3.22.3 CONTROLSS_SDFMn_SDIFLGCLR Registers

3.22.3.1 SDFMn_SDIFLGCLR Register (Offset = 4h) [reset = h]

Short Description: SD Module Interrupt Flag Clear Bits: Writing a "1" will clear the respective flag bit in the SDIFLG register. Writes of "0" are ignored. Note: If user writes a "1" to clear a bit on the same cycle that the hardware is trying to set the bit to "1", then hardware has priority and the bit will not be cleared.

Long Description:

Return to Summary Table

Table 3-1468. Instance Table

Table 4-42. PRU_ICSS_SPP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	Reserved
1	XFR_SHIFT_EN	R/W	0h	Enables XIN XOUT shift functionality. When enabled, R0[4-0] (internal to PRU) defines the 32-bit offset for XIN and XOUT operations with the scratch pad. 0h: Disabled. 1h: Enabled.
0	PRU1_PAD_HP_EN	R/W	0h	Defines which PRU wins write cycle arbitration to a common scratch pad bank. The PRU which has higher priority will always perform the write cycle with no wait states. The lower PRU will get stalled wait states until higher PRU is not performing write cycles. If the lower priority PRU writes to the same byte has the higher priority PRU, then the lower priority PRU will over write the bytes. 0h: PRU0 has highest priority. 1h: PRU1 has highest priority.

4.5.2 PRU_ICSS_ECC_CFG Registers

PRU_ICSS_ECC_CFG Registers lists the memory-mapped registers for the PRU_ICSS_ECC_CFG. All register offset addresses not listed in PRU_ICSS_ECC_CFG Registers should be considered as reserved locations and the register contents should not be modified.

Table 4-45. PRU_ICSS_ECC_CFG Instances

Module Name	Base Address
PRU_ICSS_ECC_CFG	5802 7000h

Table 4-46. PRU_ICSS_ECC_CFG Registers

Offset	Acronym	Register Name	PRU_ICSS_ECC_CFG Physical Address
0h	ECC_REVISION	The Revision Register contains the ID and revision information for the ECC Aggregator module. It does not support byte access.	4802 7000h
8h	ECC_VECTOR	ECC RAM ID to select the ECC RAM to control or read status.	4802 7008h
Ch	ECC_MISC_STATUS	Miscellaneous status register.	4802 700Ch
10h	ECC_WRAPPER_REVISION	The Revision Register contains the ID and revision information for the ECC wrapper.	4802 7010h
14h	ECC_CONTROL	The Control Register controls the ECC control bits for the selected ECC RAM.	4802 7014h
18h	ECC_ERROR_CONTROL1	This register contains ECC error control bits for the selected ECC RAM.	4802 7018h
1Ch	ECC_ERROR_CONTROL2	This register contains ECC error control bits for the selected ECC RAM.	4802 701Ch
20h	ECC_ERROR_STATUS1	This register contains ECC status bits for the selected ECC RAM.	4802 7020h
24h	ECC_ERROR_STATUS2	This register contains ECC status bits for the selected ECC RAM.	4802 7024h
3Ch	ECC_EOI	This is the ECC_EOI register for the interrupt to the host.	4802 703Ch
40h to 7Ch	ECC_INT_STATUS to ECC_INT_STATUS_15	These are the raw level interrupt status bits where each bit corresponds to the pending status from an ECC RAM.	4802 7040h to 4802 707Ch
80h to BCh	ECC_INT_ENABLE_0 to ECC_INT_ENABLE_15	These are interrupt enables associated with the interrupt from each of the ECC RAMs.	4802 7080h to 4802 70BCh
C0h to FCh	ECC_INT_CLEAR_0 to ECC_INT_CLEAR_15	These are interrupt enable clear bits associated with the interrupt from each of the ECC RAMs.	4802 70C0h to 4802 70FCh

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 4-56. ECC_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	Reserved
6	ERROR_ONCE	R/W	0h	If this bit is set, the FORCE_SEC/ FORCE_DED will inject an error to the specified row only once. The FORCE_SEC bit will be cleared once a writeback happens. If writeback is not enabled, this error will be cleared the cycle following the read when the data is corrected. For double-bit errors, the FORCE_DED bit will be cleared the cycle following the double-bit error. Any subsequent reads will not force an error.
5	FORCE_N_ROW	R/W	0h	Force single/double-bit error on the next RAM read.
4	FORCE_DED	R/W	0h	Force double-bit error. Cleared the cycle following the error if ERROR_ONCE is asserted.
3	FORCE_SEC	R/W	0h	Force single-bit error. Cleared on a writeback or the cycle following the error if ERROR_ONCE is asserted.
2	ENABLE_RMW	R/W	1h	Enable read-modify-write on partial word writes.
1	ECC_CHECK	R/W	1h	Enable ECC check. ECC is completely bypassed if both ECC_ENABLE and ECC_CHECK are 0.
0	ECC_ENABLE	R/W	1h	Enable ECC generation.

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 4-62. ECC_ERROR_STATUS1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ECC_ROW	R	0h	Indicates the row/address where the single or double-bit error occurred.
15-11	RESERVED	R	0h	Reserved
10	CLR_ECC_OTHER	R/W1C	0h	1 indicates a successive single-bit error. Writing a 1 clears the status bit.
9	CLR_ECC_DED	R/W1C	0h	1 indicates a pending double-bit error. Writing a 1 clears the status bit.
8	CLR_ECC_SEC	R/W1C	0h	1 indicates a pending single-bit error. Writing a 1 clears the status bit.
7-3	RESERVED	R	0h	Reserved
2	ECC_OTHER	R/W1S	0h	1 indicates that successive single-bit errors have occurred while a writeback is still pending. Software can also write a 1 to set the pending status and write a '1' to the corresponding clear bit to clear the status.
1	ECC_DED	R/W1S	0h	1 indicates pending double-bit error. Since the double-bit error from the ECC logic is a pulsed interrupt, this is also a status set register. The software can also write a '1' to set the pending status and write a '1' to the corresponding clear bit to clear the status.
0	ECC_SEC	R/W1S	0h	1 indicates pending single-bit error status. Since the single-bit error from the ECC logic is a pulsed interrupt, this is also a status set register. The software can also write a '1' to set the pending status and write a '1' to the corresponding clear bit to clear the status.

LEGEND: R = Read Only; R/W = Read/Write; *-n* = value after reset

Table 4-76. PRU_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PCOUNTER_RST_VAL	R/W	0h	Program Counter Reset Value: This field controls the address where the PRU will start executing code from after it is taken out of reset.
15	RUNSTATE	R	0h	Run State: This bit indicates whether the PRU is currently executing an instruction or is halted. 0 = PRU is halted and host has access to the instruction RAM and debug registers regions. 1 = PRU is currently running and the host is locked out of the instruction RAM and debug registers regions. This bit is used by an external debug agent to know when the PRU has actually halted when waiting for a HALT instruction to execute, a single step to finish, or any other time when the pru_enable has been cleared.
14	BIG_ENDIAN	R	0h	
13-9	RESERVED	R	0h	Reserved
8	SINGLE_STEP	R/W	0h	Single Step Enable: This bit controls whether or not the PRU will only execute a single instruction when enabled. 0 = PRU will free run when enabled. 1 = PRU will execute a single instruction and then the pru_enable bit will be cleared. Note that this bit does not actually enable the PRU, it only sets the policy for how much code will be run after the PRU is enabled. The pru_enable bit must be explicitly asserted. It is legal to initialize both the single_step and pru_enable bits simultaneously. (Two independent writes are not required to cause the stated functionality.)
7-4	RESERVED	R	0h	Reserved

Table 4-76. PRU_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	COUNTER_ENABLE	R/W	0h	PRU Cycle Counter Enable: Enables PRU cycle counters. 0 = Counters not enabled 1 = Counters enabled
2	SLEEPING	R/W	0h	PRU Sleep Indicator: This bit indicates whether or not the PRU is currently asleep. 0 = PRU is not asleep 1 = PRU is asleep If this bit is written to a 0, the PRU will be forced to power up from sleep mode.
1	ENABLE	R/W	0h	Processor Enable: This bit controls whether or not the PRU is allowed to fetch new instructions. 0 = PRU is disabled. 1 = PRU is enabled. If this bit is de-asserted while the PRU is currently running and has completed the initial cycle of a multi-cycle instruction (LBxO,SBxO,SCAN, etc.), the current instruction will be allowed to complete before the PRU pauses execution. Otherwise, the PRU will halt immediately. Because of the unpredictability timing sensitivity of the instruction execution loop, this bit is not a reliable indication of whether or not the PRU is currently running. The pru_state bit should be consulted for an absolute indication of the run state of the core. When the PRU is halted, its internal state remains coherent therefore this bit can be reasserted without issuing a software reset and the PRU will resume processing exactly where it left off in the instruction stream.
0	SOFT_RST_N	R/W	1h	Soft Reset: When this bit is cleared, the PRU will be reset. This bit is set back to 1 on the next cycle after it has been cleared.

Bit	Field	Type	Reset	Description
31-0	BITWISE_ENABLES	R/W	0h	Wakeup Enables: This field is ANDed with the incoming R31 status inputs (whose bit positions were specified in the stmap parameter) to produce a vector which is unary ORed to produce the status_wakeup source for the core. Setting any bit in this vector will allow the corresponding status input to wake up the core when it is asserted high. The PRU should set this enable vector prior to executing a SLP (sleep) instruction to ensure that the desired sources can wake up the core.

CYCLECOUNT																															
R/W-0h																															

LEGEND: R/W = Read/Write; *-n* = value after reset

Table 4-82. PRU_CYCLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CYCLECOUNT	R/W	0h	This value is incremented by 1 for every cycle during which the PRU is enabled and the counter is enabled (both bits ENABLE and COUNTENABLE set in the PRU control register). Counting halts while the PRU is disabled or counter is disabled, and resumes when re-eneabled. Counter clears the COUNTENABLE bit in the PRU control register when the count reaches FFFFFFFFh. (Count does does not wrap). The register can be read at any time. The register can be cleared when the counter or PRU is disabled. Clearing this register also clears the PRU Stall Count Register.

4.5.3.5 PRU_STALL Register (Offset = 10h) [reset = 0h]

PRU_STALL is shown in Figure 4-27 and described in Table 4-84.

STALL COUNT. This register counts the number of cycles for which the PRU has been enabled, but unable to fetch a new instruction. It is linked to the Cycle Count Register (0Ch) such that this register reflects the stall cycles measured over the same cycles as counted by the cycle count register. Thus the value of this register is always less than or equal to cycle count.

Table 4-83. PRU_STALL Instances

Instance	Physical Address

4.5.3.6 PRU_CTBIR0 Register (Offset = 20h) [reset = 0h]

PRU_CTBIR0 is shown in Figure 4-28 and described in Table 4-86.

CONSTANT TABLE BLOCK INDEX REGISTER 0. This register is used to set the block indices which are used to modify entries 24 and 25 in the PRU Constant Table. This register can be written by the PRU whenever it needs to change to a new base pointer for a block in the State Scratchpad RAM. This function is useful since the PRU is often processing multiple processing threads which require it to change contexts. The PRU can use this register to avoid requiring excessive amounts of code for repetitive context switching.

Table 4-85. PRU_CTBIR0 Instances

4.5.3.8 PRU_CTPPR0 Register (Offset = 28h) [reset = 0h]

PRU_CTPPR0 is shown in Figure 4-30 and described in Table 4-90.

CONSTANT TABLE PROGRAMMABLE POINTER REGISTER 0. This register allows the PRU to set up the 256-byte page index for entries 28 and 29 in the PRU Constant Table which serve as general purpose pointers which can be configured to point to any locations inside the session router address map. This register is useful when the PRU needs to frequently access certain structures inside the session router address space whose locations are not hard coded such as tables in scratchpad memory.

Table 4-89. PRU_CTPPR0 Instances

Instance	Physical Address

4.5.4.1 PRU_ICSS_DBG_GPREG0 Register (Offset = 0h) [reset = 0h]

PRU_ICSS_DBG_GPREG0 is shown in Figure 4-32 and described in Table 4-96.

Return to Summary Table.

DEBUG PRU GENERAL PURPOSE REGISTER 0. This register allows an external agent to debug the PRU while it is disabled. Reading or writing to these registers will have the same effect as a read or write to these registers from an internal instruction in the PRU. For R30, this includes generation of the pulse outputs whenever the register is written.

Table 4-95. PRU_ICSS_DBG_GPREG0 Instances

4.5.4.14 PRU_ICSS_DBG_GPREG13 Register (Offset = 34h) [reset = 0h]

PRU_ICSS_DBG_GPREG13 is shown in Figure 4-45 and described in Table 4-122.

Return to Summary Table.

DEBUG PRU GENERAL PURPOSE REGISTER 13. This register allows an external agent to debug the PRU while it is disabled. Reading or writing to these registers will have the same effect as a read or write to these registers from an internal instruction in the PRU. For R30, this includes generation of the pulse outputs whenever the register is written.

4.5.4.30 PRU_ICSS_DBG_GPREG29 Register (Offset = 74h) [reset = 0h]

PRU_ICSS_DBG_GPREG29 is shown in Figure 4-61 and described in Table 4-154.

Return to Summary Table.

DEBUG PRU GENERAL PURPOSE REGISTER 29. This register allows an external agent to debug the PRU while it is disabled. Reading or writing to these registers will have the same effect as a read or write to these registers from an internal instruction in the PRU. For R30, this includes generation of the pulse outputs whenever the register is written.

Table 4-153. PRU_ICSS_DBG_GPREG29 Instances

Instance	Physical Address
PRU_ICSS_PRU_DEBUG_0	4802 2474h

4.5.4.46 PRU_ICSS_DBG_CT_REG13 Register (Offset = B4h) [reset = 48310000h]

PRU_ICSS_DBG_CT_REG13 is shown in Figure 4-77 and described in Table 4-186.

Return to Summary Table.

DEBUG PRU CONSTANTS TABLE ENTRY 13. This register allows an external agent to debug the PRU while it is disabled. Since some of the constants table entries may actually depend on system inputs / and or the internal state of the PRU, these registers are provided to allow an external agent to easily determine the state of the constants table.

PRU_ICSS_DBG_CT_REG28 is shown in Figure 4-92 and described in Table 4-216.

Return to Summary Table.

DEBUG PRU CONSTANTS TABLE ENTRY 28. This register allows an external agent to debug the PRU while it is disabled. Since some of the constants table entries may actually depend on system inputs / and or the internal state of the PRU, these registers are provided to allow an external agent to easily determine the state of the constants table.

Table 4-215. PRU_ICSS_DBG_CT_REG28 Instances

Instance	Physical Address

4.5.5.4 PRU_ICSS_INTC_GNLR Register (Offset = 1Ch) [reset = 100h]

PRU_ICSS_INTC_GNLR is shown in Figure 4-99 and described in Table 4-232.

The Global Nesting Level Register allows the checking and setting of the global nesting level across all host interrupts when automatic global nesting mode is set. The nesting level is the channel (and all of lower priority) that are nested out because of a current interrupt. This register is only available when nesting is configured.

Table 4-231. PRU_ICSS_INTC_GNLR Instances

Instance	Physical Address
PRU_ICSS_INTC	4802 001Ch

4.5.5.8 PRU_ICSS_INTC_EICR Register (Offset = 2Ch) [reset = 0h]

PRU_ICSS_INTC_EICR is shown in Figure 4-103 and described in Table 4-240.

The System Interrupt Enable Indexed Clear Register allows disabling an interrupt. The interrupt to disable is the index value written. This clears the Enable Register bit of the given index.

4.5.5.9 PRU_ICSS_INTC_HIEISR Register (Offset = 34h) [reset = 0h]

PRU_ICSS_INTC_HIEISR is shown in Figure 4-104 and described in Table 4-242.

The Host Interrupt Enable Indexed Set Register allows enabling a host interrupt output. The host interrupt to enable is the index value written. This enables the host interrupt output or triggers the output again if already enabled.

4.5.5.52 PRU_ICSS_INTC_SITR1 Register (Offset = D84h) [reset = 0h]

PRU_ICSS_INTC_SITR1 is shown in Figure 4-147 and described in Table 4-328.

The System Interrupt Type Register1 define the type of the system interrupts 32 to 63. There is a type for each system interrupt. The type of all system interrupts is pulse; always write 0 to the bits of this register.

Table 4-327. PRU_ICSS_INTC_SITR1 Instances

Instance	Physical Address

4.5.6.1 PRU_ICSS_UART_RBR_THR Register (Offset = 0h) [reset = 0h]

PRU_ICSS_UART_RBR_THR is shown in Figure 4-159 and described in Table 4-354.

Return to Summary Table.

In the non-FIFO mode, when a character is placed in Receiver buffer register and the receiver data-ready interrupt is enabled (DR = 1 in Interrupt identification register), an interrupt is generated. This interrupt is cleared when the character is read from Receiver buffer register. In the FIFO mode, the interrupt is generated when the FIFO is filled to the trigger level selected in the FIFO control register, and it is cleared when the FIFO contents drop below the trigger level.
In the non-FIFO mode, if Transmitter holding register is empty and the THR empty (THRE) interrupt is enabled (ETBEI = 1 in Interrupt enable register), an interrupt is generated. This interrupt is cleared when a character is loaded into Transmitter holding register or the Interrupt identification register is read. In the FIFO mode, the interrupt is generated when the transmitter FIFO is empty, and it is cleared when at least one byte is loaded into the FIFO or Interrupt identification register is read.

4.5.6.3 PRU_ICSS_UART_INTERRUPT_IDENTIFICATION_FIFO_CONTROL Register (Offset = 8h) [reset = 1h]

PRU_ICSS_UART_INTERRUPT_IDENTIFICATION_FIFO_CONTROL is shown in Figure 4-161 and described in Table 4-358.

Return to Summary Table.

The Interrupt identification register is a read-only register at the same address as the FIFO control register, which is a write-only register. When an interrupt is generated and enabled in the Interrupt enable register, Interrupt identification register indicates that an interrupt is pending in the IPEND bit and encodes the type of interrupt in the INTID bits. Reading Interrupt identification register clears any THR empty (THRE) interrupts that are pending. The FIFOEN bit in Interrupt identification register can be checked to determine whether the UART is in the FIFO mode or the non-FIFO mode.
Use FIFO control register to enable and clear the FIFOs and to select the receiver FIFO trigger level. The FIFOEN bit in FIFO control register must be set to 1 before other FIFO control register bits are written to or the FIFO control register bits are not programmed.

Table 4-358. PRU_ICSS_UART_INTERRUPT_IDENTIFICATION_FIFO_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	FIFOEN_RXFIFTL	RW	0h	**Read:** FIFOs enabled. 0h: Non-FIFO mode 1h-2h: Reserved 3h: FIFOs are enabled. FIFOEN bit in the FIFO control register (FCR) is set to 1.
				Write: Receiver FIFO trigger level. RXFIFTL sets the trigger level for the receiver FIFO. When the trigger level is reached, a receiver data-ready interrupt is generated (if the interrupt request is enabled). Once the FIFO drops below the trigger level, the interrupt is cleared. 0h: 1 byte 1h: 4 bytes 2h: 8 bytes 3h: 14 bytes
5-4	RESERVED	R	0h	Reserved
3-1	INTID	RW	0h	**Read:** Interrupt type. See . 0h: Reserved 1h: Transmitter holding register empty (priority 3) 2h: Receiver data available (priority 2) 3h: Receiver line status (priority 1, highest) 4h-5h: Reserved 6h: Character timeout indication (priority 2) 7h: Reserved
				Write: **Bit 3: DMAMODE1:** DMA MODE1 enable if FIFOs are enabled. Always write 1 to DMAMODE1. After a hardware reset, change DMAMODE1 from 0 to 1. DMAMODE1 = 1 is a requirement for proper communication between the UART and the EDMA controller. 0h: DMA MODE1 is disabled. 1h: DMA MODE1 is enabled. **Bit 2: TXCLR:** Transmitter FIFO clear. Write a 1 to TXCLR to clear the bit. 0h: No effect. 1h: Clears transmitter FIFO and resets the transmitter FIFO counter. The shift register is not cleared. **Bit 1: RXCLR:** Receiver FIFO clear. Write a 1 to RXCLR to clear the bit. 0h: No effect. 1h: Clears receiver FIFO and resets the receiver FIFO counter. The shift register is not cleared.
0	IPEND_FIFOEN	RW	1h	**Read:** Interrupt pending. When any UART interrupt is generated and is enabled in IER, IPEND is forced to 0. IPEND remains 0 until all pending interrupts are cleared or until a hardware reset occurs. If no interrupts are enabled, IPEND is never forced to 0. 0h: Interrupts pending. 1h: No interrupts pending.
				Write: Transmitter and receiver FIFOs mode enable. FIFOEN must be set before other FCR bits are written to or the FCR bits are not programmed. Clearing this bit clears the FIFO counters. 0h: Non-FIFO mode. The transmitter and receiver FIFOs are disabled, and the FIFO pointers are cleared. 1h: FIFO mode. The transmitter and receiver FIFOs are enabled.

4.5.6.4 PRU_ICSS_UART_LINE_CONTROL Register (Offset = Ch) [reset = 0h]

PRU_ICSS_UART_LINE_CONTROL is shown in Figure 4-162 and described in Table 4-360.

Return to Summary Table.

The system programmer controls the format of the asynchronous data communication exchange by using Line control register. In addition, the programmer can retrieve, inspect, and modify the content of line control register; this eliminates the need for separate storage of the line characteristics in system memory.

Table 4-359. PRU_ICSS_UART_LINE_CONTROL Instances

Instance	Physical Address
PRU_ICSS_UART	4802 800Ch

Copyright © 2024 Texas Instruments Incorporated

Table 4-364. PRU_ICSS_UART_LINE_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	TEMT	R	1h	Transmitter empty (TEMT) indicator. **In non-FIFO mode:** 0h: Either the transmitter holding register (THR) or the transmitter shift register (TSR) contains a data character. 1h: Both the transmitter holding register (THR) and the transmitter shift register (TSR) are empty.
				In FIFO mode: 0h: Either the transmitter FIFO or the transmitter shift register (TSR) contains a data character. 1h: Both the transmitter FIFO and the transmitter shift register (TSR) are empty.
5	THRE	R	1h	Transmitter holding register empty (THRE) indicator. If the THRE bit is set and the corresponding interrupt enable bit is set (ETBEI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: Transmitter holding register (THR) is not empty. THR has been loaded by the CPU. 1h: Transmitter holding register (THR) is empty (ready to accept a new character). The content of THR has been transferred to the transmitter shift register (TSR).
				In FIFO mode: 0h: Transmitter FIFO is not empty. At least one character has been written to the transmitter FIFO. You can write to the transmitter FIFO if it is not full. 1h: Transmitter FIFO is empty. The last character in the FIFO has been transferred to the transmitter shift register (TSR).
4	BI	R	0h	Break indicator. The BI bit is set whenever the receive data input (UARTn_RXD) was held low for longer than a full-word transmission time. A full-word transmission time is defined as the total time to transmit the START, data, PARITY, and STOP bits. If the BI bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver buffer register (RBR). 1h: A break has been detected with the character in the receiver buffer register (RBR).
				In FIFO mode: 0h: No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver FIFO and the next character to be read from the FIFO has no break indicator. 1h: A break has been detected with the character at the top of the receiver FIFO.

Table 4-364. PRU_ICSS_UART_LINE_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	FE	R	0h	Framing error (FE) indicator. A framing error occurs when the received character does not have a valid STOP bit. In response to a framing error, the UART sets the FE bit and waits until the signal on the RX pin goes high. Once the RX signal goes high, the receiver is ready to detect a new START bit and receive new data. If the FE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 1h: A framing error has been detected with the character in the receiver buffer register (RBR).
				In FIFO mode: 0h: No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no framing error. 1h: A framing error has been detected with the character at the top of the receiver FIFO.
2	PE	R	0h	Parity error (PE) indicator. A parity error occurs when the parity of the received character does not match the parity selected with the EPS bit in the line control register (LCR). If the PE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 1h: A parity error has been detected with the character in the receiver buffer register (RBR).
				In FIFO mode: 0h: No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no parity error. 1h: A parity error has been detected with the character at the top of the receiver FIFO.

Table 4-364. PRU_ICSS_UART_LINE_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	OE	R	0h	Overrun error (OE) indicator. An overrun error in the non-FIFO mode is different from an overrun error in the FIFO mode. If the OE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 1h: Overrun error has been detected. Before the character in the receiver buffer register (RBR) could be read, it was overwritten by the next character arriving in RBR.
				In FIFO mode: 0h: No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 1h: Overrun error has been detected. If data continues to fill the FIFO beyond the trigger level, an overrun error occurs only after the FIFO is full and the next character has been completely received in the shift register. An overrun error is indicated to the CPU as soon as it happens. The new character overwrites the character in the shift register, but it is not transferred to the FIFO.
0	DR	R	0h	Data-ready (DR) indicator for the receiver. If the DR bit is set and the corresponding interrupt enable bit is set (ERBI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0h: Data is not ready, or the DR bit was cleared because the character was read from the receiver buffer register (RBR). 1h: Data is ready. A complete incoming character has been received and transferred into the receiver buffer register (RBR).
				In FIFO mode: 0h: Data is not ready, or the DR bit was cleared because all of the characters in the receiver FIFO have been read. 1h: Data is ready. There is at least one unread character in the receiver FIFO. If the FIFO is empty, the DR bit is set as soon as a complete incoming character has been received and transferred into the FIFO. The DR bit remains set until the FIFO is empty again.

4.5.6.9 PRU_ICSS_UART_DIVISOR_LSB Register (Offset = 20h) [reset = 0h]

PRU_ICSS_UART_DIVISOR_LSB is shown in Figure 4-167 and described in Table 4-370.

Return to Summary Table.

Two 8-bit register fields (DLL and DLH), called divisor latches, store the 16-bit divisor for generation of the baud clock in the baud generator. DLH holds the most-significant bits of the divisor, and DLL holds the least-significant bits of the divisor. These divisor latches must be loaded during initialization of the UART in order to ensure desired operation of the baud generator. Writing to the divisor latches results in two wait states being inserted during the write access while the baud generator is loaded with the new value.

Table 4-396. PRU_ICSS_ECAP_ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SWSYNC	R/W	0h	Software-forced Counter (TSCNT) Synchronizing. This provides a convenient software method to synchronize some or all ECAP time bases. In APWM mode, the synchronizing can also be done via the CTR = PRD event. Note: Selection CTR = PRD is meaningful only in APWM mode. However, you can choose it in CAP mode if you find doing so useful. 0h: Writing a zero has no effect. Reading always returns a zero 1h: Writing a one forces a TSCNT shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 1'b00. After writing a 1, this bit returns to a zero.
7-6	SYNCO_SEL	R/W	0h	Sync-Out Select 0h: Select sync-in event to be the sync-out signal (pass through) 1h: Select CTR = PRD event to be the sync-out signal 2h: Disable sync out signal 3h: Disable sync out signal
5	SYNCI_EN	R/W	0h	Counter (TSCNT) Sync-In select mode 0h: Disable sync-in option 1h: Enable counter (TSCNT) to be loaded from PRU_ICSS_ECAP_CNTPHS register upon either a SYNCI signal or a S/W force event.
4	TSCNTSTP	R/W	0h	Time Stamp (TSCNT) Counter Stop (freeze) Control 0h: TSCNT stopped 1h: TSCNT free-running
3	REARMRESET	R/W	0h	One-Shot Re-Arming Control, that is, wait for stop trigger. Note: The re-arm function is valid in one shot or continuous mode. 0h: Has no effect (reading always returns a 0) 1h: Arms the one-shot sequence as follows: 1) Resets the Mod4 counter to zero. 2) Unfreezes the Mod4 counter. 3) Enables capture register loads.

Table 4-396. PRU_ICSS_ECAP_ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2-1	STOPVALUE	R/W	3h	Stop value for one-shot mode. This is the number (between 1 and 4) of captures allowed to occur before the CAP (1 through 4) registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number (between 1 and 4) of the capture register in which the circular buffer wraps around and starts again. Notes: STOPVALUE is compared to Mod4 counter and, when equal, the following two actions occur. (1) Mod4 counter is stopped (frozen). (2) Capture register loads are inhibited. In one-shot mode, further interrupt events are blocked until re-armed. 0h: Stop after Capture Event 1 in one-shot mode. Wrap after Capture Event 1 in continuous mode. 1h: Stop after Capture Event 2 in one-shot mode. Wrap after Capture Event 2 in continuous mode. 2h: Stop after Capture Event 3 in one-shot mode. Wrap after Capture Event 3 in continuous mode. 3h: Stop after Capture Event 4 in one-shot mode. Wrap after Capture Event 4 in continuous mode.
0	CONTONESHT	R/W	0h	Continuous or one-shot mode control (applicable only in capture mode) 0h: Operate in continuous mode 1h: Operate in one-shot mode

TI Confidential - NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

Table 4-410. PRU_ICSS_MII_RT_RXCFG0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	RX_AUTO_FWD_PRE	R/W	0h	Enables auto-forward of received preamble. When enabled, this will forward the preamble nibbles including the SFD to the TX L1 FIFO that is attached to the PRU. First data byte seen by PRU R31 and/or RX L2 is destination address (DA). **Note: Odd number of preamble nibbles is supported in this mode. For example, 0x55D Note that new RX should only occur after the current TX completes** 0h: Disable 1h: Enable, it must disable RX_CUT_PREAMBLE and TX_AUTO_PREAMBLE
5	RX_BYTE_SWAP	R/W	0h	Defines the order of Byte0/1 placement for RX R31 and RX L2. **Note: that if TX_AUTO_SEQUENCE enabled, this bit cannot get enable since TX_BYTE_SWAP on swaps the PRU output. This bit must be selected/updated when the port is disabled or there is no traffic.** 0h: R31 [15:8]/RXL2 [15:8] = Byte1{Nibble3,Nibble2} R31[7:0]/RXL2 [7:0] = Byte0{Nibble1,Nibble0} 1h: R31 [15:8]/RXL2 [15:8] = Byte0{Nibble1,Nibble0} R31[7:0]/RXL2 [7:0] = Byte1{Nibble3,Nibble2} Nibble0 is the first nibble received.
4	RX_L2_EN	R/W	0h	Enables RX L2 buffer. 0h: Disable (RX L2 can function as generic scratch pad) 1h: Enable
3	RX_MUX_SEL	R/W	0h	Selects receive data source. Typically, the setting for this will not be identical for the two MII receive configuration registers. 0h: MII RX Data from Port 0 (default for PRU_ICSS_MII_RT_RXCFG0) 1h: MII RX Data from Port 1 (default for PRU_ICSS_MII_RT_RXCFG1)
2	RX_CUT_PREAMBLE	R/W	0h	Removes received preamble. 0h: All data from Ethernet PHY are passed on to PRU register. This assumes Ethernet PHY which does not shorten the preamble. 1h: MII interface suppresses preamble and sync frame delimiter. First data byte seen by PRU register is destination address.
1	RX_DATA_RDY_MODE_DIS	R/W	0h	0h: R31, Bit 16 is configured for DATA_RDY mode. 1h: R31, Bit 16 is configured for TX_EOF mode.
0	RX_ENABLE	R/W	0h	Enables the receive traffic currently selected by RX_MUX_SELECT. 0h: Disable 1h: Enable

Table 4-412. PRU_ICSS_MII_RT_RXCFG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	RX_AUTO_FWD_PRE	R/W	0h	Enables auto-forward of received preamble. When enabled, this will forward the preamble nibbles including the SFD to the TX L1 FIFO that is attached to the PRU. First data byte seen by PRU R31 and/or RX L2 is destination address (DA). **Note: Odd number of preamble nibbles is supported in this mode. For example, 0x55D Note that new RX should only occur after the current TX completes** 0h: Disable 1h: Enable, it must disable RX_CUT_PREAMBLE and TX_AUTO_PREAMBLE
5	RX_BYTE_SWAP	R/W	0h	Defines the order of Byte0/1 placement for RX R31 and RX L2. **Note: that if TX_AUTO_SEQUENCE enabled, this bit cannot get enable since TX_BYTE_SWAP on swaps the PRU output. This bit must be selected/updated when the port is disabled or there is no traffic.** 0h: R31 [15:8]/RXL2 [15:8] = Byte1{Nibble3,Nibble2} R31[7:0]/RXL2 [7:0] = Byte0{Nibble1,Nibble0} 1h: R31 [15:8]/RXL2 [15:8] = Byte0{Nibble1,Nibble0} R31[7:0]/RXL2 [7:0] = Byte1{Nibble3,Nibble2} Nibble0 is the first nibble received.
4	RX_L2_EN	R/W	0h	Enables RX L2 buffer. 0h: Disable (RX L2 can function as generic scratch pad) 1h: Enable
3	RX_MUX_SEL	R/W	1h	Selects receive data source. Typically, the setting for this will not be identical for the two MII receive configuration registers. 0h: MII RX Data from Port 0 (default for PRU_ICSS_MII_RT_RXCFG0) 1h: MII RX Data from Port 1 (default for PRU_ICSS_MII_RT_RXCFG1)
2	RX_CUT_PREAMBLE	R/W	0h	Removes received preamble. 0h: All data from Ethernet PHY are passed on to PRU register. This assumes Ethernet PHY which does not shorten the preamble. 1h: MII interface suppresses preamble and sync frame delimiter. First data byte seen by PRU register is destination address.
1	RX_DATA_RDY_MODE_DIS	R/W	0h	0h: R31, Bit 16 is configured for DATA_RDY mode. 1h: R31, Bit 16 is configured for TX_EOF mode.
0	RX_ENABLE	R/W	0h	Enables the receive traffic currently selected by RX_MUX_SELECT. 0h: Disable 1h: Enable

Table 4-414. PRU_ICSS_MII_RT_TXCFG0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25-16	TX_START_DELAY	R/W	40h	Defines the minimum time interval (delay) between receiving the RXDV for the current frame and the start of the transmit interface sending data to the MII interface. Delay value is in units of MII_RT clock cycles, which uses the ICSS_i_VCLK_CLK (default is 200MHz, or 5ns). Default TX_START_DELAY value is 320ns, which is optimized for minimum latency at 16 bit processing. Counter is started with RX_DV signal going active. Transmit interface stops sending data when no more data is written into transmit interface by PRU along with TX_EOF marker bit set. If the TX FIFO has data when the delay expires, then TX will start sending data. But if the TX FIFO is empty, it will not start until the TX FIFO is not empty. It is possible to overflow the TX FIFO with the max delay setting when auto-forwarding is enabled since the time delay is larger than the amount of data it needs to store. As long as TX L1 FIFO overflows, software will need to issue a TX_RESET to reset the TX FIFO. The total delay is 96-byte times (size of TX FIFO), but you need to allow delays for synchronization. Do to this fact, the maximum delay should be 80ns less when auto forwarding is enabled. Therefore, 0x3F0 is the maximum in this configuration.
15-12	RESERVED	R	0h	Reserved
11	TX_32_MODE_EN	R/W	0h	0h: Disable 32-bit Data Push mode. 1h: Enable 32-bit, 16-bit, and 8-bit Data Push mode with TX_MASK disabled. In this mode, the internal PRU R30 byte write strobes are used and not the R31 CMD TX_PUSH mode. Any update to R30 will trigger an TX PUSH. See .
10	RESERVED	R	0h	Reserved
9	TX_AUTO_SEQUENCE	R/W	0h	Enables transmit auto-sequence. Note the transmit data source is determined by TX_MUX_SEL setting. 0h: Disable 1h: Enable, transmit state machine based on events on receiver path that is connected to the respective transmitter. Also, the masking logic is disabled and only the MII data is used.
8	TX_MUX_SEL	R/W	1h	Selects transmit data source. The default/reset setting for TX Port 0 is 1. This setting permits MII TX Port 0 to receive data from PRU1 and the MII TX Port 1 which is connected to PRU0 by default. 0h: Data from PRU0 (default for PRU_ICSS_MII_RT_TXCFG1) 1h: Data from PRU1 (default for PRU_ICSS_MII_RT_TXCFG0)
7-4	RESERVED	R	0h	Reserved

Table 4-454. PRU_ICSS_MII_MDIO_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	MDIO state machine IDLE. Set to 1 when the state machine is in the idle state.
30	ENABLE	R/W	0h	Enable control. Writing a 1 to this bit enables the MDIO state machine, writing a 0 disables it. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register.
29	RESERVED	R	0h	Reserved
28-24	HIGHEST_USER_CHANNEL	R	1h	Highest user channel. This field specifies the highest useraccess channel that is available in the module and is currently set to 1. This implies that **MDIOUserAccess1** is the highest available user access channel.
23-21	RESERVED	R	0h	Reserved
20	PREAMBLE	R/W	0h	Preamble disable. Writing a 1 to this bit disables this device from sending MDIO frame preambles.
19	FAULT	RWr1Clr	0h	Fault indicator. This bit is set to 1 if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1 to it clears this bit.
18	FAULT_DETECT_ENABLE	R/W	0h	Fault detect enable. This bit has to be set to 1 to enable the physical layer fault detection.

Table 4-454. PRU_ICSS_MII_MDIO_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	INT_TEST_ENABLE	R/W	0h	Interrupt test enable. This bit can be set to 1 to enable the host to set the userint and linkint bits for test purposes.
16	RESERVED	R	0h	Reserved
15-0	CLKDIV	R/W	FFh	Clock Divider. This field specifies the division ratio between CLK and the frequency of MDCLK. MDCLK is disabled when clkdiv is set to 0. MDCLK frequency = clk frequency/(clkdiv+1).

Table 4-456. PRU_ICSS_MII_MDIO_ALIVE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ALIVE	RWr1Clr	0h	MDIO Alive bitfield. Each of the 32 bits of this register is set if the most recent access to the PHY with address corresponding to the register bit number was acknowledged by the PHY, the bit is reset if the PHY fails to acknowledge the access. Both the user and polling accesses to a PHY will cause the corresponding alive bit to be updated. The alive bits are only meant to be used to give an indication of the presence or not of a PHY with the corresponding address. Writing a 1 to any bit will clear it, writing a 0 has no effect.

LINK																															
R-0h																															

LEGEND: R = Read Only; *-n* = value after reset

Table 4-458. PRU_ICSS_MII_MDIO_LINK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LINK	R	0h	MDIO Link state. This register is updated after a read of the Generic Status Register of a PHY. The bit is set if the PHY with the corresponding address has link and the PHY acknowledges the read transaction. The bit is reset if the PHY indicates it does not have link or fails to acknowledge the read transaction. Writes to the register have no effect. In addition, the status of the two PHYs specified in the **MDIOUserPhySel** registers can be determined using the **MLINK** input pins. This is determined by the **linksel** bit in the **MDIOUserPhySel** register.

SLOW_COMPEN_CNT																															
R/W-0h																															

LEGEND: R/W = Read/Write; *-n* = value after reset

Table 4-488. PRU_ICSS_IEP_SLOW_COMPENSATION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SLOW_COMPEN_CNT	R/W	0h	Slow compensation counter. Write 0h: Slow compensation is disabled and counter will increment by DEFAULT_INC. Write Nh: Compensation is enabled for 1 count for every SLOW_COMPEN_CNT cycle, this is free running and continuous until software clears the MMR. For example, SLOW_COMPEN_CNT = 16, every 16 clock cycles the compensation value is used for 1 count. Note: COMPEN_CNT MUST be set to zero IF SLOW_COMPEN_CNT is not zero. Software can read the number of cycles left until the compensation event. For example, software writes SLOW_COMPEN_CNT = 100h and reads SLOW_COMPEN_CNT = 7h. This means in 6 more IEP_CLK cycles before the counter reaches 1h for the compensation event. If software writes SLOW_COMPEN_CNT = 8000h before compensation event, then the counter will reset to 8000h.

Table 4-540. PRU_ICSS_IEP_COMPARE_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-0	CMP_HIT	RWr1Clr	0h	Status bit for each of the compare registers. "Match" indicates the current counter is greater than or equal to the compare value. Note it is the firmware's responsibility to handle the IEP overflow. CMP_HITj/k = 0: No match has occured CMP_HITj/k = 1: A match occured. The associated hardware event signal will assert and remain high until the status is cleared.

Table 4-652. PRU_ICSS_IEP_DIGIO_DATA_OUT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DATA_OUT	R/W	0h	Data output. Digital outputs can be configured to be updated in four ways. 1h: Digital outputs are updated at the end of each frame (EOF mode). 2h: Digital outputs are updated with SYNC0 events 3h: Digital outputs are updated SYNC1 events. 4h: Digital outputs are updated at the end of a frame which triggered the Process Data Watchdog. Digital Outputs are only updated if the frame was correct (WD_TRIG mode). These can be configured by [7-6] OUT_MODE bit field in the PRU_ICSS_IEP_DIGIO_CTRL.

4.8.2 R5SSn_STC_STCGCR0 Registers

4.8.2.1 R5SS0_STCGCR0 Register (Offset = 0h) [reset = h]

Short Description: Self test Global control Reg0. *NOT BYTE ACCESSIBLE

Long Description:

Return to Summary Table

Table 4-722. Instance Table

Instance Name	Physical Address
R5SS0_STC	5350 0000h
R5SS1_STC	5351 0000h

Access Types Legend

Table 4-723. STCGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	INTCOUNT_B16	RW	1h	Number of intervals of the self test run (RWP - Read, Priviledge Mode Write only)Count of intervals that need to be covered for a specific selftest run.The selftest controller sends out ?complete? indication once it runs all of the intervals programmed in this field.INTCOUNT_B16=0 is an invalid configuration for a selftest.
15 - 11	NU0	RO	0h	Reserved bits
10 - 8	CAP_IDLE_CYCLE	RW	1h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only)Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7 - 5	SCANEN_HIGH_CAP_IDLE_CYCLE	RW	1h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only). *NOT BYTE ACCESSIBLEIdle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock (scan_en going high to func_clk_en generation) and misr_log_clk (scan_en going high to misr_log_en generation) generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
4 - 2	NU1	RO	0h	Reserved bits
1 - 0	RS_CNT_B1	RW	0h	Restart/Continue or preload (RWP - Read, Priviledge Mode Write only)This bit specifies the selftest controller whether to continue the run from next interval onwards, restart from ROM address 0 or preload from a prescribed interval. This bit gets reset after the completion of selftest run.00 = Continue NSTC run from previous interval01 = Restart NSTC run from ROM address 01X = Start from segment number specified in STC_SEGPLR register

Bit	Field	Type	Reset	Description
31 - 0	TO_PRELOAD	RW	8C3DEFB1 EDB984FE2 AC71C71C7 h	Self test time out preload (RWP - Read, Priviledge Mode Write only)This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run. This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective.This register value (preload count value) gets loaded into the self test timeout down counter whenever a self test run is initiated (ST_ENA is enabled). and gets disabled on completion of a self test run.

Table 4-882. Instance Table

Instance Name	Physical Address
CPSW	5280 0034h

Access Types Legend

Table 4-883. RGMII2_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
3	FULLDUPLEX	RO	0h	Rgmii2 full dulex: 0=Half-duplex, 1=Full-duplex
2 - 1	SPEED	RO	0h	Rgmii2 speed: 00=10Mbps, 01=100Mbps, 10=1000Mbps, 11=reserved
0	LINK	RO	0h	Rgmii2 link indicator: 0=Link is down, 1=Link is up

4.9.10 Access Table

Table 4-884. Access Type Codes

Access Type	Code	Description
RO	RO	Read
RW	RW	Read / Write
WO	WO	Write

4.10 CPSW_SS_SS Registers

Table 4-1391. ALE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE_ALE	R/W	0h	Enable ALE 0 - Drop all packets 1 - Enable ALE packet processing
30	CLEAR_TABLE	R/W	0h	Clear ALE address table - Setting this bit causes the ALE hardware to write all table bit values to zero. Software must perform a clear table operation as part of the ALE setup/configuration process. Setting this bit causes all ALE accesses to be held up for 64 clocks while the clear is performed. Access to all ALE registers will be blocked (wait states) until the 64 clocks have completed. This bit cannot be read as one because the read is blocked until the clear table is completed at which time this bit is cleared to zero.
29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now - Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
	RESERVED	NONE		Reserved
25 - 24	MIRROR_DP	R/W	0h	Mirror Destination Port - This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the ~imirror_top port.

DRAFT ONLY
TI Confidential - NDA Restricted

Table 4-1391. ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23 - 21	UPD_BW_CTRL	R/W	0h	The ~iupd_bw_ctrl field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the ~iupd_bw_ctrl can be programmed more aggressive. If the ~iupd_bw_ctrl is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0 - 350Mhz, 5M 1 - 359Mhz, 11M 2 - 367Mhz, 16M 3 - 375Mhz, 22M 4 - 384Mhz, 28M 5 - 392Mhz, 34M 6 - 400Mhz, 39M 7 - 409Mhz, 45M
	RESERVED	NONE		Reserved
17 - 16	MIRROR_TOP	R/W	0h	Mirror To Port - This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.
15	UPD_STATIC	R/W	0h	Update Static Entries - A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be '0' for most switch configurations.
14	LRN_HOST_DST	R/W	0h	Learn Host Destination - This field is set to only learn unicast packet source addresses that are destined to the host port. This bit is only valid for 3 port switches and allows the ALE table to only contain addresses the host port is concerned about. This bit is affectively disabled when ~ien_host_uni_flood is set since any unknown unicast is also sent to the host port for extended bridging operations.
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn - This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable - This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the ~imirror_midx entry index will have that traffic also sent to the ~imirror_top port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable - This field enables the destination port mirror option. When this bit is set any traffic destined for the ~imirror_dp port will have its transmit traffic also sent to the ~imirror_top port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable - This field enables the source port mirror option. When this bit is set any port with the ~ipX_mirror_sp set in the ALE Port Control registers set will have its received traffic also sent to the ~imirror_top port.
	RESERVED	NONE		Reserved
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host 0 - unknown unicast packets are not sent to the host 1 - unknown unicast packets flood to host port as well as other ports
7	LEARN_NO_VLANID	R/W	0h	Learn No VID - 0 - VID is learned with the source address 1 - VID is not learned with the source address (source address is not tied to VID). Determines the entry type.
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode 0 - Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1 - Process the priority tagged packet with VID = 0.
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode - When set, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry. When cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass - When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0 - no bypass 1 - bypass the ALE

Table 4-1391. ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode 0 - Broadcast and multicast rate limit counters are received port based 1 - Broadcast and multicast rate limit counters are transmit port based
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware - Determines how traffic is forwarded using VLAN rules. 0 - Simple switch rules, packets forwarded to all ports for unknown destinations. 1 - VLAN Aware rules, packets forwarded based on VLAN members
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode - Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0 - The ALE is not in MAC authorization mode 1 - The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0 - Broadcast/Multicast rates not limited 1 - Broadcast/Multicast packet reception limited to the port control register rate limit fields.

Table 4-1393. ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address - This field enables the destination MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address - This field enables the source MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority - This field enables the VLAN Priority bits to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
	RESERVED	NONE		Reserved
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN - This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
	RESERVED	NONE		Reserved
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address - This field enables the source IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address - This field enables the destination IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.

DRAFT ONLY TI confidential - NDA Restrictions

Table 4-1393. ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the ~iALE_NXT_HDR register values.
	RESERVED	NONE		Reserved
18 - 16	TRK_BASE	R/W	0h	Trunk Base - This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the ~itrk_en_dst, ~itrk_en_src, ~itrk_en_pri and ~itrk_en_vlan are '0', this value is used as the distribution index. That is a '0' will select the 1st bit of an 'N' link trunk, a '1' will select the second, etc. Below is the distribution across the trunk links. The first number in the ~iitalic sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0 will go to the base port (0), hash result 1 will go to the highest port of the trunk group (2), hash result 2 will go to the middle port (1), etc. 1 - ~i00000000 2 - ~i01010101 3 - ~i02102102 4 - ~i03210321
	RESERVED	NONE		Reserved
8 - 0	MIRROR_MIDX	R/W	0h	Mirror Index - This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the ~imirror_top port. That is any VLAN, ONU or address with or withou VLAN can be selected for traffic mirroring.

Table 4-1409. I0_ALE_PORTCTL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 24	I0_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23 - 16	I0_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field.The ~imcast_limit is the number of Multicast packets that will be forwaded per ~iale_prescale time.
15	I0_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	I0_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.
13	I0_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with ~imaconly set.

DRAFT ONLY
TI confidential - NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

Table 4-1409. I0_ALE_PORTCTL0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	I0_REG_P0_DIS_PAUTH MOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	I0_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the ~ip0_maconly bit set and the ~ip0_no_learn also set. If ~ip0_maconly bit is set and the ~ip0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	I0_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the ~ip0_trunken its set and having the same ~ip0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.
9 - 8	I0_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the ~ip0_trunken is also set. Ports with the same trunk number that have the ~ip0_trunken also set will have traffic distributed within the trunk based on the result of the hash function descrived above.
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the ~imirror_top port.
	RESERVED	NONE		Reserved
5	I0_REG_P0_NO_SA_UP DATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
3	I0_REG_P0_VID_INGRE SS_CHECK	R/W	0h	VLAN Ingress Check - When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	I0_REG_P0_DROP_UN_ TAGGED	R/W	0h	If Drop Untagged - When set will drop packets without a VLAN tag.
1 - 0	I0_REG_P0_PORTSTATE	R/W	0h	Port State - Defins the current port state used for lookup operations. 0 - Disabled 1 - Blocked 2 - Learning 3 - Forwarding

Table 4-1423. EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0: NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. 0xff: Swap SA and DA of packet, this is intended to allow OAM diagnostics for a link.
23 - 21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements elclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
	RESERVED	NONE		Reserved
2 - 0	DEST_PORTS	R/W	0h	The Destination Ports is a list of the ports the classified packet will be set to. If a destination is a Trunk, all the port bits for that trunck must be set.

Table 4-1441. POLICECONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POLICING_EN	R/W	0h	Policing Enable - Enables the policing to color the packets, this also enables red or yellow drop capabilities.
	RESERVED	NONE		Reserved
29	RED_DROP_EN	R/W	0h	RED Drop Enable - Enables the ALE to drop the red colored packets.
28	YELLOW_DROP_EN	R/W	0h	WELLOW Drop Enable - Enables the ALE to drop yellow packets based on the ~iyellowthresh value. This field would normally not be used as to let the switch drop packets at a buffer threshold instead. In the event that the switch does not enable buffer threshold dropping, YELLOW packets can be dropped based on this feature.
	RESERVED	NONE		Reserved
26 - 24	YELLOWTHRESH	R/W	0h	Yellow Threshold - When set enables a portion of the yellow packets to be dropped based on the ~iyellow_drop_en enable. 0-100% 1=50% 2-33% 3-25% 4=20% 5-17% 6-14% 7-13%
23 - 22	POLMCHMODE	R/W	0h	Policing Match Mode - This field determines what happens to packets that fail to hit any policing/classifier entry. 0 - No Hit packets are marked GREEN 1 - No Hit packets are marked YELLOW 2 - No Hit packets are marked RED 3 - No Hit packets are marked based on policing/classifier entry=0 state.
21	PRIORITY_THREAD_EN	R/W	0h	Priority Thread Enable - This field determines if priority is OR'd to the default thread when no classifiers hit and the default thread is enabled.
20	MAC_ONLY_DEF_DIS	R/W	0h	MAC Only Default Disable - This field when set disables the default thread on MAC Only Ports. That is the default thread will be {port,priority}. If the traffic matches a classifier with a thread mapping, the classifier thread mapping still occurs.
	RESERVED	NONE		Reserved

Access Types Legend

Table 4-1502. DCCGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
15 - 12	DONEENA	R/W	65h	The DONEENA bit enables/disables the done interrupt signal, but has no effect on the done status flag in DCCSTAT register. User, privilege, and debug mode (read): 0101 = the done signal is disabled others = the done signal is enabled Privilege and debug mode (write): 0101 = disable done signal generation others = enable done signal generation
11 - 8	SINGLESHOT	R/W	65h	The SINGLESHOT bit enables/disables repetitive operation of the DCC. User, privilege, and debug mode (read): 1010 = stop counting when counter0 and valid0 both reach zero 1011 = stop counting when counter1 reaches zero others = continuously repeat (until error) Privilege and debug mode (write): 1010 = stop counting when counter0 and valid0 both reach zero 1011 = stop counting when counter1 reaches zero others = continuously repeat (until error)
7 - 4	ERRENA	R/W	65h	The ERRENA bit enables/disables the error signal. User, privilege, and debug mode (read): 0101 = the error signal is disabled others = the error signal is enabled Privilege and debug mode (write): 0101 = disable error signal generation others = enable error signal generation
3 - 0	DCCENA	R/W	65h	The DCCENA bit starts and stops the operation of the dcc. User, privilege, and debug mode (read): 0101 = counters are stopped others = counters are running Privilege and debug mode (write): 0101 = stop counters and error-checking others = load the counters with their seed values and begin counting

Access Types Legend

Table 4-1504. DCCREV Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 30	SCHEME	R	1h	User, privilege, and debug mode (read): Returns 01. Privilege and debug mode (write): Writes have no effect.
	RESERVED	NONE		Reserved
27 - 16	FUNC	R	1h	Reflects software-compatability. If there is no level of software compatability, a unique func number is assigned; for compatible modules, the same number is maintained. User, privilege, and debug mode (read): 0x0 Privilege and debug mode (write): Writes have no effect.
15 - 11	RTL	R	0h	Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented. User, privilege, and debug mode (read): 0x0 Privilege and debug mode (write): Writes have no effect.
10 - 8	MAJOR	R	Bh	Represents major changes to the module (e.g. entirely new features are added/changed). The major revision number for this module. User, privilege, and debug mode (read): 0x2 Privilege and debug mode (write): Writes have no effect.
7 - 6	CUSTOM	R	0h	Indicates a special version of the module. May not be supported by standard software. User, privilege, and debug mode (read): 0x0 Privilege and debug mode (write): Writes have no effect.
5 - 0	MINOR	R	0h	Represents minor changes to the module (e.g. enhancements to existing features). The minor revision number for this module. User, privilege, and debug mode (read): 0x4 Privilege and debug mode (write): Writes have no effect.

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
15 - 12	KEY	R/W	0h	This field enables or disables clock source selection for counter 1. User, privilege, and debug mode (read): Returns the current value of the key. Privilege and debug mode (write): Sets the key value. Key values: 1010: The CLKSRC field selects the clock source for counter 1. others: Clock source selection is disabled. The secondary oscillator (clock source 1) is selected for counter 1.
	RESERVED	NONE		Reserved
4 - 0	CLKSRC1	R/W	0h	This field specifies the clock source for counter 1, when the KEY field enables this feature. User, privilege, and debug mode (read): Returns the current value of CLKSRC. Privilege and debug mode (write): Sets the value of CLKSRC.

Table 4-1524. DCCGCTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
11 - 8	FIFO_NONERR	R/W	65h	Enables/disables FIFO writes without the error event on completion of comparison window. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Source values: 0101: Counter values are captured to non-full FIFO only upon Error event. Others: Write counter values to non-full FIFO upon completion of comparison window regardless of error or not.
7 - 4	FIFO_READ	R/W	65h	Enables the counter read registers reflect FIFO output instead of the live counter value. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Source values: 0101: Counter value is read directly. Others: Counters FIFO output is read.
3 - 0	CONT_ON_ERR	R/W	65h	Continues to next window of comparison despite the error condition. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Enable values: 0101: Comparison and counter reload is stopped from advancing if error is detected. Others: Counters get reloaded with seed and continue counting despite the error condition.

4.16 MSS_GPIO Registers

Note

GPIOn_x is generic name used to describe a GPIO signal, where n represents the specific GPIO module ranging from 0 to 3 and x represents one of the input/output signals associated with the module.

For additional description information on the device GPIO, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

4.17.4 MSS_I2Cn_ICSTR Registers

4.17.4.1 I2Cn_ICSTR Register (Offset = 8h) [reset = h]

Short Description: I2C Interrupt Status register

Long Description:

Return to Summary Table

Table 4-1780. Instance Table

Instance Name	Physical Address
I2C0	5250 0008h
I2C1	5250 1008h
I2C2	5250 2008h
I2C3	5250 3008h

Access Types Legend

Table 4-1781. ICSTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 15	NU2	RW	0h	Reserved
14	SDIR	RW	0h	Slave Direction. This bit is clear to '0' indicating the I2C is a master transmitter/receiver or a slave receiver. This bit is also clear by STOP condition or START condition. It is set to '1' when the I2C slave is a transmitter. In DLB mode (which the configuration should be master-transmitter slave-receiver) this bit is clear to '0'. Writing a"1" to this bit to clear it.
13	NACKSNT	RW	0h	A No Acknowledge is sent due to NACKMOD is set to a"1". NACKSNT =0: A No Acknowledge is not sent. NACKSNT =1: A No Acknowledge is sent. Writing a"1" to this bit to clear it.
12	BB	RW	0h	Bus Busy. This bit indicates the state of the serial bus. BB=0: The bus is free. BB=1: The bus is occupied. On reception of a"start" condition the device sets BB to 1. This bit is also set if the I2C detects SCL low state. BB is clear to 0 after reception of a"stop" condition. BB is kept to"0" regardless SCL state when the I2C is in reset (IRS_=0). If the IRS_ is set to"1" during transaction between other I2C devices the BB bit is set at the first falling edge of SCL or START condition. - (RW)
11	RSFULL	RW	0h	Receive shift full. This bit indicates whether the receiver has experienced overrun. Overrun occurs when the receive shift register (ICRSR) is full and ICDRR has not been read since the ICRSR-to-ICDRR transfer. The FSM is holding for ICDRR read access. RSFULL is clear when reading the ICDRR. RSFULL is set to"1" when the I2C has recognized an overrun. The contents of ICDRR are NOT lost in this case. In repeat mode since double buffer (ICRSR and ICDRR) behaves like a single buffer RSFULL is set to"1" every time the data is received. RSFULL is clear as a result of reading the ICDRR. - (RW)
10	XSMT	RW	0h	Transmit shift empty not. This bit indicates whether the transmitter has experienced underflow. Underflow occurs when the transmit shift register (ICXSR) is empty and ICDXR has not been loaded. The FSM is holding for ICDXR write access. XSMT_ is cleared when underflow has occurred. XSMT_ is set to"1" as a result of writing to ICDXR. In repeat mode if the I2C in master transmitter mode is holding transfer with XSMT_=0 (i.e. waiting for further action) and the STT or STP bit is set XSMT_ is set to"1" by hardware.
9	AAS	RW	0h	Address As Slave. This bit is set to 1 by the device when it has recognized its own slave address or an address of all (8) zeros. The AAS bit is reset by stop condition or detection of any address byte that does not match ICOAR. - (RW)

DRAFT ONLY
TI Confidential – NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

Table 4-1781. ICSTR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	AD0	RW	0h	Address Zero Status: This bit is set to 1 by device if it detects the address of all (8) zeros (i.e. general call). The AD0 bit is reset to 0 (default value) when a"start" or"stop" condition is detected. - (RW)
7 - 6	NU1	RW	0h	Reserved
5	SCD	RW	0h	Stop Condition Detection bit SCD is set when the I2C sends or receives STOP condition. This bit is cleared by reading ICIVR (as 110) or writing '1' to itself.
4	ICXRDY	RW	0h	Transmit Data Ready interrupt flag bit. ICXRDY is set to"1" is generated when the transmitted data has been copied from ICDXR to the transmit-shift register (ICXSR). ICRXDY is clear to"0" when the ICDXR is written. This bit can also be polled by the CPU to write a new transmitted data into the ICDXR. Write '1' to this bit will set it and DXR Write will clear it.
3	ICRRDY	RW	0h	Receive Data Ready interrupt flag bit. ICRRDY is set to"1" when the received data has been copied from ICRSR into the ICDRR. ICRRDY is cleared to"0" when the ICDRR is read. This bit can also be polled by the CPU to read the received data in the ICDRR. Write '1' or DRR Read will clear it.
2	ARDY	RW	0h	Register-access-ready interrupt flag bit. ARDY is generated by the hardware if the I2C is in the master mode when the previously programmed data and command has been performed and status bit has been updated. This flag is used by the CPU to let it knows that the I2C registers are ready to be accessed again. When RM=0 ARDY is set when the internal data count is passed 0 if STP register bit has not been set. When RM=1 ARDY is set at each byte end. If the I2C is in FDF mode(FDF=1) ARDY is set just after Start condition. This bit is automatically cleared by hardware when writing data to ICDXR in transmit mode reading data from ICDRR in receive mode or setting STT or STP bit. Write '1' will clear it.
1	NACK	RW	0h	No-Acknowledgement interrupt flag bit. The No Acknowledge flag bit is set when the hardware in "master" mode detects no acknowledge has been received. This bit is NOT set by no-acknowledgement after Start byte Write '1' or Read the ICIVR (as 010) will clear it.
0	AL	RW	0h	Arbitration-Lost interrupt flag bit. The Arbitration Lost flag bit is set to 1 when the device in the "master" mode senses it has lost an arbitration when two or more transmitters start a transmission almost simultaneously or when the I2C attempts to start a transfer while BB (bus busy) is 1. When this is set to 1 due to arbitration lost the MST/STT/STP bits are clear the I2C becomes a slave. Write '1' or Read the ICIVR (as 001) will clear it.

4.17.11 MSS_I2Cn_ICMDR Registers

4.17.11.1 I2Cn_ICMDR Register (Offset = 24h) [reset = h]

Short Description: I2C Mode register

Long Description:

Return to Summary Table

Table 4-1794. Instance Table

Instance Name	Physical Address
I2C0	5250 0024h
I2C1	5250 1024h
I2C2	5250 2024h
I2C3	5250 3024h

Access Types Legend

Table 4-1795. ICMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	NU2	RW	0h	Reserved
15	NACKMOD	RW	0h	No Acknowledge (NACK) mode. This bit is used to send an Acknowledge (ACK) or a No Acknowledge (NACK) to the transmitter. This bit is only applicable when the I2C is in receiver mode. In master receiver mode when the internal data count counter decrements to zero the I2C sends a NACK. The master receiver I2C finishes a transfer when it sends a NACK. The I2C ignores ICCNT when NACKMOD is '1'. The NACKMOD bit should be set before the rising edge of the last data bit (bit 8) if a NACK must be sent and this bit is cleared once a NACK has been sent. NACKMOD=0 the I2C sends an ACK to the transmitter during the acknowledge cycle. NACKMOD=1 the I2C sends a NACK to the transmitter during the acknowledge cycle.
14	FREE	RW	0h	Free Running. This bit is used to determine the state of the I2C when a breakpoint is encountered in the HLL debugger. FREE=0: (default) Stops immediately if SCL is low and keep driving SCL low whether I2C is master transmitter/receiver. If SCL is high I2C waits until SCL becomes low and then stops. If the I2C is a slave it will stop when the transmission/receiving completes. FREE=1: The I2C runs free.
13	STT	RW	0h	Start Condition (Master only mode). This bit can be set to a"1" by the CPU to generate a Start condition. In master mode when setting Start to"1" generates a Start condition. It is reset to "0" by the hardware after the Start condition has been generated. The Start/ Stop bits can be configured to generate different transfer formats. Note that the STT and STP can be used to terminate the repeat mode. ST T___STP____Conditions_____Bus Activities _1_____0_____Start_____S-A-D _0_____1_____Stop_____P _1_____1_____Start-Stop (ICCNT= n)_____S-A-D..(n)..D-P _1_____0_____Start (ICCNT= n)_____S-A-D..(n)..D
12	NU1	RW	0h	Reserved for IDLEEN (IDLE Enable on 5509). - (RW)
11	STP	RW	0h	Stop Condition (Master mode only). This bit can be set to a"1" by the CPU to generate a Stop condition. It is reset to "0" by the hardware after the Stop condition has been generated. The Stop condition is generated when ICCNT passes 0 when the I2C is in non-repeat mode(RM=0).

DRAFT ONLY
TI Confidential - Restrictions

Copyright © 2024 Texas Instruments Incorporated

Table 4-1795. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	MST	RW	0h	Master. MST=0: The I 2 C peripheral is in the"slave" mode and clock is received from the"master" device. MST=1: The I 2 C peripheral is in the"master" mode and it generates the clock. This bit is clear when the transfer completed.
9	TRX	RW	0h	Transmitter. TRX=0: The I 2 C is in the"receiver" mode and data on data line SDA is shifted into the data register ICDRR. TRX=1: The I 2 C is in the"transmitter" mode and the data in ICDXR is shifted out on data line SDA. The operating modes (not in FDF mode) are defined as follows. In FDF mode TRX must be configured even if the I2C is in slave mode because there is no address/direction byte in FDF mode. _____MST___TRX___Operating Modes _0_____x_____"slave receiver" _0_____x_____"slave transmitter" _1_____0_____"master receiver" _1_____1_____"master transmitter" _____
8	XA	RW	0h	Expanded Address. XA=0: (default) 7-bit address mode (normal address mode). XA=1: 10-bit address mode (expanded address mode) Please note that XA needs to be configured even if the I2C is in slave mode.
7	RM	RW	0h	Repeat Mode. This bit is set to a"1" by the CPU to put the I2C in the repeat mode. In this mode data is continuously transmitted out of the ICDXR until the STP bit is set to"1" regardless of ICCNT value. This bit is don"t care if the I2C is configured in slave mode. _____ __RM___STT___STP___Conditions_____Bus Activities_____Mode _0_____0_____0_____Idle_____None_____NA _0_____0_____1_____Stop_____P_____NA _0_____1_____0_____(Re)Start_____S-A-D..(n)..D____Repeat n _0_____1_____1_____(Re)Start-Stop___S-A-D..(n)..D-P__Repeat n _1_____0_____0_____Idle_____none_____NA _1_____0_____1_____Stop_____P _____NA _1_____1_____0_____(Re)Start_____S-A-D-D-D..____Continuous _1_____1_____1_____Reserved_____None_____NA _____ __
6	DLB	RW	0h	Digital Loop Back (in master transmit mode only). This bit is set to a"1" by the CPU to put the I2C in the loop back mode. In this mode data transmitted out of the ICDXR will be received in the ICDRR after ((CPU freq/I2C freq)8) CPU cycles via an internal path. The address of the ICOAR is output on SDA.
5	IRS	RW	0h	I2C Reset Not. This can be set to a"0" by the CPU to put the I2C in reset or to a"1" to take the I2C out of reset. When this bit is reset to 0 all status bits in ICSTR and ICIVR are set to default values. Note that if this bit is reset during a transfer it can cause the I2C bus hang (SDA and SCL are tri-stated).
4	STB	RW	0h	Start Byte (Master only mode). The Start Byte mode bit is set to 1 by the CPU to configure the I2C in Start byte mode the I2C sends "00000001"? regardless ICSAR value. Refer to the Philip I2C spec for more details.
3	FDF	RW	0h	Free Data Format. This bit can be set to"1" by the CPU to configure the I2C in Free Data Format mode. _____FDF___MST___TRX_____Operating mode _0_____0_____ x____Slave in non FDF mode _0_____1_____0____Master receive in non FDF mode _0_____1_____1____Master transmit in non FDF mode _1_____0_____0____Slave receiver in FDF mode _1_____0_____1____Slave transmitter in FDF mode _1_____1_____0____Master receiver in FDF mode _1_____1_____1____Master transmitter in FDF mode _____

Table 4-1797. ICIVR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 12	NU2	RW	0h	Reserved.
11 - 8	TESTMD	RW	0h	Reserved for internal testing.
7 - 3	NU1	RW	0h	Reserved.
2 - 0	INTCODE	RW	0h	Interrupt code. The binary-coded-interrupt vector indicates which interrupt has occurred. Reading the ICIVR clears the interrupt code except ARDY(011) RRDY(100) and XRDY(101). Interrupt code for ARDY RRDY and XRDY is cleared when ARDY ICRRDY and ICXRDY bits in the ICSTR is cleared to default value respectively. If other interrupts are pending a new interrupt is generated. If there are more than one interrupt flag reading the ICIVR clears the highest priority interrupt code. Reading the ICIVR also clears corresponding status bit in the ICSTR except ARDY ICRRDY ICXRDY and AAS. Note that users must read (clear) the ICIVR before doing another start otherwise the ICIVR could contain incorrect (old interrupt flags) value. Interrupt Code Interrupt Occurred 000 (default) None 001 (highest priority) Arbitration Lost interrupt 010 No Acknowledgement interrupt 011 Register Access Ready interrupt 100 Receive Data Ready interrupt 101 Transmit Data Ready interrupt 110 Stop Condition Detection 111 (lowest priority) Address As Slave - (RW)

Access Types Legend

Table 4-1807. ICDMAC Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	NU	RW	0h	Reserved. - (RW)
1	TXDMAEN	RW	0h	Transmit DMA enable. This bit controls the receive DMA event pin to the system. When this bit is 1 the DMA event is enabled and ICTEVT_POR pin is asserted when the DMA transfer is required. When this bit is 0 the ICTEVT_POR pin is never asserted. RXDMAEN=0: DMA transmit event is disabled. RXDMAEN=1: DMA transmit event is enabled. (Default)
0	RXDMAEN	RW	0h	Receive DMA enable. This bit controls the receive DMA event pin to the system. When this bit is 1 the DMA event is enabled and ICREVT_POR pin is asserted when the DMA transfer is required. When this bit is 0 the ICREVT_POR pin is never asserted. RXDMAEN=0: DMA receive event is disabled. RXDMAEN=1: DMA receive event is enabled. (Default)

Access Types Legend

Table 4-1813. ICPFUNC Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 1	NU	RW	0h	Reserved.
0	PFUNC0	RW	0h	Controls the function of the I2C SCL and SDA pins. 0 = Pins function as SCL and SDA 1 = Pins functions as GPIO Note: No hardware protection is required to disable I2C function when the PFUNC[0] and IRS_ bits are both set to one. When PFUNC[0] is"1" (GPIO mode) the sub-module which controls the I2C function receives the value"1" for SCL and SDA. IRS_ can be set to"1" regardless of PFUNC[0] and the I2C function works whenever the IRS_ bit is"1". The user is expected to hold I2C in reset via IRS_ bit when changing to/from GPIO mode via the PFUNC[0] bit.

Table 4-1838. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	RXENA	RW	0h	Receive enable.[[br]]This bit is effective in LIN or SCI-compatible mode. RXENA allows or prevents the transfer of data from SCIRXSHF to SCIRD or the receive multibuffers.[[br]] [[br]]Note: Clearing RXENA stops received characters from being transferred into the receive buffer or multi-buffers, prevents the RX status flags (see Table 7) from being updated by receive data, and inhibits both receive and error interrupts. However, the shift register continues to assemble data regardless of the state of RXENA.[[br]] [[br]]Note: If RXENA is cleared before the time the reception of a frame is complete, the data from the frame is not transferred into the receive buffer.[[br]] [[br]]Note: If RXENA is set before the time the reception of a frame is complete, the data from the frame is transferred into the receive buffer. If RXENA is set while SCIRXSHF is in the process of assembling a frame, the status flags are not guaranteed to be accurate for that frame. To ensure that the status flagscorrectly reflect what was detected on the bus during a particular frame, RXENA should be set before the detection of that frame 0 | RXENA_SUSPENDPrevents the receiver from transferring data from the shift buffer to the receive buffer or multi-buffers 1 | RXENA_RUNAllows the receiver to transfer data from the shift buffer to the receive buffer or multi-buffers
23 - 18	RESERVED_2	RO	0h	Reserved
17	CONT	RW	0h	Continue on suspend.[[br]]This bit has an effect only when a program is being debugged with an emulator, and it determines how the SCI/LIN operates when the program is suspended. This bit affects the LIN counters. When this bit is set, the counters are not stopped during debug. When this bit is cleared, the counters are stopped during debug. 0 | CONT_SUSPENDWhen debug mode is entered, the SCI/LIN state machine is frozen. Transmissions and LIN counters are halted and resume when debug mode is exited. 1 | CONT_RUNWhen debug mode is entered, the SCI/LIN continues to operate until the current transmit and receive functions are complete.
16	LOOPBACK	RW	0h	Loopback bit.[[br]]This bit is effective in LIN or SCI-compatible mode. The self-checking option for the SCI/LIN can be selected with this bit. If the LINTX and LINRX pins are configured with SCI/LIN functionality, then the LINTX pin is internally connected to the LINRX pin. Externally, during loop back operation, the LINTX pin outputs a high value and the LINRX pin is in a high-impedance state. If this bit value is changed while the SCI/LIN is transmitting or receiving data, errors may result. 0 | LOOPBACK_DISABLELoopback mode is disabled. 1 | LOOPBACK_ENABLELoopback mode is enabled.
15 - 14	RESERVED_1	RO	0h	Reserved
13	STOPEXTFRAME	RW	0h	Stop extended frame communication.[[br]]This bit is effective in LIN mode only. This bit can be written only during extended frame communication. When the extended frame communication is stopped, this bit is cleared automatically. 0 | STOPEXTFRAME_NO_EFFECTNo effect 1 | STOPEXTFRAME_EFFECTExtended frame communication will be stopped, once current frame transmission/reception is completed.
12	HGENCTRL	RW	0h	HGEN control bit.[[br]]This bit is effective in LIN mode only. This bit controls the type of mask filtering comparison. 0 | HGENCTRL_IDBYTEID filtering using ID-Byte. [[br]]RECEIVEDID and IDBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in NO match. 1 | HGENCTRL_IDSLAVEID filtering using ID-SlaveTask byte (Recommended). [[br]]RECEIVEDID and IDSLAVETASKBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in ALWAYS match

Table 4-1838. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	CTYPE	RW	0h	Checksum type.[[br]]This bit is effective in LIN mode only. This bit controls the type of checksum to be used: classic or enhanced. 0 | CTYPE_CLASSICClassic checksum is used. [[br]]This checksum is compatible with LIN 1.3 slave nodes. The classic checksum contains the modulo-256 sum with carry over all data bytes. Frames sent with Identifier 60 (0x3C) to 63 (0x3F) must allways use the classic checksum. 1 | CTYPE_ENHANCEDEnhanced checksum is used. [[br]]The enhanced checksum is compatible with LIN 2.0 and newer slave nodes. The enhanced checksum contains the modulo-256 sum with carry over all data bytes AND the protected Identifier.
10	MBUFMODE	RW	0h	Multibuffer mode.[[br]]This bit is effective in LIN or SCI-compatible mode. This bit controls receive/transmit buffer usage, that is, whether the RX/TX multibuffers are used or a single register, RD0/TD0, is used. 0 | MBUFMODE_DISABLEDThe multi-buffer mode is disabled. 1 | MBUFMODE_ENABLEDThe multi-buffer mode is enabled.
9	ADAPT	RW	0h	Adapt mode enable.[[br]]This mode is effective in LIN mode only. This bit has an effect during the detection of the Sync Field. There are two LIN protocol bit rate modes that could be enabled with this bit according to the Node capability file definition: automatic or select. Software and network configuration will decide which of the previous two modes. When this bit is cleared, the LIN 2.0 protocol fixed bit rate should be used. If the ADAPT bit is set, a LIN slave node detecting the baudrate will compare it to the prescalers in BRSR register and update it if they are different. The BRSR register will be updated with the new value. If this bit is not set there will be no adjustment to the BRSR register.[[br]] [[br]]This field is writable in LIN mode only. 0 | ADAPT_DISABLEAutomatic baudrate adjustment is disabled. 1 | ADAPT_ENABLEAutomatic baudrate adjustment is enabled.
8	SLEEP	RW	0h	SCI sleep.[[br]]SCI compatibility mode only. In a multiprocessor configuration, this bit controls the receive sleep function. Clearing this bit brings the SCI out of sleep mode.[[br]] [[br]]The receiver still operates when the SLEEP bit is set; however, RXRDY is updated and SCIRD is loaded with new data only when an address frame is detected. The remaining receiver status flags are updated and an error interrupt is requested if the corresponding interrupt enable bit is set, regardless of the value of the SLEEP bit. In this way, if an error is detected on the receive data line while the SCI is asleep, software can promptly deal with the error condition. The SLEEP bit is not automatically cleared when an address byte is detected.[[br]] [[br]]This field is writable in SCI mode only. 0 | SLEEP_DISABLESleep mode is disabled. 1 | SLEEP_ENABLESleep mode is enabled.
7	SWNRST	RW	0h	Software reset (active low).[[br]]This bit is effective in LIN or SCI-compatible mode. The SCI/LIN should only be configured while SWnRST = 0.[[br]] [[br]]Only the following configuration bits can be changed in runtime (i.e.,[[br]]while SWnRESET = 1):[[br]]- STOP EXT Frame (SCIGCR1[13])[[br]]- CC bit (SCIGCR2[17])[[br]]- SC bit (SCIGCR2[16]) 0 | SWNRST_RESETThe SCI/LIN is in its reset state; no data will be transmitted or received. Writing a 0 to this bit intializes the SCI/LIN state machines and operating flags. All affected logic is held in the reset state until a 1 is written to this bit. 1 | SWNRST_READYThe SCI/LIN is in its ready state; transmission and reception can occur. After this bit is set to 1, the configuration of the module should not change.
6	LINMODE	RW/P	0h	LIN mode[[br]]This bit controls the mode of operation of the module. 0 | LINMODE_DISABLELIN mode is disabled; SCI compatibility mode is enabled. 1 | LINMODE_ENABLELIN mode is enabled; SCI compatibility mode is disabled.

Table 4-1838. SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	CLK_MASTER	RW	0h	SCI internal clock enable or LIN Master/Slave configuration.[[br]]In the SCI mode, this bit enables the clock to the SCI module. In LIN mode, this bit determines whether a LIN node is a slave or master. 0 | CLK_MASTER_OFFSCI-compatible mode: Reserved.[[br]]LIN mode: The module is in slave mode. 1 | CLK_MASTER_ONSCI-compatible mode: Enable clock to the SCI module.[[br]]LIN mode: The node is in master mode.
4	STOP	RW	0h	SCI number of stop bits.[[br]]This bit is effective in SCI-compatible mode only.[[br]] [[br]]Note: The receiver checks for only one stop bit. However in idle-line mode, the receiver waits until the end of the second stop bit (if STOP = 1) to begin checking for an idle period. [[br]] [[br]]This field is writable in SCI mode only. 0 | STOP_ONEOne stop bit is used. 1 | STOP_TWOTwo stop bits are used.
3	PARITY	RW	0h	SCI parity odd/even selection.[[br]]This bit is effective in SCI-compatible mode only. If the PARITY ENA bit (SCIGCR1.2) is set, PARITY designates odd or even parity. The parity bit is calculated based on the data bits in each frame and the address bit (in address-bit mode). The start and stop fields in the frame are not included in the parity calculation.[[br]] [[br]]This field is writable in SCI mode only. 0 | PARITY_ODDOdd parity is used. The SCI transmits and expects to receive a value in the parity bit that makes odd the total number of bits in the frame with the value of 1. 1 | PARITY_EVENEven parity is used. The SCI transmits and expects to receive a value in the parity bit that makes even the total number of bits in the frame with the value of 1.
2	PARITYENA	RW	0h	Parity enable.[[br]]Enables or disables the parity function. 0 | PARITYENA_DISABLESCI-compatible mode: Parity disabled; no parity bit is generated during transmission or is expected during reception.[[br]]LIN mode: ID-parity verification is disabled. 1 | PARITYENA_ENABLESCI compatible mode: Parity enabled. A parity bit is generated during transmission and is expected during reception.[[br]]LIN mode: ID-parity verification is enabled.
1	TIMINGMODE	RW	0h	SCI timing mode bit.[[br]]This bit is effective in SCI-compatible mode only. It must be set to 1 when the SCI mode is used. This bit configures the SCI for asynchronous operation. 0 | TIMINGMODE_RSVDReserved. 1 | TIMINGMODE_SETMust be set to 1 when module is configured for SCI operation
0	COMMMODE	RW	0h	SCI/LIN communication mode bit.[[br]]In compatibility mode, it selects the SCI communication mode. In LIN mode it selects length control option for ID-field bits ID4 and ID5. 0 | COMMMODE_UNUSESCI-compatible mode: Idle-line mode is used. [[br]]LIN mode: ID4 and ID5 are not used for length control. 1 | COMMMODE_USESCI-compatible mode: Address-bit mode is used. [[br]]LIN mode: ID4 and ID5 are used for length control.

Table 4-1840. SCIGCR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 18	RESERVED_3	RO	0h	Reserved
17	CC	RW	0h	Compare Checksum.[[br]]This mode is effective in LIN mode only. This bit is used by the receiver for extended frames to trigger a checksum compare. The user will initiate this transaction by writing a one to this bit.[[br]]In non multibuffer mode, once the CC bit is set, the checksum will be compared on the byte that is currently being received, expected to be the checkbyte.[[br]]During Multi-buffer mode, following are the scenarios associated with the CC bit :[[br]]- If CC bit is set during the reception of the data, then the byte that is received after the reception of the programmed no. of data bytes indicated by SCIFORMAT[18:16], is treated as a checksum byte.[[br]]- If CC bit is set during the IDLE period (i.e. during inter-frame space), then the next immediate byte will be treated as a checksum byte.[[br]] [[br]]A CE will immediatly be flagged if there is a checksum error. This bit is automatically cleared once the checksum is successfully compared. 0 | CC_NO_EFFECTNo effect 1 | CC_EFFECTCompare checksum on expected checkbyte

Copyright © 2024 Texas Instruments Incorporated

Table 4-1840. SCIGCR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	SC	RW	0h	Send Checksum[[br]]This mode is effective in LIN mode only. This bit is used by the transmitter with extended frames to send a checkbyte. In non multibuffer mode the checkbyte will be sent after the current byte transmission. In multibuffer mode the checkbyte will be sent after the last byte count, indicated by the SCIFORMAT[18:16]). [[br]] [[br]]This field is writable in LIN mode only. 0 | SC_NO_CHECKNo checkbyte will be sent. 1 | SC_CHECKA checkbyte will be sent. This bit will automatically get cleared after the checkbyte is transmitted. The checksum will not be sent if this bit is set before transmitting the very first byte, that is, during interframe space.
15 - 9	RESERVED_2	RO	0h	Reserved
8	GENWU	RW	0h	Generate wakeup signal.[[br]]This bit controls the generation of a wakeup signal, by transmitting the TDO buffer value. This bit is cleared on reception of a valid sync break. 0 | GENWU_NO_EFFECTNo effect 1 | GENWU_EFFECTTransmit TDO for wakeup. This bit will be cleared on a SWnRST (SCIGCR1.7)
7 - 1	RESERVED_1	RO	0h	Reserved
0	POWERDOWN	RW	0h	Power down.[[br]]This bit is effective in LIN or SCI-compatible mode. When the powerdown bit is set, the SCI/LIN module attempts to enter local low-power mode. If the POWERDOWN bit is set while the receiver is actively receiving data and the wakeup interrupt is disabled, then the SCI/LIN will delay low-power mode from being entered until completion of reception. In LIN mode the user may set the POWERDOWN bit on Sleep Command reception or on idle bus detection (more than 4 seconds, i.e. 80,000 cycles at 20kHz) 0 | POWERDOWN_RUNNormal operation 1 | POWERDOWN_LOWRequest local low-power mode

Table 4-1842. SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	SETNREINT	RW	0h	Set no-response-error interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when a no-response error occurs.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETNREINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETNREINT_ENABLEInterrupt is enabled.
26	SETFEINT	RW	0h	Set framing-error interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a framing error occurs. 0 | SETFEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETFEINT_ENABLEInterrupt is enabled.
25	SETOEINT	RW	0h	Set overrun-error interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when an overrun error occurs. 0 | SETOEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETOEINT_ENABLEInterrupt is enabled.
24	SETPEINT	RW	0h	Set parity interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a parity error occurs. 0 | SETPEINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETPEINT_ENABLEInterrupt is enabled.
23 - 19	RESERVED_5	RO	0h	Reserved
18	SET_RX_DMA_ALL	RW	0h	Set receiver DMA for Address & Data frames.[[br]]This bit is effective in LIN or SCI-compatible mode. To enable RX DMA request for address and data frames this bit must be set. If it is cleared, RX interrupt request is generated for address frames and DMA requests are generated for data frames. 0 | SERXDMAALL_DISABLEReceiver DMA request is disabled for address frames (RX interrupt request is enabled for address frames). Writing a 0 to this bit has no effect. 1 | SERXDMAALL_ENABLEReceiver DMA request is enabled for address and data frames
17	SET_RX_DMA	RW	0h	Set receiver DMA.[[br]]This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the receiver this bit must be set. If it is cleared, interrupt requests are generated depending on SETRXINT. 0 | SERXDMA_DISABLEReceiver DMA request is disabled. Writing a 0 to this bit has no effect. 1 | SERXDMA_ENABLEReceiver DMA request is enabled.
16	SET_TX_DMA	RW	0h	Set transmit DMA.[[br]]This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the transmitter, this bit must be set. If it is cleared, interrupt requests are generated depending on SETTXINT. 0 | SETXDMA_DISABLETransmit DMA request is disabled. Writing a 0 to this bit has no effect. 1 | SETXDMA_ENABLETransmit DMA request is enabled
15 - 14	RESERVED_4	RO	0h	Reserved
13	SETIDINT	RW	0h	Set Identification interrupt.[[br]]This bit is effective in LIN mode only. This bit is set to enable interrupt once a valid matching identifier is received. 0 | SETIDINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETIDINT_ENABLEInterrupt is enabled.
12 - 10	RESERVED_3	RO	0h	Reserved
9	SETRXINT	RW	0h	Set Receiver interrupt.[[br]]Setting this bit enables the SCI/LIN to generate a receive interrupt after a frame has been completely received and the data is being transferred from SCIRXSHF to SCIRD. 0 | SETRXINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETRXINT_ENABLEInterrupt is enabled.
8	SETTXINT	RW	0h	Set Transmitter interrupt.[[br]]Setting this bit enables the SCI/LIN to generate a transmit interrupt as data is being transferred from SCITD to SCITXSHF and the TXRDY bit is being set. 0 | SETTXINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETTXINT_ENABLEInterrupt is enabled.

Table 4-1842. SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	SETTOA3WUSINT	RW	0h	Set Timeout After 3 Wakeup Signals interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after 3 wakeup signals have been sent.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETTOA3WUSINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETTOA3WUSINT_ENABLEInterrupt is enabled.
6	SETTOAWUSINT	RW	0h	Set Timeout After Wakeup Signal interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after one wakeup signal has been sent.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETTOAWUSINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETTOAWUSINT_ENABLEInterrupt is enabled.
5	RESERVED_2	RO	0h	Reserved
4	SETTIMEOUTINT	RW	0h	Set timeout interrupt.[[br]]This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when no LIN bus activity (bus idle) occurs for at least 4 seconds.[[br]] [[br]]This field is writable in LIN mode only. 0 | SETTIMEOUTINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETTIMEOUTINT_ENABLEInterrupt is enabled.
3 - 2	RESERVED_1	RO	0h	Reserved
1	SETWAKEUPINT	RW	0h	Set wake-up interrupt.[[br]]This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN to generate a wake-up interrupt and thereby exit low-power mode. The wake-up interrupt is asserted on falling edge of the wake-up pulse. If enabled, the wake-up interrupt is asserted when local low-power mode is requested while the receiver is busy or if a low level is detected on the SCIRX pin during low-power mode. Wake-up interrupt is not asserted upon a wakeup pulse if the module is not in power down mode. 0 | SETWAKEUPINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETWAKEUPINT_ENABLEInterrupt is enabled.
0	SETBRKDTINT	RW	0h	Set break-detect interrupt.[[br]]This bit is effective in SCI-compatible mode only. Setting this bit enables the SCI/LIN to generate an interrupt if a break condition is detected on the LINRX pin.[[br]] [[br]]This field is writable in SCI mode only. 0 | SETBRKDTINT_DISABLEInterrupt is disabled. Writing a 0 to this bit has no effect. 1 | SETBRKDTINT_ENABLEInterrupt is enabled.

Table 4-1850. SCIFLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BE	RW	0h	Bit Error Flag.[[br]]This bit is effective in LIN mode only. This bit is set when there has been a bit error. This is detected by the bit monitor in the internal bit monitor. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]This field is writable in LIN mode only. 0 | BE_NO_EFFECTNo bit error detected. 1 | BE_EFFECTBit error detected.
30	PBE	RW	0h	Physical Bus Error Flag.[[br]]This bit is effective in LIN mode only. This bit is set when there has been a physical bus error. This is detected by the bit monitor in TED. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]Note: thie PBE will ony be flagged if no sync break can be generated. (because of a bus shortage to VBAT) or if no sync break delimeter can be generated (because of a bus shortage to GND).[[br]] [[br]]This field is writable in LIN mode only. 0 | PBE_NO_EFFECTNo physiscal bus error detected. 1 | PBE_EFFECTPhysical bus error detected.

Table 4-1850. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	CE	RW	0h	Checksum Error Flag. [[br]]This bit is effective in LIN mode only. This bit is set when there is checksum error detected by a receiving node. The type of checksum to be used depends on the SCIGCR1.CTYPE bit. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]This field is writable in LIN mode only. 0 | CE_NO_EFFECTNo Checksum error detected. 1 | CE_EFFECTChecksum error detected.
28	ISFE	RW	0h	Inconsistent Sync Field Error Flag.[[br]]This bit is effective in LIN mode only. This bit is set when there has been an inconsistent Sync Field error detected by the synchronizer during header reception. See the "Header Reception and Adaptive Baudrate" section for more information. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]This field is writable in LIN mode only. 0 | ISFE_NO_EFFECTNo Inconsistent Sync Field error detected. 1 | ISFE_EFFECTInconsistent Sync Field error detected.
27	NRE	RW	0h	No-Response Error Flag.[[br]]This bit is effective in LIN mode only. This bit is set when there is no response to a master's header completed within TFRAME_MAX. This timeout period is applied for message frames of unknown length (identifiers 0 to 61). This error is detected by the synchronizer of the module. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new sync break[[br]] [[br]]This field is writable in LIN mode only. 0 | NRE_NO_EFFECTNo No-Response error detected. 1 | NRE_EFFECTNo-Response error detected.
26	FE	RW	0h	Framing error flag.[[br]]This bit is effective in LIN or SCI-compatible mode. This bit is set when an expected stop bit is not found. In SCI compatible mode, only the first stop bit is checked. The missing stop bit indicates that synchronization with the start bit has been lost and that the character is incorrectly framed. Detection of a framing error causes the SCI to generate an error interrupt if the RXERR INT ENA bit is set. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reception of a new character (SCI-compatible mode), or frame (LIN mode)[[br]]In multibuffer mode the frame is defined in the SCIFORMAT register. 0 | FE_NO_EFFECTNo framing error detected. 1 | FE_EFFECTFraming error detected.
25	OE	RW	0h	Overrun error flag.[[br]]This bit is effective in LIN or SCI-compatible mode. This bit is set when the transfer of data from SCIRXSHF to SCIRD overwrites unread data already in SCIRD or the RDy buffers. Detection of an overrun error causes the LIN to generate an error interrupt if the SET OE INT bit is one. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit 0 | OE_NO_EFFECTNo overrun error detected. 1 | OE_EFFECTOverrun error detected.

Table 4-1850. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	PE	RW	0h	Parity error flag.[[br]]This bit is effective in LIN or SCI-compatible mode. This bit is set when a parity error is detected in the received data. In SCI address-bit mode, the parity is calculated on the data and address bit fields of the received frame. In idle-line mode, only the data is used to calculate parity. An error is generated when a character is received with a mismatch between the number of 1s and its parity bit. For more information on parity checking, see the "SCI Global Control Register (SCIGCR1)" description. If the parity function is disabled (that is, SCIGCR1.2 = 0), the PE flag is disabled and read as 0. Detection of a parity error causes the LIN to generate an error interrupt if the SET PE INT bit = 1. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Reception of a new charcter (SCI-compatible mode) orframe (LIN mode)[[br]]- Writing a 1 to this bit 0 | PE_NO_EFFECTNo parity error or parity disabled. 1 | PE_EFFECTParity error detected.
23 - 16	RESERVED_3	RO	0h	Reserved
15	RESERVED_2	RO	0h	Reserved
14	IDRXFLAG	RW	0h	Identifier On Receive Flag.[[br]]This bit is effective in LIN mode only. This flag is set once an identifier is received with an RX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on an RX match. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Reading the LINID register[[br]]- Writing a 1 to this bit[[br]] [[br]]This field is writable in LIN mode only. 0 | IDRXFLAG_NO_EFFECTNo valid ID received. 1 | IDRXFLAG_EFFECTValid ID RX received in LINID[23:16] on RX match.
13	IDTXFLAG	RW	0h	Identifier On Transmit Flag.[[br]]This bit is effective in LIN mode only. This flag is set once an identifier is received with a TX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on a TX match. This bit is cleared by: [[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- RESET bit (SCIGCR0.0)[[br]]- Setting SWnRESET[[br]]- System reset[[br]]- Reading the LINID register[[br]]- Writing a 1 to this bit [[br]] [[br]]This field is writable in LIN mode only. 0 | IDTXFLAG_NO_EFFECTNo valid ID received. 1 | IDTXFLAG_EFFECTValid ID received in LINID[23:16] on TX match.
12	RXWAKE	RO	0h	Receiver wakeup detect flag.[[br]]This bit is effective in SCI-compatible mode only. The SCI sets this bit to indicate that the data currently in SCIRD is an address. This bit is cleared by: [[br]]- RESET bit[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- System reset[[br]]- Receipt of a data frame[[br]] [[br]]This bit is writable in SCI mode only. Read0 | RXWAKE_NO_EFFECTThe data in SCIRD is not an address. Read1 | RXWAKE_EFFECTThe data in SCIRD is an address.[[br]]See [1] Section 3.4.4, Sleep Mode for Multiprocessor Communication, on page 16 for more information on using the RXWAKE bit with sleep mode.

Table 4-1850. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	TXEMPTY	RO	1h	Transmitter Empty flag.[[br]]The value of this flag indicates the contents of the transmitter's buffer register(s) (SCITD/TDy) and shift register (SCITXSHF). In multibuffer mode, this flag indicates the value of the TDx registers and shift register (SCITXSHF). In non multibuffer mode, this flag indicates the value of LINTD0 (byte) and shift register (SCITXSHF). This bit is set by: [[br]]- RESET bit (SCIGCR0.0)[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- System reset. [[br]] [[br]]Note: This bit does not cause an interrupt request. Read0 | TXEMPTY_NO_EFFECTCompatible mode or LIN with no multibuffer:[[br]]Transmitter buffer or shift register (or both) are loaded with data.[[br]]In LIN mode using multibuffer mode: [[br]]Multibuffer or shift register (or all) are loaded with data. Read1 | TXEMPTY_EFFECTCompatible mode or LIN with no multibuffer: [[br]]Transmitter buffer and shift registers are both empty.[[br]]In LIN mode using multibuffer mode:[[br]]Multibuffer and shift registers are all empty.
10	TXWAKE	RW	0h	SCI transmitter wakeup method select.[[br]]This bit is effective in SCI-compatible mode only. The TXWAKE bit controls whether the data in SCITD should be sent as an address or data frame using multiprocessor communication format. This bit is set to 1 or 0 by software before a byte is written to SCITD and is cleared by the SCI when data is transferred from SCITD to SCITXSHF or by a system reset. TXWAKE is not cleared by the SWnRESET bit (SCIGCR1.7). 0 | TXWAKE_ADDR0Address-bit mode: Frame to be transmitted will be data (address bit = 0).[[br]]Idle-line mode: Frame to be transmitted will be data. 1 | TXWAKE_ADDR1Address-bit mode:[[br]]Frame to be transmitted will be an address (address bit=1).[[br]]Idle-line mode: [[br]]Following frame to be transmitted will be an address (writing a 1 to this bit followed by writing dummy data to the SCITD will result in a idle period of 11 bit periods before the next frame is transmitted).
9	RXRDY	RW	0h	Receiver ready flag. [[br]]In SCI compatibility mode, the receiver sets this bit to indicate that the SCIRD contains new data and is ready to be read by the CPU. In LIN mode, RXRDY is set once a valid frame is received in multibuffer mode, a valid frame being a message frame received with no errors. In non multibuffer mode RXRDY is set for each received byte and will be set for the last byte of the frame if there are no errors. The SCI/LIN generates a receive interrupt when RXRDY flag bit is set[[br]]if the interrupt-enable bit is set (SCISETINT.9). RXRDY is cleared by:[[br]]- RESET bit (SCIGCR0.0)[[br]]- Setting the SWnRESET[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]]- Reading SCIRD in while in SCI compatibility mode[[br]]- Reading last data byte RDy of the response in LIN mode [[br]] [[br]]Note: The RXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0/1 register. 0 | RXRDY_NO_EFFECTNo new data in SCIRD/RDy. 1 | RXRDY_EFFECTNew data ready to be read from SCIRD.
8	TXRDY	RO	1h	Transmitter buffer register ready flag.[[br]]When set, this bit indicates that the transmit buffer(s) register (SCITD in compatibility mode and LINTD0, LINTD1 in MBUF mode) is/are ready to get another character from a CPU write. [[br]]In SCI compatibility mode, writing data to SCITD automatically clears this bit. In LIN mode, this bit is cleared once byte 0 (TD0) is written to LINTD0. This bit is set after the data of the TX buffer are shifted into the SCITXSHF register. This event can trigger a transmit DMA event if the DMA enable bit is set. This bit is set to 1 by:[[br]]- RESET bit (SCIGCR0.0)[[br]]- Setting the SWnRESET (SCIGCR1.7)[[br]]- System reset[[br]] [[br]]Note: The TXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0/1 register.[[br]] [[br]]Note: The transmit interrupt request can be eliminated until the next series of data is written into the transmit buffers LINTD0 and LINTD1, by disaLINg the corresponding interrupt via theSCICLEARINT register or by disaLINg the transmitter via the TXENA bit (SCIGCR1.25=0). Read0 | TXRDY_FULLCompatible mode: SCITD is full.[[br]]LIN mode: The multibuffers are full. Read1 | TXRDY_EMPTYCompatible mode: SCITD is ready to receive the next character.[[br]]LIN mode: The multibuffers are ready to receive the next character(s).

Table 4-1850. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	TOA3WUS	RW	0h	Timeout After 3 Wakeup Signals flag.[[br]]This bit is effective in LIN mode only. This flag is set if there is no Sync Break received after 3 wakeup signals and a period of 1.5 seconds have passed. Such expiration time is used before issuing another round of wakeup signals. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]] [[br]]This field is writable in LIN mode only. 0 | TOA3WUS_NO_EFFECTNo timeout after 3 wakeup signals. 1 | TOA3WUS_EFFECTTimeout after 3 wakeup signals and 1.5s time.
6	TOAWUS	RW	0h	Timeout After Wakeup Signal flag.[[br]]This bit is effective in LIN mode only. This bit is set if there is no Sync Break received after a wakeup signal has been sent. A minimum of 150 ms expiration time is used before issuing another wakeup signal. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]] [[br]]This field is writable in LIN mode only. 0 | TOAWUS_NO_EFFECTNo timeout after one wakeup signal (150 ms). 1 | TOAWUS_EFFECTTimeout after one wakeup signal.
5	RESERVED_1	RO	0h	Reserved
4	TIMEOUT	RW	0h	LIN Bus IDLE timeout flag.[[br]]This bit is effective in LIN mode only. This bit is set if there is no LIN bus activity for at least 4 seconds. LIN bus activity being a transition from recessive to dominant. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit[[br]] [[br]]This field is writable in LIN mode only. 0 | TIMEOUT_NO_EFFECTNo bus idle detected. 1 | TIMEOUT_EFFECTLIN bus idle detected.
3	BUSY	RO	0h	Bus BUSY flag.[[br]]This bit is effective in LIN mode and SCI-compatible mode. This bit indicates whether the receiver is in the process of receiving a frame. As soon as the receiver detects the beginning of a start bit, the BUSY bit is set to 1. When the reception of a frame is complete, the BUSY bit is cleared. If SET WAKEUP INT is set and power down is requested while this bit is set, the SCI/LIN automatically prevents low-power mode from being entered and generates wakeup interrupt. The BUSY bit is controlled directly by the SCI receiver but can be cleared by:[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset. Read0 | BUSY_NO_EFFECTReceiver is not currently receiving a frame. Read1 | BUSY_EFFECTReceiver is currently receiving a frame.
2	IDLE	RO	1h	SCI receiver in idle state.[[br]]This bit is effective in SCI-compatible mode only. While this bit is set, the SCI looks for an idle period to resynchronize itself with the bit stream. The receiver does not receive any data while the bit is set. The bus must be idle for 11 bit periods to clear this bit. The SCI enters this state:[[br]]- After a system reset[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- After coming out of power down[[br]] [[br]]This bit is writable in SCI mode only. Read0 | IDLE_NO_EFFECTIdle period detected, the SCI is ready to receive. Read1 | IDLE_EFFECTIdle period not detected, the SCI will not receive any data.
1	WAKEUP	RW	0h	Wake-up flag.[[br]]This bit is effective in LIN mode only. This bit is set by the SCI/LIN when receiver or transmitter activity has taken the module out of power-down mode. An interrupt is generated if the SET WAKEUP INT bit (SCISETINT.1) is set. This bit is cleared by:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register.[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- Writing a 1 to this bit.[[br]] [[br]]This field is writable in LIN mode only. 0 | WAKEUP_NO_EFFECTDo not wake up from power-down mode. 1 | WAKEUP_EFFECTWake up from power-down mode.

Table 4-1850. SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	BRKDT	RW	0h	SCI break-detect flag.[[br]]This bit is effective in SCI-compatible mode only. This bit is set when the SCI detects a break condition on the LINRX pin. A break condition occurs when the LINRX pin remains continuously low for at least 10 bits after a missing first stop bit, that is, after a framing error. Detection of a break condition causes the SCI to generate an error interrupt if the BRKDT INT ENA bit is set. The BRKDT bit is cleared by the following:[[br]]- Reading the corresponding interrupt offset in the SCIINTVECT0/1 register.[[br]]- Setting the SWnRESET bit (SCIGCR1.7)[[br]]- RESET bit (SCIGCR0.0)[[br]]- System reset[[br]]- By writing a 1 to this bit.[[br]] [[br]]This bit is writable in SCI mode only. 0 | BRKDT_NO_EFFECTNo break condition detected. 1 | BRKDT_EFFECTBreak condition detected.

Table 4-1856. SCIFORMAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 19	RESERVED_2	RO	0h	Reserved
18 - 16	LENGTH	RW	0h	Frame length control bits.[[br]]In LIN mode, these bits indicate the number of bytes in the response field from 1 to 8 bytes. In buffered SCI mode, these bits indicate the number of characters. When these bits are used to indicate LIN response length (SCIGCR1[0] = 1), then when there is an ID RX match, this value should be updated with the expected length of the response. In buffered SCI mode, these bits indicate the number of characters with SCIFORMAT[2:0] bits per character. i.e. these bits indicate the transmitter/receiver format for the number of characters: 1 to 8. There can be up to eight characters with eight bits each. 0x0 | FIELD_1The response field has 1 bytes/characters. 0x1 | FIELD_2The response field has 2 bytes/characters. 0x2 | FIELD_3The response field has 3 bytes/characters. 0x3 | FIELD_4The response field has 4 bytes/characters. 0x4 | FIELD_5The response field has 5 bytes/characters. 0x5 | FIELD_6The response field has 6 bytes/characters. 0x6 | FIELD_7The response field has 7 bytes/characters. 0x7 | FIELD_8The response field has 8 bytes/characters.

Bit	Field	Type	Reset	Description
31	RESERVED_1	RO	0h	Reserved
30 - 28	U	RW	0h	Superfractional Divider Selection. (U)[[br]]These bits are an additional fractional part for the baudrate specification. These bits allow a super fine tuning of the fractional baudrate with 7 more intermediate values for each of the M fractional divider values. See the Superfractional Divider section for more details.
27 - 24	M	RW	0h	SCI/LIN 4-bit Fractional Divider Selection. (M)[[br]]These bits are effective in LIN or SCI asynchronous mode. These bits are used to select a baud rate for the SCI/LIN module, and they are a fractional part for the baud rate specification. The M divider allows fine-tuning of the baud rate over the P prescaler with 15 additional intermediate values for each of the P integer values.
23 - 16	SCI_LIN_PSH	RW	0h	PRESCALER P (High Bits).[[br]]SCI/LIN 24-bit Integer Prescaler Selection.[[br]]These bits are used to select a baudrate for the SCI/LIN module. These bits are effective in LIN mode and SCI compatible mode. The SCI/LIN has an internally generated serial clock determined by the LIN module input clock and the prescalers P and M in this register. The SCI/LIN uses the 24-bit integer prescaler P value to select 1 of over 16,700,000 available baud rates. The additional 4-bit fractional prescaler M refines the baudate selection.

Table 4-1862. SCIRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 8	RESERVED_1	RO	0h	Reserved
7 - 0	RD	RO	0h	Received Data.[[br]]This bit is effective in SCI-compatible mode only. When a frame has been completely received, the data in the frame is transferred from the receiver shift register SCIRXSHF to this register. As this transfer occurs, the RXRDY flag is set and a receive interrupt is generated if RX INT ENA (SCISETINT0.9) is set. When the data is read from SCIRD, the RXRDY flag is automatically cleared.[[br]] [[br]]When the SCI receives data that is fewer than eight bits in length, it loads the data into this register in a left justified format padded with trailing zeros. Therefore, your software should perform a logical shift on the data by the correct number of positions to make it right justified.

Table 4-1898. MBRSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 13	RESERVED_1	RO	0h	Reserved
12 - 0	MBR	RW	19A312CE6Ch	Maximum Baud Rate Prescaler.[[br]]This field is effective in LIN mode only. This 13-bit prescaler is used during the synchronization phase (see the "Header Reception and Adaptive Baudrate" section) of a slave module if the ADAPT bit is set. In this way, a SCI/LIN slave using an automatic or select bit rate modes detects any LIN bus legal rate automatically.[[br]] [[br]]The MBR value should be programmed to allow a maximum baud rate that is not more than 10% above the expected operating baud rate in the LIN network. Otherwise a s 0x00 data byte could mistakenly be detected as sync break. [[br]]The default value is for a 70MHz LINCLK (0xDAC).[[br]]This MBR prescaler is used by the wake-up and idle time counters for a constant expiration time relative to a 20kHz rate.

Table 4-1904. LIN_GLB_INT_FLG Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	RESERVED_1	RO	0h	Reserved
1	INT1_FLG	RO	0h	Global Interrupt Flag for LIN INT1.[[br]]This bit indicates if an interrupt was generated to the PIE due to an enabled interrupt on the INT1 interrupt line. Refer to the LIN Interrupt Status Register for the condition that generated the interrupt.[[br]]This bit can be cleared by writing a 1 to the corresponding bit in the LIN_GLB_INT_CLR register. Read0 | INT1_FLG_NOT_GENERATEDNo interrupt is active on the INT1 line. Read1 | INT1_FLG_GENERATEDAn interrupt was generated due to an enabled interrupt on the INT1 interrupt line.
0	INT0_FLG	RO	0h	Global Interrupt Flag for LIN INT0.[[br]]This bit indicates if an interrupt was generated to the PIE due to an enabled interrupt on the INT0 interrupt line. Refer to the LIN Interrupt Status Register for the condition that generated the interrupt.[[br]]This bit can be cleared by writing a 1 to the corresponding bit in the LIN_GLB_INT_CLR register. Read0 | INT0_FLG_NOT_GENERATEDNo interrupt is active on the INT0 line. Read1 | INT0_FLG_GENERATEDAn interrupt was generated due to an enabled interrupt on the INT0 interrupt line.

4.24.8 MSS_MCRC0_CRC_BUSY Registers

4.24.8.1 MCRC0_CRC_BUSY Register (Offset = 38h) [reset = h]

Short Description: Contains the busy flag for each channel

Long Description:

Return to Summary Table

Table 4-2132. Instance Table

Instance Name	Physical Address
MCRC0	3500 0038h

Access Types Legend

Table 4-2133. CRC_BUSY Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 25	RESERVED4	RO	0h	Not Defined
24	NU40	RO	0h	Reserved
23 - 17	RESERVED3	RO	0h	Not Defined
16	NU39	RO	0h	Reserved
15 - 9	RESERVED2	RO	0h	Not Defined
8	CH2_BUSY	RO	0h	Ch2_BUSY. During AUTO mode, the busy flag is set when thefirst data pattern of the block is compressed and remains set untilthe the last data pattern of the block is compressed. The flag iscleared when the last data pattern of the block is compressed.
7 - 1	RESERVED1	RO	0h	Not Defined
0	CH1_BUSY	RO	0h	CH1_BUSY. During AUTO mode, the busy flag is set when thefirst data pattern of the block is compressed and remains set untilthe the last data pattern of the block is compressed. The flag iscleared when the last data pattern of the block is compressed.

4.24.11 MSS_MCRC0_CRC_CURSEC_REG1 Registers

4.24.11.1 MCRC0_CRC_CURSEC_REG1 Register (Offset = 48h) [reset = h]

Short Description: Channel 1 current sector register contains the sector number which causes CRC failure

Long Description:

Return to Summary Table

Table 4-2138. Instance Table

Instance Name	Physical Address
MCRC0	3500 0048h

Access Types Legend

Table 4-2139. CRC_CURSEC_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	RESERVED1	RO	0h	Not Defined
15 - 0	CRC_CURSEC1	RW	0h	Channel 1 Current Sector ID Register. In AUTO mode, thisregister contains the current sector number of which the signatureverification fails. The sector counter is a free running up counter.When a sector fails, the erroneous sector number is logged intocurrent sector ID register and the CRC fail interrupt is generatedThe sector ID register is frozen until it is read and the CRC failstatus bit is cleared by CPU. While it is frozen, it does not captureanother erroneous sector number. When this condition happens,an overrun interrupt is generated instead. Once the register is readand the CRC fail interrupt flag is cleared it can capture new erro-neous sector number.

4.26.2 MSS_RTIn_RTIGCTRL Registers

4.26.2.1 RTIn_RTIGCTRL Register (Offset = 0h) [reset = h]

Short Description: Global Control Register starts / stops the counters

Long Description:

Return to Summary Table

Table 4-2305. Instance Table

Instance Name	Physical Address
RTI0	5218 0000h
RTI1	5218 1000h
RTI2	5218 2000h
RTI3	5218 3000h

Access Types Legend

Table 4-2306. RTIGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 20	RESERVED2	RW	0h	Reserved.Reads return 0 and writes have no effect
19 - 16	NTUSEL	RW	0h	NTUSEL: Select NTU signal.These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL.User and privilege mode (read):0000 = NTU00101 = NTU11010 = NTU21111 = NTU3other = tied to ?0? Privilege mode (write):0000 = NTU00101 = NTU11010 = NTU21111 = NTU3other = tied to ?0?
15	COS	RW	0h	COS: Continue On Suspend.This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting.User and privilege mode (read):0 = counters are stopped while in debug mode1 = counters are running while in debug modePrivilege mode (write):0 = stop counters in debug mode1 = continue counting in debug mode
14 - 2	RESERVED1	RW	0h	Reserved.Reads return 0 and writes have no effect
1	CNT1EN	RW	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 (UC1 and FRC1).User and privilege mode (read):0 = counters are stopped1 = counters are runningPrivilege mode (write):0 = stop counters1 = start countersGives the absolute 32 bit destination address (physical).
0	CNT0EN	RW	0h	CNT0EN: Counter 0 Enable.The CNT0EN bit starts and stops the operation of counter block 0 (UC0 and FRC0).User and privilege mode (read):0 = counters are stopped1 = counters are runningPrivilege mode (write):0 = stop counters1 = start countersGives the absolute 32 bits source address (physical).

Short Description: Timebase Control selection which source triggers free running counter 0

Long Description:

Return to Summary Table

Table 4-2307. Instance Table

Instance Name	Physical Address
RTI0	5218 0004h
RTI1	5218 1004h
RTI2	5218 2004h
RTI3	5218 3004h

Access Types Legend

Table 4-2308. RTITBCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	RESERVED3	RW	0h	Reserved
1	INC	RW	0h	INC: Increment Free Running Counter 0.This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected.User and privilege mode (read):0 = FRC0 will not be incremented1 = FRC0 will be incrementedPrivilege mode (write):0 = Do not increment FRC0 on failing external clock1 = Increment FRC0 on failing external clock
0	TBEXT	RW	0h	TBEXT: Timebase External.The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx.When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset.The selection if the external signal should be used, can only be done by software.User and privilege mode (read):0 = UC0 clocks FRC01 = NTUx clocks FRC0Privilege mode (write):0 = MUX is switched to internal UC0 clocking scheme1 = MUX is switched to external NTUx clocking scheme

4.26.15 MSS_RTIn_RTICAUC1 Registers

4.26.15.1 RTIn_RTICAUC1 Register (Offset = 44h) [reset = h]

Short Description: Capture Up Counter 1 current value of prescale counter 1 on external event

Long Description:

Return to Summary Table

Table 4-2331. Instance Table

Instance Name	Physical Address
RTI0	5218 0044h
RTI1	5218 1044h
RTI2	5218 2044h
RTI3	5218 3044h

Access Types Legend

Table 4-2332. RTICAUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	CAUC1	RW	0h	CAUC1: Capture Up Counter 1.This registers captures the current value of the Up Counter 1 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 1 and Free Running Counter 1. So the RTICAFRC1 register has to be read first, before the RTICAUC1 register is read. This sequence ensures that the value of the RTICAUC1 register is the corresponding value to the RTICAFRC1 register, even if another capture event happens in between the two reads.User and privilege mode (read):value of Up Counter 1 on a capture event

4.26.16 MSS_RTIn_RTICOMP0 Registers

4.26.16.1 RTIn_RTICOMP0 Register (Offset = 50h) [reset = h]

Short Description: Compare 0 compare value to be compared with the counters

Long Description:

Return to Summary Table

Table 4-2333. Instance Table

Instance Name	Physical Address
RTI0	5218 0050h
RTI1	5218 1050h
RTI2	5218 2050h
RTI3	5218 3050h

Access Types Legend

Table 4-2334. RTICOMP0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 0	COMP0	RW	0h	COMP0: Compare 0.This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request.User and privilege mode (read):current compare valuePrivilege mode (write):update of the compare register with a new compare valueNote: Reset behaviorA reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

Bit	Field	Type	Reset	Description
31 - 12	RESERVED17	RW	0h	Reserved.Reads return 0 and writes have no effect
11 - 0	DWDPRLD	RW	0h	DWDPRLD: Digital Watchdog Preload Value.User and priviledge mode (read):A read from this register in any CPU mode returns the current preload value.Priviledge mode (write):If the DWD is always enabled after reset is released:The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires.When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value.If the DWD is implemented such that the down counter is enabled by software:The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter.The expiration time of the DWD Down Counter can be determined with following equation:texp = (RTIDWDPRLD+1) x 2 ^ 13 / RTICLK1where: RTIDWDPRLD = 0...4095

4.26.31 MSS_RTIn_RTIWDSTATUS Registers

4.26.31.1 RTIn_RTIWDSTATUS Register (Offset = 98h) [reset = h]

Short Description: Watchdog Status reflects the status of Analog and Digital Watchdog

Long Description:

Return to Summary Table

Table 4-2363. Instance Table

Instance Name	Physical Address
RTI0	5218 0098h
RTI1	5218 1098h
RTI2	5218 2098h
RTI3	5218 3098h

Access Types Legend

Table 4-2364. RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 6	RESERVED18	RW	0h	Reserved.Reads return 0 and writes have no effect
5	DWWD_ST	RW	0h	DWWD ST: Windowed Watchdog Status.This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog.User and priviledge mode (read):0 = no time-window violation has occurred.1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.
4	ENDTIMEVIOL	RW	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status.This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag.User and priviledge mode (read):0 = no end-time window violation has occurred.1 = the end-time defined by the windowed watchdog configuration has been violated.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0.
3	STARTTIMEVIOL	RW	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened.User and priviledge mode (read):0 = no start-time window violation has occurred.1 = the start-time defined by the windowed watchdog configuration has been violated.Priviledge mode (write):0 = leaves the current value unchanged.1 = clears the bit to 0.
2	KEYST	RW	0h	KEYST: Watchdog KeyStatus.This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register.User and priviledge mode (read):0 = no wrong key or key-sequence written1 = wrong key or key-sequence written to RTIWDKEY registerPriviledge mode (write):0 = leaves the current value unchanged1 = clears the bit to 0
1	DWDST	RW	0h	DWDST: Digital Watchdog Status.This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons.User and priviledge mode (read):0 = DWD timeout period not expired1 = DWD timeout period has expiredPriviledge mode (write):0 = leaves the current value unchanged1 = clears the bit to 0

4.26.32 MSS_RTIn_RTIWDKEY Registers

4.26.32.1 RTIn_RTIWDKEY Register (Offset = 9Ch) [reset = h]

Short Description: Watchdog Key correct written key values discharge the external capacitor

Long Description:

Return to Summary Table

Table 4-2365. Instance Table

Instance Name	Physical Address
RTI0	5218 009Ch
RTI1	5218 109Ch
RTI2	5218 209Ch
RTI3	5218 309Ch

Access Types Legend

Table 4-2366. RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	RESERVED19	RW	0h	Reserved.Reads return 0 and writes have no effect
15 - 0	WDKEY	RW	0h	WDKEY: Watchdog Key.User and privilege mode reads are indeterminate.Privilege mode (write):A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1?s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3.Note: Register write access time precautionThe user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

Table 4-2387. HL_REV Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 30	SCHEME	R	1h	Used to distinguish between old scheme and current
29 - 28	RSVD	R	0h	Reserved These bits are initialized to zero, and writes to them are ignored
27 - 16	FUNC	R	1ADB0h	Function indicates a software compatible module family If there is no level of software compatibility a new Func number [and hence REVISION] should be assigned
15 - 11	R_RTL	R	Bh	RTL Version [R], maintained by IP design owner RTL follows a numbering such as XYRZ which are explained in this table R changes ONLY when: [1] PDS uploads occur which may have been due to spec changes [2] Bug fixes occur [3] Resets to '0' when X or Y changes Design team has an internal 'Z' [customer invisible] number which increments on every drop that happens due to DV and RTL updates Z resets to 0 when R increments
10 - 8	X_MAJOR	R	Ah	Major Revision [X], maintained by IP specification owner X changes ONLY when: [1] There is a major feature addition An example would be adding Master Mode to Utopia Level2 The Func field [or Class/ Type in old PID format] will remain the same X does NOT change due to: [1] Bug fixes [2] Change in feature parameters
7 - 6	CUSTOM	R	0h	Indicates a special version for a particular device Consequence of use may avoid use of standard Chip Support Library [CSL] / Drivers

Table 4-2387. HL_REV Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5 - 0	Y_MINOR	R	3F3h	Minor Revision [Y], maintained by IP specification owner Y changes ONLY when: [1] Features are scaled [up or down] Flexibility exists in that this feature scalability may either be represented in the Y change or a specific register in the IP that indicates which features are exactly available [2] When feature creeps from Is-Not list to Is list But this may not be the case once it sees silicon; in which case X will change Y does NOT change due to: [1] Bug fixes [2] Typos or clarifications [3] major functional/feature change/addition/ deletion Instead these changes may be reflected via R, S, X as applicable Spec owner maintains a customer-invisible number 'S' which changes due to: [1] Typos/clarifications [2] Bug documentation Note that this bug is not due to a spec change but due to implementation Nevertheless, the spec tracks the IP bugs An RTL release [say for silicon PG11] that occurs due to bug fix should document the corresponding spec number [XYS] in its release notes

4.27.3 MSS_MCSPIn_HL_HWINFO Registers

4.27.3.1 MCSPIn_HWINFO Register (Offset = 4h) [reset = 9h]

Short Description: MCSPI hardware configuration register

Long Description: Information about the IP module's hardware configuration, that is, typically the module's HDL generics (if any). Actual field format and encoding is up to the module's designer to decide.

Note

Some of the MCSPI features described in this section may not be supported on this family of devices. For more information, see MCSPI Not Supported Features.

Table 4-2407. MODULCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 9	RESERVED	N/A		Reads returns 0
8	FDAA	R/W	0h	FIFO DMA Address 256-bit aligned This register is used when a FIFO is managed by the module and DMA connected to the controller provides only 256 bit aligned address If this bit is set the enabled channel which uses the FIFO has its datas managed through MCSPI_DAFTX and MCSPI_DAFRX registers instead of MCSPI_TX[i] and MCSPI_RX[i] registers
7	MOA	R/W	0h	Multiple word ocp access: This register can only be used when a channel is enabled using a FIFO It allows the system to perform multiple SPI word access for a single 32-bit OCP word access This is possible for WL < 16
6 - 4	INITDLY	R/W	0h	Initial spi delay for first transfer: This register is an option only available in SINGLE master mode, The controller waits for a delay to transmit the first spi word after channel enabled and corresponding TX register filled This Delay is based on SPI output frequency clock, No clock output provided to the boundary and chip select is not active in 4 pin mode within this period
3	SYSTEM_TEST	R/W	0h	Enables the system test mode
2	MS	R/W	1h	Master/ Slave
1	PIN34	R/W	0h	Pin mode selection: This register is used to configure the SPI pin mode, in master or slave mode If asserted the controller only use SIMO,SOMI and SPICLK clock pin for spi transfers
0	SINGLE	R/W	0h	Single channel / Multi Channel [master mode only]

Table 4-2429. CH2CONF Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	DMAR	R/W	0h	DMA Read request The DMA Read request line is asserted when the channel is enabled and a new data is available in the receive register of the channel The DMA Read request line is deasserted on read completion of the receive register of the channel
14	DMAW	R/W	0h	DMA Write request The DMA Write request line is asserted when The channel is enabled and the transmitter register of the channel is empty The DMA Write request line is deasserted on load completion of the transmitter register of the channel
13 - 12	TRM	R/W	0h	Transmit/Receive modes
11 - 7	WL	R/W	0h	SPI word length
6	EPOL	R/W	0h	SPIEN polarity
5 - 2	CLKD	R/W	0h	Frequency divider for SPICLK [only when the module is a Master SPI device] A programmable clock divider divides the SPI reference clock [CLKSPIREF] with a 4-bit value, and results in a new clock SPICLK available to shift-in and shift-out data By default the clock divider ratio has a power of two granularity when MCSPI_CHCONF[CLKG] is cleared, Otherwise this register is the 4 LSB bit of a 12-bit register concatenated with clock divider extension MCSPI_CHCTRL[EXTCLK] registerThe value description below defines the clock ratio when MCSPI_CHCONF[CLKG] is set to 0
1	POL	R/W	0h	SPICLK polarity
0	PHA	R/W	0h	SPICLK phase

4.34.2 MSS_UARTn_DLL Registers

4.34.2.1 UARTn_DLL Register (Offset = 0h) [reset = 0h]

Short Description: Baud clock divisor LSB value register

Long Description: This register, with UART_DLH, stores the 14-bit divisor for generation of the baud clock in the baud rate generator. UART_DLH stores the most-significant part of the divisor. UART_DLL stores the least-significant part of the divisor.

Return to Summary Table

4.34.3 MSS_UARTn_RHR Registers

4.34.3.1 UARTn_RHR Register (Offset = 0h) [reset = 0h]

Short Description: Receiver holding register

Long Description: The receiver section consists of the receiver holding register (UART_RHR) and the receiver shift register. The UART_RHR is a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the UART_RHR. If the FIFO is disabled, location 0 of the FIFO stores the single data character. Note: If an overflow occurs, the data in the UART_RHR is not overwritten.

4.34.4 MSS_UARTn_THR Registers

4.34.4.1 UARTn_THR Register (Offset = 0h) [reset = 0h]

Short Description: Transmit holding register

Long Description: The transmitter section consists of the transmit holding register (UART_THR) and the transmit shift register. The UART_THR is a 64-byte FIFO. The local host (LH) writes data to the UART_THR. The data is placed in the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled, location 0 of the FIFO stores the data.

4.34.5 MSS_UARTn_DLH Registers

4.34.5.1 UARTn_DLH Register (Offset = 4h) [reset = 0h]

Short Description: Baud clock divisor MSB value register

Long Description: This register, with UART_DLL, stores the 14-bit divisor for generating the baud clock in the baud rate generator. DLH stores the most-significant part of the divisor. DLL stores the least-significant part of the divisor

4.34.6 MSS_UARTn_IER_CIR Registers

4.34.6.1 UARTn_IER_CIR Register (Offset = 4h) [reset = 0h]

Short Description: CIR mode interrupt enable register

Long Description: There are 6 types of interrupt in these modes, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/disabled individually. Notes: The RX_STOP_IT interrupt is generated based on the value set in the BOF Length register (UART_EBLR). In IR-CIR mode, contrary to the IR-IRDA mode, the TX_STATUS_IT has only one meaning corresponding to the case UART_MDR2[0] = 0.

4.34.7 MSS_UARTn_IER_IRDA Registers

4.34.7.1 UARTn_IER_RDA Register (Offset = 4h) [reset = 0h]

Short Description: IrDA mode interrupt enable register

Long Description: There are 8 types of interrupt in these modes, received EOF, LSR interrupt, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/ disabled individually. Note: The TX_STATUS_IT interrupt reflects two possible conditions. The UART_MDR2[0] should be read to determine the status in the event of this interrupt.

4.34.8 MSS_UARTn_IER_UART Registers

4.34.8.1 UARTn_IER_UART Register (Offset = 4h) [reset = 0h]

Short Description: UART mode Interrupt Enable Register

Long Description: The interrupt enable register (UART_IER_UART) can be programmed to enable/disable any interrupt. There are seven types of interrupt in this mode: receiver error, UART_RHR interrupt, UART_THR interrupt, XOFF received and CTS*/RTS* change of state from low to high. Each interrupt can be enabled/ disabled individually. There is also a sleep mode enable bit.

4.34.9 MSS_UARTn_EFR Registers

4.34.9.1 UARTn_EFR Register (Offset = 8h) [reset = 0h]

Short Description: Enhanced Feature Register

Long Description: This register enables or disables enhanced features. Most of the enhanced functions apply only to UART modes, but UART_EFR[4] enables write accesses to UART_FCR[5:4], the TX trigger level, which is also used in IrDA modes.

Return to Summary Table

Table 4-2516. Instance Table

Instance Name	Physical Address
UART0	5230 0008h
UART1	5230 1008h
UART2	5230 2008h
UART3	5230 3008h
UART4	5230 4008h

Table 4-2517. EFR Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
7	AUTO_CTS_EN	R/W	0h	Auto-CTS enable bit. 0: Normal operation. 1: Auto-CTS flow control is enabled i.e. transmission is halted when the CTS* pin is high (inactive).
6	AUTO_RTS_EN	R/W	0h	Auto-RTS enable bit. 0: Normal operation. 1: Auto- RTS flow control is enabled i.e. RTS* pin goes high (inactive) when the receiver FIFO HALT trigger level, TCR[3:0], is reached, and goes low (active) when the receiver FIFO RESTORE transmission trigger level is reached.
5	SPECIAL_CHAR_DETECT	R/W	0h	0: Normal operation. 1: Special character detect enable. Received data is compared with XOFF2 data. If a match occurs the received data is transferred to RX FIFO and IIR bit 4 is set to 1 to indicate a special character has been detected.
4	ENHANCED_EN	R/W	0h	Enhanced functions write enable bit. 0: Disables writing to IER bits 4-7, FCR bits 4-5, and MCR bits 5-7. 1: Enables writing to IER bits 4-7, FCR bits 4-5, and MCR bits 5-7.
3 - 0	SW_FLOW_CONTROL	R/W	0h	Combinations of Software flow control can be selected by programming bit 3 - bit 0. See Software Flow Control Options

4.34.22 MSS_UARTn_TCR Registers

4.34.22.1 UARTn_TCR Register (Offset = 18h) [reset = fh]

Short Description: Transmission control register

Long Description: This register stores the RX FIFO threshold levels to start/stop transmission during hardware/software flow control. Notes: Trigger levels from 0 to 60 bytes are available with a granularity of 4. (Trigger level = 4 x [4-bit register value]) The programmer must ensure that UART_TCR[3:0] > UART_TCR[7:4] when auto-RTS or software flow control is enabled to avoid a mis-operation of the device. In FIFO interrupt mode with flow control, the programmer must ensure that the trigger level to halt transmission is greater than or equal to the RX FIFO trigger level (UART_TLR[7:4] or UART_FCR[7:6]); otherwise, FIFO operation stalls. In FIFO DMA mode with flow control, this concept does not exist because a DMA request is sent each time a byte is received.

4.34.27 MSS_UARTn_MDR1 Registers

4.34.27.1 UARTn_MDR1 Register (Offset = 20h) [reset = 7h]

Short Description: Mode definition register 1

Long Description: The mode of operation can be programmed by writing to MDR1[2:0] and therefore the UART_MDR1 must be programmed on startup after configuration of the configuration registers (UART_DLL, UART_DLH, and UART_LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to 111, interrupt requests can still be generated unless disabled through the interrupt enable register (UART_IER). In this case, UART mode interrupts are visible. Reading the interrupt identification register (UART_IIR) shows UART mode interrupt flags.

Return to Summary Table

4.34.28 MSS_UARTn_MDR2 Registers

4.34.28.1 UARTn_MDR2 Register (Offset = 24h) [reset = 0h]

Short Description: Mode definition register 2

Long Description: IR-IrDA and IR-CIR modes only. UART_MDR2[0] describes the status of the interrupt in UART_IIR[5]. The IRTX_UNDERRUN bit should be read after an UART_IIR[5] TX_STATUS_IT interrupt. The bits [2:1] of this register set the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in UART_MDR1[2:0].

Note

The UART_MDR2[6] gives the flexibility to invert the RX pin in the UART to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most transceivers invert the IR receive pin.

4.34.29 MSS_UARTn_SFLSR Registers

4.34.29.1 UARTn_SFLSR Register (Offset = 28h) [reset = 0h]

Short Description: Status FIFO line status register

Long Description: IrDA modes only. Reading this register effectively reads frame status information from the status FIFO (this register does not physically exist). Reading this register increments the status FIFO read pointer (UART_SFREGL and UART_SFREGH must be read first).

Return to Summary Table

4.34.30 MSS_UARTn_TXFLL Registers

4.34.30.1 UARTn_TXFLL Register (Offset = 28h) [reset = 0h]

Short Description: Transmit frame length register low

Long Description: IrDA modes only. The UART_TXFLL and UART_TXFLH registers hold the 13-bit transmit frame length (expressed in bytes). UART_TXFLL holds the LSBs and UART_TXFLH holds the MSBs. The frame length value is used if the frame length method of frame closing is used.

4.34.31 MSS_UARTn_RESUME Registers

4.34.31.1 UARTn_RESUME Register (Offset = 2Ch) [reset = 0h]

Short Description: Resume halted operation register

Long Description: IR-IrDA and IR-CIR modes only. This register is used to clear internal flags, which halt transmission/reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.

4.34.34 MSS_UARTn_SFREGL Registers

4.34.34.1 UARTn_SFREGL Register (Offset = 30h) [reset = 0h]

Short Description: Status FIFO register high

Long Description: IrDA modes only. The frame lengths of received frames are written into the status FIFO. This information can be read by reading the UART_SFREGL and UART_SFREGH registers (these registers do not physically exist). The LSBs are read from UART_SFREGL and the MSBs are read from UART_SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the UART_SFLSR register.

4.34.37 MSS_UARTn_BLR Registers

4.34.37.1 UARTn_BLR Register (Offset = 38h) [reset = 40h]

Short Description: BOF control register

Long Description: IrDA modes only. The UART_BLR[6] bit selects whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR mode. If only one start flag is required, this is always 0xC0. If n start flags are required, (-1) 0xC0 or (-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).

Return to Summary Table

4.34.38 MSS_UARTn_UASR Registers

4.34.38.1 UARTn_UASR Register (Offset = 38h) [reset = 0h]

Short Description: UART autobauding status register

Long Description: UART autobauding mode only. This status register returns the speed, the number of bits by characters, and the type of the parity in UART autobauding mode. In autobauding mode, the input frequency of the UART modem must be fixed to 48 MHz. Any other module clock frequency results in incorrect baud rate recognition. Note: When the UART is in autobauding mode, this register, instead of the UART_LCR, UART_DLL, and UART_DLH registers, is used to set up transmission according to the characteristics of the previous reception. To reset the autobauding hardware (to start a new AT detection), set UART_MDR1[2:0] to 111 (reset value), then set UART_MDR1[2:1] to 010 (UART in autobaud mode). To set the UART to standard mode (no autobaud), set UART_MDR1[2:1] to 000.

Return to Summary Table

Table 4-2577. ACREG Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 8	RESERVED_24	R	0h	
7	PULSE_TYPE	R/W	0h	SIR pulse width select: 1 | PULSE_TYPE_Value_1 | 1.6us
6	SD_MOD	R/W	0h	Primary output used to configure transceivers. Connected to the SD/MODE input pin of IrDA transceivers. 1 | SD_MOD_Value_1 | SD pin is set to low
5	DIS_IR_RX	R/W	0h	1 | DIS_IR_RX_Value_1 | Disables RX input (permanent state - independent of transmit).
4	DIS_TX_UNDERRUN	R/W	0h	It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting ACREG[4]=1, garbage data is sent over TX line. 1 | DIS_TX_UNDERRUN_Value_1 | Long stop bits can be transmitted, TX underrun is disabled
3	SEND_SIP	R/W1TS	0h	MIR/FIR Modes only.Send Serial Infrared Interaction Pulse [SIP] If this bit is set during a MIR/FIR transmission, the SIP will be send at the end of it.This bit automatically gets cleared at the end of the SIP transmission. 1 | SEND_SIP_Value_1 | Send SIP pulse.
2	SCTX_EN	R/W1TS	0h	Store and controlled TX start. When MDR1[5] = 1 and the LH writes 1 to this bit the TX state machine starts frame transmission. This bit is self-clearing.

DRAFT ONLY
TI Confidential – NDA Restrictions

Copyright © 2024 Texas Instruments Incorporated

Table 4-2577. ACREG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	ABORT_EN	R/W	0h	Frame Abort. The LH can intentionally abort transmission of a frame by writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame. If transmit FIFO is not empty and MDR1[5]=1, UART IrDA will start a new transfer with data of previous frame as soon as abort frame has been sent. Therefore, TX FIFO must be reset before sending an abort frame.
0	EOT_EN	R/W1TS	0h	EOT [end of transmission] bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit automatically gets cleared when the LH writes to the THR [TX FIFO].

4.34.40 MSS_UARTn_SCR Registers

4.34.40.1 UARTn_SCR Register (Offset = 40h) [reset = 0h]

Short Description: Supplementary control register

Long Description: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the UART_IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the UART_IIR register, the UART_SSR[1] bit must be checked. To clear the wake-up interrupt, bit UART_SCR[4] must be reset to 0.

4.34.42 MSS_UARTn_EBLR Registers

4.34.42.1 UARTn_EBLR Register (Offset = 48h) [reset = 0h]

Short Description: BOF length register

Long Description: IR-IrDA and IR-CIR modes only. In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must account for the BOF character; therefore, to send only one BOF with no XBOF, this register must be set to 1. To send one BOF with N XBOF, this register must be set to N + 1. The value 0 sends 1 BOF plus 255 XBOF. In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags). In IR-CIR mode, this register specifies the number of consecutive 0s to be received before generating the RX_STOP interrupt (UART_IIR[2]). All received 0s are stored in the RX FIFO. When the register is set to 0, this feature is deactivated and always in reception state, which can be disabled by setting the UART_ACREG[5] to 1.

Note

If the RX_STOP interrupt occurs before a byte boundary, the remaining bits of the last byte are filled with 0s and passed into the RX FIFO.

Return to Summary Table

4.34.44 MSS_UARTn_SYSC Registers

4.34.44.1 UARTn_SYSC Register (Offset = 54h) [reset = 0h]

Short Description: System configuration register

Long Description: The AUTOIDLE bit controls a power-saving technique to reduce the logic power consumption of the open-core protocol (OCP) interface. When the feature is enabled, the clock is gated off until an OCP command for this device is detected. When the software reset bit is set high, it causes a full device reset.

4.34.46 MSS_UARTn_WER Registers

4.34.46.1 UARTn_WER Register (Offset = 5Ch) [reset = ffh]

Short Description: Wake-up enable register

Long Description: The UART wake-up enable register is used to mask and unmask a UART event that would subsequently notify the system. An event is any activity in the logic that could cause an interrupt and/or an activity that would require the system to wake up. Even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, the UART registers the interrupt.

4.34.47 MSS_UARTn_CFPS Registers

4.34.47.1 UARTn_CFPS Register (Offset = 60h) [reset = 69h]

Short Description: Carrier frequency prescaler

Long Description: Because the consumer IR works at modulation rates of 30 to 56.8 kHz, the 48-MHz clock must be prescaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote-control requirements in baud multiples of 12x. The value of the CFPS at reset is 0105 decimal, which equals 38.1 kHz output from starting conditions. The 48-MHz carrier is prescaled by the CFPS, which is then divided by the 12x baud multiple.

4.34.56 MSS_UARTn_TX_DMA_THRESHOLD Registers

4.34.56.1 UARTn_TX_DMA_THRESHOLD Register (Offset = 84h) [reset = 0h]

Short Description: TX DMA threshold level register

Long Description: Use to manually set the TX DMA threshold level. UART_MDR3[2] SET_TX_DMA_THRESHOLD must be 1 and must be value + tx_trigger_level = 64 (TX FIFO size). If not, 64-tx_trigger_level will be used without modifying the value of this register.

Table 4-2795. INTVECTOR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 2	ADDR	RW	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt.Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed.Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1 - 0	RES20	RO	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Access Types Legend

Table 4-2875. CCERR Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 17	RES33	RO	0h	RESERVE FIELD
16	TCERR	RO	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors were previously clear) then an error will be signaled with TPCC error interrupt.
15 - 8	RES34	RO	0h	RESERVE FIELD
7	QTHRXCD7	RO	0h	Queue Threshold Error for Q7: QTHRXCD7 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD7 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD7 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
6	QTHRXCD6	RO	0h	Queue Threshold Error for Q6: QTHRXCD6 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD6 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD6 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
5	QTHRXCD5	RO	0h	Queue Threshold Error for Q5: QTHRXCD5 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD5 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD5 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
4	QTHRXCD4	RO	0h	Queue Threshold Error for Q4: QTHRXCD4 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD4 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD4 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
3	QTHRXCD3	RO	0h	Queue Threshold Error for Q3: QTHRXCD3 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD3 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD3 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

Table 4-2875. CCERR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	QTHRXCD2	RO	0h	Queue Threshold Error for Q2: QTHRXCD2 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD2 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD2 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
1	QTHRXCD1	RO	0h	Queue Threshold Error for Q1: QTHRXCD1 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD1 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD1 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
0	QTHRXCD0	RO	0h	Queue Threshold Error for Q0: QTHRXCD0 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD0 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD0 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

4.38.42 TPCC0_ER Registers

4.38.42.1 TPCC0_ER Register (Offset = 1000h) [reset = h]

Short Description: Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.38.48 TPCC0_CER Registers

4.38.48.1 TPCC0_CER Register (Offset = 1018h) [reset = h]

Short Description: Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.38.50 TPCC0_EER Registers

4.38.50.1 TPCC0_EER Register (Offset = 1020h) [reset = h]

Short Description: Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

4.38.56 TPCC0_SER Registers

4.38.56.1 TPCC0_SER Register (Offset = 1038h) [reset = h]

Short Description: Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

4.38.71 TPCC0_QER Registers

4.38.71.1 TPCC0_QER Register (Offset = 1080h) [reset = h]

Short Description: QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

4.38.77 TPCC0_ER_RN Registers

4.38.77.1 TPCC0_ER_RN Register (Offset = 2000h) [reset = h]

Short Description: Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.38.78 TPCC0_ERH_RN Registers

4.38.78.1 TPCC0_ERH_RN Register (Offset = 2004h) [reset = h]

Short Description: Event Register (High Part): If ERH.En bit is set and the EERH.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ERH.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EERH.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ERH.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EERH register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECRH pseudo-register.

4.38.83 TPCC0_CER_RN Registers

4.38.83.1 TPCC0_CER_RN Register (Offset = 2018h) [reset = h]

Short Description: Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.38.85 TPCC0_EER_RN Registers

4.38.85.1 TPCC0_EER_RN Register (Offset = 2020h) [reset = h]

Short Description: Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

4.38.106 TPCC0_QER_RN Registers

4.38.106.1 TPCC0_QER_RN Register (Offset = 2080h) [reset = h]

Short Description: QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Long Description:

4.38.107 TPCC0_QEER_RN Registers

4.38.107.1 TPCC0_QEER_RN Register (Offset = 2084h) [reset = h]

Short Description: QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

Bit	Field	Type	Reset	Description
31	PRIV	RO	0h	Privilege level: privilege level (supervisor vs. user) for the host/cpu/dma that programmed this PaRAM Entry. Value is set with the vbus priv value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus. PRIV = 0 : User level privilege PRIV = 1 : Supervisor level privilege
30 - 28	RES83	RO	0h	RESERVE FIELD
27 - 24	PRIVID	RO	0h	Privilege ID: Privilege ID for the external host/cpu/dma that programmed this PaRAM Entry. This value is set with the vbus privid value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus.
23	ITCCHEN	RW	0h	Intermediate transfer completion chaining enable: 0: Intermediate transfer complete chaining is disabled. 1: Intermediate transfer complete chaining is enabled.
22	TCCHEN	RW	0h	Transfer complete chaining enable: 0: Transfer complete chaining is disabled. 1: Transfer complete chaining is enabled.
21	ITCINTEN	RW	0h	Intermediate transfer completion interrupt enable: 0: Intermediate transfer complete interrupt is disabled. 1: Intermediate transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
20	TCINTEN	RW	0h	Transfer complete interrupt enable: 0: Transfer complete interrupt is disabled. 1: Transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
19	WIMODE	RW	0h	Backward compatibility mode: 0: Normal operation 1 : WI Backwards Compatibility mode forces BCNT to be adjusted by '1' upon TR submission (0 means 1 1 means 2 ...) and forces ACNT to be treated as a word-count (left shifted by 2 by hardware to create byte cnt for TR submission)
18	RES84	RO	0h	RESERVE FIELD
17 - 12	TCC	RW	0h	Transfer Complete Code: The 6-bit code is used to set the relevant bit in CER (bit CER[TCC]) for chaining or in IER (bit IER[TCC]) for interrupts.
11	TCCMODE	RW	0h	Transfer complete code mode: Indicates the point at which a transfer is considered completed. Applies to both chaining and interrupt. 0: Normal Completion A transfer is considered completed after the transfer parameters are returned to the CC from the TC (which was returned from the peripheral). 1: Early Completion A transfer is considered completed after the CC submits a TR to the TC. CC generates completion code internally .
10 - 8	FWID	RW	0h	FIFO width: Applies if either SAM or DAM is set to FIFO mode. Pass-thru to TC.
7 - 4	RES85	RO	0h	RESERVE FIELD

Short Description: A and B byte count

Long Description:

Return to Summary Table

Table 4-3074. Instance Table

Instance Name	Physical Address
TPCC0	4702 4008h

Access Types Legend

Table 4-3075. ABCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	BCNT	RW	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 (64K-1 arrays). BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ...
15 - 0	ACNT	RW	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes (64K-1 bytes). ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation (to translate between a word count and a byte count) will dropthe 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT.

4.38.117 TPCC0_LNK Registers

4.38.117.1 TPCC0_LNK Register (Offset = 4014h) [reset = h]

Short Description: Link and Reload parameters

Long Description:

Return to Summary Table

Table 4-3080. Instance Table

Instance Name	Physical Address
TPCC0	4702 4014h

Access Types Legend

Table 4-3081. LNK Register Field Descriptions

Bit	Field	Type	Reset	Description
31 - 16	BCNTRLD	RW	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT (conceptually) reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field.
15 - 0	LINK	RW	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination (i.e. after count fields are decremented to '0') with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case (5-lsbs) behavior is undefined forthe user (i.e. don't have to test it). In the former case (2 msbs) user should be able to take advantage of this feature (i.e. do have to test it). If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.

Access Types Legend

Table 4-3093. TCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
	RESERVED	NONE		Reserved
13 - 12	DFSTRTPTR	RO	0h	Dst FIFO Start PointerRepresents the offset to the head entry of Dst Register FIFO in units of entries. Legal values = 0x0 to 0x3
	RESERVED	NONE		Reserved
8	ACTV	RO	1h	Channel ActiveChannel Active is a logical-OR of each of the BUSY/ ACTV signals. The ACTV bit must remain high through the life of a TR.ACTV = 0 : Channel is idle.ACTV = 1 : Channel is busy.
	RESERVED	NONE		Reserved
6 - 4	DSTACTV	RO	0h	Destination Active StateSpecifies the number of TRs that are resident in the Dst Register FIFO at a given instant.Legal values are constrained by the DSTREGDEPTH parameter.
	RESERVED	NONE		Reserved
2	WSACTV	RO	0h	Write Status ActiveWSACTV = 0 : Write status is not pending. Write status has been received for all previously issued write commands.WSACTV = 1 : Write Status is pending. Write status has not been received for all previously issued write commands.
1	SRCACTV	RO	0h	Source Active StateSRCACTV = 0 : Source Active set is idle. Any TR written to Prog Set will immediately transition to Source Active set as long as the Dst FIFO Set is not full [DSTFULL == 1].SRCACTV = 1 : Source Active set is busy either performing read transfers or waiting to perform read transfers for current Transfer Request.
0	PROGBUSY	RO	0h	Program Register Set BusyPROGBUSY = 0 : Prog set idle and is available for programming.PROGBUSY = 1 : Prog set busy. User should poll for PROGBUSY equal to '0' prior to re-programming the Program Register set.

You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI’s products are provided subject to TI’s Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI’s provision of these resources does not expand or otherwise alter TI’s applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
