About This Register Addendum

This Register Addendum (RA) provides detailed register references for each peripheral and subsystem in the device including:

- Register Address
- Register Name
- Register Types
- Register Reset Values
- Register Descriptions
- Bit-field Descriptions

This Register Addendum has been created in order to make the Technical Reference Manual a more effective and size-efficient collateral document. The AM263x Technical Reference Manual can be downloaded at https://www.ti.com/lit/SPRUJ17.

Note on Register Names

Note

This sections and the examples need to be read before proceeding to other chapters

Rev D now expands upon register name by prepending additional information to show where in the IP the register is located. There are three main types of locations. Examples are described below:

- Memory Related Registers
  - These registers are prefixed with *MEM*
  - Example: MEM_QSPI0_CSN0_CFG
- Configuration Related Registers
  - These registers are prefixed with *CFG*
  - Example: CFG0_ATTR_STATUS
- Region Specific Registers
  - These registers are prefixed with a name relating to the IP
  - Example 1: CPSW_VBUSP_REGS_INT_REGS_INT_SS_C0_TH_THRESH_PULSE_EN_REG means REGS_INT_REGS_INT_SS_C0_TH_THRESH_PULSE_EN_REG is related to CPSW_NCSS_VBUSP
  - Example 2: CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC_ECC_REV says CPSW's ECC_REG is related to CPSW_NCSS_VBUSP_CPSW_NC_CPSW_NC. Name to be shorter and aligned in a future revision.

This change in names is also followed by sub section headers and figure titles showing different naming conventions for the registers, but the header and figure are referring to the same register. The different naming conventions help legacy users search for registers. A future revision of this document can align the registers names.

Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

AM263x Documentation

- AM263x Data sheet
- AM263x Errata
- AM263x Technical Reference Manual
  - Technical Reference Manual contains programming guides at the end of select IPs' chapters
- AM263x Register Addendum
- AM263x Hardware Design Guidelines

AM263x Software

- Sitara MCU+ Academy for AM263x
  - Texas Instruments offers the MCU+ Academy as a resource for designing with the MCU+ software and tools on supported devices.
  - The MCU+ Academy features easy-to-use training modules that range from the basics of getting started to advanced development topics.
- MCU-PLUS-SDK-AM263x

AM263x Product Folders

- AM2634 Product Folder
- AM2632 Product Folder
- AM2631 Product Folder

AM263x Evaluation Modules

- AM263x Control Card (TMDSCNCD263)
- AM263x LaunchPad (LP-AM263)

Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

Release History (Register Addendum)

The below table summarizes Register Addendum versions and changes.

Version	Literature Number	Date	Notes
*1	SPRUJ42*1	March 2022	Initial Creation
-	SPRUJ42	April 2022	Original Release Added Read This First Content

DRAFT ONLY
TI Confidential – NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

Version	Literature Number	Date	Notes
A	SPRUJ42A	September 2022	Memory Map Updates: • Core-specific Memory Maps added Updates included for the following CTRLMMR Registers: • TOP_CTRL • MSS_CTRL • MSS_IOMUX • MSS_TOPRCM • MSS_RCM CONTROLSS_EPWM Register Descriptions Added Updates included for the following CONTROLSS Registers: • CONTROLSS_ADC* • CONTROLSS_CMPSS* • CONTROLSS_DAC • CONTROLSS_ECAP • CONTROLSS_EQEP • CONTROLSS_FSI* • CONTROLSS_GLOBAL_CTRL • CONTROLSS_*XBAR Updates included for the following SoC Registers • MSS_GPIO • MSS_LIN • MSS_SPINLOCK
B	SPRUJ42B	October 2022	Updates included for the following CTRLMMR Registers: • TOP_CTRL • MSS_CTRL • MSS_IOMUX • MSS_TOPRCM • MSS_RCM Updates included for the following CONTROLSS Registers: • CONTROLSS_CMPSS* • CONTROLSS_ECAP • CONTROLSS_EQEP • CONTROLSS_GLOBAL_CTRL • CONTROLSS_*XBAR Updates included for the following SoC Registers • XBAR and INTR Registers • MSS_*
C	SPRUJ42C	December 2022	Updates in general register description layout applied across document. PRU-ICSS Registers Added CONTROLSS_EPWM Registers Added Updates included for the following CTRLMMR Registers: • TOP_CTRL • MSS_CTRL • MSS_IOMUX • MSS_TOPRCM • MSS_RCM Updates included for the following SoC Registers • XBAR and INTR Registers • MSS_*

Version	Literature Number	Date	Notes
D	SPRUJ42D	December 2023	• Aligned register reset values in tables and images • Update register names with nomenclature used in other register addendums – Uncompressed instances and registers in EPWM. – Removed "n" variable from register nomenclature from CMPSSA, CMPSSB, ECAP, EQEP, FSI_RX, FSI_TX, OTTOCAL, R5SS, DCC, MCAN, MCRC, RTI, UART, and SDFM • Adding missing figures. ESM, GPIO, I2C, and INPUTXBAR still need missing figures added • CPSW combined into one chapter • TCM, TCMA, TCMB, CCMR, and STC moved into R5SS_Core chapter • Combined TPTC and TPCC chapter into EDAM chapter • Removed chapter CTRLMMR_CONTROLSS_GLOBAL_CTRL which was one page linking to another chapter • MCAN chapters combined into one chapter • Changed AGG to AGGR • TSXBAR_INTR renamed to SoC_TIMESYNC_XBAR0 • SOC_TSXBAR_INTR chapter renamed to SoC_TIMESYNC_XBAR1 and moved to 3.24 • TOP PBIST renamed to PBIST with instance name of PBIST0 • CMPSS instances renamed to CMPSS12B. Names to align with CMPSSA in future revision • Global Control Registers have register name changes from epwm to etpwm and cmpssb to cmpss*b0. • Added GPMC, ELM, and WDT chatpers

1 Memory Map

This chapter summarizes the memory map address regions for the device.

1.1 Device Memory Map

This section describes the device memory map.

Note

The memory locations not shown are either unallocated or reserved and not used.

Accesses to these locations are not recommended and must be avoided.

(2) In Lockstep mode, the R5FSS*x* CORE**1** memory region is not accessible.
(3) The size of these memories changes based on Dual-Core vs Lockstep operation.
For more information about Dual-Core and Lockstep modes, see the *R5FSS* chapter.
For more information about ATCM and BTCM, see the *Tightly-Coupled Memories (TCM)* section within the *R5FSS* chapter.
(4) This memory region is used by each CPU core to access the TCM/Cache memory space of other CPU cores.
(5) Each R5FSS contains 16 KB i-cache and 16 KB d-cache. However, the system interconnect sees an 8 MB address range at ICACHE/DCACHE. Any core attempting to access more than 16 KB will wrap around and access the same cache multiple times.

2 Control Module (CTRLMMR) Registers

The Control module is the main controller for top-level device behavior in various states. Module contains registers for configuration, bootstrap (SOP) signals, I/O terminal pad multiplexing, clock selection, and many others. There are various Control or (CTRLMMR) modules defined in this device:

General SoC Control Modules

- TOP_CTRL (CTRLMMR0): SoC-level configuration registers
- MSS_CTRL (CTRLMMR1): SoC and Peripheral-level configuration registers
- CONTROLSS_GLOBAL_CTRL (CTRLMMR2): CONTROLSS-level configuration registers including general control, reset, and clocking-related functions for the real time control subsystem (CONTROLSS))

Pad Configuration Control Modules

- MSS_IOMUX (PADCFG_CTRLMMR0): SoC-level terminal configuration control registers

Reset and Clocking Control Modules

- MSS_TOPRCM (RCM_CTRLMMR0): SoC-level Clock and Reset control registers
- MSS_RCM (RCM_CTRLMMR1): SoC and Peripheral-level Clock and Reset control registers

2.1 MMR Write Protection

All Control Module MMR have a protection mechanism which prevents spurious writes from changing register values. LOCK0_KICK0 and LOCK0_KICK1 registers are used for this purpose. The sequence to unlock these MMR is as follows:

1. Write exact unlock value (Table 2-1) to <Control Module>LOCK0_KICK0:KEY field
2. Write exact unlock value (Table 2-1) to <Control Module>LOCK0_KICK1:KEY field

The sequence to lock the MMR is as follows:

1. Write zero (or anyother value other than the unlock value)Table 2-1) to <Control Module>LOCK0_KICK1:KEY field
2. Write zero (or anyother value other than the unlock value)Table 2-1) to <Control Module>LOCK0_KICK0:KEY field

- **Note**

  If the above sequence for locking the IOMUX is not followed, an AHB_WRITE_ERROR interrupt will occur (if enabled).

For example, to unlock Control Module MSS_CTRL the sequence is as below:

1. Write 0x01234567 to MSS_CTRL.LOCK0_KICK0:KEY
2. Write 0xFEDCBA8 to MSS_CTRL.LOCK0_KICK1:KEY

To lock the Control Module MSS_CTRL the sequence is as below:

1. Write 0x0 to MSS_CTRL.LOCK0_KICK1:KEY
2. Write 0x0 to MSS_CTRL.LOCK0_KICK0:KEY

Any writes to locked memory region will result in assertion of the MMR_ACCESS_ERR_WR event by the respective control modules. This assertion can be enabled or disabled by writing the appropriate value to <Control Module>.INTR_ENABLE.KICK_ERR_EN field.

The table below shows the values that must be written to the LOCK0_KICK0 and LOCK0_KICK1 registers to unlock the various Control modules' MMR.

Table 2-1. Kick Protection Register Unlock Values

Protected Register	LockKick Register	Unlock Value
TOP_CTRL	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
MSS_CTRL	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
CONTROLSS_CTRL	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
TOP_RCM	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
MSS_RCM	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
IOMUX	LOCK0_KICK0	0x83E70B13
	LOCK0_KICK1	0x95A4F1E0

Note

To ensure that all registers from a given partition are write protected, software must always re-lock the protection mechanism after completing the register writes.

The kick protection registers described in this section are an exception and are not write protected by the protection mechanism.

2.3.1 MSS_CTRL Registers

Address Offset	ShortName	Alternate Software Name	LongName	Description
0x20	R5SS0_CONTROL		R5SS0 Lock Step configure register	This register is used to configure R5SS0 in Lock step or Dual core mode. The mode change can be affected only once in a SOC power cycle
0x024	R5SS0_COREA_HALT	R5SS0_CORE0_HALT	R5SS0 Core 0 Halt Register	This register is used to Halt or Unhalt R5SS0 Core 0
0x028	R5SS0_COREB_HALT	R5SS0_CORE1_HALT	R5SS0 Core 1 Halt Register	This register is used to Halt or Unhalt R5SS0 Core 1
0x02C	R5SS0_STATUS_REG		R5SS0 Lock step Status register	This register shows whether R5SS0 is in Lock step or Dual core mode
0x030	R5SS0_CORE0_STAT		R5SS0 Core 0 Idle Status register	This register shows the WFI WFE status of R5SS0 Core 0
0x034	R5SS0_CORE1_STAT		R5SS0 Core 1 Idle Status register	This register shows the WFI WFE status of R5SS0 Core 1

Address Offset	ShortName	Alternate Software Name	LongName	Description
0x038	MSS_STC_CONTROL0	R5SS0_FORCE_WFI	R5SS0 Force WFI register	This register is used to override and force WFI from R5SS0 to RCM
0x040	R5SS1_CONTROL		R5SS1 Lock Step configure register	This register is used to configure R5SS1 in Lock step or Dual core mode. The mode change can be affected only once in a SOC power cycle
0x044	R5SS1_COREA_HALT	R5SS1_CORE0_HALT	R5SS1 Core 0 Halt Register	This register is used to Halt or Unhalt R5SS1 Core 0
0x048	R5SS1_COREB_HALT	R5SS1_CORE1_HALT	R5SS1 Core 1 Halt Register	This register is used to Halt or Unhalt R5SS1 Core 1
0x04C	R5SS1_STATUS_REG		R5SS1 Lock step Status register	This register shows whether R5SS1 is in Lock step or Dual core mode
0x050	R5SS1_CORE0_STAT		R5SS1 Core 0 Idle Status register	This register shows the WFI WFE status of R5SS1 Core 0
0x054	R5SS1_CORE1_STAT		R5SS1 Core 1 Idle Status register	This register shows the WFI WFE status of R5SS1 Core 1
0x058	MSS_STC_CONTROL1	R5SS1_FORCE_WFI	R5SS1 Force WFI register	This register is used to override and force WFI from R5SS1 to RCM
0x090	R5SS[0]_GLOBAL_CONFIG	R5SS[0]_TEINIT	R5SS[0] Default exception state Register	This register is used to set the Exception state of R5SS[0] at reset
0x200	MSS_ATCM0_MEM_INIT	R5SS0_ATCM_MEM_INIT	R5SS0 ATCM Memory Initialisation Trigger Register	This register is used to initialise the data and ECC of ATCM memory of R5SS0
0x204	MSS_ATCM0_MEM_INIT_DONE	R5SS0_ATCM_MEM_INIT_DONE	R5SS0 ATCM Memory Initialisation Completion Register	This register is used to indicate the ATCM memory initialisation completion for R5SS0
0x208	MSS_ATCM0_MEM_INIT_STATUS	R5SS0_ATCM_MEM_INIT_STATUS	R5SS0 ATCM Memory Initialisation Status Register	This register is used to indicate the status of ongoing memory initialisation for ATCM memory of R5SS0
0x210	MSS_BTCM0_MEM_INIT	R5SS0_BTCM_MEM_INIT	R5SS0 BTCM Memory Initialisation Trigger Register	This register is used to initialise the data and ECC of BTCM memory of R5SS0
0x214	MSS_BTCM0_MEM_INIT_DONE	R5SS0_BTCM_MEM_INIT_DONE	R5SS0 BTCM Memory Initialisation Completion Register	This register is used to indicate the BTCM memory initialisation completion for R5SS0
0x218	MSS_BTCM0_MEM_INIT_STATUS	R5SS0_BTCM_MEM_INIT_STATUS	R5SS0 BTCM Memory Initialisation Status Register	This register is used to indicate the status of ongoing memory initialisation for BTCM memory of R5SS0
0x220	MSS_ATCM1_MEM_INIT	R5SS1_ATCM_MEM_INIT	R5SS1 ATCM Memory Initialisation Trigger Register	This register is used to initialise the data and ECC of ATCM memory of R5SS1
0x224	MSS_ATCM1_MEM_INIT_DONE	R5SS1_ATCM_MEM_INIT_DONE	R5SS1 ATCM Memory Initialisation Completion Register	This register is used to indicate the ATCM memory initialisation completion for R5SS1
0x228	MSS_ATCM1_MEM_INIT_STATUS	R5SS1_ATCM_MEM_INIT_STATUS	R5SS1 ATCM Memory Initialisation Status Register	This register is used to indicate the status of ongoing memory initialisation for ATCM memory of R5SS1
0x230	MSS_BTCM1_MEM_INIT	R5SS1_BTCM_MEM_INIT	R5SS1 BTCM Memory Initialisation Trigger Register	This register is used to initialise the data and ECC of BTCM memory of R5SS1
0x234	MSS_BTCM1_MEM_INIT_DONE	R5SS1_BTCM_MEM_INIT_DONE	R5SS1 BTCM Memory Initialisation Completion Register	This register is used to indicate the BTCM memory initialisation completion for R5SS1
0x238	MSS_BTCM1_MEM_INIT_STATUS	R5SS1_BTCM_MEM_INIT_STATUS	R5SS1 BTCM Memory Initialisation Status Register	This register is used to indicate the status of ongoing memory initialisation for BTCM memory of R5SS1
0x240	MSS_L2_MEM_INIT	L2IOCRAM_MEM_INIT	L2OCRAM Memory Initialisation Trigger Register	This register is used to initialise the data and ECC of L2OCRAM

2.3.2 MSS_CTRL_R5SS0_CONTROL Registers

2.3.2.1 MSS_R5SS0_CONTROL Register (Offset = 20h) [reset = h]

Short Description: R5SS0_CONTROL register

Long Description:

Return to Summary Table

Table 2-103. Instance Table

Instance Name	Physical Address
MSS_CTRL	50D0 0020h

Access Types Legend

Table 2-104. R5SS0_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
26 - 24	ROM_WAIT_STATE	RW	0h	Writing '111' enables a single cycle wait state with respect to CR5A_clk for rom access.This needs to be set when R5 clock is at 400MHZ and Interconnect-clk is at 200MHZ. (because it is a timing issue in this scenario)
	RESERVED	NONE		Reserved
18 - 16	RESET_FSM_TRIGGER	RW	0h	Write pulse bit field : Writing 3'b111 will trigger the reset FSM. Reset FSM ensures reset to R5SS and inturn ensures the latching of lock_step and also mem_swap bit
	RESERVED	NONE		Reserved
10 - 8	LOCK_STEP_SWITCH_WAIT	RW	6Fh	Writing 3'b111 ensures switch happens only after R5SS reset. Or else it will be a immediate switch.
	RESERVED	NONE		Reserved
2 - 0	LOCK_STEP	RW	6Fh	Writing 3'b000 ensures R5 to be in Dual-Core mode. Note: The change happens after the R5SS reset assertion if R5_CONTROL_lock_step_switch_wait is set. Or else the switiching to Dual-core happens on the fly.

2.3.3 MSS_CTRL_R5SS0_CORE0_HALT Registers

2.3.3.1 MSS_R5SS0_CORE0_HALT Register (Offset = 24h) [reset = h]

Short Description: R5SS0_CORE0_HALT register

Long Description:

Return to Summary Table

Table 2-105. Instance Table

Instance Name	Physical Address
MSS_CTRL	50D0 0024h

Access Types Legend

Table 2-106. R5SS0_CORE0_HALT Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
2 - 0	HALT	RW	6Fh	Writing '000' will unhalt CR5A. This register should be written only once.

DRAFT ONLY
TI Confidential – NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

2.3.4 MSS_CTRL_R5SS0_CORE1_HALT Registers

2.3.4.1 MSS_R5SS0_CORE1_HALT Register (Offset = 28h) [reset = h]

Short Description: R5SS0_CORE1_HALT register

Long Description:

Return to Summary Table

Table 2-107. Instance Table

Instance Name	Physical Address
MSS_CTRL	50D0 0028h

Access Types Legend

Table 2-108. R5SS0_CORE1_HALT Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
2 - 0	HALT	RW	6Fh	Writing '000' will unhalt for CR5B. This register should be written only once.

DRAFT ONLY
TI Confidential – NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

2.3.5 MSS_CTRL_R5SS0_STATUS_REG Registers

2.3.5.1 MSS_R5SS0_STATUS_REG Register (Offset = 2Ch) [reset = h]

Short Description: R5SS0_STATUS_REG register

Long Description:

Return to Summary Table

Table 2-109. Instance Table

Instance Name	Physical Address
MSS_CTRL	50D0 002Ch

Access Types Legend

Table 2-110. R5SS0_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
8	LOCK_STEP	RO	0h	Reading 1: confirms R5SS is in lockstep mode. Reading 0: confirms R5SS is in Dual-core mode.
	RESERVED	NONE		Reserved
0	MEMSWAP	RO	0h	Reading 1: confirms ROM is Eclipsed from with RAM for R5.

2.3.196.1 MSS_R5SS1_CPU1_TCM_ADDRPARITY_ERRAGG_STATUS_RAW Register (Offset = 18158h) [reset = h]

Short Description: R5SS1_CPU1_TCM_ADDRPARITY_ERRAGG_STATUS_RAW register

Long Description:

Return to Summary Table

Table 2-491. Instance Table

Instance Name	Physical Address
MSS_CTRL	50D1 8158h

Access Types Legend

Table 2-492. R5SS1_CPU1_TCM_ADDRPARITY_ERRAGG_STATUS_RAW Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
2	R5SS1_CPU1_B1TCM1_PARITY_ERR	RW	0h	Raw Status of Interrupt from address parity error of corresponding CPU*_TCM_ADDRPARITY_ERRAGG_MASK register. Write 0x1 to clear this interrupt.
1	R5SS1_CPU1_B0TCM1_PARITY_ERR	RW	0h	Raw Status of Interrupt from address parity error of corresponding CPU*_TCM_ADDRPARITY_ERRAGG_MASK register. Write 0x1 to clear this interrupt.
0	R5SS1_CPU1_ATCM1_PARITY_ERR	RW	0h	Raw Status of Interrupt from address parity error of corresponding CPU*_TCM_ADDRPARITY_ERRAGG_MASK register. Write 0x1 to clear this interrupt.

Instance Name	Physical Address
IOMUX	5310 007Ch

Access Types Legend

Table 2-578. RGMII1_RD0_CFG_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	HSMASTER	RW	0h	MMR bits for HSMASTER pin incase of true I2C pads
30	HSMODE	RW	0h	MMR bits for HSMODE pin incase of true I2C pads
	RESERVED	NONE		Reserved
20	INP_INV_SEL	RW	0h	Select value for choosing inverted version of PAD input for chip: • 0: Non Inverted • 1: Inverted
19 - 18	QUAL_SEL	RW	0h	Select value for choosing input qualifier type for PAD. • 00: Sync • 01: 3 Samples • 10: 6 Samples • 11: Async
17 - 16	GPIO_SEL	RW	0h	R5F CPU ownership select for GPIO. • 0: GPO0 • 1: GPO1 • 2: GPO2 • 3: GPO3
	RESERVED	NONE		Reserved
10	SC1	RW	1h	IO Slew rate control: • 0: Higher Slew Rate • 1: Lower Slew Rate
9	PUPDSEL	RW	0h	Pull Up/Pull Down Selection • 0: Pull Down • 1: Pull Up
8	PI	RW	1h	Internal Pull Resistor Disable • 0: Enable • 1: Disable
7	OE_OVERRIDE	RW	1h	Active Low Output Override
6	OE_OVERRIDE_CTRL	RW	1h	Active Low Output Override Control Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	IE_OVERRIDE	RW	1h	Active Low Input Override
4	IE_OVERRIDE_CTRL	RW	1h	Active Low Input Override Control. Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware

2.4.122.1 IOMUX_REFCLK0_CFG_REG Register (Offset = 1E4h) [reset = h]

Short Description: RW

Long Description:

Return to Summary Table

Table 2-757. Instance Table

Instance Name	Physical Address
IOMUX	5310 01E4h

Access Types Legend

Table 2-758. EXT_REFCLK0_CFG_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	HSMASTER	RW	0h	MMR bits for HSMASTER pin incase of true I2C pads
30	HSMODE	RW	0h	MMR bits for HSMODE pin incase of true I2C pads
	RESERVED	NONE		Reserved
20	INP_INV_SEL	RW	0h	Select value for choosing inverted version of PAD input for chip: • 0: Non Inverted • 1: Inverted
19 - 18	QUAL_SEL	RW	0h	Select value for choosing input qualifier type for PAD. • 00: Sync • 01: 3 Samples • 10: 6 Samples • 11: Async
17 - 16	GPIO_SEL	RW	0h	R5F CPU ownership select for GPIO. • 0: GPO0 • 1: GPO1 • 2: GPO2 • 3: GPO3
	RESERVED	NONE		Reserved
10	SC1	RW	1h	IO Slew rate control: • 0: Higher Slew Rate • 1: Lower Slew Rate
9	PUPDSEL	RW	0h	Pull Up/Pull Down Selection • 0: Pull Down • 1: Pull Up
8	PI	RW	1h	Internal Pull Resistor Disable • 0: Enable • 1: Disable
7	OE_OVERRIDE	RW	1h	Active Low Output Override
6	OE_OVERRIDE_CTRL	RW	1h	Active Low Output Override Control Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	IE_OVERRIDE	RW	1h	Active Low Input Override
4	IE_OVERRIDE_CTRL	RW	1h	Active Low Input Override Control. Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware

Instance Name	Physical Address
TOP_RCM	5320 0020h

Access Types Legend

Table 2-870. PAD_XTAL_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
3	XTAL_XI_OE_N	RW	0h	When gz is low, the padxo output is enabled, padxi to padxo is a single stage inverter, and the oscillator can oscillate with an external crystal plus capacitors/resistor. When gz is high, padxo is in high impedance mode, padxi and Y are driven low, and the oscillator is disabled. With gz high, the internal bias resistor between padxi and padxo is disconnected regardless of the state of resselect.
2	XTAL_XO_RESSELECT	RW	0h	When resselect is low, an internal 1Meg Ohm resistor is connected between padxi and padxo for oscillator bias. When resselect is asserted (high), the internal resistor is disconnected. For oscillation with a crystal while resselect is high, an external resistor must be connected between padxi and padxo to provide bias.
1	XTAL_XO_SW2	RW	0h	XTAL pad control bit frequency selection pin SW2 Based on table belowsw2 sw1 Freq of operation0 0 5 20 MHz0 1 15 35 MHz1 0 30 40 MHz1 1 40 55 MHz

2.5.24 TOP_RCM_MSS_TOPRCM_PLL_CORE_STATUS Registers

2.5.24.1 TOP_PLL_CORE_STATUS Register (Offset = 424h) [reset = h]

Short Description: RO

Long Description:

Return to Summary Table

Table 2-899. Instance Table

Instance Name	Physical Address
TOP_RCM	5320 0424h

Access Types Legend

Table 2-900. PLL_CORE_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	RO	1h	Status of the weak power-switch0x0 : indicates the/OFF status of the weak power-switch in digital toSOC.0x1 : ndicates the ON status of the weak power-switch in digital toSOC.
30	PGOODOUT	RO	1h	Status of the strong power-switch0x0 : indicates the/OFF status of the strong power-switch in digital toSOC.0x1 : ndicates the ON status of the strong power-switch in digital toSOC.
29	LDOPWDN	RO	1h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT willbe un-defined in this condition
28	RECAL_BSTATUS3	RO	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	RO	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
	RESERVED	NONE		Reserved
12	CLKOUTLDOENACK	RO	1h	Indicates the enable/disable condition of CLKOUTLDOEN0x0 = CLKOUTLDO gating completed0x1 = CLKOUTLDO enabling completed
11	CLKDCOLDOACK	RO	0h	Indicates the enable/disable condition of CLKDCOLDOEN0x0 = CLKDCOLDO gating completed0x1 = CLKDCOLOD enabling completed
10	PHASELOCK	RO	0h	Status on PHASELOCK output pin
9	FREQLOCK	RO	0h	Status on FREQLOCK output pin
8	BYPASSACK	RO	1h	Status of BYPASSACK output pin
7	STBYRETACK	RO	0h	Standby and retention status0x0: indicates to SOC that all internal clocks in ADPLLLJ are activeand it is starting the relock process.0x1: indicates to SOC that all internal clocks in ADPLLLJ are gatedand it is ready for retention.
6	LOSSREF	RO	1h	Reference input loss
5	CLKOUTENACK	RO	0h	Indicates the enable/disable condition of CLKOUTEN0x0 = CLKOUT gating completed0x1 = CLKOUT enabling completed
4	LOCK2	RO	0h	ADPLL internal loop lock status
3	M2CHANGEACK	RO	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1(depending on current value) once CLKOUT frequency change hascompleted.
2	SSCACK	RO	0h	Spread Spectrum status0x0 : Spread-spectrum Clocking is disabled on output clocks0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	RO	0h	1 indicates jitter. After PHASELOCK is asserted high, theHIGHJITTER flag is asserted high if phase error between REFCLKand FBCLK greater than 24%.
0	BYPASS	RO	1h	Bypass status signal. 1 CLKOUT in bypass

2.5.48.1 TOP_PLL_PER_FRACCTRL Register (Offset = 820h) [reset = h]

Short Description: RW

Long Description:

Return to Summary Table

Table 2-947. Instance Table

Instance Name	Physical Address
TOP_RCM	5320 0820h

Access Types Legend

Table 2-948. PLL_PER_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	RW	0h	Controls frequency spread0x0 : enables both side frequency spread about the programmed frequency.0x1 : enables low frequency spread only
30 - 28	MODFREQDIVIDEREXPONENT	RW	0h	Exponent of the REFCLK divider to define the modulation frequency.
27 - 21	MODFREQDIVIDERMANTISSA	RW	0h	Mantissa of the REFCLK divider to define the modulation frequency
20 - 18	DELTAMSTEPINTEGER	RW	0h	Integer part of Frequency Spread control
17 - 0	DELTAMSTEPFRACTION	RW	0h	The fraction part of Frequency Spread control

2.5.49 TOP_RCM_MSS_TOPRCM_PLL_PER_STATUS Registers

2.5.49.1 TOP_PLL_PER_STATUS Register (Offset = 824h) [reset = h]

Short Description: RO

Long Description:

Return to Summary Table

Table 2-949. Instance Table

Instance Name	Physical Address
TOP_RCM	5320 0824h

Access Types Legend

Table 2-950. PLL_PER_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	RO	1h	Status of the weak power-switch0x0 : indicates the/OFF status of the weak power-switch in digital toSOC.0x1 : ndicates the ON status of the weak power-switch in digital toSOC.
30	PGOODOUT	RO	1h	Status of the strong power-switch0x0 : indicates the/OFF status of the strong power-switch in digital toSOC.0x1 : ndicates the ON status of the strong power-switch in digital toSOC.
29	LDOPWDN	RO	1h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT willbe un-defined in this condition
28	RECAL_BSTATUS3	RO	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	RO	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
	RESERVED	NONE		Reserved
12	CLKOUTLDOENACK	RO	1h	Indicates the enable/disable condition of CLKOUTLDOEN0x0 = CLKOUTLDO gating completed0x1 = CLKOUTLDO enabling completed
11	CLKDCOLDOACK	RO	0h	Indicates the enable/disable condition of CLKDCOLDOEN0x0 = CLKDCOLDO gating completed0x1 = CLKDCOLDO enabling completed
10	PHASELOCK	RO	0h	Status on PHASELOCK output pin
9	FREQLOCK	RO	0h	Status on FREQLOCK output pin
8	BYPASSACK	RO	1h	Status of BYPASSACK output pin
7	STBYRETACK	RO	0h	Standby and retention status0x0: indicates to SOC that all internal clocks in ADPLLLJ are activeand it is starting the relock process.0x1: indicates to SOC that all internal clocks in ADPLLLJ are gatedand it is ready for retention.
6	LOSSREF	RO	1h	Reference input loss
5	CLKOUTENACK	RO	0h	Indicates the enable/disable condition of CLKOUTEN0x0 = CLKOUT gating completed0x1 = CLKOUT enabling completed
4	LOCK2	RO	0h	ADPLL internal loop lock status
3	M2CHANGEACK	RO	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1(depending on current value) once CLKOUT frequency change hascompleted.
2	SSCACK	RO	0h	Spread Spectrum status0x0 : Spread-spectrum Clocking is disabled on output clocks0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	RO	0h	1 indicates jitter. After PHASELOCK is asserted high, theHIGHJITTER flag is asserted high if phase error between REFCLKand FBCLK greater than 24%.
0	BYPASS	RO	1h	Bypass status signal. 1 CLKOUT in bypass

2.5.75 TOP_RCM_MSS_TOPRCM_FAULT_TYPE_STATUS Registers

2.5.75.1 TOP_FAULT_TYPE_STATUS Register (Offset = 1028h) [reset = h]

Short Description: Fault Type Status register

Long Description:

Return to Summary Table

Table 2-1001. Instance Table

Instance Name	Physical Address
TOP_RCM	5320 1028h

Access Types Legend

Table 2-1002. FAULT_TYPE_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
6	FAULT_NS	RO	0h	Non-secure access.
5 - 0	FAULT_TYPE	RO	0h	Fault Type 10_0000 = Supervisor read fault - priv = 1 dir = 1 dtype ! = 1 01_0000 = Supervisor write fault - priv = 1 dir = 0 00_1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_0010 = User write fault - priv = 0 dir = 0 00_0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_0000 = No fault

2.5.76 TOP_RCM_MSS_TOPRCM_FAULT_ATTR_STATUS Registers

2.5.76.1 TOP_FAULT_ATTR_STATUS Register (Offset = 102Ch) [reset = h]

Short Description: Fault Attribute Status register

Long Description:

Return to Summary Table

Table 2-1003. Instance Table

Instance Name	Physical Address
TOP_RCM	5320 102Ch

Access Types Legend

Table 2-1004. FAULT_ATTR_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 20	FAULT_XID	RO	0h	XID.
19 - 8	FAULT_ROUTEID	RO	0h	Route ID.
7 - 0	FAULT_PRIVID	RO	0h	Privilege ID.

2.5.77 TOP_RCM_MSS_TOPRCM_FAULT_CLEAR Registers

2.5.77.1 TOP_FAULT_CLEAR Register (Offset = 1030h) [reset = h]

Short Description: Fault Clear register

Long Description:

Return to Summary Table

Table 2-1005. Instance Table

Instance Name	Physical Address
TOP_RCM	5320 1030h

Access Types Legend

Table 2-1006. FAULT_CLEAR Register Field Descriptions

Bit	Field	Type	Reset	Description
0	FAULT_CLR	WO	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

2.5.78 Access Table

Table 2-1007. Access Type Codes

Access Type	Code	Description
RO	RO	Read
RW	RW	Read / Write
WO	WO	Write

2.6 MSS_RCM Registers

Table 2-1008. MSS_RCM Registers Base Address Table

Offset	Length	Acronym	Register Name	MSS_RCM Physical Address
0h	32	MSS_RCM_PID	PID register	5320 8000h
10h	16	MSS_RCM_R5SS0_RST_STATUS	R5SS0_RST_STATUS register	5320 8010h

2.6.5 MSS_RCM_MSS_RCM_R5SS0_RST_ASSERDLY Registers

2.6.5.1 MSS_R5SS0_RST_ASSERDLY Register (Offset = 1Ch) [reset = h]

Short Description: R5SS0_RST_ASSERDLY register

Long Description:

Return to Summary Table

Table 2-1017. Instance Table

Instance Name	Physical Address
MSS_RCM	5320 801Ch

Access Types Legend

Table 2-1018. R5SS0_RST_ASSERDLY Register Field Descriptions

Bit	Field	Type	Reset	Description
7 - 0	COUNT	RW	457h	Value decides number of cycles reset should be kept asserted for CR5SS related resets. Programming a value of 0xFF will keep the reset asserted untill a new value other than 0xFF is written to this registerThe actual duration is count + 2 cycles. S/W Recommended value for this is 0x0FThe COUNT is applicable to both CPU cores

2.6.285 MSS_RCM_MSS_RCM_FAULT_ATTR_STATUS Registers

2.6.285.1 MSS_FAULT_ATTR_STATUS Register (Offset = 102Ch) [reset = h]

Short Description: Fault Attribute Status register

Long Description:

Return to Summary Table

Table 2-1577. Instance Table

Instance Name	Physical Address
MSS_RCM	5320 902Ch

Access Types Legend

Table 2-1578. FAULT_ATTR_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 20	FAULT_XID	RO	0h	XID.
19 - 8	FAULT_ROUTEID	RO	0h	Route ID.
7 - 0	FAULT_PRIVID	RO	0h	Privilege ID.

2.6.286 MSS_RCM_MSS_RCM_FAULT_CLEAR Registers

2.6.286.1 MSS_FAULT_CLEAR Register (Offset = 1030h) [reset = h]

Short Description: Fault Clear register

Long Description:

Return to Summary Table

Table 2-1579. Instance Table

Instance Name	Physical Address
MSS_RCM	5320 9030h

Access Types Legend

Table 2-1580. FAULT_CLEAR Register Field Descriptions

Bit	Field	Type	Reset	Description
0	FAULT_CLR	WO	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

2.6.287 Access Table

Table 2-1581. Access Type Codes

Access Type	Code	Description
RO	RO	Read
RW	RW	Read / Write
WO	WO	Write

2.7 CTRLMMR CONTROLSS_GLOBAL_CTRL Registers

These registers are documented in the respective CONTROLSS chapter.

Please refer to .

3 Real-time Control Subsystem (CONTROLSS) Registers

The Real-time Control Subsystem (CONTROLSS) registers are described in the following sections.

3.1 CONTROLSS 16-bit Register Access Note

Note

8-bit wide register access is **not allowed** for ADC, EPWM, DAC, CMPSS, EQEP, SDFM, and FSI MMR regions. 16-bit access must be used instead.

Table 3-22. ADCSOCPRICTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9 - 5	RRPOINTER	R	10h	Round Robin Pointer. Holds the value of the last converted round robin SOCx to be used by the round robin scheme to determine order of conversions. 00h SOC0 was last round robin SOC to convert, SOC1 is highest round robin priority. 01h SOC1 was last round robin SOC to convert, SOC2 is highest round robin priority. 02h SOC2 was last round robin SOC to convert, SOC3 is highest round robin priority. 03h SOC3 was last round robin SOC to convert, SOC4 is highest round robin priority. 04h SOC4 was last round robin SOC to convert, SOC5 is highest round robin priority. 05h SOC5 was last round robin SOC to convert, SOC6 is highest round robin priority. 06h SOC6 was last round robin SOC to convert, SOC7 is highest round robin priority. 07h SOC7 was last round robin SOC to convert, SOC8 is highest round robin priority. 08h SOC8 was last round robin SOC to convert, SOC9 is highest round robin priority. 09h SOC9 was last round robin SOC to convert, SOC10 is highest round robin priority. 0Ah SOC10 was last round robin SOC to convert, SOC11 is highest round robin priority. 0Bh SOC11 was last round robin SOC to convert, SOC12 is highest round robin priority. 0Ch SOC12 was last round robin SOC to convert, SOC13 is highest round robin priority. 0Dh SOC13 was last round robin SOC to convert, SOC14 is highest round robin priority. 0Eh SOC14 was last round robin SOC to convert, SOC15 is highest round robin priority. 0Fh SOC15 was last round robin SOC to convert, SOC0 is highest round robin priority. 10h Reset value to indicate no SOC has been converted. SOC0 is highest round robin priority. Set to this value when the device is reset, when the ADCCTL1.RESET bit is set, or when the ADCSOCPRICTL register is written. In the latter case, if a conversion is currently in progress, it will complete and then the new priority will take effect. Others Invalid value.
4 - 0	SOCPRIORITY	R/W	0h	SOC Priority Determines the cutoff point for priority mode and round robin arbitration for SOCx 00h SOC priority is handled in round robin mode for all channels. 01h SOC0 is high priority, rest of channels are in round robin mode. 02h SOC0-SOC1 are high priority, SOC2-SOC15 are in round robin mode. 03h SOC0-SOC2 are high priority, SOC3-SOC15 are in round robin mode. 04h SOC0-SOC3 are high priority, SOC4-SOC15 are in round robin mode. 05h SOC0-SOC4 are high priority, SOC5-SOC15 are in round robin mode. 06h SOC0-SOC5 are high priority, SOC6-SOC15 are in round robin mode. 07h SOC0-SOC6 are high priority, SOC7-SOC15 are in round robin mode. 08h SOC0-SOC7 are high priority, SOC8-SOC15 are in round robin mode. 09h SOC0-SOC8 are high priority, SOC9-SOC15 are in round robin mode. 0Ah SOC0-SOC9 are high priority, SOC10-SOC15 are in round robin mode. 0Bh SOC0-SOC10 are high priority, SOC11-SOC15 are in round robin mode. 0Ch SOC0-SOC11 are high priority, SOC12-SOC15 are in round robin mode. 0Dh SOC0-SOC12 are high priority, SOC13-SOC15 are in round robin mode. 0Eh SOC0-SOC13 are high priority, SOC14-SOC15 are in round robin mode. 0Fh SOC0-SOC14 are high priority, SOC15 is in round robin mode. 10h All SOCs are in high priority mode, arbitrated by SOC number. Others Invalid selection.

Table 3-24. ADCINTSOCSEL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 14	SOC7	R/W	0h	SOC7 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC7. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC7. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC7. 10 ADCINT2 will trigger SOC7. 11 Invalid selection.
13 - 12	SOC6	R/W	0h	SOC6 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC6. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC6. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC6. 10 ADCINT2 will trigger SOC6. 11 Invalid selection.
11 - 10	SOC5	R/W	0h	SOC5 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC5. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC5. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC5. 10 ADCINT2 will trigger SOC5. 11 Invalid selection.
9 - 8	SOC4	R/W	0h	SOC4 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC4. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC4. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC4. 10 ADCINT2 will trigger SOC4. 11 Invalid selection.

Table 3-28. ADCSOCFLG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R	0h	SOC15 Start of Conversion Flag. Indicates the state of SOC15 conversions. 0 No sample pending for SOC15. 1 Trigger has been received and sample is pending for SOC15. This bit will be automatically cleared when the SOC15 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
14	SOC14	R	0h	SOC14 Start of Conversion Flag. Indicates the state of SOC14 conversions. 0 No sample pending for SOC14. 1 Trigger has been received and sample is pending for SOC14. This bit will be automatically cleared when the SOC14 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
13	SOC13	R	0h	SOC13 Start of Conversion Flag. Indicates the state of SOC13 conversions. 0 No sample pending for SOC13. 1 Trigger has been received and sample is pending for SOC13. This bit will be automatically cleared when the SOC13 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-28. ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	SOC12	R	0h	SOC12 Start of Conversion Flag. Indicates the state of SOC12 conversions. 0 No sample pending for SOC12. 1 Trigger has been received and sample is pending for SOC12. This bit will be automatically cleared when the SOC12 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
11	SOC11	R	0h	SOC11 Start of Conversion Flag. Indicates the state of SOC11 conversions. 0 No sample pending for SOC11. 1 Trigger has been received and sample is pending for SOC11. This bit will be automatically cleared when the SOC11 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
10	SOC10	R	0h	SOC10 Start of Conversion Flag. Indicates the state of SOC10 conversions. 0 No sample pending for SOC10. 1 Trigger has been received and sample is pending for SOC10. This bit will be automatically cleared when the SOC10 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
9	SOC9	R	0h	SOC9 Start of Conversion Flag. Indicates the state of SOC9 conversions. 0 No sample pending for SOC9. 1 Trigger has been received and sample is pending for SOC9. This bit will be automatically cleared when the SOC9 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
8	SOC8	R	0h	SOC8 Start of Conversion Flag. Indicates the state of SOC8 conversions. 0 No sample pending for SOC8. 1 Trigger has been received and sample is pending for SOC8. This bit will be automatically cleared when the SOC8 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
7	SOC7	R	0h	SOC7 Start of Conversion Flag. Indicates the state of SOC7 conversions. 0 No sample pending for SOC7. 1 Trigger has been received and sample is pending for SOC7. This bit will be automatically cleared when the SOC7 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
6	SOC6	R	0h	SOC6 Start of Conversion Flag. Indicates the state of SOC6 conversions. 0 No sample pending for SOC6. 1 Trigger has been received and sample is pending for SOC6. This bit will be automatically cleared when the SOC6 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-28. ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	SOC5	R	0h	SOC5 Start of Conversion Flag. Indicates the state of SOC5 conversions. 0 No sample pending for SOC5. 1 Trigger has been received and sample is pending for SOC5. This bit will be automatically cleared when the SOC5 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
4	SOC4	R	0h	SOC4 Start of Conversion Flag. Indicates the state of SOC4 conversions. 0 No sample pending for SOC4. 1 Trigger has been received and sample is pending for SOC4. This bit will be automatically cleared when the SOC4 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
3	SOC3	R	0h	SOC3 Start of Conversion Flag. Indicates the state of SOC3 conversions. 0 No sample pending for SOC3. 1 Trigger has been received and sample is pending for SOC3. This bit will be automatically cleared when the SOC3 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
2	SOC2	R	0h	SOC2 Start of Conversion Flag. Indicates the state of SOC2 conversions. 0 No sample pending for SOC2. 1 Trigger has been received and sample is pending for SOC2. This bit will be automatically cleared when the SOC2 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
1	SOC1	R	0h	SOC1 Start of Conversion Flag. Indicates the state of SOC1 conversions. 0 No sample pending for SOC1. 1 Trigger has been received and sample is pending for SOC1. This bit will be automatically cleared when the SOC1 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
0	SOC0	R	0h	SOC0 Start of Conversion Flag. Indicates the state of SOC0 conversions. 0 No sample pending for SOC0. 1 Trigger has been received and sample is pending for SOC0. This bit will be automatically cleared when the SOC0 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-30. ADCSOCFRC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R-0/W	0h	SOC15 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC15 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC15 flag bit to 1. This will cause a conversion to start once priority is given to SOC15. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC15 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
14	SOC14	R-0/W	0h	SOC14 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC14 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC14 flag bit to 1. This will cause a conversion to start once priority is given to SOC14. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC14 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-30. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	SOC13	R-0/W	0h	SOC13 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC13 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC13 flag bit to 1. This will cause a conversion to start once priority is given to SOC13. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC13 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
12	SOC12	R-0/W	0h	SOC12 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC12 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC12 flag bit to 1. This will cause a conversion to start once priority is given to SOC12. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC12 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
11	SOC11	R-0/W	0h	SOC11 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC11 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC11 flag bit to 1. This will cause a conversion to start once priority is given to SOC11. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC11 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
10	SOC10	R-0/W	0h	SOC10 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC10 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC10 flag bit to 1. This will cause a conversion to start once priority is given to SOC10. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC10 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
9	SOC9	R-0/W	0h	SOC9 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC9 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC9 flag bit to 1. This will cause a conversion to start once priority is given to SOC9. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC9 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-30. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SOC8	R-0/W	0h	SOC8 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC8 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC8 flag bit to 1. This will cause a conversion to start once priority is given to SOC8. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC8 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
7	SOC7	R-0/W	0h	SOC7 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC7 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC7 flag bit to 1. This will cause a conversion to start once priority is given to SOC7. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC7 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
6	SOC6	R-0/W	0h	SOC6 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC6 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC6 flag bit to 1. This will cause a conversion to start once priority is given to SOC6. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC6 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
5	SOC5	R-0/W	0h	SOC5 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC5 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC5 flag bit to 1. This will cause a conversion to start once priority is given to SOC5. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC5 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
4	SOC4	R-0/W	0h	SOC4 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC4 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC4 flag bit to 1. This will cause a conversion to start once priority is given to SOC4. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC4 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-30. ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	SOC3	R-0/W	0h	SOC3 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC3 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC3 flag bit to 1. This will cause a conversion to start once priority is given to SOC3. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC3 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
2	SOC2	R-0/W	0h	SOC2 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC2 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC2 flag bit to 1. This will cause a conversion to start once priority is given to SOC2. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC2 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
1	SOC1	R-0/W	0h	SOC1 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC1 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC1 flag bit to 1. This will cause a conversion to start once priority is given to SOC1. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC1 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
0	SOC0	R-0/W	0h	SOC0 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC0 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC0 flag bit to 1. This will cause a conversion to start once priority is given to SOC0. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC0 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-32. ADCSOCOVF1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R	0h	SOC15 Start of Conversion Overflow Flag. Indicates an SOC15 event was generated in hardware while an existing SOC15 event was already pending. 0 No SOC15 event overflow. 1 SOC15 event overflow. An overflow condition does not stop SOC15 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
14	SOC14	R	0h	SOC14 Start of Conversion Overflow Flag. Indicates an SOC14 event was generated in hardware while an existing SOC14 event was already pending. 0 No SOC14 event overflow. 1 SOC14 event overflow. An overflow condition does not stop SOC14 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
13	SOC13	R	0h	SOC13 Start of Conversion Overflow Flag. Indicates an SOC13 event was generated in hardware while an existing SOC13 event was already pending. 0 No SOC13 event overflow. 1 SOC13 event overflow. An overflow condition does not stop SOC13 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
12	SOC12	R	0h	SOC12 Start of Conversion Overflow Flag. Indicates an SOC12 event was generated in hardware while an existing SOC12 event was already pending. 0 No SOC12 event overflow. 1 SOC12 event overflow. An overflow condition does not stop SOC12 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.

Table 3-32. ADCSOCOVF1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	SOC11	R	0h	SOC11 Start of Conversion Overflow Flag. Indicates an SOC11 event was generated in hardware while an existing SOC11 event was already pending. 0 No SOC11 event overflow. 1 SOC11 event overflow. An overflow condition does not stop SOC11 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
10	SOC10	R	0h	SOC10 Start of Conversion Overflow Flag. Indicates an SOC10 event was generated in hardware while an existing SOC10 event was already pending. 0 No SOC10 event overflow. 1 SOC10 event overflow. An overflow condition does not stop SOC10 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
9	SOC9	R	0h	SOC9 Start of Conversion Overflow Flag. Indicates an SOC9 event was generated in hardware while an existing SOC9 event was already pending. 0 No SOC9 event overflow. 1 SOC9 event overflow. An overflow condition does not stop SOC9 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
8	SOC8	R	0h	SOC8 Start of Conversion Overflow Flag. Indicates an SOC8 event was generated in hardware while an existing SOC8 event was already pending. 0 No SOC8 event overflow. 1 SOC8 event overflow. An overflow condition does not stop SOC8 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
7	SOC7	R	0h	SOC7 Start of Conversion Overflow Flag. Indicates an SOC7 event was generated in hardware while an existing SOC7 event was already pending. 0 No SOC7 event overflow. 1 SOC7 event overflow. An overflow condition does not stop SOC7 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
6	SOC6	R	0h	SOC6 Start of Conversion Overflow Flag. Indicates an SOC6 event was generated in hardware while an existing SOC6 event was already pending. 0 No SOC6 event overflow. 1 SOC6 event overflow. An overflow condition does not stop SOC6 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
5	SOC5	R	0h	SOC5 Start of Conversion Overflow Flag. Indicates an SOC5 event was generated in hardware while an existing SOC5 event was already pending. 0 No SOC5 event overflow. 1 SOC5 event overflow. An overflow condition does not stop SOC5 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
4	SOC4	R	0h	SOC4 Start of Conversion Overflow Flag. Indicates an SOC4 event was generated in hardware while an existing SOC4 event was already pending. 0 No SOC4 event overflow. 1 SOC4 event overflow. An overflow condition does not stop SOC4 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
3	SOC3	R	0h	SOC3 Start of Conversion Overflow Flag. Indicates an SOC3 event was generated in hardware while an existing SOC3 event was already pending. 0 No SOC3 event overflow. 1 SOC3 event overflow. An overflow condition does not stop SOC3 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.
2	SOC2	R	0h	SOC2 Start of Conversion Overflow Flag. Indicates an SOC2 event was generated in hardware while an existing SOC2 event was already pending. 0 No SOC2 event overflow. 1 SOC2 event overflow. An overflow condition does not stop SOC2 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not affect this bit.

Table 3-102. ADCPPB2OFFCAL Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 10	RESERVED	R		Reserved
9 - 0	OFFCAL	R/W	0h	ADC Post Processing Block 2 Offset Correction. This bit field can be used to digitally remove any system level offset inherent in the ADCIN circuit. This 10-bit signed value is subtracted from the ADC output before being stored in the ADCRESULT register. 000h No change. The ADC output is stored directly into ADCRESULT. 001h ADC output - 1 is stored into ADCRESULT. 002h ADC output - 2 is stored into ADCRESULT. ... 200h ADC output + 512 is stored into ADCRESULT. ... 3FFh ADC output + 1 is stored into ADCRESULT. NOTE: In 16-bit mode, the subtraction will saturate at 0000h and FFFFh before being stored into the ADCRESULT register. In 12-bit mode, the subtraction will saturate at 0000h and 0FFFh before being stored into the ADCRESULT register.

Table 3-104. ADCPPB2OFFREF Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 0	OFFREF	R/W	0h	ADC Post Processing Block 2 Offset Correction. This bit field can be used to either calculate the feedback error or convert a unipolar signal to bipolar by subtracting a reference value. This 16-bit unsigned value is subtracted from the ADCRESULT register before being passed through an optional two's complement function and stored in the ADCPPB2RESULT register. This subtraction is not saturated. 0000h No change. The ADCRESULT value is passed on. 0001h ADCRESULT - 1 is passed on. 0002h ADCRESULT - 2 is passed on. ... 8000h ADCRESULT - 32,768 is passed on. ... FFFFh ADCRESULT - 65,535 is passed on. NOTE: In 12-bit mode the size of this register does not change from 16-bits. It is the user's responsibility to ensure that only a 12-bit value is written to this register when in 12-bit mode.

9 - 0	OFFCAL	R/W	0h	ADC Post Processing Block 4 Offset Correction. This bit field can be used to digitally remove any system level offset inherent in the ADCIN circuit. This 10-bit signed value is subtracted from the ADC output before being stored in the ADCRESULT register. 000h No change. The ADC output is stored directly into ADCRESULT. 001h ADC output - 1 is stored into ADCRESULT. 002h ADC output - 2 is stored into ADCRESULT. ... 200h ADC output + 512 is stored into ADCRESULT. ... 3FFh ADC output + 1 is stored into ADCRESULT. NOTE: In 16-bit mode, the subtraction will saturate at 0000h and FFFFh before being stored into the ADCRESULT register. In 12-bit mode, the subtraction will saturate at 0000h and 0FFFh before being stored into the ADCRESULT register.

Table 3-128. ADCPPB4OFFREF Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 0	OFFREF	R/W	0h	ADC Post Processing Block 4 Offset Correction. This bit field can be used to either calculate the feedback error or convert a unipolar signal to bipolar by subtracting a reference value. This 16-bit unsigned value is subtracted from the ADCRESULT register before being passed through an optional two's complement function and stored in the ADCPPB4RESULT register. This subtraction is not saturated. 0000h No change. The ADCRESULT value is passed on. 0001h ADCRESULT - 1 is passed on. 0002h ADCRESULT - 2 is passed on. ... 8000h ADCRESULT - 32,768 is passed on. ... FFFFh ADCRESULT - 65,535 is passed on. NOTE: In 12-bit mode the size of this register does not change from 16-bits. It is the user's responsibility to ensure that only a 12-bit value is written to this register when in 12-bit mode.

3.6.4 CONTROLSS_DAC0_DACVALS Registers

3.6.4.1 DAC0_DACVALS Register (Offset = 6h) [reset = h]

Short Description: DAC Value Register - Shadow

Long Description:

Return to Summary Table

Table 3-306. Instance Table

Instance Name	Physical Address
CONTROLSS_DAC0	5026 0006h

Access Types Legend

Table 3-307. DACVALS Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 12	RESERVED	RO		Reserved
11 - 0	DACVALS	RW	0h	Shadow output code to be loaded into DACVALA

DRAFT ONLY
TI Confidential – NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

3.6.5 CONTROLSS_DAC0_DACOUTEN Registers

3.6.5.1 DAC0_DACOUTEN Register (Offset = 8h) [reset = h]

Short Description: DAC Output Enable Register

Long Description:

Return to Summary Table

Table 3-308. Instance Table

Instance Name	Physical Address
CONTROLSS_DAC0	5026 0008h

Access Types Legend

Table 3-309. DACOUTEN Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 1	RESERVED	RO		Reserved
0	DACOUTEN	RW	0h	DAC output enable[[br]] [[br]] 0 DAC output is disabled[[br]] 1 DAC output is enabled

3.6.6 CONTROLSS_DAC0_DACLOCK Registers

3.6.6.1 DAC0_DACLOCK Register (Offset = Ah) [reset = h]

Short Description: DAC Lock Register

Long Description:

Return to Summary Table

Table 3-310. Instance Table

Instance Name	Physical Address
CONTROLSS_DAC0	5026 000Ah

Access Types Legend

Table 3-311. DACLOCK Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 12	KEY	RW RRETURNS 0S	0h	Writes to this register succeed only if this field is written with a value of 0xA.[[br]] [[br]]Only 16-bit writes will succeed (provided the KEY matches). Read-modify-writes to individual bits in this register will be ignored.
11 - 3	RESERVED	RO		Reserved
2	DACOUTEN	RW SONCE	0h	Lock write-access to the DACOUTEN register.[[br]] [[br]] 0 DACOUTEN register is not locked. Write 0 to this bit has no effect. [[br]] 1 DACOUTEN register is locked. Only a system reset can clear this bit.
1	DACVAL	RW SONCE	0h	Lock write-access to the DACVALS register.[[br]] [[br]] 0 DACVALS register is not locked. Write 0 to this bit has no effect.[[br]] 1 DACVALS register is locked. Only a system reset can clear this bit.
0	DACCTL	RW SONCE	0h	Lock write-access to the DACCTL register.[[br]] [[br]] 0 DACCTL register is not locked. Write 0 to this bit has no effect.[[br]] 1 DACCTL register is locked. Only a system reset can clear this bit.

3.6.7 CONTROLSS_DAC0_DACTRIM Registers

3.6.7.1 DAC0_DACTRIM Register (Offset = Ch) [reset = h]

Short Description: DAC Trim Register

Long Description:

Return to Summary Table

Table 3-312. Instance Table

Instance Name	Physical Address
CONTROLSS_DAC0	5026 000Ch

Access Types Legend

Table 3-313. DACTRIM Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 12	RESERVED	RO		Reserved
11 - 8	RESERVED	RW		DAC Gain Trim. This signed (two's complement) bit field is used to adjust the gain of the DAC. This register will be written with a factory set value during the device boot procedure.[[br]] [[br]] 1000 Gain is increased by the equivalent of 0.8%[[br]] ...[[br]] 1110 Gain is increased by the equivalent of 0.2% LSB[[br]] 1111 Gain is increased by the equivalent of 0.1% LSB[[br]] 0000 Gain is not adjusted[[br]] 0001 Gain is decreased by the equivalent of 0.1% LSB[[br]] 0010 Gain is decreased by the equivalent of 0.2% LSB[[br]] ...[[br]] 0111 Gain is decreased by the equivalent of 0.7% LSB
7 - 0	OFFSET_TRIM	RW	0h	DAC Offset Trim.[[br]] [[br]]This register should not be modified unless specifically indicated by TI Errata or other documentation. Modifying the contents of this register could cause this module to operate outside of datasheet specifications.

3.6.8 Access Table

Table 3-314. Access Type Codes

Access Type	Code	Description
RO	RO	Read
RW	RW	Read / Write
RW RRETURNS0S	RW RRETURNS0S	Read returns 0s/Write
RW SONCE	RW SONCE	Read/Write (Set Once)

CONTROLSS_ECAP9	5024 9000h

Access Types Legend

Table 3-338. TSCTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	TSCTR	RW	0h	Active 32-bit counter register that is used as the capture time-base HR mode : 1) This register reads HRCOUNTER value and is not writable 2) can be reset using CTRFILTRESET 3) Its not synchronized to SYSCLK domain so reads may not be accurate

CONTROLSS_ECAP7	5024 7004h
CONTROLSS_ECAP8	5024 8004h
CONTROLSS_ECAP9	5024 9004h

Access Types Legend

Table 3-340. CTRPHS Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	CTRPHS	RW	0h	Counter phase value register that can be programmed for phase lag/lead. This register CTRPHS is loaded into TSCTR upon either a SYNCI event or S/W force via a control bit. Used to achieve phase control synchronization with respect to other eCAP and EPWM time-bases. This register is not applicable in HR mode.

Table 3-354. ECCTL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 14	MODCNTRSTS	RW	0h	This bit field reads current status on modulo counter 00b (R) = CAP1 register gets loaded on next capture event. 01b (R) = CAP2 register gets loaded on next capture event. 10b (R) = CAP3 register gets loaded on next capture event. 11b (R) = CAP4 register gets loaded on next capture event.
13 - 12	DMAEVTSEL	RW	0h	DMA event select Capture Mode: 00b (R/W) = DMA interrupt source is CEVT1 01b (R/W) = DMA interrupt source is CEVT2 10b (R/W) = DMA interrupt source is CEVT3 11b (R/W) = DMA interrupt source is CEVT4 APWM Mode: 00b (R/W) = DMA interrupt source is period match 01b (R/W) = DMA interrupt source is compare match 10b (R/W) = DMA interrupt source is period match or compare match 11b (R/W) = Disabled
11	CTRFILTRESET	RW RRETURNS 0S	0h	Reset Bit 0h (R) = No effect 1h (W) = Resets event filter, counter, modulo counter and CEVT[1,2,3,4] and CNTOVF , HRERROR flags Note: This provides an ability start capture module from known state in case spurious inputs are captured while ECAP is configured.
10	APWMPOL	RW	0h	APWM output polarity select. This is applicable only in APWM operating mode. 0 | ECAP_OUTPUT_ACTIVE_HIGHOutput is active high (Compare value defines high time) 1 | ECAP_OUTPUT_ACTIVE_LOWOutput is active low (Compare value defines low time)
9	CAP_APWM	RW	0h	CAP/APWM operating mode select 0 | ECAP_MODULEECAP module operates in capture mode. This mode forces the following configuration: - Inhibits TSCTR resets via CTR = PRD event - Inhibits shadow loads on CAP1 and 2 registers - Permits user to enable CAP1-4 register load - CAPx/APWMx pin operates as a capture input 1 | ECAP_MODULE_APWMECAP module operates in APWM mode. This mode forces the following configuration: - Resets TSCTR on CTR = PRD event (period boundary - Permits shadow loading on CAP1 and 2 registers - Disables loading of time-stamps into CAP1-4 registers - CAPx/APWMx pin operates as a APWM output

Table 3-354. ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SWSYNC	RW RRETURNS 0S	0h	Software-forced Counter (TSCTR) Synchronizer. This provides the user a method to generate a synchronization pulse through software. In APWM mode, the synchronization pulse can also be sourced from the CTR = PRD event. 0 | ECAP_ZERO_NOEFFECTWriting a zero has no effect. Reading always returns a zero 1 | ECAP_WRITE_TSCTRWriting a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to a zero. Note: Selection CTR = PRD is meaningful only in APWM mode; however, you can choose it in CAP mode if you find doing so useful.
7 - 6	SYNCO_SEL	RW	0h	Sync-Out Select 0x0 | SWSYNCsync out signal is SWSYNC 0x1 | ECAP_CTR_PRD_TO_SYNCOUTSelect CTR = PRD event to be the sync-out signal 0x2 | ECAP_DISABLE_SYNC_OUTDisable sync out signal 0x3 | ECAP_DISABLE_SYNC_OUTDisable sync out signal
5	SYNCI_EN	RW	0h	Counter (TSCTR) Sync-In select mode 0 | ECAP_DISABLE_SYNC_INDisable sync-in option 1 | ECAP_ENABLE_COUNTER_REGISTEREnable counter (TSCTR) to be loaded from CTRPHS register upon either a SYNCI signal or a S/W force event.
4	TSCTRSTOP	RW	0h	Time Stamp (TSCTR) Counter Stop (freeze) Control 0 | ECAP_TSCTR_STOPPEDTSCTR stopped 1 | ECAP_TSCTR_FREE_RUNNINGTSCTR free-running
3	REARM	RW RRETURNS 0S	0h	Re-Arming Control. Note: The re-arm function is valid in one shot or continuous mode 0 | ECAP_NO_EFFECT_RETURNS_0Has no effect (reading always returns a 0) 1 | ECAP_ARMS_ONESHOTArms the one-shot sequence as follows: 1) Resets the Mod4 counter to zero 2) Unfreezes the Mod4 counter 3) Enables capture register loads
2 - 1	STOP_WRAP	RW	Bh	Stop value for one-shot mode. This is the number (between 1-4) of captures allowed to occur before the CAP(1-4) registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number (between 1-4) of the capture register in which the circular buffer wraps around and starts again. Notes: STOP_WRAP is compared to Mod4 counter and, when equal, 2 actions occur: - Mod4 counter is stopped (frozen) - Capture register loads are inhibited In one-shot mode, further interrupt events are blocked until re-armed. 0x0 | ECAP_STOPEVENT1_WRAPEVENT2Stop after Capture Event 1 in one-shot mode Wrap after Capture Event 1 in continuous mode. 0x1 | ECAP_STOPEVENT2_WRAPEVENT2Stop after Capture Event 2 in one-shot mode Wrap after Capture Event 2 in continuous mode. 0x2 | ECAP_STOPEVENT3_WRAPEVENT2Stop after Capture Event 3 in one-shot mode Wrap after Capture Event 3 in continuous mode. 0x3 | ECAP_STOPEVENT4_WRAPEVENT2Stop after Capture Event 4 in one-shot mode Wrap after Capture Event 4 in continuous mode.
0	CONT_ONESHT	RW	0h	Continuous or one-shot mode control (applicable only in capture mode) 0 | ECAP_OPP_CONTOperate in continuous mode 1 | ECAP_OPP_ONEOperate in one-Shot mode

3.8.11 CONTROLSS_ECAPn_ECEINT Registers

3.8.11.1 ECAPn_ECEINT Register (Offset = 2Ch) [reset = h]

Short Description: The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ECCLR registers. The proper procedure for configuring peripheral modes and interrupts is as follows: - Disable global interrupts - Stop eCAP counter - Disable eCAP interrupts - Configure peripheral registers - Clear spurious eCAP interrupt flags - Enable eCAP interrupts - Start eCAP counter - Enable global interrupts

Long Description:

3.9 EPWM Registers

EPWM Instance Count Note

Note

N = [(m * 0x4 0000h) + (n * 0x1000h) + (Offset)] where
m = [0:3] and
n = [0:31]
for the EPWM registers defined below.

1	0	0		0	0	3	

Access Types Legend

Table 3-402. TBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events 00: Stop after the next time-base counter increment or decrement 01: Stop when counter completes a whole cycle: - Up-count mode: stop when the time-base counter = period (TBCTR = TBPRD) - Down-count mode: stop when the time-base counter = 0x00 (TBCTR = 0x00) - Up-down-count mode: stop when the time-base counter = 0x00 (TBCTR = 0x00) 1x: Free run
13	PHSDIR	R/W	0h	Phase Direction Bit This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter (TBCTR) will count after a synchronization event occurs and a new phase value is loaded from the phase (TBPHS) register. This is irrespective of the direction of the counter before the synchronization event.. In the up-count and down-count modes this bit is ignored. 0: Count down after the synchronization event. 1: Count up after the synchronization event.
12 - 10	CLKDIV	R/W	0h	Time Base Clock Pre-Scale Bits These bits select the time base clock pre-scale value (TBCLK = EPWMCLK/(HSPCLKDIV * CLKDIV)): 000: /1 (default on reset) 001: /2 010: /4 011: /8 100: /16 101: /32 110: /64 111: /128
9 - 7	HSPCLKDIV	R/W	1h	High Speed Time Base Clock Pre-Scale Bits These bits determine part of the time-base clock prescale value. TBCLK = EPWMCLK / (HSPCLKDIV x CLKDIV). This divisor emulates the HSPCLK in the TMS320x281x system as used on the Event Manager (EV) peripheral. 000: /1 001: /2 (default on reset) 010: /4 011: /6 100: /8 101: /10 110: /12 111: /14
6	SWFSYNC	R-0/W	0h	Software Forced Sync Pulse 0: Writing a 0 has no effect and reads always return a 0. 1: Writing a 1 forces a one-time synchronization pulse to be generated. SWFSYNC can be enabled to affect EPWMxSYNCO by setting the EPWMSYNCOUTEN.SWEN bit.

Table 3-402. TBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	PRDLD	R/W	0h	Active Period Reg Load from Shadow Select 0: The period register (TBPRD) is loaded from its shadow register when the time-base counter, TBCTR, is equal to zero and/or a sync event as determined by the TBCTL2[PRDLDSYNC] bit. A write/read to the TBPRD register accesses the shadow register. 1: Immediate Mode (Shadow register bypassed): A write or read to the TBPRD register accesses the active register.
2	PHSEN	R/W	0h	Counter Reg Load from Phase Reg Enable 0: Do not load the time-base counter (TBCTR) from the time-base phase register (TBPHS). 1: Allow Counter to be loaded from the Phase register (TBPHS) and shadow to active load events when an EPWMxSYNCI input signal occurs or a software-forced sync signal, see bit 6.
1 - 0	CTRMODE	R/W	3h	Counter Mode The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 00: Up-count mode 01: Down-count mode 10: Up-down count mode 11: Freeze counter operation (default on reset)

Table 3-410. TBSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 3	RESERVED	R-0		Reserved
2	CTRMAX	R/W	0h	Time-Base Counter Max Latched Status Bit 0: Reading a 0 indicates the time-base counter never reached its maximum value. Writing a 0 will have no effect. 1: Reading a 1 on this bit indicates that the time-base counter reached the max value 0xFFFF. Writing a 1 to this bit will clear the latched event.
1	SYNCI	R/W	0h	Input Synchronization Latched Status Bit 0: Writing a 0 will have no effect. Reading a 0 indicates no external synchronization event has occurred. 1: Reading a 1 on this bit indicates that an external synchronization event has occurred (EPWMxSYNCI). Writing a 1 to this bit will clear the latched event.
0	CTRDIR	R	1h	Time Base Counter Direction Status Bit 0: Time-Base Counter is currently counting down. 1: Time-Base Counter is currently counting up. Note: This bit is only valid when the counter is not frozen.

R/W		R/W		R/W		R/W	
0		0		0		0	

Access Types Legend

Table 3-420. DBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit 0: Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1: Half cycle clocking enabled. The dead-band counters are clocked at TBCLK*2.
14	DEDB_MODE	R/W	0h	Dead Band Dual-Edge B Mode Control (S8 switch) 0: Rising edge delay applied to InA/InB as selected by S4 switch (IN-MODE bits) on A signal path only. Falling edge delay applied to InA/InB as selected by S5 switch (INMODE bits) on B signal path only. 1: Rising edge delay and falling edge delay applied to source selected by S4 switch (INMODE bits) and output to B signal path only. Note: When this bit is set to 1, user should always either set OUT_MODE bits such that Apath = InA OR OUTSWAP bits such that OutA=Bpath otherwise, OutA will be invalid.
13 - 12	OUTSWAP	R/W	0h	Dead Band Output Swap Control Bit 13 controls the S6 switch and bit 12 controls the S7 switch. 00: OutA and OutB signals are as defined by OUT-MODE bits. 01: OutA = A-path as defined by OUT-MODE bits. OutB = A-path as defined by OUT-MODE bits (rising edge delay or delay-bypassed A signal path). 10: OutA = B-path as defined by OUT-MODE bits (falling edge delay or delay-bypassed B signal path). OutB = B-path as defined by OUT-MODE bits. 11: OutA = B-path as defined by OUT-MODE bits (falling edge delay or delay-bypassed B signal path). OutB = A-path as defined by OUT-MODE bits (rising edge delay or delay-bypassed A signal path).
11	SHDWDBFEDMODE	R/W	0h	FED Dead-Band Load Mode 0: Immediate mode. Only the active DBFED register is used. All writes/reads via the CPU directly access the active register for immediate "FED dead-band action." 1: Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode (for compatibility with legacy).

DRAFT ONLY
TI Confidential - NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

Table 3-420. DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	SHDWDBREDMODE	R/W	0h	RED Dead-Band Load Mode 0: Immediate mode. Only the active DBRED register is used. All writes/reads via the CPU directly access the active register for immediate "RED dead-band action." 1: Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode (for compatibility with legacy).
9 - 8	LOADFEDMODE	R/W	0h	Active DBFED Load from Shadow Select Mode 00: Load on Counter = 0 (CNT_eq) 01: Load on Counter = Period (PRD_eq) 10: Load on either Counter = 0, or Counter = Period 11: Freeze (no loads possible) Note: has no effect in Immediate mode.
7 - 6	LOADREDMODE	R/W	0h	Active DBRED Load from Shadow Select Mode 00: Load on Counter = 0 (CNT_eq) 01: Load on Counter = Period (PRD_eq) 10: Load on either Counter = 0, or Counter = Period 11: Freeze (no loads possible) Note: has no effect in Immediate mode.
5 - 4	IN_MODE	R/W	0h	Dead-Band Input Mode Control Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays. 00: EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay. 01: EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal. 10: EPWMxA In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal. 11: EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal.
3 - 2	POLSEL	R/W	0h	Polarity Select Control Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 1,1 and DBCTL[IN_MODE] = 0x0. Other enhanced modes are also possible, but not regarded as typical usage modes. 00: Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default). 01: Active low complementary (ALC) mode. EPWMxA is inverted. 10: Active high complementary (AHC). EPWMxB is inverted. 11: Active low (AL) mode. Both EPWMxA and EPWMxB are inverted.
1 - 0	OUT_MODE	R/W	0h	Dead-Band Output Mode Control Bit 1 controls the S1 switch and bit 0 controls the S0 switch. 00: DBM is fully disabled or by-passed. In this mode the POLSEL and IN-MODE bits have no effect. 01: Apath = InA (delay is by-passed for A signal path) Bpath = FED (Falling Edge Delay in B signal path) 10: Apath = RED (Rising Edge Delay in A signal path) Bpath = InB (delay is by-passed for B signal path) 11: DBM is fully enabled (i.e. both RED and FED active)

Table 3-434. HRCNFG Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 14	LINESEL	R/W	0h	Delay Line Selection Bits: Selects which of the 4 delay lines for a particular ePWM/EPWM module to send to CALIN for calibration.
13	RESERVED	R-0		Reserved
12 - 11	HRLOADB	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPBHR shadow value into the active register. 00: Load on CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000) 01: Load on CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 10: Load on either CTR = Zero or CTR = PRD 11: Load on CMPB_EQ (Translator Event CMPB-3)
10	CTLMODEB	R/W	0h	Control Mode Bits Selects the register (CMP/TBPRD or TBPHS) that controls the MEP: 0: CMPBHR(8) or TBPRDHR(8) Register controls the edge position (i.e., this is duty or period control mode). (Default on Reset) 1: TBPHSHR(8) Register controls the edge position (i.e., this is phase control mode).
9 - 8	EDGMODEB	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position (MEP) logic: 00: HRPWM capability is disabled (default on reset) 01: MEP control of rising edge (CMPBHR) 10: MEP control of falling edge (CMPBHR) 11: MEP control of both edges (TBPHSHR or TBPRDHR)
7	SWAPAB	R/W	0h	Swap ePWM A & B Output Signals This bit enables the swapping of the A & B signal outputs. The selection is as follows: 0: ePWMxA and ePWMxB outputs are unchanged. 1: ePWMxA signal appears on ePWMxB output and ePWMxB signal appears on ePWMxA output.

Table 3-434. HRCNFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	AUTOCONV	R/W	0h	Auto Convert Delay Line Value Selects whether the fractional duty cycle/period/phase in the CMPAHR/TBPRDHR/TBPHSHR register is automatically scaled by the MEP scale factor in the HRMSTEP register or manually scaled by calculations in application software. The SFO library function automatically updates the HRMSTEP register with the appropriate MEP scale factor. 0: Automatic HRMSTEP scaling is disabled. 1: Automatic HRMSTEP scaling is enabled. If application software is manually scaling the fractional duty cycle, or phase (i.e. software sets CMPAHR = (fraction(PWMduty * PWMperiod) * MEP Scale Factor)<<8 + 0x080 for duty cycle), then this mode must be disabled.
5	SELOUTB	R/W	0h	EPWMxB Output Select Bit This bit selects which signal is output on the ePWMxB channel output. The inversion will take the high resolution mode into account and the inverted signal will contain any high resolution modification. The inversion takes place as the last step in modifying the ePWMxB signal. 0: ePWMxB output is normal. 1: ePWMxB output is inverted version of ePWMxA signal.
4 - 3	HRLOAD	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPAHR shadow value into the active register. 00: Load on CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000) 01: Load on CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 10: Load on either CTR = Zero or CTR = PRD 11: Load on CMPA_EQ (Translator Event CMPA-3)
2	CTLMODE	R/W	0h	Control Mode Bits Selects the register (CMP/TBPRD or TBPHS) that controls the MEP: 0: CMPAHR(8) or TBPRDHR(8) Register controls the edge position (i.e., this is duty or period control mode). (Default on Reset) 1: TBPHSHR(8) Register controls the edge position (i.e., this is phase control mode).
1 - 0	EDGMODE	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position (MEP) logic: 00: HRPWM capability is disabled (default on reset) 01: MEP control of rising edge (CMPAHR) 10: MEP control of falling edge (CMPAHR) 11: MEP control of both edges (TBPHSHR or TBPRDHR)

Table 3-438. HRPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 7	RESERVED	R-0		Reserved
6 - 4	PWMSYNCSELX	R/W	0h	Extended selection bits for EPWMSYNCPER 000: EPWMSYNCPER is defined by PWMSYNCSEL - ' default condition (compatible with previous EPWM versions) 001: Reserved 010: Reserved 011: Reserved 100: CTR = CMPC, Count direction Up 101: CTR = CMPC, Count direction Down 110: CTR = CMPD, Count direction Up 111: CTR = CMPD, Count direction Down
3	HRPSYNCE	R/W	0h	SYNC Enable Bit (TRSYNCE)/High Resolution Period SYNC Enable Bit (HRPSYNCE)
2	TBPHSHRLOADE	R/W	0h	TBPHSHR Load Enable This bit allows you to synchronize ePWM modules with a high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event. This allows for multiple ePWM modules operating at the same frequency to be phase aligned with high-resolution. 0: Disables synchronization of high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event: 1: Synchronize the high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital comparator synchronization event. The phase is synchronized using the contents of the high-resolution phase TBPHSHR register. The TBCTL[PHSEN] bit which enables the loading of the TBCTR register with TBPHS register value on a SYNCIN or TBCTL[SWFSYNC] event works independently. However, users need to enable this bit also if they want to control phase in conjunction with the high-resolution period feature. This bit and the TBCTL[PHSEN] bit must be set to 1 when high-resolution period is enabled forup-down count mode even if TBPHSHR = 0x0000. This bit does not need to be set when only high-resolution duty is enabled.
1	PWMSYNCSEL	R/W	0h	PWMSYNC Source Select Bit: This bit selects the source for the EPWMSYNCPER signal that goes to the CMPSS and GPDAC: 0 CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 1 CTR = zero: Time-base counter equal to zero (TBCTR = 0x00)

3.9.23 CONTROLSS_Gm_EPWMn_EPWMXLINK Registers

3.9.23.1 Gm_EPWMn_EPWMXLINK Register (Offset = 70h) [reset = h]

Short Description: EPWMx Link Register This register controls which EPWMs are linked to other EPWM modules. The default reset value will vary for each module. The reset value will link each EPWM module to itself to prevent unintentional linking of modules.

Long Description:

Table 3-476. TBPHS Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	TBPHS	R/W	0h	Phase Offset Register These bits set time-base counter phase of the selected ePWM relative to the time-base that is supplying the synchronization input signal. - If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase. - If TBCTL[PHSEN] = 1, then the time-base counter (TBCTR) will be loaded with the phase (TBPHS) when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal (EPWMxSYNCI) or by a software forced synchronization.
15 - 0	TBPHSHR	R/W	0h	Phase Offset (High Resolution) Register. TBPHSHR must not be used. Instead TRREM (HRPWM remainder register) must be used to mimic the functionality of TBPHSHR. The lower 8 bits in this register are ignored - writes are ignored and reads return zero

Access Types Legend

Table 3-484. CMPA Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	CMPA	R/W	0h	Compare A Register The value in the active CMPA register is continuously compared to the time-base counter (TBCTR). When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include: - Do nothing the event is ignored. - Clear: Pull the EPWMxA and/or EPWMxB signal low - Set: Pull the EPWMxA and/or EPWMxB signal high - Toggle the EPWMxA and/or EPWMxB signal Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed. - If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and anywrite or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register. - Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full. - If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. - In either mode, the active and shadow registers share the same memory map address.
15 - 0	CMPAHR	R/W	0h	Compare A HRPWM Extension Register The UPPER 8-bits contain the high-resolution portion (most significant 8-bits) of the counter-compare A value. CMPA:CMPAHR can be accessed in a single 32-bit read/write. Shadowing is enabled and disabled by the CMPCTL[SHDWAMODE] bit as described for the CMPA register. The lower 8 bits in this register are ignored

Table 3-512. TZFLG Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 8	RESERVED	R-0		Reserved
7	CAPEVT	R	0h	Latched Status Flag for Capture Event 0: Indicates no trip event has occurred on CAPEVT 1: Indicates a trip event has occurred for the event defined for CAPEVT
6	DCBEVT2	R	0h	Latched Status Flag for Digital Compare Output B Event 2 0: Indicates no trip event has occurred on DCBEVT2 1: Indicates a trip event has occurred for the event defined for DCBEVT2
5	DCBEVT1	R	0h	Latched Status Flag for Digital Compare Output B Event 1 0: Indicates no trip event has occurred on DCBEVT1 1: Indicates a trip event has occurred for the event defined for DCBEVT1
4	DCAEVT2	R	0h	Latched Status Flag for Digital Compare Output A Event 2 0: Indicates no trip event has occurred on DCAEVT2 1: Indicates a trip event has occurred for the event defined for DCAEVT2
3	DCAEVT1	R	0h	Latched Status Flag for Digital Compare Output A Event 1 0: Indicates no trip event has occurred on DCAEVT1 1: Indicates a trip event has occurred for the event defined for DCAEVT1
2	OST	R	0h	Latched Status Flag for A One-Shot Trip Event 0: No one-shot trip event has occurred. 1: Indicates a trip event has occurred on a pin selected as a one-shot trip source. This bit is cleared by writing the appropriate value to the TZCLR register.
1	CBC	R	0h	Latched Status Flag for Cycle-By-Cycle Trip Event 0: No cycle-by-cycle trip event has occurred. 1: Indicates a trip event has occurred on a signal selected as a cycle-by-cycle trip source. The TZFLG[CBC] bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the signal is automatically cleared when the ePWM time-base counter reaches zero (TBCTR = 0x00) if the trip condition is no longer present. The condition on the signal is only cleared when the TBCTR = 0x00 no matter where in the cycle the CBC flag is cleared. This bit is cleared by writing the appropriate value to the TZCLR register.

Table 3-512. TZFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	INT	R	0h	Latched Trip Interrupt Status Flag 0: Indicates no interrupt has been generated. 1: Indicates an EPWMx_TZINT PIE interrupt was generated because of a trip condition. No further EPWMx_TZINT PIE interrupts will be generated until this flag is cleared. If the interrupt flag is cleared when either CBC or OST is set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts. This bit is cleared by writing the appropriate value to the TZCLR register.

Table 3-518. TZCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	INT	R-0/W	0h	Global Interrupt Clear Flag 0: Has no effect. Always reads back a 0. 1: Clears the trip-interrupt flag for this ePWM module (TZFLG[INT]). NOTE: No further EPWMx_TZINT PIE interrupts will be generated until the flag is cleared. If the TZFLG[INT] bit is cleared and any of the other flag bits are set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts.

Table 3-530. ETPS Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 14	SOCBCNT	R	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Counter Register These bits indicate how many selected ETSEL[SOCBSEL] events have occurred: 00: No events have occurred. 01: 1 event has occurred. 10: 2 events have occurred. 11: 3 events have occurred.
13 - 12	SOCBPRD	R/W	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Period Select These bits determine how many selected ETSEL[SOCBSEL] events need to occur before an EPWMxSOCB pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCBEN] = 1). The SOCB pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCB] = 1). Once the SOCB pulse is generated, the ETPS[SOCBCNT] bits will automatically be cleared. 00: Disable the SOCB event counter. No EPWMxSOCB pulse will be generated 01: Generate the EPWMxSOCB pulse on the first event: ETPS[SOCBCNT] = 0,1 10: Generate the EPWMxSOCB pulse on the second event: ETPS[SOCBCNT] = 1,0 11: Generate the EPWMxSOCB pulse on the third event: ETPS[SOCBCNT] = 1,1
11 - 10	SOCACNT	R	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Counter Register These bits indicate how many selected ETSEL[SOCASEL] events have occurred: 00: No events have occurred. 01: 1 event has occurred. 10: 2 events have occurred. 11: 3 events have occurred.
9 - 8	SOCAPRD	R/W	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Period Select These bits determine how many selected ETSEL[SOCASEL] events need to occur before an EPWMxSOCA pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCAEN] = 1). The SOCA pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCA] = 1). Once the SOCA pulse is generated, the ETPS[SOCACNT] bits will automatically be cleared. 00: Disable the SOCA event counter. No EPWMxSOCA pulse will be generated 01: Generate the EPWMxSOCA pulse on the first event: ETPS[SOCACNT] = 0,1 10: Generate the EPWMxSOCA pulse on the second event: ETPS[SOCACNT] = 1,0 11: Generate the EPWMxSOCA pulse on the third event: ETPS[SOCACNT] = 1,1

Table 3-530. ETPS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	SOCPSSEL	R/W	0h	EPWMxSOC A/B Pre-Scale Selection Bits 0: Selects ETPS [SOCACNT/SOCBCNT] and [SOCAPRD/SOCBPRD] registers to determine frequency of events (interrupt once every 0-3 events). 1: Selects ETSOCPS [SOCACNT2/SOCBCNT2] and [SOCAPRD2/ SOCBPRD2] registers to determine frequency of events (interrupt once every 0-15 events).
4	INTPSSEL	R/W	0h	EPWMxINTn Pre-Scale Selection Bits 0: Selects ETPS [INTCNT, and INTPRD] registers to determine frequency of events (interrupt once every 0-3 events). 1: Selects ETINTPS [INTCNT2, and INTPRD2] registers to determine frequency of events (interrupt once every 0-15 events).
3 - 2	INTCNT	R	0h	ePWM Interrupt Event (EPWMx_INT) Counter Register These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD]. 00: No events have occurred. 01: 1 event has occurred. 10: 2 events have occurred. 11: 3 events have occurred.
1 - 0	INTPRD	R/W	0h	ePWM Interrupt (EPWMx_INT) Period Select These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled (ETSEL[INT] = 1). If the interrupt status flag is set from a previous interrupt (ETFLG[INT] = 1) then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared. Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear. Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented. 00: Disable the interruptevent counter. No interrupt will be generated and ETFRC[INT] is ignored. 01: Generate an interrupt on the first event INTCNT = 01 (first event) 10: Generate interrupt on ETPS[INTCNT] = 1,0 (second event) 11: Generate interrupt on ETPS[INTCNT] = 1,1 (third event)

0						0	0

Access Types Legend

Table 3-560. DCCAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CAPMODE	R/W	0h	Counter Capture Mode 0: When a DCEVTFILT occurs and the counter capture is enabled, then the current TBCNT value is captured in the active register. When the respective trip event occurs, further trip (capture) events are ignored until the next PRD_eq or CNT_zero event (as selected by the PULSESEL bit in the DCFCTL register) re-triggers the capture mechanism. If active mode is enabled, via SHDWMODE bit in DCCAPCTL register, CPU reads of this register will return the active register value. If shadow mode is enabled, via SHDWMODE bit in DCCAPCTL register, the active register is copied to the shadow register on the PRD_eq or CNT_zero event (whichever is selected by PULSESEL bit in DCFCTL register). CPU reads of this register will return the shadow register value. 1: When a DCEVTFILT occurs and the counter capture is enabled, then the current TBCNT value is captured in the active register. When the respective trip event occurs - itwill set the CAPSTS flag and further trip (capture) events are ignored until this bit is cleared. CAPSTS can be cleared by writing to CAPCLR bit in DCCAPCTL register and it re-triggers the capture mechanism. If active mode is enabled, via SHDWMODE bit in DCCAPCTL register, CPU reads of this register will return the active register value. If shadow mode is enabled, via SHDWMODE bit in DCCAPCTL register, the active register is copied to the shadow register on the PRD_eq or CNT_zero event (whichever is selected by PULSESEL bit in DCFCTL register). CPU reads of this register will return the shadow register value.
14	CAPCLR	R-0/W	0h	DC Capture Latched Status Clear Flag 0: Writing a 0 has no effect. 1: Writing a 1 will clear this CAPSTS (set) condition.
13	CAPSTS	R	0h	Latched Status Flag for Capture Event 0: No DC capture event occurred. 1: A DC capture event has occurred.

Table 3-562. DCFOFFSET Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 0	DCFOFFSET	R/W	0h	Blanking Window Offset These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted.

Table 3-574. DCCAP Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 0	DCCAP	R	0h	Digital Compare Time-Base Counter Capture To enable time-base counter capture, set the DCCAPCLT[CAPE] bit to 1. If enabled, reflects the value of the time-base counter (TBCTR) on the low to high edge transition of a filtered (DCEVTFLT) event. Further capture events are ignored until the next period or zero as selected by the DCFCTL[PULSESEL] bit. Shadowing of DCCAP is enabled and disabled by the DCCAPCTL[SHDWMODE] bit. By default this register is shadowed. - If DCCAPCTL[SHDWMODE] = 0, then the shadow is enabled. In this mode, the active register is copied to the shadow register on the TBCTR = TBPRD or TBCTR = zero as defined by the DCFCTL[PULSESEL] bit. CPU reads of this register will return the shadow register value. - If DCCAPCTL[SHDWMODE] = 1, then the shadow register is disabled. In this mode, CPU reads will return the active register value. The active and shadow registers share the same memory map address.

Table 3-584. CAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 9	RESERVED	R		Reserved
8	FRCLOAD	R-0/W	0h	0: Writing of 0 is ignored. Always reads back a 0. 1: Forces a LOAD to occur on the DCCAP - an equivalent LOAD.active pulse
7 - 5	RESERVED	R		Reserved
4	PULSECTL	R/W	0h	Capture Input Polarity Select Mux: 0: Pulse selection determined by PULSESEL bits (common pulse selection for Blanking and Capture logic) 1: Pulse selection determined by CAPMIXSEL register (independent pulse selection for Blaning and Capture logic)
3	CAPINPOL	R/W	0h	Capture Input Polarity Select Mux: 0: CAPIN.sync not inverted 1: CAPIN.sync Inverted Default state assumption for these inputs can be active high. If the user is providing active low signal then invert option can be configured
2 - 1	CAPGATEPOL	R/W	0h	Capture Gate Input Polarity Select Mux: 00: Set to 1 - Gate is always ON 01: Set to 0 - Gate is always OFF 10: CAPGATE.sync 11: CAPGATE.sync Inverted Default state assumption for these inputs can be active high. If the user is providing active low signal then invert option can be configured
0	SRCSEL	R/W	0h	Capture Logic Input Select Mux: 0: DCEVTFILT (Sync) - same as Type-4 1: CAPIN.sync

3.10.2 CONTROLSS_EQEPn_QPOSCNT Registers

3.10.2.1 EQEPn_QPOSCNT Register (Offset = 0h) [reset = h]

Short Description: Position Counter

Long Description:

Return to Summary Table

Table 3-609. Instance Table

Instance Name	Physical Address
CONTROLSS_EQEP0	5027 0000h
CONTROLSS_EQEP1	5027 1000h
CONTROLSS_EQEP2	5027 2000h

Access Types Legend

Table 3-610. QPOSCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	QPOSCNT	RW	0h	Position Counter This 32-bit position counter register counts up/down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. This Register acts as a Read ONLY register while counter is counting up/down. Note: It is recommended to only write to the position counter register (QPOSCNT) during initialization, i.e. when the eQEP position counter is disabled (QPEN bit of QEPCTL is zero). Once the position counter is enabled (QPEN bit is one), writing to the eQEP position counter register (QPOSCNT) may cause unexpected results.

Table 3-634. QEPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	SEL	RW	0h	Strobe event latch of position counter 0 | SEL_QEPSRISINGThe position counter is latched on the rising edge of QEPS strobe (QPOSSLAT = POSCCNT). Latching on the falling edge can be done by inverting the strobe input using the QSP bit in the QDECCTL register 1 | SEL_QEPSCLOCKClockwise Direction: Position counter is latched on rising edge of QEPS strobe Counter Clockwise Direction: Position counter is latched on falling edge of QEPS strobe
5 - 4	IEL	RW	0h	Index event latch of position counter (software index marker) 0x0 | IEL_RSVDReserved 0x1 | IEL_POSRISINGLatches position counter on rising edge of the index signal 0x2 | IEL_POSFALLINGLatches position counter on falling edge of the index signal 0x3 | IEL_SIMSoftware index marker. Latches the position counter and quadrature direction flag on index event marker. The position counter is latched to the QPOSILAT register and the direction flag is latched in the QEPSTS[QDLF] bit. This mode is useful for software index marking.
3	QPEN	RW	0h	Quadrature position counter enable/software reset 0 | QPEN_RESETReset the eQEP peripheral internal operating flags/ read-only registers. Control/configuration registers are not disturbed by a software reset. When QPEN is disabled, some flags in the QFLG register do not get reset or cleared and show the actual state of that flag. 1 | QPEN_ENABLEeQEP position counter is enabled
2	QCLM	RW	0h	QEP capture latch mode 0 | QCLM_CPULatch on position counter read by CPU. Capture timer and capture period values are latched into QCTMRLAT and QCPRDLAT registers when CPU reads the QPOSCNT register. 1 | QCLM_TIMEOUTLatch on unit time out. Position counter, capture timer and capture period values are latched into QPOSLAT, QCTMRLAT and QCPRDLAT registers on unit time out.
1	UTE	RW	0h	QEP unit timer enable 0 | UTE_DISABLEDisable eQEP unit timer 1 | UTE_ENABLEEnable unit timer
0	WDE	RW	0h	QEP watchdog enable 0 | WDE_DISABLEDisable the eQEP watchdog timer 1 | WDE_ENABLEEnable the eQEP watchdog timer

3.11.2 CONTROLSS_FSI_RXn_RX_MASTER_CTRL_ALTC_ Registers

3.11.2.1 FSI_RXn_RX_MASTER_CTRL_ALTC_ Register (Offset = 0h) [reset = h]

Short Description: Receive master control register

Long Description:

Return to Summary Table

Table 3-668. Instance Table

Instance Name	Physical Address
CONTROLSS_FSI_RX0	5029 0000h
CONTROLSS_FSI_RX1	5029 1000h
CONTROLSS_FSI_RX2	502B 0000h
CONTROLSS_FSI_RX3	502B 1000h

Access Types Legend

Table 3-669. RX_MASTER_CTRL_ALTC_ Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 8	KEY	WO	0h	Write Key. In order to write to this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every change to this register.
7 - 5	RESERVED	RO		Reserved
4	DATA_FILTER_EN	RW	0h	Data Filter Enable Bit. 0h (R/W) = Data filtering is disabled. 1h (R/W) = Data filtering is enabled.
3	INPUT_ISOLATE	RW	0h	When set to 1, the FSI RX inputs (RXCLK, RXD0 and RXD1) will be isolated from what is driven from the device pins and will be held at inactive level of '1'.This isolation facilitates the user to switch the RX inputs to a different set of device pins and hence any potential glitch that could occur during the process of switching will not affect the RX module itself.
2	SPI_PAIRING	RW	0h	Clock Pairing for SPI-like Behavior Enable bit This bit enables the internal clock pairing with the FSI TX module. This feature internally connects the TXCLK to RXCLK allowing the FSI TX module, acting as a SPI master, to clock data into the receiver and out of the transmitter like a standard SPI module. This configuration is valid when the Module is in SPI mode only (RX_OPER_CTRL.SPI_MODE = 1) 0h (R/W) = SPI clock pairing is not enabled. 1h (R/W) = SPI clock pairing is enabled. The RXCLK will be internally connected to the TXCLK of the corresponding FSI module. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.
1	INT_LOOPBACK	RW	0h	Internal Loopback Enable bit This bit enables the internal loopback functionality of the FSI receiver. By enabling this bit, a mux will select the signals coming directly from the corresponding FSI transmitter module rather than from the pins. 0h (R/W) = Internal loopback is disabled. The FSI RX module will receive signals coming from the pins. 1h (R/W) = Internal loopback is enabled. The FSI RX module will receive signals from the directly from FSI TX module rather than the pins. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.
0	CORE_RST	RW	0h	Receiver Master Core Reset bit This bit controls the receiver master core reset. In order to receive any frame, this bit must be cleared. Note: For reset to take affect, the FSI RX module must be held in reset for at least 4 SYSCLK cycles. 0h (R/W) = Receiver core is not in reset and can receive frames. 1h (R/W) = Receiver core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

3.11.3 CONTROLSS_FSI_RXn_RX_OPER_CTRL Registers

3.11.3.1 FSI_RXn_RX_OPER_CTRL Register (Offset = 8h) [reset = h]

Short Description: Receive operation control register

Long Description:

Return to Summary Table

Table 3-670. Instance Table

Instance Name	Physical Address
CONTROLSS_FSI_RX0	5029 0008h
CONTROLSS_FSI_RX1	5029 1008h
CONTROLSS_FSI_RX2	502B 0008h
CONTROLSS_FSI_RX3	502B 1008h

Access Types Legend

Table 3-671. RX_OPER_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 9	RESERVED	RO		Reserved
8	PING_WD_RST_MODE	RW	0h	Ping Watchdog Timeout Mode Select bit This bit selects the mode by which the ping watchdog counter is reset. The watchdog counter can be reset and restarted only by ping frames or by any received frame. 0h (R/W) = The ping watchdog counter will reset and restart only by ping frames. 1h (R/W) = The ping watchdog counter will reset and restart by any received frame.
7	ECC_SEL	RW	0h	ECC Data Width Select bit This bit selects between whether the ECC computation is done on 16-bit or 32-bit words. 0h (R/W) = 32-bit ECC is used. 1h (R/W) = 16-bit ECC is used.
6 - 3	N_WORDS	RW	0h	Number of Words to Receive This field defines the number of words which will be received in a DATA_N_WORD frame. This is a user-defined field that must match the corresponding field in the transmitter. Set this bitfield to be one less than the number of words to be received. This value is only applicable when the frame type received is DATA_N_WORD. 0h (R/W) = 1 data word frame (16-bit data). 1h (R/W) = 2 data word frame (32-bit data). .. Fh (R/W) = 16 data word frame (256-bit data).
2	SPI_MODE	RW	0h	SPI Mode Enable bit This bit enables and disables the SPI compatibility mode of the FSI RX. The received data must be formatted as an FSI frame in order for the data to properly be received. SPI compatibility mode will allow FSI RX to receive data that is sent using SPI signal format. Refer to the applicable section in the FSI TRM chapter for more information. 0h (R/W) = FSI is in normal mode of operation. 1h (R/W) = FSI is operating in SPI compatibility mode.
1 - 0	DATA_WIDTH	RW	0h	Receive Data Width Select bit These bits decide the number of data lines used for receiving data. 0h (R/W) = Data will be received on one data line, RXD0. 1h (R/W) = Data will be received on two data lines, RXD0 and RXD1. 2h, 3h (R/W) = Reserved

CONTROLSS_FSI_RX3	502B 100Ch

Access Types Legend

Table 3-673. RX_FRAME_INFO Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 4	RESERVED	RO		Reserved
3 - 0	FRAME_TYPE	RO	0h	Received Frame Type This field indicates the type of frame that was successfully received last. 0000b (R/W) = A ping frame was received 0100b (R/W) = A DATA_1_WORD frame was received (16-bit data). 0101b (R/W) = A DATA_2_WORD frame was received (32-bit data). 0110b (R/W) = A DATA_4_WORD frame was received (64-bit data). 0111b (R/W) = A DATA_6_WORD frame was received (96-bit data). 0011b (R/W) = A DATA_N_WORD frame was received. The N_WORD field will determine the number of words (1 to 16) to be sent. The number of words received must equal the value programmed in RX_OPER_CTRL.N_WORDS. 1111b (R/W) = An error frame was received. This frame can be used during error conditions or any condition where the transmitter wants to signal the receiver for attention. However, the user software is at liberty to use this for any purpose. 0001b, 0010b, and 1000b through 1110b are Reserved and should not be used.

Access Types Legend

Table 3-675. RX_FRAME_TAG_UDATA Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 8	USER_DATA	RO	0h	Received User Data This field contains the 8-bit user data field of the last successfully received frame.
7 - 5	RESERVED	RO		Reserved
4 - 1	FRAME_TAG	RO	0h	Received Frame Tag This field contains the 4-bit frame tag from the last successfully received frame. This is intentionally shifted into bits 4:1 so that the register can be used as a 32-bit address index based on the received tag.
0	RESERVED	RO		Zero bit This bit will always read as 0. This is intentionally provided to create a 32-bit offset if required. Using the FRAME_TAG and ZERO bits of this register (bits 4:0), application software can directly index into an array of 32-bit data.

Access Types Legend

Table 3-679. RX_EVT_STS_ALT1_ Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	RO		Reserved
14	ERROR_TAG_MATCH	RO	0h	Error Tag Match Flag This bit indicates that an error frame was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = No tag-matched error frame received. 1h (R) = A tag-matched error frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
13	DATA_TAG_MATCH	RO	0h	Data Tag Match Flag This bit indicates that a dataframe was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = No tag-matched data frame received. 1h (R) = A tag-matched data frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
12	PING_TAG_MATCH	RO	0h	Ping Tag Match Flag This bit indicates that a ping frame was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = No tag-matched ping frame received. 1h (R) = A tag-matched ping frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
11	DATA_FRAME	RO	0h	Data Frame Received Flag This bit indicates that an data frame has been received. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = No data frame has been received. 1h (R) = A data frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
10	FRAME_OVERRUN	RO	0h	Frame Overrun Flag This bit indicates that a frame overrun condition has occured. This bit gets set to 1 when a new DATA/ERROR frame is received and the corresponding DATA_FRAME_RCVD/ ERROR_FRAME_RCVD flag is still set to 1. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = Frame overrun has not ocurred. 1h (R) = Frame overrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
9	PING_FRAME	RO	0h	Ping Frame Received Flag This bit indicates that an ping frame has been received. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = No ping frame has been received. 1h (R) = A ping frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

Table 3-679. RX_EVT_STS_ALT1_ Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	ERR_FRAME	RO	0h	Error Frame Received Flag This bit indicates that an error frame has been received. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = No error frame has been received. 1h (R) = An error frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
7	BUF_UNDERRUN	RO	0h	Receive Buffer Underrun Flag This bit indicates that a buffer underrun condition has occured in the receive buffer. This will happen when software reads the buffer which is empty and has no valid data. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = Receive Buffer Underrun has not ocurred. 1h (R) = Receive Buffer Underrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
6	FRAME_DONE	RO	0h	Frame Done Flag This bit indicates that a frame has been successfully received without error. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = No frame has been successfully received. 1h (R) = A frame has been successfully received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
5	BUF_OVERRUN	RO	0h	Receive Buffer Overrun Flag This bit indicates that a buffer overrun condition has occured in the receive buffer. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = Receive buffer overrun has not ocurred. 1h (R) = Receive buffer overrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
4	EOF_ERR	RO	0h	End-of-Frame Error Flag This bit indicates that an invalid end-of-frame bit pattern has been received. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = Invalid end-of-frame has not been received. 1h (R) = Invalid end-of-frame has been received To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
3	TYPE_ERR	RO	0h	Frame Type Error Flag This bit inditcates that an invalid frame type has been received. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = Invalid frame type has not been received. 1h (R) = Invalid frame type has been received To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
2	CRC_ERR	RO	0h	CRC Error Flag This bit indicates that a CRC error has occured. A CRC error will be generated on a data frame where the received CRC and the computed CRC do not match. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = CRC error has not occured. 1h (R) = CRC error has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
1	FRAME_WD_TO	RO	0h	Frame Watchdog Timeout Flag This bit indicates that the frame watchdog timer has timed out. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = Frame watchdog timeout has not occured. 1h (R) = Frame watchdog timeout has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
0	PING_WD_TO	RO	0h	Ping Watchdog Timeout Flag This bit indicates that the ping watchdog timer has timed out. Software can also force this bit to get set by writing to the RX_EVT_FRC register. 0h (R) = Ping watchdog timeout has not occured. 1h (R) = Ping watchdog timeout has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

Table 3-685. RX_EVT_FRC_ALT1_ Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	ERR_FRAME	WO	0h	Error Frame Received Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.
7	BUF_UNDERRUN	WO	0h	Receive Buffer Underrun Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.
6	FRAME_DONE	WO	0h	Frame Done Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.
5	BUF_OVERRUN	WO	0h	Receive Buffer Overrun Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.
4	EOF_ERR	WO	0h	End-of-Frame Error Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.
3	TYPE_ERR	WO	0h	Frame Type Error Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.
2	CRC_ERR	WO	0h	CRC Error Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.
1	FRAME_WD_TO	WO	0h	Frame Watchdog Timeout Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.
0	PING_WD_TO	WO	0h	Ping Watchdog Timeout Flag Force bit This bit will cause the corresponding bit in the RX_EVT_STS register to get set. The purpose of this register is to allow software to simulate the effect of the event and test the associated software/ISR. 0h (W) = Writing a 0 to this bit will have no effect. 1h (W) = Force the corresponding bit in the RX_EVT_STS Register.

CONTROLSS_FSI_RX3	502B 101Ch

Access Types Legend

Table 3-687. RX_BUF_PTR_LOAD Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 4	RESERVED	RO		Reserved
3 - 0	BUF_PTR_LOAD	RW	0h	Buffer Pointer Load. This is the value to be loaded into the receive word pointer when written. This is to allow software to force the receiver to start storing the received data starting at a specific location in the buffer. NOTE: The value of the CURR_BUF_PTR in the RX_BUF_PTR_STS will not get reflected immediately. This will take effect only when there is a valid receive operation with incoming clocks after (3 RXCLK + 3 SYCLK) cycles.

3.11.13 CONTROLSS_FSI_RXn_RX_FRAME_WD_CTRL Registers

3.11.13.1 FSI_RXn_RX_FRAME_WD_CTRL Register (Offset = 20h) [reset = h]

Short Description: Receive frame watchdog control register

Long Description:

Return to Summary Table

Table 3-690. Instance Table

Instance Name	Physical Address
CONTROLSS_FSI_RX0	5029 0020h
CONTROLSS_FSI_RX1	5029 1020h
CONTROLSS_FSI_RX2	502B 0020h
CONTROLSS_FSI_RX3	502B 1020h

Access Types Legend

Table 3-691. RX_FRAME_WD_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 2	RESERVED	RO		Reserved
1	FRAME_WD_EN	RW	0h	Frame Watchdog Counter Enable bit This bit will enable or disable the frame watchdog counter. The counter (RX_FRAME_WD_CNT) will begin counting from 0 when a valid start-of-frame pattern is received. When the reference value (RX_FRAME_WD_REF) is reached, it will generate a frame watchdog timeout event (RX_EVT_STS.FRAME_WD_TO) and the counter value will reset to 0 and continue counting on the next valid start-of-frame. 0h (R/W) = The frame watchdog counter is disabled and not running. 1h (R/W) = The frame watchdog counter logic is enabled and running.
0	FRAME_WD_CNT_RST	RW	0h	Frame Watchdog Counter Reset bit This bit will reset the frame watchdog counter to 0. Writing a 1 to this bit will reset the frame watchdog counter to 0. The counter will stay in reset as long as this bit is set to 1. This bit needs to be cleared to 0 to use the counter 0h (R/W) = Clear the FRAME_WD_CNT_RST. 1h (W) = The frame watchdog counter will be reset to 0.

Table 3-707. RX_INT2_CTRL_ALT1_ Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	INT2_EN_ERR_FRAME	RW	0h	Enable Error Frame Received Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = A error frame received event will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register
7	INT2_EN_UNDERRUN	RW	0h	Enable Buffer Underrun Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = A buffer underrun event will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register
6	INT2_EN_FRAME_DONE	RW	0h	Enable Frame Done Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = A frame done event will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register
5	INT2_EN_OVERRUN	RW	0h	Enable Buffer Overrun Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = A buffer overrun event will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register
4	INT2_EN_EOF_ERR	RW	0h	Enable End-of-Frame Error Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = An end-of-frame error event will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register
3	INT2_EN_TYPE_ERR	RW	0h	Enable Frame Type Error Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = A frame type error event will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register
2	INT2_EN_CRC_ERR	RW	0h	Enable CRC Error Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = A CRC error will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register
1	INT2_EN_FRAME_WD_TO	RW	0h	Enable Frame Watchdog Timeout Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = A frame watchdog timeout event will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register
0	INT2_EN_PING_WD_TO	RW	0h	Enable Ping Watchdog Timeout Interrupt to INT2 bit This is an enable register which decides whether an interrupt (RX_INT2) will be generated on the enabled event. 0h (R/W) = This event will not trigger an interrupt on RX_INT2. 1h (R/W) = A ping watchdog timeout event will trigger an interrupt on RX_INT2. The event itself will be latched in the corresponding bit in the RX_EVT_STS Register

CONTROLSS_FSI_RX3	502B 103Ch

Access Types Legend

Table 3-709. RX_LOCK_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 8	KEY	WO	0h	Write Key. In order to write to this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every change to this register.
7 - 1	RESERVED	RO		Reserved
0	LOCK	RW	0h	Control Register Lock Enable bit This bit locks the contents of all the receive control registers that support a lock protection. Once locked, further writes will not take effect until SYSRS unlocks the register. Once set, further writes even to this bit will be ignored. 0h (R/W) = Receive control registers can be modified and are not locked. 1h (R/W) = Receive control registers are locked and cannot be modified until this bit is cleared by SYSRS. Any further writes to this bit are ignored. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Table 3-735. RX_VIS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 4	RESERVED	RO		Reserved
3	RX_CORE_STS	RO	0h	Receiver Core Status bit This bit indicates the status of the receiver core. If this bit is set, the receiver should undergo a reset and subsequent resynchronization with the transmitter. This bit will be always be set when the receiver has detected and end of frame error or a frame type error. This bit can also be set if the receiver becomes corrupted due to noise on the signal lines. If the receiver has experienced a ping watchdog or frame watchdog timeout, this bit should be read to determine if the cause was due to a corrupt transaction, thus putting the receiver core into an unrecoverable state. Only a soft reset will reset the recevier core and thus reset this bit. 0h (R) The receiver core is operating normally. 1h (R) The receiver core has entered into an error state and should be reset.

Table 3-744. TX_MASTER_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 8	KEY	WO	0h	Write Key In order to write to any bit in this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every change to this register.
7 - 2	RESERVED	RO		Reserved
1	FLUSH	RW	0h	Flush Operation Start bit This bit will cause the transmitter to initiate a flush pattern of a single toggle on the TXD0 and TXD1 followed by five full cycles of TXCLK. This bit should be written only when the CORE_RST bit is 0 and the clock to the Transmitter core is turned on. 0h (R/W) = Clear this bit. 1h (R/W) = Setting this bit will Initiate flush sequence. To properly execute a flush sequence, Set FLUSH to 1, wait for five TXCLK cycles then clear FLUSH to 0. Note: The KEY field must contain 0xA5 for any write to this bit to take effect. The software must keep this bit set to 1 for at least five TXCLK cycles before setting it back to 0.
0	CORE_RST	RW	0h	Transmitter Master Core Reset bit This bit controls the transmitter master core reset. In order to send any frame, this bit must be cleared. 0h (R/W) = Transmitter core is not in reset and can transmit frames. 1h (R/W) = Transmitter core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

CONTROLSS_FSI_TX3	5028 3008h

Access Types Legend

Table 3-748. TX_OPER_CTRL_LO_ALT2_ Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 11	RESERVED	RO		Reserved
10	SEL_TDM_IN	RW	0h	Input TDM port Select bit This bit selects the input port for the transmitter core between the TDM input pins or the RX module. When this bit is '0', the inputs selected for TDM are from the TDM input pins. When this bit is '1', then inputs selected for TDM are from the RX module.
9	TDM_ENABLE	RW	0h	Transmit TDM Mode Enable bit. This bit enables the TDM Mode for multi-slave TDM operation. 0h (R/W) Transmit TDM Mode is not enabled. 1h (R/W) Transmit TDM Mode is enabled.
8	SEL_PLLCLK	RW	0h	Input Clock Select bit This bit selects the input clock source for the transmitter core. 0h (R/W) = SYSCLK is the source of the transmitter clock into the clock prescaler. 1h (R/W) = PLLRAWCLK is the source of the transmitter core clock into the clock prescaler.
7	PING_TO_MODE	RW	0h	Ping Counter Reset Mode Select bit This bit selects when the ping counter will reset. 0h (R/W) = The ping counter will reset and restart only on hardware initiated ping frames, when ping counter has timed out. 1h (R/W) = The ping counter will reset and restart on any software initiated frame as well as a ping counter timeout
6	SW_CRC	RW	0h	CRC Source Select bit This bit selects the source of the CRC value that is transmitted. 0h (R/W) = The transmitted CRC value is computed by hardware. 1h (R/W) = The transmitted CRC value is sourced from the value programmed in the TX_USER_CRC register.
5 - 3	START_MODE	RW	0h	Transmission Start Mode Select bit These bits select the method by which a new frame transmission is started. 0h (R/W) = Only a software write to TX_FRAME_CTRL.START initiate a new transmission. 1h (R/W) = The configured external trigger will initiate a new transmission. 2h (R/W) = Either writing to TX_FRAME_CTRL.START or the TX_FRAME_TAG_UDATA register will initiate a new transmission. All other combinations of bits are illegal and reserved for future use.
2	SPI_MODE	RW	0h	SPI Mode Select bit This bit enables and disables SPI compatibility mode. 0h (R/W) = FSI is in normal mode of operation. 1h (R/W) = FSI is operating in SPI compatibility mode.
1 - 0	DATA_WIDTH	RW	0h	Transmit Data Width Select bits These bits define the number of data lines used by the transmitter. 0h (R/W) = Data will be transmitted on one data line (TXD0) 1h (R/W) = Data will be transmitted on two data lines (TXD0 and TXD1). The format of the data is described in the preceeding chapter. 2h, 3h (R/W) = Reserved

Bit	Field	Type	Reset	Description
15 - 13	RESERVED	RO		Reserved
12 - 7	EXT_TRIG_SEL	RW	0h	External Trigger Select bit These bits define which of the 64 external inputs will be used as the source for the external input trigger. 00h (R/W) = Trigger 1 is the source. 01h (R/W) = Trigger 2 is the source. 02h (R/W) = Trigger 3 is the source. ... 3Fh (R/W) = Trigger 64 is the source.
6	ECC_SEL	RW	0h	ECC Data Width Select bit This bit selects between 16-bit and 32-bit ECC computation. 0h (R/W) = 32-bit ECC is used. 1h (R/W) = 16-bit ECC is used.
5	FORCE_ERR	RW	0h	Error Frame Force bit This bit will force the the CRC value of the transmitted data frame to 0 whenever there is a buffer overrun or underrun condition. This can be used to force a corrupted CRC as the data is not guaranteed to be reliable. The receiver will treat the data as invalid and can handle this as needed. Note: DO NOT use FORCE_ERR if using the SW CRC mode (FSI Transmit). 0h (R/W) = The CRC will not be forced to 0. 1h (R/W) = The CRC will be forced to 0 in a buffer overrun or underrun condition.

Access Types Legend

Table 3-752. TX_FRAME_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	START	RW	0h	Start Transmission bit This bit will cause the FSI to start transmitting the next frame. 0h (R/W) = Writing a 0 to this bit will have no effect. 1h (R/W) = Start the next transmission. This bit will be cleared by hardware.
14 - 8	RESERVED	RO		Reserved
7 - 4	N_WORDS	RW	0h	Number of Words to be Transmitted This field defines the number of words which will be transmitted in a DATA_N_WORD frame. This is a user-defined field that must match the corresponding field in the receiver. Set this bitfield to be one less than the number of words to be transmitted. 0h (R/W) = 1 data word frame (16-bit data). 1h (R/W) = 2 data word frame (32-bit data). .. Fh (R/W) = 16 data word frame (256-bit data).
3 - 0	FRAME_TYPE	RW	0h	Transmit Frame Type This field determines the type of frame that will be transmitted next. 0000b (R/W) = Ping Frame. This frame can be sent either by software or automatically by hardware. 0100b (R/W) = DATA_1_WORD Frame. One word data frame (16-bit data). 0101b (R/W) = DATA_2_WORD Frame. Two word data frame (32-bit data). 0110b (R/W) = DATA_4_WORD Frame. Four word data frame (64-bit data). 0111b (R/W) = DATA_6_WORD Frame. Six word data frame (96-bit data). 0011b (R/W) = DATA_N_WORD Frame. The N_WORDS field will determine the number of words (1 to 16) to be sent. Both the transmitter and receiver must have the same value programmed. 1111b (R/W) = Error Frame. This frame can be used during error conditions or any condition where the transmitter wants to notify the receiver of a high priorty status. However, the user software is at liberty to use this for any purpose. 0001b, 0010b, and 1000b through 1110b are Reserved and should not be used.

Table 3-760. TX_PING_CTRL_ALT1_ Register Field Descriptions

Bit	Field	Type	Reset	Description
15 - 9	RESERVED	RO		Reserved
8 - 3	EXT_TRIG_SEL	RW	0h	External Trigger Select bits This bitfield will select one of the 64 external trigger inputs to as the source to generate a ping frame. A ping frame will only be generated if the EXT_TRIG_EN bit is set. 0h (R/W) = Trigger 1 will be used to generate a ping frame. 1h (R/W) = Trigger 2 will be used to generate a ping frame. .. 3Fh (R/W) = Trigger 64 will be used to generate a ping frame.
2	EXT_TRIG_EN	RW	0h	External Trigger Enable bit This bit will allow the external trigger logic to generate a ping frame. 0h (R/W) = External triggers will not be used to generate ping frames. 1h (R/W) = The selected external trigger (selected by EXT_TRIG_SEL bits) will be able to generate a ping frame. The ping timer will be ignored if this bit is set.
1	TIMER_EN	RW	0h	Ping Timer Enable bit This bit will enable the ping timer for generating periodic ping frames. 0h (R/W) = The ping timer is disabled and will not generate ping frames. 1h (R/W) = The ping timer is enabled and can be used to generate ping frames.Once the timer count reaches the value set by the TX_PING_TO_REF register, it will initiate a ping frame transmission. Note: If the ping timer is used, EXT_TRIG_EN should not be set as it will override this function.
0	CNT_RST	RW	0h	Ping Counter Reset bit Writing a 1 to this bit will reset the ping counter to 0. The counter will stay in reset as long as this bit is set to 1. This bit needs to be cleared to 0 to use the counter. 0h (R/W) = Clear the CNT_RST. 1h (R/W) = The ping counter will be reset to 0.

3.13.232 CONTROLSS_GLOBAL_CTRL_CMPSSB3_HALTEN Registers

3.13.232.1 GLOBAL_CTRL_CMPSSB3_HALTEN Register (Offset = 5B4h) [reset = h]

Short Description: RW

Long Description:

Return to Summary Table

Table 3-1253. Instance Table

Instance Name	Physical Address
CONTROLSS_CTRL	502F 05B4h

Access Types Legend

Table 3-1254. CMPSSB3_HALTEN Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
3	CR5B1	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt
2	CR5A1	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt
1	CR5B0	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt
0	CR5A0	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt

3.13.233 CONTROLSS_GLOBAL_CTRL_CMPSSB4_HALTEN Registers

3.13.233.1 GLOBAL_CTRL_CMPSSB4_HALTEN Register (Offset = 5B8h) [reset = h]

Short Description: RW

Long Description:

Return to Summary Table

Table 3-1255. Instance Table

Instance Name	Physical Address
CONTROLSS_CTRL	502F 05B8h

Access Types Legend

Table 3-1256. CMPSSB4_HALTEN Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
3	CR5B1	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt
2	CR5A1	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt
1	CR5B0	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt

3.13.234 CONTROLSS_GLOBAL_CTRL_CMPSSB5_HALTEN Registers

3.13.234.1 GLOBAL_CTRL_CMPSSB5_HALTEN Register (Offset = 5BCh) [reset = h]

Short Description: RW

Long Description:

Return to Summary Table

Table 3-1257. Instance Table

Instance Name	Physical Address
CONTROLSS_CTRL	502F 05BCh

Access Types Legend

Table 3-1258. CMPSSB5_HALTEN Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
3	CR5B1	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt
2	CR5A1	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt
1	CR5B0	RW	0h	1'b0: IP Halt disabled with corresponding CPU halt1'b1: IP Halt enabled with corresponding CPU halt
