SET — *Set Bit Field Bounded by Two Immediate Values*

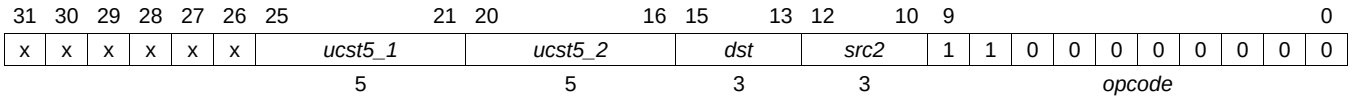
Syntax

SET *ucst5_1, ucst5_2, src2, dst*

Functional unit = L

Opcode

32 bit



Description

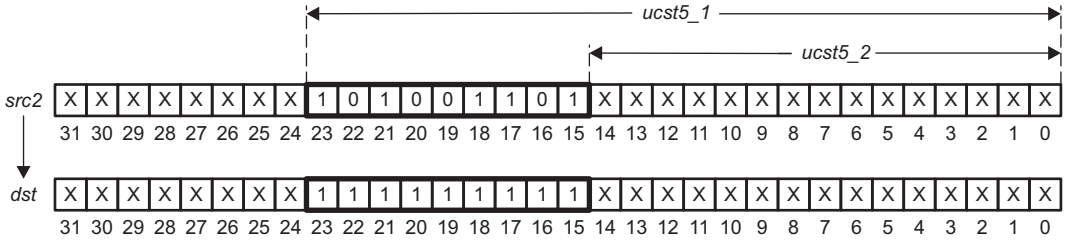
For *ucst5_1* ≥ *ucst5_2*, the field in *src2* as specified by *ucst5_2* to *ucst5_1* is set to all 1s and the resulting value of *src2* is written to *dst*. *src2* is left unchanged. *ucst5_2* is the LSB of the field and *ucst5_1* is the MSB of the field. In other words, *ucst5_2* and *ucst5_1* represent the beginning and ending bits, respectively, of the field to be set to all 1s. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *ucst5_1* and *ucst5_2* are:

- 0 ≤ *ucst5_1* ≤ 31; 0 ≤ *ucst5_2* ≤ 31
- *ucst5_1* ≥ *ucst5_2*

For *ucst5_1* < *ucst5_2*, the result is undefined.

In the following example, *ucst5_2* is 15 and *ucst5_1* is 23.



Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2
for( i = 0; i < 32; i++) {
  if ( i >= ucst5_2 && i <= ucst5_2) dst[i] = 1;
};
```

Copyright © 2015–2020, Texas Instruments Incorporated

SET *Set Bit Field Bounded by Two Register Values*

Syntax

SET *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	13	12	10	9	7	6						0
x	x	x	x	x	x	x	x	x	x	x	1	0	0	0	0	*dst*		*src2*		*src1*		0	0	0	0	1	0	0
																3		3		3					*opcode*			

Description

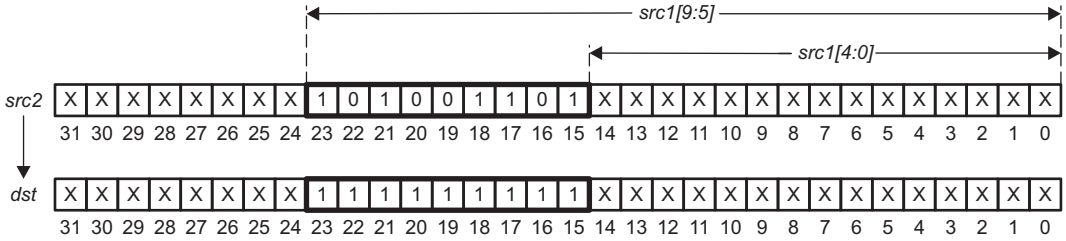
For *src1[9:5]* ≥ *src1[4:0*, the field in *src2* as specified by *src1[4:0]* to *src1[9:5]* is set to all 1s and the resulting value of *src2* is written to *dst*. *src2* is left unchanged. *src1[4:0]* is the LSB of the field and *src1[9:5]* is the MSB of the field. In other words, *src1[4:0]* and *src1[9:5]* represent the beginning and ending bits, respectively, of the field to be set to all 1s. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *src1[9:5* and *src1[4:0]* are:

- 0 ≤ *src1[9:5]* ≤ 31; 0 ≤ *src1[4:0]* ≤ 31
- *src1[9:5]* ≥ *src1[4:0]*

For *src1[9:5]* < *src1[4:0]*, the result is undefined.

In the following example, *src1[4:0]* is 15 and *src1[9:5]* is 23.



Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2
for( i = 0; i < 32; i++) {
  if ( i >= src1[4:0] && i <= src1[9:5]) dst[i] = 1;
};

SHL *Logical Shift Left by 5-Bit Unsigned Constant*

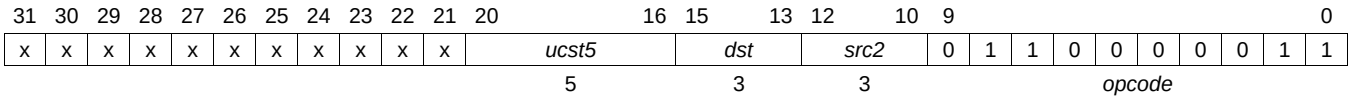
Syntax

SHL *ucst5, src2, dst*

Functional unit = L

Opcode

32 bit



Description

src2 is left shifted by a 5-bit unsigned constant (*ucst5*) and the result is stored to *dst*. The shift in value is 0.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = src2 << ucst5
```

Copyright © 2015–2020, Texas Instruments Incorporated

SHL *Logical Shift Left by Register Value*

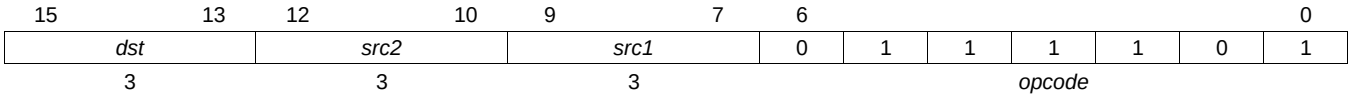
Syntax

SHL *src1, src2, dst*

Functional unit = L

Opcode

16 bit



15–13	12–10	9–7	6						0
dst	*src2*	*src1*	0	1	1	1	1	0	1
3	3	3	*opcode*						

Description

src2 is left shifted by an unsigned value (*src1*) and the result is stored to *dst*. The shift in value is 0. If the *src1* value is greater than 31, *dst* is cleared to 0.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = (src1 > 31) ? 0: (src2 << src1)
```

SHRA *Arithmetic Shift Right by 5-Bit Unsigned Constant*

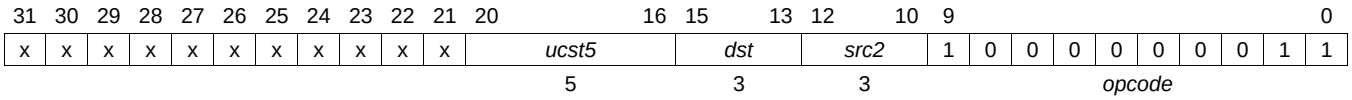
Syntax

SHRA *ucst5, src2, dst*

Functional unit = L

Opcode

32 bit



31	30	29	28	27	26	25	24	23	22	21	20 – 16	15 – 13	12 – 10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	*ucst5*	*dst*	*src2*	1	0	0	0	0	0	0	0	1	1
											5	3	3	*opcode*									

Description

src2 is right shifted by a 5-bit unsigned constant (*ucst5*) and the result is stored to *dst*. The shift in value is the sign bit (bit 31) of *src2*.

Using **DIV** (integer division) and **SHRA** (arithmetic right shift) does not produce the same result for negative numbers. The quotient of **DIV** is rounded towards zero, whereas the quotient of **SHRA** is rounded towards negative infinity. For example, using the **DIV** instruction: -9/4 = -2, whereas using the **SHRA** instruction: -9/4 = -3.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = {sign extend}{src2 >> ucst5}
```

SLA *Set Loop Address*

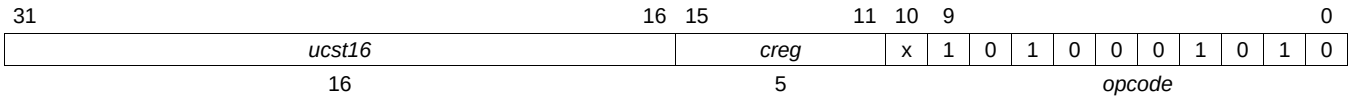
Syntax

SLA *ucst16, creg*

Functional unit = S

Opcode

32 bit



Description

Sets up loop bound address using a program counter (PC)-relative immediate positive offset. A zero-extended 16-bit unsigned immediate value (*ucst16*) is added to the PC of the instruction and is written to *creg*. Note that the offset is treated as a halfword offset. The only allowed *creg* registers for this instruction are: LSA0, LEA0, LSA1, and LEA1.

Condition Codes

None

Pseudo Code

```
creg = PC + {zero extend}ucst16
```

Copyright © 2015–2020, Texas Instruments Incorporated

SSUB *Subtraction of Two Register Values with Saturation*

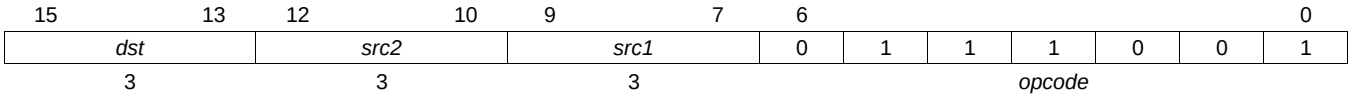
Syntax

SSUB *src1, src2, dst*

Functional unit = D

Opcode

16 bit



15–13	12–10	9–7	6			5–0			
dst	*src2*	*src1*	0	1	1	1	0	0	1
3	3	3	*opcode*						

Description

src1 is subtracted from *src2* with result saturation and stored to *dst*. If a saturate occurs, the SAT bit in the control status register (CSR) is set after *dst* is written.

Condition Codes

CSR[2] EQ = (dst == 0)

CSR[6] SAT = satP OR satN

Pseudo Code

```
tmp = src2 - src1
satP = tmp > 2^31 -     1
satN = tmp <     -2^31
dst = satP ? (2^31 - 1)     : (satN ? -2^31 : tmp)
```

STB *Store Byte to Memory with a 3-Bit Unsigned Constant Offset*

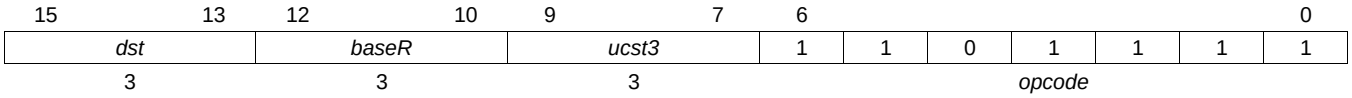
Syntax

STB *dst, *+baseR[ucst3]*

Functional unit = D

Opcode

16 bit



15–13	12–10	9–7	6						0
dst	*baseR*	*ucst3*	1	1	0	1	1	1	1
3	3	3	*opcode*						

Description

The 8 LSBs (byte) of *dst* are stored to memory (effective address). The memory address is formed from a base address register (*baseR*) and an offset (number of bytes) that is a 3-bit unsigned constant (*ucst3*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst3* is scaled by a left-shift of 0 bits. After scaling, *ucst3* is added to *baseR*. The result of the calculation is the effective address in memory that contains the content from *dst*.

Condition Codes

If an offset is not given, the assembler assigns an offset of zero. You must type the brackets, [ ], around the specified offset, if you use the optional offset parameter.

The square brackets, [ ], indicate that the *ucst19* is scaled by a left-shift of 1 bit. After scaling, *ucst19* is added to GDP. The result of the calculation is the effective address in memory that contains the content from *dst*.

Halfword addresses must be aligned on halfword (LSB is 0) boundaries.

Condition Codes

None

Pseudo Code

```
*(GDP[ucst19]) = *dst
```

STRF *Store Register File to Stack Pointer*

Syntax

STRF *op1, op2*

Functional unit = D

Opcode

16 bit

15 13	12 10	9	8	7	6						0
op2	*op1*	x	x	x	1	0	1	0	0	1	0
3	3							*opcode*			

Description

The current base register file is stored to the starting address specified by the postdecremented value of the stack pointer (SP). *op1* specifies the ending register (last register stored) and *op2* specifies the beginning register (first register stored). All registers between *op1* and *op2* are stored inclusive. The registers are stored in order from lowest register (*op2*) to highest register (*op1*).

Valid values of *op1* and *op2* are: *op1* ≥ *op2*

For *op1* < *op2*, results in unspecified behavior.

Condition Codes

```

Copyright © 2015–2020, Texas Instruments Incorporated

SUB *Signed Subtraction of Two Register Values*

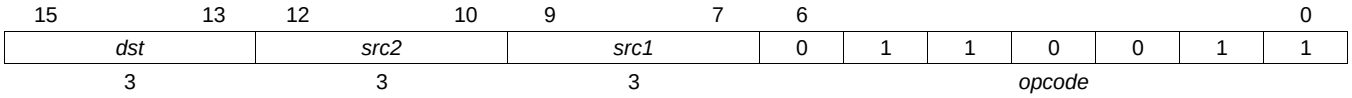
Syntax

SUB *src1, src2, dst*

Functional unit = D

Opcode

16 bit



15–13	12–10	9–7	6			5–0			
dst	*src2*	*src1*	0	1	1	0	0	1	1
3	3	3	*opcode*						

Description

Subtract *src1* from *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {not borrow} from (src2 - src1)

CSR[7]V = {overflow} from (src2 - src1)

Note that the carry (CSR[5]C) and overflow (CSR[7]V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

The status of the CSR[5]C bit can be used to synthesize multiword (wider) subtraction. With the **SUB** instruction, the CSR[5]C bit is set if no borrow occurs and the CSR[5]C bit is cleared if a borrow occurs. In other words, for **SUB** instructions, the CSR[5]C bit represents a not borrow. To synthesize multiword subtractions, subsequent instructions can use the CSR[5]C bit as a NOT(borrow) operand, performing a normal subtraction if CSR[5]C == 1 and subtracting one more than usual if CSR[5]C == 0.

For example, if register pairs R0/R1 and R2/R3 hold 64-bit values (where R0 and R2 hold the least-significant words), the following instructions leave the 64-bit difference in the register pair R4/R5:

```
     SUB   R2, R0, R4       ; R4=R0-R2, sets CSR[C]
     MVC   CSR, R6          ; leaves CSR[C] untouched
     EXTU  5, 5, R6, R6     ; if (CSR[C]) R6=0x1 else R6=0x0
     BNEQ  L1
     SUB   R3, R1, R5       ; R5=R1-R3
     SUB   1, R5, R5        ; R5=R5-1 if CSR[C] was NOT set
L1:  NOP                    ; else R5=R5
```

Note that the above example needs appropriate modification in order to generate correct carry/overflow applicable for the total 64-bit result.

Pseudo Code

```
dst = src2 - src1
```

8.2.6 Clock, Reset, and Dynamic Power Management

8.2.6.1 Introduction

The ARP32 CPU has a single clock domain (cpu_fclk) and two reset domains:

- An asynchronous Power-On-Reset (cpu_porz_i)
- An asynchronous CPU Functional Reset (cpu_resetz_i)

Both of the reset signals are used asynchronously inside the design. Both the leading and trailing edges of these reset signals are synchronized with the CPU input clock by the external clock/reset management logic.

To reduce dynamic power consumption, the ARP32 CPU gates all of its internal clocks based on debugger connection status and CPU idle/standby status:

- If the ARP32 CPU is in the IDLE state and the CPU standby indication is asserted, all internal clocks of the ARP32 CPU remain gated.
- If debug connection is established, indicated via the input port cpu_dbgenable_i, the ARP32 CPU unconditionally enables all its internal clocks.

8.2.6.2 CPU Reset Modes

Table 8-354 summarizes the two reset signals of the ARP32 CPU and their effects. Table 8-355 summarizes the different application of the two resets.

Figure 8-58 illustrates the ARP32 CPU power-on-reset sequence.

If warm reset is applied without Power on reset, to avoid meta-stability issues within the CPU core, the functional clock to the CPU core must be stopped by external clock generation logic prior to Warm reset assertion and the functional clock must be restored prior to Warm reset de-assertion.

Table 8-354. CPU Reset Types

			Does CPU Reset?	
Reset Type	**Signal Name**	**Reset Type**	**Debug Logic**	**Functional Logic**
Power On Reset	cpu_porz_i	Async	Yes	No
Warm Reset	cpu_resetz_i	Async	No	Yes

Table 8-355. CPU Reset Modes

				Does CPU Reset?		Need Synchronization?	
cpu_ porz_i	**cpu_resetz_i**	**Reset Mode**	**Application**	**Debug Logic**	**Functional Logic**	**Assertion**	**De-assertion**
0	0	Power On Reset	Reset at power up, full system reset	Yes	No	NA	Yes
0	1	Not supported	NA	NA	NA	NA	NA
1	0	Warm Reset	Reset of CPU core only, for example, watchdog reset	No	Yes	Yes	Yes
1	1	Normal	No reset, normal running mode	No	No	NA	NA

Copyright © 2015–2020, Texas Instruments Incorporated

Copyright © 2015–2020, Texas Instruments Incorporated

8.2.6.3 Dynamic Power Management

The ARP32 CPU supports instruction driven transition to a low-power state that is used to trigger a CPU system-wide low-power state. This is accomplished by the **IDLE** instruction. Upon execution of the **IDLE** instruction, the ARP32 CPU waits for any pending instruction or data memory transaction to complete and then goes to an endless wait state.

When in idle state, the CPU output signal cpu_standby_o is asserted high. During this window, the CPU gates clocks to all of its registers (except the interrupt flag register (IFR)) to achieve maximum saving of dynamic power. It is assured that the ARP32 CPU does not issue any new transactions on either instruction or data memory interfaces during this window. So, peripherals external to the CPU that don't need to be active while the CPU is in IDLE are also clock gated during this window.

The CPU comes out of this wait state only via an enabled external interrupt (NMI, INT4-INT7) or reset. The cpu_standby_o signal is de-asserted as soon as one of the following events occurs:

- any of the interrupt flag register (IFR) bits are set
- a debug connection is established (cpu_dbgenable_i is asserted high)

Interrupt enable conditions (like GIE, IER, etc.) are not considered when de-asserting cpu_standby_o. Thus, a disabled interrupt being asserted at the CPU boundary causes the cpu_standby_o signal to be de-asserted but the CPU still remains in idle state until an enabled interrupt (or reset) occurs.

Figure 8-59 provides an illustrative waveform showing the CPU going into IDLE mode followed by a wakeup via INT4.

8.2.7 Notes on Programming Model

8.2.7.1 Booting

The entry for reset in the ARP32 interrupt service table (IST) is setup such that the program flow after reset calls an initialization or boot code as soon as possible and performs at least the following functions:

- Initialize the stack pointer (SP) register.
- Initialize the global data pointer (GDP) register.
- Call 'main' function.

The following tasks are additionally performed if interrupt processing is needed from the very beginning; else, they are done as soon as the system is ready for (or expecting) interrupt processing:

- Initialize the interrupt enable register (IER) to enable the required maskable interrupts, as required.
- Initialize the interrupt enable register (IER) to enable the nonmaskable interrupt, if required.
- Initialize the control status register (CSR) to enable all the maskable interrupts globally.

8.2.7.2 Enabling and Disabling Interrupts

The ARP32 CPU provides a mechanism for easy and flexible interrupt control.

8.2.7.2.1 Globally Enabling or Disabling Maskable Interrupts

The global interrupt enable (GIE) bit in the control status register (CSR) allows programmers to enable or disable all maskable interrupts by controlling the value of a single bit. On the ARP32 CPU, programs must directly manipulate the GIE bit in CSR to disable and enable interrupts:

- CSR[0]GIE = 1 enables the maskable interrupts so that they are processed
- CSR[0]GIE = 0 disables the maskable interrupts so that they are not processed

For example, the following code sequence globally enables all maskable interrupts:

```
MVC   CSR, R0        ; Get CSR into R0
SET   0, 0, R0, R0   ; Set R0[0]
MVC   R0, CSR        ; Copy R0 back to CSR (sets GIE)
```

Similarly, the following code sequence globally disables all maskable interrupts:

```
MVC   CSR, R0        ; Get CSR into R0
CLR   0, 0, R0, R0   ; Clear R0[0]
MVC   R0, CSR        ; Copy R0 back to CSR (clears GIE)
```

As interrupt detection occurs in parallel with CPU execution, the CPU takes an interrupt in the cycle immediately following an **MVC** instruction that clears the GIE bit. However, CPU context save/restore behavior ensures that interrupts do not occur after subsequent instruction. Consider the following code example where the CPU takes an interrupt between instructions 1 and 2, between instructions 2 and 3, or between instructions 3 and 4. The CPU does not service an interrupt between instructions 4 and 5.

```
; assume GIE=1
MVC   CSR, R0        ;(1) Get CSR
AND   -2, R0, R0     ;(2) Get ready to clear GIE
MVC   R0, CSR        ;(3) Clear GIE
ADD   R0, R2, R3     ;(4)
ADD   R4, R4, R5     ;(5)
```

If the CPU services an interrupt between instructions 1 and 2 or between instructions 2 and 3, the SCSR[0]GIE bit holds the value 1 when arriving at the interrupt service routine. If the CPU services an interrupt between instructions 3 and 4, the SCSR[0]GIE bit holds the value 0. Thus, when the interrupt service routine resumes the interrupted code, it resumes with the GIE bit cleared (as a result of context restore of SCSR to CSR) as the interrupted code intended.

Copyright © 2015–2020, Texas Instruments Incorporated

8.2.7.2.2 Enabling or Disabling Individual Interrupts

Software can enable and disable individual interrupts by setting and clearing the bits in the interrupt enable register (IER) that correspond to the individual interrupts. An interrupt can trigger interrupt processing only if the corresponding bit in the IER is set.

For example, the following code sequence enables INT4:

```
MVC   IER, R0        ; Get IER into R0
SET   4, 4, R0, R0   ; Set R0[4]
MVC   R0, IER        ; Copy R0 back to IER (sets IER[4])
```

Similarly, the following code sequence disables INT5:

```
MVC   IER, R0        ; Get IER into R0
CLR   5, 5, R0, R0   ; Clear R0[5]
MVC   R0, IER        ; Copy R0 back to IER (clears IER[5])
```

8.2.7.3 Stack Usage in Interrupt Service Routine

The ARP32 CPU has only one stack pointer and thus a unified stack is used for background and interrupt code. As a result, the programmer is responsible for maintaining a clean boundary of operations that modifies the stack pointer (for example, stack allocation and de-allocation for a function, context save onto stack via push/pop operations using the **LDRF/STRF** instructions).

Instructions/operations in the CPU that modify the stack pointer are designed so that an interrupt cannot disrupt the operations halfway through to completion. For example, a stack allocation and de-allocation for function can happen via the **ADD** *ucst16,* **SP** instruction that atomically modifies the stack. The return address save while taking a CALL or retrieving the return address while executing a RET is also atomic, and cannot be interrupted. The **LDRF/STRF** instructions used for single or multiple pop and push are also uninterruptable. The ARP32 C/++ compiler uses these instructions to maintain the C/C++ stack and thus the sanity of the stack is always maintained.

Under certain scenarios, to save additional user context onto the stack, it is done via the **LDRF/STRF** instruction. **LDRF/STRF** modifies the stack pointer and hence results in the stack layout of a function to be not valid anymore. Hence, such additional context save/restore to the stack must happen at function boundaries only.

These considerations are important for assembly level programmers doing additional context save/restore (beyond what the ARP32 compiler does) and also to new custom instruction design for the ARP32 CPU if they depend on stack pointer relative operations.

8.2.7.4 General Restrictions

The ARP32 CPU has the following restrictions on the programming model:

- **Long Long (as 64 bit) is not supported natively in the architecture.** 'long long' is supported via emulation in the Run Time Support (RTS) library. Since this is non-standard and sub-optimal, use of long may severely degrade performance. Hence, it is highly recommended not to use the C 'long long' datatype.
- **64-bit arithmetic.** Add/sub of more than 32-bit values (operand or results) requires **ADDC/SUBC/BC** (addition with carry, subtraction with borrow, branch on carry) instructions that are not supported in the ARP32 CPU. Again, it is possible to emulate this in RTS but it is a sub-optimal implementation and it is not recommended.
- **Multi-threading via mutex is not supported in the architecture.** In the ARP32 CPU, it does not implement an "EXCLUSIVE access instruction" to implement a 'proper' mutex in RTS. A polling based multi-threading is still possible.

8.3 VCOP CPU and Instruction Set

NOTE: Throughout this section, various sample assembly code pieces are used to illustrate VCOP architecture and functionality. Programmers are expected to write code in VCOP Kernel-C, instead of in assembly.

8.3.1 Module Overview

The Embedded Vision Engine (EVE) module is a programmable imaging and vision processing engine, intended to be used in devices that serves consumer electronics imaging and vision applications. Its programmability allows late-in-development or post-silicon processing requirements to be met, and allows third party or customers to add differentiating features in imaging and vision products.

The EVE Module consists of an ARP32 scalar core, a VCOP vector core, and a DMA controller.

8.3.2 Features

- Interfaces
  - CLK/2 MHz custom interface with the scalar core
- Functionality
  - CLK MHz functional clock
  - Based on VICP coprocessor
  - Dual-issue, N-way SIMD per instruction
  - Scalable in N ways of SIMD, N = {2 | 4 | 8 | 16 | 32}
  - For the first version of VCOP N = 8
  - 16 entries x N ways x 40-bit register file
  - Binary morphology acceleration
  - N-way table lookup and histogram acceleration (capable of N lookups per cycle or N histograms per 4 cycle)
  - Up to 20-bit vector data memory address space
- Debug interface with visibility of loop variables and load/store pointers (VCOP_LD_PTR_i/VCOP_ST_PTR_j).

8.3.3 Block Diagram

The EVE subsystem contains an ARP32 scalar core, VCOP vector core, EDMA, memory blocks, memory switch, local interconnect, reset/clock, interrupt controller, SCTM and SMSET instrumentation blocks. Figure 8-60 provides a block diagram.

Figure 8-60. EVE Block Diagram

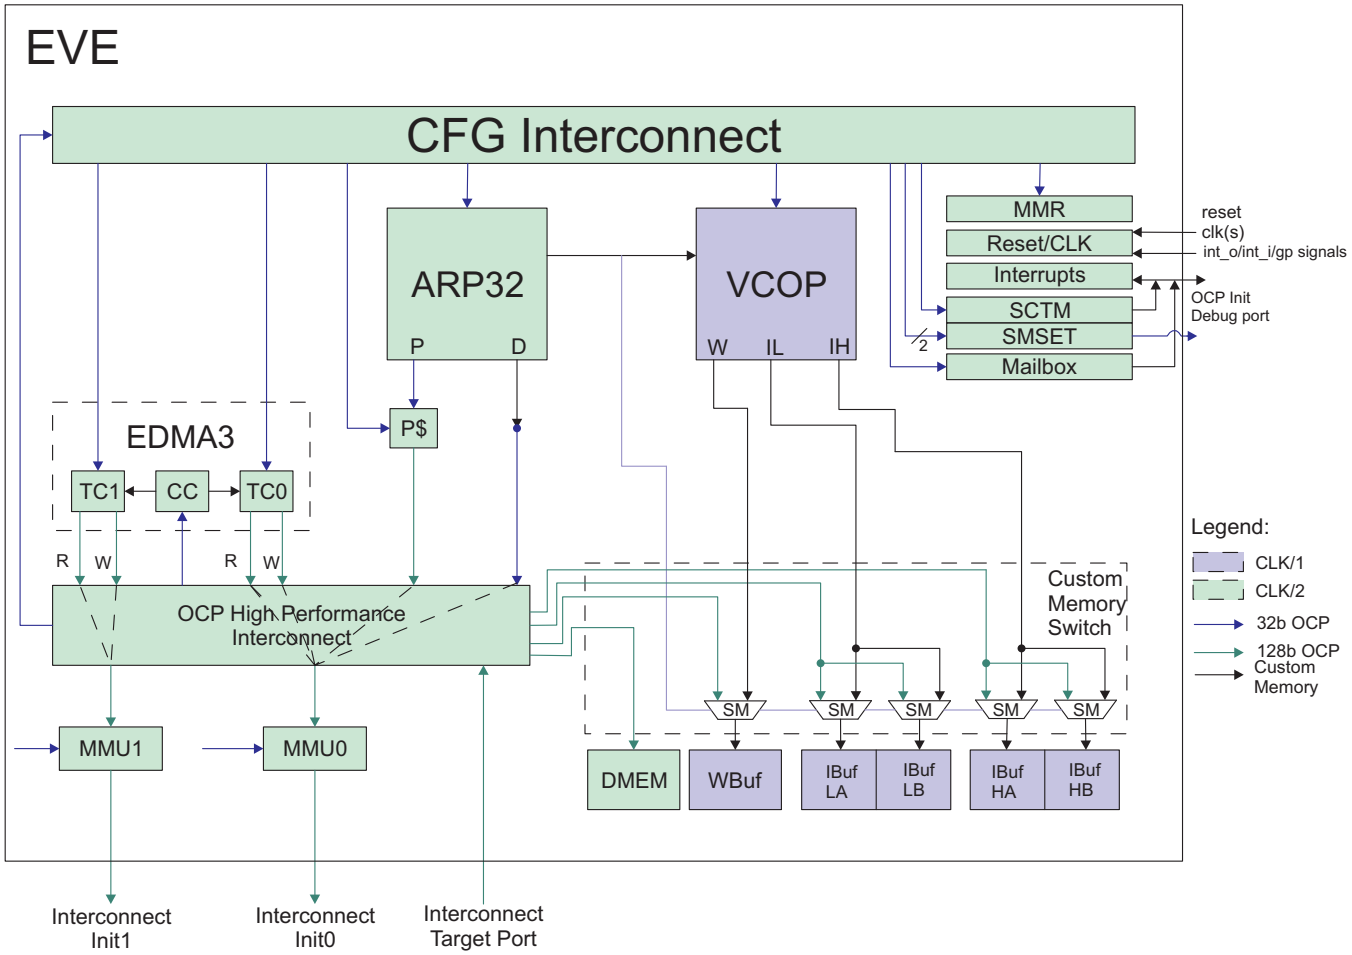

Figure 8-61 depicts the functional block diagram of EVE's Vector Coprocessor (VCOP).

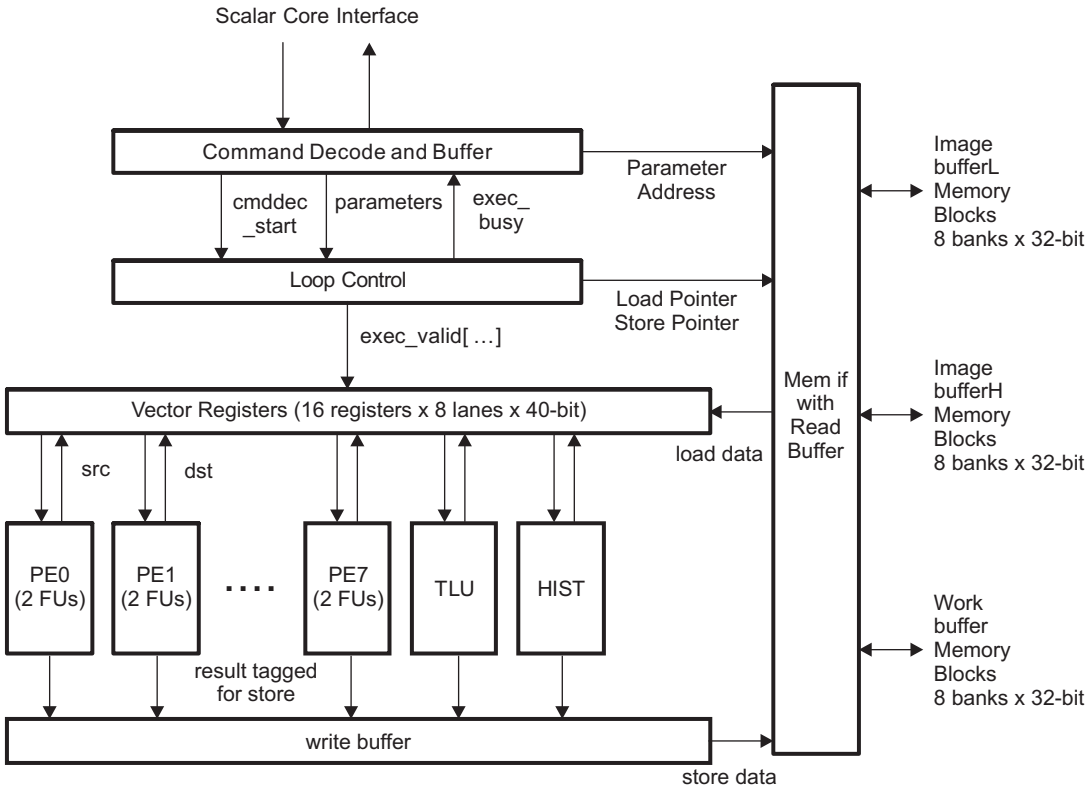
Figure 8-61. VCOP Block Diagram



8.3.4 System Interfaces

8.3.4.1 Interrupts

The vec_err_intn interrupt is driven by the vector core and indicates that the vector core has encountered an error condition, see Section 8.3.7.2.1 VCOP Register Manual for details.

8.3.4.2 Configuration Bus Slave Port

VCOP has a configuration bus slave interface that follows the OCP 32-bit slave protocol. The interface enables module configuration, status, processor state readout during debug.

The interface operates in the same clock domain as clk_eve_sca, the scalar core and scalar/vector interface clock.

The memory map of the configuration bus is specified in Section 8.3.7.2.1.

8.3.4.3 Performance Counter Interface

On the EVE level there is an SCTM module and an SMSET module to collect performance statistics.

SCTM is for counting signal active time and rise and fall transitions. SMSET is for conveying events to include into the system trace. Table 8-356 lists the signals that are exported to SCTM or SMSET as indicated. All SCTM signals are level signals operating at full vector core speed (clk_eve_vec), and all SMSET signals are rising-edge triggered signals.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 8-356. Performance Counter Signal List

Signal	Destination	Description
vcop_busy	SCTM	Indicate VCOP busy, for measuring VCOP loading
vcop_idle_and_done	SCTM	Indicate VCOP idle and done, basically not(vcop_busy) and vec_done, for measuring slack in real-time schedule
vcop_wait_for_arp32	SCTM	Indicate VCOP idle and waiting for ARP32 to feed instruction, basically vec_rdy and not(vec_instr) and not(vcop_busy). This indicates VCOP under utilization that might be improved by reducing ARP32 interrupt services
vcop_arp32_awaits	SCTM	Indicate ARP32 has vector instruction ready and is waiting for VCOP to accept it, basically not(vec_rdy) and vec_valid. This indicates ARP32 idle time that might be utilized, however, not to the extent that vcop_wait_for_ARP32 time becomes significant.
vcop_overhead	SCTM	Indicate VCOP busy but not executing the loop, meaning exposed command decode (from decode-execute pipeline) and parameter access time. The former might be reduced by having more back-to-back loops, and the latter is unavoidable.
vcop_ld_stall_by_st	SCTM	Indicate LD stage is stalled by ST stage (forced write when write buffer is full). This means there is insufficient gaps in LD for ST to occur in the background, but this does not mean LD+ST is slowing down computation.
vcop_op_stall_by_ldst	SCTM	Indicate gaps in operation stage between iterations due to LD+ST, indicating extent of load/store bound (as opposed to compute-bound). This may be reduced by merging loops to reduce load/store.
vcop_op_stall_by_ dependency	SCTM	Idle cycle inserted in operation stage due to dependency. This may be minimized by scheduling.
vcop_rd_ibufl	SCTM	Indicate VCOP reading from IBUFL
vcop_rd_ibufh	SCTM	Indicate VCOP reading from IBUFH
vcop_rd_wbuf	SCTM	Indicate VCOP reading from WBUF
vcop_wr_ibufl	SCTM	Indicate VCOP writing to IBUFL
vcop_wr_ibufh	SCTM	Indicate VCOP writing to IBUFH
vcop_wr_wbuf	SCTM	Indicate VCOP writing to WBUF
vcop_loop_start	SMSET	Indicate VCOP getting a VLOOP instruction
vcop_done	SMSET	Indicate VCOP executing a VWDONE instruction, copy of vec_done

8.3.4.4 Data Memory Map

The first instance of EVE has a data memory configuration and a memory-map as listed in Table 8-357.

Memory maps for scalar and vector core are shown in Figure 8-62. An optional MMR field, VEC_MEM_128KB, wraps the VCOP memory map around 128KB, aliasing the A and B sets to the same address range.

Table 8-357. EVE Vector Data Memory Map

Byte Address	Name	Description
0x00000 ~ 0x07FFF	WBUF	Vector working buffer, 32Kbytes
0x08000 ~ 0x0FFFF	reserved	Reserved for future expansion
0x10000 ~ 0x13FFF	IBUFLA	Image buffer low copy A, 16 Kbytes
0x14000 ~ 0x17FFF	IBUFHA	Image buffer high copy A, 16 Kbytes
0x30000 ~ 0x33FFF	IBUFLB	Image buffer low copy B, 16 Kbytes
0x34000 ~ 0x37FFF	IBUFHB	Image buffer high copy B, 16 Kbytes

8.3.5 Functional Description

8.3.5.1 Scalar-Vector Architecture

The EVE subsystem consists of a scalar core as the subsystem controller, a vector core as the high-throughput coprocessor, shared memories, DMA, clock/reset and interrupt controllers. See the *EVE Subsystem Reference Guide* for details.

8.3.5.1.1 Scalar Core

The scalar core executes conventional RISC instructions. The scalar core is based on the ARP32 processor.

See the *ARP32 CPU and Instruction Set Reference Guide* for more details.

8.3.5.1.2 Scalar-Vector Interaction

The EVE scalar and vector cores share one program memory, but can execute in parallel on separate threads. The scalar core has sole control of the program memory, so all vector instructions are accessed by the scalar core, recognized being a vector instruction, and relayed via the scalar/vector interface to the vector core for execution. The vector core executes a sequence of instructions (called a vector command) repeatedly, so typically can be busy executing and does not need further vector instructions for thousands of clock cycles at a time.

The vector core has temporary instruction storage. There is a pre-decode buffer of 64 words, plus a decoded buffer for two maximal-sized commands (see Figure 8-63). The vector core attempts to decode and fill the two commands first, and if vector instructions keep coming, fill the pre-decode buffer. Together the buffering holds 4 or more typical vector commands, and keep the vector core busy for a while, allowing the scalar core to switch context to serve interrupts when interrupts occur.

Figure 8-63. VCOP Instruction Buffering

8.3.5.2 Vector Core Overview

The vector core is a SIMD machine with built-in loop control and address generation. It is programmed in array or 2D block processing level. The vector core has the following resources:

- 4 nested for loops, with loop variables i1, i2, i3, and i4, plus an optional outer loop i0
- 8 address generators, each capable of 4-dimensional addressing, that is, the address pattern is: base + i1 × const1 + i2 × const2 + i3 × const3 + i4 × const4
- 16-entry vector register file, each entry is N-way SIMD × 40-bit signed (sign-extended or zero-padded from 8/16/32-bit signed/unsigned memory data, or from operation upon register data)
- Two general-purpose functional units, each N-way SIMD. Functional spec supports N = {2 | 4 | 8 | 16 | 32}, first instance N = 8.
- Table lookup unit supporting up to N parallel lookups.
- Histogram unit supporting up to N parallel histogram operations.
- 8 load units
- 8 store units

The vector core supports the following functions:

- Generic compute
- Table lookup
- Histogram and weighted histogram

8.3.5.2.1 Nested for Loop Model

EVE vector operation is controlled by a four-level nested for loop. Inside the loop, the behavior can be represented in sequential stages: load, arithmetic operation, store, and pointer update.

In each stage, a number of load, operation, stores, or pointer updates are carried out, with respect to the 16 × N × 40-bit vector register file. There is no dependency among loads, stores, or pointer updates; multiple loads unto the same register file is not allowed. Dependency among operations assumes 2 operations are carried out in parallel, with no delay slot for most operations, and 1 cycle of delay slot for some specific operations.

The vector register file, loop variables, address generators are replicated as needed in the hardware to support pipelining among the various stages.

Example 8-8 shows a skeleton of the nested loop model. There are four loop variables, i1, i2, i3, and i4. A snapshots of the loop variables are contained in the follwoing registers:

- VCOP_I0_I1[15:0] I0 - I0 loop variable
- VCOP_I0_I1[31:16] I1 - I1 loop variable
- VCOP_I2_I3[15:0] I2 - I2 loop variable
- VCOP_I2_I3[31:16] I3 - I3 loop variable
- VCOP_I4[15:0]I4 - I4 loop variable

Copyright © 2015–2020, Texas Instruments Incorporated

Example 8-8. Nested Loop Model Skeleton

```
EVE_compute(...)
{
   for (i1=0; i1<=lpend1; i1++) {
      for (i2=0; i2<=lpend2; i2++) {
         for (i3=0; i3<=lpend3; i3++) {
            for (i4=0; i4<=lpend4; i4++) {

               for (k=0; k<num_inits; k++)
                  initialize_vreg_from_parameters(...);

               for (k=0; k<num_loads; k++)
                  load_vreg_from_local_memory(...);

               for (k=0; k<num_ops; k++)
                  op(...);         // 2 functional units, executing 2 ops per cycle

               for (k=0; k<num_stores; k++)
                  store_vreg_to_local_memory(...);

               for (k=0; k<num_agens; k++)
                  update_agen(...);
            }
         }
      }
   }
}
```

Each stage is described in more details in the following sections.

Note that loads and stores are predicated on the loop variables matching specific conditions and are thus not always carried out at every i4 iteration.

Each i4 iteration takes a number of cycles equal to the maximal number of cycles spent in loads, arithmetic operatoins, and stores. Cycle count in the arthmetic operations is constant for each loop, but cycle count in load and store can change depending on pointer update, loop level, and read/write memory contention.

For example, with lpend1 = 3, lpend2 = 1, lpend3 = 2, and lpend4 = 4, the nested for loop executes in exactly 4 × 2 × 3 × 5 = 120 i4 iterations. For the first few iterations the loop variables progress as:

i1	i2	i3	i4
0	0	0	0
0	0	0	1
0	0	0	2
0	0	0	3
0	0	0	4
0	0	1	0
0	0	1	1
0	0	1	2
...			

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.2.2 Instruction Organization

Vector instructions cannot appear in the program stream in arbitrary order. Instructions are classified as:

- Control
  - Repeat end count
  - Parameter pointer
  - Write buffer switch
- Synchronization
  - Wait for ready
  - Wait for done
- Computation
  - VLOOP
  - Register initialization
  - Address generator
  - Load
  - Operations
  - Store

The sequencing rule is that computation instructions that form a loop are in one contiguous block, starting with VCOP_VLOOP_PTR[31:0]VLOOP_PTR. This block of computation instructions is called a vector command. Control, synchronization, and scalar instructions can appear in any order, except that they cannot appear inside a vector command.

8.3.5.3 Vector Control

The VCTRL instruction is used to convery control information to the vector core. The instruction syntax is:

VCTRL *scalar_register*, *control_register*

The control registers so far defined are 0: RPT_END and 1: PARAM_PTR (VCOP_PARAM.

8.3.5.3.1 Repeat End Count

A VCTRL instruction variation programs the repeat end count. The syntax is:

VCTRL *scalar_register*, **RPT_END**

Subsequent VLOOP is executed RPT_END + 1 times. Reset default is 0, or repeating just once, and is the normal mode of operation. At end of loop execution, RPT_END is automatically reset to 0, so if the subsequent is non-repeating, which is most of the cases, there is no need to issue another VCTRL RPT_END to reset it.

RPT_END is a 12-bit value; the largest value supported is 0:4095, allowing for up to 4096 iterations of the repeat loop.

Note that the VLOOP instruction that follows can be of any type (computer, table lookup, histogram).

The repeat mechanism can be viewed as enclosing VLOOP by an outer loop, i0. The difference between this i0 loop and the i1, i2, i3, i4 loops inside VLOOP is that parameter pointer is advanced at the end of VLOOP. The repeat feature allows the same program code to be executed with a different set of parameters each time.

The repeat feature is useful for performing the same processing steps on a list of data regions that are not spaced regularly and/or not having the same dimension. Instead of having a scalar loop around the repeated VLOOP, using the repeat feature reduces scalar/vector interaction and resulting overhead.

Software must allocate memory appropriately to allow results of these data blocks to be stored (sequentially or otherwise is under programmer's control).

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.3.2 Parameter Pointer

In addition to the vector instructions in PMEM, the vector core must read a parameter file in WBUF or IBUFL/IBUFH (depending on the pointer value) before it begins intended computation. The parameters include loop counts, address pointers to arrays, constants used in the computation, round/truncate shift count, saturation bounds, etc. The parameter pointer is located in VCOP_PARAM_PTR[31:0] PARAM_PTR.

Separation of configuration coded in the program memory versus configuration conveyed in data memory is essential, as this allows library functions to be constructed with reasonable code size and can serve a variety of need in applications. Loop counts and address pointers being conveyed via parameters is needed, so that, for example, one filter function works for various data/coefficient/output arrays and block and coefficient kernel sizes. Round/truncation shifts being convey via parameters means that, for example, the same filtering kernel program can work for filters with different radix point bit positions for filter coefficients.

Parameter registers are 16-bit per entry in the parameter file, up to 64 entries. The first 2 entries of the parameter file, P0 and P1, are hard-coded to constant values 0 and 1 respectively, as these are commonly used and it reduces code size by referring to these constants without taking up data memory space.

Parameters are referred to in the vector instructions either as single register, 16-bit parameter, or as a register pair, together make up 32-bit. Where a pair is used, the first parameter must be an even index, and contains the lower 16-bit of the 32-bit.

From an application development point of view, algorithm kernels are sometimes coded in one vector command per kernel, sometimes in several commands. Thus it is beneficial for the vector core to advance the parameter pointer automatically to reduce overhead. This requires a mechanism to specify or modify the parameter pointer when needed. This is addressed by the parameter pointer update feature through VCTRL.

A VCTRL instruction variation updates the parameter pointer for the subsequent VLOOP. The syntax is:

VCTRL *scalar_register*, **PARAM_PTR**

Unless updated again by VCTRL, the parameter pointer is advanced automatically at the end of VLOOP execution by the #PL field of VLOOP. Thus, parameter blocks for multiple consecutive VLOOPs can be placed consecutively in data memory, and no VCTRL VCOP_PARAM_PTR is needed except for the first VLOOP.

For efficiency of parameter access by VLOOP, the pointer value conveyed via VCTRL must be 32-bit aligned. The parameter length specified in VLOOP is also 32-bit aligned. Thus, at the beginning of any VLOOP, the pointer is 32-bit aligned.

Note that inside a VLOOP while parameters are pulled off to configure the loop, the parameter pointer is only 16-bit aligned.

For example, if 11 parameter registers are used in a vector command, P0..10, the encoded parameter length is ceiling((11 – 2)/2) = 5. The subsequent next vector command accesses parameter registers 5 32-bit words from the current vector command, leaving one 16-bit halfword in memory unused.

8.3.5.3.3 Switch Buffers

To minimize task-switching overhead, an instruction is added to write to buffer switch MMR. The instruction syntax is:

VSWITCHBUF *ucst20*

Copyright © 2015–2020, Texas Instruments Incorporated

Where ucst20 is a 20-bit immediate value to be written to a dedicated MMR for buffer switches.

This instruction is carried out by the scalar core, and vector core just ignores it.

Change made to the buffer switch is visible in MMR as well, as both VSWITCHBUF and generic scalar core store to the buffer switch MMR are both valid ways to program the buffer switches, only that VSWITCHBUF achieves lower latency. Both mechanisms are kept consistent in the simulator/ debugger toolset.

8.3.5.4 Vector-Scalar Synchronization

8.3.5.4.1 Wait for Vector Core Done

The VWDONE instruction is used as a synchronization barrier between scalar and vector core, and affects the scalar/vector interface signal vec_done. Upon reset, vec_done is true. Upon execution of VWDONE in the scalar core, the scalar stalls and waits for vec_done. The vector core, upon exeucting this instruction, implying all previous submitted vector instructions are all done, asserts vec_done. Once asserted, vec_done stays true until receiving a subsequent VLOOP that turns the vector busy and vec_done false again.

The VWDONE instruction is typically used before the scalar core switches shared memory to itself or DMA. Before it changes the switch it makes sure that the vector core is idle and thus not accessing the memory.

VWDONE must appear between vector commands in the program, not inside a vector command.

8.3.5.4.2 Wait for Vector Core Ready

The VWRDY instruction is used to stall the scalar core until vector core is ready to accept additonal vector instructions. Vector core ignores this instruciton.

Normally the scalar core can simply issues vector instruction, and when the vector core is not ready, VCOP_STATUS[2]VEC_RDY = 0 the scalar core is automatically stalled. Having VWRDY allows inserting timer read before and after VWRDY to measure the time duration of vector core not being ready, for performance tuning purposes.

8.3.5.5 Vector Computation

8.3.5.5.1 Vector Loop

The VLOOP instruction marks the beginning of a vector command specifying a loop. Assembly format:

VLOOP *cmd_type* **,** *CL#* **:** *cmd_len***,** *PL#***:***param_len*

The *cmd_type* field specifies whether it is the main compute (COMP), table lookup (TLU), or histogram (HIST).

Command length (*cmd_len*) and parameter length (*param_len*) in 32-bit words are encoded to facilitate quick parsing of the vector commands. The ending loop counts, lpend1/2/3/4, are encoded at fixed entries in the parameter file, P2 = lpend1, P3 = lpend2, P4 = lpend3, P5 = lpend4. This allows easy adaptation of EVE function to different array dimensions.

The first two entries of the parameter file have implicit values and are thus not conveyed in the data memory. P0 = 0 and P1 = 1. **The param_len does not include these two entries.**

The binary code of VLOOP includes a *version* field, which allows a compiler/assembler to indicate which version of EVE hardware the vector command is compiled for. The first version has *version* = 0, the next version, *version* = 1, and so on. This allows future version of EVE to offer backward compatibility; that is, execute previous-version binary as is. For example, if a future version of EVE has 16-way SIMD, it can execute 8-way SIMD binary by disabling half of the datapath.

Each vector command can have:

Copyright © 2015–2020, Texas Instruments Incorporated

- Up to 8 address generators
- Up to 16 vector register initialization
- Up to 8 loads
- Up to 40 operations
- Up to 8 stores

Maximal command length is 81 instructions (VLOOP + 16 VINITs + 8 VAGENs + 8 VLDs + 40 operations + 8 VSTs).

8.3.5.5.1.1 Retention of State Between VLOOPs

From one VLOOP to the next VLOOP, the following state information is retained:

- Parameter pointer, advanced by parameter length in the first VLOOP
- Vector register contents, whatever left over from the last iteration of the first VLOOP

The following state information is not retained, thus must be configured within each VLOOP:

- Parameter register file (must be reloaded from data memory)
- Agen configuration, such as association of the four counts to parameter registers
- Agen address counter (reset at the beginning of each VLOOP execution)

8.3.5.5.2 Vector Register Initialization

It is useful to initialize vector register with constants provided in the parameter file. As parameter file is scalar (not NWAY SIMD), each value is broadcast to all NWAY of the destination vector register. Assembly syntax:

VINIT *type_init_loop preg***,** *vreg*

The data *type* can be signed/unsigned halfword or word. In case of word, two parameter register entries (16-bit each) are used, first one being copied to the lower halfword, and the second one to the upper halfword.

For the word type initialization, *preg* specified is the lower halfword and must be even. For example, *VINITWU_ONCE P10, V2* initializes V2 using (P11 << 16) + P10.

The *init_loop* field can be {ONCE, I234_ZERO, I34_ZERO, I4_ZERO, ALWS }.

The VINIT instruction is equivalent to initializing a specific vector register in the nested i1/i2/i3/i4 loop shown in Section 8.3.5.3.2:

- ONCE is for initialization before the loop.
- I234_ZERO is for initialization inside the i1 loop, before entering the i2 loop.
- I34_ZERO is for initialization inside the i2 loop, before entering the i3 loop.
- I4_ZERO is for initialization inside the i3 loop, before entering the i4 loop.
- ALWS is for initialization inside the i4 loop, running every iteration.

The VINIT feature is used to initialize vector registers to certain initial values. For example, FIR filtering is implemented by iterating over filter taps with MADD instructions, and VINIT is used to initialize the accumulator to zero at the proper iteration, i4 for 1-D filter, and i3 for 2-D filter. Constants are brought into the computation loop with VINIT as well. For example, to scale an entire input array by a constant factor.

Note that VINIT broadcasts one value to all SIMD lanes. Initializing a vector register to multiple values is accomplished with a vector load (VLD) with zero address increment.

Sometimes it is useful to refer to loop variables in the computation. For example, to collect the maximal five values in an array and recording their indices, software can first do this in SIMD fashion to get to 5 sets of values and indices, then merge among SIMD lanes. Indices are readily copied from the loop variable i4, instead of spending cycles to compute with ALU operations.

VINIT provides this capability by extending the parameter count to cover loop variables:

Copyright © 2015–2020, Texas Instruments Incorporated

- P64 = i0, the repeat outer loop enabled via VCTRL <scalar_reg>, RPT_END
- P65 = i1
- P66 = i2
- P67 = i3
- P68 = i4

When using these parameter counts, only the unsigned halfword type is supported.

8.3.5.5.3 Address Generator (agen)

In image, video, vision computation, there are often many operations performed on arrays of the same dimension; which can use the same addressing pattern (with different base addresses) in the memory read/write. The address generator resource is included to take advantage of this. One agen can be shared among multiple loads and/or multiple stores.

The VAGEN instruction has this assembly format:

VAGEN *agen*, [*pinc4*, *pinc3*, *pinc2*, *pinc1*]

Agen field is a label (A0..7) to identify one of 8 agen resources.

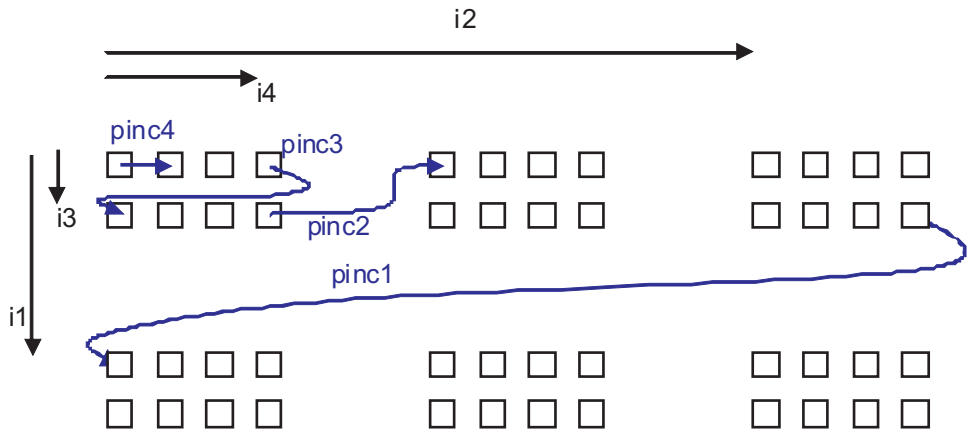
VAGEN is defined in strict linear order A0, A1, A2, till the last agen used in the command. The agens defined can be used (in loads and stores) in any order. It is allowed to share agen between load(s) and store(s).

The address increments represent:

- pinc4: inside the i4 loop, default
- pinc3: inside the i3 loop, when i4 matches the ending loop count
- pinc2: inside the i2 loop, when where i3 and i4 both match the ending loop counts
- pinc1: inside the i1 loop, when i2, i3, and i4 all match the ending loop counts

Figure 8-64 shows an example of 2 × 3 × 2 × 4 data object, addressed by the loop variables i1, i2, i3 and i4, with i1 being the outer-most loop. The address increments to access the object are shown in Figure 8-64.

Figure 8-64. Addressing a Four-Dimensional Data Object



Copyright © 2015–2020, Texas Instruments Incorporated

In the VAGEN instruction, pointers to the parameter file are encoded, not the address increments themselves. Most data objects do not require 4-dimension addressing. For example, coefficient data for 2D FIR filter is normally stored consecutively, and advance by 1 data point most of the times, and wraps back at the end of i3 loop.Then pinc4 = pinc3 is specified to one parameter register (initialized to 2 for 16-bit coefficients), and pinc2 = pinc1 to another parameter register for the wrap-back. Thus, this scheme reduces command plus parameter data.

All address increments are in bytes. This allows misaligned halfword (16-bit) and word (32-bit) accesses that are some times needed in the processing.

Each address increment is encoded with one 16-bit parameter register, treated as signed value. The above example shows address increment moving forward, but in many cases, for example coefficients for filtering, negative increments are used.

Note that the address increments together specify addressing pattern of a single pointer, and the data distribution controls how consecutive memory data from that pointer, up to 32N-bit, are distributed among the SIMD dimension of the vector register entry.

In case multiple VAGEN instructions are issued for the same agen resource (for example, A0), the last one takes effect, and the preceding ones with the same agen resource is ignored.

8.3.5.5.4 Vector Load

The VLD instruction specifies the data distribution, data type, base address, agen, and the vector register to load the data to. Format of the VLD instruction in assembly is:

VLD *type_distribution base* [*agen*], *vreg*

The *base* field points to a pair of parameter registers (even/odd pair only), for example base = P8 to refer to the P8:P9 pair. The vector data memory space is 20-bit, with the lower 16-bit encoded in the even parameter register (P8 in this case), the upper 4-bit in the odd parameter register (P9 in this case).

The destination vector register specified in VLD must be an even register. VLD_DINTRLV loads into an even/odd pair of registers. VLD with any other distribution option loads into one register.There are up to eight VLD instructions in a loop to potentially load up all 16 registers. No register can be the destination of more than one VLD instruction in the same loop.

As EVE is an N-way SIMD machine, loading of N consecutive data points from local memory is supported, with each data point being a byte, short, or long (32-bit) word, either signed or unsigned.

In addition to loading N data points, EVE supports a few other distribution options. EVE supports the following:

- NPT: N data points, one to each way of SIMD
- 1PT: broadcasting one data point to all
- CIRC2: circuiting between two data points, useful for Bayer image processing
- DS2: downsample by 2; every other data point (**not available for word-size input**)
- US2: upsample by 2; repeat each input data point twice
- DINTRLV: deinterleave inputs; load 2N data points into two registers, deinterleave data items so that even items go to the first register, odd items go to the second register. Supported only for byte or halfword per data point, **not word data type**. Two registers must be an even/odd pair, but only the first register (even) is encoded in assembly and in instruction binary.
- CUST_P8: custom distribution as provided by {P8..} in the parameter file
- CUST_P16: custom distribution as provided by {P16..} in the parameter file
- CUST_P24: custom distribution as provided by {P24..} in the parameter file
- EXP: load with expansion using predicate register V0
- NBITS: N bits, one bit to each way of SIMD, regardless of the data type (for example, when N = 16, a halfword is read). Signed/unsigned data type affects how this bit is to be sign-extended. Unsigned means 0 -> 0, 1 -> 1, and signed means 0 -> 0, 1 -> -1. This is useful for expanding load and other cases where boolean arrays are packed.

Copyright © 2015–2020, Texas Instruments Incorporated

For CUST_Pi options, number of bits required to specify the address offset for each way of SIMD depends on N, the number of ways of SIMD. Arbitrary distribution of N data items (each a byte, halfword, or word) is supported. For N = {2 | 4 | 8 | 16}, 4 bits is used to encode each destination. For N = 32, 5 bits is used; and each 16-bit parameter register supplies three fields (leaving 1 bit unused).

- N = 2, 2 × 4 = 8 bits, one parameter register required
- N = 4, 4× 4 = 16 bits, one parameter register required
- N = 8, 8 × 4 = 32 bits, two parameter registers required
- N = 16, 16 × 4 = 64 bits, four parameter registers required
- N = 32, ceiling(32/3) = 11 parameter registers required

The DINTRLV option is supported so software can fully utilize the two function units for simple operation sequences, by processing 2N data points in parallel.

VLD instruction normally loads into one destination vector register. VLD_DINTRLV is the exception in that it loads into a pair of vector registers. Only even registers, V0, V2, ..., V14, can be referenced in the destination register field. In case of VLD_DINTRLV, the referenced register and the next register shall be the destination, for example V0 and V1.

The following data types are supported:

- B: signed byte
- BU: unsigned byte
- H: signed halfword (16-bit)
- HU: unsigned halfword
- W: signed word (32-bit)
- WU: unsigned word

Address offsets for each way of SIMD, as the function of distribution option and data type are shown in Table 8-358 and Figure 8-65, Figure 8-66, and Figure 8-67.

Table 8-358. VLD Data Distribution Options[1][2]

Distribution	vreg[r][0] gets	vreg[r][1] gets	vreg[r][2] gets	vreg[r][3] gets	vreg[r][4] gets	vreg[r][5] gets	vreg[r][6] gets	vreg[r][7] gets
NPT	data[0]	data[1]	data[2]	data[3]	data[4]	data[5]	data[6]	data[7]
1PT	data[0]	data[0]	data[0]	data[0]	data[0]	data[0]	data[0]	data[0]
CIRC2	data[0]	data[1]	data[0]	data[1]	data[0]	data[1]	data[0]	data[1]
DS2	data[0]	data[2]	data[4]	data[6]	data[8]	data[10]	data[12]	data[14]
US2	data[0]	data[0]	data[1]	data[1]	data[2]	data[2]	data[3]	data[3]
DINTRLV	vreg[r][0] = data[0], vreg[r+1][0] = data[1]	vreg[r][1] = data[2], vreg[r+1][1] = data[3]	vreg[r][2] = data[4], vreg[r+1][2] = data[5]	vreg[r][3] = data[6], vreg[r+1][3] = data[7]	vreg[r][4] = data[8], vreg[r+1][4] = data[9]	vreg[r][5] = data[10], vreg[r+1][5] = data[11]	vreg[r][6] = data[12], vreg[r+1][6] = data[13]	vreg[r][7] = data[14], vreg[r+1][7] = data[15]
CUST_Pi[3]	data[pf[0]]	data[pf[1]]	data[pf[2]]	data[pf[3]]	data[pf[4]]	data[pf[5]]	data[pf[6]]	data[pf[7]]

(1) Table “data” is type-cast to the appropriate signed/unsigned byte/halfword/word so that correct offsets are applied.

(2) This is a table of what data element gets loaded into each SIMD lane of a vector register, in the order lane 0 to lane 7. This does not reflect a debugger memory window hex display.

(3) pf[0], pf[1], ... pf[7] refer to bit fields in the indicated parameter registers. For example, for the 8-way SIMD EVE, it takes two parameter registers for the distribution information, so for CUST_P8 use: distrib_info = (P9 << 16) | P8, and assign (distrib_info >> (4 × i)) & 0xF to pf[i].

Copyright © 2015–2020, Texas Instruments Incorporated

Loads are automatically predicated. Loads are always performed at the very first iteration, and then subsequently upon any change in the associated agen address pointer.

See Section 8.3.5.5.10 for address alignment requirement for various data type and distribution options.

LD_EXP is load with expansion, and is for reading a compacted (collated) array and expanding the elements to the original locations. It is the opposite of ST_COLLAT (collating store). Per-item address increment is implied by the load data type (1/2/4 bytes depending on byte/halfword/word type). The agen field is don't care. Per iteration, load pointer (VCOP_LD_PTR_i/VCOP_ST_PTR_j) is increment by number of non-zeroes in predicate register V2 times the data size. Agen is not used, and so the agen field is not required in the assembly code:

VLD *type*_**EXP** *base*, *vreg*

For example with this instruction, where V2 = {0, 0, 1, 0, 1, 1, 0, 0}, load_ptr = 0x100:

```
LDBU_EXP Pbase[A0], V1
```

There shall be, after this instruction:

```
V1 = {0, 0, mem[0x100], 0, mem[0x101], mem[0x102], 0, 0}, and load_ptr = 0x103
```

Load with expansion is restricted to be used in table lookup VLOOP. This is because the dependency (where the expanding load depends on predicated register data from another load) is more similar to table lookup, and thus it's feasible to achieve N data points per clock cycle inside table lookup pipeline. As in normal table lookup, no operation instructions are allowed in table lookup VLOOP.

8.3.5.5.5 Vector Arithmetic/Logic Operations

Various arithmetic and logic operations are available in the compute command, which is indicated by starting the command with:

VLOOP COMP, *cmd_len*, *param_len*

Vector arithmetic/logic instructions have the following assembly formats, depending on whether it is 1-input-1-output, 2-input-1-output, 2-input-2-output, or 3-input-1-output, whether accumulator clearing is enabled, and whether rounding is enabled.

V<op_1i1o> src1, dst

V<op_2i1o> src1, src2, dst

V<op_2i1o> src1, src2, dst, RND: rnd_param

V<op_2i2o> src1/dst1, src2/dst2

V<op_2i2o> src1, src2/dst1, dst2

V<op_3i1o> src1, src2, src3, dst

V<op_3i1o> src1, src2, src3, dst, RND: rnd_param

All operations are 40-bit, except:

- Input to multiply (MPY, MADD, MSUB) is 17-bit data.
- BINLOG, BITC, BITDI, BITI, BITR are 32-bit instructions.
- BITPK, BITUNPK, SORT2, MIN, MAX are 33-bit instructions (to allow processing of up to 32-bit signed data)
- BITTR, bit transpose, bit width is limited to ways of SIMD, thus 8-bit data for 8-way SIMD.

The operations in Table 8-359 are supported. See Section 8.3.5.9 for details on each operation.

Table 8-359. VCOP Arithmetic/Logic Operations

Operation	#In- Out	#Bits	#Del	Syntax[1]	Note
VNOP		40		VNOP	
VADD	2-1	40		VADD src1, src2, dst	src1 + src2
VSUB	2-1	40		VSUB src1, src2, dst	src1 – src2
VABSDIF	2-1	40		VABSDIF src1, src2, dst	|src1 – src2|
VMPY	2-1	17/33	1	VMPY src1, src2, dst, RND:rnd_param	src1 * src2
VAND	2-1	40		VAND src1, src2, dst	src1 & src2
VOR	2-1	40		VOR src1, src2, dst	src1 | src2
VXOR	2-1	40		VXOR src1, src2, dst	src2 ^ src2
VMIN	2-1	33		VMIN src1, src2, dst	min(src1, src2)
VMAX	2-1	33		VMAX src1, src2, dst	max(src1, src2)
VANDN	2-1	40		VANDN src1, src2, dst	src1 & (~src2)
VSHF	2-1	40/6		VSHF src1, src2, dst	src1 << src2, or src1 >> (-src2)
VRND	2-1	40/5	1	VRND src1, src2, dst	(src1 + (1 << (src2-1)) >> src2
VCMPEQ	2-1	40		VCMPEQ src1, src2, dst	(src1 == src2) ? 1 : 0
VCMPGT	2-1	40		VCMPGT src1, src2, dst	(src1 > src2) ? 1 : 0
VCMPGE	2-1	40		VCMPGE src1, src2, dst	(src1 >= src2) ? 1 : 0
VBINLOG	1-1	32	1	VBINLOG src1, dst	approximate binary log
VBITC	1-1	32	1	VBITC src1, dst	count one bits
VNOT	1-1	40		VNOT src1, dst	~src1

(1) The parameters src1, src2, src3, dst, dst2 refer to the vector register entry for source or destination.

Table 8-359. VCOP Arithmetic/Logic Operations (continued)

Operation	#In- Out	#Bits	#Del	Syntax[1]	Note
VMADD	3-1	17/40	1 / 2	VMADD src1, src2, src3, dst, RND: rnd_param	src3 + src1 * src2
VMSUB	3-1	17/40	1 / 2	VMSUB src1, src2, src3, dst, RND: rnd_param	src3 – src1 * src2
VADD3	3-1	40	1	VADD3 src1, src2, src3, dst	src1 + src2 + src3
VSAD	3-1	40	1	VSAD src1, src2, src3, dst	src3 + abs(src1 – src2)
VSEL	3-1	40		VSEL src1, src2, src3, dst	src1 ? src2 : src3
VAND3	3-1	40	1	VAND3 src1, src2, src3, dst	src1 & src2 & src3
VOR3	3-1	40	1	VOR3 src1, src2, src3, dst	src1 | src2 | src3
VSHFOR	3-1	40/6	1	VSHFOR src1, src2, src3, dst	src3 | (src1 << src2) or src3 | (src1 >> -src2)
VSORT2	2-2	33		VSORT2 src1/dst1, src2/dst2	dst1 = min(src1, src2) dst2 = max(src1, src2)
VBITPK	2-1	33	1	VBITPK src1, src2, dst	compare, bit-pack, broadcast
VBITUNPK	2-1	40	1	VBITUNPK src1, src2, dst	bit unpack
VEXITNZ		40		VEXITNZ level, src1	exit loop at end of iteration when (src1 != 0)
VCMOV		40		VCMOV cond, src1, dst	conditional move
VBITR	1-1	32	1	VBITR src1, dst	bit reverse
VBITI	2-1	32	1	VBITI src1, src2, dst	bit interleave
VBITDI	1-2	32		VBITI src1, dst1, dst2	bit deinterleave
VABS	1-1	40		VABS src1, dst	abs(src1)
VADDH	2-1	40		VADDH src1, src2, dst	src1+ signext(src2[39:32])
VLMBD	3-1	40	1	VLMBD src1, src2, dst	left-most-bit-detect
VBITTR	1-1	NSIMD	1	VBITTR src1, dst	bit transpose
VSIGN	2-1	40		VSIGN src1, src2, dst	apply sign of src1 on src2
VADDSUB	2-2	40		VADDSUB src1/dst1, src2/dst2	dst1 = src1 + src2 dst2 = src1 – src2
VINTRLV	2-2	40		VINTRLV src1/dst1, src2/dst2	interleave
VDINTRLV	2-2	40		VDINTRLV src1/dst1, src2/dst2	deinterleave
VMINSETF	2-2	33		VMINSETF src1, src2/dst1, dst2	minimum and set flag
VMAXSETF	2-2	33		VMAXSETFsrc1, src2/dst1, dst2	maximum and set flag
VINTRLV2	2-2	40		VINTRLV2 src1/dst1, src2/dst2	interleave with 2-element frequency
VDINTRLV2	2-2	40		VDINTRLV2 src1/dst1, src2/dst2	deinterleave with 2-element frequency
VINTRLV4	2-2	40		VINTRLV2 src1/dst1, src2/dst2	interleave with 4-element frequency
VSHF16	1-2	33		VSHF16 src1, dst1, dst2	shift up 16 bits into 2 registers
VADIF3	3-1	40	1	VADIF3 src1, src2, src3, dst	add difference, dst = src1 – src2 + src3
VSWAP	3-2	40		VSWAP cond, src1/dst1, src2/dst2	conditional swap

Copyright © 2015–2020, Texas Instruments Incorporated

Operations with two destinations must use two different destination registers, otherwise the outcome is undefined.

The accumulating register (being a source as well as the destination of an operation) must be src1 for 2-input-1-output operations, and must be src3 for 3-input-1-output operations.

The rounding parameter is needed for VMPY, VMADD and VMSUB instructions, and specifies an index to the parameter file, see Section 8.3.5.9.

EVE hardware executes up to 2 operations in parallel per clock cycle. Assembly program (by programmer or by compiler) contains the parallel bar notation to indicate if an instruction is to be executed by itself, or is to be executed in parallel with another instruction.

VMADD, VMSUB instruction have two delay slots for the multiplication input, and one delay slot for the addition/subtraction input.

VMPY, VRND, VBINLOG, VBITC, VADD3, VSAD, VAND3, VOR3, VSHFOR, VBITPK, VBITUNPK, VBITR, VBITI, VLMBD, VBITTR, VADIF3 instructions have one delay slot.

All other operations do not have delay slots.

The hardware detects and treats write/read dependency between any two sequential instructions, but not inside parallel executed instruction pairs. When necessary for correctness, hardware inserts idle cycles automatically. Still to achieve good performance, software must try to schedule the operations to avoid automatic idle cycles.

There is a forwarding path *within each* functional unit and *between* the two functional units to forward from destination to source 3 (accumulator input) of 3-input-1-output operations.

Register forwarding, dependency checking and automatic idle cycle insertion work across iterations as well, from end of one iteration to the beginning of the next iteration. For example, the FIR filtering kernel executes in one cycle per iteration with the destination-to-source3 dependency across iterations.

Table 8-360 shows delay slots and automatically inserted idle cycles.

Table 8-360. Example of Operation Delay Slots

Time	VMPY	VMADD	VSUB	VMSUB	VAND	VOR	VADD
0	V0*V1						
1	V0*V1 => V7	V2*V3	V2-V6 => V6				
2		V2*V3 =>p		V4*V5	V3 & V6 => V6		
3		V7 + p => V7		V4*V5 => p		wait for V7	
4				V7 - p => V7		wait for V7	
5						V1|V8 => V9	V6 + V7 => V6

Zero-delay slot operation executes in one cycle. VMPY, an one-delay slot opeartion takes two cycles to execute. VMADD and VMSUB, two-delay slot operations take 3 cycles for execution, but need its additional input only on the third cycle. The dependency between the two instructions (VMADD-VMSUB) on the additional operand does not introduce idle cycles, but VMSUB-VADD dependency adds 2 idle cycles to execution per iteration.

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.5.6 Vector Store

The VST instruction specifies the data distribution, data type, base address (index to parameter file), agen, the vector register to get the store from, loop level when stores are to occur, and rounding/saturation configuration. Format of VST is:

[*pred***] VST***type_ distribution_wr_loop vreg***, base[***agen***], RND_SAT:** *rnd_sat_param*

Storing of up to N data points from vector register to local memory is supported, with each data point being a byte, short, or long (32-bit) word, either signed or unsigned. Signed/unsigned information is used in performing saturation.

There are up to eight VST instructions in one loop, and each VST can be from the full vector register file, V0..V15. It is allowed to overlap the source registers, i.e., having more than one VST instructions storing out the same vector register. Also, in the extreme case of having all eight VST being interleaving stores, all 16 vector registers can be written out.

There is a further constraint on source registers for vector store. Only V0, V1, V2, and V3 can be stored without being the destination of any operation.

VCOP supports the following store patterns:

- NPT: For 8-way SIMD, 8 data points
- 1PT: write only the first SIMD unit
- DS2: downsample by 2; every-other SIMD units are written
- INTRLV: interleave outputs; store 2N data points from two registers interleaved. Two registers must be an {i, i+1} pair (i = 0..14), but only the first register (i) is encoded in assembly and in instruction binary. Byte and halfword types are supported, but not word type. It is NOT allowed to predicate interleaving stores. (If one must predicate interleaving store, use VINTRLV operation to interleave two sets of N data points, then use two predicated VST<type>_NPT.)
- OFFST_NP1: write out all N data points, in (N + 1) words = (4N + 4) bytes address increments (for transposition). Note that although address offset is word-aligned, storing to partial word, in case of byte and halfword types, are supported. In case of byte or halfword type, the 2 LSBs of address determines the byte or halfword within each word that VCOP writes data into.
- COLLAT: collating store, use predicate register to indicate store/not-store, up to N data items stored per cycle, agen is don't care, and hardware increments store address by the size implied by the data type. The agen field is not required in the assembly code:

[*pred***] VST***type_* **COLLAT***_wr_loop vreg***, base, RND_SAT:** *rnd_sat_param*

- SDDA: sequential data-driven addressing, taking M cycles to store M data points (predication can lead to less than N stores), store Vreg[i] to address base + agen + V0[i] Note that agen can be used to vary the pointer, in addition to V0. Only unsigned address offset in V0 is supported.
- PDDA: parallel data-driven addressing. Use this mode when address offsets in V0 is such that all lanes enabled for store go to separate memory banks. Hardware executes the store of up to N data points in one cycle. In case there is bank conflict, outcome is indefinite, and an error interrupt is generated.
- SKIP: store N data points into every other elements in memory. Allowed for byte and halfword types, not for word type.

The following data types are supported:

- B: signed byte
- BU: unsigned byte
- H: signed halfword (16-bit)
- HU: unsigned halfword
- W: signed word (32-bit)
- WU: unsigned word

Copyright © 2015–2020, Texas Instruments Incorporated

Table 8-361. EVE ST Data Distribution Options for NWAY = 8[1][2]

Distribution	vreg[r][0] goes to	vreg[r][1] goes to	vreg[r][2] goes to	vreg[r][3] goes to	vreg[r][4] goes to	vreg[r][5] goes to	vreg[r][6] goes to	vreg[r][7] goes to
NPT	dptr[0]	dptr[1]	dptr[2]	dptr[3]	dptr[4]	dptr[5]	dptr[6]	dptr[7]
1PT	dptr[0]	n/a	n/a	n/a	n/a	n/a	n/a	n/a
DS2	dptr[0]	n/a	dptr[1]	n/a	dptr[2]	n/a	dptr[3]	n/a
INTRLV	dptr[0] = vreg[r][0], dptr[1] = vreg[r+1][0]	dptr[2] = vreg[r][1], dptr[3] = vreg[r+1][1]	dptr[4] = vreg[r][2], dptr[5] = vreg[r+1][2]	dptr[6] = vreg[r][3], dptr[7] = vreg[r+1][3]	dptr[8] = vreg[r][4], dptr [9] = vreg[r+1][4]	dptr[10] = vreg[r][5], dptr[11] = vreg[r+1][5]	dptr[12] = vreg[r][6], dptr[13] = vreg[r+1][6]	dptr[14] = vreg[r][7], dptr[15] = vreg[r+1][7]
OFFST_NP1	dptr[0]	dptr[9]	dptr[18]	dptr[27]	dptr[36]	dptr[45]	dptr[54]	dptr[63]
COLLAT	none or *dptr++	none or *dptr++	none or *dptr++	none or *dptr++	none or *dptr++	none or *dptr++	none or *dptr++	none or *dptr++
SDDA/PDDA	dptr[V0[0]]	dptr[V0[1]]	dptr[V0[2]]	dptr[V0[3]]	dptr[V0[4]]	dptr[V0[5]]	dptr[V0[6]]	dptr[V0[7]]
SKIP	dptr[0]	dptr[2]	dptr[4]	dptr[6]	dptr[8]	dptr[10]	dptr[12]	dptr[14]

(1) Table “dptr” is type-cast to the appropriate signed/unsigned byte/halfword/word so that correct offsets are applied. dptr = base + agen.
(2) Custom distribution is not supported for stores.

Stores are predicated to perform at the indicated loop level, with wr_loop selectable from:

- ALWS: write out on every i4 iteration
- LAST_I4: write out on the last i4 iteration, when i4 = lpend4
- LAST_I34: write out on the last i3 iteration, when i3 = lpend3 and i4 = lpend4
- LAST_I234: write out on the last i2 iteration, when i2 = lpend2, i3 = lpend3, and i4 = lpend4

Rounding and saturation arithmetic is available in the store pipeline to provide rounding and saturation without taking additional cycles.

Rounding and saturation parameters are provided in the parameter file to allow easy adaptation of EVE functions to different rounding and saturation configurations. The rnd_sat_param field in the instruction points to a parameter (instruction encoding limits this field to 5 bits, thus restricting it to P0..P31) that contains the following fields shown in Figure 8-68.

Figure 8-68. VST Rounding and Saturation Parameters

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
sat_mode: 0 = NO_SAT 1 = SYMM 2 = ASYMM 3 = 4PARAM 4 = SYMM32 5 = ASYMM32			sat_bound_param: index to param that specifies saturation bound						rnd_mode: 0 = no rounding 1 = round 2 = truncate		rnd_shift: number of bits to round/shift down				

The following saturation modes are supported:

- NO_SAT: no saturation performed
- SYMM: signed symmetrical saturation [-bound, bound] (for unsigned store, [0, bound])
- ASYMM: signed asymmetrical saturation [-bound-1, bound] (for unsigned store, [0, bound]), useful for fixed bit width. For example, when bound = 1023, saturate to [-1024, 1023]
- 4PARAM: use 4 parameter registers to specify sat_high_cmp, sat_high_set, sat_low_cmp, sat_low_set.
- SYMM32: same as SYMM, except using a pair of parameters to specify a 32-bit bound
- ASYMM32: same as ASYMM, except using a pair of parameters to specify a 32-bit bound

Signed/unsigned designation is on the VST type, and signed/unsigned designation affects whether the bound parameter(s) are interpreted as signed or unsigned. The comparison is carried out between signed 40-bit register and such interpreted bounds.

Copyright © 2015–2020, Texas Instruments Incorporated

When no rounding and saturation feature is needed, specifying RND_SAT: P0 is working, since constant 0 in these fields represents doing nothing.

Conditional store is specified by the pred field. Omission means no predication. Pred = V1, V2, V3 indicates that register V1, V2, V3 is used to predicate the store of each way of SIMD; store is executed when the register is not zero.

With the COLLAT distribution option, all SIMD ways are examined for conditional store. Truth in the predication register leads to the data item being stored and incrementing of the data pointer by size of the store type (1/2/4 bytes). False in the predication register leads to doing nothing. Thus, stored data items are compacted without leaving any gaps for the blocked data items.

With other distribution options, conditional store behaves differently. Agen is incremented as in unconditional stores. Truth in the predication register leads to the data item being stored, and false in the predication register leads to the data item being skipped. Thus, it is possible for the stored data items to contain gaps among them from the blocked data items.

The store stage hardware has separate resource for each VCOP data memory region (IBUFL, IBUFH, WBUF). Sequential data-driven store is executed in X cycles, X being the number of data items enabled in predication (or when predication is not used, N). The other store modes are executed in a single cycle per store (note that collating store executes in one cycle as well). All memory regions are carried out in parallel, but there is also potential memory contention with the load stage. There is write buffering in the store stage to reduce load/store contention to some degree. See Section 8.3.5.6 for load/store buffering details.

8.3.5.5.7 Table Lookup Operation

Table lookup operation is indicated by starting the vector command with

VLOOP TLU, *CL#***:***cmd_len***,** *PL#***:** *param_len*

The table lookup operation uses a subset of the available resources and instructions:

- VAGEN (address generator): fixed A0 for data, A1 for table pointer, A2 for output.
- VLD (load): one for loading data into V2.
- VTLD (table load): for performing the lookup, using V2 as indices to load table entry into V0.
- VST (store): for storing outcome in V0.
- Full set of 4 levels for looping.

The table pointer is allowed to move via agen, to allow loop-variable-dependent manipulation of table base. For example, software might process three color components (RGB or YUV), each having a different table, in the same command, and use the outer loop variables to index among the color components and the corresponding tables.

Data is loaded with normal load into V2, for example:

```
VLDBU_1PT      data_base[A0], V2
```

The data load using VLD has access to a subset of load distribution options: {NPT, 1PT, DS2, US2}.

- 1PT works for single table configuration
- NPT works for all other cases of normal table lookup
- DS2 and US2 provides additional flexibility to downsample/upsample data

A special table load, VTLD, is used for the lookup:

VTLD*type_m* **TBL_** *n***PT** *tbl_base*[*tbl_agen*][**V2**]**, V0, RND_SAT:***rnd_sat*

Copyright © 2015–2020, Texas Instruments Incorporated

Normally lookups only fetch one item per lookup. Multiple items are useful for bilinear and bicubic interpolations. The _*m*TBL field in VTLD specifies the number of parallel tables and the _*n*PT field in VTLD specifies the number of data items per lookup table.

There are constraints on num_par_tbl, num_data_per_lu, and the table data size:

- num_par_tbl × num_data_per_lu <= N (ways of SIMD)
- num_data_per_lu = {1 | 2 | 4} regardless of N (ways of SIMD)

Constraints for 8-way SIMD architecture are shown in Table 8-362.

Table 8-362. Lookup Constraints for 8-Way SIMD

Table type	Num items per lookup, num_data_per_lu	Number of parallel tables, num_par_tbl			
		1	2	4	8
Byte	1	√	√	√	√
	2	√	√	√	
	4	√	√		
	8	√			
Half word	1	√	√	√	√
	2	√	√	√	
	4	√	√		
	8	√			
Word	1	√	√	√	√
	2	√	√	√	
	4	√	√		
	8	√			

Results are stored back to memory with a normal data store as in compute loop with simplification:

VST*type_distribution*_**ALWS V0,** *base*[*agen*]**, RND_SAT:** *rnd_sat_param*

This VST has access to a subset of store distribution optons: {NPT | SKIP}.

Number of data points that are stored per i4 iteration is num_data_per_lu × num_par_tbl from the table load, and this is an implicit predication.

For example, when there is table load VTLDHU_1TBL_2PT, the store VSTHU_NPT is not storing N points, but just 2 point.

In forming the indices for lookup, data are read in, rounded and saturated. Rounding and saturation parameters are specified in VTLD's RND_SAT: rnd_sat field. This field is 5-bit (like VST), so only P0..P31 is allowed. The same set of round/saturate parameters as the normal store, VST, are used. VTLD's RND_SAT is for round/saturate the data to form table lookup index. VST also contains a RND_SAT field, which is used to round/saturate looked up table entries before storing back to data memory.

Various other table lookup parameters are extracted from the instructions:

- Input data type is from VLD*type*, and is limited to unsigned types.
- Table entry type is from VTLD*type*, and can be signed or unsigned although the signed/ unsigned information is not used.
- Output type is from VST*type*, can be signed or unsigned, and can be different from the table entry type. Signed versus unsigned information is used for saturation.
- Input data distribution is from VLD V2, with SIMD units 0..num_par_tbl-1 used for the lookup.
- Output distribution option is either NPT, storing consecutively (which may not be N points), or SKIP, storing to every other memory location.

Copyright © 2015–2020, Texas Instruments Incorporated

- Table entries are read into the vector register SIMD lanes by iterating on num_par_tbl in the outer loop, and num_data_per_lu in the inner loop. For example, with num_par_tbl = 2 and num_data_per_lu = 4, with VSTBU_NPT we have:

```
V0[0] = tbl_base[data0],      V0[1] = tbl_base[data0 + 1],
V0[2] = tbl_base[data0+2],    V0[3] = tbl_base[data0 + 3],
V0[4] = tbl_base[data1],      V0[5] = tbl_base[data1 + 1],
V0[6] = tbl_base[data1+2],    V0[7] = tbl_base[data1 + 3]
```

Table organization in memory depends on table type and num_par_tbl. The N physical banks of 32-bit memory is partitioned into num_par_tbl logical banks, and each parallel table is organized inside its own bank.

For example, when NWAY = 8, you can have 1, 2, 4, or 8 parallel tables. Data organization for these and byte, halfword, and word type entries is shown in Figure 8-69.

A few examples of the table lookup operation follow. The NPT distribution for load and store works for normal lookup scenarios.

```
; single table, byte data, short table/output

   VLOOP            TLU, #cmd_len, #param_len
   VAGEN            A0, ...
   VAGEN            A1, ...
   VAGEN            A2, ...
   VLDBU_1PT        data_base[A0], V2                          ; load data to V0
   VTLDHU_1TBL_1PT  table_base[A1][V2], V0, RND_SAT: rnd_sat   ; look up
   VSTH_NPT_ALWS    V0, outp_base[A2], RND_SAT: rnd_sat_st     ; store outcome
; 4 parallel tables, 2 items per table, short data, byte table/output

   VLOOP            TLU, #cmd_len, #param_len
   VAGEN            A0, ...
   VAGEN            A1, ...
   VAGEN            A2, ...
   VLDHU_NPT        data_base[A0], V2                          ; load data to V0
   VTLDBU_4TBL_2PT  table_base[A1][V2], V0, RND_SAT: rnd_sat   ; look up
   VSTB_NPT_ALWS    V0, outp_base[A2], RND_SAT: rnd_sat_st     ; store outcome
```

Load with expansion can only be used in a table lookup loop. An example follows.

```
; load with expansion, short input data, unsigned byte flags, short expanded output

   VLOOP            TLU, #cmd_len, #param_len
   VAGEN            A0, ...
   VAGEN            A2, ...
   VLDBU_NPT        flag_base[A0], V2                          ; load flags to V2
   VLDH_EXP         input_base, V0                             ; load with expansion
   VSTH_NPT_ALWS    V0, outp_base[A2], RND_SAT: rnd_sat_st     ; store outcome
```

For example, in a particular iteration, suppose there are flags V2 = {0, 0, 1, 0, 1, 1, 0, 0}, and the expanding load pointer = 0x100 before the expanding load. After the expanding load:

```
V0 = {0, 0, mem[0x100], 0, mem[0x102], mem[0x104], 0, 0}
```

The pointer is advanced to 0x106, incremented by 3 (number of nonzero flags) times the size of data type (2 bytes for halfword).

Optionally, predicated store can be used while writing the expanded outcome array, leaving flag==0 data points unaltered.

```
   VLOOP            TLU, #cmd_len, #param_len
   VAGEN            A0, ...
   VAGEN            A2, ...
   VLDBU_NPT        flag_base[A0], V2                        ; load flags to V2
   VLDH_EXP         input_base, V0                           ; load with expansion
[V2] VSTH_NPT_ALWS  V0, outp_base[A2], RND_SAT: rnd_sat_st   ; store where V2 != 0
```

Performance of load with expansion is NWAY expanded data points per cycle when there is no memory contention, by pipelining the flag load, data load, and output store.

8.3.5.5.8 Histogram Operation

Histogram functionality includes normal histogram, in which the addressed bin entry is incremented by 1, and weighted histogram, in which the addressed bin entry is incremented by an element in the weight array input.

Histogram operation is indicated by starting the vector command with:

VLOOP HIST,*CL#***:***cmd_len* **,** *PL#***:** *param_len*

The histogram operation uses a subset of the available resources and instructions:

- VAGEN (address generator): fixed A0 for data, optional A1 for histogram input/output pointer, A2 for weights
- VINIT (register initialization) for normal histogram, providing a fixed increment value (normally 1)
- VLD (load): one load for data, and in the case of weighted histogram, one additional load for weights
- VHLD (histogram load): load histogram bins
- VADD (add) to increment histogram bins
- VHST (histogram store): store histogram bins back to memory
- Full set of 4 levels for looping

For normal histogram, the increment value is initialized via a VINIT instruction on V4:

```
VINITHU_ONCE   P1, V4
```

Data is loaded with normal load into V2, for example,

```
VLDBU_NPT      data_base[A0], V2
```

Distribution options of VLD are {1PT, NPT, DS2, US2}. 1PT works for single histogram configuration, NPT works for 2, 4, or 8 parallel histograms.

Optional weights (for weighted histogram) are loaded with another normal load into V4, for example,

```
VLDBU_NPT      weight_base[A1], V4
```

A special histogram load, VHLD, is used to read in the bins:

VHLD*type_m***HIST** *hist_base*[*hist_agen*][**V2**]**, V0, RND_SAT:** *rnd_sat*

The bins are then incremented with normal VADD.

```
VADD  V0, V4, V0
```

Results are stored back to the histogram memory with a special histogram store, VHST:

VHST*type_m***HIST V0,** *hist_base*[*hist_agen*][**V2**]

Base and agen are supposed to be consistent between VHLD and VHST; otherwise, the outcome is undetermined.

Both signed and unsigned types are supported in data load, weight load, histogram load/store, to support unsigned histogram as well as weighted histogram with positive and negative weights.

Parameters for histogram are extracted from the instructions:

- Input data type is from VLD V2
- Input data distribution is from VLD V2, with SIMD units 0..num_par_hist-1 used for indexing histogram. NPT, 1PT, DS2, US2 distribution options are supported.
- Optional weight type is from VLD V4.
- Weight distribution behaves like data distribution, i.e., SIMD units 0..num_par_hist-1 used for incrementing parallel histogram bins
- Histogram data type is from VHLD and VHST, and the two instructions must be consistent in the data type, otherwise the outcome is indeterminate.

Copyright © 2015–2020, Texas Instruments Incorporated

- rnd_sat in VHLD specifies round/truncate mode and how many bits to round off data before indexing the histogram, and also saturation mode and bound. This field is 5-bit (like VST and VTLD), so only P0..P31 is allowed.

The histogram command basically takes the data array, and processes num_par_hist data points at a time by assuming that many sets of parallel histogram bin storage. Each data value is rounded, saturated to generate a bin index. The address bin storage elements (which can be byte, halfword, or word) is then incremented by 1 or the weight, saturated to min/max values of that type, signed/unsigned byte/halfword/word:

- For unsigned byte, bin data is saturated to [0, 255].
- For signed byte, bin data is saturated to [-128, 127].
- For unsigned halfword, bin data is saturated to [0, 65535].
- For signed halfword, bin data is saturated to [-32768, 32767].
- For unsigned word, bin data is saturated to [0, 0xFFFF FFFF].
- For signed word, bin data is saturated to [-0x8000 0000, 0x7FFF FFFF].

There are restrictions on the weight data type (as indicated on the VLD into V4):

- Its signed/unsigned designation must agree with the histogram bin (as indicated in VHLD, VHST).
- Its size is limited to byte and halfword, and must be no bigger size then the histogram bin. Thus, for byte sized bins, only byte-sized weights are possible. For halfword or word sized bins, byte or halfword sized weights are possible.

C representation of histogram processing for a single histogram is as follows.

```
for (i=0; i<num_data; i++)
{
    data = data_base[i];
    bin = saturate(round(data));
    hist[bin]++;
}
```

Weighted histogram has the following C representation:

```
for (i=0; i<num_data; i++)
{
    data = data_base[i];
    bin = saturate(round(data));
    hist[bin] += weight[i];
}
```

Histogram organization in memory depends on histogram type and num_par_hist. The N physical banks of 32-bit memory is partitioned into num_par_hist logical banks, and each parallel histogram is organized inside its own bank, as with parallel lookup tables (see Figure 8-69).

The histogram command does not pre-initialize the histogram bin storage. The histogram command also does not sum up the parallel sets of storage into a single set; this is performed as a post-processing step.

Histogram operation takes 2M/P cycles plus some per-command overhead to process M data items with P parallel histograms (P = 1, 2, 4, or 8). As P parallel histograms takes P times the storage of a single histogram, it is a tradeoff of memory size and performance.

An example of histogram operation is:

```
; single histogram, byte data, short histogram, round down 2 bits, 33 bins
; rounding mode, shift, saturation bound coded in P7 using scalar instructions

   VLOOP            HIST, CL#: cmd_len, PL#: param_len
   VINITHU_ONCE     P1, V4                          ; initialize V4 = 1
   VLDBU_NPT        data_base[A0], V2               ; load data to V2
   VHLDHU_1HIST     hist_base[A1][V2], V0, RND_SAT: P7 ; load hist entry into V0
   VADD             V0, V4, V0                      ; increment entry
   VHSTH_1HIST      V0, hist_base[A1][V2]           ; store histogram entry
```

Copyright © 2015–2020, Texas Instruments Incorporated

An example of weighted histogram operation is:

```
; single weighted histogram, byte data, byte weight, short histogram,
; round down 2 bits, 33 bins
; rounding mode, shift, saturation bound coded in P7 using scalar instructions

   VLOOP            HIST, CL#: cmd_len, PL#: param_len
   VLDBU_NPT        data_base[A0], V2                ; load data to V2
   VLDBU_NPT        weight_base[A2], V4              ; load weights to V4
   VHLDHU_1HIST     hist_base[A1][V2], V0, RND_SAT: P7 ; load hist entry into V0
   VADD             V0, V4, V0                       ; increment entry by weights
   VHSTH_1HIST      V0, hist_base[A1][V2]            ; store histogram entry
```

Table lookup and histogram loops are limited to use designated vector register and address generator resources as shown in Table 8-363.

Table 8-363. Table Lookup and Histogram Hardware Resources

Loop type	Input/outputstream	Address generator	Vector register
table lookup	data	A0	V2
	table	A1	V0
	output	A2	V0
load with expansion	flag	A0	V2
	data	n/a	V0
	output	A2	V0
histogram	data	A0	V2
	histogram	A1	V0
	weight	A2	V4

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.5.9 Circular Buffer Addressing Support

In certain applications, it is desirable to maintain circular buffers for input data and intermediate results. Thus, circular buffer addressing is supported in VCOP.

- Support circular buffer in VLD and VST instructions in compute loops, table lookup loops, and histogram loops. No circular buffer in VTLD (table load) and VHLD/VHST (histogram bin load/store).
- Support is in pointer increment arithmetic, so no load or store in any iteration should straddle the circular buffer boundary.
- Support only 2's power buffer size from 1Kbytes, aligned to the size. For example, 1KB circular buffer can only start/end at 1KB alignment of the memory map.
- Support is in all memory regions.

Circular buffer addressing option is encoded in the circ_buf field taking up bits 23..20 of base address:

- 0: no circular buffer addressing
- 1: circular buffer size 1K bytes
- 2: circular buffer size 2K bytes
- 3: circular buffer size 4K bytes
- 4: circular buffer size 8K bytes
- 5: circular buffer size 16K bytes
- 6: circular buffer size 32K bytes
- 7~15: reserved

The base address does not need to be aligned to the circular buffer size, in the abive example's case, 0x400. To avoid any single load/store straddle the circular buffer boundary, the base address and the pointer increments must all be aligned to the access size of each iteration.

For example, when loading N data points of halfword data, where N = 8. Access size = 16, so the base address and any pointer increment must be aligned to multiples of 16.

Hardware adjusts the memory address for circular buffering by this process:

```
circ_buf = (base >> 20) & 0xF;            // extract circ_buf
mask = (0x200 << circ_buf) - 1;           // mask = size of buffer - 1
cbuf = (base & 0xFFFFF) & ~mask;          // find base addr of buffer
addr = cbuf + (base + agen) & mask;       // add offset from base of buffer
```

For example, base = 0x10420, agen = 0xFF0.

1. Extract circ_buf field by cir_buf = (base >> 20) & 0xF = 1, indicating 1KB circular buffer size.
2. Set mask = (0x200 << 1) – 1 = 0x3FF, forming the bit mask that defines the circular addressing bits versus linear, non-circular bits.
3. Get rid of the circ_buf field by ANDing base with 0xFFFFF, then zero out the circular addressing bits by ANDing with the complement of mask, to get cbuf = 0x400, so the circular buffer is 0x400 ~ 0x7FF.
4. Next, add the address generator value to the base address, and AND with mask to find offset from the cbuf base. (base + agen) & mask = (0x10420 + 0xFF0) & 0x3FF = 0x11410 & 0x3FF = 0x10.
5. Finally, add the offset 0x10 to the circular buffer base 0x400 to get the final address, 0x410.

The agen is allowed to go over the circular buffer many times over to wrap back inside, and that agen can even go backward to wrap from the beginning to the end of the buffer.

8.3.5.5.10 Load/Store Address Alignment Constraints

Load/store pointer alignment constraints are summarized in Table 8-364, for data load/store as well as table and histogram load/store, for various data types.

Table 8-364. Load and Store Address Alignment Constraints

Type of load/store and distribution	Byte type	halfword type	Word type
VLD_NPT	any	any	word-aligned
VLD_1PT	any	any	any
VLD_CIRC2	any	any	any
VLD_DS2	any	halfword-aligned	not supported
VLD_US2	any	any	any
VLD_DINTRLV	any	word-aligned	not supported
VLD_CUST_Pi	any	any	word-aligned
VLD_EXP	any	halfword-aligned	word-aligned
VST_NPT	any	halfword-aligned	word-aligned
VST_1PT	any	halfword-aligned	word-aligned
VST_DS2	any	halfword-aligned	word-aligned
VST_INTRLV	any	word-aligned	not supported
VST_OFFST_NP1	any	halfword-aligned	word-aligned
VST_COLLAT	any	halfword-aligned	word-aligned
VST_DDA	any	halfword-aligned	word-aligned
VST_SKIP	any	halfword-aligned	not supported
VTLD_1TBL_1PT	any	halfword-aligned	word-aligned
VTLD_mTBL_nPT (other than 1TBL_1PT)	32-byte-aligned	32-byte-aligned	32-byte-aligned
VHLD_mHIST	32-byte-aligned	32-byte-aligned	32-byte-aligned
VHST_mHIST	32-byte-aligned	32-byte-aligned	32-byte-aligned

The rationale is:

- For data load, in general any alignment is supported. Exception: When software loads 32 bytes, the pointer needs to be word-aligned.
- For data store, in general any alignment is supported for byte, halfword alignment for halfword, and word-alignment for word. Exception: When 32 or 64 bytes is stored, the value needs to be word-aligned. In case of LDH_DS2, the pointer must be 16-bit aligned.
- For table load with one table, 1-point lookup, the table base pointer can be of any alignment for byte, halfword alignment for halfword, and word-alignment for word.
- For table load with other configurations, only a 32-byte aligned table base is supported.
- Table store is really data store with 1, 2, 4, or 8 data points. The same alignment is supported as a data store, i.e., any alignment for byte, halfword alignment for halfword, and word-alignment for word.
- For histogram load/store, the histogram base pointer must be 32-byte aligned.

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.6 Load/Store Buffer and Scheduling

There is load data buffer associated with each VLD instruction in the loop to reduce memory reads and resulting contention and slow-down.

- Size of the buffer is 32 bytes, and is filled with 8 32-bit words on word alignment.
- When the requested data is not contained in the buffer (completely or partially), VCOP reads another 8 32-bit words from the first requested word.
- There is no sharing of data among separate load data buffers.

There is one common store data buffer, basically a shadow copy of all vector registers, for all the VST instructions in the loop to skew memory write timing to reduce memory contentions and resulting slow-down.

- The store data buffer is 16 × 8 × 40-bit in size.
- Vector registers are copied to the store data buffer at the end of i4 iteration, when there is any store to be performed for that iteration. In case stores are not all completed then, load and execution stages are stalled, until all stores are completed.
- Write data from multiple iterations of the same store instruction are not combined. For example, STB_NPT_ALWS causes a memory store of 8 bytes in each iteration.
- Write data from multiple stores of the loop, same iteration, are not combined.

Memory loads and stores are arbitrated for each memory port. There are three memory ports:

- WBUF: Dedicated to WBUF
- IBUFL: For IBULA and IBUFLB
- IBUFH: For IBUFHA and IBUFHB

Load store priorities are: force store > load > store. Force store is issued when the load and operation stages are stalled to free up the store stage so the hardware can advance to the next iteration. Other than force store, load has priority over normal store.

Example 8-9. 3-Tap Horizontal Filtering, Byte Type

```
      VLDB_DINTRLV  Pdata[a0], V0                ; data, starts from 0x10000 (IBUFLA)
      VLDB_1PT      Pcoef[a1], V2                ; coef, starts from 0x0 (WBUF)
      VMADD         V0, V2, V4, V4
||    VMADD         V1, V2, V5, V5
      VSTB_INTRLV   V4, Pout[a2], RND_SAT: rnd_sat_param ; output, start from 0x10400 (IBUFLA)
```

Table 8-365. Load and Store Buffering Example, Byte-Type Horizontal Filter

Cycle	LD stage	OP stage	ST stage
0	iter 0 LD0 need 0x10000..0x1000F, **read IBUFLA** LD0_buf = {0x10000..0x1001F} LD2 need 0x0, **read WBUF** LD2_buf = {0x0..0x1F}		
1	iter 1 LD0 need 0x10001..0x10010, from LD0_buf LD2 need 0x1, from LD2_buf	iter 0 MADD || MADD	
2	iter 2 LD0 need 0x10002..0x10011, from LD0_buf LD2 need 0x2, from LD2_buf	iter 1 MADD || MADD	iter 0
3	iter 3 LD0 need 0x10010..0x1001F, from LD0_buf LD2 need 0x0, from LD2_buf	iter 2 MADD || MADD	iter 1
4	iter 4 LD0 need 0x10011..0x10020, **read IBUFLA** LD0_buf = {0x10010..0x1002F} LD2 need 0x1, from LD2_buf	iter 3 MADD || MADD	iter 2 ST0 store 0x10400..0x1040F queue the store

Copyright © 2015–2020, Texas Instruments Incorporated

Table 8-365. Load and Store Buffering Example, Byte-Type Horizontal Filter (continued)

Cycle	LD stage	OP stage	ST stage
5	iter 5 LD0 need 0x10012..0x10021, from LD0_buf LD2 need 0x2, from LD2_buf	iter 4 MADD || MADD	iter 3 store IBUFLA
6	iter 6 LD0 need 0x10020..0x1002F, from LD0_buf LD2 need 0x0, from LD2_buf	iter 5 MADD || MADD	iter 4
7	iter 7 LD0 need 0x10021..0x10030, **read IBUFLA** LD0_buf = {0x10020..0x1003F} LD2 need 0x1, from LD2_buf	iter 6 MADD || MADD	iter 5 ST0 store 0x10410..0x1041F queue the store

Here LDB_DINTRLV is used to read 16 data points, to operate on 16 outputs in parallel. The hardware issues memory reads for iteration 0, 4, 7, etc, is able to supply data for subsequent hold data read in for subsequent LD; on average there is 1 read every 3 cycles. For coefficient, since only 3 bytes is used, just one read in iteration 0 is sufficient to supply data for the whole loop. Output is produced in iteration 2, 5, etc, and the store buffer delays the write until there is no read traction, avoiding read/write contention and slowdown.

Due to memory read/write timing, delayed slot in operation, and round/saturate feature in the store stage, the skew between load, operation, and store stages is more than what is shown in Table 8-365, but for calculating steady-state performance, simplified analysis like this is sufficient.

Example 8-10. Horizontal Filtering, Short Type

```
      VLDH_NPT      Pdata0[a0], V0              ; data, start from 0x10000 (IBUFLA)
      VLDH_NPT      Pdata1[a0], V2              ; data next row, start from 0x10080 (IBUFLA)
      VLDH_1PT      Pcoef[a1], V4               ; coef, start from 0x0 (WBUF)
      VMADD         V0, V4, V6, V6
||    VMADD         V2, V4, V7, V7
      VSTH_NPT      V6, Pout0[a2], RND_SAT: rnd_sat_param ; start from 0x10400 (IBUFLA)
      VSTH_NPT      V7, Pout1[a2], RND_SAT: rnd_sat_param ; start from 0x10480 (IBUFLA)
```

Software cannot issue VLDH_DINTRLV on odd halfwords, so use two LDH_NPT.

Table 8-366. Load and Store Buffering Example, Short-Type Horizontal Filter

Cycle	LD stage	OP stage	ST stage
0	iter 0 LD0 need 0x10000..0x1000F, **read IBUFLA** LD0_buf = {0x10000..0x1001F} LD1 need 0x10080 .. 0x1008F, **stalled** LD2 need 0..1, **read WBUF** LD2_buf = {0x0..0x1F}

Table 8-366. Load and Store Buffering Example, Short-Type Horizontal Filter (continued)

Cycle	LD stage	OP stage	ST stage
5	iter 4 LD0 need 0x10012..0x10021, **read IBUFLA** LD0_buf = {0x10010..0x1002F} LD1 need 0x10092 .. 0x100A1, **stall** LD2 need 2..3, from LD2_buf	iter 3 MADD || MADD	iter 2 ST0 store 0x10400..0x1040F ST0 queued ST1 store 0x10480..0x1048F ST1 queued
6	iter 4 LD1 **read IBUFLA** LD1_buf = {0x10090..0x100AF}	stalled	stalled
7	iter 5 LD0 need 0x10014..0x10023, from LD0_buf LD1 need 0x10094..0x100A3, from LD1_buf LD2 need 4..5, from LD2_buf	iter 4 MADD || MADD	iter 3 ST0 **write IBUFLA**
8	iter 6 LD0 need 0x10020..0x1002F, from LD0_buf LD1 need 0x100A0..0x100AF, from LD1_buf LD2 need 0..1, from LD2_buf	iter 5 MADD || MADD	iter 4 ST1 **write IBUFLA**
9	iter 7 LD0 need 0x10022..0x10031, **read IBUFLA** LD0_buf = {0x20..x3F} LD1 need 0x100A2..0x100B1, **stall** LD2 need 2..3, from LD2_buf	iter 6	iter 5 ST0 store 0x10410..0x1041F ST0 queuedST1 store 0x10490..0x1049F ST1 queued
10	iter 7 LD1 **read IBUFLA** LD1_buf = {0x100A0..0x100BF}	stalled	stalled

In this loop, with 2 VLDH_NPT to sustain 16 multiply-accumulates per iteration, the load stage stalled due to memory contention in IBUFL from the 2 loads. The read buffer supplies data for 2 subsequent iterations in steady state, leaving 2 memory-read free cycles every 3 iterations. With output writing back to IBUFL, the store buffer effectively delays the memory writes to use these free memory slots. Each i4 loop of 3 iterations thus takes 4 cycles to complete.

8.3.5.7 VCOP Per-Loop Overhead

For each vector command specifying a loop, several overhead components are present. In general, developers are encouraged to run place into each loop as much processing as possible and run as many iterations as possible to reduce the percentage of time spent on overhead.

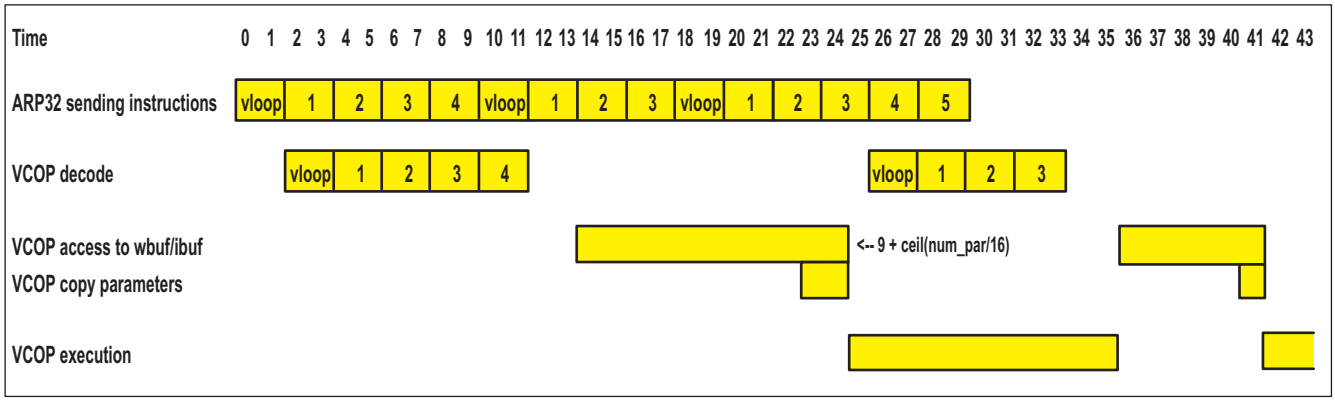
Overhead components are:

- Command decode time: it takes 2 cycles per instruction to decode, since scalar core is providing instructions at this rate. Command decode time can be hidden if ARP32 feeds these instructions while VCOP is executing a previous command.
- Parameter fetch time: it takes 9 + ceiling(num_param/16) cycles to fetch parameter from data memory (WBUF, IBUFL, or IBUFH).
- Execution pipeline ramp up/down time: it takes time to ramp up and down the long pipeline of VCOP. Minimal time for any loop is execution is about 17 cycles, due to the pipeline ramp up/down time.

Figure 8-70 shows a decode-parameter-fetch-execution time line.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 8-70. Example of Operation Delay Slots



- t = 0, ARP32 sends VLOOP, followed by VCOP instructions in the loop, instructions go into FIFO.
- t = 2, VCOP pulls instruction out of FIFO, recognizes VLOOP.
- t = 10 (depend on command length), VCOP pulls last instruction of loop from FIFO.
- t = 10, ARP32 sends next command, starting from VLOOP.
- t = 14, VCOP starts access to parameter memory, 16 parameters/cycle.
- t = 18, ARP32 keeps sending vector commands, until program stream switches to scalar code, or VCOP pre-decode instruction FIFO becomes full (capacity is 64 words).
- t = 23 (14 + 9), VCOP starts to copy parameters into decoded command buffer.
- t = 25 (after parameter copy), VCOP starts executing the loop.
- t = 26 (sync to 250-MHz clock), VCOP pulls instruction out of FIFO, recognizes VLOOP.
- t = 32 (depend on command length), VCOP pulls last instruction of loop from FIFO.
- t = 36 (after prev loop finishes executing), VCOP starts to access parameter memory.

This is for showing the dependency among activities; execution time here is not realistic; it takes minimally 17 cycles to execute any loop, due to the pipeline depth.

8.3.5.8 VCOP Error Handling

Upon detection of erroneous instruction code, parameter, load/store address, or loop in execution exceeding programmed max iteration count, VCOP signals the error by generating an interrupt and registering the error source in the MMR VCOP_ERROR. Refer to register manual for details.

Upon detection of error, VCOP:

1. Terminates current loop, leaving vloop_ptr, param_ptr, loop variables i0, i1, i2, i3, i4 in MMR.
2. Parses and clears vector instructions until encountering VWDONE.
3. Issues interrupt, assert vec_done = 1, deassert vec_rdy = 0 to block subsequent vector instructions.
4. Upon VCOP_ERROR status being cleared (by writing 1s to clear bits 10:0), VCOP becomes idle (assert VCOP_STATUS[2]VEC_RDY = 1) and ready to resume processing.
5. Alternatively, VCOP can be reset to resume processing.

Depending on the EVE-level memory switch setting, VCOP's access of the data memory space may be deemed invalid by the memory switch. When this happens, the memory switch signals VCOP to enter error handling state, as described above. VCOP does not send an error interrupt, as the memory switch is doing that (for invalid access from VCOP or from other masters).

8.3.5.9 Vector Operation Details

8.3.5.9.1 VABS

Assembly syntax:	**VABS** *src1*, *dst*
Operation:	Absolute value
Classification:	1-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = abs(src1);

8.3.5.9.2 VABSDIF

Assembly syntax:	**VABSDIF** *src1*, *src2*, *dst*
Operation:	absolute-difference
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = abs(src1 – src2);

8.3.5.9.3 VADD

Assembly syntax:	**VADD** *src1*, *src2*, *dst*
Operation:	addition
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 + src2;

8.3.5.9.4 VADDH

Assembly syntax:	**VADDH** *src1*, *src2*, *dst*
Operation:	Add high
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 + (src2 >> 32);

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.5 VADDSUB

Assembly syntax:	VADDSUB src1/dst1, src2/dst2
Operation:	Add-subtract
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst1 = src1 + src2; dst2 = src1 – src2;

8.3.5.9.6 VADD3

Assembly syntax:	**VADD3** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Add 3 items,
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst = src1 + src2 + src3;

8.3.5.9.7 VADIF3

Assembly syntax:	**VADIF3** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Add difference
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst = src1 – src2 + src3;

8.3.5.9.8 VAND

Assembly syntax:	**VAND** *src1*, *src2*, *dst*
Operation:	Bitwise and
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 & src2;

8.3.5.9.9 VANDN

Assembly syntax:	**VANDN** *src1*, *src2*, *dst*
Operation:	Bitwise and-not
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 & ~src2;

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.10 VAND3

Assembly syntax:	**VAND3** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Bitwise-and 3 items
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst3 = src1 & src2 & src3;

Using VAND3 accelerates a morphological erosion operation.

8.3.5.9.11 VBINLOG

Assembly syntax:	**VBINLOG** *src1*, *dst*
Operation:	Binary log
Classification:	1-input 1-output
Bit width:	32-bit
Delay slot:	one
C statement:	As follows

VBINLOG computes an approximate binary log, by detecting the left-most 1 bit in the input, encoding the bit position in bits 31..28, and left-justifying the following input bits in bits 27..0. The detected position of bit 31 is encoded as 15 (bit position minus 16), bit 30 as 14, and so on, and bit 17 as 1. If the left-most 1 bit is not found in bits 31..17, 0 is coded.

The VBINLOG operation is a non-standard floating point representation. Say a 32-bit integer x = 2^exp * (1 + frac/(2^28)), where exp and frac are integers. If (exp >= 16), binlog(x) = (exp – 16) * (2^28) + frac, concatenating the 4-bit adjusted exponent, exp – 16, with the 28-bit fraction. Otherwise, the representation is subnormal, leaving 0 in the exponent and bits 16..0 of input left-justified in the fraction part of output, bits 27..0.

For example, the number 0x0700_0000 has leading 1 in bit 26, so the bit position is coded as 26 – 16 = 10 = 0xA. The subsequent bits, two 1s immediately following the leading 1, left-justified in 28 bits or 7 hex digits, is 0xC00_0000. Thus the VBINLOG outcome of the number is 0xAC00_0000.

For a subnormal example, the number 0x8000 < 2^16 (is half of that), so its VBINLOG outcome is 0x0400_0000.

Figure 8-71. Binlog Function

Input of VBINLOG is 32-bit, and so is the outcome, not 40-bit. VLMBD supports full 40-bit input range leading bit detection. VBINLOG is useful in compressing dynamic range and preserving precision. VBINLOG followed by table lookup can be used to produce the reciprocal of a number.

8.3.5.9.12 VBITC

Assembly syntax:	**VBIT** *src1*, *dst*
Operation:	Bit count
Classification:	1-input 1-output
Bit width:	32-bit
Delay slot:	one
C statement:	As follows

Count number of “1” bits in src1[31:0].

8.3.5.9.13 VBITDI

Assembly syntax:	**VBITDI** *src1*, *dst1*, *dst2*
Operation:	Bit deinterleave
Classification:	1-input 2-output
Bit width:	32-bit
Delay slot:	0
C statement:	As follows

Bit deinterleave is basically the inverse of bit interleave (VBITI).

For example,

```
src1 = 0x523(0000_0000_0000_0000_0000_1001_0010_0011)
```

Results in:

```
dst1 = 0x25 (0000_0000_0010_0101),
dst2 = 0x11(0000_0000_0001_0001)
```

8.3.5.9.14 VBITI

Assembly syntax:	**VBITI** *src1*, *src2*, *dst*
Operation:	Bit interleave
Classification:	2-input 1-output
Bit width:	32-bit
Delay slot:	one
C statement:	As follows

Bit interleave 16 LSBs of src1 and src2 (each), and write to dst.

For example,

```
src1 = 0x25 (0000_0000_0010_0101)
src2 = 0x11(0000_0000_0001_0001)
```

Results in:

```
dst = 0x523(0000_0000_0000_0000_0000_1001_0010_0011)
```

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.15 VBITPK

Assembly syntax:	**VBITPK** *src1*, *src2*, *dst*
Operation:	Bit-pack
Classification:	2-input 1-output
Bit width:	33-bit
Delay slot:	one
C statement:	As follows

Pack boolean (src1[i] >= src2[i]) into bits in dst[0], and broadcast dst[0] to all SIMD lanes so that dst[j] = dst[0], 1 <= j <= NSIMD.

VBITPK is useful in accessing bit-packed data (binary images).

8.3.5.9.16 VBITR

Assembly syntax:	**VBITR** *src1*, *dst*
Operation:	Bit reverse
Classification:	1-input 1-output
Bit width:	32-bit
Delay slot:	one
C statement:	As follows

Reverse bits in src1[31:0] and write to dst.

8.3.5.9.17 VBITTR

Assembly syntax:	**VBITTR** *src1*, *dst*
Operation:	Bit transpose
Classification:	1-input 1-output
Bit width:	NSIMD-bit
Delay slot:	one

VBITTR, bit transpose, also called corner turn, takes N × N bits in the source, from N LSBs of each of the N registers, and transpose them. Here is an example:

Input:

		Bit position			
Lane	**Value**	**0**	**1**	**2**	**3**
0	1	1	0	0	0
1	2	0	1	0	0
2	3	1	1	0	0
3	4	0	0	1	0

Output:

		Bit position			
Lane	**Value**	**0**	**1**	**2**	**3**
0	5	1	0	1	0
1	6	0	1	1	0
2	8	0	0	0	1
3	0	0	0	0	0

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.18 VBITUNPK

Assembly syntax:	**VBITUNPK** *src1*, *src2*, *dst*
Operation:	Bit-unpack
Classification:	2-input 1-output
Bit width:	33-bit
Delay slot:	one
C statement:	As follows

Unpack bits in src1[0]. Set dst[i] = src2[i] if the unpacked bit to lane i is 1, otherwise dst[i] = 0.

8.3.5.9.19 VCMOV

Assembly syntax:	**VCMOV** *cond*, *src1*[, *src2*|*dst*]
Operation:	Conditional move
Classification:	special
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

cond = {I1234_ZERO, I234_ZERO, I34_ZERO, LAST_I4_ZERO, LAST_I34, LAST_I234, LAST_I1234}.

Move src1 to dst in the iterations designated by cond. This is parallel move within each SIMD lane; dst[i] = src1[i] when condition is true. Otherwise, dst[i] = src2[i]. By always writing to the dst register, dst register does not need to be {V0, V1, V2, V3} (see Section 8.3.5.5.6 for details on the store-without-being destination register constraint).

8.3.5.9.20 VCMPEQ

Assembly syntax:	**VCMPEQ***src1*, *src2*, *dst*
Operation:	Compare equal
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = (src1 == src2) ? 1 : 0;

8.3.5.9.21 VCMPGE

Assembly syntax:	**VCMPGE** *src1*, *src2*, *dst*
Operation:	Compare greater-than-or-equal
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = (src1 >= src2) ? 1 : 0;

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.22 VCMPGT

Assembly syntax:	**VCMPGT** *src1*, *src2*, *dst*
Operation:	Compare greater-than
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = (src1 > src2) ? 1 : 0;

8.3.5.9.23 VDINTRLV

Assembly syntax:	**VDINTRLV** {*src1*|*dst1*}, {*src2*|*dst2*}
Operation:	Deinterleave
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VDINTRLV is basically the inverse of VINTRLV.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst2[0] = src1[1];
dst1[1] = src1[2];
dst2[1] = src1[3];
dst1[2] = src1[4];
dst2[2] = src1[5];
dst1[3] = src1[6];
dst2[3] = src1[7];
dst1[4] = src2[0];
dst2[4] = src2[1];
dst1[5] = src2[2];
dst2[5] = src2[3];
dst1[6] = src2[4];
dst2[6] = src2[5];
dst1[7] = src2[6];
dst2[7] = src2[7];
```

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.24 VDINTRLV2

Assembly syntax:	**VDINTRLV2** {*src1*|*dst1*}**,** {*src2*|*dst2*}
Operation:	Deinterleave with 2-element frequency
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VDINTRLV2 is basically the inverse of VINTRLV2.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst1[1] = src1[1];
dst2[0] = src1[2];
dst2[1] = src1[3];
dst1[2] = src1[4];
dst1[3] = src1[5];
dst2[2] = src1[6];
dst2[3] = src1[7];
dst1[4] = src2[0];
dst1[5] = src2[1];
dst2[4] = src2[2];
dst2[5] = src2[3];
dst1[6] = src2[4];
dst1[7] = src2[5];
dst2[6] = src2[6];
dst2[7] = src2[7];
```

8.3.5.9.25 VEXITNZ

Assembly syntax:	**VEXITNZ** *level***,** *src1*
Operation:	Exit upon non-zero
Classification:	special
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VEXITNZ is for early termination of VLOOP or in the repeat-loop level. The designated src1 register's 0th way is examined every time the instruction executes, and if it is not zero, the hardware terminates either at VLOOP level or at VRPT level, as indicated by the level parameter.

Parameter src1 is examined at the time the instruction executes, and an exit/no-exit decision is made. However, any exit/no-exit action is not taken immediately. For VEXITNZ VLOOP, subsequent instructions in the same iteration, remaining operations and all the stores, are executed, then the loop terminates. For VEXITNZ VRPT; all subsequent instructions in the same loop are executed, including the rest of the iteration, and all remaining iterations until i1, i2, i3, i4 all run to respective end counts, then the repeated loop terminates.

There can only be one VEXITNZ in each vector command; no mixing of VEXITNZ VLOOP and VEXITNZ VRPT. When the vector command is not repeated (RPT_END = 0), VEXITNZ VRPT behaves like VEXITNZ VLOOP.

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.26 VINTRLV

Assembly syntax:	**VINTRLV** {*src1*|*dst1*}**,** {*src2*|*dst2*}
Operation:	Interleave
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VINTRLV is basically interleaving among SIMD lanes.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst1[1] = src2[0];
dst1[2] = src1[1];
dst1[3] = src2[1];
dst1[4] = src1[2];
dst1[5] = src2[2];
dst1[6] = src1[3];
dst1[7] = src2[3];
dst2[0] = src1[4];
dst2[1] = src2[4];
dst2[2] = src1[5];
dst2[3] = src2[5];
dst2[4] = src1[6];
dst2[5] = src2[6];
dst2[6] = src1[7];
dst2[7] = src2[7];
```

8.3.5.9.27 VINTRLV2

Assembly syntax:	**VINTRLV2** {*src1*|*dst1*}**,** {*src2*|*dst2*}
Operation:	Interleave with 2-element frequency
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VINTRLV is basically interleaving among SIMD lanes.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst1[1] = src1[1];
dst1[2] = src2[0];
dst1[3] = src2[1];
dst1[4] = src1[2];
dst1[5] = src1[3];
dst1[6] = src2[2];
dst1[7] = src2[3];
dst2[0] = src1[4];
dst2[1] = src1[5];
dst2[2] = src2[4];
dst2[3] = src2[5];
dst2[4] = src1[6];
dst2[5] = src1[7];
dst2[6] = src2[6];
dst2[7] = src2[7];
```

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.28 VINTRLV4

Assembly syntax:	**VINTRLV4** {*src1*|*dst1*}**,** {*src2*|*dst2*}
Operation:	Interleave with 4-element frequency
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VINTRLV is basically interleaving among SIMD lanes.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst1[1] = src1[1];
dst1[2] = src1[2];
dst1[3] = src1[3];
dst1[4] = src2[0];
dst1[5] = src2[1];
dst1[6] = src2[2];
dst1[7] = src2[3];
dst2[0] = src1[4];
dst2[1] = src1[5];
dst2[2] = src1[6];
dst2[3] = src1[7];
dst2[4] = src2[4];
dst2[5] = src2[5];
dst2[6] = src2[6];
dst2[7] = src2[7];
```

8.3.5.9.29 VLMBD

Assembly syntax:	**VLMBD** *src1***,** *src2***,** *dst*
Operation:	Left-most bit detect
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	As follows

Depending on src2 being zero or not, VLMBD searches for 0 or 1 in src1, starting from bit 39. Bit position where the first 0 or 1 occurs is returned, and -1 is returned if it's not found.

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.30 VMADD

Assembly syntax:	**VMADD** *src1*, *src2*, *src3*, *dst*, **RND:** *rnd_param* (dst same as src3)
Operation:	Multiply-add
Classification:	3-input 1-output
Bit width:	17-bit src1/src2, 40-bit src3/dst
Delay slot:	2 delay from src1/src2, 1 delay from src3
C statement:	dst = src3 + round_or_shift(src1 * src2, rnd_param)

The RND field specifies a parameter, in which additional fields are read to support built-in round/shift feature in the operation:

Figure 8-72. VMPY, VMADD and VMSUB Rounding Parameters

Parameter Indexed by rnd_param

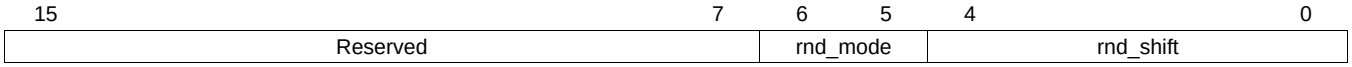

Table 8-367. Parameter Indexed by rnd_param Field Descriptions

Bits	Name	Description	
15-7	Reserved		
6-5	rnd_mode	Sets rounding mode:	
		0	No rounding
		1	Round
		2	Truncate
		3	Left-shift
4-0	rnd_shift	Number of bits to round/shift, limited to:	
		{8|15|16}	Round/truncate
		1	Left-shift

When rnd_mode = round or truncate, src1 * src2 is rounded down before the addition or subtraction. When rnd_mode = left-shift, src1 * src2 is shifted up before the addition or subtraction. Note the restriction on the number of bits to shift.

8.3.5.9.31 VMAX

Assembly syntax:	**VMAX** *src1*, *src2*, *dst*
Operation:	Maximum
Classification:	2-input 1-output
Bit width:	33-bit
Delay slot:	no
C statement:	dst = (src1 > src2) ? src1 : src2;

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.32 VMAXSETF

Assembly syntax:	**VMAXSETF** *src1*, {*src2*|*dst1*}, *dst2*
Operation:	Maximum and set flag
Classification:	2-input 2-output
Bit width:	33-bit
Delay slot:	no
C statement	dst1 = max(src1, src2); dst2 = (src1>src2) ? 1:0

8.3.5.9.33 VMIN

Assembly syntax:	**VMIN** *src1*, *src2*, *dst*
Operation:	Minimum
Classification:	2-input 1-output
Bit width:	33-bit
Delay slot:	no
C statement:	dst = (src1 < src2) ? src1 : src2;

8.3.5.9.34 VMINSETF

Assembly syntax:	**VMINSETF** *src1*, {*src2*|*dst1*}, *dst2*
Operation:	Minimum and set flag
Classification:	2-input 2-output
Bit width:	33-bit
Delay slot:	
C statement:	dst1 = min(src1, src2); dst2 = (src1 < src2) ? 1 : 0;

8.3.5.9.35 VMPY

Assembly syntax:	**VMPY** *src1*, *src2*, *dst*, **RND:** *rnd_param*
Operation:	multiply
Classification:	2-input 1-output
Bit width:	17-bit input, 40-bit output
Delay slot:	one
C statement:	dst = round_or_shift(src1 * src2, rnd_param);

See VMADD for the RND field.

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.36 VMSUB

Assembly syntax:	**VMSUB** *src1*, *src2*, *src3*, *dst*, **RND:** *rnd_param* (dst same as src3)
Operation:	Multiply-subtract
Classification:	3-input 1-output
Bit width:	17-bit src1/src2, 40-bit src3/dst
Delay slot:	2 delay from src1/src2, 1 delay from src3
C statement:	dst = src3 - round_or_shift(src1 * src2, rnd_param);

See VMADD for the RND field.

8.3.5.9.37 VNOP

Assembly syntax:	**VNOP**
Operation:	no operation
Classification:	n/a
Bit width:	n/a
Delay slot:	no
C statement:	n/a

NOP is used to pad the two operations per clock cycle operation pipeline, so the next operation is mapped to functional unit 1. This is used to align data dependency to within functional unit 0 or 1, to avoid idle cycles being inserted by hardware.

8.3.5.9.38 VNOT

Assembly syntax:	**VNOT** *src1*, *dst*
Operation:	Bitwise complement
Classification:	1-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = ~src1;

8.3.5.9.39 VOR

Assembly syntax:	**VOR** *src1*, *src2*, *dst*
Operation:	Bitwise or
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 | src2;

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.40 VOR3

Assembly syntax:	**VOR3** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Bitwise-or 3 items
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst3 = src1 | src2 | src3;

Using VOR3 accelerates the morphological dilation operation.

8.3.5.9.41 VRND

Assembly syntax:	**VRND** *src1*, *src2*, *dst*
Operation:	Round src1 by number of bits expressed in src2
Classification:	2-input 1-output
Bit width:	40-bit src1/dst, 5-bit src2, allowing rounding by 0 ~ 31 bits
Delay slot:	one
C statement:	rnd_add = (src2 > 0) ? (1 << (src2 – 1)) : 0; dst = (src1 + rnd_add) >> src2;

A half-unit is added before the right-shift. For example, if src2 = 8, dst = (src1 + 128) >> 8.

Only src2[4:0] are read, so for example src2 = 40 causes a rounding by 8 bits, since src2[4:0] = 0x08.

8.3.5.9.42 VSAD

Assembly syntax:	**VSAD** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Sum of absolute difference, dst = |src1 – src2| + src3
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst = src3 + abs(src1 – src2);

8.3.5.9.43 VSEL

Assembly syntax:	**VSEL** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Select
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 ? src2 : src3;

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.44 VSHF

Assembly syntax:	**VSHF** *src1*, *src2*, *dst*
Operation:	Arithmetic shift, shift left when src2 > 0, shift right by –src2 when src2 < 0
Classification:	2-input 1-output
Bit width:	40-bit src1/dst, 6-bit src2, allowing shifting by -32 ~ 31 bits
Delay slot:	no
C statement:	dst = (src2 >= 0) ? (src1 << src2) : (src1 >> –src2);

VSHF is an arithmetic shift, not logic shift, compared to conventional instruction sets that have both options. This is because VCOP performs sign extension in the load stage, and all signed/unsigned 8/16/32-bit operations are carried out with the 40-bit register file.

Only src2[5:0] are read, so for example src2 = 32 causes a right-shift by 32 bits, since src2[5:0] = 0x20.

8.3.5.9.45 VSHFOR

Assembly syntax:	**VSHFOR** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Shift-or
Classification:	3-input 1-output
Bit width:	40-bit src1/src3, 6-bit src2
Delay slot:	one
C statement:	dst3 = (src2 >= 0) ? (src3 | (src1 << src2)) : (src3 | (src1 >> –src2));

See VSHF for the supported range of src2.

8.3.5.9.46 VSHF16

Assembly syntax:	**VSHF16** *src1*, *dst2*, *dst2*
Operation:	Shift-up 16 bits
Classification:	1-input 2-output
Bit width:	33-bit src1
Delay slot:	no
C statement:	dst1 = (src1 & 0xffff) << 16;dst2 = src1 >> 16;

Shift up src1 by 16 bits, producing two destinations to hold the outcome, dst1 having the lower unsigned 32-bit, and dst2 having the signed upper portion, sign extended from src1[32] to full 40 bits in dst2.

VSHF16 is useful for 32 × 32 multiplication.

8.3.5.9.47 VSIGN

Assembly syntax:	**VSIGN** *src1*, *src2*, *dst*
Operation:	Sign
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = (src1 == 0) ? 0 :((src1 > 0) ? src2 : –src2);

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.5.9.48 VSORT2

Assembly syntax:	**VSORT2** *src1*, *src2*, *dst*
Operation:	Sort two items
Classification:	2-input 2-output
Bit width:	33-bit
Delay slot:	no
C statement:	dst1 = min(src1, src2); dst2 = max(src1, src2);

8.3.5.9.49 VSUB

Assembly syntax:	**VSUB** *src1*, *src2*, *dst*
Operation:	Subtraction
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 – src2;

8.3.5.9.50 VSWAP

Assembly syntax:	**VSWAP** *cond*, {*src1*|*dst1*}, {*src2*|*dst2*}
Operation:	Conditional swap
Classification:	3-input 2-output
Bit width:	1-bit cond, 40-bit src1 & src2
Delay slot:	no
C statement:	if (cond & 1) swap(src1, src2)

Only the LSB of the vector register indicated by cond is checked. A swap/no-swap decision is made in each SIMD lane using the LSB of cond register in the lane.

8.3.5.9.51 VXOR

Assembly syntax:	**VXOR** *src1*, *src2*, *dst*
Operation:	Bitwise exclusive-or
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 ^ src2;

Copyright © 2015–2020, Texas Instruments Incorporated

8.3.6 Debug Support

VCOP supports single stepping, one innermost (i4) iteration per step. Due to the deeply pipelined architecture, instruction-by-instruction single stepping support is not feasible.

Normally VCOP executes load in one stage of the pipeline, and operations and stores in the next stage of the pipeline. In single step mode, only one iteration is executed at a time, so there is no pipelining among iterations. The hardware executes all the loads, then operations and stores, then halts until instructed to continue on the next iteration. The signle step operation is controlled via the VCOP_CTRL register. The operation is enabled by setting VCOP_CTRL[0]STEP_EN to 1. Setting VCOP_CTRL[1]STEP_GO to 1 the engine starts executing i4 iteration.

As outlined in the previous section, step_en, step_go, step_rdy register fields are provided for single stepping control. In addition, VCOP internal state is exported as read-only view as memory-map registers as well.

Interaction of debug driver, scalar core, and VCOP is as follows:

1. Debug driver enables debug mode by setting VCOP_CTRL[0]STEP_EN = 1 and wait for VCOP_STATUS[0]STEP_RDY = 1.
2. Scalar core sends the vector command to be single-stepped the normal fashion.
3. Vector core executes the vector command and stalls at the end of the first i4 iteration and assert sVCOP_STATUS[0]STEP_RDY.
4. When VCOP_STATUS[0]STEP_RDY =1, debug driver accesses buffer switch and switch WBUF, IBUFL/H memories to system bus.
5. Debug driver read out the memory contents to refresh on the debugger user interface.
6. Debug driver read out VCOP internal state to refresh on the debugger user interface.
7. Debug driver accesses buffer switch and switch memories to VCOP.
8. Debug driver triggers VCOP to take the next step by writing ‘1’ to step_go, and wait for VCOP_STATUS[0]STEP_RDY = 1.
9. Repeat 3 through 8, until completion of the vector command or user input to stop single-stepping.
10. The debug driver disables the debug mode by setting VCOP_CTRL[0]STEP_EN = 0.
11. VCOP and scalar core continue to operate.

Video Input Port

This chapter describes the Video Input Port (VIP) module for the device.

Topic **Page**

9.1	**VIP Overview**	**2159**
9.2	**VIP Environment**	**2161**
9.3	**VIP Integration**	**2168**
9.4	**VIP Functional Description**	**2170**
9.5	**VIP Register Manual**	**2316**

Copyright © 2015–2020, Texas Instruments Incorporated

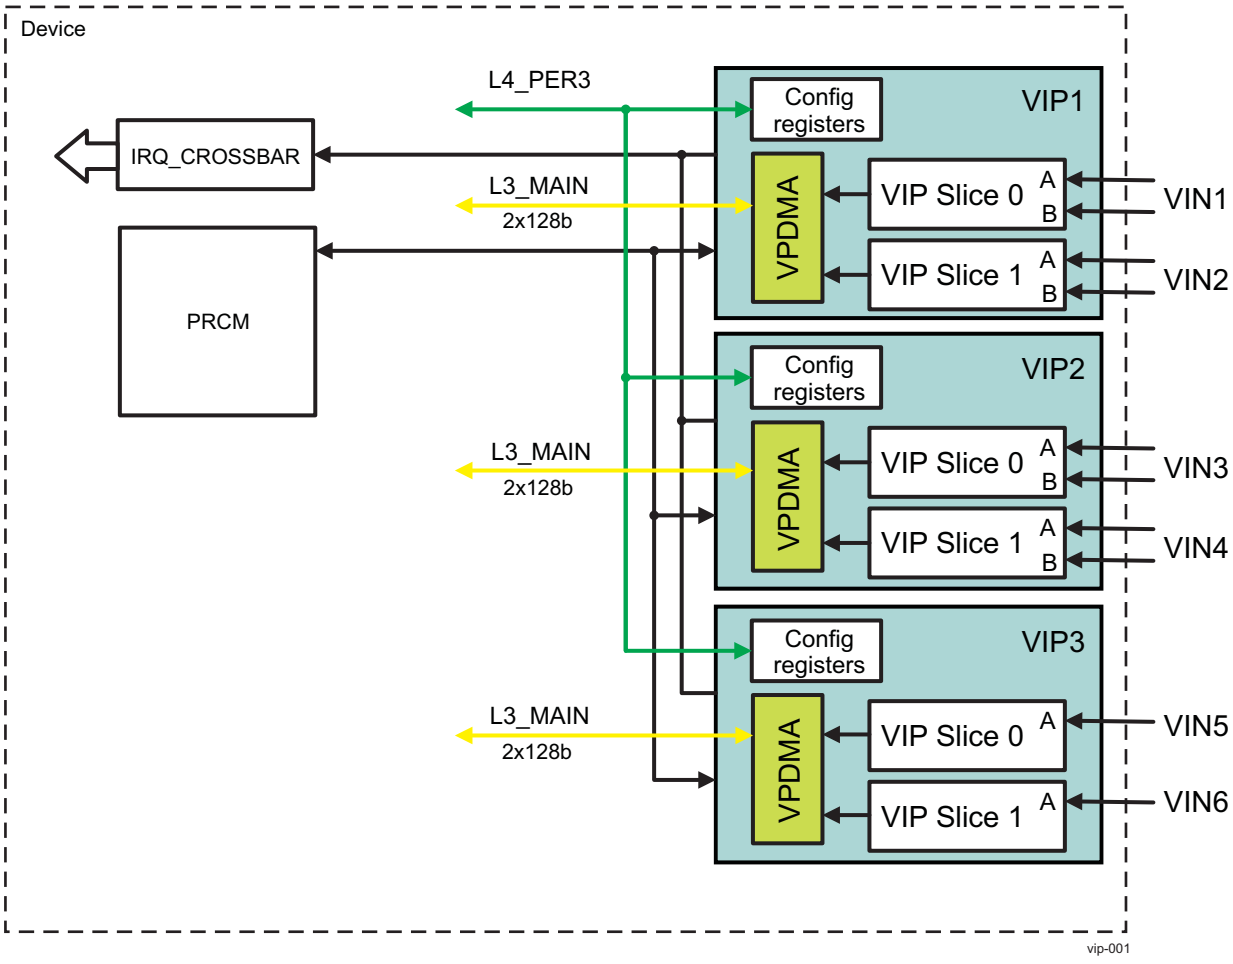
9.1 VIP Overview

NOTE: This chapter describes a module (subsystem) in the superset device. The available number of instances and supported set of features is device part number dependent. Refer to device Data Manual, for more information.

The VIP module provides video capture functions for the device. VIP incorporates a multi-channel raw video parser, various video processing blocks, and a flexible Video Port Direct Memory Access (VPDMA) engine to store incoming video in various formats. The device integrates three instantiations of the VIP module giving the ability of capturing up to ten video streams.

Figure 9-1 shows a block diagram with the VIP modules within the device.

Figure 9-1. VIP Overview



A VIP module includes the following main features:

- Two independently configurable external video input capture slices (Slice 0 and Slice 1) each providing up to two video input ports, Port A and Port B:
  - Port A can be configured as a 24/16/8-bit port. Port A of VIP3 slices provides only 16-bit interface.
  - Port B is a fixed 8-bit port. Port B of VIP3 slices is not used.
  - At device level, the same device pads may be shared between Port A and Port B of each slice. For more information, see the multiplexing characteristics in device Data Manual.
- Each video Port A can be operated as a port with clock independent input channels (with interleaved or separated Y/C data input). Embedded sync and external sync modes are supported for all input configurations.

Copyright © 2015–2020, Texas Instruments Incorporated

- Support for a single external asynchronous pixel clock, up to 165MHz per port.
- Pixel Clock Input Domain Port A supports up to one 24-bit input data bus, including BT.1120 style embedded sync for 16-bit and 24-bit data.
- Embedded Sync data interface mode supports single or multiplexed sources
- Discrete Sync data interface mode supports only single source input
- 24-bit data input plus discrete syncs can be configured to include:
  - 8-bit YUV422 (Y and U/V time interleaved)
  - 16-bit YUV422 (CbY and CrY time interleaved)
  - 24-bit YUV444
  - 16-bit RGB565
  - 24-bit RGB888
  - 12/16-bit RAW Capture
  - 24-bit RAW capture
- Discrete sync modes include:
  - VSYNC + HSYNC (FID determined by FID signal pin or HSYNC/VSYNC skew)
  - VSYNC + ACTVID + FID
  - VBLANK + ACTVID (ACTVID toggles in VBLANK) + FID
  - VBLANK + ACTVID (no ACTVID toggles in VBLANK) + FID
- Multichannel parser (embedded syncs only):
  - Embedded syncs only
  - Pixel (2x or 4x) or Line multiplexed modes supported
  - Performs demultiplexing and basic error checking
  - Supports maximum of 9 channels in Line Mux (8 normal + 1 split line)
- Ancillary data capture support:
  - For 16-bit or 24-bit input, ancillary data may be extracted from any single channel
  - For 8-bit time interleaved input, ancillary data can be chosen from the Luma channel, the Chroma channel, or both channels
  - Horizontal blanking interval data capture only supported when using discrete syncs (VSYNC + HSYNC or VSYNC + HBLANK)
  - Ancillary data extraction supported on multichannel capture as well as single source streams
- Format conversion and scaling:
  - Programmable color space conversion
  - YUV422 to YUV444 conversion
  - YUV444 to YUV422 conversion
  - YUV422 to YUV420 conversion
  - YUV444 Source: YUV444 to YUV444, YUV444 to RGB888, YUV444 to YUV422, YUV444 to YUV420
  - RGB888 Source: RGB888 to RGB888, RGB888 to YUV444, RGB888 to YUV422, RGB888 to YUV420
  - YUV422 Source: YUV422 to YUV422, YUV422 to YUV420, YUV422 to YUV444, YUV422 to RGB888
  - Supports RAW to RAW (no processing)
  - Scaling and format conversions do not work for multiplexed input
- Supports up to 2047 pixels wide input - when scaling is engaged
- Supports up to 3840 pixels wide input - when only chroma up/down sampling is engaged, without scaling
- Supports up to 4095 pixels wide input - without scaling and chroma up/down sampling

Copyright © 2015–2020, Texas Instruments Incorporated

- The maximum supported input resolution is further limited by:
  - Pixel clock and feature-dependent constraints
  - For RGB24-bit format (RAW data), the maximum frame width is limited to 2730 pixels

A VPDMA module includes the following main features:

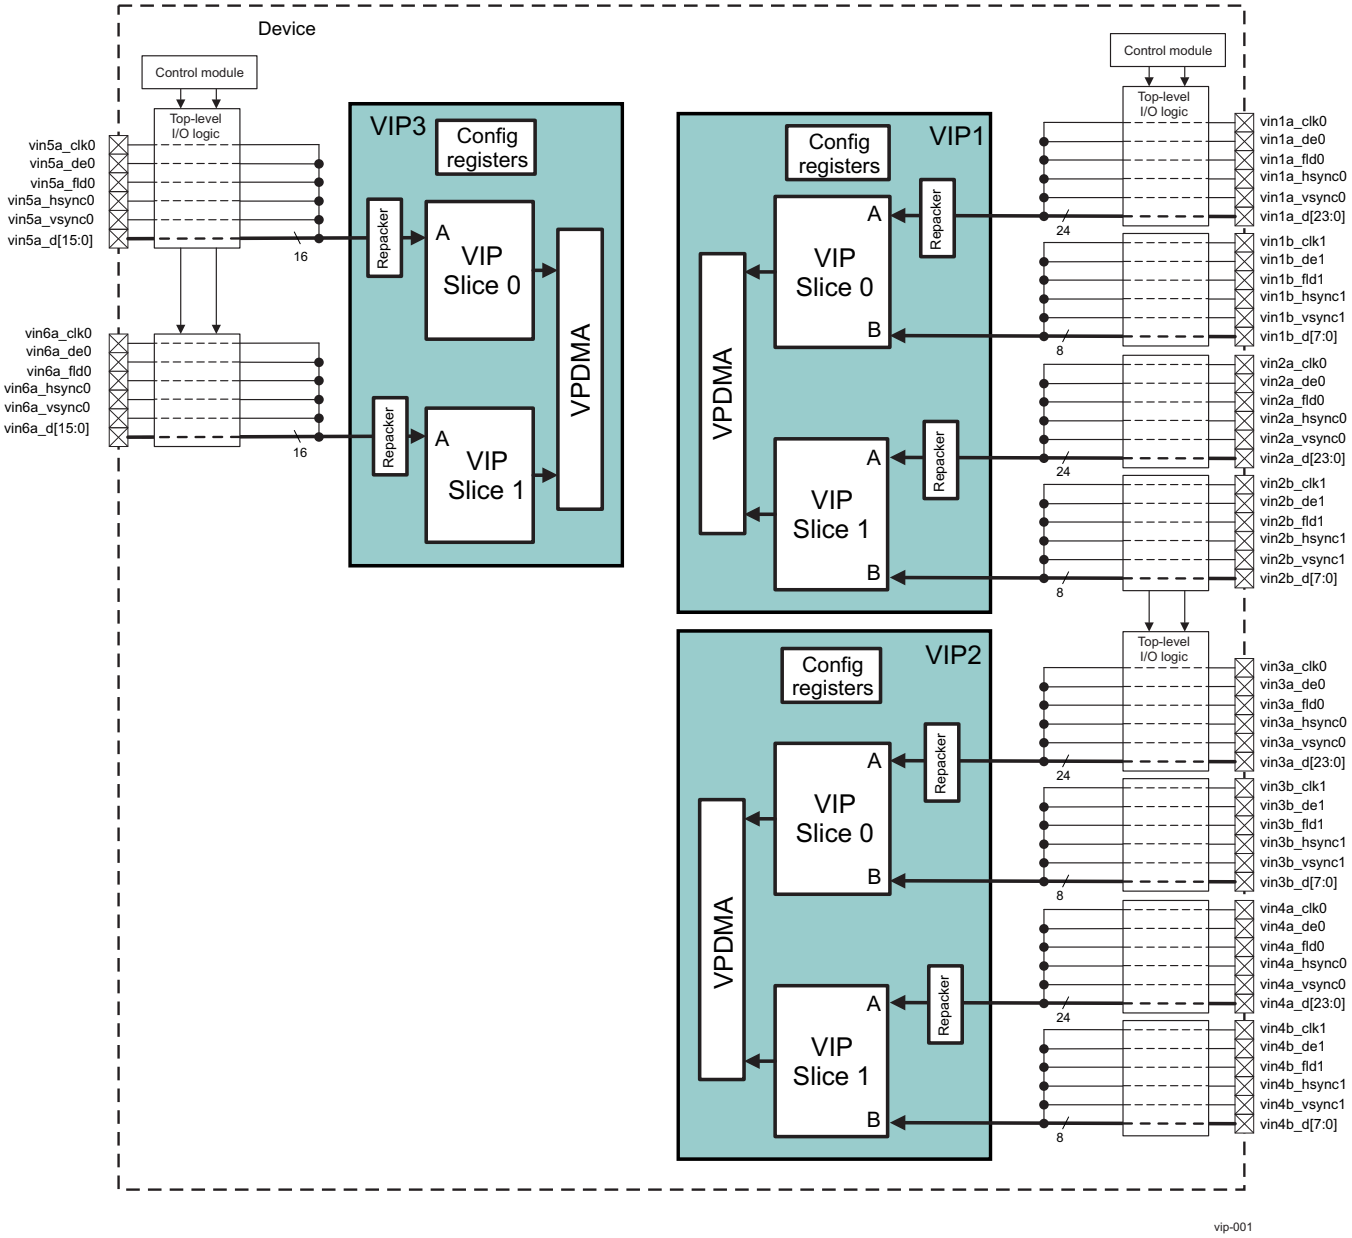
- VPDMA output buffer size restriction feature, which ensures that writes do not exceed allocated memory buffer size
- Support for Tiled (2D) and raster addressing without bandwidth penalty
- Dual clients per channel allows for capture of scaled and nonscaled versions of the data stream (non-multiplexed mode only)
- Start on new frame capability
- Interrupt every X number of frames
- Interrupt every X lines (synced to frame start)
- Dynamic MFLAG generation

9.2 VIP Environment

This section describes the VIP modules from an environment point of view (external connections). It describes the VIP connectivity options and lists all possible interfaces. Figure 9-2 is a block diagram of the VIP environment.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-2. VIP Environment



NOTE: VIP3 does not include port B, and VIP3 Port A can be configured up to 16 bits, for each slice.

NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to different pads of the device and is programmable in the device Control Module registers and/or dedicated module registers. For more information, see Section 18.4.6.1.1, *Pad Configuration Registers* in Chapter 18, *Control Module*.

Table 9-1. VIP1 Interface Signals

Sub-module Name	Signal Name	Type[1]	Description
Slice 0	vin1a_d[23:0]	I	Pixel data.
Port A	vin1a_clk0	I	Pixel clock.
	vin1a_vsync0	I	Vertical synchronization.
	vin1a_hsync0	I	Horizontal synchronization.
	vin1a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin1a_fld0	I	The FID signal indicates the field identifier for the video input field: • 0 means even. • 1 means odd.
Slice 0	vin1b_d[7:0]	I	Pixel data.
Port B	vin1b_clk1	I	Pixel clock.
	vin1b_vsync1	I	Vertical synchronization.
	vin1b_hsync1	I	Horizontal synchronization.
	vin1b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin1b_fld1	I	The FID signal indicates the field identifier for the video input field: • 0 means even. • 1 means odd.
Slice 1	vin2a_d[23:0]	I	Pixel data.
Port A	vin2a_clk0	I	Pixel clock.
	vin2a_vsync0	I	Vertical synchronization.
	vin2a_hsync0	I	Horizontal synchronization.
	vin2a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin2a_fld0	I	The FID signal indicates the field identifier for the video input field: • 0 means even. • 1 means odd.
Slice 1	vin2b_d[7:0]	I	Pixel data.
Port B	vin2b_clk1	I	Pixel clock.
	vin2b_vsync1	I	Vertical synchronization.
	vin2b_hsync1	I	Horizontal synchronization.
	vin2b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.

vinXa_d1	Blue 1	-	Cr1	Cb1/Cr1/...	Cb1/Y1/Cr1/...
vinXa_d0	Blue 0 (LS bit)	-	Cr0 (LS bit)	Cb0/Cr0/... (LS bit)	Cb0/Y0/Cr0/... (LS bit)

(1) Chroma is time division multiplexed (interleaved). For more details, see Section 9.4.5.6.2, *16b Interface Mode*.
(2) Luma and Chroma are time division multiplexed (interleaved). For more details, see Section 9.4.5.6.1, *8b Interface Mode*.

NOTE: 16-bit RGB data can be captured also on the vinXa_d[15:0] input data bus of Port A. In this case, the 16-bit RGB data captured by the VIP_PARSER will be passed to VPDMA, as if it is a 16-bit YUV data. The VIP_MAIN[1:0] DATA_INTERFACE_MODE register bit-field must be configured for a 16-bit input mode. The VPDMA will then directly store this data in memory as a 16-bit data, provided that any 16-bit data type in the VPDMA outbound descriptor is set.

Table 9-5. VIP Port B Input Data Signals to YUV Color Components Mapping

9.3 VIP Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests. Figure 9-3summarizes the integration of the module in the device.

Figure 9-3. VIP Integration

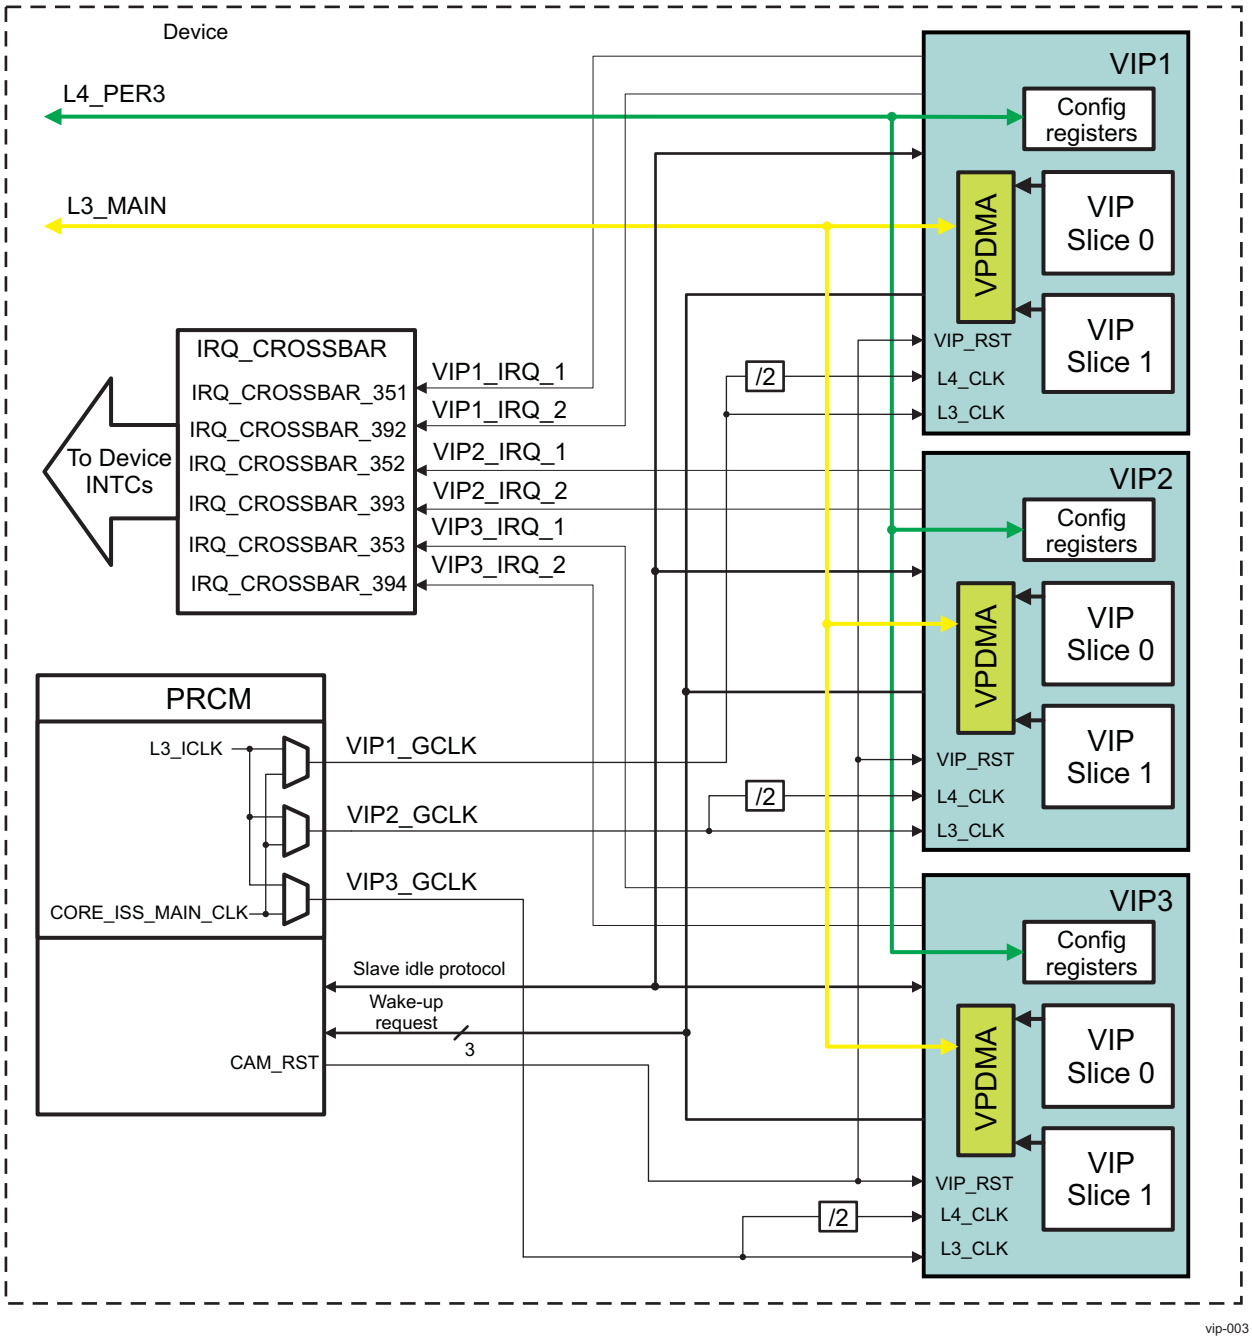

Table 9-6 and Table 9-7 list the integration attributes and clock and resets, respectively.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-6. VIP Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
VIP1 VIP2 VIP3	PD_CAM	L4_PER3 for configuration L3_MAIN for data (through VPDMA module)

Table 9-7. VIP Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
VIP1	L3_CLK PROC_CLK	VIP1_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VIP subsystem uses this clock to fetch external data and transfer this data to internal processing PROC_CLK is the clock used to drive data processing within the VIP subsystem.
	L4_CLK	VIP1_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus
VIP2	L3_CLK PROC_CLK	VIP2_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VIP subsystem uses this clock to fetch external data and transfer this data to internal processing PROC_CLK is the clock used to drive data processing within the VIP subsystem.
	L4_CLK	VIP2_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus
VIP3	L3_CLK PROC_CLK	VIP3_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VIP subsystem uses this clock to fetch external data and transfer this data to internal processing PROC_CLK is the clock used to drive data processing within the VIP subsystem.
	L4_CLK	VIP3_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
VIP1	VIP_RST	CAM_RST	PRCM	VIP1 Reset
VIP2	VIP_RST	CAM_RST	PRCM	VIP2 Reset
VIP3	VIP_RST	CAM_RST	PRCM	VIP3 Reset

Table 9-8. VIP Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-8. VIP Hardware Requests (continued)

VIP1	VIP1_IRQ1	IRQ_CROSSBAR_351	N/A	VIP1 interrupt requests. These IRQ source signals are not mapped by default to any device INTC.
	VIP1_IRQ2	IRQ_CROSSBAR_392	N/A	
VIP2	VIP2_IRQ1	IRQ_CROSSBAR_352	N/A	VIP2 interrupt requests. These IRQ source signals are not mapped by default to any device INTC.
	VIP2_IRQ2	IRQ_CROSSBAR_393	N/A	
VIP3	VIP3_IRQ1	IRQ_CROSSBAR_353	N/A	VIP3 interrupt requests. These IRQ source signals are not mapped by default to any device INTC.
	VIP3_IRQ2	IRQ_CROSSBAR_394	N/A	

NOTE: The "**Default Mapping**" column in Table 9-8 *VIP Hardware Requests* shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.
For more information about the IRQ_CROSSBAR module, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.
For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.

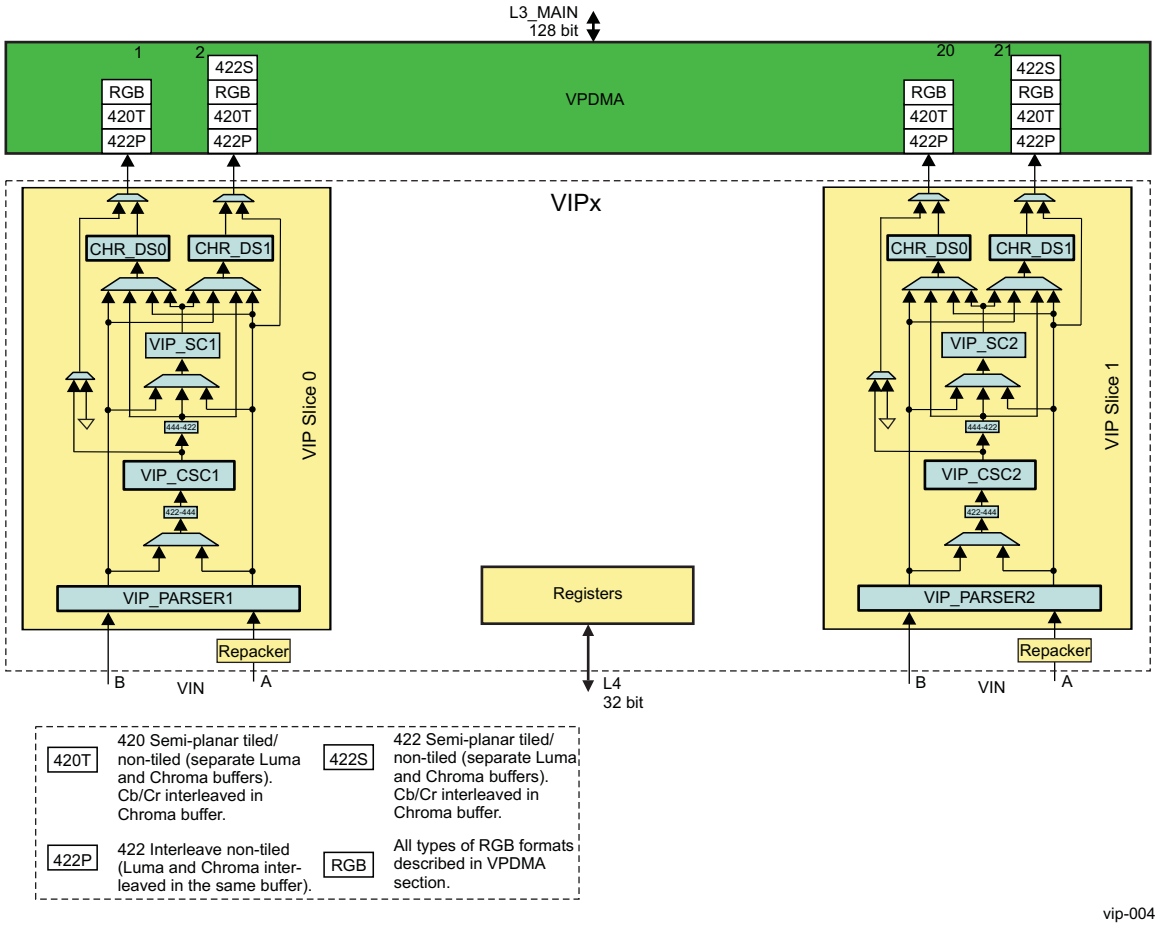
9.4 VIP Functional Description

9.4.1 VIP Block Diagram

Figure 9-4 shows the internal structure of a single VIP module in the device.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-4. VIP Block Diagram



9.4.2 VIP Software Reset

Software reset in the VIP module can be done by setting the VIP_CLKC_RST[16] VIP1_DP_RST for Slice 0, VIP_CLKC_RST[17] VIP2_DP_RST for Slice 1, VIP_CLKC_RST[0] VPDMA_RST for VIP VPDMA to 0x1. By setting VIP_CLKC_RST[31] MAIN_RST reset is performed for all modules within the instance. Software must ensure that the software reset completes before performing operations within the VIP module.

9.4.3 VIP Power and Clocks Management

The VIP modules support the MStandby/Wait and IdleReq/SidleAck protocols as defined in Chapter 3, *Power, Reset, and Clock Management.*

Power Management within the VIP module can be accomplished in several ways:

- L4 MConnect/SConnect can disable the internal L4 clock network
- L3 MConnect/Sconnect can disable the internal L3 clock network

These items are accomplished using the standard slave idle (for L4) and master standby (for L3) protocols. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shut down applies to the clock signals - L3_CLK and L4_CLK.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.3.1 VIP Clocks

The VIP internal clock domains can only be shut down by writing the appropriate register bit within the Clock Enable register - VIP_CLKC_CLKEN[16] VIP1_DP_EN for slice0, VIP_CLKC_CLKEN[17] VIP2_DP_EN for slice1 and VIP_CLKC_CLKEN[0] VPDMA_EN for the VPDMA engine

9.4.3.2 VIP Idle Mode

The VIP supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected byprogramming the appropriate value in the VIP_SYSCONFIG[3:2] IDLEMODE bit field.

Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state.

- Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements.
- No-idle mode: local target never enters idle state.
- Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA related requests) wakeup events

9.4.3.3 VIP StandBy Mode

The VIP supports no-standby mode and force-standby mode. The mode is set in the VIP_SYSCONFIG[5:4] STANDBYMODE bit field.

Configuration of the local initiator state management mode:

- Force-standby mode: local initiator is unconditionally placed in standby state.
- No-standby mode: local initiator is unconditionally placed out of standby state.

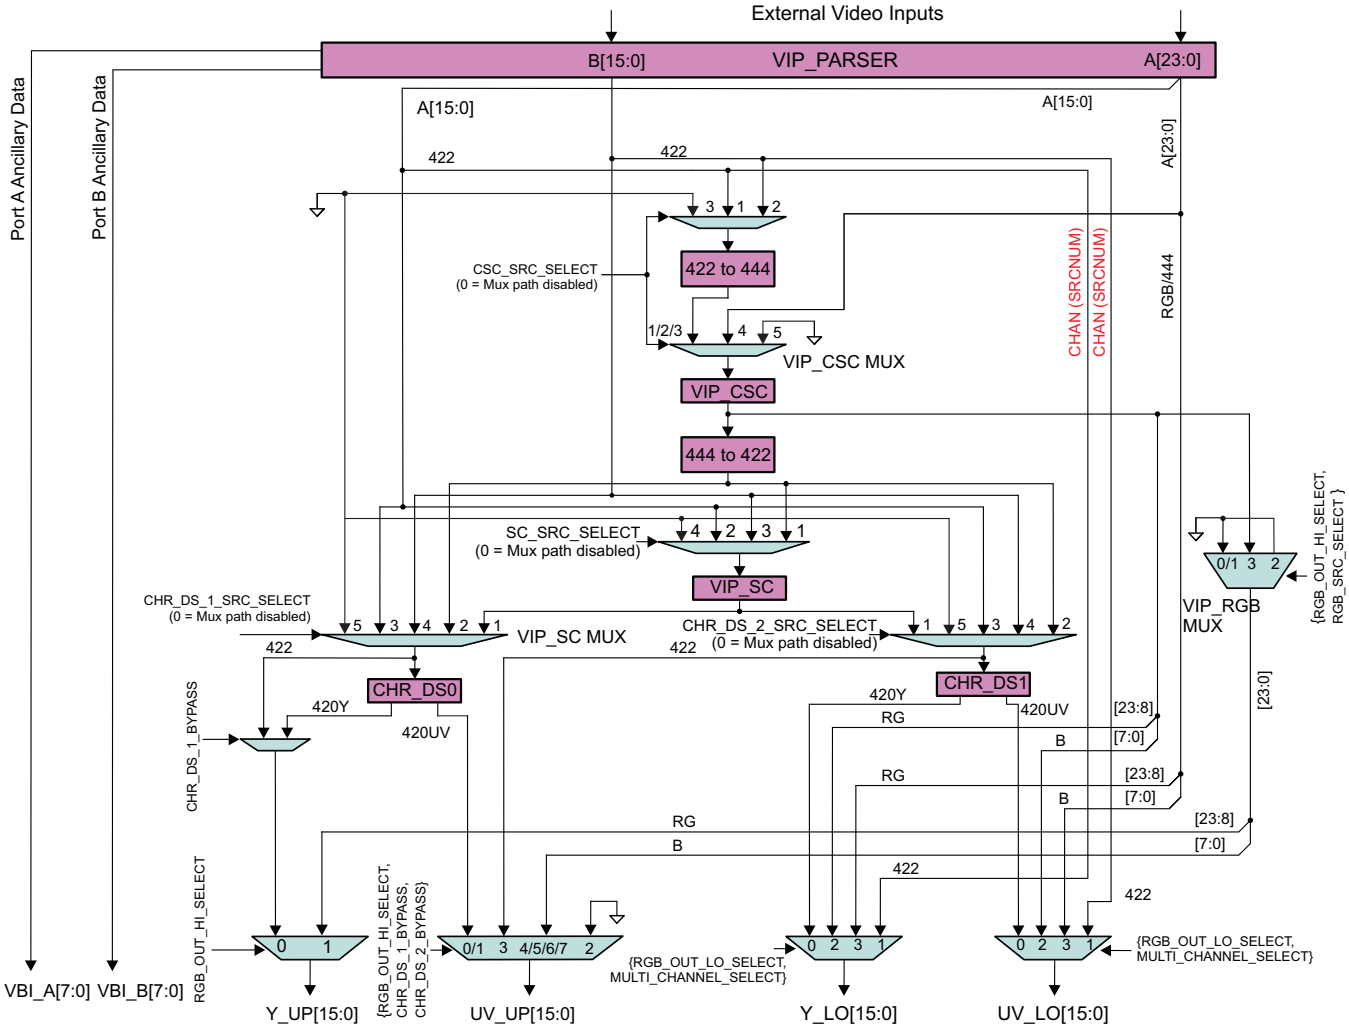
9.4.4 VIP Slice

9.4.4.1 VIP Slice Processing Path Overview

Figure 9-5 shows in details the internal processing path and output signals to VPDMA for a single VIP Slice. External video source drives the input side of the VIP Slice. Port A[x:y] can be in YUV422 format (A[15:0] in the diagram) or RGB/YUV444 format (A[23:0] in the diagram), depending on the external video input source and configuration options within the VIP_PARSER. Port B[x:y] can be in YUV422 format (B[15:0] in the diagram). When the VIP_PARSER is configured to capture 24bit RGB/444 data, A[23:0] is used and the data path inside VIP must be configured correctly for it. Multiplexer selections and controls shown in Figure 9-5 are described in register VIP_CLKC_VIP0DPS for Slice 0, and register VIP_CLKC_VIP1DPS for Slice 1. The outputs of each VIP Slice drive the VPDMA module, which sends the resulting data to DDR memory.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-5. VIP Slice Processing Path Block Diagram



NOTE: Port A of VIP3 module supports up to 16-bit data, and Port B is not used (this applies to both Slice 0 and Slice 1 of VIP3).

Table 9-9 provides summary of the registers controlling the multiplexers within VIP slice processing path.

Table 9-9. VIP Slice Processing Path Control

Multiplexer Control	Register Bit-fields for Slice 0	Register Bit-fields for Slice 1	Description

9.4.4.2 VIP Slice Processing Path Multiplexers

9.4.4.2.1 VIP_CSC Multiplexers

The following registers are controling the VIP Color Space Converter (CSC) multiplexers: VIP_CLKC_VIP0DPS[2:0] VIP1_CSC_SRC_SELECT for Slice 0 and VIP_CLKC_VIP1DPS[2:0] VIP2_CSC_SRC_SELECT for Slice 1.

The VIP_CSC block (for each slice within the VIP subsystem) receives data from one the following sources:

- VIP_PARSER Port A Output (422)
- VIP_PARSER Port B Output (422)
- VIP_PARSER Port A Output (RGB)

The default state for this multiplexer is disabled, so there is no VIP_CSC input.

9.4.4.2.2 VIP_SC Multiplexer

The multiplexer for Slice 0 and Slice 1 is controleld by VIP_CLKC_VIP0DPS[5:3] VIP1_SC_SRC_SELECT and VIP_CLKC_VIP1DPS[5:3] VIP2_SC_SRC_SELECT, respectively.

The scaler module (VIP_SC) within the VIP subsystem (for a single slice) receives data from one of the following sources:

- VIP_CSC
- VIP_PARSER Port A Output
- VIP_PARSER Port B Output

The default state for this multiplexer is disabled, so there is no VIP_SC input.

9.4.4.2.3 Output to VPDMA Multiplexers

This section is under development and is included as a placeholder for future updates.

9.4.4.3 VIP Slice Processing Path Examples

The following sections provide VIP Slice data path examples for different types of input data, and describe the corresponding multiplexer configurations. Refer to Table 9-9, *VIP Slice Processing Path Control*, for mapping of the multiplexer controls to registers.

In the block diagrams of the following sections:

Copyright © 2015–2020, Texas Instruments Incorporated

- Output A refers to the result of processing Input A data.
- Output B refers to the result of processing Input B data.

9.4.5 VIP Parser

The VIP Parser (VIP_PARSER) module is used to capture the external video data into the VIP module.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.5.1 Features

Each VIP module contains two VIP_PARSER modules (one VIP_PARSER per slice).

For a single VIP_PARSER, the video capture functions include:

- Two Pixel Clock Input Domains are supported (Port A and Port B):
  - Each Pixel Clock Input Domain has separate clock and framing signals.
  - Each Pixel Clock Input Domain can support embedded (BT.656/1120 style in /24-bit, or BT.656 in 8-bit) or discrete (BT.601 style) sync.
  - Pixel Clock Input Domain Port B supports one 8-bit input data bus. Port A supports one 24-bit input data bus. At device level, the same device pads may be shared between Port A and Port B. For more information, see the multiplexing characteristics in device Data Manual.
- Embedded Sync data interface mode supports single or multiplexed sources;
- Discrete Sync data interface mode supports only single source input;
- The two Pixel Clock Input Domains can be individually configured in any combination of Embedded or Discrete Sync;
- Vertical Ancillary Data capture is supported for each input source;
- A maximum of 8 + 1 (8 normal line sources + 1 split-line source) multiplexed sources are supported for a single Pixel Clock Input Domain using TI Line Mux Mode;
- Multiplexed data can only appear in embedded sync mode;
- Where possible, blanking pixels that may contain embedded vertical ancillary data will be stored in a dedicated buffer per each video source;
- Optional selection of channel (Luma or Chroma, or both) from which Vertical Ancillary data is extracted for YUV422 source;
- For RGB source, Vertical Ancillary data can be found in one of the R, G, or B channels. The VIP_PARSER can select the channel from which Vertical Ancillary data is extracted;
- Ancillary Data can appear in the Horizontal Blanking as well as the Vertical Blanking. Typically, only Vertical Blanking Ancillary Data is captured. However, Horizontal Blanking Ancillary Data can be captured as well using HSYNC style discrete sync capture mode;
- Video up to WUXGA (1920 × 1200) can be supported using Port A in 16-bit or 24-bit mode.

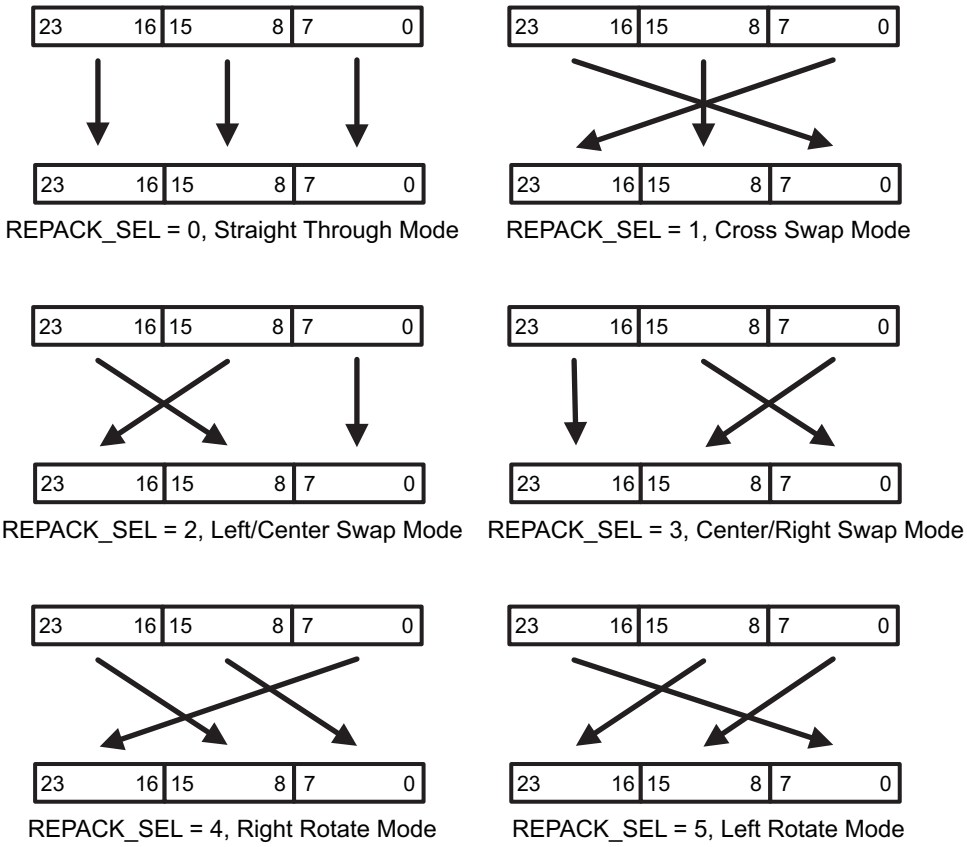
9.4.5.2 Repacker

The Repacker module rearranges the input bit ordering of the 24-bit data bus on Port A of each VIP slice. This module allows external input data to be presented to the datapath such that various data packing formats can be achieved in memory. As shown in Figure 9-15, a Repacker exists for each 24-bit input port.

The Repacker module is a simple multiplexer that serves to move input bits to different locations on the its output bus to VIP Parser. Figure 9-15 shows the supported bytelane swapping modes corresponding to different VIP_XTRA_PORT_A[30:28] REPACK_SEL settings.

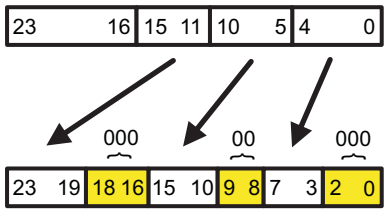
Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-15. Bytelane Swapping Modes



16-bit RAW data entering the VIP subsystem is packed as a contiguous input bus from bits 15 to 0. This 16-bit RAW input must be remapped to the RGB565 format, so that it can be saved to DDR memory properly, because the VPDMA does not support the RAW16 input format natively. Instead, the RAW 16 format is first remapped as RGB565 data and then given to the VPDMA. Figure 9-16 describes the VIP_XTRA_PORT_A[30:28] REPACK_SEL = 6 option to remap a contiguous [15:0] RAW input data bus to a RGB565 compliant output bus. This RAW16 data will use RGB565 data types in the VPDMA Data Descriptors.

Figure 9-16. RAW16 to RGB565 Mapping

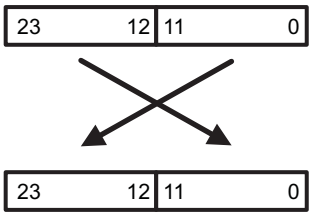


REPACK_SEL = 6, RAW16 Mapping Mode

Figure 9-17 describes the mux configuration where 12 bit components are swapped. This mode may be useful when the input data is 12 bit per component YUV422 and is sent directly to memory.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-17. RAW12 Swap



REPACK_SEL = 7, RAW12 Swapping Mode

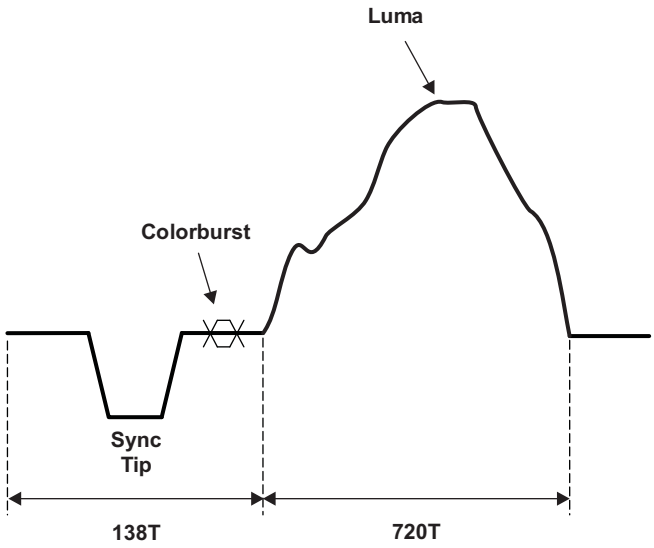
NOTE: There is no repacker for the 8-bit input port (Port B of each VIP slice).

The RAW16 and RAW12 mapping modes do not work for embedded sync streams.

9.4.5.3 Analog Video

A digital interface stream is based on analog video. The waveform for a line of NTSC analog video is shown in Figure 9-18.

Figure 9-18. NTSC Analog Video Waveform for One Horizontal Line



T is a time constant. For NTSC, T=1/13.5 MHz = 74ns.

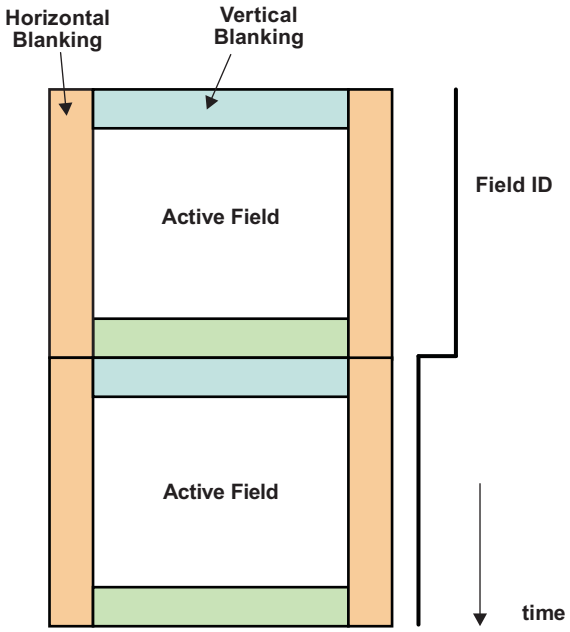
9.4.5.4 Digitized Video

Digitized video is based on scan lines in found in analog video. BT.601 uses various sync signals to specify when a new field and a new line starts. BT.656 and BT.1120 uses sync words embedded in the data stream to specify start of field and start of line.

An image can be digitized into regions shown in Figure 9-19.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-19. Digitized Video

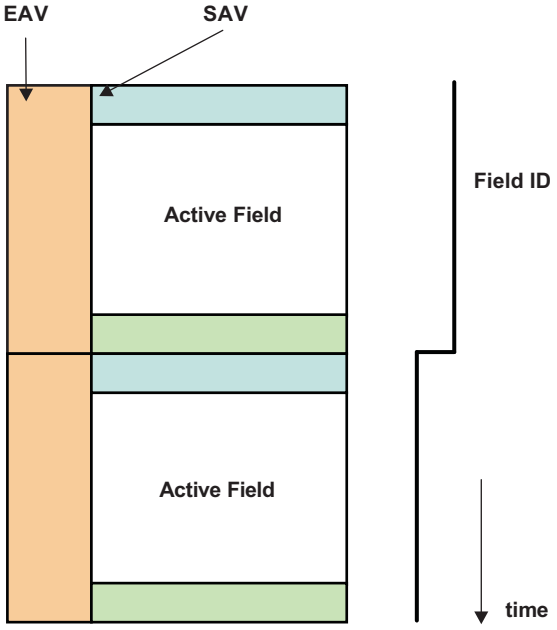


With the capability to encode sync words inside the data stream, there is more flexibility for adding non-video related data, called Ancillary Data. Also, code words embedded in the digital stream can be used as a type of identifier for multiplexing several sources of video into one data stream.

Figure 9-20 shows End-of-Active-Video (EAV) and Start-of-Active-Video (SAV) code words added to a video transmission. The period between the EAV and SAV is equivalent to Horizontal Blanking. The period between the SAV to the next EAV is active video or vertical blanking.

In the BT.656 or BT.1120 embedded code word scheme, three bits of the EAV/SAV code word are important: F (field), H (horizontal blanking), and V (vertical blanking).

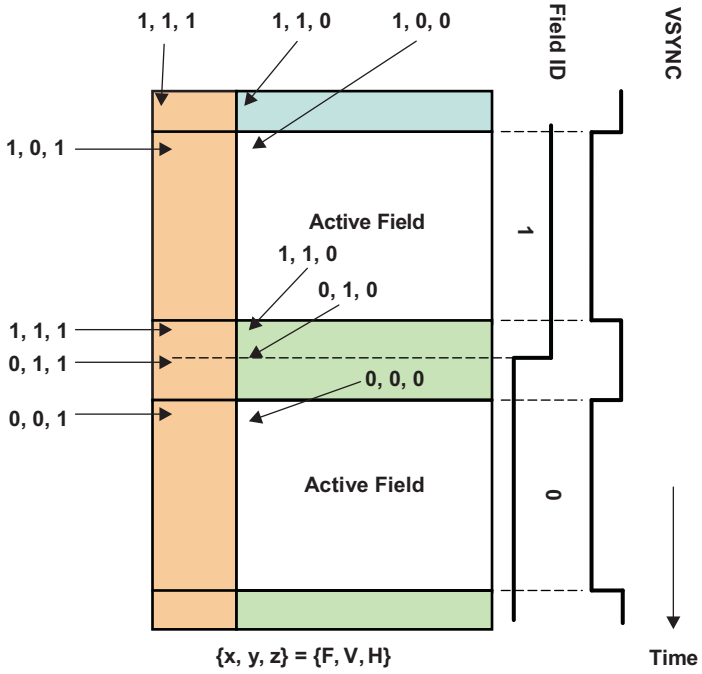
Figure 9-20. Code Word Embedded Video Format



Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-21 shows the values of F, V, and H flags at different locations in the picture. The Field flag represents the state of the Field ID for the picture. For progressive frames, F is always '0.' The V flag specifies vertical blanking areas. The H flag specifies horizontal blanking portions of the picture.

Figure 9-21. Digitized Video with F, V, and H Flags in EAV/SAV



9.4.5.5 Frame Buffers

The VIP/VPDMA support Frame Buffers in DDR memory for Active Video and Ancillary Data.

4:2:2 data is always saved in packed pixel buffers.

4:2:0 data is saved in Planar Luma buffers and Planar CbCr pair buffers.

A Luma Frame Buffer is a Planar storage area. Each line is the width in pixels (1Byte/pixel) of the output picture size format. The frame buffer contains the number of active video lines in the output picture size format.

A Chroma Pair Frame Buffer is Planar storage of CbCr pixel pairs, with each pixel being a byte. For 4:2:0 storage, N lines in the output picture active video results in N/2 lines of CbCr pairs being stored.

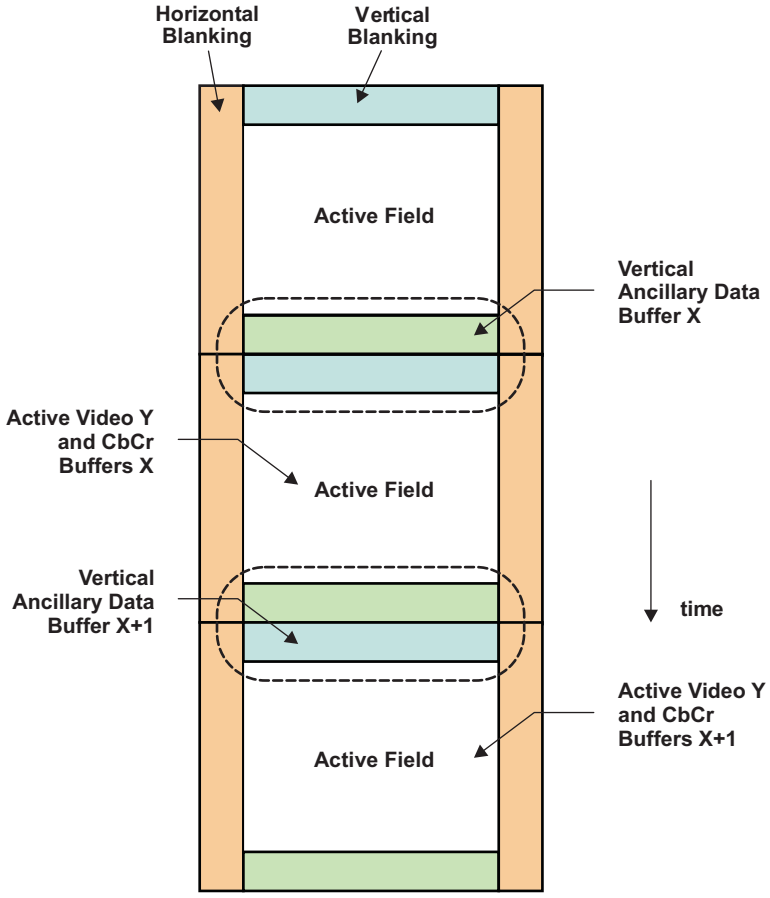
The Ancillary Data buffer is different than the Active Video Frame Buffers. The Ancillary Data buffer only stores Vertical Blanking Ancillary Data. The number of lines in the Ancillary Data buffer is the same as the number of Vertical Blanking lines. Typically, only one channel is extracted from the Vertical Blanking data, so the width of the Ancillary Data buffer is the same as the width of the Luma Buffer.

In 8-bit input mode, it is possible for both Luma and Chroma sites to be extracted for Vertical Ancillary data. Each color component is strobed on separate input clock cycles. In this case, the line width of the Ancillary data is twice the Luma line width of the picture. Both Luma and Chroma sites cannot be extracted for 16-bit input mode because both Luma and Chroma are sent on the same input clock cycle and the Ancillary port to the VPDMA VPI is only 8 bits wide.

Figure 9-22 shows how the planar data regions are stored in DDR memory. The vertical blanking data is stored in a set of Planar Buffers. Note that the bottom of the Vertical Ancillary Data from the previous field or frame is stored in the same buffer as the top of the Vertical Ancillary Data from the current field or frame.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-22. Planar Buffer Storage Description



The Luma representing Active Video is stored in a set of Planar Buffers. The CbCr Chroma Pairs are stored in a set of Planar Buffers.

9.4.5.6 Input Data Interface

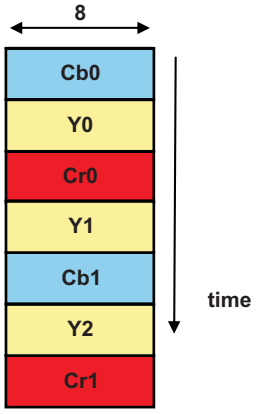
This section describes how the data (luma and chroma data for YUV422 format capture and R,G, and B data for RGB888 format capture) is muxed for the various interface modes.

9.4.5.6.1 8b Interface Mode

In 8-bit data interface mode, the input pixels are multiplexed according to Figure 9-23. The Chroma Format is 4:2:2. Sites with Cb/Cr pixels are known as Chroma sites. Those sites with Y pixels are known as Luma sites.

Copyright © 2015–2020, Texas Instruments Incorporated

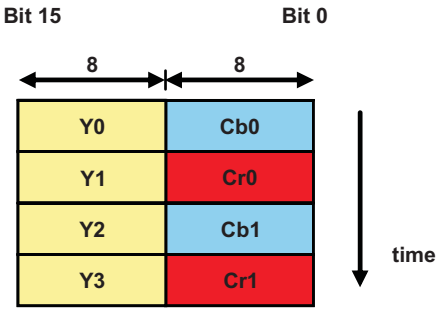
Figure 9-23. 8-bit Interface Discrete Sync Pixel Multiplexing



9.4.5.6.2 16b Interface Mode

In 16-bit interface mode, Luma is on 8 MSB bits of the data bus and Cb/Cr chroma pixels alternate on the other 8 bits of the data bus as shown in Figure 9-24.

Figure 9-24. 16-bit Interface Discrete Sync Pixel Multiplexing

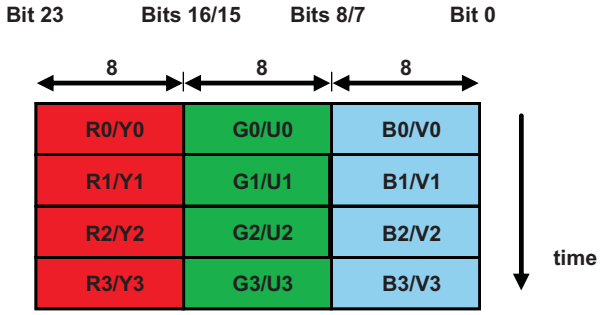


9.4.5.6.3 24b Interface Mode

RGB or YUV444 data is sent in 24b Interface Mode. The three components are packed into the data bus and sent to the VPDMA. The 24-bit Luma VPI client to the VPDMA carries all three components. This data is saved to the DDR in packed mode. That is, the three components are not separated by hardware. The 24-bit data bus is shown in Figure 9-25.

Ancillary data is saved in the Ancillary Data buffer. The VIP_PORT_A[5:4] CTRL_CHAN_SEL and VIP_PORT_B[5:4] CTRL_CHAN_SEL configuration register is used to select whether the ancillary data is from the R/Y, G/U, or B/V channels.

Figure 9-25. 24b Interface RGB Discrete Sync



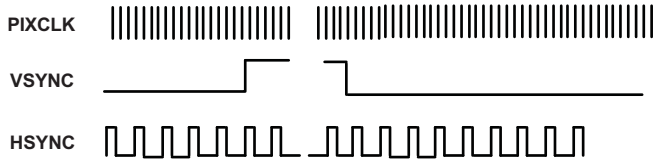
Copyright © 2015–2020, Texas Instruments Incorporated

In 24b interface mode YUV4:4:4 data is also supported. The flow for YUV4:4:4 data is the same as RGB data (Figure 9-25). Bits [23:16] of the input data bus are placed on bits [23:16] of the data bus going to VPDMA, bits [15:8] of the input bus are placed on bits [15:8] of the data bus going to VPDMA and finally bits [7:0] of the input data bus, are placed on bits [7:0] on the bus going to VPDMA.

9.4.5.6.4 Signal Relationships

A digital representation of video can be realized by using HSYNC and VSYNC signals to identify frame start and line start. Suppose HSYNC and VSYNC are active high, Figure 9-26 shows the general relationship of these signals.

Figure 9-26. Discrete Sync Signals



Every PIXCLK cycle carries either an active pixel or a blanking pixel. VSYNC pulses between two fields (or frames, in the case of progressive video). HSYNC pulses to signify the beginning of every line. An ACTVID signal can be used as a data valid to specify active video.

Discrete Sync cannot be used with any multi-camera multiplexed stream inputs. In the device, if Port A is configured for 24-bit discrete sync, then Port B must be disabled since there are no more data input pins left over for Port B.

If Port A is not 24 bits, then the 8-bit Port B can be configured and enabled for either discrete or embedded sync.

9.4.5.6.5 General 5 Pin Interfaces

Discrete Sync signal handling varies among different sending devices. The information that must be conveyed includes the pixel data value, field ID, horizontal blanking, and vertical blanking. Many devices can be configured to adjust the timing of the signals relative to each other.

In this section, DATA will be depicted as 8 bits. However, discrete sync does optionally support 16-bit and 24-bit data input. Type 1 is named after a generic five pin interface between the sending and receiving devices.

In Figure 9-27, P0 represents the first pixel in the horizontal blanking interval following the last vertical blanking line of the previous field or frame. HSYNC specifies the horizontal blanking region and VSYNC specifies that the P0 pixel is in the vertical sync area. HSYNC can be a strobe that is active one or more cycles and can deassert before the actual end of horizontal blanking or HSYNC may be active for the full duration of horizontal blanking.

Likewise, VSYNC can be a strobe that is active one or more cycles and can deassert before the actual end of vertical blanking or VSYNC may be active for the full duration of vertical blanking.

FID can change at this pixel or it may change later. For interlaced source, though, the FID will be inverted for this pixel at the same time point in the next field. So, it does not really matter when FID is captured. Many sending devices allow the location of FID changes to be programmable.

In this diagram and all others in this document, the active polarities of the interface signals can be either high or low. For the sake of uniformity in this document, all polarities are drawn active high. Also, different vendors have different datasheet names for the interface signals.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-27. Type 1, First Horizontal Blanking Pixel

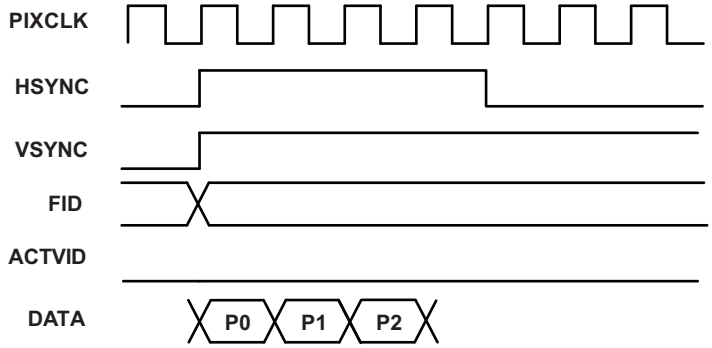


Figure 9-28 shows the P0 pixel being the first Chroma Channel data value in the Vertical Ancillary Data region. HSYNC is definitely de-asserted by now since P0 is no longer in horizontal blanking. ACTVID may or may not be active for Vertical Ancillary Data. Some devices consider these pixels to be Active (as in non-horizontal blanking). Other devices consider only video to be ACTIVE Video.

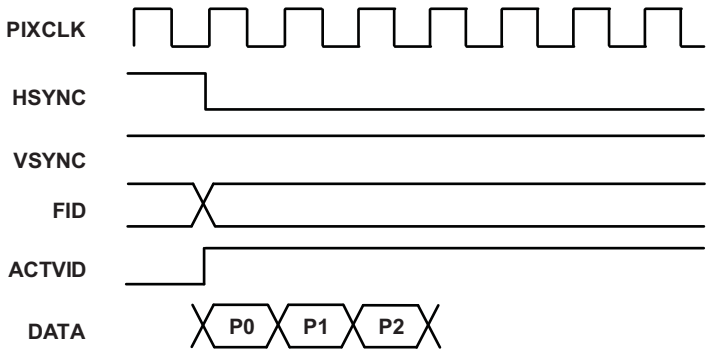
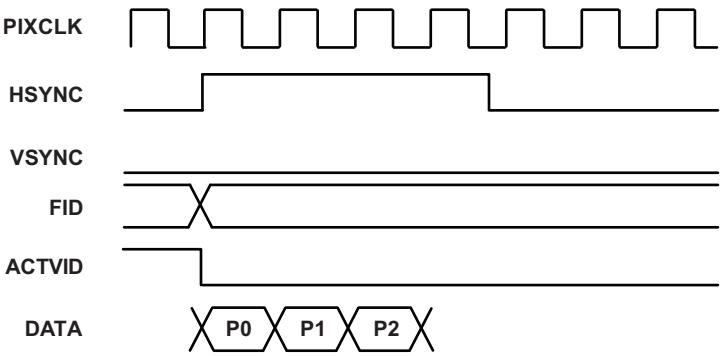
Figure 9-28. Type 1, First Vertical Ancillary Data Pixel



Following the vertical blanking region, the video portion of the field or frame starts. Figure 9-29 shows the horizontal blanking area in this video portion of the field or frame. P0 is the first pixel in the horizontal blanking. HSYNC is active for one or more pixel clocks. VSYNC is inactive in this video area. FID can change here. ACTVID is low since P0 is horizontal blanking.

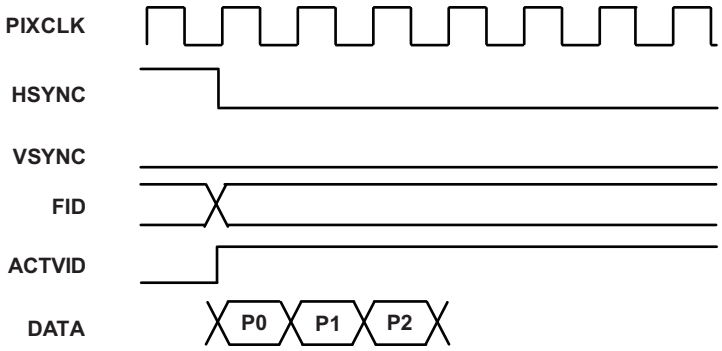
Figure 9-29. Type 1, Horizontal Blanking in Video Region



In Figure 9-30, P0 represents the first Chroma pixel in the Active video line. HSYNC is inactive, since P0 is in the active video region. Likewise, VSYNC is inactive. FID may or may not change here. ACTVID is high to signal capturing of video pixels.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-30. Type 1, First Video Pixel



9.4.5.6.6 Signal Subsets—4 Pin VSYNC, ACTVID, and FID

A sending device may use only a subset of the signals described in Section 9.4.5.6.4. The sending device just needs to convey important signals required to capture the field or frame. It can be shown that various selections of four pins can be used to satisfy all Type 1 conditions.

Three pins, VSYNC, ACTVID, and FID, plus a pixel clock can be used to support discrete sync. VSYNC would bump the capture buffer. An inactive to active level of ACTVID specifies a line of data to capture. FID determines the field ID polarity. The scenario in which the sending device wants the receiving end to capture Vertical Ancillary Data using 4-pin signaling is shown in Figure 9-31.

Figure 9-31. 4-Pin Reduced ACTVID Signaling with Vertical Ancillary Data

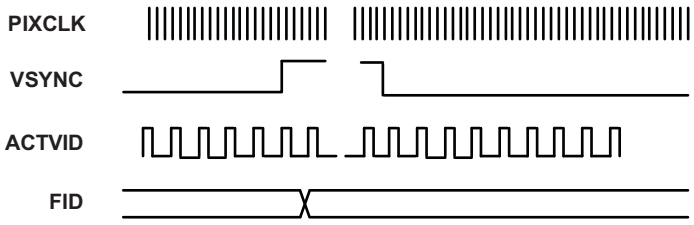


Figure 9-32 describes the case using the 4-pin interface in which the sending device does not send Vertical Ancillary Data.

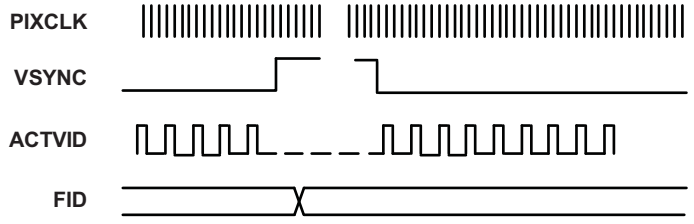
Figure 9-32. 4-Pin Reduced ACTVID Signaling with No Vertical Ancillary Data



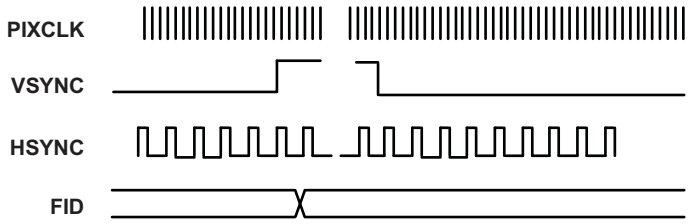
9.4.5.6.7 Signal Subsets—4 Pin VSYNC, HSYNC, and FID

In this style of Discrete Sync, as shown in Figure 9-33, four pins are used including the Pixel Clock. HSYNC signals the beginning of the line. All data in the line is captured, including Horizontal Blanking Data. In fact, this signaling mode is the only one which allows Horizontal Blanking Data to be captured.

Of course, by capturing the horizontal blanking pixels in the frame buffers, there is no way to be certain exactly where the blanking ends and the active video starts. One would have to rely solely on video format specs to find the active video inside the frame buffer.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-33. 4-Pin Reduced HSYNC Signaling with Vertical Ancillary Data



9.4.5.6.8 Vertical Sync

Vertical Sync is used to indicate lines that are in the vertical blanking interval. The VSYNC also separates fields or frames. To be spec compliant, VSYNC should be active for a few lines at the bottom of the picture. The exact number of vertical blanking lines at the bottom depends on the specification for the picture format (480i, 480p, 720p, 1080i, 1080p).

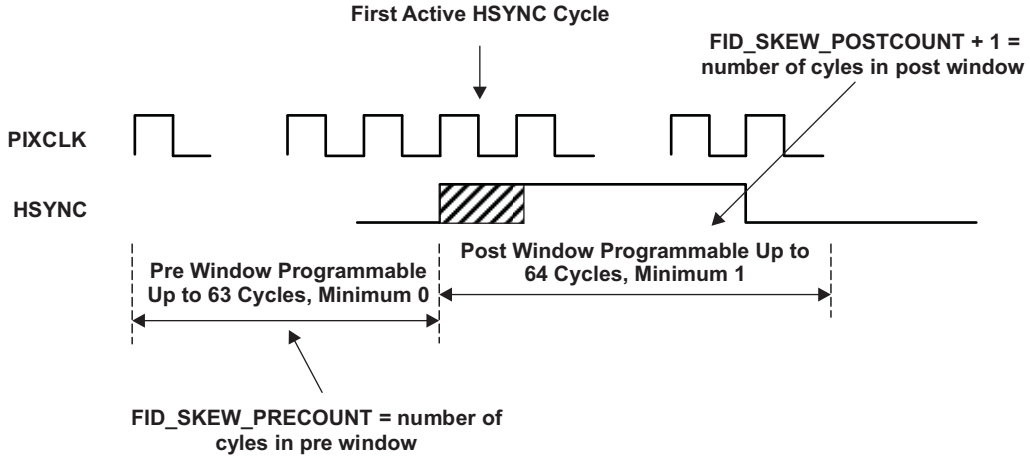
Likewise, the number of vertical blanking lines at the top of the picture depends on the video format specification corresponding to the incoming picture.

In the VIP_PARSER, lines associated with an Active VSYNC are stored in the vertical ancillary data buffers using the ANC VPI port to the VPDMA. Lines without an Active VSYNC are stored in the active video Luma and Chroma-pair buffers using the Y and UV VPI ports, respectively, to the VPDMA.

When using HSYNC signaling instead of ACTVID, the VSYNC signal may be derived from an analog source such as an NTSC/PAL decoder. In this case, VSYNC may not transition on the exact cycle as HSYNC. Thus, the VIP_PARSER supports a window region around HSYNC in which VSYNC transitions will be detected. A VSYNC transition occurring within the window is identified the same way as if VSYNC transitioned on the same cycle as HSYNC going active.

The window is defined by a pre-window, which is determined by the VIP_PORT_A[21:16] FID_SKEW_PRECOUNT and VIP_PORT_B[21:16] FID_SKEW_PRECOUNT registers. There is also a post-window that is defined by VIP_PORT_A[29:24] FID_SKEW_POSTCOUNT and VIP_PORT_B[29:24] FID_SKEW_POSTCOUNT for port B. Note that although the configuration registers are named FID_SKEW, they are also used for defining the VSYNC transition window. The window region definition is shown in Figure 9-34.

Figure 9-34. VSYNC Pre and Post Window



The results of VSYNC behavior in the transition window are shown in Figure 9-35. A low to high transition in the window is equivalent to VSYNC going low to high on the active HSYNC cycle.

Likewise, a high to low transition in the window is equivalent to VSYNC going high to low on the active HSYNC cycle.

Two transitions of VSYNC within the VSYNC window is not allow and is undefined behavior.

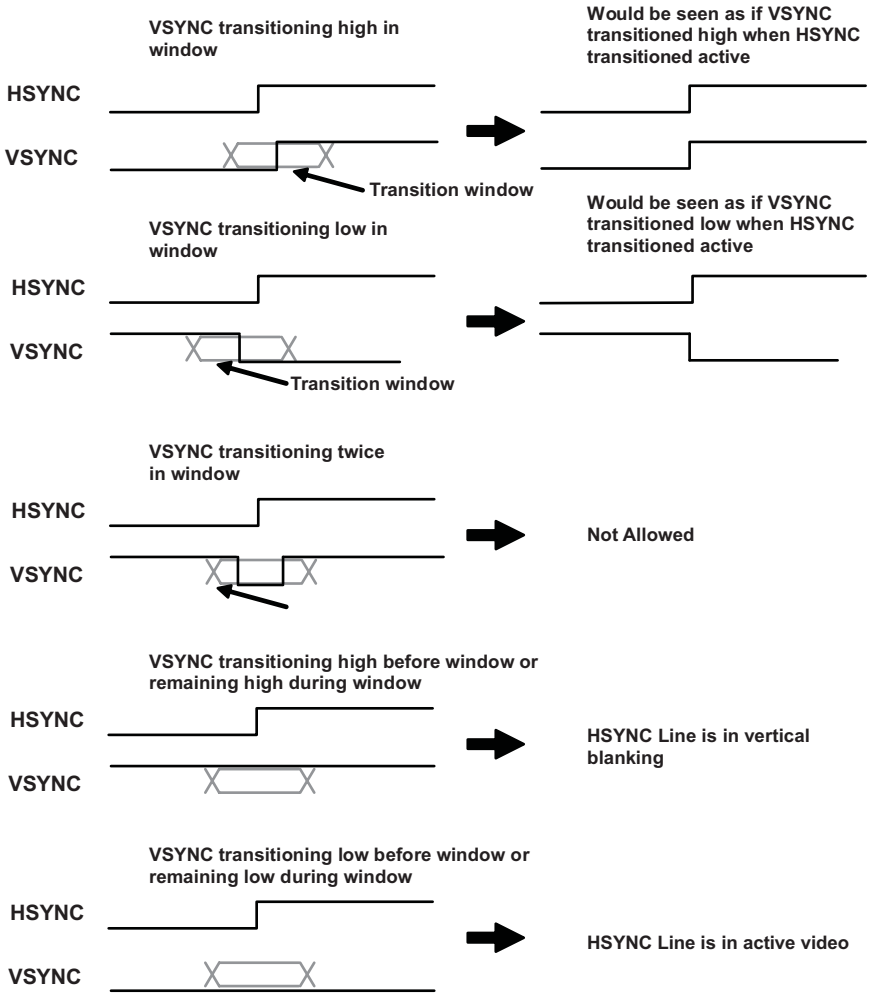
Copyright © 2015–2020, Texas Instruments Incorporated

If VSYNC is high throughout the transition window, then the HSYNC line is in vertical blanking.

If VSYNC is low throughout the transition window, then the HSYNC line is in active video.

Note that VSYNC skew generally only applies to input signals that have been sampled from an analog source, as in a NTSC/PAL decoder. If the VSYNC is a VBLANK-type signal or if the sending device is another all-digital IC, then the VSYNC signal does not have a skew since VSYNC will be aligned to HSYNC. In this case, setting FID_SKEW_PRECOUNT = '0' and FID_SKEW_POSTCOUNT = '0' (within PORT_A and PORT_B registers) defines a minimum size window which will capture the value of VSYNC on the same cycle that HSYNC goes active.

Figure 9-35. VSYNC Equivalence When Using Transition Window



9.4.5.6.9 Field ID Determination Using Dedicated Signal

For Progressive Source, FIELD ID is always '0.'

For Interlaced Source, FIELD ID needs to be extracted consistently.

In some cases, vertical sync is active on the first pixel of a line in the vertical blanking period and it stays active until the last line in the vertical blanking period.

Copyright © 2015–2020, Texas Instruments Incorporated

However, the pixel where the FIELD ID signal transitions can be quite variable and depends on the external chip driving the VIP_PARSER. Many parts that generate digitized raw video have a programmable feature to specify when FIELD ID changes. FIELD ID is valid at the same point for every field. That is, if FIELD ID is read at one particular place in a field, the polarity of the signal will be reversed at the same location in the next field. So, FIELD ID can be corrected with a programmable polarity configuration bit FID_POLARITY (within VIP_PORT_A and VIP_PORT_B registers) that is XOR'ed with the captured value.

For discrete sync mode, FIELD ID will be registered on the first active pixel capture cycle of each line in both styles of HSYNC and ACTVID usage as specified in Figure 9-36 and Figure 9-37.

Figure 9-36. FID Registering When Using HSYNC

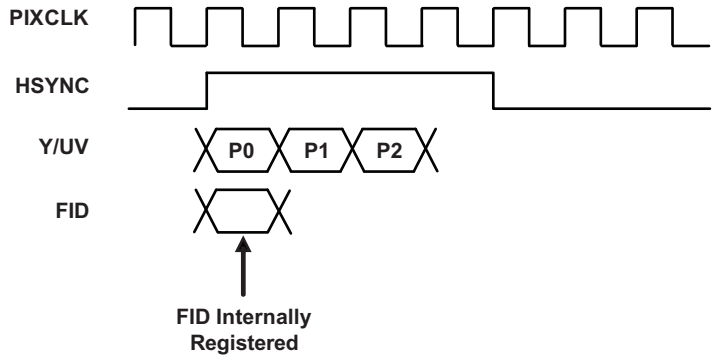


Figure 9-37. FID Registering When Using ACTVID

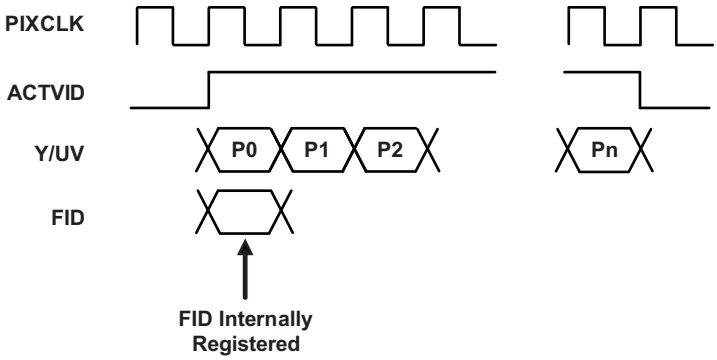


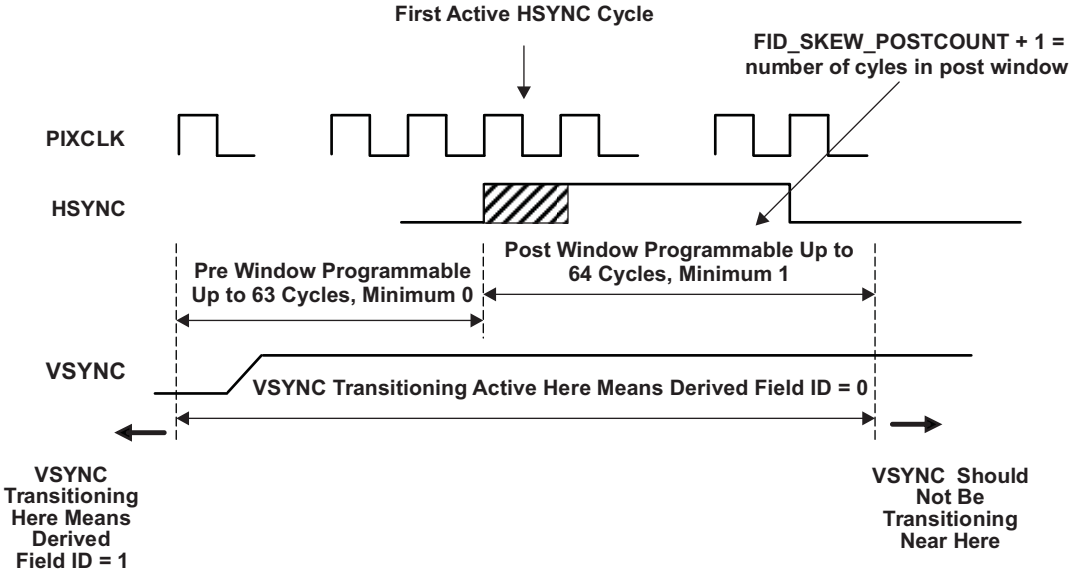
9.4.5.6.10 Field ID Determination Using VSYNC Skew

In order to save a device pin, there is a case where a skew may be inserted into VSYNC (with respect to HSYNC) when HSYNC is used as a start of line indicator as described in Figure 9-33. In this case, no FIELD ID signal is sent by the source chip. A description of Field ID determination by VSYNC skew is shown in Figure 9-38.

The active polarity of VSYNC falling within n pixel clock cycles of the first active cycle of HSYNC indicates the field id. If VSYNC is active before this time window, then the FIELD_ID = '1' for the next picture. If VSYNC becomes active within this window, then FIELD_ID = '0' for the next picture.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-38. Field ID Determination By VSYNC Skew



When using FID determination by VSYNC skew, the value for VSYNC is also determined by transitions in the window as shown in Figure 9-35.

The VIP_PARSER supports a configuration FID_POLARITY bit within VIP_PORT_A and VIP_PORT_B registers. For FID determination by VSYNC Skew, the fid determination functions are described in Table 9-10.

Table 9-10. Polarity Table for FID Determination By VSYNC Skew

FID_POLARITY	Transition in Pre/Post Range	FID Determination
0	No	1
0	Yes	0
1	No	0
1	Yes	1

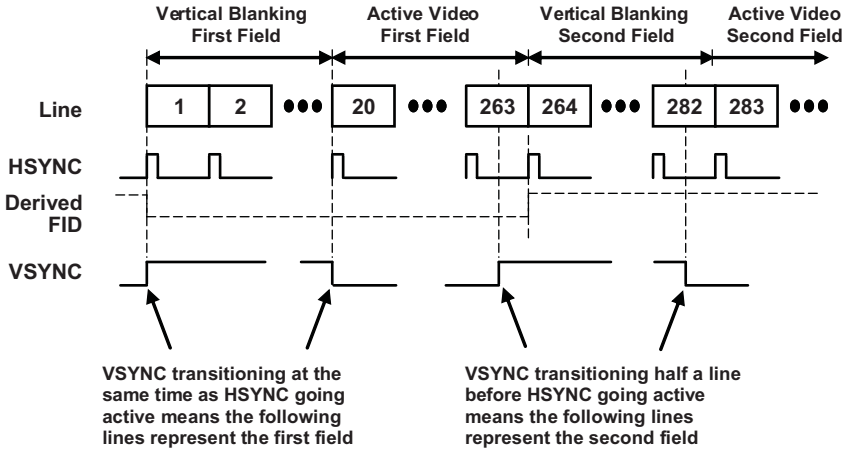
9.4.5.6.11 Rationale for FID Determination By VSYNC Skew

FID determination by VSYNC skew is a method for field ID determination derived from the analog NTSC and PAL interlaced specifications. Under this method, the sending device will not be providing a FID signal. NTSC has 525 total lines split between two fields. PAL has 625 total lines split between two fields. Each of these interlaced standards support an odd number of lines.

Let's consider just the 525 active line NTSC signal. For the sake of consistency, let's call Line 1 the first line of the 2-field pair and Line 525 the last line of the 2-field pair.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-39. Example of 525-line FID Determination By VSYNC Skew



A waveform is shown in Figure 9-39. VSYNC is defined to go active at the same time as HSYNC for the first line of the first field in a two-field picture pair. For this first field, VSYNC will go inactive after Line 20.

For the second field, VSYNC will go active in the middle of Line 263 to signal that Line 264 is the start of a vertical blanking interval. When HSYNC for Line 264 arrives, coinciding with the vertical blanking interval for the beginning of the second field, VSYNC has already been active for half of Line 263. For the second field, VSYNC will go inactive midway through Line 282 to indicate that Line 283 is active video. When HSYNC for Line 283 appears, VSYNC has already been inactive for half a line.

By seeing whether VSYNC transitions at the beginning of a line or whether it transitions at the midway point of a line, one can determine whether the upcoming group of lines represents the first field or the second field. The derived FID is shown in dashed lines.

The analog NTSC specification defines the field ID changing part way into the vertical blanking. That is, the first few lines of vertical blanking belong to the previous field and the next several lines of vertical blanking belong to the upcoming field. The VIP_PARSER saves one channel of the entire vertical blanking interval between two active video fields into a single buffer. The hardware does not discriminate between whether the vertical blanking lines belong to the bottom of the previous field or those belonging to the start of the next field. This usage model is consistent with vertical ancillary data capture for embedded sync mode of operation.

Obviously, FID Determination by VSYNC skew cannot be used when framing does not use the VSYNC signal but rather relies on the ACTVID signal instead.

9.4.5.6.12 ACTVID Framing

Instead of an HSYNC signal, the VIP_PARSER can use ACTVID framing as described in Figure 9-32. Under ACTVID Framing, VSYNC is used to separate vertical blanking lines from active video lines.

FID determination by VSYNC Skew is not allowed for ACTVID framing because there is no HSYNC input signal in this mode. Also, the VSYNC transition window is not employed. VSYNC is captured at the first pixel of each ACTVID grouping of pixels. Lines are separated by ACTVID transitioning inactive.

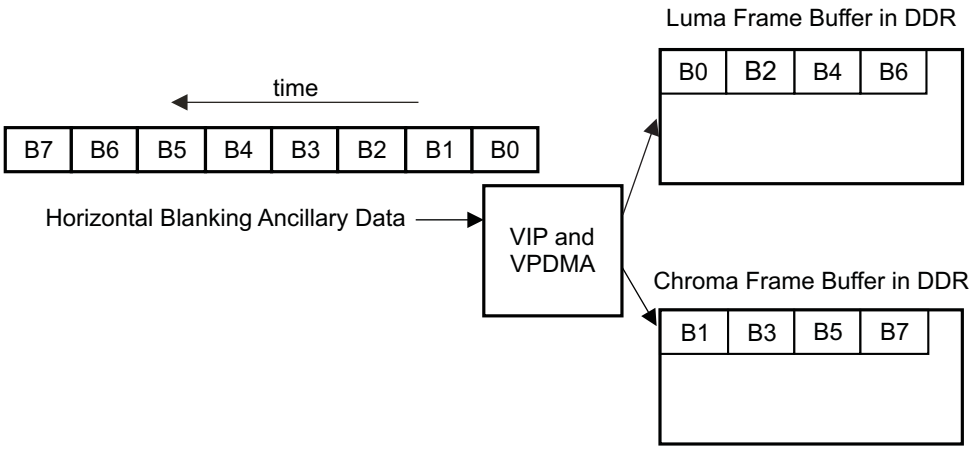
9.4.5.6.13 Ancillary Data Storage in Descrete Sync Mode

Ancillary data appearing in horizontal blanking is called Horizontal Blanking Ancillary Data. Ancillary Data in vertical blanking is called Vertical Blanking Ancillary Data.

Horizontal Blanking Ancillary Data is not commonly used. For the ACTVID data valid mode described in Figure 9-31, there is no way to capture Horizontal Blanking Ancillary Data. Using the HSYNC mode in Figure 9-33, all blanking pixels are captured. However, the horizontal ancillary data is byte-by-byte distributed between the Luma and Chroma frame buffers. Chroma sited bytes are saved in the Chroma frame buffer and Luma sited bytes are saved in the Luma frtame buffer. Some CPU effort would be needed in order to extract ancillary data from the desired Luma or Chroma channel frame buffers. Also, the video on each line starts after the horizontal blanking period. This situation is shown in Figure 9-40.

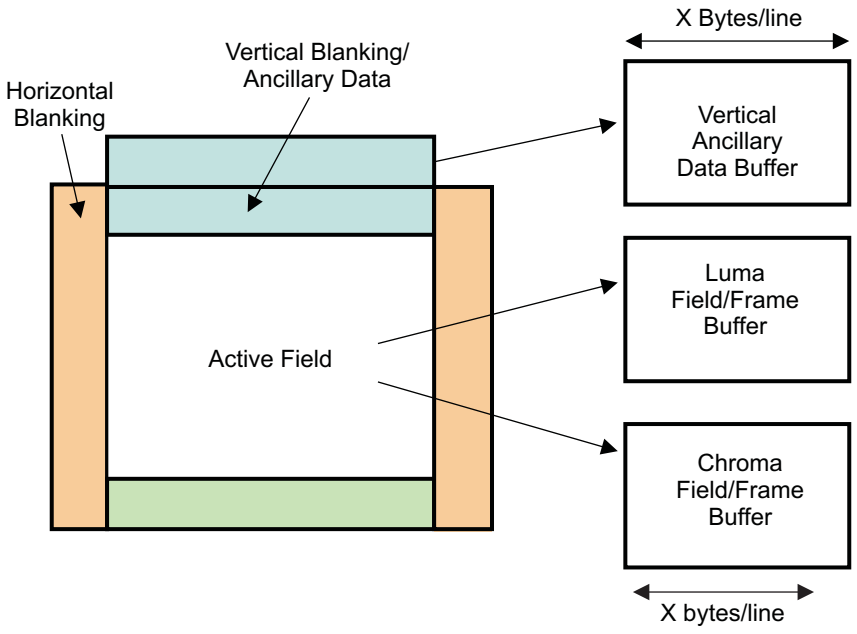
Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-40. Horizontal Ancillary Data Packing When HSYNC Used as Sync Signal



With Interlaced source material, Vertical Blanking Ancillary data will be stored in a separate Vertical Ancillary Data Buffer as shown in Figure 9-41. The Channel from which vertical ancillary data is extracted is a configuration option. For an input image of x active pixels per line, each line of Vertical Blanking Ancillary Data will have x bytes. Unlike the horizontal case, the CPU parsing this Ancillary Data will see a contiguous section of Vertical Ancillary Data that is not intermixed with Video data.

Figure 9-41. Interlaced Field Vertical Blanking Ancillary Data Storage



For Progressive source video, the FIELD ID does not change. So, the Vertical Ancillary Data Buffer will contain all the information beginning from the vertical blanking of the previous frame. This situation is shown in Figure 9-42.

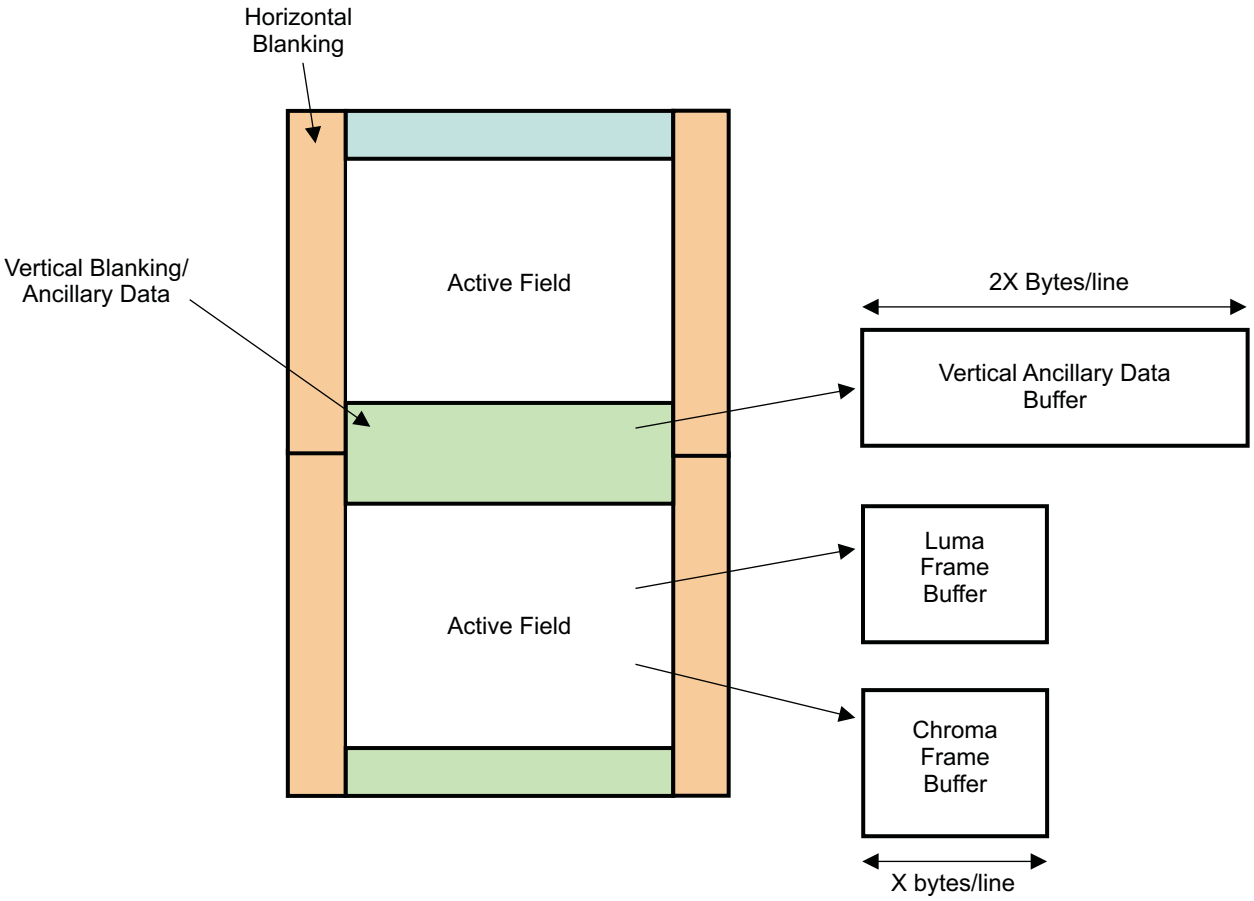
Figure 9-42. Progressive Frame Vertical Blanking Ancillary Data Storage

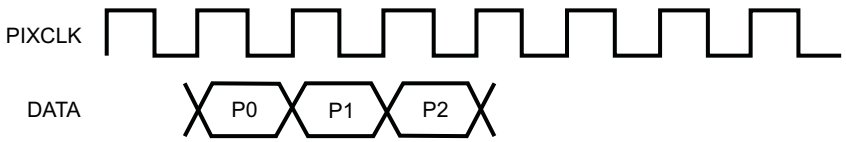


9.4.5.7 BT.656 Style Embedded Sync

9.4.5.7.1 Data Input

Like Discrete Sync Input, Embedded Sync mode takes data from the 24b input bus. Input data can be 8, 16, or 24 bits wide. A sample is retrieved each and every Pixel Clock cycle. There is no valid signal gating data entry. Figure 9-43 shows a valid data sample each Pixel Clock period.

Figure 9-43. Embedded Sync Data Entry



9.4.5.7.2 Sync Words

In embedded sync mode, code words are inserted into the stream at pixel clock rates. For external devices that send out 10 bits (single pixel interface) or 20 bits (parallel Y-Cb/Cr interface) of data, only the 8 (single pixel interface) or 16 (parallel 8bY-8bCb/Cr interface) most significant bits of each pixel are used.

The key code words are Start of Active Video (SAV) and End of Active Video (EAV). Three flags are found in these code words: F (field), V (vertical sync), and H (horizontal sync). These flags signify the position in the frame corresponding to the data immediately following the codeword. The flags determine whether the code is EAV or SAV and where they lie in the picture. The first byte of the code word is 0xFF. The second and third bytes are 0x00. The bit ordering of the fourth byte is detailed in Table 9-11.

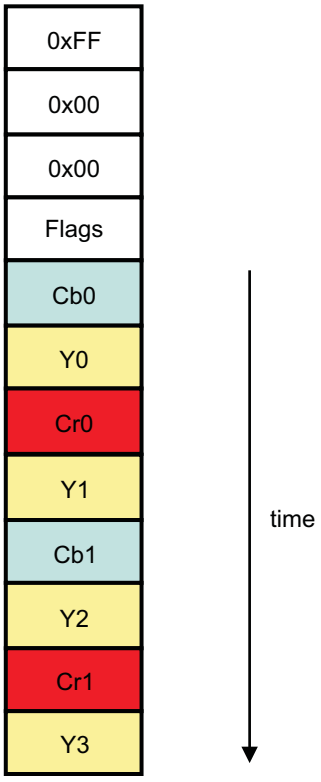
An example of the input ordering of the embedded code word, followed by active video, is shown in Figure 9-44. The input data mode is 8 bits for the example.

Figure 9-44. Code Word Format Example Followed by Video Data



9.4.5.7.3 Error Correction

The FVH flags are sent with four protection bits to support double error detection, single error correction. A non-correctable detected error is simply ignored. An option exists for the protection bits to correct a single bit error in the FVH flags. The correction table is shown in Table 9-12. n/c means that the error condition is detected, but it is non-correctable.

9.4.5.7.4 Embedded Sync Ancillary Data

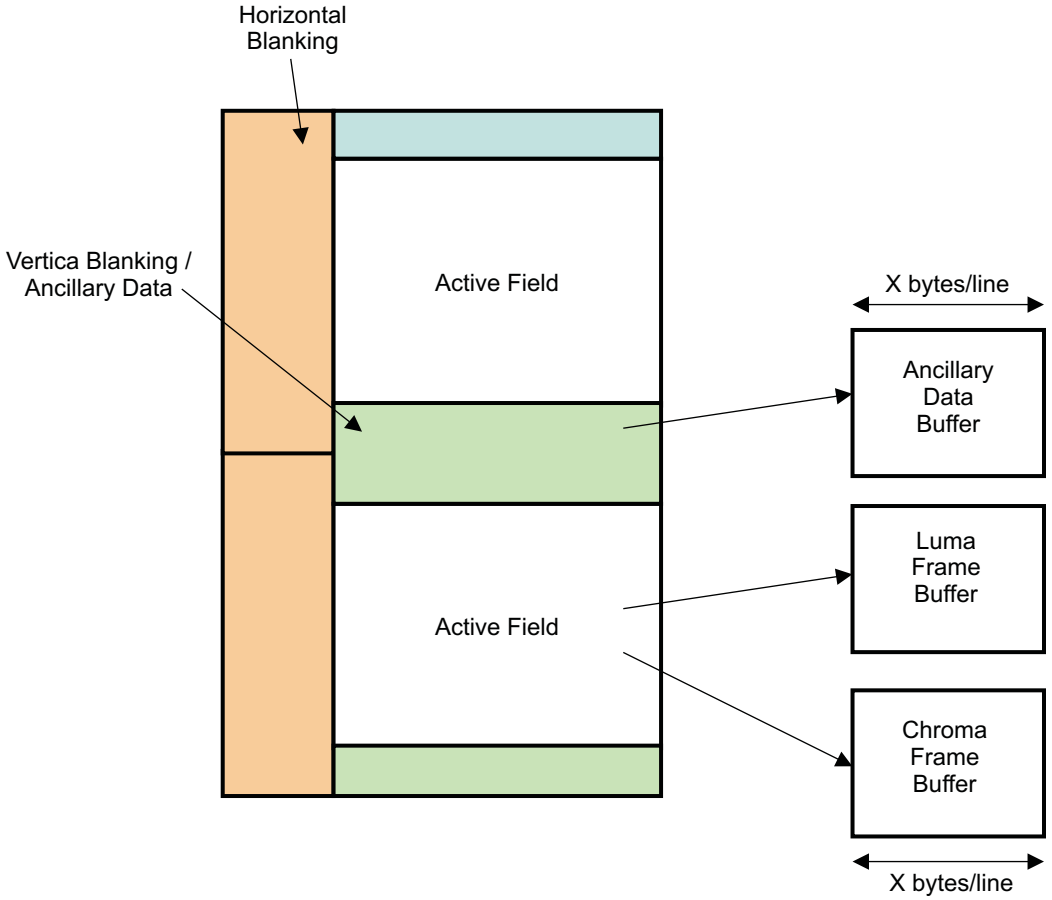
With Embedded Sync streams, only Vertical Ancillary Data can be extracted. The Vertical Ancillary Data buffer is the same width as the corresponding Luma and Chroma buffers. The channel from which Vertical Ancillary Data is extracted is a configuration option.

Horizontal Ancillary data cannot be extracted using embedded sync mode.

The Vertical Ancillary Data is captured starting from the end of the previous active video. See Figure 9-45 for a more detailed description of embedded sync packing.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-45. Embedded Sync Packing



9.4.5.7.5 Embedded Sync RGB 24-bit Data

YUV streams are separated into a planar Luma buffer, a planar Chroma Pair (CbCr) buffer, and a planar Vertical Ancillary Data buffer. RGB streams, on the other hand, are stored in a packed R-G-B format, as shown in Figure 9-46.

The BT.1120 standard defines a method of carrying RGB streams. After the SAV code, 8 bits of R, 8 bits of G, and 8 bits of B data are clocked in one cycle. A 24 bit data bus is required. The channel in which to search for the embedded sync codes and the FVH control code is determined by a configuration selection. Only vertical ancillary data from one channel (R, G, or B), which happens to be the channel where control codes are found, are captured. Vertical ancillary data in the other two channels are ignored.

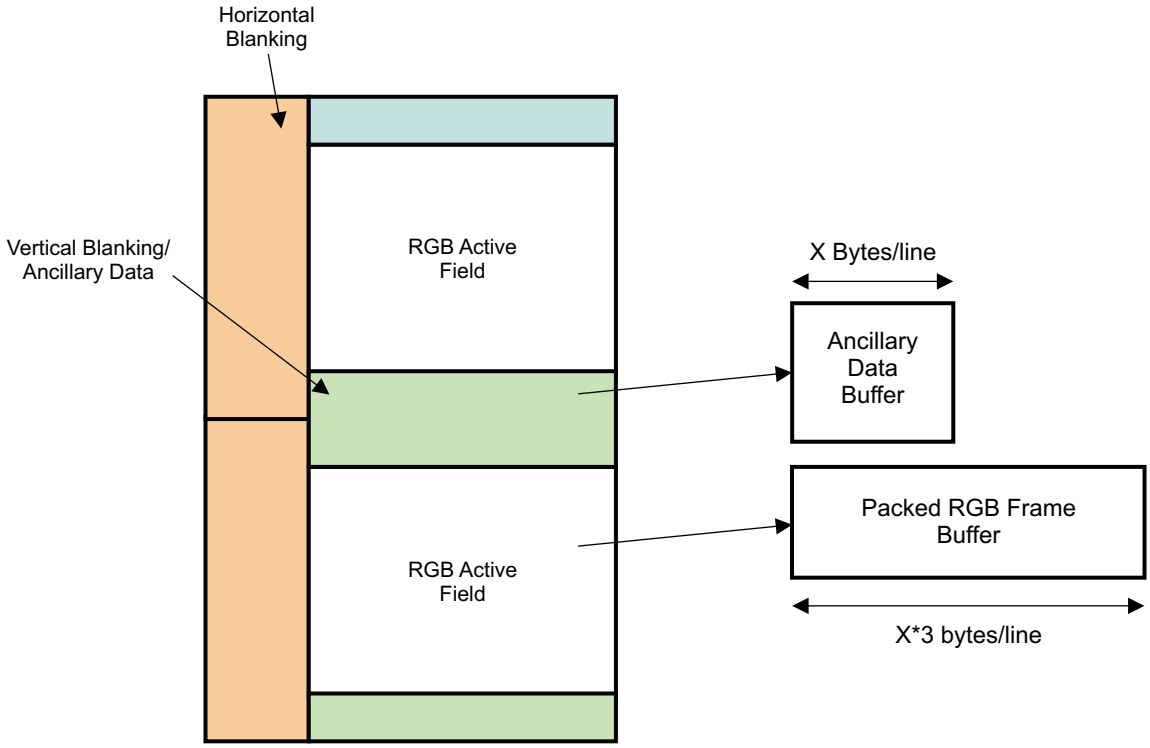
Figure 9-46. RGB Frame Storage



9.4.5.8 Source Multiplexing

9.4.5.8.1 Multiplexing Scenarios

Some applications require multiple camera sources to be used at the same time. For this type of device, one solution would be to support N-number of 8-bit or 16-bit data interfaces for each of N cameras. However, this solution does not efficiently minimize pin count. One set of 8-bit or 16-bit interfaces has the bandwidth to support more than one video source, depending on the resolution of the video. Table 9-13 is explanatory only and shows the number of sources that can be multiplexed in one VIP for 8-bit and 16-bit interface modes. Note that it does not reflect the capabilities of the VIP_PARSER. In addition, the interface pixel clock rates are shown. The VPDMA limits 16 camera sources to be saved to DDR memory per Pixel Clock Input Domain.

Table 9-13. Multiplexing Configurations and Pixel Clock Rates

	Maximum Channels in Single 16-bit Data Interface Mode	Maximum Channels in Dual 8-bit Data Interface Mode - Interleaved Channels per Single 8-bit Port. One 16-bit VIP can be configured to support two such 8-bit ports.	Interface Clock Rate (MHz)
HD Interlaced	2	1	148.5
D1 Interlaced	8	4	108.1
CIF Interlaced	n/a	n/a	n/a
HD Progressive	1	n/a	148.5
D1 Progressive	4	2	108.1
CIF Progressive (1)	32	16	162.2

(1) Blanking pixels are not used in the CIF clock rate calculations. Addition of blanking pixels would require a slightly higher clock rate.

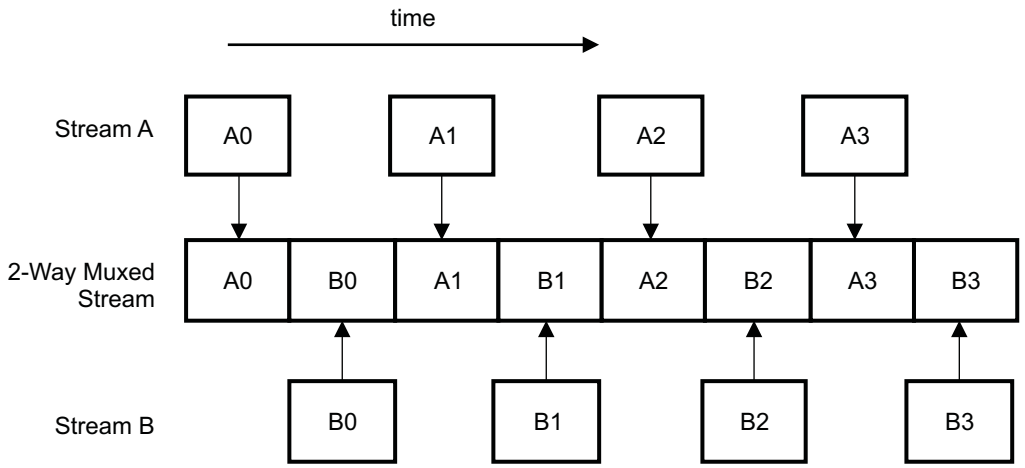
Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: These Channel Density values reflect one VIP subsystem.

9.4.5.8.2 2-Way Multiplexing

For 2-Way Multiplexing, two embedded sync streams are interleaved a pixel at a time as shown in Figure 9-47.

Figure 9-47. 2-Way Multiplexing



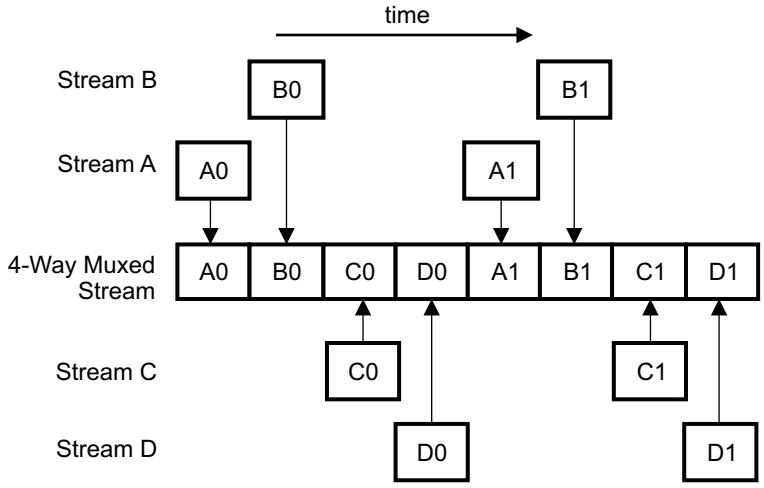
The sync codeword, FF-00-00-XY, is replicated in both source streams. In 2-Way Multiplexing, the sizes of both camera sources must be the same. Likewise, the Vertical Ancillary Data size for both sources must be identical. However, the two streams are not necessarily sending the same pixel site in adjacent clock cycles.

9.4.5.8.3 4-Way Multiplexing

For 4-Way Multiplexing, four embedded sync streams are multiplexed into one as seen in Figure 9-48.

Again, the sync codeword is in all four sources. Like 2-Way Multiplexing, the sizes of the four camera sources are the same and the sizes of the Vertical Ancillary Data regions are the same. The four streams are not necessarily sending the same pixel site in adjacent clock cycles.

Figure 9-48. Example of 4-Way Multiplexing

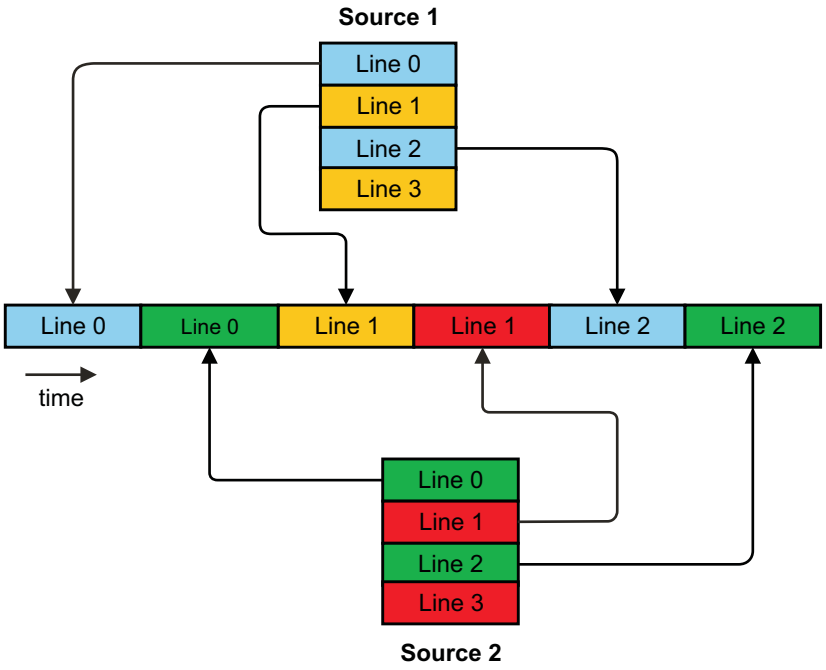


Copyright © 2015–2020, Texas Instruments Incorporated

9.4.5.8.4 Line Multiplexing

In Line Multiplexing, n-different sources are sent into the VIP a complete line at a time using a modified version of embedded sync. An example of Line Multiplexing for two sources is shown in Figure 9-49.

Figure 9-49. Example of Line Multiplexing



The width and height of each source in Line Multiplexed data can be different. For instance, one source can be PAL while another one can be NTSC. A line is comprised of YUV422 pixels in repeating patterns of CbYCrY.

9.4.5.8.5 Super Frame Concept in Line Multiplexing

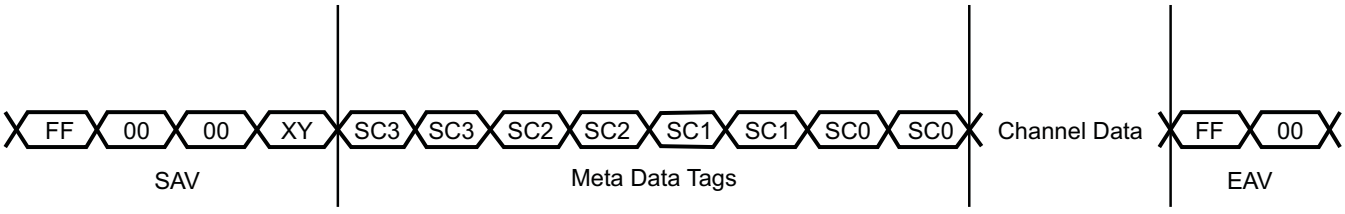
Different camera sources are interleaved on a line-by-line basis. The beginning of each line carries a Metadata tag that provides key information about that line. This Metadata tag is preceded by a SAV codeword in which F=0, V=0, and H=0.

At the end of the line, an EAV code is inserted with an appropriate number of padding pixels following it. This EAV code has F=0, V=0, and H=1. The startcodes used for the Metadata wrapped lines and the dummy lines form the Super Frame. The VIP_PARSER module has logic to parse out the super frame, analyze the Metadata tags, and frame buffer the line contents appropriately.

9.4.5.8.6 8-bit Data Interface in Line Multiplexing

Figure 9-50 is an example of an 8-bit line multiplexing interface. Channel Data is the CbYCrY sequence representing a line. Preceding Channel Data is the four byte Meta Data tags. Note that the Meta Data bytes are replicated in both the Luma and the Chroma sites. The entire structure is bounded by a traditional SAV/EAV code in which the V flag is 0.

Figure 9-50. 8-bit Line Mux Interface

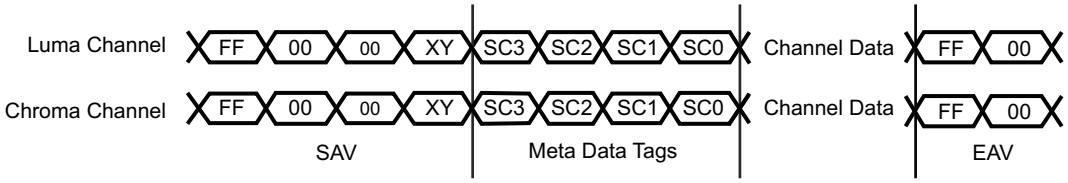


Copyright © 2015–2020, Texas Instruments Incorporated

9.4.5.8.7 16-bit Data Interface in Line Multiplexing

Figure 9-51 describes the 16-bit line multiplexing interface. Channel Data is the active line. All the Y pixels are in the Luma Channel. The CbCr pixels are in the Chroma Channel. Each cycle, a 16-bit value representing one Luma sample and one Chroma sample enters the VIP_PARSER. The Meta Data tags are replicated in both channels. Likewise, the SAV/EAV startcodes are found in both channels. The V flags for the SAV/EAV startcodes are always 0.

Figure 9-51. 16-bit Line Mux Interface



9.4.5.8.8 Split Lines in Line Multiplex Mode

Suppose an external device is sending two dissimilar sources in Line Multiplex mode. One narrower source has X pixels per line. The wider source has 2X pixels per line.

The Meta Data has provisions for the external device to split a line. The Beginning of Line (BOL) and End of Line (EOL) flags tag a split line as described in Table 9-14.

Table 9-14. Split Line Table

BOL	EOL	Function
0	0	Undefined
0	1	Line Segment is the second half of a line
1	0	Line Segment is the first half of a line
1	1	Line has not been segmented into two.

9.4.5.8.9 Meta Data

Table 9-15 shows the bitfields in the Meta Data start codes.

Table 9-15. Meta Data Layout

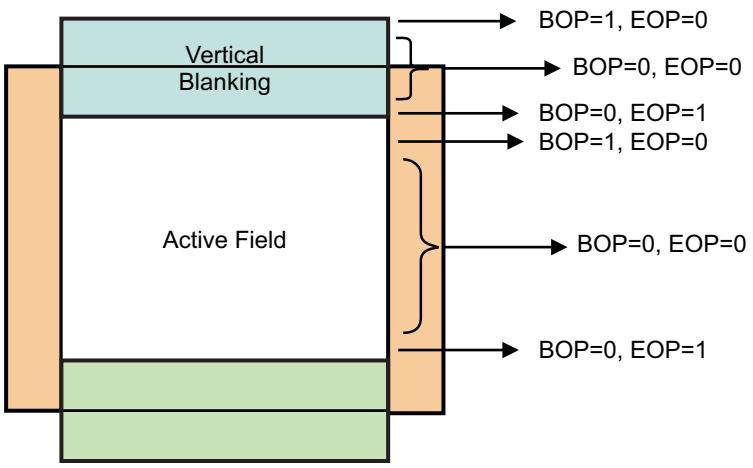
Byte	7	6	5	4	3	2	1	0
SC3	1	BOP	EOP	RSVD	CH_ID[3:0]			
SC3	1	BOP	EOP	RSVD	CH_ID[3:0]			
SC2	0	BOL	EOL	VDET	LINE_ID[10:7]			
SC1	~LINE_ID[6]	LINE_ID[6:0]						
SC0	PAD	F	V	H	P3	P2	P1	P0

BOP tags the line as a startline in a period. A period is defined as the contiguous lines in a vertical blanking period or the contiguous lines in a field or frame. For the vertical blanking period case, the vertical blanking at the bottom of the previous field or frame combined with the vertical blanking at the top of the current field or frame is combined to create one period.

EOP tags the line as an endline in a period. Figure 9-52 shows the definition of the two types of Periods as outlined by BOP and EOP.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-52. BOP/EOP Definition of a Period



For the Split Line at the top of a Period, the BOP bit is set for both halves of the split line. Likewise, for the Split Line at the bottom of a Period, the EOP bit is set for both halves of the split line.

CH_ID is the channel ID, which tags the camera source that generated the incoming line. A maximum of 16 camera sources are support per Pixel Input Clock Domain.

LINE_ID is the line number, starting from 0 and incrementing by one for each subsequent line from the same source.

PAD is a flag which tags the line as an artificially inserted padding line. When PAD is '0', the line should be discarded.

F, V, H, P3, P2, P1, and P0 are the bits representing the normal XY code. F is the Field ID associated with line, V signals when the line is in the vertical blanking, H specifies that the line is in the Horizontal Blanking, and P3:P0 are the protection bits.

Since only active video and vertical ancillary data lines are encapsulated in the Meta Data, the H bit in the SC0 byte should never be '1'.

9.4.5.8.10 TI Line Mux Mode, Split Lines, and Channel ID Remapping

The VIP_PARSER supports a maximum of 8 different Channel IDs per Port. The Channel IDs must be in the range {0:7} (3 bits). In the source multiplex, only one source can be a split line source and have the same Channel ID as one of the non-split line sources.

This scenario involves an external NTSC decoder which supports 8 D1 cameras. The external NTSC decoder will downscale the 8 sources to SIF format. However, one camera source will be sent in the multiplex as both the downscaled version and the original D1 sized version. They will both have the same Channel ID. However, the D1 version will be sent as a split-line. The source multiplex will thus have 9 maximum streams.

The VIP_PARSER (for TI Line Mux Mode only), will left shift the Channel ID by one. Bit 0 is used as an indicator whether the Source is a split-line source or a normal non-split line source. Only one of the nine inputs can be a split line source.

Table 9-16. TI Line Mux Mode Channel ID Remapping

	Channel ID Sent to VPDMA	
Source Input Channel ID	**Non-split Line**	**Split Line**
0x0	0x0	0x1
0x1	0x2	0x3
0x2	0x4	0x5
0x3	0x6	0x7
0x4	0x8	0x9

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-16. TI Line Mux Mode Channel ID Remapping (continued)

0x5	0xA	0xB
0x6	0xC	0xD
0x7	0xE	0xF

All subsequent references to the Camera Source, such as in a VPDMA return descriptor, will reference the remapped Channel ID.

The VIP_OUTPUT_PORT_A_SRC0_SIZE through VIP_OUTPUT_PORT_A_SRC15_SIZE registers for Port A, and VIP_OUTPUT_PORT_B_SRC0_SIZE through VIP_OUTPUT_PORT_B_SRC15_SIZE registers for Port B and the VIP_OUTPUT_PORT_A_SRC_FID and VIP_OUTPUT_PORT_B_SRC_FID status registers reflect the remapped Channel ID when the port is in TI Line Mux mode.

9.4.5.9 Channel ID Extraction for 2x/4x Multiplexed Source

9.4.5.9.1 Channel ID Extraction Overview

For 2-way and 4-way multiplexed source, the Channel ID is either embedded in the four protection bits inside the EAV/SAV code words or in the horizontal blanking pixel data. A configuration setting determines where the VIP_PARSER would search for the Channel ID.

9.4.5.9.2 Channel ID Embedded in Protection Bits for 2- and 4-Way Multiplexing

The four-bit channel ID is an identifier corresponding with the source number (camera) of the incoming video. As shown in Table 9-17, the Channel ID is placed in the code fourth byte of the EAV/SAV code words normally used for protection bits. With 4 bits, the maximum number of sources that can be defined in this range is 16. However, only Channel IDs in the range {0:7} are supported. Obviously, error correction cannot be performed on the FVH flags since the protection bits are no longer there.

Table 9-17. Channel ID Embedded in EAV/SAV

7 (fixed)	6 (F)	5 (V)	4 (H)	3 (ch_id[3])	2 (ch_id[2])	1 (ch_id[1])	0 (ch_id[0])	Description
1	0	0	0	Ch_id = {0:15}				SAV, Field 0, Active Video
1	0	0	1	Ch_id = {0:15}				EAV, Field 0, Horizontal Blanking
1	0	1	0	Ch_id = {0:15}				SAV, Field 0, Vertical Blanking
1	0	1	1	Ch_id = {0:15}				EAV, Field 0, Horizontal Blanking in Vertical Blanking Region
1	1	0	0	Ch_id = {0:15}				SAV, Field 1, Active Video
1	1	0	1	Ch_id = {0:15}				EAV, Field 1, Horizontal Blanking
1	1	1	0	Ch_id = {0:15}				SAV, Field 1, Vertical Blanking
1	1	1	1	Ch_id = {0:15}				EAV, Field 1, Horizontal Blanking in Vertical Blanking Region

9.4.5.9.3 Channel ID Embedded in Horizontal Blanking Pixel Data for 2- and 4-Way Multiplexing

In Horizontal Blanking and Vertical Blanking, non-ancillary data pixels should be Y=0x10 and Cb=Cr=0x80. When the Channel ID is embedded in the Horizontal Blanking for 2 and 4-way multiplexing, the lower nibbles of all Luma and Chroma pixels are replaced by the 4 bit Channel ID. This scenario is shown in Figure 9-53. The maximum number of values defined by this 4-bit range is 2^4 = 16. However, only Channel IDs in the range {0:7} are supported.

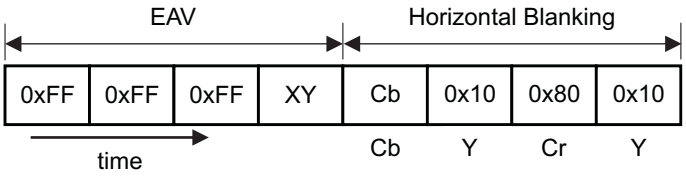
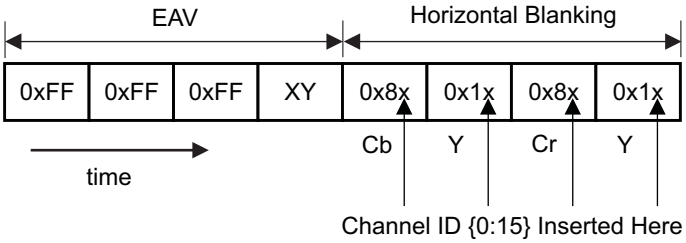
Figure 9-53. Channel ID Inserted Into Horizontal Blanking

Regular Horizontal Blanking Following EAV



Channel ID Inserted Into Horizontal Blanking Following EAV



9.4.5.10 Embedded Sync Mux Modes and Data Bus Widths

Legal combinations of Embedded Sync Mux Modes and Data Bus Widths are described in Table 9-18.

Table 9-18. Valid Embedded Sync Mux Mode and Data Bus Width Combinations

	1x Mux	2x Mux	4x Mux	Line Mux
8 Bit	v	v	v	v
16 Bit	v	n/a	n/a	v
24 Bit	v	n/a	n/a	n/a

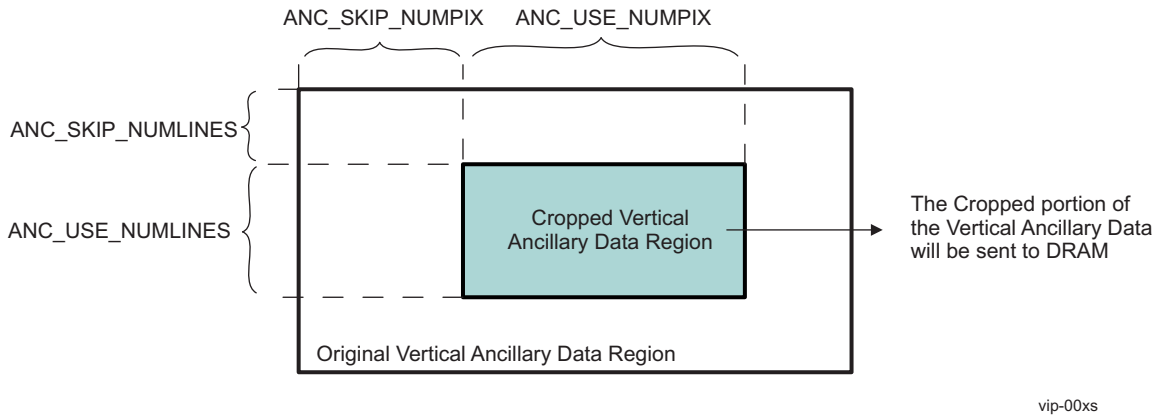
9.4.5.11 Ancillary and Active Video Cropping

One Source Number for each Port can be cropped. Cropping is available for both Ancillary Data and Active Video.

For the Vertical Ancillary Data from Port A, cropping is enabled by setting the VIP_ANC_CROP_HORZ_PORT_A[15] ANC_BYPASS_N bit. The Source Number from Port A that gets cropped is defined by the VIP_ANC_CROP_HORZ_PORT_A[31:28] ANC_TARGET_SRCNUM register. VIP_ANC_CROP_HORZ_PORT_A[11:0] ANC_SKIP_NUMPIX, VIP_ANC_CROP_HORZ_PORT_A[27:16] ANC_USE_NUMPIX, VIP_ANC_CROP_VERT_PORT_A[11:0] ANC_SKIP_NUMLINES, and VIP_ANC_CROP_VERT_PORT_A[27:16] ANC_USE_NUMLINES define the region of the selected Source Number that is cropped and sent to DRAM. The Vertical Ancillary Data Cropping region is described in Figure 9-54.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-54. Vertical Ancillary Data Cropping

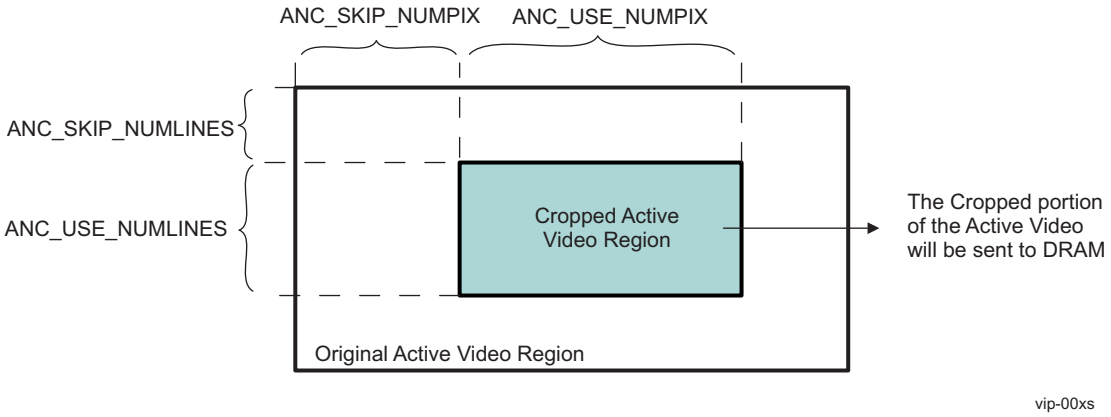


Note that for 8-bit input mode only, a setting exists that allow Vertical Ancillary data from both the Luma and Chroma channels to be captured. Both channels of Vertical Ancillary Data are captured when VIP_XTRA_PORT_A[14:13] ANC_CHAN_SEL_8B is set to “1x”. Thus, the number of data elements per line in this case is twice the equivalent number of Luma pixels per line. In other words, for this particular dual channel capture example, if there are 720 Luma pixels per line, then the total number of Vertical Ancillary Data Pixels in the source picture can be 2x720=1440 pixels.

For Active Video from Por tA, cropping is enabled by setting the VIP_CROP_HORZ_PORT_A[15] ACT_BYPASS_N bit. The Source Number from Port A that gets cropped is defined by the VIP_CROP_HORZ_PORT_A[31:28] ACT_TARGET_SRCNUM register.

VIP_CROP_HORZ_PORT_A[11:0] ACT_SKIP_NUMPIX, VIP_CROP_HORZ_PORT_A[27:16] ACT_USE_NUMPIX, VIP_CROP_VERT_PORT_A[11:0] ACT_SKIP_NUMLINES, and VIP_CROP_VERT_PORT_A[27:16] ACT_USE_NUMLINES define the region of the selected Source Number that is cropped and sent to DRAM. The Vertical Ancillary Data Cropping region is described in Figure 9-55

Figure 9-55. Active Video Cropping



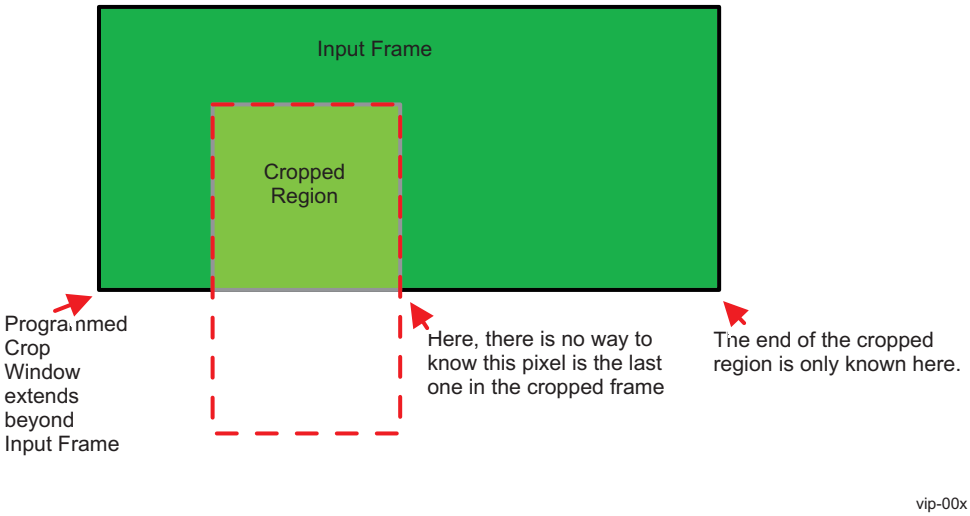
Cropping for Port B works in a similar way to Port A. Since picture data is in 4:2:2 format, ANC_SKIP_NUMPIX(ACT_SKIP_NUMPIX) and ANC_USE_NUMPIX (ACT_USE_NUMPIX) must be evenly divisible by 2. If the output of VIP_PARSER is sent to a 4:2:2 to 4:2:0 converter, then ANC_USE_NUMLINES(ACT_USE_NUMLINES) must also be evenly divisible by 2.

Error cases in cropping occur when the crop window programmed is larger than the incoming video frame. Crop window errors normally result in the return of the crop region where the crop window overlays the incoming video frame. However, there is one problematic error cropping case, as illustrated in Figure 9-56.

The programmed crop window extends below the input picture and the last pixel of the input picture is not a part of the selected crop region. In this case, at the last pixel of the last line in the green crop output, there is no way to determine that this pixel is the last pixel of the cropped output.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-56. Problematic Error Cropping Case



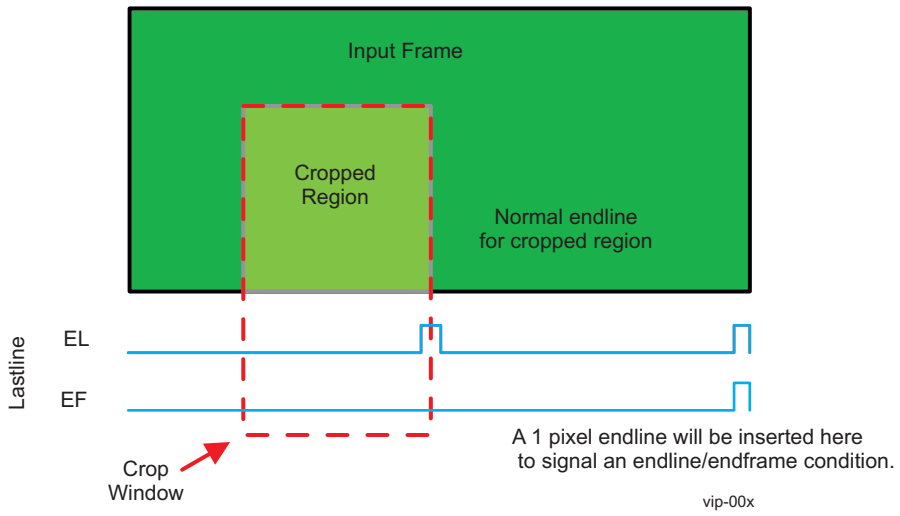
In this case, the crop tool sends outs a single pixel with an endline and endframe when it reaches the last pixel of the input picture. If the green cropped region has n lines, the actual output from the crop tool will have n+1 lines and the width of the last line will be 1 pixel.

Figure 9-57 shows the endline (EL) and endframe (EF) signals corresponding to the last line of the cropped region. At the last line and last pixel of the cropped region, the crop tool will only output an endline. It cannot output an endframe at this point because the crop tool might get another line from the streaming input.

Later, on the same input line, the last pixel of the input frame appears. Here, the crop tool knows that the cropped region has ended. In this case, a single endline/endframe pixel is sent out to signal that the frame has ended.

NOTE: There is no interrupt to notify that application level that a crop error has occurred.

Figure 9-57. Endline/Endframe Behavior for Error Cropping Case



9.4.5.12 Interrupts

The VIP_PARSER module has 19 interrupts out of which one can be mapped to VIP top level.

Copyright © 2015–2020, Texas Instruments Incorporated

When an interrupt occurs and is determined to be from the VIP_PARSER module, the VIP_PARSER level of masks, clears, and status registers must be checked and updated first.

Table 9-19 describes each of the interrupts events supported by the VIP_PARSER, together with associated Interrupt Mask (VIP_FIQ_MASK), Interrupt Clear (VIP_FIQ_CLEAR), and Interrupt Status (VIP_FIQ_STATUS) registers.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-19. VIP_PARSER Interrupt Events

Event Flag	Event Mask	Map to	Description
VIP_FIQ_STATUS[21] PORT_A_YUV_PROTOCOL_VIOLATION	VIP_FIQ_MASK[21] PORT_A_YUV_PROTOCOL_VIOLATION_MASK	PrtBDisableComplete	When a port is running and VIP_PORT_B[8] ENABLE bit is turned off, logic exists to ensure that a complete frame is sent out of the Ancillary and Active Video VPI ports. That is, a frame is not stopped in the middle. This interrupt is activated when all active frames have been sent out Port B following a disable.
VIP_FIQ_STATUS[20] PORT_A_ANC_PROTOCOL_VIOLATION	VIP_FIQ_MASK[20] PORT_A_ANC_PROTOCOL_VIOLATION_MASK	PrtADisableComplete	When a port is running and VIP_PORT_A[8] ENABLE bit is turned off, logic exists to ensure that a complete frame is sent out of the Ancillary and Active Video VPI ports. That is, a frame is not stopped in the middle. This interrupt is activated when all active frames have been sent out Port A following a disable.
VIP_FIQ_STATUS[19] PORT_B_YUV_PROTOCOL_VIOLATION	VIP_FIQ_MASK[19] PORT_B_YUV_PROTOCOL_VIOLATION_MASK	PrtBANCProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Ancillary VPI of Port B.
VIP_FIQ_STATUS[18] PORT_B_ANC_PROTOCOL_VIOLATION	VIP_FIQ_MASK[18] PORT_B_ANC_PROTOCOL_VIOLATION_MASK	PrtBYUVProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Active Video VPI of Port B.
VIP_FIQ_STATUS[17] PORT_A_CFG_DISABLE_COMPLETE	VIP_FIQ_MASK[17] PORT_A_CFG_DISABLE_COMPLETE_MASK	PrtAANCProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Ancillary VPI of Port A.
VIP_FIQ_STATUS[16] PORT_B_CFG_DISABLE_COMPLETE_CLR	VIP_FIQ_MASK[16] PORT_B_CFG_DISABLE_COMPLETE_MASK	PrtAYUVProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Active Video VPI of Port A.
VIP_FIQ_STATUS[15] PORT_B_SRC0_SIZE_STATUS	VIP_FIQ_MASK[15] PORT_B_SRC0_SIZE	PrtBSrc0Size	The output size for Srcnum=0 on Port B differs from the XTRA_PORT_B[11:0] SRC0_NUMLINES and [27:16] SRC0_NUMPIX register settings
VIP_FIQ_STATUS[14] PORT_A_SRC0_SIZE_STATUS	VIP_FIQ_MASK[14] PORT_A_SRC0_SIZE	PrtASrc0Size	The output size for Srcnum=0 on Port A differs from the XTRA_PORT_B[11:0] SRC0_NUMLINES and [27:16] SRC0_NUMPIX register settings
VIP_FIQ_STATUS[13] PORT_B_DISCONN_STATUS	VIP_FIQ_MASK[13] PORT_B_DISCONN	PrtBDisconn	Port B Link Disconnect for Srcnum 0
VIP_FIQ_STATUS[12] PORT_B_CONN_STATUS	VIP_FIQ_MASK[12] PORT_B_CONN	PrtBConn	Port B Link Connect for Srcnum 0

Table 9-19. VIP_PARSER Interrupt Events (continued)

Event Flag	Event Mask	Map to	Description
VIP_FIQ_STATUS[6] OUTPUT_FIFO_PRTA_ANC_STATUS	VIP_FIQ_MASK[6] OUTPUT_FIFO_PRTA_ANC_OF	OpPrtAAnc	Overflow at Ancillary Data VPDMA interface for the Port A
VIP_FIQ_STATUS[4] OUTPUT_FIFO_PRTA_LUMA_STATUS	VIP_FIQ_MASK[4] OUTPUT_FIFO_PRTA_YUV_OF	OpPrtAYUV	Overflow at Luma VPDMA interface for Port A
VIP_FIQ_STATUS[3] ASYNC_FIFO_PRTB_STATUS	VIP_FIQ_MASK[3] ASYNC_FIFO_PRTB_OF	InPrtB	Overflow at Input Async FIFO for Port B
VIP_FIQ_STATUS[2] ASYNC_FIFO_PRTA_STATUS	VIP_FIQ_MASK[2] ASYNC_FIFO_PRTA_OF	InPrtA	Overflow at Input Async FIFO for Port A
VIP_FIQ_STATUS[1] PRTB_VDET_STATUS	VIP_FIQ_MASK[1] PRTB_VDET_MASK	PrtBVdet	Video Detect Interrupt for Port B
VIP_FIQ_STATUS[0] PRTA_VDET_STATUS	VIP_FIQ_MASK[0] PRTA_VDET_MASK	PrtAVdet	Video Detect Interrupt for Port A

A ‘1’ in the Status register associated with an Interrupt source shows that the interrupt source is pending. The Status register is read-only. To clear a bit in the Status register, the associated bit in the Clear register must be written with a ‘1.’

A ’1’ in the bit position of the Mask register associated with an Interrupt source ensures that the hardware interrupt will never be passed on to the VIP top level. A ‘0’ in the bit position of the Mask register associated with an Interrupt source will cause the interrupt controller to see a VIP_PARSER interrupt in the event the hardware in the parser triggers it.

A ‘1’ in the bit position of the Clear register associated with an Interrupt source clears the hardware interrupt status register until the next time the hardware triggers it. After a Clear, the CPU should set the bit back to a ‘0.’ Otherwise, the hardware would not be able to set any subsequent interrupts of the same type.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.5.13 VDET Interrupt

For Line Multiplexing Embedded Sync mode only, the Meta Data Header includes a Video Detect (VDET) flag. The device sets this VDET flag whenever NTSC or PAL sync is found. Some other external devices using Line Multiplexing mode may not use VDET. However, when VDET changes, a VDET interrupt is issued (see Table 9-19, *Interrupts*, for more details on the interrupt). Each Pixel Clock Input Domain (Port A and Port B) has a separate VDET interrupt.

The VDET status register is comprised of 32 bits, each bit representing the value of the VDET flag found in the meta data of the Channel ID. Bit 0 is the VDET value from Channel ID 0, Bit 1is is VDET value from Channel ID 1, and so on. There is a separate status register for each Pixel Input Clock Domain (VIP_PORT_A_VDET_VEC and VIP_PORT_B_VDET_VEC registers).

In Line Mux mode, the meta-data field defining the srcnum is 5-bits wide. Only the last three bits of this field and the upper two bits are reserved. This bit should always be set to 1 in TI Line Mux mode.

9.4.5.14 Source Video Size

For each Pixel Input Clock Domain, status registers are available to log the last active video height and width found from 16 camera sources. There is no interrupt activated on the change in the source size in any of the input sources. These readonly registers only inform the application of the width and the height of the last active field or frame associated with each channel ID.

In 2x/4x pixel multiplexing, the four bit nibble carrying the Srcnum defines a maximum of 16 sources.

9.4.5.15 Clipping

In ITU-656/BT.1120 embedded sync streams, the values 0x00 and 0xFF are reserved for sync detection. These values are illegal in the rest of the stream. Only when the ITU-1364 standard came out to for digitally inserted vertical blanking data structures did the 0x00 and 0xFF codes get re-used in the packet synchronization structure.

The VIP_PARSER supports one configuration bit that, when enabled, changes all 0x00 to 0x01 and 0xFF to 0xFE in the vertical ancillary data. Another configuration bit, when enabled, changes all 0x00 to 0x01 and 0xFF to 0xFE in the active video portion of the input picture.

Generally, clipping is only desired for discrete sync input data captured from a NTSC/PAL decoder type of device which does not follow pixel range rules. For Discrete Sync input, the possibility to clip inputs to legal values exists. Clipping is desired if the picture sent to DRAM will be streamed out of the IC again usin an ITU-656/BT.1120 style output port. If the picture is processed inside the SOC before it is streamed out, then the processing procedure or the output streaming hardware needs to ensure that illegal values are not in the stream.

For Embedded Sync input, illegal values should not exist except for the ITU-1364 data sync sequence 00-FF-FF. Otherwise, the VIP Parser cannot determine good EAV/SAV. In the hardware, clipping is allowed for Embedded Sync streams even though it is not particularly a useful feature.

Note that if the clipping is enabled for ancillary data, the post processing software will never be able to find a data packet sync header, since the 00-FF-FF sequence will be changed to 01-FE-FE.

For 24-bit YUV, clipping is done on each 8 bit channel. If data[23:16]==0xFF, the clipped value will be 0xFE. If data[23:16]==0x00, the clipped value will be 0x01. Likewise, clipping is done for data bit ranges 15:8 and 7:0

From a software point of view, clipping should never be enabled for 24-bit RGB. RGB should use the full 8-bit quantization range for each color component. The hardware, however, will clip RGB in active video, if VIP_MAIN[5] CLIP_ACTIVE='1'. The clipping will be done on each 8-bit channel as described for 24-bit YUV.

9.4.5.16 Current and Last FID Value

The FID values for the current field or frame are reported in the Status Registers. When a new field or frame enters, the current FID values are saved into the previous FID status registers and the new FID value is loaded into the current FID register.

Copyright © 2015–2020, Texas Instruments Incorporated

Following a reset, the previous and current FID status registers are set to '1.' The first two fields or frames are ignored. On the third input field or frame after a reset, the previous FID is loaded with the current FID ('1'), and the current FID is loaded with the actual FID. By the fourth field or frame after a reset, both the previous and current FID values should represent the values found in the input stream.

The FID values are reported for each camera source in both Pixel Input Clock Domains.

9.4.5.17 Disable Handling

A feature was defined for the case of single stream (either discrete sync or embedded sync) input handling where VIP_PORT_A[8] ENABLE for Port A and VIP_PORT_B[8] ENABLE for Port B is taken inactive. The single stream case was deemed more important than the multi-stream one since the output of the VIP_PARSER may be used to drive the Scaler module. The Scaler needs to work on a frame boundary (startframe to endframe) or it may lock up without a reset. The goal of the disable handling for the single stream case is to complete a field or frame of output data to the downstream module. Then, upon enabling of the port again, the system should start up properly without a need to reset the individual modules within the VIP instance.

In this scenario, suppose the VIP_PARSER has been processing a single input stream. Then, ENABLE is brought inactive. The VIP_PARSER will continue to output data downstream until it sends out an endframe pixel and the downstream module accepts the endframe pixel.

9.4.5.18 Picture Size Interrupt

Each VIP port can be set up to trigger an interrupt if the picture size varies from a pre-programmed expected picture size. This interrupt is supported only for the Active Video portion of the input video and not for the Vertical Ancillary portion. Also this interrupt is only support for source number 0 in multi channel capture.

The interrupts are named PrtASrc0Size and PrtBSrc0Size. They are described in Table 9-19, *VIP_PARSER Interrupt Events*

For Port A, the expected active video picture size values are programmed in VIP_XTRA_PORT_A[11:0] SRC0_NUMLINES and VIP_XTRA_PORT_A[27:16] SRC0_NUMPIX. For PortB, the expected active video picture size values are programmed in VIP_XTRA_PORT_B[11:0] SRC0_NUMLINES and VIP_XTRA_PORT_B[27:16] SRC0_NUMPIX.

NOTE: Picture Size Interrupt reflects the Active Video going into the DRAM. If cropping is enabled for Srcnum=0, the Picture Size is the post-cropped size.

9.4.5.19 Discrete Sync Signals

External ICs generally produce discrete sync interface signals seen in Figure 9-58.

VBLNKrepresents the vertical blanking interval. Generally, vertical blanking is at the top of a NTSC/PAL field. In certain standards, the last few lines of a field or frame are in vertical blanking in addition to the beginning few lines in the following field or frame.

VSYNC is the vertical sync indicator. VSYNC is active during a portion of the vertical blanking. For NTSC and PAL, since these standards define an odd number of lines for a field pair, VSYNC can be use in conjunction with HSYNC to determine FID polarity. Generally, VSYNC is defined to transition inactive to active sometime during vertical blanking. This signal then transitions to an inactive state before the end of vertical blanking. Certain standards define the line numbers where VSYNC transitions.

HBLNK is the horizontal blanking interval for each line. The horizontal blanking is the same number of pixels whether the line is in the active video region or in the vertical blanking region of the scan.

ACTVID is the region of a line that is active video. It is the inverse of the HBLNK signal. The number of pixels in the ACTVID region is the same for a line in vertical blanking as a line in active video. ACTVID(1) is a situation where the signal toggles in vertical blanking as well as active video. ACTVID(2) shows the signal toggling only in non-vertical blanking regions. Once ACTVID transitions active, it stays active for every PIXCLK until the end of the line.

Copyright © 2015–2020, Texas Instruments Incorporated

HSYNC transitions from inactive to active for the first pixel of each line, which is a horizontal blanking pixel. HSYNC will transition to the inactive state before the end of the line. HSYNC is similar to HBLNK in that they both transition active on the same PIXCLK cycle. However, HBLNK transitions inactive at the end of the horizontal blanking period. HSYNC can transition inactive either before or after the horizontal blanking period.

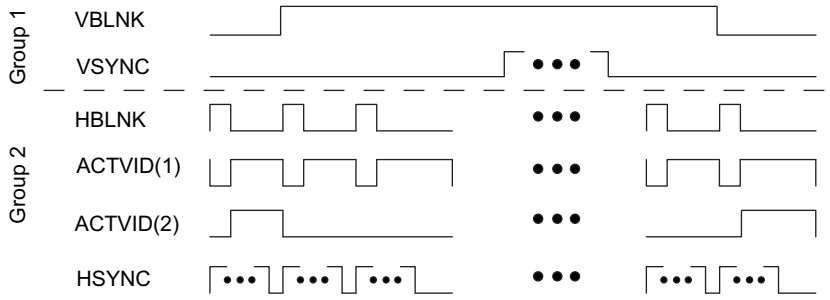
Group 1 signals define the vertical separation between fields or frames. Group 2 signals define the separation between lines. One of the Group 1 signals can be tied to the VSYNC input. The ACTVID(1) and ACTVID(2) signals from Group 2 are tied to the ACTVID input. One of the other two Group 2 signals, HBLNK or HSYNC, can be tied to the HSYNC input.

VIP_PORT_A[15] USE_ACTVID_HSYNC_N for Port A and VIP_PORT_B[15] USE_ACTVID_HSYNC_N for Port B defines whether the line separation method uses the signal from the ACTVID or the HSYNC input of the VIP_PARSER module.

VIP_PORT_A[22] DISCRETE_BASIC_MODE for Port A VIP_PORT_B[22] DISCRETE_BASIC_MODE for Port B determines whether discrete sync works as described in Section 9.4.5.6 *Input Data Interface* or whether a “basic mode” input handler is invoked.

By choosing one signal from Group 1 and one signal from Group 2, there should be a way to capture the external data.

Figure 9-58. Generic External Sync Signals



NOTE: 1. VIP_PARSER module defines three discrete sync control signals: ACTVID, HSYNC, and VSYNC.

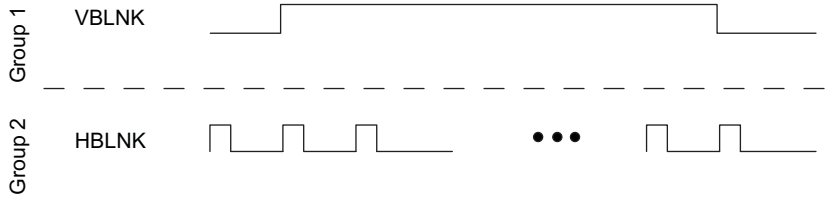
2. In order to capture external data PIXCLK must never stop, for either horizontal or vertical blanking.

9.4.5.19.1 VBLNK and HBLNK

Figure 9-59 shows VBLNK from Group 1 and HBLNK from Group 2 being used. In this case, set USE_ACTVID_HSYNC_N=’0’ and DISCRETE_BASIC_MODE=’0’. Vertical Ancillary lines will be sent to the Vertical Ancillary output at Active Video will be sent out the Active Video output.

If DISCRETE_BASIC_MODE=’1’ is chosen, all lines including vertical blanking ones will be sent to the Active Video buffer. Since a line is delineated by HBLNK and HBLNK toggles in vertical blanking as well as active video, every incoming pixel will be save to the Active Video buffer.

Figure 9-59. vblnk and hblnk



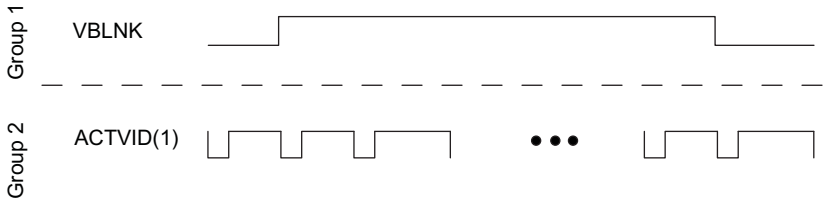
Copyright © 2015–2020, Texas Instruments Incorporated

9.4.5.19.2 BLNK and ACTVID (1)

Figure 9-60 shows VBLNK from Group 1 and ACTVID(1) from Group 2 being used. ACTVID is toggling during Vertical Blanking. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output and Active Video will be sent out the Active Video output.

If DISCRETE_BASIC_MODE='1' is chosen, all lines will be sent to the Active Video output.

Figure 9-60. VBLNK and ACTID (1)

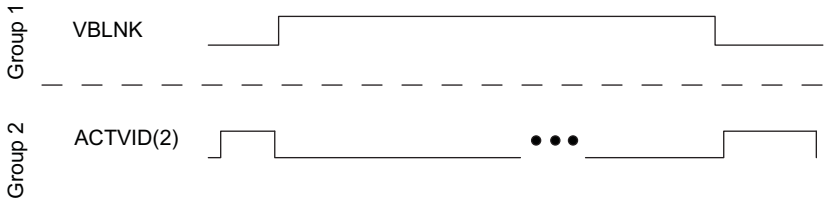


9.4.5.19.3 VBLNK and ACTVID(2)

Figure 9-61 shows VBLNK from Group 1 and ACTVID(2) from Group 2 being used. ACTVID is not toggling during Vertical Blanking. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='1'. Since there are no line sync/clocking signals in the Vertical Blanking period, only Active Video lines will be sent to the Active Video output.

If DISCRETE_BASIC_MODE='0' is set, then the hardware will lock up as there is no way for it to determine a frame boundary.

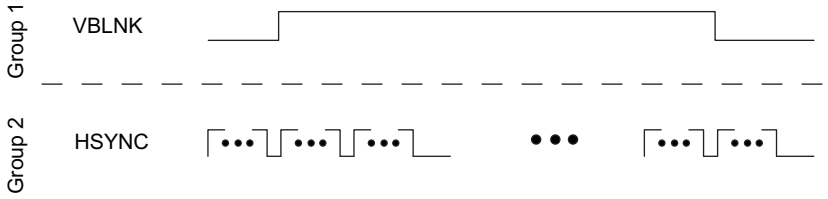
Figure 9-61. VBLNK and ACTVID(2)



9.4.5.19.4 VBLNK and HSYNC

Figure 9-62 shows VBLNK from Group 1 and HSYNC from Group 2 being used. In this scenario, set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODEN='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output at Active Video will be sent out the Active Video output.

Figure 9-62. VBLNK and HSYNC



9.4.5.19.5 VSYNC and HBLNK

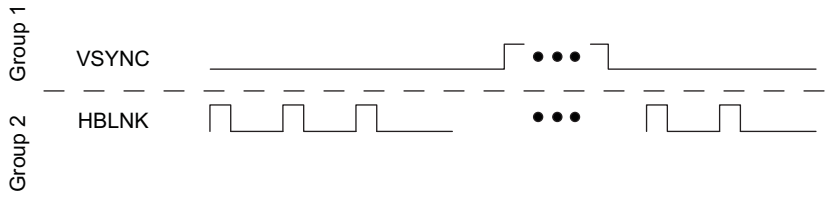
Figure 9-63 shows VSYNC from Group 1 and HBLINK from Group 2 being used. Set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='1'.

Copyright © 2015–2020, Texas Instruments Incorporated

Also, no automatic parsing of vertical ancillary data will be performed so the Ancillary VPI port to the VPDMA should be disabled. All lines, including both vertical ancillary and active video, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Every data element strobed on the Pixel clock's active edge will be stored in the Active Video Buffer.

In Figure 9-63, it is likely the HBLINK will toggle when VSYNC is active. In this case, setting USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='0' mean that those lines appearing under the active VSYNC will be sent to the Ancillary Data Buffer. All other captured lines will be sent to the Active Video Buffer.

Figure 9-63. VSYNC and HBLNK

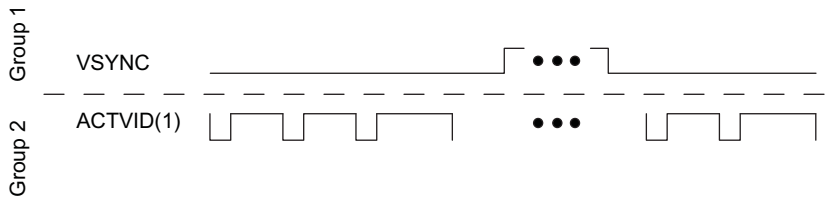


9.4.5.19.6 VSYNC and ACTIVID(1)

Figure 9-64 shows VSYNC from Group 1 and ACTIVID(1) from Group 2 being used. ACTIVID is toggling during the VBLNK interval. ACTIVID does not necessarily toggle during VSYNC. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='1'.

Also, no automatic parsing of vertical ancillary data will be performed so there is no activity on the Ancillary VPI port to the VPDMA. All lines, including both vertical ancillary and active video, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Lines are denoted by an inactive to active transition of ACTIVID. Only those pixels gated by an active ACTIVID will be saved.

Figure 9-64. VSYNC and ACTIVID(1)



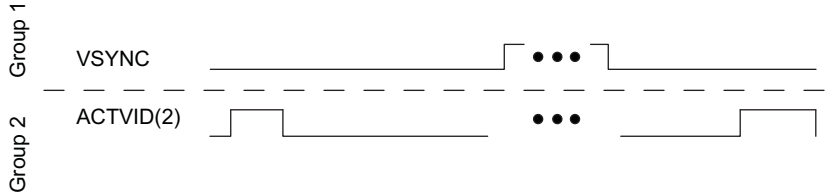
9.4.5.19.7 VSYNC and ACTIVID(2)

Figure 9-65 shows VSYNC from Group 1 and ACTIVID(2) from Group 2 being used. ACTIVID is not toggling during the entire VBLNK interval. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='1'.

Also, no automatic parsing of vertical ancillary data will be performed so the the Ancillary VPI port to the VPDMA should be turned off. All active video lines, since there are no vertical ancillary data lines, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Lines are denoted by an inactive to active transition of ACTIVID. Once a line starts, ACTIVID stays active for every pixel clock until the end of the line. Only those pixels gated by an active ACTIVID will be saved.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-65. VSYNC and ACTIVID(2)

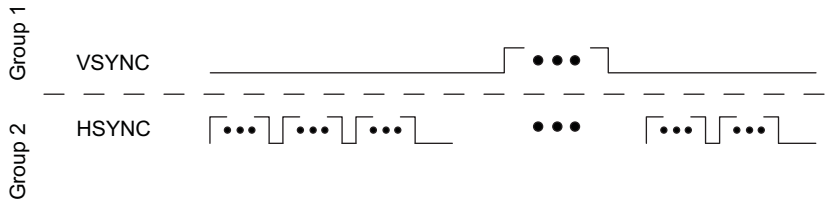


9.4.5.19.8 VSYNC and HSYNC

Figure 9-66 shows VSYNC from Group 1 and HSYNC from Group 2 being used. Set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='1'.

In the event that the machine is set to DISCRETE_BASIC_MODE='0', lockup will not occur as long as there is an HSYNC active transition during the time that VSYNC is active. This scenario is likely. However, if there is not at least one such transition on HSYNC, then the machine experiences a lock up. It cannot distinguish the end of one frame from the start of the next frame.

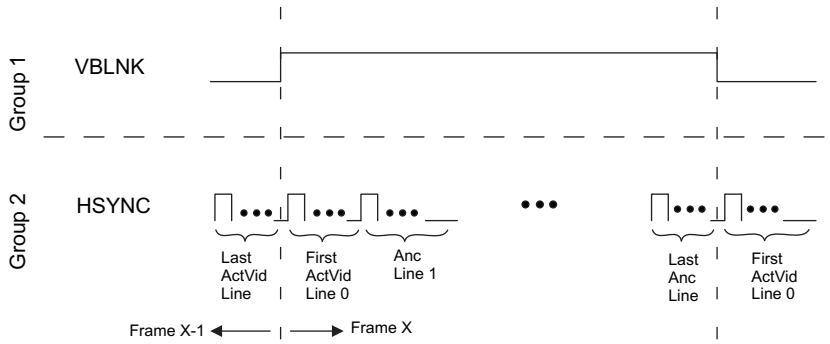
Figure 9-66. VSYNC and HSYNC



9.4.5.19.9 Line and Pixel Capture Examples

When DISCRETE_BASIC_MODE='0', VBLNK is generally used. All the lines where the start of line is under an active VBLNK are sent to the Ancillary Data buffer. All the lines where the start of line is not under an active VBLNK are sent to the Active Video framebuffer. This situation is shown in Figure 9-67.

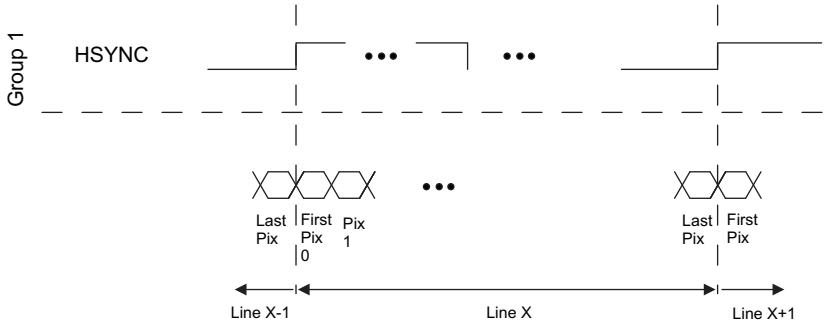
Figure 9-67. Ancillary and Active Video Line Determination



The start of line is the pixel represented by the inactive to active transition on HSYNC when USE_ACTVID_HSYNC_N = '1'. Figure 9-68 illustrates the delineation of a line when using USE_ACTVID_HSYNC_N = '1.'

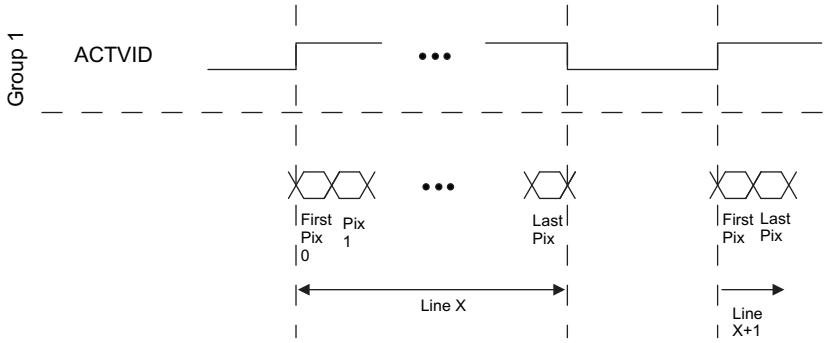
Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-68. HSYNC Pixel Capture



The start of line is the pixel represented by the inactive to active transition on ACTVID when USE_ACTVID_HSYNC_N = '0.' Note that ACTVID stays active for the entire duration of active video portion of the line. This scenario is shown in Figure 9-69

Figure 9-69. ACTVID Pixel Capture



In 8-bit mode, the 4:2:2 YUV input color component order is Cb, Y followed by Cr and Y. For 16-bit and 24-bit input modes, all the components are sent in the same cycle.

9.4.5.20 VIP Overflow Detection and Recovery

It is possible that an overflow can occur in the VIP_PARSER. Overflow detection is determined by reading the VIP_FIQ_STATUS register and checking for bits 8, 7, 5, 4, 3 and 2. If video is being captured, and any of these bits are set, it indicates that not all of the incoming video data was sent to DDR meory. VIP overflow can be caused by one of the following:

1. External pixel clock is faster than processing clock

2. DDR bandwidth is temporarily over-consumed

3. VIP scaler is being used inline with external video input, and is upscaling.

- VIP scaler in this use case can only be used for downscaling

4. VIP scaler is being used inline with external video input, but has not been configured with scaler coefficients

- VIP scaler will not accept video input if it is not first configured with scaler coefficients. This will cause overflow

5. VIP scaler is being used inline, but has not been enabled

6. External cables are connected or disconnected while the system is running, resulting in corrupted video streams going into the VIP

7. Bad external video cable, which causes corrupted video streams going into the VIP

Items 6 and 7 above are typically seen as noise events, where it is likely that multiple horizontal syncs per line and/or multiple vertical syncs per frame will be observed. These result in high peak throughput requirements, leading to DDR bandwidth being temporarily over-consumed, and thus VIP overflow.

Copyright © 2015–2020, Texas Instruments Incorporated

The high level recovery method for VIP overflow on Port A is outlined in the steps below. Port B is similar.

1. Set VIP_XTRA6_PORT_A[31:16] YUV_SRCNUM_STOP_IMMEDIATELY = 0xFFFF_FFFF
2. Set VIP_XTRA6_PORT_A[15:0] ANC_SRCNUM_STOP_IMMEDIATELY = 0xFFFF_FFFF
3. Set VIP_PORT_A[8] ENABLE = 0
4. Set VIP_PORT_A[7] CLR_ASYNC_FIFO_RD and VIP_PORT_A[6] CLR_ASYNC_FIFO_WR to 1
5. Set VIP_PORT_A[23] SW_RESET to 1
6. Reset other VIP modules
   - For each module used downstream of VIP_PARSER, write 1 to the bit location of the VIP_CLKC_RST register which is connected to VIP_PARSER
7. Abort VPDMA channels
   - Write to list attribute to stop list 0
   - Write to list address register location of abort list
   - Write to list attribute register list 0 and size of abort list
8. Set VIP_PORT_A[23] SW_RESET to 0
9. Un-reset other VIP modules
   - For each module used downstream of VIP_PARSER, write 0 to the bit location of the VIP_CLKC_RST register which is connected to VIP_PARSER
10. (Delay)
11. SC coeff downloaded (if VIP_SCALER is being used)
12. (Delay)
13. Set VIP_XTRA6_PORT_A[31:16] YUV_SRCNUM_STOP_IMMEDIATELY = 0x0000_0000
14. Set VIP_XTRA6_PORT_A[15:0] ANC_SRCNUM_STOP_IMMEDIATELY = 0x0000_0000
15. Set VIP_PORT_A[8] ENABLE = 1
16. Set VIP_PORT_A[7] CLR_ASYNC_FIFO_RD and VIP_PORT_A[6] CLR_ASYNC_FIFO_WR to 0

9.4.6 VIP Color Space Converter (CSC)

The Color Space Converter (CSC) module is used to convert video data from one color space to another with nine programmable integer multipliers.

9.4.6.1 CSC Features

- All parameters are programmable
- Each parameter is configurable in signed 13-bits
- Support for Bypass Mode

9.4.6.2 CSC Functional Description

The conversion between the different color spaces requires addition and multiplication operations on color and intensity components. The mathematical expression of the conversion can be written as:

```
Y   = A0*R + B0*G + C0*B + D0
Cb  = A1*R + B1*G + C1*B + D1
Cr  = A2*R + B2*G + C2*B + D2
```

Color space coeficients are set through the following registers:

- For luma component:
  - VIP_CSC00[12:0] A0
  - VIP_CSC00[28:16] B0

Copyright © 2015–2020, Texas Instruments Incorporated

  - VIP_CSC01[28:16] C0
  - VIP_CSC04[27:16] D0
- For Cb component:
  - VIP_CSC01[28:16] A1
  - VIP_CSC02[12:0] B1
  - VIP_CSC02[27:16] C1
  - VIP_CSC05[11:0] D1
- For Cr component :
  - VIP_CSC03[12:0] A2
  - VIP_CSC03[27:16] B2
  - VIP_CSC04[12:0] C2
  - VIP_CSC05[27:16] D2

Using YUV to RGB conversion as an example: YUV represents one color space and RGB represents another color space. The conversion can be written in the matrix format shown in Figure 9-70.

Figure 9-70. Matrix Format

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} A0 & B0 & C0 \\ A1 & B1 & C1 \\ A2 & B2 & C2 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} D0 \\ D1 \\ D2 \end{bmatrix}$$

Since HDTV and SDTV have different conversion requirements, both conversions of RGB-to-YCbCr and YCbCr-to-RGB are described. The details of derivations of these matrixes will be given in the following subsections.

9.4.6.2.1 HDTV Application

9.4.6.2.1.1 HDTV Application with Video Data Range

The two equations presented in this section are for the HDTV application. The chromaticity parameters are defined by ITU-R709 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 9-71. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.2126 & 0.7152 & 0.0722 \\ -0.1172 & -0.3942 & 0.5114 \\ 0.5114 & -0.4646 & -0.0468 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Copyright © 2015–2020, Texas Instruments Incorporated

Conversion from YCbCr to RGB:

Figure 9-72. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1.5396 \\ 1 & -0.1831 & -0.4577 \\ 1 & 1.8142 & 0 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -197 \\ 82 \\ -232 \end{bmatrix} D$$

9.4.6.2.1.2 HDTV Application with Graphics Data Range

The two equations presented in this section are for the HDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R709 standard.

The input data ranges for these equations are as follows.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 9-73. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.1826 & 0.6142 & 0.0620 \\ -0.1006 & -0.3385 & 0.4392 \\ 0.4392 & -0.3990 & -0.0402 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 9-74. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1.1644 & -0.0003 & 1.7927 \\ 1.1644 & -0.2132 & -0.5329 \\ 1.1642 & 2.1125 & -0.0001 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -248 \\ 77 \\ -289 \end{bmatrix} D$$

9.4.6.2.1.3 Quantized Coefficients for Color Space Converter in HDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for HDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.6.2.2 SDTV Application

9.4.6.2.2.1 SDTV Application with Video Data Range

The two equations presented in this section are for the SDTV application. The chromaticity parameters are defined by ITU-R601 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 9-75. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.172 & -0.339 & 0.511 \\ 0.511 & -0.428 & -0.083 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 9-76. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & -0.0003 & 1.3717 \\ 1 & -0.3365 & -0.6984 \\ 1 & 1.7336 & -0.0016 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -176 \\ 132 \\ -222 \end{bmatrix} D$$

9.4.6.2.2.2 SDTV Application with Graphics Data Range

The two equations presented in this section are for the SDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R601 standard.

The input data ranges for these equations are as following.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-77. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.257 & 0.504 & 0.098 \\ -0.148 & -0.291 & 0.439 \\ 0.439 & -0.368 & -0.071 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 9-78. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1.1641 & -0.0018 & 1.5958 \\ 1.1641 & -0.3914 & -0.8135 \\ 1.1641 & 2.0178 & -0.0012 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -223 \\ 136 \\ -277 \end{bmatrix} D$$

9.4.6.2.2.3 Quantized Coefficients for Color Space Converter in SDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for SDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

9.4.6.3 CSC Bypass Mode

CSC module can be bypassed by setting VIP_CSC05[28] BYPASS bit-field to 1.

9.4.7 VIP Scaler (SC)

This section describes the highly optimized video resizers, SC (scalers), in the VIP modules.

9.4.7.1 SC Features

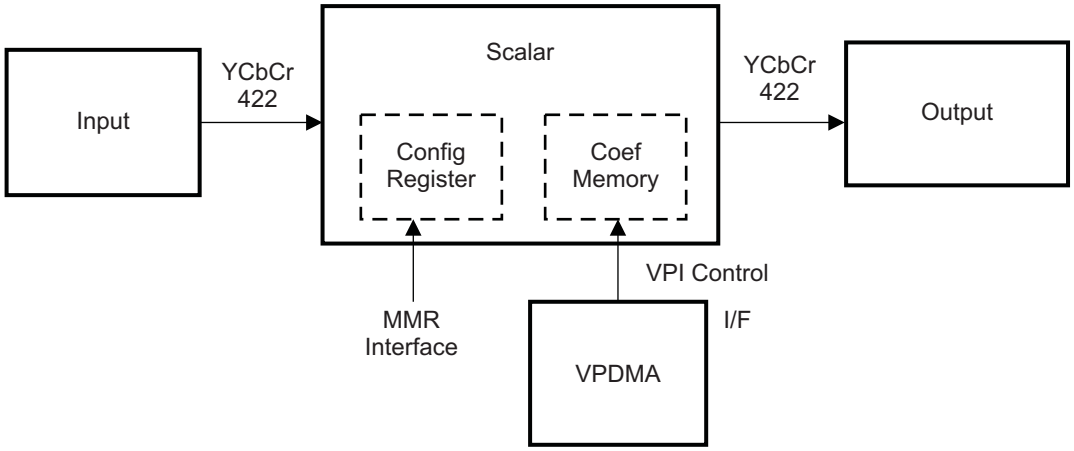
- Independent vertical and horizontal up and down scaling
- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Maximum horizontal scaling ratio only limited by output line buffer (2047 pixels)
- Scaling filter Coefficient memory download via VPI (Video Port Interface) Control interface

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.7.2 SC Functional Description

Scaler takes in a 10-bit YCbCr 422 video frame from an upstream module, performs vertical/horizontal scaling and outputs a YCbCr422 scaled image to a next downstream module. All configurations are done via the MMR interface except for the scaler coefficient memory configuration that is done via the common VPI control interface bus by VPDMA. Figure 9-79 shows the high-level block diagram of the scaler module.

Figure 9-79. High Level Block Diagram

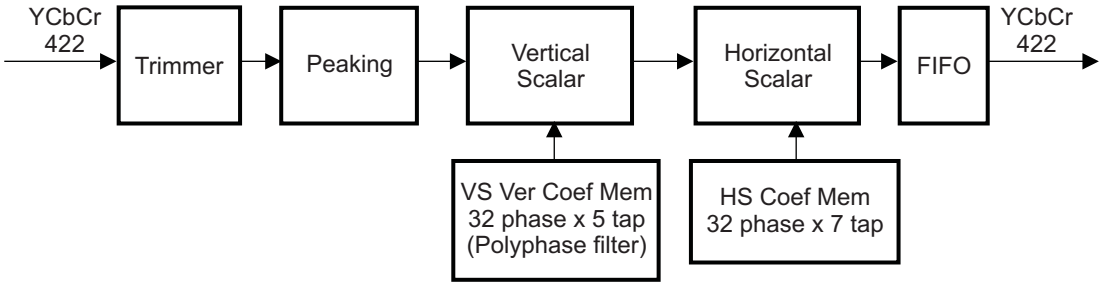


The SC is used in the video path and in all other video write-back data paths in the VIP module.

Scaling is performed in following three steps:

1. Trimming and Pre-peaking filtering
2. Vertical Scaling (Polyphase/Running Average Filter)
3. Horizontal polyphase scaling

Figure 9-80. SC Block Diagram



9.4.7.2.1 Trimmer

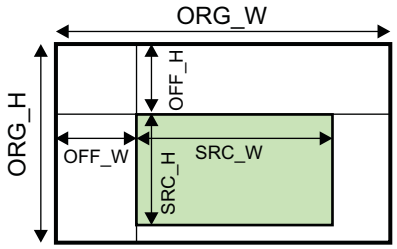
The trimmer can be programmed to re-define a new source image within the input video frame sent from an upstream module before it is sent to the scaling sub-modules. This feature enables small area zoom out, source pan/scan, or removal of unwanted area in the video (such as black box / curtains / noisy line-21 video) without modifying the VPDMA parameters.

Horizontal and vertical offset is set through VIP_CFG_SC25[26:16] CFG_OFF_W and VIP_CFG_SC25[10:0] CFG_OFF_H registers.

Width and height are set through VIP_CFG_SC24[26:16] CFG_ORG_W and VIP_CFG_SC24[10:0] CFG_ORG_H registers.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-81. Input Image Trimming



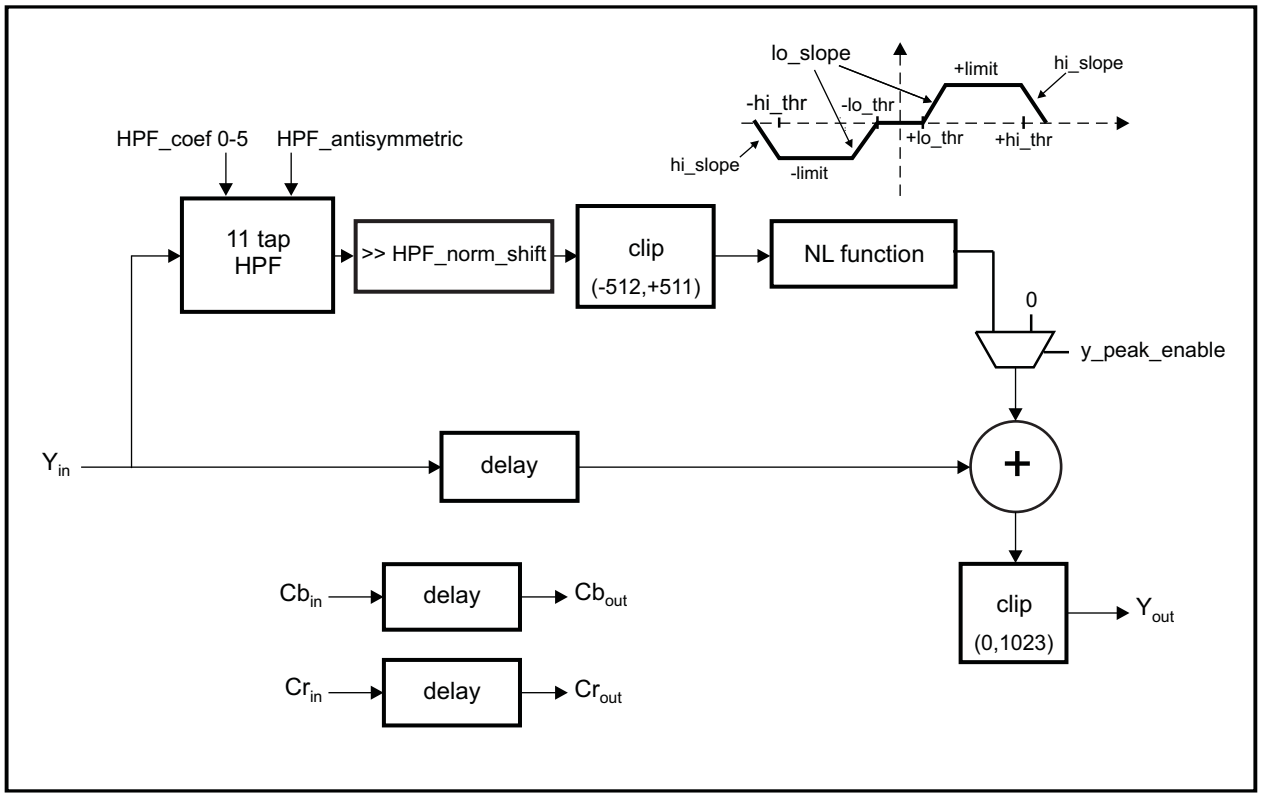
NOTE: Width and height of the source image are global parameters and are set with VIP_CFG_SC5[22:12] CFG_SRC_W and VIP_CFG_SC5[10:0] CFG_SRC_H registers.

It is required that the input image frame (CFG_SRC_W x CFG_SRC_H) to be at least 32 × 32 (after trimming, if the trimming is enabled) to properly fill the input filter stage pipelines.

9.4.7.2.2 Peaking

The peaking block increases the amplitude of high frequency luminance information in horizontal direction to increase the sharpness of a video image before it is scaled. As shown in Figure 9-82, the high-frequency luminance is increased using an 11-tap High-Pass filter with adjustable gain. The non-linear coring function removes low-level noise and the modified luminance is then added to the original luminance signal. The implementation details are shown in Figure 9-82.

Figure 9-82. Filter Implementation and Parameter Description



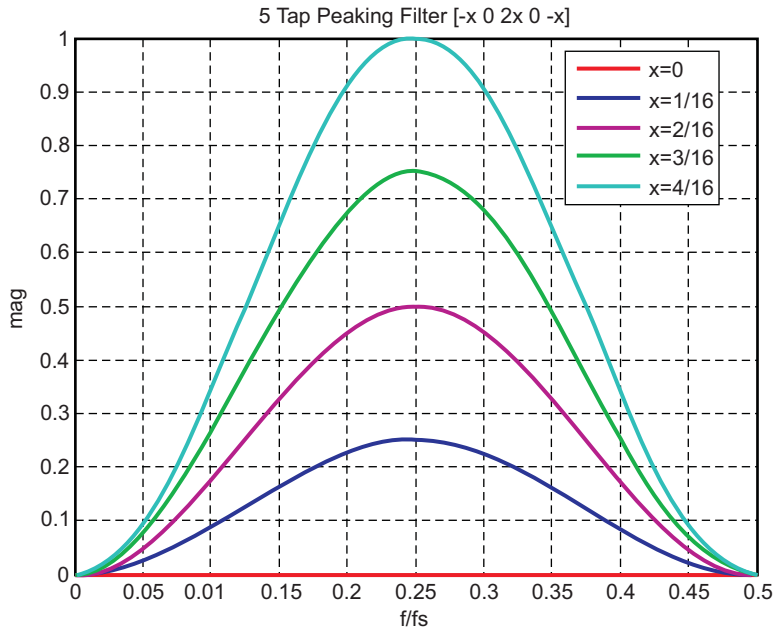
Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-24. Parameter Description

Parameter	Description	Bits	Default
VIP_CFG_SC19[7:0] CFG_HPF_COEF0 to VIP_CFG_SC20[15:8] CFG_HPF_COEF5	FIR coefficients	8	[0 0 0-4 0 8]
VIP_CFG_SC20[18:16] CFG_HPF_NORM_SHIFT	Right shift	3	4
VIP_CFG_SC21[8:0] CFG_NL_LO_THR	Coring threshold	9	16
VIP_CFG_SC22[8:0] CFG_NL_HI_THR	High threshold	9	400
VIP_CFG_SC21[23:16] CFG_NL_LO_SLOPE	Lo slope= - CFG_NL_LO_SLOPE/16	8	16
VIP_CFG_SC22[18:16] CFG_NL_HI_SLOPE_SHIFT	Hi slope = $2^{(CFG_NL_HI_SLOPE_SHIFT-3)}$	3	4
VIP_CFG_SC20[28:20] CFG_NL_LIMIT	Clipping limit	9	200
VIP_CFG_SC0[14] CFG_Y_PK_EN	Control	1	0

Parameters for the Peaking filters are defined in VIP_CFG_SC19 through VIP_CFG_SC22 registers. The frequency responses of the peaking-filter with different sets of coefficients are shown in Figure 9-83. If the source of the input video is NTSC or PAL format, the peaking filter can be configured to reject the color subcarrier frequency.

Figure 9-83. Peaking Filter at fs/4

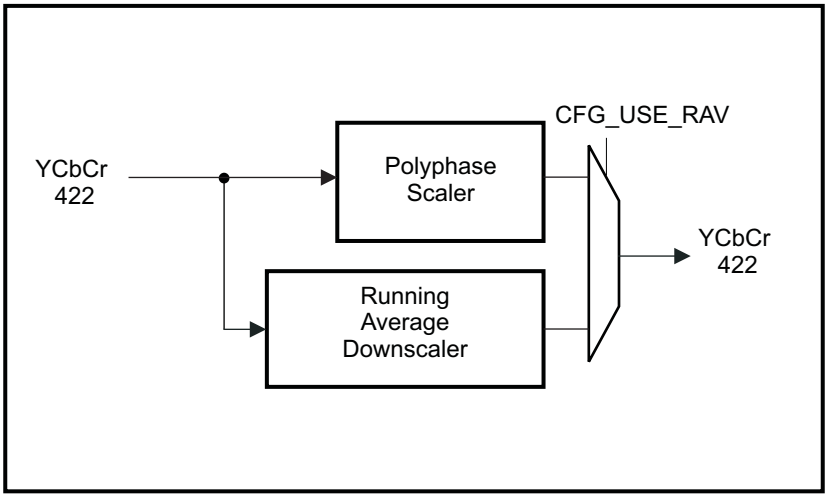


9.4.7.2.3 Vertical Scaler

The vertical scaler has a polyphase (32-phase × 5-tap) filter and a running average filter as shown in Figure 9-84. While the polyphase filter can be used for any up-scaling and preferably downscaling to 3/16 scale factor, the running average filter is used only for downscaling to a ½ or less size. Selection between these two scalers is based on the user setting of VIP_CFG_SC0[4] CFG_USE_RAV parameter (CFG_USE_RAV= '0' for poliphase filter, and CFG_USE_RAV= '1' for running average filter), according to the user preference of the tradeoff between sharpness preserving and introduced artifacts.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-84. Vertical Scaler Block Diagram



9.4.7.2.3.1 Running Average Filter

When a poly-phase filter is used, usually it has to have many taps in order to achieve acceptable quality for very small downscaling ratio, which requires the use of many line buffers. In VIP, there is a weighted Running Average filter for downscaling when the scaling factor is small (for example, when the scaling ratio is less than 0.5). This highly optimized design requires only one line buffer for luma and one for chroma, which still achieving acceptable quality. The output of the running average filter is based on weighted average of pixels in the current and previous rows in vertical direction. Initializations of accumulators affect the weights.

9.4.7.2.3.2 Vertical Scaler Configuration Parameters

Table 9-25. Vertical Scaler Configuration Parameters

Parameter	Typical Value	Controls	Description
VIP_CFG_SC0[10] CFG_INTERLACE_I		Frame or Field	0 = progressive, 1 = interlace
VIP_CFG_SC0[0] CFG_INTERLACE_O			0 = progressive 1 = interlace
VIP_CFG_SC0[3] CFG_INVT_FID			Invert field ID input
VIP_CFG_SC0[4] CFG_USE_RAV		Scaler Mode	0 = use polyphase scaler 1 = use running average scaler
VIP_CFG_SC1[26:0] CFG_ROW_ACC_INC		Bilinear & Polyphase Scalers	For progressive in/progressive out: round(2^{16}*(srcH-1)/(tarH - 1)) For progressive_in/interlace_out: round(2^{16}*2*(srcH-1)/(2*tarH - 1)) For interlace_in/progressive_out: round(2^{16}*(2*srcH-1)/(2*(tarH - 1))) For interlace_in/interlace_out: round(2^{16}*(2*srcH - 1)/(2*tarH - 1)) For interlace in/out, srcH/tarH are number of field lines as specified in VIP_CFG_SC4/VIP_CFG_SC5 descriptions.
VIP_CFG_SC2[27:0] CFG_ROW_ACC_OFFSET	0		Initial row accumulator value for progressive frame and top field
VIP_CFG_SC3[27:0] CFG_ROW_ACC_OFFSET_B	0		Initial row accumulator value for bottom field
VIP_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR	4	Bilinear Scaler	Range for chroma soft switch based on pixel differences (max limit = 8)

Table 9-25. Vertical Scaler Configuration Parameters (continued)

Parameter	Typical Value	Controls	Description
VIP_CFG_SC13[21:12] CFG_CHROMA_INTP_THR	64		Threshold used in chroma soft switch based on pixel differences
VIP_CFG_SC13[9:0] CFG_SC_FACTOR_RAV		Running Average Scaler	Scale factor = round(1024 × tarH/srcH)
VIP_CFG_SC6[9:0] CFG_ROW_ACC_INIT_RAV			Initial row accumulator value for progressive frame and top field
VIP_CFG_SC6[19:10] CFG_ROW_ACC_INIT_RAV_B			Initial row accumulator value for bottom field

NOTE: Bi-linear scaler is not present in this device

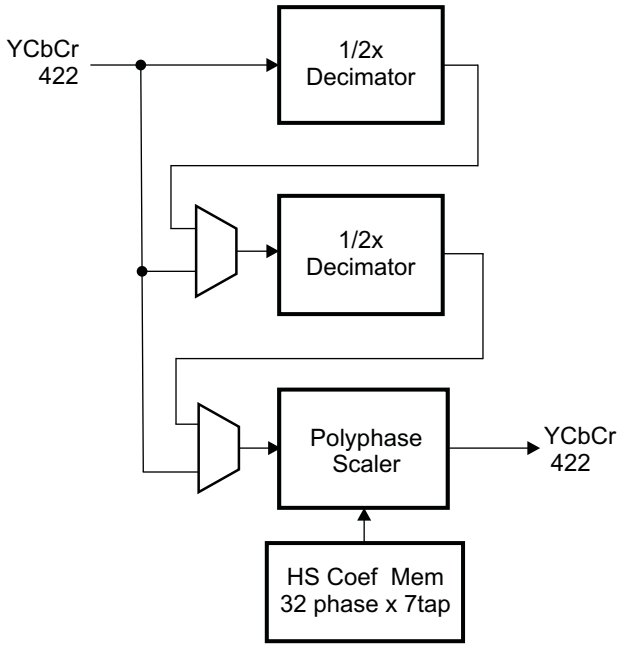
9.4.7.2.4 Horizontal Scaler

The Horizontal scaler is implemented using a 32-phase × 7-tap polyphase filter preceded by two sets of 1/2x decimators. The general configuration of the Horizontal scaler is performed as follows:

- For up scaling, the input video is interpolated using the polyphase scaler.
- For downscaling, it is recommended that input video is decimated by 2 until the modified scale factor falls between 1/2 and 1. Then, a polyphase filter is configured with coefficients selected based on the mod_scale_factor calculated as shown below from one of nine different sets of coefficients: (8,9,10,11,12,13,14,15,16)/16.

```
if  (scale_factor>=1/2)  {
   mux=0;  mod_scale_factor=scale factor;
} else if  (scale_factor>=1/4) {
   mux=1; mod_scale_factor=2*scale_factor;
} else {
   mux=2; mod_scale_factor=4*scale_factor;
}
```

Figure 9-85. Horizontal Scaler Block Diagram



Copyright © 2015–2020, Texas Instruments Incorporated

In auto mode (CFG_AUTO_HS == 1), scaler will operate as per above recommendation. In addition to this, for (CFG_AUTO_HS==1), polyphase filtering will be bypassed when (scale_factor == 1) or (scale_factor == ½) or (scale_factor == ¼). If CFG_AUTO_HS==0) is used, user must provide proper values for dcm_2x, dcm_4x, proper values for all inputs to polyphase filter in the registers as well as appropriate coefficient sets. There is no constraint on polyphase filtering in terms of scaling ratio. However, there are constraints on input and output image width for scaler. Frame dimensions are limited from 64x64 to 2047x2047.

9.4.7.2.4.1 Half Decimation Filter

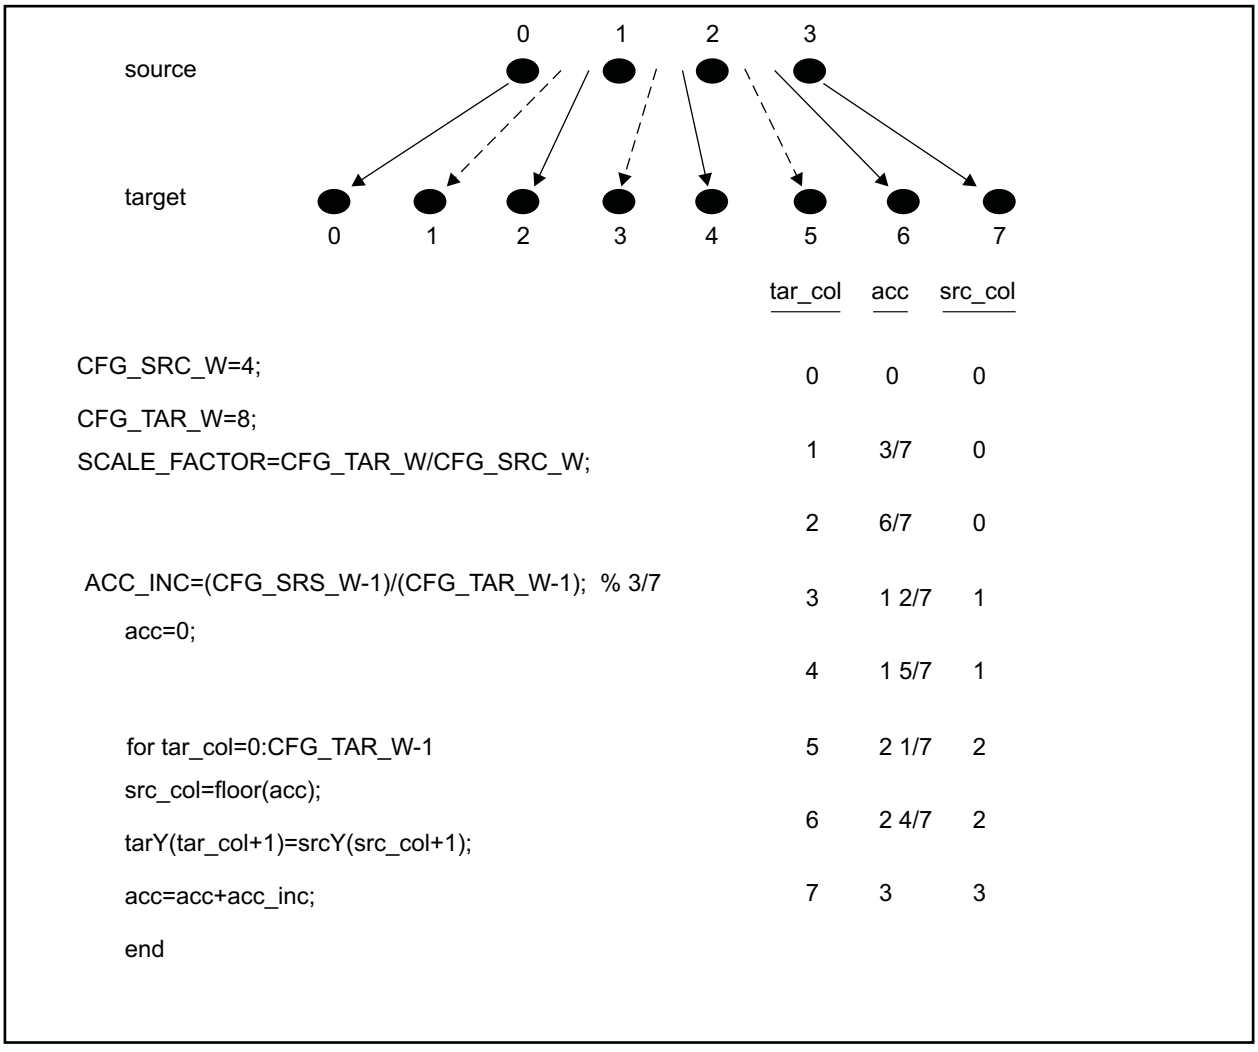
The half-decimation filter is an 11-tap filter with following coefficients: (14, 0, -29, 0, 79, 128, 79, 0, -29, 0, 14). For processing left and right edge pixels, the first and last data are repeated to pre-fill and extend the filter data pipeline respectively. These coefficients are hard-coded into scaler design and user cannot modify these.

9.4.7.2.4.2 Polyphase Filter

The horizontal scaling is done by stepping across the target row and interpolating target pixels based on source pixels. Accumulator points to the source pixel that corresponds to the target pixel.

Figure 9-86 shows an up-scaling example.

Figure 9-86. Polyphase Filtering Example



Copyright © 2015–2020, Texas Instruments Incorporated

9.4.7.2.4.3 Nonlinear Horizontal Scaling

The horizontal scaler supports non-linear scaling to maintain the same aspect ratio for inner picture while stretching picture edges to fill the required resolution when capturing a 4 × 3 picture and fetching it as a 16 × 9 to memory. Non-linear scaling parameters are set with VIP_CFG_SC4[30:28] CFG_NLIN_ACC_INIT_U and VIP_CFG_SC4[26:24] CFG_LIN_ACC_INC_U registers. When setting up a non-linear scaling application, the inner picture is defined as the center square portion of the image with width and height equal to the height of the source image. Remaining side regions are then scaled non-linearly. Figure 9-87 shows a non-linear scaling case.

Figure 9-87. Non-linear Scaling Example

9.4.7.2.6 Coefficient Memory

9.4.7.2.6.1 Overview

The scaler requires initialization of eight coefficient SRAMS prior to processing a video frame. These coefficients are stored in the external DDR memories and downloaded by the VPDMA. The VPDMA writes the coefficient data through the VPI Control Interface bus.

The eight coefficient SRAMs are:

- HS horizontal polyphase scaler, Luma and Chroma (7tap)
- VS vertical polyphase scaler, Luma and Chroma (5tap or 3tap)

9.4.7.2.6.2 Physical Coefficient SRAM Layout

Each of the six legacy coefficient SRAMs is 32 phases × 91 bits. A single coefficient value is 13 bits. Therefore, one word of the SRAM contains 7 coefficient values as shown in Figure 9-88, and 224 coefficient values are stored in each SRAM.

Figure 9-88. SRAM Layout for 7tap Coefficient

Phase 0	C6	C5	C4	C3	C2	C1	C0
Phase 31	C223	C222	C221	C220	C219	C218	C217

The two vertical polyphase SRAMs are 32 phases × 65 bits. A single coefficient is 13 bits. Therefore, one word of SRAM contains 5 coefficient values as shown in Figure 9-89.

Figure 9-89. SRAM Layout for 5tap Coefficient

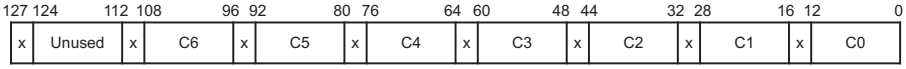
Phase 0	C4	C3	C2	C1	C0
Phase 31	C221	C220	C219	C218	C217

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.7.2.6.3 Scaler Coefficients Packing on 128-bit VPI Control I/F

A coefficient value is 13 bits wide and takes a single half word. Thus, one VPI Control write carries one phase's worth of coefficients. The last half-word in a quad-word is not used for 7tap coefficients.

Figure 9-90. VPI Control I/F Coef Data Format (7tap)



The Vertical Polyphase scaler coefficients have only five or three values per phase, so the last three (or five) entries are unused. The Vertical Polyphase coefficient packing is shown in Figure 9-91 and Figure 9-92.

Figure 9-91. VPI Control I/F Coef Data Format (5tap)

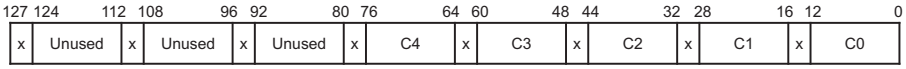


Figure 9-92. VPI Control I/F Coef Data Format (3tap)

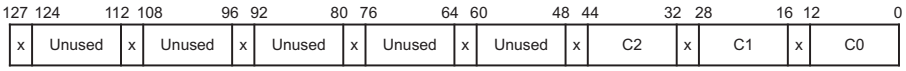
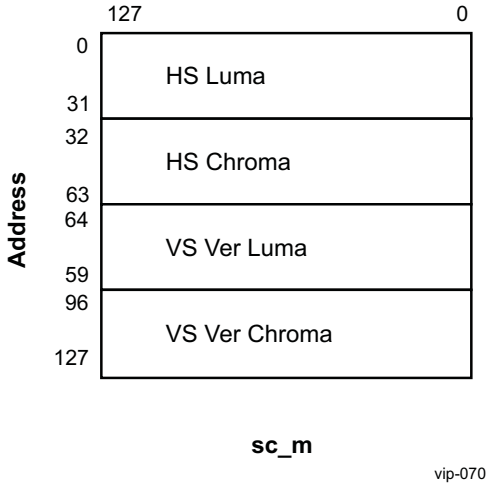


9.4.7.2.6.4 VPI Control I/F Memory Map for Scaler Coefficients

The memory map of the VPI Control I/F for the Scaler coefficients is shown in Figure 9-93. All coefficients can be filled up by a single VPI Control write command. The update address feature of VPI Control I/F enables individual access to a certain location of memories.

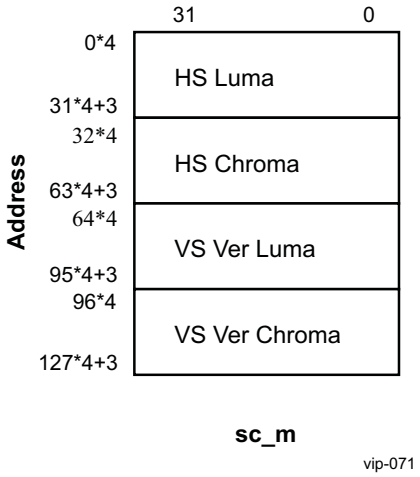
Figure 9-93. VPI Control I/F Memory Map (Write)



The module supports the VPI Control Read to read back the contents in the coefficient memories for debug purpose. Figure 9-94 shows the memory map of the VPI Control Read. As the VPI Control Read has only 32 bit data bus, it requires the word addressing while the write does the quad-word addressing.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 9-94. VPI Control I/F Memory Map (Read)



9.4.7.2.6.5 VPI Control Interface

VPDMA is used to configure the coefficient memories of scaler through VPI control interface. Since the coefficient memories are not shadowed (unlike the memory mapped registers), VPI control write access needs to be done only during the gap between video frame processing times. If a write request is made while the Scaler is active, the access will be held off by the hardware until the last data of the currently processed frame is sent out. Care must be given to the order of the DMA descriptors so that blocking of VPI control bus does not occur.

9.4.7.2.6.6 Coefficient Table Selection Guide

The scaler filter coefficient tables are pre-generated using a MATLAB® program for various scaling factor ranges. Table 9-31 provides a general selection guide table for coefficient data files.

The mentioned .dat files are available in Section 9.4.7.4.

Table 9-31. Coefficient Data Files

9.4.7.3.3 Typical Configuration Values

The following is the list of all scaler register fields that are set to constant values, representing typical settings:

VIP_CFG_SC0[3] CFG_INVT_FID = 0 (Field ID will be used without inversion)

VIP_CFG_SC0[5] CFG_ENABLE_EV = 1 (Field ID will be used without inversion)

VIP_CFG_SC0[6] CFG_AUTO_HS = 1 (The hardware will automatically decide, if current operation is up or down scaling. In down-scaling, it will also decide, if 2X or 4X decimation filter is needed)

VIP_CFG_SC0[7] CFG_DCM_2X = 0 (The 2X decimation filter is disabled)

VIP_CFG_SC0[8] CFG_DCM_4X = 0 (The 4X decimation filter is disabled)

VIP_CFG_SC0[11] CFG_ENABLE_SIN2_VER_INTP = 1 (Modified bilinear interpolation is used)

VIP_CFG_SC0[14] CFG_Y_PK_EN = 0 (Luma peaking is disabled)

VIP_CFG_SC0[15] CFG_TRIM= 1 (Trimming is enabled)

VIP_CFG_SC12[24:0] CFG_COL_ACC_OFFSET = 0 (No horizontal offset is involved)

VIP_CFG_SC13[21:12] CFG_CHROMA_INTP_THR = 64 (If the difference is less than this threshold, the interpolation of chroma should be done along edge direction. Otherwise, the interpolation of chroma should be done vertically)

VIP_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR = 4 (max limit=8)

9.4.8 VIP Video Port Direct Memory Access (VPDMA)

9.4.8.1 VPDMA Introduction

The VPDMA primary function is to move data between external memory and internal processing modules that source or sink data. VPDMA is capable buffering this data and then delivering the data as demanded to the modules as programmed. The modules that source or sink data are referred to as clients. A channel is setup inside the VPDMA to connect a specific memory buffer to a specific client. The VPDMA centralizes the DMA control functions and buffering required to allow all the clients to minimize the effect of long latency times. The VPDMA also supports a descriptor based mode where lists of descriptors can be setup to configure all the channels as they become available.

Additionally, in a third-party configuration, the VPDMA is capable of performing DMA transfers as requested by the pulsing of an event strobe. The VPDMA is capable of generation of an address which may reach any location in the range for which it is configured. It is capable of moving this data either to or from a Shared Buffer and ultimately to or from a Client Buffer. For the two type of Client Buffers that are used to drive data into a subsystem (Streaming Buffer and Random Access Buffer) data is either pushed into the buffer or pulled out of the buffer dependent upon the direction of the data transfer. For third-party DMA operations the data is transferred into a Client buffer, and then transferred out of the Client Buffer to the transfer destination. These transfers are triggered by an Event pulse to each of the Client Buffers which are Routing Buffer types.

9.4.8.2 VPDMA Basic Definitions

9.4.8.2.1 Client

The modules that source or sink data are referred to as clients. The clients of the VPDMA are the physical between the processing modules (VIP) and external memory. A channel is the mechanism inside the VPDMA that connects a specific memory buffer or transfer to a specific client.

The start event can also be selected by a channel attribute or to be controlled by an internal frame signal controlled by the List Manager.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.2.2 Channel

The VPDMA requires a channel to be setup for each group of transfers. All the channels are described through a Data Transfer Descriptor that has a common format. The client that the channel is mapped to interprets the information in the descriptor to perform the requested data transfer.

Each of the channels has a type of data that it can support based upon the client that it services. The VPDMA supports three types of channels:

- **YUV Channel** - Clients taking data YUV data
- **RGB Channel** - Clients taking RGB data
- **Miscellaneous Channel** - The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client.

9.4.8.2.3 List

A list is a group of descriptors that makes up a set of DMA transfers that need to be completed. The VPDMA supports one kind of list only:

- The **Regular List** is a single list that the VPDMA will execute each descriptor once and initiate an interrupt when the list has completed. A regular list can contain any kind of descriptor without limitation and be of any size.

The VPDMA Controller works on lists of descriptors. In this mode the processor writes the lists of descriptors in the order it wants them executed. It then writes the location of the list to the VIP_LIST_ADDR register, followed by writing the size (bit LIST_SIZE) and type (bit LIST_TYPE) of the list, and list number (bit LIST_NUM) to the VIP_LIST_ATTR register. The List Manager module then schedules a DMA transfer to pull in the portion of the list that it can store in internal VPDMA memory. The List Manager will sequentially process the active list of descriptors until either the descriptor requires the use of a client that is currently active, or if it is waiting for the next portion of the list to be transferred from a DMA request. If there is no active list to process the list manager will go into an IDLE mode waiting for any client that is blocking a list or a list DMA transfer to complete.

All the DMA transfers are controlled by List Manager module inside VPDMA. List Manager needs to be loaded with FIRMWARE, before any DMA transfer from memory, after the VPDMA reset. The first MMR write to VIP_LIST_ADDR register after VPDMA reset should be the address of the memory buffer(128-bit aligned, that is, last four bits of the buffer address should be zero) where the firmware is stored. List Manager then schedules a DMA transaction to fetch the firmware and sets the VIP_LIST_ATTR[19] RDY bit after the firmware loading is complete.

9.4.8.2.4 Data Formats Supported

Following list summarizes the data formats supported in the VPDMA. For more inforamtion see Section 9.4.8.9, *VPDMA Data Formats*.

- RGB Data Types:
  - RGB16-565
  - ARGB-1555
  - ARGB-4444
  - RGBA-5551
  - RGBA-4444
  - ARGB24-6666
  - RGB24-888
  - ARGB32-8888
  - RGBA24-6666
  - RGBA32-8888
  - BGR16-565
  - ABGR-1555

Copyright © 2015–2020, Texas Instruments Incorporated

  - ABGR-4444
  - BGRA-5551
  - BGRA-4444
  - ABGR24-6666
  - BGR24-888
  - ABGR32-8888
  - BGRA24-6666
  - BGRA32-8888
- YUV Data Types:
  - Y 4:4:4
  - Y 4:2:2
  - Y 4:2:0
  - C 4:4:4
  - C 4:2:2
  - C 4:2:0
  - CY 4:2:2
  - YCbC 4:4:4
  - YC 4:2:2

NOTE: VPDMA supports swapping formats (RGB/BGR and Cb/Cr)

9.4.8.3 VPDMA Client Buffering and Functionality

Table 9-32 lists for each client:

- The channels used, amount of buffering allocated for it, and the shared buffer used for its memory
- The line sizes it handles for tiled and non-tiled memory spaces, as well as any additional features it supports

Table 9-32. VPDMA Client Buffering and Functionality

Client	Channel(s)	Tiled Memory Max Line Size	Non-Tiled Memory Max Line Size	Additional Features
vip1_lo_y	vip1_mult_porta_src0 vip1_mult_porta_src1 vip1_mult_porta_src2 vip1_mult_porta_src3 vip1_mult_porta_src4 vip1_mult_porta_src5 vip1_mult_porta_src6 vip1_mult_porta_src7 vip1_mult_porta_src8 vip1_mult_porta_src9 vip1_mult_porta_src10 vip1_mult_porta_src11 vip1_mult_porta_src12 vip1_mult_porta_src13 vip1_mult_porta_src14 vip1_mult_porta_src15 vip1_portb_luma vip1_portb_rgb	1920 (color seperate) 960 (interleaved)	4096	TILED

9.4.8.4 VPDMA Channels Assignment

Table 9-33 lists all of the channels in VPDMA and its base attributes. The Data Type column states what type of data YUV, RGB or OTHER the channel handles and in parentheses are the legal data type values that can be entered into a data transfer decriptor. The Client field states the name of the Client and in parentheses it states the reference number in Figure 9-4, *VIP Block Diagram*.

Table 9-33. VPDMA Channels Assignment

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src0	Video Input 1 Port A Channel 0	38	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src1	Video Input 1 Port A Channel 1	39	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src2	Video Input 1 Port A Channel 2	40	YUV (0x7)	vip1_lo_y (2)

9.4.8.5 VPDMA MFLAG Mechanism

The device L3_MAIN interconnect accepts MFLAG signals from certain initiators that can influence the internal L3_MAIN arbitration mechanisms. As a result, a higher priority is given to the data traffic initiated by these initiators. The VIP VPDMA can directly drive such MFLAG signals dynamically. The MFLAG generation for VIP VPDMA is enabled by default, and there is no register control over it.

The VPDMA arbitrates between multiple DMA sources within the VIP based on FIFO levels of DMA channels connected to VPDMA. Priority escalation mechanism implemented within VIP subsystem is based on overflow threshold and FIFO margin.

The following is a summary of priority and MFLAG levels provided by the VIP:

Copyright © 2015–2020, Texas Instruments Incorporated

- High priority (MFLAG = 3) when FIFO margin is below 25%
- Medium priority (MFLAG = 1) when FIFO margin is between 25% and 50%
- Low priority (MFLAG = 0) when FIFO margin is above 50%

Additionally, the VIP subsystem also generates MReqPriority based upon a programmed descriptor configuration. The MReqPriority configuration influences the arbitration mechanism in the Memory Subsystem only and has no influence on the arbitration that takes place within L3_MAIN interconnect. For more information see Section 9.4.8.7.1.4, *Data Packet Descriptor Word 3*.

9.4.8.6 VPDMA Interrupts

The VPDMA has 4 interrupt group(s). Each group has an interrupt for all the client interrupts, an interrupt for every 32 channels, a interrupt for each list complete, an interrupt for each list notify and an interrupt for for all of the descriptor interrupts. Each of these groups can be individually masked so that only the interrupts specified will trigger the higher level interrupt.

Each interrupt source can be individually masked independently for each seperate interrupt group. A status register bit exists for each interrupt source for for each interrupt group, that is set whenever the interrupt event occurs even when if the interrupt is masked. The status register bit will remain set until cleared by software by writing a one to the status bit.

Table 9-34 shows all interrupt events from VPDMA that go to VIP top level. The interrupt events are mapped to two interrupt lines, INT0 and INT1, that go to VIP top level.

Table 9-34. VPDMA Interrupt Events

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group0	VIP_INT0_CHANNEL0_INT_STAT VIP_INT1_CHANNEL0_INT_STAT	VIP_INT0_CHANNEL0_INT_MASK VIP_INT1_CHANNEL0_INT_MASK	An unmasked channel interrupt for interrupt group 0 in channel register 0 or 1 has fired.
vpdma_int_channel_group1	VIP_INT0_CHANNEL1_INT_STAT VIP_INT1_CHANNEL1_INT_STAT	VIP_INT0_CHANNEL1_INT_MASK VIP_INT1_CHANNEL1_INT_MASK	An unmasked channel interrupt for interrupt group 1 in channel register 0 or 1 has fired.
vpdma_int_channel_group2	VIP_INT0_CHANNEL2_INT_STAT VIP_INT1_CHANNEL2_INT_STAT	VIP_INT0_CHANNEL2_INT_MASK VIP_INT1_CHANNEL2_INT_MASK	An unmasked channel interrupt for interrupt group 2 in channel register 0 or 1 has fired.
vpdma_int_channel_group3	VIP_INT0_CHANNEL3_INT_STAT VIP_INT1_CHANNEL3_INT_STAT	VIP_INT0_CHANNEL3_INT_MASK VIP_INT1_CHANNEL3_INT_MASK	An unmasked channel interrupt for interrupt group 3 in channel register 0 or 1 has fired.
vpdma_int_channel_group4	VIP_INT0_CHANNEL4_INT_STAT VIP_INT1_CHANNEL4_INT_STAT	VIP_INT0_CHANNEL4_INT_MASK VIP_INT1_CHANNEL4_INT_MASK	An unmasked channel interrupt for interrupt group 4 in channel register 0 or 1 has fired.
vpdma_int_channel_group5	VIP_INT0_CHANNEL5_INT_STAT VIP_INT1_CHANNEL5_INT_STAT	VIP_INT0_CHANNEL5_INT_MASK VIP_INT1_CHANNEL5_INT_MASK	An unmasked channel interrupt for interrupt group 5 in channel register 0 or 1 has fired.
vpdma_int_list0_complete			List 0 has completed
vpdma_int_list0_notify			The data transfer in list 0 with the Notify Field set in the descriptor has completed
vpdma_int_list1_complete			List 1 has completed

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-34. VPDMA Interrupt Events (continued)

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_list1_notify			The data transfer in list 1 with the Notify Field set in the descriptor has completed
vpdma_int_list2_complete			List 2 has completed
vpdma_int_list2_notify			The data transfer in list 2 with the Notify Field set in the descriptor has completed
vpdma_int_list3_complete			List 3 has completed
vpdma_int_list3_notify			The data transfer in list 3 with the Notify Field set in the descriptor has completed

vpdma_int_list5_complete			List 5 has completed
vpdma_int_list5_notify			The data transfer in list 5 with the Notify Field set in the descriptor has completed
vpdma_int_list6_complete			List 6 has completed
vpdma_int_list6_notify			The data transfer in list 6 with the Notify Field set in the descriptor has completed
vpdma_int_list7_complete			List 7 has completed
vpdma_int_list7_notify			The data transfer in list 7 with the Notify Field set in the descriptor has completed
vpdma_int_client	VIP_INT0_CLIENT0_INT_STAT VIP_INT0_CLIENT1_INT_STAT VIP_INT1_CLIENT0_INT_STAT VIP_INT1_CLIENT1_INT_STAT	VIP_INT0_CLIENT0_INT_MASK VIP_INT0_CLIENT1_INT_MASK VIP_INT1_CLIENT0_INT_MASK VIP_INT1_CLIENT1_INT_MASK	Client Interrupt
vpdma_int_descriptor	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	Descriptor Interrupt

In Table 9-34 above, the “channel_group”, “client” and “descriptor” interrupts are actually a set of additional interrupts. When software receives an interrupt from a “channel_group,” “client,” or “descriptor” it must read the appropriate register within the VPDMA (refer to Table 9-35 to determine what the actual interrupt was).

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-35. VIP Interrupt Sources

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_ancb_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src10	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src11	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src12	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src13	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src14	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src15	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_ancb_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_porta_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src10	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src11	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_porta_src12	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src13	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src14	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src15	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_porta_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_luma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point.
channel_vip1_portb_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_luma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip2_mult_anca_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_ancb_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src10	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src11	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src12	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src13	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src14	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src15	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_ancb_src4	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src5	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src6	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src7	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src8	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src9	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_porta_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src10	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src11	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src12	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src13	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_porta_src14	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src15	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src4	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src5	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src6	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src7	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src8	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src9	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_portb_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 9-35. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

9.4.8.7 VPDMA Descriptors

The VPDMA needs to be programmed through descriptors (a pre-defined structure of eight or four 32-bit words depending on type of descriptors) other than VPDMA Memory Mapped Registers (MMR). Descriptors are of three types:

i. **Data Transfer Descriptors** - A memory structure used to describe a desired memory transaction to or from a client.

ii. **Control Descriptors** - A memory structure used to perform a control operation inside the DMA controller

iii. **Configuration Descriptors** - A memory structure used to described a setup that should be applied to an processing modules like MMR write, scalar coefficient write etc.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.1 Data Transfer Descriptors

In order to set up data transfers from the VPDMA, a data transfer descriptor is added into a list. The fields used for an Inbound and Outbound descriptor vary slightly. An outbound transfer can have two different outbound transfers. The two transfers are the main data transfer and a write of an Inbound Descriptor. The created inbound descriptor is formatted so it can be read back in directly to the next channel specified in the original descriptor.

Figure 9-95. Inbound Data Transfer Descriptor Format

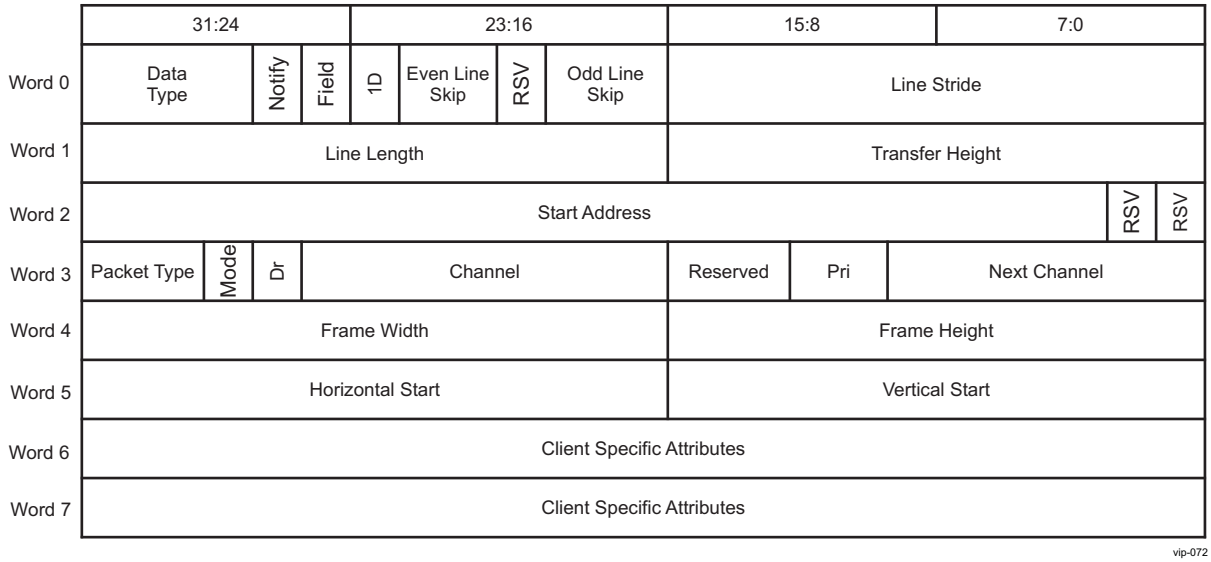

Figure 9-96. Outbound Data Transfer Descriptor Format

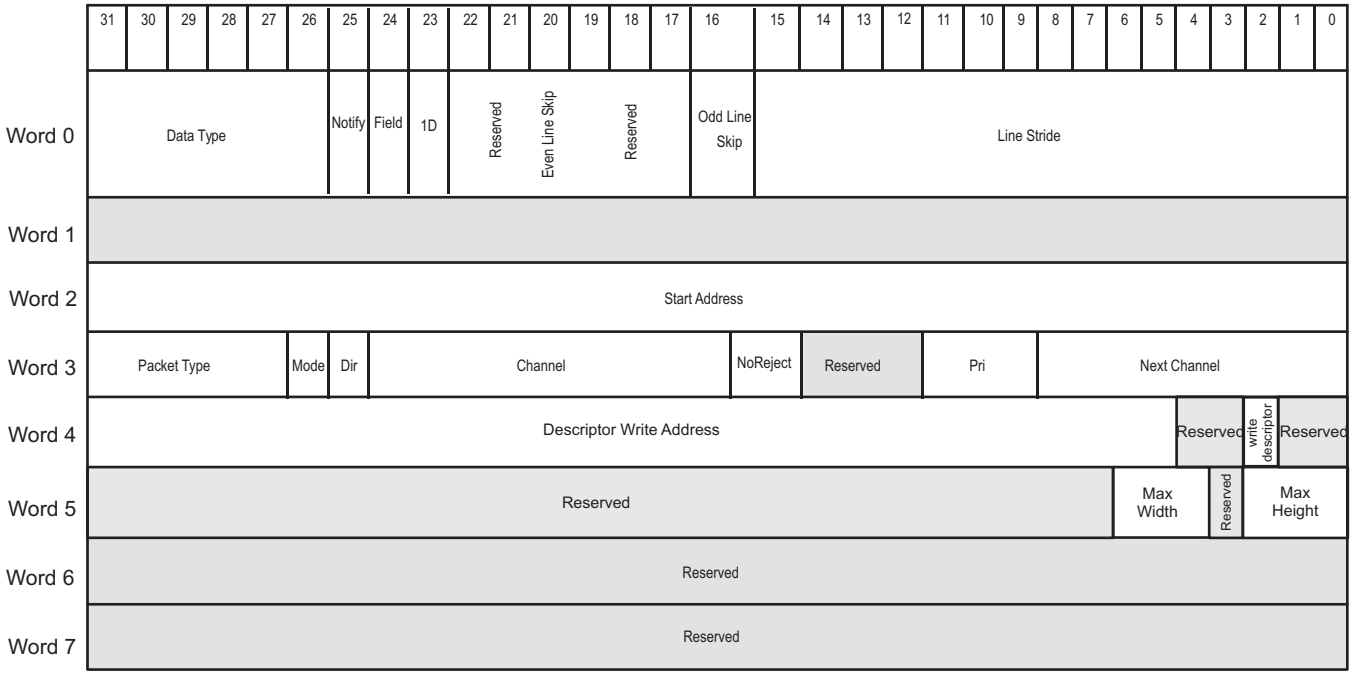

The general data transfer Descriptor formats can be seen in the above figures. The descriptor consists of 8 × 32bit words. A Data Transfer Descriptor will be removed from the list when the resource specified by the Channel field is free. If the Channel is not free when the list reaches a data transfer descriptor then the list will stall until the current transfer on the channel has completed.

Table 9-36. Data Packet Descriptor Word 0 Field Descriptions (continued)

Bit	Field	Value	Description
22:20	Even Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
19	Reserved		Reserved for future use
18:16	Odd Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
15:0	Line Stride	0-FFFFh	Address stride between lines in bytes

9.4.8.7.1.1.1 Data Type

Bits 31-26 indicate the type of data that is to be transferred. This value is used to compute the number of bytes per pixel so that transactions may be made for the appropriate amount of data. The types of data are dependent on the type of channel. The VPDMA descriptor data types RGB or YUV are defined associated with the VPDMA channel assignment. This helps the engine to distinguish between the overlapping values of the descriptor data types for RGB and YUV data.

- For the Miscellaneous channel, the Data Type selects the size in bits of the data. The range is from 0 to 63 to represent the sizes from 1 to 64 bits.
- For a YUV channel, the Data Type determines, if the data channel is interleaved or color space separate. If color spaced separate, it is still assumed that the two chroma pixels are interleaved.

CAUTION

VPDMA defines the component ordering for its RGB data types in the opposite direction of what commonly used image identifiers expect. To avoid color component swapping in the display and/or in the video/image data written out to the memory, the proper Data Type settings for both RGB and YUV data types must be made. The following paragraphs provide more details on how to set Data Type correctly, in order to match the data stored or expected in the memory.

Setting RGB Data Types

The commonly used RGB format identifiers require the color components to be stored in a little-endian style, where the left most component is the LSB component.

- For an ARGB data type, the A component is the LSB location, as shown in Table 9-37 and Table 9-38;
- For a BGRA data type, the B component would be in the LSB location;

Table 9-37. Common ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
A	R	G	B

Table 9-38. Common ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
B	G	R	A

Copyright © 2015–2020, Texas Instruments Incorporated

VPDMA specifies its component ordering in the big-endian style, which requires the data to be stored in the reversed order. Example with ARGB data type is shown in Table 9-39 and Table 9-40. The VPDMA ordering for ARGB data type matches the common BGRA data format.

Table 9-39. VPDMA ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
B	G	R	A

Table 9-40. VPDMA ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
A	R	G	B

In order color components to be mapped correctly and to avoid swapping, the reversal must be taken into consideration when configuring the Data Type in the VPDMA transfer descriptor.

Table 9-41 shows the proper settings required for RGB data types for both storage schemes.

Table 9-41. VPDMA Descriptor RGB Data Type Mapping

Source/Destination Image		VPDMA Data Type Mapping Value	
RGB Component order	Common Image Format Names	**Column A** Source data stored in the VPDMA defined order	**Column B** Source data stored in the opposite of VPDMA defined order
RGB	RGB16-565	0x0	0x10
	ARGB-1555	0x1	0x13
	ARGB-4444	0x2	0x14
	RGBA-5551	0x3	0x11
	RGBA-4444	0x4	0x12
	ARGB24-6666	0x5	0x18
	RGB24-888	0x6	0x16
	ARGB32-8888	0x7	0x19
	RGBA24-6666	0x8	0x15
	RGBA32-8888	0x9	0x17
BGR	BGR16-565	0x10	0x0
	ABGR-1555	0x11	0x3
	ABGR-4444	0x12	0x4
	BGRA-5551	0x13	0x1
	BGRA-4444	0x14	0x2
	ABGR24-6666	0x15	0x8
	BGR24-888	0x16	0x6
	ABGR32-8888	0x17	0x7
	BGRA24-6666	0x18	0x5
	BGRA32-8888	0x19	0x9

In Table 9-41, if the application uses the same data type definition as the VPDMA (that is, RGB24 refers to the B in the LSB), the data types in Column A should be used. But, if the application expects the common data type component order for RGB data type names, the VPDMA data types in Column B should be used.

For example:

- To display an ARGB32-8888 source image data with A in the LSB, the data type in the descriptor should be set to 0x19. But, to display an ARGB32-888 source image data with B in the LSB, the data type in the descriptor should be set to 0x7.
- To capture and write out a RGB24-888 image in the memory with R in the LSB, the data type in the

Copyright © 2015–2020, Texas Instruments Incorporated

descriptor should be set to 0x16 (this case assumes the VIP VIN d[23:0] data input is mapped to RGB bus with B component in the LSB).

Setting YUV Data Types

There is no component order reversal for YUV data types. The VPDMA uses generic data type names to specify the memory storage format and the application simply needs to follow the VPDMA defined ordering.

Table 9-42 shows how common YUV data types map to the VPDMA YUV data types in order to clarify the YUV data type configuration.

Table 9-42. VPDMA Descriptor YUV Data Type Mapping

Source YUV Image Types			VPDMA Data Type Mapping (Value)		
Chroma Sub-sample	Common YUV Image Format Type Names	Memory Packed Order [MSB - LSB]	Luma/Chroma Interleaved Channel	Luma-only Channel	Chroma-only Channel
444	YUV	V U Y	YC 4:4:4 (0x8)		
	UVY	Y V U	Cb 4:4:4 (0x14)		
422	NV16 (YUV422SP_UV)	V U		Y 4:2:2 (0x1)	C 4:2:2 (0x5)
	NV16 (YUV422SP_VU)	U V		Y 4:2:2 (0x1)	Cb 4:2:2 (0x15)
	YUV2/YUYV/V422 (YUV422I_YUYV)	V Y U Y	YC 4:2:2 (0x7)		
	YUV422I_YVYU	U Y V Y	CbY 4:2:2 (0x17)		
	Y422/UYVY (YUV422I_UYVY)	Y V Y U	YC 4:2:2 (0x27)		
	YUV422I_VYUY	Y U Y V	YCb 4:2:2 (0x37)		
420	NV12 (YUV420SP_UV)	V U		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see (1))	C 4:2:0 (0x6) YC 4:2:2 (0x7) (see (1))
	NV21 (YUV420SP_VU)	U V		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see (1))	Cb 4:2:0 (0x16) YC 4:2:2 (0x7) (see (1))

(1) If 422 source data is used, unused component data fetched (either Luma or Chroma) will be discarded.

For further details on the data formats, refer to Section 9.4.8.9, *VPDMA Data Formats*.

9.4.8.7.1.1.2 Notify

The Notify bit is used in conjunction with the Notify interrupts and when the channel has completed the DMA transfer the Notify Interrupt for the list that contains the descriptor will fire. The last Notify bit set for a specific list will be used so only a single Notify should be set in a list.

9.4.8.7.1.1.3 Field

The Field bit is the field value of the data that will be passed down to the clients. If the data is interlaced, then this value should be cleared to 0.

9.4.8.7.1.1.4 Even Line Skip

The Even Line skip is used with Line Stride to generate the next line address on an even line. All frames start on line 0. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

9.4.8.7.1.1.5 Odd Line Skip

The Odd Line skip is used with Line Stride to generate the next line address on an odd line. All frames start on line 0, so this will apply starting with the second line. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.1.1.6 Line Stride

Bits 15:0 are the stride between lines in bytes at the external address. This value is added or subtracted based upon an adjustment using the current skip value. Operation of the external address pointer shall load the Source Address upon start of the transfer, then at the end of each line increment or decrement by the value computed using the Line Stride and Skip value for the line. The line stride must be aligned to an L3 data bus width. The lower bits of the stride will always be treated as zero to force the alignment.

9.4.8.7.1.2 Data Packet Descriptor Word 1

Table 9-43. Data Packet Descriptor Word 1 Field Description

Bits	Name	Description
31:16	Line Length	Line Length in Pixels
15:0	Transfer Height	Number of rows in transfer.

9.4.8.7.1.2.1 Line Length

Bits 31-16 are the line length in pixels of the current channel. This is ignored for the outbound transfer as the client will provide the line length with the end of line signal on the client interface. The maximum supported line length is currently 4096.

9.4.8.7.1.2.2 Transfer Height

Bits 15-0 are the number of lines to be transferred in the current channel. This is ignored for outbound transfers as the client will provide the line length with the end of frame signal on the client interface. The maximum supported transfer size is currently 2048.

9.4.8.7.1.3 Data Packet Descriptor Word 2

Table 9-44. Data Packet Descriptor Word 2 Field Descriptions

Bit	Field	Value	Description
31:0	Start Address		32-bit data source address [31:0]
			If Mode is TILED, then TILER specific ADDRESS Map is used:
			Bits 31-29:
		0	0-degree view
		1h	180-degree view + mirroring
		2h	0-degree view + mirroring
		3h	180-degree view
		4h	270-degree view + mirroring
		5h	270-degree view
		6h	90-degree view
		7h	90-degree view + mirroring
			Bits 28-27:
		0	8-bit container
		1h	16-bit container
		2h	32-bit container
		3h	Page Mode
			If Mode is NORMAL, then bits 31-26 are the upper bits of the address.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.1.3.1 Start Address

This is the byte aligned address for the first data transfer. The address on the OCP bus will always be word aligned.

9.4.8.7.1.4 Data Packet Descriptor Word 3

Table 9-45. Data Packet Descriptor Word 3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xa
26	Mode	0= Normal, 1=TILED
25	Direction	Inbound = 0, Outbound = 1
24:16	Channel	Channel for which this descriptor describes
15	Reserved	Reserved for future use
11:9	Priority	Only Bit 9 and Bit 11 are used to set the priority. Bit 10 is ignored. Highest = 0, Lowest = 3 By default, hardware assigns priority = 3. This priority level is used in the arbitration between the masters (for DDR access). See Section 9.4.8.7.1.4.5, *Priority*, for more details.
8:0	Next Channel	Next Channel to execute on a line or the channel to use in the generated write descriptor.

9.4.8.7.1.4.1 Packet Type

Bits 31:27 are a unique code which indicates that this Descriptor is a VPDMA descriptor.

9.4.8.7.1.4.2 Mode

Bit 26 is used to indicate if the transfer is to regular memory space or to Tiled memory space. The VPDMA will use this to determine if it does standard raster based addressing or if it assumes that the data is stored in TILER format. If data is stored in TILER format then the buffer is turned into 2 or 4 line buffers depending on the container type. For shared clients that use the memory, such as the ancillary data and the VIP port, only one can be active, if the mode field is set. Only clients that support Tiling will properly pack the data for tiling on the output interface. This must only be set for channels going to clients that support the TILING feature in the client configuration.

9.4.8.7.1.4.3 Direction

Bit 25 is used to indicate the direction of transfer. This bit indicates that the data flow is from an external source to an internal buffer (inbound) or data transfers form an internal buffer to an external location (outbound).

9.4.8.7.1.4.4 Channel

Bits 24:16 are the Channels which is supported by the descriptor. This is the identification of the specific Channel which is controlled by the contents of the descriptor. The channel assignments can be found in the channel table.

9.4.8.7.1.4.5 Priority

Bits 11:9 are set to indicate priority of the transfer, these are directly mapped to the OCP reqinfo bits.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.1.4.6 Next Channel

Bits 8:0 give the next channel to use to create a composite frame. The next channel must be to a free channel. The last channel of a row should point back to the initial channel which must be a channel tied directly to a client. The Descriptor for the Next Channel must be of the same type as the current descriptor.

9.4.8.7.1.5 Data Packet Descriptor Word 4

9.4.8.7.1.5.1 Inbound data

Table 9-46. Data Packet Descriptor Word 4 Inbound Data Field Descriptions

Bits	Name	Description
31:16	Frame Width	Width of the client frame.
15:0	Frame Height	Height of the client frame

9.4.8.7.1.5.1.1 Frame Width

Bits 31:16 indicate the width in pixels of the frame. This is the width of the entire frame and not just the width of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum width is 4096.

9.4.8.7.1.5.1.2 Frame Height

Bits 15:0 indicate the height in pixels of the entire frame. This is the height of the entire frame and not just the height of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum height is 2048.

9.4.8.7.1.5.2 Outbound data

Table 9-47. Data Packet Descriptor Word 4 Outbound Data Field Descriptions

Bits	Name	Description
31:5	Descriptor Write Address	The 32 byte aligned location to write an inbound descriptor
2	Write Descriptor	If set to 1, a descriptor will be generated when the client completes a frame.
1	Drop Data	If set to 1, the data will not be written out. Also, if this is set, the write descriptor bit must be set. This allows for descriptors to only be written out so that software can determine the size of the required buffer before data is written out.
0	Use Descriptor Register	If set to 1, the CURRENT_DESCRIPTOR register will be used for the write address location. If set to 0, the Descriptor Write Address field in this word will be used for the Descriptor Write Address.

9.4.8.7.1.5.2.1 Descriptor Write Address

Bits 31:5 set the 32 byte address to write the generated descriptor. This address is only used if the Write Descriptor bit is set to 1 and the Use Descriptor Register bit is set to 0. If this case is met when the channel is complete a descriptor that meets the inbound descriptor format will be written to the location specified by this field. This allows for software to have a specific channel write its descriptor to a specific address no matter what order the channel completes compared to other outbound channels.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.1.5.2.2 Write Descriptor

Bit 2 determines if a descriptor should be written out when the client is completed. If this bit is set the descriptor will be written. The format of the descriptor will be of an Inbound Data Transfer descriptor with the LINE LENGTH and TRANSFER HEIGHT fields determined by the counters in the clients. This means that the direction bit will be the opposite of the inbound descriptor. The FRAME WIDTH and FRAME HEIGHT values will match the LINE LENGTH and TRANSFER HEIGHT fields. The CHANNEL and NEXT CHANNEL fields will match the NEXT CHANNEL field of the original descriptor. The FIELD bit will match the source field captured by the client. The NOTIFY bit will always be 0. All other fields will match the original outbound descriptor. If the Outbound descriptor MODE is set to TILED data then the descriptor address used will be in TILED data space and software must ensure that the address is in page mode for the address of the descriptor.

9.4.8.7.1.5.2.3 Drop Data

Bit 1 determines if the data should be written out or not. In some cases software might only want to write the descriptor out to determine the size of the buffer that will be required to store incoming data. By setting this bit,no data will be written out. If this bit is set then the Write Descriptor bit MUST be set. Bit 0 determines where the descriptor should be written.

9.4.8.7.1.6 Data Packet Descriptor Word 5

9.4.8.7.1.6.1 Outbound data

Width and Height are set in the following register bit-fields:

- For Max_Size1: VIP_MAX_SIZE1[31:16] MAX_WIDTH and VIP_MAX_SIZE1[15:0] MAX_HEIGHT registers
- For Max_Size2: VIP_MAX_SIZE2[31:16] MAX_WIDTH and VIP_MAX_SIZE2[15:0] MAX_HEIGHT registers
- For Max_Size3: VIP_MAX_SIZE3[31:16] MAX_WIDTH and VIP_MAX_SIZE3[15:0] MAX_HEIGHT registers

Table 9-48. Data Packet Descriptor Word 5 Outbound Data Field Descriptions

Bits	Name	Description
6:4	Max Width	The maximum allowable pixels per line. 0: Unlimited Line Size
		1: Use Max_Size1 Max Width field
		2: Use Max_Size2 Max Width field
		3: Use Max_Size3 Max Width field
		4: 352 pixels
		5: 768 pixels
		6: 1280 pixels
		7: 1920 pixels
		Others: Reserved
2:0	Max Height	The maximum allowable lines per frame. 0: Unlimited Frame Size
		1: Use Max_Size1 Max Height field
		2: Use Max_Size2 Max Height field
		3: Use Max_Size3 Max Height field
		4: 288 lines
		5: 576 lines
		6: 720 lines
		7: 1080 lines
		Others: Reserved

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.1.6.1.1 Max Width

Bits 6:4 are encoded to set the maximum transferred line size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed pixels the data will continue to be received from the client but will not be sent to external memory until an end of line is received from the client sending data. The outbound descriptor if created will still have the transmitted size of the last line of the frame which will match the max width. If the frame does not exceed the max width then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0. If Max Width is 0 and the line size is larger then 4096 pixels then the address counters will overflow and the data at the start of the line will be overwritten.

9.4.8.7.1.6.1.2 Max Height

Bits 2:0 are encoded to set the maximum transferred frame size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed lines the data will continue to be received from the client but will not be sent to external memory until an end of frame is received from the client sending data. The outbound descriptor if created will still have the transmitted number of lines received which would match the max height. If the frame does not exceed the max height then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0.

9.4.8.7.2 Configuration Descriptor

The Configuration Descriptor is used in a List to setup a client configuration. The configuration descriptor consists of a header and a payload portion. The payload can either be part of the list that the descriptor is contained in or it can be at a separate location. The VPDMA will pass the payload of the configuration descriptor down to the client over the VPI Control port interface or through the MMR configuration port depending on the destination field. A Configuration Descriptor to any single destination except Destination 0 must be on a single list. Configuration Descriptors to different destinations may be on different lists..

The Configuration Descriptor Header is 4 × 32 bit words. A configuration descriptor is not consumed until the destination specified has received the entire configuration payload. Therefore the list is expected to stall while the configuration takes place. This ensures that all descriptors after a configuration descriptor in the list will occur after the desired configuration.

9.4.8.7.2.1 Configuration Descriptor Header Word0

Table 9-49. Configuration Descriptor Header Word0 Field Descriptions

Bits	Name	Description
31:0	Address Offset of the Destination	This is the address offset location in the destination that the block of data in the payload should be written. This field is only used if the descriptor Class is a block type. Otherwise this field is reserved.

9.4.8.7.2.2 Configuration Descriptor Header Word1

Table 9-50. Configuration Descriptor Header Word1 Field Descriptions

Bits	Name	Description
15:0	Number of Data Words	Length of First Data Packet for Class 1(block).

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.2.2.1 Number of Data Words

Bits 15:0 indicate the length of the first data block if the class is 1 as specified in Configuration Descriptor Header Word3. If the class is not 1 then this field should be set to 0.

9.4.8.7.2.3 Configuration Descriptor Header Word2

Table 9-51. Configuration Descriptor Header Word2 Field Descriptions

Bits	Name	Description
31:0	Payload Location	Pointer to the data payload

9.4.8.7.2.3.1 Payload Location

Bits 31:0 contain the pointer to the data payload if the command packet is an indirect type. This value along with the Payload Length will be combined to issue a DMA transaction that must complete before the List Manager can finish processing this descriptor. The list will be made inactive pending this DMA completion. This address should be on a 16 byte boundary so the lower 4 bits should always be 0.

9.4.8.7.2.4 Configuration Descriptor Header Word3

Table 9-52. Configuration Descriptor Header Word3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xb
26	Direct	Direct Command = 1 Indirect Command = 0
25:24	Class	0 = Address, Data Set 1 = Block 2,3 Reserved for Future Use
23:16	Destination	Destination of the configuration payload
15:0	Payload Length	Length of Payload in Words.

9.4.8.7.2.4.1 Packet Type

Bits 31:27, this field indicates the type of descriptor and should be set 0xB for configuration descriptor.

9.4.8.7.2.4.2 Direct

Bit 26, this field indicates that the descriptor is a direct command or indirect command. A direct command means that the payload is contiguous with the descriptor and will be pulled in by the list manager descriptor control as it processes the list. A direct payload must end on or before a 256 byte boundary in the list. An indirect command is when the Address is located in Word2 is a pointer to the data payload. A DMA transaction will be scheduled to bring the payload into the List Manager to allow for the payload to be sent to the destination.

9.4.8.7.2.4.3 Class

Bits 25:24, this field indicates the type of payload is associated with command descriptor, and thus how to handle the payload.

Copyright © 2015–2020, Texas Instruments Incorporated

A 0 indicates that the payload consists of blocks of data with each block having an address and length. The first word after a sub-block contains the next address and length in bytes. This allows for writing to multiple configuration regions in a client. The Configuration Descriptor word1 is the first address and length pair. All addresses used must be larger then the previous address for all destinations except for the MMR destination. If a sub block length is not evenly divisible into 16 then zeroes should be padded in the payload so that the Next Client Address and Length field start on a 16 byte boundary.

9.4.8.7.2.4.3.1 Address Data Block Format

Table 9-53. Address Data Block Format Field Descriptions

Bits	Name	Description
31-0		Next Client Address
31-0		Configuration for Next Client Address
31-0		Configuration for Next Client Address + 4
31-0		Configuration for Next Client Address + 8
31-0		Configuration for Next Client Address + 12
31-0		Configuration for Next Client Address + 16
31-0		Next Client Address 2
15-0		Sub Block Length

A 1 indicates the payload is simply block data. The data is contiguous and starts at the offset of the destination as specified in word1.

9.4.8.7.2.4.4 Destination

The Destination field is used to determine where the configuration payload should be sent. The values for the destination field can be seen in the table below.

Table 9-54. Destination Field Description

Destination Value	Actual Destination	Description
0	mmr_client	Write to MMR registers to setup other modules
7	VIP Slice 0	VIP Slice 0 Scaler Coefficient Tables
8	VIP Slice 1	VIP Slice 1 Scaler Coefficient Tables

9.4.8.7.2.4.5 Descriptor Length

Bits 15:0, this field indicates the size of the payload in words for the command. This is 128 bit words. The maximum number of words is 1023 words in a single payload

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.3 Control Descriptor

9.4.8.7.3.1 Generic Control Descriptor Format

A control descriptor is the mechanism that is used in a list to give commands to the List Manager. These descriptors are not considered consumed until the List Manager has done the instruction required by the descriptor. All control descriptors have a common Header located at Word 3 but the remaining words are based on the specific control descriptor.

9.4.8.7.3.2 Control Descriptor Header Description

Table 9-55. Control Descriptor Header Description

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xc
26:25	Reserved	Reserved
24:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	The type of control descriptor that should be run by the List Manager

9.4.8.7.3.2.1 Packet Type

This field indicates a VPDMA control descriptor.

9.4.8.7.3.2.2 Source

The source is combined with the control field to determine what the control descriptor should use as the source for its synchronization event.

9.4.8.7.3.2.3 Control

The Control field defines the specific function of the descriptor. Table 9-56 lists the different control descriptors.

9.4.8.7.3.3 Control Descriptor Types

Table 9-56. Control Descriptor Types Summary

Control Descriptor	Control Field Value	Description
Sync on Client	0	Wait for the client attached to the channel specified to reach a certain event before proceeding.
Sync on List	1h	Wait for another list(s) to reach its Sync on List Descriptor
Sync on External Event	2h	Wait for a Register write to the LIST_STAT_SYNC bit specified or for an external event.
Sync on Channel	4h	Wait for the channel specified to complete
Change Client Interrupt	5h	Change the interrupt event for a client interrupt but do not wait for the event to occur.
Send Interrupt	6h	Generate an interrupt event on one of the Control Descriptor Interrupts
Reload List	7h	Reload the list from the location and size specified.
Abort Channel	8h	Abort the transfer in the channel specified.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.3.3.1 Sync on Client

A Sync on Client Control descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. For a client that supports multiple channels then only an event on the portion of the client that supports that client will cause the interrupt to be generation. After configuring the interrupt generation event the list will then stall until that event has occurred.

Table 9-57. Sync on Client Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger

Table 9-58. Sync on Client Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 0

9.4.8.7.3.3.2 Sync on List

The Sync on List Control descriptor is a mechanism to ensure that multiple lists have all reached a common point. The Sync on List descriptor uses the Source field as a mask for each list that should be synchronized which must include the list where the control descriptor resides. Once all lists specified in the source field have reached their Sync on List descriptor all lists will resume with the lowest list number resuming first. All Sync on List Control descriptors in each of the lists must have the same source field so that all lists will synchronize upon reaching that point.

If it is desired to synchronize list 0 and list 1 then the source field would be 0x3. If it is desired to synchronize list 1, list 3, and list 4 then the source field would be 0x1a. Word 0, Word 1 and Word 2 are reserved.

Table 9-59. Sync on List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 1h

9.4.8.7.3.3.3 Sync on External Event

A Sync on External Event descriptor ensures an external event has occurred before proceeding. The external event can be a write to a bit of the LIST_STAT_SYNC register or other external events that are determined at VPDMA elaboration to have occurred. This descriptor can be used to allow for external software to control progression of the list. The descriptor can also be used to select external signals that are brought into the VPDMA. The current implementation just synchronize on the LIST_STAT_SYNC bit for the list number that called the descriptor.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-60. Sync on External Event Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 2h

9.4.8.7.3.3.4 Sync on Channel

A Sync on Channel descriptor stalls the list until the channel specified is free. If the channel is already free then the descriptor will not cause the list to stall. Word 0, Word 1 and Word 2 are reserved.

Table 9-61. Sync on Channel Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 4h

9.4.8.7.3.3.5 Sync on LM Timer

A Sync on LM Timer descriptor sets a value from the current timer position to wait. The LM timer is a free running counter at the LM processing clock. The Timer Value in the descriptor is added to the value of the timer at the time the descriptor is received and the list will stall for this many cycles before it becomes active again.

9.4.8.7.3.3.6 Change Client Interrupt

A Change Channel Interrupt Source descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. The list will not stall on this descriptor. The format of the fields is identical to the Sync on Client Descriptor. Word 0 is reserved.

Table 9-62. Change Client Interrupt Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger.

Table 9-63. Change Client Interrupt Field Descriptions (Word - 2)

Bits	Name	Description
31:4	Reserved	Reserved
3:0	Event	Specify the event which should trigger the client interrupt.

Table 9-64. Change Client Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Copyright © 2015–2020, Texas Instruments Incorporated

Table 9-64. Change Client Interrupt Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 5h

9.4.8.7.3.3.7 Send Interrupt

A Send Interrupt descriptor will cause the VPDMA to generate an interrupt on the list manager controlled interrupts as specified by the Source Field. The list will not stall on this descriptor. For example, if source is 0 then control_descriptor_int0 will fire. If source is 12, then control_descriptor_int12 will fire. For more information ot VPDMA interrupt events, see Section 9.4.8.6, *VPDMA Interrupts*.

Table 9-65. Send Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 6h

9.4.8.7.3.3.8 Reload List

A Reload List descriptor causes ending descriptors after this descriptor in the original list to be dropped and a new list at the location and of the size specified in the descriptor. This descriptor can be used to allow for linked lists in the VPDMA as the list will continue from this point and fetch the list specified and it does not have to be continuous with the current list.

Table 9-66. Reload List Field Descriptions (Word - 0)

Bits	Name	Description
31:0	LIST_ADDRESS	31 most-significant Bits of the memory address where the descriptors to be loaded are stored. Address must be 16 byte aligned.

Table 9-67. Reload List Field Descriptions (Word - 1)

Bits	Name	Description
31:16	Reserved	Reserved
15:0	LIST_SIZE	Size of the list to load

Table 9-68. Reload List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 7h

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.7.3.3.9 Abort Channel

An Abort Channel descriptor is used to clear a channel. This clears the channel from issuing any more requests. Any outstanding requests for that channel will complete as originally scheduled. All data inside the client will be flushed. For Tiled Clients such as the noise filter it is required to issue two consecutive abort channel descriptors to ensure the channel is aborted for both the current tile and next tile. Word 0, Word 1 and Word 2 are reserved.

Table 9-69. Abort Channel Field Descriptions (Word - 3)

Bit	Name	Description
31:27	Packet Type	Host Packet Descriptor type = 0xC
26:24	Reserved	Reserved
23:16	Source	VPDMA Channel Number whose transfers are to be aborted
15:4	Reserved	Reserved
3:0	Control	Control type = 9h

9.4.8.8 VPDMA Configuration

The following section describes the different ways of configuring VPDMA for data transfers.

9.4.8.8.1 Regular List

A regular list executes each descriptor in order until the end of the list is reached. When the end of the list is reached an interrupt is sent and the list can be reused by software. A regular list can contain any descriptor types. Software creates the list at some location in external memory. After completing writing the list software then writes the location of the list to the VIP_LIST_ADDR[31:0] VIP_LIST_ADDR register and then writes the VIP_LIST_ATTR register. If the NUMBER in the VIP_LIST_ATTR[26:24] LIST_NUM is not an active list then the List will be loaded and begin to execute the next time the List Manager gets to IDLE after processing previous loaded lists. If the NUMBER in the VIP_LIST_ATTR[26:24] LIST_NUM is busy then the VIP_LIST_ADDR and VIP_LIST_ATTR registers will be locked until the active list specified by NUMBER completes.

The different ports inside VPDMA requires different list setup, as explained in the following sections.

9.4.8.8.2 Video Input Ports

The Video Input Ports can be used in multiple ways. Depending on how the input ports are configured will determine how the lists to manage them need to be setup. The ways in which the ports can work are multiplexed data stream, single YUV color separate stream, dual YUV interleaved or single RGB stream. Each port also has an ancillary data port that can run either multiplexed or single data stream and shares the buffering with the main data stream. For all cases the descriptor must be loaded into the client before the vertical sync is received on the VIP port or the entire frame will be dropped. As with all write clients the VIP channels can be shadowed so the next frame/field descriptor can be loaded while the previous frame is running without stalling the list.

9.4.8.8.2.1 Multiplexed Data Streams

In the case of a multiplexed data stream input the channels that should be used are VIP(X)_MULT_PORT(Y)_SRC(Z). Where X is the specific VIP slice of the instance that wants to be used and port Y is the port A or port B that is receiving the data. Finally Z is the channel number. For Split line mux mode the LSB of the channel will determine, if the line is a split line or a complete line. This is required so that the data streams do not get mixed when a channel ends without completing a line. In this mode the data will always be sent out as 422 Interleaved data to the destination specified in the descriptor.

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.8.2.2 Single YUV Color Separate

If the port is configured to be used as sending out color separated YUV data then the channels that must be used are VIPX_PORTY_LUMA and VIPX_PORTY_CHROMA for the luma and chroma components respectively. The data type can be either 420 or 422 color separate in this case.

9.4.8.8.2.3 Dual YUV Interleaved

If the port is configured to be used to send out 422 interleaved data from a non-multiplexed source then the channels that must be used are VIPX_PORTY_LUMA or VIPX_PORTY_CHROMA depending on if the data stream is connected to the luma or chroma port. The data type must be 422 interleaved in this case.

9.4.8.9 VPDMA Data Formats

Each of the channels has a type of data that it can support based upon the client that it services. Also for each channel, the data type will assume that data is packed in memory a certain way and will be prevented to the client in the same manner to the client no matter what the format of the data in memory.

9.4.8.9.1 YUV Data Formats

The YUV formatted channels expect video data that is in YUV color space. The YUV data can be type is for YUV data and it can support both interleaved data where Luma and Chroma are in the same data buffer or it can support co-planar data where the Luma and Chroma are in separate data buffers. The YUV channel also can be given a position to give a different start position for the client instead of the default upper left hand corner of the frame. The storage format for YUV data depends on the data type field. The data type must be set to a data type that the channel can support. All the clients that data are provided too will either accept Luma Only, Chroma Only or Luma and Chroma in a parallel data bus.

9.4.8.9.1.1 Y 4:4:4 (Data Type 0)

The Y 4:4:4 data type is used for a co-planar 4:4:4 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and height set to the desired frame size expected by the receiving client.

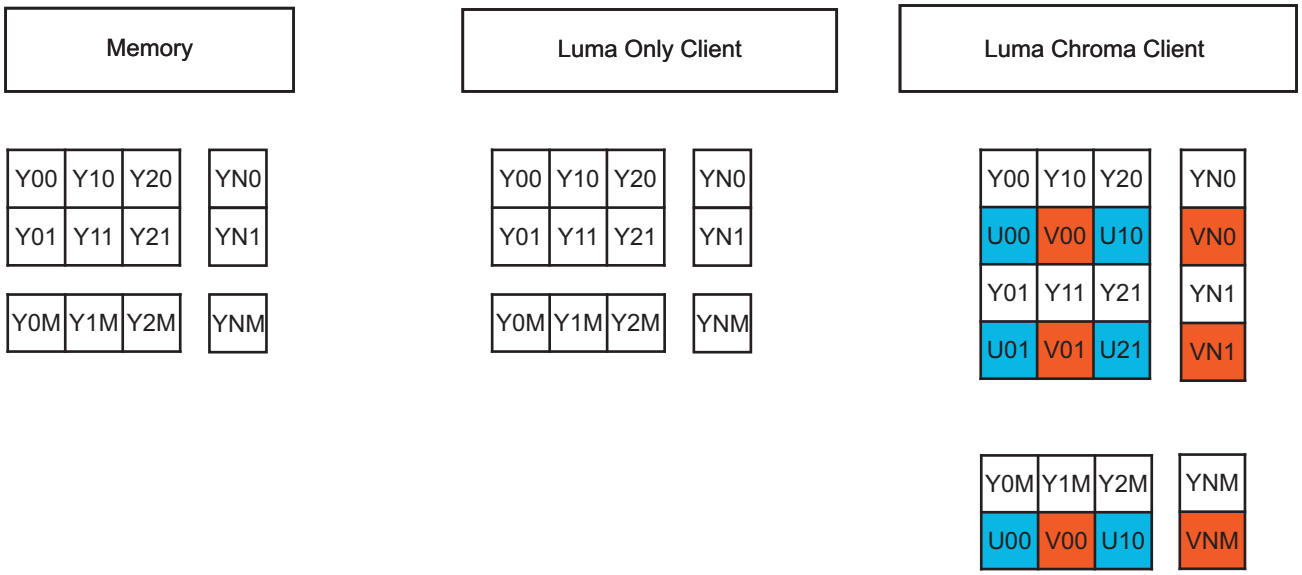
Figure 9-97. Y 4:4:4 (Data Type 0)

Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.9.1.2 Y 4:2:2 (Data Type 1)

The Y 4:2:2 data type is used for a co-planar 4:2:2 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the desired frame sent by the VPDMA to the receive client.

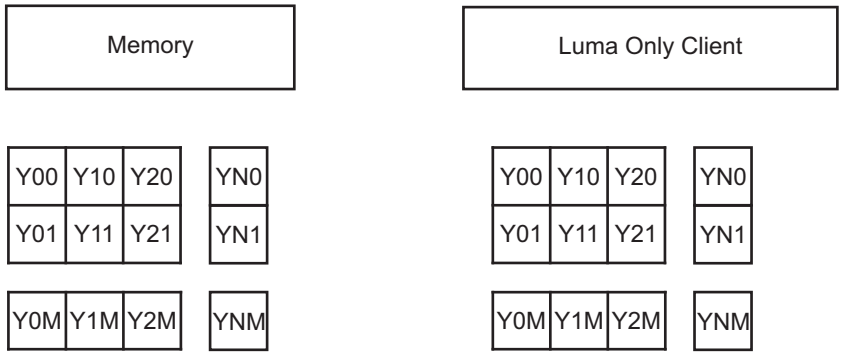
Figure 9-98. Y 4:2:2 (Data Type 1)



9.4.8.9.1.3 Y 4:2:0 (Data Type 2)

The Y 4:2:0 data type is used for a co-planar 4:2:0 data type. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the expected frame for the client.

Figure 9-99. Y 4:2:0 (Data Type 2)



Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.9.1.4 C 4:4:4 (Data Type 4)

The C 4:4:4 data type is used for a co-planar 4:4:4 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and height of the expected client frame.

Figure 9-100. C 4:4:4 (Data Type 4)

9.4.8.9.1.5 C 4:2:2 (Data Type 5)

The C 4:2:2 data type is used for co-planar 4:2:2 data.It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and the height of the expected client frame.

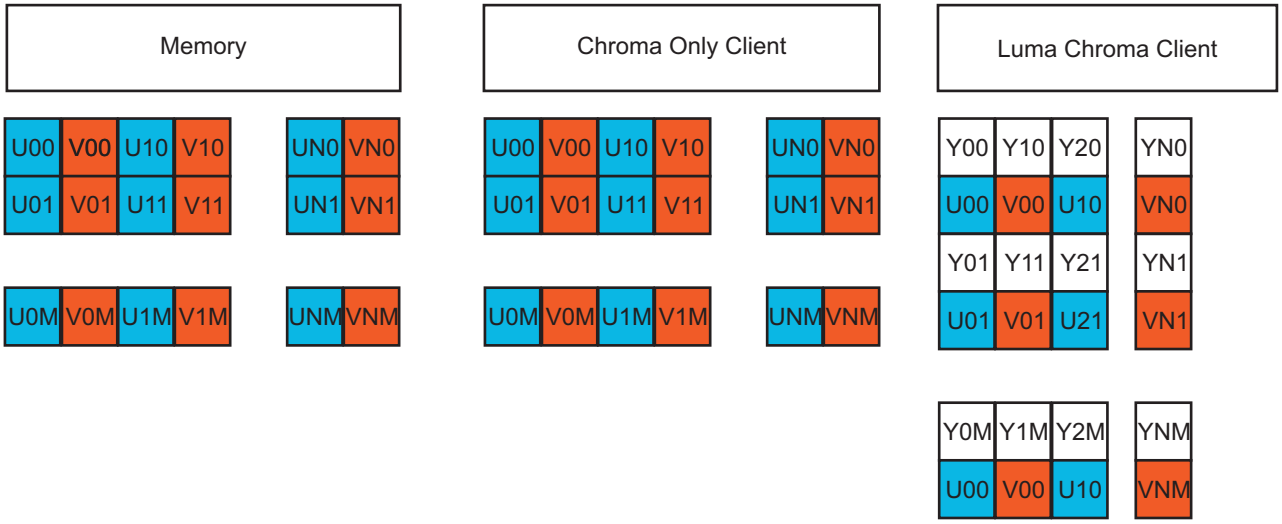
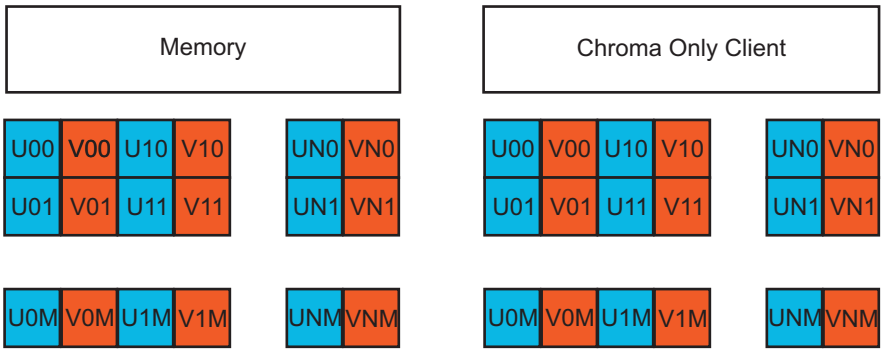
Figure 9-101. C 4:2:2 (Data Type 5)



9.4.8.9.1.6 C 4:2:0 (Data Type 6)

The C 4:2:0 data type is used for a co-planar 4:2:0 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in a 16 bit container. This data block should have the width and half the height of the expected clients frame.

Figure 9-102. C 4:2:0 (Data Type 6)

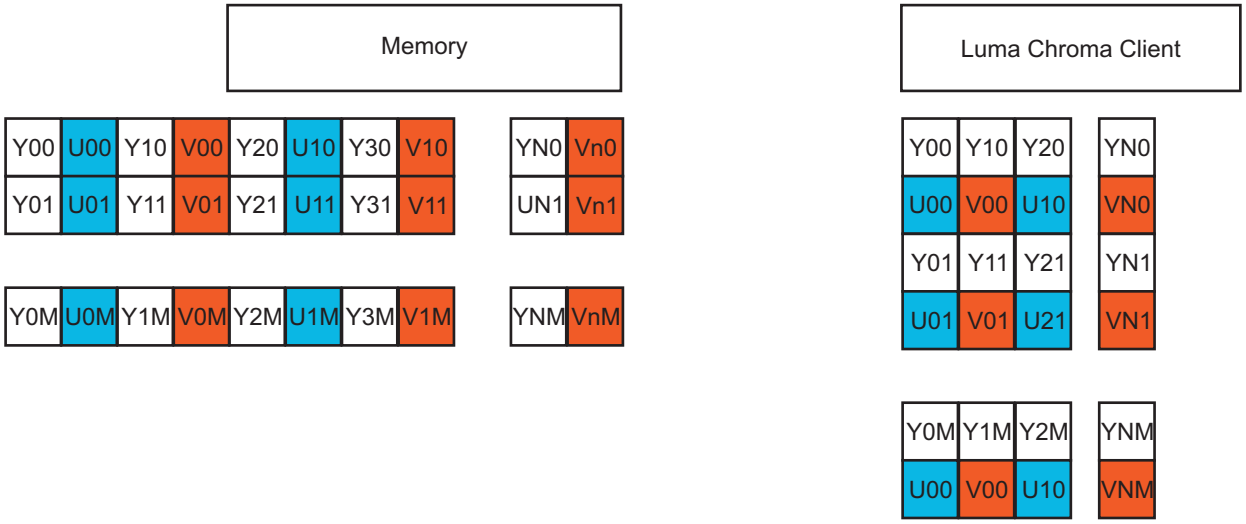


9.4.8.9.1.7 YC 4:2:2 (Data Type 7)

The YC 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Y1 finally Cr in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Copyright © 2015–2020, Texas Instruments Incorporated

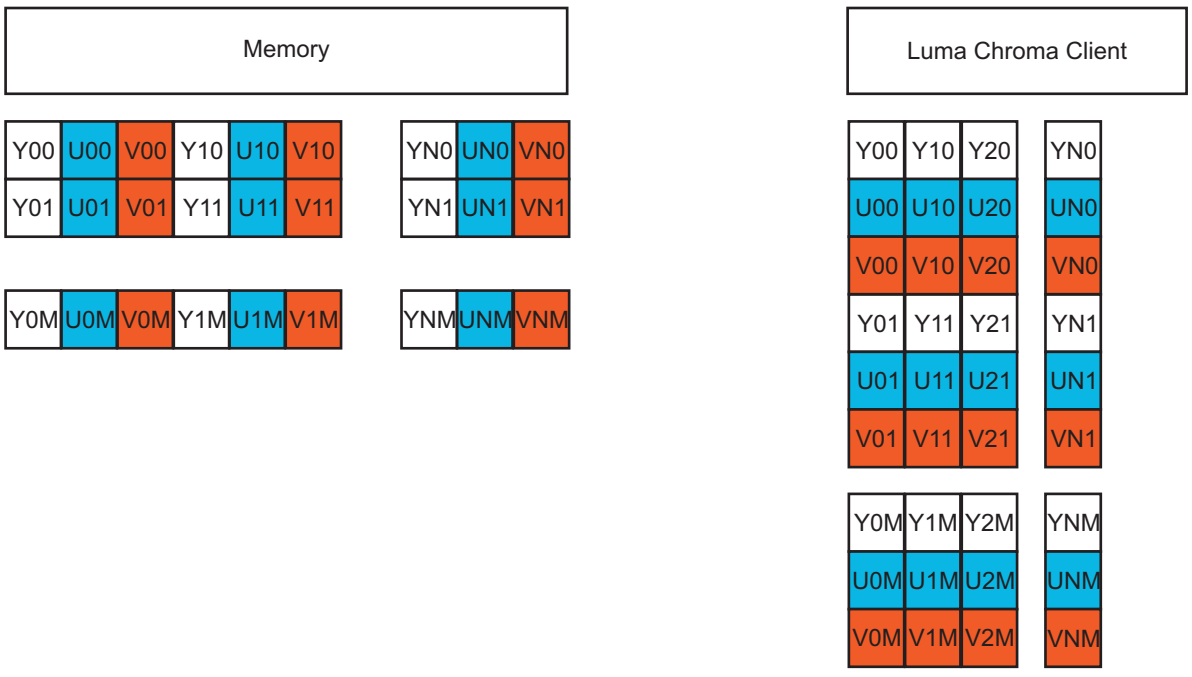
Figure 9-103. YC 4:2:2 (Data Type 7)



9.4.8.9.1.8 YC 4:4:4 (Data Type 8)

The YC 4:4:4 data type is used for interleaved 4:4:4 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Cr. The transfer counts each YCbCr triplet in a 24 bit word as a pixel. A 2D transfer of the data is NOT supported in the VPDMA. The data block width and height should be set to the number of pixels and lines that are expected by the client.

Figure 9-104. YC 4:4:4 (Data Type 8)

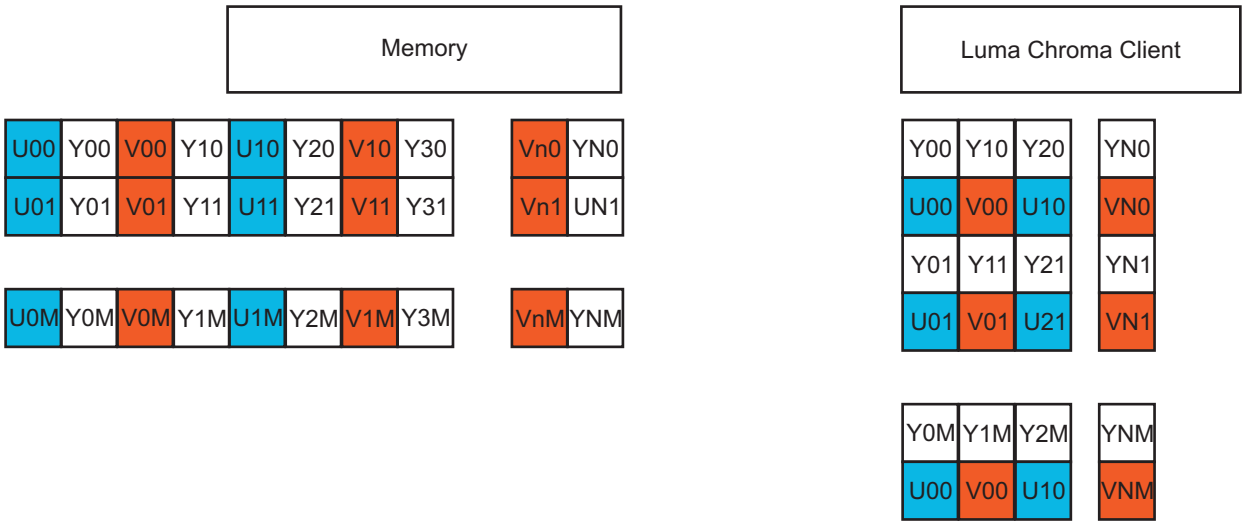


Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.9.1.9 CY 4:2:2 (Data Type 23)

The CY 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Cb in the lowest byte followed by Y0 followed by Cr finally Y1 in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 9-105. CY 4:2:2 (Data Type 23h)



9.4.8.9.2 RGB Data Formats

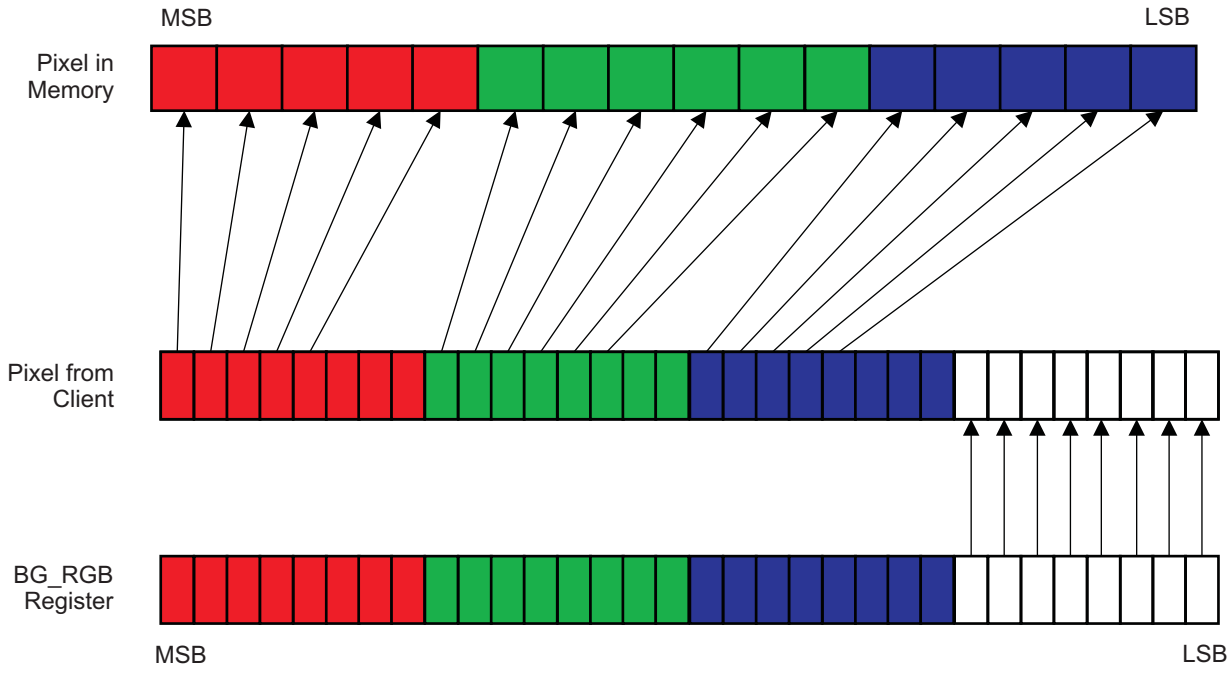
The RGB channel type is used to provide data for a client that expects to transmit RGB data. In all modes the client is always RGBA 8888 data. The lower bits, if not provided by the data stream, are a replication of the lower bit of the data. For outbound data the input is assumed to be RGB 888 and the Alpha value is taken from the Background Color register to make a full ARGB 8888. The lower bits are dropped from this data, if a data type specifies less then the full 8 bits per color. The client has individual data buses for each component so they have no order dependency in the data bus.

9.4.8.9.2.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Copyright © 2015–2020, Texas Instruments Incorporated

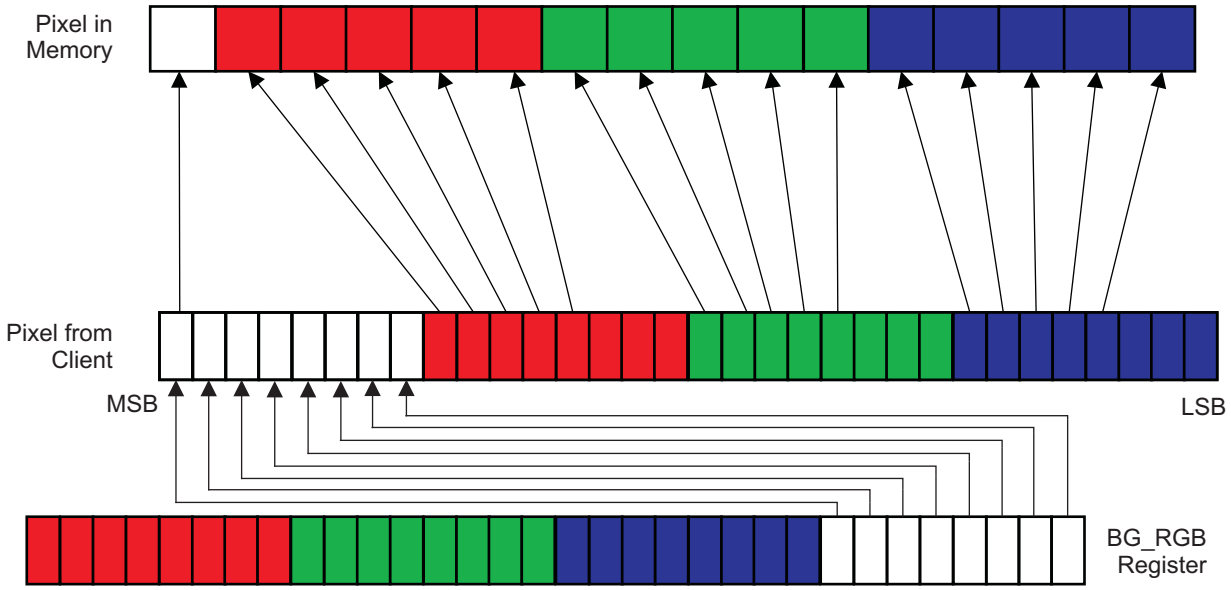
Figure 9-106. RGB16-565 (Data Type 0)



9.4.8.9.2.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

Figure 9-107. ARGB-1555 (Data Type 1)

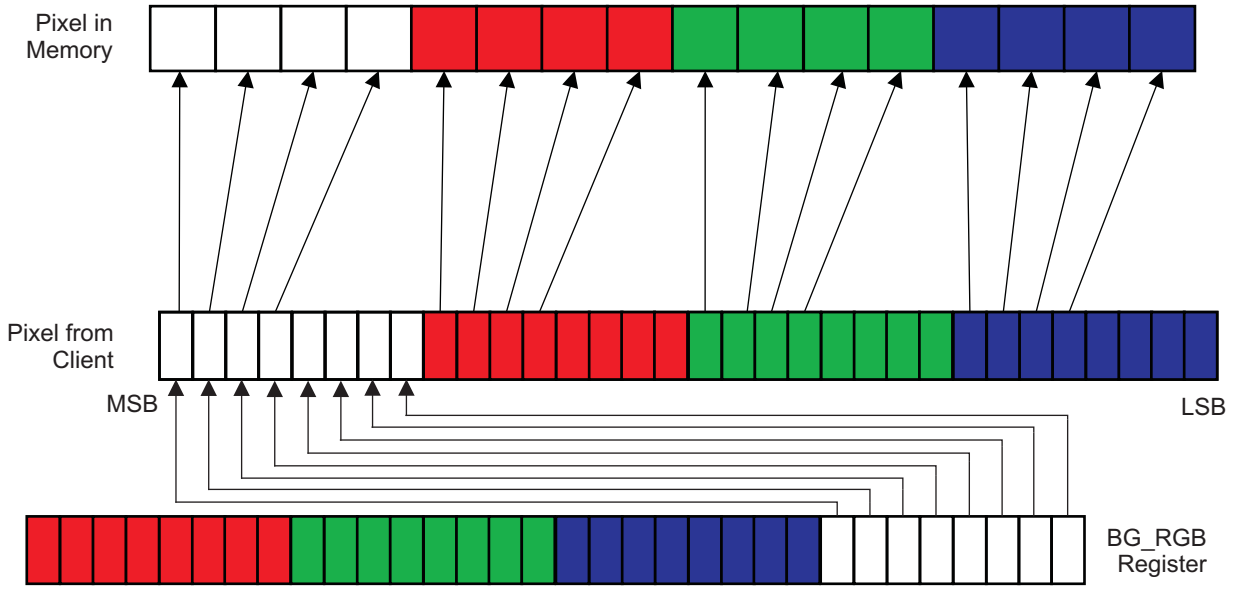


Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.9.2.3 ARGB-4444 (Data Type 2)

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

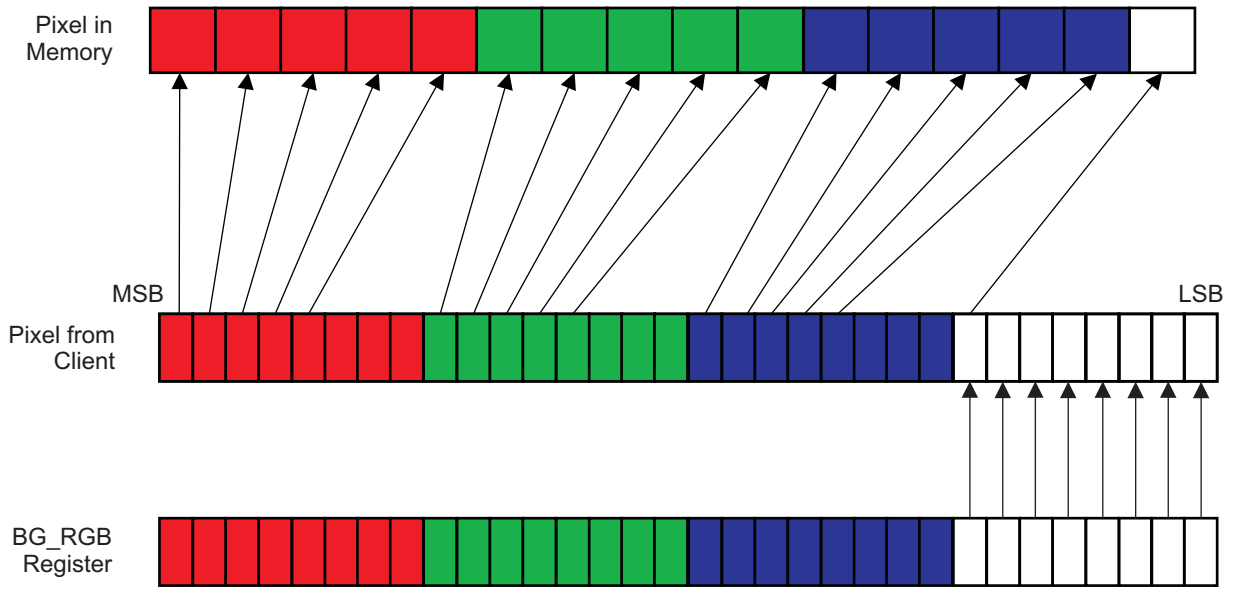
Figure 9-108. ARGB-4444 (Data Type 2)



9.4.8.9.2.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

Figure 9-109. RGBA-5551 (Data Type 3)

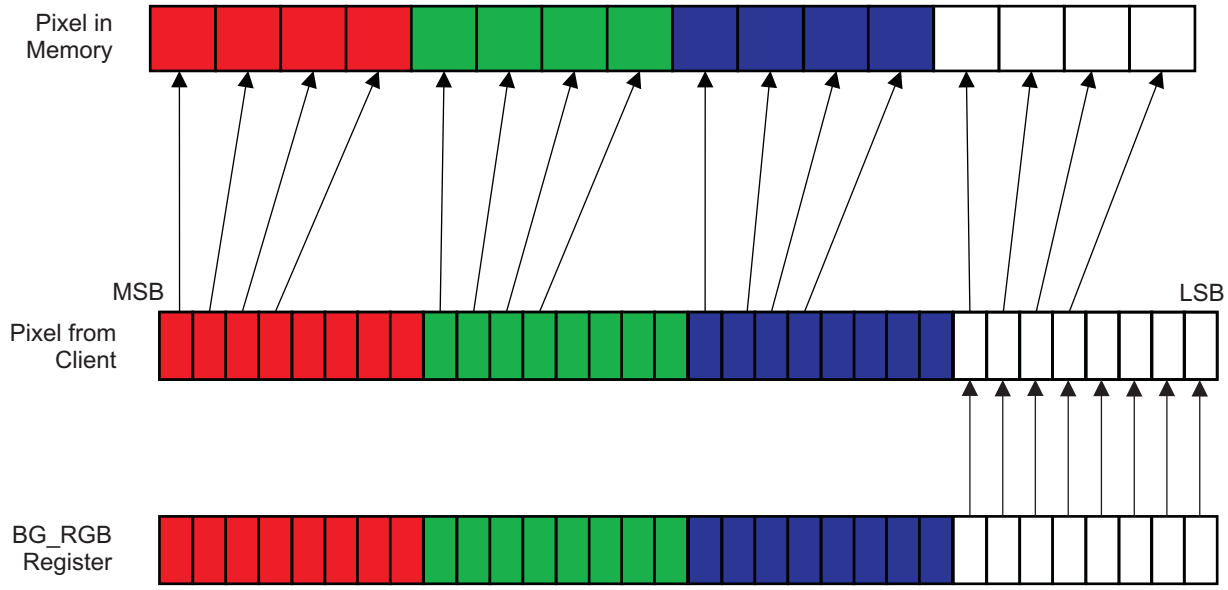


Copyright © 2015–2020, Texas Instruments Incorporated

9.4.8.9.2.5 RGBA-4444 (Data Type 4)

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

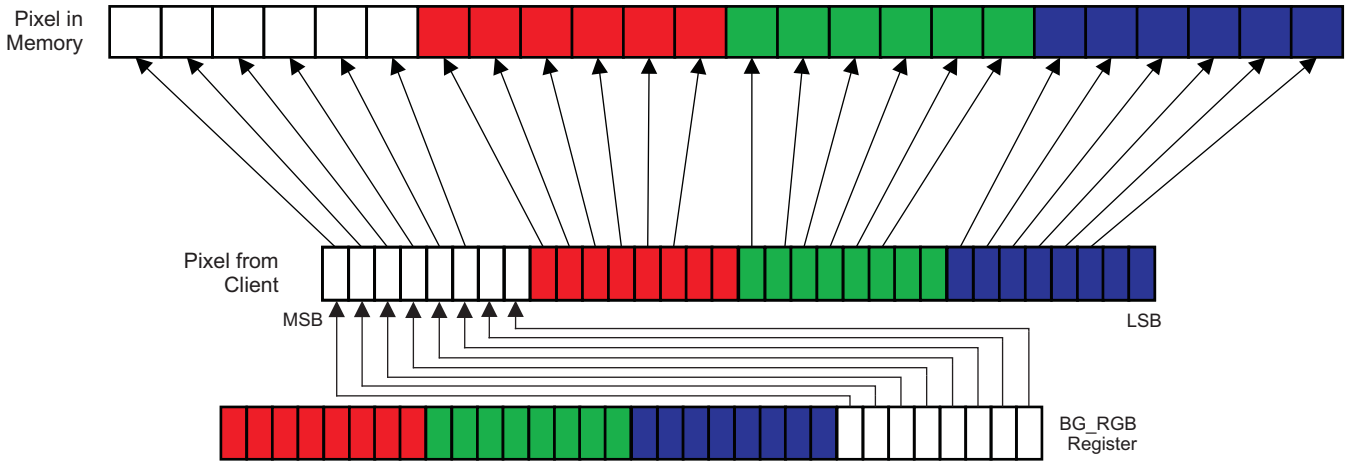
Figure 9-110. RGBA-4444 (Data Type 4)



9.4.8.9.2.6 ARGB24-6666 (Data Type 5)

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

Figure 9-111. ARGB24-6666 (Data Type 5)



9.4.8.9.2.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the BG_RGB Blend value for the Blend value.

9.4.8.9.3 Miscellaneous Data Type

The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client. The size of the miscellaneous data type is always determined by the Data Type field of the descriptor which specifies the number of bits in the descriptor.

A memory structure used to describe a desired memory transaction to or from a client. The descriptor at a minimum gives an address location for the memory portion of the transfer, the channel to use for this transaction and the size of the transaction. The data descriptor can also contain attributes to be passed down to the client or be linked to another data descriptor to form a larger frame from many smaller frames.

ANALYZER_FVH_ERR_CORRECTION_ENABLE	ANALYZER_2X4X_SRCNUM_POS	FID_SKEW_POSTCOUNT						SW_RESET	DISCRETE_BASIC_MODE	FID_SKEW_PRECOUNT						USE_ACTVID_HSYNC_N	FID_DETECT_MODE	ACTVID_POLARITY	VSYNC_POLARITY	HSYNC_POLARITY	PIXCLK_EDGE_POLARITY	FID_POLARITY	ENABLE	CLR_ASYNC_FIFO_RD	CLR_ASYNC_FIFO_WR	CTRL_CHAN_SEL	SYNC_TYPE				

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_ENABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port A logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
13	ACTVID_POLARITY	Discrete Sync Only 0 = ACTVID is active low 1 = ACTVID is active high	RW	0x0
12	VSYNC_POLARITY	Discrete Sync Only 0 = VSYNC is active low 1 = VSYNC is active high	RW	0x0
11	HSYNC_POLARITY	Discrete Sync Only 0 = HSYNC is active low 1 = HSYNC is active high	RW	0x0
10	PIXCLK_EDGE_POLARITY	0 = Rising Edge is active PIXCLK edge 1 = Falling Edge is active PIXCLK edge	RW	0x0
9	FID_POLARITY	0 = Keep FID as found 1 = Invert Determined Value of FID	RW	0x0
8	ENABLE	0 = Disable Port 1 = Enable Port	RW	0x0
7	CLR_ASYNC_FIFO_RD	0 = Normal 1 = Clear Async FIFO Read Logic	RW	0x0
6	CLR_ASYNC_FIFO_WR	0 = Normal 1 = Clear Async FIFO Write Logic	RW	0x0
5:4	CTRL_CHAN_SEL	Embedded Sync Only In 8b mode.. there is only one channel on data[7:0]. In 16b mode.. there are two channels. The Luma Channel is on data[15:8]. The Chroma Channel is on data[7:0]. In 24b mode.. there are three channels. The R channel is on data[23:16].. the G channel is on [15:8]. and the B channel is on data[7:0]. 00 = Use data[7:0] to extract control codes. 01 = Use data[15:8] to extract control codes. 10 = Use data[23:16] to extract control codes. 11 = Undefined In 16b and 24b modes.. this register is also used to select the channel from which Ancillary Data is extracted. The Ancillary Data channel must be the same as the control code channel. For 8b mode.. the anc_chan_sel_8b register is used to select the Luma or Chroma channel from which Ancillary Data is taken.	RW	0x0
3:0	SYNC_TYPE	0000 = embedded sync single 4:2:2 YUV stream 0001 = embedded sync 2x multiplexed 4:2:2 YUV stream 0010 = embedded sync 4x multiplexed 4:2:2 YUV stream 0011 = embedded sync line multiplexed 4:2:2 YUV stream 0100 = discrete sync single 4:2:2 YUV stream 0101 = embedded sync single RGB stream or single 444 YUV stream 0110 = reserved 0111 = reserved 1000 = reserved 1001 = reserved 1010 = discrete sync single 24b RGB stream	RW	0x0

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_ENABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port B logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0

Bits	Field Name	Description	Type	Reset
31:16	YUV_SRCNUM_STOP_IMMEDIATELY	For the Active Video Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following cfg_enable transitioning inactive for that port. Each bit in this vector represents a srcnum (remapped srcnum for TI line mux mode) going to the VPDMA. For example, bit 0 is srcnum 0, bit 1 is srcnum 1, etc. A ?0? in a bit position means that the hardware will wait for that srcnum, if it is in the middle of a frame, to continue until the end of the frame before stopping. A ?1? in a bit position means that it is ok for a srcnum to stop in the middle of a frame. For example, suppose a source is removed and the input will never complete sending a frame. If the bit position representing that srcnum is set to ?0?, the port will never disable.	RW	0x0
15:0	ANC_SRCNUM_STOP_IMMEDIATELY	For the Ancillary Data Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following cfg_enable transitioning inactive for that port. Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								B0								RESERVED								A0							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED		RW	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. (Same format conversion as A0)	RW	0x0
15:13	RESERVED		RW	0x0
12:0	A0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. Rules for converting a real number coefficient to a 12-bit hex number for this register: - If the real number is positive, then simply multiply it by 1024, and convert the integer part to hex format. For example, 0.673 X 1024 = 689.152, then 0x2B1 should fill in to this register - If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is -1.893, by *1024 to this number, it becomes -1938. The 2'S compliment format of -1938 is 0x186E (in 13-bit width). Then 0x186E should be the number assigned to this register.	RW	0x0

RESERVED															CFG_FID_SELFGEN	CFG_TRIM	CFG_Y_PK_EN	RESERVED			CFG_INTERLACE_I	CFG_HP_BYPASS	CFG_DCM_4X	CFG_DCM_2X	CFG_AUTO_HS	CFG_ENABLE_EV	CFG_USE_RAV	CFG_INVT_FID	CFG_SC_BYPASS	CFG_LINEAR	CFG_INTERLACE_O

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16	CFG_FID_SELFGEN	FID self generate enable. When input is progressive and this bit is set, the SC generates self-toggling (top/bottom) output FID when performing interlacing.	RW	0x0
15	CFG_TRIM	Trimming enable. When 1, the input image whose size is specified by orgW and orgH registers is trimmed to the size with srcW and srcH from the offset specified by offW and offH. 0: disable trimming 1: enable trimming	RW	0x0
14	CFG_Y_PK_EN	This parameter is used by peaking block. 0: disable luma peaking 1: enable luma peaking	RW	0x0
13:11	RESERVED		R	0x0
10	CFG_INTERLACE_I	This parameter is used by both horizontal and vertical scaling 0: the input video format is progressive 1: the input video format is interlace	RW	0x0
9	CFG_HP_BYPASS	This parameter is used by horizontal scaling. If cfg_auto_hs is 0, horizontal polyphase filter is always enabled. In this case, this register is DON?T CARE. If cfg_auto_hs is 1, 0 : The polyphase scaler is always used regardless of the scaling ratio. 1 : The polyphase scaler is bypassed only when (tar_w == src_w) or (tar_w == src_w/2) or (tar_w == src_w/4)	RW	0x0
8	CFG_DCM_4X	This parameter is used by horizontal scaling. 0: the 4X decimation filter is disabled 1: the 4X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (horizontal scale ratio 0.25). (3) This register is DON?T CARE when cfg_auto_hs = 1.	RW	0x0
7	CFG_DCM_2X	This parameter is used by horizontal scaling. 0: the 2X decimation filter is disabled 1: the 2X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (0.25 horizontal scale ratio 0.5). (3) This register is DON?T CARE when cfg_auto_hs = 1.	RW	0x0
6	CFG_AUTO_HS	This parameter is used by horizontal scaling. 0: the cfg_dcm_2x and cfg_dcm_4x bits will enable appropriate decimation filters 1: HW will decide whether up-scaling or down-scaling is required based on horizontal scaling ratio (SR). SR 0.5 : horizontal polyphase filter is enabled, all decimation filters are disabled SR = 0.5 : dcm_2x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.5 SR 0.25 : dcm_2x and horizontal polyphase filter both are enabled SR = 0.25 : dcm_4x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.25 SR 0.125 : dcm_4x and horizontal polyphase filter are both enabled SR = 0.125 : Functionally supported, but not recommended in auto mode for image quality concerns	RW	0x0
5	CFG_ENABLE_EV	This parameter is used by the edge-detection block. 0: The output of edge-detection block will be force to ?0? 1: The calculation results of edge-detection block will be output normally	RW	0x0

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
4	CFG_USE_RAV	This parameter is used by vertical scaling. 0: Poly-phase filter will be used for the vertical scaling 1: Running average filter will be used for the vertical scaling (down scaling only)	RW	0x0
3	CFG_INVT_FID	This parameter is used by vertical scaling. 0: Progressive input 1: Interlaced input Must be set to 1 when CFG_INTERFACE_I = 1.	RW	0x0
2	CFG_SC_BYPASS	This parameter is a general purpose. 0: Scaling module will engaged 1: Scaling module will be bypassed	RW	0x0
1	CFG_LINEAR	This parameter is used by horizontal scaling. 0: Anamorphic scaling 1: Linear scaling	RW	0x0
0	CFG_INTERLACE_O	This parameter is used by vertical scaling. 0: The output format of SC is progressive 1: The output format of SC is interlace	RW	0x0

RESERVED								CFG_ROW_ACC_INC																							

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:0	CFG_ROW_ACC_INC	This parameter is used by vertical scaling. It defines the increment of the row accumulator in vertical poly-phase filter. It can be calculated by following formula: row_acc_inc = round(2^16 *(src_h)/(tar_h)) In case of interlaced input, srcH is input field height In case of interlaced output, tarH is output field height.	RW	0x0

9.5.6 VIP VPDMA Registers

NOTE: The functionality of the following sets of registers is not supported by VIP VPDMA in this family of devices:

- All VIP_INT2_* registers
- All VIP_INT3_* registers

The following channels are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these channels should be kept at their reset value.

- HQ_*
- GRPX_*
- SCALER_OUT
- SCALER_LUMA
- SCALER_CHROMA
- NF_*
- TRANSCODE1_*
- TRANSCODE2_*
- AUX_IN
- PIP_FRAME
- POST_COMP_WR
- VBI_SD_VENC

The following clients are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these clients should be kept at their reset value.

- DEI_HQ_*
- TRANS1_LUMA
- TRANS1_CHROMA
- TRANS2_LUMA
- TRANS2_CHROMA
- HDMI_WRBK
- VBI_SDVENC
- NF_420_UV_OUT
- NF_420_Y_OUT
- NF_420_UV_IN
- NF_420_Y_IN
- NF_422_IN
- GRPX1_ST
- GRPX2_ST
- GRPX3_ST
- GRPX1_DATA
- GRPX2_DATA
- GRPX3_DATA
- PIP_WRBK
- SC_IN_*
- SC_OUT
- COMP_WRBK

Table 9-301. VIP_LIST_ATTR

Address Offset	0x0000 0008		
Physical Address	0x4897 D008 0x4899 D008 0x489B D008	**Instance**	VIP1_VPDMA VIP2_VPDMA VIP3_VPDMA
Description	The attributes of a new list. This register should always be written after VIP_LIST_ADDR.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED					LIST_NUM			RESERVED			STOP	RDY	LIST_TYPE			LIST_SIZE																

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at VIP_LIST_ADDR. If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VIP_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the VIP_LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated.\\n0: Normal List\\n1: Self-Modifying List\\n2: List Doorbell\\nOthers Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel nf_write_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_HQ_VID2_CHROMA	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel nf_write_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

15	INT_MASK_NF_420_UV_IN	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
14	INT_MASK_NF_420_Y_IN	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
13	INT_MASK_NF_422_IN	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
12	INT_MASK_GRPX3_ST	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
11	INT_MASK_GRPX2_ST	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
10	INT_MASK_GRPX1_ST	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
9	INT_MASK_VIP2_UP_UV	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
8	INT_MASK_VIP2_UP_Y	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
7	INT_MASK_VIP2_LO_UV	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
6	INT_MASK_VIP2_LO_Y	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
5	INT_MASK_VIP1_UP_UV	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
4	INT_MASK_VIP1_UP_Y	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
3	INT_MASK_VIP1_LO_UV	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
2	INT_MASK_VIP1_LO_Y	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
1	INT_MASK_GRPX3_DATA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0
0	INT_MASK_GRPX2_DATA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0

Bits	Field Name	Description	Type	Reset
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles..This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles.This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0
13:10	FRAME_START	The source of the start frame event for the client.\\n0 : Change in value of hdmi_field_id\\n1 : Change in value of dvo2_field_id\\n2 : Change in value of hdcomp_field_id\\n3 : Change in value of sd_field_id\\n4 : Use List Manager Internal Field0\\n5 : Use List Manager Internal Field1\\n6 : Use List Manager Internal Field2\\n7 : Start on channel active	RW	0x0

10.1 VPE Overview

NOTE: This chapter describes a module (subsystem) in the superset device. The availability is device part number dependent. Refer to device *Data Manual*, for more information.

VPE Features:

- Supports memory to memory operations only.
- VPE consist of a single memory to memory path which can perform the following operations:
  - Read of raster or tiled YUV420 coplanar, YUV422 coplanar or YUV422 interleaved video
  - Deinterlacing of the input video using a 4 field motion based algorithm
  - Scaling of the input video up to 1080p (1920x1080) resolution
  - Write of the resulting video in YUV420 coplanar (raster or tiled), YUV422 coplanar (raster or tiled), YUV422 interleaved (raster or tiled), YUV444 single plane (raster only) or RGB888 (raster only)
  - Deinterlacing up to two 1080i video sources.
  - The single data path performs operations in the following order
    - Chroma Upsampling from 420 to 422 (if needed)
    - Deinterlacing of 422 video from interlaced to progressive (if needed)
    - Scaling of 422 video after deinterlace
    - Conversion of 422 video to 420, 444 or RGB (if needed)
  - VC-1 Range Mapping and Range Reduction support on input video before Chroma Upsampling (if needed)
- Chroma Upsampling Features
  - 4 line Catmull-Rom based implementation
  - Programmable coefficients for interlaced or progressive conversion. Separate coefficients can be provided for top and bottom fields
- Deinterlacer Features
  - 8-bit, YCbCr 4:2:2
  - Motion-adaptive deinterlacing (MDT)
    - Motion detection is based on Luma only
    - 4-field data is used
    - Motion values adaptive to the frequency of luma texture
  - Edge-Directed Interpolation (EDI)
    - Edge detection using luma pixels in a 2x7 window
    - Seven edge vectors: -1.5, -1, -0.5, 0, 0.5, 1, 1.5
    - Edge-directed chroma interpolation
    - Soft-switch between edge directed interpolation and vertical interpolation depending on the confidence factor
  - Film Mode Detection (FMD)
    - 3-2 pull down detection
    - 2-2 pull down detection
    - Hysteresis controls how fast FMD can enter/exit film mode (software function)
    - Bad Edit Detection (BED)
  - Progessive Input
    - For Progressive Input, the module passes input to output. No internal processing is performed. This is essentially a bypass mode
  - Interlace Bypass
    - For Interlace Input, the module can pass the inputs data directly to the outputs in a bypass configuration. No internal processing is performed

Copyright © 2015–2020, Texas Instruments Incorporated

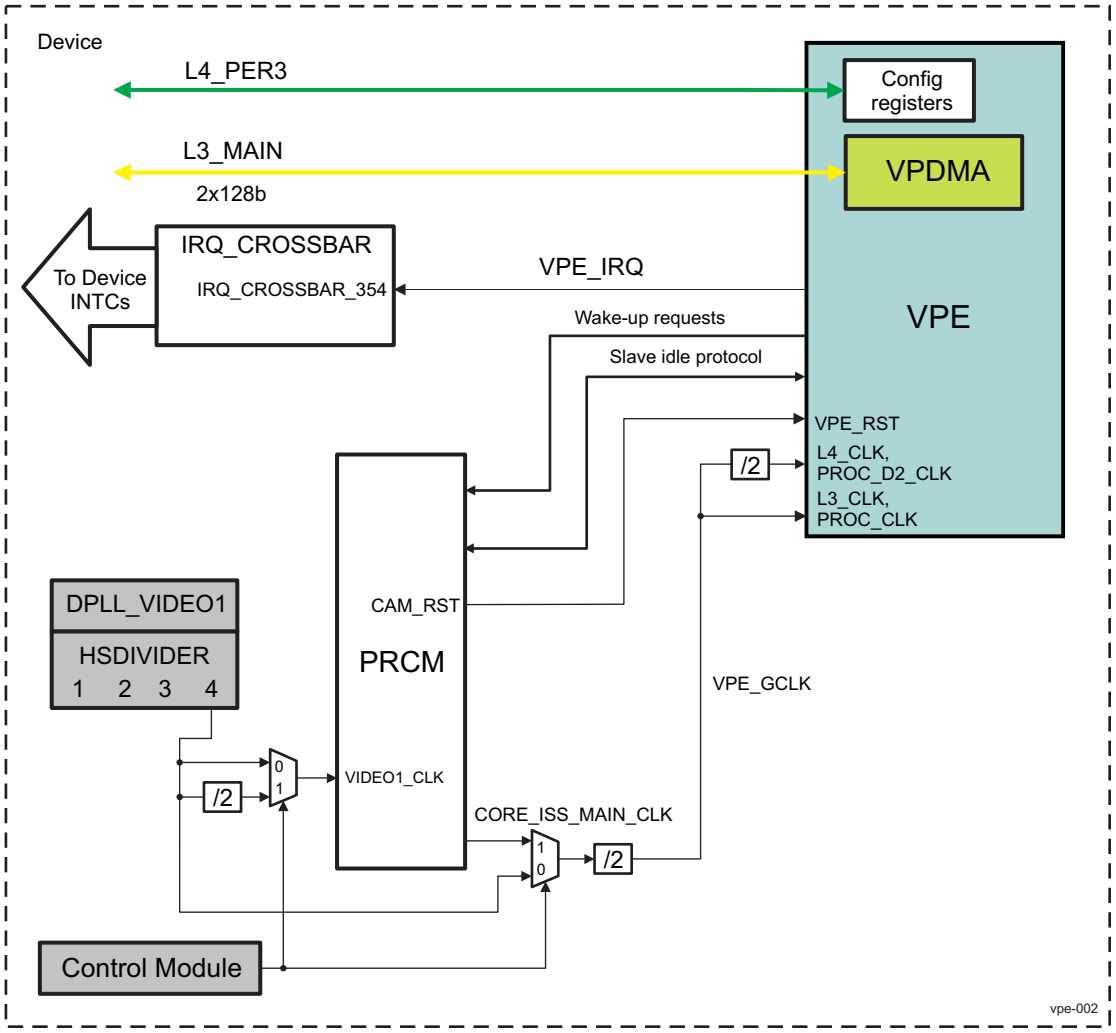
- Scaler Features
  - Vertical and horizontal up/down scaling
    - Polyphase filter upscaling
  - Running average vertical down scaling for memory optimization
  - Decimation and polyphase filtering for horizontal scaling
  - Non-linear scaling for stretched/compressed left and right sides
  - Input image trimmer for pan/scan support
  - Pre-scaling peaking filter for enhanced sharpness
  - Scale field as frame
  - Interlacing of scaled output
  - Full 1080p input and output support
  - YCbCr422 input and output
  - Minimum horizontal scaling ratio = 1/8x
  - Maximum horizontal scaling ratio – limited by output line buffer (2014 pixels)
  - Scaling filter Coefficient memory download
- Chroma Downsampler Features
  - Simple two-line averager capable of converting from YUV422 to YUV420 space
- 422 to 444 Features
  - Catmull-Rom based filter
  - 4 pixel, fixed coefficient
- Color Space Converter Features
  - Fully programmable 3x3 matrix multiplier with offset control

10.2 VPE Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests. Figure 10-1 summarizes the integration of the module in the device.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-1. VPE Integration



NOTE: Alternative clocking to the VPE module is provided from DPLL_VIDEO1. For more information about configuring DPLL_VIDEO1, see Section 11.1.2.1, *Display Subsystem Clocks*. Source clock selection is done with CTRL_CORE_SMA_SW_1[8] VPE_CLK_DIV_BY_2_EN register from the Control Module. For more information, see Chapter 18, *Control Module*.

Table 10-1 and Table 10-2 list the integration attributes and clock and resets, respectively.

Table 10-1. VPE Integration Attributes

Module Instance	Attributes

Table 10-2. VPE Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
VPE	L3_CLK PROC_CLK	VPE_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VPDMA uses this clock to send and receive external data and transfer this data to internal processing. PROC_CLK is the clock used to drive data processing within the VPE subsystem.
	L4_CLK PROC_D2_CLK	VPE_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus PROC_D2_CLK is an additional clock used by the DEI within the DEI Subsystem. Inputs and outputs of the DEI operate on PROC_CLK, but internally, the data paths within the DEI operate on this clock.
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
VPE	VPE_RST	VPE_RST	PRCM	VPE Reset

Table 10-3. VPE Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
VPE	VPE_IRQ	IRQ_CROSSBAR_354	N/A	VPE interrupt requests. These IRQ source signals are not mapped by default to any device INTC.

NOTE: The "**Default Mapping**" column in Table 10-3 *VPE Hardware Requests* shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.
For more information about the IRQ_CROSSBAR module, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.
For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.

10.3 VPE Functional Description

10.3.1 VPE Block Diagram

Figure 10-2 shows the internal structure of the VPE module in the device.

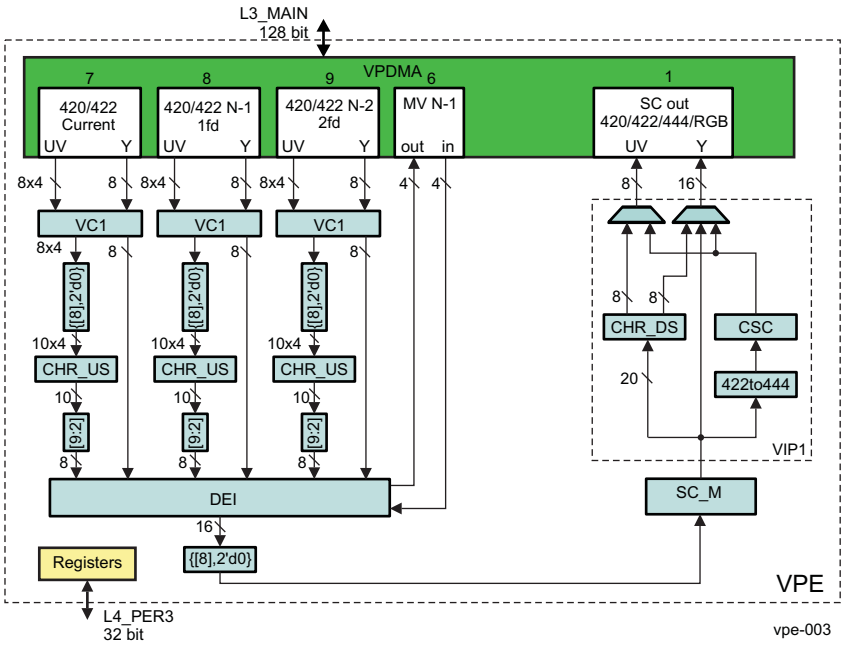
Figure 10-2. VPE Block Diagram



10.3.2 VPE VC1 Range Mapping/Range Reduction

VC1 range mapping and range reduction is implemented prior to the Chroma Upsampler (CHR_US) in the Primary Input Paths of the module.

Range Mapping is performed by setting VPE_CLKC_RANGE_MAP[6] RANGE_MAP_PRIM_ON bit to '1'. The output for every component is calculated by the follwing formulas:

Y[n] = (((Y[n] – 128) * (RANGE_MAPY_PRIM + 9) + 4) >> 3) + 128

Cb[n] = (((Cb[n] – 128) * (RANGE_MAPUV_PRIM + 9) + 4) >> 3) + 128

Cr[n] = (((Cr[n] – 128) * (RANGE_MAPUV_PRIM + 9) + 4) >> 3) + 128

In the above, VPE_CLKC_RANGE_MAP[2:0] RANGE_MAPY_PRIM and VPE_CLKC_RANGE_MAP[5:3] RANGE_MAPUV_PRIM are defined as in the register descriptions for each instantiation of this function.

Range Reduction is performed based by setting VPE_CLKC_RANGE_MAP[28] RANGE_REDUCTION_PRIM_ON bit to '1'. The output for the color components is calculated by the follwing formulas:

Y[n] =(Y[n] – 128) * 2 + 128

Cb[n] =(Cb[n] – 128) * 2 + 128

Cr[n] = (Cr[n] – 128) * 2 + 128

NOTE: The block performs Range Mapping first, and the output of Range Mapping drives Range Reduction. Although Range Mapping and Range Reduction are supposed to be mutually exclusive, the implementation allows both to be done simultaneous.

10.3.3 VPE Deinterlacer (DEI)

10.3.3.1 Functional Description

Figure 10-3 illustrates the block-diagram of motion-adaptive Deinterlacer. The general concept behind motion adaptive deinterlacing is that spatial filtering works very well for images with motion, while temporal filtering works very well for static images. So, the intuitive way is to combine them together. Motion detection is used to switch or fade between the use of spatial deinterlacing and temporal deinterlacing, as shown in the following formula:

$$\hat{y}(j, i, n) = \alpha y_{spat}(j, i, n) + (1 - \alpha) y_{temp}(j, i, n)$$

where $y_{spat}(j, i, n)$ is the spatial interpolation output, $y_{temp}(j, i, n)$ is temporal interpolation output, α is the motion detection output ranging from 0 to 1, $\hat{y}(j, i, n)$ is the final output from deinterlacer, and j, i, n are the vertical, horizontal, and temporal indexes, respectively. From the previous formula, the final output is controlled by the motion detector output, α. The higher the motion, the higher value of α, and the output favors spatial interpolation. If the motion is absent or very low, the temporal interpolation has higher weight.

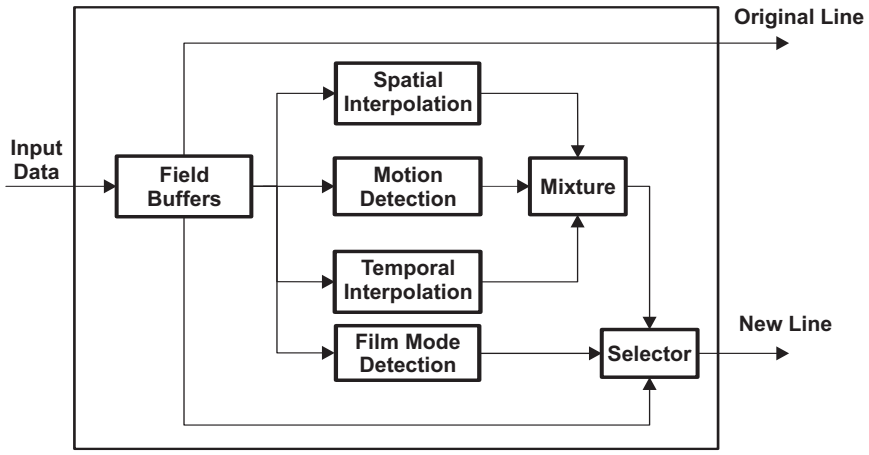
Temporal interpolation can be disabled by programmable control registers. In that case we have:

$$\hat{y}(j, i, n) = y_{spat}(j, i, n)$$

Chroma interpolation is handled in the same manner as luma with regards to the above equations. There is a separate control for disabling temporal interpolation for chroma, such that luma can perform the full mixture, and chroma can only be spatial. If luma temporal interpolation is disabled, chroma temporal interpolation is also disabled.

Figure 10-3 provides a simple description of how a motion-adaptive deinterlacer operates. The actual interpolation used is edge directed interpolation. Edge directed interpolation is only performed spatially prior to the output mixing.

Figure 10-3. Block Diagram of Motion-Adaptive Deinterlacer



The Deinterlacer consists of:

- MMR Configuration Register Block
  - – - Used to program configuration items for the Deinterlacer
- VPDMA Interface Block
  - – Used to read source video/motion data from VPDMA
  - – Used to write generated motion data to VPDMA
- Motion Detection (MDT) Block
  - – Examines 3 fields of input video data (luma only) and calculates a 4 bit motion vector to drive the Edge Directed Interpolation Block

Copyright © 2015–2020, Texas Instruments Incorporated

- Edge Directed Interpolation (EDI) Block
  - Performs the motion based edge directed interpolation on Luma and Chroma inputs to generate the missing line in the interlaced source
- Film Mode Detection (FMD) Block
  - Field Difference : Accumulated difference between the spatial interpolated frame and the adjacent input field of opposite field ID
  - Frame Difference : Accumulated difference between two fields with the same field ID
  - Combing Artifacts : Accumulated sum-of-difference between two adjacent fields
- Output Multiplexor (MUX) Block
- Line Buffer Block

10.3.3.2 Bypass Mode

The DEI can be operated in bypass mode and deinterlacer mode.

In the bypass mode, input luma and chroma are buffered and sent to the stage after DEI without processing. To bypass the DEI module registers VPE_DEI_REG0[31] PROGRESSIVE_BYPASS or VPE_DEI_REG0[29] INTERLACE_BYPASS must be set to '1' for progressive and interlaced source input respectivly.

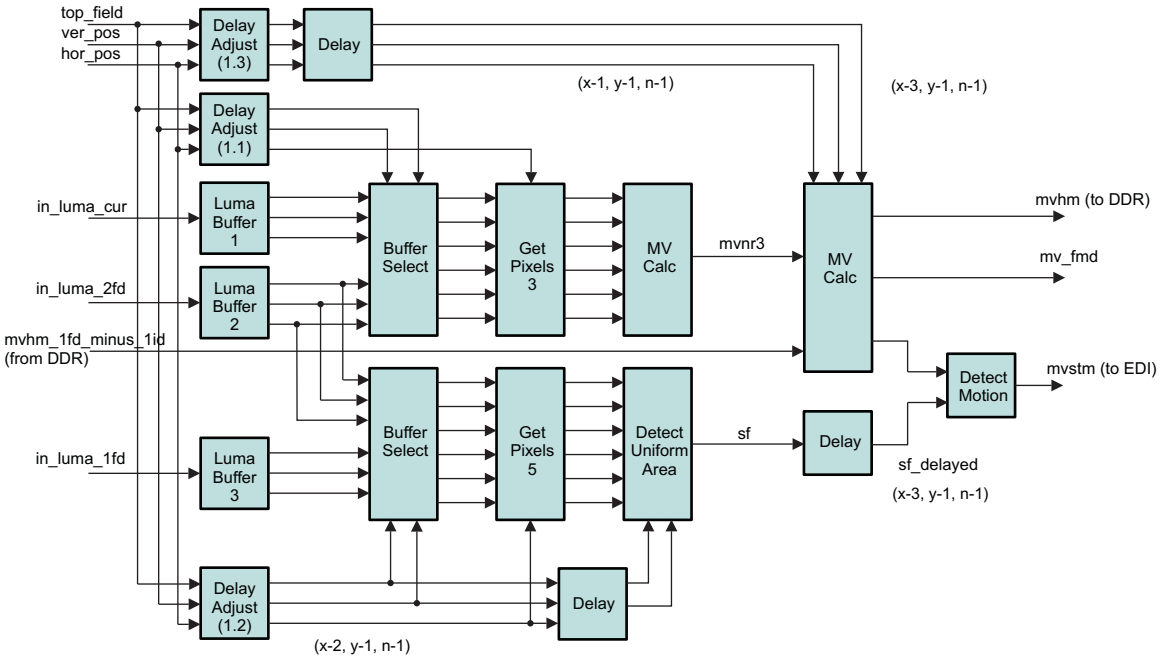
10.3.3.2.1 VPDMA Interface

The VPDMA interface handles transactions between the internal core of the design and the VPI interface protocol, which is used for both external module input and motion vector output. All input data is pixel aligned, but has different request and ready signals. Motion Output is not pixel aligned with input.

10.3.3.2.2 MDT

A block diagram representing the Motion Detection (MDT) Block is shown on Figure 10-4.

Figure 10-4. Motion Detection (MDT) Block Diagram



The Motion Detection block takes as input 3 adjacent fields of Luma data, motion data calculated from the previous 3 fields, and the current X, Y and field ID indicators and generates motion vector outputs which drive the Edge Directed Interpolation (EDI), Film Mode (FMD) and output motion values to DDR

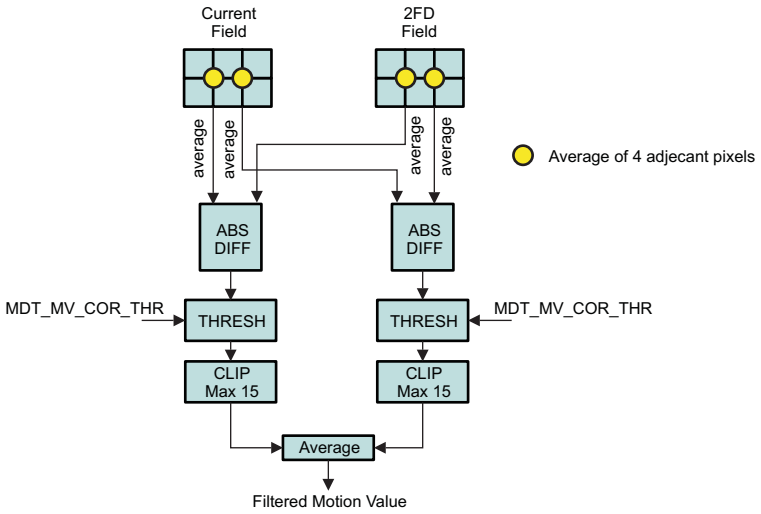
Copyright © 2015–2020, Texas Instruments Incorporated

There are two parallel paths - Motion Vector Calculation and Uniform Area Detection.

The Motion Vector Calculation path generates the FMD motion vector and the DDR output motion vector. The combination of the Motion Vector and Uniform Area Detection is used to calculate the EDI motion vector value.

The Motion Vector Calculation Path operates using a sliding 3 pixel wide by 2 pixel tall window over 2 adjacent fields of the same field ID polarity (2 top fields or 2 bottom fields). The first stage is to calculate the filtered motion value (MV Calc). The below diagram shows the dataflow for calculating the Filtered Motion Value from MV Calc:

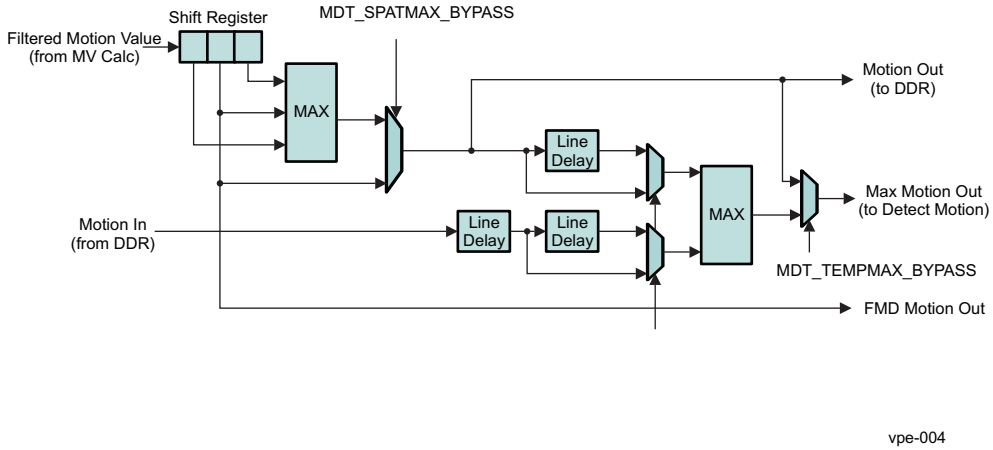
Figure 10-5. Motion Detection (MDT) MV Calc Data Path



The Filtered Motion Value is then operated on by the Max Filter operation, which performs a maximum operation between the last 3 filtered motion values and the last frame's motion value. The process is to calculate the maximum value of the last 3 filter motion values, and this value is written to DDR to be read back in on the next frame. The maximum value is taken between the previous frame's maximum value as read back from DDR, and the maximum value between the current last 3 motion values, and this is passed to the Detect Motion block which will drive the EDI module.

The Film Mode motion value output is just the output from the MV Calc data path. The following diagram shows the data path. Please note the line buffers, which are used to adjust for different polarity of fields (2 motion value fields are of opposite polarity, meaning a 1 line difference in one or the other field):

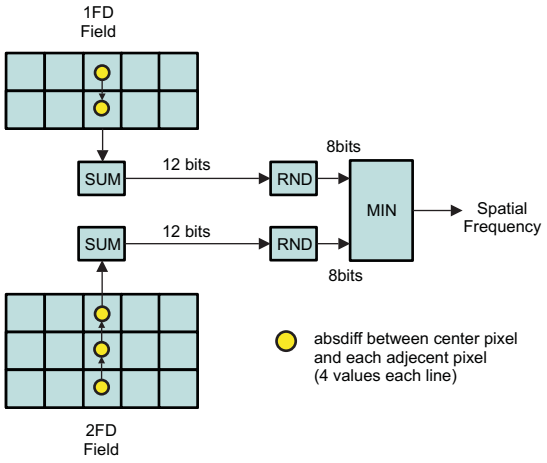
Figure 10-6. Motion Detection (MDT) Max Filter Data Path



The Uniform Area Detection Path operates using a sliding 5 pixel wide by 3 pixel tall window over 2 adjacent fields of opposite field ID polarity (1 field delay and 2 field delay) to calculate a spatial frequency component. The following diagram shows how this component is calculated within each pixel window:

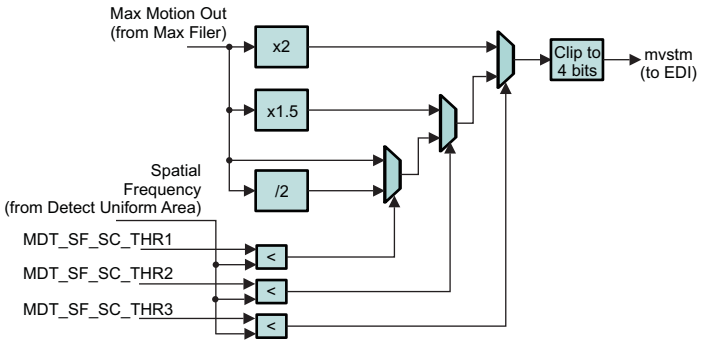
Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-7. Motion Detection (MDT) Uniform Area Data Path



The spatial frequency output is used to scale the motion vector generated by the Maximum Filter operation based on thresholding against the MMR values VPE_DEI_REG2[7:0] MDT_SF_SC_THR1, VPE_DEI_REG2[15:8] MDT_SF_SC_THR2 and VPE_DEI_REG2[23:16] MDT_SF_SC_THR3. The following diagram (in the Detect Motion block) performs this thresholding to generate the final motion vector output to the EDI module:

Figure 10-8. Motion Detection (MDT) Detect Motion Data Path

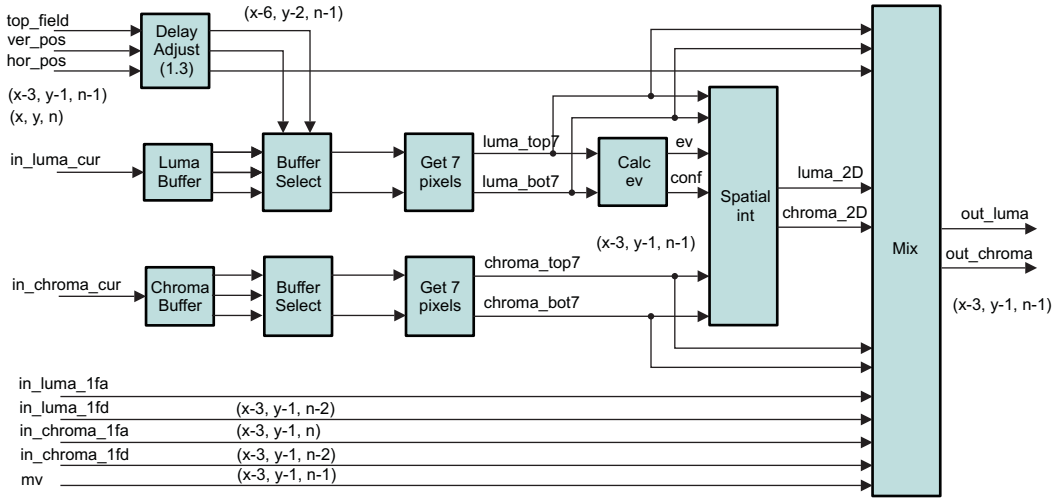


10.3.3.2.3 EDI

A block diagram representing the Edge Directed Interpolation (EDI) Block is shown on Figure 10-9

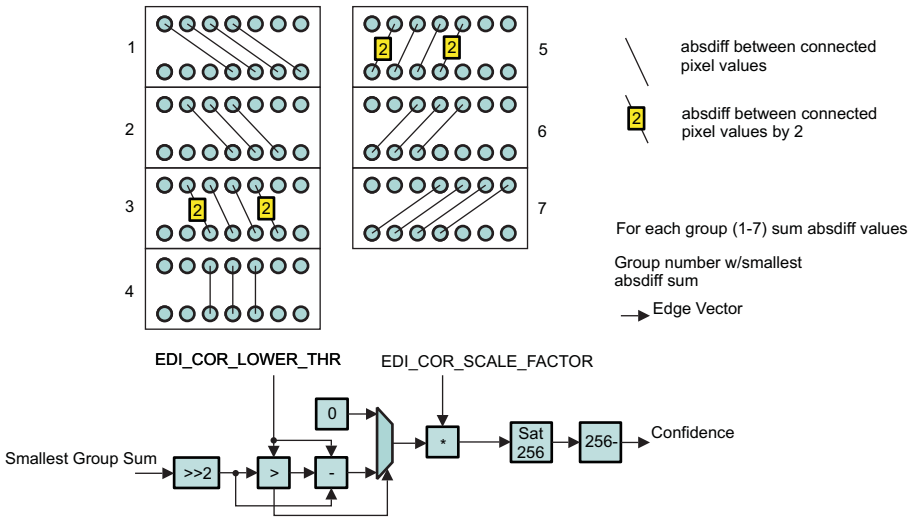
Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-9. Edge Directed Interpolation (EDI) Block Diagram



The Edge Directed Interpolation module operates on a 7x2 window (7 pixels wide, 2 in height) in both Luma and Chroma. Luma data is used to calculate an edge vector and edge vector confidence. Correlation scaling factor is set with VPE_DEI_REG3[31:24] EDI_COR_SCALE_FACTOR register. A diagram showing this calculation follows (Calc ev):

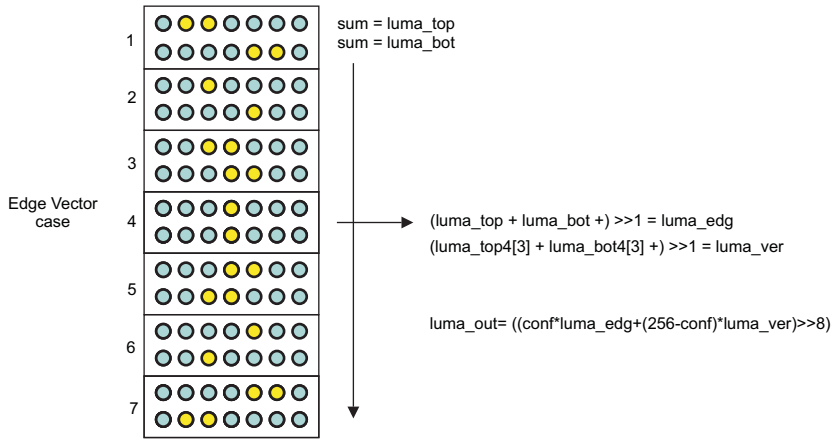
Figure 10-10. Edge Directed Interpolation Edge Vector Calculation



The edge vector and edge vector confidence are passed to the Spatial Interpolation module, which performs edge directed spatial interpolation. Following is a diagram showing how Luma is interpolated:

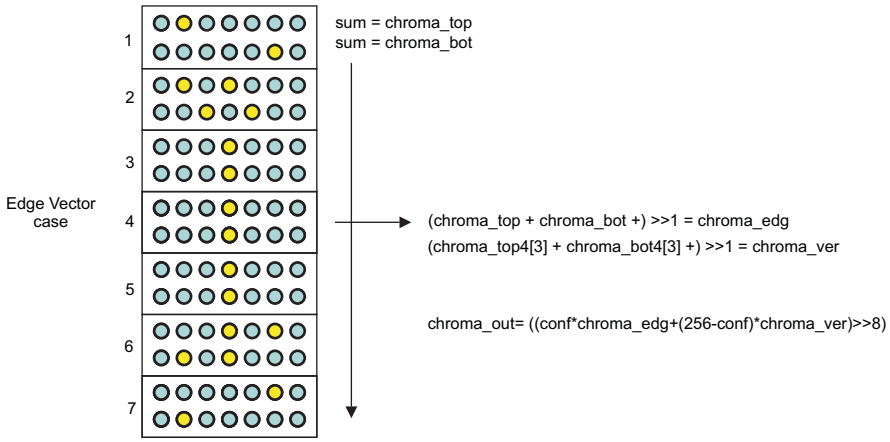
Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-11. Edge Directed Interpolation Luma Interpolation Calculationn



The following diagram shows how Chroma is interpolated:

Figure 10-12. Edge Directed Interpolation Chroma Interpolation Calculation



Each of the cases shown above is on the 7x2 input pixel window for Luma and Chroma, based on the edge vector that was calculated. Each output equation (luma_out and chroma_out) is a combination of a straight vertical interpolation (luma/chroma_ver) and edge directed interpolation (luma/chroma_edge) using the Confidence factor output from the Edge Vector Calculation module. In the case of chroma interpolation, if the register VPE_DEI_REG3[1:0] EDI_INP_MODE = “11”, the chroma_out calculated for spatial interpolation is forced to the the vertical chroma output.

The Mix module does that actual mixing of spatial and temporal interpolation to produce the final result. 4 different interpolation modes are supported: Line double, Field double, 3D interpolation and 2D interpolation.

- Line double averages the top and bottom pixel to produce the interpolated pixel. Setting of MDT mode has no effect on output pictures.
- Field double averages the previous and next frame pixel to produce the interpolated pixel. In other words, if the current field is a top field, the interpolated bottom field picture is created by averaging pixels from bottom field pictures before and after the current field
- 2D interpolation uses the Edge Directed interpolation result only as the interpolated pixel
- 3D interpolation uses the EDI LUT table values with the MDT motion vector as an index to blend between the 2D result and the value from the previous field temporally.

NOTE: 3D processing is enabled with VPE_DEI_REG3[2] EDI_ENABLE_3D register

Copyright © 2015–2020, Texas Instruments Incorporated

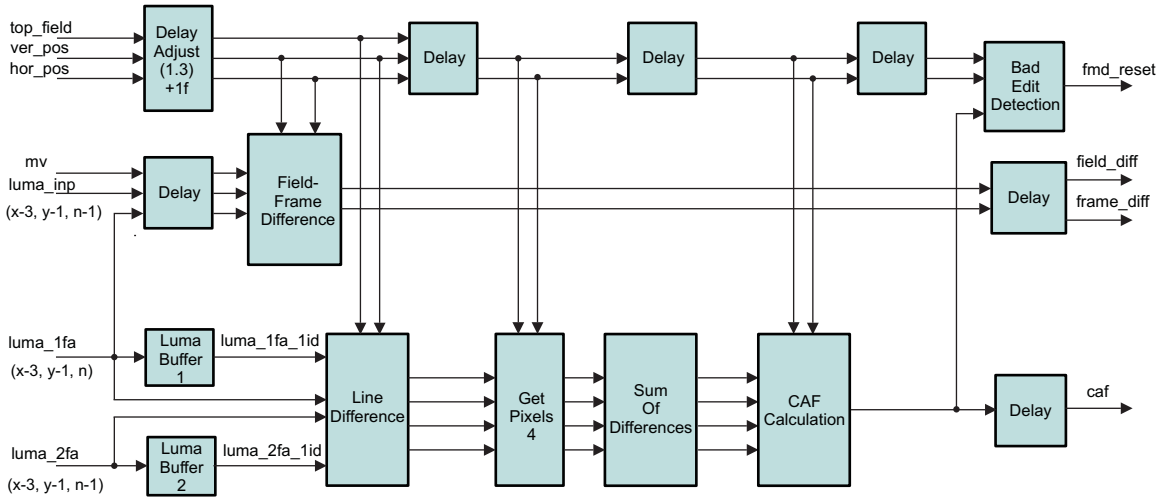
The EDI Lut value selected based on the motion value will perform a blend between temporal and edge directed spatial interpolation using the equation:

$\hat{y}(j, i, n) = \alpha y_{spat}(j, i, n) + (1 - \alpha) y_{temp}(j, i, n)$

10.3.3.2.4 FMD

The following shows the block diagram of the Film Mode Detection (FMD) module:

Figure 10-13. Film Mode Detection (FMD) Block Diagram

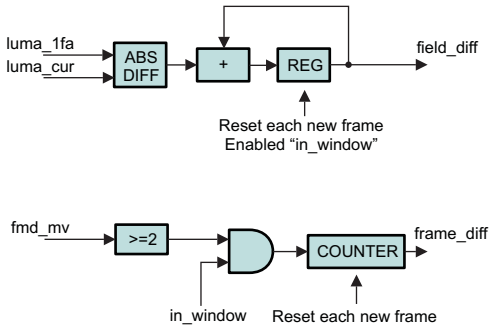


Film Mode Detection calculates four parameters which are used in conjuction with software to determine if the source of the video is film (3:2 or 2:2 sequences). This block is not part of the main data path, but calculates statistics based on the main data path for each frame generated, then interrupts the processor to read the information and then set to '1' the VPE_DEI_REG10[1] FMD_LOCK (lock to film mode) and VPE_DEI_REG10[2] FMD_JAM_DIR (direction of field jam) registers, to set the design to film mode operation.

All of the calculations are performed within a window defined by VPE_DEI_REG8[10:0] FMD_WINDOW_MINX, VPE_DEI_REG8[26:16] FMD_WINDOW_MAXX, VPE_DEI_REG9[10:0] FMD_WINDOW_MINY, VPE_DEI_REG9[26:16] FMD_WINDOW_MAXY. All calculations are reset on each new input frame.

Field difference is calculated as the absolute difference (absdiff) between the current Luma input and the previous field Luma input. Value can be read on VPE_DEI_REG13[27:0] FMD_FIELD_DIFF register. Frame difference is calculated using the motion input from the MDT. Value can be read on VPE_DEI_REG14[19:0] FMD_FRAME_DIFF register. Figure 10-14 is showing how these are calculated is shown below:

Figure 10-14. Film Mode Detection (FMD) Frame/Field Difference Calculation

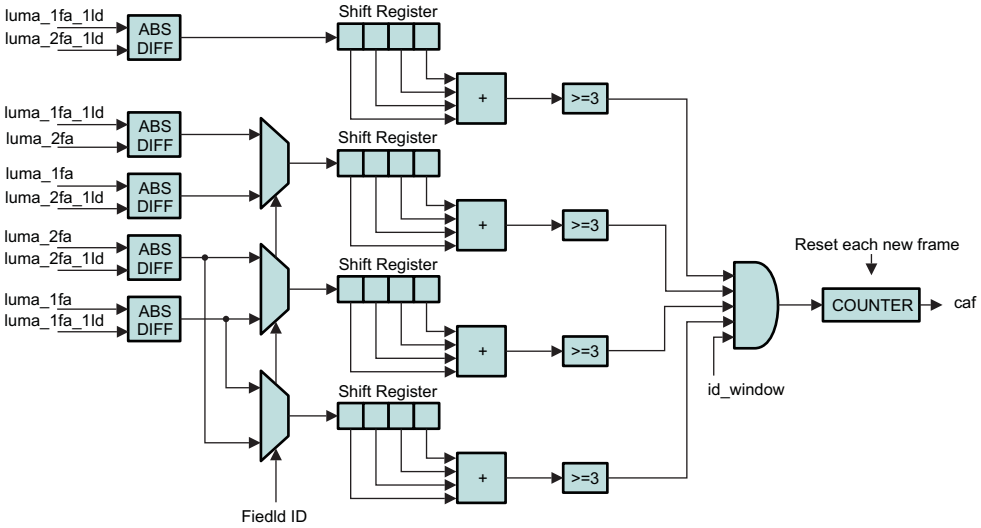


Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: Value of FMD_WINDOW_MAXX must be less then WIDTH and value of FMD_WINDOW_MAXY must be less then ½ HEIGHT.

Combing Artifacts value is calculated as shown in Figure 10-15. Value can be read on VPE_DEI_REG12[20:0] FMD_CAF register.

Figure 10-15. Film Mode Detection (FMD) Combing Artifacts Calculation



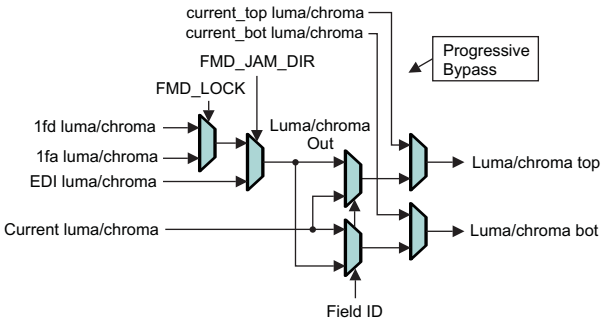
FMD_RESET is set to tell software when the Film Mode Detection should be unlocked back to normal operation. The logic controlling this is based on the caf output, and is set based on caf being above a threshold set by VPE_DEI_REG11[19:0] FMD_CAF_THR and where within the window the current x/y position is. If the position is over ¾ in height, and caf > FMD_CAF_THR OR if over ½ in height and caf > ¾*FMD_CAF_THR OR if over ¼ in height and caf > ¼*FMD_CAF_THR, then VPE_DEI_REG12[24] FMD_RESET must be set (it will clear at the start of the next field input).

The Film Mode Interrupt (fmd_int) will be generated at the end of the window defined for FMD operation and tells software to read the above parameters. When the interrupt fires, the above parameters are latched into the DEI Control Interface (MMR) so they can be read.

10.3.3.2.5 MUX

The MUX block generates the proper outputs based whether the design is in standard Deinterlacer modes (interpolated inputs from the EDI), Film Mode Deinterlacer mode (direct inputs) or progressive bypass mode. The following diagram shows this data path:

Figure 10-16. Film Mode Detection (FMD) Combing Artifacts Data Path



When in Film Mode (VPE_DEI_REG10[1] FMD_LOCK = '1'), the output of the DEI depends only on the input field sequences. Depending on the Jam Direction , either the previous or next field data is output. If not in Film Mode, the interpolated result from the EDI is output.

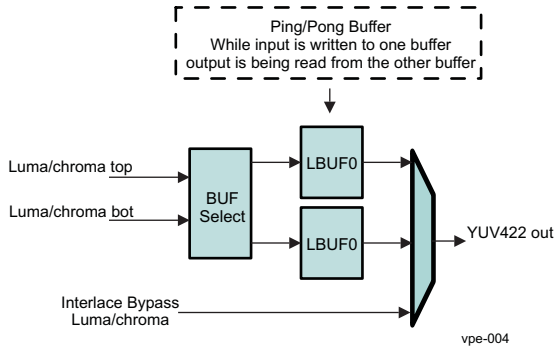
Copyright © 2015–2020, Texas Instruments Incorporated

Because the DEI produces the missing line in an interlaced frame, what this part of the data path is selecting is the “interpolated” line. The other line output is the current line. Together, the interpolated line and the current line form the actual output of the main part of the DEI data path. Depending on if the current field is a top field or bottom field (as selected by Field ID), the output “top” of the MUX is either the current or interpolated lines, and the output “bot” is the opposite.

10.3.3.2.6 LINE BUFFER

The Line Buffer takes two lines of data (top line and bottom line) and serializes this into a single stream. The following diagram shows this data path:

Figure 10-17. Output Data Path



The sequencing is such that LBUF0 is being written while LBUF1 is being read. When LBUF0 has been completely written, it will try to write to LBUF1 next. If on the output side LBUF1 has not been completely read, then the data path will stall waiting for the output to finish reading LBUF1 and switch to reading LBUF0 (and visa versa)

10.3.4 VPE Scaler (SC)

This section is used for driver development for the highly optimized video resizers, SC (scalers), in the VPE module.

10.3.4.1 SC Features

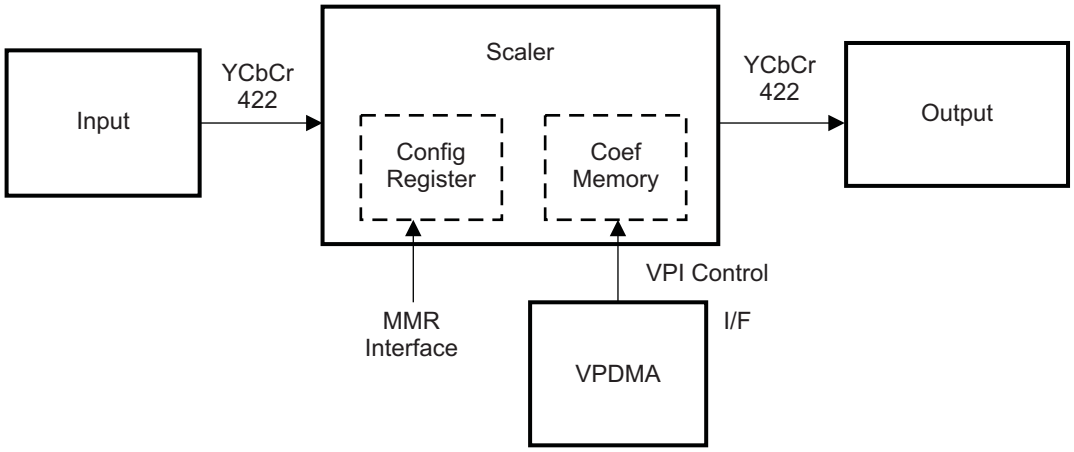
- Independent vertical and horizontal up and down scaling
- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Maximum horizontal scaling ratio only limited by output line buffer (2047 pixels)
- Scaling filter Coefficient memory download via VPI (Video Port Interface) Control interface

10.3.4.2 SC Functional Description

Scaler takes in a 10-bit YCbCr 422 video frame from an upstream module, performs vertical/horizontal scaling and outputs a YCbCr422 scaled image to a next downstream module. All configurations are done via the MMR interface except for the scaler coefficient memory configuration that is done via the common VPI control interface bus by VPDMA. Figure 10-18 shows the high-level block diagram of the scaler module.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-18. High Level Block Diagram

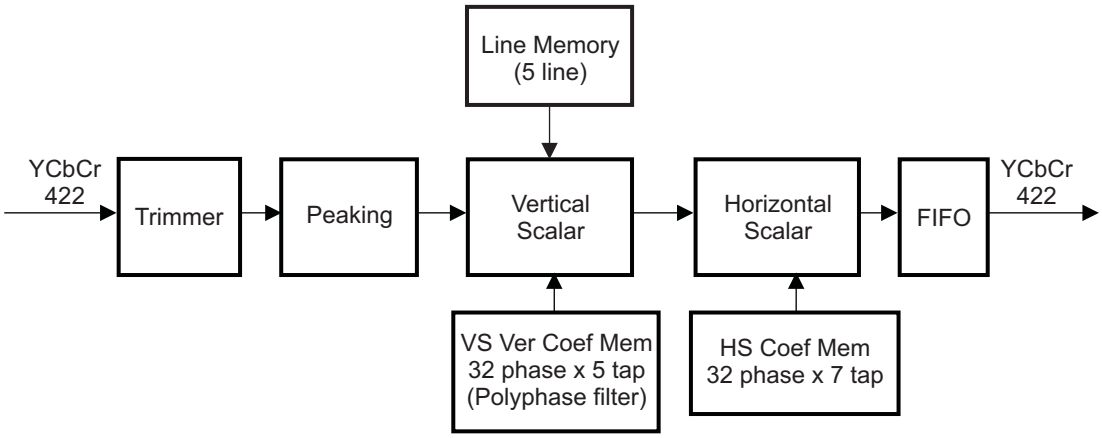


The SC is used in the video path and in all other video write-back data paths in the VPE module.

Scaling is performed in following three steps:

1. Trimming and Pre-peaking filtering
2. Vertical Scaling (Polyphase/Running Average Filter)
3. Horizontal polyphase scaling

Figure 10-19. SC Block Diagram



10.3.4.2.1 Trimmer

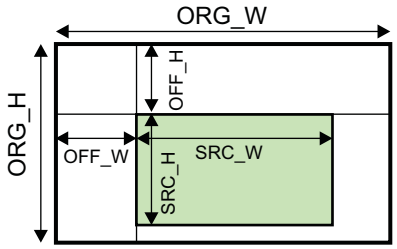
The trimmer can be programmed to re-define a new source image within the input video frame sent from an upstream module before it is sent to the scaling sub-modules. This feature enables small area zoom out, source pan/scan, or removal of unwanted area in the video (such as black box / curtains / noisy line-21 video) without modifying the VPDMA parameters.

Horizontal and vertical offset is set through VPE_CFG_SC25[26:16] CFG_OFF_W and VPE_CFG_SC25[10:0] CFG_OFF_H registers.

Width and height are set through VPE_CFG_SC24[26:16] CFG_ORG_W and VPE_CFG_SC24[10:0] CFG_ORG_H registers.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-20. Input Image Trimming



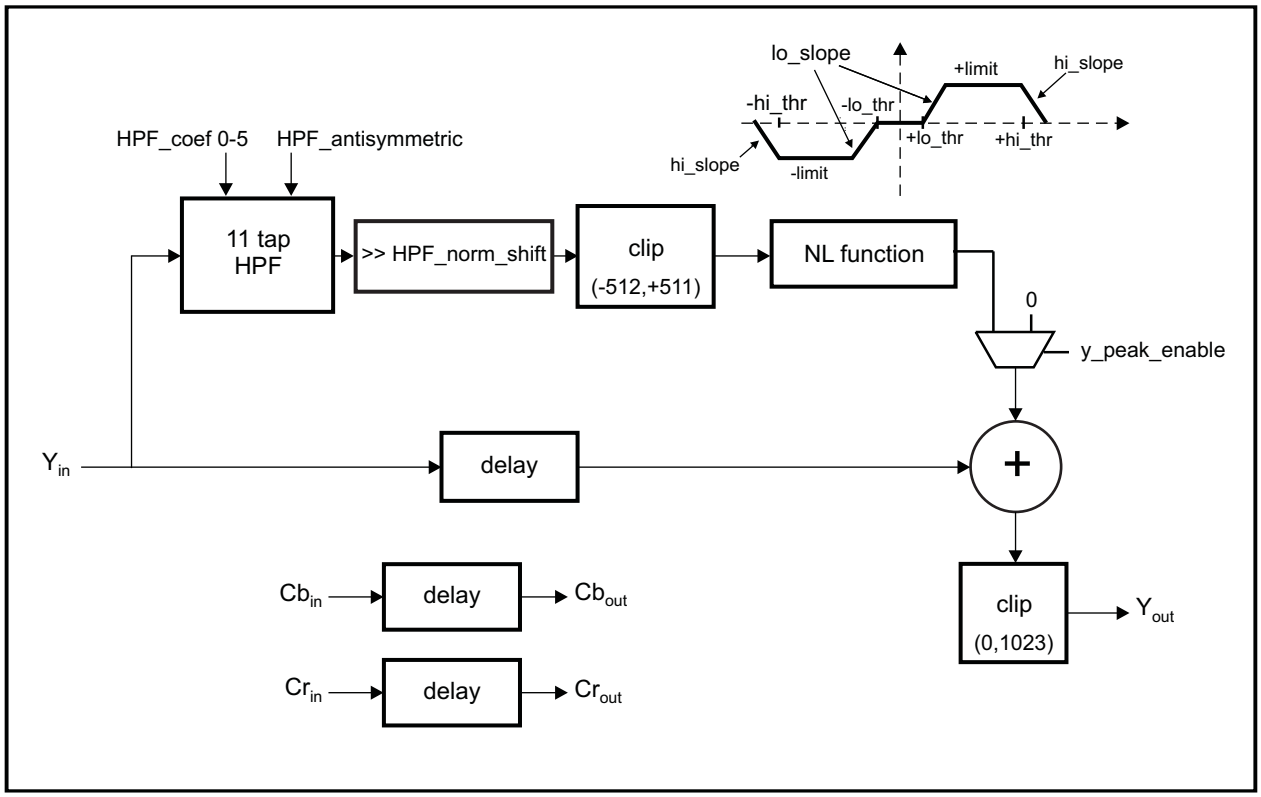
NOTE: Width and height of the source image are global parameters and are set with VPE_CFG_SC5[22:12] CFG_SRC_W and VPE_CFG_SC5[10:0] CFG_SRC_H registers.

It is required that the input image frame (CFG_SRC_W x CFG_SRC_H) to be at least 32 × 32 (after trimming, if the trimming is enabled) to properly fill the input filter stage pipelines.

10.3.4.2.2 Peaking

The peaking block increases the amplitude of high frequency luminance information in horizontal direction to increase the sharpness of a video image before it is scaled. As shown in Figure 10-21, the high-frequency luminance is increased using an 11-tap High-Pass filter with adjustable gain. The non-linear coring function removes low-level noise and the modified luminance is then added to the original luminance signal. The implementation details are shown in Figure 10-21.

Figure 10-21. Filter Implementation and Parameter Description



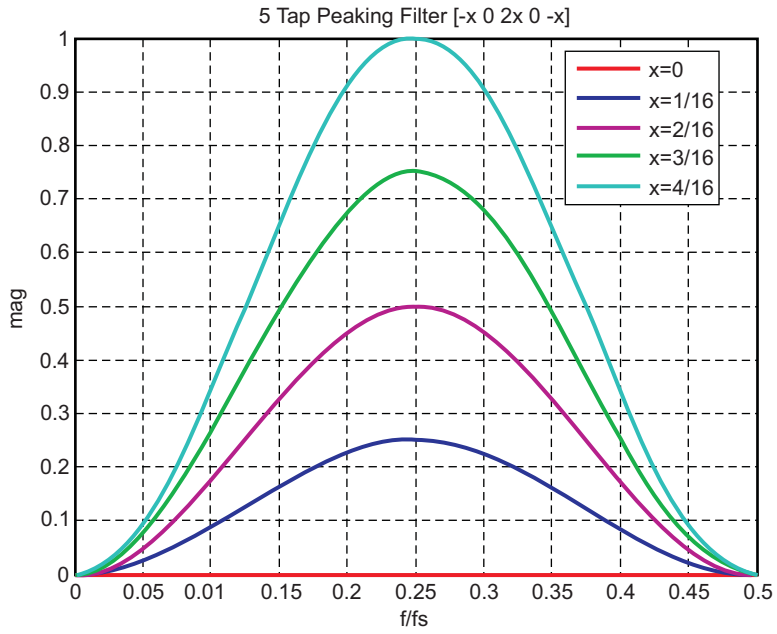
Copyright © 2015–2020, Texas Instruments Incorporated

Table 10-4. Parameter Description

Parameter	Description	Bits	Default
VPE_CFG_SC19[7:0] CFG_HPF_COEF0 to VPE_CFG_SC20[15:8] CFG_HPF_COEF5	FIR coefficients	8	[0 0 0-4 0 8]
VPE_CFG_SC20[18:16] CFG_HPF_NORM_SHIFT	Right shift	3	4
VPE_CFG_SC21[8:0] CFG_NL_LO_THR	Coring threshold	9	16
VPE_CFG_SC22[8:0] CFG_NL_HI_THR	High threshold	9	400
VPE_CFG_SC21[23:16] CFG_NL_LO_SLOPE	Lo slope= - CFG_NL_LO_SLOPE/16	8	16
VPE_CFG_SC22[18:16] CFG_NL_HI_SLOPE_SHIFT	Hi slope = $2^{(CFG_NL_HI_SLOPE_SHIFT-3)}$	3	4
VPE_CFG_SC20[28:20] CFG_NL_LIMIT	Clipping limit	9	200
VPE_CFG_SC0[14] CFG_Y_PK_EN	Control	1	0

Parameters for the Peaking filters are defined in VPE_CFG_SC19 through VPE_CFG_SC22 registers. The frequency responses of the peaking-filter with different sets of coefficients are shown in Figure 10-22. If the source of the input video is NTSC or PAL format, the peaking filter can be configured to reject the color subcarrier frequency.

Figure 10-22. Peaking Filter at fs/4

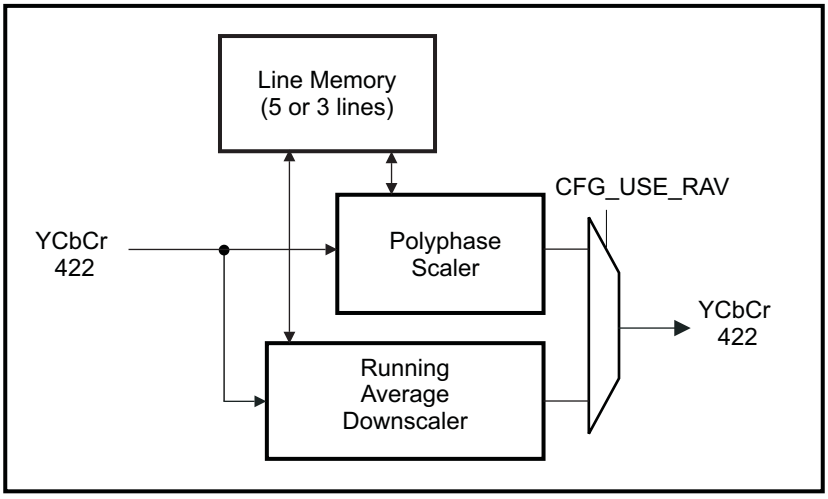


10.3.4.2.3 Vertical Scaler

The vertical scaler has a polyphase (32-phase × 5-tap) filter and a running average filter as shown in Figure 10-23. While the polyphase filter can be used for any up-scaling and preferably downscaling to 3/16 scale factor, the running average filter is used only for downscaling to a ½ or less size. Selection between these two scalers is based on the user setting of VPE_CFG_SC0[4] CFG_USE_RAV parameter (CFG_USE_RAV= '0' for poliphase filter, and CFG_USE_RAV= '1' for running average filter), according to the user preference of the tradeoff between sharpness preserving and introduced artifacts.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-23. Vertical Scaler Block Diagram



10.3.4.2.3.1 Running Average Filter

When a poly-phase filter is used, usually it has to have many taps in order to achieve acceptable quality for very small downscaling ratio, which requires the use of many line buffers. In VPE, there is a weighted Running Average filter for downscaling when the scaling factor is small (for example, when the scaling ratio is less than 0.5). This highly optimized design requires only one line buffer for luma and one for chroma, which still achieving acceptable quality. The output of the running average filter is based on weighted average of pixels in the current and previous rows in vertical direction. Initializations of accumulators affect the weights.

10.3.4.2.3.2 Vertical Scaler Configuration Parameters

Table 10-5. Vertical Scaler Configuration Parameters

Parameter	Typical Value	Controls	Description
VPE_CFG_SC0[10] CFG_INTERLACE_I		Frame or Field	0 = progressive, 1 = interlace
VPE_CFG_SC0[0] CFG_INTERLACE_O			0 = progressive 1 = interlace
VPE_CFG_SC0[3] CFG_INVT_FID			Invert field ID input
VPE_CFG_SC0[4] CFG_USE_RAV		Scaler Mode	0 = use polyphase scaler 1 = use running average scaler
VPE_CFG_SC1[26:0] CFG_ROW_ACC_INC		Bilinear & Polyphase Scalers	For progressive in/progressive out: round(2^{16}*(srcH-1)/(tarH - 1)) For progressive_in/interlace_out: round(2^{16}*2*(srcH-1)/(2*tarH - 1)) For interlace_in/progressive_out: round(2^{16}*(2*srcH-1)/(2*(tarH - 1))) For interlace_in/interlace_out: round(2^{16}*(2*srcH - 1)/(2*tarH - 1)) For interlace in/out, srcH/tarH are number of field lines as specified in VPE_CFG_SC4/VPE_CFG_SC5 descriptions.
VPE_CFG_SC2[27:0] CFG_ROW_ACC_OFFSET	0		Initial row accumulator value for progressive frame and top field

VPE_CFG_SC6[19:10] CFG_ROW_ACC_INIT_RAV_B			Initial row accumulator value for bottom field

NOTE: Bi-linear scaler is not present in this device

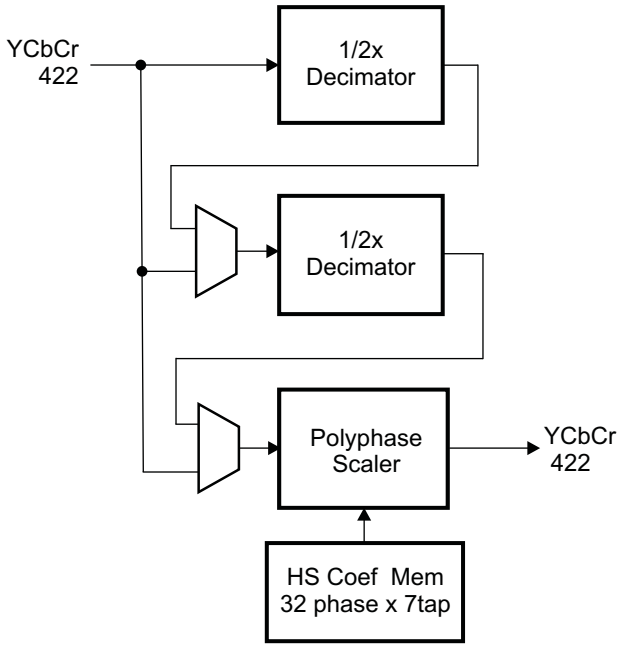
10.3.4.2.4 Horizontal Scaler

The Horizontal scaler is implemented using a 32-phase × 7-tap polyphase filter preceded by two sets of 1/2x decimators. The general configuration of the Horizontal scaler is performed as follows:

- For up scaling, the input video is interpolated using the polyphase scaler.
- For downscaling, it is recommended that input video is decimated by 2 until the modified scale factor falls between 1/2 and 1. Then, a polyphase filter is configured with coefficients selected based on the mod_scale_factor calculated as shown below from one of nine different sets of coefficients: (8,9,10,11,12,13,14,15,16)/16.

```
if  (scale_factor>=1/2)  {
   mux=0;  mod_scale_factor=scale factor;
} else if  (scale_factor>=1/4) {
   mux=1; mod_scale_factor=2*scale_factor;
} else {
   mux=2; mod_scale_factor=4*scale_factor;
}
```

Figure 10-24. Horizontal Scaler Block Diagram



Copyright © 2015–2020, Texas Instruments Incorporated

In auto mode (CFG_AUTO_HS = '1'), scaler will operate as per above recommendation. In addition to this, for (CFG_AUTO_HS = '1'), polyphase filtering will be bypassed when (scale_factor = '1') or (scale_factor = ½) or (scale_fator == ¼). If CFG_AUTO_HS = '0') is used, user must provide proper values for dcm_2x, dcm_4x, proper values for all inputs to polyphase filter in the registers as well as appropriate coefficient sets. There is no constraint on polyphase filtering in terms of scaling ratio. However, there are constraints on input and output image width for scaler. Frame dimensions are limited from 64x64 to 2047x2047.

10.3.4.2.4.1 Half Decimation Filter

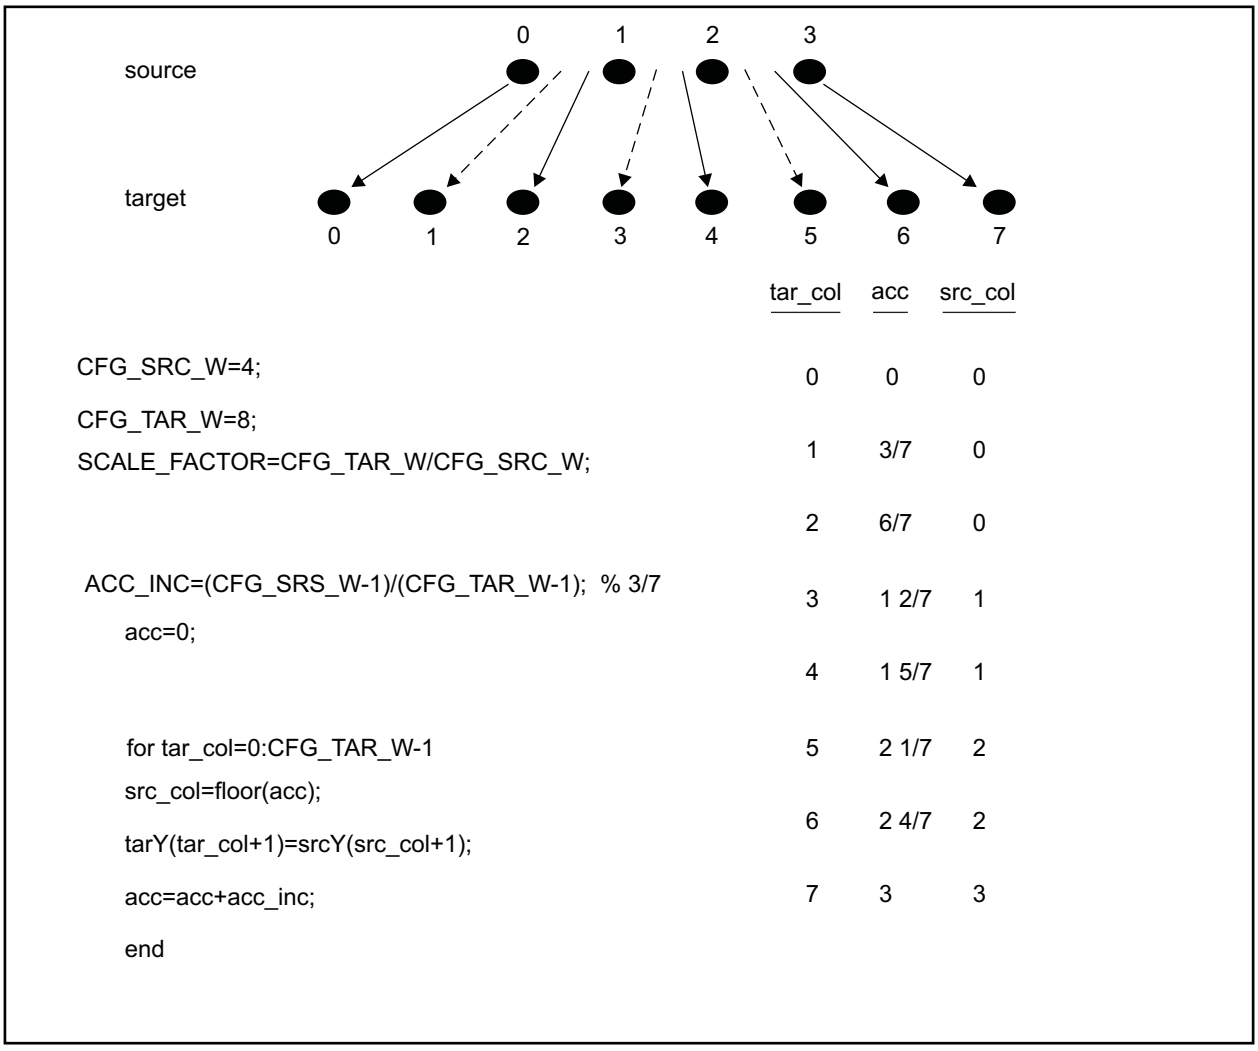
The half-decimation filter is an 11-tap filter with following coefficients: (14, 0, -29, 0, 79, 128, 79, 0, -29, 0, 14). For processing left and right edge pixels, the first and last data are repeated to pre-fill and extend the filter data pipeline respectively. These coefficients are hard-coded into scaler design and user cannot modify these.

10.3.4.2.4.2 Polyphase Filter

The horizontal scaling is done by stepping across the target row and interpolating target pixels based on source pixels. Accumulator points to the source pixel that corresponds to the target pixel.

Figure 10-25 shows an up-scaling example.

Figure 10-25. Polyphase Filtering Example



Copyright © 2015–2020, Texas Instruments Incorporated

10.3.4.2.4.3 Nonlinear Horizontal Scaling

The horizontal scaler supports non-linear scaling to maintain the same aspect ratio for inner picture while stretching picture edges to fill the required resolution when capturing a 4 × 3 picture and fetching it as a 16 × 9 to memory. Non-linear scaling parameters are set with VPE_CFG_SC4[30:28] CFG_NLIN_ACC_INIT_U and VPE_CFG_SC4[26:24] CFG_LIN_ACC_INC_U registers. When setting up a non-linear scaling application, the inner picture is defined as the center square portion of the image with width and height equal to the height of the source image. Remaining side regions are then scaled non-linearly. Figure 10-26 shows a non-linear scaling case.

Figure 10-26. Non-linear Scaling Example

10.3.4.2.6 Coefficient Memory

10.3.4.2.6.1 Overview

The scaler requires initialization of eight coefficient SRAMS prior to processing a video frame. These coefficients are stored in the external DDR memories and downloaded by the VPDMA. The VPDMA writes the coefficient data through the VPI Control Interface bus.

The eight coefficient SRAMs are:

- HS horizontal polyphase scaler, Luma and Chroma (7tap)
- VS vertical polyphase scaler, Luma and Chroma (5tap or 3tap)

10.3.4.2.6.2 Physical Coefficient SRAM Layout

Each of the six legacy coefficient SRAMs is 32 phases × 91 bits. A single coefficient value is 13 bits. Therefore, one word of the SRAM contains 7 coefficient values as shown in Figure 10-27, and 224 coefficient values are stored in each SRAM.

Figure 10-27. SRAM Layout for 7tap Coefficient

Phase 0	C6	C5	C4	C3	C2	C1	C0
Phase 31	C223	C222	C221	C220	C219	C218	C217

The two vertical polyphase SRAMs are 32 phases × 65 bits. A single coefficient is 13 bits. Therefore, one word of SRAM contains 5 coefficient values as shown in Figure 10-28.

Figure 10-28. SRAM Layout for 5tap Coefficient

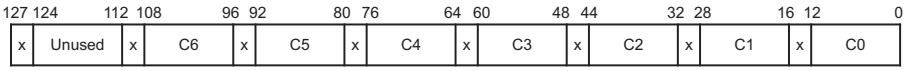
Phase 0	C4	C3	C2	C1	C0
Phase 31	C221	C220	C219	C218	C217

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.4.2.6.3 Scaler Coefficients Packing on 128-bit VPI Control I/F

A coefficient value is 13 bits wide and takes a single half word. Thus, one VPI Control write carries one phase's worth of coefficients. The last half-word in a quad-word is not used for 7tap coefficients.

Figure 10-29. VPI Control I/F Coef Data Format (7tap)



The Vertical Polyphase scaler coefficients have only five or three values per phase, so the last three (or five) entries are unused. The Vertical Polyphase coefficient packing is shown in Figure 10-30 and Figure 10-31.

Figure 10-30. VPI Control I/F Coef Data Format (5tap)

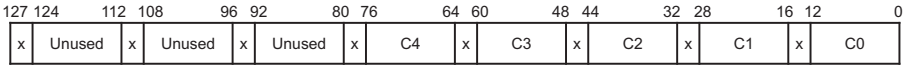


Figure 10-31. VPI Control I/F Coef Data Format (3tap)

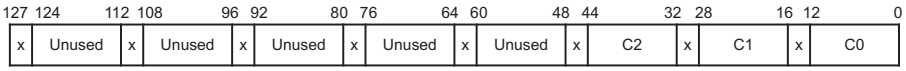
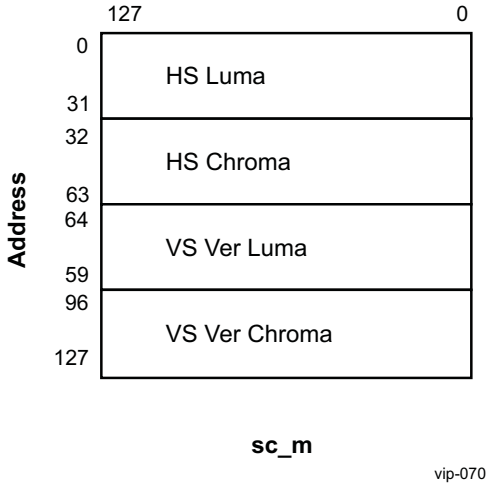


10.3.4.2.6.4 VPI Control I/F Memory Map for Scaler Coefficients

The memory map of the VPI Control I/F for the Scaler coefficients is shown in Figure 10-32. All coefficients can be filled up by a single VPI Control write command. The update address feature of VPI Control I/F enables individual access to a certain location of memories.

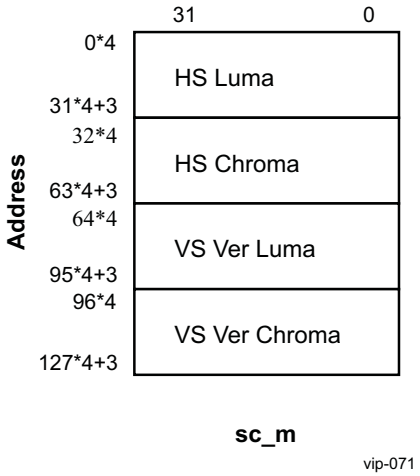
Figure 10-32. VPI Control I/F Memory Map (Write)



The module supports the VPI Control Read to read back the contents in the coefficient memories for debug purpose. Figure 10-33 shows the memory map of the VPI Control Read. As the VPI Control Read has only 32 bit data bus, it requires the word addressing while the write does the quad-word addressing.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-33. VPI Control I/F Memory Map (Read)



10.3.4.2.6.5 VPI Control Interface

VPDMA is used to configure the coefficient memories of scaler through VPI control interface. Since the coefficient memories are not shadowed (unlike the memory mapped registers), VPI control write access needs to be done only during the gap between video frame processing times. If a write request is made while the Scaler is active, the access will be held off by the hardware until the last data of the currently processed frame is sent out. Care must be given to the order of the DMA descriptors so that blocking of VPI control bus does not occur.

10.3.4.2.6.6 Coefficient Table Selection Guide

The scaler filter coefficient tables are pre-generated using a MATLAB® program for various scaling factor ranges. Table 10-11 provides a general selection guide table for coefficient data files.

The mentioned .dat files are available in Section 10.3.4.4.

Table 10-11. Coefficient Data Files

10.3.4.3.3 Typical Configuration Values

The following is the list of all scaler register fields that are set to constant values, representing typical settings:

VPE_CFG_SC0[3] CFG_INVT_FID = 0 (Field ID will be used without inversion)

VPE_CFG_SC0[5] CFG_ENABLE_EV = 1 (Field ID will be used without inversion)

VPE_CFG_SC0[6] CFG_AUTO_HS = 1 (The hardware will automatically decide, if current operation is up or down scaling. In down-scaling, it will also decide, if 2X or 4X decimation filter is needed)

VPE_CFG_SC0[7] CFG_DCM_2X = 0 (The 2X decimation filter is disabled)

VPE_CFG_SC0[8] CFG_DCM_4X = 0 (The 4X decimation filter is disabled)

VPE_CFG_SC0[11] CFG_ENABLE_SIN2_VER_INTP = 1 (Modified bilinear interpolation is used)

VPE_CFG_SC0[14] CFG_Y_PK_EN = 0 (Luma peaking is disabled)

VPE_CFG_SC0[15] CFG_TRIM= 1 (Trimming is enabled)

VPE_CFG_SC12[24:0] CFG_COL_ACC_OFFSET = 0 (No horizontal offset is involved)

VPE_CFG_SC13[21:12] CFG_CHROMA_INTP_THR = 64 (If the difference is less than this threshold, the interpolation of chroma should be done along edge direction. Otherwise, the interpolation of chroma should be done vertically)

VPE_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR = 4 (max limit=8)

10.3.5 VPE Color Space Converter (CSC)

The color space converter (CSC) module is used to convert video data from one color space to another with nine programmable integer multipliers.

10.3.5.1 CSC Features

- All parameters are programmable
- Each parameter is configurable in signed 13-bits
- Support for Bypass Mode

10.3.5.2 CSC Functional Description

The conversion between the different color spaces requires addition and multiplication operations on color and intensity components. The mathematical expression of the conversion can be written as:

```
Y   = A0*R + B0*G + C0*B + D0
Cb  = A1*R + B1*G + C1*B + D1
Cr  = A2*R + B2*G + C2*B + D2
```

Color space coeficients are set through the following registers:

- For luma component:
  - VPE_CSC00[12:0] A0
  - VPE_CSC00[28:16] B0
  - VPE_CSC01[28:16] C0
  - VPE_CSC04[27:16] D0
- For Cb component:
  - VPE_CSC01[28:16] A1
  - VPE_CSC02[12:0] B1
  - VPE_CSC02[27:16] C1
  - VPE_CSC05[11:0] D1
- For Cr component :
  - VPE_CSC03[12:0] A2
  - VPE_CSC03[27:16] B2
  - VPE_CSC04[12:0] C2
  - VPE_CSC05[27:16] D2

Using YUV to RGB conversion as an example: YUV represents one color space and RGB represents another color space. The conversion can be written in the matrix format shown in Figure 10-34.

Figure 10-34. Matrix Format

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} A0 & B0 & C0 \\ A1 & B1 & C1 \\ A2 & B2 & C2 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} D0 \\ D1 \\ D2 \end{bmatrix}$$

Since HDTV and SDTV have different conversion requirements, both conversions of RGB-to-YCbCr and YCbCr-to-RGB are described. The details of derivations of these matrixes will be given in the following subsections.

10.3.5.2.1 HDTV Application

10.3.5.2.1.1 HDTV Application with Video Data Range

The two equations presented in this section are for the HDTV application. The chromaticity parameters are defined by ITU-R709 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 10-35. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.2126 & 0.7152 & 0.0722 \\ -0.1172 & -0.3942 & 0.5114 \\ 0.5114 & -0.4646 & -0.0468 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 10-36. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1.5396 \\ 1 & -0.1831 & -0.4577 \\ 1 & 1.8142 & 0 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -197 \\ 82 \\ -232 \end{bmatrix} D$$

10.3.5.2.1.2 HDTV Application with Graphics Data Range

The two equations presented in this section are for the HDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R709 standard.

The input data ranges for these equations are as follows.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

10.3.5.2.2 SDTV Application

10.3.5.2.2.1 SDTV Application with Video Data Range

The two equations presented in this section are for the SDTV application. The chromaticity parameters are defined by ITU-R601 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 10-39. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.172 & -0.339 & 0.511 \\ 0.511 & -0.428 & -0.083 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

10.3.5.2.2.2 SDTV Application with Graphics Data Range

The two equations presented in this section are for the SDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R601 standard.

The input data ranges for these equations are as following.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 10-41. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.257 & 0.504 & 0.098 \\ -0.148 & -0.291 & 0.439 \\ 0.439 & -0.368 & -0.071 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

10.3.5.3 CSC Bypass Mode

CSC module can be bypassed by setting VPE_CSC05[28] BYPASS bit-field to 1.

10.3.6 VPE Chroma Up-Sampler (CHR_US)

The chroma up-sampler (CHR_US) module is used to convert from YCbCr 4:2:0 data format input to YCbCr 4:2:2 format output.

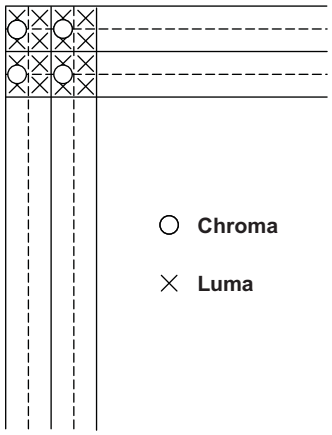
10.3.6.1 Features

- Supports both interlaced and progressive inputs
- 4-tap interpolation filtering
- Filter coefficients are all programmable
- Four sets of coefficients (each set has four coefficients) corresponding to anchor pixels and interpolated pixels of top field and bottom field
- For progressive inputs, the coefficients corresponding to top and bottom field must be identical
- Each coefficient is 14 bit (4.10 format)
- Default filter coefficients are based on Catmull-Rom algorithm
- Capable of removing the half pel vertical offset so all chroma samples are on-grid. This step ensures that the output does not suffer from any kind of rainbow effect due to chroma-upsampling.
- Provides a 10-bit interface in both directions: 10-bit input and 10-bit output
- Support bypass mode for 4:2:2 input

10.3.6.2 Functional Description

The YUV420 input to Chroma Upsampler module must be in the format shown in Figure 10-43, in which the chroma sample lies in the left column of a 2x2 pixel block with half pel vertical shift.

Figure 10-43. 4:2:0 YCrCb Color Space with Chroma Left-aligned



The upsampling is performed by an interpolation filter which uses Catmull-Rom algorithm. The Catmull-Rom Filter is based on four anchor pixels representing a four tap filter. The general 4-tap filter Catmull-Rom filter is defined in Figure 10-44.

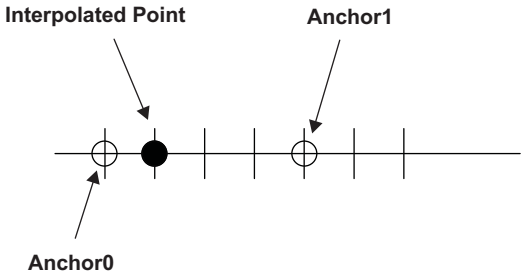
Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-44. 4:2:0 YCrCb Color Space with Chroma Left-aligned

$$[\,1 \quad x \quad x^2 \quad x^3\,] * \begin{bmatrix} 0 & 1 & 0 & 0 \\ -a & 0 & a & 0 \\ 2a & -3+a & 3-2a & -a \\ -a & 2-a & -(2-a) & a \end{bmatrix}$$

In the previous figure, x is the distance to the interpolated point between the two anchor points. In Figure 10-45, the example shows the desired interpolated point to be ¼ of the distance between Anchor0 and Anchor1. Thus, x = ¼.

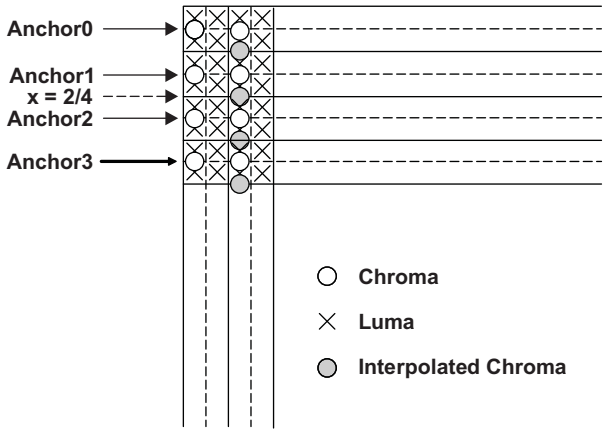
Figure 10-45. 4:2:0 YCrCb Color Space with Chroma Left-aligned



The variable 'a' determines the characteristics of the filter. a = ½ is generally used because the filter will produce an interpolated output that is an exact match to a linear input curve. In the literature, some people have noted that a=0.75 or a=1.0 may be more pleasing to the eye. In the implementation, the filter coefficients are programmable through MMR.

For the interpolated pixel, the variable x defines the positional offset relative to anchor pixel1. Figure 10-46 shows four anchor pixels with Anchor0 being near the top of the image and Anchor3 near the bottom. x is relative to Anchor1. Positive values of x goes down towards Anchor3. Negative x values imply a direction towards Anchor0. For example, if we want to interpolate a pixel midway between Anchor1 and Anchor2, x would be 2/4=1/2. There are four half pels between Anchor1 and Anchor2. Midway is two pels, so x=2/4.

Figure 10-46. Anchor Pixels



In the implementation, we need to interpolate the anchor pixel to get it on-grid. Then, we also need to interpolate a completely new pixel for YPrPb 4:2:2.

For a progressive input, x = -1/4 for getting the anchor pixel on-grid. x = 1/4 for generating the new pixel.

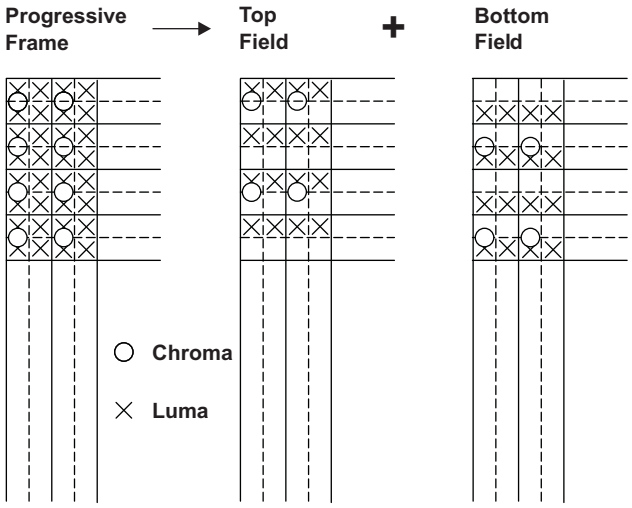
Copyright © 2015–2020, Texas Instruments Incorporated

Lines are scanned from the top of the picture to the bottom.

10.3.6.3 For Interlaced YUV420 Input Data

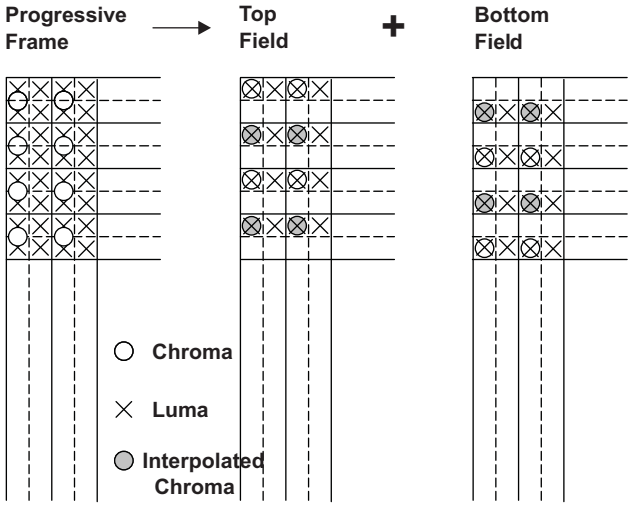
Figure 10-47 shows how 4:2:0 video is split into top and bottom fields in interlaced format. Chroma is attached to alternating Luma lines in the top and bottom fields such that color is equally spread out between the top field and the bottom field. This 4:2:0 interlaced chroma representation is shown in the following figure.

Figure 10-47. 4:2:0 Interlaced Scan



In each interlaced field, the chroma anchor points are separated by 4 pixel lines, or 8 half pels. The 4:2:2 chroma interpolated color space representation of interlaced pictures is shown in Figure 10-48.

Figure 10-48. Ideal 4:2:2 Chroma Upsampling for Interlaced Scan



Following interpolation, the chroma samples lie on a 4:2:2 grid.

Anchor pixels for the top field have been sited up by half a pel (x = -1/8). The new interpolated pixel is sited 3 half pels (x=3/8) down. Samples from the top field are distinct from samples in the bottom field.

For the bottom field, anchor pixels are sited 3 haf pels up (x = -3/8). The new interpolated pixel is sited 1 half pel down (x=1/8).

The chroma upsampling filter accepts different coefficients for the top field and the bottom field. In the case of progressive input, the coefficients for the top field and bottom field must be the same.

Copyright © 2015–2020, Texas Instruments Incorporated

It should be noted that a different implementation could have been chosen to use the same coefficients for the top and bottom fields. Instead of pushing pixels from the top to bottom of a picture, it can be shown that pushing the bottom field through the upsampling filter from the bottom to the top of the picture permits using the same values for x as in the top field case.

10.3.6.4 Edge Effects

Several methods with increasing levels of difficulty resulting in increasing quality can be employed to deal with chroma pixels near the edges. In this module, the edge pixels can be mathematically approximated using the same filter as the rest of the picture. Edge pixels are duplicated going into the filter.

10.3.6.5 Modes of Operation (VPDMA)

In both primary (PRI) and auxiliary (AUX) paths, the mode in which the VPDMA needs to be operated depends whether the chroma upsampler and de-interlacers are enabled or not. Table 1-12 shows the modes of operation.

Table 10-16. VPDMA Modes of Operation

Mode A	Mode B
Input data is 4:2:0	Input data is 4:2:2

These modes need to be set in the following register bit-fields of particular instances being used:

VPE_REG0[17:16] CFG_MODE

LINE_MODE bitfield in VPDMA registers of format RD_LB_CLIENT_CTL_STATUS need to configured as follows:

Mode A corresponds to MMR value 0

Mode B corresponds to MMR value 1

The following are the VPDMA client related bit-fields that need to be configured:

VPE_PRI_CHROMA_CSTAT[9:8] LINE_MODE

VPE_PRI_FLD1_CHROMA_CSTAT[9:8] LINE_MODE

VPE_PRI_FLD2_CHROMA_CSTAT[9:8] LINE_MODE

NOTE: 1. For VPDMA luma clients, Mode B should always be used.

2. For VPDMA chroma clients, Mode A is used for 420 data and Mode B is used for 422 data.

10.3.6.6 Coefficient Configuration

The filter coefficients are left-aligned 14-bit binary values in signed Q4.10 format. The decimal point is between bits 9 and 10 using the convention of the least significant bit being at position zero. The most significant bit, 13, is the sign bit.

In the register map, the most significant nibble of the coefficient is the sign and the integer portion of the value. The next 10 bits represent the fractional portion of the coefficient value.

Chroma upsampling requires two sets of coefficients. Each coefficient set is comprised of four 14-bit Q4.10 values. One set is used for the top field of an interlaced picture, and the other set is used for the bottom field of an interlaced picture. For a progressive picture, both sets must be identical.

The coefficients and settings should be used for the follwoing video source types:

4:2:2 input (progressive or interlaced input)

VPDMA line mode = 1

VPE_REG0[17:16] CFG_MODE = 0x1 (mode B)

Copyright © 2015–2020, Texas Instruments Incorporated

CHR_US coefficients are not used in this mode, so values are "don't care"

4:2:0 input (interlaced input):

VPDMA line mode = 0

VPE_REG0[17:16] CFG_MODE = 0x0 (mode A)

VPE_REG0[31:18] ANCHOR_FID0_C0 = 0x51

VPE_REG0[15:2] ANCHOR_FID0_C1 = 0x3d5

VPE_REG1[31:18] ANCHOR_FID0_C2 = 0x3fe3

VPE_REG1[15:2] ANCHOR_FID0_C3 = 0x3ff7

VPE_REG2[31:18] INTERP_FID0_C0 = 0x3fb5

VPE_REG2[15:2] INTERP_FID0_C1 = 0x2e9

VPE_REG3[31:18] INTERP_FID0_C2 = 0x18f

VPE_REG3[15:2] INTERP_FID0_C3 = 0x3fd3

VPE_REG4[31:18] ANCHOR_FID1_C0 = 0x16b

VPE_REG4[15:2] ANCHOR_FID1_C1 = 0x247

VPE_REG5[31:18] ANCHOR_FID1_C2 = 0xb1

VPE_REG5[15:2] ANCHOR_FID1_C3 = 0x3f9d

VPE_REG6[31:18] INTERP_FID1_C0 = 0x3fcf

VPE_REG6[15:2] INTERP_FID1_C1 = 0x3db

VPE_REG7[31:18] INTERP_FID1_C2 = 0x5d

VPE_REG7[15:2] INTERP_FID1_C3 = 0x3ff9

4:2:0 input (progressive input):

VPDMA line mode = 0

VPE_REG0[17:16] CFG_MODE = 0x0 (mode A)

VPE_REG0[31:18] ANCHOR_FID0_C0 = 0x00C8

VPE_REG0[15:2] ANCHOR_FID0_C1 = 0x0348

VPE_REG1[31:18] ANCHOR_FID0_C2 = 0x0018

VPE_REG1[15:2] ANCHOR_FID0_C3 = 0x3fd8

VPE_REG2[31:18] INTERP_FID0_C0 = 0x3fb8

VPE_REG2[15:2] INTERP_FID0_C1 = 0x0378

VPE_REG3[31:18] INTERP_FID0_C2 = 0x00e8

VPE_REG3[15:2] INTERP_FID0_C3 = 0x3fe8

VPE_REG4 to VPE_REG7 are not used so their values are "don't care".

10.3.7 VPE Chroma Down-Sampler (CHR_DS)

When the picture input is 4:2:2, the chroma must be downsampled to 4:2:0 before it is stored into DRAM for later compression by the imaging subsystem. The downsampling is performed by an averaging filter.

An array with chroma samples must be used- C_{IN}[] with range from 0 to N-1. (C_{IN}[0] is the topmost chroma sample and C_{IN}[N-1] is bottom chroma sample) .

The output array C_{OUT}(ranging from 0 to N/2 - 1) is calculated by the following formula:

$C_{OUT}[i] = CLIP[(C_{IN}[2i] + C_{IN}[2i+1]) / 2]CLIP[x]$ (x= 0 to 255).

Copyright © 2015–2020, Texas Instruments Incorporated

This filter performs simple averaging of two input lines into one output line.

10.3.8 VPE YUV422 to YUV444 Conversion

As shown on Figure 10-2, prior the CSC the video format needs to be converted from YUV422 to YUV444 format. This conversion only applies to the Chroma samples in the color space, and is implemented using a 4-tap Catmull-Rom algorithm using the following equations:

$C_{OUT}[2*i[= C_{IN}[i]$ $C_{OUT}[2*i+1] = CLIP\ (9/16*C_{IN}[i] + 9/16*C_{IN}[i+1] – 1/16*C_{IN}[i-1] – 1/16C_{IN}[i+2] + 1)$

NOTE: Edge effects are treated by repeating the first and last pixel per line.

10.3.9 VPE Video Port Direct Memory Access (VPDMA)

10.3.9.1 VPDMA Introduction

The VPDMA primary function is to move data between external memory and internal processing modules that source or sink data. VPDMA is capable buffering this data and then delivering the data as demanded to the modules as programmed. The modules that source or sink data are referred to as clients. A channel is setup inside the VPDMA to connect a specific memory buffer to a specific client. The VPDMA centralizes the DMA control functions and buffering required to allow all the clients to minimize the effect of long latency times. The VPDMA also supports a descriptor based mode where lists of descriptors can be setup to configure all the channels as they become available.

Additionally, in a third-party configuration, the VPDMA is capable of performing DMA transfers as requested by the pulsing of an event strobe. The VPDMA is capable of generation of an address which may reach any location in the range for which it is configured. It is capable of moving this data either to or from a Shared Buffer and ultimately to or from a Client Buffer. For the two type of Client Buffers that are used to drive data into a subsystem (Streaming Buffer and Random Access Buffer) data is either pushed into the buffer or pulled out of the buffer dependent upon the direction of the data transfer. For third-party DMA operations the data is transferred into a Client buffer, and then transferred out of the Client Buffer to the transfer destination. These transfers are triggered by an Event pulse to each of the Client Buffers which are Routing Buffer types.

10.3.9.2 VPDMA Basic Definitions

10.3.9.2.1 Client

The modules that source or sink data are referred to as clients. The clients of the VPDMA are the physical between the processing modules (VPE) and external memory. A channel is the mechanism inside the VPDMA that connects a specific memory buffer or transfer to a specific client.

10.3.9.2.2 Channel

The VPDMA requires a channel to be setup for each group of transfers. All the channels are described through a Data Transfer Descriptor that has a common format. The client that the channel is mapped to interprets the information in the descriptor to perform the requested data transfer.

Each of the channels has a type of data that it can support based upon the client that it services. The VPDMA supports four types of channels:

- **YUV Channel** - Clients taking data YUV data
- **RGB Channel** - Clients taking RGB data
- **Miscellaneous Channel** - The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client.
- **Free Channel** - Used in video compositions. The Free channel data type is always ignored as it uses the same data type of the descriptor that first calls the free channel.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.2.3 List

A list is a group of descriptors that makes up a set of DMA transfers that need to be completed. The VPDMA supports two types of lists: a Regular List and a Self-Modifying List.

- The **Regular List** is a single list that the VPDMA will execute each descriptor once and initiate an interrupt when the list has completed. A regular list can contain any kind of descriptor without limitation and be of any size.

The VPDMA Controller works on lists of descriptors. In this mode the processor writes the lists of descriptors in the order it wants them executed. It then writes the location of the list to the VPE_LIST_ADDR register, followed by writing the size (bit LIST_SIZE) and type (bit LIST_TYPE) of the list, and list number (bit LIST_NUM) to the LIST_ATTR register. The List Manager module then schedules a DMA transfer to pull in the portion of the list that it can store in internal VPDMA memory. The List Manager will sequentially process the active list of descriptors until either the descriptor requires the use of a client that is currently active, or if it is waiting for the next portion of the list to be transferred from a DMA request. If there is no active list to process the list manager will go into an IDLE mode waiting for any client that is blocking a list or a list DMA transfer to complete.

All the DMA transfers are controlled by List Manager module inside VPDMA. List Manager needs to be loaded with FIRMWARE, before any DMA transfer from memory, after the VPDMA reset. The first MMR write to VPE_LIST_ADDR register after VPDMA reset should be the address of the memory buffer(128-bit aligned, that is, last four bits of the buffer address should be zero) where the firmware is stored. List Manager then schedules a DMA transaction to fetch the firmware and sets the list_attr.rdy bit after the firmware loading is complete.

10.3.9.2.4 Data Formats Supported

Following list summarizes the data formats supported in the VPDMA. For more inforamtion see Section 10.3.9.8, *VPDMA Data Formats*.

- RGB Data Types:
  - RGB16-565
  - ARGB-1555
  - ARGB-4444
  - RGBA-5551
  - RGBA-4444
  - ARGB24-6666
  - RGB24-888
  - ARGB32-8888
  - RGBA24-6666
  - RGBA32-8888
- YUV Data Types:
  - Y 4:4:4
  - Y 4:2:2
  - Y 4:2:0
  - C 4:4:4
  - C 4:2:2
  - C 4:2:0
  - CY 4:2:2
  - YCbC 4:4:4
  - YC 4:2:2

NOTE: VPDMA supports swapping formats (RGB/BGR and Cb/Cr)

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.3 VPDMA Client Buffering and Functionality

Table 10-17 lists for each client:

- The channels used, amount of buffering allocated for it, and the shared buffer used for its memory
- The line sizes it handles for tiled and non-tiled memory spaces, as well as any additional features it supports

Table 10-17. VPDMA Client Buffering and Functionality

Client	Channel(s)	Tiled Memory Max Line Size	Non-Tiled Memory Max Line Size	Additional Features
dei_hq_1_chroma	hq_vid1_chroma	1920 (color seperate) 960 (interleaved)	1920 (color seperate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_1_luma	hq_vid1_luma	1920 (color seperate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_2_luma	hq_vid2_luma	1920 (color seperate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_2_chroma	hq_vid2_chroma	1920 (color seperate) 960 (interleaved)	1920 (color seperate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_3_luma	hq_3_luma	1920 (color seperate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_3_chroma	hq_3_chroma	1920 (color seperate) 960 (interleaved)	1920 (color seperate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_mv_in	hq_mv_in	Tiled Data Not Supported	4096	
dei_hq_mv_out	hq_mv_out	Tiled Data Not Supported	4096	
vip1_up_y	vip1_porta_luma vip1_porta_rgb	1920 (color seperate) 960 (interleaved)	4096	TILED
vip1_up_uv	vip1_porta_chroma	1920 (color seperate) 960 (interleaved)	4096	TILED

10.3.9.4 VPDMA Channels Assignment

Table 10-18 lists all of the channels in VPDMA and its base attributes. The Data Type column states what type of data YUV, RGB or OTHER the channel handles and in parentheses are the legal data type values that can be entered into a data transfer decriptor. The Client field states the name of the Client and in parentheses it states the reference number in Figure 10-2, *VPE Block Diagram*.

Table 10-18. VPDMA Channels Assignment

Channel	Description	Channel Number	Data Type	Client
hq_vid1_luma	High Quality DEI Video 420 Luma Data/ 422 Interleaved Data	0	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_1_luma (7)
hq_vid1_chroma	High Quality DEI Video 420 Chroma Data	1	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_1_chroma (7)
hq_vid2_luma	Low Cost DEI Field Minus 1420 Luma Data	2	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_2_luma (8)
hq_vid2_chroma	Low Cost DEI Field Minus 1 420 Chroma Data	3	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_2_chroma (8)

Copyright © 2015–2020, Texas Instruments Incorporated

Table 10-18. VPDMA Channels Assignment (continued)

Channel	Description	Channel Number	Data Type	Client
hq_vid3_luma	Low Cost DEI Field Minus 2 420 Luma Data	4	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_3_luma (9)
hq_vid3_chroma	Low Cost DEI Field Minus 2 420 Chroma Data	5	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_3_chroma (9)
hq_mv	Low Cost DEI Motion Vector	12	OTHER (4)	dei_hq_mv_in (6)
hq_mv_out	Low Cost DEI Motion Vector Write	15	OTHER (4)	dei_hq_mv_out (6)
vip1_porta_luma	Video Input 1 Port A 420 Data Luma	102	YUV (0x1, 0x2,0x7)	vip1_up_y (1)
vip1_porta_chroma	Video Input 1 Port A 420 Data Chroma	103	YUV (0x5,0x6,0x7)	vip1_up_uv (1)
vip1_porta_rgb	Video Input 1 Port A RGB Data	106	RGB (0x0-0x8)	vip1_up_y (1)

10.3.9.5 VPDMA Interrupts

The VPDMA has 4 interrupt group(s). Each group has an interrupt for all the client interrupts, an interrupt for every 32 channels, a interrupt for each list complete, an interrupt for each list notify and an interrupt for for all of the descriptor interrupts. Each of these groups can be individually masked so that only the interrupts specified will trigger the higher level interrupt.

Each interrupt source can be individually masked independently for each seperate interrupt group. A status register bit exists for each interrupt source for for each interrupt group, that is set whenever the interrupt event occurs even when if the interrupt is masked. The status register bit will remain set until cleared by software by writing a one to the status bit.

Table 10-19 shows all interrupt events from the VPDMA that go to VPE top level. The interrupt events are mapped to one interrupt line, INT0, that go to VPE top level.

Table 10-19. VPDMA Interrupt Events

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group0	VPE_INT0_CHANNEL0_INT_STAT	VPE_INT0_CHANNEL0_INT_MASK	An unmasked channel interrupt for interrupt group 0 in channel register 0 has fired.
vpdma_int_channel_group1	VPE_INT0_CHANNEL1_INT_STAT	VPE_INT0_CHANNEL1_INT_MASK	An unmasked channel interrupt for interrupt group 1 in channel register 0 has fired.
vpdma_int_channel_group2	VPE_INT0_CHANNEL2_INT_STAT	VPE_INT0_CHANNEL2_INT_MASK	An unmasked channel interrupt for interrupt group 2 in channel register 0 has fired.
vpdma_int_channel_group3	VPE_INT0_CHANNEL3_INT_STAT	VPE_INT0_CHANNEL3_INT_MASK	An unmasked channel interrupt for interrupt group 3 in channel register 0 has fired.
vpdma_int_channel_group4	VPE_INT0_CHANNEL4_INT_STAT	VPE_INT0_CHANNEL4_INT_MASK	An unmasked channel interrupt for interrupt group 4 in channel register 0 has fired.

Table 10-19. VPDMA Interrupt Events (continued)

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group5	VPE_INT0_CHANNEL5_INT_STAT	VPE_INT0_CHANNEL5_INT_MASK	An unmasked channel interrupt for interrupt group 5 in channel register 0 has fired.
vpdma_int_list0_complete			List 0 has completed
vpdma_int_list0_notify			The data transfer in list 0 with the Notify Field set in the descriptor has completed
vpdma_int_list1_complete			List 1 has completed
vpdma_int_list1_notify			The data transfer in list 1 with the Notify Field set in the descriptor has completed
vpdma_int_list2_complete			List 2 has completed
vpdma_int_list2_notify			The data transfer in list 2 with the Notify Field set in the descriptor has completed
vpdma_int_list3_complete			List 3 has completed
vpdma_int_list3_notify			The data transfer in list 3 with the Notify Field set in the descriptor has completed
vpdma_int_list4_complete	VPE_INT0_LIST0_INT_STAT	VPE_INT0_LIST0_INT_MASK	List 4 has completed
vpdma_int_list4_notify			The data transfer in list 4 with the Notify Field set in the descriptor has completed
vpdma_int_list5_complete			List 5 has completed
vpdma_int_list5_notify			The data transfer in list 5 with the Notify Field set in the descriptor has completed
vpdma_int_list6_complete			List 6 has completed
vpdma_int_list6_notify			The data transfer in list 6 with the Notify Field set in the descriptor has completed
vpdma_int_list7_complete			List 7 has completed
vpdma_int_list7_notify			The data transfer in list 7 with the Notify Field set in the descriptor has completed
vpdma_int_client	VPE_INT0_CLIENT0_INT_STAT VPE_INT0_CLIENT1_INT_STAT	VPE_INT0_CLIENT0_INT_MASK VPE_INT0_CLIENT1_INT_MASK	Client Interrupt
vpdma_int_descriptor	VPE_INT0_LIST0_INT_STAT	VPE_INT0_LIST0_INT_STAT	Descriptor Interrupt

Copyright © 2015–2020, Texas Instruments Incorporated

In Table 10-19 above, the “channel_group”, “client” and “descriptor” interrupts are actually a set of additional interrupts. When software receives an interrupt from a “channel_group,” “client,” or “descriptor” it must read the appropriate register within the VPDMA (refer to Table 10-20 to determine what the actual interrupt was).

Table 10-20. VPE Interrupt Sources

Interrupt	Interrupt Group	Description
channel_hq_mv	channel_group0	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager.
channel_hq_mv_out	channel_group0	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager.
channel_hq_vid1_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid1_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid2_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid2_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid3_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid3_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_luma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point.

Table 10-20. VPE Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
client_dei_hq_1_chroma	client	The client interface dei_hq_1_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_1_luma	client	The client interface dei_hq_1_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_2_chroma	client	The client interface dei_hq_2_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_2_luma	client	The client interface dei_hq_2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_3_chroma	client	The client interface dei_hq_2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_3_luma	client	The client interface dei_hq_3_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_mv_in	client	The client interface dei_hq_mv_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_mv_out	client	The client interface dei_hq_mv_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_uv	client	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_y	client	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vpi_ctl	client	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
control_descriptor_int0	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0.
control_descriptor_int1	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1.
control_descriptor_int10	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10.
control_descriptor_int11	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 10-20. VPE Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
control_descriptor_int12	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12.
control_descriptor_int13	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13.
control_descriptor_int14	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14.
control_descriptor_int15	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15.
control_descriptor_int2	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2.
control_descriptor_int3	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3.
control_descriptor_int4	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4.
control_descriptor_int5	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5.
control_descriptor_int6	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6.
control_descriptor_int7	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7.
control_descriptor_int8	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8.
control_descriptor_int9	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9.
list0_complete	list0_complete	List 0 has completed and a new list can be loaded.
list0_notify	list0_notify	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel.
list1_complete	list1_complete	List 1 has completed and a new list can be loaded.
list1_notify	list1_notify	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel.
list2_complete	list2_complete	List 2 has completed and a new list can be loaded.
list2_notify	list2_notify	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel.
list3_complete	list3_complete	List 3 has completed and a new list can be loaded.
list3_notify	list3_notify	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel.
list4_complete	list4_complete	List 4 has completed and a new list can be loaded.
list4_notify	list4_notify	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel.
list5_complete	list5_complete	List 5 has completed and a new list can be loaded.
list5_notify	list5_notify	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel.
list6_complete	list6_complete	List 6 has completed and a new list can be loaded.
list6_notify	list6_notify	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel.
list7_complete	list7_complete	List 7 has completed and a new list can be loaded.
list7_notify	list7_notify	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel.
other		Any channel that is not assigned to a specific client has completed.

10.3.9.6 VPDMA Descriptors

The VPDMA needs to be programmed through descriptors (a pre-defined structure of eight or four 32-bit words depending on type of descriptors) other than VPDMA Memory Mapped Registers (MMR). Descriptors are of three types:

i. **Data Transfer Descriptors** - A memory structure used to describe a desired memory transaction to or from a client.

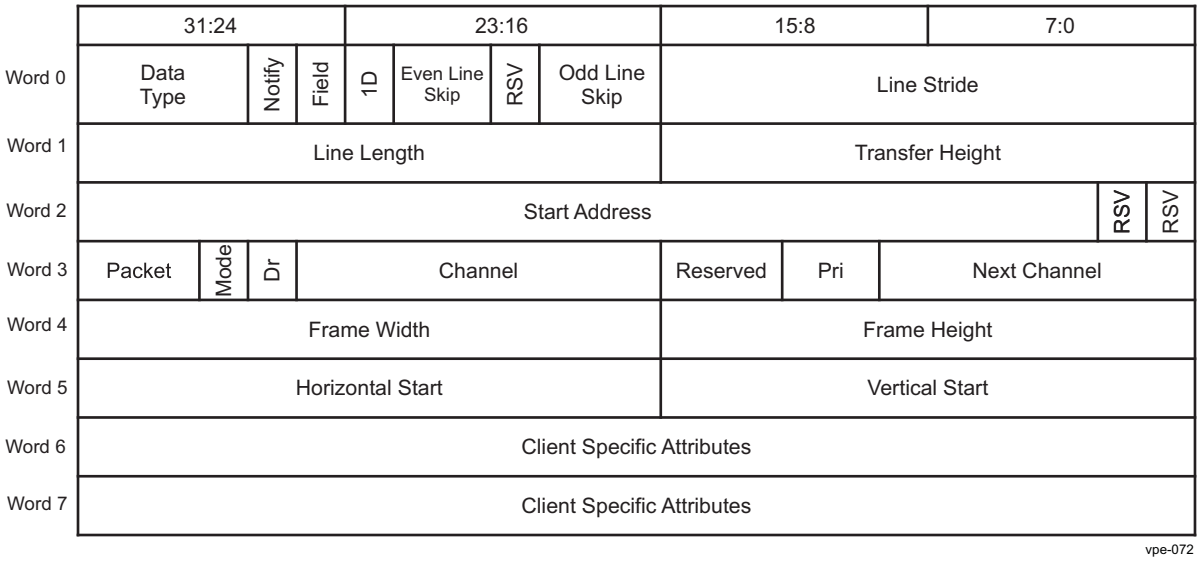
ii. **Control Descriptors** - A memory structure used to perform a control operation inside the DMA controller

iii. **Configuration Descriptors** - A memory structure used to described a setup that should be applied to an processing modules like MMR write, scalar coefficient write etc.

10.3.9.6.1 Data Transfer Descriptors

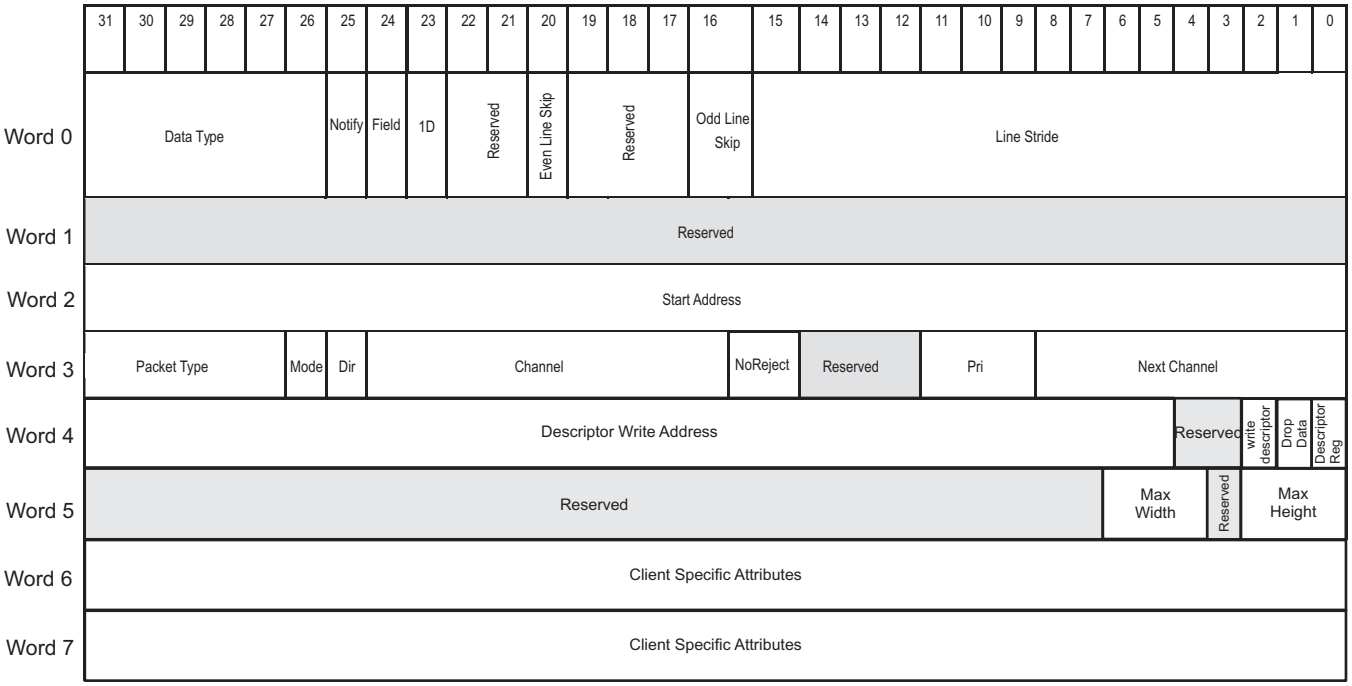
In order to set up data transfers from the VPDMA, a data transfer descriptor is added into a list. The fields used for an Inbound and Outbound descriptor vary slightly. An outbound transfer can have two different outbound transfers. The two transfers are the main data transfer and a write of an Inbound Descriptor. The created inbound descriptor is formatted so it can be read back in directly to the next channel specified in the original descriptor.

Figure 10-49. Inbound Data Transfer Descriptor Format



Copyright © 2015–2020, Texas Instruments Incorporated

Figure 10-50. Outbound Data Transfer Descriptor Format



The general data transfer Descriptor formats can be seen in the above figures. The descriptor consists of 8 × 32bit words. A Data Transfer Descriptor will be removed from the list when the resource specified by the Channel field is free. If the Channel is not free when the list reaches a data transfer descriptor then the list will stall until the current transfer on the channel has completed.

Table 10-21. Data Packet Descriptor Word 0 Field Descriptions (continued)

Bit	Field	Value	Description
22:20	Even Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
19	Reserved		Reserved for future use
18:16	Odd Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
15:0	Line Stride	0-FFFFh	Address stride between lines in bytes

10.3.9.6.1.1.1 Data Type

Bits 31-26 indicate the type of data that is to be transferred. This value is used to compute the number of bytes per pixel so that transactions may be made for the appropriate amount of data. The types of data are dependent on the type of channel. The VPDMA descriptor data types RGB or YUV are defined associated with the VPDMA channel assignment. This helps the engine to distinguish between the overlapping values of the descriptor data types for RGB and YUV data.

- For the Miscellaneous channel, the Data Type selects the size in bits of the data. The range is from 0 to 63 to represent the sizes from 1 to 64 bits.
- For a YUV channel, the Data Type determines, if the data channel is interleaved or color space separate. If color spaced separate, it is still assumed that the two chroma pixels are interleaved.

CAUTION

VPDMA defines the component ordering for its RGB data types in the opposite direction of what commonly used image identifiers expect. To avoid color component swapping in the display and/or in the video/image data written out to the memory, the proper Data Type settings for both RGB and YUV data types must be made. The following paragraphs provide more details on how to set Data Type correctly, in order to match the data stored or expected in the memory.

Setting RGB Data Types

The commonly used RGB format identifiers require the color components to be stored in a little-endian style, where the left most component is the LSB component.

- For an ARGB data type, the A component is the LSB location, as shown in Table 10-22 and Table 10-23;
- For a BGRA data type, the B component would be in the LSB location;

Table 10-22. Common ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
A	R	G	B

Table 10-23. Common ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
B	G	R	A

Copyright © 2015–2020, Texas Instruments Incorporated

VPDMA specifies its component ordering in the big-endian style, which requires the data to be stored in the reversed order. Example with ARGB data type is shown in Table 10-24 and Table 10-25. The VPDMA ordering for ARGB data type matches the common BGRA data format.

Table 10-24. VPDMA ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
B	G	R	A

Table 10-25. VPDMA ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
A	R	G	B

In order color components to be mapped correctly and to avoid swapping, the reversal must be taken into consideration when configuring the Data Type in the VPDMA transfer descriptor.

Table 10-26 shows the proper settings required for RGB data types for both storage schemes.

Table 10-26. VPDMA Descriptor RGB Data Type Mapping

Destination Image		VPDMA Data Type Mapping Value	
RGB Component order	Common Image Format Names	**Column A** Data stored in the VPDMA defined order	**Column B** Data stored in the opposite of VPDMA defined order
RGB	RGB16-565	0x0	0x10
	ARGB-1555	0x1	0x13
	ARGB-4444	0x2	0x14
	RGBA-5551	0x3	0x11
	RGBA-4444	0x4	0x12
	ARGB24-6666	0x5	0x18
	RGB24-888	0x6	0x16
	ARGB32-8888	0x7	0x19
	RGBA24-6666	0x8	0x15
	RGBA32-8888	0x9	0x17
BGR	BGR16-565	0x10	0x0
	ABGR-1555	0x11	0x3
	ABGR-4444	0x12	0x4
	BGRA-5551	0x13	0x1
	BGRA-4444	0x14	0x2
	ABGR24-6666	0x15	0x8
	BGR24-888	0x16	0x6
	ABGR32-8888	0x17	0x7
	BGRA24-6666	0x18	0x5
	BGRA32-8888	0x19	0x9

In Table 10-26, if the application uses the same data type definition as the VPDMA (that is, RGB24 refers to the B in the LSB), the data types in Column A should be used. But, if the application expects the common data type component order for RGB data type names, the VPDMA data types in Column B should be used.

For example:

- To display an ARGB32-8888 source image data with A in the LSB, the data type in the descriptor should be set to 0x19. But, to display an ARGB32-888 source image data with B in the LSB, the data type in the descriptor should be set to 0x7.

Copyright © 2015–2020, Texas Instruments Incorporated

Setting YUV Data Types

There is no component order reversal for YUV data types. The VPDMA uses generic data type names to specify the memory storage format and the application simply needs to follow the VPDMA defined ordering.

Table 10-27 shows how common YUV data types map to the VPDMA YUV data types in order to clarify the YUV data type configuration.

Table 10-27. VPDMA Descriptor YUV Data Type Mapping

Source YUV Image Types			VPDMA Data Type Mapping (Value)		
Chroma Sub-sample	Common YUV Image Format Type Names	Memory Packed Order [MSB - LSB]	Luma/Chroma Interleaved Channel	Luma-only Channel	Chroma-only Channel
444	YUV	V U Y	YC 4:4:4 (0x8)		
	UVY	Y V U	Cb 4:4:4 (0x14)		
422	NV16 (YUV422SP_UV)	V U		Y 4:2:2 (0x1)	C 4:2:2 (0x5)
	NV16 (YUV422SP_VU)	U V		Y 4:2:2 (0x1)	Cb 4:2:2 (0x15)
	YUV2/YUYV/V422 (YUV422I_YUYV)	V Y U Y	YC 4:2:2 (0x7)		
	YUV422I_YVYU	U Y V Y	CbY 4:2:2 (0x17)		
	Y422/UYVY (YUV422I_UYVY)	Y V Y U	YC 4:2:2 (0x27)		
	YUV422I_VYUY	Y U Y V	YCb 4:2:2 (0x37)		
420	NV12 (YUV420SP_UV)	V U		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see (1))	C 4:2:0 (0x6) YC 4:2:2 (0x7) (see (1))
	NV21 (YUV420SP_VU)	U V		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see (1))	Cb 4:2:0 (0x16) YC 4:2:2 (0x7) (see (1))

(1) If 422 source data is used, unused component data fetched (either Luma or Chroma) will be discarded.

For further details on the data formats, refer to Section 10.3.9.8, *VPDMA Data Formats*.

10.3.9.6.1.1.2 Notify

The Notify bit is used in conjunction with the Notify interrupts and when the channel has completed the DMA transfer the Notify Interrupt for the list that contains the descriptor will fire. The last Notify bit set for a specific list will be used so only a single Notify should be set in a list.

10.3.9.6.1.1.3 Field

The Field bit is the field value of the data that will be passed down to the clients. If the data is interlaced, then this value should be cleared to 0.

10.3.9.6.1.1.4 1D

This bit is set if a large one dimensional frame needs to be send to the client. In this case the stride is ignored and for the write the stride the generated descriptor will always be 0. If this bit is set then the transfer length and transfer height and frame width and frame height fields are combined to form one 32 bit field with the upper 8 bits reserved and the lower 24 bits being the size of the frame in pixels.

10.3.9.6.1.1.5 Even Line Skip

The Even Line skip is used with Line Stride to generate the next line address on an even line. All frames start on line 0. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.1.1.6 Odd Line Skip

The Odd Line skip is used with Line Stride to generate the next line address on an odd line. All frames start on line 0, so this will apply starting with the second line. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

10.3.9.6.1.1.7 Line Stride

Bits 15:0 are the stride between lines in bytes at the external address. This value is added or subtracted based upon an adjustment using the current skip value. Operation of the external address pointer shall load the Source Address upon start of the transfer, then at the end of each line increment or decrement by the value computed using the Line Stride and Skip value for the line. The line stride must be aligned to an L3 data bus width. The lower bits of the stride will always be treated as zero to force the alignment.

10.3.9.6.1.2 Data Packet Descriptor Word 1

Table 10-28. Data Packet Descriptor Word 1 Field Description

Bits	Name	Description
31:16	Line Length	Line Length in Pixels
15:0	Transfer Height	Number of rows in transfer.

10.3.9.6.1.2.1 Line Length

Bits 31-16 are the line length in pixels of the current channel. This is ignored for the outbound transfer as the client will provide the line length with the end of line signal on the client interface. The maximum supported line length is currently 4096.

10.3.9.6.1.2.2 Transfer Height

Bits 15-0 are the number of lines to be transferred in the current channel. This is ignored for outbound transfers as the client will provide the line length with the end of frame signal on the client interface. The maximum supported transfer size is currently 2048.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.1.3 Data Packet Descriptor Word 2

Table 10-29. Data Packet Descriptor Word 2 Field Descriptions

Bit	Field	Value	Description
31:0	Start Address		32-bit data source address [31:0]
			If Mode is TILED, then TILER specific ADDRESS Map is used:
			Bits 31-29:
		0	0-degree view
		1h	180-degree view + mirroring
		2h	0-degree view + mirroring
		3h	180-degree view
		4h	270-degree view + mirroring
		5h	270-degree view
		6h	90-degree view
		7h	90-degree view + mirroring
			Bits 28-27:
		0	8-bit container
		1h	16-bit container
		2h	32-bit container
		3h	Page Mode
			If Mode is NORMAL, then bits 31-26 are the upper bits of the address.

10.3.9.6.1.3.1 Start Address

This is the byte aligned address for the first data transfer. The address on the OCP bus will always be word aligned.

10.3.9.6.1.4 Data Packet Descriptor Word 3

Table 10-30. Data Packet Descriptor Word 3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xa
26	Mode	0= Normal, 1=TILED
25	Direction	Inbound = 0, Outbound = 1
24:16	Channel	Channel for which this descriptor describes
15	Reserved	Reserved for future use
11:9	Priority	Only Bit 9 and Bit 11 are used to set the priority. Bit 10 is ignored. Highest = 0, Lowest = 3 By default, hardware assigns priority = 3. This priority level is used in the arbitration between the masters (for DDR access). See Section 10.3.9.6.1.4.5, *Priority*, for more details.
8:0	Next Channel	Next Channel to execute on a line or the channel to use in the generated write descriptor.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.1.4.1 Packet Type

Bits 31:27 are a unique code which indicates that this Descriptor is a VPDMA descriptor.

10.3.9.6.1.4.2 Mode

Bit 26 is used to indicate if the transfer is to regular memory space or to Tiled memory space. The VPDMA will use this to determine if it does standard raster based addressing or if it assumes that the data is stored in TILER format. If data is stored in TILER format then the buffer is turned into 2 or 4 line buffers depending on the container type. For shared clients that use the memory, such as the ancillary data and the VIP port, only one can be active, if the mode field is set. Only clients that support Tiling will properly pack the data for tiling on the output interface. This must only be set for channels going to clients that support the TILING feature in the client configuration.

10.3.9.6.1.4.3 Direction

Bit 25 is used to indicate the direction of transfer. This bit indicates that the data flow is from an external source to an internal buffer (inbound) or data transfers form an internal buffer to an external location (outbound).

10.3.9.6.1.4.4 Channel

Bits 24:16 are the Channels which is supported by the descriptor. This is the identification of the specific Channel which is controlled by the contents of the descriptor. The channel assignments can be found in the channel table.

10.3.9.6.1.4.5 Priority

Bits 11:9 are set to indicate priority of the transfer, these are directly mapped to the OCP reqinfo bits.

10.3.9.6.1.4.6 Next Channel

Bits 8:0 give the next channel to use to create a composite frame. The next channel must be to a free channel. The last channel of a row should point back to the initial channel which must be a channel tied directly to a client. The Descriptor for the Next Channel must be of the same type as the current descriptor.

10.3.9.6.1.5 Data Packet Descriptor Word 4

10.3.9.6.1.5.1 Inbound data

Table 10-31. Data Packet Descriptor Word 4 Inbound Data Field Descriptions

Bits	Name	Description
31:16	Frame Width	Width of the client frame.
15:0	Frame Height	Height of the client frame

10.3.9.6.1.5.1.1 Frame Width

Bits 31:16 indicate the width in pixels of the frame. This is the width of the entire frame and not just the width of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum width is 4096.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.1.5.1.2 Frame Height

Bits 15:0 indicate the height in pixels of the entire frame. This is the height of the entire frame and not just the height of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum height is 2048.

10.3.9.6.1.5.2 Outbound data

Table 10-32. Data Packet Descriptor Word 4 Outbound Data Field Descriptions

Bits	Name	Description
31:5	Descriptor Write Address	The 32 byte aligned location to write an inbound descriptor
2	Write Descriptor	If set to 1, a descriptor will be generated when the client completes a frame.
1	Drop Data	If set to 1, the data will not be written out. Also, if this is set, the write descriptor bit must be set. This allows for descriptors to only be written out so that software can determine the size of the required buffer before data is written out.
0	Use Descriptor Register	If set to 1, the CURRENT_DESCRIPTOR register will be used for the write address location. If set to 0, the Descriptor Write Address field in this word will be used for the Descriptor Write Address.

10.3.9.6.1.5.2.1 Descriptor Write Address

Bits 31:5 set the 32 byte address to write the generated descriptor. This address is only used if the Write Descriptor bit is set to 1 and the Use Descriptor Register bit is set to 0. If this case is met when the channel is complete a descriptor that meets the inbound descriptor format will be written to the location specified by this field. This allows for software to have a specific channel write its descriptor to a specific address no matter what order the channel completes compared to other outbound channels.

10.3.9.6.1.5.2.2 Write Descriptor

Bit 2 determines if a descriptor should be written out when the client is completed. If this bit is set the descriptor will be written. The format of the descriptor will be of an Inbound Data Transfer descriptor with the LINE LENGTH and TRANSFER HEIGHT fields determined by the counters in the clients. This means that the direction bit will be the opposite of the inbound descriptor. The FRAME WIDTH and FRAME HEIGHT values will match the LINE LENGTH and TRANSFER HEIGHT fields. The CHANNEL and NEXT CHANNEL fields will match the NEXT CHANNEL field of the original descriptor. The FIELD bit will match the source field captured by the client. The NOTIFY bit will always be 0. All other fields will match the original outbound descriptor. If the Outbound descriptor MODE is set to TILED data then the descriptor address used will be in TILED data space and software must ensure that the address is in page mode for the address of the descriptor.

10.3.9.6.1.5.2.3 Drop Data

Bit 1 determines if the data should be written out or not. In some cases software might only want to write the descriptor out to determine the size of the buffer that will be required to store incoming data. By setting this bit,no data will be written out. If this bit is set then the Write Descriptor bit MUST be set. Bit 0 determines where the descriptor should be written. If it is desired that all the descriptors are written in order to a set queue then this bit should be set and the CURRENT_DESCRIPTOR, DESCRIPTOR_TOP and DESCRIPTOR_BOTTOM registers are used to define the location of the descriptor queue that will be written.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.1.5.2.4 Use Descriptor Register

Bit 0 determines where the descriptor should be written. If it is desired that all the descriptors are written in order to a set queue then this bit should be set and the CURRENT_DESCRIPTOR, DESCRIPTOR_TOP and DESCRIPTOR_BOTTOM registers are used to define the location of the descriptor queue that will be written.

10.3.9.6.1.6 Data Packet Descriptor Word 5

10.3.9.6.1.6.1 Outbound data

Table 10-33. Data Packet Descriptor Word 5 Outbound Data Field Descriptions

Bits	Name	Description
6:4	Max Width	The maximum allowable pixels per line. 0: Unlimited Line Size 1: Use VPE_MAX_SIZE1 Max Width field 2: Use VPE_MAX_SIZE2 Max Width field 3: Use VPE_MAX_SIZE3 Max Width field 4: 352 pixels 5: 768 pixels 6: 1280 pixels 7: 1920 pixels Others: Reserved
2:0	Max Height	The maximum allowable lines per frame. 0: Unlimited Frame Size 1: Use VPE_MAX_SIZE1 Max Height field 2: Use VPE_MAX_SIZE2 Max Height field 3: Use VPE_MAX_SIZE3 Max Height field 4: 288 lines 5: 576 lines 6: 720 lines 7: 1080 lines Others: Reserved

NOTE: Width and Height are set in the following register bit-fields:

- For VPE_MAX_SIZE1: VPE_MAX_SIZE1[31:16] MAX_WIDTH and VPE_MAX_SIZE1[15:0] MAX_HEIGHT
- For VPE_MAX_SIZE2: VPE_MAX_SIZE2[31:16] MAX_WIDTH and VPE_MAX_SIZE2[15:0] MAX_HEIGHT registers
- For VPE_MAX_SIZE3: VPE_MAX_SIZE3[31:16] MAX_WIDTH and VPE_MAX_SIZE3[15:0] MAX_HEIGHT

10.3.9.6.1.6.1.1 Max Width

Bits 6:4 are encoded to set the maximum transferred line size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed pixels the data will continue to be received from the client but will not be sent to external memory until an end of line is received from the client sending data. The outbound descriptor if created will still have the transmitted size of the last line of the frame which will match the max width. If the frame does not exceed the max width then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0. If Max Width is 0 and the line size is larger then 4096 pixels then the address counters will overflow and the data at the start of the line will be overwritten.

10.3.9.6.1.6.1.2 Max Height

Bits 2:0 are encoded to set the maximum transferred frame size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed lines the data will continue to be received from the client but will not be sent to external memory until an end of frame is received from the client sending data. The outbound descriptor if created will still have the transmitted number of lines received which would match the max height. If the frame does not exceed the max height then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.1.7 Data Packet Descriptor Word 6/7 (Data)

The words 4/5 give a 64 bit of configuration that can be passed specifically to the module that supports it. This is passed directly down to the module through a VPI Control port. Please see the section on the specific clients for the format of this data.

10.3.9.6.2 Configuration Descriptor

The Configuration Descriptor is used in a List to setup a client configuration. The configuration descriptor consists of a header and a payload portion. The payload can either be part of the list that the descriptor is contained in or it can be at a separate location. The VPDMA will pass the payload of the configuration descriptor down to the client over the VPI Control port interface or through the MMR configuration port depending on the destination field. A Configuration Descriptor to any single destination except Destination 0 must be on a single list. Configuration Descriptors to different destinations may be on different lists..

The Configuration Descriptor Header is 4 × 32 bit words. A configuration descriptor is not consumed until the destination specified has received the entire configuration payload. Therefore the list is expected to stall while the configuration takes place. This ensures that all descriptors after a configuration descriptor in the list will occur after the desired configuration.

10.3.9.6.2.1 Configuration Descriptor Header Word0

Table 10-34. Configuration Descriptor Header Word0 Field Descriptions

Bits	Name	Description
31:0	Address Offset of the Destination	This is the address offset location in the destination that the block of data in the payload should be written. This field is only used if the descriptor Class is a block type. Otherwise this field is reserved.

10.3.9.6.2.2 Configuration Descriptor Header Word1

Table 10-35. Configuration Descriptor Header Word1 Field Descriptions

Bits	Name	Description
15:0	Number of Data Words	Length of First Data Packet for Class 1(block).

10.3.9.6.2.2.1 Number of Data Words

Bits 15:0 indicate the length of the first data block if the class is 1 as specified in Configuration Descriptor Header Word3. If the class is not 1 then this field should be set to 0.

10.3.9.6.2.3 Configuration Descriptor Header Word2

Table 10-36. Configuration Descriptor Header Word2 Field Descriptions

Bits	Name	Description
31:0	Payload Location	Pointer to the data payload

10.3.9.6.2.3.1 Payload Location

Bits 31:0 contain the pointer to the data payload if the command packet is an indirect type. This value along with the Payload Length will be combined to issue a DMA transaction that must complete before the List Manager can finish processing this descriptor. The list will be made inactive pending this DMA completion. This address should be on a 16 byte boundary so the lower 4 bits should always be 0.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.2.4 Configuration Descriptor Header Word3

Table 10-37. Configuration Descriptor Header Word3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xb
26	Direct	Direct Command = 1 Indirect Command = 0
25:24	Class	0 = Address, Data Set 1 = Block 2,3 Reserved for Future Use
23:16	Destination	Destination of the configuration payload
15:0	Payload Length	Length of Payload in Words.

10.3.9.6.2.4.1 Packet Type

Bits 31:27, this field indicates the type of descriptor and should be set 0xB for configuration descriptor.

10.3.9.6.2.4.2 Direct

Bit 26, this field indicates that the descriptor is a direct command or indirect command. A direct command means that the payload is contiguous with the descriptor and will be pulled in by the list manager descriptor control as it processes the list. A direct payload must end on or before a 256 byte boundary in the list. An indirect command is when the Address is located in Word2 is a pointer to the data payload. A DMA transaction will be scheduled to bring the payload into the List Manager to allow for the payload to be sent to the destination.

10.3.9.6.2.4.3 Class

Bits 25:24, this field indicates the type of payload is associated with command descriptor, and thus how to handle the payload.

A 0 indicates that the payload consists of blocks of data with each block having an address and length. The first word after a sub-block contains the next address and length in bytes. This allows for writing to multiple configuration regions in a client. The Configuration Descriptor word1 is the first address and length pair. All addresses used must be larger then the previous address for all destinations except for the MMR destination. If a sub block length is not evenly divisible into 16 then zeroes should be padded in the payload so that the Next Client Address and Length field start on a 16 byte boundary.

10.3.9.6.2.4.3.1 Address Data Block Format

Table 10-38. Address Data Block Format Field Descriptions

Bits	Name	Description
31-0		Next Client Address
31-0		Configuration for Next Client Address
31-0		Configuration for Next Client Address + 4
31-0		Configuration for Next Client Address + 8
31-0		Configuration for Next Client Address + 12
31-0		Configuration for Next Client Address + 16
31-0		Next Client Address 2
15-0		Sub Block Length

A 1 indicates the payload is simply block data. The data is contiguous and starts at the offset of the destination as specified in word1.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.2.4.4 Destination

The Destination field is used to determine where the configuration payload should be sent. The values for the destination field can be seen in the table below.

Table 10-39. Destination Field Description

Destination Value	Actual Destination	Description
0	mmr_client	Write to MMR registers to setup other modules
4	VPE Scaler	VPE Scaler Coefficient Tables

10.3.9.6.2.4.5 Descriptor Length

Bits 15:0, this field indicates the size of the payload in words for the command. This is 128 bit words. The maximum number of words is 1023 words in a single payload

10.3.9.6.3 Control Descriptor

10.3.9.6.3.1 Generic Control Descriptor Format

A control descriptor is the mechanism that is used in a list to give commands to the List Manager. These descriptors are not considered consumed until the List Manager has done the instruction required by the descriptor. All control descriptors have a common Header located at Word 3 but the remaining words are based on the specific control descriptor.

10.3.9.6.3.2 Control Descriptor Header Description

Table 10-40. Control Descriptor Header Description

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xc
26:25	Reserved	Reserved
24:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	The type of control descriptor that should be run by the List Manager

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.6.3.2.1 Packet Type

This field indicates a VPDMA control descriptor.

10.3.9.6.3.2.2 Source

The source is combined with the control field to determine what the control descriptor should use as the source for its synchronization event.

10.3.9.6.3.2.3 Control

The Control field defines the specific function of the descriptor. Table 10-41 lists the different control descriptors.

10.3.9.6.3.3 Control Descriptor Types

Table 10-41. Control Descriptor Types Summary

Control Descriptor	Control Field Value	Description
Sync on Client	0	Wait for the client attached to the channel specified to reach a certain event before proceeding.
Sync on List	1h	Wait for another list(s) to reach its Sync on List Descriptor
Sync on External Event	2h	Wait for a Register write to the VPE_LIST_STAT_SYNC bit specified or for an external event.
Sync on Channel	4h	Wait for the channel specified to complete
Change Client Interrupt	5h	Change the interrupt event for a client interrupt but do not wait for the event to occur.
Send Interrupt	6h	Generate an interrupt event on one of the Control Descriptor Interrupts
Reload List	7h	Reload the list from the location and size specified.
Abort Channel	8h	Abort the transfer in the channel specified.

10.3.9.6.3.3.1 Sync on Client

A Sync on Client Control descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. For a client that supports multiple channels then only an event on the portion of the client that supports that client will cause the interrupt to be generation. After configuring the interrupt generation event the list will then stall until that event has occurred.

Table 10-42. Sync on Client Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger

Table 10-43. Sync on Client Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 10-43. Sync on Client Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 0

10.3.9.6.3.3.2 Sync on List

The Sync on List Control descriptor is a mechanism to ensure that multiple lists have all reached a common point. The Sync on List descriptor uses the Source field as a mask for each list that should be synchronized which must include the list where the control descriptor resides. Once all lists specified in the source field have reached their Sync on List descriptor all lists will resume with the lowest list number resuming first. All Sync on List Control descriptors in each of the lists must have the same source field so that all lists will synchronize upon reaching that point.

If it is desired to synchronize list 0 and list 1 then the source field would be 0x3. If it is desired to synchronize list 1, list 3, and list 4 then the source field would be 0x1a. Word 0, Word 1 and Word 2 are reserved.

Table 10-44. Sync on List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 1h

10.3.9.6.3.3.3 Sync on External Event

A Sync on External Event descriptor ensures an external event has occurred before proceeding. The external event can be a write to a bit of the VPE_LIST_STAT_SYNC register or other external events that are determined at VPDMA elaboration to have occurred. This descriptor can be used to allow for external software to control progression of the list. The descriptor can also be used to select external signals that are brought into the VPDMA. The current implementation just synchronize on the VPE_LIST_STAT_SYNC bit for the list number that called the descriptor.

Table 10-45. Sync on External Event Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 2h

10.3.9.6.3.3.4 Sync on Channel

A Sync on Channel descriptor stalls the list until the channel specified is free. If the channel is already free then the descriptor will not cause the list to stall. Word 0, Word 1 and Word 2 are reserved.

Table 10-46. Sync on Channel Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Copyright © 2015–2020, Texas Instruments Incorporated

Table 10-46. Sync on Channel Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 4h

10.3.9.6.3.3.5 Sync on LM Timer

A Sync on LM Timer descriptor sets a value from the current timer position to wait. The LM timer is a free running counter at the LM processing clock. The Timer Value in the descriptor is added to the value of the timer at the time the descriptor is received and the list will stall for this many cycles before it becomes active again.

10.3.9.6.3.3.6 Change Client Interrupt

A Change Channel Interrupt Source descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. The list will not stall on this descriptor. The format of the fields is identical to the Sync on Client Descriptor. Word 0 is reserved.

Table 10-47. Change Client Interrupt Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger.

Table 10-48. Change Client Interrupt Field Descriptions (Word - 2)

Bits	Name	Description
31:4	Reserved	Reserved
3:0	Event	Specify the event which should trigger the client interrupt.

Table 10-49. Change Client Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 5h

10.3.9.6.3.3.7 Send Interrupt

A Send Interrupt descriptor will cause the VPDMA to generate an interrupt on the list manager controlled interrupts as specified by the Source Field. The list will not stall on this descriptor. For example, if source is 0 then control_descriptor_int0 will fire. If source is 12, then control_descriptor_int12 will fire. For more information ot VPDMA interrupt events, see Section 10.3.9.5, *VPDMA Interrupts*.

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 6h

10.3.9.6.3.3.8 Reload List

A Reload List descriptor causes ending descriptors after this descriptor in the original list to be dropped and a new list at the location and of the size specified in the descriptor. This descriptor can be used to allow for linked lists in the VPDMA as the list will continue from this point and fetch the list specified and it does not have to be continuous with the current list.

Table 10-51. Reload List Field Descriptions (Word - 0)

Bits	Name	Description
31:0	LIST_ADDRESS	31 most-significant Bits of the memory address where the descriptors to be loaded are stored. Address must be 16 byte aligned.

Table 10-52. Reload List Field Descriptions (Word - 1)

Bits	Name	Description
31:16	Reserved	Reserved
15:0	LIST_SIZE	Size of the list to load

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 7h

10.3.9.6.3.3.9 Abort Channel

An Abort Channel descriptor is used to clear a channel. This clears the channel from issuing any more requests. Any outstanding requests for that channel will complete as originally scheduled. All data inside the client will be flushed. For Tiled Clients such as the noise filter it is required to issue two consecutive abort channel descriptors to ensure the channel is aborted for both the current tile and next tile. Word 0, Word 1 and Word 2 are reserved.

Table 10-54. Abort Channel Field Descriptions (Word - 3)

Bit	Name	Description
31:27	Packet Type	Host Packet Descriptor type = 0xC
26:24	Reserved	Reserved
23:16	Source	VPDMA Channel Number whose transfers are to be aborted
15:4	Reserved	Reserved
3:0	Control	Control type = 9h

10.3.9.7 VPDMA Configuration

The following section describes the different ways of configuring VPDMA for data transfers.

10.3.9.7.1 Regular List

A regular list executes each descriptor in order until the end of the list is reached. When the end of the list is reached an interrupt is sent and the list can be reused by software. A regular list can contain any descriptor types. Software creates the list at some location in external memory. After completing writing the list software then writes the location of the list to the VPE_LIST_ADDR[31:0] VPE_LIST_ADDR register and then writes the LIST_ATTR register. If the NUMBER in the VPE_LIST_ATTR[26:24] LIST_NUM is not an active list then the List will be loaded and begin to execute the next time the List Manager gets to IDLE after processing previous loaded lists. If the NUMBER in the VPE_LIST_ATTR[26:24] LIST_NUM is busy then the VPE_LIST_ADDR[31:0] LIST_ADDR and VPE_LIST_ATTR registers will be locked until the active list specified by NUMBER completes.

The different ports inside VPDMA requires different list setup, as explained in the following sections.

10.3.9.7.2 Video Input Ports

The Video Input Ports can be used in multiple ways. Depending on how the input ports are configured will determine how the lists to manage them need to be setup. The ways in which the ports can work are multiplexed data stream, single YUV color separate stream, dual YUV interleaved or single RGB stream. Each port also has an ancillary data port that can run either multiplexed or single data stream and shares the buffering with the main data stream. For all cases the descriptor must be loaded into the client before the vertical sync is received on the VIP port or the entire frame will be dropped. As with all write clients the VIP channels can be shadowed so the next frame/field descriptor can be loaded while the previous frame is running without stalling the list.

10.3.9.7.2.1 Single YUV Color Separate

If the port is configured to be used as sending out color separated YUV data then the channels that must be used are VIP1_PORTA_LUMA and VIP1_PORTA_CHROMA for the luma and chroma components respectively. The data type can be either 420 or 422 color separate in this case.

10.3.9.7.2.2 Dual YUV Interleaved

If the port is configured to be used to send out 422 interleaved data from a non-multiplexed source then the channels that must be used are VIP1_PORTA_LUMA or VIP1_PORTA_CHROMA depending on if the data stream is connected to the luma or chroma port. The data type must be 422 interleaved in this case.

10.3.9.7.2.3 Single RGB Stream

If the port is configured to be used to send out RGB stream then the channel VIP1_PORTA_RGB must be used. The incoming data is then assumed to be RGB 888 data and this is combined with the Background Color Alpha register field to make ARGB8888 data that will then be sent out based on the data type. If the data type uses less then the full 8 bits the lower bits are dropped and just the upper bits are sent to get the correct data format.

10.3.9.8 VPDMA Data Formats

Each of the channels has a type of data that it can support based upon the client that it services. Also for each channel, the data type will assume that data is packed in memory a certain way and will be prevented to the client in the same manner to the client no matter what the format of the data in memory.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.8.1 YUV Data Formats

The YUV formatted channels expect video data that is in YUV color space. The YUV data can be type is for YUV data and it can support both interleaved data where Luma and Chroma are in the same data buffer or it can support co-planar data where the Luma and Chroma are in separate data buffers. The YUV channel also can be given a position to give a different start position for the client instead of the default upper left hand corner of the frame. The storage format for YUV data depends on the data type field. The data type must be set to a data type that the channel can support. All the clients that data are provided too will either accept Luma Only, Chroma Only or Luma and Chroma in a parallel data bus.

10.3.9.8.1.1 Y 4:4:4 (Data Type 0)

The Y 4:4:4 data type is used for a co-planar 4:4:4 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and height set to the desired frame size expected by the receiving client.

Figure 10-51. Y 4:4:4 (Data Type 0)

10.3.9.8.1.2 Y 4:2:2 (Data Type 1)

The Y 4:2:2 data type is used for a co-planar 4:2:2 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the desired frame sent by the VPDMA to the receive client.

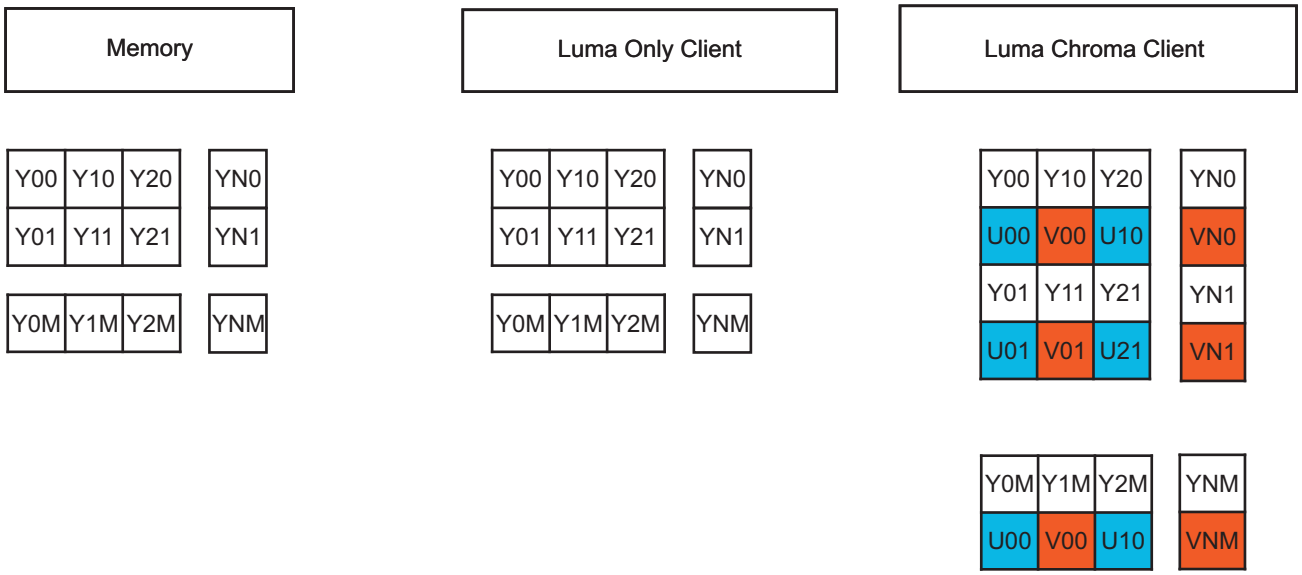
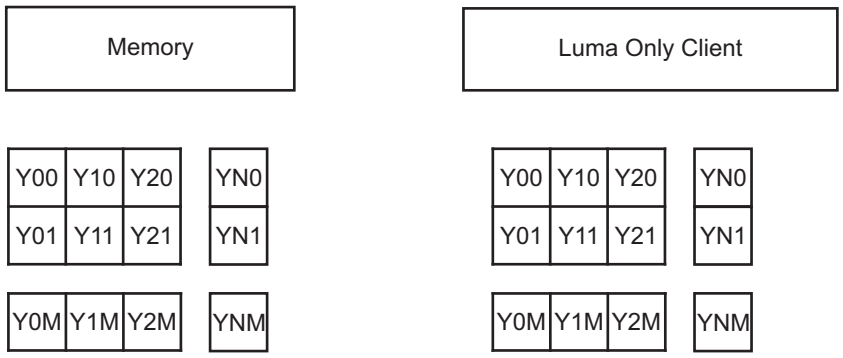
Figure 10-52. Y 4:2:2 (Data Type 1)



10.3.9.8.1.3 Y 4:2:0 (Data Type 2)

The Y 4:2:0 data type is used for a co-planar 4:2:0 data type. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the expected frame for the client.

Figure 10-53. Y 4:2:0 (Data Type 2)



10.3.9.8.1.4 C 4:4:4 (Data Type 4)

The C 4:4:4 data type is used for a co-planar 4:4:4 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and height of the expected client frame.

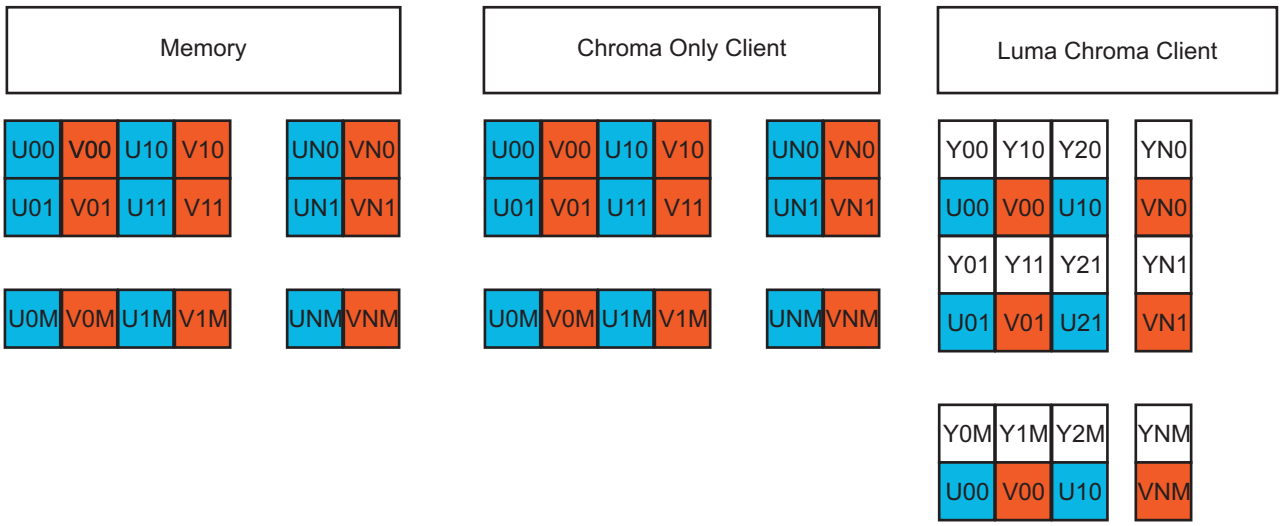
Figure 10-54. C 4:4:4 (Data Type 4)

10.3.9.8.1.5 C 4:2:2 (Data Type 5)

The C 4:2:2 data type is used for co-planar 4:2:2 data.It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and the height of the expected client frame.

Figure 10-55. C 4:2:2 (Data Type 5)

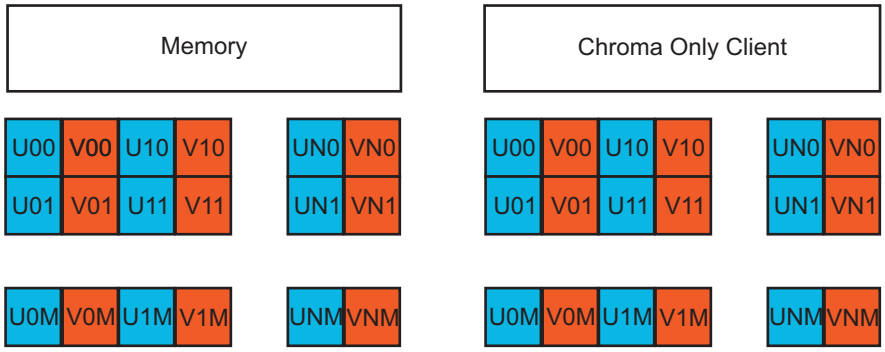


Copyright © 2015–2020, Texas Instruments Incorporated

10.3.9.8.1.6 C 4:2:0 (Data Type 6)

The C 4:2:0 data type is used for a co-planar 4:2:0 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in a 16 bit container. This data block should have the width and half the height of the expected clients frame.

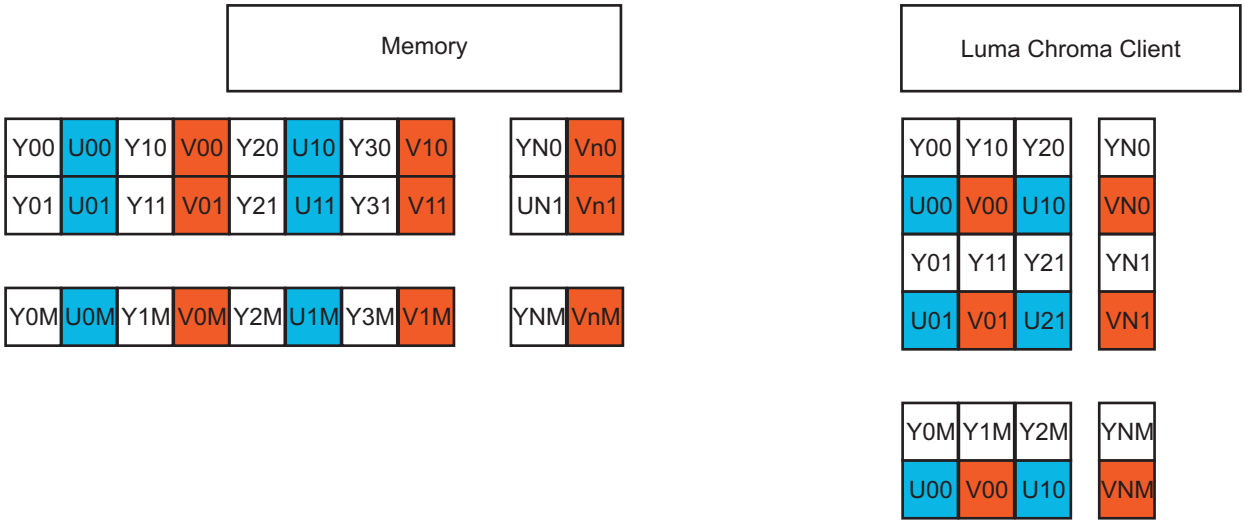
Figure 10-56. C 4:2:0 (Data Type 6)



10.3.9.8.1.7 YC 4:2:2 (Data Type 7)

The YC 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Y1 finally Cr in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 10-57. YC 4:2:2 (Data Type 7)



10.3.9.8.1.8 YC 4:4:4 (Data Type 8)

The YC 4:4:4 data type is used for interleaved 4:4:4 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Cr. The transfer counts each YCbCr triplet in a 24 bit word as a pixel. A 2D transfer of the data is NOT supported in the VPDMA. The data block width and height should be set to the number of pixels and lines that are expected by the client.

10.3.9.8.2 RGB Data Formats

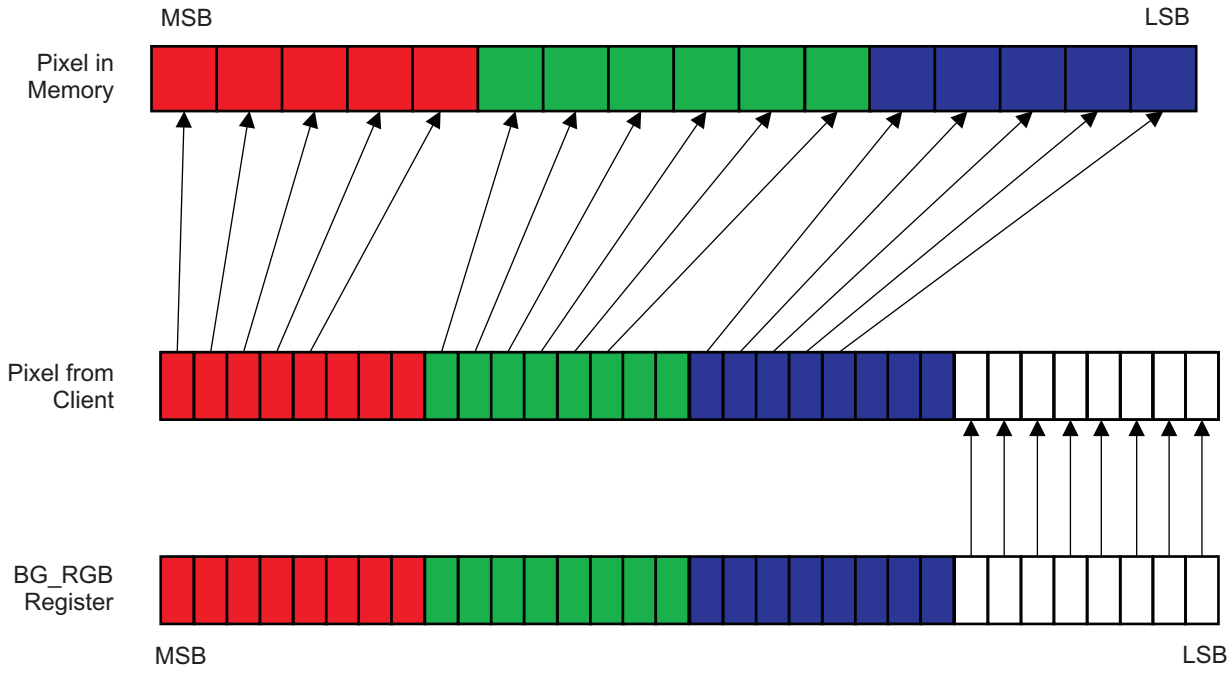
The RGB channel type is used to provide data for a client that expects to transmit RGB data. In all modes the client is always RGBA 8888 data. The lower bits, if not provided by the data stream, are a replication of the lower bit of the data. For outbound data the input is assumed to be RGB 888 and the Alpha value is taken from the Background Color register to make a full ARGB 8888. The lower bits are dropped from this data, if a data type specifies less then the full 8 bits per color. The client has individual data buses for each component so they have no order dependency in the data bus.

10.3.9.8.2.1 Input Data Formats

10.3.9.8.2.1.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Figure 10-60. RGB16-565 (Data Type 0)



10.3.9.8.2.1.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

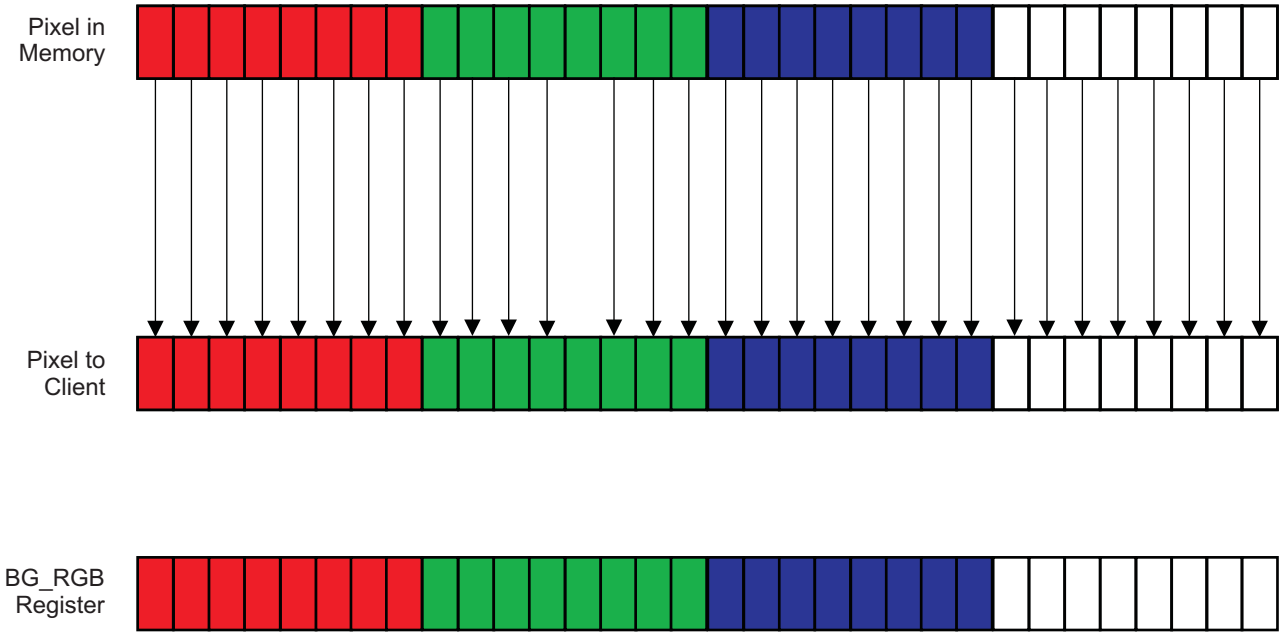
Figure 10-79. RGBA32-8888 (Data Type 9)



10.3.9.8.3 Miscellaneous Data Type

The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client. The size of the miscellaneous data type is always determined by the Data Type field of the descriptor which specifies the number of bits in the descriptor.

A memory structure used to describe a desired memory transaction to or from a client. The descriptor at a minimum gives an address location for the memory portion of the transfer, the channel to use for this transaction and the size of the transaction. The data descriptor can also contain attributes to be passed down to the client or be linked to another data descriptor to form a larger frame from many smaller frames.

10.3.10 VPE Software Reset

Software reset in the VPE module can be done by setting the VPE_CLKC_RST[1] PRIM_DP_RST and VPE_CLKC_RST[0] VPDMA_RST for VPE VPDMA to 0x1. Software must ensure that the software reset completes before performing operations within the VPE module.

10.3.11 VPE Power and Clocks Management

The VPE modules support the MStandby/Wait and IdleReq/SidleAck protocols as defined in Chapter 3, *Power, Reset, and Clock Management.*

Power Management within the VPE module can be accomplished in several ways:

- L4 MConnect/SConnect can disable the internal L4 clock network
- L3 MConnect/Sconnect can disable the internal L3 clock network

These items are accomplished using the standard slave idle (for L4) and master standby (for L3) protocols. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shut down applies to the clock signals - L3_CLK and L4_CLK.

Copyright © 2015–2020, Texas Instruments Incorporated

10.3.11.1 VPE Clocks

The VPE internal clock domains can only be shut down by writing the appropriate register bit within the Clock Enable register - VPE_CLKC_CLKEN[1] PRIM_DP_EN and VPE_CLKC_CLKEN[0] VPDMA_EN for the VPDMA engine

10.3.11.2 VPE Idle Mode

The VPE supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected byprogramming the appropriate value in the VPE_SYSCONFIG[3:2] IDLEMODE bit field.

Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state.

- Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements.
- No-idle mode: local target never enters idle state.
- Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA related requests) wakeup events

10.3.11.3 VPE StandBy Mode

The VPE supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the VPE_SYSCONFIG[5:4] STANDBYMODE bit field.

Configuration of the local initiator state management mode:

- Force-standby mode: local initiator is unconditionally placed in standby state.
- No-standby mode: local initiator is unconditionally placed out of standby state.

RESERVED								B0								RESERVED								A0							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED		R	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of -4. to +4 represent in Q3.10 format. The MSB is sign bit. (Same format conversion as A0 in VPE_CSC00)	RW	0x0
15:13	RESERVED		R	0x0
12:0	A0	Its is represented as Q3.10 number. So the value ranges from -4 to +4. To convert a decimal number, multiply the number by 1024 and write it in the register in hex format. For example, to program 0.673, 0x2B1 should be written in the register. (int)(0.673 X 1024) = (int)689.152 = 689 = 0x2B1. If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is - 1.893, 0x186E needs to be written in the register. (int)(-1.893*1024)= -1938 = 0x186E (2'S compliment format of -1938 in 13-bit width)	RW	0x0

31 30 29 28	27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
MDT_MVSTMAX_COR_THR	MDT_MV_COR_THR	MDT_SF_SC_THR3	MDT_SF_SC_THR2	MDT_SF_SC_THR1

Bits	Field Name	Description	Type	Reset
31:28	MDT_MVSTMAX_COR_THR	This is used for increasing noise robustness. Increasing this threshold leads to more robustness to noise, but with the potential of introducing ghosting effect. Note that this threshold is used for motion values for EDI only, and it is in addition mdt_mv_cor_thr.	RW	0x0
27:24	MDT_MV_COR_THR	This threshold is for the coring for motion value, mv. MDT will become more noise robust if this value increases. But the picture may be washed out if this value is set to high. This threshold can be interpreted as the noise threshold for calculating motion values for all blocks.	RW	0x0
23:16	MDT_SF_SC_THR3	Spatial frequency threshold 3	RW	0x0
15:8	MDT_SF_SC_THR2	Spatial frequency threshold 2	RW	0x0
7:0	MDT_SF_SC_THR1	Spatial frequency threshold It is used for adaptive scaling of motion values according to how busy the texture is. If the texture is flat, motion values need to be scaled up to reflect the sensitivity of motion values with respect to the detection error. Increasing the thresholds will make the motion value scaling more sensitive to the frequency of the texture. Note: 0 = mdt_sf_sc_thr1 = mdt_sf_sc_thr2 = mdt_sf_sc_thr3	RW	0x0

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31:24	EDI_COR_SCALE_FACTOR	Scaling factor for correlation along detected edge	RW	0x0
23:16	EDI_DIR_COR_LOWER_THR	Lower threshold used for correlation along detected edge	RW	0x0
15:8	EDI_CHROMA3D_COR_THR	Correlation threshold used in 3D processing for chroma. Because the motion values used for chroma 3D processing are based on luma only. Extra protection is needed. Temporal interpolation is only performed for chroma, when there is strong spatial or temporal correlation for the chroma pixel being processed. When the pixel difference is less than this threshold, it is assumed that there exists strong correlation between these two pixels. Thus, increasing this value leads to more chroma pixels being processed in 3D	RW	0x0
7:4	RESERVED		R	0x0
3	EDI_CHROMA_3D_ENABLE	3D Chroma Enable 0x0 : Disable 3D processing for chroma 0x1 : Enable 3D processing (temporal interpolation)	RW	0x0
2	EDI_ENABLE_3D	3D Enable 0x0 : Disable 3D processing 0x1 : Enable 3D processing (temporal interpolation)	RW	0x0
1:0	EDI_INP_MODE	Interpolation mode. Note that mode 00 and 01 are used for debug purpose 0x0 : line average 0x1 : field average 0x2 : edge-directed interpolation for luma only 0x3 : edge-directed interpolation for both luma and chroma	RW	0x0

FMD_CAF_LINE_THR								FMD_CAF_FIELD_THR								RESERVED												FMD_BED_ENABLE	FMD_JAM_DIR	FMD_LOCK	FMD_ENABLE

Bits	Field Name	Description	Type	Reset
31:24	FMD_CAF_LINE_THR	CAF threshold used for the pixels from two lines in one field This is the threshold used for combing artifacts detection. The difference of two consecutive lines from the same field (so there is one line in between if two fields are merged into one progressive frame) is compared with this threshold. Decreasing this threshold leads to be more conservative in detecting CAF. Both fmd_caf_field_thr and fmd_caf_line_thr are close the values that two pixels differed by this value is observable.	RW	0x0
23:16	FMD_CAF_FIELD_THR	CAF threshold used for the pixels from two fields This is the threshold used for combing artifacts detection. The difference of two consecutive lines (when merging two fields into one progressive frame) is used to compare with this threshold. Increasing this threshold leads to be more conservative in detecting CAF.	RW	0x0
15:4	RESERVED		R	0x0
3	FMD_BED_ENABLE	Film Mode Bad Edit Detection 0x0 : Disable 0x1 : Enable	RW	0x0
2	FMD_JAM_DIR	Film Mode Field Jamming Direction 0x0 : Current field jammed with previous field 0x1 : Current field jammed with next field	RW	0x0
1	FMD_LOCK	Film Mode Field Jamming Direction 0x0 : Current field jammed with previous field 0x1 : Current field jammed with next field	RW	0x0
0	FMD_ENABLE	Enable film mode processing 0x0 : Disable 0x1 : Enable	RW	0x0

10.4.6 VPE_VPDMA Registers

NOTE: The functionality of the following sets of registers is not supported by VPE VPDMA in this family of devices:

- All VPE_INT1_* registers
- All VPE_INT2_* registers
- All VPE_INT3_* registers

The following channels are not used by VPE VPDMA in this family of devices. All register bit-fields corresponding to these channels should be kept at their reset value.

- VIP1_*, except for the following:
  - VIP1_PORTA_RGB
  - VIP1_PORTA_LUMA
  - VIP1_PORTA_CHROMA
- VIP2_*
- GRPX_*
- SCALER_OUT
- SCALER_LUMA
- SCALER_CHROMA
- NF_*
- TRANSCODE1_*
- TRANSCODE2_*
- AUX_IN
- PIP_FRAME
- POST_COMP_WR
- VBI_SD_VENC

10.4.6.2 VPE_VPDMA Register Description

Table 10-161. VPE_VPDMA_PID

Address Offset	0x0000 0000		
Physical Address	0x489D D000	**Instance**	VPE_VPDMA
Description	This register follows the format described in PDR3.5		
Type	R		

Copyright © 2015–2020, Texas Instruments Incorporated

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SCHEME								FUNC								RTL					MAJOR			VPDMA_LOAD_COMPLETE	VPDMA_ACCESS_TYPE	MINOR							

Bits	Field Name	Description	Type	Reset
31:30	SCHEME	The scheme of the register used. Currently this is PDR 3.5 Scheme	R	0x0
29:16	FUNC	The funcition of the module being used. The value is for vpe0_vayu_vpdma.	R	0x0
15:11	RTL	RTL Release Version The PDR release number of this IP. After Bootup this value becomes the firmware Revision ID	R	0x0
10:8	MAJOR	Major Release Number	R	0x0
7	VPDMA_LOAD_COMPLETE	This bit will be 1 when the VPDMA state machines image and data image have successfuly been fetched and loaded.	R	0x0
6	VPDMA_ACCESS_TYPE	After bootup this bit states how DMA transaction are setup by lists or through register access. 0x0 : Lists 0x1 : Register Access	R	0x0
5:0	MINOR	Minor Release Number	R	0x0

- VPE_VPDMA Register Description: [7]

Table 10-165. VPE_LIST_ATTR

Address Offset	0x0000 0008		
Physical Address	0x489D D008	**Instance**	VPE_VPDMA
Description	The attributes of a new list. This register should always be written after list_addr.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED					LIST_NUM			RESERVED			STOP	RDY	LIST_TYPE			LIST_SIZE																

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at LIST_ADDR. If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VPE_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated. 0x0 : Normal List 0x1 : Self-Modifying List 0x2 : List Doorbell Others Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

Table 10-167. VPE_LIST_STAT_SYNC

Address Offset	0x0000 000C		
Physical Address	0x489D D00C	**Instance**	VPE_VPDMA
Description	The register is used for processor to List Manager syncronization and status registers for the list.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								LIST7_BUSY	LIST6_BUSY	LIST5_BUSY	LIST4_BUSY	LIST3_BUSY	LIST2_BUSY	LIST1_BUSY	LIST0_BUSY	RESERVED								SYNC_LISTS7	SYNC_LISTS6	SYNC_LISTS5	SYNC_LISTS4	SYNC_LISTS3	SYNC_LISTS2	SYNC_LISTS1	SYNC_LISTS0

Bits	Field Name	Description	Type	Reset
31:24	RESERVED		R	0x0
23	LIST7_BUSY	The list 7 is currently running. Any attempt to load a new list to list 7 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
22	LIST6_BUSY	The list 6 is currently running. Any attempt to load a new list to list 6 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
21	LIST5_BUSY	The list 5 is currently running. Any attempt to load a new list to list 5 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
20	LIST4_BUSY	The list 4 is currently running. Any attempt to load a new list to list 4 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
19	LIST3_BUSY	The list 3 is currently running. Any attempt to load a new list to list 3 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
18	LIST2_BUSY	The list 2 is currently running. Any attempt to load a new list to list 2 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
17	LIST1_BUSY	The list 1 is currently running. Any attempt to load a new list to list 1 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
16	LIST0_BUSY	The list 0 is currently running. Any attempt to load a new list to list 0 will result in the LM_ADDR and LM_ATTR registers to be locked until the list is complete and this value goes to 0.	R	0x0
15:8	RESERVED		R	0x0
7	SYNC_LISTS7	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 7 waiting on it.	RW	0x0
6	SYNC_LISTS6	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 6 waiting on it.	RW	0x0
5	SYNC_LISTS5	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 5 waiting on it.	RW	0x0
4	SYNC_LISTS4	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 4 waiting on it.	RW	0x0
3	SYNC_LISTS3	Writing a 1 to this field causes a sync event to fire that clears a Control Descriptor in List 3 waiting on it.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last read DMA transaction has occurred for channel grpx3 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx3_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last read DMA transaction has occurred for channel grpx2 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx2_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_GRPX1	The last read DMA transaction has occurred for channel grpx1 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx1_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value	RW	0x0
27:20	RESERVED	Reserved	R	0x00
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

REQ_DELAY	REQ_RATE	BUSY	DMA_ACTIVE	FRAME_START	LINE_MODE	RESERVED

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles..This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles.This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0
13:10	FRAME_START	The source of the start frame event for the client. 0 : Change in value of hdmi_field_id 1 : Change in value of dvo2_field_id 2 : Change in value of hdcomp_field_id 3 : Change in value of sd_field_id 4 : Use List Manager Internal Field0 5 : Use List Manager Internal Field1 6 : Use List Manager Internal Field2 7 : Start on channel active	RW	0x0
9:8	LINE_MODE	Selects the output mode of the line buffer. 0: repeat lines twice each output data line gets 2 times the number of frame lines. 1: each line once with Line Buffer Disabled, so no mirroring. Each line gets frame lines with identical data. 2: Each line seen once Mirroring is enabled so the top lines get the top lines repeated at the top of the frame and the bottom lines have the bottom lines repeated. Each line of data gets frame lines + number of buffered lines. 3: each line once only on one line. Each data line gets number of frame lines divided by number of buffered lines.	RW	0x0
7:0	RESERVED		R	0x0

RESERVED																										STANDBYMODE		IDLEMODE		RESERVED	

Copyright © 2015–2020, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31:6	RESERVED		R	0x0
5:4	STANDBYMODE	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state 0x0: Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only 0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only 0x2: Same behavior as bit-field value of 0x1. 0x3: Reserved	RW	0x2
3:2	IDLEMODE	Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state 0x0: Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only 0x1: No-idle mode: local target never enters idle state. Backup mode, for debug only 0x2: Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wakeup events 0x3: Smart-idle wakeup-capable mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module may generate (IRQ- or DMA-request-related) wakeup events when in idle state. Mode is only relevant if the appropriate IP module "swakeup" output(s) is (are) implemented	RW	0x2

Bits	Field Name	Description	Type	Reset
31:19	RESERVED		R	0x0
18	COLOR_SEPARATE_422	422 Color Separate Select 0x0 : 422 output will be 16 bit interleaved (YCbCr) 0x1 : 422 output will be 8 bit coplanar (Y, CbCr) This bit controls whether 422 output will be color separate or interleaved. This bit only applies IF chr_ds_bypass is 1 (means 422 output, not 420) and rgb_out_select is 0 (means 422 output, not RGB or 444). 420 is always coplanar, so this only applies if the output type is 422.	RW	0x0
17	RESERVED		R	0x0
16	CHR_DS_BYPASS	Chroma Downsampler Bypass 0x0 : Chroma Downsampler selected 0x1 : Chroma Downsampler Bypassed Chroma Downsampler Bypassed means the output format from VPE0 will be 422 data. Selected means the output format will be 420. This bit is only applicable if rgb_out_select is 0. It is a don't care if rgb_out_select is 1.	RW	0x0

11.1 Display Subsystem Overview

NOTE: All the Display and HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. The availability of features is device part number dependent. Refer to the software development kit (SDK) and to device *Data Manual*, for more information. For devices with a single video output (VOUT1), the information on VOUT2 and VOUT3 can be ignored.

The Display Subsystem (DSS) provides the logic to display a video frame from the system memory frame buffer on a liquid-crystal display (LCD) panel or TV set.

The display subsystem can display different pictures simultaneously by using three LCD outputs (LCD1, LCD2, and LCD3), in addition to a TV output.

All three LCD outputs are available on three parallel interfaces (DPI1, DPI2, and DPI3), providing support for MIPI DPI 2.0, or BT-656 or BT-1120.

The TV output is available on one of the following interfaces

- High-Definition Multimedia Interface (HDMI)
- DPI1 parallel interface

The modules integrated in the display subsystem are:

- Display controller (DISPC):
  - One direct memory access (DMA) engine
  - One graphics pipeline (GFX), three video (VID) pipelines, and one write-back (WB) pipeline
  - Three LCD outputs and one TV output, each with a dedicated overlay manager
- HDMI protocol engine:
  - HDMI 1.4a support up to 1080p@60Hz (including 3D frame-packing support)
  - 36-bit RGB color
  - HDCP 1.4 key protection
  - Deep color mode support (10-bit/12-bit for 148.5-MHz pixel clock)

The necessary video phase-locked loops (PLLs) with their corresponding control modules, and the physical layer (PHY) for HDMI are outside the display subsystem. The video PLLs allow independant display outputs at different frequencies. The supported PLLs and PHY are:

- DPLL_HDMI / HDMI_PHY
- DPLL_VIDEO1
- DPLL_VIDEO2

To ensure efficient bandwidth, the display subsystem integrates a connection between the device L3_MAIN interconnect and the DISPC to exchange data with synchronous dynamic random access memory (SDRAM) using the DISPC DMA engine. The same connection is also used for configuration.

Figure 11-1 is a high-level diagram of the display subsystem.

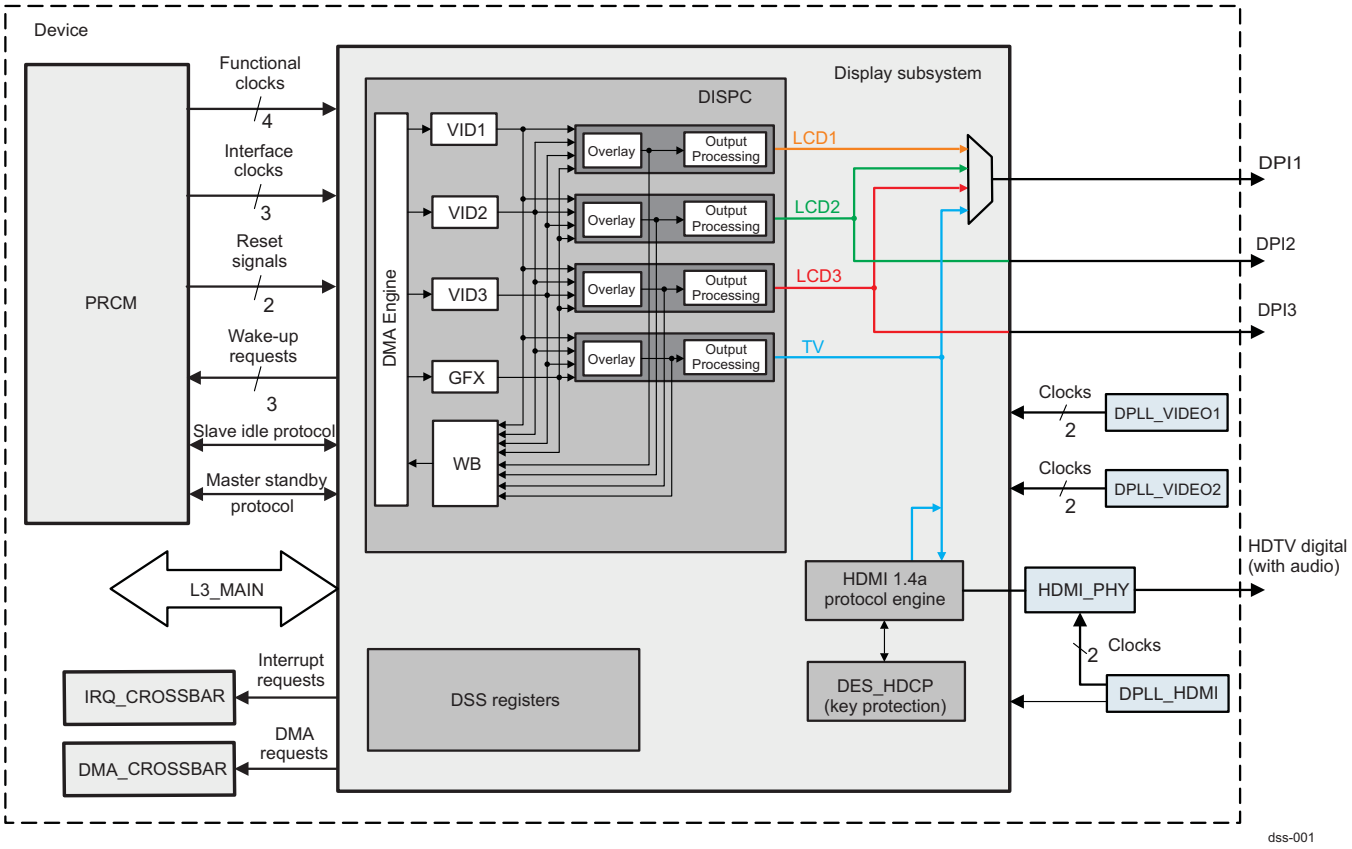
Figure 11-1. Display Subsystem Overview



11.1.1 Display Subsystem Environment

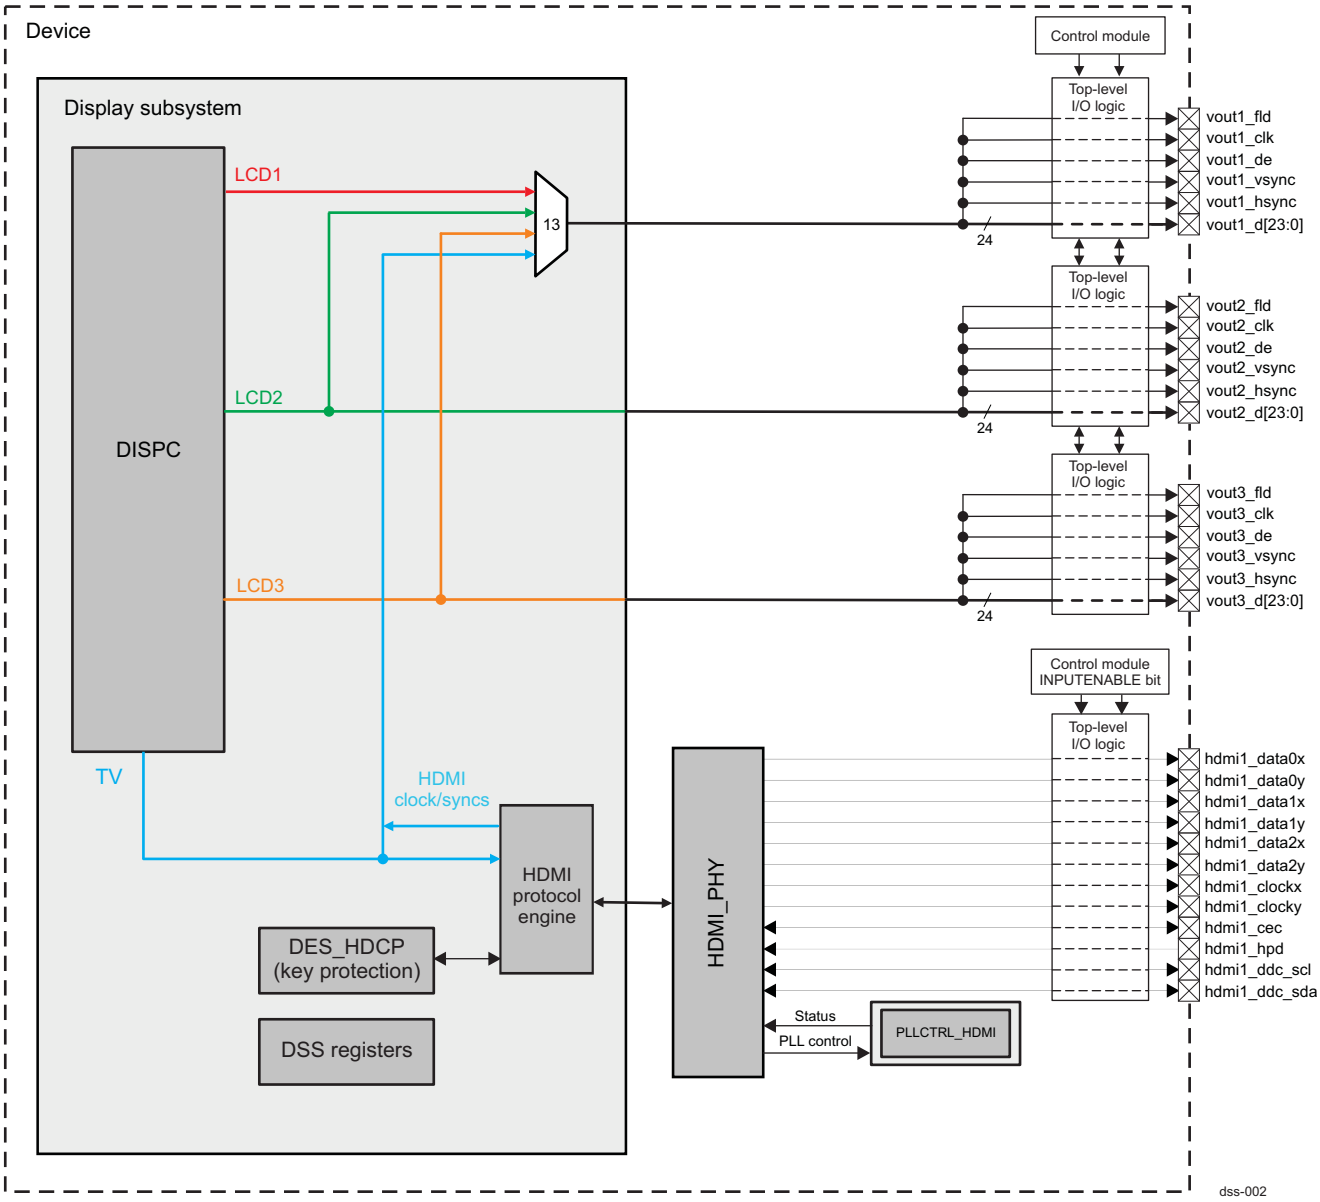
This section describes the various outputs handled by the display subsystem:

- LCD support
- TV display support

Figure 11-2 is a diagram of the display subsystem environment.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 11-2. Display Subsystem Environment



NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see Section 18.4.6.1.1 *Pad Configuration Registers* in Chapter 18, *Control Module*.

11.1.1.1 Display Subsystem LCD Support

LCD panels can be connected to the display subsystem of the device using DPI1, DPI2, and/or DPI3 parallel interfaces.

11.1.1.1.1 Display Subsystem LCD with Parallel Interfaces

Using parallel output mode, the module on the display subsystem processing path is DISPC.

Copyright © 2015–2020, Texas Instruments Incorporated

In synchronous parallel interface, the required data and control signals are provided directly to external MIPI DPI 2.0, or BT-656 or BT-1120 compatible parallel panels.

The DISPC is connected to the system memory through the device L3_MAIN interconnect and uses its own DMA engine (with embedded FIFO) to read data from the system memory. For more details, see Section 11.2.1, *Display Controller*.

All three DISPC LCD outputs are available for DSS DPI1 output, with selection done through the DSS_CTRL[17:16] PARALLEL_SEL bit field (multiplexer 13 in Figure 11-2). DSS DPI2 and DPI3 outputs are hardwired to DISPC LCD2 and LCD3 outputs.

Table 11-1 to Table 11-3 lists the outgoing display subsystem signals on the device boundary pads.

Table 11-1. Display Subsystem DPI1 Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DSS_CTRL[17:16] PARALLEL_SEL = 1, 2, or 3 DISPC LCDx Channel Out (pixel data, clock, syncs) (where x = 1, 2, or 3)
vout1_fid	DISPC_LCDx_FID
vout1_clk	DISPC_LCDx_PCLK
vout1_de	DISPC_LCDx_DE
vout1_vsync	DISPC_LCDx_VSYNC
vout1_hsync	DISPC_LCDx_HSYNC
vout1_d[23:0]	DISPC_LCDx_DATA[23:0]

NOTE: By default, DSS_CTRL[17:16] PARALLEL_SEL = 0x0, and DISPC TV data and HDMI clk/sync signals are output on DPI1 interface pins. Software must program the PARALLEL_SEL bit-field to value other than 0x0, in order DISPC LCD data and clk/sync signals to be output on DPI1 interface pins.

Table 11-2. Display Subsystem DPI2 Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DISPC LCD2 Channel Out (pixel data, clock, syncs)
vout2_fid	DISPC_LCD2_FID
vout2_clk	DISPC_LCD2_PCLK
vout2_de	DISPC_LCD2_DE
vout2_vsync	DISPC_LCD2_VSYNC
vout2_hsync	DISPC_LCD2_HSYNC
vout2_d[23:0]	DISPC_LCD2_DATA[23:0]

Table 11-3. Display Subsystem DPI3 Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DISPC LCD3 Channel Out (pixel data, clock, syncs)

vout3_hsync	DISPC_LCD3_HSYNC
vout3_d[23:0]	DISPC_LCD3_DATA[23:0]

Copyright © 2015–2020, Texas Instruments Incorporated

For more details on LCD output pixel data formats for the parallel interface, see Section 11.2 *DISPC Environment*, in *Display Controller*.

11.1.1.2 Display Subsystem TV Display Support

When TV data flow is needed from the display subsystem, the DPI1 output or HDMI output can be used.

11.1.1.2.1 Display Subsystem TV With Parallel Interfaces

In synchronous parallel interface configuration, the required data is provided by the DISPC TV output, and control signals are provided by the HDMI module. Then they are merged and provided to the DPI1 output.

This configuration option is available and can be selected through the DSS_CTRL[17:16] PARALLEL_SEL bit field (multiplexer 13 in Figure 11-4).

Table 11-4 lists the outgoing display subsystem signals on the device boundary pads.

Table 11-4. Display Subsystem TV Parallel Interface Signals Mapping

Signal Names at Device Pads (See Figure 11-2)	DSS_CTRL[17:16] PARALLEL_SEL = 0 DISPC TV Channel Out (pixel data) HDMI (pixel clock, syncs)
vout1_fid	HDMI_M_FID
vout1_clk	DSS_HDMI_PCLK
vout1_de	HDMI_M_DE
vout1_vsync	HDMI_M_VS
vout1_hsync	HDMI_M_HS
vout1_d[23:0]	DISPC_TV_DATA[29:0]

For more details on TV output pixel data formats for the parallel interface, see Section 11.2.2 *DISPC Environment*, in *Section 11.2.1 Display Controller*.

11.1.1.2.2 Display Subsystem TV With Serial Interfaces

In serial interface configuration, the HDMI module is used. The DISPC, HDMI, DES_HDCP, and the associated HDMI PHY module are used in the data path. The HDMI module converts the RGB video into standard high-definition digital video format. The HDMI module has a dedicated PLL, which can multiply the pixel clock by an appropriate factor. The data is transmitted on three differential data pairs and an additional clock pair.

For more details, see Section 11.3, in *High-Definition Multimedia Interface*.

11.1.2 Display Subsystem Integration

This section describes the integration of the display subsystem module in the device, including information about clocks, resets, and hardware requests.

Figure 11-3 shows the integration of the display subsystem in the device.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 11-3. Display Subsystem Integration

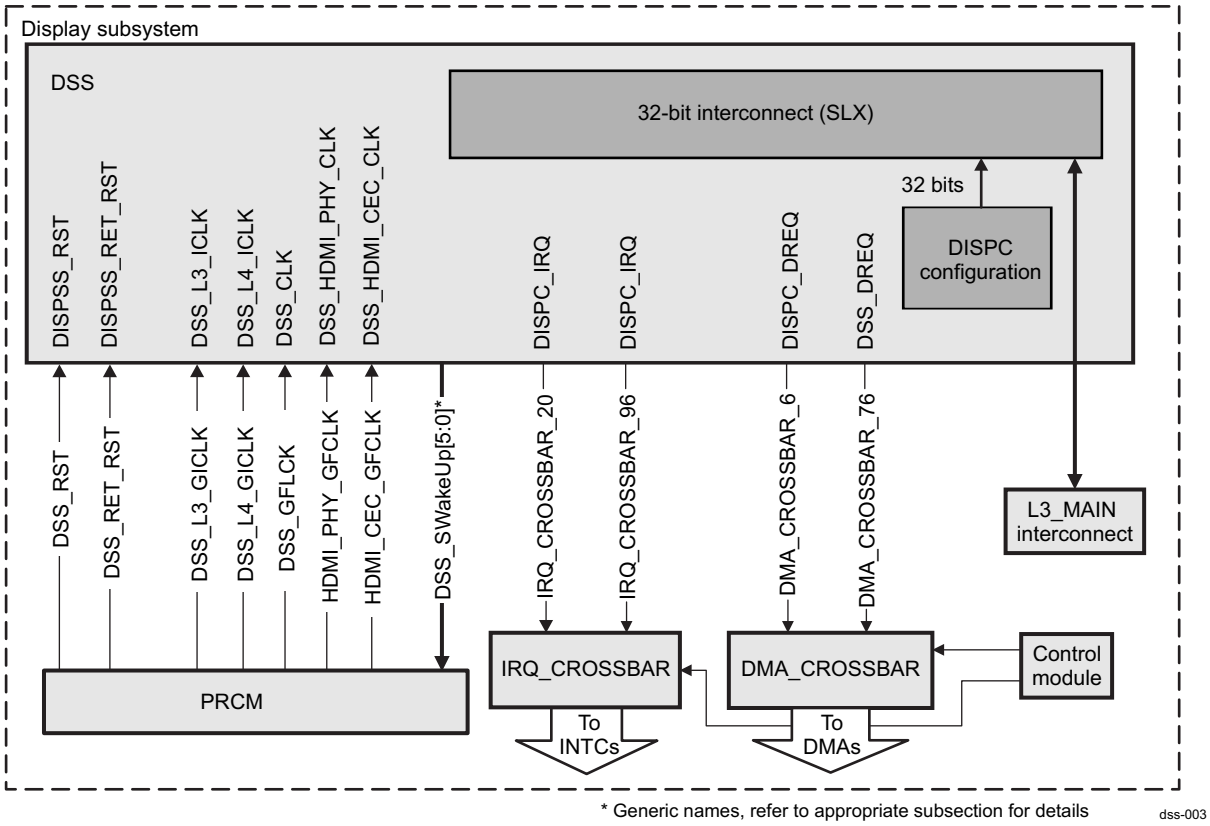

Table 11-5. Display Subsystem Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	MPU_IRQ_25 DSP1_IRQ_58 DSP2_IRQ_58 IPU1_IRQ_26 IPU2_IRQ_26	DISPC interrupt requests.
HDMI	HDMI_IRQ	IRQ_CROSSBAR_96	MPU_IRQ_101 IPU1_IRQ_26 IPU2_IRQ_26	HDMI interrupt requests.
DMA Requests				
Module Instance	**Source Signal Name**	**Destination DMA_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5 DMA_SYSTEM_DREQ_5	The line trigger signal to synchronize a memory-to-memory logical channel in the DMA is generated by the DISPC IP.
HDMI	DSS_DREQ	DMA_CROSSBAR_76	DMA_SYSTEM_DREQ_75	Display subsystem HDMI audio DMA request

Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: The "**Default Mapping**" column in Table 11-5 *Display Subsystem Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.
For more information about the DMA_CROSSBAR module, see Section 18.4.6.5, *DMA_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.
For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.
For more information about the device DMA_SYSTEM module, see Section 16.1, *System DMA*.
For more information about the device EDMA module, see Section 16.2, *Enhanced DMA*.

11.1.2.1 Display Subsystem Clocks

The power, reset, and clock management (PRCM) module provides clock signals to the display subsystem.

Figure 11-4 shows the details of the display subsystem clock tree.

Figure 11-4. Display Subsystem Clock Tree

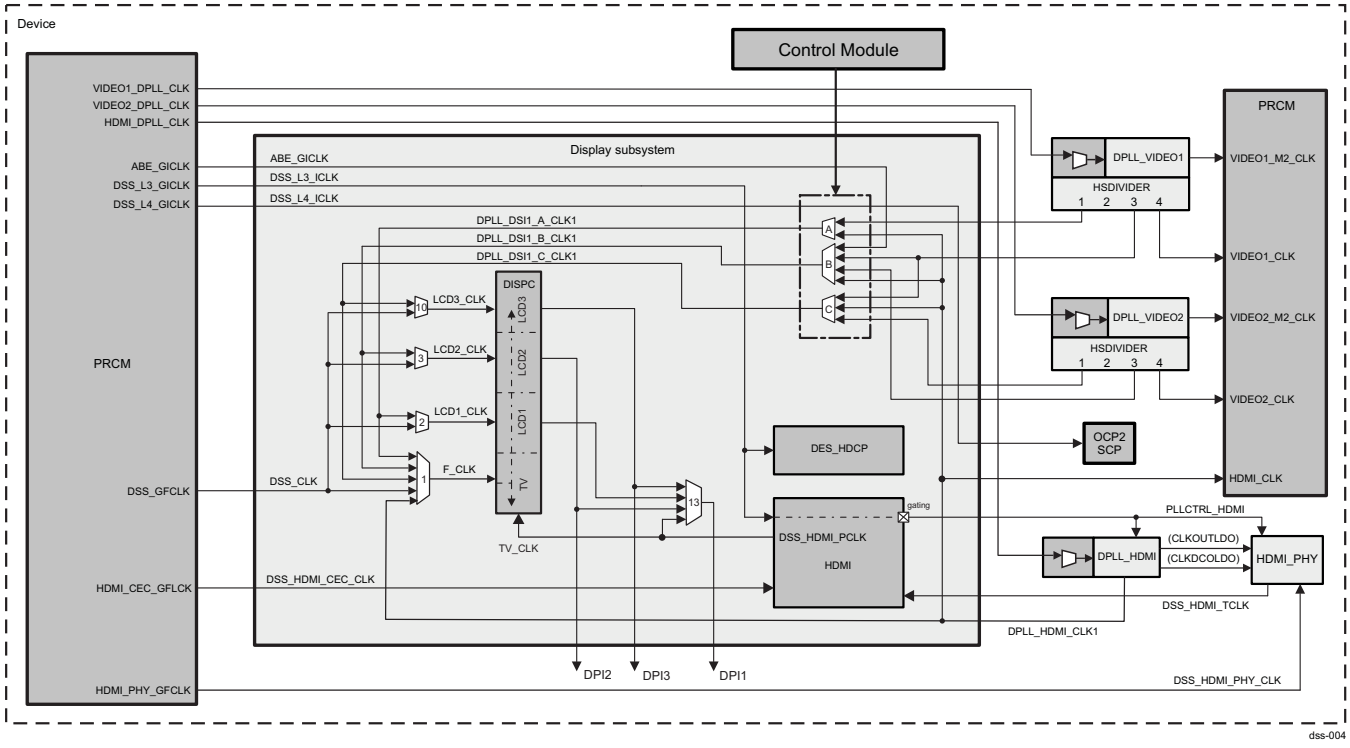

Table 11-6 lists the main DSS clocks and their sources.

Table 11-6. Display Subsystem Clocks

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DSS	DPLL_VIDEO1 input	VIDEO1_DPLL_CLK	PRCM module	Functional clock
	DPLL_VIDEO2 input	VIDEO2_DPLL_CLK	PRCM module	Functional clock
	DPLL_HDMI input	HDMI_DPLL_CLK	PRCM module	Functional clock

Copyright © 2015–2020, Texas Instruments Incorporated

Table 11-6. Display Subsystem Clocks (continued)

	DSS_L3_ICLK	DSS_L3_GICLK	PRCM module	Interface clock
	DSS_L4_ICLK	DSS_L3_GICLK	PRCM module	Interface clock
	-	ABE_GICLK	PRCM, DPLL_ABE	Functional clock
	DSS_CLK	DSS_GFCLK	PRCM module	Main display subsystem functional clock
	HDMI_CEC_GFCLK	DSS_HDMI_CEC_CLK	PRCM module	HDMI core CEC engine clock
	HDMI_PHY_GFCLK	DSS_HDMI_PHY_CLK	PRCM module	HDMI_PHY clock

- The clock source for the L3 interface clock is DSS_L3_ICLK. All clocks can be gated at PRCM level. See Section 3.1.1.1.2, *Module-Level Clock Management*, in Chapter 3, *Power, Reset and Clock Management*.
- The clock sources for the display subsystem modules are listed in Table 11-7.

Table 11-7. Display Subsystem Modules Clock Sources

Destination	Source Signal Name	Source	Multiplexer Number in Figure 11-4	DSS_CTRL Register Bit-field
DISPC functional clock (F_CLK)	DSS_CLK	PRCM	1	[9:7] F_CLK_SWITCH
	DPLL_DSI1_A_CLK1	DPLL_VIDEO1, DPLL_HDMI		
	DPLL_DSI1_B_CLK1	DPLL_VIDEO1, DPLL_VIDEO2, DPLL_HDMI, DPLL_ABE		
	DPLL_DSI1_C_CLK1	DPLL_VIDEO1, DPLL_VIDEO2, DPLL_HDMI

Copyright © 2015–2020, Texas Instruments Incorporated

NOTE:

- In Figure 11-4, clkout1, clkout3, and clkout4 of DPLL_VIDEO1 and DPLL_VIDEO2 correspond to M4, M6, and M7 outputs of the associated HS divider module (HSDIVIDER). For more information on the configuration of DPLL_VIDEO clocks, see Section 11.1.3.3, *DPLL_VIDEO Functional Description*.
- For synchronization purpose, the clkout4 (M7) output of each HSDIVIDER is used to source McASP module and peripheral timers. For more information, see Chapter 22, *Timers,* and Section 24.5*, Multichannel Audio Serial Ports*.
- Multiplexers A, B, and C in Figure 11-4 are controlled by [4:3] DSI1_A_CLK1_SELECTION, [6:5] DSI1_B_CLK1_SELECTION, and [8:7] DSI1_C_CLK1_SELECTION bit-fields, respectively, of DSS_PLL_CONTROL register in the device Control Module. For more information, see Chapter 18, *Control Module*.

11.1.2.2 Display Subsystem Resets

The PRCM module provides two reset signals to the display subsystem.

Figure 11-5 shows the details of the reset tree for the display subsystem.

Figure 11-5. Display Subsystem Reset Scheme

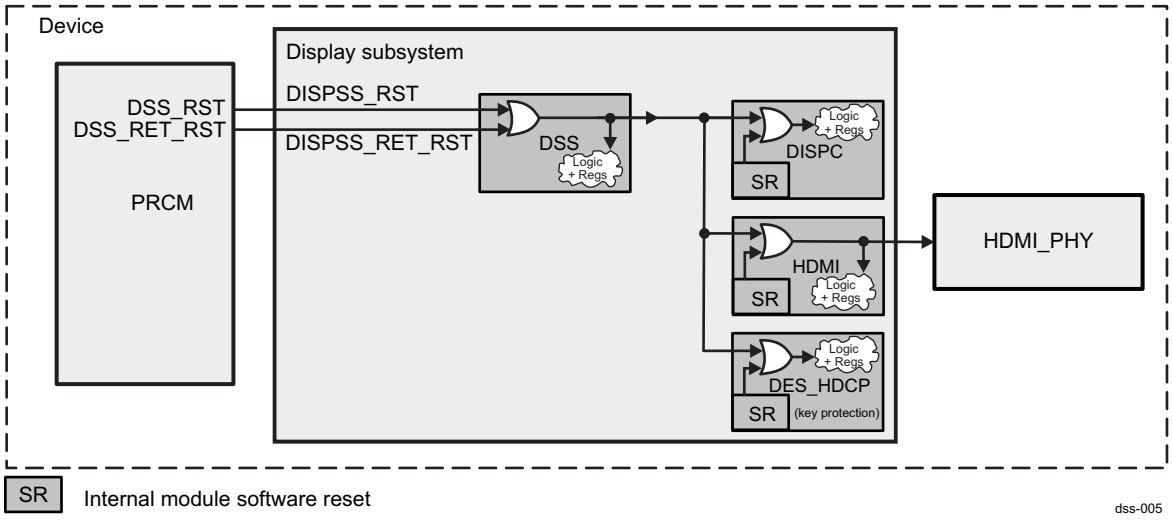

Table 11-8 lists the resets for the display subsystem.

Table 11-8. Display Subsystem Resets

Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DSS	DISPSS_RET_RST	DSS_RET_RST	PRCM module	Retention reset
	DISPSS_RST	DSS_RST	PRCM module	Nonretention reset

The display subsystem receives its DISPSS_RST reset signal (the reset signal of the display subsystem power domain) from the PRCM module. The DISPSS_RET_RST is used only for the DES_HDCP key protection module and HDMI.

11.1.2.3 Display Subsystem Power Management

The display subsystem modules are in the display subsystem power domain.

Table 11-9 lists the power domains in the display subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 11-9. Display Subsystem Power Domains

Module Instance	Attributes
	Power Domain
Display subsystem	PD_DSS
DISPC	For more details, see Section 11.2.1 *DISPC Overview*, in *Display Controller*.
HDMI	For more details, see Section 11.3.1 *HDMI Overview*, in *High-Definition Multimedia Interface*.

11.1.2.3.1 Display Subsystem Standby Mode

As part of the system-wide power-management scheme, the display subsystem supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

- MStandby/MWait
  - DISPC
- SIdleReq/SIdleAck
  - DISPC
  - HDMI
  - DES_HDCP (key protection)
  - DSS interconnect

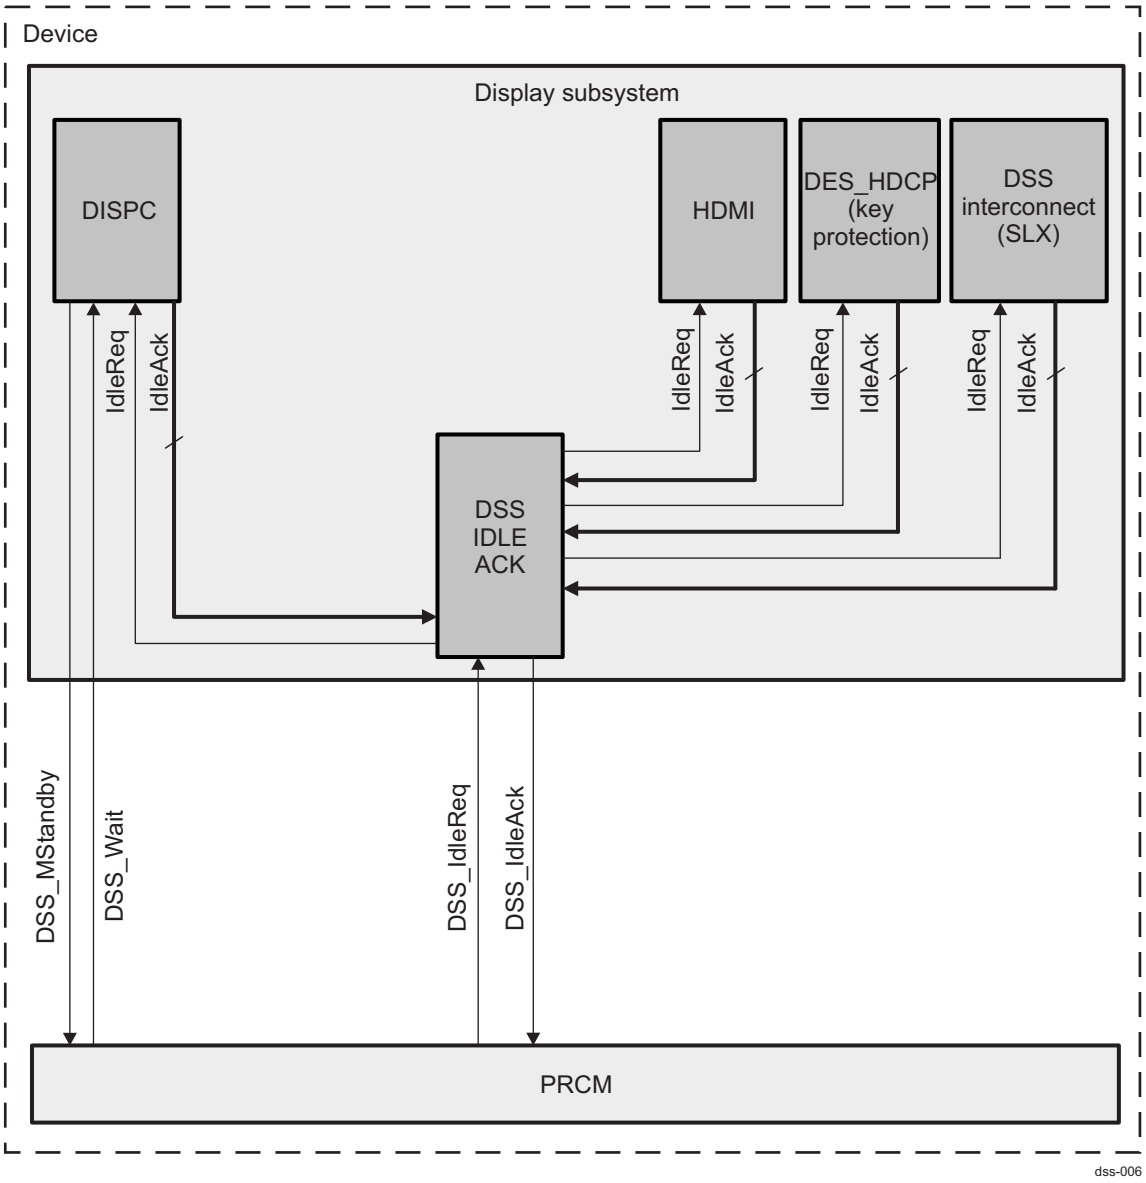
The PRCM module asserts the MWait and received MStandby directly from DISPC. When the display subsystem initiates a standby procedure, it also initiates a master standby/wait protocols with the PRCM module that lets the PRCM module cut the display subsystem clocks. For information about the conditions that allow the subsystem to exit standby mode, see Section 11.2.1 *DISPC Overview*, in *Display Controller*.

The PRCM also asserts the SIdleReq. Then, it is split at the display subsystem level and send to the appropriate modules. Consequently, all SIdleAck are merged into one and sent back to PRCM.

Figure 11-6 shows the generation of SIdleAck/MStandby in the display subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 11-6. Display Subsystem SIdleAck/MStandby Generation



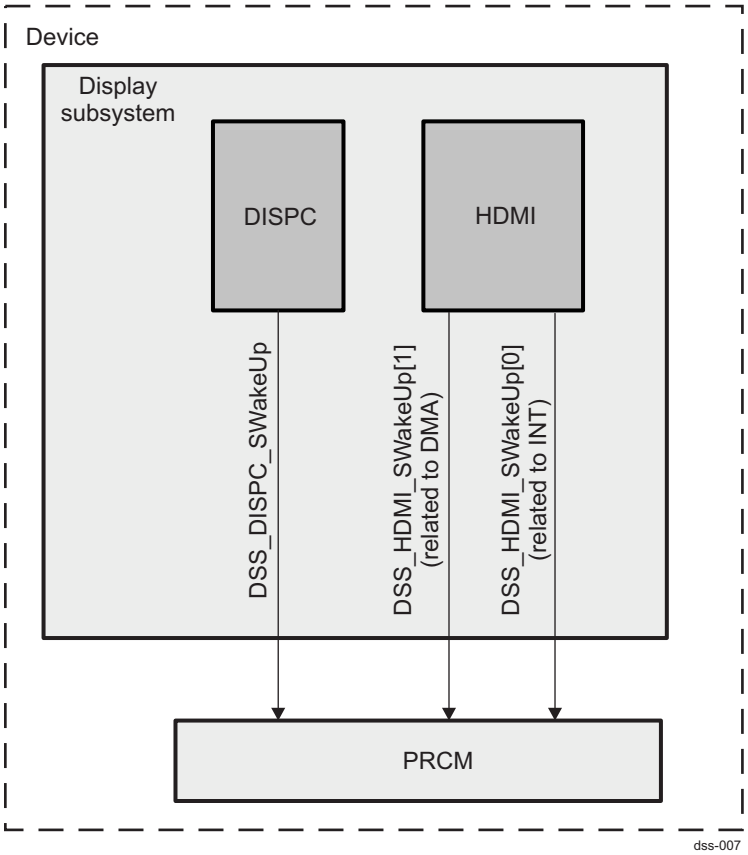
11.1.2.3.2 Display Subsystem Wake-Up Mode

The DISPC and HDMI modules support the wake-up protocol. DSS_HDMI_SWakeUp is associated with HMDI_IRQ, which is generated by the HDMI module. For the events that generate an Swakeup and the description and configuration of the registers, see the DISPC and HDMI TRM chapters.

Figure 11-7 shows wake-up generation in the display subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 11-7. Display Subsystem Wake-Up Generation



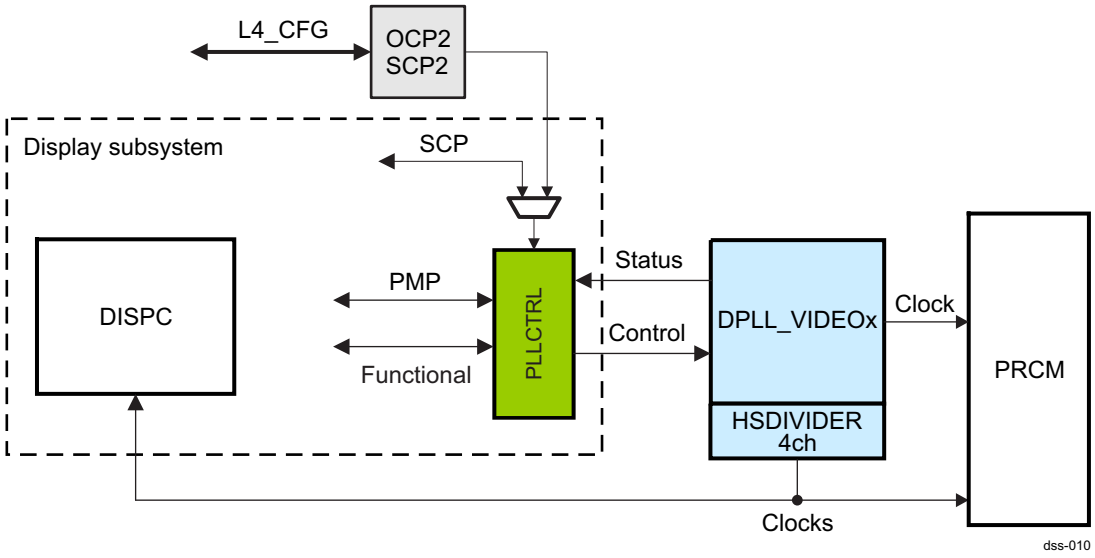
11.1.3 Display Subsystem DPLL Controllers Functional Description

11.1.3.1 DPLL Controllers Overview

Three PLL controller modules are part of the display subsystem. They use the SCP and power-management port (PMP) as the primary interfaces. The SCP interface sets the configuration of the digital phase-locked loop (DPLL) and HSDIVIDER modules, primarily the various counter values. The PMP controls the power state of the DPLL and HSDIVIDER modules. Figure 11-8 is an overview of a single DPLL_VIDEO controller module in the display subsystem. For more information on DPLL_HDMI control, see Section 11.1.3.4, *DPLL_HDMI*.

Copyright © 2015–2020, Texas Instruments Incorporated

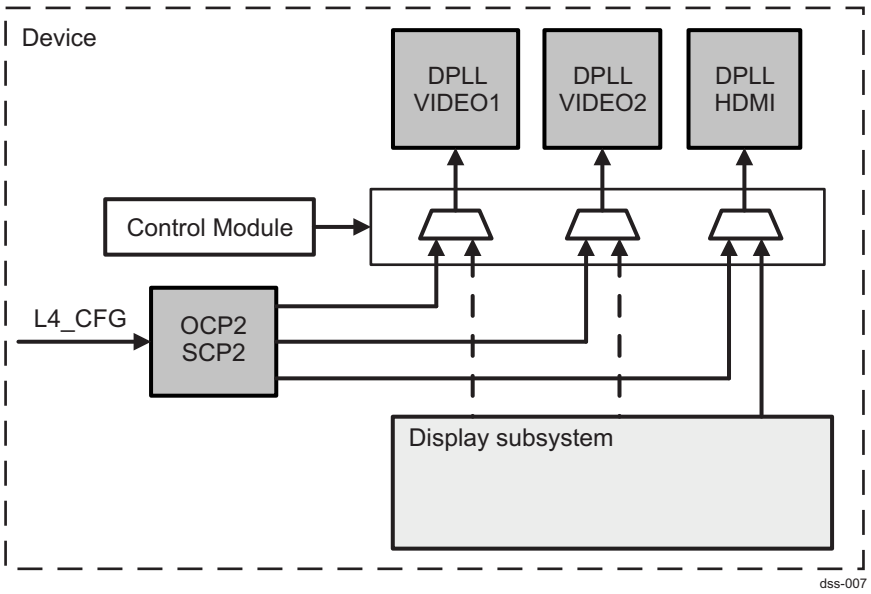
Figure 11-8. PLL Controller Overview



11.1.3.2 OCP2SCP2 Functional Description

In case DSS module is not used, DPLL_VIDEO1, DPLL_VIDEO2 and DPLL_HDMI can be still used to source other modules in the device. The OCP2SCP2 module, which serves as a L4_CFG interconnect adapter, lets user software configure the PLLCTRL for DPLL_VIDEO1, DPLL_VIDEO2 and DPLL_HDMI registers over the L4_CFG port. Figure 11-9 is an overview of the OCP2SCP2 bridge interface.

Figure 11-9. OCP2SCP2 Overview



NOTE: Selection of how DPLLs are controlled is done through registers DSS_PLL_CONTROL[0] PLL_VIDEO1_DSS_CONTROL_DISABLE, DSS_PLL_CONTROL[1] PLL_VIDEO2_DSS_CONTROL_DISABLE and DSS_PLL_CONTROL[2] PLL_HDMI_DSS_CONTROL_DISABLE of the device Control Module. For more information, see Chapter 18, *Control Module*.

Copyright © 2015–2020, Texas Instruments Incorporated

11.1.3.2.1 OCP2SCP2 Reset

11.1.3.2.1.1 Hardware Reset

The module receives an asynchronous hardware reset (L3INIT_RST) upon power-on reset (POR) at its active low PIRSTNA input. For more information on the hardware reset source, see Section 3.5.5, *Reset Domains*, in Chapter 3,*Power, Reset, and Clock Management.*

11.1.3.2.1.2 Software Reset

Setting the OCP2SCP_SYSCONFIG[1] SOFTRESET bit to 1 triggers a software reset on the OCP2SCP2 interconnect adapter. The OCP2SCP_SYSSTATUS[0] RESETDONE bit is used by software to monitor the status of reset completion. Hardware keeps this bit it at 0 while the reset is being executed. A RESETDONE bit transition from 0 to 1 indicates the OCP2SCP2 reset is complete.

11.1.3.2.2 OCP2SCP2 Power Management

The OCP2SCP2 features idle acknowledgement protocol with the PRCM.

11.1.3.2.2.1 Idle Mode

The smart-idle mode supported by OCP2SCP2 is not wakeup capable, meaning that software should explicitly take care to wake the OCP2SCP2, setting the OCP2SCP_SYSCONFIG[4:3] IDLEMODE bit field to 0x1 (no-idle), once it has previously gone to an idle mode. For more information, see Section 3.1.1.1.4, *Module-Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management.*

NOTE: Software must get the OCP2SCP2 module out of IDLE state by setting the OCP2SCP_SYSCONFIG[4:3] IDLEMODE bit field to 0x1, once smart-ilde mode has been selected (OCP2SCP_SYSCONFIG[4:3] IDLEMODE = 0x2).

11.1.3.2.2.2 Clock Gating

OCP2SCP2 module has a local support for an automatic clock gating based on L4_CFG interconnect activity. This feature is enabled by setting the OCP2SCP2[0] AUTOIDLE bit to 0x1, otherwise the module interface clock is free running. For more information, see Section 3.6.4.1.4, *Clock Domain-Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management.*

11.1.3.2.3 OCP2SCP2 Timing Registers

The timing configuration register sets various parameters controlling the timing constraints of the OCP2SCP2 module. The division ratio between the L4_CFG interconnect clock - L3INIT_L4_GICLK and the serial configuration port output clock is set through the OCP2SCP_TIMING[9:7] DIVISIONRATIO bit field, with a valid range of 0x1 to 0x7. The OCP2SCP_TIMING[6:4] SYNC1 timing information is programmable in the range 0 to 7 clock cycles, and shows the acceptable delay between the enable and command availability on SCP. The value of OCP2SCP_TIMING[3:0] SYNC2 is also programmable in the range 1 to 15 clock cycles, measured from the moment the command is available on SCP until data is accessible.

11.1.3.3 DPLL_VIDEO Functional Description

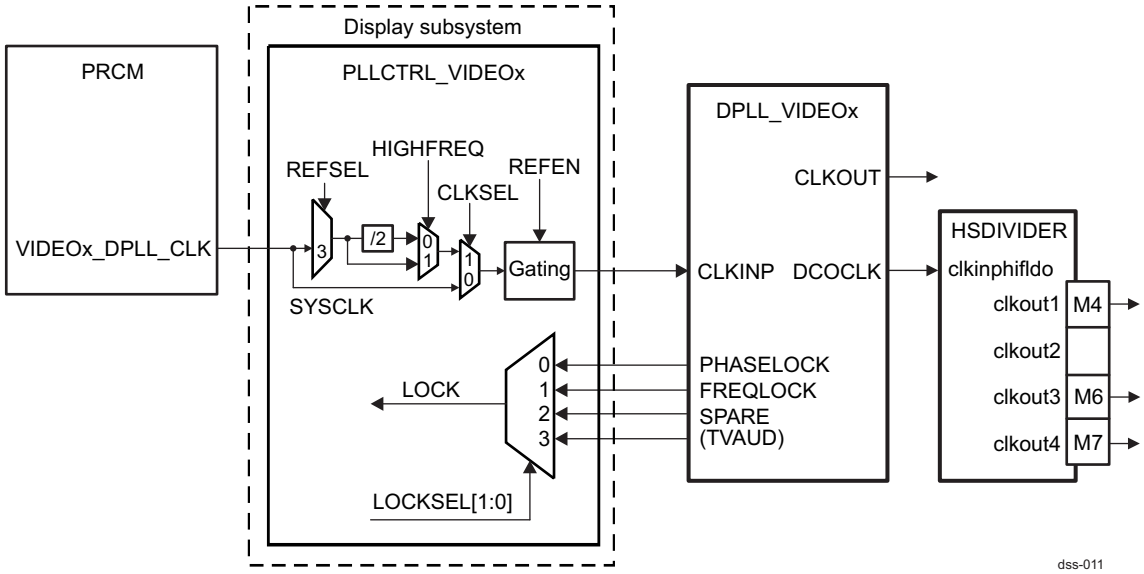
11.1.3.3.1 DPLL_VIDEO Controller Architecture

VIDEO1 PLL and VIDEO2 PLL use type-A instances of the DPLL modules. For information regarding DPLL types, see Chapter 3, PRCM.

Figure 11-10 shows the internal reference diagram of a single VIDEO PLL.

Copyright © 2015–2020, Texas Instruments Incorporated

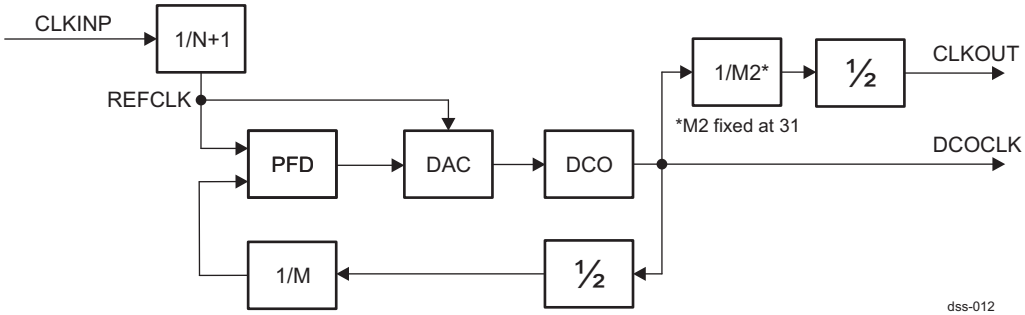
Figure 11-10. VIDEO PLL Reference Diagram



Reference clock control is enabled with PLL_CONFIGURATION2[13] PLL_REFEN bit.

Figure 11-11 is a simplified block diagram of the DPLL_VIDEO instance used for pixel clock generation.

Figure 11-11. DPLL_VIDEO Functional Block Diagram



The input clock CLKINP goes to a pre-divider N + 1. The entire loop runs on the REFCLK clock after this pre-divider. The value of N + 1 is controlled through the PLL_CONFIGURATION1[8:1] PLL_REGN bit field. The CLKINP range is 0.032MHz to 52MHz. The REFCLK range is 0.15MHz to 52MHz.

The output clock DCOCLK is synthesized by a digitally controlled oscillator (the DCO block) that automatically detects the frequency range. The DCOCLK frequency can be given with DCOCLK = CLKINP × 2 × M / (N + 1). For that purpose the feedback multiplier M must be configured through the PLL_CONFIGURATION1[20:9] PLL_REGM bit field.

The CLKOUT frequency can be given with CLKOUT = DCOCLK / (M2 × 2) = DCOCLK / 62. The M2 divider value is hardcoded in HW at 31 (0x1F).

DPLL_VIDEO1 supports Spread Spectrum Clocking (SSC) using the configurations described in the device *Spread Spectrum Clocking Configuration Application Report* (SPRABY0). The SSC feature on DPLL_VIDEO2 is not supported.

11.1.3.3.2 DPLL_VIDEO Operations

The PLL configuration signals operate according to Table 11-10, which indicates the operation when the PLLs are not locked.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 11-10. VIDEO PLL Operation Modes When Not Locked

PLL Operation Mode	Stop Mode Low Power[1]	Stop Mode Fast Relock[1]	Idle Bypass
Mode Description	Output clocks stopped Lowest power standby	Output clocks stopped Fastest start-up time	Selects when PLL and HSDIVIDER bypass clocks are used
PLL_CONFIGURATION2[0] PLL_IDLE	0	0	1
PLL_CONFIGURATION2[6] PLL_LOWCURRSTBY	1	0	1

(1) This mode must be used for better performance.

When locked, the PLL output frequency (DCOCLK) is: Input frequency × 2 × M / (N + 1), where:

- M multiplier is programmed in the PLL_CONFIGURATION1[20:9] PLL_REGM bit field.
- N divider is programmed in the PLL_CONFIGURATION1[8:1] PLL_REGN bit field.

NOTE: When the PLL_REGM bit field is set to 1, the PLL enters a MN-Bypass mode. The DCOCLK clock output goes low and remains low until the PLL exits MN-Bypass mode (by changing the PLL_REGM bit field to a value other than 0 or 1).

11.1.3.3.3 DPLL_VIDEO Error Handling

The PLL lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The PLL_STATUS[1] PLL_LOCK status bit gives the VIDEOx PLL lock state.
- The PLL_STATUS[2] PLL_RECAL status bit informs whether the PLL must be uncalibrated.

11.1.3.3.4 DPLL_VIDEO Software Reset

The VIDEO PLL control module does not have its own software reset. It is reset by the global DSS_RST signal at PRCM module level. See Section 11.1.2.2, *Display Subsystem Resets*. Nevertheless, software users can monitor the reset statuse of the VIDEO PLL control module by reading the PLL_STATUS[0] PLLCTRL_RESET_DONE status bits.

11.1.3.3.5 DPLL_VIDEO Power Management

PLLCTRL manages only the LDO power of the DPLL and HSDIVIDER; this is done by overriding the SYSRESET signals. All other power-management signals are integrated with the display subsystem power management.

The PMP is used to manage the LDO power of the VIDEO digital phase-locked loop (DPLL) through the PLLCTRL module.

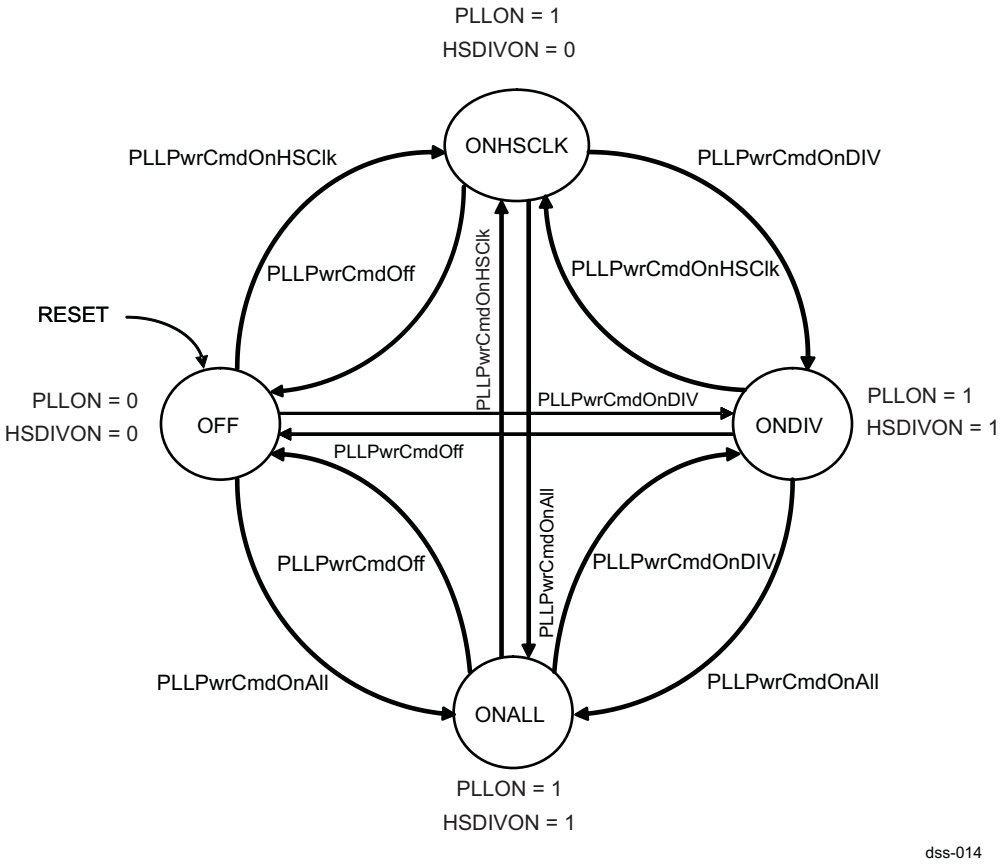
Figure 11-12 shows the power states, which can be controlled through DSI_CLK_CTRL[31:30] PLL_PWR_CMD bit field.

The PLLCTRL power status can be read through the DSI_CLK_CTRL [29:28] PLL_PWR_STATUS bit field.

- OFF power state: PLLCTRL is powered down. Internal clock is off.
- ONHSCLK: Power command received
- ONDIV: Clock dividers set.
- ONALL: PLLCTRL is in active state.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 11-12. VIDEO PLL Power State Diagram



11.1.3.3.6 DPLL_VIDEO HSDIVIDER Loading Operation

In manual mode (PLL_CONTROL[0] PLL_AUTOMODE = 0), it is possible to update the configuration values of HSDIVIDER without starting the DPLL locking sequence. Once all the configuration values have been programmed into the registers, the PLL_GO[1] HSDIVLOAD bit must be set. The TENABLEDIV output is driven high for six SCP clock periods while the TINITZ and TENABLE signals remain unchanged. The HSDIVLOAD bit is cleared at the end of the sequence.

The SCPBUSY signal is high during the sequence until the HSDIVLOAD bit is cleared, thus indicating that there is pending activity in the SCPClk domain. SCPClk must be kept running while this signal is asserted.

The HSDIVIDER sequence and the GO sequence cannot be performed at the same time. If one of the two sequences is running and the trigger bit of the other sequence is set, PLLCTRL finishes the first sequence and then immediately starts the other sequence.

11.1.3.3.7 DPLL_VIDEO Clock Sequence

The VIDEO PLL generates DCOCLK clock to a dedicated HSDIVIDER, which outputs three clocks (clkout1, clkout3, clkout4). If these three clocks are not used, the HSDIVIDER functions are not required.

In addition, a CLKOUT clock is also generated. It is output directly, and does not go through HSDIVIDER.

The following must be considered for Figure 11-13:

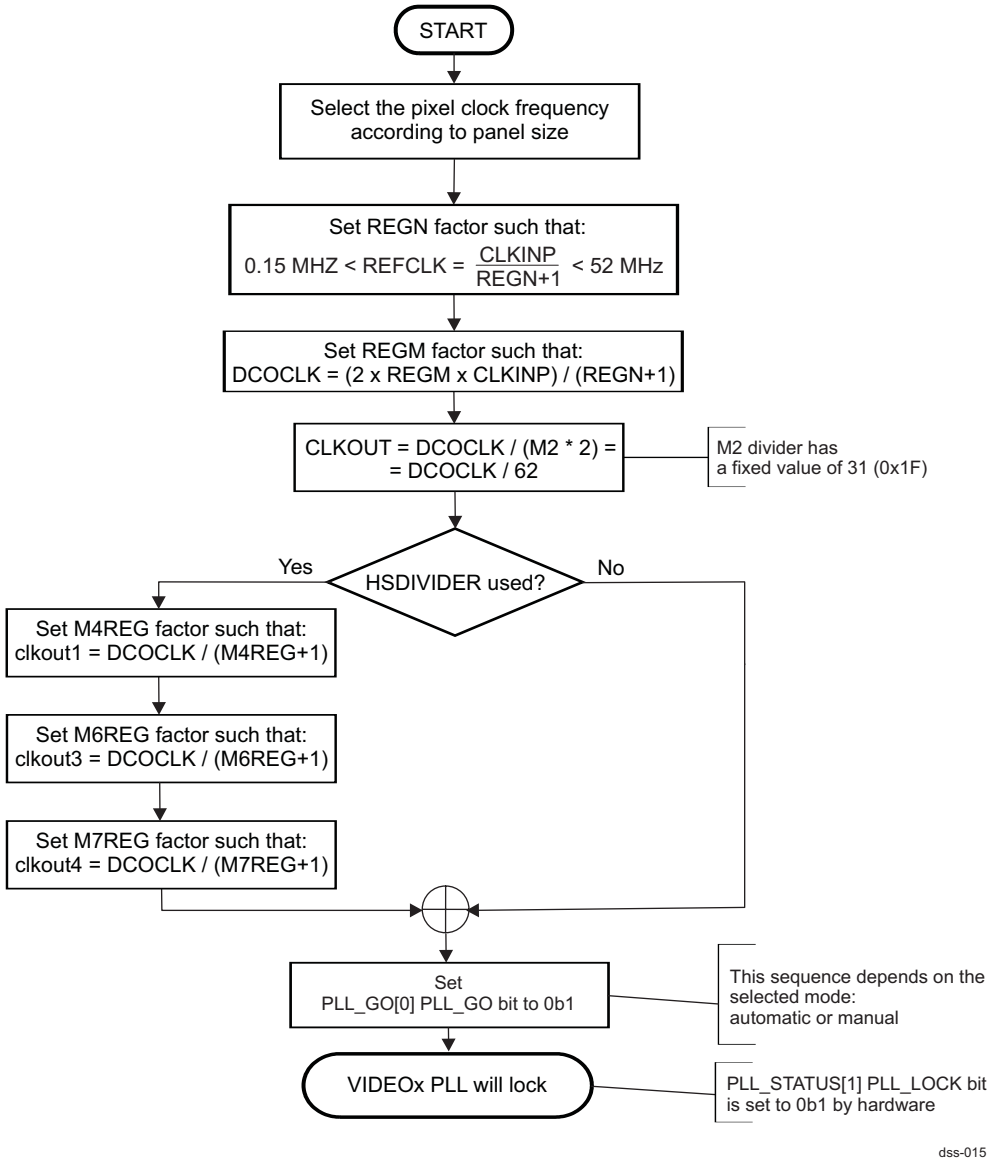
- REGM factor is programmed by the PLL_CONFIGURATION1[20:9] PLL_REGM bit field. It is used to tune DCOCLK clock.
- REGN factor is programmed by the PLL_CONFIGURATION1[8:1] PLL_REGN bit field. It is used to tune DCOCLK clock.
- M4REG factor is programed by the PLL_CONFIGURATION1[25:21] M4_CLOCK_DIV bit field, and applies to clkout1 of the DPLL_VIDEO HSDIVIDER.

Copyright © 2015–2020, Texas Instruments Incorporated

- M6REG factor is programmed by the PLL_CONFIGURATION3[4:0] M6_CLOCK_DIV bit field, and applies to clkout3 of the DPLL_VIDEO HSDIVIDER.
- M7REG factor is programmed by the PLL_CONFIGURATION3[9:5] M7_CLOCK_DIV bit field, and applies to clkout4 of the DPLL_VIDEO HSDIVIDER.
- M2 divider is hardcoded in HW at 31 (0x1F), and applies to CLKOUT.

Figure 11-13 shows the programming sequence.

Figure 11-13. VIDEO PLL Programming Sequence



NOTE:

- Most of the VIDEO PLL programming values are available for software flexibility, but it is not recommended to update the values in normal use. For the recommended VIDEO PLL values, see Section 11.1.3.3.9, *VIDEO PLL Recommended Values*.

Copyright © 2015–2020, Texas Instruments Incorporated

11.1.3.3.8 DPLL_VIDEO Go Sequence

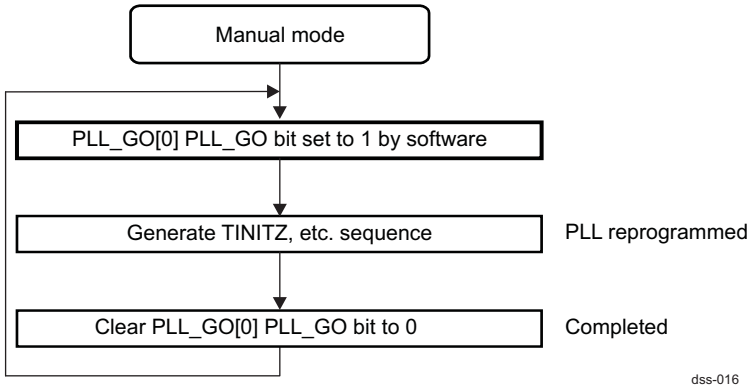
In manual mode (the PLL_CONTROL[0] PLL_AUTOMODE bit is set to 0), the DPLL requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DPLL. The PLL_GO[0] PLL_GO bit is cleared to 0 at the end of the sequence.

The TENABLEDIV signal is shared with the HSDIVIDER module so that it is programmed at the same time. In this mode, software must deassert CLKINEN by setting the PLL_CONFIGURATION2[14] PHY_CLKINEN bit to 0 and assert HSDIVBYPASS correctly by setting the PLL_CONFIGURATION2[20] HSDIVBYPASS bit to 1 to prevent uncontrolled frequencies affecting the display subsystem or the other modules using DPLL_VIDEO during PLL locking. In manual mode, the shadow register is updated anyway so that valid values are present when later selecting automatic mode.

Figure 11-14 shows the VIDEO PLL Go flow chart in manual mode (the PLL_CONTROL[0] PLL_AUTOMODE bit is set to 0).

Figure 11-14. VIDEO PLL Go Sequence (Manual Mode)



NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

In automatic mode (the PLL_CONTROL[0] PLL_AUTOMODE bit is set to 1), the TINITZ, TENABLE, and TENABLEDIV sequence and the update of the PLL configuration from the PLL_CONFIGURATION2 register are deferred until the time of the front porch time signal sent by the DISPC module. This is intended to simplify the software to implement a configuration change (such as a frequency change to support a different link bandwidth). In this mode, CLKINEN, HSDIVBYPASS, and REFEN are automatically controlled and the register value is overridden.

Figure 11-15 shows the VIDEO PLL Go flow chart in automatic mode (the PLL_CONTROL[0] PLL_AUTOMODE bit is set to 1).

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

11.1.3.3.9 DPLL_VIDEO Recommended Values

Table 11-11 shows the recommended values for PLL configuration.

Table 11-11. DPLL_VIDEO Recommended Programming Values

Field Name	Value	Description
PLL_CONTROL[4] HSDIV_SYSRESET	0	Allow power FSM to control
PLL_CONTROL[3] PLL_SYSRESET	0	Allow power FSM to control
PLL_GO[0] PLL_GO	1–>0	Write 1 when PLL is to be (re)locked with new parameters. This bit is cleared by hardware when the PLL request completes.
PLL_CONFIGURATION2[20] HSDIVBYPASS	0	PLL controls HSDIVIDER bypass

Copyright © 2015–2020, Texas Instruments Incorporated

Table 11-11. DPLL_VIDEO Recommended Programming Values (continued)

Field Name	Value	Description
PLL_CONFIGURATION2[16] M4_CLOCK_EN or PLL_CONFIGURATION2[23] M6_CLOCK_EN or PLL_CONFIGURATION2[25] M7_CLOCK_EN	1	If PLL/HSDIVIDER is used as the clock source
PLL_CONFIGURATION2[14] PHY_CLKINEN	1	Enable DCOCLK clock
PLL_CONFIGURATION2[13] PLL_REFEN	1	Enable PLL reference
PLL_CONFIGURATION2[10:9] PLL_LOCKSEL	0x0	Phase lock criteria to lock the PLL
PLL_CONFIGURATION2[8] PLL_DRIFTGUARDEN	0x0	The RECAL status/interrupt must be used to decide when to perform a PLL uncalibration. No automatic uncalibration is performed.
PLL_CONFIGURATION2[6] PLL_LOWCURRSTDBY	0/1	Set to 0 for fast PLL unlock, but higher standby current. Set to 1 for leakage level standby current, but longer unlock time.
PLL_CONFIGURATION2[5] PLL_PLLLPMODE	0	Normal operation. For smaller display sizes, it may be possible to set to 1.
PLL_CONFIGURATION2[0] PLL_IDLE	0	PLL active

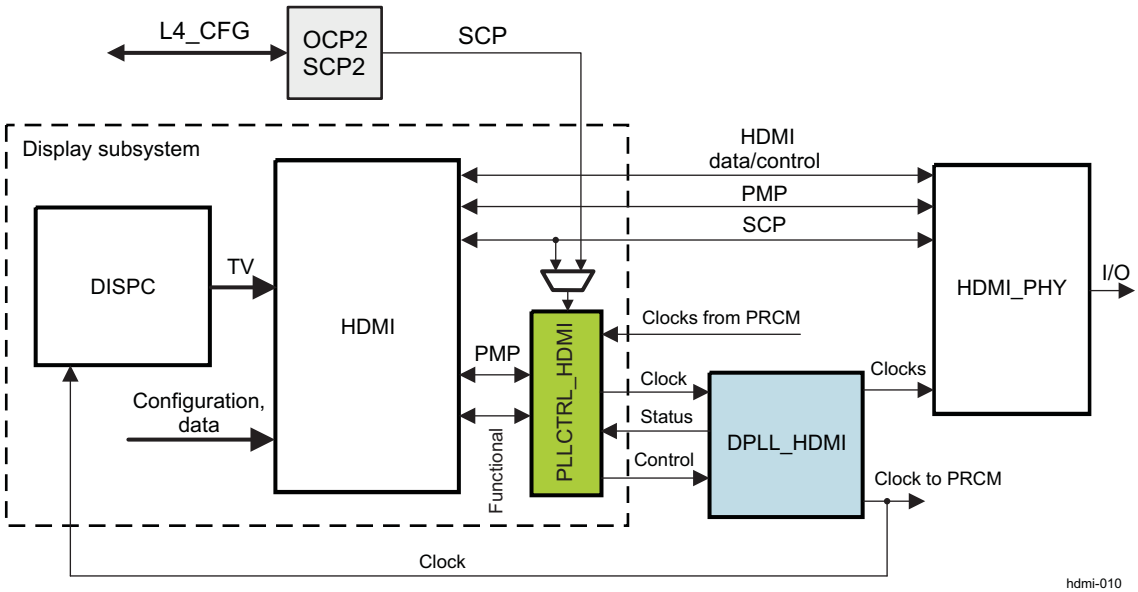
11.1.3.4 DPLL_HDMI Functional Description

11.1.3.4.1 DPLL_HDMI and PLLCTRL_HDMI Overview

The DPLL_HDMI control module (PLLCTRL_HDMI) uses the SCP and PMP as the primary interfaces to the HDMI module. The SCP interface is used to set the configuration of the digital phase-locked loop (DPLL) module, primarily the various counter values. The PMP is used to control the power state of the DPLL_HDMI module.

Figure 11-16 shows an overview of the PLLCTRL_HDMI and DPLL_HDMI modules in the display subsystem.

Figure 11-16. DPLL_HDMI and PLLCTRL_HDMI Overview



Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: The PLLCTRL_HDMI module does not have an interface to L3_MAIN interconnect. The programmable features are managed by registers mapped into the HDMI_WP module.

11.1.3.4.2 DPLL_HDMI and PLLCTRL_HDMI Architecture

The DPLL_HDMI uses instance of the DPLL module of type B. For information regarding DPLL types, see Chapter 3, *PRCM.*

Figure 11-17 shows the internal reference diagram of the DPLL_HDMI and PLLCTRL_HDMI interconnection in the device.

Figure 11-17. DPLL_HDMI and PLLCTRL_HDMI Reference Diagram

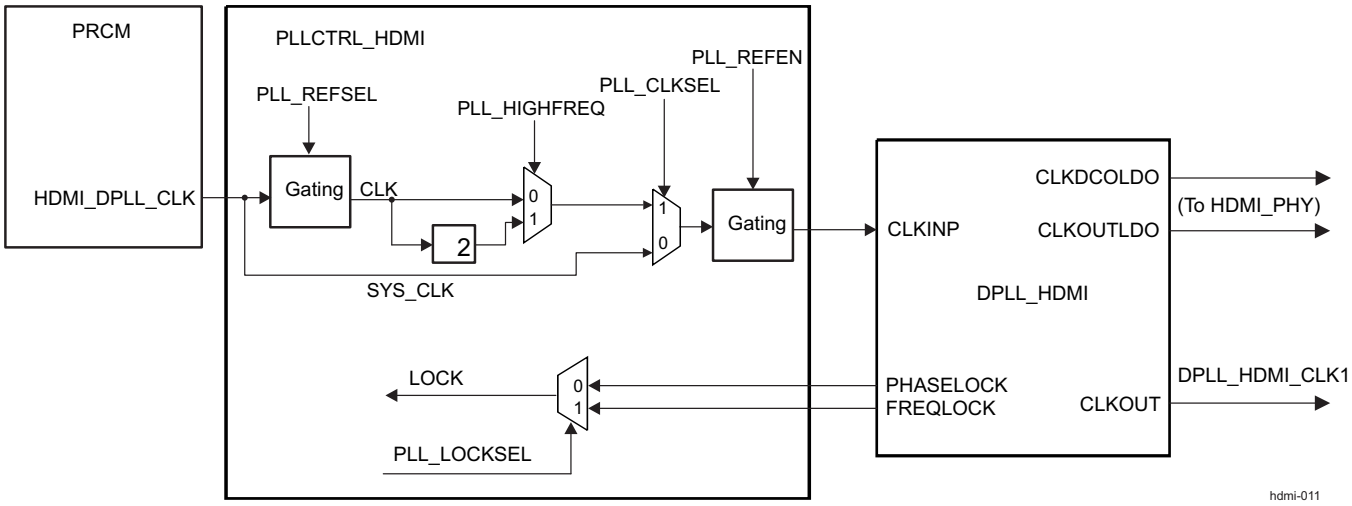


Figure 11-18 shows a simplified block diagram of the DPLL instance used for the DPLL_HDMI.

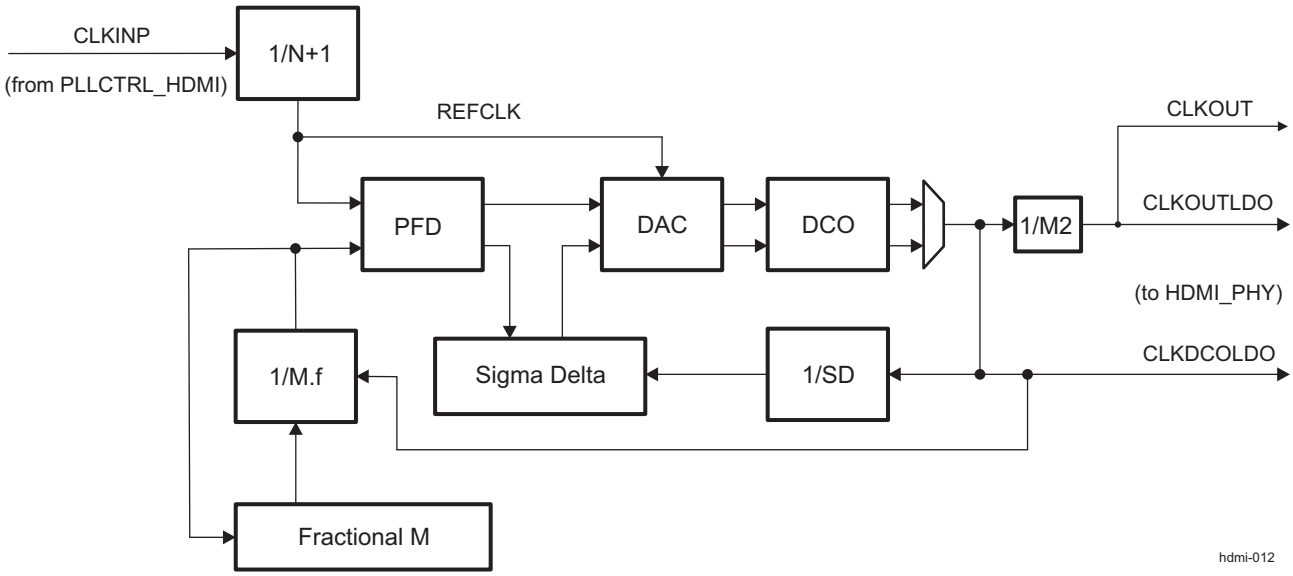
Figure 11-18. DPLL_HDMI Functional Block Diagram



The DPLL input clock CLKINP goes to a predivider N + 1. The entire loop runs on the REFCLK clock after this predivider. The value of N + 1 is controlled through the PLLCTRL_HDMI_CONFIGURATION1[8:1] PLL_REGN bit field. The CLKINP range is 0.62 to 60MHz. The REFCLK range is 0.62 to 2.5MHz.

Copyright © 2015–2020, Texas Instruments Incorporated

The output clock CLKDCOLDO is synthesized by a digitally controlled oscillator (DCO block). The CLKDCOLDO frequency can be given with CLKDCOLDO = CLKINP × M/(N + 1). For this purpose, the feedback multiplier M must be configured through the PLLCTRL_HDMI_CONFIGURATION1[20:9] PLL_REGM bit field. The frequency range of the DCO must be selected via the PLLCTRL_HDMI_CONFIGURATION2[3:1] PLL_SELFREQDCO register bit-field depending on the CLKDCOLDO frequency.

The DPLL module supports fractional synthesis. That is, the frequency multiplication factor M can be programmed as fractional. This is done through the use of a sigma-delta feedback divider (M). A fractional value (REGM.f) of 18 bits is supported, thereby enabling control for better accuracy. Programming the fractional value is done by setting the PLLCTRL_HDMI_CONFIGURATION4[17:0] PLL_REGM_F bit field. Fractional synthesis is not supported for M > 4093. For integer only division the PLL_REGM_F bit-field must be set to 0x00000.

The programming of the sigma-delta feedback divider is mandatory to get the optimal jitter performance. The value is determined by PLL_SD = ceiling ((M/(N + 1)) × CLKINP/250), and can be programmed into the PLLCTRL_HDMI_CONFIGURATION3[17:10] PLL_SD register bit-field.

11.1.3.4.3 DPLL_HDMI Operations

NOTE: The DPLL_HDMI must be configured before any transfer on the HDMI link. The HDMI module is fully operational only when the DPLL_HDMI runs and provides the TMDS clock.

The DPLL_HDMI configuration signals operate according to Table 11-12, which indicates the operation when the DPLL is not locked.

Table 11-12. DPLL_HDMI Operation Modes When Not Locked

DPLL_HDMI Operation Mode	Idle Bypass
Mode Description	Selects when DPLL_HDMI Bypass Clocks Are Used
PLLCTRL_HDMI_CONFIGURATION2[0] PLL_IDLE	1

When locked, the DPLL_HDMI output frequency is:

- For CLKOUT output: [(M+M.f)/(N+1)] * CLKINP * [1/M2]
- For CLKOUTLDO output: [(M+M.f)/(N+1)] * CLKINP * [1/M2]
- For CLKDCOLDO output: [(M+M.f)/(N+1)] * CLKINP

CLKINP is the input frequency in MHz. The divider and multiplier values in the above formulas can be set through the following registers:

- M frequency multiplier is programmed in the PLLCTRL_HDMI_CONFIGURATION1[20:9] PLL_REGM bit field.
- Fractional M (if fractional M divider is required by the use case) is programmed in the PLLCTRL_HDMI_CONFIGURATION4[17:0] PLL_REGM_F bit field
- N divider is programmed in the PLLCTRL_HDMI_CONFIGURATION1[8:1] PLL_REGN bit field.
- M2 divider is programmed in the PLLCTRL_HDMI_CONFIGURATION4[24:18] PLL_REGM2 bit field.
- SD divider is programmed in the PLLCTRL_HDMI_CONFIGURATION3[17:10] PLL_SD bit field.

NOTE: When the PLL_REGM bit field is set to 1, the DPLL enters a MN-Bypass mode. This is a low-power mode, where the DPLL gates its internal clocks and powers down the analog blocks. The CLKDCOLDO and CLKOUTLDO clock outputs go low and remain like that until the DPLL exits MN-Bypass mode (by changing the PLL_REGM bit-field to a value other than 0 or 1).

NOTE: The DPLL_HDMI must be configured before any data transfer to HDMI_PHY.

Copyright © 2015–2020, Texas Instruments Incorporated

11.1.3.4.4 DPLL_HDMI Register Access

The configuration registers are accessed through the HDMI module register spaces using the SCP interface. This includes all the configuration signals and returning status signals.

CAUTION

All writes must be 32-bit operations because the SCP interface always transfers 32 bits; 16- or 8-bit operations can lead to unpredictable errors.

11.1.3.4.5 DPLL_HDMI Error Handling

The DPLL_HDMI lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The PLLCTRL_HDMI_STATUS[1] PLL_LOCK bit gives the DPLL_HDMI lock state.
- The PLLCTRL_HDMI_STATUS[2] PLL_RECAL bit informs whether the PLL must be recalibrated.

These signals can also generate interrupts at the HDMI module level.

The PLL reference loss status signal can also be monitored:

- The PLLCTRL_HDMI_STATUS[3] PLL_LOSSREF bit informs whether the DPLL_HDMI has lost the reference clock.

11.1.3.4.6 DPLL_HDMI Software Reset

The PLLCTRL_HDMI module does not have its own software reset. It is reset by the HDMI module. Nevertheless, the reset status of the PLLCTRL_HDMI module can be monitored by reading the PLLCTRL_HDMI_STATUS[0] PLLCTRL_RESET_DONE bit.

11.1.3.4.7 DPLL_HDMI Power Management

The PLLCTRL_HDMI manages only the LDO power of the DPLL_HDMI. This is done by overriding the SYSRESET signal. All other power-management signals are integrated with the display subsystem power management.

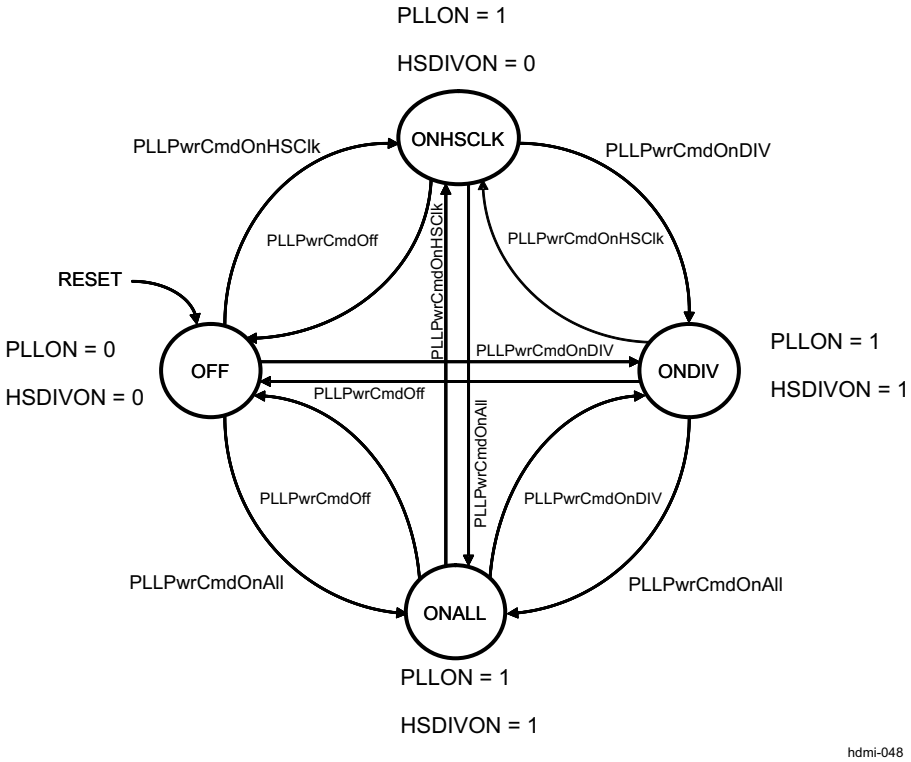
The PMP is used to manage the LDO power of the HDMI_DPLL through the PLLCTRL_HDMI module.

Figure 11-19 shows the power states, which can be controlled through HDMI_WP_PWR_CTRL[3:2] PLL_PWR_CMD bit field.

The PLLCTRL_HDMI power status can be read through the HDMI_WP_PWR_CTRL[1:0] PLL_PWR_STATUS bit field.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 11-19. PLLCTRL_HDMI Power State Diagram



- OFF power state: PLLCTRL_HDMI is powered down. Internal clock is off.
- ONHSCLK: Power command received
- ONDIV: Clock dividers set.
- ONALL: PLLCTRL_HDMI is in active state.

11.1.3.4.8 DPLL_HDMI Lock Sequence

The DPLL_HDMI generates the clocks to the HDMI_PHY module and the DPLL_HDMI_CLK1 clock used by the DISPC and various system modules.

The DPLL_HDMI factors must be calculated based on the required input and output frequencies, keeping the DPLL_HDMI internal reference frequency in the appropriate range:

- REGM factor is programmed in the PLLCTRL_HDMI_CONFIGURATION1[20:9] PLL_REGM bit field.
- REGM.f factor (if fractional M divider is required by the use case) is programmed in the PLLCTRL_HDMI_CONFIGURATION4[17:0] PLL_REGM_F bit field.
- REGN factor is programmed in the PLLCTRL_HDMI_CONFIGURATION1[8:1] PLL_REGN bit field.
- REGM2 factor is programmed in the PLLCTRL_HDMI_CONFIGURATION4[24:18] PLL_REGM2 bit field.
- SD divider is programmed in the PLLCTRL_HDMI_CONFIGURATION3[17:10] PLL_SD bit field.

Figure 11-20 shows the programming sequence.

Table 11-13. DPLL_HDMI Register Call Summary for HDMI PLL Programming Sequence

Register Name	Register Name	Register Name	Register Name	Register Name
PLLCTRL_HDMI_CONFIGURATION2	PLLCTRL_HDMI_GO	PLLCTRL_HDMI_STATUS	PLLCTRL_HDMI_CONFIGURATION3	PLLCTRL_HDMI_CONFIGURATION4

Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: The following should be considered for the programming sequence in Figure 11-20:

- The equation for the DPLL output applies to both CLKDCOLDO and CLKOUTLDO outputs of the DPLL_HDMI. The REGM2 divisor value must be considered only in case the CLKOUTLDO frequency needs to be calculated. Programming of REGM.f is needed only if fractional M divider is required by the use case.
- The DPLL_HDMI_CLK1 clock is sourced from the CLKDCOLDO output of the DPLL_HDMI:
  - The DPLL_HDMI_CLK1 frequency must be a multiple of the PCLK frequency (for proper settings of the PCD and LCD factors in the DISPC).
  - The DPLL_HDMI_CLK1 frequency must be lower than 186 MHz.
- The PLLCTRL_HDMI_CONFIGURATION2[3:1] PLL_SELFREQDCO register bit field should be programmed depending on the value of CLKDCOLDO = CLKINP × M/(N + 1). See Section 11.1.3.4.3, *DPLL_HDMI Operations*.
- Programming of other DPLL_HDMI parameters is available for software flexibility, but it is not recommended to update their values in normal use. For the recommended DPLL_HDMI values, see Section 11.1.3.4.10, *DPLL_HDMI Recommended Values*.

11.1.3.4.9 DPLL_HDMI Go Sequence

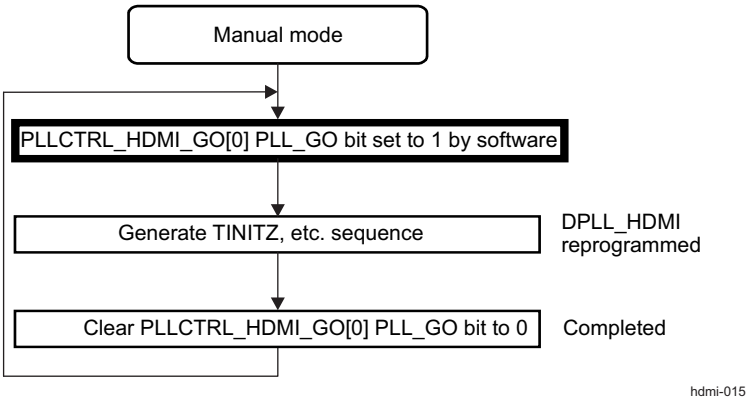
The DPLL_HDMI controller works in manual mode. In this mode the DPLL_HDMI requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DPLL_HDMI. The PLLCTRL_HDMI_GO[0] PLL_GO bit is cleared to 0 at the end of the sequence.

In this mode, software must deassert CLKINEN by resetting the PLLCTRL_HDMI_CONFIGURATION2[14] PHY_CLKINEN bit to 0 to prevent uncontrolled frequencies affecting HDMI_PHY and the display subsystem during DPLL_HDMI locking.

Figure 11-21 shows the PLLCTRL HDMI GO flow chart in manual mode.

Figure 11-21. DPLL_HDMI GO Sequence (Manual Mode)



NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

11.1.3.4.10 DPLL_HDMI Recommended Values

Table 11-14 lists the main DPLL_HDMI and PLLCTRL_HDMI recommended values.

Copyright © 2015–2020, Texas Instruments Incorporated

Table 11-14. DPLL_HDMI Recommended Programming Values

Field Name	Value	Description
PLLCTRL_HDMI_GO[0] PLL_GO	1 - 0	Write 1 when DPLL_HDMI is to be (re)locked with new parameters. This bit is cleared to 0 by hardware when the DPLL_HDMI request completes.
PLLCTRL_HDMI_CONFIGURATION1[20:9] PLL_REGM	See (1)	DPLL_HDMI feedback clock divider.
PLLCTRL_HDMI_CONFIGURATION4[17:0] PLL_REGM_F	See (1)	Fractional part of the DPLL_HDMI feedback clock divider. Must be kept at 0, if integer divider only will be used.
PLLCTRL_HDMI_CONFIGURATION1[8:1] PLL_REGN	See (1)	DPLL_HDMI reference clock divider.
PLLCTRL_HDMI_CONFIGURATION2[15] BYPASSEN	0	When this bit is 0, the CLKOUT clock depends on the DPLL_HDMI configuration (DPLL locked). For small displays, it may be possible to use the functional clock, in which case this bit must be set to 1. When 1, the internal DPLL_HDMI configuration path is bypassed, and CLKINP is sent on the CLKOUT output.
PLLCTRL_HDMI_CONFIGURATION2[14] PHY_CLKINEN	1	Enable DPLL_HDMI clock output to HDMI_PHY.
PLLCTRL_HDMI_CONFIGURATION2[13] PLL_REFEN	1	Enable the DPLL_HDMI reference clock.
PLLCTRL_HDMI_CONFIGURATION2[10:9] PLL_LOCKSEL	0x0	Phase-lock criteria to lock the DPLL_HDMI.
PLLCTRL_HDMI_CONFIGURATION2[8] PLL_DRIFTGUARDEN	0	The RECAL status/interrupt must be used to decide when to perform a DPLL_HDMI uncalibration. No automatic uncalibration is performed.
PLLCTRL_HDMI_CONFIGURATION2[3:1] PLL_SELFREQDCO	See (1)	Must be programmed based on the DPLL_HDMI lock frequency.
PLLCTRL_HDMI_CONFIGURATION2[0] PLL_IDLE	0	DPLL_HDMI active.
PLLCTRL_HDMI_CONFIGURATION3[17:10] PLL_SD	See (1)	Sigma-delta divider = ceiling { [PLL_REGM /(PLL_REGN+1)] * CLKINP(MHz) / 250 }

(1) The value of the bit field must be set according to the desired clock frequency.

11.1.4 Display Subsystem Programming Guide

This section provides recommended steps for initializing the DSS module.

Table 11-15. DSS Initialization Sequence

Step	Register / Bit Field / Chapter	Value
Enable DSS clock domain		
Configure DPLL_PER and associated HS12 divider, according to the desired DSS_GFCLK frequency	Refer to Chapter 3, section *DPLL_PER Description*	-
Enable DES_HDCP clock	Set CTRL_CORE_CONTROL_IO_2[0] DSS_DESHDCP_CLKEN register bit; Refer to Section 18.5, *Control Module Register Manual*	0x1
Set SW wake-up transition for DSS clock domain	Set CM_DSS_CLKSTCTRL[1:0] CLKTRCTRL register bitfield; Refer to Section 3.12, *PRCM Register Manual*	0x2
Enable (ungate) DSS_GFCLK clock	Set CM_DSS_DSS_CLKCTRL[8] OPTFCLKEN_DSSCLK register bit; Refer to Section 3.12, *PRCM Register Manual*	0x1
Enable DSS clocks	Set CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE register bitfield; Refer to Section 3.12, *PRCM Register Manual*	0x2
Wait for DSS idle status (functional or in idle mode)	Read CM_DSS_DSS_CLKCTRL[17:16] IDLEST register bit-field; Refer to Section 3.12, *PRCM Register Manual*	0x0 or 0x2
Make DSS DPLLs accessible via DSS address space		
Make VIDEO1, VIDEO2 and HDMI DPLLs accessible via DSS	Clear the following bits in CTRL_CORE_DSS_PLL_CONTROL register: [2] PLL_HDMI_DSS_CONTROL_DISABLE bit; [1] PLL_VIDEO2_DSS_CONTROL_DISABLE bit; [0] PLL_VIDEO1_DSS_CONTROL_DISABLE bit; Refer to Section 18.5, *Control Module Register Manual*	0x0
Enable DSS internal SCP interface		
Enable DSS internal SCP interface for VIDEO1 and VIDEO2 DPLL register configuration	Set DSI_CLK_CTRL[14] CIO_CLK_ICG register bit	0x1
Configure DSS internal SCP interface for HDMI DPLL register configuration	Set HDMI_WP_CLK[10:8] SCP_PWR_DIV register bit-field	0x-
Configure DSS DPLLs		
Enable (ungate) VIDEO1, VIDEO2 and HDMI DPLLs source clocks	Set the following bits in CM_DSS_DSS_CLKCTRL register: [13] OPTFCLKEN_VIDEO2_CLK bit; [12] OPTFCLKEN_VIDEO1_CLK bit; [10] OPTFCLKEN_HDMI_CLK bit; Refer to Section 3.12, *PRCM Register Manual*	0x1
Proceed with VIDEO1, VIDEO2 and HDMI DPLLs configuration	Refer to Section 11.1.3, *Display Subsystem DPLL Controllers Functional Description*	-

RESERVED																					SCP_PWR_DIV			RESERVED							

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x00 0000
10:8	SCP_PWR_DIV	Defines the divisor value to be used for the generation of the SCP_PWR clock (up to 66.5MHz) from the input interface clock (up to 266MHz). 0x0 means gated 0x1 means free-running The valid values are from 0 to 7. In case of interface access to register through SCP interface, if the SCP_PWR clock is gated, the HW automatically generates the clock by using a divisor of 7 and updates the bit-field with the value 7. It is then software responsibility to change the value at any time in order to improve SCP latency when accessing the registers in the HDMI_PHY and PLLCTRL_HDMI by reducing the value.	RW	0x0
7:0	RESERVED		R	0x0

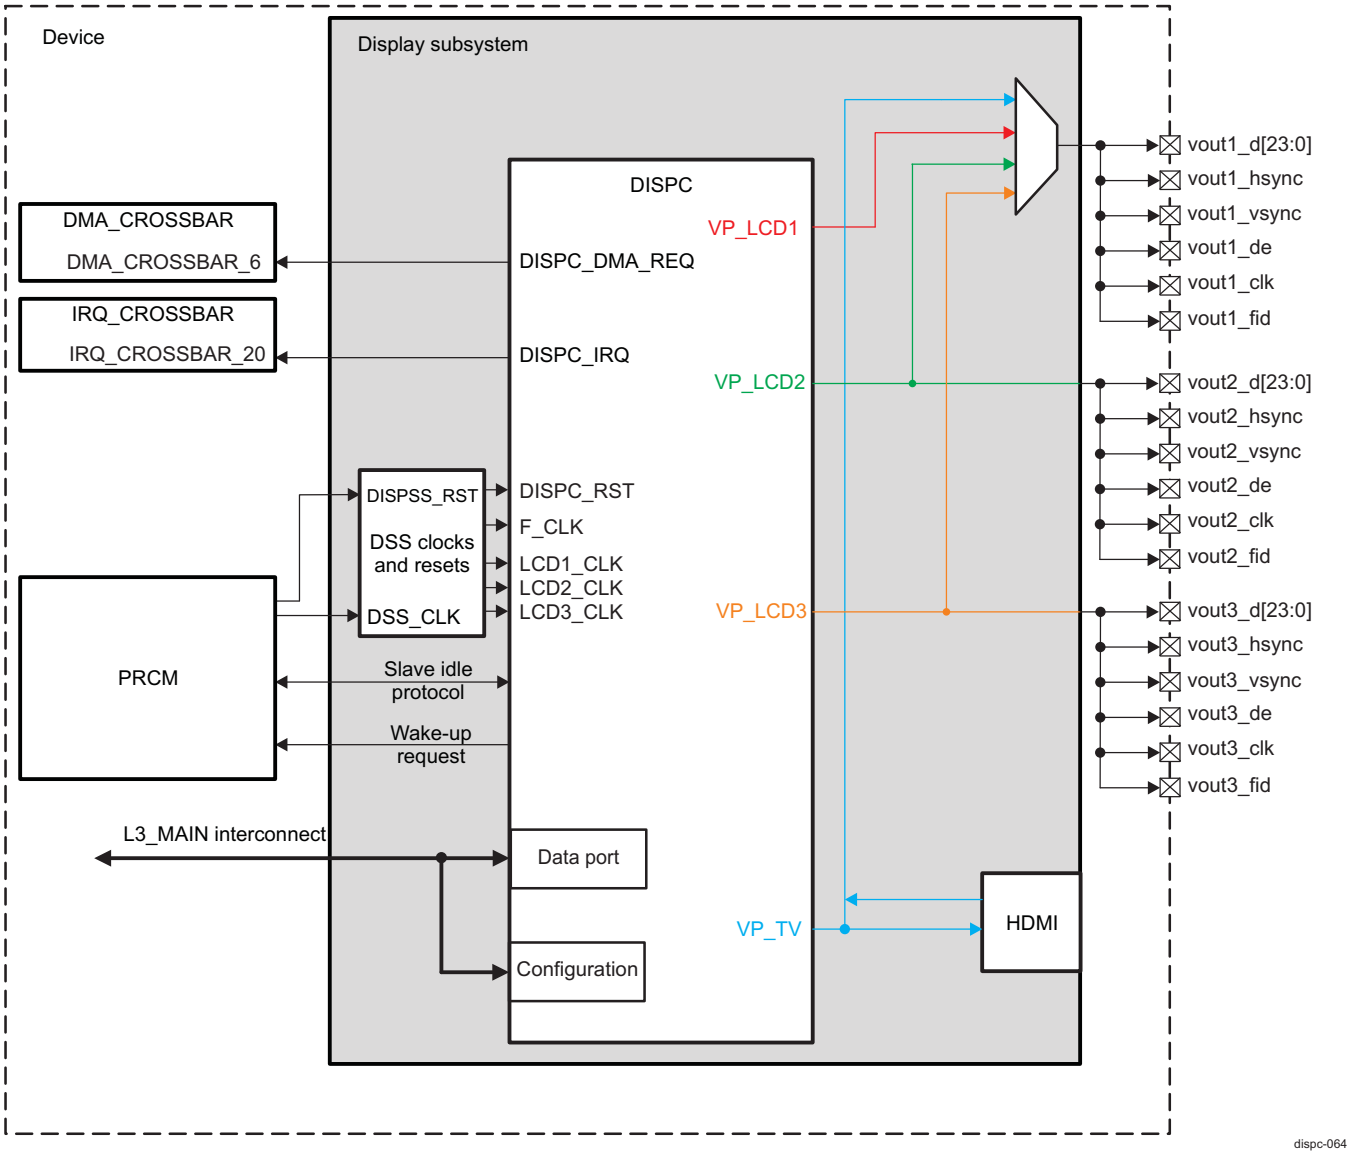
11.2 Display Controller

11.2.1 DISPC Overview

Figure 11-22 shows a block diagram of the display controller (DISPC) within the display subsystem.

Copyright © 2015–2020, Texas Instruments Incorporated

Figure 11-22. DISPC Overview



The DISPC includes the following main features:

- Five pipelines for processing:
  - One Graphics (GFX):
    - Pixel formats: ARGB16-4444, xRGB12-4444, RGBA16-4444, RGBx12-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, xRGB24-8888, RGBx24-8888, BGRA32-8888, RGB24-888 (packed), where x means that the corresponding bits in the container are not used
    - Premultiplied ARGB and RGBA formats
    - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the most significant bits [MSBs] or adding 0s)
    - Support for antiflicker on RGB pixel formats using 3-tap filter
  - Three Video pipelines (VID1, VID2, and VID3):
    - Pixel formats: ARGB16-4444, xRGB12-4444, RGBx12-4444, RGBA12-3333, RGBA16-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888,

Copyright © 2015–2020, Texas Instruments Incorporated

RGBx32-8888, RGB24-888, BGRA32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21 (where x means that the corresponding bits in the container are not used)

- Premultiplied ARGB and RGBA formats
- Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the MSBs or adding 0s)
- Programmable poly-phase filter:
  - Independent horizontal and vertical resampling: Upsampling (up to x8) and downsampling (down to 1/4)
  - Maximum input width of 1920 pixels
  - No limitation on the input height
  - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21
  - Alpha blending factor is rescaled like the R, G, and B color components.
- Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB32-8888. Images in YUV4:2:2 format with 90- or 270-degree rotation are preprocessed to YUV4:4:4 before the scaler, by duplicating the missing Chroma.
- Programmable VC-1 range mapping

– One write-back (WB) pipeline: Allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame
  - Programmable color space conversion RGB24 into YUV4:4:4 or to YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21 using programmable poly-phase filter
  - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21
  - Selection of the color depth reduction from RGB24 to RGB16
  - Programmable poly-phase filter:
    - Independent horizontal and vertical resampling: Upsampling (up to x8) and downsampling (down to 1/4)
    - Maximum input width of 1920 pixels
    - No limitation on the input height
    - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21
    - Alpha blending factor is rescaled like the R, G, and B color components.
  - Selection of the source of the data:
    - Overlay output:
      - Primary LCD output
      - Secondary LCD output
      - Third LCD output
      - TV output
    - Pipelines:
      - Graphic
      - Video 1
      - Video 2
      - Video 3

- Three LCD outputs: primary (LCD1), secondary (LCD2), and tertiary (LCD3):
  – Input pixel format: ARGB32-8888

Copyright © 2015–2020, Texas Instruments Incorporated

  - Output pixel format: RGB24-888 and YUV4:2:2 (YUV4:2:2 only available when BT mode output is enabled)
  - Overlay of graphic and video for one to four pipelines
  - Source and destination transparency color key
  - Global and pixel alpha blending (up to 8-bit blending factor)
  - Z-order programmable (full flexibility)
  - Displays supported:
    - Active matrix color: 12-, 16-, 18-, and 24-bit panel interface support (replicated or dithered encoded pixel values)
  - Independent programmable timing generators for LCD1, LCD2, and LCD3 to support:

Using DPI1 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps
Using DPI2 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps
Using DPI3 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps

  - Configurable LCD output mode: progressive or interlace mode
  - Multiple-cycle output format on 8-, 9-, 12-, and 16-bit interface time division multiplexing (TDM)
- One TV output:
  - Input pixel format: ARGB40-10.10.10.10
  - Output pixel format: ARGB40-10.10.10.10
  - Overlay of graphic and video for one to four pipelines
  - Source and destination transparency color key
  - Global and pixel alpha blending (up to 10-bit blending factor)
  - Z-order programmable (full flexibility)
  - Slave mode support (no master mode support) with synchronization signals provided by HDMI TX:
    - HSYNC (horizontal synchronization signal)
    - VSYNC (vertical synchronization signal)
    - RE (data request signal)
    - FID (field ID: even and odd field information)
  - RGB30-10.10.10 data bus output for connection to HDMI TX and extended to 36 by duplication of the MSBs
  - HD-1080p, HD-1080i, HD-720p, SD-480p, SD-576p, SD-576i, and SD-480i using HDMI
  - HDMI deep color mode support, 30-bit data output to HDMI encoder
  - Pixel duplication capability (from one pixel clock cycle up to eight cycles)
- Panel support with MIPI DPI protocol:
  - 12-, 16-, 18-, and 24-bit active matrix panel interface support (replicated or dithered encoded pixel values)
- Common:
  - Rotation 0, 90, 180, and 270 degrees using DMM-TILER
  - Synchronized buffer update
  - Hardware cursor (using the graphics pipeline or one of the video pipelines)
  - Independent gamma curve support on LCDs outputs and TV output
  - Multiple-buffer support
  - Mirroring/flip-flop support (using DMM-TILER)
  - Programmable color phase rotation (CPR)
  - Alpha blending support:

Copyright © 2015–2020, Texas Instruments Incorporated

        - Embedded pixel factor (ARGB and RGBA)
        - Global alpha
- DMA (internal to the DISPC):
  - Support for accessing tiled structure through the TILER inside the dynamic memory management (DMM)
  - Support for accessing nontiled structure through the TILER or directly
  - Support for rotation, flip-flop, and mirroring through the TILER inside the DMM
  - Support for memory fragmentation through the TILER inside the DMM
  - Integrated shared buffers between DMA engine and pipelines
  - Programmable buffer thresholds
  - Bandwidth limiter on write request (insertion on idle cycles between requests)
- Advanced:
  - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
  - DMA buffer hand-check in stall mode
  - Arbitration between high and low priority (GFX, VID1, VID2, VID3, and WB pipelines)
- Power modes:
  - Low-power saving modes
  - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
  - Merge capability of the DMA buffers to support greater OFF period on the L3_MAIN interconnect
    - All buffers associated to a single pipeline
    - Reallocation of the buffers of the nonactive pipelines to the active pipelines

11.2.2 DISPC Environment

The DISPC provides the required control signals to interface directly to an external parallel panel for the MIPI DPI protocol.

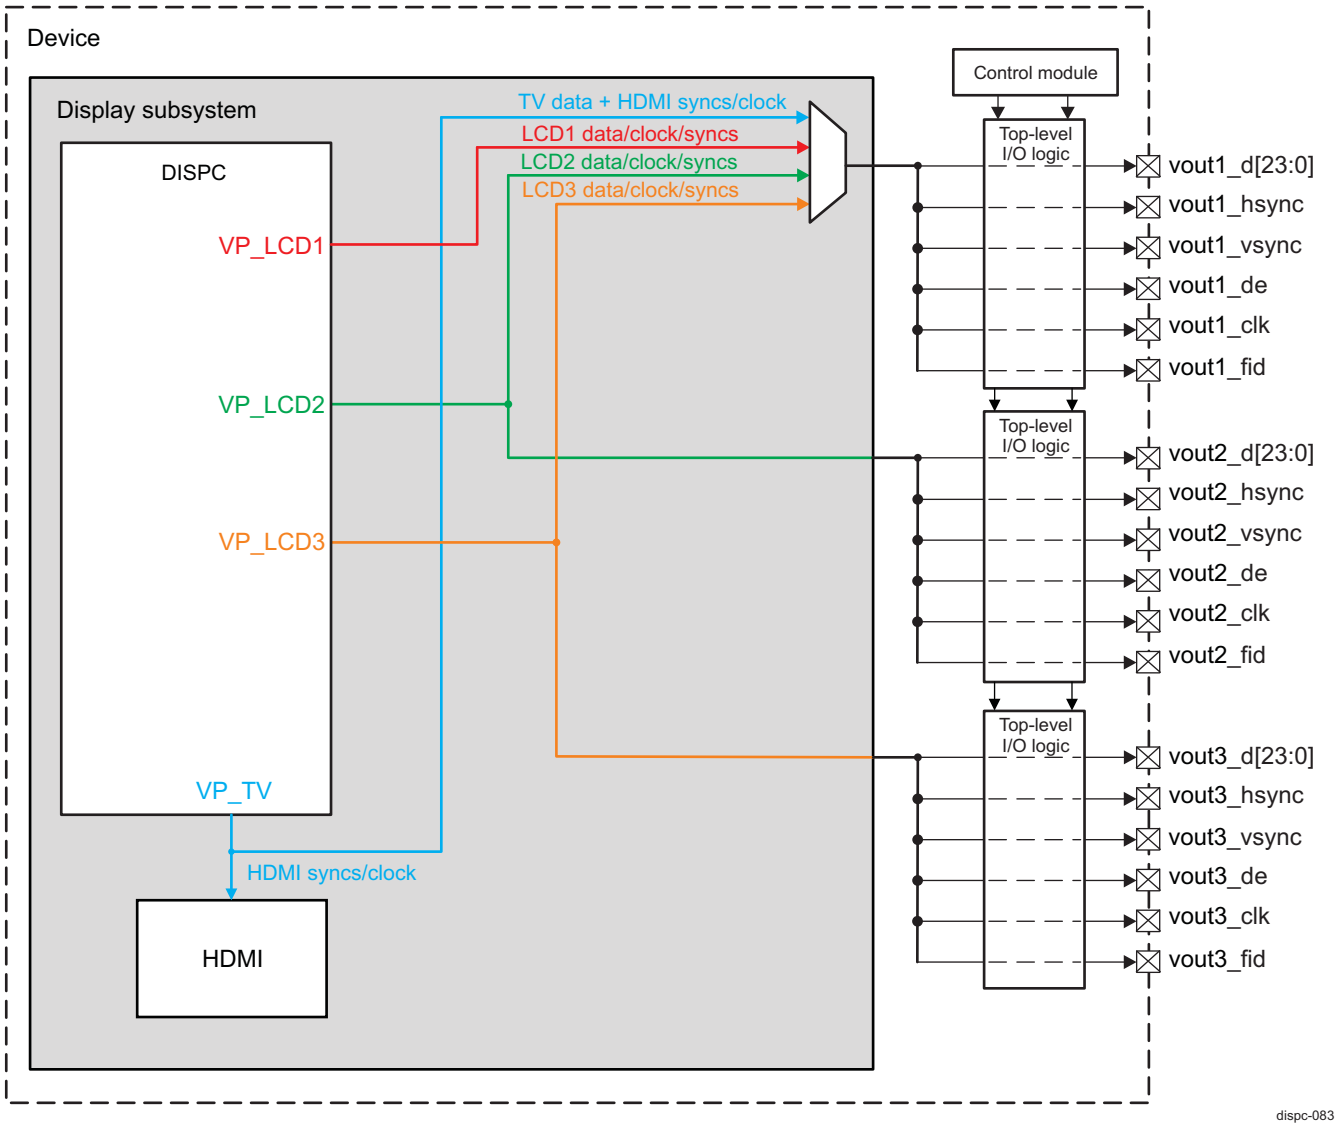
Figure 11-23 shows the LCD support parallel interface.

NOTE: Parallel interface is available through the LCD1, LCD2, LCD3, and TV outputs of the DISPC.

The LCD data and control signals are multiplexed with the TV output data, and control signals are provided by the HDMI module.

The selection can be done at the top level of the display subsystem. For further details and signal mapping, see Section 11.1.1, *Display Subsystem Environment*.

Figure 11-23. DISPC LCD Support Parallel Interface



Copyright © 2015–2020, Texas Instruments Incorporated

NOTE: The path from a module pin to device pad (or pads) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see Section 18.4.6.1.1, Pad Configuration Registers, in Chapter 18 *Control Module*.

Table 11-83 describes the interface signals to/from the LCD panel in bypass mode.

Table 11-83. DISPC Parallel Interface Signals

Signal Name[1]	Type[2]	Description
voutX_d[23:0]	O	Pixel data
voutX_clk	O	Pixel clock
voutX_vsync	O	Vertical synchronization. The LCD frame clock (vsync) toggles after all the lines in a frame are transmitted to the LCD panel and a programmable number of line clock cycles has elapsed at the beginning and end of each frame.
voutX_hsync	O	Horizontal synchronization. The LCD line clock (hsync) toggles after all pixels in a line are transmitted to the LCD panel and a programmable number of pixel clock wait-states has elapsed at the beginning and end of each line.
voutX_de	O	In active matrix technology, the DE signal acts as an output-enable signal to indicate when data must be latched using the pixel clock.
voutX_fid	O	The FID signal indicates the field identifier for the LCD output field: • 0 means even. • 1 means odd.

(1) X = 1, 2, or 3, indicates the corresponding parallel video output (VOUT1, VOUT2, or VOUT3)
(2) I = Input, O = Output, I/O = Input/Output

11.2.2.1 DISPC LCD Output and Data Format for the Parallel Interface

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

Figure 11-24 through Figure 11-27 show the pixel data bus, depending on the use of 12-, 16-, 18-, or 24-pixel data output pins.

In the Active matrix display type, one pixel per pixel clock is displayed.

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel.

Figure 11-24 through Figure 11-27 show 12-, 16-, 18-, and 24-bit active matrix displays, respectively.

11.2.2.2 DISPC Transaction Timing Diagrams

Figure 11-28 through Figure 11-31 show timing diagrams of synchronization signals and pixel clocks for active matrix panels. The DISPC directly drives these signals, which are related to the programmable fields listed in Table 11-85.

Table 11-85. DISPC Programmable Fields in Bypass Mode

Name	Register	Description
PPL	DISPC_SIZE_LCDo[11:0] PPL value + 1	Pixels per line
LPP	DISPC_SIZE_LCDo[27:16] LPP value + 1	Lines per panel
HBP	DISPC_TIMING_Ho[31:20] HBP value + 1	Horizontal back porch
HFP	DISPC_TIMING_Ho[19:8] HFP value + 1	Horizontal front porch
HSW	DISPC_TIMING_Ho[7:0] HSW value + 1	Horizontal synchronization pulse width
VBP	DISPC_TIMING_Vo[31:20] VBP value	Vertical back porch
VFP	DISPC_TIMING_Vo[19:8] VFP value	Vertical front porch
VSW	DISPC_TIMING_Vo[7:0] VSW value + 1	Vertical synchronization pulse width
ONOFF(1)	DISPC_POL_FREQo[17] ONOFF	DISPC_HSYNC and DISPC_VSYNC pixel clock control
RF(2)	DISPC_POL_FREQo[16] RF	DISPC_HSYNC and DISPC_VSYNC pixel clock edge control
IEO	DISPC_POL_FREQo[15] IEO	Invert DISPC_ACBIAS
IPC(3)	DISPC_POL_FREQo[14] IPC	Invert DISPC_PCLK
IHS	DISPC_POL_FREQo[13] IHS	Invert DISPC_HSYNC
IVS	DISPC_POL_FREQo[12] IVS	Invert DISPC_VSYNC

(1) DISPC_POL_FREQo[17] ONOFF and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_ON_OFF must match (x = 0,1,2).
(2) DISPC_POL_FREQo[16] RF and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_RF must match (x = 0,1,2).
(3) DISPC_POL_FREQo[14] IPC and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC must match (x = 0,1,2).

- Active matrix timing configuration 1:
  - DISPC_POL_FREQo[17] ONOFF = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_ON_OFF = 0
  - DISPC_POL_FREQo[16] RF = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_RF = 0
    The HSYNC and VSYNC signals are driven on the opposite edge of PCLK from the pixel data.
  - DISPC_POL_FREQo[15] IEO = 0
    The DE signal is active high.
  - DISPC_POL_FREQo[14] IPC = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC = 0
    The pixel data are driven on the rising edge of PCLK.
  - DISPC_POL_FREQo[13] IHS = 0
    The HSYNC signal is active high.
  - DISPC_POL_FREQo[12] IVS = 0
    The VSYNC signal is active high.

Copyright © 2015–2020, Texas Instruments Incorporated

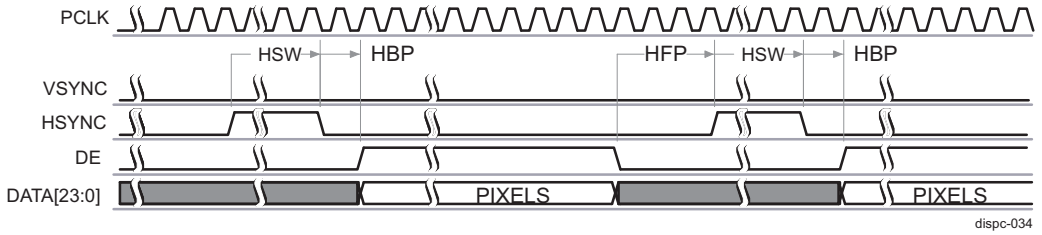

Figure 11-30. DISPC Active Matrix Timing Diagram of Configuration 1 (Between Frames)

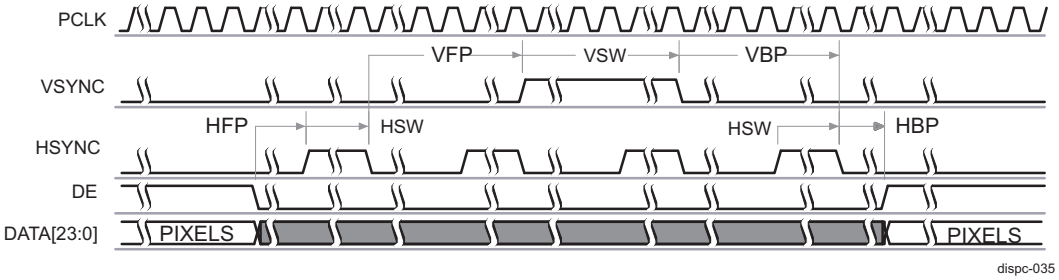

Figure 11-31. DISPC Active Matrix Timing Diagram of Configuration 1 (End of Frame)

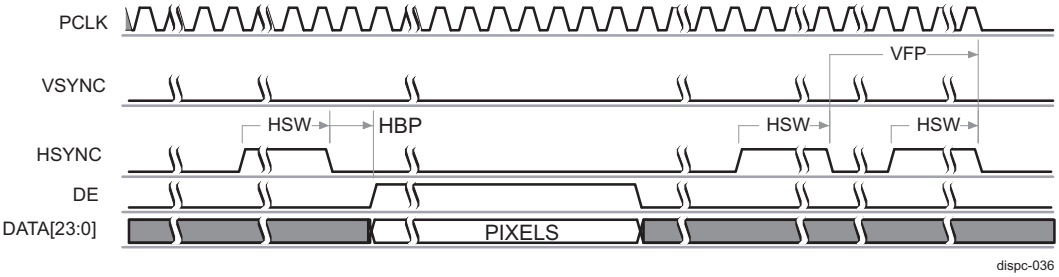

- Active matrix timing configuration 2:
  - DISPC_POL_FREQo[17] ONOFF = 1 and CTRL_CORE_SMA_SW_1[]DSS_CHx_ON_OFF = 1
  - DISPC_POL_FREQo[16] RF = 1 and CTRL_CORE_SMA_SW_1[]DSS_CHx_RF = 1
    The HSYNC and VSYNC signals are driven on the rising edge of PCLK.
  - DISPC_POL_FREQo[15] IEO = 1
    The DE signal is active low.
  - DISPC_POL_FREQo[14] IPC = 1 and CTRL_CORE_SMA_SW_1[]DSS_CHx_IPC = 1
    The pixel data is driven on the falling edge of PCLK.
  - DISPC_POL_FREQo[13] IHS = 1
    The HSYNC signal is active low.
  - DISPC_POL_FREQo[12] IVS = 1

Copyright © 2015–2020, Texas Instruments Incorporated

The VSYNC signal is active low.

Figure 11-32. DISPC Active Matrix Timing Diagram of Configuration 2 (Start of Frame)

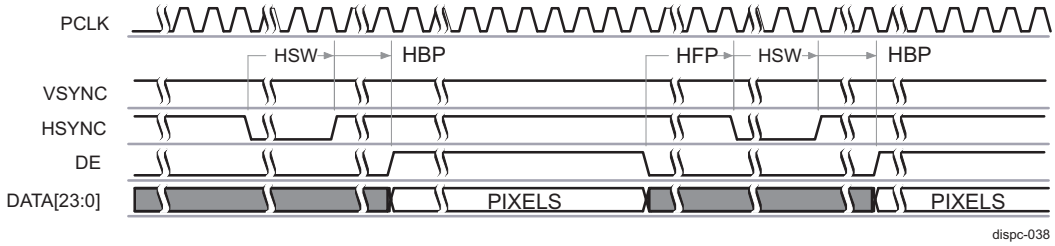

Figure 11-34. DISPC Active Matrix Timing Diagram of Configuration 2 (Between Frames)

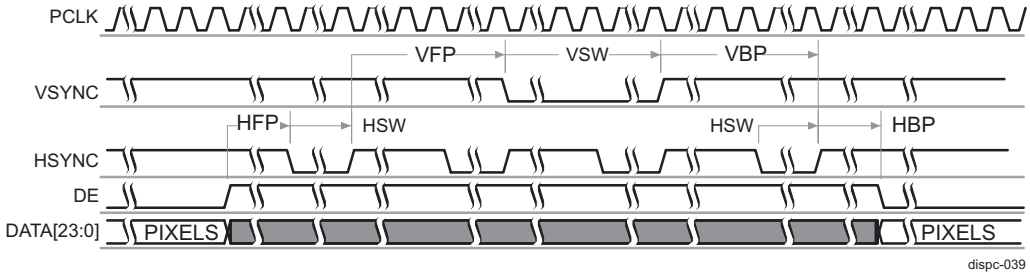

Figure 11-35. DISPC Active Matrix Timing Diagram of Configuration 2 (End of Frame)

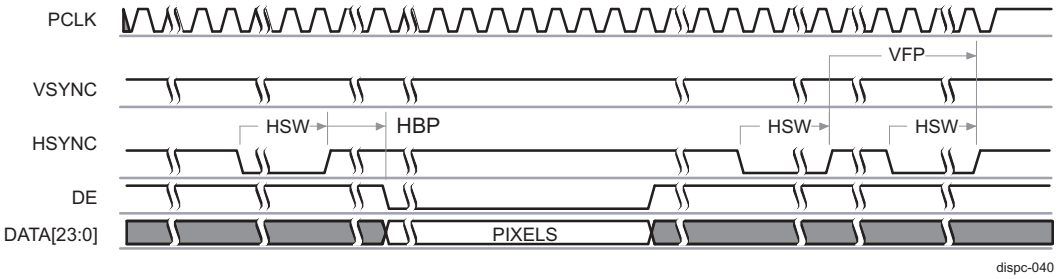

- Active matrix timing configuration 3:
  - DISPC_POL_FREQo[17] ONOFF = 1 and CTRL_CORE_SMA_SW_1[]DSS_CHx_ON_OFF = 1
  - DISPC_POL_FREQo[16] RF = 1 and CTRL_CORE_SMA_SW_1[]DSS_CHx_RF = 1
    The HSYNC and VSYNC signals are driven on the rising edge of PCLK.
  - DISPC_POL_FREQo[15] IEO = 0
    The DE signal is active high.
  - DISPC_POL_FREQo[14] IPC = 0 and CTRL_CORE_SMA_SW_1[]DSS_CHx_IPC = 0
    The pixel data are driven on the rising edge of PCLK.
  - DISPC_POL_FREQo[13] IHS = 0
    The HSYNC signal is active high.

11.2.2.3 DISPC TV Output and Data Format for the Parallel Interface

This section describes the TV output pixel data bus for the parallel interface.
