWRLVLFULL_START	RDWRLVLINC_PRE	RDLVLINC_INT	RDLVLGATEINC_INT	WRLVLINC_INT

Bits	Field Name	Description	Type	Reset
31	RDWRLVLFULL_START	Full leveling trigger. Writing a 1 to this field triggers full read and write leveling. This bit will self clear to 0.	RW	0
30:24	RDWRLVLINC_PRE	Incremental leveling pre-scalar in number of refresh periods. The value programmed is minus one the required value. Refresh period is defined by REFRESH_RATE in EMIF_SDRAM_REFRESH_CONTROL register. **NOTE: Incremental leveling is not supported on this device.**	RW	0x00
23:16	RDLVLINC_INT	Incremental read data eye training interval. Number of RDWRLVLINC_PRE intervals between incremental read data eye training. A value of 0 will disable incremental read data eye training. **NOTE: Incremental leveling is not supported on this device.**	RW	0x00
15:8	RDLVLGATEINC_INT	Incremental read DQS gate training interval. Number of RDWRLVLINC_PRE intervals between incremental read DQS gate training. A value of 0 will disable incremental read DQS gate training. **NOTE: Incremental leveling is not supported on this device.**	RW	0x00

Bits	Field Name	Description	Type	Reset
7:0	WRLVLINC_INT	Incremental write leveling interval. Number of RDWRLVLINC_PRE intervals between incremental write leveling. A value of 0 will disable incremental write leveling. **NOTE: Incremental leveling is not supported on this device.**	RW	0x00

Table 15-136. EMIF_DDR_PHY_CONTROL_1

Address Offset	0x0000 00E4		
Physical Address	0x4C00 00E4	**Instance**	EMIF1
Description	PHY control register 1		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				RDLVL_MASK	RDLVLGATE_MASK	WRLVL_MASK	RESERVED			PHY_HALF_DELAYS	PHY_CLK_STALL_LEVEL	PHY_DIS_CALIB_RST	PHY_INVERT_CLKOUT	PHY_DLL_LOCK_DIFF								PHY_FAST_DLL_LOCK	RESERVED				READ_LATENCY						

Bits	Field Name	Description	Type	Reset
31:28	RESERVED	Reserved	RW	0x0
27	RDLVL_MASK	Writing a 1 to this field will mask read data eye training during full leveling command, plus drives reg_phy_use_rd_data_eye_level control low to allow user to use programmed ratio values.	RW	0
26	RDLVLGATE_MASK	Writing a 1 to this field will mask dqs gate training during full leveling command, plus drives reg_phy_use_rd_dqs_level control low to allow user to use programmed ratio values.	RW	0
25	WRLVL_MASK	Writing a 1 to this field will mask write leveling training during full leveling command, plus drives reg_phy_use_wr_level control low to allow user to use programmed ratio values.	RW	0
24:22	RESERVED	Reserved	RW	0x0
21	PHY_HALF_DELAYS	Adjust slave delay line delays to support 2× mode 1: 2× mode (MDLL clock is half the rate of PHY) 0: 1× mode (MDLL clock rate is same as PHY)	RW	0
20	PHY_CLK_STALL_LEVEL	Enable variable idle value for delay lines. Enable during normal operations to avoid differential aging in the delay lines.	RW	0
19	PHY_DIS_CALIB_RST	Disable the dll_calib (internally generated) signal from resetting the Read Capture FIFO pointers and portions of data PHYs. Debug only. Note: dll_calib is generated by 1. EMIF_MISC_REG[0] DLL_CALIB_OS set to 1,or 2. by the PHY when it detects that the clock frequency variation has exceeded the bounds set by PHY_DLL_LOCK_DIFF or 3. periodically throughout the leveling process.	RW	0
18	PHY_INVERT_CLKOUT	Inverts the polarity of DRAM clock. 0: core clock is passed on to DRAM 1: inverted core clock is passed on to DRAM	RW	0

Bits	Field Name	Description	Type	Reset
17:10	PHY_DLL_LOCK_DIFF	The maximum number of delay line taps variation while maintaining the master DLL lock. When the PHY is in locked state and the variation on the clock exceeds the variation indicated by this field, the lock signal is de-asserted and a dll_calib signal is generated. To prevent the dll_calib signal from being asserted in the middle of traffic when the clock jitter exceeds the variation, this register needs to be set to a value which will ensure that the lock will not be lost. Recommended value is 16.	RW	0x02
9	PHY_FAST_DLL_LOCK	Controls master DLL to lock fast or average logic must be part of locking process. Set to 1 before OPP transition commences, and set back to 0 after OPP transition completes. 1: MDLL lock is asserted based on single sample 0: MDLL lock is asserted based on average of 16 samples.	RW	0
8:5	RESERVED	Reserved	RW	0x00
4:0	READ_LATENCY	This field defines the read latency for the read data from SDRAM in number of DDR clock cycles. This field is used by the EMIF as well as the PHY. READ_LATENCY = RL + reg_phy_rdc_we_to_re -1. EMIF uses above equation to calculate reg_phy_rdc_we_to_re and forward it to the PHY. For DDR3, the true RL is used, not the decoded value. See JEDEC spec.	RW	0x01E

Bits	Field Name	Description	Type	Reset
31:24	REG_1B_ECC_ERR_THRSH	1-bit ECC error threshold. The EMIF will generate an interrupt when the 1-bit ECC error count is greater than or equal to this threshold. A value of 0 will disable the generation of the interrupt.	RW	0x0
23:16	RESERVED		R	0x0

Bits	Field Name	Description	Type	Reset
15:0	REG_1B_ECC_ERR_WIN	1-bit ECC error window in number of refresh periods. The EMIF will generate an interrupt when the 1-bit ECC error count is equal to or greater than the threshold within this window. A value of 0 will disable the window. Refresh period is defined by EMIF_SDRAM_REFRESH_CONTROL[15:0] REFRESH_RATE. The software can set this bitfield to 0x0 to reset the internal counter.	RW	0x0

Table 15-149. EMIF_1B_ECC_ERR_DIST_1

Address offset	0x138		
Physical Address	0x4C00 0138	**Instance**	EMIF1
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_1B_ECC_ERR_DIST_1																															

Bits	Field Name	Description	Type	Reset
31:0	REG_1B_ECC_ERR_DIST_1	1-bit ECC error distribution over data bus bit 31:0. A value of 1 on a bit indicates 1-bit error on the corresponding bit on the data bus. Writing a 1 to any bit will clear that bit. Writing a 0 has no effect.	RW	0x0

Table 15-150. EMIF_1B_ECC_ERR_ADDR_LOG

Address offset	0x13C		
Physical Address	0x4C00 013C	**Instance**	EMIF1

REG_1B_ECC_ERR_ADDR																															

Bits	Field Name	Description	Type	Reset
31:0	REG_1B_ECC_ERR_ADDR	1-bit ECC error address. Most significant bits of the starting address(es) related to the SDRAM reads that had a 1-bit ECC error. This field displays up to four addresses logged in the 4 deep address logging FIFO. Writing a 0x1 will pop one element of the FIFO. Writing a 0x2 will pop all elements of the FIFO. Writing any other alue will have no effect.	RW	0x0

Table 15-151. EMIF_2B_ECC_ERR_ADDR_LOG

Address offset	0x140

Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0x0
30:24	REG_PHY_DQ_OFFSET_HI	The user programmable offset ratio value from write DQS to write DQ. This value is used for the write DQ slave DLL in PHY ECC data macro. The ratio represents the fraction of a clock cycle in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 (in addition to the write DQS delay) to get the delay value for the slave delay line.	RW	0x0
23:17	RESERVED		R	0x0
16	REG_PHY_GATELVL_INIT_MODE	The user programmable init ratio selection mode. Recommended value is 0x1.	RW	0x1
15:13	RESERVED		R	0x0
12	REG_PHY_USE_RANK0_DELAYS	Delay selection. Chip select 0 delay line ratios are used for all chip selects when set to 1. Each chip select uses its own delays when set to 0.	RW	0x0
11:9	RESERVED		R	0x0
8:0	REG_PHY_WR_DATA_SLAVE_DELAY	The user programmable write DQ delay value used when DLL_OVERRIDE = 1.	RW	0x80

15.4 General-Purpose Memory Controller

This section describes the features and functions of the device GPMC controller.

15.4.1 GPMC Overview

The general-purpose memory controller (GPMC) is a unified memory controller dedicated for interfacing with external memory devices like:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in nonmultiplexed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

Figure 15-52 shows the GPMC module overview.

The GPMC features are introduced in Section 15.1.4, *GPMC Overview* of Section 15.1, *Memory Subsystem Overview*.

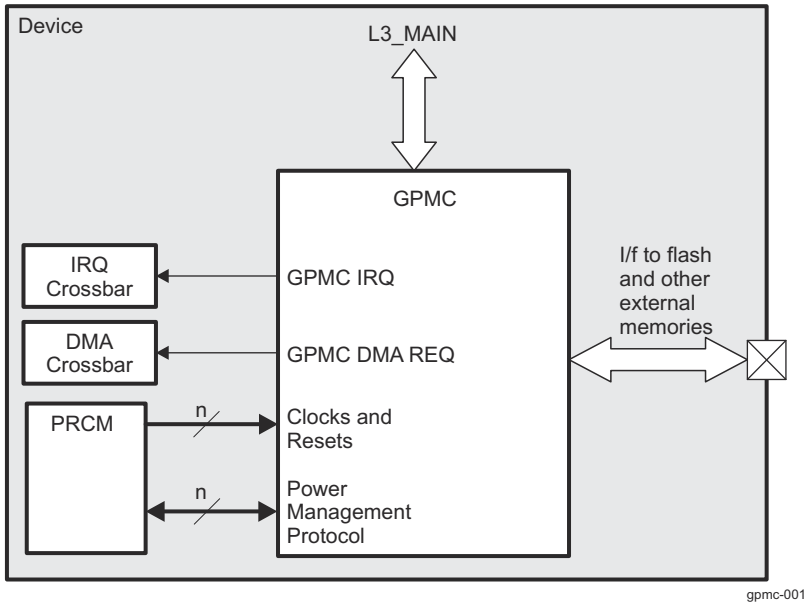

Figure 15-52. GPMC Overview

15.4.2 GPMC Environment

This section describes the GPMC application fields from an environment point of view (external connections). It describes GPMC connectivity options, and gives three possible interfaces.

15.4.2.1 GPMC Modes

This section shows three GPMC external connections options:

- Figure 15-53 shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol uses fewer address pins) external memory device.
- Figure 15-54 shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device.
- Figure 15-55 shows a connection between the GPMC and an 8-bit synchronous non-multiplexed external memory device.
- Figure 15-56 shows a connection between the GPMC and a 8-bit NAND device.

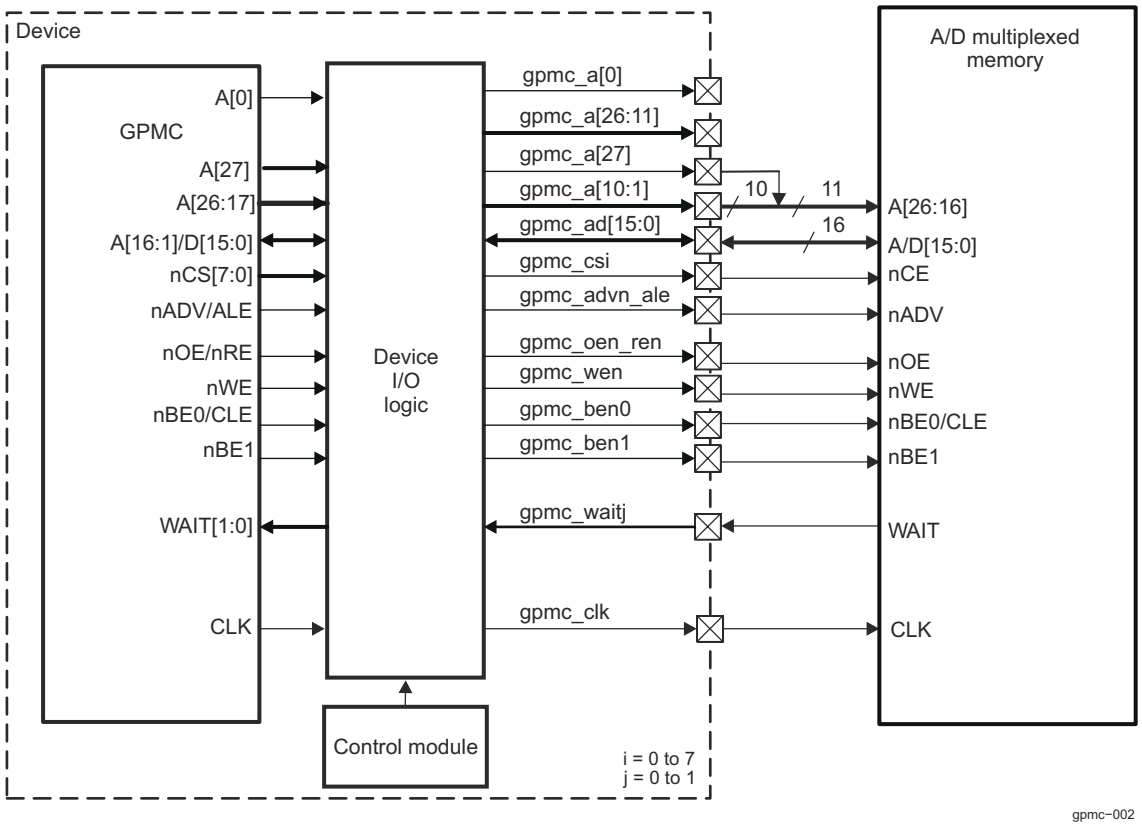

Figure 15-53. GPMC to 16-Bit Address/Data-Multiplexed Memory

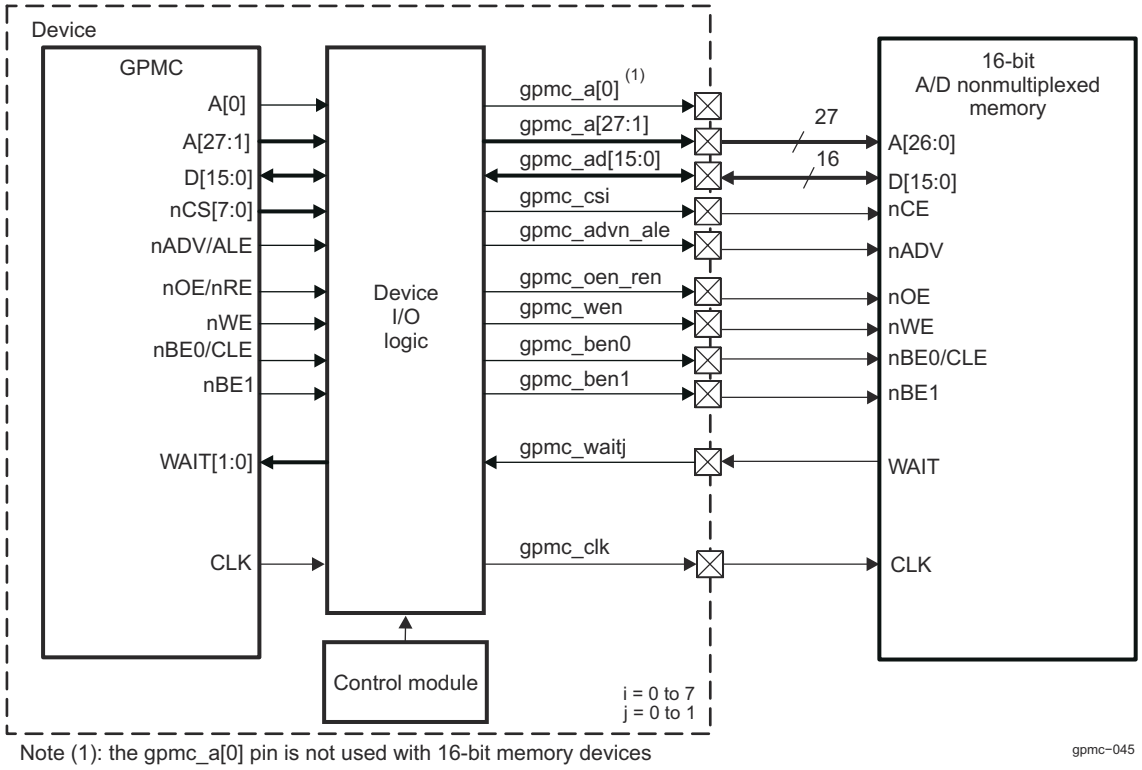

Note (1): the gpmc_a[0] pin is not used with 16-bit memory devices

Figure 15-54. GPMC to 16-Bit Nonmultiplexed Memory

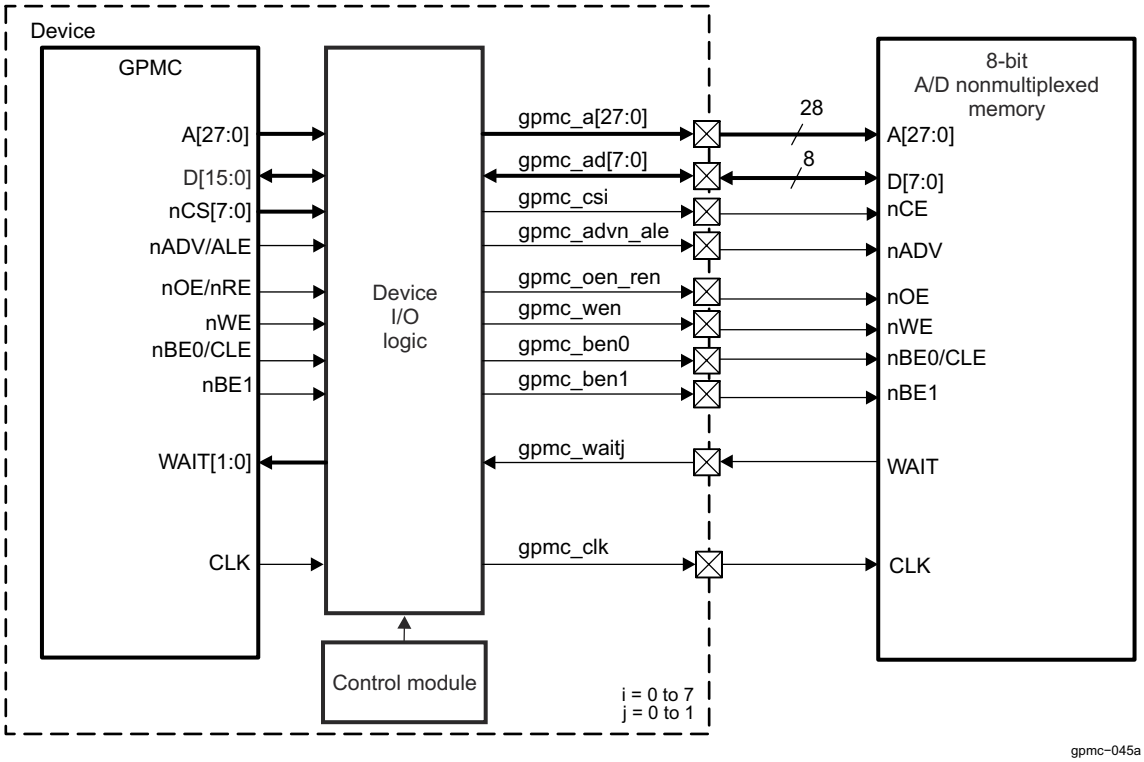

Figure 15-55. GPMC to 8-Bit Nonmultiplexed Memory

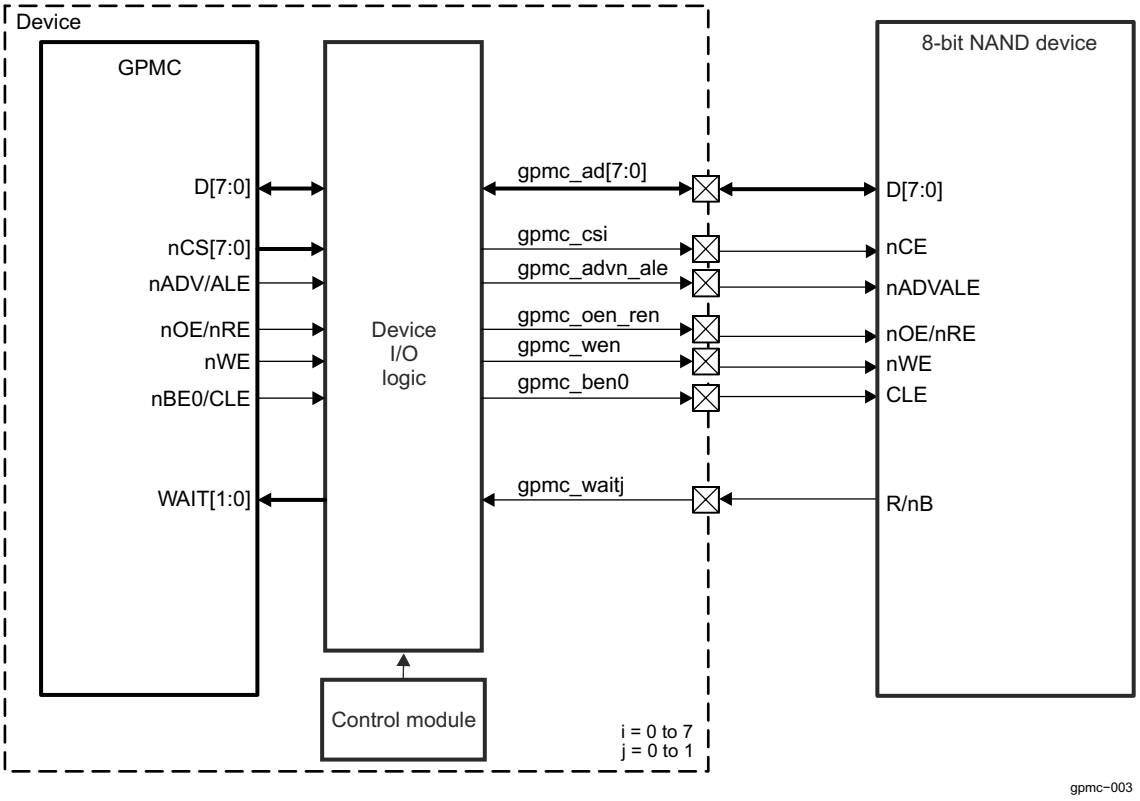

Figure 15-56. GPMC to 8-Bit NAND Device

15.4.2.2 GPMC Signals

Table 15-252 lists the GPMC subsystem input/output (I/O) pins.

Table 15-252. GPMC I/O Description

Pin Name	Device Signal	I/O(1)	Description
A[27:0]	gpmc_a[27:0]	O	28-bit output address bus
A[16:1]/D[15:0]	gpmc_ad[15:0]	I/O	Multiplexed address/data
nCS[7:0]	gpmc_cs[7:0]	O	Chip-selects (active low)
CLK	gpmc_clk	O	Clock generated for the external memory or device
nADV/ALE	gpmc_advn_ale	O	Address valid (active low). Also used as address latch enable (active high) for NAND protocol memories.
nOE/nRE	gpmc_oen_ren	O	Output enable (active low). Also used as read enable (active low) for NAND protocol memories.
nWE	gpmc_wen	O	Write enable (active low)
nBE0/CLE	gpmc_ben0	O	Lower-byte enable (active low). Also used as command latch enable for NAND protocol memories.
nBE1	gpmc_ben1	O	Upper-byte enable (active low).
WAIT[1:0]	gpmc_wait[1:0]	I	External wait signal for NOR and NAND protocol memories. The wait signals can be mapped on any of the chip-select.

(1) I = Input; O = Output

Note

For the gpmc_clk signal to work properly, the INPUTENABLE bit of the appropriate CTRL_CORE_PAD_x register should be set to 0x1 because of retiming purposes.

Note

On SR2.x devices the internal PU/PD resistors on pads gpmc_a[27:24, 22:19] can be permanently disabled. For more information, see *Permanent PU/PD disabling (SR 2.x only)* in *Control Module*.

Table 15-253 shows the use of address and data GPMC controller pins based on the type of external device.

(1) Used to effectively address 8-bit (only) non-multiplexed memories

With all device types, the GPMC does not drive unnecessary address lines. They stay at their reset value of 0x00.

Address mapping supports address/data-multiplexed 16-bit-wide devices:

- The NOR flash memory controller still supports nonmultiplexed address and data memory devices.
- Multiplexing mode can be selected through the GPMC_CONFIG1_i[9:8] MUXADDDATA bit field (where i = 0 to 7).
- Asynchronous page mode is not supported for multiplexed address and data devices.

15.4.3 GPMC Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- No master standby protocol
- Supports slave idle protocol with device PRCM
- Supports Auto Idle
- No wake-up request
- One direct memory access request mapped via the device DMA crossbar (DMA_CROSSBAR) to all device integrated DMA controllers
- One interrupt request mapped via the device interrupt crossbar (IRQ_CROSSBAR) to all device integrated interrupt controllers (MPU_INTC, etc.)
- One clock for functional and interface domains

Figure 15-57 shows GPMC integration.

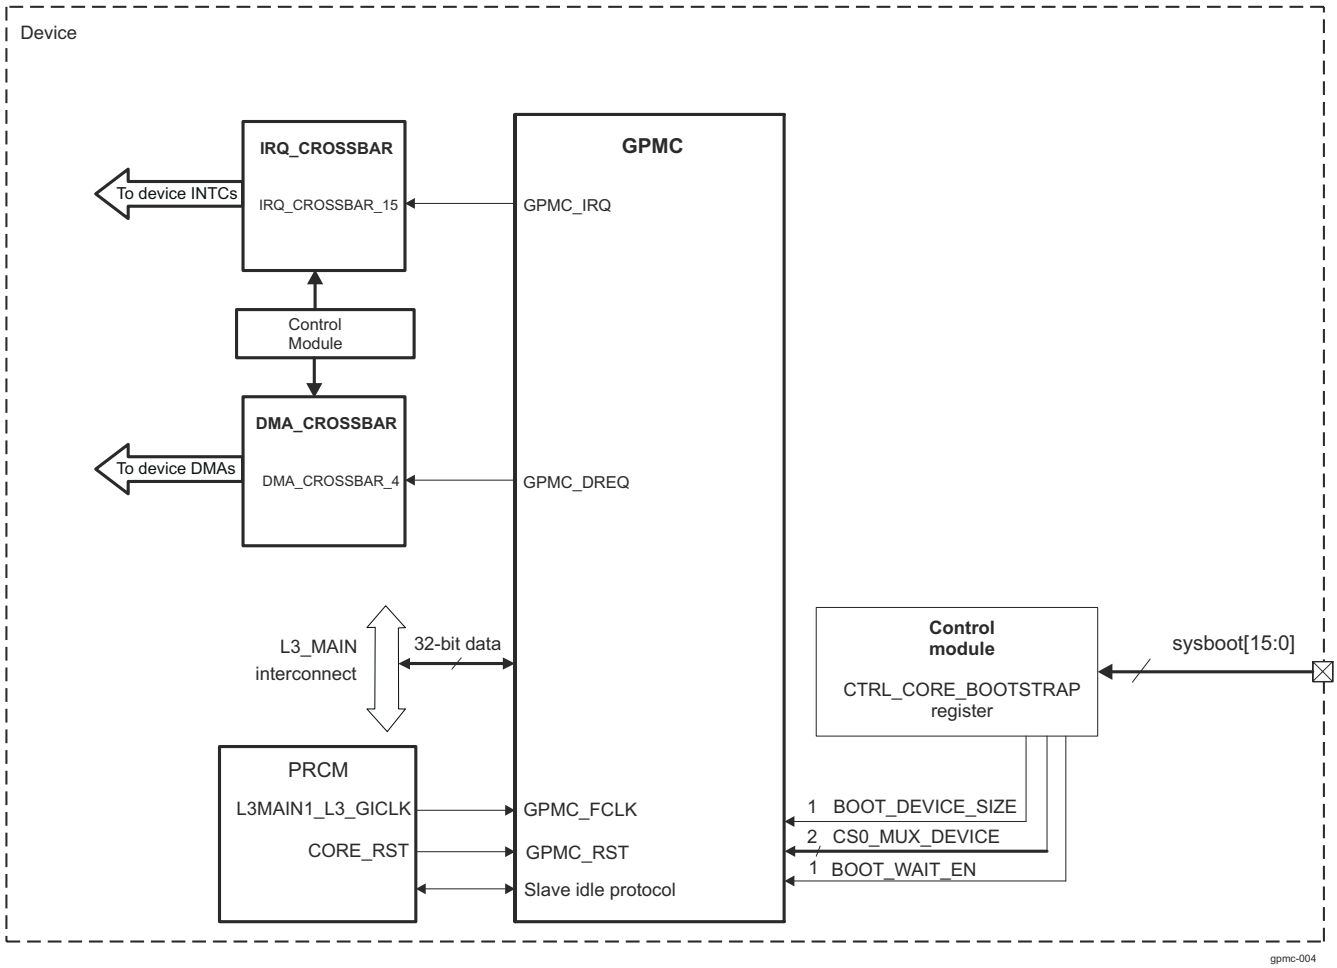

Figure 15-57. GPMC Integration

Table 15-254, Table 15-255 and Table 15-256 summarize the integration of the module in the device.

Table 15-254. GPMC Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
GPMC	PD_COREAON	No	L3_MAIN

Note

- For the description of the operation performance point (OPP) configuration, see *Module Level Clock Management*, in *Power, Reset, and Clock Management*.
- For information about frequencies associated with each OPP, see the device data manual.

Table 15-255. GPMC Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
GPMC	GPMC_FCLK	L3MAIN1_L3_GICLK	PRCM	Functional clock
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**

Note

For the clock description, see Section 15.4.4.2, *GPMC Clock Configuration*.

Table 15-256. GPMC Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
GPMC	GPMC_IRQ	IRQ_CROSSBAR_15	MPU_IRQ_20 DSP1_IRQ_46 PRUSS1_IRQ_46 PRUSS2_IRQ_46	GPMC interrupt
DMA Requests				
Module Instance	**Source Signal Name**	**Destination DMA_CROSSBAR Input**	**Default Mapping**	**Description**
GPMC	GPMC_DREQ	DMA_CROSSBAR_4	DMA_EDMA_DREQ_3 DMA_SYSTEM_DREQ_3	DMA request from GPMC prefetch engine.

Note

The "**Default Mapping**" column in Table 15-256 *GPMC Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see *IRQ_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.
For more information about the device DMA_SYSTEM module, see Section 16.1, *System DMA*.
For more information about the device EDMA module, see Section 16.2, *Enhanced DMA*.

Note

For the description of the interrupt source, see Section 15.4.4.5, *GPMC Interrupt Requests*.

15.4.4 GPMC Functional Description

The GPMC basic programming model offers maximum flexibility to support various access protocols for each of the eight configurable chip-selects. Use optimal chip-select settings, based on the characteristics of the external device:

- Different protocols can be selected to support generic asynchronous or synchronous random-access devices (NOR flash, SRAM) or to support specific NAND devices.
- The address and data bus can be multiplexed on the same external bus.
- Read and write access can be independently defined as asynchronous or synchronous.
- System requests (byte, 16-bit word, burst) are performed through single or multiple accesses. External access profiles (single, multiple with optimized burst length, native- or emulated-wrap) are based on external device characteristics (supported protocol, bus width, data buffer size, native-wrap support).
- System burst read or write requests are synchronous-burst (multiple-read or multiple-write). When neither burst nor page mode is supported by external memory or ASIC devices, system burst read or write requests are translated to successive single synchronous or asynchronous accesses (single reads or single writes). 8-bit wide devices are supported only in single synchronous or single asynchronous read or write mode.
- To simulate a programmable internal-wait-state, an external wait pin can be monitored to dynamically control external access at the beginning (initial access time) of and during a burst access.

Each control signal is controlled independently for each chip-select. The internal functional clock of the GPMC (GPMC_FCLK) is used as a time reference to specify the following:

- Read- and write-access duration
- Most GPMC external interface control-signal assertion and deassertion times
- Data-capture time during read access
- External wait-pin monitoring time
- Duration of idle time between accesses, when required

15.4.4.1 GPMC Block Diagram

Figure 15-58 shows the GPMC functional block diagram. The GPMC consists of six blocks:

- L3 interconnect port interface
- Address decoder, GPMC configuration, and chip-select configuration register file
- Access engine
- Prefetch and write-posting engine
- Error correction code engine (ECC)
- External device/memory port interface

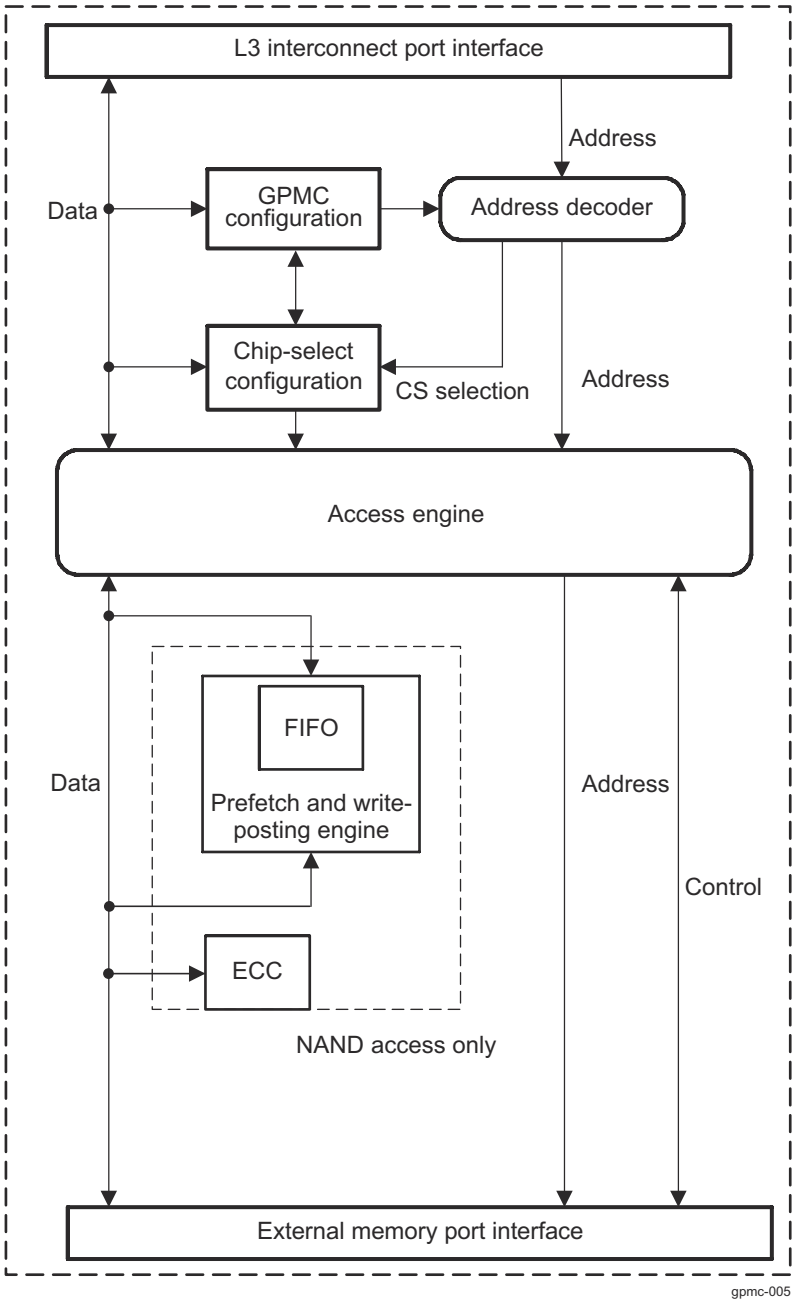

Figure 15-58. GPMC Block Diagram

The GPMC can access various external devices. The flexible programming model allows a wide range of attached device types and access schemes.

Based on the programmed configuration bit fields stored in the GPMC registers, the GPMC can generate the timing of all control signals depending on the attached device and access type.

Given the chip-select decoding and its associated configuration registers, the GPMC selects the appropriate control signal timing for the device type.

15.4.4.2 GPMC Clock Configuration

Table 15-257 describes the GPMC clocks.

Table 15-257. GPMC Clocks

Signal	I/O(1)	Description
GPMC_FCLK	I	Functional and interface clock
gpmc_clk	O	External clock provided to synchronous external memory devices

(1) I = Input; O = Output

The gpmc_clk is generated by the GPMC from the internal GPMC_FCLK clock. The source of the GPMC_FCLK is described in Table 15-255. The gpmc_clk is configured using the GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER bit field (where i = 0 to 7), as shown in Table 15-258.

Table 15-258. gpmc_clk Configuration

Source Clock	GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER	gpmc_clk Generated Clock Provided to External Memory Device
GPMC_FCLK	00	GPMC_FCLK
	01	GPMC_FCLK/2
	10	GPMC_FCLK/3
	11	GPMC_FCLK/4

15.4.4.3 GPMC Software Reset

The GPMC can be reset by software through the GPMC_SYSCONFIG[1] SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Hardware and software resets initialize all GPMC registers and the finite state-machine (FSM) immediately and unconditionally. The GPMC_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1. Software must ensure that the software reset completes before performing GPMC operations.

15.4.4.4 GPMC Power Management

GPMC power is supplied by the CORE power domain, and GPMC power management complies with system power-management guidelines.

Table 15-259 describes the power-management features available for the GPMC module.

Note

- For information about source clock gating and sleep/wake-up transitions, see *Clock Management*, in *Power, Reset, and Clock Management*.
- For descriptions of the EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see *Clock Management Functional Description*, in *Power, Reset, and Clock Management*.

Table 15-259. GPMC Local Power-Management Features

Feature	Registers	Description
Clock autogating	GPMC_SYSCONFIG[0] AUTOIDLE	This bit allows a local power optimization inside the module, by gating the GPMC_FCLK clock upon the internal activity.
Slave idle modes	GPMC_SYSCONFIG[4:3] SIDLEMODE	Force-idle, no-idle and smart-idle wake-up modes are available.
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	N/A	Feature not available

15.4.4.5 GPMC Interrupt Requests

The GPMC generates one interrupt request (see Figure 15-57).

Table 15-260 lists the event flags, and their mask, that can cause module interrupts.

Table 15-260. GPMC Interrupt Events

Event Flag	Event Mask	Sensitivity	Description
GPMC_IRQSTATUS[9] WAIT1EDGE DETECTIONSTATUS	GPMC_IRQENABLE[9] WAIT1EDGE DETECTIONENABLE	Edge	Wait1 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait1 signal. The rising or falling edge detection of Wait1 is selected through the GPMC_CONFIG[9] WAIT1PINPOLARITY bit.
GPMC_IRQSTATUS[8] WAIT0EDGE DETECTIONSTATUS	GPMC_IRQENABLE[8] WAIT0EDGE DETECTIONENABLE	Edge	Wait0 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait0 signal. The rising or falling edge detection of Wait0 is selected through the GPMC_CONFIG[8] WAIT0PINPOLARITY bit.
GPMC_IRQSTATUS[1] TERMINAL COUNTSTATUS	GPMC_IRQENABLE[1] TERMINAL COUNTENABLE	Level	Terminal count event: Triggered on prefetch process completion; that is, when the number of currently remaining data to be requested reaches 0
GPMC_IRQSTATUS[0] FIFOEVENTSTATUS	GPMC_IRQENABLE[0] FIFOEVENTENABLE	Level	FIFO event interrupt: Indicates available FIFO levels for write-posting mode and prefetch mode. GPMC_PREFETCH_CONFIG1[2] DMAMODE must be set to 0.

15.4.4.6 L3 Interconnect Interface

The GPMC L3 interconnect interface is a pipelined interface including a 16 × 32-bit word write buffer.

Any system host can issue external access requests through the GPMC.

The device system can issue the following requests through this interface:

- One 8-, 16-, or 32-bit interconnect access (read/write)
- Two incrementing 32-bit interconnect accesses (read/write)
- Two wrapped 32-bit interconnect accesses (read/write)
- Four incrementing 32-bit interconnect accesses (read/write)
- Four wrapped 32-bit interconnect accesses (read/write)
- Eight incrementing 32-bit interconnect accesses (read/write)
- Eight wrapped 32-bit interconnect accesses (read/write)

Only linear burst transactions are supported; interleaved burst transactions are not supported. Only power-of-two-length precise bursts 2 × 32, 4 × 32, 8 × 32, and 16 × 32, with the burst base address aligned on the total burst size, are supported (this limitation applies to incrementing bursts only).

This interface also provides one interrupt and one DMA request line for specific event control.

It is recommended to program the GPMC_CONFIG1_i[24:23] ATTACHEDDEVICEPAGELENGTH bit field according to the page length of the effective attached device and to enable the GPMC_CONFIG1_i[31] WRAPBURST bit if the attached device supports wrapping burst.

It is possible, however, to emulate wrapping burst on a nonwrapping memory by providing relevant addresses within the page or by splitting transactions. Bursts larger than the memory page length are chopped into multiple burst transactions. Because of the alignment requirements, a page boundary is never crossed.

15.4.4.7 GPMC Address and Data Bus

The current application supports GPMC connection to NAND devices and to address/data-multiplexed memories or devices. Connection to address/data-nonmultiplexed memories or devices is supported with an address range up to 256 MB (that is, 28 address bits in 8-bit mode or 27 address bits in 16-bit mode).

Depending on the GPMC configuration of each chip-select, address and data bus lines that are not required for a particular access protocol are not updated (changed from current value) and are not sampled when input (input data bus).

- For address/data-multiplexed and AAD-multiplexed NOR devices, the address is multiplexed on the data bus.
- 8-bit-wide NOR devices do not use GPMC I/O: gpmc_ad[15:8] for data (they are used for address if needed).

- 16-bit-wide NAND devices do not use GPMC I/O: gpmc_a[27:0].
- 8-bit-wide NAND devices do not use GPMC I/O: gpmc_a[27:0] and GPMC I/O: gpmc_ad[15:8].

15.4.4.7.1 GPMC I/O Configuration Setting

Note

In this section and the following sections, the i in GPMC_CONFIGx_i stands for the GPMC chip-select i, where i = 0 to 7.

To select a NAND device, program the following register fields:

- GPMC_CONFIG1_i[11:10] DEVICETYPE = 0b10
- GPMC_CONFIG1_i[9:8] MUXADDDATA = 0b00

To select an address/data-multiplexed device, program the following register fields:

- GPMC_CONFIG1_i[11:10] DEVICETYPE = 0b00
- GPMC_CONFIG1_i[9:8] MUXADDDATA = 0b10

To select an address/address/data-multiplexed device, program the following register fields:

- GPMC_CONFIG1_i[11:10] DEVICETYPE = 0b00
- GPMC_CONFIG1_i[9:8] MUXADDDATA = 0b01

To select an address/data-nonmultiplexed device, program the following register fields:

- GPMC_CONFIG1_i[11:10] DEVICETYPE = 0b00
- GPMC_CONFIG1_i[9:8] MUXADDDATA = 0b00

15.4.4.7.2 GPMC CS0 Default Configuration at Device Reset

To ensure a correct, fast external boot (see *Fast External Booting*, in *Initialization*) with a GPMC access on device reset, several pins are sampled:

- The "sysboot0" through "sysboot5" pins (device boundary) define the sequence of interfaces and devices to use for booting (i.e. SYSBOOT[5:0] vector). They are sampled by the control module at reset and used later by the device ROM code. For more information, see *Sysboot Configuration*, in *Initialization*.
- Additional pins are used to configure reset values in the GPMC_CONFIG1_i register (where i = 0) as explained in the following and in Table 15-261:
  - The *bootdevicesize* input pin (at the GPMC boundary) defines the size of the attached device on chip-select 0 (CS0) and is used to configure the GPMC_CONFIG1_i[13:12] DEVICESIZE bit field (where i = 0). The BOOT_DEVICE_SIZE signal is propagated from the device Control Module. Its value 0b0 (8-bit memories) or 0b1 (16-bit memories) can be externally determined upon booting by **user hardware** via the device external input signal - "sysboot13".
  - The *cs0muxdevice* input pin (at the GPMC boundary) selects whether or not the device attached to CS0 is an address/data-multiplexed device. The input pin is used to configure the GPMC_CONFIG1_i[9:8] MUXADDDATA bit field (where i = 0). The CS0_MUX_DEVICE[1:0] signal is propagated from the Control Module. Its value 0x0 **(non-muxed memory attached)** or 0x2 **(Addr-Data Mux memory attached)** can be externally determined upon booting by **user hardware** via combining the device external input signals - "sysboot12" and "sysboot11", i.e. SYSBOOT[12:11].
  - The *bootwaiten* input pin (at the GPMC boundary) enables the monitoring on CS0 of the wait pin at device reset release time for read accesses. The input pin is used to configure the GPMC_CONFIG1_i[22] WAITREADMONITORING bit (where i = 0). The BOOT_WAIT_EN signal is propagated from the Control Module. Its value 0x0 **(wait pin is not monitored for read accesses)** or 0x1 **(wait pin is monitored for read accesses)** can be externally determined upon booting by **user hardware** via the device external input signal - "sysboot10".

Note

If WAIT pin monitoring function is enabled upon booting (i.e. BOOT_WAIT_EN="1"), the default (power-on-reset) monitored input for CS0 is always the device gpmc_wait0 input.

Table 15-261. Boot Control Interface Input Signals Description

Signal Name	Width	Description
BOOT_DEVICE_SIZE	1	Size of the device attached on CS0 0b00: 8-bit 0b01: 16-bit 0b10: Reserved (not used) 0b11: Reserved (not used)
CS0_MUX_DEVICE	2	Multiplexing mode of the device on CS0 0b00: Nonmultiplexed device on CS0 0b01: AAD-multiplexed device on CS0 (address-address-data) 0b10: Address/data-multiplexed device on CS0 0b11: Reserved
BOOT_WAIT_EN	1	Wait monitoring on CS0 at device reset release time for read accesses 0: Wait pin is not monitored 1: Wait pin is monitored

CAUTION

Using the internal boot code, the entire CS0 configuration can be modified before the first CS0 access. For more information, see *Memory Booting*, and *Image Format*, in *Initialization*. This modification of internal boot code is necessary for two external devices:

- NAND device attached to CS0
- Nonmultiplexed memory device attached to CS0

At reset time, the device can boot from the internal ROM.

The reset values of the timing control parameters are defined to cope with direct boot on address and data-multiplexed NOR flash devices, nonmultiplexed NOR flash devices, or any asynchronous device with large timing margins, assuming a low GPMC_FCLK frequency (for example, 19.2 MHz) at boot time.

For a multiplexed access, the address 16 low-order bits are presented onto gpmc_ad[15:0], while the high-order bits are presented onto gpmc_a[26:16]. If the external chip interface to the memories uses a 16-bit data bus, the high-order address bits are sampled on the address bus.

The reset values of timing parameters used at boot time are:

- CSONTIME = 1
- CSRDOFFTIME = 16
- ADVONTIME = 4
- ADVRDOFFTIME = 5
- OEONTIME = 6
- OEOFFTIME = 16
- RDACCESSTIME = 15
- RDCYCLETIME = 17

For an AAD-multiplexed access, all address bits are passed onto the data bus using two nADV rising edges. The first rising edge latches the address most-significant bit (MSB) down to bit 17, while the second rising edge latches address bits 16 down to 1. This configuration is only used for 16-bit memories.

The reset values of these timing parameters used at boot time are:

- ADVAADMUXONTIME = 1
- ADVAADMUXRDOFFTIME = 2

- OEAADMUXONTIME = 1
- OEAADMUXOFFTIME = 3

15.4.4.8 Address Decoder and Chip-Select Configuration

Addresses are decoded accordingly with the address request of the chip-select and the content of the chip-select base address register file, which includes a set of global GPMC configuration registers and eight sets of chip-select configuration registers.

The GPMC configuration register file is memory-mapped and can be read or written with byte, 16-bit word, or 32-bit word accesses. The register file must be configured as a noncacheable, nonbufferable region to prevent any desynchronization between host execution (write request) and the completion of register configuration (write completed with register updated). Section 15.4.7, *GPMC Register Manual*, provides the GPMC register locations. For the map of GPMC memory locations, see *Memory Mapping*.

After the chip-select is configured, the access engine accesses the external device, drives the external interface control signals, and applies the interface protocol based on user-defined timing parameters and settings.

15.4.4.8.1 Chip-Select Base Address and Region Size

Any external memory or ASIC device attached to the GPMC external interface can be accessed by any device system host within the GPMC 512-MiB address space. For more information, see *Memory Mapping*.

Note

Even though GPMC supports total address space of 1GB, only 512MB are physically available in this device.

The GPMC 512-MiB address space can be divided into a maximum of eight chip-select regions with programmable base address and programmable chip-select size. The chip-select size is programmable from 16 MiB to 256 MiB (must be a power-of-two) and is defined by the mask field. Attached memory smaller than the programmed chip-select region size is accessed through the entire chip-select region (aliasing).

Each chip-select has a 6-bit base address encoding and 4-bit decoding mask, which must be programmed according to the following rules:

- The programmed chip-select region base address must be aligned on the chip-select region size address boundary and is limited to a power-of-two address value. During access decoding, the value of the register base address is used to compare the address with the address bit line mapping, as shown in Figure 15-59 (with A0 as the device system byte-address line). The base address is programmed through the GPMC_CONFIG7_i[5:0] BASEADDRESS bit field.
- The register mask is used to exclude some address lines from the decoding. A register mask bit field set to 0 suppresses the associated address line from the address comparison (incoming address bit line is don't care). The value of the register mask must be limited to the subsequent value, based on the desired chip-select region size. Any other value has an undefined result. When multiple chip-select regions with overlapping addresses are enabled concurrently, access to these chip-select regions is cancelled and a GPMC access error is posted. The mask field is programmed through the GPMC_CONFIG7_i[11:8] MASKADDRESS bit field.

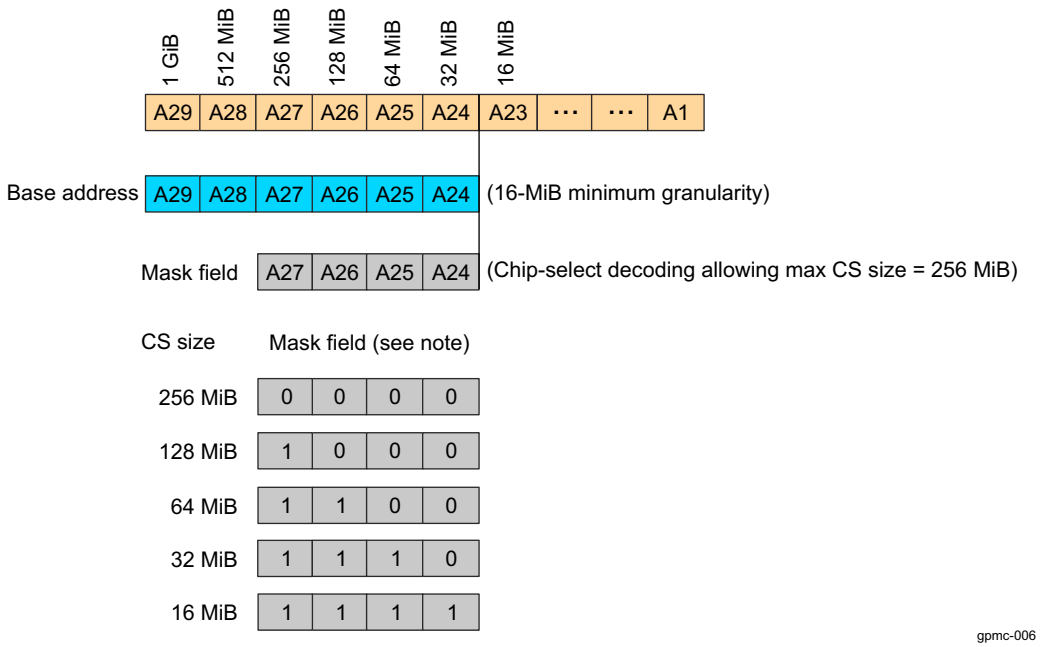

Figure 15-59. Chip-Select Address Mapping and Decoding Mask

Following is an example mapping that divides the 512MB memory reach into two 256MB regions:

- 1st 256MB region – 0x0000 0000 to 0x0FFF FFFF – program base address for that chip select equal to 0x0
- 2nd 256MB region – 0x1000 0000 to 0x1FFF FFFF – program base address for that chip select equal to 0x10

Chip-select configuration (base and mask address or any protocol and timing settings) must be performed while the associated chip-select is disabled through the GPMC_CONFIG7_i[6] CSVALID bit (where i stands for the GPMC chip-select value, 0 to 7). In addition, a chip-select configuration can be disabled only if there is no ongoing access to that chip-select. This requires monitoring the activity of the prefetch or write-posting engine if the engine is active on the chip-select. Also, the write buffer state must be monitored to wait for any posted write completion to the chip-select.

Any access attempted to a nonvalid GPMC address region (CSVALID disabled or address decoding outside a valid chip-select region) is not propagated to the external interface and a GPMC access error is posted. In case of overlapping chip-selects, an error is generated and no access occurs on either chip-select.

CS0 is the only chip-select region enabled after a power up or GPMC reset.

CAUTION

Although the GPMC interface can drive up to eight chip-selects, the frequency specified for this interface is for a specific load. If this load is exceeded, the maximum frequency cannot be reached. One solution is to implement a board with buffers to allow the slowest device to maintain the total load on the lines .

15.4.4.8.2 Access Protocol

15.4.4.8.2.1 Supported Devices

The access protocol of each chip-select can be independently specified through the GPMC_CONFIG1_i[11:10] DEVICETYPE parameter (where i = 0 to 7) for:

- Random-access synchronous or asynchronous memory, such as NOR flash and SRAM
- NAND flash asynchronous devices

Note

For more information about the NAND flash GPMC basic programming model and NAND support, see Section 15.4.4.12, *NAND Device Basic Programming Model*, and Section 15.4.4.12.1, *NAND Memory Device in Byte or Word16 Stream Mode*.

15.4.4.8.2.2 Access Size Adaptation and Device Width

Each chip-select can be independently configured through the GPMC_CONFIG1_i[13:12] DEVICESIZE bit field (where i = 0 to 7) to interface with a 16- or 8-bit-wide device. System requests with data width greater than the external device data bus width are split into successive accesses according to the external device data-bus width and little-endian data organization.

15.4.4.8.2.3 Address/Data-Multiplexing Interface

For random synchronous or asynchronous memory interfacing (DEVICETYPE = 0b00), an address- and data-multiplexing protocol can be selected through the GPMC_CONFIG1_i[9:8] MUXADDDATA bit field (where i = 0 to 7). The nADV signal must be used as the external device address latch control signal. For the associated chip-select configuration, nADV assertion and deassertion time and nOE assertion time must be set to the appropriate value to meet the address latch setup/hold time requirements of the external device. See Section 15.4.3, *GPMC Integration*.

Note

This address/data-multiplexing interface is not applicable to NAND device interfacing. NAND devices require a specific address, command, and data-multiplexing protocol. See Section 15.4.4.12, *NAND Device Basic Programming Model*.

15.4.4.8.3 External Signals

Note

The "DIR" (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

15.4.4.8.3.1 Wait Pin Monitoring Control

GPMC access time can be dynamically controlled using an external gpmc_wait pin when the external device access time is not deterministic and cannot be defined and controlled using only the GPMC internal RDACCESSTIME, WRACCESSTIME, and PAGEBURSTACCESSTIME wait-state generator.

The GPMC features two input wait pins: gpmc_wait1, and gpmc_wait0. These pins allow control of external devices with different wait pin polarity. They also allow the overlap of wait pin assertion from different devices without affecting access to devices for which the wait pin is not asserted.

- The GPMC_CONFIG1_i[17:16] WAITPINSELECT bit field (where i = 0 to 7) selects which input gpmc_wait pin is used for the device attached to the corresponding chip-select.
- The polarity of the wait pin is defined through the WAITxPINPOLARITY bit of the GPMC_CONFIG register. A wait pin configured to be active low means that low level on the WAIT signal indicates that the data is not ready and that the data bus is invalid. When a wait pin is inactive, data is valid.

The GPMC access engine can be configured per chip-select to monitor or not the wait pin of the external memory device, based on the access type: read or write.

- The GPMC_CONFIG1_i[22] WAITREADMONITORING bit defines whether or not the wait pin must be monitored during read accesses.
- The GPMC_CONFIG1_i[21] WAITWRITEMONITORING bit defines whether or not the wait pin must be monitored during write accesses.

The GPMC access engine can be configured to monitor the wait pin of the external memory device asynchronously or synchronously with the GPMC_CLK clock, depending on the access type: synchronous or asynchronous (the GPMC_CONFIG1_i[29] READTYPE and GPMC_CONFIG1_i[27] WRITETYPE bits).

15.4.4.8.3.1.1 Wait Monitoring During Asynchronous Read Access

When wait pin monitoring is enabled for read accesses (WAITREADMONITORING), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state.

During asynchronous read accesses with wait pin monitoring enabled, the wait pin must be at a valid level (asserted or deasserted) for at least two GPMC clock cycles before RDACCESSTIME completes, to ensure correct dynamic access-time control through wait pin monitoring. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

In this context, RDACCESSTIME is used as a wait invalid timing window and is set to such a value that the wait pin is at a valid state two GPMC clock cycles before RDACCESSTIME completes.

Similarly, during a multiple-access cycle (for example, asynchronous read page mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-deasserted state. Wait monitoring pipelining is also applicable to multiple accesses (access within a page).

- Wait monitored as active freezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, wait monitored as asserted extends the current access time in the page. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- Wait monitored as inactive unfreezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, wait monitored as inactive completes the current access time and starts the next access phase in the page. The data bus is considered valid, and data are captured during this clock cycle. In case of a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their related control timing value and according to the CYCLETIME counter status.

When a delay larger than two GPMC clocks must be observed between wait-pin deactivation time and data valid time (including the required GPMC and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data-capture time and the effective unlock of the CYCLETIME counter. This extra delay can be programmed in the GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME bit field (where i = 0 to 7).

Note

- The WAITMONITORINGTIME parameter does not delay the wait pin active or inactive detection, nor does it modify the two GPMC clocks pipelined detection delay.
- This extra delay is expressed as a number of GPMC_CLK clock cycles, even though the access is defined as asynchronous, and no GPMC_CLK clock is provided to the external device. Still, because GPMCFCLKDIVIDER is used as a divider for the GPMC clock, it must be programmed to define the correct WAITMONITORINGTIME delay.

Figure 15-60 shows wait behavior during an asynchronous single read access.

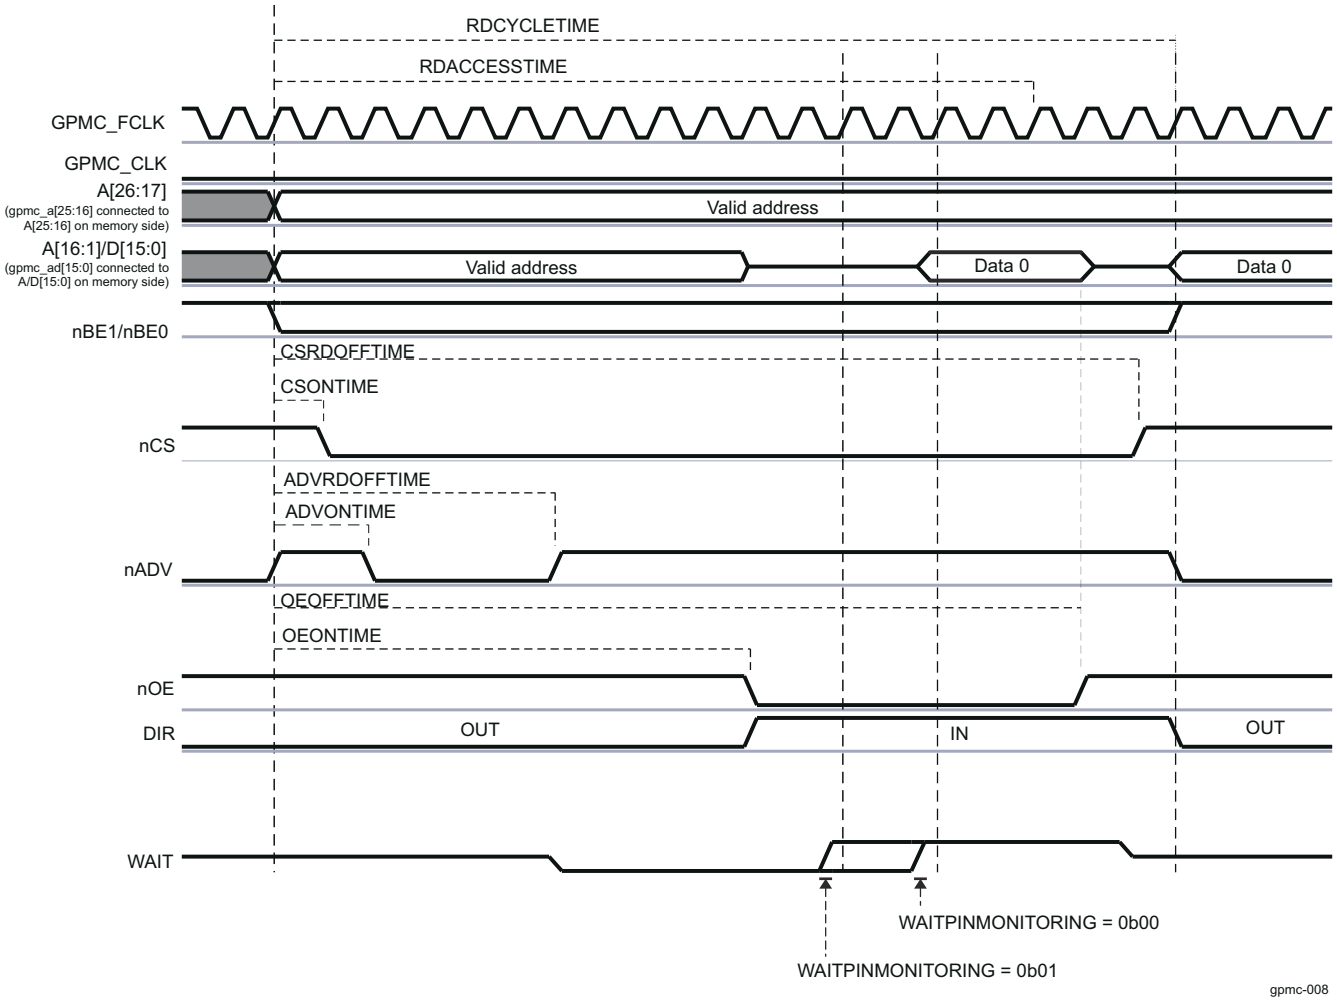

Figure 15-60. Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1)

Note

The WAIT signal is active low. GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME = 0b00, or 0b01.

15.4.4.8.3.1.2 Wait Monitoring During Asynchronous Write Access

When wait pin monitoring is enabled for write accesses (GPMC_CONFIG1_i[21] WAITWRITEMONITORING bit = 0x1), the wait invalid timing window is defined by the WRACCESSTIME field. WRACCESSTIME must be set so that the wait pin is at a valid state two GPMC clock cycles before WRACCESSTIME completes. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

- Wait monitored as active freezes the CYCLETIME counter. This informs the GPMC that the data bus is not captured by the external device. The control signals are kept in their current state. The data bus still drives the data.
- Wait monitored as inactive unfreezes the CYCLETIME counter. This informs that the data bus is correctly captured by the external device. All signals, including the data bus, are controlled according to their related control timing value and to the CYCLETIME counter status.

When a delay larger than two GPMC clock cycles must be observed between wait-pin deassertion time and the effective data write into the external device (including the required GPMC data setup time and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data write

time into the external device and the effective unfreezing of the CYCLETIME counter. This extra delay can be programmed in the GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME bit field (where i = 0 to 7).

Note

- The WAITMONITORINGTIME parameter does not delay the wait pin assertion or deassertion detection, nor does it modify the two GPMC clock cycles pipelined detection delay.
- This extra delay is expressed as a number of GPMC_CLK clock cycles, even though the access is defined as asynchronous, and even though no clock is provided to the external device. Still, because the GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER bit field is used as a divider for the GPMC clock, it must be programmed to define the correct WAITMONITORINGTIME delay.

15.4.4.8.3.1.3 Wait Monitoring During Synchronous Read Access

During synchronous accesses with wait pin monitoring enabled, the wait pin is captured synchronously with GPMC_CLK, using the rising edge of this clock.

The WAIT signal can be programmed to apply to the same clock cycle in which it is captured. Alternatively, it can be sampled one or two GPMC_CLK cycles ahead of the clock cycle to which it applies. This pipelining is applicable to the entire burst access and to all data phases in the burst access. This wait pipelining depth is programmed in the GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME bit field (where i = 0 to 7), and is expressed as a number of GPMC_CLK clock cycles.

In synchronous mode, when wait pin monitoring is enabled (the GPMC_CONFIG1_i[22] WAITREADMONITORING bit), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state detection.

Depending on the programmed value of WAITMONITORINGTIME, the wait pin must be at a valid level, either asserted or deasserted:

- In the same clock cycle the data is valid if WAITMONITORINGTIME = 0 (at RDACCESSTIME completion)
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC_FCLK clock cycles before RDACCESSTIME completion if WAITMONITORINGTIME is not equal to 0

Similarly, during a multiple-access cycle (burst mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the WAIT-INACTIVE state. The wait pipelining-depth programming applies to the whole burst access.

- Wait monitored as active freezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in a lock state), wait monitored as active extends the current access time in the burst. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- Wait monitored as inactive unfreezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in lock state), wait monitored as inactive completes the current access time and starts the next access phase in the burst. The data bus is considered valid, and data are captured during this clock cycle. In a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their relative control timing value and the CYCLETIME counter status.

Figure 15-61 shows wait behavior during a synchronous read burst access.

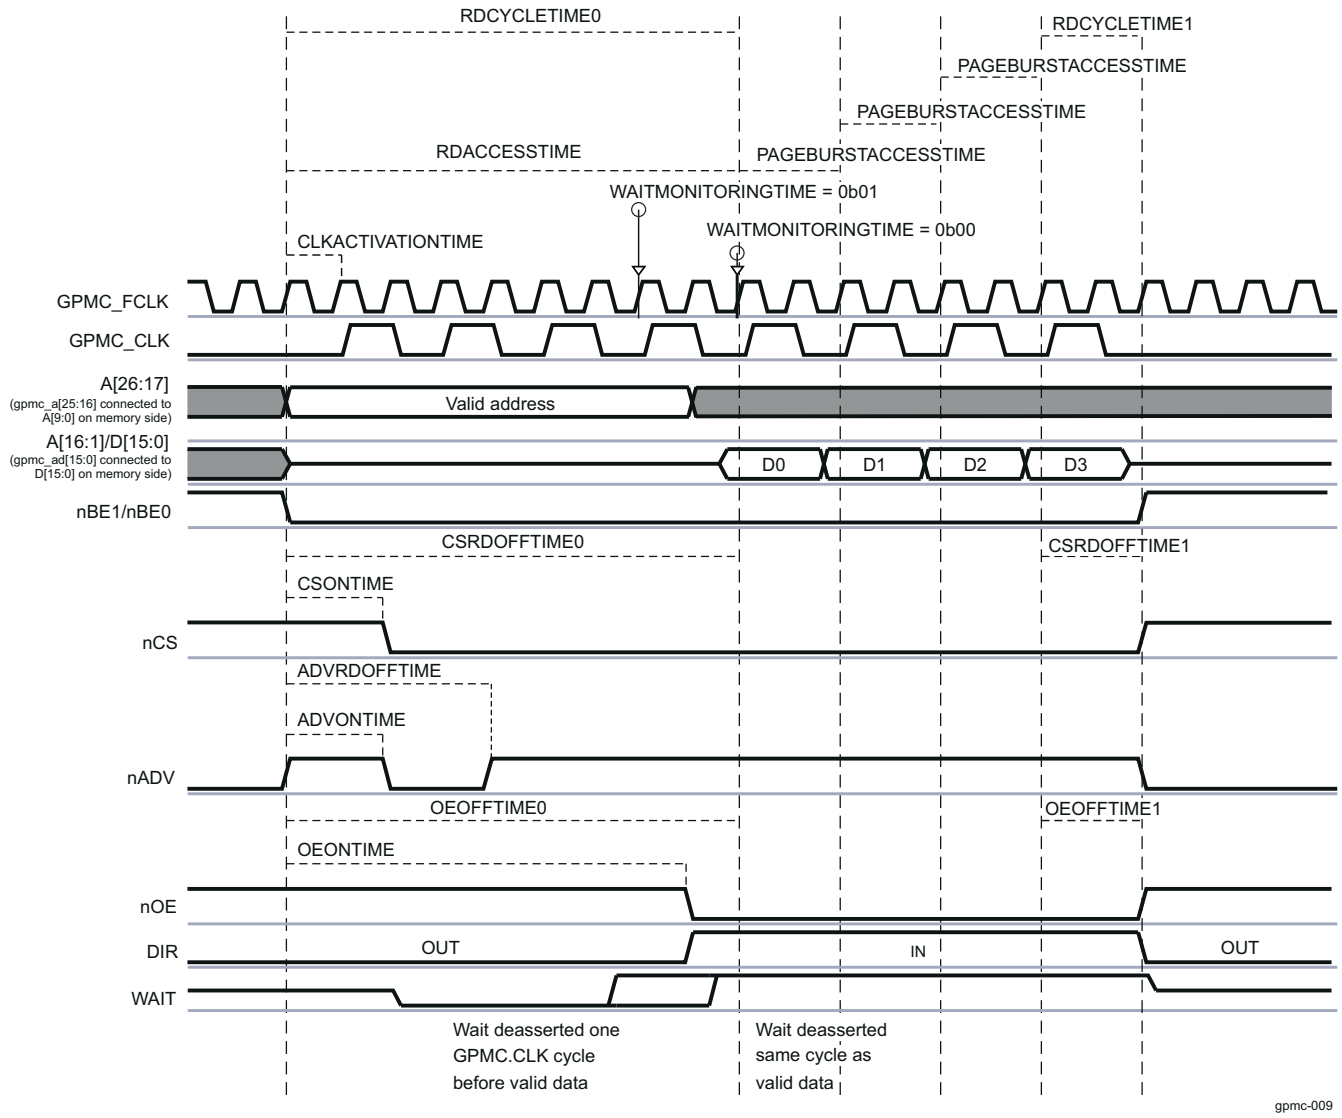

Figure 15-61. Wait Behavior During a Synchronous Read Burst Access

Note

The WAIT signal is active low. WAITMONITORINGTIME = 00, 01.

15.4.4.8.3.1.4 Wait Monitoring During Synchronous Write Access

During synchronous accesses with wait pin monitoring enabled (the WAITWRITEMONITORING bit), the wait pin is captured synchronously with GPMC_CLK, using the rising edge of this clock.

If enabled, external wait pin monitoring can be used in combination with WRACCESSTIME to delay the GPMC_CLK capture edge of the effective memory device.

Wait-monitoring pipelining depth is similar to synchronous read access:

- At WRACCESSTIME completion if WAITMONITORINGTIME = 0
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC_FCLK cycles before WRACCESSTIME completion if WAITMONITORINGTIME is not equal to 0

Wait-monitoring pipelining definition applies to whole burst accesses:

- Wait monitored as active freezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, wait monitored as active indicates that the data bus is not being captured by the external device. Control signals are kept in their current state. The data bus is kept in its current state.
- Wait monitored as inactive unfreezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, wait monitored as inactive indicates the effective data capture of the bus by the external device and starts the next access of the burst. In case of a single access or if this was the last access in a multiple access cycle, all signals, including the data bus, are controlled according to their related control timing value and the CYCLETIME counter status.

Note

Wait monitoring is supported for all configurations except GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME = 0x0 (where i = 0 to 7) for write bursts with a clock divider of 1 or 2 (the GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER bit field is equal to 0x0 or 0x1, respectively).

15.4.4.8.3.1.5 Wait With NAND Device

For information about the use of the wait pin for communication with a NAND flash external device, see Section 15.4.4.12.2, *NAND Device-Ready Pin*.

15.4.4.8.3.1.6 Idle Cycle Control Between Successive Accesses

15.4.4.8.3.1.6.1 Bus Turnaround (BUSTURNAROUND)

To prevent data-bus contention, an access that follows a read access to a slow memory/device must be delayed (in other words, control the nCS/nOE deassertion to data bus in high-impedance delay).

The bus turnaround is a time-out counter starting after nCS or nOE deassertion time, whichever occurs first, and delays the next access start-cycle time. The counter is programmed through the GPMC_CONFIG6_i[3:0] BUSTURNAROUND bit field (where i = 0 to 7).

After a read access to a chip-select with a nonzero BUSTURNAROUND, the next access is delayed until the BUSTURNAROUND delay completes, if the next access is one of the following:

- A write access to any chip-select (the same or different chip-select from which the data was read)
- A read access to a different chip-select than the chip-select from which the data was read access
- A read or write access to a chip-select associated with an address/data-multiplexed device

Note

Bus keeping starts after bus turnaround completion so that DIR changes from IN to OUT after bus turnaround. The bus does not have enough time to go into high-impedance even though it can be driven with the same value before bus turnaround timing.

BUSTURNAROUND delay runs in parallel with GPMC_CONFIG6_i[3:0] CYCLE2CYCLEDELAY bi field delays. BUSTURNAROUND is a timing parameter for the ending chip-select access, while CYCLE2CYCLEDELAY is a timing parameter for the following chip-select access. The effective minimum delay between successive accesses is driven by these delay timing parameters and by the access type of the following access (see Figure 15-62 through Figure 15-64).

Another way to prevent bus contention is to define an earlier nCS or nOE deassertion time for slow devices or to extend the value of RDCYCLETIME. Doing this prevents bus contention, but it also affects all accesses of this specific chip-select.

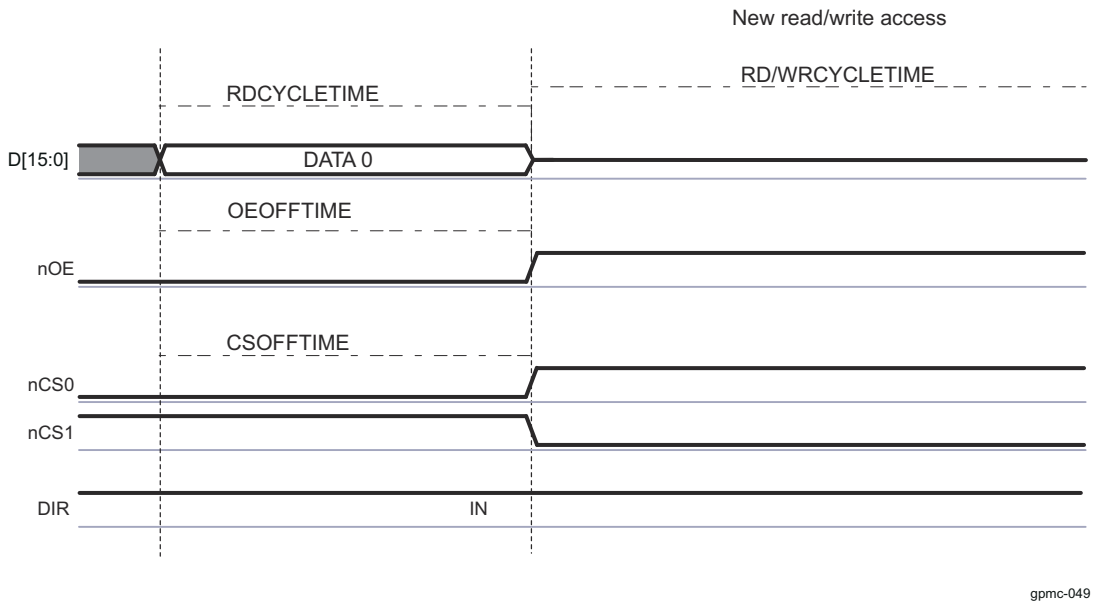

Figure 15-62. Read-to-Read for an Address-Data Multiplexed Device, on Different Chip-Select, Without Bus Turnaround (nCS Attached to a Fast Device)

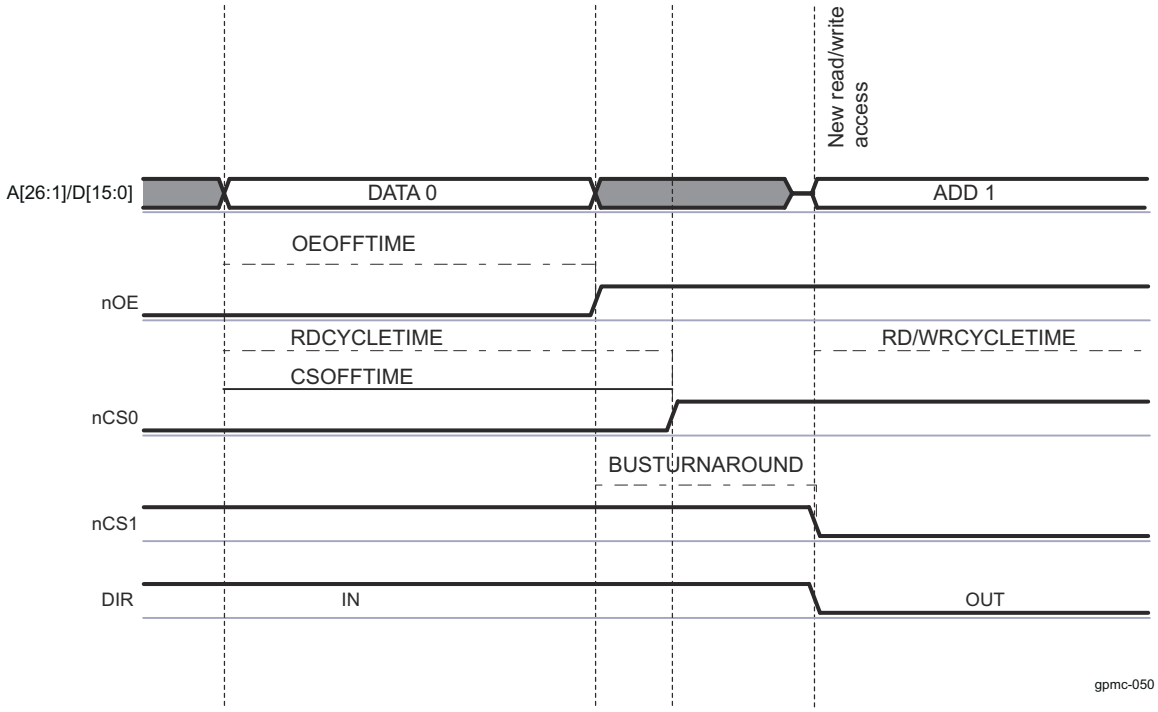

Figure 15-63. Read- to-Read/Write for an Address-Data Multiplexed Device, on Different Chip-Select, With Bus Turnaround

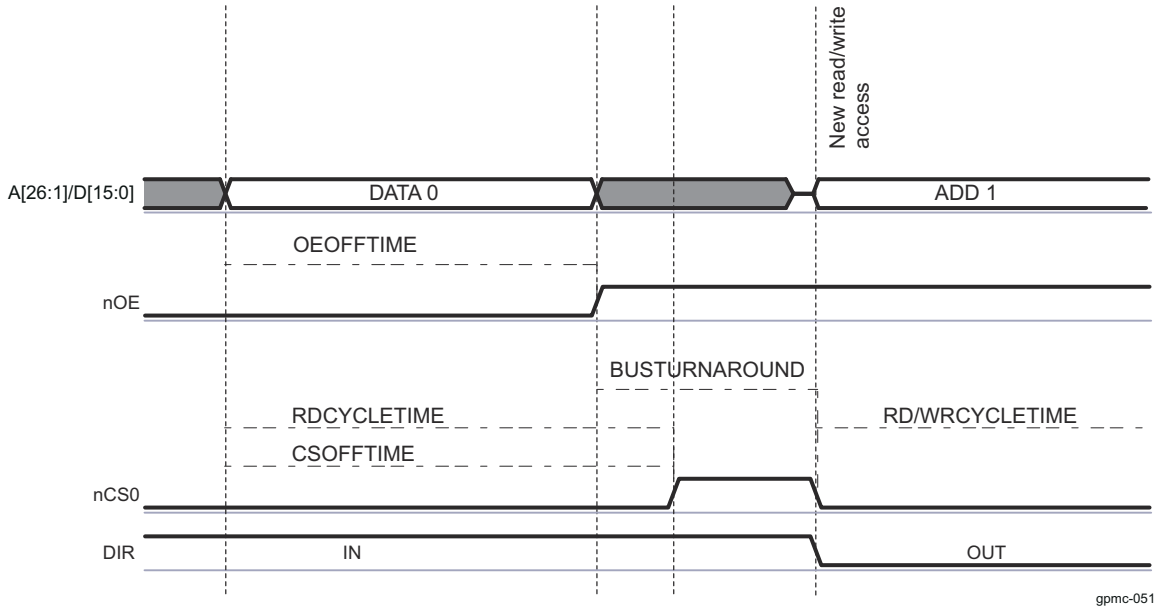

Figure 15-64. Read-to-Read/Write for a Address-Data or AAD-Multiplexed Device, on Same Chip-Select, With Bus Turnaround

15.4.4.8.3.1.6.2 Idle Cycles Between Accesses to Same Chip-Select (CYCLE2CYCLESAMECSEN, CYCLE2CYCLEDELAY)

Some devices require a minimum chip-select signal inactive time between accesses. The GPMC_CONFIG6_i[7] CYCLE2CYCLESAMECSEN bit (where i = 0 to 7) enables insertion of a minimum number of GPMC_FCLK cycles, defined by the GPMC_CONFIG6_i[11:8] CYCLE2CYCLEDELAY bit field, between successive accesses of any type (read or write) to the same chip-select.

If CYCLE2CYCLESAMECSEN is enabled, any subsequent access to the same chip-select is delayed until its CYCLE2CYCLEDELAY completes. The CYCLE2CYCLEDELAY counter starts when CSRDOFFTIME/CSWROFFTIME completes.

The same applies to successive accesses occurring during 32-bit word or burst accesses split into successive single accesses when the single-access mode is used (GPMC_CONFIG1_i[30] READMULTIPLE = 0 or GPMC_CONFIG1_i[28] WRITEMULTIPLE = 0).

All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC.FCLK cycles. This prevents back-to-back accesses to the same chip-select without idle cycles between accesses.

15.4.4.8.3.1.6.3 Idle Cycles Between Accesses to Different Chip-Select (CYCLE2CYCLEDIFFCSEN, CYCLE2CYCLEDELAY)

Because of the pipelined behavior of the system, successive accesses to different chip-selects can occur back-to-back with no idle cycles between accesses. Depending on the control signals (nCS, nADV/ALE, nBE0/CLE, nOE/RE, nWE) assertion and deassertion timing parameters and on the device timing parameters, the assertion times of some control signals may overlap between the successive accesses to a different chip-select. Similarly, some control signals (WE, OE/RE) may not respect required transition times.

To work around overlapping and to observe the required control-signal transitions, a minimum of CYCLE2CYCLEDELAY inactive cycles is inserted between the access being initiated to this chip-select and the previous access ending for a different chip-select. This applies to any type of access (read or write).

If the GPMC_CONFIG6_i[6] CYCLE2CYCLEDIFFCSEN bit is enabled, the chip-select access is delayed until CYCLE2CYCLEDELAY cycles have expired since the end of a previous access to a different chip-select.

CYCLE2CYCLEDELAY count starts at CSRDOFFTIME/CSWROFFTIME completion. All control signals are kept inactive during the idle GPMC_FCLK cycles.

Note

CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDIFFCSEN must be set in the GPMC_CONFIG6_i registers to get idle cycles inserted between accesses on this chip-select and after accesses to a different chip-select, respectively.

The CYCLE2CYCLEDELAY delay runs in parallel with the BUSTURNAROUND delay. The BUSTURNAROUND is a timing parameter defined for the ending chip-select access, whereas CYCLE2CYCLEDELAY is a timing parameter defined for the starting chip-select access. The effective minimum delay between successive accesses is based on the larger delay timing parameter and on access type combination, because bus turnaround does not apply to all access types. For more information about bus turnaround, see Section 15.4.4.8.3.1.6.1, *Bus Turnaround (BUSTURNAROUND)*.

Table 15-262 describes the configuration required for idle cycle insertion.

Table 15-262. Idle Cycle Insertion Configuration

1st Access Type	BUSTURNAROUND Timing Parameter	Second Access Type	Chip-Select	Add/Data Multiplexed	CYCLE2CYCLE SAMECSEN Parameter	CYCLE2CYCLE DIFFCSEN Parameter	Idle Cycle Insertion Between the Two Accesses
R/W	= 0	R/W	Any	Any	0	x	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Same	Nonmuxed	x	0	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Different	Nonmuxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	R/W	Any	Muxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	W	Any	Any	0	0	BUSTURNAROUND cycles are inserted.
W	> 0	R/W	Any	Any	0	0	No idle cycles are inserted if the two accesses are well pipelined.
R/W	= 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted.
R/W	= 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted.
R/W	> 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is max (BUSTURNAROUND, CYCLE2CYCLEDELAY).
R/W	> 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is maximum (BUSTURNAROUND, CYCLE2CYCLEDELAY).

15.4.4.8.3.1.7 Slow Device Support (TIMEPARAGRANULARITY Parameter)

All access-timing parameters can be multiplied by 2 by setting the GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY bit (where i stands for the GPMC chip-select value, 0 to 7). Increasing all access timing parameters allows support of slow devices.

15.4.4.8.3.2 Reset

No reset signal is sent to the external memory device by the GPMC. For more information about external-device reset, see *Power, Reset, and Clock Management*.

The PRCM module provides an input pin, global_rst_n, to the GPMC:

- The global_rst_n pin is activated during device warm reset and cold reset.
- The global_rst_n pin initializes the internal state-machine and the internal configuration registers.

15.4.4.8.3.3 Byte Enable (nBE1/nBE0)

Byte enable signals (nBE1/nBE0) are:

- Valid (asserted or nonasserted according to the incoming system request) from access start to access completion for asynchronous and synchronous single accesses
- Asserted low from access start to access completion for asynchronous and synchronous multiple read accesses
- Valid (asserted or nonasserted, according to the incoming system request) synchronously to each written data for synchronous multiple write accesses

15.4.4.8.4 Error Handling

When an error occurs in the GPMC, the error information is stored in the GPMC_ERR_TYPE register and the address of the illegal access is stored in the GPMC_ERR_ADDRESS register. The GPMC keeps only the first error abort information until the GPMC_ERR_TYPE register is reset. Subsequent accesses that cause errors are not logged until the error is cleared by hardware with the GPMC_ERR_TYPE[0] ERRORVALID bit.

- ERRORNOTSUPPADD occurs when an incoming system request address decoding does not match any valid chip-select region, or if two chip-select regions are defined as overlapped, or if a register file access is tried outside the valid address range of 1KiB.
- ERRORNOTSUPPMCMD occurs when an unsupported command request is decoded at the L3 interconnect interface.
- ERRORTIMEOUT: A time-out mechanism prevents the system from hanging. The start value of the 9-bit time-out counter is defined in the GPMC_TIMEOUT_CONTROL register and enabled with the GPMC_TIMEOUT_CONTROL[0] TIMEOUTENABLE bit. When enabled, the counter starts at start-cycle time until it reaches 0 and data is not responded to from memory, and then a time-out error occurs. When data are sent from memory, this counter is reset to its start value. With multiple accesses (asynchronous page mode or synchronous burst mode), the counter is reset to its start value for each data access within the burst.

The GPMC does not generate interrupts on these errors. True abort to the MPU or interrupt generation is handled at interconnect level.

15.4.4.9 Timing Setting

The GPMC offers maximum flexibility to support various access protocols. Most of the timing parameters of the protocol access used by the GPMC to communicate with attached memories or devices are programmable on a chip-select basis. Assertion and deassertion times of control signals are defined to match the attached memory or device timing specifications and to get maximum performance during accesses. For more information about GPMC_CLK and GPMC_FCLK see Section 15.4.4.9.6, *GPMC_CLK*.

Note

In the following sections, the start access time refers to the time at which the access begins.

15.4.4.9.1 Read Cycle Time and Write Cycle Time (RDCYCLETIME / WRCYCLETIME)

The GPMC_CONFIG5_i[4:0] RDCYCLETIME and GPMC_CONFIG5_i[12:8] WRCYCLETIME bit fields (where i = 0 to 7) define the address bus and byte-enable valid times for read and write accesses. To ensure a correct duty cycle of GPMC_CLK between accesses, RDCYCLETIME and WRCYCLETIME are expressed in GPMC_FCLK cycles and must be multiples of the GPMC_CLK cycle. The RDCYCLETIME and WRCYCLETIME bit fields can be set with a granularity of 1 or 2 through the GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY bit.

When RDCYCLETIME or WRCYCLETIME completes, if they are not already deasserted, all control signals (nCS, nADV/ALE, nOE/RE, nWE, and BE0/CLE) are deasserted to their reset values, regardless of their deassertion time parameters.

An exception to this forced deassertion occurs when a pipelined request to the same chip-select or to a different chip-select is pending. In such a case, it is not necessary to deassert a control signal with deassertion time parameters equal to the cycle-time parameter. This exception to forced deassertion prevents any unnecessary glitches. This requirement also applies to BE signals, thus avoiding an unnecessary BE glitch transition when pipelining requests.

Note

All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC.FCLK cycles.

If no inactive cycles are required between successive accesses to the same chip-select or a different chip-select (GPMC_CONFIG6_i[7] CYCLE2CYCLESAMECSEN = 0 or GPMC_CONFIG6_i[6] CYCLE2CYCLEDIFFCSEN = 0, where i = 0 to 7), and if assertion-time parameters associated with the pipelined access are equal to 0, asserted control signals (nCS, nADV/ALE, nBE0/CLE, nWE, and nOE/RE) are kept asserted. This applies to any read/write to read/write access combination.

If inactive cycles are inserted between successive accesses (that is, CYCLE2CYCLESAMECSEN = 1 or CYCLE2CYCLEDIFFCSEN = 1), the control signals are forced to their respective default reset values for the number of GPMC_FCLK cycles defined in CYCLE2CYCLEDELAY.

15.4.4.9.2 nCS: Chip-Select Signal Control Assertion/Deassertion Time (CSONTIME / CSRDOFFTIME / CSWROFFTIME / CSEXTRADELAY)

The GPMC_CONFIG2_i[3:0] CSONTIME bit field (where i = 0 to 7) defines the nCS signal-assertion time relative to the start access time. It is common for read and write accesses.

The GPMC_CONFIG2_i[12:8] CSRDOFFTIME (read access) and GPMC_CONFIG2_i[20:16] CSWROFFTIME (write access) bit fields define the nCS signal deassertion time relative to start access time.

The CSONTIME, CSRDOFFTIME, and CSWROFFTIME parameters apply to synchronous and asynchronous modes. CSONTIME can be used to control an address and byte-enable setup time before chip-select assertion. CSRDOFFTIME and CSWROFFTIME can be used to control an address and byte-enable hold time after chip-select deassertion.

nCS signal transitions, as controlled through CSONTIME, CSRDOFFTIME, and CSWROFFTIME, can be delayed by a half-GPMC_FCLK period by enabling the GPMC_CONFIG2_i[7] CSEXTRADELAY bit. This half-GPMC_FCLK period provides more granularity on the nCS assertion and deassertion time to ensure proper setup and hold time relative to GPMC_CLK. CSEXTRADELAY is especially useful in configurations where GPMC_CLK and GPMC_FCLK have the same frequency, but it can also be used for all GPMC configurations. If enabled, CSEXTRADELAY applies to all parameters that control nCS transitions.

The CSEXTRADELAY bit must be used carefully to avoid control signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than the nCS signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

15.4.4.9.3 nADV/ALE: Address Valid/Address Latch Enable Signal Control Assertion/ Deassertion Time (ADVONTIME / ADVRDOFFTIME / ADVWROFFTIME / ADVEXTRADELAY/ADVAADMUXONTIME/ ADVAADMUXRDOFFTIME/ADVAADMUXWROFFTIME)

The GPMC_CONFIG3_i[3:0] ADVONTIME field (where i = 0 to 7) defines the nADV/ALE signal-assertion time relative to start access time. It is common to read and write accesses.

The GPMC_CONFIG3_i[12:8] ADVRDOFFTIME (read access) and GPMC_CONFIG3_i[20:16] ADVWROFFTIME (write access) bit fields define the nADV/ALE signal-deassertion time relative to start access time.

ADVONTIME can be used to control an address and byte-enable valid setup time control before nADV/ALE assertion. ADVRDOFFTIME and ADVWROFFTIME can be used to control an address and byte-enable valid hold time control after nADV/ALE deassertion. ADVRDOFFTIME and ADVWROFFTIME apply to synchronous and asynchronous modes.

The nADV/ALE signal transitions as controlled through ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME can be delayed by a half-GPMC_FCLK period by enabling the GPMC_CONFIG3_i[7] ADVEXTRADELAY bit. This half-GPMC_FCLK period provides more granularity on nADV/ALE assertion and deassertion time to ensure proper setup and hold time relative to GPMC_CLK. The ADVEXTRADELAY configuration parameter is especially useful in configurations where GPMC_CLK and GPMC_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, ADVEXTRADELAY applies to all parameters controlling nADV/ALE transitions.

ADVEXTRADELAY must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than nADV/ALE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

GPMC_CONFIG3_i[6:4] ADVAADMUXONTIME, GPMC_CONFIG3_i[26:24] ADVAADMUXRDOFFTIME, and GPMC_CONFIG3_i[30:28] ADVAADMUXWROFFTIME parameters have the same functions as ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME, but apply to the first address phase in the AAD-multiplexed protocol. The user must ensure that ADVAADMUXxxOFFTIME is programmed to a value less than or equal to ADVxxOFFTIME. Functionality in AAD-multiplexed mode is undefined if the settings do not comply with this requirement. ADVAADMUXxxOFFTIME can be programmed to the same value as ADVONTIME if no high nADV pulse is needed between the two AAD-multiplexed address phases, which is the typical case in synchronous mode. In this configuration, nADV is kept low until it reaches the correct ADVxxOFFTIME.

For more information about the use of ADVONTIME, ADVRDOFFTIME, ADVWROFFTIME, and ADVAADMUXRDOFFTIME and ADVAADMUXWROFFTIME for command latch enable (CLE) and address latch enable (ALE) use for a NAND flash interface, see Section 15.4.4.12, *NAND Access Description*.

15.4.4.9.4 nOE/nRE: Output Enable/Read Enable Signal Control Assertion/Deassertion Time (OEONTIME / OEOFFTIME / OEEXTRADELAY / OEAADMUXONTIME / OEAADMUXOFFTIME)

The GPMC_CONFIG4_i[3:0] OEONTIME bit field (where i = 0 to 7) defines the nOE/nRE signal assertion time relative to start access time. It applies only to read accesses.

The GPMC_CONFIG4_i[12:8] OEOFFTIME bit field defines the nOE/nRE signal deassertion time relative to start access time. It applies only to read accesses. nOE/nRE is not asserted during a write cycle.
