TDA2x
SoC for Advanced Driver Assistance Systems (ADAS)
Silicon Revision 2.0, 1.1

Texas Instruments ADAS Family of Products

Technical Reference Manual

Literature Number: SPRUI29G
November 2015–Revised February 2020

Contents

Revision History **349**

Preface **350**

1 Introduction **357**

1.1 TDA2x Overview 358
1.2 TDA2x Environment 359
1.3 TDA2x Description 360
1.3.1 MPU Subsystem 361
1.3.2 DSP Subsystems 361
1.3.3 EVE Subsystems 361
1.3.4 IPU Subsystems 361
1.3.5 IVA-HD Subsystem 362
1.3.6 Display Subsystem 362
1.3.7 Video Processing Subsystem 362
1.3.8 Video Capture 363
1.3.9 3D GPU Subsystem 363
1.3.10 BB2D Subsystem 364
1.3.11 On-Chip Debug Support 364
1.3.12 Power, Reset, and Clock Management 365
1.3.13 On-Chip Memory 365
1.3.14 Memory Management 365
1.3.15 External Memory Interfaces 365
1.3.16 System and Connectivity Peripherals 366
1.3.16.1 System Peripherals 366
1.3.16.2 Media Connectivity Peripherals 366
1.3.16.3 Car Connectivity Peripherals 367
1.3.16.4 Audio Connectivity Peripherals 367
1.3.16.5 Serial Control Peripherals 367
1.4 TDA2x Family 368
1.5 TDA2x Device Identification 368
1.6 TDA2x Package Characteristics Overview 371

2 Memory Mapping **372**

2.1 Introduction 373
2.2 L3_MAIN Memory Map 375
2.2.1 L3_INSTR Memory Map 378
2.3 L4 Memory Map 380
2.3.1 L4_CFG Memory Map 380
2.3.2 L4_WKUP Memory Map 383
2.4 L4_PER Memory Map 384
2.4.1 L4_PER1 Memory Map 384
2.4.2 L4_PER2 Memory Map 386
2.4.3 L4_PER3 Memory Map 388
2.5 MPU Memory Map 391
2.6 IPU Memory Map 393
2.7 DSP Memory Map 394
2.8 EVE Memory Map 396

2.9 TILER View Memory Map 397
3 Power, Reset, and Clock Management 398
3.1 Device Power Management Introduction 399
3.1.1 Device Power-Management Architecture Building Blocks 400
3.1.1.1 Clock Management 400
3.1.1.1.1 Module Interface and Functional Clocks 400
3.1.1.1.2 Module-Level Clock Management 401
3.1.1.1.3 Clock Domain 406
3.1.1.1.4 Clock Domain-Level Clock Management 407
3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences 408
3.1.1.1.6 Clock Domain Sleep/Wake-up 411
3.1.1.1.7 Clock Domain Dependency 412
3.1.1.2 Power Management 419
3.1.1.2.1 Power Domain 419
3.1.1.2.2 Module Logic and Memory Context 421
3.1.1.2.3 Power Domain Management 421
3.1.1.3 Voltage Management 423
3.1.1.3.1 Voltage Domain 423
3.1.1.3.2 Voltage Domain Management 424
3.1.1.3.3 AVS Overview 424
3.1.2 Power-Management Techniques 426
3.1.2.1 Standby Leakage Management 426
3.1.2.2 Dynamic Voltage and Frequency Scaling 427
3.1.2.3 Dynamic Power Switching 427
3.1.2.4 Adaptive Voltage Scaling 428
3.1.2.5 Adaptive Body Bias 428
3.1.2.6 SR3-APG (Automatic Power Gating) 429
3.1.2.7 Combining Power-Management Techniques 429
3.1.2.7.1 DPS Versus SLM 430
3.2 PRCM Subsystem Overview 431
3.2.1 Introduction 431
3.2.2 Power-Management Framework Features 432
3.3 PRCM Subsystem Environment 434
3.3.1 External Clock Signals 434
3.3.2 External Boot Signals 434
3.3.3 External Reset Signals 435
3.3.4 External Voltage Inputs 436
3.4 PRCM Subsystem Integration 437
3.4.1 Device Power-Management Layout 437
3.4.2 Power-Management Scheme, Reset, and Interrupt Requests 441
3.4.2.1 Power Domain 441
3.4.2.2 Resets 441
3.4.2.3 PRCM Interrupt Requests 442
3.5 Reset Management Functional Description 443
3.5.1 Overview 443
3.5.1.1 PRCM Reset Management Functional Description 443
3.5.1.1.1 Power-On Reset 443
3.5.1.1.2 Warm Reset 443
3.5.1.2 PRM Reset Management Functional Description 443
3.5.2 General Characteristics of Reset Signals 443
3.5.2.1 Scope 444
3.5.2.2 Occurrence 444
3.5.2.3 Source Type 444

Copyright © 2015–2020, Texas Instruments Incorporated

3.5.2.4 Retention Type 444
3.5.3 Reset Sources 445
3.5.3.1 Global Reset Sources 445
3.5.3.2 Local Reset Sources 445
3.5.4 Reset Logging 446
3.5.5 Reset Domains 446
3.5.6 Reset Sequences 472
3.5.6.1 MPU Subsystem Power-On Reset Sequence 472
3.5.6.2 MPU Subsystem Warm Reset Sequence 473
3.5.6.3 MPU Subsystem Reset Sequence on Sleep and Wake-Up Transitions From RETENTION State 473
3.5.6.4 IVA Subsystem Power-On Reset Sequence 474
3.5.6.5 IVA Subsystem Software Warm Reset Sequence 475
3.5.6.6 DSP1 Subsystem Power-On Reset Sequence 476
3.5.6.7 DSP1 Subsystem Software Warm Reset Sequence 476
3.5.6.8 DSP2 Subsystem Power-On Reset Sequence 477
3.5.6.9 DSP2 Subsystem Software Warm Reset Sequence 478
3.5.6.10 IPU1 Subsystem Power-On Reset Sequence 478
3.5.6.11 IPU1 Subsystem Software Warm Reset Sequence 479
3.5.6.12 IPU2 Subsystem Power-On Reset Sequence 480
3.5.6.13 IPU2 Subsystem Software Warm Reset Sequence 481
3.5.6.14 EVE1 Subsystem Power-On Reset Sequence 482
3.5.6.15 EVE1 Subsystem Software Warm Reset Sequence 483
3.5.6.16 EVE2 Subsystem Power-On Reset Sequence 484
3.5.6.17 EVE2 Subsystem Software Warm Reset Sequence 484
3.5.6.18 EVE3 Subsystem Power-On Reset Sequence 485
3.5.6.19 Global Warm Reset Sequence 485
3.5.7 Reset Status Requirements 487
3.6 Clock Management Functional Description 488
3.6.1 Overview 488
3.6.2 External Clock Inputs 489
3.6.2.1 FUNC_32K_CLK Clock 489
3.6.2.2 High-Frequency System Clock Input 489
3.6.2.3 External Reference Clock Input 489
3.6.3 Internal Clock Sources and Generators 489
3.6.3.1 PRM Clock Source 489
3.6.3.2 CM Clock Source 491
3.6.3.2.1 CM_CORE_AON Clock Generator 491
3.6.3.2.2 CM_CORE_AON_CLKOUTMUX Overview 497
3.6.3.2.3 CM_CORE_AON_TIMER Overview 502
3.6.3.2.4 CM_CORE_AON_MCASP Overview 506
3.6.3.3 Generic DPLL Overview 508
3.6.3.3.1 Generic APLL Overview 509
3.6.3.3.2 DPLLs Output Clocks Parameters 510
3.6.3.3.3 Enable Control, Status, and Low-Power Operation Mode 512
3.6.3.3.4 DPLL Power Modes 512
3.6.3.3.5 DPLL Recalibration 514
3.6.3.3.6 DPLL Output Power Down 515
3.6.3.4 DPLL_PER Description 515
3.6.3.4.1 DPLL_PER Overview 515
3.6.3.4.2 DPLL_PER Synthesized Clock Parameters 515
3.6.3.4.3 DPLL_PER Power Modes 516
3.6.3.4.4 DPLL_PER Recalibration 516
3.6.3.5 DPLL_CORE Description 517

Copyright © 2015–2020, Texas Instruments Incorporated

3.6.3.5.1 DPLL_CORE Overview 517
3.6.3.5.2 DPLL_CORE Synthesized Clock Parameters 518
3.6.3.5.3 DPLL_CORE Power Modes 518
3.6.3.5.4 DPLL_CORE Recalibration 519
3.6.3.6 DPLL_ABE Description 519
3.6.3.6.1 DPLL_ABE Overview 519
3.6.3.6.2 DPLL_ABE Synthesized Clock Parameters 520
3.6.3.6.3 DPLL_ABE Power Modes 520
3.6.3.6.4 DPLL_ABE Recalibration 521
3.6.3.7 DPLL_MPU Description 521
3.6.3.7.1 DPLL_MPU Overview 521
3.6.3.7.2 DPLL_MPU Tactical Clocking Adjustment 522
3.6.3.7.3 DPLL_MPU Synthesized Clock Parameters 522
3.6.3.7.4 DPLL_MPU Power Modes 522
3.6.3.7.5 DPLL_MPU Recalibration 523
3.6.3.8 DPLL_IVA Description 523
3.6.3.8.1 DPLL_IVA Overview 523
3.6.3.8.2 DPLL_IVA Synthesized Clock Parameters 524
3.6.3.8.3 DPLL_IVA Power Modes 524
3.6.3.8.4 DPLL_IVA Recalibration 525
3.6.3.9 DPLL_USB Description 525
3.6.3.9.1 DPLL_USB Overview 525
3.6.3.9.2 DPLL_USB Synthesized Clock Parameters 525
3.6.3.9.3 DPLL_USB Power Modes 526
3.6.3.9.4 DPLL_USB Recalibration 526
3.6.3.10 DPLL_EVE Description 526
3.6.3.10.1 DPLL_EVE Overview 526
3.6.3.10.2 DPLL_EVE Synthesized Clock Parameters 527
3.6.3.10.3 DPLL_EVE Power Modes 527
3.6.3.10.4 DPLL_EVE Recalibration 528
3.6.3.11 DPLL_DSP Description 528
3.6.3.11.1 DPLL_DSP Overview 528
3.6.3.11.2 DPLL_DSP Synthesized Clock Parameters 528
3.6.3.11.3 DPLL_DSP Power Modes 529
3.6.3.11.4 DPLL_DSP Recalibration 529
3.6.3.12 DPLL_GMAC Description 530
3.6.3.12.1 DPLL_GMAC Overview 530
3.6.3.12.2 DPLL_GMAC Synthesized Clock Parameters 530
3.6.3.12.3 DPLL_GMAC Power Modes 531
3.6.3.12.4 DPLL_GMAC Recalibration 531
3.6.3.13 DPLL_GPU Description 532
3.6.3.13.1 DPLL_GPU Overview 532
3.6.3.13.2 DPLL_GPU Synthesized Clock Parameters 532
3.6.3.13.3 DPLL_GPU Power Modes 533
3.6.3.13.4 DPLL_GPU Recalibration 533
3.6.3.14 DPLL_DDR Description 534
3.6.3.14.1 DPLL_DDR Overview 534
3.6.3.14.2 DPLL_DDR Synthesized Clock Parameters 534
3.6.3.14.3 DPLL_DDR Power Modes 534
3.6.3.14.4 DPLL_DDR Recalibration 535
3.6.3.15 DPLL_PCIE_REF Description 535
3.6.3.15.1 DPLL_PCIE_REF Overview 535
3.6.3.15.2 DPLL_PCIE_REF Synthesized Clock Parameters 536

Copyright © 2015–2020, Texas Instruments Incorporated

3.6.3.15.3 DPLL_PCIE_REF Power Modes 536
3.6.3.16 APLL_PCIE Description 537
3.6.3.16.1 APLL_PCIE Overview 537
3.6.3.16.2 APLL_PCIE Synthesized Clock Parameters 537
3.6.3.16.3 APLL_PCIE Power Modes 537
3.6.4 Clock Domains 538
3.6.4.1 CD_WKUPAON Clock Domain 538
3.6.4.1.1 Overview 538
3.6.4.1.2 Clock Domain Modes 538
3.6.4.1.3 Clock Domain Dependency 539
3.6.4.1.4 Clock Domain Module Attributes 542
3.6.4.2 CD_DSP1 Clock Domain 544
3.6.4.2.1 Overview 544
3.6.4.2.2 Clock Domain Modes 545
3.6.4.2.3 Clock Domain Dependency 545
3.6.4.2.4 Clock Domain Module Attributes 547
3.6.4.3 CD_DSP2 Clock Domain 547
3.6.4.3.1 Overview 547
3.6.4.3.2 Clock Domain Modes 548
3.6.4.3.3 Clock Domain Dependency 548
3.6.4.3.4 Clock Domain Module Attributes 550
3.6.4.4 CD_CUSTEFUSE Clock Domain 550
3.6.4.4.1 Overview 550
3.6.4.4.2 Clock Domain Modes 551
3.6.4.4.3 Clock Domain Dependency 551
3.6.4.4.4 Clock Domain Module Attributes 551
3.6.4.5 CD_MPU Clock Domain 552
3.6.4.5.1 Overview 552
3.6.4.5.2 Clock Domain Modes 552
3.6.4.5.3 Clock Domain Dependency 553
3.6.4.5.4 Clock Domain Module Attributes 554
3.6.4.6 CD_L4PER1 Clock Domain 555
3.6.4.6.1 Overview 555
3.6.4.6.2 Clock Domain Modes 555
3.6.4.6.3 Clock Domain Dependency 556
3.6.4.6.4 Clock Domain Module Attributes 585
3.6.4.7 CD_L4PER2 Clock Domain 591
3.6.4.7.1 Overview 591
3.6.4.7.2 Clock Domain Modes 591
3.6.4.7.3 Clock Domain Dependency 592
3.6.4.7.4 Clock Domain Module Attributes 602
3.6.4.8 CD_L4PER3 Clock Domain 606
3.6.4.8.1 Overview 606
3.6.4.8.2 Clock Domain Modes 606
3.6.4.8.3 Clock Domain Dependency 607
3.6.4.8.4 Clock Domain Module Attributes 607
3.6.4.9 CD_L4SEC Clock Domain 608
3.6.4.9.1 Overview 608
3.6.4.9.2 Clock Domain Modes 609
3.6.4.9.3 Clock Domain Dependency 609
3.6.4.9.4 Clock Domain Module Attributes 610
3.6.4.10 CD_L3INIT Clock Domain 611
3.6.4.10.1 Overview 611

3.7 Power Management Functional Description 689
3.7.1 PD_WKUPAON Description 689
3.7.1.1 Power Domain Modes 690
3.7.1.1.1 Logic and Memory Area Power Modes 690
3.7.2 PD_DSP1 Description 690
3.7.2.1 Power Domain Modes 690
3.7.2.1.1 Logic and Memory Area Power Modes 691
3.7.2.1.2 Logic and Memory Area Power Modes Control and Status 691
3.7.3 PD_DSP2 Description 692
3.7.3.1 Power Domain Modes 692
3.7.3.1.1 Logic and Memory Area Power Modes 692
3.7.3.1.2 Logic and Memory Area Power Modes Control and Status 693
3.7.4 PD_CUSTEFUSE Description 693
3.7.4.1 Power Domain Modes 693
3.7.4.1.1 Logic and Memory Area Power Modes 694
3.7.4.1.2 Logic and Memory Area Power Modes Control and Status 694
3.7.5 PD_MPU Description 694
3.7.5.1 Power Domain Modes 695
3.7.5.1.1 Logic and Memory Area Power Modes 695
3.7.5.1.2 Logic and Memory Area Power Modes Control and Status 695
3.7.5.1.3 Power State Override 696
3.7.6 PD_IPU Description 696
3.7.6.1 Power Domain Modes 697
3.7.6.1.1 Logic and Memory Area Power Modes 697
3.7.6.1.2 Logic and Memory Area Power Modes Control and Status 697
3.7.7 PD_L3INIT Description 698
3.7.7.1 Power Domain Modes 699
3.7.7.1.1 Logic and Memory Area Power Modes 699
3.7.7.1.2 Logic and Memory Area Power Modes Control and Status 700
3.7.8 PD_L4PER Description 701
3.7.8.1 Power Domain Modes 703
3.7.8.1.1 Logic and Memory Area Power Modes 703
3.7.8.1.2 Logic and Memory Area Power Modes Control and Status 704

22.3.4.1 COUNTER_32K Timer Register Mapping Summary 5904
22.3.4.2 COUNTER_32K Timer Register Description 5905
22.4 Watchdog Timer 5907
22.4.1 Watchdog Timer Overview 5907
22.4.1.1 Watchdog Timer Features 5907
22.4.2 Watchdog Timer Integration 5909
22.4.3 Watchdog Timer Functional Description 5911
22.4.3.1 Power Management 5911
22.4.3.1.1 Wake-Up Capability 5911
22.4.3.2 Interrupts 5911
22.4.3.3 General Watchdog Timer Operation 5912
22.4.3.4 Reset Context 5912
22.4.3.5 Overflow/Reset Generation 5913
22.4.3.6 Prescaler Value/Timer Reset Frequency 5913
22.4.3.7 Triggering a Timer Reload 5914
22.4.3.8 Start/Stop Sequence for Watchdog Timer (Using the WSPR Register) 5915
22.4.3.9 Modifying Timer Count/Load Values and Prescaler Setting 5915
22.4.3.10 Watchdog Counter Register Access Restriction (WCRR) 5915
22.4.3.11 Watchdog Timer Interrupt Generation 5915
22.4.3.12 Watchdog Timer Under Emulation 5916
22.4.3.13 Accessing Watchdog Timer Registers 5916
22.4.4 Watchdog Timer Low-Level Programming Model 5918
22.4.4.1 Global Initialization 5918
22.4.4.1.1 Surrounding Modules Global Initialization 5918
22.4.4.1.2 Watchdog Timer Module Global Initialization 5919
22.4.4.2 Operational Mode Configuration 5919
22.4.4.2.1 Watchdog Timer Basic Configuration 5919
22.4.5 Watchdog Timer Register Manual 5920
22.4.5.1 Watchdog Timer Instance Summary 5920
22.4.5.2 Watchdog Timer Registers 5920
22.4.5.2.1 Watchdog Timer Register Summary 5920
22.4.5.2.2 Watchdog Timer Register Description 5922
23 Real-Time Clock (RTC) 5934
23.1 RTC Overview 5935
23.1.1 RTC Features 5935
23.2 RTC Environment 5937

26.3.2 USB3_PHY_RX Registers ... 7254
26.3.2.1 USB3_PHY_RX Register Summary ... 7254
26.3.2.2 USB3_PHY_RX Register Description ... 7255
26.3.3 USB3_PHY_TX Registers ... 7261
26.3.3.1 USB3_PHY_TX Register Summary ... 7261
26.3.3.2 USB3_PHY_TX Register Description ... 7261
26.3.4 DPLLCTRL Registers ... 7264
26.3.4.1 DPLLCTRL Register Summary ... 7264
26.3.4.2 DPLLCTRL Register Description ... 7264
26.4 PCIe PHY Subsystem ... 7271
26.4.1 PCIe PHY Subsystem Overview ... 7271
26.4.1.1 PCIe PHY Subsystem Key Features ... 7272
26.4.2 PCIe PHY Subsystem Environment ... 7274
26.4.2.1 PCIe PHY I/O Signals ... 7274
26.4.3 PCIe Shared PHY Subsystem Integration ... 7276
26.4.4 PCIe PHY Subsystem Functional Description ... 7279
26.4.4.1 PCIe PHY Subsystem Block Diagram ... 7279
26.4.4.2 OCP2SCP Functional Description ... 7280
26.4.4.2.1 OCP2SCP Reset ... 7280
26.4.4.2.2 OCP2SCP Power Management ... 7280
26.4.4.2.3 OCP2SCP Timing Registers ... 7280
26.4.4.3 PCIe PHY Serializer and Deserializer Functional Descriptions ... 7281
26.4.4.3.1 PCIe PHY Module Resets ... 7281
26.4.4.3.2 PCIe PHY Subsystem Clocking ... 7281
26.4.4.3.3 PCIe PHY Power Management ... 7283
26.4.4.3.4 PCIe PHY Hardware Requests ... 7284
26.4.4.4 PCIe PHY Clock Generator Subsystem Functional Description ... 7284
26.4.4.4.1 PCIe PHY DPLL Clock Generator ... 7285
26.4.4.4.2 PCIe PHY APLL Clock Generator ... 7291
26.4.4.4.3 ACSPCIE reference clock buffer ... 7294
26.4.5 PCIePHY Subsystem Low-Level Programming Model ... 7294
26.4.6 PCIe PHY Subsystem Register Manual ... 7297
26.4.6.1 PCIe PHY Instance Summary ... 7297
26.4.6.1.1 PCIe_PHY_RX Registers ... 7297
26.4.6.1.2 PCIe_PHY_TX Registers ... 7303
26.4.6.1.3 OCP2SCP Registers ... 7307
27 General-Purpose Interface ... 7310
27.1 General-Purpose Interface Overview ... 7311
27.2 General-Purpose Interface Environment ... 7314
27.2.1 General-Purpose Interface as a Keyboard Interface ... 7314
27.2.2 General-Purpose Interface Signals ... 7315
27.3 General-Purpose Interface Integration ... 7318
27.4 General-Purpose Interface Functional Description ... 7323

28.1.5.2.1 PWMSS_CFG Register Summary 7374
28.1.5.2.2 PWMSS_CFG Register Description 7375
28.2 Enhanced PWM (ePWM) Module 7379
28.2.1 ePWM Overview 7379
28.2.2 ePWM Functional Description 7383
28.2.2.1 ePWM Submodule Features 7383
28.2.2.2 Proper ePWM Interrupt Initialization Procedure 7386
28.2.2.3 ePWM Time-Base (TB) Submodule 7386
28.2.2.3.1 Purpose of the ePWM Time-Base Submodule 7387
28.2.2.3.2 Controlling and Monitoring the ePWM Time-Base Submodule 7388
28.2.2.3.3 Calculating PWM Period and Frequency 7389
28.2.2.3.4 Phase Locking the Time-Base Clocks of Multiple ePWM Modules 7392
28.2.2.3.5 ePWM Time-Base Counter Modes and Timing Waveforms 7392
28.2.2.4 ePWM Counter-Compare (CC) Submodule 7397
28.2.2.4.1 Purpose of the ePWM Counter-Compare Submodule 7398
28.2.2.4.2 Controlling and Monitoring the ePWM Counter-Compare Submodule 7398
28.2.2.4.3 Operational Highlights for the ePWM Counter-Compare Submodule 7400
28.2.2.4.4 ePWM Count Mode Timing Waveforms 7400
28.2.2.5 ePWM Action-Qualifier (AQ) Submodule 7403
28.2.2.5.1 Purpose of the ePWM Action-Qualifier Submodule 7403
28.2.2.5.2 Controlling and Monitoring the ePWM Action-Qualifier Submodule 7403
28.2.2.5.3 ePWM Action-Qualifier Event Priority 7406
28.2.2.5.4 Waveforms for Common ePWM Configurations 7407
28.2.2.6 ePWM Dead-Band Generator (DB) Submodule 7421
28.2.2.6.1 Purpose of the ePWM Dead-Band Submodule 7421
28.2.2.6.2 Controlling and Monitoring the ePWM Dead-Band Submodule 7421
28.2.2.6.3 Operational Highlights for the ePWM Dead-Band Generator Submodule 7422
28.2.2.7 PWM-Chopper (PC) Submodule 7425
28.2.2.7.1 Purpose of the PWM-Chopper Submodule 7425
28.2.2.7.2 Controlling the PWM-Chopper Submodule 7425
28.2.2.7.3 Operational Highlights for the PWM-Chopper Submodule 7426
28.2.2.7.4 PWM Chopper Waveforms 7427
28.2.2.8 ePWM Trip-Zone (TZ) Submodule 7429
28.2.2.8.1 Purpose of the ePWM Trip-Zone Submodule 7429
28.2.2.8.2 Controlling and Monitoring the ePWM Trip-Zone Submodule 7430
28.2.2.8.3 Operational Highlights for the ePWM Trip-Zone Submodule 7430
28.2.2.8.4 Generating ePWM Trip Event Interrupts 7431
28.2.2.9 ePWM Event-Trigger (ET) Submodule 7433
28.2.2.9.1 Purpose of the ePWM Event-Trigger Submodule 7433
28.2.2.9.2 Controlling and Monitoring the ePWM Event-Trigger Submodule 7433
28.2.2.9.3 Operational Overview of the ePWM Event-Trigger Submodule 7434
28.2.2.10 High-Resolution PWM (HRPWM) Submodule 7438
28.2.2.10.1 Purpose of the High-Resolution PWM Submodule 7439
28.2.2.10.2 Architecture of the High-Resolution PWM Submodule 7440

29 Initialization 7541

29.1 Initialization Overview 7542
29.1.1 Terminology 7542
29.1.2 Initialization Process 7542
29.2 Preinitialization 7544
29.2.1 Power Requirements 7544
29.2.2 Interaction With the PMIC Companion 7547
29.2.3 Clock, Reset, and Control 7548
29.2.3.1 Overview 7548
29.2.3.2 Clocking Scheme 7549
29.2.3.3 Reset Configuration 7550
29.2.3.3.1 ON/OFF Interconnect and Power-On-Reset 7550
29.2.3.3.2 Warm Reset 7550
29.2.3.3.3 Peripheral Reset by GPIO 7550
29.2.3.3.4 Warm Reset Impact on GPIOs 7550
29.2.3.4 PMIC Control 7551
29.2.3.5 PMIC Request Signals 7551
29.2.4 Sysboot Configuration 7552
29.2.4.1 GPMC Configuration for XIP/NAND 7552
29.2.4.2 System Clock Speed Selection 7553
29.2.4.3 QSPI Redundant SBL Images Offset 7553
29.2.4.4 Booting Device Order Selection 7553
29.2.4.5 Boot Peripheral Pin Multiplexing 7555
29.3 Device Initialization by ROM Code 7556
29.3.1 Booting Overview 7556
29.3.1.1 Booting Types 7556
29.3.1.2 ROM Code Architecture 7556
29.3.2 Memory Maps 7558
29.3.2.1 ROM Memory Map 7558
29.3.2.2 RAM Memory Map 7559
29.3.3 Overall Booting Sequence 7561
29.3.4 Startup and Configuration 7563
29.3.4.1 Startup 7563
29.3.4.2 Control Module Configuration 7564
29.3.4.3 PRCM Module Mode Configuration 7564
29.3.4.4 Clocking Configuration 7565
29.3.4.5 Booting Device List Setup 7566
29.3.5 Peripheral Booting 7567
29.3.5.1 Description 7567
29.3.5.2 Initialization Phase for UART Boot 7571
29.3.5.3 Initialization Phase for USB Boot 7571
29.3.5.3.1 Initialization Procedure 7571
29.3.5.3.2 SATA Peripheral Device Flashing over USB Interface 7572
29.3.5.3.3 USB Driver Descriptors 7573
29.3.5.3.4 USB Customized Vendor and Product IDs 7576
29.3.5.3.5 USB Driver Functionality 7577
29.3.6 Fast External Booting 7578
29.3.6.1 Overview 7578
29.3.6.2 Fast External Booting Procedure 7578
29.3.7 Memory Booting 7580
29.3.7.1 Overview 7580
29.3.7.2 Non-XIP Memory 7581

Revision History

Changes from October 9, 2018 to July 1, 2019 (from F Revision (October 2018) to G Revision) **Page**

- Updated Speed Grade in Table TDA2x Part Number Identifier 368
- Updated EffectiveResolution Parameter Value 3326
- Updated Table EMIF Configuration Sequence 3705
- Updated GPMC XIP Timing Parameters 3834
- Updated GPMC Subsection Chip-Select Base Address and Region Size 3834
- Updated Section Write Nonposting Synchronization Mode and Reset Value of TSICR[2] POSTED Bit 5867
- Updated Figure in Multimaster High-Speed I2C Controller 6005
- Removed Caution from HS I2C Registers 6012
- Updated Subsection McSPI Programming Guide 6199
- Updated Description about the WDCNT Bit Field Behavior 6246
- Updated Note for MMCHS_HCTL[2] HSPE Bit and Added Note for MMCHS_CAPA[21] HSS Bit 7175
- Added Footnote for Genx and Genm 7232
- Added MEM_DLL_PHINT_RATE to Low-Level Programming Sequence 7232
- Fixed Typo in Number of GPIO Interrupt Lines 7324
- Updated GPMC XIP Timing Parameters 7583

About This Manual

Information About Cautions and Warnings

This book may contain cautions and warnings.

CAUTION

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

WARNING

This is an example of a warning statement.

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

Copyright © 2015–2020, Texas Instruments Incorporated

Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: <*Module name*>.<*Register name*>; for example: UART.UASR
- For a bit field call:
  - <*Module name*>.<*Register name*>*[End:Start]* <*Field name*> *field*; for example, UART.UASR[4:0] SPEED bit field
  - <*Field name*> *field* <*Module name*>.<*Register name*>*[End:Start]*; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
  - <*Module name*>.<*Register name*>*[pos]* <*Bit name*> *bit*; for example, UART.UASR[5] BIT_BY_CHAR bit
  - <*Bit name*> *bit* <*Module name*>.<*Register name*>*[pos]*; for example, BIT_BY_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

Coding Rules

The programming models or code listings follow the rules:

Type	Definition	Example
File	Starts with the module name	PRCM_test1.c MCBSP1_init.h
Variable	Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p"	g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan
Function	Starts with the module name	PRCM_SetupClocks() ArmIntC_MaskInterrupts()
Typedef	Ends with "_t"	PRCM_Struct_t
Definition	Starts with the module name and is followed by the register name	#define SMS_ERR_TYPE *((volatileUint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C)
Enumeration	Starts with the module name	Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t;

Copyright © 2015–2020, Texas Instruments Incorporated

Flow Chart Rules

Flow charts follow the following rules:

Shape	Name	Definition
	Process	Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information
	Decision	A decision or switching-type operation that determines which of a number of alternate paths is followed
	Predefined process or sub-process	One or more named operations or program steps specified in a subroutine or another set of flow charts
	Data or I/O	General I/O function; information available for processing (input) or recording of processed information (output)
	Terminator	Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine
	Annotation	Additional descriptive clarification, comment
	On page connector (reference)	Exit to, or entry from, another part of chart in the same page
	Off page connector (reference)	The flow continues on a different page.
	Summing Junction	Logical AND
	Or	Logical OR
	Parallel mode (ISO)	Beginning or end of two or more simultaneous operations
	Flow Line	Lines indicate the sequence of steps and the direction of flow.

1.1 TDA2x Overview

The TDA2x is a high-performance, automotive vision application device based on enhanced OMAP™ architecture integrated on a 28-nm technology.

- The architecture is designed for Advanced Driver Assistance System applications, including Vision Analytics for Single/Dual Front Camera, LVDS/Ethernet Surround View, Night Vision, Blind Spot Detection, Sensor Fusion and LIDAR, among others, and best-in-class CPU performance, video, image, and graphics processing sufficient to support:
  - Streaming video up to full high definition (Full-HD) (1920×1080p, 60 fps)
  - 2-dimensional (2D) and 3-dimensional (3D) graphics

NOTE: The supported set of features and peripherals is device part number dependent. Refer to device-specific Data Manual, for more information.

- The device is composed of the following subsystems:
  - Cortex®-A15 microprocessor unit (MPU) subsystem, including two ARM® Cortex-A15 cores
  - Two digital signal processor (DSP) C66x subsystems
  - Image and video accelerator high-definition (IVA-HD) subsystem
  - Two Cortex®-M4 image processing unit (IPU) subsystems, each including two ARM Cortex-M4 microprocessors available for general purpose usage
  - Four Embedded Vision Engine (EVE) subsystems
  - Display subsystem (DSS)
  - Video Processing subsystem (VPE)
  - Video Input Capture (VIP)
  - 3D-graphics processing unit (GPU) subsystem, including POWERVR™ SGX544 dual-core
  - 2D-graphics accelerator (BB2D) subsystem, including Vivante™ GC320 core
  - Three pulse-width modulation (PWM) subsystems
  - Real-time clock (RTC) subsystem
  - Debug subsystem
- The device provides a rich set of connectivity peripherals, including among others:
  - One USB3.0 and three USB2.0 subsystems
  - Two PCI Express Gen2 subsystems
  - Gigabit Ethernet (GMAC) subsystem
  - SATA 2 subsystem
  - Two Controller Area Network (DCAN) subsystems
- The device includes support for functional safety system requirements:
  - Error Detection and Correction:
    - Parity bit per byte on C66x DSP L1 program cache and Single-Error Correction Dual-Error Detection (SECDED) on L2 memories on the DSP
    - SECDED on Large L3 memory
    - EVE: Error detection for all internal data memories (DMEM, WBUF, IBUFLA, IBUFLB, IBUFHA, IBUFHB):
      - Single bit error detection (parity bit per byte) on DMEM, WBUF and IBUFs
      - Double bit error detection (distance 3, 10-bit hamming code) and parity on VCOP accesses to memory and working/image buffers in EVE
    - SECDED on external DDR memory interface (EMIF1 only)
  - MMU/MPU
    - MMU used for key masters (Cortex-A15 MPU, Cortex-M4 IPU, C66x DSP, EVE, EDMA)
    - Memory protection of C66x cores

Copyright © 2015–2020, Texas Instruments Incorporated

- MMU inside the Dynamic Memory Manager

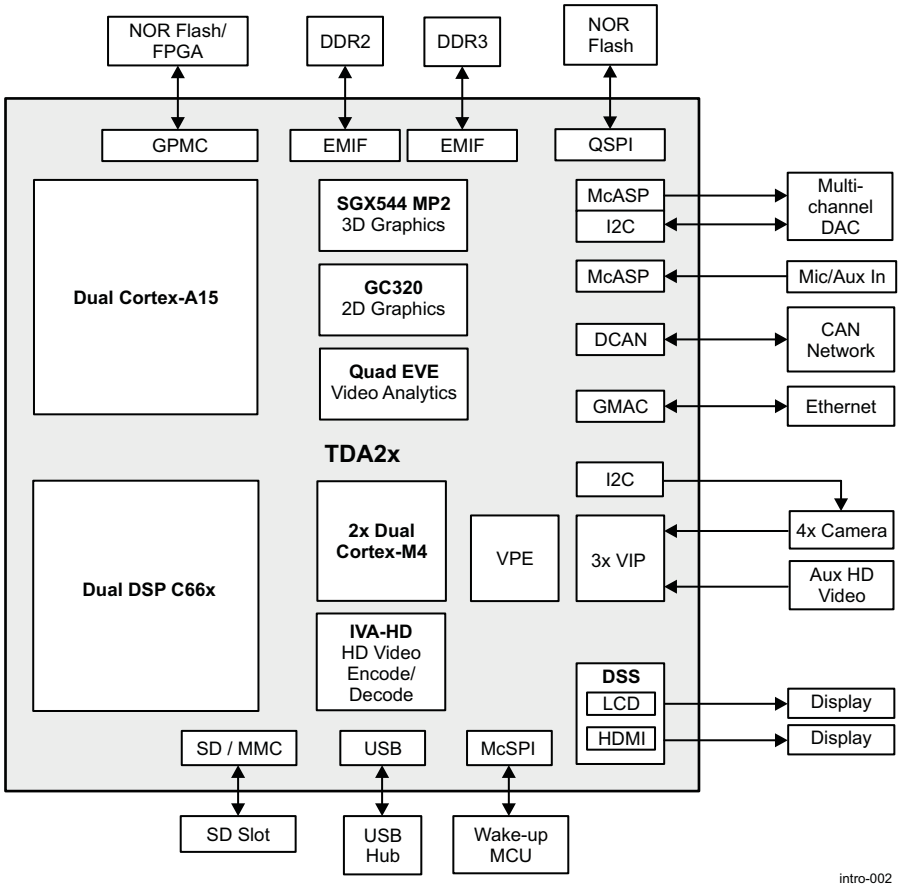
- The device includes state-of-the-art integrated power-management techniques required for high-performance automotive vision products.
- The device also integrates:
  - On-chip memory
  - External memory interfaces
  - Memory management
  - Level 3 (L3) and level 4 (L4) interconnects
  - System, audio and serial control peripherals

1.2 TDA2x Environment

This section provides an overview of the TDA2x environment.

Figure 1-1 is an example for a non-exhaustive environment for the device.

Figure 1-1. TDA2x Sample Environment Diagram



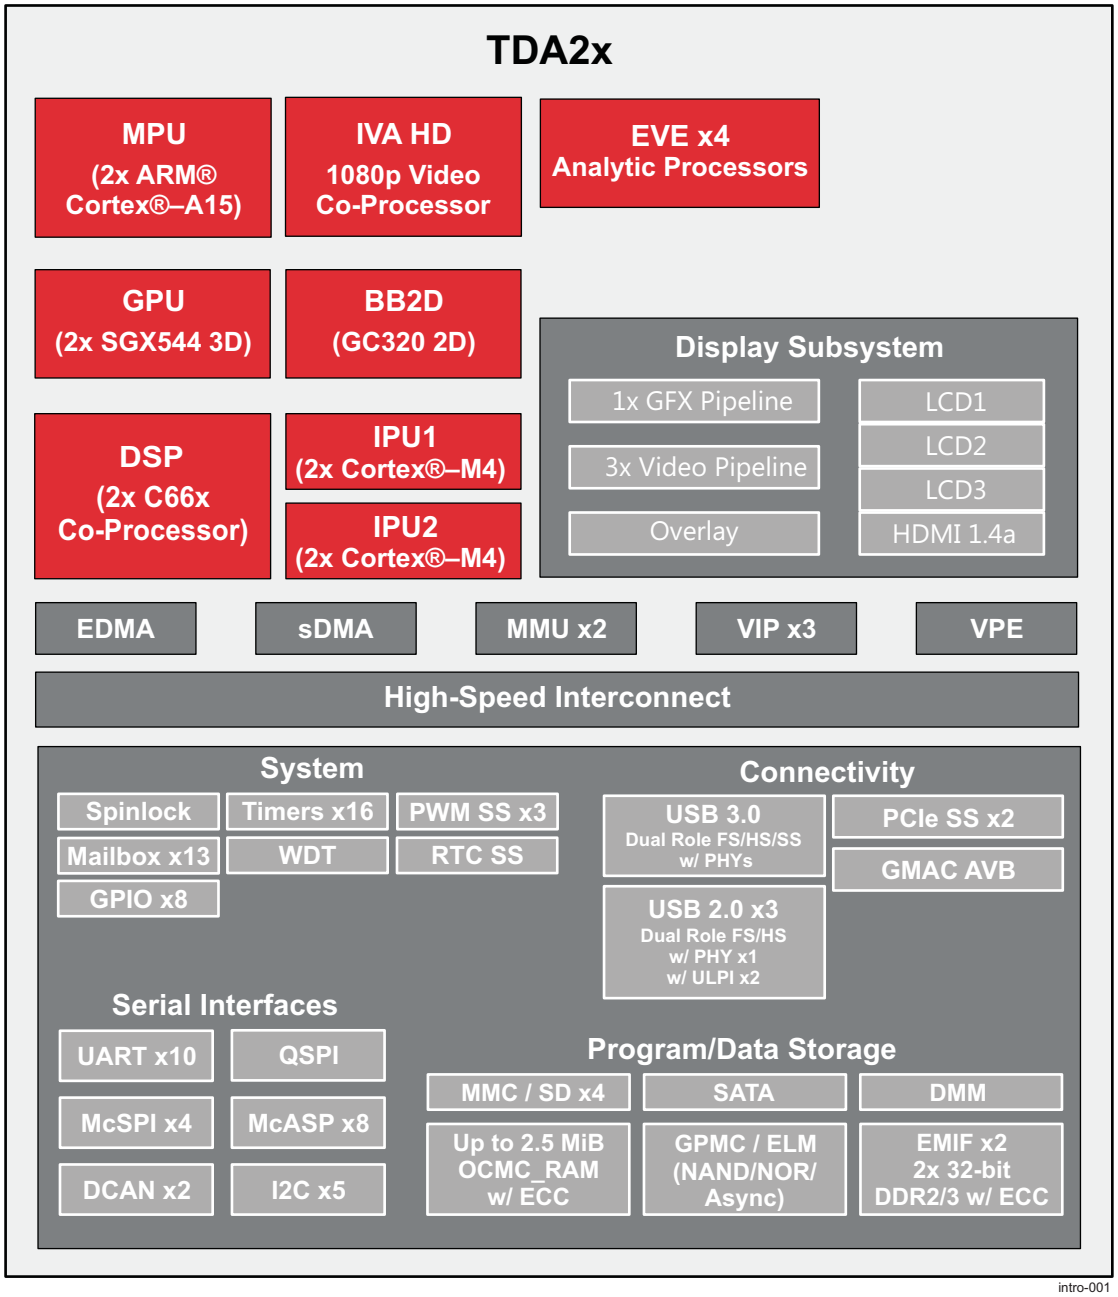
Copyright © 2015–2020, Texas Instruments Incorporated

1.3 TDA2x Description

The TDA2x device is offered in two types of packages. See Section 1.6, *TDA2x Package Characteristics Overview*, for more information.

Figure 1-2 is the block diagram of the TDA2x device.

Figure 1-2. TDA2x Block Diagram



NOTE: The supported set of features and peripherals is device part number dependent. Refer to device-specific Data Manual, for more information.

Copyright © 2015–2020, Texas Instruments Incorporated

1.3.1 MPU Subsystem

The Cortex-A15 MPU subsystem integrates the following submodules:

- ARM Cortex-A15 MPCore
  - Two central processing units (CPUs)
  - ARM Version 7 ISA: Standard ARM instruction set plus Thumb®-2, Jazelle® RCT Java™ accelerator, hardware virtualization support, and large physical address extensions (LPAE)
  - Neon™ SIMD coprocessor and VFPv4 per CPU
  - Interrupt controller with up to 160 interrupt requests
  - One general-purpose timer and one watchdog timer per CPU
  - Debug and trace features
  - 32-KiB instruction and 32-KiB data level 1 (L1) cache per CPU
- Shared 2-MiB level 2 (L2) cache
- 48-KiB bootable ROM
- Local power, reset, and clock management (PRCM) module
- Emulation features
- Digital phase-locked loop (DPLL)

1.3.2 DSP Subsystems

There are two DSP subsystems in the device. Each DSP subsystem contains the following submodules:

- TMS320C66x™ VLIW DSP core for audio processing, and general-purpose imaging and video processing. It extends the performance of existing C64x+™ and C647x™ DSPs through enhancements and new features.
  - 32-KiB L1D, and 32-KiB L1P cache or addressable SRAM
  - 288-KiB L2 cache
    - 256-KiB configurable as cache or SRAM
    - 32-KiB SRAM
- Enhanced direct memory access (EDMA) engine for video and audio data transfer
- Memory management units (MMU) for address management.
- Interrupt controller (INTC)
- Emulation capabilities

1.3.3 EVE Subsystems

The Embedded Vision Engine (EVE) module is a programmable imaging and vision processing engine allowing late in-development or post-silicon processing requirements to be met by addition of differentiating features in imaging and vision products.

There are four EVE subsystems in the device, each consisting of:

- ARP32 scalar core with 32-KiB direct mapped program cache, and 32-KiB data memory
- VCOP vector core with 16 processing elements, 32-KiB working buffer, and four 16-KiB image buffers
- Integrated EDMA controller and memory management units
- Internal Mailboxes for EVE to EVE, and EVE to MPU/IPU/DSP communication

1.3.4 IPU Subsystems

There are two Cortex-M4 IPU subsystems in the device available for general purpose usage.

Each Cortex-M4 IPU subsystem includes the following components:

- Two Cortex-M4 CPUs
- ARMv7E-M and Thumb-2 instruction set architectures

Copyright © 2015–2020, Texas Instruments Incorporated

- Hardware division and single-cycle multiplication acceleration
- Dedicated INTC with up to 63 physical interrupt events with 16-level priority
- Two-level memory subsystem hierarchy
  - L1

    32-KiB shared cache memory
  - L2 ROM + RAM
    - 64-KiB RAM
    - 16-KiB bootable ROM
- MMU for address translation
- Integrated power management
- Emulation feature embedded in the Cortex-M4

1.3.5 IVA-HD Subsystem

The IVA-HD subsystem is a set of video encoder and decoder hardware accelerators.

The list of supported codecs can be found in the software development kit (SDK) documentation.

1.3.6 Display Subsystem

The display subsystem provides the control signals required to interface the device system memory frame buffer (SDRAM) directly to the displays. It supports hardware cursor, independent gamma curve on all interfaces, multiple-buffer, and programmable color phase rotation. The display subsystem allows low-power display refresh and arbitration between normal and low-priority pipelines.

The display subsystem consists of the following components:

- **Display controller:** Reads and displays the encoded pixel data stored in memory and writes the output of one of the overlays or one of the pipelines into the system memory. The display controller supports the following components:
  - Three video pipelines, one graphic pipeline, and one write-back pipeline. The graphic pipeline supports pixel formats such as: ARGB16-4444, RGB16-565, ARGB16-1555, ARGB32-8888, RGBA32-8888, RGB24-888. It allows selection of the color-depth expansion.
  - Write-back pipeline: Uses poly-phase filtering for independent horizontal and vertical resampling (upsampling and downsampling). It allows programmable color space conversion of RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12 or NV21, and selection of color-depth reduction from RGB24 to RGB16.
  - Three LCD outputs, each one with dedicated overlay manager, for support of active matrix color displays (up to 24-bit interface). Maximum listed resolutions are not supported concurrently on all outputs.
    - First main LCD output delivered on MIPI® DPI 1.0 LCD pixel interface, supporting up to WUXGA (1920 x 1200) with reduced blanking periods.
    - Second and third LCD outputs delivered on MIPI DPI 2.0 LCD pixel interfaces, supporting up to WUXGA (1920 x 1200) with reduced blanking periods.
  - One TV output with dedicated overlay manager to support HDMI v1.4a interface (1080p @ 60 fps video and multichannel audio)
  - Own direct memory access (DMA) engine
- **High-definition multimedia interface (HDMI) encoder** with the following main features:
  - HDMI 1.4a and DVI 1.0 compliant

1.3.7 Video Processing Subsystem

The video processing engine (VPE) module provides support for the following memory-to-memory operations:

- Reads of raster or tiled YUV420 coplanar, YUV422 coplanar, or YUV422 interleaved video

Copyright © 2015–2020, Texas Instruments Incorporated

- Deinterlacing up to two 1080i video streams
- Scaling up to 1080p (1920x1080 resolution) of the input video
- Chroma up- and downsampling
- VC-1 Range Mapping and Range Reduction
- Color space conversion
- Writes of the resulting video in YUV420 coplanar (raster or tiled), YUV422 coplanar (raster or tiled), YUV422 interleaved (raster or tiled), YUV444 single plane (raster only), or RGB888 (raster only).

1.3.8 Video Capture

There are three Video Input Port (VIP) modules in the device, providing video capture functions.

VIP1 and VIP2 modules support each up to:

- Two separate 24-bit video ports for parallel RGB/YUV/RAW (or BT656/1120) data, up to 165 MHz
- Two separate 8-bit video ports for YUV/RAW (or BT656) data, up to 165 MHz

VIP3 module supports up to two separate 16-bit video ports for parallel RGB/YUV/RAW (or BT656/1120) data, up to 165 MHz.

Each VIP module supports:

- Embedded Sync (multiplexed sources) and Discrete Sync (single source) data interface modes
- Color space conversion and scaling:
  - Up to 2047 pixels wide input with scaling
  - Up to 3840 pixels wide input - when chroma up/down sampling without scaling
  - Up to 4095 pixels wide input - without scaling and chroma up/down sampling
  - Maximum supported input resolution is further limited by:
    - Pixel clock and feature-dependent constraints
    - For RGB24-bit format (RAW data), the maximum frame width is limited to 2730 pixels
- Embedded DMA engine, supporting tiled (2D) and raster addressing

1.3.9 3D GPU Subsystem

The 3D graphics processing unit (GPU) subsystem is based on POWERVR® SGX544 subsystem from Imagination Technologies. It provides support for photo-realistic high-performance 3D graphics. The GPU can process different data types simultaneously, such as: pixel data, vertex data, video data, and general-purpose data.

The GPU subsystem has the following features:

- Multicore GPU architecture: two SGX544 cores. Shared system level cache of 128 KiB
- Tile-based deferred rendering architecture
- Second-generation universal scalable shader engines (USSE2), multithreaded engines incorporating pixel and vertex shader functionality
- Present and texture load accelerators
  - Enables to move, rotate, twiddle, and scale texture surfaces.
  - Supports RGB, ARGB, YUV422, and YUV420 surface formats.
  - Supports bilinear upscale.
  - Supports source colorkey.
- Industry-standard API supports DirectX® 9, OpenVG™ 1.1, and OpenCL™1.1 Embedded Profile
- Fine-grained task switching, load balancing, and power management
- Programmable high-quality image antialiasing
- Bilinear, trilinear, anisotropic texture filtering
- Advanced geometry DMA driven operation for minimum CPU interaction

Copyright © 2015–2020, Texas Instruments Incorporated

- Fully virtualized memory addressing for OS operation in a unified memory architecture (MMU)

1.3.10 BB2D Subsystem

The 2D BitBlt (BB2D) graphics accelerator subsystem is based on the GC320 core from Vivante Corporation and has the following features:

- API support:
  - OpenWF™, DirectFB
  - GDI/DirectDraw
  - Adobe® Flash®
- BB2D architecture:
  - BitBlt and StretchBlt
  - DirectFB hardware acceleration
  - ROP2, ROP3, ROP4 full alpha blending and transparency
  - Clipping rectangle support
  - Alpha blending includes Java 2 Porter-Duff compositing rules
  - 90-, 180-, 270-degree rotation on every primitive
  - YUV-to-RGB color space conversion
  - Programmable display format conversion with 14 source and 7 destination formats
  - High-quality, 9-tap, 32-phase filter for image and video scaling at 1080p
  - Monochrome expansion for text rendering
  - 32K × 32K coordinate system

1.3.11 On-Chip Debug Support

The on-chip debug support has the following features:

- Multiprocessor debugging lets users control multiple CPU cores embedded in the device, such as:
  - Global starting and stopping of individual or multiple processors
  - Each processor can generate triggers that can be used to alter the execution flow of other processors
  - System clocking and power down
  - Interconnection of multiple devices
  - Channel triggering
- Target debugging, using IEEE1149.1 (JTAG®)
- Reduction of power consumption in normal operating mode

The debug subsystem includes:

- Generic TAP for emulation and test control (ICEPick-D™)
- Debug access port (DAP)
- Embedded Trace Macro (ETM)
- Trace Port Interface Unit (TPIU)
- Embedded Trace Buffer (ETM)
- Emulation Pin Manager (EPM)
- Cross triggering (XTRIG)

The debug subsystem provides also:

- ICEMelter, for controlling the wake-up and power-down of the emulation power domain
- L3_INSTR CORE instrumentation interconnect
- OCP watch-point (OCP-WP), for monitoring L3 interconnect transaction when target transaction attributes match the user-defined attributes or trigger on external debug event

Copyright © 2015–2020, Texas Instruments Incorporated

- Power-management events profiler (PM instrumentation)
- Clock-management events profiler (CM instrumentation)
- Statistics collector (performance probes)

1.3.12 Power, Reset, and Clock Management

The PRCM module allows efficient control of clocks and power according to the required performance, and reduction of power consumption. The PRCM module is divided into:

- Power and reset management (PRM) with the following features:
  - Dynamic clock gating
  - Dynamic voltage and frequency scaling (DVFS)
  - Dynamic power switching (DPS)
  - Static leakage management (SLM)
- Clock management (CM) for clock generation and distribution, allowing reduction of dynamic consumption.

1.3.13 On-Chip Memory

- The device includes three instantiations of an On-Chip Memory Controller (OCMC) with associated RAM with ECC, with total size of 2.5MB
- Circular buffer feature for each OCMC RAM (8-MiB virtual address space required) allowing on-the-fly processing of VIP data by EVE
- Save and Restore Memory / Scratch Pad in the wake-up domain

1.3.14 Memory Management

The memory management is performed from:

- System DMA controller with up to 128 hardware requests, 32 prioritizable logical channels, and 256 × 64-bit FIFO dynamically allocable between active channels.
- Enhanced DMA (EDMA) controller supporting two simultaneous read and two simultaneous write physical channels, and up to 64 programmable logical channels.
- Dynamic memory management (DMM) module, which performs global address translation, address rotation (tiling), and access interleaving between the two EMIF channels.
- Two memory management units (MMU), with 4KiB, 64KiB, 1MiB, 16MiB programmable page sizes, and 32 entries TLB.
  - MMU1 dedicated to EDMA
  - MMU2 dedicated to PCIe

1.3.15 External Memory Interfaces

- Two 32-bit DDR2 / DDR3 controllers (EMIF1 and EMIF2), each of which with the following features:
  - Dual-port controller for efficient memory sharing between applications
  - 32-bit data path, one chip-select per memory controller
  - Memory density up to 2 GiB supported over one chip-select providing a total SDRAM space of 4GiB addressable by the MPU extended address range.
  - EMIF1 controller supports Single bit Error Correction and Dual Error Detection (SECDED)
    - SECDED supported in both 32-bit and 16-bit/Narrow mode
    - Programmable address ranges to define SECDED protected region
    - Parity bits calculated and stored on all writes to SECDED protected address region
    - Parity bits verified on all reads from SECDED protected address region
    - Statistics for 1-bit and 2-bit errors
- General-purpose memory controller (GPMC) supporting connection with:

Copyright © 2015–2020, Texas Instruments Incorporated

  - Asynchronous SRAM memories
  - Asynchronous and synchronous NOR flash memories
  - NAND flash memories, with up to 16-bit ECC via the Error Location Module (ELM)
  - Pseudo-SRAM devices
- Quad SPI module, supporting 1 to 4 address bytes for SPI NOR flash, and up to 66-MHz single data rate

1.3.16 System and Connectivity Peripherals

The device supports a rich set of peripherals to provide flexible and high-speed interfacing and on-chip programming resources.

1.3.16.1 System Peripherals

- Sixteen general-purpose timers (two timer modules supporting 1-ms tick generation)
- One watchdog timer (WDT)
- One 32-kHz synchronization timer
- System control module, which contains registers for the following functions:
  - Static device configuration
  - Debug and observability
  - Status
  - Pad configuration
  - I/O configuration
  - eFuse logic
  - Analog function control
  - System boot decoding logic
- Thirteen system Mailboxes for communication between MPU, DSP, and IPU subsystems.
- SpinLock module for hardware semaphore between the MPU, DSP, and IPU subsystems.
- Inter-processor Communication Register.
- Three Pulse Width Modulation Subsystems (PWMSS), each containing Enhanced High Resolution Pulse Width Modulator (eHRPWM), Enhanced Capture (eCAP), and Enhanced Quadrature Encoded Pulse (eQEP) modules.
- Real-Time-Clock Subsystem (RTCSS), supporting four external wake-up inputs and one power enable output, all of which are 3.3- or 1.8-V multivoltage I/Os.
- Eight general-purpose input/output (GPIO) modules with 32 I/Os each. One GPIO module supporting wake-up request generation.

1.3.16.2 Media Connectivity Peripherals

- Four HS-MMC/SD/SDIO modules:
  - Two modules acting as HS-MMC/SD initiator controllers, supporting JEDEC JESD84 v4.5-A441 and SD3.0 physical layer with SDA3.00 standards
    - One controller with 8-bit interface for JESD84 memories with dual voltage IOs (1.8 or 3.3 V). Another controller with 4-bit interface for external card support with embedded dual voltage I/Os (1.8 or 3 V) and supporting UHS-I rates.
    - Each controller including its DMA controller compliant to ADMA2 (SDA3.00 Part A2 DMA controller)
  - Two modules acting as SDIO interface controllers. One controller supporting 4-bit data bus width. Another controller supporting up to 8-bit data bus width.
- One SuperSpeed Universal Serial Bus (USB) Dual-Role-Device (DRD) subsystem with embedded HS and SS PHYs, compatible with the USB2.0 (up to 480 Mbps) and USB3.0 (5 Gbps) standards
- Three High Speed USB subsystems:

Copyright © 2015–2020, Texas Instruments Incorporated

- One HS USB subsystem with embedded HS PHY, supporting up to 480 Mbps.
- Two HS USB subsystems, each with with ULPI (SDR) interface to external HS PHY, supporting up to 480 Mbps.

- One SATA subsystem, providing interface for solid-state drive (SSD) or hard-disk drive (HDD) mass storage. Supports one HBA port with SATA-2 generation speed of 3 Gbps.

1.3.16.3 Car Connectivity Peripherals

- One Gigabit Ethernet subsystem (GMAC), supporting 10, 100, or 1000 Mbps. The subsystem provides one external Ethernet port and one internal CPPI interface port with AVB/Industrial Ethernet and 802.1ae support. Included support for 3.3-V RMII/MII and 1.8- or 3.3-V RGMII.
- Two DCAN controllers, supporting bitrates up to 1 Mbit/s and compliant to the Controller Area Network (CAN) 2.0B protocol specification.
- Two PCI Express subsystems, one providing Gen2 compliant 2-lane port, and the other providing Gen2 compliant 1-lane port, up to 5.0 Gbps per lane. Both PCIe subsystems provide support for either Root Complex or Endpoint. The two PCIe subsystems share common 2-lane PCIe PHY, configurable to operate either as 2-lane to one controller (PCIe_SS1) or two separate lanes to two controllers (PCIe_SS1 and PCIe_SS2).

1.3.16.4 Audio Connectivity Peripherals

- Eight multichannel audio serial ports (McASP):
  - Two McASP supporting up to 16 channels each and independent TX/RX clock/sync domains
  - Six McASP supporting up to 4 channels each and unified clock/sync domain
  - Features list of the McASP include:
    - Independent transmit and receive modules, each including programmable clock and frame sync generator, TDM streams from 2 to 32, support for time slot sizes up to 32 bits, data formatter for bit manipulation
    - Glueless connection to audio analog-to-digital converters (ADC), digital-to-analog converters (DAC), codec, digital audio interface receiver (DIR), and S/PDIF transmit physical layer components.
    - Wide variety of I2S and similar bit-stream formats
    - Integrated digital audio interface transmitter (DIT) supporting S/PDIF, IEC60958-1, AES-3 formats, and enhanced channel status/user data RAM
    - 384-slot TDM with external digital audio interface receiver (DIR) device
    - Extensive error checking and recovery

1.3.16.5 Serial Control Peripherals

- Ten universal asynchronous receiver/transmitter (UART) modules as serial-communication interfaces, 16C750 compatible.
  - One UART module supporting extended modem control signals
  - One UART module with IrDA features
- Four general-purpose multichannel serial peripheral interface (McSPI) modules
- Five multimaster HS I^2C controller modules, compliant with Philips I^2C specification version 2.1.
  - I2C1 and I2C2 controllers suppot Fast-mode, with rates up to 400 Kbps
  - I2C3, I2C4 and I2C5 controllers support High-speed mode, with rates up to 3.4 Mbps

1.4 TDA2x Family

The TDA2x family is composed of the following devices:

- Vision Super Surround 28
- Vision High Surround 28
- Vision Mid Surround 28
- Vision Super 28
- Vision High 28
- Vision Mid 28

The supported set of features and peripherals is device part number dependent. Refer to device Data Manual, for more information.

1.5 TDA2x Device Identification

Table 1-1 describes the identification registers.

The identification registers include the data registers listed in Table 1-2 and Table 1-4. These registers are read-only accessed ports that are programmed into eFuses FARM FROM.

Table 1-1. Device Identification Register Fields

Register Field	Alias Name	Physical Address	Address Offset
CTRL_CORE_STATUS[8:6] DEVICE_TYPE	DEVICE_TYPE	0x4A00 2134	0x134
CTRL_WKUP_STD_FUSE_DIE_ID_0[31:0] STD_FUSE_DIE_ID_0	DIE_ID[31:0]	0x4AE0 C200	0x200
CTRL_WKUP_ID_CODE[31:0] STD_FUSE_IDCODE	ID_CODE	0x4AE0 C204	0x204
CTRL_WKUP_STD_FUSE_DIE_ID_1[31:0] STD_FUSE_DIE_ID_1	DIE_ID[63:32]	0x4AE0 C208	0x208
CTRL_WKUP_STD_FUSE_DIE_ID_2[31:0] STD_FUSE_DIE_ID_2	DIE_ID[95:64]	0x4AE0 C20C	0x20C
CTRL_WKUP_STD_FUSE_DIE_ID_3[31:0] STD_FUSE_DIE_ID_3	DIE_ID[127:96]	0x4AE0 C210	0x210
CTRL_WKUP_STD_FUSE_PROD_ID_0[31:0] STD_FUSE_PROD_ID	PROD_ID	0x4AE0 C214	0x214

Table 1-2. DIE_ID

Register Field	Alias Name	Value
CTRL_WKUP_STD_FUSE_DIE_ID_0[31:0] STD_FUSE_DIE_ID_0	DIE_ID[31:0]	This register is for internal-use only.
CTRL_WKUP_STD_FUSE_DIE_ID_1[31:0] STD_FUSE_DIE_ID_1	DIE_ID[63:32]	This register is for internal-use only.
CTRL_WKUP_STD_FUSE_DIE_ID_2[31:0] STD_FUSE_DIE_ID_2	DIE_ID[95:64]	Part number identifier. See Table 1-3 for more information.
CTRL_WKUP_STD_FUSE_DIE_ID_3[31:0] STD_FUSE_DIE_ID_3	DIE_ID[127:96]	Reserved

The part number identification data can be read in the [31:0] STD_FUSE_DIE_ID_2 bit-field of the CTRL_WKUP_STD_FUSE_DIE_ID_2 register. See Table 1-3 for more information.

1.6 TDA2x Package Characteristics Overview

The TDA2x die will be offered with the following characteristics:

- Package type 1
  - Body: 23 × 23 mm
  - Technology: Ball Grid Array (BGA) package
  - Ball pitch: 0.8-mm ball pitch with Via Channel™ Array (VCA) technology
  - Pattern: partial grid
  - Pins: 760 total device pins
- Package type 2
  - Body: 17 × 17 mm
  - Technology: Ball Grid Array (BGA) package
  - Ball pitch: 0.65-mm ball pitch with microvia
  - Pattern: full grid
  - Pins: 625 total device pins

For more information refer to device Data Manual.

2.1 Introduction

The microprocessor unit (MPU) has a 32-bit address port, which allows it to handle a 4-GiB space divided into several regions, depending on the target type.

The memory map has the following features that are shared among the initiators, such as the MPU subsystem:

- Memory space: General-purpose memory controller (GPMC)
- Dynamic memory management (DMM) controller
- Register spaces: Level 3 (L3) and level 4 (L4) interconnects
- Dedicated spaces: EVE/IPU/DSP subsystem.

The GPMC and DMM are dedicated to memory connection. The GPMC is used for NOR and NAND flash and static random access memories (SRAMs). The DMM is used for synchronous dynamic random access memories (SDRAMs), such as DDR. For more information, see Section 15.2, *Dynamic Memory Manager*, and Section 15.3, *EMIF Controller*.

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers across the platform between initiators and targets are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see Section 14.2, *L3 Interconnect*, and Section 14.3, *L4 Interconnect*.

Figure 2-1 shows the interconnect of the device and the main modules and subsystems in the platform.

NOTE: The supported set of features and peripherals is device part number dependent. Refer to device Data Manual, for more information.

2.2 L3_MAIN Memory Map

The memory space system is hierarchical: level 1 (L1), level 2 (L2), L3_MAIN, and L4. L1 and L2 are memories in the MPU, IPU, and digital signal processor (DSP) subsystems. L3_MAIN handles many types of data transfers, including data exchange with system on-chip/external memories. The chip-level interconnect, which consists of one L3_MAIN and five L4s, enables communication among all modules and subsystems.

This section provides a global view of the memory mapping of the device at the L3_MAIN interconnect and describes the boot, GPMC, and SDRAM controller (SDRC) (EMIF/DMM) spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- L1: The four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GiB address space (the total low-address space is 4 GiB, 32-bit). The CPU extended address range is labeled as high memory (Q8 – Q15) and provides a total of 8 GiB.
- L2: Each quarter is divided into eight blocks of 32 MiB, with target spaces mapped in the blocks.

This organization allows the decoding of all target spaces based on the 7 most-significant bits (MSBs) of the 32-bit address ([31:25]).

- Boot space:

  When booting from the on-chip ROM with the appropriate external sys_boot pin configuration, the lowest 1-MiB memory space [0x0000 0000–0x000F FFFF] is redirected to the on-chip boot ROM address space [0x4000 0000–0x400F FFFF].

  When booting from the GPMC, the memory space is part of the GPMC address space. At reset, the 0x0000 0000 address is available on chip-select 0 (CS0) for a memory size of 16 MiB.

  For more information about the sys_boot pins configuration, see Section 15.4, *General-Purpose Memory Controller*, and Chapter 29, *Initialization*.
- GPMC space:

  Eight independent GPMC chip-selects (CS0 to CS7) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM. The chip-selects have a programmable start address and programmable size (up to 128 MiB) in a total memory space of (Q0) 1GiB, but limited now to 512 MiB.
- EMIF1/EMIF2 CS0 space:

  Q2 addressing space is interleaved on two DDR-memory controllers (EMIF1 and EMIF2), each activating its CS0 line. These chip-selects can be programmed to 64, 128, 256, 512, 1024, and 2048 MiB. Interleaving occurs at 128-byte granularity.

  The EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GiB address space at reset (interleaving is disabled at reset).

  Q3 addressing space is interleaved on two SDRAM controllers (EMIF1 and EMIF2), each activating its CS0 line. These chip-selects can be programmed to 64, 128, 256, 512, and 1024 MiB. Interleaving occurs at 128-byte granularity.

  EMIF1-CS0 and EMIF2-CS0 in Q3 space are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0 in Q2 space, regardless of the address range programmed.
- TILER space:

  Q3 addressing space is also used to access the TILER system. This space is visible only for the Display Subsystem (DSS). See Table 2-12.
- 8 GiB of SDRAM virtualization (only 4 GiB are physically available; the other 4 GiB are reserved):

  This is a high address range (Q8 – Q15) that requires an address greater than 32 bits. This space is visible only for the MPU Subsystem. See Table 2-8.

Table 2-1 describes the global memory map.

	QSPI_ADDRSP1	0x5C00_0000	0x5FFF_FFFF	64MiB	QSPI CS0/CS1/CS2/CS3 space (Maddrspace 1)
	TILER	0x6000_0000	0x7FFF_FFFF	512MiB	SDRAM addressing through DMM with TILER off
Q2[4] (1GiB)	DDR-SDRAM address space				
	EMIF1_SDRAM_CS0	0x8000_0000	0xBFFF_FFFF	1GiB	EMIF1 CS0: Access to DDR
	EMIF2_SDRAM_CS0	0x8000_0000	0xBFFF_FFFF	1GiB	EMIF2 CS0: Access to DDR
Q3[4] (1GiB)	EMIF1_SDRAM_CS0	0xC000_0000	0xFFFF_FFFF	1GiB	EMIF1 CS0: Access to DDR
	EMIF2_SDRAM_CS0	0xC000_0000	0xFFFF_FFFF	1GiB	EMIF2 CS0: Access to DDR

[4] Depending on the DMM_LISA_MAP_i settings the Q2 address space can be configured in the following ways:
- Allocated only to EMIF1_SDRAM_CS0
- Allocated only to EMIF2_SDRAM_CS0
- Shared between EMIF1_SDRAM_CS0 and EMIF2_SDRAM_CS0 but not interleaved
- Interleaved between EMIF1_SDRAM_CS0 and EMIF2_SDRAM_CS0

The same applies to the Q3 address space.

2.2.1 L3_INSTR Memory Map

The L3_INSTR interconnect is a 8-MiB space composed of the L3_INSTR interconnect configuration registers and module registers.

Table 2-2 describes the mapping of the registers for the L3_INSTR interconnect.

Table 2-2. L3_INSTR Memory Map

2.3 L4 Memory Map

The L4 interconnects handle transfers with peripherals. The L4 interconnect comprises the following interconnects:

- L4_CFG
- L4_WKUP
- L4_PER1
- L4_PER2
- L4_PER3

The L4 interconnect can be configured to tune the access according to the characteristics of each module.

The following sections describe the register mapping of the L4 interconnect. Software configures these registers.

2.3.1 L4_CFG Memory Map

The L4_CFG interconnect is a 12-MiB space composed of the L4_CFG interconnect configuration registers and the module registers.

Table 2-3 describes the mapping of the registers for the L4_CFG interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_CFG interconnect. All other accesses are internal to the L4_CFG interconnect.

Table 2-3. L4_CFG Memory Map

Module name	Region Name	Start_address (hex)	End_address (hex)	Size	Description

2.3.2 L4_WKUP Memory Map

The L4_WKUP interconnect is a 256-KiB space composed of the L4_WKUP interconnect configuration registers and the module registers.

Table 2-4 describes the mapping of the registers for the L4_WKUP interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_WKUP interconnect. All other accesses are internal to the L4_WKUP interconnect.

Table 2-4. L4_WKUP Memory Map

Module name	Region name	Start_address (hex)	End_address (hex)	Size	Description
L4_WKUP	L4_WKUP_AP	0x4AE0_0000	0x4AE0_07FF	2 KiB	Address protection

NOTE: 8- and 16-bit peripherals are aligned on 32-bit address boundaries.

2.4 L4_PER Memory Map

The L4_PER interconnect has three memory spaces:

- L4_PER1 memory space (Table 2-5)
- L4_PER2 memory space (Table 2-6)
- L4_PER3 memory space (Table 2-7)

The L4_PER interconnects are composed of the L4_PER interconnect confguration registers and the module registers.

NOTE: All memory spaces described as modules provide direct access to the module registers outside the L4_PER interconnects. All other accesses are internal to the L4_PER interconnects.

2.4.1 L4_PER1 Memory Map

Table 2-5 describes the mapping of the registers for the L4_PER1 interconnect.

Q10(5)	EMIF1_SDRAM_CS0	0x02_8000_0000	0x02_BFFF_FFFF	1GiB	EMIF1 CS0: Access to DDR. Alias of Q2 (see Table 2-1).
	EMIF2_SDRAM_CS0	0x02_8000_0000	0x02_BFFF_FFFF	1GiB	EMIF2 CS0: Access to DDR. Alias of Q2 (see Table 2-1).
Q11(5)	EMIF1_SDRAM_CS0	0x02_C000_0000	0x02_FFFF_FFFF	1GiB	EMIF1 CS0: Access to DDR. Alias of Q3 (see Table 2-1).
	EMIF2_SDRAM_CS0	0x02_C000_0000	0x02_FFFF_FFFF	1GiB	EMIF2 CS0: Access to DDR. Alias of Q3 (see Table 2-1).
Q12	Reserved	0x03_0000_0000	0x03_3FFF_FFFF	1GiB	Reserved
Q13	Reserved	0x03_4000_0000	0x03_7FFF_FFFF	1GiB	Reserved
Q14	Reserved	0x03_8000_0000	0x03_BFFF_FFFF	1GiB	Reserved
Q15	EMIF2_SDRAM_CS0	0x03_C000_0000	0x03_FFFF_FFFF	1GiB	EMIF2 CS0: Access to DDR
	8 GiB(3) of SDRAM virtualization when interleaving(4) is enabled.				
Q8	EMIF1_SDRAM_CS0	0x02_0000_0000	0x02_3FFF_FFFF	1GiB(6)	EMIF1 CS0: Access to DDR
	EMIF2_SDRAM_CS0	0x02_0000_0000	0x02_3FFF_FFFF	1GiB(6)	EMIF2 CS0: Access to DDR

(1) Boot space location depends on the external sys_boot [5:0] pins.

(2) Ex = Executable

(3) Only 4 GiB are physically available within this 8-GiB address range.

(4) Interleaving is configurable with one setting in the MPU memory adapter (MPU_MA) for all 8 GiB of SDRAM high memory. For more information about interleaving, see Section 4.3.4, *Memory Adapter*.

(5) As Q10 is alias of Q2, depending on the DMM_LISA_MAP_i settings the Q10 address space can be configured in the following ways:
- Allocated only to EMIF1_SDRAM_CS0
- Allocated only to EMIF2_SDRAM_CS0
- Shared between EMIF1_SDRAM_CS0 and EMIF2_SDRAM_CS0 but not interleaved
- Interleaved between EMIF1_SDRAM_CS0 and EMIF2_SDRAM_CS0

The same applies to the Q11 address space, as it is alias of Q3.

(6) Because of the fixed MPU-to-EMIF address mapping with high-order interleaving enabled only 512MiB of this address space are used by EMIF1_SDRAM_CS0. The other 512MiB are used by EMIF2_SDRAM_CS0.

2.6 IPU Memory Map

The device implements two IPU subsystems (IPU1, IPU2). For more information about IPU, see Chapter 7.

Table 2-9 describes the IPU memory mapping.

NOTE: Some of the system (L3) resources, such as EVE and EDMA, are not directly accessible by IPU, as they are overlapping with IPU's own resources in its memory space. In such cases, software must properly configure IPU AMMU / L2 MMU so that IPU can access these system resources.

Table 2-9. IPU Memory Map

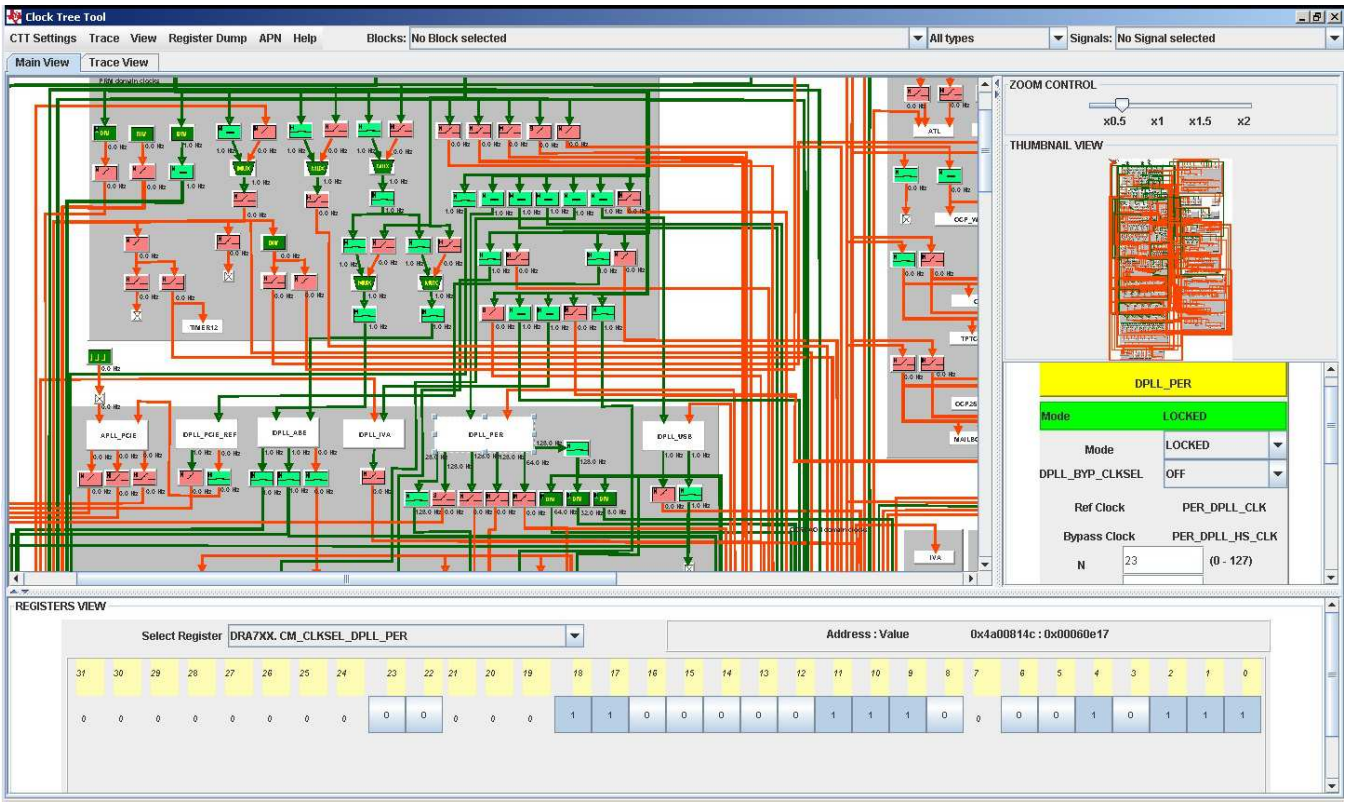
NOTE: For a detailed visual representation of the distribution and management of the device clocks at the PRCM level, see the clock device interactive software for the device CLOCKTREETOOL-AUTOMOTIVE.

Programmable Real-Time Unit and Industrial Communication Subsystems (PRU-ICSS) is not supported in this family of devices.

Figure 3-1. Clock Tree Tool (CTT)



prcm-095

The Clock Tree Tool (CTT) is a Java™-based, stand-alone application. The CTT is interactive clock tree configuration software for the device. The CTT lets the user:

- Visualize the device clock tree
- Interact with clock tree elements and view the effect on PRCM registers
- Interact with the PRCM registers and view the effect on the device clock tree
- View a trace of all the device registers affected by the user interaction with clock tree
- Extract registers and register dumps for Code Composer Studio™ and Lauterbach

The advantage of the CTT is that the user can visualize the clock tree state of the device on power-on reset and then customize the configuration of the clock tree for the specific use case and identify the device register settings associated to that configuration. Furthermore, the user can dump and read in register settings for the specific scenarios.

Being an interactive visual tool, the CTT gives the user a global view of the device clock tree architecture and allows determining the exact register settings to obtain the specific configuration.

3.1 Device Power Management Introduction

Power management is one of the most important design aspects of any system.

Copyright © 2015–2020, Texas Instruments Incorporated

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

3.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture that supports multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains.

A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager considers the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

NOTE: In the following sections, the term <*module*> is used to represent the device IPs (that is, modules or subsystems), other than the PRCM module, that receive clock, reset, or power signals from the PRCM module.

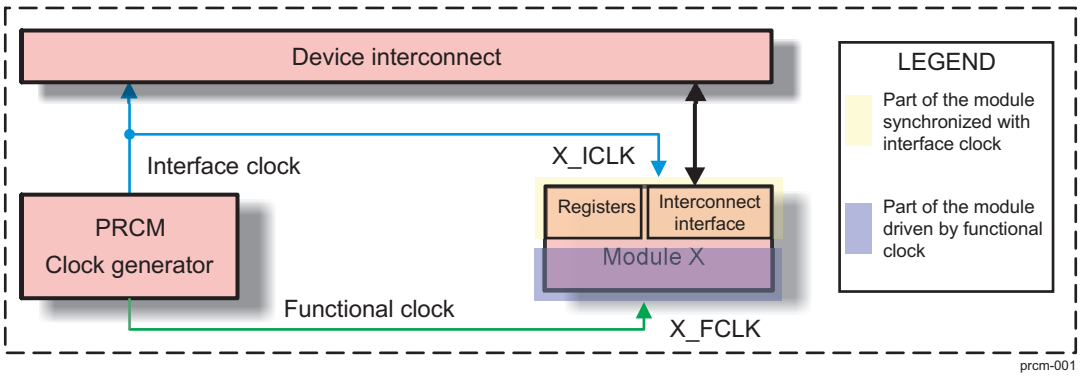
3.1.1.1 Clock Management

The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

3.1.1.1.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristics requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks (see Figure 3-2).

Figure 3-2. Functional and Interface Clocks



The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.

Copyright © 2015–2020, Texas Instruments Incorporated

- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified with an _ICLK suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity (for example, the clock for the camera).
- From the standpoint of the PRCM module, a functional clock is distributed directly to the related modules through a dedicated clock tree. It is identified with an _FCLK suffix.

Some clocks are qualified as permanent clocks. They are functional clocks, that can stay active while the corresponding entity manages them.

NOTE: At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed by a PRCM module functional clock output or a PRCM module interface clock output. In the latter case, the functional and interface module clocks inherit the clock-management features (autoidle features) of the PRCM module interface clock.

3.1.1.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be active when operating in specific modes, or they may be gated. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks.

The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module) or it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

Master standby protocol

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for that purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes.

Similarly, when the master module no longer requires the clocks, it informs the PRCM module, which can then gate the clocks to the module. The master module is then said to be in standby mode.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the module. This is done by setting the <*Module*>_SYSCONFIG. MIDLEMODE or <*Module*>_SYSCONFIG. STANDBYMODE bit fields, as described in Table 3-1. The behavior, identified in the STANDBYMODE Bit Value column, must be configured.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-1. Master Module Standby Mode Settings

STANDBYMODE Bit Value	Selected Mode	Description
0x0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent loss of data at the time the clocks are gated.
0x1	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active; however, it is not efficient from a power-saving perspective because it never allows the PRCM module output clocks to be gated.
0x2	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
0x3	Smart-standby wake-up-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in standby state. The mode is relevant only if the appropriate module mwakeup output is implemented.

NOTE:

- Smart-standby mode is the preferred mode of operation, while force-standby and no-standby modes are intended for debugging purposes.
- A master module may support all or some of the standby modes listed in Table 3-1. See the power-management section in the module chapter to identify the supported standby mode.

The standby status of a master module is indicated by the CM_<*Power domain*>_<*Module*>_CLKCTRL[x]. STBYST bit in the PRCM module. Table 3-2 describes the master module standby status.

Table 3-2. Master Module Standby Status

STBYST Bit Value	Description
0x0	The module is functional.
0x1	The module is in standby mode.

Table 3-3 lists the enabling conditions for the master module clocks managed by the standby protocol.

Table 3-3. Master Module Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Master module standby request is deasserted.
		Master module wake-up request is asserted.

Slave idle protocol

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an IDLE request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module, and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module.

Similarly, an idled slave module may need to be woken up because of a service request from a master module or because the slave module receives a wake-up event (for example, an interrupt or a direct memory access [DMA] request). In this situation the PRCM module enables the clocks for the module, and then signals the module to wake up by deasserting the IDLE request.

Copyright © 2015–2020, Texas Instruments Incorporated

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the slave module. This is done by setting the <*Module*>_SYSCONFIG. SIDLEMODE or <*Module*>_SYSCONFIG. IDLEMODE bit field, as described in Table 3-4. The behavior, identified in the IDLEMODE Bit Value column, must be configured by software.

Table 3-4. Module Idle Mode Settings

IDLEMODE Bit Value	Selected Mode	Description
0x0	Force-idle	The module unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent loss of data at the time the clock is switched off.
0x1	No-idle	The module never acknowledges any IDLE request from the PRCM module. This mode is safe from a module point of view because it ensures the clocks remain active; however, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.
0x2	Smart-idle	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management.
0x3	Smart-idle wake-up-capable mode	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module swakeup output(s) is implemented.

NOTE:

- Smart-idle mode is the preferred mode of operation, while force-idle and no-idle modes are intended for debugging purposes.
- A slave module may support all or some of the idle modes listed in Table 3-4. See the power-management section in the module chapter to identify the supported idle modes.

The idle status of a slave module is indicated by the CM_<*Power domain*>_<*Module*>_CLKCTRL[x] IDLEST bit field in the PRCM module. Table 3-5 lists the possible idle statuses for a slave module.

Table 3-5. Slave Module Idle Status

IDLEST Bit Value	Idle Status	Description
0x0	Functional	The module is fully functional. The interface and functional clocks are active.
0x1	In transition	The module is performing a wake-up or a sleep transition.
0x2	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.
0x3	Full idle	The module is fully idle. The interface and functional clocks are gated.

When configured in smart-idle mode, the slave module may acknowledge the IDLE request of the PRCM module based on the activity of its interface and/or functional clocks. To define which module clocks (that is, interface and/or functional) should be considered when responding to the PRCM module request, software must configure the <*Module*>_SYSCONFIG[x] CLOCKACTIVITY bit field.

The CLOCKACTIVITY setting is used internally by the module to determine the part of the module on which the conditions to acknowledge the PRCM module IDLE request are tested. As an example, if the functional clock must remain active when the module is in idle mode, the module must acknowledge a PRCM module IDLE request by considering only the interface clock gating conditions (that is, there is no pending activity on the interconnect).

Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: See the power-management section in the module chapter to identify whether this feature is configurable.

Using the CLOCKACTIVITY setting along with smart-idle mode ensures that the clock remains active for the module features that must remain available during the module idle mode. Table 3-6 describes the possible CLOCKACTIVITY settings for a module.

Table 3-6. Slave Module Clock Activity Settings

CLOCKACTIVITY Bit Value	Module Interface Clock	Module Functional Clock	Description
0x0	Gated	Gated	The interface and functional clocks are considered when generating the acknowledgment. This setting also means both clocks may be gated upon a PRCM module IDLE request.
0x1	Active	Gated	The interface clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the functional clock is considered.
0x2	Gated	Active	The functional clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the interface clock is considered.
0x3	Active	Active	The interface and functional clocks are not shut down. The module can acknowledge the IDLE request without checking the internal functions linked to its clocks.

NOTE:

- The software configuration of the CLOCKACTIVITY settings may not be available for a given module. For some modules, the CLOCKACTIVITY settings can be hardwired.
- A slave module may support all or some of the CLOCKACTIVITY settings listed in Table 3-6.

See the power-management section in the specific module chapter to identify the supported idle feature and settings.

CAUTION

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings of the module. Software must ensure consistent programming between the CLOCKACTIVITY settings of the module and the clock-gating control bits in the PRCM module. The PRCM module must be configured (where software control is available) not to gate the module clock, which should remain active according to the CLOCKACTIVITY settings of the module.

For idle protocol management on the PRCM module side, the behavior of the PRCM module is configured in the CM_<Clock domain>_<module>_CLKCTRL[1:0] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the IDLE request to the module unconditionally (that is, immediately when software requests) or through hardware control when the module idle conditions are satisfied. Table 3-7 describes the configurable behavior of MODULEMODE.

Table 3-7. Slave Module Mode Settings in PRCM

MODULEMODE Bit Value	Selected Mode	Description
0x0	Disabled	The PRCM module unconditionally asserts the module IDLE request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled). It can react only to an asynchronous wake-up event (that is, a wake-up event that does not require the module functional clock to be active).

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-7. Slave Module Mode Settings in PRCM (continued)

MODULEMODE Bit Value	Selected Mode	Description
0x1	Auto	This mode applies to a module when the PRCM module manages only its interface clock and not its functional clock. The PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate the interface clock to the module.
0x2	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate only the interface clock to the module.
0x3	Reserved	Not available

NOTE: The PRCM module may support all or some of the MODULEMODE module settings listed in Table 3-7. See the CM_<Clock domain>_<module>_CLKCTRL[1:0] MODULEMODE bit field description for the module to identify the supported settings.

NOTE: Modules, which can be configured with DISABLED or AUTO values of ModuleMode, cannot go from IDLE to DISABLED state if ModuleMode is changed from AUTO to DISABLED while module is in IDLE state. Once the CM_<Clock domain>_CLKSTCTRL[1:0] CLKTRCTRL has been set to SW_WKUP, then SW has to poll for PM_<Clock_domain>_PWRSTST[1:0] PowerStateSt = 0x03 and PM_<Clock_domain>_PWRSTST[20] InTransition = 0x00 before update MODULEMODE bit field.

Table 3-8 and Table 3-9 list the enabling conditions for the slave module clocks managed by the idle protocol.

Table 3-8. Slave Module Interface Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module wake-up request is asserted.

Table 3-9. Slave Module Functional Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module idle status is 0x2 (interface clock is idled).
		Slave module wake-up request is asserted.

The module clock domain must be ready for the optional clocks to the module, and any associated clock-enable control is asserted.

NOTE: A given clock can be used by more that one module. Clock-enabling conditions are then ORed together (that is, the clock is provided as soon as one of the enabling conditions is true). As a consequence, the clock is disabled only when all related enabling conditions are false.

Copyright © 2015–2020, Texas Instruments Incorporated

Module wake-up request

In IDLE state, a slave module may have to wake up to generate an interrupt or a DMA request. This can be the result of an external request (for example, to the input/output [I/O] port of a general-purpose input/output [GPIO] module) or an internally generated event (for example, WD_TIMER time up). The slave module, with wake-up capability, sends a wake-up request to the PRCM module. The PRCM module then activates the module clocks and acknowledges the module wake-up request.

In IDLE state, some slave modules may require functional clock(s) to generate a wake-up event. Such requests are called synchronous wake-up events on the PRCM module side, while the events generated when the functional or interface module clocks are gated are called asynchronous wake-up events.

NOTE: See the power-management section in the module chapter to identify whether its wake-up event is synchronous or asynchronous.

The standby and idle clock-management protocols allow the configuration of the module-level clock-management interaction between the PRCM module and individual modules of the device. However, the PRCM module may not necessarily gate the clock to the module immediately after the module switches to standby or idle mode at the end of this interaction. This is because the same clock can be shared by other modules that are active and need this shared clock to complete their activity. As a result, the PRCM module provides a second level of clock management called the clock-domain level, as explained in Section 3.1.1.1.3, *Clock Domain*.

3.1.1.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see Figure 3-3). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE [gated] state). Thus, a clock domain allows control of the dynamic power consumption of the device.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to activate and gate individually each device clock domain.

Figure 3-3. Generic Clock Domain

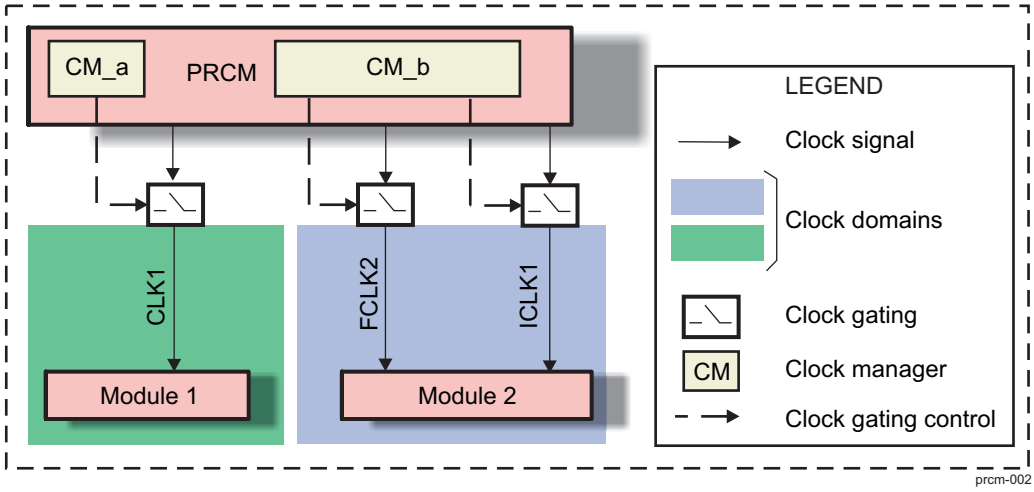


Figure 3-3 is an example of two clock managers: CM_a and CM_b. Each clock manager manages a clock domain. The clock domain of CM_b is composed of two clocks, a functional clock (FCLK2) and an interface clock (ICLK1), while that of CM_a consists of a clock (CLK1) that is used by the module as functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use.

Copyright © 2015–2020, Texas Instruments Incorporated

The PRCM module lets software check the status of the clock domain functional clocks. The CM_<Clock domain>_CLKSTCTRL[x] CLKACTIVITY_FCLK/<Clock name>_FCLK bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table 3-10 lists the two possible states of the functional clock.

Table 3-10. Clock Domain Functional Clock States

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The functional clock of the clock domain is inactive.
0x1	Active	The functional clock of the clock domain is running.

Table 3-11. Clock Domain Interface Clock States

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The interface clock of the clock domain is inactive.
0x1	Active	The interface clock of the clock domain is running.

All Clock Domains are summarized and described in Section 3.6.4, *Clock Domains.*

3.1.1.1.4 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

A clock domain can switch between three possible states: ACTIVE, IDLE_TRANSITION (IDLEREQ), and INACTIVE (IDLE). Figure 3-4 shows the sleep and wake-up transitions of the clock domain between ACTIVE and INACTIVE states.

Figure 3-4. Clock Domain State Transitions

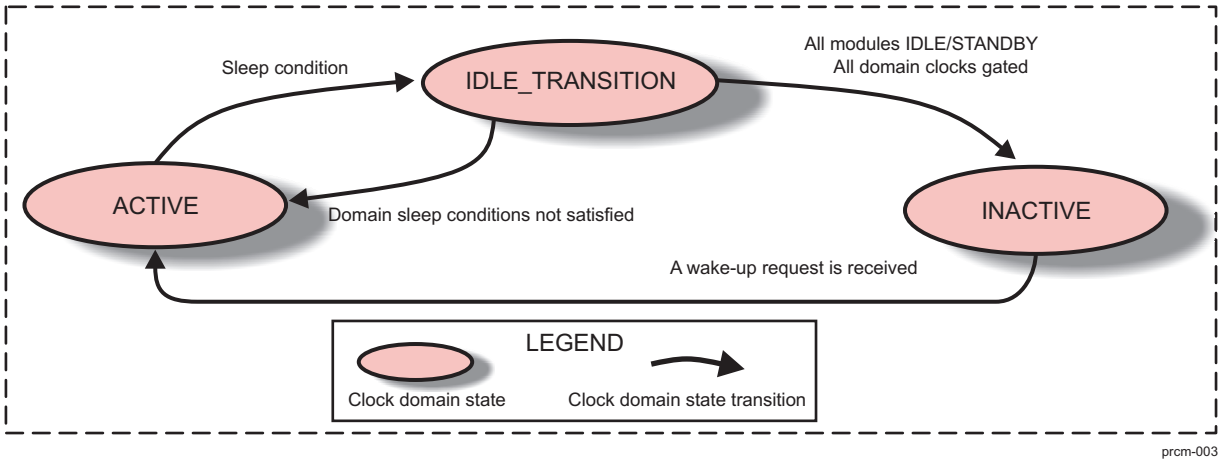

Table 3-12 defines the clock domain states.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-12. Clock Domain Clock States

State	Description
ACTIVE	• Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state. • All mandatory functional clocks to the active slave modules (that is, not idled) of the clock domain are provided. • All interface clocks to the nondisabled slave modules in the clock domain are provided. • All mandatory functional and interface clocks to the active master modules (that is, not in STANDBY state) in the clock domain are provided. • Every enabled optional clock to the modules in the clock domain is provided.
IDLE_TRANSITION	This is a transitory state. • Every master module in the clock domain is in STANDBY state. • Every IDLE request to all the slave modules in the clock domain is asserted. • The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active. • Every enabled optional clock to the modules in the clock domain is provided.
INACTIVE	All clocks within the clock domain are gated. • Every slave module in the clock domain (that is, those whose MODULEMODE value is set to disabled or auto) is in IDLE state and set to disabled or auto mode. • Every master module in the clock domain is in STANDBY state. • Every optional functional clock in the clock domain is gated.

Each clock domain transition behavior is managed by an associated register bit field in the CM_<Clock domain>_CLKSTCTRL[x] CLKTRCTRL PRCM module.

Table 3-13 describes the clock transition mode settings of the clock domain.

Table 3-13. Clock Domain Clock Transition Mode Settings

CLKTRCTRL Bit Value	Selected Mode	Description
0x0	NO_SLEEP	A clock domain sleep transition is never initiated, regardless of the hardware conditions.
0x1	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied (see Table 3-15).
0x2	SW_WKUP	A software-forced clock domain wake-up transition is initiated, regardless of the hardware conditions identified in Table 3-14.
0x3	HW_AUTO	Hardware-controlled automatic sleep and wake-up transition is initiated by the PRCM module when the associated hardware conditions are satisfied (see Table 3-14 and Table 3-15).

NOTE: Depending on its characteristics, a clock domain may or may not support all the clock transition mode settings described in Table 3-13. See the clock domain clock management section of the specific clock domain to identify the supported clock transition mode settings.

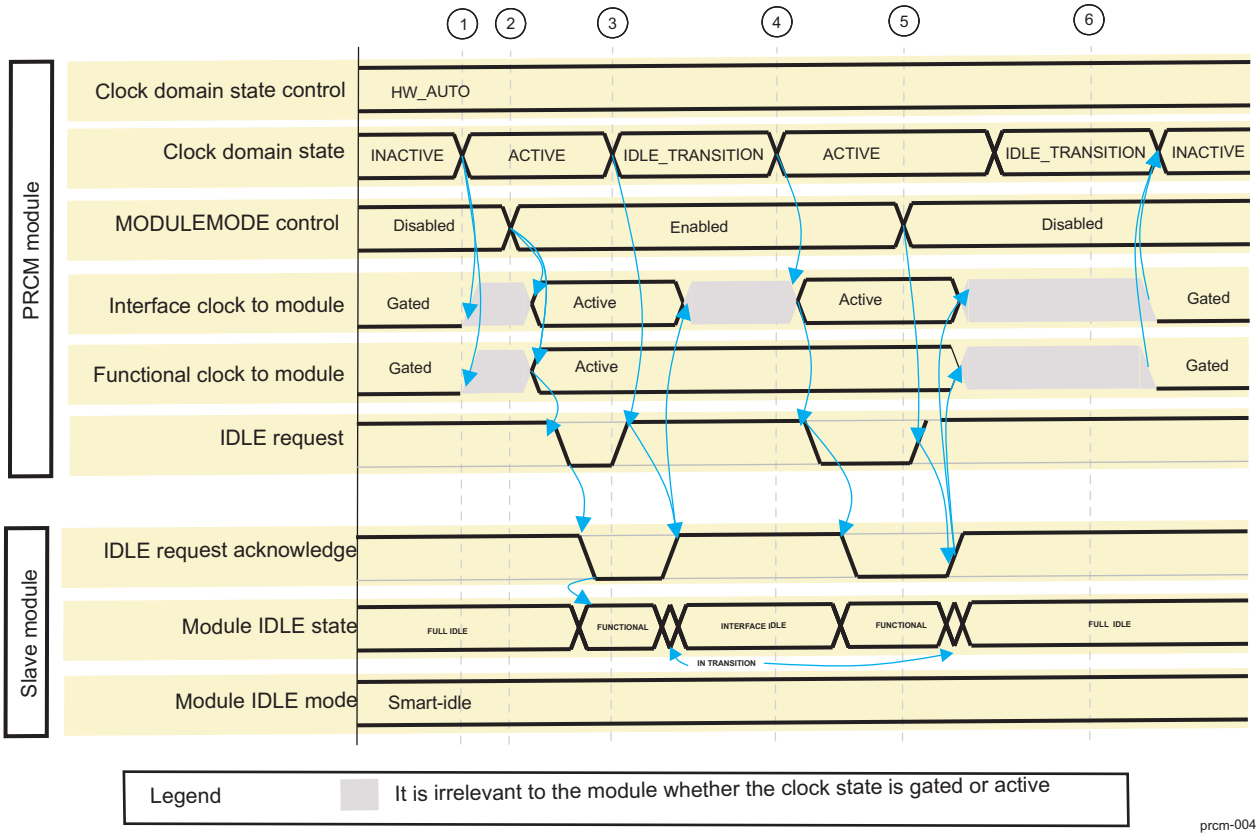
3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences

The sequence diagrams in Figure 3-5 through Figure 3-7 identify the PRCM module hardware-controlled enabling and gating of the functional and interface clocks to the module. They show the changes in the state of the module based on the changes to the clock domain state and module mode settings.

Figure 3-5 shows the behavior of a slave module receiving the interface and functional clocks and having two configurable module modes: disabled and enabled.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-5. Clock Domain/Slave Module Clock-Management Interaction Sequence 1



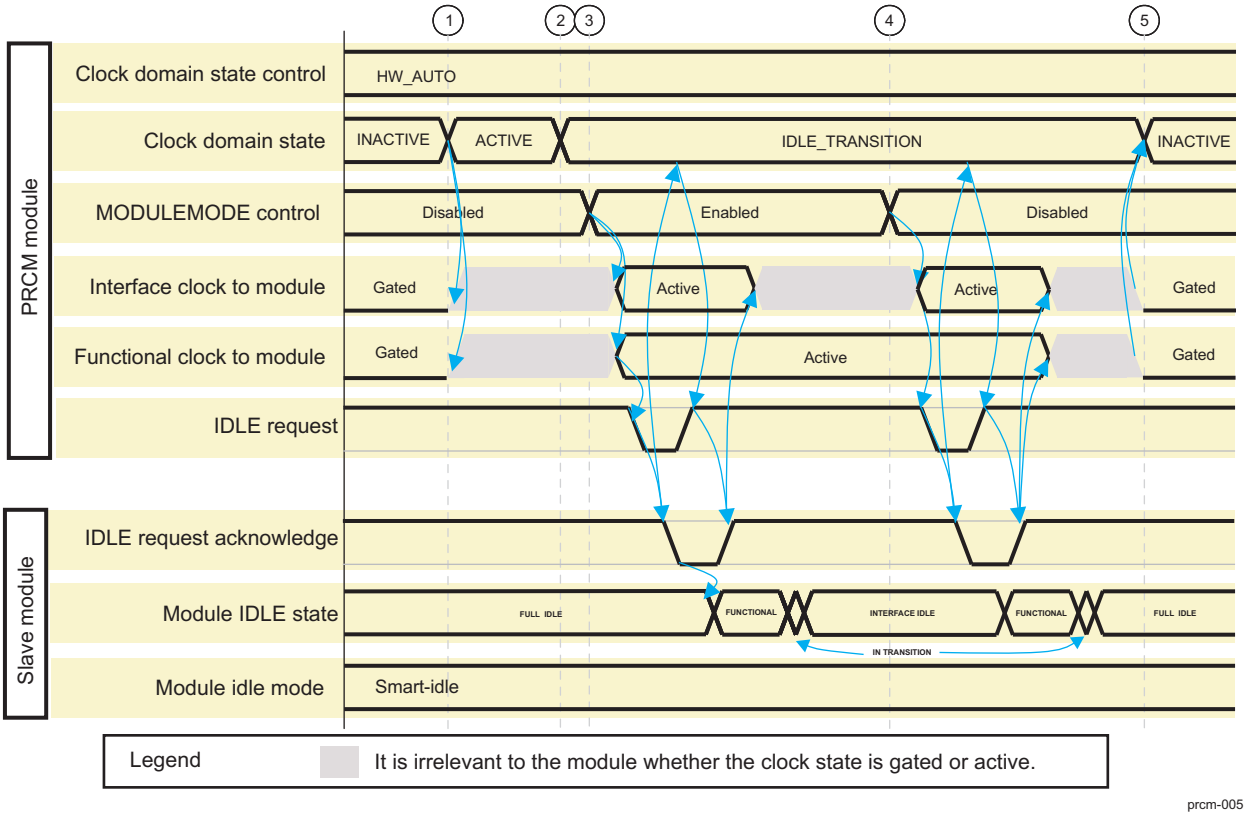
Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is still disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. Software changes the module mode to ENABLED. The clocks to the module are automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake. The module IDLE state is functional.
3. The clock domain switches to IDLE_TRANSITION state. In turn, the PRCM module requests the module to go into IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock. The functional clock of the module remains enabled because the module is in enabled mode.
4. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, and then the module is put out of IDLE state.
5. Software disables the module. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock.
6. The clock domain switches to IDLE_TRANSITION state. When the sleep transition conditions of the clock domain are satisfied, the clocks (functional and interface) are gated. The clock domain then switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-6 shows the behavior of the same slave module, receiving the interface and functional clocks, when the module mode is changed while the clock domain state is IDLE_TRANSITION.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-6. Clock Domain/Slave Module Clock-Management Interaction Sequence 2



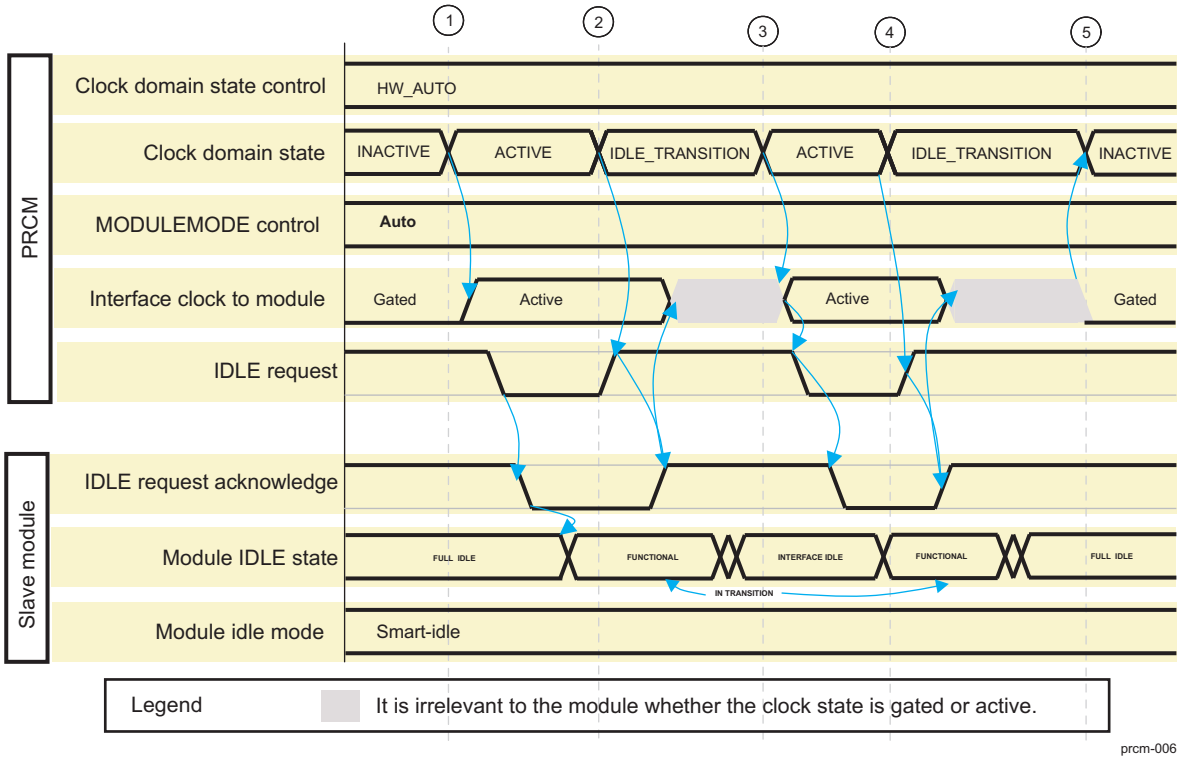
Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. The clock domain goes into the IDLE_TRANSITION state. Because the module mode control is disabled, this event has no effect on the module state.
3. Software changes the module mode to ENABLED. The clocks to the module are restarted automatically and then the module is put out of IDLE state. As soon as acknowledged, the module is requested to go back to IDLE state with gating of the interface clock only (that is, the INTERFACE IDLE state). The interface clock to the module can be gated, depending on other modules sharing the same clocks.
4. Software disables the module. The interface clock to the module is restarted automatically. The PRCM module requests the module to go out of IDLE state by asserting the IDLE request signal. As IDLE request acknowledge is de-asseted, PRCM set back the module to IDLE state. When acknowledged, the interface and the functional clocks to the module can be gated, depending on other modules sharing the same clock.
5. When the clock domain sleep transition conditions are satisfied and the functional and interface clocks are gated, the clock domain switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-7 shows the behavior of a slave module receiving only interface clock and supporting the configurable auto module mode.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-7. Clock Domain/Slave Module Clock-Management Interaction Sequence 3



Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its interface clock is gated.

1. The clock domain wakes up and changes its state to ACTIVE. In turn, the interface clock to the module is automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake; that is, the module IDLE state is functional.
2. The clock domain switches to IDLE_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.
3. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, and then the module goes out of IDLE state.
4. This step is the same as Step 2.
5. The clock domain has all conditions to complete the sleep transition. The module is in IDLE state and its clock is gated.

3.1.1.1.6 Clock Domain Sleep/Wake-up

The clock domain manager initiates a domain wake-up transition when the conditions listed in Table 3-14 are satisfied.

Table 3-14. Clock Domain Wake-Up Conditions

Relation	Condition
OR	The SW_WKUP clock transition mode for the clock domain is set (CLKTRCTRL = 0x2).
	At least one wake-up request is asserted by one of the modules of the clock domain.
	At least one dynamic dependency(1) from another clock domain is active.
	At least one static dependency(1) from another clock domain is active.

(1) The dynamic, static, and wake-up dependencies are explained in Section 3.1.1.1.7, *Clock Domain Dependency*.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-14. Clock Domain Wake-Up Conditions (continued)

Relation	Condition
	At least one wake-up dependency[1] from a module in another clock domain is active.

The clock domain manager initiates a domain sleep transition when the conditions listed in Table 3-15 are satisfied.

Table 3-15. Clock Domain Sleep Conditions

Relation		Condition
AND		All master modules in the clock domain are in STANDBY state.
		No wake-up request is asserted by any module of the clock domain.
		No dynamic domain dependency[1] from any other domain is active.
		No wake-up dependency[1] from any module in another domain is active.
		No static domain dependency[1] from any other domain is active.
	OR	The SW_SLEEP clock transition mode is set for the clock domain (CLKTRCTRL = 0x1).
		The HW_AUTO clock transition mode is set for the clock domain (CLKTRCTRL = 0x3).

(1) The dynamic, static, and wake-up dependencies are explained in Section 3.1.1.1.7, *Clock Domain Dependency*.

3.1.1.1.7 Clock Domain Dependency

A domain dependency is a binary relationship between two clock domains. A clock domain A is said to depend on a clock domain B when a module in clock domain B provides services to a module in clock domain A. As a result, clock domain B must be active when clock domain A is active so that the module in clock domain B is accessible by the module in clock domain A.

Dependency between two clock domains can also exist if one clock domain serves to ensure communication between two modules (for example, the clock domain of the device interconnect).

Thus, a clock domain can support the types of clock domain dependencies described in the following sections.

Table 3-16 and Table 3-17 detail all the domain dependencies:

- **NA/NA**: if no dependency can exist because no corresponding interconnect path exists in the device
- When cell is different than NA/NA, the cell contains two attributes:
  - First attribute for the presence and control method of a static dependency:
    - **SW**: Static dependency is controlled by a software bit. This is the most generic way of control. Depending on the use case and on latency requirement for accessing target domain, software can enable or not the static dependency. When not enabled, access to those domains is performed using dynamic dependencies.
    - **1**: Static dependency is always enabled (hard-wired). This is relevant for a domain that has an "exact standby" system initiator with the target domain being the domain containing the interconnect module to which the initiator is connected.
    - **0**: Static dependency is never enabled (hard-wired). This is relevant for domains that do not have strong access latency requirements, or for which a static dependency is not desired for specific reasons (for example, dependencies with emulation domain). Access to those domains is performed using dynamic dependencies.
    - **NA**: Nonapplicable (means domain has no system initiator able to access the other domain)
  - Second attribute for the presence and control method of a dynamic dependency:
    - **1..n**: Dynamic dependency is always enabled (hard-wired). The number of corresponding interconnect interfaces is also specified. This is relevant for most of the domain-to-domain direct interconnect connection.
    - **0**: Dynamic dependency is never enabled (hard-wired). This is relevant only when a static

Copyright © 2015–2020, Texas Instruments Incorporated

dependency is always enabled between same domains, or when the target domain cannot support the wakeup on access feature.

- **NA**: Nonapplicable (means that both domains are not directly linked by an OCP interface)

When a static dependency is hardware-coded between two domains directly linked by one or several interconnect interfaces, then the corresponding dynamic dependency is useless.

Emulation domain (DAP initiator) has no static dependency with any other domain. It has, however, a dynamic dependency with the L3_MAIN2 interconnect. A domain that can access an emulation domain does not have static or dynamic dependency with it.

Domain dependencies are chosen such that any access (even from EMU/DAP) towards a nondisabled target is always completed normally. Using static dependencies allows having minimal access latencies by keeping necessary domains on whenever the initiator is not standby. This may be at the expense of additional power consumption because some domains may stay on while not in use for a long time. By disabling static dependencies, applicative access is still completed normally by waking up, if applicable, the necessary domain on the path from the initiator to the target. Power consumption can be optimized at the expense of additional access latencies.

NOTE: Once the CM_<Clock domain>_CLKSTCTRL[1:0] CLKTRCTRL has been set to SW_WKUP, then SW has to poll for PM_<Clock_domain>_PWRSTST[1:0] PowerStateSt = 0x03 and PM_<Clock_domain>_PWRSTST[20] InTransition = 0x00 before update MODULEMODE bit field.

Copyright © 2015–2020, Texas Instruments Incorporated

3.1.1.1.7.1 Static Dependency

If clock domain A has a master module that can access a slave module in clock domain B, then clock domain A can have a static dependency with clock domain B. Similarly, a static dependency can also exist between domain A and B if domain B conveys the transactions from a domain A module toward a module in any other domain. For example, CD_DSP can have a static dependency with CD_L3_MAIN1 because this domain has a level 3 (L3) interconnect to carry the transactions from the digital signal processor (DSP) module.

This static dependency consists of forcing clock domain B to stay active as long as there is at least one master module of clock domain A that is not in STANDBY state. If clock domains A and B are initially in GATED state, then clock domain B becomes active as soon as clock domain A becomes active when a wake-up request from the master module is received by the PRCM module.

Similarly, as a result of the static dependency, clock domain B can be gated only if all the master modules of clock domain A that can access the slave modules in clock domain B are in STANDBY state.

The static dependency between a source clock domain and a destination clock domain is configured in the PRCM module by setting the CM_<Source Clock domain>_STATICDEP[x] <Destination Clock domain>_STATDEP bit. As a result, the source clock domain forces the destination clock domain to become active and stay active as long as the source clock domain is active.

The destination domain must be put into forced wake-up (CM_<X>_CLKSTCTRL[1:0] CLKTRCTRL = SW_WKUP) before changing a configurable static dependency.

3.1.1.1.7.2 Dynamic Dependency

When clock domains A and B contain modules directly linked to a common device interconnect, these clock domains can have a dynamic dependency.

A dynamic dependency consists of forcing clock domain B to stay active as long as a module from clock domain A is communicating with the module in clock domain B through the interconnect. Clock domain B becomes active as soon as the communication is initiated. This is automatically managed by the PRCM module by monitoring the communication on the interconnect between the modules of the two clock domains.

Similarly, the inverse condition of this dependency can be stated: Clock domain B can be inactive only if there has not been transactions from clock domain A to clock domain B, identified as a sliding window duration on the interconnect activity status.

The size of the sliding window is based on the number of cycles of a prescaled level 4 (L4) clock whose frequency is configured by setting the CM_DYN_DEP_PRESCAL[5:0] PRESCAL bit field. The prescaled clock frequency is given as:

Prescaled clock frequency = L4 interface clock frequency / (PRESCAL + 1)

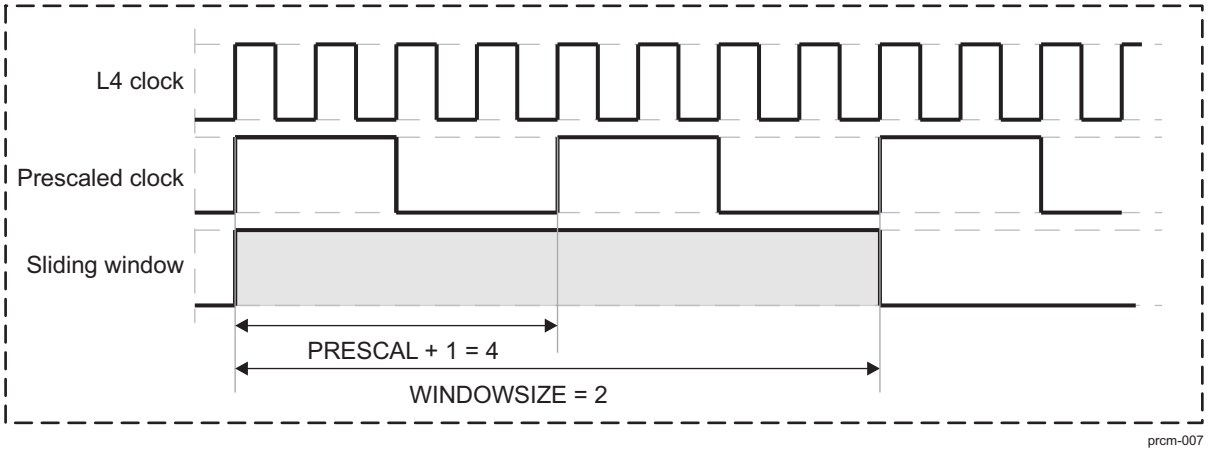
The size of the sliding window is fixed by setting the CM_<Clock domain>_DYNAMICDEP[27:24] WINDOWSIZE bit field. It is given as:

Sliding window duration = WINDOWSIZE × Period of Prescaled clock cycle

Figure 3-8 is an example of the sliding window duration equal to eight clock cycles of an L4 clock when PRESCAL is set to 3 and WINDOWSIZE is set to 2.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-8. Sliding Window for Dynamic Dependency



This dynamic dependency is also referred to as the autosleep/autowakeup feature.

NOTE:

- The static dependency between two clock domains can be configured by software (PRCM module registers) or hardwired in the PRCM module.
- The dynamic dependency between two clock domains is hardwired in the PRCM module.

A dynamic dependency is said to be active when both of the following conditions are met:

- There has been one or more transaction on the interconnect within the sliding window duration.

Otherwise, a dynamic dependency is said to be inactive.

The dynamic dependency between a source clock domain and a destination clock domain can be read in the PRCM module from the corresponding read-only CM_<Source Clock domain>_DYNAMICDEP[x] <Destination Clock domain>_DYNDEP bit.

NOTE: It is recommended to use dynamic dependencies. They give better power results. Static dependencies should be rarely used (in some cases they can be used as they give shorter latency for a system initiator to access slave).

3.1.1.1.7.3 Wake-Up Dependency

A wake-up dependency is a dependency between the clock domain of a module that owns one or several wake-up signals toward the clock domain of another module needed to service the associated wake-up event. As a result of this dependency, the wake-up event to a module activates not only its clock domain but also the clock domain of the servicing module.

NOTE: To ensure that the clock domain of the servicing module remains active, the wake-up signal that triggers a wake-up dependency stays active as long as the source of the event is not serviced.

Wake-up dependencies allow acceleration of the wake-up transition of multiple domains needed to service the wake-up event by initiating their transition in parallel. The static and dynamic dependencies can allow the wake-up of related domains, but the complete wake-up transition of all the associated domains is slower because of the sequential cascading of their wake-up transitions.

In the device, the source event of the wake-up signal to a slave module can be either of following types:

- Interrupt request to the microprocessor unit (MPU), DSP, or image processor unit (IPU) interrupt controller (INTC)

Copyright © 2015–2020, Texas Instruments Incorporated

- DMA request to a DMA controller

Upon wake-up by these types of wake-up events, and for as long as they remain asserted, the PRCM module takes the following actions:

- The power domain of the servicing module (for example, MPU, DSP, IPU, or DMA) is forced to POWER ON state and the clock domain becomes active.
- The power domain of the device interconnect between the servicing module and the module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The power domain of the slave module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The slave module originator of the wake-up event is switched from IDLE to ACTIVE state.

On assertion of a wake-up event of a stand-alone master module, and as long as it remains asserted, the PRCM module takes the following action:

- The power domain of the master module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.

NOTE: For slave modules, the static and dynamic dependencies of a clock domain are not affected by its wake-up dependency settings. For master modules, the static dependencies are not affected.

Hence, in addition to the activation of the clock domains previously described, all clock domains associated by static dependencies are also activated.

However, the clock domains associated with the wake-up clock domain through dynamic dependencies are activated only if a transaction is initiated to these clock domains.

For each wake-up signal coming from a slave module, the type of the corresponding event can be configured in the PM_<Power domain>_<Originator Module> _WKDEP[x] WKUPDEP_<Originator Module>_[IRQ/DMA]_<Servicing Module> bit of the PRCM module, where <Power domain> is the name of the power domain of the originator module of the wake-up event identified as <Originator Module>. Servicing Module refers to the module servicing the wake-up event.

NOTE: When only one event type is associated with the wake-up signal of a slave module, the wake-up dependency (WKUPDEP) for the module clock domain is not configurable and may be hardwired in the PRCM module.

For the master modules, there is no configurable wake-up dependency. Their power domain is switched on and their clock domain is activated by the PRCM module when they assert their wake-up signal.

3.1.1.2 Power Management

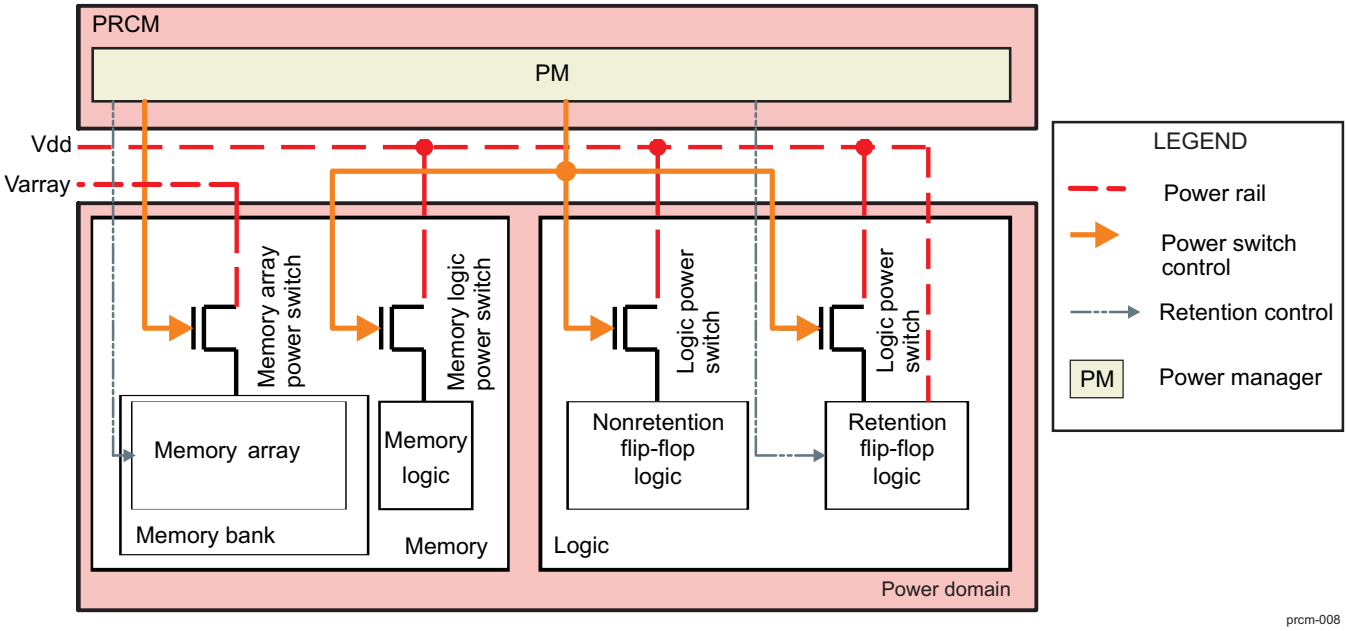
The PRCM module manages the switching on and off of the power supply to the device modules. To minimize device power consumption, the power to the modules can be switched off when they are not in use. Independent power control of sections of the device lets the PRCM module turn on and off specific sections of the device without affecting other sections.

3.1.1.2.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with an independent and dedicated power manager (see Figure 3-9). A power domain can be turned on and off without affecting other parts of the device.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-9. Generic Power Domain



To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into logic and memory areas.

The memory area contains two entities:

- Memory bank: Composed of memory arrays. It is powered by a dedicated voltage rail and an associated power switch (for example, Varray and memory array power switches).
- Memory logic: Powered by the same voltage source as the logic area of the power domain, but has its dedicated power switch (for example, Vdd and memory logic power switches)

The logic area in the power domain can also be split between retention flip-flops (RFFs) and nonretention flip-flops (DFFs).

Table 3-18 lists the possible states and substates of the logic area in a power domain.

Table 3-18. States of a Logic Area in a Power Domain

State	Substate	Description
ON	ON-ACTIVE	Logic is fully powered and at least one enclosed clock domain is active.
	ON-INACTIVE	Logic is fully powered and all enclosed clock domains are idled.
RETENTION	CSWR (close switch retention)	Logic is fully powered and all enclosed clock domains are idled.
OFF		Logic power switches are off. All the logic (DFF and RFF) is lost except for the context, which has been saved in the scratchpad memory of an always-on power domain. Vdd can be set to 0 V if all associated power domains are in this state.

RETENTION state is useful for quickly switching to low-power idle mode (in which the domain clocks are gated and the domain voltage is less than the on-voltage level) without losing the context, and then quickly switching back to ON-ACTIVE state when necessary. In RETENTION state, power consumption is less than in ON power state.

The behavior of the memory array power switch and memory logic power switch can be selected through software settings in the PRCM module or can be hardwired. Once the behavior is selected, the PRCM module hardware automatically handles these elements to ensure correct power transition sequencing between the power domain states.

Copyright © 2015–2020, Texas Instruments Incorporated

Software can also initiate power state changes of the memory array when the associated power domain is in ON power state. This allows the memory array to be turned off and on as needed.

The memory area can be configured to any of the power states listed in Table 3-19.

Table 3-19. States of a Memory Area in a Power Domain

State	Description
ON	The memory array is powered and fully functional.
RETENTION	The memory array is fully powered, but memory is not accessible. The array can be put into retention through an applicable direct retention control signal. Data in memory are always retained.
OFF	The memory array is powered down. Data in memory are lost.

3.1.1.2.2 Module Logic and Memory Context

In case of a power state transition in the logic or memory areas, the context of the module may no longer be valid. This can also be the case when the domain resets are asserted by the device. A specific RM_<Clock Domain Name>_<Module Name>_CONTEXT register provides the status of the device logic and memory context.

- The module logic context consists of simple flip-flops (DFFs) if the module has no logic RFFs.
- If the module has logic retention (full or partial), it is assumed that the context consists of: only RFFs, only DFFs or both RFFs and DFFs.

NOTE: The display subsystem is an exception where the status of DFF and RFF context is given, because only HMDI keys are retained, while most of the display subsystem is not retained.

These context status bits must be cleared by software.

3.1.1.2.3 Power Domain Management

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state (for example, from ON-ACTIVE state to CSWR RETENTION state).

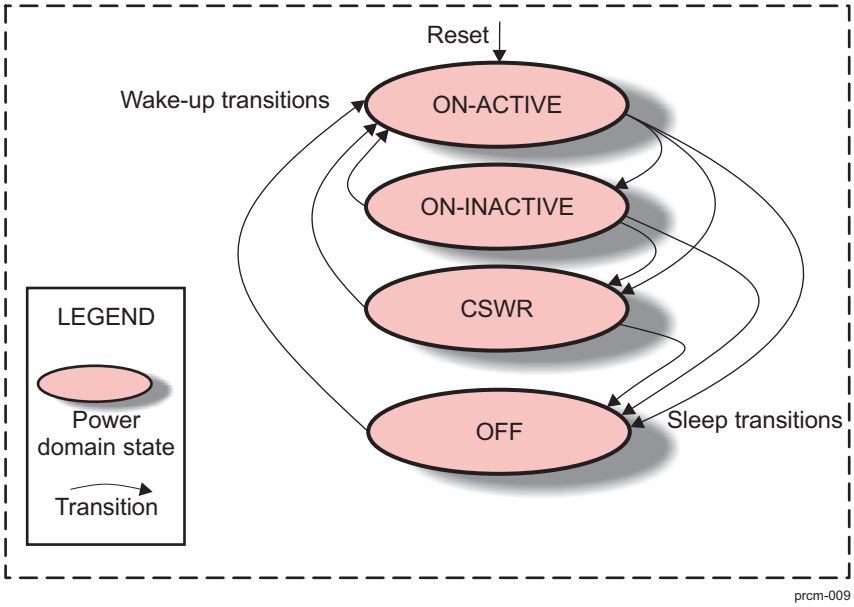
The hardware condition for power domain transition from ON-ACTIVE to any other transition state is:

- All clock domain managers in the power domain are in IDLE state.

Figure 3-10 shows all possible power domain state transitions.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-10. Power Domain Transitions



Successive power-down transitions can be performed by lowering the power state from ON-ACTIVE to ON-INACTIVE to RETENTION, and then to OFF and LOWPOWERSTATECHANGE, as long as the hardware condition is satisfied.

However, the power domain wake-up transition from any low-power state (ON-INACTIVE, CSWR or OFF) to ON-ACTIVE state is always direct.

The power domain manager initiates a power domain wake-up transition when the conditions listed in Table 3-20 are satisfied.

Table 3-20. Power Domain Wake-Up Conditions

Relation		Condition
AND		Voltage domain is on.
	OR	There is at least a wake-up condition for one enclosed functional clock domain.
		There is a request for clock generation or distribution enclosed in the power domain.
		There is a PRCM module service request (applicable only to power domains, including PRCM module logic).

The power domain manager initiates a domain sleep transition when the conditions listed in Table 3-21 are satisfied.

Table 3-21. Power Domain Sleep Conditions

Relation	Condition
AND	All functional clock domains enclosed in the power domain are idled.
	All clock generation or distribution enclosed in the power domain is quiet, and corresponding input clocks are gated. For example, DPLL, if present, must be in stop mode.
	There is no PRCM module service request (applicable only to power domains, including PRCM module logic).

Table 3-22 lists the control and status features of the PRCM module power domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-22. Power Domain Control and Status Registers

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain among OFF, ON-ACTIVE, ON-INACTIVE, and RETENTION
PM_<Power domain>_PWRSTCTRL[x] LOWPOWERSTATECHANGE	Control	Power state change request when domain has already performed a sleep transition. Allows going into deeper low-power state without waking up the power domain.
PM_<Power domain>_PWRSTCTRL[2] LOGICRETSTATE	Control	Selects whether the power domain logic is in CSWR or RETENTION state when the domain transitions to RETENTION state
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_RETSTATE	Control	Selects whether the memory bank in the power domain is in ON, or RETENTION state when the power domain is in RETENTION state. The memory bank cannot be in ON state when the power domain is in RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_ONSTATE	Control	Selects whether the memory bank is in ON, RETENTION, or OFF state when the power domain is in ON state
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain. It can be OFF or ON.
PM_<Power domain>_PWRSTST[20] INTRANSITION	Status	Identifies whether a power state transition in the power domain is in progress or there is no ongoing transition
PM_<Power domain>_PWRSTST[x] <memory bank>_STATEST	Status	Identifies the current power state of the memory bank in the power domain. It can be OFF, RETENTION, or ON.
PM_<Power domain>_PWRSTST[25:24] LASTPOWERSTATEENTERED	Status	Identifies the last (previous) power state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE.

3.1.1.3 Voltage Management

The PRCM module do not provide controls over the Voltage management. All OPP changes will be handled by Application software directly without any PRCM intervention.

3.1.1.3.1 Voltage Domain

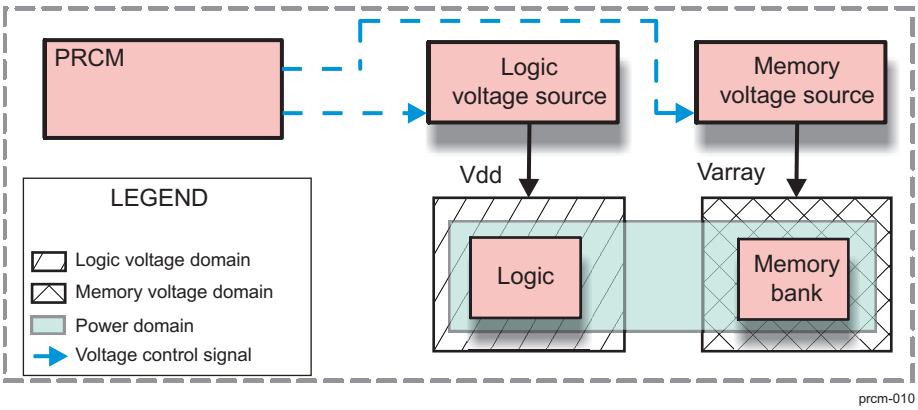
A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDOs or external switch mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module.

The voltage managers in the PRCM module is one type:

- Dynamically configurable by software to scale the domain voltage level to specific values within the operational voltage range of the device. This is called adaptive voltage scaling (AVS).

Figure 3-11 shows a voltage domain.

Figure 3-11. Generic Voltage Domain



Copyright © 2015–2020, Texas Instruments Incorporated

By partitioning the device into independent voltage domains, different operating voltages can be assigned to the different sections of the device (that is, a group of modules or memory banks). The independent voltage control allows voltage scaling of device subsections to ensure that each module or memory bank operates at the optimized operating voltage level based on the application performance requirements.

3.1.1.3.2 Voltage Domain Management

Figure 3-12 shows the different voltage control paths available within a generic logic voltage management block to control the voltage supply to the logic voltage domains of the device.

Figure 3-12. Generic Logic Voltage Management

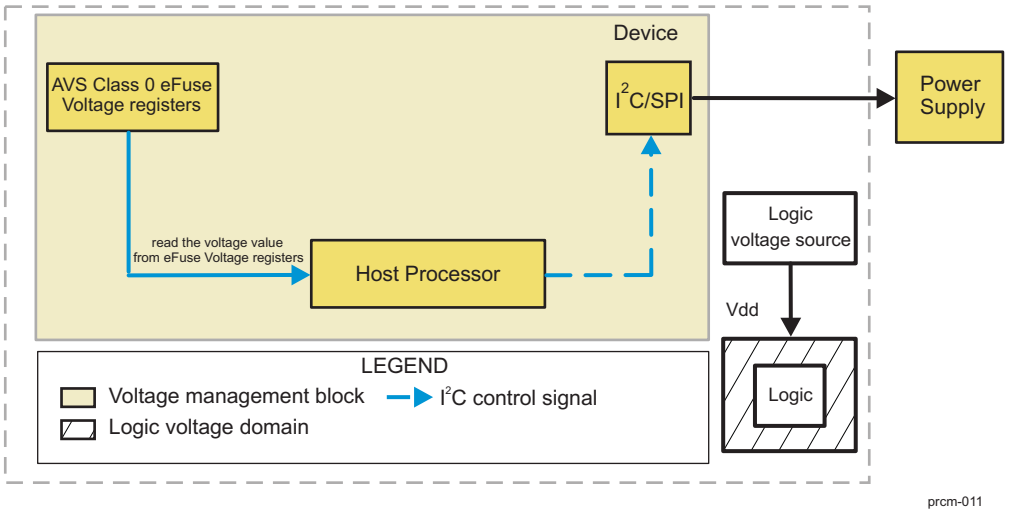


Figure 3-13 shows the voltage control path available within a generic memory voltage management block to control the voltage supply to the memory voltage domains of the device.

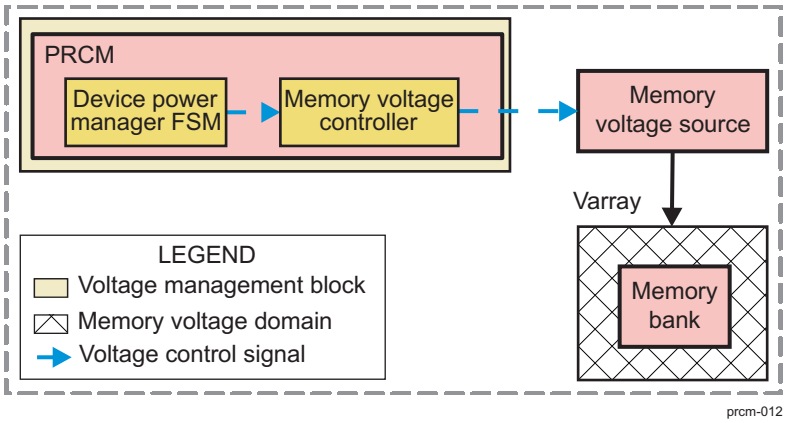
Figure 3-13. Generic Memory Voltage Management



The PRCM hardware supports automatic scaling down of the memory array supply whenever the memory domains transition to RETENTION power state. The device power manager FSM manages the voltage scaling of memory voltage domains through the memory voltage controller (or LDO).

3.1.1.3.3 AVS Overview

Adaptive Voltage Scaling (AVS) Class 0 (also referred to as SmartReflex™) is a power-management technique used to control the operating voltage of a device to reduce its active power consumption.

With SmartReflex, the power supply voltage is adapted to the silicon performance in one way:

- Statically adapted to the manufacturing process of a given device

Copyright © 2015–2020, Texas Instruments Incorporated

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum.

The static correction of the device voltage level (see Figure 3-14) is based on the desired performance level and silicon performance characteristics of the device. As a result of process dispersion, each die has its specific silicon performance. The range of the process distribution defines the weak devices (low-performance silicon) and the strong devices (high-performance silicon).

A weak device is a device with the lowest performance tolerated for a process distribution; that is, at the typical voltage, the inherent maximum frequency is the lowest frequency of the chip distribution. Considered as the worst case, weak devices are used to constrain the target frequency of all the chips (OPP definition).

A strong device is a device with the highest performance tolerated for a process distribution. The inherent maximum frequency at the typical voltage is greater than the targeted frequency.

Figure 3-14 shows that with the SmartReflex voltage-control architecture, it is possible to compensate for the device silicon characteristics and obtain optimal performance characteristics. Based on the device characteristics, the device voltage level can be adjusted for specific performance level.

Figure 3-14. SmartReflex Static Voltage Adjustment

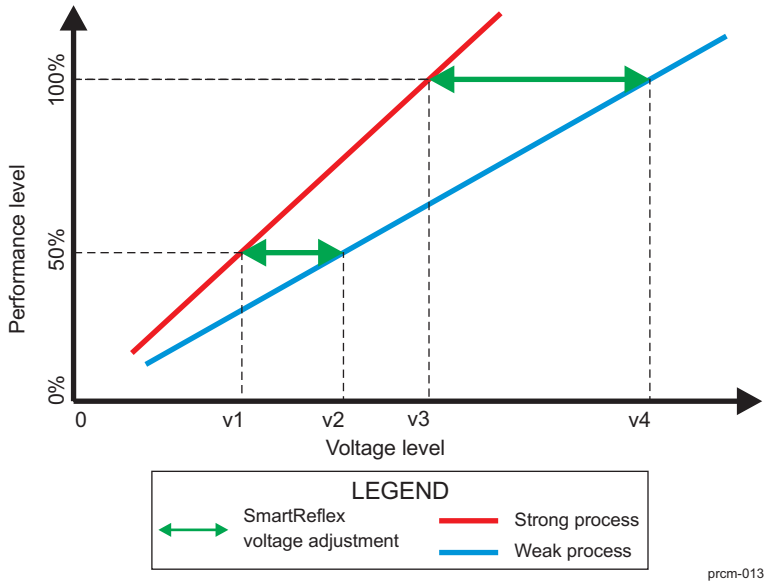


Figure 3-15 is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

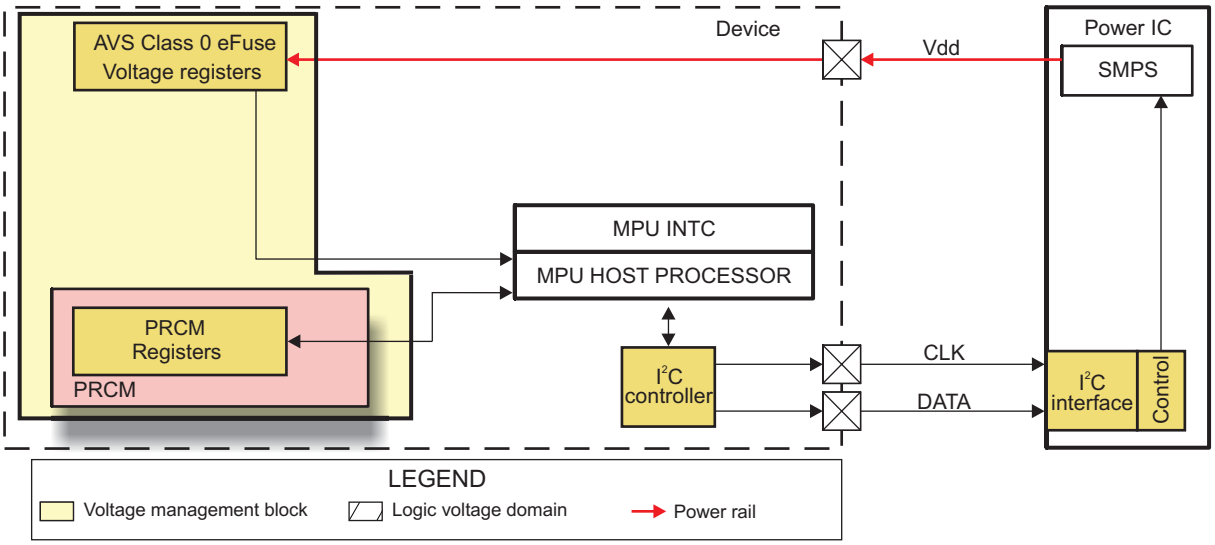
Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-15. SmartReflex Voltage Control Functional Overview



SmartReflex voltage control consists of the following modules:

- MPU HOST Processor
- I^2C interface
- SMPS

The device supports one operational mode for SmartReflex voltage control:

- Class 0, Manufacturing Test Calibration

3.1.1.3.3.1 AVS Class 0 (SmartReflex™) Voltage Control

Adaptive Voltage Scaling (AVS) Class 0 (also referred to as SmartReflex™) is a procedure for lowering the voltage on certain device power rails. AVS Class 0 attempts to normalize the power consumption across all devices. The optimal voltage for each AVS supported rail of each device is determined after analysis in the factory. This value is written in the device eFuse where it can be read through dedicated registers. These registers reside in the control module. For more information, see Section 18.4.6.12, *AVS Class 0 Associated Registers*, in Chapter 18, *Control Module*.

3.1.2 Power-Management Techniques

The following sections describe the power-management techniques supported by the device.

NOTE: The values in Figure 3-16 through Figure 3-18, which show the power-management techniques, are hypothetical. They do not represent valid test results on the device.

3.1.2.1 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

Copyright © 2015–2020, Texas Instruments Incorporated

3.1.2.2 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

NOTE: The values in Figure 3-16 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

Figure 3-16. Comparison of Energy Consumed With/Without DVFS

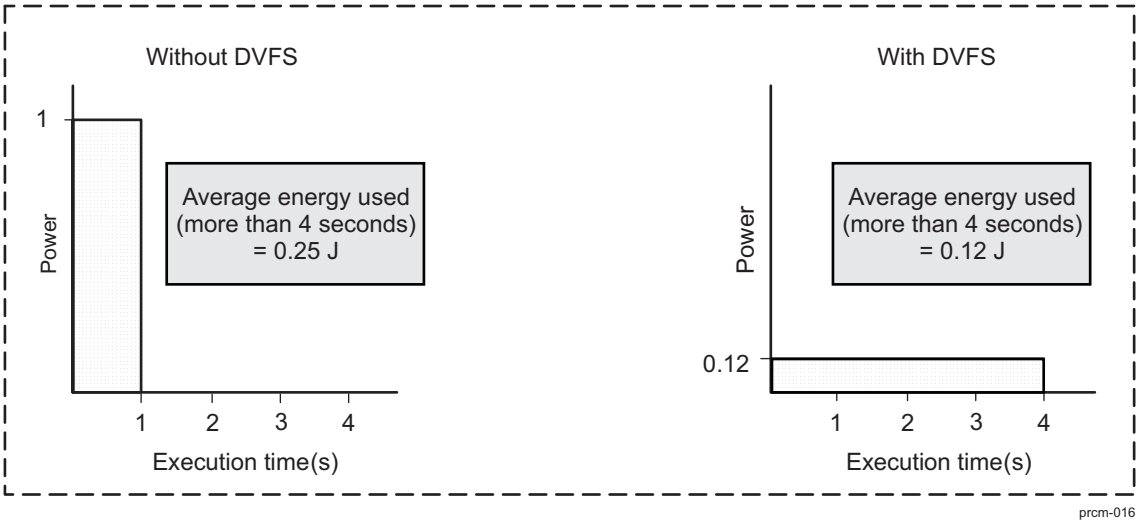


Figure 3-16 shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (see the left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode.

With DVFS (see the right side of the figure), the operating frequency is reduced to optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to the development of the device (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

3.1.2.3 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique intended to reduce the active power consumption of a device. However, whereas DVFS reduces dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

Copyright © 2015–2020, Texas Instruments Incorporated

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

NOTE: The values in Figure 3-17 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

Figure 3-17. Comparison of Energy Consumed With/Without DPS

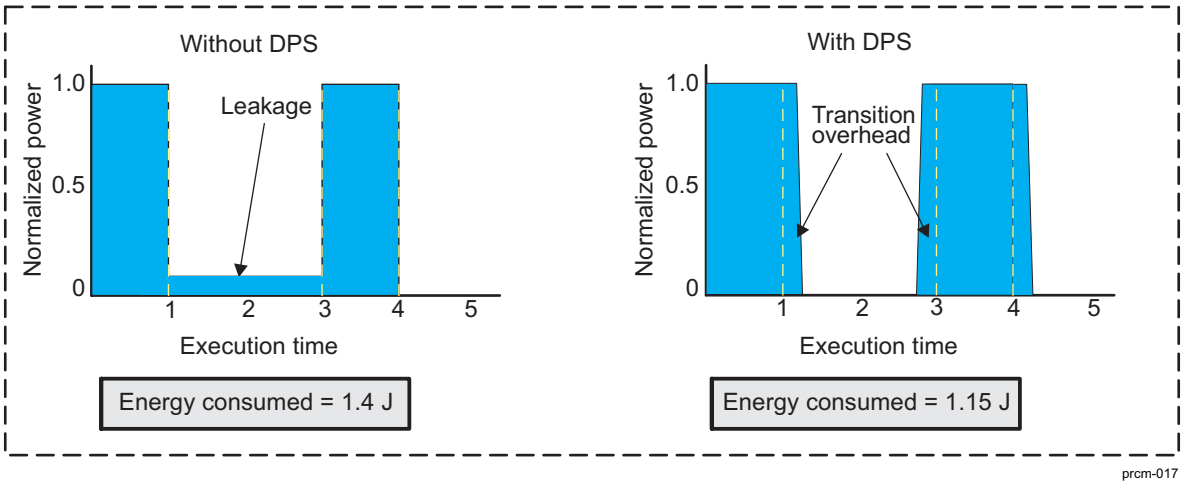

Figure 3-17 compares the behavior of power consumption for the same operation of the device without DPS (see the left side of the figure) and with DPS (see the right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to 0. However, the transitions between system power modes may require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see Figure 3-17). This results in additional dynamic power consumption, referred to as transition overhead (see Figure 3-17). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, the user can identify an optimal idle-time limit, after which the DPS is useful for dynamic power saving.

3.1.2.4 Adaptive Voltage Scaling

With SmartReflex, power-supply voltage is adapted to silicon performance, statically (based on performance points predefined in the manufacturing process of a given device).

AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum. This ensures optimal power consumption for a given OPP.

3.1.2.5 Adaptive Body Bias

The device implements transistor body bias techniques for forward body bias (FBB) to boost the operating clock frequency for operation at higher OPPs.

Adaptive body bias (ABB) is based on the process corner and the current OPP. This is configured in the EFUSE_CTRL_CUST bit field at the device characterization and is not continuously updated. A dedicated LDO (VBBLDO) is used to produce the voltage bias.

ABB is supported only for MPU, IVAHD, DSPEVE, GPU voltage domains.

Copyright © 2015–2020, Texas Instruments Incorporated

3.1.2.6 SR3-APG (Automatic Power Gating)

In addition to power-management techniques supported in the device, the MPU subsystem also employs SR3-APG power-management technology to reduce leakage. This technology allows for full logic and memory retention on MPU_C0 and MPU_C1 when required conditions are satisfied. It is controlled by the PRCM_MPU. For more information, see Chapter 4, *Dual Cortex-A15 MPU Subsystem*.

3.1.2.7 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power savings are obtained by combining the DVFS, DPS, SLM, and AVS techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

AVS must be used at boot time to adapt the voltage to the process characteristics (strong/weak) of the device and then be used continuously to compensate temperature variations. AVS can also ensure the maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

SLM must be used when no applications are running and performance requirement drops to 0.

NOTE: The OPPs shown in Figure 3-18 are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

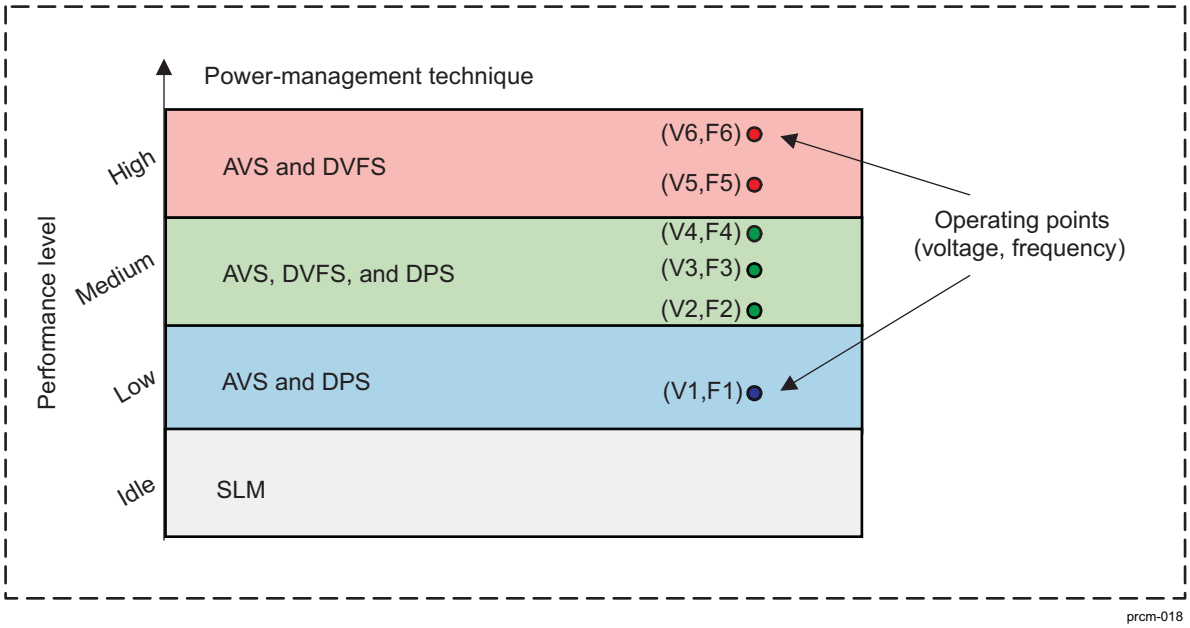
Figure 3-18. Performance Level and Applied Power-Management Techniques



3.1.2.7.1 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10 µs and 100 µs) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1–10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

3.2 PRCM Subsystem Overview

3.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The power-management framework (PMFW) of the device is handled by the PRCM which is a logical module composed of the following three physical submodules:

- PRM: Handles device-level power and reset management. It also handles some clocks in the device. This module always remains on, unless no power is supplied to the device pads.
- CM_CORE_AON: Handles device-level clock management of the MPU, DSP1, DSP2, COREAON, CORE, IPU, L4PER, DSS, VPE, L3INIT, CAM, IVAHD, CUSTEFUSE, EVE1,EVE2, EVE3, EVE4, RTC and GPU power domains. This module always remains on, unless no power is supplied to the device pads.
- CM_CORE: Handles device-level clock management of the MMR block.

The device supports the power-management techniques with the following features:

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows any combination of domain ON/OFF states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of the power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- DVFS support for the processor and peripherals

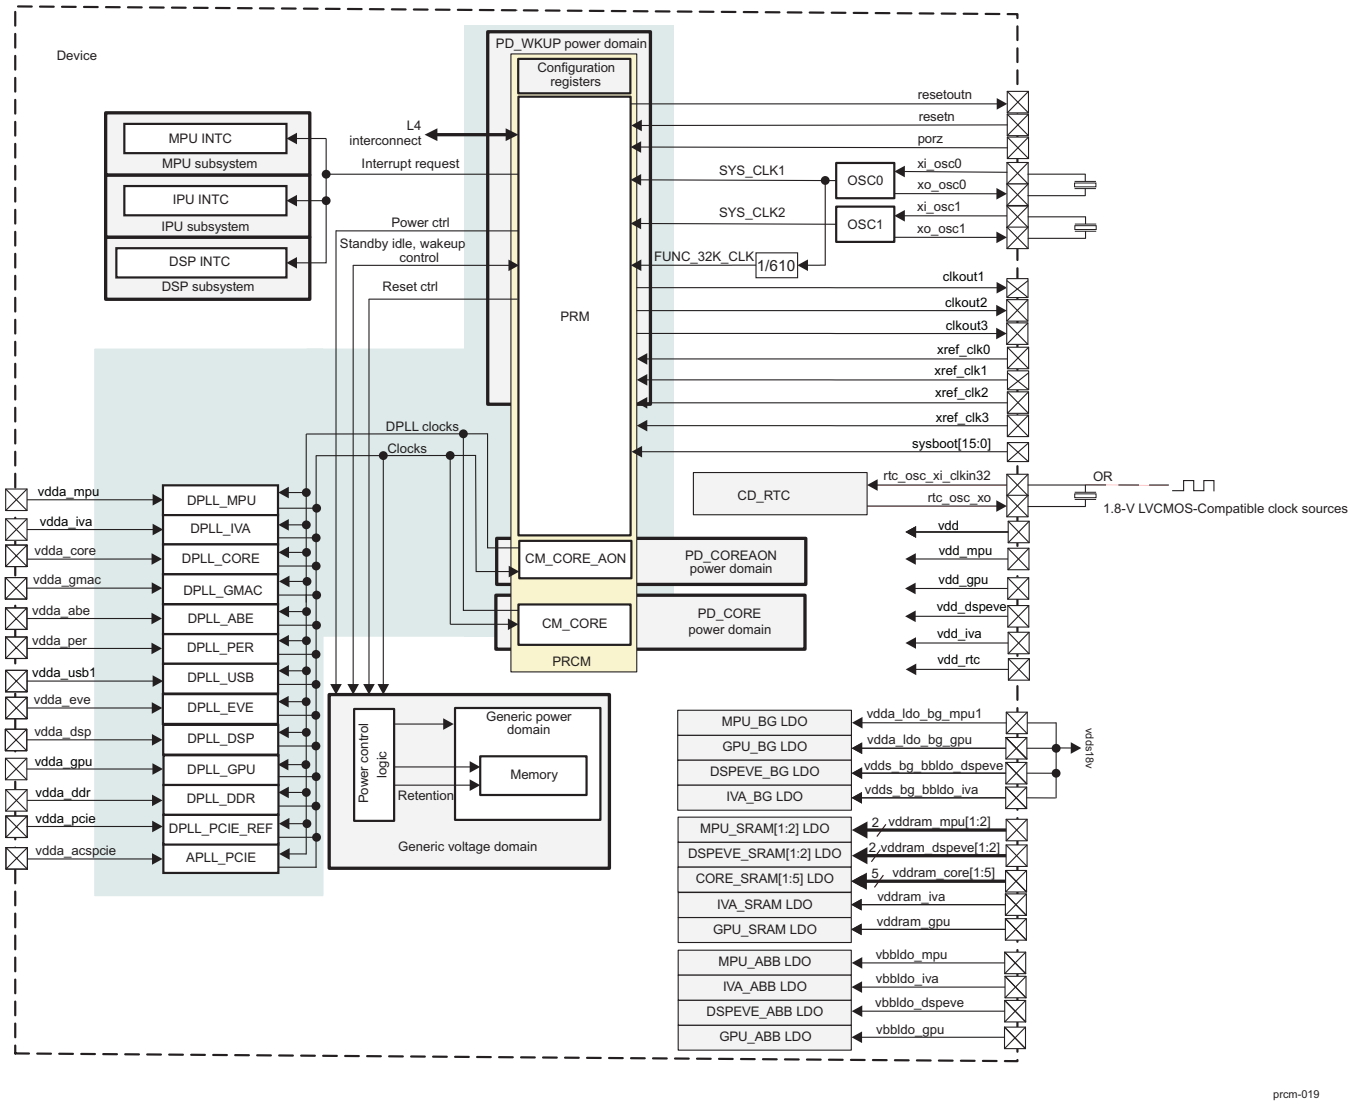
The PMFW interfaces with all the components of the device for power, clock, and reset management through associated control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The power-management modules are fully configurable through their L4 interface ports.

Figure 3-19 is an overview of the power-management modules and their internal connections with a generic power domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-19. PMFW Overview



NOTE: The device I/O logic maps the module signals to the different pads of the device. For more information, see the *Pad Configuration Registers* and sections in Section 18.1, *Control Module*.

3.2.2 Power-Management Framework Features

The power-management modules:

- Manage independent power domains
- Control scalable logic voltage domains and selectable voltage modes for memory voltage domains
- Handle standby, idle, and wake-up procedures for the modules of the device
- Allow software and partial hardware control
- Monitor and handle wake-up events
- Control system clock and reset input sources
- Manage and distribute clocks and resets with high control granularity
- Handle power-up sequences

Copyright © 2015–2020, Texas Instruments Incorporated

- Have debug and emulation features
- Control RFFs of device modules to support DPS

Copyright © 2015–2020, Texas Instruments Incorporated

3.3 PRCM Subsystem Environment

The modules of the PMFW receive the external reset, clock, and power signals. See Figure 3-19.

The following sections describe the interfaces for external clock, reset, and power sources.

3.3.1 External Clock Signals

Table 3-23 lists the external clock pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-23. External Clock Signals

Pin	Signal	I/O[1]	PMFW Module	Description
rtc_osc_xi_clkin32	RTC_32K_CLK	I	Primary Input to SoC	RTC clock input. Optional external 32k clock.
rtc_osc_xo	32K_CTRL	O	Primary Output	External 32k oscilator clock control (optional).
xi_osc0	XI_OSC0	I	Primary Input to SoC	System Oscillator OSC0 Crystal Input.This is the main system clock of the device.
xo_osc0	XO_OSC0	O	Primary Output	System Oscillator OSC0 Crystal output.
xi_osc1	XI_OSC1	I	Primary Input to SoC	Auxiliary Oscillator OSC1 Crystal input .
xo_osc1	XO_OSC1	O	Primary Output	Auxiliary Oscillator OSC1 Crystal output .
clkout1	CLKOUTMUX1_CLK	O	Primary Output	Device Clock output 1.Can be used as a system clock for other devices.
clkout2	CLKOUTMUX2_CLK	O	Primary Output	Device Clock output 2.Can be used as a system clock for other devices.
clkout3	CLKOUTMUX0_CLK	O	Primary Output	Device Clock output 3.Can be used as a system clock for other devices.
xref_clk0	XREF_CLK0	I	Primary Input to SoC	External Reference Clock 0.For Audio and other Peripherals.
xref_clk1	XREF_CLK1	I	Primary Input to SoC	External Reference Clock 1.For Audio and other Peripherals.
xref_clk2	XREF_CLK2	I	Primary Input to SoC	External Reference Clock 2.For Audio and other Peripherals.
xref_clk3	XREF_CLK3	I	Primary Input to SoC	External Reference Clock 3.For Audio and other Peripherals.

(1) I = Input; O = Output; I/O = Bidirectional

3.3.2 External Boot Signals

The PRM receives SYSBOOT[15:0] information from external pins sys_boot[15:0]. They are used to select interfaces or devices for the booting list. For more information, see Chapter 29, *Initialization*, Section 29.2.4, *Sysboot Configuration* .

Table 3-24 lists the external boot pins, signal names, their direction, the associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-24. External Boot Signals

Pin	Signal	I/O [1]	PMWF Module	Description	Module Reset Value
sys_boot0	SYSBOOT0	I	PRM	System boot configuration pin 0: Latched at power-on reset (POR)	Z
sys_boot1	SYSBOOT1	I	PRM	System boot configuration pin 1: Latched at POR	Z
sys_boot2	SYSBOOT2	I	PRM	System boot configuration pin 2: Latched at POR	Z

(1) I = Input; O = Output; I/O = bidirectional

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-24. External Boot Signals (continued)

Pin	Signal	I/O [1]	PMWF Module	Description	Module Reset Value
sys_boot3	SYSBOOT3	I	PRM	System boot configuration pin 3: Latched at POR	Z
sys_boot4	SYSBOOT4	I	PRM	System boot configuration pin 4: Latched at POR	Z
sys_boot5	SYSBOOT5	I	PRM	System boot configuration pin 5: Latched at POR	Z
sys_boot6	SYSBOOT6	I	PRM	System boot configuration pin6: Latched at POR	Z
sys_boot7	SYSBOOT7	I	PRM	System boot configuration pin 7: Latched at POR	Z
sys_boot8	SYSBOOT8	I	PRM	System boot configuration pin 8: Latched at POR	Z
sys_boot9	SYSBOOT9	I	PRM	System boot configuration pin 9: Latched at POR	Z
sys_boot10	SYSBOOT10	I	PRM	System boot configuration pin 10: Latched at POR	Z
sys_boot11	SYSBOOT11	I	PRM	System boot configuration pin 11: Latched at POR	Z
sys_boot12	SYSBOOT12	I	PRM	System boot configuration pin12: Latched at POR	Z
sys_boot13	SYSBOOT13	I	PRM	System boot configuration pin 13: Latched at POR	Z
sys_boot14	SYSBOOT14	I	PRM	System boot configuration pin 14: Latched at POR	Z
sys_boot15	SYSBOOT15	I	PRM	System boot configuration pin15: Latched at POR	Z

NOTE: For proper device operation, sysboot14 must be tied to vss. For SR1.1, sysboot15 must be tied to vdd, but for SR2.0 it is configurable. For more information, see Section 18.4.6.1.1.1, *Permanent PU/PD disabling (SR 2.0 only)* in Chapter 18, *Control Module*.

3.3.3 External Reset Signals

The PRM drives the SYS_WARM_OUT_RST reset output signal which is directly mapped as RESETOUT device pin.

The PRM asserts SYS_WARM_OUT_RST output upon the assertion of any source of global reset (warm or cold). SYS_WARM_OUT_RST assertion results in the assertion of device pin RESETOUT. This reset signal keeps external peripherals under reset while the device is under reset.

Table 3-25 lists the external reset pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-25. External Reset Signals

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
resetn	SYS_WARM_IN_RST	I	PRCM	Device Reset Input	Z
rstoutn	SYS_WARM_OUT_RST	O	PRCM	Reset out	Z
porz	SYS_PWRON_RST	I	PRCM	Power on Reset	Z

(1) I = Input; O = Output; I/O = bidirectional

Copyright © 2015–2020, Texas Instruments Incorporated

3.3.4 External Voltage Inputs

Table 3-26 lists the external voltage sources related to the PRCM module.

NOTE: Table 3-26 lists only the voltage sources that are directly managed by the PRCM module or received by parts of the PRCM module (for example, DPLLs, LDOs, etc.). It does not give the device voltage sources not directly associated with the PRCM module.

Table 3-26. Voltage Sources

Pin	Signal	Managed by the PRCM	Description
vdd	VDD_CORE_L	Yes (AVS)	Supplies VDD_CORE_L logic voltage domain
vdd_mpu	VDD_MPU_L	Yes (AVS, ABB and DVFS)	Supplies VDD_MPU_L logic voltage domain
vdd_iva	VDD_IVAHD_L	Yes (AVS, ABB and DVFS)	Supplies VDD_IVAHD_L logic voltage domain
vdd_gpu	VDD_GPU_L	Yes (AVS, ABB, and DVFS)	Supplies VDD_GPU_L logic voltage domain
vdd_dspeve	VDD_DSPEVE_L	Yes (AVS, ABB, and DVFS)	Supplies VDD_DSPEVE_L logic voltage domain
vdda_gmac	VDDA_DPLL_GMAC	No (fixed)	DPLL_GMAC and HSDIVIDER analog power supply
vdda_core	VDDA_DPLL_CORE	No (fixed)	DPLL_CORE and HSDIVIDER analog power supply
vdda_mpu	VDDA_DPLL_MPU	No (fixed)	DPLL_MPU analog power supply
vdda_iva	VDDA_DPLL_IVA	No (fixed)	DPLL_IVA analog power supply
vdda_abe	VDDA_DPLL_ABE	No (fixed)	DPLL_ABE analog power supply
vdda_per	VDDA_DPLL_PER	No (fixed)	DPLL_PER and PER HSDIVIDER analog power supply
vdda_usb1	VDDA_DPLL_USB	No (fixed)	DPLL_USB and HS USB1 analog power supply
vdda_dsp	VDDA_DPLL_DSP	No (fixed)	DPLL_DSP analog power supply
vdda_eve	VDDA_DPLL_EVE	No (fixed)	DPLL_EVE analog power supply
vdda_gpu	VDDA_DPLL_GPU	No (fixed)	DPLL_GPU analog power supply
vdda_ddr	VDDA_DPLL_DDR	No (fixed)	DPLL_DDR and DDR HSDIVIDER analog power supply
vdda_pcie	VDDA_DPLL_PCIE	No (fixed)	DPLL_PCIe_REF and PCIe analog power supply
vdda_acspcie	VDDA_APLL_PCIE	No (fixed)	APLL_PCIe analog power supply
vdd_rtc	VDD_RTC	No (fixed)	RTC voltage domain supply
vdda_ldo_bg_mpu1	VDDA_LDO_BG_MPU1	No	Supplies LDO_MPU and BG
vdda_ldo_bg_gpu	VDDA_LDO_BG_GPU	No	Supplies LDO_GPU and BG
vddram_mpu[1:2]	VDDRAM_MPU[1:2]	Yes (AVS)	Supplies LDO_MPU for MPU SRAM
vdds_bg_bbldo_dspeve	VDDS_LDO_BG_BBLDO_DSPEVE	No	Supplies LDO_DSPEVE for DSPEVE SRAM
vddram_dspeve[1:2]	VDDRAM_DSPEVE[1:2]	Yes (AVS)	Supplies LDO_DSPEVE for EVE-DSP SRAM
vdds_bg_bbldo_iva	VDDS_BG_BBLDO_IVA	No	Supplies Bandgap near IVA and BBLDO
vddram_iva	VDDRAM_IVA	Yes (AVS)	Supplies LDO_IVA for IVA SRAM
vddram_core[1:5]	VDDRAM_CORE[1:5]	Yes (AVS)	Supplies LDO_CORE for CORE SRAM
vddram_gpu	VDDRAM_GPU	Yes (AVS)	Supplies LDO_GPU for GPU SRAM
vbbldo_mpu	VBBLDO_MPU	Yes (AVS)	MPU Back bias supply
vbbldo_iva	VBBLDO_IVA	Yes (AVS)	IVA Back bias supply
vbbldo_dspeve	VBBLDO_DSPEVE	Yes (AVS)	EVE-DSP Back bias supply
vbbldo_gpu	VBBLDO_GPU	Yes (AVS)	GPU Back bias supply

3.4 PRCM Subsystem Integration

The internal configuration registers of the power-management modules can be accessed for configuration and control through their respective L4_WKUP interconnect. In addition to the L4 interconnect, the internal module interface contains the following interfaces and signals:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals for the modules
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU, IPU, and DSP INTCs
- Phase-locked loop (PLL) control commands for recalibration and bypass of the digital phase-locked loops (DPLLs)

Figure 3-19 shows details of the control interface to a generic power domain.

3.4.1 Device Power-Management Layout

Programmable Real-Time Unit and Industrial Communication Subsystems (PRU-ICSS) is not supported in this family of devices.

The PMFW sees the device split into voltage domains, power domains, and clock domains. Table 3-27 provides the device-level view with module association to the clock, power, and voltage domains.

Table 3-27. PMFW Device-Level Layout

3.4.2 Power-Management Scheme, Reset, and Interrupt Requests

3.4.2.1 Power Domain

Table 3-28 lists the PMFW modules and their associated power domains.

Table 3-28. PMFW Module Power Domains

PMFW Module	Power Domain
PRM	PD_WKUPAON
CM_CORE_AON	PD_COREAON
CM_CORE	PD_CORE

The PRM part of the PRCM module is in the PD_WKUPAON power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM_CORE_AON part of the PRCM module is in the PD_COREAON power domain, which is an always-on power domain, while the CM_CORE part of the PRCM module is in the PD_CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

3.4.2.2 Resets

The PMFW modules are reset by independent reset signals (see Table 3-29).

Table 3-29. PMFW Module Reset Signals

PMFW Module	Reset Signal
PRM	SYS_PWRON_RST_IN
CM_CORE_AON	CM_CORE_AON_PWRON_RST
	CM_CORE_AON_RST
CM_CORE	CM_CORE_PWRON_RET_RST
	CM_CORE_RET_RST

Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: For more information about the reset trigger sources and assertion conditions, see Section 3.5.3, *Reset Sources*.

3.4.2.3 PRCM Interrupt Requests

The PMFW modules can generate the interrupts listed in Table 3-30.

Table 3-30. PMFW Hardware Requests

	Interrupt Requests			
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
PRM	PRM_IRQ_MPU	IRQ_CROSSBAR_6	MPU_IRQ_11 DSP1_IRQ_37 DSP2_IRQ_37	PRM MPU interrupt request
	PRM_IRQ_IPU1	IRQ_CROSSBAR_133	IPU1_IRQ_47 IPU2_IRQ_47	PRM IPU1 interrupt request
	PRM_IRQ_IPU2	IRQ_CROSSBAR_386	-	This IRQ source signal is not mapped by default to eny device INTC.

NOTE: The "**Default Mapping**" column in Table 3-30 *PMFW Hardware Requests* shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.
For more information about the IRQ_CROSSBAR module, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.
For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.

3.5 Reset Management Functional Description

3.5.1 Overview

In the device, the reset scheme is managed by the PRM, device-level reset manager.

3.5.1.1 PRCM Reset Management Functional Description

The PRM handles the device power-on and warm reset pads: porz, resetn, and rstoutn. The PRM:

- Extends the reset duration beyond the porz pad release
- Provides the reset duration period after the resetn pad assertion
- Routes the device pad resets

The PRM is functionally sensitive to the device POR.

3.5.1.1.1 Power-On Reset

The PRM receives the device POR on the porz reset pad of the device. It extends the duration of the POR module until at least stable 32-kHz clock and SYS_CLK1 are provided to it. The 32-kHz clock and SYS_CLK1 of the device are propagated once the PRCM releases the internal POR.

3.5.1.1.2 Warm Reset

The device warm reset can be received from an external source or the device PRM module as a result of an internal event.

The PRCM can generate the global reset used by the domain Reset Managers from these warm reset input sources:

- SYS_WARM_IN_RST
- MPU_WDT_RST
- GLOBAL_SW_WARM_RST

3.5.1.2 PRM Reset Management Functional Description

The PRM module manages the resets to all power domains inside the device.

NOTE: The PRM module has no knowledge or control over resets generated locally within a module (for example, through the <Module name>_SYSCONFIG[x] SOFTRESET configuration register bit). A software reset has the same effect on the module logic as a hardware reset.

All PRM reset outputs are asynchronously asserted, while the deassertion is synchronous to the SYS_CLK1 clock. The reset managers in PRM use this clock to stall, or delay, deassertion of reset upon source deactivation.

In each power domain one or more reset domains are defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing of the release of resets and ensures a safe reset of the entire power domain.

3.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on four criteria:

- Scope: Global or local reset
- Occurrence: Cold or warm reset
- Source type: Software-controlled or hardware-triggered reset
- Retention type: Retention reset or nonretention reset

Copyright © 2015–2020, Texas Instruments Incorporated

3.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by the reset):

- Global reset:Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up (POR) or an abnormal operation is detected (watchdog timeout, thermal shutdown, etc.)
- Local reset: Affects one power domain, reset domain, or module.

3.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs on device power up (POR), or in certain emulation modes. Also, it can be software-initiated. Upon cold reset, it is assumed the device is being powered up, and therefore, everything in the device is being reset. That is, cold resets must be considered as global resets.
- Warm reset: Warm reset types are not necessarily applied globally within device. Also, a module can use a warm reset to reset a subset of its logic. This is often done to speed up reset recovery time; that is, the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include software-triggered reset per power domain, watchdog time-out, externally triggered and emulation initiated.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

The following modules are reset upon global cold reset events and not upon global warm reset events:

- All DPLLs associated with the PRCM module
- EMIF
- Control module: CTRL_MODULE_CORE, CTRL_MODULE_WKUP

NOTE: The DPLLs state will change after warm reset even though they are not warm reset-sensitive, refer to Section 3.5.6.19, *Global Warm Reset Sequence* for more details.

NOTE: For information about the PRCM module registers affected by the global warm reset, see the register description in Section 3.12, *PRCM Register Manual*.

3.5.2.3 Source Type

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module
- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

3.5.2.4 Retention Type

The power domain manager in PRM controls the assertion of two types of local cold reset sources, retention and nonretention reset. They are identified by the naming convention <PowerDomain>_DOM_RET_RST and <PowerDomain>_DOM_RST, respectively.

Upon transitioning a power domain to the ON-ACTIVE power state from the OFF power state:

- Retention type reset source is always asserted.
- Nonretention type reset source is always asserted.

Upon transitioning a power domain to the ON-ACTIVE power state from the RETENTION power state:

- Retention type reset source is never asserted.
- Nonretention type reset source is optionally asserted. The software-selectable option enables the PRM to support CSWRET mechanism. Nonretention type reset source has the following behavior:
  - It is not asserted if the power domain state transitions from the CSWR-RETENTION state.

3.5.3 Reset Sources

The reset sources triggering the reset managers in the PRM are described in this section.

3.5.3.1 Global Reset Sources

Table 3-31 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the bit triggering the reset is identified.

Table 3-31. Global Reset Sources

Type[1]	Name	Source/Control	Description
H/C	SYS_PWRON_RST	porz input pin	The entire device is held in reset during porz pin assertion. porz pin is typically asserted by external PMIC at POR. PMIC keeps porz asserted until all voltage rails are ramped-up and stable. PRM extends device internal reset after porz release. Refer to Power Supply Sequences in Device Data Manual.
H/W	SYS_WARMIN_RST	resetn input pin	Warm reset from external device. Internal warm reset is triggered by the active (falling) edge of this signal and is extended with RstTime1.
S/C	GLOBAL_COLD_SW_RST	PRM_RSTCTRL[1] RST_GLOBAL_COLD_SW	Global software cold reset
S/W	GLOBAL_WARM_SW_RST	PRM_RSTCTRL[0] RST_GLOBAL_WARM_SW	Global software warm reset
H/W	TSHUT_MPU_RST	MPU voltage domain thermal sensor	Asserted when measured temperature is greater than shutdown temperature threshold
H/W	TSHUT_IVA_RST	IVAHD voltage domain thermal sensor	
H/W	TSHUT_CORE_RST	Device thermal sensor, placed close to the ISS, DSP, and IVA	
H/W	TSHUT_DSPEVE_RST	DSPEVE voltage domain thermal sensor	
H/W	TSHUT_GPU_RST	GPU voltage domain thermal sensor	
H/W	ICEPICK_RST	ICEPick™ module	ICEPick warm reset. It is used only in emulation mode.
H/C	ICEPICK_POR_RST	ICEPick module	ICEPick cold reset. It is used only in emulation mode.
H/W	MPU_WDT_RST	WD_TIMER2 or MPU subsystem WDT	It is triggered by a time-out event.

(1) H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

3.5.3.2 Local Reset Sources

In addition to the global reset sources the device can have a number of local reset sources for each power domain. The local reset sources can be cold or warm reset sources. They can be software-controlled or hardware-triggered. Table 3-32 identifies the possible types of hardware-triggered local cold reset sources. Some power domains can support one or both of these local cold reset sources. The table does not list the software-triggered local warm reset sources that are listed in the reset management section of the respective power domains. A local reset source signal received by the reset manager resets only a specific part of the device (for example, some modules/subsystems within the power domain).

Table 3-32. Local Reset Sources

Type[1]	Name	Source/Control	Description
H/C	<Power domain>_RET_RST	PRCM	Asserted only for a power domain state transition from OFF to ON-ACTIVE state
H/C	<Power domain>_RST	PRCM	Asserted for any power domain transition from OFF to ON-ACTIVE state

(1) H = Hardware reset, C = Cold reset

Copyright © 2015–2020, Texas Instruments Incorporated

3.5.4 Reset Logging

The reset status registers RM_<power domain>_RSTST and PRM_RSTST are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the PRM_RSTST[0] GLOBAL_COLD_RST bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset is asserted and then released, but a global cold reset source is asserted before the release of the domain reset signal.

3.5.5 Reset Domains

A power domain can receive power-on reset (PWRON_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- On any global or local cold reset, RST and PWRON_RST are asserted.
- On any global or local warm reset, only RST is asserted.
- On wakeup from OFF, PWRON_RST are asserted.

A power domain can receive two additional retention logic reset signals: power-on retention reset (PWRON_RET_RST) and/or retention reset (RET_RST). These signals behave as follows:

- On any global cold reset, RET_RST and PWRON_RET_RST are asserted.
- On any global cold reset or wakeup from OFF state to ON-ACTIVE state, RET_RST and PWRON_RET_RST are asserted.
- On any global warm reset, only RET_RST is asserted.

This section discusses the trigger sources and attributes for all reset domains of the device. For an explanation of each reset trigger source of the device, see Section 3.5.3, *Reset Sources.*

Table 3-33 identifies the associated power and rest domains for each module.

NOTE: The DPLLs state will change after warm reset even though they are not warm reset-sensitive, refer to Section 3.5.6.19, *Global Warm Reset Sequence* for more details.

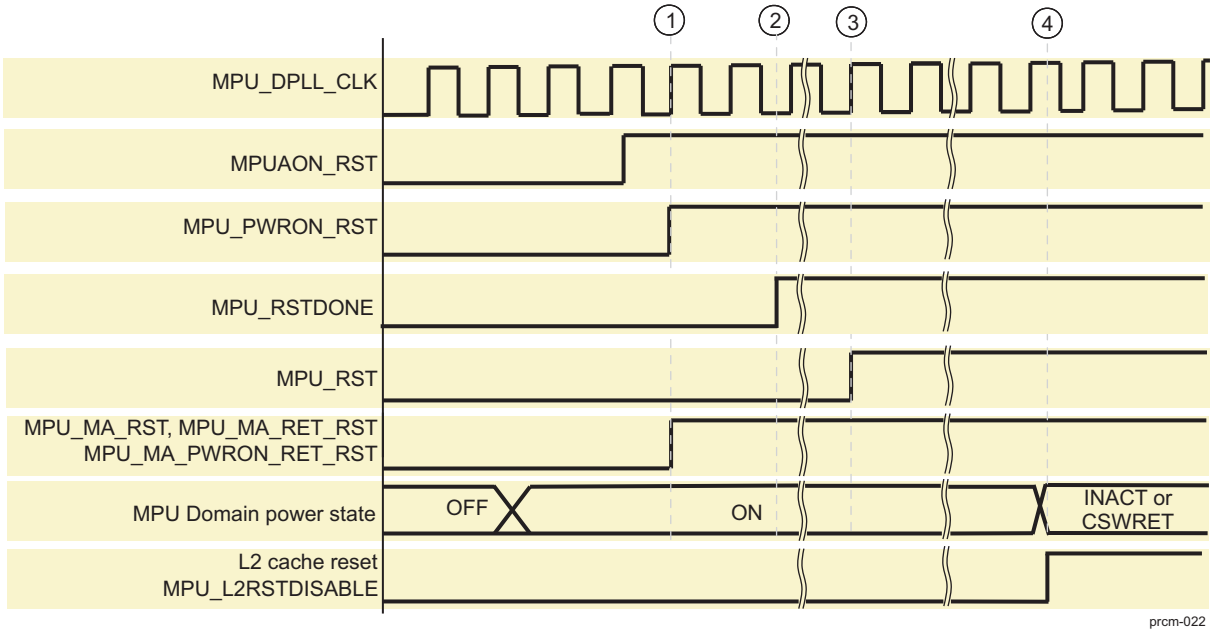
3.5.6 Reset Sequences

3.5.6.1 MPU Subsystem Power-On Reset Sequence

Figure 3-20 shows the POR sequence of the MPU subsystem.

Figure 3-20. MPU Power-On Reset Sequence



The assumptions after power-on reset assertion are:

- The PRCM module provides the DPLL_MPU reference clock and the bypass clock.
- The PRCM module has released DPLL_MPU reset and DPLL_MPU is in bypass mode providing the clock (that is, bypass clock) to all the modules in the MPU subsystem.

The POR sequence is:

1. The PRCM module releases asynchronously in PD_MPUAON the MPUAON_RST reset to the INTC_MPU module in the MPU subsystem.
2. The PRCM module releases in PD_MPU the MPU_PWRON_RST (only after MPU_DPLL_CLK is active) to the MPU subsystem and waits until the subsystem completes its internal reset sequence. MA_MPU (Memory-adapter) dedicated reset signals (MPU_MA_RST, MPU_MA_RET_RST, and MPU_MA_PWRON_RET_RST) are released when MPU_DPLL_CLK is running (at the same time as MPU_PWRON_RST). When PRCM receive active MPU_RSTDONE signal from MPU, it de-asserts MPU_RST.
3. When the MPU subsystem internal reset sequence completes, the PRCM module releases in PD_MPU the MPU_RST signal and the MPU starts booting.
4. The PRCM module drives the MPU_L2RSTDISABLE signal low a minimum of 32 SYS_CLK cycles after MPU_RST is deasserted. The PRCM module keeps the MPU_L2RSTDISABLE signal low until the next power domain transition.

NOTE:

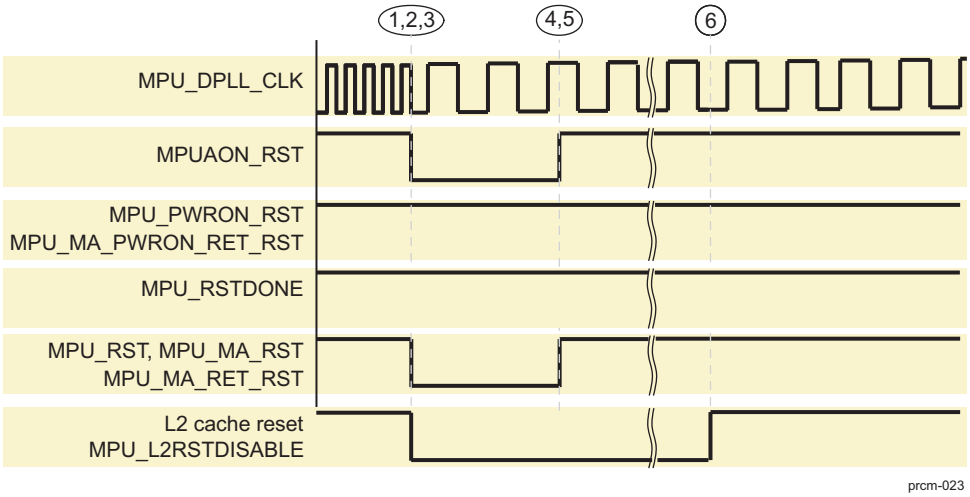
- The reset to the L2 cache memory (MPU_L2RSTDISABLE) in the MPU subsystem is asserted during initial POR (that is, when the PD_MPU wakes up from OFF state). It is also asserted during local or global warm reset. However, it is not asserted when the PD_MPU wakes up from RETENTION state (that is, when the logic is OFF and L2 memory is in RETENTION state). This ensures that the L2 cache is retained on wakeup.
- The L1 cache memory in the MPU subsystem is not retained on PD_MPU wakeup.

Copyright © 2015–2020, Texas Instruments Incorporated

3.5.6.2 MPU Subsystem Warm Reset Sequence

Figure 3-21 shows the warm reset sequence of the MPU subsystem.

Figure 3-21. MPU Warm Reset Sequence



The assumptions are:

- The DPLL_MPU is locked and is providing the clock to the MPU subsystem.
- A global warm reset to the MPU subsystem is asserted.

The warm reset sequence is:

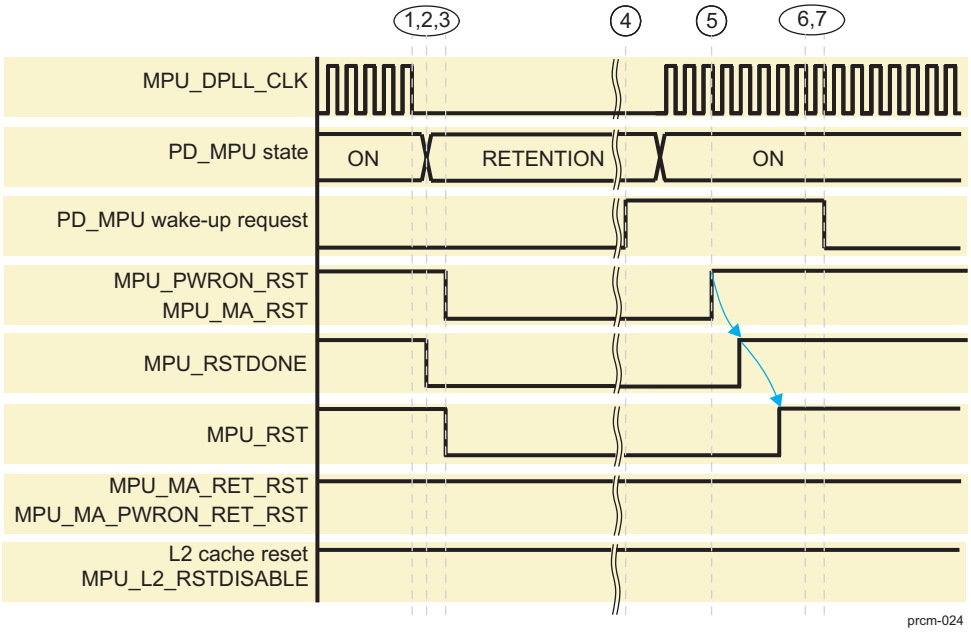
1. The PRCM module asserts in PD_MPUAON the MPUAON_RST reset to the INTC_MPU module in the MPU subsystem. The MPU DPLL is locked.
2. The PRCM module asserts in PD_MPU the MPU_RST reset to the MPU subsystem and also asserts MPU_MA_RST and MPU_MA_RET_RST resets to the MA_MPU module.
3. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
4. The PRCM module releases the MPUAON_RST reset to the INTC_MPU module. The MPU DPLL is in bypass mode.
5. The PRCM module releases MPU_RST, MPU_MA_RST, and MPU_MA_RET_RST only after DPLL_MPU is in bypass mode and MPU_DPLL_CLK is stable and active.
6. The PRCM module drives the MPU_L2RSTDISABLE signal low a minimum of 32 SYS_CLK cycles after MPU_RST is deasserted. The PRCM keeps the MPU_L2RSTDISABLE signal low until the next power domain transition.

3.5.6.3 MPU Subsystem Reset Sequence on Sleep and Wake-Up Transitions From RETENTION State

Figure 3-21 shows the sleep and wake-up transitions reset sequence from the RETENTION state of the MPU subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-22. MPU Reset Sequence on Sleep and Wake-Up Transition



The assumption is:

- The DPLL_MPU is locked and is providing the clock to the MPU subsystem.

The sleep and wake-up transitions reset sequence is:

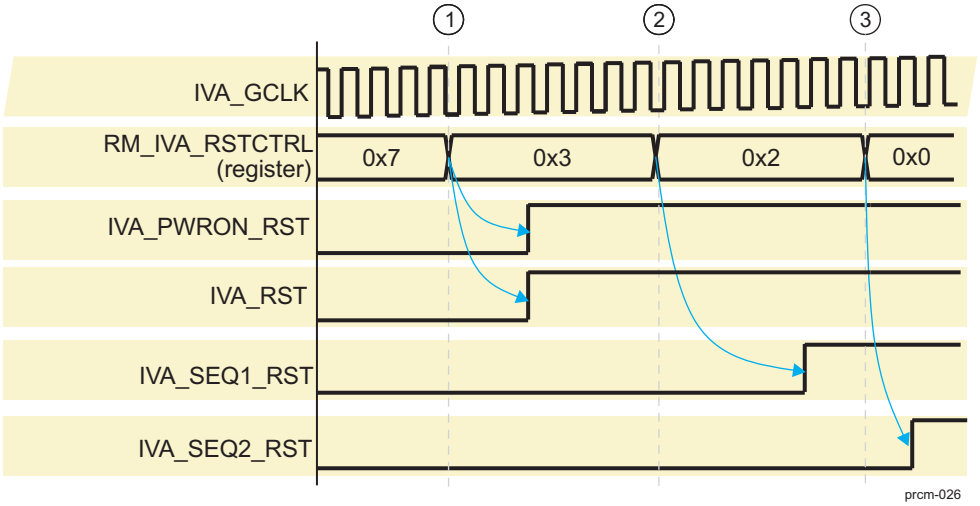
1. The PRCM module gates MPU_DPLL_CLK to the MPU subsystem.
2. The PRCM module switches PD_MPU to OSWR state.
3. The PRCM module asserts MPU_PWRON_RST and MPU_RST resets to the MPU subsystem, and asserts MPU_MA_RST to the MA_MPU module. The entire logic in the PD_MPU is held in reset. The reset to the L2 cache memory in the MPU subsystem is not asserted if the logic in PD_MPU is held in reset.
4. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
5. The PRCM module releases MPU_RST when the MPU_DPLL_CLK is stable and active. The PRCM deasserts the MPU_PWRON_RST, MPU_MA_RST. When PRCM receives active MPU_RSTDONE signal from MPU, it de-asserts MPU_RST.
6. During the wakeup from RET state, the MPU_L2RSTDISABLE signal must be maintained at active high so the L2 cache will not be reset when the MPU is reset.

3.5.6.4 IVA Subsystem Power-On Reset Sequence

Figure 3-23 shows the power-on reset sequence of the IVA subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-23. IVA Power-On Reset Sequence



The power-on reset to IVA is applied when PD_IVA is powered. The assumptions after power-on reset assertion are:

- The PRCM module provides the IVA_GCLK functional clock to the IVA subsystem, and it has been enabled by MPU software control.

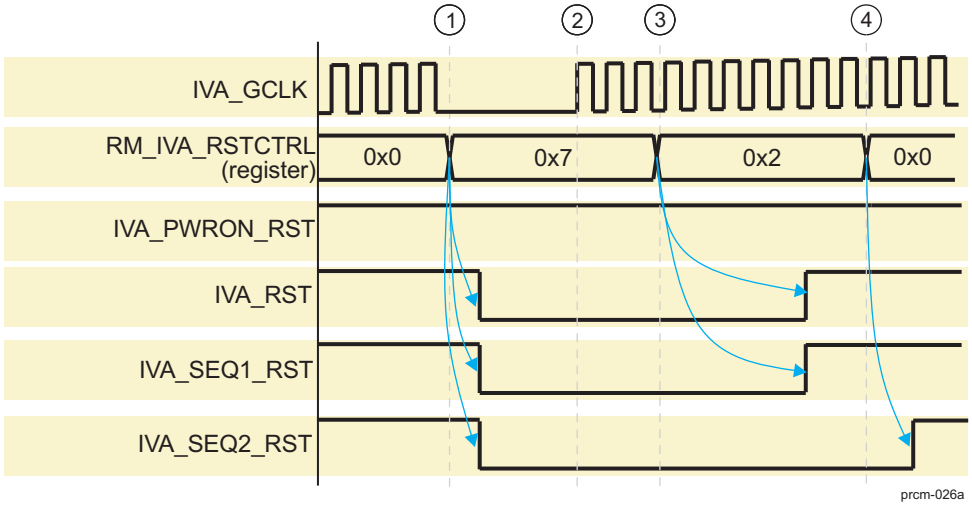
The power-on reset sequence is:

1. Software clears the RM_IVA_RSTCTRL[2] RST_LOGIC bit. This causes the PRCM module to release the IVA_PWRON_RST reset used inside IVA mainly to reset the emulation logic and the IVA_RST reset used to reset all logic inside IVA. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. When the TCM memory is initialized, software clears the RM_IVA_RSTCTRL[0] RST_SEQ1 bit. This releases IVA_SEQ1_RST reset to the Sequencer1 CPU.
3. Similarly, software can clear the RM_IVA_RSTCTRL[1] RST_SEQ2 bit. This releases IVA_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.5 IVA Subsystem Software Warm Reset Sequence

Figure 3-24 shows the software warm reset sequence of the IVA subsystem.

Figure 3-24. IVA Software Warm Reset Sequence



Before asserting the software reset to the IVA subsystem the MPU software must ensure that:

Copyright © 2015–2020, Texas Instruments Incorporated

- IVA sequencer CPUs are in IDLE state (CM_IVA_IVA_CLKCTRL[17:16] IDLEST).
- The IVA subsystem is in STANDBY state (CM_IVA_IVA_CLKCTRL[18] STBYST).
- The functional clock to the IVA subsystem has been gated by the PRCM module (CM_IVA_CLKSTCTRL[8] CLKACTIVITY_IVA_GCLK).

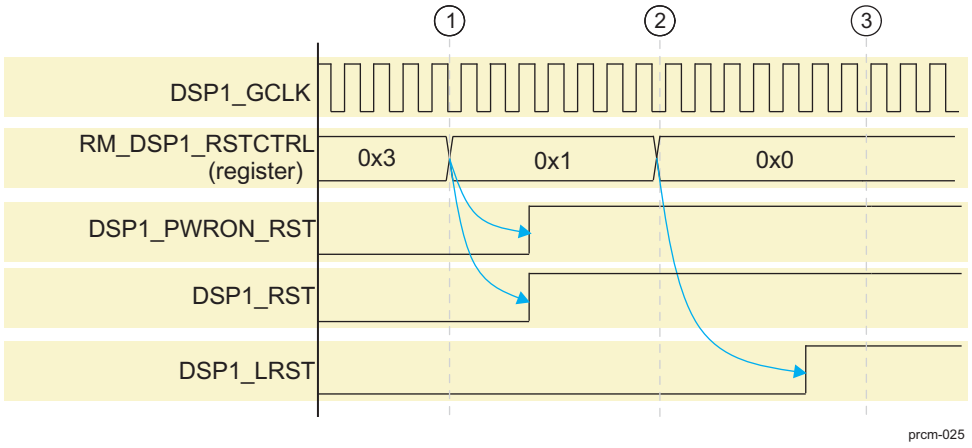
The software reset sequence is:

1. The MPU software sets the RM_IVA_RSTCTRL[2] RST_LOGIC, RM_IVA_RSTCTRL[1] RST_SEQ2, and RM_IVA_RSTCTRL[0] RST_SEQ1 bits. This causes the PRCM module to assert the IVA_RST, IVA_SEQ1_RST, and IVA_SEQ2_RST resets to the IVA subsystem. The IVA_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the IVA subsystem.
3. The MPU software clears the RM_IVA_RSTCTRL[2] RST_LOGIC and RM_IVA_RSTCTRL[0] RST_SEQ1 bits. This causes the PRCM module to release the IVA_RST and IVA_SEQ1_RST resets to the IVA subsystem.
4. The MPU software clears the RM_IVA_RSTCTRL[1] RST_SEQ2 bit. This releases the IVA_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.6 DSP1 Subsystem Power-On Reset Sequence

Figure 3-25 shows the power-on reset sequence of the DSP1 subsystem.

Figure 3-25. DSP1 Subsystem Power-On Reset Sequence



The power-on reset to DSP1 is applied when PD_DSP1 is powered. The assumptions ofter power-on reset assertion are:

- PD_DSP1 is on.
- The PRCM module provides DSP1_GCLK functional clock to the DSP subsystem, and it has been enabled by MPU software control.

The Power-On Reset sequence is:

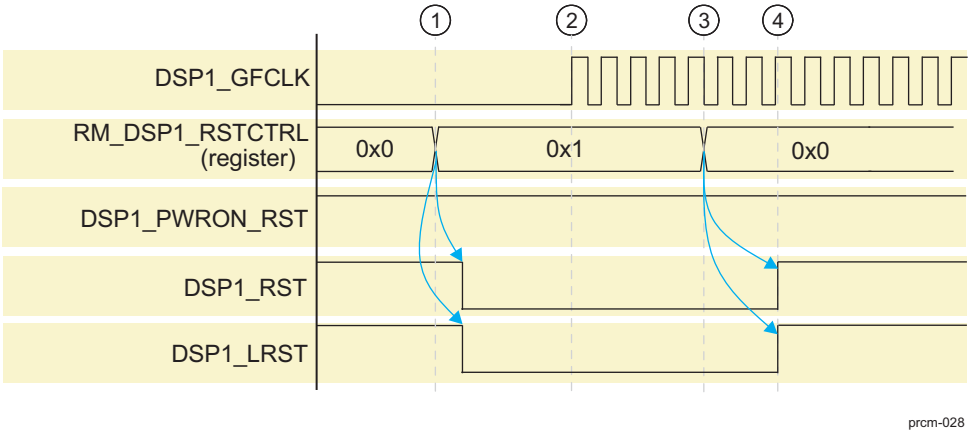
1. Software clears the RM_DSP1_RSTCTRL[1] RST_DSP1 bit. This causes the PRCM module to release the DSP1_PWRON_RST used inside DSP1 mainly to reset the emulation logic and the DSP1_RST used to reset all logic inside DSP1. Then software can download data into TCM memory while keeping the CPU under reset.
2. When the memory is initialized, software clears the RM_DSP1_RSTCTRL[0] RST_DSP1_LRST bit. This release DSP1_LRST to the local CPU inside DSP subsystem.

3.5.6.7 DSP1 Subsystem Software Warm Reset Sequence

Figure 3-26 shows the software warm reset sequence of the DSP1 subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-26. DSP1 Subsystem Software Warm Reset Sequence



Before asserting the software reset to the DSP subsystem, the MPU software must ensure that:

- The DSP CPUs are in IDLE state (CM_DSP1_DSP1_CLKCTRL[17:16] IDLEST).
- The DSP subsystem is in STANDBY state (CM_DSP1_DSP1_CLKCTRL[18] STBYST).
- The functional clock to the DSP subsystem has been gated by the PRCM module (CM_DSP1_CLKSTCTRL[8] CLKACTIVITY_DSP1_GFCLK)

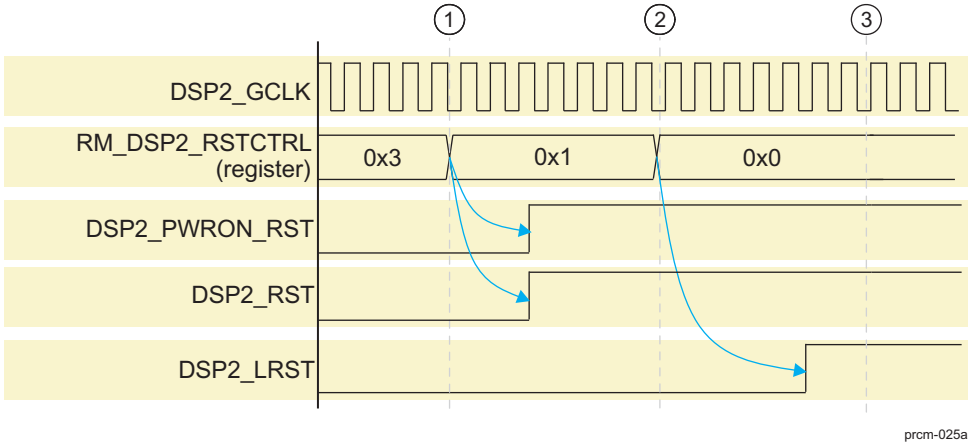
The software reset sequence is:

1. MPU software sets the RM_DSP1_RSTCTRL[1] RST_DSP1 = 0 and RM_DSP1_RSTCTRL[0] RST_DSP1_LRST = 1. This causes the PRCM module to assert DSP1_RST, DSP1_LRST to the DSP subsystem. The DSP1_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the DSP subsystem.
3. The MPU software cleares theRM_DSP1_RSTCTRL[1] RST_DSP1 and RM_DSP1_RSTCTRL[0] RST_DSP1_LRST bits. This causes the PRCM module to release DSP1_RST and DSP1_LRST to the DSP subsystem.

3.5.6.8 DSP2 Subsystem Power-On Reset Sequence

Figure 3-27 shows the power-on reset sequence of the DSP2 subsystem.

Figure 3-27. DSP2 Subsystem Power-On Reset Sequence



The power-on reset to DSP2 is applied when PD_DSP2 is powered. The assumptions ofter power-on reset assertion are:

- PD_DSP2 is on.
- The PRCM module provides DSP2_GCLK functional clock to the DSP subsystem, and it has been

Copyright © 2015–2020, Texas Instruments Incorporated

enabled by MPU software control.

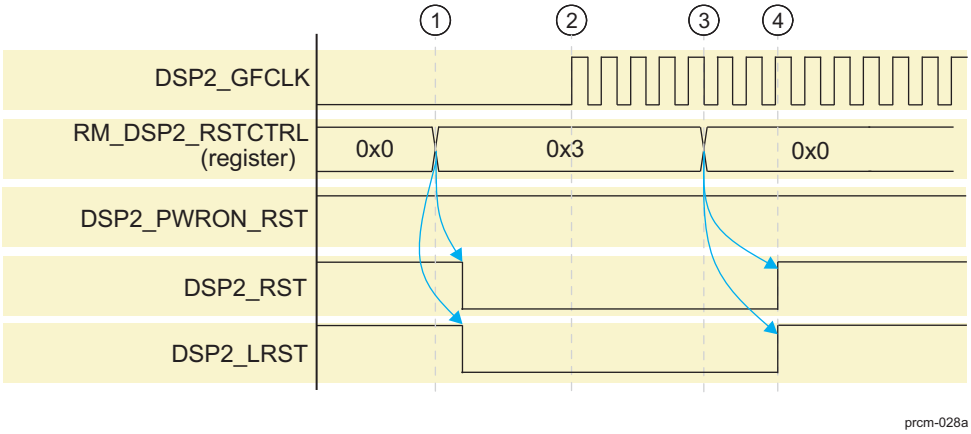
The Power-On Reset sequence is:

1. Software clears the RM_DSP2_RSTCTRL[1] RST_DSP2 bit. This causes the PRCM module to release the DSP2_PWRON_RST used inside DSP2 mainly to reset the emulation logic and the DSP2_RST used to reset all logic inside DSP2. Then software can download data into TCM memory while keeping the CPU under reset.
2. When the memory is initialized, software clears the RM_DSP2_RSTCTRL[0] RST_DSP2_LRST bit. This release DSP2_LRST to the local CPU inside DSP subsystem.

3.5.6.9 DSP2 Subsystem Software Warm Reset Sequence

Figure 3-26 shows the software warm reset sequence of the DSP2 subsystem.

Figure 3-28. DSP2 Subsystem Software Warm Reset Sequence



Before asserting the software reset to the DSP subsystem, the MPU software must ensure that:

- The DSP CPUs are in IDLE state (CM_DSP2_DSP2_CLKCTRL[17:16] IDLEST).
- The DSP subsystem is in STANDBY state (CM_DSP2_DSP2_CLKCTRL[18] STBYST).
- The functional clock to the DSP subsystem has been gated by the PRCM module (CM_DSP2_CLKSTCTRL[8] CLKACTIVITY_DSP2_GFCLK)

The software reset sequence is:

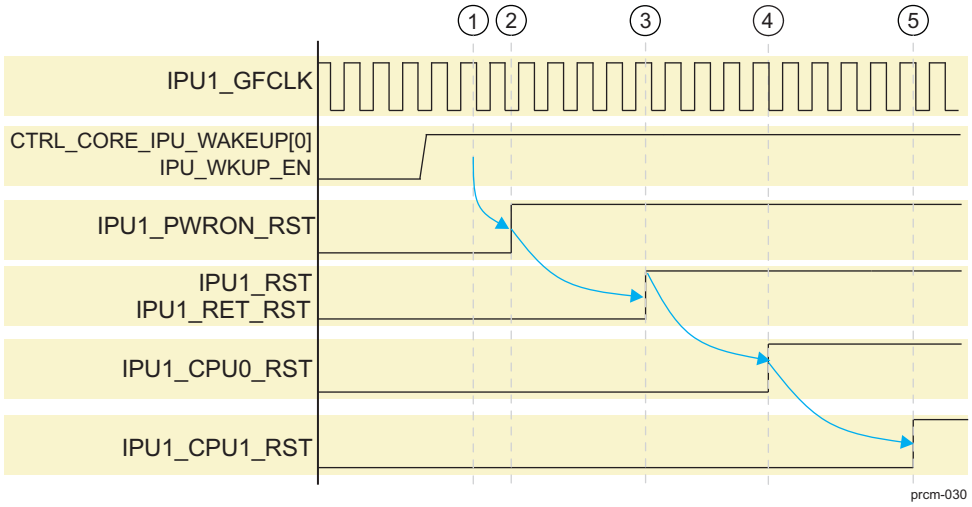
1. MPU software sets the RM_DSP2_RSTCTRL[1] RST_DSP2 = 0 and RM_DSP2_RSTCTRL[0] RST_DSP2_LRST = 1. This causes the PRCM module to assert DSP2_RST, DSP2_LRST to the DSP subsystem. The DSP2_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the DSP subsystem.
3. The MPU software cleares theRM_DSP2_RSTCTRL[1] RST_DSP2 and RM_DSP2_RSTCTRL[0] RST_DSP2_LRST bits. This causes the PRCM module to release DSP2_RST and DSP2_LRST to the DSP subsystem.

3.5.6.10 IPU1 Subsystem Power-On Reset Sequence

Figure 3-29 shows the power-on reset sequence of the IPU1 subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-29. IPU1 Power-On Reset Sequence



The assumptions on power-on reset assertion are:

- The IPU subsystem is held in reset by the PRCM module and the following are asserted:
  - IPU1_PWRON_RST
  - IPU1_RET_RST
  - IPU1_CPU0_RST
  - IPU1_CPU1_RST
  - IPU1_RST

The power-on reset sequence is:

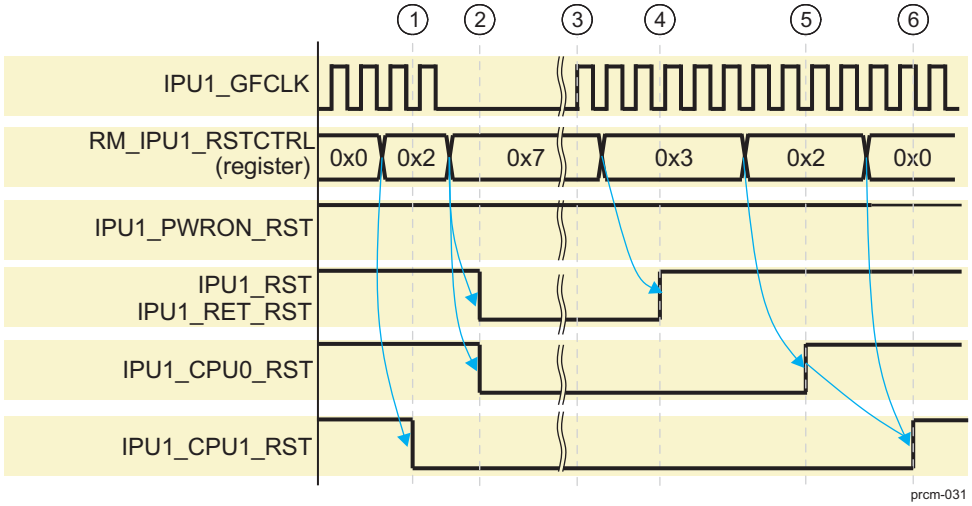
1. Software clears the RM_IPU1_RSTCTRL[2] RST_IPU bit in the PRCM module register to release the IPU shared cache and CACHE_MMU_IPU from reset.
2. The PRCM module releases IPU1_PWRON_RST once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit and the IPU1_GFCLK is running. Upon deassertion of the POR signal, the IPU subsystem starts the CPU and CACHE_MMU_IPU initialization sequence.
3. When the reset sequence of Step 2 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU1_RST and IPU1_RET_RST signals.
4. MPU software must configure CACHE_MMU_IPU once CACHE_MMU_IPU is out of reset. After CACHE_MMU_IPU configuration and cache initialization is done, MPU software clears the RM_IPU1_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. The PRCM module releases IPU_CPU0_RST, which causes IPU_C0 to start booting.
6. MPU software can clear the RM_IPU1_RSTCTRL[1] RST_CPU1 bit in the PRCM module register so that the PRCM module releases the IPU_CPU1_RST to IPU_C1.

3.5.6.11 IPU1 Subsystem Software Warm Reset Sequence

Figure 3-30 shows the software warm reset sequence of the IPU1 subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-30. IPU1 Subsystem Software Warm Reset Sequence



For doing the software reset of IPU1, the MPU software must ensure that IPU CPUs (IPU1_C0 and IPU1_C1) are in IDLE state and clock is gated

The software warm reset sequence is:

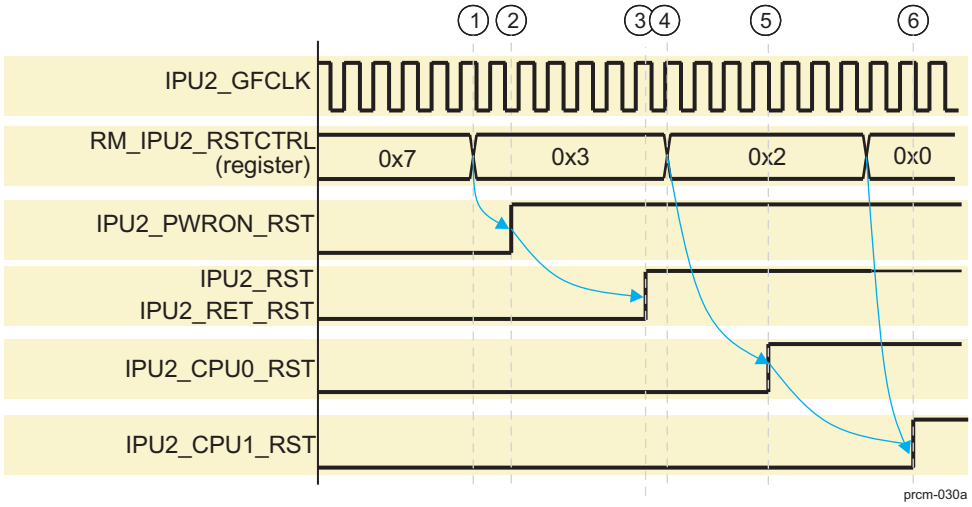
1. When IPU1_C1 is in IDLE state, IPU1_C0 software or MPU software sets the RM_IPU1_RSTCTRL[1] RST_CPU1 bit. The PRCM module asserts the IPU1_CPU1_RST reset signal to IPU1_C1.
2. When IPU1_C0 is in IDLE state, the MPU software sets the RM_IPU1_RSTCTRL[2] RST_IPU and RM_IPU1_RSTCTRL[0] RST_CPU0 bits.
3. The PRCM module asserts the IPU1_RST, IPU1_RET_RST, and IPU1_CPU0_RST reset signals. The IPU1_PWRON_RST remains deasserted in this case.
4. The MPU software reenables the IPU1_GFCLK and the initialization sequence starts inside the IPU subsystem. Software clears the RM_IPU1_RSTCTRL[2] RST_IPU bit and RM_IPU1_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. When the reset sequence of Step 4 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU1_RST, IPU1_RET_RST, and IPU1_CPU0_RST reset signals. IPU1_C0 starts rebooting.
6. Software can then clear the RM_IPU1_RSTCTRL[1] RST_CPU1 bit in the PRCM module register. The PRCM module releases the IPU1_CPU1_RST reset signal to IPU1_C1 to start booting.

3.5.6.12 IPU2 Subsystem Power-On Reset Sequence

Figure 3-31 shows the power-on reset sequence of the IPU2 subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-31. IPU2 Power-On Reset Sequence



The assumptions on power-on reset assertion are:

- The IPU subsystem is held in reset by the PRCM module and the following are asserted:
  - IPU2_PWRON_RST
  - IPU2_RET_RST
  - IPU2_CPU0_RST
  - IPU2_CPU1_RST
  - IPU2_RST

The power-on reset sequence is:

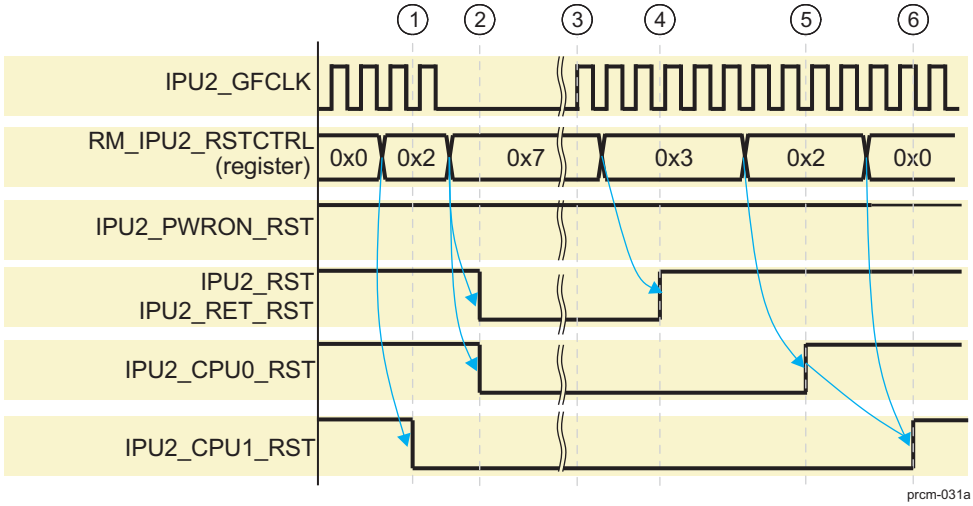
1. Software clears the RM_IPU2_RSTCTRL[2] RST_IPU bit in the PRCM module register to release the IPU shared cache and CACHE_MMU_IPU from reset.
2. The PRCM module releases IPU2_PWRON_RST once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit and the IPU2_GFCLK is running. Upon deassertion of the POR signal, the IPU subsystem starts the CPU and CACHE_MMU_IPU initialization sequence.
3. When the reset sequence of Step 2 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU_MMU_CACHE_RST and IPU2_RET_RST signals.
4. MPU software must configure CACHE_MMU_IPU once CACHE_MMU_IPU is out of reset. After CACHE_MMU_IPU configuration and cache initialization is done, MPU software clears the RM_IPU2_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. The PRCM module releases IPU2_CPU0_RST, which causes IPU_C0 to start booting.
6. MPU software can clear the RM_IPU2_RSTCTRL[1] RST_CPU1 bit in the PRCM module register so that the PRCM module releases the IPU2_CPU1_RST to IPU_C1.

3.5.6.13 IPU2 Subsystem Software Warm Reset Sequence

Figure 3-32 shows the software warm reset sequence of the IPU2 subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-32. IPU2 Subsystem Software Warm Reset Sequence



For doing the software reset of IPU2, the MPU software must ensure that IPU CPUs (IPU2_C0 and IPU2_C1) are in IDLE state and clock is gated

The software warm reset sequence is:

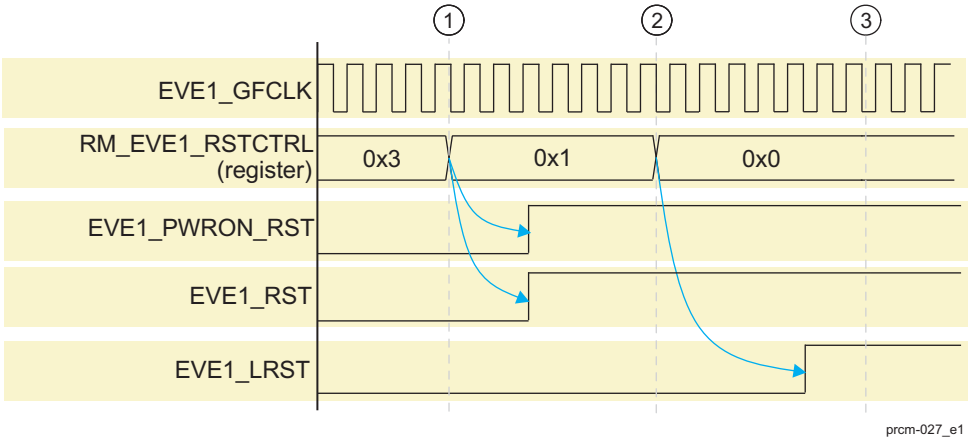
1. When IPU2_C1 is in IDLE state, IPU2_C0 software or MPU software sets the RM_IPU2_RSTCTRL[1] RST_CPU1 bit. The PRCM module asserts the IPU2_CPU1_RST reset signal to IPU2_C1.
2. When IPU2_C0 is in IDLE state, the MPU software sets the RM_IPU2_RSTCTRL[2] RST_IPU and RM_IPU2_RSTCTRL[0] RST_CPU0 bits.
3. The PRCM module asserts the IPU2_RST, IPU2_RET_RST, and IPU2_CPU0_RST reset signals. The IPU2_PWRON_RST remains deasserted in this case.
4. The MPU software reenables the IPU2_GFCLK and the initialization sequence starts inside the IPU subsystem. Software clears the RM_IPU2_RSTCTRL[2] RST_IPU bit and RM_IPU2_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. When the reset sequence of Step 4 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU2_RST, IPU2_RET_RST, and IPU2_CPU0_RST reset signals. IPU2_C0 starts rebooting.
6. Software can then clear the RM_IPU2_RSTCTRL[1] RST_CPU1 bit in the PRCM module register. The PRCM module releases the IPU2_CPU1_RST reset signal to IPU2_C1 to start booting.

3.5.6.14 EVE1 Subsystem Power-On Reset Sequence

Figure 3-33 shows the power-on reset sequence of the EVE1 subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-33. EVE1 Subsystem Power-On Reset Sequence



The power-on reset to EVE1 is applied when PD_EVE1 is powered. The assumptions on power-on reset assertion are:

- The PRCM module provides the EVE1_GFCLK functional clock to the EVE subsystem, and it has been enabled by MPU software control.

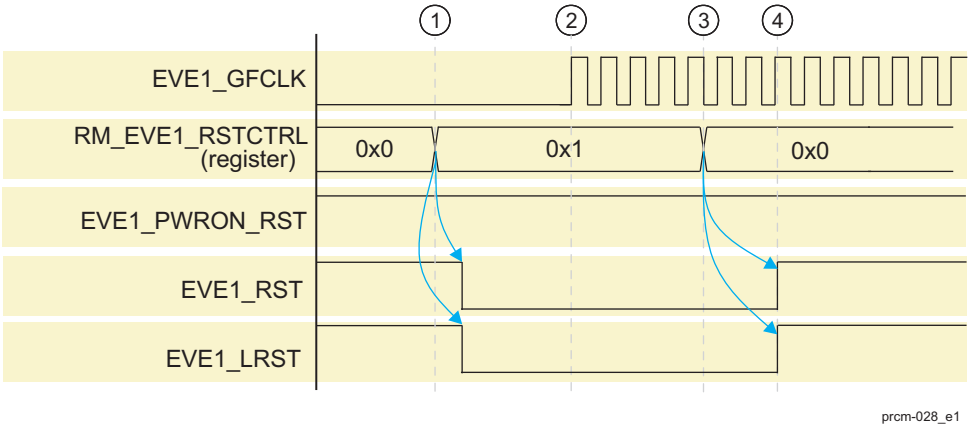
The power-on reset sequence is:

1. Software clears the RM_EVE1_RSTCTRL[1] RST_EVE1 bit. This causes the PRCM module to release the EVE1_PWRON_RST and the EVE1_RST signals. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. When the TCM memory is initialized, software clears the RM_EVE1_RSTCTRL[0] RST_EVE1_LRST bit .This release EVE1_LRST to the local CPU inside EVE subsystem.

3.5.6.15 EVE1 Subsystem Software Warm Reset Sequence

Figure 3-34 shows the software warm reset sequence of the EVE1 subsystem.

Figure 3-34. EVE1 Subsystem Software Warm Reset Sequence



For doing the software reset of EVE1 the MPU software must ensure that EVE1 CPU is in IDLE state and EVE1 is in STANDBY state and the functional clock to EVE1 has been gated.

The software warm reset sequence is:

1. MPU software sets the RM_EVE1_RSTCTRL register to 0x1. This causes the PRCM module to asset the EVE1_RST, EVE1_LRST to the EVE subsystem. The EVE1_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the EVE1 subsystem.
3. The MPU software cleares the RM_EVE1_RSTCTRL[1] RST_EVE1 and RM_EVE1_RSTCTRL[0] RST_EVE1_LRST bits. This causes the PRCM module to release EVE1_RST and EVE1_LRST to the

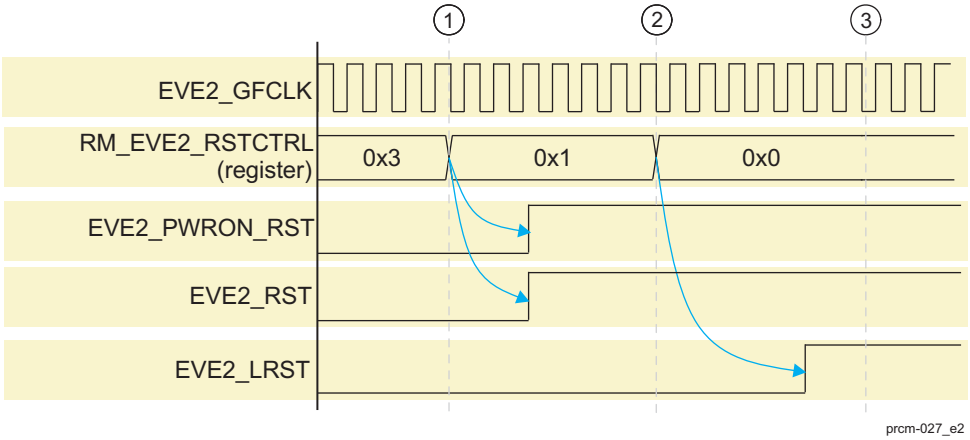
EVE subsystem.

3.5.6.16 EVE2 Subsystem Power-On Reset Sequence

Figure 3-35 shows the power-on reset sequence of the EVE2 subsystem.

Figure 3-35. EVE2 Subsystem Power-On Reset Sequence



The power-on reset to EVE2 is applied when PD_EVE2 is powered. The assumptions on power-on reset assertion are:

- The PRCM module provides the EVE2_GFCLK functional clock to the EVE subsystem, and it has been enabled by MPU software control.

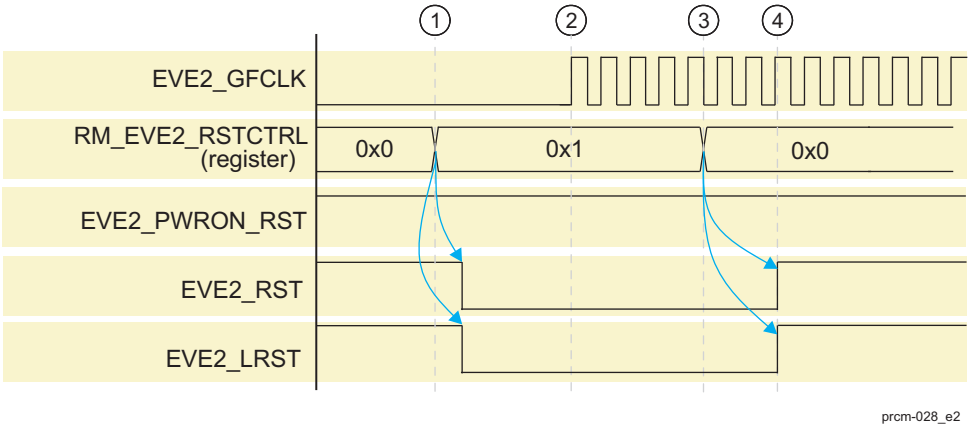
The power-on reset sequence is:

1. Software clears the RM_EVE2_RSTCTRL[1] RST_EVE2 bit.This causes the PRCM module to release the EVE2_PWRON_RST used inside EVE2 to reset mainly the emulation logic and EVE2_RST used to reset all logic inside EVE2. Then software can download data into TCM memory while keeping the CPU under reset.
2. When the TCM memory is initialized, software clears the RM_EVE2_RSTCTRL[0] RST_EVE2_LRST bit. This releases EVE2_LRST to the local CPU inside EVE subsystem.

3.5.6.17 EVE2 Subsystem Software Warm Reset Sequence

Figure 3-36 shows the software warm reset sequence of the EVE2 subsystem.

Figure 3-36. EVE2 Subsystem Software Warm Reset Sequence



For doing the software reset of EVE2 the MPU software must ensure that EVE2 CPU is in IDLE state and EVE2 is in STANDBY state and the functional clock to EVE2 has been gated.

Copyright © 2015–2020, Texas Instruments Incorporated

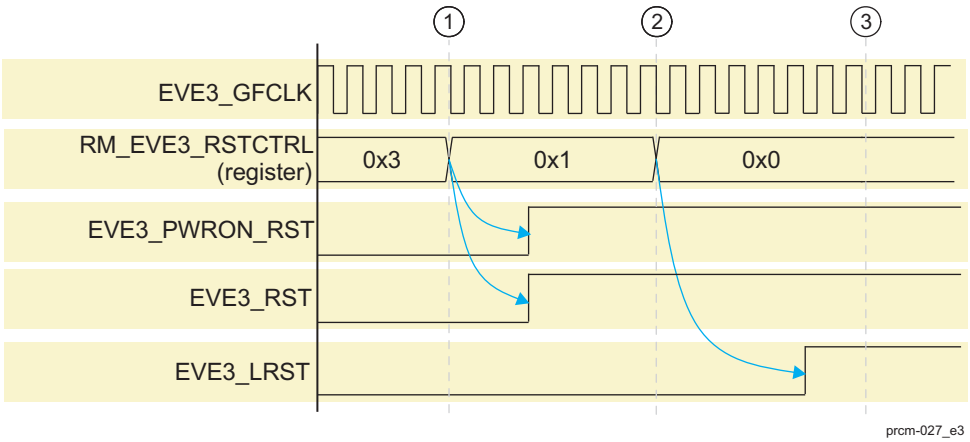
The software warm reset sequence is:

1. MPU software sets the RM_EVE2_RSTCTRL register to 0x1. This causes the PRCM module to asset the EVE2_RST, EVE2_LRST to the EVE subsystem. The EVE2_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the EVE2 subsystem.
3. The MPU software cleares the RM_EVE2_RSTCTRL[1] RST_EVE2 and RM_EVE2_RSTCTRL[0] RST_EVE2_LRST bits. This causes the PRCM module to release EVE2_RST and EVE2_LRST to the EVE subsystem.

3.5.6.18 EVE3 Subsystem Power-On Reset Sequence

Figure 3-37 shows the power-on reset sequence of the EVE3 subsystem.

Figure 3-37. EVE3 Subsystem Power-On Reset Sequence



The power-on reset to EVE3 is applied when PD_EVE3 is powered. The assumptions on power-on reset assertion are:

- The PRCM module provides the EVE3_GFCLK functional clock to the EVE subsystem, and it has been enabled by MPU software control.

The power-on reset sequence is:

1. Software clears the RM_EVE3_RSTCTRL[1] RST_EVE3 bit.This causes the PRCM module to release the EVE3_PWRON_RST used inside EVE3 to reset mainly the emulation logic and EVE3_RST used to reset all logic inside EVE3. Then software can download data into TCM memory while keeping the CPU under reset.
2. When the TCM memory is initialized, software clears the RM_EVE3_RSTCTRL[0] RST_EVE3_LRST bit .This release EVE3_LRST to the local CPU inside EVE subsystem.

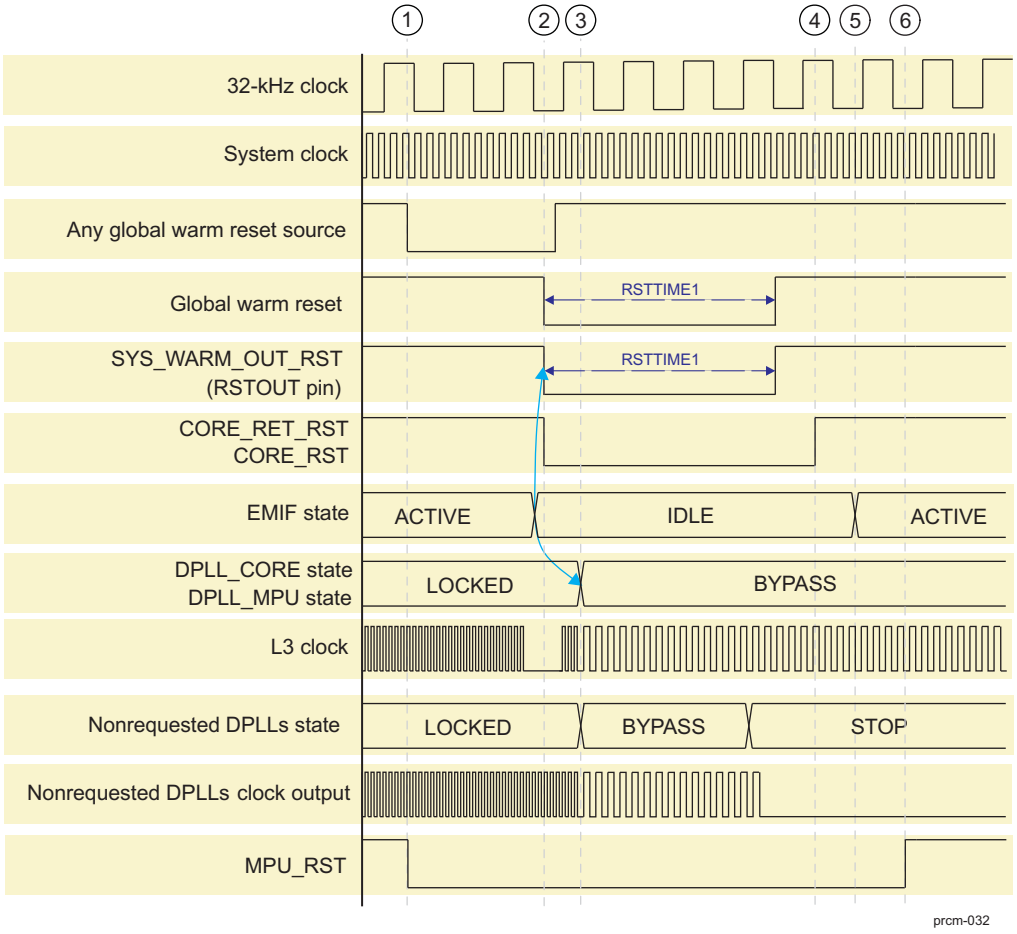
3.5.6.19 Global Warm Reset Sequence

This section describes the global warm reset sequence.

Figure 3-38 shows the global warm reset sequence.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-38. Global Warm Reset Sequence



The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The device is active:
  - All resets are released.
  - MPU, CORE, and IVA DPLLs are locked.

The steps of a global warm reset sequence are:

1. On assertion of any global warm reset source the PRM signals the EMIF that a global warm reset event has occurred. The EMIF initiates the transition to IDLE state. The PRCM module delays global warm reset to the device for a minimum of 16 L3 clock cycles so that the EMIF switches to IDLE state and switches the external SDRAM to self-refresh mode.
2. The reset managers in the PRM assert the following resets:
   - The external warm reset SYS_WARM_RST (rstoutn pin).
   - All power domain warm resets are asserted.
   - The PRM and CM registers, sensitive to warm reset, are asynchronously reset.
   - DPLL hardware resets are not asserted.
     - DPLL_MPU transitions to bypass mode.
     - DPLL_CORE transitions to bypass mode once the EMIF switches to IDLE state.
     - DPLL_IVA, DPLL_PER, DPLL_USB, DPLL_DSP, DPLL_EVE, DPLL_GPU and DPLL_DDR transition to idle bypass low-power mode. Then, as clock signals are no more requested, they are gated and these DPLLs go to stop mode.

Copyright © 2015–2020, Texas Instruments Incorporated

  - DPLL_ABE configuration is not changed.
  - DPLL_GMAC configuration is not changed.
- CM gates the clocks that are not needed, as per their default reset setting in the associated registers.

3. The device warm reset (internal and rstoutn pin) duration is set up by the PRM_RSTTIME[9:0] RSTTIME1 bit field. It defines the global warm reset duration in number of FUNC_32K_CLK clock cycles. Default value loaded after POR is 6 clock cycles. During this time, the DPLL_ABE control registers are reset and DPLL_ABE transitions to bypass mode when the system clock restarts and the DPLL_ABE outputs are no longer used.
4. The CORE power domain is released from reset (that is, warm reset-sensitive modules in the CORE power domain).
5. The PRCM module switches the EMIF from IDLE state back to ACTIVE state.
6. PD_MPU is released from reset when the clocks to the MPU subsystem are active. The MPU reboots.

NOTE:

- The PD_DSP and PD_IVA, PD_EVE, PD_IPU2 power domains are held under reset after global warm reset by assertion of the software source of the reset.
- The following are held under reset after global warm reset until the PRCM module enables their interface clock:
  - PD_L4PER
  - PD_L3INIT
  - PD_DSS
  - PD_GPU
  - PD_CAM

3.5.7 Reset Status Requirements

The PRCM module is required to provide a reset activity output status to the control module or subsystems inside the device whenever the domain is reset. These domains include:

- MPU
- DSP
- IVA
- CAM
- DSS
- GPU
- CORE
- L3INIT
- EMU

Reset activity indicators are logged in the control module. Reset activity indicators that are to be logged inside the CTRL_MODULE_CORE module are active high. A handshake is in place between the PRCM and control modules. The PRCM module provides reset status signals to the control module. The control module provides clear reset status signals (one per reset status line) to the PRCM module when status is logged in the control module. The PRCM module clears reset activity indicators when a clear reset status signal from the control module is asserted.

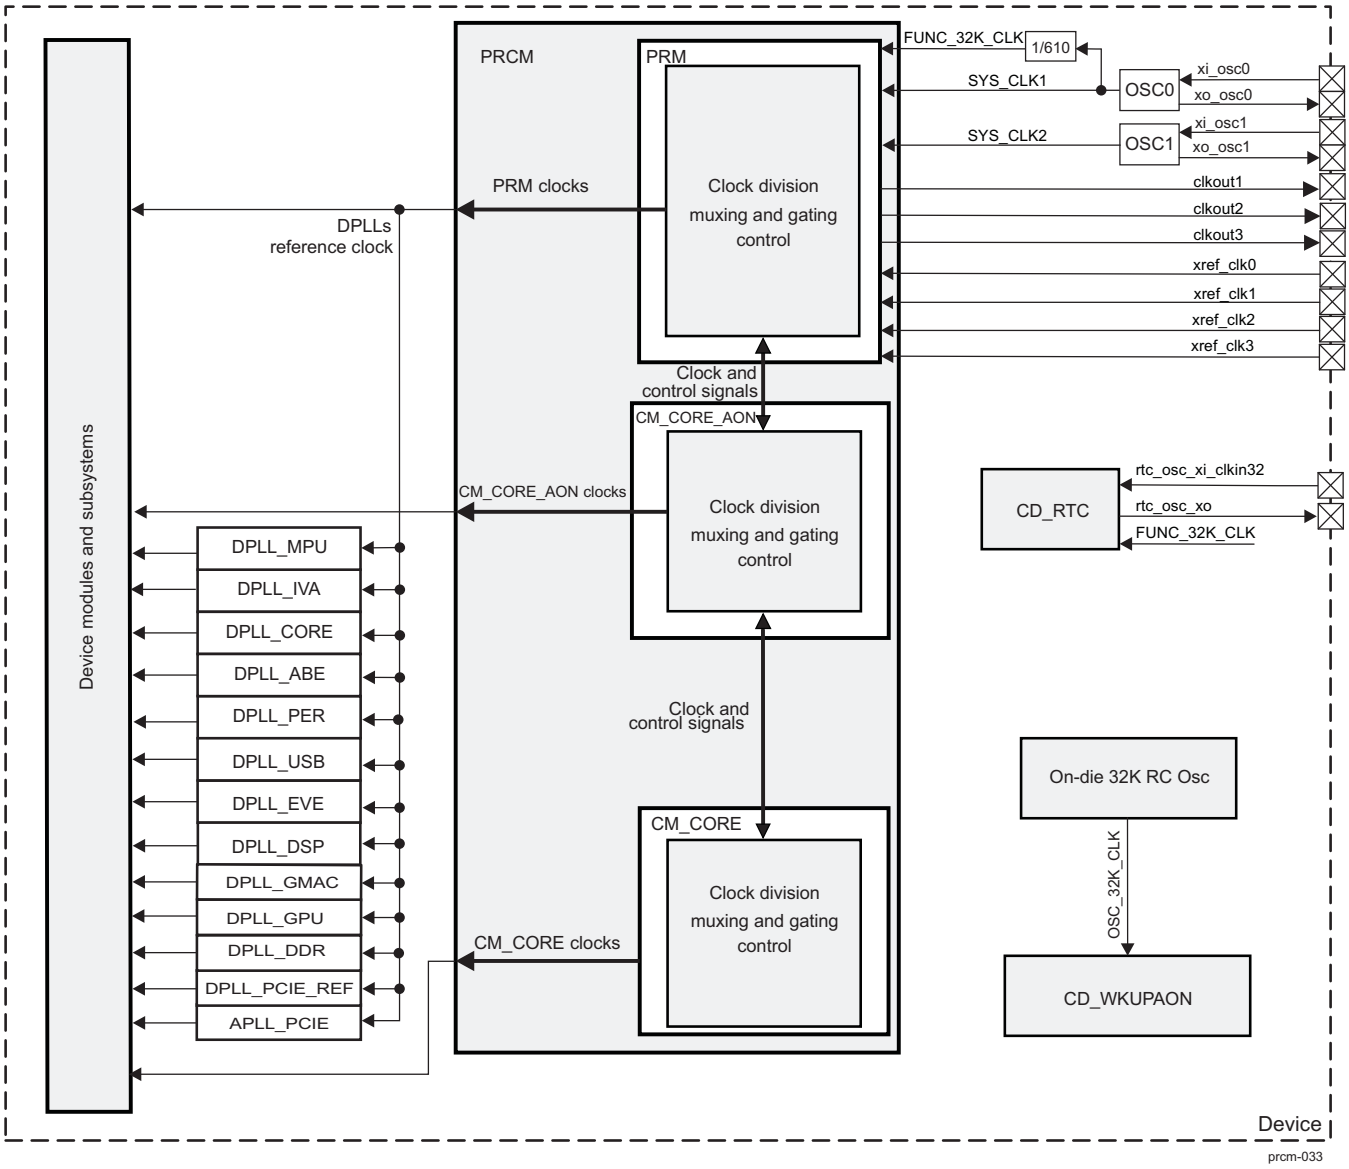
3.6 Clock Management Functional Description

3.6.1 Overview

The PRCM module provides the control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device. For information about the clock-management functional architecture of the device, see Section 3.1.1.1, *Clock Management*.

The PRCM module provides clocks to the internal DPLLs for internal high-frequency clock generation. Clock division and gating are handled by the PRM, CM_CORE_AON, and CM_CORE sections of the PRCM module. Figure 3-39 shows the high-level clock-management scheme in the device.

Figure 3-39. PRCM Module Clock Manager Overview



Copyright © 2015–2020, Texas Instruments Incorporated

3.6.2 External Clock Inputs

3.6.2.1 FUNC_32K_CLK Clock

The 32-kHz frequency is used for low-frequency operation. FUNC_32K_CLK is derived from SYS_CLK1. It supplies the always-on wake-up domain for operation in lowest power mode and as the clock source to the DPLL_ABE.

3.6.2.2 High-Frequency System Clock Input

The system clocks SYS_CLK1 and SYS_CLK2, are the main source clocks of the device. SYS_CLK1 and SYS_CLK2 are received directly from internal oscillators (OSC0 and OSC1) of the PRCM module. They are supplied as the reference clock to the DPLLs and as functional clock to several modules.

3.6.2.3 External Reference Clock Input

The external reference clocks xref_clk0, xref_clk1, xref_clk2, and xref_clk3 are received directly from external reference clock source for the device. They are supplied as the functional clock to the TIMERs, and as reference clock to the McASP and other peripherals.

3.6.3 Internal Clock Sources and Generators

The PRCM module clock sources/generators are split into the following parts:

- PRM clock source that receives system clocks SYS_CLK1 and SYS_CLK2 inputs.
- CM_CORE_AON and CM_CORE clock sources that distribute high-frequency clocks
- DPLL clock generators that synthesize high-frequency clocks for the device

Table 3-36. Internal Clock Sources

Clock Name	Source	Frequency	Note
FUNC_32K_CLK	SYS_CLK1/610	32 KHz	See Section 3.6.3.1 *PRM Clock Source*
SYS_CLK1	xi_osc0	19.2, 20, 27 MHz	See Section 3.6.3.1 *PRM Clock Source*
SYS_CLK2	xi_osc1	(19.2 - 32) MHz	See Section 3.6.3.1 *PRM Clock Source*
OSC_32K_CLK(1)	On-die 32K RC Osc	32 KHz	See Section 3.6.3.2.2, *CM_CORE_AON_CLKOUTMUX Overview*
FUNC_96M_AON_CLK	DPLL_PER	96 MHz	See Section 3.6.3.4 *DPLL_PER Description*
FUNC_192M_CLK	DPLL_PER	192 MHz	See Section 3.6.3.4 *DPLL_PER Description*
FUNC_128M_CLK	DPLL_PER	128 MHz	See Section 3.6.3.4 *DPLL_PER Description*
CORE_CLK	DPLL_CORE	532 MHz	See Section 3.6.3.5 *DPLL_CORE Description*

(1) The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

3.6.3.1 PRM Clock Source

NOTE: The audio back end (ABE) module is not supported for this family of devices, but the ABE name is still present in some clock or DPLL names.

Copyright © 2015–2020, Texas Instruments Incorporated

The PRM clock source receives the SYS_CLK1 and SYS_CLK2 clocks from external input pins. Along with these clocks, it receives a clock ABE_LP_CLK, divided version of DPLL_ABE_X2_CLK, which is generated by DPLL_ABE. The PRM manages the low-frequency clocks associated with these four (counting also FUNC_32K_CLK as an input clock) input clocks. The PRM sources various versions (through gating controls) of these externally sourced clocks to supply:

- PRCM-managed DPLLs with a reference clock, which is permanently supplied with always-on buffers
- The DSS with a reference clock, which is permanently supplied with always-on buffers
- The various timers and watchdog timers with clocks supplied by always-on buffers
- The clocks for the CM clock generator and the CORE power domain
- Timer functional clocks
- The bandgap and control module for thermal sensor feature
- Reference clock for various modules:
  - USB_OTG_SS
  - SATA

Figure 3-40 is a logical representation of the PRM clock source.

Divider L3INSTR_TS_GCLK and L3INSTR_DLL_AGING_GCLK	CM_L3INSTR_CTRL_MODULE_BANDGAP_CLKCTRL[25:24] CLKSEL

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

The PRM provides a 32-kHz gated and ungated clock for use by portions of the PD_WKUPAON power domain and some peripherals outside the PD_WKUPAON power domain.

The PRM creates COREAON_32K_GFCLK (gated version of FUNC_32K_CLK) to provide 32kHz clock to peripherals outside of PD_WKUPAON.

It also provides the system clock to the DSS, a gated and buffered version to the WKUPAON_GICLK interconnect clock, and the DPLLs controlled by the PRCM module.

3.6.3.2 CM Clock Source

The clock manager (CM) is primarily responsible for generating interface and functional clocks from the internal clocks provided by DPLL_CORE and DPLL_PER. The CM is physically divided into two independent entities: CM_CORE_AON, which is placed in the PD_COREAON always-on power domain, and CM_CORE, which is placed in the PD_CORE switchable power domain. The split is done to provide control over various entities, such as modules, DPLLs, and clocks, during low-power use case scenarios when the PD_CORE power domain can be switched to RETENTION state.

3.6.3.2.1 CM_CORE_AON Clock Generator

CM_CORE_AON receives a system clocks (SYS_CLK1 and SYS_CLK2) from the PRM, which serves as its functional clock. CM_CORE_AON provides a gated clock to

- PD_CAM

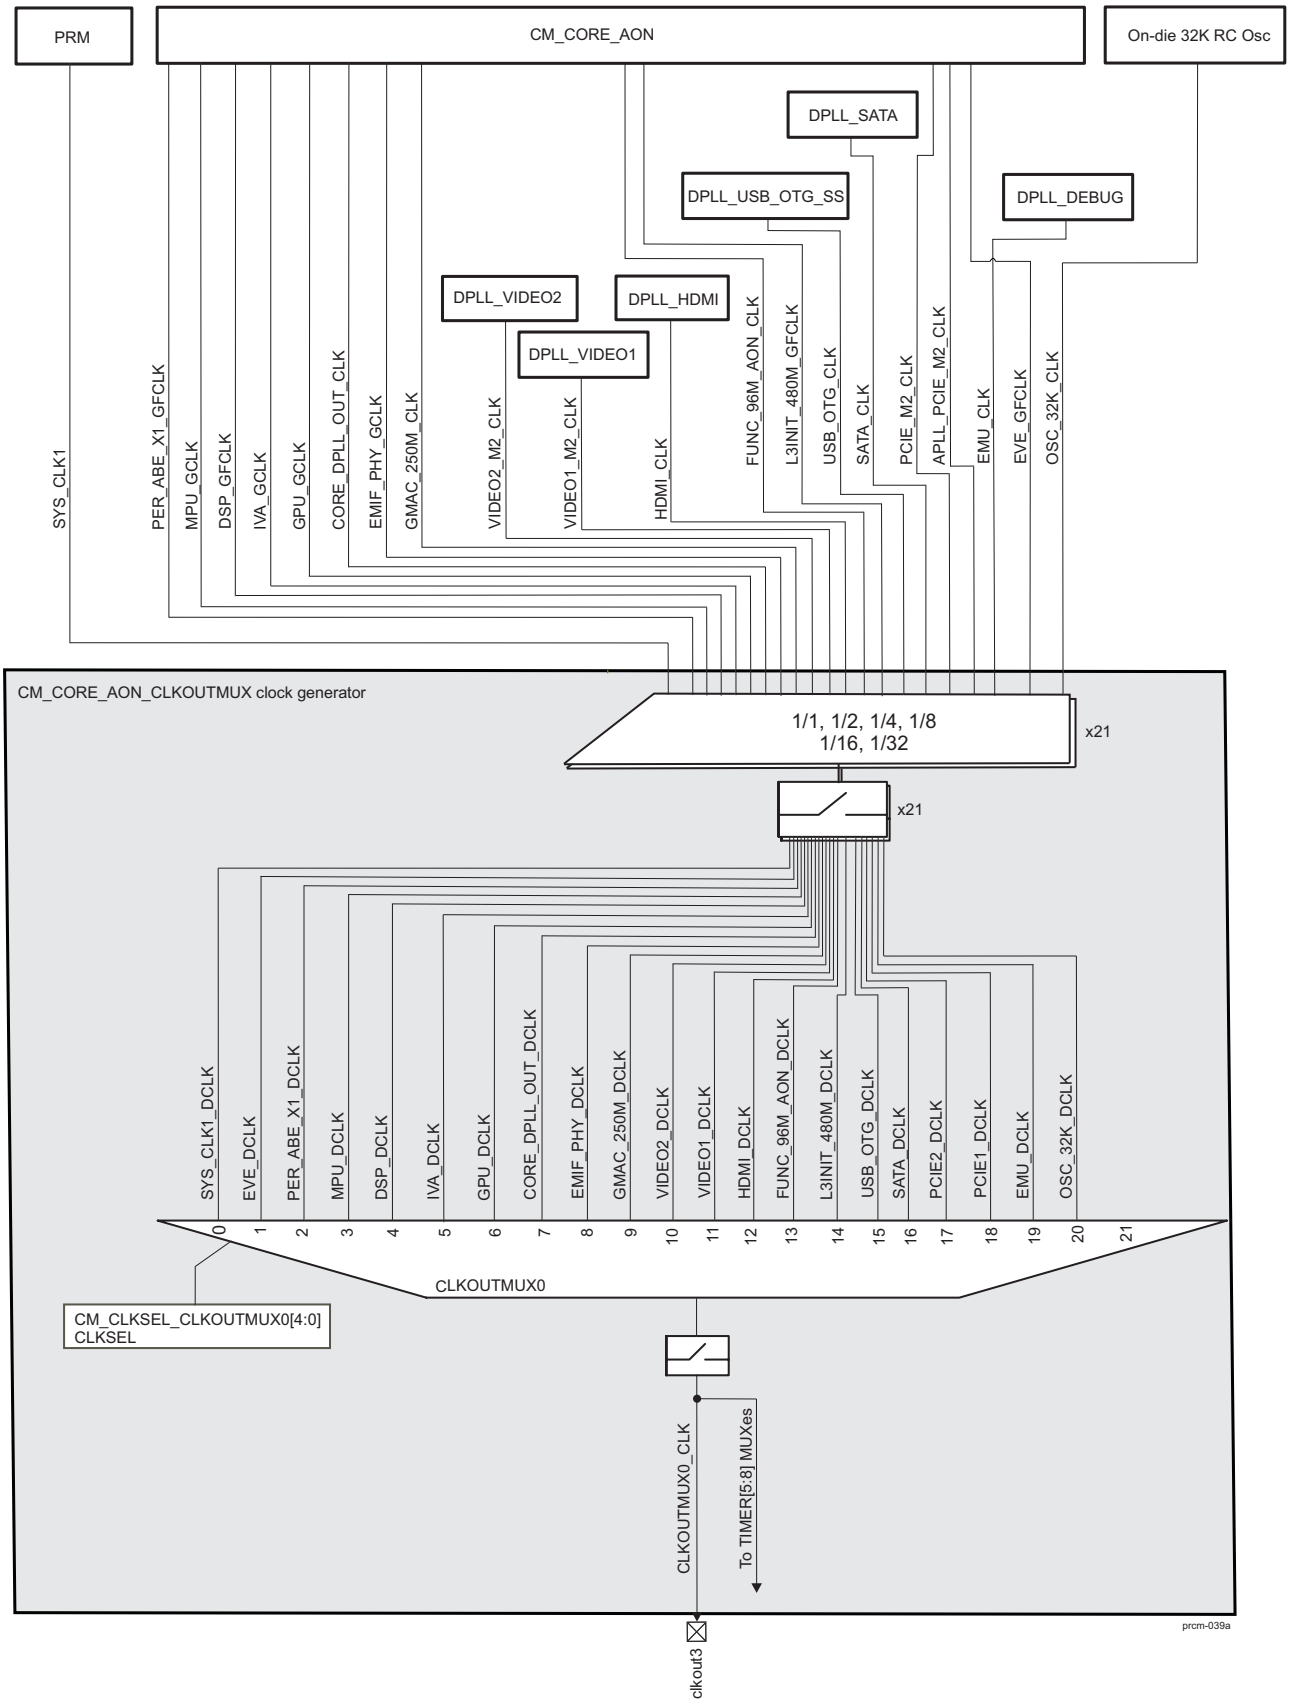
Figure 3-43. CM_CORE_AON_CLKOUTMUX Clock Manager Overview (CLKOUTMUX0)



Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: There is no dedicated register to enable CLKOUTMUX0_CLK clock to propagate to clkout3 device pad. The CLKOUTMUX0_CLK will stay gated until one of the TIMER5/6/7/8 is enabled and CLKOUTMUX0_CLK is selected as the source clock for the timer functional clock. The CLKOUTMUX0_CLK clock is propagated to clkout3 device pad only when at least one of the following registers is configured: CM_IPU_TIMER5/6/7/8_CLKCTRL[27:24] CLKSEL (value: 0xB).

In addition, if there is a need to propagate MPU_GCLK to device pad (clkout3), the user needs to write 0x1 to the hardware observability control register: CTRL_CORE_HWOBS_CONTROL[0] HWOBS_MACRO_ENABLE.

NOTE: The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: In order to enable CLKOUTMUX1_CLK and CLKOUTMUX2_CLK clocks to propagate to the corresponding devise pads (clkout1 and clkout2), the user needs to configure registers: CM_COREAON_CLKOUTMUX1_CLKCTRL[8] OPTFCLKEN_CLKOUTMUX1_CLK (value: 0x1) and CM_COREAON_CLKOUTMUX2_CLKCTRL[8] OPTFCLKEN_CLKOUTMUX2_CLK (value: 0x1)

In addition, if there is a need to propagate MPU_GCLK to device pad (clkout1 or clkout2), the user needs to write 0x1 to the hardware observability control register: CTRL_CORE_HWOBS_CONTROL[0] HWOBS_MACRO_ENABLE.

NOTE: The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

3.6.3.3 Generic DPLL Overview

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

The following DPLLs belong to type A:

- DPLL_MPU
- DPLL_IVA
- DPLL_CORE
- DPLL_PER
- DPLL_ABE
- DPLL_DSP
- DPLL_EVE
- DPLL_GMAC
- DPLL_GPU
- DPLL_DDR

The following DPLL belong to type B:

- DPLL_USB
- DPLL_PCIE_REF

All DPLLs (type A and type B) support the features described in the following sections, unless otherwise identified.

Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: This chapter discusses only the DPLLs that are directly controlled by the PRCM module. The other DPLLs embedded in and managed by other subsystems are described in their respective subsystems.

3.6.3.3.1 Generic APLL Overview

APLL_PCIE is an analog PLL which supplies high speed clock to PCI Express. APLL_PCIE is controlled directly by the PRCM module.

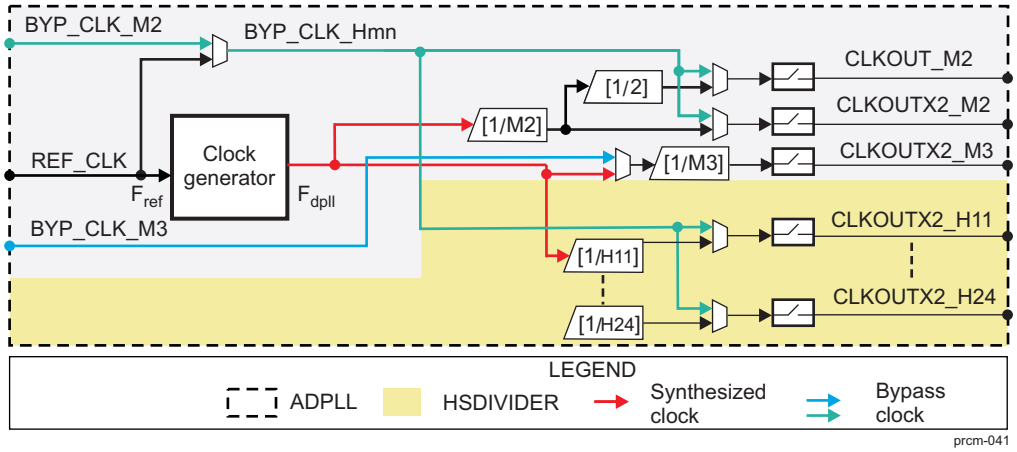
All the feature support by APLL_PCIE are described in Section 3.6.3.16, *APLL_PCIE Description*

Copyright © 2015–2020, Texas Instruments Incorporated

3.6.3.3.2 DPLLs Output Clocks Parameters

Figure 3-52 shows the functional architecture of a generic DPLL.

Figure 3-52. Generic DPLL Functional Diagram



The DPLL has three input clocks:

- REF_CLK: Used to generate the synthesized clock but can also be used as the bypass clock for some outputs of the DPLL whenever the DPLL enters bypass mode. It is mandatory for the DPLL clock synthesis.
- BYP_CLK_M2: Selectable bypass clock for the output of an M2 post-divider (optional)
- BYP_CLK_M3: Selectable bypass clock for the output of an M3 post-divider (optional)

The DPLL provides the bypass clock used by HSDIVIDER: BYP_CLK_Hmn, which is output by the multiplexer between the BYP_CLK_M2 and REF_CLK clock signals.

NOTE: The [1/2] divider located after the M2 post-divider is not valid when the CM_CLKSEL_DPLL_MPU[22] DCC_EN bit is set (applies only to DPLL_MPU when a frequency higher than 1.4 GHz is needed).

The DPLL can be programmed to be locked at any frequency given by one of the following equations:

- $F_{dpll} = F_{ref} \times 2 \times M / (N + 1)$
- $F_{dpll} = F_{ref} \times 2 \times (4 \times M / (N + 1))$ in case the CM_CLKMODE_DPLL_ABE[11] DPLL_REGM4XEN bit is set (applies only to DPLL_ABE)
- $F_{dpll} = F_{ref} \times (M / (N + 1))$ in case the CM_CLKSEL_DPLL_MPU[22] DCC_EN bit is set (applies only to DPLL_MPU when frequency higher than 1.4GHz is needed).

Where:

- F_{dpll} is the DPLL lock frequency.
- F_{ref} is the REF_CLK frequency. F_{ref} is also known as CLKINP.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

NOTE: It is preferred to minimize the value for N parameter (it minimizes lock time and jitter). Then M should be chosen to provide correct frequency (with lowest delta as possible).

It internally generates three main clocks: CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 as shown in Table 3-43.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-43. CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 Frequencies With DPLL State

Output	Equation	DPLL Mode
CLKOUT_M2	F_{dpll} / (2 x M2)	Locked (typical case)
	F_{ref} or BYP_CLK_M2	Before lock or during relock
	F_{dpll} / M2	DC corrector logic is used (DCC_EN bit is set) with M2 set to 0x1.
CLKOUTX2_M2	F_{dpll} / M2	Locked (typical case)
	F_{ref} or BYP_CLK_M2	Before lock or during relock
	F_{dpll} / M2	DC corrector logic is used (DCC_EN bit is set).
CLKOUTX2_M3	F_{dpll} / M3 or BYP_CLK_M3/M3	Locked (typical case)
	0	Before lock or during relock
	F_{dpll} / M3 or BYP_CLK_M3/M3	DC corrector logic is used (DCC_EN bit is set).

Where:

- M2 is the software-configured division ratio binary value.
- M3 is the software-configured division ratio binary value.
- CLKOUT_M2 and CLKOUTX2_M2 bypass clock input can be switched when the DPLL is not in locked state by using the M2 bypass clock select control bit.
- CLKOUTX2_M3 output clock can be switched when the DPLL is in locked state by using the M3 clock select control bit.

NOTE:

- A value of 0 for M2 and M3 division ratios is not allowed. They are set to 1 after reset.
- CLKOUT_M2 is generated based on a fixed divide-by-2 ratio, except in bypass mode.

The DPLL can contain one or two HSDIVIDER modules to produce more clocks with divided ratio based on the DPLL synthesized clock frequency. HSDIVIDER1 provides four extra post-dividers from H11 to H14 (the output clocks are CLKOUTX2_H11 through CLKOUTX2_H14). HSDIVIDER2 provides four extra post-dividers from H21 through H24 (the output clocks are CLKOUTX2_H21 through CLKOUTX2_H24). The HSDIVIDER output clock frequency is given by the equations in Table 3-44.

Table 3-44. CLKOUTX2_Hmn Frequencies With DPLL State

Equation	DPLL Mode
CLKOUTX2_Hmn = F_{dpll} /Hmn	Locked
CLKOUTX2_Hmn = BYP_CLK_Hmn	Before lock or during relock

Where:

- F_{dpll} is the DPLL lock frequency.
- Hmn is the software-configured division ratio binary value.
- n is in the range from 1 to 4.
- m is equal to 1 or 2.

NOTE: Hmn division ratio is set to 1 after reset.

Copyright © 2015–2020, Texas Instruments Incorporated

All clock outputs of the DPLL can be gated. The PRCM module provides the DPLL with a clock-gating control signal to enable or disable the clock. DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. The PRCM module provides a CM_IDLEST_DPLL_dpll_name[0] ST_DPLL_CLK status bit, which indicates the lock state or nonlock state of the DPLL.

The type B DPLL (DPLL_USB) has two outputs: CLKOUT and CLKDCOLDO. The DPLL can be programmed to be locked with the output clock frequencies given by the following equation:

- $F_{clkout} = F_{ref} \times (M / (N + 1)) \times (1 / M2)$
- $F_{clkdcoldo} = F_{ref} \times (M / (N + 1))$

Where:

- F_{clkout} is the frequency of the clock at output CLKOUT.
- $F_{clkdcoldo}$ is the frequency of the clock at output CLKDCOLDO.
- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.
- M2 is the software-configured division ratio binary value.

CLKOUT supports the same bypass modes as previously identified. CLKDCOLDO does not support bypass mode.

The type B DPLL output clock is synthesized by an internal oscillator that is phase-locked to the REF_CLK. Two oscillators are built within a type B DPLL. The oscillators are user-selectable based on the synthesized output clock frequency requirement. If the required frequency is greater than or equal to 1500 MHz, the user must program a value of 1 in the CM_CLKSEL_DPLL_dpll_name[21] DPLL_SELFREQDCO bit. This drives a value of 100 on the SELFREQDCO input of the corresponding type B DPLL. If the required frequency is less than 1500 MHz, the user must program a value of 0 in the CM_CLKSEL_DPLL_dpll_name[21] DPLL_SELFREQDCO bit. This drives a value of 010 on the SELFREQDCO input of the corresponding type B DPLL.

3.6.3.3.3 Enable Control, Status, and Low-Power Operation Mode

The DPLL has a manual mode control bit field, which allows the setting of the different operating modes of the DPLL. When the DPLL is switched to lock mode, the current values of the multiplication ratio (M) and the division ratio (N) are latched in the DPLL. The DPLL then starts the lock or relock sequence to synthesize the corresponding output frequency clock.

The status of the synthesized clock output of the DPLL is represented by the CLKOUT status bit. It can be gated or active.

The type A DPLLs can be switched to low-power operation mode (also called LPMODE) to optimize DPLL power consumption when the input and output clock frequencies are low. This mode can be software-enabled using the low-power mode control bit of the DPLL.

It must be enabled only if both of the following operating conditions are satisfied:

- $F_{ref} / (N + 1)$ is less than or equal to 1 MHz.
- $F_{ref} \times M / (N + 1)$ is less than or equal to 100 MHz.

Where:

- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

3.6.3.3.4 DPLL Power Modes

DPLL supports several power modes for type A and only one power mode for type B. Each mode results in a tradeoff between power savings and relock time. The PRCM module allows only a few modes for each DPLL, depending on the use of the DPLL.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-45 lists the DPLL power modes.

Table 3-45. DPLL Power Modes

Power Mode	CLKOUT State	Logic Current (mA)	Analog Current (mA)	Freq Lock Time	Phase Lock Time
Low-power stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Fast-relock stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Low-power bypass	Bypass clock/clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Fast-relock bypass	Bypass clock/clock stopped	0.065 (leakage)	0.5 (leakage)	0.05 µs + (70 × (N+1) / F_{ref})	0.05 µs + (120 × (N+1) / F_{ref})
Lock	Synthesized clock	0.95 (active)	3 (active)	N/A	N/A

Where:

- F_{ref} is the REF_CLK frequency.

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions.

A DPLL can switch from one mode to another as a result of the following:

- Software-programmed transition (manual): Software configures the dedicated DPLL manual mode control feature for the next desired DPLL mode. It must ensure that the transition can be performed based on the clock activity on the device.
- Combined software-programmed and hardware-conditions-based transition (auto): This mode allows the DPLL to automatically transition to a low-power state (that is, any state other than the LOCK state) when the output clocks are gated or the destination clock domain is inactive, and to switch back to the LOCK state when the output clock is needed (that is, the clock is ungated or the clock domain becomes active). The desired low-power state for the automatic transition is configured in the dedicated Auto Mode Control parameter of the DPLL.

NOTE: With T_{ref} = 1 / F_{ref} = (N + 1) / CLKINP; (Fref = CLKINP / (N + 1)):

$T_{ref}$is the REF_CLK period.

This formula indicates that a smaller N divider value provides a smaller time for switching the clock after an M2 post-divider change.

A compromise is necessary between the clock switching latency and power consumption. Having a smaller N value:

- Requires a higher M2 post-divider value to obtain the same target frequency.
- Results in a higher DPLL lock frequency, and then higher power consumption.

NOTE:

- A manual transition can be performed from any power mode to any other power mode.
- An automatic transition can be performed from lock mode to any low-power mode.

NOTE: When the DPLL is in Low-Power bypass mode, Auto-idle mode is disabled and no clock is requested, the DPLL makes a transition to Low-power stop mode.

Copyright © 2015–2020, Texas Instruments Incorporated

3.6.3.3.5 DPLL Recalibration

The DPLL recalibration applies only to type-A DPLLs. Each time the DPLL is reset or performs a lock sequence (following a change in the value of multiplier M or divider N), it performs a recalibration of the output frequency, based on voltage and temperature conditions. In lock mode, the DPLL maintains a steady lock frequency output by compensating for voltage and temperature changes within a certain range. However, if the voltage or temperature drifts outside the range or shows a significant or fast change, the DPLL may not be able to track and compensate it. It would need a recalibration, which is signaled by assertion of a recalibration flag.

NOTE:

- The recalibration mechanism is active only while the DPLL is in lock mode. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag.
- If the DPLL drifts out of the operating range limits while not locked, and then when it tries to relock, it fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference between this case and a standard relock is the recalibration delay.

During recalibration, the DPLL loses lock and output clock switches to the bypass clock.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be triggered by software control. The trigger setting of the recalibration can be configured by the corresponding registers of the DPLL in the PRCM module. The software-controlled recalibration mode is selected by default.

Software-controlled recalibration: The DPLL continues its tracking mechanism as long as the recalibration is not triggered by software (that is, by enabling the recalibration-enable control parameter). If the DPLL reaches upper or lower bounds of the DCO control code and software has still not triggered recalibration, the DPLL stops its tracking mechanism. The output clock remains active, but frequency and jitter are not ensured to meet the requirement.

Automatic recalibration: The DPLL immediately starts the recalibration as soon as the recalibration flag is asserted.

NOTE: Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode, which introduces a frequency change. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the external memory EMIF controller is sensitive to a frequency change on the DPLL because its embedded DLL relocks on a frequency change. Any EMIF access during this DLL relock period can be corrupted. It is, therefore, important to stall EMIF access during DPLL recalibration.

To allow software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on the processor power domain, followed by an interrupt on the processor subsystem when the DPLL recalibration flag is asserted.

Table 3-46 lists the DPLL recalibration and control parameters.

Table 3-46. DPLL Recalibration Control Parameters

Parameter	Register	Description
Recalibration-enable control	CM_CLKMODE_DPLL_<module>[8] DPLL_DRIFTGUARD_EN	Enable/disable the DPLL automatic recalibration feature.
Recalibration-interrupt mask control	PRM_IRQENABLE_MPU PRM_IRQENABLE_MPU_2 PRM_IRQENABLE_IPU1 PRM_IRQENABLE_IPU2 PRM_IRQENABLE_DSP1 PRM_IRQENABLE_DSP2	Mask/unmask the DPLL recalibration interrupt to processor.

Table 3-46. DPLL Recalibration Control Parameters (continued)

Parameter	Register	Description
Recalibration-interrupt status	PRM_IRQSTATUS_MPU PRM_IRQSTATUS_MPU_2 PRM_IRQSTATUS_IPU1 PRM_IRQSTATUS_IPU2 PRM_IRQSTATUS_DSP1 PRM_IRQSTATUS_DSP2	Status of the DPLL recalibration interrupt to processor

3.6.3.3.6 DPLL Output Power Down

The DCO clock LDO (DCOCLKLDO) of the DPLL can be powered down if all output dividers of the DPLL are powered down. The PRCM module automatically reenables the power to the LDO when an output divider is powered up or the DPLL switches to bypass mode.

Table 3-47. DPLL Power-Down Control Parameters

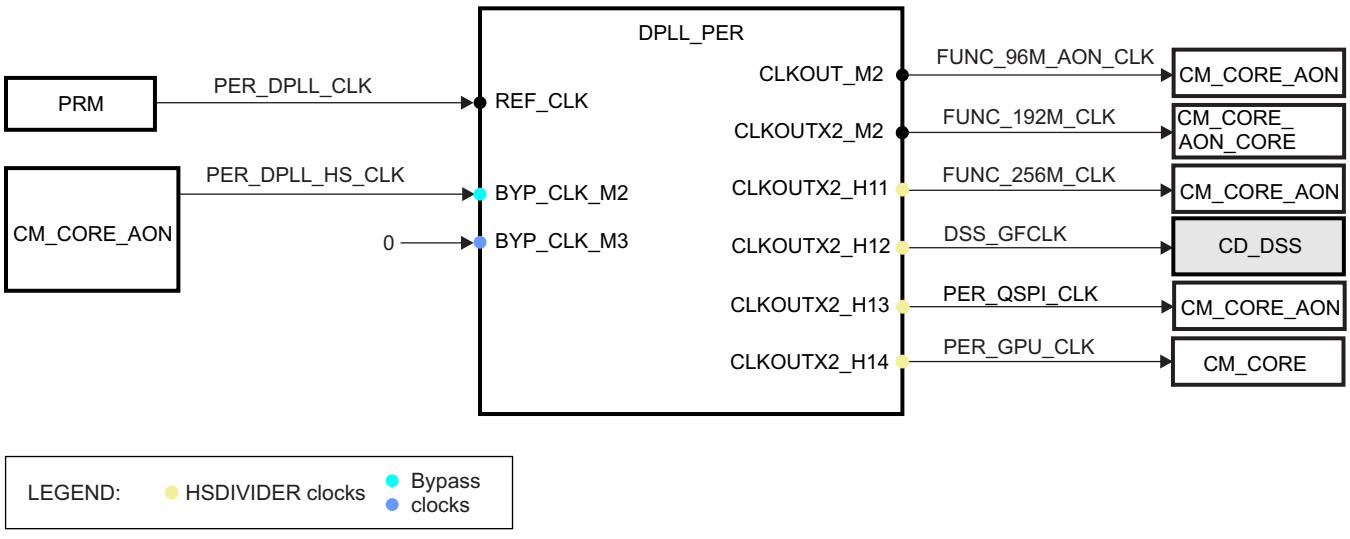
Parameter	Description
DCO clock LDO power down control	Enable/disable automatic power-down feature if all output dividers are powered down.

3.6.3.4 DPLL_PER Description

3.6.3.4.1 DPLL_PER Overview

Figure 3-53 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-53. DPLL_PER Overview



3.6.3.4.2 DPLL_PER Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*

Table 3-48 lists the clock synthesis parameters of the DPLL.

Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE3[4] DPLL_ABE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE3[4] DPLL_ABE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE4[4] DPLL_ABE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE4[4] DPLL_ABE_RECAL_EN

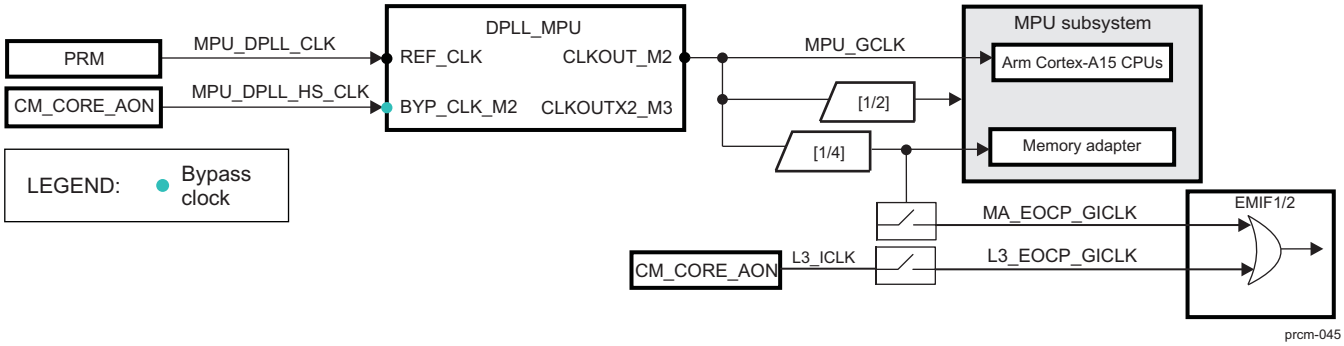
3.6.3.7 DPLL_MPU Description

3.6.3.7.1 DPLL_MPU Overview

Figure 3-56 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-56. DPLL_MPU Overview



3.6.3.7.2 DPLL_MPU Tactical Clocking Adjustment

Figure 3-56 includes the clocking adjustment scheme for DPLL_MPU. Another clock is requested by the EMIF1/2 modules and this clock must be dynamically switched between L3_EOCP_GICLK clock and MA_EOCP_GICLK clock coming from the MPU subsystem (namely from Memory Adapter part of it), depending on the respective activity of MPU and EMIF clock domain.

3.6.3.7.3 DPLL_MPU Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-63 lists the clock synthesis parameters of the DPLL.

Table 3-63. DPLL_MPU Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_MPU[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_MPU[6:0] DPLL_DIV

Table 3-64 lists the clock output divider parameters of the DPLL.

Table 3-64. DPLL_MPU Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_MPU[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_DPLL_MPU[4:0] DIVHS
CLKOUT_M2 - DCC	DCC feature control	CM_CLKSEL_DPLL_MPU[22] DCC_EN

3.6.3.7.4 DPLL_MPU Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes, and associated control and status features, see Section 3.6.3.3.3, *Enable Control, Status, and Low-Power Operation Mode*, and Section 3.6.3.3.4, *DPLL Power Modes*.

Table 3-65 lists the operating modes supported by the DPLL.

Table 3-65. DPLL_MPU Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-66 lists the control bit fields for the operating mode control of the DPLL.

Table 3-66. DPLL_MPU Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_MPU[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_MPU[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_MPU[2:0] AUTO_DPLL_MODE

NOTE: The user software must ensure that the MPU voltage domain is on before programming DPLL_MPU. This can be ensured by performing a forced wakeup (CLKCTRL= SW_WKUP) on MPU domain. When software detects that the domain is "ON", DPLL_MPU can be programmed.

3.6.3.7.5 DPLL_MPU Recalibration

Table 3-67 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.5, *DPLL Recalibration*.

Table 3-67. DPLL_MPU Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_MPU[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[1] DPLL_MPU_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[1] DPLL_MPU_RECAL_EN

3.6.3.8.4 DPLL_IVA Recalibration

Table 3-72 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.5, *DPLL Recalibration*.

Table 3-72. DPLL_IVA Recalibration Feature Parameters

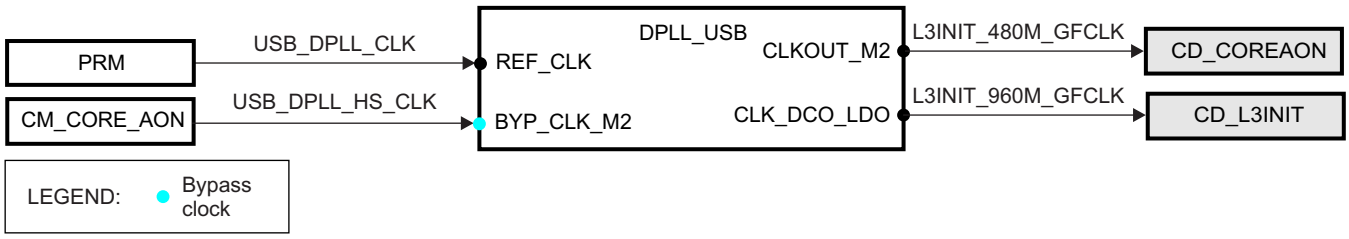
Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_IVA[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU1[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU1[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU2[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU2[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_DSP1[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP1[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_DSP2[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP2[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE1[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE1[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE2[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE2[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE3[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE3[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE4[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE4[2] DPLL_IVA_RECAL_EN

3.6.3.9 DPLL_USB Description

3.6.3.9.1 DPLL_USB Overview

Figure 3-58 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-58. DPLL_USB Overview



3.6.3.9.2 DPLL_USB Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-73 lists the clock synthesis parameters of the DPLL.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-73. DPLL_USB Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_USB[19:8] DPLL_MULT
N	CM_CLKSEL_DPLL_USB[7:0] DPLL_DIV

Table 3-74 lists the clock output divider parameters of the DPLL.

Table 3-74. DPLL_USB Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_USB[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_DPLL_USB[6:0] DIVHS
CLK_DCO_LDO	DCO output control	CM_CLKSEL_DPLL_USB[21] DPLL_SELFREQDCO

3.6.3.9.3 DPLL_USB Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.3, *Enable Control, Status, and Low-Power Operation Mode,* and Section 3.6.3.3.4, *DPLL Power Modes*.

Table 3-75 lists the operating modes supported by the DPLL.

Table 3-75. DPLL_USB Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Available	Not available	Available	Not available	Available

Table 3-76 lists the control bit fields for the operating mode control of the DPLL.

Table 3-76. DPLL_USB Mode Control Parameters

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_DPLL_USB[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_USB[2:0] AUTO_DPLL_MODE

3.6.3.9.4 DPLL_USB Recalibration

Table 3-77 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.5, *DPLL Recalibration*.

Table 3-77. DPLL_USB Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP1[13] DPLL_USB_RECAL_EN(1)

(1) DPLL_USB recalibration feature is not supported on the TDA2x family of devices.

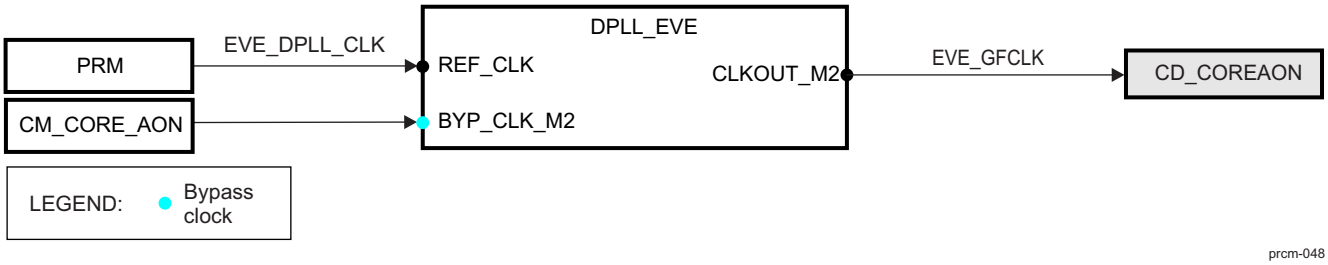
3.6.3.10 DPLL_EVE Description

3.6.3.10.1 DPLL_EVE Overview

Figure 3-59 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-59. DPLL_EVE Overview



3.6.3.10.2 DPLL_EVE Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-78 lists the clock synthesis parameters of the DPLL.

Table 3-78. DPLL_EVE Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_EVE[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_EVE[6:0] DPLL_DIV

Table 3-79 lists the clock output divider parameters of the DPLL.

Table 3-79. DPLL_EVE Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_EVE[9] CLKST
CLKOUT_M2	Divider Control	CM_DIV_M2_DPLL_EVE[4:0] DIVHS

3.6.3.10.3 DPLL_EVE Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.3, *Enable Control, Status, and Low-Power Operation Mode,* and Section 3.6.3.3.4, *DPLL Power Modes*.

Table 3-80 lists the operating modes supported by the DPLL.

Table 3-80. DPLL_EVE Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Table 3-81 lists the control bit fields for the operating mode control of the DPLL.

Table 3-81. DPLL_EVE Mode Control Parameters

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_DPLL_EVE[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_EVE[2:0] AUTO_DPLL_MODE

Copyright © 2015–2020, Texas Instruments Incorporated

3.6.3.10.4 DPLL_EVE Recalibration

Table 3-82 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.5, *DPLL Recalibration*.

Table 3-82. DPLL_EVE Recalibration Feature Parameters

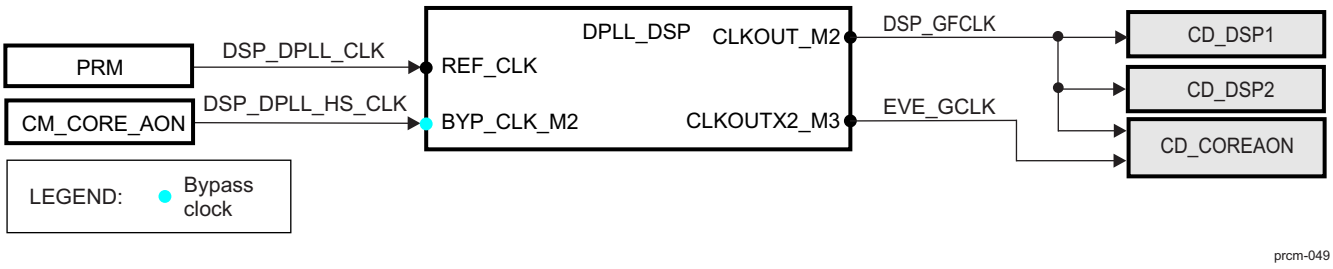
Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_EVE[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[11] DPLL_EVE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU1[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU1[12] DPLL_EVE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU2[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU2[12] DPLL_EVE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_DSP1[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP1[12] DPLL_EVE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_DSP2[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP2[12] DPLL_EVE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE1[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE1[12] DPLL_EVE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE2[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE2[12] DPLL_EVE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE3[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE3[12] DPLL_EVE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_EVE4[12] DPLL_EVE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_EVE4[12] DPLL_EVE_RECAL_EN

3.6.3.11 DPLL_DSP Description

3.6.3.11.1 DPLL_DSP Overview

Figure 3-60 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-60. DPLL_DSP Overview



3.6.3.11.2 DPLL_DSP Synthesized Clock Parameters

This section lists the clock synthesis and clock out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-83 lists the clock synthesis parameters of the DPLL.

Table 3-83. DPLL_DSP Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_DSP[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_DSP[6:0] DPLL_DIV

Table 3-84 lists the clock output divider parameters of the DPLL.

Table 3-84. DPLL_DSP Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_DSP[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_DPLL_DSP[4:0] DIVHS
CLKOUTX2_M3	Status	CM_DIV_M3_DPLL_DSP[9] CLKST
CLKOUTX2_M3	Divider control	CM_DIV_M3_DPLL_DSP[4:0] DIVHS

3.6.3.11.3 DPLL_DSP Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.3, *Enable Control, Status, and Low-Power Operation Mode,* and Section 3.6.3.3.4, *DPLL Power Modes*.

Table 3-85 lists the operating modes supported by the DPLL.

Table 3-85. DPLL_DSP Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Available	Available	Available	Available	Not available

Table 3-86 lists the control bit fields for the operating mode control of the DPLL.

Table 3-86. DPLL_DSP Mode Control Parameters

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_DPLL_DSP[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_DSP[2:0] AUTO_DPLL_MODE

3.6.3.11.4 DPLL_DSP Recalibration

Table 3-87 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.5, *DPLL Recalibration*.

Table 3-87. DPLL_DSP Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_DSP[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[11] DPLL_DSP_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[10] DPLL_DSP_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU1[11] DPLL_DSP_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU1[11] DPLL_DSP_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU2[11] DPLL_DSP_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU2[11] DPLL_DSP_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_DSP1[11] DPLL_DSP_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_DSP1[11] DPLL_DSP_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_DSP2[11] DPLL_DSP_RECAL_ST

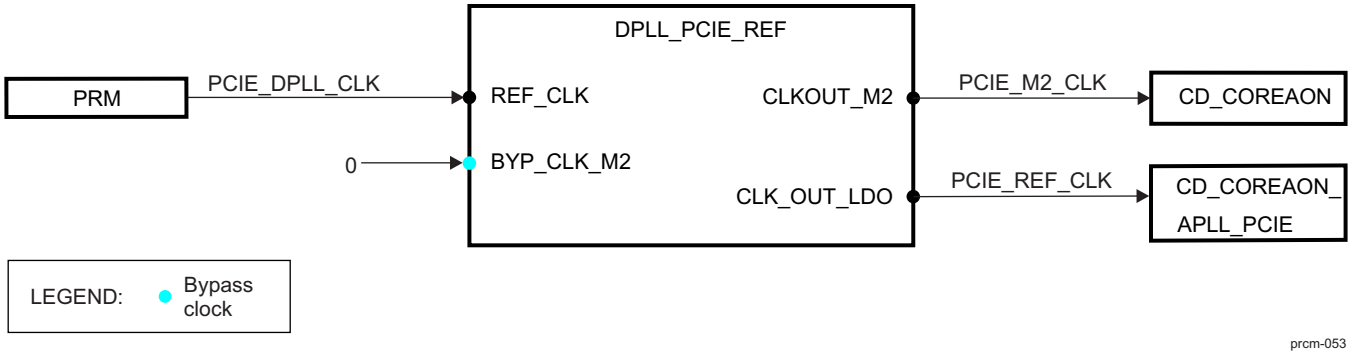
3.6.3.15 DPLL_PCIE_REF Description

3.6.3.15.1 DPLL_PCIE_REF Overview

Figure 3-64 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-64. DPLL_PCIE_REF Overview



3.6.3.15.2 DPLL_PCIE_REF Synthesized Clock Parameters

This section lists the clock synthesis and clock out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-103 lists the clock synthesis parameters of the DPLL.

Table 3-103. DPLL_PCIE_REF Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_PCIE_REF[19:8] DPLL_MULT
N	CM_CLKSEL_DPLL_PCIE_REF[7:0] DPLL_DIV

Table 3-104 lists the clock output divider parameters of the DPLL.

Table 3-104. DPLL_PCIE_REF Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUTX2_M2	Status	CM_DIV_M2_DPLL_PCIE_REF[9] CLKST
CLKOUTX2_M2	Divider control	CM_DIV_M2_DPLL_PCIE_REF[6:0] DIVHS
CLKOUTX2_M2_LDO	Status	CM_DIV_M2_DPLL_PCIE_REF[10] CLKLDOST

3.6.3.15.3 DPLL_PCIE_REF Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.3, *Enable Control, Status, and Low-Power Operation Mode,* and Section 3.6.3.3.4, *DPLL Power Modes*.

Table 3-105 lists the operating modes supported by the DPLL.

Table 3-105. DPLL_PCIE_REF Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Not Available	Not Available	Available

Table 3-106 lists the control bit fields for the operating mode control of the DPLL.

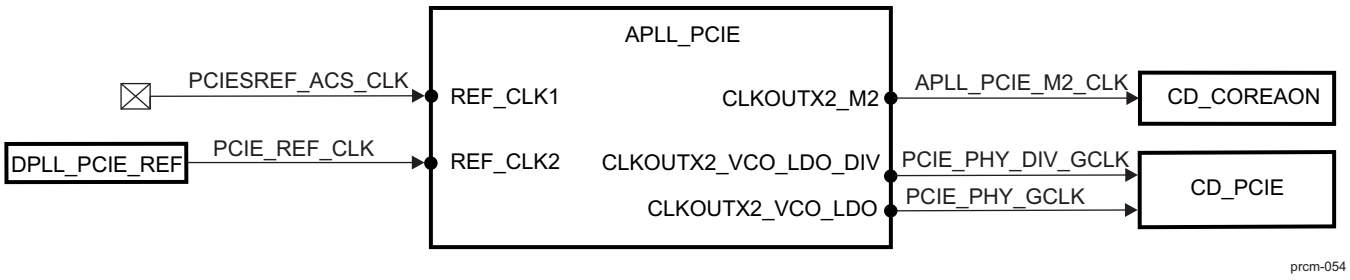
3.6.3.16 APLL_PCIE Description

3.6.3.16.1 APLL_PCIE Overview

Figure 3-65 is an overview of the APLL. For a functional overview of a generic APLL module, see Section 3.6.3.3.1, *Generic APLL Overview*.

Figure 3-65. APLL_PCIE Overview



3.6.3.16.2 APLL_PCIE Synthesized Clock Parameters

This section lists the clock synthesis and clock out divider parameters of the APLL.

Table 3-107 lists the clock output divider parameters of the APLL.

Table 3-107. APLL_PCIE Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_APLL_PCIE[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_APLL_PCIE[6:0] DIVHS
CLKOUTX2_VCO_LDO_DIV	Status	CM_CLKVCOLDO_APLL_PCIE[10] CLK_DIVST
CLKOUTX2_VCO_LDO	Status	CM_CLKVCOLDO_APLL_PCIE[9] CLKST

3.6.3.16.3 APLL_PCIE Power Modes

This section identifies the operating modes supported by the APLL and the control bit fields to set its operating modes.

NOTE: In order to disable the APLL_PCIE, the user needs to disable PCIe_SSx (where x = 1 or 2) using the CM_PCIE_PCIESSx_CLKCTRL[1:0] MODULEMODE registers. When PCIe_SS is disabled, the PRCM module automatically disables the APLL_PCIE. Please note that setting CM_CLKMODE_APLL_PCIE[1:0] MODE_SELECT bitfield to 0x0 does not disable the APLL_PCIE.

Table 3-105 lists the operating modes supported by the DPLL.

Table 3-108. APLL_PCIE Modes

Table 3-109 lists the control bit fields for the operating mode control of the APLL.

Table 3-109. APLL_PCIE Mode Control Parameters

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_APLL_PCIE[1:0] MODE_SELECT

3.6.4 Clock Domains

In this sections are summarized and described all Clock Domains in the device.

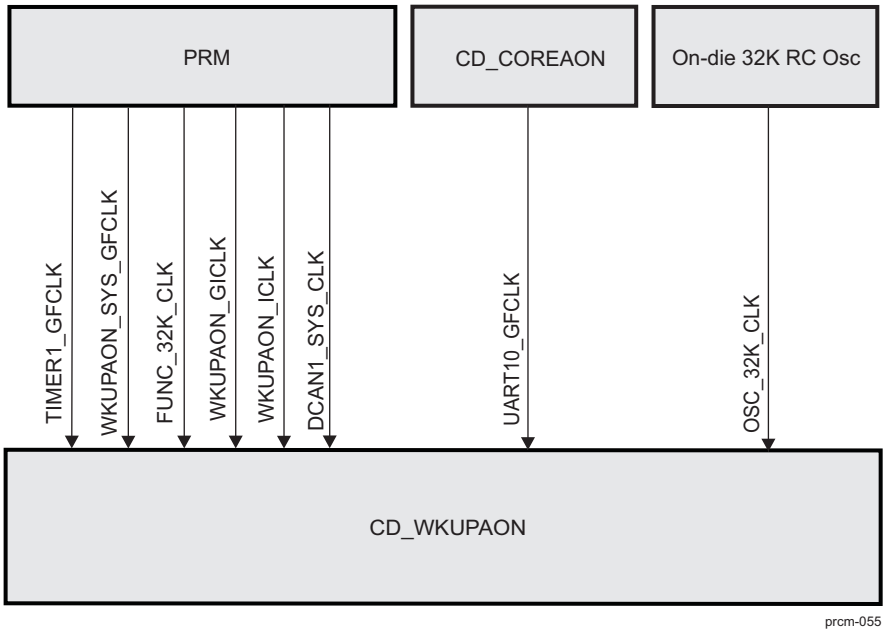
3.6.4.1 CD_WKUPAON Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.1.1 Overview

Figure 3-66 is an overview of the clock domain.

Figure 3-66. CD_WKUPAON Overview



NOTE: The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

3.6.4.1.2 Clock Domain Modes

Table 3-110 lists the clock domain modes supported by the clock domain.

Table 3-110. CD_WKUPAON Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-111 lists the clock domain state transition control and status bits for the clock in this clock domain

Table 3-111. CD_WKUPAON Control and Status Parameters

Parameter Name	Control/Status Bit Field
ABE_LP_CLK Clock Status	CM_WKUPAON_CLKSTCTRL[9] CLKACTIVITY_ABE_LP_CLK
WKUPAON_GICLK Clock Status	CM_WKUPAON_CLKSTCTRL[12] CLKACTIVITY_WKUPAON_GICLK
SYS_CLK Clock Status; includes profiling EMU_SYS_CLK and all functional SYS_CLK	CM_WKUPAON_CLKSTCTRL[8] CLKACTIVITY_SYS_CLK
SYS_CLK Clock Status of functional branches, exclude activity of the EMU_SYS_GCLK clock	CM_WKUPAON_CLKSTCTRL[14] CLKACTIVITY_SYS_CLK_FUNC
WKUPAON_SYS_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[11] CLKACTIVITY_WKUPAON_SYS_GFCLK
WKUPAON_32K_GFCLK Clock Control for GPIO1	CM_WKUPAON_GPIO1_CLKCTRL[8] OPTFCLKEN_DBCLK
DCAN1_SYS_CLK Clock Status	CM_WKUPAON_CLKSTCTRL[16] CLKACTIVITY_DCAN1_SYS_CLK
TIMER1_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[17] CLKACTIVITY_TIMER1_GFCLK
UART10_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[18] CLKACTIVITY_UART10_GFCLK
Clock Domain State Transition Control	CM_WKUPAON_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.1.3 Clock Domain Dependency

CD_WKUPAON has no static dependency or dynamic dependency with any other clock domain of the device.

3.6.4.1.3.1 Wake-Up Dependency

Table 3-112 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-112. CD_WKUPAON Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
GPIO1	CD_WKUPAON	CD_DSP1	Disabled	PM_WKUPAON_GPIO1_WKDEP[2] WKUPDEP_GPIO1_IRQ1_DSP1	Read/write
GPIO1	CD_WKUPAON	CD_DSP2	Disabled	PM_WKUPAON_GPIO1_WKDEP[5] WKUPDEP_GPIO1_IRQ1_DSP2	Read/write

3.6.4.1.4 Clock Domain Module Attributes

Programmable Real-Time Unit and Industrial Communication Subsystems (PRU-ICSS) is not supported in this family of devices.

Table 3-113 lists for each module of the clock domain the clocks it receives and their role (that is, functional or interface clock).

Table 3-113. CD_WKUPAON Modules Clocks Association

Module	Clock	Clock Type
PRCM_MPU	FUNC_32K_CLK	Functional
	WKUPAON_ICLK	Interface
GPIO1	WKUPAON_GICLK	Interface
	WKUPAON_SYS_GFCLK	Functional
COUNTER_32K	FUNC_32K_CLK	Functional

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-113. CD_WKUPAON Modules Clocks Association (continued)

Module	Clock	Clock Type
	WKUPAON_GICLK	Interface
TIMER1	TIMER1_GFCLK	Functional
	WKUPAON_GICLK	Interface
TIMER12	WKUPAON_GICLK	Interface
	OSC_32K_CLK(1)	Functional
WD_TIMER2	WKUPAON_GICLK	Interface
	WKUPAON_SYS_GFCLK	Functional
CTRL_MODULE_WKUP	WKUPAON_GICLK	Interface
L4_WKUP interconnect	WKUPAON_GICLK	Interface
DCAN1	DCAN1_SYS_CLK	Functional
	WKUPAON_GICLK	Interface
UART10	UART10_GFCLK	Functional
	WKUPAON_GICLK	Interface

(1) The OSC_32K_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

Table 3-114 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-114. CD_WKUPAON Modules Wake-Up Request

Module	Wake-Up Feature
PRCM_MPU	None
CTRL_MODULE_WKUP	None
DCAN1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ or DMA_SYSTEM-DMA)
GPIO1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
COUNTER_32K	None
TIMER1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
TIMER12	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
WD_TIMER2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
L4_WKUP interconnect	None
UART10	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ or DMA_SYSTEM-DMA)

Table 3-115 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-115. CD_WKUPAON Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
GPIO1	Slave	CM_WKUPAON_GPIO1_CLKCTRL[17:16] IDLEST	Idle status
COUNTER_32K	Slave	CM_WKUPAON_COUNTER_32K_CLKCTRL[17:16] IDLEST	Idle status
TIMER1	Slave	CM_WKUPAON_TIMER1_CLKCTRL[17:16] IDLEST	Idle status

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-115. CD_WKUPAON Modules Clock-Management Modes and Control (continued)

Module	Clock-Management Protocol	Status Bit Field	Role
TIMER12	Slave	CM_WKUPAON_TIMER12_CLKCTRL[17:16] IDLEST	Idle status
WD_TIMER2	Slave	CM_WKUPAON_WD_TIMER2_CLKCTRL[17:16] IDLEST	Idle status
L4_WKUP interconnect	Slave	CM_WKUPAON_L4_WKUP_CLKCTRL[17:16] IDLEST	Idle status
DCAN1	Slave	CM_WKUPAON_DCAN1_CLKCTRL[17:16] IDLEST	Idle status
UART10	Slave	CM_WKUPAON_UART10_CLKCTRL[17:16] IDLEST	Idle status

Table 3-116 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-116. CD_WKUPAON Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GPIO1	Available	Available	N/A	CM_WKUPAON_GPIO1_CLKCTRL[1:0] MODULEMODE	Read/write
COUNTER_32K	N/A	Available	N/A	CM_WKUPAON_COUNTER_32K_CLKCTRL[1:0] MODULEMODE	Read only
TIMER1	Available	N/A	Available	CM_WKUPAON_TIMER1_CLKCTRL[1:0] MODULEMODE	Read/write

3.6.4.6.4 Clock Domain Module Attributes

Table 3-151 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-151. CD_L4PER1 Modules Clocks Association

Module	Clock	Clock Type
TIMER10	TIMER10_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
TIMER11	TIMER11_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
TIMER2	TIMER2_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
TIMER3	TIMER3_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
TIMER4	TIMER4_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
TIMER9	TIMER9_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
ELM	L4PER_L3_GICLK	Interface(1)
GPIO2	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
GPIO3	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
GPIO4	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
GPIO5	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
GPIO6	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
GPIO7	GPIO_GFCLK	Functional
	L4PER_L3_GICLK	Interface(1)
GPIO8	GPIO_GFCLK	Functional

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4PER_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

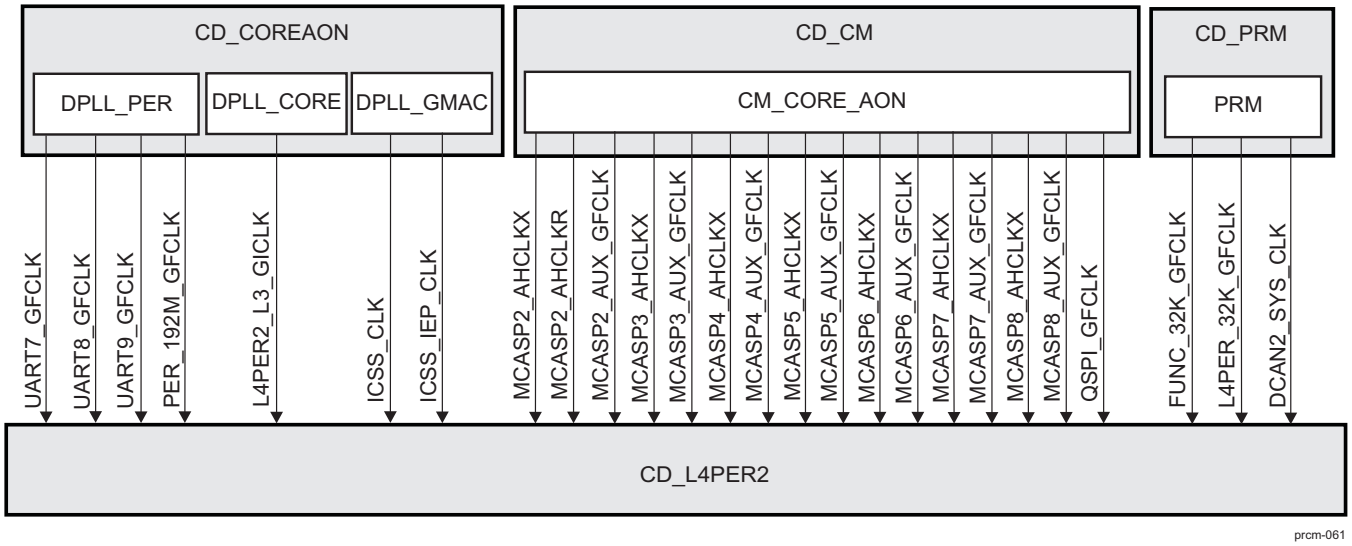
3.6.4.7 CD_L4PER2 Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.7.1 Overview

Figure 3-72 is an overview of the clock domain.

Figure 3-72. CD_L4PER2 Overview



3.6.4.7.2 Clock Domain Modes

Table 3-155 lists the clock domain modes supported by the clock domain.

Table 3-155. CD_L4PER2 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-156 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-156. CD_L4PER2 Control and Status Parameters

Parameter Name	Control/Status Bit Field
ICSS_CLK clock statusc	CM_L4PER2_CLKSTCTRL[8] CLKACTIVITY_ICSS_CLK
ICSS_IEP_CLK clock status	CM_L4PER2_CLKSTCTRL[14] CLKACTIVITY_ICSS_IEP_CLK
UART7_GFCLK clock status	CM_L4PER2_CLKSTCTRL[9] CLKACTIVITY_UART7_GFCLK
UART8_GFCLK clock status	CM_L4PER2_CLKSTCTRL[10] CLKACTIVITY_UART8_GFCLK
UART9_GFCLK clock status	CM_L4PER2_CLKSTCTRL[11] CLKACTIVITY_UART9_GFCLK
QSPI_GFCLK clock status	CM_L4PER2_CLKSTCTRL[12] CLKACTIVITY_QSPI_GFCLK
L4PER2_L3_GICLK clock status	CM_L4PER2_CLKSTCTRL[16] CLKACTIVITY_L4PER2_L3_GICLK
DCAN2_SYS_CLK clock status	CM_L4PER2_CLKSTCTRL[15] CLKACTIVITY_DCAN2_SYS_CLK
PER_192M_GFCLK clock status	CM_L4PER2_CLKSTCTRL[13] CLKACTIVITY_PER_192M_GFCLK
MCASP2_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[17] CLKACTIVITY_MCASP2_AHCLKX

Table 3-156. CD_L4PER2 Control and Status Parameters (continued)

Parameter Name	Control/Status Bit Field
MCASP2_AHCLKR clock status	CM_L4PER2_CLKSTCTRL[18] CLKACTIVITY_MCASP2_AHCLKR
MCASP2_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[19] CLKACTIVITY_MCASP2_AUX_GFCLK
MCASP3_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[20] CLKACTIVITY_MCASP3_AHCLKX
MCASP3_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[21] CLKACTIVITY_MCASP3_AUX_GFCLK
MCASP4_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[22] CLKACTIVITY_MCASP4_AHCLKX
MCASP4_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[23] CLKACTIVITY_MCASP4_AUX_GFCLK
MCASP5_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[25] CLKACTIVITY_MCASP5_AHCLKX
MCASP5_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[24] CLKACTIVITY_MCASP5_AUX_GFCLK
MCASP6_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[26] CLKACTIVITY_MCASP6_AHCLKX
MCASP6_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[27] CLKACTIVITY_MCASP6_AUX_GFCLK
MCASP7_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[28] CLKACTIVITY_MCASP7_AHCLKX
MCASP7_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[29] CLKACTIVITY_MCASP7_AUX_GFCLK
MCASP8_AHCLKX clock status	CM_L4PER2_CLKSTCTRL[30] CLKACTIVITY_MCASP8_AHCLKX
MCASP8_AUX_GFCLK clock status	CM_L4PER2_CLKSTCTRL[31] CLKACTIVITY_MCASP8_AUX_GFCLK
Clock Domain State Transition Control	CM_L4PER2_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.7.3 Clock Domain Dependency

CD_L4PER2 has no static dependency with any other clock domain of the device.

3.6.4.7.3.1 Dynamic Dependency

Table 3-157 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-157. CD_L4PER2 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_CFG	Always enabled	CM_L4PER2_DYNAMICDEP[12] L4CFG_DYNDEP	Read only
CD_L3INIT	Always enabled	CM_L4PER2_DYNAMICDEP[7] L3INIT_DYNDEP	Read only
CD_IPU	Always enabled	CM_L4PER2_DYNAMICDEP[3] IPU_DYNDEP	Read only
CD_GMAC	Always enabled	CM_L4PER2_DYNAMICDEP[22] GMAC_DYNDEP	Read only

3.6.4.7.3.2 Wake-Up Dependency

Table 3-158 lists the wake-up dependency settings for the modules of this clock domain.

3.6.4.7.4 Clock Domain Module Attributes

Table 3-159 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-159. CD_L4PER2 Modules Clocks Association

Module	Clock	Clock Type
L4_PER2 interconnect	L4PER2_L3_GICLK	Interface(1)
DCAN2	L4PER2_L3_GICLK	Interface
	DCAN2_SYS_CLK	Functional
McASP2	L4PER2_L3_GICLK	Interface(1)
	MCASP2_AHCLKR	Functional
	MCASP2_AHCLKX	Functional
	MCASP2_AUX_GFCLK	Functional
McASP3	L4PER2_L3_GICLK	Interface(1)
	MCASP3_AHCLKX	Functional
	MCASP3_AUX_GFCLK	Functional
McASP4	L4PER2_L3_GICLK	Interface(1)
	MCASP4_AHCLKX	Functional
	MCASP4_AUX_GFCLK	Functional
McASP5	L4PER2_L3_GICLK	Interface(1)
	MCASP5_AHCLKX	Functional
	MCASP5_AUX_GFCLK	Functional
McASP6	L4PER2_L3_GICLK	Interface(1)
	MCASP6_AHCLKX	Functional
	MCASP6_AUX_GFCLK	Functional

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4PER2_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-159. CD_L4PER2 Modules Clocks Association (continued)

Module	Clock	Clock Type
McASP7	L4PER2_L3_GICLK	Interface[1]
	MCASP7_AHCLKX	Functional
	MCASP7_AUX_GFCLK	Functional
McASP8	L4PER2_L3_GICLK	Interface[1]
	MCASP8_AHCLKX	Functional
	MCASP8_AUX_GFCLK	Functional
PRU-ICSS1	ICSS_CLK	Interface
	ICSS_IEP_CLK	Functional
	PER_192M_GFCLK	Functional
QSPI	L4PER2_L3_GICLK	Interface
	QSPI_GFCLK	Functional
PWMSS1	L4PER2_L3_GICLK	Interface[1] and Functional[2]
PWMSS2	L4PER2_L3_GICLK	Interface[1] and Functional[2]
PWMSS3	L4PER2_L3_GICLK	Interface[1] and Functional[2]
UART7	L4PER2_L3_GICLK	Interface[1]
	UART7_GFCLK	Functional
UART8	L4PER2_L3_GICLK	Interface[1]
	UART8_GFCLK	Functional
UART9	L4PER2_L3_GICLK	Interface[1]
	UART9_GFCLK	Functional

[2] The module's functional clock is equal to L4PER2_L3_GICLK/2.

Table 3-160 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-160. CD_L4PER2 Modules Wake-Up Request

Module	Wake-Up Feature
L4_PER2 interconnect	None
DCAN2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ DMA_SYSTEM-DMA)
McASP2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ, DMA_SYSTEM-DMA)
McASP3	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ, DMA_SYSTEM-DMA)
McASP4	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ, DMA_SYSTEM-DMA)
McASP5	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ, DMA_SYSTEM-DMA)
McASP6	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ, DMA_SYSTEM-DMA)
McASP7	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ, DMA_SYSTEM-DMA)
McASP8	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ, DMA_SYSTEM-DMA)
PRU-ICSS1	None

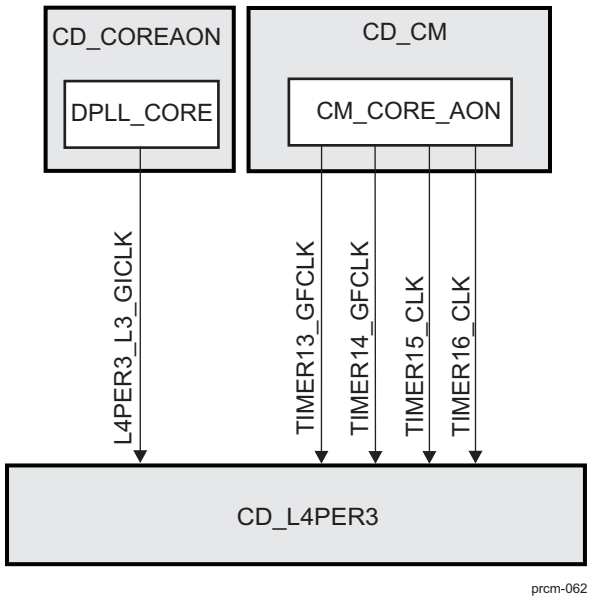
3.6.4.8 CD_L4PER3 Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.8.1 Overview

Figure 3-73 is an overview of the clock domain.

Figure 3-73. CD_L4PER3 Overview



3.6.4.8.2 Clock Domain Modes

Table 3-163 lists the clock domain modes supported by the clock domain.

Table 3-163. CD_L4PER3 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-164 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-164. CD_L4PER3 Control and Status Parameters

Parameter Name	Control/Status Bit Field
TIMER13_GFCLK clock status	CM_L4PER3_CLKSTCTRL[9] CLKACTIVITY_TIMER13_GFCLK
TIMER14_GFCLK clock status	CM_L4PER3_CLKSTCTRL[10] CLKACTIVITY_TIMER14_GFCLK
TIMER15_GFCLK clock status	CM_L4PER3_CLKSTCTRL[11] CLKACTIVITY_TIMER15_GFCLK
TIMER16_GFCLK clock status	CM_L4PER3_CLKSTCTRL[12] CLKACTIVITY_TIMER16_GFCLK
L4PER3_L3_GICLK clock status	CM_L4PER3_CLKSTCTRL[8] CLKACTIVITY_L4PER3_L3_GICLK
Clock Domain State Transition Control	CM_L4PER3_CLKSTCTRL[1:0] CLKTRCTRL

Copyright © 2015–2020, Texas Instruments Incorporated

3.6.4.8.3 Clock Domain Dependency

CD_L4PER3 has no static dependency with any other clock domain of the device.

3.6.4.8.3.1 Dynamic Dependency

Table 3-165 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-165. CD_L4PER3 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_CFG	Always enabled	CM_L4PER3_DYNAMICDEP[12] L4CFG_DYNDEP	Read only
CD_L3INIT	Always enabled	CM_L4PER3_DYNAMICDEP[7] L3INIT_DYNDEP	Read only
CD_IPU	Always enabled	CM_L4PER3_DYNAMICDEP[3] IPU_DYNDEP	Read only
CD_L3MAIN1	Always enabled	CM_L4PER3_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only
CD_RTC	Always enabled	CM_L4PER3_DYNAMICDEP[23] RTC_DYNDEP	Read only
CD_CAM	Always enabled	CM_L4PER3_DYNAMICDEP[9] CAM_DYNDEP	Read only
CD_VPE	Always enabled	CM_L4PER3_DYNAMICDEP[31] VPE_DYNDEP	Read only

3.6.4.8.3.2 Wake-Up Dependency

CD_L4PER3 has no module wake-up dependency with any other clock domain of the device.

3.6.4.8.4 Clock Domain Module Attributes

Table 3-166 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-166. CD_L4PER3 Modules Clocks Association

Module	Clock	Clock Type
L4_PER3 interconnect	L4PER3_L3_GICLK	Interface(1)
TIMER13	L4PER3_L3_GICLK	Interface(1)
	TIMER13_GFCLK	Functional
TIMER14	L4PER3_L3_GICLK	Interface(1)
	TIMER14_GFCLK	Functional
TIMER15	L4PER3_L3_GICLK	Interface(1)
	TIMER15_GFCLK	Functional
TIMER16	L4PER3_L3_GICLK	Interface(1)
	TIMER16_GFCLK	Functional

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4PER3_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-167 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-167. CD_L4PER3 Modules Wake-Up Request

Module	Wake-Up Feature
L4_PER3 interconnect	None
TIMER13	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
TIMER14	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
TIMER15	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-167. CD_L4PER3 Modules Wake-Up Request (continued)

Module	Wake-Up Feature
TIMER16	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)

Table 3-168 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-168. CD_L4PER3 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
L4_PER3 interconnect	Slave	CM_L4PER3_L4_PER3_CLKCTRL[17:16] IDLEST	Idle status
TIMER13	Slave	CM_L4PER3_TIMER13_CLKCTRL[17:16] IDLEST	Idle status
TIMER14	Slave	CM_L4PER3_TIMER14_CLKCTRL[17:16] IDLEST	Idle status
TIMER15	Slave	CM_L4PER3_TIMER15_CLKCTRL[17:16] IDLEST	Idle status
TIMER16	Slave	CM_L4PER3_TIMER16_CLKCTRL[17:16] IDLEST	Idle status

Table 3-169 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-169. CD_L4PER3 Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L4_PER3 interconnect	N/A	Available	N/A	CM_L4PER3_L4_PER3_CLKCTRL[1:0] MODULEMODE	Read only
TIMER13	Available	N/A	Available	CM_L4PER3_TIMER13_CLKCTRL[1:0] MODULEMODE	Read/write
TIMER14	Available	N/A	Available	CM_L4PER3_TIMER14_CLKCTRL[1:0] MODULEMODE	Read/write
TIMER15	Available	N/A	Available	CM_L4PER3_TIMER15_CLKCTRL[1:0] MODULEMODE	Read/write
TIMER16	Available	N/A	Available	CM_L4PER3_TIMER16_CLKCTRL[1:0] MODULEMODE	Read/write

3.6.4.9 CD_L4SEC Clock Domain

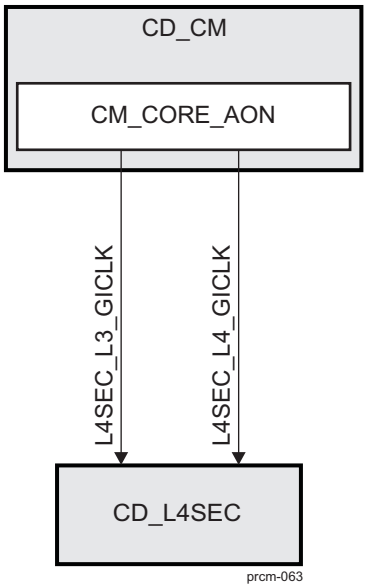
This section identifies the modes supported by the clock domain, the associated control, and status bits. It also identifies the dependencies of the domain with the other clock domains of the device.

3.6.4.9.1 Overview

Figure 3-74 shows an overview of the clock domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-74. CD_L4SEC Overview



3.6.4.9.2 Clock Domain Modes

Table 3-170 lists the clock domain modes supported by the clock domain.

Table 3-170. CD_L4SEC Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-171 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-171. CD_L4SEC Control and Status Parameters

Parameter Name	Control/Status Bit Field
L4SEC_L3_GICLK clock status	CM_L4SEC_CLKSTCTRL[8] CLKACTIVITY_L4SEC_L3_GICLK
Clock Domain State Transition Control	CM_L4SEC_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.9.3 Clock Domain Dependency

CD_L4SEC has no module wake-up dependency with any other clock domain of the device.

3.6.4.9.3.1 Static Dependency

Table 3-172 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-172. CD_L4SEC Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4PER1	Disabled	CM_L4SEC_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_L3_MAIN1	Always enabled	CM_L4SEC_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_EMIF	Disabled	CM_L4SEC_STATICDEP[4] EMIF_STATDEP	Read/Write

Copyright © 2015–2020, Texas Instruments Incorporated

3.6.4.9.3.2 Dynamic Dependency

Table 3-173 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-173. CD_L4SEC Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Disabled	CM_L4SEC_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only

3.6.4.9.4 Clock Domain Module Attributes

Table 3-174 lists the clocks received by each module of the clock domain and the role (that is, functional clock or interface clock).

Table 3-174. CD_L4SEC Modules Clocks Association

Module	Clock	Clock Type
AES1	L4SEC_L3_GICLK	Interface
AES2	L4SEC_L3_GICLK	Interface
SHA2MD5_1	L4SEC_L3_GICLK	Interface
SHA2MD5_2	L4SEC_L3_GICLK	Interface
CryptoDMA	L4SEC_L3_GICLK	Interface(1) and Functional
DES3DES	L4SEC_L3_GICLK	Interface(1)
RNG	L4SEC_L3_GICLK	Interface(1)
FPKA	L4SEC_L3_GICLK	Interface(1) and Functional(2)

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4SEC_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.
(2) The module's functional clock is equal to L4SEC_L3_GICLK/2.

Table 3-175 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-175. CD_L4SEC Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
AES1	Slave	CM_L4SEC_AES1_CLKCTRL[17:16] IDLEST	Idle status
AES2	Slave	CM_L4SEC_AES2_CLKCTRL[17:16] IDLEST	Idle status
SHA2MD5_1	Slave	CM_L4SEC_SHA2MD51_CLKCTRL[17:16] IDLEST	Idle status
SHA2MD5_2	Slave	CM_L4SEC_SHA2MD52_CLKCTRL[17:16] IDLEST	Idle status
CryptoDMA	Master/Slave	CM_L4SEC_DMA_CRYPTO_CLKCTRL[18] STBYST	Standby status
		CM_L4SEC_DMA_CRYPTO_CLKCTRL [17:16] IDLEST	Idle status
DES3DES	Slave	CM_L4SEC_DES3DES_CLKCTRL[17:16] IDLEST	Idle status
RNG	Slave	CM_L4SEC_RNG_CLKCTRL[17:16] IDLEST	Idle status
FPKA	Slave	CM_L4SEC_FPKA_CLKCTRL[17:16] IDLEST	Idle status

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-176 lists the supported slave clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-176. CD_L4SEC Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
AES1	Available	Available	N/A	CM_L4SEC_AES1_CLKCTRL[1:0] MODULEMODE	Read/Write
AES2	Available	Available	N/A	CM_L4SEC_AES2_CLKCTRL[1:0] MODULEMODE	Read/Write
SHA2MD5_1	Available	Available	N/A	CM_L4SEC_SHA2MD51_CLKCTRL[1:0] MODULEMODE	Read/Write
SHA2MD5_2	Available	Available	N/A	CM_L4SEC_SHA2MD52_CLKCTRL[1:0] MODULEMODE	Read/Write
DMA_CRYPTO	N/A	Available	N/A	CM_L4SEC_DMA_CRYPTO_CLKCTRL[1:0] MODULEMODE	Read only
DES3DES	Available	Available	N/A	CM_L4SEC_DES3DES_CLKCTRL[1:0] MODULEMODE	Read/Write
RNG	Available	Available	N/A	CM_L4SEC_RNG_CLKCTRL[1:0] MODULEMODE	Read/Write
FPKA	Available	N/A	Available	CM_L4SEC_FPKA_CLKCTRL[1:0] MODULEMODE	Read/Write

3.6.4.10 CD_L3INIT Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.10.1 Overview

Figure 3-75 is an overview of the clock domain.

Figure 3-75. CD_L3INIT Overview

3.6.4.10.2 Clock Domain Modes

Table 3-177 lists the clock domain modes supported by the clock domain.

Table 3-177. CD_L3INIT Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-178 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-178. CD_L3INIT Control and Status Parameters

Parameter Name	Control/Status Bit Field
USB_OTG_SS_REF_CLK Clock Status	CM_L3INIT_CLKSTCTRL[20] CLKACTIVITY_USB_OTG_SS_REF_CLK
L3INIT_480M_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[21] CLKACTIVITY_L3INIT_480M_GFCLK
USB_DPLL_HS_CLK Clock Status	CM_L3INIT_CLKSTCTRL[13] CLKACTIVITY_USB_DPLL_HS_CLK
USB_DPLL_CLK Clock Status	CM_L3INIT_CLKSTCTRL[12] CLKACTIVITY_USB_DPLL_CLK
L3INIT_48M_GFCLK Clock Statuss	CM_L3INIT_CLKSTCTRL[11] CLKACTIVITY_L3INIT_48M_GFCLK
L3INIT_32K_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[23] CLKACTIVITY_L3INIT_32K_GFCLK
MMC1_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[15] CLKACTIVITY_MMC1_GFCLK
MMC1_32K_GFCLK Optional functional clock control	CM_L3INIT_MMC1_CLKCTRL[8] OPTFCLKEN_32K_CLK
MMC2_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[16] CLKACTIVITY_MMC2_GFCLK
MMC2_32K_GFCLK Optional functional clock control	CM_L3INIT_MMC2_CLKCTRL[8] OPTFCLKEN_32K_CLK
SATA_REF_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[24] CLKACTIVITY_SATA_REF_GFCLK
L3INIT_L3_GICLK Clock Status	CM_L3INIT_CLKSTCTRL[8] CLKACTIVITY_L3INIT_L3_GICLK
L3INIT_L4_GICLK Clock Status	CM_L3INIT_CLKSTCTRL[9] CLKACTIVITY_L3INIT_L4_GICLK
L3INIT_USB_LFPS_TX_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[10] CLKACTIVITY_L3INIT_USB_LFPS_TX_GFCLK
L3INIT_960M_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[22] CLKACTIVITY_L3INIT_960M_GFCLK
COREAON_32K_GFCLK Clock Status	CM_COREAON_CLKSTCTRL[12] CLKACTIVITY_COREAON_32K_GFCLK
COREAON_32K_GFCLK Clock Control	CM_COREAON_USB_PHY1_CORE_CLKCTRL[8] OPTFCLKEN_CLK32K
COREAON_32K_GFCLK Clock Control	CM_COREAON_USB_PHY2_CORE_CLKCTRL[8] OPTFCLKEN_CLK32K
COREAON_32K_GFCLK Clock Control	CM_COREAON_USB_PHY3_CORE_CLKCTRL[8] OPTFCLKEN_CLK32K
ABE_GICLK Clock Status	CM_COREAON_CLKSTCTRL[16] CLKACTIVITY_ABE_GICLK
Clock Domain State Transition Control	CM_COREAON_CLKSTCTRL[1:0] CLKTRCTRL
Clock Domain State Transition Control	CM_L3INIT_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.10.3 Clock Domain Dependency

3.6.4.10.3.1 Static Dependency

Table 3-179 lists the static dependency of the clock domain with respect to other clock domains of the device.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-179. CD_L3INIT Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVA	Disabled	CM_L3INIT_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Always enabled	CM_L3INIT_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_L4_CFG	Disabled	CM_L3INIT_STATICDEP[12] L4CFG_STATDEP	Read/write
CD_L4PER	Disabled	CM_L3INIT_STATICDEP[13] L4PER_STATDEP	Read/write
CD_L4SEC	Disabled	CM_L3INIT_STATICDEP[14] L4SEC_STATDEP	Read/write
CD_EMIF	Disabled	CM_L3INIT_STATICDEP[4] EMIF_STATDEP	Read/write
CD_WKUPAON	Disabled	CM_L3INIT_STATICDEP[15] WKUPAON_STATDEP	Read/write
CD_L4PER3	Disabled	CM_L3INIT_STATICDEP[27] L4PER3_STATDEP	Read/write

3.6.4.10.3.2 Dynamic Dependency

Table 3-180 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-180. CD_L3INIT Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always disabled	CM_L3INIT_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only

3.6.4.10.3.3 Wake-Up Dependency

Table 3-181 lists the wake-up dependency settings for the modules of this clock in the clock domain.

Table 3-181. CD_L3INIT Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
MMC1	CD_L3INIT	CD_DMA, CD_L3_MAIN1, CD_L4PER1, CD_L4PER2, CD_L4PER3	Disabled	PM_L3INIT_MMC1_WKDEP[3] WKUPDEP_MMC1_SDMA	Read/write
MMC1	CD_L3INIT	CD_DSP, CD_L3_MAIN1, CD_L4PER1, CD_L4PER2, CD_L4PER3	Disabled	PM_L3INIT_MMC1_WKDEP[2] WKUPDEP_MMC1_DSP1	Read/write

3.6.4.10.4 Clock Domain Module Attributes

Table 3-182 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-182. CD_L3INIT Modules Clocks Association

Module	Clock	Clock Type
MMC1	MMC1_GFCLK	Functional
	L3INIT_32K_GFCLK	Functional
	L3INIT_L3_GICLK	Interface(1)
MMC2	MMC2_GFCLK	Functional
	L3INIT_32K_GFCLK	Functional
	L3INIT_L3_GICLK	Interface(1)
USB1	L3INIT_960M_GFCLK	Functional
	L3INIT_L3_GICLK	Interface(1)
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
	USB_LFPS_TX_GFCLK	Interface
USB2	L3INIT_960M_GFCLK	Functional
	L3INIT_L3_GICLK	Interface(1)
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
USB3	L3INIT_L3_GICLK	Interface
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
USB4	L3INIT_L3_GICLK	Interface(1)
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
USB2PHY1	COREAON_32K_GFCLK	Functional
USB2PHY2	COREAON_32K_GFCLK	Functional
USB3_PHY	COREAON_32K_GFCLK	Functional
SATA	L3INIT_L3_GICLK	Interface
	L3INIT_48M_GFCLK	Functional
	SATA_REF_GFCLK	Functional
IEEE1500_2_OCP	L3INIT_L3_GICLK	Interface and functional
	L3INIT_L4_GICLK	Interface
OCP2SCP1	L3INIT_L4_GICLK	Interface
OCP2SCP3	L3INIT_L4_GICLK	Interface

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L4SEC_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-183 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-183. CD_L3INIT Modules Wake-Up Request

Module	Wake-Up Feature
MMC1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ, DMA_SYSTEM-DMA)

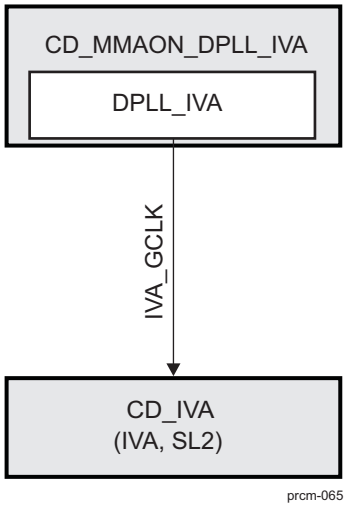
3.6.4.11 CD_IVA Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.11.1 Overview

Figure 3-76 is an overview of the clock domain.

Figure 3-76. CD_IVA Overview



3.6.4.11.2 Clock Domain Modes

Table 3-186 lists the clock domain modes supported by the clock domain.

Table 3-186. CD_IVA Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-187 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-187. CD_IVA Control and Status Parameters

Parameter Name	Control/Status Bit Field
IVA_GCLK Clock Status	CM_IVA_CLKSTCTRL[8] CLKACTIVITY_IVA_GCLK
Clock Domain State Transition Control	CM_IVA_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.11.3 Clock Domain Dependency

CD_IVA has no module wake-up dependency with any other clock domain of the device.

3.6.4.11.3.1 Static Dependency

Table 3-188 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-188. CD_IVA Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always enabled	CM_IVA_STATICDEP[5] L3MAIN1_STATDEP	Read only

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-203 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-203. CD_EMU Control and Status Parameters

Parameter Name	Control/Status Bit Field
EMU_SYS_GCLK Clock Status	CM_EMU_CLKSTCTRL[8] CLKACTIVITY_EMU_SYS_CLK
Clock Domain State Transition Control	CM_EMU_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.13.3 Clock Domain Dependency

CD_EMU has no static or module wake-up dependency with any other clock domain of the device.

3.6.4.13.3.1 Dynamic Dependency

Table 3-204 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-204. CD_EMU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always enabled	CM_EMU_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only

3.6.4.13.4 Clock Domain Module Attributes

Table 3-205 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-205. CD_EMU Modules Clocks Association

Module	Clock	Clock Type
DEBUGSS	EMU_SYS_CLK	Interface and functional

Table 3-206 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-206. CD_EMU Modules Wake-Up Request

Module	Wake-Up Feature
DEBUGSS	Master wake-up request

3.6.4.14 CD_DSS Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device. BB2D is a part of CD_DSS clock domain. BB2D_GFCLK is the functional clock for BB2D module. It is derived from H24 post divider of DPLL_CORE.

3.6.4.14.1 Overview

3.6.4.14.4 Clock Domain Module Attributes

Table 3-212 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-212. CD_DSS Modules Clocks Association

Module	Clock	Clock Type
DSS	HDMI_DPLL_CLK	Functional
	DSS_GFCLK	Functional
	HDMI_PHY_GFCLK	Functional
	HDMI_CEC_GFCLK	Functional
	VIDEO1_DPLL_CLK	Functional
	VIDEO2_DPLL_CLK	Functional
	DSS_L3_GICLK	Interface[(1)]
BB2D	BB2D_GFCLK	Functional
	DSS_L3_GICLK	Interface

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the DSS_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-213 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-213. CD_DSS Modules Wake-Up Request

Module	Wake-Up Feature
DSS	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ DMA_SYSTEM-DMA)
BB2D	None

Table 3-214 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-214. CD_DSS Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DSS	Master/slave	CM_DSS_DSS_CLKCTRL[18] STBYST	Standby status
		CM_DSS_DSS_CLKCTRL[17:16] IDLEST	Idle status
BB2D	Master/slave	CM_DSS_BB2D_CLKCTRL[18] STBYST	Standby status
		CM_DSS_BB2D_CLKCTRL[17:16] IDLEST	Idle status

Table 3-215 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-215. CD_DSS Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DSS	Available	N/A	Available	CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE	Read/write
BB2D	Available	N/A	Available	CM_DSS_BB2D_CLKCTRL[1:0] MODULEMODE	Read/write

3.6.4.16 CD_L3_INSTR Clock Domain

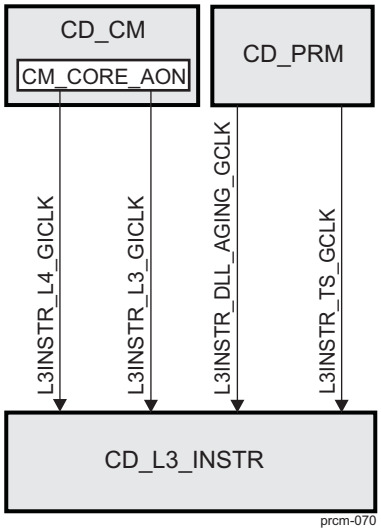
This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.16.1 Overview

Figure 3-81 is an overview of the clock domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-81. CD_L3_INSTR Overview



3.6.4.16.2 Clock Domain Modes

Table 3-223 lists the clock domain modes supported by the clock domain.

Table 3-223. CD_L3_INSTR Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Not available	Available

Table 3-224 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-224. CD_L3_INSTR Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3INSTR_L3_GICLK Clock Status	CM_L3INSTR_CLKSTCTRL[8] CLKACTIVITY_L3INSTR_L3_GICLK
L3INSTR_DLL_AGING_GCLK Clock Status	CM_L3INSTR_CLKSTCTRL[9] CLKACTIVITY_L3INSTR_DLL_AGING_GCLK
L3INSTR_TS_GCLK Clock Status	CM_L3INSTR_CLKSTCTRL[10] CLKACTIVITY_L3INSTR_TS_GCLK
Clock Domain State Transition Control	CM_L3INSTR_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.16.3 Clock Domain Dependency

CD_L3_INSTR has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

For aging, DLL requires a low-frequency clock that must run as long as the CORE power domain is on. To match this requirement, the DLL_AGING module has been created and instantiated in this clock domain, which is the last to transition in low-power state.

3.6.4.16.4 Clock Domain Module Attributes

Table 3-225 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-225. CD_L3_INSTR Modules Clocks Association

3.6.4.17.2 Clock Domain Modes

Table 3-229 lists the clock domain modes supported by the clock domain.

Table 3-229. CD_L3_MAIN1 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-230 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-230. CD_L3_MAIN1 Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3MAIN1_L3_GICLK Clock Status	CM_L3MAIN1_CLKSTCTRL[8] CLKACTIVITY_L3MAIN1_L3_GICLK
L3MAIN1_L4_GICLK Clock Status	CM_L3MAIN1_CLKSTCTRL[9] CLKACTIVITY_L3MAIN1_L4_GICLK
Clock Domain State Transition Control	CM_L3MAIN1_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.17.3 Clock Domain Dependency

CD_L3_MAIN1 has no static or module wake-up dependency with any other clock domain of the device.

3.6.4.17.3.1 Dynamic Dependency

Table 3-231 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-231. CD_L3_MAIN1 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IPU	Always enabled	CM_L3MAIN1_DYNAMICDEP[3] IPU_DYNDEP	Read only
CD_IPU1	Always enabled	CM_L3MAIN1_DYNAMICDEP[18] IPU1_DYNDEP	Read only
CD_IPU2	Always enabled	CM_L3MAIN1_DYNAMICDEP[0] IPU2_DYNDEP	Read only
CD_DSP1	Always enabled	CM_L3MAIN1_DYNAMICDEP[1] DSP1_DYNDEP	Read only
CD_DSP2	Always enabled	CM_L3MAIN1_DYNAMICDEP[20] DSP2_DYNDEP	Read only
CD_IVA	Always enabled	CM_L3MAIN1_DYNAMICDEP[2] IVA_DYNDEP	Read only
CD_EMIF	Always enabled	CM_L3MAIN1_DYNAMICDEP[4] EMIF_DYNDEP	Read only
CD_DSS	Always enabled	CM_L3MAIN1_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_GPU	Always enabled	CM_L3MAIN1_DYNAMICDEP[10] GPU_DYNDEP	Read only
CD_L4PER	Always enabled	CM_L3MAIN1_DYNAMICDEP[13] L4PER_DYNDEP	Read only
CD_L4PER2	Always enabled	CM_L3MAIN1_DYNAMICDEP[22] L4PER2_DYNDEP	Read only
CD_L4PER3	Always enabled	CM_L3MAIN1_DYNAMICDEP[23] L4PER3_DYNDEP	Read only
CD_L4SEC	Always enabled	CM_L3MAIN1_DYNAMICDEP[14] L4SEC_DYNDEP	Read only
CD_L4_CFG	Always enabled	CM_L3MAIN1_DYNAMICDEP[12] L4CFG_DYNDEP	Read only

Table 3-231. CD_L3_MAIN1 Dynamic Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_PCIE	Always enabled	CM_L3MAIN1_DYNAMICDEP[21] PCIE_DYNDEP	Read only
CD_WKUPAON	Always enabled	CM_L3MAIN1_DYNAMICDEP[15] WKUPAON_DYNDEP	Read only
CD_EVE1	Always enabled	CM_L3MAIN1_DYNAMICDEP[28] EVE1_DYNDEP	Read only
CD_EVE2	Always enabled	CM_L3MAIN1_DYNAMICDEP[29] EVE2_DYNDEP	Read only
CD_EVE3	Always enabled	CM_L3MAIN1_DYNAMICDEP[30] EVE3_DYNDEP	Read only
CD_EVE4	Always enabled	CM_L3MAIN1_DYNAMICDEP[31] EVE4_DYNDEP	Read only

3.6.4.17.4 Clock Domain Module Attributes

Table 3-232 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-232. CD_L3_MAIN1 Modules Clocks Association

Module	Clock	Clock Type
L3_MAIN1 interconnect	L3MAIN1_L3_GICLK	Interface
	L3MAIN1_L4_GICLK	Interface
GPMC	L3MAIN1_L3_GICLK	Interface
OCMC_RAM1	L3MAIN1_L3_GICLK	Interface(1)
OCMC_RAM2	L3MAIN1_L3_GICLK	Interface(1)
OCMC_RAM3	L3MAIN1_L3_GICLK	Interface(1)
MMU_EDMA	L3MAIN1_L3_GICLK	Interface(1)
MMU_PCIESS	L3MAIN1_L3_GICLK	Interface(1)
EDMA_TPCC	L3MAIN1_L3_GICLK	Interface
EDMA_TC0	L3MAIN1_L3_GICLK	Interface
EDMA_TC1	L3MAIN1_L3_GICLK	Interface

(1) The L4 clock, required by the L4 interface, is created internally to the module. It is derived from the L3MAIN1_L3_GICLK clock divided by 2 using a gated version of L4_ICLK.

Table 3-233 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-233. CD_L3_MAIN1 Modules Wake-Up Request

Module	Wake-Up Feature
L3_MAIN1 interconnect	None
GPMC	None
OCMC_RAM1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
OCMC_RAM2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
OCMC_RAM3	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)
MMU_EDMA	None
MMU_PCIESS	None
EDMA_TPCC	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-233. CD_L3_MAIN1 Modules Wake-Up Request (continued)

Module	Wake-Up Feature
EDMA_TC0	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)/ Master wake-up request
EDMA_TC1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)/ Master wake-up request

Table 3-234 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-234. CD_L3_MAIN1 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
L3_MAIN1 interconnect	Slave	CM_L3MAIN1_L3_MAIN_1_CLKCTRL[17:16] IDLEST	Idle status
GPMC	Slave	CM_L3MAIN1_GPMC_CLKCTRL[17:16] IDLEST	Idle status
OCMC_RAM1	Slave	CM_L3MAIN1_OCMC_RAM1_CLKCTRL[17:16] IDLEST	Idle status
OCMC_RAM2	Slave	CM_L3MAIN1_OCMC_RAM2_CLKCTRL[17:16] IDLEST	Idle status
OCMC_RAM3	Slave	CM_L3MAIN1_OCMC_RAM3_CLKCTRL[17:16] IDLEST	Idle status
MMU_EDMA	Slave	CM_L3MAIN1_MMU_EDMA_CLKCTRL[17:16] IDLEST	Idle status
MMU_PCIESS	Slave	CM_L3MAIN1_MMU_PCIESS_CLKCTRL[17:16] IDLEST	Idle status
EDMA_TPCC	Slave	CM_L3MAIN1_TPCC_CLKCTRL[17:16] IDLEST	Idle status
EDMA_TC0	Master/slave	CM_L3MAIN1_TPTC1_CLKCTRL[18] STBYST	Standby status
		CM_L3MAIN1_TPTC1_CLKCTRL[17:16] IDLEST	Idle status
EDMA_TC1	Master/slave	CM_L3MAIN1_TPTC2_CLKCTRL[18] STBYST	Standby status
		CM_L3MAIN1_TPTC2_CLKCTRL[17:16] IDLEST	Idle status

Table 3-235 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-235. CD_L3_MAIN1 Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L3_MAIN1 interconnect	N/A	Available	N/A	CM_L3MAIN1_L3_MAIN_1_CLKCTRL[1:0] MODULEMODE	Read only

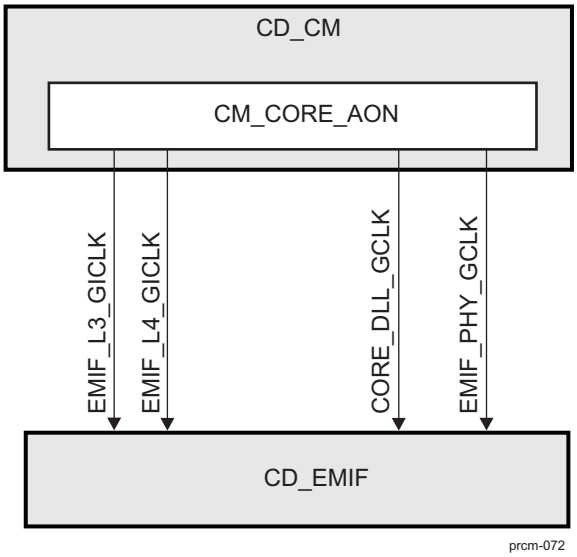
3.6.4.18 CD_EMIF Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.18.1 Overview

Figure 3-83 is an overview of the clock domain.

Figure 3-83. CD_EMIF Overview



3.6.4.18.2 Clock Domain Modes

Table 3-236 lists the clock domain modes supported by the clock domain.

Table 3-236. CD_EMIF Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-237 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-237. CD_EMIF Control and Status Parameters

Parameter Name	Control/Status Bit Field
CORE_DLL_GCLK Clock Status	CM_EMIF_CLKSTCTRL[9] CLKACTIVITY_EMIF_DLL_GCLK
CORE_DLL_GCLK Clock Control	CM_EMIF_EMIF_DLL_CLKCTRL[8] OPTFCLKEN_DLL_CLK
EMIF_L3_GICLK Clock Status	CM_EMIF_CLKSTCTRL[8] CLKACTIVITY_EMIF_L3_GICLK
EMIF_PHY_GCLK Clock Status	CM_EMIF_CLKSTCTRL[10] CLKACTIVITY_EMIF_PHY_GCLK
Clock Domain State Transition Control	CM_EMIF_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.18.3 Clock Domain Dependency

CD_EMIF has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

3.6.4.18.4 Clock Domain Module Attributes

Table 3-238 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-238. CD_EMIF Modules Clocks Association

Module	Clock	Clock Type
DLL	EMIF_DLL_GCLK	Functional
DMM	EMIF_L3_GICLK	Interface
EMIF1	EMIF_L3_GICLK	Interface
	MA_EOCP_GICLK(1)	Interface
	L3_EOCP_GICLK(1)	Interface
	EMIF_PHY_GCLK	Interface
EMIF2	EMIF_L3_GICLK	Interface
	MA_EOCP_GICLK(1)	Interface
	L3_EOCP_GICLK(1)	Interface
	EMIF_PHY_GCLK	Interface
EMIF_OCP_FW	EMIF_L3_GICLK	Interface
	EMIF_L4_GICLK	Interface

(1) EMIF modules are clocked by MA_EOCP_GICLK when MPU is active; otherwise, the L3_EOCP_GICLK clock is used.

Table 3-239 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-239. CD_EMIF Modules Wake-Up Request

Module	Wake-Up Feature
DLL	None
DMM	None
EMIF1	None
EMIF2	None
EMIF_OCP_FW	None

Table 3-240 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

3.6.4.20.4 Clock Domain Module Attributes

Table 3-254 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-254. CD_IPU1 Modules Clocks Association

Module	Clock	Clock Type
IPU1	IPU1_GFCLK	Interface and Functional
	IPU1_GFCLKDIV2(1)	Interface and Functional

(1) IPU1_GFCLKDIV2 is divided by 2 version of the IPU1_GFCLK. For more information about the IPU1_GFCLK additional division by 2, see Section 7.2.1 *Dual Cortex-M4 IPU Subsystem Clock and Reset Distribution.*

Table 3-255 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-255. CD_IPU1 Modules Wake-Up Request

Module	Wake-Up Feature
IPU1	Master wake-up request

Table 3-256 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-256. CD_IPU1 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
IPU1	Master/slave	CM_IPU1_IPU1_CLKCTRL[18] STBYST	Standby status
		CM_IPU1_IPU1_CLKCTRL[17:16] IDLEST	Idle status
		CM_IPU1_IPU1_CLKCTRL[24] CLKSEL	Select the timer functional clock

Table 3-257 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-257. CD_IPU1 Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
IPU1	Available	Available	N/A	CM_IPU1_IPU1_CLKCTRL[1:0] MODULEMODE	Read/write

3.6.4.21 CD_IPU2 Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.21.1 Overview

Figure 3-86 is an overview of the clock domain.

3.6.4.25.3 Clock Domain Dependency

3.6.4.25.3.1 Static Dependency

Table 3-288 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-288. CD_GMAC Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always enabled	CM_GMAC_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_EMIF	Disabled	CM_GMAC_STATICDEP[4] EMIF_STATDEP	Read/write
CD_L4PER2	Disabled	CM_GMAC_STATICDEP[26] L4PER2_STATDEP	Read/write

3.6.4.25.3.2 Dynamic Dependency

Table 3-289 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-289. CD_GMAC Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always disabled	CM_GMAC_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only

3.6.4.25.4 Clock Domain Module Attributes

Table 3-290 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-290. CD_GMAC Modules Clocks Association“

Module	Clock	Clock Type
CPGMAC	GMAC_MAIN_CLK	Interface
	GMAC_RFT_CLK	Functional
	GMII_250MHZ_CLK	Functional
	RGMII_5MHZ_CLK	Functional
	RMII_50MHZ_CLK	Functional

Table 3-291 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-291. CD_GMAC Modules Wake-Up Request

Module	Wake-Up Feature
GMAC	None

Table 3-292 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-292. CD_GMAC Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
GMAC	Master/slave	CM_GMAC_GMAC_CLKCTRL[18] STBYST	Standby status

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-292. CD_GMAC Modules Clock-Management Modes and Control (continued)

Module	Clock-Management Protocol	Status Bit Field	Role
		CM_GMAC_GMAC_CLKCTRL[17:16] IDLEST	Idle status
		CM_GMAC_GMAC_CLKCTRL[24] CLKSEL_REF	Select the source of the functional clock
		CM_GMAC_GMAC_CLKCTRL[27:25] CLKSEL_RFT	Select the source of the CPTS_RFT_CLK

Table 3-293 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-293. CD_GMAC Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GMAC	Available	N/A	Available	CM_GMAC_GMAC_CLKCTRL[1:0] MODULEMODE	Read/write

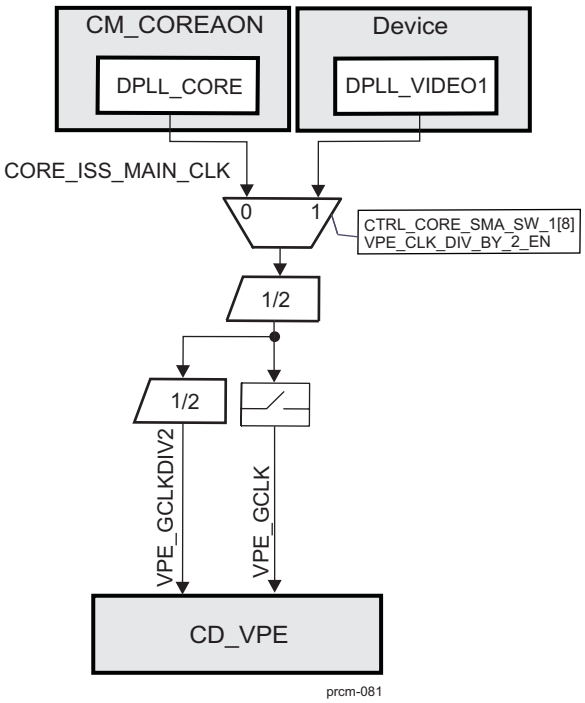
3.6.4.26 CD_VPE Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.26.1 CD_VPE Overview

Figure 3-91 is an overview of the clock domain.

Figure 3-91. CD_VPE Overview



3.6.4.26.2 Clock Domain Modes

Table 3-294 lists the clock domain modes supported by the clock domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-294. CD_VPE Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-295 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-295. CD_VPE Control and Status Parameters

Parameter Name	Control/Status Bit Field
CLKACTIVITY_VPE_GCLK Clock Status	CM_VPE_CLKSTCTRL[8] CLKACTIVITY_VPE_GCLK
Clock Domain State Transition Control	CM_VPE_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.26.3 Clock Domain Dependency

Table 3-296 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-296. CD_VPE Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always enabled	CM_VPE_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_EMIF	Disabled	CM_VPE_STATICDEP[4] EMIF_STATDEP	Read/write
CD_L4PER3	Disabled	CM_VPE_STATICDEP[27] L4PER3_STATDEP	Read/write

3.6.4.26.3.1 Wake-Up Dependency

Table 3-297 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-297. CD_VPE Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
VPE	CD_VPE	CD_IPU1, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[4] WKUPDEP_VPE_IPU1	Read/write
	CD_VPE	CD_IPU2, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[1] WKUPDEP_VPE_IPU2	Read/write
	CD_VPE	CD_MPU, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[0] WKUPDEP_VPE_MPU	Read/write
	CD_VPE	CD_DSP1, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[2] WKUPDEP_VPE_DSP1	Read/write
	CD_VPE	CD_DSP2, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[5] WKUPDEP_VPE_DSP2	Read/write
	CD_VPE	CD_EVE1,CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[6] WKUPDEP_VPE_EVE1	Read/write

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-297. CD_VPE Wake-Up Dependency Association Parameters (continued)

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
	CD_VPE	CD_EVE2, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[7] WKUPDEP_VPE_EVE2	Read/write
	CD_VPE	CD_EVE3, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[8] WKUPDEP_VPE_EVE3	Read/write
	CD_VPE	CD_EVE4, CD_L3_MAIN1, L4PER1, L4PER2, L4PER3	Disabled	PM_VPE_VPE_WKDEP[9] WKUPDEP_VPE_EVE4	Read/write

3.6.4.26.4 Clock Domain Module Attributes

Table 3-298 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-298. CD_VPE Modules Clocks Association

Module	Clock	Clock Type
VPE	VPE_GCLK	Functional
	VPE_GCLKDIV2(1)	Interface

(1) VPE_GCLKDIV2 is divided by 2 version of the VPE_GCLK. For more information about the VPE_GCLK additional division by 2, please see Section 10.2 *VPE Integration.*

Table 3-299 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-299. CD_VPE Modules Wake-Up Request

Module	Wake-Up Feature
VPE	Master wake-up request
	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)

Table 3-300 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-300. CD_VPE Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
VPE	Master/Slave	CM_VPE_VPE_CLKCTRL[18] STBYST	Standby status
		CM_VPE_VPE_CLKCTRL[17:16] IDLEST	Idle status

Table 3-301 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-301. CD_VPE Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type

3.6.4.32.4 Clock Domain Module Attributes

Table 3-345 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-345. CD_PCIE Modules Clocks Association

Module	Clock	Clock Type
PCIe_SS1	PCIE_L3_GICLK	Interface
	PCIE_REF_GFCLK	Functional
	PCIE_32K_GFCLK	Functional
	PCIE_PHY_GCLK	Functional
	PCIE_PHY_DIV_GCLK	Functional
PCIe_SS2	PCIE_L3_GICLK	Interface
	PCIE_REF_GFCLK	Functional
	PCIE_32K_GFCLK	Functional
	PCIE_PHY_GCLK	Functional
	PCIE_PHY_DIV_GCLK	Functional

Table 3-346 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-346. CD_PCIE Modules Wake-Up Request

Module	Wake-Up Feature
PCIe_SS1	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)/ Master wake-up request
PCIe_SS2	Slave wake-up request (MPU-IRQ, IPU1-IRQ, IPU2-IRQ, DSP1-IRQ, DSP2-IRQ, EVE1-IRQ, EVE2-IRQ, EVE3-IRQ, EVE4-IRQ)/ Master wake-up request

NOTE: In order to disable the APLL_PCIE, the user needs to disable PCIe_SSx (where x = 1 or 2) using the CM_PCIE_PCIESSx_CLKCTRL[1:0] MODULEMODE registers. When PCIe_SS is disabled, the PRCM module automatically disables the APLL_PCIE. Please note that setting CM_CLKMODE_APLL_PCIE[1:0] MODE_SELECT bitfield to 0x0 does not disable the APLL_PCIE.

Table 3-347 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-347. CD_PCIE Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
PCIe_SS1	Master/Slave	CM_PCIE_PCIESS1_CLKCTRL[18] STBYST	Standby status
		CM_PCIE_PCIESS1_CLKCTRL[17:16] IDLEST	Idle status
		CM_PCIE_PCIESS1_CLKCTRL[10] OPTFCLKEN_PCIEPHY_CLK_DIV	PCIE PHY optional clock control
		CM_PCIE_PCIESS1_CLKCTRL[9] OPTFCLKEN_PCIEPHY_CLK	PCIE PHY optional clock control
		CM_PCIE_PCIESS1_CLKCTRL[8] OPTFCLKEN_32KHZ	PCIE PHY optional clock control
PCIe_SS2	Master/Slave	CM_PCIE_PCIESS2_CLKCTRL[18] STBYST	Standby status
		CM_PCIE_PCIESS2_CLKCTRL[17:16] IDLEST	Idle status
		CM_PCIE_PCIESS2_CLKCTRL[10] OPTFCLKEN_PCIEPHY_CLK_DIV	PCIE PHY optional clock control
		CM_PCIE_PCIESS2_CLKCTRL[9] OPTFCLKEN_PCIEPHY_CLK	PCIE PHY optional clock control
		CM_PCIE_PCIESS2_CLKCTRL[8] OPTFCLKEN_32KHZ	PCIE PHY optional clock control

NOTE: In order to disable the APLL_PCIE, the user needs to disable PCIe_SSx (where x = 1 or 2) using the CM_PCIE_PCIESSx_CLKCTRL[1:0] MODULEMODE registers. When PCIe_SS is disabled, the PRCM module automatically disables the APLL_PCIE. Please note that setting CM_CLKMODE_APLL_PCIE[1:0] MODE_SELECT bitfield to 0x0 does not disable the APLL_PCIE.

Table 3-348 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-348. CD_PCIE Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
PCIe_SS1	Available	N/A	Available	CM_PCIE_PCIESS1_CLKCTRL[1:0] MODULEMODE	Read/write

3.7 Power Management Functional Description

NOTE: Only the MPU Subsystem supports memory retention. MPU subsystem does not support OFF state. Only CPU1 supports FORCED_OFF state with no subsequent recovery to ON/active state - this is very application specific and may not be available in all TI standard software offerings.

NOTE: In the L3INIT power domain OFF state is only allowed in systems where Ethernet RGMII is NOT used in the system - this is very application specific and may not be available in all TI standard software offerings.

This section describes the functional concepts of power management at the power domain level in the device.

The following power domains support dynamic power switching (DPS) with switching times of less than 5 µs.

- PD_CORE
- PD_MPU

3.7.1 PD_WKUPAON Description

PD_WKUPAON contains the following reset domains:

- WKUPAON_PWRON_RST
- WKUPAON_RST
- WKUPAON_SYS_PWRON_RST
- PRM_PWRON_RST
- PRM_RST
- LPRM_PWRON_RST
- LPRM_RST

PD_WKUPAON contains the CD_WKUPAON clock domain.

Table 3-349 lists the logic retention capability for each module of the power domain.

Table 3-349. PD_WKUPAON Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CTRL_MODULE_WKUP	No	None	None
GPIO1	No	RM_WKUPAON_GPIO1_CONTEXT[0] LOSTCONTEXT_DFF	None
PRCM_MPU	No	None	None
COUNTER_32K	No	RM_WKUPAON_COUNTER_32K_CONTEXT[0] LOSTCONTEXT_DFF	None
TIMER1	No	RM_WKUPAON_TIMER1_CONTEXT[0] LOSTCONTEXT_DFF	None

Table 3-349. PD_WKUPAON Modules Power Attributes (continued)

Module	Logic Retention	DFF Context Status	RFF Context Status
DCAN1	No	RM_WKUPAON_DCAN1_CONTEXT[0] LOSTCONTEXT_DFF	None
UART10	No	RM_WKUPAON_UART10_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.1.1 Power Domain Modes

The PD_WKUPAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_WKUPAON power domain has two memory banks (UART_MEM, DCAN_MEM) which are related to UART10 and DCAN1.

3.7.1.1.1 Logic and Memory Area Power Modes

Table 3-350 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-350. PD_WKUPAON Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
WKUP_BANK		ON	RETENTION	
	UART10 - UART_MEM	always_on	always_retention	
	DCAN1 - DCAN_MEM	always_on	always_retention	

3.7.2 PD_DSP1 Description

PD_DSP1 contains the following reset domains:

- DSP1_RST
- DSP1_PWRON_RST
- DSP1_RET_RST
- DSP1_SYS_RST

PD_DSP1 contains the CD_DSP1 clock domain.

Table 3-351 lists the logic retention capability for each module of the power domain.

Table 3-351. PD_DSP1 Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSP1	No	RM_DSP1_DSP1_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.2.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.2.1.1 Logic and Memory Area Power Modes

Table 3-352 lists the power modes supported by the logic area of the power domain.

Table 3-352. PD_DSP1 Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-353 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-353. PD_DSP1 Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
DSP1_EDMA		ON	RETENTION	OFF
	DSP – DSP_DMA	always_on	always_retention	
DSP1_L1		ON	OFF, RETENTION	OFF
	DSP – DSP_L1	always_on	software_control	
DSP1_L2		ON	OFF, RETENTION	OFF
	DSP – DSP_L2	always_on	software_control	

3.7.2.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-354 lists the power mode controls for the power domain.

Table 3-354. PD_DSP1 Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_DSP1_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	DSP1_EDMA	PM_DSP1_PWRSTCTRL[21:20] DSP1_EDMA_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	DSP1_L2	PM_DSP1_PWRSTCTRL[19:18] DSP1_L2_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	DSP1_L1	PM_DSP1_PWRSTCTRL[17:16] DSP1_L1_ONSTATE	Read only
Power Domain – State Transition Control		PM_DSP1_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-355 lists the power mode status for the power domain.

Table 3-355. PD_DSP1 Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_DSP1_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	DSP1_EDMA	PM_DSP1_PWRSTST[9:8] DSP1_EDMA_STATEST
Memory Area – State Status	DSP1_L2	PM_DSP1_PWRSTST[7:6] DSP1_L2_STATEST
Memory Area – State Status	DSP1_L1	PM_DSP1_PWRSTST[5:4] DSP1_L1_STATEST
Power Domain – State Transition Status		PM_DSP1_PWRSTST[20] INTRANSITION

Table 3-355. PD_DSP1 Power Modes Status Parameters (continued)

Parameter Name	Memory Bank	Status Bit Field
Logic Area – State Status		PM_DSP1_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_DSP1_PWRSTST[1:0] POWERSTATEST

3.7.3 PD_DSP2 Description

PD_DSP2 contains the following reset domains:

- DSP2_RST
- DSP2_PWRON_RST
- DSP2_RET_RST
- DSP2_SYS_RST

PD_DSP2 contains the CD_DSP2 clock domain.

Table 3-356 lists the logic retention capability for each module of the power domain.

Table 3-356. PD_DSP2 Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSP2	No	RM_DSP2_DSP2_CONTEXT[1] LOSTCONTEXT_DFF	None

3.7.3.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.3.1.1 Logic and Memory Area Power Modes

Table 3-357 lists the power modes supported by the logic area of the power domain.

Table 3-357. PD_DSP2 Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-358 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-358. PD_DSP2 Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
DSP2_EDMA		ON	RETENTION	OFF
	DSP – DSP_DMA	always_on	always_retention	
DSP2_L1		ON	OFF, RETENTION	OFF
	DSP – DSP_L1	always_on	software_control	
DSP2_L2		ON	OFF, RETENTION	OFF
	DSP – DSP_L2	always_on	software_control

3.7.3.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-359 lists the power mode controls for the power domain.

Table 3-359. PD_DSP2 Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_DSP2_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	DSP2_EDMA	PM_DSP2_PWRSTCTRL[21:20] DSP2_EDMA_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	DSP2_L2	PM_DSP2_PWRSTCTRL[19:18] DSP2_L2_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	DSP2_L1	PM_DSP2_PWRSTCTRL[17:16] DSP2_L1_ONSTATE	Read only
Power Domain – State Transition Control		PM_DSP2_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-360 lists the power mode status for the power domain.

Table 3-360. PD_DSP2 Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power domain transition status		PM_DSP2_PWRSTST[20] INTRANSITION
Memory Area – State Status	DSP2_L1	PM_DSP2_PWRSTST[5:4] DSP2_L1_STATEST
Memory Area – State Status	DSP2_L2	PM_DSP2_PWRSTST[7:6] DSP2_L2_STATEST
Memory Area – State Status	DSP2_EDMA	PM_DSP2_PWRSTST[9:8] DSP2_EDMA_STATEST
Logic Area – Retention State Control		PM_DSP2_PWRSTST[2] LOGICSTATEST
Power Domain – State Transition Control		PM_DSP2_PWRSTST[1:0] POWERSTATE
Last low power state entered		PM_DSP2_PWRSTST[25:24] LASTPOWERSTATEENTERED

3.7.4 PD_CUSTEFUSE Description

PD_CUSTEFUSE contains the following reset domains:

- CUSTEFUSE_RST

PD_CUSTEFUSE contains the CD_CUSTEFUSE clock domain.

Table 3-351 lists the logic retention capability for each module of the power domain.

Table 3-361. PD_CUSTEFUSE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
EFUSE_CTRL_CUST	No	RM_CUSTEFUSE_EFUSE_CTRL_CUST_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.4.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

Copyright © 2015–2020, Texas Instruments Incorporated

3.7.4.1.1 Logic and Memory Area Power Modes

Table 3-352 lists the power modes supported by the logic area of the power domain.

Table 3-362. PD_CUSTEFUSE Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-353 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

There is no memory bank implemented for the PD_CUSTEFUSE.

3.7.4.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-354 lists the power mode controls for the power domain.

Table 3-363. PD_CUSTEFUSE Power Modes Control Parameters

Parameter Name	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control	PM_CUSTEFUSE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Power Domain – State Transition Control	PM_CUSTEFUSE_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-355 lists the power mode status for the power domain.

Table 3-364. PD_CUSTEFUSE Power Modes Status Parameters

Parameter Name	Status Bit Field
Power Domain – Last Power State Entered Status	PM_CUSTEFUSE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status	PM_CUSTEFUSE_PWRSTST[20] INTRANSITION
Logic Area – State Status	PM_CUSTEFUSE_PWRSTST[2] LOGICSTATEST
Power Domain – State Status	PM_CUSTEFUSE_PWRSTST[1:0] POWERSTATEST

3.7.5 PD_MPU Description

PD_MPU contains the following reset domains:

- MPU_PWRON_RST
- MPU_RST
- MPU_MA_RST
- MPU_MA_RET_RST
- MPU_MA_PWRON_RET_RST

PD_MPU contains the CD_MPU clock domain.

Table 3-365 lists the logic retention capability for each module of the power domain.

Table 3-365. PD_MPU Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
MPU	Partial	RM_MPU_MPU_CONTEXT[0] LOSTCONTEXT_DFF	RM_MPU_MPU_CONTEXT[1] LOSTCONTEXT_RFF

3.7.5.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.5.1.1 Logic and Memory Area Power Modes

Table 3-366 lists the power modes supported by the logic area of the power domain.

Table 3-366. PD_MPU Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available	Available

Table 3-367 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-367. PD_MPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
MPU_L2		ON	OFF or RETENTION	
	MPU – MPU_L2	always_on	always_retention	
MPU_RAM		ON	RETENTION	
	MPU - MPU_RAM	always_on	always_retention	

3.7.5.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-368 lists the power mode controls for the power domain.

Table 3-368. PD_MPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	MPU_L2	PM_MPU_PWRSTCTRL[9] MPU_L2_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	MPU_RAM	PM_MPU_PWRSTCTRL[10] MPU_RAM_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_MPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read only
Logic Area – Retention State Control		PM_MPU_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Memory Area – State Control (logic in ON state)	MPU_L2	PM_MPU_PWRSTCTRL[19:18] MPU_L2_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	MPU_RAM	PM_MPU_PWRSTCTRL[21:20] MPU_RAM_ONSTATE	Read only
Power Domain – State Transition Control		PM_MPU_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-369 lists the status of the power modes for the power domain.

Table 3-369. PD_MPU Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_MPU_PWRSTST[25:24] LASTPOWERSTATEENTERED

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-369. PD_MPU Power Mode Status Parameters (continued)

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	MPU_L2	PM_MPU_PWRSTST[7:6] MPU_L2_STATEST
Memory Area – State Status	MPU_RAM	PM_MPU_PWRSTST[9:8] MPU_RAM_STATEST
Power Domain – State Transition Status		PM_MPU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_MPU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_MPU_PWRSTST[1:0] POWERSTATEST

3.7.5.1.3 Power State Override

The PRCM module controls the power state of the MPU subsystem, whereas the PRCM_MPU controls the power state of each CPU (CPU0 and CPU1). The MPU subsystem requires that the MPU power domain can transition only to a low-power mode when CPU0 and CPU1 are in a lower power mode than is specified in the PM_MPU_PWRSTCTRL register. The power mode of the CPUs is communicated to the PRCM module by the PRCM_MPU through two dedicated internal signals. These two signals specify the lowest power state that the MPU can enter and, if necessary, override the low-power state programmed in the PM_MPU_PWRSTCTRL register.

Table 3-370 lists the low-power modes allowed by the MPU.

Table 3-370. MPU Allowed Low-Power Mode

MPU Allowed Low-Power Mode	Comment
CSWRET	CPUs are in SR3-APG mode and L1$ is in RETENTION state.
INACTIVE	CPUs are in SR3-APG mode and L1$ is in ON state, or CPUs are in INACTIVE state.
ON	CPUs are in ON state.

If PM_MPU_PWRSTCTRL is programmed to a lower power state than allowed (specified by the two signals), then it is overwritten by the hardware. The valued of the PM_MPU_PWRSTCTRL register is not changed (that is, not overwritten).

3.7.6 PD_IPU Description

PD_IPU contains the following reset domains:

- IPU1_PWRON_RST
- IPU1_RST
- IPU1_RET_RST
- IPU_RST
- IPU_RET_RST
- IPU1_CPU0_RST
- IPU1_CPU1_RST

PD_IPU contains the CD_IPU and CD_IPU1 clock domain.

Table 3-371 lists the logic retention capability for each module of the power domain.

Table 3-371. PD_IPU Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
IPU1	Partial	RM_IPU1_IPU1_CONTEXT[0] LOSTCONTEXT_DFF	RM_IPU1_IPU1_CONTEXT[1] LOSTCONTEXT_RFF
McASP1	No	RM_IPU_MCASP1_CONTEXT[0] LOSTCONTEXT_DFF	None

Table 3-371. PD_IPU Module Power Attributes (continued)

Module	Logic Retention	DFF Context Status	RFF Context Status
TIMER5	No	RM_IPU_TIMER5_CONTEXT[0] LOSTCONTEXT_DFF	None
TIMER6	No	RM_IPU_TIMER6_CONTEXT[0] LOSTCONTEXT_DFF	None
TIMER7	No	RM_IPU_TIMER7_CONTEXT[0] LOSTCONTEXT_DFF	None
TIMER8	No	RM_IPU_TIMER8_CONTEXT[0] LOSTCONTEXT_DFF	None
UART6	Full	None	RM_IPU_UART6_CONTEXT[1] LOSTCONTEXT_RFF
I2C5	No	RM_IPU_I2C5_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.6.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.6.1.1 Logic and Memory Area Power Modes

Table 3-372 lists the power modes supported by the logic area of the power domain.

Table 3-372. PD_IPU Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-373 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-373. PD_IPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
AESSMEM		ON	OFF or RETENTION	
	IPU1 – IPU_L2RAM_MEM	always_on	software_control	
PERIPHMEM		ON	OFF or RETENTION	
	IPU1 - IPU_UNICACHE_MEM	always_on	always_retention	
	UART6 - UART_MEM	always_on	always_retention	

3.7.6.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-374 lists the power mode controls for the power domain.

Table 3-374. PD_IPU Power Modes Control Parameters

3.7.8 PD_L4PER Description

Programmable Real-Time Unit and Industrial Communication Subsystems (PRU-ICSS) is not supported in this family of devices.

PD_L4PER contains the following reset domains:

- L4PER_PWRON_RET_RST
- L4PER_RET_RST
- L4PER_RST
- PRUSS1_RST

PD_L4PER contains the CD_L4PER1, CD_L4PER2, CD_L4PER3, CD_L4SEC clock domains.

Table 3-381 lists the logic retention capability for each module of the power domain.

Table 3-381. PD_L4PER Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
AES1	Full	None	None
AES2	Full	None	None
DCAN2	No	RM_L4PER2_DCAN2_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.8.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.8.1.1 Logic and Memory Area Power Modes

Table 3-382 lists the power modes supported by the logic area of the power domain.

Table 3-382. PD_L4PER Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available	Available

Table 3-383 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-383. PD_L4PER Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
NONRETAINED_ BANK		ON	OFF	OFF
	MMC3 - MMC_RAM	always_on	always_off	
	MMC4 – MMC_RAM	always_on	always_off	
	FPKA – pka_mem	always_on	always_off	
RETAINED_BANK		ON	RETENTION	OFF
	DCAN2 – DCAN_MEM	always_on	always_retention	

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-383. PD_L4PER Memory Area Power Modes (continued)

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
	DMA_CRYPTO – DMA_CRYPTO_MEM	always_on	always_retention	
	UART1 – UART_MEM	always_on	always_retention	
	UART2 – UART_MEM	always_on	always_retention	
	UART3 – UART_MEM	always_on	always_retention	
	UART4 – UART_MEM	always_on	always_retention	
	UART5 – UART_MEM	always_on	always_retention	
	UART7 – UART_MEM	always_on	always_retention	
	UART8 – UART_MEM	always_on	always_retention	
	UART9 – UART_MEM	always_on	always_retention	
	PRU-ICSS1 – imem3	always_on	always_off	

3.7.8.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-384 lists the power modes controls for the power domain.

Table 3-384. PD_L4PER Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	RETAINED_BANK	PM_L4PER_PWRSTCTRL[8] RETAINED_BANK_RETSTATE	Read only
Memory Area – State Control (logic in RETENTION state)	NONRETAINED_BANK	PM_L4PER_PWRSTCTRL[9] NONRETAINED_BANK_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_L4PER_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – RETENTION State Control		PM_L4PER_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Memory Area – State Control (logic in ON state)	RETAINED_BANK	PM_L4PER_PWRSTCTRL[17:16] RETAINED_BANK_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	NONRETAINED_BANK	PM_L4PER_PWRSTCTRL[19:18] NONRETAINED_BANK_ONSTATE	Read only
Power Domain – State Transition Control		PM_L4PER_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-385 lists the status of the power modes for the power domain.

Table 3-385. PD_L4PER Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_L4PER_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	RETAINED_BANK	PM_L4PER_PWRSTST[5:4] RETAINED_BANK_STATEST
Memory Area – State Status	L3INIT_BANK2	PM_L4PER_PWRSTST[7:6] NONRETAINED_BANK_STATEST
Power Domain – State Transition Status		PM_L4PER_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_L4PER_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_L4PER_PWRSTST[1:0] POWERSTATEST

3.7.9 PD_IVA Description

PD_IVA contains the following reset domains:

- IVA_PWRON_RST
- IVA_RST
- IVA_SEQ1_RST
- IVA_SEQ2_RST

PD_IVA contains the CD_IVA clock domain.

Table 3-386 lists the logic retention capability for each module of the power domain.

Table 3-386. PD_IVA Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
IVA	No	RM_IVA_IVA_CONTEXT[0] LOSTCONTEXT_DFF	None
SL2	No	RM_IVA_SL2_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.9.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.9.1.1 Logic and Memory Area Power Modes

Table 3-387 lists the power modes supported by the logic area of the power domain.

Table 3-387. PD_IVA Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Available	Available

Table 3-388 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-388. PD_IVA Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
HWA_MEM		ON	OFF	OFF
	IVA – HWA_MEM	always_on	always_off	
SL2_MEM		ON	OFF or RETENTION	OFF
	SL2 – SL2MEM	always_on	software_control	
TCM_1_MEM		ON	OFF or RETENTION	OFF
	IVA – TCM_1	always_on	software_control	
TCM_2_MEM		ON	OFF or RETENTION	OFF
	IVA – TCM_2	always_on	software_control	

3.7.9.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-389 lists the power mode controls for the power domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-389. PD_IVA Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	SL2_MEM	PM_IVA_PWRSTCTRL[9] SL2_MEM_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	HWA_MEM	PM_IVA_PWRSTCTRL[8] HWA_MEM_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_IVA_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	TCM_2_MEM	PM_IVA_PWRSTCTRL[23:22] TCM2_MEM_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	TCM_1_MEM	PM_IVA_PWRSTCTRL[21:20] TCM1_MEM_ONSTATE	Read only
Logic Area – Retention State Control		PM_IVA_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area – State Control (logic in ON state)	SL2_MEM	PM_IVA_PWRSTCTRL[19:18] SL2_MEM_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	HWA_MEM	PM_IVA_PWRSTCTRL[17:16] HWA_MEM_ONSTATE	Read only
Memory Area – State Control (logic in RETENTION state)	TCM_2_MEM	PM_IVA_PWRSTCTRL[11] TCM2_MEM_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	TCM_1_MEM	PM_IVA_PWRSTCTRL[10] TCM1_MEM_RETSTATE	Read/write
Power Domain – State Transition Control		PM_IVA_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-390 lists the status of the power modes for the power domain.

Table 3-390. PD_IVA Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_IVA_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	TCM_1_MEM	PM_IVA_PWRSTST[9:8] TCM1_MEM_STATEST
Memory Area – State Status	TCM_2_MEM	PM_IVA_PWRSTST[11:10] TCM2_MEM_STATEST
Memory Area – State Status	SL2_MEM	PM_IVA_PWRSTST[7:6] SL2_MEM_STATEST
Memory Area – State Status	HWA_MEM	PM_IVA_PWRSTST[5:4] HWA_MEM_STATEST
Power Domain – State Transition Status		PM_IVA_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_IVA_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_IVA_PWRSTST[1:0] POWERSTATEST

3.7.10 PD_GPU Description

PD_GPU contains the GPU_RST reset domain.

PD_GPU contains the CD_GPU clock domain.

Table 3-391 lists the logic retention capability for each module of the power domain.

Table 3-391. PD_GPU Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
GPU	No	RM_GPU_GPU_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.10.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.10.1.1 Logic and Memory Area Power Modes

Table 3-392 lists the power modes supported by the logic area of the power domain.

Table 3-392. PD_GPU Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Available	Available

Table 3-393 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-393. PD_GPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
GPU_MEM		ON		OFF
	GPU – GPU_MEM	always_on	always_off	

3.7.10.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-394 lists the power mode controls for the power domain.

Table 3-394. PD_GPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_GPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	GPU_MEM	PM_GPU_PWRSTCTRL[17:16] GPU_MEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_GPU_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-395 lists the status of the power modes for the power domain.

Table 3-395. PD_GPU Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	GPU_MEM	PM_GPU_PWRSTST[5:4] GPU_MEM_STATEST
Power Domain – Last Power State Entered Status		PM_GPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_GPU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_GPU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_GPU_PWRSTST[1:0] POWERSTATEST

3.7.11 PD_EMU Description

PD_EMU contains the following reset domains:

- EMU_EARLY_PWRON_RST
- EMU_PWRON_RST
- EMU_RST

PD_EMU contains the CD_EMU clock domain.

Table 3-396 lists the logic retention capability for each module of the power domain.

Table 3-396. PD_EMU Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DEBUGSS logic	No	RM_EMU_DEBUGSS_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.11.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.11.1.1 Logic and Memory Area Power Modes

Table 3-397 lists the power modes supported by the logic area of the power domain.

Table 3-397. PD_EMU Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Available	Available

Table 3-398 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-398. PD_EMU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
EMU_BANK		ON		OFF
	DEBUGSS – DebugSS_MEM	always_on	always_off	

3.7.11.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-399 lists the power modes controls for the power domain.

Table 3-399. PD_EMU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (logic in ON state)	EMU_BANK	PM_EMU_PWRSTCTRL[17:16] EMU_BANK_ONSTATE	Read only
Power Domain - State Transition Control		PM_EMU_PWRSTCTRL[1:0] POWERSTATE	Read only

Table 3-400 lists the status of the power modes for the power domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-400. PD_EMU Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	EMU_BANK	PM_EMU_PWRSTST[5:4] EMU_BANK_STATEST
Power Domain – Last Power State Entered Status		PM_EMU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_EMU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_EMU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_EMU_PWRSTST[1:0] POWERSTATEST

3.7.12 PD_DSS Description

PD_DSS contains the following reset domains:

- DSS_RET_RST
- DSS_RST

PD_DSS contains the CD_DSS clock domain.

Table 3-401 lists the logic retention capability for each module of the power domain.

Table 3-401. PD_DSS Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSS	Partial	RM_DSS_DSS_CONTEXT[0] LOSTCONTEXT_DFF	RM_DSS_DSS_CONTEXT[1] LOSTCONTEXT_RFF
BB2D	None	RM_DSS_BB2D_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.12.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.12.1.1 Logic and Memory Area Power Modes

Table 3-402 lists the power modes supported by the logic area of the power domain.

Table 3-402. PD_DSS Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-403 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-403. PD_DSS Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
DSS_MEM		ON	OFF	OFF
	DSS – DSSMEM	always_on	always_off	
	BB2D - BB2D_MEM	always_on	always_off

3.7.12.1.2 Logic and Memory Area Power Mode Control and Status

Table 3-404 lists the power modes controls for the power domain.

Table 3-404. PD_DSS Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	DSS_MEM	PM_DSS_PWRSTCTRL[8] DSS_MEM_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_DSS_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – RETENTION State Control		PM_DSS_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area – State Control (logic in ON state)	DSS_MEM	PM_DSS_PWRSTCTRL[17:16] DSS_MEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_DSS_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-405 lists the status of the power modes for the power domain.

Table 3-405. PD_DSS Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	DSS_MEM	PM_DSS_PWRSTST[5:4] DSS_MEM_STATEST
Power Domain – Last Low Power State Entered Status		PM_DSS_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_DSS_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_DSS_PWRSTST[2] LOGICSTATEST
Power Domain – Current Power State Status		PM_DSS_PWRSTST[1:0] POWERSTATEST

3.7.13 PD_CORE Description

PD_CORE contains the following reset domains:

- CM_CORE_PWRON_RET_RST
- CM_CORE_RET_RST
- CORE_PWRON_RET_RST
- CORE_PWRON_RST
- CORE_RET_RST
- CORE_RST
- DLL_RST
- IPU2_PWRON_RST
- IPU2_RET_RST
- IPU2_CPU0_RST
- IPU2_CPU1_RST
- IPU2_RST
- DMA_RET_RST

PD_CORE contains the following clock domains:

- CD_DMA
- CD_IPU2
- CD_EMIF
- CD_L3_MAIN1

Copyright © 2015–2020, Texas Instruments Incorporated

- CD_L3_INSTR
- CD_L4_CFG

Table 3-406 lists the logic retention capability for each module of the power domain.

Table 3-406. PD_CORE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CONTROL_MODULE_CORE	Full	None	None
CONTROL_MODULE_BANDGAP	No	None	None
CM_CORE	Full	None	None
DLL	No	RM_EMIF_EMIF_DLL_CONTEXT[0] LOSTCONTEXT_DFF	None
DLL_AGING	No	None	None

3.7.13.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.13.1.1 Logic and Memory Area Power Modes

Table 3-407 lists the power modes supported by the logic area of the power domain.

Table 3-407. PD_CORE Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available	Available

Table 3-408 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-408. PD_CORE Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
CORE_NRET_BANK		ON	OFF	
	DMM – DMM_MEMBANK1	always_on	always_retention	
	OCP_WP_NOC – OCPWP_BANK	always_on	always_off	
CORE_OCMRAM		ON	RETENTION	
	OCMC_RAM1 – OCMC_RAM_Bank1	always_on	always_retention	
	OCMC_RAM2 – OCMC_RAM_Bank1	always_on	always_retention	
	OCMC_RAM3 – OCMC_RAM_Bank1	always_on	always_retention	
CORE_OTHER_BANK		ON	RETENTION	
	DMA_SYSTEM – DMA_MEM	always_on	always_retention	
	DMM – DMM_MEMBANK2	always_on	always_off	
	TPCC – TPCC_MEM	software_control	software_control	
	TPTC1 – TPTC_MEM	software_control	software_control	
	TPTC2 – TPTC_MEM	software_control	software_control	
IPU_L2RAM		ON	OFF or RETENTION	
	IPU2 – IPU_L2RAM_MEM	always_on	software_control	
IPU_UNICACHE		ON	OFF or RETENTION	
	IPU2 – IPU_UNICACHE_mem	always_on	software_control	

3.7.13.1.2 Logic and Memory Area Power Mode Control and Status

Table 3-409 lists the power mode controls for the power domain.

Table 3-409. PD_CORE Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (Logic in RETENTION state)	CORE_OCMRAM	PM_CORE_PWRSTCTRL[9] CORE_OCMRAM_RETSTATE	Read only
Memory Area – State Control (Logic in RETENTION state)	CORE_OTHER_BANK	PM_CORE_PWRSTCTRL[8] CORE_OTHER_BANK_RETSTATE	Read only
Memory Area – State Control (Logic in ON state)	CORE_NRET_BANK	PM_CORE_PWRSTCTRL[25:24] OCP_NRET_BANK_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	IPU_UNICACHE	PM_CORE_PWRSTCTRL[23:22] IPU_UNICACHE_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	IPU_L2RAM	PM_CORE_PWRSTCTRL[21:20] IPU_L2RAM_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	CORE_OCMRAM	PM_CORE_PWRSTCTRL[19:18] CORE_OCMRAM_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	CORE_OTHER_BANK	PM_CORE_PWRSTCTRL[17:16] CORE_OTHER_BANK_ONSTATE	Read only
Memory Area – State Control (Logic in RETENTION state)	CORE_NRET_BANK	PM_CORE_PWRSTCTRL[12] OCP_NRET_BANK_RETSTATE	Read only
Memory Area – State Control (Logic in RETENTION state)	IPU_UNICACHE	PM_CORE_PWRSTCTRL[11] IPU_UNICACHE_RETSTATE	Read/write
Memory Area – State Control (Logic in RETENTION state)	IPU_L2RAM	PM_CORE_PWRSTCTRL[10] IPU_L2RAM_RETSTATE	Read/write

Table 3-409. PD_CORE Power Modes Control Parameters (continued)

Parameter Name	Memory Bank	Control Bit Field	Access Type
Logic Area – RETENTION State Control	N/A	PM_CORE_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Power Domain – Low-Power State Change Control	N/A	PM_CORE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Power Domain – State Transition Control	N/A	PM_CORE_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-410 lists the status of the power modes for the power domain.

Table 3-410. PD_CORE Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_CORE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	IPU_L2RAM	PM_CORE_PWRSTST[9:8] IPU_L2RAM_STATEST
Memory Area – State Status	CORE_OCMRAM	PM_CORE_PWRSTST[7:6] CORE_OCMRAM_STATEST
Memory Area – State Status	CORE_OTHER_BANK	PM_CORE_PWRSTST[5:4] CORE_OTHER_BANK_STATEST
Memory Area – State Status	CORE_NRET_BANK	PM_CORE_PWRSTST[13:12] OCP_NRET_BANK_STATEST
Memory Area – State Status	IPU_UNICACHE	PM_CORE_PWRSTST[11:10] IPU_UNICACHE_STATEST
Logic Area – State Status		PM_CORE_PWRSTST[2] LOGICSTATEST
Power Domain – State Transition Status		PM_CORE_PWRSTST[20] INTRANSITION
Power Domain – State Status		PM_CORE_PWRSTST[1:0] POWERSTATEST

3.7.14 PD_CAM Description

PD_CAM contains the CAM_RST reset domain.

PD_CAM contains the CD_CAM clock domain.

Table 3-411 lists the logic retention capability for each module of the power domain.

Table 3-411. PD_CAM Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
VIP1	No	RM_CAM_VIP1_CONTEXT[0] LOSTCONTEXT_DFF	None
VIP2	No	RM_CAM_VIP2_CONTEXT[0] LOSTCONTEXT_DFF	None
VIP3	No	RM_CAM_VIP3_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.14.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.14.1.1 Logic and Memory Area Power Modes

Table 3-412 lists the power modes supported by the logic area of the power domain.

Table 3-412. PD_CAM Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Available	Available

Table 3-413 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-413. PD_CAM Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
VIP_BANK		ON		OFF
	VIP1 – VIP_MEM	always_on	always_retention	
	VIP2 – VIP_MEM	always_on	always_retention	
	VIP3 – VIP_MEM	always_on	always_retention	

3.7.14.1.2 Logic and Memory Area Power Mode Control and Status

Table 3-414 lists the power mode controls for the power domain.

Table 3-414. PD_CAM Power Mode Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_CAM_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (Logic in ON state)	VIP_BANK	PM_CAM_PWRSTCTRL[17:16] VIP_BANK_ONSTATE	Read only
Power Domain – State Transition Control		PM_CAM_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-415 lists the status of the power modes for the power domain.

Table 3-415. PD_CAM Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	VIP_BANK	PM_CAM_PWRSTST[5:4] VIP_BANK_STATEST
Power Domain – Last Power State Entered Status		PM_CAM_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_CAM_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_CAM_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_CAM_PWRSTST[1:0] POWERSTATEST

3.7.15 PD_MPUAON Description

PD_MPUAON contains the following reset domains:

- MPUON_RST
- DPLL_MPU_PWRON_RST

PD_MPUAON has no associated clock domains.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-416 lists the logic retention capability for each module of the power domain.

Table 3-416. PD_MPUAON Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_MPU	No	None	None

3.7.15.1 Power Domain Modes

The PD_MPUAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD_MPUAON power domain has no memory banks.

3.7.16 PD_MMAON Description

PD_MMAON contains the following reset domains:

- MMAON_RST
- DPLL_DSP_PWRON_RST
- DPLL_EVE_PWRON_RST

PD_MMAON has no associated clock domains.

Table 3-417 lists the logic retention capability for each module of the power domain.

Table 3-417. PD_MMAON Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_DSP	No	None	None
DPLL_EVE	No	None	None

3.7.16.1 Power Domain Modes

The PD_MMAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD_MMAON power domain has no memory banks.

3.7.17 PD_COREAON Description

PD_COREAON contains the following reset domains:

- CM_CORE_AON_PWRON_RST
- CM_CORE_AON_RST
- COREAON_PWRON_RST
- COREAON_RST
- DPLL_IVA_PWRON_RST

PD_COREAON contains the CD_COREAON_L4 clock domain.

Table 3-418 lists the logic retention capability for each module of the power domain.

Table 3-418. PD_COREAON Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CM_CORE_AON	No	None	None
DPLL_ABE	No	None	None
DPLL_CORE	No	None	None
DPLL_PER	No	None	None

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-418. PD_COREAON Module Power Attributes (continued)

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_DDR	No	None	None
DPLL_GMAC	No	None	None
DPLL_GPU	No	None	None
DPLL_IVA	No	None	None
DPLL_PCIE_REF	No	None	None
APLL_PCIE	No	None	None
DPLL_USB	No	None	None
WUGEN_IPU	No	None	None
WUGEN_DMA_SYSTEM	No	None	None
SPINNER	No	None	None

3.7.17.1 Power Domain Modes

The PD_COREAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD_COREAON power domain has no memory banks.

3.7.18 PD_VPE Description

PD_VPE contains the following reset domains:

- VPE_RST

PD_VPE contains the CD_VPE clock domain.

Table 3-419 lists the logic retention capability for each module of the power domain.

Table 3-419. PD_VPE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
VPE	No	RM_VPE_VPE_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.18.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.18.1.1 Logic and Memory Area Power Modes

Table 3-420 lists the power modes supported by the logic area of the power domain.

Table 3-420. PD_VPE Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available

Table 3-421 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-421. PD_VPE Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
VPE_BANK		ON	OFF or RETENTION	OFF
	VPE – VPE_MEM	always_on	always_retention	

3.7.18.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-422 lists the power mode controls for the power domain.

Table 3-422. PD_VPE Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (Logic in ON state)	VPE_BANK	PM_VPE_PWRSTCTRL[17:16] VPE_BANK_ONSTATE	Read only
Memory Area – State Control (logic in RETENTION state)	VPE_BANK	PM_VPE_PWRSTCTRL[8] VPE_BANK_RETSTATE	Read/write
Power Domain – Low-Power State Change Control		PM_VPE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – Retention State Control		PM_VPE_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Power Domain – State Transition Control		PM_VPE_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-423 lists the status of the power modes for the power domain.

Table 3-423. PD_VPE Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_VPE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	VPE_BANK	PM_VPE_PWRSTST[5:4] VPE_BANK_STATEST
Power Domain – State Transition Status		PM_VPE_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_VPE_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_VPE_PWRSTST[1:0] POWERSTATEST

3.7.19 PD_EVE1 Description

PD_EVE1 contains the following reset domains:

- EVE1_CPU_RST
- EVE1_PWRON_RST
- EVE1_RST

PD_EVE1 contains the CD_EVE1 clock domain.

Table 3-424 lists the logic retention capability for each module of the power domain.

Table 3-424. PD_EVE1 Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
EVE1	No	RM_EVE1_EVE1_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.19.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.19.1.1 Logic and Memory Area Power Modes

Table 3-425 lists the power modes supported by the logic area of the power domain.

Table 3-425. PD_EVE1 Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-426 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-426. PD_EVE1 Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
EVE1_BANK		ON	OFF or RETENTION	OFF
	EVE1 – EVE_BANK	always_on	always_off	

3.7.19.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-427 lists the power mode controls for the power domain.

Table 3-427. PD_EVE1 Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (Logic in ON state)	EVE1_BANK	PM_EVE1_PWRSTCTRL[17:16] EVE1_BANK_ONSTATE	Read only
Power Domain – Low-Power State Change Control		PM_EVE1_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Power Domain – State Transition Control		PM_EVE1_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-428 lists the status of the power modes for the power domain.

Table 3-428. PD_EVE1 Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_EVE1_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	EVE1_BANK	PM_EVE1_PWRSTST[5:4] EVE1_BANK_STATEST
Power Domain – State Transition Status		PM_EVE1_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_EVE1_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_EVE1_PWRSTST[1:0] POWERSTATEST

Copyright © 2015–2020, Texas Instruments Incorporated

3.7.20 PD_EVE2 Description

PD_EVE2 contains the following reset domains:

- EVE2_CPU_RST
- EVE2_PWRON_RST
- EVE2_RST

PD_EVE2 contains the CD_EVE2 clock domain.

Table 3-429 lists the logic retention capability for each module of the power domain.

Table 3-429. PD_EVE2 Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
EVE2	No	RM_EVE2_EVE2_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.20.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.20.1.1 Logic and Memory Area Power Modes

Table 3-430 lists the power modes supported by the logic area of the power domain.

Table 3-430. PD_EVE2 Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-431 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-431. PD_EVE2 Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
EVE2_BANK		ON	OFF or RETENTION	OFF
	EVE2 – EVE_BANK	always_on	always_off	

3.7.20.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-432 lists the power mode controls for the power domain.

Table 3-432. PD_EVE2 Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (Logic in ON state)	EVE2_BANK	PM_EVE2_PWRSTCTRL[17:16] EVE2_BANK_ONSTATE	Read only
Power Domain – Low-Power State Change Control		PM_EVE2_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Power Domain – State Transition Control		PM_EVE2_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-433 lists the status of the power modes for the power domain.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-433. PD_EVE2 Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_EVE2_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	EVE2_BANK	PM_EVE2_PWRSTST[5:4] EVE2_BANK_STATEST
Power Domain – State Transition Status		PM_EVE2_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_EVE2_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_EVE2_PWRSTST[1:0] POWERSTATEST

3.7.21 PD_EVE3 Description

PD_EVE3 contains the following reset domains:

- EVE3_CPU_RST
- EVE3_PWRON_RST
- EVE3_RST

PD_EVE3 contains the CD_EVE3 clock domain.

Table 3-434 lists the logic retention capability for each module of the power domain.

Table 3-434. PD_EVE3 Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
EVE3	No	RM_EVE3_EVE3_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.21.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.21.1.1 Logic and Memory Area Power Modes

Table 3-435 lists the power modes supported by the logic area of the power domain.

Table 3-435. PD_EVE3 Logic Area Power Modes

Off	Retention-CSWR	On-Inactive	On-Active
Available	N/A	Available	Available

Table 3-436 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-436. PD_EVE3 Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
EVE3_BANK		ON	OFF or RETENTION	OFF
	EVE3 – EVE_BANK	always_on	always_off	

Copyright © 2015–2020, Texas Instruments Incorporated

3.7.21.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-437 lists the power mode controls for the power domain.

Table 3-437. PD_EVE3 Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (Logic in ON state)	EVE3_BANK	PM_EVE3_PWRSTCTRL[17:16] EVE3_BANK_ONSTATE	Read only
Power Domain – Low-Power State Change Control		PM_EVE3_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write

3.8 Voltage-Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

3.8.1 Overview

The voltage-management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see Section 3.1.1.3, *Voltage Management*). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated LDO. The following voltage domains are managed by the PRCM module:

- VDD_CORE_L
- VDD_MPU_L
- VDD_IVAHD_L
- VDD_DSPEVE_L
- VDD_GPU_L
- VDD_RTC_L

NOTE: For the association of the device power supply pin to the power domain, see Table 3-26.

The PRCM module supports the AVS technique on the VDD_MPU_L, VDD_CORE_L, and VDD_IVAHD_L, VDD_DSPEVE_L, VDD_GPU_L, VDD_RTC_L voltage domains.

The PRCM module also supports the ABB technique on the MPU, IVAHD, DSPEVE and GPU voltage domains through the VDD_MPU_ABB, VDD_IVA_ABB, VDD_DSPEVE_ABB and VDD_GPU_ABB biasing voltages.

At boot time, the device is set with all five voltage domains (VDD_MPU_L, VDD_GPU_L, VDD_CORE_L, VDD_DSPEVE_L, VDD_IVAHD_L) at OPP_NOM.

3.8.2 Voltage-Control Architecture

The PRM is split over several blocks that manage the different voltage sources.

- A device PRCM for managing the I/O wake-up control and system clock control sequencing during device sleep and wake-up transitions.
- LDO regulator controllers for ABB management, memory arrays voltage management, and WAKEUP logic.
- BANDGAPs reference voltage sleep control

Figure 3-98 shows the architecture for PRM voltage control. This figure represents an example in which the I^2C interface is used to control the PMIC.

3.8.3 Internal LDOs Control

3.8.3.1 VDD_MPU_L, VDD_CORE_L, and VDD_IVAHD_L, VDD_GPU_L, VDD_DSPEVE_L Control

3.8.3.1.1 Adaptive Voltage Scaling

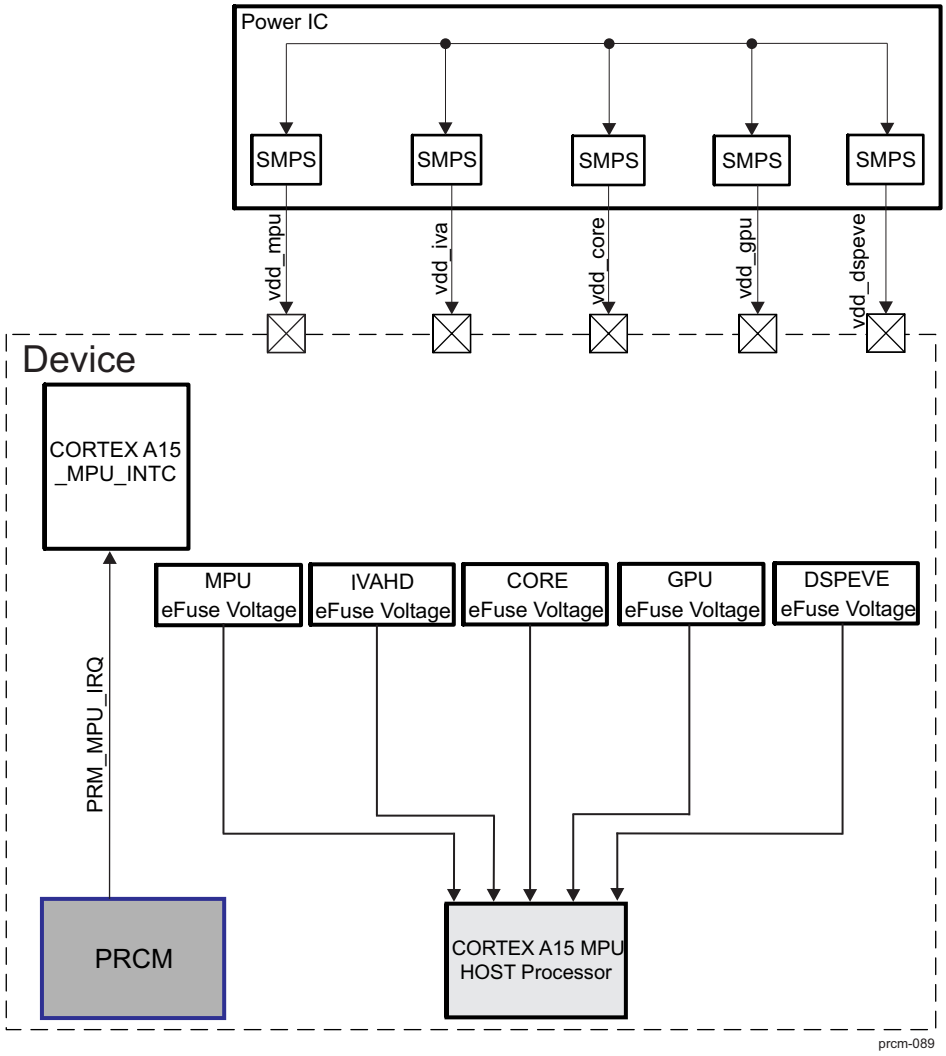
As explained in Section 3.1.2.4, *Adaptive Voltage Scaling*, the SmartReflex technology. With SmartReflex, the power supply voltage can be adapted to the silicon performance statically (for example, adapted to the manufacturing process of a given device).

3.8.3.1.1.1 SmartReflex in the Device

Figure 3-99 shows the SmartReflex integration.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-99. SmartReflex Integration



3.8.3.2 Memory LDOs

Embedded SRAM LDOs are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, on-retention, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic, which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage never to be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on and retention mode:

- On (active) mode: 1.15 V is the normal voltage reference used through all functional OPPs whenever memories must be functional. When logic voltage level VDD_x_L (where x can be MPU, CORE, or IVAHD) becomes higher than the associated memory voltage level VDD_x_M, the LDO operates in tracking mode and follows its respective VDD_x_M or VDD_x_ABB voltage level.
- Retention mode: 0.6 V is set when software allows and when all memory banks belonging to the LDO memory voltage are in RETENTION or OFF state. In this mode, the output voltage is generated from the corresponding VDD_WKUP_L logic voltage source.

, *Memory LDOs Transitions*, describes the state transition conditions and sequences for the memory LDOs.

Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

3.8.3.3 ABB LDOs Control

The ABBLDO supports three voltage modes:

- Bypass mode: In this mode, the ABBLDO_x is bypassed and outputs the VDD_x_L voltages (x refers to the MPU and IVA). This mode is activated when FBB is not required, or when the voltage domain enters low-power mode.
- FBB mode is enabled when the device is a weak process device at the highest OPP.

The PRCM module provides the PRM_ABBLDO_MPU_SETUP and PRM_ABBLDO_GPU_SETUP registers for configuration with the following controls:

- SR2EN: To enable or bypass the ABB power management
- ACTIVE_FBB_SEL: To enable or bypass FBB mode
- SR2_WTCNT_VALUE: LDO settling delay on OPP change. The delay is in the number of system clock cycles.

The PRCM module provides the PRM_ABBLDO_MPU_CTRL and PRM_ABBLDO_GPU_CTRL registers for control:

- OPP_SEL: Current operational OPP
- OPP_CHANGE: Initiate an OPP-based ABBLDO setting change
- SR2_STATUSº: Current mode of operation of ABBLDO
- SR2_IN_TRANSITION: ABBLDO in transition

3.8.3.4 ABB LDO Programming Sequence

Anytime the user enters or leaves one of the ABB required OPPs, the appropriate procedure must be followed to enable or disable the ABB LDO.

3.8.3.4.1 ABB LDO Enable Sequence

The following steps turn on the ABB LDO after the voltage change when entering an OPP that requires ABB (FBB):

1. If set, clear the status of the PRCM interrupt for the ABB LDO transition completion:
   - The PRM_IRQSTATUS_MPU[x] ABB<Voltage_Domain_Name>_DONE_ST bit should be set to 0x1.
2. Based on which ABB voltage mode (Bypass or FBB) is selected for the OPP (single write), configure the ABB transition:
   - To enter in Forward Body Bias (FBB) mode, the user should set the PRM_ABBLDO_<Voltage_Domain_Name>_SETUP[2] ACTIVE_FBB_SEL bit to 0x1.
3. The user should set the PRM_ABBLDO_<Voltage_Domain_Name>_CTRL[2] OPP_ CHANGE bit to 0x0.
4. PRM_ABBLDO_MPU_CTRL[1:0] OPP_SEL bits should be set to 0x1, which select 'Fast' or Forward Body Bias mode.
5. The user should set the ABB voltage value in CTRL_<CORE|WKUP>_LDOVBB_<Voltage_ Domain_Name>_VOLTAGE_CTRL[4:0] LDOVBB<Voltage_Domain_Name>_FBB_VSET_ OUT.
   - To use the override value, set the CTRL_<CORE|WKUP>_LDOVBB_<Voltage_ Domain_Name>_VOLTAGE_CTRL[10] LDOVBB<Voltage_Domain_Name>_FBB_MUX_ CTRL bit to 0x1.
6. To enable the ABB LDO OPP change, set the PRM_ABBLDO_<Voltage_ Domain_Name>_CTRL[2] OPP_CHANGE bit to 0x1.
   - Wait until the transaction is complete: the PRM_IRQSTATUS_MPU[x] ABB_<Voltage_Domain _Name>_DONE_ST bit should be set to 0x1.

Copyright © 2015–2020, Texas Instruments Incorporated

- Clear interrupt status: the PRM_IRQSTATUS_MPU[x] ABB_<Voltage_Domain _Name>_ DONE_ ST bit should be set to 0x0.

3.8.3.4.2 ABB LDO Disable Sequence (Entering in Bypass Mode)

The following steps turn off the ABB LDO after the voltage change when entering an OPP that requires ABB (FBB):

1. If set, clear the status of the PRCM interrupt for the ABB LDO transition completion:
   - The PRM_IRQSTATUS_MPU[x] ABB<Voltage_Domain_Name>_DONE_ST bit should be set to 0x1.
2. Based on which ABB voltage mode (Bypass) is selected for the OPP (single write), configure the ABB transition:
   - To enter in Nominal (Bypass) mode, set the PRM_ABBLDO_<Voltage _Domain_Name>_SETUP[2] ACTIVE_FBB_SEL bit to 0x0.
3. The user should set the PRM_ABBLDO_<Voltage_Domain_Name>_CTRL[2] OPP_ CHANGE bit to 0x0.
4. PRM_ABBLDO_MPU_CTRL[1:0] OPP_SEL bits should be set to 0x0, which select Bypass mode.
5. To enable the ABB LDO OPP change, set the PRM_ABBLDO_<Voltage_ Domain_Name>_CTRL[2]OPP_CHANGE bit to 0x1.
   - Wait until the transaction is complete: the PRM_IRQSTATUS_MPU[x] ABB_<Voltage_Domain _Name>_DONE_ST bit should be set to 0x1.
   - Clear interrupt status: the PRM_IRQSTATUS_MPU[x] ABB_<Voltage_Domain _Name>_DONE_ ST bit should be set to 0x1.
6. The user should set ABB voltage value in CTRL_<CORE|WKUP>_LDOVBB_<Voltage _Domain_Name>_VOLTAGE_CTRL[4:0] LDOVBB<Voltage_Domain_Name>_VSET_OUT to 0x0.

To use the eFuse voltage value, set the CTRL_<CORE|WKUP>_LDOVBB_<Voltage_Domain_Name>_VOLTAGE_CTRL[10] LDOVBB<Voltage_Domain_Name>_FBB_MUX_ CTRL bit to 0x0.

3.8.3.5 BANDGAPs Control

BANDGAPs provides voltage reference for internal LDOs. The PRCM module automatically controls the switching between ON and OFF states of the BANDGAPs, based on the power state of the device. It is completely transparent to user software.

BANDGAPs startup time is 100 µs. The PRM_BANDGAP_SETUP[7:0] STARTUP_COUNT bit field must be set accordingly.

3.8.3.6 Memory LDO Transitions

The transition trigger condition for on-to-retention mode is:

- At least all memory banks associated with the LDO are in RETENTION state.

The transition sequence is:

1. Transition trigger conditions are true (that is, satisfied).
2. Switch LDO reference to:
   - Retention mode value if on-to-retention mode transition
3. Start counter for LDO stabilization.
4. When counter expires, voltage transition is complete.

3.8.3.7 VDD_WKUP_L Transitions

The ON-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY).

Copyright © 2015–2020, Texas Instruments Incorporated

- Clock states: Only the 32K clock is active in CD_WKUPAON.

The SLEEP-to-ON transition trigger conditions are:

- Any device wake-up event other than emulation wake-up event

The EMULATION-to-ON transition trigger conditions are:

- Power domain states: device is in active mode.
- Clock states: any clock other than 32K clock is active in PD_WKUPAON.
- PD_EMU in OFF state.

The EMULATION-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY).
- Clock states: Only the 32K clock is active in CD_WKUPAON.
- PD_EMU in OFF state.

The SLEEP or ON-to-EMULATION transition trigger condition is:

- Any wake-up event on PD_EMU

The transition sequence is:

1. Transition trigger conditions are met.
2. VDD_WKUP_L initiates the transition.
3. Starts a counter for VDD_WKUP_L transition.
4. VDD_WKUP_L transition completes.

3.8.4 DVFS

Dynamic voltage and frequency scaling is a technique that can be used on the logic voltage domains (VDD_MPU_L, VDD_IVAHD_L, VDD_DSPEVE_ L and VDD_GPU_L), independently of one another. Upon a current or predictive performance request, determined by software according to ad hoc algorithms or heuristics, software can configure the PRCM module to change the OPP of a voltage domain. For an increase in performance, the voltage is first raised, and then the frequency is increased. For a decrease in performance, the frequency is first decreased, and then the voltage is dropped.

Copyright © 2015–2020, Texas Instruments Incorporated

3.9 Device Low-Power States

The device low-power states are the result of any valid combination of power domain states in which all the power domains are no longer in ACTIVE state. In such a situation the PRCM module hardware can trigger events to further lower the consumption of the device and the system.

These device low-power states are characterized by the system power consumption, wake-up latency, and required functionality.

The low-power state is:

- "**RTC mode**" : All logic voltage domains (VD_CORE, VD_MPU, VD_GPU, VD_SDRAM, VD_DSPEVE) are into OFF state except for the VD_RTC domain which is ON.

NOTE: The VD_RTC remains always ON regardless of the low power state. RTC_SS is the only wake-up event source in the lowest power mode - "RTC mode".

- "**STANDBY**" : Any combination of logic voltage domain states (SLEEP or RETENTION) other than ACTIVE state.

For more details on the wakeup-sources from the "RTC mode" and the "STANDBY" low-power modes, refer to the Table 3-446.

Once the PRCM module hardware detects any valid combination of power domain states, and if a proper programming model of the PRCM module is set, the PRCM module automatically triggers the transition into the device low-power mode.

3.9.1 Device Wake-Up Source Summary

The wake-up events can be asynchronous or synchronous. Synchronous wake-up events require the 32-kHz clock or the system clock to be active, while asynchronous wake-up events do not require an active clock.

The *Modules Attributes* subsection of each clock domain in Section 3.6, *Clock Management Functional Description*, describes the wake-up capability support for each module of the corresponding power domain.

While the device is in STANDBY mode, additional asynchronous wakeup events from other domains are able to wake up the device.

Table 3-446 identifies which modules in which power domains can be configured to generate a wake-up while the device is in a low-power mode.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-446. Wake-Up Sources During Device Low Power Mode

Device Power Mode name	VD_RTC VOLTAGE STATE	VD_CORE VOLTAGE STATE	VD_MPU VOLTAGE STATE	VD_GPU VOLTAGE STATE	VD_IVAHD VOLTAGE STATE	VD_DSPEVE VOLTAGE STATE	Domain containing wake-up source	Wakeup sources
Really OFF	OFF	OFF	OFF	OFF	OFF	OFF	N/A	Application of Power Supply and Power on Reset Sequence
RTC Mode	ON	OFF	OFF	OFF	OFF	OFF	RTC_SS sends signal to power supply to apply power voltage to all other voltage domains	RTC ("alarm" and "timer" slave wake-up capabilities), EXT_WKUP0, EXT_WKUP1, EXT_WKUP2, EXT_WKUP3
STANDBY		Active Voltage Level					PD_IPU	I2C5 , IPU1 , McASP1, TIMER5, TIMER6, TIMER7, TIMER8, UART6
							PD_CORE	DMA_SYSTEM, IPU2, OCMC_RAM1, OCMC_RAM2, OCMC_RAM3, EDMA_TPCC, EDMA_TPTC1, EDMA_TPTC2

Table 3-446. Wake-Up Sources During Device Low Power Mode (continued)

Device Power Mode name	VD_RTC VOLTAGE STATE	VD_CORE VOLTAGE STATE	VD_MPU VOLTAGE STATE	VD_GPU VOLTAGE STATE	VD_IVAHD VOLTAGE STATE	VD_DSPEVE VOLTAGE STATE	Domain containing wake-up source	Wakeup sources
							PD_EMU	(Debug_logic) Any ForceActive directive Dynanic depedency towards L3_MAIN

3.9.2 Wakeup Upon Global Warm Reset

When global warm reset is the source of the device wakeup, the sequence is modified as follows:

- The PRCM module releases its reset line. In parallel, the device reset manager counts for global reset extension (set up by the PRM_RSTTIME[9:0] RSTTIME1 bit field). The PRCM module holds the other asserted resets until the global reset counter overflows.

The hardware blocks and modifies the CM_SHADOW_FREQ_CONFIG1[0] FREQ_UPDATE and CM_MPU_CLKSTCTRL[1:0] CLKTRCTRL bit fields.

3.9.3 Global Warm Reset During a Device Wake-Up Sequence

If a global warm reset occurs before the PRCM module completes the voltage stabilization count, the global warm reset is applied immediately. As a consequence, the sequence described in Section 3.9.2, *Wakeup Upon Global Warm Reset*, is performed.

If the global warm reset occurs after the PRCM module completes voltage stabilization (during phase 1 of automatic restore):

1. Global warm reset is delayed and applied after phase 1 restore completes.
2. Phase 2 of restore is discarded.
3. MPU boots after the warm reset sequence completes.

If the global warm reset occurs during phase 2 of automatic restore:

1. Global warm reset is applied immediately.
2. Phase 2 of restore is discarded.
3. MPU boots after the warm reset sequence completes.

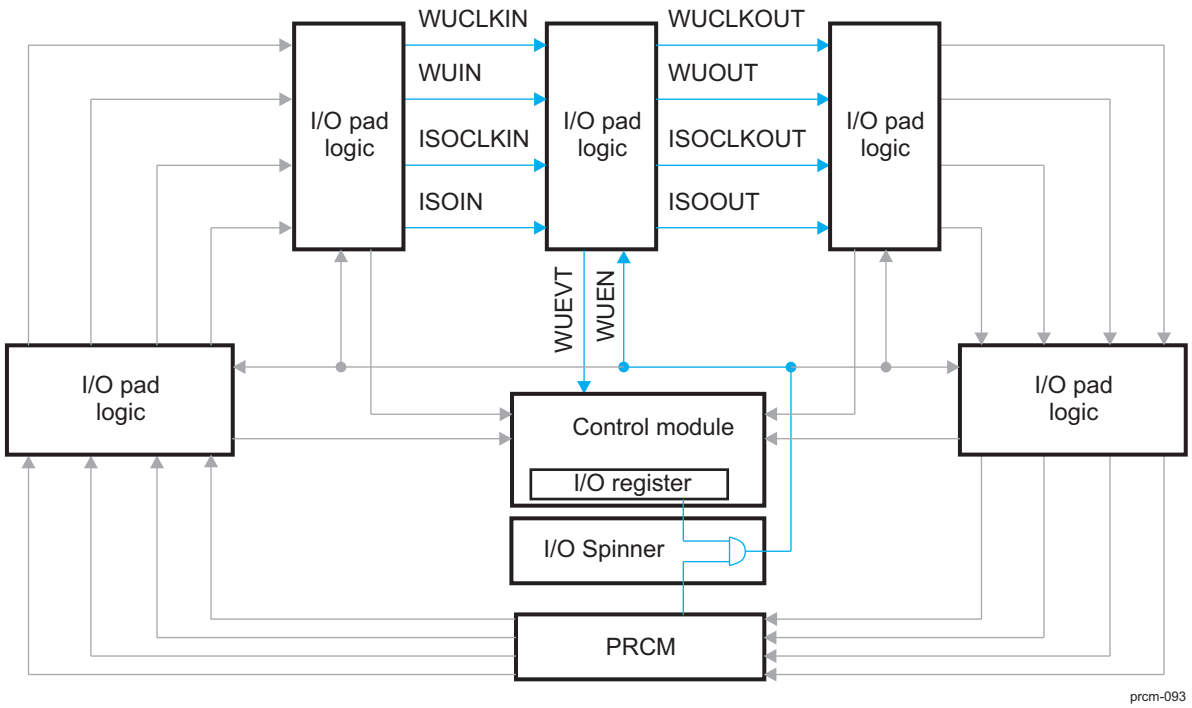
3.9.4 I/O Management

Figure 3-100 is an overview of the power-management modules and their internal connections with a generic power domain.

ISOIN, ISOCLKIN, WUCLKIN, WUIN, ISOOUT, ISOCLKOUT, WUCLKOUT and WUOUT connections are built with daisy chaining approach and are all VDD_WKUP_L level signals driven by PRM. WUEN and WUEVNT are VDD level signals driven by the control module and/or IO control module. ISOOVR and ISOBYPASS (for DDR IO only) are VDD level signals driven by the PRM.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 3-100. I/O Pads Daisy-Chain Configuration



NOTE: ISOBYPASS control from PRM is routed to all the EMIF i/f IOs and ISOOVR control from PRM is routed to all the remaining IOs. These control signals are routed using ALWON VDD buffers. The ISOOVR pin on EMIF IOs is tied to 0 using ALWON tie-off cells. PRM also provides an output status "IO_ISO_ACTIVE" which is set when EMIF IOs are isolated or transitioning between isolation and functional mode, and which is cleared when EMIF IOs are functional.

it is required that the ISOCLKIN is forced to 1 during global power-on reset (PRM_PWRON_RST_n = 0).

3.9.4.1 Isolation / Wakeup Sequence

Enabling Wake-Up Feature:

- Program Control module MMR to assert "WKEN" for each IO (To enable Wakeup feature of IO)
- Write the bit PRM_IO_PMCTRL[8] WUCLK_CTRL to 1 to assert high the signal WUCLKIN.
- Write the bit PRM_IO_PMCTRL[8] WUCLK_CTRL to 0 to assert low the signal WUCLKIN.
- This will latch WKEN, Latch the current pad input value.
- The PRCM register PRM_IO_PMCTRL[9] WUCLK_STATUS logs the signal WUCLK of the last pad of the IO ring.(Should be 0).

Device goes into sleep mode (There is no need to put IO in ISOLATION and hence no need to toggle ISOCLKIN and ISOIN (As core supply is still ON)) :

- WKUP event is generated by one of the IOs
- WUOUT of the last IO is asserted HIGH.
- Because of #9, PRM interrupt is generated towards MPU/Host processor
- MPU/Host processor disables the WUKP feature of each IO and power up the required domains.

DISABLING WKUP feature:

- Write the bit PRM_IO_PMCTRL[8] WUCLK_CTRL to 1 to assert high the signal WUCLKIN.
- Write the bit PRM_IO_PMCTRL[8] WUCLK_CTRL to 0 to assert low the signal WUCLKIN.

Copyright © 2015–2020, Texas Instruments Incorporated

- The PRCM register PRM_IO_PMCTRL[9] WUCLK_STATUS logs the signal WUOUT of the last pad of the IO ring.

3.9.4.1.1 Software-Controlled I/O Isolation

The PRM_IO_PMCTRL[4] ISOOVR_EXTEND bit allows extending the non-EMIF I/O isolation. This feature can be used by software to restore modules driving output, such as GPIO, while non-EMIF I/Os are still isolated. Once software completes the relevant module restore, it clears the bit and hardware performs full-isolation-to-EMIF on the hardware-controlled I/O transition.

The PRM_IO_PMCTRL[5] IO_ON_STATUS bit is available for software to check completion of the EMIF on transition.

3.10 PRCM Module Programming Guide

3.10.1 DPLLs Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the module.

3.10.1.1 Global Initialization

3.10.1.1.1 Surrounding Module Global Initialization

This section identifies the requirements for initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-447 describes the global initialization of the surrounding modules.

Table 3-447. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Ensure that the DPLL reference clock (gated version of system clock) is active.

3.10.1.1.2 DPLL Global Initialization

3.10.1.1.2.1 Main Sequence – DPLL Global Initialization

This procedure initializes the DPLL after a POR or software reset and then locks it to the desired synthesized clock frequency.

Table 3-448. DPLL Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure recalibration parameters.	See Section 3.10.1.1.2.2.	
Set DPLL automatic idle mode.	CM_AUTOIDLE_<DPLL name>[2:0] AUTO_DPLL_MODE	xx(1)
Configure synthesized clock parameters.	See Section 3.10.1.1.2.3.	
Configure output clocks parameters.	See Section 3.10.1.1.2.4.	
Lock DPLL.	CM_CLKMODE_<DPLL name>[2:0] DPLL_EN	0x7

(1) It depends on the desired auto idle mode. See Section 3.6.3.3.4, *DPLL Power Modes*.

3.10.1.1.2.2 Subsequence – Recalibration Parameter Configuration

This procedure enables the recalibration feature and the associated processor interrupt flag.

Table 3-449. DPLL Recalibration Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Clear recalibration interrupt status.	PRM_IRQSTATUS _<Processor name>[x] <DPLL name>_RECAL_ST	0x0
Unmask recalibration interrupt flag.	PRM_IRQENABLE _<Processor name>[x] <DPLL name>_RECAL_EN	0x1
Enable recalibration feature.	CM_CLKMODE_<DPLL name>[8] DPLL_DRIFTGUARD_EN	0x1

3.10.1.1.2.3 Subsequence – Synthesized Clock Parameter Configuration

This procedure configures the settings for the synthesized clock of the DPLL.

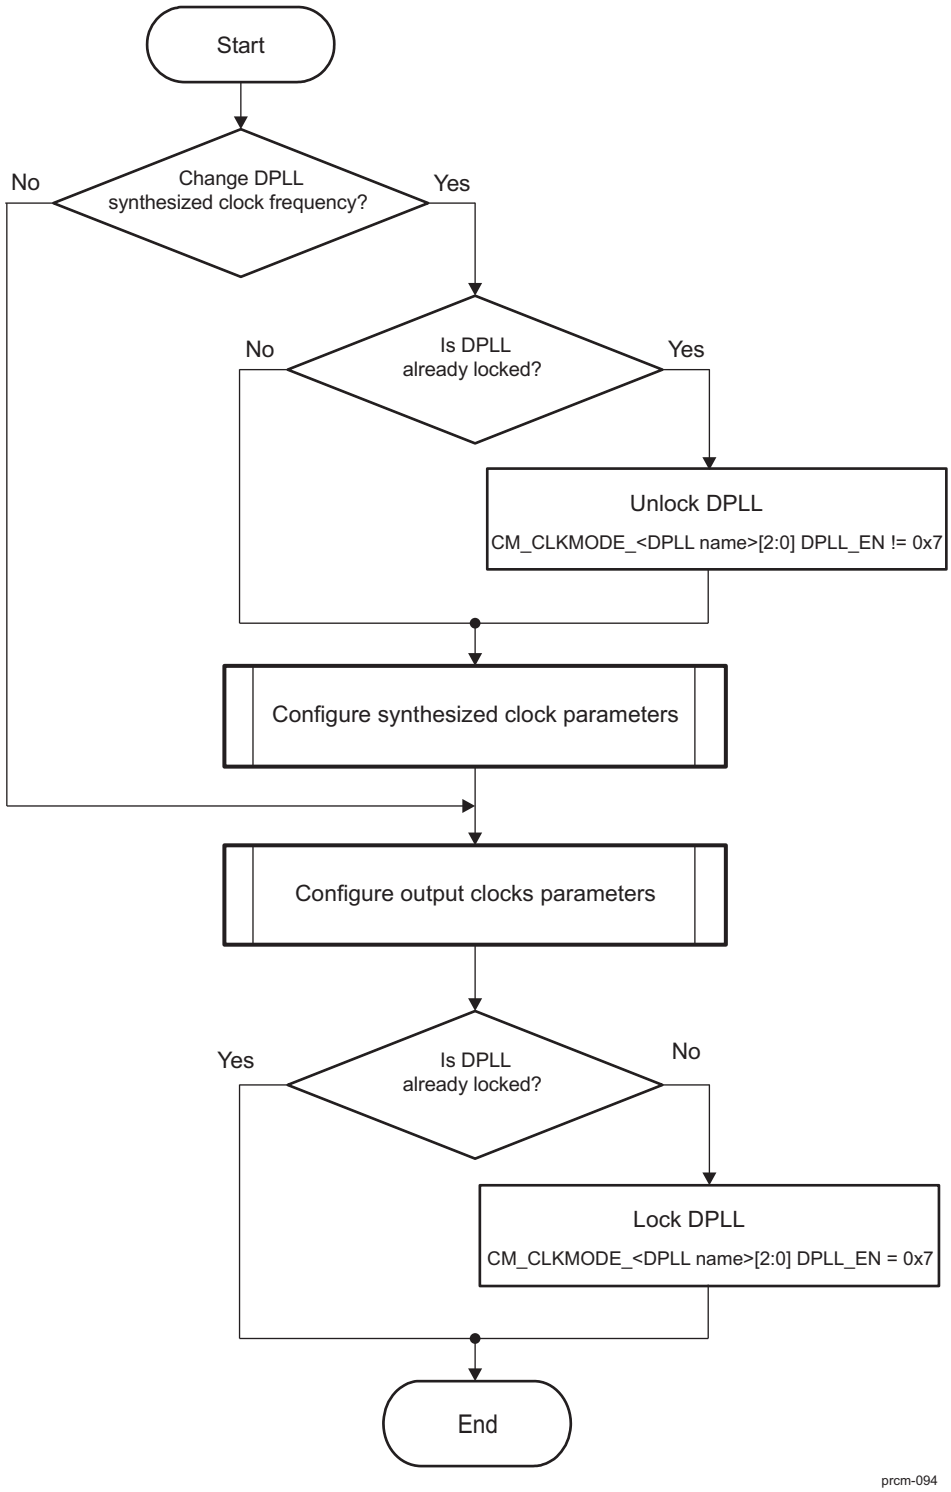
3.10.1.2 DPLL Output Frequency Change

Figure 3-101 shows the DPLL output-frequency change.

Figure 3-101. DPLL Output-Frequency Change



To unlock a DPLL, a mode different from the Lock Mode (0x7) should be programmed in the CM_CLKMODE_<DPLL NAME>[2:0] DPLL_EN bit field. The modes that can be programmed in the DPLL_EN bit field and can unlock the DPLL are:

Copyright © 2015–2020, Texas Instruments Incorporated

- For type A DPLLs: Idle Low Power bypass mode (0x5) and Idle Fast Relock bypass mode (0x6)
- For type B DPLLs: Low Power Stop mode (0x1) and Idle Low Power bypass mode (0x5)

Table 3-452 and Table 3-453 summarize register and subprocess call sequences for DPLL output frequency changes.

Table 3-452. Register Call Summary for Sequence – DPLL Output Frequency Change

Register Name
CM_CLKMODE_DPLL name

Table 3-453. Subprocess Call Summary for Sequence – DPLL Output Frequency Change

Subprocess Name	Cross-Reference
Configure synthesized clock parameters.	See Section 3.10.1.1.2.3.
Configure output clocks parameters.	See Section 3.10.1.1.2.4.

3.10.2 Clock Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the clocks in the device.

3.10.2.1 Global Initialization

3.10.2.1.1 Surrounding Module Global Initialization

This section identifies the requirements for initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-454 describes the global initialization of the surrounding modules.

Table 3-454. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM DPLLs	Ensure that the DPLLS managed by the PRCM module are initialized.

3.10.2.1.2 Clock Management Global Initialization

3.10.2.1.2.1 Main Sequence – Clock Domain Global Initialization

This procedure initializes the clock domain of the device after a POR or software reset.

Table 3-455. Clock Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure module clock-management feature of master modules in the clock domain.	<Module name>_SYSCONFIG[x] MIDLEMODE <Module name>_SYSCONFIG[x] STANDBYMODE	xx(1)
Configure module clock-management feature of slave modules in the clock domain.	See Section 3.10.3.3.	
Enable/disable static sleep dependency with other clock domains (that is, destination clock domains). Not all dependencies are configurable.	CM_<Clock Domain name>_STATICDEP[x] <Destination Clock Domain name>_STATDEP	0x0: Disable 0x1: Enable
Set dynamic dependency window size.	CM_<Clock Domain name>_DYNAMICDEP[27:24] WINDOWSIZE	xx(2)

(1) See the module register for valid modes.
(2) It depends on the desired size of the window. See Section 3.1.1.1.7.2, *Clock Domain Dependency*.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-455. Clock Domain Global Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
Enable/disable module wake-up dependency for the modules of the clock domain. It is available when the module can generate an interrupt or a DMA request to a service provider module (for example, a processor or DMA).	PM_<Clock Domain name>_<Module name>_WKDEP[x] WKUPDEP_<Module name>_<DMA/IRQ reques>t_<DMA/Processor name>	0x0: Disable 0x1: Enable
Set clock domain state transition feature.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	xx(3)

(3) It depends on the desired state of the clock domain. See Table 3-12.

3.10.2.1.2.2 Subsequence – Slave Module Clock-Management Parameters Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-456. Slave Module Clock-Management Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Configure module idle mode feature.	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	xx(1)
IF : Smart-idle mode is selected	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	0x10
Configure module clock requirement feature.	<Module name>_SYSCONFIG[x] CLOCKACTIVITY	x(1)
ENDIF		
Configure module management behavior on the PRCM module side.	CM_<Clock Domain name>_<Module name>_CLKCTRL[1:0] MODULEMODE	xx(2)

(1) See the module register for valid settings.
(2) The selected value depends on the desired clock-management behavior.

3.10.2.2 Clock Domain Sleep Transition and Troubleshooting

This procedure initiates a sleep transition on a clock domain and allows debugging if the transition does not occur.

Table 3-457. Clock Domain Sleep Transition and Troubleshooting

Step	Register/Bit Field/Programming Model	Value
Set clock domain sleep transition state.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	0x1: SW_SLEEP 0x3: HW_AUTO
IF : Clock domain sleep transition not initiated?		
Check that all clock domain master modules are in standby mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[18] STBYST	0x1: Module in standby
Check that all clock domain slave modules are in idle mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[17:16] IDLEST	0x1: In transition 0x2: Interface clock idled 0x3: Module idled
ENDIF		

3.10.2.3 Enable/Disable Software-Programmable Static Dependency

To change the setting of a software-programmable static dependency, use the procedure described in Table 3-458.

Table 3-458. Enable/Disable Software-Programmable Static Dependency

Step	Register/Bit Field/Programming Model	Value
Force destination domain to be awake (SW_WKUP).	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x2

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-458. Enable/Disable Software-Programmable Static Dependency (continued)

Step	Register/Bit Field/Programming Model	Value
Wait until power domain that encloses the destination domain is ON.	PM_<Dest_PDname>_PWRSTST	=0x3
Change the static dependency.	CM_<Src_CDname>_STATICDEP[x] Dest_CDname_STATDEP	0x1
Put destination domain back to automatic transition (HW_AUTO).	CM_<Dest_CDname> _CLKSTCTRL[1:0] CLKTRCTRL	0x3

3.10.3 Power Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and control of the power domain in the device.

3.10.3.1 Global Initialization

3.10.3.1.1 Surrounding Module Global Initialization

Initialization of any surrounding modules within the device is not required. The external power IC and the device clocks should be active.

3.10.3.1.2 Power Management Global Initialization

3.10.3.1.2.1 Main Sequence – Power Domain Global Initialization and Setting

This procedure initializes the power domain of the device after a POR or software reset.

Table 3-459. Power Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure memory area power state when the power domain is on. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x0: OFF 0x1: RETAINED 0x3: ON
Configure memory area power state when the power domain transitions to RETENTION state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_RETSTATE	0x0: OFF 0x1: RETAINED
Configure logic area RETENTION power state when the power domain transitions to RETENTION state.	PM_<Power Domain name>_PWRSTCTRL[2] LOGICRETSTATE	0x1: CSWR
Select target power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x0: OFF 0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE
Wait until power state change is complete.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x0: OFF 0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE

3.10.3.2 Forced Memory Area State Change With Power Domain ON

This procedure initiates a forced memory area state change while the power domain is ON.

Table 3-460. Forced Memory Area State Change With Power Domain ON

Step	Register/Bit Field/Programming Model	Value
Configure memory area target power state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x0: OFF 0x1: RETAINED 0x3: ON

Copyright © 2015–2020, Texas Instruments Incorporated

Table 3-460. Forced Memory Area State Change With Power Domain ON (continued)

Step	Register/Bit Field/Programming Model	Value
Get memory area current state.	PM_<Power Domain name>_PWRSTST[x] <Memory Bank name>_STATEST	0x0: OFF 0x1: RETAINED 0x3: ON

3.10.3.3 Forced Power Domain Low-Power State Transition

Table 3-461. Forced Power Domain Low-Power State Transition

Step	Register/Bit Field/Programming Model	Value
Select target low-power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x0: OFF 0x1: RETENTION
Force power domain low-power state transition.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x1: Force change
Wait until state change is complete.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x0: Change complete
Get current power state.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x0: OFF 0x1: RETENTION

3.11 PRCM Software Configuration for OPP_PLUS

NOTE: For more information about the support of OPP_PLUS, see the "Operating Performance Points" section of the device Data Manual.

NOTE: Contact your TI software support representative for details on OPP_PLUS configuration.

3.12 PRCM Register Manual

Table 3-638. CM_EVE3_EVE3_CLKCTRL

Address Offset	0x0000 0020		
Physical Address	0x4A00 56E0	**Instance**	CM_CORE_AON__EVE3
Description	This register manages the EVE3 clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED													STBYST	IDLEST		RESERVED														MODULEMODE	

Bits	Field Name	Description	Type	Reset
31:19	RESERVED		R	0x0
18	STBYST	Module standby status. [warm reset insensitive]	R	0x1
		0x0: Module is functional (not in standby)		
		0x1: Module is in standby		
17:16	IDLEST	Module idle status. [warm reset insensitive]	R	0x3
		0x0: Module is fully functional, including OCP		
		0x1: Module is performing transition: wakeup, or sleep, or sleep abortion		
		0x2: Module is in Idle mode (only OCP part). It is functional if using separate functional clock		
		0x3: Module is disabled and cannot be accessed		
15:2	RESERVED		R	0x0
1:0	MODULEMODE	Control the way mandatory clocks are managed.	RW	0x0
		0x0: Module is disabled by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).		
		0x1: Module is managed automatically by HW according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CLKTRCTRL=3, any OCP access to module is always granted. Module clocks may be gated according to the clock domain state.

Table 3-685. CM_IPU_UART6_CLKCTRL

Address Offset	0x0000 0080		
Physical Address	0x4A00 5580	**Instance**	CM_CORE_AON__IPU
Description	This register manages the UART6 clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLKSEL	RESERVED							IDLEST	RESERVED													MODULEMODE	

Bits	Field Name	Description	Type	Reset
31:25	RESERVED		R	0x0
24	CLKSEL	Selects functional clock for UART between FUNC_48M_FCLK and FUNC_192M_CLK 0x0: Selects FUNC_48M_FCLK 0x1: Selects FUNC_192M_CLK	RW	0x0
23:18	RESERVED		R	0x0
17:16	IDLEST	Module idle status. [warm reset insensitive] 0x0: Module is fully functional, including OCP 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disabled by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: Reserved 0x2: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guarantied to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: Reserved	RW	0x0

3.12.11.2 CM_CORE_AON__MPU Register Description

Table 3-688. CM_MPU_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4A00 5300	**Instance**	CM_CORE_AON__MPU
Description	This register enables the MPU domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							CLKACTIVITY_MPU_GCLK	RESERVED						CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:9	RESERVED		R	0x0
8	CLKACTIVITY_MPU_GCLK	This field indicates the state of the MPU_DPLL_CLK clock in the domain. [warm reset insensitive] 0x0: Corresponding clock is definitely gated 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0x0
7:2	RESERVED		R	0x0
1:0	CLKTRCTRL	Controls the clock state transition of the MPU clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

3.12.14.2 CM_CORE_AON__RTC Register Description

Table 3-747. CM_RTC_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4A00 5740	**Instance**	CM_CORE_AON__RTC
Description	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																					CLKACTIVITY_RTC_AUX_CLK	RESERVED	CLKACTIVITY_RTC_L4_GICLK	RESERVED							CLKTRCTRL	

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x0
10	CLKACTIVITY_RTC_AUX_CLK	This field indicates the state of the RTC_AUX_CLK in the domain. [warm reset insensitive] 0x0: Corresponding clock is definitely gated 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0x0
9	RESERVED		R	0x0
8	CLKACTIVITY_RTC_L4_GICLK	This field indicates the state of the RTC_L4_GICLK clock in the domain. [warm reset insensitive] 0x0: Corresponding clock is definitely gated 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0x0
7:2	RESERVED		R	0x0
1:0	CLKTRCTRL	Controls the clock state transition of the WKUPAON clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

Table 3-749. CM_RTC_RTCSS_CLKCTRL

Address Offset	0x0000 0004		
Physical Address	0x4A00 5744	**Instance**	CM_CORE_AON__RTC
Description	This register manages the RTC clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED														IDLEST		RESERVED								MODULEMODE							

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:16	IDLEST	Module idle status. [warm reset insensitive] 0x0: Module is fully functional, including OCP 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3: Module is disabled and cannot be accessed	R	0x3

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
15:2	RESERVED		R	0x0
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disabled by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: Reserved 0x2: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guarantied to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: Reserved	RW	0x0

Address Offset	0x0000 0004		
Physical Address	0x4A00 5764	**Instance**	CM_CORE_AON__VPE
Description	This register manages the VPE clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED													STBYST	IDLEST		RESERVED														MODULEMODE	

Bits	Field Name	Description	Type	Reset
31:19	RESERVED		R	0x0
18	STBYST	Module standby status. [warm reset insensitive] 0x0: Module is functional (not in standby) 0x1: Module is in standby	R	0x1
17:16	IDLEST	Module idle status. [warm reset insensitive] 0x0: Module is fully functional, including OCP 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disabled by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: Module is managed automatically by HW according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CLKTRCTRL=3, any OCP access to module is always granted. Module clocks may be gated according to the clock domain state. 0x2: Reserved 0x3: Reserved	RW	0x0

Address Offset	0x0000 010C		
Physical Address	0x4A00 820C	**Instance**	CM_CORE__CKGEN
Description	This register provides controls over the DPLL.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DPLL_SD_DIV								DPLL_BYP_CLKSEL	DCC_EN	DPLL_SELFREQDCO	RESERVED	DPLL_MULT												DPLL_DIV							

Bits	Field Name	Description	Type	Reset
31:24	DPLL_SD_DIV	Sigma-Delta divider select (2-255). This factor must be set by s/w to ensure optimum jitter performance. DPLL_SD_DIV = CEILING ([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250), where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked. 0x0: Reserved 0x1: Reserved	RW	0x4
23	DPLL_BYP_CLKSEL	Allows control of the BYPASS clock of the PLL and the associated HSDIVIDER. Same as ULOWCLKEN on DPLL. In DPLL Locked mode, 0 - No impact 1 - No impact In DPLL Bypass mode, 0 - CLKINP is selected as the BYPASS clock for CLKOUT 1 - CLKINPULOW is selected as the BYPASS clock for CLKOUT	R	0x0
22	DCC_EN	Duty-cycle corrector for high frequency clock 0x0: Duty-cycle corrector is disabled	R	0x0
21	DPLL_SELFREQDCO	select DCO output according to required frequency. 0x0: DCO clock is 1500MHz SELFREQDCO input of DPLL is set to '010' 0x1: DCO clock is 1250MHz SELFREQDCO input of DPLL is set to '100'	RW	0x0
20	RESERVED		R	0x0
19:8	DPLL_MULT	DPLL multiplier factor (2 to 4095). (equal to input M of DPLL; M=2 to 4095 = DPLL multiplies by M). [warm reset insensitive] 0x0: Reserved 0x1: Reserved	RW	0x0
7:0	DPLL_DIV	DPLL divider factor (0 to 255) (equal to input N of DPLL; actual division factor is N+1). [warm reset insensitive]	RW	0x0

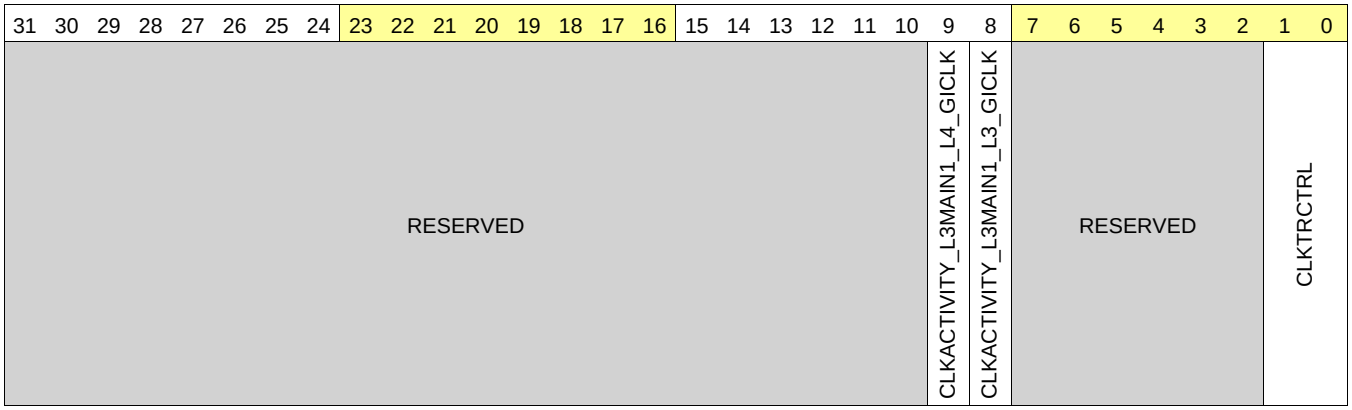
3.12.19.2 CM_CORE__CORE Register Description

Table 3-838. CM_L3MAIN1_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4A00 8700	**Instance**	CM_CORE__CORE
Description	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.		
Type	RW		



Bits	Field Name	Description	Type	Reset
31:10	RESERVED		R	0x0
9	CLKACTIVITY_L3MAIN1_L4_GICLK	This field indicates the state of the L3MAIN1_L4_GICLK clock in the domain. [warm reset insensitive] 0x0: Corresponding clock is definitely gated 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0x0
8	CLKACTIVITY_L3MAIN1_L3_GICLK	This field indicates the state of the L3MAIN1_L3_GICLK clock in the domain. [warm reset insensitive] 0x0: Corresponding clock is definitely gated 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0x0
7:2	RESERVED		R	0x0
1:0	CLKTRCTRL	Controls the clock state transition of the L3MAIN1 clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: Reserved 0x2: Reserved 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

5	L3MAIN1_DYNDEP	Dynamic dependency towards L3MAIN1 clock domain 0x0: Dependency is disabled	R	0x0
4:0	RESERVED		R	0x0

Table 3-971. Register Call Summary for Register CM_IVA_DYNAMICDEP

Clock Management Functional Description
- Clock Domain Dependency: [0]

PRCM Register Manual
- CM_CORE__IVA Register Summary: [1]

Table 3-972. CM_IVA_IVA_CLKCTRL

Address Offset	0x0000 0020		
Physical Address	0x4A00 8F20	**Instance**	CM_CORE__IVA
Description	This register manages the IVA clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED													STBYST	IDLEST		RESERVED														MODULEMODE	

Bits	Field Name	Description	Type	Reset
31:19	RESERVED		R	0x0
18	STBYST	Module standby status. [warm reset insensitive] 0x0: Module is functional (not in standby) 0x1: Module is in standby	R	0x1

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
17:16	IDLEST	Module idle status. [warm reset insensitive] 0x0: Module is fully functional, including OCP 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disabled by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: Module is managed automatically by HW according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CLKTRCTRL=3, any OCP access to module is always granted. Module clocks may be gated according to the clock domain state. 0x2: Reserved 0x3: Reserved	RW	0x0

Table 3-973. Register Call Summary for Register CM_IVA_IVA_CLKCTRL

Reset Management Functional Description • IVA Subsystem Software Warm Reset Sequence: [0][1]
Clock Management Functional Description • Clock Domain Module Attributes: [2][3][4]
